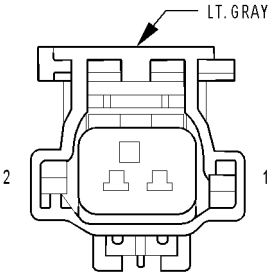
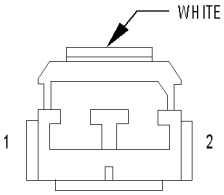
16	A14 18RD/WT	FUSED B(+)



DECKLID CYLINDER UNLOCK SWITCH (PT27)

DECKLID CYLINDER UNLOCK SWITCH (PT27) - LT. GRAY 2 WAY

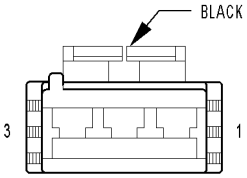
CAV	CIRCUIT	FUNCTION
1	P96 20WT/DG	PASSENGER DOOR SWITCH MUX
2	Z1 20BK	GROUND



DECKLID HANDLE SWITCH (PT27)

DECKLID HANDLE SWITCH (PT27) - WHITE 2 WAY

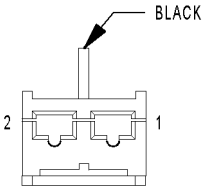
CAV	CIRCUIT	FUNCTION
1	G78 20TN/BK	DECKLID AJAR SWITCH SENSE
2	Z1 20BK	GROUND



DECKLID RELEASE MOTOR (PT27)

DECKLID RELEASE MOTOR (PT27) - BLACK 3 WAY

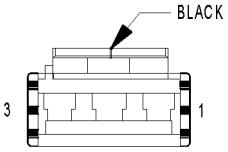
CAV	CIRCUIT	FUNCTION
1	Z1 16BK	GROUND
2	-	-
3	Q2 16LG/BK	DECKLID RELEASE RELAY OUTPUT



DECKLID RELEASE SWITCH (PT27)

DECKLID RELEASE SWITCH (PT27) - BLACK 2 WAY

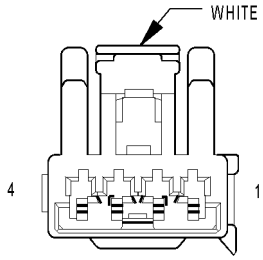
CAV	CIRCUIT	FUNCTION
1	Q33 20BR/LB	DECKLID RELEASE SWITCH SENSE
2	Z2 20BK/LG	GROUND



DOME LAMP

DOME LAMP - BLACK 3 WAY

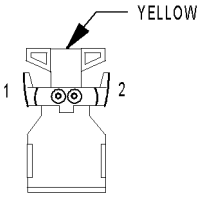
CAV	CIRCUIT	FUNCTION
1	-	-
2	M1 20PK	FUSED B(+)
3	M2 20YL	COURTESY LAMPS DRIVER



DOME LAMP/INTRUSION SENSOR (EXPORT)

DOME LAMP/INTRUSION SENSOR (EXPORT) - WHITE 4 WAY

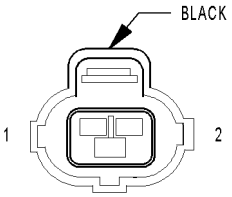
CAV	CIRCUIT	FUNCTION
1	M2 20YL	COURTESY LAMPS DRIVER
2	M1 20PK	FUSED B(+)
3	Z2 20BK/LG	GROUND
3	Z2 20BK/LG (OVERHEAD CONSOLE)	GROUND
4	G120 20WT/LB	INTRUSION SENSOR SIGNAL



DRIVER AIRBAG SQUIB 1

DRIVER AIRBAG SQUIB 1 - YELLOW 2 WAY

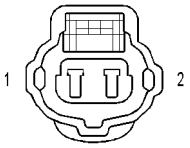
CAV	CIRCUIT	FUNCTION
1	R43 20BK/LB	DRIVER SQUIB 1 LINE 1
2	R45 20DG/LB	DRIVER SQUIB 1 LINE 2



DRIVER DOOR AJAR SWITCH

DRIVER DOOR AJAR SWITCH - BLACK 2 WAY

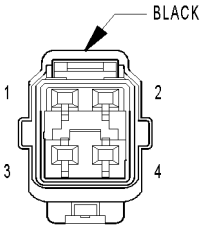
CAV	CIRCUIT	FUNCTION
1	G75 20TN/DB	DRIVER DOOR AJAR SWITCH SENSE
2	Z1 20BK	GROUND



DRIVER DOOR HANDLE SWITCH (PT27)

DRIVER DOOR HANDLE SWITCH (PT27) - 2 WAY

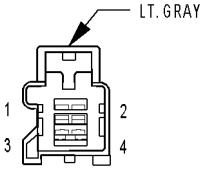
CAV	CIRCUIT	FUNCTION
1	Q59 20OR/YL	DRIVER WINDOW DROP SWITCH SENSE
2	Z2 20BK/LG	GROUND



DRIVER DOOR POWER LOCK MOTOR/AJAR SWITCH

DRIVER DOOR POWER LOCK MOTOR/AJAR SWITCH - BLACK 4 WAY

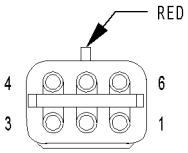
CAV	CIRCUIT	FUNCTION
1	G75 20TN/DB (LHD)	LEFT FRONT DOOR AJAR SWITCH SENSE
1	G74 20TN/DB (RHD)	RIGHT FRONT DOOR AJAR SWITCH SENSE
2	Z1 20BK	GROUND
3	P34 20PK/BK	DRIVER DOOR UNLOCK RELAY OUTPUT
4	P35 20OR/VT (PT27)	DOOR LOCK RELAY OUTPUT
4	P35 20OR/WT (PT44 LHD)	DOOR LOCK RELAY OUTPUT
4	P33 20OR/BK (PT44 RHD)	DOOR LOCK RELAY OUTPUT



DRIVER HEATED SEAT CUSHION

DRIVER HEATED SEAT CUSHION - LT. GRAY 4 WAY

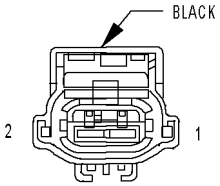
CAV	CIRCUIT	FUNCTION
1	Z121 18BK	GROUND
2	P131 20RD/DG	DRIVER SEAT HEATER CUSHION DRIVER
3	P141 20TN/LB	SEAT TEMPERATURE SENSOR 5VOLT SUPPLY
4	P143 20BK/DG	DRIVER SEAT TEMPERATURE SENSOR RETURN



DRIVER HEATED SEAT SWITCH

DRIVER HEATED SEAT SWITCH - RED 6 WAY

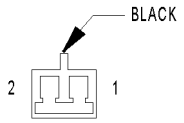
CAV	CIRCUIT	FUNCTION
1	P137 20VT/DG	DRIVER SEAT LOW HEAT LED DRIVER
2	-	-
3	Z121 18BK	GROUND
4	F99 18RD/WT	HEATED SEAT RELAY OUTPUT
5	P139 20VT/WT	DRIVER SEAT HIGH HEAT LED DRIVER
6	P7 20LB/BK	DRIVER HEATED SEAT SWITCH



DRIVER REAR WINDOW MOTOR (PT27)

DRIVER REAR WINDOW MOTOR (PT27) - BLACK 2 WAY

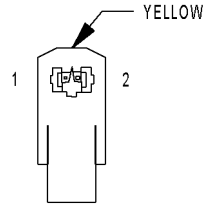
CAV	CIRCUIT	FUNCTION
1	Q23 14RD/WT	DRIVER REAR WINDOW DRIVER DOWN
2	Q13 14DB	DRIVER REAR WINDOW DRIVER UP



DRIVER SEAT BELT SWITCH

DRIVER SEAT BELT SWITCH - BLACK 2 WAY

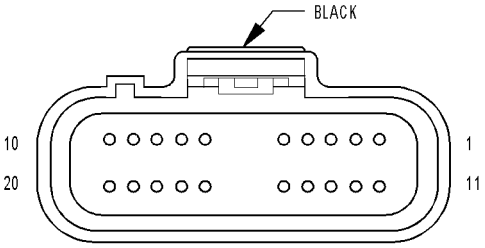
CAV	CIRCUIT	FUNCTION
1	G10 20LG/RD	SEAT BELT SWITCH SENSE
2	Z1 20BK	GROUND



DRIVER SEAT BELT TENSIONER

DRIVER SEAT BELT TENSIONER - YELLOW 2 WAY

CAV	CIRCUIT	FUNCTION
1	R53 20LG/YL	DRIVER SEAT BELT TENSIONER LINE 2
2	R55 20LG/DG	DRIVER SEAT BELT TENSIONER LINE 1



DRIVER WINDOW REGULATOR MODULE (PT27)

DRIVER WINDOW REGULATOR MODULE (PT27) - BLACK 20 WAY

CAV	CIRCUIT	FUNCTION
1	Z1 16BK	GROUND
2	G75 18TN/DB	LEFT FRONT DOOR AJAR SWITCH SENSE
3	Q325 20OR/LB	DRIVER REAR WINDOW SWITCH MUX

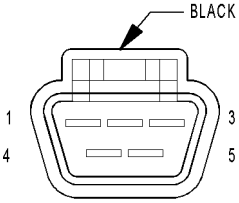
FRONT WASHER PUMP MOTOR

FRONT WASHER PUMP MOTOR - BLACK 2 WAY

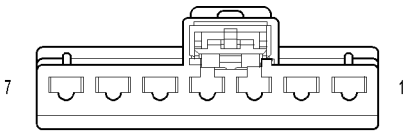
CAV	CIRCUIT	FUNCTION
1	V20 18BK/WT	REAR WASHER MOTOR CONTROL
2	V10 18BR	WASHER SWITCH SENSE



FRONT WIPER MOTOR

FRONT WIPER MOTOR - BLACK 5 WAY

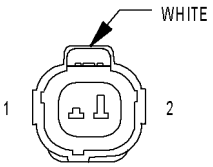
CAV	CIRCUIT	FUNCTION
1	V5 16DG	WIPER SWITCH MODE SENSE
2	F88 16RD/WT	FUSED IGNITION SWITCH OUTPUT (RUN-ACC)
3	V4 16RD/YL	WIPER SWITCH HIGH SPEED OUTPUT
4	Z1 16BK	GROUND
5	V3 16BR/WT	WIPER SWITCH LOW SPEED OUTPUT



FRONT WIPER/WASHER SWITCH

FRONT WIPER/WASHER SWITCH - 7 WAY

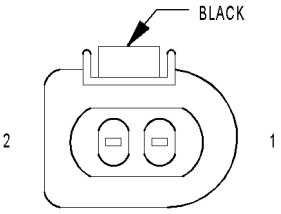
CAV	CIRCUIT	FUNCTION
1	V5 18DG	WIPER SWITCH MODE SENSE
2	Z1 18BK	GROUND
3	V10 18BR	WASHER SWITCH SENSE
4	F88 16DB	FUSED IGNITION SWITCH OUTPUT (RUN-ACC)
5	V4 16RD/YL	WIPER SWITCH HIGH SPEED OUTPUT
6	V3 16BR/WT	WIPER SWITCH LOW SPEED OUTPUT
7	-	-



FUEL HEATER MODULE (DIESEL)

FUEL HEATER MODULE (DIESEL) - WHITE 2 WAY

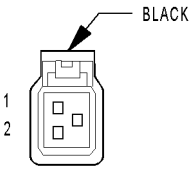
CAV	CIRCUIT	FUNCTION
1	A93 14RD/BK	FUEL HEATER RELAY OUTPUT
2	-	-



FUEL INJECTOR NO. 1 (DIESEL)

FUEL INJECTOR NO. 1 (DIESEL) - BLACK 2 WAY

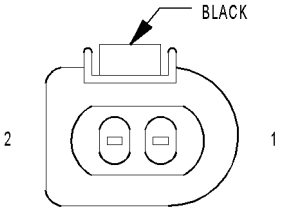
CAV	CIRCUIT	FUNCTION
1	K11 12BK/LB	FUEL INJECTOR NO. 1 CONTROL
2	K63 12BK	COMMON INJECTOR DRIVER



FUEL INJECTOR NO. 1 (GAS)

FUEL INJECTOR NO. 1 (GAS) - BLACK 2 WAY

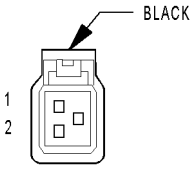
CAV	CIRCUIT	FUNCTION
1	K11 18WT/DB (1.6L)	FUEL INJECTOR NO. 1 DRIVER
1	K11 18WT/DB (EXCEPT 1.6L)	INJECTOR CONTROL NO. 1
2	A142 18DG/OR	AUTOMATIC SHUT DOWN RELAY OUTPUT



FUEL INJECTOR NO. 2 (DIESEL)

FUEL INJECTOR NO. 2 (DIESEL) - BLACK 2 WAY

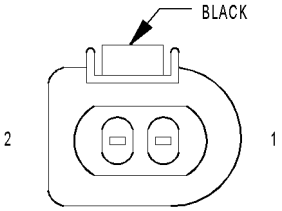
CAV	CIRCUIT	FUNCTION
1	K12 12BK/VT	FUEL INJECTOR NO. 2 CONTROL
2	K63 12LB	COMMON INJECTOR DRIVER



FUEL INJECTOR NO. 2 (GAS)

FUEL INJECTOR NO. 2 (GAS) - BLACK 2 WAY

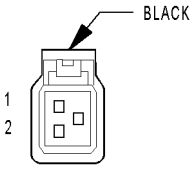
CAV	CIRCUIT	FUNCTION
1	K12 18TN (1.6L)	FUEL INJECTOR NO. 2 DRIVER
1	K12 18TN (EXCEPT 1.6L)	INJECTOR CONTROL NO. 2
2	A142 18DG/OR	AUTOMATIC SHUT DOWN RELAY OUTPUT



FUEL INJECTOR NO. 3 (DIESEL)

FUEL INJECTOR NO. 3 (DIESEL) - BLACK 2 WAY

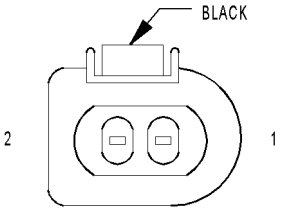
CAV	CIRCUIT	FUNCTION
1	K13 12BK/RD	FUEL INJECTOR NO. 3 CONTROL
2	K63 12LB	COMMON INJECTOR DRIVER



FUEL INJECTOR NO. 3 (GAS)

FUEL INJECTOR NO. 3 (GAS) - BLACK 2 WAY

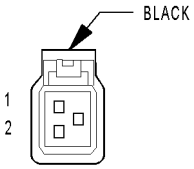
CAV	CIRCUIT	FUNCTION
1	K13 18YL/WT (1.6L)	FUEL INJECTOR NO. 3 DRIVER
1	K13 18YL/WT (EXCEPT 1.6L)	INJECTOR CONTROL NO. 3
2	A142 18DG/OR	AUTOMATIC SHUT DOWN RELAY OUTPUT



FUEL INJECTOR NO. 4 (DIESEL)

FUEL INJECTOR NO. 4 (DIESEL) - BLACK 2 WAY

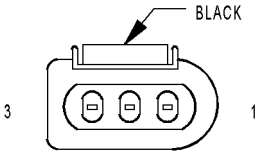
CAV	CIRCUIT	FUNCTION
1	K14 12BK/YL	FUEL INJECTOR NO. 4 CONTROL
2	K63 12BK	COMMON INJECTOR DRIVER



FUEL INJECTOR NO. 4 (GAS)

FUEL INJECTOR NO. 4 (GAS) - BLACK 2 WAY

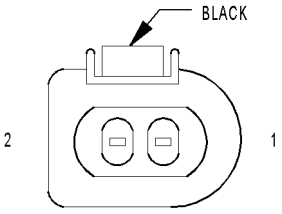
CAV	CIRCUIT	FUNCTION
1	K14 18LB/BR (1.6L)	FUEL INJECTOR NO. 4 DRIVER
1	K14 18LB/BR (EXCEPT 1.6L)	INJECTOR CONTROL NO. 4
2	A142 18DG/OR	AUTOMATIC SHUT DOWN RELAY OUTPUT



FUEL PRESSURE SENSOR (DIESEL)

FUEL PRESSURE SENSOR (DIESEL) - BLACK 3 WAY

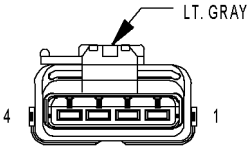
CAV	CIRCUIT	FUNCTION
1	N920 20BR/GY	FUEL PRESSURE SENSOR GROUND
2	N20 20LG/VT	FUEL PRESSURE SENSOR SIGNAL
3	Y99 20RD/LB	FUEL PRESSURE SENSOR 5 VOLT SUPPLY



FUEL PRESSURE SOLENOID (DIESEL)

FUEL PRESSURE SOLENOID (DIESEL) - BLACK 2 WAY

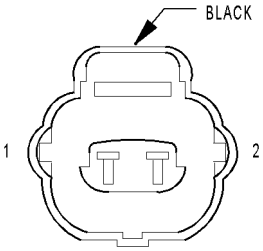
CAV	CIRCUIT	FUNCTION
1	K46 20BK/WT	FUEL PRESSURE SOLENOID CONTROL
2	A142 20RD/LG	AUTOMATIC SHUT DOWN RELAY OUTPUT



FUEL PUMP MODULE

FUEL PUMP MODULE - LT. GRAY 4 WAY

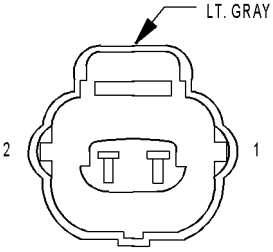
CAV	CIRCUIT	FUNCTION
1	Z1 16BK	GROUND
2	Z2 20BK/LG	GROUND
3	G4 20DB	FUEL LEVEL SENSOR SIGNAL
4	A141 16DG/WT	FUEL PUMP RELAY OUTPUT



GENERATOR (2.4L TURBO)

GENERATOR (2.4L TURBO) - BLACK 2 WAY

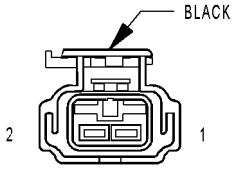
CAV	CIRCUIT	FUNCTION
1	Z1 20BK	GROUND
2	K20 20DG	GEN FIELD CONTROL



GENERATOR (DIESEL)

GENERATOR (DIESEL) - LT. GRAY 2 WAY

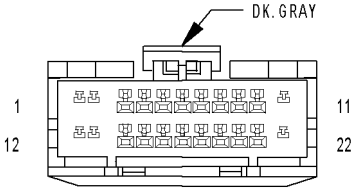
CAV	CIRCUIT	FUNCTION
1	K20 12LB/WT	GENERATOR FIELD CONTROL
2	A142 20RD/LG	AUTOMATIC SHUT DOWN RELAY OUTPUT



GENERATOR (GAS EXCEPT 2.4L TURBO)

GENERATOR (GAS EXCEPT 2.4L TURBO) - BLACK 2 WAY

CAV	CIRCUIT	FUNCTION
1	K20 18DG (1.6L)	GENERATOR FIELD CONTROL
1	Z1 20BK (2.4L)	GROUND
2	A142 18DG/OR (1.6L)	AUTOMATIC SHUT DOWN RELAY OUTPUT
2	K20 20DG (2.4L)	GEN FIELD CONTROL



HANDS FREE MODULE C1

HANDS FREE MODULE C1 - DK. GRAY 22 WAY

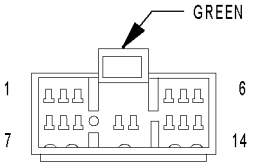
HEADLAMP LEVELING SWITCH (EXPORT)

HEADLAMP LEVELING SWITCH (EXPORT) - BLACK 4 WAY

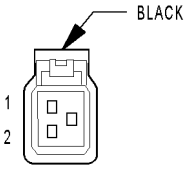
CAV	CIRCUIT	FUNCTION
1	L13 20BR/YL	HEADLAMP ADJUST SIGNAL
2	L43 18VT	FUSED LEFT LOW BEAM OUTPUT
3	Z1 20BK	GROUND
4	E2 20OR	PANEL LAMPS DRIVER



HEATED SEAT MODULE

HEATED SEAT MODULE - GREEN 14 WAY

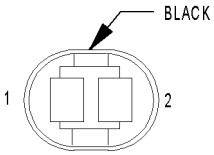
CAV	CIRCUIT	FUNCTION
1	P7 20LB/BK	DRIVER HEATED SEAT SWITCH
2	P141 20TN/LB	SEAT TEMPERATURE SENSOR 5 VOLT SUPPLY
3	P130 18RD/TN	PASSENGER SEAT HEATER CUSHION DRIVER
4	F99 18RD/WT	HEATED SEAT RELAY OUTPUT
5	P131 20RD/DG	DRIVER SEAT HEATER CUSHION DRIVER
6	F99 18RD/WT	HEATED SEAT RELAY OUTPUT
7	P144 20BK/LG	PASSENGER SEAT TEMPERATURE SENSOR RETURN
8	P143 20BK/DG	DRIVER SEAT TEMPERATURE SENSOR RETURN
9	P8 20LB/WT	PASSENGER HEATED SEAT SWITCH
10	P138 20VT/LG	PASSENGER SEAT LOW HEAT LED DRIVER
11	P140 20VT/BK	PASSENGER SEAT HIGH HEAT LED DRIVER
12	P137 20VT/DG	DRIVER SEAT LOW HEAT LED DRIVER
13	Z121 18BK	GROUND
14	P139 20VT/WT	DRIVER SEAT HIGH HEAT LED DRIVER



HIGH NOTE HORN (EXPORT)

HIGH NOTE HORN (EXPORT) - BLACK 2 WAY

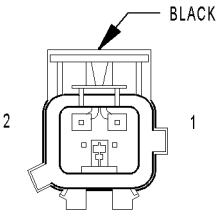
CAV	CIRCUIT	FUNCTION
1	X2 20DG/RD	HORN RELAY OUTPUT
2	Z1 20BK	GROUND



HOOD AJAR SWITCH (EXPORT)

HOOD AJAR SWITCH (EXPORT) - BLACK 2 WAY

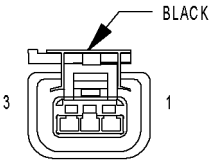
CAV	CIRCUIT	FUNCTION
1	G70 20BR/TN	HOOD AJAR SWITCH SENSE
2	Z1 20BK	GROUND



IDLE AIR CONTROL MOTOR (2.4L)

IDLE AIR CONTROL MOTOR (2.4L) - BLACK 2 WAY

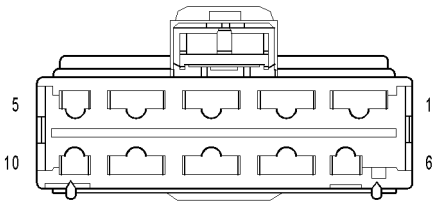
CAV	CIRCUIT	FUNCTION
1	K610 18VT/GY	IAC MOTOR CONTROL
2	K961 18BR/VT	IAC RETURN



IGNITION COIL (GAS)

IGNITION COIL (GAS) - BLACK 3 WAY

CAV	CIRCUIT	FUNCTION
1	K17 18DB/TN (1.6L)	IGNITION COIL NO. 2 DRIVER
1	K17 18DB/TN (2.4L EXCEPT TURBO)	COIL CONTROL NO. 2
1	K17 18DB/TN (2.4L TURBO)	COIL CONTROL NO. 2
2	A142 18DG/OR (1.6L/2.4L TURBO)	AUTOMATIC SHUT DOWN RELAY OUTPUT
2	A142 16DG/OR (2.4L EXCEPT TURBO)	AUTOMATIC SHUT DOWN RELAY OUTPUT
3	K19 18BK/GY (1.6L)	IGNITION COIL NO. 1 DRIVER
3	K19 18BK/GY (2.4L EXCEPT TURBO)	COIL CONTROL NO. 1
3	K19 18BK/GY (2.4L TURBO)	COIL CONTROL NO. 1



IGNITION SWITCH C1

IGNITION SWITCH C1 - 10 WAY

CAV	CIRCUIT	FUNCTION
1	A1 14RD	FUSED B(+)
1	A1 14RD (AUTOSTICK)	FUSED B(+)
2	A21 14DB	IGNITION SWITCH OUTPUT (RUN-START)
3	F30 16RD	IGNITION SWITCH OUTPUT (RUN-ACC)
4	F1 16DB/BK	FUSED B(+)
4	F1 16DB/BK (POWER OUTLET)	FUSED B(+)
5	G26 20LB	KEY-IN IGNITION SWITCH SENSE

TABLE OF CONTENTS

page

CONNECTOR/GROUND/SPLICE LOCATION
DESCRIPTION 1

CONNECTOR/GROUND/SPLICE LOCATION

DESCRIPTION

This section provides illustrations identifying connector, ground and splice locations in the vehicle. Connector, ground and splice indexes are provided. Use the wiring diagrams in each section for connector, ground and splice identification. Refer to the appropriate index for the proper figure number. For items that are not shown in this section N/S is placed in the Fig. column.

CONNECTORS

CONNECTOR NAME/ NUMBER	COLOR	LOCATION	FIG.
A/C Compressor Clutch	BK	Lower Right Side of Engine Compartment On Engine	21, 22, 24, 27
A/C High Pressure Switch (Diesel)	LT GY	Lower Right Side Engine Compartment	N/S
A/C Low Pressure Switch (LHD)	BK	Right Rear of Engine Compartment	1, 11, 12, 18
A/C Low Pressure Switch (RHD)	BK	Left Rear of Engine Compartment	16
A/C Pressure Transducer	GY	Lower Left Side of Engine Compartment on Engine	22, 24, 27
A/C-Heater Control Switch	GY	Center of Instrument Panel	31
Accelerator Pedal Position Sensor	BK	Right Side Engine Compartment	10, 12, 18
Airbag Control Module (ORC) (Base)	YL	Under Center Console	43
Airbag Control Module (ORC) C1 (Premium)	YL	Under Center Console	43
Airbag Control Module (ORC) C2 (Premium)	YL	Under Center Console	43
Ambient Temperature Sensor (Gas)	BK	Lower Left Front Fascia	1
Ambient Temperature Sensor (Diesel)	BK	Left Front Engine Compartment	20
Ambient Temperature Sensor (NGC)	BK	Left Front Engine Compartment	1
Autostick Switch	WT	Center Console	43
Back-Up Lamp Switch	GY	Left Side of Engine Compartment on Manual Transmission	21, 22, 24, 26, 27

CONNECTOR/GROUND/SPLICE LOCATION (Continued)

CONNECTOR NAME/ NUMBER	COLOR	LOCATION	FIG.
Battery Jump Post		Left Rear Engine Compartment	19
Battery Temperature Sensor (Diesel)	BK	Lower Passenger B-Pillar	64
Battery Temperature Sensor (Gas)	BK	Left Front Engine Compartment	14
Battery (+) (Diesel)		Under Left of Rear Seat	64
Battery (-) (Diesel)		Under Left of Rear Seat	64
Blower Motor	BK	Right Rear of Instrument Panel	N/S
Blower Motor Resistor Block	BK	Right Side of Cowl Panel	5, 14, 15, 17
Boost Pressure Sensor	BK	Lower Rear of Engine Compartment on Engine	21
Brake Lamp Switch	GY	Left Side of Brake Pedal	14, 15, 17
Brake Transmission Shift Interlock Solenoid	WT	Below Steering Column	28
Brake Warning Indicator Switch (LHD)	BK	Left Rear of Engine Compartment	1, 3, 5, 13
Brake Warning Indicator Switch (RHD)	BK	Right Rear of Engine Compartment	10
C102	LT GY	Front Left Side of Engine Compartment	1, 22, 24, 25
C103 (2.4L)	DK GY	Front Side of Engine Compartment on Engine	22
C103 (2.4L Turbo)	BK	Front Side of Engine Compartment on Engine	24
C105	WT	Left Side of Instrument Panel	14, 15, 17, 29, 35
C106	GY	Left Side of Instrument Panel	14, 15, 17, 29, 35
C107 (Export)	BK	Left Front of Vehicle	4, 5, 13, 16
C108 (Export)	BK	Right Front of Vehicle	9, 20
C109	BK	Lower Right Side of Engine Compartment	10, 11, 12, 18
C110	BK	Lower Right Side of Engine Compartment	10, 11, 12, 18
C111	LT GY	Left Front of Engine Compartment	5, 27
C112	BK	Left Front of Engine Compartment	5, 27
C114	DK GY	Left Front of Engine Compartment	5, 27
C121	BK	Front of Engine Compartment	20, 21
C122	LT GY	Front of Engine Compartment	20, 21
C124	DK GY	Front of Engine Compartment	20, 21
C125	BK	Front of Engine Compartment	13, 16, 21
C126	DK GY	Left Side of Engine Compartment	13, 16
C127	BK	Left Rear of Engine Compartment	13, 16, 19
C128	BK	Left Rear of Engine Compartment	13, 16, 19
C200	BK	Left Side of Instrument Panel	29, 34
C201	BK	Right Side of Instrument Panel	30, 35

CONNECTOR/GROUND/SPLICE LOCATION (Continued)

CONNECTOR NAME/ NUMBER	COLOR	LOCATION	FIG.
C202 (LHD)	WT	Left Kick Panel	29, 56, 58
C202 (RHD)	GY	Left Kick Panel	34
C203 (PT27)	LT GY	Lower Right Kick Panel	30, 50
C203 (PT44)	GN	Lower Right Kick Panel	30, 35, 49
C204	WT	Left Side of Instrument Panel	29, 34, 45, 46, 47, 56
C205	WT	Upper Right Kick Panel	30, 35, 45, 46, 47, 49

C212	BK	Center Of Instrument Panel	33
C300	BK	Left B-Pillar	48, 57
C301	BK	Right B-Pillar	48, 51
C302	WT	Top Left of Liftgate	61, 70, 71
C303	DK GY	Left Rear Quarter	59, 72
C304	BK	Side of Fuel Tank	65
C305	YL	Left Rear of Front Console	43, 49, 50, 56
C306	YL	Left Side of Front Console	43, 49, 56, 58
C307	BK	Under Passenger Seat	43, 49, 50, 56
C308	BK	Under Driver Seat	43, 49, 56, 58
C343 (PT27)	LT GY	Left Decklid	69
C349 (PT27)	BL	Left Rear Cargo Area	62
C362 (PT27)	LT GY	Left Side Body	60, 66, 67
Camshaft Position Sensor	BK	On Engine Left Side of Engine Compartment	21, 23, 24, 26
Cargo Lamp	BK	Cargo Area	54, 55
Center High Mounted Stop Lamp (PT27)	WT	Top of Decklid	69
Center High Mounted Stop Lamp (PT44)	BK	Top of Liftgate	70, 71
Center Stack Lamp	BK	Bottom Center of Instrument Panel	31
Cigar Lighter	BK	Bottom Center of Instrument Panel	43
Clockspring	GN	Bottom of Steering Wheel	28
Clutch Pedal Position Switch (Up)	BK	Left Side of Steering Column	14, 15, 17
Compass/Temperature Mirror Module	BK	Top Center Windshield	39, 42
Controller Antilock Brake	BK	Left Side of Engine Compartment	1, 3, 5, 13, 16
Crankshaft Position Sensor (2.4L)	BK	Lower Rear of Engine Compartment On Engine	24
Crankshaft Position Sensor (1.6L Gas/ 2.2L Diesel)	BK	Lower Front of Engine Compartment on Engine	21, 27

CONNECTOR/GROUND/SPLICE LOCATION (Continued)

CONNECTOR NAME/ NUMBER	COLOR	LOCATION	FIG.
Data Link Connector	BK	Left Side of Instrument Panel	14, 15, 17
Decklid Cylinder Lock Switch	LT GY	Decklid	69
Decklid Handle Switch	WT	Decklid	69
Decklid Release Motor	BK	Decklid	69
Decklid Release Switch	BK	In Glove Box	30
Dome Lamp	BK	Center of Headliner	N/S
Dome Lamp/Intrusion Sensor	WT	Center of Headliner	N/S
Driver Airbag	YL	Front of Steering Wheel	N/S
Driver Door Ajar Switch	BK	Left B-Pillar	N/S
Driver Door Handle Switch (PT27)		Driver Door	46
Driver Door Power Lock Motor/Ajar Switch (PT27)	BK	Driver Door	46
Driver Door Power Lock Motor/Ajar Switch (PT44)	BK	Driver Door	45, 47
Driver Heated Seat Cushion	LT GY	Driver Seat	N/S
Driver Heated Seat Switch	RD	Driver Seat	N/S
Driver Seat Airbag	YL	Driver Seat	N/S
Driver Seat Belt Switch (LHD PT44)	BK	Lower Left B-Pillar	57
Driver Seat Belt Switch (PT27)	BK	Left Side Body	58
Driver Seat Belt Switch (RHD)	BK	Lower Right B-Pillar	51
Driver Seat Belt Tensioner (LHD PT44)	YL	Left B-Pillar	57
Driver Seat Belt Tensioner (PT27)	YL	Left Side Body	58
Driver Seat Belt Tensioner (RHD)	YL	Right B-Pillar	51
Driver Side Impact Sensor 1 (LHD)	GY	Lower Left B-Pillar	57
Driver Side Impact Sensor 1 (RHD)	GY	Lower Right B-Pillar	51
EGR Solenoid	GY	Rear of Engine Compartment on Engine	13, 16
Electronic Throttle Control Module (1.6L)	BK	Center of Engine Compartment on Top of Engine	26, 27
Engine Control Module - C1	BK	Left Side Engine Compartment	21
Engine Control Module - C2	BK	Left Side of Engine Compartment	21
Engine Coolant Temperature Sensor	BK	Left Side of Engine Compartment on Engine	27
Engine Oil Pressure Switch	LT GN	Right Rear of Engine Compartment	21, 23, 25, 26
Engine Starter Motor (1.6L)	-	Lower Rear of Engine Compartment on Engine	6, 26
Engine Starter Motor (2.4L Except Turbo, 2.2L Diesel)	-	Lower Front of Engine Compartment on Engine	7, 19, 21, 22

CONNECTOR/GROUND/SPLICE LOCATION (Continued)

CONNECTOR NAME/ NUMBER	COLOR	LOCATION	FIG.
Engine Starter Motor (2.4L Turbo)	-	Rear Engine Compartment on Engine	8, 24
EVAP/Purge Solenoid	BK	Lower Right Rear of Engine Compartment	1, 5, 11
Front Power Window Switch	NAT	Top Center of Instrument Panel	31
Front Washer Pump Motor	BK	Attached to Washer Reservoir	5, 14, 15, 17
Front Wiper Motor	BK	Center of Cowl Panel	5, 14, 15, 17
Front Wiper/Washer Switch	GY	Part of Multi-Function Switch	28
Fuel Heater Module (Diesel)	WT	Rear of Engine Compartment	13, 16
Fuel Injector No.1	BK	Center of Engine Compartment At Injector	21
Fuel Injector No.2	BK	Center of Engine Compartment At Injector	21
Fuel Injector No.3	BK	Center of Engine Compartment At Injector	21
Fuel Injector No.4	BK	Center of Engine Compartment At Injector	21, 27
Fuel Pressure Sensor	BK	Front of Engine Compartment on Engine	N/S
Fuel Pressure Solenoid	BK	Front of Engine Compartment Top of Engine	N/S
Fuel Pump Module	LT GY	On Fuel Tank	65
Fuse Block	BK	Left Bottom of Instrument Panel	28, 29, 35
Fusible Link (2.4L)	-	Front of Engine Compartment on Engine	N/S
Generator	BK	Right Front of Engine Compartment on Engine	19, 21, 23, 27
Glow Plug No. 1		Center of Engine Compartment Top of Engine	N/S
Glow Plug No. 2		Center of Engine Compartment Top of Engine	N/S
Glow Plug No. 3		Center of Engine Compartment Top of Engine	N/S
Glow Plug No. 4		Center of Engine Compartment Top of Engine	N/S
Hands Free Module C1		Left Center of Instrument Panel	32
Hands Free Module C2	DK GY	Left Center of Instrument Panel	32
Hands Free Module C3	BK	Left Center of Instrument Panel	32
Headlamp Leveling Switch	BK	Center of Instrument Panel	31
Heated Seat Module	GR	Driver Seat	N/S
High Note Horn	BK	Left Inner Fender	1, 9, 20
Hood Ajar Switch	BK	Left Rear Engine Compartment	1, 5, 13, 16
Idle Air Control Motor	BK	Center of Engine Compartment Top of Engine	23, 24

CONNECTOR/GROUND/SPLICE LOCATION (Continued)

CONNECTOR NAME/ NUMBER	COLOR	LOCATION	FIG.
Ignition Coil	BK	Left Rear of Engine Compartment on Engine	23, 26, 27
Ignition Switch C1	BK	Right Side of Steering Column	28
Ignition Switch C2	WT	Right Side of Steering Column	28
Inlet Air Temperature Sensor	BK	Left Side Engine Compartment on Engine	21, 23, 24, 26, 27
Input Speed Sensor	GY	Front of Engine Compartment on Transmission	22, 24
Instrument Cluster C1	BK	Driver's Side of Instrument Panel	28
Instrument Cluster C2	BK	Driver's Side of Instrument Panel	28
Intake Air Temperature Sensor (Diesel)	BK	Left Top of Engine	N/S
Knock Sensor	BK	Front of Engine Compartment on Engine	22, 24
Leak Detection Pump (Except NGC)	BK	Near Fuel Tank Module	N/S
Left Back-Up Lamp	GY	Left Side of Rear Fascia	72
Left City Lamp	GY	Left Front of Vehicle Near C107	N/S

POWER DISTRIBUTION

DESCRIPTION

The power distribution system for this vehicle consists of the following components:

- Power Distribution Center (PDC)
- Fuse Block

OPERATION

The power distribution system for this vehicle is designed to provide safe, reliable, centralized, and convenient to access, distribution of the electrical current required to operate all of the many standard and optional factory-installed electrical and electronic powertrain, chassis, safety, comfort and convenience systems. At the same time, these systems were designed to provide centralized locations for conducting diagnosis of faulty circuits, and for sourcing the additional current requirements of many aftermarket vehicle accessory and convenience items.

These power distribution systems also incorporate various types of circuit control and protection features, including:

- Fuses
- Fuse cartridges
- Fusible links
- Automatic resetting circuit breakers
- Relays
- Flashers
- Timers
- Circuit splice blocks.

CIGAR LIGHTER/POWER OUTLET

DESCRIPTION

INSTRUMENT PANEL MOUNTED

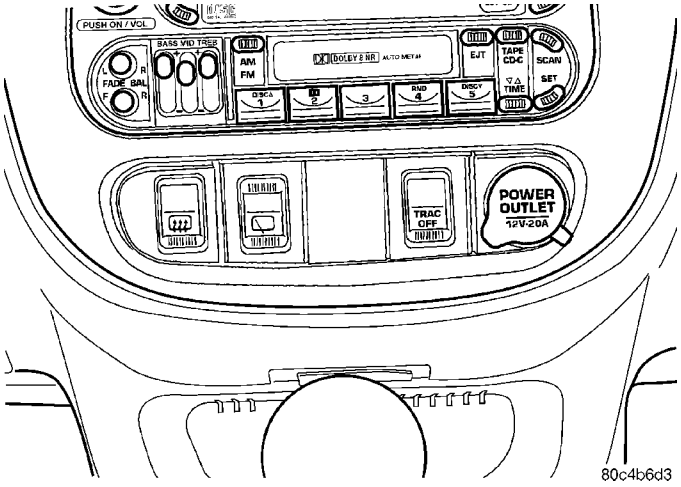

Fig. 1 Instrument Panel Mounted Cigar Lighter/ Power Outlet Location

An instrument panel mounted cigar lighter/power outlet receptacle (Fig. 1) is optional equipment on this model. On models equipped with the optional Smoker's Package, the cigar lighter knob and heating element are included. On models without the Smoker's Package, the cigar lighter receptacle is equipped with a snap fit plastic cap and is treated as an auxiliary power outlet. The cigar lighter receptacle is installed in the instrument panel accessory switch

CIGAR LIGHTER/POWER OUTLET (Continued)

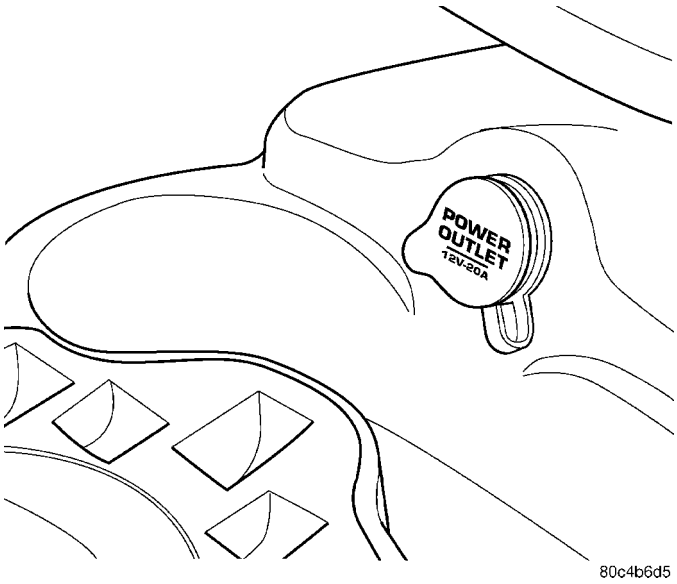

Fig. 2 Console Mounted Power Outlet Location

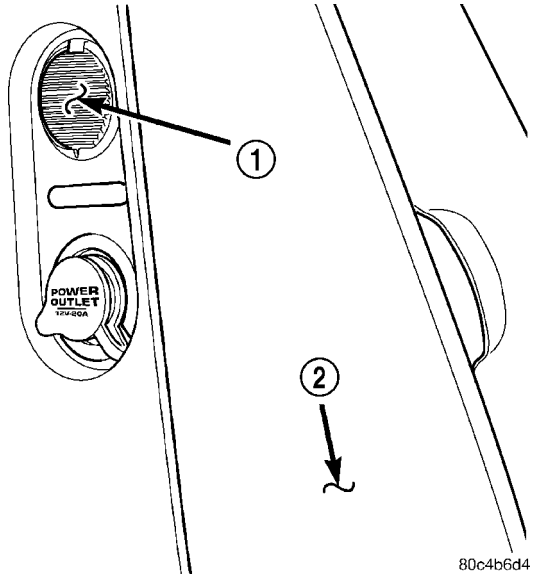

Fig. 3 Rear Cargo Area Power Outlet Location

1 - CARGO LAMP
2 - SPARE TIRE JACK COVER

bezel, which is located near the bottom of the instrument panel center stack area, below the radio. The cigar lighter base is secured by a snap fit within the center lower bezel. This power outlet has a constant 12 volt battery feed.

The cigar lighter receptacle is serviced with the accessory switch bezel and if defective, the entire switch bezel must be replaced. The plastic cap and the knob and heating element unit are available for service replacement. These components cannot be repaired and, if faulty or damaged, they must be replaced.

FRONT CONSOLE AND REAR CARGO MOUNTED

A front console mounted power outlet is standard equipment and a rear cargo area power outlet is optional equipment on this model. The front console mounted power outlet is mounted near the front of the console just in front of the cup holders (Fig. 2). This outlet can be used as a cigar lighter or power outlet, but only has 12 volt battery voltage when the ignition is in the ON or ACC positions. The rear power outlet is installed in the right rear quarter trim panel, near the spare tire jack (Fig. 3). The power outlet base and mount are secured by a snap fit within the quarter trim panel. A plastic protective cap snaps into the power outlet base when the power outlet is not being used, and hangs from the power outlet base mount by an integral bail strap while the power outlet is in use. While the power outlet is very similar to a cigar lighter base unit, it does not include the two small spring-clip retainers inside the bottom of the receptacle shell that are used to secure the cigar lighter heating element to the insulated contact. It has 12 volt battery voltage when the ignition is in the ON or ACC positions.

OPERATION

CIGAR LIGHTER/POWER OUTLET (INSTRUMENT PANEL AND CONSOLE MOUNTED)

The cigar lighter consists of two major components: a knob and heating element unit, and the cigar lighter base or receptacle shell. The receptacle shell is connected to ground, and an insulated contact in the bottom of the shell is connected to battery current.

The cigar lighter knob and heating element are encased within a spring-loaded housing, which also features a sliding protective heat shield. When the knob and heating element are inserted in the receptacle shell, the heating element resistor coil is grounded through its housing to the receptacle shell. If the cigar lighter knob is pushed inward, the heat shield slides up toward the knob exposing the heating element, and the heating element extends from the housing toward the insulated contact in the bottom of the receptacle shell.

Two small spring-clip retainers are located on either side of the insulated contact inside the bottom of the receptacle shell. These clips engage and hold the heating element against the insulated contact long enough for the resistor coil to heat up. When the heating element is engaged with the contact, battery current can flow through the resistor coil to ground, causing the resistor coil to heat.

When the resistor coil becomes sufficiently heated, excess heat radiates from the heating element causing the spring-clips to expand. Once the spring-clips

CIGAR LIGHTER/POWER OUTLET (Continued)

expand far enough to release the heating element, the spring-loaded housing forces the knob and heating element to pop back outward to their relaxed position. When the cigar lighter knob and element are pulled out of the receptacle shell, the protective heat shield slides downward on the housing so that the heating element is recessed and shielded around its circumference for safety.

POWER OUTLET (REAR CARGO AREA MOUNTED)

The power outlet base or receptacle shell is connected to ground, and an insulated contact in the bottom of the shell is connected to battery current. The power outlet receives battery voltage from a fuse in the Power Distribution Center (PDC) through a fuse in the fuse block when the ignition is in the ON or ACC positions.

REMOVAL

This procedure applies to the **Front Console and Rear Cargo Area** mounted outlets on this vehicle. If the instrument panel mounted cigar lighter/power outlet is defective, the entire accessory switch bezel must be replaced.

(1) Disconnect and isolate the battery negative cable.

(2) Look inside and note position of the retaining bosses (Fig. 4).

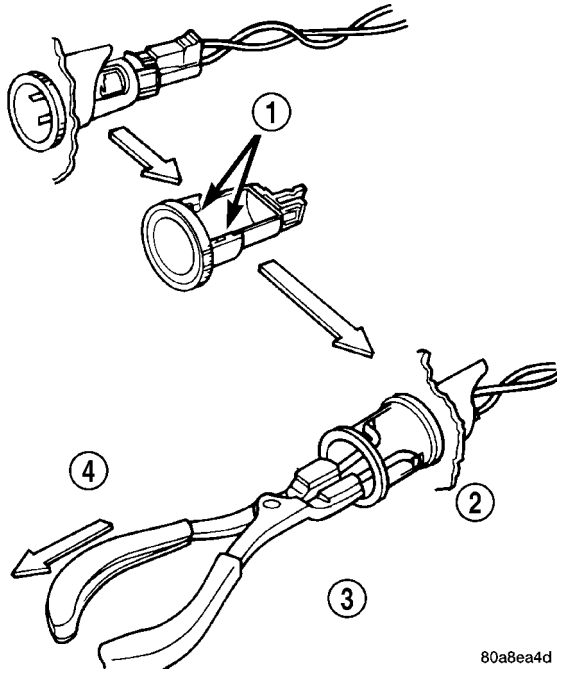

Fig. 4 Cigar Lighter/Power Outlet Base Removal

1 - RETAINING BOSSES-ENGAGE PLIERS HERE
2 - PARTIALLY REMOVED
3 - EXTERNAL SNAP-RING PLIERS
4 - PULL BASE OUT-THROUGH MOUNTING RING

(3) Using external snap ring pliers with 90 degree tips. Insert pliers with tips against bosses and squeeze forcing bosses out of base.

(4) Pull out the base through mounting ring by gently rocking pliers.

(5) Disconnect the base wires.

(6) Set base aside and remove base mount ring.

INSTALLATION

This procedure applies to the **Front Console and Rear Cargo Area** mounted outlets on this vehicle. If the instrument panel mounted cigar lighter/power outlet is defective, the entire accessory switch bezel must be replaced.

(1) Position mount ring to the instrument panel and feed the wires through ring. Index the cap and the mount ring with the index tab at 9 o'clock to the key in the instrument panel. Install the ring.

(2) Connect wires to base. Orient base alignment rib at 11 o'clock to mate the groove in mount ring at the same location

(3) Push base into the bezel till it locks.

(4) Install cigar lighter cap.

(5) Connect the battery negative cable.

FUSE BLOCK

DESCRIPTION

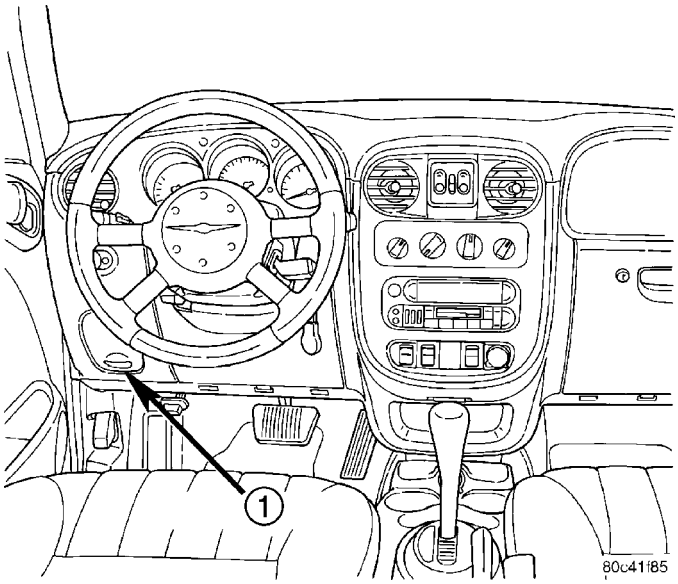

Fig. 5 Fuse Block Location

1 - FUSE PANEL

An electrical Fuse Block is located in the left front lower instrument panel (Fig. 5). It serves to simplify and centralize numerous electrical components, as well as to distribute electrical current to many of the accessory systems in the vehicle.

FUSE BLOCK (Continued)

The Fuse Block is positioned on a mounting bracket up and under the left instrument panel. It is secured by two screws. The fuse block is concealed behind a fuse panel cover. The fuse panel cover is a snap-fit access cover that conceals the fuse block fuses. A fuse layout placard is on the back of the end cap to ensure proper fuse identification.

OPERATION

The fuse block houses blade-type fuses and automatic resetting circuit breakers. Internal connection of all the fuse block circuits is accomplished by an intricate network of hard wiring and bus bars. Refer to Wiring Diagrams for complete circuit diagrams.

The fuses and circuit breakers are available for service replacement. The fuse block unit cannot be repaired and is only serviced as an assembly. If any circuit or the fuse block housing is faulty or damaged, the entire fuse block and instrument panel wire harness assembly must be replaced.

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO RESTRAINT SYSTEMS BEFORE ATTEMPTING ANY STEERING COLUMN OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

The Fuse Block is serviced with the instrument panel wire harness. If service is required to the fuse block, the entire instrument panel harness must be replaced.

(1) Disconnect and isolate the battery negative cable.

(2) Remove the instrument panel from the vehicle (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - REMOVAL).

(3) With the instrument panel on the bench, de-trim the instrument panel enough to gain access to all screws and connectors to remove instrument panel wire harness with fuse block.

INSTALLATION

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO RESTRAINT SYSTEMS BEFORE ATTEMPTING ANY STEERING COLUMN OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Install the new wire harness and fuse block.

(2) Re-trim the instrument panel with what was necessary for harness removal.

(3) Install instrument panel into vehicle (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - INSTALLATION).

Ensure that the wire terminals and connectors are in good condition and connectors are properly installed.

(4) Connect the battery negative cable.

IOD FUSE

DESCRIPTION

All vehicles are equipped with an Ignition-Off Draw (IOD) fuse that is disconnected within the Power Distribution Center (PDC) when the vehicle is shipped from the factory. Dealer personnel are to reconnect the IOD fuse in the PDC as part of the preparation procedures performed just prior to new vehicle delivery.

OPERATION

The term ignition-off draw identifies a normal condition where power is being drained from the battery with the ignition switch in the Off position. The IOD fuse feeds the memory and sleep mode functions for some of the electronic modules in the vehicle as well as various other accessories that require battery current when the ignition switch is in the Off position, including the clock. The only reason the IOD fuse is disconnected is to reduce the normal IOD of the vehicle electrical system during new vehicle transportation and pre-delivery storage to reduce battery depletion, while still allowing vehicle operation so that the vehicle can be loaded, unloaded and moved as needed by both vehicle transportation company and dealer personnel.

The IOD fuse is disconnected from PDC fuse cavity 18 when the vehicle is shipped from the assembly plant. Dealer personnel must reconnect the IOD fuse when the vehicle is being prepared for delivery in order to restore full electrical system operation. Once the vehicle is prepared for delivery, the IOD function of this fuse becomes transparent and the fuse that has been assigned the IOD designation becomes only another Fused B(+) circuit fuse. The IOD fuse serves no useful purpose to the dealer technician in the service or diagnosis of any vehicle system or condition, other than the same purpose as that of any other standard circuit protection device.

The IOD fuse can be used by the vehicle owner as a convenient means of reducing battery depletion when a vehicle is to be stored for periods not to exceed about thirty days. However, it must be

IOD FUSE (Continued)

remembered that disconnecting the IOD fuse will not eliminate IOD, but only reduce this normal condition. If a vehicle will be stored for more than about thirty days, the battery negative cable should be disconnected to eliminate normal IOD; and, the battery should be tested and recharged at regular intervals during the vehicle storage period to prevent the battery from becoming discharged or damaged.

REMOVAL

NOTE: When removing or installing the IOD fuse, it is important that the ignition switch be in the Off position. Failure to place the ignition switch in the Off position can cause the radio display to become scrambled when the IOD fuse is installed. Removing and installing the IOD fuse again with the ignition switch in the Off position will usually correct the scrambled radio display condition.

(1) Turn the ignition switch to the Off position.
(2) Remove the cover from the Power Distribution Center (PDC).
(3) Remove fuse 18 from the PDC.

INSTALLATION

(1) Insert fuse 18 into the Power Distribution Center (PDC).
(2) Install the cover to the PDC.

POWER DISTRIBUTION CENTER

DESCRIPTION

All of the electrical current distributed throughout this vehicle is directed through the standard equipment Power Distribution Center (PDC) (Fig. 6). The molded plastic PDC housing is located in the left front corner of the engine compartment, just behind the air cleaner housing and the battery. The PDC housing has a molded plastic cover. The PDC cover is easily removed for service access and has a convenient fuse and relay layout label affixed to the inside surface of the cover to ensure proper component identification.

The PDC housing is secured to the left inner fender well an indexing pin and one screw. All of the PDC outputs are through the integral engine compartment wire harness.

OPERATION

All of the current from the generator cable connection goes to the battery through a 10 gauge fusible link that is secured with a nut to the positive battery terminal at the starter. The PDC houses up to ten six

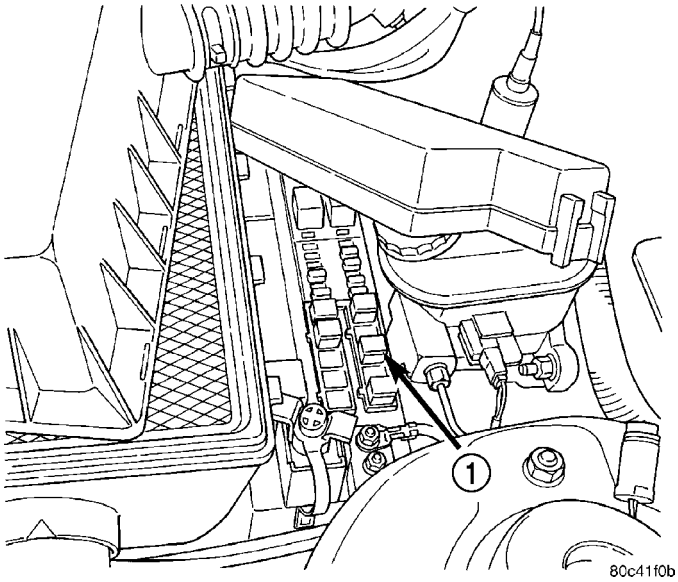

Fig. 6 Power Distribution Center (PDC) Location

1 - PDC

fuse cartridges, which replace all in-line fusible links. The PDC also houses up to twelve blade-type fuses, up to two full International Standards Organization (ISO) relays, and up to eight mini International Standards Organization (ISO) relays. Internal connection of all the PDC circuits is accomplished by an intricate network of hard wiring and bus bars. Refer to Wiring Diagrams for complete circuit diagrams.

The fusible link, fuses and relays are available for service replacement. The PDC unit cannot be repaired and is only serviced as a unit with the engine compartment wire harness. If the PDC is inoperative or damaged, the engine compartment wire harness assembly must be replaced.

REMOVAL

The Power Distribution Center (PDC) is serviced as a unit with the engine compartment wire harness. If any internal circuit of the PDC or the PDC housing is faulty or damaged, the entire PDC and engine compartment wire harness unit must be replaced. Refer to Wiring Diagrams for more information on the locations of the affected connectors.

(1) Open hood.
(2) Disconnect and isolate the battery negative cable.
(3) Disconnect each of the engine compartment wire harness connectors.
(4) Remove the fasteners that secure each of the engine compartment wire harness ground eyelets to the vehicle body and chassis components.
(5) Disengage each of the retainers that secure the engine compartment wire harness to the vehicle body and chassis components.

POWER DISTRIBUTION CENTER (Continued)

(6) Disengage and remove the PDC housing from its mounting bracket.

(7) Remove the PDC and the engine compartment wire harness from the engine compartment as a unit.

INSTALLATION

The Power Distribution Center (PDC) is serviced as a unit with the engine compartment wire harness. If any internal circuit of the PDC or the PDC housing is faulty or damaged, the entire PDC and engine compartment wire harness unit must be replaced.

NOTE: If the power distribution center (PDC) is being replaced with a new unit, be certain to transfer each of the fuses and relays from the old power distribution center to the proper cavities of the new power distribution center. Refer to Wiring Diagrams for the proper power distribution center cavity assignments.

(1) Position the PDC in the engine compartment.

(2) Align the PDC on its mounting bracket and install.

(3) Route the engine compartment wire harness from the PDC through the engine compartment, engaging each of the harness retainers to the mounting provisions in the vehicle body and chassis components. Refer to Wiring Diagrams for more information on the harness routing and retainer locations.

(4) Install and tighten the fasteners that secure each of the engine compartment wire harness ground eyelets to the vehicle body and chassis components. Refer to Wiring Diagrams for more information on the ground eyelet locations.

(5) Reconnect each of the engine compartment wire harness connectors. Refer to Wiring Diagrams for more information on the locations of the affected connectors.

(6) Torque nut retaining positive battery cable at PDC to 96 - 141 N·m (85 - 130 in. lbs.).

(7) Reconnect the battery negative cable.

(8) Close hood.

(9) Verify vehicle and system operation.

RELAY

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove cover from Power Distribution Center (PDC).

(3) Using special tool C-4817, grip the relay by the sides and pull upward with an even effort (Fig. 7).

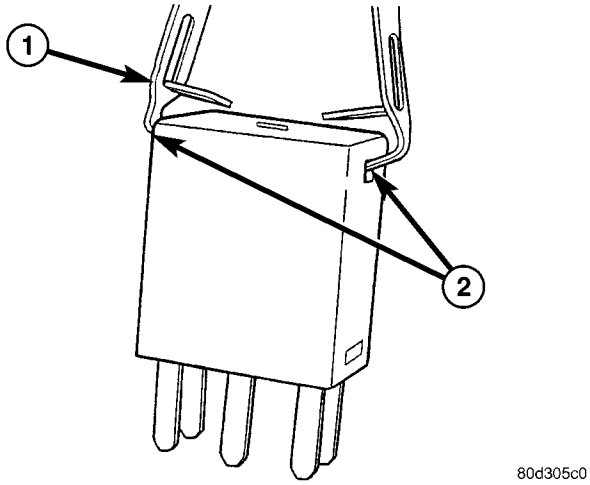

Fig. 7 RELAY REMOVAL

1 - SPECIAL TOOL C-4817
2 - RELAY

INSTALLATION

(1) Align relay with Power Distribution Center (PDC) and press into position.

(2) Install cover to PDC.

(3) Connect battery negative cable.

ENGINE 1.6L SOHC

DESCRIPTION

The 1.6 Liter (97.6 cu. in.) in-line four cylinder engine is a single over head camshaft with four valves per cylinder design. The engine does not have provisions for a “free wheeling” valve train.

The cylinders are numbered from front of the engine to the rear. The firing order is 1–3–4–2.

The engine identification number is stamped onto a machined pad located on the right front of the cylinder block below the cylinder head sealing surface (Fig. 1).

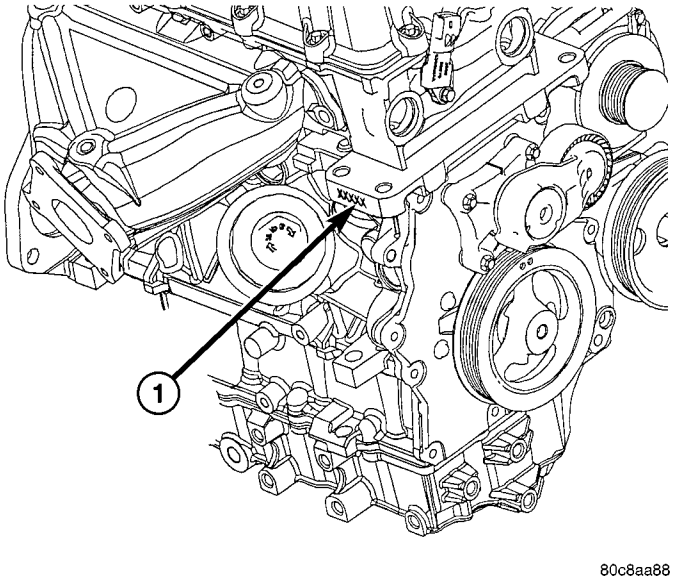

Fig. 1 Engine Identification

1 - LOCATION OF V.I.N.

DIAGNOSIS AND TESTING

INTRODUCTION

Engine diagnosis is helpful in determining the causes of malfunctions not detected and remedied by routine maintenance.

These malfunctions may be classified as either mechanical (e.g., a strange noise), or performance (e.g., engine idles rough and stalls).

Refer to the Engine Mechanical and the Engine Performance diagnostic charts, for possible causes and corrections of malfunctions (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING - MECHANICAL) (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING - PERFORMANCE).

For fuel system diagnosis, (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - DIAGNOSIS AND TESTING).

Additional tests and diagnostic procedures may be necessary for specific engine malfunctions that cannot be isolated with the Service Diagnosis charts. Information concerning additional tests and diagnosis is provided within the following:

- Cylinder Compression Pressure Test
- Cylinder Combustion Pressure Leakage Test
- Engine Cylinder Head Gasket Failure Diagnosis
- Lash Adjuster Noise Diagnosis
- Engine Oil Leak Inspection

ENGINE 1.6L SOHC (Continued)

ENGINE PERFORMANCE

CONDITION	POSSIBLE CAUSE	CORRECTION
ENGINE WILL NOT START	1. Weak battery.	1. Test battery. Charge or replace as necessary. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - DIAGNOSIS AND TESTING)
	2. Corroded or loose battery connections.	2. Clean and tighten battery connections. Apply a coat of light mineral grease to terminals.
	3. Faulty starter.	3. Test starting system. (Refer to 8 - ELECTRICAL/STARTING - DIAGNOSIS AND TESTING)
	4. Faulty coil(s) or control unit.	4. Test and replace as needed. (Refer to Appropriate Diagnostic Information)
	5. Incorrect spark plug gap.	5. Set gap. (Refer to 8 - ELECTRICAL/IGNITION CONTROL - SPECIFICATIONS)
	6. Contamination in fuel system.	6. Clean system and replace fuel filter.
	7. Faulty fuel pump.	7. Test fuel pump and replace as needed. (Refer to Appropriate Diagnostic Information)
	8. Incorrect engine timing.	8. Check for a skipped timing chain.
ENGINE STALLS OR IDLES ROUGH	1. Incorrect fuel mixture.	1. (Refer to Appropriate Diagnostic Information)
	2. Intake manifold leakage.	2. Inspect intake manifold, manifold gasket, and vacuum hoses.
	3. Faulty ignition coil(s).	3. Test and replace as necessary. (Refer to Appropriate Diagnostic Information)

ENGINE 1.6L SOHC (Continued)

CONDITION	POSSIBLE CAUSE	CORRECTION
ENGINE LOSS OF POWER	1. Dirty or incorrectly gapped plugs.	1. Clean plugs and set gap.
	2. Contamination in fuel system.	2. Clean system and replace fuel filter.
	3. Faulty fuel pump.	3. Test and replace as necessary. (Refer to Appropriate Diagnostic Information)
	4. Incorrect valve timing.	4. Correct valve timing.
	5. Leaking cylinder head gasket.	5. Replace cylinder head gasket.
	6. Low compression.	6. Test compression of each cylinder.
	7. Burned, warped, or pitted valves.	7. Replace valves.
	8. Plugged or restricted exhaust system.	8. Perform exhaust restriction test. (Refer to 11 - EXHAUST SYSTEM - DIAGNOSIS AND TESTING) Install new parts, as necessary.
	9. Faulty ignition coil(s).	9. Test and replace as necessary. (Refer to Appropriate Diagnostic Information)
ENGINE MISSES ON ACCELERATION	1. Dirty or incorrectly gapped spark plugs.	1. Clean spark plugs and set gap.
	2. Contamination in Fuel System.	2. Clean fuel system and replace fuel filter.
	3. Burned, warped, or pitted valves.	3. Replace valves.
	4. Faulty ignition coil(s).	4. Test and replace as necessary. (Refer to Appropriate Diagnostic Information)
ENGINE MISSES AT HIGH SPEED	1. Dirty or incorrect spark plug gap.	1. Clean spark plugs and set gap.
	2. Faulty ignition coil(s).	2. Test and replace as necessary. (Refer to Appropriate Diagnostic Information)
	3. Dirty fuel injector(s).	3. Test and replace as necessary. (Refer to Appropriate Diagnostic Information)
	4. Contamination in fuel system.	4. Clean system and replace fuel filter.

ENGINE MECHANICAL

CONDITION	POSSIBLE CAUSES	CORRECTION
VALVETRAIN NOISE	1. High or low oil level in crankcase.	1. Check and correct engine oil level.
	2. Thin or diluted oil.	2. Change oil to correct viscosity.
	3. Thick oil	3. (a) Change engine oil and filter. (b) Run engine to operating temperature. (c) Change engine oil and filter again.
	4. Low oil pressure.	4. Check and correct engine oil level.
	5. Dirt in lash adjusters.	5. Replace rocker arm/hydraulic lash adjuster assembly.
	6. Worn rocker arms.	6. Inspect oil supply to rocker arms.
	7. Worn lash adjusters.	7. Install new rocker arm/hydraulic lash adjuster assembly.
	8. Worn valve guides.	8. Replace cylinder head.
	9. Excessive runout of valve seats on valve faces.	9. Grind valves, replace cylinder head.
	10. Missing adjuster pivot.	10. Replace rocker arm/hydraulic lash adjuster assembly.
CONNECTING ROD NOISE	1. Insufficient oil supply.	1. Check engine oil level.
	2. Low oil pressure.	2. Check engine oil level. Inspect oil pump relief valve and spring.
	3. Thin or diluted oil.	3. Change oil to correct viscosity.
	4. Thick oil	4. (a) Change engine oil and filter. (b) Run engine to operating temperature. (c) Change engine oil and filter again.
	5. Excessive bearing clearance.	5. Measure bearings for correct clearance. Repair as necessary.
	6. Connecting rod journal out-of-round.	6. Replace crankshaft or grind surface.
	7. Misaligned connecting rods.	7. Replace bent connecting rods.

ENGINE 1.6L SOHC (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
MAIN BEARING NOISE	1. Insufficient oil supply.	1. Check engine oil level.
	2. Low oil pressure.	2. Check engine oil level. Inspect oil pump relief valve and spring.
	3. Thin or diluted oil.	3. Change oil to correct viscosity.
	4. Thick oil	4. (a) Change engine oil and filter. (b) Run engine to operating temperature. (c) Change engine oil and filter again.
	5. Excessive bearing clearance.	5. Measure bearings for correct clearance. Repair as necessary.
	6. Excessive end play.	6. Check thrust bearing for wear on flanges.
	7. Crankshaft journal out-of-round or worn.	7. Replace crankshaft or grind journals.
	8. Loose flywheel or torque converter.	8. Tighten to correct torque.
OIL PRESSURE DROP	1. Low oil level.	1. Check engine oil level.
	2. Faulty oil pressure switch.	2. Install new oil pressure switch.
	3. Low oil pressure.	3. Check sending unit and main bearing oil clearance.
	4. Clogged oil filter.	4. Install new oil filter.
	5. Worn parts in oil pump.	5. Replace worn parts or pump.
	6. Thin or diluted oil.	6. Change oil to correct viscosity.
	7. Oil pump relief valve stuck.	7. Remove valve and inspect, clean, or replace.
	8. Oil pump suction tube loose.	8. Remove oil pan and install new tube or clean, if necessary.
	9. Oil pump cover warped or cracked.	9. Install new oil pump.
	10. Excessive bearing clearance.	10. Measure bearings for correct clearance.
OIL LEAKS	1. Misaligned or deteriorated gaskets.	1. Replace gasket(s).
	2. Loose fastener, broken or porous metal part.	2. Tighten, repair or replace the part.
	3. Misaligned or deteriorated cup or threaded plug.	3. Replace as necessary.

ENGINE 1.6L SOHC (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
OIL CONSUMPTION OR SPARK PLUGS FOULED	1. PCV system malfunction.	1. Check system and repair as necessary. (Refer to 25 - EMISSIONS CONTROL/ EVAPORATIVE EMISSIONS/PCV VALVE - DIAGNOSIS AND TESTING)
	2. Worn, scuffed or broken rings.	2. Hone cylinder bores. Install new rings.
	3. Carbon in oil ring slots.	3. Install new rings.
	4. Rings fitted too tightly in grooves.	4. Remove rings and check grooves. If groove is not proper width, replace piston.
	5. Worn valve guide(s).	5. Replace cylinder head.
	6. Valve stem seal(s) worn or damaged.	6. Replace seal(s).

CYLINDER COMPRESSION PRESSURE TEST

The results of a cylinder compression pressure test can be utilized to diagnose several engine malfunctions.

Ensure the battery is completely charged and the engine starter motor is in good operating condition. Otherwise the indicated compression pressures may not be valid for diagnosis purposes.

(1) Check engine oil level and add oil if necessary.

(2) Drive the vehicle until engine reaches normal operating temperature. Select a route free from traffic and other forms of congestion, observe all traffic laws, and accelerate through the gears several times briskly.

CAUTION: When removing spark plugs, use Special Tool 8448 Protective Sleeve on extension (Fig. 2) or damage to spark plug tubes may result.

(3) Remove all spark plugs from engine. As spark plugs are being removed, check electrodes for abnormal firing indicators fouled, hot, oily, etc. Record cylinder number of spark plug for future reference.

(4) Remove the Auto Shutdown (ASD) relay from the PDC.

(5) Insert compression gauge adaptor Special Tool 8116 or the equivalent, into the #1 spark plug hole in cylinder head. Connect the 0–500 psi (Blue) pressure transducer (Special Tool CH7059) with cable adaptors to the DRBIII®. For Special Tool identification, (Refer to 9 - ENGINE - SPECIAL TOOLS).

(6) Crank engine until maximum pressure is reached on gauge. Record this pressure as #1 cylinder pressure.

(7) Repeat the previous step for all remaining cylinders.

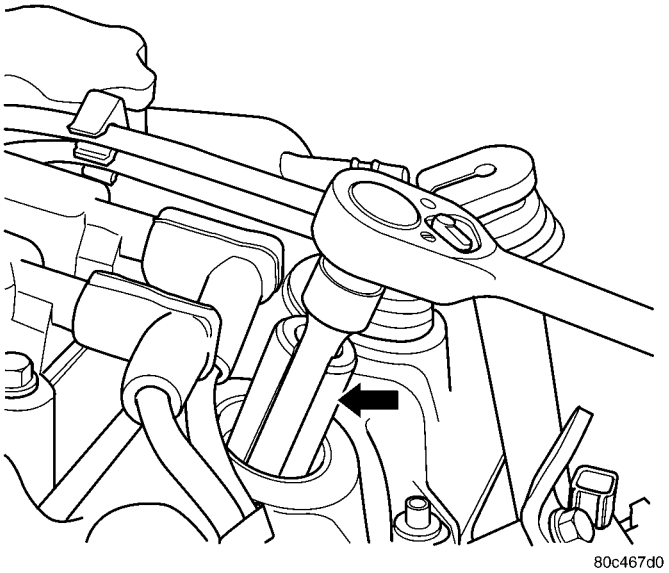

Fig. 2 Special Tool 8448 Protective Sleeve

(8) Compression should not be less than 689 kPa (100 psi) and not vary more than 25 percent from cylinder to cylinder.

(9) If one or more cylinders have abnormally low compression pressures, repeat the compression test.

(10) If the same cylinder or cylinders repeat an abnormally low reading on the second compression test, it could indicate the existence of a problem in the cylinder in question. **The recommended compression pressures are to be used only as a guide to diagnosing engine problems. An engine should not be disassembled to determine the cause of low compression unless some malfunction is present.**

ENGINE 1.6L SOHC (Continued)

CYLINDER COMBUSTION PRESSURE LEAKAGE TEST

The combustion pressure leakage test provides an accurate means for determining engine condition.

Combustion pressure leakage testing will detect:

- Exhaust and intake valve leaks (improper seating).
- Leaks between adjacent cylinders or into water jacket.
- Any causes for combustion/compression pressure loss.

WARNING: DO NOT REMOVE THE PRESSURE CAP WITH THE SYSTEM HOT AND UNDER PRESSURE BECAUSE SERIOUS BURNS FROM COOLANT CAN OCCUR.

Check the coolant level and fill as required. DO NOT install the pressure cap.

Start and operate the engine until it attains normal operating temperature, then turn the engine OFF.

Clean spark plug recesses with compressed air.

Remove the spark plugs.

Remove the oil filler cap.

Remove the air cleaner.

Calibrate the tester according to the manufacturer's instructions. The shop air source for testing should maintain 483 kPa (70 psi) minimum, 1,379 kPa (200 psi) maximum, with 552 kPa (80 psi) recommended.

Perform the test procedures on each cylinder according to the tester manufacturer's instructions. While testing, listen for pressurized air escaping through the throttle body, tailpipe and oil filler cap opening. Check for bubbles in the coolant.

All gauge pressure indications should be equal, with no more than 25% leakage per cylinder.

FOR EXAMPLE: At 552 kPa (80 psi) input pressure, a minimum of 414 kPa (60 psi) should be maintained in the cylinder.

CYLINDER HEAD GASKET

A cylinder head gasket leak can be located between adjacent cylinders or between a cylinder and the adjacent water jacket.

Possible indications of the cylinder head gasket leaking between adjacent cylinders are:

- Loss of engine power
- Engine misfiring
- Poor fuel economy

Possible indications of the cylinder head gasket leaking between a cylinder and an adjacent water jacket are:

- Engine overheating
- Loss of coolant
- Excessive steam (white smoke) emitting from exhaust
- Coolant foaming

CYLINDER-TO-CYLINDER LEAKAGE TEST

To determine if an engine cylinder head gasket is leaking between adjacent cylinders, follow the procedures in Cylinder Compression Pressure Test (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING). An engine cylinder head gasket leaking between adjacent cylinders will result in approximately a 50–70% reduction in compression pressure.

CYLINDER-TO-WATER JACKET LEAKAGE TEST

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING WITH COOLANT PRESSURE CAP REMOVED.

VISUAL TEST METHOD

With the engine cool, remove the coolant pressure cap. Start the engine and allow it to warm up until thermostat opens.

If a large combustion/compression pressure leak exists, bubbles will be visible in the coolant.

COOLING SYSTEM TESTER METHOD

WARNING: WITH COOLING SYSTEM TESTER IN PLACE, PRESSURE WILL BUILD UP FAST. EXCESSIVE PRESSURE BUILT UP, BY CONTINUOUS ENGINE OPERATION, MUST BE RELEASED TO A SAFE PRESSURE POINT. NEVER PERMIT PRESSURE TO EXCEED 138 kPa (20 psi).

Install Cooling System Tester 7700 or equivalent to pressure cap neck. Start the engine and observe the tester's pressure gauge. If gauge pulsates with every power stroke of a cylinder a combustion pressure leak is evident.

CHEMICAL TEST METHOD

Combustion leaks into the cooling system can also be checked by using Bloc-Chek Kit C-3685-A or equivalent. Perform test following the procedures supplied with the tool kit.

LASH ADJUSTER NOISE DIAGNOSIS

A tappet-like noise may be produced from several items. Check the following items.

(1) Engine oil level too high or too low. This may cause aerated oil to enter the adjusters and cause them to be spongy.

(2) Insufficient running time after rebuilding cylinder head. Low speed running up to 1 hour may be required.

ENGINE 1.6L SOHC (Continued)

(3) During this time, turn engine off and let set for a few minutes before restarting. Repeat this several times after engine has reached normal operating temperature.

(4) Low oil pressure.

(5) The oil restrictor (integral to the head gasket) in the vertical oil passage to the cylinder head is plugged with debris.

(6) Air ingested into oil due to broken or cracked oil pump pick up.

(7) Worn valve guides.

(8) Rocker arm ears contacting valve spring retainer.

(9) Rocker arm loose, adjuster stuck or at maximum extension and still leaves lash in the system.

(10) Faulty lash adjuster.

• Check lash adjusters for sponginess while installed in cylinder head. Depress part of rocker arm over adjuster. Normal adjusters should feel very firm. Spongy adjusters can be bottomed out easily.

• Remove suspected rocker arm/lash adjuster assembly, and replace as necessary.

ENGINE OIL LEAK INSPECTION

Begin with a thorough visual inspection of the engine, particularly at the area of the suspected leak. If an oil leak source is not readily identifiable, the following steps should be followed:

(1) Do not clean or degrease the engine at this time because some solvents may cause rubber to swell, temporarily stopping the leak.

(2) Add an oil soluble dye (use as recommended by manufacturer). Start the engine and let idle for approximately 15 minutes. Check the oil dipstick to make sure the dye is thoroughly mixed as indicated with a bright yellow color under a black light.

(3) Using a black light, inspect the entire engine for fluorescent dye, particularly at the suspected area of oil leak. If the oil leak is found and identified, repair as necessary.

(4) If dye is not observed, drive the vehicle at various speeds for approximately 24 km (15 miles), and repeat inspection.

(5) **If the oil leak source is not positively identified at this time**, proceed with the air leak detection test method as follows:

• Disconnect the fresh air hose (make-up air) at the cylinder head cover and plug or cap the nipple on the cover.

• Remove the PCV valve hose from the cylinder head cover. Cap or plug the PCV valve nipple on the cover.

• Attach an air hose with pressure gauge and regulator to the dipstick tube.

CAUTION: Do not subject the engine assembly to more than 20.6 kpa (3 PSI) of test pressure.

• Gradually apply air pressure from 1 psi to 2.5 psi maximum while applying soapy water at the suspected source. Adjust the regulator to the suitable test pressure that provides the best bubbles which will pinpoint the leak source. If the oil leak is detected and identified, repair per service manual procedures.

• If the leakage occurs at the crankshaft rear oil seal area, refer to the section, Inspection for Rear Seal Area Leak.

(6) If no leaks are detected, turn off the air supply. Remove the air hose, all plugs, and caps. Install the PCV valve and fresh air hose (make-up air). Proceed to next step.

(7) Clean the oil off the suspect oil leak area using a suitable solvent. Drive the vehicle at various speeds approximately 24 km (15 miles). Inspect the engine for signs of an oil leak by using a black light.

NOTE: If oil leakage is observed at the dipstick tube to block location; remove the tube, clean and reseal using Mopar® Stud & Bearing Mount (press fit tube applications only), and for O-ring style tubes, remove tube and replace the O-ring seal.

INSPECTION FOR REAR SEAL AREA LEAKS

Since it is sometimes difficult to determine the source of an oil leak in the rear seal area of the engine, a more involved inspection is necessary. The following steps should be followed to help pinpoint the source of the leak.

If the leakage occurs at the crankshaft rear oil seal area:

(1) Disconnect the battery.

(2) Raise the vehicle.

(3) Remove torque converter or clutch housing cover and inspect rear of block for evidence of oil. Use a black light to check for the oil leak. If a leak is present in this area, remove transmission for further inspection.

(a) Circular spray pattern generally indicates seal leakage or crankshaft damage.

(b) Where leakage tends to run straight down, possible causes are a porous block, oil gallery cup plug, bedplate to cylinder block mating surfaces and seal bore. See proper repair procedures for these items.

(4) If no leaks are detected, pressurize the crankcase as previously described.

CAUTION: Do not exceed 20.6 kPa (3 psi).

ENGINE 1.6L SOHC (Continued)

(5) If the leak is not detected, very slowly turn the crankshaft and watch for leakage. If a leak is detected between the crankshaft and seal while slowly turning the crankshaft, it is possible the crankshaft seal surface is damaged. The seal area on the crankshaft could have minor nicks or scratches that can be polished out with emery cloth.

CAUTION: Use extreme caution when crankshaft polishing is necessary to remove minor nicks and scratches. The crankshaft seal flange is especially machined to complement the function of the rear oil seal.

(6) For bubbles that remain steady with shaft rotation, no further inspection can be done until disassembled.

(7) After the oil leak root cause and appropriate corrective action have been identified, replace component(s) as necessary.

STANDARD PROCEDURE

REPAIR OF DAMAGED OR WORN THREADS

Damaged or worn threads (excluding spark plug and camshaft bearing cap attaching threads) can be repaired. Essentially, this repair consists of drilling out worn or damaged threads, tapping the hole with a special Heli-Coil Tap, (or equivalent) and installing an insert into the tapped hole. This brings the hole back to its original thread size.

CAUTION: Be sure that the tapped holes maintain the original center line.

Heli-Coil tools and inserts are readily available from automotive parts jobbers.

HYDROSTATIC LOCKED ENGINE

When an engine is suspected to be hydrostatically locked, regardless of what caused the problem, the following steps should be used.

CAUTION: DO NOT use starter motor to rotate the engine, severe damage may occur.

(1) Inspect air cleaner, induction system and intake manifold to insure system is dry and clear of foreign material.

(2) Remove negative battery cable.

(3) Place a shop towel around the spark plugs when removing them from the engine. This will catch any fluid that may possibly be in the cylinder under pressure.

(4) With all spark plugs removed, rotate engine crankshaft using a breaker bar and socket.

(5) Identify the fluid in the cylinder(s) (i.e., coolant, fuel, oil or other).

(6) Make sure all fluid has been removed from the cylinders. Inspect engine for damage (i.e., connecting rods, pistons, valves, etc.)

(7) Repair engine or components as necessary to prevent this problem from re-occurring.

CAUTION: Squirt approximately one teaspoon of oil into the cylinders, rotate engine to lubricate the cylinder walls to prevent damage on restart.

(8) Install new spark plugs.

(9) Drain engine oil and remove oil filter.

(10) Install a new oil filter.

(11) Fill engine with specified amount of approved oil.

(12) Connect negative battery cable.

(13) Start engine and check for any leaks.

FORM-IN-PLACE GASKETS AND SEALERS

There are numerous places where form-in-place gaskets are used on the engine. Care must be taken when applying form-in-place gaskets to assure obtaining the desired results. **Do not use form-in-place gasket material unless specified.** Bead size, continuity, and location are of great importance. Too thin a bead can result in leakage while too much can result in spill-over which can break off and obstruct fluid feed lines. A continuous bead of the proper width is essential to obtain a leak-free gasket.

There are numerous types of form-in-place gasket materials that are used in the engine area. Mopar® Engine RTV GEN II, Mopar® ATF-RTV, and Mopar® Gasket Maker gasket materials, each have different properties and can not be used in place of the other.

MOPAR® ENGINE RTV GEN II is used to seal components exposed to engine oil. This material is a specially designed black silicone rubber RTV that retains adhesion and sealing properties when exposed to engine oil. Moisture in the air causes the material to cure. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® ATF RTV is a specifically designed black silicone rubber RTV that retains adhesion and sealing properties to seal components exposed to automatic transmission fluid, engine coolants, and moisture. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® GASKET MAKER is an anaerobic type gasket material. The material cures in the absence of air when squeezed between two metallic surfaces. It

ENGINE 1.6L SOHC (Continued)

will not cure if left in the uncovered tube. The anaerobic material is for use between two machined surfaces. Do not use on flexible metal flanges.

MOPAR® BED PLATE SEALANT is a unique (green-in-color) anaerobic type gasket material that is specially made to seal the area between the bed plate and cylinder block without disturbing the bearing clearance or alignment of these components. The material cures slowly in the absence of air when torqued between two metallic surfaces, and will rapidly cure when heat is applied.

MOPAR® GASKET SEALANT is a slow drying, permanently soft sealer. This material is recommended for sealing threaded fittings and gaskets against leakage of oil and coolant. Can be used on threaded and machined parts under all temperatures. This material is used on engines with multi-layer steel (MLS) cylinder head gaskets. This material also will prevent corrosion. Mopar® Gasket Sealant is available in a 13 oz. aerosol can or 4oz./16 oz. can w/applicator.

SEALER APPLICATION

Mopar® Gasket Maker material should be applied sparingly 1 mm (0.040 in.) diameter or less of sealant to one gasket surface. Be certain the material surrounds each mounting hole. Excess material can easily be wiped off. Components should be torqued in place within 15 minutes. The use of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Engine RTV GEN II or ATF RTV gasket material should be applied in a continuous bead approximately 3 mm (0.120 in.) in diameter. All mounting holes must be circled. For corner sealing, a 3.17 or 6.35 mm (1/8 or 1/4 in.) drop is placed in the center of the gasket contact area. Uncured sealant may be removed with a shop towel. Components should be torqued in place while the sealant is still wet to the touch (within 10 minutes). The usage of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Gasket Sealant in an aerosol can should be applied using a thin, even coat sprayed completely over both surfaces to be joined, and both sides of a gasket. Then proceed with assembly. Material in a can w/applicator can be brushed on evenly over the sealing surfaces. Material in an aerosol can should be used on engines with multi-layer steel gaskets.

ENGINE GASKET SURFACE PREPARATION

To ensure engine gasket sealing, proper surface preparation must be performed, especially with the use of aluminum engine components and multi-layer steel cylinder head gaskets.

Never use the following to clean gasket surfaces:

- Metal scraper
- Abrasive pad or paper to clean cylinder block and head
- High speed power tool with an abrasive pad or a wire brush (Fig. 3)

NOTE: Multi-Layer Steel (MLS) head gaskets require a scratch free sealing surface.

Only use the following for cleaning gasket surfaces:

- Solvent or a commercially available gasket remover
- Plastic or wood scraper (Fig. 3)
- Drill motor with 3M Roloc™ Bristle Disc (white or yellow) (Fig. 3)

CAUTION: Excessive pressure or high RPM (beyond the recommended speed), can damage the sealing surfaces. The mild (white, 120 grit) bristle disc is recommended. If necessary, the medium (yellow, 80 grit) bristle disc may be used on cast iron surfaces with care.

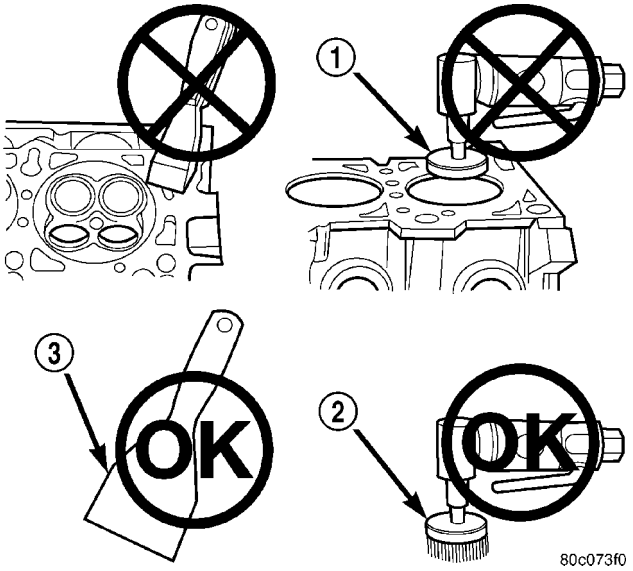

Fig. 3 Proper Tool Usage For Surface Preparation

1 - ABRASIVE PAD
2 - 3M ROLOC™ BRISTLE DISC
3 - PLASTIC/WOOD SCRAPER

ENGINE 1.6L SOHC (Continued)

MEASURING BEARING CLEARANCE USING PLASTIGAGE

Engine crankshaft bearing clearances can be determined by use of Plastigage or equivalent. The following is the recommended procedure for the use of Plastigage:

(1) Remove oil film from surface to be checked. Plastigage is soluble in oil.

(2) Place a piece of Plastigage across the entire width of the bearing shell in the cap approximately 6.35 mm (1/4 in.) off center and away from the oil holes (Fig. 4). (In addition, suspected areas can be checked by placing the Plastigage in the suspected area). Torque the bearing cap/bed plate bolts of the bearing being checked to the proper specifications.

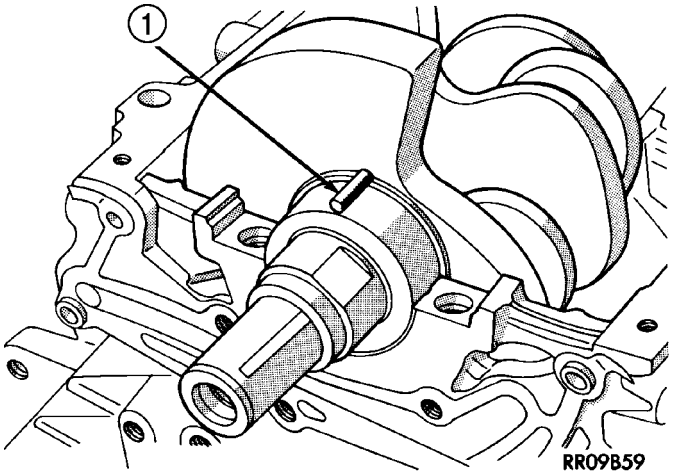

Fig. 4 Plastigage Placed in Lower Shell—Typical

1 - PLASTIGAGE

(3) Remove the bearing cap and compare the width of the flattened Plastigage with the metric scale provided on the package. Locate the band closest to the same width. This band shows the amount of clearance in thousandths of a millimeter. Differences in readings between the ends indicate the amount of taper present. Record all readings taken. Compare clearance measurements to specs found in engine specifications (Refer to 9 - ENGINE - SPECIFICATIONS). **Plastigage generally is accompanied by two scales. One scale is in inches, the other is a metric scale.**

NOTE: Plastigage is available in a variety of clearance ranges. Use the most appropriate range for the specifications you are checking.

(4) Install the proper crankshaft bearings to achieve the specified bearing clearances.

ENGINE CORE AND OIL GALLERY PLUGS

Using a blunt tool such as a drift and a hammer, strike the bottom edge of the cup plug. With the cup plug rotated, grasp firmly with pliers or other suitable tool and remove plug (Fig. 5).

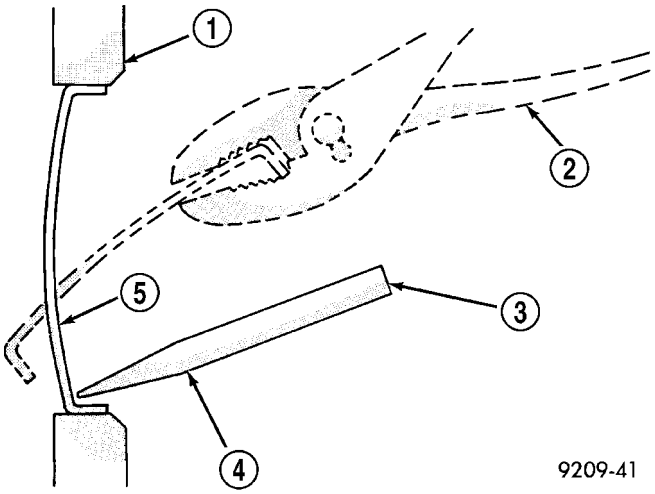

Fig. 5 Core Hole Plug Removal

1 - CYLINDER BLOCK
2 - REMOVE PLUG WITH PLIERS
3 - STRIKE HERE WITH HAMMER
4 - DRIFT PUNCH
5 - CUP PLUG

CAUTION: Do not drive cup plug into the casting as restricted cooling can result and cause serious engine problems.

Thoroughly clean inside of cup plug hole in cylinder block or head. Be sure to remove old sealer. Lightly coat inside of cup plug hole with Mopar® Stud and Bearing Mount. Make certain the new plug is cleaned of all oil or grease. Using proper drive plug, drive plug into hole so that the sharp edge of the plug is at least 0.5 mm (0.020 in.) inside the lead-in chamfer.

It is not necessary to wait for curing of the sealant. The cooling system can be refilled and the vehicle placed in service immediately.

ENGINE 1.6L SOHC (Continued)

REMOVAL - ENGINE ASSEMBLY

(1) Perform fuel pressure release procedure (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE).

(2) Remove throttle body air inlet hose and air cleaner housing assembly.

(3) Disconnect negative battery cable.

(4) Disconnect positive battery cable. Remove battery and battery tray (Fig. 6) and (Fig. 7).

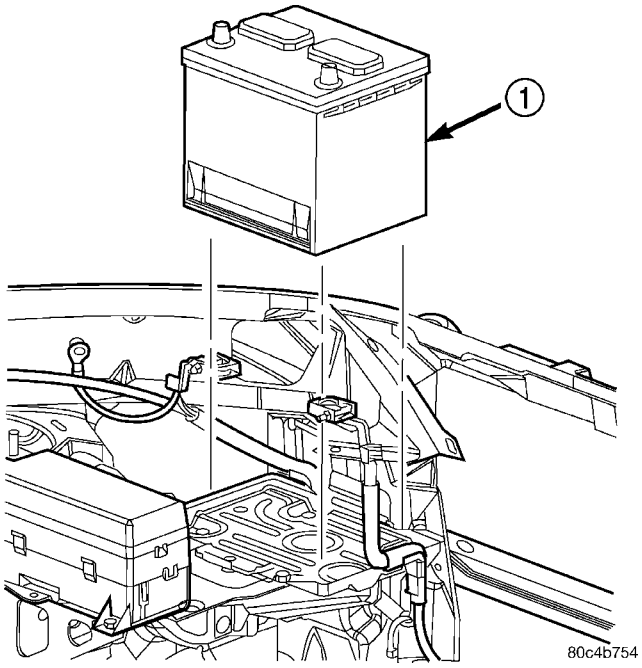

Fig. 6 Battery—Removal/Installation

1 - BATTERY

(5) Drain cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).

(6) Discharge air conditioning system, if equipped (Refer to 24 - HEATING & AIR CONDITIONING - STANDARD PROCEDURE).

(7) Disconnect engine wiring harness at Powertrain Control Module (PCM).

(8) Disconnect positive cable from Power Distribution Center (PDC) and ground wire from vehicle body. Remove bolts attaching PDC and set aside (Fig. 8).

(9) Disconnect coolant recovery container hose from radiator neck.

(10) Disconnect heater hoses at thermostat housing and heater return tube.

(11) Disconnect wiring connectors at lower battery tray support.

(12) Remove upper radiator support crossmember (Refer to 23 - BODY/EXTERIOR/RADIATOR CROSSMEMBER - REMOVAL).

(13) Remove upper radiator hose.

(14) Remove lower radiator hose.

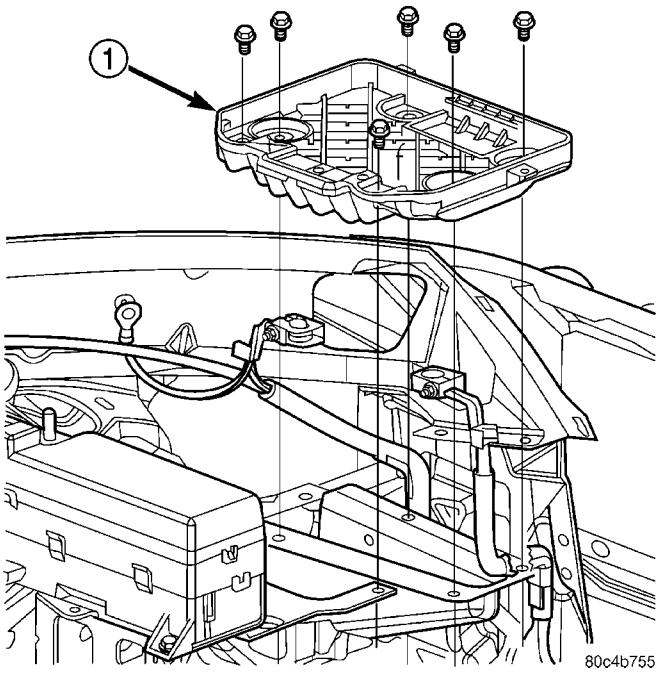

Fig. 7 Battery Tray—Removal/Installation

1 - BATTERY TRAY

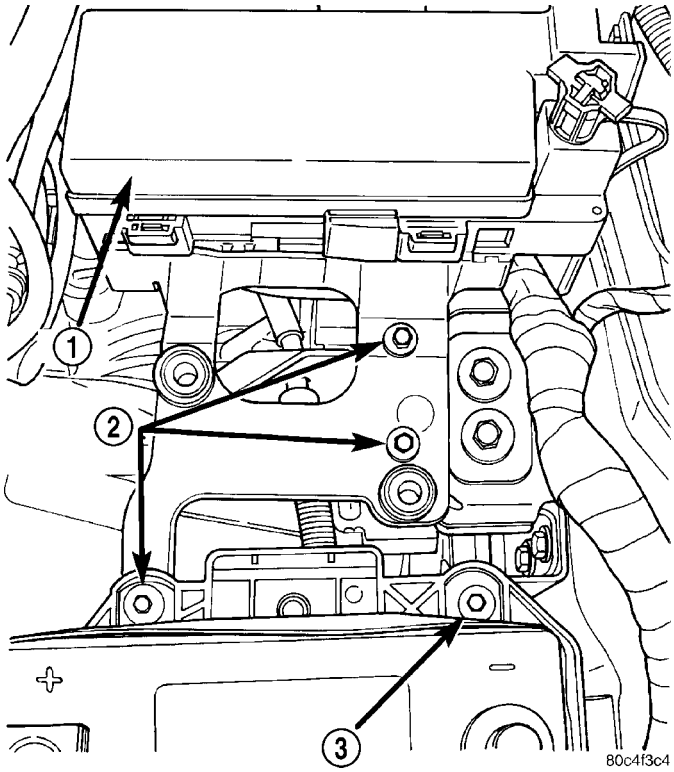

Fig. 8 PDC Bracket Attaching Bolts

1 - PDC
2 - PDC BRACKET BOLTS
3 - BATTERY TRAY BOLT

(15) Disconnect upper A/C line from A/C condenser.

ENGINE 1.6L SOHC (Continued)

(16) Disconnect A/C lines at junction near upper torque strut.

(17) Disconnect radiator fan electrical connector and remove cooling module assembly (fan, radiator, A/C condenser).

(18) Disconnect transmission shift cables and transmission electrical connectors.

(19) Disconnect brake booster and purge solenoid vacuum hoses.

(20) Disconnect ground strap at cylinder head.

(21) Remove fasteners holding power steering return line to right engine bracket. Remove fasteners holding power steering reservoir to right engine bracket. Disconnect reservoir hose from power steering pump. Reposition reservoir out of way.

(22) Raise vehicle on hoist.

(23) Drain engine oil.

(24) Remove both front wheels.

(25) Remove accessory drive belt splash shield.

(26) Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELT - REMOVAL).

(27) Remove pencil strut and lower torque strut (Fig. 9).

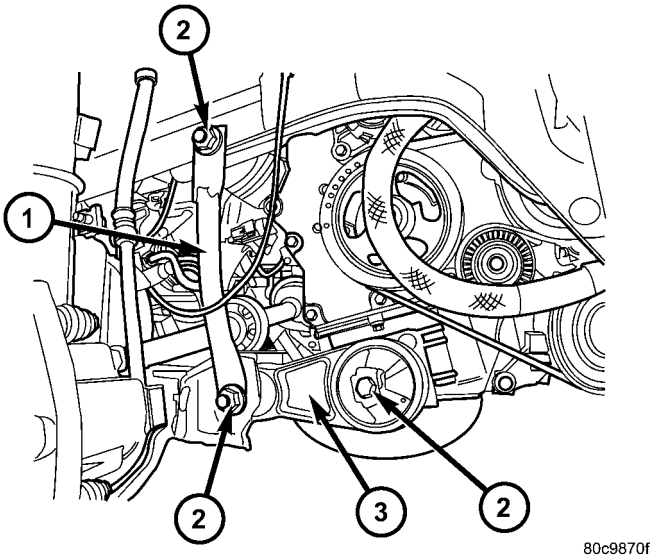

Fig. 9 Lower Torque Strut

1 - PENCIL STRUT
2 - TORQUE STRUT FASTENERS
3 - LOWER TORQUE STRUT

(28) Remove left and right drive axles (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - REMOVAL).

(29) Remove fasteners securing exhaust pipe to exhaust manifold.

(30) Remove clutch slave cylinder and damper fasteners (Fig. 10). Reposition and support with suitable strap.

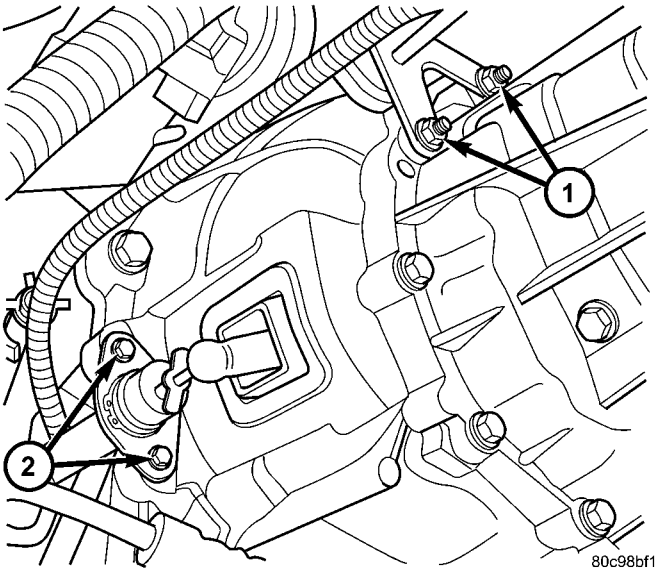

Fig. 10 Clutch Slave Cylinder/Damper

1 - DAMPER FASTENERS
2 - CLUTCH SLAVE CYLINDER FASTENERS

(31) Disconnect power steering pressure line from power steering pump.

(32) Disconnect A/C compressor electrical connectors.

(33) Remove A/C compressor mounting bolts. Remove A/C compressor.

(34) Lower vehicle.

(35) Disconnect fuel line from fuel rail.

(36) Raise vehicle enough to allow engine dolly, cradle, and posts, (Special Tools 6135, 6710, and 6848) to be installed under vehicle. For Special Tool identification (Refer to 9 - ENGINE - SPECIAL TOOLS).

(37) Loosen engine support posts to allow movement for positioning onto engine locating holes (Fig. 13). Position wooden blocks under oil pan (Fig. 13). Lower vehicle and position cradle until the engine is resting on support posts and wooden blocks (Fig. 13). Tighten post mounts to cradle frame. This will keep support posts from moving when removing or installing engine and transmission.

(38) Install safety straps around the engine to cradle (Fig. 13). Tighten straps and lock them into position.

WARNING: Safety straps MUST be used to secure engine to the dolly fixture.

(39) Raise vehicle enough to see if straps are tight enough to hold cradle assembly to engine.

(40) Lower vehicle so weight of the engine and transmission ONLY is on the cradle assembly.

(41) Remove upper torque strut (Fig. 11).

ENGINE 1.6L SOHC (Continued)

(42) Remove right mount through bolt (Fig. 11) and left mount attaching bolts (Fig. 12).

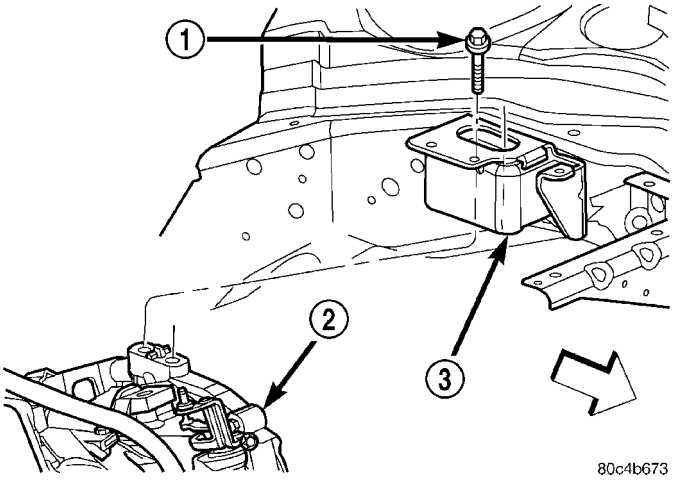

Fig. 12 Left Mount Bolts

1 - BOLT
2 - TRANSAXLE
3 - LEFT MOUNT

(43) Continue raising vehicle slowly until engine/transaxle assembly clears engine compartment. It may be necessary to move the engine/transmission assembly with the cradle to allow for removal around body flanges.

INSTALLATION - ENGINE ASSEMBLY

(1) Position engine and transmission assembly under vehicle and slowly lower the vehicle over the engine/transaxle assembly.

(2) Continue lowering vehicle until engine/transaxle aligns to mounting locations. Install mounting bolts at the right and left engine/transaxle mounts (Fig. 11) and (Fig. 12). Tighten bolts to 118 N·m (87 ft. lbs.).

(3) Install the upper engine torque strut (Fig. 11).

(4) Remove safety straps from engine/transaxle assembly. Slowly raise vehicle enough to remove the engine dolly and cradle.

(5) Raise vehicle.

(6) Install A/C compressor mounting bolts. Reconnect A/C compressor electrical connectors.

(7) Connect power steering pressure line to power steering pump.

ENGINE 1.6L SOHC (Continued)

1 - SAFETY STRAPS
2 - SPECIAL TOOL 6710
3 - WOODEN BLOCK
4 - SPECIAL TOOL 6848
5 - PLACE REAR POSTS INTO LOCATING HOLES

(8) Install fasteners securing clutch slave cylinder and damper (Fig. 10).

(9) Connect exhaust pipe to exhaust manifold. Install fasteners and torque to 28 N·m (250 in. lbs.).

(10) Install left and right drive axles (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - INSTALLATION).

(11) Install pencil strut and lower torque strut (Fig. 9).

(12) Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELT - INSTALLATION).

(13) Install accessory drive belt splash shield.

(14) Install both front wheels.

(15) Lower vehicle.

(16) Connect fuel line to fuel rail.

(17) Connect power steering reservoir hose to power steering pump. Install fastener securing power steering return line to right engine bracket. Install fasteners securing power steering reservoir bracket to right engine bracket.

(18) Connect ground strap to cylinder head.

(19) Connect brake booster and purge solenoid vacuum hoses.

(20) Connect transmission shift cables and transmission electrical connectors.

(21) Install cooling module assembly (fan, radiator, A/C condenser). Connect radiator fan electrical connector.

(22) Connect A/C lines at junction near upper torque strut.

(23) Connect upper A/C line to A/C condenser.

(24) Connect upper and lower radiator hoses.

(25) Install upper radiator crossmember (Refer to 23 - BODY/EXTERIOR/RADIATOR CROSSMEMBER - INSTALLATION).

(26) Connect heater hoses to thermostat housing and heater return tube.

(27) Connect coolant recovery container hose to radiator neck.

(28) Install bolts attaching Power Distribution Center (PDC). Connect positive cable to PDC and ground wire to vehicle body (Fig. 8).

(29) Connect engine wiring harness at Powertrain Control Module (PCM).

(30) Install battery tray and battery (Fig. 6) and (Fig. 7). Connect positive battery cable.

(31) Connect negative battery cable.

(32) Install air cleaner housing and throttle body air inlet hose.

(33) Install new oil filter. Fill engine crankcase with proper oil to correct level.

(34) Fill power steering system.

(35) Fill Cooling system (Refer to 7 - COOLING/ ENGINE - STANDARD PROCEDURE).

(36) Evacuate and recharge A/C system (Refer to 24 - HEATING & AIR CONDITIONING - STANDARD PROCEDURE).

(37) Start engine and run until operating temperature is reached.

(38) Perform torque strut adjustment procedure (Refer to 9 - ENGINE/ENGINE MOUNTING/ TORQUE STRUT - ADJUSTMENTS).

(39) Adjust transmission linkage, if necessary.

AIR CLEANER ELEMENT

REMOVAL

(1) Unsnap the 2 clips holding the air cleaner housing cover.
(2) Lift the air cleaner housing cover up.
(3) Remove the air cleaner element (Fig. 14).

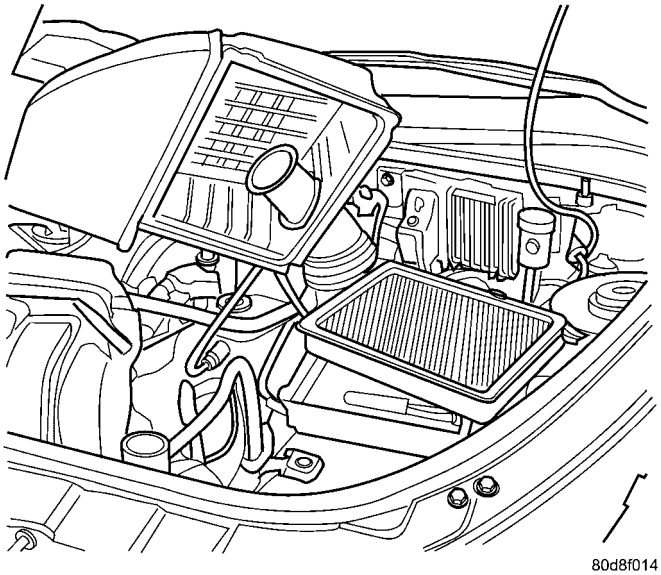

Fig. 14 Air Cleaner Housing Cover

INSTALLATION

(1) Install air cleaner element into the air cleaner housing (Fig. 14).
(2) Reposition the air cleaner housing cover.
(3) Latch the 2 spring clips.

AIR CLEANER HOUSING

REMOVAL

(1) Disconnect the inlet air temperature sensor.
(2) Remove the inlet tube to throttle body.
(3) Unsnap the 2 clips holding the air cleaner housing cover.
(4) Lift the air cleaner housing cover up.
(5) Remove the air cleaner element (Fig. 14).
(6) Pull air cleaner housing straight up and off of the 2 locating pins (Fig. 15).

INSTALLATION

(1) Install air cleaner housing onto the locating pins.
(2) Install the air cleaner element.
(3) Install the inlet tube onto the throttle body.
(4) Install cover to the air cleaner housing.
(5) Latch the 2 spring clips.
(6) Connect the electrical connector to the inlet air temperature sensor.

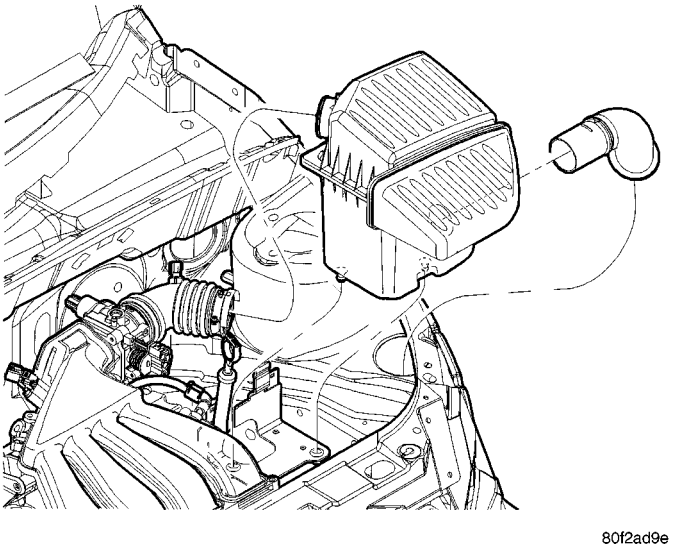

Fig. 15 AIR CLEANER HOUSING

CYLINDER HEAD

REMOVAL - CYLINDER HEAD

(1) Perform fuel system pressure release procedure (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE).
(2) Disconnect negative battery cable.
(3) Drain cooling system (Refer to 7 - COOLING/ ENGINE - STANDARD PROCEDURE).
(4) Disconnect throttle body air inlet hose.
(5) Disconnect ground strap from cylinder head.
(6) Disconnect vacuum hoses from throttle body.
(7) Disconnect the following electrical components:
- Upstream Oxygen Sensor
- Camshaft Position Sensor
- Ignition Coil and Capacitor
- Fuel Injectors
- MAP Sensor
- Knock Sensor
- Electronic Throttle Control Motor
- ECT Sensor
- Generator

(8) Disconnect heater hoses from thermostat housing and heater return tube.
(9) Remove fastener securing heater return tube to thermostat housing.
(10) Disconnect upper radiator hose.
(11) Raise vehicle on hoist.
(12) Remove right front wheel.
(13) Remove accessory drive belt splash shield.
(14) Remove lower torque strut.
(15) Remove lower bolt for right engine mount bracket.
(16) Remove fasteners securing exhaust pipe to exhaust manifold.

CYLINDER HEAD (Continued)

(17) Lower vehicle.

(18) Remove upper torque strut.

(19) Remove fastener securing power steering return line to right engine mount bracket.

(20) Remove fasteners securing power steering reservoir to right engine mount bracket.

(21) Support engine with floor jack and wooden block on oil pan.

(22) Remove right engine mount through bolt.

(23) Jack up engine. Remove remaining fasteners holding right engine mount bracket. Remove right engine mount bracket.

(24) Remove camshaft position sensor.

(25) Remove cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(26) Rotate crankshaft until triangular timing mark on camshaft sprocket is at the 12 o'clock position.

(27) For reassembly purposes, paint the timing chain link that lines up with camshaft timing mark (Fig. 16).

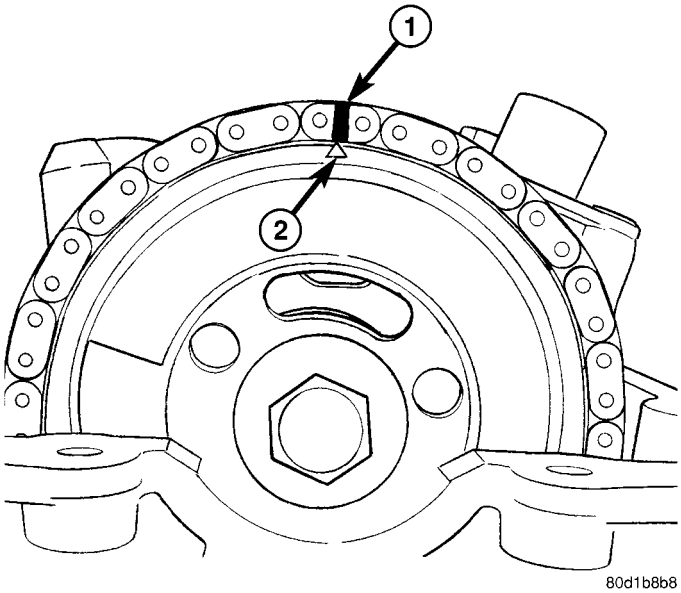

Fig. 16 Identify Timing Chain Link for Reassembly Purposes

1 - PAINT THE LINK THAT ALIGNS WITH TIMING MARK
2 - CAMSHAFT SPROCKET TIMING MARK

(28) Using Special Tool 8435 to hold camshaft sprocket, remove camshaft sprocket bolt (Fig. 17).

(29) Remove the timing chain tensioner plug from engine block. Remove oil reservoir cap and timing chain tensioner (Fig. 18).

NOTE: The design of the timing chain cover will allow the timing chain to stay on the crankshaft sprocket without skipping any teeth. Do not rotate engine.

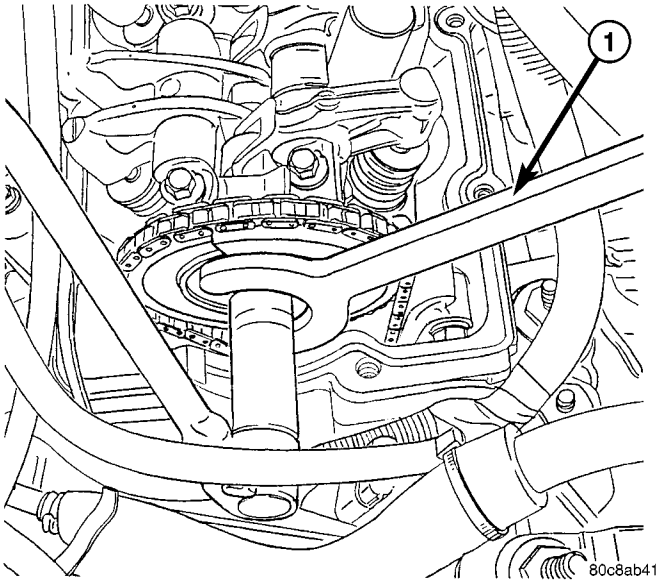

Fig. 17 Special Tool 8435 - Camshaft Sprocket Holding Wrench

1 - SPECIAL TOOL 8435

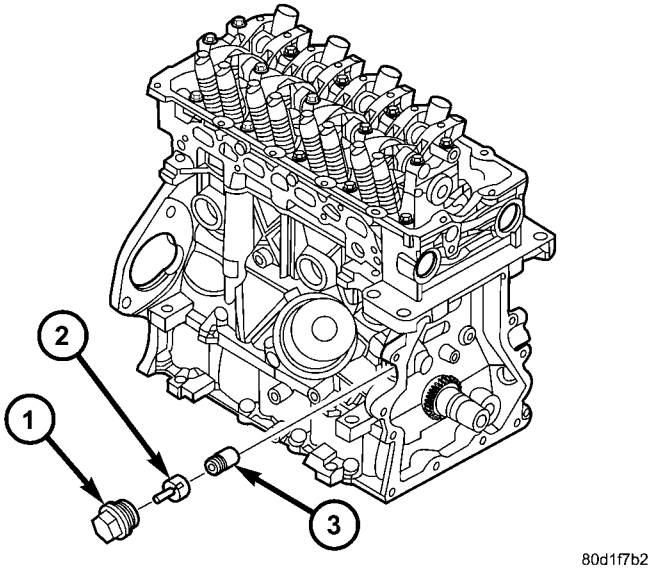

Fig. 18 Timing Chain Tensioner

1 - PLUG WITH SEAL RING
2 - OIL RESERVOIR CAP
3 - TIMING CHAIN TENSIONER

(30) Remove camshaft sprocket from camshaft. Partially lower camshaft sprocket to allow timing chain to be removed from camshaft sprocket. Allow timing chain to fall into crankcase.

CYLINDER HEAD (Continued)

(31) Remove cylinder head plugs. Remove fasteners holding timing chain guides to cylinder head. Remove timing chain guides (Fig. 19).

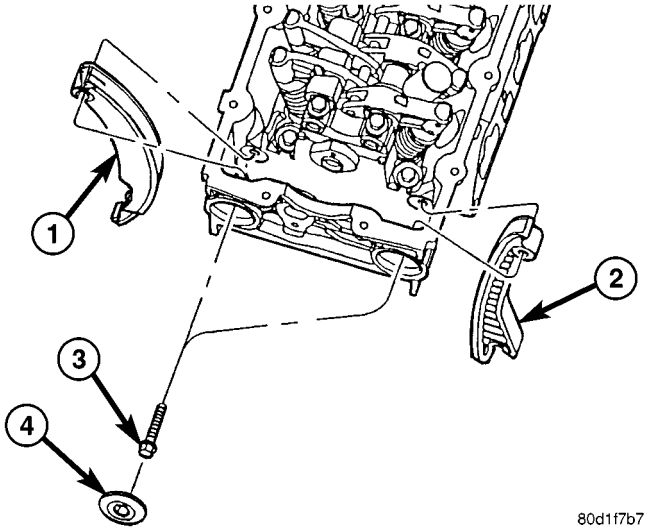

Fig. 19 Timing Chain Guide Mounting

1 - RIGHT TIMING CHAIN GUIDE (MOVABLE)
2 - LEFT TIMING CHAIN GUIDE (FIXED)
3 - FASTENER(S)
4 - CYLINDER HEAD PLUG(S)

CAUTION: Avoid damaging spark plug tubes when removing cylinder head bolts.

(32) Remove cylinder head bolts (Fig. 20).
(33) Remove cylinder head and gasket.

CLEANING

To ensure engine gasket sealing, proper surface preparation must be performed, especially with the use of aluminum engine components and multi-layer steel cylinder head gaskets.

NOTE: Multi-Layer Steel (MLS) head gaskets require a scratch free sealing surface.

Remove all gasket material from cylinder head and block (Refer to 9 - ENGINE - STANDARD PROCEDURE). Be careful not to gouge or scratch the aluminum head sealing surface.

Clean all engine oil passages.

INSPECTION

(1) Cylinder head must be flat within 0.1 mm (0.004 in.) (Fig. 21).
(2) Inspect camshaft bearing journals for scoring.
(3) Remove carbon and varnish deposits from inside of valve guides with a reliable guide cleaner.

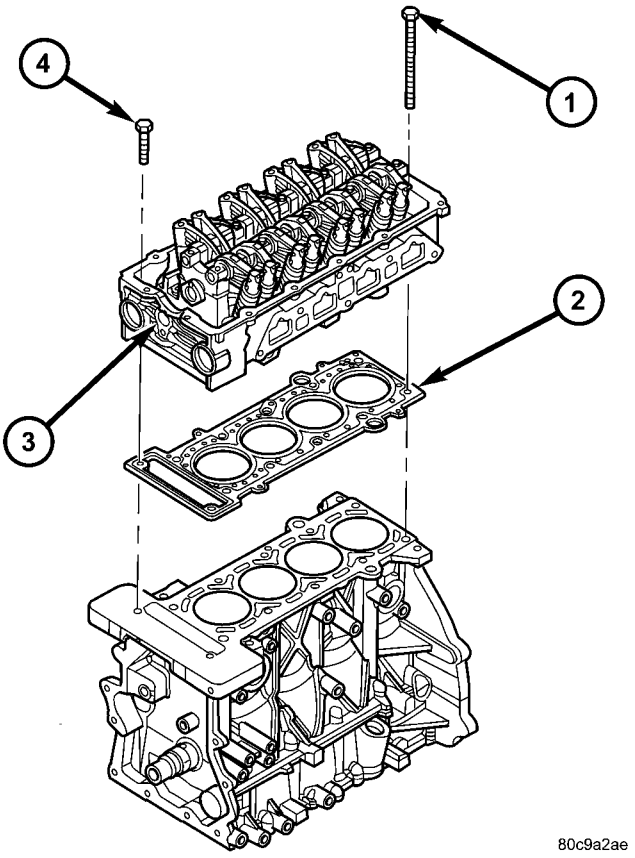

Fig. 20 Cylinder Head and Gasket

2 - CYLINDER HEAD GASKET
3 - CYLINDER HEAD
4 - M8 CYLINDER HEAD BOLT (QTY 2)

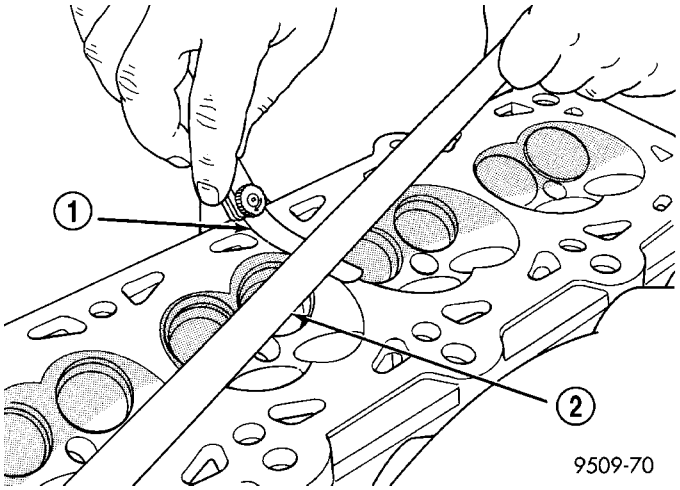

Fig. 21 Checking Cylinder Head Flatness

1 - FEELER GAUGE
2 - STRAIGHT EDGE

CYLINDER HEAD (Continued)

(4) Using a small hole gauge and a micrometer, measure valve guides in 3 places top, middle and bottom (Fig. 22). (Refer to 9 - ENGINE - SPECIFICATIONS). Replace cylinder head if they are not within specification.

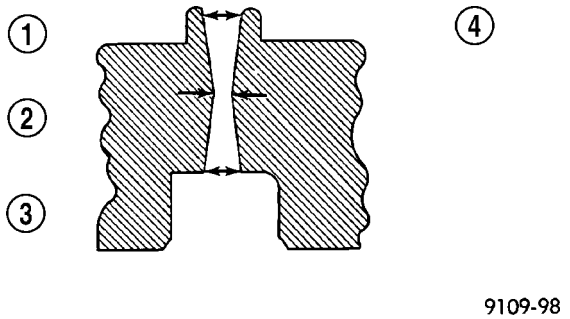

Fig. 22 Checking Wear on Valve Guide—Typical

1 - TOP
2 - MIDDLE
3 - BOTTOM
4 - CUT AWAY VIEW OF VALVE GUIDE MEASUREMENT LOCATIONS

INSTALLATION - CYLINDER HEAD

NOTE: The cylinder head bolts should be examined BEFORE reuse. If the threads are necked down, the bolt(s) should be replaced (Fig. 23).

Necking can be checked by holding a scale or straight edge against the threads. If all the threads do not contact the scale, the bolt(s) should be replaced.

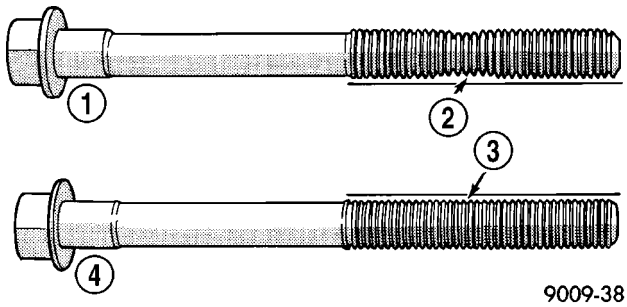

Fig. 23 Checking Bolts for Stretching (Necking)

1 - STRETCHED BOLT
2 - THREADS ARE NOT STRAIGHT ON LINE
3 - THREADS ARE STRAIGHT ON LINE
4 - UNSTRETCHED BOLT

(1) Clean the cylinder head and cylinder block sealing surfaces (Refer to 9 - ENGINE/CYLINDER HEAD - CLEANING).

(2) Position a new cylinder head gasket on the locating dowels.

(3) Position the cylinder head onto the engine block. Make sure the cylinder head seats fully over the locating dowels.

CAUTION: Avoid damaging spark plug tubes when installing/torquing cylinder head bolts.

(4) Before installing cylinder head bolts, the threads should be oiled with engine oil.

(5) Tighten the cylinder head bolts in the sequence shown in (Fig. 24). Using the 4 step torque method, tighten according to the following values:

Step One:

- Tighten the ten M10 bolts to 20 N·m (15 ft. lbs.)
- Tighten the two M8 bolts to 15 N·m (11 ft. lbs.)

Step Two:

- Tighten the ten M10 bolts to 41 N·m (30 ft. lbs.)

Step Three:

- Recheck the ten M10 bolts to 41 N·m (30 ft. lbs.)

Step Four:

- **Do not use a torque wrench for this step.** Tighten the ten M10 bolts an additional 90 degrees
- Tighten the two M8 bolts to 30 N·m (22 ft. lbs.)

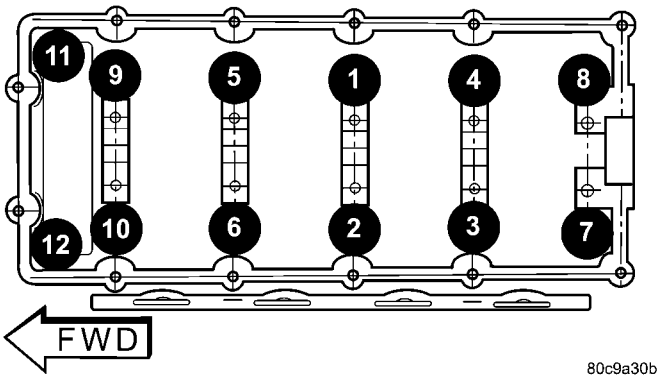

Fig. 24 Cylinder Head Bolt Tightening Sequence

(6) Install timing chain guides. Torque fasteners to 28 N·m (250 in. lbs.) (Fig. 19).

(7) Retrieve timing chain from crankcase with a magnet or fabricated hook.

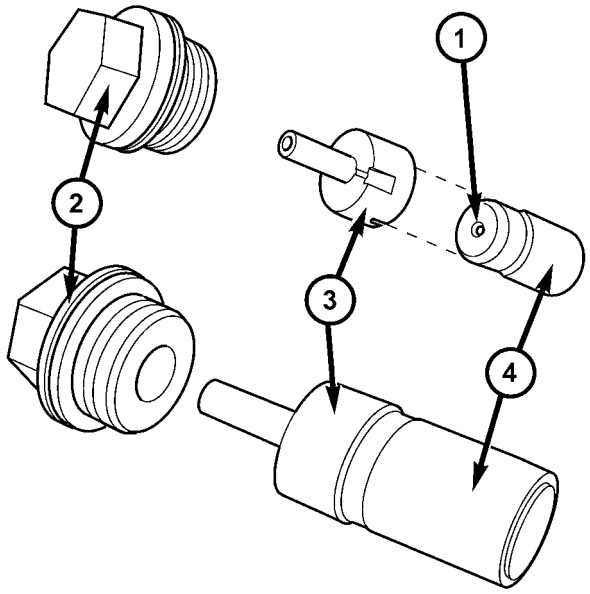
(8) Align triangular timing mark on cam sprocket with the timing chain link that was painted during disassembly. Install timing chain on cam sprocket (Fig. 16).

(9) Install camshaft sprocket on the camshaft.

CAUTION: Do Not use an impact wrench for tightening the camshaft sprocket bolt. Damage to the camshaft timing pin can result. Use a hand wrench only.

(10) Install camshaft sprocket bolt. While holding the camshaft sprocket with Special Tool 8435, torque bolt to 115 N·m (85 ft. lbs.) (Fig. 17).

CYLINDER HEAD (Continued)



80d1fafd

Fig. 25 Timing Chain Tensioner/Oil Reservoir Cap/Plug

1 - CHECK BALL
2 - PLUG WITH SEAL RING
3 - OIL RESERVOIR CAP
4 - TIMING CHAIN TENSIONER

(11) Reset the timing chain tensioner using the following method:

(a) Remove oil reservoir cap from timing chain tensioner (Fig. 25).

(b) Place tensioner on a clean flat surface.

(c) Place your palm against the tensioner and press down on the tensioner with continuous pressure until the fully extended tensioner bottoms out (Fig. 26).

(d) Install oil reservoir cap onto timing chain tensioner (Fig. 25).

(12) Install timing chain tensioner with oil reservoir cap into engine block (Fig. 18).

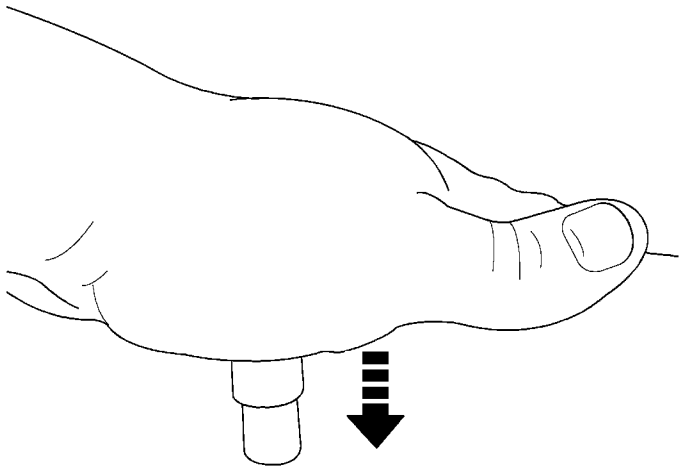
(13) Install timing chain tensioner plug with seal ring. Torque plug to 62 N·m (46 ft. lbs.).

CAUTION: Do not pry directly on chain. Damage to timing chain may occur.

(14) Using a long thin screwdriver, pry in on the right (movable) timing chain guide until the timing chain tensioner rachets out to tension the chain (Fig. 27).

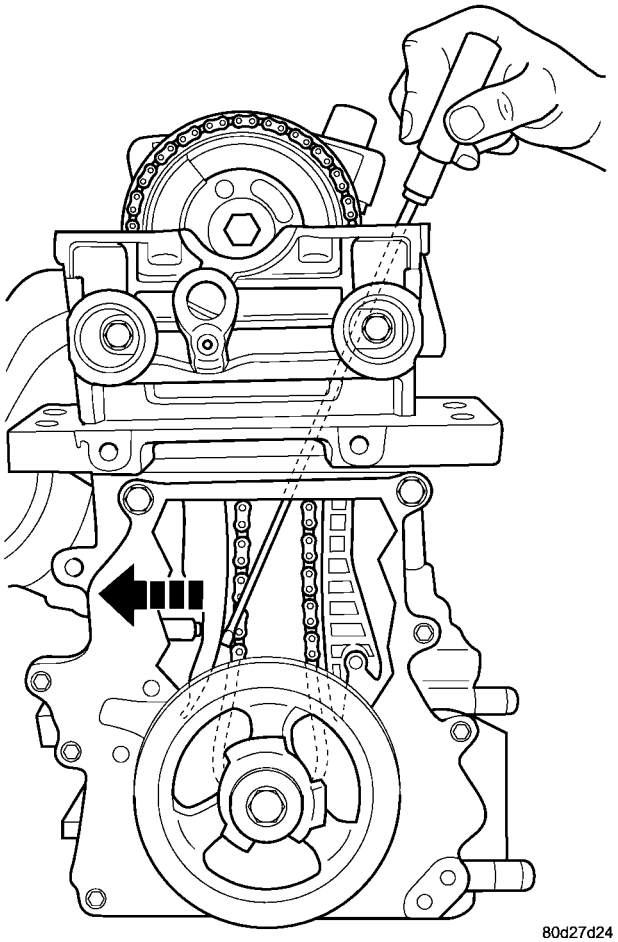
NOTE: Ensure the timing chain is properly positioned within the channel of the timing chain guides.

(15) Install cylinder head plugs. Torque to 18 N·m (162 in. lbs.) (Fig. 19).



80c9ba20

Fig. 26 Resetting Timing Chain Tensioner



80d27d24

Fig. 27 Timing Chain Tensioner Activation

(16) Install cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

CYLINDER HEAD (Continued)

(17) Install camshaft position sensor. Torque fastener to 10 N·m (85 in. lbs.). Reconnect connector.
(18) Install right engine mount bracket (Refer to 9 - ENGINE/ENGINE MOUNTING/ENGINE MOUNT BRACKET - INSTALLATION).
(19) Lower engine until right engine mount through bolt can be installed.
(20) Install right engine mount through bolt.
(21) Remove floor jack from under engine.
(22) Install fastener securing power steering return line to right engine mount bracket.
(23) Install fasteners securing power steering reservoir to right engine mount bracket.
(24) Install upper torque strut.
(25) Raise vehicle on hoist.
(26) Install fasteners securing exhaust pipe to exhaust manifold. Torque fasteners to 28 N·m (250 in. lbs.).
(27) Install lower torque strut.
(28) Install accessory drive belt splash shield.
(29) Install right front wheel.
(30) Lower vehicle.
(31) Connect upper radiator hose.
(32) Install fastener securing heater return tube to thermostat housing.
(33) Connect heater hoses to thermostat housing and heater return tube.
(34) Connect the following electrical components:
- Upstream Oxygen Sensor
- Camshaft Position Sensor
- Ignition Coil and Capacitor
- Fuel Injectors
- MAP Sensor
- Knock Sensor
- Electronic Throttle Control Motor
- ECT Sensor
- Generator

(35) Connect vacuum hoses to throttle body.
(36) Connect ground strap to cylinder head.
(37) Connect throttle body air inlet hose.
(38) Connect negative battery cable.
(39) Fill cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).
(40) Perform torque strut adjustment procedure (Refer to 9 - ENGINE/ENGINE MOUNTING/TORQUE STRUT - ADJUSTMENTS).

CYLINDER HEAD COVER

REMOVAL

(1) Disconnect the negative battery cable.
(2) Remove upper intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).
(3) Disconnect make-up air hose and PCV hoses (Fig. 28) from cylinder head cover.

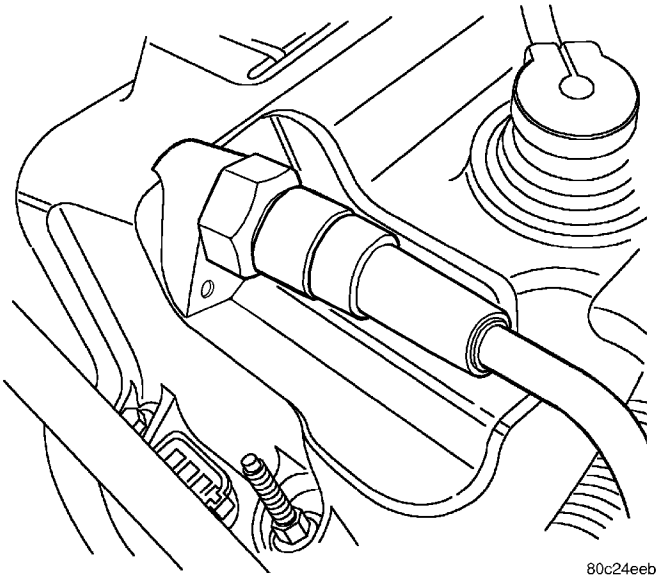


Fig. 28 PCV Valve Location

(4) Disconnect the ignition coil and capacitor electrical connectors.
(5) Remove the spark plug cables, twist spark plug boots, then pull straight up.
(6) Remove ignition coil bolts and then remove the ignition coil and spark plug cables as an assembly.
(7) Remove ignition coil capacitor.
(8) Remove cylinder head cover bolts.
(9) Remove cylinder head cover (Fig. 29).

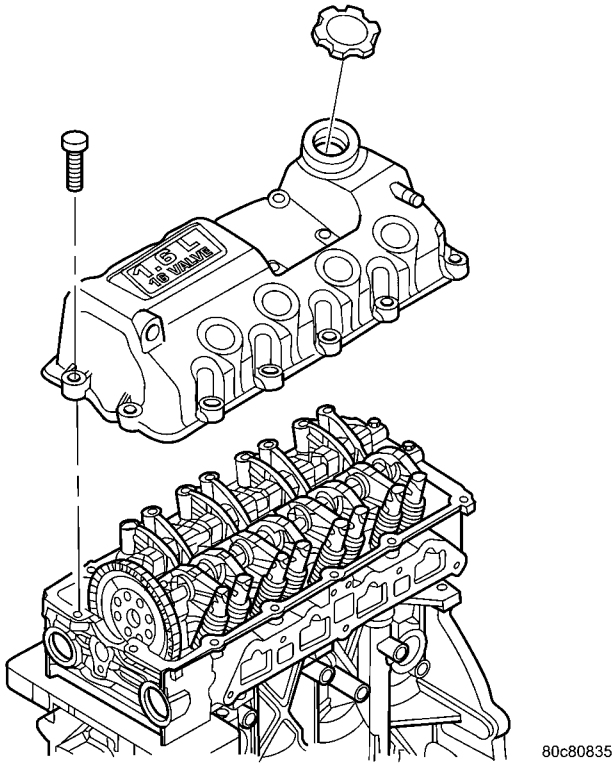

Fig. 29 Cylinder Head Cover

CYLINDER HEAD COVER (Continued)

CLEANING

Clean cylinder head and cover mating surfaces using a suitable solvent.

INSPECTION

Inspect cover rails for flatness.

INSTALLATION

(1) Inspect gasket and seals (Fig. 30). Replace as necessary. For replacement of spark plug tube seals, (Refer to 9 - ENGINE/CYLINDER HEAD/SPARK PLUG TUBE SEAL - REMOVAL) and (Refer to 9 - ENGINE/CYLINDER HEAD/SPARK PLUG TUBE SEAL - INSTALLATION).

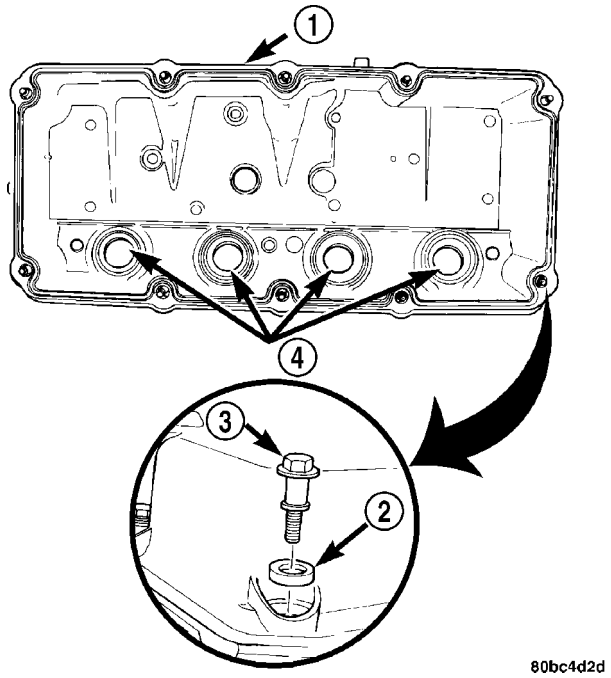

Fig. 30 Cylinder Head Cover Gasket and Seals

1 - CYLINDER HEAD COVER GASKET
2 - SEAL
3 - BOLT
4 - SPARK PLUG TUBE SEALS

(2) Install cylinder head cover and gasket. The cylinder head cover bolts have to be tightened in 2 steps and in a tightening sequence. The first torque is to tighten the bolts to 6 N·m (60 in. lbs.) then tighten the bolts to 12 N·m (105 in. lbs.) (Fig. 31).

(3) Install ignition coil capacitor.

(4) Install ignition coil and spark plug cables. Make sure the rubber insulators are in place on the ignition coil (Fig. 32). Tighten ignition coil fasteners to 12 N·m (105 in. lbs.).

(5) Connect make-up air and PCV hoses (Fig. 28).

(6) Connect the ignition coil and capacitor electrical connectors.

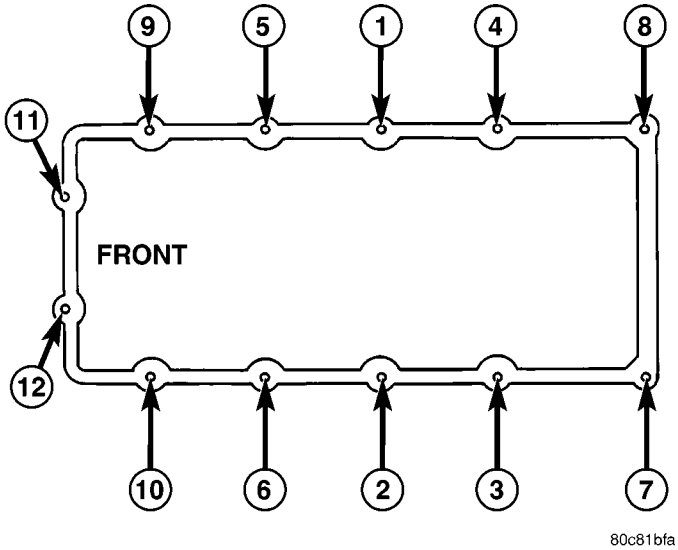

Fig. 31 Cylinder Head Cover Tightening Sequence

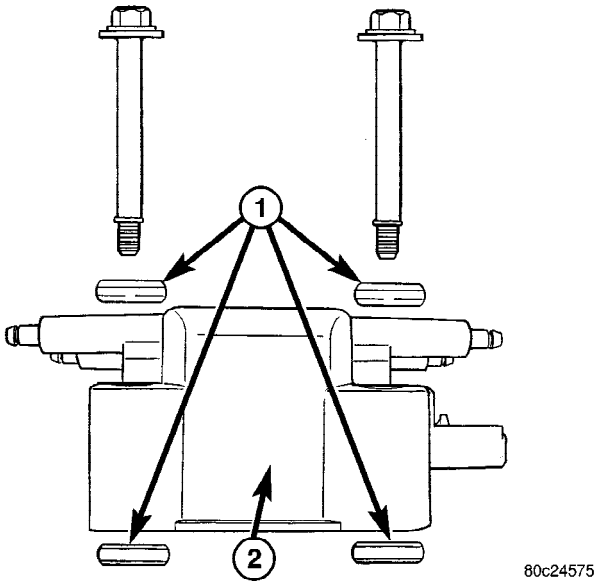

Fig. 32 Rubber Insulators and Ignition Coil

1 - Rubber Insulators
2 - Coil

(7) Install upper intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).

(8) Connect the negative battery cable.

SPARK PLUG TUBE SEAL

DESCRIPTION

The spark plug tube seals are located in the cylinder head cover (Fig. 33). These seals are pressed into the cylinder head cover to seal the outside perimeter of the spark plug tubes. If these seals show signs of hardness and/or cracking, they should be replaced.

REMOVAL

(1) Remove the cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER - REMOVAL).

(2) Using an appropriate tool, carefully remove spark plug tube seals (Fig. 33). Care should be taken not to damage cylinder head cover sealing surfaces.

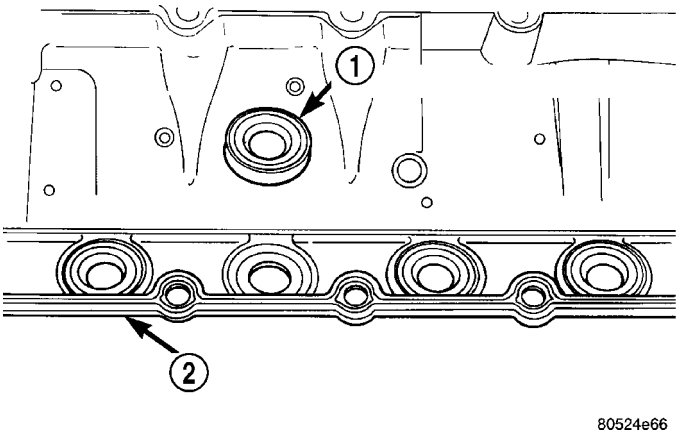

Fig. 33 Spark Plug Tube Seals

1 - SPARK PLUG TUBE SEAL
2 - CYLINDER HEAD COVER

INSTALLATION

(1) Clean all sealing surfaces.

NOTE: Position seal with the concave side facing the installation tool (Fig. 34).

(2) Install seals using Special Tool MB-998306 (Fig. 34). Only hand pressure on tool is needed to install new seals.

(3) Install the cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER - INSTALLATION).

SPARK PLUG TUBE

REMOVAL

(1) Disconnect negative battery cable.

(2) Remove upper intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).

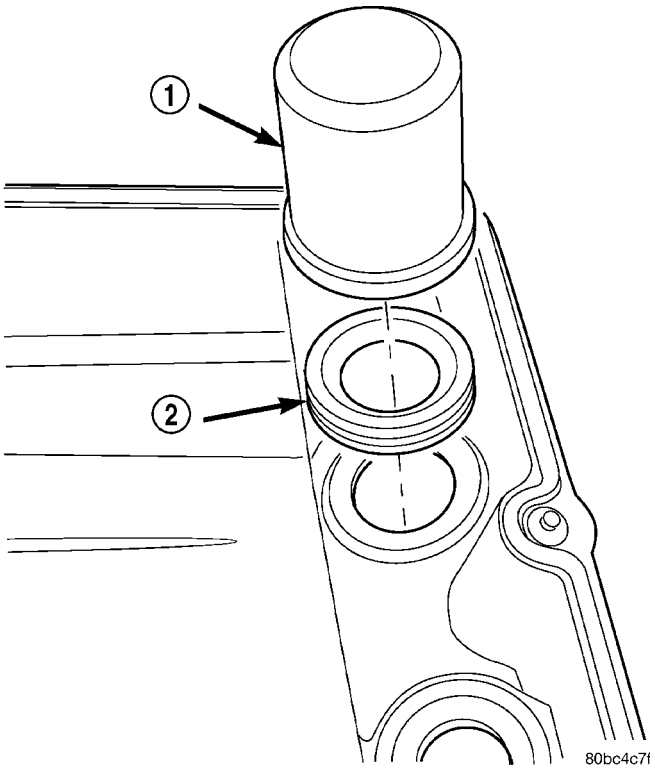

Fig. 34 Spark Plug Tube Seal Installation

1 - SPECIAL TOOL MD-998306
2 - SPARK PLUG TUBE SEAL

(3) Remove the cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(4) Remove lower intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).

(5) Position Special Tool 8819 on spark plug tube. Tighten the set screws to 16 N·m (142 in. lbs.) (Fig. 35).

(6) Using the Special Tool C-3752 attached to 8819, remove the tube from the cylinder head (Fig. 35).

(7) Loosen the set screws and rotate Special Tool 8819 one-quarter turn to remove from the tube. Discard the tube.

INSTALLATION

(1) Clean area around spark plug with Mopar® parts cleaner or equivalent.

(2) Apply Mopar® Stud and Bearing Mount or equivalent to a new tube approximately 1 mm (0.039 in.) from the end in a 3 mm (0.118 in.) wide area.

(3) Remove the spark plug.

(4) Install Special Tool 8447–1 into the spark plug bore (Fig. 36).

(5) Install sealer end of tube into the cylinder head. Carefully install the tube using Special Tool

SPARK PLUG TUBE (Continued)

8447–2 Installer and mallet until Special Tool 8447–2 bottoms against 8447–1 (Fig. 37).

(6) Unscrew Special Tool 8447–1 from the spark plug bore. Using the long bolt (8447–3), remove Special Tool 8447–1 (Fig. 38).

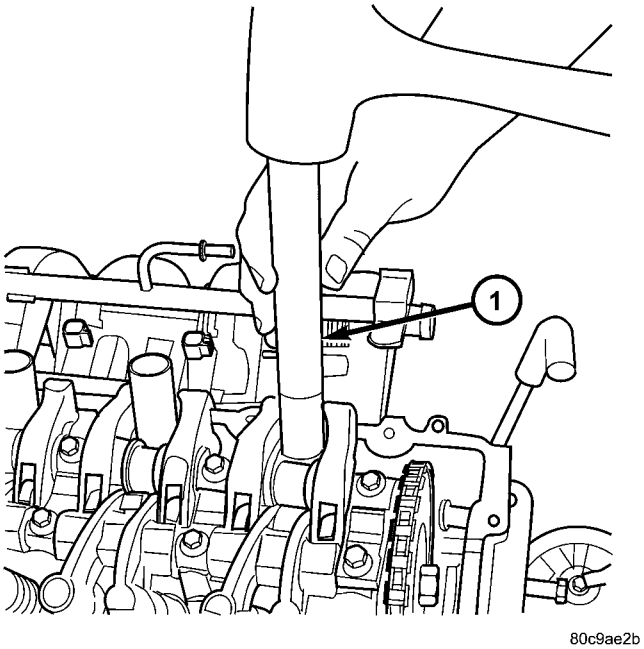

Fig. 37 Spark Plug Tube Installation

1 - SPECIAL TOOL 8447-2

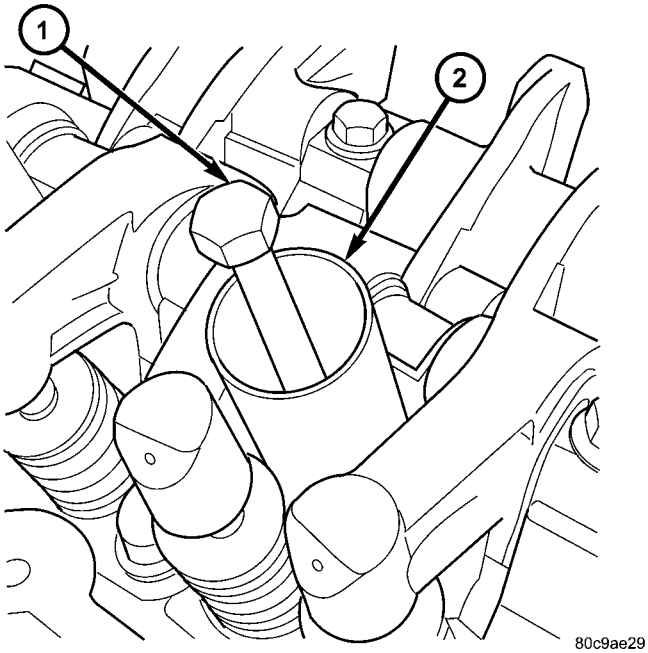

Fig. 38 8447-1 Removal

1 - SPECIAL TOOL 8447-3 (BOLT)
2 - SPARK PLUG TUBE

(7) Install the spark plug.

(8) Install lower intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).

SPARK PLUG TUBE (Continued)

(9) Install the cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

(10) Install upper intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).

(11) Connect negative battery cable.

ROCKER ARM SHAFT / ROCKER ARM / LASH ADJUSTER

DESCRIPTION

The two rocker shafts are mounted to the top of the camshaft bearing caps. The left rocker shaft holds the eight roller rocker arms for the intake valves, while the right rocker shaft holds the four forked roller rocker arms for the exhaust valves. The roller rocker arms are mounted to rocker shafts and are positioned over the camshaft and valve stems. The rocker shaft is installed through the center of the roller rocker arms, which allows the roller rocker arms to pivot. The valve stem end of the roller rocker arms contain a hydraulic lash adjuster. The hydraulic lash adjuster, using oil pressure, constantly maintains the correct clearance between the rocker arm and camshaft/valve stem. The camshaft end of the roller rocker arm contains a roller that rides on the lobe of the camshaft. Roller rocker arms provide the camshaft with a quiet, low-friction means of opening the valves. Hydraulic lash adjusters are replaced as an assembly with the rocker arms (Fig. 39).

REMOVAL

(1) Disconnect negative battery cable.

(2) Remove cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER - REMOVAL).

NOTE: Use the following procedure to remove both the intake and exhaust rocker shafts.

CAUTION: To avoid damage to the rocker shafts, loosen each rocker shaft/camshaft bearing cap bolt one turn at a time in the following sequence:

(3) Loosen the rocker shaft/camshaft bearing cap bolts starting with the center bolt and working toward the ends.

(4) Remove the rocker shafts/roller rocker arm assemblies (Fig. 39).

NOTE: Hydraulic lash adjusters are replaced as an assembly with the rocker arms.

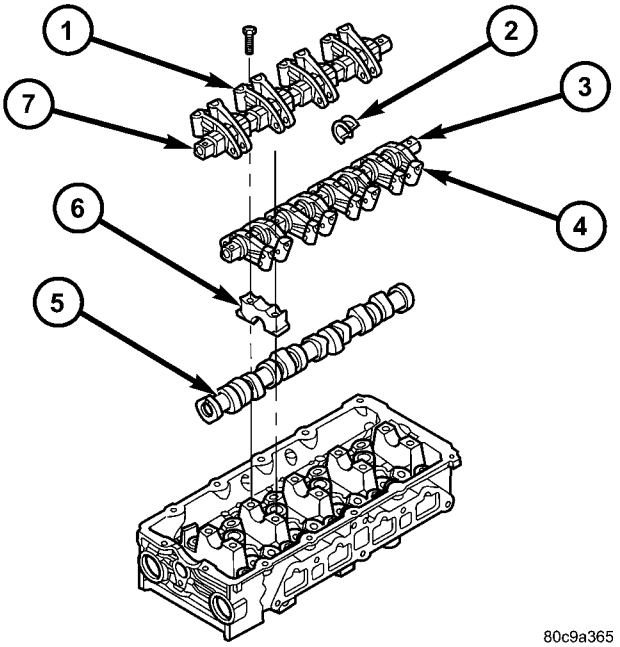

Fig. 39 Rocker Arm Shafts/Lash Adjusters/Camshaft

3 - INTAKE VALVE ROCKER SHAFT
4 - INTAKE VALVE ROCKER ARM
5 - CAMSHAFT
6 - CAMSHAFT BEARING CAP
7 - EXHAUST VALVE ROCKER SHAFT

INSTALLATION

(1) Lubricate the roller portion of the rocker arms with clean engine oil.

(2) Install the rocker shaft/roller rocker arm assemblies on the camshaft bearing caps, camshaft, and valve stems (Fig. 39).

(3) Hand start rocker shaft/camshaft bearing cap bolts.

NOTE: When tightening the rocker shaft/camshaft bearing cap bolts, ensure the camshaft bearing caps are fully seated and the roller rocker arms remain seated in their proper position.

ROCKER ARM SHAFT / ROCKER ARM / LASH ADJUSTER (Continued)

(4) Tighten the rocker shaft/camshaft bearing cap bolts gradually in the sequence shown in (Fig. 40). Final torque all bolts to 25 N·m (225 in. lbs.).

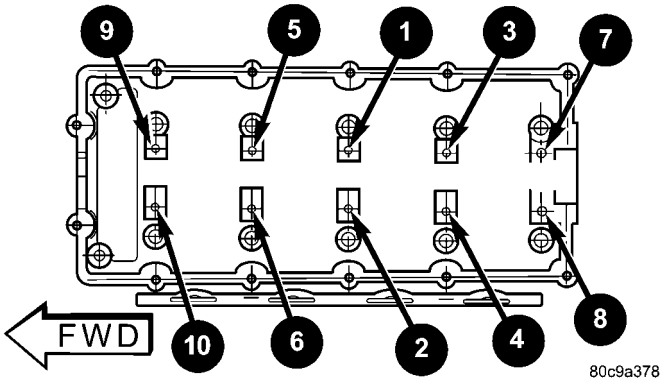

Fig. 40 Rocker Arm Shaft Tightening Sequence

(5) Install cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER - INSTALLATION).

(6) Connect negative battery cable.

CAMSHAFT

REMOVAL

(1) Disconnect negative battery cable.

(2) Remove cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER - REMOVAL).

(3) Disconnect camshaft position sensor connector. Remove camshaft position sensor.

(4) Rotate crankshaft until number one cylinder is at TDC on compression stroke.

(5) Using Special Tool 8435 to hold camshaft sprocket, remove camshaft sprocket bolt (Fig. 41).

(6) Install Special Tool 8446 as shown in (Fig. 42). Hold tool against camshaft and tighten tool mounting bolts.

(7) Slide camshaft sprocket onto Special Tool 8446 (Fig. 42).

NOTE: Use the following procedure to remove both the intake and exhaust rocker shafts.

CAUTION: To avoid damage to the rocker shafts, loosen each rocker shaft/camshaft bearing cap bolt one turn at a time in the following sequence:

(8) Loosen the rocker shaft/camshaft bearing cap bolts starting with the center bolt and working toward the ends.

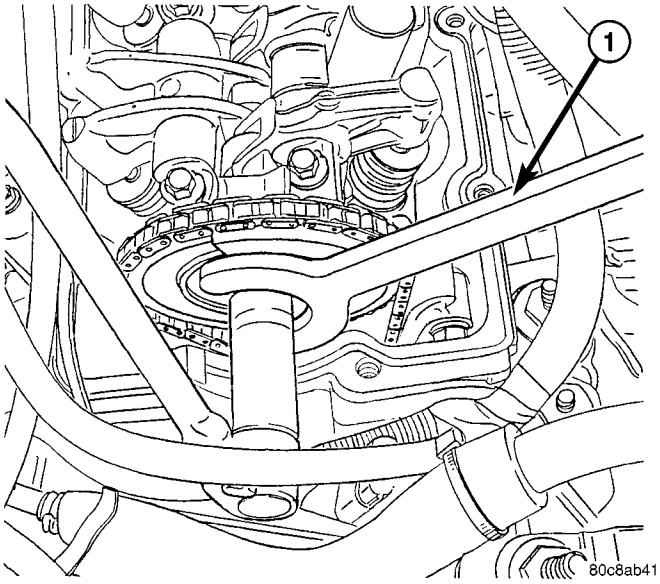

Fig. 41 Special Tool 8435 - Camshaft Sprocket Holding Wrench

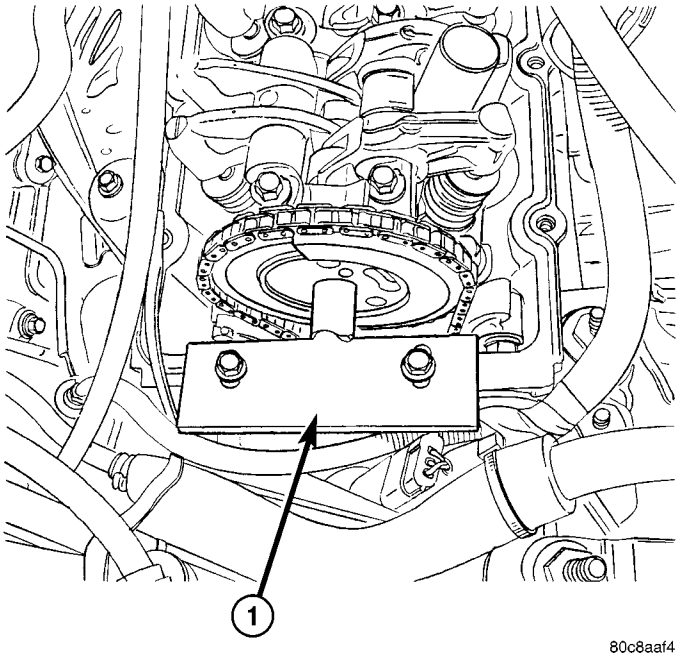

Fig. 42 Special Tool 8446 - Camshaft Sprocket Holder

1 - SPECIAL TOOL 8446

CAMSHAFT (Continued)

(9) Remove the rocker shafts/roller rocker arm assemblies (Fig. 43).

(10) Remove camshaft bearing caps noting orientation and numbering for reassembly purposes (Fig. 43).

(11) Lift camshaft from cylinder head (Fig. 43).

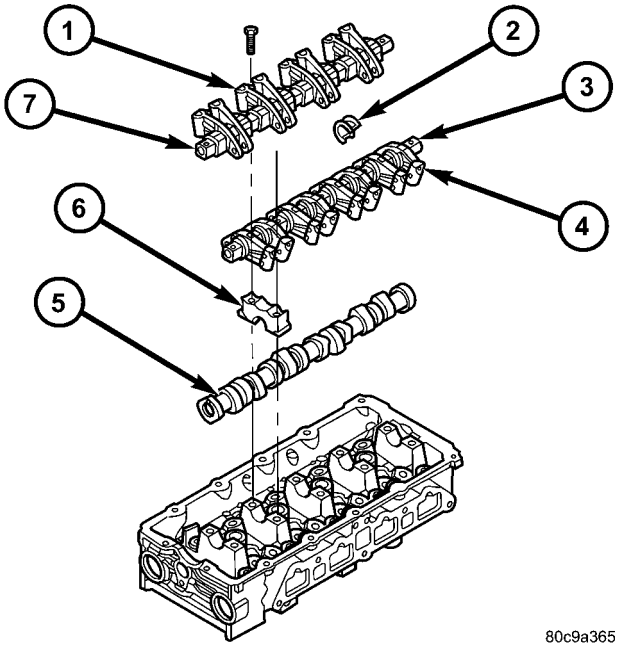

Fig. 43 Rocker Arm Shafts/Lash Adjusters/Camshaft

1 - EXHAUST VALVE ROCKER ARM
2 - INTAKE VALVE ROCKER ARM SPACER
3 - INTAKE VALVE ROCKER SHAFT
4 - INTAKE VALVE ROCKER ARM
5 - CAMSHAFT
6 - CAMSHAFT BEARING CAP
7 - EXHAUST VALVE ROCKER SHAFT

INSPECTION

(1) Inspect camshaft bearing journals for damage and binding (Fig. 44). If journals are binding, check the cylinder head for damage. Also check cylinder head oil holes for clogging.

(2) Check the cam lobe and bearing surfaces for abnormal wear and damage. Replace camshaft if defective.

(3) Inspect camshaft bearing caps for abnormal wear and damage.

NOTE: If camshaft is replaced due to lobe wear or damage, always replace the rocker arms.

(4) Measure the lobe actual wear (unworn area - wear zone = actual wear) (Fig. 44) and replace camshaft if out of limit. Standard value is 0.0254 mm (0.001 in.), wear **limit** is 0.254 mm (0.010 in.).

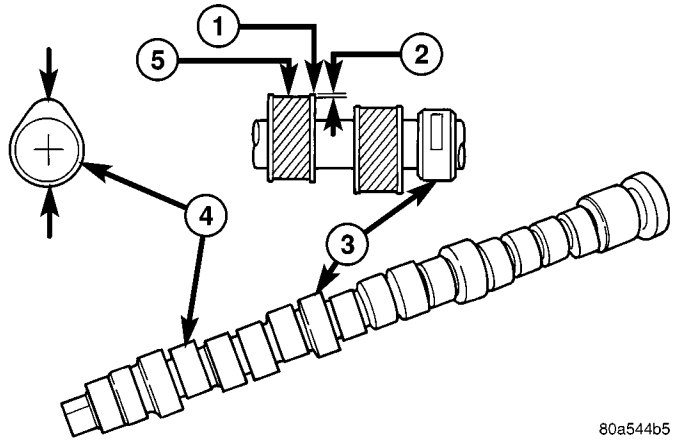

Fig. 44 Checking Camshaft for Wear

1 - UNWORN AREA
2 - ACTUAL WEAR
3 - BEARING JOURNAL
4 - LOBE
5 - WEAR ZONE

INSTALLATION

(1) Lubricate the camshaft bearing journals with clean engine oil.

(2) Install the camshaft with the camshaft sprocket alignment pin in the 12 o'clock position.

(3) Install the camshaft bearing caps in their proper position (Fig. 43).

WARNING: Prior to installing the rocker shafts, ensure the camshaft sprocket alignment pin on the camshaft is in the 12 o'clock position. Failure to position the camshaft may result in damage to the valvetrain and pistons.

(4) Lubricate the roller portion of the rocker arms with clean engine oil.

(5) Install the rocker shaft/roller rocker arm assemblies on the camshaft bearing caps, camshaft, and valve stems.

(6) Hand start rocker shaft/camshaft bearing cap bolts.

NOTE: When tightening the rocker shaft/camshaft bearing cap bolts, ensure the camshaft bearing caps are fully seated and the roller rocker arms remain seated in their proper position.

CAMSHAFT (Continued)

(7) Tighten the rocker shaft/camshaft bearing cap bolts gradually in the sequence shown in (Fig. 45). Final torque all bolts to 25 N·m (225 in. lbs.).

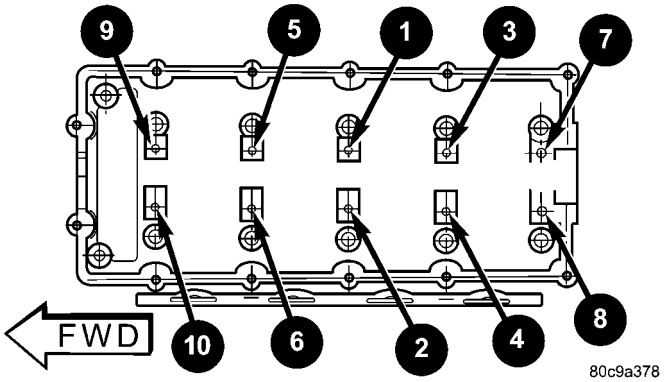

Fig. 45 Rocker Arm Shaft Tightening Sequence

NOTE: It may be necessary to use the flats on the front of the camshaft to slightly rotate camshaft for camshaft sprocket installation.

(8) Slide camshaft sprocket off Special Tool 8446 and into it's mounting position. Remove Special Tool 8446 from cylinder head (Fig. 42).

CAUTION: Do Not use an impact wrench for tightening the camshaft sprocket bolt. Damage to the camshaft timing pin can result. Use a hand wrench only.

(9) Install camshaft sprocket bolt. While holding the camshaft sprocket with Special Tool 8435, torque bolt to 115 N·m (85 ft. lbs.) (Fig. 41).

(10) Install camshaft position sensor. Torque fastener to 10 N·m (85 in. lbs.). Reconnect connector.

(11) Install cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER - INSTALLATION).

(12) Connect negative battery cable.

VALVE SPRINGS AND SEALS (ON VEHICLE SERVICE)

STANDARD PROCEDURE - VALVE SPRINGS AND SEALS (ON VEHICLE SERVICE)

(1) Disconnect negative battery cable.

(2) Remove cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(3) Remove intake and exhaust rocker shaft/rocker arm assemblies (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - REMOVAL).

(4) Install Special Tool 8813 Adapter Studs/Spacers as shown in (Fig. 46).

(5) Install Special Tool MD998772A Compressor with Special Tool 6779 adapter as shown in (Fig. 46).

CAUTION: When removing spark plugs, use Special Tool 8448 Protective Sleeve on extension (Fig. 47) or damage to spark plug tubes may result.

(6) Remove spark plugs.

(7) Rotate crankshaft until piston of cylinder being worked on is at TDC.

(8) Install air hose attached to adapter tool in spark plug hole. Apply 90-120 psi of air pressure to the cylinder (Fig. 46).

(9) Using Special Tool MD998772A with adapter 6779 (Fig. 46), compress valve spring and remove valve locks.

(10) Release tension on valve spring. Remove valve spring retainer and valve spring.

(11) Remove valve seal/spring seat (Fig. 48).

(12) Replace valve seal/spring seat (Fig. 50).

(13) Install valve spring and valve spring retainer.

(14) Using Special Tool MD998772A with adapter 6779 (Fig. 46), compress valve spring and install valve locks.

(15) Release tension on valve spring.

(16) Repeat above procedures on remaining cylinders.

(17) Remove Special Tools MD998772A, 6779, 8813.

(18) Install intake and exhaust rocker shaft/rocker arm assemblies (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - INSTALLATION).

(19) Install cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER - INSTALLATION).

(20) Install spark plugs.

(21) Connect negative battery cable.

VALVE SPRINGS AND SEALS (ON VEHICLE SERVICE) (Continued)

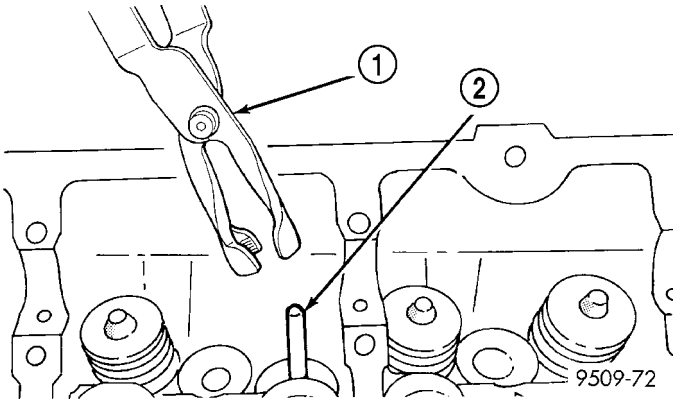

Fig. 48 Valve Stem Seal Removal - Typical

1 - VALVE SEAL TOOL
2 - VALVE STEM

VALVE SPRINGS AND SEALS (CYLINDER HEAD REMOVED)

STANDARD PROCEDURE - VALVE SPRINGS AND SEALS (CYLINDER HEAD REMOVED)

(1) Compress valve spring using Special Tools C-3422–D Spring Compressor with adapter 6526A (Fig. 49).

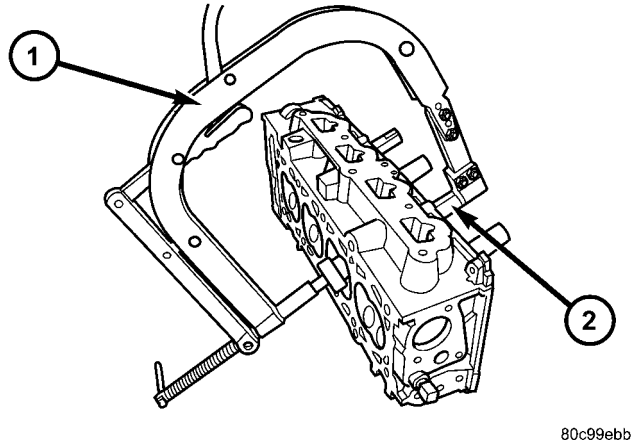

Fig. 49 Valve Spring Removal/Installation

1 - SPECIAL TOOL C-3422-D
2 - SPECIAL TOOL 6526A

(2) Remove valve locks (Fig. 50).

(3) Release valve spring compressor. Remove valve spring retainer and valve spring.

(4) Remove valve seal/spring seat (Fig. 48).

(5) Replace valve seal/spring seat.

(6) Install valve spring and valve spring retainer.

(7) Compress valve spring using Special Tools C-3422–D Spring Compressor with adapter 6526A (Fig. 49).

(8) Install valve locks.

(9) Release Spring compressor.

(10) Repeat procedure for remaining valve springs and seals.

INSPECTION

When valves have been removed for inspection, reconditioning or replacement, valve springs should be tested (Fig. 51). **As an example;** the compression length of the spring to be tested is 38.00 mm (1.496 in.). Turn table of Tool C-647 until surface is in line with the 38.00 mm (1.496 inches.) mark on the threaded stud and the zero mark on the front. Place spring over stud on the table and lift compressing lever to set tone device. Pull on torque wrench until ping is heard. Take reading on torque wrench at this instant. Multiply this reading by two. This will give the spring load at test length. Fractional measurements are indicated on the table for finer adjustments. Refer to Engine Specifications to obtain

5 - CYLINDER HEAD
6 - INTAKE VALVE
7 - EXHAUST VALVE

specified height and allowable tensions (Refer to 9 - ENGINE - SPECIFICATIONS). Replace springs that do not meet specifications.

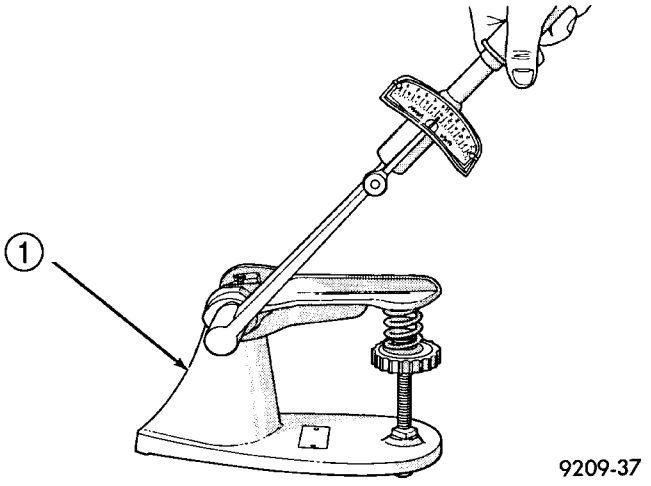

Fig. 51 Testing Valve Spring

1 - SPECIAL TOOL C-647

INTAKE/EXHAUST VALVES & SEATS

STANDARD PROCEDURE - VALVE AND VALVE SEAT REFACING

For all applicable valve and seat dimensions and angles (Refer to 9 - ENGINE - SPECIFICATIONS).

(1) Reface valves using a suitable valve refacing machine.

(2) Inspect the remaining margin after the valves are refaced (Fig. 52). Intake valves with less than 0.79 mm (0.0312 in.) margin and exhaust valves with less than 1.19 mm (0.0469 in.) margin should be replaced.

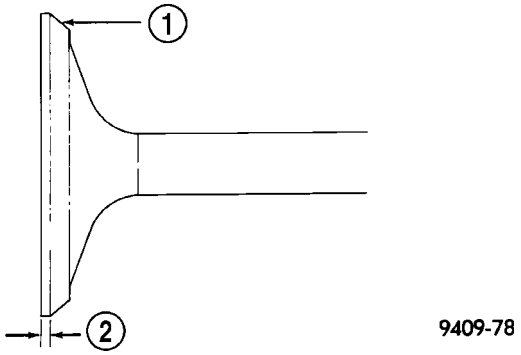

Fig. 52 Intake and Exhaust Valve Refacing

1 - VALVE FACE
2 - VALVE MARGIN

(3) Valve seats which are worn or burned can be reworked, provided that correct angle and seat width are maintained. Otherwise the cylinder head must be replaced.

(4) Reface valve seats using a suitable valve seat machine

(5) When refacing valve seats, it is important that the correct size valve guide pilot be used for reseating stones or cutter. A true and complete surface must be obtained.

(6) Measure the concentricity of valve seat and valve guide using a valve seat runout dial indicator. Total runout should not exceed. 0.051 mm (0.002 in.) (total indicator reading).

(7) Inspect the valve seat with Prussian blue to determine where the valve contacts the seat. To do this, coat valve seat **LIGHTLY**with Prussian blue then set valve in place. Rotate the valve with light pressure. If the blue is transferred to the center of valve face, contact is satisfactory. If the blue is transferred to top edge of the valve face, lower valve seat with a 15 degrees stone/cutter. If the blue is transferred to the bottom edge of valve face raise valve seat with a 65 degrees stone/cutter.

(8) When seat is properly positioned the width of intake and exhaust seats should be 0.75–1.25 mm (0.029–0.049 in.) (Fig. 53).

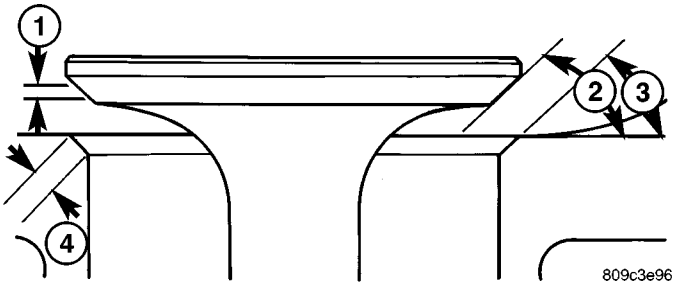

Fig. 53 Valve Face and Seat

1 - SEAT WIDTH
2 - FACE ANGLE
3 - SEAT ANGLE
4 - SEAT CONTACT AREA

(9) Check valve tip to cylinder head surface dimensions after machining the valve seats or faces. Grind valve tip until within specifications. Measure from valve tip to cylinder head surface when valve is installed in the head (measurement A) (Fig. 54). For valve tip specifications, (Refer to 9 - ENGINE - SPECIFICATIONS). The valve tip chamfer is needed to be reground to prevent seal damage when the valve is installed.

(10) Measure valve spring installed height (measurement B) (Fig. 54). Measure from the top of the valve spring seat/seal to the bottom of the valve spring retainer. For valve spring installed height specifications, (Refer to 9 - ENGINE - SPECIFICATIONS).

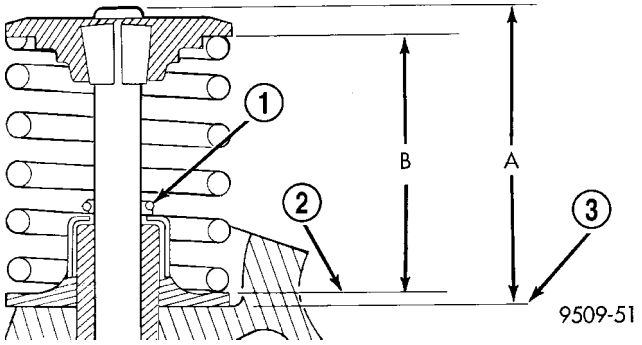

Fig. 54 Valve Tip Height/Valve Spring Installed Height

A - VALVE TIP HEIGHT
B - VALVE SPRING INSTALLED HEIGHT
1 - GARTER SPRING
2 - TOP OF VALVE SPRING SEAT/SEAL
3 - CYLINDER HEAD SURFACE

ENGINE BLOCK

DESCRIPTION

The cast iron engine block is a two-piece assembly, consisting of the engine block and bed plate (Fig. 55). The bed plate incorporates the main bearing caps and bolts to the engine block. This design offers a much stronger lower end and increased engine block rigidity. The rear oil seal retainer is integral with the block. The bed plate and block are serviced as an assembly.

6 - UPPER CRANKSHAFT MAIN BEARINGS
7 - ENGINE BLOCK

ENGINE BLOCK (Continued)

STANDARD PROCEDURE

CYLINDER BORE HONING

(1) Used carefully, the cylinder bore resizing hone, recommended tool C-823 or equivalent, equipped with 220 grit stones, is the best tool for this honing procedure. In addition to deglazing, it will reduce taper and out-of-round as well as removing light scuffing, scoring or scratches. Usually a few strokes will clean up a bore and maintain the required limits.

(2) Deglazing of the cylinder walls may be done using a cylinder surfacing hone, recommended tool C-3501 or equivalent, equipped with 280 grit stones, if the cylinder bore is straight and round. 20–60 strokes depending on the bore condition, will be sufficient to provide a satisfactory surface. Use a light honing oil. **Do not use engine or transmission oil, mineral spirits or kerosene.** Inspect cylinder walls after each 20 strokes.

(3) Honing should be done by moving the hone up and down fast enough to get a cross-hatch pattern. When hone marks **intersect** at 40-60 degrees, the cross hatch angle is most satisfactory for proper seating of rings (Fig. 56).

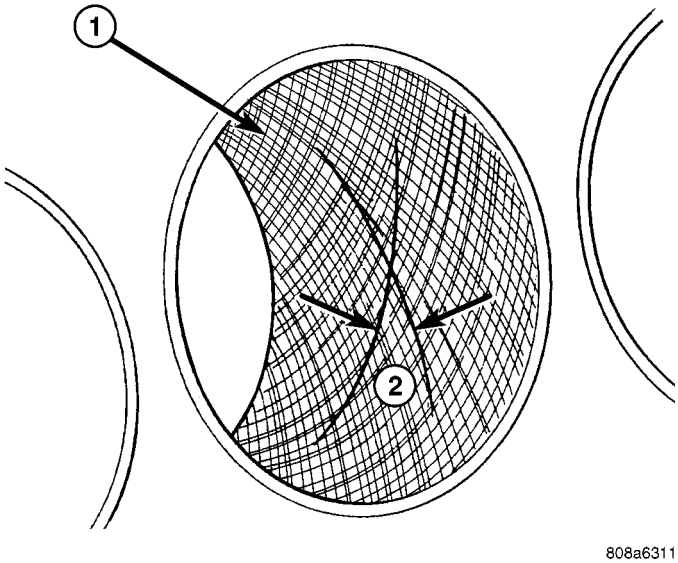

Fig. 56 Cylinder Bore Cross-Hatch Pattern

1 - CROSS-HATCH PATTERN
2 - 40°–60°

(4) A controlled hone motor speed between 200–300 RPM is necessary to obtain the proper cross-hatch angle. The number of up and down strokes per minute can be regulated to get the desired 40–60 degree angle. Faster up and down strokes increase the cross-hatch angle.

(5) After honing, it is necessary that the block be cleaned again to remove all traces of abrasive.

CAUTION: Ensure all abrasives are removed from engine parts after honing. It is recommended that a solution of soap and hot water be used with a brush and the parts then thoroughly dried. The bore can be considered clean when it can be wiped clean with a white cloth and cloth remains clean. Oil the bores after cleaning to prevent rusting.

CLEANING

Clean cylinder block thoroughly using a suitable cleaning solvent.

INSPECTION

ENGINE BLOCK

(1) Clean cylinder block thoroughly and check all core hole plugs for evidence of leaking.

(2) If new core plugs are to be installed, (Refer to 9 - ENGINE - STANDARD PROCEDURE - ENGINE CORE AND OIL GALLERY PLUGS).

(3) Examine block and cylinder bores for cracks or fractures.

(4) Check block deck surfaces for flatness. Deck surface must be within service limit of 0.1 mm (0.004 in.).

CYLINDER BORE

NOTE: The cylinder bores should be measured at normal room temperature, 21°C (70°F).

The cylinder walls should be checked for out-of-round and taper with Tool C119 or equivalent (Fig. 57) (Refer to 9 - ENGINE - SPECIFICATIONS). If the cylinder walls are badly scuffed or scored, the cylinder block should be replaced, and new pistons and rings fitted.

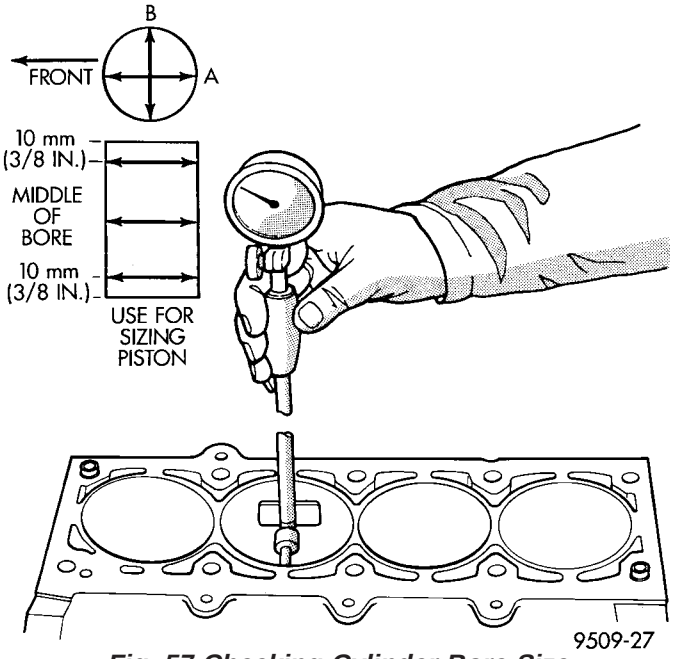

Fig. 57 Checking Cylinder Bore Size

ENGINE BLOCK (Continued)

Measure the cylinder bore at three levels in directions A and B (Fig. 57). Top measurement should be 10 mm (3/8 in.) down and bottom measurement should be 10 mm (3/8 in.) up from bottom of bore. (Refer to 9 - ENGINE - SPECIFICATIONS).

CRANKSHAFT MAIN BEARINGS

DESCRIPTION

NOTE: The upper and lower main bearing shells are NOT interchangeable.

The crankshaft is supported by five main bearings. All upper bearing shells in the crankcase have oil grooves/oil feed holes. All lower bearing shells installed in the (bed plate) main bearing cap are plain. Crankshaft end play is controlled by a flanged bearing on the number three upper main bearing journal (Fig. 58).

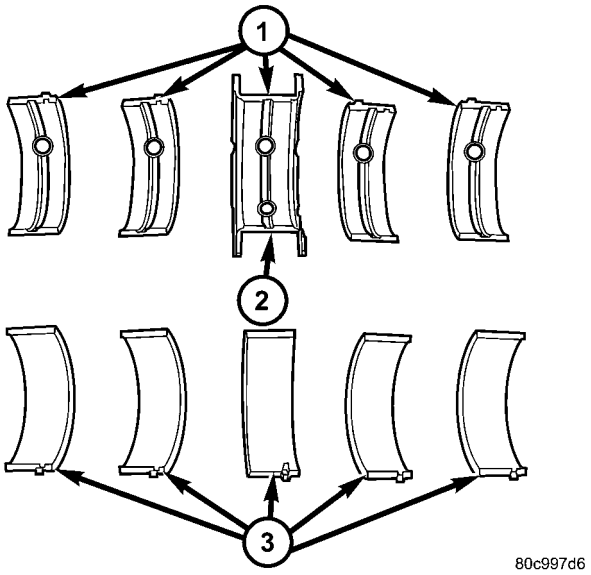

Fig. 58 Crankshaft Main Bearings

1 - UPPER CRANKSHAFT MAIN BEARINGS
2 - THRUST BEARING
3 - LOWER CRANKSHAFT MAIN BEARINGS

CRANKSHAFT

DESCRIPTION

The crankshaft is made of nodular cast iron and includes five main bearing journals and four connecting rod journals (Fig. 59). The number three journal is the location for the thrust bearing. The crankshaft utilizes a replaceable tonewheel for crankshaft position sensor function.

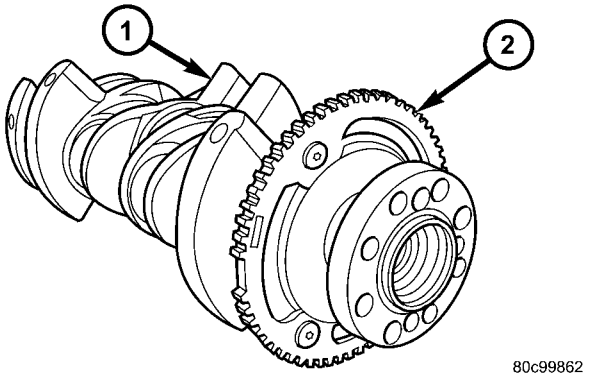

Fig. 59 Crankshaft

1 - CRANKSHAFT
2 - TONEWHEEL

STANDARD PROCEDURE - CRANKSHAFT END PLAY

(1) Mount a dial indicator to front of engine, locating probe on nose of the crankshaft (Fig. 60).

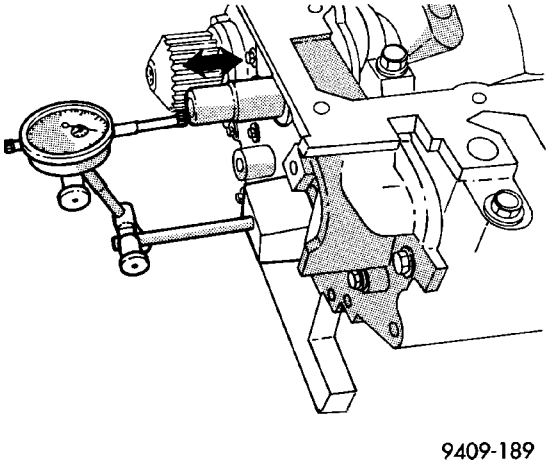

Fig. 60 Checking Crankshaft End Play - Typical

(2) Move crankshaft all the way to the rear of its travel.

(3) Zero the dial indicator.

(4) Move crankshaft all the way to the front of its travel and read the dial indicator. For crankshaft specifications (Refer to 9 - ENGINE - SPECIFICATIONS).

REMOVAL

(1) Remove engine assembly from vehicle (Refer to 9 - ENGINE - REMOVAL).

(2) Separate transaxle from engine.

(3) Remove clutch and pressure plate. Remove flywheel.

(4) Remove crankshaft rear oil seal (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT OIL SEAL - REAR - REMOVAL).

(5) Mount engine on a suitable repair stand.

CRANKSHAFT (Continued)

(6) Remove the right engine mount bracket (Refer to 9 - ENGINE/ENGINE MOUNTING/ENGINE MOUNT BRACKET - REMOVAL).

(7) Remove crankshaft vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).

(8) Remove the timing chain (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).

(9) Remove the intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).

(10) Remove the oil dipstick tube.

(11) Remove oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).

(12) Remove oil pump pick-up tube (Fig. 61).

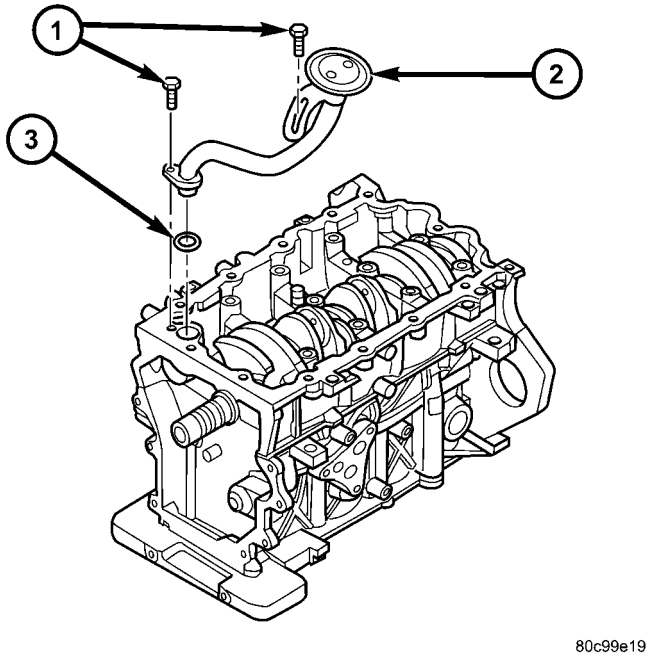

Fig. 61 Oil Pump Pick-up Tube

1 - FASTENERS
2 - OIL PUMP PICK-UP
3 - O-RING

(13) Remove crankshaft position sensor.

(14) Using a permanent ink or paint marker, identify cylinder number on each connecting rod cap.

CAUTION: DO NOT use a number stamp or a punch to mark connecting rods. Damage to connecting rod could occur.

(15) Remove all connecting rod bolts and caps. Care should be taken not to damage the fracture rod and cap surfaces.

NOTE: Do not reuse connecting rod bolts.

(16) Remove all main bearing cap and bed plate bolts from the engine block (Fig. 55).

(17) Using a mallet tap the bed plate loose from the engine block dowel pins.

CAUTION: Do not pry up on one side of the bed plate. Damage may occur to cylinder block and bed plate alignment.

(18) Bed plate should be removed evenly from the cylinder block dowel pins.

(19) Lift out crankshaft from cylinder block. Be sure not to damage the main bearings or journals when removing the crankshaft.

INSPECTION

The crankshaft journals should be checked for excessive wear, taper and scoring (Fig. 62). Limits of taper or out of round on any crankshaft journals should be held to 0.025 mm (0.001 in.). Journal grinding should not exceed 0.305 mm (0.012 in.) under the standard journal diameter. DO NOT grind thrust faces of No. 3 main bearing. DO NOT nick crank pin or bearing fillets. After grinding, remove rough edges from crankshaft oil holes and clean out all passages.

CAUTION: With the nodular cast iron crankshafts, it is important that the final paper or cloth polish be in the same direction as normal rotation in the engine.

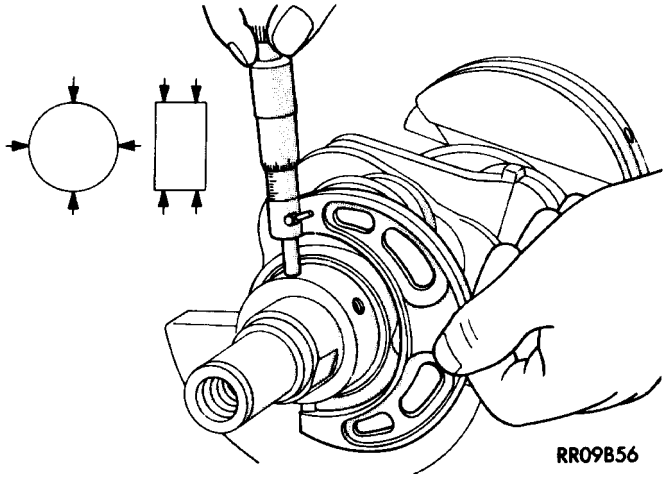

Fig. 62 Crankshaft Journal Measurements - Typical

The upper number three bearing half is flanged to carry the crankshaft thrust load and is **NOT** interchangeable with any other bearing halves in the engine (Fig. 63). All bearing cap bolts removed during service procedures are to be cleaned and oiled before installation.

CRANKSHAFT (Continued)

INSTALLATION

(1) Install the upper main bearing shells with the lubrication groove in the cylinder block. (Fig. 63).

(2) Make certain oil holes in block line up with oil hole in bearings and bearing tabs seat in the block tab slots.

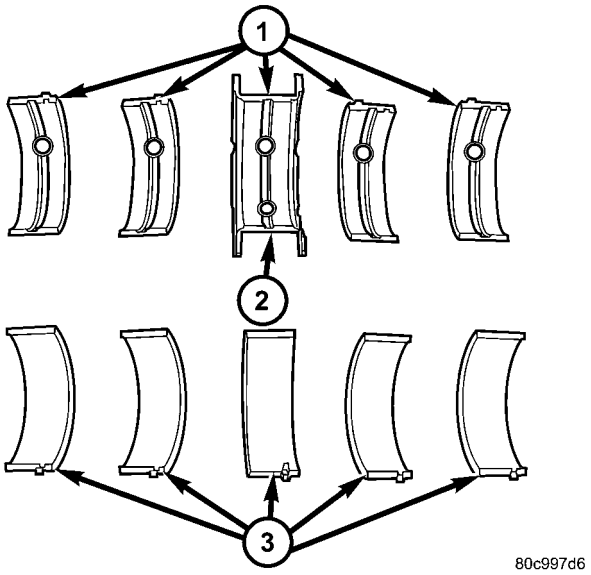

Fig. 63 Crankshaft Main Bearings

1 - UPPER CRANKSHAFT MAIN BEARINGS
2 - THRUST BEARING
3 - LOWER CRANKSHAFT MAIN BEARINGS

CAUTION: Do Not get oil on the bed plate mating surface. It will affect the ability of the sealer to seal the bed plate to cylinder block.

(3) Oil the bearings and journals and install crankshaft in cylinder block.

CAUTION: Use only the specified anaerobic sealer on the bed plate or damage may occur to the engine.

(4) Apply 1.5–2.0 mm (0.059–0.078 in.) bead of Mopar® Bed Plate Sealant to bed plate as shown in (Fig. 64).

(5) Install lower main bearings into main bearing cap/bed plate. Make certain the bearing tabs are seated into the bed plate slots. Install the main bearing/bed plate onto engine block.

(6) Before installing the main bearing cap/bed plate bolts, oil threads with clean engine oil, wipe off any excess oil.

(7) Install and finger tighten the main bearing cap bolts.

(8) Install and finger tighten the bed plate bolts.

(9) Snug the three bed plate bolts at the dowel locations (bolts 11, 17, and 20) to bring the bed plate down to the block (Fig. 65).

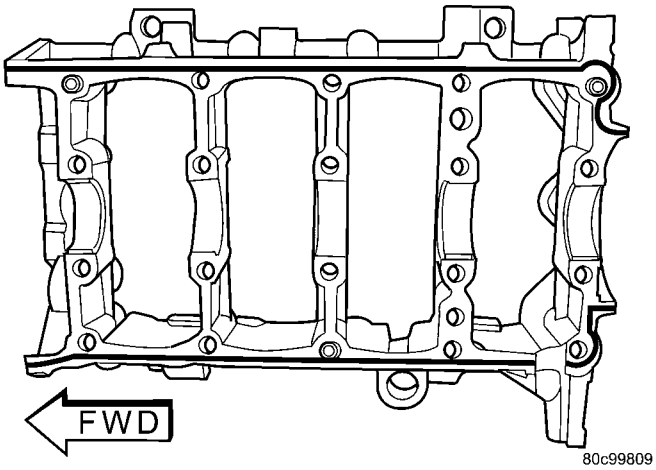

Fig. 64 Bed plate Sealing

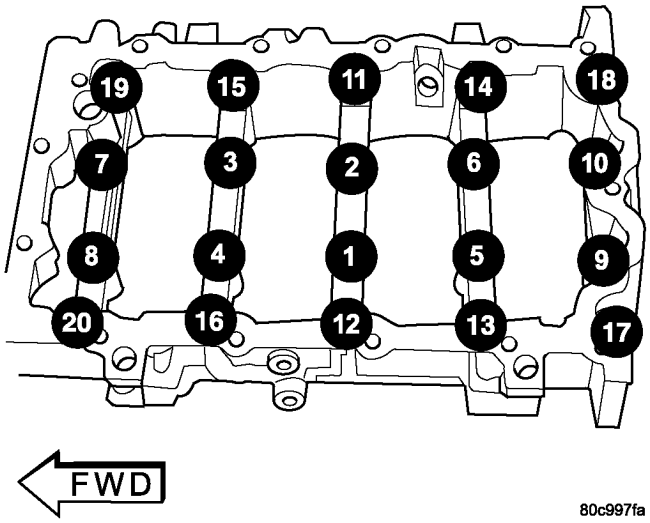

Fig. 65 Main Bearing Caps/Bed plate Torque Sequence

(10) Snug the remaining main bearing cap/bed plate bolts.

(11) Torque the main bearing cap /bed plate bolts to the sequence shown in (Fig. 65) to the following torque:

- Main Bearing Cap Bolts — 61 N·m (45 ft. lbs.)
- Bed plate Bolts — 30 N·m (22 ft. lbs.)

(12) After the main bearing bed plate is installed, check the crankshaft turning torque. The turning torque should not exceed 5.6 N·m (50 in. lbs.).

(13) Check crankshaft end play (Refer to 9 - ENGINE - SPECIFICATIONS).

(14) Install connecting rod bearings and caps. Install new connecting rod bolts and tighten to 26 N·m (19 ft. lbs.) plus 1/4 turn.

(15) Install oil pick-up tube (Fig. 61).

(16) Install the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

CRANKSHAFT (Continued)

(17) Install the oil dipstick tube.

(18) Install the intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).

(19) Install the timing chain (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).

(20) Install the right engine mount bracket (Refer to 9 - ENGINE/ENGINE MOUNTING/ENGINE MOUNT BRACKET - INSTALLATION).

(21) Remove engine from repair stand and position on Special Tools 6135 and 6710 Engine Dolly and Cradle. Install safety straps around the engine to cradle and tighten and lock them into position.

(22) Install the crankshaft rear oil seal. (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT OIL SEAL - REAR - INSTALLATION)

(23) Install flywheel. Install clutch and pressure plate.

(24) Install the transaxle to engine.

(25) Install the engine assembly (Refer to 9 - ENGINE - INSTALLATION).

CRANKSHAFT OIL SEAL - FRONT

REMOVAL

(1) Remove timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING CHAIN COVER - REMOVAL).

(2) Using a suitable tool, drive the front crankshaft oil seal out of the timing chain cover from the back side.

INSTALLATION

(1) Install front crankshaft oil seal into timing cover using Special Tool 6780.

(2) Install timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING CHAIN COVER - INSTALLATION).

CRANKSHAFT OIL SEAL - REAR

REMOVAL

(1) Remove transaxle (Refer to 21 - TRANSMISSION/TRANSAXLE/MANUAL - REMOVAL).

(2) Remove clutch and pressure plate.

(3) Remove flywheel.

(4) Insert a 3/16 flat bladed screwdriver between the dust lip and the metal case of the crankshaft seal. Angle the screwdriver (Fig. 66) through the dust lip against metal case of the seal. Pry out seal.

CAUTION: Do not permit the screwdriver blade to contact crankshaft seal surface. Contact of the screwdriver blade against crankshaft edge (chamfer) is permitted.

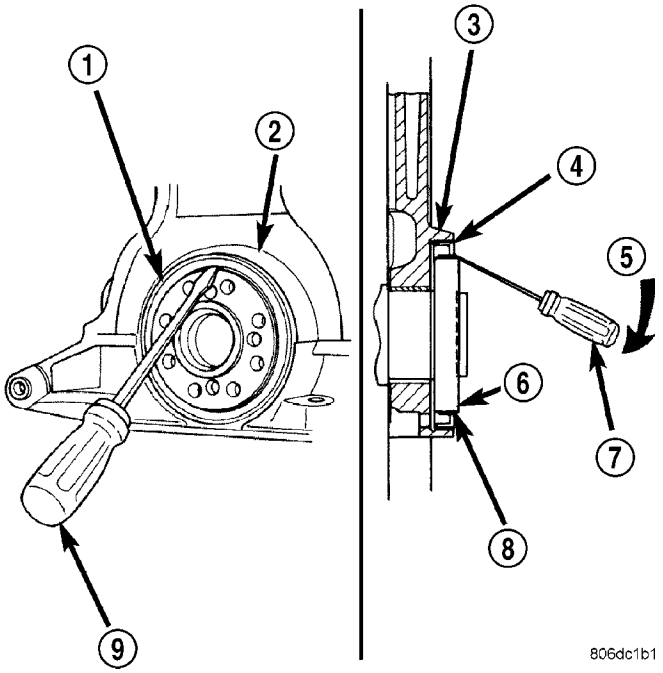

Fig. 66 Rear Crankshaft Oil Seal - Removal

1 - REAR CRANKSHAFT SEAL
2 - ENGINE BLOCK
3 - ENGINE BLOCK
4 - REAR CRANKSHAFT SEAL METAL CASE
5 - PRY IN THIS DIRECTION
6 - CRANKSHAFT
7 - SCREWDRIVER
8 - REAR CRANKSHAFT SEAL DUST LIP
9 - SCREWDRIVER

INSTALLATION

(1) Place Special Tool 6926-1 on crankshaft. This is a pilot tool with a magnetic base (Fig. 67).

(2) Position seal over pilot tool. Pilot tool should remain on crankshaft during installation of seal. Ensure that the lip of the seal is facing towards the crankcase during installation.

CAUTION: If the seal is driven into the block past flush, an oil leak may result.

CRANKSHAFT OIL SEAL - REAR (Continued)

(3) Drive the seal into the block using Special Tool 6926-2 and handle C-4171 until the tool bottoms out against the block (Fig. 67).

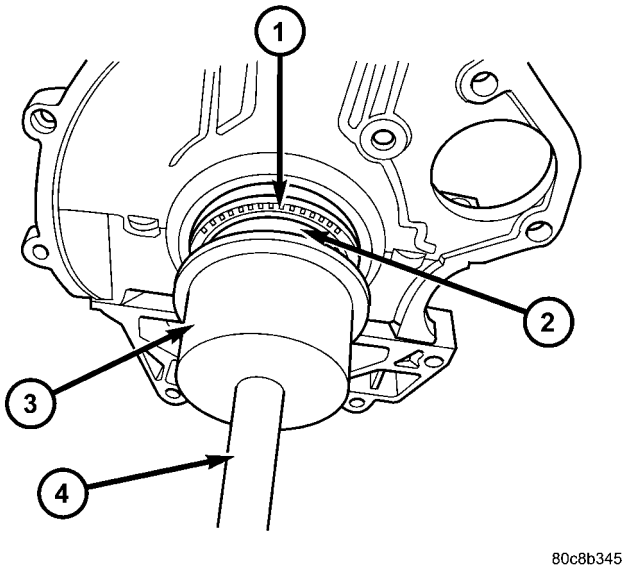

Fig. 67 Rear Crankshaft Seal Installation

1 - REAR CRANKSHAFT OIL SEAL
2 - SPECIAL TOOL 6926-1 PILOT
3 - SPECIAL TOOL 6926-2 INSTALLER
4 - SPECIAL TOOL C-4171 DRIVE HANDLE

(4) Install flywheel.
(5) Install clutch and pressure plate.
(6) Install transaxle (Refer to 21 - TRANSMISSION/TRANSAXLE/MANUAL - INSTALLATION).

PISTON & CONNECTING ROD

DESCRIPTION

NOTE: The engine DOES NOT have provisions for a free wheeling valve train. Non free wheeling valve train means, in the event of a broken timing chain, pistons will contact the valves.

The pistons are made of a cast aluminum alloy. The pistons have pressed-in pins attached to forged powdered metal connecting rods. The connecting rods are a cracked cap design and are not repairable. Hex head cap screws are used to provide alignment and durability in the assembly. The pistons and connecting rods are serviced as an assembly.

STANDARD PROCEDURE

CONNECTING ROD AND BEARING - FITTING

(1) Measure connecting rod bearing clearance using Plastigage (Fig. 68). For more information on use of Plastigage (Refer to 9 - ENGINE - STANDARD PROCEDURE). Refer to Engine Specifications for connecting rod specifications. (Refer to 9 - ENGINE - SPECIFICATIONS)

CAUTION: Do not rotate crankshaft or the Plastigage may be smeared.

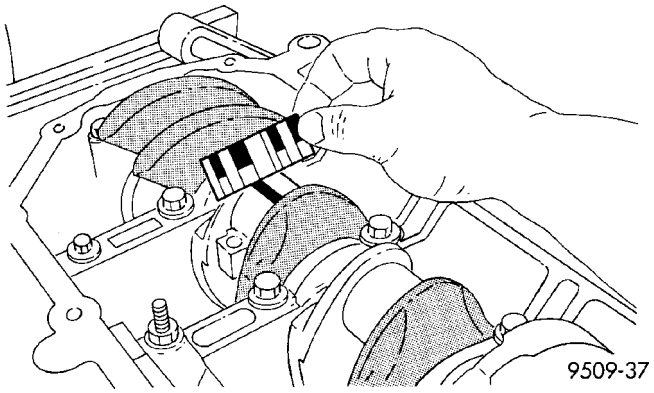

Fig. 68 Connecting Rod Bearing Clearance - Typical

NOTE: The rod bearing bolts should not be reused.

(2) Before installing **NEW** bolts, lubricate the threads with clean engine oil.
(3) Install each bolt finger tight than alternately torque each bolt to assemble the cap properly.
(4) Tighten the bolts to 26 N·m PLUS 1/4 turn (19 ft. lbs. PLUS 1/4 turn) **Do not use a torque wrench for last step.**
(5) Using a feeler gauge, check connecting rod side clearance (Fig. 69). Refer to Engine Specifications for connecting rod specifications. (Refer to 9 - ENGINE - SPECIFICATIONS)

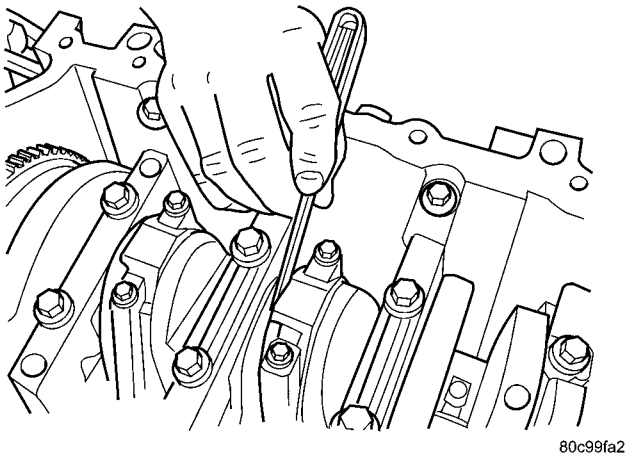

Fig. 69 Measuring Connecting Rod Side Clearance - Typical

PISTON & CONNECTING ROD (Continued)

CYLINDER BORE AND PISTON - FITTING

Piston and cylinder wall must be clean and dry. Piston diameter should be measured 90 degrees to piston pin about 14 mm (9/16 inch.) from the bottom of the skirt as shown in (Fig. 71). Cylinder bores should be measured halfway down the cylinder bore and transverse (measurement location B) to the engine crankshaft center line shown in (Fig. 70). (Refer to 9 - ENGINE - SPECIFICATIONS) Correct piston to bore clearance must be established in order to assure quiet and economical operation.

NOTE: Pistons and cylinder bores should be measured at normal room temperature, 70°F (21°C).

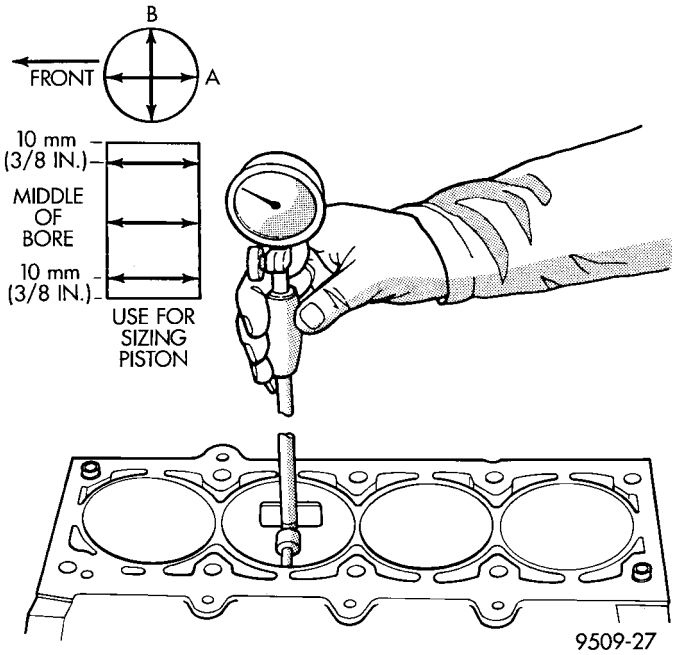

Fig. 70 Checking Cylinder Bore - Typical

REMOVAL

(1) Remove top ridge of cylinder bores with a reliable ridge reamer before removing pistons from cylinder block. **Be sure to keep tops of pistons covered during this operation**.

CAUTION: DO NOT use a number stamp or a punch to mark connecting rods. Damage to connecting rod could occur.

(2) Using a permanent ink marker or scribe tool mark the cylinder number on the side of the rod and cap (Fig. 72) for identification.

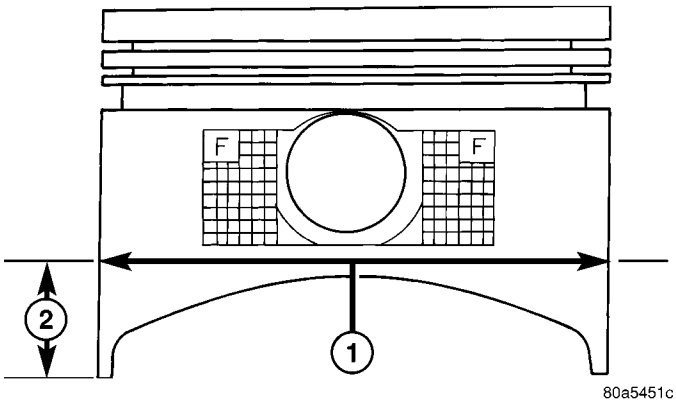

Fig. 71 Piston Measurement Location

1 - PISTON DIAMETER
2 - 14 mm (9/16 in.)

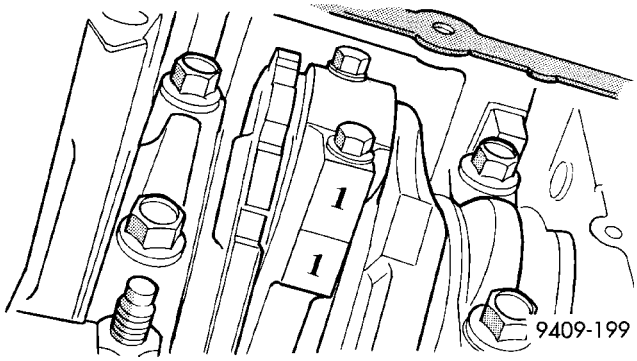

Fig. 72 Identify Connecting Rod to Cylinder - Typical

(3) Pistons and connecting rods must be removed from top of cylinder block. Rotate crankshaft so that each connecting rod is centered in cylinder bore.

(4) Remove connecting rod cap bolts **Do not use old bolts if reinstalling connecting rod.**

(5) To protect crankshaft journal and fractured rod surfaces, install Special Tool 8388, connecting rod guides onto connecting rod (Fig. 73). Carefully push each piston and rod assembly out of cylinder bore.

CAUTION: Care must be taken not to damage the fractured rod and cap joint surfaces, as engine damage many occur.

(6) Remove Special Tool 8388, connecting rod guides and re-install bearing cap on the mating rod.

PISTON & CONNECTING ROD (Continued)

NOTE: Piston and rods are serviced as an assembly.

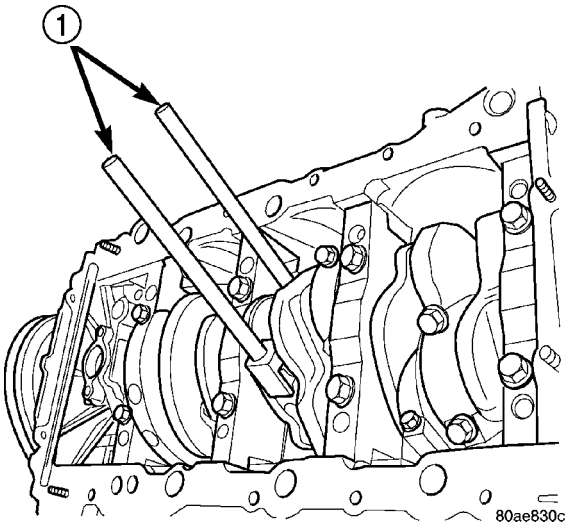

Fig. 73 Connecting Rod Guides - Typical

1 - SPECIAL TOOL 8388 CONNECTING ROD GUIDES

INSTALLATION

(1) Install piston rings on piston (Refer to 9 - ENGINE/ENGINE BLOCK/PISTON RINGS - INSTALLATION).

(2) Rotate crankshaft so that the connecting rod journal is on the center of the cylinder bore. Lubricate connecting rod journal with clean engine oil.

(3) Install connecting rod bearing half onto connecting rod.

(4) Install Special Tool 8388 connecting rod guides onto connecting rod (Fig. 74).

(5) Before installing pistons and connecting rod assemblies into the bore, ensure the compression ring gaps are staggered, and neither is in line with the oil ring rail gap. Ensure the oil ring expander ends are butted and the rail gaps are staggered.

(6) Immerse the piston head and rings in clean engine oil, slide the ring compressor over the piston. **Be sure position of rings does not change during this operation**.

(7) Compress piston rings.

(8) Install piston into cylinder making sure marks on piston face toward front of engine (Fig. 74).

(9) Tap the piston down in cylinder bore, using a hammer handle. At the same time, guide connecting rod into position on connecting rod journal.

(10) Remove Special Tool 8388, connecting rod guides.

(11) Install connecting rod lower bearing half and cap. Install **New** bolts and tighten to 26 N·m (19 ft. lbs.) plus 1/4 turn.

CAUTION: Do not use a torque wrench for the second step.

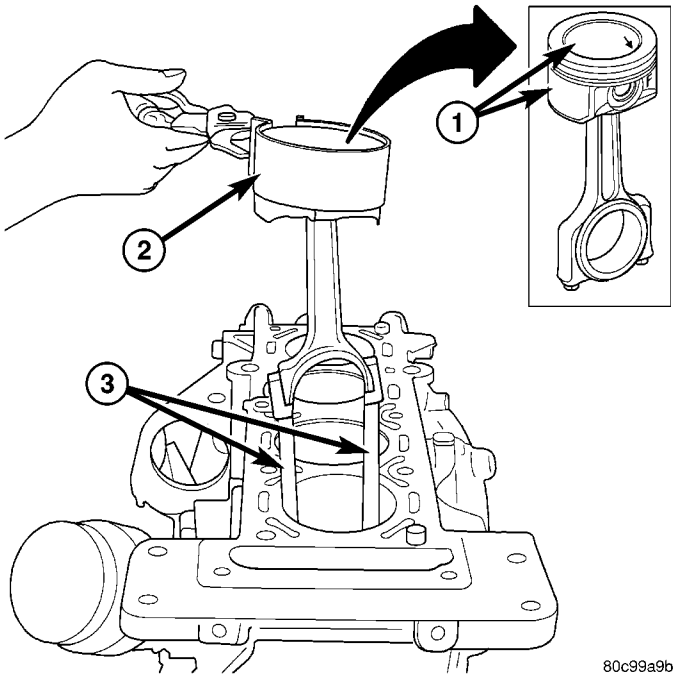

Fig. 74 Piston/Connecting Rod Installation

1 - MARKINGS ON PISTON FACE FRONT OF ENGINE
2 - RING COMPRESSOR
3 - SPECIAL TOOL 8388 CONNECTING ROD GUIDES

PISTON RINGS

STANDARD PROCEDURE - PISTON RING - FITTING

(1) Wipe cylinder bore clean. Insert ring and push down with piston to ensure it is square in bore. The ring gap measurement must be made with the ring positioned below normal ring travel in the cylinder bore. Check gap with feeler gauge (Fig. 75). For piston ring specifications (Refer to 9 - ENGINE - SPECIFICATIONS).

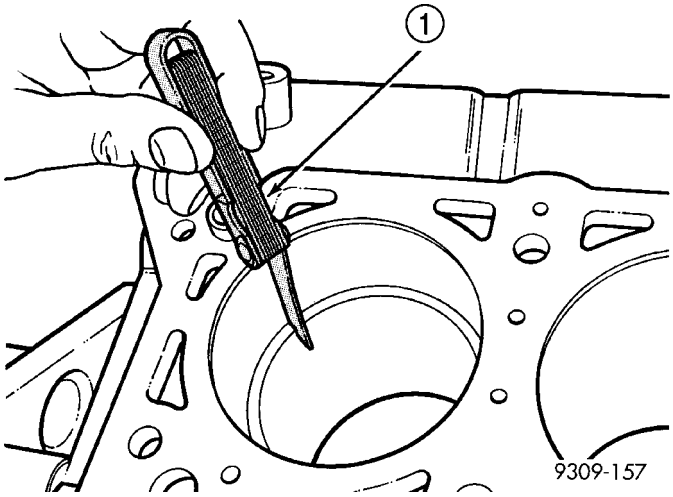

Fig. 75 Piston Ring Gap - Typical

1 - FEELER GAUGE

PISTON RINGS (Continued)

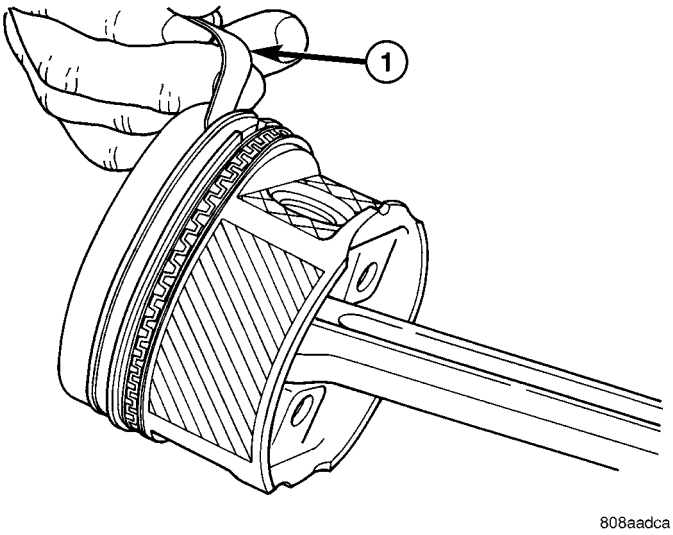

Fig. 76 Piston Ring Side Clearance - Typical

1 - FEELER GAUGE

(2) Check piston ring to groove side clearance (Fig. 76). For piston ring specifications (Refer to 9 - ENGINE - SPECIFICATIONS).

REMOVAL

(1) Using a suitable ring expander, remove upper and intermediate piston rings (Fig. 77).

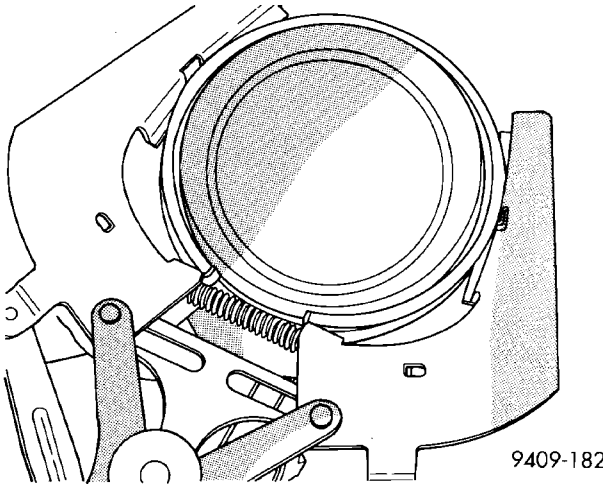

Fig. 77 Piston Rings—Removing and Installing - Typical

(2) Remove the upper oil ring side rail, lower oil ring side rail and then oil ring expander from piston.

(3) Clean ring grooves of any carbon deposits.

INSTALLATION

Install rings with manufacturers identification mark facing up, to the top of the piston (Fig. 78).

CAUTION: Install piston rings in the following order:

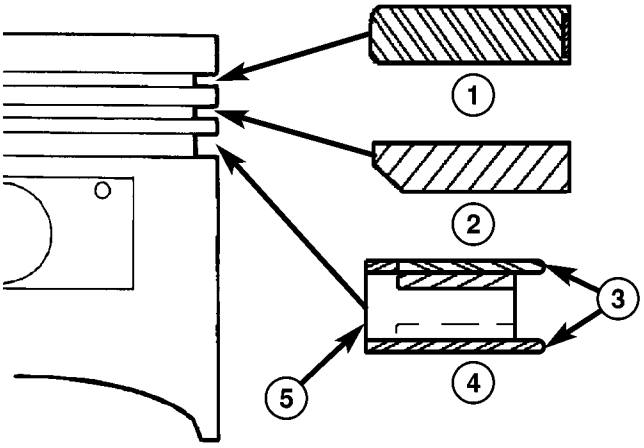

Fig. 78 Piston Ring Installation

1 - NO. 1 PISTON RING
2 - NO. 2 PISTON RING
3 - SIDE RAIL
4 - OIL RING
5 - OIL RING EXPANDER

- Oil ring expander.
- Upper oil ring side rail.
- Lower oil ring side rail.
- No. 2 Intermediate piston ring.
- No. 1 Upper piston ring.

(1) Install oil ring expander (Fig. 78).

(2) Install upper side rail first and then the lower side rail. Install the side rails by placing one end between the piston ring groove and the oil ring expander. Hold end firmly and press down the portion to be installed until side rail is in position. **Do not use a piston ring expander (Fig. 79).**

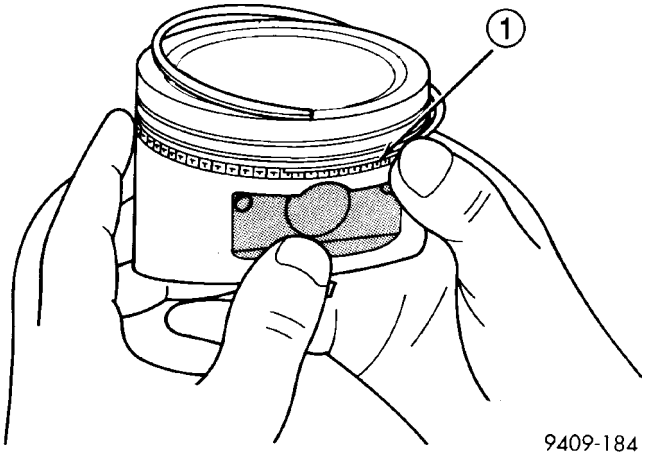

Fig. 79 Installing Side Rail

1 - SIDE RAIL END

PISTON RINGS (Continued)

(3) Install No. 2 piston ring and then No. 1 piston ring (Fig. 78).

(4) Position piston ring end gaps as shown in (Fig. 80).

(5) Position oil ring expander gap at least 45° from the side rail gaps but **not** on the piston pin center or on the thrust direction. Staggering ring gap is important for oil control.

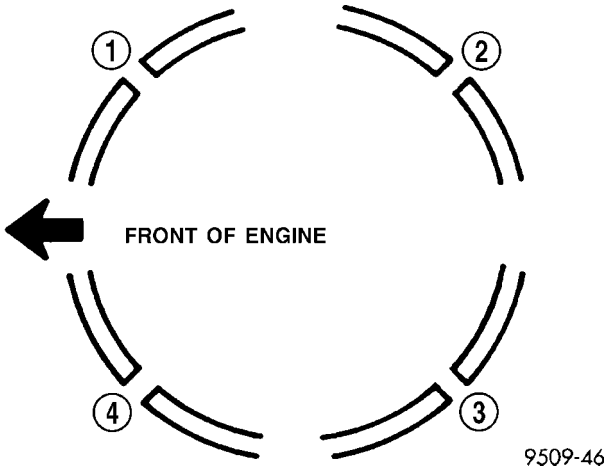

Fig. 80 Piston Ring End Gap Position

1 - GAP OF LOWER SIDE RAIL
2 - NO. 1 RING GAP
3 - GAP OF UPPER SIDE RAIL
4 - NO. 2 RING GAP AND SPACER EXPANDER GAP

VIBRATION DAMPER

REMOVAL

(1) Disconnect negative battery cable.

(2) Raise vehicle on hoist.

(3) Remove the right wheel and accessory drive belt splash shield.

(4) Remove accesory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELT - REMOVAL).

(5) Remove crankshaft vibration damper bolt. Remove damper using Special Tool 1026 puller and 6827A insert (Fig. 81).

INSTALLATION

(1) Install crankshaft vibration damper using Special Tool 8385 installer (Fig. 82).

(2) Install vibration damper bolt. Tighten bolt to 115 N·m (85 ft. lbs.).

(3) Install the accesory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELT - INSTALLATION).

(4) Install the accessory drive belt splash shield and right wheel.

(5) Lower the vehicle.

(6) Connect negative battery cable.

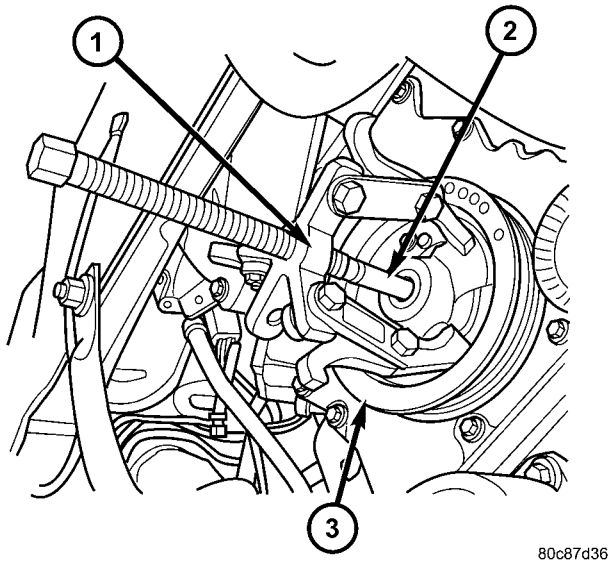

Fig. 81 Vibration Damper Removal

ENGINE MOUNTING

DESCRIPTION

The engine mounting system consists of a four-point system utilizing two load-carrying mounts and two torque struts. The load-carrying mounts are located on each frame rail. The right mount is a hydro-elastic mount and left mount is a conventional

ENGINE MOUNTING (Continued)

elastomeric isolator. The two torque controlling struts are attached at the front of the engine, straddling the right side load-carrying mount. The upper torque strut connects to the suspension strut tower and the lower torque strut connects to the suspension cross-member.

TORQUE STRUTS

REMOVAL

UPPER TORQUE STRUT

(1) Remove bolts attaching strut to shock tower bracket and engine mount bracket (Fig. 83).

(2) Remove the upper torque strut.

LOWER TORQUE STRUT

(1) Raise vehicle on hoist.

(2) Remove accessory drive belt splash shield.

(3) Remove pencil strut (Fig. 84).

(4) Remove bolts attaching lower strut to cross-member and strut bracket (Fig. 83) and (Fig. 84).

(5) Remove lower torque strut.

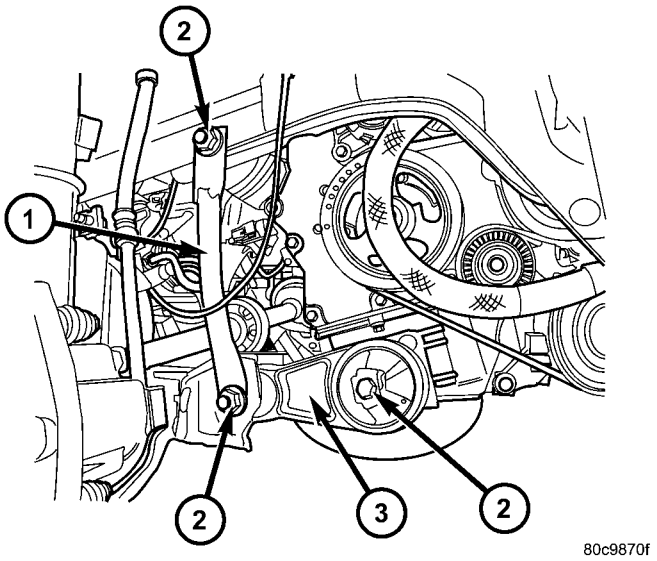

Fig. 84 Lower Torque Strut

1 - PENCIL STRUT
2 - TORQUE STRUT FASTENERS
3 - LOWER TORQUE STRUT

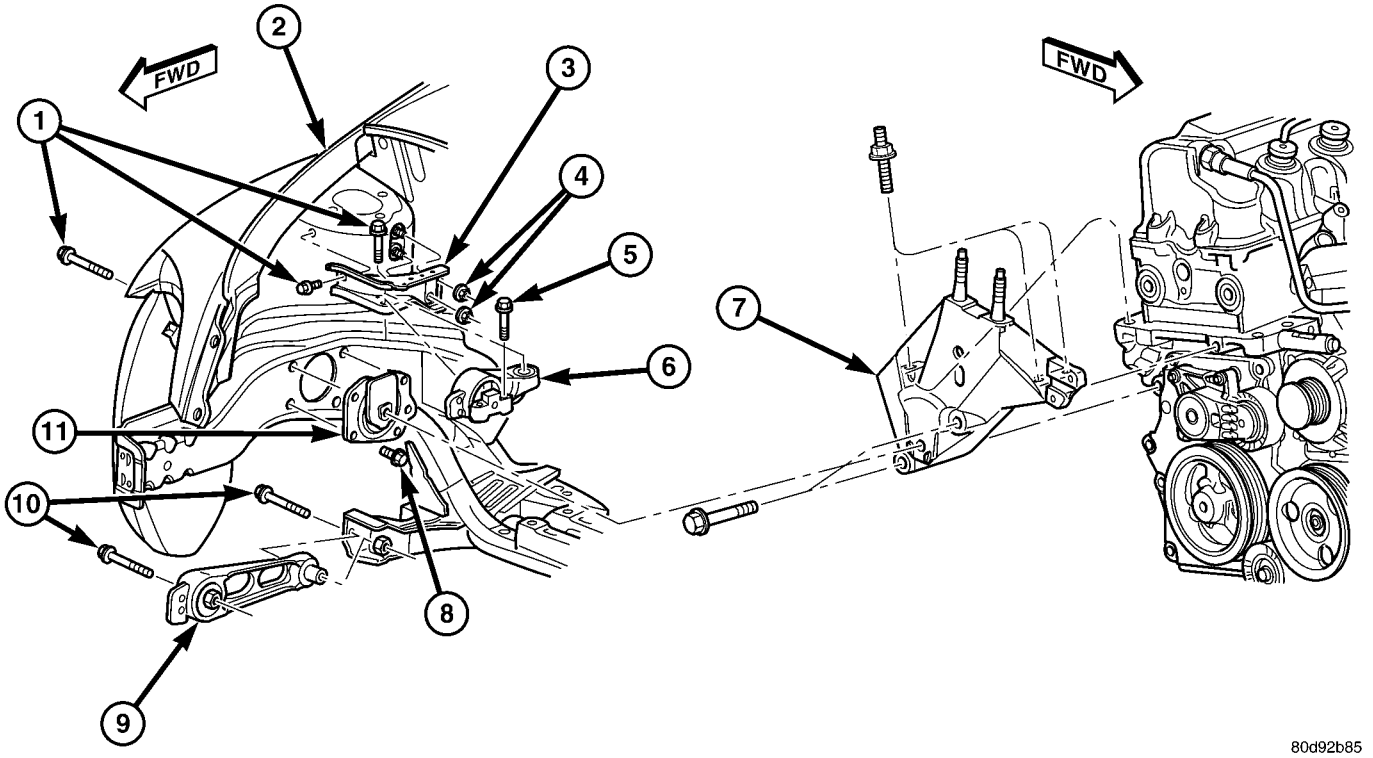

Fig. 83 Engine Mounting - Right Side

1 - BOLTS
2 - RIGHT FENDER

5 - BOLT
6 - UPPER TORQUE STRUT
7 - ENGINE MOUNT BRACKET
8 - BOLT
9 - LOWER TORQUE STRUT
10 - BOLT
11 - RIGHT ENGINE MOUNT

TORQUE STRUTS (Continued)

INSTALLATION

UPPER TORQUE STRUT

(1) Position the upper torque strut into mounting locations (Fig. 83).

(2) Install the mounting bolts.

(3) Perform torque strut adjustment procedure (Refer to 9 - ENGINE/ENGINE MOUNTING/ TORQUE STRUT - ADJUSTMENTS).

LOWER TORQUE STRUT

(1) Position lower torque strut into mounting locations (Fig. 83).

(2) Install mounting bolts.

(3) Install pencil strut (Fig. 84).

(4) Perform torque strut adjustment procedure (Refer to 9 - ENGINE/ENGINE MOUNTING/ TORQUE STRUT - ADJUSTMENTS).

(5) Install accessory drive belt splash shield.

(6) Lower vehicle.

ADJUSTMENTS

ADJUSTMENT

The upper and lower torque struts need to be adjusted together to assure proper engine positioning and engine mount loading. Whenever a torque strut bolt(s) is loosened, this procedure must be performed.

(1) Loosen the upper and lower torque strut attaching bolt at the suspension crossmember and shock tower bracket.

(2) The engine position may now be adjusted by positioning a suitable floor jack on the forward edge of the transmission bell housing (Fig. 85).

NOTE: The floor jack must be positioned as shown in (Fig. 85) to prevent minimal upward lifting of the engine.

(3) With the engine supported, remove the upper and lower torque strut attachment bolt(s) at shock tower bracket and suspension crossmember (Fig. 83). Verify that the torque struts are free to move within the shock tower bracket and crossmember. Reinstall the torque strut bolt(s), but do not tighten.

(4) Carefully apply upward force, allowing the upper engine to rotate rearward until the distance between the center of the rearmost attaching stud on the engine mount bracket (point “A”) and the center of the hole for the washer hose clip on the shock tower bracket (point “B”) is 119 mm (4.70 in.) (Fig. 86).

(5) With the engine held at the proper position, tighten both the upper and lower torque strut bolts to 118 N·m (87 ft. lbs.) (Fig. 83).

(6) Remove the floor jack.

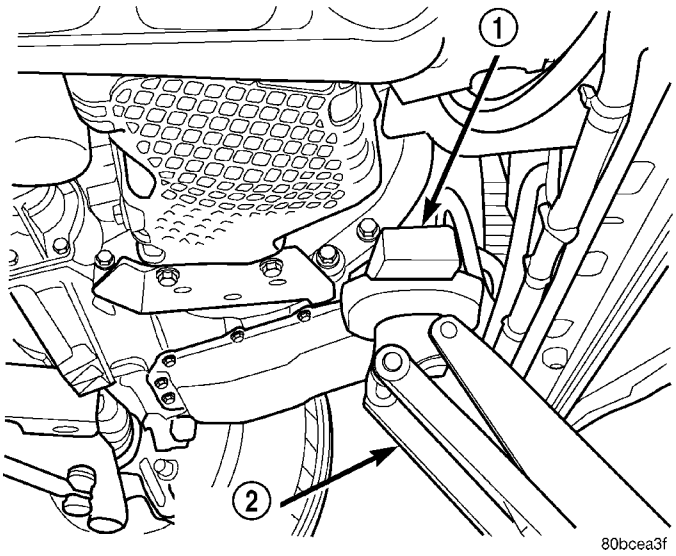

Fig. 85 Floor Jack Positioning

1 - WOOD BLOCK
2 - FLOOR JACK

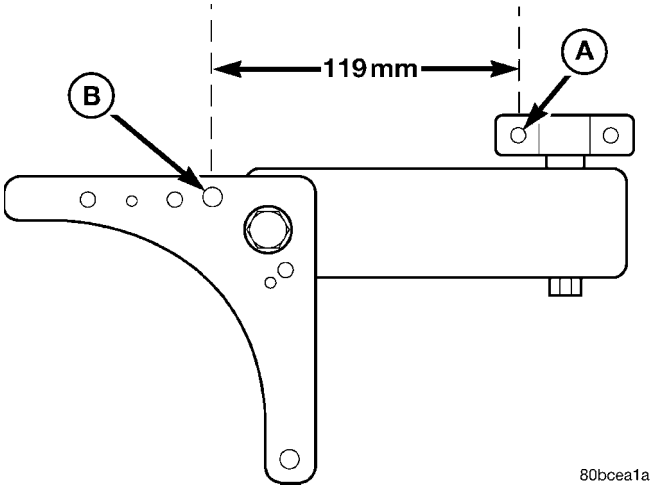

Fig. 86 Engine Position Measurement

RIGHT ENGINE MOUNT BRACKET

REMOVAL

(1) Remove upper torque strut (Refer to 9 - ENGINE/ENGINE MOUNTING/TORQUE STRUT - REMOVAL).

(2) Remove fasteners securing power steering reservoir bracket to right engine mount bracket.

(3) Remove fastener securing power steering return line to right engine mount bracket.

(4) Raise vehicle on hoist.

(5) Remove right front wheel.

(6) Remove accessory drive belt splash shield.

RIGHT ENGINE MOUNT BRACKET (Continued)

(7) Remove lower torque strut (Refer to 9 - ENGINE/ENGINE MOUNTING/TORQUE STRUT - REMOVAL).

(8) Remove lower right engine mount bracket bolt.

(9) Lower vehicle.

(10) Support engine with floor jack and wooden block on oil pan.

(11) Remove access cover in right frame rail for right engine mount through bolt.

(12) Remove right engine mount through bolt.

(13) Raise engine with floor jack.

(14) Remove remaining bolts and studs for right engine mount bracket. Remove bracket (Fig. 87).

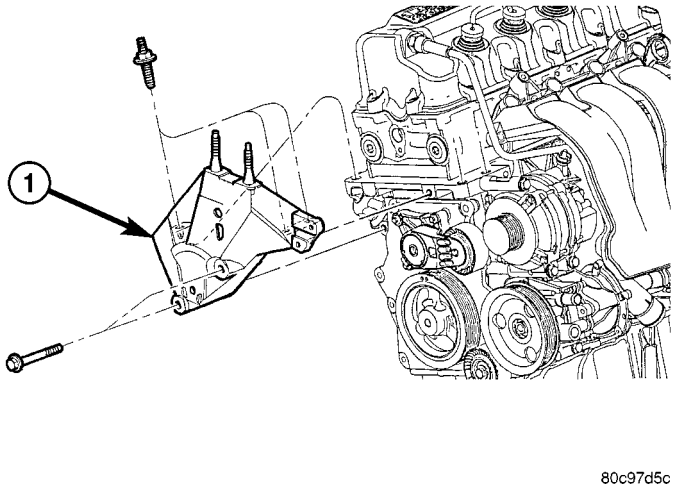

Fig. 87 Right Engine Mount Bracket

1 - RIGHT ENGINE MOUNT BRACKET

INSTALLATION

(1) Install right engine mount bracket. Hand start all fasteners. Torque M10 bolts to 68 N·m (50 ft. lbs.). Torque M12 studs to 118 N·m (87 ft. lbs.) (Fig. 87).

(2) Lower engine enough to install right engine mount through bolt.

(3) Install right engine mount through bolt. Torque bolt to 118 N·m (87 ft. lbs.).

(4) Install access cover in right side frame rail.

(5) Remove floor jack and wooden.

(6) Raise vehicle on hoist.

(7) Install lower torque strut (Refer to 9 - ENGINE/ENGINE MOUNTING/TORQUE STRUT - INSTALLATION).

(8) Install accessory drive belt splash shield.

(9) Install right front wheel.

(10) Lower vehicle.

(11) Install fastener securing power steering return line to right engine mount bracket.

(12) Install fasteners securing power steering reservoir bracket to right engine mount bracket.

(13) Install upper torque strut (Refer to 9 - ENGINE/ENGINE MOUNTING/TORQUE STRUT - INSTALLATION).

RIGHT MOUNT

REMOVAL

(1) Remove right engine mount bracket (Refer to 9 - ENGINE/ENGINE MOUNTING/ENGINE MOUNT BRACKET - REMOVAL).

NOTE: The right engine mount attaching holes are slightly oversize to compensate for manufacturing tolerances. The mount has been set at the manufacturing plant for proper powertrain alignment. Therefore, it is necessary to mark the position of the mount before the attaching bolts are loosened.

(2) Using a permanent ink marker or equivalent, mark the position of engine mount to the body frame rail.

(3) Remove bolts attaching mount to body (Fig. 88).

(4) Remove mount between engine and body frame rail.

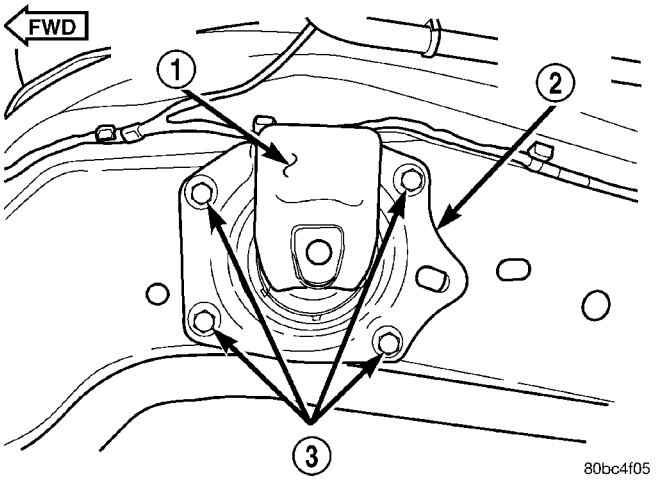

Fig. 88 Engine Mount—Right

1 - SNUBBER PAD
2 - RIGHT ENGINE MOUNT
3 - BOLTS

INSTALLATION

(1) Position the mount into the original position on body frame rail (Fig. 88).

NOTE: Engine mount must be installed in the original position on body frame rail. If mount was not marked or frame rail was replaced, perform the following procedure.

RIGHT MOUNT (Continued)

(2) Perform the following procedure if mount position was not previously marked or the frame rail was replaced:

- Insert the new mount loosely in frame rail.
- Align the four holes in the mount with the mating holes in the rail such that the holes are concentric (frame rail holes centered in the mount holes).
- Using a permanent ink marker or equivalent, mark the position of engine mount to the body frame rail while maintaining mounting hole concentricity.

(3) Ensure the mount maintains originally marked position and install mount bolts. Tighten bolts to 28 N·m (250 in. lbs.) (Fig. 88).

(4) Install right engine mount bracket (Refer to 9 - ENGINE/ENGINE MOUNTING/ENGINE MOUNT BRACKET - INSTALLATION).

(5) Remove the support from under engine.

LEFT MOUNT

REMOVAL

(1) Remove air cleaner assembly.

(2) Disconnect negative cable from battery.

(3) Remove bolts attaching the power distribution center (PDC) bracket to left mount and battery tray (Fig. 89).

(4) Support transaxle with a suitable jack.

(5) Remove mount to transaxle bolts (Fig. 90).

(6) Remove left mount bracket to body frame rail fasteners (Fig. 90).

(7) Remove mount.

INSTALLATION

(1) Install engine mount bracket to body frame rail and tighten fasteners to 28 N·m (250 in. lbs.) (Fig. 90).

(2) Position engine/transaxle for installation of mount to transaxle bolts. Install and tighten bolts to 68 N·m (50 ft. lbs.) (Fig. 90).

(3) Remove jack from under transaxle.

(4) Install bolts attaching the power distribution center (PDC) bracket to left mount and battery tray (Fig. 89).

(5) Connect negative cable to battery.

(6) Install air cleaner assembly.

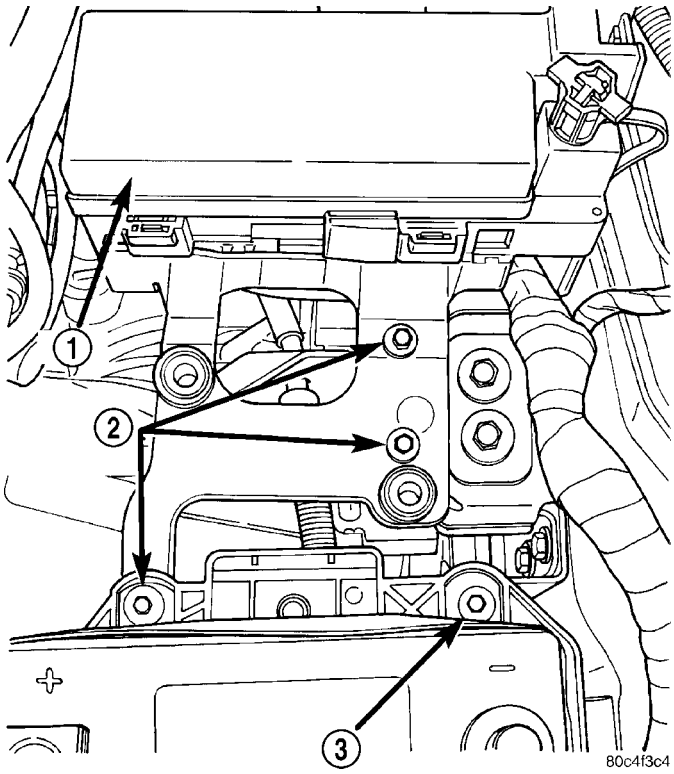

Fig. 89 PDC Bracket Attaching Bolts

LUBRICATION

DESCRIPTION

The lubrication system is a full-flow filtration, pressure feed type. The oil pump is incorporated into the timing chain cover and driven by the crankshaft. Oil pressure is controlled by a relief valve mounted inside the oil pump housing (Fig. 91).

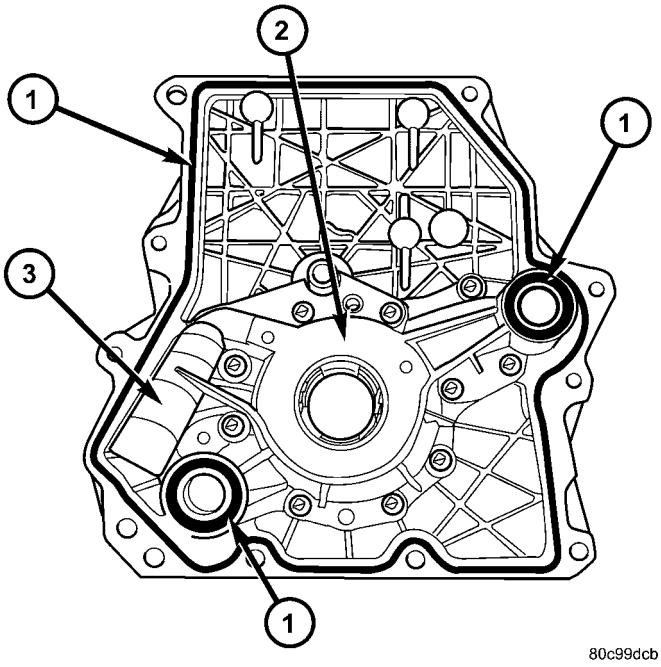

Fig. 91 Oil Pump

1 - TIMING CHAIN COVER SEALS
2 - OIL PUMP
3 - PRESSURE RELIEF VALVE

OPERATION

Engine oil is drawn up through the pickup tube and is pressurized by the oil pump and routed through the oil filter to the main oil gallery running the length of the cylinder block. A diagonal hole in each bulkhead feeds oil to each main bearing. Drilled passages within the crankshaft route oil from the main bearing journals to the connecting rod journals. The main oil gallery also feeds oil pressure to the timing chain tensioner. A vertical hole at the number three main bearing area routes pressurized oil through a restrictor up into the cylinder head. The restrictor that is integral to the cylinder head gasket, provides increased oil flow to the main gallery. Upper engine lubrication is provided by one main feed to the number three camshaft bearing cap. Oil is then routed through the rocker shafts to the remaining camshaft bearing caps and rocker arms/hydraulic lash adjusters. Oil returning to the oil pan from the pressurized components supplies lubrication to the valve stems. The cylinder bores and wrist pins are splash lubricated from directed slots on the connecting rod thrust collar (Fig. 92).

LUBRICATION (Continued)

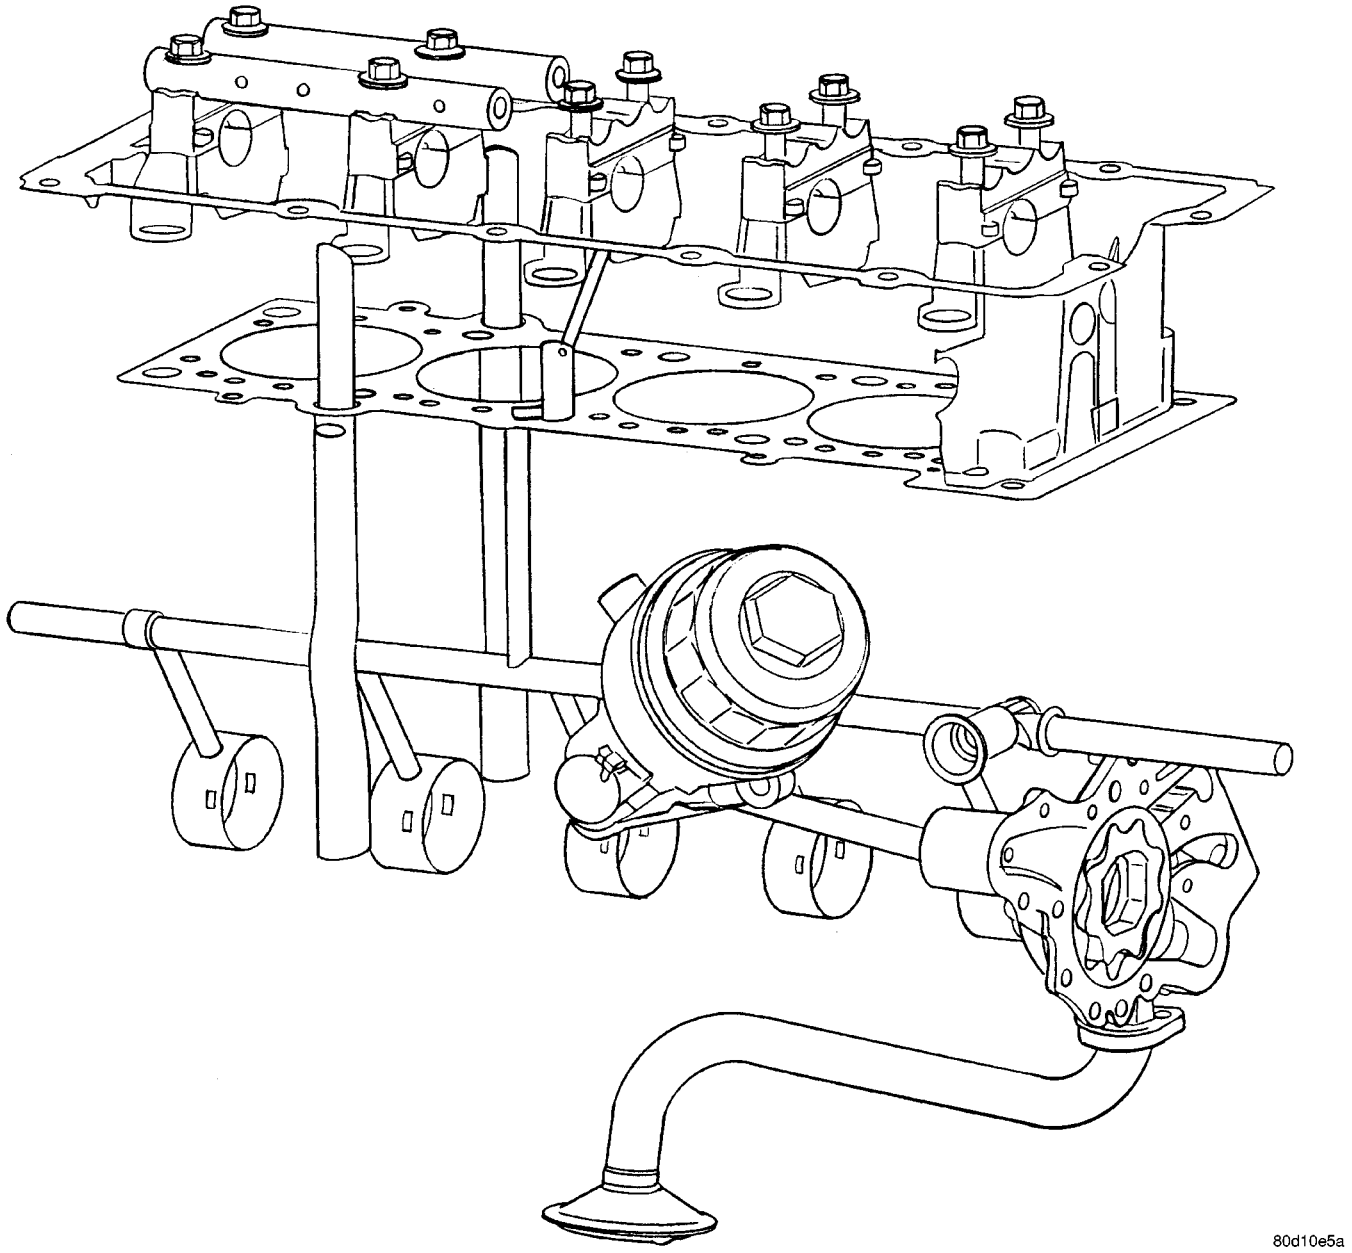

Fig. 92 Oil Lubrication System

LUBRICATION (Continued)

DIAGNOSIS AND TESTING

CHECKING ENGINE OIL PRESSURE

Check oil pressure using a gauge at oil pressure switch location.

(1) Remove pressure sending unit. The pressure sending unit is located on the oil filter cartridge housing (Fig. 93).

(2) Install oil pressure test gauge, Special Tool C-3292 with Adapter 8406. For Special Tool identification, (Refer to 9 - ENGINE - SPECIAL TOOLS).

CAUTION: If oil pressure is 0 at idle, Do Not Run engine at 3000 RPM.

(3) Warm engine to normal operating temperature.

(4) Monitor gauge readings at idle and 3000 rpm. For specifications (Refer to 9 - ENGINE - SPECIFICATIONS).

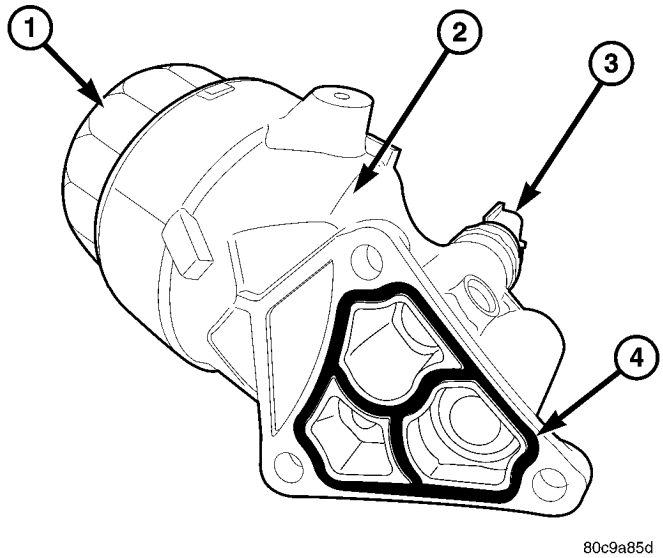

Fig. 93 Oil Filter Cartridge Housing

1 - OIL FILTER CAP
2 - OIL FILTER CARTRIDGE HOUSING
3 - OIL PRESSURE SWITCH
4 - SEAL

OIL FILTER CARTRIDGE

REMOVAL

(1) Turn oil filter cap counterclockwise 2 ½ turns and wait one minute (Fig. 94).

NOTE: A drain back valve incorporated into the oil filter cartridge housing allows oil to drain back into the crankcase as the oil filter cartridge is removed (Fig. 94).

(2) Continue turning the oil filter cap counterclockwise. Remove cap slowly to avoid spill of oil.

(3) Remove oil filter cartridge from the cap (Fig. 94).

NOTE: If the center tube (Fig. 94) separates from the cap and stays inside the filter cartridge, you must remove the center tube from the filter element and snap it back onto the cap with the spring.

(4) Remove and discard o-ring from cap.

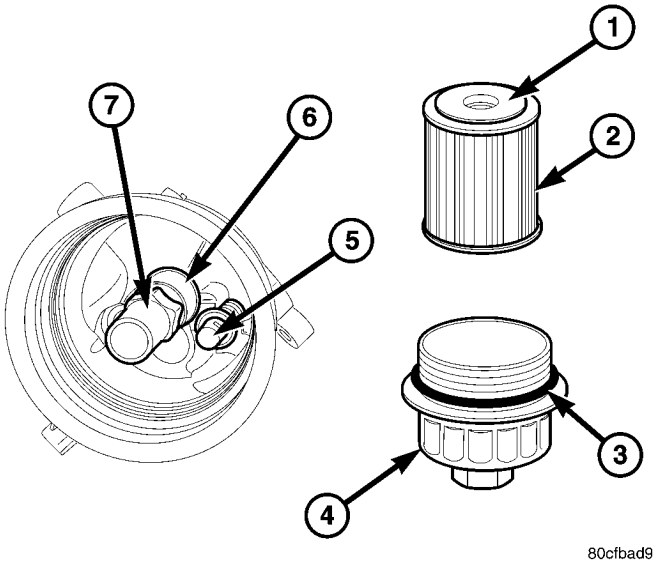

Fig. 94 Oil Filter Cartridge

1 - GROMMET
2 - OIL FILTER CARTRIDGE
3 - O-RING
4 - CAP
5 - DRAIN BACK VALVE
6 - CENTER POST
7 - STANDPIPE

INSTALLATION

(1) Install new o-ring on cap (Fig. 94).

(2) Install new oil filter cartridge over center tube of cap (Fig. 94).

NOTE: Before installation, make sure no grommet is left on the center post of the oil filter housing from the previous filter (Fig. 94).

(3) Align the grommet hole of the oil filter cartridge with the center post of the filter housing.

(4) Press in and turn oil filter cap clockwise. Tighten cap to 25 N·m (18 ft. lbs). Cap flange should sit tightly on the housing flange.

(5) Fill oil to proper level.

(6) Start engine. Check for leaks.

OIL FILTER CARTRIDGE HOUSING

DESCRIPTION

The oil filter cartridge housing is attached to the right side of the engine utilizing a seal between the housing and engine block. The housing contains an oil filter cartridge that cleans the engine oil coming from the oil pump prior to it entering the main engine oil gallery. The oil pressure switch is used to provide the driver with engine oil pressure information (Fig. 95).

Other components of the oil filter cartridge housing (Fig. 95):

- By-Pass Valve: If the oil filter cartridge becomes plugged, this valve opens allowing unfiltered oil to enter the main engine oil gallery.
- Inlet Check Valve: This valve opens when engine oil pressure pushes against it. After the engine is shut off, the valve closes allowing oil to remain in the oil filter cartridge housing.
- Drainback Valve: With the oil filter cartridge installed, this valve is closed. As the oil filter cap and oil filter cartridge are removed, the valve opens allowing the reserve of oil in the cartridge housing to drain back into the engine oil pan.

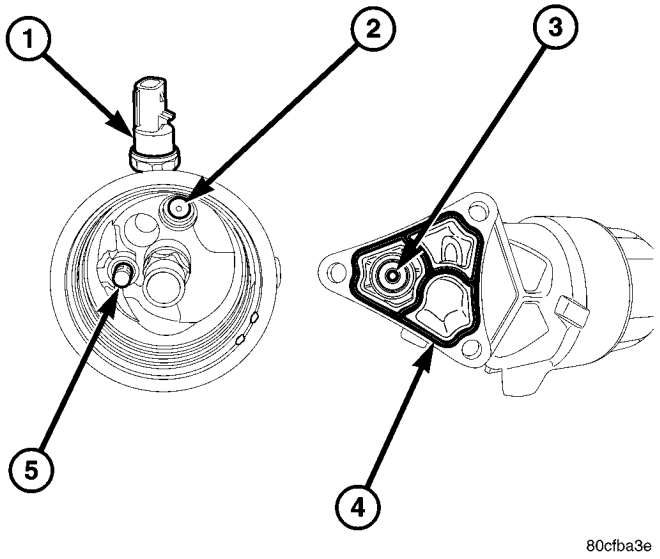

Fig. 95 Oil Filter Cartridge Housing

1 - OIL PRESSURE SWITCH
2 - BY-PASS VALVE
3 - INLET CHECK VALVE
4 - SEAL
5 - DRAINBACK VALVE

REMOVAL

(1) Raise vehicle on hoist.

(2) Disconnect oil pressure switch electrical connector.

(3) Remove oil filter cartridge (Refer to 9 - ENGINE/LUBRICATION/OIL FILTER CARTRIDGE - REMOVAL).

(4) Remove fasteners securing oil filter cartridge housing to engine block.

(5) Remove oil filter cartridge housing.

INSTALLATION

(1) Inspect and clean oil filter cartridge housing sealing surfaces.

(2) Replace oil filter cartridge housing seal (Fig. 96)

(3) Install oil filter cartridge housing mounting fasteners. Torque fasteners to 28 N·m (250 in. lbs.).

(4) Install oil filter cartridge (Refer to 9 - ENGINE/LUBRICATION/OIL FILTER CARTRIDGE - INSTALLATION).

(5) Connect oil pressure switch electrical connector.

(6) Lower vehicle.

(7) Start engine. Check for leaks.

(8) Turn engine off. Check oil level. Fill oil to proper level.

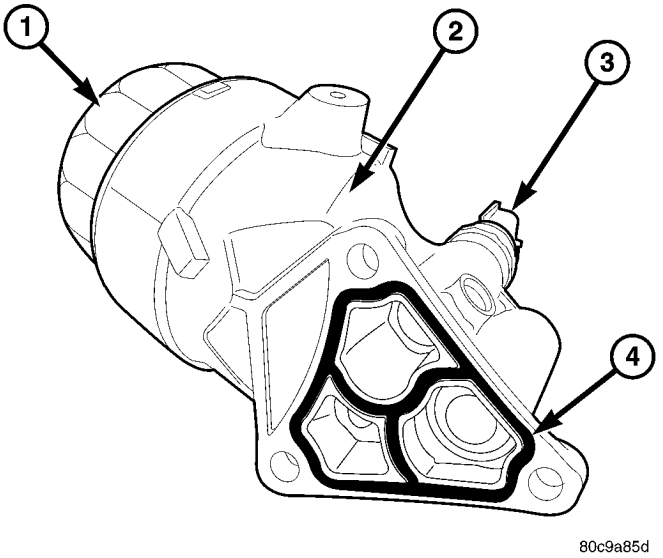

Fig. 96 Oil Filter Cartridge Housing

1 - OIL FILTER CAP
2 - OIL FILTER CARTRIDGE HOUSING
3 - OIL PRESSURE SWITCH
4 - SEAL

OIL PAN

REMOVAL

(1) Disconnect negative battery cable.

(2) Raise vehicle on hoist.

(3) Remove right front wheel.

(4) Remove accessory drive belt splash shield.

(5) Drain engine oil.

OIL PAN (Continued)

(6) Remove air conditioning compressor lower bracket (Fig. 97).

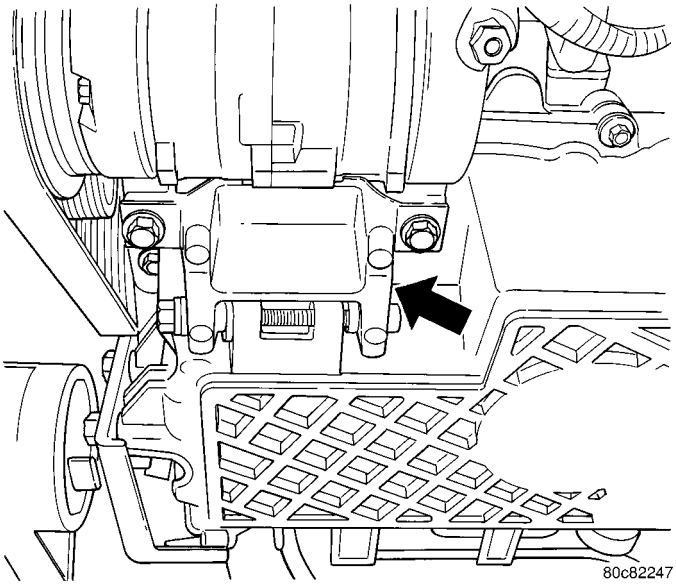

Fig. 97 Air Conditioning Compressor Lower Bracket

(7) Remove bolt attaching lower torque strut to oil pan bracket (Fig. 98).

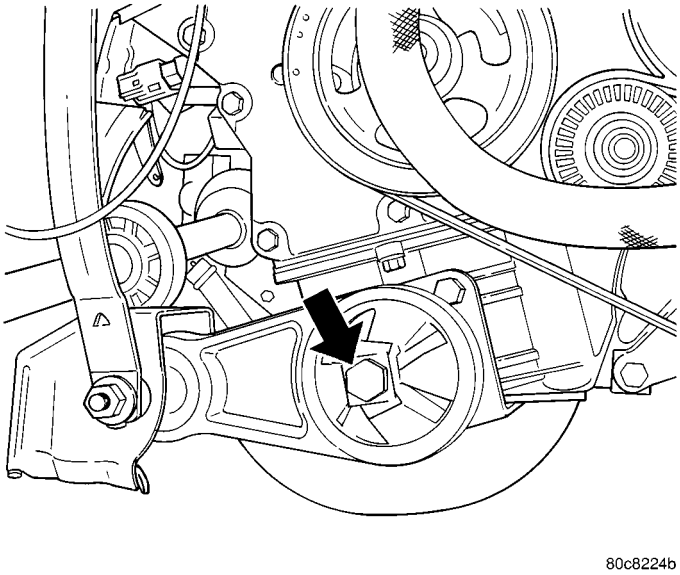

Fig. 98 Torque Strut Bracket

(8) Remove clutch slave cylinder and reposition (Fig. 99).

(9) Remove oil pan fasteners.

(10) Remove oil pan.

INSTALLATION

(1) Clean oil pan and all sealing surfaces.

(2) Position new oil pan gasket onto pan.

(3) Install oil pan (Fig. 100).

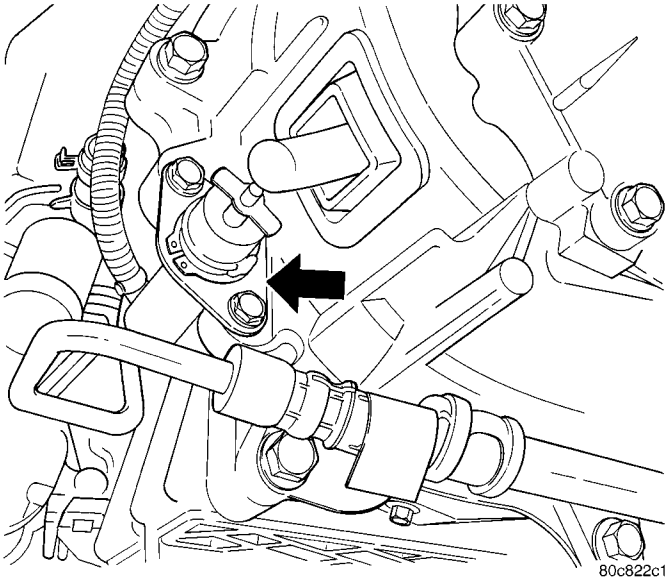

Fig. 99 Clutch Slave Cylinder

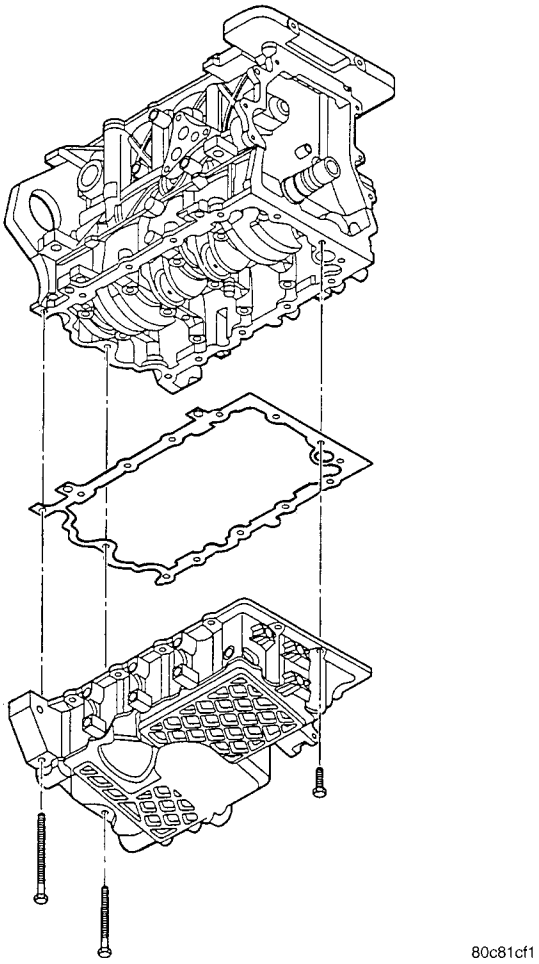

Fig. 100 Oil Pan and Gasket

OIL PAN (Continued)

(4) Install oil pan fasteners and tighten in sequence (Fig. 101). Torque bolts to 31 N·m (275 in. lbs.).

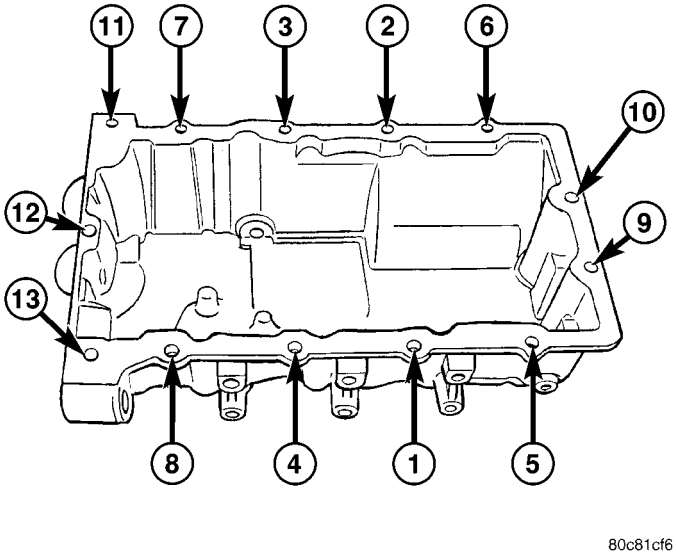

Fig. 101 Oil Pan Tightening Sequence

(5) Install the clutch slave cylinder (Fig. 99).

(6) Install air conditioning compressor lower bracket (Fig. 98).

(7) Install accessory drive belt splash shield.

(8) Install right front wheel.

(9) Lower vehicle.

(10) Fill engine crankcase with the proper oil to correct level. Refer to LUBRICATION AND MAINTENANCE for oil capacity and type.

(11) Connect negative battery cable.

OIL PUMP

REMOVAL

(1) Remove timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING CHAIN COVER - REMOVAL).

INSTALLATION

(1) Install timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING CHAIN COVER - INSTALLATION).

OIL PUMP PICK-UP

REMOVAL

(1) Remove oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).

(2) Remove fasteners securing oil pump pick-up to engine block (Fig. 102).

(3) Remove oil pump pick-up.

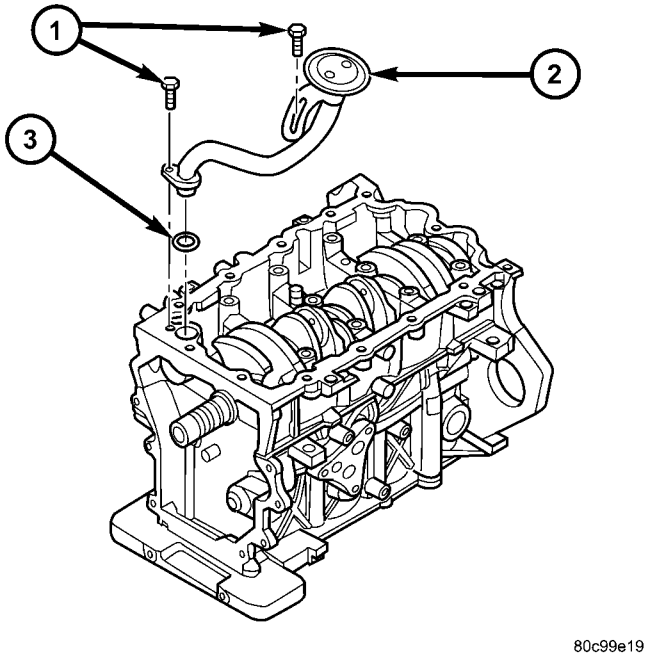

Fig. 102 Oil Pump Pick-up

1 - FASTENERS
2 - OIL PUMP PICK-UP
3 - O-RING

INSTALLATION

(1) Clean sealing surfaces.

(2) Replace o-ring (Fig. 102).

(3) Install oil pump pick-up. Torque fasteners to 12 N·m (105 in. lbs.).

(4) Install oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

INTAKE MANIFOLD

REMOVAL

UPPER INTAKE MANIFOLD

(1) Disconnect negative battery cable.

(2) Disconnect throttle body air inlet hose and purge solenoid vacuum hose from throttle body (Fig. 103).

(3) Disconnect PCV hose from upper intake manifold (Fig. 103).

(4) Disconnect brake booster vacuum hose.

(5) Disconnect electronic throttle control motor electrical connector.

(6) Remove upper intake manifold support bracket fasteners (Fig. 103).

(7) Remove upper intake manifold fasteners (Fig. 103).

INTAKE MANIFOLD (Continued)

(8) Remove upper intake manifold and gasket.

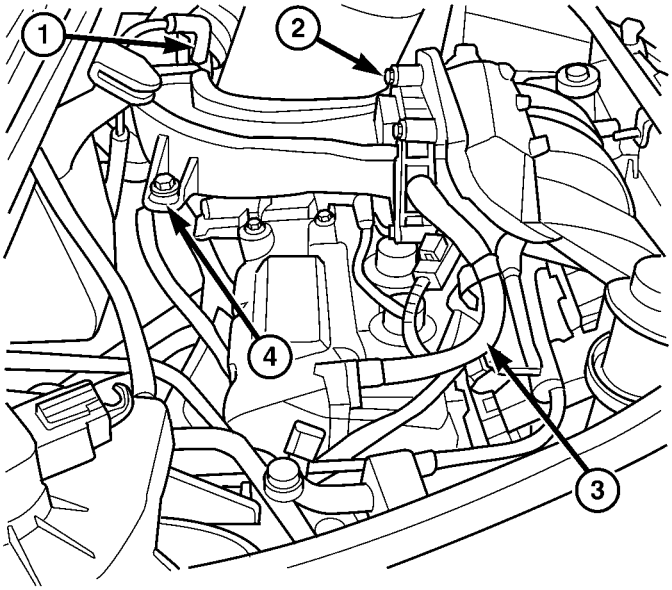

Fig. 103 Upper Intake Manifold

1 - PURGE SOLENOID VACUUM HOSE
2 - UPPER INTAKE FASTENERS
3 - PCV HOSE
4 - MANIFOLD SUPPORT BRACKET FASTENERS

LOWER INTAKE MANIFOLD

(1) Perform fuel pressure release procedure (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE).

(2) Disconnect negative battery cable.

(3) Remove upper intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).

(4) Disconnect fuel line from fuel rail.

(5) Disconnect fuel injector electrical connectors.

(6) Remove fuel rail.

(7) Remove lower intake manifold mounting bolts.

(8) Remove lower intake manifold (Fig. 104).

INSTALLATION

UPPER INTAKE MANIFOLD

(1) Position the upper intake manifold and gasket.

(2) Install upper intake manifold fasteners. Tighten to 12 N·m (105 in. lbs.).

(3) Install upper intake manifold support bracket fasteners (Fig. 103). Tighten M6 fasteners to 19 N·m (165 in. lbs.) and M8 fasteners to 28 N·m (250 in. lbs.).

(4) Connect PCV hose to upper intake manifold (Fig. 103).

(5) Connect brake booster vacuum hose.

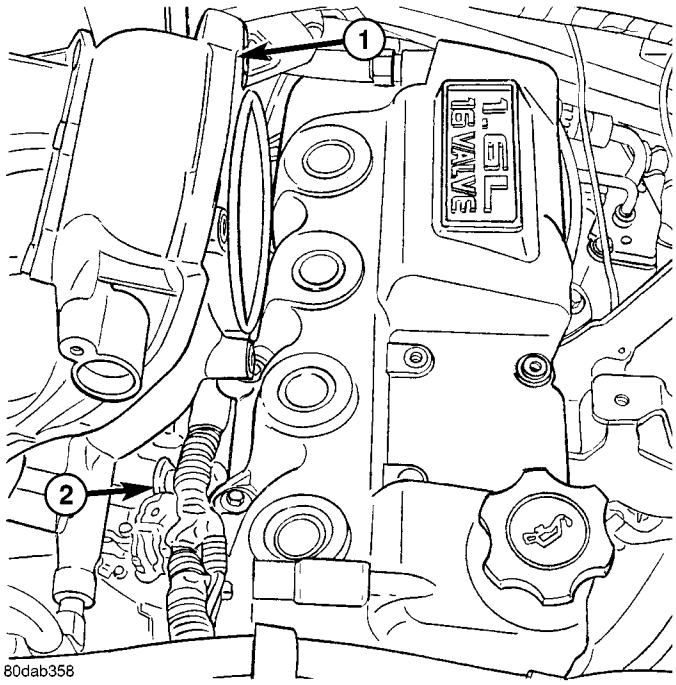

Fig. 104 LOWER INTAKE MANIFOLD

1 - LOWER INTAKE MANIFOLD
2 - LOWER INTAKE MOUNTING BOLTS

(6) Connect electronic throttle control motor electrical connector.

(7) Connect throttle body air inlet hose and purge solenoid vacuum hose to throttle body (Fig. 103).

(8) Connect negative battery cable.

LOWER INTAKE MANIFOLD

(1) Clean manifold sealing surfaces.

(2) Inspect and replace intake manifold seals as necessary.

(3) Position lower intake manifold.

(4) Install lower intake manifold mounting bolts. Tighten bolts to 26 N·m (230 in. lbs.). (Fig. 104).

(5) Apply a light coating of clean engine oil to the O-ring on the nozzle end of each injector.

(6) Insert fuel injector nozzles into openings in lower intake manifold. Seat the injectors in place. Install fule rail fasteners. Tighten fuel rail mounting fasteners to 22.5 N·m ± 3 N·m (200±30 in. lbs.).

(7) Connect fuel injector electrical connectors.

(8) Connect fuel line to fuel rail.

(9) Install upper intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).

(10) Connect negative battery cable.

EXHAUST MANIFOLD

REMOVAL

(1) Disconnect negative battery cable.

(2) Disconnect ignition coil and capacitor electrical connectors.

(3) Remove ignition coil and plug wires (Refer to 8 - ELECTRICAL/IGNITION CONTROL/IGNITION COIL - REMOVAL).

(4) Raise vehicle on hoist.

(5) Disconnect exhaust pipe from exhaust manifold.

(6) Remove starter heat shield bolt (Fig. 105).

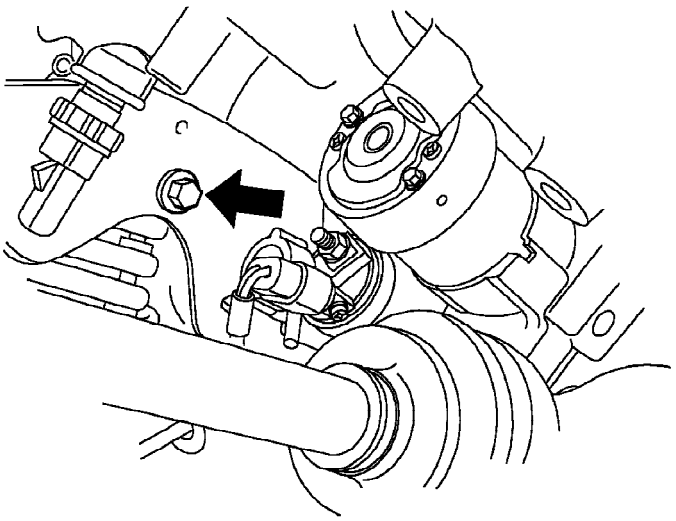

Fig. 105 Heat Shield Bolt

(7) Lower vehicle.

(8) Remove exhaust manifold upper heat shield bolts and remove heat shield.

(9) Remove exhaust manifold bolts and remove manifold.

CLEANING

(1) Discard gasket (if equipped) and clean all surfaces of manifold and cylinder head.

INSPECTION

(1) Inspect manifold gasket surfaces for flatness with straight edge. Surface must be flat within 0.15 mm per 300 mm (0.006 in. per foot) of manifold length.

(2) Inspect manifolds for cracks or distortion. Replace manifold as necessary.

INSTALLATION

(1) Clean gasket surfaces.

(2) Install exhaust manifold with a new gasket and install bolts to hold gasket in place (Fig. 106). The gasket has tabs in the bolt holes to retain the exhaust manifold bolts for installation purposes.

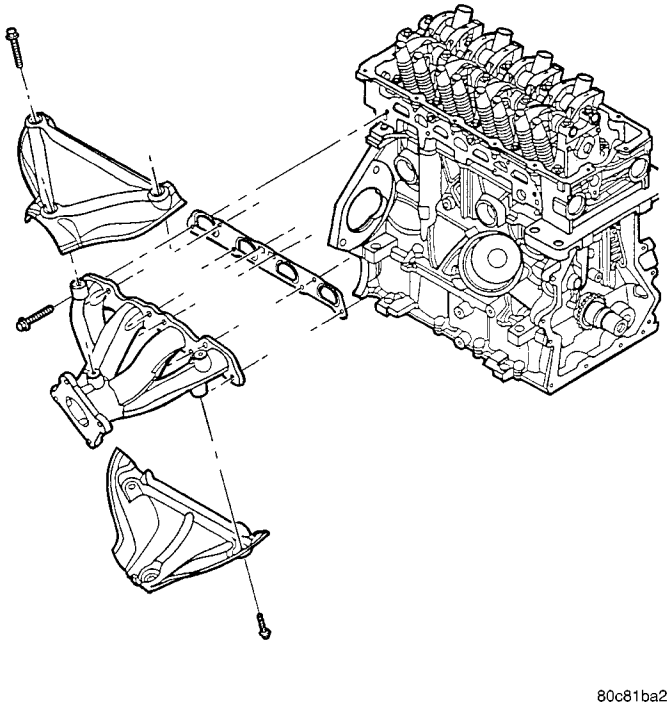

Fig. 106 Exhaust Manifold, Heat Shield, and Gasket

(3) Tighten the exhaust manifold bolts in a spiral pattern starting with the center bolts and working outward. Tighten bolts to 23 N·m (200 in. lbs.).

(4) Install exhaust manifold upper heat shield and tighten bolts to 28 N·m (250 in. lbs.).

(5) Raise vehicle vehicle on hoist.

(6) Install the starter heat shield bolt (Fig. 105).

(7) Install the exhaust pipe to the exhaust manifold. Tighten bolts to 28 N·m (250 in. lbs.).

(8) Lower vehicle.

(9) Install ignition coil and spark plug cables (Refer to 8 - ELECTRICAL/IGNITION CONTROL/IGNITION COIL - INSTALLATION).

(10) Connect ignition coil and capacitor electrical connector.

(11) Connect negative battery cable.

VALVE TIMING

DESCRIPTION

The timing drive system consists of the following (Fig. 107):

- Timing Chain
- Camshaft Sprocket
- Crankshaft Sprocket
- Right Timing Chain Guide (Movable)
- Left Timing Chain Guide (Fixed)
- Timing Chain Tensioner/Oil Reservoir Cap/Plug with Seal Ring

The camshaft sprocket is attached to the front of the camshaft and is used with the timing chain and crankshaft sprocket to turn the camshaft. The camshaft position sensor target is part of the sprocket and is used with the camshaft position sensor to provide the PCM with valvetrain position information.

The timing chain tensioner is installed in the right side of the engine block. Using engine oil pressure, the tensioner applies constant pressure to the right side (movable) timing chain guide, which in turn applies pressure to the timing chain. Also as the tensioner extends, it rachet locks in position to provide constant timing chain tension. An oil reservoir cap attaches to the timing chain tensioner to provide an available “pocket” of oil to the tensioner during initial start up.

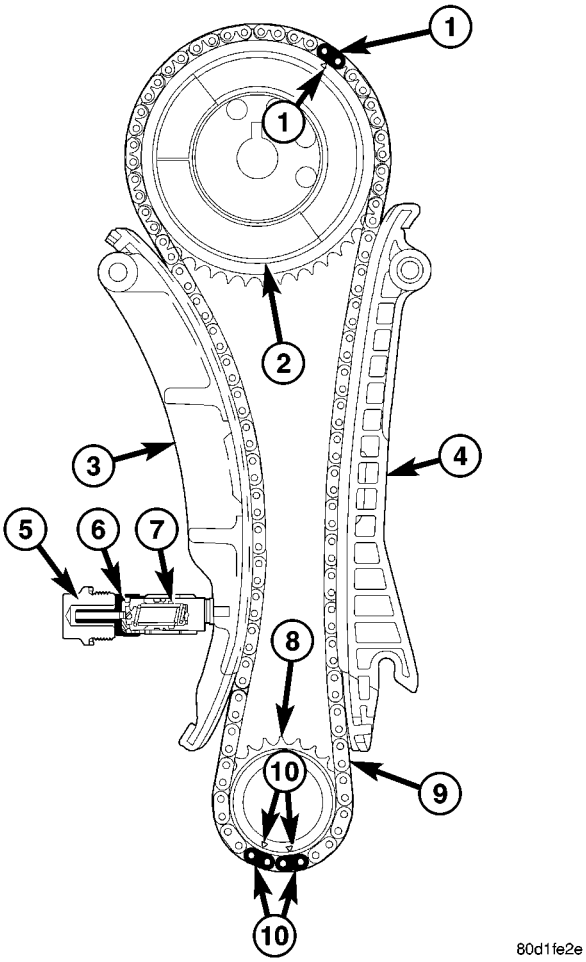

Fig. 107 Timing Drive System

1 - CAMSHAFT TIMING MARK ALIGNS WITH SINGLE PLATED/DIMPLED LINK

8 - CRANKSHAFT SPROCKET
9 - TIMING CHAIN
10 - CRANKSHAFT TIMING MARKS ALIGN WITH DOUBLE PLATED/DIMPLED LINKS

STANDARD PROCEDURE

VALVE TIMING VERIFICATION

(1) Remove cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER - REMOVAL).

(2) Remove number one spark plug.

(3) Using a dial indicator, set number one cylinder to TDC on the compression stroke.

(4) The mark on the camshaft sprocket should be in line with the cylinder head cover sealing surface (Fig. 108).

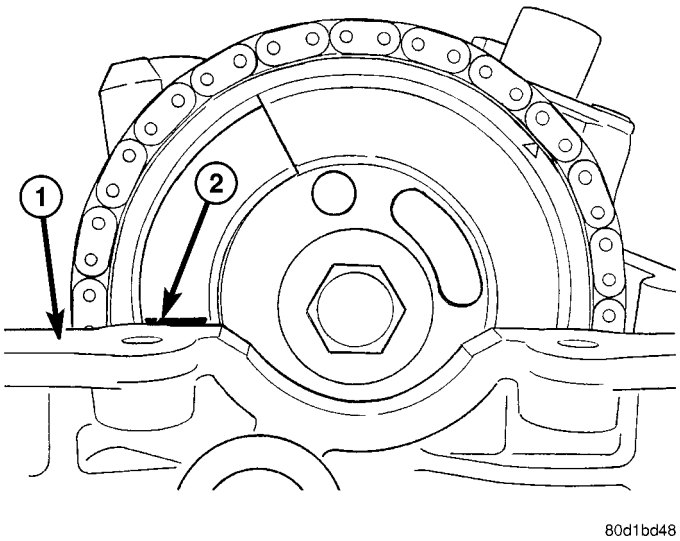

Fig. 108 Camshaft Timing Mark

1 - CYLINDER HEAD COVER SEALING SURFACE
2 - CAMSHAFT SPROCKET MARK

VALVE TIMING (Continued)

(5) Using a suitable light, look down into the timing chain cavity at the crankshaft sprocket. A paint mark on the crankshaft sprocket should align with the edge of the engine block boss indicated in (Fig. 109).

(6) Install cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

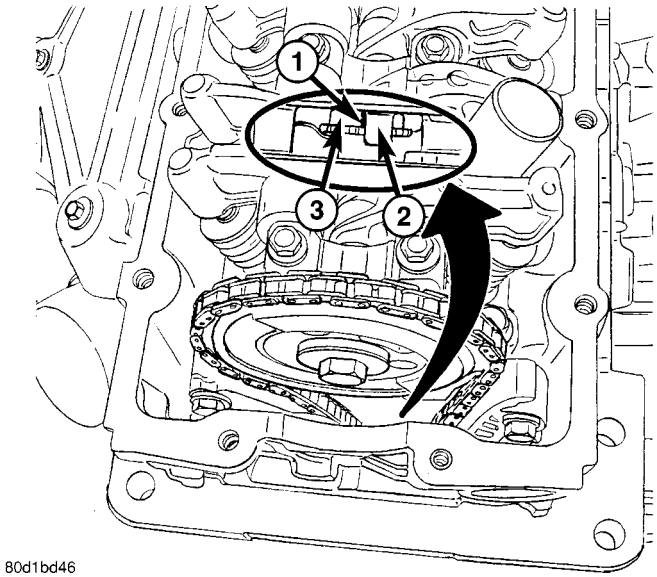

Fig. 109 Crankshaft Timing Mark

1 - PAINT MARK ON CRANKSHAFT SPROCKET
2 - ENGINE BLOCK BOSS
3 - CRANKSHAFT SPROCKET

TIMING CHAIN COVER

REMOVAL

(1) Disconnect and isolate the negative battery cable.

(2) Remove the power steering reservior bracket bolts (Refer to 19 - STEERING/PUMP/RESERVOIR - REMOVAL).

(3) Partialy drain the cooling system and disconnect the upper radiatior hose at the radiator.

(4) Remove the radiator cooling fan (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).

(5) Raise vehicle on hoist.

(6) Remove the right front wheel.

(7) Remove the accessory drive belt splash shield.

(8) Remove the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(9) Remove the crankshaft vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).

(10) Remove the accessory drive belt tensioner (Refer to 7 - COOLING/ACCESSORY DRIVE/BELT TENSIONERS - REMOVAL).

(11) Remove the accessory drive belt idler pulley (Refer to 7 - COOLING/ACCESSORY DRIVE/IDLER PULLEY - REMOVAL).

(12) Remove the air conditioning compressor mounting bolts and position compressor out of the way. **Do Not** disconnect lines from air conditioning compressor. Support air conditioning compressor with suitable strap.

(13) Remove the power steering pump/water pump mounting bolts and position pump out of the way.

(14) Remove the timing cover bolts. Note the location of the shoulder bolt(s).

(15) Remove the timing cover (Fig. 110).

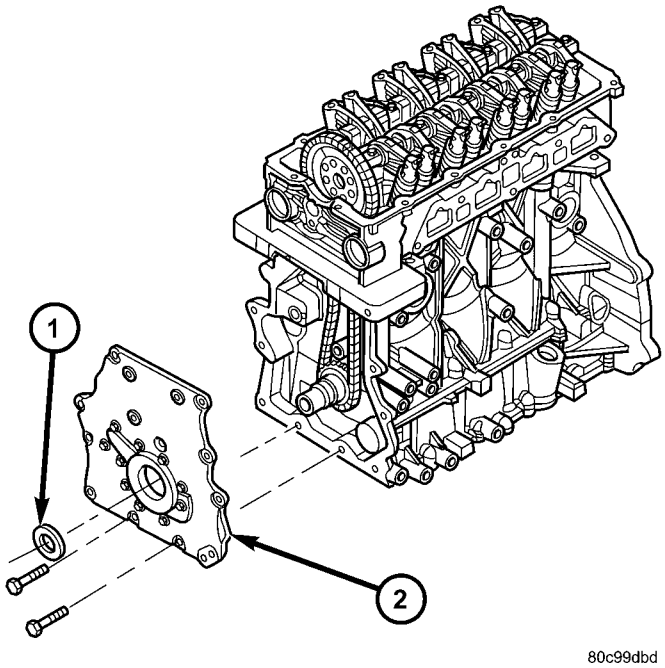

Fig. 110 Timing Chain Cover

1 - FRONT CRANKSHAFT OIL SEAL
2 - TIMING CHAIN COVER

TIMING CHAIN COVER (Continued)

INSTALLATION

(1) Clean all sealing surfaces.
(2) Replace timing cover seals (Fig. 111).

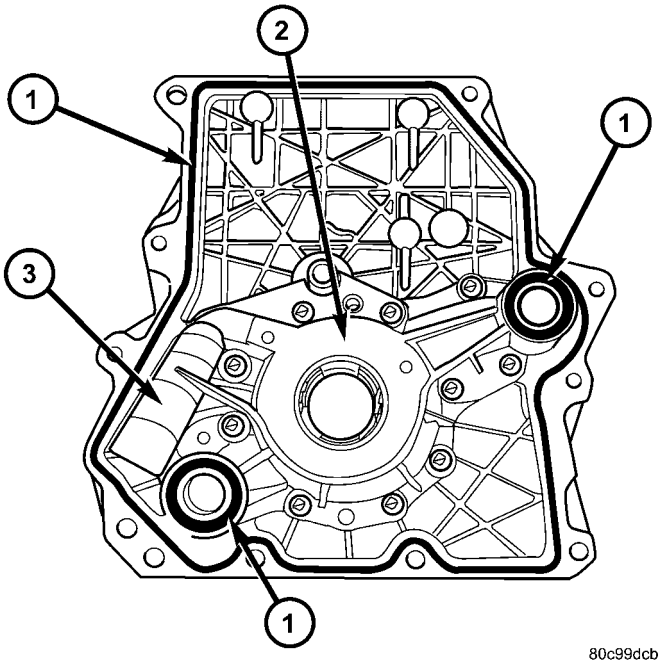

Fig. 111 Timing Chain Cover Seals

1 - TIMING CHAIN COVER SEALS
2 - OIL PUMP
3 - PRESSURE RELIEF VALVE

(3) Apply a 3.2 mm (0.125 in.) bead of Mopar® Engine RTV GEN II at the parting line of the engine block/bedplate as shown in (Fig. 112).

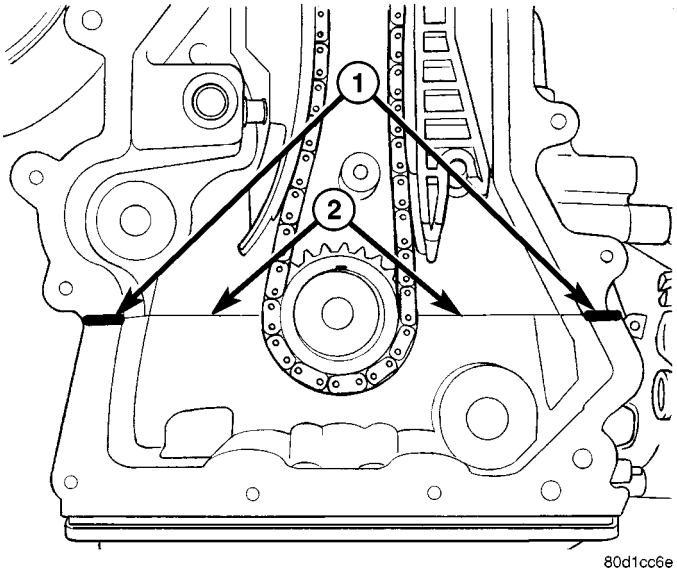

Fig. 112 Timing Chain Cover Sealing - RTV Location

1 - 3.2 mm (0.125 in.) BEAD OF RTV AT PARTING LINE
2 - PARTING LINE OF ENGINE BLOCK/BEDPLATE

(4) Prime oil pump before installation by filling rotor cavity with engine oil.

(5) Align oil pump rotor flats with flats on crankshaft as you install the timing cover to the block. Hand start all fasteners. Torque fasteners in the sequence shown in (Fig. 113) to 12 N·m (105 in. lbs.).

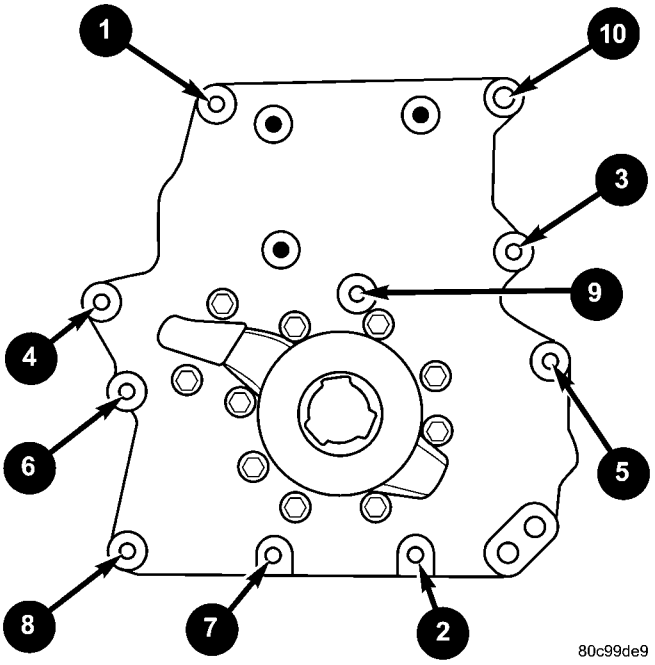

Fig. 113 Timing Chain Cover Tightening Sequence

(6) Install the power steering/water pump. Tighten bolts to 28 N·m (250 in. lbs.).
(7) Install air conditioning compressor. Tighten bolts to 28 N·m (250 in. lbs.).
(8) Install the accessory drive belt idler pulley (Refer to 7 - COOLING/ACCESSORY DRIVE/IDLER PULLEY - INSTALLATION).
(9) Install the accessory drive belt tensioner (Refer to 7 - COOLING/ACCESSORY DRIVE/BELT TENSIONERS - INSTALLATION).
(10) Install the crankshaft vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).
(11) Install the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
(12) Install the accessory drive belt splash shield.
(13) Install the right front wheel.
(14) Lower vehicle.
(15) Install the radiator cooling fan (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).
(16) Connect upper radiator hose.
(17) Install the power steering reservoir bracket bolts.
(18) Connect the negative battery cable.
(19) Fill the cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).

TIMING CHAIN/GUIDES/ SPROCKETS

REMOVAL

TIMING CHAIN AND GUIDES

(1) Disconnect negative battery cable.

(2) Remove cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(3) Remove camshaft position sensor.

(4) Remove timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING CHAIN COVER - REMOVAL).

(5) Rotate crankshaft until number one cylinder is at TDC on compression stroke.

(6) Using Special Tool 8435 to hold camshaft sprocket, remove camshaft sprocket bolt (Fig. 114).

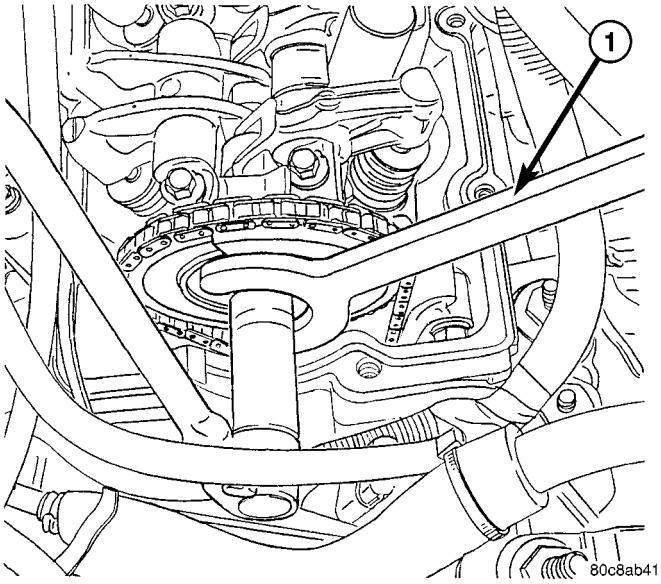

Fig. 114 Special Tool 8435 - Camshaft Sprocket Holding Wrench

1 - SPECIAL TOOL 8435

(7) Remove the timing chain tensioner plug from engine block. Remove oil reservoir cap and timing chain tensioner (Fig. 115).

(8) Remove right engine mount bracket (Refer to 9 - ENGINE/ENGINE MOUNTING/ENGINE MOUNT BRACKET - REMOVAL).

(9) Remove camshaft sprocket from camshaft. Partially lower camshaft sprocket to allow timing chain to be removed from camshaft sprocket.

(10) Remove cylinder head plugs. Remove fasteners holding timing chain guides to cylinder head. Remove timing chain guides (Fig. 116).

(11) Remove timing chain (Fig. 121).

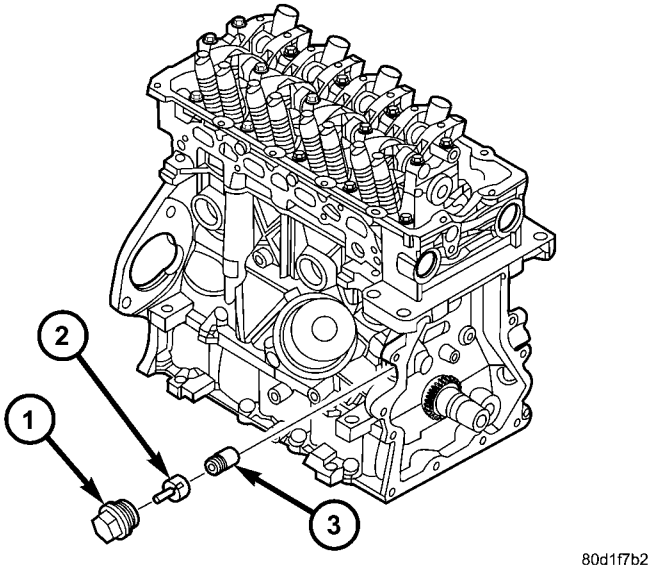

Fig. 115 Timing Chain Tensioner

1 - PLUG WITH SEAL RING
2 - OIL RESERVOIR CAP
3 - TIMING CHAIN TENSIONER

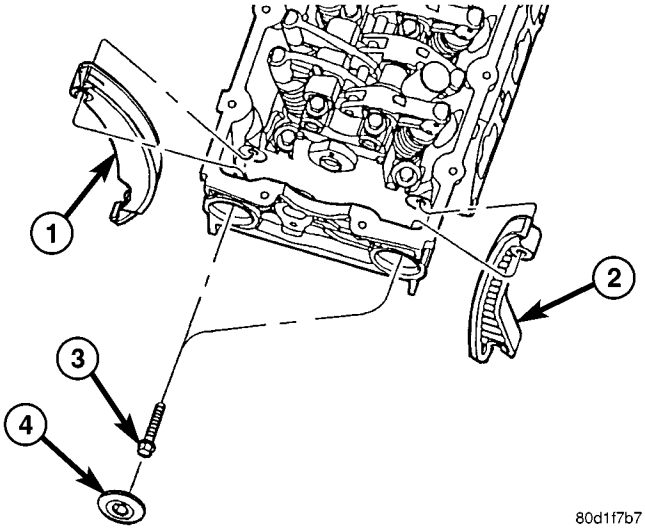

Fig. 116 Timing Chain Guide Mounting

1 - RIGHT TIMING CHAIN GUIDE (MOVABLE)
2 - LEFT TIMING CHAIN GUIDE (FIXED)
3 - FASTENER(S)
4 - CYLINDER HEAD PLUG(S)

CAMSHAFT SPROCKET

(1) Disconnect negative battery cable.

(2) Remove cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(3) Disconnect and remove the camshaft position sensor.

(4) Rotate crankshaft until triangular timing mark on camshaft sprocket is at the 12 o'clock position.

TIMING CHAIN/GUIDES/SPROCKETS (Continued)

(5) For reassembly purposes, paint the timing chain link that lines up with camshaft timing mark (Fig. 117).

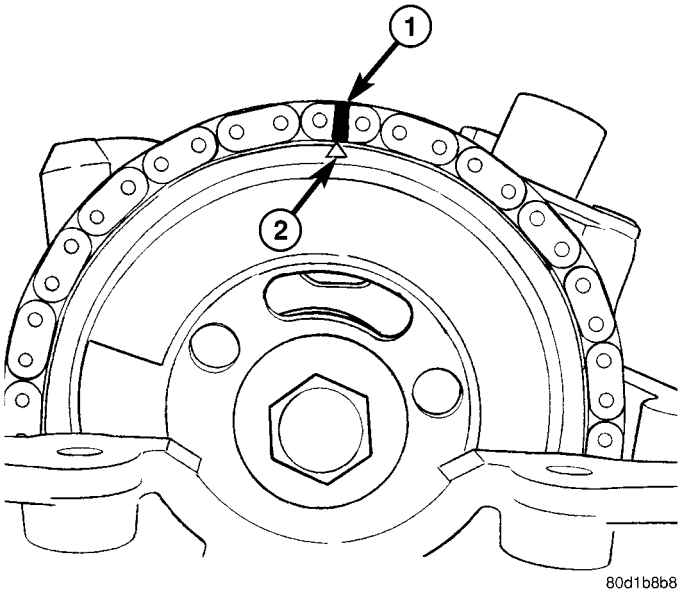

Fig. 117 Identify Timing Chain Link for Reassembly Purposes

1 - PAINT THE LINK THAT ALIGNS WITH TIMING MARK
2 - CAMSHAFT SPROCKET TIMING MARK

(6) Using Special Tool 8435 to hold camshaft sprocket, remove camshaft sprocket bolt (Fig. 114).

(7) Remove the timing chain tensioner plug from engine block. Remove oil reservoir cap and timing chain tensioner (Fig. 115).

(8) Remove camshaft sprocket from camshaft. Partially lower camshaft sprocket to allow timing chain to be removed from camshaft sprocket.

CRANKSHAFT SPROCKET

(1) Remove timing chain (Refer to 9 - ENGINE/VALVE TIMING/TIMING CHAIN - REMOVAL).

(2) Remove crankshaft sprocket by first installing crankshaft vibration damper bolt. Apply grease or equivalent to damper bolt head and position Special Tools 5048-1, 5048-6, and 8539 on sprocket and crankshaft nose (Fig. 118).

(3) Remove sprocket using care not to rotate the crankshaft.

INSTALLATION

CRANKSHAFT SPROCKET

(1) Install crankshaft sprocket using Special Tools 8385 and 8386 (Fig. 119).

(2) Install sprocket using care not to rotate the crankshaft.

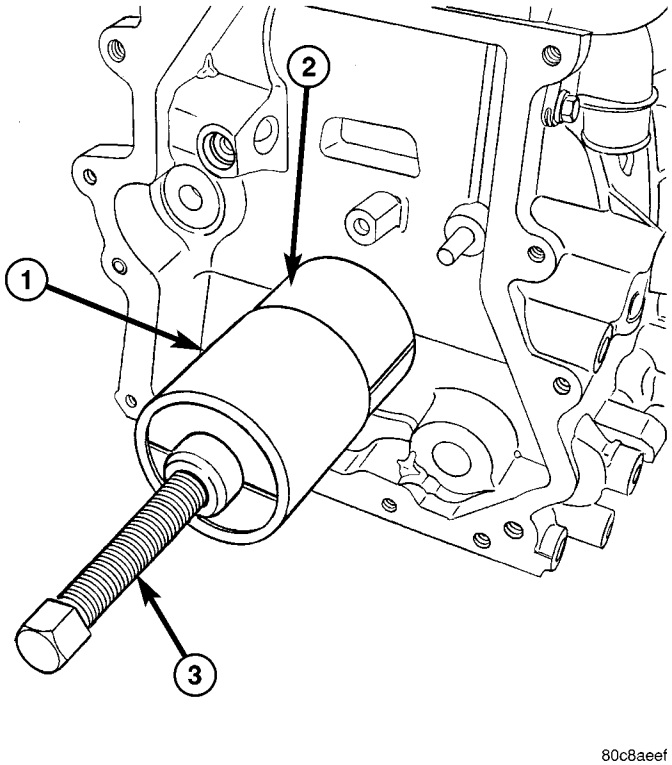

Fig. 118 Crankshaft Sprocket Removal

1 - SPECIAL TOOL 5048-6
2 - SPECIAL TOOL 8539
3 - SPECIAL TOOL 5048-1

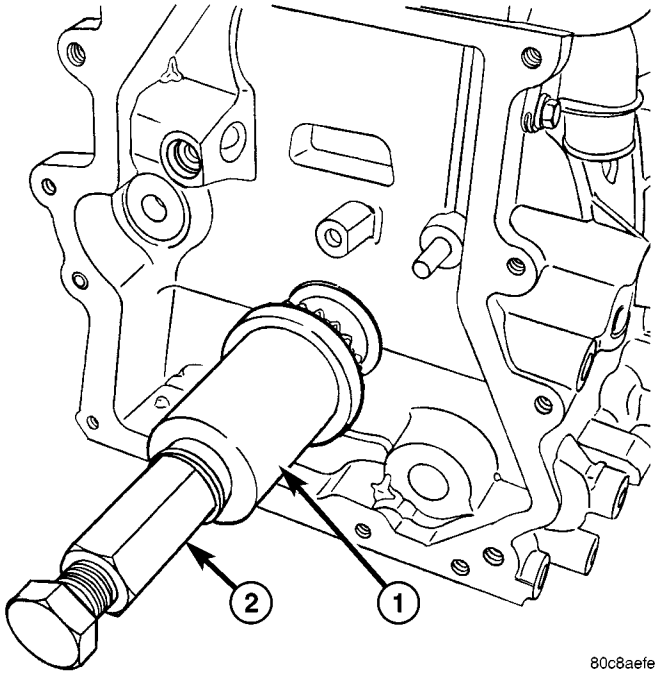

Fig. 119 Crankshaft Sprocket Installation

1 - SPECIAL TOOL 8386

TIMING CHAIN/GUIDES/SPROCKETS (Continued)

CAMSHAFT SPROCKET

(1) Align triangular timing mark on cam sprocket with the timing chain link that was painted during disassembly. Install timing chain on cam sprocket (Fig. 117).

(2) Install camshaft sprocket on the camshaft.

CAUTION: Do Not use an impact wrench for tightening the camshaft sprocket bolt. Damage to the camshaft timing pin can result. Use a hand wrench only.

(3) Install camshaft sprocket bolt. While holding the camshaft sprocket with Special Tool 8435, torque bolt to 115 N·m (85 ft. lbs.) (Fig. 114).

(4) Reset the timing chain tensioner using the following method:

(a) Remove oil reservoir cap from timing chain tensioner (Fig. 122).

(b) Place tensioner on a clean flat surface.

(c) Place your palm against the tensioner and press down on the tensioner with continuous pressure until the fully extended tensioner bottoms out (Fig. 123).

(d) Install oil reservoir cap onto timing chain tensioner (Fig. 122).

(5) Install timing chain tensioner with oil reservoir cap into engine block (Fig. 115).

(6) Install timing chain tensioner plug with seal ring. Torque plug to 62 N·m (46 ft. lbs.).

CAUTION: Do not pry directly on chain. Damage to timing chain may occur.

(7) Using a long thin screwdriver, pry in on the right (movable) timing chain guide until the timing chain tensioner rachets out to tension the chain (Fig. 120).

NOTE: Ensure the timing chain is properly positioned within the channel of the timing chain guides.

(8) Install cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

(9) Install camshaft position sensor. Torque fastener to 10 N·m (85 in. lbs.). Reconnect connector.

(10) Connect negative battery cable.

TIMING CHAIN AND GUIDES

(1) Install the left timing chain guide. Torque fastener to 28 N·m (250 in. lbs.) (Fig. 116).

(2) Install the right timing chain guide. Torque fastener to 28 N·m (250 in. lbs.) (Fig. 116).

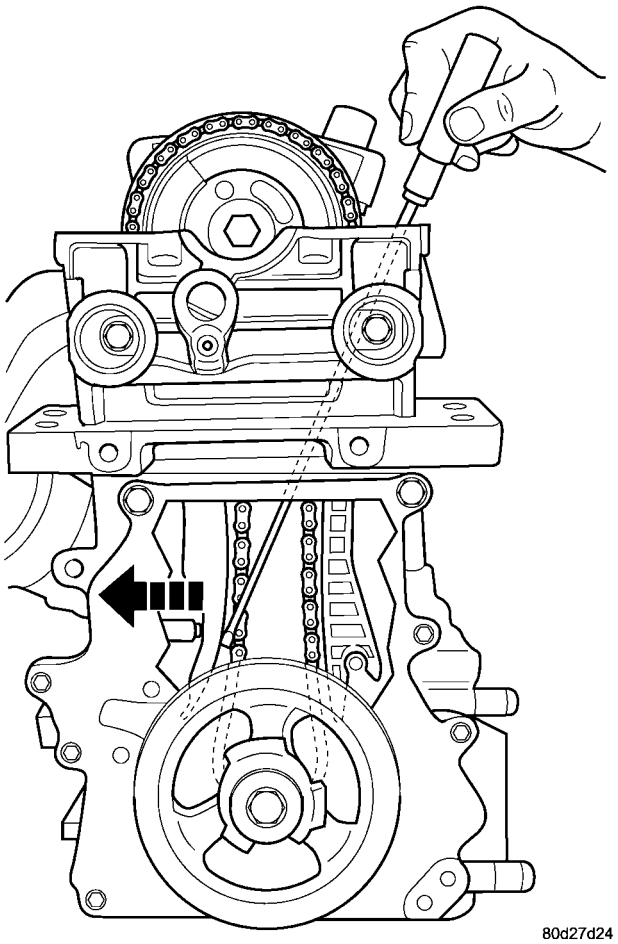

Fig. 120 Timing Chain Tensioner Activation

NOTE: When installing the timing chain, ensure the plated links on the timing chain are aligned with the timing marks on the crankshaft and camshaft sprockets. If a timing chain is being re-used, and the plating is wore off the chain, the links also have machined dimples (Fig. 121).

(3) Feed the timing chain through the opening in the top of the cylinder head.

(4) Install the timing chain around the crankshaft sprocket, aligning the two plated links with the crankshaft sprocket timing marks (Fig. 121).

(5) Install the timing chain around the camshaft sprocket, aligning the single plated link with the camshaft sprocket timing mark (Fig. 121).

(6) Install the camshaft sprocket on the camshaft.

CAUTION: DO NOT use an impact wrench (or any other air operated tool) for tightening the camshaft sprocket bolt. Damage to the camshaft timing pin can result. ONLY use a hand wrench while holding camshaft sprocket with Special Tool.

TIMING CHAIN/GUIDES/SPROCKETS (Continued)

(7) Install camshaft sprocket bolt. While holding the camshaft sprocket with Special Tool 8435, torque bolt to 115 N·m (85 ft. lbs.) (Fig. 114).

(8) Reset the timing chain tensioner using the following method:

(a) Remove oil reservoir cap from timing chain tensioner (Fig. 122).

(b) Place tensioner on a clean flat surface.

(c) Place your palm against the tensioner and press down on the tensioner with continuous pressure until the fully extended tensioner bottoms out (Fig. 123).

(d) Install oil reservoir cap onto timing chain tensioner (Fig. 122).

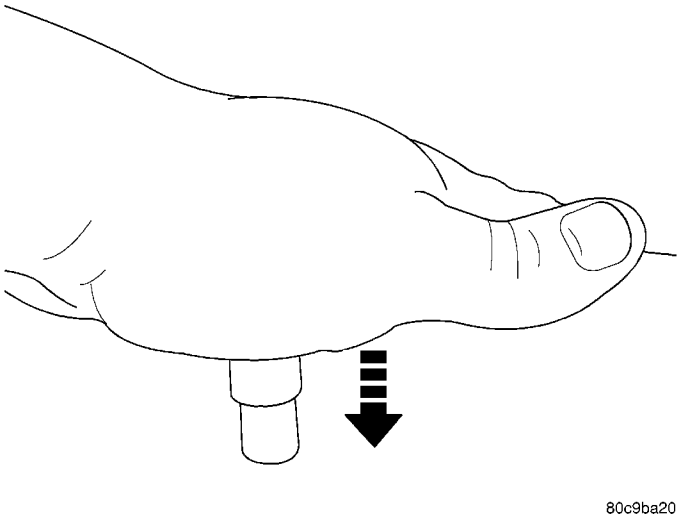

Fig. 123 Resetting Timing Chain Tensioner

TIMING CHAIN/GUIDES/SPROCKETS (Continued)

(9) Install timing chain tensioner with oil reservoir cap into engine block (Fig. 115).

(10) Install timing chain tensioner plug with seal ring. Torque plug to 62 N·m (46 ft. lbs.).

WARNING: DO NOT ALLOW FINGERS TO GET TRAPPED BETWEEN THE TIMING CHAIN AND GUIDE

(11) Depress the right timing chain guide against the tensioner until it releases (Fig. 124).

(12) Install cylinder head plugs. Torque to 18 N·m (162 in. lbs.) (Fig. 116).

(13) Install cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

(14) Install camshaft position sensor. Torque fastener to 10 N·m (85 in. lbs.). Reconnect connector.

(15) Install right engine mount bracket (Refer to 9 - ENGINE/ENGINE MOUNTING/ENGINE MOUNT BRACKET - INSTALLATION).

(16) Install the timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

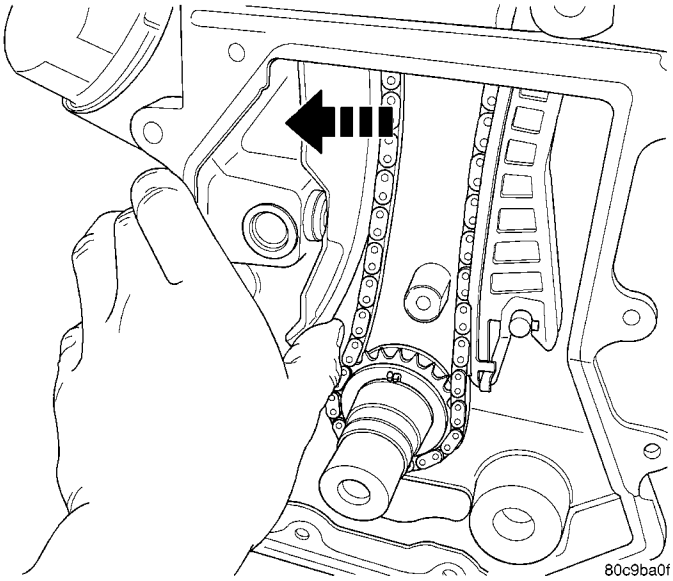

Fig. 124 Timing Chain Tensioner Activation

(17) Connect negative battery cable.

ENGINE 2.4L DOHC

DESCRIPTION

The 2.4 Liter (148 cu. in.) in-line four cylinder engine is a double over head camshaft with hydraulic lash adjusters and four valve per cylinder design. The engine is free-wheeling; meaning it has provisions for piston-to-valve clearance. However valve-to-valve interference can occur, if camshafts are rotated independently.

The cylinders are numbered from front of the engine to the rear. The firing order is 1–3–4–2.

The engine identification number is located on the rear of the cylinder block (Fig. 1).

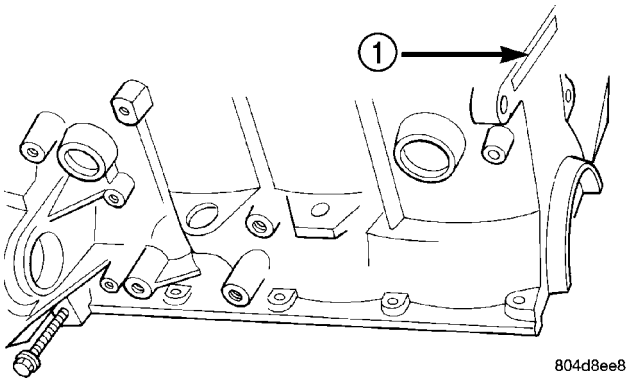

Fig. 1 Engine Identification

1 - ENGINE IDENTIFICATION LOCATION

DIAGNOSIS AND TESTING

ENGINE DIAGNOSIS - INTRODUCTION

Engine diagnosis is helpful in determining the causes of malfunctions not detected and remedied by routine maintenance.

These malfunctions may be classified as either mechanical (e.g., a strange noise), or performance (e.g., engine idles rough and stalls).

Refer to the Engine Mechanical and the Engine Performance diagnostic charts, for possible causes and corrections of malfunctions (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING - MECHANICAL) (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING - PERFORMANCE).

For fuel system diagnosis, (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - DIAGNOSIS AND TESTING).

Additional tests and diagnostic procedures may be necessary for specific engine malfunctions that cannot be isolated with the Service Diagnosis charts. Information concerning additional tests and diagnosis is provided within the following:

- Cylinder Compression Pressure Test
- Cylinder Combustion Pressure Leakage Test
- Engine Cylinder Head Gasket Failure Diagnosis
- Intake Manifold Leakage Diagnosis
- Hydraulic Lash Adjuster Noise Diagnosis
- Engine Oil Leak Inspection

ENGINE 2.4L DOHC (Continued)

ENGINE DIAGNOSIS - PERFORMANCE

CONDITION	POSSIBLE CAUSE	CORRECTION
ENGINE WILL NOT START	1. Weak battery.	1. Test battery. Charge or replace as necessary. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - DIAGNOSIS AND TESTING)
	2. Corroded or loose battery connections.	2. Clean and tighten battery connections. Apply a coat of light mineral grease to terminals.
	3. Faulty starter.	3. Test starting system. (Refer to 8 - ELECTRICAL/STARTING - DIAGNOSIS AND TESTING)
	4. Faulty coil(s) or control unit.	4. Test and replace as needed. (Refer to Appropriate Diagnostic Information)
	5. Incorrect spark plug gap.	5. Set gap. (Refer to 8 - ELECTRICAL/IGNITION CONTROL - SPECIFICATIONS)
	6. Contamination in fuel system.	6. Clean system and replace fuel filter.
	7. Faulty fuel pump.	7. Test fuel pump and replace as needed. (Refer to Appropriate Diagnostic Information)
	8. Incorrect engine timing.	8. Check for a skipped timing belt/chain.
ENGINE STALLS OR IDLES ROUGH	1. Idle speed too low.	1. Test minimum air flow. (Refer to Appropriate Diagnostic Information)
	2. Incorrect fuel mixture.	2. (Refer to Appropriate Diagnostic Information)
	3. Intake manifold leakage.	3. Inspect intake manifold, manifold gasket, and vacuum hoses.
	4. Faulty ignition coil(s).	4. Test and replace as necessary. (Refer to Appropriate Diagnostic Information)

ENGINE 2.4L DOHC (Continued)

CONDITION	POSSIBLE CAUSE	CORRECTION
ENGINE LOSS OF POWER	1. Dirty or incorrectly gapped plugs.	1. Clean plugs and set gap.
	2. Contamination in fuel system.	2. Clean system and replace fuel filter.
	3. Faulty fuel pump.	3. Test and replace as necessary. (Refer to Appropriate Diagnostic Information)
	4. Incorrect valve timing.	4. Correct valve timing.
	5. Leaking cylinder head gasket.	5. Replace cylinder head gasket.
	6. Low compression.	6. Test compression of each cylinder.
	7. Burned, warped, or pitted valves.	7. Replace valves.
	8. Plugged or restricted exhaust system.	8. Perform exhaust restriction test. (Refer to 11 - EXHAUST SYSTEM - DIAGNOSIS AND TESTING) Install new parts, as necessary.
	9. Faulty ignition coil(s).	9. Test and replace as necessary. (Refer to Appropriate Diagnostic Information)
ENGINE MISSES ON ACCELERATION	1. Dirty or incorrectly gapped spark plugs.	1. Clean spark plugs and set gap.
	2. Contamination in Fuel System.	2. Clean fuel system and replace fuel filter.
	3. Burned, warped, or pitted valves.	3. Replace valves.
	4. Faulty ignition coil(s).	4. Test and replace as necessary. (Refer to Appropriate Diagnostic Information)
ENGINE MISSES AT HIGH SPEED	1. Dirty or incorrect spark plug gap.	1. Clean spark plugs and set gap.
	2. Faulty ignition coil(s).	2. Test and replace as necessary. (Refer to Appropriate Diagnostic Information)
	3. Dirty fuel injector(s).	3. Test and replace as necessary. (Refer to Appropriate Diagnostic Information)
	4. Contamination in fuel system.	4. Clean system and replace fuel filter.

ENGINE 2.4L DOHC (Continued)

ENGINE DIAGNOSIS - MECHANICAL

CONDITION	POSSIBLE CAUSES	CORRECTION
VALVETRAIN NOISE	1. High or low oil level in crankcase.	1. Check and correct engine oil level.
	2. Thin or diluted oil.	2. Change oil to correct viscosity.
	3. Thick oil	3. (a) Change engine oil and filter. (b) Run engine to operating temperature. (c) Change engine oil and filter again.
	4. Low oil pressure.	4. Check and correct engine oil level.
	5. Dirt in lash adjusters.	5. Replace rocker arm/hydraulic lash adjuster assembly.
	6. Worn rocker arms.	6. Inspect oil supply to rocker arms.
	7. Worn lash adjusters.	7. Install new rocker arm/hydraulic lash adjuster assembly.
	8. Worn valve guides.	8. Ream guides and install new valves with oversize stems.
	9. Excessive runout of valve seats on valve faces.	9. Grind valve seats and valves.
	10. Missing adjuster pivot.	10. Replace rocker arm/hydraulic lash adjuster assembly.
CONNECTING ROD NOISE	1. Insufficient oil supply.	1. Check engine oil level.
	2. Low oil pressure.	2. Check engine oil level. Inspect oil pump relief valve and spring.
	3. Thin or diluted oil.	3. Change oil to correct viscosity.
	4. Thick oil	4. (a) Change engine oil and filter. (b) Run engine to operating temperature. (c) Change engine oil and filter again.
	5. Excessive bearing clearance.	5. Measure bearings for correct clearance. Repair as necessary.
	6. Connecting rod journal out-of-round.	6. Replace crankshaft or grind surface.
	7. Misaligned connecting rods.	7. Replace bent connecting rods.

ENGINE 2.4L DOHC (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
MAIN BEARING NOISE	1. Insufficient oil supply.	1. Check engine oil level.
	2. Low oil pressure.	2. Check engine oil level. Inspect oil pump relief valve and spring.
	3. Thin or diluted oil.	3. Change oil to correct viscosity.
	4. Thick oil	4. (a) Change engine oil and filter. (b) Run engine to operating temperature. (c) Change engine oil and filter again.
	5. Excessive bearing clearance.	5. Measure bearings for correct clearance. Repair as necessary.
	6. Excessive end play.	6. Check thrust bearing for wear on flanges.
	7. Crankshaft journal out-of-round or worn.	7. Replace crankshaft or grind journals.
	8. Loose flywheel or torque converter.	8. Tighten to correct torque.
OIL PRESSURE DROP	1. Low oil level.	1. Check engine oil level.
	2. Faulty oil pressure sending unit.	2. Install new sending unit.
	3. Low oil pressure.	3. Check sending unit and main bearing oil clearance.
	4. Clogged oil filter.	4. Install new oil filter.
	5. Worn parts in oil pump.	5. Replace worn parts or pump.
	6. Thin or diluted oil.	6. Change oil to correct viscosity.
	7. Oil pump relief valve stuck.	7. Remove valve and inspect, clean, or replace.
	8. Oil pump suction tube loose.	8. Remove oil pan and install new tube or clean, if necessary.
	9. Oil pump cover warped or cracked.	9. Install new oil pump.
	10. Excessive bearing clearance.	10. Measure bearings for correct clearance.
OIL LEAKS	1. Misaligned or deteriorated gaskets.	1. Replace gasket(s).
	2. Loose fastener, broken or porous metal part.	2. Tighten, repair or replace the part.
	3. Misaligned or deteriorated cup or threaded plug.	3. Replace as necessary.

ENGINE 2.4L DOHC (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
OIL CONSUMPTION OR SPARK PLUGS FOULED	1. PCV system malfunction.	1. Check system and repair as necessary. (Refer to 25 - EMISSIONS CONTROL/ EVAPORATIVE EMISSIONS/PCV VALVE - DIAGNOSIS AND TESTING)
	2. Worn, scuffed or broken rings.	2. Hone cylinder bores. Install new rings.
	3. Carbon in oil ring slots.	3. Install new rings.
	4. Rings fitted too tightly in grooves.	4. Remove rings and check grooves. If groove is not proper width, replace piston.
	5. Worn valve guide(s).	5. Ream guide(s) and replace valve(s) with oversize valve(s) and seal(s).
	6. Valve stem seal(s) worn or damaged.	6. Replace seal(s).

CYLINDER COMBUSTION PRESSURE LEAKAGE TEST

The combustion pressure leakage test provides an accurate means for determining engine condition.

Combustion pressure leakage testing will detect:

- Exhaust and intake valve leaks (improper seating).
- Leaks between adjacent cylinders or into water jacket.
- Any causes for combustion/compression pressure loss.

WARNING: DO NOT REMOVE THE PRESSURE CAP WITH THE SYSTEM HOT AND UNDER PRESSURE BECAUSE SERIOUS BURNS FROM COOLANT CAN OCCUR.

Check the coolant level and fill as required. DO NOT install the pressure cap.

Start and operate the engine until it attains normal operating temperature, then turn the engine OFF.

Clean spark plug recesses with compressed air.

Remove the spark plugs.

Remove the oil filler cap.

Remove the air cleaner.

Calibrate the tester according to the manufacturer's instructions. The shop air source for testing should maintain 483 kPa (70 psi) minimum, 1,379 kPa (200 psi) maximum, with 552 kPa (80 psi) recommended.

Perform the test procedures on each cylinder according to the tester manufacturer's instructions. While testing, listen for pressurized air escaping through the throttle body, tailpipe and oil filler cap opening. Check for bubbles in the coolant.

All gauge pressure indications should be equal, with no more than 25% leakage per cylinder.

FOR EXAMPLE: At 552 kPa (80 psi) input pressure, a minimum of 414 kPa (60 psi) should be maintained in the cylinder.

CYLINDER COMPRESSION PRESSURE TEST

The results of a cylinder compression pressure test can be utilized to diagnose several engine malfunctions.

Ensure the battery is completely charged and the engine starter motor is in good operating condition. Otherwise the indicated compression pressures may not be valid for diagnosis purposes.

(1) Check engine oil level and add oil if necessary.

(2) Drive the vehicle until engine reaches normal operating temperature. Select a route free from traffic and other forms of congestion, observe all traffic laws, and accelerate through the gears several times briskly.

(3) Remove all spark plugs from engine. As spark plugs are being removed, check electrodes for abnormal firing indicators fouled, hot, oily, etc. Record cylinder number of spark plug for future reference.

(4) Remove the Auto Shutdown (ASD) relay from the PDC.

(5) Be sure throttle blade is fully open during the compression check.

(6) Insert compression gauge adaptor Special Tool 8116 or the equivalent, into the #1 spark plug hole in cylinder head. Connect the 0–500 psi (Blue) pressure transducer (Special Tool CH7059) with cable adap-

tors to the DRBIII®. For Special Tool identification, (Refer to 9 - ENGINE - SPECIAL TOOLS).

(7) Crank engine until maximum pressure is reached on gauge. Record this pressure as #1 cylinder pressure.

(8) Repeat the previous step for all remaining cylinders.

(9) Compression should not be less than 689 kPa (100 psi) and not vary more than 25 percent from cylinder to cylinder.

(10) If one or more cylinders have abnormally low compression pressures, repeat the compression test.

(11) If the same cylinder or cylinders repeat an abnormally low reading on the second compression test, it could indicate the existence of a problem in the cylinder in question. **The recommended compression pressures are to be used only as a guide to diagnosing engine problems. An engine should not be disassembled to determine the cause of low compression unless some malfunction is present.**

ENGINE OIL LEAK INSPECTION

Begin with a thorough visual inspection of the engine, particularly at the area of the suspected leak. If an oil leak source is not readily identifiable, the following steps should be followed:

(1) Do not clean or degrease the engine at this time because some solvents may cause rubber to swell, temporarily stopping the leak.

(2) Add an oil soluble dye (use as recommended by manufacturer). Start the engine and let idle for approximately 15 minutes. Check the oil dipstick to make sure the dye is thoroughly mixed as indicated with a bright yellow color under a black light.

(3) Using a black light, inspect the entire engine for fluorescent dye, particularly at the suspected area of oil leak. If the oil leak is found and identified, repair as necessary.

(4) If dye is not observed, drive the vehicle at various speeds for approximately 24 km (15 miles), and repeat inspection.

(5) **If the oil leak source is not positively identified at this time**, proceed with the air leak detection test method as follows:

- Disconnect the fresh air hose (make-up air) at the cylinder head cover and plug or cap the nipple on the cover.
- Remove the PCV valve hose from the cylinder head cover. Cap or plug the PCV valve nipple on the cover.
- Attach an air hose with pressure gauge and regulator to the dipstick tube.

CAUTION: Do not subject the engine assembly to more than 20.6 kpa (3 PSI) of test pressure.

- Gradually apply air pressure from 1 psi to 2.5 psi maximum while applying soapy water at the suspected source. Adjust the regulator to the suitable test pressure that provides the best bubbles which will pinpoint the leak source. If the oil leak is detected and identified, repair per service manual procedures.
- If the leakage occurs at the crankshaft rear oil seal area, refer to the section, Inspection for Rear Seal Area Leak.

(6) If no leaks are detected, turn off the air supply. Remove the air hose, all plugs, and caps. Install the PCV valve and fresh air hose (make-up air). Proceed to next step.

(7) Clean the oil off the suspect oil leak area using a suitable solvent. Drive the vehicle at various speeds approximately 24 km (15 miles). Inspect the engine for signs of an oil leak by using a black light.

NOTE: If oil leakage is observed at the dipstick tube to block location; remove the tube, clean and reseal using Mopar® Stud & Bearing Mount (press fit tube applications only), and for O-ring style tubes, remove tube and replace the O-ring seal.

INSPECTION FOR REAR SEAL AREA LEAKS

Since it is sometimes difficult to determine the source of an oil leak in the rear seal area of the engine, a more involved inspection is necessary. The following steps should be followed to help pinpoint the source of the leak.

If the leakage occurs at the crankshaft rear oil seal area:

(1) Disconnect the battery.

(2) Raise the vehicle.

(3) Remove torque converter or clutch housing cover and inspect rear of block for evidence of oil. Use a black light to check for the oil leak. If a leak is present in this area, remove transmission for further inspection.

(a) Circular spray pattern generally indicates seal leakage or crankshaft damage.

(b) Where leakage tends to run straight down, possible causes are a porous block, oil gallery cup plug, bedplate to cylinder block mating surfaces and seal bore. See proper repair procedures for these items.

(4) If no leaks are detected, pressurize the crankcase as previously described.

CAUTION: Do not exceed 20.6 kPa (3 psi).

(5) If the leak is not detected, very slowly turn the crankshaft and watch for leakage. If a leak is detected between the crankshaft and seal while slowly turning the crankshaft, it is possible the

ENGINE 2.4L DOHC (Continued)

crankshaft seal surface is damaged. The seal area on the crankshaft could have minor nicks or scratches that can be polished out with emery cloth.

CAUTION: Use extreme caution when crankshaft polishing is necessary to remove minor nicks and scratches. The crankshaft seal flange is especially machined to complement the function of the rear oil seal.

(6) For bubbles that remain steady with shaft rotation, no further inspection can be done until disassembled.

(7) After the oil leak root cause and appropriate corrective action have been identified, replace component(s) as necessary.

STANDARD PROCEDURE

REPAIR OF DAMAGED OR WORN THREADS

Damaged or worn threads (excluding spark plug and camshaft bearing cap attaching threads) can be repaired. Essentially, this repair consists of drilling out worn or damaged threads, tapping the hole with a special Heli-Coil Tap, (or equivalent) and installing an insert into the tapped hole. This brings the hole back to its original thread size.

CAUTION: Be sure that the tapped holes maintain the original center line.

Heli-Coil tools and inserts are readily available from automotive parts jobbers.

HYDROSTATIC LOCKED ENGINE

When an engine is suspected to be hydrostatically locked, regardless of what caused the problem, the following steps should be used.

CAUTION: DO NOT use starter motor to rotate the engine, severe damage may occur.

(1) Inspect air cleaner, induction system and intake manifold to insure system is dry and clear of foreign material.

(2) Remove negative battery cable.

(3) Place a shop towel around the spark plugs when removing them from the engine. This will catch any fluid that may possibly be in the cylinder under pressure.

(4) With all spark plugs removed, rotate engine crankshaft using a breaker bar and socket.

(5) Identify the fluid in the cylinder(s) (i.e., coolant, fuel, oil or other).

(6) Make sure all fluid has been removed from the cylinders. Inspect engine for damage (i.e., connecting rods, pistons, valves, etc.)

(7) Repair engine or components as necessary to prevent this problem from re-occurring.

CAUTION: Squirt approximately one teaspoon of oil into the cylinders, rotate engine to lubricate the cylinder walls to prevent damage on restart.

(8) Install new spark plugs.

(9) Drain engine oil and remove oil filter.

(10) Install a new oil filter.

(11) Fill engine with specified amount of approved oil.

(12) Connect negative battery cable.

(13) Start engine and check for any leaks.

FORM-IN-PLACE GASKETS AND SEALERS

There are numerous places where form-in-place gaskets are used on the engine. Care must be taken when applying form-in-place gaskets to assure obtaining the desired results. **Do not use form-in-place gasket material unless specified.** Bead size, continuity, and location are of great importance. Too thin a bead can result in leakage while too much can result in spill-over which can break off and obstruct fluid feed lines. A continuous bead of the proper width is essential to obtain a leak-free gasket.

There are numerous types of form-in-place gasket materials that are used in the engine area. Mopar® Engine RTV GEN II, Mopar® ATF-RTV, and Mopar® Gasket Maker gasket materials, each have different properties and can not be used in place of the other.

MOPAR® ENGINE RTV GEN II is used to seal components exposed to engine oil. This material is a specially designed black silicone rubber RTV that retains adhesion and sealing properties when exposed to engine oil. Moisture in the air causes the material to cure. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® ATF RTV is a specifically designed black silicone rubber RTV that retains adhesion and sealing properties to seal components exposed to automatic transmission fluid, engine coolants, and moisture. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® GASKET MAKER is an anaerobic type gasket material. The material cures in the absence of air when squeezed between two metallic surfaces. It will not cure if left in the uncovered tube. The

ENGINE 2.4L DOHC (Continued)

anaerobic material is for use between two machined surfaces. Do not use on flexible metal flanges.

MOPAR® BED PLATE SEALANT is a unique (green-in-color) anaerobic type gasket material that is specially made to seal the area between the bed plate and cylinder block without disturbing the bearing clearance or alignment of these components. The material cures slowly in the absence of air when torqued between two metallic surfaces, and will rapidly cure when heat is applied.

MOPAR® GASKET SEALANT is a slow drying, permanently soft sealer. This material is recommended for sealing threaded fittings and gaskets against leakage of oil and coolant. Can be used on threaded and machined parts under all temperatures. This material is used on engines with multi-layer steel (MLS) cylinder head gaskets. This material also will prevent corrosion. Mopar® Gasket Sealant is available in a 13 oz. aerosol can or 4oz./16 oz. can w/applicator.

SEALER APPLICATION

Mopar® Gasket Maker material should be applied sparingly 1 mm (0.040 in.) diameter or less of sealant to one gasket surface. Be certain the material surrounds each mounting hole. Excess material can easily be wiped off. Components should be torqued in place within 15 minutes. The use of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Engine RTV GEN II or ATF RTV gasket material should be applied in a continuous bead approximately 3 mm (0.120 in.) in diameter. All mounting holes must be circled. For corner sealing, a 3.17 or 6.35 mm (1/8 or 1/4 in.) drop is placed in the center of the gasket contact area. Uncured sealant may be removed with a shop towel. Components should be torqued in place while the sealant is still wet to the touch (within 10 minutes). The usage of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Gasket Sealant in an aerosol can should be applied using a thin, even coat sprayed completely over both surfaces to be joined, and both sides of a gasket. Then proceed with assembly. Material in a can w/applicator can be brushed on evenly over the sealing surfaces. Material in an aerosol can should be used on engines with multi-layer steel gaskets.

ENGINE GASKET SURFACE PREPARATION

To ensure engine gasket sealing, proper surface preparation must be performed, especially with the use of aluminum engine components and multi-layer steel cylinder head gaskets.

Never use the following to clean gasket surfaces:

- Metal scraper
- Abrasive pad or paper to clean cylinder block and head
- High speed power tool with an abrasive pad or a wire brush (Fig. 2)

NOTE: Multi-Layer Steel (MLS) head gaskets require a scratch free sealing surface.

Only use the following for cleaning gasket surfaces:

- Solvent or a commercially available gasket remover
- Plastic or wood scraper (Fig. 2)
- Drill motor with 3M Roloc™ Bristle Disc (white or yellow) (Fig. 2)

CAUTION: Excessive pressure or high RPM (beyond the recommended speed), can damage the sealing surfaces. The mild (white, 120 grit) bristle disc is recommended. If necessary, the medium (yellow, 80 grit) bristle disc may be used on cast iron surfaces with care.

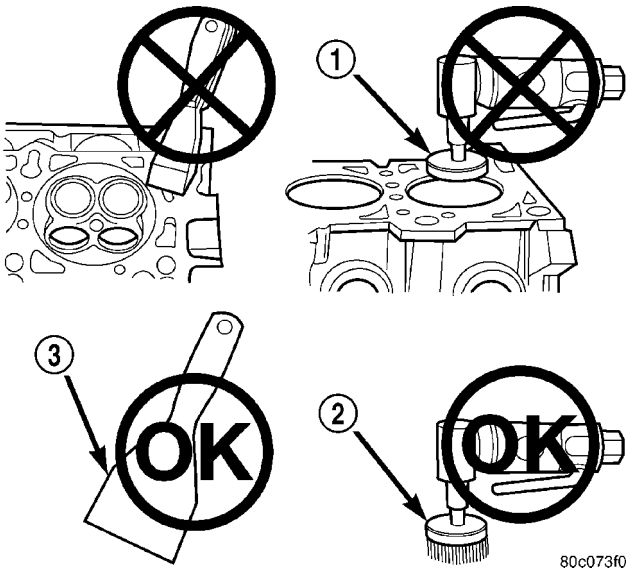

Fig. 2 Proper Tool Usage For Surface Preparation

1 - ABRASIVE PAD
2 - 3M ROLOC™ BRISTLE DISC
3 - PLASTIC/WOOD SCRAPER

ENGINE 2.4L DOHC (Continued)

ENGINE CORE AND OIL GALLERY PLUGS

Using a blunt tool such as a drift and a hammer, strike the bottom edge of the cup plug. With the cup plug rotated, grasp firmly with pliers or other suitable tool and remove plug (Fig. 3).

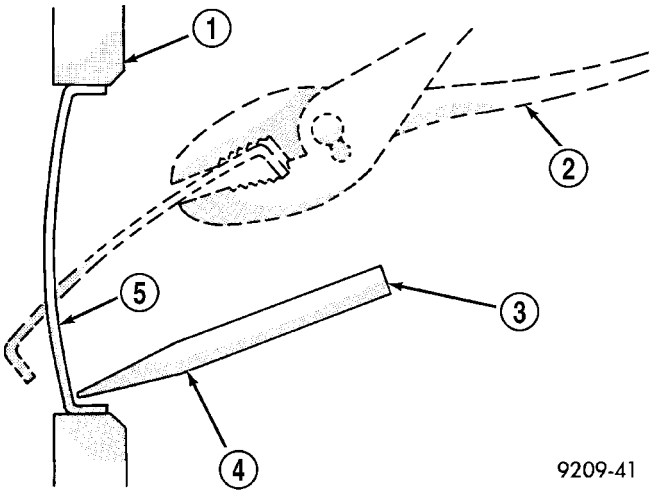

Fig. 3 Core Hole Plug Removal

1 - CYLINDER BLOCK
2 - REMOVE PLUG WITH PLIERS
3 - STRIKE HERE WITH HAMMER
4 - DRIFT PUNCH
5 - CUP PLUG

CAUTION: Do not drive cup plug into the casting as restricted cooling can result and cause serious engine problems.

Thoroughly clean inside of cup plug hole in cylinder block or head. Be sure to remove old sealer. Lightly coat inside of cup plug hole with Mopar® Stud and Bearing Mount. Make certain the new plug is cleaned of all oil or grease. Using proper drive plug, drive plug into hole so that the sharp edge of the plug is at least 0.5 mm (0.020 in.) inside the lead-in chamfer.

It is not necessary to wait for curing of the sealant. The cooling system can be refilled and the vehicle placed in service immediately.

MEASURING BEARING CLEARANCE USING PLASTIGAGE

Engine crankshaft bearing clearances can be determined by use of Plastigage or equivalent. The following is the recommended procedure for the use of Plastigage:

(1) Remove oil film from surface to be checked. Plastigage is soluble in oil.

(2) Place a piece of Plastigage across the entire width of the bearing shell in the cap approximately 6.35 mm (1/4 in.) off center and away from the oil holes (Fig. 4). (In addition, suspected areas can be checked by placing the Plastigage in the suspected area). Torque the bearing cap/bed plate bolts of the bearing being checked to the proper specifications.

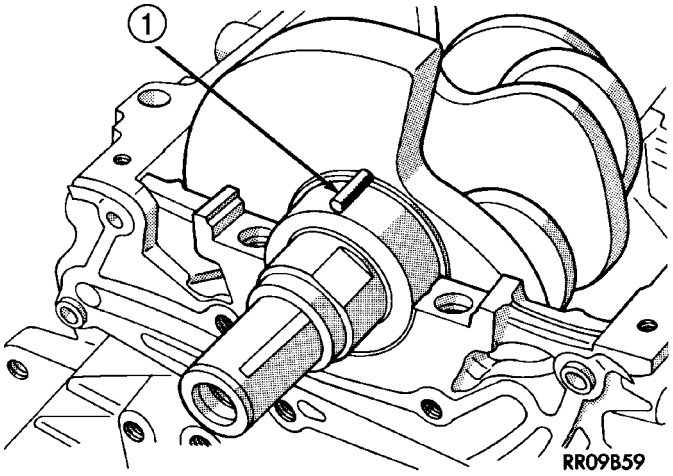

Fig. 4 Plastigage Placed in Lower Shell—Typical

1 - PLASTIGAGE

(3) Remove the bearing cap and compare the width of the flattened Plastigage with the metric scale provided on the package. Locate the band closest to the same width. This band shows the amount of clearance in thousandths of a millimeter. Differences in readings between the ends indicate the amount of taper present. Record all readings taken. Compare clearance measurements to specs found in engine specifications (Refer to 9 - ENGINE - SPECIFICATIONS). **Plastigage generally is accompanied by two scales. One scale is in inches, the other is a metric scale.**

NOTE: Plastigage is available in a variety of clearance ranges. Use the most appropriate range for the specifications you are checking.

(4) Install the proper crankshaft bearings to achieve the specified bearing clearances.

REMOVAL - ENGINE ASSEMBLY

(1) Perform fuel pressure release procedure, then disconnect and remove fuel line (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE).

(2) Remove air cleaner housing assembly and clean air hose (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).

(3) Disconnect both cables from battery.

(4) Remove battery and battery tray (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - REMOVAL).

(5) Drain cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).

ENGINE 2.4L DOHC (Continued)

(6) Discharge air conditioning system, if equipped (Refer to 24 - HEATING & AIR CONDITIONING - STANDARD PROCEDURE).

(7) Disconnect throttle and speed control cables from throttle body.

(8) Disconnect engine wiring harness at Powertrain Control Module (PCM).

(9) Disconnect positive cable from Power Distribution Center (PDC) and ground wire from vehicle body. Remove bolts attaching PDC and set aside (Fig. 5).

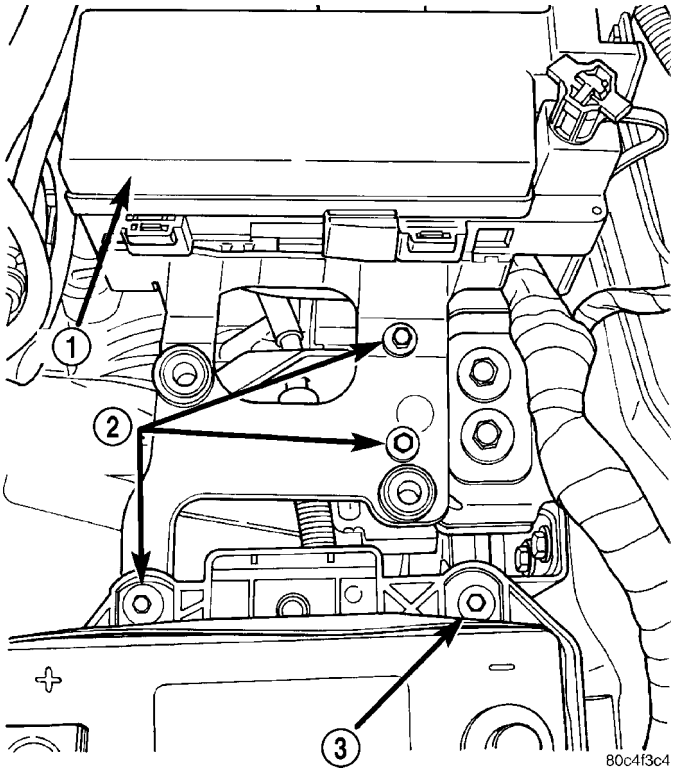

Fig. 5 PDC Bracket Attaching Bolts

1 - PDC
2 - PDC BRACKET BOLTS
3 - BATTERY TRAY BOLT

(10) Disconnect wiring connectors at lower battery tray support.

(11) Disconnect ground wire from the vehicle body-to-engine at the right side strut tower.

(12) Disconnect brake booster vacuum hose from intake manifold.

(13) Disconnect the proportional purge hose from throttle body.

(14) Disconnect coolant reserve/recovery hose from coolant outlet connector.

(15) Disconnect heater hoses.

(16) Remove grill (Refer to 23 - BODY/EXTERIOR/GRILLE - REMOVAL).

(17) Remove upper radiator closure and center brace (Refer to 23 - BODY/EXTERIOR/RADIATOR CROSSMEMBER - REMOVAL) (Fig. 6).

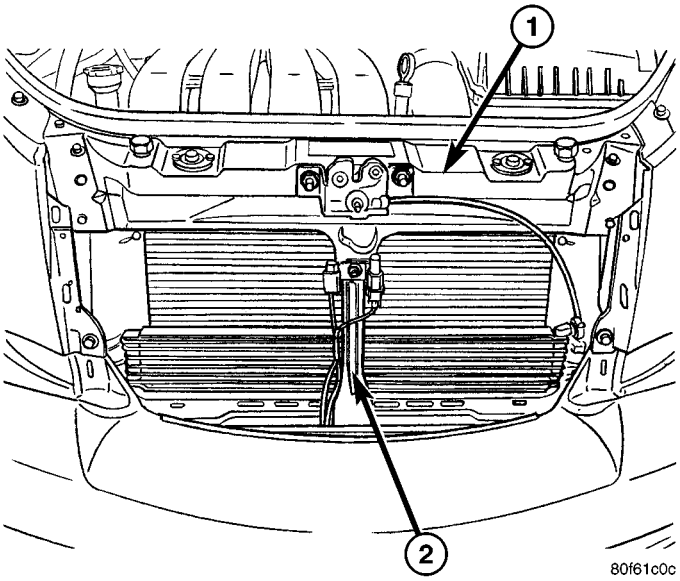

Fig. 6 Upper Radiator Closure Panel and Center Brace

1 - UPPER RADIATOR CLOSURE PANEL
2 - CENTER BRACE

(18) Remove upper radiator hose.

(19) Remove lower radiator hose.

(20) Remove thermostat housing.

(21) Disconnect upper A/C line from A/C condenser.

(22) Disconnect A/C lines at junction near upper torque strut.

(23) **Automatic Transmission equipped vehicles:**

(a) Using a blade or suitable hose cutter, cut transaxle oil cooler lines off flush with transmission fittings. Plug lines and fittings to prevent debris from entering transaxle or cooler circuit. A service splice kit will be installed upon reassembly.

(b) Disconnect transmission electrical connectors.

(c) Disconnect transmission shift linkage.

ENGINE 2.4L DOHC (Continued)

(24) **Manual Transmission equipped vehicles:**

(a) Using Special Tool 6638A, disconnect clutch hydraulic line (Fig. 7) and (Fig. 8).

(b) Disconnect transmission shift linkage.

(c) Disconnect transmission electrical connectors.

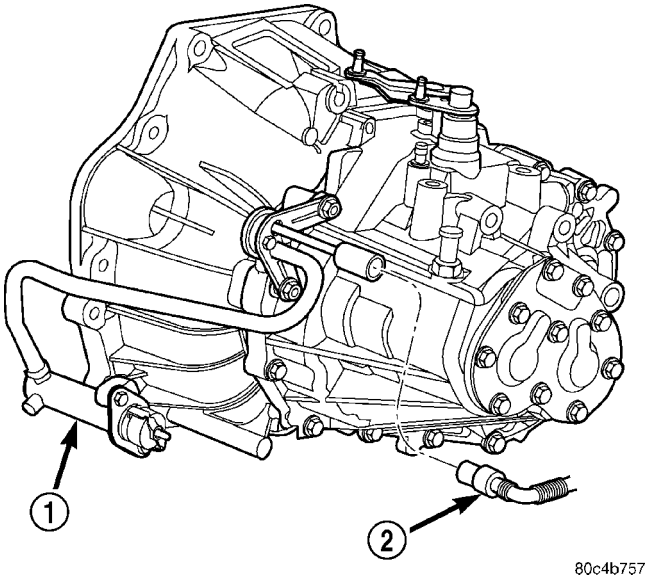

Fig. 7 Clutch Hydraulic Line to Slave Cylinder

(25) **Turbocharger equipped vehicles:** Disconnect power steering hoses from radiator.

(26) Disconnect radiator fan electrical connector and remove cooling module assembly (fan, radiator, A/C condenser, transmission oil cooler).

(27) Hoist vehicle and remove front wheels.

(28) Remove right and left inner splash shields.

(29) Remove both axle shafts (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - REMOVAL).

(30) Remove accessory drive belts (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(31) Remove generator and support brackets.

(32) **Turbocharger equipped vehicles:** Remove charge air cooler hoses (Fig. 9).

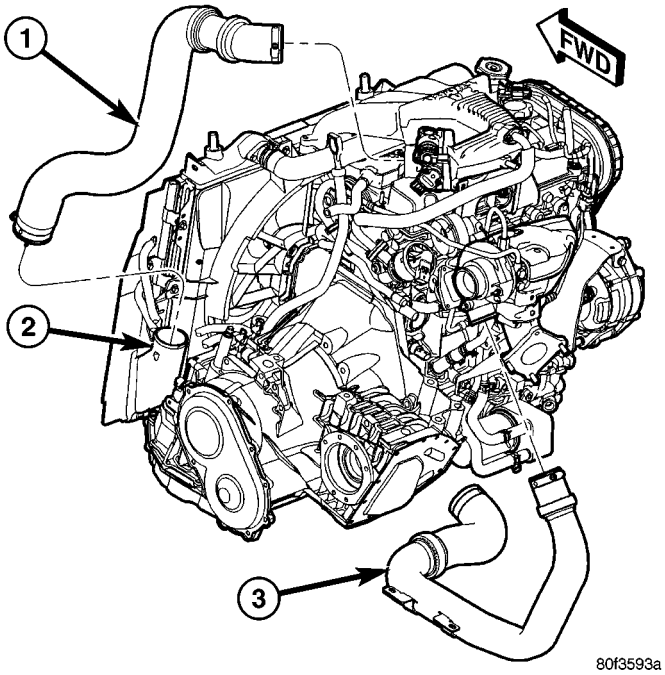

Fig. 9 Charge Air Cooler Hoses

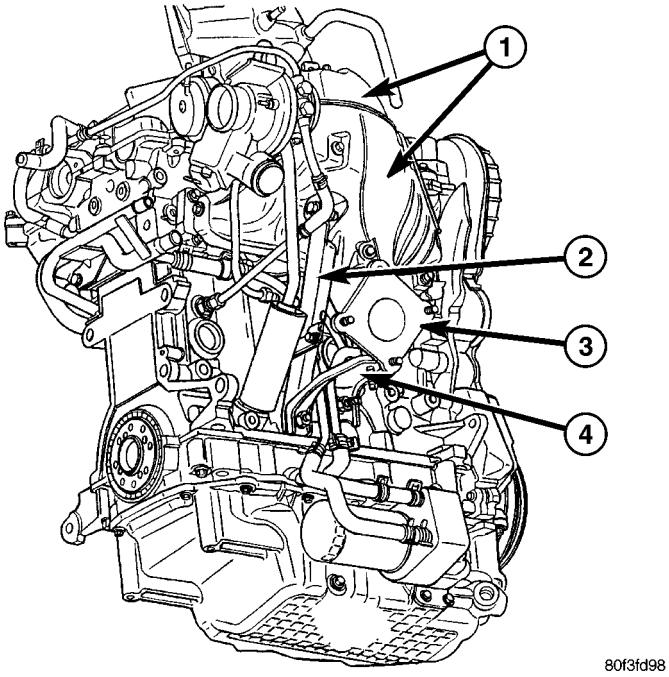

Fig. 14 Turbocharger Brackets and Heat Shields

1 - UPPER/LOWER HEAT SHIELDS
2 - TURBOCHARGER SUPPORT BRACKET
3 - ELBOW
4 - ELBOW SUPPORT BRACKET

(39) Remove structural collar (Refer to 9 - ENGINE/ENGINE BLOCK/STRUCTURAL COLLAR - REMOVAL).

(40) **Automatic Transmission equipped vehicles:**

(a) Remove torque converter bolts and mark converter to flex plate orientation for reassembly.

(41) **Manual Transmission equipped vehicles:**

(a) Remove drive plate to clutch module bolts.

(42) Remove lower engine torque strut (Refer to 9 - ENGINE/ENGINE MOUNTING/TORQUE STRUT - REMOVAL).

(43) Lower vehicle and remove A/C compressor.

(44) Disconnect power steering lines from power steering pump.

(45) Remove power steering pump.

(46) Raise vehicle enough to allow engine dolly, cradle, and posts, (Special Tools 6135, 6710, and 6848) to be installed under vehicle. For Special Tool identification (Refer to 9 - ENGINE - SPECIAL TOOLS).

(47) Loosen engine support posts to allow movement for positioning onto engine locating holes and flange on the engine bedplate. Lower vehicle and position cradle until the engine is resting on support posts (Fig. 17). Tighten mounts to cradle frame. This will keep support posts from moving when removing or installing engine and transmission.

(48) Install safety straps around the engine to cradle (Fig. 17). Tighten straps and lock them into position.

WARNING: Safety straps MUST be used.

(49) Raise vehicle enough to determine if straps are secure enough to hold cradle assembly to engine.

(50) Lower vehicle so weight of the engine and transmission ONLY is on the cradle assembly.

(51) Remove the upper engine torque strut.

(52) Remove right mount through bolt (Fig. 15) and left mount attaching bolts (Fig. 16).

(53) Raise vehicle slowly until engine/transaxle assembly clears engine compartment. It may be necessary to move the engine/transmission assembly with the cradle to allow for removal around body flanges.

INSTALLATION - ENGINE ASSEMBLY

(1) Position engine and transmission assembly under vehicle and slowly lower the vehicle over the engine/transaxle assembly.

(2) Continue lowering vehicle until engine/transaxle aligns to mounting locations. Install mounting bolts at the right and left engine/transaxle mounts (Fig. 15) and (Fig. 16). Tighten bolts to 118 N·m (87 ft. lbs.).

(3) Install upper engine torque strut.

(4) Remove safety straps from engine/transaxle assembly. Slowly raise vehicle enough to remove the engine dolly and cradle.

(5) Install power steering pump.

(6) Connect power steering lines to power steering pump.

(7) Install A/C compressor.

(8) Install lower engine torque strut (Refer to 9 - ENGINE/ENGINE MOUNTING/TORQUE STRUT - INSTALLATION).

(9) **Automatic Transmission equipped vehicles:**

(a) Install torque converter bolts.

(10) **Manual Transmission equipped vehicles:**

(a) Install drive plate to clutch module bolts.

(11) Install structural collar (Refer to 9 - ENGINE/ENGINE BLOCK/STRUCTURAL COLLAR - INSTALLATION).

(12) **Turbocharger equipped vehicles:** Install elbow, turbocharger support bracket, elbow support bracket, and upper and lower heat shields (Fig. 14).

(13) **Non-Turbo equipped vehicles:** Connect power steering pressure hose to steering gear (Fig. 12).

(14) **Turbocharger equipped vehicles:** Connect both power steering hoses to steering gear (Fig. 13).

(15) Connect exhaust system to manifold (Fig. 10) or (Fig. 11).

(16) Connect the downstream oxygen sensor.

(17) **Turbocharger equipped vehicles:** Install charge air cooler hoses (Fig. 9).

(18) Install generator and mounting brackets.

(19) Install accessory drive belts (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(20) Install axle shafts (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - INSTALLATION).

(21) Install right inner splash shield.

(22) Install wheels and lower vehicle.

(23) Install cooling module assembly (fan, radiator, A/C condenser, transmission oil cooler). Connect radiator fan electrical connector.

(24) **Turbocharger equipped vehicles:** Connect power steering hoses to radiator.

(25) **Manual Transmission equipped vehicles:**

(a) Connect clutch hydraulic line (Fig. 7).

ENGINE 2.4L DOHC (Continued)

(b) Connect transmission shift linkage.
(c) Connect transmission electrical connectors.

NOTE: It is not necessary to bleed the clutch hydraulic system. The quick-connect fittings close immediately after disconnection; allowing no fluid to escape.

(26) **Automatic Transmission equipped vehicles:**
(a) Connect transmission oil cooler lines using service splice kit. Refer to instructions provided with kit.
(b) Connect transmission electrical connectors.
(c) Connect transmission shift linkage.

(27) Connect A/C lines at junction near upper torque strut.

(28) Connect upper A/C line to A/C condenser.

(29) Install upper and lower radiator hoses.

(30) Install upper radiator closure panel and center brace (Refer to 23 - BODY/EXTERIOR/RADIATOR CLOSURE PANEL - INSTALLATION) (Fig. 18).

(31) Install grille (Refer to 23 - BODY/EXTERIOR/GRILLE - INSTALLATION).

(32) Connect fuel line and heater hoses.

(33) Connect coolant reserve/recovery hose to coolant outlet connector.

(34) Connect brake booster vacuum hose to intake manifold.

(35) Connect the proportional purge hose to throttle body.

(36) Install all ground straps and connect engine wiring harness.

(37) Position PDC and install bolts (Fig. 5). Connect positive battery cable to PDC and ground wire to vehicle body.

(38) Connect engine wiring harness at Powertrain Control Module (PCM).

(39) Connect throttle and speed control cables.

(40) Install battery tray and battery (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - INSTALLATION).

(41) Connect cables to battery.

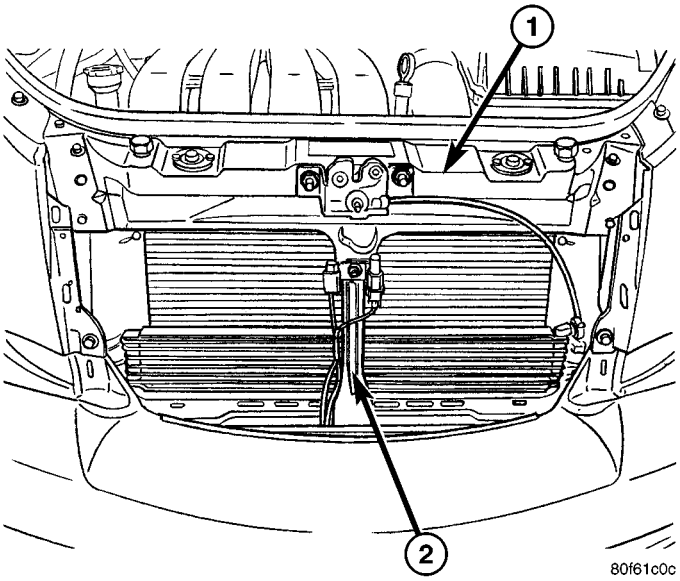

Fig. 18 Upper Radiator Closure Panel and Center Brace

1 - UPPER RADIATOR CLOSURE PANEL
2 - CENTER BRACE

(42) Install air cleaner housing assembly and connect clean air hose (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - INSTALLATION).

(43) Install oil filter. Fill engine crankcase with proper oil to correct level.

(44) Fill power steering system.

(45) Fill cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).

(46) Evacuate and recharge A/C system (Refer to 24 - HEATING & AIR CONDITIONING - STANDARD PROCEDURE).

(47) Start engine and run until operating temperature is reached.

(48) Perform torque strut adjustment procedure (Refer to 9 - ENGINE/ENGINE MOUNTING/TORQUE STRUT - ADJUSTMENTS).

(49) Adjust transmission linkage, if necessary.

AIR CLEANER ELEMENT

REMOVAL

(1) Unfasten clasps on sides of air cleaner housing cover. Lift cover off air cleaner housing (Fig. 19).

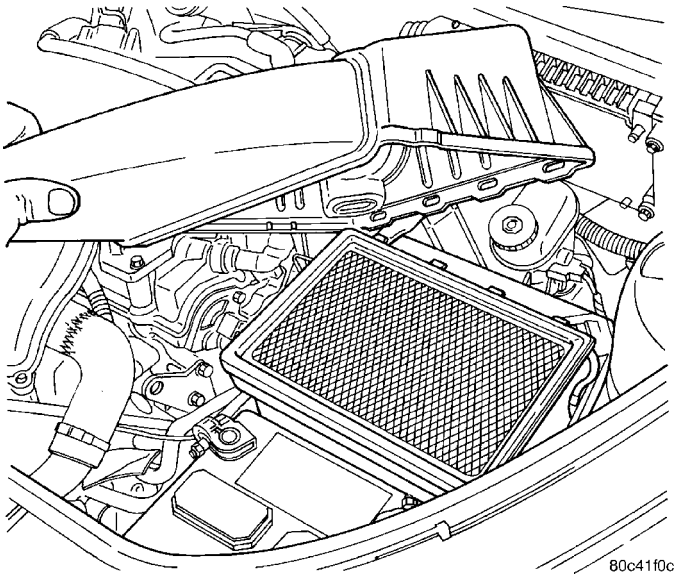

Fig. 19 Air Cleaner Cover

(2) Remove filter element.

(3) If necessary, clean the inside of the air cleaner housing.

INSTALLATION

(1) Install new filter element.

(2) Place cover over air cleaner housing. Snap clasps in place.

AIR CLEANER HOUSING

REMOVAL

(1) Disconnect the throttle body air inlet hose/ clean air hose from the air cleaner housing (Fig. 20) or (Fig. 21) and (Fig. 22).

(2) Pull air cleaner housing straight up to remove.

(3) Remove the inlet duct from the air cleaner housing.

INSTALLATION

(1) Install inlet duct to the air cleaner housing.

(2) Make sure the rubber grommets, for the air cleaner housing lower pins, are in place when reinstalling the air cleaner housing. The rubber grommets mount to the PDC bracket (Fig. 20) or (Fig. 21).

(3) Push air cleaner housing down while aligning pins into the grommets.

(4) Connect the throttle body air inlet hose/clean air hose to the air cleaner housing (Fig. 20) or (Fig. 21) and (Fig. 22).

CYLINDER HEAD

DESCRIPTION

The cross flow designed, aluminum cylinder head contains dual over-head camshafts with four valves per cylinder (Fig. 23). The valves are arranged in two in-line banks. The intake valves face toward the front of the vehicle. The exhaust valves face the dash panel. The cylinder head incorporates powdered metal valve guides and seats. The cylinder head is sealed to the block using a multi-layer steel head gasket and retaining bolts.

Integral oil galleries provide lubrication passages to the hydraulic lash adjusters, camshafts, and valve mechanisms.

DIAGNOSIS AND TESTING

CYLINDER HEAD GASKET

A cylinder head gasket leak can be located between adjacent cylinders or between a cylinder and the adjacent water jacket.

Possible indications of the cylinder head gasket leaking between adjacent cylinders are:

- Loss of engine power
- Engine misfiring
- Poor fuel economy

Possible indications of the cylinder head gasket leaking between a cylinder and an adjacent water jacket are:

- Engine overheating
- Loss of coolant
- Excessive steam (white smoke) emitting from exhaust
- Coolant foaming

CYLINDER-TO-CYLINDER LEAKAGE TEST

To determine if an engine cylinder head gasket is leaking between adjacent cylinders, follow the procedures in Cylinder Compression Pressure Test (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING). An engine cylinder head gasket leaking between adjacent cylinders will result in approximately a 50–70% reduction in compression pressure.

CYLINDER-TO-WATER JACKET LEAKAGE TEST

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING WITH COOLANT PRESSURE CAP REMOVED.

VISUAL TEST METHOD

With the engine cool, remove the coolant pressure cap. Start the engine and allow it to warm up until thermostat opens.

CYLINDER HEAD (Continued)

If a large combustion/compression pressure leak exists, bubbles will be visible in the coolant.

COOLING SYSTEM TESTER METHOD

WARNING: WITH COOLING SYSTEM TESTER IN PLACE, PRESSURE WILL BUILD UP FAST. EXCESSIVE PRESSURE BUILT UP, BY CONTINUOUS ENGINE OPERATION, MUST BE RELEASED TO A SAFE PRESSURE POINT. NEVER PERMIT PRESSURE TO EXCEED 138 kPa (20 psi).

Install Cooling System Tester 7700 or equivalent to pressure cap neck. Start the engine and observe the tester's pressure gauge. If gauge pulsates with every power stroke of a cylinder a combustion pressure leak is evident.

CHEMICAL TEST METHOD

Combustion leaks into the cooling system can also be checked by using Bloc-Chek Kit C-3685-A or equivalent. Perform test following the procedures supplied with the tool kit.

REMOVAL - CYLINDER HEAD

(1) Perform fuel system pressure release procedure **before attempting any repairs (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE).**

(2) Remove clean air hose and air cleaner housing (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).

(3) Disconnect negative cable from battery.

(4) Drain cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).

(5) Remove upper intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).

(6) Remove fastener attaching dipstick tube to lower intake manifold (Fig. 24) or (Fig. 25).

(7) **Turbocharger equipped vehicles:** Remove lower intake manifold support bracket (Fig. 25).

(8) Disconnect the fuel supply line quick-connect at the fuel rail assembly (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE).

(9) Remove heater tube support bracket from cylinder head.

(10) Remove upper radiator hose. Disconnect heater hoses from thermostat housing.

(11) Disconnect engine coolant temperature sensor connector.

(12) Remove accessory drive belts (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(13) Disconnect exhaust pipe from manifold.

(14) **Turbocharger equipped vehicles:** (Fig. 26)

(15) **Turbocharger equipped vehicles:** (Refer to 11 - EXHAUST SYSTEM/TURBOCHARGER SYSTEM/LINES AND HOSES - REMOVAL) (Fig. 27).

- Remove oil return tube
- Remove oil supply line
- Remove coolant supply line
- Remove coolant return line

(16) Disconnect ignition coil wiring connector. Remove ignition coil and plug wires from engine.

(17) Disconnect camshaft position sensor wiring connector.

(18) Remove timing belt and camshaft sprockets (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT AND SPROCKETS - REMOVAL).

(19) Remove timing belt idler pulley and rear timing belt cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT COVER(S) - REMOVAL).

(20) **Non-Turbo equipped vehicles:** Remove fasteners securing power steering pump fluid reservoir/bracket to cylinder head.

(21) Remove cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER - REMOVAL).

(22) Remove camshafts (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - REMOVAL).

(23) Remove rocker arms.

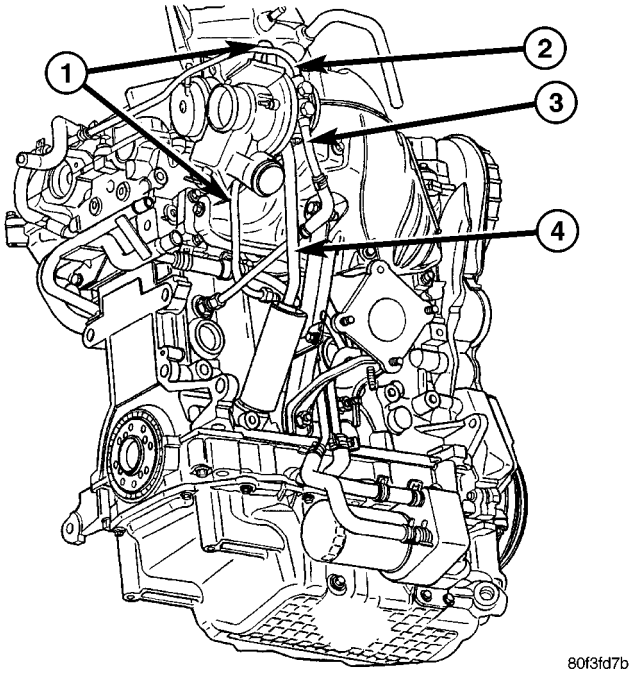

Fig. 27 Turbocharger Lines and Hoses

1 - OIL SUPPLY LINE
2 - COOLANT RETURN LINE
3 - COOLANT SUPPLY LINE
4 - OIL RETURN TUBE

(24) Remove cylinder head bolts in the reverse sequence of tightening (Fig. 33).

(25) Remove cylinder head from engine block.

(26) Inspect and clean cylinder head and block sealing surfaces. Refer to Cleaning and Inspection in this section for procedures.

NOTE: Ensure cylinder head bolt holes in the block are clean, dry (free of residual oil or coolant), and threads are not damaged.

CLEANING

To ensure engine gasket sealing, proper surface preparation must be performed, especially with the use of aluminum engine components and multi-layer steel cylinder head gaskets.

NOTE: Multi-Layer Steel (MLS) head gaskets require a scratch free sealing surface.

Remove all gasket material from cylinder head and block (Refer to 9 - ENGINE - STANDARD PROCEDURE). Be careful not to gouge or scratch the aluminum head sealing surface.

Clean all engine oil passages.

CYLINDER HEAD (Continued)

INSPECTION

(1) Cylinder head must be flat within 0.1 mm (0.004 in.) (Fig. 28).

(2) Inspect camshaft bearing journals for scoring.

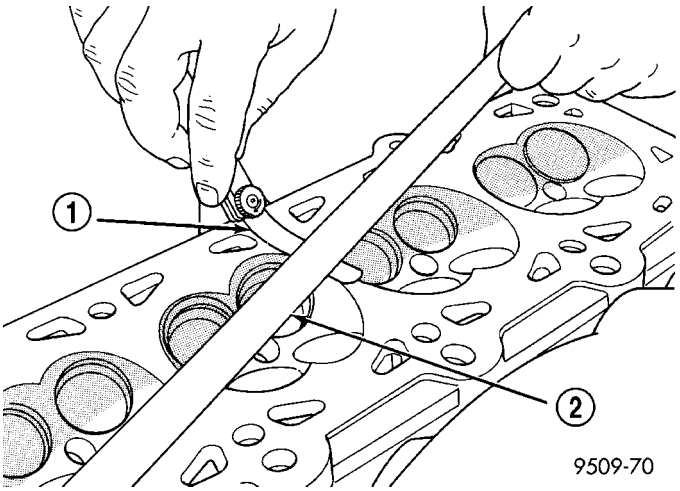

Fig. 28 Checking Cylinder Head Flatness

1 - FEELER GAUGE
2 - STRAIGHT EDGE

(3) Remove carbon and varnish deposits from inside of valve guides with a reliable guide cleaner.

(4) Using a small hole gauge and a micrometer, measure valve guides in 3 places top, middle and bottom (Fig. 29). (Refer to 9 - ENGINE - SPECIFICATIONS) Replace guides if they are not within specification.

(5) Check valve guide height (Fig. 30).

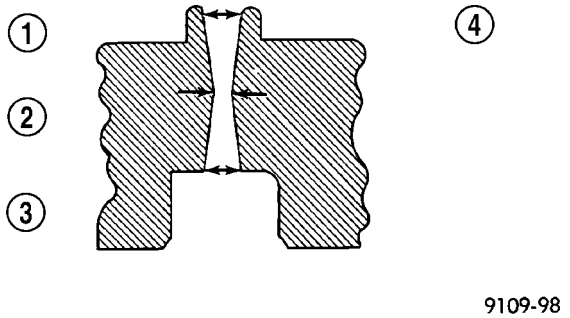

Fig. 29 Checking Wear on Valve Guide—Typical

1 - TOP
2 - MIDDLE
3 - BOTTOM
4 - CUT AWAY VIEW OF VALVE GUIDE MEASUREMENT LOCATIONS

INSTALLATION - CYLINDER HEAD

NOTE: The Cylinder head bolts should be examined BEFORE reuse. If the threads are necked down, the bolts should be replaced (Fig. 31).

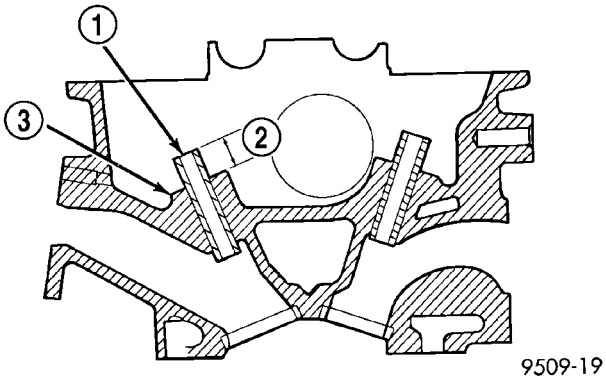

Fig. 30 Valve Guide Height

1 - VALVE GUIDE
2 - 13.25 - 13.75 MM (0.521 - 0.541 IN.)
3 - SPRING SEAT

Necking can be checked by holding a scale or straight edge against the threads. If all the threads do not contact the scale, the bolt should be replaced.

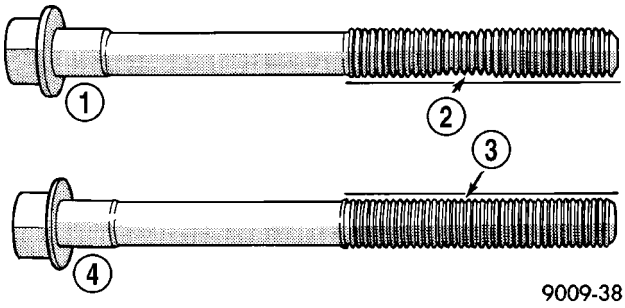

Fig. 31 Checking Bolts for Stretching (Necking)

1 - STRETCHED BOLT
2 - THREADS ARE NOT STRAIGHT ON LINE
3 - THREADS ARE STRAIGHT ON LINE
4 - UNSTRETCHED BOLT

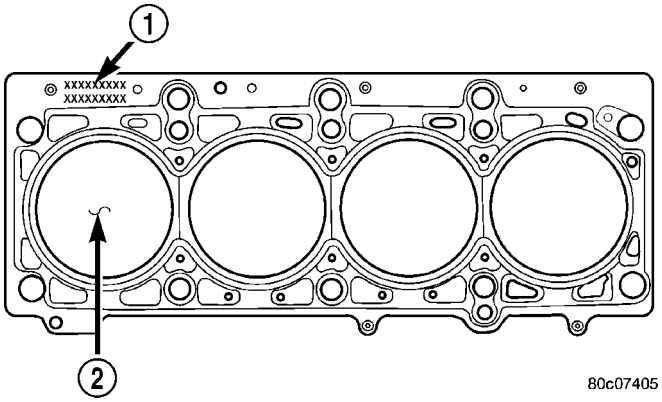

Fig. 32 Cylinder Head Gasket Positioning

1 - PART NUMBER FACES UP
2 - NO. 1 CYLINDER

CYLINDER HEAD (Continued)

NOTE: Head gaskets for Non-Turbo and Turbo applications are NOT interchangeable.

(1) Position the new cylinder head gasket on engine block with the part number facing up (Fig. 32). Ensure gasket is seated over the locating dowels in block.

(2) Position cylinder head onto engine block.

(3) Before installing the bolts, the threads should be lightly coated with engine oil.

(4) For **Non -Turbo equiped** engines tighten the cylinder head bolts in the sequence shown in (Fig. 33). Using the 4 step torque-turn method, tighten according to the following values:

- First: All to 34 N·m (25 ft. lbs.)
- Second: All to 68 N·m (50 ft. lbs.)
- Third: All to 68 N·m (50 ft. lbs.)

CAUTION: Do not use a torque wrench for the Fourth step.

- **Fourth: Turn all bolts an additional 1/4 Turn**

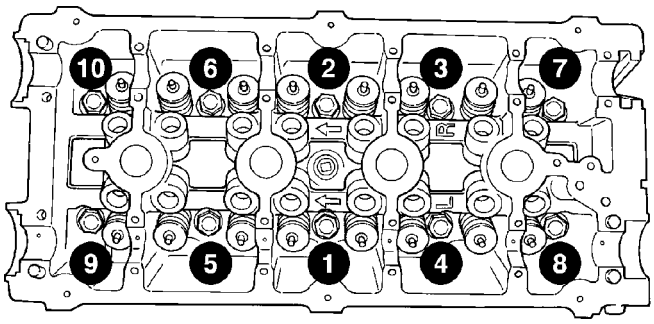

Fig. 33 Cylinder Head Tightening Sequence

(5) For **Turbo equiped** engines tighten the cylinder head bolts in the sequence shown in (Fig. 33). Using the 4 step torque-turn method, tighten according to the following values:

- First: All to 34 N·m (25 ft. lbs.)
- Second: All to 82 N·m (60 ft. lbs.)
- Third: All to 82 N·m (60 ft. lbs.)

CAUTION: Do not use a torque wrench for the Fourth step.

- **Fourth: Turn all bolts an additional 1/4 Turn**

(6) Install rocker arms and camshafts (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - INSTALLATION).

(7) Install cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER - INSTALLATION).

(8) Install rear timing belt cover and timing belt idler pulley (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT COVER(S) - INSTALLATION).

(9) Install camshaft sprockets and timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT AND SPROCKETS - INSTALLATION).

(10) Connect cam sensor wiring connector.

(11) Install ignition coil and plug wires. Connect ignition coil wiring connector.

(12) **Non-Turbo equipped vehicles:** Install power steering pump reservoir/bracket to cylinder head.

(13) **Turbocharger equipped vehicles:** (Refer to 11 - EXHAUST SYSTEM/TURBOCHARGER SYSTEM/LINES AND HOSES - INSTALLATION) (Fig. 27).

- Install coolant return line
- Install coolant supply line
- Install oil supply line
- Install oil return tube

(14) **Turbocharger equipped vehicles:** (Fig. 26)

- Install elbow
- Install turbocharger support bracket
- Install elbow support bracket
- Install turbocharger heat shields

(15) Install exhaust pipe to manifold. Tighten fasteners to 28 N·m (20 ft. lbs.).

(16) Install accessory drive belts (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(17) Connect engine coolant temperature sensor connector.

(18) Connect upper radiator hose. Connect heater hoses to thermostat housing.

(19) Install heater tube support bracket to cylinder head.

(20) **Turbocharger equipped vehicles:** Install lower intake manifold support bracket (Fig. 25).

(21) Install fastener attaching dipstick tube to lower intake manifold (Fig. 24) or (Fig. 25).

(22) Connect fuel supply line quick-connect at the fuel rail assembly (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE).

(23) Install upper intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).

(24) Fill cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).

(25) Connect negative cable to battery.

(26) Install clean air hose and air cleaner housing (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - INSTALLATION).

CAMSHAFT OIL SEAL(S)

REMOVAL

(1) Remove timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT AND SPROCKETS - REMOVAL).

(2) Hold each camshaft sprocket with Special Tool 6847 while removing center bolt (Fig. 34).

(3) Remove camshaft sprockets.

(4) Remove rear timing belt cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT COVER(S) - REMOVAL).

(5) Remove camshaft seal using Special Tool C-4679A (Fig. 35).

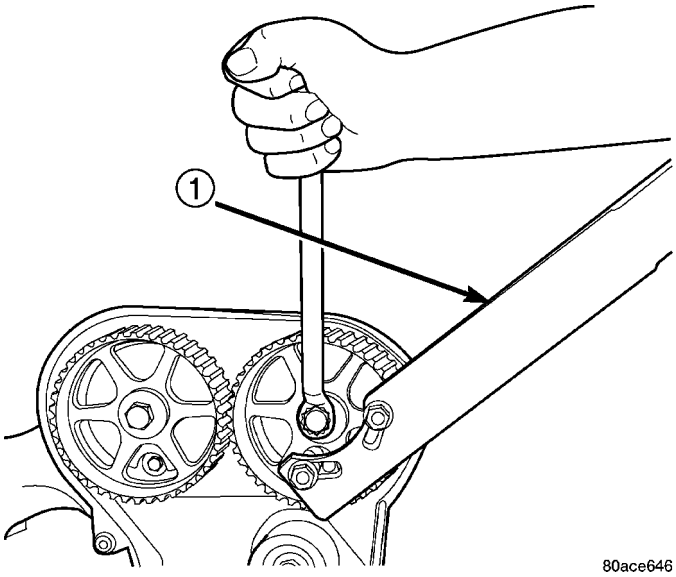

Fig. 34 Camshaft Sprocket - Removal/Installation

1 - SPECIAL TOOL 6847

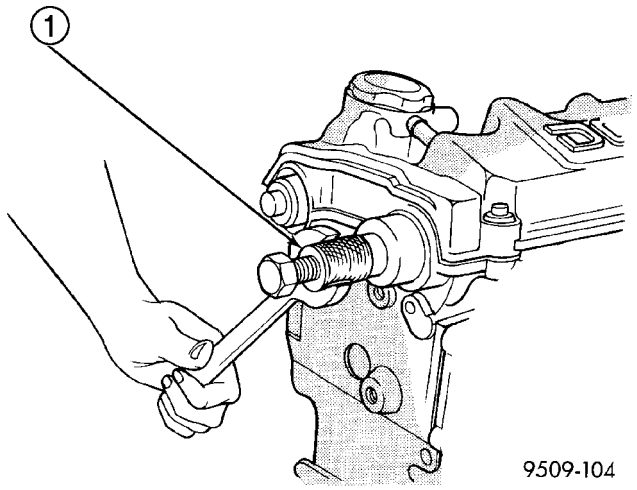

Fig. 35 Camshaft Oil Seal - Removal With C-4679A

1 - SPECIAL TOOL C-4679

CAUTION: Do not nick shaft seal surface or seal bore.

INSTALLATION

(1) Shaft seal surface must be free of varnish, dirt or nicks. Polish with 400 grit paper if necessary.

(2) Install camshaft seals into cylinder head using Special Tool MD-998306 until flush with head (Fig. 36).

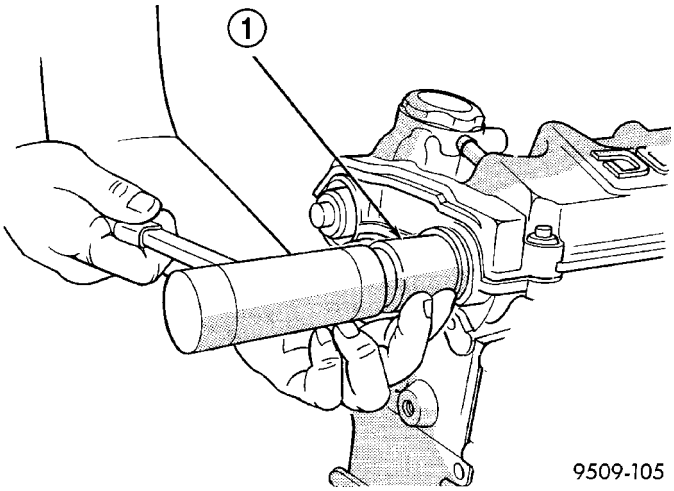

Fig. 36 Camshaft Seal - Installation

1 - SPECIAL TOOL MD-998306

(3) Install timing belt rear cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT COVER(S) - INSTALLATION).

(4) Install camshaft sprockets. Hold each sprocket with Special Tool 6847 and tighten center bolt to 115 N·m (85 ft. lbs.) (Fig. 34).

(5) Install timing belt and front covers (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT AND SPROCKETS - INSTALLATION) (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT COVER(S) - INSTALLATION).

CAMSHAFT(S)

DESCRIPTION

Both camshafts have six bearing journal surfaces and two cam lobes per cylinder (Fig. 37). Flanges at the rear journals control camshaft end play. Provision for a cam position sensor is located on the intake camshaft on the rear of the cylinder head. A hydrodynamic oil seal is used for oil control at the front of the camshaft.

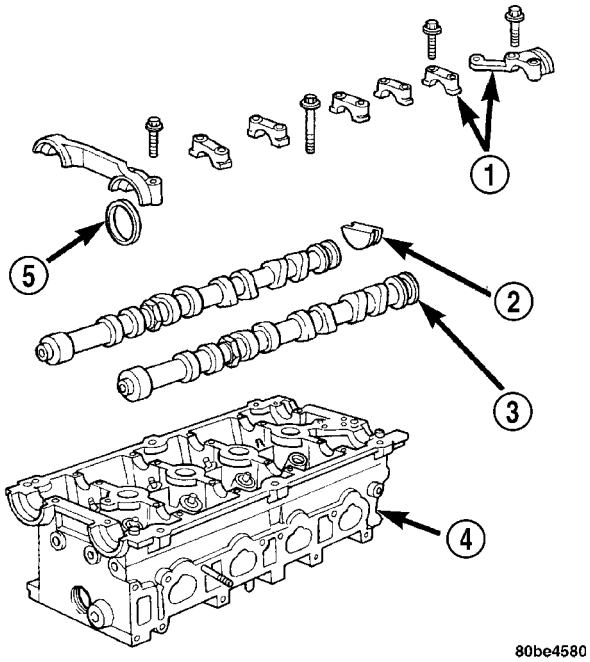

Fig. 37 Camshafts

1 - CAMSHAFT BEARING CAPS
2 - PLUG
3 - CAMSHAFT
4 - CYLINDER HEAD
5 - CAMSHAFT OIL SEAL

OPERATION

The camshaft is driven by the crankshaft via drive sprockets and belt. The camshaft has precisely machined lobes to provide accurate valve timing and duration.

STANDARD PROCEDURE

MEASURING CAMSHAFT END PLAY

(1) Oil camshaft journals and install camshaft **WITHOUT** rocker arms. Install rear cam caps and tighten screws to specified torque.

(2) Using a suitable tool, move camshaft as far rearward as it will go.

(3) Zero dial indicator (Fig. 38).

(4) Move camshaft as far forward as it will go.

(5) Record reading on dial indicator. For end play specification, (Refer to 9 - ENGINE - SPECIFICATIONS).

(6) If end play is excessive, check cylinder head and camshaft for wear; replace as necessary.

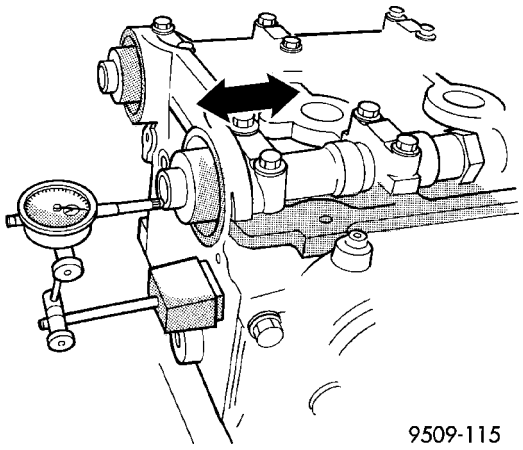

Fig. 38 Camshaft End Play - Typical

REMOVAL

(1) Remove cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER - REMOVAL).

(2) Remove camshaft position sensor and camshaft target magnet (Refer to 8 - ELECTRICAL/IGNITION CONTROL/CAMSHAFT POSITION SENSOR - REMOVAL).

(3) Remove timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT AND SPROCKETS - REMOVAL).

(4) Remove camshaft sprockets and timing belt rear cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT COVER(S) - REMOVAL).

(5) Bearing caps are identified for location. Remove the outside bearing caps first (Fig. 39).

(6) Loosen the camshaft bearing cap attaching fasteners in sequence shown (Fig. 40) one camshaft at a time.

CAUTION: Camshafts are not interchangeable. The intake cam number 6 thrust bearing face spacing is wider.

(7) Identify the camshafts before removing from the head. The camshafts are not interchangeable.

(8) Remove camshafts from cylinder head.

NOTE: If removing rocker arms, identify for reinstallation in the original position.

CLEANING

Clean camshaft with a suitable solvent.

CAMSHAFT(S) (Continued)

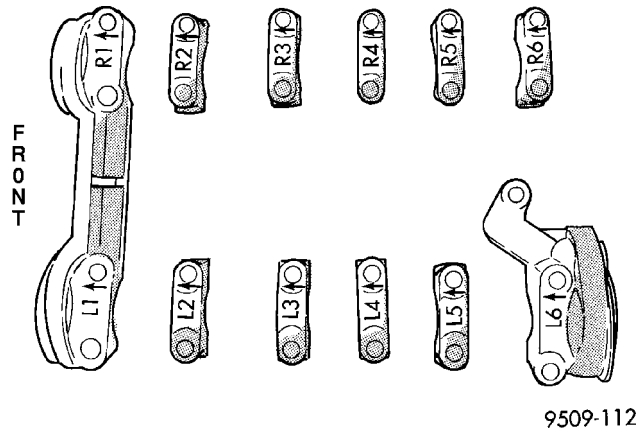

Fig. 39 Camshaft Bearing Cap Identification

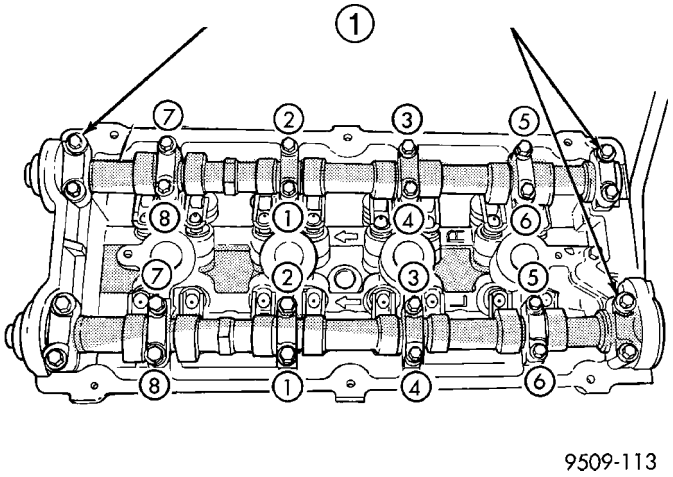

Fig. 40 Camshaft Bearing Cap - Removal

1 - REMOVE OUTSIDE BEARING CAPS FIRST

INSPECTION

(1) Inspect camshaft bearing journals for damage and binding (Fig. 41). If journals are binding, check the cylinder head for damage. Also check cylinder head oil holes for clogging.

(2) Check the cam lobe and bearing surfaces for abnormal wear and damage. Replace camshaft if defective.

NOTE: If camshaft is replaced due to lobe wear or damage, always replace the rocker arms.

(3) Measure the lobe actual wear (unworn area - wear zone = actual wear) (Fig. 41) and replace camshaft if out of limit. Standard value is 0.0254 mm (0.001 in.), wear **limit** is 0.254 mm (0.010 in.).

INSTALLATION

CAUTION: Ensure that NONE of the pistons are at top dead center when installing the camshafts.

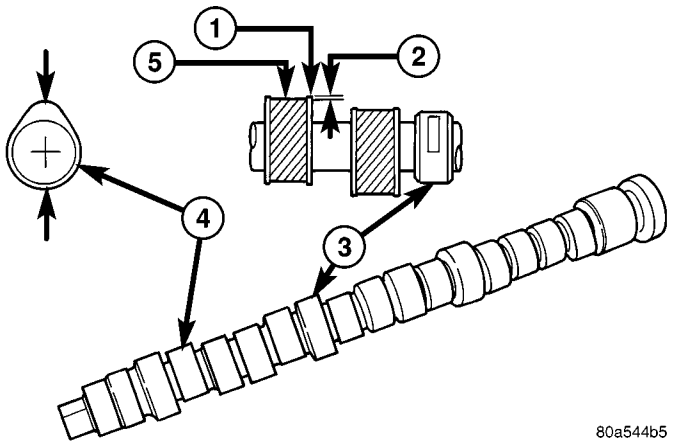

Fig. 41 Checking Camshaft(s) for Wear

1 - UNWORN AREA
2 - ACTUAL WEAR
3 - BEARING JOURNAL
4 - LOBE
5 - WEAR ZONE

(1) Lubricate all camshaft bearing journals, rocker arms and camshaft lobes.

(2) Install all rocker arms in original positions, if reused.

(3) Position camshafts on cylinder head bearing journals. Install right and left camshaft bearing caps No. 2 – 5 and right No. 6. Tighten M6 fasteners to 12 N·m (105 in. lbs.) in sequence shown in (Fig. 42).

(4) Apply Mopar® Gasket Maker to No. 1 and No. 6 bearing caps (Fig. 43). Install bearing caps and tighten M8 fasteners to 28 N·m (250 in. lbs.).

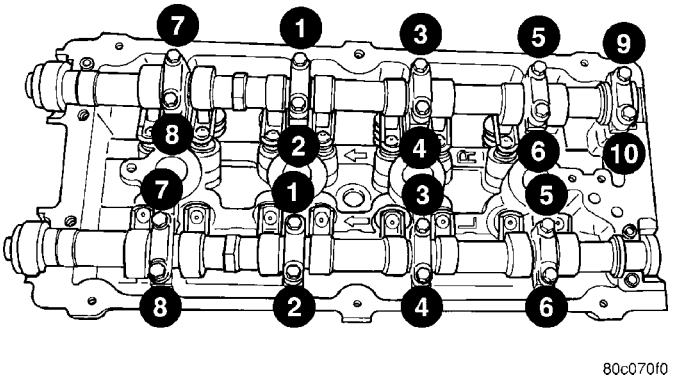

Fig. 42 Camshaft Bearing Cap Tightening Sequence

NOTE: Bearing end caps must be installed before seals can be installed.

(5) Install camshaft oil seals (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT OIL SEAL(S) - INSTALLATION).

(6) Install camshaft target magnet and camshaft position sensor.

(7) Install cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER - INSTALLATION).

CAMSHAFT(S) (Continued)

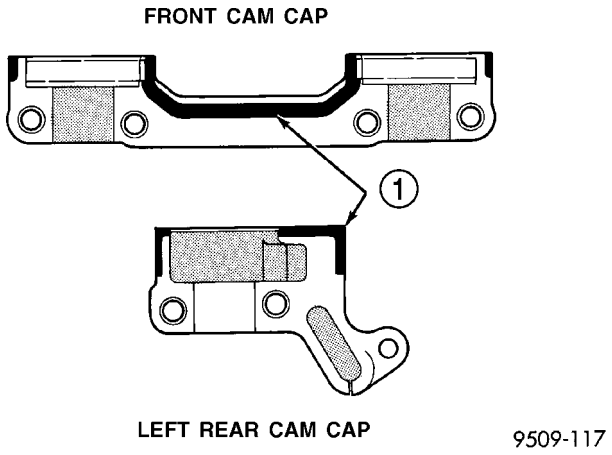

Fig. 43 Camshaft Bearing Cap Sealing

1 - 1.5 mm (.060 in.) DIAMETER BEAD OF MOPAR GASKET MAKER

(8) Install timing belt rear cover and camshaft sprockets (Refer to 9 - ENGINE/VALVE TIMING/ TIMING BELT COVER(S) - INSTALLATION).

(9) Install timing belt (Refer to 9 - ENGINE/ VALVE TIMING/TIMING BELT AND SPROCKETS - INSTALLATION).

CYLINDER HEAD COVER

REMOVAL

(1) Remove upper intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).

(2) Remove ignition coil and spark plug wires.

(3) Disconnect PCV and make-up air hoses from cylinder head cover (Fig. 44).

(4) Remove cylinder head cover bolts.

CAUTION: When removing cylinder head cover bolts, be careful not to interchange the two (2) center bolts with the seven (7) perimeter bolts. The two (2) center bolts contain an aluminum washer between the bolt head and torque limiter for sealing purposes.

(5) Remove cylinder head cover from cylinder head.

INSTALLATION

NOTE: Replace spark plug well seals and bolt seals when installing a new cylinder head cover gasket.

(1) Install new cylinder head cover gaskets (Fig. 45) and spark plug well seals (Fig. 46).

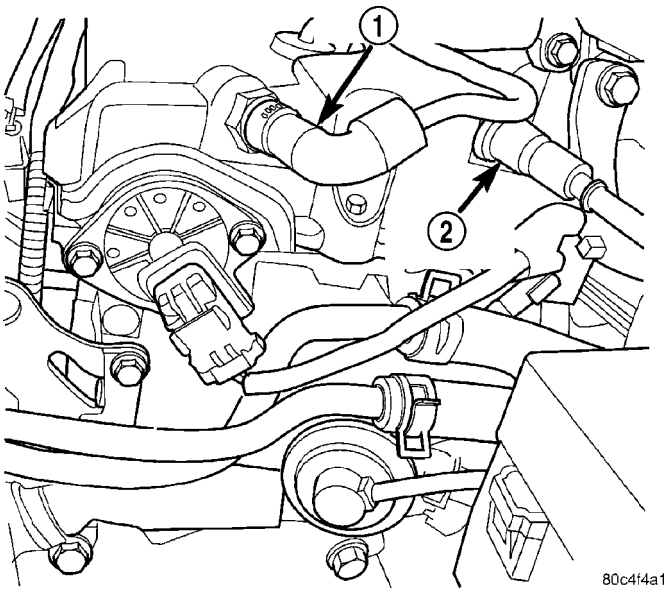

Fig. 44 PCV and Make-up

1 - PCV HOSE
2 - MAKE-UP AIR HOSE

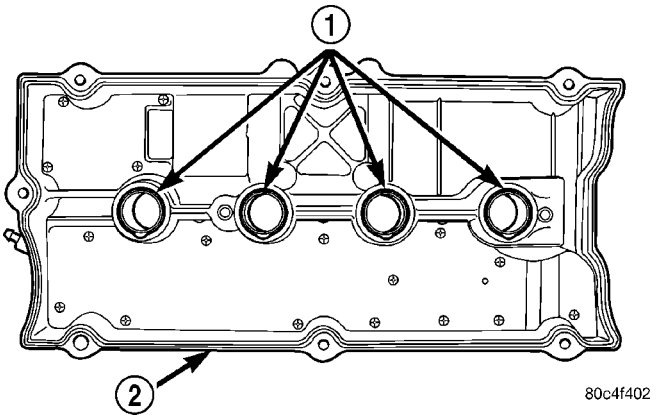

Fig. 45 Cylinder Head Cover Gasket and Spark Plug Well Seals

1 - SPARK PLUG WELL SEALS
2 - GASKET

CYLINDER HEAD COVER (Continued)

(2) Replace cylinder head cover bolt seals (Fig. 47).

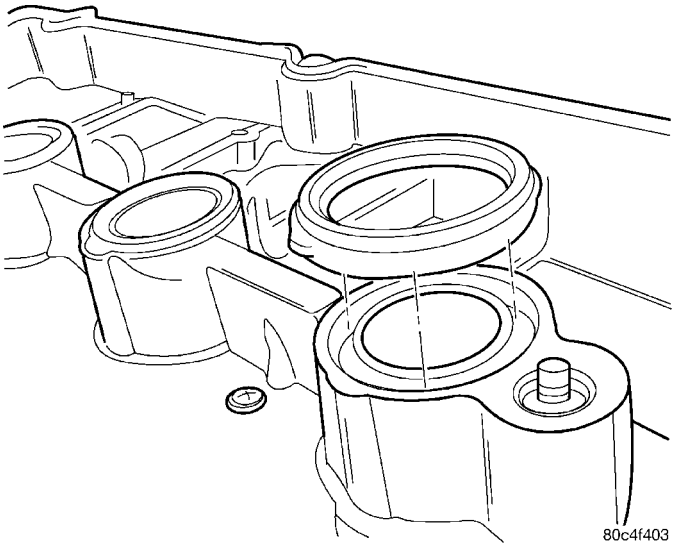

Fig. 46 Spark Plug Well Seals

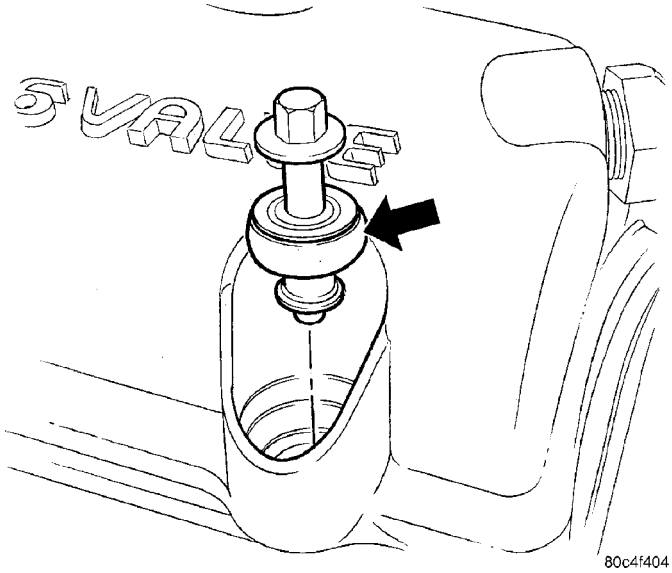

Fig. 47 Cylinder Head Cover Bolt Assembly

CAUTION: Do not allow oil or solvents to contact the timing belt as they can deteriorate the rubber and cause tooth skipping.

(3) Apply Mopar® Engine RTV GEN II at the camshaft cap corners and at the top edges of the 1/2 round seal (Fig. 48).

CAUTION: When installing cylinder head cover bolts, be careful not to interchange the two (2) center bolts with the seven (7) perimeter bolts. The two (2) center bolts contain an aluminum washer between the bolt head and torque limiter for sealing purposes.

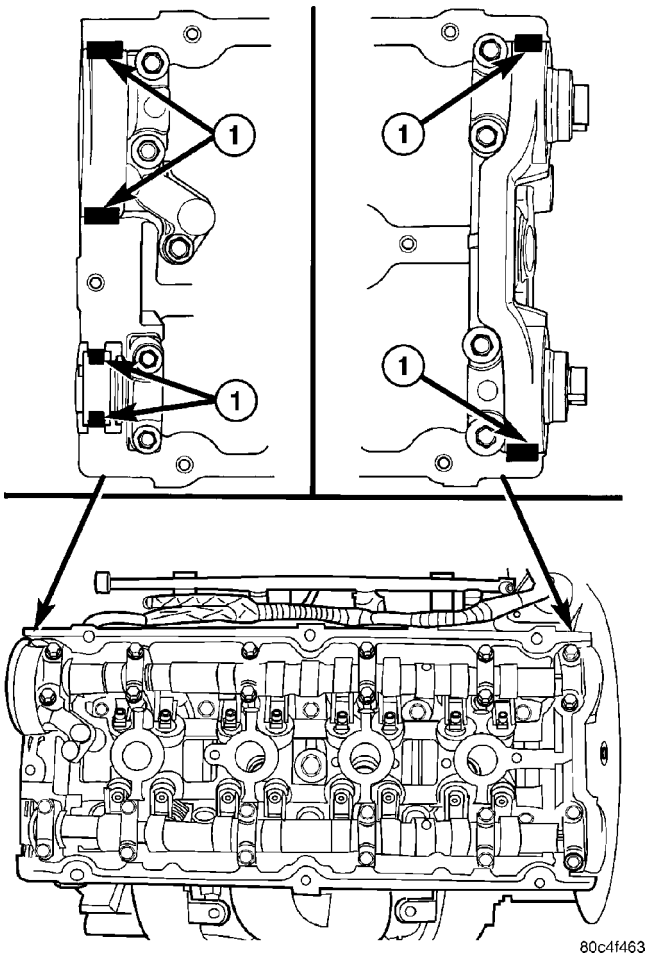

Fig. 48 Sealer Locations

1 – SEALER LOCATION

(4) Install cylinder head cover assembly to cylinder head. Install all bolts, ensuring the two (2) bolts containing the sealing washer are located in the center locations of cover. Tighten bolts in sequence shown in (Fig. 49). Using a 3 step torque method as follows:

(a) Tighten all bolts to 4.5 N·m (40 in. lbs.).
(b) Tighten all bolts to 9.0 N·m (80 in. lbs.).
(c) Tighten all bolts to 12 N·m (105 in. lbs.).

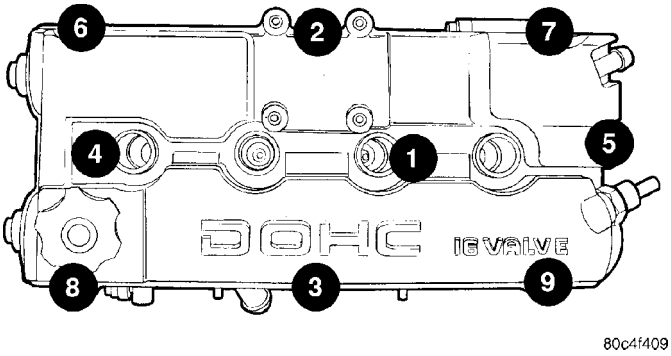

Fig. 49 Cylinder Head Cover Tightening Sequence (Typical Cover Shown)

CYLINDER HEAD COVER (Continued)

(5) Install ignition coil and spark plug wires. Tighten fasteners to 12 N·m (105 in. lbs.).

(6) If the PCV valve was removed, apply Mopar® Thread Sealant with Teflon to threads and install valve to cylinder head cover. Tighten PCV valve to 8 N·m (70 in. lbs.).

(7) Connect PCV and make-up air hoses to cylinder head cover (Fig. 44).

(8) Install upper intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).

HYDRAULIC LASH ADJUSTERS

DIAGNOSIS AND TESTING

HYDRAULIC LASH ADJUSTER NOISE DIAGNOSIS

A tappet-like noise may be produced from several items. Check the following items.

(1) Engine oil level too high or too low. This may cause aerated oil to enter the adjusters and cause them to be spongy.

(2) Insufficient running time after rebuilding cylinder head. Low speed running up to 1 hour may be required.

(3) During this time, turn engine off and let set for a few minutes before restarting. Repeat this several times after engine has reached normal operating temperature.

(4) Low oil pressure.

(5) The oil restrictor (integral to the cylinder head gasket) in the vertical oil passage to the cylinder head is plugged with debris.

(6) Air ingested into oil due to broken or cracked oil pump pick up.

(7) Worn valve guides.

(8) Rocker arm ears contacting valve spring retainer.

(9) Rocker arm loose, adjuster stuck or at maximum extension and still leaves lash in the system.

(10) Faulty lash adjuster.

- Check lash adjusters for sponginess while installed in cylinder head. Depress part of rocker arm over adjuster. Normal adjusters should feel very firm. Spongy adjusters can be bottomed out easily.
- Remove suspected lash adjusters, and replace as necessary.

REMOVAL

NOTE: This procedure is for in-vehicle service with camshafts installed.

(1) Remove cylinder head cover. (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL)

(2) Remove rocker arm. (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARMS - REMOVAL)

(3) Remove hydraulic lash adjuster (Fig. 50).

(4) Repeat removal procedure for each hydraulic lash adjuster.

(5) If reusing, mark each hydraulic lash adjuster for reassembly in original position. Lash adjusters are serviced as an assembly.

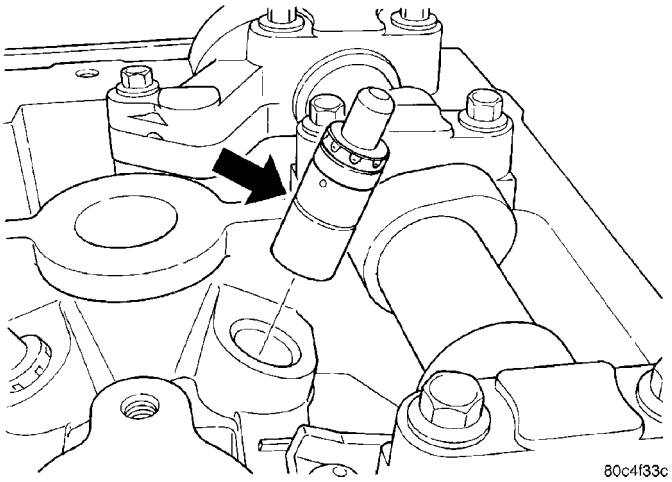

Fig. 50 Hydraulic Lash Adjuster

INSTALLATION

(1) Install hydraulic lash adjuster (Fig. 50). Ensure the lash adjusters are at least partially full of engine oil. This is indicated by little or no plunger travel when the lifter is depressed.

(2) Install rocker arm. (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARMS - INSTALLATION)

(3) Repeat installation procedure for each hydraulic lash adjuster.

(4) Install cylinder head cover. (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION)

INTAKE/EXHAUST VALVES & SEATS

DESCRIPTION

The valves are made of heat resistant steel. They have chrome plated stems to prevent scuffing. Viton rubber valve stem seals are integral with the spring seats. The valves have three-bead lock keepers to retain springs and to promote valve rotation.

INTAKE/EXHAUST VALVES & SEATS (Continued)

OPERATION

The four valves per cylinder (two intake and two exhaust) are opened by using roller rocker arms which pivot on hydraulic lash adjusters.

CLEANING

(1) Clean all valves thoroughly and discard burned, warped and cracked valves.

ROCKER ARMS

REMOVAL

NOTE: This procedure is for in-vehicle service with camshafts installed.

(1) Remove cylinder head cover. (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL)
(2) Remove spark plugs.
(3) Rotate engine until the camshaft lobe, on the follower being removed, is positioned on its base circle (heel). Also, the piston should be a minimum of 6.3 mm (0.25 in) below TDC position.

CAUTION: If cam follower assemblies are to be reused, always mark position for reassembly in their original positions.

(4) Using Special Tools 8215A and 8436 slowly depress valve assembly until rocker arm can be removed (Fig. 51).
(5) Repeat removal procedure for each rocker arm.

INSPECTION

Inspect the rocker arm for wear or damage (Fig. 52). Replace as necessary.

INSTALLATION

(1) Lubricate rocker arm with clean engine oil.
(2) Using Special Tools 8215A and 8436 slowly depress valve assembly until rocker arm can be installed on the hydraulic lifter and valve stem (Fig. 51).
(3) Repeat installation procedure for each rocker arm.
(4) Install spark plugs.
(5) Install cylinder head cover. (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION)

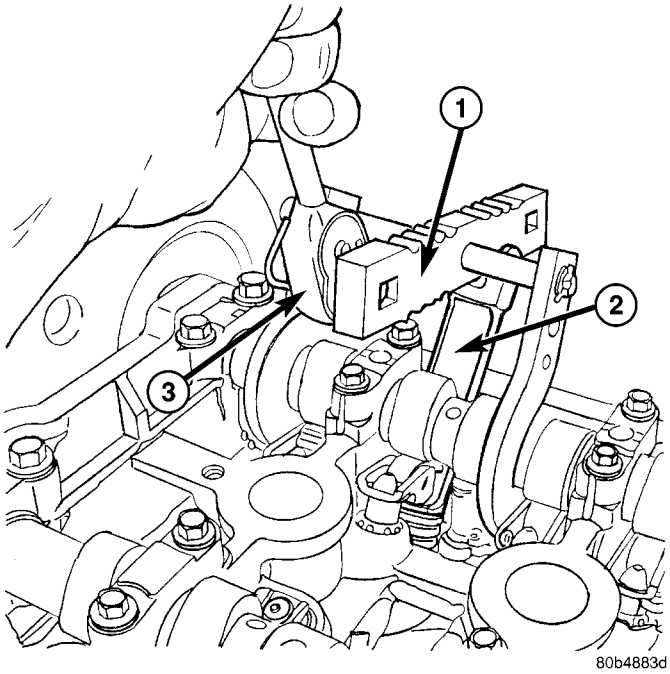

Fig. 51 Rocker Arm - Removal/Installation

2 - SPECIAL TOOL 8436
3 - 3/8″ DRIVE RACHET

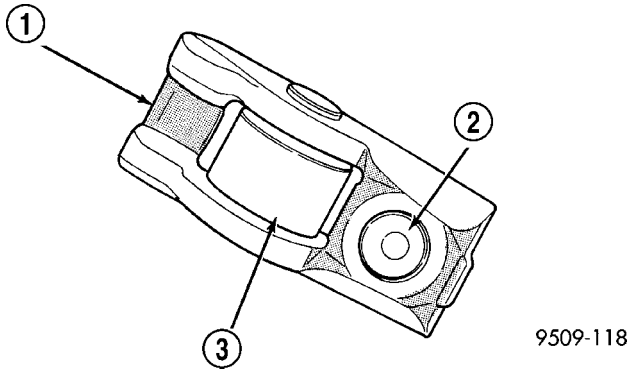

Fig. 52 Rocker Arm

1 - TIP
2 - LASH ADJUSTER POCKET
3 - ROLLER

VALVE SPRINGS & SEALS

REMOVAL

CYLINDER HEAD ON

(1) Remove cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(2) Remove camshafts (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - REMOVAL).

(3) Rotate crankshaft until piston is at TDC on compression.

(4) With air hose attached to adapter tool installed in spark plug hole, apply 90-120 psi air pressure.

(5) Using Special Tool MD-998772-A with adapter 6779 (Fig. 53), compress valve springs and remove valve locks.

(6) Remove valve spring(s).

(7) Remove valve stem seal(s) by a using valve stem seal tool (Fig. 55).

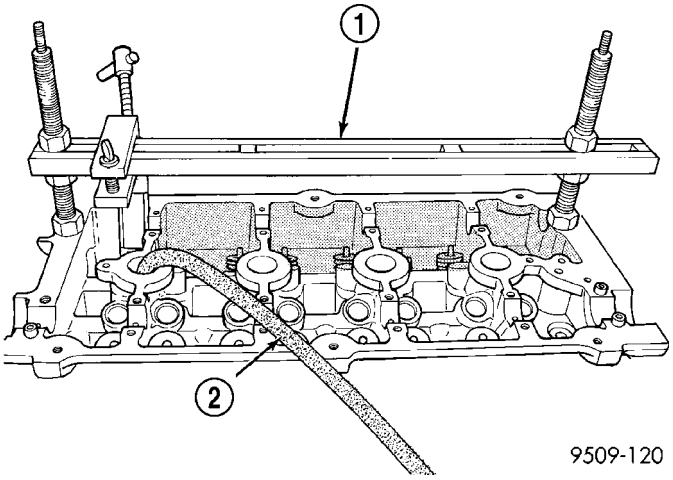

Fig. 53 Valve Spring - Removal/Installation

1 - VALVE SPRING COMPRESSOR MD 998772A
2 - AIR HOSE

CYLINDER HEAD OFF

(1) With cylinder head removed from cylinder block, compress valve springs using a universal valve spring compressor.

(2) Remove valve retaining locks, valve spring retainers, valve stem seals and valve springs.

(3) Before removing valves, **remove any burrs from valve stem lock grooves to prevent damage to the valve guides.** Identify valves, locks and retainers to insure installation in original location.

(4) Inspect the valves. (Refer to 9 - ENGINE/CYLINDER HEAD/VALVE SPRINGS - INSPECTION)

INSPECTION

(1) Whenever valves have been removed for inspection, reconditioning or replacement, valve springs should be tested for correct tension. Discard the springs that do not meet specifications. The following specifications apply to both intake and exhaust valves springs:

- Valve Closed Nominal Tension—75 lbs. @ 38.0 mm (1.50 in.)
- Valve Open Nominal Tension—134 lbs. @ 29.75 mm (1.17 in.)

(2) Inspect each valve spring for squareness with a steel square and surface plate, test springs from both ends. If the spring is more than 1.5 mm (1/16 inch) out of square, install a new spring.

INSTALLATION

CYLINDER HEAD ON

(1) Install valve seal/valve spring seat assembly (Fig. 54). Push the assembly down to seat it onto the valve guide.

(2) Install valve spring and retainer, use Special Tool MD-998772-A with adapter 6779 to compress valve springs only enough to install locks (Fig. 53). Correct alignment of tool is necessary to avoid nicking valve stems.

(3) Remove air hose and install spark plugs.

(4) Install camshafts (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - INSTALLATION).

(5) Install cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER - INSTALLATION).

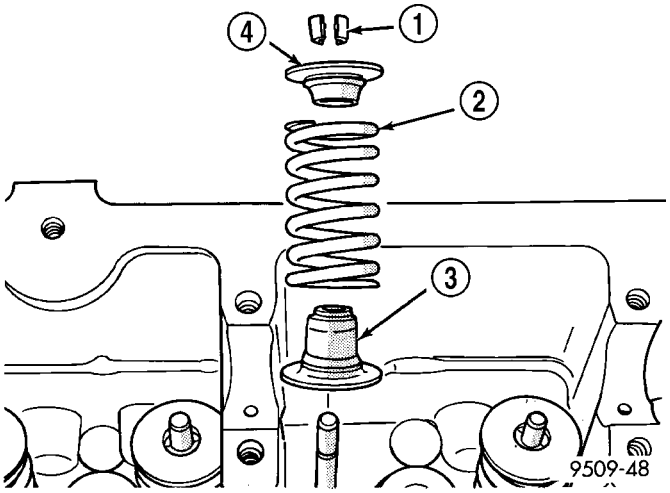

Fig. 54 Valve Stem Seal/Valve Spring Seat

1 - VALVE RETAINING LOCKS
2 - VALVE SPRING
3 - VALVE SEAL AND VALVE SPRING SEAT ASSEMBLY
4 - VALVE SPRING RETAINER

VALVE SPRINGS & SEALS (Continued)

CYLINDER HEAD OFF

(1) Coat valve stems with clean engine oil and insert in cylinder head.

(2) Install new valve stem seals on all valves using a valve stem seal tool (Fig. 55). The valve stem seals should be pushed firmly and squarely over valve guide.

CAUTION: When oversize valves are used, the corresponding oversize valve seal must also be used. Excessive guide wear may result if oversize seals are not used with oversize valves.

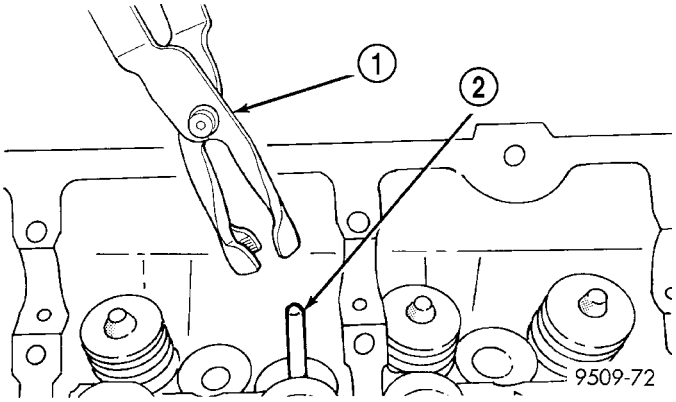

Fig. 55 Valve Stem Oil Seal Tool

1 - VALVE SEAL TOOL
2 - VALVE STEM

(3) Install valve springs and retainers. Compress valve springs only enough to install locks, taking care not to misalign the direction of compression. Nicked valve stems may result from misalignment of the valve spring compressor.

CAUTION: When depressing the valve spring retainers with valve spring compressor the locks can become dislocated. Ensure both locks are in the correct location after removing tool.

(4) Check the valve spring installed height B after refacing the valve and seat (Fig. 56). Make sure measurements are taken from top of spring seat to the bottom surface of spring retainer. If height is greater than 38.75 mm (1.525 in.), install a 0.762 mm (0.030 in.) spacer under the valve spring seat to bring spring height back within specification.

ENGINE BLOCK

DESCRIPTION

The cast iron cylinder block is a two-piece assembly, consisting of the cylinder block and bed plate (Fig. 57). The bed plate incorporates the main bearing caps and bolts to the cylinder block. This design

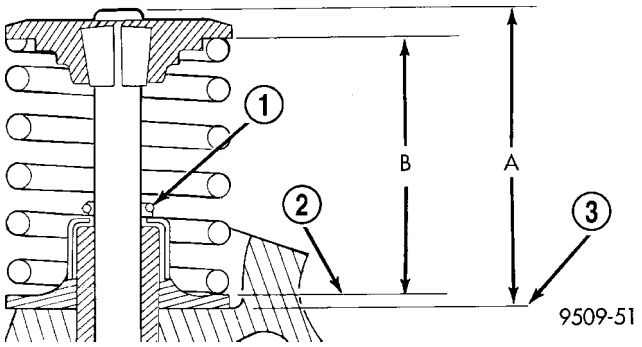

Fig. 56 Checking Spring Installed Height and Valve Tip Height Dimensions

1 - GARTER SPRING
2 - VALVE SPRING SEAT
3 - CYLINDER HEAD SURFACE

offers a much stronger lower end and increased cylinder block rigidity. The rear oil seal retainer is integral with the block. The bed plate and block are serviced as an assembly.

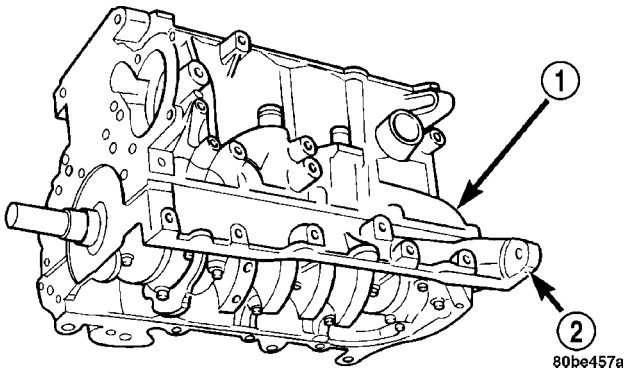

Fig. 57 Cylinder Block and Bed plate

1 - CYLINDER BLOCK
2 - BED PLATE

STANDARD PROCEDURE

CYLINDER BORE HONING

(1) Used carefully, the cylinder bore resizing hone, recommended tool C-823 or equivalent, equipped with 220 grit stones, is the best tool for this honing procedure. In addition to deglazing, it will reduce taper and out-of-round as well as removing light scuffing, scoring or scratches. Usually a few strokes will clean up a bore and maintain the required limits.

(2) Deglazing of the cylinder walls may be done using a cylinder surfacing hone, recommended tool C-3501 or equivalent, equipped with 280 grit stones, if the cylinder bore is straight and round. 20–60 strokes depending on the bore condition, will be sufficient to provide a satisfactory surface. Use a light honing oil. **Do not use engine or transmission oil,**

ENGINE BLOCK (Continued)

mineral spirits or kerosene. Inspect cylinder walls after each 20 strokes.

(3) Honing should be done by moving the hone up and down fast enough to get a cross-hatch pattern. When hone marks **intersect** at 40-60 degrees, the cross hatch angle is most satisfactory for proper seating of rings (Fig. 58).

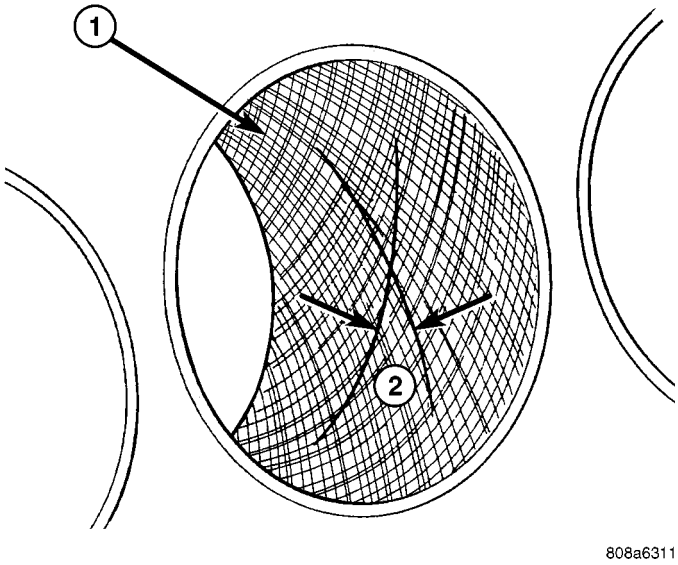

Fig. 58 Cylinder Bore Cross-Hatch Pattern

1 - CROSS-HATCH PATTERN
2 - 40°–60°

(4) A controlled hone motor speed between 200–300 RPM is necessary to obtain the proper cross-hatch angle. The number of up and down strokes per minute can be regulated to get the desired 40–60 degree angle. Faster up and down strokes increase the cross-hatch angle.

(5) After honing, it is necessary that the block be cleaned again to remove all traces of abrasive.

CAUTION: Ensure all abrasives are removed from engine parts after honing. It is recommended that a solution of soap and hot water be used with a brush and the parts then thoroughly dried. The bore can be considered clean when it can be wiped clean with a white cloth and cloth remains clean. Oil the bores after cleaning to prevent rusting.

CLEANING

Clean cylinder block thoroughly using a suitable cleaning solvent.

INSPECTION

ENGINE BLOCK

(1) Clean cylinder block thoroughly and check all core hole plugs for evidence of leaking.

(2) If new core plugs are to be installed, (Refer to 9 - ENGINE - STANDARD PROCEDURE - ENGINE CORE AND OIL GALLERY PLUGS).

(3) Examine block and cylinder bores for cracks or fractures.

(4) Check block deck surfaces for flatness. Deck surface must be within service limit of 0.1 mm (0.004 in.).

CYLINDER BORE

NOTE: The cylinder bores should be measured at normal room temperature, 21°C (70°F).

The cylinder walls should be checked for out-of-round and taper with Tool C119 or equivalent (Fig. 59) (Refer to 9 - ENGINE - SPECIFICATIONS). If the cylinder walls are badly scuffed or scored, the cylinder block should be replaced, and new pistons and rings fitted.

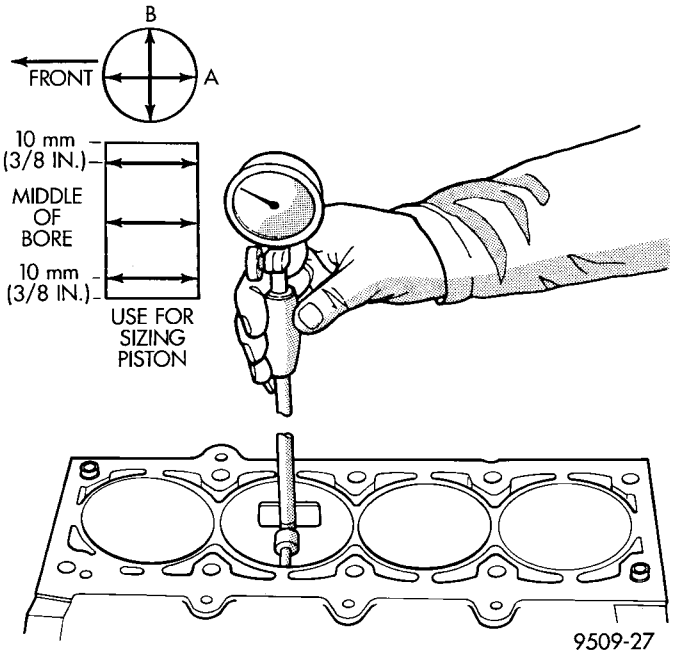

Fig. 59 Checking Cylinder Bore Size

Measure the cylinder bore at three levels in directions A and B (Fig. 59). Top measurement should be 10 mm (3/8 in.) down and bottom measurement should be 10 mm (3/8 in.) up from bottom of bore. (Refer to 9 - ENGINE - SPECIFICATIONS).

CRANKSHAFT

STANDARD PROCEDURE

MEASURING CRANKSHAFT END PLAY

(1) Mount a dial indicator to front of engine with the locating probe on nose of crankshaft (Fig. 60).

(2) Move crankshaft all the way to the rear of its travel.

(3) Zero the dial indicator.

(4) Move crankshaft all the way to the front and read the dial indicator. (Refer to 9 - ENGINE - SPECIFICATIONS) for end play specification.

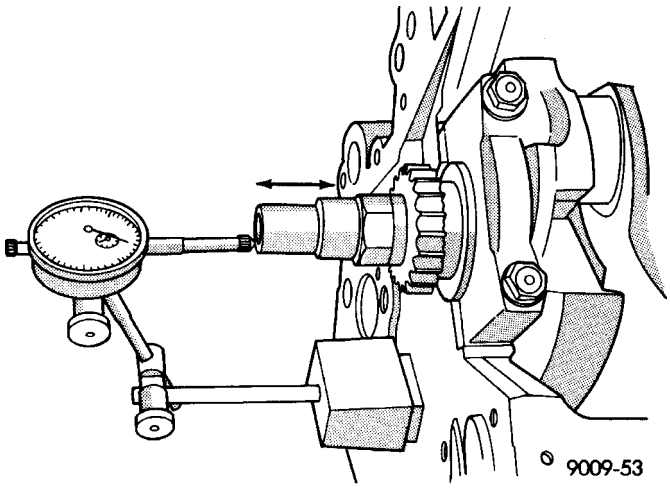

Fig. 60 Checking Crankshaft End Play - Typical

REMOVAL - CRANKSHAFT

NOTE: Crankshaft can not be removed when engine is in vehicle.

(1) Remove engine assembly from vehicle (Refer to 9 - ENGINE - REMOVAL).

(2) Separate transaxle from engine.

(3) Remove drive plate/flex plate.

(4) Remove crankshaft rear oil seal (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT OIL SEAL - REAR - REMOVAL).

(5) Mount engine on a suitable repair stand.

(6) Drain engine oil and remove oil filter.

(7) Remove crankshaft vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).

(8) Remove engine mount support bracket.

(9) Remove front timing belt covers (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT COVER(S) - REMOVAL).

(10) Remove the timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT AND SPROCKETS - REMOVAL).

(11) Remove the rear timing belt cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT COVER(S) - REMOVAL).

(12) Remove the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).

(13) Remove oil pump pick-up tube.

(14) Remove the crankshaft sprocket and oil pump (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - REMOVAL).

(15) Remove balance shafts and housing assembly (Refer to 9 - ENGINE/VALVE TIMING/BALANCE SHAFT - REMOVAL).

(16) Remove crankshaft position sensor.

NOTE: If piston/connecting rod replacement is necessary, remove cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL).

(17) Using a permanent ink or paint marker, identify cylinder number on each connecting rod cap (Fig. 61).

CAUTION: DO NOT use a number stamp or a punch to mark connecting rods. Damage to connecting rod could occur.

(18) Remove all connecting rod bolts and caps. Care should be taken not to damage the fracture rod and cap surfaces.

NOTE: Do not reuse connecting rod bolts.

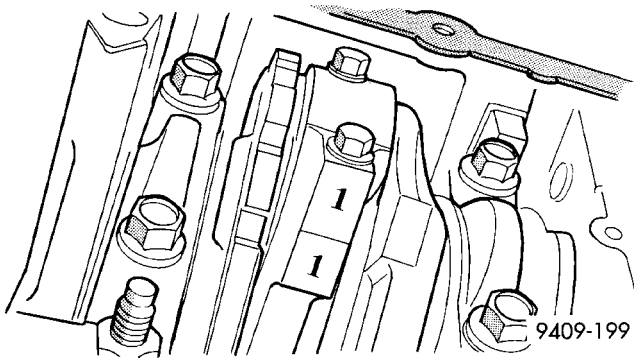

Fig. 61 Identify Connecting Rod to Cylinder-Typical

(19) Remove all bed plate bolts from the engine block (Fig. 62).

(20) Using a mallet gently tap the bedplate loose from the engine block dowel pins.

CAUTION: Do not pry up on one side of the bed plate. Damage may occur to cylinder block to bed plate alignment and thrust bearing.

(21) Bed plate should be removed evenly from the cylinder block dowel pins to prevent damage to the dowel pins and thrust bearing.

CRANKSHAFT (Continued)

CAUTION: Use extreme care when handling crankshaft. Tone wheel damage can occur if crankshaft is mis-handled.

(22) Lift out crankshaft from cylinder block. Do not damage the main bearings or journals when removing the crankshaft.

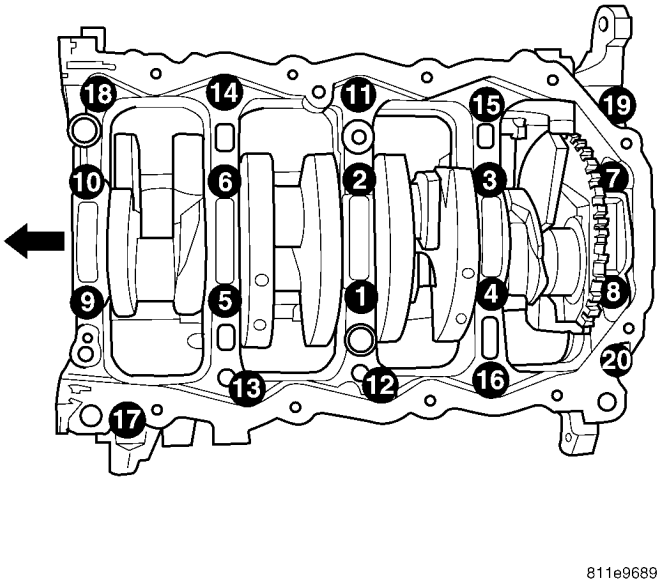

Fig. 62 Bed Plate Bolt Removal Sequence

(23) Remove the target ring mounting screws and discard.

(24) Remove the target ring from the crankshaft.

INSPECTION

The crankshaft journals should be checked for excessive wear, taper and scoring (Fig. 63). Limits of taper or out of round on any crankshaft journals should be held to 0.025 mm (0.001 in.). Journal grinding should not exceed 0.305 mm (0.012 in.) under the standard journal diameter. DO NOT grind thrust faces of No. 3 main bearing. DO NOT nick crank pin or bearing fillets. After grinding, remove rough edges from crankshaft oil holes and clean out all passages.

CAUTION: With the nodular cast iron crankshafts, it is important that the final paper or cloth polish be in the same direction as normal rotation in the engine.

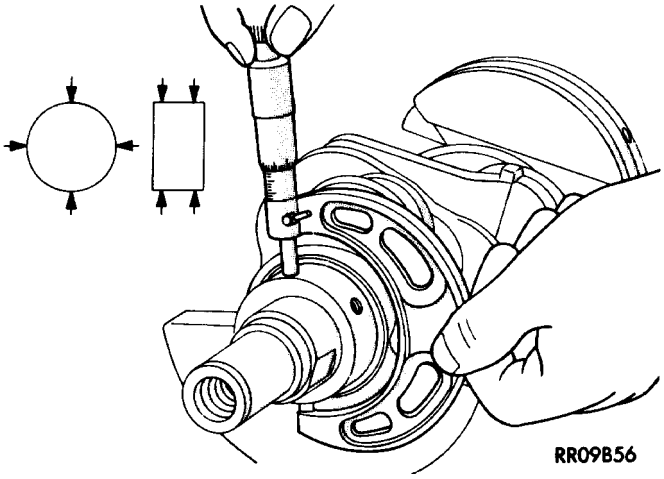

Fig. 63 Crankshaft Journal Measurements - Typical

INSTALLATION - CRANKSHAFT

CRANKSHAFT MAIN BEARING LOCATION

CAUTION: The upper and lower thrust bearing halves are NOT interchangeable. Make certain the bearing half with the oil groove and hole is installed in the engine block.

The crankshaft is supported in five main bearings. All upper bearing shells in the crankcase have oil grooves and holes. All lower bearing shells **except** for the thrust bearing half have oil grooves and holes (Fig. 64). Crankshaft end play is controlled by a flanged bearing on the number three main bearing journal.

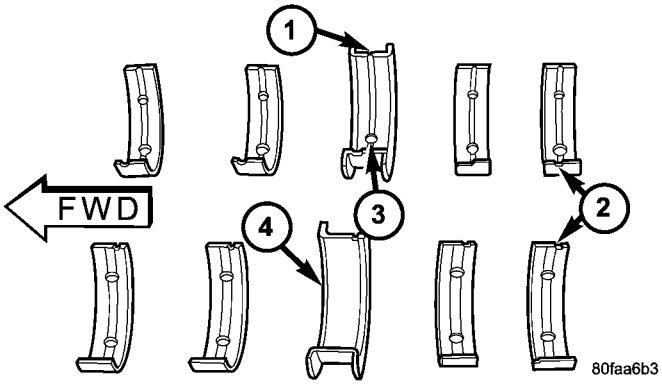

Fig. 64 Main Bearing Identification

1 - OIL GROOVE
2 - MAIN BEARINGS
3 - OIL HOLE
4 - LOWER THRUST BEARING PLAIN (NO OIL HOLE OR GROOVE)

CRANKSHAFT (Continued)

(1) Install the main bearing upper shells with the lubrication groove and oil hole in the engine block (Fig. 65).

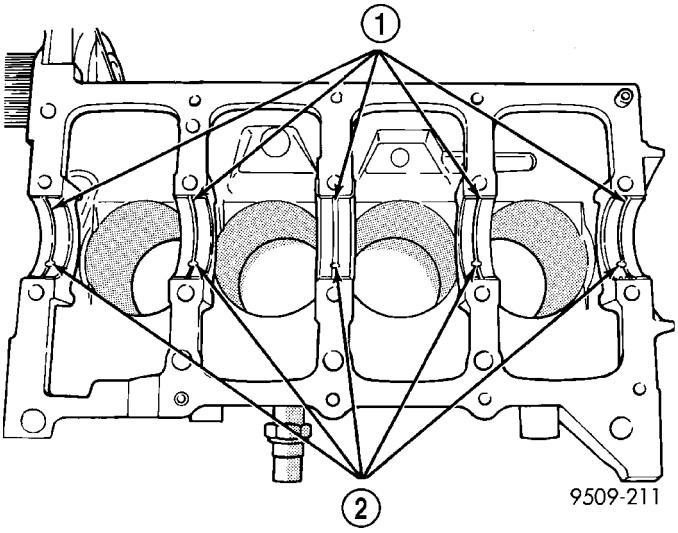

Fig. 65 Installing Main Bearing Upper Shell

1 - LUBRICATION GROOVES
2 - OIL HOLES

(2) Make certain oil holes in block line up with oil hole in bearings and bearing tabs seat in the block tab slots.

CAUTION: Do not get oil on the bed plate mating surface. It will affect the ability of the sealer to seal the bed plate to cylinder block.

NOTE: If the crankshaft is sent out for machine work, it must be balenced as an assembly with the target ring installed.

(3) Clean crankshaft and target ring with MOPAR® Brake Parts cleaner and dry with compressed air to ensure that the crankshaft mating surface and target ring mounting holes are free from oil and lock patch debris.

NOTE: Always use NEW mounting screws whether installing original or new target ring.

(4) Install **NEW**mounting screws finger tight starting with the #1 location. Make sure engagment occurs with the shoulder of the screws and mounting hole before starting all other screws.

(5) Torque all mounting screws with T30 torx bit to 13 Nm (110 in-lbs) following the torque sequence. (Fig. 66)

(6) Oil the bearings and journals. Install crankshaft in engine block.

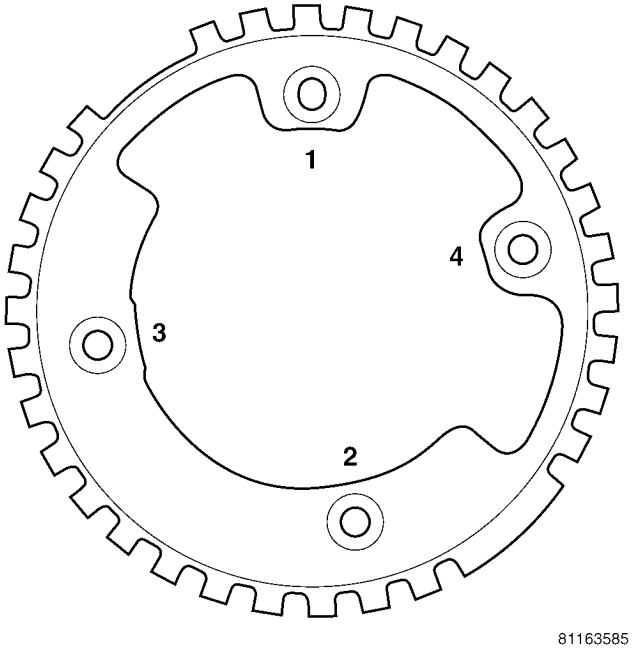

Fig. 66 Target Ring

1 - TARGET RING

CAUTION: Use only the specified anaerobic sealer on the bed plate or damage may occur to the engine.

(7) Apply a 1.5 to 2.0 mm (0.059 to 0.078 in.) bead of Mopar® Bed Plate Sealant to bed plate as shown in (Fig. 67).

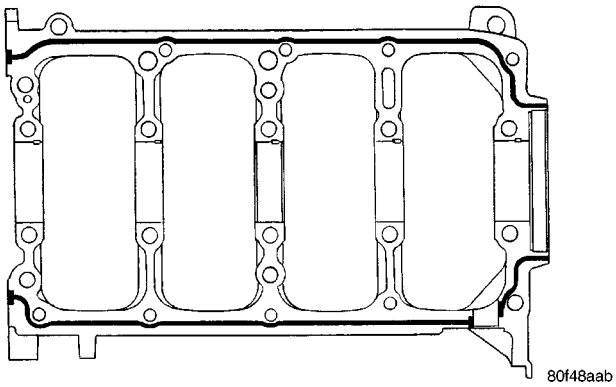

Fig. 67 Bed Plate Sealing

(8) Install lower main bearings into main bearing cap/bed plate. Make certain the bearing tabs are seated into the bed plate slots. Install the main bearing/bed plate into engine block.

(9) Before installing the bolts the threads should be oiled with clean engine oil, wipe off any excess oil.

CRANKSHAFT (Continued)

(10) Install main bearing cap/bed plate to engine block bolts 11, 17, and 20 finger tight. Tighten these bolts down together until the bed plate contacts the cylinder block (Fig. 68).

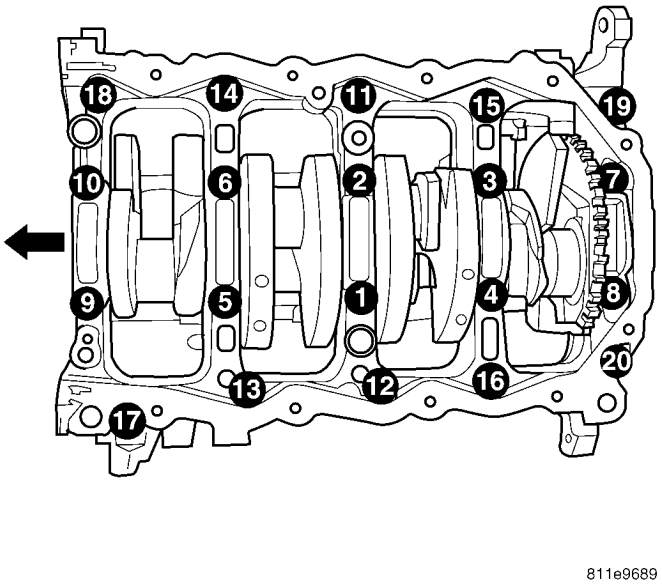

Fig. 68 Main Bearing Caps/Bed Plate Bolt Torque Sequence

(11) To ensure correct thrust bearing alignment, perform the following steps:

- Step 1: Rotate crankshaft until number 4 piston is at TDC.
- Step 2: Move crankshaft rearward to limits of travel.
- Step 3: Then, move crankshaft forward to limits of travel.
- Step 4: Wedge an appropriate tool between the rear of the cylinder block **(NOT BED PLATE)** and the rear crankshaft counterweight. This will hold the crankshaft in it's furthest forward position.
- Step 5: Install and tighten bolts (1–10) in sequence shown in (Fig. 68) to 41 N·m (30 ft. lbs.).
- Step 6: Remove wedge tool used to hold crankshaft.

(12) Tighten bolts (1–10) again to 41 N·m (30 ft. lbs.) in sequence shown in (Fig. 68).

(13) Install main bearing bed plate to engine block bolts (11–20), and torque each bolt to 28 N·m (250 in. lbs.) in sequence shown in (Fig. 68).

(14) Tighten bolts (1–10) to 75 N·m (55 ft. lbs.) in sequence shown in (Fig. 68).

(15) Tighten bolts (11–20) again to 28 N·m (250 in. lbs.) in sequence shown in (Fig. 68).

(16) After the main bearing bed plate is installed, check the crankshaft turning torque. The turning torque should not exceed 5.6 N·m (50 in. lbs.).

(17) Check crankshaft end play (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT - STANDARD PROCEDURE).

(18) Install connecting rod bearings and caps. **Do Not Reuse Connecting Rod Bolts.** Torque connecting rod bolts to 27 N·m (20 ft. lbs.) plus 1/4 turn.

(19) Install balance shafts and housing assembly (Refer to 9 - ENGINE/VALVE TIMING/BALANCE SHAFT - INSTALLATION).

(20) Install the oil pump (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - INSTALLATION).

(21) Install oil pump pick-up tube. Torque fastener to 23 N·m (200 in. lbs.).

(22) Install the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

(23) Install crankshaft position sensor.

(24) Install cylinder head if it was removed (Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION).

(25) Install the timing belt rear cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT COVER(S) - INSTALLATION).

(26) Install front crankshaft oil seal and crankshaft sprocket (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT OIL SEAL - FRONT - INSTALLATION).

(27) Install the timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT AND SPROCKETS - INSTALLATION).

(28) Install the timing belt front covers (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT COVER(S) - INSTALLATION).

(29) Install engine mount support bracket.

(30) Install crankshaft vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).

(31) Install **NEW** oil filter.

(32) Remove engine from repair stand and position on Special Tools 6135 and 6710 Engine Dolly and Cradle. Install safety straps around the engine to cradle and tighten and lock them into position.

(33) Install crankshaft rear oil seal (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT OIL SEAL - REAR - INSTALLATION).

(34) Install drive plate/flex plate. Apply Mopar® Lock & Seal Adhesive to bolt threads and tighten to 95 N·m (70 ft. lbs.).

(35) Attach transaxle to engine. Tighten attaching bolts to 101 N·m (75 ft. lbs.).

(36) Install the engine assembly (Refer to 9 - ENGINE - INSTALLATION).

CRANKSHAFT OIL SEAL - FRONT

REMOVAL

(1) Remove the crankshaft vibration damper. (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL)

(2) Remove timing belt. (Refer to 9 - ENGINE/ VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL)

(3) Remove crankshaft sprocket using Special Tool 6793 and insert C-4685-C2 (Fig. 69).

CAUTION: Do not nick shaft seal surface or seal bore.

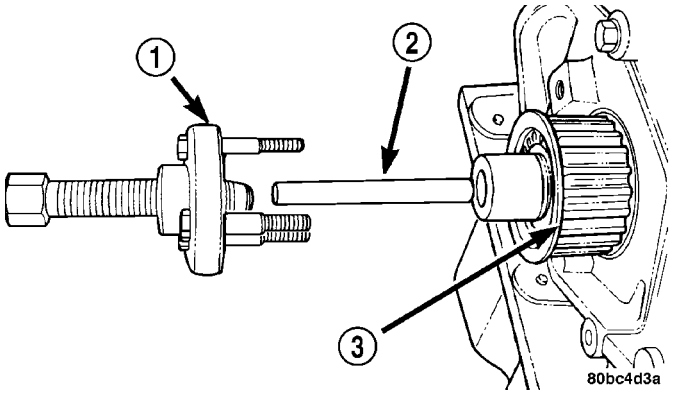

Fig. 69 Crankshaft Sprocket - Removal

1 - SPECIAL TOOL 6793
2 - SPECIAL TOOL C-4685–C2
3 - CRANKSHAFT SPROCKET

(4) Using Tool 6771 to remove front crankshaft oil seal (Fig. 70). Be careful not to damage the seal surface of cover.

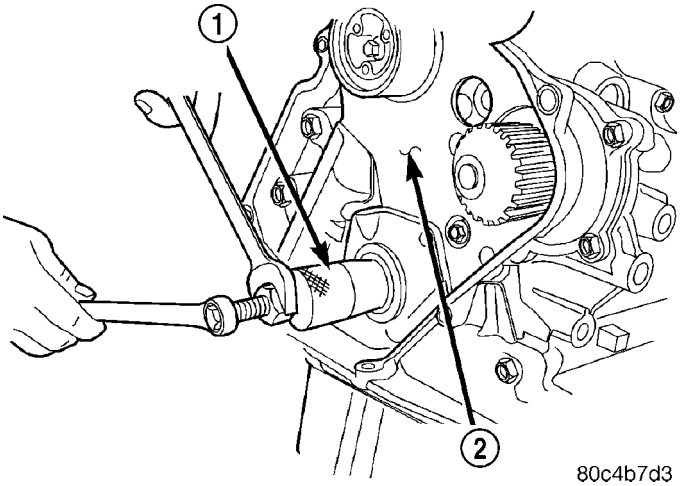

Fig. 70 Front Crankshaft Oil Seal - Removal

1 - SPECIAL TOOL 6771
2 - REAR TIMING BELT COVER

INSTALLATION

(1) Install new seal by using Special Tool 6780 (Fig. 71).

(2) Place seal into opening with seal spring towards the inside of engine. Install seal until flush with cover.

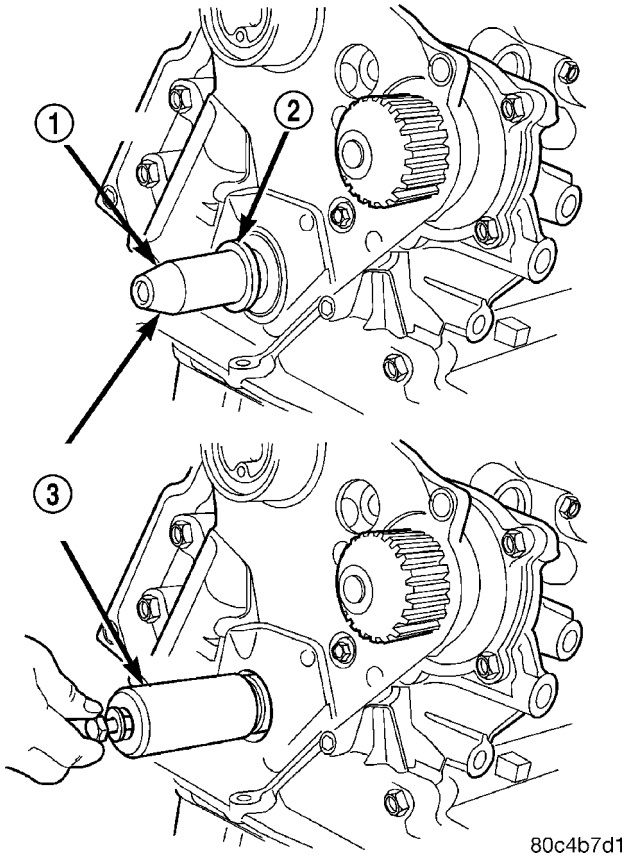

Fig. 71 Crankshaft Front Oil Seal - Installation

1 - PROTECTOR
2 - SEAL
3 - SPECIAL TOOL 6780

CRANKSHAFT OIL SEAL - FRONT (Continued)

(3) Install crankshaft sprocket using Special Tool 6792 (Fig. 72).

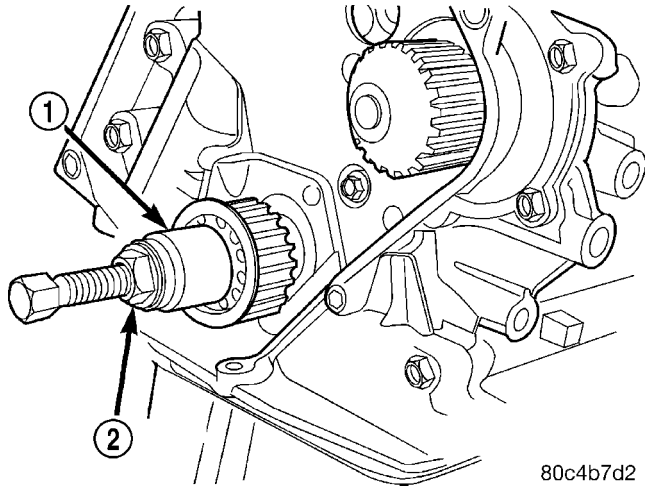

Fig. 72 Crankshaft Sprocket - Installation

1 - SPECIAL TOOL 6792
2 - TIGHTEN NUT TO INSTALL

(4) Install timing belt. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION)

(5) Install crankshaft vibration damper. (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION)

CRANKSHAFT OIL SEAL - REAR

REMOVAL

(1) Remove transaxle. Refer to TRANSMISSION/TRANSAXLE - REMOVAL for procedure.

(2) Remove flex plate.

(3) Insert a 3/16 flat bladed screwdriver between the dust lip and the metal case of the crankshaft seal. Angle the screwdriver (Fig. 73)through the dust lip against metal case of the seal. Pry out seal.

CAUTION: Do not permit the screwdriver blade to contact crankshaft seal surface. Contact of the screwdriver blade against crankshaft edge (chamfer) is permitted.

INSTALLATION

CAUTION: If a burr or scratch is present on the crankshaft edge (chamfer), cleanup with 400 grit sand paper to prevent seal damage during installation of new seal.

NOTE: When installing seal, no lube on seal is needed.

(1) Place Special Tool 6926-1 Seal Guide on crankshaft (Fig. 74).

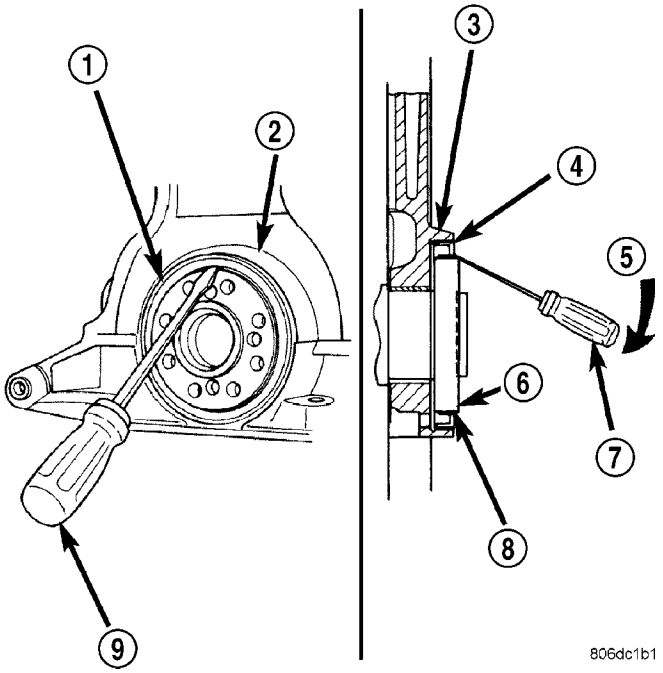

Fig. 73 Rear Crankshaft Oil Seal - Removal

1 - REAR CRANKSHAFT SEAL
2 - ENGINE BLOCK
3 - ENGINE BLOCK
4 - REAR CRANKSHAFT SEAL METAL CASE

8 - REAR CRANKSHAFT SEAL DUST LIP
9 - SCREWDRIVER

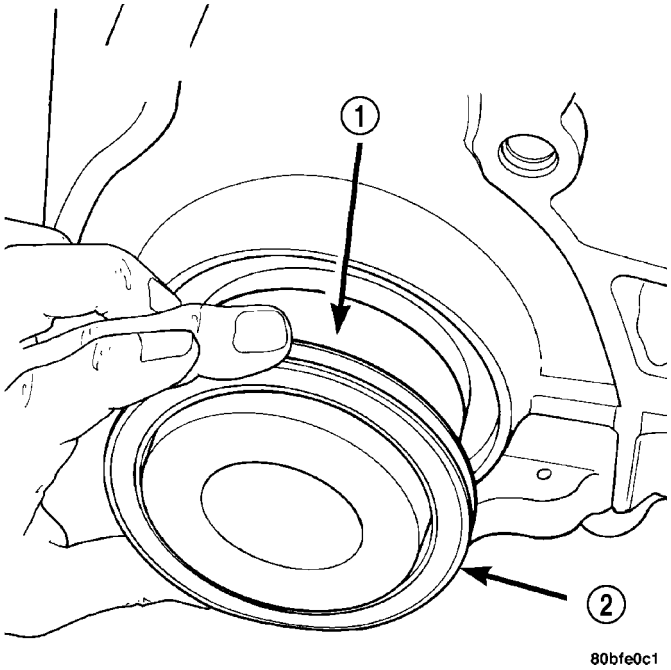

Fig. 74 Rear Crankshaft Seal and Special Tool 6926-1

1 - SPECIAL TOOL 6926–1 PILOT
2 - SEAL

CRANKSHAFT OIL SEAL - REAR (Continued)

(2) Position seal over guide tool (Fig. 74). Guide tool should remain on crankshaft during installation of seal. Ensure that the lip of the seal is facing towards the crankcase during installation.

CAUTION: If the seal is driven into the block past flush, this may cause an oil leak.

(3) Drive the seal into the block using Special Tool 6926-2 and handle C-4171 (Fig. 75) until the tool bottoms out against the block (Fig. 76).

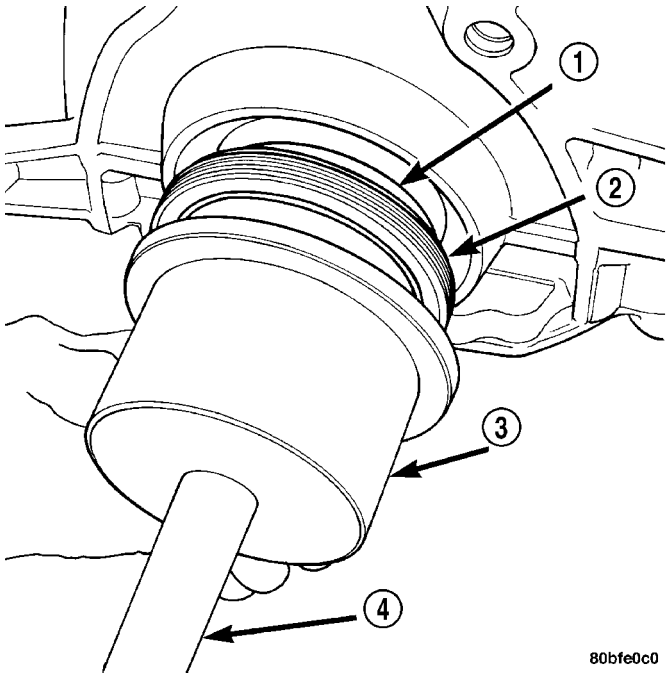

Fig. 75 Crankshaft Seal and Special Tools 6926-2 & C-4171

1 - SPECIAL TOOL 6926–1 PILOT
2 - SEAL
3 - SPECIAL TOOL 6926–2 INSTALLER
4 - SPECIAL TOOL C-4171

(4) Install flex plate. Apply Mopar® Lock & Seal Adhesive to bolt threads and tighten bolts to 95 N·m (70 ft. lbs.).

(5) Install transaxle. Refer to TRANSMISSION/ TRANSAXLE - INSTALLATION for procedure.

PISTON & CONNECTING ROD

DESCRIPTION

Non-Turbo

The pistons are made of a cast aluminum alloy. The pistons have pressed-in pins attached to forged powdered metal connecting rods. The pistons pin is offset 1 mm (0.0394 in.) towards the thrust side of the piston. The connecting rods are a cracked cap design and are not repairable. Hex head cap screws are used to provide alignment and durability in the assembly. The pistons and connecting rods are serviced as an assembly.

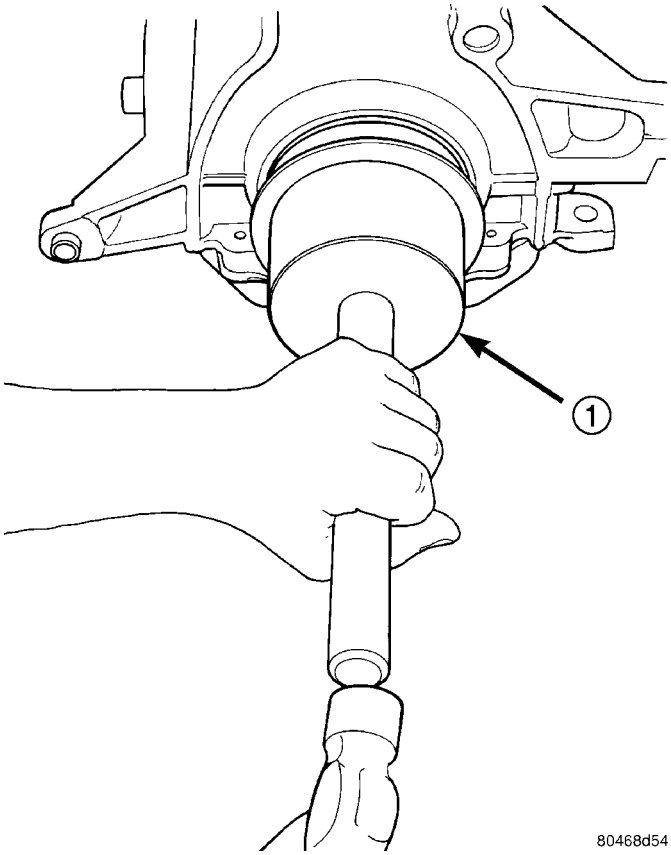

Fig. 76 Rear Crankshaft Seal - Installation

1 - SPECIAL TOOL 6926–2 INSTALLER

Turbo

The pistons are made of a cast aluminum alloy. The pistons have full floating pins attached to forged steel connecting rods. The pistons pin is offset 1 mm (0.0394 in.) towards the thrust side of the piston. The connecting rods are a cracked cap design and are not repairable. Hex head cap screws are used to provide alignment and durability in the assembly. The connecting rod has an oil squirt hole to provide extra cylinder wall lubrication. The pistons and connecting rods are serviced as an assembly.

STANDARD PROCEDURE

PISTON TO CYLINDER BORE FITTING

NOTE: Pistons and cylinder bores should be measured at normal room temperature, 21°C (70°F).

PISTON & CONNECTING ROD (Continued)

Piston and cylinder wall must be clean and dry. Piston diameter should be measured 90 degrees to piston pin.

Non-Turbo:

• Measurement should be taken approximately 14 mm (0.551 in.) from the bottom of the skirt as shown in (Fig. 77).

Turbo:

• Measurement should be taken approximately 22 mm (0.866 in.) from the bottom of the skirt as shown in (Fig. 78).

Cylinder bores should be measured halfway down the cylinder bore and transverse (measurement location B) to the engine crankshaft center line shown in (Fig. 79). Refer to for Engine Specifications (Refer to 9 - ENGINE - SPECIFICATIONS). Correct piston to bore clearance must be established in order to assure quiet and economical operation.

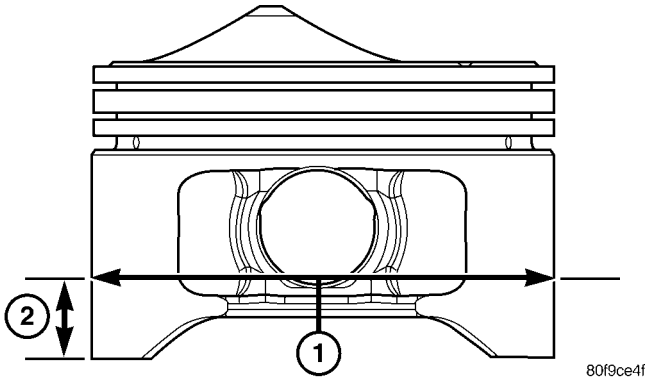

Fig. 77 Piston Measurement

1 - PISTON DIAMETER
2 - 14 mm (0.551 in.)

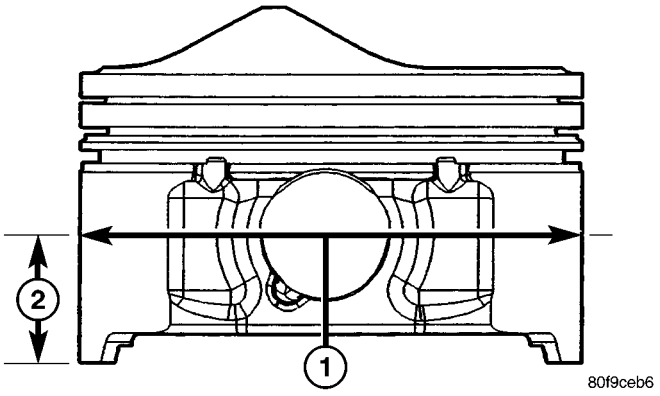

Fig. 78 Piston Measurement - Turbo

1 - PISTON DIAMETER
2 - 22 mm (0.866 in.)

REMOVAL

(1) Remove cylinder head (Refer to 9 - ENGINE/ CYLINDER HEAD - REMOVAL).

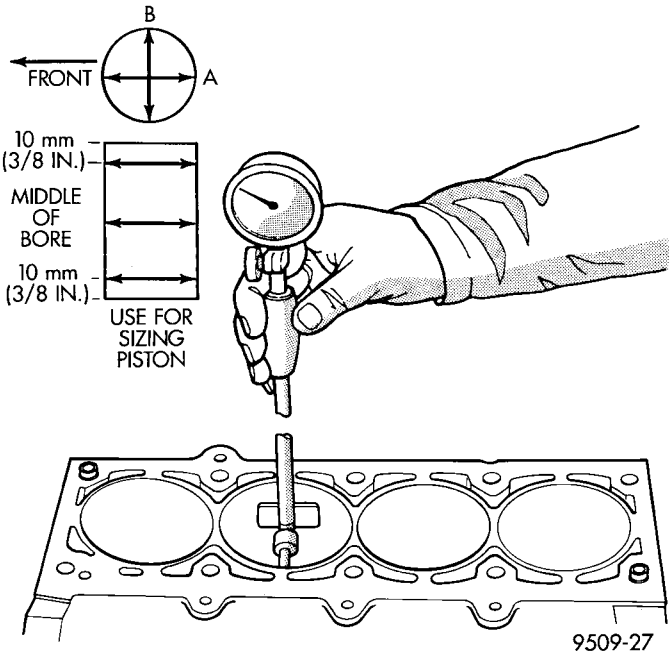

Fig. 79 Checking Cylinder Bore

(2) Remove oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).

(3) Remove Balance Shaft Carrier Assembly (Refer to 9 - ENGINE/VALVE TIMING/BALANCE SHAFT CARRIER - REMOVAL).

(4) Remove top ridge of cylinder bores with a reliable ridge reamer before removing pistons from cylinder block. **Be sure to keep tops of pistons covered during this operation**.

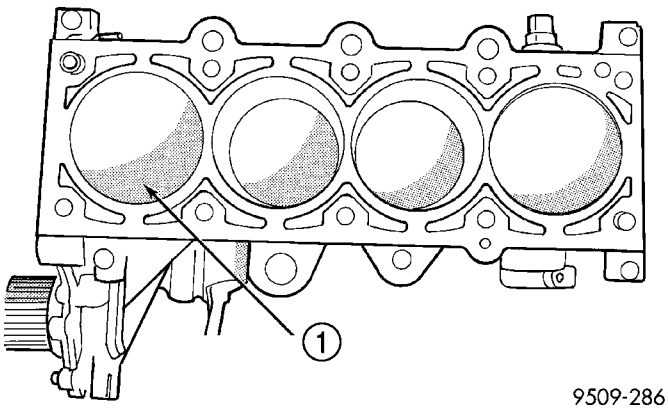

Fig. 80 Piston Markings

1 - DIRECTIONAL ARROW WILL BE IMPRINTED IN THIS AREA

(5) Pistons have a directional stamping in the front half of the piston facing towards the **front** of engine (Fig. 80).

(6) Pistons and connecting rods must be removed from top of cylinder block. Rotate crankshaft so that each connecting rod is centered in cylinder bore.

PISTON & CONNECTING ROD (Continued)

(7) Using a permanent ink or paint marker, identify cylinder number on each connecting rod cap (Fig. 81).

CAUTION: DO NOT use a number stamp or a punch to mark connecting rods. Damage to connecting rod could occur.

(8) Remove connecting rod bolts and cap. Care should be taken not to damage the fracture rod and cap surfaces.

NOTE: Do not reuse connecting rod bolts.

CAUTION: Care must be taken not to damage the fractured rod and cap joint surfaces, as engine damage many occur.

(9) To protect crankshaft journal and fractured rod surfaces, install Special Tool 8189, connecting rod guides onto connecting rod (Fig. 82). Carefully push each piston and rod assembly out of cylinder bore.

NOTE: On Turbocharger equipped engines, be careful not to damage the oil jet assembly when removing piston/connecting rod (Fig. 83).

(10) Remove Special Tool 8189, connecting rod guides and re-install bearing cap on the mating rod.

NOTE: Piston and rods are serviced as an assembly.

(11) Repeat procedure for each piston and connecting rod assembly.

(12) Remove piston rings (Refer to 9 - ENGINE/ENGINE BLOCK/PISTON RINGS - REMOVAL).

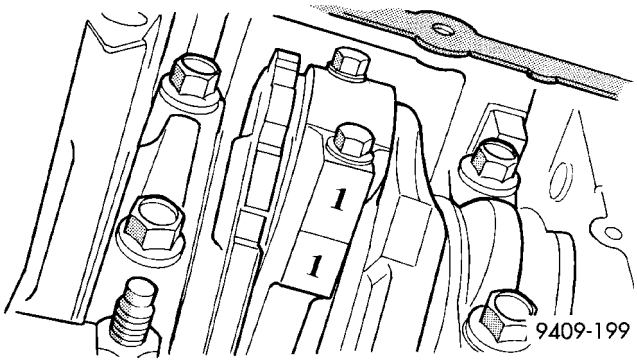

Fig. 81 Identify Connectng Rod to Cylinder - Typical

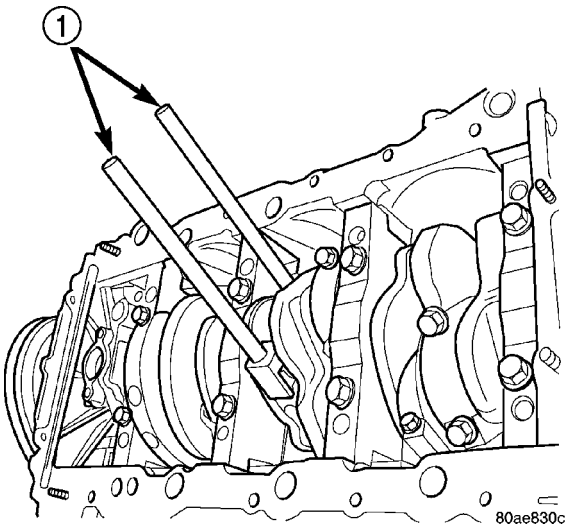

Fig. 82 Connecting Rod Guides - Typical

3 - ENGINE BLOCK
4 - CYLINDER WALL

PISTON & CONNECTING ROD (Continued)

INSTALLATION

(1) Install piston rings on piston (Refer to 9 - ENGINE/ENGINE BLOCK/PISTON RINGS - INSTALLATION)

(2) Before installing pistons and connecting rod assemblies into the bore, be sure that compression ring gaps are staggered so that neither is in line with oil ring rail gap (Fig. 84).

(3) Before installing the ring compressor, make sure the oil ring expander ends are butted and the rail gaps located as shown in (Fig. 84). As viewed from top.

(4) Immerse the piston head and rings in clean engine oil, slide the ring compressor, over the piston (Fig. 85). **Be sure position of rings does not change during this operation** .

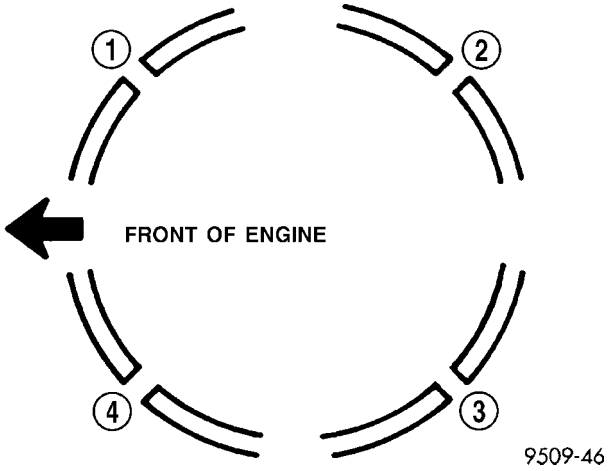

Fig. 84 Piston Ring End Gap Position

1 - GAP OF LOWER SIDE RAIL
2 - NO. 1 RING GAP
3 - GAP OF UPPER SIDE RAIL
4 - NO. 2 RING GAP AND SPACER EXPANDER GAP

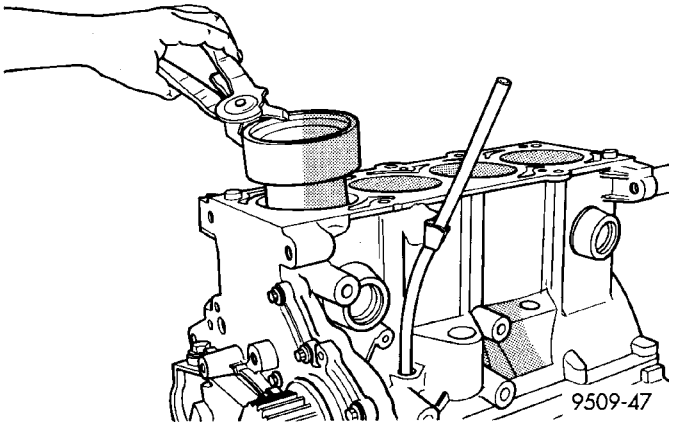

Fig. 85 Piston—Installation

(5) The directional stamp on the piston should face toward the front of the engine (Fig. 80).

(6) Rotate crankshaft so that the connecting rod journal is on the center of the cylinder bore. Lubricate connecting rod journal with clean engine oil.

(7) Install connecting rod upper bearing half into connecting rod. Install Special Tool 8189, connecting rod guides onto connecting rod (Fig. 82).

(8) Tap the piston down in cylinder bore, using a hammer handle. At the same time, guide connecting rod into position on connecting rod journal.

(9) Remove Special Tool 8189, connecting rod guides.

NOTE: The connecting rod cap bolts should not be reused.

(10) Before installing the **NEW** bolts, the threads should be coated with clean engine oil.

(11) Install connecting rod lower bearing half into connecting rod cap. Install connecting rod cap.

(12) Install each bolt finger tight then alternately torque each bolt to assemble the cap properly.

(13) Tighten the connecting rod bolts using the 2 step torque-turn method. Tighten according to the following values:

CAUTION: Do not use a torque wrench for the second step.

1. Tighten the bolts to 27 N·m (20 ft. lbs.).
2. Tighten the connecting rod bolts an additional **1/4 TURN.**

(14) Using a feeler gauge, check connecting rod side clearance (Fig. 86). (Refer to 9 - ENGINE - SPECIFICATIONS) for connecting rod side clearance.

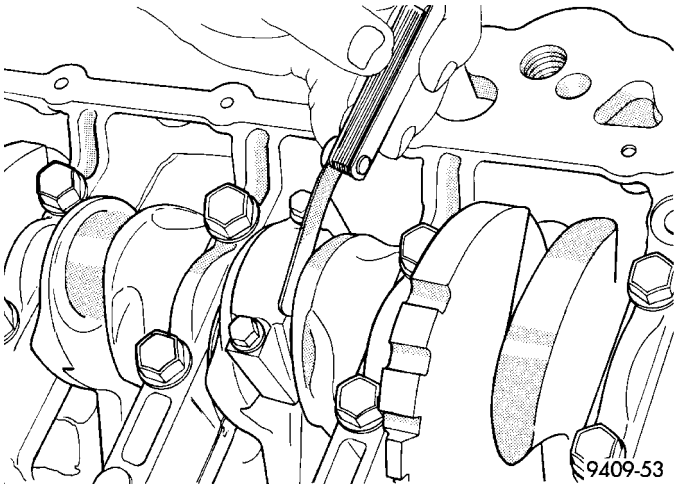

Fig. 86 Checking Connecting Rod Side Clearance - Typical

(15) Install Balance Shaft Carrier Assembly (Refer to 9 - ENGINE/VALVE TIMING/BALANCE SHAFT CARRIER - INSTALLATION).

PISTON & CONNECTING ROD (Continued)

(16) Install oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

(17) Install cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION).

CONNECTING ROD BEARINGS

STANDARD PROCEDURE

CONNECTING ROD - FITTING

(1) For measuring connecting rod bearing clearance procedure and use of Plastigage (Refer to 9 - ENGINE - STANDARD PROCEDURE). For bearing clearance refer to Engine Specifications. (Refer to 9 - ENGINE - SPECIFICATIONS)

NOTE: The rod bearing bolts should not be reused.

(2) Before installing the **NEW** bolts the threads should be oiled with clean engine oil.

(3) Install each bolt finger tight then alternately torque each bolt to assemble the cap properly.

(4) Tighten the connecting rod bolts using the 2 step torque-turn method. Tighten according to the following values:

CAUTION: Do not use a torque wrench for the second step.

1. Tighten the bolts to 27 N·m (20 ft. lbs.).
2. Tighten the connecting rod bolts an additional **1/4 TURN.**

(5) Using a feeler gauge, check connecting rod side clearance (Fig. 87). Refer to clearance specifications (Refer to 9 - ENGINE - SPECIFICATIONS).

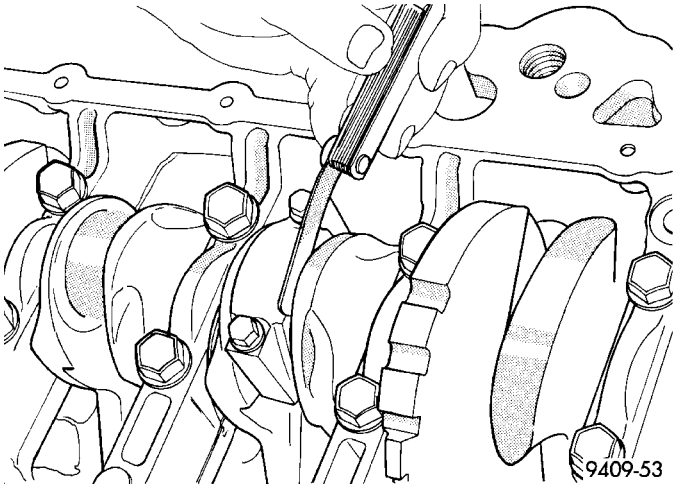

Fig. 87 Connecting Rod Side Clearance - Typical

PISTON RINGS

STANDARD PROCEDURE

PISTON RING - FITTING

(1) Wipe cylinder bore clean. Insert ring and push down with piston to ensure it is square in bore. The ring gap measurement must be made with the ring positioning at least 12 mm (0.50 inch) from bottom of cylinder bore. Check gap with feeler gauge (Fig. 88). Refer to Engine Specifications.

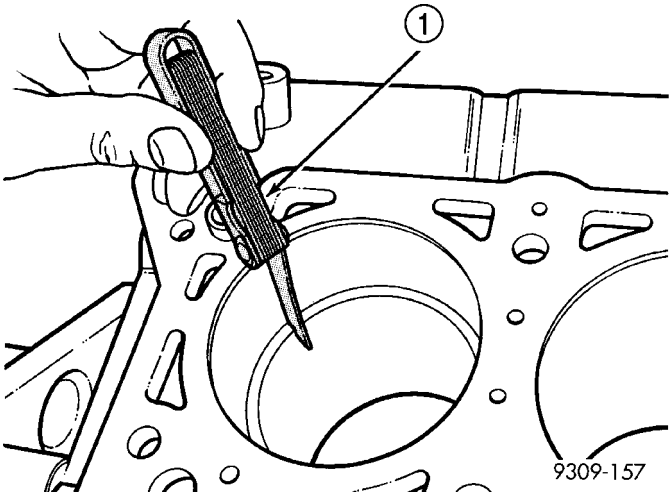

Fig. 88 Piston Ring Gap

1 - FEELER GAUGE

(2) Check piston ring to groove side clearance (Fig. 89). Refer to Engine Specifications.

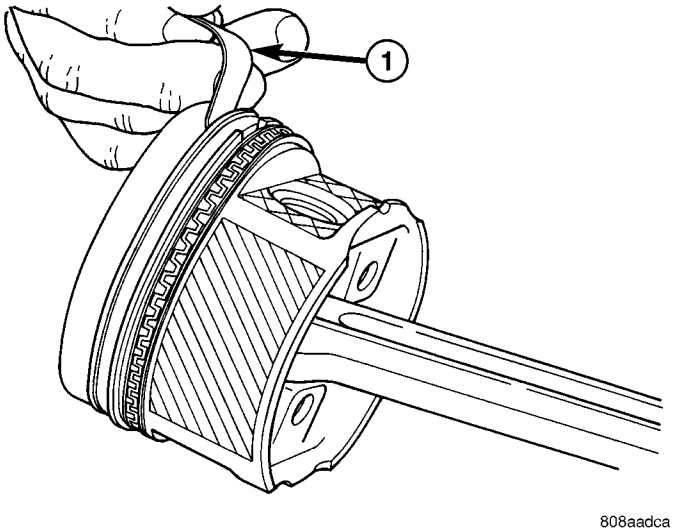

Fig. 89 Piston Ring Side Clearance

1 - FEELER GAUGE

PISTON RINGS (Continued)

REMOVAL

(1) Using a suitable ring expander, remove upper and intermediate piston rings (Fig. 90).

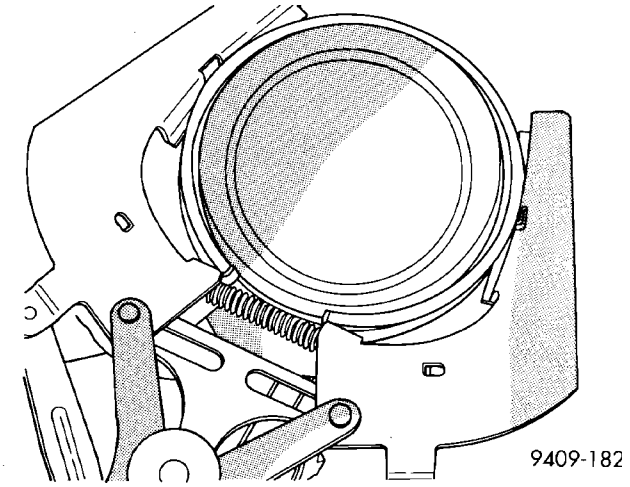

Fig. 90 Piston Rings—Removing and Installing

(2) Remove the upper oil ring side rail, lower oil ring side rail and then oil ring expander from piston.

(3) Clean ring grooves of any carbon deposits.

INSTALLATION

NOTE: The identification mark on face of upper and intermediate piston rings must point toward top of piston.

Install rings with manufacturers identification mark facing up, to the top of the piston (Fig. 91).

CAUTION: Install piston rings in the following order:

1. Oil ring expander.
2. Upper oil ring side rail.
3. Lower oil ring side rail.
4. No. 2 Intermediate piston ring.
5. No. 1 Upper piston ring.

(1) Install oil ring expander (Fig. 91).

(2) Install upper side rail first and then the lower side rail. Install the side rails by placing one end between the piston ring groove and the oil ring expander. Hold end firmly and press down the portion to be installed until side rail is in position. **Do not use a piston ring expander (Fig. 92).**

(3) Install No. 2 piston ring and then No. 1 piston ring (Fig. 91).

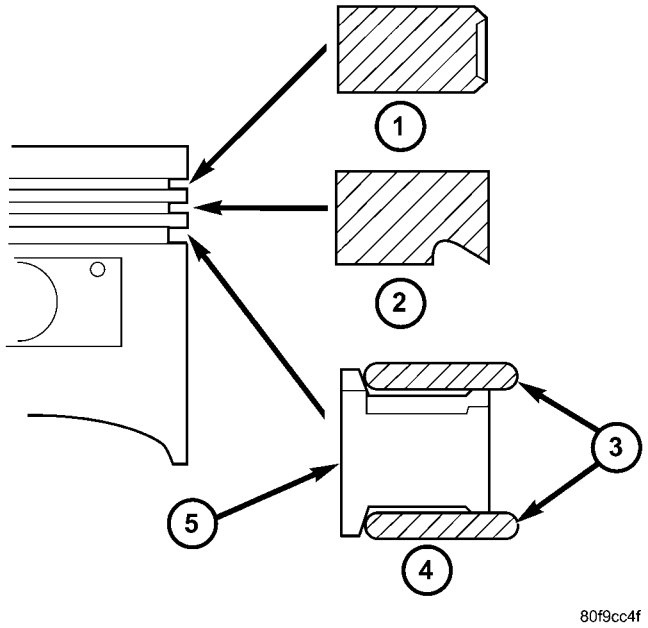

Fig. 91 Piston Ring Installation

1 - NO. 1 PISTON RING
2 - NO. 2 PISTON RING
3 - SIDE RAIL
4 - OIL RING
5 - SPACER EXPANDER

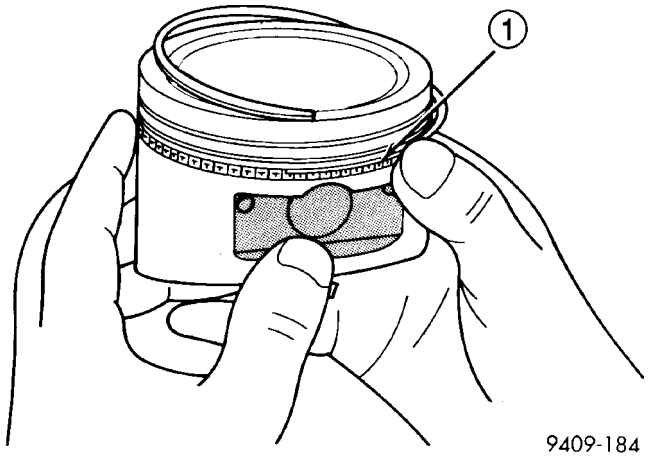

Fig. 92 Installing Side Rail

1 - SIDE RAIL END

PISTON RINGS (Continued)

(4) Position piston ring end gaps as shown in (Fig. 93).

(5) Position oil ring expander gap at least 45° from the side rail gaps but **not** on the piston pin center or on the thrust direction. Staggering ring gap is important for oil control.

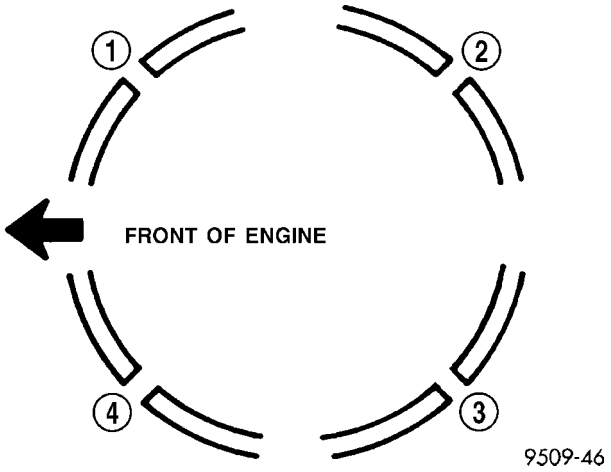

Fig. 93 Piston Ring End Gap Position

1 - GAP OF LOWER SIDE RAIL
2 - NO. 1 RING GAP

STRUCTURAL COLLAR

REMOVAL

STRUCTURAL COLLAR—AUTOMATIC TRANSAXLE EQUIPPED

(1) Raise vehicle on hoist.

(2) Remove bolts attaching bending strut to engine and transaxle (Fig. 94).

(3) Remove bolts attaching collar and strut to engine, oil pan, and transaxle (Fig. 94). Remove strut and collar.

STRUCTURAL COLLAR—MANUAL TRANSAXLE EQUIPPED

(1) Raise vehicle on hoist.

(2) Remove bolts attaching bending strut to engine and transaxle (Fig. 95). Remove strut.

(3) Remove bolts attaching collar and clutch slave cylinder to transaxle (Fig. 95).

(4) Remove remaining bolts attaching collar to oil pan and transaxle (Fig. 95). Remove collar.

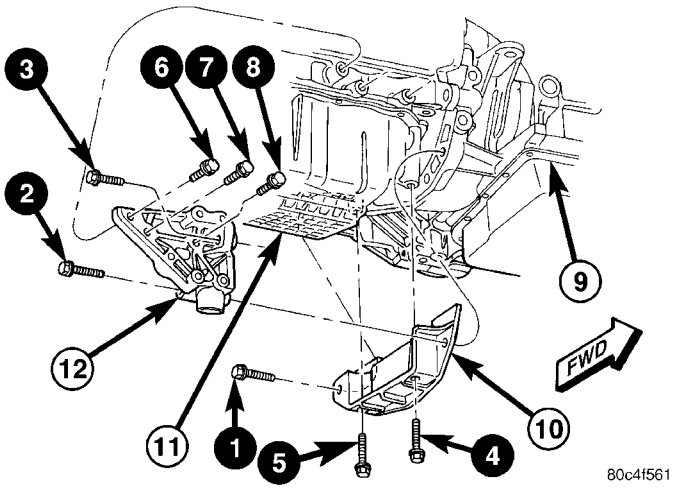

Fig. 94 Structural Collar and Bending Strut— (Automatic Transaxle Equipped)

7 – TRANSAXLE
8 – POWER STEERING HOSE
9 – COLLAR

STRUCTURAL COLLAR (Continued)

INSTALLATION

STRUCTURAL COLLAR—AUTOMATIC TRANSAXLE EQUIPPED

CAUTION: Torque procedure for the structural collar and bending strut must be followed or damage could occur to oil pan, collar, and/or bending strut.

(1) Perform the following steps for installing structural collar and bending strut. Refer to (Fig. 94):

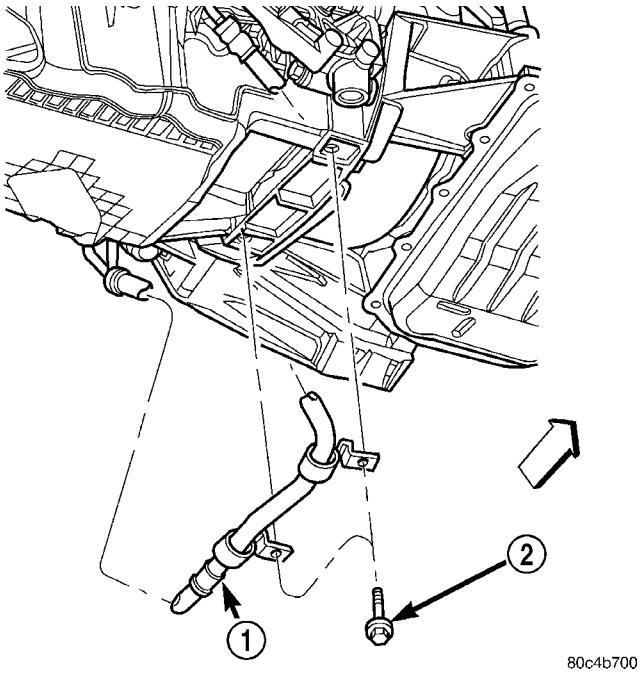

Fig. 96 Power Steering Hose To Structural Collar

1 - POWER STEERING HOSE
2 - BOLT

- Step 1: Place collar into position between transaxle and oil pan. Install collar to transaxle bolt (1), **hand start only**.
- Step 2: Position power steering hose support bracket (Fig. 96) and install collar to oil pan bolt (4), **hand tight only.**
- Step 3: Position bending strut in place and **hand start only** bolt (3) into the upper transaxle hole.
- Step 4: Install bolt (2), through strut and collar, **hand start only**.
- Step 5: Install bolt (6), strut to cylinder block, **hand tight only.**
- Step 6: Position power steering hose support bracket (Fig. 96) and install the remaining collar to oil pan bolt (5), **hand tight only.**
- Step 7: Final torque collar to transaxle bolts (1–3), to 101 N·m (75 ft. lbs.)
- Step 8: Install bolts (7) and (8), through strut and into cylinder block.
- Step 9: Final torque bolts (4–8) to 61 N·m (45 ft. lbs.).

(2) Lower vehicle.

STRUCTURAL COLLAR—MANUAL TRANSAXLE EQUIPPED

CAUTION: Torque procedure for the structural collar and bending strut must be followed or damage could occur to oil pan, collar, and/or bending strut.

(1) Perform the following steps for installing structural collar and bending strut. Refer to (Fig. 95):

- Step 1: Place collar into position between transaxle and oil pan. Install collar to transaxle bolt (1), **hand start only**.
- Step 2: Position power steering hose support bracket (Fig. 95) and install collar to oil pan bolt (2), **hand tight only**.
- Step 3: Position clutch slave cylinder into mounting position and install bolts (3) and (4) **hand tight only**.
- Step 4: Position power steering hose support bracket and install the remaining collar to oil pan bolt (5) **hand tight only**.
- Step 5: Final torque all bolts in sequence shown in (Fig. 95) to the following torque values:
  - Bolt (1) to 101 N·m (75 ft. lbs.)
  - Bolts (2) and (5) to 61 N·m (45 ft. lbs.)
  - Bolts (3) and (4) to 28 N·m (20 ft. lbs.)

(2) Lower vehicle.

VIBRATION DAMPER

REMOVAL

(1) Remove accessory drive belts (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(2) Remove crankshaft damper bolt.

(3) Remove damper by using Special Tool 1026 and Insert 6827A (Fig. 97).

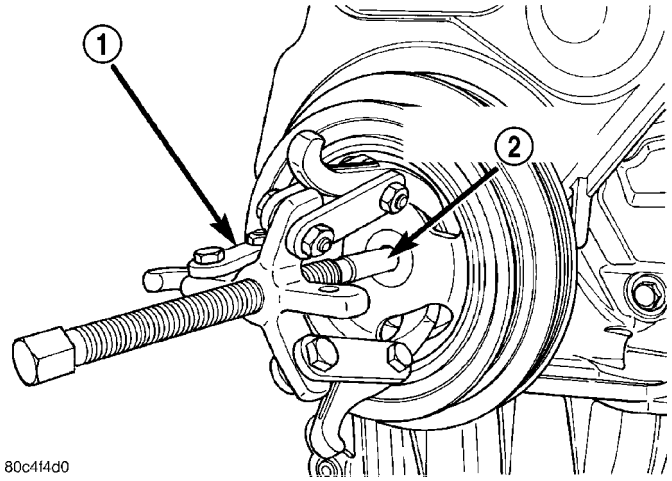

Fig. 97 Crankshaft Damper—Removal

1 - SPECIAL TOOL 1026 3 - JAW PULLER
2 - SPECIAL TOOL 6827A INSERT

INSTALLATION

(1) Install crankshaft damper using Special Tool 6792 (M12 1.75 x 150 mm bolt, washer, thrust bearing and nut).

NOTE: Lubricate the threads of the M12 1.75 x 150 mm bolt using Mopar® Nickel Anti-seize Compound or equivalent, before beginning to press the damper on.

(2) Apply Mopar® Lock & Seal Adhesive (Medium Strength Threadlocker) to crankshaft damper bolt and tighten to 136 N·m (100 ft. lbs.) (Fig. 98).

(3) Install accessory drive belts (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

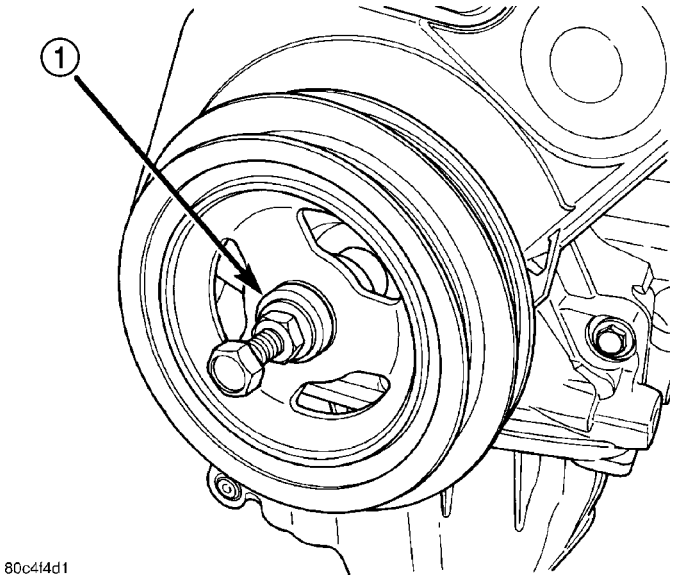

Fig. 98 Crankshaft Damper—Installation

1 - SPECIAL TOOL 6792

ENGINE MOUNTING

DESCRIPTION

The engine mounting system (Fig. 100) and (Fig. 102) consists of a four-point system utilizing two load-carrying mounts and two torque struts. The load-carrying mounts are located on each frame rail. The right mount is a hydro-elastic mount and left mount is a conventional elastomeric isolator. The two torque controlling struts are attached at the front of the engine, straddling the right side load-carrying mount. The upper strut connects to the suspension strut tower and the lower to the suspension cross-member.

OPERATION

The four-point engine mounting system minimizes the transmission of structure-borne engine noise to the passenger compartment. The load-carrying right and left mounts dampen and isolate vertical motion and vibration. The two struts absorbs torque reaction forces and torsional vibrations.

LEFT MOUNT

REMOVAL

(1) Remove air cleaner assembly.
(2) Disconnect negative cable from battery.
(3) Remove bolts attaching the power distribution center (PDC) bracket to left mount and battery tray (Fig. 99).
(4) Support transaxle with a suitable jack.
(5) Remove mount to transaxle bolts (Fig. 100).
(6) Remove left mount bracket to body frame rail fasteners (Fig. 100).
(7) Remove mount.

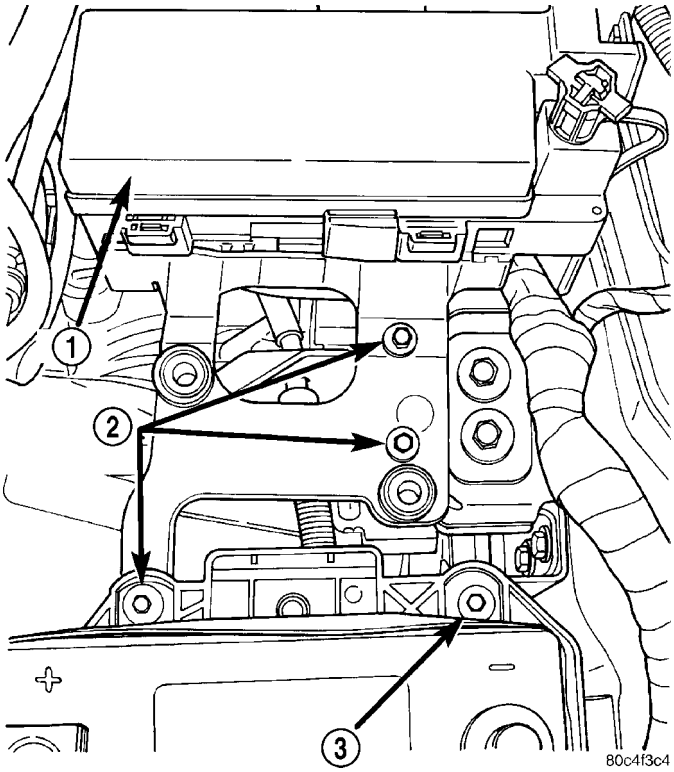

Fig. 99 PDC Bracket Attaching Bolts

1 - PDC
2 - PDC BRACKET BOLTS
3 - BATTERY TRAY BOLT

INSTALLATION

(1) Install engine mount bracket to body frame rail and tighten fasteners to 28 N·m (250 in. lbs.) (Fig. 100).
(2) Position engine/transaxle for installation of mount to transaxle bolts. Install and tighten bolts to 68 N·m (50 ft. lbs.) (Fig. 100).
(3) Remove jack from under transaxle.
(4) Install bolts attaching the power distribution center (PDC) bracket to left mount and battery tray (Fig. 99).
(5) Connect negative cable to battery.
(6) Install air cleaner assembly.

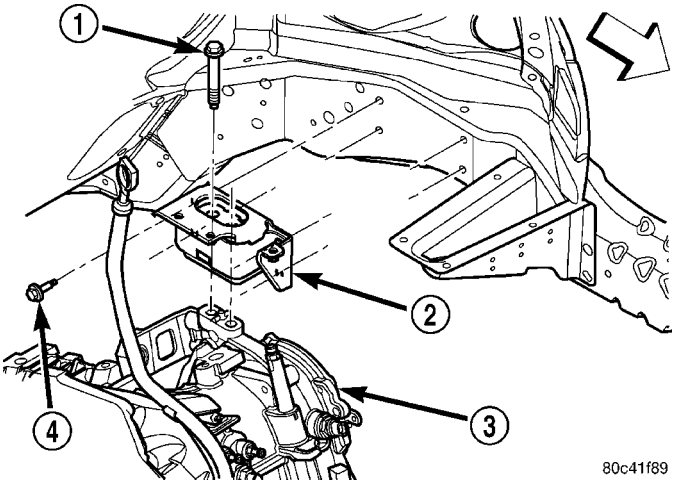

Fig. 100 Left Mount

1 - BOLT
2 - LEFT MOUNT
3 - TRANSAXLE
4 - BOLT

RIGHT MOUNT

REMOVAL

(1) Remove the engine assembly for the required clearance to access the engine mount (Refer to 9 - ENGINE - REMOVAL).

NOTE: The right engine mount attaching holes are slightly oversize to compensate for manufacturing tolerances. The mount has been set at the manufacturing plant for proper powertrain alignment. Therefore, it is necessary to mark the position of the mount before the attaching bolts are loosened.

(2) Using a permanent ink marker or equivalent, mark the position of engine mount to the body frame rail.
(3) Remove bolts attaching mount to body (Fig. 101).
(4) Remove mount.

INSTALLATION

(1) Position mount into the original position on body frame rail (Fig. 101).

NOTE: Engine mount must be installed in the original position on body frame rail. If mount was not marked or frame rail was replaced, perform the following procedure.

(2) Perform the following procedure if the mount position was not previously marked, or the frame rail was replaced:
(a) Insert new mount loosely in frame rail.

RIGHT MOUNT (Continued)

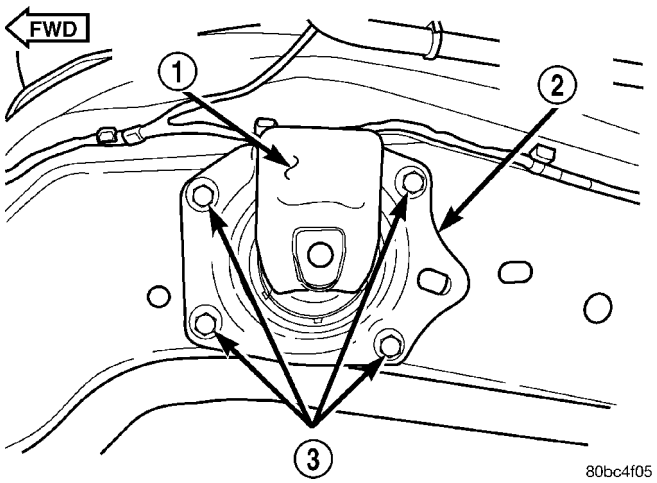

Fig. 101 Engine Mount—Right

1 - SNUBBER PAD
2 - RIGHT ENGINE MOUNT
3 - BOLTS

(b) Align the four holes in the mount with the mating holes in the rail such that the holes are concentric (frame rail holes centered in the mount holes).

(c) Using a permanent ink marker or equivalent, mark the position of engine mount to the body frame rail while maintaining mounting hole concentricity.

(3) Ensure the mount maintains originally marked position and install mount bolts. Tighten bolts to 28 N·m (250 in. lbs.) (Fig. 101).

(4) Install the engine assembly (Refer to 9 - ENGINE - INSTALLATION).

TORQUE STRUT

REMOVAL

UPPER

(1) Remove bolts attaching upper torque strut to shock tower bracket and engine mount bracket (Fig. 102).

(2) Remove timing belt front upper cover (if A/C equipped).

(3) Remove the upper torque strut.

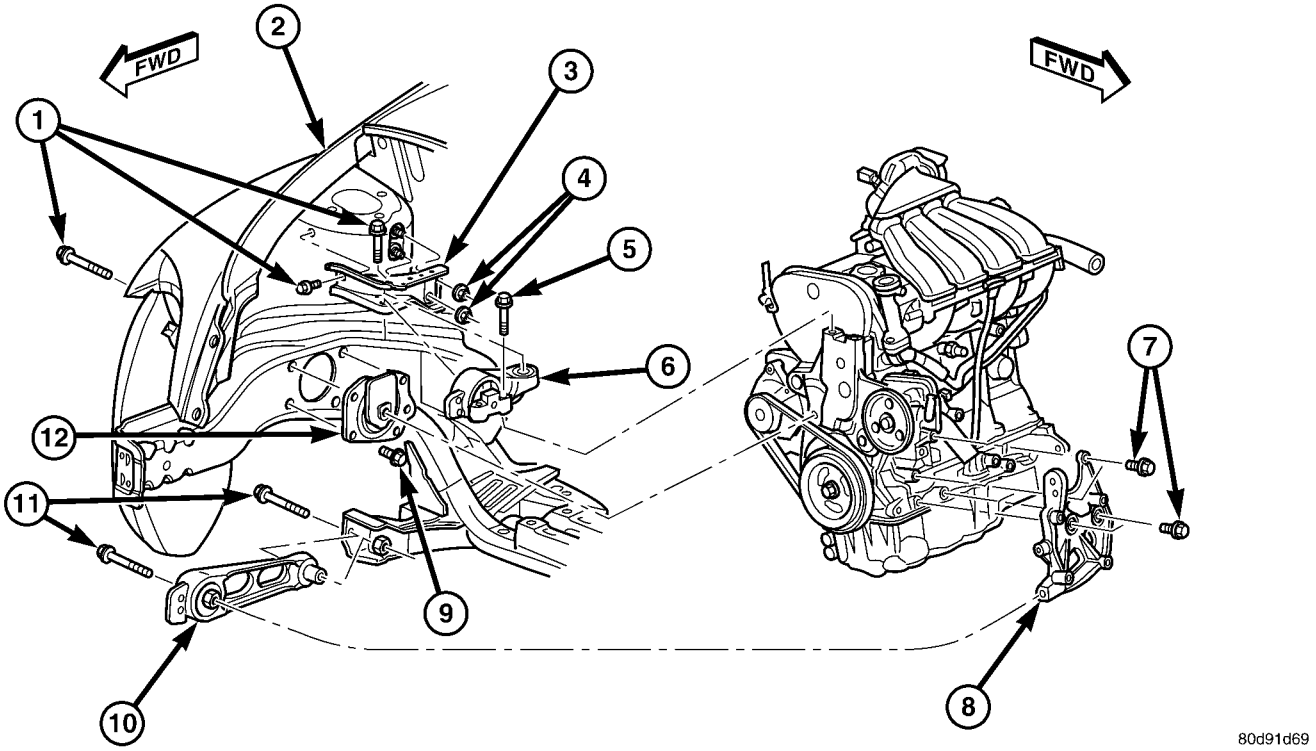

Fig. 102 Engine Mounting - Right Side

1 - BOLT
2 - RIGHT FENDER
3 - UPPER TORQUE STRUT BRACKET
4 - NUTS
5 - BOLT
6 - UPPER TORQUE STRUT
7 - BOLT
8 - LOWER TORQUE STRUT BRACKET
9 - BOLT
10 - LOWER TORQUE STRUT
11 - BOLT
12 - RIGHT ENGINE MOUNT

TORQUE STRUT (Continued)

LOWER

(1) Raise vehicle on hoist.

(2) Remove accessory drive belt splash shield (Fig. 103).

(3) Remove pencil strut (Fig. 104).

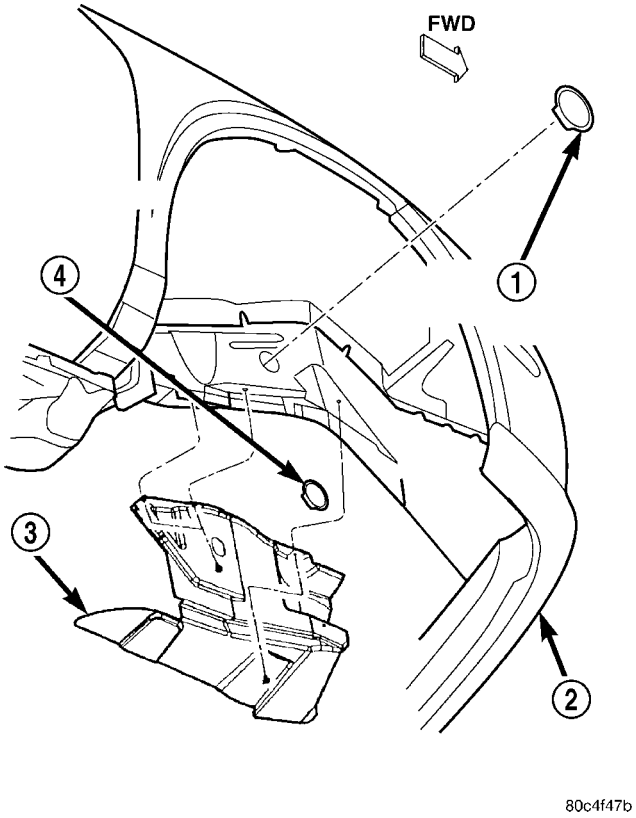

Fig. 103 Splash Shield

1 - RIGHT MOUNT BOLT ACCESS PLUG
2 - FASCIA
3 - SPLASH SHIELD
4 - CRANKSHAFT BOLT ACCESS PLUG

(4) Remove bolts attaching lower torque strut to crossmember and strut bracket (Fig. 102).

(5) Remove lower torque strut.

INSTALLATION

UPPER

(1) Position the upper torque strut into mounting location (Fig. 102).

(2) Move torque strut aside (towards right fender) and install timing belt front upper cover (if A/C equipped).

(3) Install the torque strut mounting bolts and perform the torque strut adjustment procedure (Refer to 9 - ENGINE/ENGINE MOUNTING/TORQUE STRUT - ADJUSTMENTS).

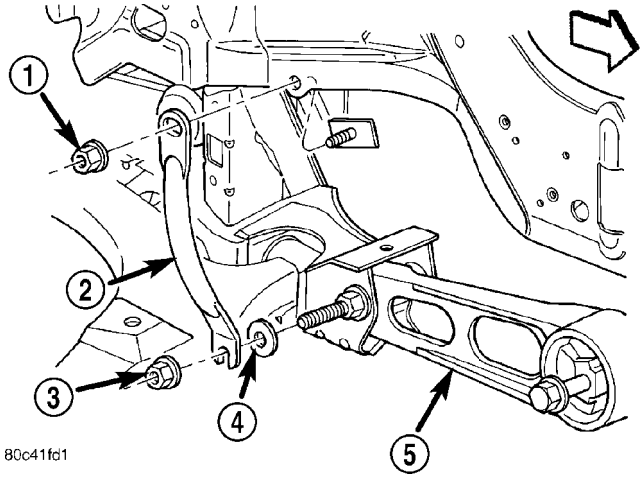

Fig. 104 Pencil Strut

1 - NUT
2 - PENCIL STRUT
3 - NUT
4 - FLAT WASHER
5 - LOWER TORQUE STRUT

INSTALLATION - LOWER

(1) Position lower torque strut into mounting locations.

(2) Install mounting bolts and perform torque strut adjustment procedure (Refer to 9 - ENGINE/ENGINE MOUNTING/TORQUE STRUT - ADJUSTMENTS).

(3) Install pencil strut and tighten nuts to 58 N·m (43 ft. lbs.) (Fig. 104).

(4) Install accessory belt splash shield (Fig. 103) and lower vehicle.

ADJUSTMENTS

ENGINE TORQUE STRUT ADJUSTMENT

The upper and lower torque struts need to be adjusted together to assure proper engine positioning and engine mount loading. Whenever a torque strut bolt(s) is loosened, this procedure must be performed.

(1) Remove accessory drive belt splash shield (Fig. 103).

(2) Remove pencil strut (Fig. 104).

(3) Loosen the upper and lower torque strut attaching bolt at the suspension crossmember and shock tower bracket (Fig. 102).

(4) The engine position may now be adjusted by positioning a suitable floor jack on the forward edge of the transmission bell housing (Fig. 105).

NOTE: The floor jack must be positioned as shown in (Fig. 105) to prevent minimal upward lifting of the engine.

TORQUE STRUT (Continued)

(5) With the engine supported, remove the upper and lower torque strut attachment bolt(s) at shock tower bracket and suspension crossmember (Fig. 102). Verify that the torque struts are free to move within the shock tower bracket and crossmember. Reinstall the torque strut bolt(s), but do not tighten.

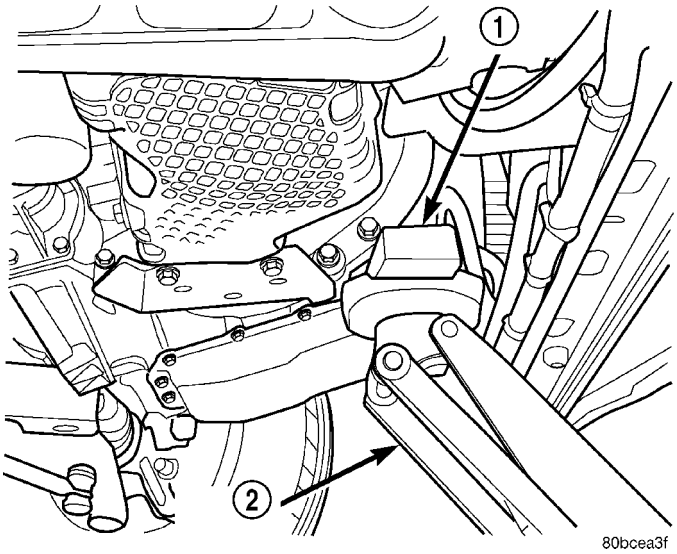

Fig. 105 Floor Jack Positioning

1 - WOOD BLOCK
2 - FLOOR JACK

(6) Carefully apply upward force, allowing the upper engine to rotate rearward until the distance between the center of the rearmost attaching bolt on the engine mount bracket (point “A”) and the center of the hole on the shock tower bracket (point “B”) is 119 mm (4.70 in.) (Fig. 106).

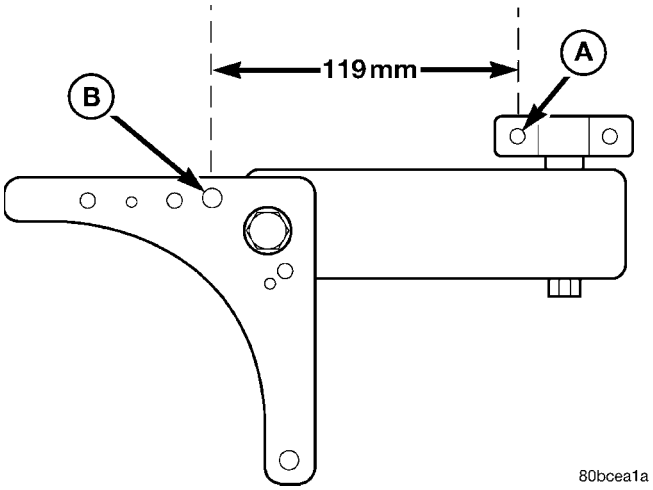

Fig. 106 Engine Position Measurement

CAUTION: The engine must be held in position with jack until both the upper and lower torque strut bolts are tightened.

(7) With the engine held at the proper position, tighten both the upper and lower torque strut bolts to 115 N·m (85 ft. lbs.) (Fig. 102).

(8) Remove the floor jack.

(9) Install pencil strut and tighten nuts to 58 N·m (43 ft. lbs.) (Fig. 104).

(10) Install accessory drive belt splash shield (Fig. 103).

LUBRICATION

DESCRIPTION

The lubrication system is a full-flow filtration, pressure feed type. The oil pump is mounted in the front engine cover and driven by the crankshaft.

OPERATION

Engine oil drawn up through the pickup tube and is pressurized by the oil pump and routed through the full-flow filter to the main oil gallery running the length of the cylinder block. A diagonal hole in each bulkhead feeds oil to each main bearing. Drilled passages within the crankshaft route oil from main bearing journals to connecting rod journals. Balance shaft lubrication is provided through an oil passage from the number one main bearing cap through the balance shaft carrier support leg. This passage directly supplies oil to the front bearings and internal machined passages in the shafts that routes oil from front to the rear shaft bearing journals. A vertical hole at the number five bulkhead routes pressurized oil through a restrictor (integral to the cylinder head gasket) up past a cylinder head bolt to an oil gallery running the length of the cylinder head. The camshaft journals are partially slotted to allow a predetermined amount of pressurized oil to pass into the bearing cap cavities. Lubrication of the camshaft lobes are provided by small holes in the camshaft bearing caps that are directed towards each lobe. Oil returning to the pan from pressurized components supplies lubrication to the valve stems. Cylinder bores and wrist pins are splash lubricated from directed slots on the connecting rod thrust collars.

DIAGNOSIS AND TESTING

CHECKING ENGINE OIL PRESSURE

(1) Disconnect and remove oil pressure switch. (Refer to 9 - ENGINE/LUBRICATION/OIL PRESSURE SENSOR/SWITCH - REMOVAL)

(2) Install Special Tools C-3292 Gauge with 8406 Adaptor fitting.

LUBRICATION (Continued)

(3) Start engine and record oil pressure. Refer to Specifications for correct oil pressure requirements. (Refer to 9 - ENGINE - SPECIFICATIONS)

CAUTION: If oil pressure is 0 at idle, do not perform the 3000 RPM test

(4) If oil pressure is 0 at idle. Shut off engine, check for pressure relief valve stuck open, a clogged oil pick-up screen or a damaged oil pick-up tube O-ring.

(5) After test is complete, remove test gauge and fitting.

(6) Install oil pressure switch and connector. (Refer to 9 - ENGINE/LUBRICATION/OIL PRESSURE SENSOR/SWITCH - INSTALLATION)

OIL

STANDARD PROCEDURE

ENGINE OIL LEVEL CHECK

The best time to check engine oil level is after the vehicle has sat overnight, or if the engine has been running, allow the engine to be shut off for at least 5 minutes before checking oil level.

Checking the oil while the vehicle is on level ground will improve the accuracy of the oil level reading. Remove dipstick (Fig. 107) or (Fig. 108), and observe oil level. Add oil only when the level is at or below the MIN mark (Fig. 109).

CAUTION: Do not operate engine if the oil level is above the MAX mark on the dipstick. Excessive oil volume can cause oil aeration which can lead to engine failure due to loss of oil pressure or increase in oil temperature.

ENGINE OIL AND FILTER CHANGE

WARNING: NEW OR USED ENGINE OIL CAN BE IRRITATING TO THE SKIN. AVOID PROLONGED OR REPEATED SKIN CONTACT WITH ENGINE OIL. CONTAMINANTS IN USED ENGINE OIL, CAUSED BY INTERNAL COMBUSTION, CAN BE HAZARDOUS TO YOUR HEALTH. THOROUGHLY WASH EXPOSED SKIN WITH SOAP AND WATER. DO NOT WASH SKIN WITH GASOLINE, DIESEL FUEL, THINNER, OR SOLVENTS, HEALTH PROBLEMS CAN RESULT. DO NOT POLLUTE, DISPOSE OF USED ENGINE OIL PROPERLY. CONTACT YOUR DEALER OR GOVERNMENT AGENCY FOR LOCATION OF COLLECTION CENTER IN YOUR AREA.

3 - ENGINE OIL DIPSTICK
4 - COOLANT PRESSURE CAP

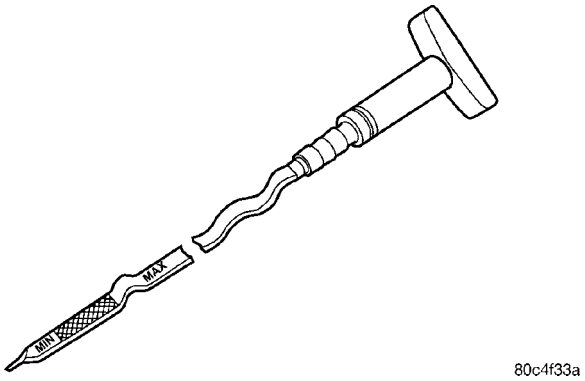

Fig. 109 Engine Oil Dipstick

Change engine oil at mileage and time intervals described in the Maintenance Schedule (Refer to LUBRICATION & MAINTENANCE/MAINTENANCE SCHEDULES - DESCRIPTION).

(1) Run engine until achieving normal operating temperature.

(2) Position the vehicle on a level surface and turn engine off.

(3) Remove oil fill cap (Fig. 107) or (Fig. 108).

(4) Raise vehicle on hoist.

(5) Place a suitable oil collecting container under oil pan drain plug.

(6) Remove oil pan drain plug (Fig. 110) or (Fig. 111) and allow oil to drain into collecting container. Inspect drain plug threads for stretching or other damage. Replace drain plug and gasket if damaged.

(7) Remove oil filter (Fig. 110) or (Fig. 111) (Refer to 9 - ENGINE/LUBRICATION/OIL FILTER - REMOVAL).

(8) Install oil pan drain plug. Torque drain plug to 28 N·m (20 ft. lbs.).

(9) Install new oil filter (Refer to 9 - ENGINE/LUBRICATION/OIL FILTER - INSTALLATION).

(10) Lower vehicle and fill crankcase with specified type and amount of engine oil (Refer to LUBRICATION & MAINTENANCE/SPECIFICATIONS - FLUID CAPACITIES) and (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION).

(11) Install oil fill cap (Fig. 107) or (Fig. 108).

(12) Start engine and inspect for leaks.

(13) Stop engine and inspect oil level.

OIL FILTER SPECIFICATION

All engines are equipped with a high quality full-flow, disposable type oil filter. Replace oil filter with a Mopar® or the equivalent.

OIL (Continued)

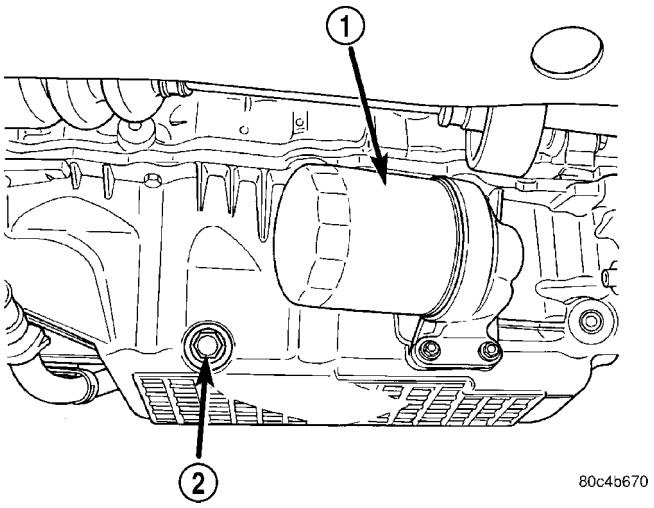

Fig. 110 Oil Filter and Drain Plug

1 - OIL FILTER
2 - DRAIN PLUG

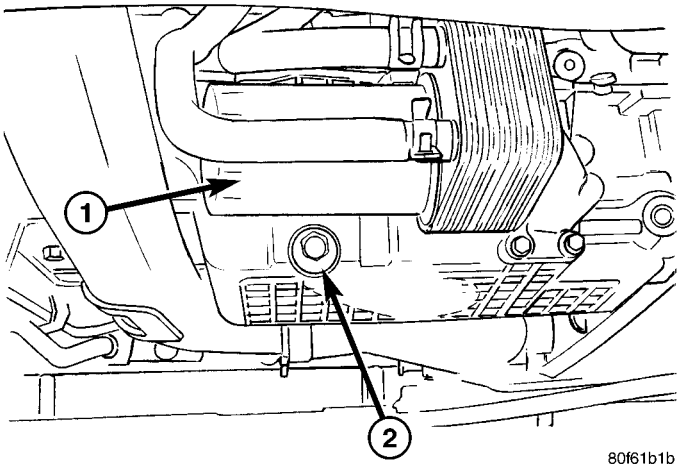

Fig. 111 Oil Filter and Drain Plug - 2.4L Turbo

1 - OIL FILTER
2 - DRAIN PLUG

USED ENGINE OIL DISPOSAL

Care should be exercised when disposing used engine oil after it has been drained from a vehicle engine. Refer to the WARNING listed above.

OIL FILTER

REMOVAL

CAUTION: When servicing the oil filter avoid deforming the filter can by installing the remove/install tool band strap against the can to base lock seam. The lock seam joining the can to the base is reinforced by the base plate.

(1) Using a suitable filter wrench, turn oil filter (Fig. 110) or (Fig. 111) counterclockwise to remove.

INSTALLATION

(1) Clean and check filter mounting surface. The surface must be smooth, flat and free of debris or pieces of gasket.

(2) Lubricate new oil filter gasket.

(3) Screw oil filter (Fig. 110) or (Fig. 111) on until the gasket contacts base. Tighten to 21 N·m (15 ft. lbs.).

OIL FILTER ADAPTER

REMOVAL

(1) Raise vehicle on hoist.

(2) Place a suitable oil collecting container under oil filter.

(3) Remove oil filter (Refer to 9 - ENGINE/LUBRICATION/OIL FILTER - REMOVAL).

(4) **Turbocharger Equipped Vehicles:** Remove oil cooler connector bolt. **DO NOT** disconnect coolant lines from oil cooler. Reposition oil cooler.

(5) Remove filter adapter attaching bolts (Fig. 112).

(6) Remove filter adapter and gasket (Fig. 112).

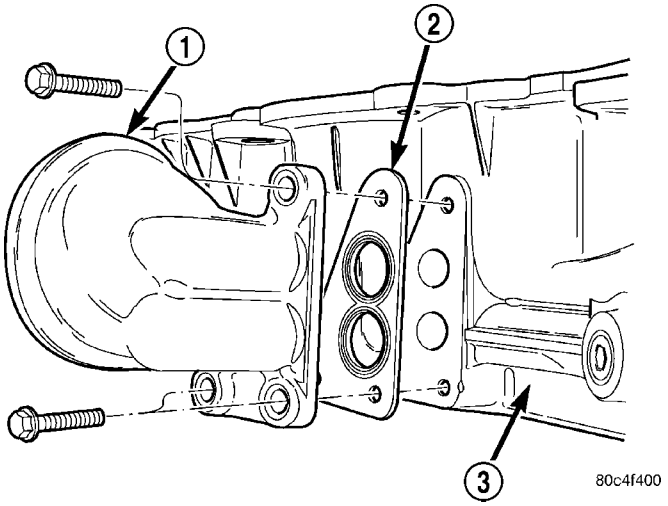

Fig. 112 Oil Filter Adaptor

1 - OIL FILTER ADAPTER
2 - GASKET
3 - OIL PAN

INSTALLATION

(1) Clean all gasket sealing surfaces

(2) Install gasket and filter adaptor to oil pan (Fig. 112). Tighten bolts to 12 N·m (105 in. lbs.).

(3) **Turbocharger Equipped Vehicles:**

- Replace oil cooler seal
- Lubricate seal and position oil cooler to oil filter adapter, aligning notch to tab

OIL FILTER ADAPTER (Continued)

- Install oil cooler connector bolt. Torque connector bolt to 55 N·m (41 ft. lbs.)

(4) Install oil filter (Refer to 9 - ENGINE/LUBRICATION/OIL FILTER - INSTALLATION).

(5) Lower vehicle and check engine oil level. Adjust level as necessary.

OIL PAN

REMOVAL

(1) Raise vehicle on hoist.

(2) Drain engine oil and remove oil filter.

(3) Remove accessory drive belt splash shield.

(4) **Turbocharger Equipped Vehicles:** Remove turbocharger to charge air cooler hose assembly (Refer to 11 - EXHAUST SYSTEM/TURBOCHARGER SYSTEM/CHARGE AIR COOLER AND HOSES - REMOVAL).

(5) **Turbocharger Equipped Vehicles:** Remove oil cooler connector bolt. **DO NOT** disconnect coolant lines from oil cooler. Reposition oil cooler.

(6) Remove structural collar (Refer to 9 - ENGINE/ENGINE BLOCK/STRUCTURAL COLLAR - REMOVAL).

(7) Remove lower torque strut (Refer to 9 - ENGINE/ENGINE MOUNTING/TORQUE STRUT - REMOVAL).

(8) Remove oil filter adapter and gasket (Fig. 113).

(9) Remove oil pan and gasket (Fig. 113).

(10) Clean oil pan and all gasket surfaces.

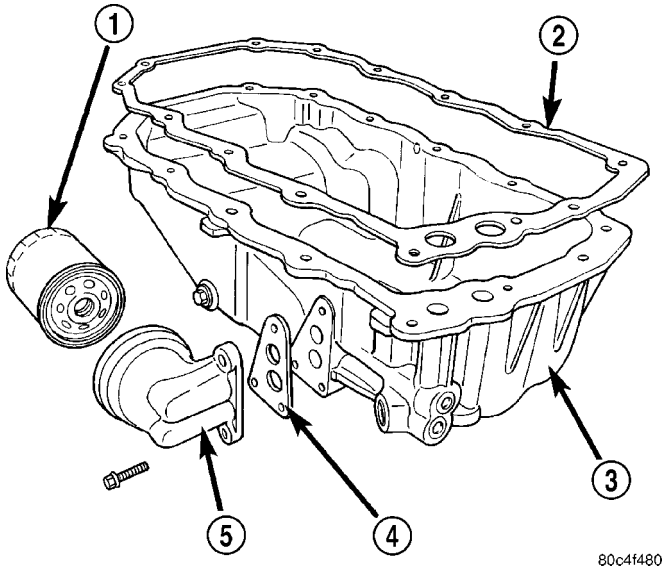

Fig. 113 Oil Pan

1 - OIL FILTER
2 - OIL PAN GASKET
3 - OIL PAN
4 - ADAPTER GASKET
5 - OIL FILTER ADAPTER

INSTALLATION

(1) Apply Mopar® Engine RTV GEN II at the oil pump to engine block parting lines (Fig. 114).

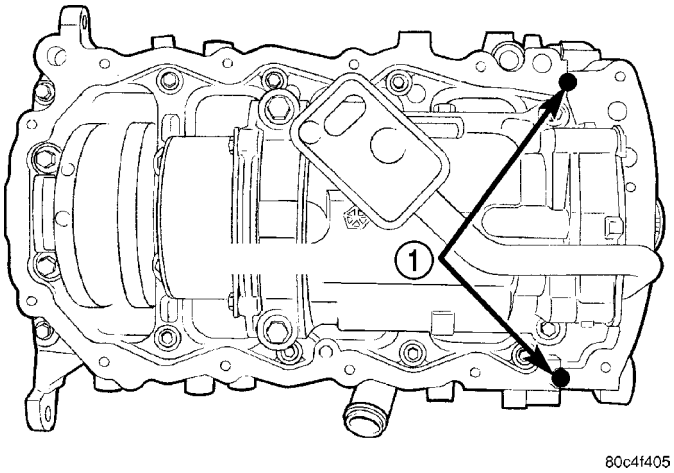

Fig. 114 Oil Pan Sealing

1 - SEALER LOCATIONS

(2) Install oil pan gasket to the block.

(3) Install pan gasket and pan. Tighten screws to 12 N·m (105 in. lbs.).

(4) Install oil filter adapter and gasket (Fig. 113). Tighten screws to 12 N·m (105 in. lbs.).

(5) **Turbocharger Equipped Vehicles:**

- Replace oil cooler seal
- Lubricate seal and position oil cooler to oil filter adapter, aligning notch to tab
- Install oil cooler connector bolt. Torque connector bolt to 55 N·m (41 ft. lbs.)

(6) Install oil drain plug and oil filter.

(7) Install structural collar (Refer to 9 - ENGINE/ENGINE BLOCK/STRUCTURAL COLLAR - INSTALLATION).

(8) Install lower torque strut (Refer to 9 - ENGINE/ENGINE MOUNTING/TORQUE STRUT - INSTALLATION).

(9) **Turbocharger Equipped Vehicles:** Install turbocharger to charge air cooler hose assembly (Refer to 11 - EXHAUST SYSTEM/TURBOCHARGER SYSTEM/CHARGE AIR COOLER AND HOSES - INSTALLATION).

(10) Lower vehicle and fill engine crankcase with proper oil to correct level.

OIL PRESSURE SENSOR/ SWITCH

DESCRIPTION

The oil pressure switch is located on the right rear side of the engine block (Fig. 115). The oil pressure switch is a pressure sensitive switch that is activated

OIL PRESSURE SENSOR/SWITCH (Continued)

by the engine's oil pressure (in the main oil gallery). The switch is a two terminal device (one terminal is provided to the wiring harness and the other terminal is the switch's metal housing that screws into the engine block).

OPERATION

The oil pressure switch is normally "Closed." The switch changes from a "Closed" circuit to an "Open" circuit, on increasing pressure of 7 psig. The oil pressure switch changes from an "Open" circuit to a "Closed" circuit, on decreasing pressure, between 2 psig and 4 psig.

REMOVAL

(1) Raise vehicle.

(2) Position oil collecting container under pressure switch location.

(3) Disconnect oil pressure switch electrical connector and remove switch (Fig. 115).

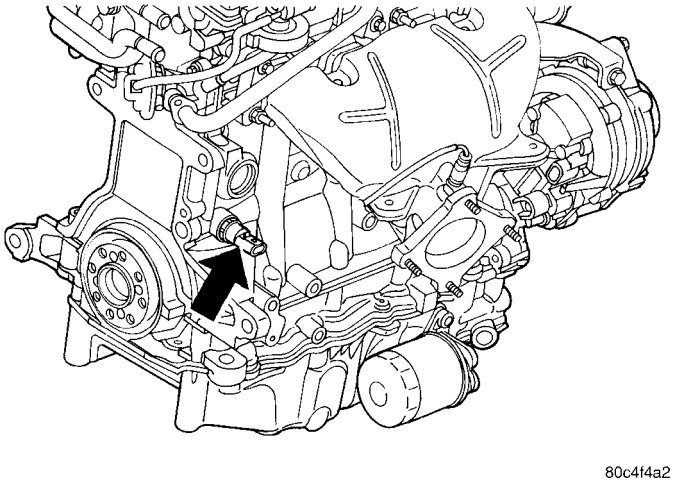

Fig. 115 Engine Oil Pressure Switch

INSTALLATION

(1) Install oil pressure switch and connect electrical connector (Fig. 115).

(2) Lower vehicle.

(3) Start engine and allow to run a minimum of 2 minutes.

(4) Shut engine off and check engine oil level. Adjust level as necessary.

OIL PUMP

REMOVAL

(1) Disconnect negative cable from battery.

(2) Remove timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT AND SPROCKETS - REMOVAL).

(3) Remove timing belt rear cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT COVER(S) - REMOVAL).

(4) Remove oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).

(5) Remove crankshaft sprocket using Special Tools 6793 and C-4685-C2 (Fig. 116).

(6) Remove crankshaft key (Fig. 117).

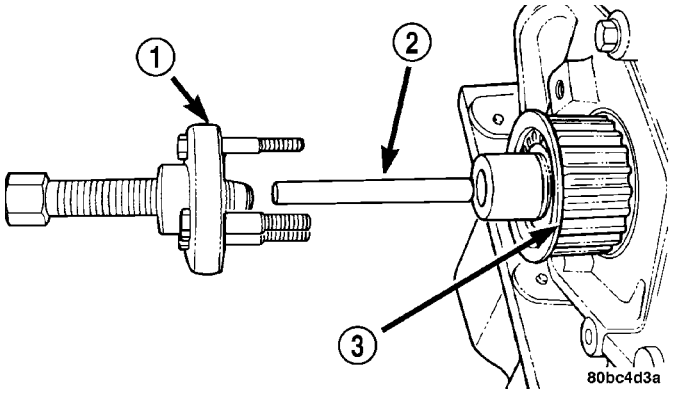

Fig. 116 Crankshaft Sprocket - Removal

1 - SPECIAL TOOL 6793
2 - SPECIAL TOOL C-4685–C2
3 - CRANKSHAFT SPROCKET

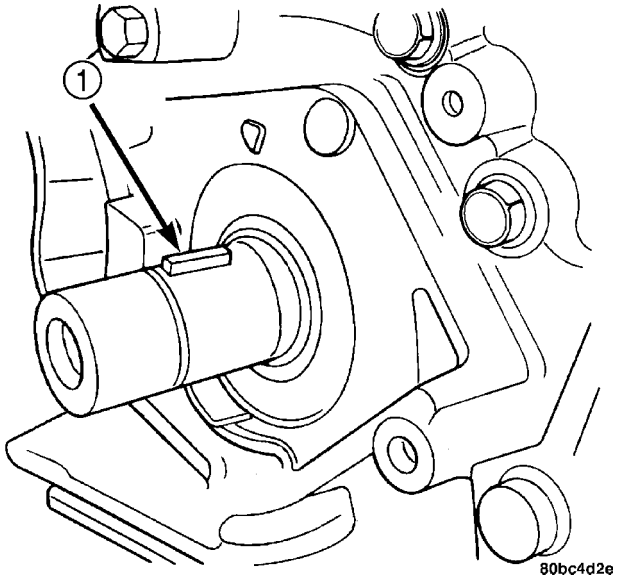

Fig. 117 Crankshaft Key

1 - CRANKSHAFT KEY

OIL PUMP (Continued)

(7) Remove oil pick-up tube.

(8) Remove oil pump (Fig. 118) and front crankshaft seal.

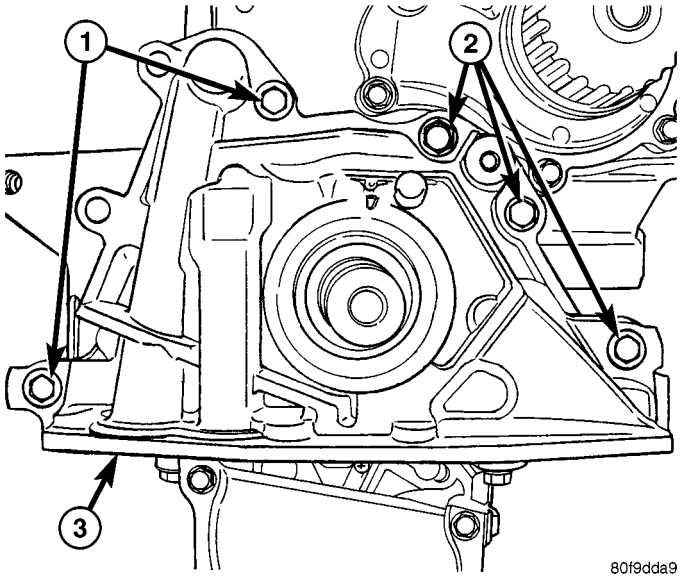

Fig. 118 Oil Pump

1 - BOLTS
2 - BOLTS
3 - OIL PUMP

DISASSEMBLY

(1) Remove oil pump cover fasteners, and lift off cover (Fig. 119).

(2) Remove pump rotors (Fig. 119).

(3) Wash all parts in a suitable solvent and inspect carefully for damage or wear.

CLEANING

Clean all parts thoroughly.

INSPECTION

(1) Inspect the mating surface of the oil pump. Surface should be smooth. Replace pump cover if scratched or grooved.

(2) Lay a straightedge across the pump cover surface (Fig. 120). If a 0.025 mm (0.001 in.) feeler gauge can be inserted between cover and straight edge, cover should be replaced.

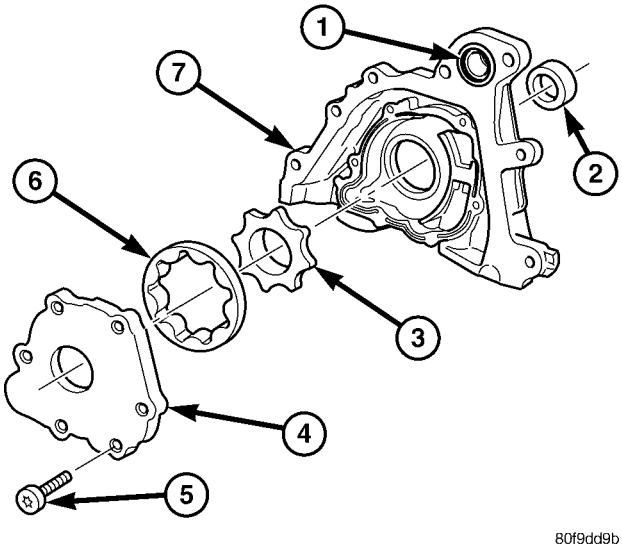

Fig. 119 Oil Pump

6 - OUTER ROTOR
7 - OIL PUMP BODY

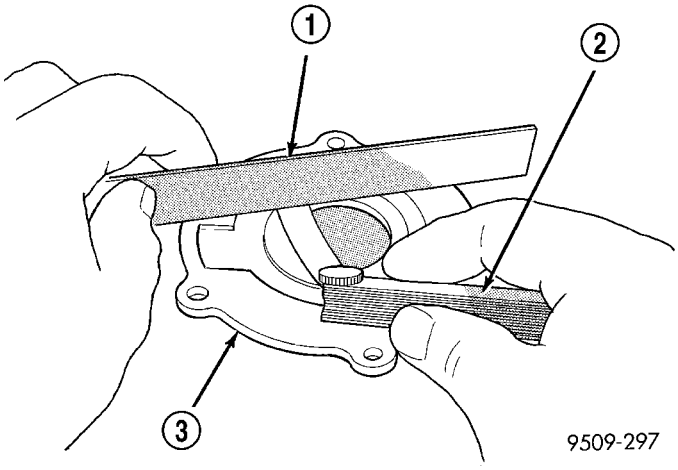

Fig. 120 Checking Oil Pump Cover Flatness

1 - STRAIGHT EDGE
2 - FEELER GAUGE
3 - OIL PUMP COVER

OIL PUMP (Continued)

(3) Measure thickness and diameter of outer rotor. If outer rotor thickness measures 10.699 mm (0.421 in.) or less (Fig. 121), or if the diameter is 85.924 mm (3.383 in.) or less, replace outer rotor.

(4) If inner rotor measures 10.699 mm (0.421 in.) or less replace inner rotor (Fig. 122).

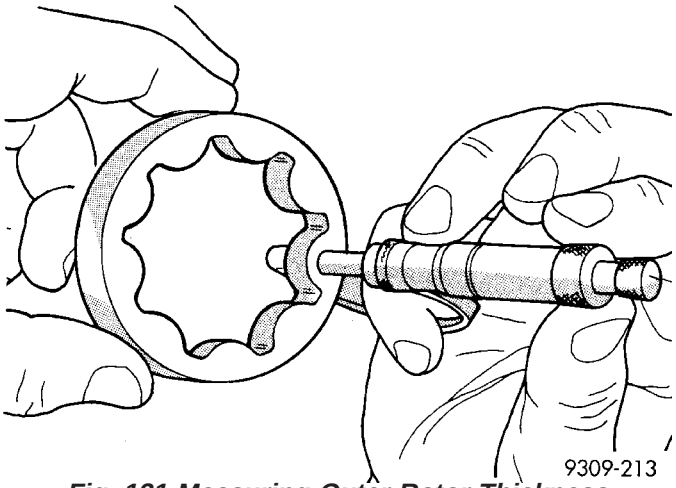

Fig. 121 Measuring Outer Rotor Thickness

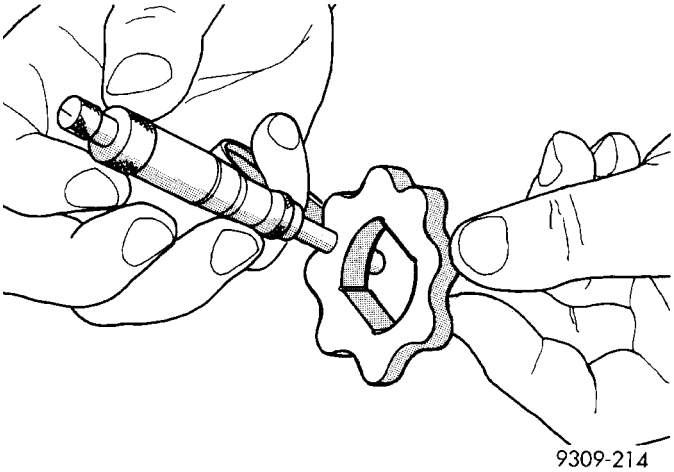

Fig. 122 Measuring Inner Rotor Thickness

ASSEMBLY

(1) Assemble pump, using new parts as required. **Install the inner rotor with chamfer facing the cast iron oil pump cover.**

(2) Prime oil pump before installation by filling rotor cavity with engine oil.

(3) Install cover and tighten fasteners to 13 N·m (118 in. lbs.) (Fig. 119).

INSTALLATION

(1) Make sure all surfaces are clean and free of oil and dirt.

(2) Apply Mopar® Gasket Maker to oil pump as shown in (Fig. 123). Install O-ring into oil pump body discharge passage.

(3) Prime oil pump with engine oil before installation.

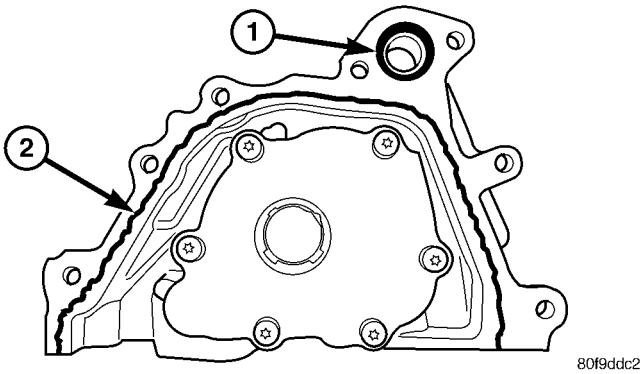

Fig. 123 Oil Pump Sealing

1 - O-RING
2 - SEALER LOCATION

(4) Align oil pump rotor flats with flats on crankshaft. Install the oil pump to the block (Fig. 118).

CAUTION: To align, the front crankshaft seal MUST be out of pump, or damage may result.

(5) Install new front crankshaft seal using Special Tool 6780 (Fig. 124).

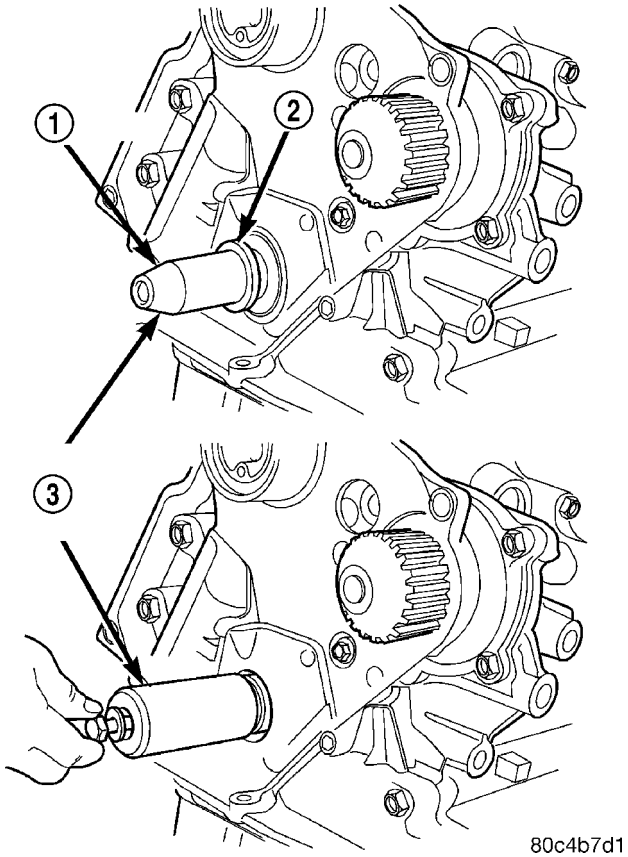

Fig. 124 Front Crankshaft Seal - Installation

1 - PROTECTOR
2 - SEAL
3 - SPECIAL TOOL 6780

OIL PUMP (Continued)

(6) Install crankshaft key (Fig. 117).

CAUTION: The crankshaft sprocket is set to a predetermined depth from the factory for correct timing belt tracking. If removed, use of Special Tool 6792 is required to set the sprocket to original installation depth. An incorrectly installed sprocket will result in timing belt and engine damage.

(7) Install crankshaft sprocket using Special Tool 6792 (Fig. 125).

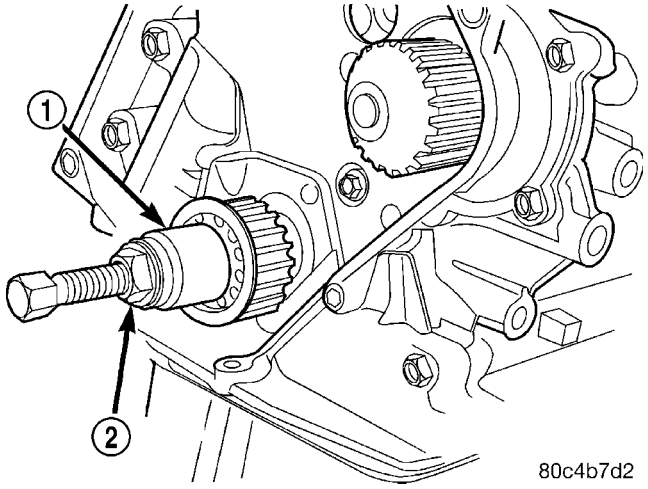

Fig. 125 Crankshaft Sprocket - Installation

1 - SPECIAL TOOL 6792
2 - TIGHTEN NUT TO INSTALL

(8) Install oil pump pick-up tube.

(9) Install oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

(10) Install timing belt rear cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT COVER(S) - INSTALLATION).

(11) Install timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT AND SPROCKETS - INSTALLATION).

OIL JET - 2.4L TURBO

DESCRIPTION

The 2.4L Turbocharged engines are equipped with four oil jets installed in the engine block. The oil jets are provided engine oil pressure from the main oil gallery. The oil jets are used to cool the pistons. An integral check ball controls the flow of oil through the oil jet (Fig. 126).

REMOVAL

(1) Remove crankshaft (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT - REMOVAL).

(2) Remove oil jet fastener (Fig. 127).

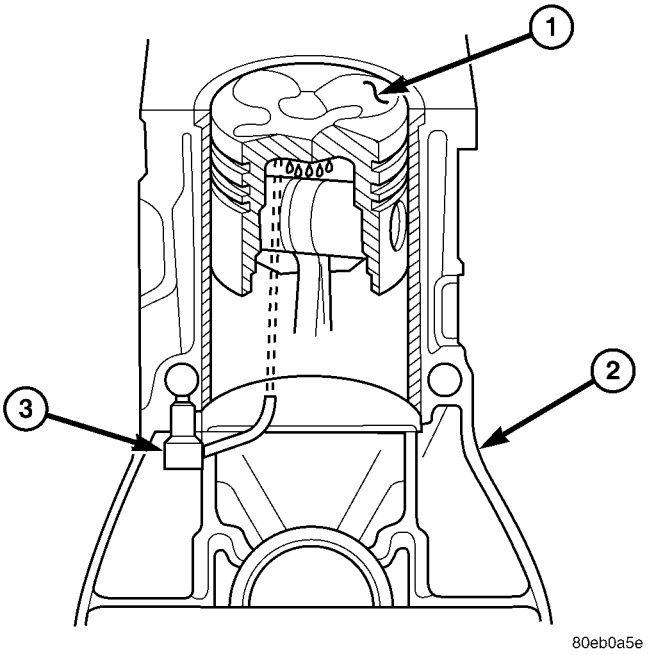

Fig. 126 Oil Jet - 2.4L Turbo

1 - PISTON ASSEMBLY
2 - ENGINE BLOCK
3 - OIL JET

CAUTION: Do Not Pull on Oil Jet Tube

(3) Using pliers or other similar tool, pull oil jet from engine block.

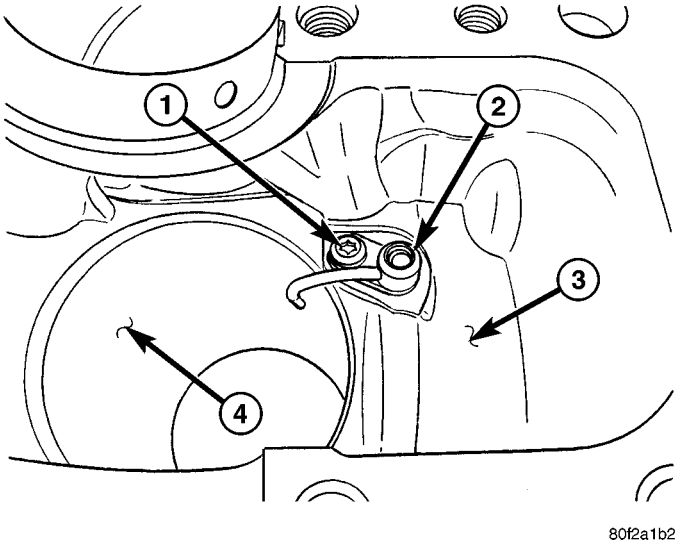

Fig. 127 Oil Jet Fastener - 2.4L Turbo

1 - FASTENER - 12 N·m (105 in. lbs.)
2 - OIL JET
3 - ENGINE BLOCK
4 - CYLINDER WALL

OIL JET - 2.4L TURBO (Continued)

INSTALLATION

(1) Inspect oil jet o-ring (Fig. 128).
(2) Lightly coat o-ring with clean engine oil.
(3) Push oil jet into engine block until it is fully seated.

CAUTION: Ensure oil jet is fully seated in engine block before installing fastener. Do Not use the oil jet fastener to draw the oil jet into the engine block. Damage to oil jet may occur.

(4) Install oil jet fastener. Torque fastener to 12 N·m (105 in. lbs.) (Fig. 127).
(5) Install crankshaft (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT - INSTALLATION).

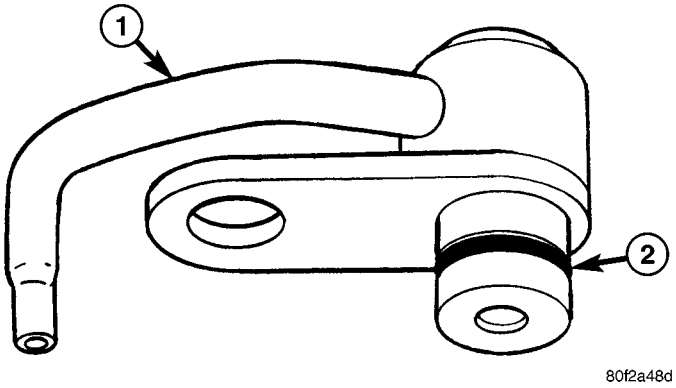

Fig. 128 Oil Jet O-ring

1 - OIL JET
2 - O-RING

OIL COOLER & LINES - 2.4L TURBO

DESCRIPTION

An engine oil cooler is used on the 2.4L Turbocharged engine. The cooler is a coolant-to-oil type and mounted between the oil filter and oil filter adapter (Fig. 129).

REMOVAL

(1) Raise vehicle on hoist.
(2) Drain cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).
(3) Disconnect oil cooler coolant hoses (Fig. 129).
(4) Remove oil filter.
(5) Remove oil cooler connector bolt (Fig. 130).
(6) Remove oil cooler.

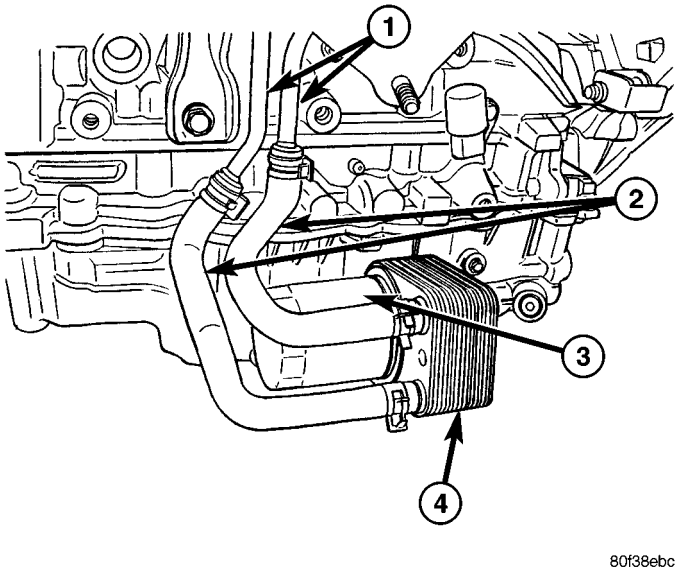

Fig. 129 Oil Cooler and Lines

OIL COOLER & LINES - 2.4L TURBO (Continued)

INSTALLATION

(1) Replace oil cooler seal (Fig. 131).
(2) Lubricate seal and position oil cooler to oil filter adapter, aligning notch to tab (Fig. 132).
(3) Install oil cooler connector bolt. Torque connector bolt to 55 N·m (41 ft. lbs.) (Fig. 130).
(4) Install oil filter.
(5) Connect oil cooler coolant hoses (Fig. 129).
(6) Lower vehicle.
(7) Fill cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).

INTAKE MANIFOLD

DIAGNOSIS AND TESTING

INTAKE MANIFOLD LEAKS

An intake manifold air leak is characterized by lower than normal manifold vacuum. Also, one or more cylinders may not be functioning.

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING. DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR THE FAN. DO NOT WEAR LOOSE CLOTHING.

(1) Start the engine.
(2) Spray a small stream of water (Spray Bottle) at the suspected leak area.
(3) If engine RPM'S change, the area of the suspected leak has been found.
(4) Repair as required.

REMOVAL

UPPER INTAKE MANIFOLD

Non-Turbo

(1) Disconnect inlet air temperature sensor and make-up air hose from clean air hose (Fig. 133).
(2) Remove air cleaner housing and clean air hose assembly.

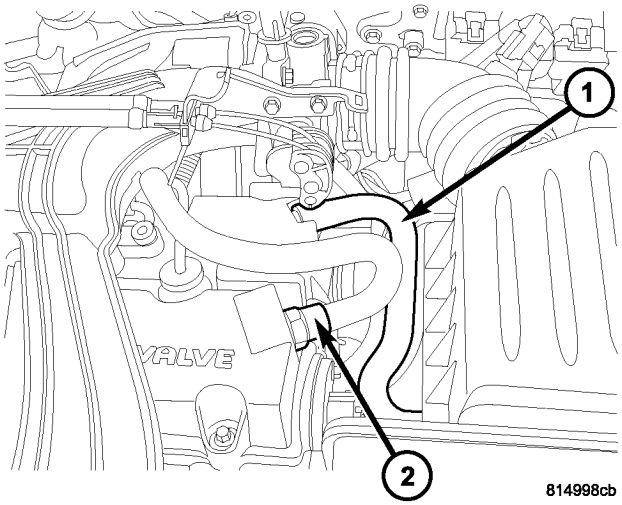

Fig. 133 PCV

1 - MAKE-UP AIR HOSE
2 - PCV VALVE

(3) Disconnect negative cable from battery.

INTAKE MANIFOLD (Continued)

(4) Remove throttle and speed control cables from throttle lever and bracket.

(5) Disconnect manifold absolute pressure (MAP) sensor (Fig. 134), idle air control (IAC) motor and throttle position sensor (TPS) wiring connectors (Fig. 135).

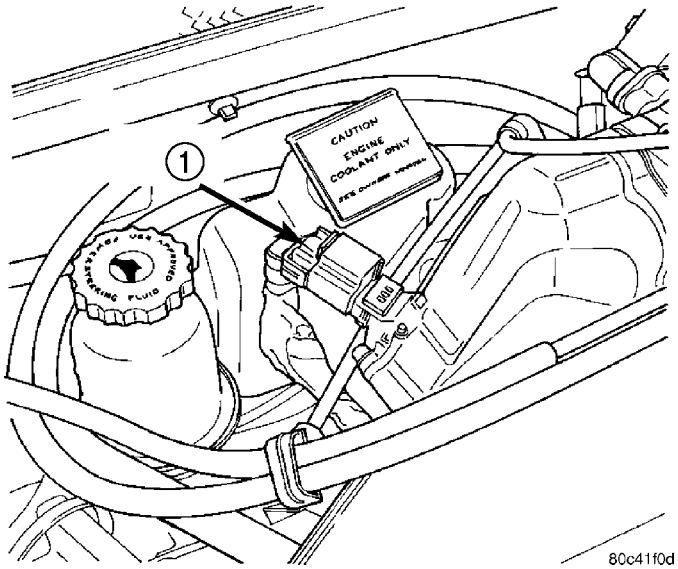

Fig. 134 MAP Sensor

1 - MAP SENSOR

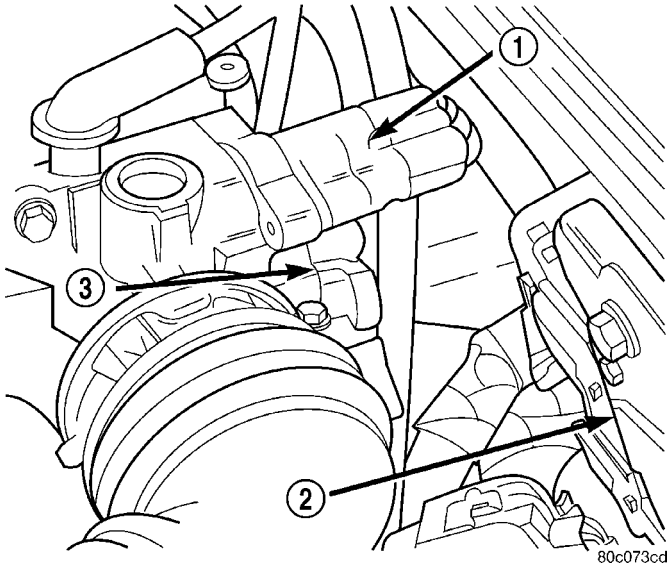

Fig. 135 Idle Air Control (IAC) Motor and Throttle Position Sensor (TPS) Wiring Connectors

(6) Disconnect proportional purge hoses (Fig. 136).

(7) Disconnect brake booster hose (Fig. 137).

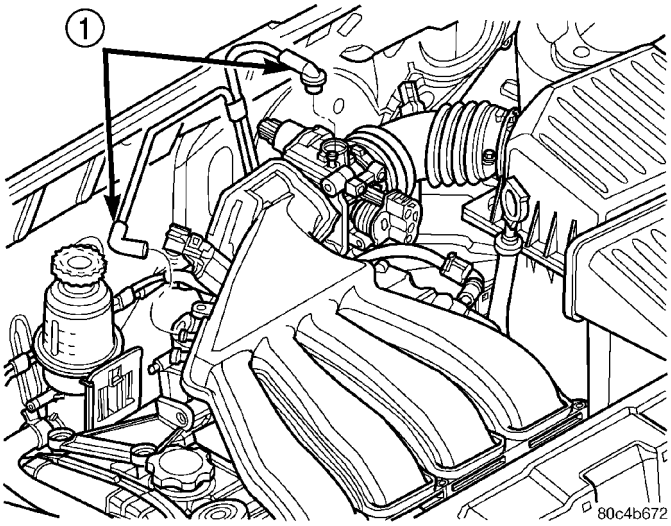

Fig. 136 Proportional Purge Hoses

1 - PROPORTIONAL PURGE HOSES

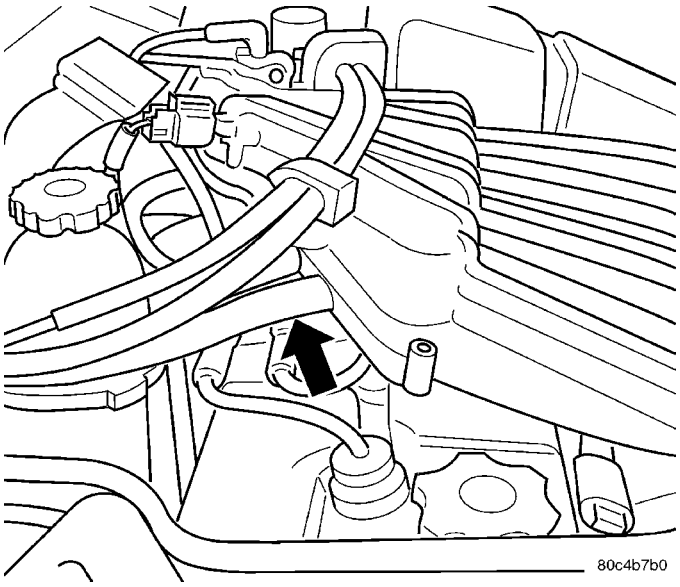

Fig. 137 Brake Booster Hose

(8) Disconnect PCV hose from intake manifold (Fig. 133).

INTAKE MANIFOLD (Continued)

(9) Remove rear intake manifold support bracket (Fig. 138).

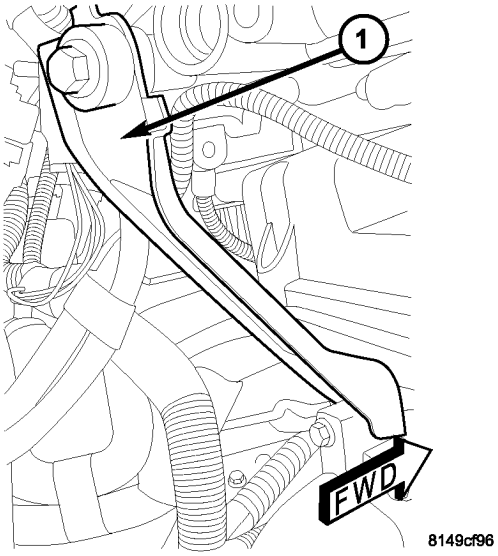

Fig. 138 INTAKE MANIFOLD SUPPORT

1 - INTAKE MANIFOLD SUPPORT BRACKET

(10) Remove upper intake manifold fasteners (Fig. 150).

(11) Remove upper intake manifold.

(12) If further service is required, cover the lower intake manifold openings to prevent foreign materials from entering the engine (Fig. 139).

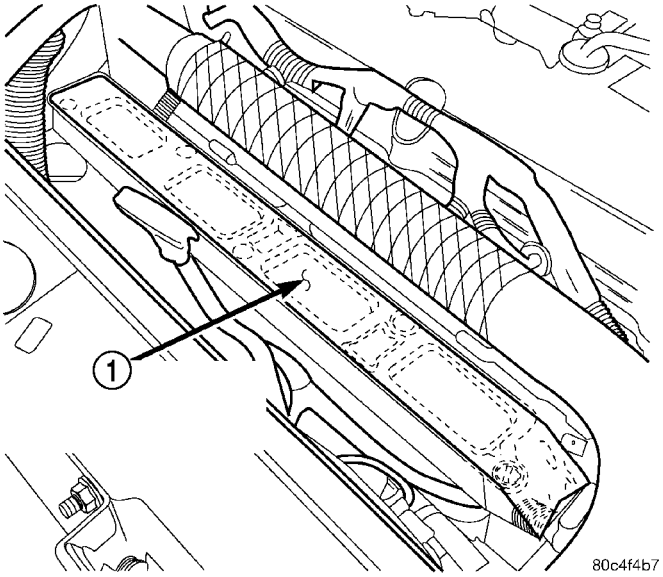

Fig. 139 Cover Lower Intake Manifold Openings

1 - INTAKE MANIFOLD MUST BE COVERED DURING SERVICE

Turbo

NOTE: This engine could be equiped with an aluminum Intake manifold or a plastic intake manifold.

(1) Disconnect negative battery cable.

(2) Disconnect the inlet air temperature (IAT) sensor connector (Fig. 140).

(3) Disconnect the throttle inlet pressure (TIP) hose (Fig. 140).

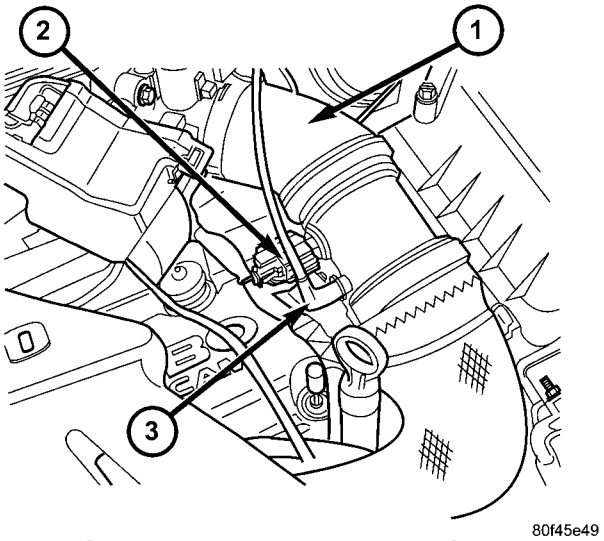

Fig. 140 IAT Sensor - 2.4L Turbo

1 - HOSE - CHARGE AIR COOLER TO THROTTLE BODY
2 - IAT SENSOR
3 - TIP HOSE

(4) Disconnect charge air cooler hose at throttle body (Fig. 140) and (Fig. 141).

2 - CHARGE AIR COOLER
3 - HOSE - TURBOCHARGER TO CHARGE AIR COOLER

INTAKE MANIFOLD (Continued)

(5) Disconnect idle air control (IAC) motor and throttle position sensor connectors.

(6) Disconnect the MAP sensor connector (Fig. 142).

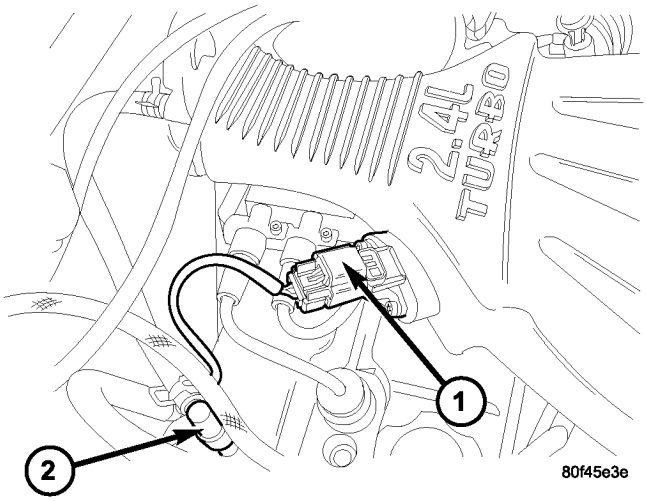

Fig. 142 MAP Sensor - 2.4L Turbo

1 - MAP SENSOR

(7) Remove the throttle control shield (Fig. 143).

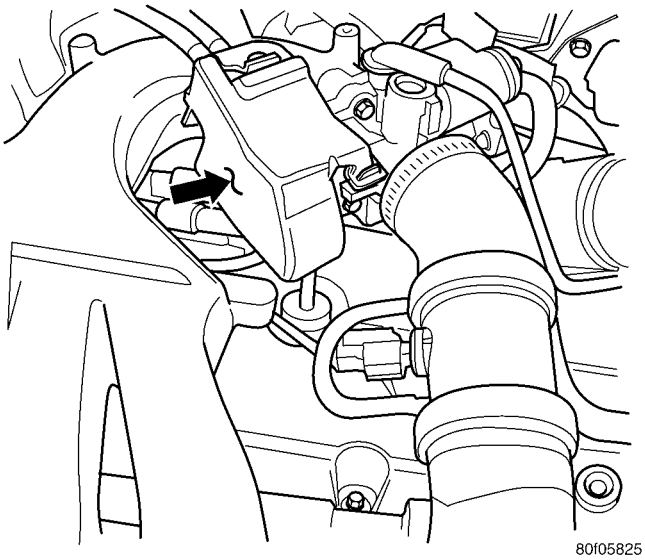

Fig. 143 Throttle Control Shield 2.4L Turbo

(8) Remove the throttle cable from the throttle body lever (Fig. 144).

(9) If equipped with speed control, remove speed control cable from the throttle lever by sliding clasp out hole used for throttle cable.

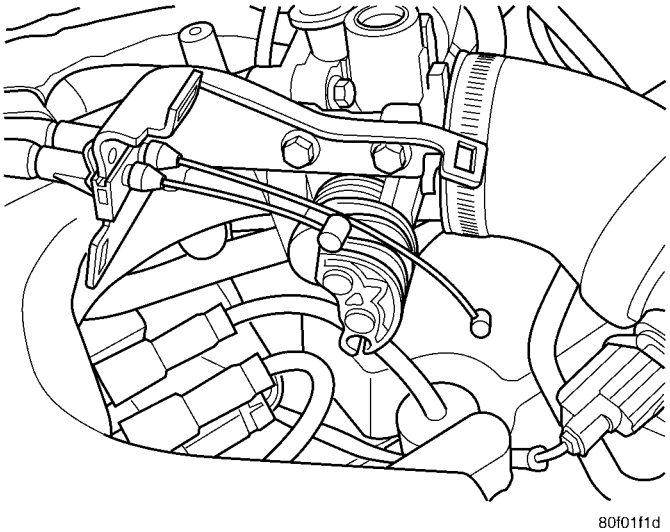

Fig. 144 Throttle Cables - 2.4L Turbo

(10) Remove the 2 screws for the throttle cable bracket.

(11) Reposition throttle cable bracket (Fig. 145).

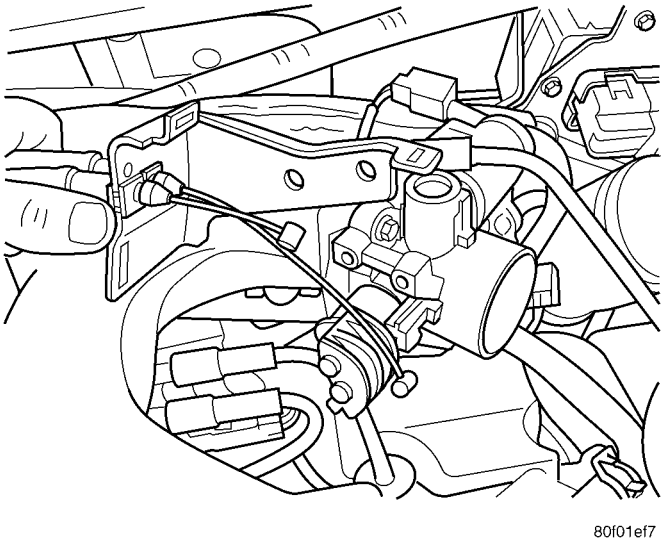

Fig. 145 Throttle Cable Bracket - 2.4L Turbo

(12) Remove intake manifold cover.

NOTE: To remove intake manifold cover, start with clips near throttle body.

INTAKE MANIFOLD (Continued)

(13) Disconnect brake booster hose and PCV hose from intake manifold (Fig. 146).

(14) Disconnect purge solenoid hose from throttle body (Fig. 146).

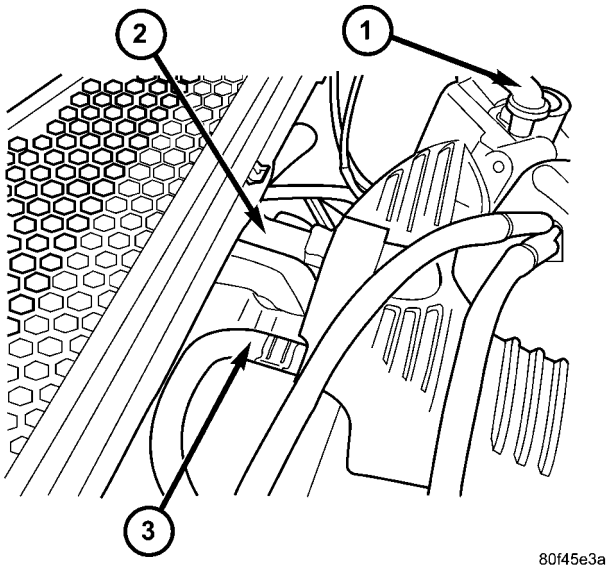

Fig. 146 Vacuum Hoses - 2.4L Turbo

1 - PURGE SOLENOID HOSE
2 - BRAKE BOOSTER HOSE
3 - PCV HOSE

(15) Remove intake manifold cover.

(16) Remove upper intake manifold support bracket (Fig. 147).

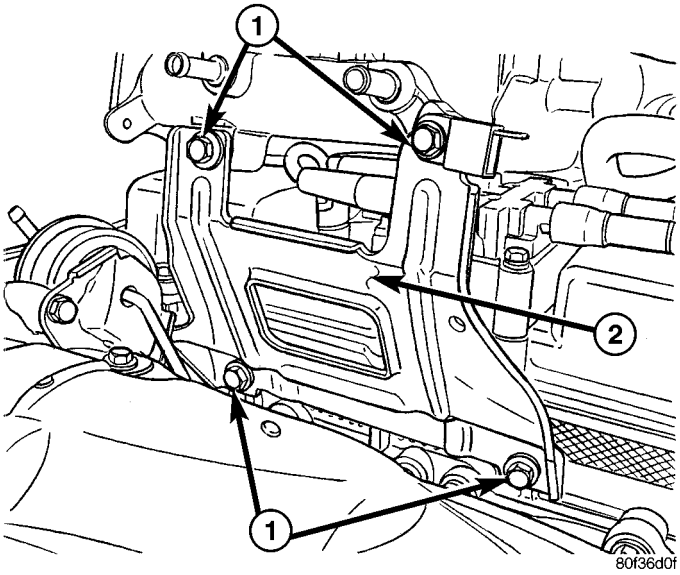

Fig. 147 Support Bracket

1 - FASTENERS
2 - UPPER INTAKE MANIFOLD SUPPORT BRACKET

(17) Remove upper intake manifold fasteners (Fig. 152).

(18) Remove upper intake manifold.

(19) If further service is required, cover the lower intake manifold openings to prevent foreign materials from entering the engine (Fig. 139).

LOWER INTAKE MANIFOLD

WARNING: RELEASE FUEL SYSTEM PRESSURE BEFORE SERVICING SYSTEM COMPONENTS. SERVICE VEHICLES IN WELL VENTILATED AREAS AND AVOID IGNITION SOURCES. NEVER SMOKE WHILE SERVICING THE VEHICLE.

NOTE: Turbo charged engines could be equiped with either an aluminum or a plastic intake manifold.

(1) Perform fuel system pressure release procedure **before attempting any repairs (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE).**

(2) Disconnect negative battery cable.

(3) Remove upper intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD UPPER - REMOVAL).

(4) Partially drain cooling system below thermostat level (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).

(5) Remove upper radiator hose.

(6) Remove coolant outlet connector and thermostat (Refer to 7 - COOLING/ENGINE/ENGINE COOLANT THERMOSTAT - REMOVAL).

(7) Disconnect the fuel supply line quick connect at the fuel rail assembly (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE).

WARNING: WRAP SHOP TOWELS AROUND HOSE TO CATCH ANY GASOLINE SPILLAGE.

INTAKE MANIFOLD (Continued)

(8) Disconnect fuel injector wiring harness.

(9) Remove screw attaching the oil dipstick tube to lower intake manifold (Fig. 148) or (Fig. 149).

(10) **Turbocharger Equipped Engine:** Remove fasteners for lower intake manifold support bracket (Fig. 149).

(11) Remove lower intake manifold fasteners (Fig. 154).

(12) Remove lower intake manifold.

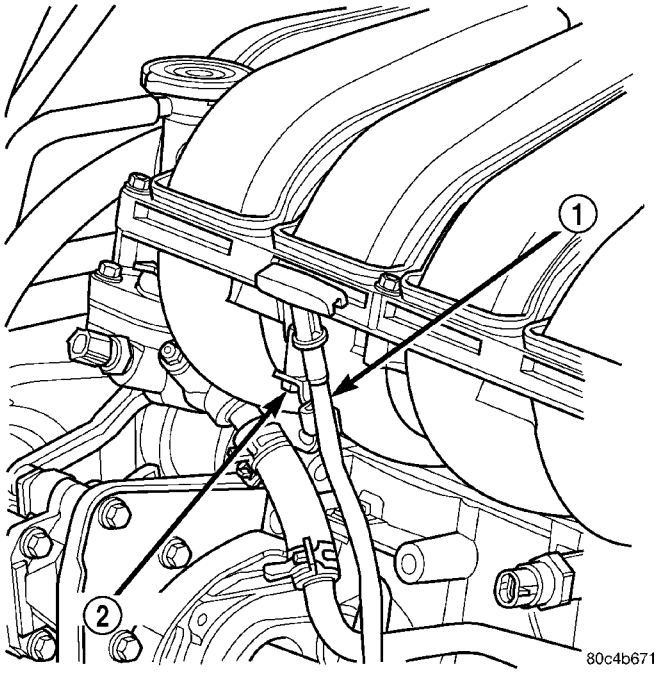

Fig. 148 Dipstick Tube

1 - DIPSTICK TUBE
2 - SCREW

CLEANING

(1) Discard gasket(s).

(2) Clean all sealing surfaces.

INSPECTION

(1) Inspect manifold for cracks, distortion, or mounting surface warpage. Replace manifold if necessary.

(2) Inspect manifold gasket for surface damage or excessive swelling. Replace gaskets as necessary.

INSTALLATION

UPPER INTAKE MANIFOLD

Non-Turbo

(1) If lower intake manifold was covered during service, remove cover (Fig. 139).

(2) Clean all sealing surfaces. Replace seals as necessary.

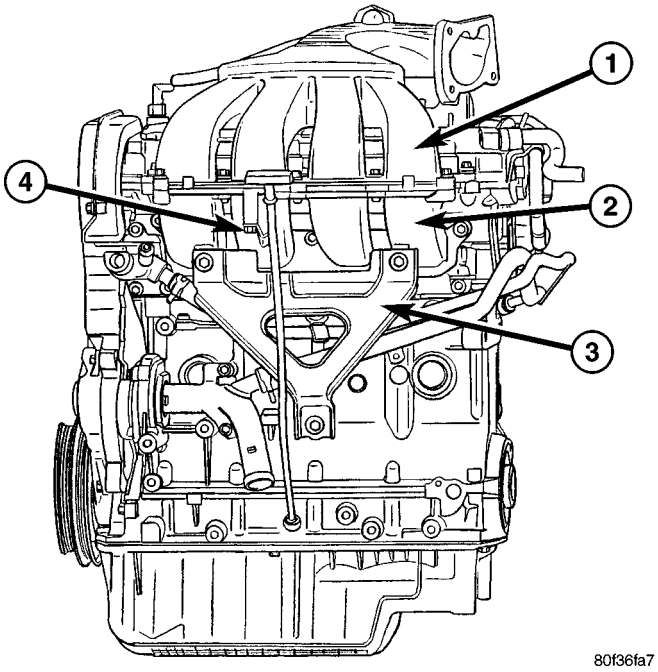

Fig. 149 Lower Intake Manifold Support Bracket - 2.4L Turbo

1 - UPPER INTAKE MANIFOLD
2 - LOWER INTAKE MANIFOLD
3 - SUPPORT BRACKET
4 - DIPSTICK TUBE SCREW

(3) Position new seals on manifold.

(4) Position upper intake manifold on lower intake manifold. Tighten upper intake manifold fasteners to 12 N·m (105 in. lbs.) in sequence shown in (Fig. 150).

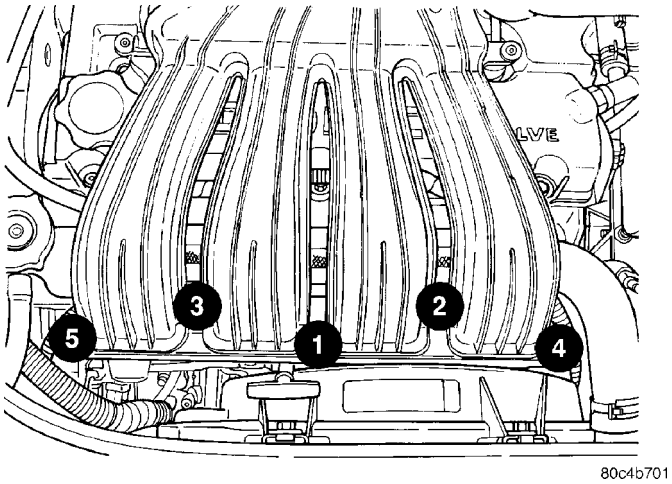

Fig. 150 Intake Manifold Tightening Sequence

INTAKE MANIFOLD (Continued)

(5) Connect PCV hose to intake manifold (Fig. 151).

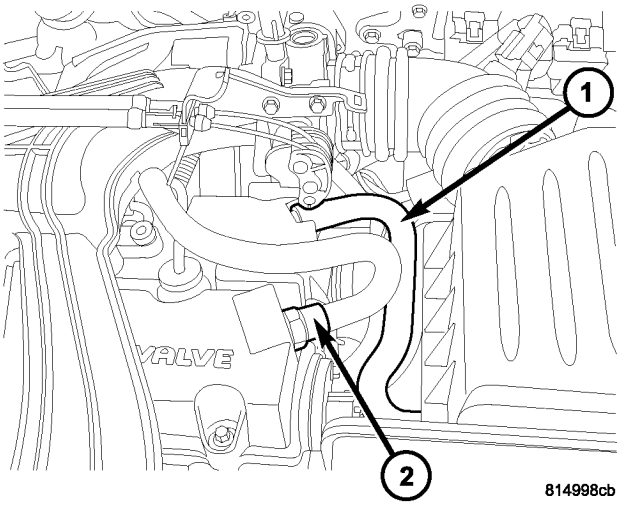

Fig. 151 PCV

1 - MAKE-UP AIR HOSE
2 - PCV VALVE

(6) Connect manifold absolute pressure (MAP) electrical connector (Fig. 134).

(7) Connect proportional purge hoses (Fig. 136).

(8) Connect brake booster hose (Fig. 137).

(9) Connect Idle Air Control (IAC) motor and Throttle Position Sensor (TPS) wiring connectors (Fig. 135).

(10) Install throttle and speed control cables to bracket. Connect cables to the throttle lever.

(11) Connect negative cable to battery.

(12) Install air cleaner housing and clean air hose. Tighten clean air hose clamp to 1.7 N·m (15 in. lbs.).

(13) Connect make-up air hose and inlet air temperature sensor (Fig. 151).

Turbo

(1) If lower intake manifold was covered during service, remove cover (Fig. 139).

(2) Clean all sealing surfaces. Replace upper intake manifold gasket.

NOTE: This engine could be equiped with either a plastic intake manifold or an aluminum intake manifold.

(3) Position upper intake manifold on lower intake manifold. On engines equiped with an aluminum intake manifold, tighten manifold fasteners to 28 N·m (250 in. lbs.) in sequence shown in (Fig. 152). On engines equiped with a plastic intake manifold, tighten manifold fasteners to 12 N·m (105 in. lbs.) in sequence shown in (Fig. 152).

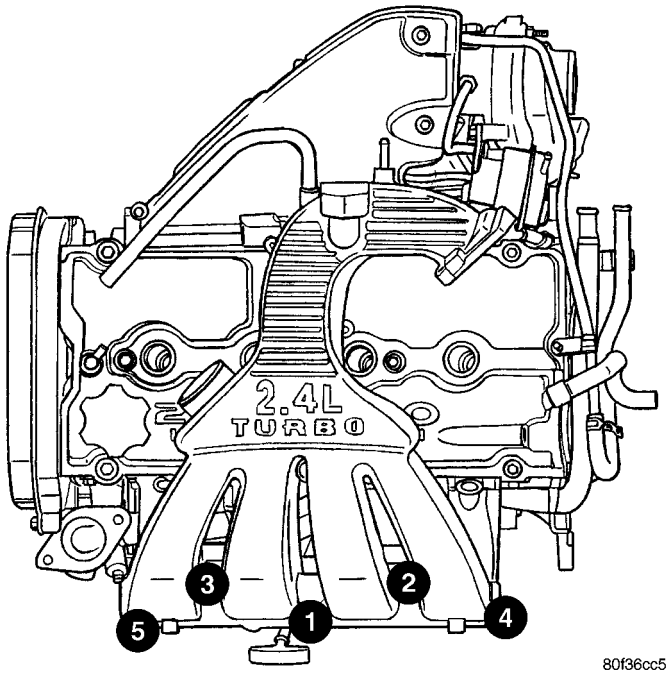

Fig. 152 Intake Manifold Tightening Sequence - 2.4L Turbo

(4) Install upper intake manifold to cylinder head support bracket (Fig. 147). Torque cylinder head fasteners to 28 N·m (250 in. lbs.) and manifold fasteners to 6 N·m (55 in. lbs.).

(5) Install the intake manifold cover.

(6) Connect purge solenoid hose to throttle body (Fig. 146).

(7) Connect brake booster vacuum hose and PCV hose to intake manifold (Fig. 146).

(8) Install the 2 screws for the throttle cable bracket and tighten to 12 N·m (105 in. lbs.) on aluminum intake manifolds and 6 N·m (55 in. lbs.) on plastic intake manifolds.

(9) If equipped with speed control, install speed control cable to the throttle lever by sliding clasp in the hole used for throttle cable.

(10) Install the throttle cable to the throttle body lever (Fig. 144).

(11) Install the throttle control shield (Fig. 143).

(12) Connect idle air control (IAC) motor and throttle position sensor connectors.

(13) Connect the MAP sensor connector (Fig. 142).

(14) Connect charge air cooler hose to throttle body (Fig. 140) and (Fig. 141). Tighten hose clamp to 1.7 N·m (15 in. lbs.).

(15) Connect negative battery cable.

LOWER INTAKE MANIFOLD

NOTE: Turbo charged engines could be equiped with either an aluminum or a plastic manifold.

INTAKE MANIFOLD (Continued)

(1) Clean all gasket surfaces.

(2) **Naturally Aspirated Engine:** Position new seals on lower intake manifold. (Fig. 153).

(3) **Naturally Aspirated Engine:** Install lower intake manifold. Tighten fasteners to 12 N·m (105 in. lbs.) in sequence shown in (Fig. 154).

(4) **Turbocharged Engine:** Replace lower intake manifold gasket.

(5) **Turbocharged Engine:** Install lower intake manifold. If equiped with an aluminum manifold, tighten fasteners to 28 N·m (250 in. lbs.) in sequence shown in (Fig. 154).If equiped with a plastic manifold, tighten fasteners to 12 N·m (105 in. lbs.) in sequence shown in (Fig. 154)

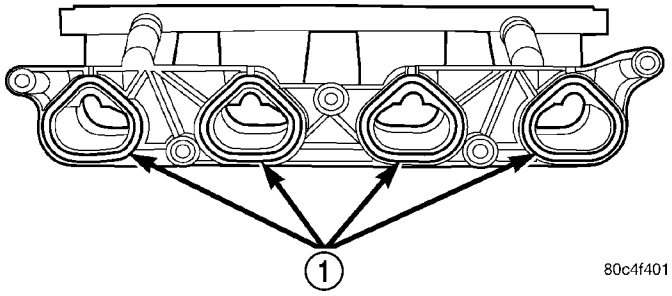

Fig. 153 Lower Intake Manifold Seals - Naturally Aspirated Engine

1 - SEALS

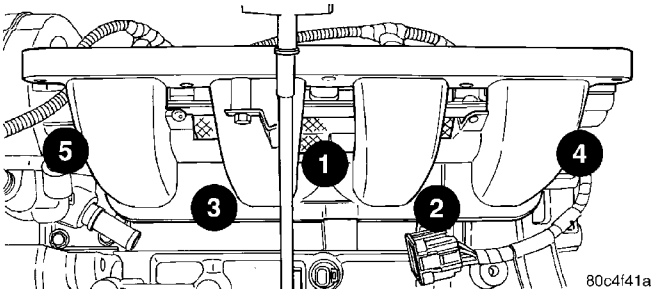

Fig. 154 Lower Intake Manifold Tightening Sequence

(6) **Turbocharger Equipped Engine:** Install fasteners for lower intake manifold support bracket (Fig. 149). If equiped with an aluminum manifold, torque fasteners to 54 N·m (40 ft. lbs.).If equiped with a plastic manifold, torque manifold fasteners to 6 N·m (55 in. lbs.).

(7) If removed, install the fuel rail assembly to intake manifold. Tighten screws to 23 N·m (200 in. lbs.).

(8) Connect fuel injector wiring harness.

(9) Inspect quick connect fittings for damage, replace if necessary (Refer to 14 - FUEL SYSTEM/ FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE). Lubricate tube with clean engine oil. Connect fuel supply hose to fuel rail assembly. Check connection by pulling on connector to insure it locked into position.

(10) Install the screw attaching the oil dipstick tube to lower intake manifold (Fig. 148) or (Fig. 149).

(11) Install coolant outlet connector and thermostat (Refer to 7 - COOLING/ENGINE/ENGINE COOLANT THERMOSTAT - INSTALLATION).

(12) Install radiator upper hose.

(13) Install upper intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD UPPER - INSTALLATION).

(14) Connect negative cable to battery.

(15) Fill the cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).

(16) With the DRBIII® scan tool use ASD Fuel System Test to pressurize system to check for leaks.

CAUTION: When using the ASD Fuel System Test, the Auto Shutdown (ASD) relay will remain energized for 7 minutes or until the ignition switch is turned to the OFF position, or Stop All Test is selected.

EXHAUST MANIFOLD

REMOVAL

NOTE: The exhaust manifold on Turbocharged equipped vehicles is serviced as an assembly with the Turbocharger. (Refer to 11 - EXHAUST SYSTEM/ TURBOCHARGER SYSTEM/TURBOCHARGER - REMOVAL).

(1) Remove clean air hose and air cleaner housing.
(2) Disconnect negative cable from battery.
(3) Disconnect throttle and speed control cables from the throttle lever and bracket.
(4) Disconnect MAP sensor electrical connector.
(5) Remove fasteners securing power steering fluid reservoir to cylinder head.
(6) Remove coolant recovery container (Refer to 7 - COOLING/ENGINE/COOLANT RECOVERY CONTAINER - REMOVAL).
(7) Remove bolts attaching upper heat shield (Fig. 155).
(8) Remove upper heat shield.

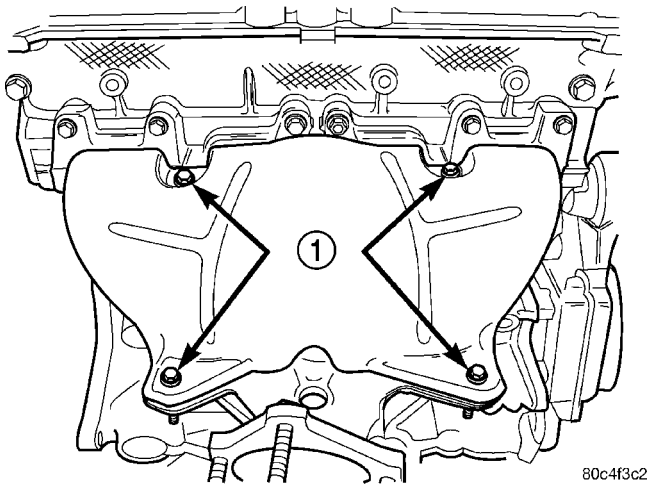

Fig. 155 Exhaust Manifold Heat Shield Bolts

1 - BOLTS

(9) Raise vehicle.
(10) Disconnect exhaust pipe from manifold (Fig. 156).
(11) Remove engine wiring heat shield (Fig. 157).

EXHAUST MANIFOLD (Continued)

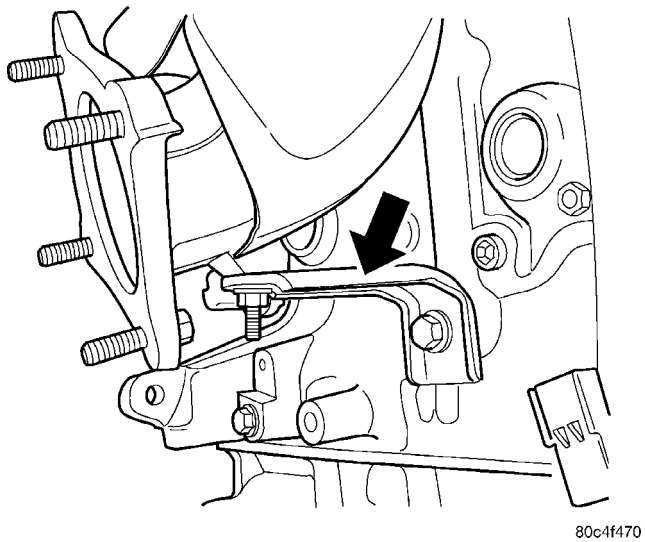

Fig. 158 Exhaust Manifold Support Bracket

(12) Remove manifold support bracket (Fig. 158).

(13) Remove lower exhaust manifold heat shield (Fig. 159).

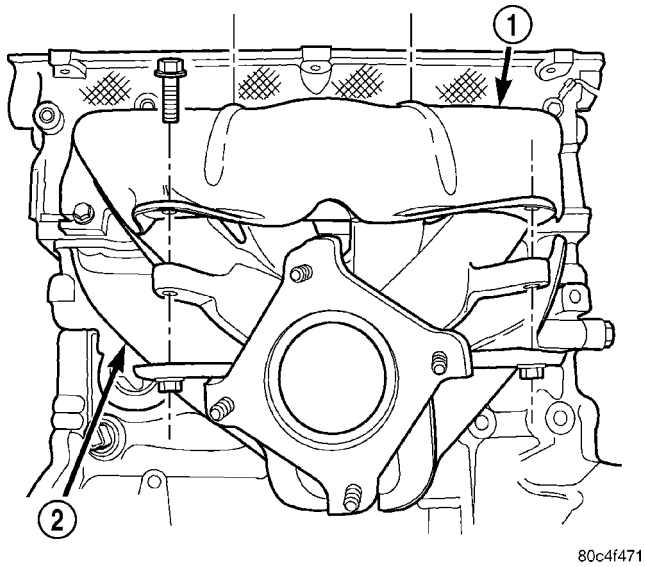

Fig. 159 Exhaust Manifold Heat Shields

1 - UPPER HEAT SHIELD
2 - LOWER HEAT SHIELD

(14) Disconnect oxygen sensor electrical connector.

(15) Remove exhaust manifold lower retaining fasteners.

(16) Lower vehicle and remove the upper exhaust manifold retaining fasteners.

(17) Remove exhaust manifold (Fig. 160) from above/between the engine and cowl panel.

(18) Remove and discard manifold gasket.

CLEANING

(1) Discard gasket (if equipped) and clean all surfaces of manifold and cylinder head.

INSPECTION

(1) Inspect manifold gasket surfaces for flatness with straight edge. Surface must be flat within 0.15 mm per 300 mm (0.006 in. per foot) of manifold length.

(2) Inspect manifolds for cracks or distortion. Replace manifold as necessary.

INSTALLATION

NOTE: The exhaust manifold on Turbocharged equipped vehicles is serviced as an assembly with the Turbocharger. (Refer to 11 - EXHAUST SYSTEM/ TURBOCHARGER SYSTEM/TURBOCHARGER - INSTALLATION).

(1) Install a new exhaust manifold gasket. **DO NOT APPLY SEALER**.

(2) Position exhaust manifold in place. Tighten fasteners, starting at center and progressing outward in both directions to 23 N·m (200 in. lbs.) (Fig. 160). Raise and lower vehicle for fastener access as necessary. Repeat tightening procedure until all fasteners are at specified torque.

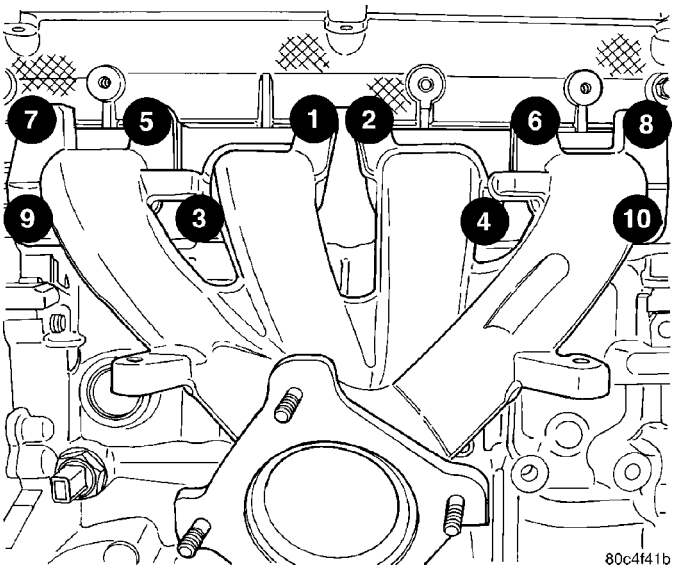

Fig. 160 Exhaust Manifold Tightening Sequence

(3) Install exhaust manifold heat shields (Fig. 159). Tighten bolts to 12 N·m (105 in. lbs.) (Fig. 155).

(4) Install exhaust manifold support bracket (Fig. 158).

(5) Install engine wiring heat shield (Fig. 157).

(6) Connect oxygen sensor electrical connector.

(7) Install exhaust pipe to manifold (Fig. 156). Tighten fasteners to 28 N·m (250 in. lbs.).

(8) Install coolant recovery container (Refer to 7 - COOLING/ENGINE/COOLANT RECOVERY CONTAINER - INSTALLATION).

EXHAUST MANIFOLD (Continued)

(9) Install fasteners securing power steering fluid reservoir to cylinder head.

(10) Connect MAP sensor electrical connector.

(11) Connect throttle and speed control cables to the throttle lever and bracket.

(12) Connect negative cable to battery.

(13) Install clean air hose and air cleaner housing.

TIMING BELT COVER(S)

REMOVAL

FRONT COVER—UPPER

(1) Remove upper torque strut attaching bolts and set strut aside (Refer to 9 - ENGINE/ENGINE MOUNTING/TORQUE STRUT - REMOVAL).

(2) **Turbocharger equipped vehicles:**

• Discharge and evacuate and air conditioning system (Refer to 24 - HEATING & AIR CONDITIONING - STANDARD PROCEDURE).

• Disconnect air conditioning lines at junction block near upper timing belt cover.

(3) Remove upper timing belt cover fasteners (Fig. 161) and remove cover.

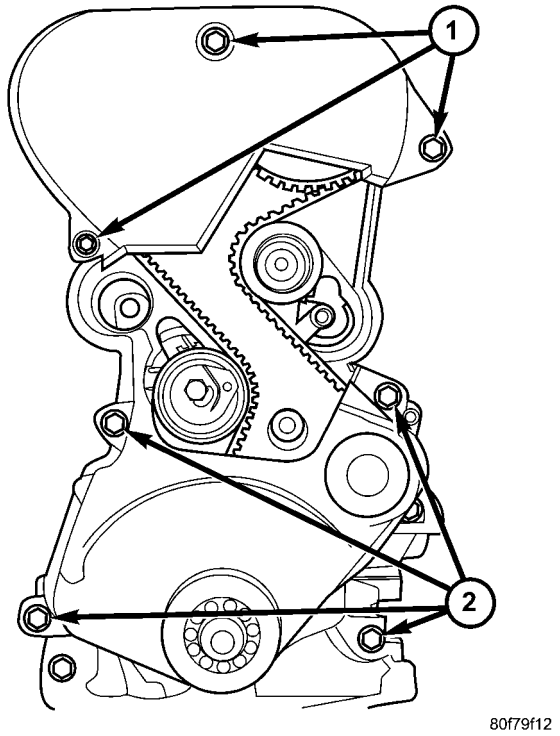

Fig. 161 Front Timing Belt Covers

1 - UPPER COVER FASTENERS
2 - LOWER COVER FASTENERS

FRONT COVER—LOWER

(1) Disconnect negative battery cable.

(2) Raise vehicle on hoist. Remove right front wheel.

(3) Remove the right splash shield.

(4) Remove accessory drive belts (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(5) Remove crankshaft damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).

(6) Remove the lower torque strut (Refer to 9 - ENGINE/ENGINE MOUNTING/TORQUE STRUT - REMOVAL).

(7) Disconnect exhaust system from manifold.

(8) Disconnect A/C pressure switch at rear of compressor housing.

(9) Lower vehicle and support engine with a jack.

(10) Discharge A/C system and disconnect A/C lines at coupling block (Refer to 24 - HEATING & AIR CONDITIONING - STANDARD PROCEDURE).

(11) Remove upper torque strut (Refer to 9 - ENGINE/ENGINE MOUNTING/TORQUE STRUT - REMOVAL).

(12) Remove screw attaching ground strap to strut bracket.

(13) Remove torque strut bracket from strut tower.

(14) Remove upper radiator closure panel (Refer to 23 - BODY/EXTERIOR/RADIATOR CLOSURE PANEL- REMOVAL).

(15) Remove power steering pump and bracket. Set pump aside. **Do not disconnect lines from pump.**

(16) With engine properly supported, remove right engine mount through bolt.

(17) Raise engine with jack until engine support bracket bolts are accessible (Fig. 162).

(18) Remove engine support bracket (Fig. 162).

(19) Remove timing belt cover fasteners and remove cover (Fig. 161).

TIMING BELT COVER(S) (Continued)

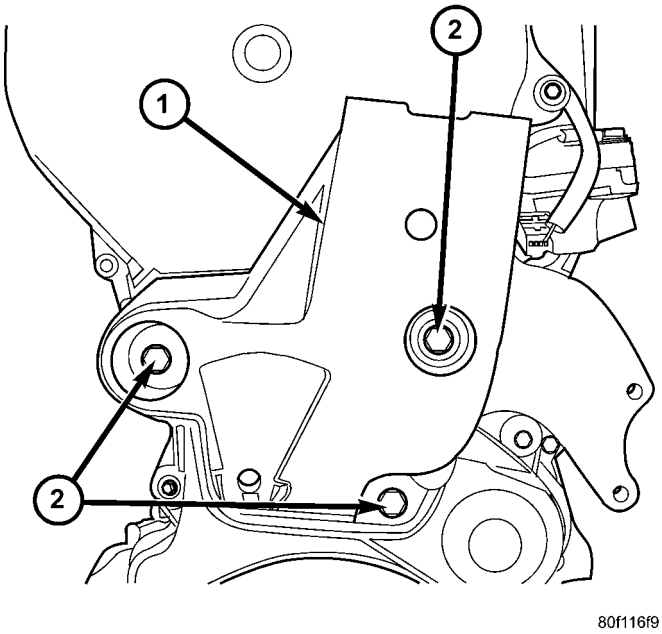

Fig. 162 Engine Support Bracket

1 - ENGINE SUPPORT BRACKET
2 - BOLTS - 61 N·m (45 ft. lbs.)

REAR COVER

(1) Remove front timing belt covers. Refer to above procedures.

(2) Remove timing belt (Refer to 9 - ENGINE/ VALVE TIMING/TIMING BELT AND SPROCKETS - REMOVAL).

(3) Remove timing belt idler pulley (Fig. 163).

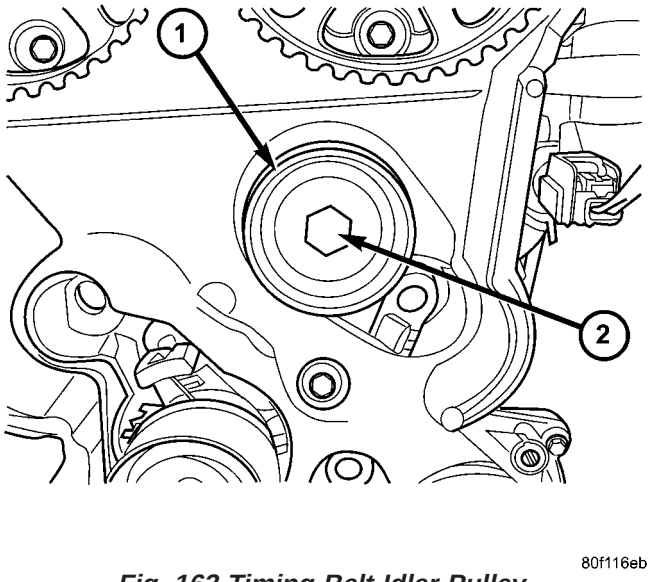

Fig. 163 Timing Belt Idler Pulley

1 - IDLER PULLEY
2 - BOLT

(4) Remove camshaft sprockets. Use Special Tool 6847 to hold camshaft sprockets while removing the sprocket bolts (Fig. 164).

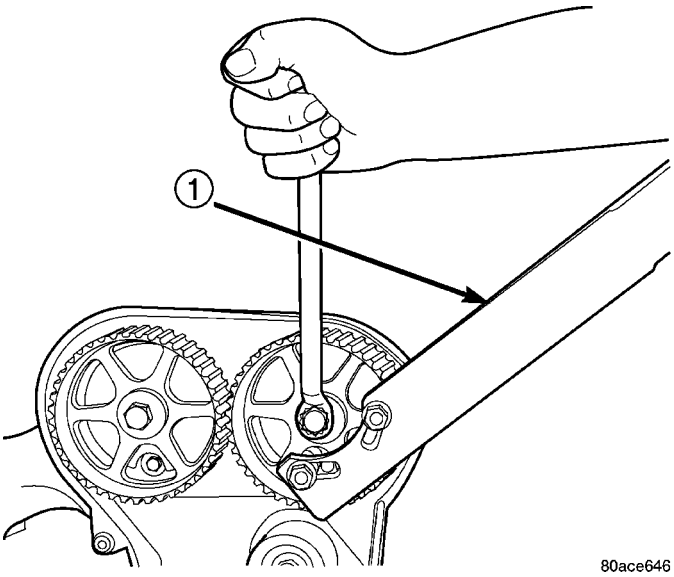

Fig. 164 Camshaft Sprocket—Removal/Installation

1 - SPECIAL TOOL 6847

(5) Remove rear timing belt cover fasteners and remove cover from engine (Fig. 165).

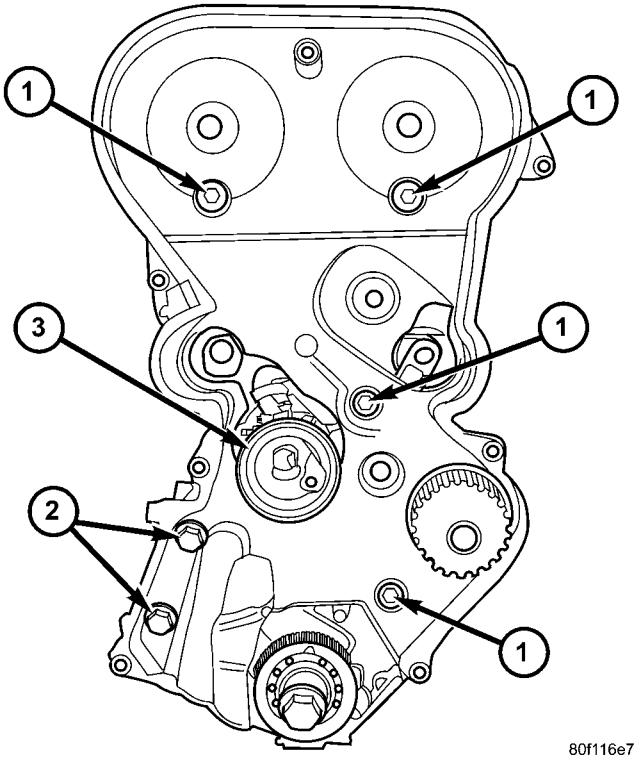

Fig. 165 Rear Timing Belt Cover Fasteners

1 - M6 BOLTS - 12 N·m (105 in. lbs.)
2 - M8 BOLTS - 28 N·m (250 in. lbs.)
3 - TIMING BELT TENSIONER

TIMING BELT COVER(S) (Continued)

INSTALLATION

FRONT COVER—UPPER

(1) Install timing belt cover and tighten fasteners to 6 N·m (50 in. lbs.) (Fig. 161).

(2) Install upper torque strut (Refer to 9 - ENGINE/ENGINE MOUNTING/TORQUE STRUT - INSTALLATION).

(3) **Turbocharger equipped vehicles:**

• Connect air conditioning lines at junction block near upper timing belt cover.

• Recharge air conditioning system (Refer to 24 - HEATING & AIR CONDITIONING - STANDARD PROCEDURE).

(4) Perform torque strut adjustment procedure (Refer to 9 - ENGINE/ENGINE MOUNTING/ TORQUE STRUT - ADJUSTMENTS).

FRONT COVER—LOWER

(1) Install lower timing belt cover and tighten fasteners to 6 N·m (50 in. lbs.) (Fig. 161).

(2) Install right engine support bracket (Fig. 162). Ensure the power steering pump is properly located in mounting location on bracket. Tighten mount bracket bolts to 61 N·m (45 ft. lbs.).

(3) Lower engine into mounting position and install right engine mount through bolt. Tighten bolt to 118 N·m (87 ft. lbs.).

(4) Install power steering pump and bracket.

(5) Install upper radiator closure panel (Refer to 23 - BODY/EXTERIOR/RADIATOR CLOSURE PANEL- INSTALLATION).

(6) Install torque strut bracket to strut tower.

(7) Connect ground strap to bracket.

(8) Install upper torque strut.

(9) Connect A/C lines and charge A/C system (Refer to 24 - HEATING & AIR CONDITIONING - STANDARD PROCEDURE).

(10) Raise vehicle.

(11) Connect exhaust system to manifold.

(12) Connect A/C pressure switch connector.

(13) Install crankshaft damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).

(14) Install accessory drive belts (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(15) Install lower torque strut (Refer to 9 - ENGINE/ENGINE MOUNTING/TORQUE STRUT - INSTALLATION).

(16) Perform torque strut adjustment procedure (Refer to 9 - ENGINE/ENGINE MOUNTING/ TORQUE STRUT - ADJUSTMENTS).

(17) Install right splash shield.

(18) Install right front wheel.

(19) Connect negative cable to battery.

REAR COVER

(1) Install rear timing belt cover and fasteners. Torque fasteners to values specified in (Fig. 165).

(2) Install timing belt idler pulley (Fig. 163). Torque timing belt idler pulley fastener to 61 N·m (45 ft. lbs.).

CAUTION: Do not use an impact wrench to tighten camshaft sprocket bolts. Damage to the camshaft-to-sprocket locating dowel pin may occur.

(3) Install camshaft sprockets. Hold sprockets with Special Tool 6847 while tightening center bolt to 115 N·m (85 ft. lbs.) (Fig. 164).

(4) Install timing belt (Refer to 9 - ENGINE/ VALVE TIMING/TIMING BELT AND SPROCKETS - INSTALLATION).

(5) Install front timing belt covers. Refer to above procedures.

TIMING BELT AND SPROCKETS

REMOVAL

TIMING BELT

(1) Disconnect negative battery cable.

(2) Remove upper and lower front timing belt covers (Fig. 161). (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT COVER(S) - REMOVAL).

CAUTION: When aligning crankshaft and camshaft timing marks always rotate engine from crankshaft. Camshaft should not be rotated after timing belt is removed. Damage to valve components may occur. Always align timing marks before removing timing belt.

(3) Before the removal of the timing belt, rotate crankshaft until the TDC mark on oil pump housing aligns with the TDC mark on crankshaft sprocket (trailing edge of sprocket tooth) (Fig. 166).

NOTE: The crankshaft sprocket TDC mark is located on the trailing edge of the sprocket tooth. Failure to align trailing edge of sprocket tooth to TDC mark on oil pump housing will cause the camshaft timing marks to be misaligned.

(4) Loosen timing belt tensioner lock bolt (Fig. 167).

(5) Insert a 6 mm Allen wrench into the hexagon opening located on the top plate of the belt tensioner pulley (Fig. 167). Rotate the top plate **CLOCKWISE**

TIMING BELT AND SPROCKETS (Continued)

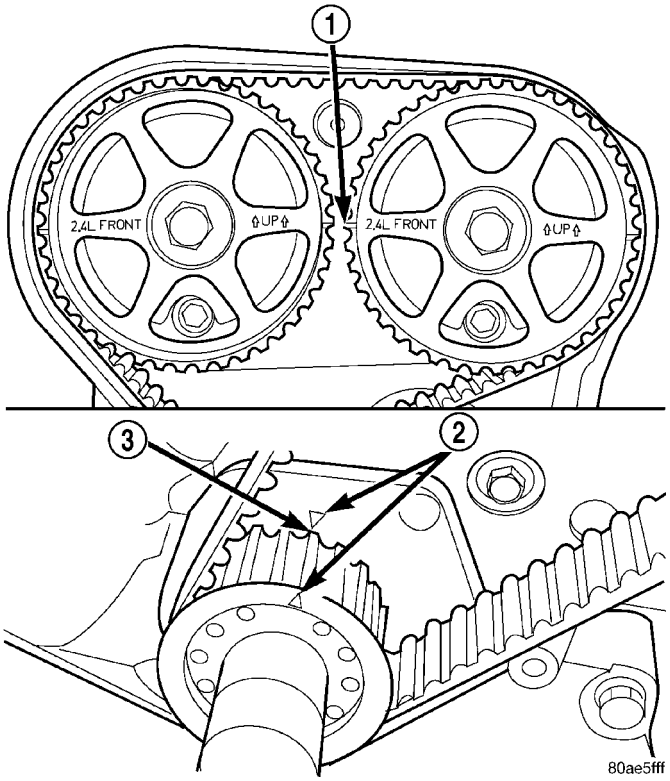

Fig. 166 Crankshaft and Camshaft Timing

1 - CAMSHAFT TIMING MARKS
2 - CRANKSHAFT TDC MARKS
3 - TRAILING EDGE OF SPROCKET TOOTH

until there is enough slack in timing belt to allow for removal.

(6) Remove timing belt.

CAUTION: If timing belt was damaged due to incorrect tracking (alignment), the belt tensioner pulley and bracket must be replaced as an assembly (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT TENSIONER & PULLEY - REMOVAL).

CAMSHAFT SPROCKET(S)

(1) Remove upper and lower front timing belt covers (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT COVER(S) - REMOVAL).

(2) Remove timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT - REMOVAL).

(3) Use Special Tool 6847 to hold camshaft sprockets while removing the sprocket bolt(s) (Fig. 168). Remove camshaft sprocket(s).

CRANKSHAFT SPROCKET

(1) Remove upper and lower front timing belt covers (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT COVER(S) - REMOVAL).

(2) Remove timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT - REMOVAL).

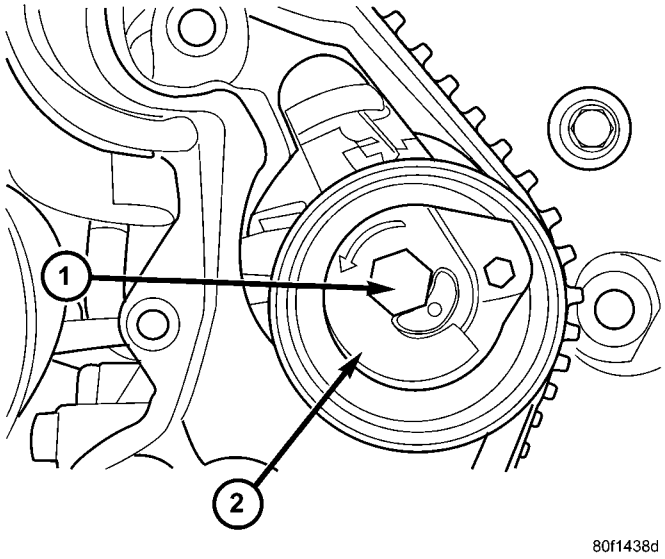

Fig. 167 Timing Belt Tensioner

1 - LOCK BOLT
2 - TOP PLATE

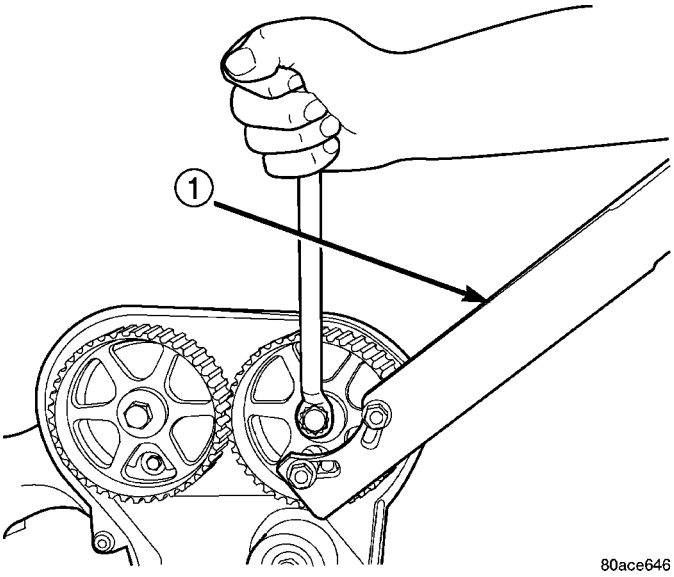

Fig. 168 Camshaft Sprocket—Removal/Installation

1 - SPECIAL TOOL 6847

(3) Remove crankshaft sprocket using Special Tool 6793 and insert C-4685-C2 (Fig. 169).

TIMING BELT AND SPROCKETS (Continued)

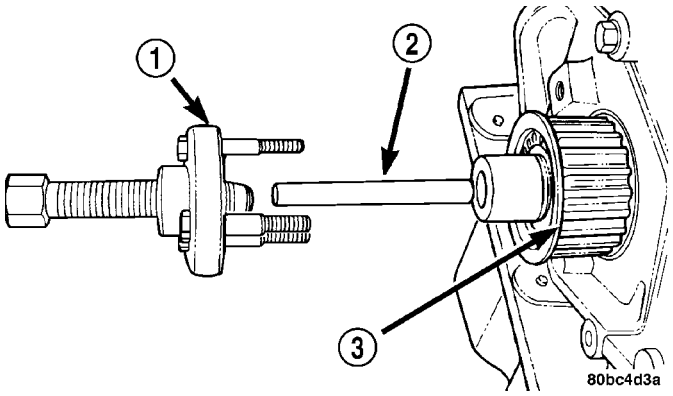

Fig. 169 Crankshaft Sprocket - Removal

1 - SPECIAL TOOL 6793
2 - SPECIAL TOOL C-4685–C2
3 - CRANKSHAFT SPROCKET

INSTALLATION

CRANKSHAFT SPROCKET

CAUTION: The crankshaft sprocket is set to a predetermined depth from the factory for correct timing belt tracking. If removed, use of Special Tool 6792 is required to set the sprocket to original installation depth. An incorrectly installed sprocket will result in timing belt and engine damage.

(1) Install crankshaft sprocket using Special Tool 6792 (Fig. 170).

(2) Install timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT - INSTALLATION).

(3) Install upper and lower front timing belt covers (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT COVER(S) - INSTALLATION).

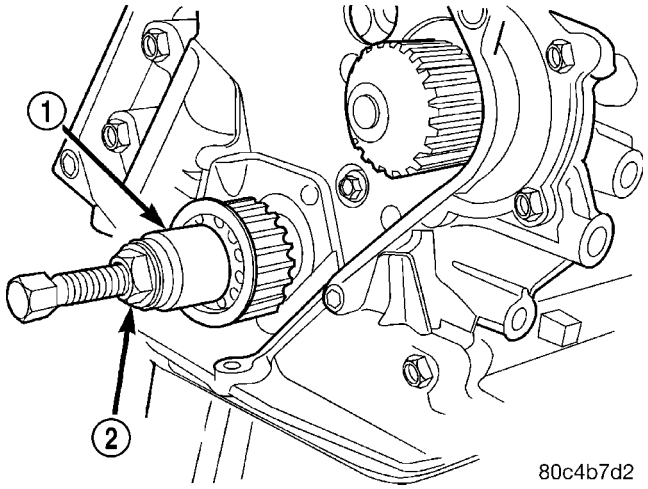

Fig. 170 Crankshaft Sprocket - Installation

1 - SPECIAL TOOL 6792
2 - TIGHTEN NUT TO INSTALL

CAMSHAFT SPROCKET(S)

CAUTION: Do not use an impact wrench to tighten camshaft sprocket bolts. Damage to the camshaft-to-sprocket locating dowel pin may occur.

(1) Install camshaft sprockets. Hold sprockets with Special Tool 6847 while tightening center bolt to 115 N·m (85 ft. lbs.) (Fig. 168).

(2) Install timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT - INSTALLATION).

(3) Install upper and lower front timing belt covers (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT COVER(S) - INSTALLATION).

TIMING BELT

(1) Set crankshaft sprocket to TDC by aligning the sprocket with the arrow on the oil pump housing.

(2) Set camshafts timing marks so that the exhaust camshaft sprocket is a 1/2 notch below the intake camshaft sprocket (Fig. 171).

CAUTION: Ensure that the arrows on both camshaft sprockets are facing up.

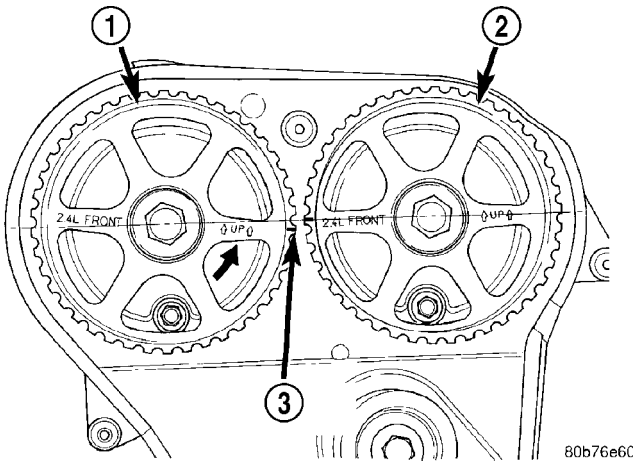

Fig. 171 Camshaft Sprocket Alignment For Timing Belt Installation

1 - CAMSHAFT SPROCKET-EXHAUST
2 - CAMSHAFT SPROCKET-INTAKE
3 - 1/2 NOTCH LOCATION

TIMING BELT AND SPROCKETS (Continued)

(3) Install timing belt. Starting at the crankshaft, go around the water pump sprocket, idler pulley, camshaft sprockets and then around the tensioner (Fig. 172).

(4) Move the exhaust camshaft sprocket counterclockwise (Fig. 172) to align marks and take up belt slack.

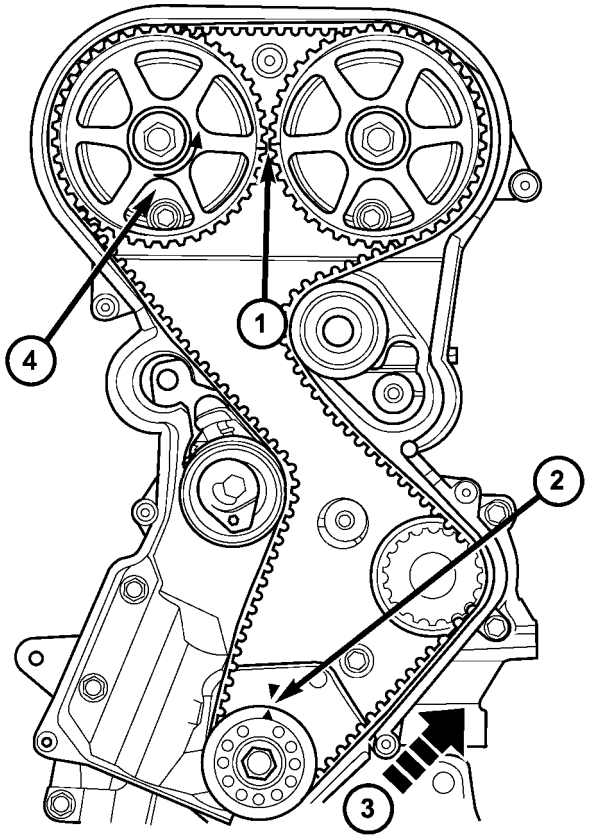

Fig. 172 Timing Belt Installation

1 - CAMSHAFT TIMING MARKS 1/2 NOTCH LOCATION
2 - CRANKSHAFT AT TDC
3 - INSTALL BELT IN THIS DIRECTION
4 - ROTATE CAMSHAFT SPROCKET TO TAKE UP BELT SLACK

(5) Insert a 6 mm Allen wrench into the hexagon opening located on the top plate of the belt tensioner pulley. Rotate the top plate **COUNTERCLOCKWISE**. The tensioner pulley will move against the belt and the tensioner setting notch will eventually start to move clockwise. Watching the movement of the setting notch, continue rotating the top plate counterclockwise until the setting notch is aligned with the spring tang (Fig. 173). Using the allen wrench to prevent the top plate from moving, torque the tensioner lock bolt to 25 N·m (220 in. lbs.). Setting notch and spring tang should remain aligned after lock bolt is torqued.

(6) Remove allen wrench and torque wrench.

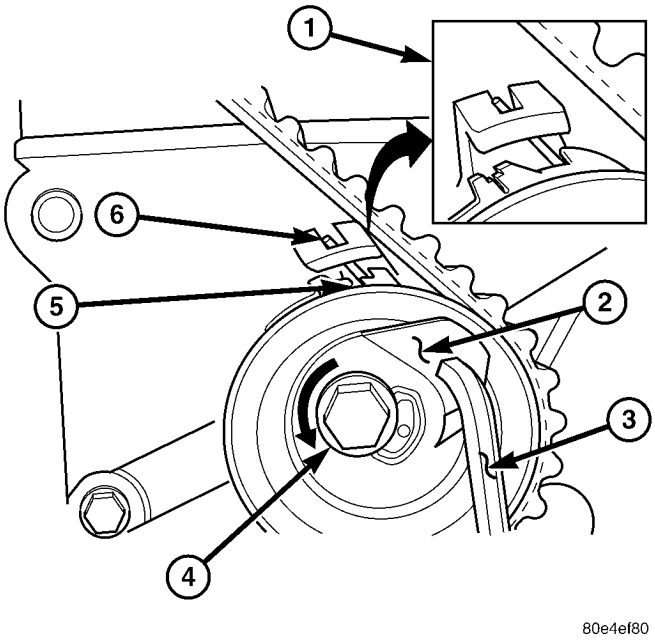

Fig. 173 Timing Belt Tension Adjustment

1 - ALIGN SETTING NOTCH WITH SPRING TANG
2 - TOP PLATE
3 - 6mm ALLEN WRENCH
4 - LOCK BOLT
5 - SETTING NOTCH
6 - SPRING TANG

NOTE: Repositioning the crankshaft to the TDC position must be done only during the CLOCKWISE rotation movement. If TDC is missed, rotate a further two revolutions until TDC is achieved. DO NOT rotate crankshaft counterclockwise as this will make verification of proper tensioner setting impossible.

TIMING BELT AND SPROCKETS (Continued)

(7) Rotate the crankshaft CLOCKWISE two complete revolutions manually for seating of the belt, until the crankshaft is repositioned at the TDC position. Verify that the camshaft and crankshaft timing marks are in proper position (Fig. 174).

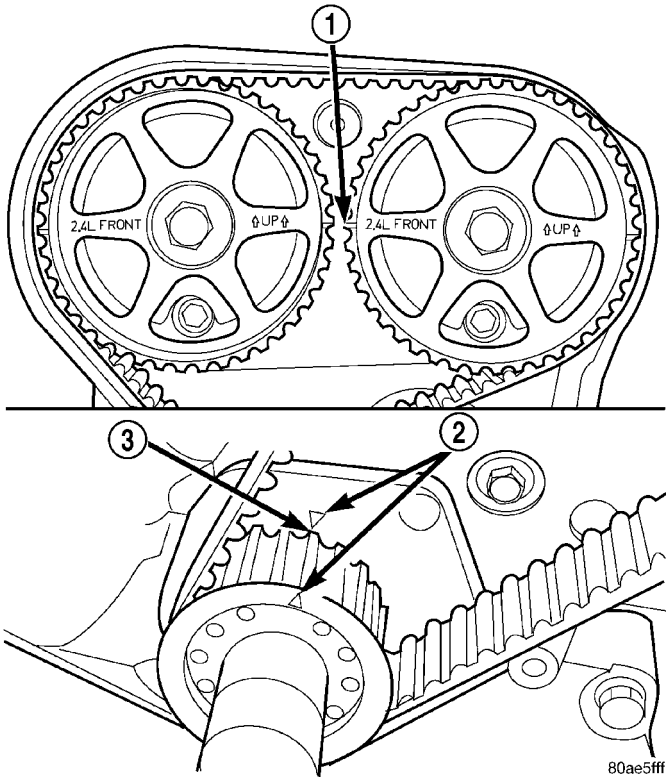

Fig. 174 Crankshaft and Camshaft Timing

1 - CAMSHAFT TIMING MARKS
2 - CRANKSHAFT TDC MARKS
3 - TRAILING EDGE OF SPROCKET TOOTH

(8) Check if the spring tang is within the tolerance window (Fig. 175). If the spring tang is within the tolerance window, the installation process is complete and nothing further is required. If the spring tang is not within the tolerance window, repeat Steps 5 through 7.

(9) Install upper and lower front timing belt covers (Fig. 161). (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT COVER(S) - INSTALLATION).

(10) Connect negative cable to battery.

TIMING BELT TENSIONER & PULLEY

REMOVAL

(1) Remove timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT AND SPROCKETS - REMOVAL).

(2) Remove timing belt idler pulley.

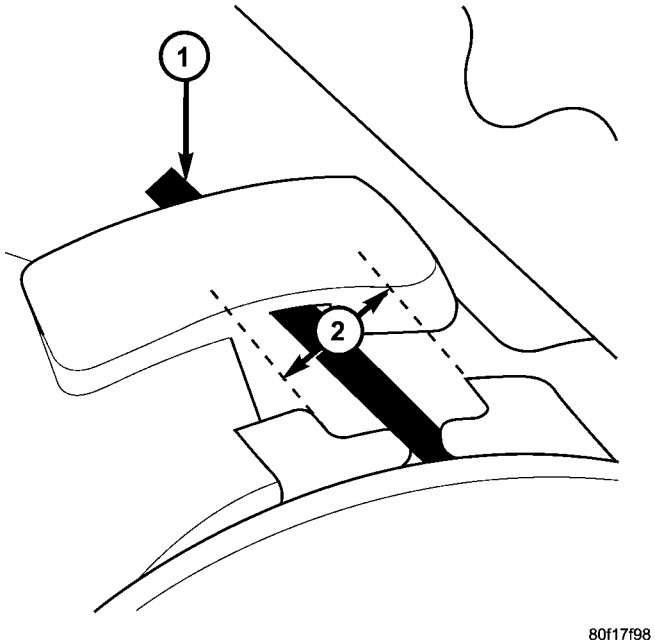

Fig. 175 Timing Belt Tension Verification

1 - SPRING TANG
2 - TOLERANCE WINDOW

(3) Hold camshaft sprocket with Special Tool 6847 while removing bolt (Fig. 176). Remove both camshaft sprockets.

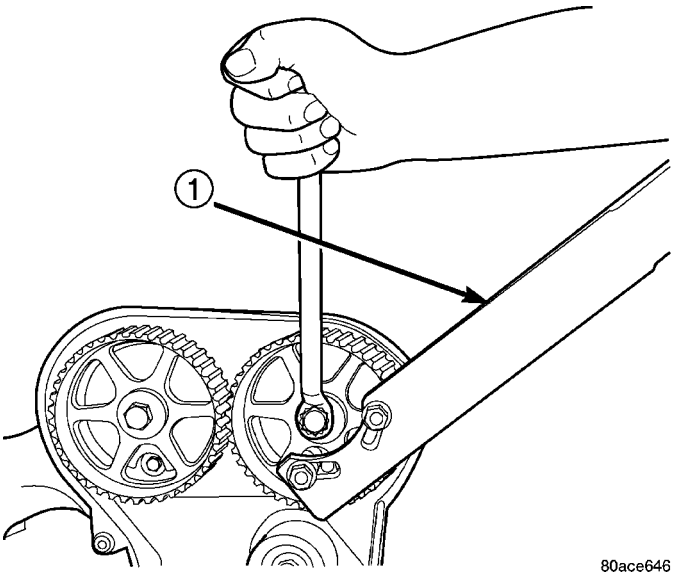

Fig. 176 Camshaft Sprockets

1 - SPECIAL TOOL 6847

TIMING BELT TENSIONER & PULLEY (Continued)

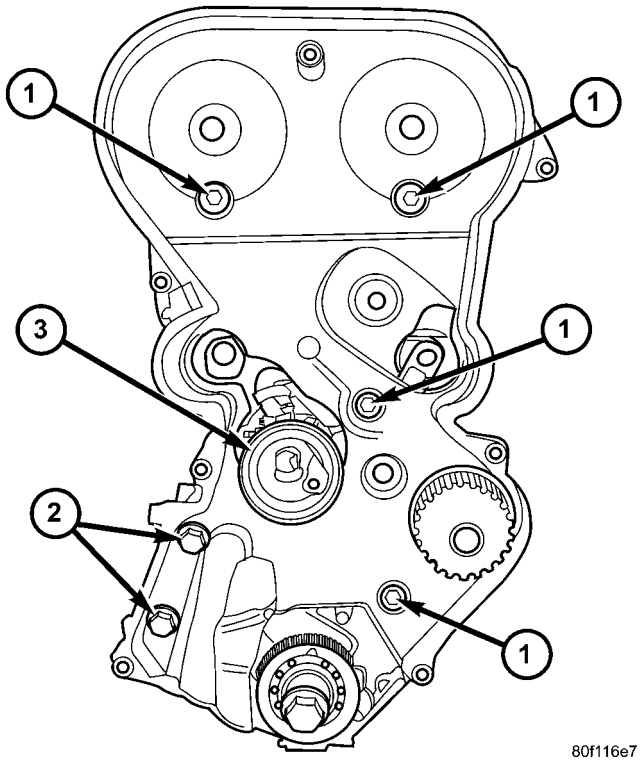

Fig. 177 Rear Timing Belt Cover Fasteners

1 - M6 BOLTS - 12 N·m (105 in. lbs.)
2 - M8 BOLTS - 28 N·m (250 in. lbs.)
3 - TIMING BELT TENSIONER

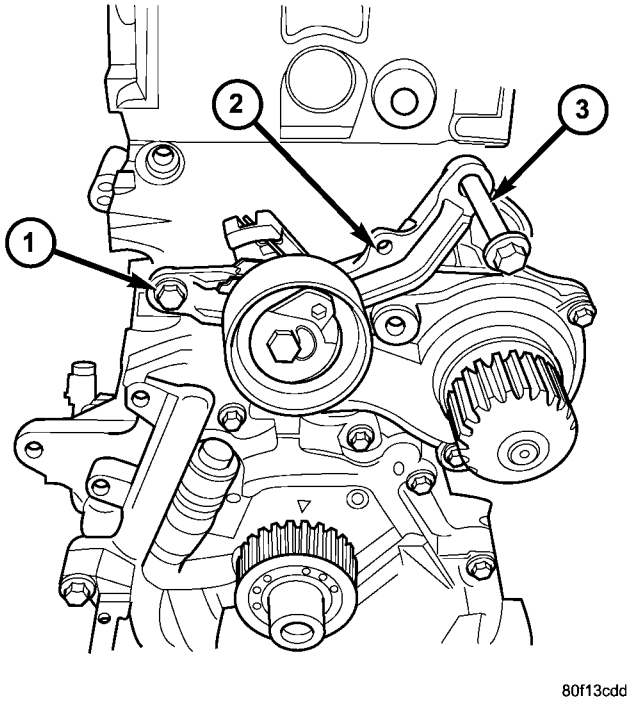

Fig. 178 Timing Belt Tensioner/Bracket Assembly

1 - BOLT
2 - TENSIONER ASSEMBLY
3 - BOLT-INSTALL FOR PROPER ALIGNMENT

(4) Remove rear timing belt cover fasteners and remove cover from engine (Fig. 177).

(5) Remove lower bolt attaching timing belt tensioner assembly to engine and remove tensioner **as an assembly** (Fig. 178).

INSTALLATION

(1) Align timing belt tensioner assembly to engine and install lower mounting bolt **but do not tighten** (Fig. 178). To properly align tensioner assembly to engine; temporarily install one of the engine bracket mounting bolts (M10) 5–7 turns into the tensioner assembly upper mounting location (Fig. 178).

(2) Torque the tensioner's lower mounting bolt to 61 N·m (45 ft. lbs.). Remove the upper bolt used for tensioner alignment.

(3) Install rear timing belt cover and fasteners (Fig. 177).

(4) Install timing belt idler pulley and torque mounting bolt to 61 N·m (45 ft. lbs.).

CAUTION: Do not use an impact wrench to tighten camshaft sprocket bolts. Damage to the camshaft-to-sprocket locating dowel pin may occur.

(5) Install camshaft sprockets. Use Special Tool 6847 to hold sprockets (Fig. 176) and tighten bolts to 115 N·m (85 ft. lbs.).

(6) Install timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT AND SPROCKETS - INSTALLATION).

BALANCE SHAFTS AND CARRIER ASSEMBLY

DESCRIPTION

The 2.4L engine is equipped with two nodular cast iron balance shafts installed in a cast aluminum carrier attached to the lower cylinder block (Fig. 179).

OPERATION

The balance shafts are driven by the crankshaft via a roller chain and sprockets. The balance shafts are connected by helical gears. The dual counter rotating shafts decrease second order vertical shaking forces caused by component movement.

REMOVAL

BALANCE SHAFTS/CHAIN/SPROCKETS

NOTE: For service procedures requiring only temporary relocation of carrier assembly refer to BALANCE SHAFT CARRIER procedure below.

(1) Drain engine oil.

(2) Remove the oil pan and pick-up tube (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).

(3) If replacing crankshaft sprocket, remove oil pump (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - REMOVAL).

(4) Remove chain cover, guide and tensioner. Discard pivot screw and adjuster screw. (Fig. 180).

(5) Remove screw retaining balance shaft drive sprocket (Fig. 181). Remove chain and sprocket.

(6) Using two wide pry bars, work the crankshaft sprocket back and forth until it is off the crankshaftshaft.

(7) Remove gear cover retaining stud (double ended to also retain chain guide). Remove cover and balance shaft gears (Fig. 182).

(8) Remove rear cover and balance shafts (Fig. 183).

(9) Remove four carrier to crankcase attaching bolts to separate carrier from engine bedplate.

BALANCE SHAFT CARRIER

The following components will remain intact during carrier removal: Gear cover, gears, balance shafts and the rear cover (Fig. 179).

(1) Drain engine oil.

(2) Remove the oil pan and pick-up tube (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).

(3) Remove chain cover, guide and tensioner (Fig. 180).

3 - BALANCE SHAFT

(4) Remove screw retaining balance shaft drive sprocket (Fig. 181).

(5) Move balance shaft inboard through drive chain sprocket. Sprocket will hang in lower chain loop.

(6) Remove carrier to crankcase attaching bolts to remove carrier.

BALANCE SHAFTS AND CARRIER ASSEMBLY (Continued)

INSTALLATION

BALANCE SHAFT INSTALLATION/TIMING

Balance shaft and carrier assembly installation is the reverse of the removal procedure. **During installation crankshaft-to-balance shaft timing must be established. Refer to Timing procedure in this section.**

(1) With balance shafts installed in carrier (Fig. 179) position carrier on crankcase and install four attaching bolts and tighten to 54 N·m (40 ft. lbs.).

(2) Turn balance shafts until both shaft key ways are up, parallel to vertical centerline of engine. Install short hub drive gear on sprocket driven shaft and long hub gear on gear driven shaft. After installation gear and balance shaft keyways must be up with gear timing marks meshed as shown in (Fig. 184).

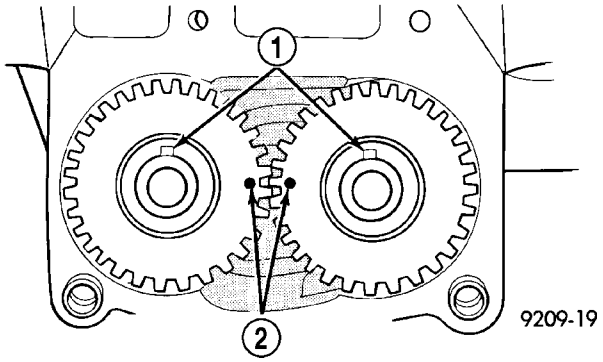

Fig. 184 Gear Timing

1 - KEY WAYS UP
2 - GEAR ALIGNMENT DOTS

(3) Install gear cover and tighten double ended stud/washer fastener to 12 N·m (105 in. lbs.).

(4) Align flat on balance shaft drive sprocket to the flat on crankshaft (Fig. 185).

(5) Install balance shaft drive sprocket on crankshaft using Special Tool 6052 (Fig. 186).

(6) Turn crankshaft until number 1 cylinder is at top dead center (TDC). The timing marks on the chain sprocket should line up with the parting line on the left side of number one main bearing cap. (Fig. 187).

(7) Place chain over crankshaft sprocket so that the plated link of the chain is over the number 1 cylinder timing mark on the balance shaft crankshaft sprocket (Fig. 187).

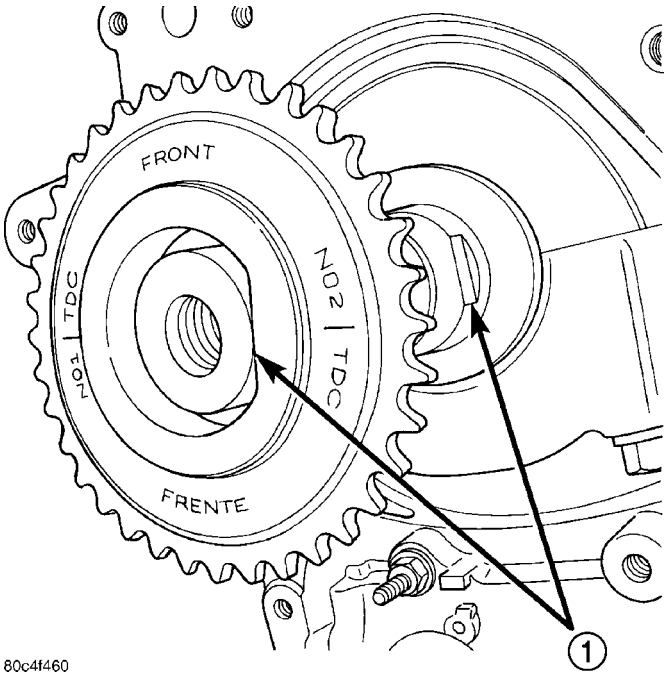

Fig. 185 Balance Shaft Sprocket Alignment to Crankshaft

1 - ALIGN FLATS

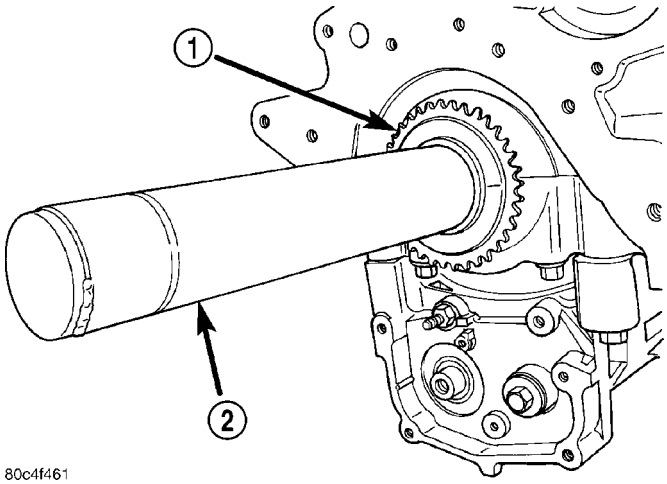

Fig. 186 Balance Shaft Drive

1 - SPROCKET
2 - SPECIAL TOOL 6052

BALANCE SHAFTS AND CARRIER ASSEMBLY (Continued)

(8) Place balance shaft sprocket into the timing chain (Fig. 187) and align the timing mark on the sprocket (dot) with the (lower) plated link on the chain.

NOTE: The lower plated link is 8 links from the upper link.

(9) With balance shaft keyways pointing up (12 o'clock) slide the balance shaft sprocket onto the nose of the balance shaft. The balance shaft may have to be pushed in slightly to allow for clearance.

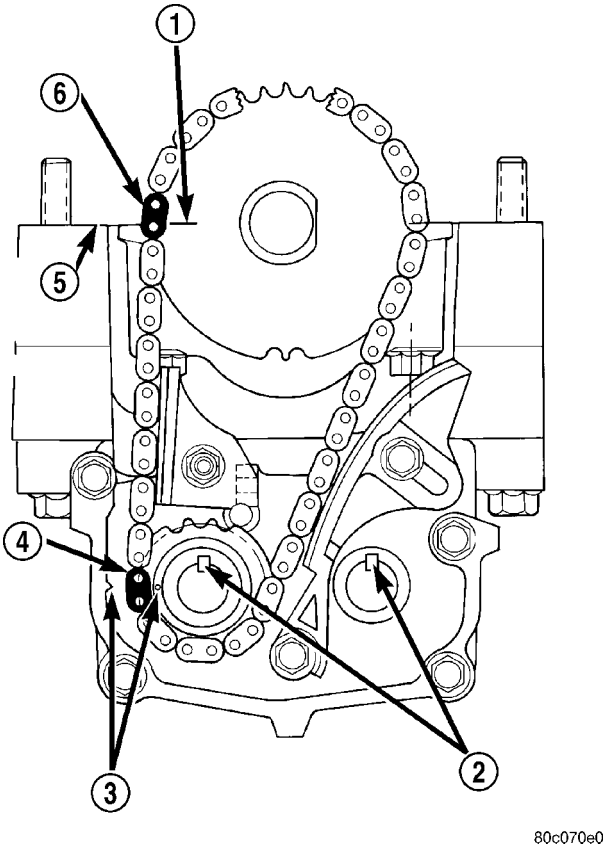

Fig. 187 Balance Shaft Timing

1 - MARK ON SPROCKET
2 - KEYWAYS UP
3 - ALIGN MARKS
4 - PLATED LINK
5 - PARTING LINE (BEDPLATE TO BLOCK)
6 - PLATED LINK

NOTE: THE TIMING MARK ON THE SPROCKET, THE (LOWER) NICKEL PLATED LINK, AND THE ARROW ON THE SIDE OF THE GEAR COVER SHOULD LINE UP WHEN THE BALANCE SHAFTS ARE TIMED CORRECTLY.

(10) If the sprockets are timed correctly, install the balance shaft bolts and tighten to 28 N·m (250 in. lbs.). A wood block placed between crankcase and crankshaft counterbalance will prevent crankshaft and gear rotation.

(11) **CHAIN TENSIONING:**

(a) Install chain tensioner loosely assembled with **new** adjuster screw and shouldered pivot screw.

(b) Position guide on double ended stud making sure tab on the guide fits into slot on the gear cover. Install and tighten nut/washer assembly to 12 N·m (105 in. lbs.).

(c) Place a shim 1 mm (0.039 in.) thick x 70 mm (2.75 in.) long between tensioner and chain. Push tensioner and shim up against the chain. **Apply firm pressure 2.5–3 Kg (5.5–6.6 lbs.) directly behind the adjustment slot to take up all slack.** Chain must have shoe radius contact as shown in (Fig. 188).

(d) With the load applied, tighten top tensioner adjuster bolt first, then bottom shouldered pivot bolt. Tighten bolts to 12 N·m (105 in. lbs.). Remove shim.

(e) Install carrier covers and tighten screws to 12 N·m (105 in. lbs.).

(12) If removed, install oil pump (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - INSTALLATION).

(13) Install pick-up tube and oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

(14) Fill engine crankcase with proper oil to correct level.

EXHAUST SYSTEM AND TURBOCHARGER

DESCRIPTION - EXHAUST SYSTEM

The exhaust system components consist of a catalytic converter, intermediate pipe, muffler, clamps and support isolators (Fig. 1).

EXHAUST SYSTEM AND TURBOCHARGER (Continued)

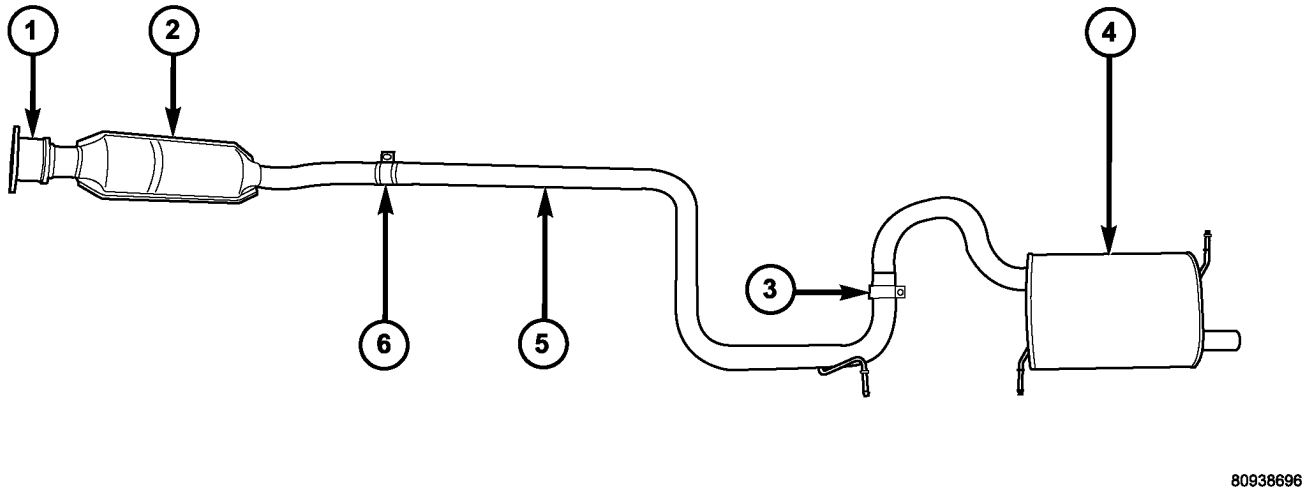

Fig. 1 Exhaust System

1 - FLEX PIPE
2 - CATALYTIC CONVERTER

DIAGNOSIS AND TESTING

EXHAUST SYSTEM DIAGNOSIS

CONDITION	POSSIBLE CAUSES	CORRECTION
EXCESSIVE EXHAUST NOISE (UNDER HOOD)	1. Exhaust manifold cracked or broken.	1. Replace manifold.
	2. Manifold to cylinder head leak.	2. Tighten manifold and/or replace gasket.
	3. Exhaust flex joint to manifold leak.	3.Tighten fasteners or replace gasket.
	4. Exhaust flex joint.	4. Replace catalytic converter assembly.
	5. Pipe and shell noise from front exhaust pipe.	5. Characteristic of single wall pipes.
EXCESSIVE EXHAUST NOISE	1. Leaks at pipe joints.	1. Tighten or replace clamps at leaking joints.
	2. Burned, blown, or rusted out exhaust pipe or muffler.	2. Replace muffler or exhaust pipes.
	3. Restriction in muffler or tailpipe.	3. Remove restriction, if possible or replace as necessary.
	4. Catalytic converter material in muffler.	4. Replace muffler and converter assembly. Check fuel injection and ignition systems for proper operation.

EXHAUST SYSTEM AND TURBOCHARGER (Continued)

DIAGNOSIS AND TESTING - EXHAUST SYSTEM RESTRICTION CHECK

Exhaust system restriction can be checked by measuring back pressure using the DRB III® and PEP module pressure tester.

WARNING: THE NORMAL OPERATING TEMPERATURE OF THE EXHAUST SYSTEM IS VERY HIGH. THEREFORE, NEVER WORK AROUND OR ATTEMPT TO SERVICE ANY PART OF THE EXHAUST SYSTEM UNTIL IT IS COOLED. SPECIAL CARE SHOULD BE TAKEN WHEN WORKING NEAR THE CATALYTIC CONVERTER. THE TEMPERATURE OF THE CONVERTER RISES TO A HIGH LEVEL AFTER A SHORT PERIOD OF ENGINE OPERATION TIME.

NOTE: For Special Tool identification, (Refer to 11 - EXHAUST SYSTEM - SPECIAL TOOLS).

(1) Disconnect and remove the upstream (before catalytic converter) oxygen sensor. (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/O2 SENSOR - REMOVAL)

(2) Install the Exhaust Back Pressure Fitting Adaptor CH8519.

(3) Connect the Low Pressure Sensor (15 psi) CH7063 to the back pressure fitting.

(4) Following the PEP module instruction manual, connect all required cables to the DRB III® and PEP module. Select the available menu options on the DRBIII® display screen for using the digital pressure gauge function.

(5) Apply the park brake and start the engine.

(6) With transmission in Park or Neutral, raise engine speed to 2000 RPM. Monitor the pressure readings on the DRBIII®. Back pressure should not exceed specified limit. Refer to specification in table below EXHAUST BACK PRESSURE LIMITS.

(7) If pressure exceeds maximum limits, inspect exhaust system for restricted component. For further catalytic converter inspection procedures, (Refer to 11 - EXHAUST SYSTEM/CATALYTIC CONVERTER - INSPECTION). Replace component(s) as necessary.

EXHAUST BACK PRESSURE LIMITS

Exhaust Back Pressure Limit (Max)	
Vehicle in Park/Neutral (no load) @2000 RPM	3.45 Kpa (0.5 psi)

INSPECTION

Inspect the exhaust pipes, catalytic converters, muffler, and resonators for cracked joints, broken welds and corrosion damage that would result in a leaking exhaust system. Inspect the clamps, support brackets, and insulators for cracks and corrosion damage.

NOTE: Slip joint band clamps are spot welded to exhaust system. If a band clamp must be replaced, the spot weld must be ground off.

ADJUSTMENTS

EXHAUST SYSTEM ALIGNMENT

A misaligned exhaust system is usually indicated by a vibration, rattling noise, or binding of exhaust system components. These noises are sometimes hard to distinguish from other chassis noises. Inspect exhaust system for broken or loose clamps, heat shields, insulators, and brackets. Replace or tighten as necessary. It is important that exhaust system clearances and alignment be maintained.

Perform the following procedures to align the exhaust system. Refer to (Fig. 2) for exhaust system clearance specifications.

(1) Loosen clamps and support brackets.

(2) Align the exhaust system starting at the front, working rearward.

(3) Tighten all clamps and brackets once alignment and clearances are achieved.

SPECIFICATIONS

EXHAUST SYSTEM CLEARANCE

(1) Refer to the following illustration to adjust the exhaust system (Fig. 2).

MUFFLER

REMOVAL

WARNING: THE NORMAL OPERATING TEMPERATURE OF THE EXHAUST SYSTEM IS VERY HIGH. THEREFORE, NEVER WORK AROUND OR ATTEMPT TO SERVICE ANY PART OF THE EXHAUST SYSTEM UNTIL IT IS COOLED. SPECIAL CARE SHOULD BE TAKEN WHEN WORKING NEAR THE CATALYTIC CONVERTER. THE TEMPERATURE OF THE CONVERTER RISES TO A HIGH LEVEL AFTER A SHORT PERIOD OF ENGINE OPERATING TIME.

(1) Raise vehicle on hoist and apply penetrating oil to band clamp fastener of component being removed.

NOTE: Do not use petroleum-based lubricants when removing/installing muffler or exhaust pipe isolators as it may compromise the life of the part. A suitable substitute is a mixture of liquid dish soap and water.

(2) Remove exhaust system ground strap at rear of muffler.

(3) Loosen band clamp and remove support isolators at muffler. Remove muffler from intermediate pipe (Fig. 3).

(4) Clean ends of pipes and muffler to assure mating of all parts. Discard broken or worn isolators, rusted or overused clamps, supports, and attaching parts.

NOTE: When replacement is required on any component of the exhaust system, you must use original equipment parts (or their equivalent).

INSTALLATION

When assembling exhaust system **do not** tighten clamps until components are aligned and clearances are checked.

(1) Install the muffler to intermediate pipe and the isolator supports to the underbody.

(2) Working from the front of system; align each component to maintain position and proper clearance with underbody parts (Fig. 2). For clearance specifications (Refer to 11 - EXHAUST SYSTEM - SPECIFICATIONS). Tighten band clamp to 47 N·m (35 ft. lbs.) (Fig. 4).

MUFFLER (Continued)

CAUTION: Band clamps should never be tightened such that the two sides of the clamps are bottomed out against the center hourglass shaped center block. Once this occurs, the clamp band has been stretched and has lost its clamping force and must be replaced.
To replace the band clamp; remove the nut and peel back the ends of the clamp until spot weld breaks. File or grind remaining weld material until pipe surface is smooth.

NOTE: Maintain proper clamp orientation when replacing with new clamp.

(3) Connect the exhaust system ground strap.

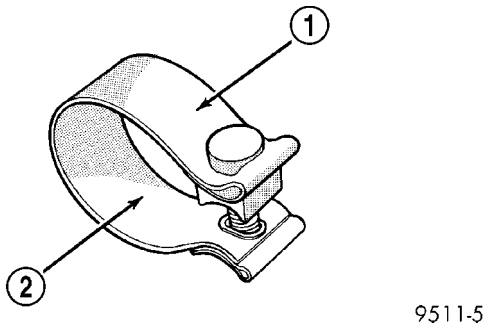

Fig. 4 Band Clamp

1 - CLAMP SIZE
2 - TORQUE SPECIFICATION

(4) Start the engine and inspect for exhaust leaks. Repair exhaust leaks as necessary.

(5) Check the exhaust system for contact with the body panels. Make the necessary adjustments, if needed.

INTERMEDIATE PIPE

REMOVAL

WARNING: THE NORMAL OPERATING TEMPERATURE OF THE EXHAUST SYSTEM IS VERY HIGH. THEREFORE, NEVER WORK AROUND OR ATTEMPT TO SERVICE ANY PART OF THE EXHAUST SYSTEM UNTIL IT IS COOLED. SPECIAL CARE SHOULD BE TAKEN WHEN WORKING NEAR THE CATALYTIC CONVERTER. THE TEMPERATURE OF THE CONVERTER RISES TO A HIGH LEVEL AFTER A SHORT PERIOD OF ENGINE OPERATING TIME.

(1) Raise vehicle on hoist and apply penetrating oil to band clamp fastener of component being removed.

NOTE: Do not use petroleum-based lubricants when removing/installing muffler or exhaust pipe isolators as it may compromise the life of the part. A suitable substitute is a mixture of liquid dish soap and water.

(2) Remove muffler (Refer to 11 - EXHAUST SYSTEM/MUFFLER - REMOVAL).

(3) Loosen band clamp and remove support isolator. Remove intermediate pipe from catalytic converter pipe (Fig. 5).

(4) Clean ends of pipes and muffler to assure mating of all parts. Discard broken or worn isolators, rusted or overused clamps, supports, and attaching parts.

NOTE: When replacement is required on any component of the exhaust system, you must use original equipment parts (or their equivalent).

INSTALLATION

When assembling exhaust system **do not** tighten clamps until components are aligned and clearances are checked.

(1) Install intermediate pipe and the isolator supports to the underbody (Fig. 5).

(2) Install muffler (Refer to 11 - EXHAUST SYSTEM/MUFFLER - INSTALLATION).

(3) Working from the front of system; align each component to maintain position and proper clearance with underbody parts (Fig. 2). For clearance specifications (Refer to 11 - EXHAUST SYSTEM - SPECIFICATIONS).

(4) Tighten band clamps to 47 N·m (35 ft. lbs.) (Fig. 6).

CAUTION: Band clamps should never be tightened such that the two sides of the clamps are bottomed out against the center hourglass shaped center block. Once this occurs, the clamp band has been stretched and has lost its clamping force and must be replaced.
To replace the band clamp; remove the nut and peel back the ends of the clamp until spot weld breaks. File or grind remaining weld material until pipe surface is smooth.

NOTE: Maintain proper clamp orientation when replacing with new clamp.

(5) Start the engine and inspect for exhaust leaks. Repair exhaust leaks as necessary.

CATALYTIC CONVERTER

DESCRIPTION

An under-floor catalytic converter inlet is attached to the exhaust manifold using fasteners and a gasket for sealing (Fig. 7). A flex joint that is integral to the converter allows movement between the engine and the exhaust system. The converter outlet attaches to the intermediate pipe.

OPERATION

The three-way catalytic converter simultaneously converts three exhaust emissions into harmless gases. Specifically, HC and CO emissions are converted into water (H2O) and carbon dioxide (CO2). Oxides of Nitrogen (NOx) are converted into Nitrogen (N) and Oxygen. The three-way catalyst is most efficient in converting HC, CO and NOx at the stoichiometric air fuel ratio of 14.7:1.

CATALYTIC CONVERTER (Continued)

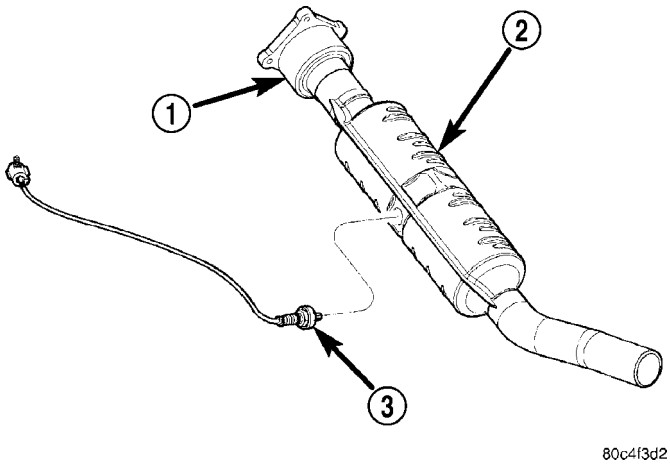

Fig. 7 Catalytic Converter - Typical

1 - FLEX JOINT
2 - CATALYTIC CONVERTER
3 - OXYGEN SENSOR

The oxygen content in a catalyst is important for efficient conversion of exhaust gases. When a high oxygen content (lean) air/fuel ratio is present for an extended period, oxygen content in a catalyst can reach a maximum. When a rich air/fuel ratio is present for an extended period, the oxygen content in the catalyst can become totally depleted. When this occurs, the catalyst fails to convert the gases. This is known as catalyst ″punch through.″

Catalyst operation is dependent on its ability to store and release the oxygen needed to complete the emissions-reducing chemical reactions. As a catalyst deteriorates, its ability to store oxygen is reduced. Since the catalyst's ability to store oxygen is somewhat related to proper operation, oxygen storage can be used as an indicator of catalyst performance. Refer to the appropriate Diagnostic Information for diagnosis of a catalyst related Diagnostic Trouble Code (DTC).

The combustion reaction caused by the catalyst releases additional heat in the exhaust system, causing temperature increases in the area of the reactor under severe operating conditions. Such conditions can exist when the engine misfires or otherwise does not operate at peak efficiency. **Do not** remove spark plug wires from plugs or by any other means short out cylinders. Failure of the catalytic converter can occur due to temperature increases caused by unburned fuel passing through the converter. This deterioration of the catalyst core can result in excessively high emission levels, noise complaints, and exhaust restrictions.

Unleaded gasoline must be used to avoid ruining the catalyst core. Do not allow engine to operate above 1200 RPM in neutral for extended periods over 5 minutes. This condition may result in excessive exhaust system/floor pan temperatures because of no air movement under the vehicle.

The flex joint allows flexing as the engine moves, preventing breakage that could occur from the back-and-forth motion of a transverse mounted engine.

CAUTION: Due to exterior physical similarities of some catalytic converters with pipe assemblies, extreme care should be taken with replacement parts. There are internal converter differences required in some parts of the country (particularly vehicles built for States with strict emission requirements) and between model years.

REMOVAL

WARNING: THE NORMAL OPERATING TEMPERATURE OF THE EXHAUST SYSTEM IS VERY HIGH. THEREFORE, NEVER ATTEMPT TO SERVICE ANY PART OF THE EXHAUST SYSTEM UNTIL IT IS COOLED. SPECIAL CARE SHOULD BE TAKEN WHEN WORKING NEAR THE CATALYTIC CONVERTER. THE TEMPERATURE OF THE CONVERTER RISES TO A HIGH LEVEL AFTER A SHORT PERIOD OF ENGINE OPERATION TIME.

NOTE: Before replacing a catalytic converter, determine the root cause of failure. Most catalytic converter failures are caused by air, fuel or ignition problems. Refer to the appropriate service diagnostic information for repair procedures.

(1) Loosen intermediate pipe-to catalytic converter clamp.

NOTE: Do not use petroleum-based lubricants when removing/installing muffler or exhaust pipe isolators as it may compromise the life of the part. A suitable substitute is a mixture of liquid dish soap and water.

(2) Remove muffler/intermediate pipe insolators as necessary to slide muffle/intermediate pipe assembly out of catalytic converter.

(3) 1.6L Engine - Disconnect upstream oxygen sensor electrical connector.

(4) Disconnect downstream oxygen sensor electrical connector (Fig. 8).

(5) Remove catalytic converter to exhaust manifold attaching fasteners and remove converter from vehicle (Fig. 9), (Fig. 10), (Fig. 11) or (Fig. 12).

(6) Remove and discard flange gasket.

NOTE: When replacement is required on any component of the exhaust system, original equipment parts (or equivalent) must be used.

INSPECTION

WARNING: THE NORMAL OPERATING TEMPERATURE OF THE EXHAUST SYSTEM IS VERY HIGH. THEREFORE, NEVER ATTEMPT TO SERVICE ANY PART OF THE EXHAUST SYSTEM UNTIL IT IS COOLED. SPECIAL CARE SHOULD BE TAKEN WHEN WORKING NEAR THE CATALYTIC CONVERTER. THE TEMPERATURE OF THE CONVERTER RISES TO A HIGH LEVEL AFTER A SHORT PERIOD OF ENGINE OPERATION TIME.

Check catalytic converter for a flow restriction. (Refer to 11 - EXHAUST SYSTEM - DIAGNOSIS AND TESTING) Exhaust System Restriction Check for procedure.

Visually inspect the catalytic converter element by using a borescope or equivalent. Remove oxygen sensor(s) and insert borescope. If borescope is not available, remove converter and inspect element using a flashlight. Inspect element for cracked or melted substrate.

NOTE: Before replacing a catalytic converter, determine the root cause of failure. Most catalytic converter failures are caused by air, fuel or ignition problems. (Refer to Appropriate Diagnostic Information) for test procedures.

INSTALLATION

NOTE: When assembling exhaust system do not tighten clamps until all components are aligned and clearances are checked.

(1) Assemble catalytic converter to exhaust manifold connection. Use a new flange gasket.

(2) Tighten the catalytic converter to exhaust manifold fasteners to 28 N·m (250 in. lbs.) (Fig. 9), (Fig. 10), (Fig. 11) or (Fig. 12).

(3) Install intermediate pipe and muffler (Refer to 11 - EXHAUST SYSTEM/INTERMEDIATE PIPE - INSTALLATION).

(4) Working from the front of system; align each component to maintain position and proper clearance with underbody parts (Fig. 2). For clearance specifications (Refer to 11 - EXHAUST SYSTEM - SPECIFICATIONS).

(5) Tighten band clamps to 47 N·m (35 ft. lbs.).

CAUTION: Band clamps should never be tightened such that the two sides of the clamps are bottomed out against the center hourglass shaped center block. Once this occurs, the clamp has lost clamping force and must be replaced.

(6) If removed, install downstream oxygen sensor (Fig. 8).

(7) Connect downstream oxygen sensor electrical connector.

(8) 1.6L Engine - Connect upstream oxygen sensor connector.

(9) Start the engine and inspect for exhaust leaks. Repair exhaust leaks as necessary.

(10) Check the exhaust system for contact with the body panels. Make the necessary adjustments, if needed.

SUPPORT BRACKETS AND ISOLATORS

REMOVAL

(1) Disconnect isolator from exhaust system component.

(2) Remove screws attaching isolator bracket to underbody (Fig. 13).

(3) Remove isolator assembly (Fig. 13).

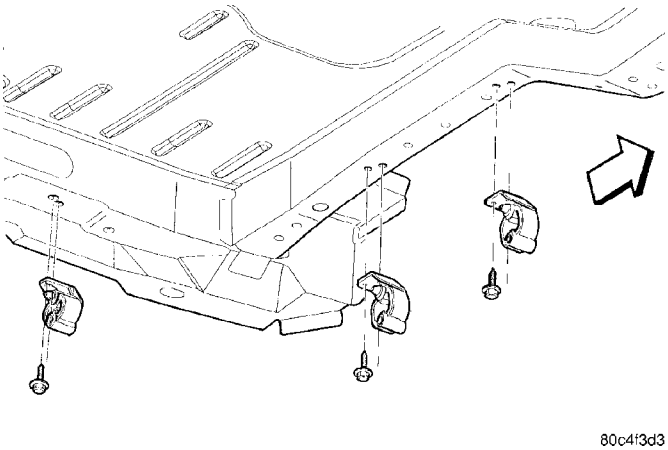

Fig. 13 Exhaust System Isolator and Bracket

INSTALLATION

(1) Position isolator bracket to underbody and install attaching screws (Fig. 13). Tighten bracket screws to frame rail to 8.5 N·m (75 in. lbs.) and bracket screws to the rear panel to 3.7 N·m (33 in. lbs.).

(2) Connect isolator to exhaust system component.

(3) Start the engine and inspect for exhaust leaks. Repair exhaust leaks as necessary.

(4) Check the exhaust system for contact with the body panels. Make the necessary adjustments, if needed.

HEAT SHIELDS

DESCRIPTION

Heat shields (Fig. 14), (Fig. 15), (Fig. 16), and (Fig. 17) are needed to protect both the vehicle and the environment from the high temperatures developed in the vicinity of the catalytic converter.

CAUTION: Avoid application of rust prevention compounds or undercoating materials to exhaust system floor pan heat shield on cars if equipped. Light over-spray near the edges is permitted. Application of coating will greatly reduce the efficiency of the heat shields resulting in excessive floor pan temperatures and objectionable fumes.

INSTALLATION

(1) Position heat shield(s) to underbody.

(2) Install heat shield fasteners (Fig. 14), (Fig. 15), (Fig. 16), or (Fig. 17).

(3) Inspect heat shield to exhaust system clearances and adjust as necessary (Fig. 2). For clearance specifications (Refer to 11 - EXHAUST SYSTEM - SPECIFICATIONS).

(4) Lower vehicle.

(5) Start the engine and inspect for exhaust leaks. Repair exhaust leaks as necessary.

(6) Check the exhaust system for contact with the body panels. Make the necessary adjustments, if needed.

TURBOCHARGER SYSTEM

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - TURBOCHARGER

Check for Diagnostic Trouble Codes (DTC'S) stored in PCM memory. If any DTC'S are present, refer to the appropriate Powertrain Diagnostic Information.

TURBOCHARGER DIAGNOSIS

CONDITION	POSSIBLE CAUSES
Low boost pressure, lack of power	Clogged air filter Leaks between engine and turbocharger Exhaust restriction Restriction in charge air cooler hose(s) Wastegate stuck open Wastegate actuator malfunction Seized turbocharger shaft
Overboost	Wastegate stuck shut Wastegate actuator malfunction
Noisy operation or vibration	Leak(s) in charge air cooler hose(s) Intake or exhaust leaks Oil starvation Worn turbocharger bearings Damaged turbine/ compressor fins
Blue smoke from exhaust	Oil return line blocked Engine breather clogged Turbocharger shaft seals damaged

TURBOCHARGER SYSTEM (Continued)

DIAGNOSIS AND TESTING - SRT4

During normal operation the SRT - 4 turbocharger will emit a very high frequency whistle at full boost 68.9 - 103.4 kPa (10 - 15 psi) during WOT acceleration.

During throttle tip-out, the surge valve will emit a light air “woosh” noise. If there is excessive NVH or other air leak/turbocharger noises, the intercooler plumbing or turbocharger control system may be compromised.

TO identify the source of the concern, check for Diagnostic Trouble Codes (DTC’S) stored in PCM memory. If any DTC’S are present, refer to the appropriate Powertrain Diagnostic Information.

If there are no DTC’S stored, use the folling chart.

CONDITION	POSSIBLE CAUSES	CORRECTION
UNDERBOOST - 20.6 - 27.5 kPa and turbocharger lag at WOT with some air leak noise OVERBOOST - 103.4 kPa (10 psi) or more even at part throttle (could be as high as 137.8 kPa (20 psi) or more). A ″Fluttering″ noise can be heard during overboost. **CAUTION: Engine damage can result from prolonged Overboost.**	Waste Gate control hose plumbing compromised/disconnected	Refer to (Refer to 11 - EXHAUST SYSTEM/TURBOCHARGER SYSTEM/CHARGE AIR COOLER AND PLUMBING - INSTALLATION)
UNDERBOOST - 27.5 - 62 kPa (4 - 9 psi) @ WOT with ″horse laugh″ on throttle tip-out.	Surge valve control hose plumbing compromised.	Repair plumbing (Refer to 11 - EXHAUST SYSTEM/ TURBOCHARGER SYSTEM/ CHARGE AIR COOLER AND PLUMBING - INSTALLATION)
NORMAL BOOST - but turbocharger lag and ″horse laugh″ noise on throttle tip-out.	Surge valve scroll and vacuum feeds reversed	Reverse vacuum lines (Refer to 11 - EXHAUST SYSTEM/ TURBOCHARGER SYSTEM/ SOLENOID - INSTALLATION)
UNDERBOOST - 0-20.6 kPa (0-3 psi) a WOT with loud air leak noise outside vehicle. Turbocharger may emit a ″howling″ noise.	Intercoooler plumbing hose disconnected	Inspect plumbing and install (Refer to 11 - EXHAUST SYSTEM/ TURBOCHARGER SYSTEM/ CHARGE AIR COOLER AND PLUMBING - INSTALLATION)
Very rough idle	TIP/MAP sensor hoses connected improperly or TIP disconnected	Inspect hosed (Refer to 11 - EXHAUST SYSTEM/ TURBOCHARGER SYSTEM/LINES AND HOSES - INSTALLATION)

TURBOCHARGER

DESCRIPTION

CAUTION: The turbocharger is a performance part and must not be tampered with. Tampering with the wastegate components can reduce durability by increasing cylinder pressure and thermal loading due to incorrect inlet and exhaust manifold pressure. Poor fuel economy and failure to meet regulatory emissions laws may result. Increasing the turbocharger boost WILL NOT increase engine power.

The turbocharger is an exhaust-driven supercharger which increases the pressure and density of the air entering the engine. With the increase of air entering the engine, more fuel can be injected into the cylinders, which creates more power during combustion.

The turbocharger assembly consists of four (4) major component systems (Fig. 18):

- Turbine section
- Compressor section
- Bearing housing
- Wastegate

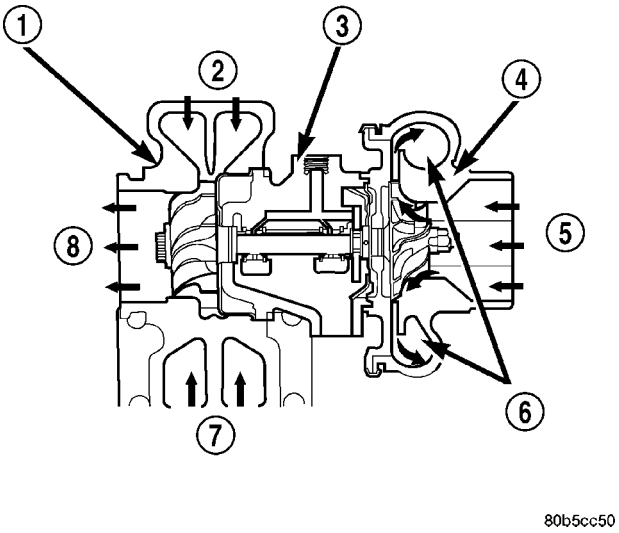

Fig. 18 Turbocharger - Typical

1 - TURBINE SECTION
2 - EXHAUST GAS
3 - BEARING HOUSING
4 - COMPRESSOR SECTION
5 - INLET AIR
6 - COMPRESSED AIR TO ENGINE
7 - EXHAUST GAS
8 - EXHAUST GAS TO EXHAUST PIPE

OPERATION

Exhaust gas pressure and energy drive the turbine, which in turn drives a centrifugal compressor that compresses the inlet air, and forces the air into the engine through the charge air cooler and plumbing. Since heat is a by-product of this compression, the air must pass through a charge air cooler to cool the incoming air and maintain power and efficiency.

Increasing air flow to the engine provides:

- Improved engine performance
- Improved operating economy
- Altitude compensation

The turbocharger also uses a wastegate (Fig. 19), which regulates intake manifold air pressure and prevents over boosting at high engine speeds. When the wastegate valve is closed, all of the exhaust gases flow through the turbine wheel. As the intake manifold pressure increases, the wastegate actuator opens the valve, diverting some of the exhaust gases away from the turbine wheel. This limits turbine shaft speed and air output from the impeller.

The turbocharger is cooled by engine coolant. The coolant is delivered to the turbocharger by a supply line that connects from engine block to the turbocharger. A coolant return line connects the turbocharger to heater tubes.

The turbocharger is lubricated by engine oil that is pressurized, cooled, and filtered. The oil is delivered to the turbocharger by a supply line that is tapped into the cylinder block. The oil travels into the bearing housing, where it lubricates the shaft and bearings (Fig. 20). A return pipe at the bottom of the bearing housing, routes the engine oil back to the crankcase.

The most common turbocharger failure is bearing failure related to repeated hot shutdowns with inadequate “cool-down” periods. A sudden engine shut down after prolonged operation will result in the transfer of heat from the turbine section of the turbocharger to the bearing housing. This causes the oil to overheat and break down, which causes bearing and shaft damage the next time the vehicle is started.

Letting the engine idle after extended operation allows the turbine housing to cool to normal operating temperature. The following chart should be used as a guide in determining the amount of engine idle time required to sufficiently cool down the turbocharger before shut down, depending upon the type of driving and the amount of cargo.

3 - OIL RETURN (TO OIL PAN)

REMOVAL - TURBOCHARGER

CAUTION: IF TURBOCHARGER IS REPLACED DUE TO A BEARING FAILURE, REPLACEMENT OF THE OIL PRESSURE FEED LINE IS REQUIRED. OIL RETURN TUBE SHOULD BE CLEANED ALSO.

NOTE: The turbocharger and exhaust manifold are serviced as an assembly. Do Not attempt to remove the turbocharger from the exhaust manifold. Exhaust leaks will result. It is recommended that the turbocharger elbow be replaced along with the turbocharger/exhaust manifold assembly.

(1) Disconnect negative battery cable.

(2) Drain cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE - DRAINING COOLING SYSTEM).

(3) Remove air cleaner housing and lid (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).

(4) Disconnect clean air hose from turbocharger (Fig. 21).

(5) Disconnect throttle and speed control cables at throttle body.

(27) Remove lower exhaust manifold fasteners that are accessible while vehicle is on hoist.

(28) Lower vehicle.

(29) Remove upper exhaust manifold fasteners.

(30) Remove turbocharger/exhaust manifold assembly from above/between the engine and cowl panel.

(31) Remove and discard exhaust manifold gasket.

INSPECTION - TYPICAL TURBOCHARGER

Visually inspect the turbocharger and exhaust manifold gasket surfaces. Replace stripped or eroded mounting studs.

(1) Visually inspect the turbocharger for cracks. The following cracks are NOT acceptable:

- Cracks in the turbine and compressor housing that go completely through.
- Cracks in the mounting flange that are longer than 15 mm (0.6 in.).
- Cracks in the mounting flange that intersect bolt through-holes.
- Two (2) Cracks in the mounting flange that are closer than 6.4 mm (0.25 in.) together.

(2) Visually inspect the impeller and compressor wheel fins for nicks, cracks, or chips.

(3) Visually inspect the turbocharger compressor housing for an impeller rubbing condition (Fig. 28). Replace the turbocharger if the condition exists.

(4) Measure the turbocharger axial end play:

(a) Install a dial indicator. Zero the indicator at one end of travel.

(b) Move the impeller shaft fore and aft and record the measurement. Allowable end play is 0.038 mm (0.0015 in.) MIN. and 0.089 mm (0.0035 in.) MAX. If the recorded measurement falls outside these parameters, replace the turbocharger assembly.

(5) Measure the turbocharger bearing radial clearance:

(a) Insert a narrow blade or wire style feeler gauge between the compressor wheel and the housing.

(b) Gently push the compressor wheel toward the housing and record the clearance.

(c) With the feeler gauge in the same location, gently push the compressor wheel away from the housing and again record the clearance.

(d) Subtract the smaller clearance from the larger clearance. This is the radial bearing clearance.

(e) Allowable radial bearing clearance is 0.326 mm (0.0128 in.) MIN. and 0.496 mm (0.0195 in.) MAX. If the recorded measurement falls outside these specifications, replace the turbocharger assembly.

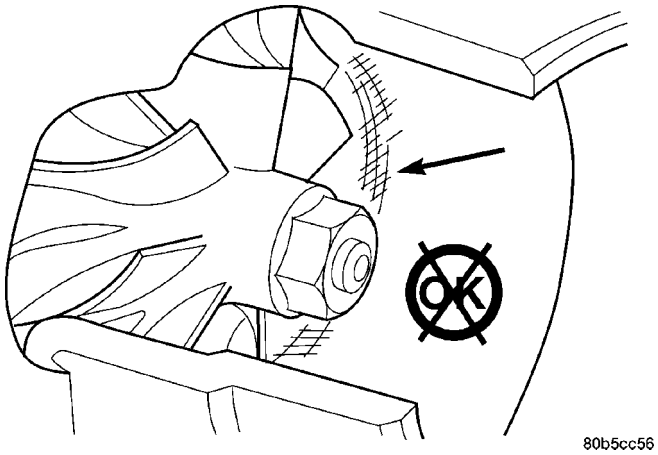

Fig. 28 Inspect Compressor Housing for Impeller Rubbing Condition

INSTALLATION - TURBOCHARGER

CAUTION: IF TURBOCHARGER IS REPLACED DUE TO A BEARING FAILURE, REPLACEMENT OF THE OIL PRESSURE FEED LINE IS REQUIRED. OIL RETURN TUBE SHOULD BE CLEANED ALSO.

TURBOCHARGER (Continued)

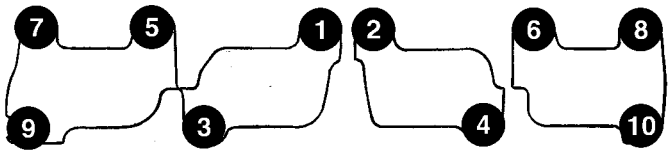
NOTE: The turbocharger and exhaust manifold are serviced as an assembly. Do Not attempt to remove the turbocharger from the exhaust manifold. Exhaust leaks will result. It is recommended that the turbocharger elbow be replaced along with the turbocharger/exhaust manifold assembly.

(1) Clean gasket sealing surfaces. Replace exhaust manifold gasket. **DO NOT APPLY SEALER TO GASKET.**

NOTE: Stainless steel layer of exhaust manifold gasket goes against cylinder head, graphite layer of gasket goes against manifold surface.

(2) Turbocharger/exhaust manifold assembly is installed from above/between the engine and cowl panel.

(3) Position turbocharger/exhaust manifold assembly in place. Gradually tighten fasteners, starting at center and progressing outward in both directions to 28 N·m (250 in. lbs.) (Fig. 29). Raise and lower vehicle for fastener access as necessary. Repeat tightening procedure until all fasteners are at specified torque.



80f38bb9

Fig. 29 Exhaust Manifold Tightening Sequence

(4) Install turbocharger elbow. Torque fasteners to 28 N·m (250 in. lbs.) (Fig. 27).

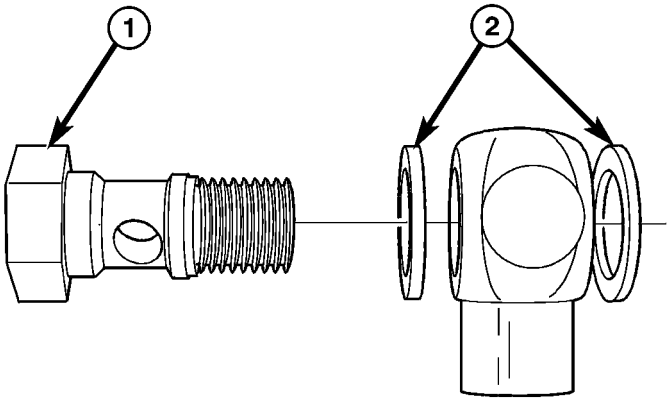
(5) Install turbocharger upper heat shield. Torque fasteners to 28 N·m (250 in. lbs.) (Fig. 27).

(6) Install turbocharger coolant supply line. Install **NEW** washers (Fig. 30). Torque banjo fitting bolt to 30 N·m (22 ft. lbs.). Torque flared fitting to 31 N·m (23 ft. lbs.) (Fig. 24).

(7) Replace oil return tube gasket. Install oil return tube. Torque fasteners to 12 N·m (105 in. lbs.). Make sure heat shield for oil return line is properly installed (Fig. 24).

(8) Install turbocharger support bracket. Torque M8 fasteners to 28 N·m (250 in. lbs.) and M10 fasteners to 54 N·m (40 ft. lbs.) (Fig. 27).

(9) Install turbocharger elbow support bracket (Fig. 27).



80f40149

Fig. 30 Banjo Bolt and Washers

1 - BANJO BOLT
2 - WASHERS

(10) Install turbocharger to charge air cooler hose assembly (Fig. 26).

(11) Install catalytic converter and intermediate pipe as an assembly.

(12) Install fasteners securing catalytic converter to exhaust manifold (Fig. 25). Torque fasteners to 28 N·m (250 in. lbs.).

(13) Install muffler. Connect muffler ground strap. (Refer to 11 - EXHAUST SYSTEM/MUFFLER - INSTALLATION).

(14) Connect downstream oxygen sensor.

(15) Lower vehicle.

(16) Connect vacuum hoses to turbocharger.

(17) Install coolant return line. Install **NEW** washers (Fig. 30). Torque banjo fitting bolt to 30 N·m (22 ft. lbs.) (Fig. 24).

(18) Connect oil supply line at turbocharger. Torque flared fitting to 31 N·m (23 ft. lbs.) (Fig. 24).

NOTE: The lower heat shield tabs must over lap the upper heat shield to prevent fatiguing and premature failure of the union.

(19) Install turbocharger lower heat shield. Torque fasteners to 28 N·m (250 in. lbs.) (Fig. 27).

(20) Install upper intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).

(21) Install upper intake manifold support bracket (Fig. 23).

(22) Connect vacuum hoses at throttle body and upper intake manifold.

(23) Connect air inlet hose at throttle body (Fig. 22).

TURBOCHARGER (Continued)

(24) Connect electrical connectors to the following components:
- Inlet Air Temperature (IAT) Sensor
- MAP Sensor
- IAC Motor
- Throttle Position Sensor
- Ignition Coil Capacitor
- Upstream Oxygen Sensor

(25) Connect throttle and speed control cables at throttle body.

(26) Connect clean air hose to turbocharger (Fig. 21).

(27) Install air cleaner housing and lid (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - INSTALLATION).

(28) Fill cooling system (Refer to 7 - COOLING/ ENGINE - STANDARD PROCEDURE).

(29) Change oil and filter.

(30) Connect negative battery cable.

(31) Start the engine and inspect for exhaust leaks. Repair exhaust leaks as necessary.

(32) Check the exhaust system for contact with the body panels. Make the necessary adjustments, if needed.

CHARGE AIR COOLER AND HOSES

REMOVAL

REMOVAL - CHARGE AIR COOLER HOSES

HOSE - CHARGE AIR COOLER TO THROTTLE BODY

(1) Remove air cleaner housing (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).

(2) Disconnect negative battery cable.

(3) Disconnect positive battery cable.

(4) Remove battery and battery tray (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - REMOVAL).

(5) Remove battery tray support bracket.

(6) Loosen hose clamp at charge air cooler (Fig. 31).

(7) Dislodge hose from charge air cooler.

(8) Disconnect Inlet Air Temperature (IAT) sensor connector (Fig. 32).

(9) Disconnect Throttle Inlet Pressure (TIP) hose from charge air cooler hose (Fig. 32).

(10) Loosen hose clamp at throttle body.

(11) Remove charge air cooler hose.

HOSE - TURBOCHARGER TO CHARGE AIR COOLER

(1) Raise vehicle on hoist.

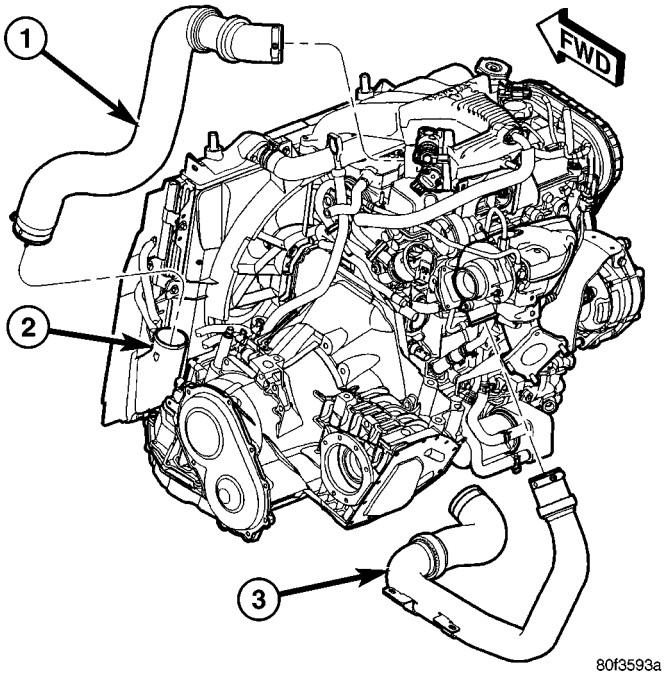


Fig. 31 Charge Air Cooler Hoses

1 - HOSE - CHARGE AIR COOLER TO THROTTLE BODY
2 - CHARGE AIR COOLER
3 - HOSE - TURBOCHARGER TO CHARGE AIR COOLER

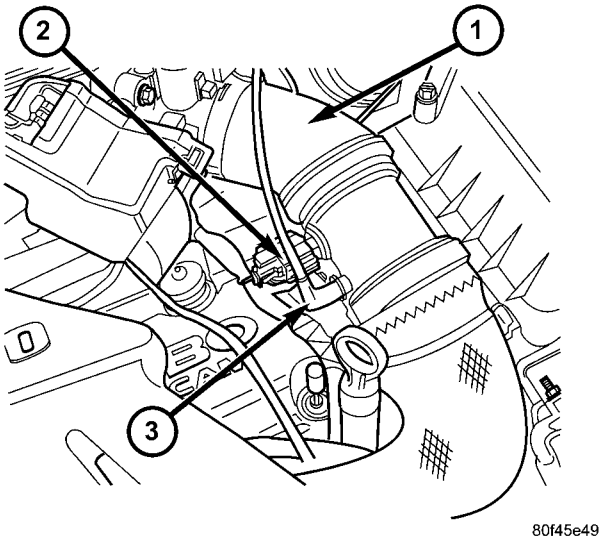

Fig. 32 IAT Sensor - 2.4L Turbo

1 - HOSE - CHARGE AIR COOLER TO THROTTLE BODY
2 - IAT SENSOR
3 - TIP HOSE

(2) Loosen hose clamp at charge air cooler (Fig. 33).

(3) Dislodge hose from charge air cooler.

(4) Loosen hose clamp at turbocharger (Fig. 31).

(5) Dislodge hose from turbocharger.

CHARGE AIR COOLER AND HOSES (Continued)

(6) Remove nuts securing charge air cooler hose to structural collar (Fig. 33).

(7) Remove charge air cooler hose.

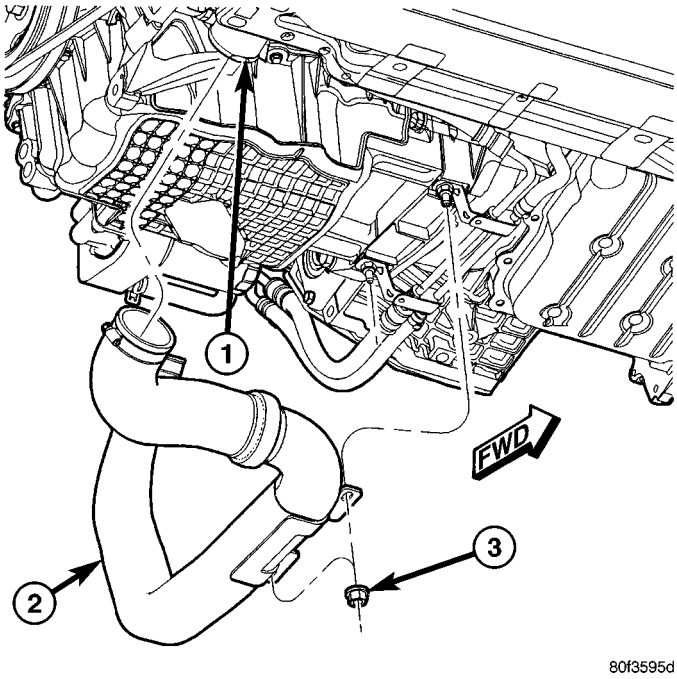

Fig. 33 Charge Air Cooler Hose

1 - CHARGE AIR COOLER
2 - HOSE - TURBOCHARGER TO CHARGE AIR COOLER
3 - NUT

REMOVAL - CHARGE AIR COOLER

(1) Drain cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).

(2) Remove air cleaner housing (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).

(3) Disconnect negative battery cable.

(4) Disconnect positive battery cable.

(5) Remove battery and battery tray (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - REMOVAL).

(6) Remove grille (Refer to 23 - BODY/EXTERIOR/GRILLE - REMOVAL).

(7) Remove upper radiator closure panel and center brace (Refer to 23 - BODY/EXTERIOR/RADIATOR CLOSURE PANEL - REMOVAL) (Fig. 34).

(8) Remove front bumper fascia (Refer to 13 - FRAME & BUMPERS/BUMPERS/FRONT FASCIA - REMOVAL).

(9) Remove front bumper (Refer to 13 - FRAME & BUMPERS/BUMPERS/FRONT BUMPER REINFORCEMENT - REMOVAL).

(10) Loosen charge air cooler hose clamps. Disconnect charge air cooler hoses (Fig. 31) and (Fig. 33).

(11) Remove radiator fan (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL) (Fig. 35).

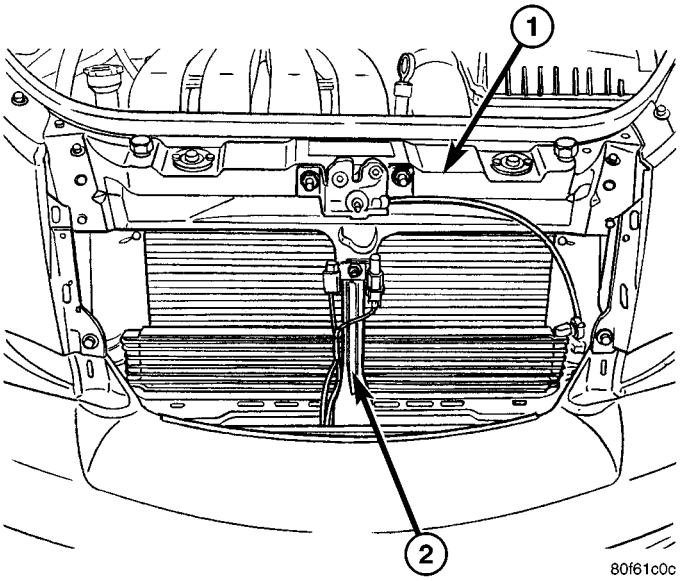

Fig. 34 Upper Radiator Closure Panel and Center Brace

1 - UPPER RADIATOR CLOSURE PANEL
2 - CENTER BRACE

(12) Remove charge air cooler fasteners (Fig. 35).

(13) Remove radiator (Refer to 7 - COOLING/ENGINE/RADIATOR - REMOVAL).

(14) Remove charge air cooler.

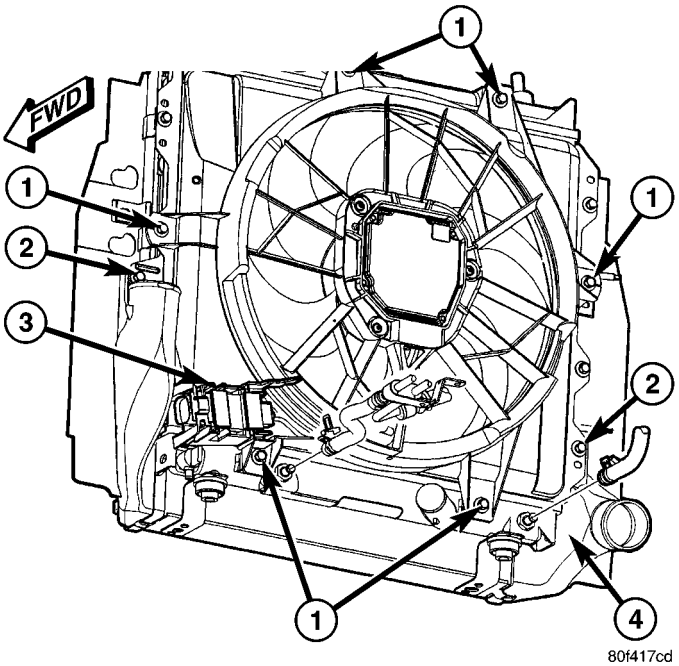

Fig. 35 Cooling Module - 2.4L Turbo

CHARGE AIR COOLER AND HOSES (Continued)

INSTALLATION

INSTALLATION - CHARGE AIR COOLER HOSES

HOSE - CHARGE AIR COOLER TO THROTTLE BODY

(1) Position hose to mounting location.
(2) Connect hose to throttle body.
(3) Connect hose to charge air cooler (Fig. 31).
(4) Tighten hose clamps to 1.7 N·m (15 in. lbs.).
(5) Connect Throttle Inlet Pressure (TIP) hose to charge air cooler hose (Fig. 32).
(6) Connect Inlet Air Temperature (IAT) sensor connector (Fig. 32).
(7) Install battery tray support bracket.
(8) Install battery tray and battery (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - INSTALLATION).
(9) Connect positive battery cable.
(10) Connect negative battery cable.
(11) Install air cleaner housing (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - INSTALLATION).

HOSE - TURBOCHARGER TO CHARGE AIR COOLER

(1) Position hose to mounting location.
(2) Temporarily install nuts securing charge air cooler hose to structural collar (Fig. 33).
(3) Connect hose to turbocharger (Fig. 31).
(4) Connect hose to charge air cooler (Fig. 33).
(5) Tighten hose clamps to 1.7 N·m (15 in. lbs.).
(6) Tighten nuts securing charge air cooler hose to structural collar (Fig. 33).
(7) Lower vehicle.

INSTALLATION - CHARGE AIR COOLER

(1) Position charge air cooler to mounting location.

NOTE: When lowering radiator, make sure lower radiator pins engage properly through charge air cooler tabs (Fig. 36).

(2) Install radiator (Refer to 7 - COOLING/ENGINE/RADIATOR - INSTALLATION).
(3) Install fasteners attaching charge air cooler to radiator. Torque fasteners to 8 N·m (70 in. lbs.) (Fig. 35).
(4) Install radiator fan (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).
(5) Connect charge air cooler hoses. Tighten hose clamps to 1.7 N·m (15 in. lbs.) (Fig. 31) and (Fig. 33).
(6) Install front bumper (Refer to 13 - FRAME & BUMPERS/BUMPERS/FRONT BUMPER REINFORCEMENT - INSTALLATION).
(7) Install front bumper fascia (Refer to 13 - FRAME & BUMPERS/BUMPERS/FRONT FASCIA - INSTALLATION).

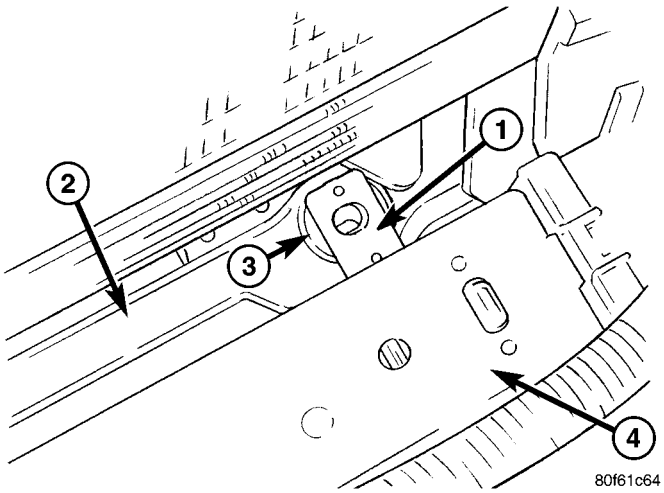

Fig. 36 Charge Air Cooler Locating Tab

1 - LOCATING TAB
2 - LOWER RADIATOR SUPPORT CROSSMEMBER
3 - RADIATOR MOUNT BUSHING
4 - CHARGE AIR COOLER

(8) Install upper radiator closure panel and center brace (Refer to 23 - BODY/EXTERIOR/RADIATOR CLOSURE PANEL - INSTALLATION) (Fig. 34).
(9) Install grille (Refer to 23 - BODY/EXTERIOR/GRILLE - INSTALLATION).
(10) Install battery tray and battery (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - INSTALLATION).
(11) Connect positive battery cable.
(12) Connect negative battery cable.
(13) Install air cleaner housing (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - INSTALLATION).
(14) Fill cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).

LINES AND HOSES

REMOVAL - LINES AND HOSES

NOTE: For line and hose location refer to (Fig. 37).

COOLANT SUPPLY LINE

(1) Raise vehicle on hoist.
(2) Drain cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).
(3) Remove banjo bolt from coolant supply line at turbocharger (Fig. 38).
(4) Disconnect coolant supply line flared fitting from brass fitting at engine block (Fig. 39).
(5) Remove coolant supply line.

LINES AND HOSES (Continued)

COOLANT RETURN LINE

(1) Drain cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).

(2) Remove air cleaner housing (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).

(3) Disconnect Inlet Air Temperature (IAT) sensor connector (Fig. 32).

(4) Disconnect Throttle Inlet Pressure (TIP) hose from charge air cooler hose (Fig. 32).

(5) Loosen hose clamp at throttle body.

(6) Disconnect charge air cooler hose from throttle body. Reposition charge air cooler hose.

(7) Remove fastener securing coolant return line bracket to cylinder head cover stud (Fig. 40).

(8) Remove hose clamp from coolant return line at heater tube (Fig. 40). Disconnect hose from heater tube.

(9) Remove banjo bolt from coolant return line at turbocharger (Fig. 38).

(10) Remove coolant return line.

OIL SUPPLY LINE

(1) Raise vehicle on hoist.

(2) Remove elbow support bracket (Fig. 41).

(3) Disconnect oil supply line flared fitting from brass fitting at engine block (Fig. 42).

(4) Lower vehicle.

(5) Disconnect oil supply line flared fitting from brass fitting at turbocharger (Fig. 43).

(6) Remove oil supply line.

LINES AND HOSES (Continued)

OIL RETURN LINE

(1) Raise vehicle on hoist.
(2) Remove the two fasteners securing the oil return line to the turbocharger.
(3) Remove hose clamp from oil return line.
(4) Remove oil return line from crankcase nipple (Fig. 37).

INSTALLATION - LINES AND HOSES

NOTE: For line and hose location refer to (Fig. 37).

COOLANT SUPPLY LINE

(1) If brass fitting was removed from engine block, apply thread sealer to threads and install in engine block. Torque brass fitting to 41 N·m (30 ft. lbs.).
(2) Position coolant supply line to mounting location.
(3) Install **NEW** washers on banjo fitting of coolant supply line (Fig. 44). Hand start banjo bolt.
(4) Hand start flared fitting of coolant supply line.
(5) Torque banjo fitting bolt to 30 N·m (22 ft. lbs.) (Fig. 38).
(6) Torque flared fitting to 31 N·m (23 ft. lbs.) (Fig. 39).
(7) Lower vehicle.
(8) Fill cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).

COOLANT RETURN LINE

(1) Position coolant return line to mounting location.
(2) Install **NEW** washers on banjo fitting of coolant return line (Fig. 44). Hand start banjo bolt.
(3) Install hose onto heater tube. Install hose clamp (Fig. 40).
(4) Torque banjo fitting bolt to 30 N·m (22 ft. lbs.) (Fig. 38).
(5) Install fastener securing coolant return line bracket to cylinder head cover stud (Fig. 40).
(6) Connect charge air cooler hose to throttle body.
(7) Tighten hose clamp to 1.7 N·m (15 in. lbs.).
(8) Connect Throttle Inlet Pressure (TIP) hose to charge air cooler hose (Fig. 32).
(9) Connect Inlet Air Temperature (IAT) sensor connector (Fig. 32).
(10) Install air cleaner housing (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - INSTALLATION).
(11) Fill cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).

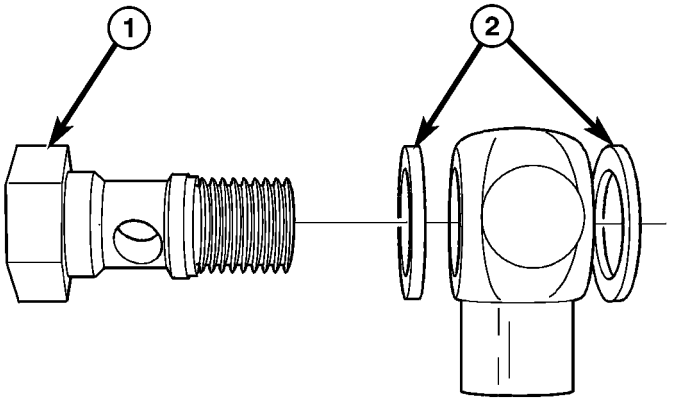

Fig. 44 Banjo Bolt and Washers

1 - BANJO BOLT
2 - WASHERS

OIL SUPPLY LINE

(1) If brass fitting was removed from engine block or turbocharger, apply thread sealer to threads and install. Torque brass fitting to 41 N·m (30 ft. lbs.).
(2) Position oil supply line to mounting location.
(3) Hand start flared fitting at turbocharger (Fig. 43).
(4) Raise vehicle on hoist.
(5) Hand start flared fitting at engine block (Fig. 42).
(6) Torque flared fittings to 31 N·m (23 ft. lbs.) (Fig. 42) and (Fig. 43).
(7) Install elbow support bracket (Fig. 41).
(8) Lower vehicle.

OIL RETURN LINE

(1) Clean gasket surfaces.
(2) Install new gasket.
(3) Install oil return line hose over crankcase nipple (Fig. 37).
(4) Install the two fasteners securing the oil return line to the turbocharger. Torque fasteners to 12 N·m (105 in. lbs.).
(5) Install hose clamp for oil return line hose.
(6) Lower vehicle.

SOLENOIDS AND VACUUM HARNESS

DESCRIPTION

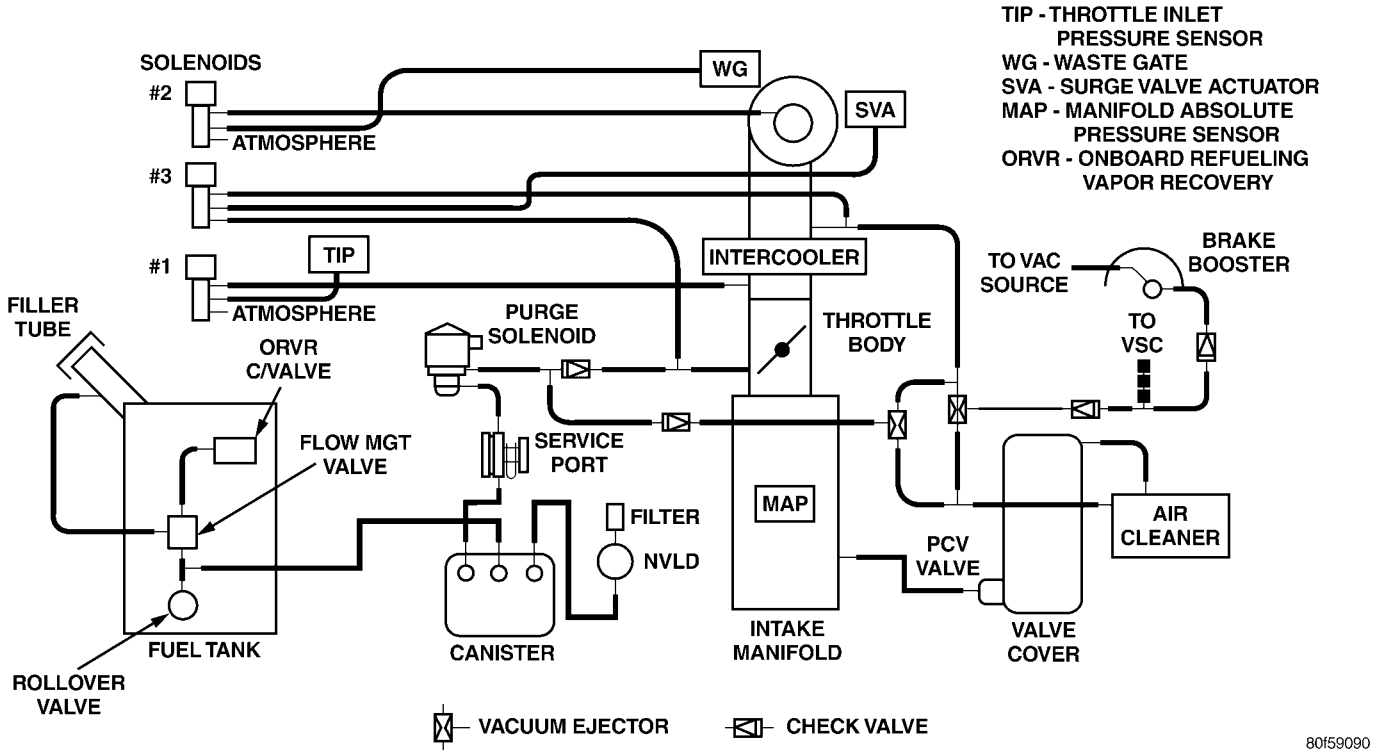

Fig. 45 Vacuum Harness Schematic

NOTE: Refer to (Fig. 45) and (Fig. 46) for component location and vacuum harness routing.

Turbocharged vehicles are equipped with three solenoids that are PCM controlled. They are mounted to the right shock tower. A vacuum harness connects the solenoids to their respective component.

- Wastegate Actuator Solenoid
- Surge Valve Actuator Solenoid
- Throttle Inlet Pressure (TIP) Solenoid

REMOVAL

NOTE: For specific solenoid location, refer to (Fig. 46).

(1) Remove nuts securing solenoid mounting bracket to shock tower (Fig. 47).

(2) Disconnect solenoid electrical connector.

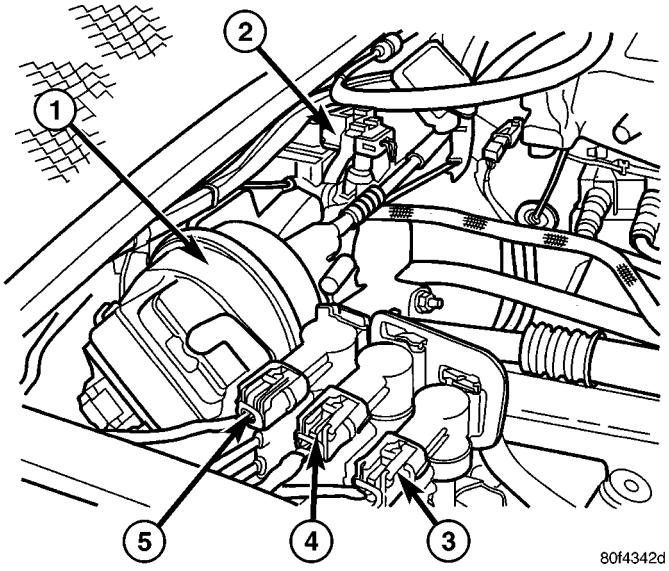

Fig. 46 Turbocharger Solenoids

1 - SPEED CONTROL SERVO
2 - TIP SENSOR
3 - WASTEGATE ACTUATOR SOLENOID
4 - SURGE VALVE ACTUATOR SOLENOID
5 - TIP SOLENOID

SOLENOIDS AND VACUUM HARNESS (Continued)

(3) Disconnect vacuum harness connector from solenoid.

(4) Push on solenoid lock tab and slide solenoid off bracket (Fig. 48).

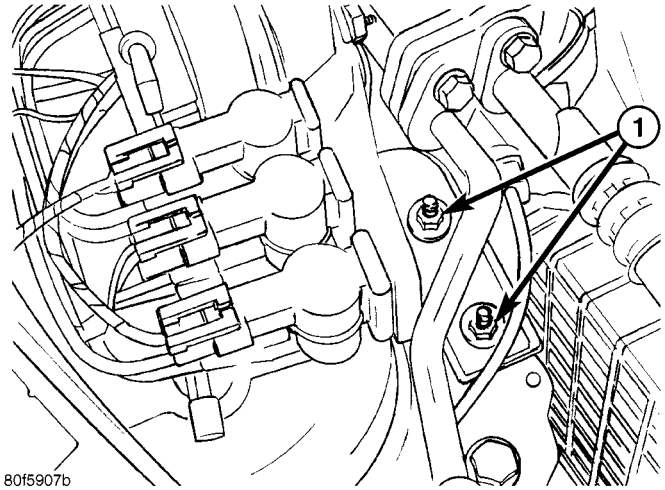

Fig. 47 Solenoid Mounting Bracket

1 - NUTS

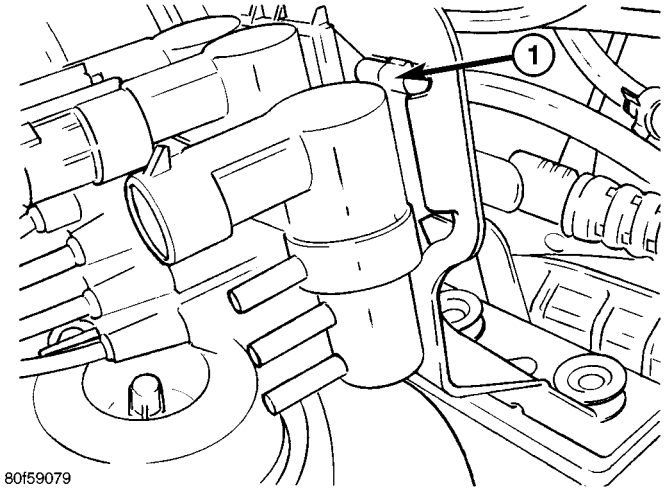

Fig. 48 Solenoid Lock Tab

1 - LOCK TAB

INSTALLATION

(1) Slide solenoid onto mounting bracket until lock tab engages (Fig. 48).

(2) Connect vacuum harness connector to solenoid.

(3) Connect solenoid electrical connector.

(4) Install nuts securing solenoid mounting bracket to shock tower (Fig. 47).

FRONT BUMPER REINFORCEMENT

REMOVAL

(1) Remove grille (Refer to 23 - BODY/EXTERIOR/GRILLE - REMOVAL).

(2) Remove front fascia (Refer to 13 - FRAME & BUMPERS/BUMPERS/FRONT FASCIA - REMOVAL).

(3) Remove bolts attaching reinforcement to the rail assembly and Remove reinforcement (Fig. 1).

(4) Remove bumper reinforcement from vehicle.

INSTALLATION

(1) Place bumper reinforcement in position (Fig. 1).

(2) Install bolts attaching reinforcement to rail assembly.

(3) Install front fascia (Refer to 13 - FRAME & BUMPERS/BUMPERS/FRONT FASCIA - INSTALLATION).

(4) Install grille (Refer to 23 - BODY/EXTERIOR/GRILLE - INSTALLATION).

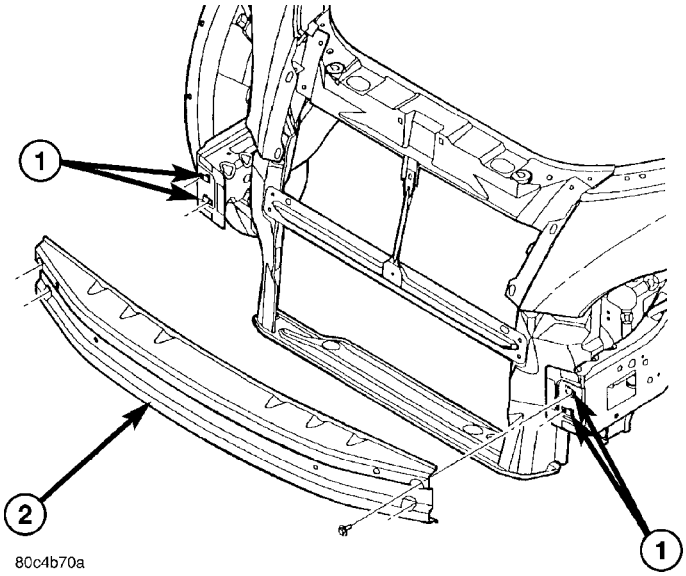

Fig. 1 Front Bumper Reinforcement

1 - U-NUT(S)
2 - FRONT BUMPER FASCIA REINFORCEMENT

FRONT BUMPER FASCIA

REMOVAL

(1) Remove grille. (Refer to 23 - BODY/EXTERIOR/GRILLE - REMOVAL).

(2) Remove three screws attaching splash shield to fascia to access fender flange on each side of vehicle.

(3) Remove spring nuts fasteners attaching fascia to fender flange (Fig. 2).

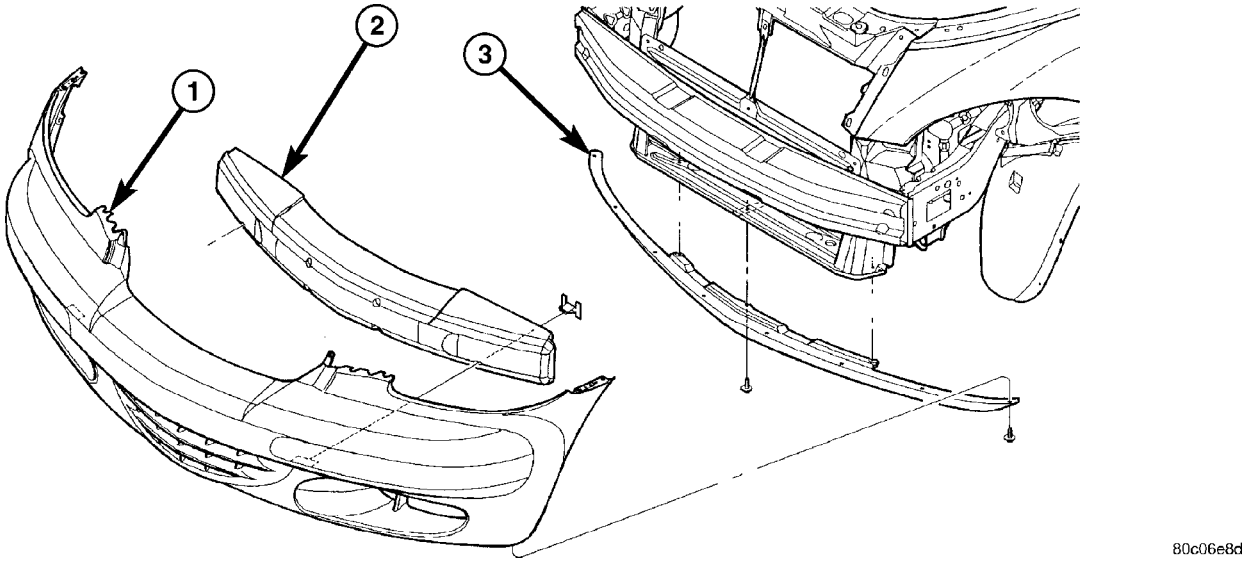

Fig. 2 FRONT BUMPER FASCIA

1 - FRONT BUMPER FASCIA
2 - FRONT BUMPER ENERGY FOAM
3 - RADIATOR AIR DAM

FRONT BUMPER FASCIA (Continued)

(4) Raise and support vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE).

(5) Remove three screws attaching air dam and lower fascia to the radiator support crossmember.

(6) Lower vehicle.

(7) Remove two fasteners attaching fascia to the fender bracket (Fig. 3).

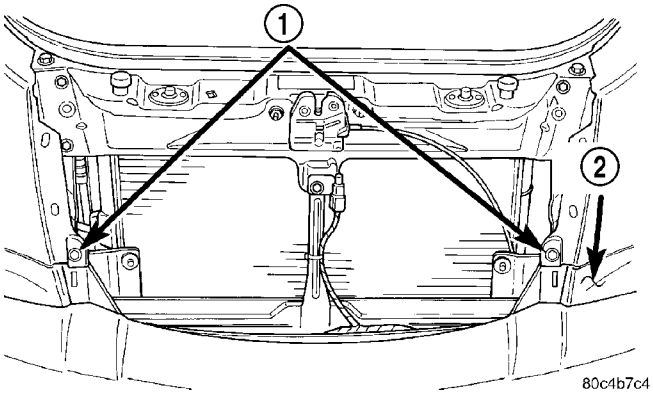

Fig. 3 FRONT FASCIA ATTACHING POINTS

1 - ATTACHING POINTS
2 - FRONT FASCIA

(8) Remove fascia to access the fog lamp wire connectors and disconnect, if equipped.

(9) Remove fascia from vehicle.

(10) Move fascia to a bench.

(11) Remove the air dam, retaining fasteners, foam, and fog lamps if equipped. (Refer to 23 - BODY/EXTERIOR/GRILLE - LOWER RADIATOR REMOVAL).

(12) Remove lower radiator grille, if equipped (Fig. 4).

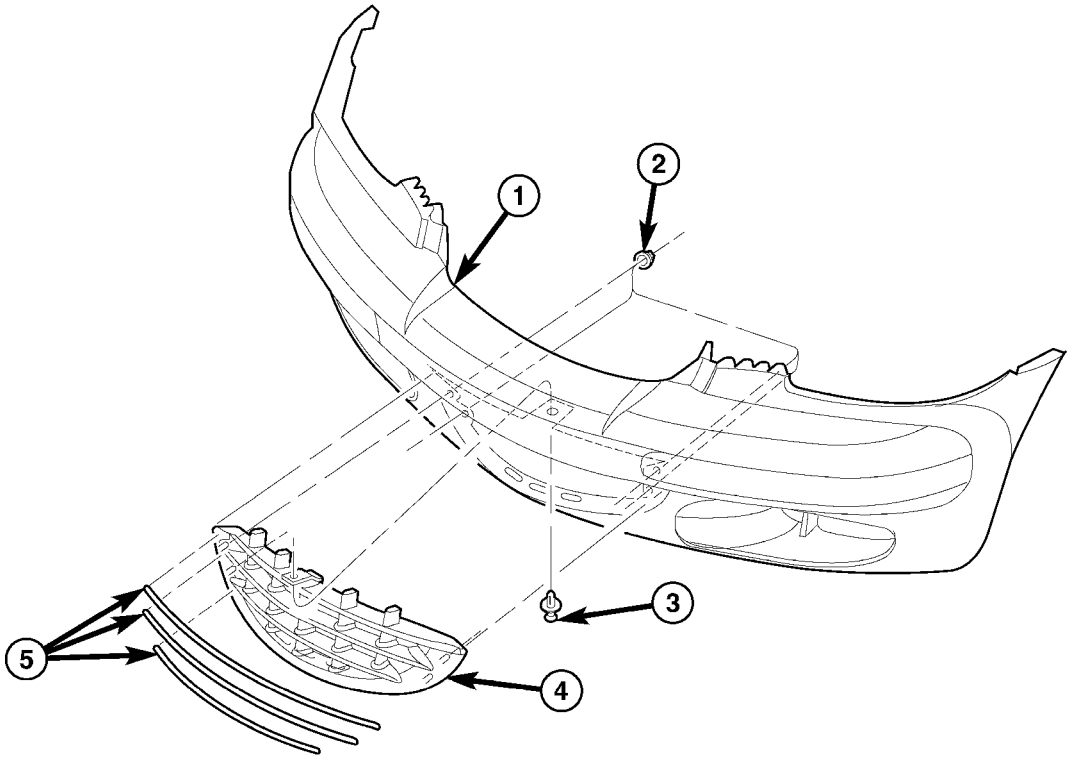

Fig. 4 FRONT FASCIA - LOWER GRILLE CHROME A

1 - FRONT FASCIA
2 - SPRING NUTS (6)
3 - PUSH PIN FASTENER
4 - LOWER RADIATOR GRILLE
5 - CHROME STRIPS

INSTALLATION

(1) Place fascia on a work bench

(2) Install lower radiator grille chrome strips, if equipped. Place chrome strip into position, and press on chrome strip until it is locked into position.

(3) Install lower radiator grille, if equipped (Fig. 5). (Refer to 23 - BODY/EXTERIOR/GRILLE - LOWER RADIATOR - INSTALLATION).

(4) Install air dam, retainer fasteners, foam and fog lamps if equipped (Fig. 7).

(5) Place fascia in position and connect fog lamp wire connectors.

(6) Install two fasteners attaching fascia to the fender bracket (Fig. 6).

(7) Raise and support vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE).

(8) Install three screws attaching air dam and lower fascia to the radiator support crossmember.

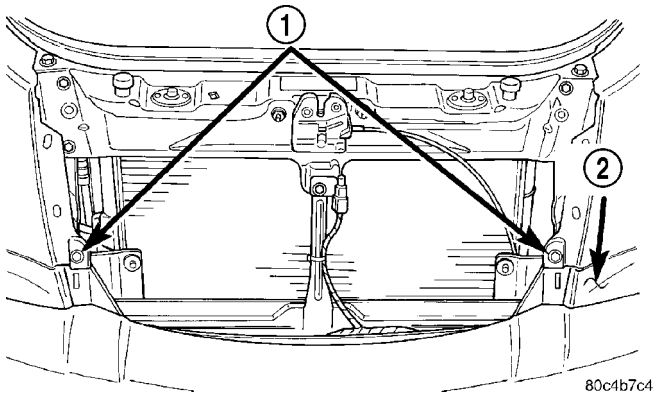

Fig. 6 FRONT FASCIA ATTACHING POINTS

3 - RADIATOR AIR DAM

(9) Install spring nuts fasteners attaching fascia to fender flange (Fig. 7).

(10) Install three screws attaching splash shield to fascia on each side of vehicle.

(11) Lower vehicle.

(12) Install radiator grille. (Refer to 23 - BODY/EXTERIOR/GRILLE - RADIATOR - INSTALLATION)

REAR BUMPER FASCIA

REMOVAL

(1) Open liftgate.

(2) Remove the rubber body plugs or mastic tape patches, if equipped.

(3) Remove nuts attaching fascia to lower floor closure (Fig. 8) and (Fig. 9).

(4) Raise vehicle on hoist.

(5) Disconnect license lamp.

(6) Remove splash shield from fascia in the wheel opening area (Refer to 23 - BODY/EXTERIOR/FRONT END SPLASH SHIELDS - REMOVAL).

(7) Remove screws attaching fascia to lower quarter panels.

(8) Remove fascia from vehicle.

INSTALLATION

(1) Position fascia on vehicle (Fig. 8) and (Fig. 9).

(2) Position fascia slots to push pins on lower quarter panels

(3) Slide fascia forward on push pins

(4) Install screws attaching fascia to lower quarter panels.

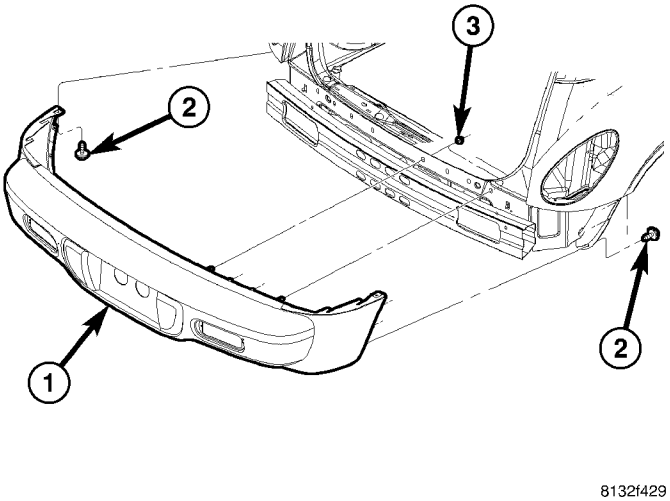

Fig. 8 REAR BUMPER FASCIA

1 - REAR BUMPER FASCIA
2 - ATTACHING SCREW
3 - STUD PLATE TO REAR FASCIA NUT

(5) Install splash shield in the wheel opening area (Refer to 23 - BODY/EXTERIOR/FRONT END SPLASH SHIELDS - INSTALLATION).

(6) Connect license lamp.

(7) Lower vehicle.

(8) Install nuts attaching fascia to lower floor closure.

REAR BUMPER FASCIA (Continued)

4 - REAR FASCIA TO CLOSURE STUD PLATE
5 - REAR BUMPER FASCIA

(9) Install the rubber body plugs or install new mastic tape patches, if equipped.

(10) Close liftgate.

REAR BUMPER REINFORCEMENT

REMOVAL

(1) Remove rear fascia (Refer to 13 - FRAME & BUMPERS/BUMPERS/REAR BUMPER - REMOVAL).

(2) Remove bolts attaching reinforcement to rear closure panel (Fig. 10).

(3) Remove bumper reinforcement from vehicle.

INSTALLATION

(1) Position bumper reinforcement to vehicle (Fig. 10).

(2) Install bolts attaching reinforcement to rear closure panel.

(3) Install rear fascia.

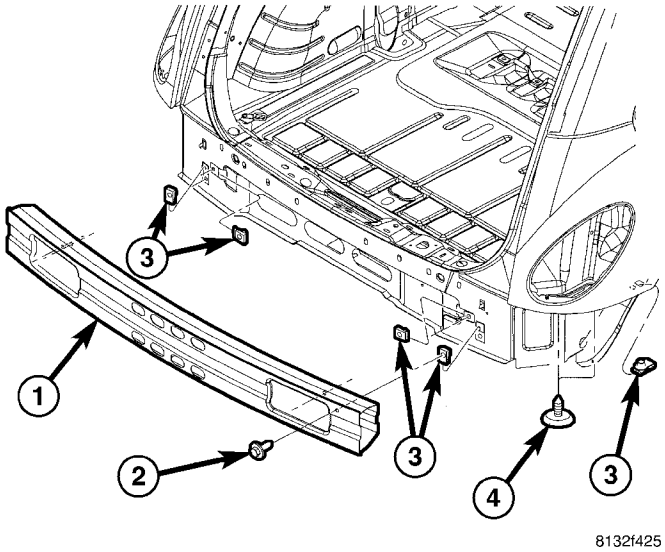

Fig. 10 REAR BUMPER REINFORCEMENT

FRAME

SPECIFICATIONS

SPECIFICATIONS - FRAME DIMENSIONS

Frame dimensions are listed in metric scale. All dimensions are from center to center of Principal Locating Point (PLP), or from center to center of PLP and fastener location.

VEHICLE PREPARATION

Position the vehicle on a level work surface. Using screw or bottle jacks, adjust the vehicle PLP heights to the specified dimension above a level work surface. Vertical dimensions can be taken from the work surface to the locations indicated were applicable.

FRONT CROSSMEMBER

REMOVAL

CAUTION: If the front suspension crossmember is being replaced due to collision damage, inspect the steering column lower coupling for damage. Refer to STEERING COLUMN in the STEERING section for the procedure.

(1) Raise the vehicle. Refer to HOISTING in the LUBRICATION AND MAINTENANCE area in this service manual for the correct lifting procedure.

(2) Remove both front tire and wheel assemblies from the vehicle.

(3) Remove both stabilizer bar links from the vehicle (Fig. 17). Remove each link by holding the upper retainer/nut with a wrench and turning the link bolt.

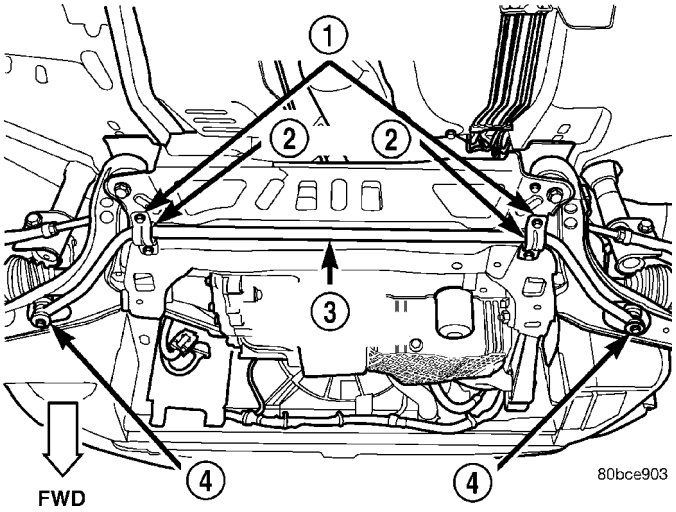

Fig. 17 Stabilizer Bar

1 - STABILIZER BAR CUSHION RETAINERS
2 - CUSHIONS
3 - FRONT STABILIZER BAR
4 - STABILIZER BAR LINKS

(4) Remove the stabilizer bar cushion retainer bolts and retainers (Fig. 17) , and remove the stabilizer bar with cushions attached from the vehicle.

(5) Remove the nut and pinch bolt clamping each ball joint stud to the steering knuckle (Fig. 18).

CAUTION: After removing the steering knuckle from the ball joint stud, do not pull outward on the knuckle. Pulling the steering knuckle outward at this point can separate the inner C/V joint on the driveshaft. Refer to FRONT DRIVESHAFTS in the DIFFERENTIAL AND DRIVELINE area for further information.

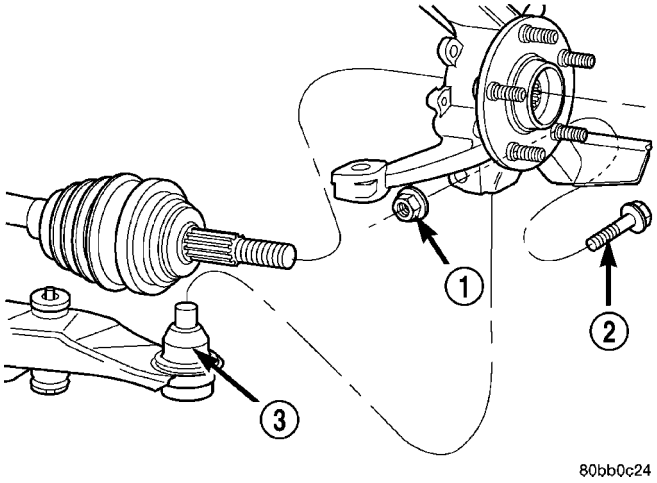

Fig. 18 Ball Joint Bolt And Nut

1 - NUT
2 - BOLT
3 - BALL JOINT

NOTE: Use caution when separating the ball joint stud from the steering knuckle, so the ball joint seal does not get cut.

(6) Separate each ball joint stud from the steering knuckle by prying down on lower control arm and up against the ball joint boss on the steering knuckle (Fig. 19).

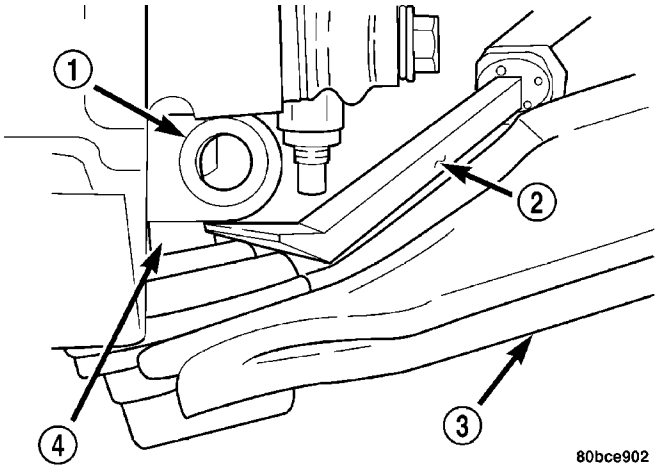

Fig. 19 Pry Bar Usage

1 - STEERING KNUCKLE
2 - PRY BAR
3 - LOWER CONTROL ARM
4 - BALL JOINT STUD

FRONT CROSSMEMBER (Continued)

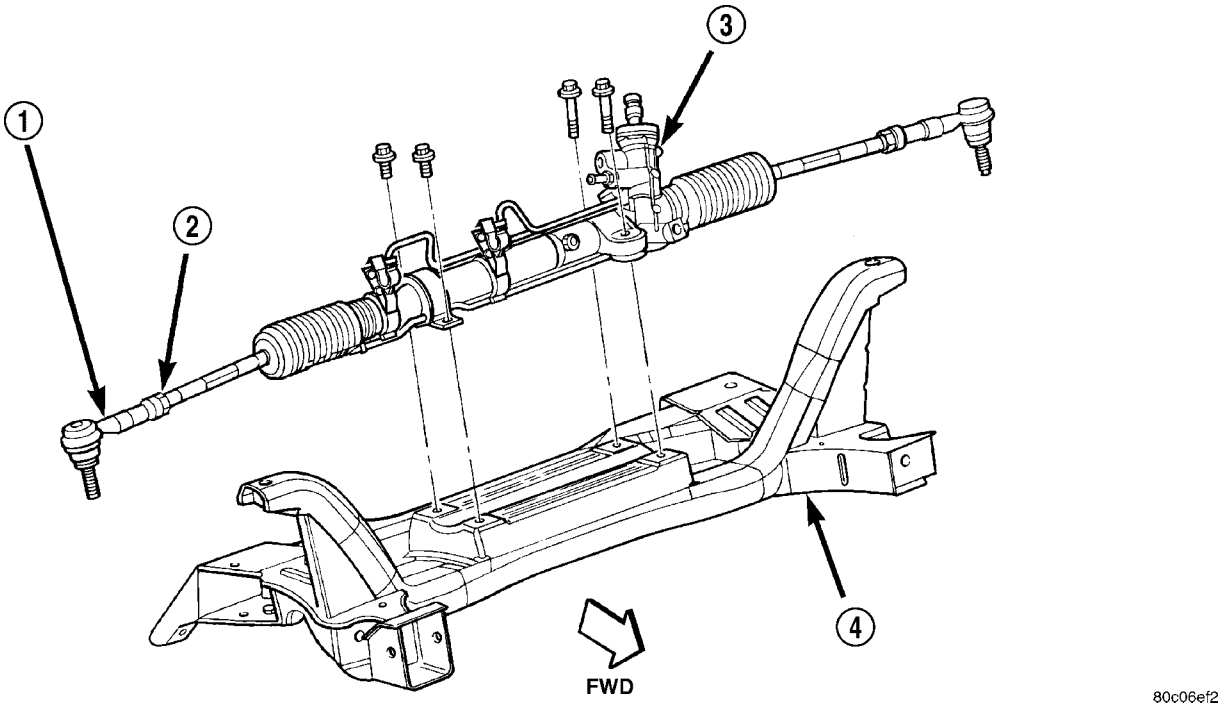

Fig. 20 Steering Gear

1 - OUTER TIE ROD
2 - JAM NUT
3 - STEERING GEAR
4 - FRONT SUSPENSION CROSSMEMBER

(7) Remove the two screws securing the cooler to the front suspension crossmember. They are located behind the cooler and can be accessed from above. Allow the cooler to hang out of the way.

(8) Using wire or a bungee cord, support and tie off the power steering gear to the underbody of the vehicle, so when the crossmember is lowered, the gear does not fall away, being held to the vehicle by only the steering column coupling and the fluid hoses.

(9) Loosen and remove the four bolts attaching the power steering gear to the front suspension crossmember (Fig. 20). Remove the power steering gear from the front suspension crossmember.

(10) Remove the pencil strut from the right front corner of the crossmember and body of the vehicle. (Fig. 21). Remove the washer behind the strut from the torque strut bolt.

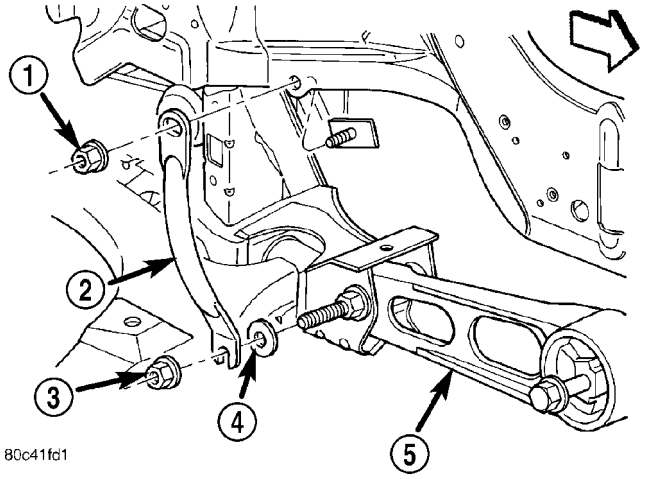

Fig. 21 Strut Mounting

1 - NUT
2 - PENCIL STRUT
3 - NUT
4 - FLAT WASHER
5 - LOWER TORQUE STRUT

FRONT CROSSMEMBER (Continued)

(11) Remove the screws fastening the front fascia to the reinforcement as necessary in order to access the drive-belt splash shield forward fastener screw (Fig. 22).

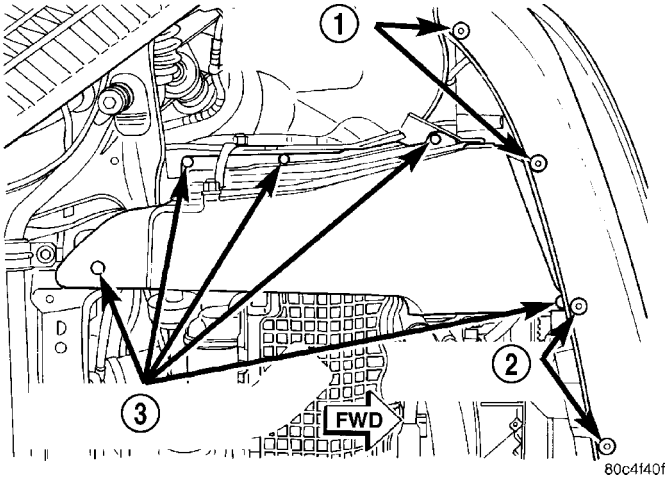

Fig. 22 Fascia And Splash Shield Fasteners

1 - FASCIA FASTENERS
2 - FASCIA FASTENERS
3 - SPLASH SHIELD FASTENERS

(12) Remove the drive-belt splash shield fasteners (Fig. 22). Remove the shield.

(13) Remove the bolt mounting the engine torque strut to the right forward corner of the front suspension crossmember (Fig. 21).

NOTE: Before removing the front suspension crossmember from the vehicle, the location of the crossmember must be scribed on the body of the vehicle. Do this so that the crossmember can be relocated upon reinstallation against the body of vehicle in the same location as before removal. If the front suspension crossmember is not reinstalled in exactly the same location as before removal, the preset front wheel alignment settings (caster and camber) will be lost.

(14) Using an awl, scribe a line marking the location of the front suspension crossmember where it is mounted against the body of the vehicle (Fig. 23).

(15) Position a transmission jack under the center of the front suspension crossmember and raise it to support the bottom of the crossmember.

(16) Loosen all six bolts attaching the front suspension crossmember and lower control arms to the body of the vehicle. Do not completely remove the two bolts going through the lower control arm rear isolator bushings. They are designed to disengage from the body threads yet stay within the lower control arm rear isolator bushing. Back the two bolts out just enough to disengage the tapping plates in the body of the vehicle. Completely remove the other four bolts.

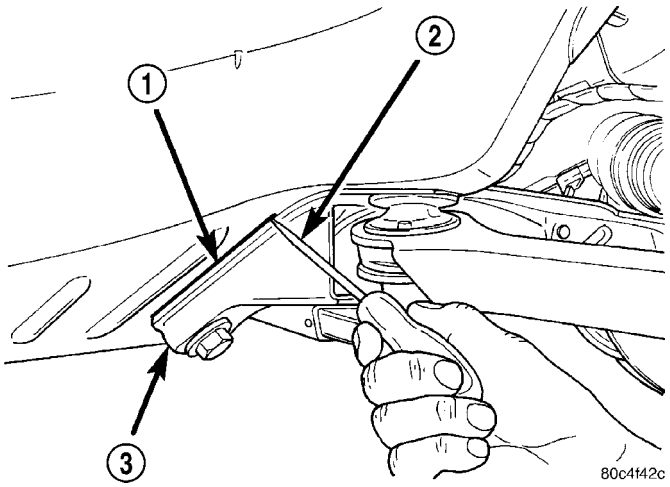

Fig. 23 Marking Crossmember Location

1 - SCRIBED LINE
2 - AWL
3 - CROSSMEMBER

(17) Lower the front suspension crossmember.

(18) Remove each lower control arm from the crossmember by removing the pivot bolts.

INSTALLATION

CAUTION: If the front suspension crossmember is being replaced due to collision damage, inspect the steering column lower coupling for damage. Refer to STEERING COLUMN in the STEERING section for the procedure.

(1) Install the lower control arms on the front suspension crossmember. Install the pivot bolts, but do not completely tighten them at this time.

(2) Using the transmission jack, raise the front suspension crossmember and lower control arms until the crossmember contacts its mounting spot against the body and frame rails of the vehicle. As the crossmember is raised, carefully guide the power steering gear into mounting position.

(3) Start the two crossmember mounting bolts through the lower control arm rear isolator bushings into the tapping plates mounted in the body. Next, install the two front and the two rear mounting bolts attaching front suspension crossmember to frame rails of vehicle. Lightly tighten all six mounting bolts to approximately 2 N·m (20 in. lbs.) to hold the front suspension crossmember in position at this time.

FRONT CROSSMEMBER (Continued)

NOTE: When reinstalling the front suspension crossmember back in the vehicle, it is very important that the crossmember be attached to the body in exactly the same spot as when it was removed. Otherwise, the vehicle's wheel alignment settings (caster and camber) will be lost.

(4) Using a soft face hammer, tap the front suspension crossmember back-and-forth or side-to-side until it is aligned with the previously scribed positioning marks on the body of the vehicle (Fig. 23). Once the front suspension crossmember is correctly positioned, tighten the two crossmember mounting bolts through the lower control arm rear isolator bushings to a torque of 250 N·m (185 ft. lbs.), then tighten the four remaining crossmember mounting bolts to a torque of 153 N·m (120 ft. lbs.).

(5) Tighten the lower control arm front pivot bolts to a torque of 163 N·m (120 ft. lbs.).

(6) Remove the wire or bungee cord suspending the power steering gear to the underbody.

(7) Attach the steering gear to the front suspension crossmember (Fig. 20). Install the four power steering gear mounting bolts. Tighten the mounting bolts to a torque of 61 N·m (45 ft. lbs.).

(8) Install the two screws securing the cooler to the front suspension crossmember. They are located behind the cooler.

(9) Install each ball joint stud into the steering knuckle aligning the bolt hole in the knuckle boss with the notch formed in the side of the ball joint stud.

(10) Install a new ball joint stud pinch bolt and nut (Fig. 18). Tighten the nut to a torque of 95 N·m (70 ft. lbs.).

(11) Fasten the engine torque strut to the right forward corner of the front suspension crossmember using its mounting bolt (Fig. 21). Follow the procedure described in the ENGINE service manual area to properly align and tighten the torque strut and it's mounting bolts.

(12) Install the washer on the end of the stud extending from the torque strut bolt (Fig. 21).

(13) Install the pencil strut to the right front corner of the crossmember and body of the vehicle (Fig. 21). Tighten the pencil strut nuts to a torque of 58 N·m (43 ft. lbs.).

(14) Install the drive-belt splash shield and fasteners (Fig. 22).

(15) Install the screws fastening the front fascia to the reinforcement (Fig. 22).

NOTE: Before installing the stabilizer bar, make sure the bar is not upside-down. The stabilizer bar must be installed with the curve on the outboard ends of the bar facing downward to clear the control arms once fully installed (Fig. 24).

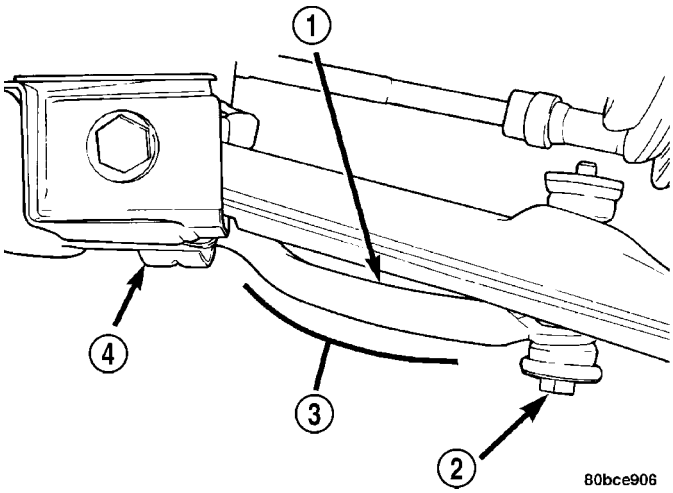

Fig. 24 Downward Curve

1 - STABILIZER BAR
2 - LINK
3 - DOWNWARD CURVE
4 - CUSHION RETAINER

(16) First, place the stabilizer bar in position on the front suspension crossmember. The slits in each cushion must point toward the front of the vehicle and sit directly on top of the raised beads formed into the stamping on the crossmember. Next, install the cushion retainers, matching the raised beads formed into the cushion retainers to the grooves formed into the cushions. Install the cushion retainer bolts, but do not completely tighten them at this time.

(17) Install both stabilizer bar links back on vehicle (Fig. 17). Start each stabilizer bar link bolt with bushing from the bottom, through the stabilizer bar, inner link bushings, lower control arm, and into the upper retainer/nut and bushing. Do not fully tighten the link assemblies at this time.

(18) Install the tire and wheel assemblies back on vehicle. Tighten the wheel mounting nuts to 135 N·m (100 ft. lbs.) torque.

(19) Lower the vehicle.

NOTE: It may be necessary to put the vehicle on a platform hoist or alignment rack to gain access to the stabilizer bar mounting bolts with the vehicle at curb height.

(20) Tighten each stabilizer bar link by holding the upper retainer/nut with a wrench and turning the link bolt. Tighten each link bolt to a torque of 28 N·m (250 in. lbs.).

(21) Tighten the stabilizer bar cushion retainer bolts to a torque of 28 N·m (250 in. lbs.).

(22) Check the front wheel alignment on the vehicle. Refer to WHEEL ALIGNMENT in the SUSPENSION service manual area.

FRONT EMERGENCY TOW EYE

REMOVAL

(1) The front tow eye contains left hand threads, simply unthread the tow eye from the tow eye bracket (Fig. 25).

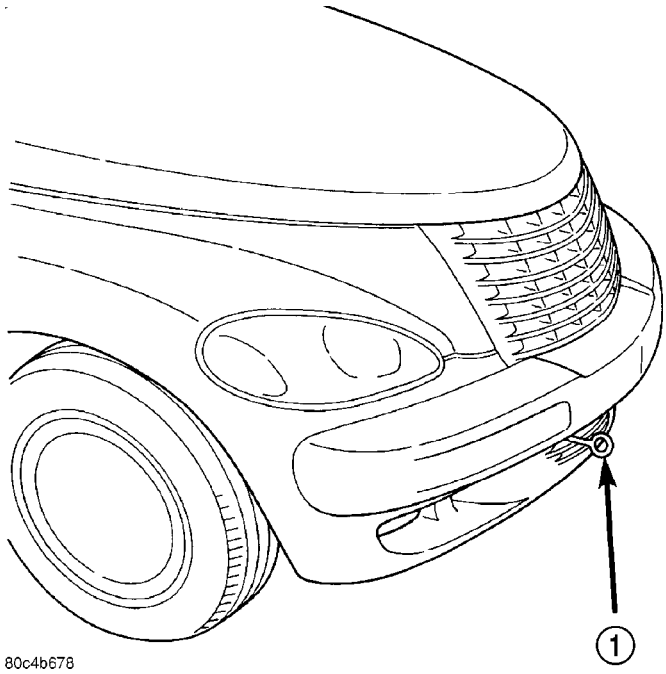

Fig. 25 Emergency Front Tow Eye

1 - FRONT TOW EYE

INSTALLATION

(1) Lubricate the threads and install the front tow eye in the front tow eye bracket. Tighten tow eye until firmly seated against bracket (Fig. 26). No torque specification is required.

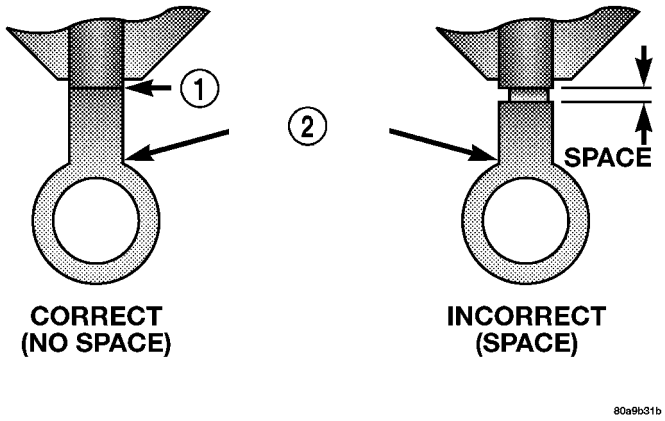

Fig. 26 Front Tow Eye Installation

1 - NO SPACE
2 - TOW HOOK

REAR EMERGENCY TOW EYE

REMOVAL

(1) Raise the vehicle on hoist. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE).

(2) Remove four bolts attaching rear side rail tow hook to rear frame rail (Fig. 27).

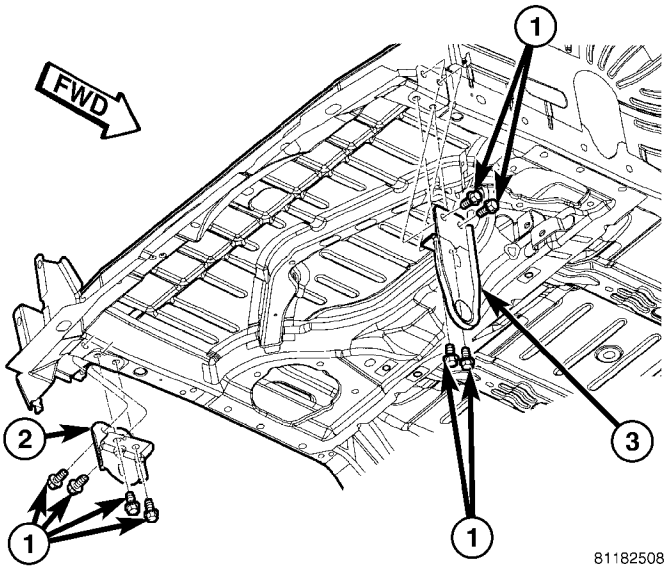

Fig. 27 REAR SIDE RAIL TOW HOOK

1 - ATTACHING BOLTS
2 - LEFT REAR SIDE RAIL SHIPPING TIE DOWN BRACKET
3 - REAR SIDE RAIL TOW HOOK

INSTALLATION

(1) Place rear side rail tow hook into position on the rear frame rail (Fig. 27).

(2) Install four bolts attaching rear side rail tow hook to rear frame rail. Tighten bolts to 68 N·m (50 ft. lbs.) torque.

(3) Lower the vehicle from hoist.

SIDE RAIL TIE DOWN BRACKET

REMOVAL

(1) Raise the vehicle on hoist. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE).

(2) Remove the four bolts attaching rear side rail shipping tie down bracket (Fig. 28).

INSTALLATION

(1) Place rear side rail shipping tie down bracket into position the rear frame rail (Fig. 28).

(2) Install the four bolts attaching rear side rail shipping tie down bracket to rear frame rail. Tighten bolts to 68 N·m (50 ft. lbs.) torque.

(3) Lower the vehicle from hoist.

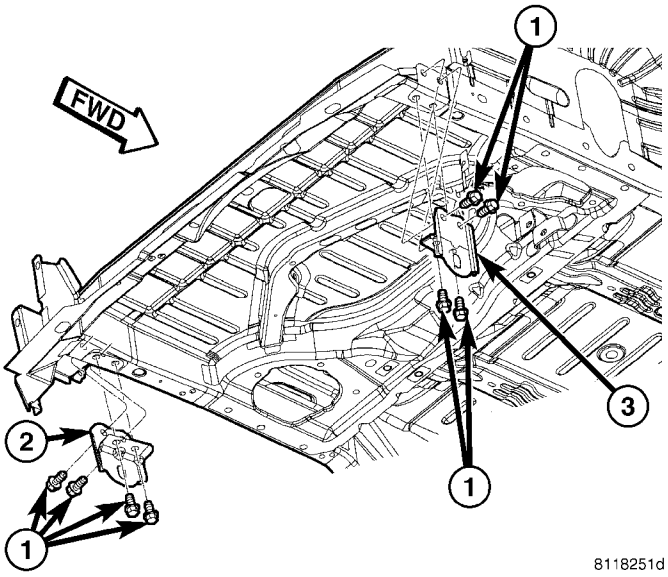

Fig. 28 REAR SIDE RAIL SHIPPING TIE DOWN BRACKET

FUEL DELIVERY

DESCRIPTION

The front wheel drive car uses a plastic fuel tank located rear center of the vehicle.

The Fuel Delivery System consists of: the following items:

- Electric fuel pump module
- Fuel filter
- Tubes/lines/hoses
- Fuel injectors

The in-tank fuel pump module contains the fuel pump. The pump is serviced as part of the fuel pump module. Refer to Fuel Pump Module.

The fuel filter is not serviceable, it is mounted on the inside of the fuel tank in the fuel pump module.

OPERATION

The fuel system provides fuel pressure by an in-tank pump module. The PCM controls the operation of the fuel system by providing battery voltage to the fuel pump through the fuel pump relay. The PCM requires only three inputs and a good ground to operate the fuel pump relay. The three inputs are:

- Ignition voltage
- Crankshaft Position (CKP) sensor
- Camshaft Position (CMP) sensor

DIAGNOSIS AND TESTING - FUEL DELIVERY SYSTEM

(Refer to Appropriate Diagnostic Information)

STANDARD PROCEDURE

STANDARD PROCEDURE - FUEL SYSTEM PRESSURE RELEASE PROCEDURE

(1) Remove Fuel Pump relay from Power Distribution Center (PDC). For location of relay, refer to label on underside of PDC cover.

(2) Start and run engine until it stalls.

(3) Attempt restarting engine until it will no longer run.

(4) Turn ignition key to OFF position.

(5) Return fuel pump relay to PDC.

(6) One or more Diagnostic Trouble Codes (DTC's) may have been stored in PCM memory due to fuel pump relay removal. The DRB III® scan tool must be used to erase a DTC.

STANDARD PROCEDURE - DRAINING FUEL TANK

Two different procedures may be used to drain fuel tank (lowering tank or using DRBIII® scan tool).

The quickest draining procedure involves lowering the fuel tank.

WARNING: RELEASE FUEL SYSTEM PRESSURE BEFORE SERVICING FUEL SYSTEM COMPONENTS. SERVICE VEHICLES IN WELL VENTILATED AREAS AND AVOID IGNITION SOURCES. NEVER SMOKE WHILE SERVICING THE VEHICLE. THIS MAY RESULT IN PERSONAL INJURY OR DEATH.

As an alternative procedure, the electric fuel pump may be activated allowing tank to be drained at fuel rail connection. Refer to DRBIII® scan tool for fuel pump activation procedures. Before disconnecting fuel line at fuel rail, release fuel pressure. Refer to the Fuel System Pressure Release Procedure in this group for procedures. Disconnect the fuel line at the fuel rail and remove the plastic retainer from the fuel rail. Take plastic retainer and install it back into the fuel line from body. Attach end of special test hose tool number 6539 at fuel line connection from the body line. Position opposite end of this hose tool to an approved gasoline draining station. Activate fuel pump and drain tank until empty. When done remove the special test hose tool number 6539 from the body line. Remove the plastic retainer from the special test hose tool number 6539 and reinstall it into the fuel line from the body. Install the fuel line to the fuel rail.

If electric fuel pump is not operating, tank must be lowered for fuel draining. Refer to following procedures.

(1) Remove fuel filler cap.

(2) Perform the Fuel System Pressure Release procedure.

(3) Disconnect negative cable from battery.

(4) Raise vehicle and support.

(5) Certain models are equipped with a separate grounding wire (strap) connecting the fuel fill tube assembly to the body. Disconnect wire by removing screw.

(6) Open fuel fill door and remove screws mounting fuel filler tube assembly to body. Do not disconnect rubber fuel fill or vent hoses from tank at this time.

(7) Place a transmission jack under center of fuel tank. Apply a slight amount of pressure to fuel tank with transmission jack.

(8) Remove fuel tank mounting strap nuts from mounting strap studs.

(9) **Lower the tank just enough so that the filler tube fitting is the highest point of the fuel tank.**

(10) Remove filler tube from fuel tank. Tank will be drained through this fitting.

FUEL DELIVERY (Continued)

NOTE: WRAP SHOP TOWELS AROUND HOSES TO CATCH ANY GASOLINE SPILLAGE.

(11) Drain fuel tank into holding tank or a properly labeled **Gasoline** safety container.

WARNING: GASOLINE OR GASOLINE VAPORS ARE HIGHLY FLAMMABLE. A FIRE COULD OCCUR IF AN IGNITION SOURCE IS PRESENT. NEVER DRAIN OR STORE GASOLINE OR DIESEL FUEL IN AN OPEN CONTAINER, DUE TO THE POSSIBILITY OF FIRE OR EXPLOSION. THIS MAY RESULT IN PERSONAL INJURY OR DEATH.

(12) If fuel pump module removal is necessary, refer to Fuel Pump Module Removal/Installation in this section.

FUEL FILTER

DESCRIPTION

The fuel filter mounts inside the fuel pump module and is a non-serviceable part.

FUEL LEVEL SENDING UNIT / SENSOR

DESCRIPTION

The fuel gauge level sending unit is attached to the side of fuel pump module. The level sensor is a variable resistor.

OPERATION

Its resistance changes with the amount of fuel in the tank. The float arm attached to the sensor moves as the fuel level changes.

The fuel level input is used as an input for OBD II. If the fuel level is below 15% or above 85% of total tank capacity several monitors are disabled. There are diagnostics for the level circuit open and shorted.

REMOVAL

(1) Remove fuel pump module. Refer to Fuel Pump Module in this section.

(2) Depress retaining tab and remove the fuel pump/level sensor connector from the **BOTTOM** of the fuel pump module electrical connector (Fig. 1).

NOTE: The pump module harness on TOP of flange is not serviceable or removable.

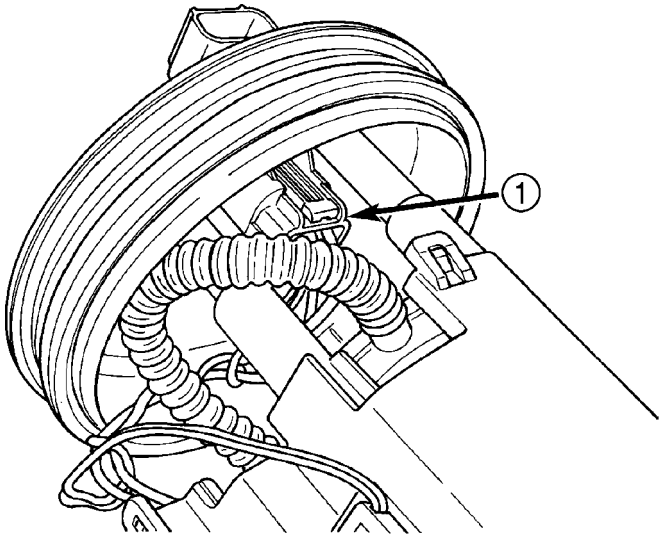

Fig. 1 Fuel Pump/Level Sensor Electrical Connector

1 - ELECTRICAL CONNECTOR

(3) Remove the wedge lock from the electrical connector (Fig. 2).

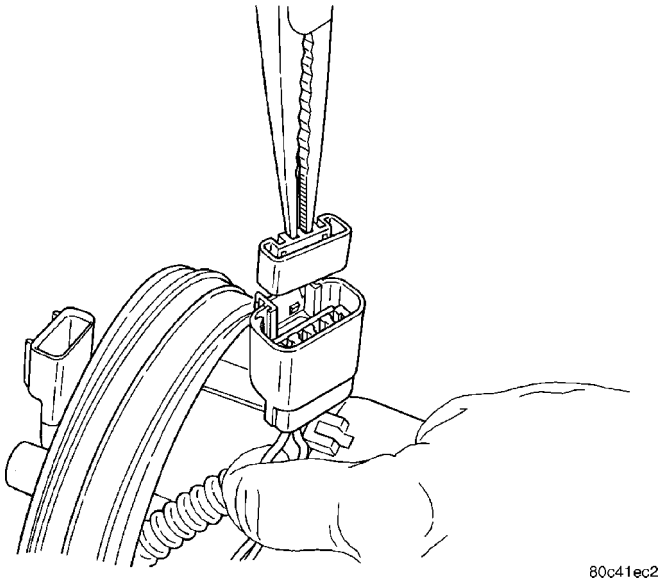

Fig. 2 Wedge Lock

FUEL LEVEL SENDING UNIT / SENSOR (Continued)

(4) Using Special Tool C-4334 terminal remover or equivalent, remove terminals from level sensor connector (Fig. 3).

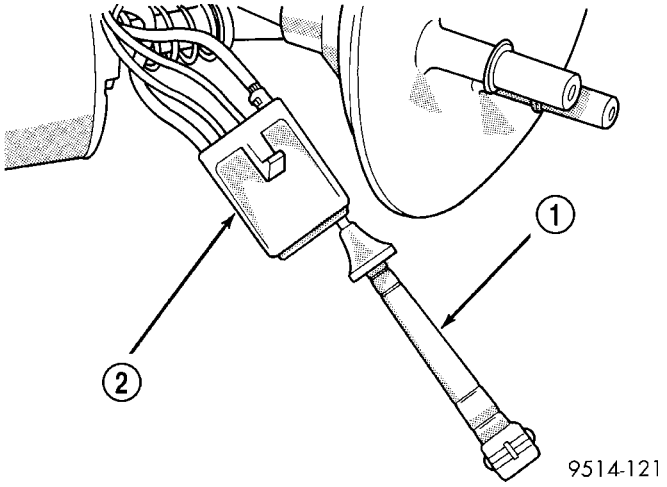

Fig. 3 Terminal Removal Tool-Tyipcal

(5) Depress the tab and slide the sensor toward the bottom of the fuel pump module (Fig. 4).

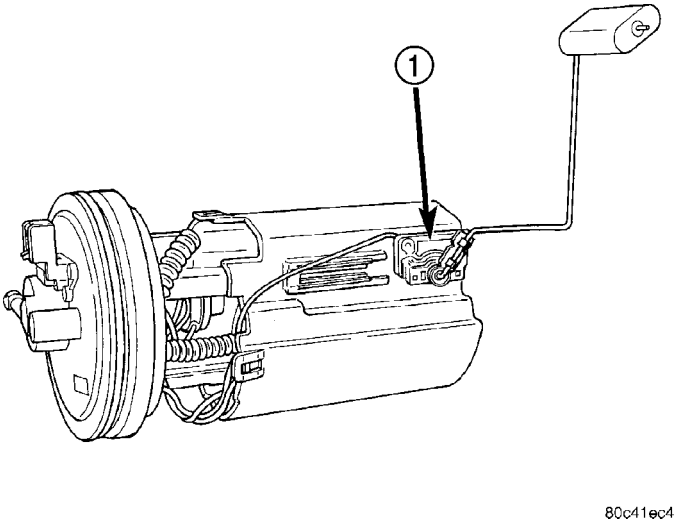

Fig. 4 Level Sensor

1 - FUEL LEVER SENSOR

(6) Slide level sensor out of channel in module.

INSTALLATION

(1) Wrap wires into groove in back of level sensor (Fig. 5).

(2) While feeding wires into guide grooves, slide level sensor up into channel until it snaps into place (Fig. 4). Ensure tab at bottom of sensor locks in place.

(3) Install level sensor wires in connector. Push the wires up through the connector and then pull them down until they lock in place. Ensure signal and ground wires are installed in the correct position refer to the Wiring section.

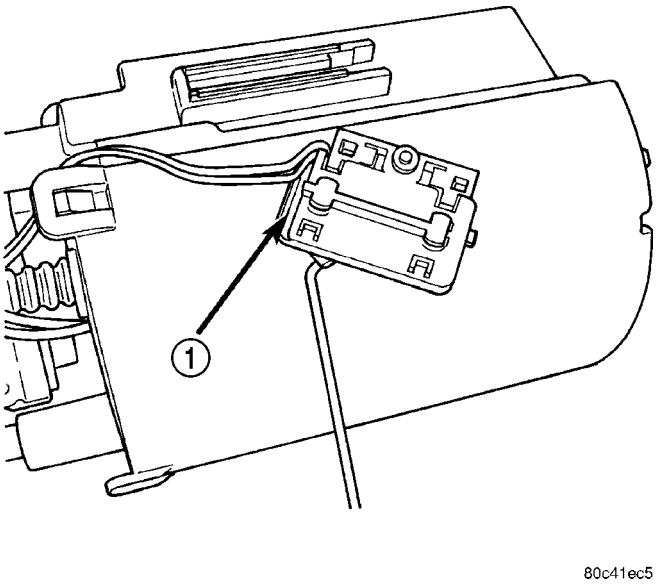

Fig. 5 Groove in Back Side of Level Sensor

1 - WIRING GROOVE

(4) Install locking wedge on connector (Fig. 2).

(5) Push connector up into bottom of fuel pump module electrical connector (Fig. 1).

(6) Install fuel pump module. Refer to Fuel Pump Module in this section.

FUEL LINES

DESCRIPTION - FUEL LINES/HOSES AND CLAMPS

Also refer to Quick-Connect Fittings.

WARNING: THE FUEL SYSTEM IS UNDER A CONSTANT PRESSURE (EVEN WITH THE ENGINE OFF). BEFORE SERVICING ANY FUEL SYSTEM HOSES, FITTINGS OR LINES, THE FUEL SYSTEM PRESSURE MUST BE RELEASED. REFER TO THE FUEL SYSTEM PRESSURE RELEASE PROCEDURE IN THIS GROUP. THIS MAY RESULT IN PERSONAL INJURY OR DEATH.

The lines/tubes/hoses used on fuel injected vehicles are of a special construction. This is due to the higher fuel pressures and the possibility of contaminated fuel in this system. If it is necessary to replace these lines/tubes/hoses, only those marked EFM/EFI may be used.

If equipped: The hose clamps used to secure rubber hoses on fuel injected vehicles are of a special rolled edge construction. This construction is used to prevent the edge of the clamp from cutting into the

FUEL LINES (Continued)

hose. Only these rolled edge type clamps may be used in this system. All other types of clamps may cut into the hoses and cause high-pressure fuel leaks.

Use new original equipment type hose clamps.

STANDARD PROCEDURE - HOSES AND CLAMP

Inspect all hose connections (clamps and quick connect fittings) for completeness and leaks. Replace cracked, scuffed, or swelled hoses. Replace hoses that rub against other vehicle components or show sign of wear.

Fuel injected vehicles use specially constructed hoses. When replacing hoses, only use hoses marked EFM/EFI.

When installing hoses, ensure that they are routed away from contact with other vehicle components that could rub against them and cause failure. Avoid contact with clamps or other components that cause abrasions or scuffing. Ensure that rubber hoses are properly routed and avoid heat sources.

The hose clamps have rolled edges to prevent the clamp from cutting into the hose. Only use clamps that are original equipment or equivalent. Other types of clamps may cut into the hoses and cause high pressure fuel leaks. Tighten hose clamps to 1 N·m (9 in. lbs.) torque.

Inspect all hose connections such as clamps, couplings and fittings to make sure they are secure and leaks are not present. The component should be replaced immediately if there is any evidence of degradation that could result in failure.

Never attempt to repair a plastic fuel line/tube. Replace as necessary.

Avoid contact of any fuel tubes/hoses with other vehicle components that could cause abrasions or scuffing. Be sure that the plastic fuel lines/tubes are properly routed to prevent pinching and to avoid heat sources.

FUEL PRESSURE REGULATOR

DESCRIPTION

The fuel pressure regulator contains a diaphragm, calibrated spring and a fuel return valve. The regulator is mounted in the fuel pump module (Fig. 6).

OPERATION

The fuel system uses a nonadjustable pressure regulator that maintains fuel system pressure at approximately 400 ±34 kPa (58 ±5 psi). The fuel pressure regulator contains a diaphragm, calibrated spring and a fuel return valve. The spring pushes down on the diaphragm and closes off the fuel return port. System fuel pressure reflects the amount of fuel pressure required to open the return port.

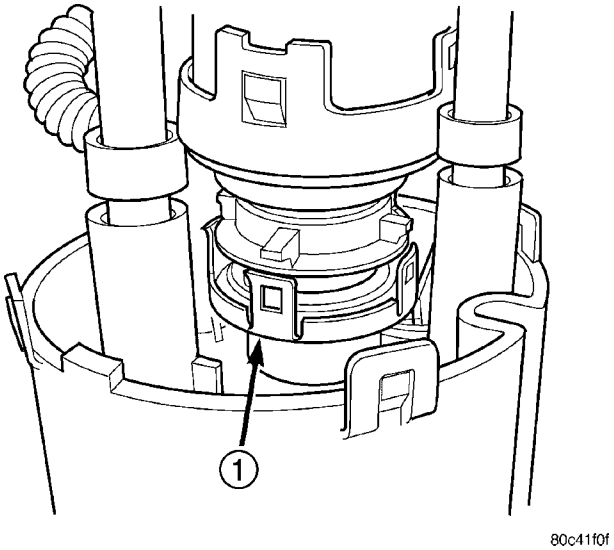

Fig. 6 Fuel Pressure Regulator

1 - FUEL PRESSURE REGULATOR

The pressure regulator is a mechanical device that is NOT controlled by the PCM or engine vacuum.

REMOVAL

The fuel pressure regulator is part of the fuel pump module (Fig. 7). Remove the fuel pump module from the fuel tank to access the fuel pressure regulator. Refer to the Fuel Pump Module removal in this section.

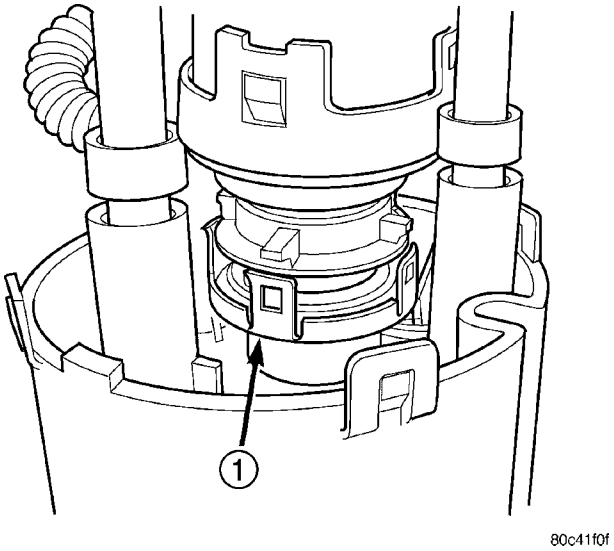

Fig. 7 Fuel Pressure Regulator Retainer

1 - FUEL PRESSURE REGULATOR

WARNING: FUEL SYSTEM PRESSURE MUST BE RELEASED BEFORE SERVICING ANY FUEL SYSTEM COMPONENT. PERFORM THE FUEL SYSTEM PRESSURE RELEASE PROCEDURE. THIS MAY RESULT IN PERSONAL INJURY OR DEATH.

FUEL PRESSURE REGULATOR (Continued)

(1) Spread tangs on pressure regulator retainer (Fig. 7).

(2) Pry fuel pressure regulator out of housing.

(3) Ensure that the O-ring was removed with regulator (Fig. 8).

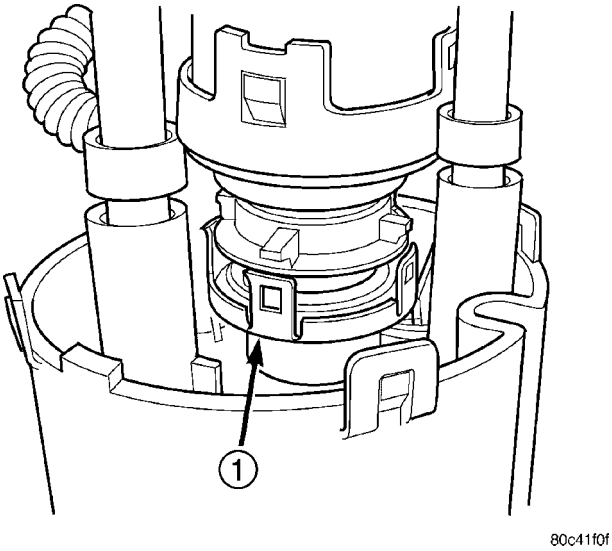

Fig. 8 Fuel Pressure Regulator Retainer

1 - FUEL PRESSURE REGULATOR

INSTALLATION

The fuel pressure regulator is part of the fuel pump module (Fig. 7). Remove the fuel pump module from the fuel tank to access the fuel pressure regulator. Refer to the Fuel Pump Module removal in this section.

(1) Lightly lubricate the O-ring with clean engine oil and place them into opening in pump module.

(2) Push regulator into opening in pump module.

(3) Push regulator retainer over tabs on housing.

(4) Install Fuel Pump Module, refer to the Fuel Pump Module installation in this section.

FUEL PUMP

DESCRIPTION

The electric fuel pump is located in and is part of the fuel pump module. It is a positive displacement, gerotor type, immersible pump with a permanent magnet electric motor. The fuel pump module is suspended in fuel in the fuel tank.

OPERATION

The pump draws fuel through a strainer and pushes it through the motor to the outlet. The pump contains a check valve. The valve, in the pump outlet, maintains pump pressure during engine off conditions, for a short while. It is normal for fuel pressure to drop to zero after cooldown. The fuel pump relay provides voltage to the fuel pump. The fuel pump has a maximum deadheaded pressure output of approximately 880 kPa (130 psi). The regulator adjusts fuel system pressure to approximately 400 kpa ±34 kpa (58 psi ± 5 psi).

NOTE: Checkvalve maintains volume of fuel in the rail and lines, not pressure.

FUEL PUMP MODULE

DESCRIPTION

The fuel pump module is installed in the top of the fuel tank (Fig. 9).

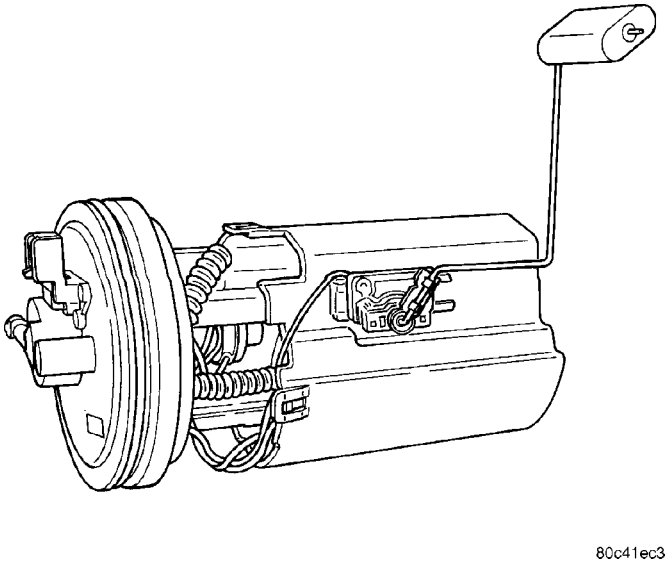

Fig. 9 Fuel Pump Module

The fuel pump module contains the following:

- Electric fuel pump
- Fuel pump reservoir
- Inlet strainer
- Fuel pressure regulator
- Fuel gauge sending unit
- Fuel supply line connection
- Fuel Filter

The fuel level sensor and the pressure regulator are the only serviceable items. If the fuel pump or electrical wiring harness requires service, replace the fuel pump module.

OPERATION

The pump draws fuel through a strainer and pushes it through the motor to the outlet. The pump contains one check valve. The check valve, in the pump outlet, maintains pump pressure during engine off conditions. The fuel pump relay provides voltage to the fuel pump.

FUEL PUMP MODULE (Continued)

The fuel pump has a maximum deadheaded pressure output of approximately 880 kPa (130 psi). The regulator adjusts fuel system pressure to approximately 400 ±34 kPa (58 ±5 psi).

FUEL PUMP ELECTRICAL CONTROL

Voltage to operate the electric pump is supplied through the fuel pump relay. For an electrical operational description of the fuel pump refer to fuel Pump Relay—PCM Output.

ELECTRICAL PUMP REPLACEMENT

The electric fuel pump is not serviceable. If the fuel pump or electrical wiring harness needs replacement, the complete fuel pump module must be replaced. Perform the Fuel System Pressure Release procedure before servicing the fuel pump.

REMOVAL

WARNING: RELEASE FUEL SYSTEM PRESSURE BEFORE SERVICING FUEL SYSTEM COMPONENTS. SERVICE VEHICLES IN WELL VENTILATED AREAS AND AVOID IGNITION SOURCES. NEVER SMOKE WHILE SERVICING THE VEHICLE. THIS MAY RESULT IN PERSONAL INJURY OR DEATH.

(1) Remove fuel filler cap and perform Fuel System Pressure Release procedure.
(2) Remove the air cleaner lid, disconnect the inlet air temperature sensor and makeup air hose.
(3) Remove the negative battery cable.
(4) Raise vehicle and support.
(5) Remove fuel tank, refer to the Fuel Tank Removal in this section.
(6) Clean top of tank to remove loose dirt and debris.
(7) **Mark the fuel pump location on the top of the fuel tank.**

NOTE: The pump has to be properly located to the tank for the fuel gauge to work properly.

(8) Disconnect fuel filter lines from fuel pump module.
(9) Using Special Tool #6856 Fuel Pump Module Ring Spanner, remove locknut to release pump module (Fig. 10).

WARNING: THE FUEL RESERVOIR OF THE FUEL PUMP MODULE DOES NOT EMPTY OUT WHEN THE TANK IS DRAINED. THE FUEL IN THE RESERVOIR MAY SPILL OUT WHEN THE MODULE IS REMOVED. USE CAUTION TO AVOID PERSONAL INJURY.

(10) Remove fuel pump module and seal from tank. Discard seal.

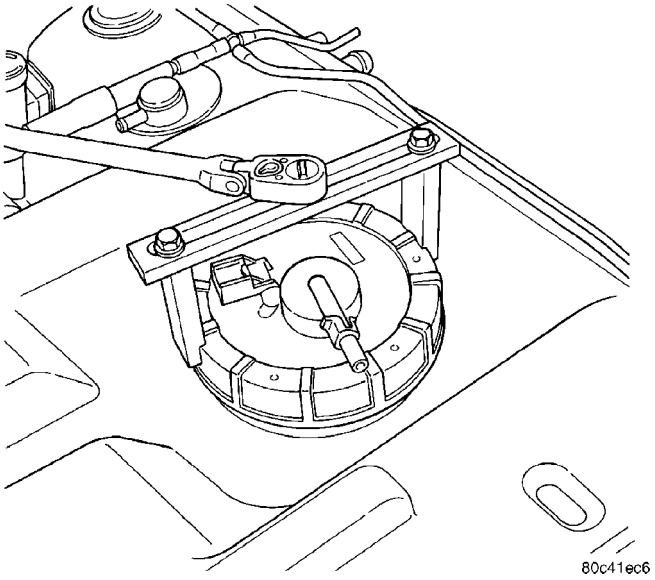

Fig. 10 Fuel Pump Module Locknut

INSTALLATION

(1) Wipe seal area of tank clean. Place a new seal between the tank threads and the pump module opening.

NOTE: The pump has to properly located to the tank for the fuel gauge to work properly.

(2) Position fuel pump module in tank. Make sure the alignment marks line up on the fuel tank and pump module.

CAUTION: Over tightening the pump lock ring may result in a leak.

(3) While holding the pump module in position, install locknut. Tighten locknut to 74.5 N·m (55 ft. lbs) torque using special tool #6856.
(4) Install fuel tank, refer to the Fuel Tank Installation in this section.
(5) Lower vehicle.
(6) Install the negative battery cable.
(7) Install the air cleaner lid, connect the inlet air temperature sensor and makeup air hose.
(8) Fill fuel tank with clean fuel. Use the DRBIII® scan tool to pressurize the system and check for leaks.

FUEL RAIL

DESCRIPTION

The fuel rail supplies the necessary fuel to each individual fuel injector and is mounted to the intake manifold (Fig. 11).

FUEL RAIL (Continued)

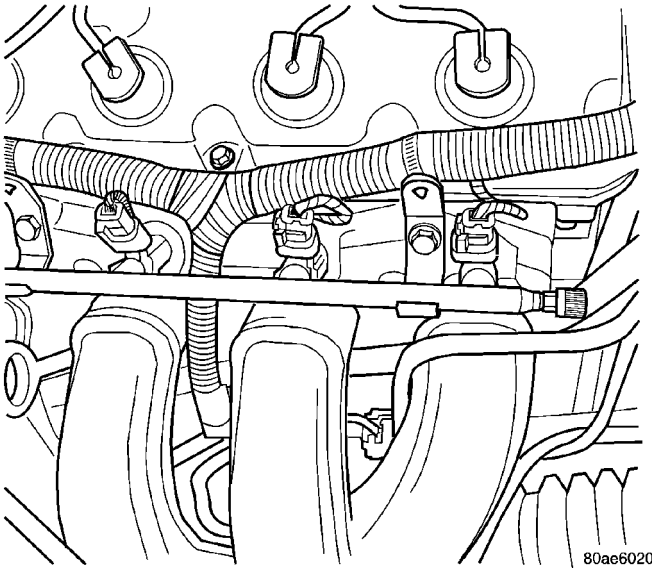

Fig. 11 Fuel Rail

OPERATION

The fuel pressure regulator is no longer mounted to the fuel rail on any engine. It is now located on the fuel tank mounted fuel pump module. Refer to Fuel Filter/Fuel Pressure Regulator in the Fuel Delivery System section of this group for information. The fuel rail is not repairable.

REMOVAL

REMOVAL

WARNING: RELEASE FUEL SYSTEM PRESSURE BEFORE SERVICING FUEL SYSTEM COMPONENTS. SERVICE VEHICLES IN WELL VENTILATED AREAS AND AVOID IGNITION SOURCES. NEVER SMOKE WHILE SERVICING THE VEHICLE. THIS MAY RESULT IN PERSONAL INJURY OR DEATH.

(1) Release fuel system pressure. Refer to Fuel System Pressure Release procedure in this section.

(2) Remove the air cleaner lid, disconnect the inlet air temperature sensor and makeup air hose.

(3) Remove the negative battery cable.

(4) Remove the engine cover or throttle control shield if equipped.

NOTE: WRAP SHOP TOWELS AROUND HOSE TO CATCH ANY GASOLINE SPILLAGE.

(5) Disconnect fuel supply tube from rail. Refer to Quick-Connect Fittings in this section.

(6) Remove the Intake Manifold, refer to the Engine section.

(7) Disconnect electrical connectors from fuel injectors (Fig. 12).

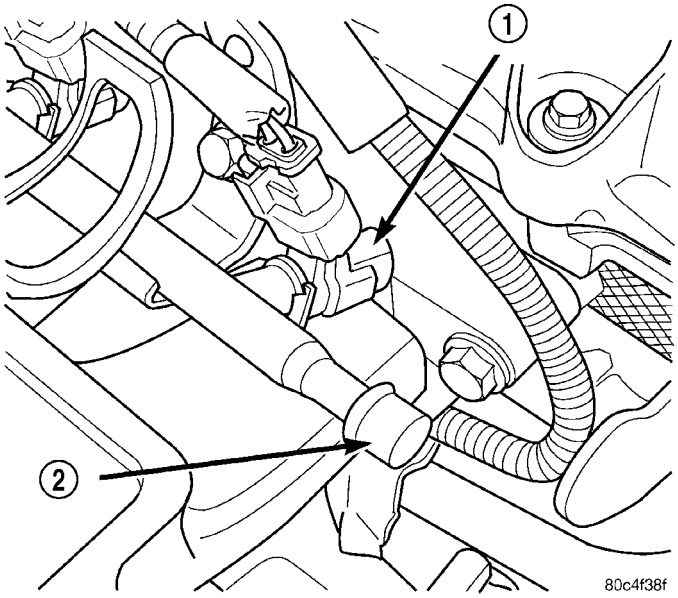

Fig. 12 Fuel Injector

1 - FUEL INJECTOR
2 - FUEL TEST PORT

(8) Remove bolts holding fuel rail (Fig. 13).

(9) Remove the fuel rail and injectors.

(10) Remove the injectors from the fuel rail.

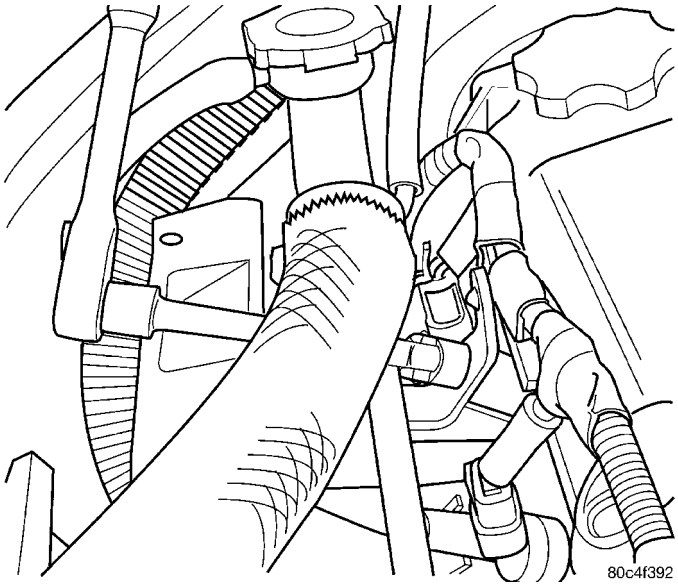

Fig. 13 Fuel Rail

REMOVAL - 2.4L TURBO

WARNING: RELEASE FUEL SYSTEM PRESSURE BEFORE SERVICING FUEL SYSTEM COMPONENTS. SERVICE VEHICLES IN WELL VENTILATED AREAS AND AVOID IGNITION SOURCES. NEVER SMOKE WHILE SERVICING THE VEHICLE. THIS MAY RESULT IN PERSONAL INJURY OR DEATH.

FUEL RAIL (Continued)

(1) Release the fuel system pressure. Refer to Fuel System Pressure Release procedure in this section.

(2) Disconnect the negative battery cable.

(3) Disconnect the throttle body inlet hose (Fig. 14) and remove from throttle body.

(4) Disconnect the purge hose from the throttle body (Fig. 14).

(5) Unlock and disconnect the electrical connection at the throttle body (Fig. 14).

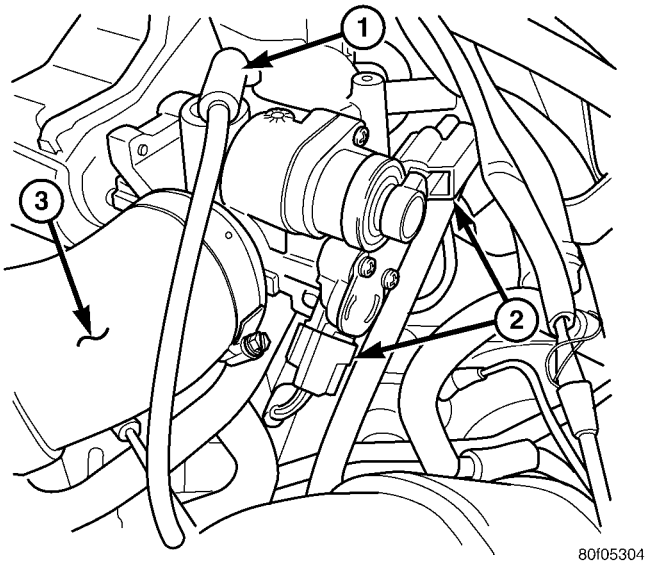

Fig. 14 THROTTLE BODY CONNECTIONS - 2.4L TURBO

1 - Purge Hose
2 - Electrical Connections
3 - Inlet Hose

(6) Remove the throttle control shield (Fig. 15).

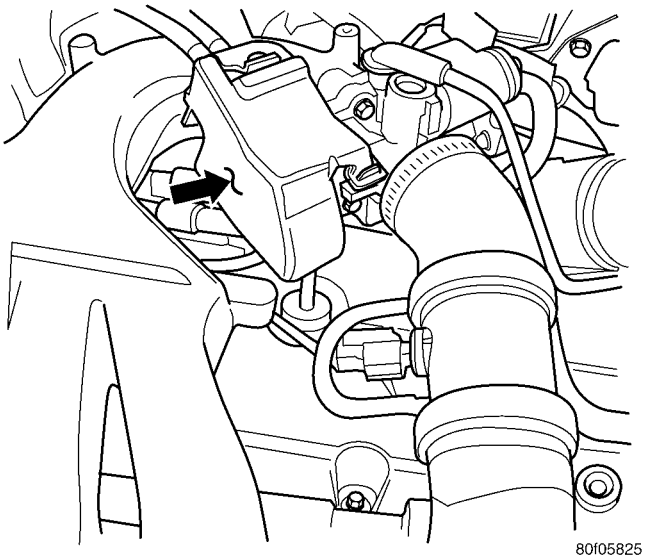

Fig. 15 THROTTLE CONTROL SHIELD - 2.4L TURBO

(7) Remove the throttle and speed control cables from the throttle body.

(8) Remove the cables from the throttle body bracket.

(9) Unlock and disconnect the MAP sensor electrical connector (Fig. 16).

(13) Remove the intake manifold. Cover the lower intake manifold openings (Fig. 18).

FUEL RAIL (Continued)

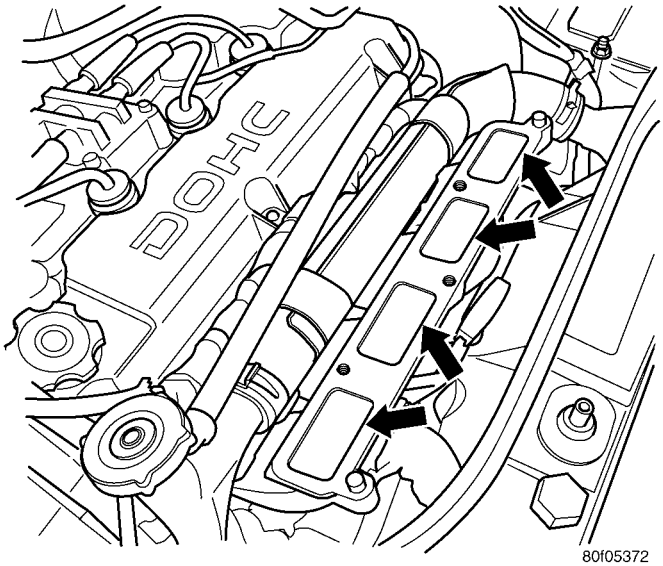

Fig. 18 LOWER INTAKE MANIFOLD - 2.4L TURBO

(14) Drain the Coolant system, refer to the Cooling section for more information.

(15) Move the upper radiator hose clamp (Fig. 19), so that the hose can be rotated up and out of the way.

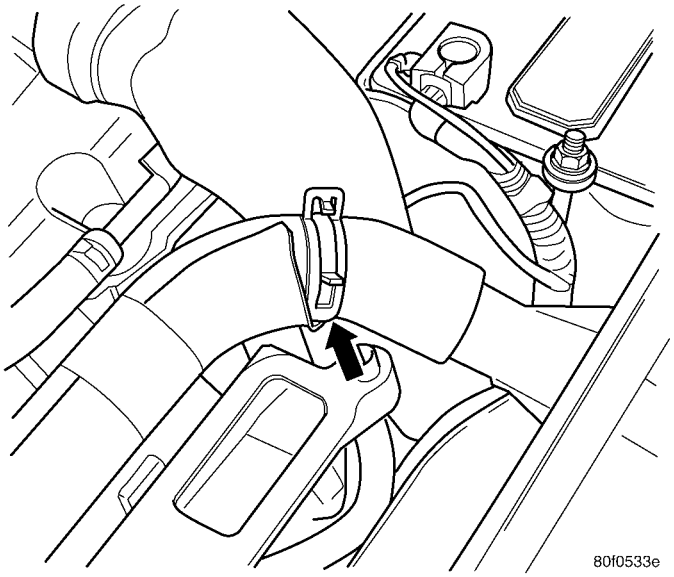

Fig. 19 UPPER RADIATOR HOSE CLAMP - 2.4L TURBO

(16) Remove the 2 small hoses from the thermostat housing (Fig. 20).

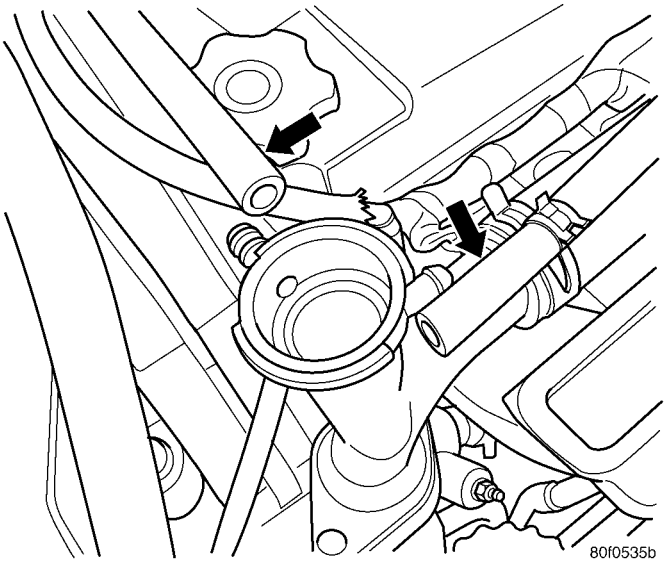

Fig. 20 SMALL HOSES AT HOUSING - 2.4L TURBO

(17) Remove the 2 bolts from the thermostat housing (Fig. 21)and rotate the assembly up and out of the way (Fig. 22).

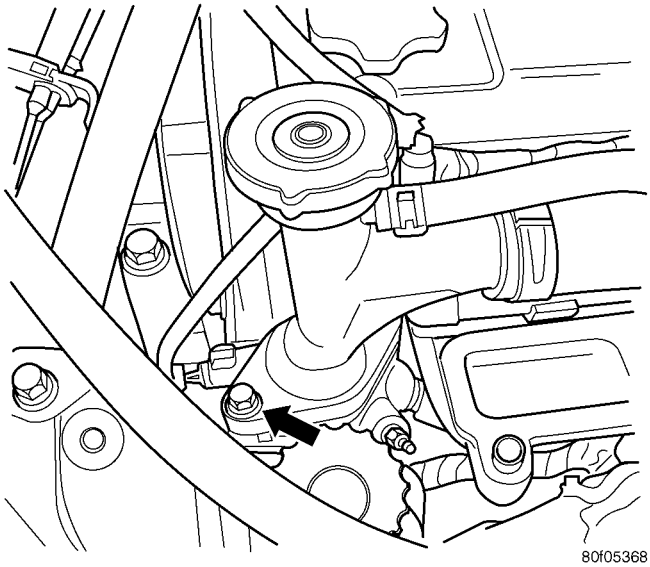

Fig. 21 THERMOSTAT HOUSING - 2.4L TURBO

NOTE: WRAP SHOP TOWELS AROUND HOSE TO CATCH ANY GASOLINE SPILLAGE.

FUEL RAIL (Continued)

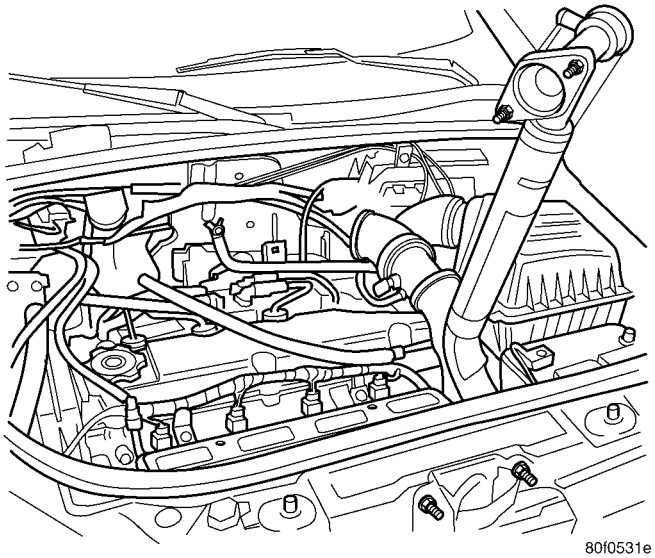

Fig. 22 HOSE AND HOUSING ROTATED - 2.4L TURBO

(18) Disconnect the fuel line from the fuel rail (Fig. 23). Refer to the Quick-Connect Fittings in this section.

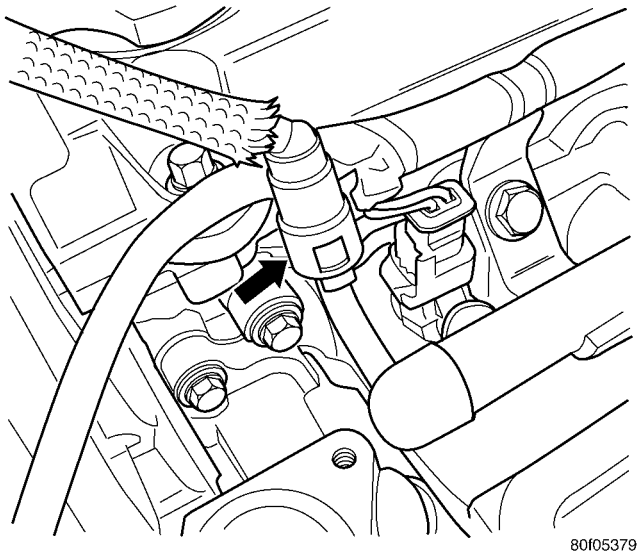

Fig. 23 FUEL LINE CONNECTION - 2.4L TURBO

(19) Unlock and disconnect the electrical connectors from the fuel injectors.

(20) Remove the wiring harness from the fuel rail (Fig. 24).

(21) Remove the 2 bolts from the fuel rail (Fig. 24).

(22) Remove the fuel rail and injectors from the intake manifold (Fig. 25).

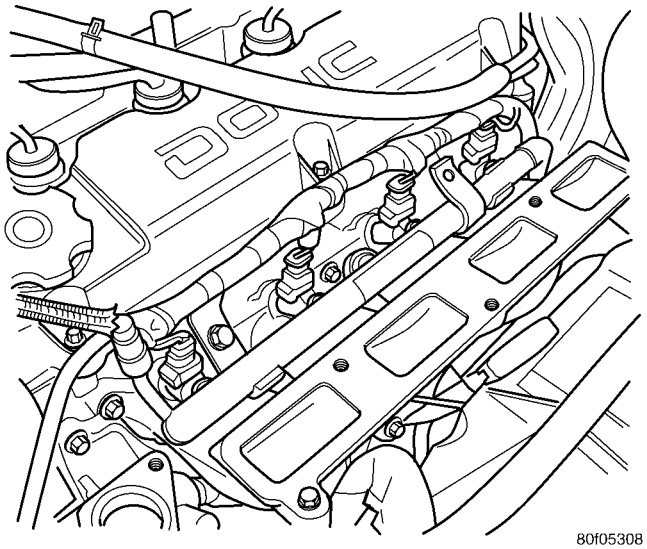

Fig. 24 FUEL RAIL - 2.4L TURBO

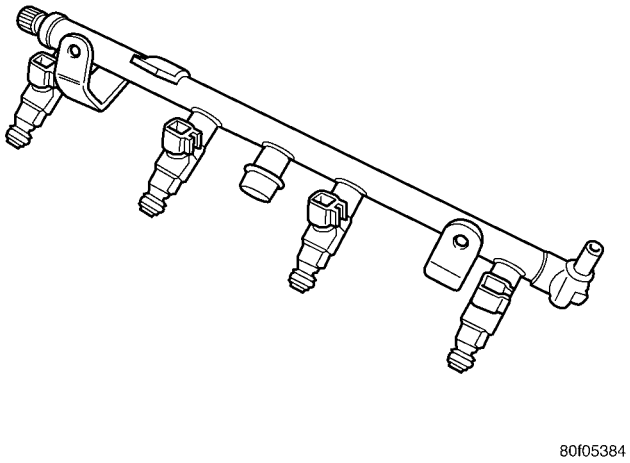

Fig. 25 FUEL RAIL & INJECTORS - 2.4L TURBO

REMOVAL - 1.6L

WARNING: RELEASE FUEL SYSTEM PRESSURE BEFORE SERVICING FUEL SYSTEM COMPONENTS. SERVICE VEHICLES IN WELL VENTILATED AREAS AND AVOID IGNITION SOURCES. NEVER SMOKE WHILE SERVICING THE VEHICLE. THIS MAY RESULT IN PERSONAL INJURY OR DEATH.

(1) Remove air cleaner assembly cover.

(2) Disconnect the negative battery cable.

(3) Disconnect the electrical connectors from the fuel injectors (Fig. 26)

(4) Remove the wiring harness from the fuel rail brackets.

FUEL RAIL (Continued)

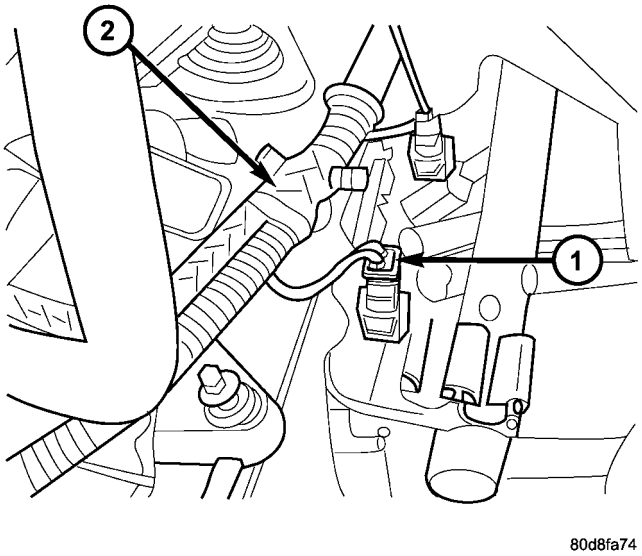

Fig. 26 INJECTOR CONNECTOR AND WIRING HARNESS

1 - FUEL INJECTOR ELECTRICAL CONNECTOR
2 - WIRING HARNESS

(5) Remove the fuel line from the fuel rail (Fig. 27).

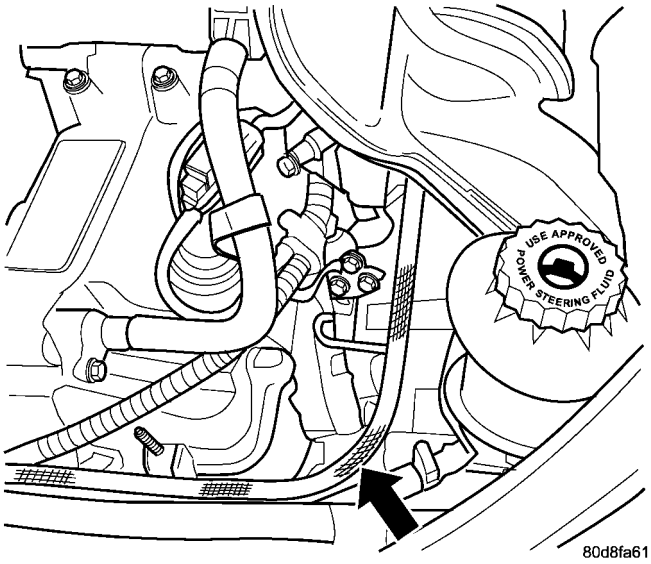

Fig. 27 FUEL LINE

(6) Remove the 2 bolts to the fuel rail at the lower manifold.

(7) Remove the fuel rail (Fig. 28)

(8) Remove the fuel injectors from the rail.

INSTALLATION

INSTALLATION

(1) Install injectors to the fuel rail.

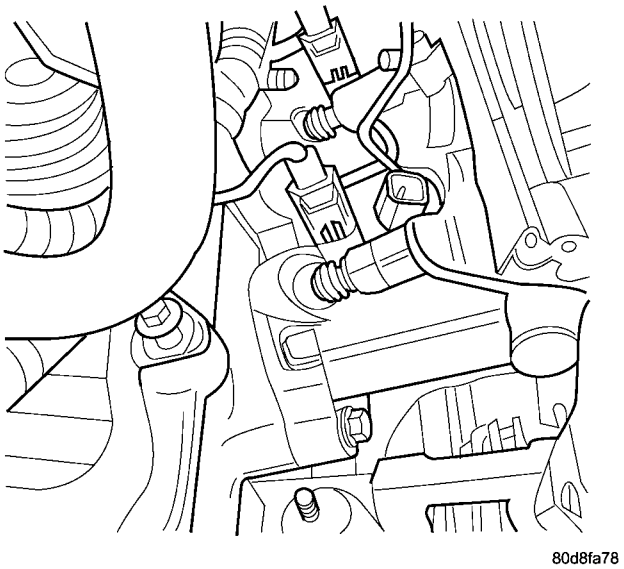

Fig. 28 FUEL RAIL AND FUEL INJECTOR

(2) Apply a light coating of clean engine oil to the O-ring on the nozzle end of each injector.

(3) Insert fuel injector nozzles into openings in intake manifold. Seat the injectors in place. Tighten fuel rail bolts to 22.5 ±3 N·m (200 ±30 in. lbs.) (Fig. 13).

(4) Attach electrical connectors to fuel injectors.

(5) Connect fuel supply tube to fuel rail. Refer to Quick Connect Fittings in the Fuel Delivery section

(6) Install Intake Manifold, refer to the Engine section.

(7) Install the engine cover or throttle control shield if equipped.

(8) Install the negative battery cable.

(9) Install the air cleaner lid, connect the inlet air temperature sensor and makeup air hose. Tighten air inlet tube clamps to 3 N·m ±1 (25 in. lbs. ±5) torque.

INSTALLATION - 2.4L TURBO

(1) Install the fuel injectors to the fuel rail (Fig. 25).

(2) Apply a light coating of clean engine oil to the O-ring on the nozzle end of each injector.

(3) Insert fuel injector nozzles into openings in intake manifold. Seat the injectors in place.

(4) Install the 2 bolts to the fuel rail (Fig. 24). Tighten fuel rail bolts to 22.5 ±3 N·m (200 ±30 in. lbs.)

(5) Install the wiring harness to the fuel rail (Fig. 24).

(6) Connect and lock the electrical connectors to the fuel injectors.

(7) Connect the fuel line to the fuel rail (Fig. 23). Refer to Quick Connect Fittings in the Fuel Delivery Section of this Group.

FUEL RAIL (Continued)

(8) Rotate the assembly back into place and install the 2 bolts to the thermostat housing tighten to 12.5 N·m (110 in. lbs.).

(9) Move the upper radiator house clamp back into place (Fig. 19).

(10) Install the 2 small hoses to the thermostat housing (Fig. 20).

(11) Fill the Coolant system, refer to the Cooling section for more information.

(12) Install the intake manifold, refer to the Engine section.

(13) Install the 2 bolts to the rear of the intake manifold (Fig. 17) tighten to 28 N·m (250 in. lbs.).

(14) Install the 5 bolts to the front of the intake manifold and tighten to 28 N·m (250 in. lbs.).

(15) Install the vacuum lines to the rear of the intake manifold (Fig. 17).

(16) Connect and lock the MAP sensor electrical connector (Fig. 16).

(17) Install the cables to the throttle body bracket.

(18) Install the throttle and speed control cables to the throttle body.

(19) Install the throttle control shield (Fig. 15).

(20) Connect and lock the electrical connections at the throttle body (Fig. 14).

(21) Connect the purge hose to the throttle body (Fig. 14).

(22) Connect the throttle body inlet hose to the throttle body (Fig. 14) and tighten clamps to 3 N·m ±1 (25 in. lbs. ±5) torque.

(23) Connect the negative battery cable.

(24) Use the DRB scan tool ASD Fuel System Test to pressurize the fuel system. Check for leaks.

INSTALLATION - 1.6L

(1) Apply a light coating of clean engine oil to the upper O-ring.

(2) Install injector in cup on fuel rail.

(3) Install retaining clip.

(4) Apply a light coating of clean engine oil to the O-ring on the nozzle end of each injector.

(5) Insert fuel injector nozzles into openings in lower intake manifold (Fig. 28). Seat the injectors in place. Tighten fuel rail mounting screws to 22.5 N·m ± 3 N·m (200±30 in. lbs.).

(6) Attach electrical connectors to fuel injectors (Fig. 26), refer to the fuel injector connector section for electrical connector installation.

(7) Connect fuel supply tube to fuel rail (Fig. 27). Refer to Quick Connect Fittings in the Fuel Delivery Section of this Group.

(8) Install the wiring harness to the fuel rail brackets.

(9) Connect the negative battery cable.

(10) Use the DRB scan tool ASD Fuel System Test to pressurize the fuel system. Check for leaks.

(11) Install air cleaner assembly cover.

FUEL TANK

DESCRIPTION

The fuel tank is constructed of a plastic material. Its main functions are for fuel storage and for placement of the fuel pump module. The tank is made from High density Polyethylene (HDPE) material.If equipped with ORVR (Onboard Refueling Vapor Recovery) it has been added to the fuel tank to control refueling vapor emissions.

OPERATION

All models pass a full 360 degree rollover test without fuel leakage. To accomplish this, fuel and vapor flow controls are required for all fuel tank connections.

All models are equipped with either one or two check valves mounted into the top of the fuel tank (or pump module).

An evaporation control system is connected to the check valve(s)/control valve(Refer to 25 - EMISSIONS CONTROL/EVAPORATIVE EMISSIONS/ ORVR - OPERATION) to reduce emissions of fuel vapors into the atmosphere, when the tank is vented due to vapor expansion in the tank. When fuel evaporates from the fuel tank, vapors pass through vent hoses or tubes to a charcoal canister where they are temporarily held. When the engine is running, the vapors are drawn into the intake manifold. In addition, fuel vapors produced during vehicle refueling are allowed to pass through the vent hoses/tubes to the charcoal canister(s) for temporary storage (prior to being drawn into the intake manifold). All models are equipped with a self-diagnosing system using a Leak Detection Pump (LDP) or Natural Vacuum Leak Detection (NVLD). Refer to the Emission Control System for additional information.

INLET CHECK VALVE

All vehicles have an inlet check valve on the inside of the fuel tank at the filler inlet

The valve prevents fuel from splashing back on customer during vehicle refueling. The valve is a non-serviceable item.

REMOVAL

WARNING: RELEASE FUEL SYSTEM PRESSURE BEFORE SERVICING FUEL SYSTEM COMPONENTS. SERVICE VEHICLES IN WELL VENTILATED AREAS AND AVOID IGNITION SOURCES. NEVER SMOKE WHILE SERVICING THE VEHICLE. THIS MAY RESULT IN PERSONAL INJURY OR DEATH.

FUEL TANK (Continued)

(1) Release fuel system pressure. Refer to Fuel Pressure Release Procedure in this section.

(2) Remove the air cleaner lid, disconnect the inlet air temperature sensor and makeup air hose.

(3) Remove the negative battery cable.

(4) Remove fuel cap slowly to release tank pressure.

(5) With vehicle on a hoist, drain fuel from tank. Drain fuel tank refer to Draining the Fuel Tank in this section.

(6) Raise and support the vehicle.

CAUTION: There may be fuel in the fill tube. Remove hose carefully to reduce fuel splash.

(7) Disconnect fuel tank from rubber fill hose.

NOTE: wrap shop towels around hoses to catch any gasoline spillage.

(8) Remove bolts from the fuel tank straps (Fig. 29).

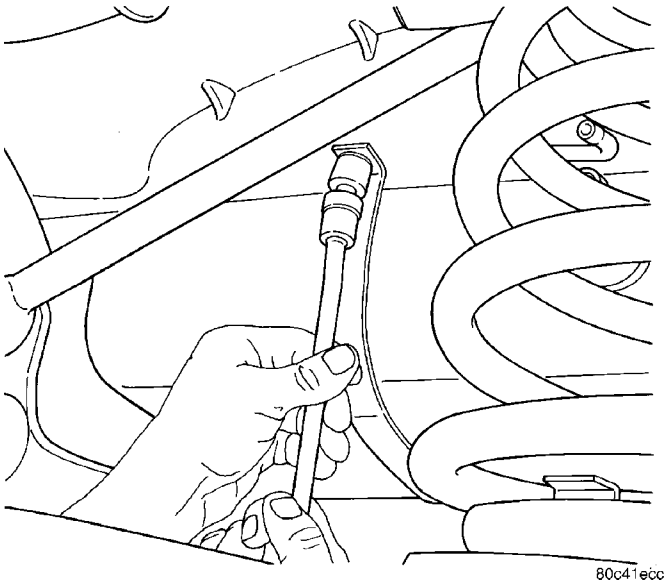

Fig. 29 Fuel Tank Straps

(9) Lower fuel tank and remove the EVAP line and recirculation line.

(10) Remove vacuum line from LDP.

(11) Disconnect fuel line, it is in the front of the fuel tank. This is a quick connect fittings (Fig. 30).

(12) Unlock the electrical connector then disconnect the electrical connector (Fig. 31)

(13) Remove hoses from EVAP canister.

(14) Remove fuel tank from vehicle.

INSTALLATION

(1) Position fuel tank on transmission jack.

(2) Raise fuel tank into position.

(3) Connect vacuum line to LDP.

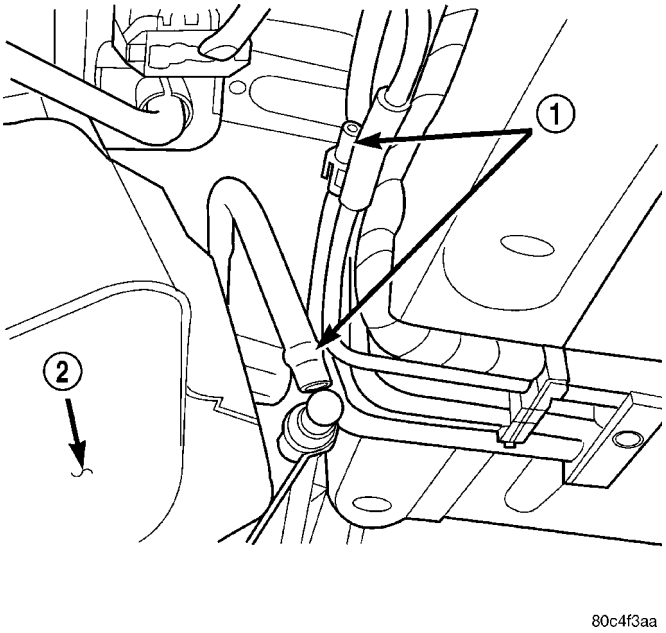

Fig. 30 Fuel Line

1 - FUEL LINE
2 - FUEL TANK

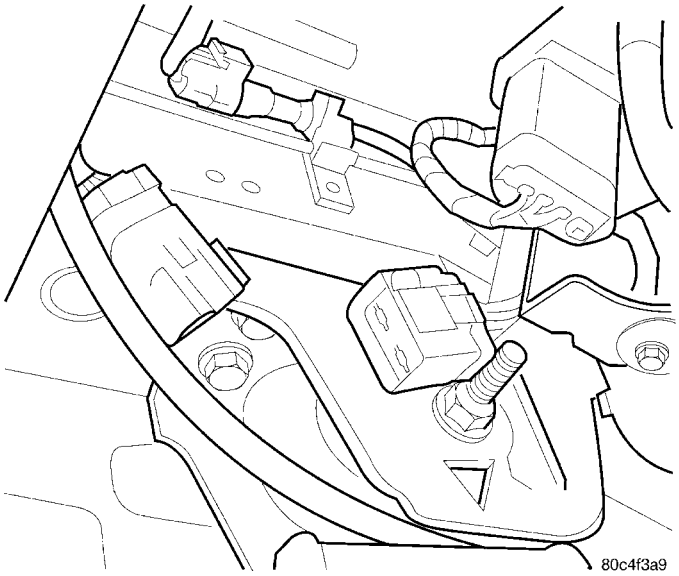

Fig. 31 Electrical Connector

(4) Install EVAP line and recirculation line.

(5) Connect electrical connector (Fig. 31) and lock the connector.

(6) Connect the fuel line (Fig. 30). Refer to Quick Connect Fittings in this section.

(7) Connect fuel fill tube to tank inlet. Tighten hose clamp to 3.5 N·m (31 in. lbs.) torque.

(8) Position fuel tank straps. Tighten fuel tank strap bolts to 23 N·m (250 in. lbs.) torque (Fig. 29). Remove transmission jack. Ensure straps are not twisted or bent.

(9) Lower vehicle.

FUEL TANK (Continued)

(10) Fill fuel tank, install filler cap.
(11) Install the negative battery cable.
(12) Install the air cleaner lid, connect the inlet air temperature sensor and makeup air hose.
(13) Use the DRBIII® scan tool ASD Fuel System Test to pressurize the fuel system. Check for leaks.

FUEL TANK FILLER TUBE

REMOVAL

(1) Remove the air cleaner lid and makeup air hose.
(2) Remove the negative battery cable.
(3) Loosen fuel filler tube cap (Fig. 32).

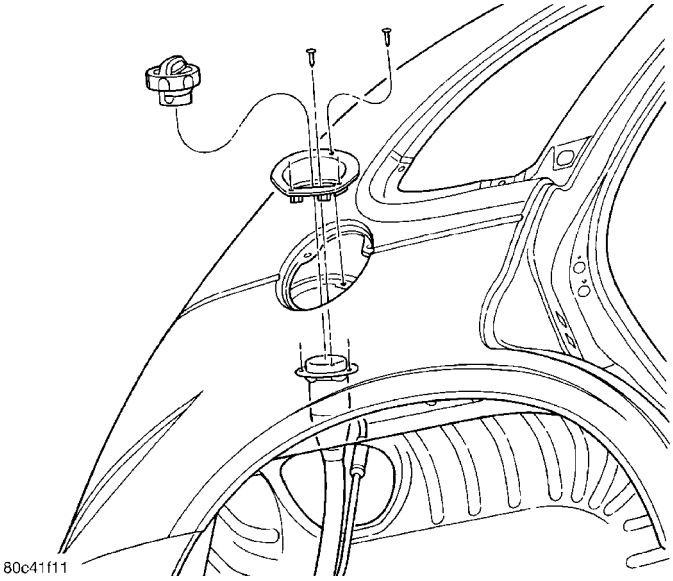

Fig. 32 Fuel Filler Cap

(4) Remove fuel filler neck screws (Fig. 33).
(5) Raise vehicle and support.
(6) Remove the right rear wheel.
(7) Remove the rear half of the inner splash shield (Fig. 34).

NOTE: Drain fuel tank if it is more than half full.

(8) Disconnect fuel filler tube hose from fuel tank neck (Fig. 35). Remove fuel filler tube assembly.

INSTALLATION

(1) Install fuel filler tube. Connect fuel filler tube hose to fuel tank neck and tighten clamp to 4.1 N·m (38 ins. lbs.) (Fig. 35).

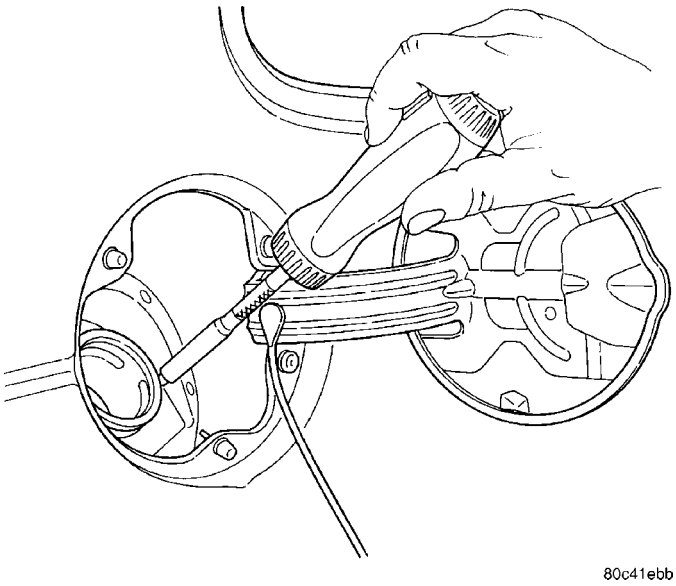

Fig. 33 Fuel Filler Neck Removal/Installation

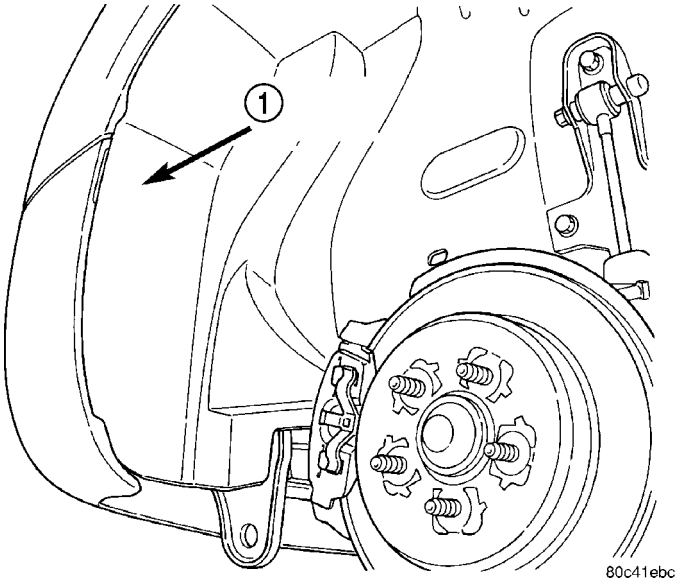

Fig. 34 Slash Shield

1 - SPLASH SHIELD

(2) Install the rear half of the inner splash shield (Fig. 34).
(3) Lower vehicle.
(4) Install fuel filler neck screws and tighten to 2.7 N·m (24 ins. lbs.) (Fig. 33).
(5) Install fuel filler tube cap.
(6) Install the negative battery cable.

FUEL TANK FILLER TUBE (Continued)

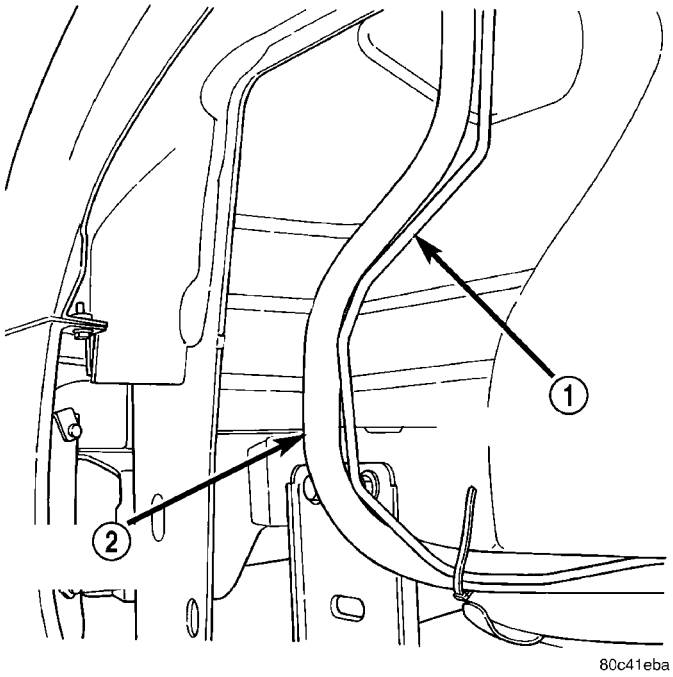

Fig. 35 Filler Tube

(7) Install the air cleaner lid and makeup air hose.

INLET FILTER

DESCRIPTION

The fuel pump inlet strainer is a non-serviceable part.

QUICK CONNECT FITTING

STANDARD PROCEDURE - QUICK-CONNECT FITTINGS

REMOVAL

When disconnecting a quick-connect fitting, the retainer will remain on the fuel tube nipple.

WARNING: RELEASE FUEL SYSTEM PRESSURE BEFORE DISCONNECTING A QUICK-CONNECT FITTINGS. REFER TO THE FUEL PRESSURE RELEASE PROCEDURE. THIS MAY RESULT IN PERSONAL INJURY OR DEATH.

(1) Perform Fuel Pressure Release Procedure. Refer to the Fuel Pressure Release Procedure in this section.

(2) Disconnect negative cable from battery or auxiliary jumper terminal.

(3) Squeeze retainer tabs together and pull fuel tube/quick-connect fitting assembly off of fuel tube nipple. The retainer will remain on fuel tube.

INSTALLATION

CAUTION: Never install a quick-connect fitting without the retainer being either on the fuel tube or already in the quick-connect fitting. In either case, ensure the retainer locks securely into the quick-connect fitting by firmly pulling on fuel tube and fitting to ensure it is secured.

(1) Using a clean lint free cloth, clean the fuel tube nipple and retainer.

(2) Prior to connecting the fitting to the fuel tube, coat the fuel tube nipple with clean engine oil.

(3) Push the quick-connect fitting over the fuel tube until the **retainer seats and a click is heard.**

(4) The plastic quick-connect fitting has windows in the sides of the casing. When the fitting completely attaches to the fuel tube, the retainer locking ears and the fuel tube shoulder are visible in the windows. If they are not visible, the retainer was not properly installed (Fig. 36). **Do not rely upon the audible click to confirm a secure connection.**

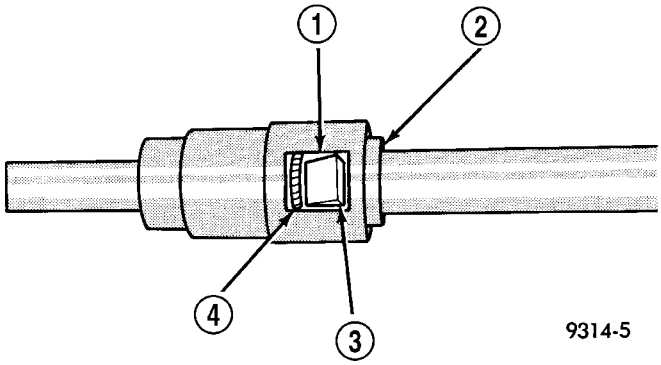

Fig. 36 Plastic Quick-Connect Fitting/Fuel Tube Connection

1 - WINDOW
2 - TAB (2)
3 - EAR
4 - SHOULDER (ON TUBE)

(5) Connect negative cable to battery or auxiliary jumper terminal.

CAUTION: When using the ASD Fuel System Test, the Auto Shutdown (ASD) Relay remains energized for several minutes, until the test is stopped, or until the ignition switch is turned to the Off position.

(6) Use the DRB III® scan tool ASD Fuel System Test to pressurize the fuel system. Check for leaks.

QUICK CONNECT FITTING (Continued)

TWO-TAB TYPE FITTING

This type of fitting is equipped with tabs located on both sides of the fitting (Fig. 37). These tabs are supplied for disconnecting the quick-connect fitting from component being serviced.

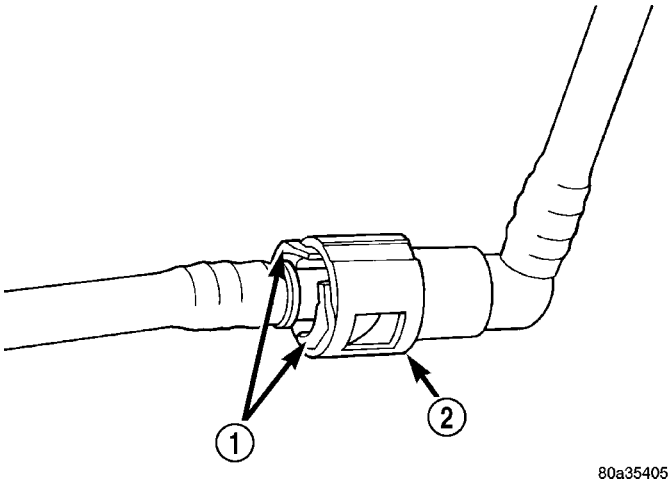

Fig. 37 Typical Two-Tab Type Quick-Connect Fitting

1 - TAB(S)
2 - QUICK-CONNECT FITTING

CAUTION: The interior components (O-rings, spacers) of this type of quick-connect fitting are not serviced separately, but new plastic retainers are available. Do not attempt to repair damaged fittings or fuel lines/tubes. If repair is necessary, replace the complete fuel tube assembly.

WARNING: THE FUEL SYSTEM IS UNDER A CONSTANT PRESSURE (EVEN WITH THE ENGINE OFF). BEFORE SERVICING ANY FUEL SYSTEM HOSES, FITTINGS OR LINES, THE FUEL SYSTEM PRESSURE MUST BE RELEASED. REFER TO THE FUEL PRESSURE RELEASE PROCEDURE IN THIS GROUP. THIS MAY RESULT IN PERSONAL INJURY OR DEATH.

DISCONNECTION/CONNECTION

(1) Perform fuel pressure release procedure. Refer to Fuel Pressure Release Procedure in this group.

(2) Disconnect negative battery cable from battery or auxiliary jumper terminal.

(3) Clean fitting of any foreign material before disassembly.

(4) To disconnect quick-connect fitting, squeeze plastic retainer tabs (Fig. 37) against sides of quick-connect fitting with your fingers. Tool use is not required for removal and may damage plastic retainer. Pull fitting from fuel system component being serviced. The plastic retainer will remain on component being serviced after fitting is disconnected. The O-rings and spacer will remain in quick-connect fitting connector body.

(5) Inspect quick-connect fitting body and component for damage. Replace as necessary.

CAUTION: When the quick-connect fitting was disconnected, the plastic retainer will remain on the component being serviced. If this retainer must be removed, very carefully release the retainer from the component with two small screwdrivers. After removal, inspect the retainer for cracks or any damage.

(6) Prior to connecting quick-connect fitting to component being serviced, check condition of fitting and component. Clean parts with a lint-free cloth. Lubricate with clean engine oil.

(7) Insert quick-connect fitting to component being serviced and into plastic retainer. When a connection is made, a click will be heard.

(8) Verify a locked condition by firmly pulling on fuel tube and fitting (15-30 lbs.).

(9) Connect negative cable to battery or auxiliary jumper terminal.

(10) Use the DRB III® scan tool ASD Fuel System Test to pressurize the fuel system. Check for leaks.

PLASTIC RETAINER RING TYPE FITTING

This type of fitting can be identified by the use of a full-round plastic retainer ring (Fig. 38) usually black in color.

CAUTION: The interior components (O-rings, spacers, retainers) of this type of quick-connect fitting are not serviced separately. Do not attempt to repair damaged fittings or fuel lines/tubes. If repair is necessary, replace the complete fuel tube assembly.

WARNING: THE FUEL SYSTEM IS UNDER A CONSTANT PRESSURE (EVEN WITH THE ENGINE OFF). BEFORE SERVICING ANY FUEL SYSTEM HOSES, FITTINGS OR LINES, THE FUEL SYSTEM PRESSURE MUST BE RELEASED. REFER TO THE FUEL SYSTEM PRESSURE RELEASE PROCEDURE IN THIS GROUP. THIS MAY RESULT IN PERSONAL INJURY OR DEATH.

DISCONNECTION/CONNECTION

(1) Perform fuel pressure release procedure. Refer to Fuel Pressure Release Procedure in this section.

(2) Disconnect negative battery cable from battery or auxiliary jumper terminal.

(3) Clean fitting of any foreign material before disassembly.

QUICK CONNECT FITTING (Continued)

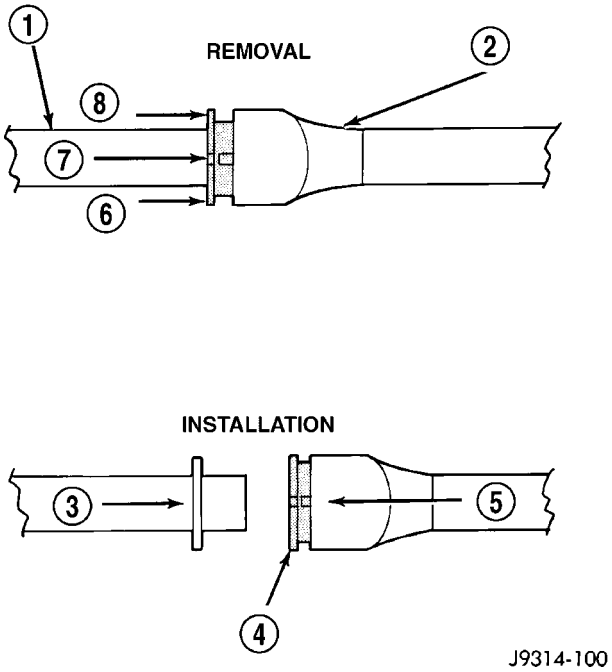

Fig. 38 Plastic Retainer Ring Type Fitting

1 - FUEL TUBE
2 - QUICK CONNECT FITTING
3 - PUSH
4 - PLASTIC RETAINER
5 - PUSH
6 - PUSH
7 - PUSH
8 - PUSH

(4) To release fuel system component from quick-connect fitting, firmly push fitting towards component being serviced while firmly pushing plastic retainer ring into fitting (Fig. 38). With plastic ring depressed, pull fitting from component. **The plastic retainer ring must be pressed squarely into fitting body. If this retainer is cocked during removal, it may be difficult to disconnect fitting. Use an open-end wrench on shoulder of plastic retainer ring to aid in disconnection.**

(5) After disconnection, plastic retainer ring will remain with quick-connect fitting connector body.

(6) Inspect fitting connector body, plastic retainer ring and fuel system component for damage. Replace as necessary.

(7) Prior to connecting quick-connect fitting to component being serviced, check condition of fitting and component. Clean parts with a lint-free cloth. Lubricate with clean engine oil.

(8) Insert quick-connect fitting into component being serviced until a click is felt.

(9) Verify a locked condition by firmly pulling on fuel tube and fitting (15-30 lbs.).

(10) Connect negative battery cable to battery or auxiliary jumper terminal.

(11) Use the DRB III® scan tool ASD Fuel System Test to pressurize the fuel system. Check for leaks.

FUEL INJECTION

OPERATION

OPERATION - INJECTION SYSTEM

All engines used in this section have a sequential Multi-Port Electronic Fuel Injection system. The MPI system is computer regulated and provides precise air/fuel ratios for all driving conditions. The Powertrain Control Module (PCM) operates the fuel injection system.

The PCM regulates:

- Ignition timing
- Air/fuel ratio
- Emission control devices
- Cooling fan
- Charging system
- Idle speed
- Vehicle speed control

Various sensors provide the inputs necessary for the PCM to correctly operate these systems. In addition to the sensors, various switches also provide inputs to the PCM.

The PCM can adapt its programming to meet changing operating conditions.

Fuel is injected into the intake port above the intake valve in precise metered amounts through electrically operated injectors. The PCM fires the injectors in a specific sequence. Under most operating conditions, the PCM maintains an air fuel ratio of 14.7 parts air to 1 part fuel by constantly adjusting injector pulse width. Injector pulse width is the length of time the injector is open.

The PCM adjusts injector pulse width by opening and closing the ground path to the injector. Engine RPM (speed) and manifold absolute pressure (air density) are the **primary** inputs that determine injector pulse width.

OPERATION - MODES OF OPERATION

As input signals to the PCM change, the PCM adjusts its response to output devices. For example, the PCM must calculate a different injector pulse width and ignition timing for idle than it does for Wide Open Throttle (WOT). There are several different modes of operation that determine how the PCM responds to the various input signals.

There are two different areas of operation, OPEN LOOP and CLOSED LOOP.

During OPEN LOOP modes the PCM receives input signals and responds according to preset PCM programming. Inputs from the upstream and downstream heated oxygen sensors are not monitored during OPEN LOOP modes, except for heated oxygen sensor diagnostics (they are checked for shorted conditions at all times).

During CLOSED LOOP modes the PCM monitors the inputs from the upstream and downstream heated oxygen sensors. The upstream heated oxygen sensor input tells the PCM if the calculated injector pulse width resulted in the ideal air-fuel ratio of 14.7 to one. By monitoring the exhaust oxygen content through the upstream heated oxygen sensor, the PCM can fine tune injector pulse width. Fine tuning injector pulse width allows the PCM to achieve optimum fuel economy combined with low emissions.

For the PCM to enter CLOSED LOOP operation, the following must occur:

(1) Engine coolant temperature must be over 35°F.

- If the coolant is over 35°F the PCM will wait 38 seconds.
- If the coolant is over 50°F the PCM will wait 15 seconds.
- If the coolant is over 167°F the PCM will wait 3 seconds.

(2) For other temperatures the PCM will interpolate the correct waiting time.

(3) O2 sensor must read either greater than 0.745 volts or less than 0.29 volt.

(4) The multi-port fuel injection systems has the following modes of operation:

- Ignition switch ON (Zero RPM)
- Engine start-up
- Engine warm-up
- Cruise
- Idle
- Acceleration
- Deceleration
- Wide Open Throttle
- Ignition switch OFF

(5) The engine start-up (crank), engine warm-up, deceleration with fuel shutoff and wide open throttle modes are OPEN LOOP modes. Under most operating conditions, the acceleration, deceleration (with A/C on), idle and cruise modes, **with the engine at operating temperature** are CLOSED LOOP modes.

IGNITION SWITCH ON (ZERO RPM) MODE

When the ignition switch activates the fuel injection system, the following actions occur:

- The PCM monitors the engine coolant temperature sensor and throttle position sensor input. The PCM determines basic fuel injector pulse width from this input.
- The PCM determines atmospheric air pressure from the MAP sensor input to modify injector pulse width.

When the key is in the ON position and the engine is not running (zero rpm), the Auto Shutdown (ASD) and fuel pump relays de-energize after approximately

FUEL INJECTION (Continued)

1 second. Therefore, battery voltage is not supplied to the fuel pump, ignition coil, fuel injectors and heated oxygen sensors.

ENGINE START-UP MODE

This is an OPEN LOOP mode. If the vehicle is in park or neutral (automatic transaxles) or the clutch pedal is depressed (manual transaxles) the ignition switch energizes the starter relay when the engine is not running. The following actions occur when the starter motor is engaged.

- If the PCM receives the camshaft position sensor and crankshaft position sensor signals, it energizes the Auto Shutdown (ASD) relay and fuel pump relay. If the PCM does not receive both signals within approximately one second, it will not energize the ASD relay and fuel pump relay. The ASD and fuel pump relays supply battery voltage to the fuel pump, fuel injectors, ignition coil, (EGR solenoid and PCV heater if equipped) and heated oxygen sensors.
- The PCM energizes the injectors (on the 69° degree falling edge) for a calculated pulse width until it determines crankshaft position from the camshaft position sensor and crankshaft position sensor signals. The PCM determines crankshaft position within 1 engine revolution.
- After determining crankshaft position, the PCM begins energizing the injectors in sequence. It adjusts injector pulse width and controls injector synchronization by turning the individual ground paths to the injectors On and Off.
- When the engine idles within ±64 RPM of its target RPM, the PCM compares current MAP sensor value with the atmospheric pressure value received during the Ignition Switch On (zero RPM) mode.

Once the ASD and fuel pump relays have been energized, the PCM determines injector pulse width based on the following:

- MAP
- Engine RPM
- Battery voltage
- Engine coolant temperature
- Inlet/Intake air temperature (IAT)
- Throttle position
- The number of engine revolutions since cranking was initiated

During Start-up the PCM maintains ignition timing at 9° BTDC.

ENGINE WARM-UP MODE

This is an OPEN LOOP mode. The following inputs are received by the PCM:

- Manifold Absolute Pressure (MAP)
- Crankshaft position (engine speed)
- Engine coolant temperature
- Inlet/Intake air temperature (IAT)
- Camshaft position
- Knock sensor
- Throttle position
- A/C switch status
- Battery voltage
- Vehicle speed
- Speed control
- O2 sensors

The PCM adjusts injector pulse width and controls injector synchronization by turning the individual ground paths to the injectors On and Off.

The PCM adjusts ignition timing and engine idle speed. Engine idle speed is adjusted through the idle air control motor.

CRUISE OR IDLE MODE

When the engine is at operating temperature this is a CLOSED LOOP mode. During cruising or idle the following inputs are received by the PCM:

- Manifold absolute pressure
- Crankshaft position (engine speed)
- Inlet/Intake air temperature
- Engine coolant temperature
- Camshaft position
- Knock sensor
- Throttle position
- Exhaust gas oxygen content (O2 sensors)
- A/C switch status
- Battery voltage
- Vehicle speed

The PCM adjusts injector pulse width and controls injector synchronization by turning the individual ground paths to the injectors On and Off.

The PCM adjusts engine idle speed and ignition timing. The PCM adjusts the air/fuel ratio according to the oxygen content in the exhaust gas (measured by the upstream and downstream heated oxygen sensor).

The PCM monitors for engine misfire. During active misfire and depending on the severity, the PCM either continuously illuminates or flashes the malfunction indicator lamp (Check Engine light on instrument panel). Also, the PCM stores an engine misfire DTC in memory, if 2nd trip with fault.

The PCM performs several diagnostic routines. They include:

- Oxygen sensor monitor
- Downstream heated oxygen sensor diagnostics during open loop operation (except for shorted)
- Fuel system monitor
- EGR monitor (if equipped)
- Purge system monitor
- Catalyst efficiency monitor
- All inputs monitored for proper voltage range, rationality.

FUEL INJECTION (Continued)

- All monitored components (refer to the Emission section for On-Board Diagnostics).

The PCM compares the upstream and downstream heated oxygen sensor inputs to measure catalytic convertor efficiency. If the catalyst efficiency drops below the minimum acceptable percentage, the PCM stores a diagnostic trouble code in memory, after 2 trips.

During certain idle conditions, the PCM may enter a variable idle speed strategy. During variable idle speed strategy the PCM adjusts engine speed based on the following inputs.

- A/C status
- Battery voltage
- Battery temperature or Calculated Battery Temperature
- Engine coolant temperature
- Engine run time
- Inlet/Intake air temperature
- Vehicle mileage

ACCELERATION MODE

This is a CLOSED LOOP mode. The PCM recognizes an abrupt increase in Throttle Position sensor output voltage or MAP sensor output voltage as a demand for increased engine output and vehicle acceleration. The PCM increases injector pulse width in response to increased fuel demand.

- Wide Open Throttle-open loop

DECELERATION MODE

This is a CLOSED LOOP mode. During deceleration the following inputs are received by the PCM:

- A/C status
- Battery voltage
- Inlet/Intake air temperature
- Engine coolant temperature
- Crankshaft position (engine speed)
- Exhaust gas oxygen content (upstream heated oxygen sensor)
- Knock sensor
- Manifold absolute pressure
- Throttle position sensor
- IAC motor (solenoid) control changes in response to MAP sensor feedback

The PCM may receive a closed throttle input from the Throttle Position Sensor (TPS) when it senses an abrupt decrease in manifold pressure. This indicates a hard deceleration (Open Loop). In response, the PCM may momentarily turn off the injectors. This helps improve fuel economy, emissions and engine braking.

WIDE-OPEN-THROTTLE MODE

This is an OPEN LOOP mode. During wide-open-throttle operation, the following inputs are used by the PCM:

- Inlet/Intake air temperature
- Engine coolant temperature
- Engine speed
- Knock sensor
- Manifold absolute pressure
- Throttle position

When the PCM senses a wide-open-throttle condition through the Throttle Position Sensor (TPS) it de-energizes the A/C compressor clutch relay. This disables the air conditioning system and disables EGR (if equipped).

The PCM adjusts injector pulse width to supply a predetermined amount of additional fuel, based on MAP and RPM.

IGNITION SWITCH OFF MODE

When the operator turns the ignition switch to the OFF position, the following occurs:

- All outputs are turned off, unless 02 Heater Monitor test is being run. Refer to the Emission section for On-Board Diagnostics.
- No inputs are monitored except for the heated oxygen sensors. The PCM monitors the heating elements in the oxygen sensors and then shuts down.

FUEL CORRECTION or ADAPTIVE MEMORIES

DESCRIPTION

In Open Loop, the PCM changes pulse width without feedback from the O2 Sensors. Once the engine warms up to approximately 30 to 35° F, the PCM goes into closed loop **Short Term Correction** and utilizes feedback from the O2 Sensors. Closed loop **Long Term Adaptive Memory** is maintained above 170° to 190° F unless the PCM senses wide open throttle. At that time the PCM returns to Open Loop operation.

OPERATION

Short Term

The first fuel correction program that begins functioning is the short term fuel correction. This system corrects fuel delivery in direct proportion to the readings from the Upstream O2 Sensor.

The PCM monitors the air/fuel ratio by using the input voltage from the O2 Sensor. When the voltage reaches its preset high or low limit, the PCM begins to add or remove fuel until the sensor reaches its switch point. The short term corrections then begin.

The PCM makes a series of quick changes in the injector pulse-width until the O2 Sensor reaches its

opposite preset limit or switch point. The process then repeats itself in the opposite direction.

Short term fuel correction will keep increasing or decreasing injector pulse-width based upon the upstream O2 Sensor input. The maximum range of authority for short term memory is 25% (+/-) of base pulse-width. Short term is violated and is lost when ignition is turned OFF.

Long Term

The second fuel correction program is the long term adaptive memory. In order to maintain correct emission throughout all operating ranges of the engine, a cell structure based on engine rpm and load (MAP) is used.

Ther number of cells varies upon the driving conditions. Two cells are used only during idle, based upon TPS and Park/Neutral switch inputs. There may be two other cells used for deceleration, based on TPS, engine rpm, and vehicle speed. The other twelve cells represent a manifold pressure and an rpm range. Six of the cells are high rpm and the other six are low rpm. Each of these cells has a specific MAP voltage range Typical Adaptive Memory Fuel Cells.

As the engine enters one of these cells the PCM looks at the amount of short term correction being used. Because the goal is to keep short term at 0 (O2 Sensor switching at 0.5 volt), long term will update in the same direction as short term correction was moving to bring the short term back to 0. Once short term is back at 0, this long term correction factor is stored in memory.

The values stored in long term adaptive memory are used for all operating conditions, including open loop and cold starting. However, the updating of the long term memory occurs after the engine has exceeded approximately 170°-190° F, with fuel control in closed loop and two minutes of engine run time. This is done to prevent any transitional temperature or start-up compensations from corrupting long term fuel correction.

Long term adaptive memory can change the pulse-width by as much as 25%, which means it can correct for all of short term. It is possible to have a problem that would drive long term to 25% and short term to another 25% for a total change of 50% away from base pulse-width calculation.

TYPICAL ADAPTIVE MEMORY FUEL CELLS

	Open Throttle	Open Throttle	Open Throttle	Open Throttle	Open Throttle	Open Throttle	Idle	Decel
Vacuum	20	17	13	9	5	0		
Above 1,984 rpm	1	3	5	7	9	11	13 Drive	15
Below 1,984 rpm	0	2	4	6	8	10	12 Neutral	14
MAP volt =	0	1.4	2.0	2.6	3.3	3.9		

Fuel Correction Diagnostics

There are two fuel correction diagnostic routines:

- Fuel System Rich
- Fuel System Lean

A DTC is set and the MIL is illuminated if the PCM detects either of these conditions. This is determined based on total fuel correction, short term times long term.

PROGRAMMABLE COMMUNICATIONS INTERFACE (PCI) BUS

DESCRIPTION

The Programmable Communication Interface Multiplex system (PCI Bus) consist of a single wire. The Body Control Module (BCM) acts as a splice to connect each module and the Data Link Connector (DLC) together. Each module is wired in parallel to the data bus through its PCI chip set and uses its ground as the bus reference. The wiring is a minimum 20 gage wire.

OPERATION

Various modules exchange information through a communications port called the PCI Bus. The Powertrain Control Module (PCM) transmits the Malfunction Indicator Lamp (Check Engine) On/Off signal and engine RPM on the PCI Bus. The PCM receives the Air Conditioning select input, transaxle gear position inputs over the PCI Bus. The PCM also receives the air conditioning evaporator temperature signal from the PCI Bus.

The following components access or send information on the PCI Bus.

FUEL INJECTION (Continued)

- Instrument Panel
- Body Control Module
- Air Bag System Diagnostic Module
- Full ATC Display Head (if equipped)
- ABS Module
- Transmission Control Module
- Powertrain Control Module
- Travel Module
- SKIM

SYSTEM DIAGNOSIS

OPERATION

The PCM can test many of its own input and output circuits. If the PCM senses a fault in a major system, the PCM stores a Diagnostic Trouble Code (DTC) in memory.

For DTC information see On-Board Diagnostics (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/POWERTRAIN CONTROL MODULE - DESCRIPTION) .

ACCELERATOR PEDAL

REMOVAL

(1) Remove the throttle cable from the throttle body cam as described in Throttle Cable of this section.

(2) Reach behind the top of the pedal shaft and push the retainer toward rear of vehicle (Fig. 1). It may be necessary to squeeze retainer ears together on dash side of pedal shaft.

(3) Lift cable up through slot in top of pedal shaft.

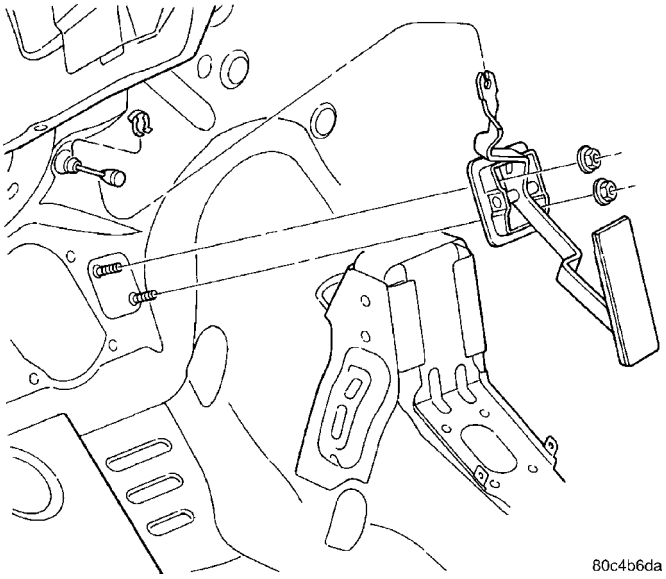

Fig. 1 Accelerator Pedal and Throttle Cable

(4) Remove nuts from accelerator pedal assembly studs. Remove assembly from vehicle.

INSTALLATION

(1) Position accelerator pedal assembly on dash panel. Install retaining nuts. Tighten retaining nuts to 12 N·m (105 in. lbs.) torque.

(2) Place cable through slot in top of pedal shaft.

(3) While holding pedal lever, Push retainer clip forward in vehicle engaging it into the pedal lever.

(4) Hold the throttle body lever in the wide open position and install the throttle cable.

ACCELERATOR PEDAL POSITION SENSOR - 1.6L

DESCRIPTION

The Accelerator Pedal Position Sensor (APPS) is a variable resistor that provides the PCM with an input signal (voltage) (Fig. 2). The signal represents throttle blade position. As the position of the accelerator pedal changes, the resistance of the APPS changes (Fig. 3).

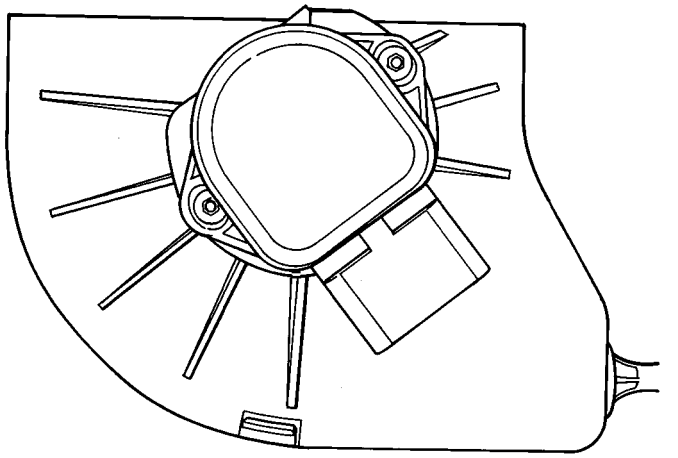

Fig. 2 APPS MODULE

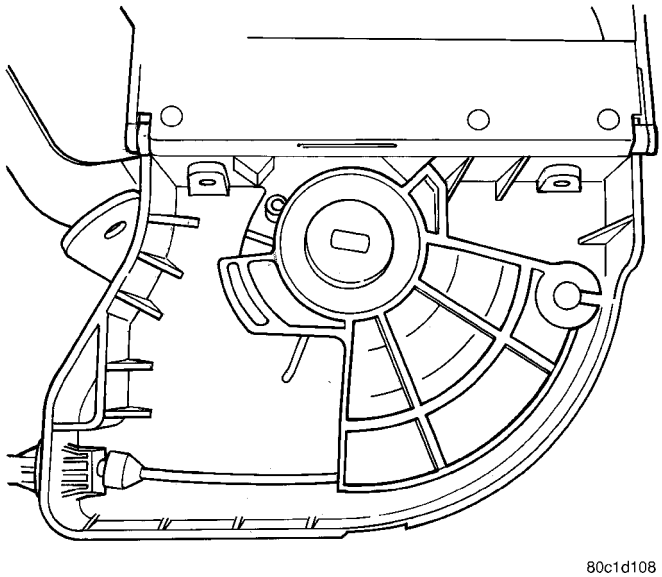

Fig. 3 ASSP MODULE OPEN

REMOVAL - LHD

(1) Remove the air cleaner cover.
(2) Disconnect the negative battery cable.
(3) Unlock the electrical connector and then disconnect the electrical connector from the module (Fig. 4).
(4) Remove the mounting bolt.
(5) Remove assembly from the mountng bracket.
(6) Open the APPS module cover and disconnect the cable from the cam and module.

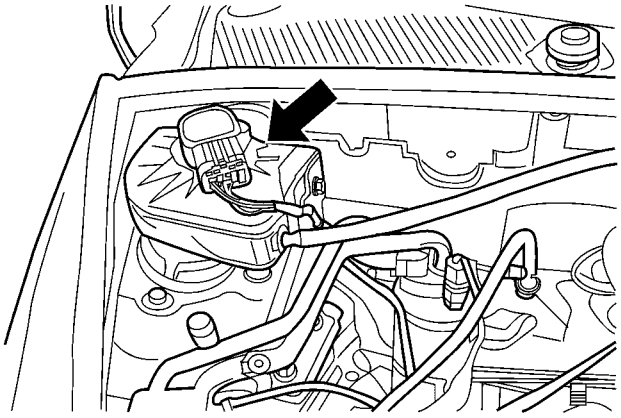

Fig. 4 PEDAL POSITION SENSOR

INSTALLATION - LHD

(1) Open APPS module and connect the cable (Fig. 4).
(2) Install APPS module.
(3) Tighten the mounting bolt.
(4) Connect the negative battery cable.
(5) Install the air cleaner cover.

CRANKSHAFT POSITION SENSOR

DESCRIPTION

The crankshaft position sensor mounts to the engine block near the starter (Fig. 5).

The PCM uses the Crankshaft Position sensor to calculate the following:

- Engine RPM
- TDC number 1 and 4
- Ignition coil synchronization
- Injector synchronization
- Camshaft-to-crankshaft misalignment (Timing belt skipped 1 tooth or more diagnostic trouble code).

OPERATION

The PCM sends approximately 5 volts to the Hall-effect sensor. This voltage is required to operate the Hall-effect chip and the electronics inside the sensor.

CRANKSHAFT POSITION SENSOR (Continued)

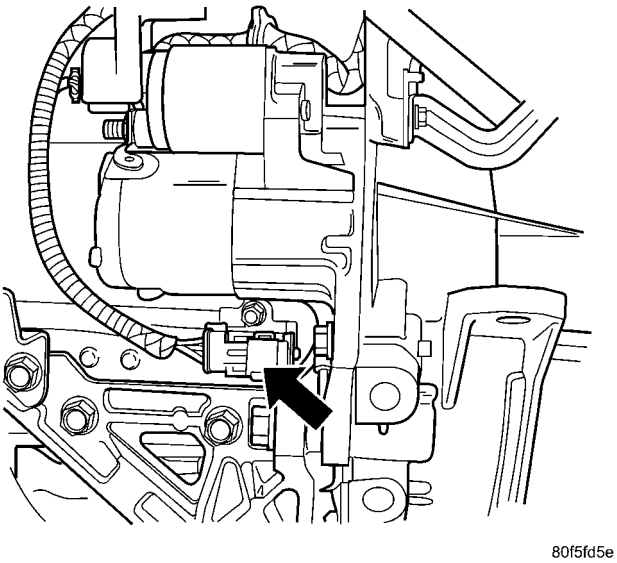

Fig. 5 Crankshaft Position Sensor

A ground for the sensor is provided through the sensor return circuit. The input to the PCM occurs on a 5 volt output reference circuit that operates as follows: The Hall-effect sensor contains a powerful magnet. As the magnetic field passes over the dense portion of the counterweight, the 5-volt signal is pulled to ground (.3 volts) through a transistor in the sensor. When the magnetic field passes over the notches in the crankshaft counterwieght, the magnetic field turns off the transistor in the sensor, causing the PCM to register the 5-volt signal. The PCM identifies crankshaft position by registering the change from 5 to 0 volts, as signaled from the Crankshaft Position sensor.

The PCM determines what cylinder to fire from the crankshaft position sensor (Fig. 6) input and the camshaft position sensor input. The #8 crankshaft counterweight has a target ring with 32 teeth and notches, including one long referance tooth and notch. From the crankshaft position sensor input the PCM determines engine speed and crankshaft angle (position).

REMOVAL

REMOVAL - 1.6L

(1) Disconnect the negative battery cable
(2) Raise vehicle and support.
(3) Disconnect the electrical connector (Fig. 7).
(4) Remove bolt from Crankshaft sensor.
(5) Remove sensor (Fig. 8).

REMOVAL - 2.0, 2.4, 2.4L TURBO

The Crankshaft Position Sensor is in the front of the engine block just under the starter motor (Fig. 9).

(1) Disconnect the negative battery cable.
(2) Raise vehicle and support.
(3) On **2.4L SRT-4** remove the lower inner cooler hose from the metal tube.

(4) Remove the Structural Collar (Fig. 10), refer to the Engine, Structural Collar Removal and Installation section.

(5) Unlock and disconnect the electrical connector to the crankshaft position sensor.

(6) Remove the crankshaft position sensor bolt.

(7) Remove the sensor (Fig. 11).

INSTALLATION

INSTALLATION - 1.6L

(1) Install the Crankshaft sensor (Fig. 7).

(2) Install bolt and tighten to 10 N·m (90 in. lbs.).

(3) Connect the electrical connector (Fig. 8).

(4) Lower vehicle.

(5) Connect the negative battery cable.

INSTALLATION - 2.0, 2.4, 2.4L Turbo

(1) Check o-ring for damage and lubricate the o-ring with engine oil before installing sensor (Fig. 11).

(2) Use a twisting motion when installing the sensor.

(3) Install and tighten the crankshaft position sensor bolt and tighten to 9 N·m (80 ±15 in. lbs.).

(4) Connect and lock the electrical connector to the crankshaft position sensor.

CRANKSHAFT POSITION SENSOR (Continued)

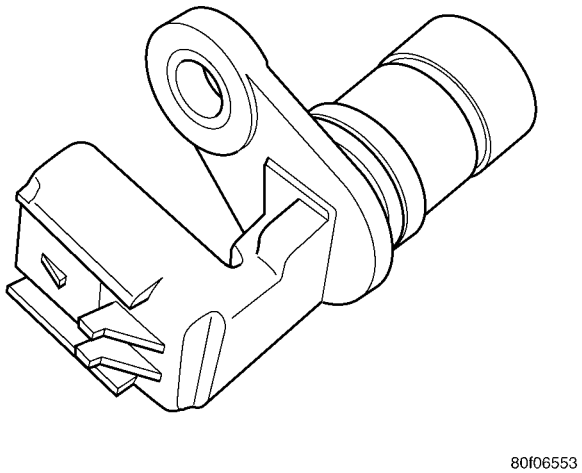

Fig. 11 CRANKSHAFT POSITION SENSOR - 2.4 L TURBO

(5) Install the Structural Collar, refer to the Engine, Structural Collar Removal and Installation section (Fig. 10).

(6) On **2.4L SRT-4** install the lower inner cooler hose to metal tube and tighten clamp.

(7) Lower vehicle.

(8) Connect the negative battery cable.

FUEL INJECTOR

DESCRIPTION

The injectors are positioned in the intake manifold with the nozzle ends directly above the intake valve port (Fig. 12).

OPERATION

The fuel injectors are 12 volt electrical solenoids (Fig. 13). The injector contains a pintle that closes off an orifice at the nozzle end. When electric current is supplied to the injector, the armature and needle move a short distance against a spring, allowing fuel to flow out the orifice. Because the fuel is under high pressure, a fine spray is developed in the shape of a hollow cone or two streams. The spraying action atomizes the fuel, adding it to the air entering the combustion chamber. Fuel injectors are not interchangeable between engines.

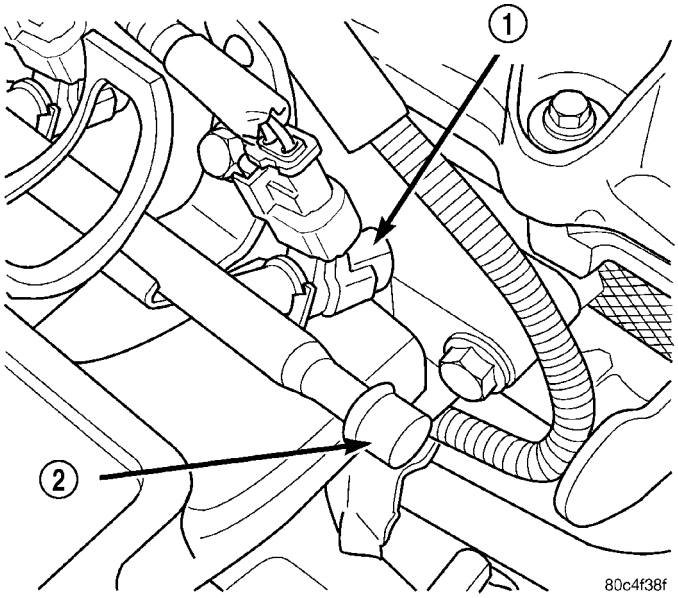

Fig. 12 Fuel Injector Location—Typical

1 - FUEL INJECTOR
2 - FUEL TEST PORT

The PCM provides battery voltage to each injector through the ASD relay. Injector operation is controlled by a ground path provided for each injector by the PCM. Injector on-time (pulse-width) is variable, and is determined by the PCM processing all the data previously discussed to obtain the optimum injector pulse width for each operating condition. The pulse width is controlled by the duration of the ground path provided.

FUEL INJECTOR (Continued)

STANDARD PROCEDURE

REMOVAL - INJECTOR CONNECTOR

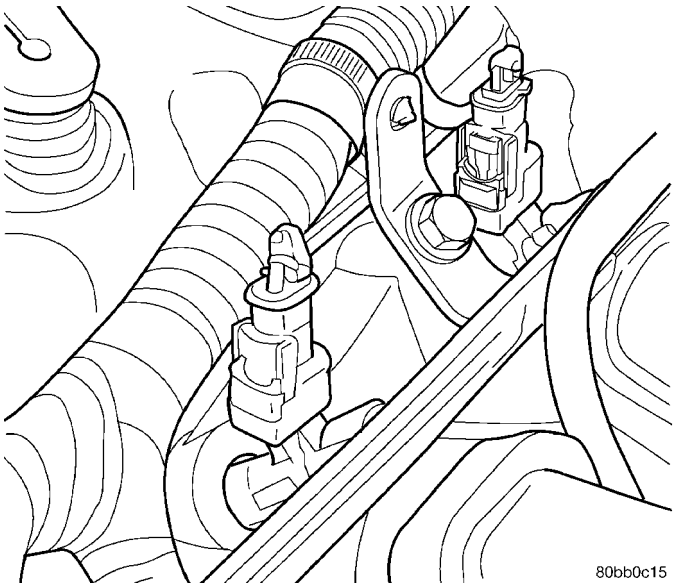

Fig. 14 Fuel Injectors

(1) Disconnect electrical connectors at the fuel injectors (Fig. 14). To remove connector refer to (Fig. 15). Pull the red colored slider away from injector (1). While pulling the slider, depress tab (2) and remove connector (3) from injector. The factory fuel injection wiring harness is numerically tagged (INJ 1, INJ 2, etc.) for injector position identification. If harness is not tagged, make note of wiring location before removal.

REMOVAL

REMOVAL - 2.0, 2.4L

WARNING: RELEASE FUEL SYSTEM PRESSURE BEFORE SERVICING FUEL SYSTEM COMPONENTS. SERVICE VEHICLES IN WELL VENTILATED AREAS AND AVOID IGNITION SOURCES. NEVER SMOKE WHILE SERVICING THE VEHICLE. THIS MAY RESULT IN PERSONAL INJURY OR DEATH.

(1) Release fuel system pressure. Refer to Fuel System Pressure Release procedure in this section.
(2) Remove the air cleaner lid, disconnect the inlet air temperature sensor and makeup air hose.
(3) Remove the negative battery cable.
(4) Remove the engine cover or throttle control shield if equipped.

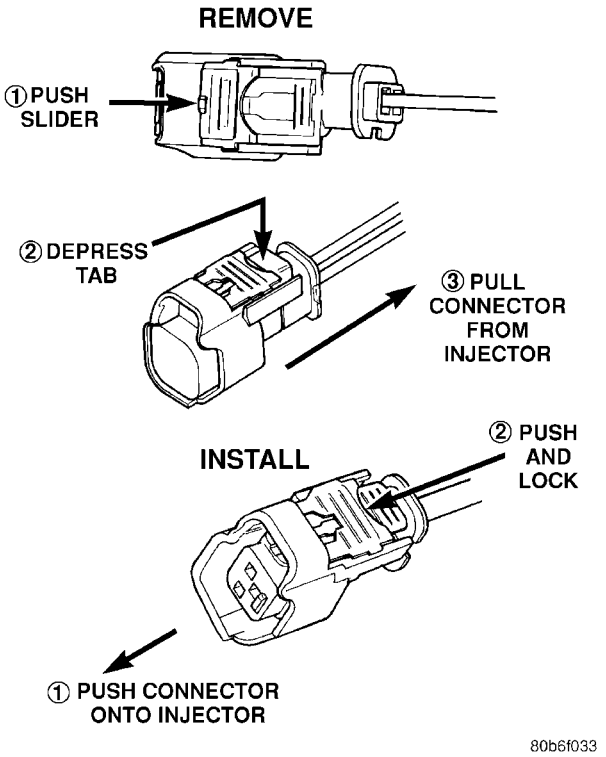

Fig. 15 Remove/Install Injector Connector

NOTE: WRAP SHOP TOWELS AROUND HOSE TO CATCH ANY GASOLINE SPILLAGE.

(5) Disconnect fuel supply tube from rail. Refer to Quick-Connect Fittings in this section.
(6) Remove the Intake Manifold, refer to the Engine section.
(7) Disconnect electrical connectors from fuel injectors.
(8) Remove bolts holding fuel rail (Fig. 16).
(9) Remove the fuel rail and injectors.
(10) Remove injectors from the fuel rail.

REMOVAL - 1.6L

WARNING: RELEASE FUEL SYSTEM PRESSURE BEFORE SERVICING FUEL SYSTEM COMPONENTS. SERVICE VEHICLES IN WELL VENTILATED AREAS AND AVOID IGNITION SOURCES. NEVER SMOKE WHILE SERVICING THE VEHICLE. THIS MAY RESULT IN PERSONAL INJURY OR DEATH.

(1) Release the fuel pressure, refer to the fuel pressure release procedure.
(2) Remove air cleaner assembly cover.
(3) Disconnect the negative battery cable.

FUEL INJECTOR (Continued)

INSTALLATION

INSTALLATION - 2.0, 2.4L

(1) Install the fuel injectors to the fuel rail.

(2) Apply a light coating of clean engine oil to the O-ring on the nozzle end of each injector.

(3) Insert fuel injector nozzles into openings in intake manifold. Seat the injectors in place. Tighten fuel rail bolts to 12 N·m (8 ft. lbs.) (Fig. 16).

(4) Attach electrical connectors to fuel injectors.

(5) Connect fuel supply tube to fuel rail. Refer to Quick Connect Fittings in the Fuel Delivery section

(6) Install Intake Manifold, refer to the Engine section.

(7) Install the engine cover or throttle control shield if equipped.

(8) Install the negative battery cable.

(9) Install the air cleaner lid, connect the inlet air temperature sensor and makeup air hose. Tighten air inlet tube clamps to 3 N·m ±1 (25 in. lbs. ±5) torque.

INSTALLATION - 1.6L

(1) Apply a light coating of clean engine oil to the upper O-ring.

(2) Install injector in cup on fuel rail.

(3) Install retaining clip.

(4) Apply a light coating of clean engine oil to the O-ring on the nozzle end of each injector.

(5) Insert fuel injector nozzles into openings in lower intake manifold (Fig. 19). Seat the injectors in place. Tighten fuel rail mounting screws to 22.5 N·m ± 3 N·m (200±30 in. lbs.).

(6) Attach electrical connectors to fuel injectors (Fig. 17), refer to the fuel injector connector section for electrical connector installation.

(7) Connect fuel supply tube to fuel rail (Fig. 18). Refer to Quick Connect Fittings in the Fuel Delivery Section of this Group.

(8) Install the wiring harness to the fuel rail brackets.

(9) Connect the negative battery cable.

(10) Use the DRB scan tool ASD Fuel System Test to pressurize the fuel system. Check for leaks.

(11) Install air cleaner assembly cover.

INSTALLATION - 2.4L TURBO

(1) Apply a light coating of clean engine oil to the upper O-ring.

(2) Install injector in cup on fuel rail.

(3) Install retaining clip.

(4) Install the fuel injectors to the fuel rail (Fig. 25).

(5) Apply a light coating of clean engine oil to the O-ring on the nozzle end of each injector.

(6) Insert fuel injector nozzles into openings in intake manifold. Seat the injectors in place.

(7) Install the 2 bolts to the fuel rail (Fig. 24). Tighten fuel rail bolts to 22.5 ±3 N·m (200 ±30 in. lbs.)

(8) Install the wiring harness to the fuel rail (Fig. 24).

(9) Connect and lock the electrical connectors to the fuel injectors.

(10) Connect the fuel line to the fuel rail (Fig. 23). Refer to Quick Connect Fittings in the Fuel Delivery Section of this Group.

(11) Rotate the assembly back into place and install the 2 bolts to the thermostat housing tighten to 12.5 N·m (110 in. lbs.).

(12) Move the upper radiator house clamp back into place (Fig. 19).

(13) Install the 2 small hoses to the thermostat housing (Fig. 20).

(14) Fill the Coolant system, refer to the Cooling section for more information.

(15) Install the intake manifold, refer to the Engine section.

(16) Install the 2 bolts to the rear of the intake manifold (Fig. 17) tighten to 28 N·m (250 in. lbs.).

(17) Install the 5 bolts to the front of the intake manifold and tighten to 28 N·m (250 in. lbs.).

(18) Install the vacuum lines to the rear of the intake manifold (Fig. 17).

(19) Connect and lock the MAP sensor electrical connector (Fig. 16).

(20) Install the cables to the throttle body bracket.

(21) Install the throttle and speed control cables to the throttle body.

(22) Install the throttle control shield (Fig. 15).

(23) Connect and lock the electrical connections at the throttle body (Fig. 14).

(24) Connect the purge hose to the throttle body (Fig. 14).

(25) Connect the throttle body inlet hose to the throttle body (Fig. 14) and tighten clamps to 3 N·m ±1 (25 in. lbs. ±5) torque.

(26) Connect the negative battery cable.

(27) Use the DRB scan tool ASD Fuel System Test to pressurize the fuel system. Check for leaks.

FUEL PUMP RELAY

DESCRIPTION

The fuel pump relay is located in the PDC. The inside top of the PDC cover has a label showing relay and fuse location.

OPERATION

The fuel pump relay supplies battery voltage to the fuel pump. A buss bar in the Power Distribution Center (PDC) supplies voltage to the solenoid side and

FUEL PUMP RELAY (Continued)

contact side of the relay. The fuel pump relay power circuit contains a fuse between the buss bar in the PDC and the relay. The fuse is located in the PDC. Refer to the Wiring Diagrams for circuit information.

The PCM controls the fuel pump relay by switching the ground path for the solenoid side of the relay on and off. The PCM turns the ground path off when the ignition switch is in the Off position. When the ignition switch is in the On position, the PCM energizes the fuel pump. If the crankshaft position sensor does not detect engine rotation, the PCM de-energizes the relay after approximately one second.

IDLE AIR CONTROL MOTOR

DESCRIPTION

The Idle Air Control (IAC) motor is mounted on the throttle body. The PCM operates the idle air control motor (Fig. 32) or (Fig. 33).

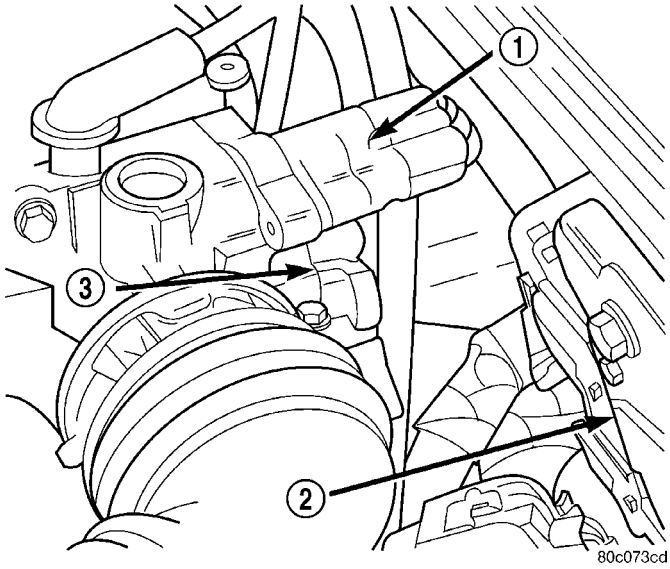

Fig. 32 Idle Air Control Motor—2.4L

1 - IAC
2 - PCM
3 - TPS

OPERATION

The PCM adjusts engine idle speed through the idle air control valve to compensate for engine load, coolant temperature or barometric pressure changes.

The throttle body has an air bypass passage that provides air for the engine during closed throttle idle. The idle air control valve regulates air flow through the bypass passage.

The PCM controls engine idle speed by adjusting the position of the idle air control valve. The adjustments are based on inputs the PCM receives. The inputs are from the throttle position sensor, crankshaft position sensor, coolant temperature sensor,

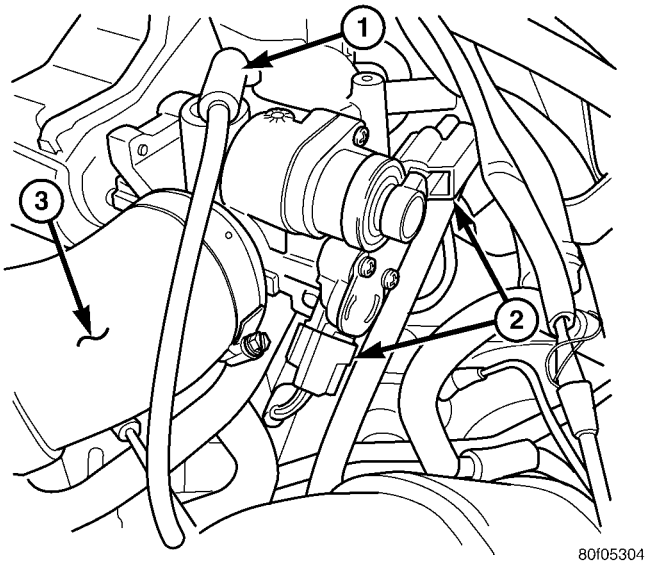

Fig. 33 THROTTLE BODY CONNECTIONS - 2.4L TURBO

1 - Purge Hose
2 - Electrical Connections
3 - Inlet Hose

MAP sensor, vehicle speed sensor and various switch operations (brake, park/neutral, air conditioning).

When engine rpm is above idle speed, the IAC is used for the following functions:

- Off-idle dashpot
- Deceleration air flow control
- A/C compressor load control (also opens the passage slightly before the compressor is engaged so that the engine rpm does not dip down when the compressor engages)

Target Idle

Target idle is determined by the following inputs:

- Gear position
- ECT Sensor
- Battery voltage
- Ambient/Battery Temperature Sensor
- VSS
- TPS
- MAP Sensor

REMOVAL

When servicing throttle body components, always reassemble components with new O-rings and seals where applicable. Never use lubricants on O-rings or seals, damage may result. If assembly of component is difficult, use water to aid assembly.

(1) Disconnect negative cable from battery.

(2) Remove electrical connector from idle air control motor.

(3) Remove idle air control motor mounting screws.

IDLE AIR CONTROL MOTOR (Continued)

(4) Remove motor from throttle body. Ensure the O-rings is removed with the motor.

INSTALLATION

When servicing throttle body components, always reassemble components with new O-rings and seals where applicable. Never use lubricants on O-rings or seals, damage may result. If assembly of component is difficult, **a light coat of engine oil may be applied to the O-RINGS ONLY (Fig. 34)** to aid assembly.

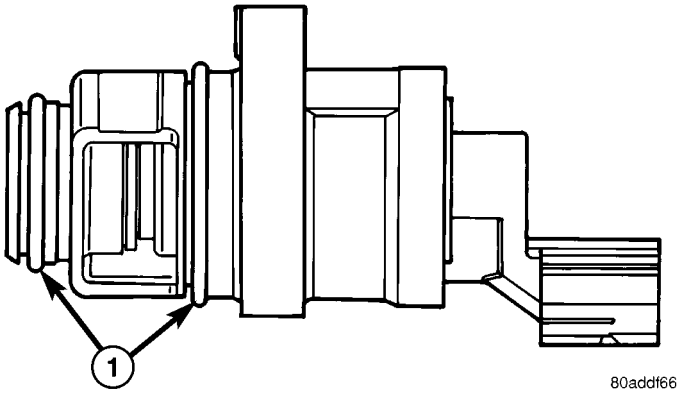

Fig. 34 O-RINGS

1 - O-rings

(1) The new idle air control motor has a new O-ring installed on it.

(2) Carefully place idle air control motor into throttle body.

(3) Install mounting screw. Tighten screw to 7 N·m (62 in. lbs.) torque.

(4) Connect electrical connector to idle air control motor.

(5) Connect negative cable to battery.

INLET AIR TEMPERATURE SENSOR

DESCRIPTION

The IAT Sensor is a Negative Temperature Coefficient (NTC) Sensor that provides information to the PCM regarding the temperature of the air entering the intake manifold (Fig. 35).

REMOVAL

The sensor is located in the clean air duct.

(1) Unlatch or unbolt the air cleaner lid.

(2) Lift air cleaner lid and reposition.

(3) Disconnect the negative battery cable.

(4) Disconnect electrical connector from the sensor (Fig. 35).

(5) Remove the sensors.

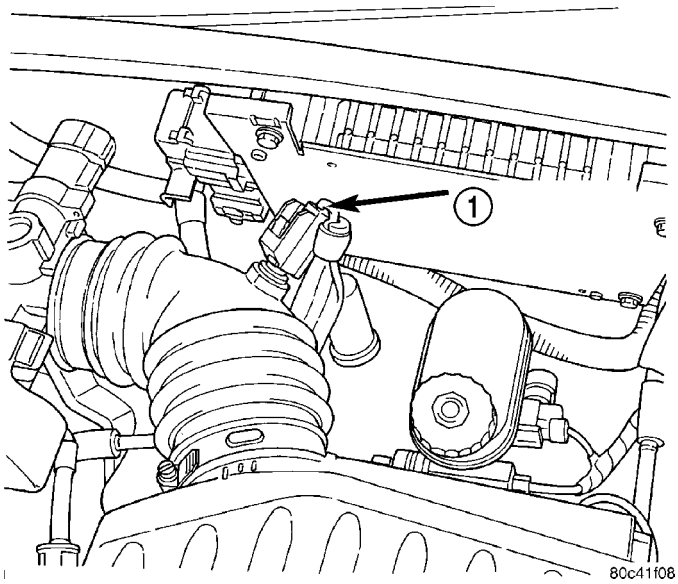

Fig. 35 Inlet Air Temperature Sensor

1 - INLET AIR TEMPERATURE SENSOR

INSTALLATION

The sensors is in the air inlet tube.

(1) Install sensor.

(2) Attach electrical connector to sensor.

(3) Connect the negative battery cable.

(4) Install the air cleaner lid..

MAP SENSOR

DESCRIPTION

The MAP sensor mounts to the intake manifold (Fig. 36).

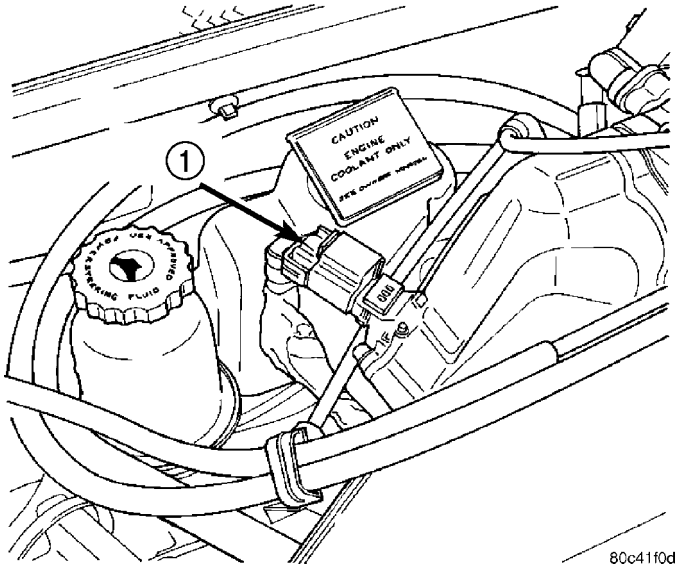

Fig. 36 MAP Sensor

1 - MAP SENSOR

MAP SENSOR (Continued)

OPERATION

The MAP serves as a PCM input, using a silicon based sensing unit, to provide data on the manifold vacuum that draws the air/fuel mixture into the combustion chamber. The PCM requires this information to determine injector pulse width and spark advance. When MAP equals Barometric pressure, the pulse width will be at maximum.

Also like the cam and crank sensors, a 5 volt reference is supplied from the PCM and returns a voltage signal to the PCM that reflects manifold pressure. The zero pressure reading is 0.5V and full scale is 4.5V. For a pressure swing of 0 — 15 psi the voltage changes 4.0V. The sensor is supplied a regulated 4.8 to 5.1 volts to operate the sensor. Like the cam and crank sensors ground is provided through the sensor return circuit.

The MAP sensor input is the number one contributor to pulse width. The most important function of the MAP sensor is to determine barometric pressure. The PCM needs to know if the vehicle is at sea level or is it in Denver at 5000 feet above sea level, because the air density changes with altitude. It will also help to correct for varying weather conditions. If a hurricane was coming through the pressure would be very, very low or there could be a real fair weather, high pressure area. This is important because as air pressure changes the barometric pressure changes. Barometric pressure and altitude have a direct inverse correlation, as altitude goes up barometric goes down. The first thing that happens as the key is rolled on, before reaching the crank position, the PCM powers up, comes around and looks at the MAP voltage, and based upon the voltage it sees, it knows the current barometric pressure relative to altitude. Once the engine starts, the PCM looks at the voltage again, continuously every 12 milliseconds, and compares the current voltage to what it was at key on. The difference between current and what it was at key on is manifold vacuum.

During key On (engine not running) the sensor reads (updates) barometric pressure. A normal range can be obtained by monitoring known good sensor in you work area.

As the altitude increases the air becomes thinner (less oxygen). If a vehicle is started and driven to a very different altitude than where it was at key On the barometric pressure needs to be updated. Any time the PCM sees Wide Open throttle, based upon TPS angle and RPM it will update barometric pressure in the MAP memory cell. With periodic updates, the PCM can make its calculations more effectively.

The PCM uses the MAP sensor to aid in calculating the following:

- Barometric pressure
- Engine load
- Manifold pressure
- Injector pulse-width
- Spark-advance programs
- Shift-point strategies (F4AC1 transmissions only, via the PCI bus)
- Idle speed
- Decel fuel shutoff

The PCM recognizes a decrease in manifold pressure by monitoring a decrease in voltage from the reading stored in the barometric pressure memory cell. The MAP sensor is a linear sensor; as pressure changes, voltage changes proportionately. The range of voltage output from the sensor is usually between 4.6 volts at sea level to as low as 0.3 volts at 26 in. of Hg. Barometric pressure is the pressure exerted by the atmosphere upon an object. At sea level on a standard day, no storm, barometric pressure is 29.92 in Hg. For every 100 feet of altitude barometric pressure drops .10 in. Hg. If a storm goes through it can either add, high pressure, or decrease, low pressure, from what should be present for that altitude. You should make a habit of knowing what the average pressure and corresponding barometric pressure is for your area.

REMOVAL

REMOVAL - 2.0, 2.4, 2.4L TURBO

The MAP sensor attaches to the intake manifold plenum (Fig. 37).

(1) Remove the air cleaner lid and makeup air hose.

(2) Remove the negative battery cable.

(3) Disconnect the electrical connector from the MAP sensor.

(4) Remove sensor mounting screws.

(5) Remove sensor.

REMOVAL - 1.6L

(1) Remove the air cleaner cover.

(2) Disconnect the negative battery cable.

(3) Disconnect the electrical connector from the MAP sensor (Fig. 38).

(4) Remove the screws from the MAP sensor.

(5) Remove the MAP sensor.

INSTALLATION

INSTALLATION - 2.0, 2.4, 2.4L Turbo

The MAP sensor attaches to the intake manifold plenum (Fig. 37).

(1) Insert sensor into intake manifold while making sure not to damage O-ring seal.

(2) Tighten mounting screws to 2 N·m (20 in. lbs) torque for plastic manifold.

MAP SENSOR (Continued)

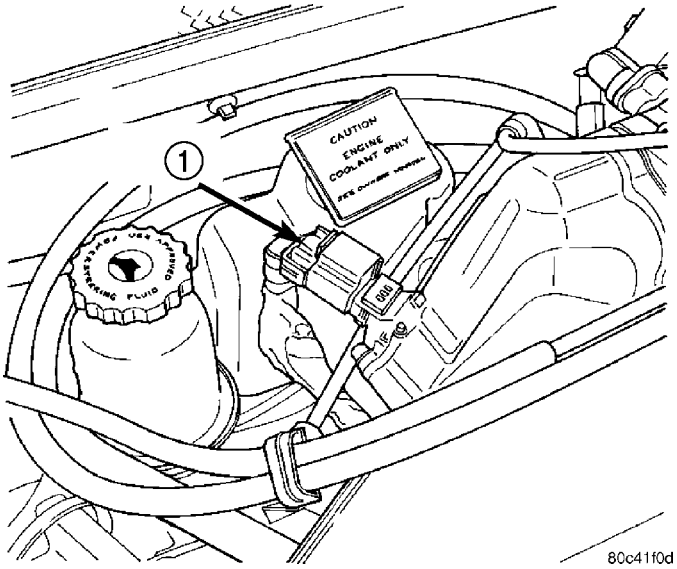

Fig. 37 MAP Sensor

1 - MAP SENSOR

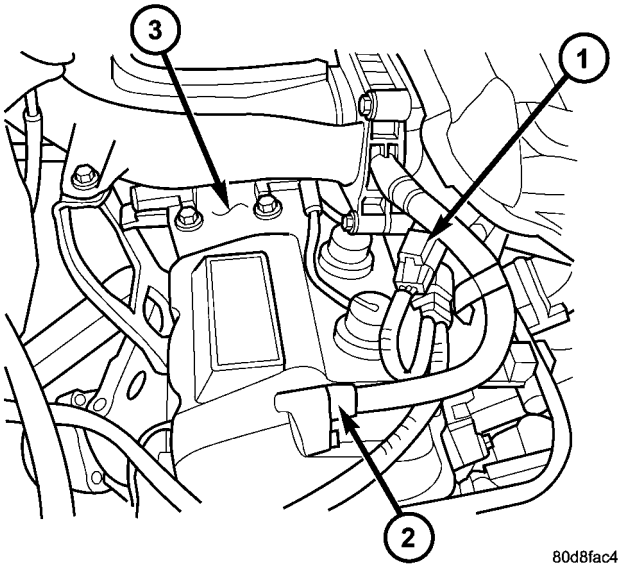

Fig. 38 IGNITION COIL, PCV, MAP SENSOR

1 - MAP Sensor
2 - PCV valve
3 - Ignition Coil

(3) Attach electrical connector to sensor.
(4) Install the negative battery cable.
(5) Install the air cleaner lid and makeup air hose.

INSTALLATION - 1.6L

(1) Make sure that the manifold is clean.
(2) Install sensor to manifold (Fig. 38).
(3) Tighten screws.
(4) Connect the electrical connetor to the sensor.
(5) Connect the negative battery cable
(6) Install the air cleaner cover.

O2 SENSOR

DESCRIPTION

The upstream oxygen sensor (Fig. 41) threads into the outlet flange of the exhaust manifold (Fig. 39).

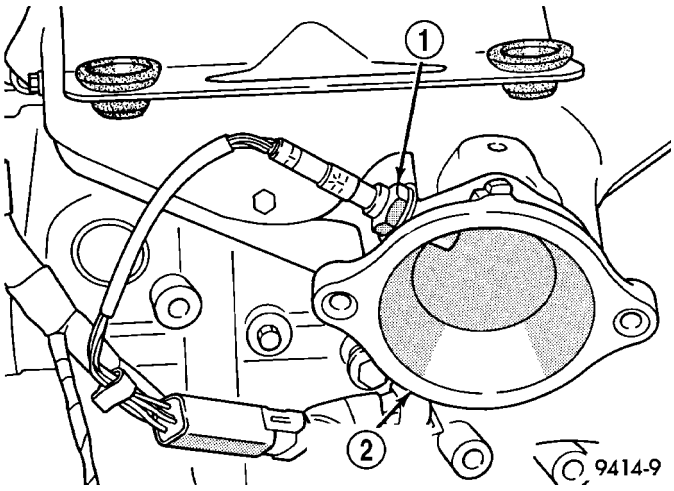

Fig. 39 Upstream Heated Oxygen Sensor 1/1

1 - OXYGEN SENSORS
2 - EXHAUST MANIFOLD

The downstream heated oxygen sensor threads into the system depending on emission package (Fig. 40). Federal package the O2s is mounted after the catalytic convertor.

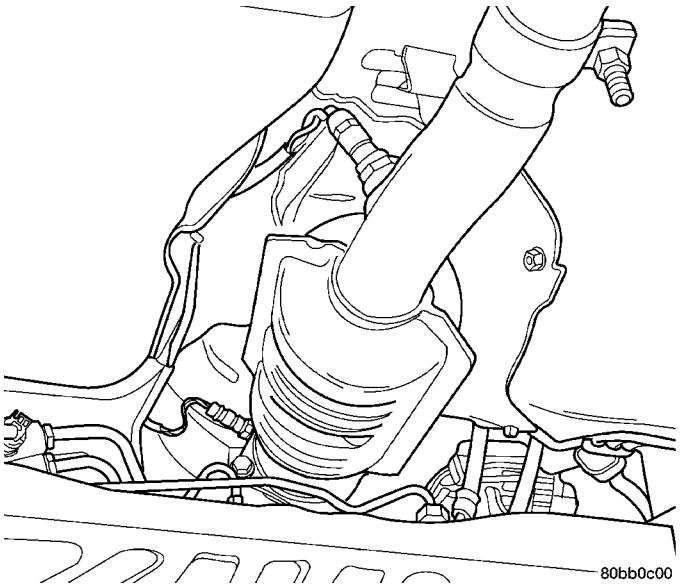

Fig. 40 Downstream Heated Oxygen Sensor 1/2

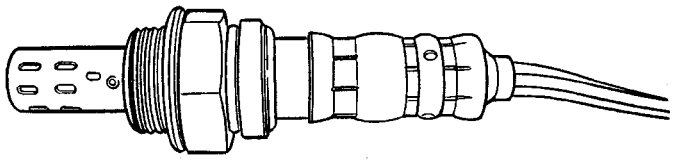
OPERATION

A seperate upstream and downstream grounds are used on the NGC vehicles (4 Cyl.).

As vehicles accumulate mileage, the catalytic convertor deteriorates. The deterioration results in a less efficient catalyst. To monitor catalytic convertor

O2 SENSOR (Continued)



80f62857

Fig. 41 NGK O2 Sensors

deterioration, the fuel injection system uses two heated oxygen sensors. One sensor upstream of the catalytic convertor, one downstream of the convertor. The PCM compares the reading from the sensors to calculate the catalytic convertor oxygen storage capacity and converter efficiency. Also, the PCM uses the upstream heated oxygen sensor input when adjusting injector pulse width.

When the catalytic converter efficiency drops below emission standards, the PCM stores a diagnostic trouble code and illuminates the malfunction indicator lamp (MIL).

The O2 sensors produce a constant 2.5 volts on NGC vehicles, depending upon the oxygen content of the exhaust gas. When a large amount of oxygen is present (caused by a lean air/fuel mixture, can be caused by misfire and exhaust leaks), the sensors produces a low voltage. When there is a lesser amount of oxygen present (caused by a rich air/fuel mixture, can be caused by internal engine problems) it produces a higher voltage. By monitoring the oxygen content and converting it to electrical voltage, the sensors act as a rich-lean switch.

The oxygen sensors are equipped with a heating element that keeps the sensors at proper operating temperature during all operating modes. Maintaining correct sensor temperature at all times allows the system to enter into closed loop operation sooner. Also, it allows the system to remain in closed loop operation during periods of extended idle.

In Closed Loop operation the PCM monitors the O2 sensors input (along with other inputs) and adjusts the injector pulse width accordingly. During Open Loop operation the PCM ignores the O2 sensor input. The PCM adjusts injector pulse width based on preprogrammed (fixed) values and inputs from other sensors.

NGC Controller - Has a common ground for the heater in the O2S. 12 volts is supplied to the heater in the O2S by the NGC controller. Both the upstream and downstream O2 sensors for NGC are pulse width modulation (PWM). **NOTE**: When replacing an O2 Sensor, the PCM RAM memory must be cleared, either by disconnecting the PCM C-1 connector or momentarily disconnecting the Battery negative terminal. The NGC learns the characteristics of each O2 heater element and these old values should be cleared when installing a new O2 sensor. The customer may experience driveability issues if this is not performed.

UPSTREAM OXYGEN SENSOR

The input from the upstream heated oxygen sensor tells the PCM the oxygen content of the exhaust gas. Based on this input, the PCM fine tunes the air-fuel ratio by adjusting injector pulse width.

The sensor input switches from 2.5 to 3.5 volt, depending upon the oxygen content of the exhaust gas in the exhaust manifold. When a large amount of oxygen is present (caused by a lean air-fuel mixture), the sensor produces voltage as low as 2.5 volt. When there is a lesser amount of oxygen present (rich air-fuel mixture) the sensor produces a voltage as high as 3.5 volt. By monitoring the oxygen content and converting it to electrical voltage, the sensor acts as a rich-lean switch.

The heating element in the sensor provides heat to the sensor ceramic element. Heating the sensor allows the system to enter into closed loop operation sooner. Also, it allows the system to remain in closed loop operation during periods of extended idle.

In Closed Loop, the PCM adjusts injector pulse width based on the upstream heated oxygen sensor input along with other inputs. In Open Loop, the PCM adjusts injector pulse width based on preprogrammed (fixed) values and inputs from other sensors.

DOWNSTREAM OXYGEN SENSOR

The downstream heated oxygen sensor input is used to detect catalytic convertor deterioration. As the convertor deteriorates, the input from the downstream sensor begins to match the upstream sensor input except for a slight time delay. By comparing the downstream heated oxygen sensor input to the input from the upstream sensor, the PCM calculates catalytic convertor efficiency. Also used to establish the upstream O2 goal voltage (switching point).

THROTTLE BODY

DESCRIPTION

The throttle body mounts to the intake manifold. The throttle position sensor and idle air control motor attach to the throttle body (Fig. 50).

OPERATION

Filtered air from the air cleaner enters the intake manifold through the throttle body. The throttle body contains an air control passage controlled by an Idle Air Control (IAC) motor. The air control passage is used to supply air for idle conditions. A throttle valve (plate) is used to supply air for above idle conditions.

Certain sensors are attached to the throttle body. The accelerator pedal cable, speed control cable are connected to the throttle body cam.

A (factory adjusted) set screw is used to mechanically limit the position of the throttle body throttle plate. **Never attempt to adjust the engine idle speed using this screw.** All idle speed functions are controlled by the PCM.

THROTTLE BODY (Continued)

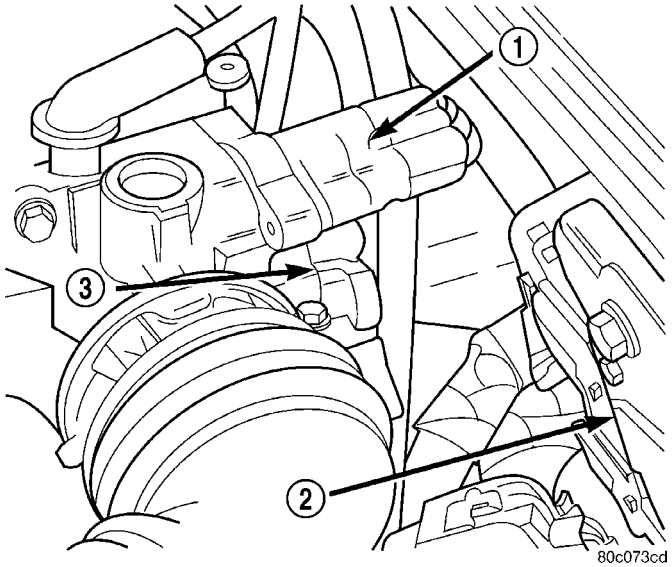

Fig. 50 Throttle Body—2.4L Engines

REMOVAL

REMOVAL - 2.0, 2.4L

(1) Remove the air cleaner lid, disconnect the inlet air temperature sensor and makeup air hose.

(2) Remove the negative battery cable.

(3) Remove the engine cover or throttle control shield if equipped.

(4) Remove throttle cable from the throttle body cam (Fig. 51)and (Fig. 52).

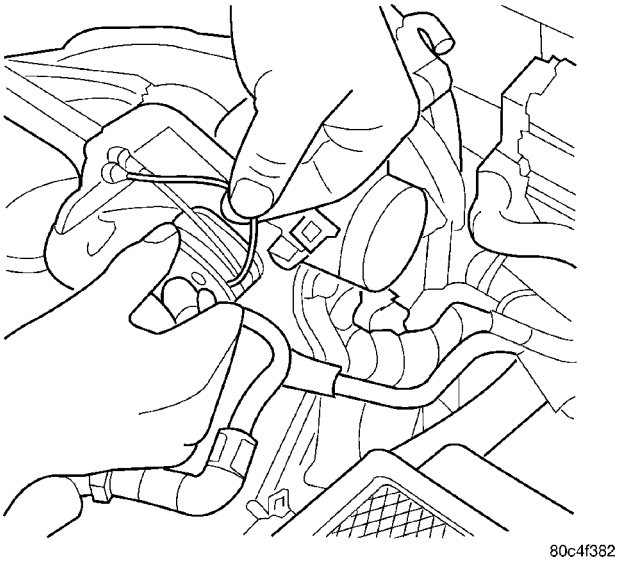

Fig. 51 Throttle Cable Attachment to Throttle Body

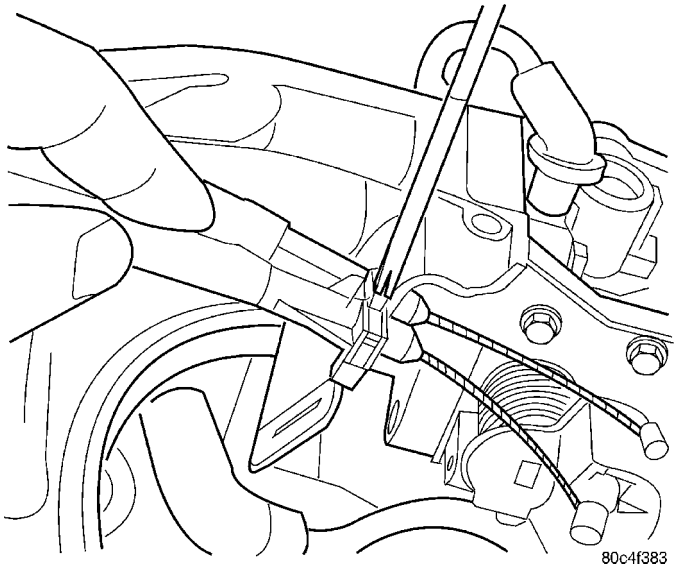

Fig. 52 Disconnecting Throttle Cable

(5) Lift the retaining tabs on the cable and slide cable out of bracket.

(6) If equipped with speed control, remove speed control cable from throttle lever by sliding clasp out hole used for throttle cable.

(7) Remove EVAP purge hose from nipple on throttle body.

(8) Remove the electrical connectors from the throttle position sensor and idle air control motor.

(9) Remove 2 screws holding cable mounting bracket and support bracket.

(10) Remove throttle body mounting bolts (Fig. 53).

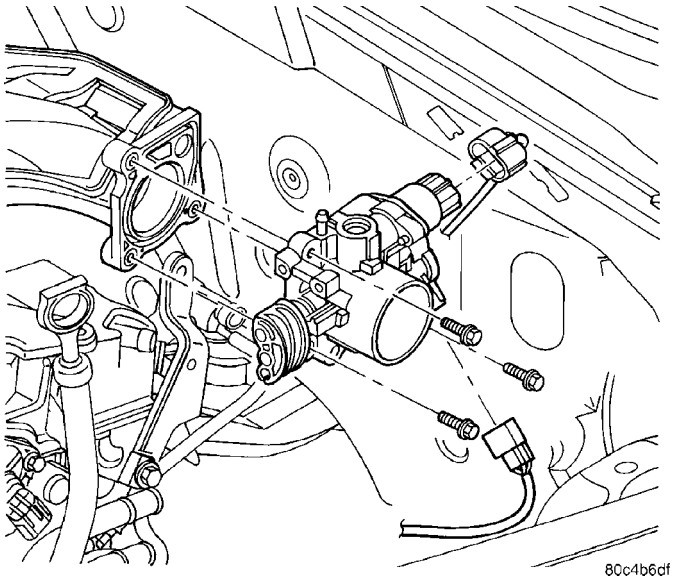

Fig. 53 Throttle Body Bolts

THROTTLE BODY (Continued)

(11) Lift throttle body straight up and away to remove the throttle body (Fig. 54).

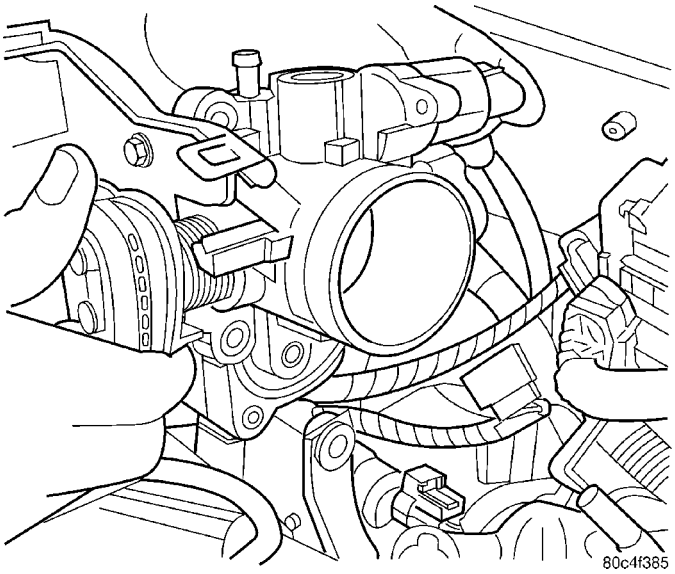

Fig. 54 Throttle Body Removal/Installation

REMOVAL - 1.6L

If any components on the throttle body are bad, the throttle body has to be replaced, except the seal to the intake manifold. There is no serviceable component on the throttle body.

(1) Remove air cleaner cover.
(2) Disconnect the negative battery cable.
(3) Disconnect the electrical connetor (Fig. 55).
(4) Remove the purge hose from throttle body.

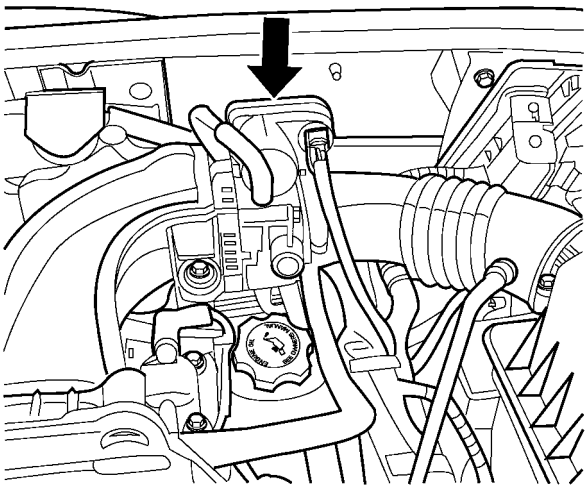

Fig. 55 THROTTLE BODY

(5) Remove the 4 bolts from throttle body (Fig. 56).
(6) Remove throttle body.

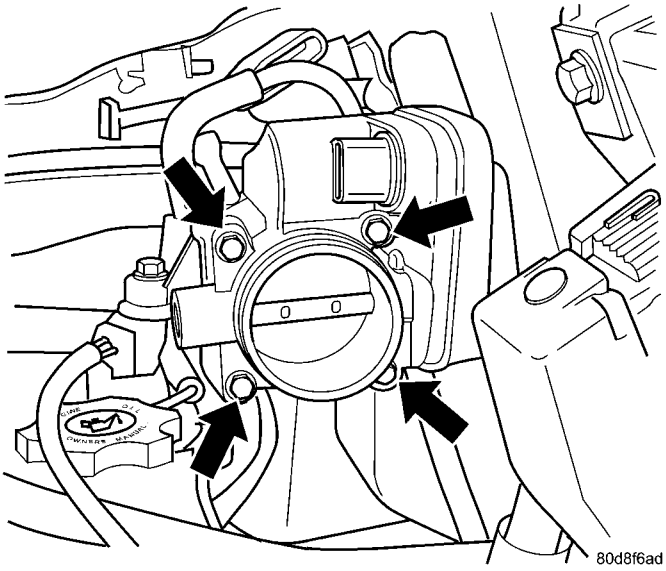

Fig. 56 THROTTLE BODY BOLTS

REMOVAL - 2.4L TURBO

(1) Disconnect the negative battery cable.
(2) Unlock and disconnect the electrical connector for the inlet air temperature sensor.
(3) Unlock and disconnect the electrical connectors from the idle air control motor and throttle position sensor.
(4) Remove the throttle control shield (Fig. 57).

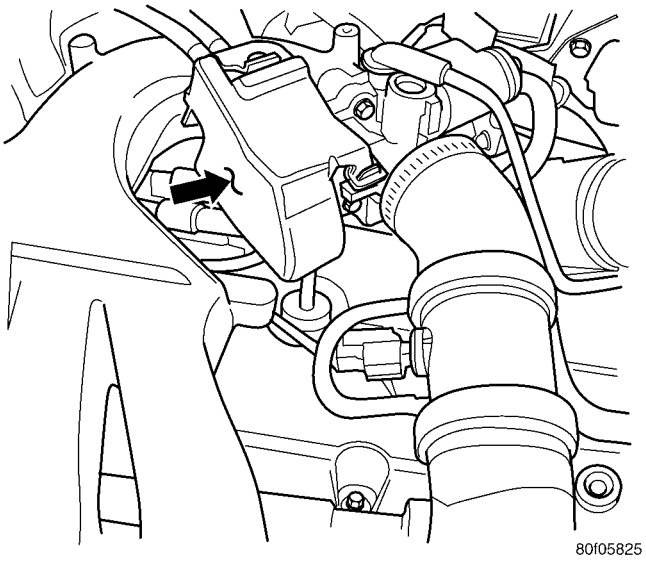

Fig. 57 THROTTLE CONTROL SHIELD - 2.4L TURBO

(5) Remove the throttle cable from the throttle body cam (Fig. 58).
(6) If equipped with speed control, remove speed control cable from the throttle cam by sliding clasp out hole used for throttle cable.

THROTTLE BODY (Continued)

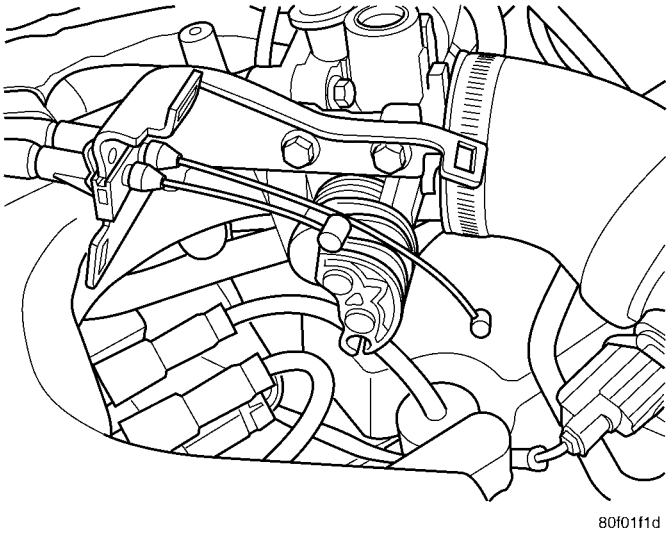

Fig. 58 THROTTLE CABLES

(7) Remove the 2 screws for the throttle cable bracket.

(8) Remove bracket (Fig. 59).

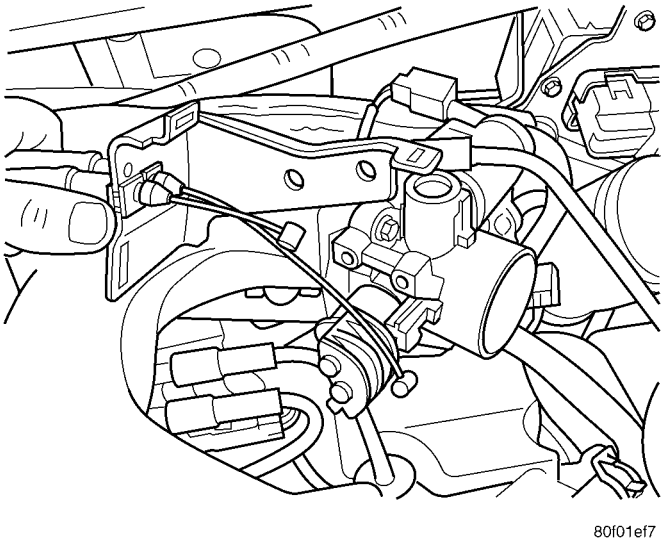

Fig. 59 THROTTLE CABLE BRACKET

(9) Disconnect the throttle body inlet hose and remove from throttle body.

(10) Disconnect the purge hose from the throttle body.

(11) Remove the 3 bolts from the throttle body (Fig. 60).

(12) Remove the throttle body (Fig. 61).

(13) Clean and replace gasket (Fig. 62).

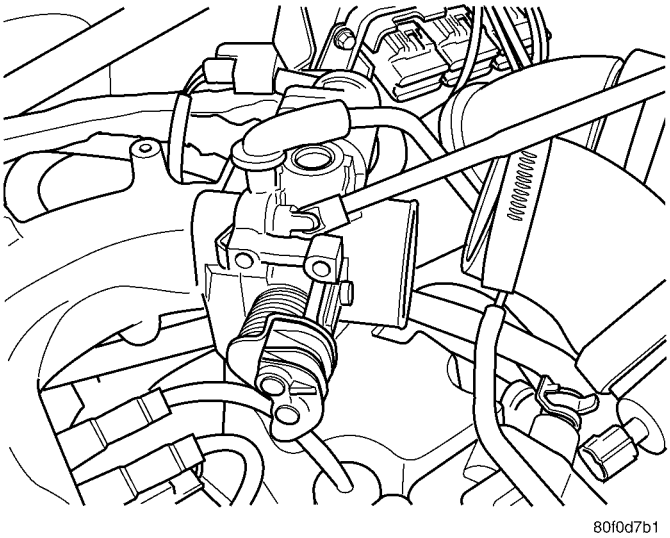

Fig. 60 THROTTLE BODY BOLTS - 2.4L TURBO

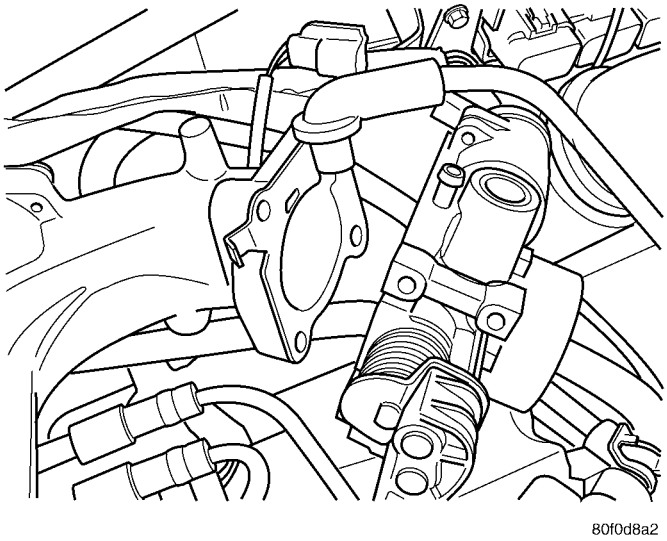

Fig. 61 THROTTLE BODY - 2.4L TURBO

INSTALLATION

INSTALLATION - 2.0, 2.4L

(1) Attach electrical connectors to idle air control motor and throttle position sensor.

(2) Make sure that the throttle body gasket is in place in the manifold.

(3) Position throttle body on intake and install mounting bolts (Fig. 54). Do Not tighten bolts at this time.

(4) Install throttle cable bracket. Do Not tighten bolts at this time.

(5) Tighten throttle body bolts to 11.8 ±2.25 N·m (105 ±20 in. lbs.) torque.

THROTTLE BODY (Continued)

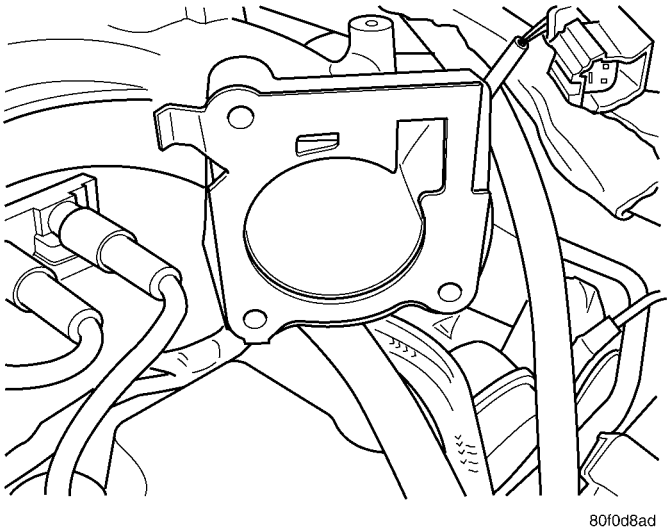

Fig. 62 THROTTLE BODY GASKET- 2.4L TURBO

(6) Tighten throttle cable bracket bolts to 11.8 ±2.25 N·m (105 ±20 in. lbs.) torque.

(7) Install EVAP purge hose to throttle body nipple.

(8) Install cable housing(s) retainer tabs into bracket (Fig. 52).

(9) Install throttle body cables by rotating the throttle cam forward to the wide open position (Fig. 51).

(10) Install throttle control shield.

(11) Install the negative battery cable.

(12) Install the air cleaner lid, connect the inlet air temperature sensor and makeup air hose.

INSTALLATION - 1.6L

NOTE: The electrical connector must be pointed toward the front of vehicle and purge nipple must be in the up position for proper orientation of the throttle body.

(1) Make sure that the mating surfaces for the throttle body and intake manifold are clean.

(2) When installing the throttle body making sure that the gasket is installed in the throttle body (Fig. 63) and (Fig. 64). Align the tabs on the manifold to the pin alignment slots in throttle body, make sure that the purge nipple is pointed up and electrical connector are pointed toward the front of vehicle.

(3) Install throttle, install so that the purge nipple is pointing up. The locating tabs (Fig. 65) on the upper intake will locate the throttle body in the proper orientation.

(4) Install the 4 bolts (Fig. 56) and tighten the bolts in a cross pattern to 11.8 N·m (105 in. lbs.).

(5) Install the purge hose.

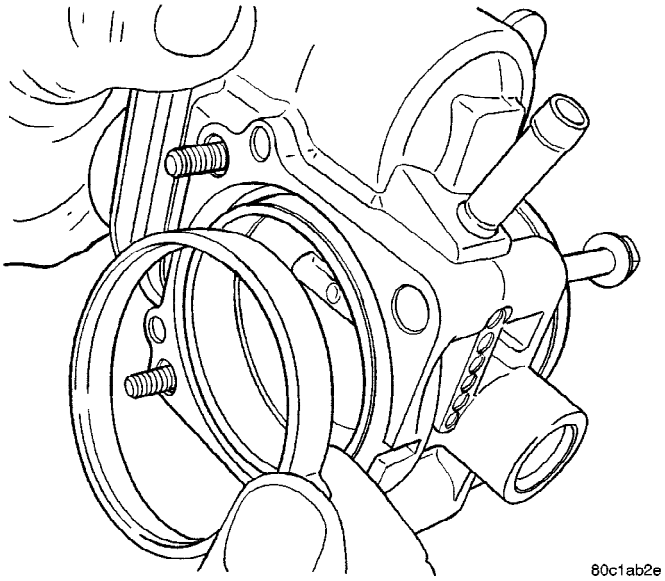

Fig. 63 THROTTLE BODY SEAL

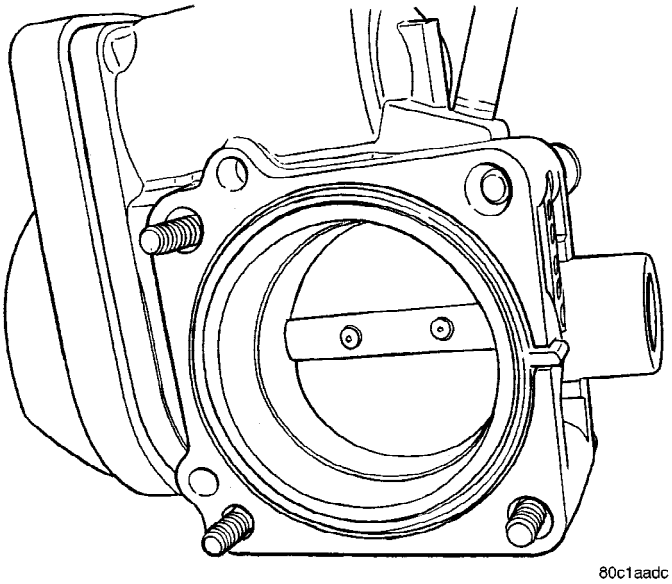

Fig. 64 THROTTLE BODY SEAL INSTALLED

(6) Connect the electrical connector (Fig. 55).

(7) Connect the negative battery cable.

(8) Install the air cleaner cover.

INSTALLATION - 2.4L TURBO

(1) Discard old gasket and clean intake manifold surface (Fig. 62).

(2) Install the throttle body (Fig. 61).

(3) Install the 3 bolts to the throttle body and tighten to N·m 11.8 ±20 (105 in. lbs.) (Fig. 60).

(4) Connect the purge hose to the throttle body.

(5) Connect the throttle body inlet hose to the throttle body and tighten clamp.

(6) Install bracket (Fig. 59).

THROTTLE BODY (Continued)

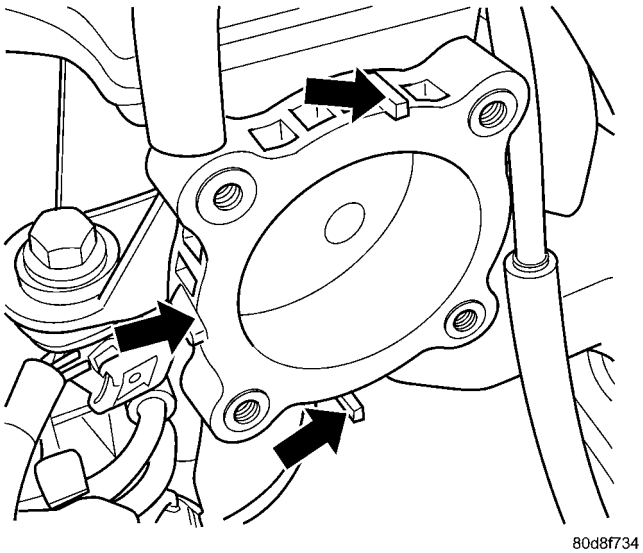

Fig. 65 LOCATING TABS

(7) Install the 2 screws for the throttle cable bracket and tighten to N·m 11.8 ±20 (105 in. lbs.).

(8) If equipped with speed control, install speed control cable to the throttle cam by sliding clasp in the hole used for throttle cable.

(9) Install the throttle cable to the throttle body cam (Fig. 58).

(10) Install the throttle control shield (Fig. 57).

(11) Connect and lock the electrical connectors from the idle air control motor and throttle position sensor.

(12) Connect and lock the electrical connector for the inlet air temperature sensor.

(13) Connect the negative battery cable.

THROTTLE CONTROL CABLE

REMOVAL

(1) Working from the engine compartment, hold the throttle body throttle lever in the wide open position.

(2) Remove the throttle cable from the throttle body cam.

(3) From inside the vehicle, hold up the pedal and remove the cable retainer and throttle cable from the upper end of the pedal shaft.

(4) Remove retainer clip from throttle cable and grommet at dash panel.

(5) From the engine compartment, pull the throttle cable and gromment out of the dash panel.

(6) Remove the throttle cable from throttle bracket by carefully compressing both retaining ears simultaneously then gently pull the throttle cable from throttle bracket or if it is the slide snap design you have to slide the locking tab out of the hole and then slide the cable assembly out of the bracket.

INSTALLATION

(1) From the engine compartment, push the housing end fitting and grommet into the dash panel.Install gromment into the dash panel.

(2) Install the cable housing (throttle body end) into the cable mounting bracket on the engine.

(3) From inside the vehicle, hold up the pedal and install throttle cable and cable retainer in the upper end of the pedal shaft.

(4) At the dash panel, install the cable retainer clip between the end of the throttle cable fitting and grommet

(5) From the engine compartment, rotate the throttle lever wide open and install the throttle cable.

THROTTLE POSITION SENSOR

DESCRIPTION

The throttle position sensor mounts to the side of the throttle body (Fig. 66).

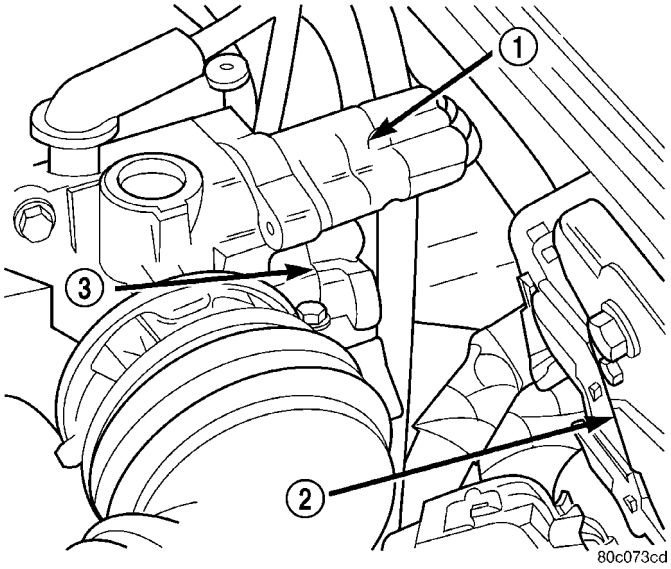

Fig. 66 Throttle Position Sensor—2.4L Engines

1 - IAC
2 - PCM
3 - TPS

OPERATION

The signal represents throttle blade position. As the position of the throttle blade changes, the resistance of the TPS changes.

The PCM supplies approximately 5 volts to the TPS. The TPS output voltage (input signal to the powertrain control module) represents throttle blade position. The TPS output voltage to the PCM varies from approximately 0.6 volt at minimum throttle opening (idle) to a maximum of 4.5 volts at wide open throttle.

THROTTLE POSITION SENSOR (Continued)

Along with inputs from other sensors, the PCM uses the TPS input to determine current engine operating conditions. The PCM also adjusts fuel injector pulse width and ignition timing based on these inputs.

REMOVAL

The throttle position sensor attaches to the side of the throttle body (Fig. 67) and (Fig. 68).

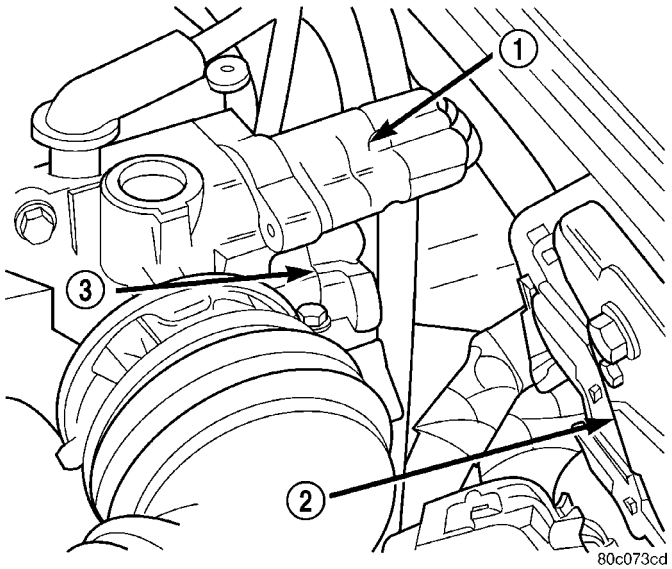

Fig. 67 Throttle Position Sensor and Idle Air Control Motor

1 - IAC
2 - PCM
3 - TPS

(1) Remove the air cleaner lid and makeup air hose. Loosen the clamp and relocate assembly.

(2) Remove the negative battery cable.

(3) Disconnect electrical connector from the throttle position sensor.

(4) Remove throttle position sensor mounting screws.

(5) Remove throttle position sensor.

INSTALLATION

The throttle position sensor attaches to the side of the throttle body (Fig. 67).

(1) The throttle shaft end of the throttle body slides into a socket in the TPS (Fig. 69). Note to make sure that the rubber o-ring is in place and seated around the TPS rotor housing surface. The socket has two tabs inside it. The throttle shaft rests against the tabs. When indexed correctly, the TPS can rotate clockwise a few degrees to line up the mounting screw holes with the screw holes in the throttle body. The TPS has slight tension when rotated into position. If it is difficult to rotate the TPS into position, reinstall the sensor with the throttle shaft on the other side of the tabs in the socket of the TPS. Tighten mounting screws to 6.2 N·m (55 in. lbs.) torque.

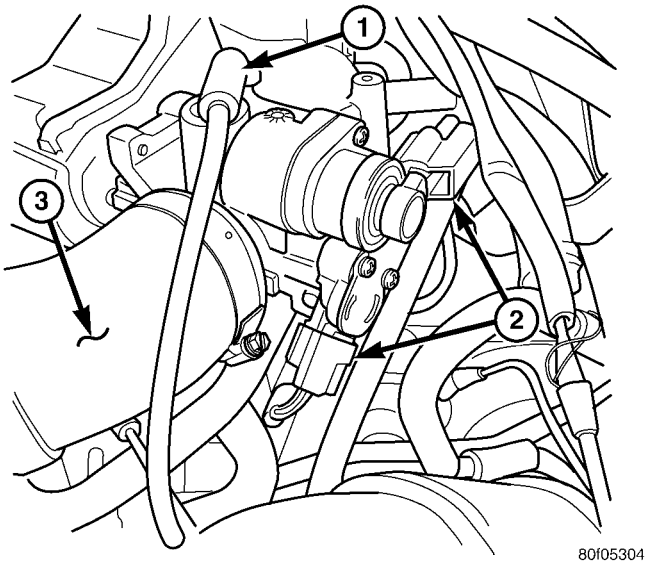

Fig. 68 THROTTLE BODY CONNECTIONS - 2.4L TURBO

1 - Purge Hose
2 - Electrical Connections
3 - Inlet Hose

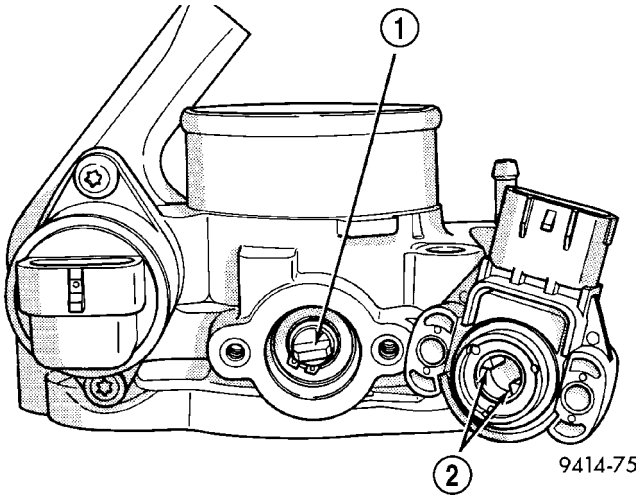

Fig. 69 Throttle Position Sensor

1 - THROTTLE SHAFT
2 - TABS

(2) After installing the TPS, the throttle plate should be closed. If the throttle plate is open, install the sensor on the other side of the tabs in the socket.

(3) Attach electrical connectors to the throttle position sensor.

(4) Install the negative battery cable.

(5) Install the air cleaner lid and makeup air hose and tighten clamp.

STEERING

DESCRIPTION - POWER STEERING SYSTEM

This vehicle comes with power steering as standard equipment and it is the only steering system available. The power steering system consists of these major components:

- POWER STEERING PUMP
- POWER STEERING GEAR
- POWER STEERING FLUID RESERVOIR
- POWER STEERING FLUID PRESSURE HOSE
- POWER STEERING FLUID RETURN HOSE
- POWER STEERING FLUID COOLER

For information on the first two components, refer to their respective sections within this service manual group. Information on the remaining components can be found in POWER STEERING PUMP.

OPERATION - POWER STEERING SYSTEM

Turning of the steering wheel is converted into linear (side-to-side) travel through the meshing of the helical pinion teeth with the rack teeth within the steering gear. The lateral travel pushes and pulls the tie rods to change the direction of the vehicle's front wheels.

Power assist steering is provided by a belt driven rotary type pump. It directs fluid through power steering fluid hoses to the power steering gear where it is used to assist the driver's turning effort.

Manual steering control of the vehicle can be maintained if power steering assist is lost. However, under this condition, steering effort is significantly increased.

WARNING

WARNINGS AND CAUTIONS

WARNING: POWER STEERING FLUID, ENGINE PARTS AND EXHAUST SYSTEM MAY BE EXTREMELY HOT IF ENGINE HAS BEEN RUNNING. DO NOT START ENGINE WITH ANY LOOSE OR DISCONNECTED HOSES. DO NOT ALLOW HOSES TO TOUCH HOT EXHAUST MANIFOLD OR CATALYST.

WARNING: FLUID LEVEL SHOULD BE CHECKED WITH THE ENGINE OFF TO PREVENT PERSONAL INJURY FROM MOVING PARTS.

CAUTION: When the system is open, cap all open ends of the hoses, power steering pump fittings or power steering gear ports to prevent entry of foreign material into the components.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - POWER STEERING FLOW AND PRESSURE TEST

WARNING: TO PREVENT PERSONAL INJURY, SAFETY GOGGLES SHOULD BE WORN AT ALL TIMES WHILE PERFORMING ANY TEST PROCEDURES ON THE POWER STEERING SYSTEM.

The following procedure is to be used to test the operation of the power steering system on this vehicle. This test will provide the flow rate of the power steering pump along with the maximum relief pressure. This test is to be performed any time a power

STEERING (Continued)

steering system problem is present to determine if the power steering pump or power steering gear is not functioning properly. The following flow and pressure test is performed using the Power Steering Analyzer Kit, Special Tool 6815 (Fig. 1), hoses, Special Tools 6905 and 6959, and adapters, Special Tool 8185A.

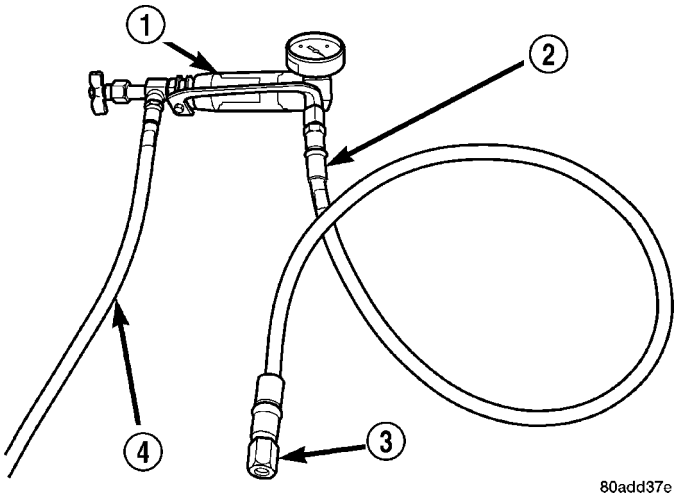

Fig. 1 Power Steering Analyzer With Hoses Installed

1 - SPECIAL TOOL 6815
2 - SPECIAL TOOL 6959
3 - SPECIAL TOOL 8185-2
4 - SPECIAL TOOL 6905 & 6713-1

(1) Assemble hoses on Power Steering Analyzer, Special Tool 6815, as shown (Fig. 1). Install Pressure Hose, Special Tool 6905 (in 6893 kit), in the inlet fitting on Power Steering Analyzer flow meter. Install Pressure Hose, Special Tool 6713 (in 6815 kit) on 6905. Install Pressure Hose, Special Tool 6959, in the outlet fitting on Power Steering Analyzer flow meter.

(2) Install Adapter Fitting, Special Tool 8185-1A, on the end of Pressure Hose, Special Tool 6713. Install Adapter Fitting, Special Tool 8185-2, on Pressure Hose, Special Tool 6959.

(3) Raise the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(4) Unscrew the tube nut and disconnect the power steering fluid pressure hose from the power steering gear (Fig. 2).

(5) Connect the vehicle's power steering pressure hose to Adapter Fitting, Special Tool 8185-2, connected to the analyzer (Fig. 3). Tighten the tube nut to a torque of 47 N·m (35 ft. lbs.). Route the hoses away from the exhaust system as well as possible.

(6) Connect Adapter Fitting, Special Tool 8185-1A, which is connected to the analyzer outlet hose (valve end), to the power steering gear port (Fig. 3). Tighten the tube nut to a torque of 47 N·m (35 ft. lbs.).

(7) Being careful not to kink or pinch the analyzer hoses, lower the vehicle to the ground.

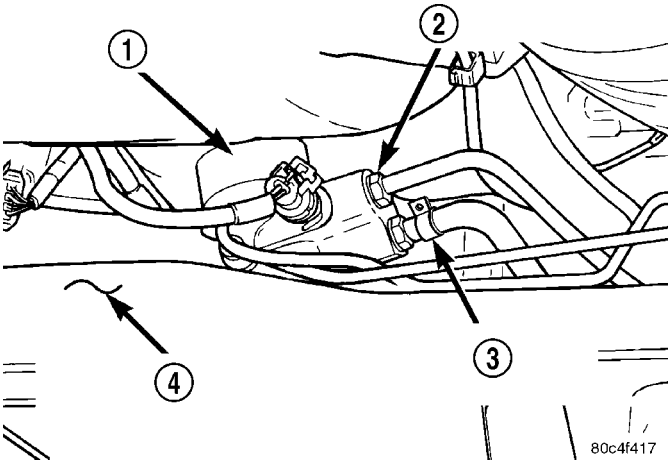

Fig. 2 Hose At Gear

1 - POWER STEERING GEAR
2 - PRESSURE HOSE TUBE NUT
3 - RETURN HOSE CLAMP
4 - REAR OF FRONT SUSPENSION CROSSMEMBER

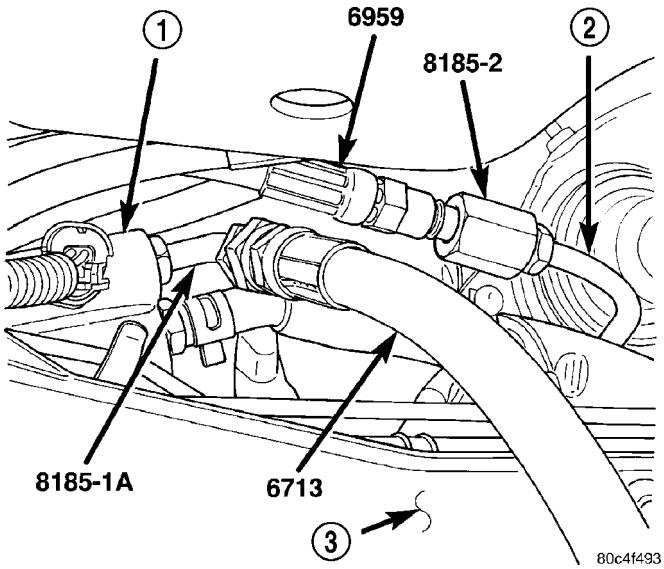

Fig. 3 Analyzer Connected To Vehicle

1 - POWER STEERING GEAR
2 - PRESSURE HOSE
3 - REAR OF FRONT SUSPENSION CROSSMEMBER

TEST PROCEDURE

(1) Completely open the valve on the Power Steering Analyzer flow meter.

(2) Start the engine and let idle long enough to circulate power steering fluid through the analyzer and hoses, until the air is out of the fluid. Shut the off engine.

(3) Check the power steering fluid level and add fluid as necessary. Start the engine again and let idle.

(4) The analyzer gauge should read below 862 kPa (125 psi). If above, inspect the hoses for restrictions and repair as necessary. The initial pressure should

STEERING (Continued)

be in the range of 345-552 kPa (50-80 psi). The flow meter should read between 1.5 and 1.7 GPM.

CAUTION: The following test procedure step involves testing maximum pump pressure output and flow control valve operation. Do not leave valve closed for more than five seconds as the pump could be damaged.

NOTE: Power steering pump maximum relief pressure is 9308 to 9998 kPa (1350 to 1450 psi.).

(5) Close the flow meter valve fully three times and record highest pressure indicated each time. **All three readings must be above specifications and within 345 kPa (50 psi) of each other.**

- If the power steering pump pressure's are above specifications, but not within 345 kPa (50 psi) of each other, replace the power steering pump.
- If the pressure's are within 345 kPa (50 psi) of each other, but below specifications, replace the power steering pump.

If the power steering pump requires replacement, refer to the section Power Steering Pump within this group for the removal and installation procedure.

CAUTION: During the next step, do not force the pump to operate against the stops for more than 5 seconds at a time as pump damage may result.

(6) Completely open the valve on the Power Steering Analyzer flow meter. Turn the steering wheel to the extreme left until the stop in the steering gear is met, then turn the steering wheel to the right until the right stop is met. Record the highest indicated pressure at each position. Compare the recorded readings to the specifications. If the highest output pressure reading against one stop is not within 345 kPa (50 psi) of the highest reading at the other stop, the steering gear is leaking internally and must be replaced.

If the power steering gear requires replacement, (Refer to 19 - STEERING/GEAR - REMOVAL).

DIAGNOSIS AND TESTING - STEERING DIAGNOSIS CHARTS

NOTE: There are three diagnosis charts following that cover the topics Power Steering Noise, Steering Wheel Feel, and Power Steering Fluid.

POWER STEERING NOISE

CONDITION	POSSIBLE CAUSES	CORRECTION
OBJECTIONABLE HISS OR WHISTLE*	1. Damaged or mispositioned steering column shaft/coupling dash panel seal.	1. Reposition or replace steering column shaft/coupling dash panel seal.
	2. Noisy valve in power steering gear.	2. Replace power steering gear.
RATTLE OR CLUNK	1. Power steering gear loose on front suspension crossmember.	1. Inspect power steering gear mounting bolts. Replace as necessary. Tighten to the specified torque.
	2. Front suspension crossmember mounting fasteners loose at frame.	2. Tighten the front suspension crossmember mounting fasteners to the specified torque.
	3. Loose tie rod (outer or inner).	3. Check tie rod pivot points for wear. Replace worn/loose parts as required.
	4. Loose lower control arm mounting bolts at front suspension crossmember.	4. Tighten control arm mounting bolts to the specified torques.
	5. Loose strut assembly mounting fasteners at strut tower.	5. Tighten strut assembly fasteners to the specified torques.
	6. Power steering fluid pressure hose touching the body of the vehicle.	6. Adjust hose to proper position by loosening, repositioning, and tightening fitting to specified torque. Do not bend tubing.

STEERING (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
	7. Internal power steering gear noise.	7. Replace power steering gear.
	8. Damaged front suspension crossmember.	8. Replace front suspension crossmember.
CHIRP OR SQUEAL (POWER STEERING PUMP)	1. Loose power steering pump drive belt.	1. Check and replace automatic belt tensioner as necessary. Replace belt if worn or glazed.
WHINE OR GROWL (POWER STEERING PUMP) **	1. Low fluid level.	1. Fill power steering fluid reservoir to proper level and check for leaks.
	2. Power steering hose touching vehicle body or frame.	2. Adjust hose to proper position by loosening, repositioning, and tightening fitting to specified torque. Do not bend tubing. Replace hose if damaged.
	3. Extreme wear of power steering pump internal components.	3. Replace power steering pump and flush system as necessary.
SUCKING AIR SOUND	1. Loose clamp on power steering fluid return hose.	1. Tighten or replace hose clamp.
	2. Missing O-Ring on power steering hose connection.	2. Inspect connection and replace O-Ring as required.
	3. Low power steering fluid level.	3. Fill power steering fluid reservoir to proper level and check for leaks.
	4. Air leak between power steering fluid reservoir and power steering pump.	4. Replace power steering pump (with reservoir).
SQUEAK OR RUBBING SOUND	1. Steering column shroud rubbing.	1. Realign shrouds as necessary.
	2. Steering column shaft rubbing.	2. Move or realign item rubbing shaft.
	3. Steering column shaft dry-rubbing seal at dash panel.	3. Lubricate contact surface.
	4. Steering gear internally noisy.	4. Replace steering gear.
SCRUBBING OR KNOCKING NOISE.	1. Incorrect tire or wheel size.	1. Replace incorrect size tire or wheel with size used as original equipment.
	2. Interference between steering gear and other vehicle components.	2. Check for bent or misaligned components and correct as necessary.
	3. Steering gear internal stops worn excessively.	3. Replace steering gear.

NOTE: * There is some noise in all power steering systems. One of the most common is a hissing sound evident when turning the steering wheel when at a standstill or when parking and the steering wheel is at the end of its travel. Hiss is a very high frequency noise similar to that experienced while slowly closing a water tap. The noise is present in every valve and results when high velocity fluid passes valve orifice edges. There is no relationship between this noise and the performance of the steering system.

NOTE: ** Power steering pump growl results from the development of high pressure fluid flow. Normally this noise level should not be high enough to be objectionable.

STEERING (Continued)

STEERING WHEEL FEEL

CONDITION	POSSIBLE CAUSES	CORRECTION
STEERING WHEEL/ COLUMN CLICKING, CLUNKING OR RATTLING.	1. Steering column preload is not set properly.	1. Loosen steering column coupling pinch bolt to reset steering column preload. Replace pinch bolt and torque to specifications.
	2. Loose steering coupling pinch bolt.	2. Replace pinch bolt and torque to specifications.
	3. Steering column bearings.	3. Replace steering column.
STEERING WHEEL HAS FORE AND AFT LOOSENESS.	1. Steering wheel retaining screw not properly tightened and torqued.	1. Tighten the steering wheel retaining nut to its specified torque.
	2. Steering column preload is not set properly.	2. Loosen steering column coupling pinch bolt to reset steering column preload. Replace pinch bolt and torque to specifications.
	3. Steering column lower bearing spring retainer slipped on steering column shaft.	3. Replace steering column.
STEERING WHEEL OR DASH VIBRATES DURING LOW SPEED OR STANDSTILL STEERING MANEUVERS.	1. Air in the fluid of the power steering system.	1. Bleed air from system following the power steering pump initial operation service procedure.*
	2. Tires not properly inflated.	2. Inflate tires to the specified pressure.
	3. Excessive engine vibration.	3. Ensure that the engine is running properly.
	4. Engine torque struts out of alignment.	4. Align engine torque struts.
	5. Loose tie rod end jam nut.	5. Tighten the inner to outer tie rod jam nut to the specified torque.
	6. Overcharged air conditioning system.	6. Check air conditioning pump head pressure and correct as necessary.
STEERING CATCHES, STICKS IN CERTAIN POSITIONS OR IS DIFFICULT TO TURN.	1. Low power steering fluid level.	1. Fill power steering fluid reservoir to specified level and check for leaks.
	2. Tires not inflated to specified pressure.	2. Inflate tires to the specified pressure.
	3. Lack of lubrication in front suspension control arm ball joints.	3. Lubricate ball joints if ball joints are not a lubricated for life type ball joint. If ball joint is a lubricated for life ball joint, replace ball joint or control arm.
	4. Lack of lubrication in steering gear outer tie rod ends.	4. Lubricate tie rod ends if they are not a lubricated for life type. If tie rod end is a lubricated for life type, replace tie rod end.

STEERING (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
	5. Loose power steering pump drive belt.	5. Check and replace automatic belt tensioner as necessary. If drive belt is worn or glazed, replace belt.
	6. Faulty power steering pump flow control (Follow Power Steering System Flow and Pressure Test procedure).	6. Replace power steering pump.
	7. Excessive friction in steering column or intermediate shaft.	7. Isolate and correct condition.
	8. Binding upper strut bearing.	8. Disassemble strut assembly. Correct binding condition in strut bearing or replace bearing.
	9. Excessive friction in power steering gear.	9. Replace power steering gear.
STIFF, HARD TO TURN, SURGE, MOMENTARY INCREASE IN EFFORT WHEN TURNING.	1. Tires not properly inflated.	1. Inflate tires to specified pressure.
	2. Low power steering fluid level.	2. Add power steering fluid as required to power steering fluid reservoir to obtain proper level. Check for leaks.
	3. Loose power steering pump drive belt.	3. Check and replace automatic belt tensioner as necessary. If drive belt is worn or glazed, replace belt.
	4. Lack of lubrication in control arm ball joints.	4. Lubricate ball joints if ball joints are not a lubricated for life type ball joint. If ball joint is a lubricated for life ball joint, replace ball joint or control arm.
	5. Low power steering pump pressure (Follow Power Steering System Flow and Pressure Test procedure).	5. Replace the power steering pump as necessary.
	6. High internal leak in power steering gear (Follow Power Steering System Flow and Pressure Test procedure).	6. Replace power steering gear.
STEERING WHEEL DOES NOT RETURN TO CENTER POSITION.	1. Tires not inflated properly.	1. Inflate tires to specified pressure.
	2. Improper front wheel alignment.	2. Check and adjust wheel alignment as necessary.
	3. Lack of lubrication in front suspension control arm ball joints.	3. Lubricate ball joints if ball joints are not a lubricated for life type of ball joint. If ball joint is a lubricated for life ball joint, replace ball joint or control arm.
	4. Steering column coupling joints misaligned.	4. Realign steering column coupling joints.
	5. Steering wheel rubbing.**	5. Adjust steering column shrouds to eliminate rubbing condition.

STEERING (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
	6. Damaged, mis-positioned or un-lubricated steering column coupler to dash seal.**	6. Replace, reposition, or lubricate dash seal.
	7. Binding upper strut bearing.	7. Disassemble strut assembly. Correct binding condition in strut bearing or replace bearing.
	8. Tight shaft bearing in steering column.	8. Replace the steering column.
	9. Excessive friction in steering column coupling.	9. Replace steering column coupling.
	10. Excessive friction in power steering gear.	10. Replace power steering gear.
EXCESSIVE STEERING WHEEL KICKBACK OR TOO MUCH STEERING WHEEL FREE PLAY.	1. Air in the fluid of the power steering system.	1. Bleed air from system following the the power steering pump initial operation service procedure.*
	2. Power steering gear loose on front suspension crossmember.	2. Inspect power steering gear mounting bolts. Replace as necessary. Tighten to the specified torque.
	3. Steering column coupling worn, broken or loose.	3. Replace steering column coupling.
	4. Free play in steering column.	4. Check all components of the steering system and repair or replace as required.
	5. Worn control arm ball joints.	5. Replace ball joint or control arm as required.
	6. Loose steering knuckle to ball joint stud pinch bolt.	6. Inspect pinch bolts, replace as necessary, and tighten to specified torque.
	7. Front wheel bearings loose or worn.	7. Replace wheel bearing or knuckle as necessary.
	8. Loose outer tie rod ends.	8. Replace outer tie rod ends that have excessive free play.
	9. Loose inner tie rod ends.	9. Replace power steering gear.
	10 Defective steering gear rotary valve.	10. Replace power steering gear.

NOTE: * Steering shudder can be expected in new vehicles and vehicles with recent steering system repairs. Shudder should dissipate after the vehicle has been driven several weeks.

NOTE: ** To evaluate this condition, it may be necessary to disconnect the coupling at the base of the steering column. Turn the steering wheel and feel or listen for internal rubbing in steering column. To avoid damaging the column clockspring, note the following. Before disconnecting coupling, place tires in the straight-ahead position and center steering wheel. Once disconnected, DO NOT rotate steering wheel more than one revolution in either direction and place steering wheel in original location before reconnecting coupling. If this position is lost, the steering column clockspring must be re-centered following the procedure found within the procedure for steering column installation in the steering column section.

STEERING (Continued)

POWER STEERING FLUID

CONDITION	POSSIBLE CAUSES	CORRECTION
LOW FLUID LEVEL WITH VISIBLE LEAK.	1. Loose power steering hose fittings.	1. Tighten the fitting to its specified torque.
	2. Damaged or missing fitting seal, gasket, or O-ring.	2. Replace as necessary.
	3. Power steering pump or power steering gear leaking.	3. Repair or replace the leaking component as required.
AERATED FLUID.*	1. Low fluid level.**	1. Fill power steering fluid reservoir to proper level.
	2. Air leak between power steering fluid reservoir and pump.	2. Inspect for proper sealing. Replace the power steering pump (with reservoir).
	3. Cracked power steering pump housing.	3. Replace the power steering pump.
RESERVOIR FLUID OVERFLOW AND FLUID IS MILKY IN COLOR	1. Water contamination.	1. Drain the power steering fluid from the system. Flush the system with fresh clean power steering fluid, drain, then refill to the proper level.

NOTE: * Aerated fluid will appear with bubbles or foam, somewhat like champagne, when viewed through the reservoir fill opening.

NOTE: ** Extremely cold temperatures may cause power steering fluid aeration, if the power steering fluid is low.

COLUMN

DESCRIPTION

This vehicle is equipped with a tilt type steering column. The steering column is designed to be serviced only as complete assembly if an internal component is found to be defective (Fig. 1). The shaft, bearings and upper coupling are all serviced with the column.

The replaceable components on the steering column assembly are:

- The key cylinder
- The ignition switch
- The multi-function switch
- The clockspring
- The trim shrouds
- The steering wheel
- The driver airbag module

These components can be serviced without removal of the steering column from the vehicle. Refer to the appropriate section for servicing these components separately.

OPERATION

Turning of the steering wheel is transferred through the steering column, upper and lower couplings to the power steering gear. The gear then moves the steering knuckles, steering the vehicle.

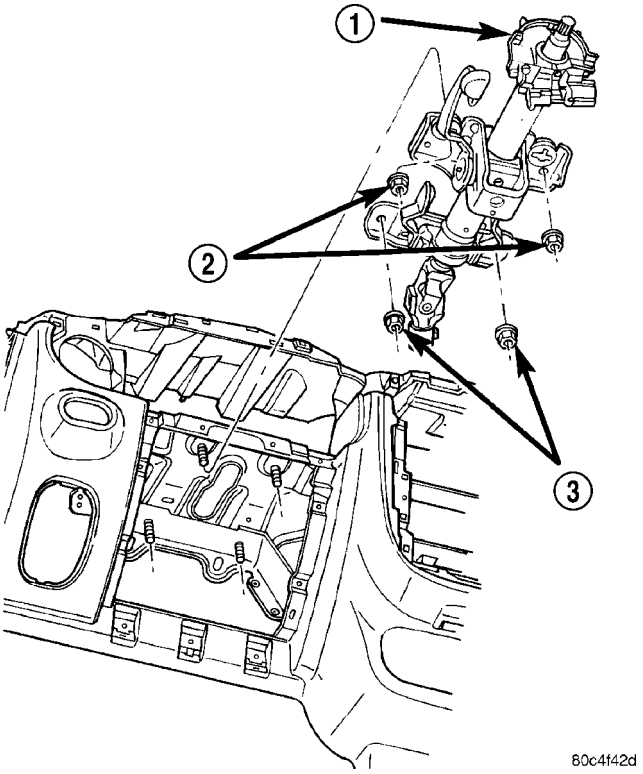

Fig. 1 Steering Column

1 - STEERING COLUMN
2 - UPPER MOUNTING NUTS
3 - LOWER MOUNTING NUTS

COLUMN (Continued)

The steering column used on vehicle's equipped with a manual transaxle has an anti-theft provision. With the key/lock cylinder turned to the LOCK position, and the key removed, the steering shaft (and steering wheel) cannot be turned more than 180 degrees before locking. **Vehicles equipped with an automatic transaxle do not have this feature.**

WARNING

WARNINGS AND CAUTIONS

WARNING: SAFETY GOGGLES SHOULD BE WORN AT ALL TIMES WHEN WORKING ON STEERING COLUMNS.

WARNING: BEFORE BEGINNING ANY SERVICE PROCEDURES THAT INVOLVES REMOVING THE AIR BAG. REMOVE AND ISOLATE THE NEGATIVE (-) BATTERY CABLE (GROUND) FROM THE VEHICLE BATTERY. THIS IS THE ONLY SURE WAY TO DISABLE THE AIR BAG SYSTEM. FAILURE TO DO THIS COULD RESULT IN ACCIDENTAL AIR BAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

WARNING: THE AIR BAG SYSTEM IS A SENSITIVE, COMPLEX ELECTRO-MECHANICAL UNIT. BEFORE ATTEMPTING TO DIAGNOSE, REMOVE OR INSTALL THE AIR BAG SYSTEM COMPONENTS YOU MUST FIRST DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE. FAILURE TO DO SO COULD RESULT IN ACCIDENTAL DEPLOYMENT OF THE AIR BAG AND POSSIBLE PERSONAL INJURY. THE FASTENERS, SCREWS, AND BOLTS, ORIGINALLY USED FOR THE AIR BAG COMPONENTS, HAVE SPECIAL COATINGS AND ARE SPECIFICALLY DESIGNED FOR THE AIR BAG SYSTEM. THEY MUST NEVER BE REPLACED WITH ANY SUBSTITUTES. ANYTIME A NEW FASTENER IS NEEDED, REPLACE WITH THE CORRECT FASTENERS PROVIDED IN THE SERVICE PACKAGE OR FASTENERS LISTED IN THE PARTS BOOKS. BEFORE SERVICING A STEERING COLUMN EQUIPPED WITH AN AIR BAG, (Refer to 8 - ELECTRICAL/RESTRAINTS - WARNING).

WARNING: WHEN HANDLING AN UNDEPLOYED AIR BAG MODULE DURING SERVICING OF THE STEERING COLUMN, THE FOLLOWING PRECAUTIONS SHOULD BE OBSERVED:

- **AT NO TIME SHOULD ANY SOURCE OF ELECTRICITY BE PERMITTED NEAR THE INFLATOR ON THE BACK OF THE AIR BAG MODULE.**
- **WHEN CARRYING A LIVE MODULE, THE TRIM COVER SHOULD BE POINTED AWAY FROM THE BODY TO MINIMIZE INJURY IF THE MODULE SHOULD ACCIDENTLY DEPLOY.**
- **IF THE AIR BAG MODULE IS PLACED ON A BENCH OR OTHER SURFACE, THE PLASTIC COVER SHOULD BE FACE-UP TO MINIMIZE MOVEMENT, IN CASE OF ACCIDENTAL DEPLOYMENT.**

CAUTION: Disconnect negative (ground) cable from the battery before servicing any column component.

CAUTION: Do not attempt to remove the pivot pins to disassemble the tilting mechanism. Damage will occur.

DIAGNOSIS AND TESTING - STEERING COLUMN

For diagnosis of conditions relating to the steering column, (Refer to 19 - STEERING - DIAGNOSIS AND TESTING).

REMOVAL

REMOVAL

NOTE: Before proceeding, (Refer to 19 - STEERING/COLUMN - WARNING).

WARNING: WHEN AN UNDEPLOYED AIRBAG MODULE IS TO BE REMOVED FROM THE STEERING WHEEL, FIRST DISCONNECT THE BATTERY GROUND CABLE AND ISOLATE IT. ALLOW THE SYSTEM CAPACITOR TO DISCHARGE FOR A MINIMUM OF TWO MINUTES, THEN BEGIN THE AIRBAG REMOVAL.

(1) Disconnect the negative (-) cable from the battery and isolate the cable.

(2) Before beginning removal of the steering column, be sure the front wheels of vehicle are in the STRAIGHT-AHEAD position.

(3) Remove the ignition key from the ignition key cylinder.

(4) Remove the silencer pad below the knee blocker panel below the steering column.

(5) Fold down and remove the knee blocker.

COLUMN (Continued)

(6) Remove the two screws attaching the lower shroud to the steering column and upper shroud (Fig. 2). After removing the screws, unclip the shrouds from each other by applying hand pressure along the seams where the shrouds connect on the sides, then remove the lower shroud from the upper shroud and column. Remove the upper shroud from the steering column.

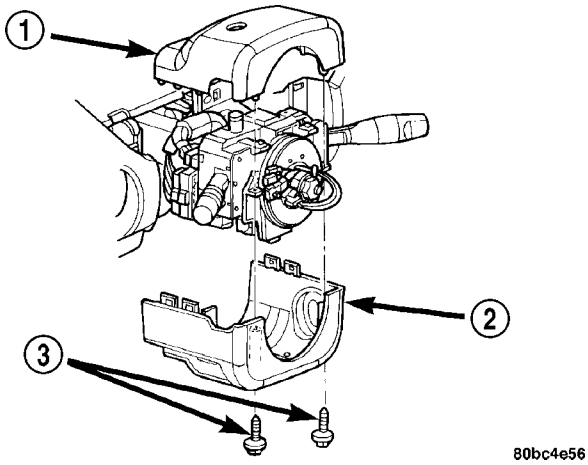

Fig. 2 Steering Column Shrouds

1 - UPPER SHROUD
2 - LOWER SHROUD
3 - MOUNTING SCREWS

(7) Use the following to properly remove the air bag module from the column:

(a) Using a pair of 90° internal snap ring pliers or equivalent, pry open the retaining clip (Fig. 3) at the top rear of the steering wheel to release the top retaining pin (Fig. 4). Pull or press rearward on the airbag module while doing this. The pin will disengage.

(b) Using a pair of 90° internal snap ring pliers or equivalent, pry open the retaining clip (Fig. 5) at the bottom rear of the steering wheel and at he same time gently pry the pin away from the retaining clip using a pocket screwdriver or equivalent, so it can slide through the middle of the clip. Use the screwdriver to push the pin through the clip.

(c) Pull the module outward enough to expose the wire harness connections. Disconnect the two harness connectors on the module (squib and horn feed) (Fig. 6).

(d) Remove the airbag module from the vehicle.

(8) Disconnect the speed control switch wiring harness connector (Fig. 6).

(9) Holding the steering wheel firmly in place, remove the steering wheel retaining bolt from the steering column shaft in the center of the steering wheel (Fig. 6).

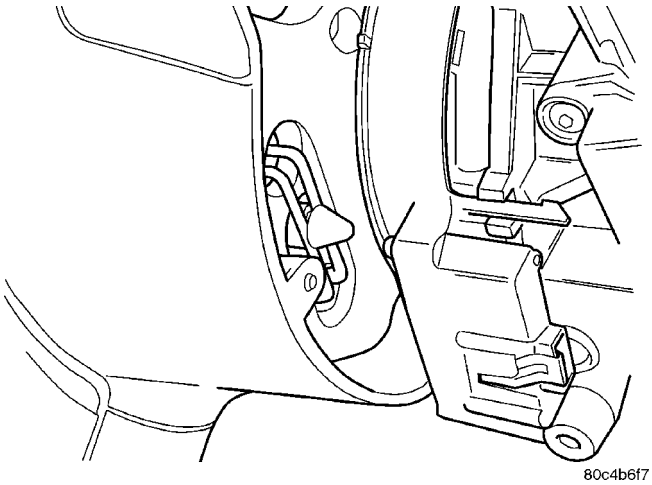

Fig. 3 Driver Airbag Pin Retaining Clip

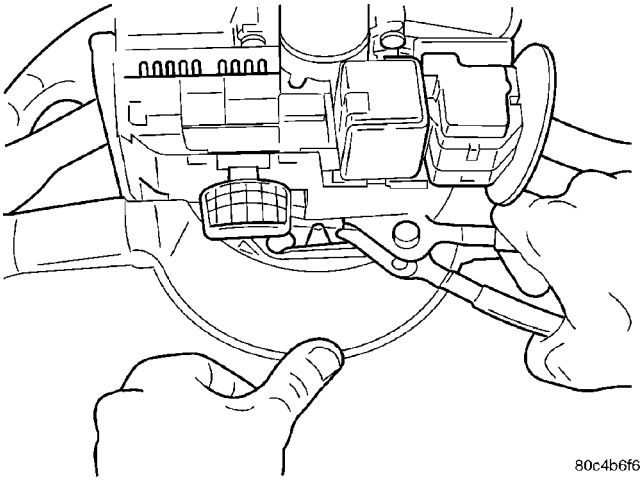

Fig. 4 Upper Driver Airbag Pin Retaining Clip Removal/Installation

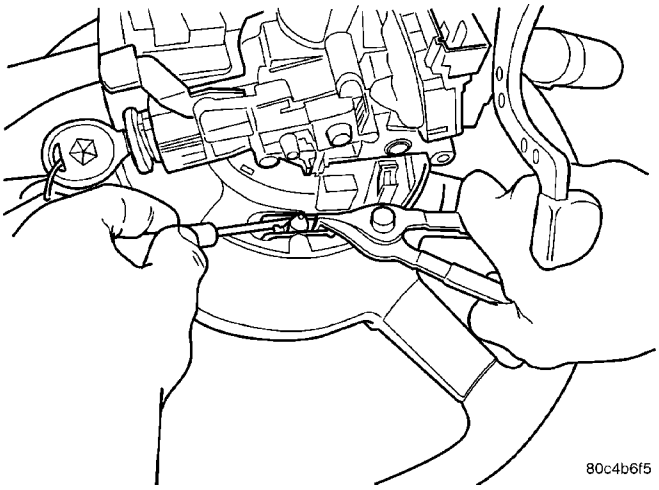

Fig. 5 Lower Driver Airbag Pin Retaining Clip Removal/Installation

COLUMN (Continued)

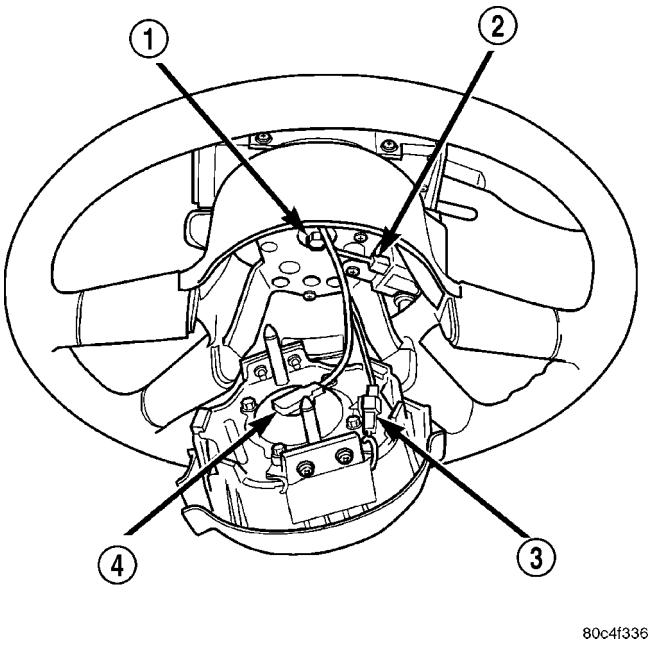

Fig. 6 Electrical Connectors

1 - STEERING WHEEL RETAINING BOLT
2 - SPEED CONTROL SWITCH CONNECTOR
3 - HORN SWITCH CONNECTOR
4 - AIRBAG CONNECTOR

CAUTION: When installing a wheel puller on the steering wheel, be sure the puller bolts are fully seated in the threaded holes on the steering wheel. If the bolts are not fully seated in the threaded holes, the threads may be stripped out of the steering wheel when attempting to remove the steering wheel. Take care not to over-thread the puller bolts such that they contact the clockspring possibly damaging it.
Also, threading the retaining bolt back in the end of the shaft until approximately 13 mm (0.5 in.) of thread is showing between the wheel and the head of the bolt allows a safe reaction surface for the puller to work against.

(10) Thread the wheel retaining bolt back into the end of the shaft until approximately 13 mm (0.5 in.) of thread is showing between the wheel and the head of the bolt.

(11) Install a steering wheel puller on the steering wheel.

CAUTION: Do not bump or hammer on steering wheel or steering column shaft when removing steering wheel from steering column.

(12) Holding the steering wheel firmly in the STRAIGHT-AHEAD position, remove steering wheel from the steering column shaft using the puller. Remove the wheel retaining bolt and the steering wheel.

(13) At the base of the column, remove the steering column coupling retainer pin, back off the pinch bolt nut, and remove the steering column coupling pinch bolt (Fig. 7) (the pinch bolt nut is caged to the coupling and is not removable). Separate the upper and lower steering column couplings.

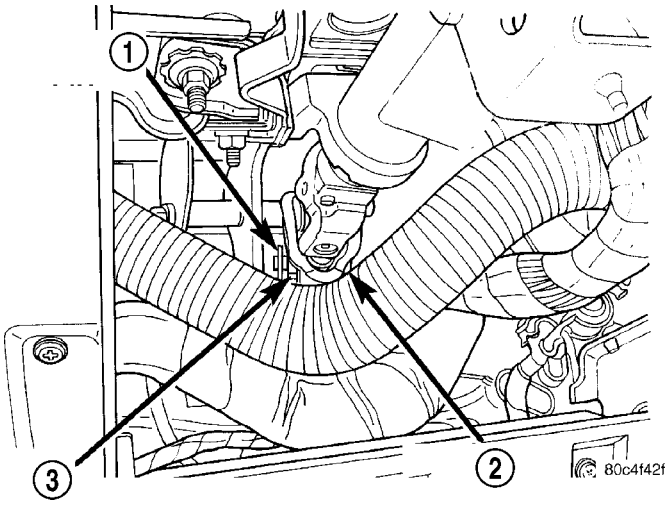

Fig. 7 Coupling Connection

1 - RETAINING PIN
2 - PINCH BOLT
3 - NUT

(14) If the vehicle is equipped with a automatic transaxle, disconnect the automatic transaxle ignition interlock cable from the steering column. Depress the tab on top of the cable connector and remove the cable from the back side of the steering column ignition cylinder housing (Fig. 8).

NOTE: If the same steering column is to be reinstalled, clamp the tilt lever to lock the column in place so that it can be easily reinstalled in the same orientation.

(15) Remove the two lower mounting nuts attaching the steering column to the instrument panel (Fig. 9).

(16) Remove the two upper mounting nuts attaching the steering column to the instrument panel (Fig. 9).

(17) Lower the steering column away from the instrument panel.

COLUMN (Continued)

(18) Disconnect the wiring harness electrical connector from the clockspring (Fig. 10).

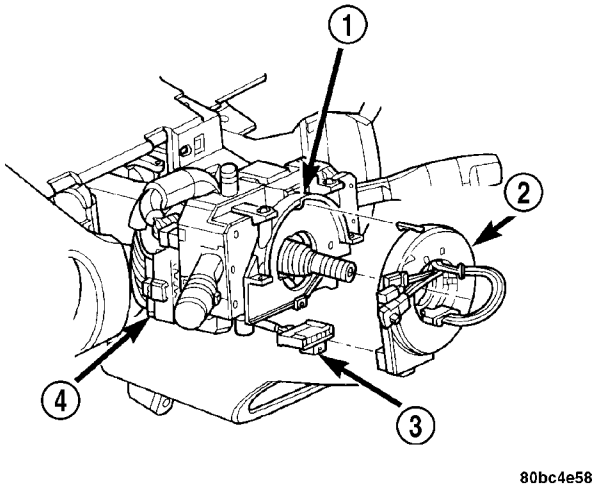

Fig. 10 Clockspring Electrical Connector

1 - STEERING COLUMN
2 - CLOCK SPRING
3 - CLOCK SPRING ELECTRICAL CONNECTOR
4 - IGNITION SWITCH ELECTRICAL CONNECTOR

(19) Disconnect the wiring harness electrical connectors from the multi-function switch, windshield wiper switch, and ignition switch (Fig. 11).

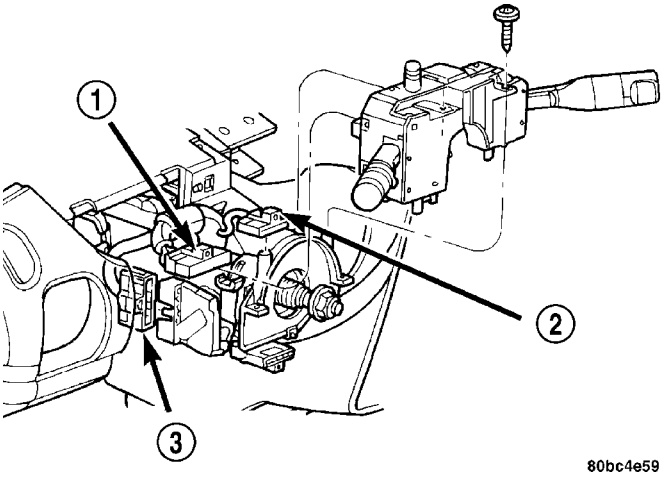

Fig. 11 Electrical Connectors

1 - MULTI-FUNCTION SWITCH ELECTRICAL CONNECTOR
2 - WINDSHIELD WIPER SWITCH ELECTRICAL CONNECTOR
3 - IGNITION SWITCH ELECTRICAL CONNECTOR

(20) If the vehicle is equipped with a Sentry Key Immobilizer Module (SKIM), disconnect its electrical connector (Fig. 12).

(21) Remove the steering column from the vehicle.

(22) If the steering column is being replaced, perform the following:

(a) Remove the ignition key cylinder from the steering column. To do this, insert the key and turn the ignition key cylinder to the ON position.

COLUMN (Continued)

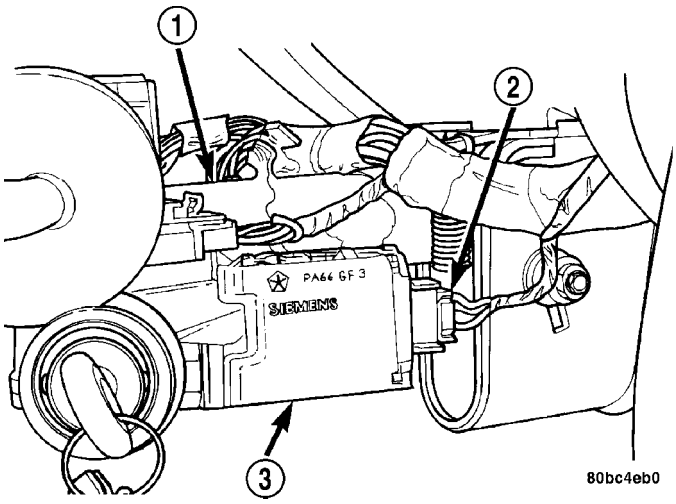

Fig. 12 SKIM Electrical Connector

1 - STEERING COLUMN
2 - SKIM ELECTRICAL CONNECTOR
3 - SKIM

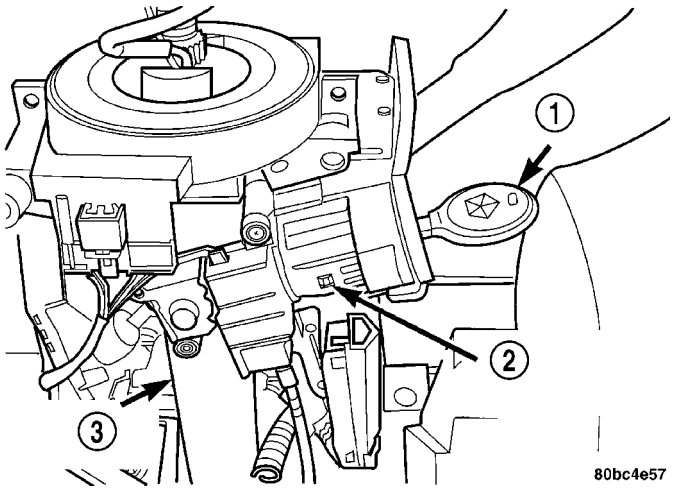

Fig. 13 Ignition Key Cylinder Retaining Tab

1 - IGNITION KEY
2 - RETAINING TAB
3 - STEERING COLUMN

Next, depress the retaining tab and remove the Ignition key cylinder by pulling the key and cylinder straight out of the column together (Fig. 13).

(b) Disengage the latch hooks on the back of the clockspring by lifting the clockspring slightly to clear the column housing with the top latch hook. Next, lower the clockspring slightly to do the same for the lower latch hook (Fig. 14). Remove the clockspring from the column.

(c) Remove the two screws securing the multi-function/windshield wiper switch to the steering column (Fig. 15). Pull the switch straight away from the column to remove it.

(d) If the column is equipped with a SKIM, remove the module from the column by removing the two mounting screws and sliding the SKIM off the non-halo trim ring (Fig. 16).

(e) Remove the non-halo trim ring from the column by unclipping it from the ignition cylinder housing (Fig. 16).

(f) If necessary, remove the ignition switch from the steering column by first removing the mounting screw (Fig. 17). Once the screw is removed, pull the switch straight out away from the column ignition cylinder housing.

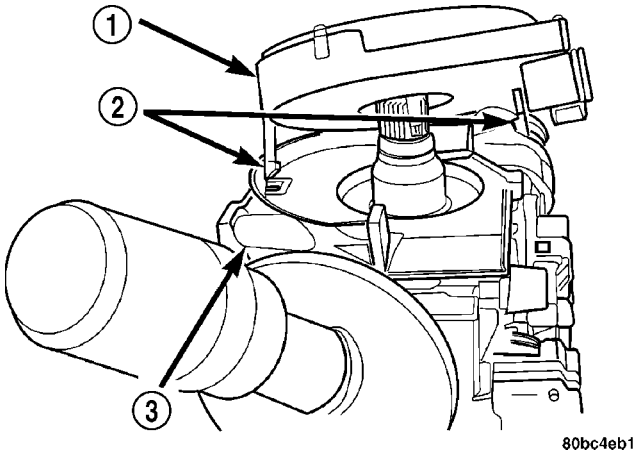

Fig. 14 Clockspring Latch Hooks

1 - CLOCK SPRING
2 - LATCH HOOKS
3 - STEERING COLUMN

REMOVAL - RHD

Right-Hand-Drive steering column is typical of Left-Hand-Drive. (Refer to 19 - STEERING/COLUMN - REMOVAL - LHD)

COLUMN (Continued)

3 - SKIM

INSTALLATION

INSTALLATION

(1) If the steering column is being replaced, perform the following on the column before installing it on the vehicle:

(a) Ensure the ignition switch is positioned in the ON position if the ignition switch needs to be installed.

(b) If necessary, Install the ignition switch on the steering column by pushing the tapered end onto the shaft and steering column ignition cylinder housing. Install the screw securing the switch to the column (Fig. 17).

(c) Install the non-halo trim ring on the column until its tabs snap into place on the ignition cylinder housing (Fig. 16).

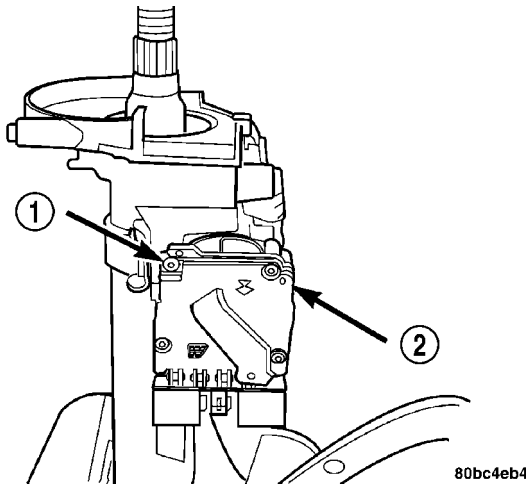

Fig. 17 Ignition Switch Mounting

1 - MOUNTING SCREW
2 - IGNITION SWITCH

(d) If the column is equipped with a Sentry Key Immobilizer Module (SKIM), install the module on the column by sliding the module onto the non halo trim ring and installing the two mounting screws (Fig. 16). Tighten the mounting screws to a torque of 3 N·m (25 in. lbs.).

(e) Position the multi-function/windshield wiper switch in onto the top of the column and install the two screws securing the switch in place (Fig. 15).

(f) Place the clockspring onto the end of the column engaging the clockspring latch hooks into the column (Fig. 14).

(g) Install the ignition key cylinder in the steering column. To do this, first position the key cylinder in the ON position (with the key in it) so the retaining tab can be depressed. Push key cylinder into the column ignition cylinder housing until the retaining tab locks into place (Fig. 13).

NOTE: When installing a tilt column, do not release the tilt lever from the locked position until after the column is installed on the instrument panel.

(2) Install the steering column into steering column access opening in the lower instrument panel.

(3) Align the slots in the mounting brackets on the steering column with the studs in the instrument panel (Fig. 9) Loosely attach the column to the instrument panel lower mounting studs using the two lower mounting nuts.

(4) If the vehicle is equipped with a SKIM, Connect its wiring harness electrical connector (Fig. 12).

(5) Connect the wiring harness electrical connectors to the multi-function switch, windshield wiper switch, and ignition switch (Fig. 11).

(6) Connect the wiring harness electrical connector to the clockspring (Fig. 10).

COLUMN (Continued)

(7) Lift the column into mounting position on the instrument panel and install the two upper mounting nuts (Fig. 9). Tighten all four (upper and lower) mounting nuts to a torque of 17 N·m (150 in. lbs.).

(8) If the vehicle is equipped with an automatic transaxle, connect the automatic transaxle ignition interlock cable to the steering column by pushing the end of the cable into the back side of the ignition cylinder housing until it snaps into place (Fig. 8).

(9) If not already positioned, position the steering column shaft in the correct position for mounting to the lower coupling. To do this, turn the steering wheel end of the shaft until the missing spline area on that end of the shaft faces straight up.

(10) Verify the front wheels of vehicle are in the STRAIGHT-AHEAD position.

NOTE: Do not tighten the coupling pinch bolt anytime the vehicle is not at curb riding height. It may cause unwanted conditions within the steering column if the vehicle is suspended in any manner when the pinch bolt is tightened.

(11) Reconnect the steering column lower coupling to the steering column upper coupling (Fig. 7). Install the coupling pinch bolt an tighten the pinch bolt nut to a torque of 28 N·m (250 in. lbs.). Install the pinch bolt retainer pin.

(12) Install the knee blocker.

(13) Install the silencer pad below the knee blocker panel.

CAUTION: If there is any question as to whether the clockspring is in the centered position of travel, the clockspring needs to be recentered before installing the steering wheel. If the clockspring is not centered, it may be overextended, causing the clockspring to become inoperative.

(14) If necessary, recenter the clockspring. To center the clockspring, use the following procedure:

- Using your fingers, rotate the clockspring rotor in the CLOCKWISE DIRECTION to the end of travel. Do not apply excessive torque.
- From the end of travel, rotate the rotor two full turns and an additional one half turn in the COUNTERCLOCKWISE DIRECTION. (The wires should end up toward the top of the clockspring).

(15) Ensure the three foam rubber driver airbag retaining clip pads are still in place on the rear of the steering wheel (Fig. 18). Replace any missing pads.

CAUTION: Do not install the steering wheel onto the shaft of the steering column by driving it onto the shaft.

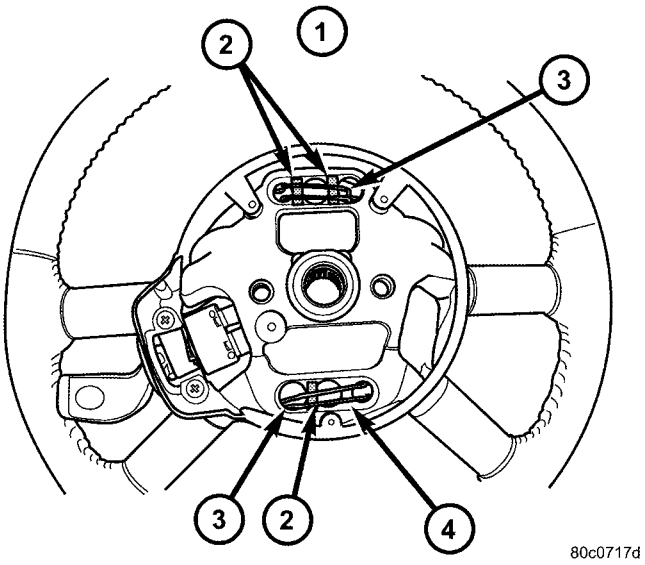

Fig. 18 Foam Rubber Pad Locations

1 - TOP REAR OF STEERING WHEEL
2 - FOAM RUBBER PADS
3 - DRIVER AIRBAG RETAINING CLIP
4 - HORN GROUND AREA- NO PAD HERE

(16) Feed the clockspring wiring leads through the hole in the steering wheel. Align the steering wheel's wide mounting spline with the steering column shaft missing spline area and push the wheel onto the shaft. Make sure the clockspring lines up with the back of the wheel and does not bind.

(17) Install the steering wheel retaining bolt and tighten it until the steering wheel is fully installed on shaft. Tighten the steering wheel retaining bolt to a torque of 54 N·m (40 ft. lbs.).

(18) Connect the wiring harness connector to the speed control switch (Fig. 6).

(19) Connect the squib wire to the driver airbag module (Fig. 6). Make airbag connection by pressing straight in on the connector. The connector should be fully seated. Feel for positive snap to assure positive connection.

(20) Connect the horn switch electrical connector.

(21) Rotate the steering wheel 90 degrees in either direction.

(22) Place driver airbag into position and firmly snap both pins into place. **Listen for the audible click at each pin. Visually check that both pins are properly seated between the legs of the clips.**

(23) Install the upper and lower steering column shrouds onto the steering column (Fig. 2). Snap the two shrouds together, then install and tighten the two screws securing the shrouds to the column.

COLUMN (Continued)

NOTE: When reconnecting the battery on a vehicle that has had the driver airbag removed, the following procedure should be used.

(24) Reconnect the ground cable to the negative post of the battery in the following manor:

(a) Connect a scan tool (DRBIII®) to the data link diagnostic connector located below the steering column.

(b) Turn the ignition key to the ON position. Exit the vehicle with the scan tool leaving the scan tool harness plugged in.

(c) Ensuring that there are no occupants in the vehicle, connect the ground (-) cable to the negative post of the battery.

(d) Using the scan tool, read and record any fault codes. Refer to the Appropriate Diagnostic Information if any faults are found.

(e) Erase any stored faults if there are no active fault codes. If a problem exists, the fault code will not erase.

(f) Reach around behind the steering wheel (just in front of the instrument cluster) and turn the ignition key to OFF, then back ON while observing the instrument cluster airbag indicator lamp. It should go on for six to eight seconds, then go out. This will indicate that the airbag system is functioning normally. If airbag indicator lamp fails to light, blinks on and off, or goes on and stays on, there is an airbag system malfunction. Refer to the Appropriate Diagnostic Information to diagnose a system malfunction.

(25) Turn the key to OFF and remove the scan tool from the vehicle.

(26) Test the operation of the horn, wipers and any other functions that are steering column operated. If applicable, reset the radio and the clock.

(27) If the steering column is a tilt column, verify the tilt mechanism operates properly.

(28) Road test the vehicle to ensure proper operation of the steering system and the speed control system.

INSTALLATION - RHD

Right-Hand-Drive steering column is typical of Left-Hand-Drive. (Refer to 19 - STEERING/COLUMN - INSTALLATION - LHD)

SPECIFICATIONS - STEERING COLUMN FASTENER TORQUE

DESCRIPTION	N·m	Ft. Lbs.	In. Lbs.
Coupling Pinch Bolt	28	21	250
SKIM Mounting Screws	3	—	25
Speed Control Switch Screw	2	—	20
Steering Column Mounting Nuts	17	—	150
Steering Wheel Retaining Bolt	54	40	—

IGNITION SWITCH

REMOVAL

The ignition switch attaches to the lock cylinder housing on the end opposite the lock cylinder (Fig. 19). For ignition switch terminal and circuit identification, refer to the Wiring Diagrams sections.

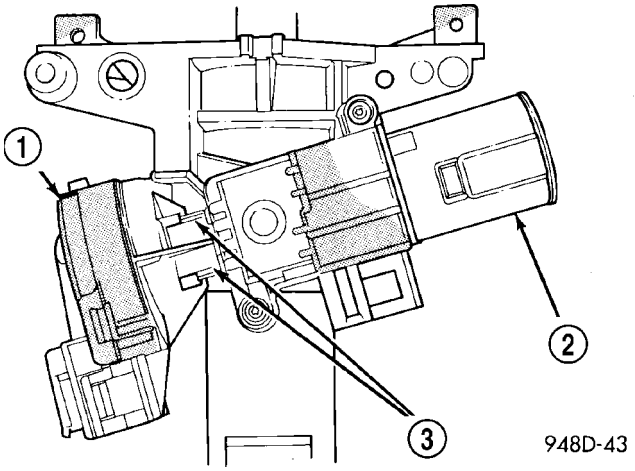

Fig. 19 Ignition Switch—Viewed From Below Column

1 - IGNITION SWITCH
2 - LOCK CYLINDER HOUSING
3 - RETAINING TABS

(1) Remove the air cleaner lid, disconnect the inlet air temperature sensor and makeup air hose.

(2) Disconnect negative cable from battery.

IGNITION SWITCH (Continued)

(3) Place key cylinder in RUN position. Through the hole in the lower shroud, depress lock cylinder retaining tab and remove key cylinder (Fig. 20).

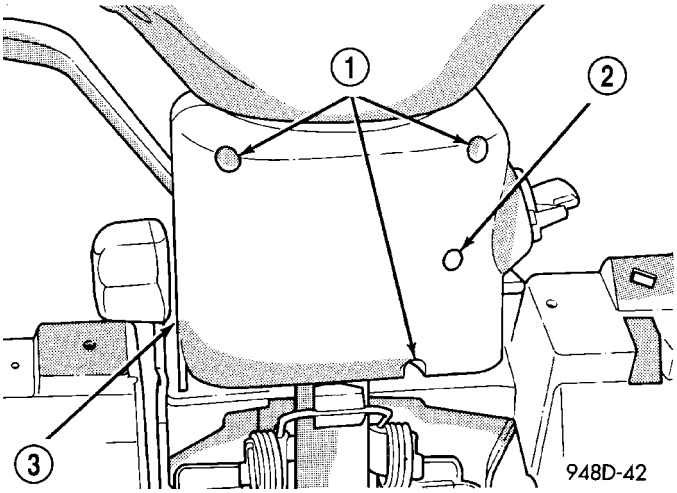

Fig. 20 Steering Column Shrouds

1 - SCREW ACCESS HOLE
2 - TAB ACCESS HOLE
3 - LOWER SHROUD

(4) Remove upper and lower shrouds from steering column.

(5) Disconnect electrical connectors from ignition switch (Fig. 21).

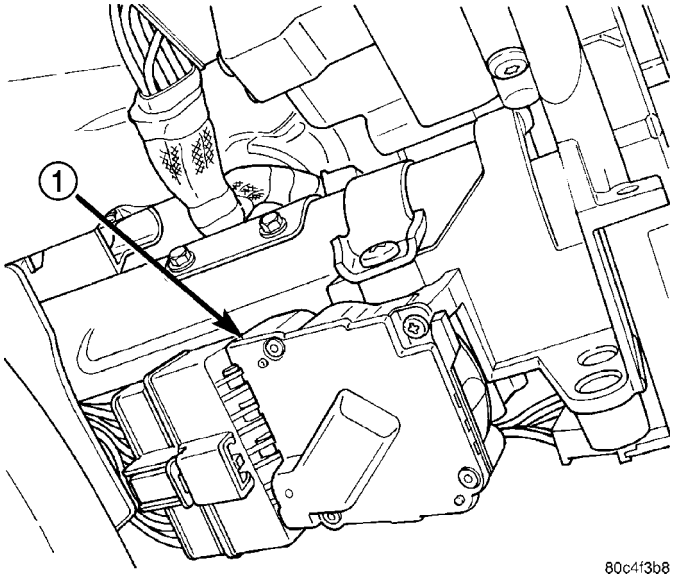

Fig. 21 Ignition Switch

1 - IGNITION SWITCH

(6) Remove the 2 screws on the top of the multi-function switch and relocate (Fig. 22).

(7) Remove ignition switch mounting screw (Fig. 23) with a #10 Torx® bit.

(8) Pull ignition switch from steering column (Fig. 24).

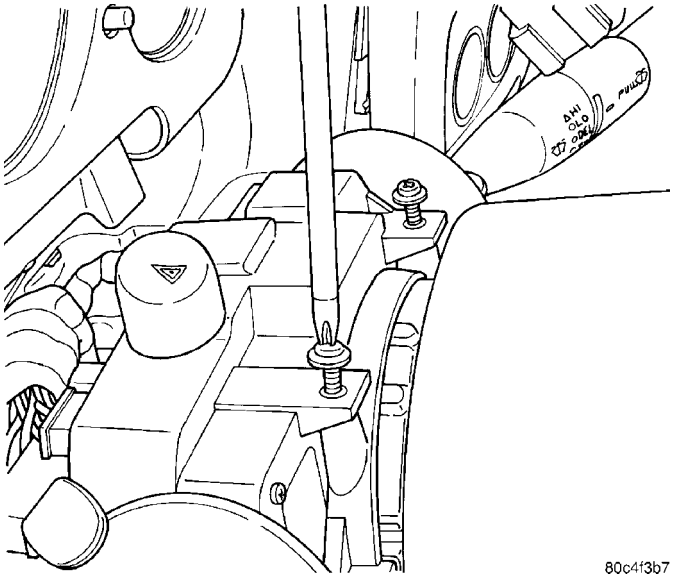

Fig. 22 Multi-Function Switch

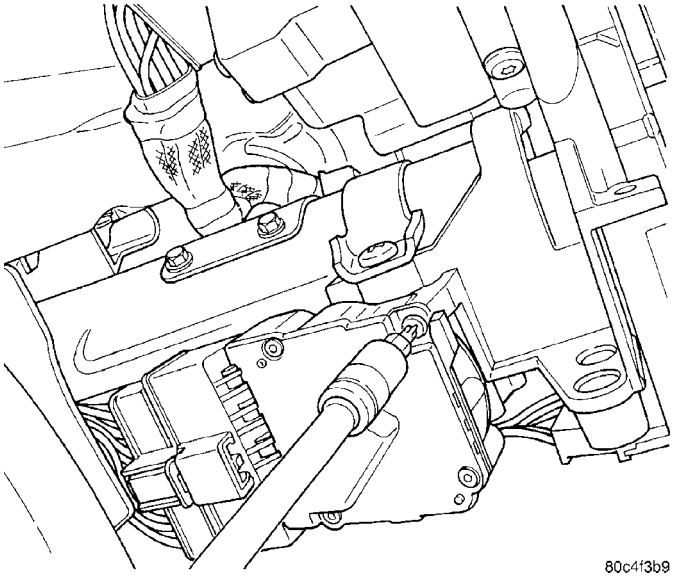

Fig. 23 Ignition Switch Mounting Screw

INSTALLATION

(1) Ensure the ignition switch is in the RUN position and the actuator shaft in the lock housing is in the RUN position.

(2) Carefully install the ignition switch. The switch will snap over the retaining tabs (Fig. 25). Install mounting screw (Fig. 23).

(3) Install electrical connectors to ignition switch.

(4) Install the multi-function switch and tighten the 2 screws (Fig. 22).

(5) Install upper and lower shrouds.

(6) Install key cylinder (cylinder retaining tab will depress only in the RUN position).

(7) Connect negative cable to battery.

(8) Install the air cleaner lid, connect the inlet air temperature sensor and makeup air hose.

IGNITION SWITCH (Continued)

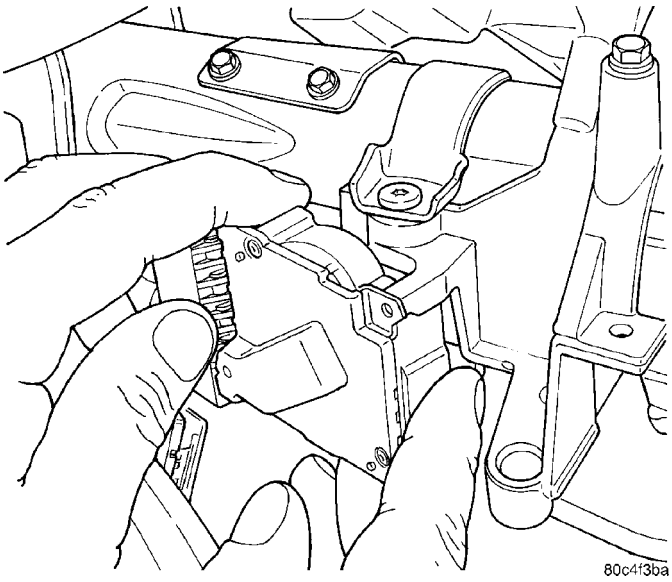

Fig. 24 Removing Ignition Switch

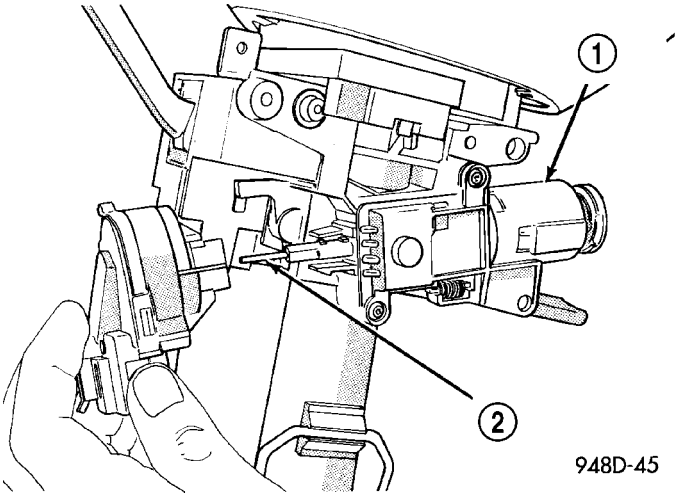

Fig. 25 Ignition Switch Installation

1 - LOCK CYLINDER HOUSING
2 - SHAFT

(9) Check for proper operation of ignition switch and key-in warning switch.

KEY/LOCK CYLINDER

REMOVAL

The lock cylinder is inserted in the end of the housing opposite the ignition switch. The ignition key rotates the cylinder to 5 different detentes (Fig. 26) :

- Accessory
- Off (lock)
- Unlock
- On/Run
- Start

(1) Disconnect negative cable from battery.

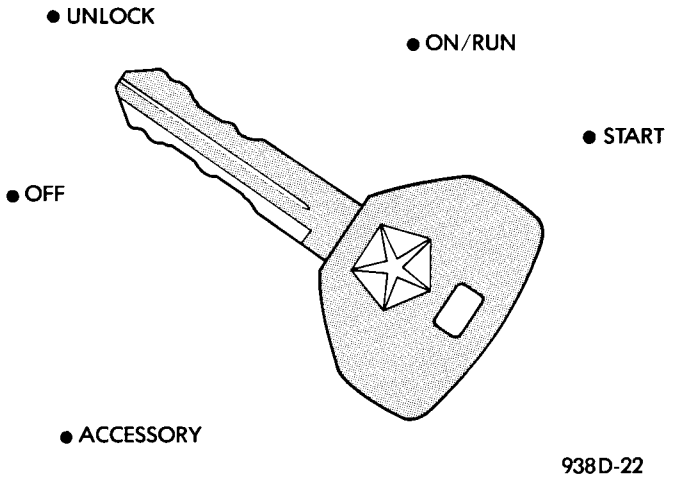

Fig. 26 Ignition Lock Cylinder Detentes

(2) Place key cylinder in RUN position. Through the hole in the lower shroud, depress lock cylinder retaining tab and remove key cylinder.

INSTALLATION

(1) Install key in lock cylinder. Turn key to RUN position (retaining tab on lock cylinder can be depressed).

(2) The shaft at the end of the lock cylinder aligns with the socket in the end of the housing. To align the socket with the lock cylinder, ensure the socket is in the Run position (Fig. 27).

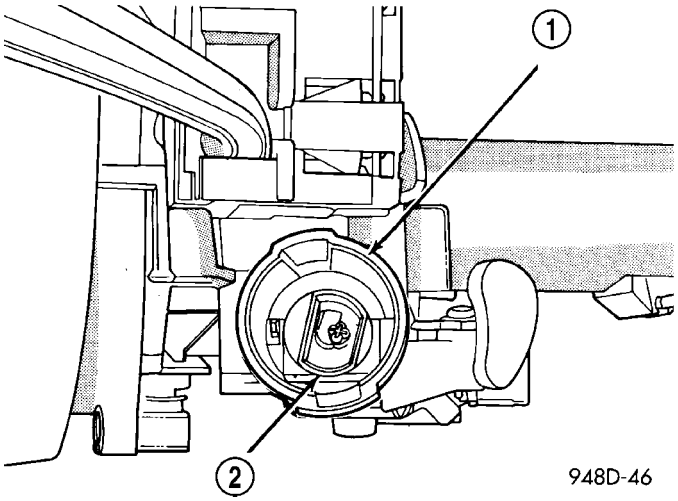

Fig. 27 Socket in Lock Cylinder Housing

1 - LOCK CYLINDER HOUSING
2 - SOCKET

(3) Align the lock cylinder with the grooves in the housing. Slide the lock cylinder into the housing until the tab sticks through the opening in the housing.

(4) Turn the key to the Off position. Remove the key.

(5) Connect negative cable to battery.

SHROUD - UPPER/LOWER

REMOVAL

(1) Fold down and remove the knee blocker panel below steering column.

(2) Remove two column shroud retaining screws.

(3) Separate upper and lower steering column shrouds (Fig. 28) and remove from vehicle.

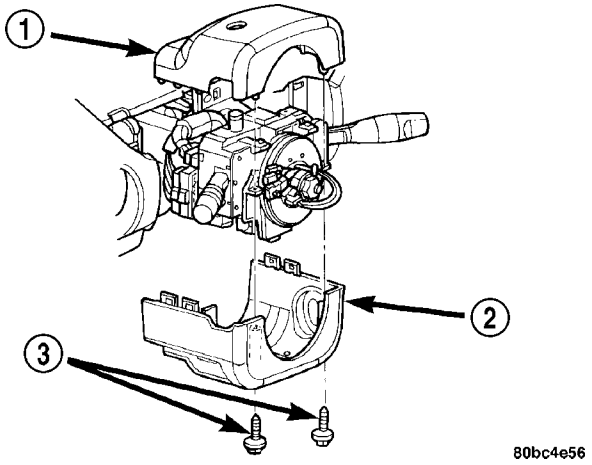

Fig. 28 Steering Column Shrouds

1 - UPPER SHROUD
2 - LOWER SHROUD
3 - MOUNTING SCREWS

INSTALLATION

(1) Connect the upper and lower steering column shrouds (Fig. 28).

NOTE: Ensure that the locking tabs on the inboard and outboard sides of the shrouds are secure.

(2) Install the two column shroud retaining screws. Torque steering column shroud retaining screws to 2 N·m (18 in. lbs.).

(3) Install the knee blocker panel below the steering column.

STEERING COUPLING - LOWER

DESCRIPTION

The steering column lower coupling incorporates an dual-stage intermediate shaft with a universal joint at its base. The lower coupling is located between the steering column's upper coupling and the input shaft of the steering gear (Fig. 29). A collar is also placed near the center of shaft.

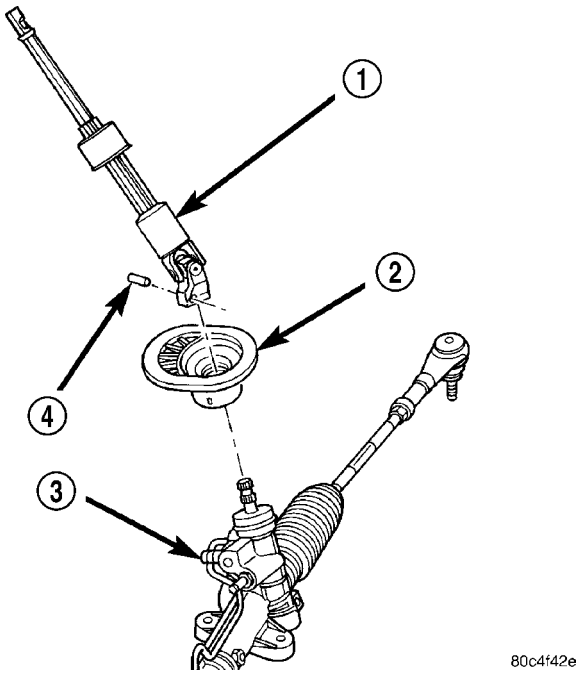

Fig. 29 Steering Column Lower Coupling (Typical)

1 - LOWER COUPLING
2 - SEAL
3 - STEERING GEAR
4 - ROLL PIN

OPERATION

The steering column lower coupling connects the steering column shaft to the steering gear input shaft. Working with a universal joint located on the end of the steering column shaft, the steering column lower coupling allows for the misalignment of the steering column with the steering gear.

There is a dual-stage collapsible sliding joint located in the center of the lower coupling intermediate shaft (Fig. 30). It allows the shaft to collapse (shorten) anytime there is rearward movement of the steering gear, such as when the vehicle is involved in a front end collision involving the steering gear. It takes approximately 400 lbs. of force to slide the joint.

The collar mounted near the center of the shaft is there to provide a clean surface for the dash seal to ride upon, sealing the gap between the shaft and the dash panel.

DIAGNOSIS AND TESTING - STEERING COLUMN LOWER COUPLING

The steering column lower coupling and its flexible joint must be inspected whenever any of the following conditions exist:

- After the vehicle has been involved in a collision which deploys the airbag, regardless of the extent of damage to the vehicle.

STEERING COUPLING - LOWER (Continued)

- After the vehicle has been involved in an undercarriage impact which results in any type of damage or bending of front suspension components or the frame of the vehicle.
- Under any conditions which result in the steering gear, steering column or steering column shaft receiving a force great enough to move the steering column or shaft forward or rearward in the vehicle.

Inspect the lower coupling shaft and its flexible joint for any of the following conditions:

- seized or binding bearings
- loose bearing stakes
- bearings not fully seated
- shaft bent
- shaft too short (see measurement procedure below)

Upon inspection, if any of the above conditions exist, replacement of the entire steering column lower coupling is necessary.

The shaft area of the lower coupling is a dual-stage type (Fig. 30). It has a Stage 1 and a Stage 2. Upon impact, Stage 1 slides into Stage 2. Measure the length of Stage 1 from Point A to Point B (Fig. 30). If the distance between Point A and Point B (length of Stage 1) is under 1.5 inches (38 mm), replace the coupling.

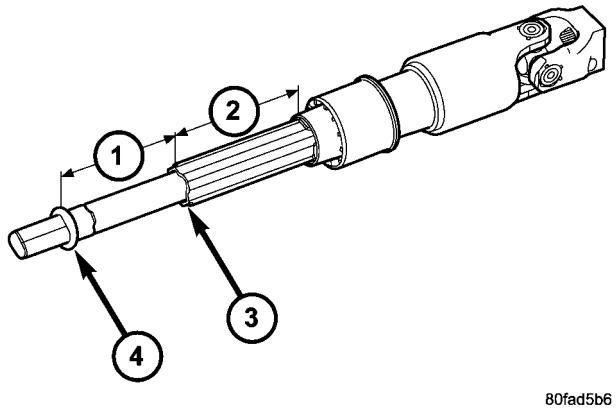

Fig. 30 Dual-Stage Shaft Coupling

1 - STAGE 1
2 - STAGE 2
3 - POINT "B"
4 - POINT "A"

REMOVAL

NOTE: Before proceeding, (Refer to 19 - STEERING - WARNING)(Refer to 19 - STEERING/COLUMN - WARNING).

(1) Place the steering wheel in the STRAIGHT-AHEAD position. Using a steering wheel holder, lock the steering wheel in place to keep it from rotating (Fig. 31). This keeps the clockspring in the proper orientation.

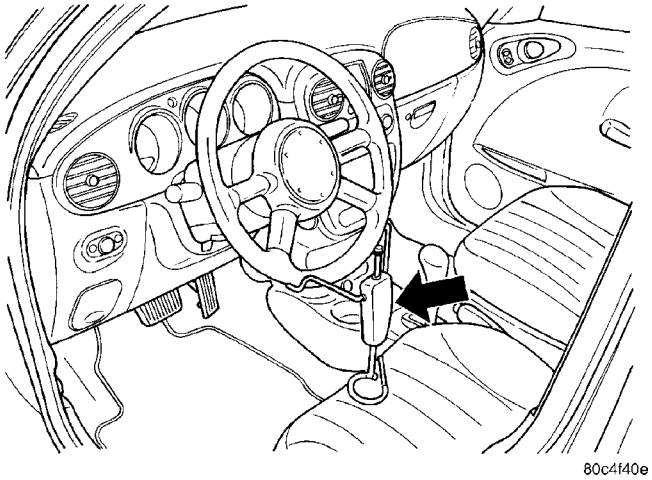

Fig. 31 Steering Wheel Holder

(2) Remove the silencer pad below the knee blocker panel below the steering column.

(3) Fold down and remove the knee blocker.

(4) Remove the steering column coupling retainer pin, back off the pinch bolt nut, and remove the steering column coupling pinch bolt (Fig. 32) (the pinch bolt nut is caged to the coupling and is not removable). Separate the upper and lower steering column couplings.

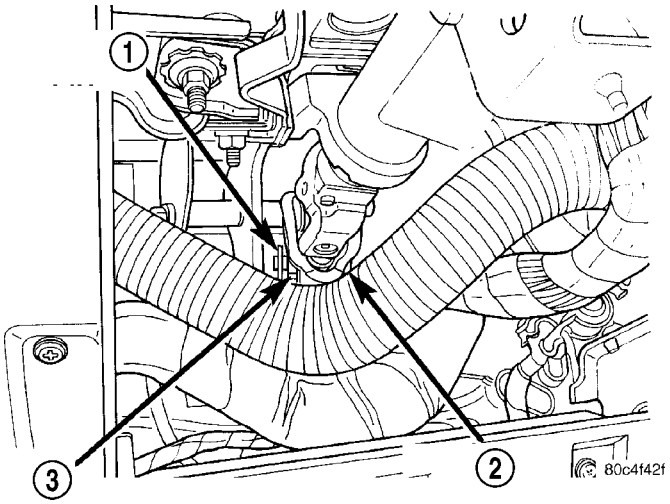

Fig. 32 Steering Column Coupling

1 - RETAINING PIN
2 - PINCH BOLT
3 - NUT

(5) Raise the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

STEERING COUPLING - LOWER (Continued)

(6) Release the locking tab on the wiring harness connector for the power steering fluid pressure switch, then remove the wiring harness connector from the power steering fluid pressure switch (Fig. 33).

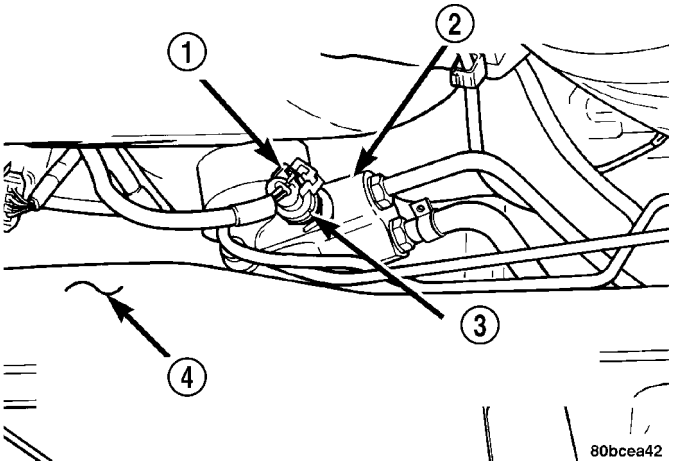

Fig. 33 Power Steering Fluid Pressure Switch

1 - WIRING HARNESS CONNECTOR
2 - POWER STEERING GEAR
3 - POWER STEERING FLUID PRESSURE SWITCH
4 - REAR OF FRONT SUSPENSION CROSSMEMBER

(7) Remove the right front tire and wheel assembly.

(8) Remove the pencil strut from the right front corner of the crossmember and body of the vehicle. (Fig. 34). Remove the washer behind the strut from the torque strut bolt.

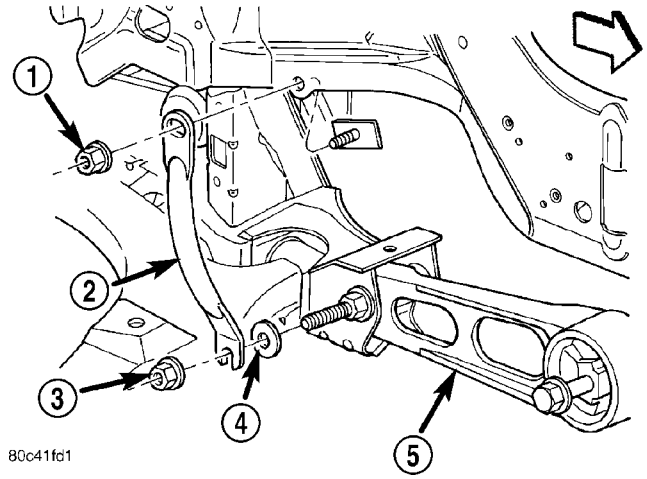

Fig. 34 Strut Mounting

1 - NUT
2 - PENCIL STRUT
3 - NUT
4 - FLAT WASHER
5 - LOWER TORQUE STRUT

(9) Remove the screws fastening the front fascia to the reinforcement as necessary in order to access the drive-belt splash shield forward fastener screw (Fig. 35).

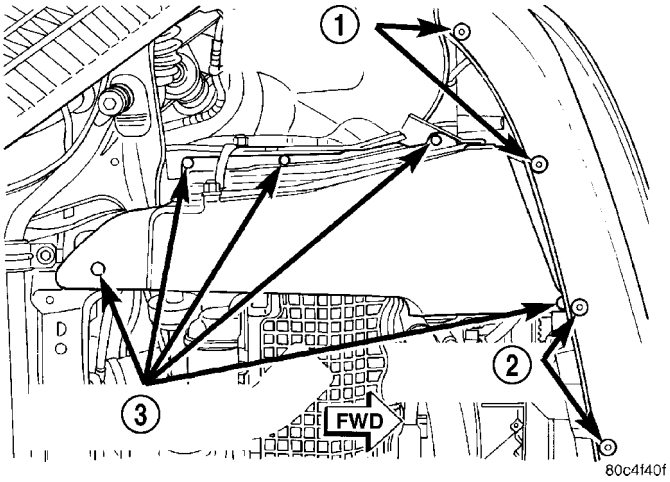

Fig. 35 Fascia And Splash Shield Fasteners

1 - FASCIA FASTENERS
2 - FASCIA FASTENERS
3 - SPLASH SHIELD FASTENERS

(10) Remove the drive-belt splash shield fasteners (Fig. 35). Remove the shield.

(11) Remove the bolt mounting the engine torque strut to the right forward corner of the front suspension crossmember (Fig. 34).

NOTE: Before removing the front suspension crossmember from the vehicle, the location of the crossmember must be scribed on the body of the vehicle (Fig. 9). Do this so the crossmember can be relocated, upon reinstallation, against the body of vehicle in the same location as before removal. If the front suspension crossmember is not reinstalled in exactly the same location as before removal, the preset front wheel alignment settings (caster and camber) will be lost.

(12) Using an awl, scribe a line marking the location of where the front suspension crossmember is mounted against the body of the vehicle (Fig. 36).

(13) Position a transmission jack under the center of the front suspension crossmember and raise it to support the bottom of the crossmember.

(14) Loosen all six bolts attaching the front suspension crossmember to the frame rails of vehicle. Do not completely remove the two mounting bolts going through the lower control arm rear isolator bushings. They are designed to disengage from the body threads yet stay within the lower control arm rear isolator bushing. Back the two bolts out just enough to disengage the threaded tapping plates in the body of the vehicle. Completely remove the other four bolts.

STEERING COUPLING - LOWER (Continued)

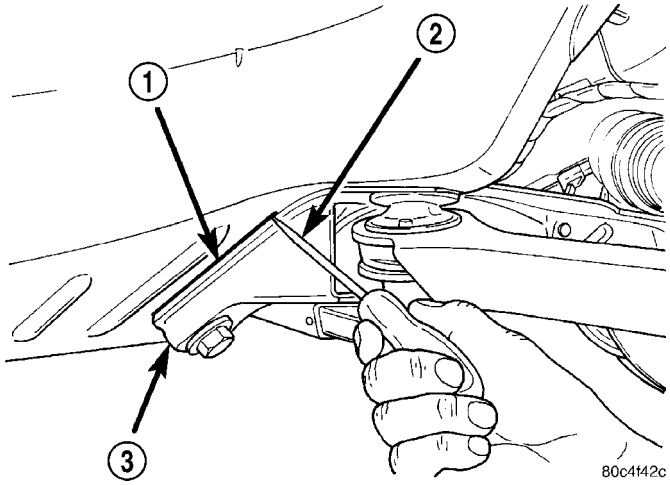

Fig. 36 Marking Crossmember Location

1 - SCRIBED LINE
2 - AWL
3 - CROSSMEMBER

CAUTION: Lower the steering gear slowly, paying special attention to the power steering fluid hoses. Do not strain or overextend the hoses because damage to the hoses or connecting hardware may occur.

(15) Lower the front suspension crossmember using the transmission jack just enough to allow access to the steering column lower coupling (Fig. 37). When lowering front suspension crossmember, do not let crossmember hang from lower control arms. The weight should be supported by the transmission jack.

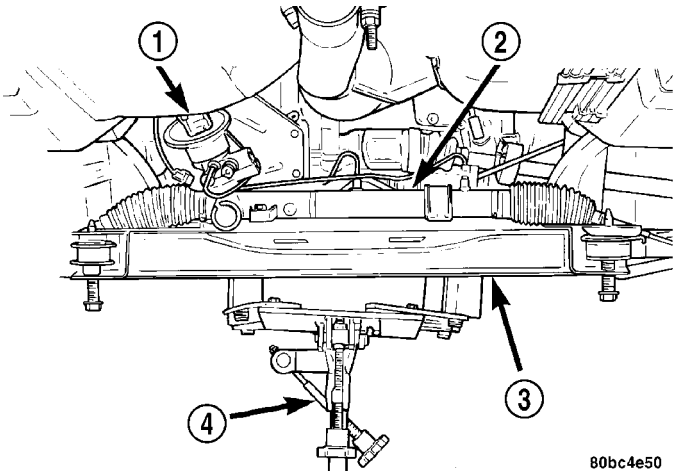

Fig. 37 Crossmember Lowered

1 - STEERING COLUMN LOWER COUPLING
2 - POWER STEERING GEAR
3 - FRONT SUSPENSION CROSSMEMBER
4 - TRANSMISSION JACK

(16) Remove the roll pin securing the steering column lower coupling to the power steering gear pinion shaft using a roll pin punch (Fig. 38). Push the steering column lower coupling up and off of the power steering gear pinion shaft.

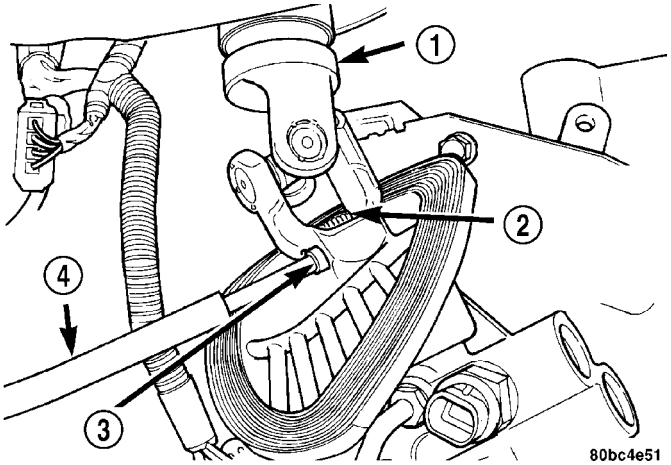

Fig. 38 Coupling Roll Pin

1 - STEERING COLUMN LOWER COUPLING
2 - POWER STEERING GEAR PINION SHAFT
3 - ROLL PIN
4 - ROLL PIN PUNCH

(17) Remove the coupling from the vehicle.

INSTALLATION

(1) Push the column end of the steering column lower coupling partway up through the hole in the dash panel, then match the flat on the on the inside of the lower coupling to the flat on the power steering gear pinion shaft and slide the coupling onto the shaft.

(2) Align the roll pin hole in the coupling to the notch in the gear pinion shaft and instal the roll pin through the coupling until it is centered (Fig. 38).

(3) Center the power steering gear rack in its travel.

(4) Using the transmission jack, raise the front suspension crossmember and power steering gear until the crossmember contacts its mounting spot against the body and frame rails of the vehicle. As the crossmember is raised, carefully guide the steering column lower coupling up through its hole in the dash panel.

(5) Start the two crossmember mounting bolts through the lower control arm rear isolator bushings into the tapping plates mounted in the body. Next, install the two front and the two rear mounting bolts attaching front suspension crossmember to frame rails of vehicle. Lightly tighten all six mounting bolts to approximately 2 N·m (20 in. lbs.) to hold the front suspension crossmember in position at this time.

STEERING COUPLING - LOWER (Continued)

NOTE: When installing the front suspension crossmember back in the vehicle, it is very important that the crossmember be attached to the body in exactly the same spot as when it was removed. Otherwise, the vehicle's wheel alignment settings (caster and camber) will be lost.

(6) Using a soft face hammer, tap the front suspension crossmember back-and-forth or side-to-side until it is aligned with the previously scribed positioning marks on the body of the vehicle (Fig. 36). Once the front suspension crossmember is correctly positioned, tighten the two crossmember mounting bolts through the lower control arm rear isolator bushings to a torque of 250 N·m (185 ft. lbs.), then tighten the four remaining crossmember mounting bolts to a torque of 153 N·m (113 ft. lbs.).

(7) Fasten the engine torque strut to the right forward corner of the front suspension crossmember using its mounting bolt (Fig. 34). Follow the procedure described in the ENGINE section to properly align and tighten the torque strut and it's mounting bolts.

(8) Install the washer on the end of the stud extending from the torque strut bolt (Fig. 34).

(9) Install the pencil strut to the right front corner of the crossmember and body of the vehicle (Fig. 34). Tighten the pencil strut nuts to a torque of 52 N·m (38 ft. lbs.).

(10) Install the drive-belt splash shield and fasteners (Fig. 35).

(11) Install the screws fastening the front fascia to the reinforcement (Fig. 35).

(12) Install the right front tire and wheel assembly. Tighten the mounting nuts to a torque of 135 N·m (100 ft. lbs.).

(13) Reconnect the wiring harness connector from the power steering fluid pressure switch (Fig. 33). Be sure the locking tab on the wiring harness connector is securely latched.

(14) Lower the vehicle.

(15) Install the dash-to-lower coupling seal in place over the lower coupling's plastic collar.

NOTE: Verify that grease is present on the lip of the dash-to-coupling seal where it contacts the coupling's plastic collar.

(16) Inside the passenger compartment, reconnect the steering column lower coupling to the steering column upper coupling (Fig. 32). Install the coupling pinch bolt and tighten the pinch bolt nut to a torque of 28 N·m (250 in. lbs.). Install the pinch bolt retainer pin.

(17) Remove the steering wheel holder.

(18) While looking under the instrument panel at the lower coupling, rotate the steering wheel back-and-forth to verify that the lower coupling does not squeak against the dash-to-coupling seal.

(19) Install the knee blocker.

(20) Install the silencer pad below the knee blocker panel below the steering column.

STEERING WHEEL

REMOVAL

WARNING:

- **DO NOT PLACE A NON-DEPLOYED AIRBAG FACE DOWN ON A HARD SURFACE, THE AIRBAG WILL PROPEL INTO THE AIR IF ACCIDENTALLY DEPLOYED, AND COULD RESULT IN SERIOUS OR FATAL INJURY.**
- **DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE BEFORE BEGINNING STEERING WHEEL REMOVAL OR INSTALLATION. THIS WILL DISABLE THE FRONT AIRBAG SYSTEM. FAILURE TO DISCONNECT THE BATTERY COULD RESULT IN ACCIDENTAL FRONT AIRBAG MODULE DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**
- **ALLOW THE FRONT AIRBAG SYSTEM CAPACITOR TO DISCHARGE FOR TWO MINUTES BEFORE REMOVING THE STEERING WHEEL OR ANY FRONT AIRBAG SYSTEM COMPONENT.**

(1) Adjust the steering wheel so that the tires are in the STRAIGHT-AHEAD position.

(2) Open hood.

(3) Disconnect and isolate the battery negative cable.

(4) Remove the driver airbag. (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - REMOVAL)

(5) While holding the steering wheel firmly in place, remove the retaining bolt securing the steering wheel to the steering column shaft (Fig. 39).

CAUTION: When installing a wheel puller on the steering wheel, be sure the puller bolts are fully seated in the threaded holes on the steering wheel. If the bolts are not fully seated in the threaded holes, the threads may be stripped out of the steering wheel when attempting to remove the steering wheel. Take care not to over-thread the puller bolts such that they contact the clockspring possibly damaging it.
Also, threading the retaining bolt back in the end of the shaft until approximately 13 mm (0.5 in.) of thread is showing between the wheel and the head of the bolt allows a safe reaction surface for the puller to work against.

STEERING WHEEL (Continued)

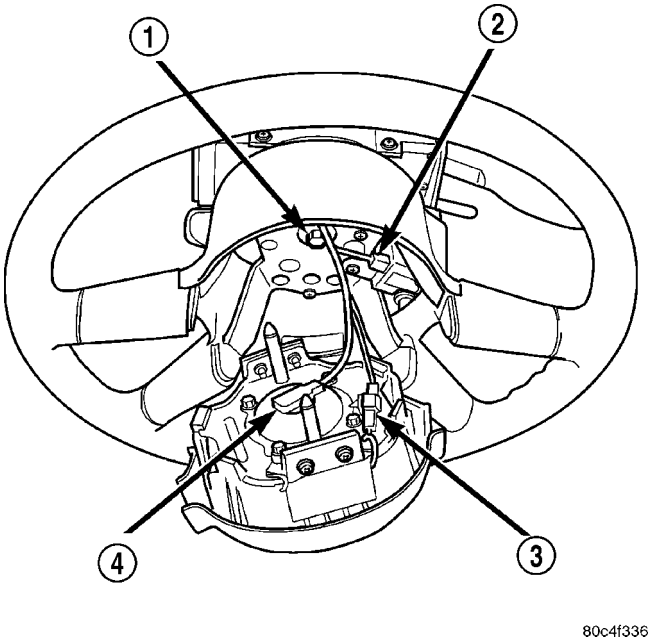

Fig. 39 Steering Wheel Retaining Bolt

1 - STEERING WHEEL RETAINING BOLT
2 - SPEED CONTROL SWITCH CONNECTOR
3 - HORN SWITCH CONNECTOR
4 - AIRBAG CONNECTOR

(6) Thread the wheel retaining bolt back into the end of the shaft until approximately 13 mm (0.5 in.) of thread is showing between the wheel and the head of the bolt.

(7) Install a steering wheel puller on the steering wheel.

CAUTION: Do not bump or hammer on steering wheel or steering column shaft when removing steering wheel from steering column.

(8) While holding the steering wheel firmly in the STRAIGHT-AHEAD position, remove steering wheel from the steering column shaft using the puller.

(9) Remove the wheel retaining bolt and the steering wheel. Take care to feed the wires gently through the holes in the steering wheel.

INSTALLATION

(1) Confirm that:

(a) The front wheels are in the STRAIGHT-AHEAD position.

(b) The turn signal stalk is in the neutral position.

(2) Ensure the three foam rubber driver airbag retaining clip pads are still in place on the rear of the steering wheel (Fig. 40). Replace any missing pads.

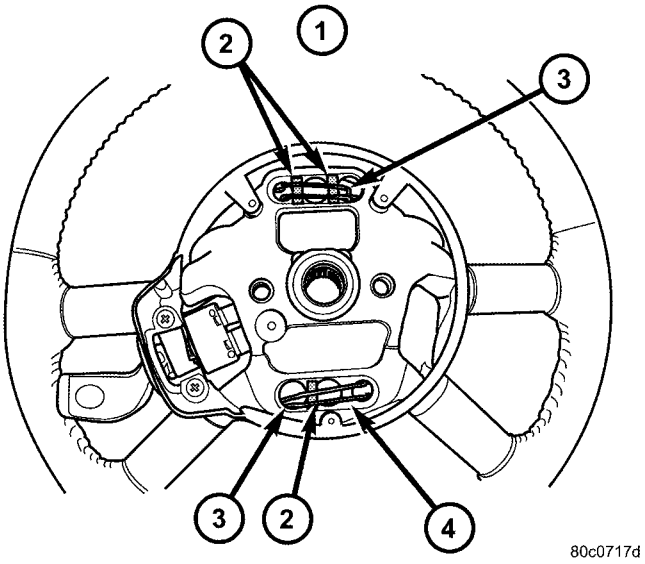

Fig. 40 Foam Rubber Pad Locations

1 - TOP REAR OF STEERING WHEEL
2 - FOAM RUBBER PADS
3 - DRIVER AIRBAG RETAINING CLIP
4 - HORN GROUND AREA- NO PAD HERE

CAUTION: Do not install the steering wheel onto the shaft of the steering column by driving it onto the shaft.

(3) Feed the clockspring wiring leads through the hole in the steering wheel. Align the steering wheel's wide mounting spline with the steering column shaft missing spline area and push the wheel onto the shaft. Make sure the clockspring lines up with the back of the wheel and does not bind.

(4) Install the steering wheel retaining bolt and tighten it until the steering wheel is fully installed on shaft. Tighten the steering wheel retaining bolt to 54 N·m (40 ft. lbs.) torque.

(5) Install the driver airbag. (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - INSTALLATION)

WARNING: DO NOT CONNECT BATTERY NEGATIVE CABLE YET. REFER FIRST TO AIRBAG SYSTEM TEST. (Refer to 8 - ELECTRICAL/RESTRAINTS - DIAGNOSIS AND TESTING)

(6) Reconnect battery using Airbag System Test procedure in Restraints. (Refer to 8 - ELECTRICAL/RESTRAINTS - DIAGNOSIS AND TESTING)

(7) Close hood.

(8) Verify vehicle and system operation.

GEAR

DESCRIPTION

The power steering gear is the rack-and-pinion type. It is mounted on the front suspension crossmember (Fig. 1). The outer ends of the outer tie rods attach to the steering knuckles.

NOTE: The power steering gear should not be serviced or adjusted. If a malfunction or oil leak occurs with the steering gear, the complete steering gear needs to be replaced.

OPERATION

Turning of the steering wheel is converted into linear (side-to-side) travel through the meshing of the helical pinion teeth with the rack teeth in the steering gear. This travel pushes and pulls the tie rods to change the direction of the vehicle's front wheels.

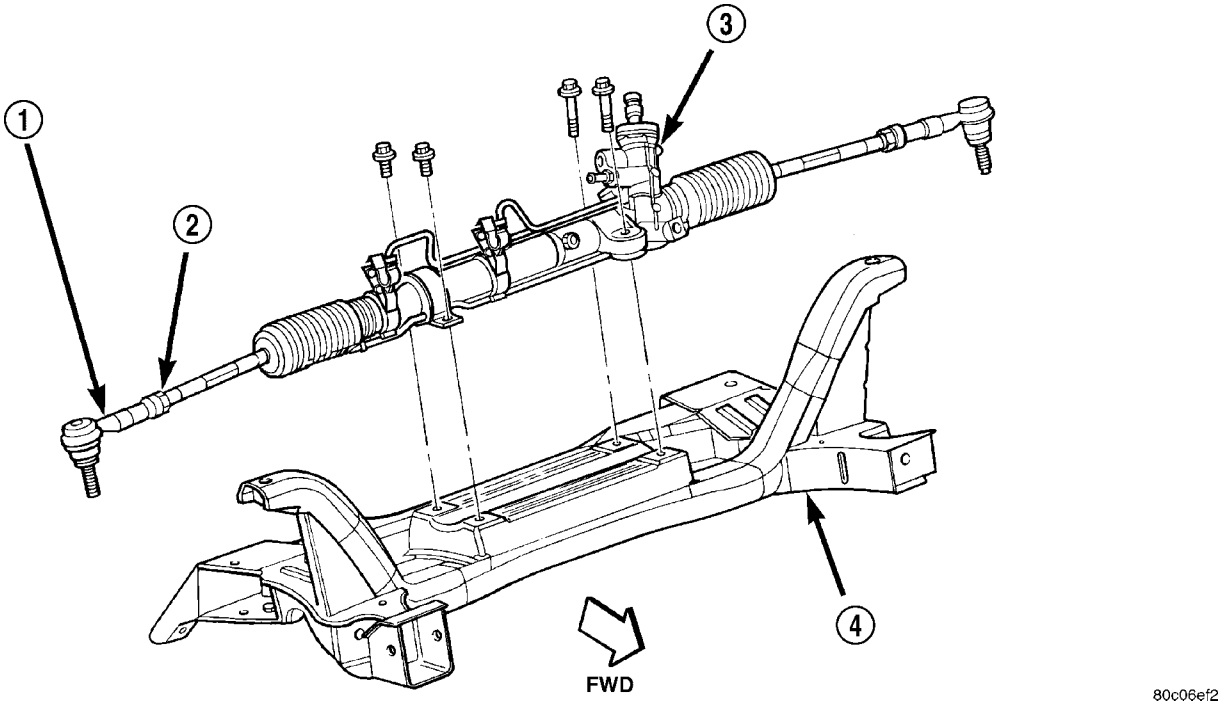

Fig. 1 Power Steering Gear - LHD Shown

1 - OUTER TIE ROD
2 - JAM NUT
3 - STEERING GEAR
4 - FRONT SUSPENSION CROSSMEMBER

GEAR (Continued)

Power assist steering provided by the power steering pump is controlled by an open-center, rotary type control valve which directs fluid from the pump to either side of the integral rack piston upon demand.

Road feel is controlled by the diameter of a torsion bar which initially steers the vehicle. As required steering effort increases, as in a turn, the torsion bar twists, causing relative rotary motion between the rotary valve body and the valve spool. This movement directs oil behind the integral rack piston which, in turn, builds up hydraulic pressure and assists in the turning effort.

Manual steering control of the vehicle can be maintained if power steering assist is lost. However, under this condition, steering effort is significantly increased.

REMOVAL

REMOVAL

NOTE: Before proceeding, (Refer to 19 - STEERING - WARNING).

(1) Place the steering wheel in the STRAIGHT-AHEAD position. Using a steering wheel holder, lock the steering wheel in place to keep it from rotating (Fig. 2). This keeps the clockspring in the proper orientation.

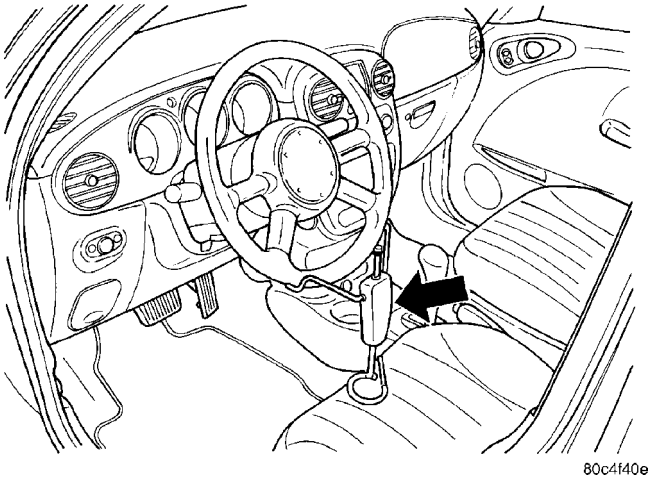

Fig. 2 Steering Wheel Holder

(2) Remove the silencer pad below the knee blocker panel below the steering column.

(3) Fold down and remove the knee blocker.

(4) Remove the steering column coupling retainer pin, back off the pinch bolt nut, and remove the steering column coupling pinch bolt (Fig. 3) (the pinch bolt nut is caged to the coupling and is not removable). Separate the upper and lower steering column couplings.

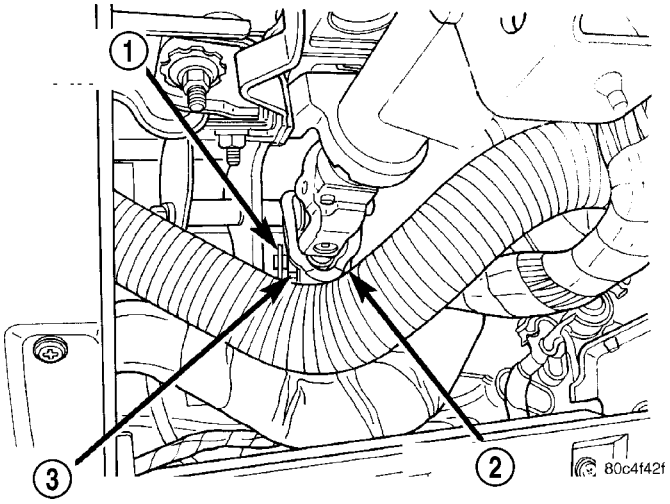

Fig. 3 Steering Column Couplings

1 - RETAINING PIN
2 - PINCH BOLT
3 - NUT

(5) Raise the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(6) Remove both front tire and wheel assemblies from the vehicle.

(7) Remove nuts attaching both outer tie rods to the steering knuckles (Fig. 4). Remove each nut by holding the tie rod stud stationary while loosening and removing the nut with a crowfoot wrench (or open-end wrench).

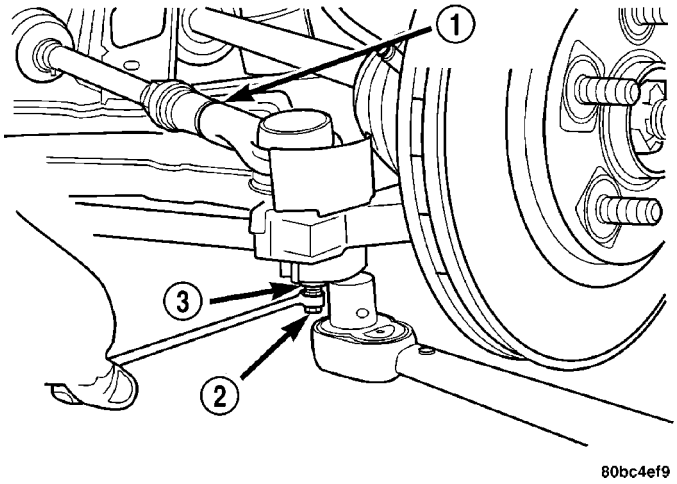

Fig. 4 Tools On Outer Tie Rod Nut

1 - OUTER TIE ROD
2 - STUD
3 - NUT

(8) Remove the outer tie rods from the steering knuckles using Remover, Special Tool MB991113 (Fig. 5).

(9) Remove the tie rod heat shields.

GEAR (Continued)

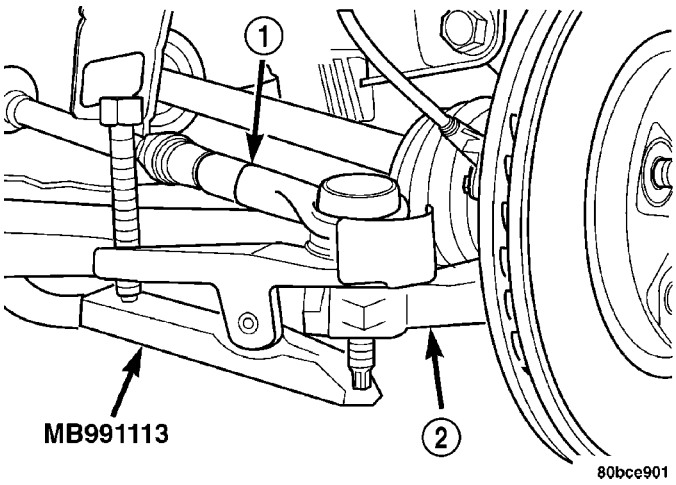

Fig. 5 Tie Rod Removal From Knuckle

1 - OUTER TIE ROD
2 - STEERING KNUCKLE

(10) On vehicles equipped with a power steering fluid pressure switch, release the locking tab on the wiring harness connector for the power steering fluid pressure switch, then remove the wiring harness connector from the power steering fluid pressure switch (Fig. 6).

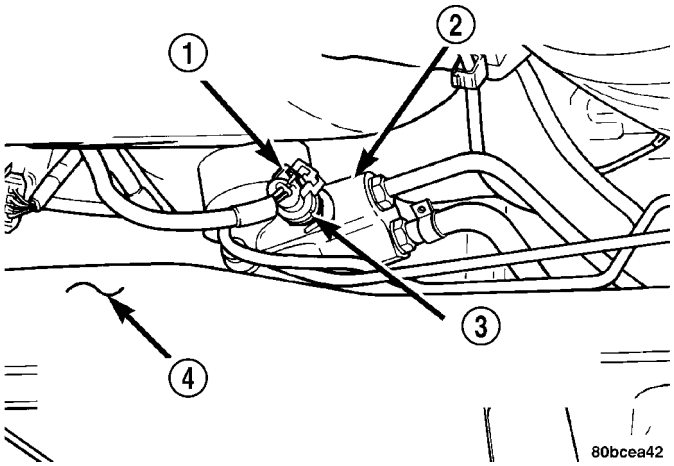

Fig. 6 Power Steering Fluid Pressure Switch

1 - WIRING HARNESS CONNECTOR
2 - POWER STEERING GEAR
3 - POWER STEERING FLUID PRESSURE SWITCH
4 - REAR OF FRONT SUSPENSION CROSSMEMBER

(11) Back out the tube nut securing the power steering fluid pressure hose to the gear (Fig. 7) (Fig. 8).

(12) Disconnect the cooler or return hose at the power steering gear outlet port fitting (Fig. 7) (Fig. 8).

(13) On vehicles equipped with crossmember mounted power steering fluid coolers:

(a) Remove the cooler tube from the right routing clip.

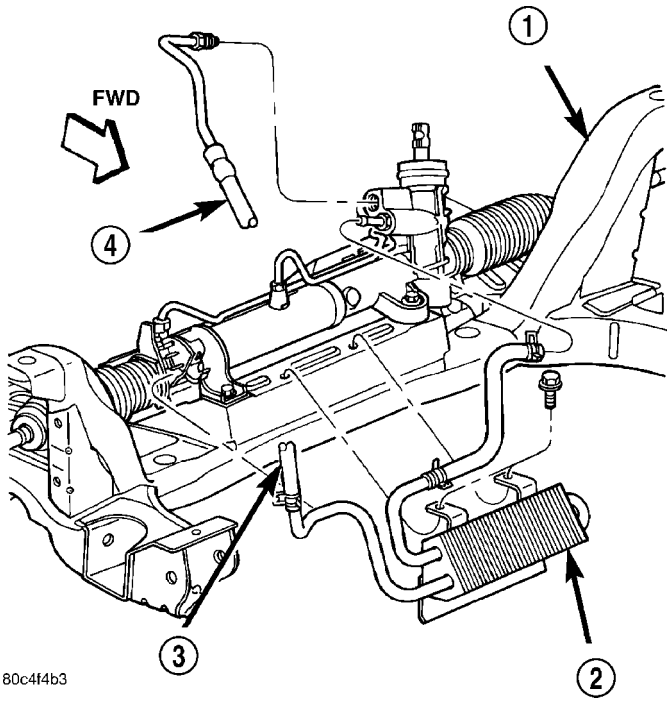

Fig. 7 Cooler And Fluid Hose Mounting

(b) Remove the two screws securing the cooler to the front suspension crossmember (Fig. 7). Allow the cooler to hang out of the way.

GEAR (Continued)

(14) Remove the pencil strut from the right front corner of the crossmember and body of the vehicle. (Fig. 9). Remove the washer behind the strut from the torque strut bolt.

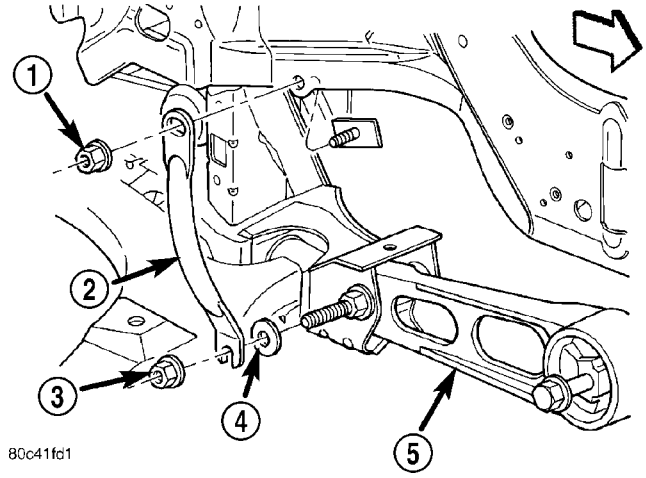

Fig. 9 Strut Mounting

1 - NUT
2 - PENCIL STRUT
3 - NUT
4 - FLAT WASHER
5 - LOWER TORQUE STRUT

(15) Remove the screws fastening the front fascia to the reinforcement as necessary in order to access the drive-belt splash shield forward fastener screw (Fig. 10).

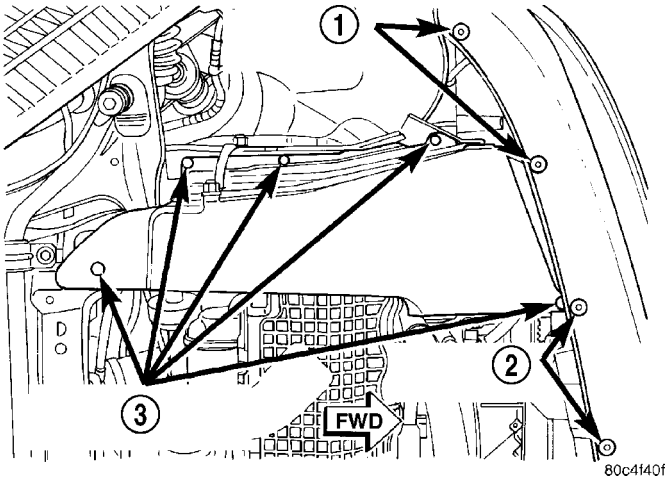

Fig. 10 Fascia And Splash Shield Fasteners

1 - FASCIA FASTENERS
2 - FASCIA FASTENERS
3 - SPLASH SHIELD FASTENERS

(16) Remove the drive-belt splash shield fasteners (Fig. 10). Remove the shield.

(17) Remove the bolt mounting the engine torque strut to the right forward corner of the front suspension crossmember (Fig. 9).

NOTE: Before removing the front suspension crossmember from the vehicle, the location of the crossmember must be scribed on the body of the vehicle (Fig. 9). Do this so the crossmember can be relocated, upon reinstallation, against the body of vehicle in the same location as before removal. If the front suspension crossmember is not reinstalled in exactly the same location as before removal, the preset front wheel alignment settings (caster and camber) will be lost.

(18) Using an awl, scribe a line marking the location of where the front suspension crossmember is mounted against the body of the vehicle (Fig. 11).

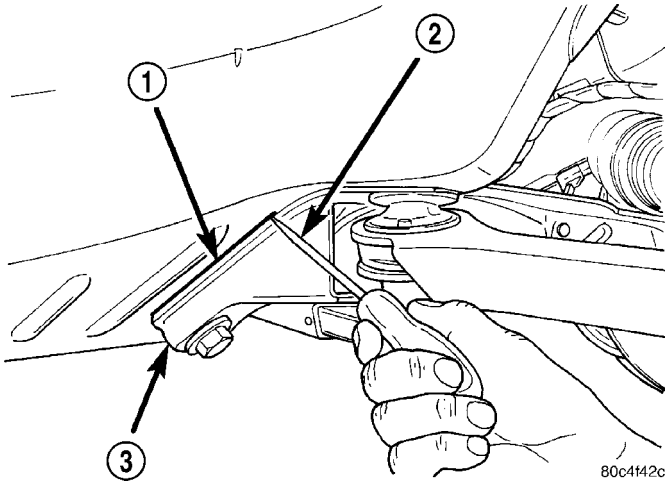

Fig. 11 Marking Crossmember Location

1 - SCRIBED LINE
2 - AWL
3 - CROSSMEMBER

(19) Position a transmission jack under the center of the front suspension crossmember and raise it to support the bottom of the crossmember.

(20) Loosen all six bolts attaching the front suspension crossmember to the frame rails of vehicle. Do not completely remove the two mounting bolts going through the lower control arm rear isolator bushings. They are designed to disengage from the body threads yet stay within the lower control arm rear isolator bushing. Back the two bolts out just enough to disengage the threaded tapping plates in the body of the vehicle. Completely remove the other four bolts.

(21) Lower the front suspension crossmember using the transmission jack enough to allow the power steering gear to be removed from the rear of the crossmember (Fig. 12). When lowering front suspension crossmember, do not let crossmember hang from lower control arms. The weight should be supported by the transmission jack.

GEAR (Continued)

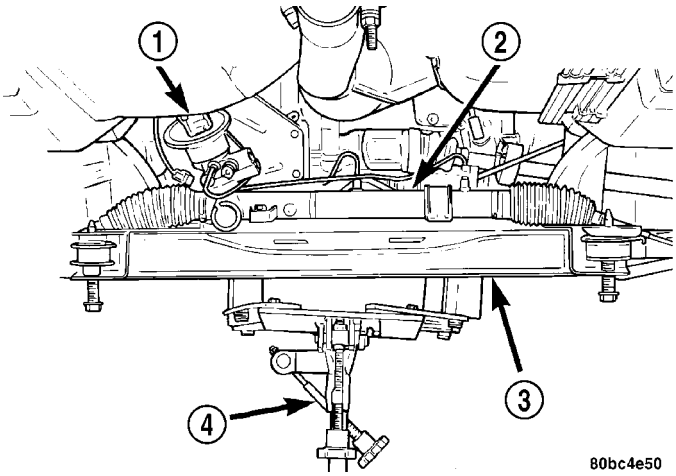

Fig. 12 Crossmember Lowered

1 - STEERING COLUMN LOWER COUPLING
2 - POWER STEERING GEAR
3 - FRONT SUSPENSION CROSSMEMBER
4 - TRANSMISSION JACK

(22) Remove the roll pin securing the steering column lower coupling to the power steering gear pinion shaft using a roll pin punch (Fig. 13). Push the steering column lower coupling up and off of the power steering gear pinion shaft.

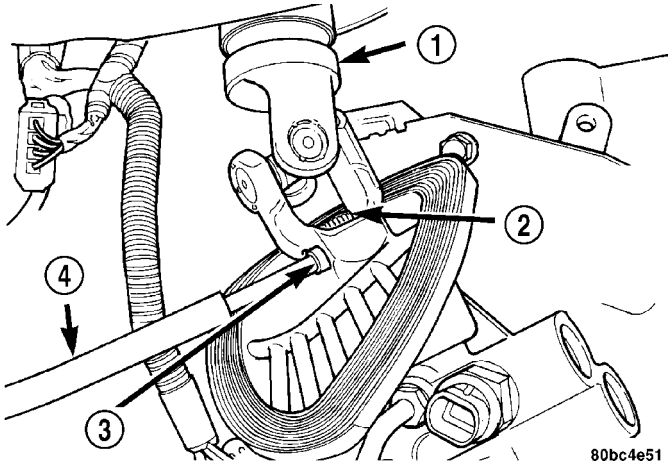

Fig. 13 Coupling Roll Pin

1 - STEERING COLUMN LOWER COUPLING
2 - POWER STEERING GEAR PINION SHAFT
3 - ROLL PIN
4 - ROLL PIN PUNCH

(23) Release the pinion shaft dash cover seal from the tabs cast into the power steering gear housing and remove the seal from the power steering gear (Fig. 14).

(24) Loosen and remove the four bolts attaching the power steering gear to the front suspension crossmember (Fig. 1). Remove the power steering gear from the front suspension crossmember.

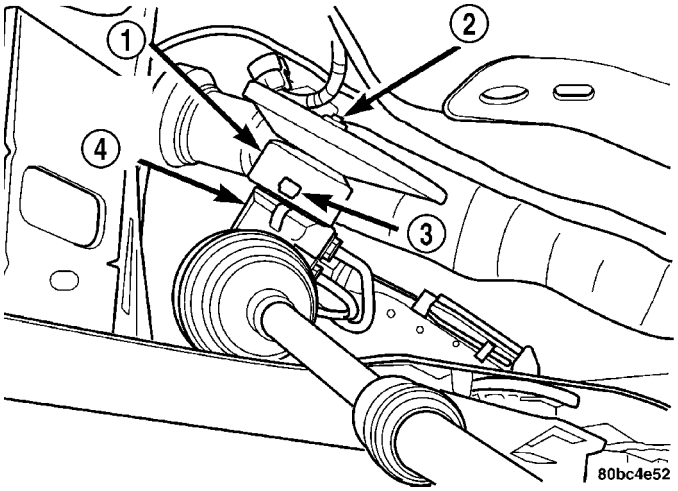

Fig. 14 Pinion Shaft Dash Cover Seal

1 - SEAL

4 - POWER STEERING GEAR

REMOVAL - RHD

Right-Hand-Drive power steering gear is typical of Left-Hand-Drive. (Refer to 19 - STEERING/GEAR - REMOVAL - LHD)

INSTALLATION

INSTALLATION

(1) Install the steering gear on the front suspension crossmember (Fig. 1). Install the four power steering gear mounting bolts. Tighten the mounting bolts to a torque of 61 N·m (45 ft. lbs.).

(2) Install the pinion shaft dash cover seal over the power steering pinion shaft and onto the power steering gear housing. Align the holes on each side of the seal with the tabs cast into the power steering gear housing (Fig. 14).

(3) With the steering column lower coupling pushed partway up through its hole in the dash panel, match the flat on the inside of the steering column lower coupling to the flat on the power steering gear pinion shaft and slide the coupling onto the top of the pinion shaft. Align the roll pin hole in the coupling with the groove in the pinion shaft and install the roll pin through the coupling until it is centered (Fig. 13).

(4) Center the power steering gear rack in its travel.

(5) Using the transmission jack, raise the front suspension crossmember and power steering gear until the crossmember contacts its mounting spot against the body and frame rails of the vehicle. As the crossmember is raised, carefully guide the steering column lower coupling up through its hole in the dash panel.

GEAR (Continued)

(6) Start the two crossmember mounting bolts through the lower control arm rear isolator bushings into the tapping plates mounted in the body. Next, install the two front and the two rear mounting bolts attaching front suspension crossmember to frame rails of vehicle. Lightly tighten all six mounting bolts to approximately 2 N·m (20 in. lbs.) to hold the front suspension crossmember in position at this time.

NOTE: When reinstalling the front suspension crossmember back in the vehicle, it is very important that the crossmember be attached to the body in exactly the same spot as when it was removed. Otherwise, the vehicle's wheel alignment settings (caster and camber) will be lost.

(7) Using a soft face hammer, tap the front suspension crossmember back-and-forth or side-to-side until it is aligned with the previously scribed positioning marks on the body of the vehicle (Fig. 11). Once the front suspension crossmember is correctly positioned, tighten the two crossmember mounting bolts through the lower control arm rear isolator bushings to a torque of 250 N·m (185 ft. lbs.), then tighten the four remaining crossmember mounting bolts to a torque of 153 N·m (113 ft. lbs.).

(8) Fasten the engine torque strut to the right forward corner of the front suspension crossmember using its mounting bolt (Fig. 9). Follow the procedure described in the ENGINE section to properly align and tighten the torque strut and it's mounting bolts. (Refer to 9 - ENGINE/ENGINE MOUNTING/ TORQUE STRUT - ADJUSTMENTS)

(9) Install the washer on the end of the stud extending from the torque strut bolt (Fig. 9).

(10) Install the pencil strut to the right front corner of the crossmember and body of the vehicle (Fig. 9). Tighten the pencil strut nuts to a torque of 52 N·m (38 ft. lbs.).

(11) Install the drive-belt splash shield and fasteners (Fig. 10).

(12) Install the screws fastening the front fascia to the reinforcement (Fig. 10).

(13) Using a lint free towel, wipe clean the open power steering hose ends and the power steering gear ports. Replace the pressure hose used O-ring with new. Lubricate the O-ring with power steering fluid.

(14) On vehicles equipped with crossmember mounted power steering fluid coolers:

(a) Place the cooler in mounting position and snap the cooler tube going to the gear into the right routing clip on the front of the gear. Close the routing clip.

(b) Install the two screws securing the cooler to the front suspension crossmember (Fig. 7). Tighten the screws to a torque of 10 N·m (90 in. lbs.).

(15) Slide the cooler or return hose onto the steel gear outlet port fitting (Fig. 7) (Fig. 8). Secure the clamp on the hose past the bead on the steel fitting.

CAUTION: On vehicles equipped with crossmember mounted power steering fluid coolers, forward of the steering gear, the power steering fluid pressure hose routes between the front suspension crossmember and the driveshaft. When tightening the pressure hose tube nut to the steering gear, the pressure hose must be positioned (clocked) such that its final routing (after tightened to 31 N·m (23 ft. lbs.)) offers 4–10 mm clearance to the front suspension crossmember (measured at the pressure hose steel-to-rubber coupling). There should be a clocking donut on the hose to preset this distance.

(16) Attach the power steering fluid pressure hose to its port on the power steering gear (Fig. 7) (Fig. 8).

(17) On turbocharged engined vehicles, install routing clip up from gear outlet tube onto fluid pressure hose tube (Fig. 8).

(18) While making sure the pressure hose is not in contact with any vehicle components (see preceding caution), tighten the pressure hose tube nut at the gear to 31 N·m (23 ft. lbs.) torque.

(19) On vehicles equipped with a power steering fluid pressure switch, reconnect the wiring harness connector at the power steering fluid pressure switch (Fig. 6). Be sure the locking tab on the wiring harness connector is securely latched.

(20) Perform the following to each outer tie rod:

(a) Place the tie rod heat shield on the knuckle's steering arm, aligning the hole in the shield with the hole in the knuckle and the tangs on the outside of the shield with the outside configuration of the steering arm. The shield should now be facing outboard, away from the power steering gear and tie rod (Fig. 4).

(b) Attach the outer tie rod end to its steering knuckle.

(c) Start the attaching nut onto the stud of the outer tie rod.

(d) While holding the stud of the tie rod stationary with a wrench, tighten the attaching nut (Fig. 4).

(e) Using a crowfoot wrench attached to a torque wrench, tighten the attaching nut to 54 N·m (40 ft. lbs.).

(21) Install the tire and wheel assemblies back on vehicle. Tighten the wheel mounting nuts to 135 N·m (100 ft. lbs.) torque.

(22) Lower the vehicle to ground level.

(23) Install the dash-to-lower coupling seal in place over the lower coupling's plastic collar.

GEAR (Continued)

NOTE: Verify that grease is present on the lip of the dash-to-coupling seal where it contacts the coupling's plastic collar.

(24) Inside the passenger compartment, reconnect the steering column lower coupling to the steering column upper coupling (Fig. 3). Install the coupling pinch bolt and tighten the pinch bolt nut to a torque of 28 N·m (250 in. lbs.). Install the pinch bolt retainer pin.

(25) Remove the steering wheel holder.

(26) While looking under the instrument panel at the lower coupling, rotate the steering wheel back-and-forth to verify that the lower coupling does not squeak against the dash-to-coupling seal.

(27) Install the knee blocker.

(28) Install the silencer pad below the knee blocker panel below the steering column.

(29) Perform the POWER STEERING PUMP INITIAL OPERATION service procedure to properly fill and bleed the power steering system. (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE)

(30) Check for fluid leaks.

(31) Adjust the front toe setting on the vehicle. (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE)

INSTALLATION - RHD

Right-Hand-Drive power steering gear is typical of Left-Hand-Drive. (Refer to 19 - STEERING/GEAR - INSTALLATION - LHD)

POWER STEERING PRESSURE SWITCH

DESCRIPTION

A power steering pressure switch is used on some versions of this vehicle to improve the vehicle's idle quality. The pressure switch improves vehicle idle quality by causing a readjustment of the engine idle speed as necessary when increased fluid pressure is sensed in the power steering system.

The pressure switch functions by signaling the powertrain control module that an increase in pressure of the power steering system is putting additional load on the engine. This type of condition exists when the front tires of the vehicle are turned while the vehicle is stationary and the engine is at idle speed. When the powertrain control module receives the signal from the power steering pressure switch, it directs the engine to increase its idle speed. This increase in engine idle speed compensates for the additional load, thus maintaining the required engine idle speed and idle quality.

The power steering pressure switch is mounted directly to the power steering gear (Fig. 15).

OPERATION

The switch provides an input to the PCM during periods of high pump load and low engine RPM; such as during parking maneuvers.

When power steering pump pressure exceeds 2758 kPa (400 psi), the switch is open. The PCM increases idle air flow through the IAC motor to prevent engine stalling. The PCM sends 12 volts through a resister to the sensor circuit to ground. When pump pressure is low, the switch is closed.

REMOVAL

NOTE: Before proceeding, (Refer to 19 - STEERING - WARNING).

(1) Disconnect negative battery cable from the negative post of the battery. Be sure cable is isolated from negative post on battery.

(2) Raise the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE).

(3) Locate the power steering fluid pressure switch on the back side of the power steering gear (Fig. 15).

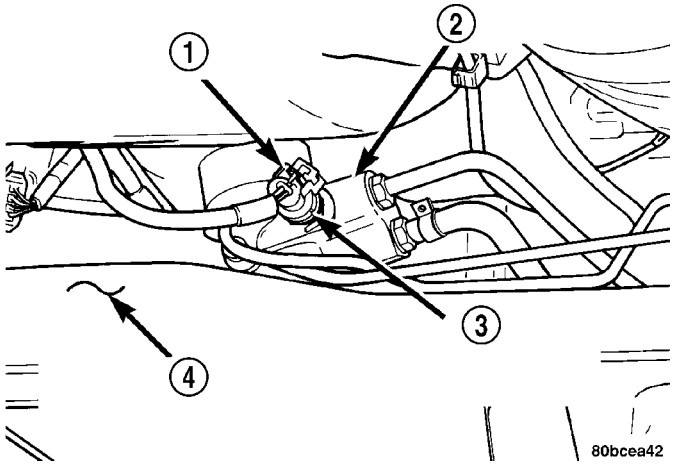

Fig. 15 Switch Location

1 - WIRING HARNESS CONNECTOR
2 - POWER STEERING GEAR
3 - POWER STEERING FLUID PRESSURE SWITCH
4 - REAR OF FRONT SUSPENSION CROSSMEMBER

(4) Remove the vehicle wiring harness connector from the power steering fluid pressure switch.

NOTE: When removing and installing the power steering pressure switch, use a 7/8 inch deep well socket. The deep well socket will prevent damage to the plastic electrical connector area of the power steering fluid pressure switch.

POWER STEERING PRESSURE SWITCH (Continued)

(5) Unscrew and remove the power steering fluid pressure switch from the power steering gear.

INSTALLATION

(1) By hand, screw the power steering pressure switch into the power steering gear until it is fully seated (Fig. 15). Tighten the power steering pressure switch to a maximum torque of 8 N·m (70 in. lbs.). Over-torquing will result in stripping the threads out of the power steering pressure switch port in the steering gear.

(2) Install the vehicle wiring harness connector. Be sure the latch on the wiring harness connector is fully engaged with the locking tab on the power steering pressure switch.

(3) Lower the vehicle.

(4) Fill the power steering fluid reservoir to the correct fluid level. (Refer to 19 - STEERING/PUMP/FLUID - STANDARD PROCEDURE)

(5) Connect the negative cable to the negative post of the battery.

(6) Start the engine and turn the steering wheel several times stop-to-stop to bleed any air from the fluid in the power steering system. Stop the engine, check the fluid level, and inspect the system for leaks.

TIE ROD - OUTER

REMOVAL

(1) Raise the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(2) Remove the tire and wheel assembly from the vehicle. (Refer to 22 - TIRES/WHEELS - REMOVAL)

(3) Loosen tie rod jam nut (Fig. 16). Thread the jam nut far enough up the inner tie rod to pull the collar away from the outer tie rod end. Pull the collar off the end of the outer tie rod.

(4) Remove the nut attaching the outer tie rod end to steering knuckle (Fig. 17). Remove the nut by holding the tie rod stud stationary while loosening and removing the nut with a wrench.

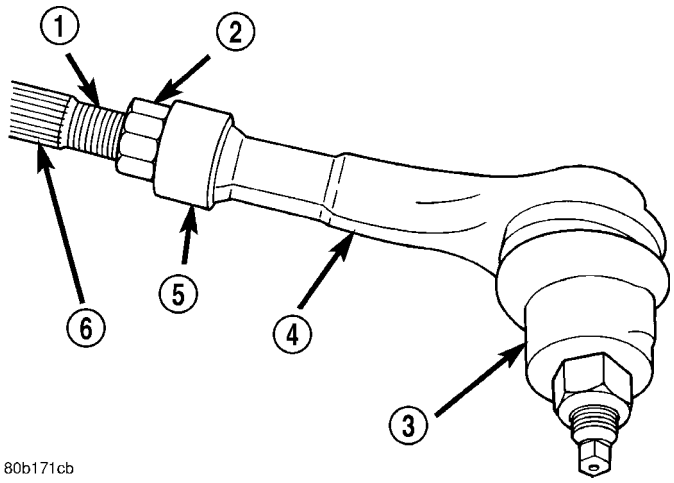

Fig. 16 Outer Tie Rod

4 - OUTER TIE ROD END
5 - COLLAR
6 - INNER TIE ROD SERRATION

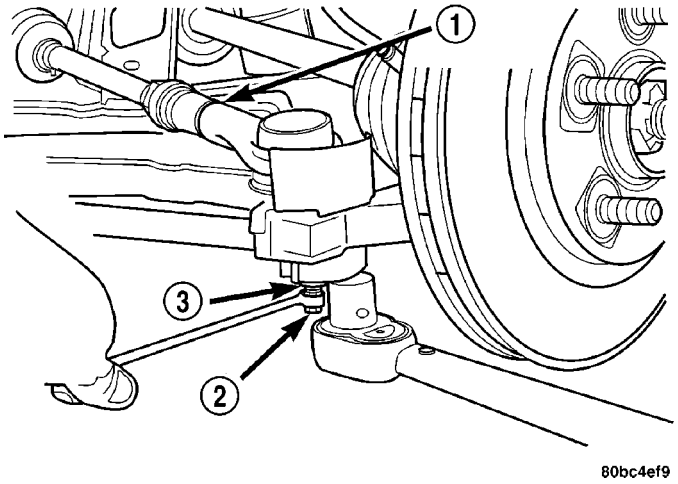

Fig. 17 Tools On Outer Tie Rod Nut

1 - OUTER TIE ROD
2 - STUD
3 - NUT

(5) Remove the outer tie rod from the steering knuckle using Remover, Special Tool MB991113 (Fig. 18).

(6) Remove the tie rod heat shield.

(7) Remove the outer tie rod from the inner tie rod by unthreading it.

TIE ROD - OUTER (Continued)

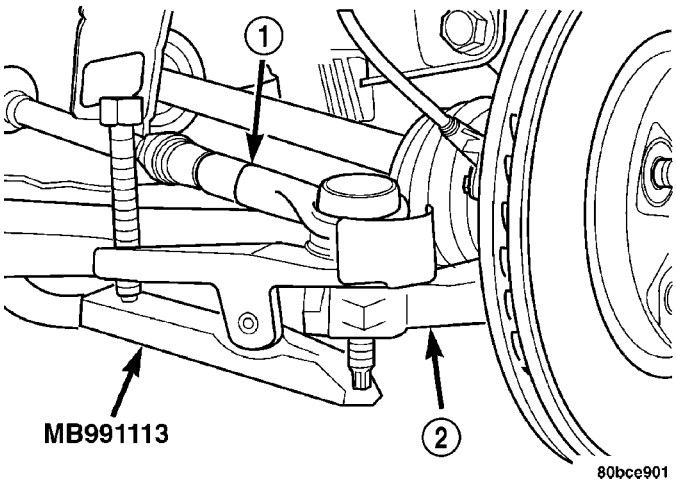

Fig. 18 Tie Rod Removal From Knuckle

1 - OUTER TIE ROD
2 - STEERING KNUCKLE

INSTALLATION

(1) Install the jam nut on the inner tie rod threads if it is not already installed (Fig. 16).

NOTE: Be sure the collar is installed on the inner tie rod with the flat end of the collar against jam nut and the open end of the collar facing the outer tie rod end.

(2) Install the collar on the inner tie rod (Fig. 16).

(3) Thread the outer tie rod onto the inner tie rod.

(4) Position the collar around the end of the outer tie rod (Fig. 16).

(5) Thread the jam nut down the inner tie rod far enough to hold the collar in place on the outer tie rod. Do not tighten the jam nut.

(6) Place the tie rod heat shield on the knuckle's steering arm, aligning the hole in the shield with the hole in the knuckle and the tangs on the outside of the shield with the outside configuration of the steering arm. The shield should now be facing outboard, away from the power steering gear and tie rod (Fig. 17).

(7) Attach the outer tie rod end to the steering knuckle.

(8) Start the attaching nut onto the stud of the outer tie rod.

(9) While holding the stud of the tie rod stationary with a wrench, tighten the attaching nut (Fig. 17).

(10) Using a crowfoot wrench attached to a torque wrench, tighten the attaching nut to 54 N·m (40 ft. lbs.).

(11) Install the tire and wheel assembly(Refer to 22 - TIRES/WHEELS - INSTALLATION). Tighten wheel nut to a torque of 135 N·m (100 ft. lbs.).

(12) Lower the vehicle.

(13) Adjust the front toe setting on the vehicle. (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE).

PUMP

DESCRIPTION

DESCRIPTION - 1.6L ENGINE

Hydraulic pressure for operation of the power steering gear is provided by a constant flow rate and displacement vane-type power steering pump. The pump is located on the front corner of the engine. It is attached to the engine water (coolant) pump to form an assembly (Fig. 1).

The power steering pump is belt driven. Its pulley driven shaft traverses the length of the pump, exiting the rear, driving the engine water pump that is attached to the rear of the pump.

Both pumps can be serviced separately. The entire power steering pump/water pump assembly must be removed as an assembly, then disassembled to service either pump. No repair procedures are to be done on the internal components of the power steering pump itself. The pulley may be serviced separately.

PUMP (Continued)

DESCRIPTION - 2.0L/2.4L/2.4L TURBO ENGINE

The hydraulic pressure for operation of the power steering gear is provided by a belt-driven power steering pump (Fig. 2) (Fig. 3). The power steering pump is a constant flow rate and displacement vane-type pump.

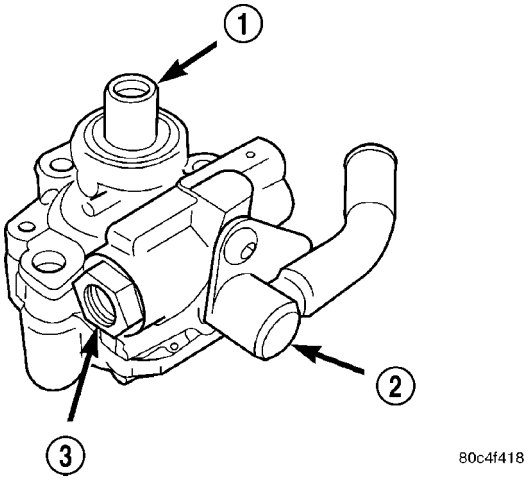

Fig. 2 Power Steering Pump - 2.4L Engine

1 - SHAFT
2 - SUPPLY FITTING
3 - PRESSURE FITTING

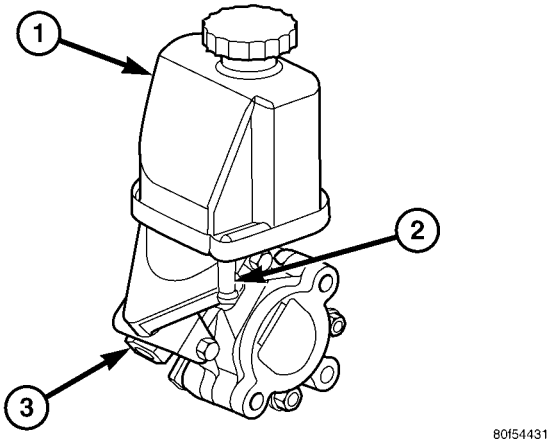

Fig. 3 Power Steering Pump - 2.4L Turbo

1 - RESERVOIR
2 - RETURN FITTING
3 - PRESSURE FITTING

The power steering pump for non-turbocharged engines consists of the power steering pump and the power steering pump pulley. The power steering fluid reservoir is remotely located on this vehicle.

The power steering pump for turbocharged engines consists of the power steering pump, the reservoir mounted to the top, and the power steering pump pulley.

No repair procedures are to be done on the internal components of the power steering pump. On turbocharged engine applications, the reservoir is serviced with the pump.

DESCRIPTION - 2.2L DIESEL

Hydraulic pressure for operation of the power steering gear is provided by a constant flow rate and displacement vane-type power steering pump. The pump is located on the front corner of the engine. It is attached to the engine water (coolant) pump to form an assembly.

The power steering pump is belt driven. Its pulley driven shaft traverses the length of the pump, exiting the rear, driving the engine water pump that is attached to the rear of the pump.

The power steering pump and water pump are serviced as one assembly. The pulley may be serviced separately.

STANDARD PROCEDURE - POWER STEERING PUMP INITIAL OPERATION

WARNING: THE FLUID LEVEL SHOULD BE CHECKED AND ADJUSTED WITH THE ENGINE OFF TO PREVENT INJURY FROM MOVING ENGINE COMPONENTS.

PUMP (Continued)

CAUTION: Use only Mopar® ATF+4 Automatic Transmission Fluid (MS-9602) in the power steering system. Do not overfill.

(1) Fill the power steering fluid reservoir to the proper level, then let the fluid settle for at least two minutes. (Refer to 19 - STEERING/PUMP/FLUID - STANDARD PROCEDURE - POWER STEERING FLUID LEVEL CHECKING)

(2) Start the engine and let run for a few seconds, then turn the engine off.

(3) Add fluid if necessary. Repeat the above procedure until the fluid level remains constant after running the engine.

(4) Raise the front wheels off the ground.

(5) Start the engine. Slowly turn the steering wheel right and left, lightly contacting the wheel stops.

(6) Add power steering fluid if necessary.

(7) Lower the vehicle and turn the steering wheel slowly from lock to lock.

(8) Stop the engine. Check the fluid level and refill as required.

(9) If the fluid is extremely foamy, allow the vehicle to stand a few minutes and repeat the above procedure.

REMOVAL

REMOVAL - 1.6L ENGINE

The power steering pump is attached to the water pump as an assembly on the engine. To remove the power steering pump, (Refer to 7 - COOLING/ENGINE/WATER PUMP - REMOVAL).

REMOVAL - 2.0L/2.4L ENGINE

NOTE: Before proceeding, (Refer to 19 - STEERING - WARNING).

(1) Siphon as much fluid as possible from the power steering fluid reservoir.

(2) Raise the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(3) Remove the right front tire and wheel assembly.

(4) Remove the screws fastening the front fascia to the reinforcement as necessary in order to access the drive-belt splash shield forward fastener screw (Fig. 4).

(5) Remove the drive-belt splash shield fasteners (Fig. 4). Remove the shield.

(6) Remove the accessory drive-belt from the A/C compressor and power steering pump. Refer to the Cooling section for the procedure.

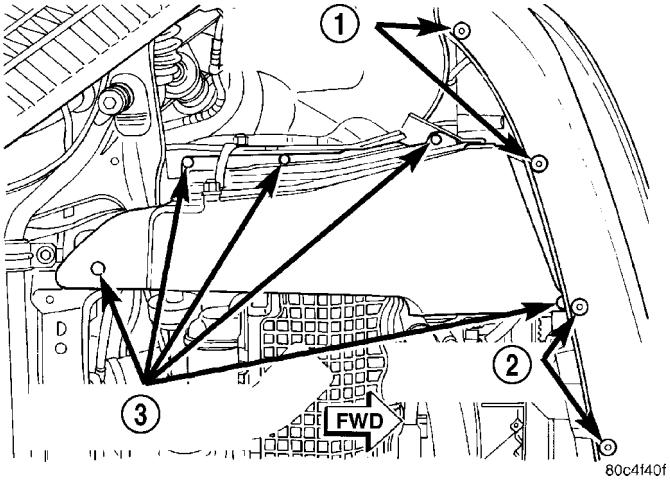

Fig. 4 Fascia And Splash Shield Fasteners

1 - FASCIA FASTENERS
2 - FASCIA FASTENERS
3 - SPLASH SHIELD FASTENERS

(7) Remove the electrical connectors from the A/C compressor (Fig. 5).

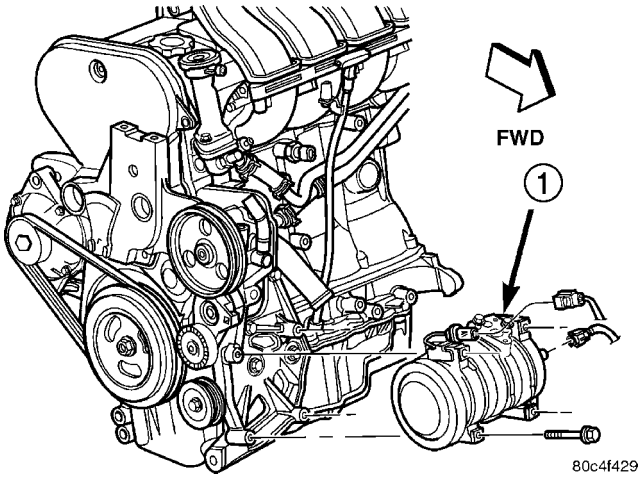

Fig. 5 A/C Compressor Mounting

1 - COMPRESSOR

(8) Remove the four bolts fastening the A/C compressor to the engine (Fig. 5), then move the compressor toward the center of the vehicle, allowing the compressor to settle in place.

(9) Remove the pressure hose from the pump in the following fashion (Fig. 6) (Fig. 7):

(a) Place a crowfoot wrench on a long extension onto the pressure hose tube nut at the pump.

(b) Place a shop towel between the crowfoot and the pump pulley to avoid slipping and possibly damaging the pulley.

(c) Unthread the tube nut from the pump.

(10) Lower the vehicle.

(11) Remove the grille from the front of the vehicle (Fig. 8).

PUMP (Continued)

2 - RETAINER

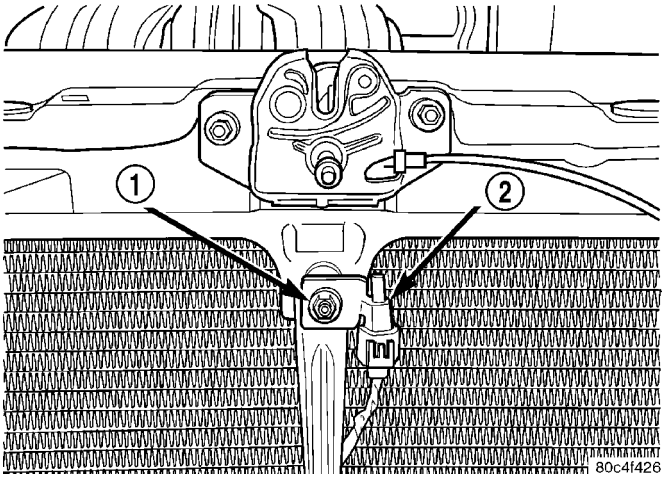

Fig. 9 Ambient Temperature Sensor

1 - FASTENER
2 - SENSOR

(15) Lift the cooling module out of its lower mounts and carefully move it toward the left side of the vehicle. It will move only a limited amount with the hoses still connected. Do not force it.

NOTE: For additional room, the right side bolts securing the lower radiator closure panel in front of the cooling module can be removed.

(16) Using a bungee cord, tie the cooling module forward as shown (Fig. 11). Be sure to attach the cord in a location that will not damage the vehicle. Do not overtighten the bungee cord. It just needs to hold the module forward.

(17) Remove the clamp securing the supply hose to the power steering pump supply fitting (Fig. 12), then remove the hose from the supply fitting.

PUMP (Continued)

PUMP (Continued)

REMOVAL - 2.4L TURBO

NOTE: Before proceeding, (Refer to 19 - STEERING - WARNING).

(1) Siphon as much fluid as possible from power steering fluid reservoir.

(2) Raise vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(3) Drain engine coolant (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE - DRAIN COOLING SYSTEM).

(4) Remove right front tire and wheel assembly.

(5) Disconnect radiator fan wiring connector (Fig. 15).

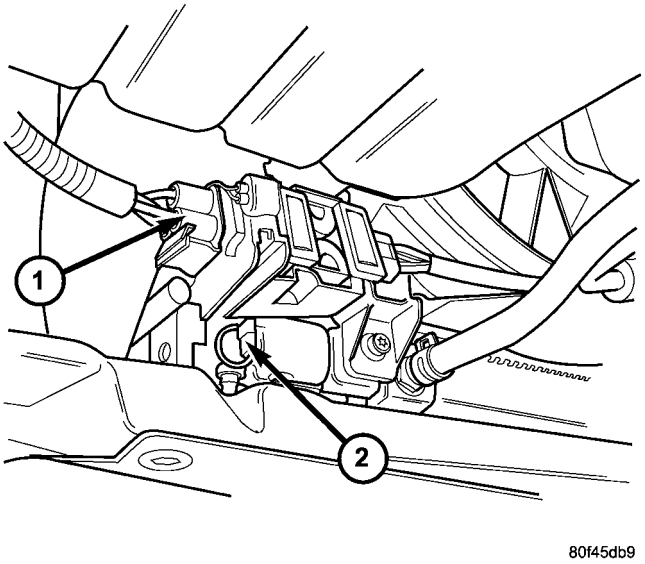

Fig. 15 Radiator Fan Connector - 2.4L Turbo

1 - RADIATOR FAN CONNECTOR
2 - RADIATOR DRAINCOCK

(6) Remove two lower fan mounting screws (Fig. 16).

(7) Remove accessory drive belt splash shield.

(8) Remove accessory drive belt. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELT - REMOVAL)

(9) Lower vehicle.

(10) Remove grille from front of vehicle (Fig. 8).

(11) Remove hood-opening weather-strip from across radiator closure panel.

(12) Remove ambient temperature sensors from radiator closure panel (Fig. 17).

(13) Remove fasteners securing upper radiator closure panel in place (Fig. 10), then remove the panel and lay it out of way.

(14) Remove 2 screws fastening upper radiator hose inlet neck to radiator, then separate inlet neck from radiator (Fig. 18).

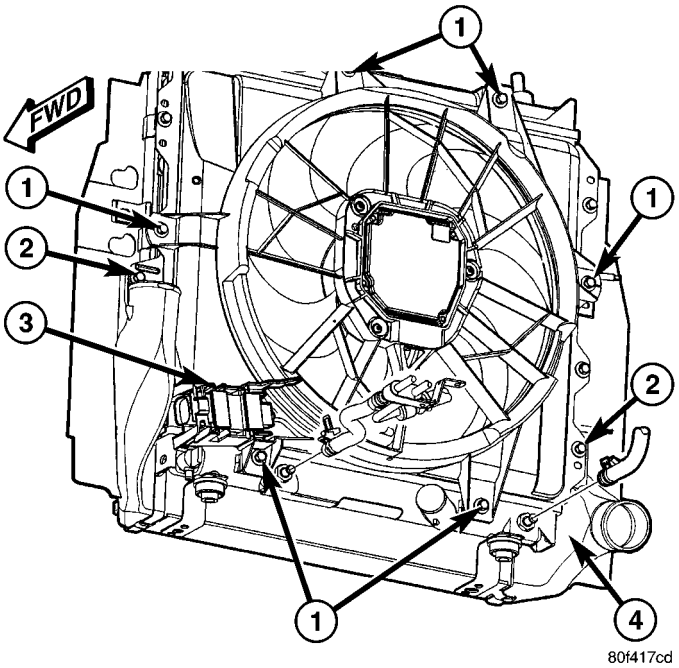

Fig. 16 Fan Mounting To Cooling Module - 2.4L Turbo

6 - POWER STEERING PUMP

(18) Back out tube nut securing fluid pressure hose to power steering pump and remove hose from pump (Fig. 19). Cap off hose end and pump pressure port.

(19) Remove three mounting bolts securing power steering pump in place (Fig. 20).

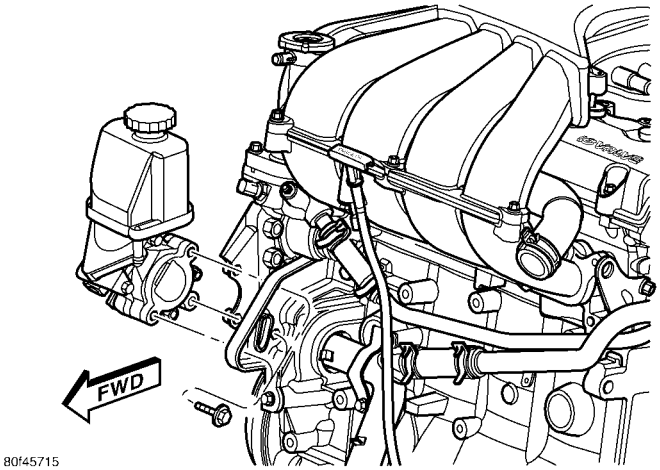

Fig. 20 Pump Mounting - 2.4L Turbo

(20) Remove 2 bolts securing stamped steel support bracket to engine block (Fig. 21). Remove bracket.

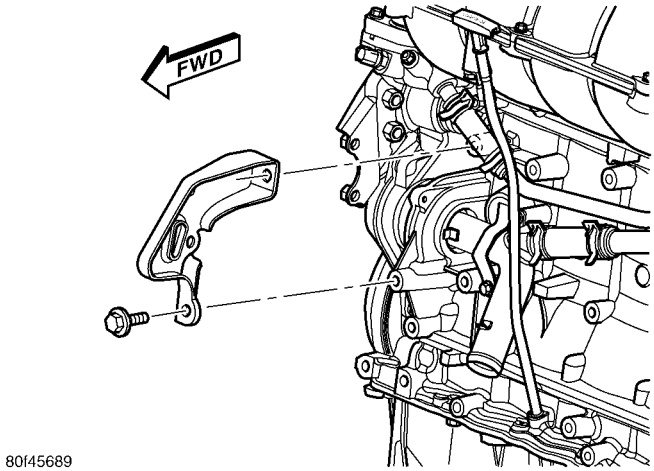

Fig. 21 Bracket Mounting To Engine - 2.4L Turbo

(21) Remove power steering pump with pulley and reservoir attached.

REMOVAL - 2.2L DIESEL

The power steering pump is attached to the water pump as an assembly on the engine. To remove the power steering pump, (Refer to 7 - COOLING/ENGINE/WATER PUMP - REMOVAL).

PUMP (Continued)

DISASSEMBLY

NOTE: The only serviceable part of the power steering pump is the pulley. The following procedure is for the removal and installation of the pulley from the pump.

NOTE: The power steering pump must be removed from the vehicle for power steering pump pulley service. (Refer to 19 - STEERING/PUMP - REMOVAL)

CAUTION: Use care when removing and installing the power steering pump pulley. It is made of plastic composite, except for the center shank. Use the special tools in the shank area only as described in the following procedure.

CAUTION: Do not hammer on the power steering pump pulley or shaft to remove the power steering pump pulley. This will damage the pulley and the power steering pump.

(1) Install Puller, Special Tool C-4333, or an equivalent, on the steering pump pulley as shown (Fig. 22). Tighten the puller screw drive and remove the pulley from the power steering pump shaft.

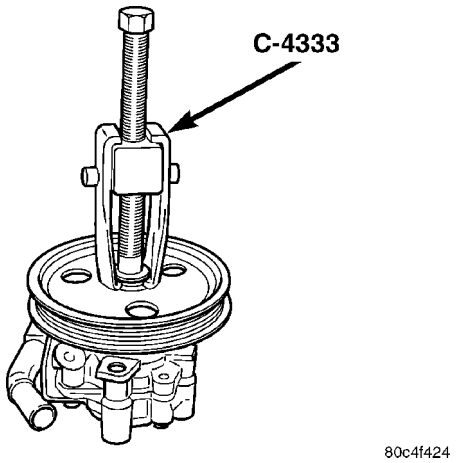

Fig. 22 Pulley Removal

(2) Remove the puller from the pulley.

ASSEMBLY

CAUTION: Use care when removing and installing the power steering pump pulley. It is made of plastic composite, except for the center shank. Use the special tools in the shank area only as described in the following procedure.

NOTE: Replace the power steering pump pulley if it is cracked or loose.

(1) Place the power steering pump pulley squarely on end of the power steering pump shaft. Mount Installer, Special Tool C-4063, or an equivalent, in the internal threads of the power steering pump shaft and against power steering pump pulley (Fig. 23).

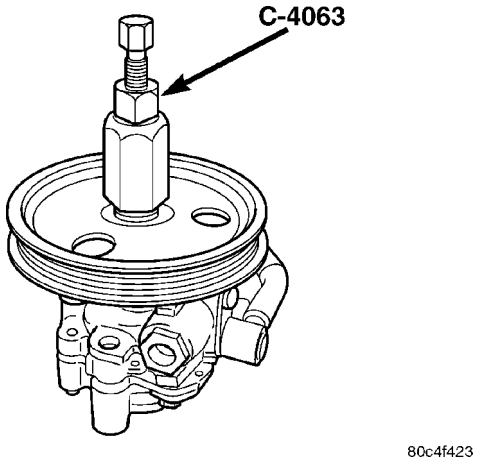

Fig. 23 Pulley Installation

(2) Ensuring that the installer and the pulley remain aligned with the pump shaft, turn the installer outer nut and force the pulley onto the power steering pump shaft until it is flush with the end of the pump shaft. Once the pulley is flush with the end of the shaft, the installer outer nut will no longer be able to turn.

(3) Remove the installer from the power steering pump.

(4) Install the power steering pump back on the engine. (Refer to 19 - STEERING/PUMP - INSTALLATION)

INSTALLATION

INSTALLATION - 1.6L ENGINE

The power steering pump is attached to the water pump as an assembly on the engine. To install the power steering pump, (Refer to 7 - COOLING/ENGINE/WATER PUMP - INSTALLATION).

INSTALLATION - 2.0L/2.4L ENGINE

(1) Using a lint free towel, wipe clean the open power steering pressure hose end and the power steering pump port. Replace any used O-rings with new. Lubricate the O-ring with clean power steering fluid.

PUMP (Continued)

(2) Ease the cooling module forward, don't force it, and install the power steering pump and pulley into its mounting area in the same fashion it was removed (Fig. 14).

(3) Place the pump in mounting position with the stamped steel support bracket behind it (Fig. 13). Install the three bolts through the bracket and pump, into the threaded engine cover. Do not tighten the bolts at this time.

(4) Install the two bolts fastening the bracket to the engine block (Fig. 13). Tighten the two bolts to a torque of 54 N·m (40 ft. lbs.).

(5) Tighten the three pump mounting bolts previously installed to a torque of 28 N·m (250 in. lbs.).

(6) Push the fluid supply hose onto the pump supply fitting. Expand the hose clamp and slide it over the hose and pump supply fitting (Fig. 12). Secure the clamp once it is past the bead formed into the fluid reservoir fitting.

CAUTION: Make sure the supply hose is routed above the engine timing chain cover. The power steering fluid supply hose must remain clear of any unfriendly surface that can cause possible damage to it.

(7) Raise the vehicle.

(8) Thread the fluid pressure hose tube nut into the pump (Fig. 6) (Fig. 7).

(9) Using a crowfoot wrench on a long extension with a torque wrench, tighten the pressure hose tube nut at the power steering pump to a torque of 31 N·m (23 ft. lbs.).

(10) Install the four bolts fastening the A/C compressor to the engine (Fig. 5). Tighten the mounting bolts to a torque of 28 N·m (250 in. lbs.).

(11) Install the A/C compressor electrical connectors (Fig. 5).

(12) Install the A/C drive belt. Refer to the Cooling section for the procedure.

(13) Install the drive-belt splash shield and fasteners (Fig. 4).

(14) Install the screws fastening the front fascia to the reinforcement (Fig. 4).

(15) Install the right front tire and wheel assembly. Install and tighten the wheel mounting nuts to a torque of 135 N·m (100 ft. lbs.).

(16) Lower the vehicle.

(17) Remove the bungee cord and move the cooling module back into is lower mounts.

(18) If previously removed, install the right side bolts securing the lower radiator closure panel in front of the cooling module.

(19) Install the radiator closure panel and fasten it in place (Fig. 10).

(20) Install the ambient temperature sensor on the radiator closure panel (Fig. 9).

(21) Install the hood-opening weather-strip across the radiator closure panel.

(22) Install the grille on the front of the vehicle (Fig. 8).

(23) Perform the POWER STEERING PUMP INITIAL OPERATION service procedure to properly fill and bleed the power steering system. (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE)

(24) Check for leaks.

INSTALLATION - 2.4L TURBO

(1) Using a lint free towel, wipe clean open power steering pressure hose end and power steering pump pressure port. Replace any used O-rings with new. Lubricate O-ring with clean power steering fluid.

(2) Install power steering pump with pulley and reservoir into its mounting area in same fashion it was removed.

(3) Place pump in mounting position with stamped steel support bracket behind it. Install three pump mounting bolts through bracket and pump, into threaded engine cover (Fig. 20). DO NOT TIGHTEN BOLTS AT THIS TIME.

(4) Install two bolts fastening support bracket to engine block (Fig. 21). Tighten two bolts to 54 N·m (40 ft. lbs.) torque.

(5) Tighten three pump mounting bolts previously installed (Fig. 20) to 28 N·m (250 in. lbs.) torque.

(6) Thread pressure hose tube nut into pump pressure fitting (Fig. 19). Tighten tube nut to 31 N·m (23 ft. lbs.) torque.

(7) Install fluid return hose onto power steering fluid reservoir return fitting (Fig. 19). Expand hose clamp and slide it over hose and pump return fitting. Secure clamp once it is past bead formed into fluid reservoir fitting.

(8) Position radiator fan and install two upper and two side mounting screws (Fig. 16). DO NOT TIGHTEN SCREWS AT THIS TIME.Tighten screws to 6 N·m (55 in. lbs.) torque.

(9) Position cooling module back into its lower mounts.

(10) Clean and inspect or replace upper radiator hose inlet neck O-ring, then install inlet neck to radiator (Fig. 18). Install 2 mounting screws.

(11) Install radiator closure panel and fasten it in place (Fig. 10).

(12) Install ambient temperature sensors on radiator closure panel (Fig. 17).

(13) Install hood-opening weather-strip across radiator closure panel.

(14) Install grille on front of vehicle (Fig. 8).

(15) Raise vehicle.

(16) Install accessory drive belt. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION)

PUMP (Continued)

(17) Install accessory drive belt splash shield.

(18) Install two remaining lower fan mounting screws (Fig. 16). Tighten screws to 6 N·m (55 in. lbs.) torque.

(19) Connect radiator fan wiring connector (Fig. 15).

(20) Install right front tire and wheel assembly. Install and tighten wheel mounting nuts to 135 N·m (100 ft. lbs.) torque.

(21) Lower vehicle.

(22) Tighten two upper and two side radiator fan mounting screws to 6 N·m (55 in. lbs.) torque (Fig. 16).

(23) Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE - FILLING COOLING SYSTEM).

(24) Perform POWER STEERING PUMP INITIAL OPERATION procedure to properly fill and bleed power steering system. (Refer to 19 - STEERING/ PUMP - STANDARD PROCEDURE)

(25) Check for leaks.

INSTALLATION - 2.2L DIESEL

The power steering pump is attached to the water pump as an assembly on the engine. To install the power steering pump, (Refer to 7 - COOLING/ENGINE/WATER PUMP - INSTALLATION).

FLUID

STANDARD PROCEDURE - POWER STEERING FLUID LEVEL CHECKING

WARNING: FLUID LEVEL SHOULD BE CHECKED WITH THE ENGINE OFF TO PREVENT PERSONAL INJURY FROM MOVING PARTS.

CAUTION: Use only Mopar® ATF+4 Automatic Transmission Fluid (MS-9602) in the power steering system. Do not overfill.

1.6L GAS/2.2L DIESEL ENGINE

The power steering fluid level can be viewed through the side of the power steering fluid reservoir. Compare the fluid level to the markings on the side of the reservoir. When the fluid is at normal ambient temperature, approximately 21°C to 27°C (70°F to 80°F), the fluid level should read between the MAX. COLD and MIN. COLD markings. When the fluid is hot, fluid level is allowed to read up to the highest end of the MAX. HOT range.

2.0L/2.4L ENGINE

The power steering fluid level can be viewed on the dipstick attached to the filler cap. There are two ranges listed on the dipstick, COLD and HOT. Before opening power steering system, wipe the reservoir filler cap free of dirt and debris. Remove the cap and check the fluid level on the dipstick. When the fluid is at normal ambient temperature, approximately 21°C to 27°C (70°F to 80°F), the fluid level should read between the minimum and maximum area of the COLD range. When the fluid is hot, fluid level is allowed to read up to the highest end of the HOT range.

2.4L TURBO ENGINE

The power steering fluid level can be viewed on the dipstick attached to the filler cap. Before opening power steering system, wipe the reservoir filler cap free of dirt and debris. Remove the cap and check the fluid level on the dipstick. When the fluid is at normal ambient temperature, approximately 21°C to 27°C (70°F to 80°F), the fluid level should read between the FULL and ADD markings.

FLUID COOLER

DESCRIPTION

All models of this vehicle are equipped with a cooler for the power steering system fluid. Vehicles not equipped with a turbocharged engine use a power steering fluid cooler that is located at the front of the front suspension crossmember (Fig. 24) (Fig. 25). It is mounted to the crossmember top surface using 2 fasteners. Vehicles equipped with a turbocharged engine use a cooler that is integrated into the radiator.

The cooler is placed in series with the power steering fluid return hose, between the steering gear fluid outlet port and the fluid return hose leading to the power steering fluid reservoir.

REMOVAL - NON-TURBO ENGINES

NOTE: Before proceeding, (Refer to 19 - STEERING - WARNING).

(1) Siphon as much fluid as possible from the power steering fluid reservoir.

(2) Raise the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE).

(3) Remove the hose clamp attaching the power steering fluid return hose to the power steering fluid cooler. Remove the return hose from the cooler.

FLUID COOLER (Continued)

(4) Remove the hose clamp attaching the power steering cooler fluid hose to the steel fitting in the power steering gear outlet port (Fig. 24) (Fig. 25).

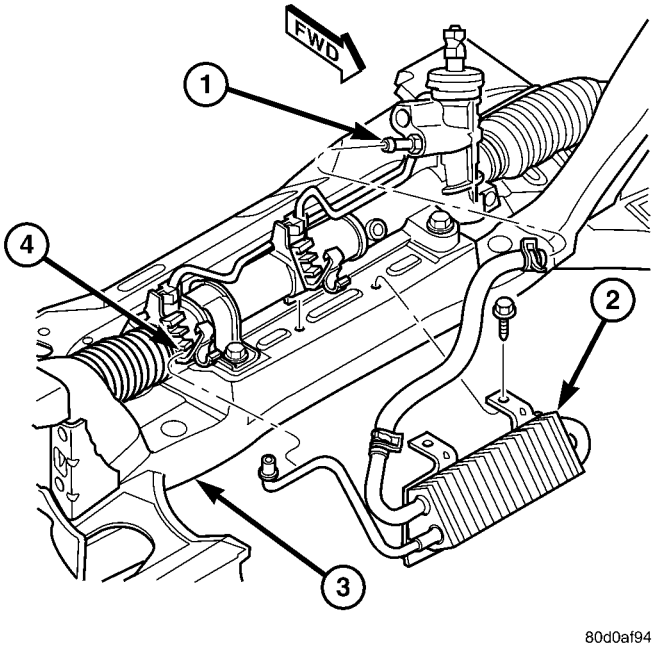

Fig. 24 Power Steering Cooler - LHD

1 - STEERING GEAR OUTLET FITTING
2 - POWER STEERING COOLER
3 - FRONT SUSPENSION CROSSMEMBER
4 - TUBE CLAMP

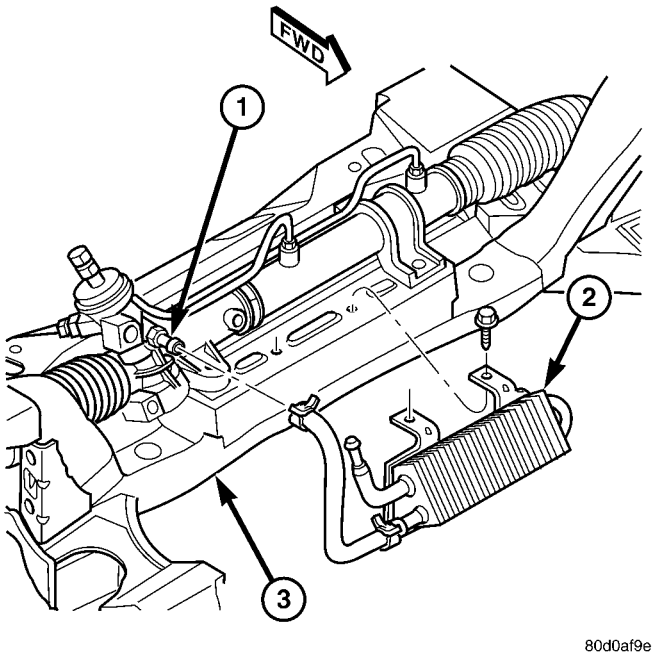

Fig. 25 Power Steering Cooler - RHD

1 - STEERING GEAR OUTLET FITTING
2 - POWER STEERING COOLER
3 - FRONT SUSPENSION CROSSMEMBER

(5) Remove the two screws securing the cooler to the front suspension crossmember (Fig. 24) (Fig. 25).

(6) On LHD vehicles, open the tube routing clamp on the right front of the power steering gear housing and remove the cooler tube from it.

(7) Remove the cooler from the vehicle.

INSTALLATION - NON-TURBO ENGINES

(1) Slide a hose clamp onto the end of the power steering cooler inlet hose (gear end) far enough to clear the steel fitting on the power steering gear once the hose is installed.

(2) On LHD vehicles, align the cooler outlet tube with the open tube routing clamp on the right front of the power steering gear housing (Fig. 24), and snap it into place. Close the clamp.

(3) Slide the hose (with cooler attached) onto the steering gear outlet fitting (Fig. 24) (Fig. 25).

(4) Install the hose clamp on the power steering cooler fluid hose past the bead formed into the steel fitting and secure in place.

(5) Install the two screws attaching the cooler to the front suspension crossmember (Fig. 24) (Fig. 25). Tighten the cooler attaching screws to a torque of 10 N·m (90 in. lbs.).

(6) Install the power steering fluid return hose on the power steering fluid cooler outlet tube. Install the hose clamp on the power steering return hose securing it to the power steering cooler. Be sure the hose clamp is installed on the return hose past the bead on the end of the cooler tube.

(7) Lower the vehicle.

(8) Perform the POWER STEERING PUMP INITIAL OPERATION procedure. (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE)

(9) Check for leaks.

HOSE - POWER STEERING PRESSURE

REMOVAL

REMOVAL - 2.0L ENGINE

NOTE: Before proceeding, (Refer to 19 - STEERING - WARNING).

(1) Siphon as much fluid as possible from the power steering fluid reservoir.

(2) Raise the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(3) Back out the tube nut securing the power steering fluid pressure hose to the gear (Fig. 28) (Fig. 26).

HOSE - POWER STEERING PRESSURE (Continued)

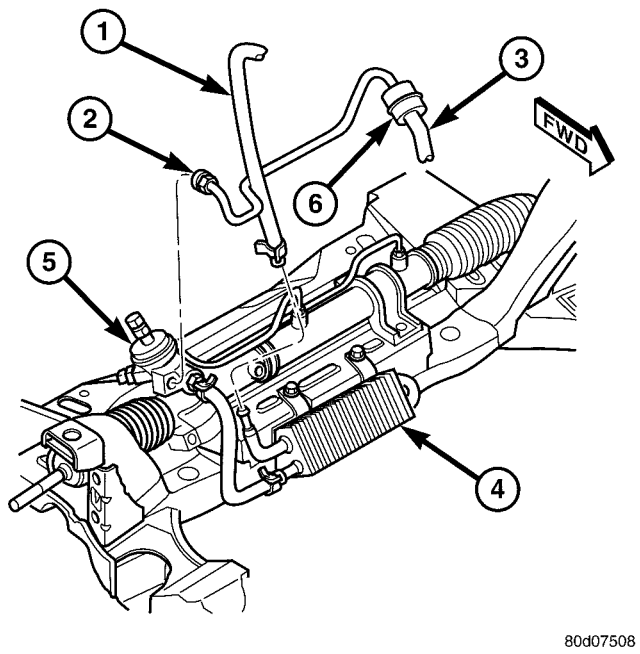

Fig. 26 HOSES AT RHD GEAR AND COOLER

1 - RETURN HOSE
2 - TUBE NUT
3 - PRESSURE HOSE
4 - FLUID COOLER
5 - POWER STEERING GEAR
6 - FOAM SLEEVE

(4) Pull the hose tube out of the gear and drain the fluid from the hose.

(5) Remove the structural collar between the engine and transaxle (Fig. 27).

(6) Remove the bolt securing the pressure hose bracket to the engine block (Fig. 27).

(7) Remove the right front tire and wheel assembly.

(8) Remove the screws fastening the front fascia to the reinforcement as necessary in order to access the drive-belt splash shield forward fastener screw (Fig. 31).

(9) Remove the drive-belt splash shield fasteners (Fig. 31). Remove the shield.

(10) Remove the accessory drive-belt from the A/C compressor. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL)

(11) Remove the electrical connectors from the A/C compressor (Fig. 32).

(12) Remove the four bolts fastening the A/C compressor to the engine (Fig. 32), then move the compressor toward the center of the vehicle, allowing the compressor to settle in place.

(13) Remove the pressure hose from the pump in the following fashion:

(a) Place a crowfoot wrench on a long extension onto the pressure hose tube nut at the pump (Fig. 33).

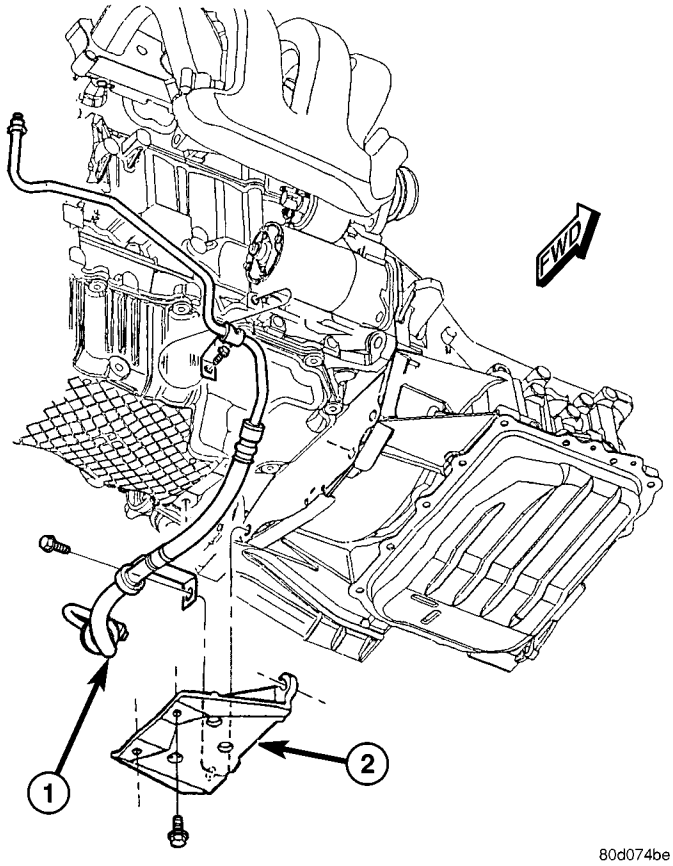

Fig. 27 PRESSURE HOSE ROUTING - 2.0L ENGINE

1 - PRESSURE HOSE
2 - STRUCTURAL COLLAR

(b) Place a shop towel between the crowfoot and the pump pulley to avoid slipping and possibly damaging the pulley.

(c) Unthread the tube nut from the pump.

(14) Remove the power steering pressure hose from the vehicle.

REMOVAL - 2.4L ENGINE

NOTE: Before proceeding, (Refer to 19 - STEERING - WARNING).

(1) Siphon as much fluid as possible from the power steering fluid reservoir.

(2) Raise the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(3) Back out the tube nut securing the power steering fluid pressure hose to the gear (Fig. 28) (Fig. 26).

(4) Pull the hose tube out of the gear and drain the fluid from the hose.

(5) Remove the bolts securing the pressure hose routing clamps to the engine's structural collar (Fig. 29).

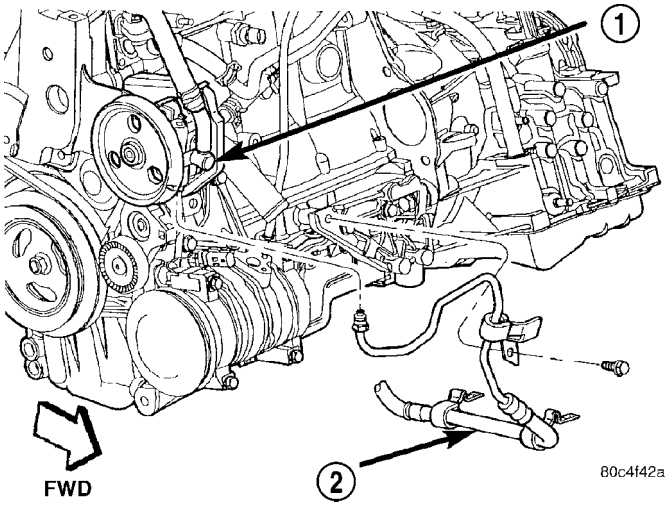

Fig. 30 Hose Connection To Pump And Engine

1 - PUMP
2 - PRESSURE HOSE

(7) Remove the right front tire and wheel assembly.

(8) Remove the screws fastening the front fascia to the reinforcement as necessary in order to access the drive-belt splash shield forward fastener screw (Fig. 31).

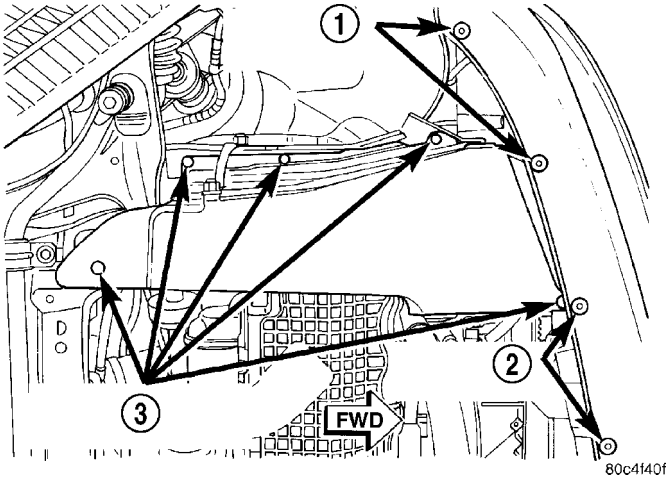

Fig. 31 Fascia And Splash Shield Fasteners

1 - FASCIA FASTENERS
2 - FASCIA FASTENERS
3 - SPLASH SHIELD FASTENERS

(9) Remove the drive-belt splash shield fasteners (Fig. 31). Remove the shield.

(10) Remove the accessory drive-belt from the A/C compressor. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL)

(11) Remove the electrical connectors from the A/C compressor (Fig. 32).

HOSE - POWER STEERING PRESSURE (Continued)

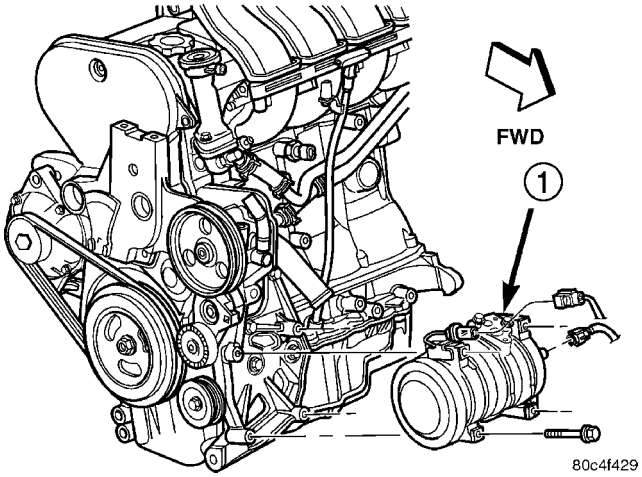

Fig. 32 A/C Compressor Mounting

1 - COMPRESSOR

(12) Remove the four bolts fastening the A/C compressor to the engine (Fig. 32), then move the compressor toward the center of the vehicle, allowing the compressor to settle in place.

(13) Remove the pressure hose from the pump in the following fashion (Fig. 30) (Fig. 33):

(a) Place a crowfoot wrench on a long extension onto the pressure hose tube nut at the pump.

(b) Place a shop towel between the crowfoot and the pump pulley to avoid slipping and possibly damaging the pulley.

(c) Unthread the tube nut from the pump.

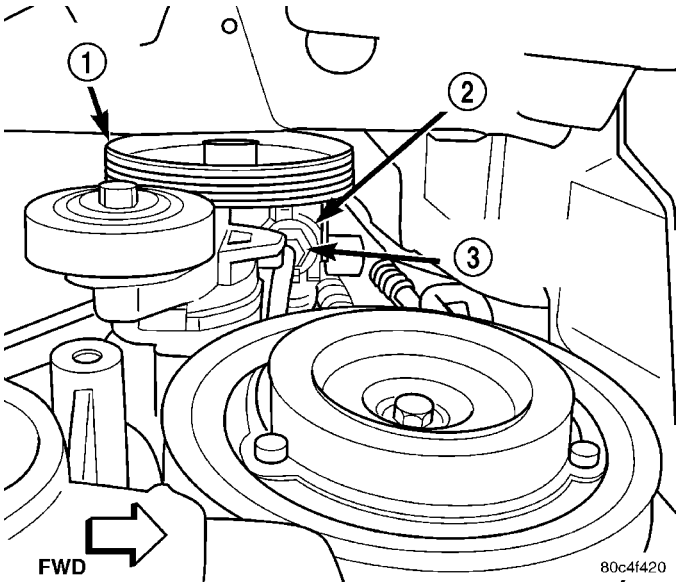

Fig. 33 Hose Fitting At Pump (View From Below)

1 - PUMP PULLEY
2 - POWER STEERING PUMP
3 - PRESSURE HOSE TUBE NUT

(14) Remove the power steering pressure hose from the vehicle.

REMOVAL - 2.2L DIESEL

NOTE: Before proceeding, (Refer to 19 - STEERING - WARNING).

(1) Siphon as much fluid as possible from power steering fluid reservoir.

(2) Raise vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(3) Remove lower engine compartment silencer assembly and accessory drive belt splash shield (Fig. 34).

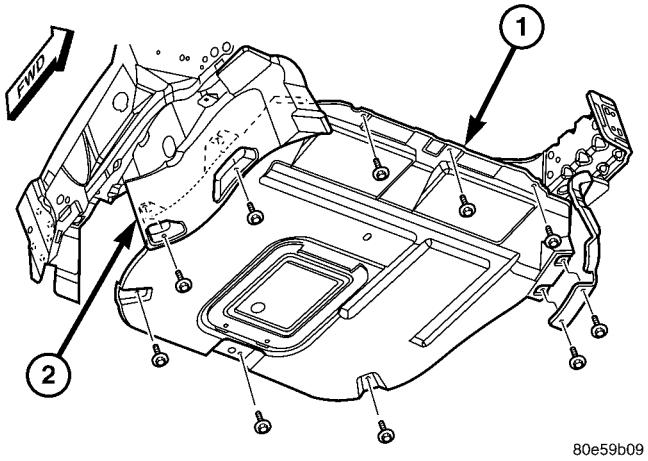

Fig. 34 Engine Compartment Lower Silencer

1 - ENGINE COMPARTMENT SILENCER
2 - ACCESSORY DRIVE BELT SPLASH SHIELD

(4) Back out tube nut securing power steering fluid pressure hose to power steering gear (Fig. 35).

(5) Pull pressure hose tube out of gear port and drain fluid from hose.

(6) Remove bolts securing pressure hose routing clamps to engine oil pan (Fig. 36).

(7) Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELT - REMOVAL).

(8) Remove 3 bolts securing pulley to power steering pump (Fig. 37). Remove pulley.

(9) Back out tube nut securing power steering fluid pressure hose to power steering pump and remove hose from pump (Fig. 37).

(10) Remove power steering pressure hose from vehicle.

INSTALLATION

INSTALLATION - 2.0L ENGINE

CAUTION: Power steering fluid hoses must remain away from the exhaust system, driveshafts, vehicle components and any unfriendly surface that can possibly damage the hoses.

(1) Using a lint free towel, wipe clean the open power steering hose end and the power steering pump port. Replace any used O-rings with new. Lubricate the O-ring with power steering fluid.

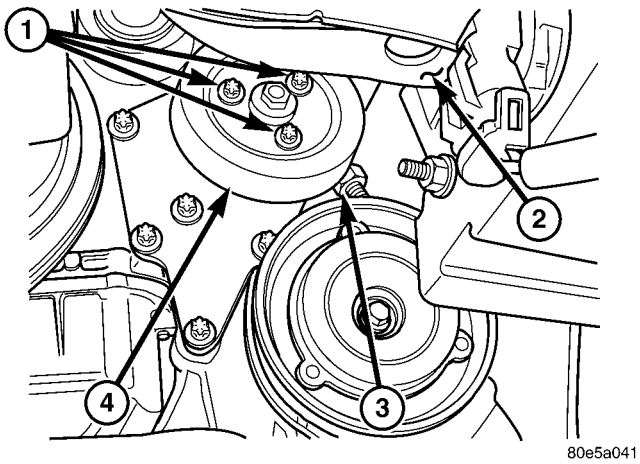

Fig. 37 Pump Pulley Mounting

1 - PULLEY MOUNTING BOLTS
2 - RIGHT FRAME RAIL
3 - PRESSURE HOSE FITTING
4 - PULLEY

(2) Install the power steering pressure hose into the engine compartment from the bottom. Guide the pump end of the hose up past the left side of the A/C compressor and into the pump pressure fitting.

(3) Start the mounting bolt through the routing bracket, loosely attaching the pressure hose to the engine block (Fig. 27).

(4) Thread the hose tube nut into the pump (Fig. 33).

(5) Using a crowfoot wrench on a long extension with a torque wrench, tighten the pressure hose tube nut at the power steering pump to a torque of 31 N·m (23 ft. lbs.).

(6) Install the four bolts fastening the A/C compressor to the engine (Fig. 32). Tighten the mounting bolts to a torque of 28 N·m (250 in. lbs.).

(7) Install the A/C compressor electrical connectors (Fig. 32).

(8) Install the A/C drive belt. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION)

(9) Install the drive-belt splash shield and fasteners (Fig. 31).

(10) Install the screws fastening the front fascia to the reinforcement (Fig. 31).

(11) Install the right front tire and wheel assembly. Install and tighten the wheel mounting nuts to a torque of 135 N·m (100 ft. lbs.).

(12) Tighten the mounting bolt securing the pressure hose and routing bracket to the engine block (Fig. 27) to a torque of 61 N·m (45 ft. lbs.).

(13) Route the hose below the oil pan near the transaxle and install the structural collar along with the hose routing bracket (Fig. 27) using the following sequence:

HOSE - POWER STEERING PRESSURE (Continued)

NOTE: Use care not to pinch pressure hose between collar and engine.

(a) Install and tighten the collar-to-oil pan bolts to 3 N·m (30 in. lbs.) torque.

(b) Install and tighten the collar-to-transaxle bolts to 108 N·m (80 ft. lbs.) torque.

(c) Repeat tightening of collar-to-oil pan bolts to a final torque of 54 N·m (40 ft. lbs.).

(14) Using a lint free towel, wipe clean the open power steering hose end and the power steering gear port. Replace any used O-rings with new. Lubricate the O-ring with power steering fluid.

CAUTION: Forward of the steering gear, the power steering fluid pressure hose routes between the front suspension crossmember and the driveshaft. When tightening the pressure hose tube nut to the steering gear, the pressure hose must be positioned (clocked) such that its final routing (after tightened) offers 4–10 mm clearance to the front suspension crossmember (measured at the pressure hose steel-to-rubber coupling). There should be a clocking donut on the hose to preset this distance.

(15) Attach the power steering fluid pressure hose to its port on the power steering gear (Fig. 28) (Fig. 26). While making sure the hose is not in contact with any vehicle components (see preceding caution), tighten the pressure hose tube nut at the gear to a torque of 31 N·m (23 ft. lbs.).

(16) Lower the vehicle.

(17) Perform the POWER STEERING PUMP INITIAL OPERATION procedure. (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE)

(18) Check for leaks at all hose connections.

INSTALLATION - 2.4L ENGINE

CAUTION: Power steering fluid hoses must remain away from the exhaust system, driveshafts, vehicle components and any unfriendly surface that can possibly damage the hoses.

(1) Using a lint free towel, wipe clean the open power steering hose end and the power steering pump port. Replace any used O-rings with new. Lubricate the O-ring with power steering fluid.

(2) Install the power steering pressure hose into the engine compartment from the bottom. Guide the pump end of the hose up past the left side of the A/C compressor and into the pump pressure fitting (Fig. 30).

(3) Start the mounting bolt through the routing bracket, loosely attaching the pressure hose to the front of the engine (Fig. 30).

(4) Thread the hose tube nut into the pump (Fig. 33).

(5) Using a crowfoot wrench on a long extension with a torque wrench, tighten the pressure hose tube nut at the power steering pump to a torque of 31 N·m (23 ft. lbs.).

(6) Install the four bolts fastening the A/C compressor to the engine (Fig. 32). Tighten the mounting bolts to a torque of 28 N·m (250 in. lbs.).

(7) Install the A/C compressor electrical connectors (Fig. 32).

(8) Install the A/C drive belt. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION)

(9) Install the drive-belt splash shield and fasteners (Fig. 31).

(10) Install the screws fastening the front fascia to the reinforcement (Fig. 31).

(11) Install the right front tire and wheel assembly. Install and tighten the wheel mounting nuts to a torque of 135 N·m (100 ft. lbs.).

(12) Tighten the mounting bolt securing the pressure hose and routing bracket to the front of the engine to a torque of 61 N·m (45 ft. lbs.).

(13) Attach the pressure hose and routing brackets to the structural collar (Fig. 29). Tighten the mounting bolts to a torque of 61 N·m (45 ft. lbs.).

(14) Using a lint free towel, wipe clean the open power steering hose end and the power steering gear port. Replace any used O-rings with new. Lubricate the O-ring with power steering fluid.

CAUTION: Forward of the steering gear, the power steering fluid pressure hose routes between the front suspension crossmember and the driveshaft. When tightening the pressure hose tube nut to the steering gear, the pressure hose must be positioned (clocked) such that its final routing (after tightened) offers 4–10 mm clearance to the front suspension crossmember (measured at the pressure hose steel-to-rubber coupling). There should be a clocking donut on the hose to preset this distance.

(15) Attach the power steering fluid pressure hose to its port on the power steering gear (Fig. 28) (Fig. 26). While making sure the hose is not in contact with any vehicle components (see preceding caution), tighten the pressure hose tube nut at the gear to a torque of 31 N·m (23 ft. lbs.).

(16) Lower the vehicle.

(17) Perform the POWER STEERING PUMP INITIAL OPERATION procedure. (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE)

(18) Check for leaks at all hose connections.

HOSE - POWER STEERING PRESSURE (Continued)

INSTALLATION - 2.2L DIESEL

CAUTION: Power steering fluid hoses must remain away from the exhaust system, driveshafts, vehicle components and any unfriendly surface that can possibly damage hoses.

(1) Using a lint free towel, wipe clean open power steering hose end and power steering pump port. Replace any used O-rings with new. Lubricate O-ring with power steering fluid.

(2) Install power steering pressure hose into engine compartment from the bottom. Guide pump end of hose up past A/C compressor and into pump pressure fitting.

(3) Thread hose tube nut into pump pressure fitting, but do not fully tighten at this time.

(4) Install three bolts securing pressure hose routing clamps to engine oil pan (Fig. 36). Tighten three mounting bolts to a torque of 8 N·m (70 in. lbs.).

(5) Tighten pressure hose tube nut at power steering pump to a torque of 32 N·m (23 ft. lbs.).

(6) Install pump drive pulley (Fig. 37). Tighten three mounting bolts to a torque of 28 N·m (21 ft. lbs.).

(7) Install accessory drive belt. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELT - INSTALLATION)

(8) Using a lint free towel, wipe clean open power steering hose end and power steering gear port. Replace any used O-rings with new. Lubricate O-ring with power steering fluid.

(9) Attach power steering fluid pressure hose to pressure port on power steering gear (Fig. 35). While making sure hose is not in contact with any vehicle components, tighten pressure hose tube nut at steering gear to a torque of 32 N·m (23 ft. lbs.).

(10) Install lower engine compartment silencer assembly and drive belt splash shield (Fig. 34).

(11) Lower vehicle.

(12) Perform POWER STEERING PUMP INITIAL OPERATION procedure. (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE)

(13) Check for leaks at all hose connections.

HOSE - POWER STEERING PRESSURE/RETURN

REMOVAL - 2.4L TURBO

NOTE: Before proceeding, (Refer to 19 - STEERING - WARNING).

(1) Siphon as much fluid as possible from power steering fluid reservoir.

(2) Raise vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(3) Drain engine coolant (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE - DRAIN COOLING SYSTEM).

(4) Disconnect radiator fan wiring connector (Fig. 38).

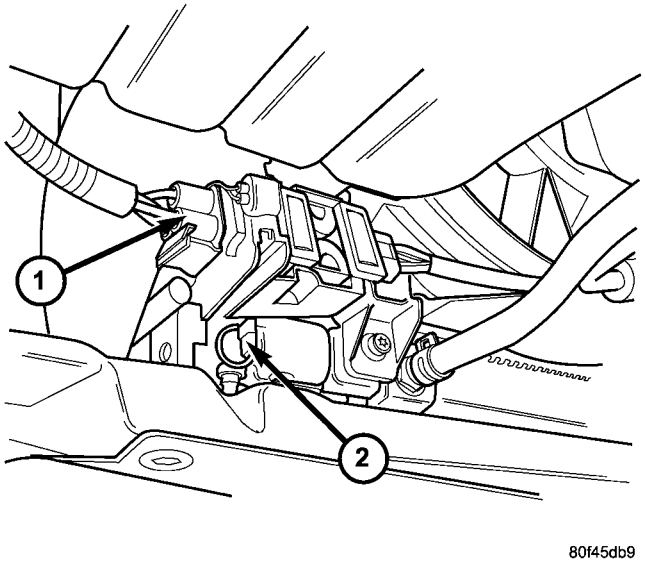

Fig. 38 Radiator Fan Connector - 2.4L Turbo

1 - RADIATOR FAN CONNECTOR
2 - RADIATOR DRAINCOCK

HOSE - POWER STEERING PRESSURE/RETURN (Continued)

(5) Remove two lower fan mounting screws (Fig. 39).

(6) Lower vehicle.

(7) Remove grille from front of vehicle (Fig. 40).

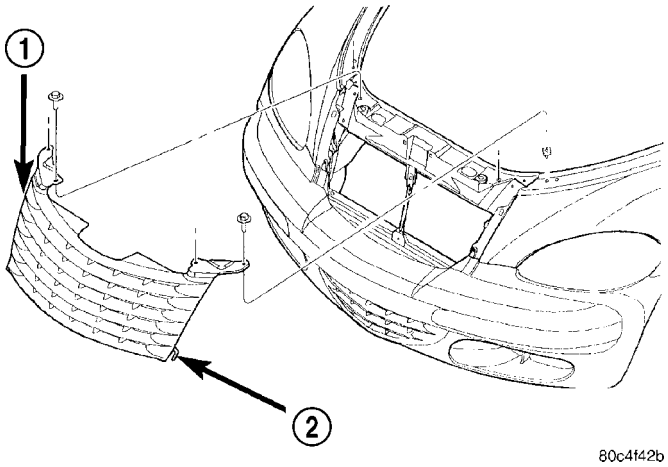

Fig. 40 Grille Attachment

1 - GRILLE
2 - RETAINER

(8) Remove hood-opening weather-strip from across radiator closure panel.

(9) Remove ambient temperature sensors from radiator closure panel (Fig. 41).

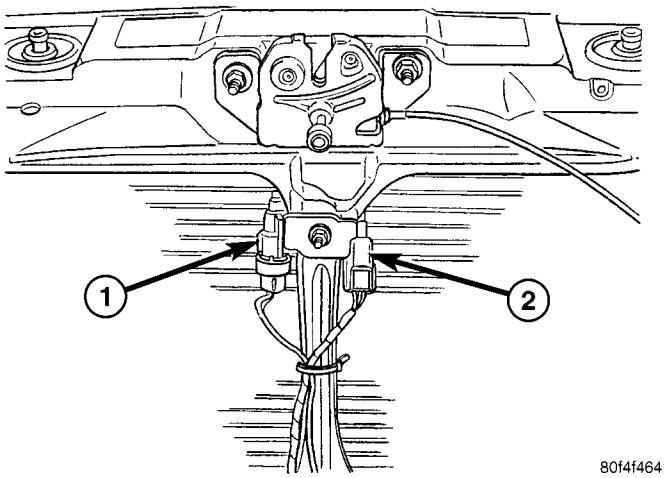

Fig. 41 Temperature Sensor Mounting

1 - AMBIENT TEMP SENSOR
2 - AMBIENT TEMP SENSOR

(10) Remove fasteners securing upper radiator closure panel in place (Fig. 42), then remove the panel and lay it out of way.

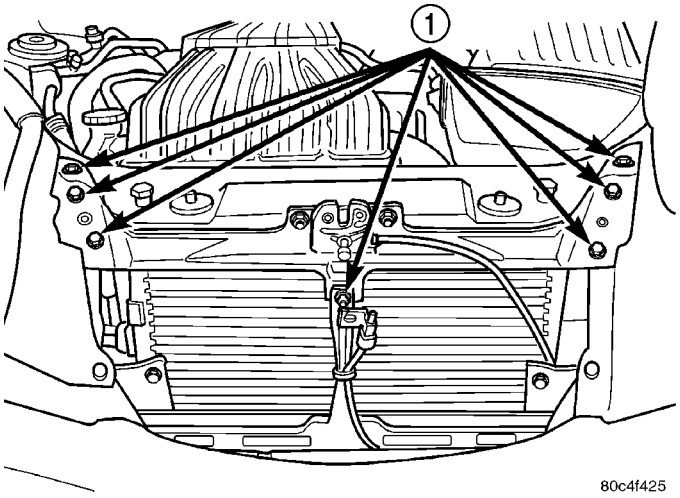

Fig. 42 Radiator Closure Panel

1 - FASTENERS

(11) Remove 2 screws fastening upper radiator hose inlet neck to radiator, then separate inlet neck from radiator (Fig. 43).

(12) Lift cooling module out of its lower mounts and carefully tip top toward front of vehicle. DO NOT FORCE IT.

(13) Remove remaining four screws fastening radiator fan to cooling module (Fig. 39). Remove fan.

(14) Remove clamp securing fluid return hose to pump reservoir (Fig. 44), then remove hose from reservoir fitting. Cap off hose end and reservoir fitting.

(15) Remove bolt securing fluid pressure hose routing clamp to engine (Fig. 44).

HOSE - POWER STEERING PRESSURE/RETURN (Continued)

INSTALLATION - 2.4L TURBO

(1) Using a lint free towel, wipe clean open power steering hose ends and power steering pump and gear ports. Replace any used O-rings with new. Lubricate O-rings with power steering fluid.

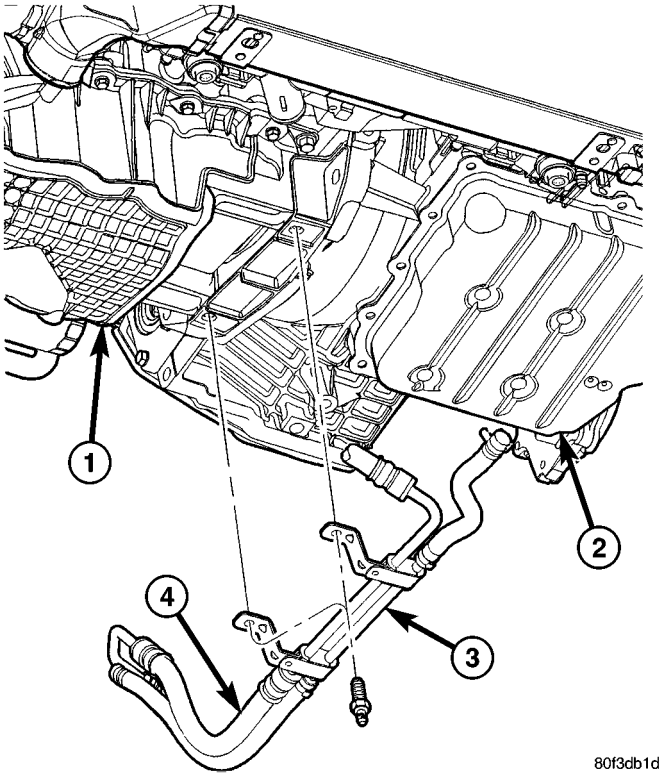

Fig. 48 Routing Clamp Bolts At Structural Collar

1 - ENGINE
2 - TRANSAXLE
3 - RETURN HOSE (SERVICED WITH PRESSURE HOSE)
4 - PRESSURE HOSE (SERVICED WITH RETURN HOSE)

(2) Install power steering pressure/return hose assembly into engine compartment from below.

(3) Attach pressure/return hose routing clamps to engine's structural collar (Fig. 48). Tighten mounting bolts to 61 N·m (45 ft. lbs.) torque.

(4) Attach charge air cooler hose to bolts in engine's structural collar (Fig. 47). Tighten nuts to 31 N·m (23 ft. lbs.) torque.

(5) Position hose clamp onto end of return hose (from steering gear) far enough to clear fitting on internal cooler located within radiator portion of cooling module.

(6) Slide return hose onto internal cooler fitting (Fig. 46). Install hose clamp on hose past bead formed into end of fitting and secure in place.

(7) Position hose clamp onto end of return hose (at steering gear) far enough to clear tube in steering gear outlet port once installed.

(8) Slide return hose onto tube extending from power steering gear outlet port (Fig. 45). Install hose clamp on hose past bead formed into end of tube and secure in place.

(9) Thread fluid pressure hose into inlet port on power steering gear (Fig. 45). DO NOT TIGHTEN AT THIS TIME.

HOSE - POWER STEERING PRESSURE/RETURN (Continued)

(10) Install routing clip up from gear outlet tube onto fluid pressure hose tube (Fig. 45).

(11) While making sure fluid pressure hose stays in routing clip, parallel with return hose, tighten pressure hose tube nut at gear to 31 N·m (23 ft. lbs.) torque.

(12) lower vehicle

(13) Thread fluid pressure hose into power steering pump pressure port (Fig. 44). DO NOT TIGHTEN AT THIS TIME.

(14) Install mounting bolt through routing bracket, attaching pressure hose to front of engine (Fig. 44). Tighten mounting bolt to 61 N·m (45 ft. lbs.) torque.

(15) Tighten pressure hose tube nut at pump to 31 N·m (23 ft. lbs.) torque.

(16) Position radiator fan and install two upper and two side mounting screws (Fig. 39). Tighten screws to 6 N·m (55 in. lbs.) torque.

(17) Position cooling module back into its lower mounts.

(18) Clean and inspect or replace upper radiator hose inlet neck O-ring, then install inlet neck to radiator (Fig. 43). Install 2 mounting screws.

(19) Install radiator closure panel and fasten it in place (Fig. 42).

(20) Install ambient temperature sensors on radiator closure panel (Fig. 41).

(21) Install hood-opening weather-strip across radiator closure panel.

(22) Install grille on front of vehicle (Fig. 40).

(23) Raise vehicle.

(24) Install two remaining lower fan mounting screws (Fig. 39). Tighten screws to 6 N·m (55 in. lbs.) torque.

(25) Connect radiator fan wiring connector (Fig. 38).

(26) Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE - FILLING COOLING SYSTEM).

(27) Perform POWER STEERING PUMP INITIAL OPERATION procedure to properly fill and bleed power steering system. (Refer to 19 - STEERING/ PUMP - STANDARD PROCEDURE)

(28) Check for leaks.

HOSE - POWER STEERING RETURN

REMOVAL

REMOVAL - 2.0L/2.4L ENGINE

NOTE: Before proceeding, (Refer to 19 - STEERING - WARNING).

(1) Siphon as much fluid as possible from the power steering fluid reservoir.

(2) Raise the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(3) Remove the hose clamp securing the return hose to the power steering fluid cooler (Fig. 49) (Fig. 26). Slide the hose off the end of the cooler tube.

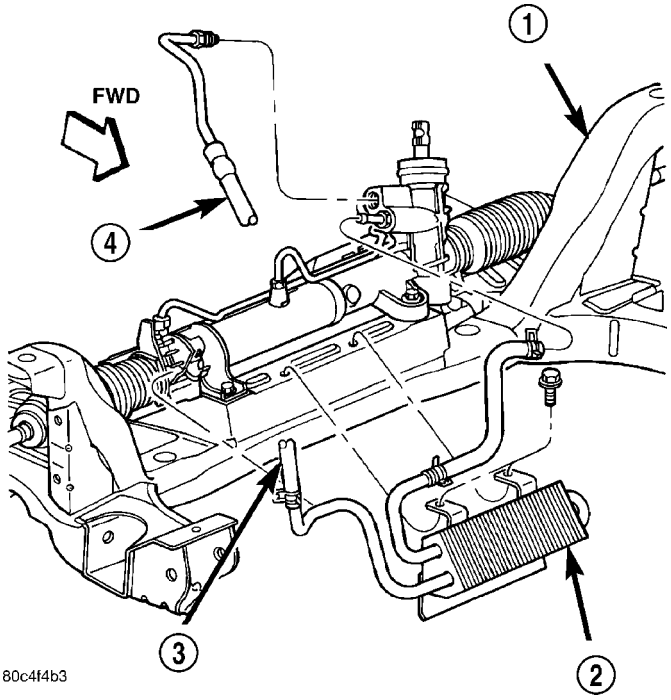

Fig. 49 Return Hose At LHD Cooler

1 - CROSSMEMBER
2 - COOLER
3 - RETURN HOSE
4 - PRESSURE HOSE

(4) Lower the vehicle.

(5) Remove the hose clamp securing the return hose to the power steering fluid reservoir (Fig. 50). Slide the hose off the end of the reservoir fitting and remove from vehicle.

HOSE - POWER STEERING RETURN (Continued)

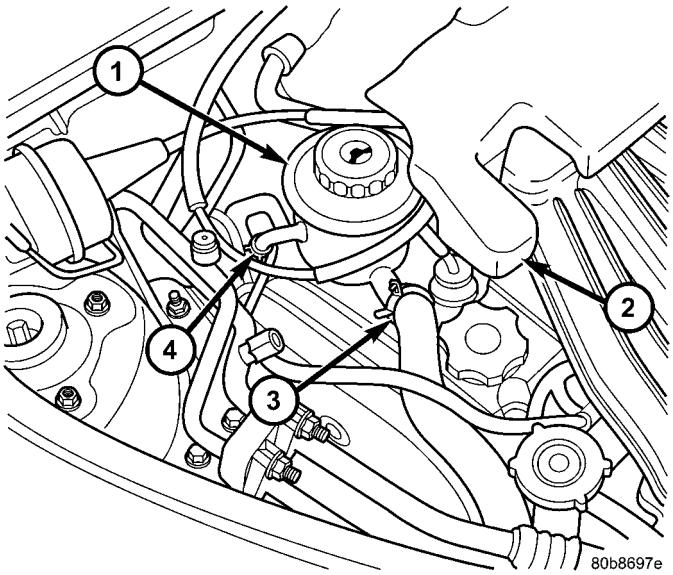

Fig. 50 Hose Connection At Reservoir

1 - POWER STEERING FLUID RESERVOIR
2 - ENGINE COVER
3 - SUPPLY HOSE
4 - RETURN HOSE

REMOVAL - 2.4L TURBO

NOTE: Before proceeding, (Refer to 19 - STEERING - WARNING).

(1) Siphon as much fluid as possible from power steering fluid reservoir.

(2) Raise vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(3) Remove hose clamp securing return hose (to reservoir) to fitting on internal cooler located within radiator portion of cooling module (Fig. 46). Slide hose off fitting and allow fluid to drain.

(4) Lower vehicle.

(5) Remove grille from front of vehicle (Fig. 40).

(6) Remove hood-opening weather-strip from across radiator closure panel.

(7) Remove ambient temperature sensors from radiator closure panel (Fig. 41).

(8) Remove fasteners securing upper radiator closure panel in place (Fig. 42), then remove the panel and lay it out of way.

(9) Remove clamp securing fluid return hose to pump reservoir (Fig. 44).

(10) Slide fluid return hose off end of reservoir fitting and remove from vehicle.

REMOVAL - 2.2L DIESEL

NOTE: Before proceeding, (Refer to 19 - STEERING - WARNING).

(1) Siphon as much fluid as possible from power steering fluid reservoir.

(2) Raise vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(3) Remove clamp securing return hose to steering gear fitting and remove hose (Fig. 35). Drain fluid from hose.

(4) Lower vehicle.

(5) Remove engine air cleaner. (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL)

(6) Remove return hose from routing clip (Fig. 51).

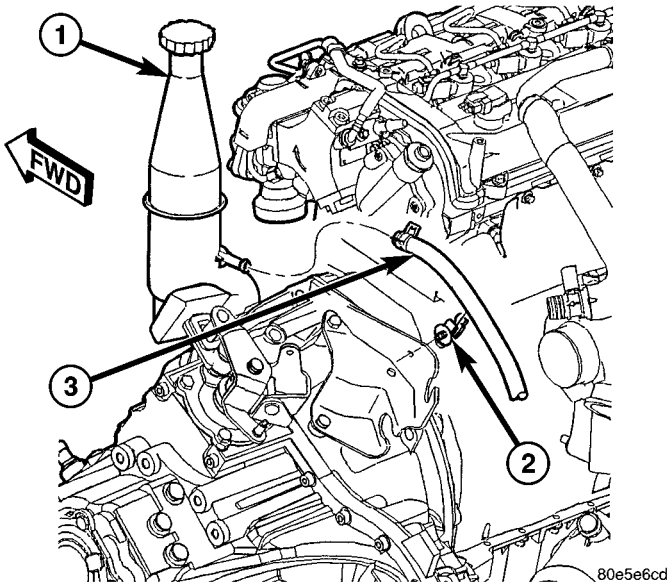

Fig. 51 Return Hose Mounting

1 - FLUID RESERVOIR
2 - ROUTING CLIP
3 - RETURN HOSE

(7) Remove clamp securing return hose to fluid reservoir fitting (Fig. 51) and remove hose.

HOSE - POWER STEERING RETURN (Continued)

INSTALLATION

INSTALLATION - 2.0L/2.4L ENGINE

(1) Slide a hose clamp onto the power steering fluid reservoir end of the hose far enough to clear the molded fitting on the reservoir once the hose is installed.

(2) Install the power steering return hose into the engine compartment from the top. First, place the reservoir end of the hose onto the molded fitting on the power steering fluid reservoir, then route the rest of the hose down the rear of the engine (Fig. 50).

(3) Expand the hose clamp and slide it onto the fluid reservoir fitting. Secure the clamp once it is past the bead formed into the fluid reservoir fitting.

(4) Raise the vehicle.

CAUTION: The power steering fluid hoses must remain away from the exhaust system, vehicle components, and unfriendly surfaces that can cause possible damage to the power steering hoses.

(5) Using a lint free towel, wipe clean the open power steering hose end and the power steering fluid cooler tube.

(6) Install a hose clamp onto the end of the hose far enough to clear the fitting on the steering gear or cooler once the hose is installed.

(7) Slide the hose onto the end of the cooler tube (Fig. 49) (Fig. 26). Install the hose clamp past the bead formed into the end of the cooler tube and secure in place.

(8) Lower the vehicle.

(9) Perform the POWER STEERING PUMP INITIAL OPERATION procedure. (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE)

(10) Check for leaks at all hose connections.

INSTALLATION - 2.4L TURBO

(1) Slide hose clamp onto power steering fluid reservoir end of return hose far enough to clear molded fitting on reservoir once hose is installed.

(2) Install power steering return hose into engine compartment from top. Place reservoir end of hose onto molded fitting on fluid reservoir (Fig. 44).

(3) Expand hose clamp and slide it onto fluid reservoir fitting. Secure clamp once it is past bead formed into fluid reservoir fitting.

(4) Install radiator closure panel and fasten it in place (Fig. 42).

(5) Install ambient temperature sensors on radiator closure panel (Fig. 41).

(6) Install hood-opening weather-strip across radiator closure panel.

(7) Install grille on front of vehicle (Fig. 40).

(8) Raise vehicle.

(9) Position hose clamp onto end of return hose (to reservoir) far enough to clear fitting on internal cooler located within radiator portion of cooling module.

(10) Slide return hose onto internal cooler fitting (Fig. 46). Install hose clamp on hose past bead formed into end of fitting and secure in place.

(11) Lower vehicle.

(12) Perform POWER STEERING PUMP INITIAL OPERATION procedure. (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE)

(13) Check for leaks.

INSTALLATION - 2.2L DIESEL

(1) Slide hose clamp onto power steering fluid reservoir end of return hose far enough to clear molded fitting on reservoir once hose is installed.

(2) Install return hose into engine compartment from top. First, place reservoir end of hose onto molded fitting on reservoir, then route remainder of hose down rear of transaxle (Fig. 51).

(3) Expand hose clamp and slide it onto fluid reservoir fitting. Secure clamp once it is past bead formed into fluid reservoir fitting.

(4) Install return hose into routing clip (Fig. 51).

(5) Raise vehicle.

CAUTION: Power steering fluid hoses must remain away from exhaust system, vehicle components, and unfriendly surfaces that can cause possible damage to power steering hoses.

(6) Using lint free towel, wipe clean open power steering hose end and power steering gear hose fitting.

(7) Install hose clamp onto the end of the hose far enough to clear fitting on the steering gear once hose is installed.

(8) Slide hose onto end of the steering gear hose fitting (Fig. 35). Install hose clamp past bead formed into end of hose fitting and secure in place.

(9) Lower vehicle.

(10) Install engine air cleaner. (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - INSTALLATION)

(11) Perform POWER STEERING PUMP INITIAL OPERATION procedure. (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE)

(12) Check for leaks at all hose connections.

HOSE - POWER STEERING SUPPLY

REMOVAL

REMOVAL - 2.0L/2.4L ENGINE

NOTE: Before proceeding, (Refer to 19 - STEERING - WARNING).

(1) Siphon as much fluid as possible from the power steering fluid reservoir.

(2) Remove the grille from the front of the vehicle (Fig. 52).

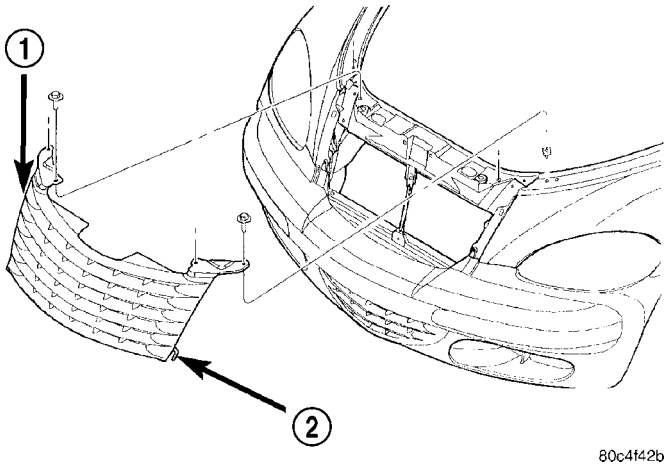

Fig. 52 Grille Attachment

1 - GRILLE
2 - RETAINER

(3) Remove the hood-opening weather-strip from across the radiator closure panel.

(4) Remove the ambient temperature sensor from the radiator closure panel (Fig. 53).

(5) Remove the fasteners securing the radiator closure panel in place (Fig. 54), then remove the panel.

(6) Remove the clamp securing the supply hose to the power steering pump supply fitting (Fig. 55), then remove the hose from the supply fitting.

(7) Remove the hose clamp securing the supply hose to the power steering fluid reservoir (Fig. 56). Slide the hose off the end of the reservoir fitting and remove from vehicle.

REMOVAL - 2.2L DIESEL

NOTE: Before proceeding, (Refer to 19 - STEERING - WARNING).

(1) Disconnect battery negative (-) terminal.

(2) Remove engine top appearance cover (Fig. 57).

(3) Siphon as much fluid as possible from power steering fluid reservoir.

(4) Remove radiator fan. (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL)

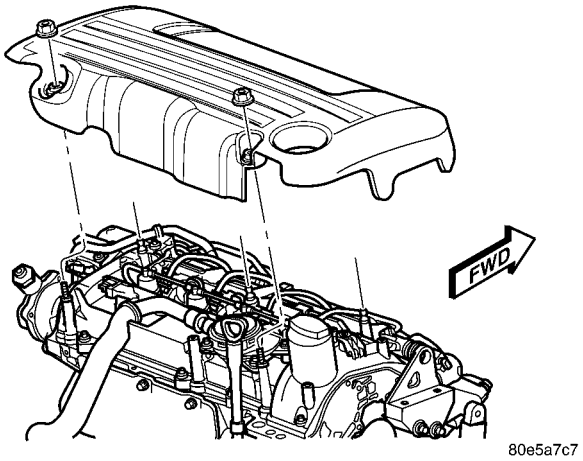

Fig. 57 Engine Top Cover Mounting

(5) Remove clamp securing supply hose to power steering pump supply fitting (Fig. 58), then remove hose from fitting.

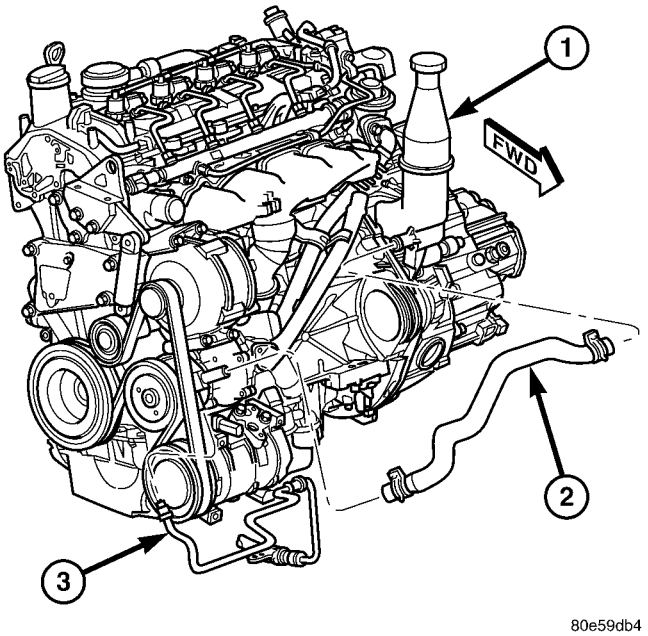

Fig. 58 Hoses At Pump And Reservoir

1 - FLUID RESERVOIR
2 - SUPPLY HOSE
3 - PRESSURE HOSE

(6) Remove hose clamp securing supply hose to power steering fluid reservoir (Fig. 58). Slide the hose off the end of the reservoir fitting and remove from vehicle.

HOSE - POWER STEERING SUPPLY (Continued)

INSTALLATION

INSTALLATION - 2.0L/2.4L ENGINE

(1) Slide hose clamps onto both ends of the power steering fluid supply hose far enough to clear the fittings on the reservoir and pump once the hose is installed.

(2) Install the power steering supply hose into the engine compartment. First, route the pump end of the hose down to the pump supply fitting, then place the reservoir end of the hose onto the fitting of the power steering fluid reservoir (Fig. 56).

(3) Expand the hose clamp at the fluid reservoir and slide it over the hose and fitting. Secure the clamp once it is past the bead formed into the fluid reservoir fitting.

(4) Expand the remaining hose clamp and slide it over the hose and pump supply fitting (Fig. 55). Secure the clamp once it is past the bead formed into the fluid supply fitting.

CAUTION: Make sure the hose routing is above the engine timing chain cover. The power steering fluid supply hose must remain clear of any unfriendly surface that can cause possible damage to it.

(5) Install the radiator closure panel and fasten it in place (Fig. 54).

(6) Install the ambient temperature sensor on the radiator closure panel (Fig. 53).

(7) Install the hood-opening weather-strip across the radiator closure panel.

(8) Install the grille on the front of the vehicle (Fig. 52).

(9) Perform the POWER STEERING PUMP INITIAL OPERATION procedure. (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE)

(10) Check for leaks at all hose connections.

INSTALLATION - 2.2L DIESEL

(1) Slide hose clamps onto both ends of power steering fluid supply hose far enough to clear fittings on reservoir and pump once hose is installed.

(2) Install power steering supply hose into engine compartment. First, route pump end of hose down to pump onto supply fitting, then place reservoir end of hose onto fitting of power steering fluid reservoir (Fig. 58).

(3) Expand hose clamp at fluid reservoir end and slide it over hose and fitting. Secure clamp once it is past bead formed into fluid reservoir fitting.

(4) Expand remaining hose clamp and slide it over hose and pump supply fitting (Fig. 58). Secure clamp once it is past bead formed into fluid supply fitting.

(5) Install radiator fan. (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION)

(6) Install engine top appearance cover (Fig. 57).

(7) Perform POWER STEERING PUMP INITIAL OPERATION procedure. (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE)

(8) Check for leaks at all hose connections.

PULLEY

REMOVAL - 2.2L DIESEL

NOTE: Before proceeding, (Refer to 19 - STEERING - WARNING).

(1) Raise vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(2) Remove lower engine compartment silencer assembly and accessory drive belt splash shield (Fig. 59).

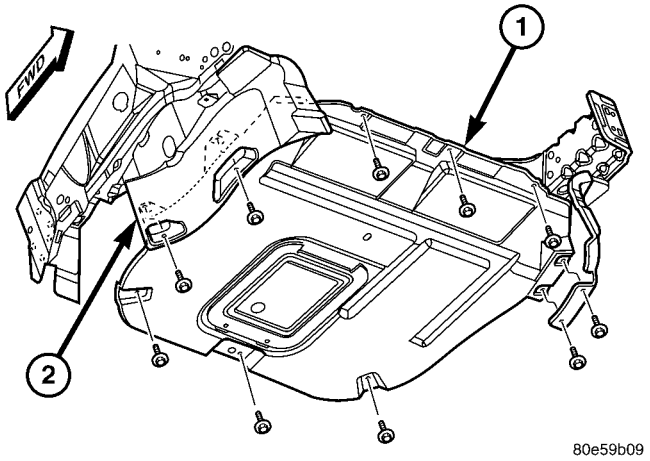

Fig. 59 Engine Compartment Lower Silencer

1 - ENGINE COMPARTMENT SILENCER
2 - ACCESSORY DRIVE BELT SPLASH SHIELD

(3) Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELT - REMOVAL).

(4) Remove 3 bolts securing pulley to power steering pump (Fig. 60). Remove pulley.

INSTALLATION - 2.2L DIESEL

(1) Install pump drive pulley (Fig. 60). Tighten three mounting bolts to a torque of 28 N·m (21 ft. lbs.).

(2) Install accessory drive belt. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELT - INSTALLATION)

(3) Install lower engine compartment silencer assembly and drive belt splash shield (Fig. 59).

(4) Lower vehicle.

PULLEY (Continued)

RESERVOIR

DESCRIPTION

The power steering reservoir used on 1.6L engines is mounted above the generator (Fig. 61). The power steering fluid reservoir for 2.0L and 2.4L non-turbo engines is mounted above the engine head cover and is attached to the backside of the engine (Fig. 62). The 2.2L Diesel uses a power steering reservoir that is mounted above the transaxle bell housing (Fig. 64).

The 2.4L turbo engine uses a power steering reservoir that is attached to the power steering pump. The reservoir is serviced with the pump.

REMOVAL

REMOVAL - 1.6L ENGINE

(1) Remove the filler cap from remote power steering fluid reservoir.

(2) Siphon as much fluid as possible from the fluid reservoir.

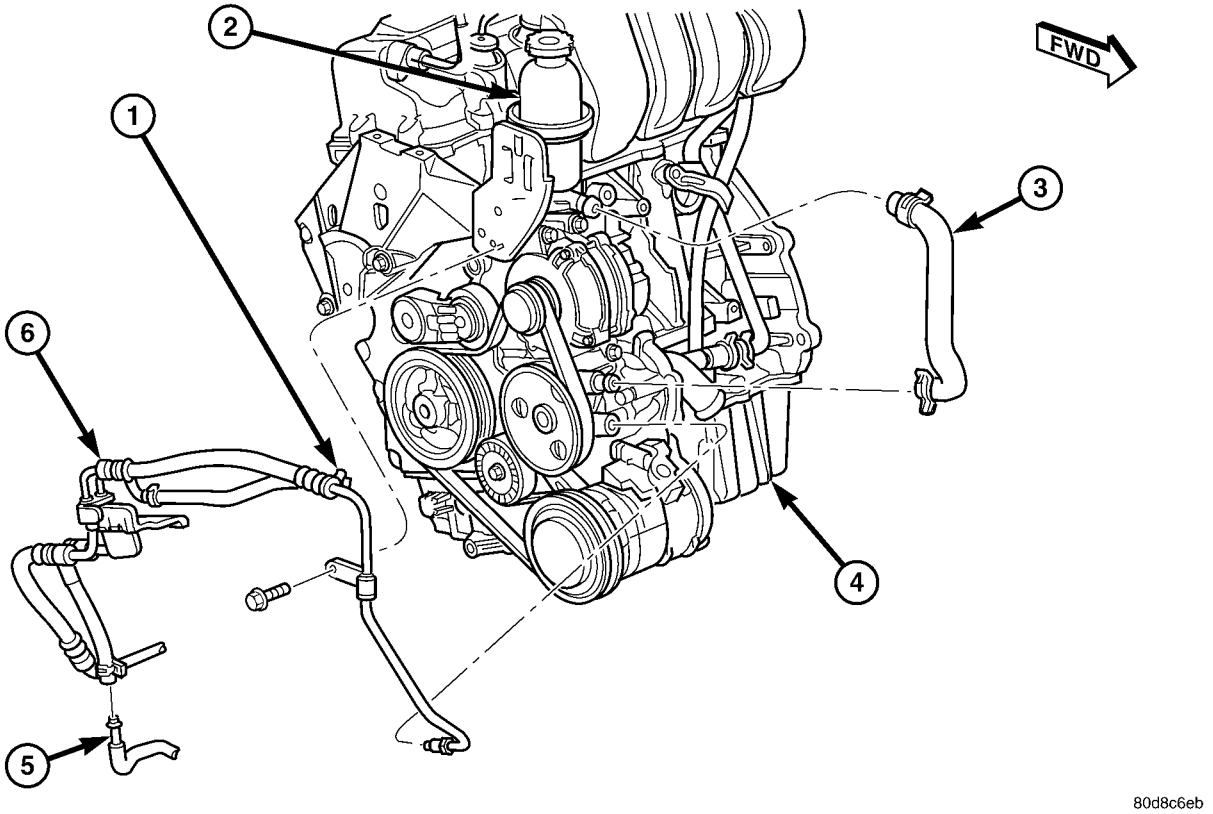

Fig. 61 Hoses, Reservoir And Pump - 1.6L Engine

1 - RETURN HOSE
2 - FLUID RESERVOIR
3 - SUPPLY HOSE
4 - 1.6L ENGINE
5 - COOLER OUTLET TUBE
6 - PRESSURE HOSE

RESERVOIR (Continued)

(3) Remove the clamp attaching the return hose to the power steering fluid reservoir. Disconnect hose from reservoir (Fig. 61).

(4) Remove the clamp attaching the supply hose to the power steering fluid reservoir. Disconnect hose from reservoir (Fig. 61).

(5) Press the tang on the reservoir mounting bracket retaining the reservoir to the bracket, then pull upward on reservoir and remove it from the bracket.

REMOVAL - 2.0L/2.4L ENGINE

NOTE: Before proceeding, (Refer to 19 - STEERING - WARNING).

(1) Remove the filler cap from remote power steering fluid reservoir (Fig. 62).

(2) Siphon as much fluid as possible from the fluid reservoir.

(3) Remove the plastic engine cover.

(4) Remove the clamp attaching the supply hose to the power steering fluid reservoir (Fig. 62). Remove the hose from the reservoir.

(5) Remove the clamp attaching the return hose to the power steering fluid reservoir (Fig. 62). Remove the hose from the reservoir.

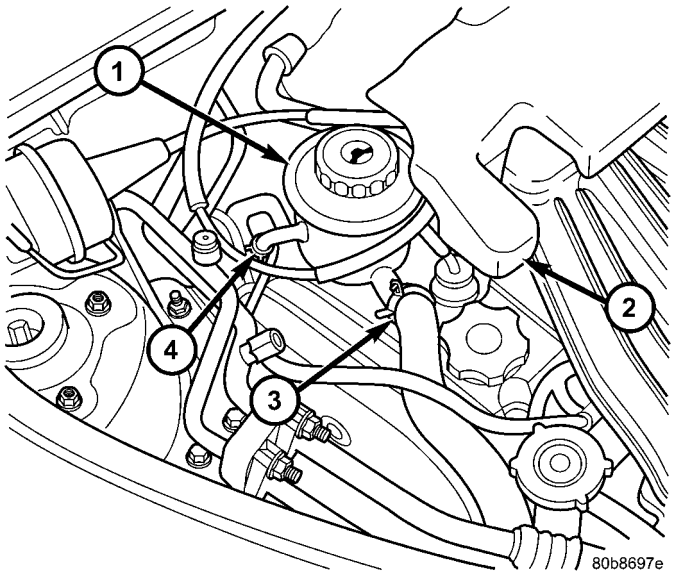

Fig. 62 Hose Connection At Reservoir

(6) Remove the 2 bolts fastening the reservoir to the rear of the engine (Fig. 63)

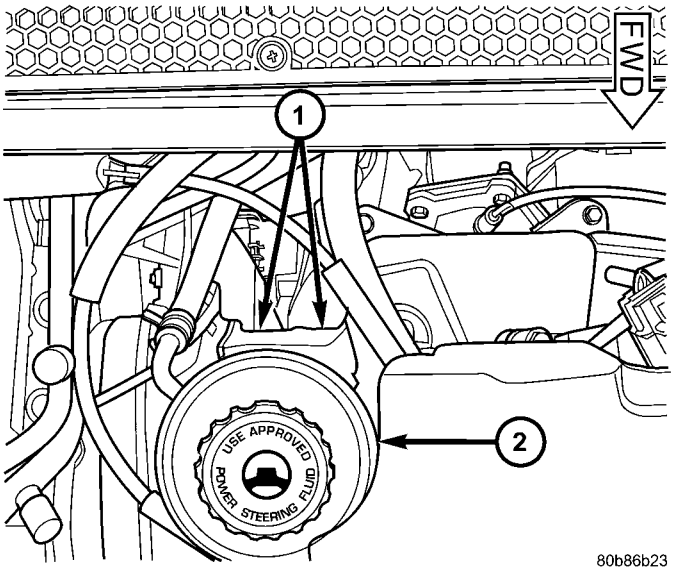

Fig. 63 Power Streering Fluid Reservoir Mounting

1 - MOUNTING BOLTS
2 - POWER STEERING FLUID RESERVOIR

REMOVAL - 2.2L DIESEL

NOTE: Before proceeding, (Refer to 19 - STEERING - WARNING).

(1) Remove engine top appearance cover (Fig. 57).

(2) Remove engine air cleaner. (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL)

(3) Siphon as much fluid as possible from power steering fluid reservoir.

(4) Remove hose clamp securing return hose to fluid reservoir fitting (Fig. 51). Slide hose off end of reservoir fitting.

(5) Remove hose clamp securing supply hose to fluid reservoir fitting (Fig. 58). Slide hose off end of reservoir fitting.

(6) Remove mounting bolts used to secure reservoir in place (Fig. 64). Remove reservoir.

RESERVOIR (Continued)

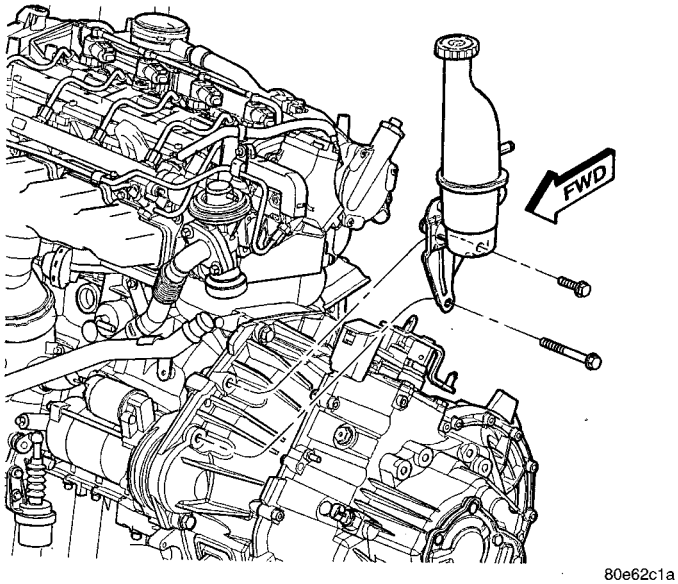

Fig. 64 Power Steering Fluid Reservoir Mounting

INSTALLATION

INSTALLATION - 1.6L ENGINE

(1) Align the guide on the rear of the reservoir with the mounting bracket and push reservoir downward until reservoir clicks into place in the bracket.

(2) Install the supply hose onto the bottom of the reservoir (Fig. 61). Slide the hose clamp into position on the fluid reservoir and attach it. **Be sure hose clamp in installed past bead on fluid reservoir fitting.**

(3) Install the return hose onto the reservoir (Fig. 61). Slide the hose clamp into position on the fluid reservoir and attach it. **Be sure hose clamp in installed past bead on fluid reservoir fitting.**

(4) Fill the fluid reservoir to the proper level. (Refer to 19 - STEERING/PUMP/FLUID - STANDARD PROCEDURE - POWER STEERING FLUID LEVEL CHECKING)

(5) Start the engine and let run for a few seconds, then turn the engine off.

(6) Add fluid as necessary.

(7) Install the filler cap.

INSTALLATION - 2.0L/2.4L ENGINE

(1) Install the power steering fluid reservoir bracket to the engine with mounting bolts (Fig. 63). Tighten bolts to 10 N·m (90 in.lb.).

NOTE: Make sure the throttle cable is routed in front of the reservoir just below the upper lip.

(2) Install the fluid supply hose onto the power steering fluid reservoir fitting (Fig. 62).

(3) Slide the hose clamp on the fluid supply hose up into position on the fluid reservoir and install it. Be sure hose clamp in installed past bead on fluid reservoir fitting.

CAUTION: Make sure the supply hose is routed above the engine timing chain cover but below engine wiring harness. The power steering fluid supply hose must remain clear of any unfriendly surface that can cause possible damage to it.

(4) Install the fluid return hose onto the power steering fluid reservoir fitting (Fig. 62).

(5) Slide the hose clamp on the fluid supply hose up into position on the fluid reservoir and install it. Be sure hose clamp in installed past bead on fluid reservoir fitting.

(6) Install plastic engine cover.

(7) Fill the fluid reservoir to the proper level. (Refer to 19 - STEERING/PUMP/FLUID - STANDARD PROCEDURE - POWER STEERING FLUID LEVEL CHECKING)

(8) Start the engine and let run for a few seconds, then turn the engine off.

(9) Add fluid if necessary.

(10) Install the filler cap.

INSTALLATION - 2.2L DIESEL

(1) Attach reservoir to vehicle using 2 mounting bolts (Fig. 64). Tighten mounting bolts to a torque of 54 N·m (40 ft. lbs.).

(2) Slide supply hose onto reservoir fitting (Fig. 58). Expand hose clamp and slide it over hose on reservoir fitting. Secure clamp once it is past bead formed into fluid reservoir fitting.

(3) Slide return hose onto reservoir fitting (Fig. 51). Expand hose clamp and slide it over hose on reservoir fitting. Secure clamp once it is past bead formed into fluid reservoir fitting.

(4) Install engine air cleaner. (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - INSTALLATION)

(5) Install engine top appearance cover (Fig. 57).

(6) Fill fluid reservoir to proper level. (Refer to 19 - STEERING/PUMP/FLUID - STANDARD PROCEDURE - POWER STEERING FLUID LEVEL CHECKING)

(7) Start engine and let run for a few seconds, then turn engine off.

(8) Add fluid if necessary.

(9) Install reservoir filler cap.

G288 MANUAL TRANSAXLE

DESCRIPTION

The Getrag 288 5-speed transaxle (Fig. 2) is a constant-mesh transaxle that is synchronized in all gear ranges.

The transaxle consists of four major sub-assemblies: the input shaft, output shaft, reverse shaft, and integral differential assembly. The transaxle is of a split-case design, utilizing a transaxle housing and clutch housing to contain as well as support the geartrain via a combination of roller and needle bearings.

The transaxle shift system consists of a mechanical shift mechanism, shift rails and forks, and gear shift cables. The unique design of this shift system provides a higher mechanical advantage, resulting in less friction and lower shift cable loads for smoother, more positive operation. The shift pattern is shown in (Fig. 1).

The Getrag 288 transaxle is available with the 2.2L Turbo Diesel and 2.4L Turbo Engine options. Its gear ratios are as follows:

GEAR	RATIO	
	2.2L DIESEL	2.4L TURBO
1st	4.25 : 1	3.92 : 1
2nd	2.35 : 1	2.21 : 1
3rd	1.46 : 1	1.46 : 1
4th	1.03 : 1	1.11 : 1
5th (Overdrive)	0.79 : 1	0.88 : 1
Reverse	3.81 : 1	3.62 : 1
Final Drive Ratio (FDR)	3.29 : 1	3.29 : 1

TRANSAXLE IDENTIFICATION

The transaxle identification label is found on clutch housing, near the differential cavity (Fig. 3). The label consists of the transaxle part number, as well a 12-digit engine identifier/build date code (Fig. 4). Digits 1-3 are the identifier (TCG = 2.2L Turbo Diesel — TBU = 2.4L Turbo). Digits 4-6 represent the day of year built. The 7th digit represents the calendar year of build, and the remaining 5 digits are the build sequence number. For example, a transaxle with the identifier “TCG114100003” is considered to be the 3rd transaxle built on the 114th day of the year 2001, and goes behind the 2.2L Turbo Diesel.

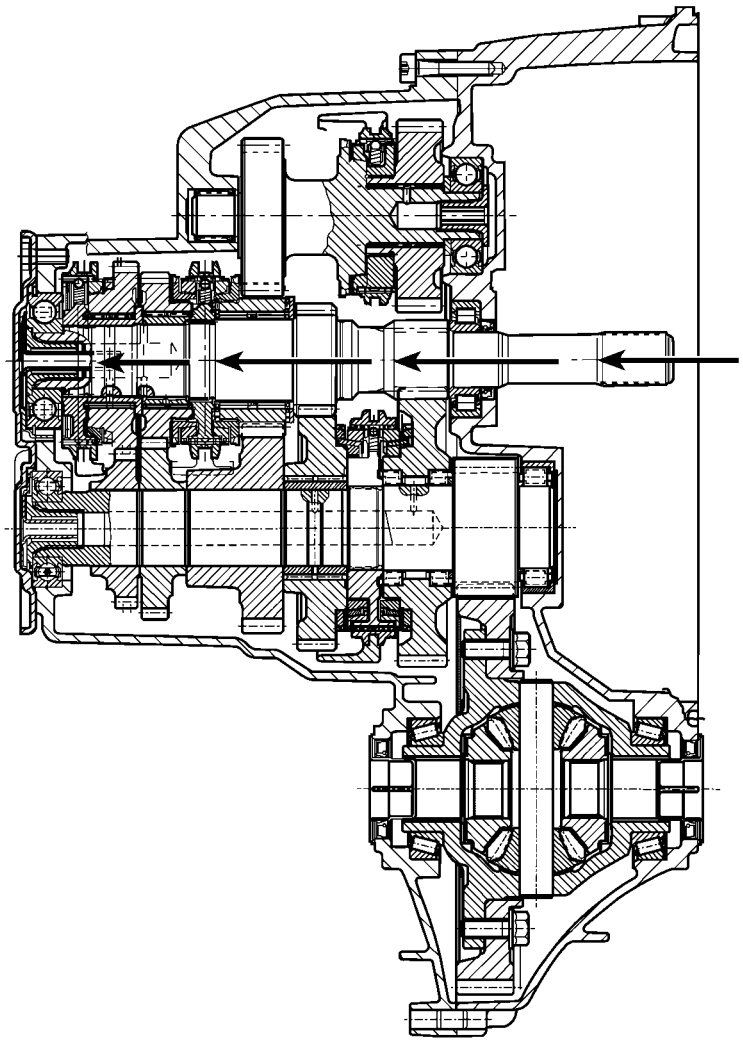
G288 MANUAL TRANSAXLE (Continued)

OPERATION

NEUTRAL

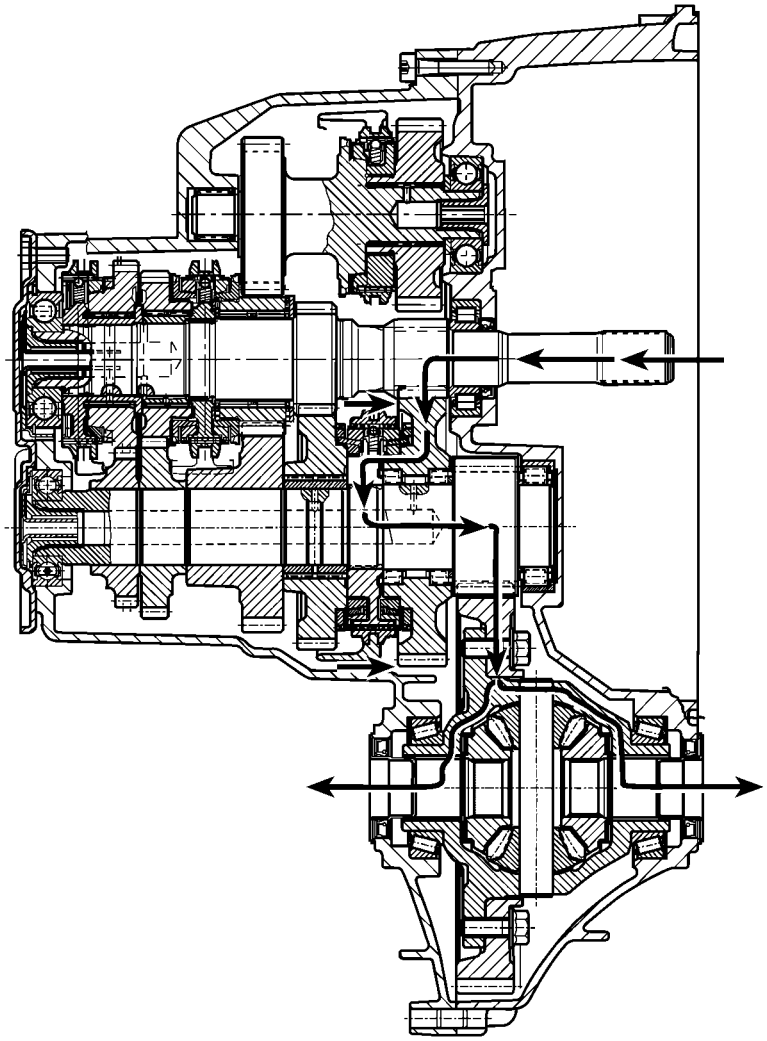
Engine power is transmitted to the input shaft via the clutch assembly and the input shaft turns. Since no synchronizers are engaged on either the input or output shafts, power is not transmitted to the output shaft and the differential does not turn (Fig. 5).



80e4caef

Fig. 5 Neutral Gear

G288 MANUAL TRANSAXLE (Continued)



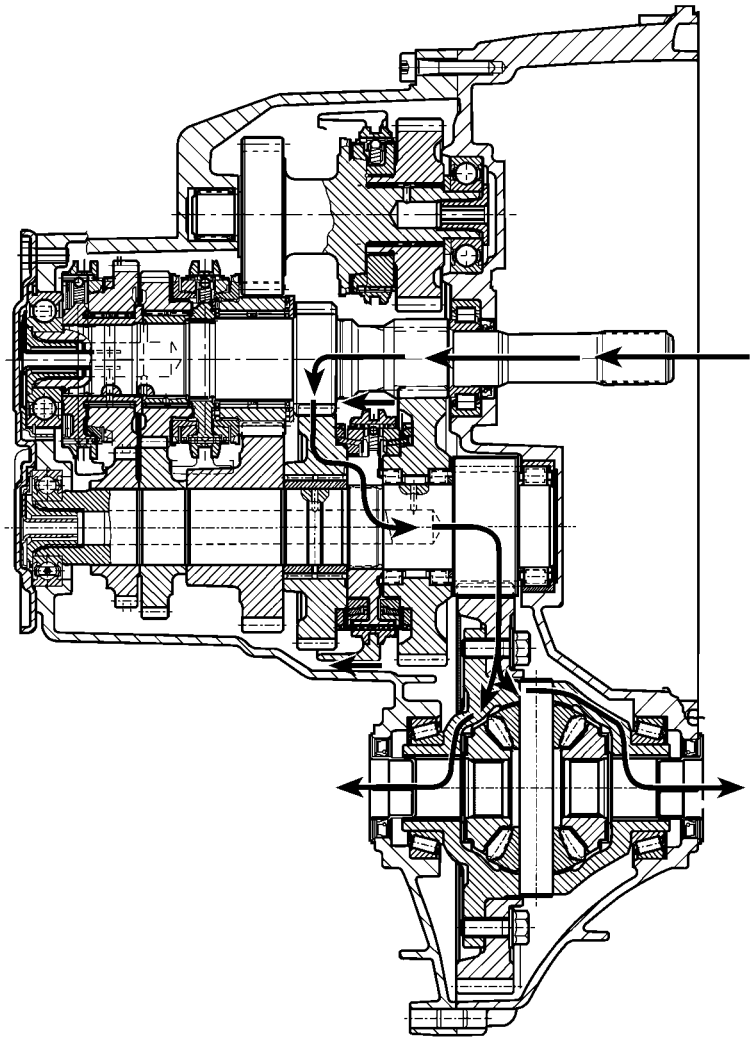
80e4caf8

Fig. 6 First Gear Powerflow

FIRST GEAR

Engine power is transmitted to the input shaft via the clutch assembly and the input shaft turns. The input shaft first gear is integral to the input shaft, and is in constant mesh with the output shaft first speed gear. Because of this constant mesh, the output shaft first speed gear freewheels until first gear is selected. As the gearshift lever is moved into the first gear position, the 1-2 fork moves the 1-2 synchronizer sleeve towards the output shaft first gear. The synchronizer sleeve engages the first gear clutch teeth, fixing the gear to the output shaft, and allowing power to transmit through the output shaft to the differential (Fig. 6).

G288 MANUAL TRANSAXLE (Continued)



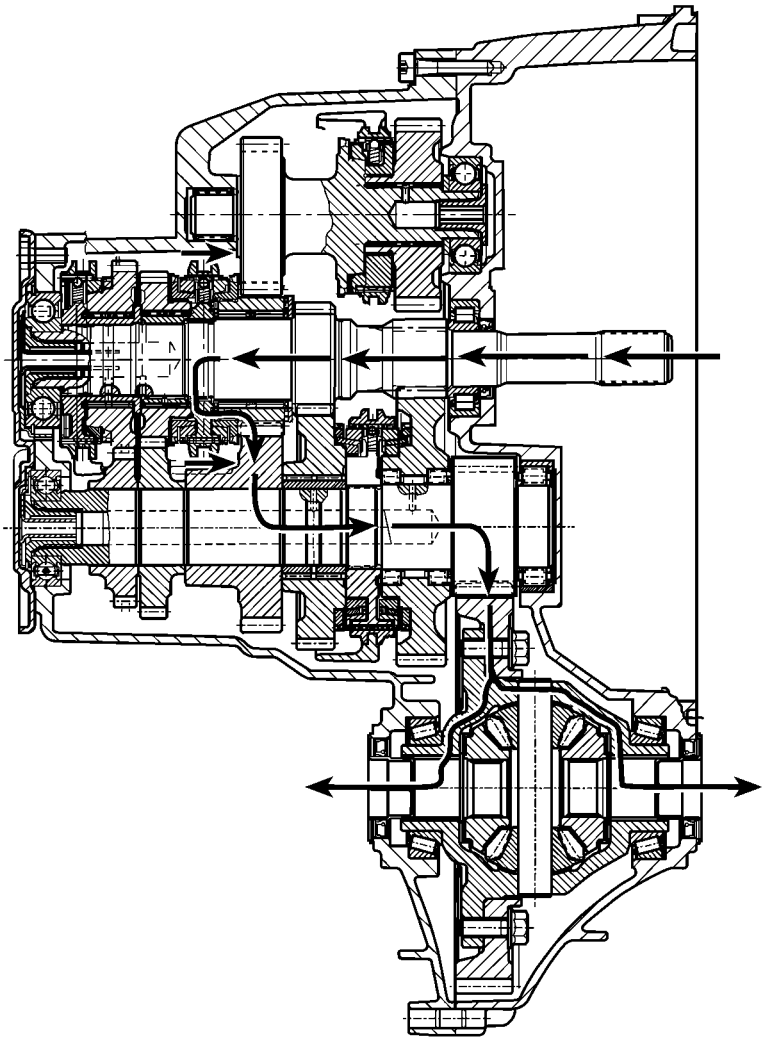
80e4cb0d

Fig. 7 Second Gear Powerflow

SECOND GEAR

Engine power is transmitted to the input shaft via the clutch assembly and the input shaft turns. The input shaft second gear is integral to the input shaft, and is in constant mesh with the output shaft second speed gear. Because of this constant mesh, the output shaft second speed gear freewheels until second gear is selected. As the gearshift lever is moved to the second gear position, the 1-2 fork moves the 1-2 synchronizer sleeve towards second gear on the output shaft. The synchronizer sleeve engages the second gear clutch teeth, fixing the gear to the output shaft, and allowing power to transmit through the output shaft to the differential (Fig. 7).

G288 MANUAL TRANSAXLE (Continued)



80e4cb29

Fig. 8 Third Gear Powerflow

THIRD GEAR

Engine power is transmitted to the input shaft via the clutch assembly and the input shaft turns. The input shaft third speed gear is in constant mesh with the output shaft third gear, which is fixed to the output shaft. Because of this constant mesh, the input shaft third speed gear freewheels until third gear is selected. As the gearshift lever is moved to the third gear position, the 3-4 fork moves the 3-4 synchronizer sleeve towards third gear on the input shaft. The synchronizer sleeve engages the third gear clutch teeth, fixing the gear to the input shaft, and allowing power to transmit through the output shaft to the differential (Fig. 8).

G288 MANUAL TRANSAXLE (Continued)

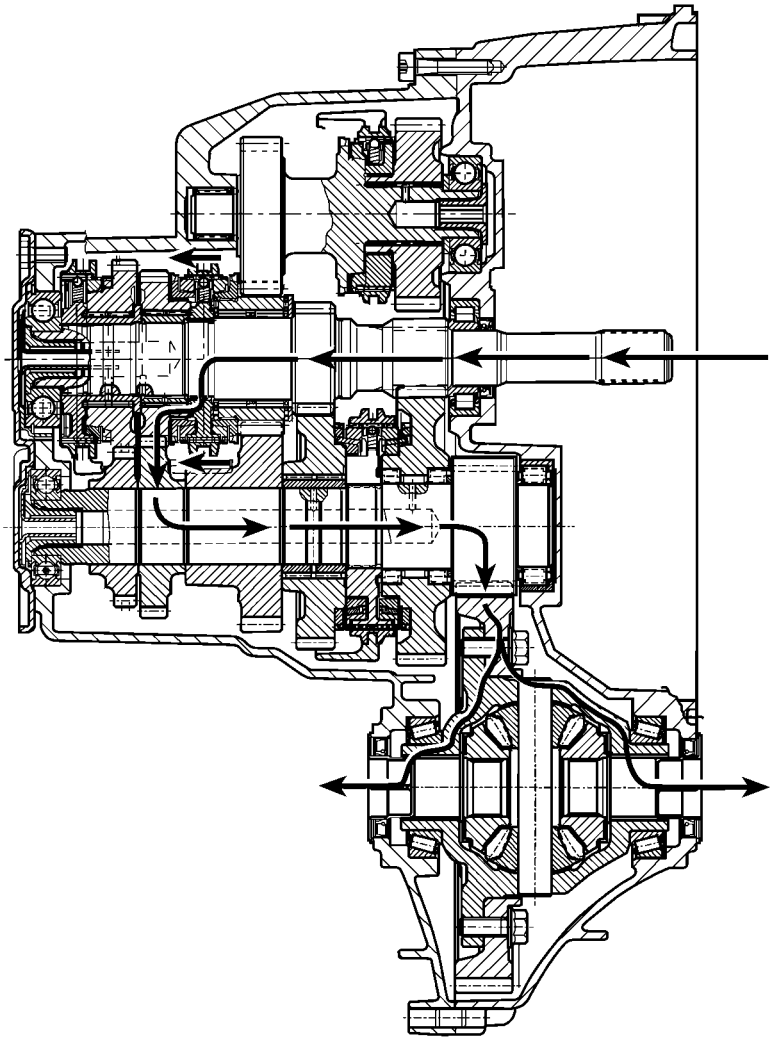


Fig. 9 Fourth Gear Powerflow

FOURTH GEAR

Engine power is transmitted to the input shaft via the clutch assembly and the input shaft turns. The input shaft fourth speed gear is in constant mesh with the output shaft fourth gear, which is fixed to the output shaft. Because of this constant mesh, the input shaft fourth speed gear freewheels until fourth gear is selected. As the gearshift lever is moved to the fourth gear position, the 3-4 fork moves the 3-4 synchronizer sleeve towards fourth gear on the input shaft. The synchronizer sleeve engages the fourth gear clutch teeth, fixing the gear to the input shaft, and allowing power to transmit through the output shaft to the differential (Fig. 9).

G288 MANUAL TRANSAXLE (Continued)

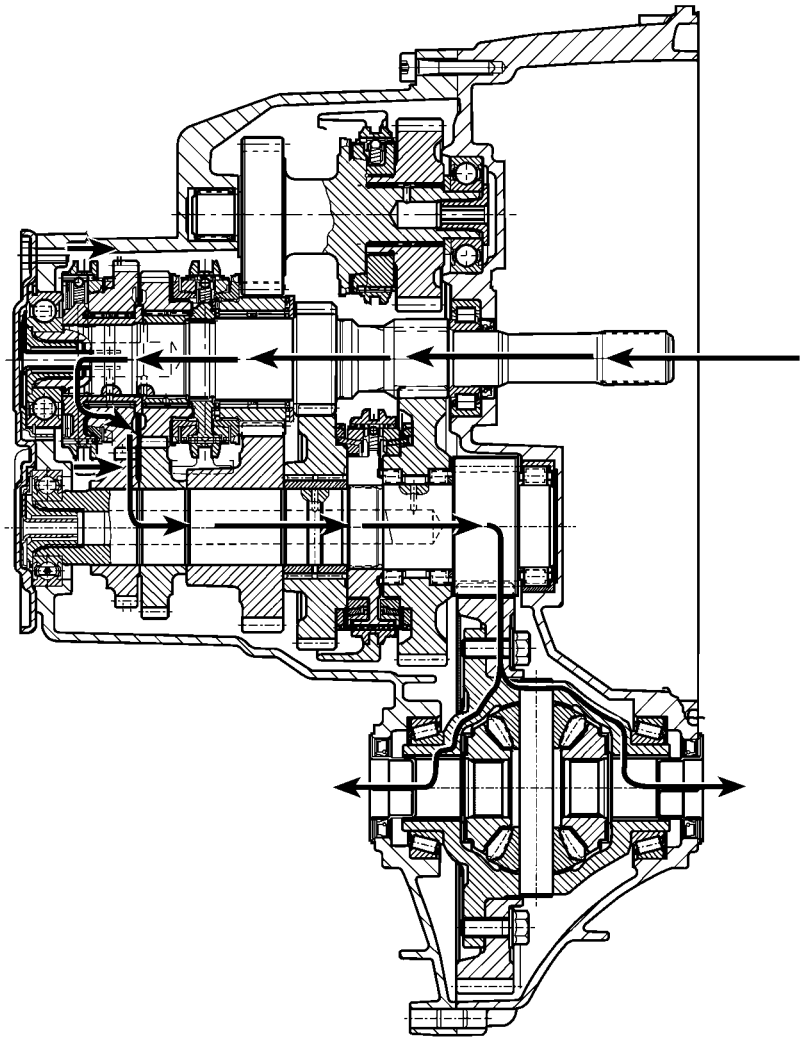

Fig. 10 Fifth Gear (Overdrive) Powerflow

FIFTH GEAR

Engine power is transmitted to the input shaft via the clutch assembly and the input shaft turns. The input shaft fifth speed gear is in constant mesh with the output shaft fifth gear, which is fixed to the output shaft. Because of this constant mesh, the input shaft fifth speed gear freewheels until fifth gear is selected. As the gearshift lever is moved to the fifth gear position, the fifth gear fork moves the fifth gear synchronizer sleeve towards the input shaft fifth speed gear. The synchronizer sleeve engages the fifth gear clutch teeth, fixing the gear to the input shaft, and allowing power to transmit through the output shaft to the differential (Fig. 10).

G288 MANUAL TRANSAXLE (Continued)

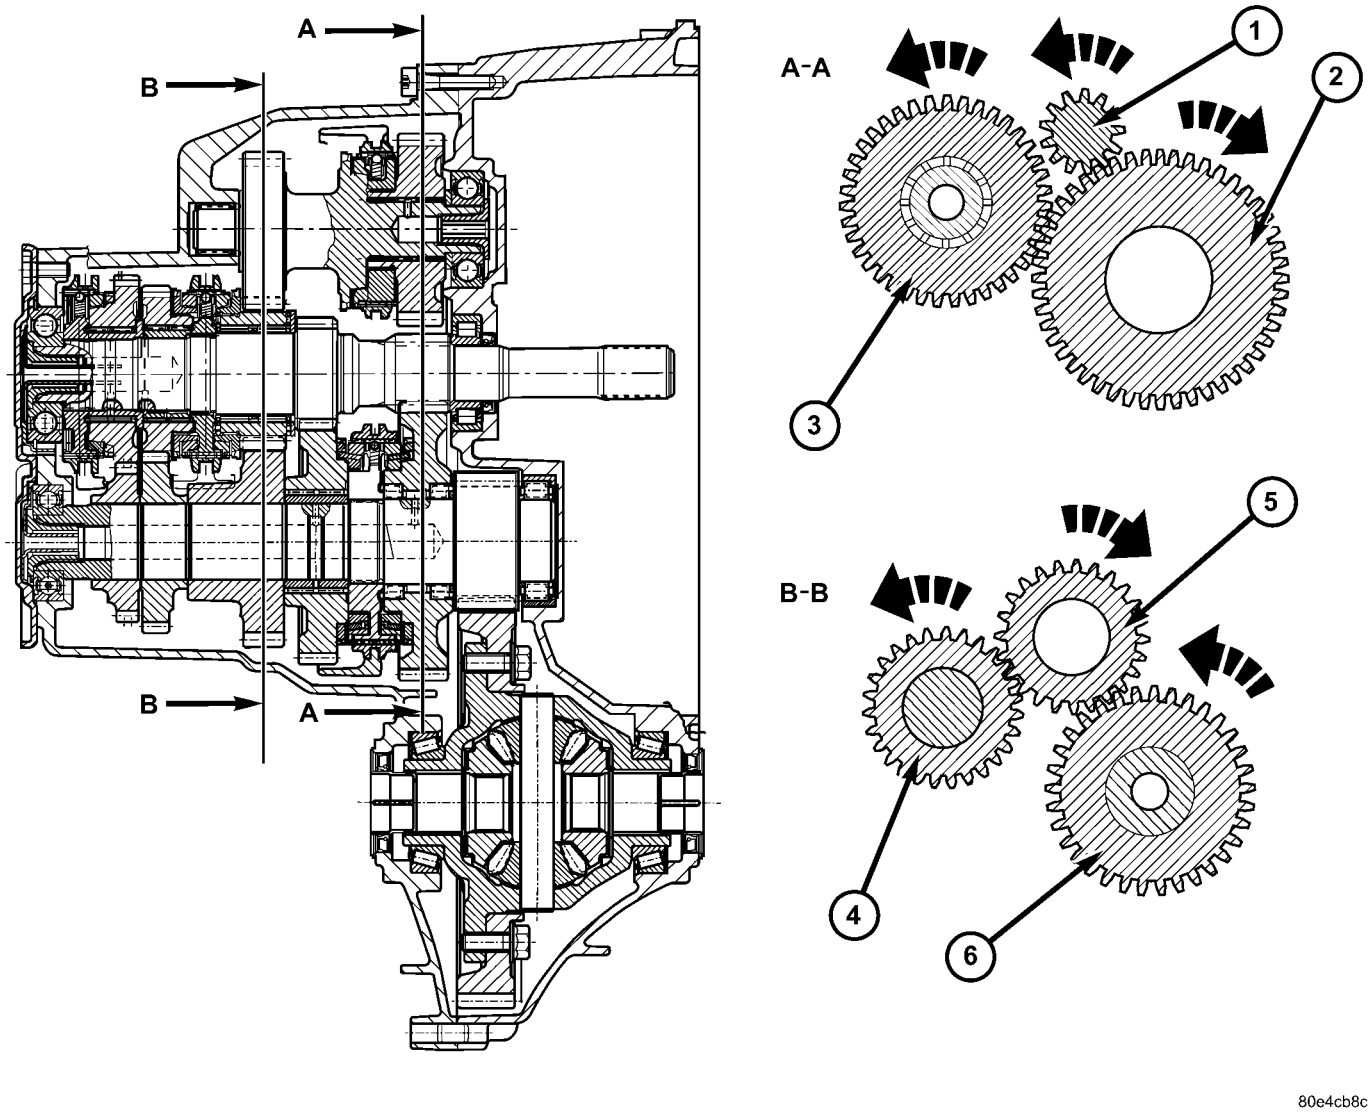

Fig. 11 Reverse Gear Powerflow

1 - INPUT SHAFT FIRST GEAR
2 - OUTPUT SHAFT FIRST GEAR
3 - REVERSE SHAFT GEAR/HUB ASSY
4 - REVERSE SHAFT FIXED GEAR
5 - INPUT SHAFT THIRD GEAR
6 - OUTPUT SHAFT THIRD GEAR

REVERSE GEAR

Engine power is transmitted to the input shaft via the clutch assembly and the input shaft turns. The input shaft fixed first gear is in constant mesh with the output shaft loose first gear, which is in constant mesh with the reverse shaft loose gear/synchro hub assembly. As reverse gear is selected, the reverse fork moves the reverse synchronizer towards the reverse shaft fixed gear. The synchronizer sleeve engages the reverse gear clutch teeth, locking the shaft into one rotating assembly. The reverse shaft fixed gear is in constant mesh with the input shaft third gear. The input shaft third gear, which is in constant mesh with the output shaft third gear, acts as an idler, which reverses output shaft direction, changing the output direction of the transaxle (Fig. 11).

(12) Remove input and output shaft bearing retainer screws (Fig. 52).

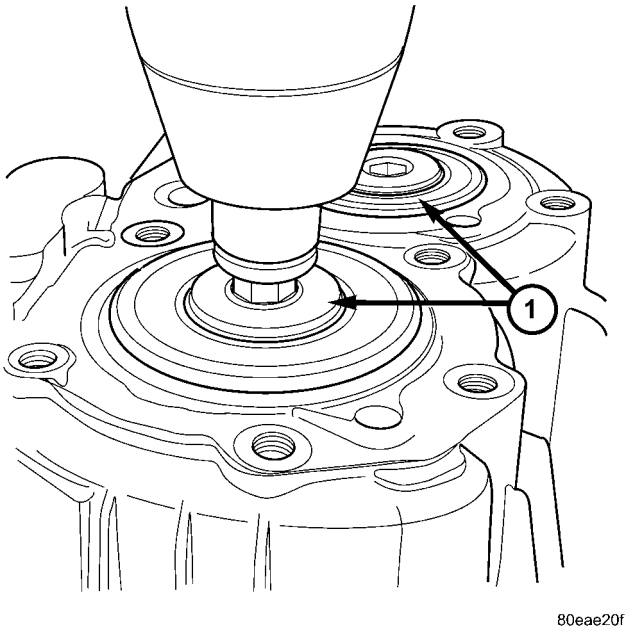

Fig. 52 Bearing Retaining Screws

1 - RETAINING SCREWS (2)

(13) Remove twenty (20) geartrain housing-to-clutch bellhousing bolts (Fig. 53) (Fig. 54).

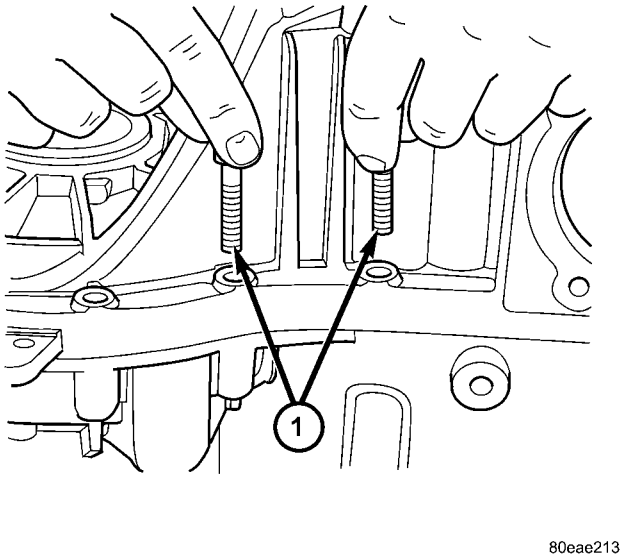

Fig. 53 Geartrain Housing-to-Clutch Bellhousing Bolts (Short)

1 - BOLTS (18-SHORT)

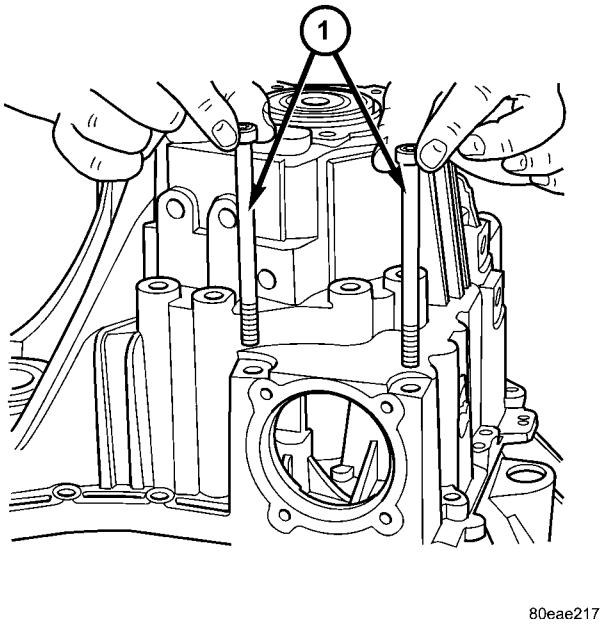

Fig. 54 Geartrain Housing-to-Clutch Bellhousing Bolts (Long)

1 - BOLTS (2-LONG)

(14) Using a soft tipped hammer, tap clutch bellhousing to break loose and remove from geartrain housing. Reverse shaft and fork/rail assembly will remain with the clutch bellhousing.

G288 MANUAL TRANSAXLE (Continued)

(15) Using a suitable prybar(s), separate reverse shaft assembly from clutch bellhousing.

(16) Remove differential assembly from transaxle housing.

(17) Place Tool 8869-2 into input and output shafts at rear of case. Set transaxle and tool on press bed as shown in (Fig. 55).

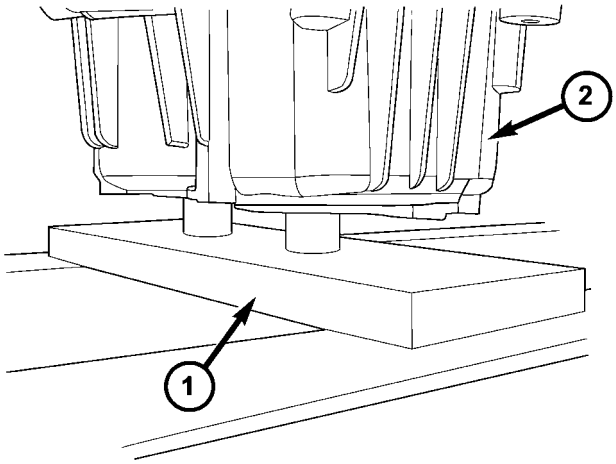

Fig. 55 Geartrain Housing on 8869-2

1 - TOOL 8869-2
2 - GEARTRAIN HOUSING

(18) Set Tool 8869-1 across case flange as shown in (Fig. 56). Press Tool 8869-1 to remove input shaft, output shaft, and fork/rail assemblies from case.

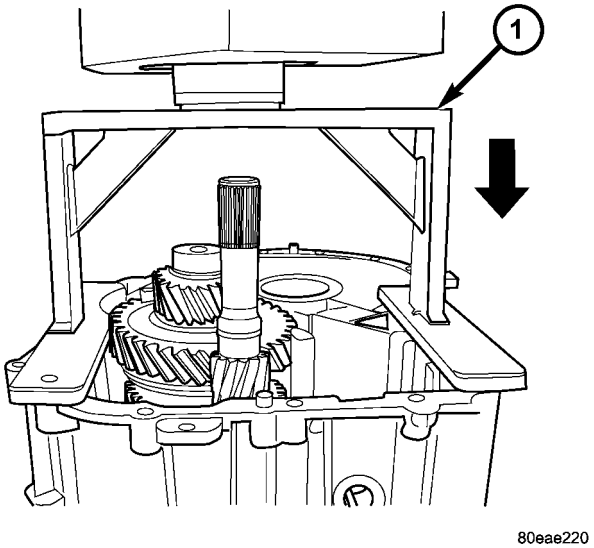

Fig. 56 Geartrain Removal from Housing

1- TOOL 8869-1

(19) Remove input and output shaft oil troughs (Fig. 57) (Fig. 58).

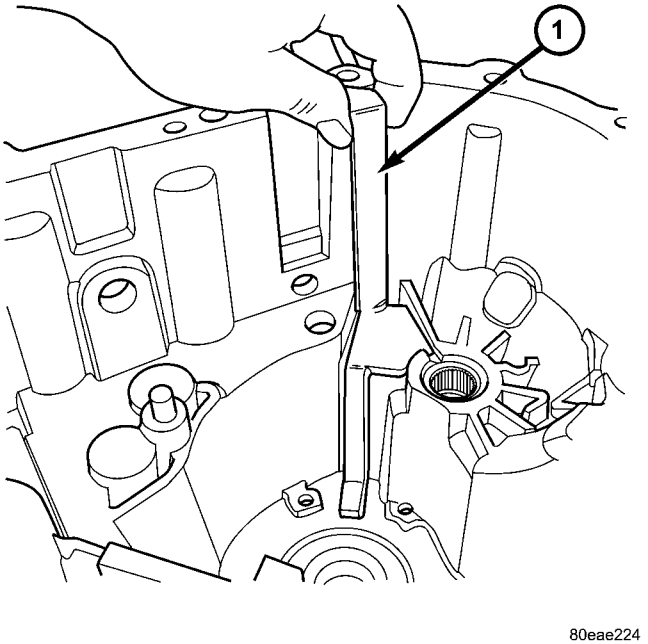

Fig. 57 Input Shaft Oil Trough

1 - OIL TROUGH

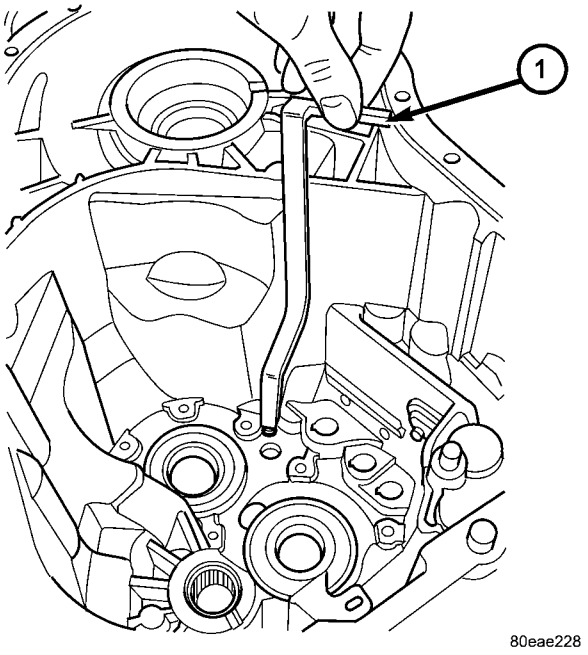

Fig. 58 Output Shaft Oil Trough

1 - OIL TROUGH

G288 MANUAL TRANSAXLE (Continued)

ASSEMBLY

(1) Install input and output shaft oil troughs to transaxle housing as shown in.

(2) Install output shaft roller bearing to clutch bellhousing (Fig. 59).

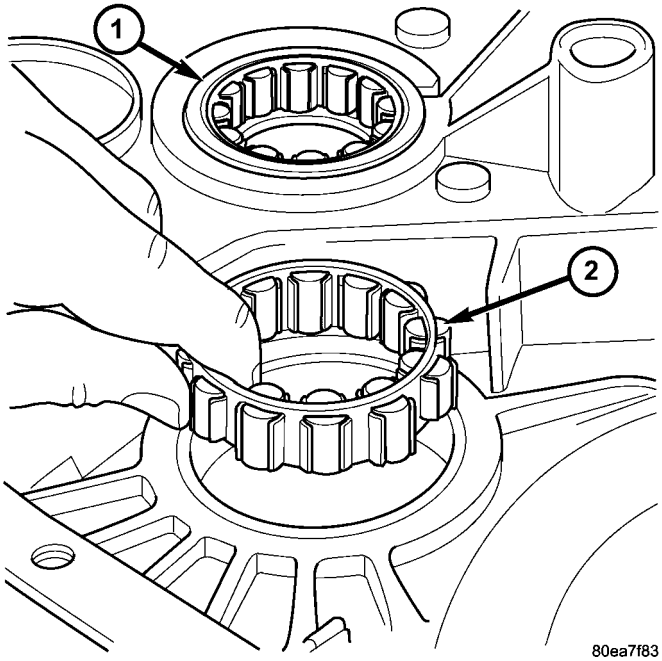

Fig. 59 Output Shaft Bearing Installation

1 - INPUT SHAFT BEARING
2 - OUTPUT SHAFT BEARING

(3) Install differential assembly (Fig. 60).

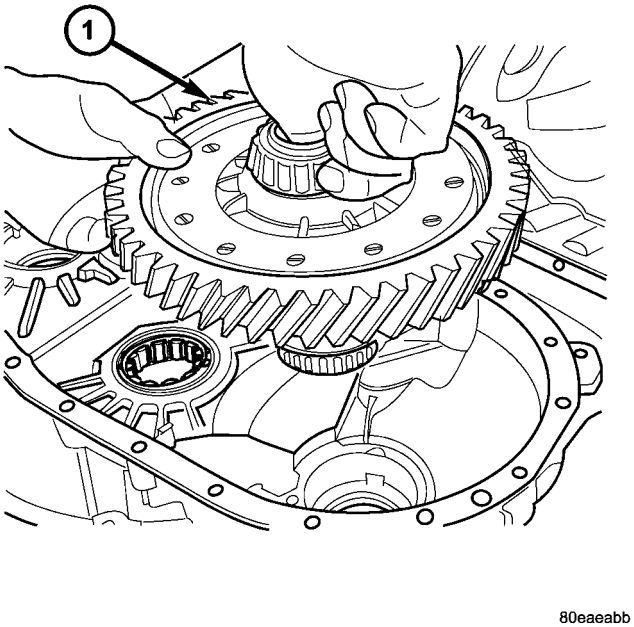

Fig. 60 Differential Assembly

1 - DIFFERENTIAL ASSEMBLY

(4) Using heat gun, heat reverse shaft bearing boss in transaxle case to expand for reverse shaft/ bearing installation (Fig. 61).

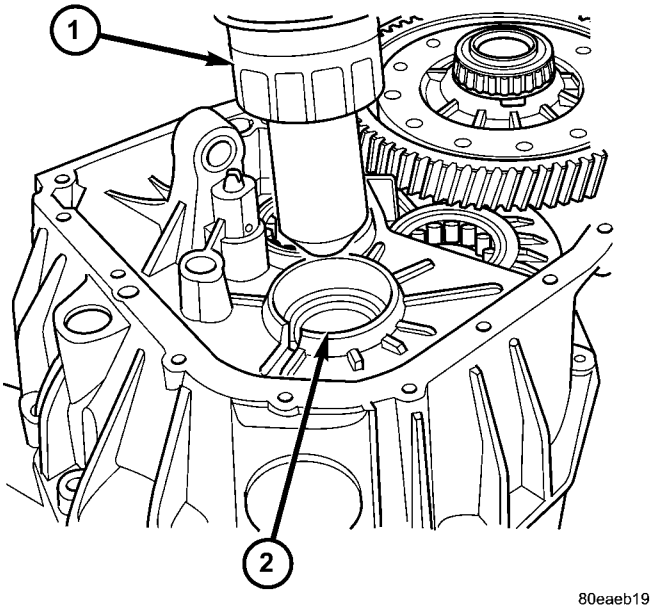

Fig. 61 Heating Reverse Shaft Bearing Bore

1 - HEAT GUN
2 - BEARING BORE

(5) Install reverse shaft and fork/rod as shown in (Fig. 62).

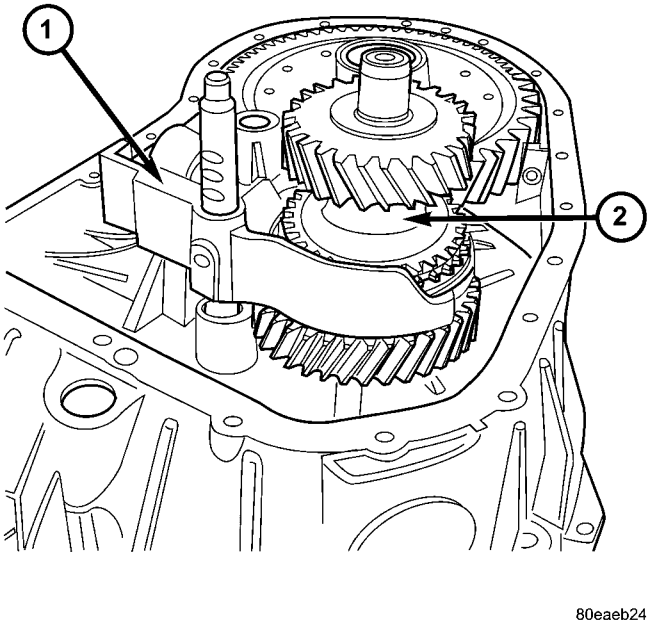

Fig. 62 Reverse Shaft and Fork Assembly

1 - FORK/ROD ASSY.
2 - REVERSE SHAFT ASSY.

G288 MANUAL TRANSAXLE (Continued)

(6) Install geartrain (with forks/rods) into case (Fig. 63). Verify proper installation of input and output shaft assemblies, as well as proper orientation of shift rod/fork assemblies (Fig. 64).

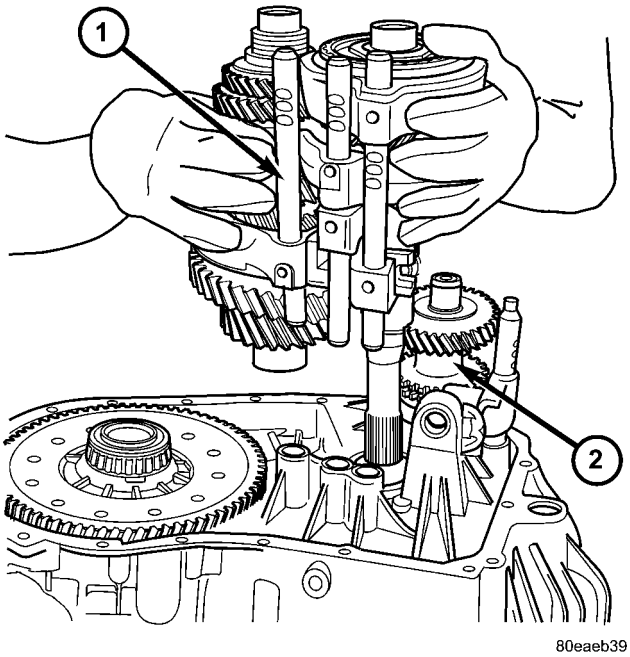

Fig. 63 Install Geartrain to Clutch Bellhousing

1 - GEARTRAIN
2 - REVERSE SHAFT ASSY.

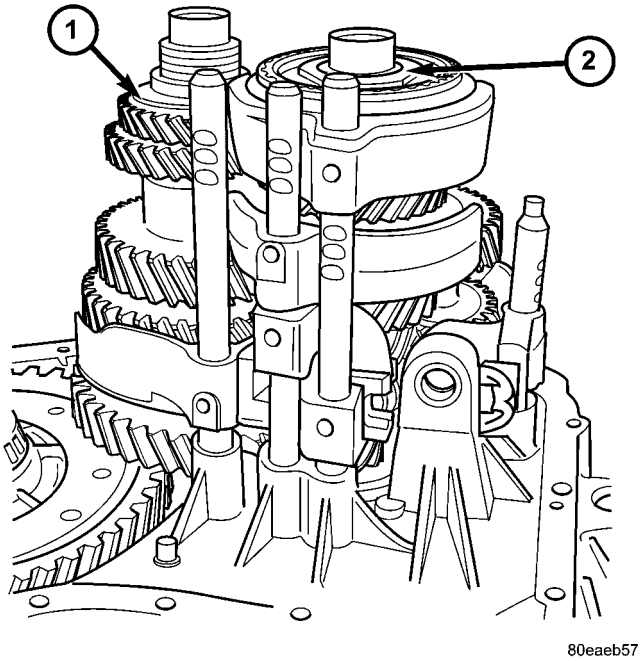

Fig. 64 Properly Installed Geartrain

1 - INTERMEDIATE SHAFT
2 - INPUT SHAFT

(7) Install chip collector magnet to case and retain with grease.

(8) Apply a bead of Mopar® Gasket Maker or Omnifit FD-40 to clutch bellhousing flange. Install geartrain housing and install transaxle housing-to-clutch bellhousing bolts by hand (Fig. 65) (Fig. 66) (Fig. 67).

1 - AXLE SEAL

INSTALLATION

(1) Using Tool 8916, install new axle seal (Fig. 112). Drive seal until flush with case.

(2) Install halfshaft(s) and intermediate shaft assembly (if removed). (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - INSTALLATION)

(3) Check transaxle fluid level. (Refer to 21 - TRANSMISSION/TRANSAXLE/MANUAL/FLUID - STANDARD PROCEDURE)

(4) Lower vehicle.

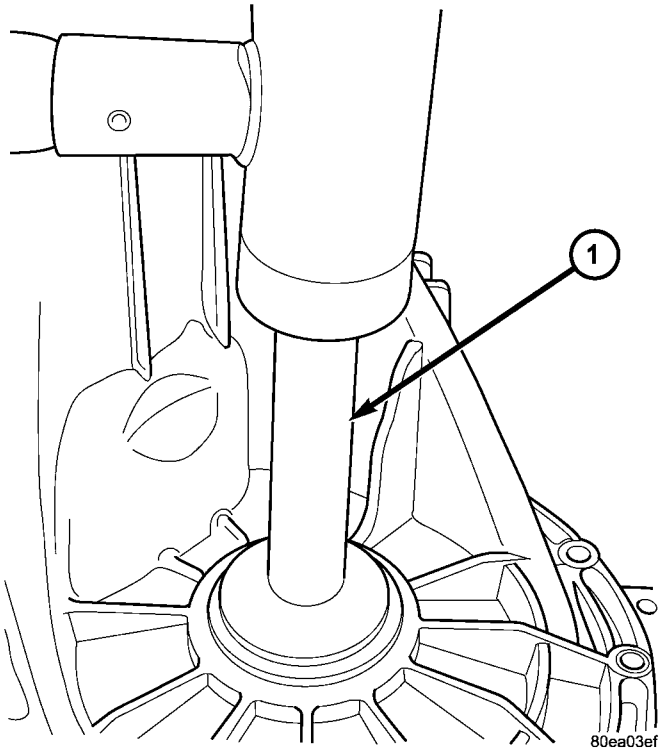

Fig. 112 Axle Seal Installation

1 - TOOL 8916

BACKUP LAMP SWITCH

REMOVAL

(1) Disconnect battery negative cable.

(2) Raise vehicle on hoist.

(3) **Diesel Models:** Remove engine compartment lower silencer (Fig. 113).

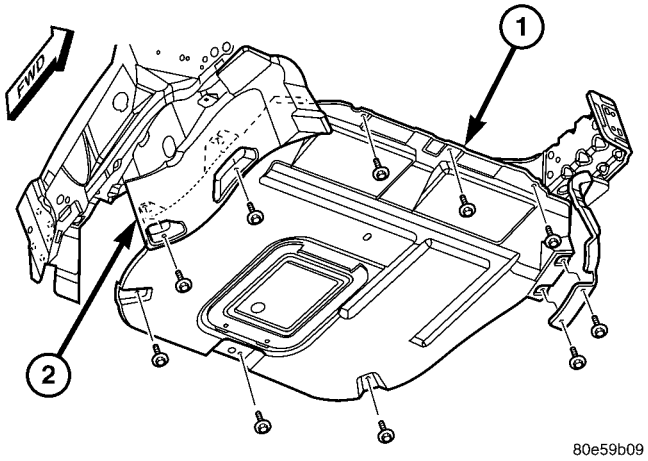

Fig. 113 Engine Compartment Lower Silencer

1 - ENGINE COMPARTMENT SILENCER
2 - ACCESSORY DRIVE BELT SPLASH SHIELD

(4) Disconnect backup lamp switch connector.

BACKUP LAMP SWITCH (Continued)

(5) Remove backup lamp switch (Fig. 114).

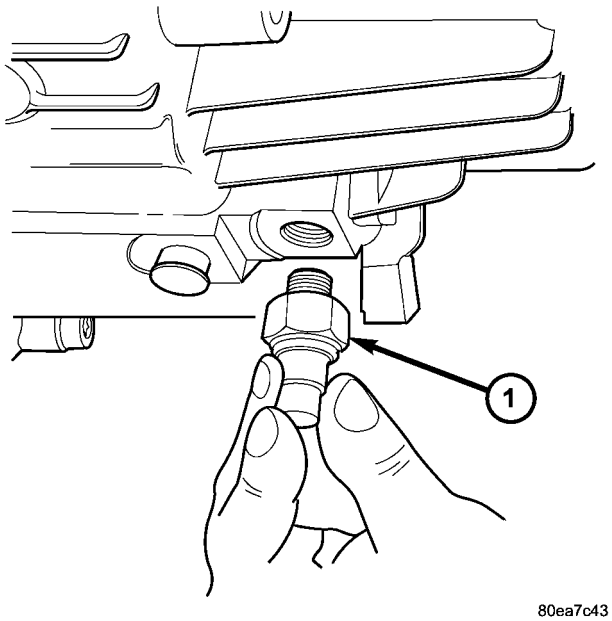

Fig. 114 Backup Lamp Switch

1 - BACKUP LAMP SWITCH

INSTALLATION

(1) Install backup lamp switch and torque to 24 N·m (18 ft. lbs.) (Fig. 114).

(2) Connect backup lamp switch connector.

(3) **Diesel Models:** Install engine compartment lower silencer (Fig. 113).

(4) Lower vehicle.

(5) Connect battery negative cable.

CLUTCH BELLHOUSING

DISASSEMBLY

(1) Using suitable punch/drift, remove input shaft seal (Fig. 115) and discard.

(2) Remove output shaft roller bearing (Fig. 116).

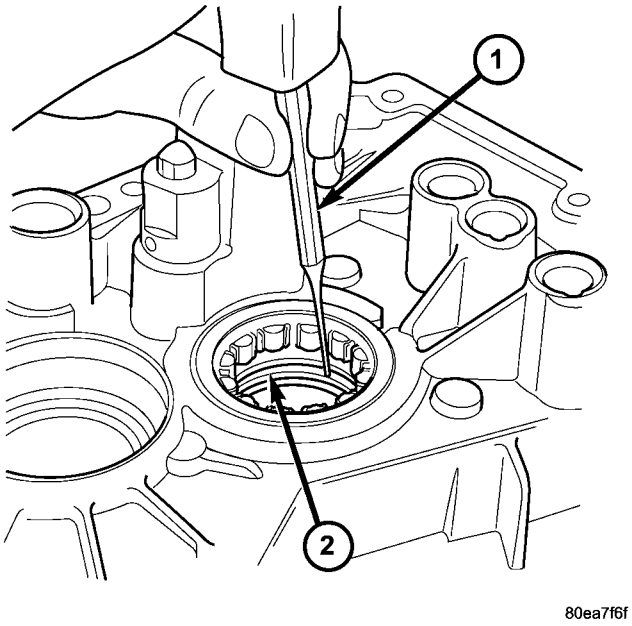

Fig. 115 Input Shaft Seal Removal

1 - DRIFT
2 - SEAL

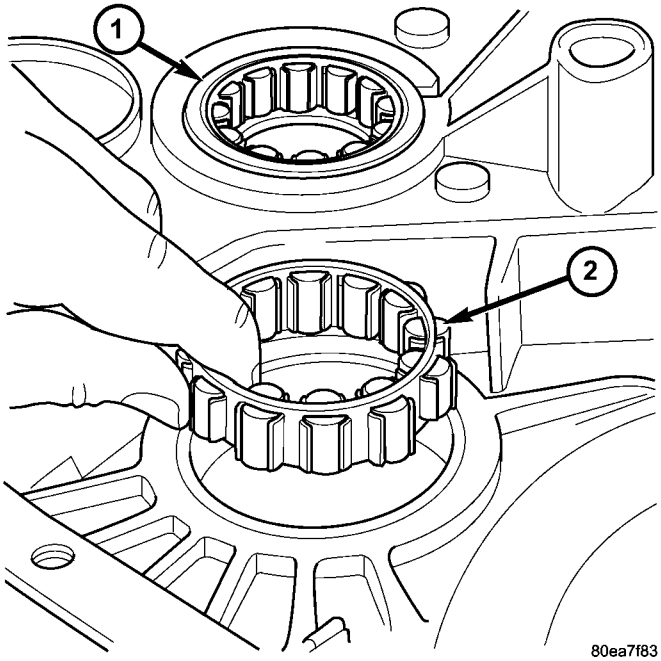

Fig. 116 Output Shaft Bearing Removal

DETENT PLUG

DESCRIPTION

The 288 Transaxle utilizes four (4) shift rod detent plugs (Fig. 129) (Fig. 130). The detent plug is a spring-loaded ball assembly that engages shift rod recesses, providing a positive shift feel while maintaining gear position.

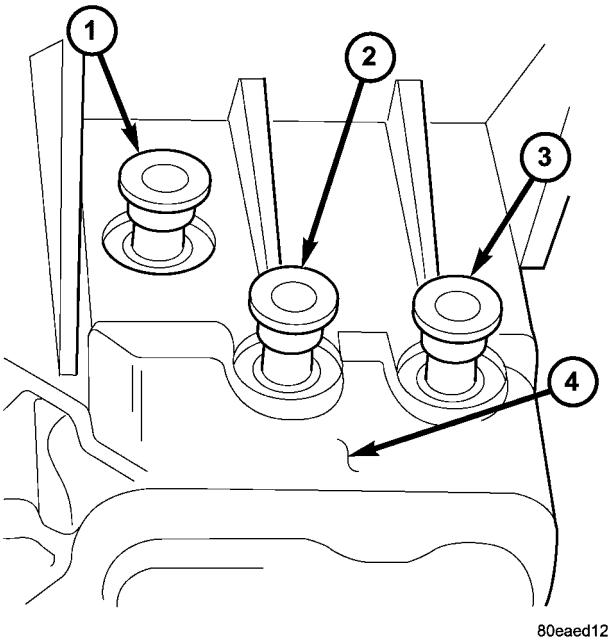

Fig. 129 Detent Plug Identification

1 - FIFTH GEAR DETENT
2 - 3/4 DETENT
3 - 1/2 DETENT
4 - TRANSAXLE HOUSING

DETENT PLUG (Continued)

9 - REVERSE SHIFT ROD
10 - BACK-UP LAMP SWITCH
11 - DETENT PLUG

DETENT PLUG (Continued)

REMOVAL

(1) Remove transaxle assembly. (Refer to 21 - TRANSMISSION/TRANSAXLE/MANUAL - REMOVAL)

(2) Using Tool 8870 attached to Tool C-3752, remove detent plug(s) from transaxle case (Fig. 131).

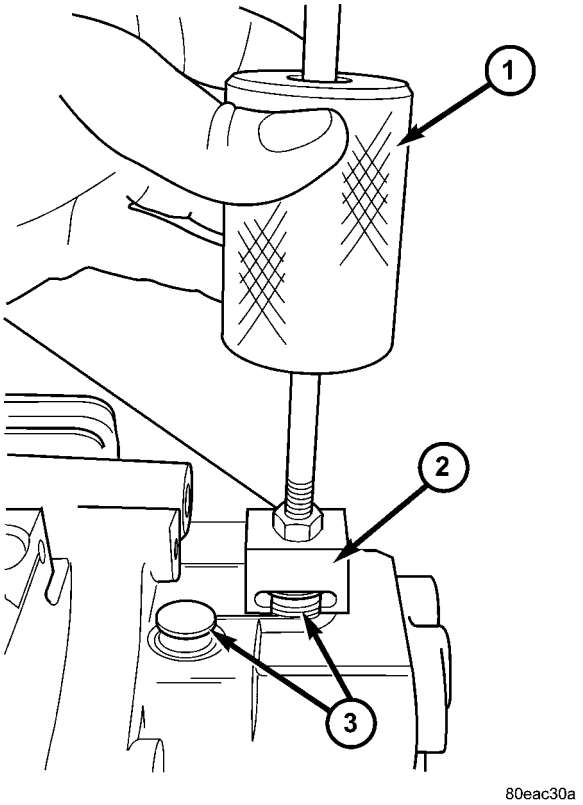

Fig. 131 Detent Plug Removal

1 - TOOL C-3752
2 - TOOL 8870
3 - DETENT PLUG

INSTALLATION

NOTE: Inspect detent plug for signs of wear or damage. If necessary, replace detent plugs with new upon installation.

(1) Install detent plug into case (Fig. 132).

(2) Using soft-tipped hammer, drive detent plug into case until it bottoms (Fig. 133)

(3) Install transaxle assembly. (Refer to 21 - TRANSMISSION/TRANSAXLE/MANUAL - INSTALLATION)

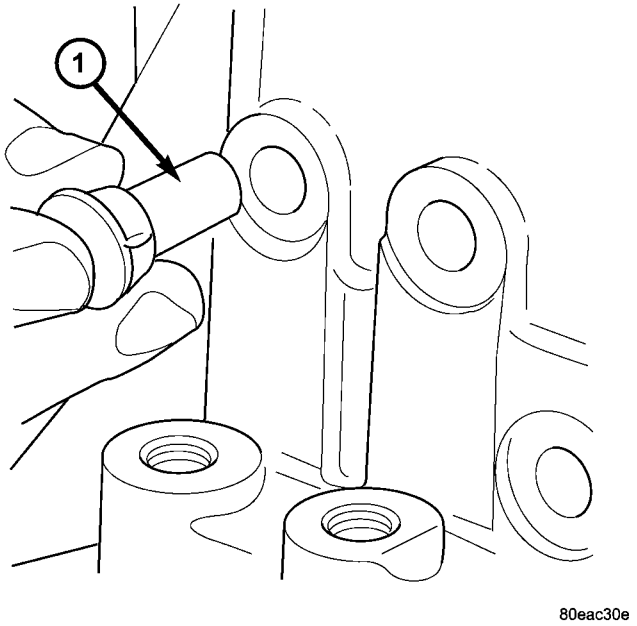

Fig. 132 Detent Plug Installation

DIFFERENTIAL

DESCRIPTION

The 288 differential (Fig. 134) is a conventional open design, and is integral to the transaxle. It consists of a single-piece case, which houses pinion and side gears. A floating pinion shaft is retained by the differential ring gear. The differential case is supported in the transaxle by tapered roller bearings.

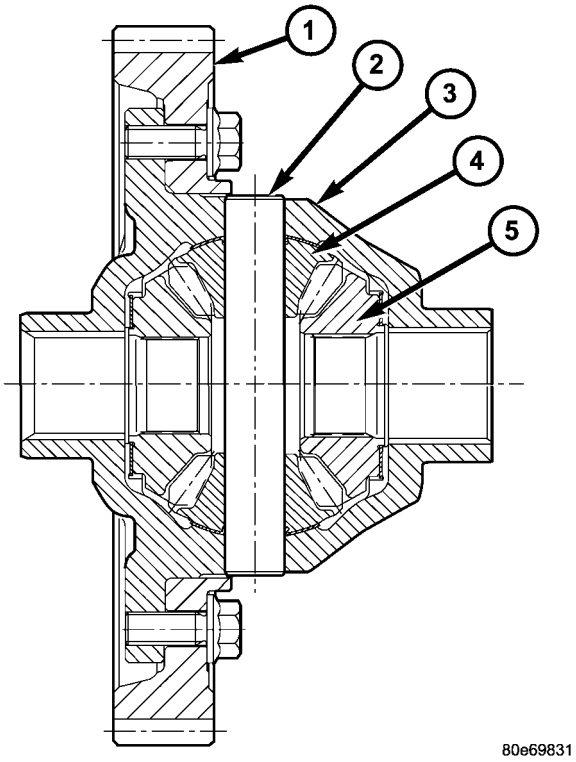

Fig. 134 Differential Assembly

1 - RING GEAR
2 - PINION SHAFT
3 - DIFFERENTIAL CASE
4 - PINION GEAR
5 - SIDE GEAR

OPERATION

The differential assembly (Fig. 134) is driven by the intermediate shaft via the ring gear. The ring gear drives the differential case, and the case drives the halfshafts through the differential gears. The differential pinion and side gears are supported in the case by pinion shafts and thrust washers. Differential pinion and side gears make it possible for front wheels to rotate at different speeds while cornering.

REMOVAL

(1) The transaxle must be removed to gain access to and service the differential assembly. (Refer to 21 - TRANSMISSION/TRANSAXLE/MANUAL - REMOVAL)

(2) Disassemble transaxle and remove differential. (Refer to 21 - TRANSMISSION/TRANSAXLE/MANUAL - DISASSEMBLY)

DISASSEMBLY

(1) Remove differential side bearings. Set up Tool 5048, with Collets 8926 as shown in (Fig. 135).

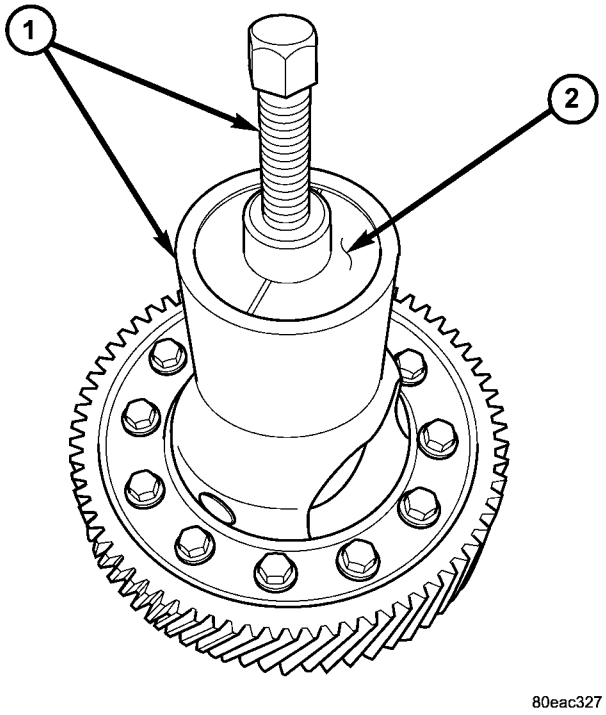

Fig. 135 Bearing Removal Set-up

1 - TOOL 5048
2 - COLLETS 8926

DIFFERENTIAL (Continued)

(2) Using suitable socket and wrench, remove differential side bearing(s) (Fig. 136).

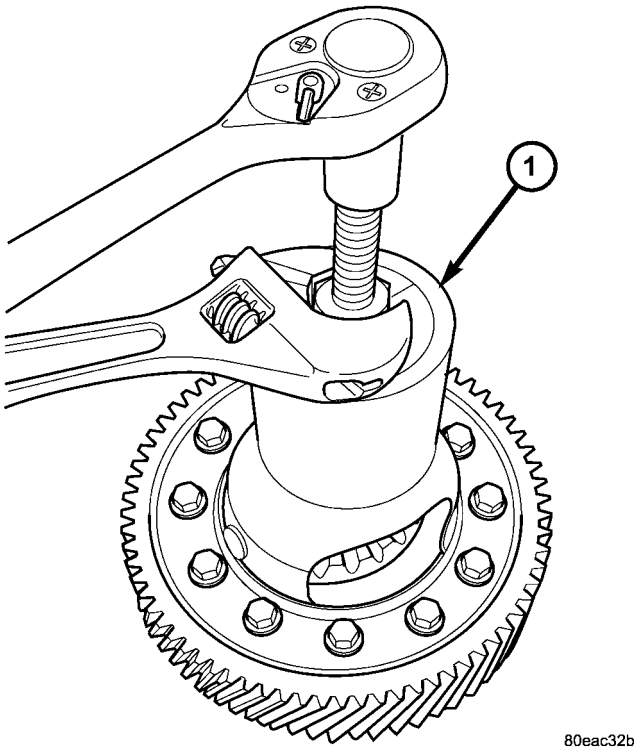

Fig. 136 Removing Differential Side Bearings

1 - TOOL 5048

(3) Remove twelve (12) differential ring gear-to-case bolts (Fig. 137). Remove differential ring gear from case.

(4) Remove pinion shaft, and remove all pinion gears, side gears, and thrust washers (Fig. 137).

ASSEMBLY

(1) Install differential pinion and side gears with washers to case (Fig. 137). Install pinion shaft. Pinion shaft is retained by ring gear.

(2) Install differential ring gear (Fig. 137). Install and torque twelve (12) ring gear-to-case bolts to 85 N·m (63 ft. lbs.).

(3) Install differential to arbor press bed.

(4) Press on differential side bearing(s) using Tool 8953 mounted onto Tool C-4171. Press until bearing bottoms on case (Fig. 138).

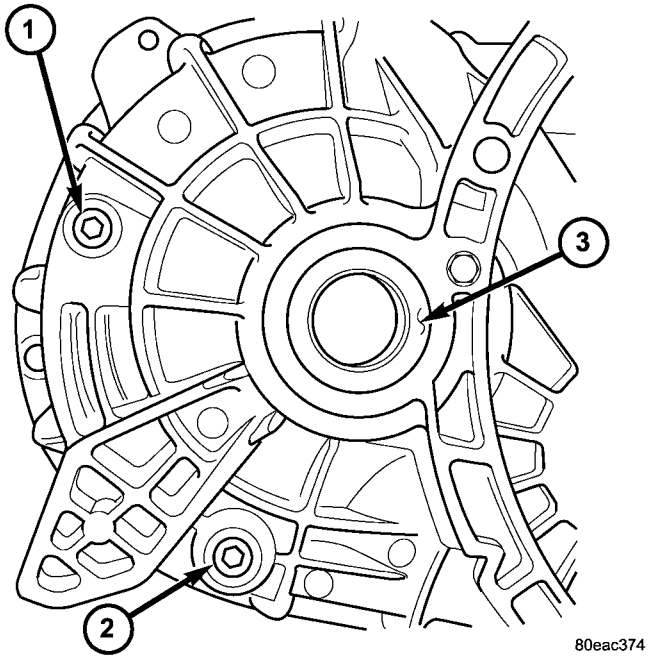

Fig. 139 Transaxle Fluid Drain and Fill Plugs

1 - FILL PLUG
2 - DRAIN PLUG
3 - RIGHT AXLE SEAL

INSTALLATION

(1) Differential installation is part of the transaxle assembly process. Be sure to use the same differential shim that was removed upon disassembly. (Refer to 21 - TRANSMISSION/TRANSAXLE/MANUAL - ASSEMBLY)

FLUID

STANDARD PROCEDURE

STANDARD PROCEDURE - FLUID LEVEL CHECKING

NOTE: The fluid required for this transaxle is Mopar® ATF+4 (Automatic Transmission Fluid). Use of improper or substitute fluids can cause shift problems and/or transaxle failure.

(1) Raise vehicle on hoist.

(2) **Diesel Models:** Remove engine compartment lower silencer (Fig. 140).

(3) Remove transaxle fill plug (Fig. 139). Inspect fluid level. Fluid should be within 4.7 mm (0.188 in.) from bottom of filler hole.

(4) If required, fill transaxle with suitable amount of ATF+4 (Automatic Transaxle Fluid).

(5) Install fill plug and torque to 39-47 N·m (29-35 ft. lbs.) (Fig. 139).

(6) **Diesel Models:** Install engine compartment lower silencer (Fig. 140).

(7) Lower vehicle.

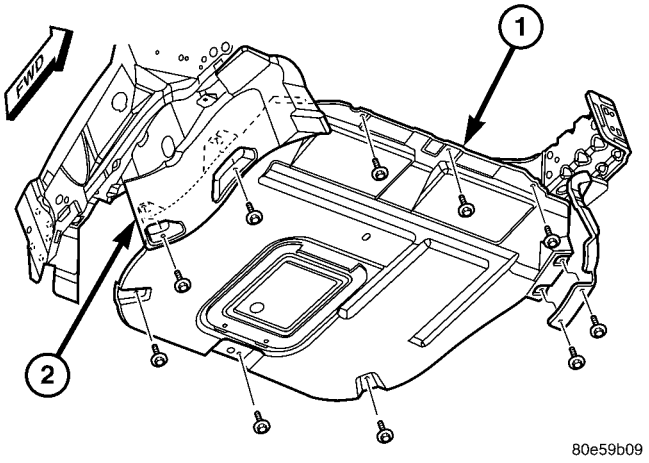

Fig. 140 Engine Compartment Lower Silencer

1 - ENGINE COMPARTMENT SILENCER
2 - ACCESSORY DRIVE BELT SPLASH SHIELD

FLUID (Continued)

STANDARD PROCEDURE - FLUID DRAIN AND FILL

NOTE: The fluid required for this transaxle is Mopar® ATF+4 (Automatic Transmission Fluid). Use of improper or substitute fluids can cause shift problems and/or transaxle failure.

(1) Raise vehicle on hoist.
(2) **Diesel Models:** Remove engine compartment lower silencer (Fig. 140).
(3) Obtain suitable fluid collection container and place under transaxle.
(4) Remove transaxle drain plug (Fig. 139). Allow fluid to drain into container until empty.
(5) Install drain plug and torque to 39-47 N·m (29-35 ft. lbs.).
(6) Remove transaxle fill plug (Fig. 139).
(7) **2.2L Turbo Diesel Models:** Add 2.0 L (2.1 qts.) of ATF+4 (Automatic Transaxle Fluid). **2.4L Turbo Models:** Add 1.8 L (1.9 qts.) of ATF+4 (Automatic Transaxle Fluid).
(8) Install fill plug and torque to 39-47 N·m (29-35 ft. lbs.) (Fig. 139).
(9) **Diesel Models:** Install engine compartment lower silencer (Fig. 140).
(10) Lower vehicle.

GEAR SHIFT BOOT

REMOVAL

(1) Pull up on gearshift knob with moderate force to remove from gearshift mechanism (Fig. 141).

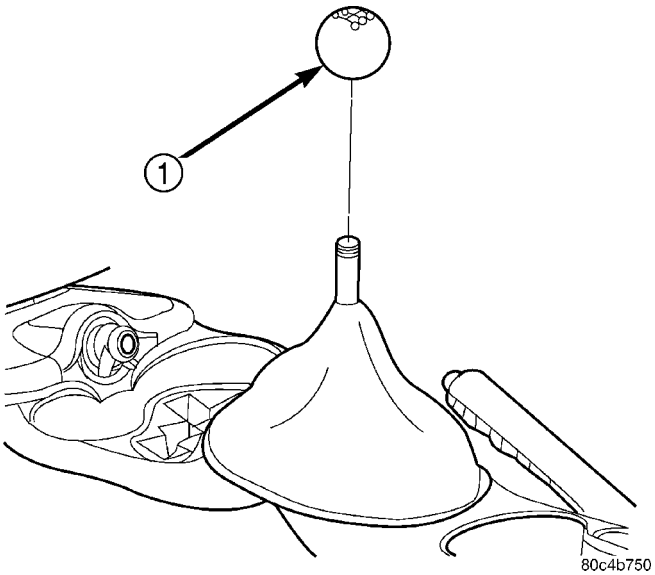

Fig. 141 Gearshift Knob Removal/Installation

1 - GEARSHIFT KNOB

(2) Remove shifter boot/bezel assembly from console by lifting up at mounting ring area (Fig. 142).

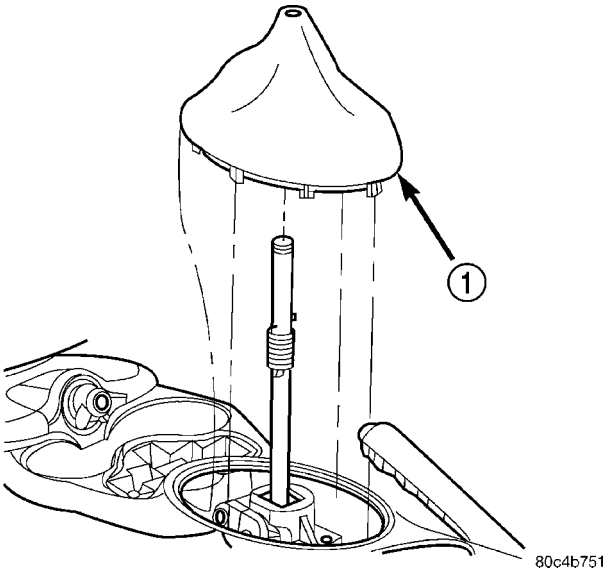

Fig. 142 Gearshift Boot Removal/Installation

1 - GEARSHIFT BOOT

INSTALLATION

(1) Position gearshift boot (Fig. 142) over the gearshift mechanism and engage tab on mount ring at front to opening in console. Apply hand pressure to engage bosses on mount ring of boot to console opening slots.
(2) Position gearshift knob hole over the gearshift mechanism (Fig. 141) and align the shift pattern.
(3) Strike knob with rubber mallet to engage knob to mechanism.
(4) Verify that shift pattern is aligned properly.

GEAR SHIFT CABLE

REMOVAL

NOTE: The crossover and selector cables are manufactured as a cable "assembly" and cannot be serviced individually.

(1) Pull up on gearshift knob with moderate force to remove from gearshift mechanism (Fig. 143).

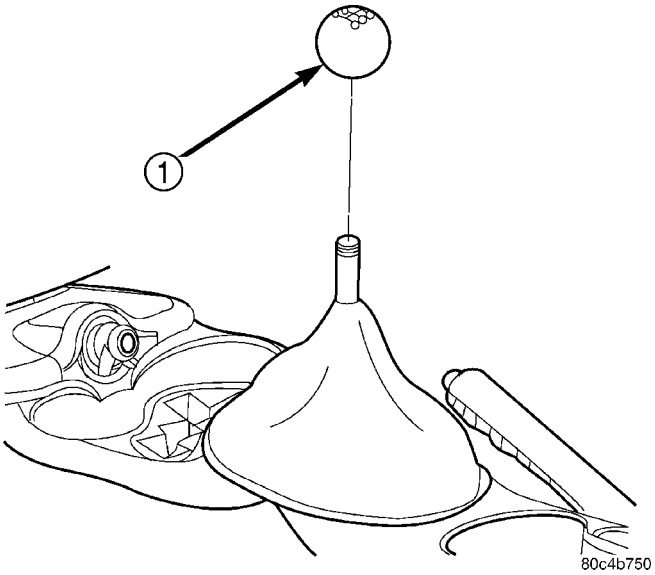

Fig. 143 Gearshift Knob Removal/Installation

1 - GEARSHIFT KNOB

(2) Remove shifter boot/bezel assembly from console by lifting up at mounting ring area (Fig. 144).

(5) Remove selector cable retaining clip and disconnect from shift lever (Fig. 147).

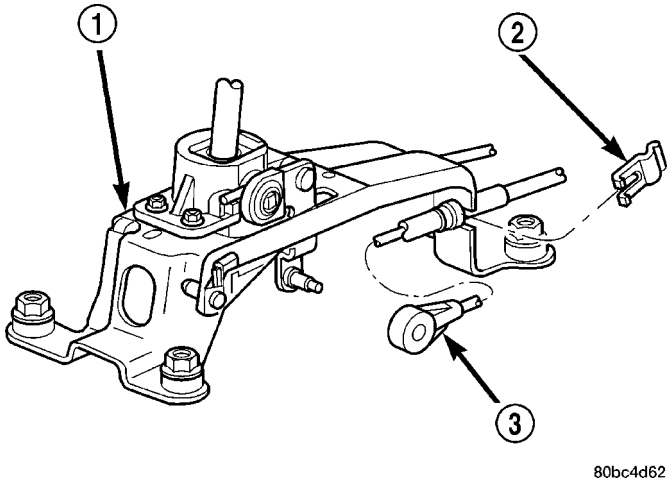

Fig. 147 Selector Cable at Shifter Assembly

1 - SHIFTER
2 - CLIP
3 - SELECTOR CABLE

(6) Remove three grommet plate-to-floor pan attaching nuts (Fig. 146).

(7) Remove air cleaner assy (Fig. 148).

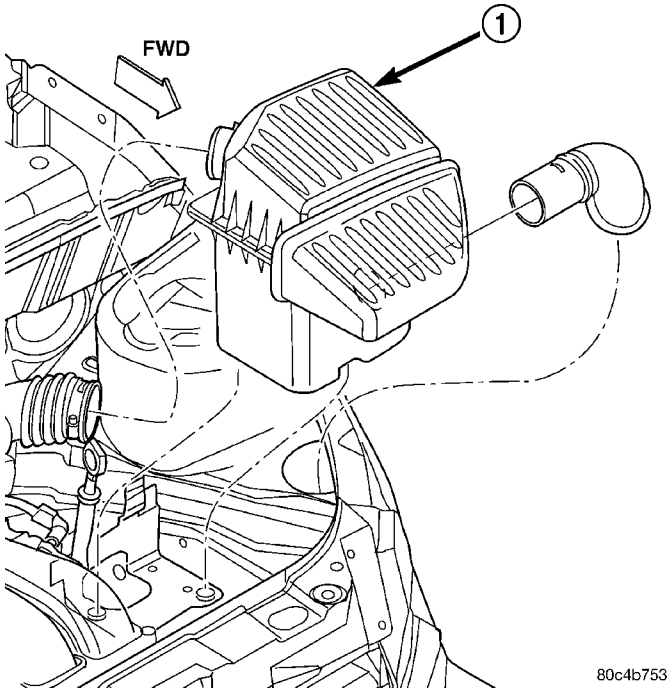

Fig. 148 Air Cleaner Assembly Removal/Installation

1 - AIR CLEANER ASSEMBLY

(8) Disconnect battery cables.

(9) Remove battery hold-down clamp and battery (Fig. 149).

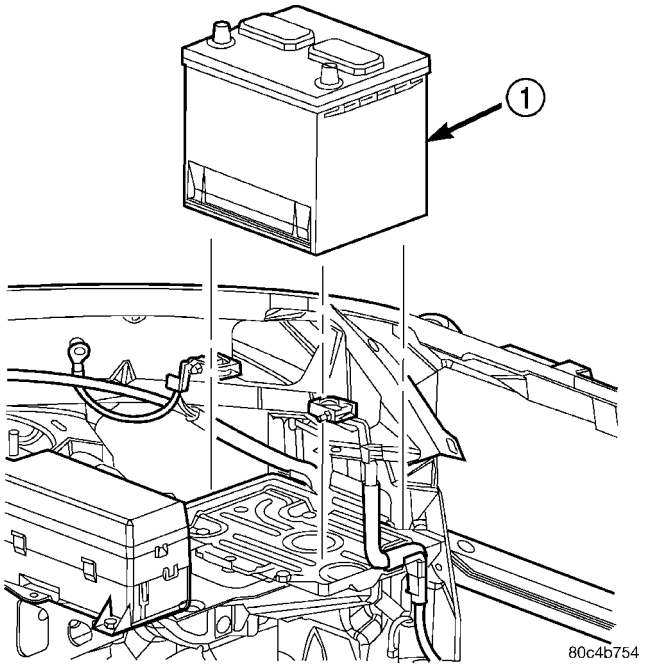

Fig. 149 Battery Removal/Installation

1 - BATTERY

(10) Remove battery tray (Fig. 150).

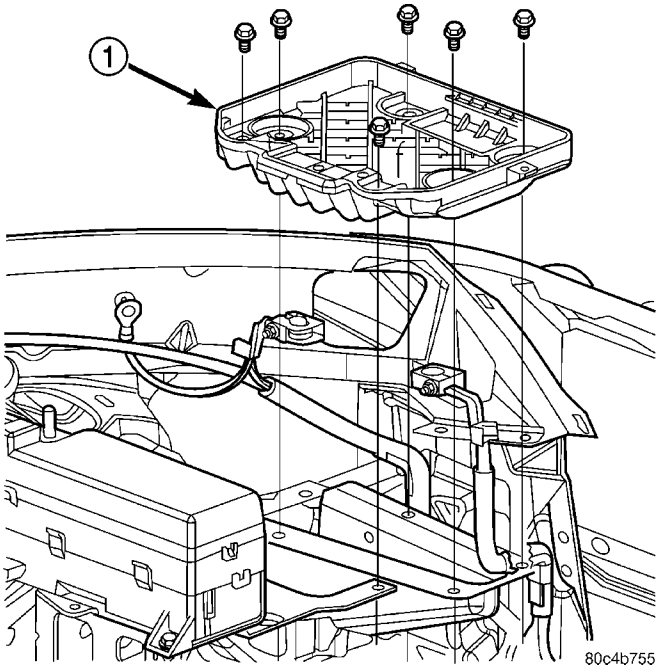

Fig. 150 Battery Tray Removal/Installation

1 - BATTERY TRAY

GEAR SHIFT CABLE (Continued)

(11) Disconnect cables from the shift levers at the transaxle (Fig. 151).

CAUTION: Pry up with equal force on both sides of shifter cable isolator bushings to avoid damaging cable isolator bushings.

(12) Remove cable retaining clips and remove cables from bracket (Fig. 151).

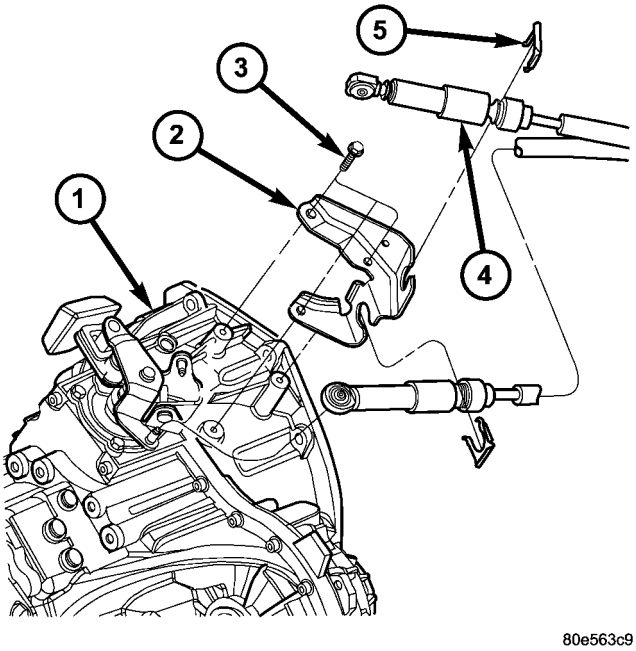

Fig. 151 Gear Shift Cables and Bracket at Transaxle

1 - TRANSAXLE
2 - GEAR SHIFT CABLE BRACKET
3 - BOLT (3)
4 - CABLE ASSEMBLY
5 - RETAINER (2)

(13) Raise vehicle on hoist.

(14) Remove converter heat shield (Fig. 152).

(15) Remove remaining grommet plate-to-floor pan screw (Fig. 153).

(16) Remove cable assembly from vehicle.

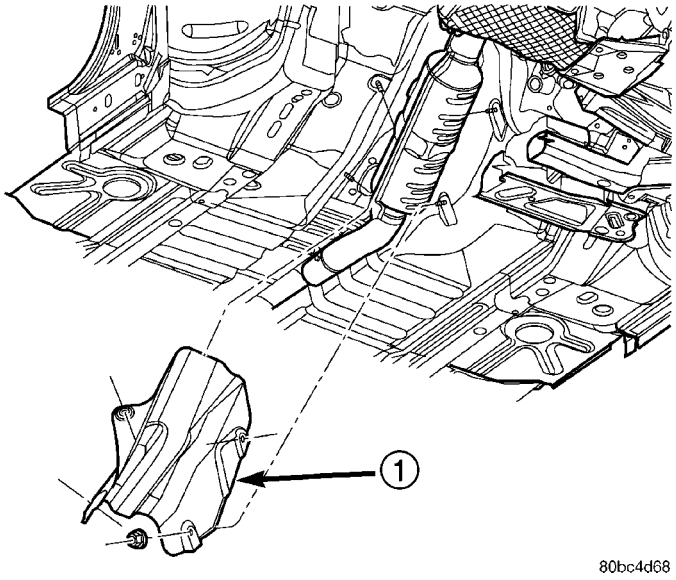

Fig. 152 Converter Heat Shield Removal/Installation

1 - CONVERTER HEAT SHIELD

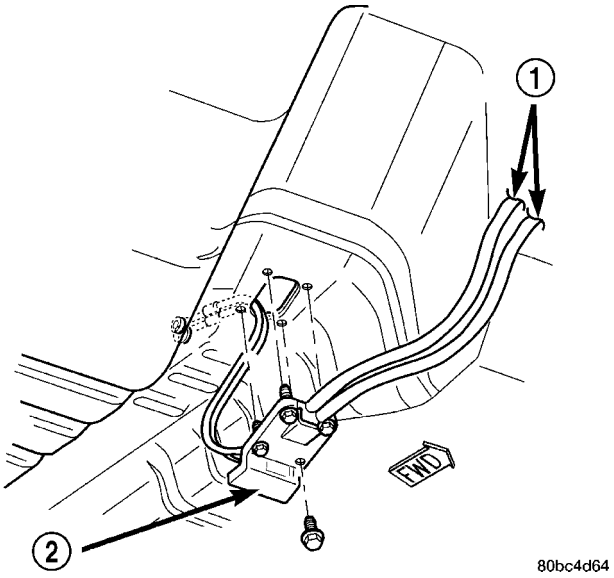

Fig. 153 Shift Cable Assembly at Floor Pan

1 - CABLE ASSEMBLY
2 - GROMMET PLATE

GEAR SHIFT CABLE (Continued)

INSTALLATION

CAUTION: Gearshift cable bushings must not be lubricated or the bushings will swell and split.

(1) Raise vehicle on hoist.

(2) Install cable assembly through floor pan opening and secure to floor pan with grommet plate and one screw (Fig. 154). Make sure the three grommet plate studs protrude through cable assembly and floor pan and tighten screw to 7 N·m (60 in. lbs.).

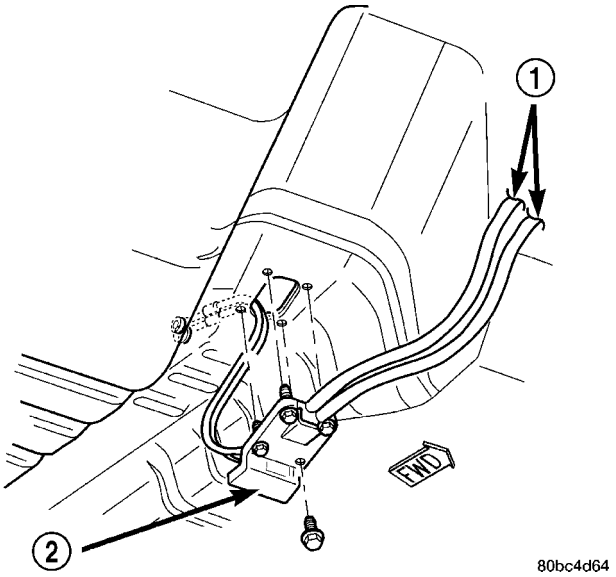

Fig. 154 Shift Cable Assembly at Floor Pan

1 - CABLE ASSEMBLY
2 - GROMMET PLATE

(3) Route transaxle end of cable assembly into engine compartment and over transaxle assembly.

(4) Install converter heat shield (Fig. 155).

(5) Lower vehicle.

(6) Install gearshift cables to mounting bracket and fasten with NEW clips (Fig. 156). Make sure clips are installed flush to bracket.

(7) Connect gearshift selector and crossover cable to shift levers at transaxle (Fig. 156).

(8) Install and tighten the three grommet plate-to-floor pan nuts to 6 N·m (50 in. lbs.) torque.

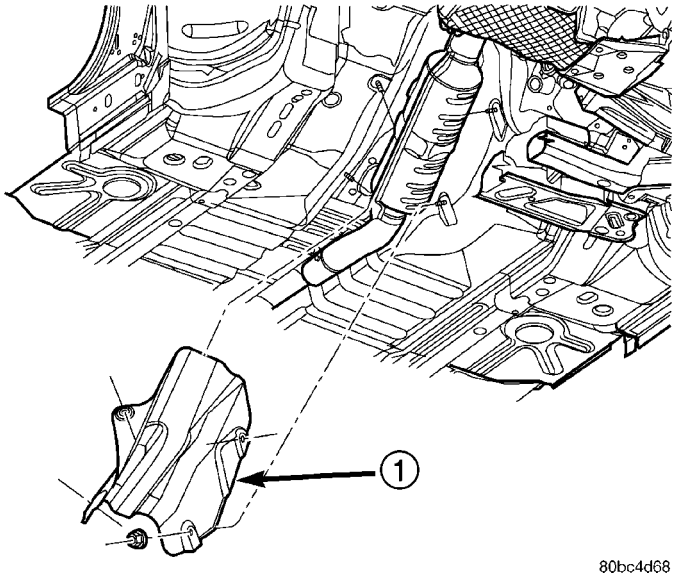

Fig. 155 Converter Heat Shield Removal/Installation

(10) Install crossover cable to shifter lever and secure cable to shifter bracket. Install clip (Fig. 158).

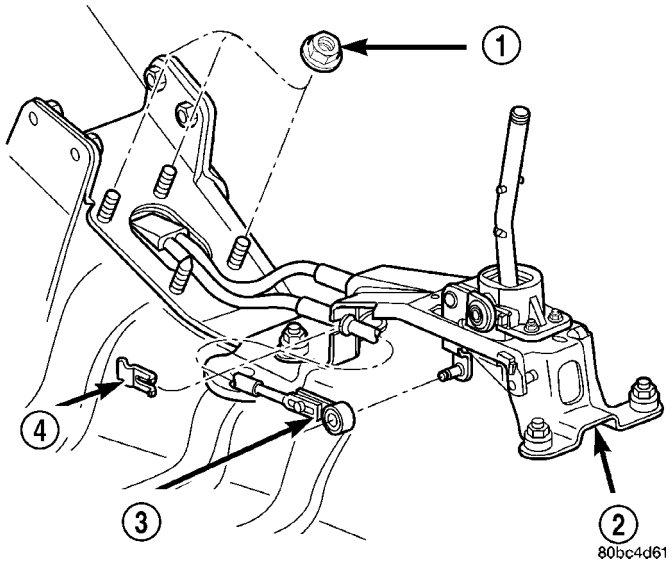

Fig. 158 Crossover Cable at Shifter Assembly

1 - GROMMET PLATE NUT
2 - SHIFTER
3 - CROSSOVER CABLE
4 - CLIP

NOTE: Only the crossover cable is adjustable. The selector cable does not have any adjustment capabilities.

(11) **Adjust crossover cable as follows:**

(a) Loosen adjusting screw on crossover cable at shifter (Fig. 159).

(b) The gearshift mechanism and transaxle crossover lever are spring-loaded and self-centering. Alignment pins used in the past are not required anymore. Allow gearshift mechanism and transaxle crossover lever to relax in their neutral positions. To ensure the gearshift lever is in the proper position, place the shifter in 3rd or 4th gear if necessary. Torque adjustment screw to 8 N·m (70 in. lbs.). Care must be taken to avoid moving the shift mechanism off-center during screw tightening.

(c) Perform functional check by shifting transaxle into all gears.

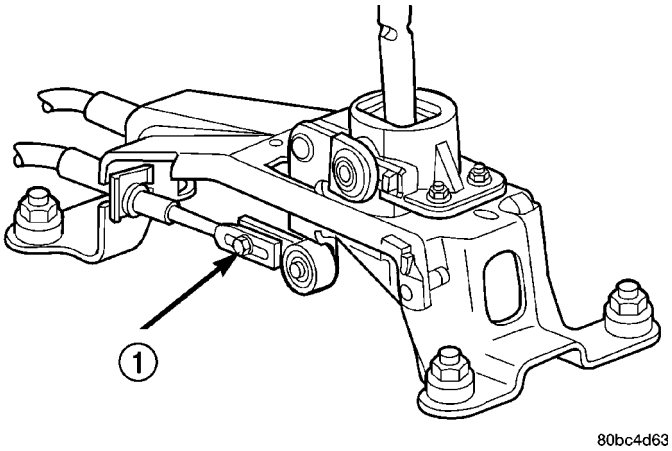

Fig. 159 Crossover Cable Adjustment Screw

1 - CROSSOVER ADJUSTMENT SCREW

(12) Install center console assembly (Fig. 160). Verify that boot is not pinched at console opening before tightening.

(13) Position gearshift boot (Fig. 161) over the gearshift mechanism and engage tab on mount ring at front to opening in console. Apply hand pressure to engage bosses on mount ring of boot to console opening slots.

GEAR SHIFT CABLE (Continued)

(19) Install the air cleaner assembly (Fig. 165).

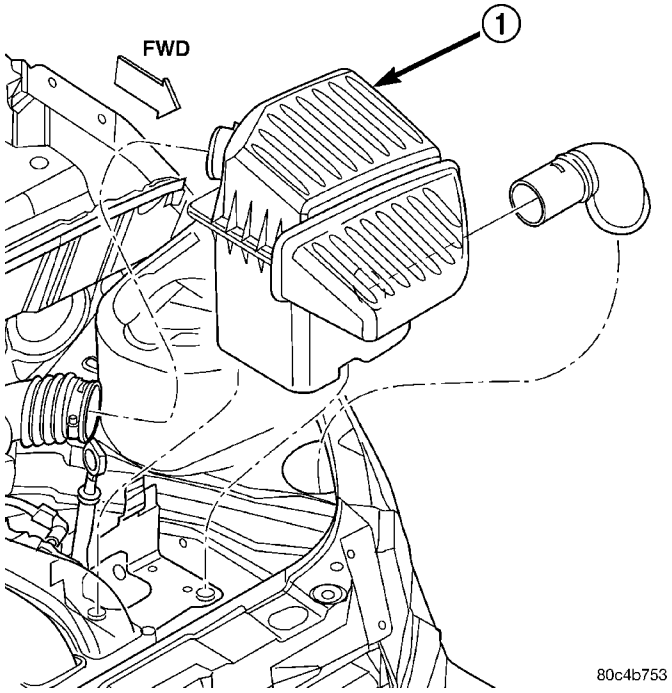

Fig. 165 Air Cleaner Assembly Removal/Installation

1 - AIR CLEANER ASSEMBLY

(20) Connect battery cables.

ADJUSTMENTS

ADJUSTMENT - GEARSHIFT CROSSOVER CABLE

(1) Remove center console from vehicle. (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - REMOVAL)

(2) Loosen adjusting screw on crossover cable at shifter (Fig. 166).

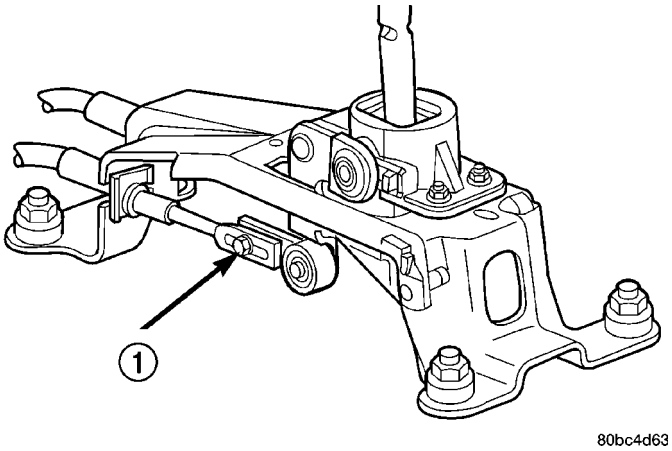

Fig. 166 Loosen Crossover Cable Adjustment Screw

1 - CROSSOVER ADJUSTMENT SCREW

(3) The gearshift mechanism and transaxle crossover lever are spring-loaded and self-centering. Alignment pins used in the past are not required anymore. Allow gearshift mechanism and transaxle crossover lever to relax in their neutral positions. To ensure the gearshift lever is in the proper position, place the shifter in 3rd or 4th gear if necessary. Torque adjustment screw to 8 N·m (70 in. lbs.). Care must be taken to avoid moving the shift mechanism off-center during screw tightening.

(4) Reinstall center console. Reinstall boot and knob. (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - INSTALLATION)

GEAR SHIFT KNOB

REMOVAL

(1) Pull up on gearshift knob with moderate force to remove from gearshift mechanism (Fig. 167).

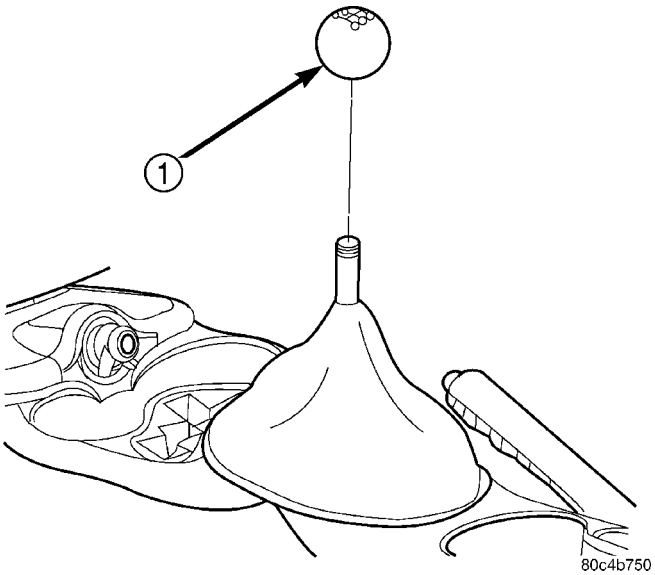

Fig. 167 Gearshift Knob Removal/Installation

1 - GEARSHIFT KNOB

INSTALLATION

(1) Position knob hole over the gearshift mechanism and align the shift pattern (Fig. 167).

(2) Strike knob with rubber mallet to engage knob to mechanism.

(3) Verify that shift pattern is aligned properly.

GEAR SHIFT MECHANISM

REMOVAL

(1) Pull up on gearshift knob with moderate force to remove from gearshift mechanism (Fig. 168).

(2) Remove shifter boot/bezel assembly from console by lifting up at mounting ring area (Fig. 169).

(3) Remove the center console assembly as shown in (Fig. 170). Remove rear power window switch (if equipped) and disconnect harness from console.

(4) Remove crossover cable retaining clip and disconnect from shift lever (Fig. 171).

(5) Remove selector cable retaining clip and disconnect from shift lever (Fig. 172).

(6) Remove four shifter assy.-to-floor pan nuts and remove shifter from vehicle (Fig. 173).

INSTALLATION

(1) Install shifter assy. to floor pan (Fig. 173). Install and tighten four nuts to 12 N·m (105 in. lbs.) torque.

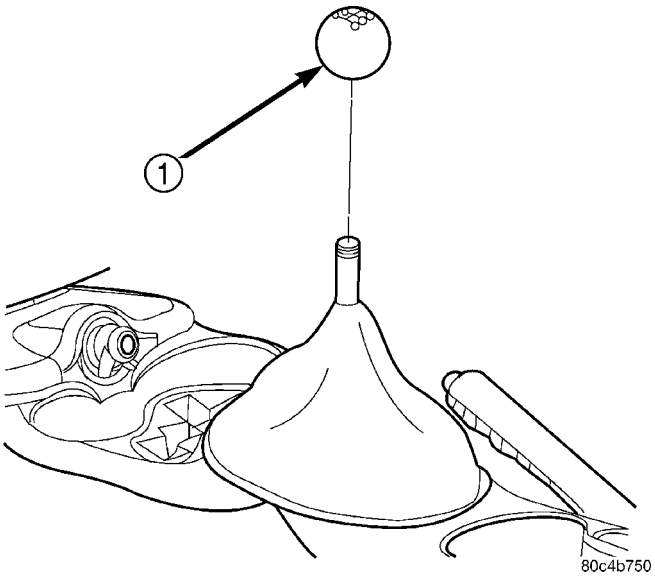

Fig. 168 Gearshift Knob Removal/Installation

1 - GEARSHIFT KNOB

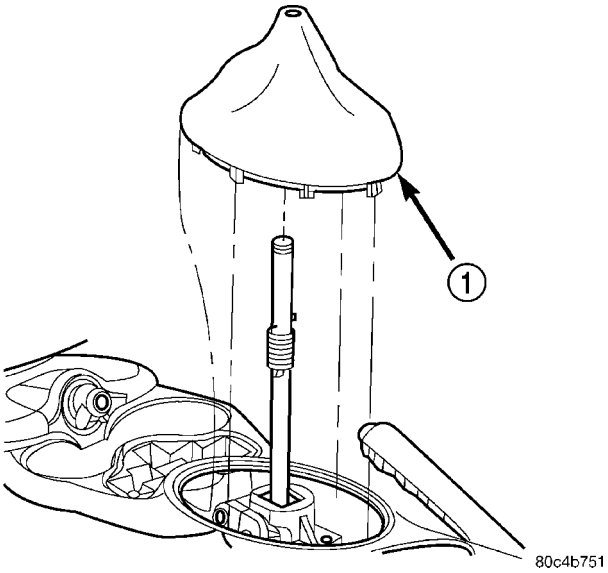

Fig. 169 Gearshift Boot Removal/Installation

1 - GEARSHIFT BOOT

(2) Install selector cable to shifter lever and secure cable to shifter bracket. Install clip (Fig. 172).

(3) Install crossover cable to shifter lever and secure cable to shifter bracket. Install clip (Fig. 171).

NOTE: Only the crossover cable is adjustable. The selector cable does not have any adjustment capabilities.

(4) Adjust crossover cable. (Refer to 21 - TRANSMISSION/TRANSAXLE/MANUAL/GEAR SHIFT CABLE - ADJUSTMENTS)

INPUT SHAFT

DESCRIPTION

The input shaft assembly (Fig. 174) is part of the transaxle geartrain, is driven by the clutch assembly, and meshes with the intermediate shaft assembly. The input shaft consists of the following major components:

- Input mainshaft
- Third Speed Gear
- Fourth Speed Gear
- Fifth Speed Gear
- 1st Gear (Fixed)
- 2nd Gear (Fixed)
- 3/4 Synchronizer
- 5th Gear Synchronizer

The input shaft assembly is supported by a caged roller bearing at the front of the transaxle, and a sealed roller bearing at the rear of the transaxle.

OUTPUT SHAFT

DESCRIPTION

The output shaft assembly (Fig. 200) is part of the transaxle geartrain, meshes with and is driven by the input shaft, drives the differential via an integrated pinion gear, and consists of the following components:

- Output Mainshaft
- 1st Speed Gear
- 2nd Speed Gear
- 3rd Gear (Fixed)
- 4th Gear (Fixed)
- 5th Gear (Fixed)
- 1/2 Synchronizer

The output shaft is supported by a caged cylindrical roller bearing at the front of the transaxle, and a sealed ball bearing at the rear of the transaxle.

OUTPUT SHAFT (Continued)

DISASSEMBLY

(1) Install output shaft to fixture 8925-3. Use split plate 8925-2 on diesel models, and 8925-4 on turbo models as shown in (Fig. 201).

(2) Remove 4th and 5th gears simultaneously. Install protective sleeve 8918 to output shaft and press 4th and 5th gears off of shaft (Fig. 201).

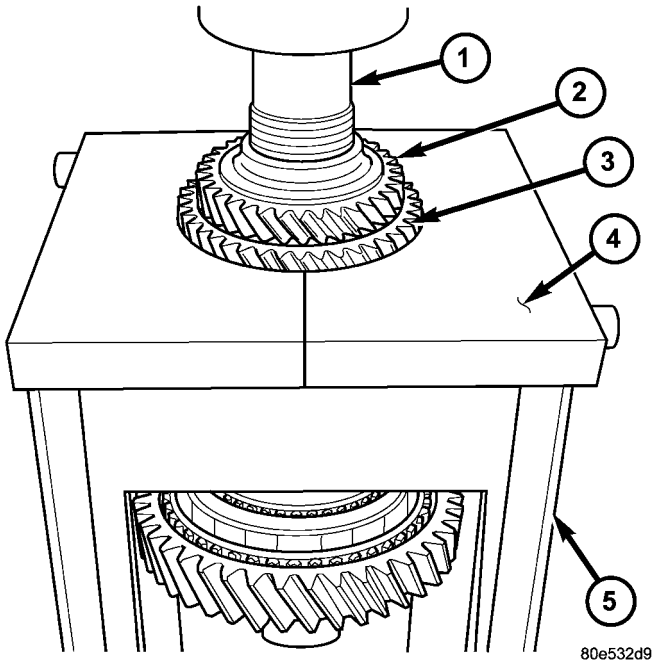

Fig. 201 4th/5th Gear Removal

1 - TOOL 8918

(3) Install output shaft to fixture 8925-3 using split plate 8925-1 as shown in (Fig. 202).

(4) Remove 3rd gear. Install protective sleeve 8918 to output shaft and press 3rd gear off of shaft (Fig. 202).

(5) Remove second gear from output shaft.

(6) Remove second gear needle bearing.

(7) Install output shaft to fixture 8925-3 using split plate 8925-2 (inverted) (Fig. 203).

(8) Install protective sleeve 8918 to output shaft and simultaneously press off 2nd gear bushing, 1-2 synchronizer, and 1st gear (Fig. 203).

REVERSE SHAFT

DESCRIPTION

The reverse shaft assembly (Fig. 225) consists of a fixed gear shaft, the reverse synchronizer, and a free gear wheel that rotates about two (2) needle bearings. The assembly is supported on one end (clutch bellhousing) by a sealed roller bearing, and a needle bearing at the other end (geartrain housing).

SYNCHRONIZER

DESCRIPTION

The 288 transaxle is fully synchronized, using synchronizers in all gear positions. The 1/2 synchronizer is a dual-cone synchronizer, and is located on the intermediate shaft assembly (Fig. 241). The 3/4 and 5th gear synchronizers are located on the input shaft assembly and are of conventional design, using only one friction element for each gear position (Fig. 242). The reverse synchronizer is located on the reverse shaft (Fig. 243).

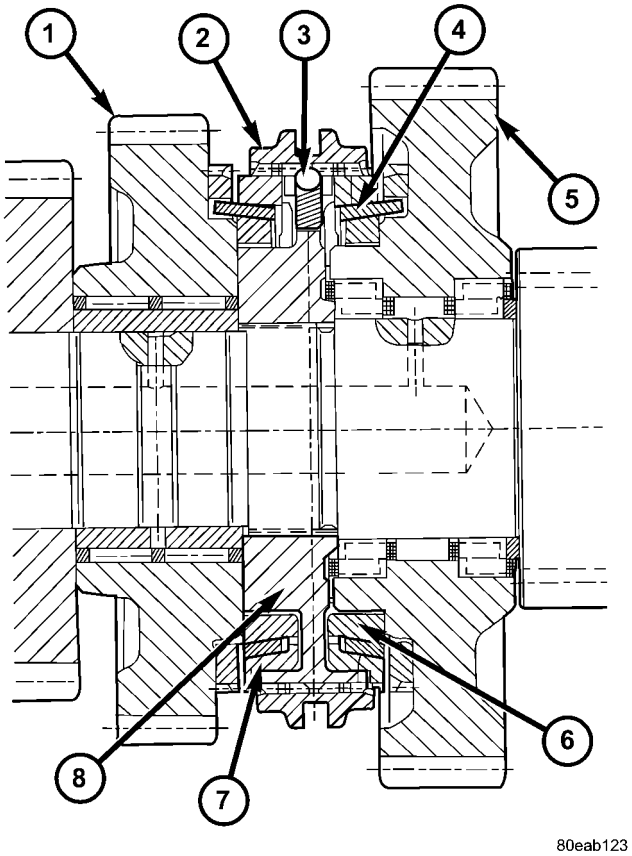

Fig. 241 1/2 Synchronizer Assembly

2 - SLEEVE
3 - STRUT ASSEMBLY
4 - FRICTION RING
5 - 1ST GEAR
6 - HUB
7 - BLOCKER RING (2)
8 - FRICTION CONE

REMOVAL

To remove the 1/2 synchronizer assembly, the intermediate shaft must be disassembled. (Refer to 21 - TRANSMISSION/TRANSAXLE/MANUAL/INTERMEDIATE SHAFT - DISASSEMBLY)

To remove the 3/4 or 5th gear synchronizer assembly, the input shaft must be disassembled. (Refer to

SYNCHRONIZER (Continued)

21 - TRANSMISSION/TRANSAXLE/MANUAL/INPUT SHAFT - DISASSEMBLY)

To remove the reverse gear synchronizer assembly, the reverse shaft must be disassembled. (Refer to 21 - TRANSMISSION/TRANSAXLE/MANUAL/REVERSE SHAFT - DISASSEMBLY)

DISASSEMBLY

(1) Remove synchronizer sleeve (Fig. 244). Three (3) synchronizer strut assemblies will free from hub.

(2) Inspect all components for wear and replace as necessary.

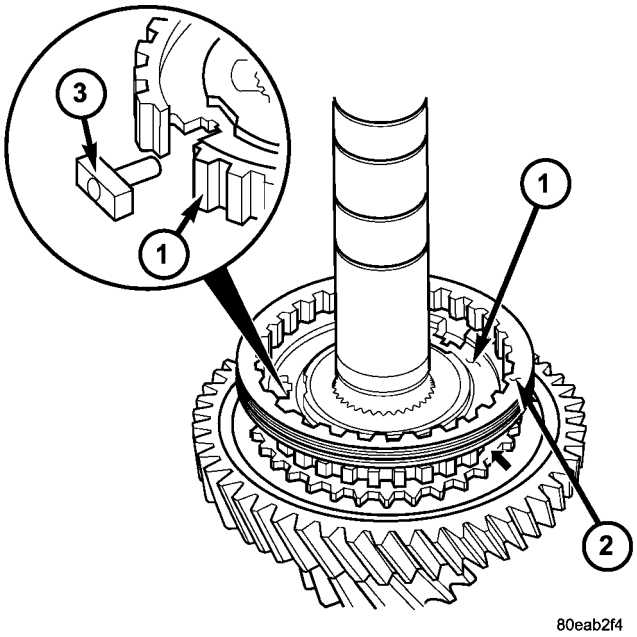

Fig. 244 Synchronizer Disassembly

1 - SYNCHRONIZER HUB
2 - SYNCHRONIZER SLEEVE
3 - STRUT ASSEMBLY

INSPECTION

(1) Install blocker ring to gear as shown in (Fig. 245). Using feeler gauge, measure wear limit (between blocker ring and gear). (Refer to 21 - TRANSMISSION/TRANSAXLE/MANUAL - SPECIFICATIONS)

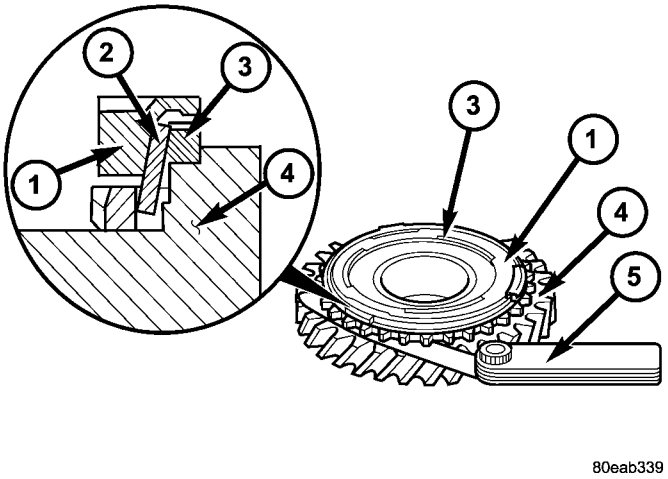

Fig. 245 Measuring Synchronizer Wear

1 - BLOCKER RING
2 - FRICTION RING
3 - FRICTION CONE
4 - GEAR
5 - FEELER GAUGE

VISUAL INSPECTION

- Inspect for scuffed, nicked, burred, broken teeth, or general wear
- Inspect strut assemblies for wear, distortion, and functionality of ball and spring

ASSEMBLY

(1) Install synchronizer sleeve to synchronizer hub (Fig. 244). Install three (3) strut assemblies.

INSTALLATION

To install 1/2 synchronizer assembly, (Refer to 21 - TRANSMISSION/TRANSAXLE/MANUAL/INTERMEDIATE SHAFT - ASSEMBLY)

To install 3/4 or 5th gear synchronizer assembly, (Refer to 21 - TRANSMISSION/TRANSAXLE/MANUAL/INPUT SHAFT - ASSEMBLY)

To install reverse gear synchronizer assembly, (Refer to 21 - TRANSMISSION/TRANSAXLE/MANUAL/REVERSE SHAFT - ASSEMBLY)

TRANSAXLE HOUSING

DISASSEMBLY

(1) Remove reverse shaft needle bearing using Tools 8915 and 8911 (Fig. 246).

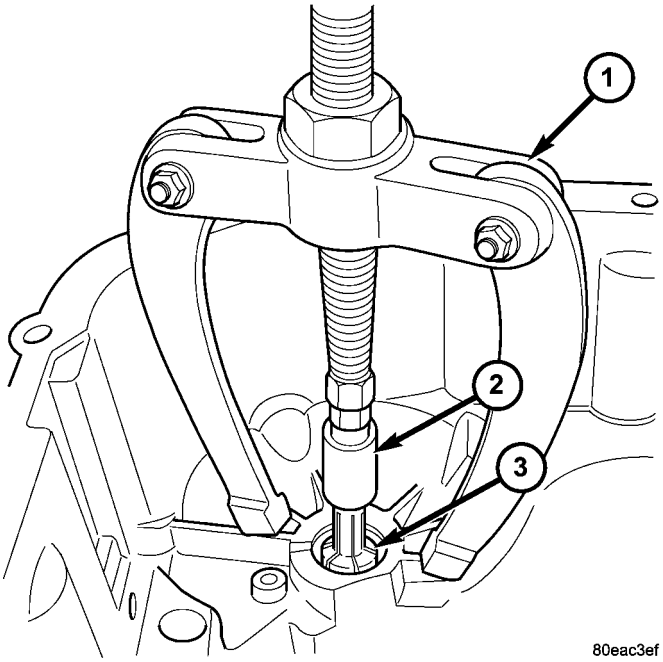

Fig. 246 Reverse Shaft Needle Bearing Removal

1 - TOOL 8915
2 - TOOL 8911
3 - BEARING

(2) Remove differential bearing cone using Tools 8915 and 8913 (Fig. 247).

(3) Drive out input and intermediate shaft sealed roller bearings using Tools C-4171 and 6954 (Fig. 248) (Fig. 249).

T350 MANUAL TRANSAXLE

DESCRIPTION

This five speed is a constant-mesh manual transaxle. All gear ranges, except reverse, are synchronized. The reverse gear utilizes a reverse brake for shifting ease. The reverse idler gear is supported on a sliding spindle idler shaft. The transaxle case is aluminum with a steel end–plate bearing cover. It is housed in a die-cast aluminum case featuring a two–piece, middle split design (Fig. 1).

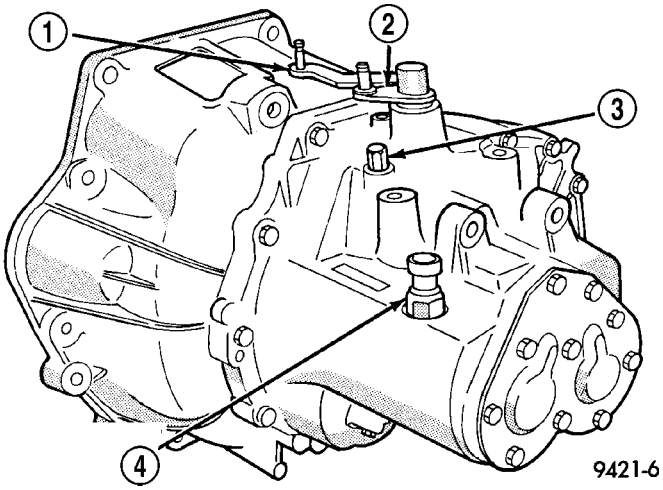

Fig. 1 T350 Manual Transaxle

1 - SHIFT LEVER
2 - CROSSOVER LEVER
3 - VENT
4 - REVERSE LAMP SWITCH

The T350 transaxle internal components can be serviced only by separating the gear case from the bellhousing case.

CAUTION: The transaxle output shaft is serviced as a unit. No disassembly and reassembly is possible. Damage to the transaxle may result.

TRANSAXLE IDENTIFICATION

The transaxle model, assembly number, and build date are on a metal I.D. tag that is attached to the end cover of the transaxle (Fig. 2). This information is also shown on a bar code label that is attached to the front of the transaxle (Fig. 3).

NOTE: Transaxles use various final drive gear ratios in different vehicle applications. Therefore, it is necessary that the correct transaxle assembly number is used when ordering service parts.

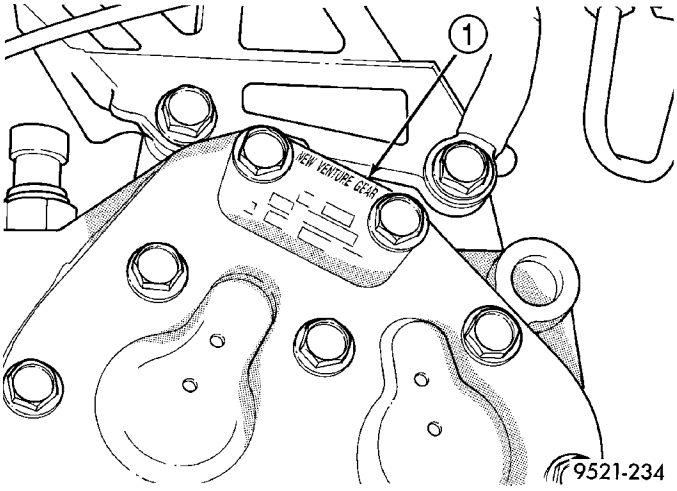

Fig. 2 Metal I.D. Tag

1 - METAL I.D. TAG

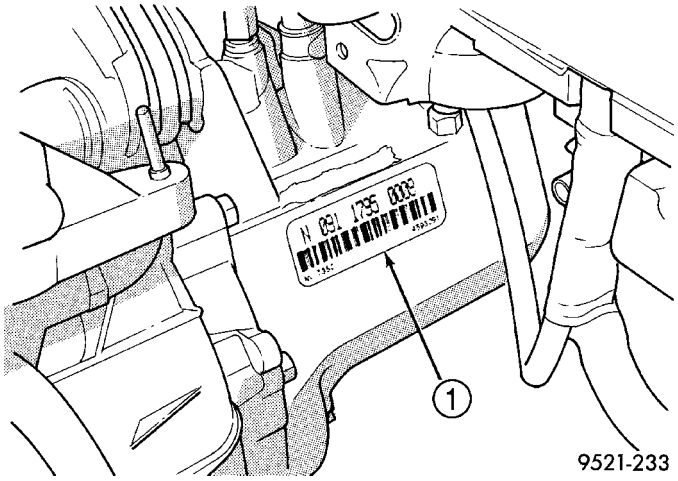

Fig. 3 Bar Code Label

1 - BAR CODE LABEL

GEAR RATIOS

CAUTION: All gears and shafts must not be interchanged with other transaxles; they will not function correctly.

The differential is a conventional arrangement of gears that is supported by tapered roller bearings. The final output gear turns the ring gear and differential assembly, thereby turning the drive axle shafts.

The gear ratios of each transaxle are shown in the following chart. The chart also shows which transaxles are available with the reverse–input shaft brake. This brake allows easier shifting into reverse and helps eliminate reverse gear clash.

T350 MANUAL TRANSAXLE (Continued)

GEAR	1.6L	2.0L	2.4L
1st	3.50	3.50	3.50
2nd	1.95	1.95	1.95
3rd	1.36	1.36	1.36
4th	0.97	0.97	0.97
5th	0.81	0.81	0.72
FINAL DRIVE RATIO	4.12	3.94	3.94
REVERSE BRAKE	YES	YES	YES
CLUTCH RELEASE SYSTEM	HYDRAULIC	HYDRAULIC	HYDRAULIC

GEARSHIFT PATTERN

The T350 transaxle shift pattern is a modified H–pattern (Fig. 4). Overdrive fifth and reverse gears are in–line and outboard of the first through fourth gear positions.

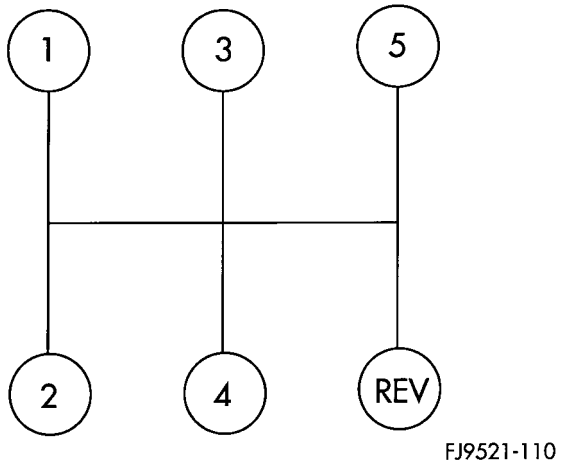

Fig. 4 T350 Transaxle Shift Pattern

LUBRICANT/ADDITIVES

NOTE: All T350 Manual Transaxles require the use of ATF+4 (Automatic Transmission Fluid).

Hypoid gear lube or engine oil should not be used in this transaxle. Hard shifting effort, bearing, gear, and/or synchronizer failure may occur if incorrect fluid is used.

The addition of any fluids to the transaxle, other than the fluid listed above, is not recommended. An exception to this policy is the use of special dyes to aid in detecting fluid leaks. The use of transmission sealers should be avoided, since they may adversely affect seals and synchronizers.

SEALANTS

The sealant used to seal the transaxle case halves and input bearing is Mopar® Gasket Maker, Loctite® 518, or equivalent. The sealant used for the bearing end plate cover is Mopar® RTV.

DIAGNOSIS AND TESTING - COMMON PROBLEM CAUSES

The majority of transaxle malfunctions are a result of:

- Insufficient lubrication
- Incorrect lubricant
- Misassembled or damaged internal components
- Improper operation

HARD SHIFTING

Hard shifting may be caused by a misadjusted crossover cable. If hard shifting is accompanied by gear clash, synchronizer clutch and stop rings or gear teeth may be worn or damaged.

Misassembled synchronizer components also cause shifting problems. Incorrectly installed synchronizer sleeves, struts, or springs can cause shift problems.

Worn, damaged, missassembled or leaking hydraulic system/components can also cause difficult shifting or gear clash.

NOISY OPERATION

Transaxle noise is most often a result of worn or damaged components. Chipped, broken gear or synchronizer teeth, and brinnelled, spalled bearings all cause noise.

Abnormal wear and damage to the internal components is frequently the end result of insufficient lubricant.

SLIPS OUT OF GEAR

Transaxle disengagement may be caused by misaligned or damaged shift components, or worn teeth on the drive gears or synchronizer components. Incorrect assembly also causes gear disengagement.

LOW LUBRICANT LEVEL

Insufficient transaxle lubricant is usually the result of leaks, or inaccurate fluid level check or refill method. **Vehicle must be level to accurately check fluid level.** Leakage is evident by the presence of oil around the leak point. If leakage is not evident, the condition is probably the result of an underfill.

If air–powered lubrication equipment is used to fill a transaxle, be sure the equipment is properly calibrated. Equipment out of calibration can lead to an underfill condition.

T350 MANUAL TRANSAXLE (Continued)

CLUTCH PROBLEMS

Worn, damaged, or misaligned clutch components can cause difficult shifting, gear clash, and noise.

A worn or damaged clutch disc, pressure plate, or release bearing can cause hard shifting and gear clash.

REMOVAL

(1) Raise hood.
(2) Remove air cleaner assembly (Fig. 5).

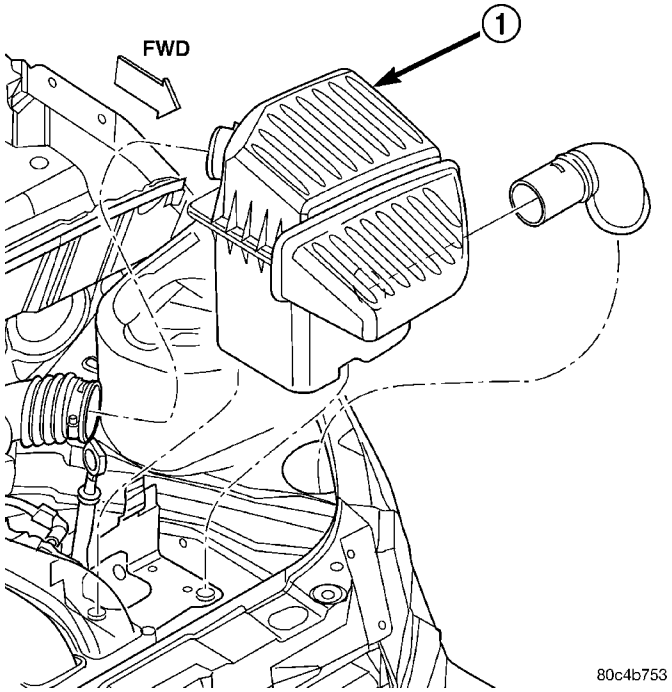

Fig. 5 Air Cleaner Assembly Removal/Installation

1 - AIR CLEANER ASSEMBLY

(3) Disconnect both battery cables.
(4) Remove battery hold down clamp and bolt, and remove battery (Fig. 6).
(5) Remove battery tray from bracket (Fig. 7).

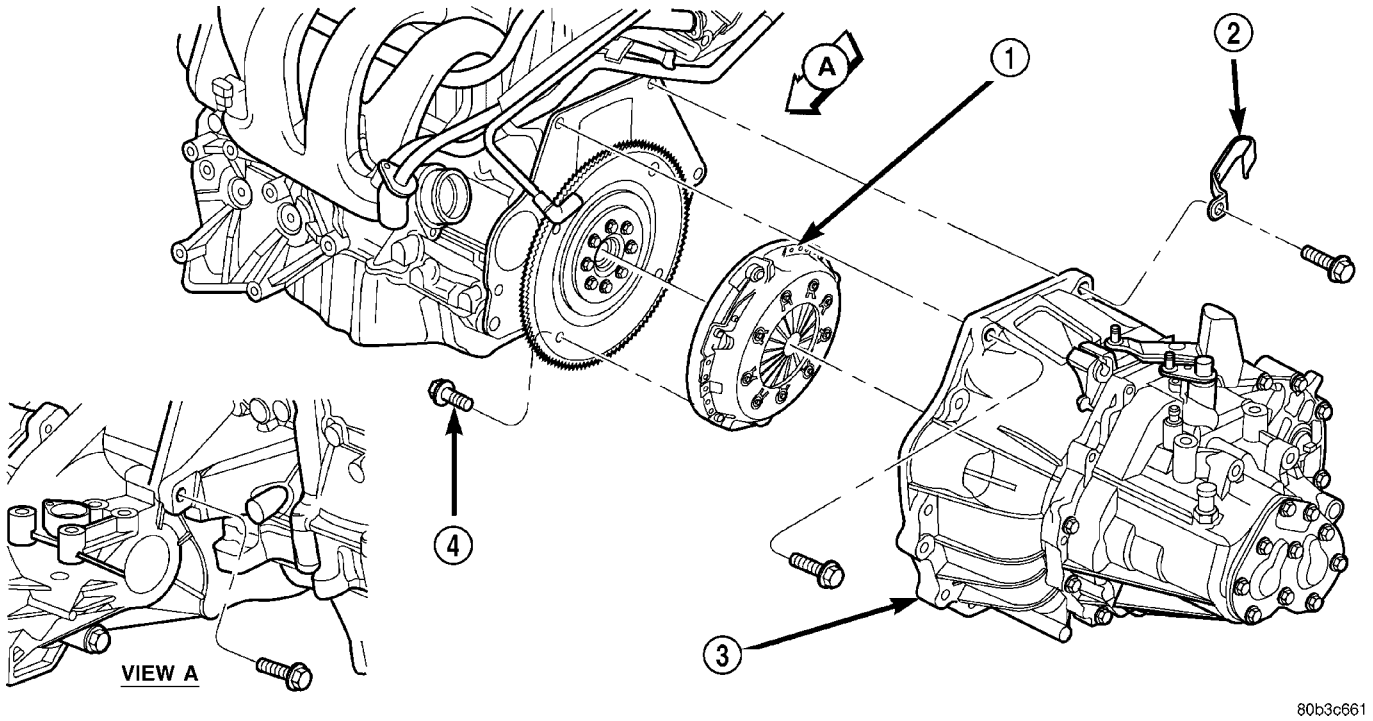

Fig. 20 Transaxle Removal/Installation (2.4L Shown)

1 - MODULAR CLUTCH ASSEMBLY
2 - CLIP
3 - TRANSAXLE
4 - CLUTCH MODULE BOLT (4)

(23) Obtain a helper to assist in holding transaxle while removing transaxle-to-engine mounting bolts (Fig. 20).

(24) Remove transaxle from vehicle (Fig. 20).

(25) Remove clutch module (Fig. 20) from transaxle input shaft (if equipped).

(26) If installing a new or replacement transaxle, remove the upper mount as shown in (Fig. 21), transfer to the replacement unit and torque all bolts to 62 N·m (45 ft. lbs.) torque.

DISASSEMBLY

The T350 transaxle internal components can be serviced only by separating the gear case from the bellhousing case.

CAUTION: The transaxle output shaft is serviced as a unit. No disassembly and reassembly is possible. Damage to the transaxle may result.

(1) Place transaxle on bench.

(2) Remove the clutch release bearing and lever. Move the release fork and bearing to an in-line position. Grasp the release lever with two hands in the pivot stud socket area. Pull with even pressure to release the lever from the pivot stud.

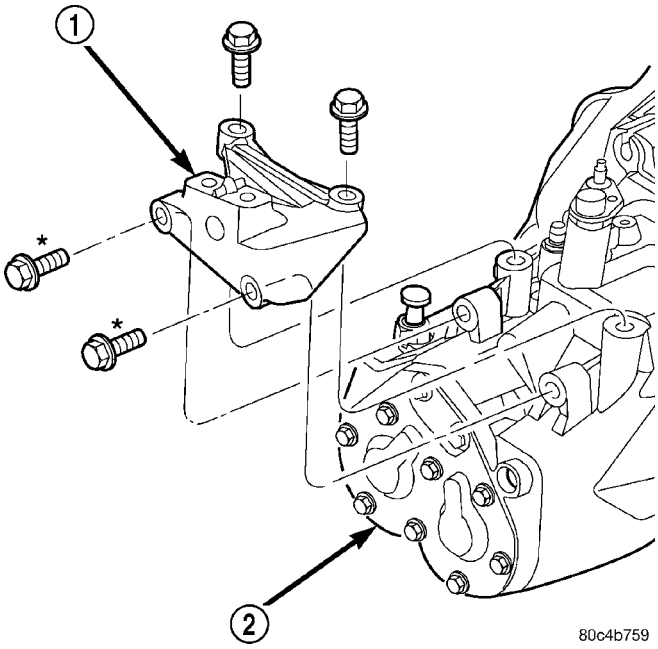

Fig. 21 Transaxle Upper Mount Bracket

1 - BRACKET
2 - TRANSAXLE

CAUTION: Do not use a screwdriver or pry bar to release the lever as this may cause damage to the lever and/or clip.

T350 MANUAL TRANSAXLE (Continued)

(3) Remove shift levers by driving out the roll pins.
(4) Remove transaxle case half bolts (Fig. 22).

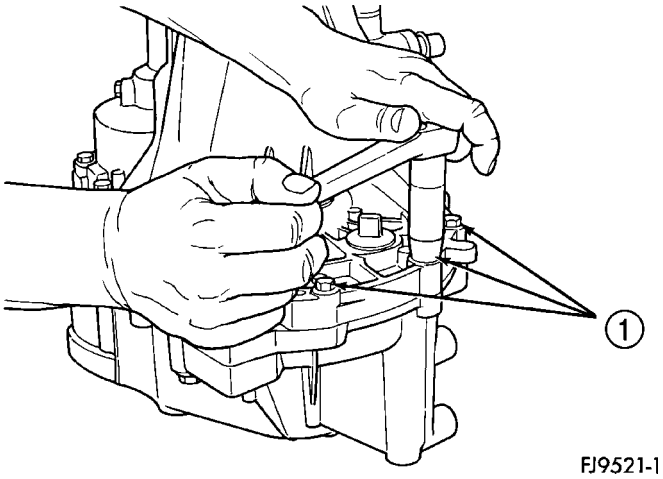

Fig. 22 Case Bolts

1 - CASE BOLTS

(5) Place two screwdrivers into the slots provided in the case halves near the dowels (Fig. 23). Separate the case halves (Fig. 24).

2 - REVERSE CAM BLOCKOUT
3 - SHIFT BLOCKER ASSEMBLY

(13) Using snap–ring pliers, remove selector shaft spacer (Fig. 32).

(14) Pull the selector shaft shift pin out of the slot in the blocker assembly. Turn selector shaft up and out of the way (Fig. 33).

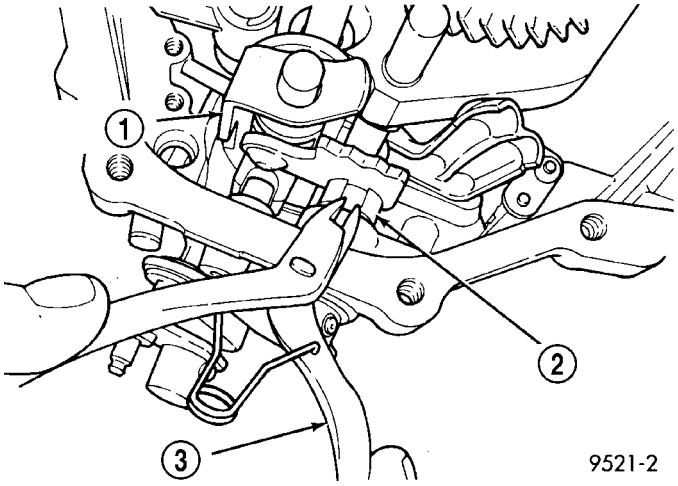

Fig. 32 Remove Selector Shaft Spacer

1 - SHIFT BLOCKER ASSEMBLY
2 - SELECTOR SHAFT SPACER (PLASTIC)
3 - SNAP RING PLIERS

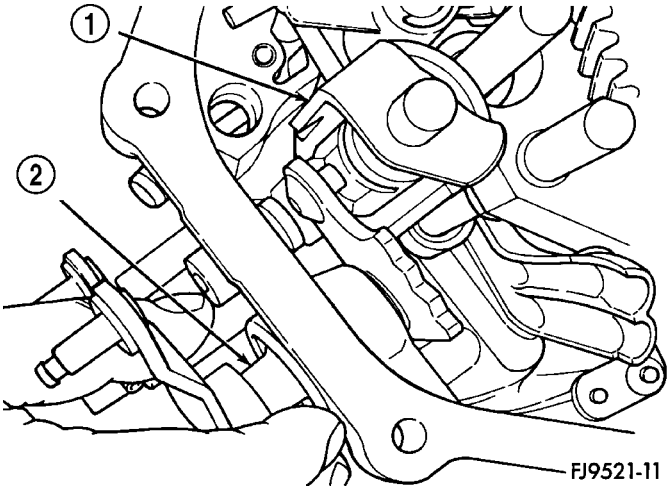

Fig. 33 Selector Shaft

1 - SHIFT ASSEMBLY
2 - SELECTOR SHAFT

T350 MANUAL TRANSAXLE (Continued)

(15) Remove transaxle end cover (Fig. 34) (Fig. 35).

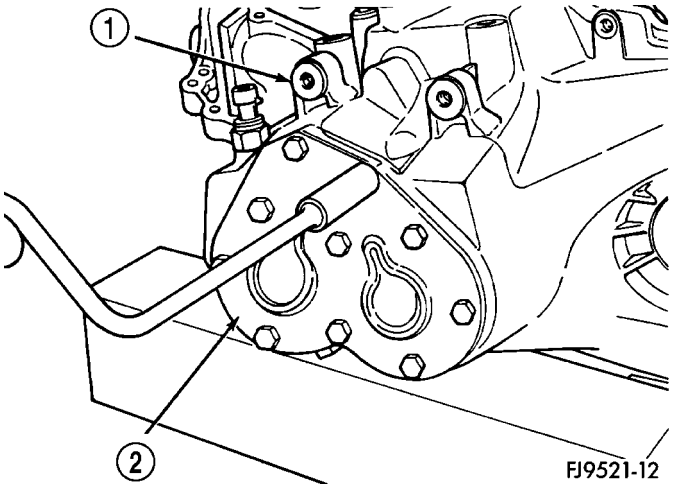

Fig. 34 Transaxle Cover Removal

1 - TRANSAXLE CASE
2 - END COVER

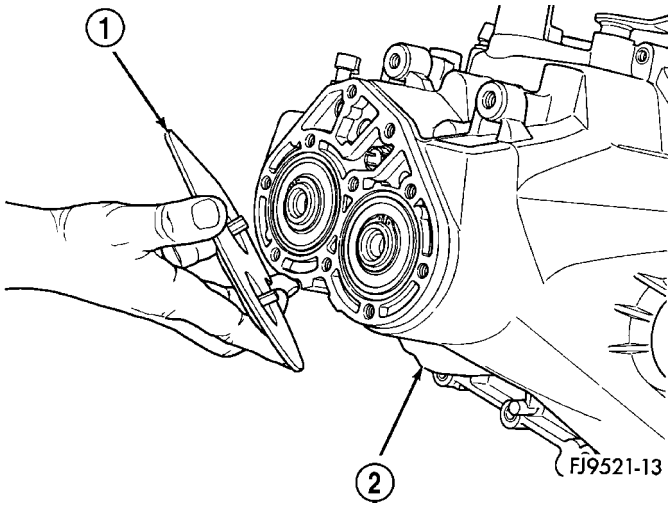

Fig. 35 End Cover

1 - END COVER
2 - CASE

(16) Remove two snap rings retaining the output shaft and the input shaft to the bearings (Fig. 36).

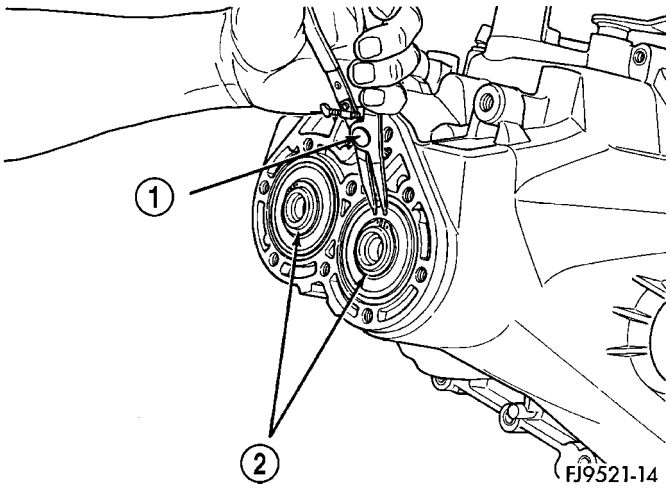

Fig. 36 Snap Rings Retaining Bearings

1 - SNAP RING PLIERS
2 - SNAP RINGS

(17) Using bench fixture and shims provided (Miller tools # 6785, 6785-1, and 6785-2), turn transaxle over. Install transaxle onto bench fixture (Fig. 37). Verify shim spacers are in position on bench fixture. Install transaxle into shop press.

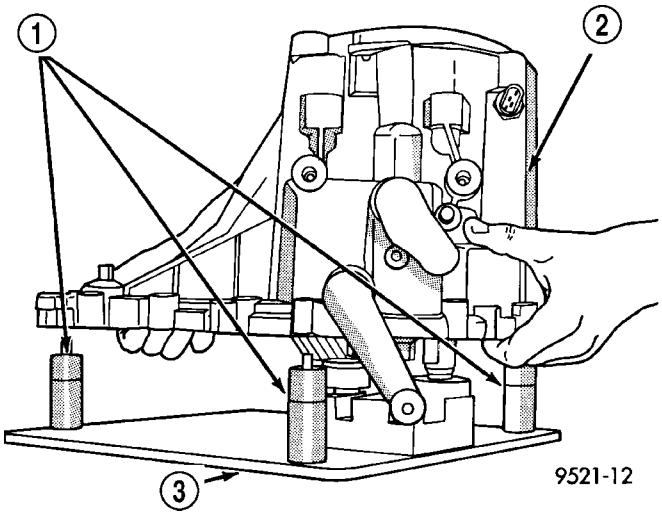

Fig. 37 Bench Fixture

1 - SHIMS
2 - TRANSAXLE
3 - 6785 BENCH FIXTURE

T350 MANUAL TRANSAXLE (Continued)

(18) Install bearing fixture Miller tool #6768 onto transaxle end bearings (Fig. 38). Verify tool is properly aligned to input and output shafts.

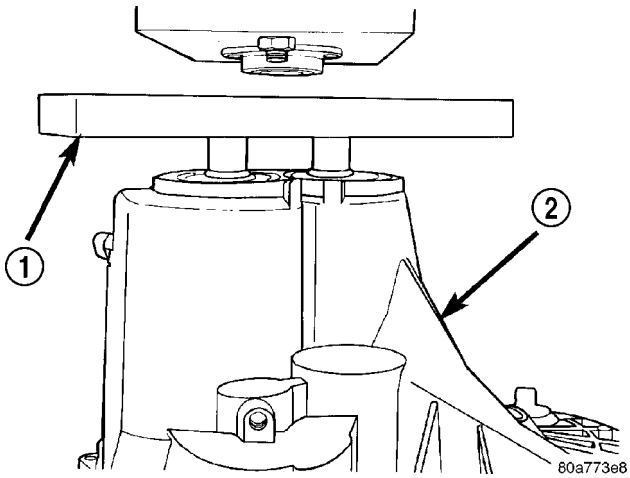

Fig. 38 Bearing Fixture

1 - BEARING FIXTURE
2 - TRANSAXLE CASE

CAUTION: The oil dams in the input and output shafts can be damaged while pressing on the shafts if the bearing fixture is not used properly.

(19) Install transaxle gear case into shop press. Press output and input shaft assemblies out of case (Fig. 39).

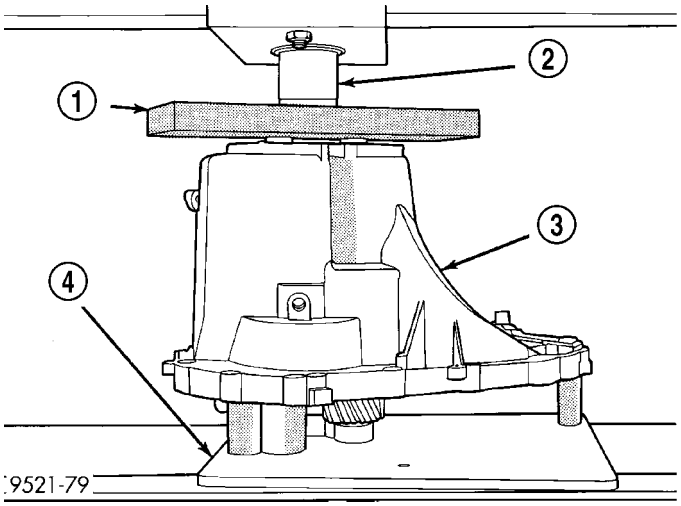

Fig. 39 Pressing Gears Out of Case

1 - BEARING FIXTURE
2 - PRESS RAM
3 - TRANSAXLE CASE
4 - BENCH FIXTURE

(20) Remove transaxle from press.

(21) Carefully remove transaxle case from the shaft assemblies and bench fixture (Fig. 40). Be sure the oil–feed trough to the end bearings is not damaged (Fig. 41).

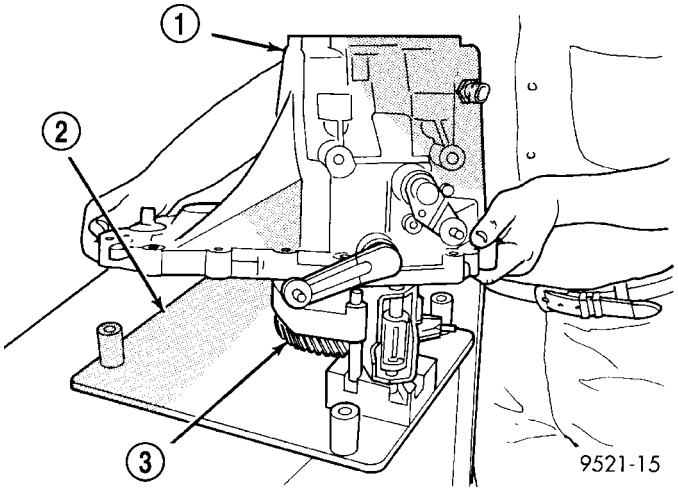

Fig. 40 Transaxle Case Removal

1 - TRANSAXLE CASE
2 - BENCH FIXTURE
3 - GEARTRAIN

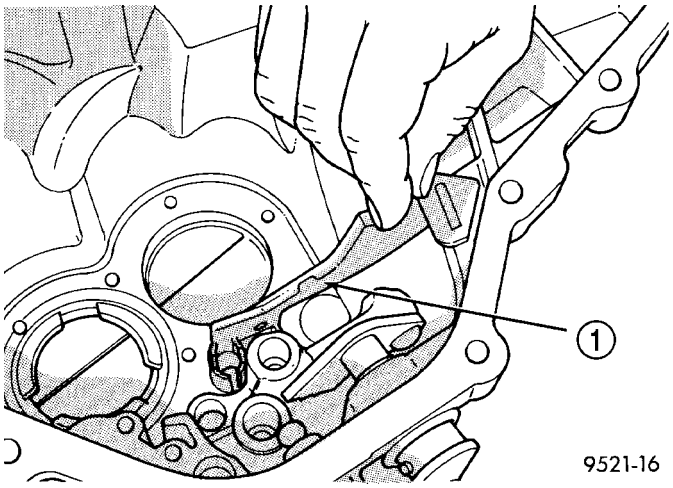

Fig. 41 Oil Feed Trough

1 - OIL FEED TROUGH

T350 MANUAL TRANSAXLE (Continued)

(22) Remove the reverse brake friction cone and blocking ring from the input shaft assembly (Fig. 42) (Fig. 43).

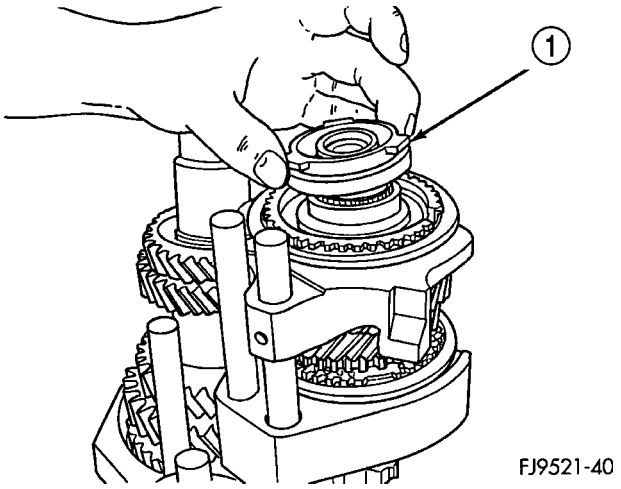

Fig. 42 Reverse Brake Friction Cone

(23) Remove the shift blocker assembly from the bench fixture (Fig. 44).

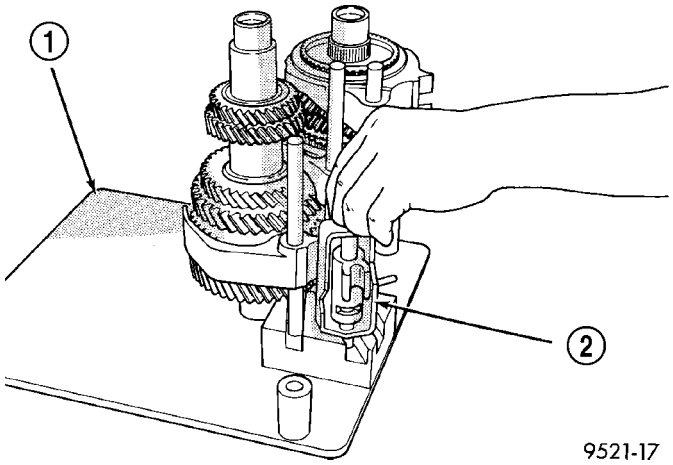

Fig. 44 Shift Blocker Removal

1 - 6785 BENCH FIXTURE
2 - SHIFT BLOCKER ASSEMBLY

(24) Remove the 1-2 shift fork from the output shaft (Fig. 45).

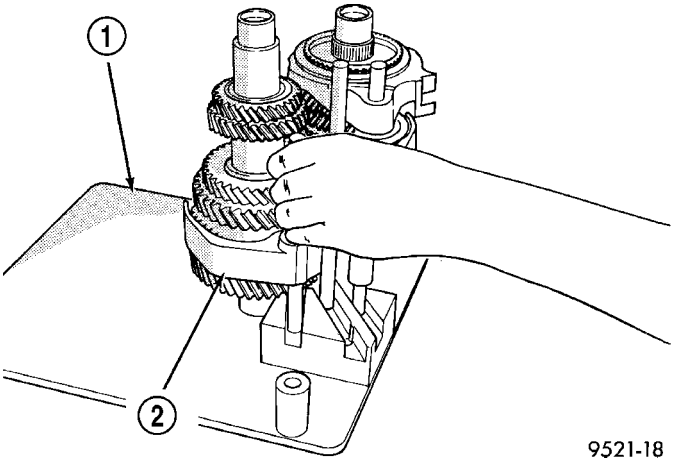

Fig. 45 1–2 Shift Fork Removal

1 - 6785 BENCH FIXTURE
2 - 1–2 SHIFT FORK

T350 MANUAL TRANSAXLE (Continued)

(25) Remove input and output shaft assemblies from bench fixture (Fig. 46).

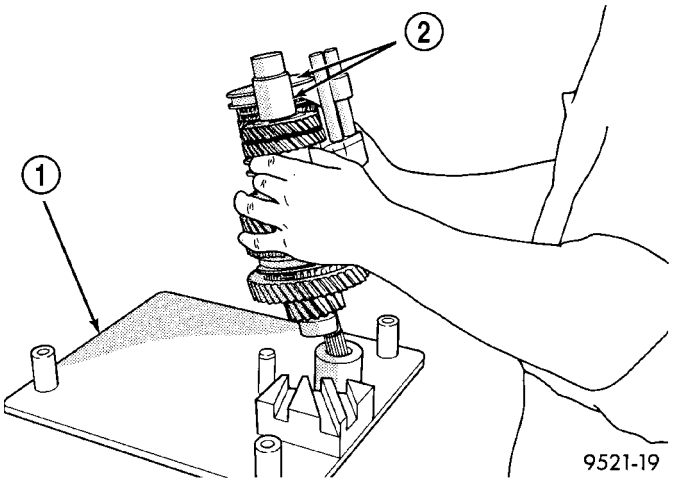

Fig. 46 Gear Train Removal

1 - 6785 BENCH FIXTURE
2 - INPUT AND OUTPUT SHAFTS

CAUTION: The output shaft assembly is serviced as an assembly. Do not try to repair any component on the output shaft. If the 1-2 synchronizer or gear fails, it is necessary to replace the complete output shaft assembly.

CLEANING

Clean the gears, bearings, shafts, synchronizers, thrust washers, oil feeder, shift mechanism, gear case, and bellhousing with solvent. Dry all parts except the bearings with compressed air. Allow the bearings to either air dry or wipe them dry with clean shop towels.

INSPECTION

Inspect the gears, bearings, shafts and thrust washers. Replace the bearings and cups if the rollers are worn, chipped, cracked, flat spotted, or brinnelled, or if the bearing cage is damaged or distorted. Replace the thrust washers if cracked, chipped, or worn. Replace the gears if the teeth are chipped, cracked, or worn thin. Inspect the synchronizers. Replace the sleeve if worn or damaged in any way. Replace the stop rings if the friction material is burned, flaking off, or worn. Check the condition of the synchro keys and springs. Replace these parts if worn, cracked, or distorted.

ASSEMBLY

The T350 transaxle internal components can be serviced only by separating the gear case from the bellhousing case.

CAUTION: The transaxle output shaft is serviced as a unit. No disassembly and reassembly is possible. Damage to the transaxle may result.

The sealant used to seal the transaxle case halves is Mopar® Gasket Maker, Loctite® 518, or equivalent. The sealant used for the bearing end plate cover is Mopar® RTV.

(1) Verify bench fixture shims are removed from bench fixture. Install output and input shafts into bench fixture (Miller tool #6785) (Fig. 47).

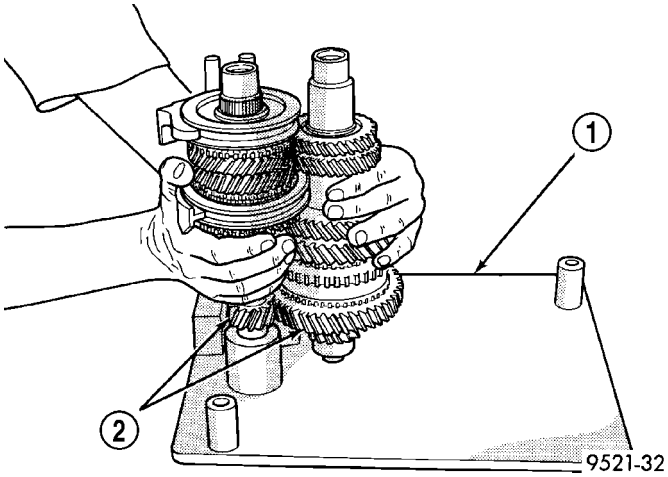

Fig. 47 Bench Fixture

1 - BENCH FIXTURE
2 - GEARTRAIN

(2) Install shift rails and forks into bench fixture (Fig. 48).

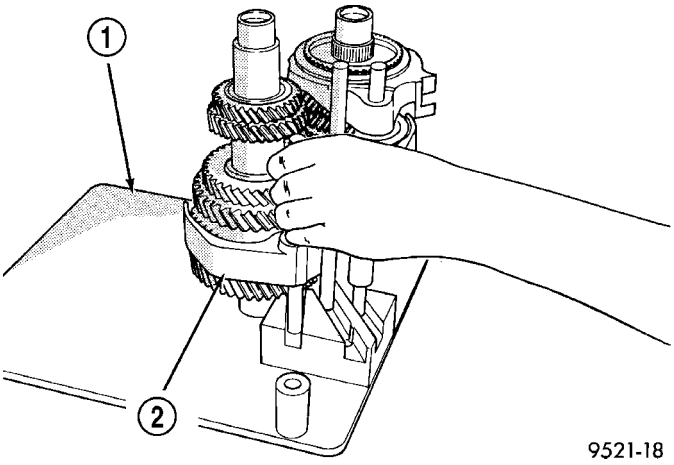

Fig. 48 Shift Rail Installation

1 - 6785 BENCH FIXTURE
2 - 1–2 SHIFT FORK

T350 MANUAL TRANSAXLE (Continued)

(3) Install shift blocker assembly into bench fixture (Fig. 49).

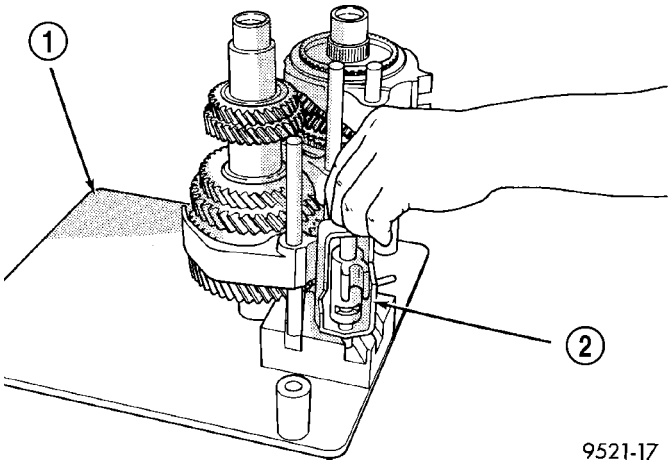

Fig. 49 Shift Blocker Installation

1 - 6785 BENCH FIXTURE
2 - SHIFT BLOCKER ASSEMBLY

(4) Install reverse brake blocking ring (Fig. 50).

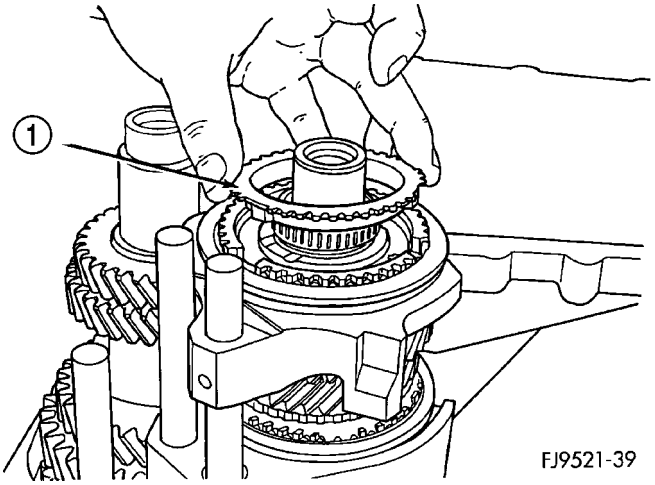

Fig. 50 Reverse Brake Blocking Ring Installation

1 - REVERSE BRAKE BLOCKING RING

(5) Install reverse brake friction cone (Fig. 51).

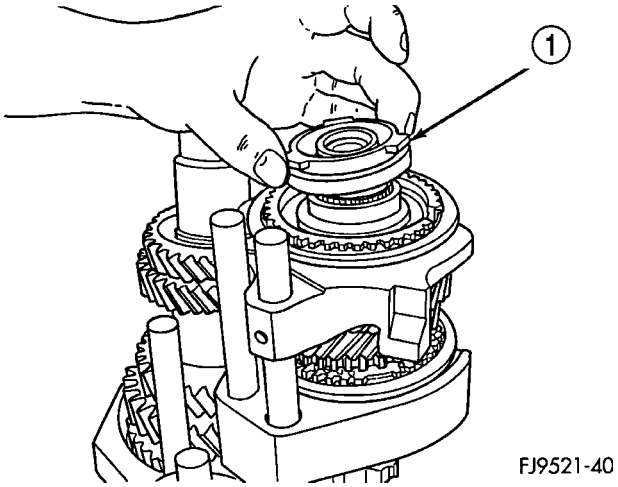

Fig. 51 Reverse Brake Friction Cone Installation

1 - REVERSE BRAKE FRICTION CONE

(6) Install gear–case half over bench fixture (Fig. 52). Line up shift finger over 3-4 lug.

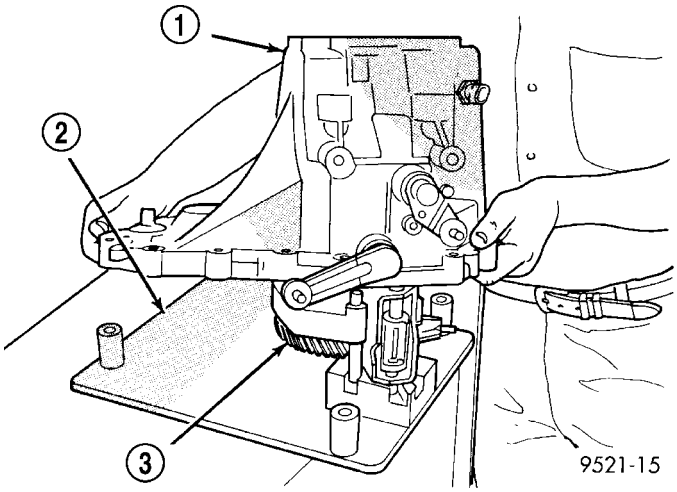

Fig. 52 Gear Case Half

2 - BENCH FIXTURE
3 - GEARTRAIN

T350 MANUAL TRANSAXLE (Continued)

(7) Line up reverse brake friction cone lugs to the slots in the gear case (Fig. 53). Verify reverse brake shim is in position.

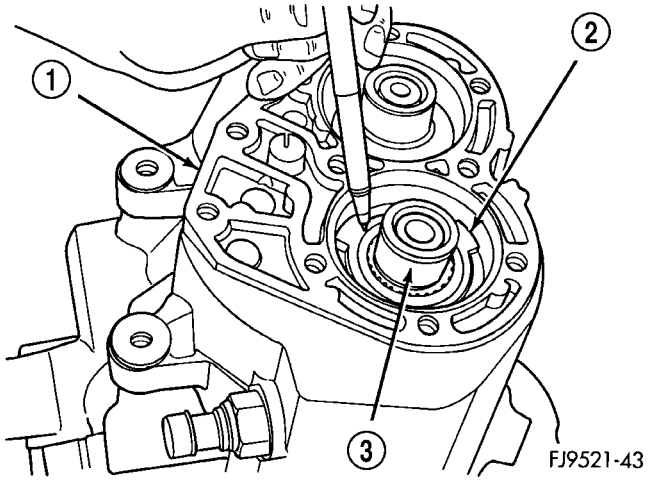

Fig. 53 Friction Cone Lugs

1 - CASE
2 - FRICTION CONE LUGS
3 - INPUT SHAFT

(8) Position input and output bearings on the shafts. Using Miller tool C-4992-1, press on input and output shaft bearings until they bottom into the case and against the shafts (Fig. 54).

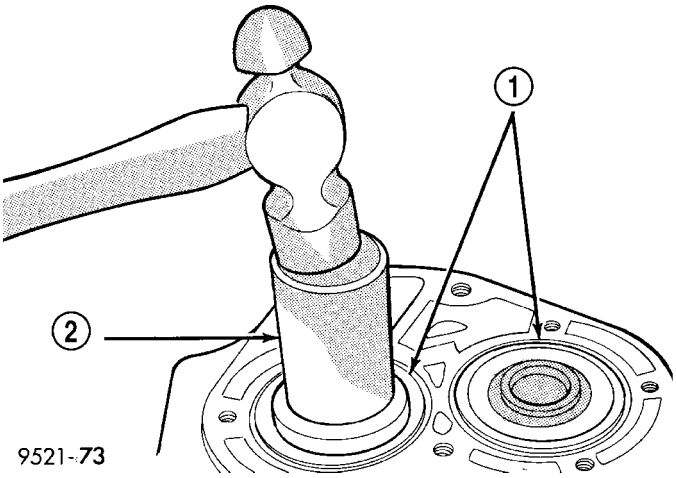

Fig. 54 Installing Input and Output Bearings

1 - INPUT AND OUTPUT BEARINGS
2 - SPECIAL TOOL C-4992-1

(9) Install shaft snap rings at input and output bearings (Fig. 55).

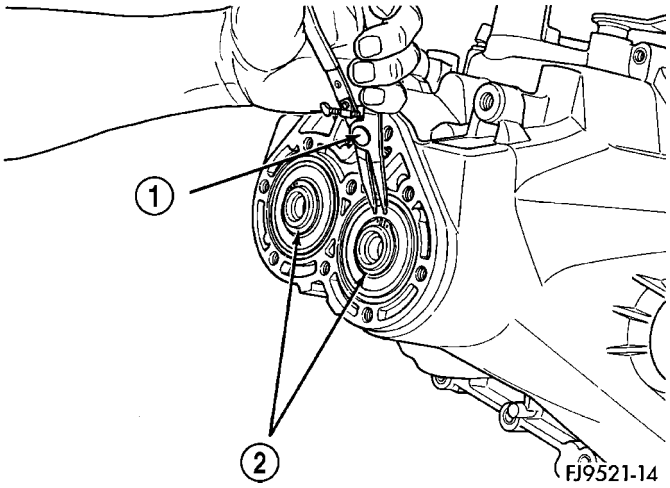

Fig. 55 Snap Rings Retaining Bearings

1 - SNAP RING PLIERS
2 - SNAP RINGS

(10) Apply Mopar® RTV sealant to end–cover outer edge and around bolt holes. Install end–cover onto gear case. Tighten end cover bolts to 29 N·m (21 ft. lbs.) torque (Fig. 56).

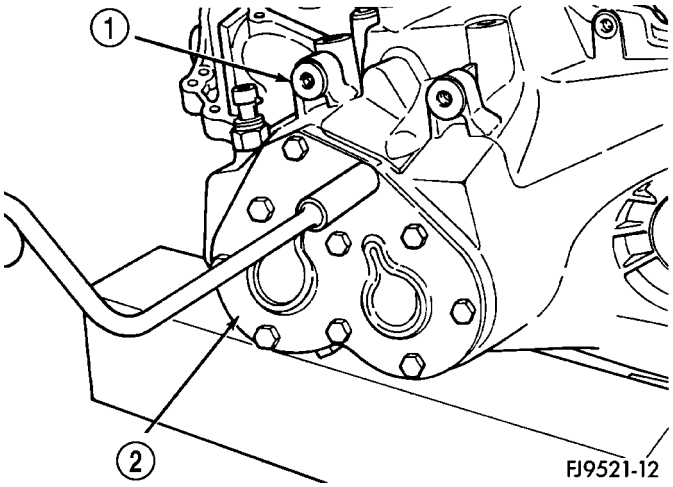

Fig. 56 Transaxle End Cover

1 - TRANSAXLE CASE
2 - END COVER

T350 MANUAL TRANSAXLE (Continued)

(11) Remove gear case from bench fixture.

(12) Install gear case in a holding fixture with end cover facing down.

(13) Turn selector shaft into slot on blocker assembly (Fig. 57).

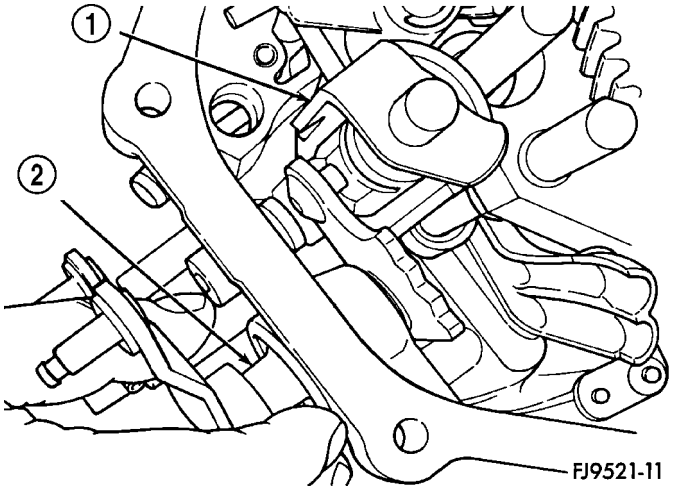

Fig. 57 Selector Shaft

1 - SHIFT ASSEMBLY
2 - SELECTOR SHAFT

(14) Push selector shaft spacer clip onto selector shaft. Install shift levers.

(15) Install reverse idler gear and spacer as shown in (Fig. 58).

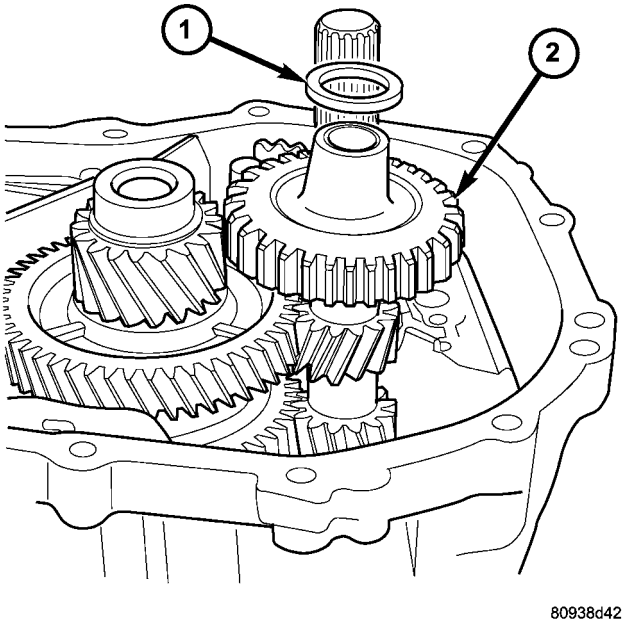

Fig. 58 Reverse Idler Gear and Spacer

1 - SPACER
2 - REVERSE IDLER GEAR

(16) Install reverse idler shaft (Fig. 59).

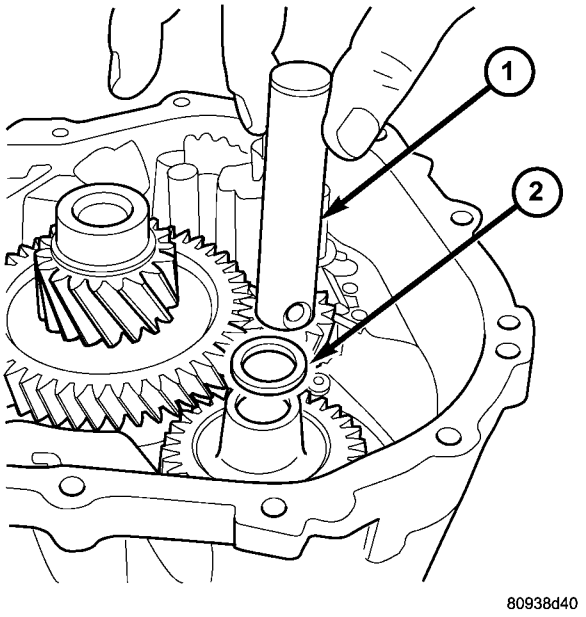

Fig. 59 Reverse Idler Shaft Installation

1 - REVERSE IDLER SHAFT
2 - SPACER

(17) Install bolt into shaft and tighten to 26 N·m (19 ft. lbs.) torque (Fig. 60).

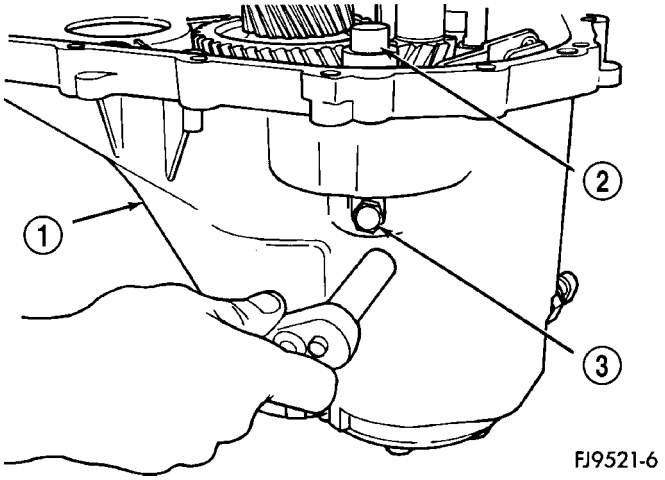

Fig. 60 Reverse Idler Shaft Bolt

1 - CASE
2 - REVERSE IDLER SHAFT
3 - REVERSE IDLER SHAFT BOLT

T350 MANUAL TRANSAXLE (Continued)

(18) Install reverse fork bracket and reverse lockout. Tighten screws to 11 N·m (96 in. lbs.) torque (Fig. 61) (Fig. 62).

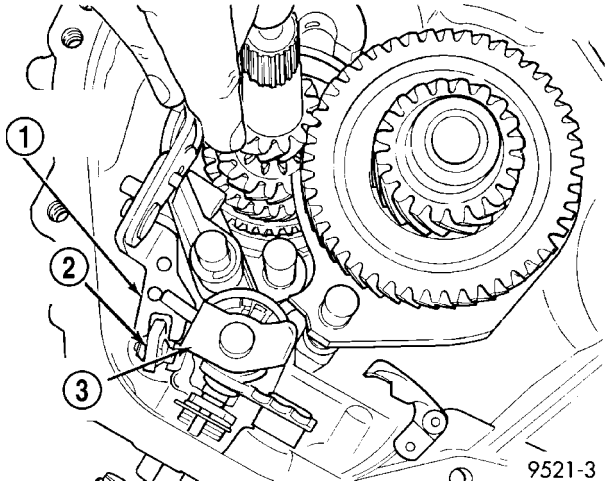

Fig. 61 Reverse Fork Bracket

1 - REVERSE FORK BRACKET
2 - REVERSE CAM BLOCKOUT
3 - SHIFT BLOCKER ASSEMBLY

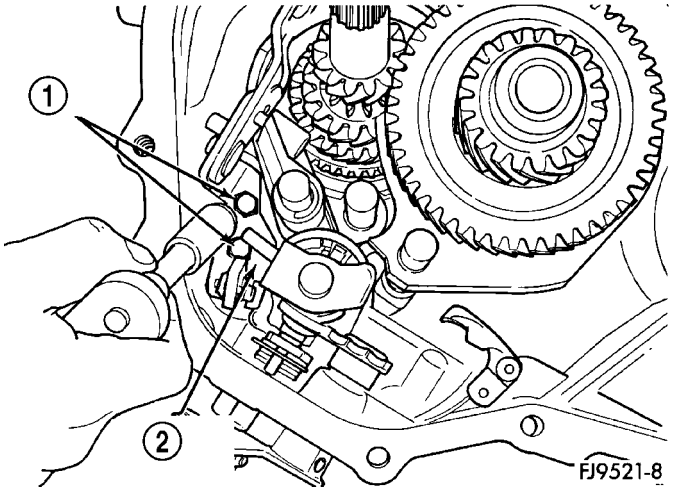

Fig. 62 Reverse Fork Screws

1 - SCREWS (2)
2 - REVERSE FORK BRACKET

(19) Install differential into gear case (Fig. 63).

BEARING ADJUSTMENT PROCEDURE

(1) Use extreme care when removing and installing bearing cups and cones. Use only an arbor press for installation, as a hammer may not properly align the bearing cup or cone. Burrs or nicks on the bearing seat gives a false end–play reading while gauging for proper shims. Improperly seated bearing cups and cones are subject to low–mileage failure.

(2) Bearing cups and cones should be replaced if they show signs of pitting or heat distress. If distress

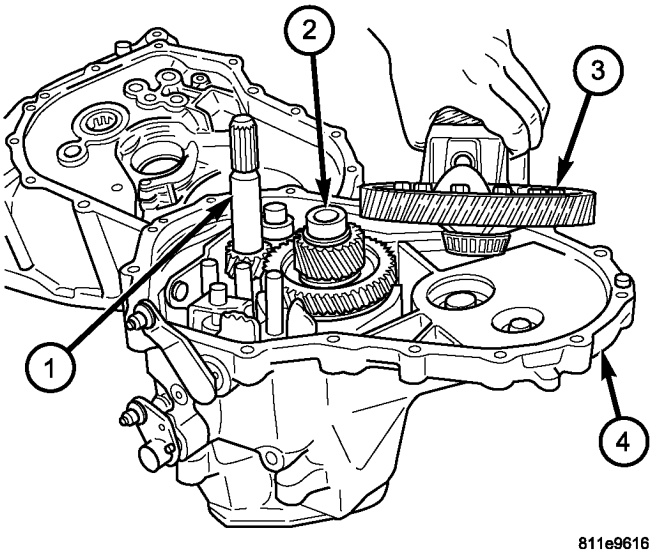

Fig. 63 Differential Removal/Installation

1 - INPUT SHAFT
2 - OUTPUT SHAFT
3 - DIFFERENTIAL ASSEMBLY
4 - GEARTRAIN HOUSING

is seen on either the cup or bearing rollers, both cup and cone must be replaced.

(3) Bearing preload and drag torque specifications must be maintained to avoid premature bearing failures. Used (original) bearings may lose up to 50% of the original drag torque after break–in. All bearing adjustments must be made with no other component interference or gear intermesh.

(4) Replace bearings as a pair: If one differential bearing is defective, replace both differential bearings, if one input shaft bearing is defective, replace both input shaft bearings.

(5) Bearing cones must not be reused if removed.

(6) Turning–torque readings should be obtained while smoothly rotating in either direction.

DIFFERENTIAL BEARING PRELOAD ADJUSTMENT

NOTE: True bearing turning–torque readings can be obtained only with the geartrain removed from the case.

(1) Remove bearing cup and existing shim from clutch bellhousing case.

(2) Press in new bearing cup into bellhousing case (or use a cup that has been ground down on the outer edge for ease of measurement).

(3) Press in new bearing cup into gear case side.

(4) Oil differential bearings with transmission fluid. Install differential assembly in transaxle gear case. Install clutch bellhousing over gear case. Install and torque case bolts to 29 N·m (21 ft. lbs.).

T350 MANUAL TRANSAXLE (Continued)

(5) Position transaxle with bellhousing facing down on workbench with C-clamps. Position dial indicator.

NOTE: Position of dial indicator in (Fig. 64) is for illustrative purposes only. The dial indicator should be parallel to T-Handle to obtain the most accurate reading.

(6) Apply a medium load to differential with Tool C-4995 and a T-handle, in the downward direction. Roll differential assembly back and forth a number of times. This will settle the bearings. Zero the dial indicator. To obtain end play readings, apply a medium load in an upward direction while rolling differential assembly back and forth (Fig. 64). Record end play.

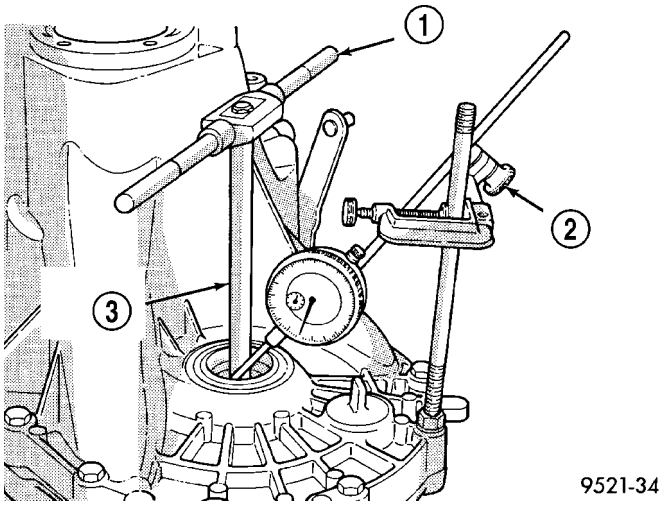

Fig. 64 Checking Differential Bearing End Play To Determine Shim Thickness

1 - T-HANDLE
2 - DIAL INDICATOR SET
3 - SPECIAL TOOL C-4995

(7) The shim required for proper bearing preload is the **total of end play, plus (constant) preload of 0.18mm (0.007 in.).** Never combine shims to obtain the required preload.

(8) Remove case bolts. Remove clutch bellhousing differential bearing cup. Install shim(s) selected in Step 7. Then press the bearing cup into clutch bellhousing.

(9) Install clutch bellhousing. Install and torque case bolts to 26 N·m (19 ft. lbs.).

(10) Using Special Tool C-4995 and an inch-pound torque wrench, check turning torque of the differential assembly (Fig. 65). **The turning torque should be 6 to 12 in. lbs. If the turning torque is too high, install a 0.05mm (0.002 inch) thinner shim. If the turning torque is too low, install a 0.05mm (0.002 inch) thicker shim.**

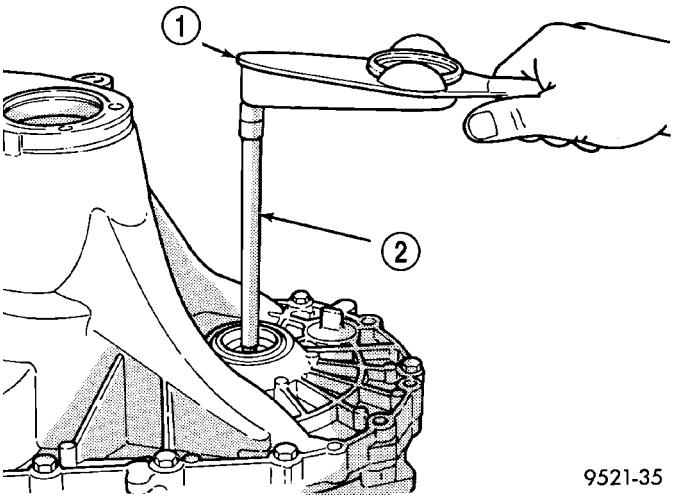

Fig. 65 Checking Differential Bearing Turning Torque

1 - INCH-POUND TORQUE WRENCH
2 - SPECIAL TOOL C-4995

(11) Recheck turning torque. Repeat Step 10 until the proper turning torque is obtained.

Once proper turning torque has been established, place gear case on the end plate. Draw a bead of Mopar® Gasket Maker, Loctite® 518, or equivalent, on the flat surface of the case mating flange. Install clutch bellhousing onto gear case. Install and tighten case bolts to 29 N·m (21 ft. lbs.).

INSTALLATION

(1) Install clutch module (if equipped) onto input shaft. Install transaxle into position.

(2) Install transaxle-to-engine mounting bolts (Fig. 20) and tighten to 108 N·m (80 ft. lbs.) torque.

(3) Raise engine and transaxle with screw jack until upper mount bracket aligns with upper mount. Install mount bolts and tighten to 68 N·m (50 ft. lbs.) torque (Fig. 19).

(4) Remove screwjack.

(5) Install four (4) modular clutch-to-driveplate bolts (Fig. 66). Align drive plate and modular clutch alignment marks placed upon disassembly. Start with tight-tolerance (slotted) hole, install and torque bolts to 88 N·m (65 ft. lbs.) torque.

(6) Install starter motor and tighten bolts to 54 N·m (40 ft. lbs.) torque. Make sure to fasten ground cable to upper starter bolt as shown in (Fig. 18).

(7) Connect starter electrical harness and tighten positive cable nut to 10 N·m (90 in. lbs.) torque.

(8) Install bellhousing dust cover (Fig. 16).

(9) Install left engine-to-transaxle bending brace and structural collar (Fig. 15). Refer to ENGINE for proper tightening procedure.

(10) Install power steering hose to structural collar.

T350 MANUAL TRANSAXLE (Continued)

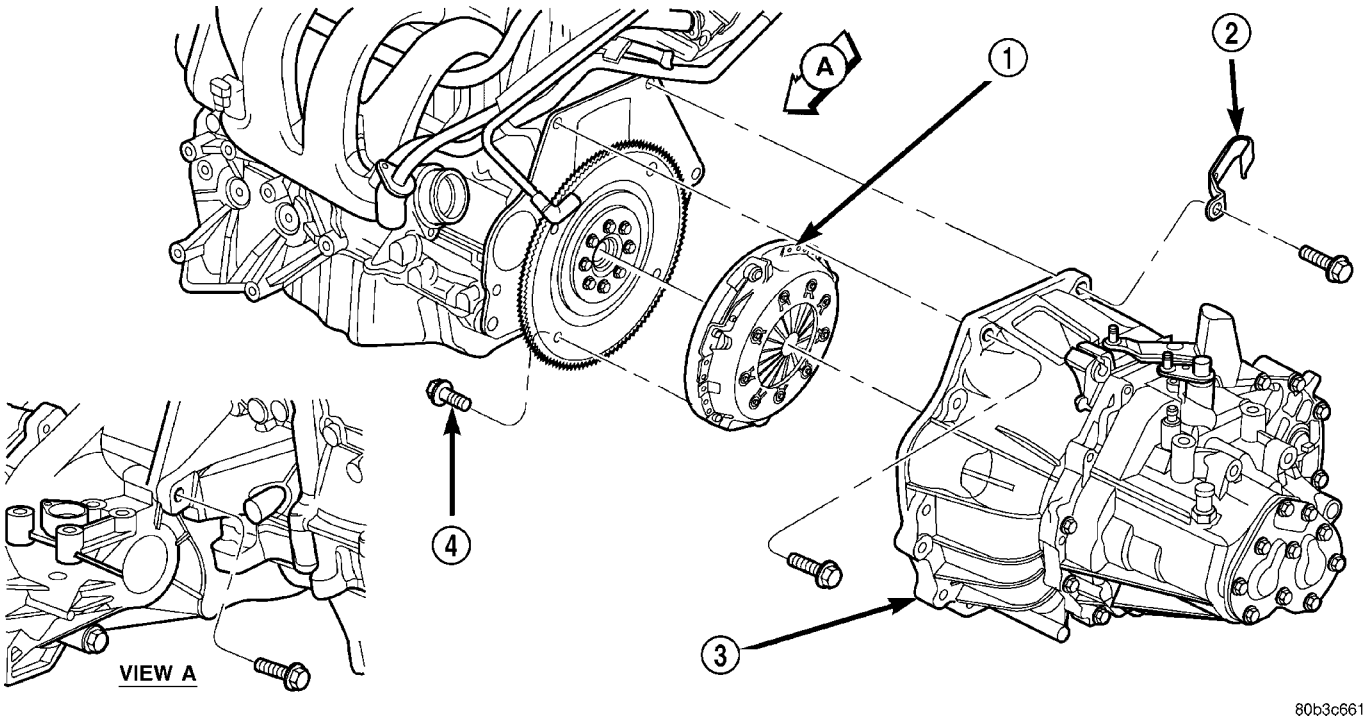

Fig. 66 Transaxle Removal/Installation (2.4L Shown)

1 - MODULAR CLUTCH ASSEMBLY
2 - CLIP
3 - TRANSAXLE
4 - CLUTCH MODULE BOLT (4)

(11) Install the right lateral bending brace and tighten bolts to 81 N·m (60 ft. lbs.) torque (Fig. 17).

(12) Install both front axle driveshafts.

(13) Fill transaxle with suitable amount of fluid.

(14) Connect clutch master cylinder tube to the hydraulic clutch slave cylinder (Fig. 12) (Fig. 13). An audible click should be heard. Verify connection by pushing and pulling quick connect.

(15) Lower vehicle.

(16) Connect vehicle speed sensor connector (Fig. 10).

(17) Connect shift crossover and selector cables to shift lever. Install cables to bracket and install retaining clips (Fig. 9).

(18) Connect back-up lamp switch connector (Fig. 8).

(19) Install battery tray (Fig. 7).

(20) Install battery and tighten hold down clamp to secure battery (Fig. 6).

(21) Install the air cleaner assembly (Fig. 5).

(22) Connect the battery cables.

(23) Road test vehicle and inspect for leaks.

T350 MANUAL TRANSAXLE (Continued)

SPECIFICATIONS

Bolts that have thread sealer or torque lock patches should not be reused. Always install new bolts in these applications.

AXLE SEAL

REMOVAL

(1) Remove axle shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - REMOVAL)

(2) Insert a flat–blade pry tool at outer edge of axle shaft seal (Fig. 67).

(3) Tap on the pry tool with a small hammer and remove axle shaft seal.

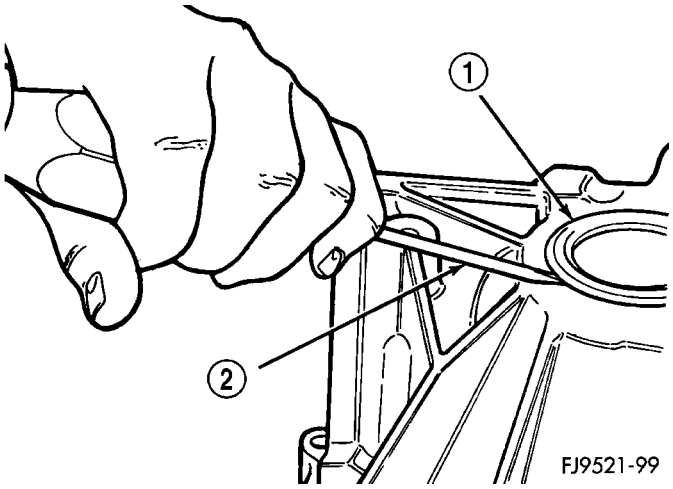

Fig. 67 Axle Shaft Seal Removal

1 - AXLE SEAL
2 - PRY TOOL

INSTALLATION

(1) Clean axle shaft seal bore of any excess sealant.

(2) Align axle shaft seal with axle shaft seal bore.

(3) Install axle seal on Tool #6709 and C-4171 and insert into axle shaft seal bore.

(4) Tap seal into position until seated against transaxle case.

(5) Install axle shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - INSTALLATION)

(6) Check transaxle fluid level and adjust as necessary.

BACK-UP LAMP SWITCH

REMOVAL

(1) Lift vehicle on hoist.

(2) From bottom side of vehicle, disconnect back-up lamp switch connector (Fig. 68).

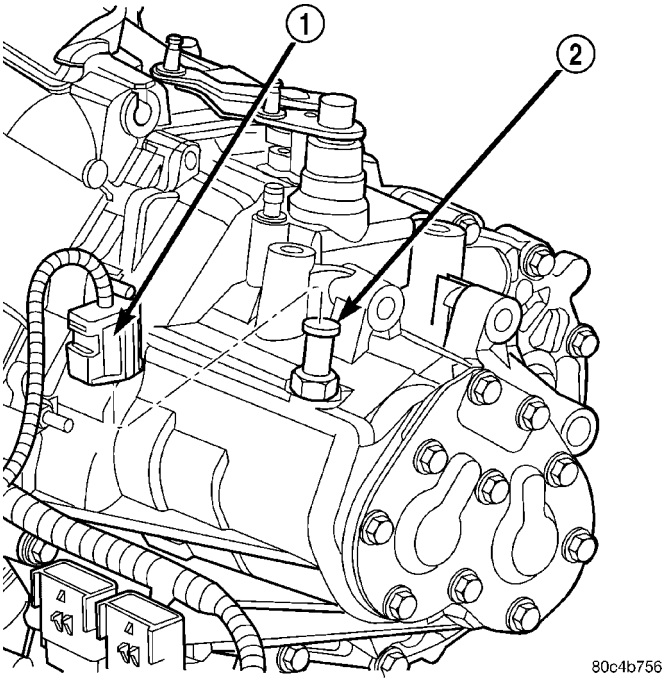

Fig. 68 BACK-UP LAMP SWITCH

1 - CONNECTOR
2 - BACK UP LAMP SWITCH

(3) Unscrew switch from transaxle.

INSTALLATION

(1) Install back-up lamp switch. Teflon tape or equivalent must be used on switch threads. Tighten switch to 24 N·m (18 ft. lbs.) torque.

CAUTION: Do not overtighten switch.

(2) Connect back-up lamp switch connector (Fig. 68).

(3) Lower vehicle.

(4) Verify back-up lamp operation.

DIFFERENTIAL

DISASSEMBLY

(1) Remove differential bearing cones (ring gear and diff. case side) using Tool C-293-PA, Adapters C-293-45, and Tool 4996 (Fig. 69) (Fig. 70).

2 - DIAL INDICATOR SET
3 - DIFFERENTIAL ASSEMBLY
4 - SIDE GEAR

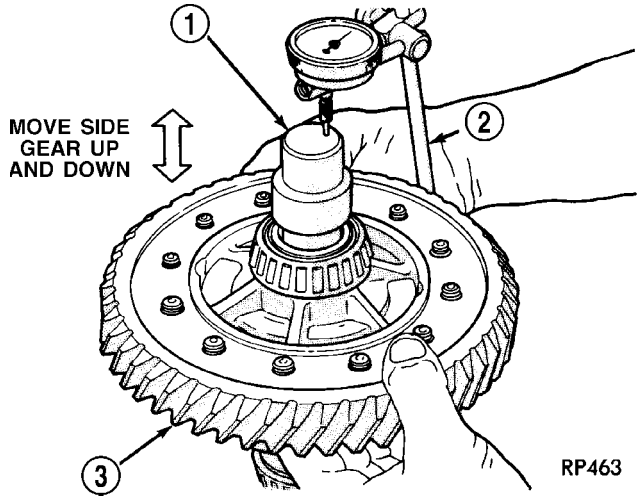

Fig. 91 Checking Side Gear End Play—Typical

1 - SPECIAL TOOL C-4996 (NOTE POSITION)
2 - DIAL INDICATOR SET
3 - DIFFERENTIAL ASSEMBLY

(2) Using the smallest end play recorded, shim that side gear to within 0.001 to 0.013 inch. The other side gear should be checked using the same procedure.

CAUTION: Side gear end play must be within 0.001 to 0.013 inch. Five select thrust washers are available: 0.027, 0.032, 0.037, 0.042, and 0.047 inch.

DIFFERENTIAL (Continued)

ADJUSTMENTS

DIFFERENTIAL BEARING PRELOAD ADJUSTMENT / SHIM SELECTION

Measure and adjust differential side bearing preload during any transaxle service, especially when the following components are replaced:

- Transaxle gear case
- Clutch bellhousing case
- Differential case
- Differential bearings

NOTE: True bearing turning torque readings can be obtained only with the geartrain removed from the case.

(1) Remove bearing cup and existing shim from clutch bellhousing case.

(2) Press in new bearing cup into bellhousing case (or use a cup that has been ground down on the outer edge for ease of measurement).

(3) Press in new bearing cup into gear case side.

(4) Oil differential bearings with transmission fluid. Install differential assembly in transaxle gear case. Install clutch bellhousing over gear case. Install and torque case bolts to 29 N·m (21 ft. lbs.).

(5) Position transaxle with bellhousing facing down on workbench with C-clamps. Position dial indicator.

NOTE: Indicator is set up as shown for illustrative purposes only (Fig. 92). Indicator must be parallel to T-Handle to obtain the most accurate reading.

(6) Apply a medium load to differential with Tool C-4995 and a T-handle, in the downward direction. Roll differential assembly back and forth a number of times. This will settle the bearings. Zero the dial indicator. To obtain end play readings, apply a medium load in an upward direction while rolling differential assembly back and forth (Fig. 92). Record end play.

(7) The shim required for proper bearing preload is the **total of end play, plus (constant) preload of 0.18 mm (0.007 in.).** Never combine shims to obtain the required preload.

(8) Remove case bolts. Remove clutch bellhousing differential bearing cup. Install shim(s) selected in Step 7. Then press the bearing cup into clutch bellhousing.

(9) Install clutch bellhousing. Install and torque case bolts to 26 N·m (19 ft. lbs.).

(10) Using Special Tool C-4995 and an inch-pound torque wrench, check turning torque of the differential assembly (Fig. 93). **The turning torque should be 6 to 12 in. lbs. If the turning torque is too high, install a 0.05 mm (0.002 inch) thinner shim. If the turning torque is too low, install a 0.05mm (0.002 inch) thicker shim.**

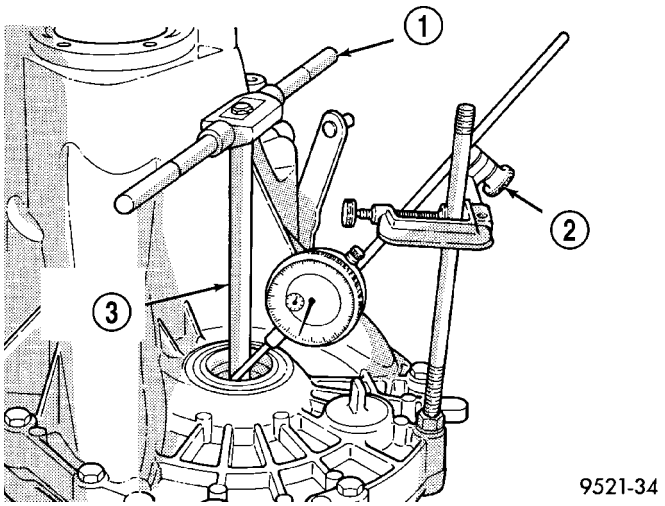

Fig. 92 Checking Differential Bearing End Play to Determine Shim Thickness

2 - DIAL INDICATOR SET
3 - SPECIAL TOOL C-4995

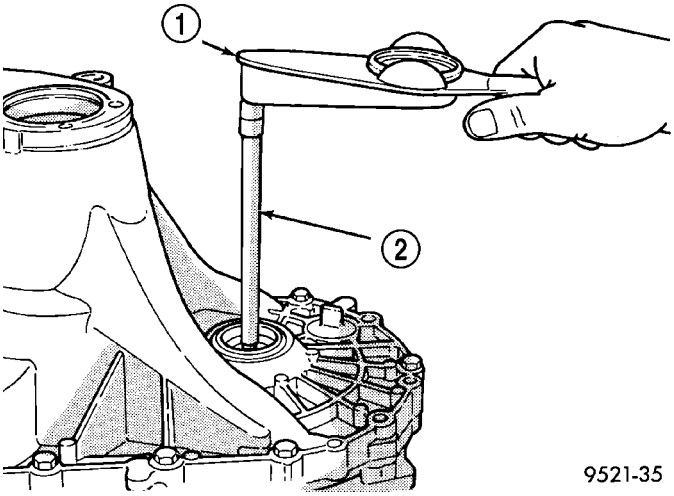

Fig. 93 Checking Differential Bearing Turning Torque

1 - INCH-POUND TORQUE WRENCH
2 - SPECIAL TOOL C-4995

(11) Recheck turning torque. Repeat Step 10 until the proper turning torque is obtained.

DIFFERENTIAL BEARING CUPS

REMOVAL

(1) Remove differential assembly from gear case using the procedure outlined in this group.

(2) Install Miller tool #L-4518 into the differential bearing cup (Fig. 94).

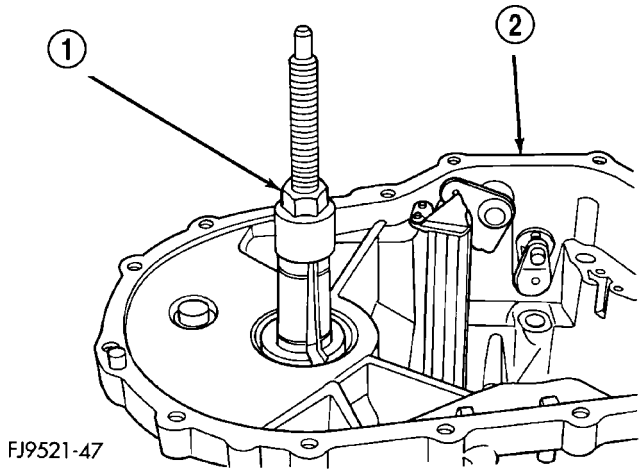

Fig. 94 Tool Installed in Bearing

1 - SPECIAL TOOL L-4518
2 - GEAR CASE

(3) Install the tool cup over the tool (Fig. 95).

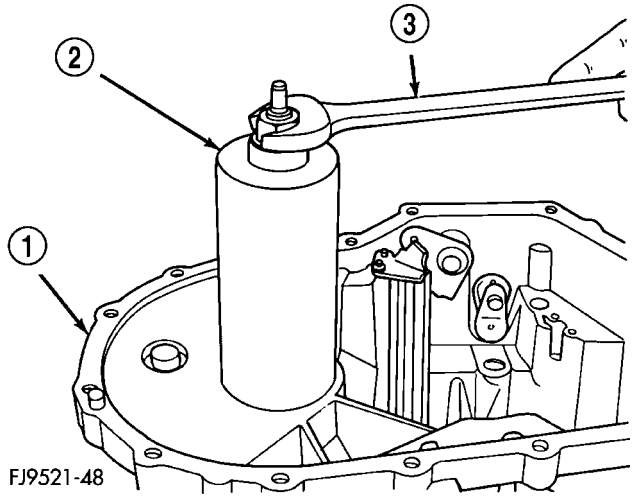

Fig. 95 Tool Cup Installed

1 - GEAR CASE
2 - SPECIAL TOOL L-4518
3 - WRENCH

(4) Tighten the tool until the race is removed from the case.

INSTALLATION

(1) Position the bearing cup into the case.

(2) Install the bearing cup onto Miller tool #L-4520.

(3) Using Miller tool #L-4520 and C-4171 driver, install differential bearing cup into the transaxle case.

FLUID

STANDARD PROCEDURE - FLUID DRAIN AND FILL

NOTE: All T350 Manual Transaxles require the use of ATF+4 (Automatic Transmission Fluid).

The transaxle fill plug is located on the left side of the transaxle differential area (Fig. 96). The fluid level should be within 3/16 inch from the bottom of the transaxle fill hole (vehicle must be level when checking).

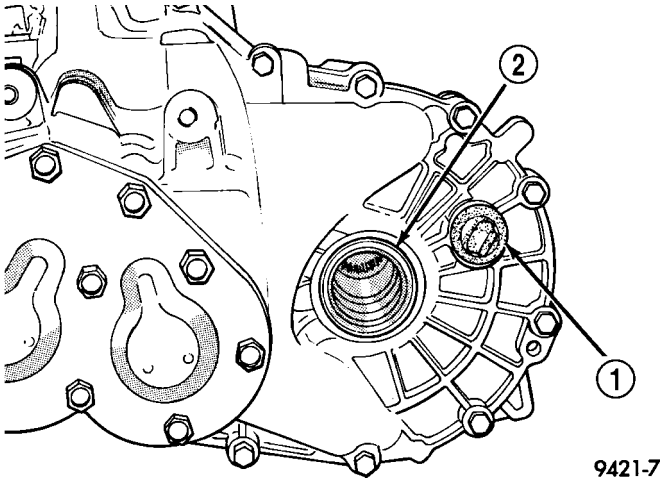

Fig. 96 Fill Plug Location

1 - RUBBER FILL PLUG
2 - LEFT DRIVESHAFT SEAL

FLUID (Continued)

The transaxle drain plug is located on the lower right side of the transaxle differential housing (Fig. 97). Tighten drain plug to 14 N·m (120 in. lbs.)

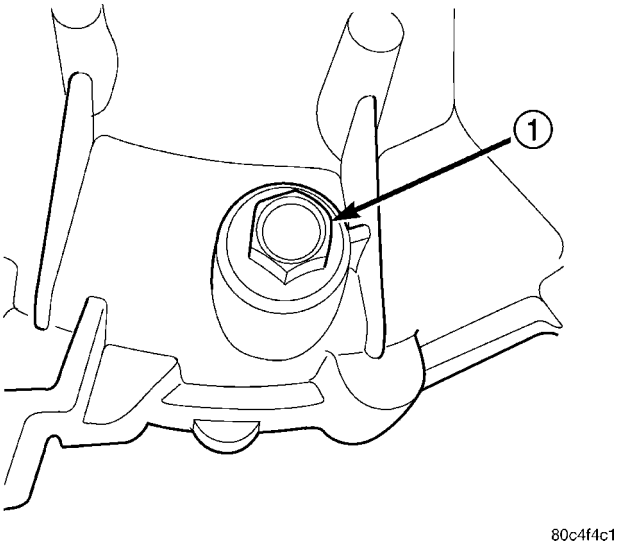

Fig. 97 Drain Plug Location

1 - DRAIN PLUG

Fill transaxle to capacity with suitable amount of ATF+4. Refer to following chart. Wipe the outside of the transaxle if any lubricant spills.

NV T350 MANUAL TRANSAXLE FLUID FILL

TRANSAXLE	METRIC MEASURE	U.S. MEASURE
NV T350	2.4-2.7 Liters	2.5-2.8 Quarts

GEAR SHIFT BOOT

REMOVAL

(1) Pull up on gearshift knob with moderate force to remove from gearshift mechanism (Fig. 98).

(2) Remove shifter boot/bezel assembly from console by lifting up at mounting ring area (Fig. 99).

INSTALLATION

(1) Position gearshift boot (Fig. 99) over the gearshift mechanism and engage tab on mount ring at front to opening in console. Apply hand pressure to engage bosses on mount ring of boot to console opening slots.

(2) Position gearshift knob hole over the gearshift mechanism (Fig. 98) and align the shift pattern.

(3) Strike knob with rubber mallet to engage knob to mechanism.

(4) Verify that shift pattern is aligned properly.

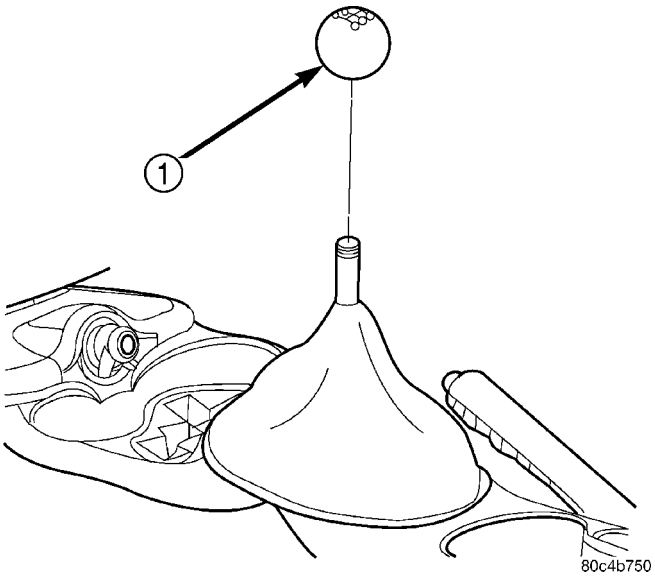

Fig. 98 Gearshift Knob Removal/Installation

1 - GEARSHIFT KNOB

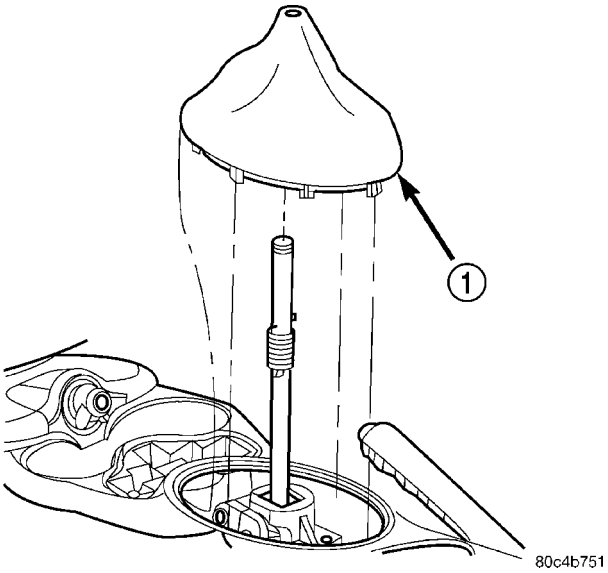

Fig. 99 Gearshift Boot Removal/Installation

1 - GEARSHIFT BOOT

GEAR SHIFT CABLE

REMOVAL

NOTE: The crossover and selector cables are manufactured as a cable "assembly" and cannot be serviced individually.

(1) Pull up on gearshift knob with moderate force to remove from gearshift mechanism (Fig. 100).

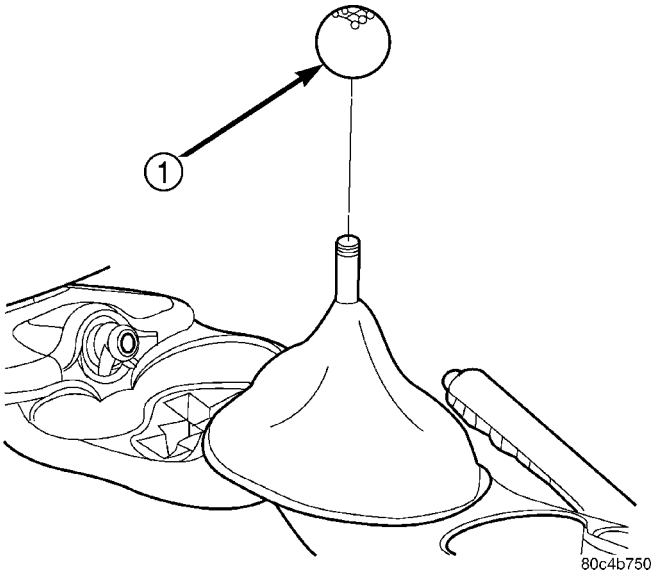

Fig. 100 Gearshift Knob Removal/Installation

1 - GEARSHIFT KNOB

(2) Remove shifter boot/bezel assembly from console by lifting up at mounting ring area (Fig. 101).

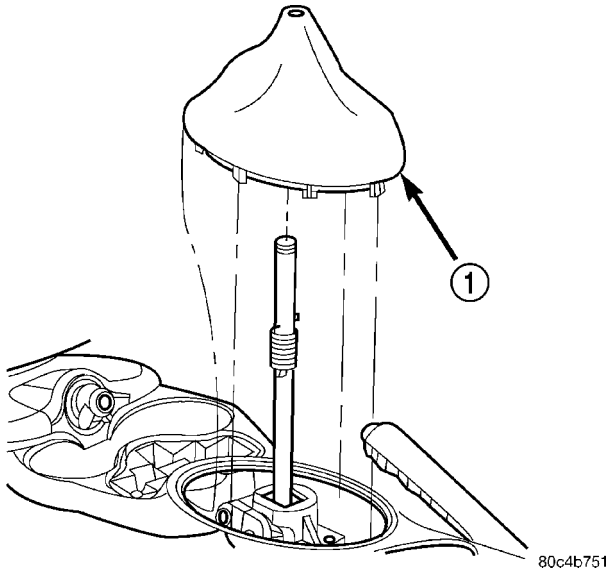

Fig. 101 Gearshift Boot

1 - GEARSHIFT BOOT

(3) Remove the center console assembly as shown in (Fig. 102).

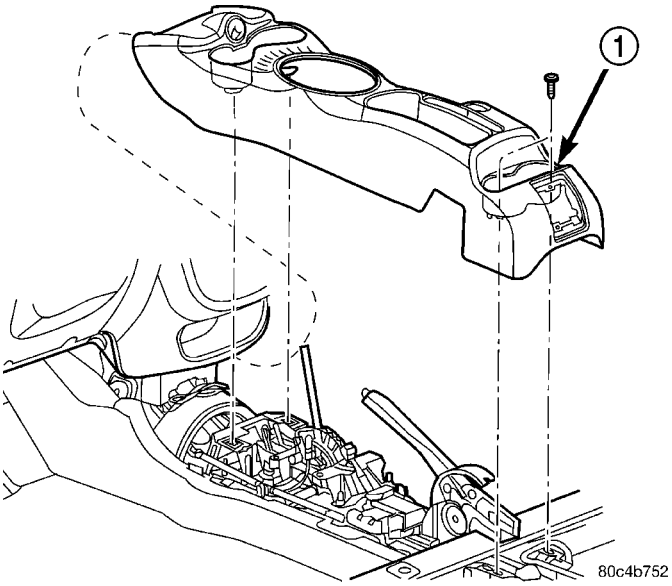

Fig. 102 Center Console Removal/Installation—Typical

1 - CENTER CONSOLE

(4) Remove crossover cable retaining clip and disconnect from shift lever (Fig. 103).

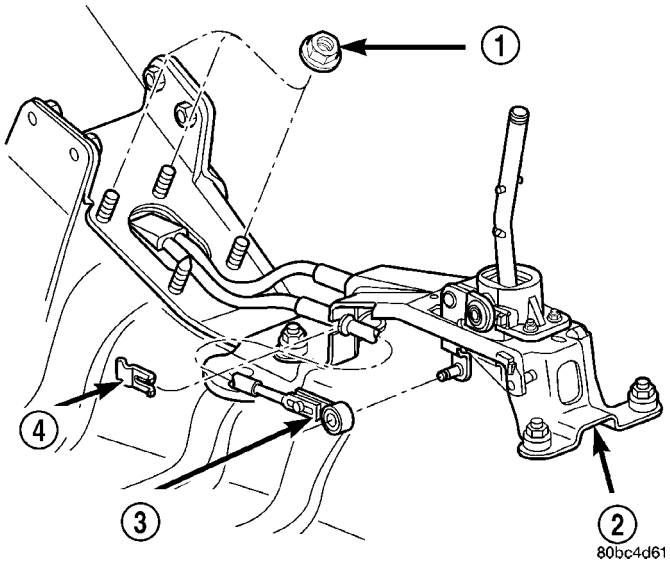

Fig. 103 Crossover Cable at Shifter Assembly

1 - GROMMET PLATE NUT
2 - SHIFTER
3 - CROSSOVER CABLE
4 - CLIP

GEAR SHIFT CABLE (Continued)

(5) Remove selector cable retaining clip and disconnect from shift lever (Fig. 104).

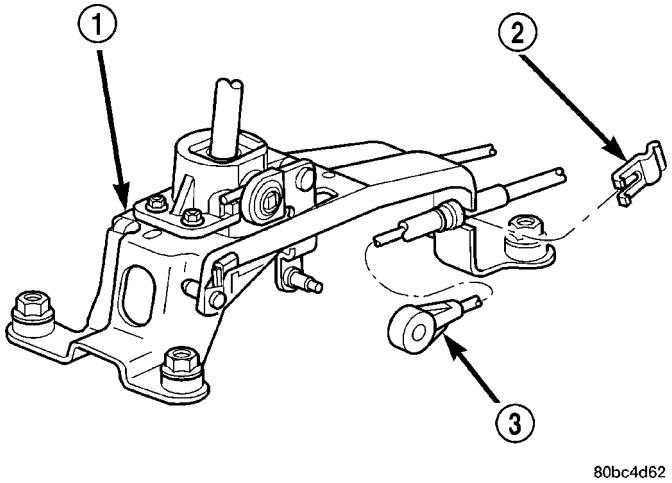

Fig. 104 Selector Cable at Shifter Assembly

1 - SHIFTER
2 - CLIP
3 - SELECTOR CABLE

(6) Remove three grommet plate-to-floor pan attaching nuts (Fig. 103).

(7) Remove air cleaner assy (Fig. 105).

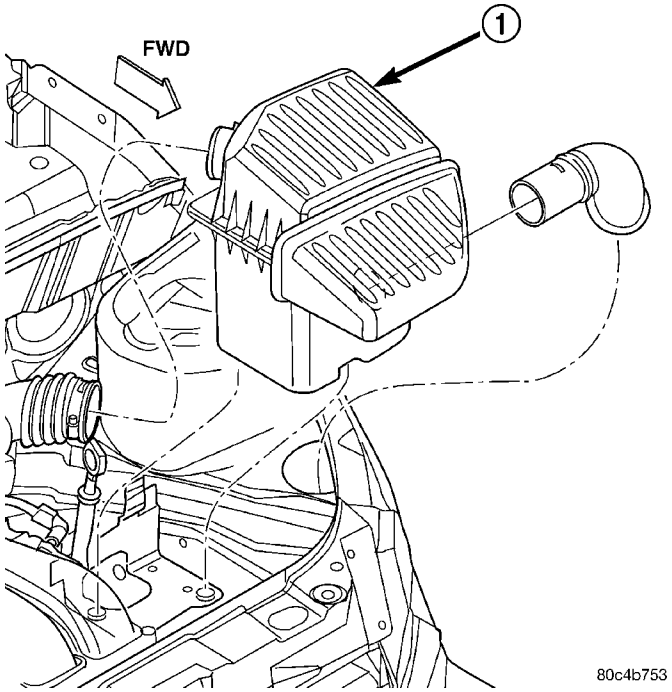

Fig. 105 Air Cleaner Assembly Removal/Installation

1 - AIR CLEANER ASSEMBLY

(8) Disconnect battery cables.

(9) Remove battery hold-down clamp and battery (Fig. 106).

(10) Remove battery tray (Fig. 107).

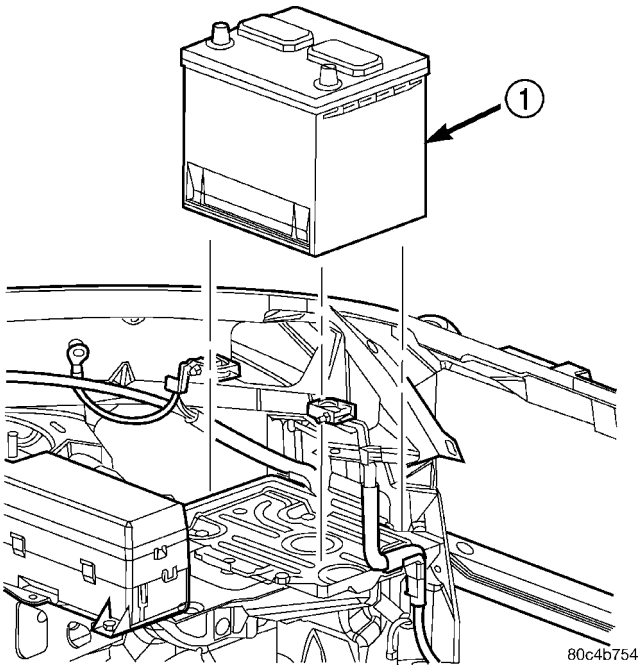

Fig. 106 Battery Removal/Installation

1 - BATTERY

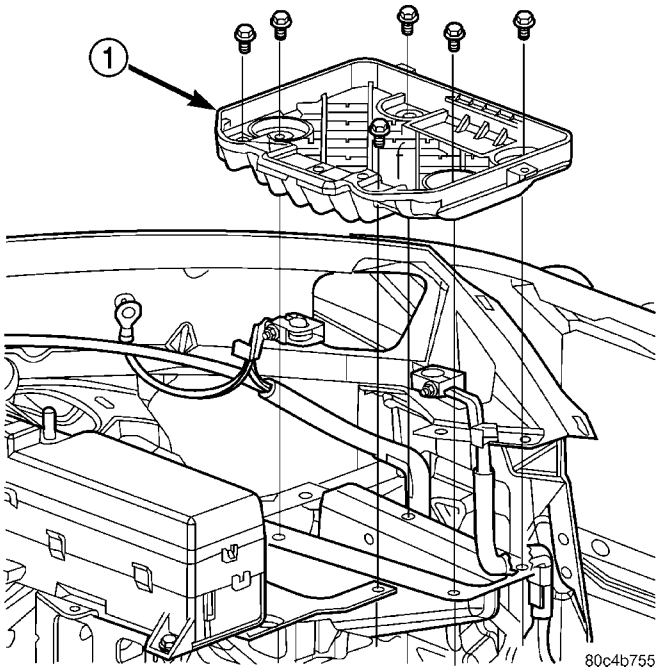

Fig. 107 Battery Tray Removal/Installation

1 - BATTERY TRAY

(11) Disconnect cables from the shift levers at the transaxle (Fig. 108).

CAUTION: Pry up with equal force on both sides of shifter cable isolator bushings to avoid damaging cable isolator bushings.

GEAR SHIFT CABLE (Continued)

(12) Remove cable retaining clips and remove cables from bracket (Fig. 108).

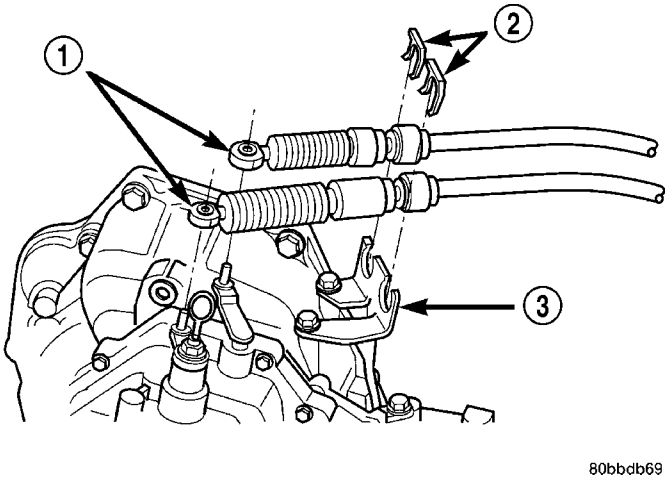

Fig. 108 Shift Cables at Transaxle

1 - SHIFT CABLES
2 - CLIPS
3 - BRACKET

(13) Raise vehicle on hoist.
(14) Remove converter heat shield (Fig. 109).

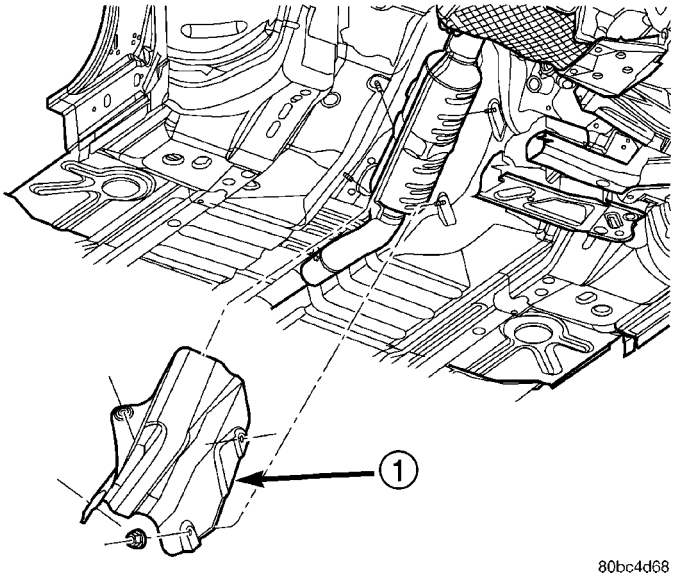

Fig. 109 Converter Heat Shield Removal/Installation

1 - CONVERTER HEAT SHIELD

(15) Remove remaining grommet plate-to-floor pan screw (Fig. 110).
(16) Remove cable assembly from vehicle.

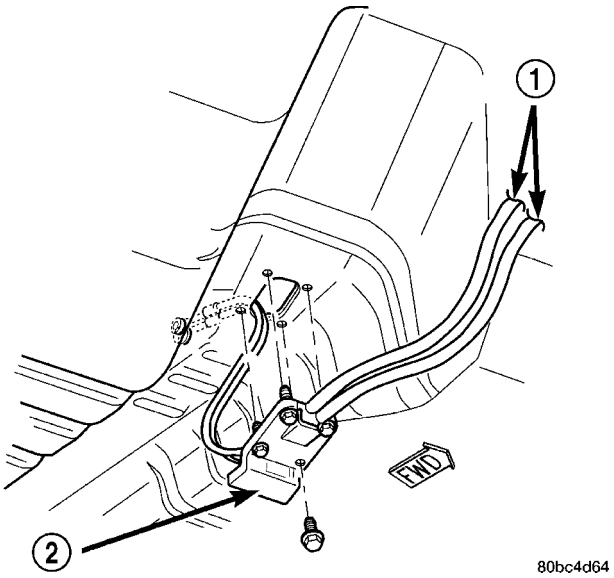

Fig. 110 Shift Cable Assembly at Floor Pan

1 - CABLE ASSEMBLY
2 - GROMMET PLATE

INSTALLATION

CAUTION: Gearshift cable bushings must not be lubricated or the bushings will swell and split.

(1) Raise vehicle on hoist.
(2) Install cable assembly through floor pan opening and secure to floor pan with grommet plate and one screw (Fig. 111). Make sure the three grommet plate studs protrude through cable assembly and floor pan and tighten screw to 7 N·m (60 in. lbs.).

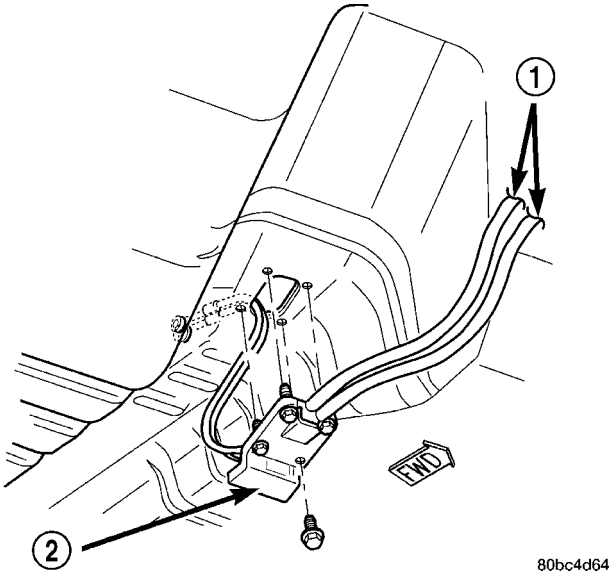

Fig. 111 Shift Cable Assembly at Floor Pan

1 - CABLE ASSEMBLY
2 - GROMMET PLATE

GEAR SHIFT CABLE (Continued)

(3) Route transaxle end of cable assembly into engine compartment and over transaxle assembly.

(4) Install converter heat shield (Fig. 112).

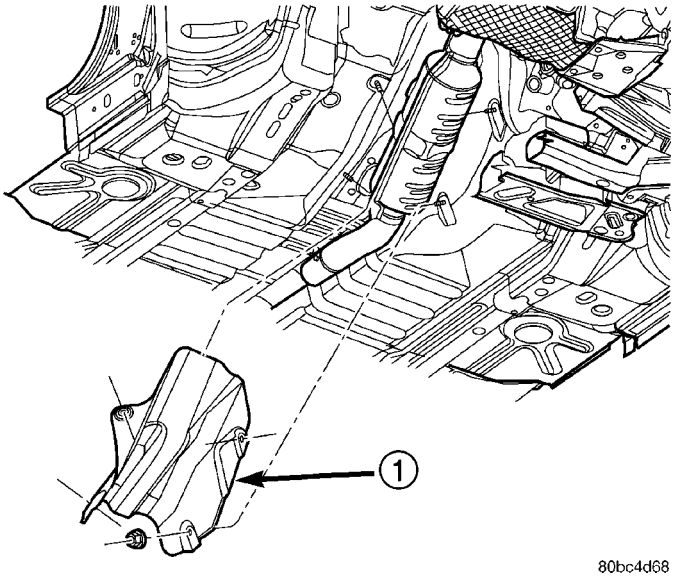

Fig. 112 Converter Heat Shield Removal/Installation

1 - CONVERTER HEAT SHIELD

(5) Lower vehicle.

(6) Install gearshift cables to mounting bracket and fasten with NEW clips (Fig. 113). Make sure clips are installed flush to bracket.

(7) Connect gearshift selector and crossover cable to shift levers at transaxle (Fig. 113).

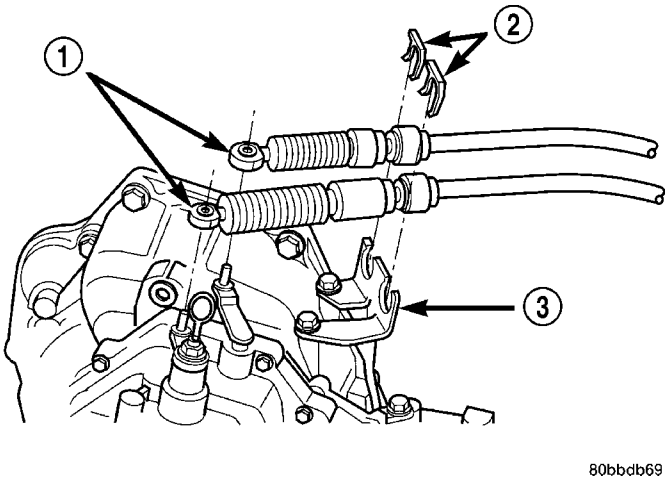

Fig. 113 Shift Cables at Transaxle

1 - SHIFT CABLES
2 - CLIPS
3 - BRACKET

(8) Install and tighten the three grommet plate-to-floor pan nuts to 6 N·m (50 in. lbs.) torque.

(9) Install selector cable to shifter lever and secure cable to shifter bracket. Install clip (Fig. 114).

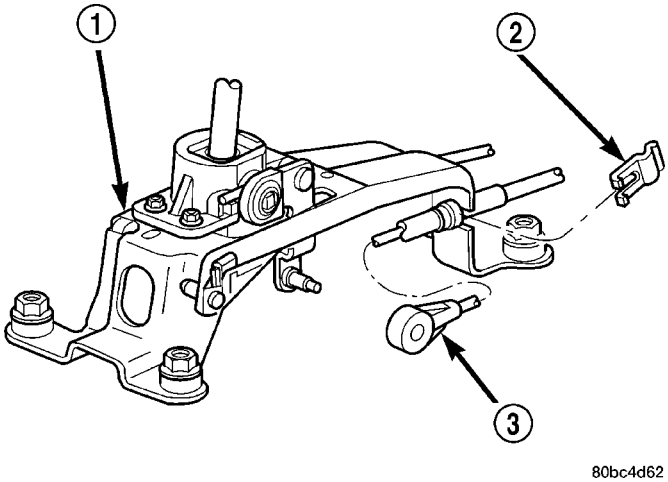

Fig. 114 Selector Cable at Shifter Assembly

1 - SHIFTER
2 - CLIP
3 - SELECTOR CABLE

(10) Install crossover cable to shifter lever and secure cable to shifter bracket. Install clip (Fig. 115).

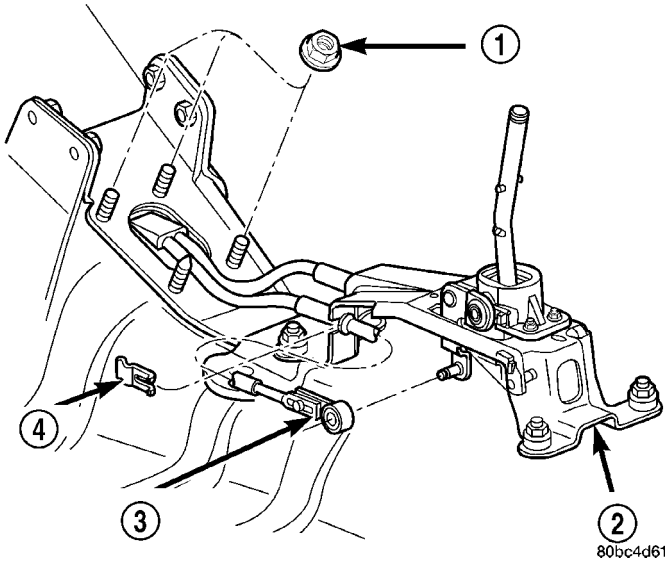

Fig. 115 Crossover Cable at Shifter Assembly

1 - GROMMET PLATE NUT
2 - SHIFTER
3 - CROSSOVER CABLE
4 - CLIP

NOTE: Only the crossover cable is adjustable. The selector cable does not have any adjustment capabilities.

(11) **Adjust crossover cable as follows:**

GEAR SHIFT CABLE (Continued)

(a) Loosen adjusting screw on crossover cable at shifter (Fig. 116).

(b) The gearshift mechanism and transaxle crossover lever are spring-loaded and self-centering. Alignment pins used in the past are not required anymore. Allow gearshift mechanism and transaxle crossover lever to relax in their neutral positions. To ensure the gearshift lever is in the proper position, place the shifter in 3rd or 4th gear if necessary. Torque adjustment screw to 8 N·m (70 in. lbs.). Care must be taken to avoid moving the shift mechanism off-center during screw tightening.

(c) Perform functional check by shifting transaxle into all gears.

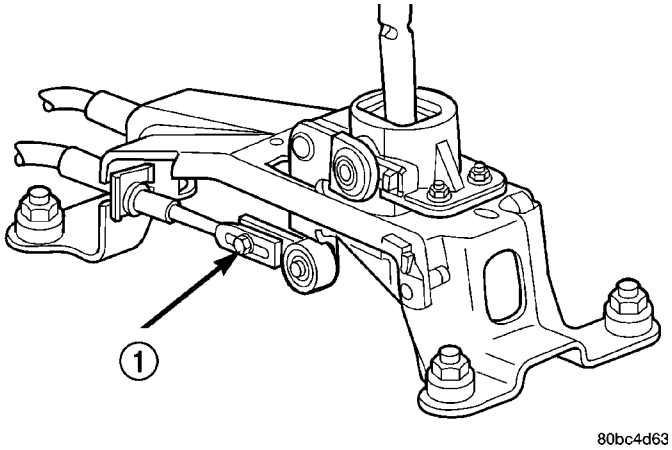

Fig. 116 Crossover Cable Adjustment Screw

1 - CROSSOVER ADJUSTMENT SCREW

(12) Install center console assembly (Fig. 117). Verify that boot is not pinched at console opening before tightening.

(13) Position gearshift boot (Fig. 118) over the gearshift mechanism and engage tab on mount ring at front to opening in console. Apply hand pressure to engage bosses on mount ring of boot to console opening slots.

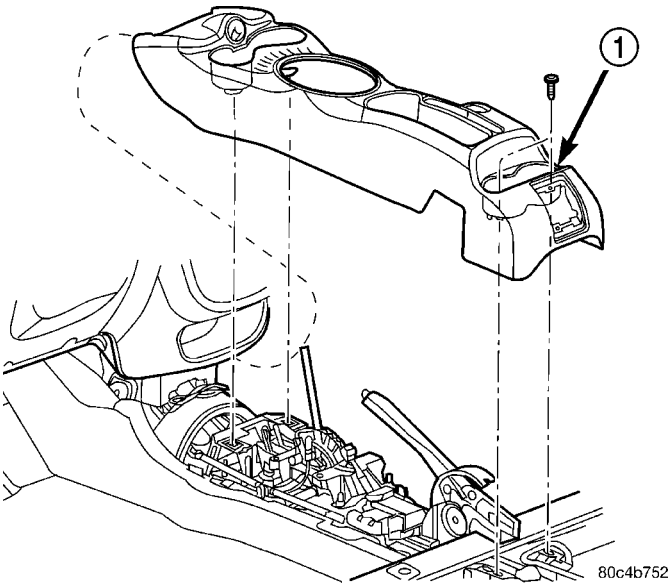

Fig. 117 Center Console Removal/Installation - Typical

1 - CENTER CONSOLE

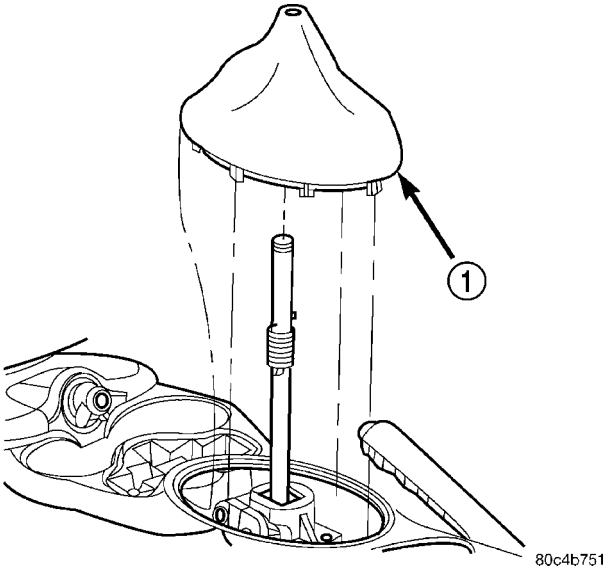

Fig. 118 Gearshift Boot

1 - GEARSHIFT BOOT

GEAR SHIFT CABLE (Continued)

(14) Position gearshift knob hole over the gearshift mechanism (Fig. 119) and align the shift pattern.

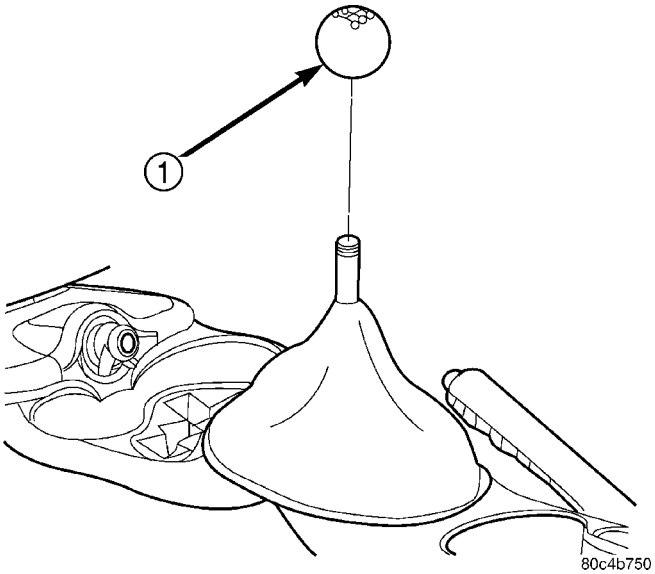

Fig. 119 Gearshift Knob Removal/Installation

1 - GEARSHIFT KNOB

(15) Strike knob with rubber mallet to engage knob to mechanism.

(16) Verify that shift pattern is aligned properly.

(17) Install battery tray (Fig. 120).

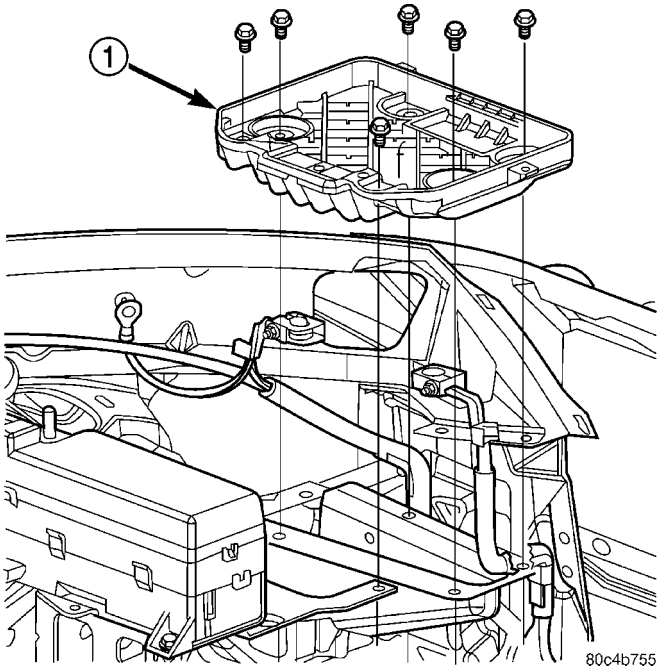

Fig. 120 Battery Tray Removal/Installation

1 - BATTERY TRAY

(18) Install battery and hold-down clamp (Fig. 121).

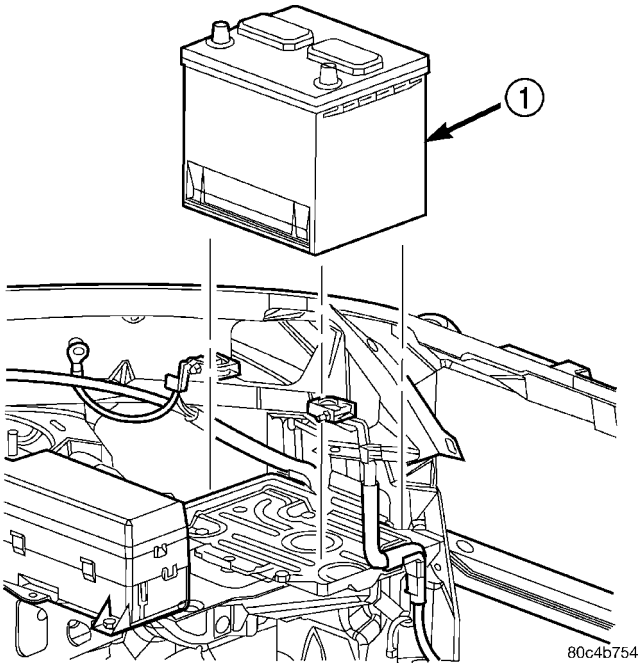

Fig. 121 Battery Removal/Installation

1 - BATTERY

(19) Install the air cleaner assembly (Fig. 122).

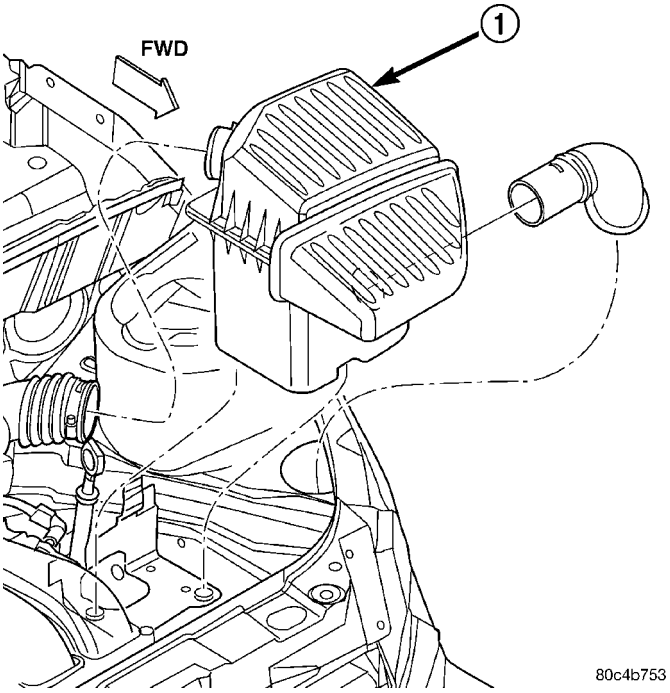

Fig. 122 Air Cleaner Assembly Removal/Installation

1 - AIR CLEANER ASSEMBLY

(20) Connect battery cables.

GEAR SHIFT CABLE (Continued)

ADJUSTMENTS

ADJUSTMENT - GEARSHIFT CROSSOVER CABLE

(1) Remove center console from vehicle. (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - REMOVAL)

(2) Loosen adjusting screw on crossover cable at shifter (Fig. 123).

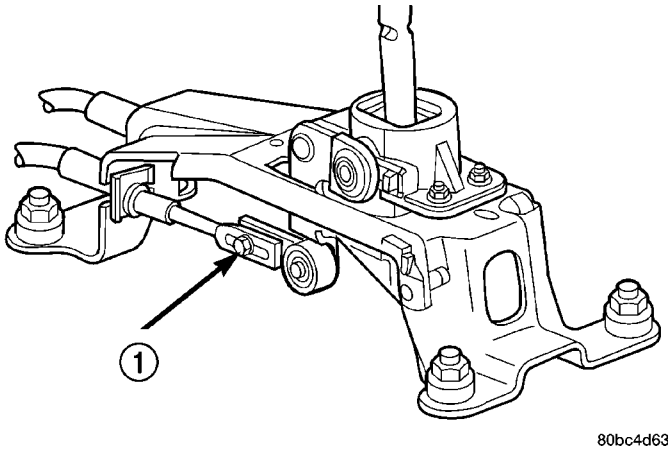

Fig. 123 Loosen Crossover Cable Adjustment Screw

1 - CROSSOVER ADJUSTMENT SCREW

(3) The gearshift mechanism and transaxle crossover lever are spring-loaded and self-centering. Alignment pins used in the past are not required anymore. Allow gearshift mechanism and transaxle crossover lever to relax in their neutral positions. To ensure the gearshift lever is in the proper position, place the shifter in 3rd or 4th gear if necessary. Torque adjustment screw to 8 N·m (70 in. lbs.). Care must be taken to avoid moving the shift mechanism off-center during screw tightening.

(4) Reinstall center console. Reinstall boot and knob. (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - INSTALLATION)

GEAR SHIFT KNOB

REMOVAL

(1) Pull up on gearshift knob with moderate force to remove from gearshift mechanism (Fig. 124).

INSTALLATION

(1) Position knob hole over the gearshift mechanism and align the shift pattern (Fig. 124).

(2) Strike knob with rubber mallet to engage knob to mechanism.

(3) Verify that shift pattern is aligned properly.

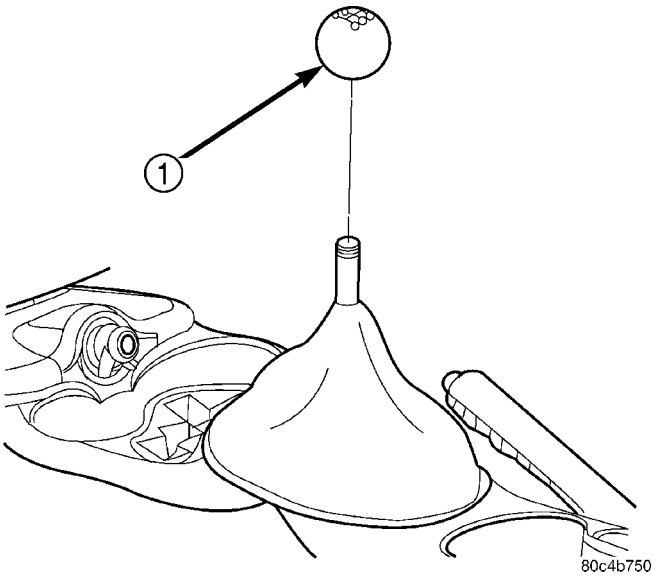

Fig. 124 Gearshift Knob Removal/Installation

GEAR SHIFT MECHANISM (Continued)

(6) Remove four shifter assy.-to-floor pan nuts and remove shifter from vehicle (Fig. 130).

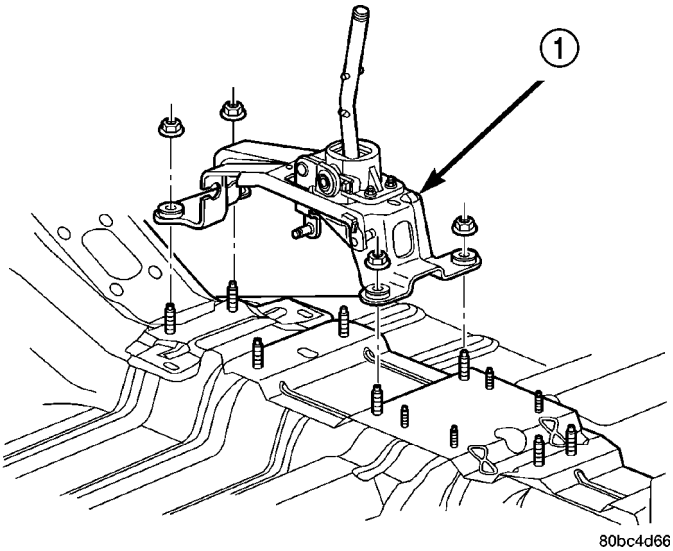

Fig. 130 Shifter Assy. Removal/Installation

1 - SHIFTER ASSEMBLY

INSTALLATION

(1) Install shifter assy. to floor pan (Fig. 130). Install and tighten four nuts to 12 N·m (105 in. lbs.) torque.

(2) Install selector cable to shifter lever and secure cable to shifter bracket. Install clip (Fig. 129).

(3) Install crossover cable to shifter lever and secure cable to shifter bracket. Install clip (Fig. 128).

NOTE: Only the crossover cable is adjustable. The selector cable does not have any adjustment capabilities.

(4) Adjust crossover cable. (Refer to 21 - TRANSMISSION/TRANSAXLE/MANUAL/GEAR SHIFT CABLE - ADJUSTMENTS)

(5) Install center console assembly (Fig. 127). Install rear power window switch (if equipped) and fasten harness to console.

(6) Position gearshift boot (Fig. 126) over the gearshift mechanism and engage tab on mount ring at front to opening in console. Apply hand pressure to engage bosses on mount ring of boot to console opening slots.

(7) Position gearshift knob hole over the gearshift mechanism (Fig. 125) and align the shift pattern.

(8) Strike knob with rubber mallet to engage knob to mechanism.

(9) Verify that shift pattern is aligned properly.

INPUT BEARING AND SLEEVE

REMOVAL

The input bearing is a one–piece bearing and sleeve unit (Fig. 131). The sleeve is the slide point for the clutch–release bearing and lever.

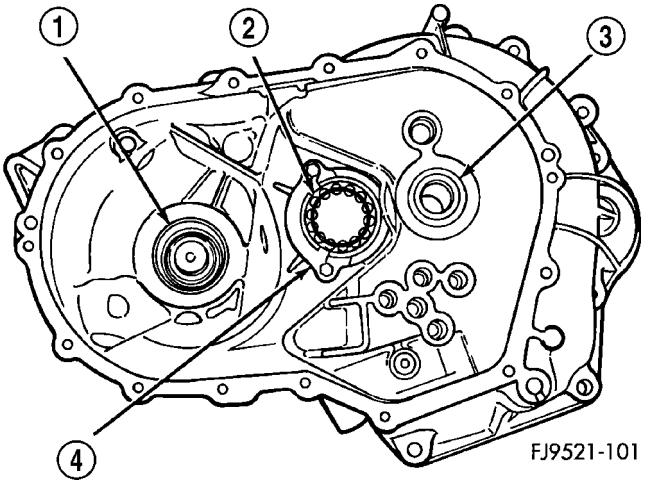

Fig. 131 Input Bearing And Sleeve

1 - DIFFERENTIAL BEARING
2 - OUTPUT BEARING
3 - INPUT BEARING
4 - BEARING RETAINER

(1) Install tool #6342 over input bearing on the gear case side of the transaxle clutch housing.

(2) Press the input bearing out of the housing (Fig. 132).

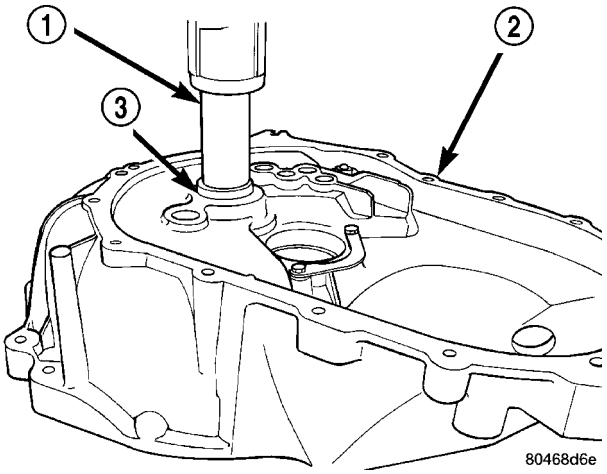

Fig. 132 Input Bearing Removal

1 - SPECIAL TOOL 6342
2 - BELLHOUSING HALF
3 - INPUT BEARING AND SLEEVE

INPUT BEARING AND SLEEVE (Continued)

INSTALLATION

(1) Apply coating of Loctite® sealant on bearing outer diameter. Position sleeve and bearing assembly at input bearing bore.

(2) Install tool #C-4680-1 over input bearing (Fig. 133).

(3) Using a suitable spacer tool and shop press, install input bearing into bore until it is fully seated (Fig. 134).

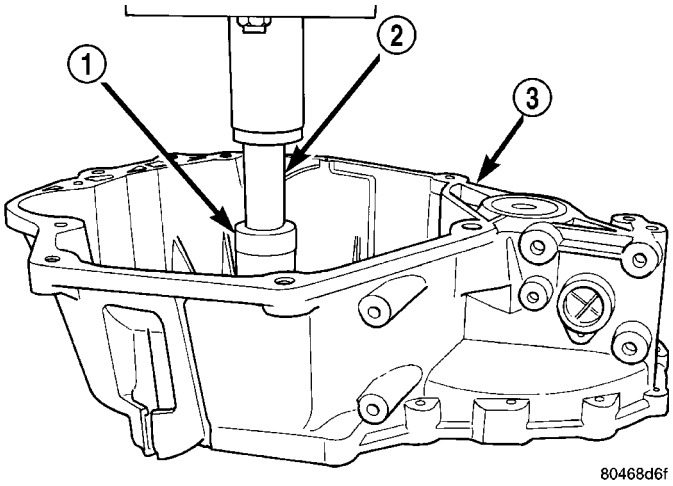

Fig. 133 Input Bearing Tool

1 - SPECIAL TOOL C-4680-1
2 - SPACER
3 - BELLHOUSING HALF

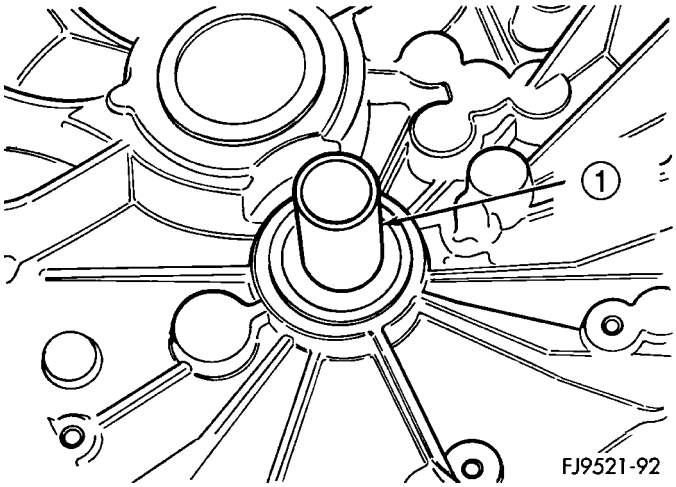

Fig. 134 Input Bearing Installed

1 - SLEEVE AND BEARING ASSEMBLY

INPUT SHAFT

DISASSEMBLY

Before disassembly of the input shaft, it is necessary to check the synchronizer stop ring gap. Use a feeler gauge to measure the gaps between the stop rings and the speed gears. The correct gaps are listed below:

- 1st - 0.522-2.208 mm (0.021-0.087 in)
- 2nd - 0.522-2.208 mm (0.021-0.087 in)
- 3rd - 0.73-1.53 mm (0.029-0.060 in)
- 4th - 0.77-1.57 mm (0.030-0.062 in).
- 5th - 0.73-1.53 mm (0.029-0.060 in)
- Reverse Brake—0.505-1.74 mm (0.020-0.068 in.)

The reverse brake measurement is taken between the stop ring and case.

If a stop ring gap does not fall within the specifications, it must be inspected for wear and replaced. If the 1st or 2nd synchronizer stop ring is worn beyond specifications, the complete output shaft assembly must be replaced.

The input shaft incorporates the 3rd, 4th, and 5th speed gears and synchronizers on the assembly (Fig. 135).

4 - SNAP RING

OUTPUT SHAFT

DISASSEMBLY

CAUTION: The output shaft is serviced as an assembly. Do not try to repair any component on the output shaft. If the 1-2 synchronizer or gear fails, it is necessary to replace the output shaft assembly.

It is necessary to check the synchronizer stop ring gap. Use a feeler gauge to measure the gaps between the stop rings and the speed gears. The correct gaps are listed below:

- 1st—0.522-2.208 mm (0.021-0.087 in)
- 2nd—0.522-2.208 mm (0.021-0.087 in)
- 3rd—0.73-1.53 mm (0.029-0.060 in)
- 4th—0.77-1.57 mm (0.030-0.062 in)
- 5th—0.73-1.53 mm (0.029-0.060 in)
- Reverse Brake—0.51-1.74 mm (0.020-0.068 in.)

If a stop ring gap does not fall within the specifications it must be inspected for wear and replaced. If the 1st or 2nd synchronizer stop ring is worn beyond specifications, the complete output shaft assembly must be replaced.

OUTPUT SHAFT (Continued)

The output shaft incorporates the 1st and 2nd gears and synchronizers on the assembly (Fig. 155).

OUTPUT BEARING AND RACE

REMOVAL

CAUTION: The position of the output shaft bearing is critical. The bearing is not identical end-to-end. Install bearing with larger diameter cage ring facing out.

(1) Remove caged roller bearing from output bearing race (Fig. 156).

(2) Remove screws at output bearing retainer strap (Fig. 157).

(3) Install tool #6787 and slide hammer (Fig. 158). Tighten tool to output bearing race.

(4) Using slide hammer, remove output bearing race.

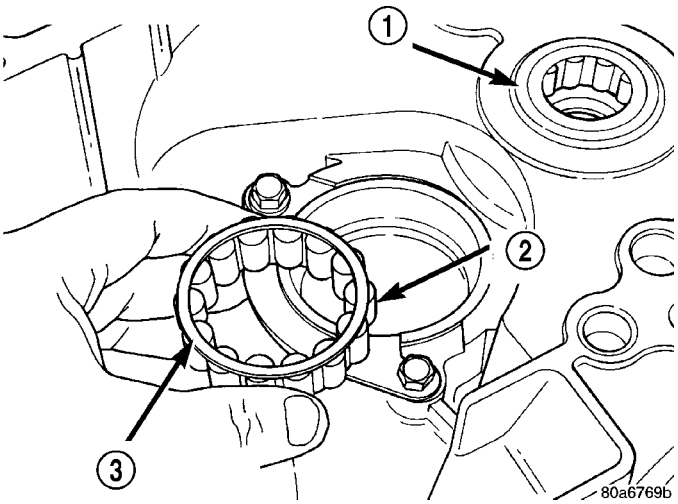

Fig. 156 Output Roller Bearing

3 - OUTPUT SHAFT BEARING RACE

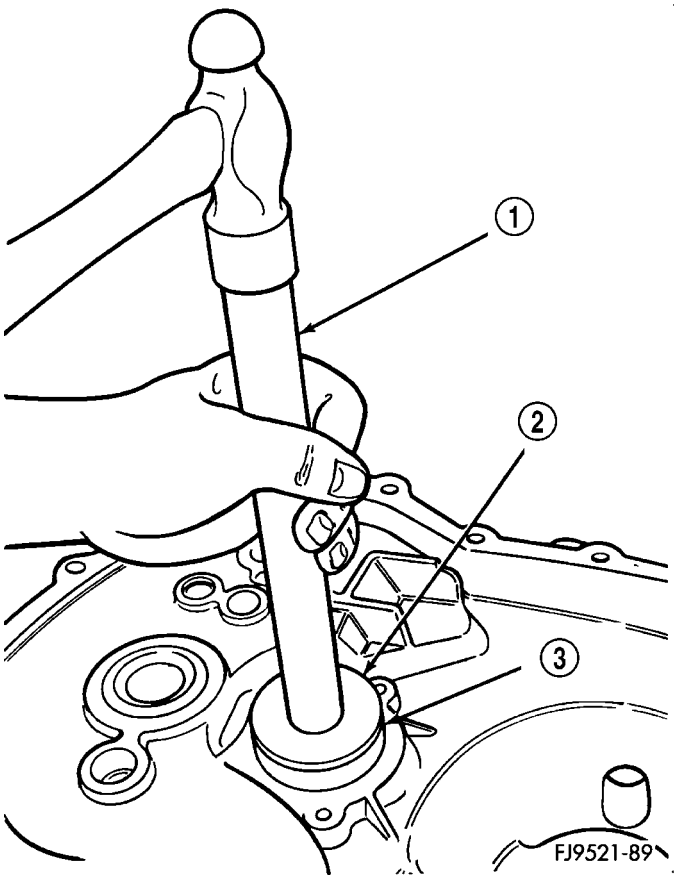

Fig. 159 Output Bearing Race Installation

1 - TOOL C-4171
2 - TOOL C-4628
3 - OUTPUT BEARING RACE

INSTALLATION

(1) Line up output bearing race to race bore.

(2) Insert tool #4628 with C-4171 into output bearing race (Fig. 159). Tap race into bore. Install output bearing into race. Verify that the larger diameter cage is facing outward. Position bearing retaining strap. Tighten bolts to 11 N·m (96 in. lbs.).

REAR BEARING OIL FEED TROUGH

REMOVAL

The bearing oil feed trough is retained in the case by a pin that is molded into the case and clips that are part of the trough (Fig. 160).

(1) Using light plier pressure, squeeze the clips together at the rear of the trough.

(2) Slide the trough over the retaining pin that locates the trough in the case.

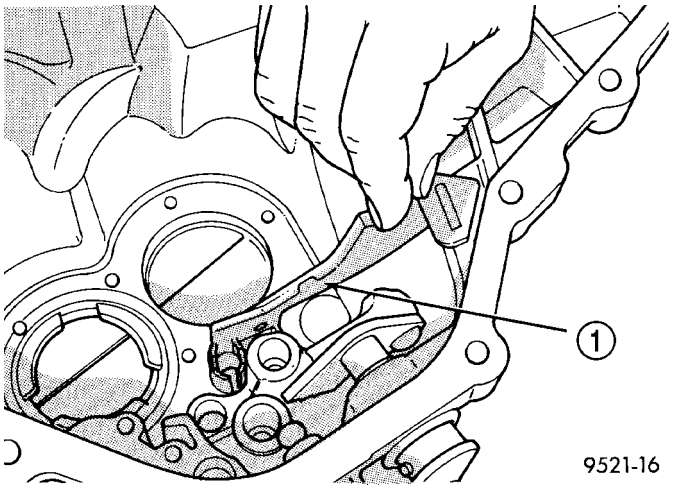

Fig. 160 Oil Feed Trough

1 - OIL FEED TROUGH

INSTALLATION

(1) To install oil feed trough, reverse removal procedure.

SHIFT CROSSOVER LEVER

REMOVAL

(1) Disconnect crossover cable from crossover lever and cable bracket. Refer to Gearshift Cable Removal and Installation in this Group.

(2) Using a pin punch, remove the crossover roll pin from lever.

(3) Pull up and remove the crossover lever from the transaxle crossover shaft (Fig. 161).

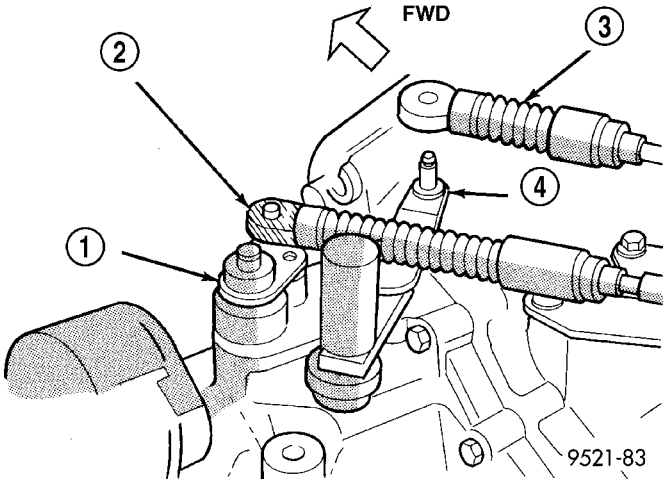

Fig. 161 Crossover Lever

1 - CROSSOVER LEVER
2 - CROSSOVER CABLE
3 - SELECTOR CABLE
4 - SELECTOR LEVER

INSTALLATION

(1) Install crossover lever to shaft and fasten with NEW roll pin.

(2) Install crossover cable to bracket. Fasten with clip.

(3) Install crossover cable to crossover lever.

SHIFT CROSSOVER SHAFT

REMOVAL

(1) Disassemble transaxle.

(2) With the transaxle disassembled, remove the crossover shaft seal.

(3) Using snap–ring pliers, remove the snap ring at the crossover shaft bore (Fig. 162).

(4) Push the crossover shaft in the case and remove the crossover assembly.

INSTALLATION

(1) Install crossover shaft to case and install snap ring (Fig. 162).

(2) Install the crossover shaft seal.

(3) Assemble transaxle.

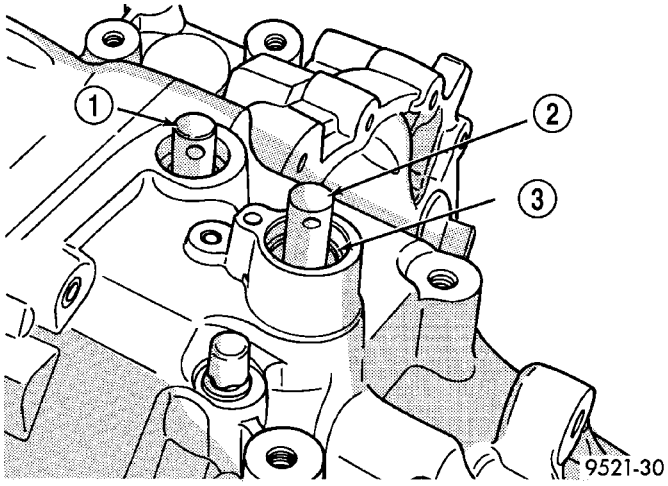

Fig. 162 Crossover Shaft Snap Ring

1 - SELECTOR SHAFT
2 - CROSSOVER SHAFT
3 - SNAP RING

SHIFT CROSSOVER SHAFT BUSHING

REMOVAL

(1) Install slide hammer #3752 through the crossover bushing.

(2) Thread nut and washer onto slide hammer.

(3) Using the slide hammer, remove the crossover shaft bushing (Fig. 163).

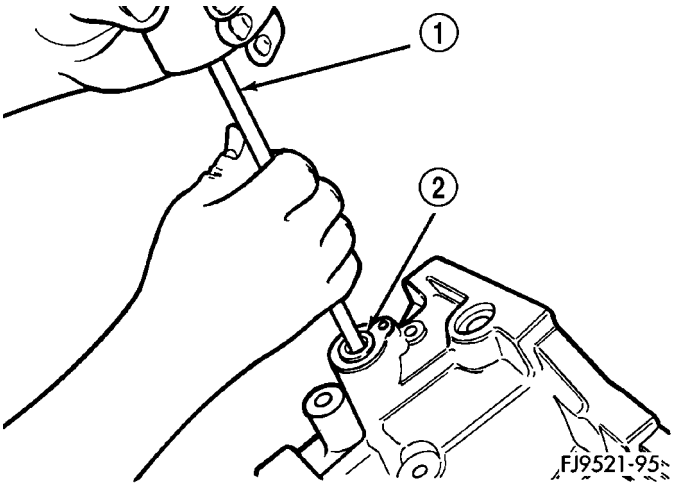

Fig. 163 Crossover Shaft Bushing Removal

1 - SLIDE HAMMER
2 - SHIFTER SHAFT BUSHING

INSTALLATION

(1) Position the replacement crossover shaft bushing over the crossover shaft bushing bore.

(2) Using an appropriate size deep–well socket, install the crossover shaft bushing into the bushing bore.

SHIFT RAIL AND FORK

DISASSEMBLY

(1) Remove shift rails from the geartrain.

(2) To service the 5-R shift rail, remove the C-clip retaining the reverse shift lever arm. Remove the 5th shift fork roll pin and remove the 5th shift fork. Remove the shift lug roll pin and remove the shift lug. Replace parts as necessary.

(3) To service the 3-4 shift rail, remove the roll pin retaining the 3-4 shift fork. Remove the shift fork. Remove the shift lug roll pin and remove the shift lug. Replace parts as necessary.

(4) To service the 1-2 shift rail, remove the roll pin retaining the 1-2 shift fork. Remove the shift fork and replace parts as necessary.

SHIFT RAIL BUSHINGS

REMOVAL

(1) Thread tool #6786 into shift rail bushing.

(2) Install slide hammer #3752 onto tool.

(3) Remove bushing using slide hammer and tool assembly (Fig. 164).

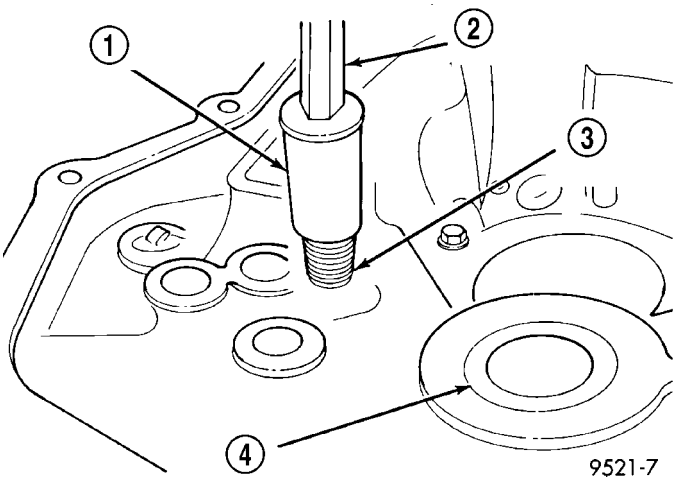

Fig. 164 Shift Rail Bushing Removal

1 - SPECIAL TOOL 6786
2 - SLIDE HAMMER C-3752
3 - SHIFTER RAIL BUSHING
4 - INPUT BEARING

INSTALLATION

(1) Line up replacement bushing in bore.

(2) Using tool #MD998343, tap bushing into bore until flush with the chamfer in the case.

SHIFT SELECTOR SHAFT

REMOVAL

(1) Disassemble transaxle.

(2) With the transaxle disassembled, remove the selector shaft by pushing on the shaft from the outside. Pull shaft out from the inside.

INSTALLATION

(1) Pull selector shaft into position from the outside.

(2) Assemble transaxle.

SHIFT SELECTOR SHAFT BUSHING

REMOVAL

(1) Remove selector shaft using procedure in this group.

(2) Thread tool #6786 into bushing.

(3) Install slide hammer #3752 onto tool and remove bushing using slide hammer (Fig. 165).

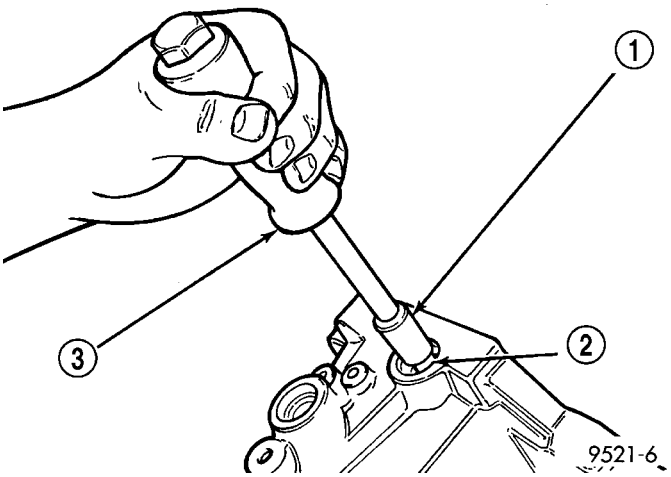

Fig. 165 Selector Shaft Bushing Removal

1 - SPECIAL TOOL 6786
2 - SHIFT SHAFT BUSHING
3 - SLIDE HAMMER C-3752

SHIFT SELECTOR SHAFT BUSHING (Continued)

INSTALLATION

(1) Position replacement bushing over selector shaft bore.

(2) Using an appropriate size deep–well socket, install bushing in selector shaft bore (Fig. 166).

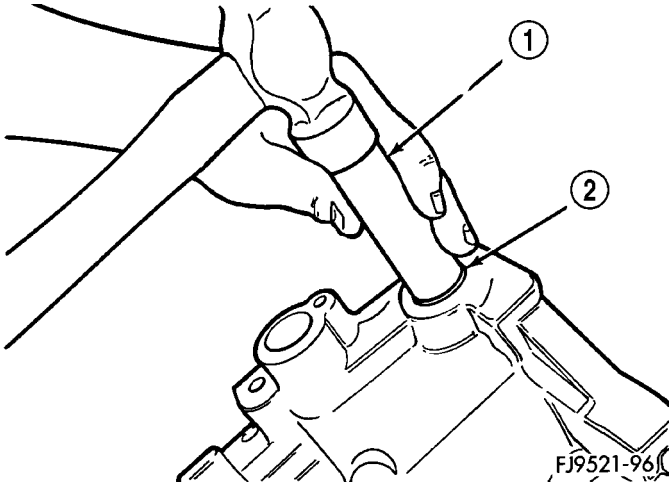

Fig. 166 Selector Shaft Bushing Installation

1 - DEEP WELL SOCKET
2 - SHIFTER SHAFT BUSHING

SHIFT SHAFT SEALS

REMOVAL

It is not necessary to remove the shift shafts from the transaxle to service the shift shaft seals.

(1) Using a pick tool, pry up on the shift shaft seal, and remove seal from bore.

INSTALLATION

(1) Position new shift shaft seal into bore.

(2) Install shift shaft seal into bore using an appropriate size deep-well socket.

SYNCHRONIZER

DISASSEMBLY

Place synchronizer in a clean shop towel and wrap. Press on inner hub. Carefully open up shop towel and remove springs, balls, keys, hub, and sleeve.

CLEANING

CLEAN

Do not attempt to clean the blocking rings in solvent. The friction material will become contaminated. Place synchronizer components in a suitable holder and clean with solvent. Air dry.

INSPECTION

INSPECT

Proper inspection of components involve:

- Teeth, for wear, scuffed, nicked, burred, or broken teeth
- Keys, for wear or distortion
- Balls and springs, for distortion, cracks, or wear

If any of these conditions exist in these components, replace as necessary.

ASSEMBLY

(1) Position synchronizer hub onto a suitable holding fixture (input shaft). The synchronizer hubs are directional. The hubs must be installed with the **U** facing upward.

(2) Install springs into hub slot (Fig. 167).

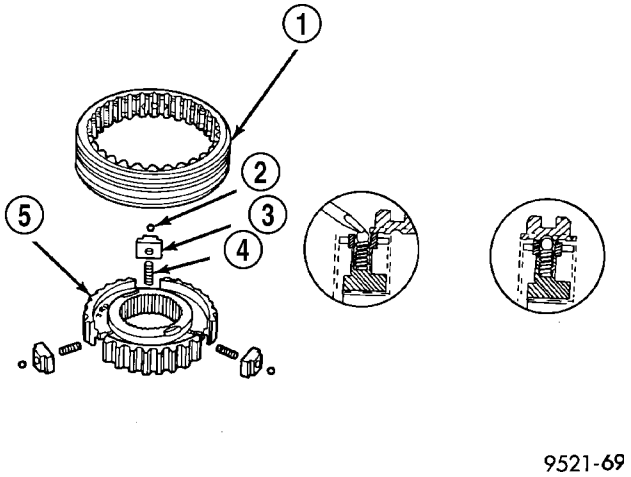

Fig. 167 Synchronizer Assembly

1 - SLEEVE
2 - BALL
3 - KEY
4 - SPRING
5 - HUB

SYNCHRONIZER (Continued)

(3) Insert key into hub and spring.

(4) Apply petroleum jelly to the hole in the key. Insert balls into each key (Fig. 168).

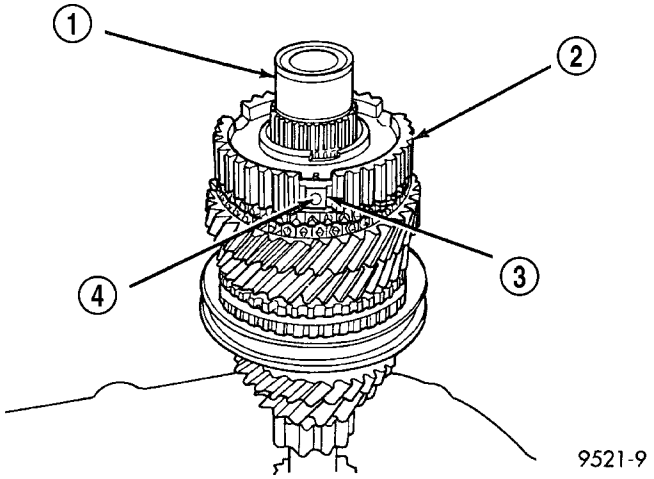

Fig. 168 Synchronizer Balls

1 - INPUT SHAFT
2 - HUB
3 - KEY
4 - BALL

(5) Slide sleeve over the hub and depress balls as you carefully slip the sleeve into position (Fig. 169).

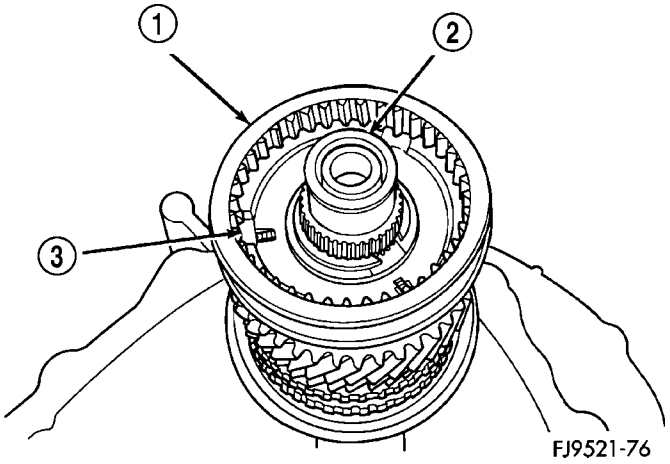

Fig. 169 Synchronizer Sleeve

1 - SLEEVE
2 - INPUT SHAFT
3 - KEY

(6) Line up stop ring tang over the keys in the hub (Fig. 170). Install stop rings. Center the keys and balls by pushing on both stop rings.

5 - SPRING

VEHICLE SPEED SENSOR

DESCRIPTION

VEHICLE SPEED SENSOR

The Vehicle Speed Sensor (VSS) is a pulse generator mounted to an adapter near the transmission output shaft. The sensor is driven through the adapter by a speedometer pinion gear. The VSS pulse signal to the speedometer/odometer is monitored by the PCM speed control circuitry to determine vehicle speed and to maintain speed control set speed.

REMOVAL

(1) Raise vehicle on hoist.

(2) Disconnect the speed sensor connector (Fig. 171).

CAUTION: Clean area around speed sensor before removing to prevent dirt from entering the transaxle during speed sensor removal.

(3) Remove speed sensor retaining bolt (Fig. 171).

(4) Remove speed sensor from transaxle.

CAUTION: Carefully remove vehicle speed sensor so that sensor drive gear does not fall into transaxle. Should sensor drive gear fall into the transaxle during sensor removal, drive gear must be reattached to sensor.

(5) Remove speed sensor drive gear from speed sensor.

INSTALLATION

(1) Install pinion gear to speed sensor (Fig. 171).

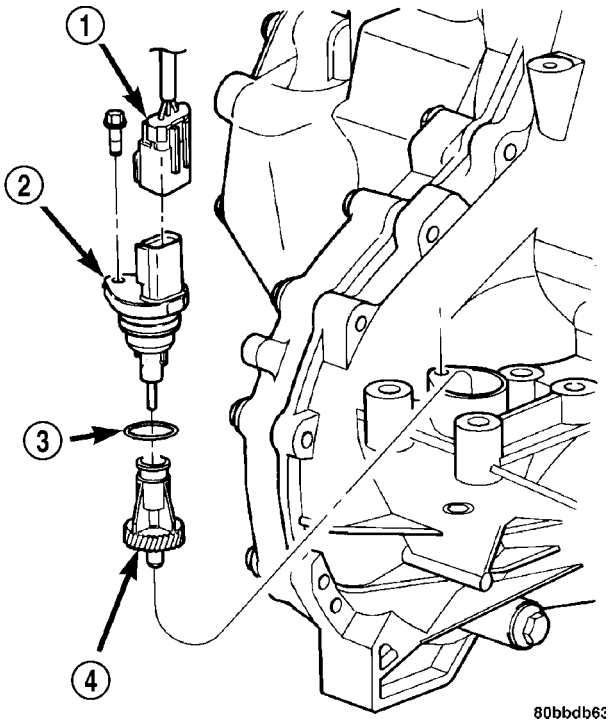

Fig. 171 Speed Sensor and Pinion—Removal/Installation

1 - CONNECTOR
2 - SENSOR
3 - O-RING
4 - SPEEDO PINION

(2) Using a NEW o-ring, install the speed sensor to the transaxle (Fig. 171).

(3) Install the bolt and torque to 7 N·m (60 in. lbs.).

(4) Connect speed sensor connector (Fig. 171).

(5) Lower vehicle and road test to verify proper speedometer operation.

40TE AUTOMATIC TRANSAXLE

DESCRIPTION

The 40TE (Fig. 1) is a four-speed transaxle that is a conventional hydraulic/mechanical assembly with an integral differential, and is controlled with adaptive electronic controls and monitors. The hydraulic system of the transaxle consists of the transaxle fluid, fluid passages, hydraulic valves, and various line pressure control components. An input clutch assembly which houses the underdrive, overdrive, and reverse clutches is used. It also utilizes separate holding clutches: 2nd/4th gear and Low/Reverse. The primary mechanical components of the transaxle consist of the following:

- Three multiple disc input clutches
- Two multiple disc holding clutches
- Four hydraulic accumulators
- Two planetary gear sets
- Hydraulic oil pump
- Valve body
- Solenoid/Pressure switch assembly
- Integral differential assembly

Control of the transaxle is accomplished by fully adaptive electronics. Optimum shift scheduling is accomplished through continuous real-time sensor feedback information provided to the Powertrain Control Module (PCM) or Transmission Control Module (TCM).

The PCM/TCM is the heart of the electronic control system and relies on information from various direct and indirect inputs (sensors, switches, etc.) to determine driver demand and vehicle operating conditions. With this information, the PCM/TCM can calculate and perform timely and quality shifts through various output or control devices (solenoid pack, transmission control relay, etc.).

The PCM/TCM also performs certain self-diagnostic functions and provides comprehensive information (sensor data, DTC's, etc.) which is helpful in proper diagnosis and repair. This information can be viewed with the DRB scan tool.

40TE AUTOMATIC TRANSAXLE (Continued)

TRANSAXLE IDENTIFICATION

The 40TE transaxle is identified by a barcode label that is fixed to the transaxle case as shown in (Fig. 2).

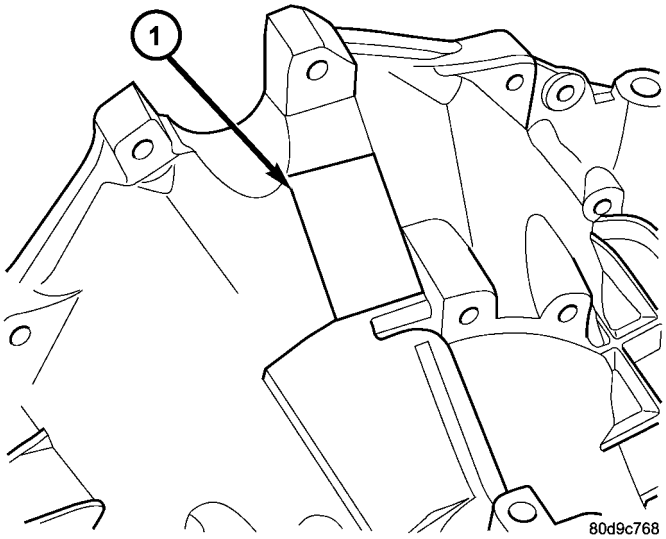

Fig. 2 Transaxle Identification Label

1 - IDENTIFICATION LABEL

The label contains a series of digits that can be translated into useful information such as transaxle part number, date of manufacture, manufacturing origin, plant shift number, build sequence number, etc. Refer to (Fig. 3) for identification label breakdown.

If the tag is not legible or missing, the “PK” number, which is stamped into the transaxle case behind the transfer gear cover, can be referred to for identification. This number differs slightly in that it contains the entire transaxle part number, rather than the last three digits.

OPERATION

Transmission output is directed to an integral differential by a transfer gear system in the following input-to-output ratios:

First	2.84 : 1
Second	1.57 : 1
Third	1.00 : 1
Overdrive	0.69 : 1
Reverse	2.21 : 1

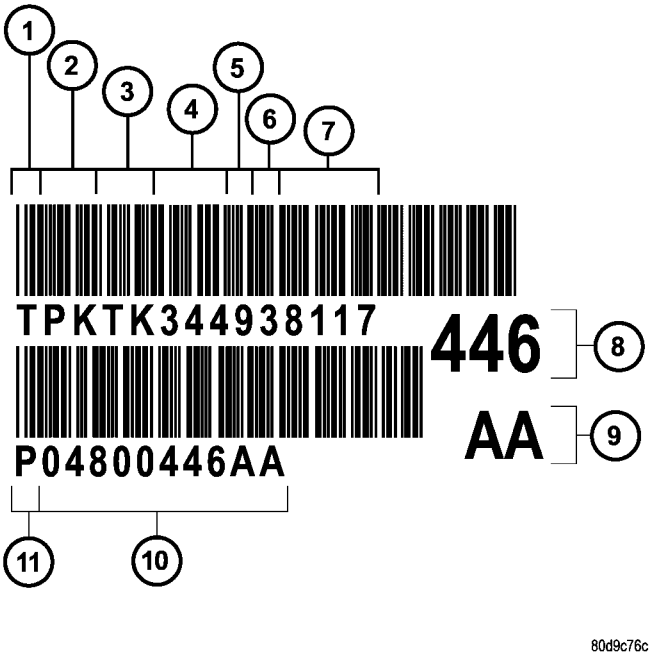

Fig. 3 Identification Label Breakdown

1 - T=TRACEABILITY
2 - SUPPLIER CODE (PK=KOKOMO)
3 - COMPONENT CODE (TK=KOKOMO TRANSMISSION)
4 - BUILD DAY (344=DEC. 9)
5 - BUILD YEAR (9=1999)
6 - LINE/SHIFT CODE (3=3RD SHIFT)
7 - BUILD SEQUENCE NUMBER
8 - LAST THREE OF P/N
9 - ALPHA
10 - TRANSAXLE PART NUMBER
11 - P=PART NUMBER

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - 4XTE TRANSAXLE GENERAL DIAGNOSIS

NOTE: Before attempting any repair on a 4XTE four-speed automatic transaxle, check for diagnostic trouble codes (DTC’s) using the DRB scan tool. Refer to the Transmission Diagnostic Procedures Manual.

Transaxle malfunctions may be caused by these general conditions:

- Poor engine performance
- Improper adjustments
- Hydraulic malfunctions
- Mechanical malfunctions
- Electronic malfunctions

Diagnosis of these problems should always begin by checking the easily accessible variables: fluid level and condition, gearshift cable adjustment. Then perform a road test to determine if the problem has been corrected or that more diagnosis is necessary. If the problem persists after the preliminary tests and cor-

rections are completed, hydraulic pressure checks should be performed.

DIAGNOSIS AND TESTING - ROAD TEST

Prior to performing a road test, verify that the fluid level, fluid condition, and linkage adjustment have been approved.

During the road test, the transaxle should be operated in each position to check for slipping and any variation in shifting.

If the vehicle operates properly at highway speeds, but has poor acceleration, the converter stator overrunning clutch may be slipping. If acceleration is normal, but high throttle opening is needed to maintain highway speeds, the converter stator clutch may have seized. Both of these stator defects require replacement of the torque converter and thorough transaxle cleaning.

Slipping clutches can be isolated by comparing the "Elements in Use" chart with clutch operation encountered on a road test. This chart identifies which clutches are applied at each position of the selector lever.

A slipping clutch may also set a DTC and can be determined by operating the transaxle in all selector positions.

ELEMENTS IN USE AT EACH POSITION OF SELECTOR LEVER

Shift Lever Position	INPUT CLUTCHES			HOLDING CLUTCHES	
	Underdrive	Overdrive	Reverse	2/4	Low/Reverse
P - PARK					X
R - REVERSE			X		X
N - NEUTRAL					X
OD - OVERDRIVE					
First	X				X
Second	X			X	
Direct	X	X			
Overdrive		X		X	
D - DRIVE*					
First	X				X
Second	X			X	
Direct	X	X			
L - LOW*					
First	X				X
Second	X			X	
Direct	X	X			
* Vehicle upshift and downshift speeds are increased when in these selector positions.					

The process of elimination can be used to detect any unit which slips and to confirm proper operation of good units. Road test analysis can diagnose slipping units, but the cause of the malfunction cannot be determined. Practically any condition can be caused by leaking hydraulic circuits or sticking valves.

DIAGNOSIS AND TESTING - HYDRAULIC PRESSURE TESTS

Pressure testing is a very important step in the diagnostic procedure. These tests usually reveal the cause of most hydraulic transaxle problems.

Before performing pressure tests, be certain that fluid level and condition, and shift cable adjustments have been checked and approved. Fluid must be at operating temperature (150 to 200 degrees F.).

Install an engine tachometer, raise vehicle on hoist which allows front wheels to turn, and position tachometer so it can be read.

40TE AUTOMATIC TRANSAXLE (Continued)

Attach 300 psi gauge (C-3293SP) to port(s) required for test(s) being conducted. Use adapter set L-4559 to adapt gauge(s) to transaxle.

Test port locations are shown in (Fig. 4).

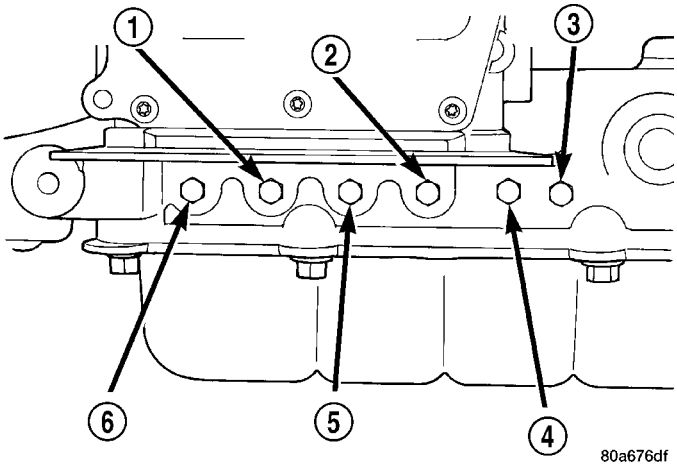

Fig. 4 Pressure Taps

1 - OVERDRIVE CLUTCH
2 - TORQUE CONVERTER OFF
3 - LOW/REVERSE CLUTCH
4 - 2/4 CLUTCH
5 - REVERSE CLUTCH
6 - UNDERDRIVE CLUTCH

TEST ONE-SELECTOR IN LOW (1st GEAR)

(1) Attach pressure gauge to the low/reverse clutch tap.

(2) Move selector lever to the (L) position.

(3) Allow vehicle wheels to turn and increase throttle opening to achieve an indicated vehicle speed to 20 mph.

(4) Low/reverse clutch pressure should read 115 to 145 psi.

(5) This test checks pump output, pressure regulation and condition of the low/reverse clutch hydraulic circuit and shift schedule.

TEST TWO-SELECTOR IN DRIVE (2nd GEAR)

NOTE: This test checks the underdrive clutch hydraulic circuit as well as the shift schedule.

(1) Attach gauge to the underdrive clutch tap.

(2) Move selector lever to the 3 position.

(3) Allow vehicle wheels to turn and increase throttle opening to achieve an indicated vehicle speed of 30 mph.

(4) In second gear the underdrive clutch pressure should read 110 to 145 psi.

TEST TWO A–SELECTOR IN OD (4th Gear)

NOTE: This test checks the underdrive clutch hydraulic circuit as well as the shift schedule.

(1) Attach gauge to the underdrive clutch tap.

(2) Move selector lever to the (OD) position.

(3) Allow wheels to rotate freely and increase throttle opening to achieve an indicated speed of 40 mph.

(4) Underdrive clutch pressure should read below 5 psi. If not, then either the solenoid assembly or PCM/TCM is at fault.

TEST THREE-OVERDRIVE CLUTCH CHECK (3rd and 2nd Gear)

(1) Attach gauge to the overdrive clutch tap.

(2) Move selector lever to the (OD) position.

(3) Allow vehicle wheels to turn and increase throttle opening to achieve an indicated vehicle speed of 20 mph. Vehicle should be in 3rd gear.

(4) Overdrive clutch pressure should read 74 to 95 psi.

(5) Move selector lever to the (3) position and increase indicated vehicle speed to 30 mph.

(6) The vehicle should be in second gear and overdrive clutch pressure should be less than 5 psi.

(7) This test checks the overdrive clutch hydraulic circuit as well as the shift schedule.

TEST FOUR-SELECTOR IN OVERDRIVE (4th Gear)

(1) Attach gauge to the 2/4 clutch tap.

(2) Move selector lever to the (OD) position.

(3) Allow vehicle front wheels to turn and increase throttle opening to achieve an indicated vehicle speed of 30 mph. Vehicle should be in 4th gear.

(4) The 2/4 clutch pressure should read 75 to 95 psi.

(5) This test checks the 2/4 clutch hydraulic circuit.

TEST FIVE-SELECTOR IN OVERDRIVE (4th Gear-CC on)

(1) Attach gauge to the torque converter clutch off pressure tap.

(2) Move selector lever to the (OD) position.

(3) Allow vehicle wheels to turn and increase throttle opening to achieve an indicated vehicle speed of 50 mph. Vehicle should be in 4th gear, CC on.

CAUTION: Both wheels must turn at the same speed.

(4) Torque converter clutch off pressure should be less than 5 psi.

(5) This test checks the torque converter clutch hydraulic circuit.

TEST SIX-SELECTOR IN REVERSE

(1) Attach gauges to the reverse and LR clutch tap.

40TE AUTOMATIC TRANSAXLE (Continued)

(2) Move selector lever to the (R) position.

(3) Read reverse clutch pressure with output stationary (foot on brake) and throttle opened to achieve 1500 rpm.

(4) Reverse and LR clutch pressure should read 165 to 235 psi.

(5) This test checks the reverse clutch hydraulic circuit.

TEST RESULT INDICATIONS

(1) If proper line pressure is found in any one test, the pump and pressure regulator are working properly.

(2) Low pressure in all positions indicates a defective pump, a clogged filter, or a stuck pressure regulator valve.

(3) Clutch circuit leaks are indicated if pressures do not fall within the specified pressure range.

(4) If the overdrive clutch pressure is greater than 5 psi in Step 4 of Test Three, a worn reaction shaft seal ring or a defective solenoid assembly is indicated.

(5) If the underdrive clutch pressure is greater than 5 psi in Step 4 of Test Two A, a defective solenoid assembly or PCM/TCM is the cause.

PRESSURE CHECK SPECIFICATIONS

Gear Selector Position	Actual Gear	Pressure Taps					
		Underdrive Clutch	Overdrive Clutch	Reverse Clutch	Torque Converter Clutch Off	2/4 Clutch	Low/ Reverse Clutch

OD # 50 mph	OVERDRIVE WITH TCC	0-2	75-95	0-2	0-5	75-95	0-2

*** Engine speed at 1500 rpm**

 # CAUTION: Both front wheels must be turning at the same speed.

40TE AUTOMATIC TRANSAXLE (Continued)

DIAGNOSIS AND TESTING - CLUTCH AIR PRESSURE TESTS

Inoperative clutches can be located using a series of tests by substituting air pressure for fluid pressure (Fig. 5) (Fig. 6). The clutches may be tested by applying air pressure to their respective passages. The valve body must be removed and Tool 6056 installed. To make air pressure tests, proceed as follows:

NOTE: The compressed air supply must be free of all dirt and moisture. Use a pressure of 30 psi.

Remove oil pan and valve body. See Valve body removal.

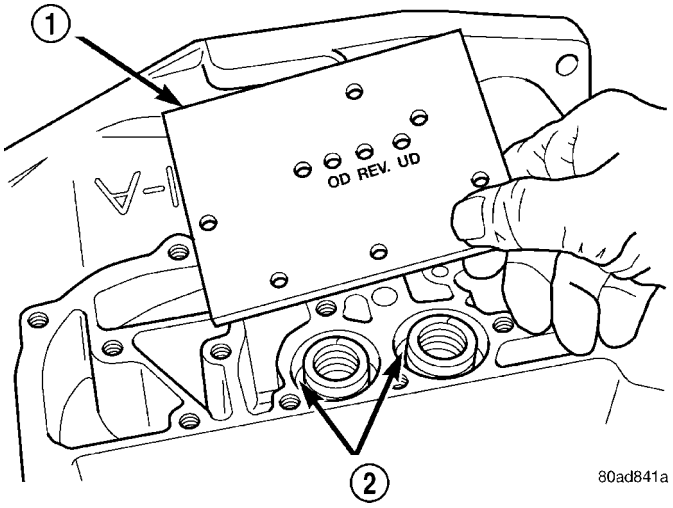

Fig. 5 Air Pressure Test Plate

1 - TOOL 6056
2 - ACCUMULATORS

OVERDRIVE CLUTCH

Apply air pressure to the overdrive clutch apply passage and watch for the push/pull piston to move forward. The piston should return to its starting position when the air pressure is removed.

REVERSE CLUTCH

Apply air pressure to the reverse clutch apply passage and watch for the push/pull piston to move rearward. The piston should return to its starting position when the air pressure is removed.

2/4 CLUTCH

Apply air pressure to the feed hole located on the 2/4 clutch retainer. Look in the area where the 2/4 piston contacts the first separator plate and watch carefully for the 2/4 piston to move rearward. The piston should return to its original position after the air pressure is removed.

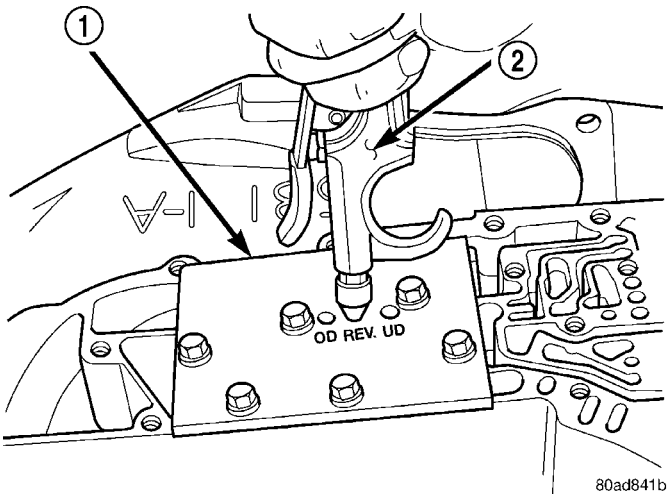

Fig. 6 Testing Reverse Clutch

1 - TOOL 6056
2 - AIR NOZZLE

LOW/REVERSE CLUTCH

Apply air pressure to the low/reverse clutch feed hole (rear of case, between 2 bolt holes). Then, look in the area where the low/reverse piston contacts the first separator plate. Watch carefully for the piston to move forward. The piston should return to its original position after the air pressure is removed.

UNDERDRIVE CLUTCH

Because this clutch piston cannot be seen, its operation is checked by function. Air pressure is applied to the low/reverse and the 2/4 clutches. This locks the output shaft. Use a piece of rubber hose wrapped around the input shaft and a pair of clamp-on pliers to turn the input shaft. Next apply air pressure to the underdrive clutch. The input shaft should not rotate with hand torque. Release the air pressure and confirm that the input shaft will rotate.

40TE AUTOMATIC TRANSAXLE (Continued)

DIAGNOSIS AND TESTING - TORQUE CONVERTER HOUSING FLUID LEAKAGE

When diagnosing converter housing fluid leaks, three actions must be taken before repair:

(1) Verify proper transmission fluid level.

(2) Verify that the leak originates from the converter housing area and is transmission fluid.

(3) Determine the true source of the leak.

Fluid leakage at or around the torque converter area may originate from an engine oil leak (Fig. 7). The area should be examined closely. Factory fill fluid is red and, therefore, can be distinguished from engine oil.

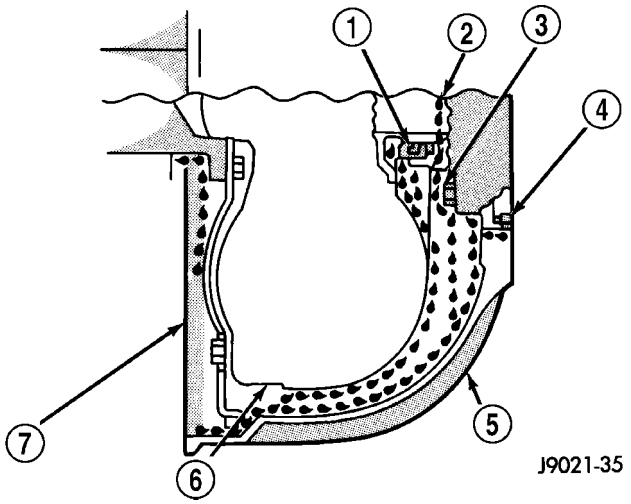

Fig. 7 Converter Housing Leak Paths

1 - PUMP SEAL
2 - PUMP VENT
3 - PUMP BOLT
4 - PUMP GASKET
5 - CONVERTER HOUSING
6 - CONVERTER
7 - REAR MAIN SEAL LEAK

Some suspected converter housing fluid leaks may not be leaks at all. They may only be the result of residual fluid in the converter housing, or excess fluid spilled during factory fill, or fill after repair. Converter housing leaks have several potential sources. Through careful observation, a leak source can be identified before removing the transmission for repair.

Pump seal leaks tend to move along the drive hub and onto the rear of the converter (Fig. 7). Pump o-ring or pump body leaks follow the same path as a seal leak. Pump attaching bolt leaks are generally deposited on the inside of the converter housing and not on the converter itself. Pump seal or gasket leaks usually travel down the inside of the converter housing (Fig. 7).

TORQUE CONVERTER LEAKAGE

Possible sources of torque converter leakage are:

- Torque converter weld leaks at the outside diameter weld (Fig. 8).
- Torque converter hub weld (Fig. 8).

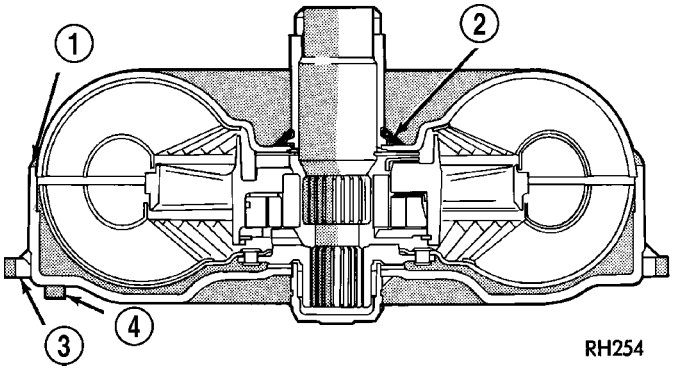

Fig. 8 Converter Leak Points - Typical

1 - OUTSIDE DIAMETER WELD
2 - TORQUE CONVERTER HUB WELD

1 - BATTERY

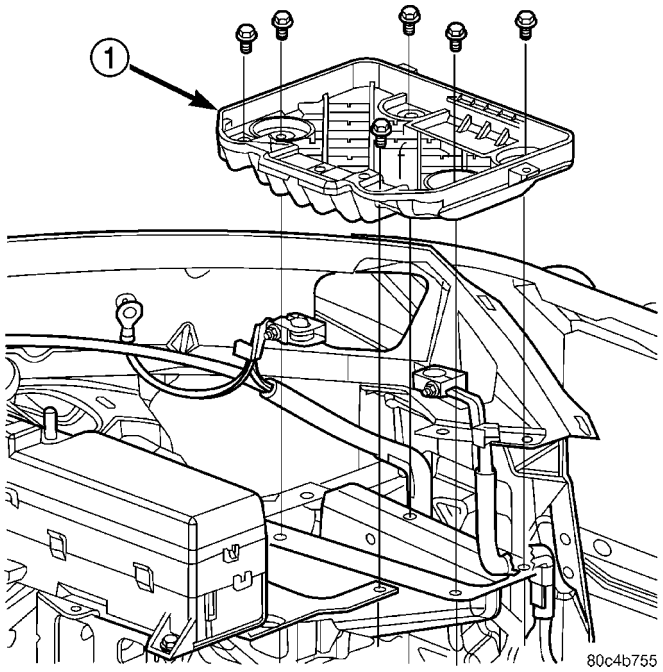

Fig. 11 Battery Tray Removal/Installation

1 - BATTERY TRAY

(5) Remove uppermost starter-to-transaxle bell-housing bolt and remove transaxle dipstick & tube. Plug hole to prevent debris from entering transaxle.

(6) Disconnect gearshift cable from manual valve lever. Remove gearshift cable from trans mount bracket and position cable out of the way.

(7) Using Tool 8875A, disconnect transaxle oil cooler lines. (Refer to 7 - COOLING/TRANSMISSION - STANDARD PROCEDURE)

(8) Disconnect input speed sensor connector (Fig. 12).

(9) Disconnect output speed sensor connector (Fig. 12).

(10) Disconnect transmission range sensor connector (Fig. 12).

(11) Disconnect solenoid/pressure switch assembly connector (Fig. 12).

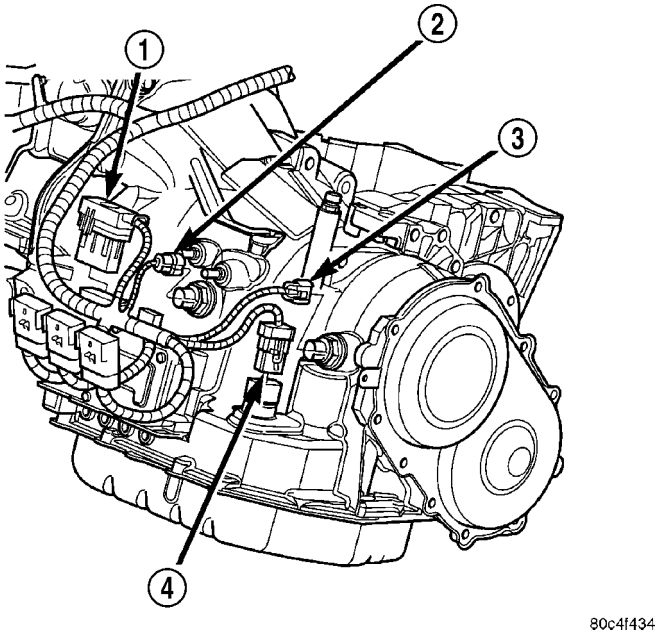

Fig. 12 Component Connector Location

1 - SOLENOID/PRESSURE SWITCH ASSY. CONNECTOR
2 - INPUT SPEED SENSOR CONNECTOR
3 - OUTPUT SPEED SENSOR CONNECTOR
4 - TRANSMISSION RANGE SENSOR CONNECTOR

(12) Raise vehicle on hoist.

(13) Remove front wheel covers (if equipped) and front wheel/tire assemblies.

(14) Remove left splash shield.

(15) Remove left and right halfshaft assemblies. Refer to DIFFERENTIAL AND DRIVELINE for proper procedures.

40TE AUTOMATIC TRANSAXLE (Continued)

(16) Disconnect power steering hose from structural collar (Fig. 13)

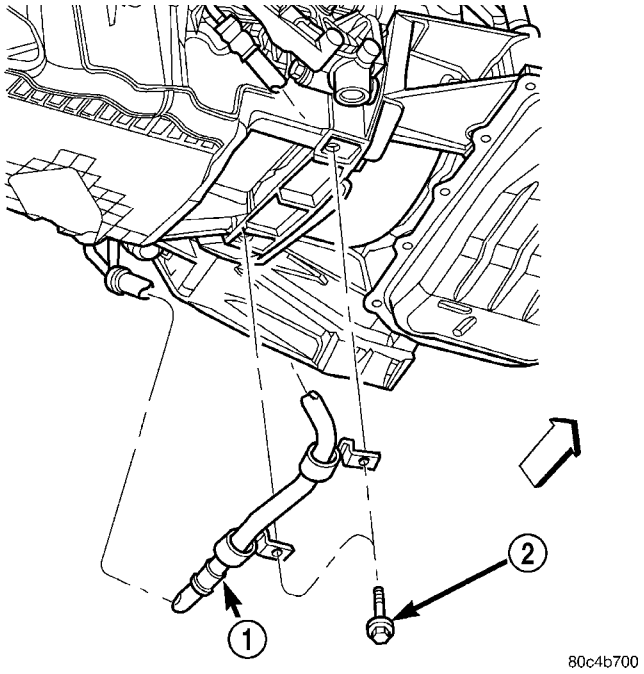

Fig. 13 Power Steering Hose to Structural Collar

1 - POWER STEERING HOSE
2 - BOLT

(17) Remove the left engine-to-transaxle lateral bending brace and structural collar (Fig. 14).

(20) Disconnect starter motor electrical connections.

(21) Remove starter motor (Fig. 17).

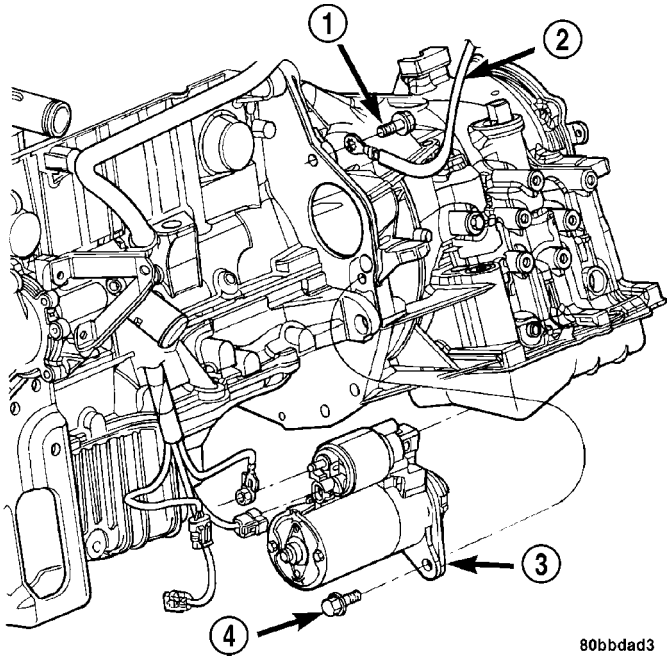

Fig. 17 Starter Motor Removal/Installation—Typical

1 - BOLT
2 - GROUND
3 - STARTER
4 - BOLT

(22) Remove lower starter-to-transaxle bellhousing lower bolt and position starter motor out of the way.

(23) Remove gearshift cable bracket. Position cable out of the way.

(24) Remove four drive plate-to-torque converter bolts.

(25) Support engine assembly with screw jack and wood block.

(26) Remove transmission upper mount to bracket bolts (Fig. 18).

(27) Lower engine/transaxle to gain access to and remove transaxle-to-engine bolts (Fig. 19).

(28) Remove transaxle from vehicle.

(29) If replacing transaxle, remove upper mount bracket and gearshift cable bracket and transfer to new/replacement transaxle.

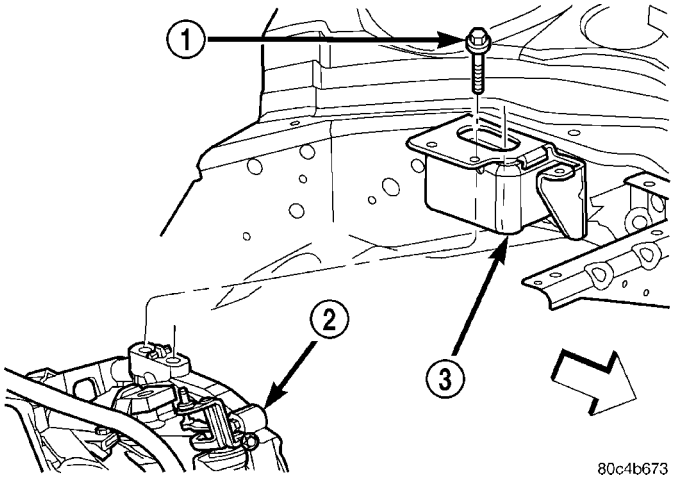

Fig. 18 Transaxle Upper Mount

1 - BOLT
2 - TRANSAXLE
3 - LEFT MOUNT

DISASSEMBLY

NOTE: If transaxle is being overhauled (clutch and/or seal replacement) or replaced, it is necessary to perform the PCM/TCM Quick Learn Procedure. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/POWERTRAIN/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE)

NOTE: This procedure does not include final drive (differential) disassembly.

(1) Remove input and output speed sensors.

(2) Remove three (3) solenoid/pressure switch assembly-to-case bolts.

(3) Remove solenoid/pressure switch assembly and gasket (Fig. 20).

(4) Remove oil pan-to-case bolts (Fig. 21).

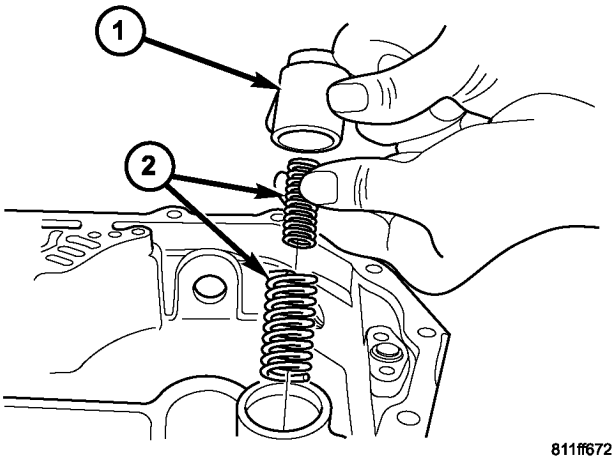

Fig. 31 Low/Reverse Accumulator

1 - PISTON
2 - RETURN SPRINGS

(14) Measure input shaft end play. Place transaxle so input shaft is vertical. Set up end play set and dial indicator as shown in (Fig. 32). **Input shaft end play should be within 0.13-0.64 mm (0.005-0.025 in.)** If outside of this range, a #4 thrust plate change is required. Record indicator reading for reference upon reassembly.

(15) Remove oil pump-to-case bolts (Fig. 33).

CAUTION: Be sure input speed sensor is removed before removing oil pump.

40TE AUTOMATIC TRANSAXLE (Continued)

(14) **OUTPUT GEAR BEARING ADJUSTMENT:**

(a) With output gear Installd, install a 4.50 mm (0.177 in.) gauging shim (Fig. 106) on the rear carrier assembly hub, using grease to hold the shim in place.

(b) Using Tool 6259, install output gear and bearing assembly. Torque to 271 N·m (200 ft. lbs.).

(c) Measure bearing end play. Attach Tool L-4432 to the gear (Fig. 105).

(d) Push and pull the gear while rotating back and forth to ensure seating of bearing rollers.

(e) Using a dial indicator mounted to the transaxle case, measure output gear end play as shown in (Fig. 105).

(f) Refer to the output gear bearing shim chart for the required shim to obtain proper bearing setting.

(g) Use Tool 6259 to remove the output gear retaining bolt and washer. To remove the output gear, use Tool L4407A.

(h) Remove the gauging shim and install the proper shim determined by the chart. Use grease to hold the shim in place.

40TE AUTOMATIC TRANSAXLE (Continued)

(31) **TRANSFER GEAR BEARING ADJUSTMENT:**

(a) Install a 4.66 mm (0.184 in.) gauging shim on the transfer shaft (Fig. 123).

(b) Install transfer shaft gear using Tool 6261. Using Tool 6259, install transfer shaft gear retaining nut to 271 N·m (200 ft. lbs.).

(c) Measure end play. Attach Tool L4432 to the transfer gear.

(d) Mount a steel ball with grease into the end of the transfer shaft.

(e) Push and pull the gear while rotating back and forth to ensure seating of the bearing rollers.

(f) Using a dial indicator, measure transfer shaft end play.

(g) Refer to the transfer shaft bearing shim chart for the required shim combination to obtain the proper bearing setting.

(h) Use Tool 6259 to remove the retaining nut and washer. Remove the transfer shaft gear using Tool L4407A.

(i) Remove the gauging shim (Fig. 123) and install the proper shim indicated by the chart.

40TE AUTOMATIC TRANSAXLE (Continued)

(32) Install the transfer shaft gear using Tool 6261 (Fig. 124).

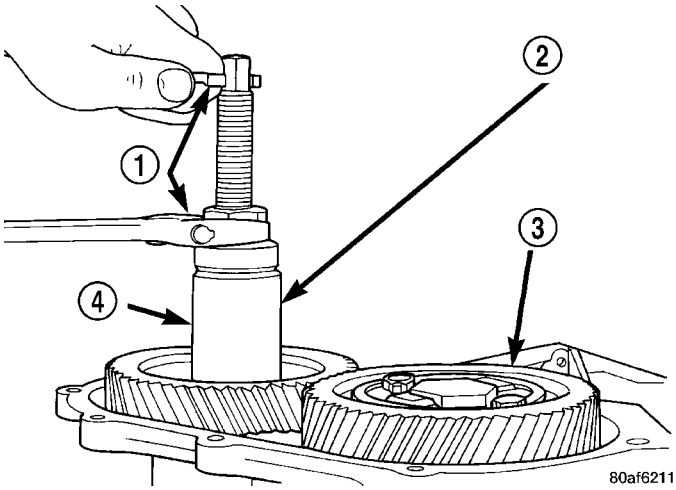

Fig. 124 Install Transfer Shaft Gear

1 - WRENCHES
2 - SPECIAL TOOL 6261
3 - OUTPUT GEAR
4 - TRANSFER SHAFT GEAR

CAUTION: Install a NEW retaining nut, as the original nut MUST NOT be reused.

(33) Install the new retaining nut and washer.

(34) Using Tool 6259, torque transfer gear retaining nut to 271 N·m (200 ft. lbs.) (Fig. 125).

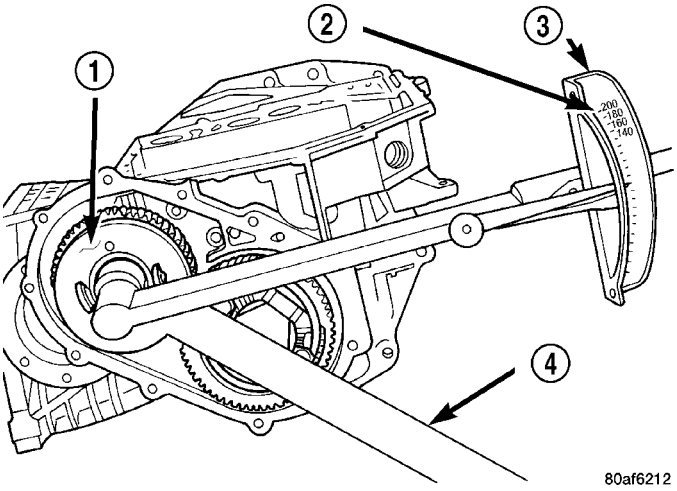

Fig. 125 Tighten Nut to 271 N•m (200 ft. lbs.)

1 - TRANSFER SHAFT GEAR
2 - 200 FT. LBS.
3 - TORQUE WRENCH
4 - SPECIAL TOOL 6259

(35) Measure transfer shaft end play. **Transfer shaft end play should be within 0.05-0.10 mm (0.002-0.004 in.).** If the end play is too high, install a 0.04 mm (0.0016 in.) thicker shim. If the end play is too low, install a 0.04 mm (0.0016 in.) thinner shim. Repeat until 0.05-0.10 mm (0.002-0.004 in.) end play is obtained.

(36) Install a bead of Mopar® ATF RTV (MS-GF41) to transfer gear cover (Fig. 126).

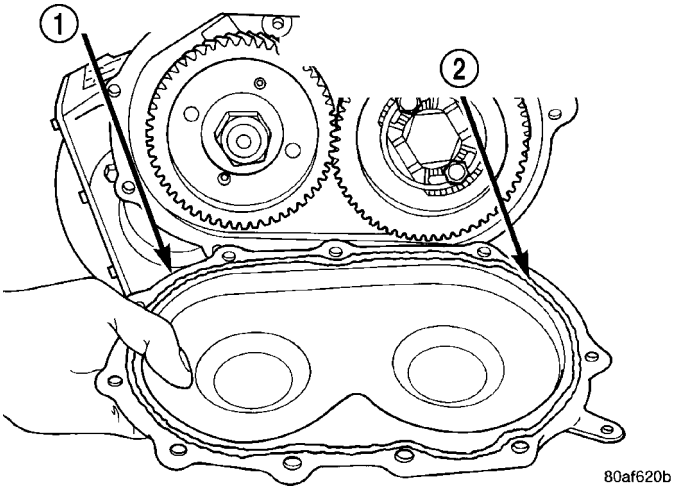

Fig. 126 Install Rear Cover

1 - REAR COVER
2 - 1/8 INCH BEAD OF MOPAR® ATF RTV (MS-GF41) AS SHOWN

(37) Install transfer gear cover-to-case bolts and torque to 20 N·m (175 in. lbs.) torque (Fig. 127).

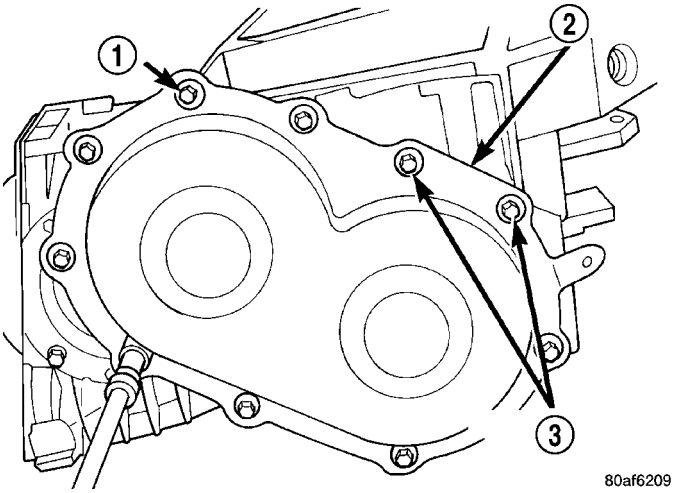

Fig. 127 Install Rear Cover Bolts

1 - REAR COVER BOLTS
2 - REAR COVER
3 - USE SEALANT ON BOLTS

40TE AUTOMATIC TRANSAXLE (Continued)

(38) Install low/reverse clutch pack (Fig. 128). Leave uppermost disc out until snap ring is installed.

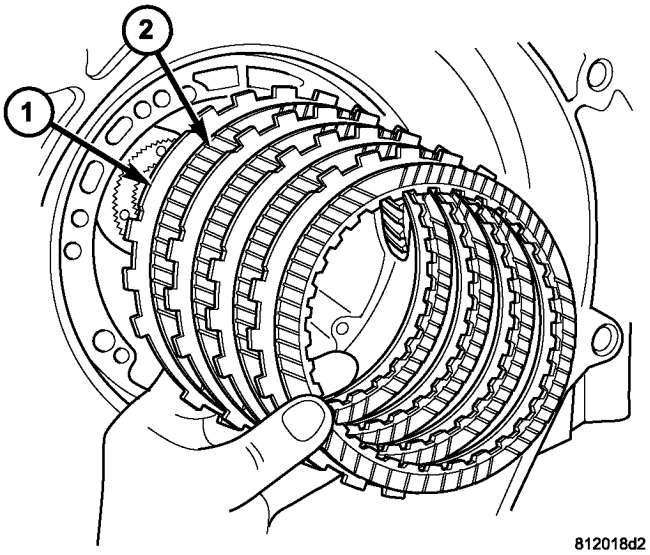

Fig. 128 Install Low/Reverse Clutch

1 - DIAL INDICATOR
2 - HOOK TOOL
3 - DIAL INDICATOR TIP TOOL 6268

40TE AUTOMATIC TRANSAXLE (Continued)

(49) Install rear sun gear and #7 needle bearing (Fig. 141).

NOTE: The number seven needle bearing has three anti-reversal tabs and is common with the number five and number two position. The orientation should allow the bearing to seat flat against the rear sun gear (Fig. 140). A small amount of petrolatum can be used to hold the bearing to the rear sun gear.

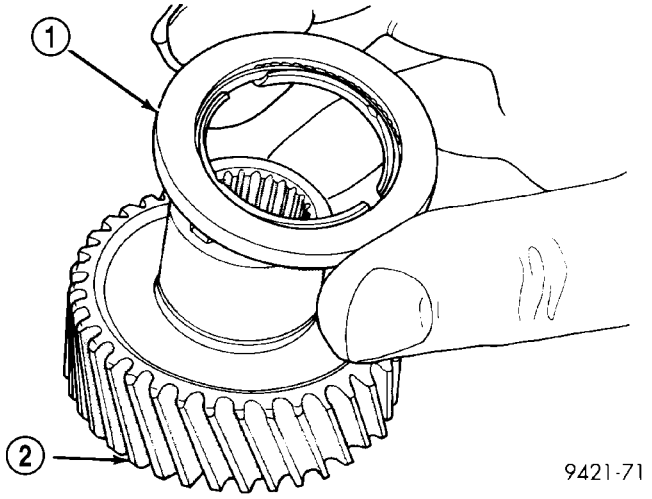

Fig. 140 Number 7 Bearing

1 - #7 NEEDLE BEARING
2 - REAR SUN GEAR

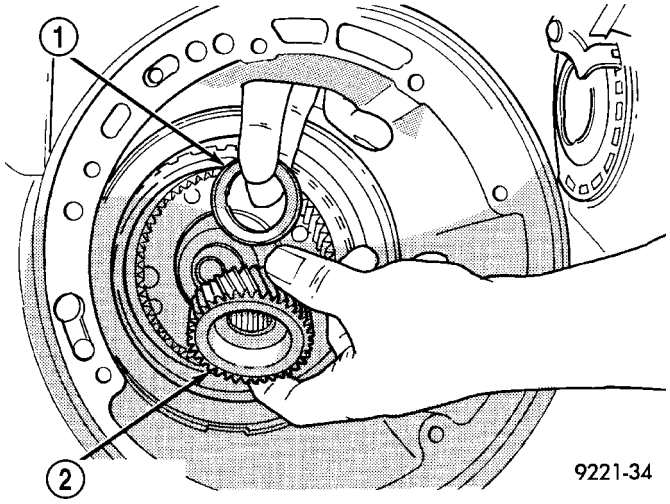

Fig. 141 Install Rear Sun Gear and #7 Needle Bearing

1 - #7 NEEDLE BEARING
2 - REAR SUN GEAR

(50) Install front carrier/rear annulus assembly and #6 needle bearing (Fig. 142).

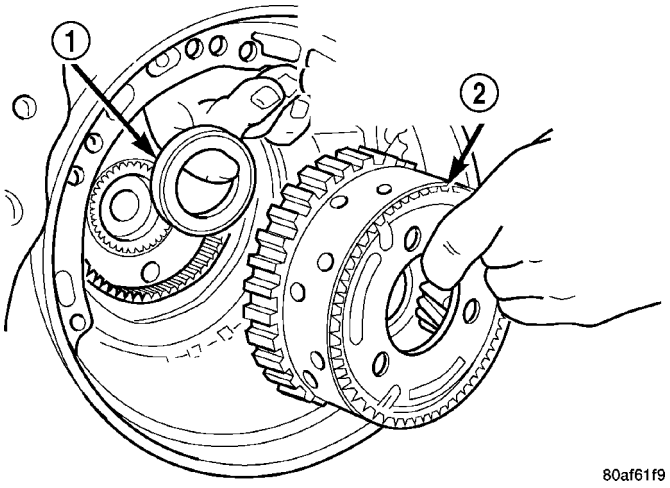

Fig. 142 Install Front Carrier/Rear Annulus Assembly

1 - #6 NEEDLE BEARING
2 - FRONT CARRIER AND REAR ANNULUS ASSEMBLY (TWIST AND PULL OR PUSH TO REMOVE OR INSTALL).

(51) Install front sun gear assembly and #4 thrust washer (Fig. 143).

1 - FRONT SUN GEAR ASSEMBLY
2 - #4 THRUST WASHER (FOUR TABS)

40TE AUTOMATIC TRANSAXLE (Continued)

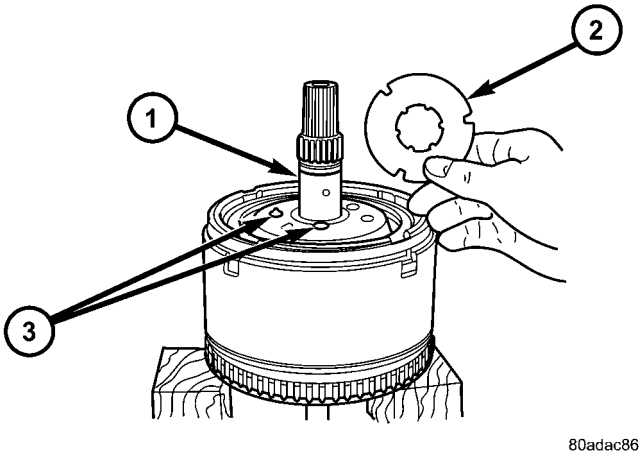

Fig. 144 Select Thinnest No. 4 Thrust Plate

1 - OVERDRIVE SHAFT ASSEMBLY
2 - #4 THRUST PLATE (SELECT)
3 - 3 DABS OF PETROLATUM FOR RETENTION

(52) **DETERMINING #4 THRUST PLATE THICKNESS / INPUT SHAFT END PLAY:**

(a) Select the thinnest #4 thrust plate thickness and install to input clutch assembly (Fig. 144). Use petrolatum to retain.

(b) Install input clutch assembly into position and verify that it is completely seated by viewing through input speed sensor hole. If view through input speed sensor hole is not as shown in (Fig. 145), the input clutch assembly is not seated properly.

(c) Remove oil pump o-ring (Fig. 146). **Be sure to reinstall oil pump o-ring after selecting the proper #4 thrust plate.**

(d) Install pump and gasket to transmission. Install and torque bolts.

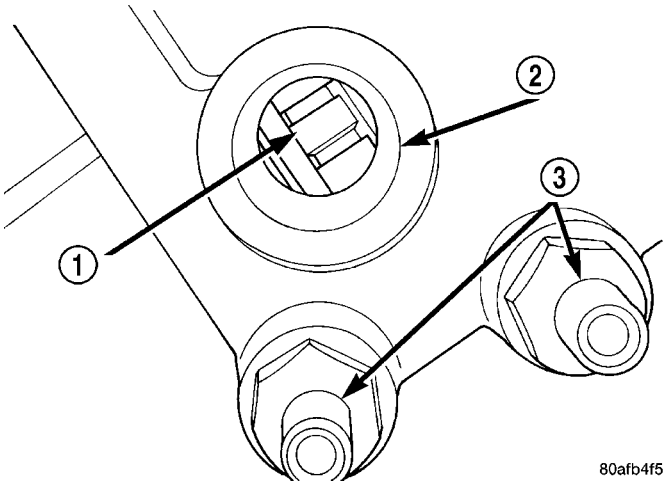

Fig. 145 View Through Input Speed Sensor Hole

1 - INPUT CLUTCH RETAINER
2 - INPUT SPEED SENSOR HOLE
3 - OIL COOLER FITTINGS

(e) Set up input shaft for measurement with Indicator Set C3339 and End Play Set 8266 as shown in (Fig. 147).

(f) Measure the input shaft end play with the transaxle in the vertical position. **Input shaft end play must be within 0.005 to 0.025 inch.** For example, if end play reading is 0.055 inch, select No. 4 Thrust Plate which is 0.071 to 0.074 thick. This should provide an input shaft end play reading of 0.020 inch which is within specifications.

(g) Refer to the No. 4 thrust plate chart to select the proper No. 4 thrust plate:

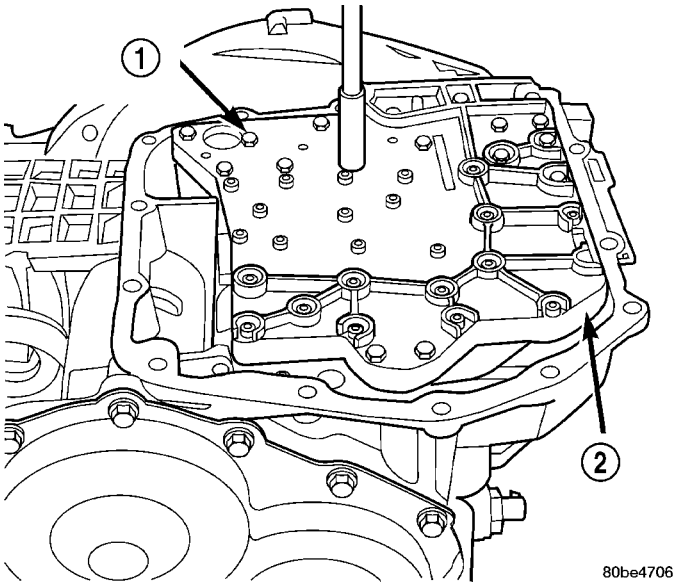

Fig. 159 Install Valve Body-to-Case Bolts

1 - VALVE BODY ATTACHING BOLTS (18)
2 - VALVE BODY

(65) Install oil filter and new o-ring (Fig. 160).

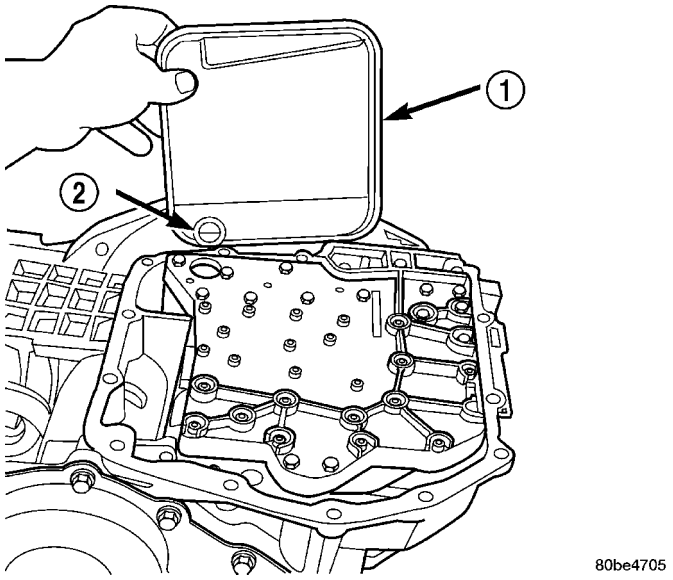

Fig. 160 Install Oil Filter and O-Ring

1 - OIL FILTER
2 - O-RING

(66) Apply an 1/8" bead of Mopar® ATF RTV (MS-GF41) to oil pan and immediately install to case (Fig. 161).

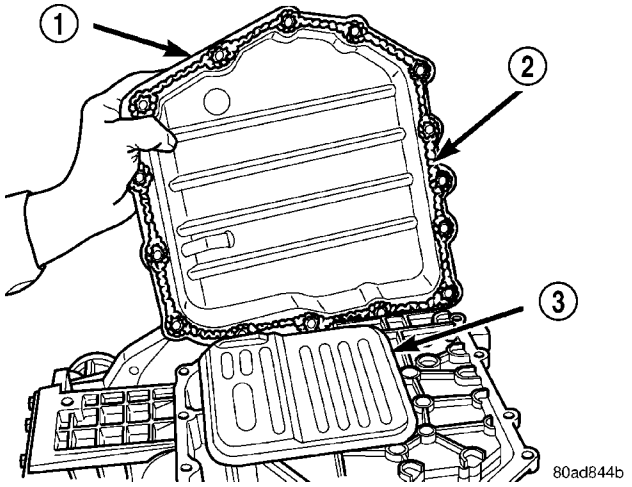

Fig. 161 Install Oil Pan

1 - OIL PAN
2 - 1/8 INCH BEAD OF MOPAR® ATF RTV (MS-GF41)
3 - OIL FILTER

(67) Install oil pan-to-case bolts and torque to 19 N·m (165 in. lbs.).

(68) Install solenoid/pressure switch assembly and gasket to case (Fig. 162).

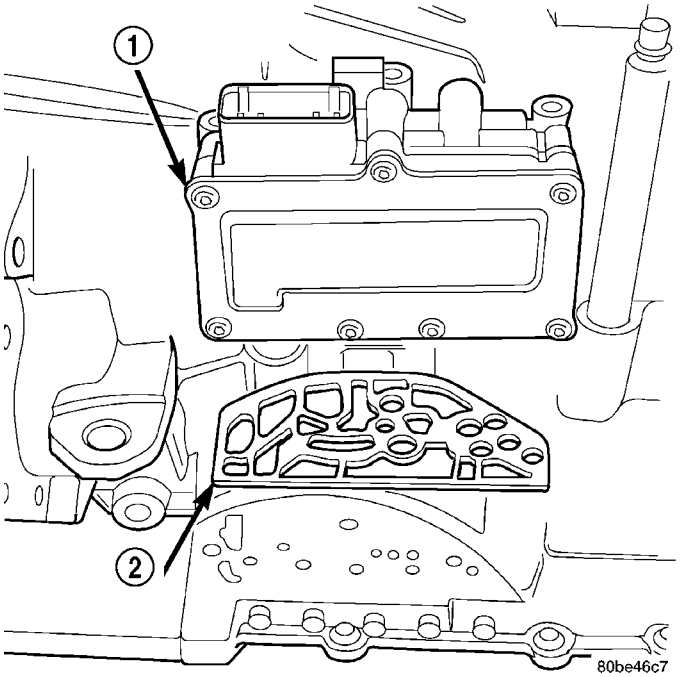

Fig. 162 Solenoid/Pressure Switch Assembly and Gasket

1 - SOLENOID/PRESSURE SWITCH ASSEMBLY
2 - GASKET

(69) Install and tighten solenoid/pressure switch assembly-to-transaxle case bolts to 12 N·m (110 in. lbs.) (Fig. 163).

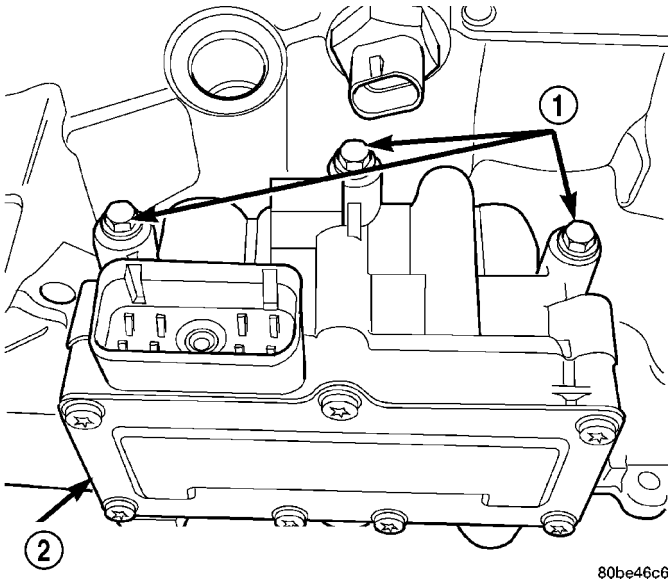

Fig. 163 Attaching Bolts

1 - BOLTS
2 - SOLENOID AND PRESSURE SWITCH ASSEMBLY

(70) Install and torque input and output speed sensors to case to 27 N·m (20 ft. lbs.).

INSTALLATION

(1) Install transaxle to engine (Fig. 19). Install and torque transaxle-to-engine bolts to 108 N·m (80 ft. lbs.).

(2) Raise engine/transaxle assembly enough line up transaxle mount bracket. Install two mount-to-transaxle bracket bolts (Fig. 18)and torque to 68 N·m (50 ft. lbs.).

(3) Remove screw jack support.

(4) Install four drive plate-to-torque converter bolts and torque to 88 N·m (65 ft. lbs.) torque.

(5) Position starter into place and hand-tighten lower bolt.

(6) Lower vehicle.

(7) Install transaxle dipstick tube. Verify that openings are free of debris and o-ring seal is intact. Replace o-ring if necessary. Secure bracket to transaxle. Install starter upper bolt through the ground cable and torque to (40 ft. lbs.).

(8) Install cable bracket-to-transaxle bellhousing bolt and torque to 61 N·m (45 ft. lbs.).

(9) Raise vehicle.

(10) Torque starter lower bolt (Fig. 17) to 54 N·m (40 ft. lbs.).

(11) Connect starter motor electrical connections.

(12) Install bellhousing dust cover (Fig. 15).

(13) Install structural collar and left (front) lateral bending brace. Refer to ENGINE for proper procedures (Fig. 14).

(14) Install right (rear) lateral bending brace (Fig. 16). Torque bolts to 81 N·m (60 ft. lbs.) torque.

(15) Install power steering line to structural collar (Fig. 13).

(16) Install front halfshafts. Refer to DIFFERENTIAL AND DRIVELINE for proper procedures and torque specifications.

(17) Install left splash shield.

(18) Install left wheel/tire assembly. Torque lug nuts to 136 N·m (100 ft. lbs.) torque.

(19) Lower vehicle.

(20) Connect transaxle oil cooler lines. An audible 'click' should be heard. Verify connection by pulling outward. (Refer to 7 - COOLING/TRANSMISSION - STANDARD PROCEDURE)

(21) Connect solenoid/pressure switch assembly connector (Fig. 12).

(22) Connect transmission range sensor connector (Fig. 12).

(23) Connect output speed sensor connector (Fig. 12).

(24) Connect input speed sensor connector (Fig. 12).

(25) Install gearshift cable to bracket and connect to the manual valve lever.

(26) Install battery tray (Fig. 11).

(27) Install battery and hold-down clamp (Fig. 10).

(28) Install air cleaner assembly (Fig. 9).

(29) Connect battery cables.

(30) Fill transaxle with fluid. Refer to SERVICE PROCEDURES for proper procedure.

ACCUMULATOR

DESCRIPTION

The 4XTE underdrive, overdrive, low/reverse, and 2/4 clutch hydraulic circuits each contain an accumulator. An accumulator typically consists of a piston, return spring(s), and a cover or plug. The overdrive and underdrive accumulators are located within the transaxle case, and are retained by the valve body (Fig. 164).

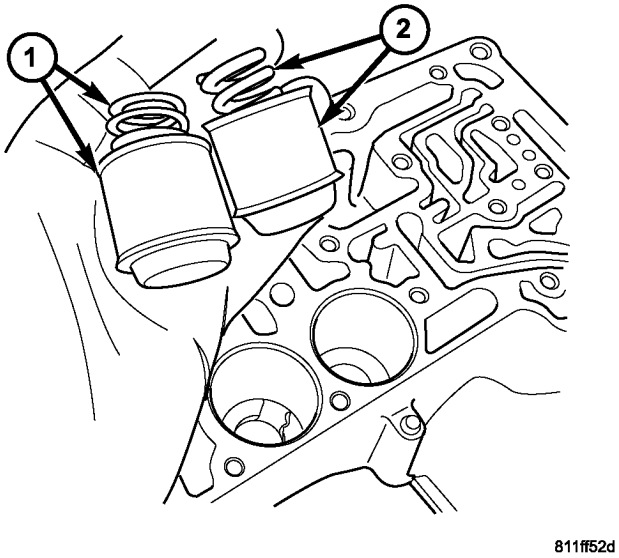

Fig. 164 Underdrive and Overdrive Accumulators

1 - OVERDRIVE PISTON AND SPRING
2 - UNDERDRIVE PISTON AND SPRING

The low reverse accumulator (Fig. 165) is also located within the transaxle case, but the assembly is retained by a cover and a snap-ring.

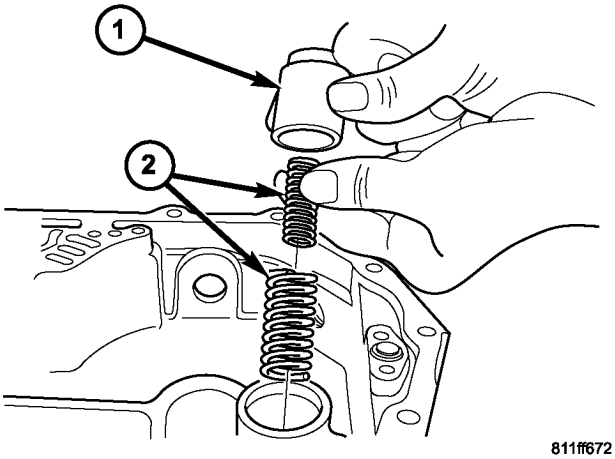

Fig. 165 Low/Reverse Accumulator

1 - PISTON
2 - RETURN SPRINGS

The 2/4 accumulator is located in the valve body. It is retained by a cover and retaining screws (Fig. 166).

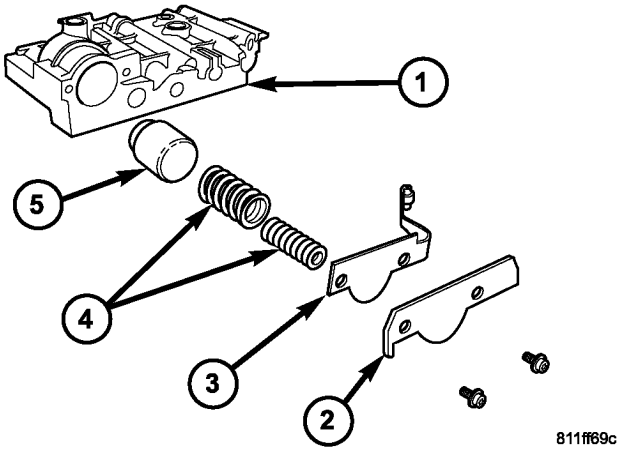

Fig. 166 2/4 Accumulator Assembly

1 - VALVE BODY
2 - RETAINER PLATE
3 - DETENT SPRING
4 - RETURN SPRINGS
5 - PISTON

OPERATION

The function of an accumulator is to cushion the application of a frictional clutch element. When pressurized fluid is applied to a clutch circuit, the application force is dampened by fluid collecting in the respective accumulator chamber against the piston and spring(s). The intended result is a smooth, firm clutch application.

DRIVING CLUTCHES

DESCRIPTION

Three hydraulically applied input clutches are used to drive planetary components. The underdrive, overdrive, and reverse clutches are considered input clutches and are contained within the input clutch assembly (Fig. 167). The input clutch assembly also contains:

- Input shaft
- Input hub
- Clutch retainer
- Underdrive piston
- Overdrive/reverse piston
- Overdrive hub
- Underdrive hub

OPERATION

The three input clutches are responsible for driving different components of the planetary geartrain.

DRIVING CLUTCHES (Continued)

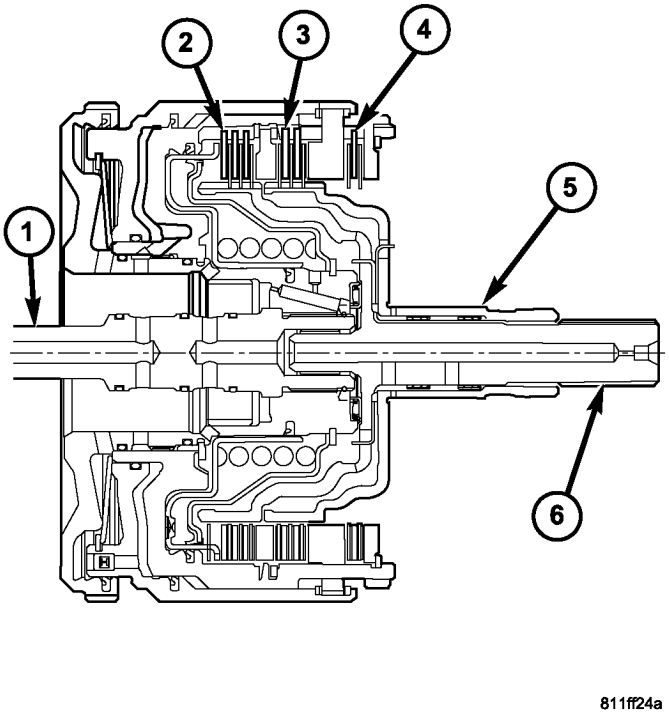

Fig. 167 Input Clutch Assembly

1 - INPUT SHAFT
2 - UNDERDRIVE CLUTCH
3 - OVERDRIVE CLUTCH
4 - REVERSE CLUTCH
5 - OVERDRIVE SHAFT
6 - UNDERDRIVE SHAFT

NOTE: Refer to the "Elements In Use" chart in Diagnosis and Testing for a collective view of which clutch elements are applied at each position of the selector lever.

UNDERDRIVE CLUTCH

The underdrive clutch is hydraulically applied in first, second, and third (direct) gears by pressurized fluid against the underdrive piston. When the underdrive clutch is applied, the underdrive hub drives the rear sun gear.

OVERDRIVE CLUTCH

The overdrive clutch is hydraulically applied in third (direct) and overdrive gears by pressurized fluid against the overdrive/reverse piston. When the overdrive clutch is applied, the overdrive hub drives the front planet carrier.

REVERSE CLUTCH

The reverse clutch is hydraulically applied in reverse gear only by pressurized fluid against the overdrive/reverse piston. When the reverse clutch is applied, the front sun gear assembly is driven.

FINAL DRIVE

DESCRIPTION

The 4XTE differential is a conventional open design. It consists of a ring gear and a differential case. The differential case consists of pinion and side gears, and a pinion shaft. The differential case is supported in the transaxle by tapered roller bearings (Fig. 168).

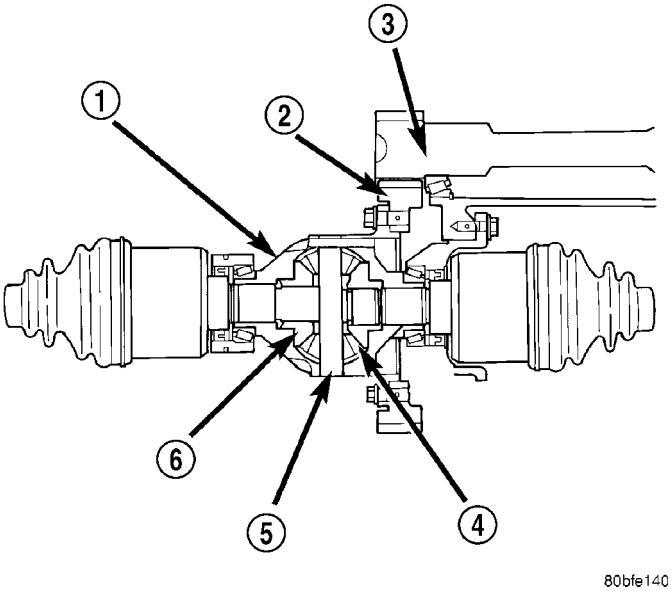

Fig. 168 Differential Assembly

1 - DIFFERENTIAL CASE
2 - RING GEAR
3 - TRANSFER SHAFT
4 - PINION GEAR
5 - PINION SHAFT
6 - SIDE GEAR

OPERATION

The differential assembly is driven by the transfer shaft by way of the differential ring gear. The ring gear drives the differential case, and the case drives the driveshafts through the differential gears. The differential pinion and side gears are supported in the case by thrust washers and a pinion shaft. Differential pinion and side gears make it possible for front tires to rotate at different speeds while cornering.

FINAL DRIVE (Continued)

DISASSEMBLY

NOTE: The transfer shaft should be removed for differential repair and bearing turning torque checking.

(1) Remove the differential cover and bolts (Fig. 169) (Fig. 170).

FINAL DRIVE (Continued)

ADJUSTMENTS

DIFFERENTIAL BEARING PRELOAD MEASUREMENT AND ADJUSTMENT

NOTE: Perform all differential bearing preload measurements with the transfer shaft and gear removed.

DIFFERENTIAL BEARING PRELOAD ADJUSTMENT USING EXISTING SHIM

(1) Position the transaxle assembly vertically on the support stand, differential bearing retainer side up.

(2) Install Tool L-4436A into the differential and onto the pinion mate shaft (Fig. 204).

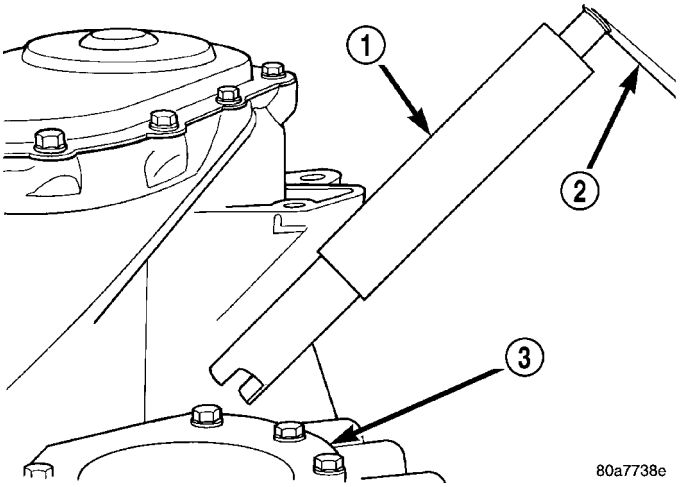

Fig. 204 Tool L-4436 and Torque Wrench

1 - SPECIAL TOOL L-4436–A
2 - TORQUE WRENCH
3 - DIFFERENTIAL BEARING RETAINER

(3) Rotate the differential at least one full revolution to ensure the tapered roller bearings are fully seated.

(4) Using Tool L-4436A and an inch-pound torque wrench, check the turning torque of the differential (Fig. 205). **The turning torque should be between 5 and 18 inch-pounds.**

(5) If the turning torque is within specifications, remove tools. Setup is complete.

(6) If turning torque is not within specifications proceed with the following steps.

(a) Remove differential bearing retainer from the transaxle case.

(b) Remove the bearing cup from the differential bearing retainer using Tool 6062A.

(c) Remove the existing shim from under the cup.

(d) Measure the existing shim.

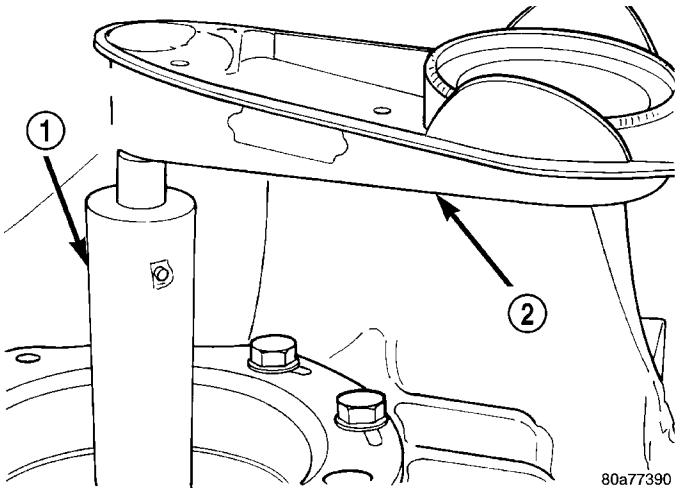

Fig. 205 Checking Differential Bearings Turning Torque

1 - SPECIAL TOOL L-4436–A
2 - TORQUE WRENCH

(e) If the turning torque was too high when measured, install a 0.05 mm (0.002 inch) thinner shim. If the turning torque is was too low, install a 0.05 mm (0.002 inch) thicker shim. Repeat until 5 to 18 inch-pounds turning torque is obtained. Oil Baffle is not required to be installed when making shim selection.

(f) Install the proper shim under the bearing cup. Make sure the oil baffle is installed properly in the bearing retainer, below the bearing shim and cup.

(g) Install the differential bearing retainer using Tool 5052 and C-4171. Seal the retainer to the housing with MOPAR® Adhesive Sealant and torque bolts to 28 N·m (250 in. lbs.).

(7) Using Tool L-4436A and an inch-pound torque wrench, recheck the turning torque of the differential (Fig. 205). **The turning torque should be between 5 and 18 inch-pounds.**

Shim thickness need be determined only if any of the following parts are replaced:

- Transaxle case
- Differential carrier
- Differential bearing retainer
- Extension housing
- Differential bearing cups and cones

FINAL DRIVE (Continued)

DIFFERENTIAL BEARING SHIM CHART

PART NUMBER	SHIM THICKNESS	
	MM	INCH
4659257	.980	0.0386

PRELOAD ADJUSTMENT W/O SHIM

(1) Remove the bearing cup from the differential bearing retainer using Miller special Tool 6062A.

(2) Remove existing shim from under bearing cup.

(3) Reinstall the bearing cup into the retainer using Miller Special Tool 6061, and C-4171.

NOTE: Oil baffle is not required when making the shim calculation.

(4) Install the bearing retainer into the case. Torque bolts to 28 N•m (250 in. lbs.).

(5) Position the transaxle assembly vertically on the support stand and install Miller Special Tool L-4436-A into the bearing retainer.

(6) Rotate the differential at least one full revolution to ensure the tapered roller bearings are fully seated.

(7) Attach a dial indicator to the case and zero the dial. Place the tip on the end of Special Tool L-4436-A.

(8) Place a large screwdriver to each side of the ring gear and lift. Check the dial indicator for the amount of end play.

CAUTION: Do not damage the transaxle case and/or differential retainer sealing surface.

(9) Using the end play measurement that was determined, add 0.18mm (0.007 inch). This should give you between 5 and 18 inch pounds of bearing preload. Refer to the Differential Bearing Shim Chart to determine which shim to use.

(10) Remove the differential bearing retainer. Remove the bearing cup.

(11) Install the oil baffle. Install the proper shim combination under the bearing cup.

(12) Install the differential bearing retainer. Seal the retainer to the housing with Mopar® Silicone Rubber Adhesive Sealant. Torque bolts to 28 N•m (250 in. lbs.).

(13) Using Miller Special Tool L-4436-A and an inch-pound torque wrench, check the turning torque

FINAL DRIVE (Continued)

of the differential (Fig. 205). The turning torque should be between 5-18 inch-pounds.

NOTE: If turning torque is too high install a 0.05mm (0.002 inch) thicker shim. If the turning torque is too low, install a 0.05mm (0.002 inch) thinner shim. Repeat until 5-18 inch-pounds of turning torque is obtained.

FLUID

STANDARD PROCEDURE

FLUID LEVEL AND CONDITION CHECK

NOTE: Only transmission fluid of the type labeled Mopar ATF+4 (Automatic Transmission Fluid) should be used in this transaxle.

FLUID LEVEL CHECK

The transmission sump has a fluid level indicator (dipstick) to check oil similar to most automatic transmissions. It is located on the left side of the engine. Be sure to wipe all dirt from dipstick handle before removing.

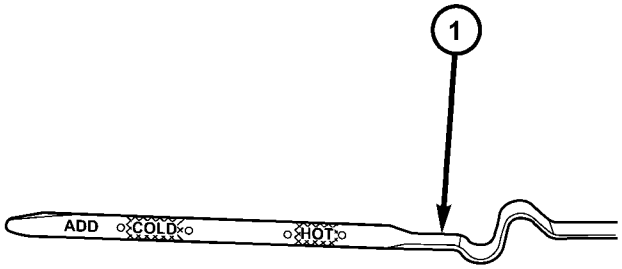
The torque converter fills in both the P Park and N Neutral positions. Place the selector lever in P Park to be sure that the fluid level check is accurate. **The engine should be running at idle speed for at least one minute, with the vehicle on level ground.** At normal operating temperature 82° C (180° F), the fluid level is correct if it is in the HOT region on the oil level indicator (Fig. 206). The fluid level should be within the COLD region of the dipstick at 27° C (80° F) fluid temperature.

FLUID LEVEL CHECK USING DRB

NOTE: Engine and Transaxle should be at normal operating temperature before performing this procedure.

(1) Start engine and apply parking brake.
(2) Hook up DRB scan tool and select transmission.
(3) Select sensors.
(4) Read the transmission temperature value.
(5) Compare the fluid temperature value with the fluid temperature chart (Fig. 207).
(6) Adjust transmission fluid level shown on the indicator according to the chart.
(7) Check transmission for leaks.

Low fluid level can cause a variety of conditions because it allows the pump to take in air along with the fluid. As in any hydraulic system, air bubbles make the fluid spongy, therefore, pressures will be low and build up slowly.



80d64ee0

Fig. 206 Fluid Level Indicator

1 - FLUID LEVEL INDICATOR

Improper filling can also raise the fluid level too high. When the transaxle has too much fluid, the gears churn up foam and cause the same conditions which occur with a low fluid level.

In either case, air bubbles can cause overheating and/or fluid oxidation, and varnishing. This can interfere with normal valve, clutch, and accumulator operation. Foaming can also result in fluid escaping from the transaxle vent where it may be mistaken for a leak.

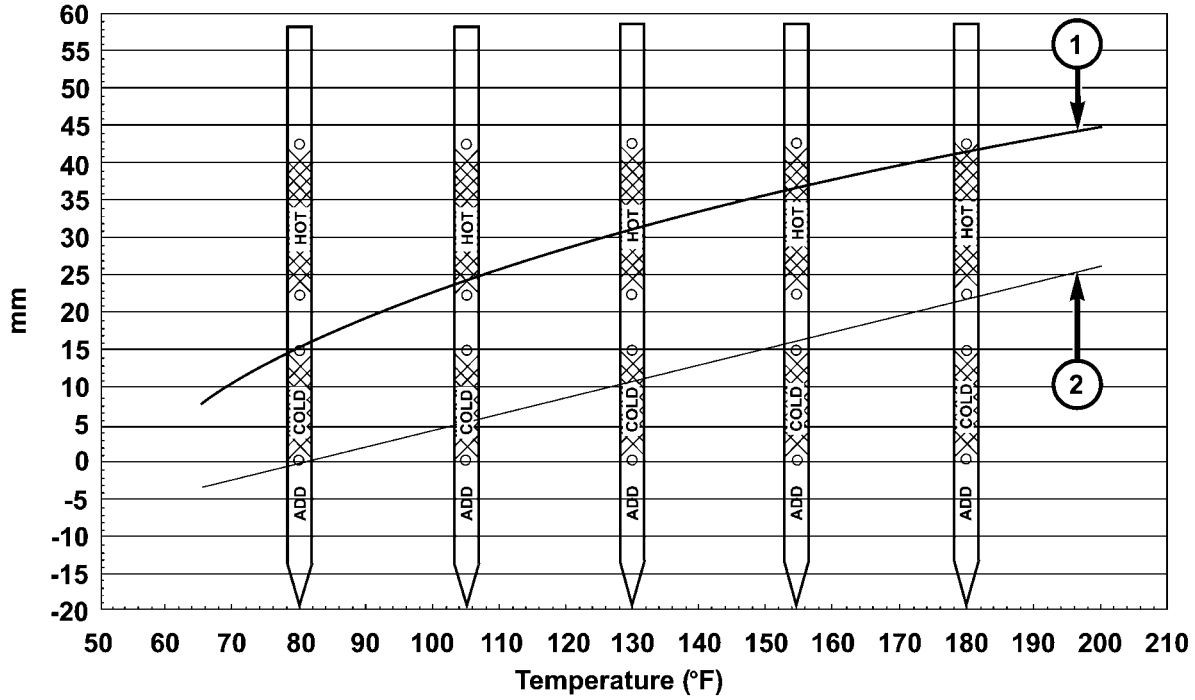
FLUID CONDITION

Along with fluid level, it is important to check the condition of the fluid. When the fluid smells burned, and is contaminated with metal or friction material particles, a complete transaxle recondition is probably required. Be sure to examine the fluid on the dipstick closely. If there is any doubt about its condition, drain out a sample for a double check.

Mopar® ATF+4 (Automatic Transmission Fluid) when new is red in color. The ATF is dyed red so it can be identified from other fluids used in the vehicle such as engine oil or antifreeze. The red color is not permanent and is not an indicator of fluid condition. As the vehicle is driven, the ATF will begin to look darker in color and may eventually become brown. **This is normal.** ATF+4 also has a unique odor that may change with age. Consequently, **odor and color cannot be used to indicate the fluid condition or the need for a fluid change.**

After the fluid has been checked, seat the dipstick fully to seal out water and dirt.

FLUID (Continued)



80d64e6e

Fig. 207 Transmission Fluid Temperature Chart

1 - MAX. LEVEL
2 - MIN. LEVEL

STANDARD PROCEDURE - FLUID AND FILTER SERVICE

NOTE: Refer to the maintenance schedules in LUBRICATION and MAINTENANCE, or the vehicle owner's manual, for the recommended maintenance (fluid/filter change) intervals for this transaxle.

NOTE: Only fluids of the type labeled Mopar® ATF+4 (Automatic Transmission Fluid) should be used. A filter change should be made at the time of the transmission oil change. The magnet (on the inside of the oil pan) should also be cleaned with a clean, dry cloth.

NOTE: If the transaxle is disassembled for any reason, the fluid and filter should be changed.

FLUID (Continued)

FLUID/FILTER SERVICE (RECOMMENDED)

(1) Raise vehicle on a hoist. Refer to LUBRICATION and MAINTENANCE for proper procedures. Place a drain container with a large opening, under transaxle oil pan.

(2) Loosen pan bolts and tap the pan at one corner to break it loose allowing fluid to drain, then remove the oil pan.

(3) Install a new filter and o-ring on bottom of the valve body (Fig. 208).

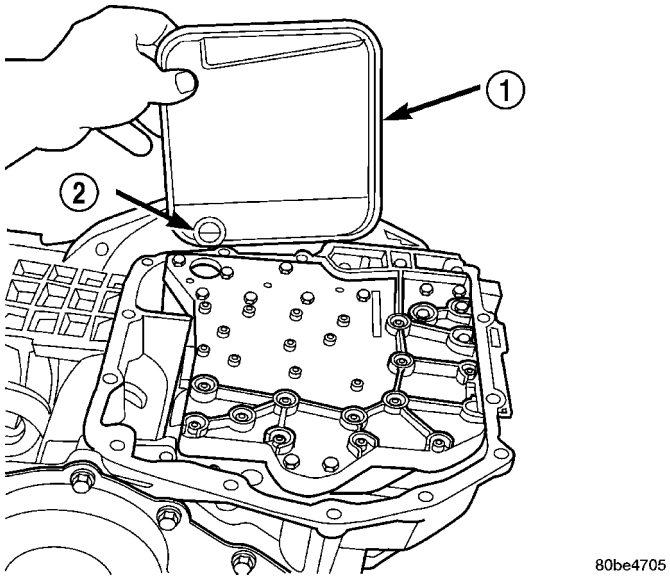


Fig. 208 Filter and O-Ring

1 - OIL FILTER
2 - O-RING

(4) Clean the oil pan and magnet. Reinstall pan using new Mopar Silicone Adhesive sealant. Tighten oil pan bolts to 19 N·m (165 in. lbs.).

(5) Pour four quarts of Mopar® ATF+4 (Automatic Transmission Fluid) through the dipstick opening.

(6) Start engine and allow to idle for at least one minute. Then, with parking and service brakes applied, move selector lever momentarily to each position, ending in the park or neutral position.

(7) Check the transaxle fluid level and add an appropriate amount to bring the transaxle fluid level to 3mm (1/8 in.) below the lowest mark on the dipstick (Fig. 209).

(8) Recheck the fluid level after the transaxle has reached normal operating temperature (180°F.). Refer to Fluid Level and Condition Check for the proper fluid fill procedure.

(9) To prevent dirt from entering transaxle, make certain that dipstick is fully seated into the dipstick opening.

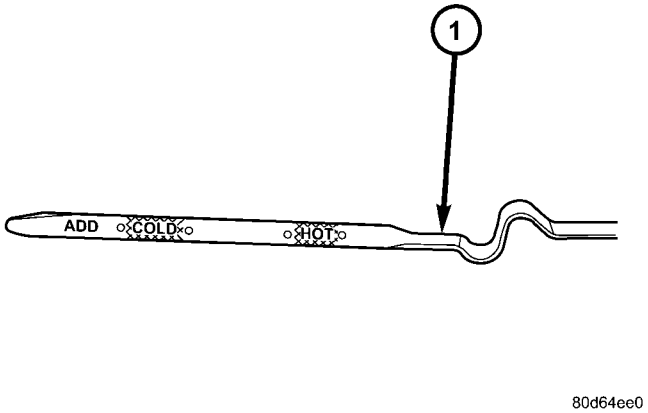

Fig. 209 Fluid Level Indicator

1 - FLUID LEVEL INDICATOR

DIPSTICK TUBE FLUID SUCTION METHOD (ALTERNATIVE)

(1) When performing the fluid suction method, make sure the transaxle is at full operating temperature.

(2) To perform the dipstick tube fluid suction method, use a suitable fluid suction device (Vacula™ or equivalent).

(3) Insert the fluid suction line into the dipstick tube.

NOTE: Verify that the suction line is inserted to the lowest point of the transaxle oil pan. This will ensure complete evacuation of the fluid in the pan.

(4) Follow the manufacturers recommended procedure and evacuate the fluid from the transaxle.

(5) Remove the suction line from the dipstick tube.

(6) Pour four quarts of Mopar® ATF+4 (Automatic Transmission Fluid) through the dipstick opening.

(7) Start engine and allow to idle for at least one minute. Then, with parking and service brakes applied, move selector lever momentarily to each position, ending in the park or neutral position.

(8) Check the transaxle fluid level and add an appropriate amount to bring the transaxle fluid level to 3mm (1/8 in.) below the lowest mark on the dipstick (Fig. 209).

(9) Recheck the fluid level after the transaxle has reached normal operating temperature (180°F.). (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 41TE/FLUID - STANDARD PROCEDURE)

(10) To prevent dirt from entering transaxle, make certain that dipstick is fully seated into the dipstick opening.

GEAR SHIFT BEZEL

REMOVAL

(1) Loosen set screw and remove knob from shifter handle (Fig. 210).

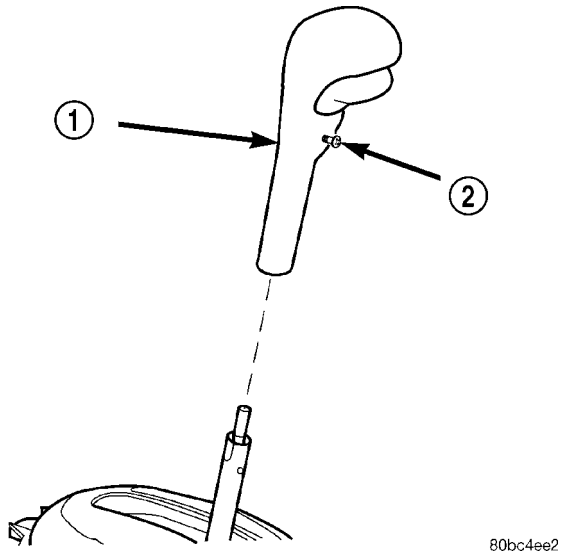

Fig. 210 Gearshift Knob Removal/Installation

1 - SHIFTER KNOB
2 - SET SCREW

(2) Remove the center console assembly as shown in (Fig. 211).

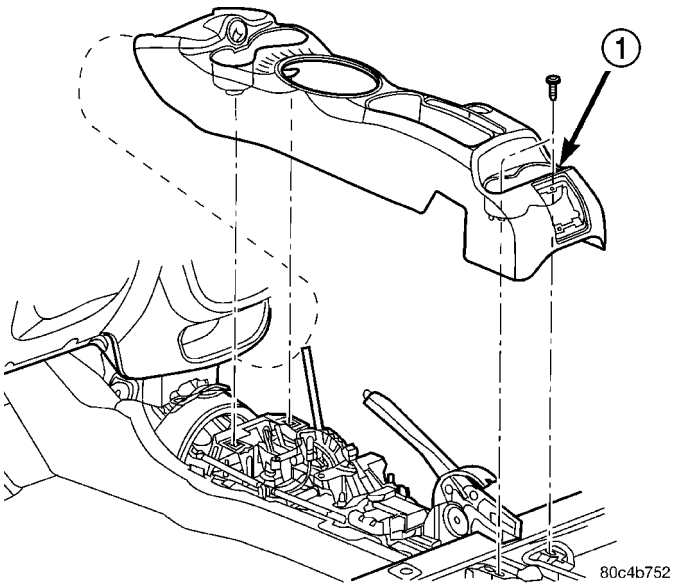

Fig. 211 Center Console Removal/Installation

1 - CENTER CONSOLE

(3) Remove shifter bezel (Fig. 212).

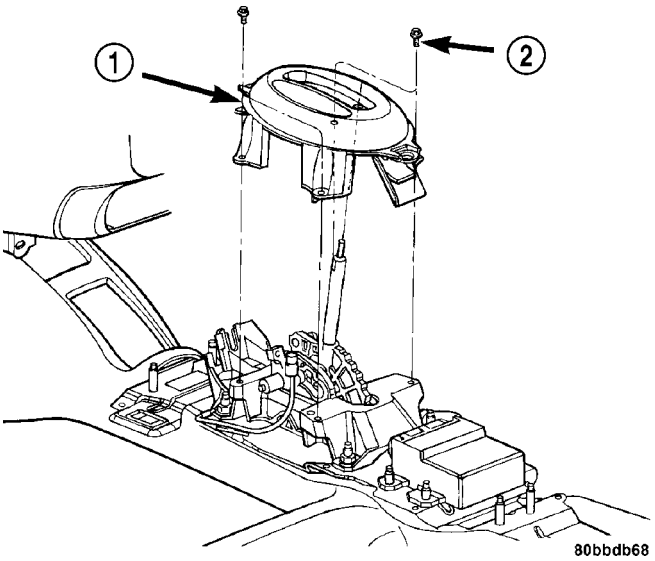

Fig. 212 Shifter Bezel Removal/Installation

1 - BEZEL
2 - SCREW (4)

INSTALLATION

(1) Install gearshift bezel (Fig. 212).
(2) Install center console assembly (Fig. 211).
(3) Install gearshift knob and tighten set screw to 2 N·m (17 in. lbs.) torque (Fig. 210).

GEAR SHIFT CABLE

REMOVAL

(1) Loosen set screw and remove knob from shifter handle (Fig. 213).

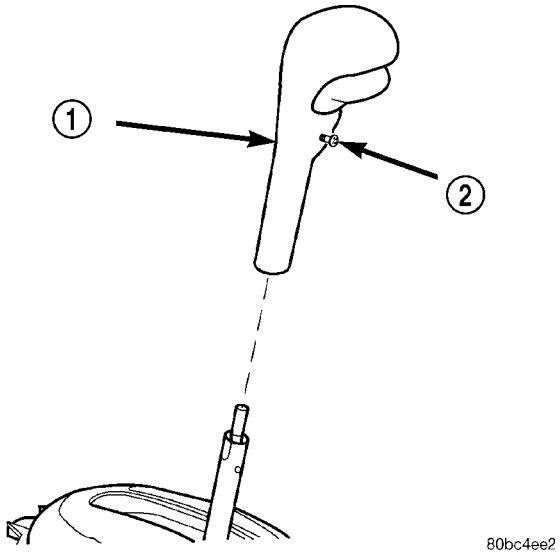

Fig. 213 Gearshift Knob Removal/Installation

1 - SHIFTER KNOB
2 - SET SCREW

GEAR SHIFT CABLE (Continued)

(2) Remove the center console assembly as shown in (Fig. 214).

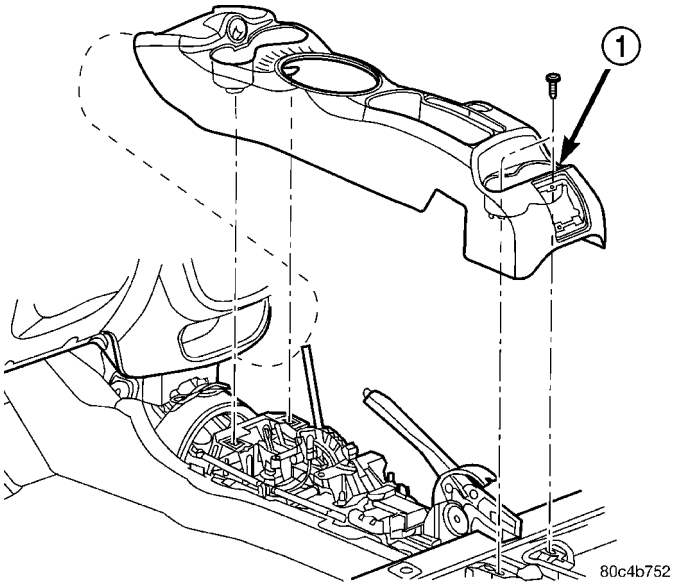

Fig. 214 Center Console Removal/Installation

1 - CENTER CONSOLE

(3) Remove shifter bezel (Fig. 215).

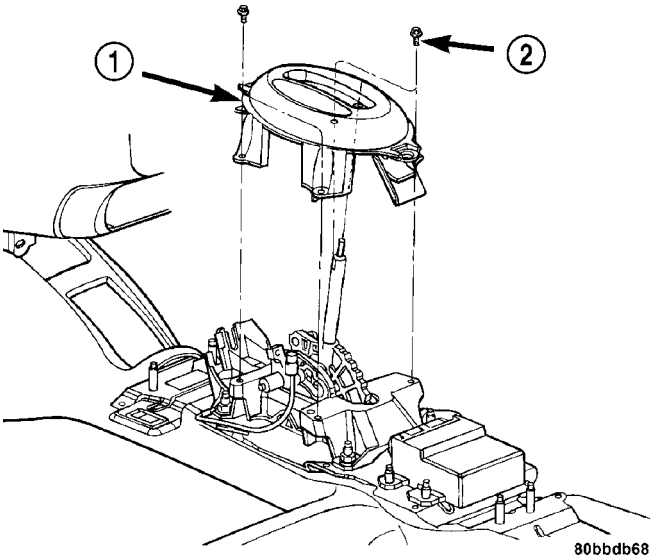

Fig. 215 Shifter Bezel Removal/Installation

1 - BEZEL
2 - SCREW (4)

(4) Disconnect shift cable from shifter mechanism as shown in (Fig. 216).

(5) Remove three grommet plate to floor pan nuts as shown in (Fig. 216).

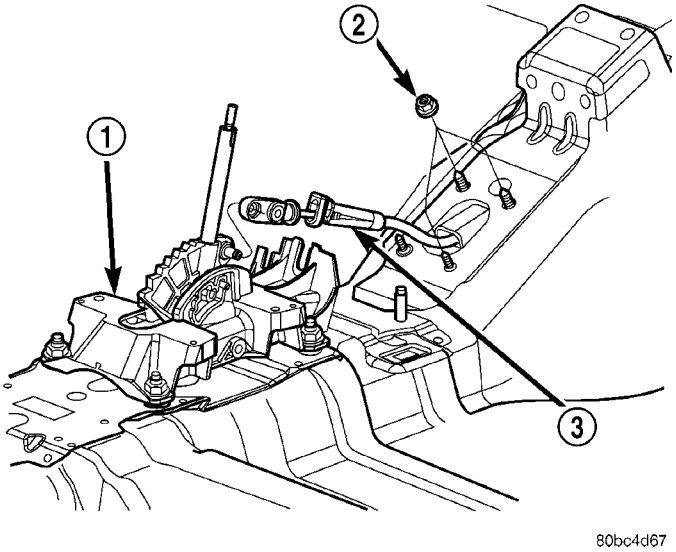

Fig. 216 Gearshift Cable at Shifter Assembly

1 - SHIFTER ASSEMBLY
2 - GROMMET PLATE NUT
3 - SHIFT CABLE

(6) Remove air cleaner assembly (Fig. 217).

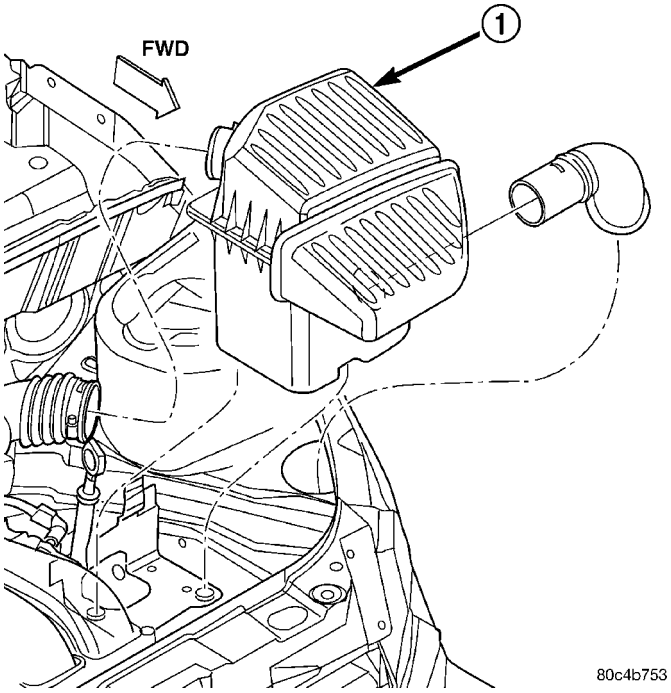

Fig. 217 Air Cleaner Assembly Removal/Installation

1 - AIR CLEANER ASSEMBLY

GEAR SHIFT CABLE (Continued)

(7) Disconnect both battery cables, remove battery hold down clamp and bolt, and remove battery (Fig. 218).

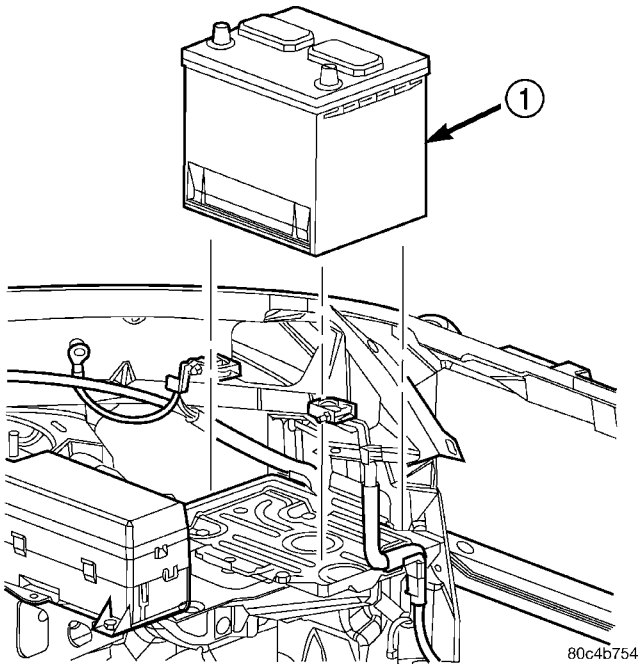

Fig. 218 Battery Removal/Installation

1 - BATTERY

(8) Remove battery tray (Fig. 219) from bracket.

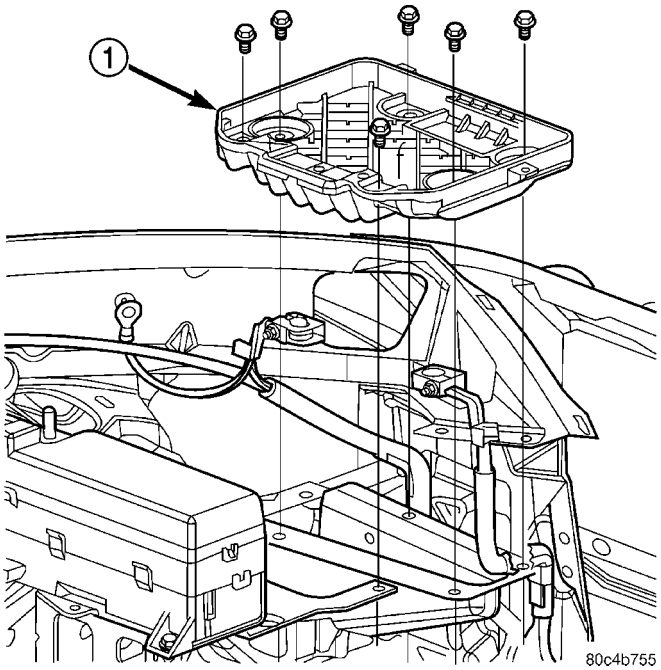

Fig. 219 Battery Tray Removal/Installation

1 - BATTERY TRAY

(9) Disconnect shifter cable from shift lever and remove from bracket (Fig. 220).

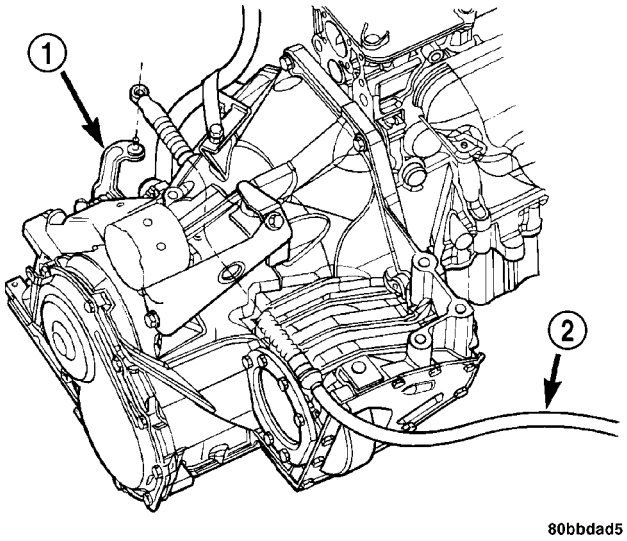

Fig. 220 Gear Shift Cable at Transaxle

1 - SHIFT LEVER
2 - SHIFT CABLE

(10) Raise vehicle on hoist.

(11) Remove catalytic converter heat shield (Fig. 221).

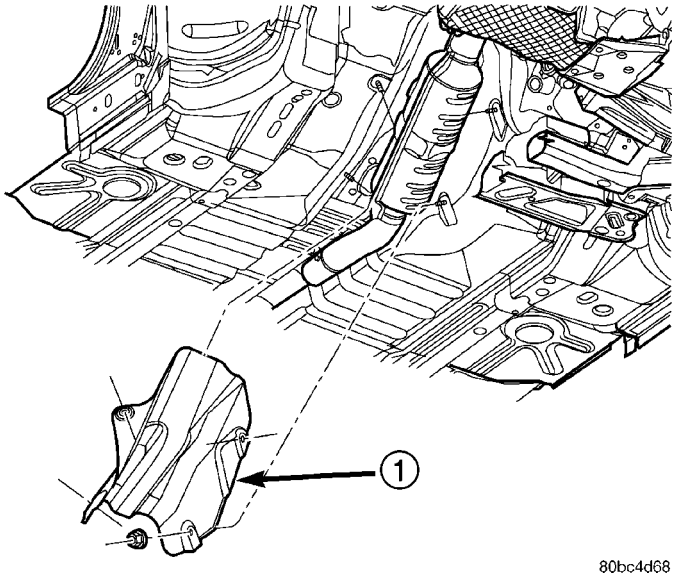

Fig. 221 Catalytic Converter Heat Shield

1 - CONVERTER HEAT SHIELD

GEAR SHIFT CABLE (Continued)

(12) Remove remaining grommet plate screw and remove cable assembly from vehicle (Fig. 222).

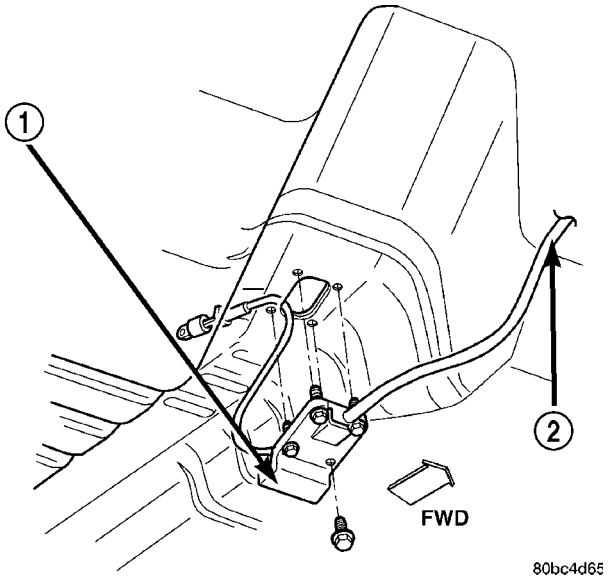

Fig. 222 Grommet Plate/Shift Cable at Floor Pan

1 - GROMMET PLATE
2 - SHIFT CABLE

INSTALLATION

(1) Install cable assembly through floor pan opening and secure to floor pan with grommet plate and one screw (Fig. 222). Make sure the three grommet plate studs protrude through cable assembly and floor pan and tighten screw to 7 N·m (60 in. lbs.).

(2) Route transaxle end of cable assembly into engine compartment and over transaxle assembly.

(3) Install catalytic converter heat shield (Fig. 221).

(4) Install gear shift cable to bracket and connect to shift lever (Fig. 220).

(5) Lower vehicle.

(6) Install and tighten the three grommet plate-to-floor pan nuts. Tighten to 6 N·m (50 in. lbs.) torque.

(7) Connect gearshift cable to shifter assembly as shown in (Fig. 216).

(8) Install shifter bezel (Fig. 215).

(9) **Adjust gearshift cable as follows:**

(a) Place gearshift lever in the PARK (P) position.

(b) Loosen shift cable adjustment screw (Fig. 223).

(c) Verify transaxle is in the PARK (P) position and the shifter lever is in gated PARK..

(d) Tighten shift cable adjustment screw to 8 N·m (70 in. lbs.) torque.

(10) Install battery tray (Fig. 219).

(11) Install battery and hold down clamp (Fig. 218).

(12) Install the air cleaner assembly (Fig. 217).

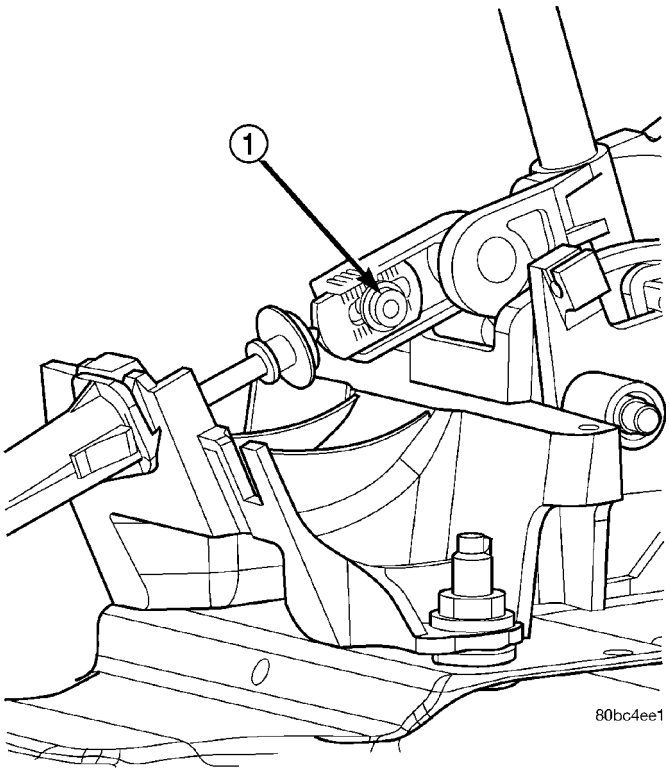

Fig. 223 Gearshift Cable Adjustment Screw

1 - GEARSHIFT CABLE ADJUSTMENT SCREW

(13) Install center console assembly (Fig. 214).

(14) Install gearshift knob and tighten set screw to 2 N·m (17 in. lbs.) torque (Fig. 213).

(15) Connect battery cables.

(16) Verify that engine starter operates in both PARK (P) and NEUTRAL (N). Starter should not operate in any other gear position.

ADJUSTMENTS

GEARSHIFT CABLE

The engine starter should only operate when the transaxle shift lever is in the PARK (P) or NEUTRAL (N) positions. If the engine starts in any other gear position, or the vehicle rolls when the shifter is in gated PARK (P), a gearshift cable adjustment is necessary.

ADJUSTMENT

(1) Loosen set screw and remove knob from shifter handle (Fig. 224).

(2) Remove the center console assembly as shown in (Fig. 225).

(3) **Adjust gearshift cable as follows:**

(a) Place gearshift lever in the PARK (P) position.

(b) Loosen shift cable adjustment screw (Fig. 226).

GEAR SHIFT CABLE (Continued)

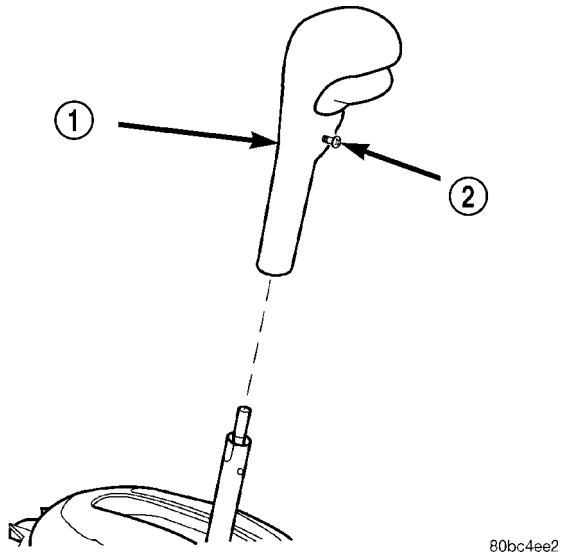

Fig. 224 Gearshift Knob Removal/Installation

1 - SHIFTER KNOB
2 - SET SCREW

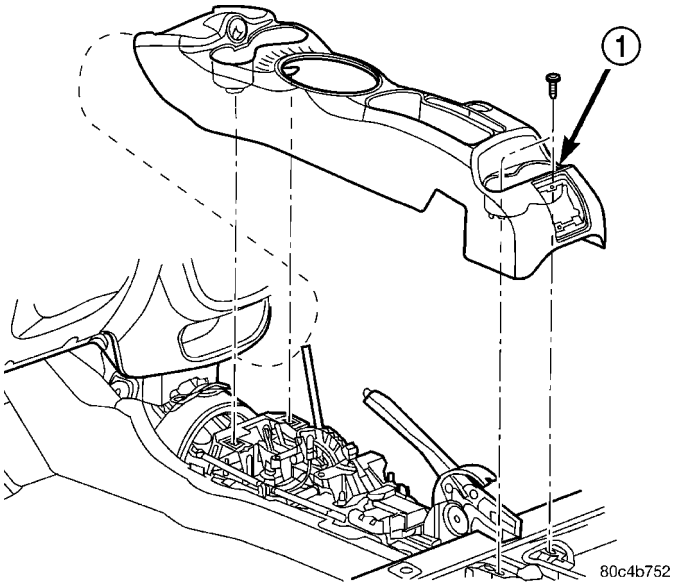

Fig. 225 Center Console Removal/Installation

1 - CENTER CONSOLE

(c) Move transaxle manual lever to the PARK. Verify transaxle is in PARK by attempting to roll vehicle in either direction.

(d) Tighten shift cable adjustment screw to 8 N·m (70 in. lbs.) torque.

(4) Verify proper cable adjustment. Engine should start with the shifter lever in PARK (P) and NEUTRAL (N) positions ONLY.

(5) Install center console assembly (Fig. 225).

(6) Install gearshift knob and tighten set screw to 2 N·m (17 in. lbs.) torque (Fig. 224).

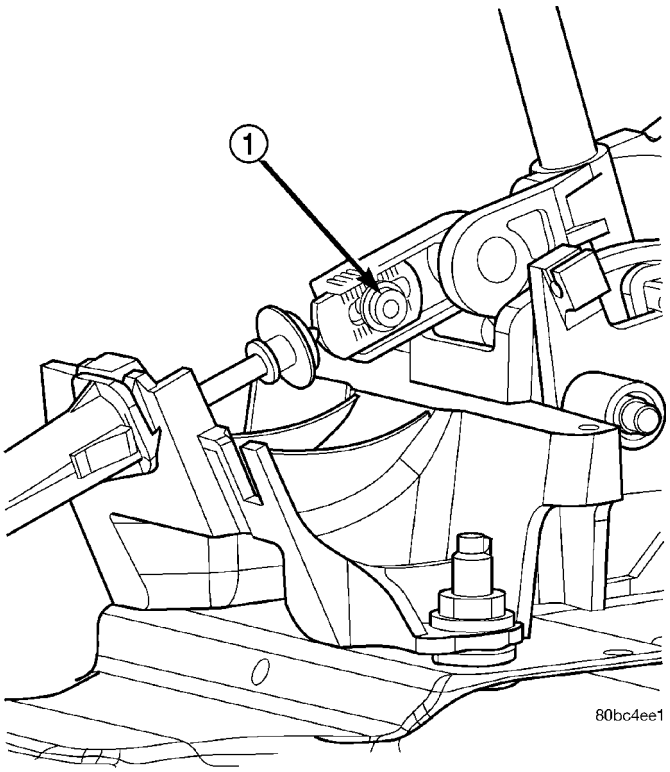

Fig. 226 Gearshift Cable Adjustment Screw

1 - GEARSHIFT CABLE ADJUSTMENT SCREW

GEAR SHIFT KNOB

REMOVAL

(1) Loosen set screw and remove knob from shifter handle (Fig. 227).

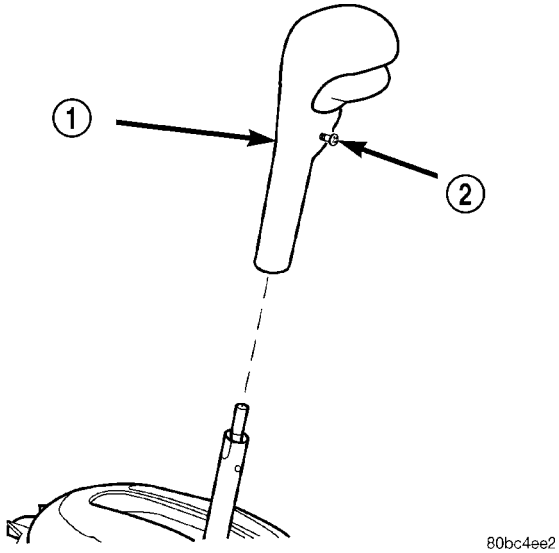

Fig. 227 Gearshift Knob Removal/Installation

1 - SHIFTER KNOB
2 - SET SCREW

GEAR SHIFT KNOB (Continued)

INSTALLATION

(1) Install gearshift knob and tighten set screw to 2 N·m (17 in. lbs.) torque (Fig. 227).

GEARSHIFT MECHANISM

REMOVAL

(1) Loosen set screw and remove knob from shifter handle (Fig. 228).

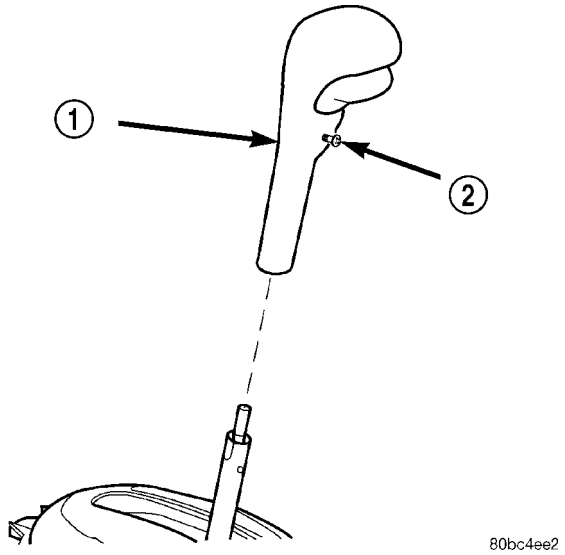

Fig. 228 Gearshift Knob Removal/Installation

1 - SHIFTER KNOB
2 - SET SCREW

(2) Remove the center console assembly as shown in (Fig. 229).

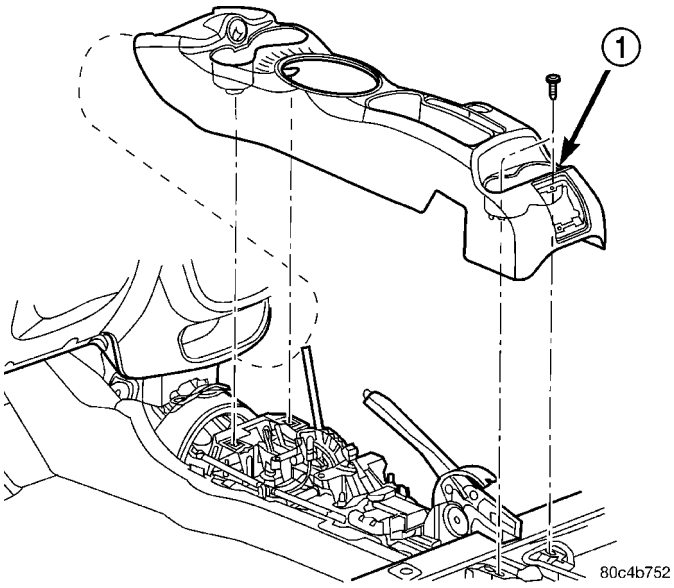

Fig. 229 Center Console Removal/Installation

1 - CENTER CONSOLE

(3) Remove shifter bezel (Fig. 230).

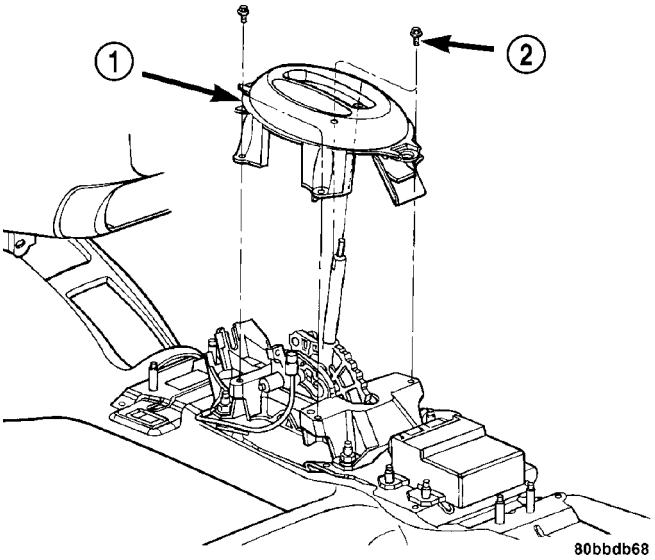

Fig. 230 Shifter Bezel Removal/Installation

1 - BEZEL
2 - SCREW (4)

(4) Disconnect BTSI cable from mechanism (Fig. 231).

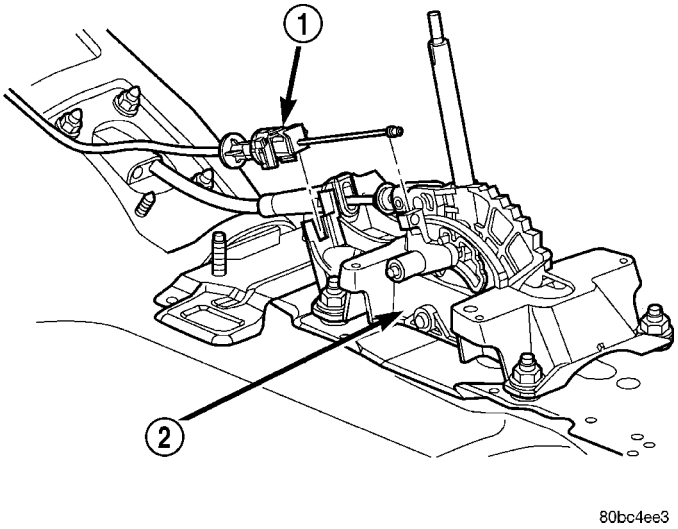

Fig. 231 Interlock Cable at Shifter Assembly

1 - INTERLOCK CABLE
2 - SHIFTER ASSEMBLY

GEARSHIFT MECHANISM (Continued)

(5) Disconnect shift cable from shifter mechanism as shown in (Fig. 232).

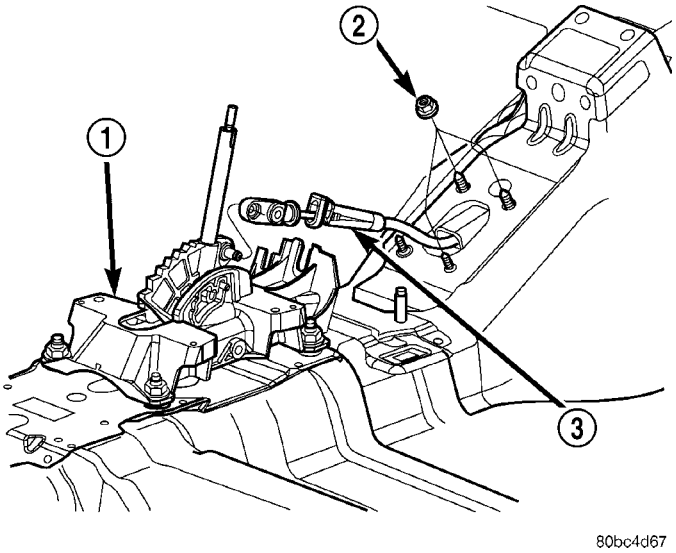

Fig. 232 Gearshift Cable at Shifter Assembly

1 - SHIFTER ASSEMBLY
2 - GROMMET PLATE NUT
3 - SHIFT CABLE

(6) Remove four (4) shift mechanism-to-floor pan nuts. Remove shift mechanism.

INSTALLATION

(1) Install shift mechanism into position. Install mechanism-to-floor pan nuts and torque to 12 N·m (105 in. lbs.).

(2) Install gearshift cable to shift mechanism (Fig. 232).

(3) Adjust gearshift cable. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 40TE/GEAR SHIFT CABLE - ADJUSTMENTS)

(4) Connect shift bezel lamp socket. Install shift bezel and torque screws to 2 N·m (17 in. lbs.) (Fig. 230).

(5) Install and secure BTSI cable to shift mechanism (Fig. 231).

(6) Adjust BTSI cable. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 40TE/SHIFT INTERLOCK SYSTEM - ADJUSTMENTS)

(7) Install center console assembly (Fig. 229).

(8) Install gear shift knob. Torque set screw to 2 N·m (17 in. lbs.).

HOLDING CLUTCHES

DESCRIPTION

Two hydraulically applied multi-disc clutches are used to hold planetary geartrain components stationary while the input clutches drive others. The 2/4 and Low/Reverse clutches are considered holding clutches and are contained at the rear of the transaxle case. (Fig. 233).

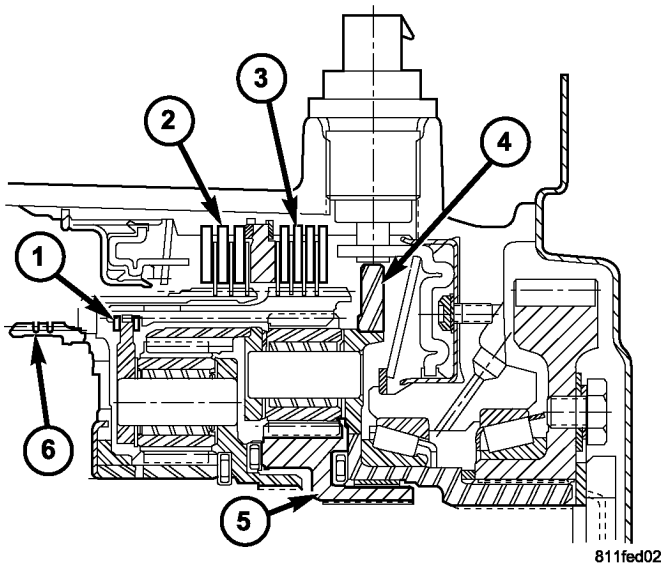

Fig. 233 2/4 and Low/Reverse Clutches

1 - FRONT PLANET CARRIER/REAR ANNULUS
2 - 2/4 CLUTCH
3 - LOW/REVERSE CLUTCH
4 - REAR PLANET CARRIER/FRONT ANNULUS
5 - REAR SUN GEAR
6 - FRONT SUN GEAR ASSEMBLY

OPERATION

NOTE: Refer to the “Elements In Use” chart in Diagnosis and Testing for a collective view of which clutch elements are applied at each position of the selector lever.

2/4 CLUTCH

The 2/4 clutch is hydraulically applied in second and fourth gears by pressurized fluid against the 2/4 clutch piston. When the 2/4 clutch is applied, the front sun gear assembly is held or grounded to the transaxle case.

LOW/REVERSE CLUTCH

The Low/Reverse clutch is hydraulically applied in park, reverse, neutral, and first gears by pressurized fluid against the Low/Reverse clutch piston. When the Low/Reverse clutch is applied, the front planet carrier/rear annulus assembly is held or grounded to the transaxle case.

INPUT CLUTCH ASSEMBLY

DISASSEMBLY

(1) Mount input clutch assembly to Input Clutch Pressure Fixture (Tool 8391).

(2) Tap down reverse clutch reaction plate to release pressure from snap ring (Fig. 234).

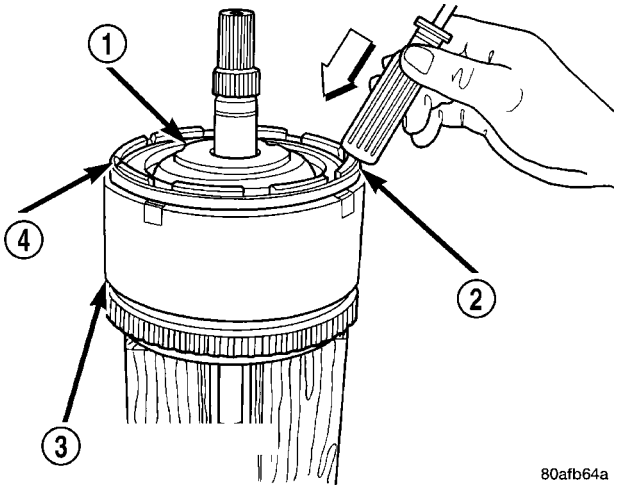

Fig. 234 Tapping Reaction Plate

1 - #4 THRUST PLATE (SELECT)

(16) Set up dial indicator on the UD clutch pack as shown in (Fig. 271).

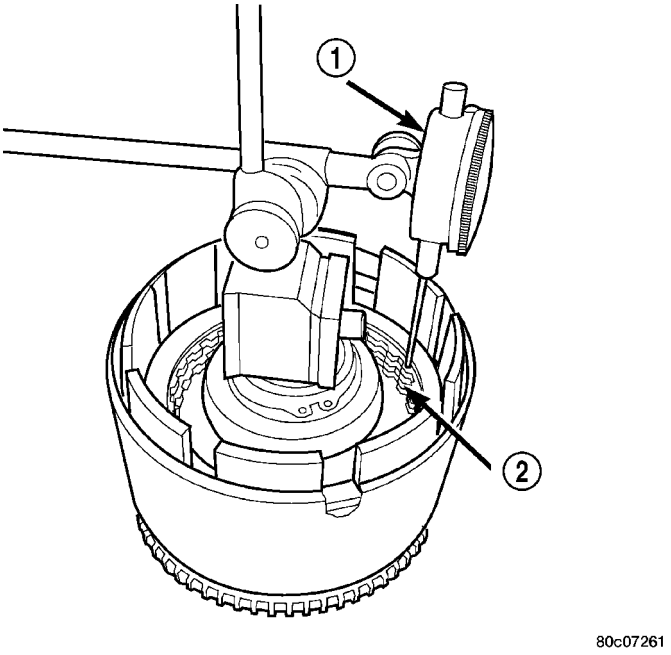

Fig. 271 Set Up Dial Indicator to Measure UD Clutch Clearance

1 - DIAL INDICATOR
2 - UNDERDRIVE CLUTCH

(17) Using moderate pressure, press down and hold (near indicator) the UD clutch pack with screwdriver or suitable tool and zero dial indicator (Fig. 272). When releasing pressure on clutch pack, indicator reading should advance 0.005–0.010.

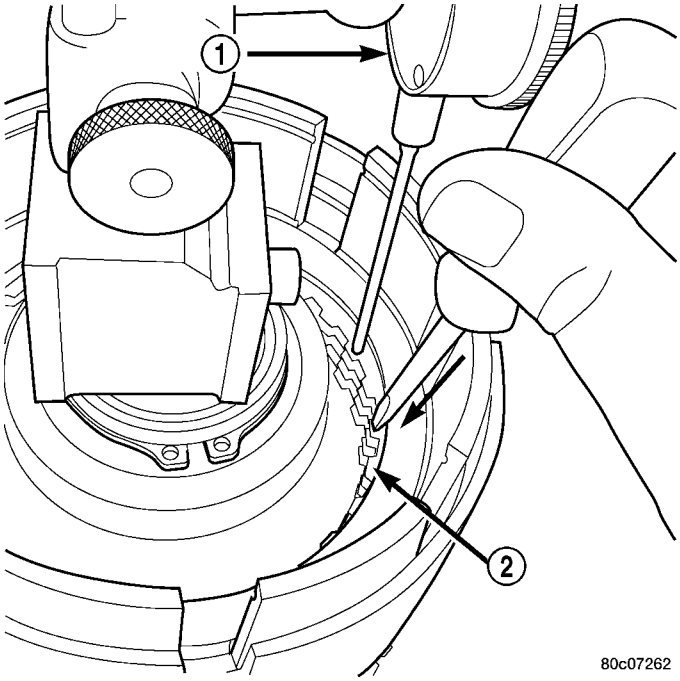

Fig. 272 Press Down on UD Clutch Pack and Zero Dial Indicator

1 - DIAL INDICATOR
2 - UNDERDRIVE CLUTCH

CAUTION: Do not apply more than 30 psi (206 kPa) to the underdrive clutch pack.

(18) Apply 30 psi (206 kPa) to the underdrive hose on Tool 8391 and measure UD clutch clearance. Measure and record UD clutch pack measurement in four (4) places, 90° apart.

(19) Take average of four measurements and compare with UD clutch pack clearance specification. **Underdrive clutch pack clearance must be 0.94-1.50 mm (0.037-0.059 in.).**

(20) If necessary, select the proper reaction plate to achieve specifications:

UNDERDRIVE REACTION PLATE THICKNESS	
4659939AB	5.837-5.937 mm (0.230-0.234 in.)
4659940AB	6.147-6.248 mm (0.242-0.246 in.)
4659941AB	6.457-6.557 mm (0.254-0.258 in.)

INPUT CLUTCH ASSEMBLY (Continued)

(21) Install the OD clutch pack (Fig. 273).

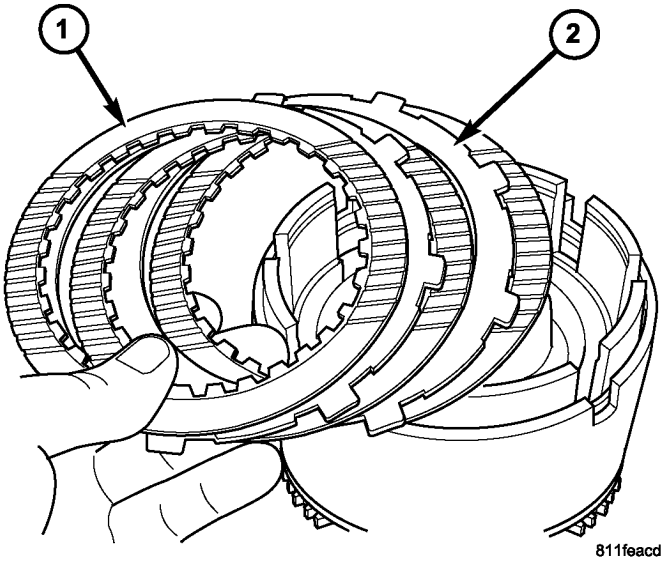

Fig. 273 Install Overdrive Clutch Pack

1 - CLUTCH DISC
2 - CLUTCH PLATE

(22) Install OD pressure plate waved snap ring (Fig. 274).

6 - INPUT CLUTCH ASSEMBLY

INPUT CLUTCH ASSEMBLY (Continued)

(25) Measure OD clutch pack clearance. Set up dial indicator on top of the OD/Reverse pressure plate as shown in (Fig. 278).

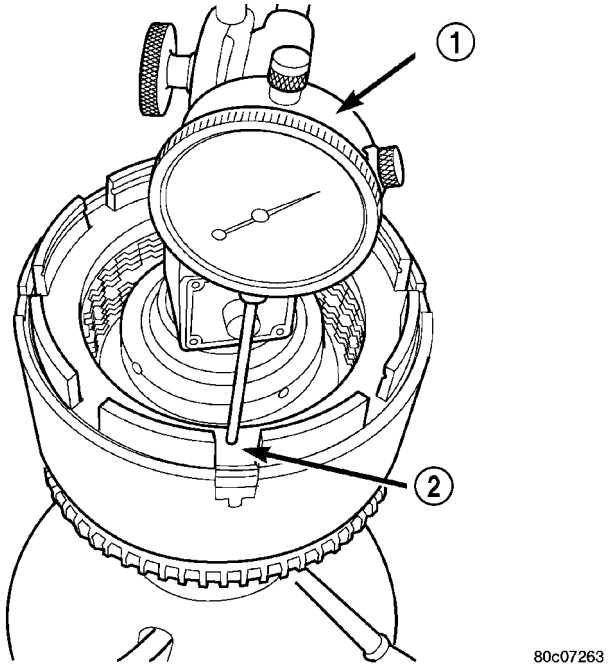

Fig. 278 Measure OD Clutch Pack Clearance

1 - DIAL INDICATOR
2 - OD/REVERSE REACTION PLATE

(26) Zero dial indicator and apply 30 psi (206 kPa) air pressure to the overdrive clutch hose on Tool 8391. Measure and record OD clutch pack measurement in four (4) places, 90° apart.

(27) Take average of four measurements and compare with OD clutch pack clearance specification. **The overdrive (OD) clutch pack clearance is 1.07-3.25 mm (0.042-0.128 in.).**

If not within specifications, the clutch is not assembled properly. There is no adjustment for the OD clutch clearance.

(28) Install reverse clutch pack (two frictions/one steel) (Fig. 279).

(29) Install reverse clutch reaction plate with the flat side down towards reverse clutch (Fig. 280).

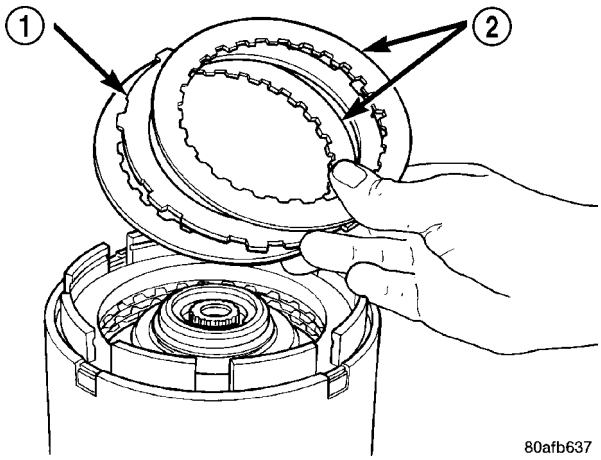

Fig. 279 Install Reverse Clutch Pack

1 - REVERSE CLUTCH PLATE
2 - REVERSE CLUTCH DISCS

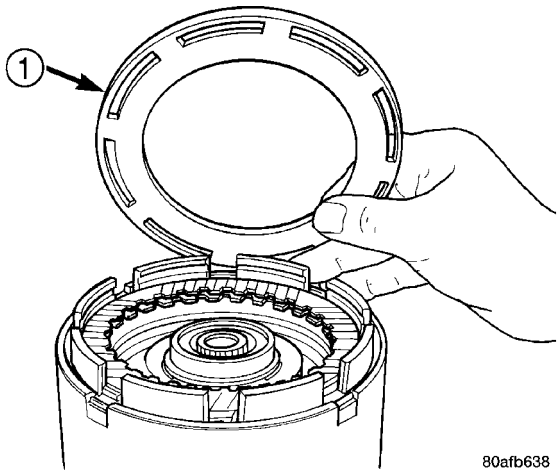

Fig. 280 Install Reaction Plate

1 - REVERSE CLUTCH REACTION PLATE (FLAT SIDE DOWN)

(32) Set up a dial indicator on the reverse clutch pack as shown in (Fig. 284).

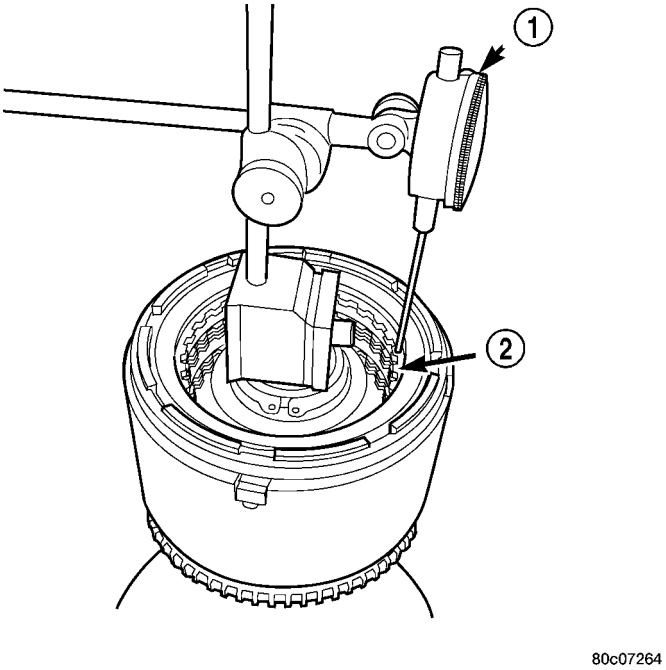

Fig. 284 Measure Reverse Clutch Pack Clearance

1 - DIAL INDICATOR
2 - REVERSE CLUTCH

(33) Using moderate pressure, press down and hold (near indicator) reverse clutch disc with screwdriver or suitable tool and zero dial indicator (Fig. 285). When releasing pressure, indicator should advance 0.005-0.010. as clutch pack relaxes.

(34) Apply 30 psi (206 kPa) air pressure to the reverse clutch hose on Tool 8391. Measure and record reverse clutch pack measurement in four (4) places, 90° apart.

(35) Take average of four measurements and compare with reverse clutch pack clearance specification. **The reverse clutch pack clearance is 0.89-1.37 mm (0.035-0.054 in.).** Select the proper reverse clutch snap ring to achieve specifications:

REVERSE CLUTCH SNAP RING THICKNESS	
4377195	1.53-1.58 mm (0.060-0.062 in.)
4412871	1.77-1.83 mm (0.070-0.072 in.)
4412872	2.02-2.07 mm (0.080-0.082 in.)
4412873	2.27-2.32 mm (0.090-0.091 in.)

(36) To complete the assembly, reverse clutch and overdrive clutch must be removed.

(37) Install the #2 needle bearing (Fig. 286).

OIL PUMP

DESCRIPTION

The oil pump is located in the pump housing inside the bell housing of the transaxle case (Fig. 292). The oil pump consists of an inner and outer gear, a housing, and a cover that also serves as the reaction shaft support.

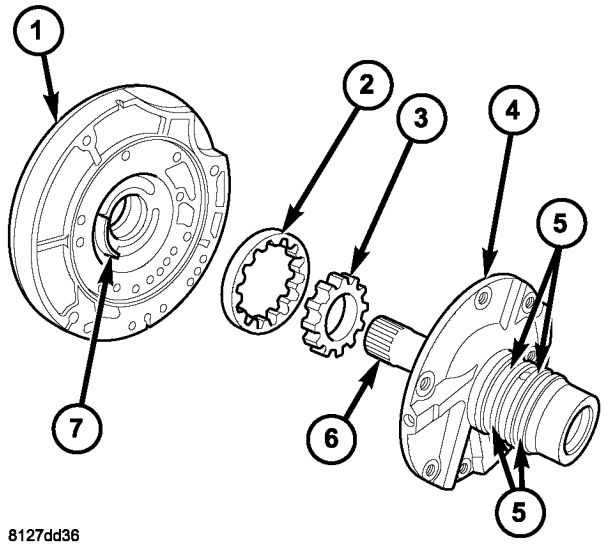

Fig. 292 Oil Pump Assembly

1 - PUMP BODY
2 - OUTER GEAR
3 - INNER GEAR
4 - REACTION SHAFT SUPPORT
5 - SEAL RINGS (4)
6 - REACTION SHAFT
7 - CRESCENT

OPERATION

As the torque converter rotates, the converter hub rotates the inner and outer gears. As the gears rotate, the clearance between the gear teeth increases in the crescent area, and creates a suction at the inlet side of the pump. This suction draws fluid through the pump inlet from the oil pan. As the clearance between the gear teeth in the crescent area decreases, it forces pressurized fluid into the pump outlet and to the valve body.

DISASSEMBLY

When disassembling the transaxle it is necessary to inspect the oil pump for wear and damage.

(1) Remove the reaction shaft support-to-pump body bolts (Fig. 293).

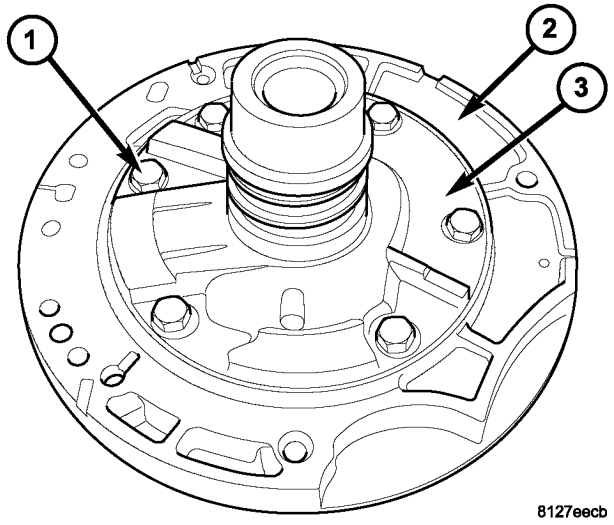

Fig. 293 Reaction Support-to-Pump Body Bolts

1 - BOLT (6)
2 - PUMP BODY
3 - REACTION SHAFT SUPPORT

(2) Remove reaction shaft support from pump housing (Fig. 294).

4 - INNER GEAR

OIL PUMP (Continued)

(8) Position an appropriate piece of Plastigage across both pump gears.

(9) Align the Plastigage to a flat area on the reaction shaft support housing.

(10) Install the reaction shaft to the pump housing (Fig. 293). Tighten the bolts to 27 N·m (20 ft. lbs.).

(11) Remove bolts and carefully separate the housings. Measure the Plastigage following the instructions supplied.

(12) Clearance between both gear end faces and the reaction shaft support should be 0.020-0.046 mm (0.0008-0.0018 in.).

ASSEMBLY

(1) Assemble oil pump as shown in (Fig. 299).

PLANETARY GEARTRAIN

DESCRIPTION

The planetary geartrain is located between the input clutch assembly and the rear of the transaxle case. The planetary geartrain consists of two sun gears, two planetary carriers, two annulus (ring) gears, and one output shaft (Fig. 301).

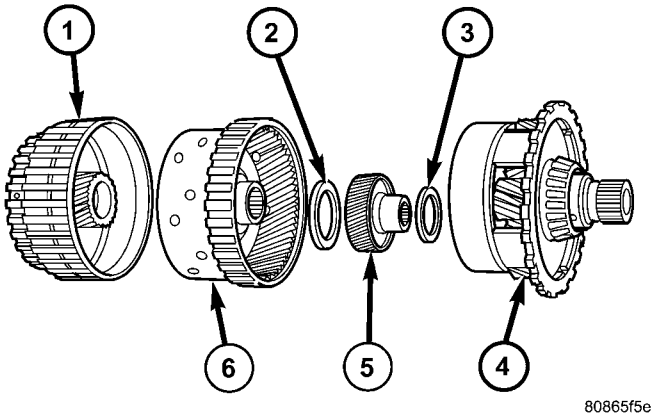

Fig. 301 Planetary Geartrain

1 - FRONT SUN GEAR ASSEMBLY
2 - #6 THRUST BEARING
3 - #7 THRUST BEARING
4 - REAR CARRIER/FRONT ANNULUS ASSEMBLY
5 - REAR SUN GEAR
6 - FRONT CARRIER/REAR ANNULUS ASSEMBLY

OPERATION

The planetary geartrain utilizes two planetary gear sets that connect the transmission input shaft to the output shaft. Input and holding clutches drive or lock different planetary members to change output ratio or direction.

SEAL - OIL PUMP

REMOVAL

(1) Remove transaxle from vehicle (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 41TE - REMOVAL).

(2) Using Tool C-3981-B, remove oil pump seal (Fig. 302).

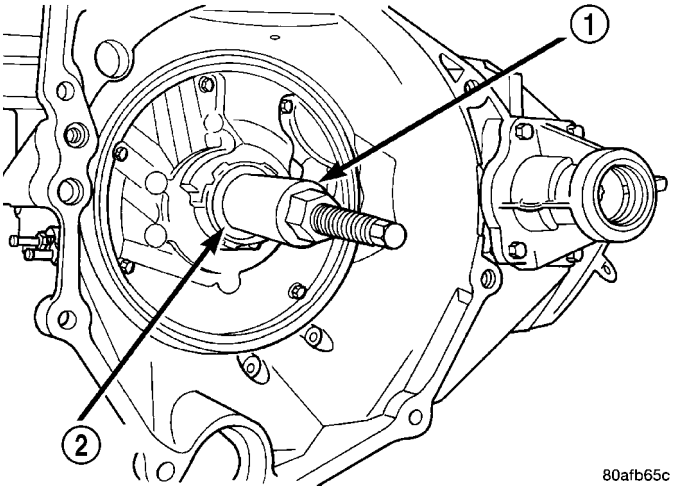

Fig. 302 Remove Oil Pump Seal

1 - TOOL C-3981–B
2 - OIL PUMP SEAL

INSTALLATION

(1) Using Tool C-4193, install oil pump seal (Fig. 303).

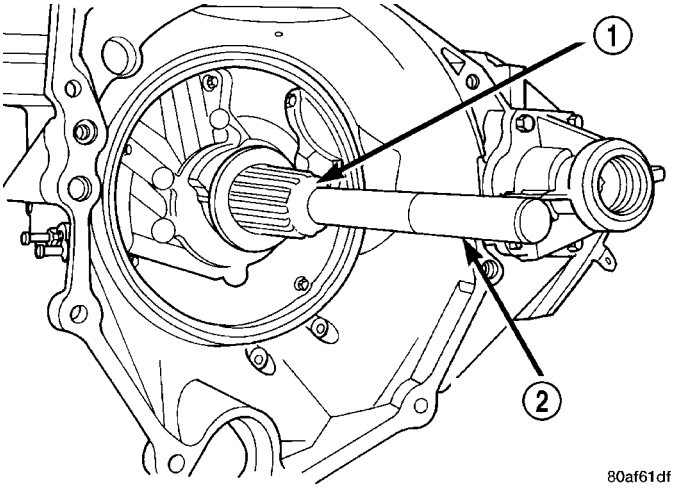

Fig. 303 Install Oil Pump Seal

1 - TOOL C-4193
2 - HANDLE TOOL C-4171

(2) Install transaxle to vehicle (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 41TE - INSTALLATION).

SHIFT INTERLOCK CABLE

REMOVAL

(1) Disconnect the battery negative cable.

(2) Loosen set screw and remove knob from shifter handle (Fig. 304).

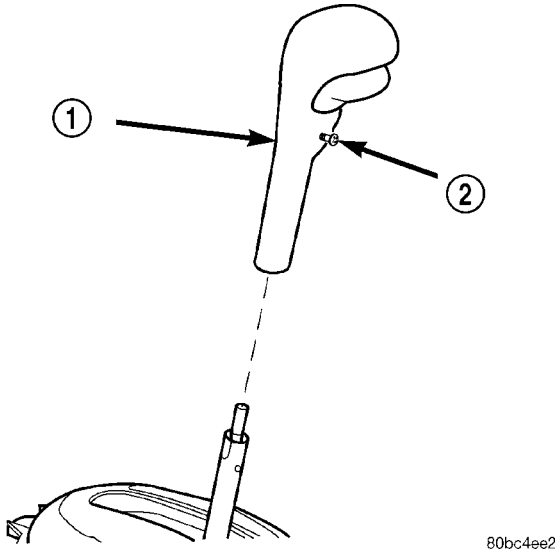

Fig. 304 Gearshift Knob Removal/Installation

1 - SHIFTER KNOB
2 - SET SCREW

(3) Remove the center console assembly as shown in (Fig. 305).

1 - IGNITION SWITCH
2 - CLIP
3 - INTERLOCK CABLE
4 - BTSI SOLENOID

(9) Rotate the ignition key to the “OFF” or “ON/RUN” position (Fig. 311).

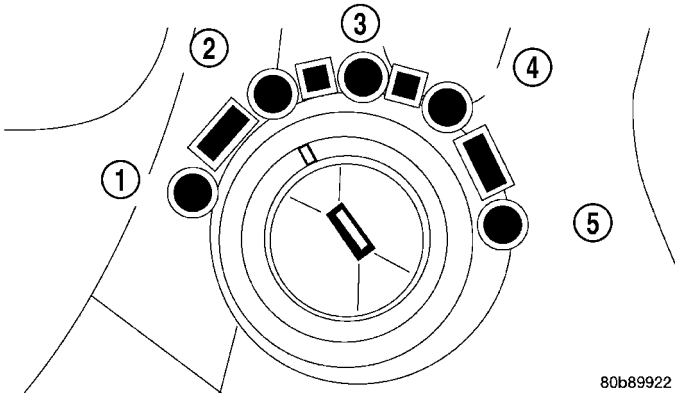

Fig. 311 Ignition Key/Switch Positions

1 - ACC
2 - LOCK
3 - OFF
4 - ON/RUN
5 - START

(10) Squeeze the interlock cable locking tab. Remove the cable from the interlock housing (Fig. 312).

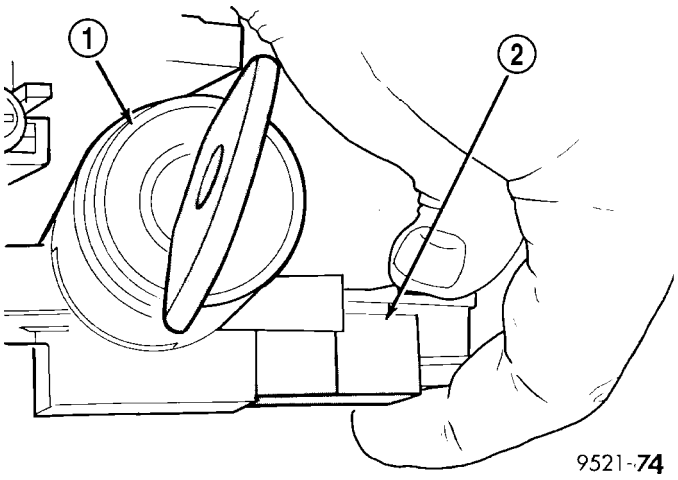

Fig. 312 Interlock Cable and Connector

1 - IGNITION LOCK CYLINDER
2 - INTERLOCK CABLE

(11) Release cable from retaining clips and remove through opening under steering column.

INSTALLATION

CAUTION: When installing interlock cable assembly, care must be taken not to bend exposed cable wire and slug at shifter end of cable.

(1) Route interlock cable through hole in instrument panel below steering column and around to gear shifter assembly.

(2) Turn the ignition key to the “OFF” or “ON/RUN” position (Fig. 311).

(3) Install the interlock cable into the interlock housing at the steering column (Fig. 313). Verify the cable snaps into the housing and is fully seated.

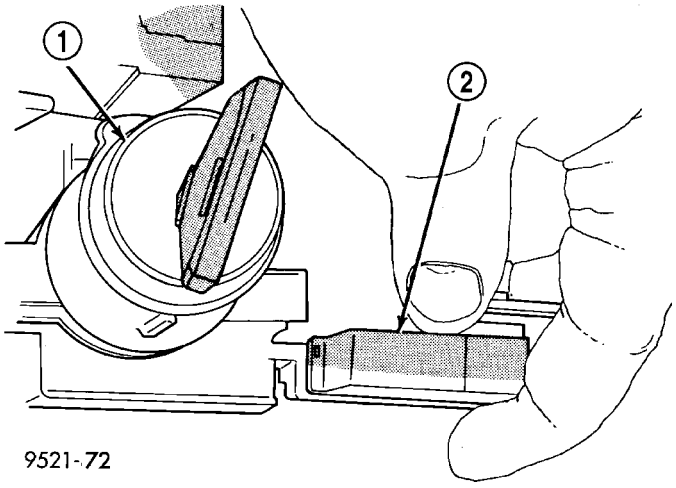

Fig. 313 Interlock Cable at Interlock Housing

1 - IGNITION SWITCH
2 - INTERLOCK CABLE

SHIFT INTERLOCK CABLE (Continued)

(4) Return the ignition key to the “LOCK” position (Fig. 311).

(5) Connect the BTSI solenoid connector (Fig. 310).

(6) Install steering column upper and lower shrouds (Fig. 309).

(7) Install steering column lower cover (Fig. 308).

(8) Verify that shifter is in gated “PARK”.

(9) Install the cable core end to the plastic cam of the shifter mechanism. Snap the shifter/ignition interlock cable end fitting into the groove in the gear-shift mechanism as shown in (Fig. 307).

(10) **Adjust interlock cable/system as follows:** If interlock cable is being replaced, it will come with an adjustment pin. Remove the pin from the cable and allow the cable to “self-adjust”. Lock cable adjustment by pressing down on the adjuster lock until bottomed at the cable housing. If interlock cable is being re-used, no pin will be provided. Pry up on cable adjuster lock to release and allow cable to “self-adjust”. Lock cable adjustment by pressing down on the adjuster lock until bottomed at the cable housing.

(11) **Connect battery negative cable and verify interlock system operation as follows:**

ACTION	EXPECTED RESPONSE
1. Turn key to the ″OFF″ position.	1. Shifter CAN be shifted out of park.
2. Turn key to the ″ON/RUN″ position.	2. Shifter CANNOT be shifted out of park.
3. Turn key to the ″ON/RUN″ position and depress the brake pedal.	3. Shifter CAN be shifted out of park.
4. Leave shifter in any gear and try to return key to the ″LOCK″ or ″ACC″ position.	4. Key cannot be returned to the ″LOCK″ or ″ACC″ position.
5. Return shifter to ″PARK″ and try to remove the key.	5. Key can be removed (after returning to ″LOCK″ position).
6. With the key removed, try to shift out of ″PARK″.	6. Shifter cannot be shifted out of ″PARK″.
NOTE: Any failure to meet these expected responses requires system adjustment or repair.	

(12) Install shifter bezel (Fig. 306).

(13) Install center console assembly (Fig. 305).

(14) Install gearshift knob and tighten set screw to 2 N·m (17 in. lbs.) torque (Fig. 304).

(15) Connect battery negative cable.

SHIFT INTERLOCK MECHANISM

REMOVAL

(1) Remove the steering column lower cover (Fig. 314).

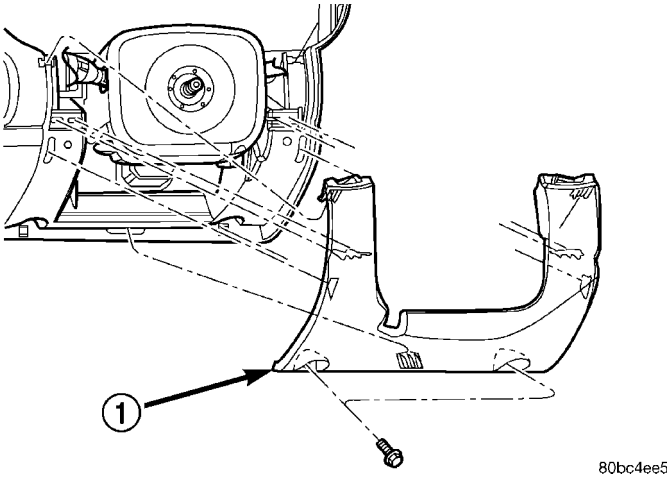

Fig. 314 Steering Column Lower Cover

1 - LOWER COVER

(2) Remove the steering column upper and lower shrouds (Fig. 315).

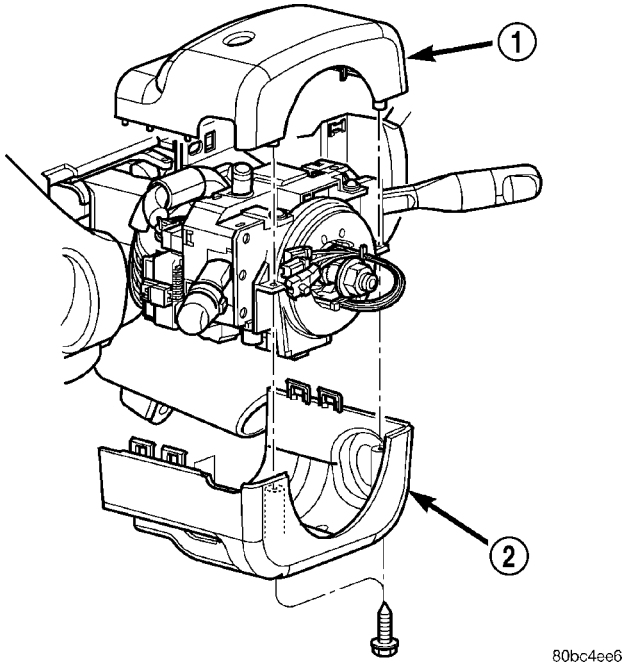

Fig. 315 Steering Column Shrouds

1 - UPPER SHROUD
2 - LOWER SHROUD

SHIFT INTERLOCK MECHANISM (Continued)

(3) Turn the ignition key to the “OFF” or “ON/RUN” position (Fig. 316).

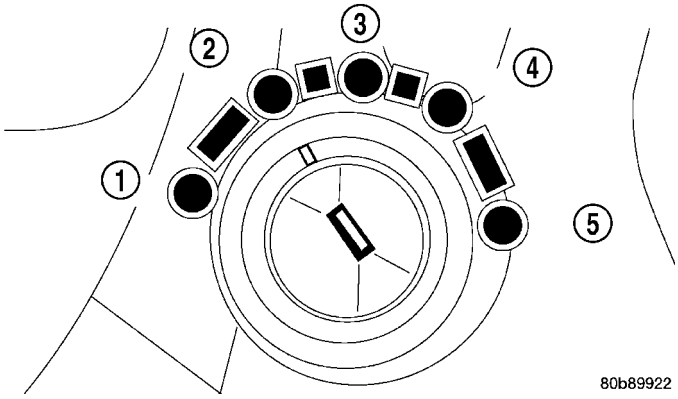

Fig. 316 Ignition Key/Switch Positions

1 - ACC
2 - LOCK
3 - OFF
4 - ON/RUN
5 - START

(4) Grasp the interlock cable and connector firmly. Remove the interlock cable (Fig. 317).

(5) Remove the two interlock mechanism-to-steering column attaching screws (Fig. 318). Remove the interlock housing.

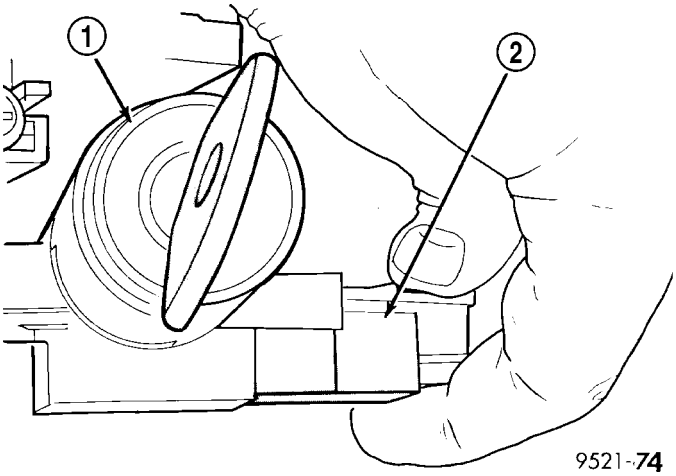

Fig. 317 Interlock Cable

1 - IGNITION LOCK CYLINDER
2 - INTERLOCK CABLE

INSTALLATION

(1) Position the interlock housing at steering column. Install the two interlock mechanism-to-steering column attaching screws. Torque screws to 3 N·m (21 in. lbs.).

(2) Snap the interlock cable into the housing.

(3) Install steering column upper and lower shrouds (Fig. 315).

(4) Install steering column lower cover (Fig. 314).

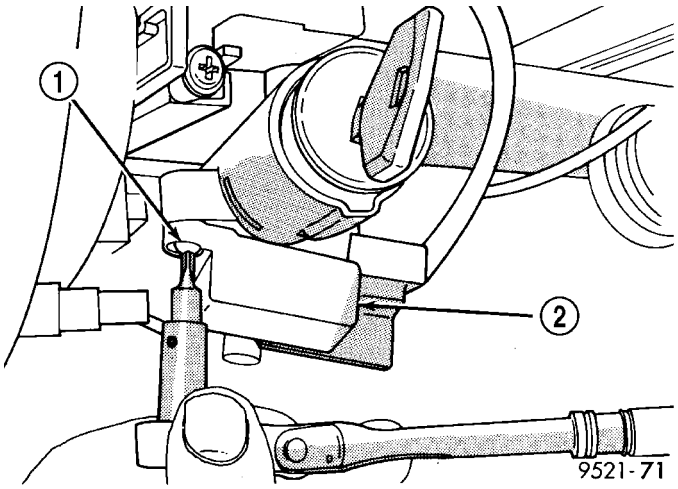

Fig. 318 Interlock Mechanism

1 - MOUNTING SCREW

SHIFT INTERLOCK SYSTEM

DESCRIPTION

The Brake Transmission Shifter/Ignition Interlock (BTSI) is a cable and solenoid operated system that prevents the transmission gear shifter from being moved out of PARK without a driver in place.

Refer to the following chart that expected shifter response, depending on ignition key/switch (Fig. 319) and brake pedal positions.

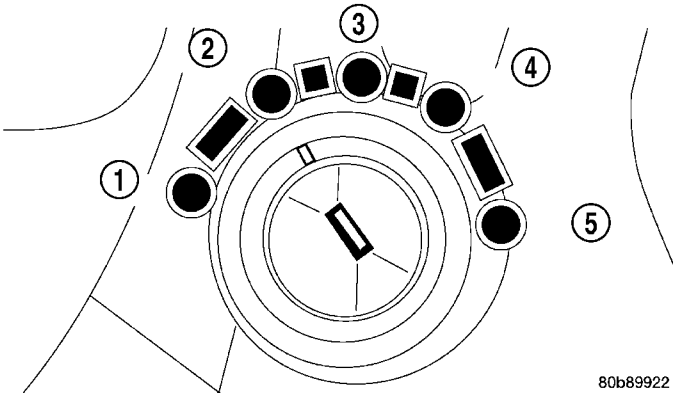

Fig. 319 Ignition Key/Switch Positions

1 - ACC
2 - LOCK
3 - OFF
4 - ON/RUN
5 - START

DIAGNOSIS AND TESTING - BRAKE/TRANSMISSION SHIFT INTERLOCK SYSTEM

The following chart describes the normal operation of the Brake Transmission Shift Interlock (BTSI) system. If the “expected response” differs from the vehi-

SHIFT INTERLOCK SYSTEM (Continued)

cle's response, then system repair and/or adjustment is necessary.

Refer to the following chart that expected shifter response, depending on ignition key/switch (Fig. 320) and brake pedal positions.

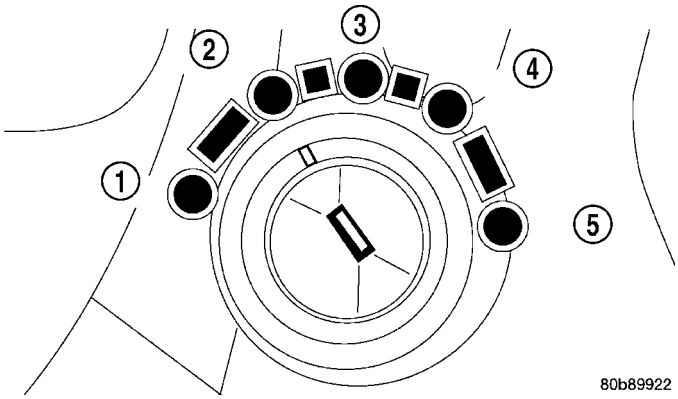

Fig. 320 Ignition Key/Switch Positions

1 - ACC
2 - LOCK
3 - OFF
4 - ON/RUN
5 - START

ACTION	EXPECTED RESPONSE
1. Turn key to the ″OFF″ position.	1. Shifter CAN be shifted out of park.
2. Turn key to the ″ON/RUN″ position.	2. Shifter CANNOT be shifted out of park.
3. Turn key to the ″ON/RUN″ position and depress the brake pedal.	3. Shifter CAN be shifted out of park.
4. Leave shifter in any gear and try to return key to the ″LOCK″ or ″ACC″ position.	4. Key cannot be returned to the ″LOCK″ or ″ACC″ position.
5. Return shifter to ″PARK″ and try to remove the key.	5. Key can be removed (after returning to ″LOCK″ position).
6. With the key removed, try to shift out of ″PARK″.	6. Shifter cannot be shifted out of ″PARK″.
NOTE: Any failure to meet these expected responses requires system adjustment or repair.	

ADJUSTMENTS

BRAKE/TRANSMISSION SHIFT INTERLOCK SYSTEM

VERIFICATION

The following chart describes the normal operation of the Brake Transmission Shift Interlock (BTSI) system. If the "expected response" differs from the vehicle's response, then system repair and/or adjustment is necessary.

ACTION	EXPECTED RESPONSE
1. Turn key to the ″OFF″ position.	1. Shifter CAN be shifted out of park.
2. Turn key to the ″ON/RUN″ position.	2. Shifter CANNOT be shifted out of park.
3. Turn key to the ″ON/RUN″ position and depress the brake pedal.	3. Shifter CAN be shifted out of park.
4. Leave shifter in any gear and try to return key to the ″LOCK″ or ″ACC″ position.	4. Key cannot be returned to the ″LOCK″ or ″ACC″ position.
5. Return shifter to ″PARK″ and try to remove the key.	5. Key can be removed (after returning to ″LOCK″ position).
6. With the key removed, try to shift out of ″PARK″.	6. Shifter cannot be shifted out of ″PARK″.
NOTE: Any failure to meet these expected responses requires system adjustment or repair.	

ADJUSTMENT

(1) Loosen set screw and remove knob from shifter handle (Fig. 321).

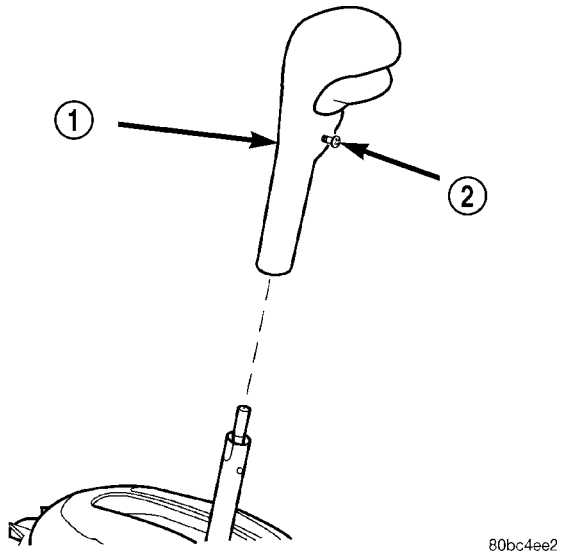

Fig. 321 Gearshift Knob

1 - SHIFTER KNOB
2 - SET SCREW

SHIFT INTERLOCK SYSTEM (Continued)

(2) Remove the center console assembly as shown in (Fig. 322).

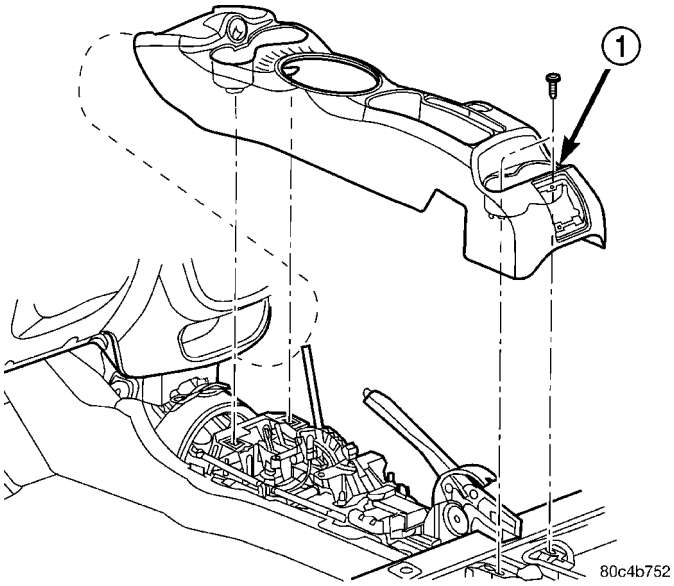

Fig. 322 Center Console Removal/Installation

1 - CENTER CONSOLE

(3) Remove shifter bezel (Fig. 323).

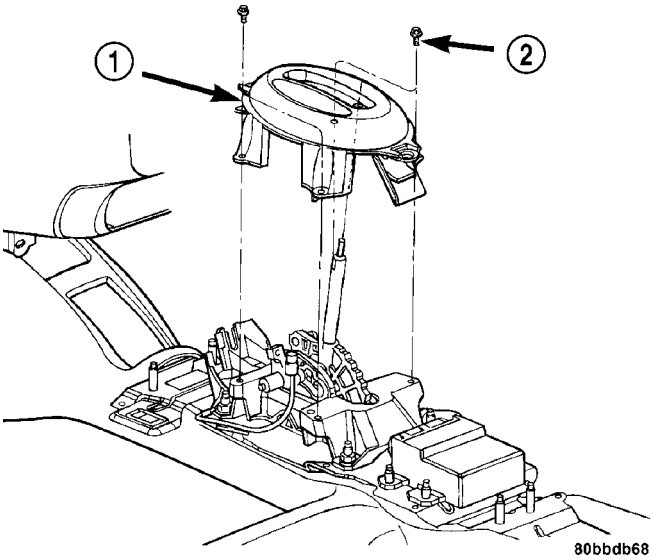

Fig. 323 Shifter Bezel Removal/Installation

1 - BEZEL
2 - SCREW (4)

(4) **Adjust interlock cable/system as follows:** Pry up on cable adjuster lock to release and allow cable to "self-adjust". Lock cable adjustment by pressing down on the adjuster lock until bottomed at the cable housing.

(5) Verify correct system operation. Refer to verification procedure.

(6) Install shifter bezel (Fig. 323).

(7) Install center console assembly (Fig. 322).

(8) Install gearshift knob and tighten set screw to 2 N·m (17 in. lbs.) torque (Fig. 321).

SOLENOID/PRESSURE SWITCH ASSY

DESCRIPTION

The Solenoid/Pressure Switch Assembly (Fig. 324) is external to the transaxle and mounted to the transaxle case. The assembly consists of four solenoids that control hydraulic pressure to the LR/CC, 2/4, OD, and UD friction elements. The reverse clutch is controlled by line pressure from the manual valve in the valve body. The solenoids are contained within the Solenoid/Pressure Switch Assembly, and can only be serviced by replacing the assembly.

The solenoid assembly also contains pressure switches that monitor and send hydraulic circuit information to the PCM/TCM. Likewise, the pressure switches can only be service by replacing the assembly.

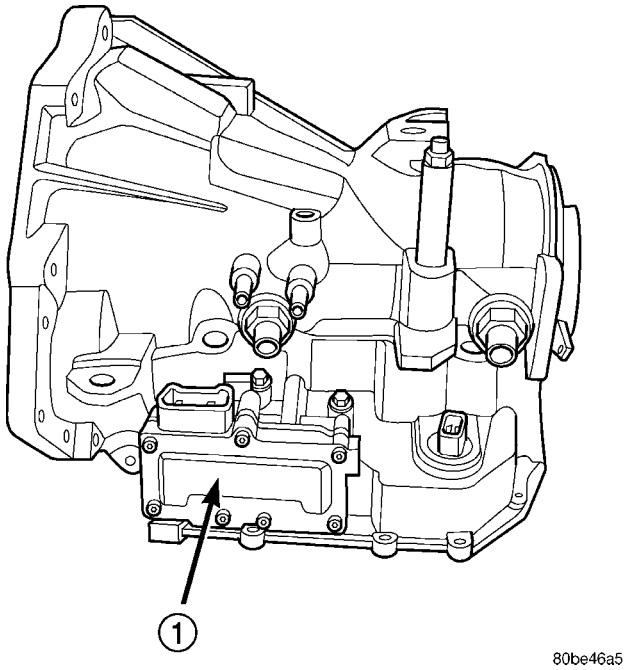

Fig. 324 Solenoid/Pressure Switch Assembly

1 - SOLENOID AND PRESSURE SWITCH ASSEMBLY

OPERATION

SOLENOIDS

The solenoids receive electrical power from the Transmission Control Relay through a single wire. The PCM/TCM energizes or operates the solenoids individually by grounding the return wire of the solenoid needed. When a solenoid is energized, the solenoid valve shifts, and a fluid passage is opened or

SOLENOID/PRESSURE SWITCH ASSY (Continued)

closed (vented or applied), depending on its default operating state. The result is an apply or release of a frictional element.

The 2/4 and UD solenoids are normally applied, which by design allow fluid to pass through in their relaxed or “off” state. This allows transaxle limp-in (P,R,N,2) in the event of an electrical failure.

The continuity of the solenoids and circuits are periodically tested. Each solenoid is turned on or off depending on its current state. An inductive spike should be detected by the PCM/TCM during this test. It no spike is detected, the circuit is tested again to verify the failure. In addition to the periodic testing, the solenoid circuits are tested if a speed ratio or pressure switch error occurs.

PRESSURE SWITCHES

The PCM/TCM relies on three pressure switches to monitor fluid pressure in the L/R, 2/4, and OD hydraulic circuits. The primary purpose of these switches is to help the PCM/TCM detect when clutch circuit hydraulic failures occur. The range for the pressure switch closing and opening points is 11-23 psi. Typically the switch opening point will be approximately one psi lower than the closing point. For example, a switch may close at 18 psi and open at 17 psi. The switches are continuously monitored by the PCM/TCM for the correct states (open or closed) in each gear as shown in the following chart:

PRESSURE SWITCH STATES

GEAR	L/R	2/4	OD
R	OP	OP	OP
P/N	CL	OP	OP
1st	CL	OP	OP
2nd	OP	CL	OP
D	OP	OP	CL
OD	OP	CL	CL

OP = OPEN

CL = CLOSED

A Diagnostic Trouble Code (DTC) will set if the PCM/TCM senses any switch open or closed at the wrong time in a given gear.

The PCM/TCM also tests the 2/4 and OD pressure switches when they are normally off (OD and 2/4 are tested in 1st gear, OD in 2nd gear, and 2/4 in 3rd gear). The test simply verifies that they are operational, by looking for a closed state when the corresponding element is applied. Immediately after a shift into 1st, 2nd, or 3rd gear with the engine speed above 1000 rpm, the PCM/TCM momentarily turns on element pressure to the 2/4 and/or OD clutch circuits to identify that the appropriate switch has closed. If it doesn’t close, it is tested again. If the switch fails to close the second time, the appropriate Diagnostic Trouble Code (DTC) will set.

REMOVAL

(1) Disconnect the battery cables.
(2) Remove air cleaner assembly (Fig. 325).

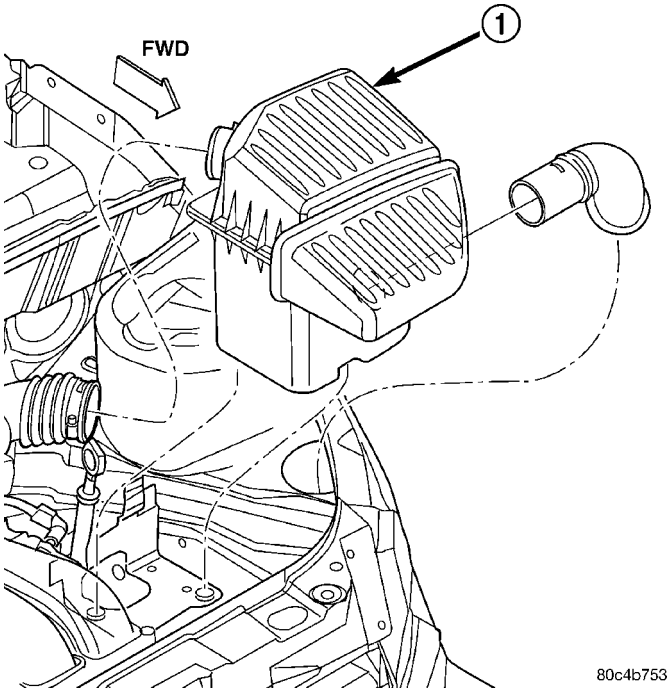

Fig. 325 Air Cleaner Assembly Removal/Installation

1 - AIR CLEANER ASSEMBLY

SOLENOID/PRESSURE SWITCH ASSY (Continued)

(3) Remove the battery hold down clamp and remove the battery (Fig. 326).

1 - BATTERY TRAY

(5) Disconnect and remove the input speed sensor (Fig. 328).

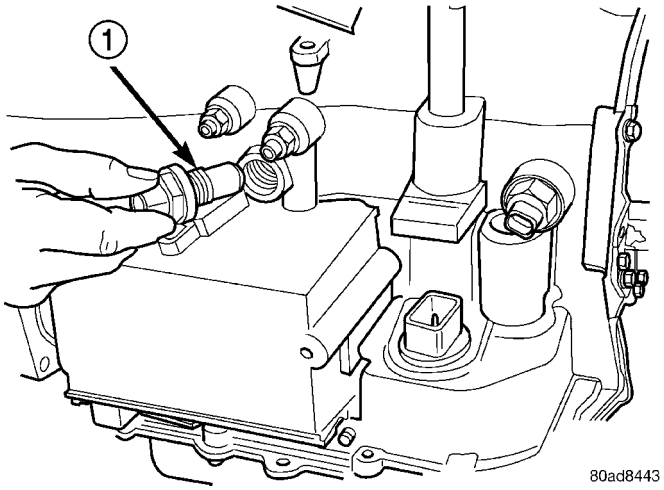

Fig. 328 Input Speed Sensor

1 - INPUT (TURBINE) SPEED SENSOR

(6) Disconnect the transmission oil cooler lines. Cap off hoses and fittings to prevent foreign matter intrusion.

(7) Disconnect the solenoid/pressure switch assembly connector.

(8) Remove the three solenoid/pressure switch assembly-to-transaxle case bolts (Fig. 329).

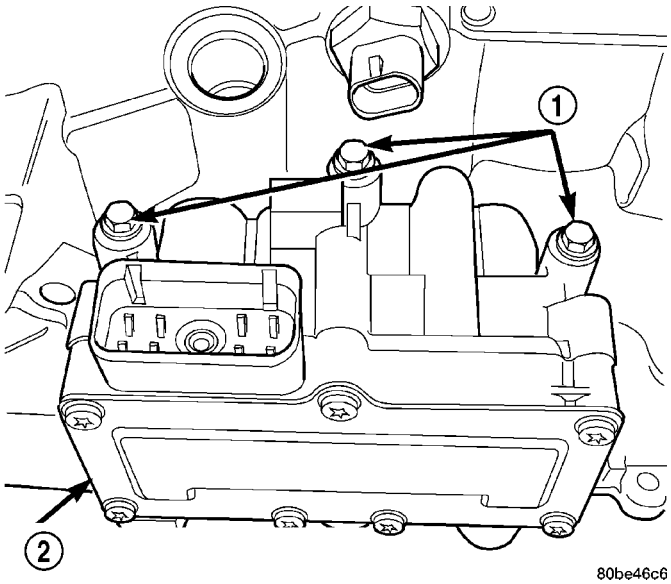

Fig. 329 Attaching Bolts

1 - BOLTS
2 - SOLENOID AND PRESSURE SWITCH ASSEMBLY

SOLENOID/PRESSURE SWITCH ASSY (Continued)

(9) Remove solenoid/pressure switch assembly and gasket (Fig. 330).

CAUTION: Be sure to keep foreign material from entering ports in transaxle case. Erratic transaxle operation and/or failure can result.

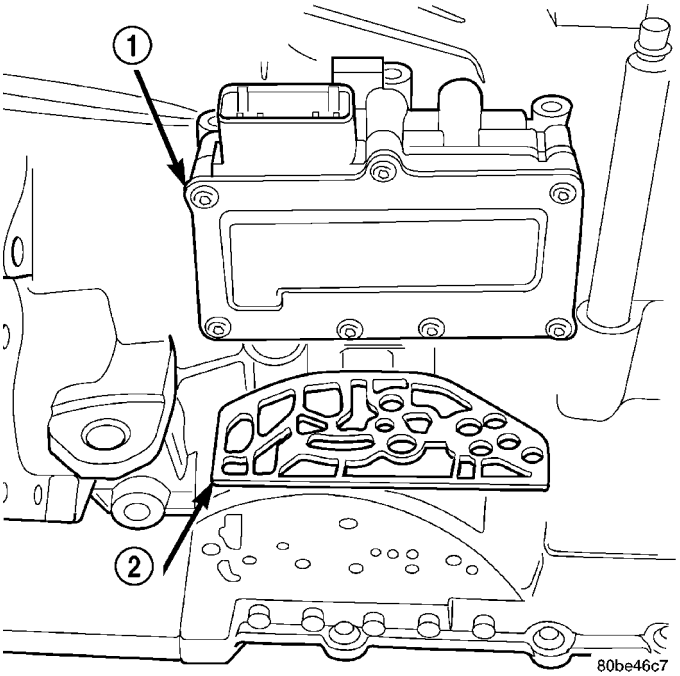

Fig. 330 Solenoid/Pressure Switch Assembly and Gasket

1 - SOLENOID/PRESSURE SWITCH ASSEMBLY
2 - GASKET

INSTALLATION

(1) Install solenoid/pressure switch assembly to case using a new gasket (Fig. 330).

(2) Install bolts and torque to 13 N·m (110 in. lbs.) (Fig. 329).

(3) Install 8-way connector and torque screw to 4 N·m (35 in. lbs.).

(4) Uncap and install transmission oil cooler lines.

(5) Install input speed sensor (Fig. 328) and torque to 27 N·m (20 ft. lbs.).

(6) Install the battery tray (Fig. 327).

(7) Install the battery and hold down clamp (Fig. 326).

(8) Install air cleaner assembly (Fig. 325).

(9) Connect battery cables.

(10) Perform Transaxle Quick Learn Procedure. Refer to SERVICE PROCEDURES.

SPEED SENSOR - INPUT

DESCRIPTION

The Input Speed Sensor is a two-wire magnetic pickup device that generates AC signals as rotation occurs. It is threaded into the transaxle case (Fig. 331), sealed with an o-ring (Fig. 332), and is considered a primary input to the Powertrain/Transmission Control Module.

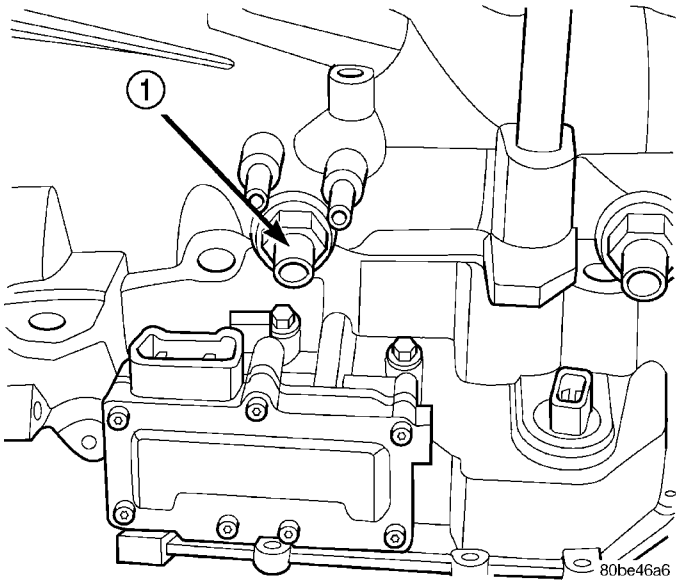

Fig. 331 Input Speed Sensor Location

1 - INPUT SPEED SENSOR

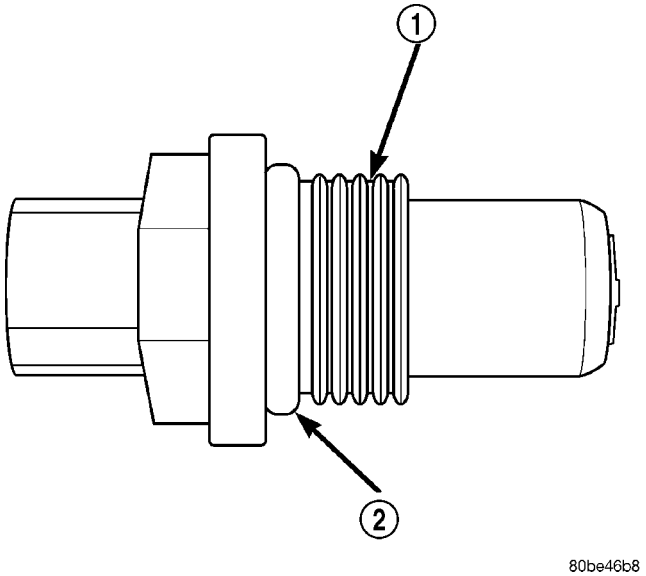

Fig. 332 O-Ring Location

1 - INPUT SPEED SENSOR
2 - O-RING

SPEED SENSOR - INPUT (Continued)

OPERATION

The Input Speed Sensor provides information on how fast the input shaft is rotating. As the teeth of the input clutch hub pass by the sensor coil (Fig. 333), an AC voltage is generated and sent to the PCM/TCM. The PCM/TCM interprets this information as input shaft rpm.

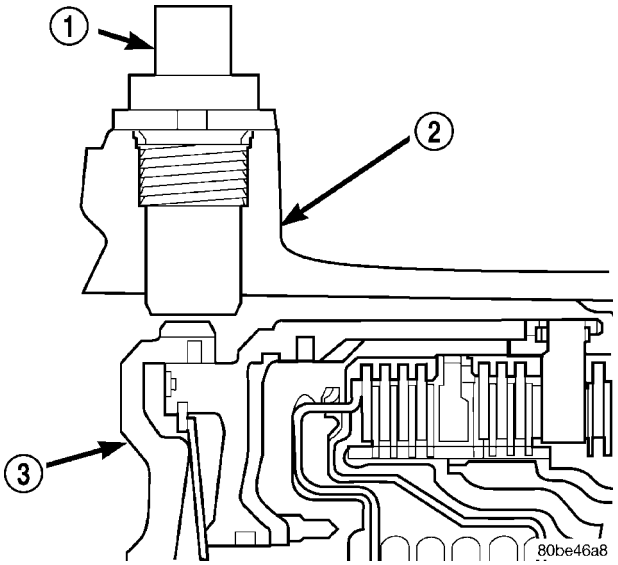

Fig. 333 Sensor Relation to Input Clutch Hub

1 - INPUT SPEED SENSOR
2 - TRANSAXLE CASE
3 - INPUT CLUTCH HUB

The PCM/TCM compares the input speed signal with output speed signal to determine the following:

- Transmission gear ratio
- Speed ratio error detection
- CVI calculation

The PCM/TCM also compares the input speed signal and the engine speed signal to determine the following:

- Torque converter clutch slippage
- Torque converter element speed ratio

REMOVAL

CAUTION: When disconnecting speed sensor connector, be sure that the connector weather seal does not fall off or remain in old sensor.

(1) Disconnect the battery cables.
(2) Remove air cleaner assembly (Fig. 334).
(3) Remove the battery hold down clamp and remove the battery (Fig. 335).

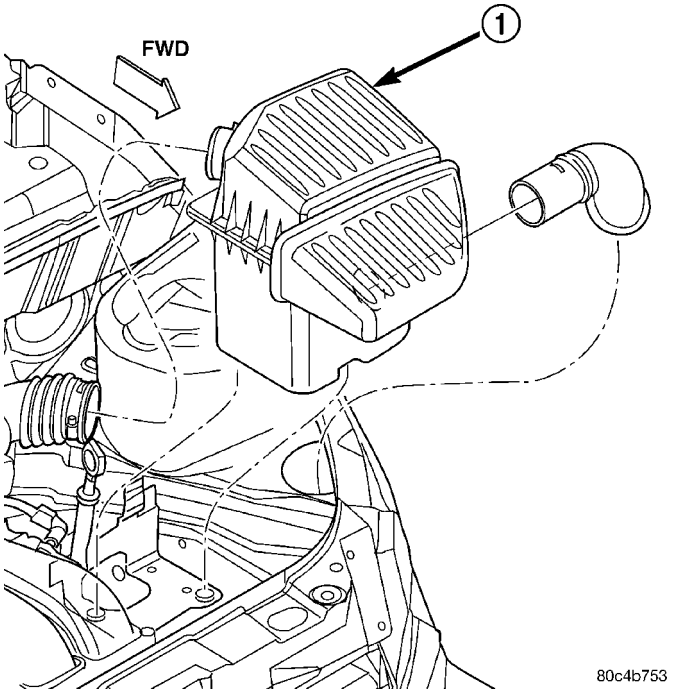

Fig. 334 Air Cleaner Assembly Removal/Installation

1 - AIR CLEANER ASSEMBLY

SPEED SENSOR - INPUT (Continued)

(4) Remove the battery tray (Fig. 336).

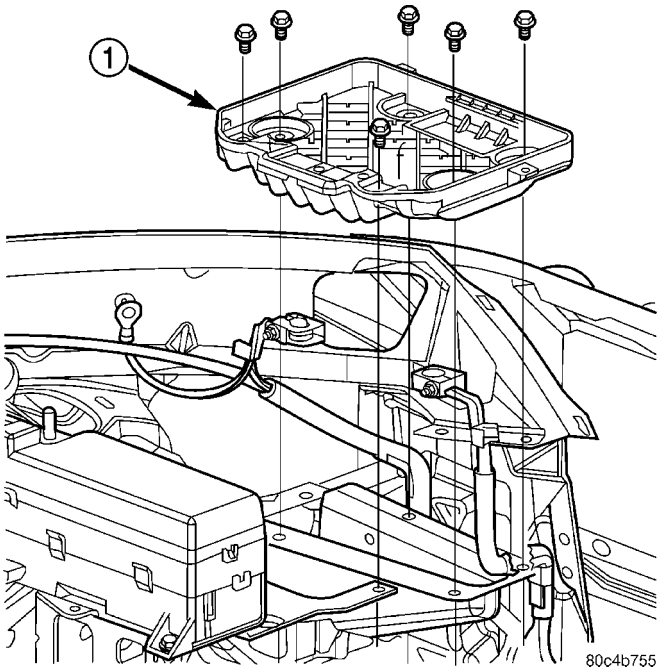

Fig. 336 Battery Tray Removal/Installation

1 - BATTERY TRAY

(5) Disconnect input speed sensor connector.

(6) Unscrew and remove input speed sensor (Fig. 337).

(7) Inspect speed sensor o-ring (Fig. 338) and replace if necessary.

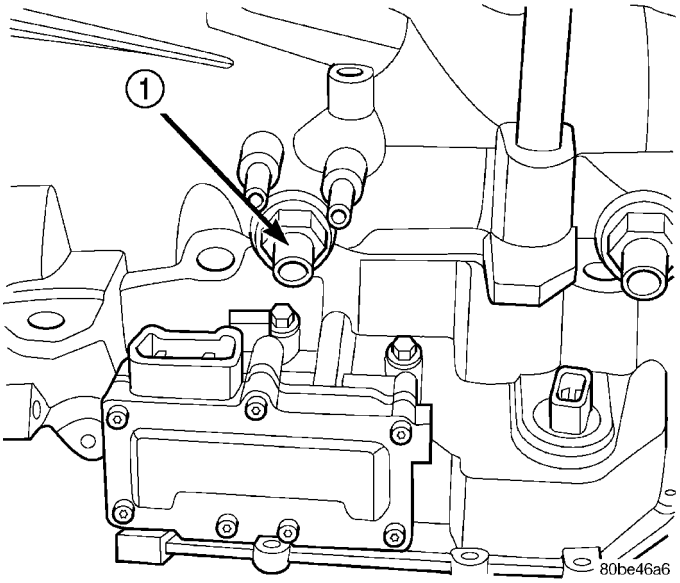

Fig. 337 Input (Turbine) Speed Sensor

1 - INPUT SPEED SENSOR

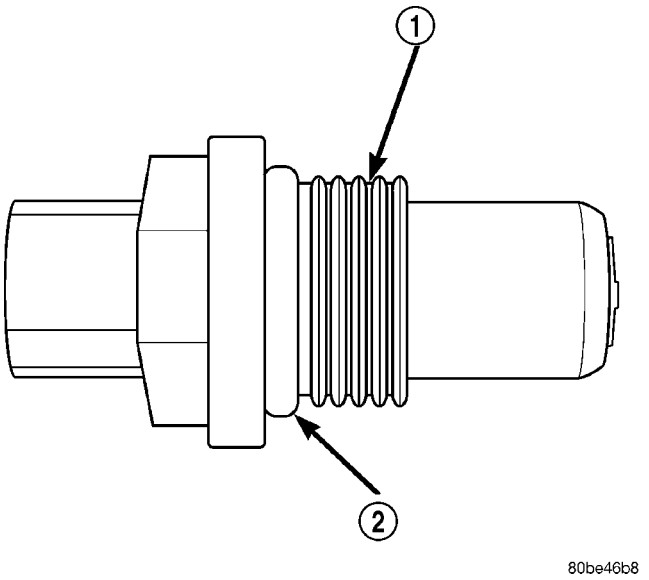

Fig. 338 O-Ring Location

1 - INPUT SPEED SENSOR
2 - O-RING

INSTALLATION

CAUTION: When disconnecting speed sensor connector, be sure that the connector weather seal does not fall off or remain in old sensor.

(1) Verify o-ring is installed into position.

(2) Install and tighten input speed sensor to 27 N·m (20 ft. lbs.).

(3) Connect speed sensor connector.

(4) Install the battery tray (Fig. 336).

(5) Install the battery and hold down clamp (Fig. 335).

(6) Install air cleaner assembly (Fig. 334).

(7) Connect battery cables.

SPEED SENSOR - OUTPUT

DESCRIPTION

The Output Speed Sensor is a two-wire magnetic pickup device that generates an AC signal as rotation occurs. It is threaded into the transaxle case (Fig. 339), sealed with an o-ring (Fig. 340), and is considered a primary input to the Powetrain/Transmission Control Module.

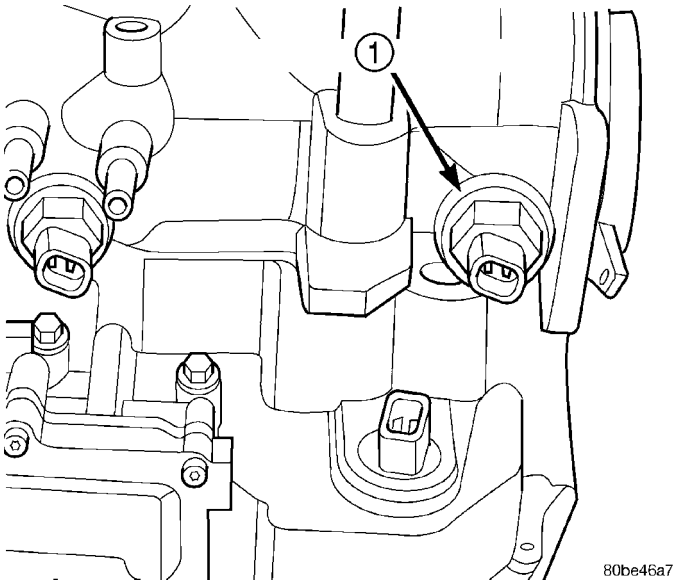

Fig. 339 Output Speed Sensor

1 - OUTPUT SPEED SENSOR

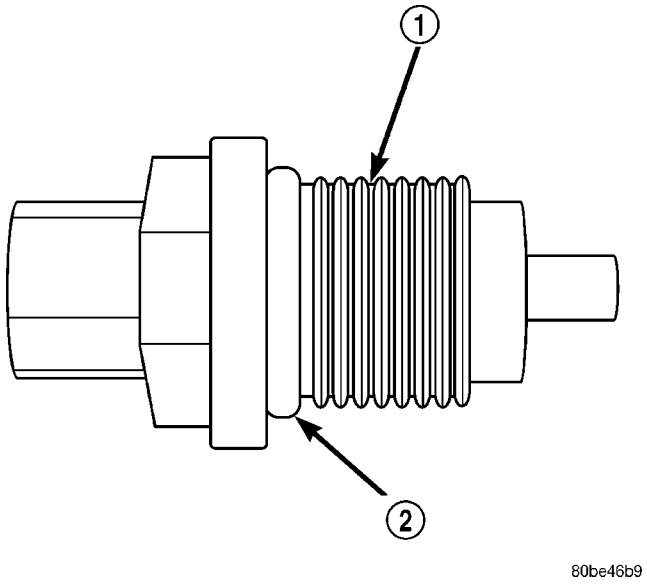

Fig. 340 O-Ring Location

1 - OUTPUT SPEED SENSOR
2 - O-RING

OPERATION

The Output Speed Sensor provides information on how fast the output shaft is rotating. As the rear planetary carrier park pawl lugs pass by the sensor coil (Fig. 341), an AC voltage is generated and sent to the PCM/TCM. The PCM/TCM interprets this information as output shaft rpm.

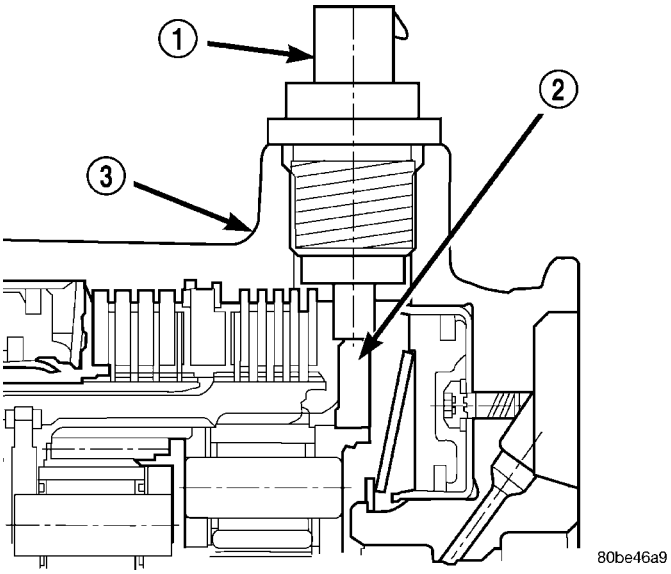

Fig. 341 Sensor Relation to Planet Carrier Park Pawl

1 - OUTPUT SPEED SENSOR
2 - REAR PLANET CARRIER/OUTPUT SHAFT ASSEMBLY
3 - TRANSAXLE CASE

The PCM/TCM compares the input and output speed signals to determine the following:

- Transmission gear ratio
- Speed ratio error detection
- CVI calculation

SPEED SENSOR - OUTPUT (Continued)

VEHICLE SPEED SIGNAL

The vehicle speed signal is taken from the Output Speed Sensor. The PCM converts this signal into a pulse per mile signal and sends the vehicle speed message across the communication bus to the BCM. The BCM sends this signal to the Instrument Cluster to display vehicle speed to the driver. The vehicle speed signal pulse is roughly 8000 pulses per mile.

REMOVAL

CAUTION: When disconnecting speed sensor connector, be sure that the connector weather seal does not fall off or remain in old sensor.

(1) Disconnect the battery cables.
(2) Remove air cleaner assembly (Fig. 342).

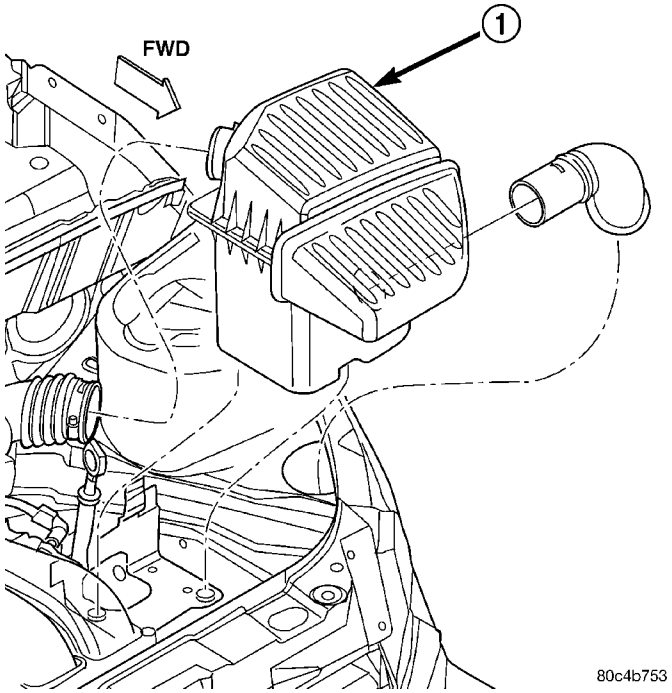

Fig. 342 Air Cleaner Assembly Removal/Installation

1 - AIR CLEANER ASSEMBLY

(3) Remove the battery hold down clamp and remove the battery (Fig. 343).
(4) Remove the battery tray (Fig. 344).
(5) Disconnect ouput speed sensor connector.
(6) Unscrew and remove output speed sensor (Fig. 345).
(7) Inspect speed sensor o-ring (Fig. 346) and replace if necessary.

1 - OUTPUT SPEED SENSOR

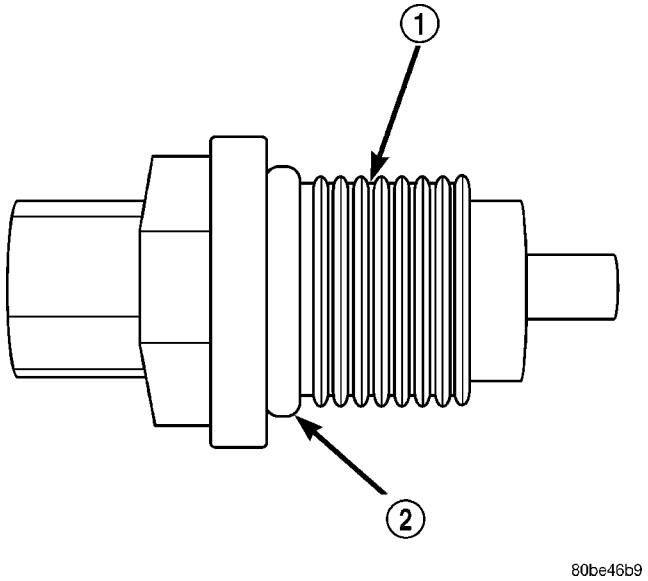

Fig. 346 O-Ring Location

1 - OUTPUT SPEED SENSOR
2 - O-RING

INSTALLATION

CAUTION: When disconnecting speed sensor connector, be sure that the connector weather seal does not fall off or remain in old sensor.

(1) Verify o-ring is installed into position (Fig. 346).

(2) Install and tighten output speed sensor to 27 N·m (20 ft. lbs.).

(3) Connect speed sensor connector.

(4) Install the battery tray (Fig. 344).

(5) Install the battery and hold down clamp (Fig. 343).

(6) Install air cleaner assembly (Fig. 342).

TORQUE CONVERTER

DESCRIPTION

The torque converter (Fig. 347) is a hydraulic device that couples the engine crankshaft to the transmission. The torque converter consists of an outer shell with an internal turbine, a stator, an overrunning clutch, an impeller and an electronically applied converter clutch. The converter clutch provides reduced engine speed and greater fuel economy when engaged. Clutch engagement also provides reduced transmission fluid temperatures. The converter clutch engages in third gear. The torque converter hub drives the transmission oil (fluid) pump.

The torque converter is a sealed, welded unit that is not repairable and is serviced as an assembly.

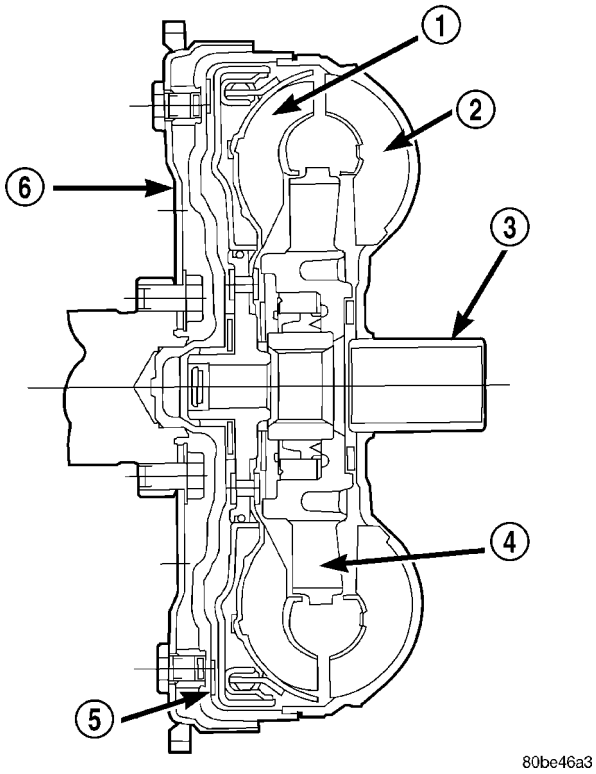

Fig. 347 Torque Converter Assembly

1 - TURBINE
2 - IMPELLER
3 - HUB
4 - STATOR
5 - CONVERTER CLUTCH DISC
6 - DRIVE PLATE

TORQUE CONVERTER (Continued)

IMPELLER

The impeller (Fig. 348) is an integral part of the converter housing. The impeller consists of curved blades placed radially along the inside of the housing on the transmission side of the converter. As the converter housing is rotated by the engine, so is the impeller, because they are one and the same and are the driving member of the system.

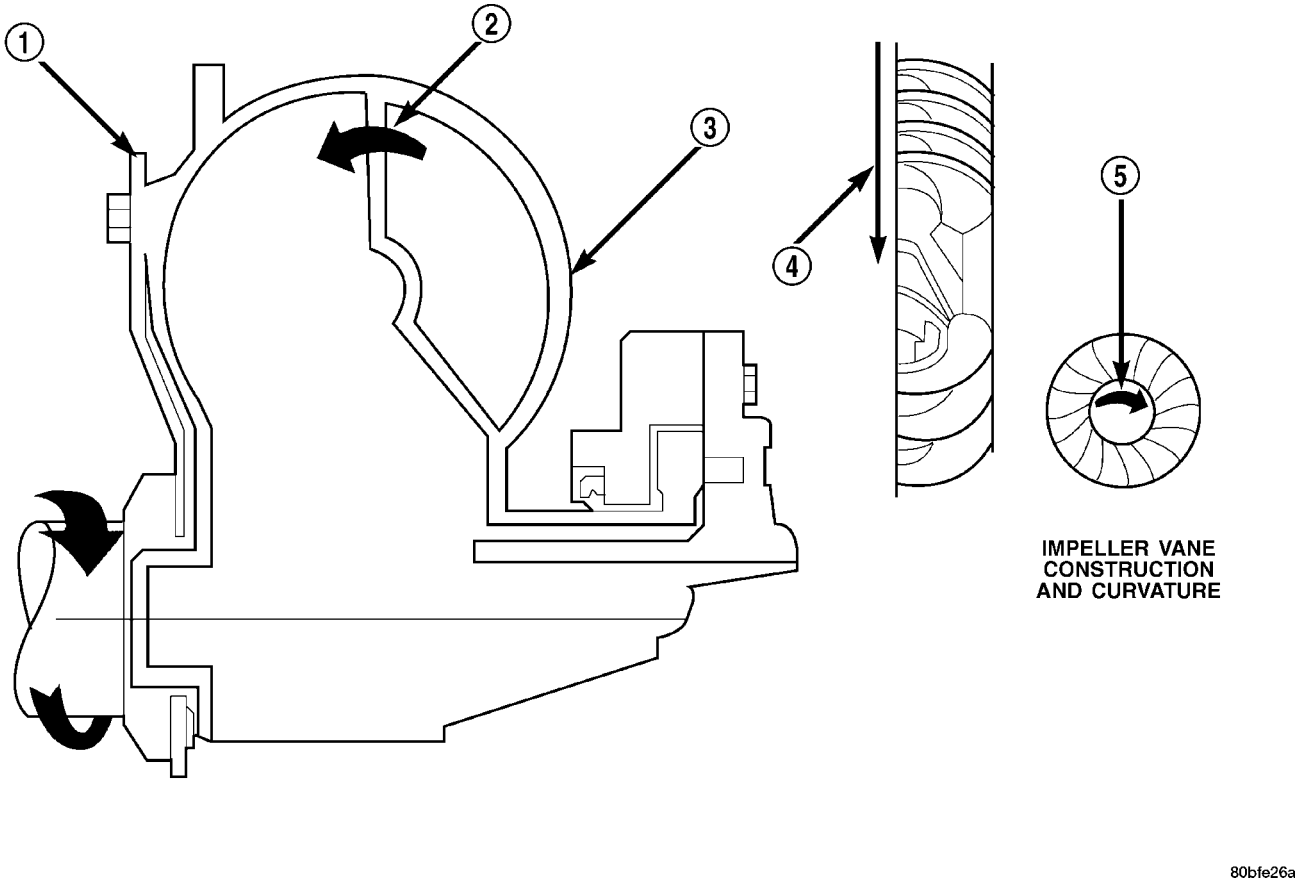

Fig. 348 Impeller

2 - OIL FLOW FROM IMPELLER SECTION INTO TURBINE SECTION
3 - IMPELLER VANES AND COVER ARE INTEGRAL
4 - ENGINE ROTATION
5 - ENGINE ROTATION

TORQUE CONVERTER (Continued)

TURBINE

The turbine (Fig. 349) is the output, or driven, member of the converter. The turbine is mounted within the housing opposite the impeller, but is not attached to the housing. The input shaft is inserted through the center of the impeller and splined into the turbine. The design of the turbine is similar to the impeller, except the blades of the turbine are curved in the opposite direction.

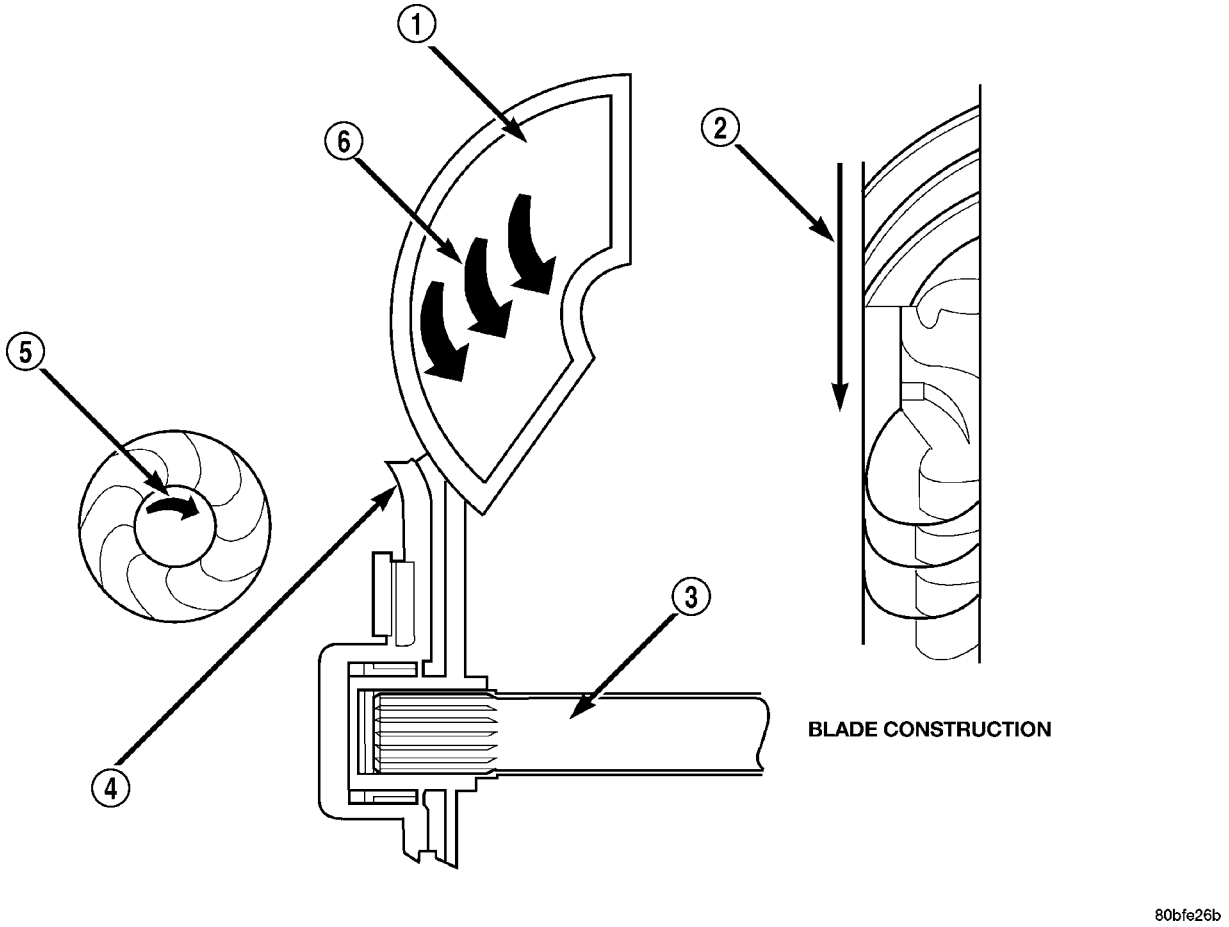

Fig. 349 Turbine

3 - INPUT SHAFT
4 - PORTION OF TORQUE CONVERTER COVER
5 - ENGINE ROTATION
6 - OIL FLOW WITHIN TURBINE SECTION

TORQUE CONVERTER (Continued)

STATOR

The stator assembly (Fig. 350) is mounted on a stationary shaft which is an integral part of the oil pump. The stator is located between the impeller and turbine within the torque converter case (Fig. 351). The stator contains an over-running clutch, which allows the stator to rotate only in a clockwise direction. When the stator is locked against the over-running clutch, the torque multiplication feature of the torque converter is operational.

3 - SPRING
4 - INNER RACE

TORQUE CONVERTER CLUTCH (TCC)

The TCC (Fig. 352) was installed to improve the efficiency of the torque converter that is lost to the slippage of the fluid coupling. Although the fluid coupling provides smooth, shock–free power transfer, it is natural for all fluid couplings to slip. If the impeller and turbine were mechanically locked together, a zero slippage condition could be obtained. A hydraulic piston was added to the turbine, and a friction material was added to the inside of the front cover to provide this mechanical lock-up.

TORQUE CONVERTER (Continued)

OPERATION

The converter impeller (Fig. 353) (driving member), which is integral to the converter housing and bolted to the engine drive plate, rotates at engine speed. The converter turbine (driven member), which reacts from fluid pressure generated by the impeller, rotates and turns the transmission input shaft.

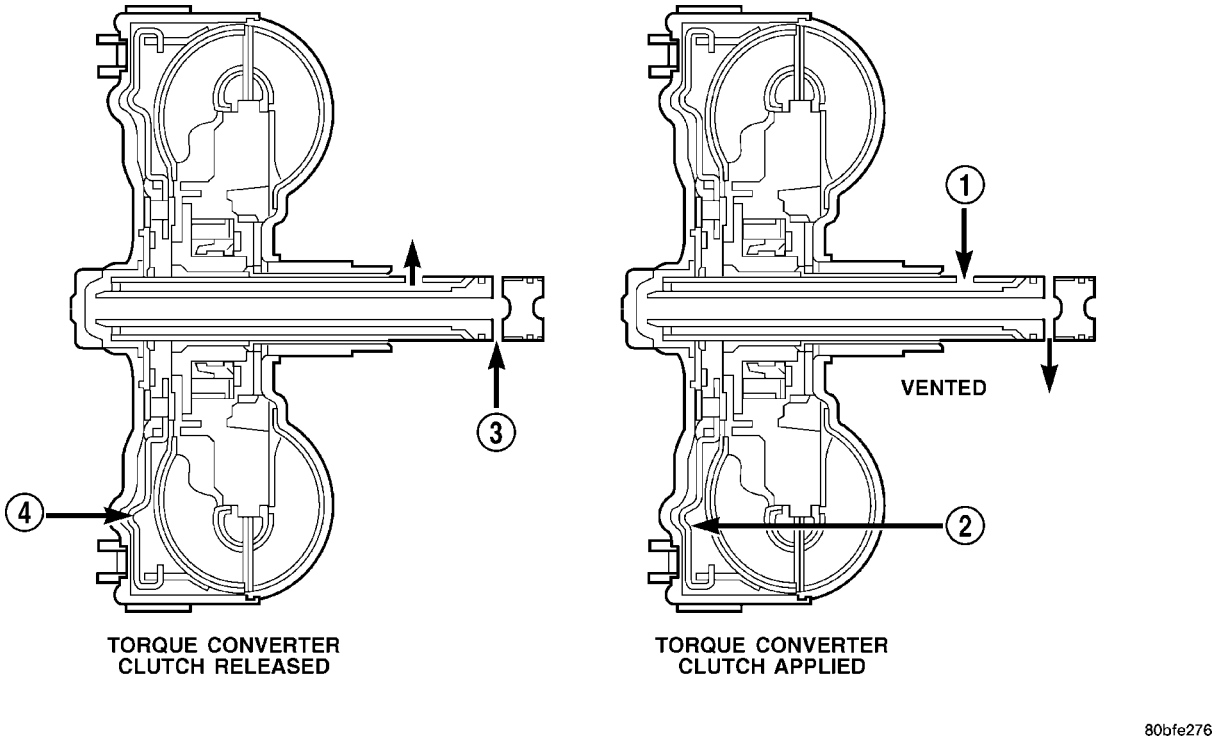

Fig. 353 Torque Converter Fluid Operation

1 - APPLY PRESSURE
2 - THE PISTON MOVES SLIGHTLY FORWARD
3 - RELEASE PRESSURE
4 - THE PISTON MOVES SLIGHTLY REARWARD

TORQUE CONVERTER (Continued)

TURBINE

As the fluid that was put into motion by the impeller blades strikes the blades of the turbine, some of the energy and rotational force is transferred into the turbine and the input shaft. This causes both of them (turbine and input shaft) to rotate in a clockwise direction following the impeller. As the fluid is leaving the trailing edges of the turbine's blades it continues in a "hindering" direction back toward the impeller. If the fluid is not redirected before it strikes the impeller, it will strike the impeller in such a direction that it would tend to slow it down.

STATOR

Torque multiplication is achieved by locking the stator's over-running clutch to its shaft (Fig. 354). Under stall conditions (the turbine is stationary), the oil leaving the turbine blades strikes the face of the stator blades and tries to rotate them in a counter-clockwise direction. When this happens the over–running clutch of the stator locks and holds the stator from rotating. With the stator locked, the oil strikes the stator blades and is redirected into a "helping" direction before it enters the impeller. This circulation of oil from impeller to turbine, turbine to stator, and stator to impeller, can produce a maximum torque multiplication of about 2.4:1. As the turbine begins to match the speed of the impeller, the fluid that was hitting the stator in such as way as to cause it to lock–up is no longer doing so. In this condition of operation, the stator begins to free wheel and the converter acts as a fluid coupling.

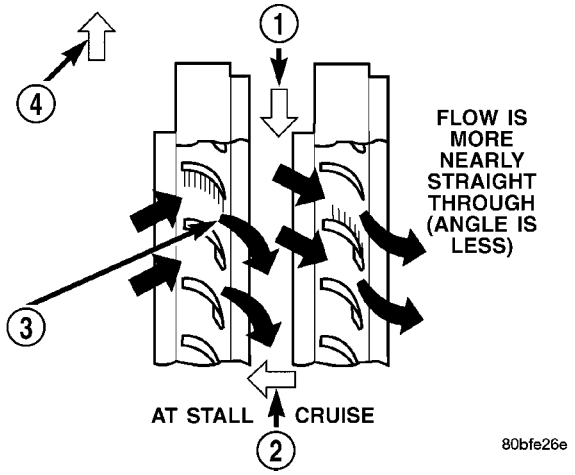

Fig. 354 Stator Operation

1 - DIRECTION STATOR WILL FREE WHEEL DUE TO OIL PUSHING ON BACKSIDE OF VANES
2 - FRONT OF ENGINE
3 - INCREASED ANGLE AS OIL STRIKES VANES
4 - DIRECTION STATOR IS LOCKED UP DUE TO OIL PUSHING AGAINST STATOR VANES

TORQUE CONVERTER CLUTCH (TCC)

In a standard torque converter, the impeller and turbine are rotating at about the same speed and the stator is freewheeling, providing no torque multiplication. By applying the turbine's piston to the front cover's friction material, a total converter engagement can be obtained. The result of this engagement is a direct 1:1 mechanical link between the engine and the transmission.

The engagement and disengagement of the TCC are automatic and controlled by the Powertrain Control Module (PCM). The engagement cannot be activated in the lower gears because it eliminates the torque multiplication effect of the torque converter necessary for acceleration. Inputs that determine clutch engagement are: coolant temperature, vehicle speed and throttle position. The torque converter clutch is engaged by the clutch solenoid on the valve body. The clutch will engage at approximately 56 km/h (35 mph) with light throttle, after the shift to third gear.

REMOVAL

(1) Remove transmission and torque converter from vehicle. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 41TE - REMOVAL)

(2) Place a suitable drain pan under the converter housing end of the transmission.

CAUTION: Verify that transmission is secure on the lifting device or work surface, the center of gravity of the transmission will shift when the torque converter is removed creating an unstable condition. The torque converter is a heavy unit. Use caution when separating the torque converter from the transmission.

(3) Pull the torque converter forward until the center hub clears the oil pump seal.

(4) Separate the torque converter from the transmission.

INSTALLATION

Check converter hub and drive notches for sharp edges, burrs, scratches, or nicks. Polish the hub and notches with 320/400 grit paper or crocus cloth if necessary. The hub must be smooth to avoid damaging the pump seal at installation.

(1) Lubricate converter hub and oil pump seal lip with transmission fluid.

(2) Place torque converter in position on transmission.

CAUTION: Do not damage oil pump seal or bushing while inserting torque converter into the front of the transmission.

TORQUE CONVERTER (Continued)

(3) Align torque converter to oil pump seal opening.

(4) Insert torque converter hub into oil pump.

(5) While pushing torque converter inward, rotate converter until converter is fully seated in the oil pump gears.

(6) Check converter seating with a scale and straightedge (Fig. 355). Surface of converter lugs should be 1/2 in. to rear of straightedge when converter is fully seated.

(7) If necessary, temporarily secure converter with C-clamp attached to the converter housing.

(8) Install the transmission in the vehicle. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 41TE - INSTALLATION)

(9) Fill the transmission with the recommended fluid. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 41TE/FLUID - STANDARD PROCEDURE)

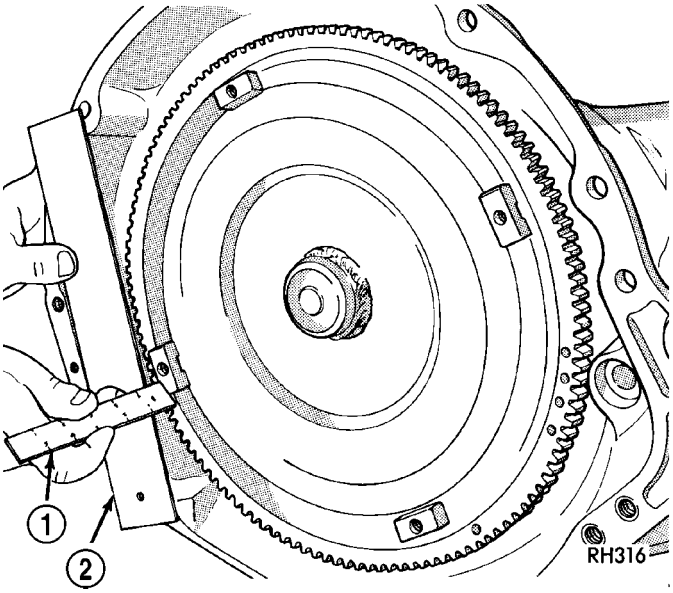

Fig. 355 Checking Torque Converter Seating

2 - STRAIGHTEDGE

TRANSMISSION CONTROL RELAY

DESCRIPTION

The transmission control relay is located in the Power Distribution Center (PDC) on the left side of the engine compartment between the brake master cylinder and the air cleaner assembly (Fig. 356).

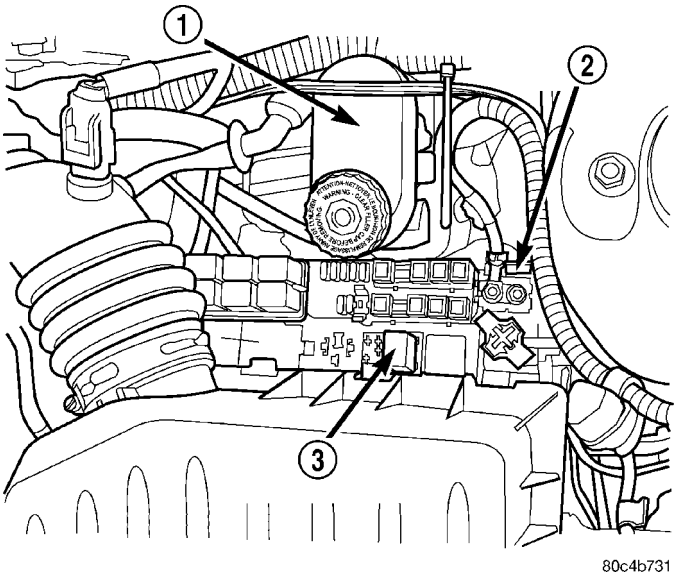

Fig. 356 Transmission Control Relay Location

1 - MASTER CYLINDER
2 - POWER DISTRIBUTION CENTER (PDC)
3 - TRANSMISSION CONTROL RELAY

OPERATION

The relay is supplied fused B+ voltage, energized by the PCM/TCM, and is used to supply power to the solenoid pack when the transmission is in normal operating mode. When the relay is “off”, no power is supplied to the solenoid pack and the transmission is in “limp-in” mode. After a controller reset (ignition key turned to the “run” position or after cranking engine), the PCM/TCM energizes the relay. Prior to this, the PCM/TCM verifies that the contacts are open by checking for no voltage at the switched battery terminals. After this is verified, the voltage at the solenoid pack pressure switches is checked. After the relay is energized, the PCM/TCM monitors the terminals to verify that the voltage is greater than 3 volts.

TRANSMISSION RANGE SENSOR

DESCRIPTION

The Transmission Range Sensor (TRS) is mounted to the top of the valve body inside the transaxle and can only be serviced by removing the valve body. The electrical connector extends through the transaxle case (Fig. 357).

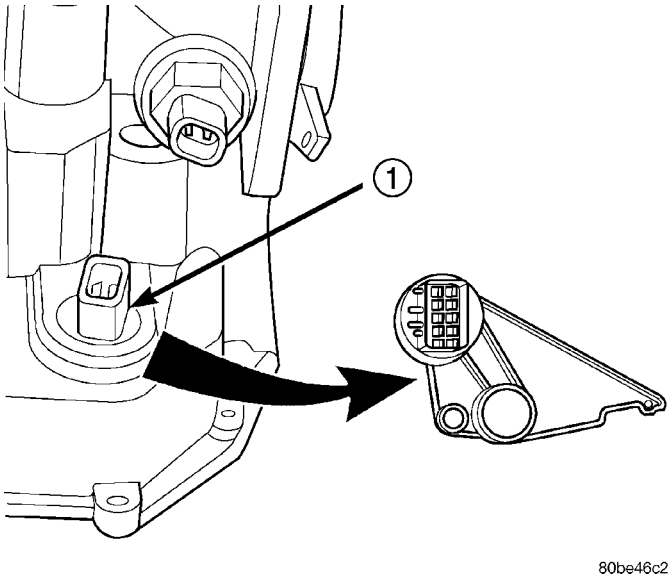

Fig. 357 Transmission Range Sensor (TRS) Location

1 - TRANSMISSION RANGE SENSOR

The Transmission Range Sensor (TRS) has four switch contacts that monitor shift lever position and send the information to the PCM/TCM.

The TRS also has an integrated temperature sensor (thermistor) that communicates transaxle temperature to the TCM and PCM (Fig. 358).

OPERATION

The Transmission Range Sensor (TRS) (Fig. 357) communicates shift lever position (SLP) to the PCM/TCM as a combination of open and closed switches. Each shift lever position has an assigned combination of switch states (open/closed) that the PCM/TCM receives from four sense circuits. The PCM/TCM interprets this information and determines the appropriate transaxle gear position and shift schedule.

Since there are four switches, there are 16 possible combinations of open and closed switches (codes). Seven of these codes are related to gear position and three are recognized as “between gear” codes. This results in six codes which should never occur. These are called “invalid” codes. An invalid code will result

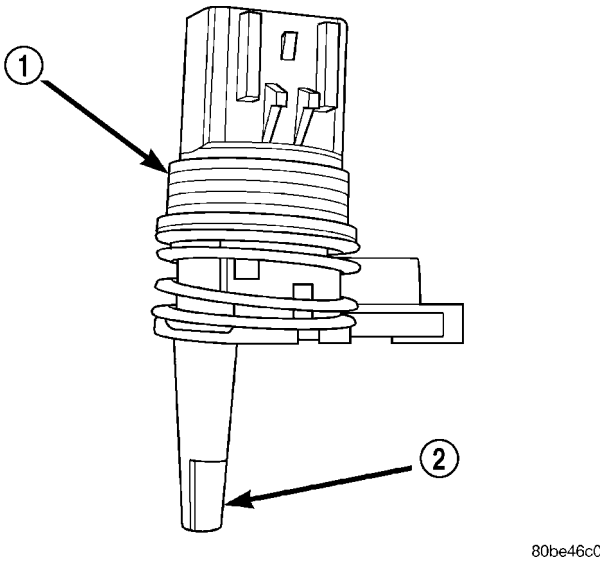

Fig. 358 Transmission Temperature Sensor

1 - TRANSMISSION RANGE SENSOR
2 - TEMPERATURE SENSOR

in a DTC, and the PCM/TCM will then determine the shift lever position based on pressure switch data. This allows reasonably normal transmission operation with a TRS failure.

TRS SWITCH STATES

SLP	T42	T41	T3	T1
P	CL	CL	CL	OP
R	CL	OP	OP	OP
N	CL	CL	OP	CL
OD	OP	OP	OP	CL
3	OP	OP	CL	OP
L	CL	OP	CL	CL

TRANSMISSION TEMPERATURE SENSOR

The TRS has an integrated thermistor (Fig. 358) that the PCM/TCM uses to monitor the transmission’s sump temperature. Since fluid temperature can affect transmission shift quality and convertor lock up, the PCM/TCM requires this information to determine which shift schedule to operate in. The PCM also monitors this temperature data so it can energize the vehicle cooling fan(s) when a transmission “overheat” condition exists. If the thermistor circuit fails, the PCM/TCM will revert to calculated oil temperature usage.

CALCULATED TEMPERATURE

A failure in the temperature sensor or circuit will result in calculated temperature being substituted for actual temperature. Calculated temperature is a pre-

TRANSMISSION RANGE SENSOR (Continued)

dicted fluid temperature which is calculated from a combination of inputs:

- Battery (ambient) temperature
- Engine coolant temperature
- In-gear run time since start-up

REMOVAL

The valve body assembly must be removed to gain access to and replace the transmission range sensor.

(1) Disconnect the battery cables.

(2) Remove air cleaner assembly (Fig. 359).

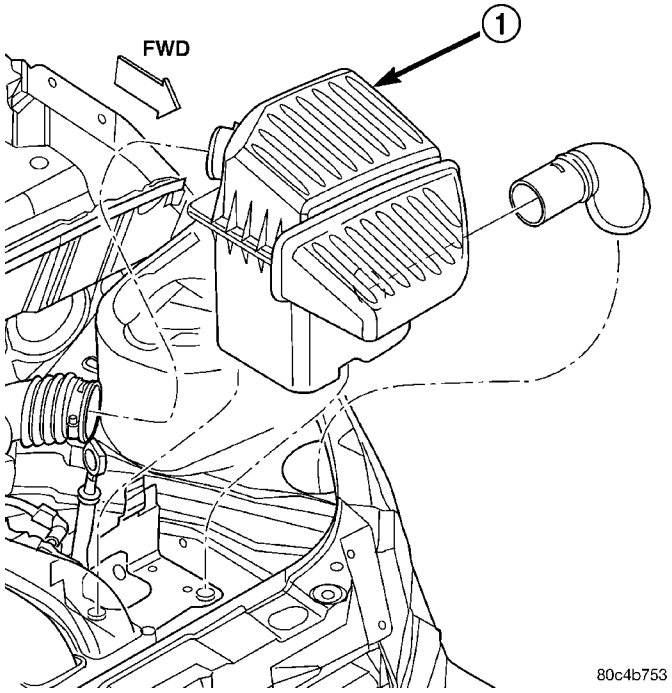

Fig. 359 Air Cleaner Assembly Removal/Installation

1 - AIR CLEANER ASSEMBLY

(3) Remove the battery hold down clamp and remove the battery (Fig. 360).

3 - RETAINING SCREW

(16) Slide Transmission Range Sensor up the manual shaft and remove (Fig. 371).

INSTALLATION

The valve body assembly must be removed to gain access to and replace the transmission range sensor.

(1) Install transmission range sensor (Fig. 371).

(2) Tighten retaining screw (Fig. 370) to 5 N·m (45 in. lbs.).

(3) Install manual shaft seal (Fig. 369).

(4) Guide park rod rollers into guide bracket while installing valve body to the transaxle case (Fig. 367) (Fig. 368).

(5) Install the valve body-to-case bolts (Fig. 366) and torque to 12 N·m (105 in. lbs.).

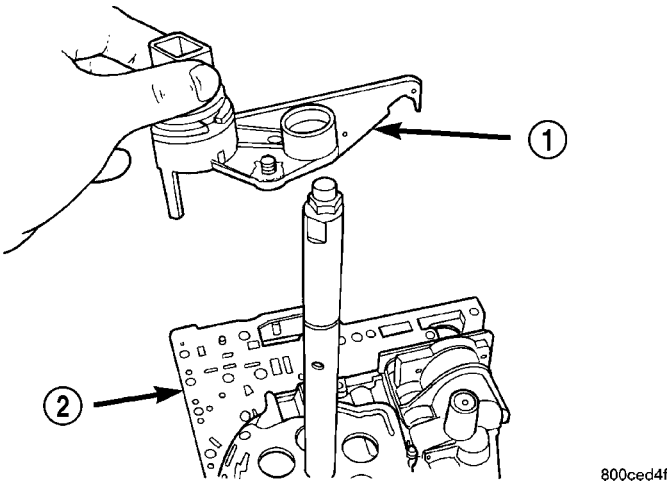

Fig. 371 Remove Transmission Range Sensor

1 - TRANSMISSION RANGE SENSOR
2 - VALVE BODY

(6) Install the oil filter (Fig. 365). Inspect the o-ring for damage and replace as necessary.

(7) Install an 1/8' bead of RTV as shown in (Fig. 364) and install pan to case.

(8) Install oil pan bolts (Fig. 363) and torque to 19 N·m (165 in. lbs.) torque.

(9) Lower vehicle.

(10) Connect transmission range sensor connector.

(11) Install manual valve lever to manual valve.

(12) Install gear shift cable to manual valve lever (Fig. 362).

(13) Install the battery tray (Fig. 361).

(14) Install the battery and hold down clamp (Fig. 360).

(15) Install air cleaner assembly (Fig. 359).

(16) Connect battery cables.

(17) Fill transaxle with ATF+4 (Automatic Transmission Fluid–Type 9602). Refer to Fluid Level and Condition in this Group.

VALVE BODY

DESCRIPTION

The valve body assembly consists of a cast aluminum valve body, a separator plate, and transfer plate. The valve body contains valves and check balls that control fluid delivery to the torque converter clutch, solenoid/pressure switch assembly, and frictional clutches. The valve body contains the following components (Fig. 372):

- Regulator valve
- Solenoid switch valve
- Manual valve
- Converter clutch switch valve
- Converter clutch control valve
- Torque converter regulator valve
- Low/Reverse switch valve

In addition, the valve body also contains the thermal valve, #2,3&4 check balls, the #5 (overdrive) check valve and the 2/4 accumulator assembly. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 41TE/VALVE BODY - DISASSEMBLY)

OPERATION

NOTE: Refer to the Hydraulic Schematics for a visual aid in determining valve location, operation and design.

REGULATOR VALVE

The regulator valve controls hydraulic pressure in the transaxle. It receives unregulated pressure from the pump, which works against spring tension to maintain oil at specific pressures. A system of sleeves and ports allows the regulator valve to work at one of three predetermined pressure levels. Regulated oil pressure is also referred to as “line pressure.”

SOLENOID SWITCH VALVE

The solenoid switch valve controls line pressure from the LR/CC solenoid. In one position, it allows the low/reverse clutch to be pressurized. In the other, it directs line pressure to the converter control and converter clutch valves.

5 - MANUAL VALVE
6 - CONVERTER CLUTCH SWITCH VALVE
7 - SOLENOID SWITCH VALVE
8 - REGULATOR VALVE

VALVE BODY (Continued)

MANUAL VALVE

The manual valve is operated by the mechanical shift linkage. Its primary responsibility is to send line pressure to the appropriate hydraulic circuits and solenoids. The valve has three operating ranges or positions.

CONVERTER CLUTCH SWITCH VALVE

The main responsibility of the converter clutch switch valve is to control hydraulic pressure applied to the front (off) side of the converter clutch piston. Line pressure from the regulator valve is fed to the torque converter regulator valve, where it passes through the valve, and is slightly regulated. The pressure is then directed to the converter clutch switch valve and to the front side of the converter clutch piston. This pressure pushes the piston back and disengages the converter clutch.

CONVERTER CLUTCH CONTROL VALVE

The converter clutch control valve controls the back (on) side of the torque converter clutch. When the PCM/TCM energizes or modulates the LR/CC solenoid to apply the converter clutch piston, both the converter clutch control valve and the converter control valve move, allowing pressure to be applied to the back side of the clutch.

T/C REGULATOR VALVE

The torque converter regulator valve slightly regulates the flow of fluid to the torque converter.

LOW/REVERSE SWITCH VALVE

The low/reverse clutch is applied from different sources, depending on whether low (1st) gear or reverse is selected. The low/reverse switch valve alternates positions depending on from which direction fluid pressure is applied. By design, when the valve is shifted by fluid pressure from one channel, the opposing channel is blocked. The switch valve alienates the possibility of a sticking ball check, thus providing consistent application of the low/reverse clutch under all operating conditions.

REMOVAL

(1) Disconnect the battery cables.

(2) Remove air cleaner assembly (Fig. 373).

(3) Remove the battery hold down clamp and remove the battery (Fig. 374).

INSTALLATION

NOTE: To ease installation of the valve body, turn the manual valve lever fully clockwise.

(1) Install overdrive and underdrive accumulators and springs as previously removed (Fig. 383).

(2) Guide park rod rollers into guide bracket while installing valve body to the transaxle case (Fig. 381) (Fig. 382).

(3) Install the valve body-to-case bolts (Fig. 380)and torque to 12 N·m (105 in. lbs.).

(4) Install the oil filter (Fig. 379). Inspect the o-ring for damage and replace as necessary.

(5) Install an 1/8' bead of RTV as shown in (Fig. 378)and install pan to case.

(6) Install oil pan bolts (Fig. 377) and torque to 19 N·m (165 in. lbs.) torque.

(7) Lower vehicle.

(8) Install manual valve lever to manual shaft (Fig. 376).

(9) Install gearshift cable to manual valve lever (Fig. 376).

(10) Install the battery tray (Fig. 375).

(11) Install the battery and hold down clamp (Fig. 374).

(12) Install air cleaner assembly (Fig. 373).

(13) Connect battery cables.

(14) Fill transaxle with fluid. Refer to SERVICE PROCEDURES for proper fluid fill procedure.

41TE AUTOMATIC TRANSAXLE

DESCRIPTION

The 41TE (Fig. 1) is a four-speed transaxle that is a conventional hydraulic/mechanical assembly with an integral differential, and is controlled with adaptive electronic controls and monitors. The hydraulic system of the transaxle consists of the transaxle fluid, fluid passages, hydraulic valves, and various line pressure control components. An input clutch assembly which houses the underdrive, overdrive, and reverse clutches is used. It also utilizes separate holding clutches: 2nd/4th gear and Low/Reverse. The primary mechanical components of the transaxle consist of the following:

- Three multiple disc input clutches
- Two multiple disc holding clutches
- Four hydraulic accumulators
- Two planetary gear sets
- Hydraulic oil pump
- Valve body
- Solenoid/Pressure switch assembly
- Integral differential assembly

Control of the transaxle is accomplished by fully adaptive electronics. Optimum shift scheduling is accomplished through continuous real-time sensor feedback information provided to the Powertrain Control Module (PCM) or Transmission Control Module (TCM).

The PCM/TCM is the heart of the electronic control system and relies on information from various direct and indirect inputs (sensors, switches, etc.) to determine driver demand and vehicle operating conditions. With this information, the PCM/TCM can calculate and perform timely and quality shifts through various output or control devices (solenoid pack, transmission control relay, etc.).

The PCM/TCM also performs certain self-diagnostic functions and provides comprehensive information (sensor data, DTC's, etc.) which is helpful in proper diagnosis and repair. This information can be viewed with the DRB scan tool.

TRANSAXLE IDENTIFICATION

The 41TE transaxle is identified by a barcode label that is fixed to the transaxle case as shown in (Fig. 2).

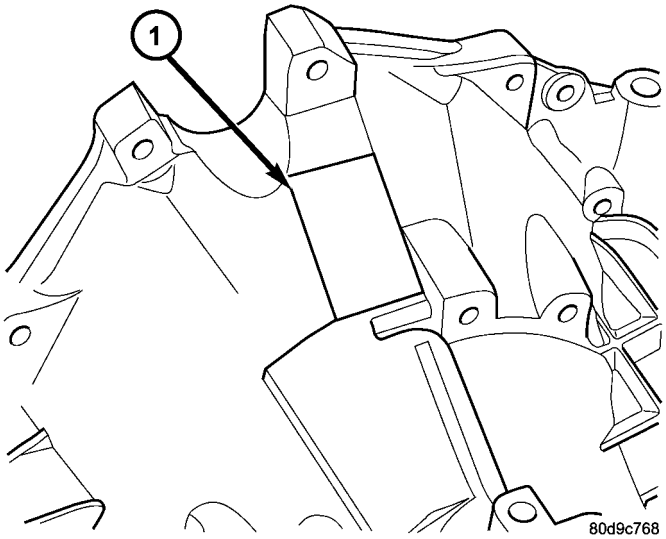

Fig. 2 Transaxle Identification Label

1 - IDENTIFICATION LABEL

The label contains a series of digits that can be translated into useful information such as transaxle part number, date of manufacture, manufacturing origin, plant shift number, build sequence number, etc. Refer to (Fig. 3) for identification label breakdown.

If the tag is not legible or missing, the “PK” number, which is stamped into the transaxle case behind the transfer gear cover, can be referred to for identification. This number differs slightly in that it contains the entire transaxle part number, rather than the last three digits.

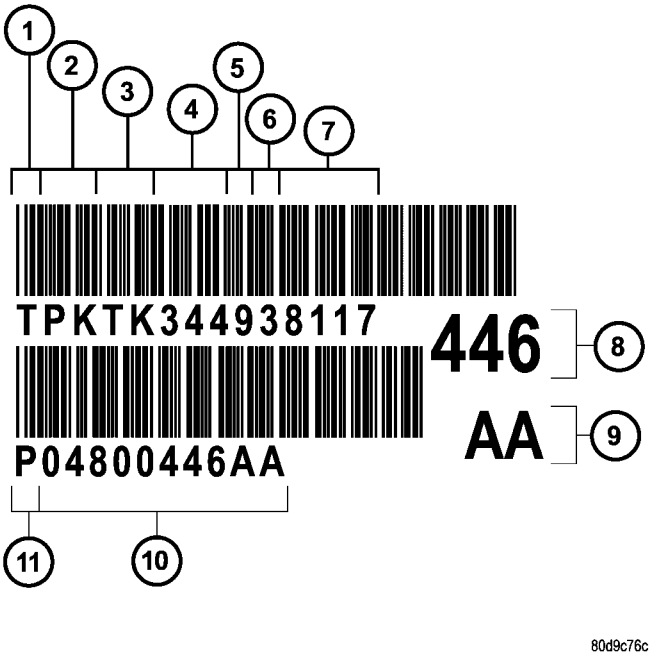

Fig. 3 Identification Label Breakdown

1 - T=TRACEABILITY
2 - SUPPLIER CODE (PK=KOKOMO)
3 - COMPONENT CODE (TK=KOKOMO TRANSMISSION)
4 - BUILD DAY (344=DEC. 9)
5 - BUILD YEAR (9=1999)
6 - LINE/SHIFT CODE (3=3RD SHIFT)
7 - BUILD SEQUENCE NUMBER
8 - LAST THREE OF P/N
9 - ALPHA
10 - TRANSAXLE PART NUMBER
11 - P=PART NUMBER

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - 4XTE TRANSAXLE GENERAL DIAGNOSIS

NOTE: Before attempting any repair on a 4XTE four-speed automatic transaxle, check for diagnostic trouble codes (DTC’s) using the DRB scan tool. Refer to the Transmission Diagnostic Procedures Manual.

Transaxle malfunctions may be caused by these general conditions:

- Poor engine performance
- Improper adjustments
- Hydraulic malfunctions
- Mechanical malfunctions
- Electronic malfunctions

Diagnosis of these problems should always begin by checking the easily accessible variables: fluid level and condition, gearshift cable adjustment. Then perform a road test to determine if the problem has been corrected or that more diagnosis is necessary. If the problem persists after the preliminary tests and corrections are completed, hydraulic pressure checks should be performed.

DIAGNOSIS AND TESTING - ROAD TEST

Prior to performing a road test, verify that the fluid level, fluid condition, and linkage adjustment have been approved.

During the road test, the transaxle should be operated in each position to check for slipping and any variation in shifting.

If the vehicle operates properly at highway speeds, but has poor acceleration, the converter stator overrunning clutch may be slipping. If acceleration is normal, but high throttle opening is needed to maintain highway speeds, the converter stator clutch may have seized. Both of these stator defects require

41TE AUTOMATIC TRANSAXLE (Continued)

replacement of the torque converter and thorough transaxle cleaning.

Slipping clutches can be isolated by comparing the "Elements in Use" chart with clutch operation encountered on a road test. This chart identifies which clutches are applied at each position of the selector lever.

A slipping clutch may also set a DTC and can be determined by operating the transaxle in all selector positions.

ELEMENTS IN USE AT EACH POSITION OF SELECTOR LEVER

Shift Lever Position	INPUT CLUTCHES			HOLDING CLUTCHES	
	Underdrive	Overdrive	Reverse	2/4	Low/Reverse
P - PARK					X
R - REVERSE			X		X
N - NEUTRAL					X
OD - OVERDRIVE First	X				X
Second	X			X	
Direct	X	X			
Overdrive		X		X	
D - DRIVE* First	X				X
Second	X			X	
Direct	X	X			
L - LOW* First	X				X
Second	X			X	
Direct	X	X			
* Vehicle upshift and downshift speeds are increased when in these selector positions.					

The process of elimination can be used to detect any unit which slips and to confirm proper operation of good units. Road test analysis can diagnose slipping units, but the cause of the malfunction cannot be determined. Practically any condition can be caused by leaking hydraulic circuits or sticking valves.

DIAGNOSIS AND TESTING - HYDRAULIC PRESSURE TESTS

Pressure testing is a very important step in the diagnostic procedure. These tests usually reveal the cause of most hydraulic transaxle problems.

Before performing pressure tests, be certain that fluid level and condition, and shift cable adjustments have been checked and approved. Fluid must be at operating temperature (150 to 200 degrees F.).

Install an engine tachometer, raise vehicle on hoist which allows front wheels to turn, and position tachometer so it can be read.

Attach 300 psi gauge (C-3293SP) to port(s) required for test(s) being conducted. Use adapter set L-4559 to adapt gauge(s) to transaxle.

Test port locations are shown in (Fig. 4).

TEST ONE-SELECTOR IN LOW (1st GEAR)

(1) Attach pressure gauge to the low/reverse clutch tap.

(2) Move selector lever to the (L) position.

(3) Allow vehicle wheels to turn and increase throttle opening to achieve an indicated vehicle speed to 20 mph.

(4) Low/reverse clutch pressure should read 115 to 145 psi.

(5) This test checks pump output, pressure regulation and condition of the low/reverse clutch hydraulic circuit and shift schedule.

41TE AUTOMATIC TRANSAXLE (Continued)

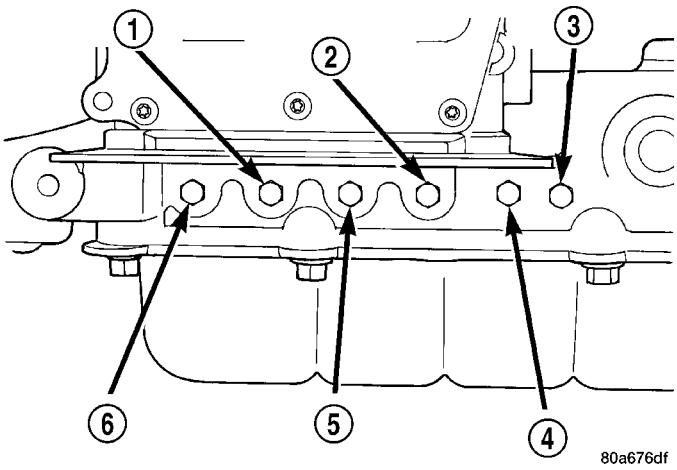

Fig. 4 Pressure Taps

1 - OVERDRIVE CLUTCH
2 - TORQUE CONVERTER OFF
3 - LOW/REVERSE CLUTCH
4 - 2/4 CLUTCH
5 - REVERSE CLUTCH
6 - UNDERDRIVE CLUTCH

TEST TWO-SELECTOR IN DRIVE (2nd GEAR)

NOTE: This test checks the underdrive clutch hydraulic circuit as well as the shift schedule.

(1) Attach gauge to the underdrive clutch tap.
(2) Move selector lever to the 3 position.
(3) Allow vehicle wheels to turn and increase throttle opening to achieve an indicated vehicle speed of 30 mph.
(4) In second gear the underdrive clutch pressure should read 110 to 145 psi.

TEST TWO A–SELECTOR IN OD (4th Gear)

NOTE: This test checks the underdrive clutch hydraulic circuit as well as the shift schedule.

(1) Attach gauge to the underdrive clutch tap.
(2) Move selector lever to the (OD) position.
(3) Allow wheels to rotate freely and increase throttle opening to achieve an indicated speed of 40 mph.
(4) Underdrive clutch pressure should read below 5 psi. If not, then either the solenoid assembly or PCM/TCM is at fault.

TEST THREE-OVERDRIVE CLUTCH CHECK (3rd and 2nd Gear)

(1) Attach gauge to the overdrive clutch tap.
(2) Move selector lever to the (OD) position.
(3) Allow vehicle wheels to turn and increase throttle opening to achieve an indicated vehicle speed of 20 mph. Vehicle should be in 3rd gear.
(4) Overdrive clutch pressure should read 74 to 95 psi.
(5) Move selector lever to the (3) position and increase indicated vehicle speed to 30 mph.
(6) The vehicle should be in second gear and overdrive clutch pressure should be less than 5 psi.
(7) This test checks the overdrive clutch hydraulic circuit as well as the shift schedule.

TEST FOUR-SELECTOR IN OVERDRIVE (4th Gear)

(1) Attach gauge to the 2/4 clutch tap.
(2) Move selector lever to the (OD) position.
(3) Allow vehicle front wheels to turn and increase throttle opening to achieve an indicated vehicle speed of 30 mph. Vehicle should be in 4th gear.
(4) The 2/4 clutch pressure should read 75 to 95 psi.
(5) This test checks the 2/4 clutch hydraulic circuit.

TEST FIVE-SELECTOR IN OVERDRIVE (4th Gear-CC on)

(1) Attach gauge to the torque converter clutch off pressure tap.
(2) Move selector lever to the (OD) position.
(3) Allow vehicle wheels to turn and increase throttle opening to achieve an indicated vehicle speed of 50 mph. Vehicle should be in 4th gear, CC on.

CAUTION: Both wheels must turn at the same speed.

(4) Torque converter clutch off pressure should be less than 5 psi.
(5) This test checks the torque converter clutch hydraulic circuit.

TEST SIX-SELECTOR IN REVERSE

(1) Attach gauges to the reverse and LR clutch tap.
(2) Move selector lever to the (R) position.
(3) Read reverse clutch pressure with output stationary (foot on brake) and throttle opened to achieve 1500 rpm.
(4) Reverse and LR clutch pressure should read 165 to 235 psi.
(5) This test checks the reverse clutch hydraulic circuit.

TEST RESULT INDICATIONS

(1) If proper line pressure is found in any one test, the pump and pressure regulator are working properly.
(2) Low pressure in all positions indicates a defective pump, a clogged filter, or a stuck pressure regulator valve.

41TE AUTOMATIC TRANSAXLE (Continued)

(3) Clutch circuit leaks are indicated if pressures do not fall within the specified pressure range.

(4) If the overdrive clutch pressure is greater than 5 psi in Step 4 of Test Three, a worn reaction shaft seal ring or a defective solenoid assembly is indicated.

(5) If the underdrive clutch pressure is greater than 5 psi in Step 4 of Test Two A, a defective solenoid assembly or PCM/TCM is the cause.

PRESSURE CHECK SPECIFICATIONS

Gear Selector Position	Actual Gear	Pressure Taps						
		Underdrive Clutch	Overdrive Clutch	Reverse Clutch	Torque Converter Clutch Off	2/4 Clutch	Low/ Reverse Clutch	
Park 0 mph	*	PARK	0-2	0-5	0-2	60-110	0-2	115-145
REVERSE 0 mph	*	REVERSE	0-2	0-7	165-235	50-100	0-2	165-235
NEUTRAL 0 mph	*	NEUTRAL	0-2	0-5	0-2	60-110	0-2	115-145
L 20 mph	#	FIRST	110-145	0-5	0-2	60-110	0-2	115-145
3 30 mph	#	SECOND	110-145	0-5	0-2	60-110	115-145	0-2
3 45 mph	#	DIRECT	75-95	75-95	0-2	60-90	0-2	0-2
OD 30 mph	#	OVERDRIVE	0-2	75-95	0-2	60-90	75-95	0-2
OD 50 mph	#	OVERDRIVE WITH TCC	0-2	75-95	0-2	0-5	75-95	0-2

*** Engine speed at 1500 rpm**

 # CAUTION: Both front wheels must be turning at the same speed.

41TE AUTOMATIC TRANSAXLE (Continued)

DIAGNOSIS AND TESTING - CLUTCH AIR PRESSURE TESTS

Inoperative clutches can be located using a series of tests by substituting air pressure for fluid pressure (Fig. 5) (Fig. 6). The clutches may be tested by applying air pressure to their respective passages. The valve body must be removed and Tool 6056 installed. To make air pressure tests, proceed as follows:

NOTE: The compressed air supply must be free of all dirt and moisture. Use a pressure of 30 psi.

Remove oil pan and valve body. See Valve body removal.

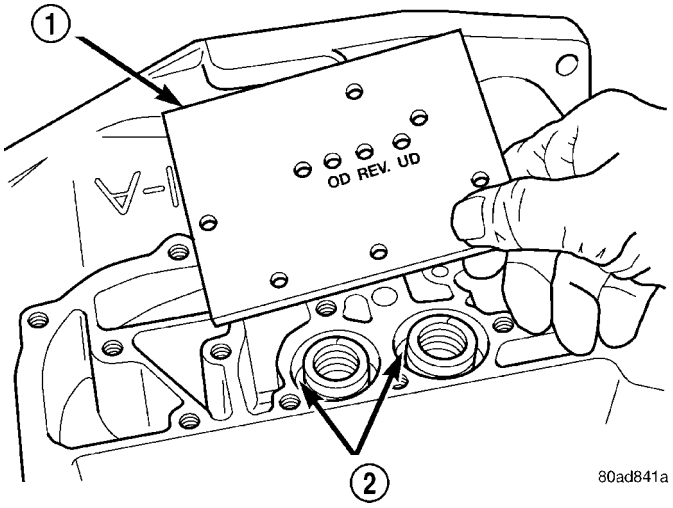

Fig. 5 Air Pressure Test Plate

1 - TOOL 6056
2 - ACCUMULATORS

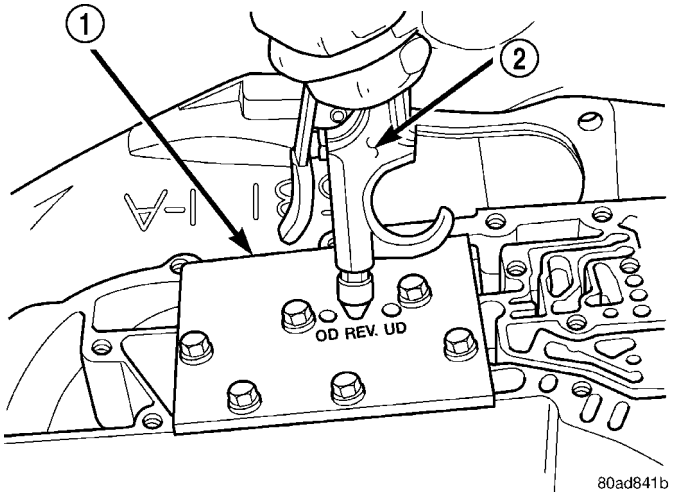

Fig. 6 Testing Reverse Clutch

1 - TOOL 6056
2 - AIR NOZZLE

OVERDRIVE CLUTCH

Apply air pressure to the overdrive clutch apply passage and watch for the push/pull piston to move forward. The piston should return to its starting position when the air pressure is removed.

REVERSE CLUTCH

Apply air pressure to the reverse clutch apply passage and watch for the push/pull piston to move rearward. The piston should return to its starting position when the air pressure is removed.

2/4 CLUTCH

Apply air pressure to the feed hole located on the 2/4 clutch retainer. Look in the area where the 2/4 piston contacts the first separator plate and watch carefully for the 2/4 piston to move rearward. The piston should return to its original position after the air pressure is removed.

LOW/REVERSE CLUTCH

Apply air pressure to the low/reverse clutch feed hole (rear of case, between 2 bolt holes). Then, look in the area where the low/reverse piston contacts the first separator plate. Watch carefully for the piston to move forward. The piston should return to its original position after the air pressure is removed.

UNDERDRIVE CLUTCH

Because this clutch piston cannot be seen, its operation is checked by function. Air pressure is applied to the low/reverse and the 2/4 clutches. This locks the output shaft. Use a piece of rubber hose wrapped around the input shaft and a pair of clamp-on pliers to turn the input shaft. Next apply air pressure to the underdrive clutch. The input shaft should not rotate with hand torque. Release the air pressure and confirm that the input shaft will rotate.

41TE AUTOMATIC TRANSAXLE (Continued)

DIAGNOSIS AND TESTING - TORQUE CONVERTER HOUSING FLUID LEAKAGE

When diagnosing converter housing fluid leaks, three actions must be taken before repair:

(1) Verify proper transmission fluid level.

(2) Verify that the leak originates from the converter housing area and is transmission fluid.

(3) Determine the true source of the leak.

Fluid leakage at or around the torque converter area may originate from an engine oil leak (Fig. 7). The area should be examined closely. Factory fill fluid is red and, therefore, can be distinguished from engine oil.

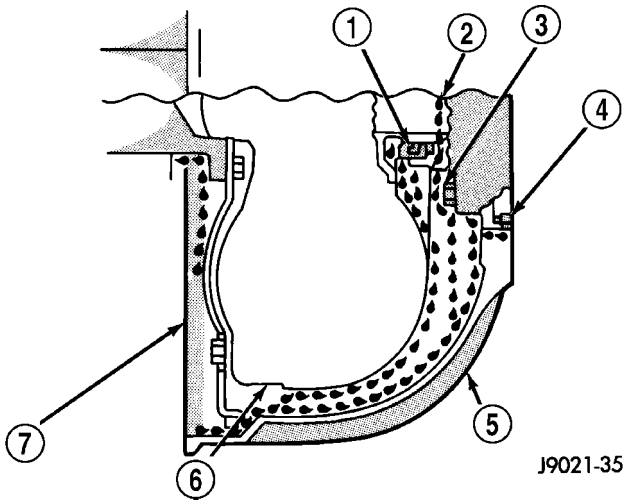

Fig. 7 Converter Housing Leak Paths

1 - PUMP SEAL
2 - PUMP VENT
3 - PUMP BOLT
4 - PUMP GASKET
5 - CONVERTER HOUSING
6 - CONVERTER
7 - REAR MAIN SEAL LEAK

Some suspected converter housing fluid leaks may not be leaks at all. They may only be the result of residual fluid in the converter housing, or excess fluid spilled during factory fill, or fill after repair. Converter housing leaks have several potential sources. Through careful observation, a leak source can be identified before removing the transmission for repair.

Pump seal leaks tend to move along the drive hub and onto the rear of the converter (Fig. 7). Pump o-ring or pump body leaks follow the same path as a seal leak. Pump attaching bolt leaks are generally deposited on the inside of the converter housing and not on the converter itself. Pump seal or gasket leaks usually travel down the inside of the converter housing (Fig. 7).

TORQUE CONVERTER LEAKAGE

Possible sources of torque converter leakage are:

- Torque converter weld leaks at the outside diameter weld (Fig. 8).
- Torque converter hub weld (Fig. 8).

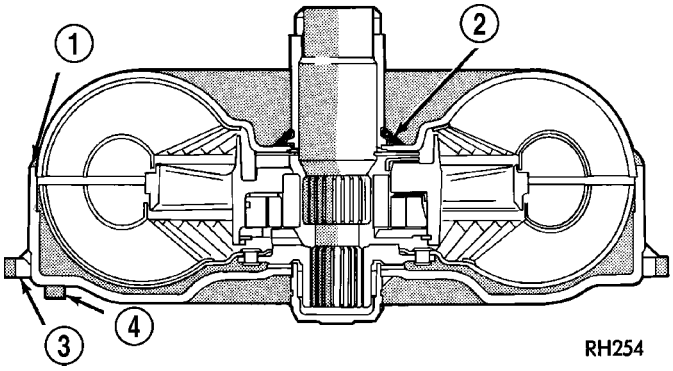

Fig. 8 Converter Leak Points - Typical

1 - OUTSIDE DIAMETER WELD

REMOVAL

(1) Disconnect battery cables.

(2) Remove air cleaner assembly (Fig. 9).

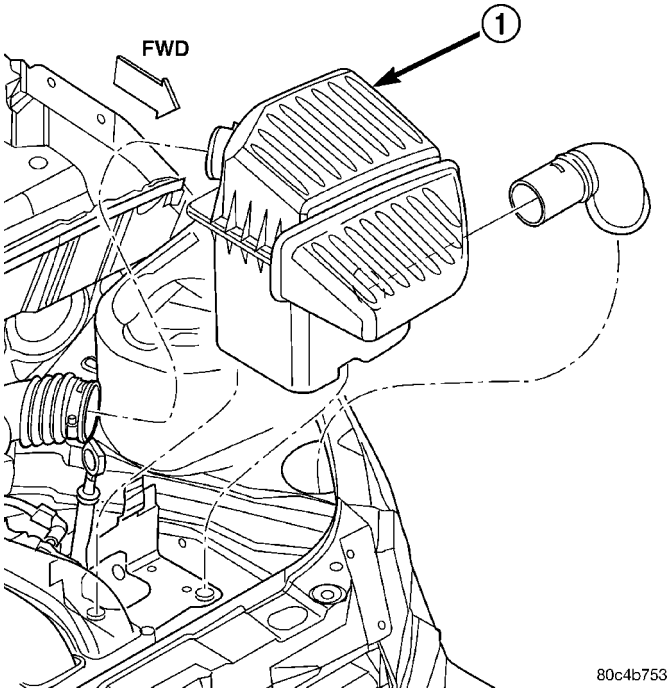

Fig. 9 Air Cleaner Assembly Removal/Installation

1 - AIR CLEANER ASSEMBLY

41TE AUTOMATIC TRANSAXLE (Continued)

(3) Remove battery (Fig. 10).

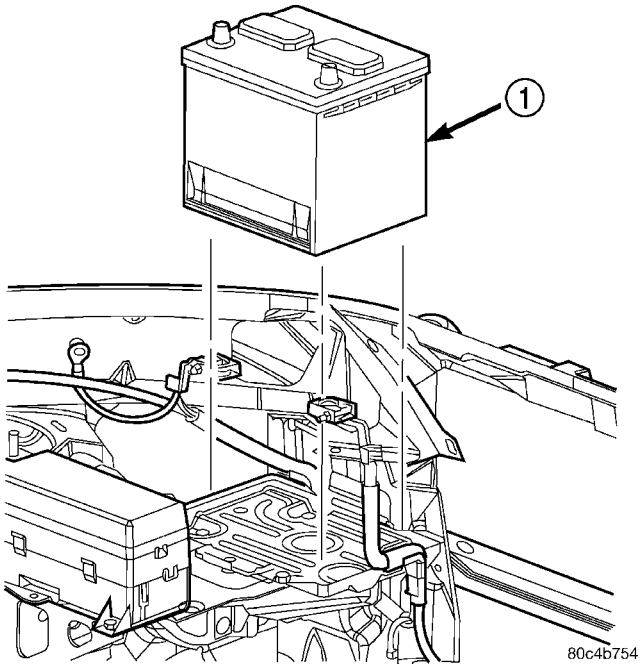

Fig. 10 Battery Removal/Installation

1 - BATTERY

(4) Remove battery tray (Fig. 11).

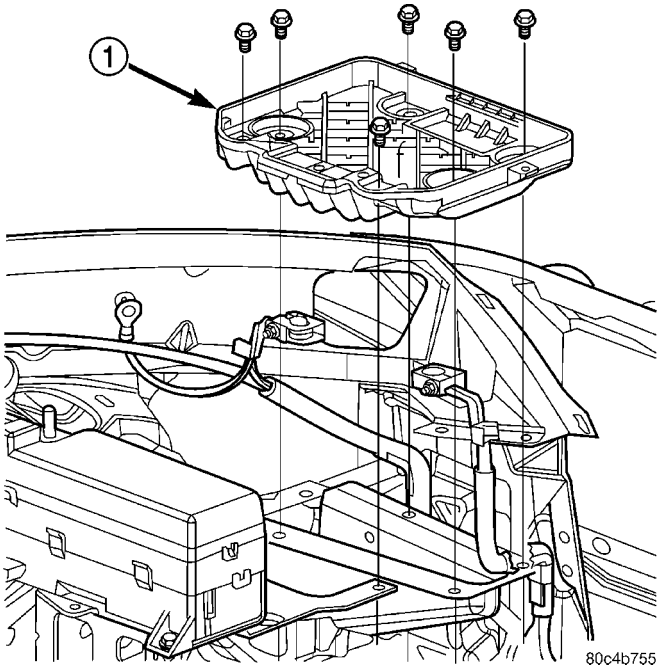

Fig. 11 Battery Tray Removal/Installation

1 - BATTERY TRAY

(5) Remove uppermost starter-to-transaxle bell-housing bolt and remove transaxle dipstick & tube. Plug hole to prevent debris from entering transaxle.

(6) Disconnect gearshift cable from manual valve lever. Remove gearshift cable from trans mount bracket and position cable out of the way.

(7) Using Tool 8875A, disconnect transaxle oil cooler lines. (Refer to 7 - COOLING/TRANSMISSION - STANDARD PROCEDURE)

(8) Disconnect input speed sensor connector (Fig. 12).

(9) Disconnect output speed sensor connector (Fig. 12).

(10) Disconnect transmission range sensor connector (Fig. 12).

(11) Disconnect solenoid/pressure switch assembly connector (Fig. 12).

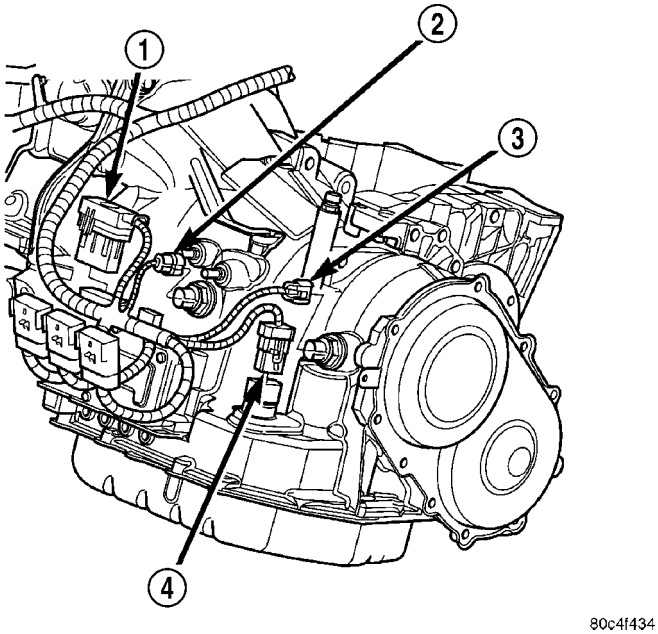

Fig. 12 Component Connector Location

1 - SOLENOID/PRESSURE SWITCH ASSY. CONNECTOR
2 - INPUT SPEED SENSOR CONNECTOR
3 - OUTPUT SPEED SENSOR CONNECTOR
4 - TRANSMISSION RANGE SENSOR CONNECTOR

(12) Raise vehicle on hoist.

(13) Remove front wheel covers (if equipped) and front wheel/tire assemblies.

(14) Remove left splash shield.

(15) Remove left and right halfshaft assemblies. Refer to DIFFERENTIAL AND DRIVELINE for proper procedures.

41TE AUTOMATIC TRANSAXLE (Continued)

(16) Disconnect power steering hose from structural collar (Fig. 13)

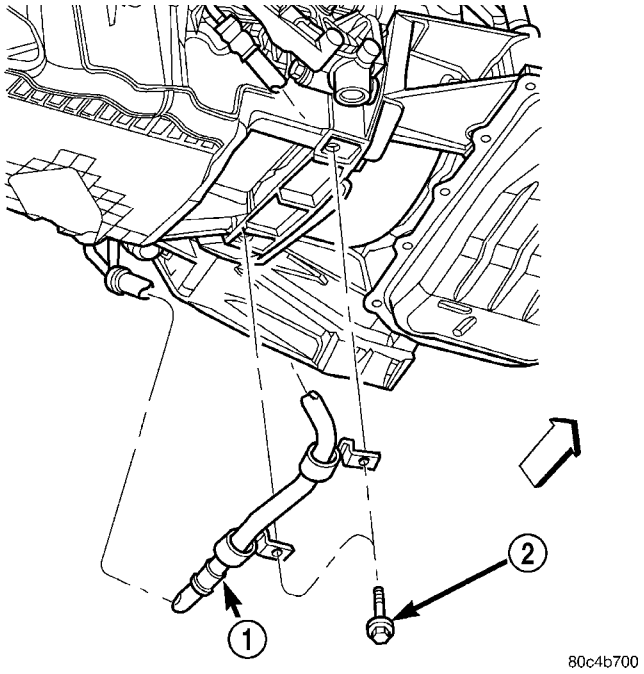

Fig. 13 Power Steering Hose to Structural Collar

1 - POWER STEERING HOSE
2 - BOLT

(17) Remove the left engine-to-transaxle lateral bending brace and structural collar (Fig. 14).

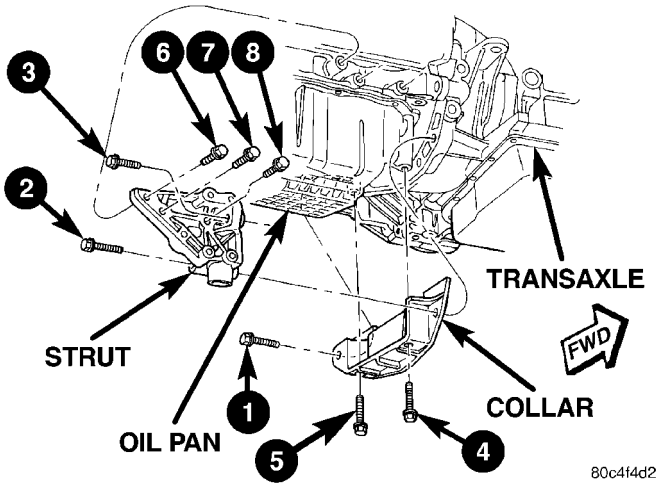

Fig. 14 Left Lateral Bending Brace and Structural

(18) Remove bellhousing dust cover (Fig. 15).

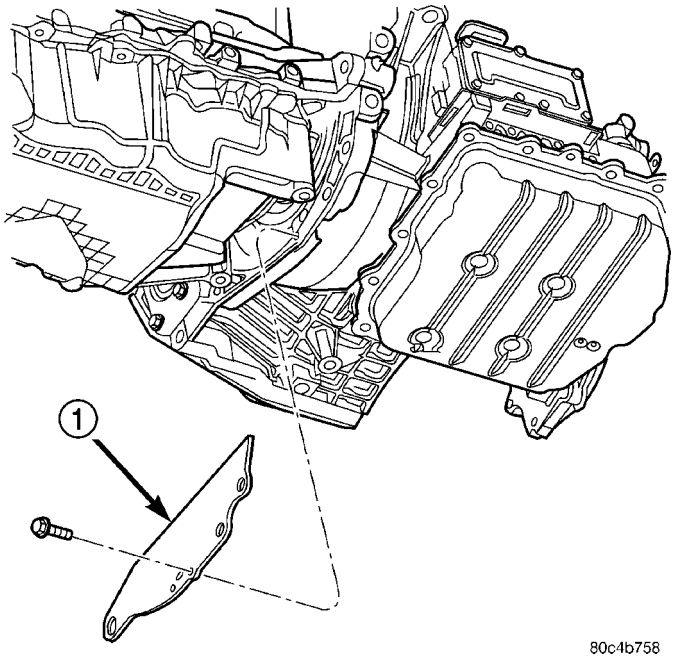

Fig. 15 Bellhousing Dust Cover Removal/Installation

1 - DUST COVER (IF EQUIPPED)

(19) Remove the right engine-to-transaxle lateral bending brace (Fig. 16).

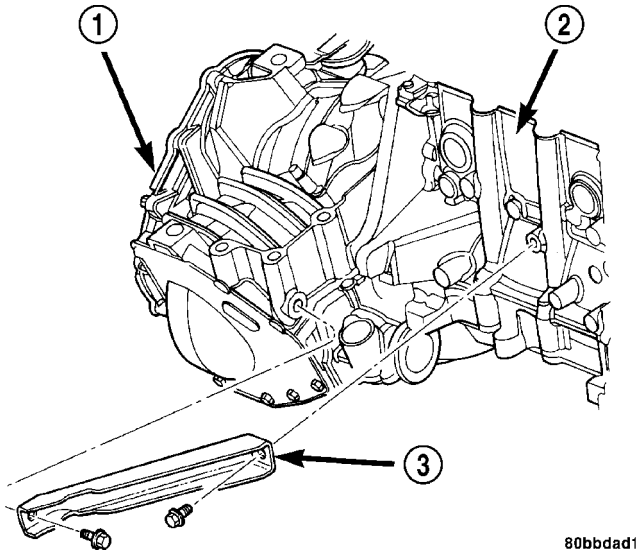

Fig. 16 Right Lateral Bending Brace Removal/ Installation—Typical

1 - TRANSAXLE
2 - ENGINE
3 - LATERAL BENDING BRACE

(20) Disconnect starter motor electrical connections.

(21) Remove starter motor (Fig. 17).

(22) Remove lower starter-to-transaxle bellhousing lower bolt and position starter motor out of the way.

41TE AUTOMATIC TRANSAXLE (Continued)

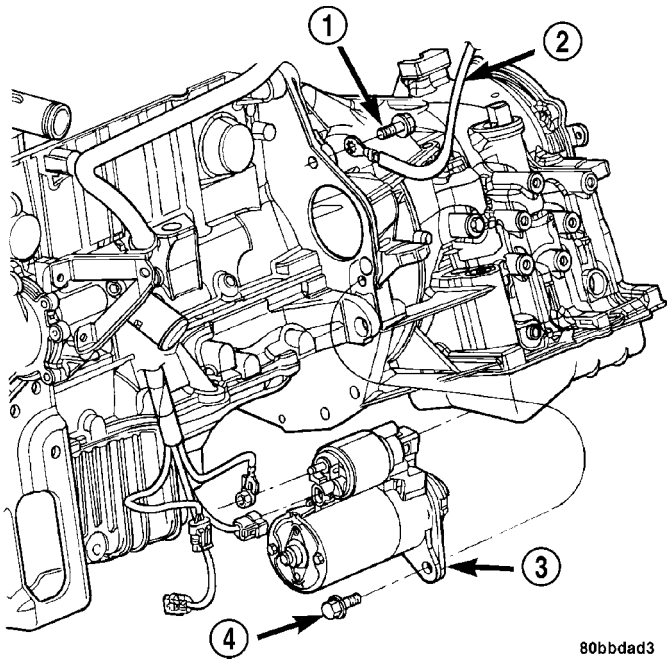

Fig. 17 Starter Motor Removal/Installation—Typical

1 - BOLT
2 - GROUND
3 - STARTER
4 - BOLT

(23) Remove gearshift cable bracket. Position cable out of the way.

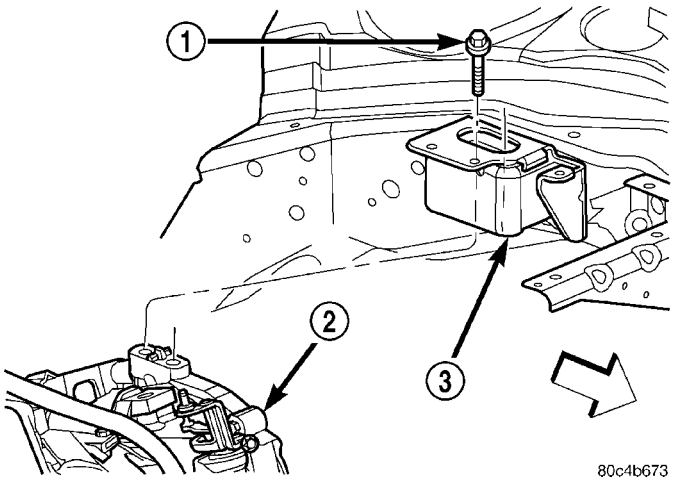

Fig. 18 Transaxle Upper Mount

1 - BOLT
2 - TRANSAXLE
3 - LEFT MOUNT

(24) Remove four drive plate-to-torque converter bolts.

(25) Support engine assembly with screw jack and wood block.

(26) Remove transmission upper mount to bracket bolts (Fig. 18).

(27) Lower engine/transaxle to gain access to and remove transaxle-to-engine bolts (Fig. 19).

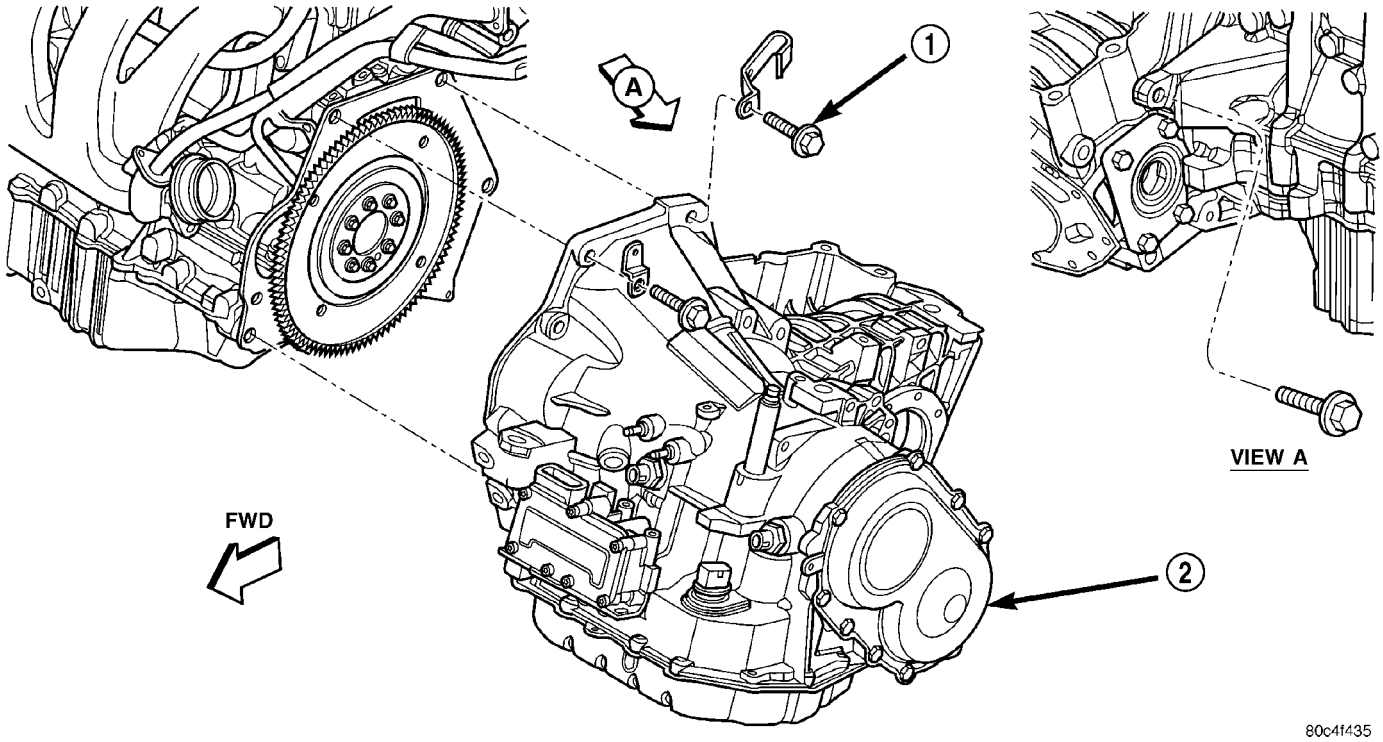

Fig. 19 Transaxle Removal/Installation

1 - BOLT (3)
2 - TRANSAXLE

41TE AUTOMATIC TRANSAXLE (Continued)

(28) Remove transaxle from vehicle.

(29) If replacing transaxle, remove upper mount bracket and gearshift cable bracket and transfer to new/replacement transaxle.

DISASSEMBLY

NOTE: If transaxle is being overhauled (clutch and/or seal replacement) or replaced, it is necessary to perform the PCM/TCM Quick Learn Procedure. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/POWERTRAIN/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE)

NOTE: This procedure does not include final drive (differential) disassembly.

(1) Remove input and output speed sensors.

(2) Remove three (3) solenoid/pressure switch assembly-to-case bolts.

(3) Remove solenoid/pressure switch assembly and gasket (Fig. 20).

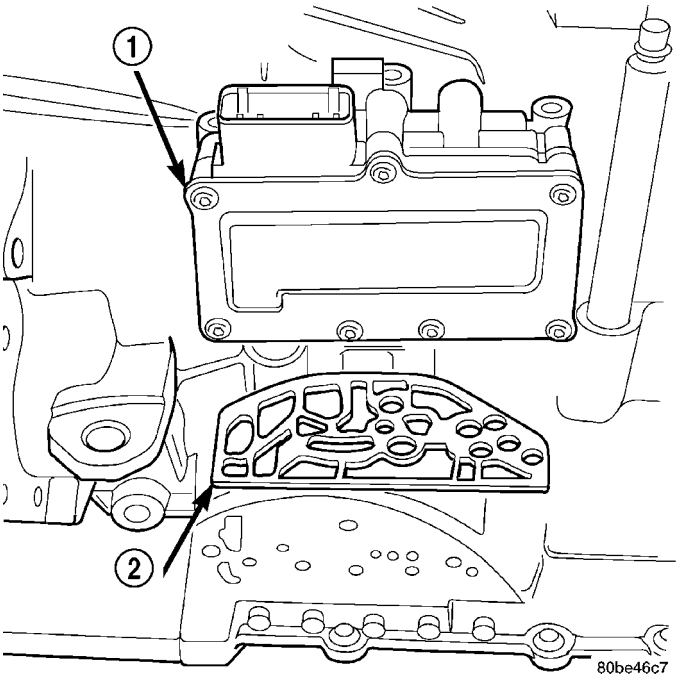

Fig. 20 Solenoid/Pressure Switch Assembly and Gasket

1 - SOLENOID/PRESSURE SWITCH ASSEMBLY
2 - GASKET

(4) Remove oil pan-to-case bolts (Fig. 21).

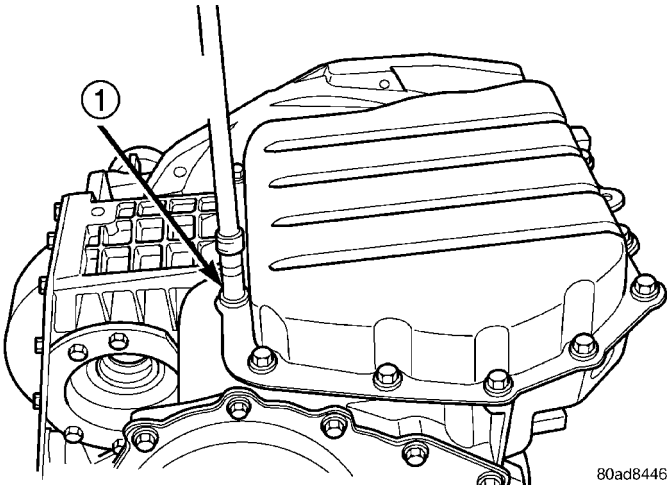

Fig. 21 Remove Oil Pan Bolts

1 - OIL PAN BOLTS (USE RTV UNDER BOLT HEADS)

(5) Remove oil pan (Fig. 22).

3 - TOOL 5052
4 - OUTPUT GEAR

(14) **OUTPUT GEAR BEARING ADJUSTMENT:**

(a) With output gear removed, install a 4.50 mm (0.177 in.) gauging shim (Fig. 106) on the rear carrier assembly hub, using grease to hold the shim in place.

(b) Using Tool 6259, install output gear and bearing assembly. Torque to 271 N·m (200 ft. lbs.).

(c) Measure bearing end play. Attach Tool L-4432 to the gear (Fig. 105).

(d) Push and pull the gear while rotating back and forth to ensure seating of bearing rollers.

(e) Using a dial indicator mounted to the transaxle case, measure output gear end play as shown in (Fig. 105).

(f) Refer to the output gear bearing shim chart for the required shim to obtain proper bearing setting.

(g) Use Tool 6259 to remove the output gear retaining bolt and washer. To remove the output gear, use Tool L4407A.

(h) Remove the gauging shim and install the proper shim determined by the chart. Use grease to hold the shim in place.

41TE AUTOMATIC TRANSAXLE (Continued)

(32) Install the transfer shaft gear using Tool 6261 (Fig. 124).

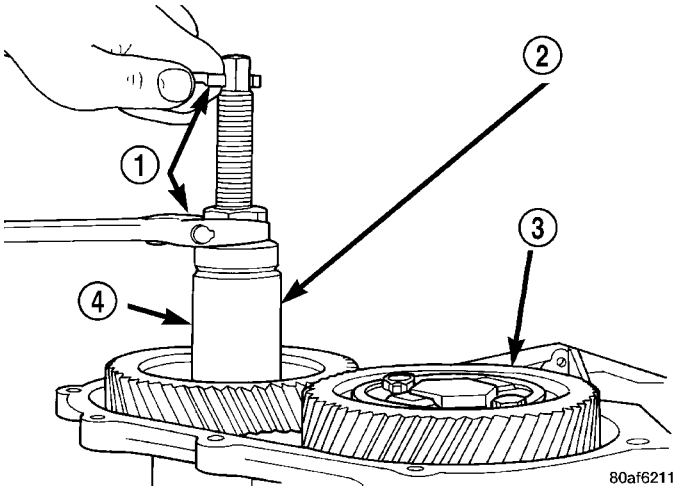

Fig. 124 Install Transfer Shaft Gear

1 - WRENCHES
2 - SPECIAL TOOL 6261
3 - OUTPUT GEAR
4 - TRANSFER SHAFT GEAR

CAUTION: Install a NEW retaining nut, as the original nut MUST NOT be reused.

(33) Install the new retaining nut and washer.

(34) Using Tool 6259, torque transfer gear retaining nut to 271 N·m (200 ft. lbs.) (Fig. 125).

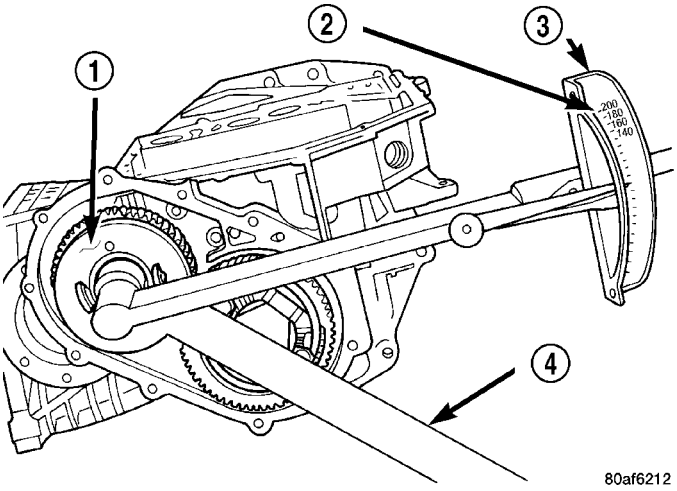

Fig. 125 Tighten Transfer Gear Nut to 271 N•m (200 ft. lbs.)

1 - TRANSFER SHAFT GEAR
2 - 200 FT. LBS.
3 - TORQUE WRENCH
4 - SPECIAL TOOL 6259

(35) Measure transfer shaft end play. **Transfer shaft end play should be within 0.05-0.10 mm (0.002-0.004 in.).** If the end play is too high, install a 0.04 mm (0.0016 in.) thicker shim. If the end play is too low, install a 0.04 mm (0.0016 in.) thinner shim. Repeat until 0.05-0.10 mm (0.002-0.004 in.) end play is obtained.

(36) Install a bead of Mopar® ATF RTV (MS-GF41) to transfer gear cover (Fig. 126).

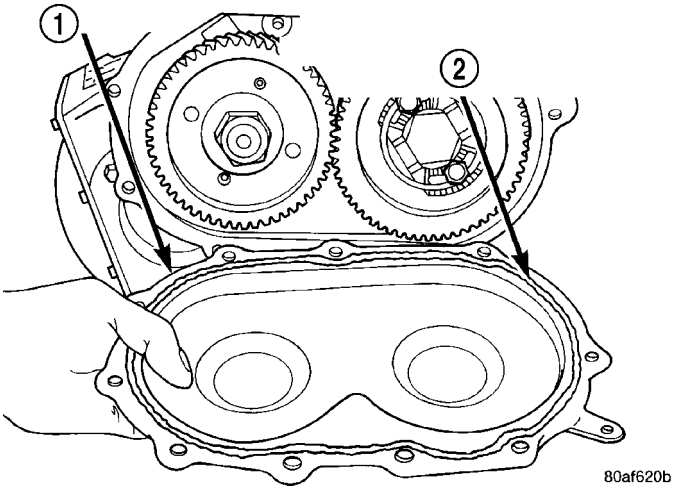

Fig. 126 Install Rear Cover

1 - REAR COVER
2 - 1/8 INCH BEAD OF MOPAR® ATF RTV (MS-GF41) AS SHOWN

(37) Install transfer gear cover-to-case bolts and torque to 20 N·m (175 in. lbs.) torque (Fig. 127).

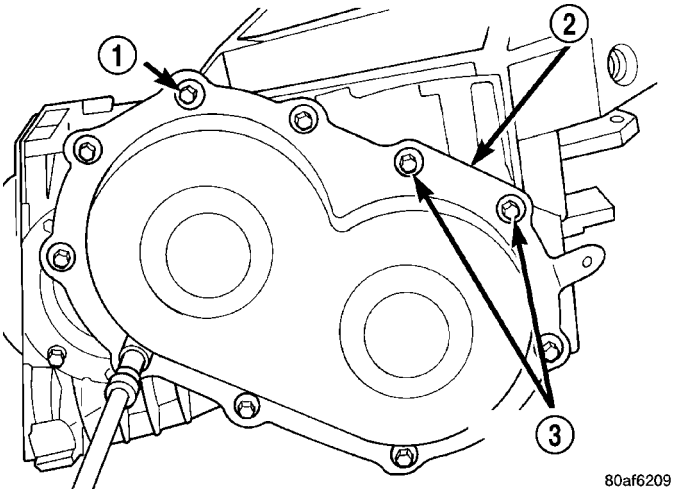

Fig. 127 Install Rear Cover Bolts

1 - REAR COVER BOLTS
2 - REAR COVER
3 - USE SEALANT ON BOLTS

41TE AUTOMATIC TRANSAXLE (Continued)

(38) Install low/reverse clutch pack (Fig. 128). Leave uppermost disc out until snap ring is installed.

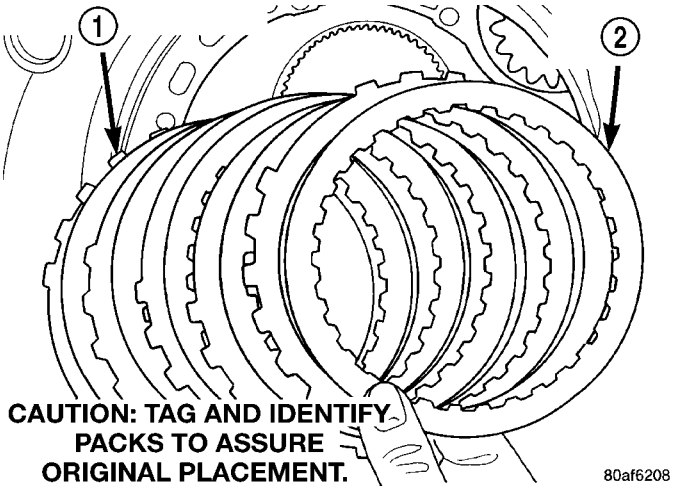

Fig. 128 Install Low/Reverse Clutch Pack

1 - CLUTCH PLATES (5)
2 - CLUTCH DISCS (5)

(39) Install low/reverse reaction plate flat snap ring (Fig. 129).

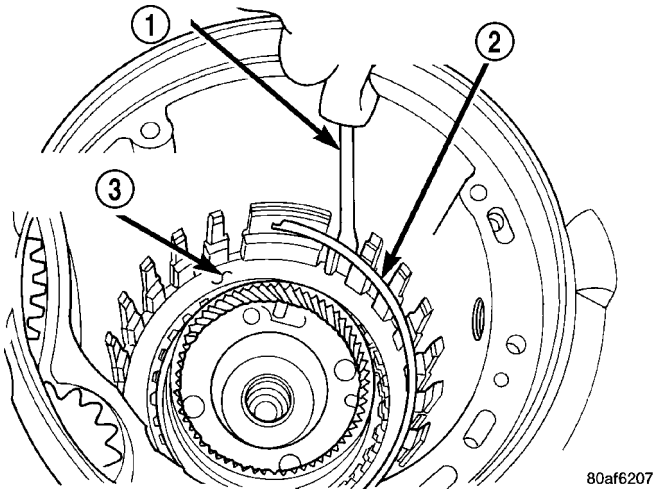

Fig. 129 Install Low/Reverse Reaction Plate Snap Ring

1 - SCREWDRIVER
2 - LOW/REVERSE REACTION PLATE FLAT SNAP RING
3 - DO NOT SCRATCH CLUTCH PLATE

(40) Install remaining low/reverse clutch disc (Fig. 130).

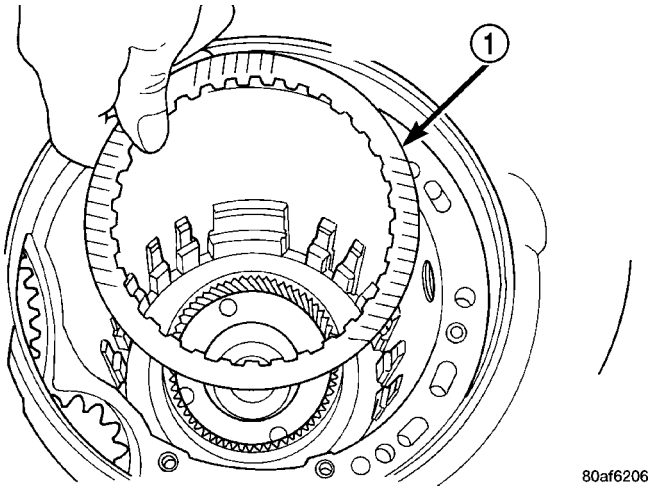

Fig. 130 Install One Disc

1 - ONE DISC FROM LOW/REVERSE CLUTCH

(41) Install low/reverse reaction plate with flat side up (Fig. 131).

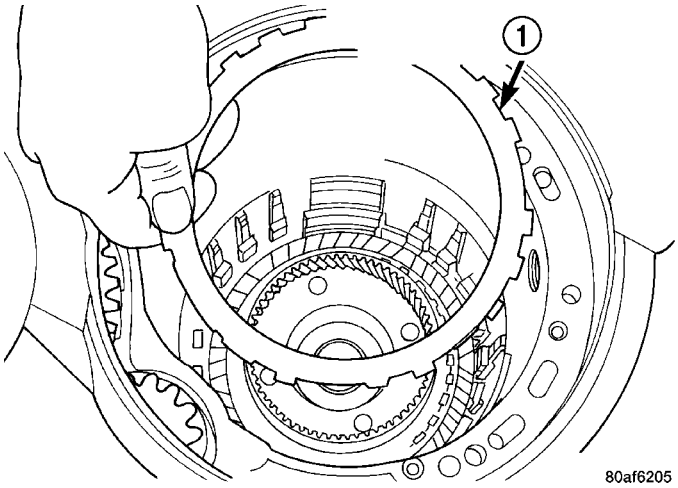

Fig. 131 Install Low/Reverse Reaction Plate

1 - LOW/REVERSE REACTION PLATE (FLAT SIDE UP)

41TE AUTOMATIC TRANSAXLE (Continued)

(42) Install tapered snap ring (with tapered side up) as shown in (Fig. 132) (Fig. 133).

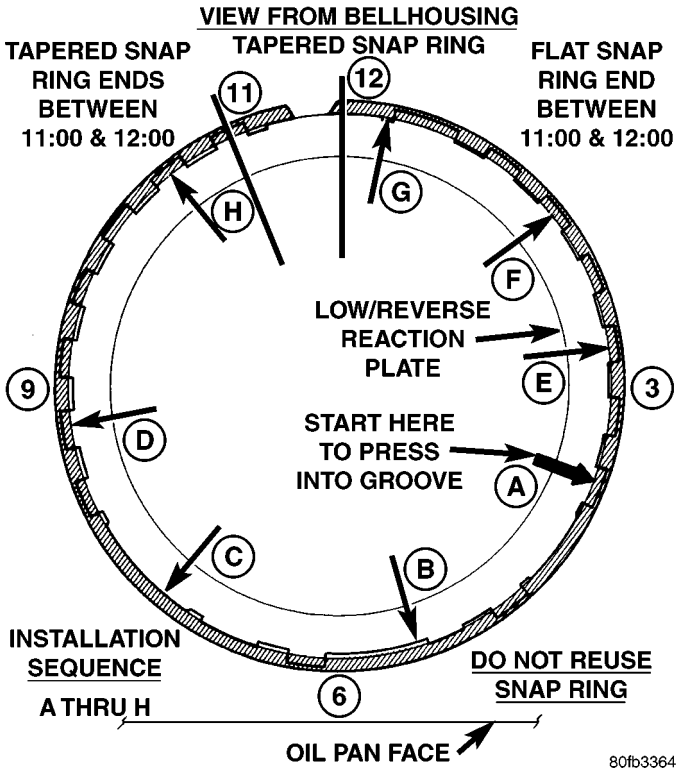

Fig. 132 Tapered Snap Ring Instructions

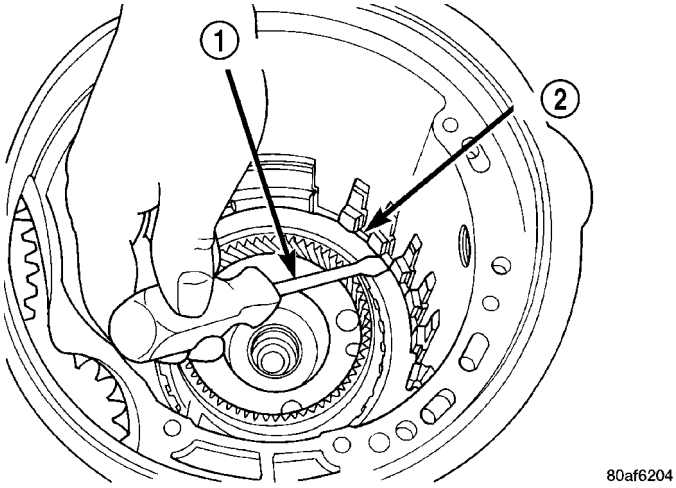

Fig. 133 Snap Ring Installed

1 - SCREWDRIVER
2 - TAPERED SNAP RING (INSTALL AS SHOWN)

(43) Set up dial indicator as shown in (Fig. 134) to measure low/reverse clutch clearance. Press down on clutch pack with finger and zero dial indicator. **Low/Reverse clutch pack clearance is 0.89-1.47 mm (0.035-0.058 in.)**. Set up indicator and record measurement in four (4) places. Take average of readings and select the proper low/reverse reaction plate to achieve specifications.

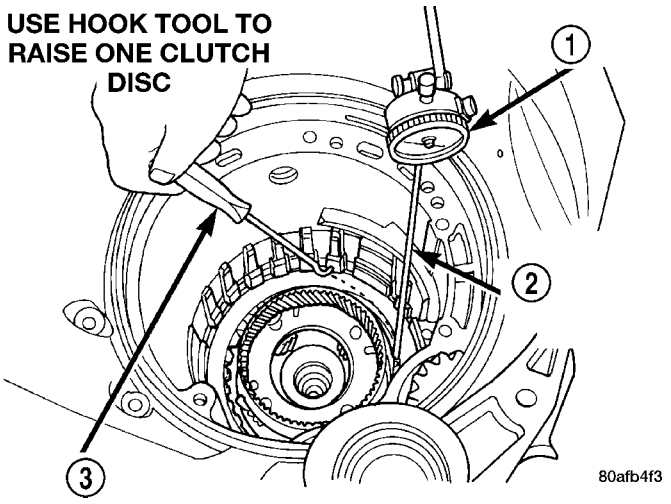

Fig. 134 Check Low/Reverse Clutch Clearance

1 - DIAL INDICATOR
2 - DIAL INDICATOR TIP TOOL 6268
3 - HOOK TOOL

LOW/REVERSE REACTION PLATE CHART

PART NUMBER	THICKNESS
4799846AA	5.88 mm (0.232 in.)
4799847AA	6.14 mm (0.242 in.)
4799848AA	6.40 mm (0.252 in.)
4799849AA	6.66 mm (0.262 in.)
4799855AA	6.92 mm (0.273 in.)

(44) Install 2/4 clutch pack (Fig. 135).

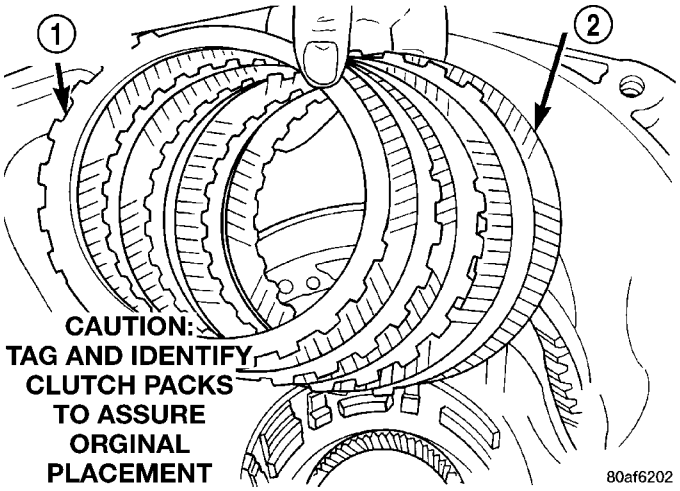

Fig. 135 Install 2/4 Clutch Pack

1 - CLUTCH PLATE (4)
2 - CLUTCH DISC (4)

NOTE: The 2/4 Clutch Piston has bonded seals which are not individually serviceable. Seal replacement requires replacement of the piston assembly.

41TE AUTOMATIC TRANSAXLE (Continued)

(45) Orient 2/4 clutch return spring to retainer as shown in (Fig. 136), and install to transaxle (Fig. 137).

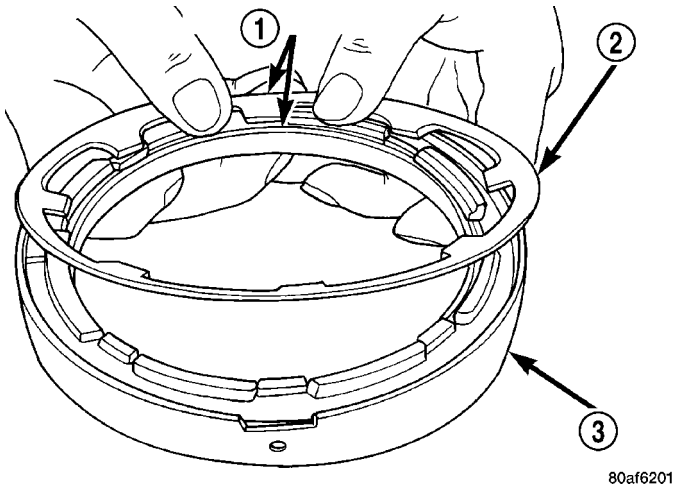

Fig. 136 Proper Orientation of 2/4 Clutch Retainer and Spring

2 - RETURN SPRING
3 - 2/4 CLUTCH RETAINER

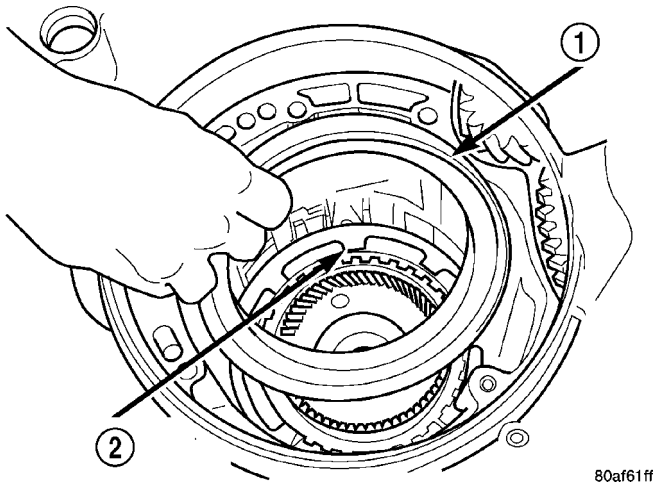

Fig. 137 2/4 Clutch Retainer

1 - 2/4 CLUTCH RETAINER
2 - 2/4 CLUTCH RETURN SPRING

(46) Using tool 5058, compress 2/4 clutch return spring just enough to install snap ring (Fig. 138).

(47) Install snap ring.

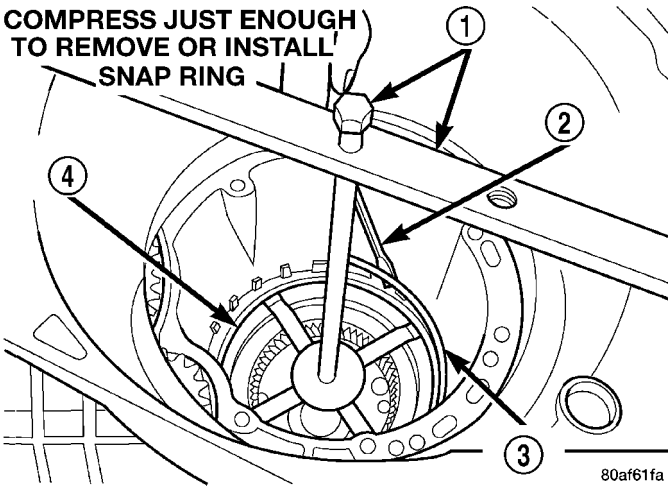

Fig. 138 Install 2/4 Clutch Retainer Snap Ring

1 - TOOL 5058
2 - SCREWDRIVER
3 - SNAP RING
4 - 2/4 CLUTCH RETAINER

(48) Set up dial indicator as shown in (Fig. 139) and measure 2/4 clutch clearance. Press down on clutch pack with finger and zero dial indicator. **2/4 clutch pack clearance is 0.76-2.64 mm (0.030-0.104 in.).** Set up indicator and record measurement in four (4) places. Take average of readings. If clearance is outside this range, the clutch is assembled improperly. **There is no adjustment for 2/4 clutch clearance.**

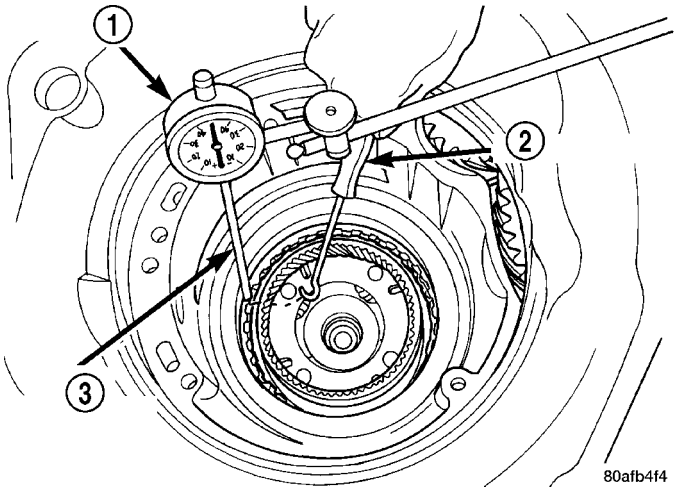

Fig. 139 Check 2/4 Clutch Clearance

1 - DIAL INDICATOR
2 - HOOK TOOL
3 - DIAL INDICATOR TIP TOOL 6268

41TE AUTOMATIC TRANSAXLE (Continued)

(49) Install rear sun gear and #7 needle bearing (Fig. 141).

NOTE: The number seven needle bearing has three anti-reversal tabs and is common with the number five and number two position. The orientation should allow the bearing to seat flat against the rear sun gear (Fig. 140). A small amount of petrolatum can be used to hold the bearing to the rear sun gear.

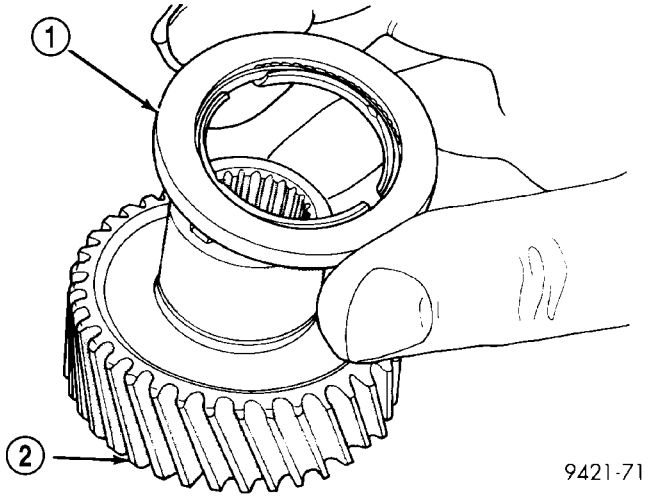

Fig. 140 Number 7 Bearing

1 - #7 NEEDLE BEARING
2 - REAR SUN GEAR

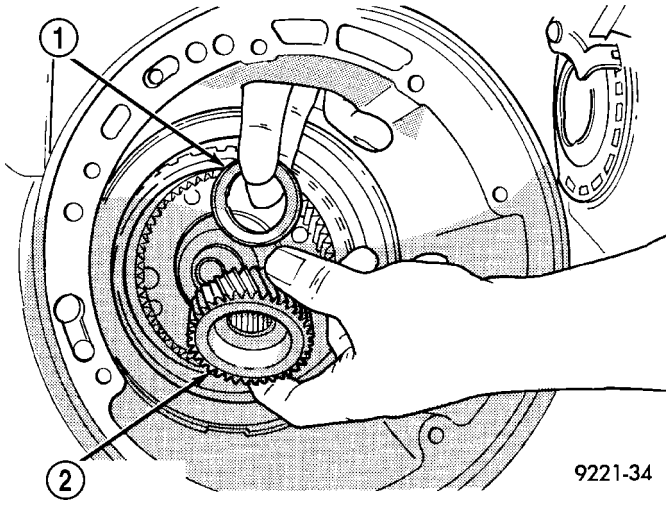

Fig. 141 Install Rear Sun Gear and #7 Needle Bearing

1 - #7 NEEDLE BEARING
2 - REAR SUN GEAR

(50) Install front carrier/rear annulus assembly and #6 needle bearing (Fig. 142).

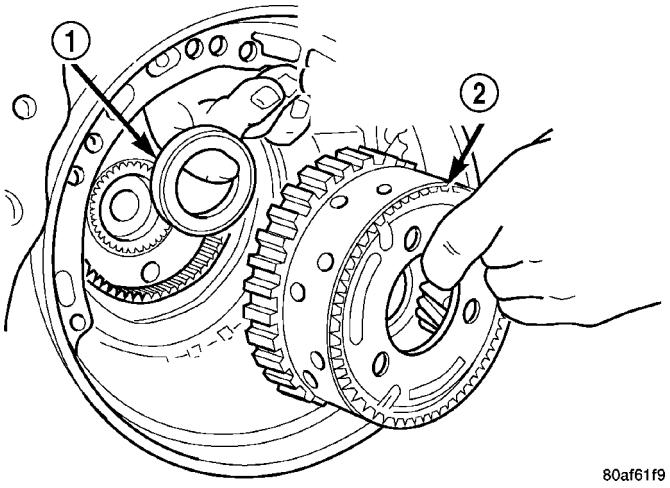

Fig. 142 Install Front Carrier and Rear Annulus Assembly

1 - #6 NEEDLE BEARING
2 - FRONT CARRIER AND REAR ANNULUS ASSEMBLY (TWIST AND PULL OR PUSH TO REMOVE OR INSTALL).

(51) Install front sun gear assembly and #4 thrust washer (Fig. 143).

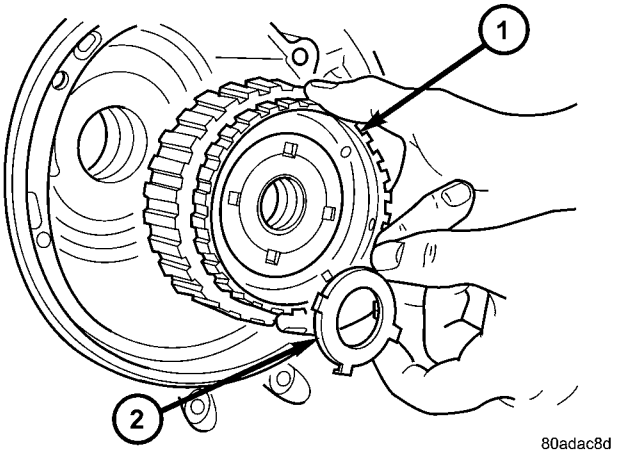

Fig. 143 Install Front Sun Gear Assembly

1 - FRONT SUN GEAR ASSEMBLY
2 - #4 THRUST WASHER (FOUR TABS)

(52) **DETERMINING #4 THRUST PLATE THICKNESS / INPUT SHAFT END PLAY:**

(a) Select the thinnest #4 thrust plate thickness and install to input clutch assembly (Fig. 144). Use petrolatum to retain.

(b) Install input clutch assembly into position and verify that it is completely seated by viewing through input speed sensor hole. If view through input speed sensor hole is not as shown in (Fig. 145), the input clutch assembly is not seated properly.

41TE AUTOMATIC TRANSAXLE (Continued)

(c) Remove oil pump o-ring (Fig. 146). **Be sure to reinstall oil pump o-ring after selecting the proper #4 thrust plate.**

(d) Install pump and gasket to transmission. Install and torque bolts.

(e) Set up input shaft for measurement with Indicator Set C3339 and End Play Set 8266 as shown in (Fig. 147).

(f) Measure the input shaft end play with the transaxle in the vertical position. **Input shaft end play must be within 0.005 to 0.025 inch.** For example, if end play reading is 0.055 inch, select No. 4 Thrust Plate which is 0.071 to 0.074 thick. This should provide an input shaft end play reading of 0.020 inch which is within specifications.

(g) Refer to the No. 4 thrust plate chart to select the proper No. 4 thrust plate:

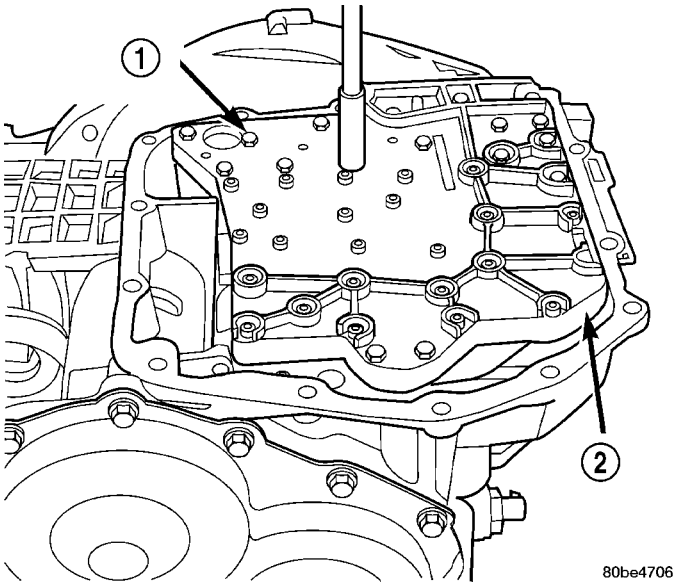

Fig. 159 Install Valve Body-to-Case Bolts

1 - VALVE BODY ATTACHING BOLTS (18)
2 - VALVE BODY

(65) Install oil filter and new o-ring (Fig. 160).

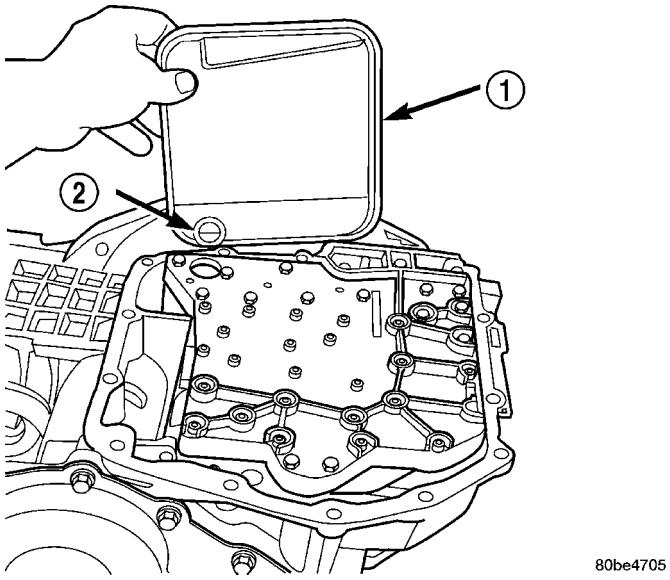

Fig. 160 Install Oil Filter

1 - OIL FILTER
2 - O-RING

(66) Apply an 1/8” bead of Mopar® ATF RTV (MS-GF41) to oil pan and immediately install to case (Fig. 161).

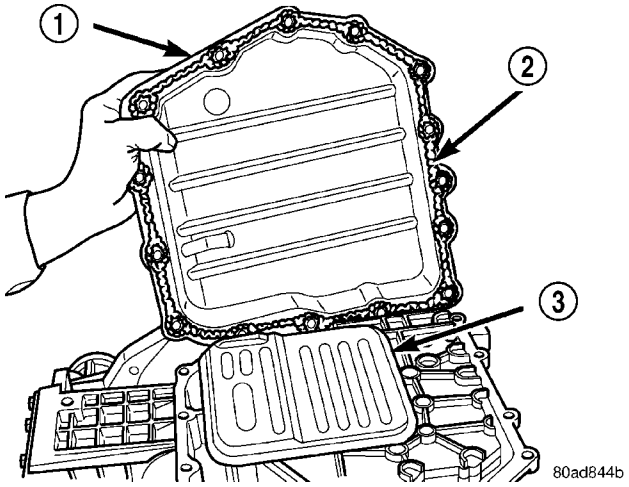

Fig. 161 Install Oil Pan

1 - OIL PAN
2 - 1/8 INCH BEAD OF MOPAR® ATF RTV (MS-GF41)
3 - OIL FILTER

(67) Install oil pan-to-case bolts and torque to 19 N·m (165 in. lbs.).

(68) Install solenoid/pressure switch assembly and gasket to case (Fig. 162).

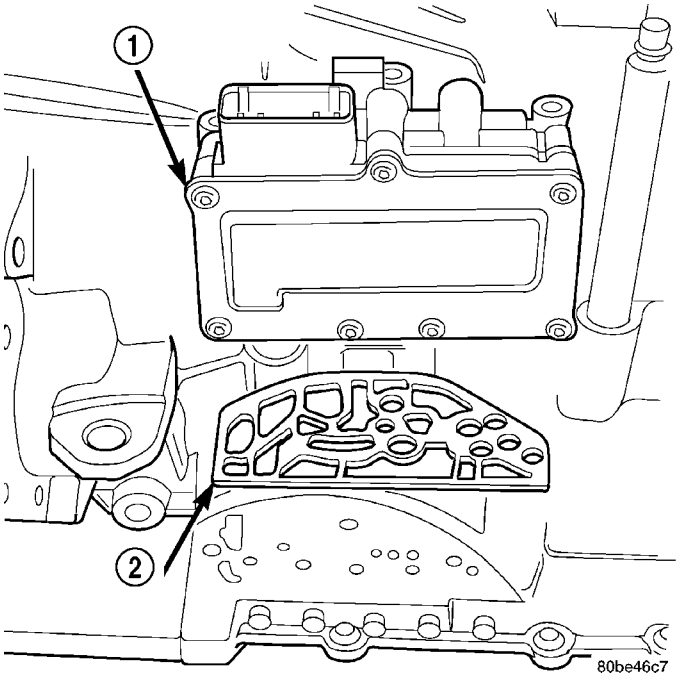

Fig. 162 Solenoid/Pressure Switch Assembly and Gasket

1 - SOLENOID/PRESSURE SWITCH ASSEMBLY
2 - GASKET

(69) Install and tighten solenoid/pressure switch assembly-to-transaxle case bolts to 12 N·m (110 in. lbs.) (Fig. 163).

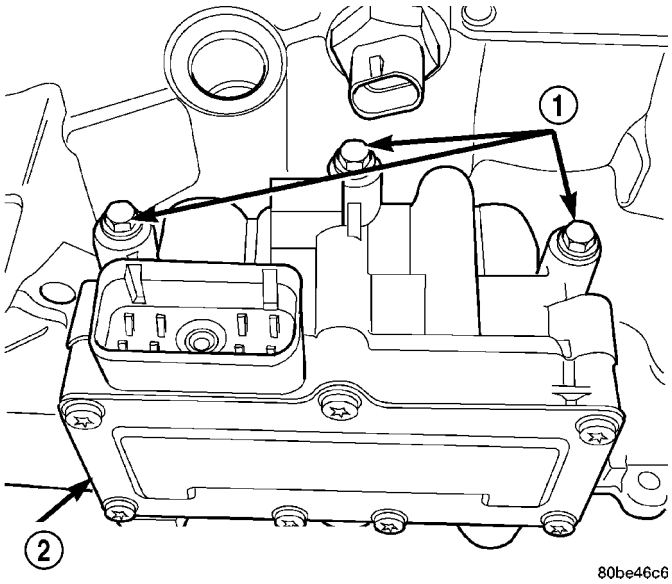

Fig. 163 Solenoid Pack-to-Transaxle Bolts

1 - BOLTS
2 - SOLENOID AND PRESSURE SWITCH ASSEMBLY

(70) Install and torque input and output speed sensors to case to 27 N·m (20 ft. lbs.).

INSTALLATION

(1) Install transaxle to engine (Fig. 19). Install and torque transaxle-to-engine bolts to 108 N·m (80 ft. lbs.).

(2) Raise engine/transaxle assembly enough line up transaxle mount bracket. Install two mount-to-transaxle bracket bolts (Fig. 18)and torque to 68 N·m (50 ft. lbs.).

(3) Remove screw jack support.

(4) Install four drive plate-to-torque converter bolts and torque to 88 N·m (65 ft. lbs.) torque.

(5) Position starter into place and hand-tighten lower bolt.

(6) Lower vehicle.

(7) Install transaxle dipstick tube. Verify that openings are free of debris and o-ring seal is intact. Replace o-ring if necessary. Secure bracket to transaxle. Install starter upper bolt through the ground cable and torque to (40 ft. lbs.).

(8) Install cable bracket-to-transaxle bellhousing bolt and torque to 61 N·m (45 ft. lbs.).

(9) Raise vehicle.

(10) Torque starter lower bolt (Fig. 17) to 54 N·m (40 ft. lbs.).

(11) Connect starter motor electrical connections.

(12) Install bellhousing dust cover (Fig. 15).

(13) Install structural collar and left (front) lateral bending brace. Refer to ENGINE for proper procedures (Fig. 14).

(14) Install right (rear) lateral bending brace (Fig. 16). Torque bolts to 81 N·m (60 ft. lbs.) torque.

(15) Install power steering line to structural collar (Fig. 13).

(16) Install front halfshafts. Refer to DIFFERENTIAL AND DRIVELINE for proper procedures and torque specifications.

(17) Install left splash shield.

(18) Install left wheel/tire assembly. Torque lug nuts to 136 N·m (100 ft. lbs.) torque.

(19) Lower vehicle.

(20) Connect transaxle oil cooler lines. An audible 'click' should be heard. Verify connection by pulling outward. (Refer to 7 - COOLING/TRANSMISSION - STANDARD PROCEDURE)

(21) Connect solenoid/pressure switch assembly connector (Fig. 12).

(22) Connect transmission range sensor connector (Fig. 12).

(23) Connect output speed sensor connector (Fig. 12).

(24) Connect input speed sensor connector (Fig. 12).

(25) Install gearshift cable to bracket and connect to the manual valve lever.

(26) Install battery tray (Fig. 11).

(27) Install battery and hold-down clamp (Fig. 10).

(28) Install air cleaner assembly (Fig. 9).

(29) Connect battery cables.

(30) Fill transaxle with fluid. Refer to SERVICE PROCEDURES for proper procedure.

ACCUMULATOR

DESCRIPTION

The 4XTE underdrive, overdrive, low/reverse, and 2/4 clutch hydraulic circuits each contain an accumulator. An accumulator typically consists of a piston, return spring(s), and a cover or plug. The overdrive and underdrive accumulators are located within the transaxle case, and are retained by the valve body (Fig. 164).

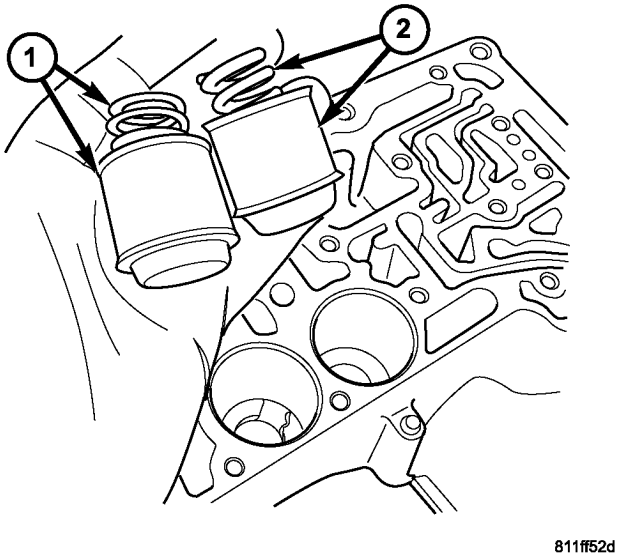

Fig. 164 Underdrive and Overdrive Accumulators

1 - OVERDRIVE PISTON AND SPRING
2 - UNDERDRIVE PISTON AND SPRING

The low reverse accumulator (Fig. 165) is also located within the transaxle case, but the assembly is retained by a cover and a snap-ring.

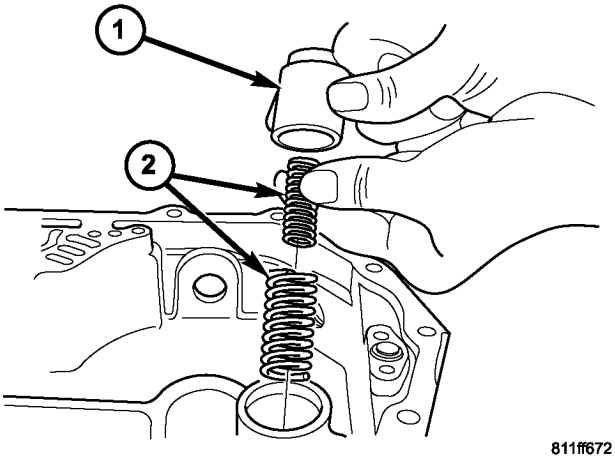

Fig. 165 Low/Reverse Accumulator

1 - PISTON
2 - RETURN SPRINGS

The 2/4 accumulator is located in the valve body. It is retained by a cover and retaining screws (Fig. 166).

5 - PISTON

OPERATION

The function of an accumulator is to cushion the application of a frictional clutch element. When pressurized fluid is applied to a clutch circuit, the application force is dampened by fluid collecting in the respective accumulator chamber against the piston and spring(s). The intended result is a smooth, firm clutch application.

DRIVING CLUTCHES

DESCRIPTION

Three hydraulically applied input clutches are used to drive planetary components. The underdrive, overdrive, and reverse clutches are considered input clutches and are contained within the input clutch assembly (Fig. 167). The input clutch assembly also contains:

- Input shaft
- Input hub
- Clutch retainer
- Underdrive piston
- Overdrive/reverse piston
- Overdrive hub
- Underdrive hub

OPERATION

The three input clutches are responsible for driving different components of the planetary geartrain.

DRIVING CLUTCHES (Continued)

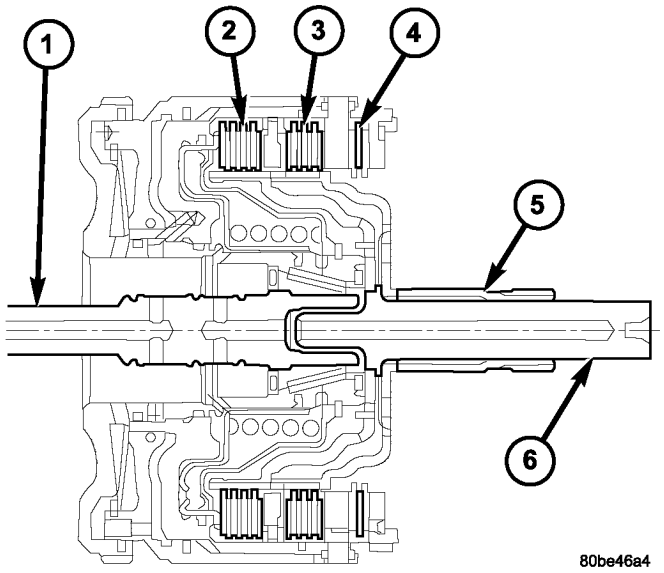

Fig. 167 Input Clutch Assembly

1 - INPUT SHAFT
2 - UNDERDRIVE CLUTCH
3 - OVERDRIVE CLUTCH
4 - REVERSE CLUTCH
5 - OVERDRIVE SHAFT
6 - UNDERDRIVE SHAFT

NOTE: Refer to the "Elements In Use" chart in Diagnosis and Testing for a collective view of which clutch elements are applied at each position of the selector lever.

UNDERDRIVE CLUTCH

The underdrive clutch is hydraulically applied in first, second, and third (direct) gears by pressurized fluid against the underdrive piston. When the underdrive clutch is applied, the underdrive hub drives the rear sun gear.

OVERDRIVE CLUTCH

The overdrive clutch is hydraulically applied in third (direct) and overdrive gears by pressurized fluid against the overdrive/reverse piston. When the overdrive clutch is applied, the overdrive hub drives the front planet carrier.

REVERSE CLUTCH

The reverse clutch is hydraulically applied in reverse gear only by pressurized fluid against the overdrive/reverse piston. When the reverse clutch is applied, the front sun gear assembly is driven.

FINAL DRIVE

DESCRIPTION

The 4XTE differential is a conventional open design. It consists of a ring gear and a differential case. The differential case consists of pinion and side gears, and a pinion shaft. The differential case is supported in the transaxle by tapered roller bearings (Fig. 168).

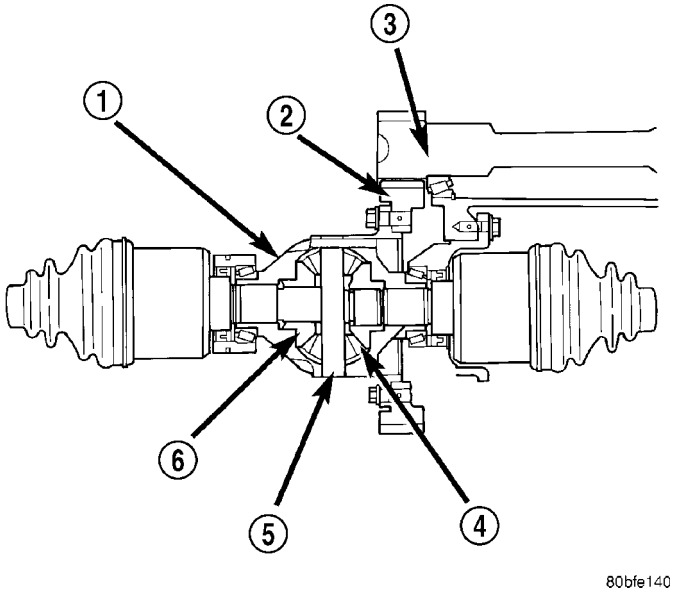

Fig. 168 Differential Assembly

1 - DIFFERENTIAL CASE
2 - RING GEAR
3 - TRANSFER SHAFT
4 - PINION GEAR
5 - PINION SHAFT
6 - SIDE GEAR

OPERATION

The differential assembly is driven by the transfer shaft by way of the differential ring gear. The ring gear drives the differential case, and the case drives the driveshafts through the differential gears. The differential pinion and side gears are supported in the case by thrust washers and a pinion shaft. Differential pinion and side gears make it possible for front tires to rotate at different speeds while cornering.

FINAL DRIVE (Continued)

DISASSEMBLY

NOTE: The transfer shaft should be removed for differential repair and bearing turning torque checking.

(1) Remove the differential cover and bolts (Fig. 169) (Fig. 170).

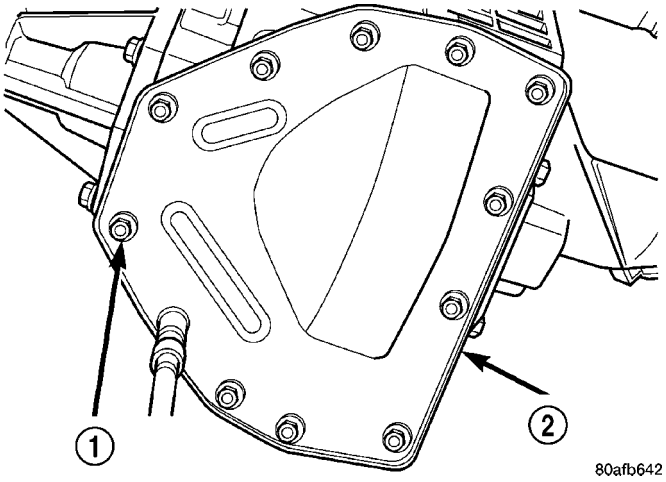

Fig. 169 Differential Cover Bolts

FINAL DRIVE (Continued)

ADJUSTMENTS

DIFFERENTIAL BEARING PRELOAD MEASUREMENT AND ADJUSTMENT

NOTE: Perform all differential bearing preload measurements with the transfer shaft and gear removed.

DIFFERENTIAL BEARING PRELOAD ADJUSTMENT USING EXISTING SHIM

(1) Position the transaxle assembly vertically on the support stand, differential bearing retainer side up.

(2) Install Tool L-4436A into the differential and onto the pinion mate shaft (Fig. 204).

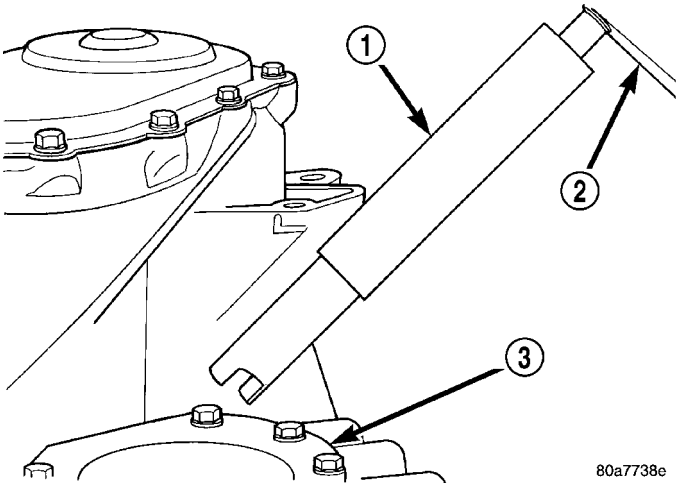

Fig. 204 Tool L-4436 and Torque Wrench

1 - SPECIAL TOOL L-4436–A
2 - TORQUE WRENCH
3 - DIFFERENTIAL BEARING RETAINER

(3) Rotate the differential at least one full revolution to ensure the tapered roller bearings are fully seated.

(4) Using Tool L-4436A and an inch-pound torque wrench, check the turning torque of the differential (Fig. 205). **The turning torque should be between 5 and 18 inch-pounds.**

(5) If the turning torque is within specifications, remove tools. Setup is complete.

(6) If turning torque is not within specifications proceed with the following steps.

(a) Remove differential bearing retainer from the transaxle case.

(b) Remove the bearing cup from the differential bearing retainer using Tool 6062A.

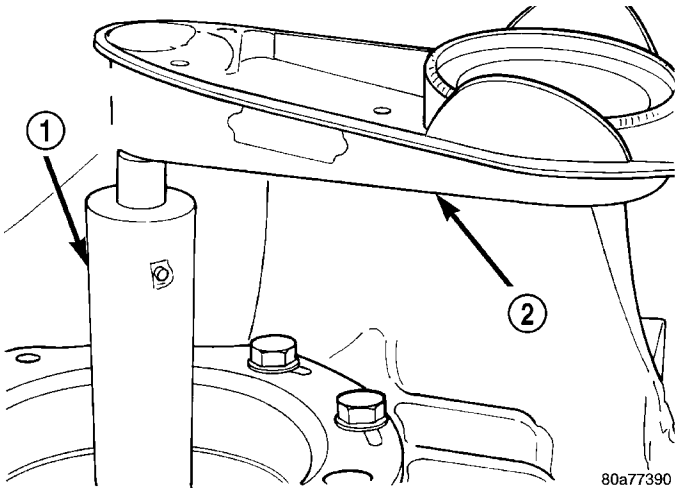

Fig. 205 Checking Differential Bearings Turning Torque

1 - SPECIAL TOOL L-4436–A
2 - TORQUE WRENCH

(c) Remove the existing shim from under the cup.

(d) Measure the existing shim.

(e) If the turning torque was too high when measured, install a 0.05 mm (0.002 inch) thinner shim. If the turning torque is was too low, install a 0.05 mm (0.002 inch) thicker shim. Repeat until 5 to 18 inch-pounds turning torque is obtained. Oil Baffle is not required to be installed when making shim selection.

(f) Install the proper shim under the bearing cup. Make sure the oil baffle is installed properly in the bearing retainer, below the bearing shim and cup.

(g) Install the differential bearing retainer using Tool 5052 and C-4171. Seal the retainer to the housing with MOPAR® Adhesive Sealant and torque bolts to 28 N·m (250 in. lbs.).

(7) Using Tool L-4436A and an inch-pound torque wrench, recheck the turning torque of the differential (Fig. 205). **The turning torque should be between 5 and 18 inch-pounds.**

Shim thickness need be determined only if any of the following parts are replaced:

- Transaxle case
- Differential carrier
- Differential bearing retainer
- Extension housing
- Differential bearing cups and cones

FINAL DRIVE (Continued)

DIFFERENTIAL BEARING SHIM CHART

PART NUMBER	SHIM THICKNESS	
	MM	INCH
4659257	.980	0.0386
4659258	1.02	0.0402
4659259	1.06	0.0418

4659284	2.06	0.0812

PRELOAD ADJUSTMENT W/O SHIM

(1) Remove the bearing cup from the differential bearing retainer using Miller special Tool 6062A.

(2) Remove existing shim from under bearing cup.

(3) Reinstall the bearing cup into the retainer using Miller Special Tool 6061, and C-4171.

NOTE: Oil baffle is not required when making the shim calculation.

(4) Install the bearing retainer into the case. Torque bolts to 28 N•m (250 in. lbs.).

(5) Position the transaxle assembly vertically on the support stand and install Miller Special Tool L-4436-A into the bearing retainer.

(6) Rotate the differential at least one full revolution to ensure the tapered roller bearings are fully seated.

(7) Attach a dial indicator to the case and zero the dial. Place the tip on the end of Special Tool L-4436-A.

(8) Place a large screwdriver to each side of the ring gear and lift. Check the dial indicator for the amount of end play.

CAUTION: Do not damage the transaxle case and/or differential retainer sealing surface.

(9) Using the end play measurement that was determined, add 0.18mm (0.007 inch). This should give you between 5 and 18 inch pounds of bearing preload. Refer to the Differential Bearing Shim Chart to determine which shim to use.

(10) Remove the differential bearing retainer. Remove the bearing cup.

(11) Install the oil baffle. Install the proper shim combination under the bearing cup.

(12) Install the differential bearing retainer. Seal the retainer to the housing with Mopar® Silicone Rubber Adhesive Sealant. Torque bolts to 28 N•m (250 in. lbs.).

(13) Using Miller Special Tool L-4436-A and an inch-pound torque wrench, check the turning torque

FINAL DRIVE (Continued)

of the differential (Fig. 205). The turning torque should be between 5-18 inch-pounds.

NOTE: If turning torque is too high install a 0.05mm (0.002 inch) thicker shim. If the turning torque is too low, install a 0.05mm (0.002 inch) thinner shim. Repeat until 5-18 inch-pounds of turning torque is obtained.

FLUID

STANDARD PROCEDURE

STANDARD PROCEDURE - FLUID AND FILTER SERVICE

NOTE: Refer to the maintenance schedules in LUBRICATION and MAINTENANCE, or the vehicle owner's manual, for the recommended maintenance (fluid/filter change) intervals for this transaxle.

NOTE: Only fluids of the type labeled Mopar® ATF+4 (Automatic Transmission Fluid) should be used. A filter change should be made at the time of the transmission oil change. The magnet (on the inside of the oil pan) should also be cleaned with a clean, dry cloth.

NOTE: If the transaxle is disassembled for any reason, the fluid and filter should be changed.

FLUID/FILTER SERVICE (RECOMMENDED)

(1) Raise vehicle on a hoist. Refer to LUBRICATION and MAINTENANCE for proper procedures. Place a drain container with a large opening, under transaxle oil pan.

(2) Loosen pan bolts and tap the pan at one corner to break it loose allowing fluid to drain, then remove the oil pan.

(3) Install a new filter and o-ring on bottom of the valve body (Fig. 206).

(4) Clean the oil pan and magnet. Reinstall pan using new Mopar Silicone Adhesive sealant. Tighten oil pan bolts to 19 N·m (165 in. lbs.).

(5) Pour four quarts of Mopar® ATF+4 (Automatic Transmission Fluid) through the dipstick opening.

(6) Start engine and allow to idle for at least one minute. Then, with parking and service brakes applied, move selector lever momentarily to each position, ending in the park or neutral position.

(7) Check the transaxle fluid level and add an appropriate amount to bring the transaxle fluid level to 3mm (1/8 in.) below the lowest mark on the dipstick (Fig. 207).

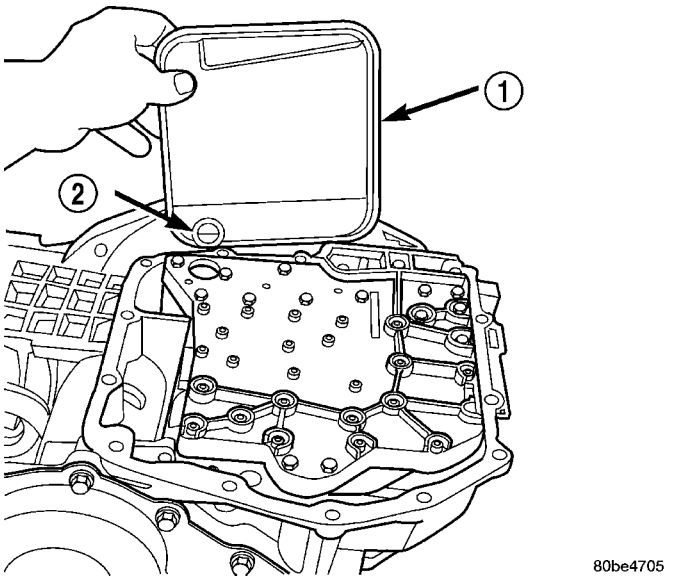

Fig. 206 Filter and O-Ring

1 - OIL FILTER
2 - O-RING

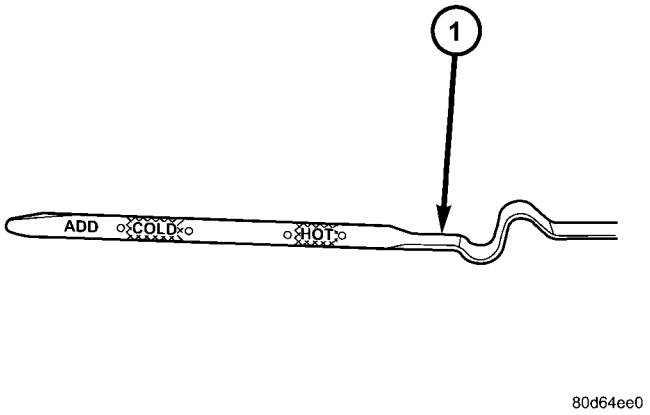

Fig. 207 Fluid Level Indicator

1 - FLUID LEVEL INDICATOR

(8) Recheck the fluid level after the transaxle has reached normal operating temperature (180°F.). Refer to Fluid Level and Condition Check for the proper fluid fill procedure.

(9) To prevent dirt from entering transaxle, make certain that dipstick is fully seated into the dipstick opening.

FLUID (Continued)

DIPSTICK TUBE FLUID SUCTION METHOD (ALTERNATIVE)

(1) When performing the fluid suction method, make sure the transaxle is at full operating temperature.

(2) To perform the dipstick tube fluid suction method, use a suitable fluid suction device (Vacula™ or equivalent).

(3) Insert the fluid suction line into the dipstick tube.

NOTE: Verify that the suction line is inserted to the lowest point of the transaxle oil pan. This will ensure complete evacuation of the fluid in the pan.

(4) Follow the manufacturers recommended procedure and evacuate the fluid from the transaxle.

(5) Remove the suction line from the dipstick tube.

(6) Pour four quarts of Mopar® ATF+4 (Automatic Transmission Fluid) through the dipstick opening.

(7) Start engine and allow to idle for at least one minute. Then, with parking and service brakes applied, move selector lever momentarily to each position, ending in the park or neutral position.

(8) Check the transaxle fluid level and add an appropriate amount to bring the transaxle fluid level to 3mm (1/8 in.) below the lowest mark on the dipstick (Fig. 207).

(9) Recheck the fluid level after the transaxle has reached normal operating temperature (180°F.). (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 41TE/FLUID - STANDARD PROCEDURE)

(10) To prevent dirt from entering transaxle, make certain that dipstick is fully seated into the dipstick opening.

FLUID LEVEL AND CONDITION CHECK

NOTE: Only transmission fluid of the type labeled Mopar ATF+4 (Automatic Transmission Fluid) should be used in this transaxle.

FLUID LEVEL CHECK

The transmission sump has a fluid level indicator (dipstick) to check oil similar to most automatic transmissions. It is located on the left side of the engine. Be sure to wipe all dirt from dipstick handle before removing.

The torque converter fills in both the P Park and N Neutral positions. Place the selector lever in P Park to be sure that the fluid level check is accurate. **The engine should be running at idle speed for at least one minute, with the vehicle on level ground.** At normal operating temperature 82° C (180° F), the fluid level is correct if it is in the HOT region on the oil level indicator (Fig. 208). The fluid level should be within the COLD region of the dipstick at 27° C (80° F) fluid temperature.

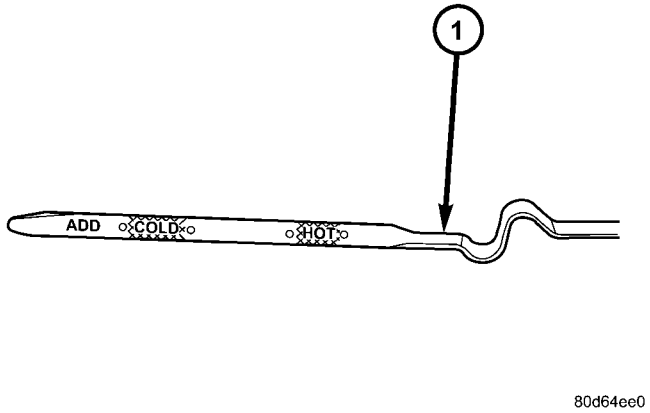

Fig. 208 Fluid Level Indicator

1 - FLUID LEVEL INDICATOR

FLUID LEVEL CHECK USING DRB

NOTE: Engine and Transaxle should be at normal operating temperature before performing this procedure.

(1) Start engine and apply parking brake.

(2) Hook up DRB scan tool and select transmission.

(3) Select sensors.

(4) Read the transmission temperature value.

(5) Compare the fluid temperature value with the fluid temperature chart (Fig. 209).

(6) Adjust transmission fluid level shown on the indicator according to the chart.

(7) Check transmission for leaks.

Low fluid level can cause a variety of conditions because it allows the pump to take in air along with the fluid. As in any hydraulic system, air bubbles make the fluid spongy, therefore, pressures will be low and build up slowly.

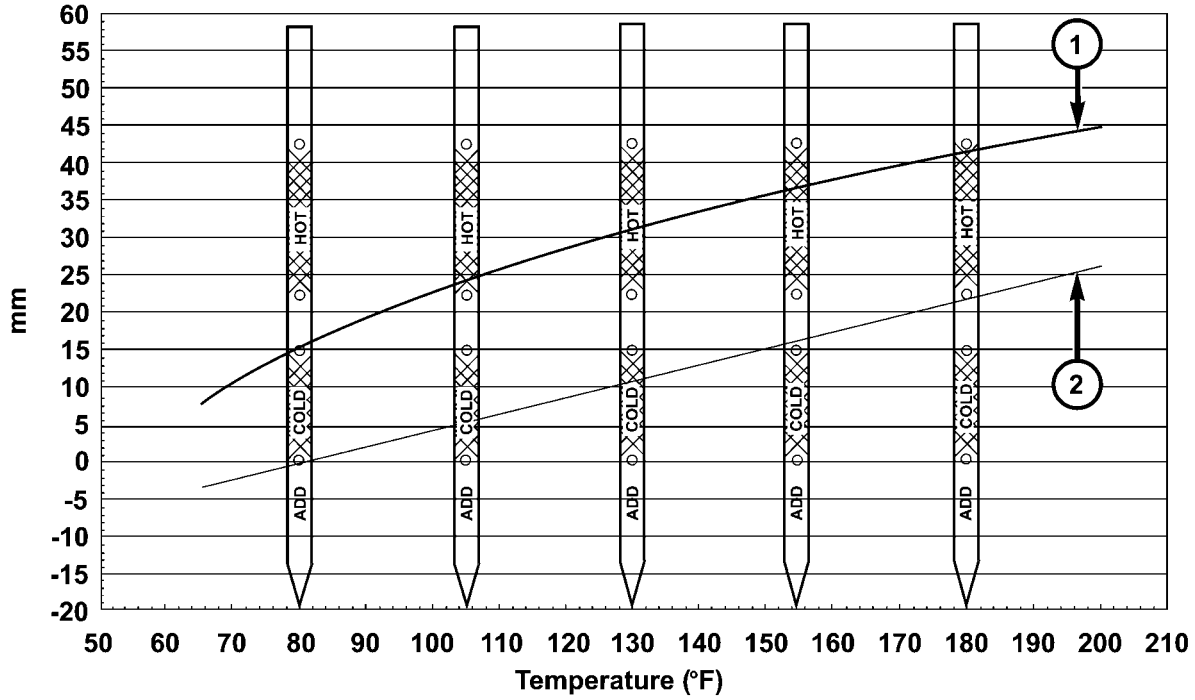
Improper filling can also raise the fluid level too high. When the transaxle has too much fluid, the gears churn up foam and cause the same conditions which occur with a low fluid level.

In either case, air bubbles can cause overheating and/or fluid oxidation, and varnishing. This can interfere with normal valve, clutch, and accumulator operation. Foaming can also result in fluid escaping from the transaxle vent where it may be mistaken for a leak.

FLUID CONDITION

Along with fluid level, it is important to check the condition of the fluid. When the fluid smells burned,

FLUID (Continued)



80d64e6e

Fig. 209 Transmission Fluid Temperature Chart

1 - MAX. LEVEL
2 - MIN. LEVEL

and is contaminated with metal or friction material particles, a complete transaxle recondition is probably required. Be sure to examine the fluid on the dipstick closely. If there is any doubt about its condition, drain out a sample for a double check.

Mopar® ATF+4 (Automatic Transmission Fluid) when new is red in color. The ATF is dyed red so it can be identified from other fluids used in the vehicle such as engine oil or antifreeze. The red color is not permanent and is not an indicator of fluid condition. As the vehicle is driven, the ATF will begin to look darker in color and may eventually become brown. **This is normal.** ATF+4 also has a unique odor that may change with age. Consequently, **odor and color cannot be used to indicate the fluid condition or the need for a fluid change.**

After the fluid has been checked, seat the dipstick fully to seal out water and dirt.

GEAR SHIFT BEZEL

REMOVAL

(1) Loosen set screw and remove knob from shifter handle (Fig. 210).

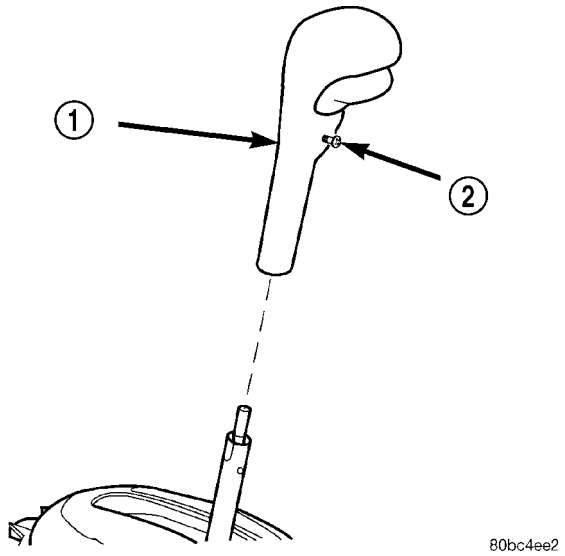


Fig. 210 Gearshift Knob Removal/Installation

1 - SHIFTER KNOB
2 - SET SCREW

(2) Remove the center console assembly as shown in (Fig. 211).

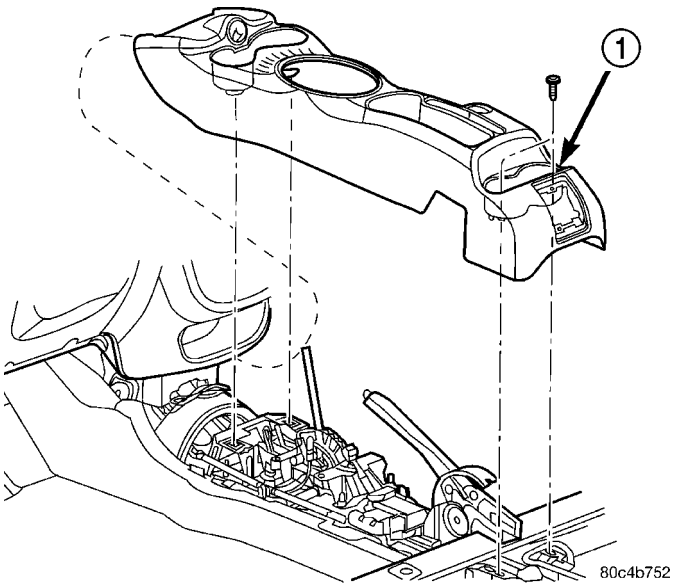

Fig. 211 Center Console Removal/Installation

1 - CENTER CONSOLE

(3) Remove shifter bezel (Fig. 212).

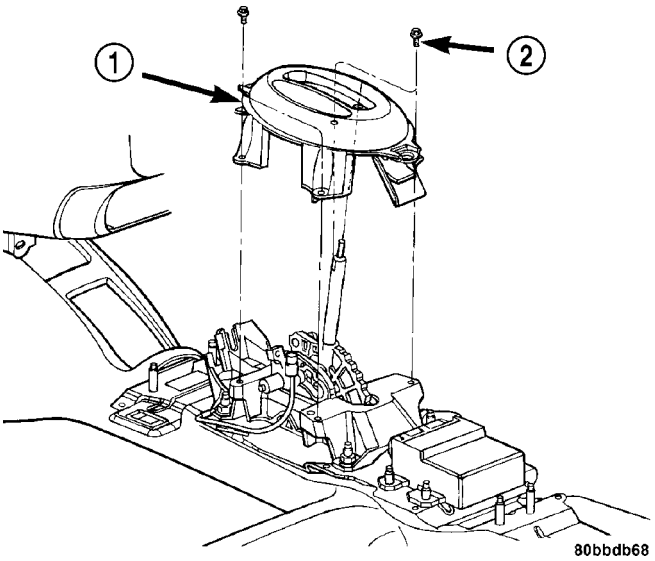

Fig. 212 Shifter Bezel Removal/Installation

1 - BEZEL
2 - SCREW (4)

INSTALLATION

(1) Install gearshift bezel (Fig. 212).
(2) Install center console assembly (Fig. 211).
(3) Install gearshift knob and tighten set screw to 2 N·m (17 in. lbs.) torque (Fig. 210).

GEAR SHIFT CABLE

REMOVAL

(1) Loosen set screw and remove knob from shifter handle (Fig. 213).

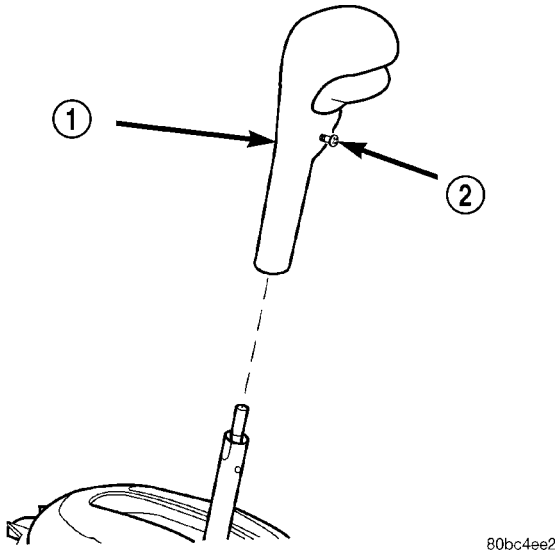

Fig. 213 Gearshift Knob Removal/Installation

1 - SHIFTER KNOB
2 - SET SCREW

GEAR SHIFT CABLE (Continued)

(2) Remove the center console assembly as shown in (Fig. 214).

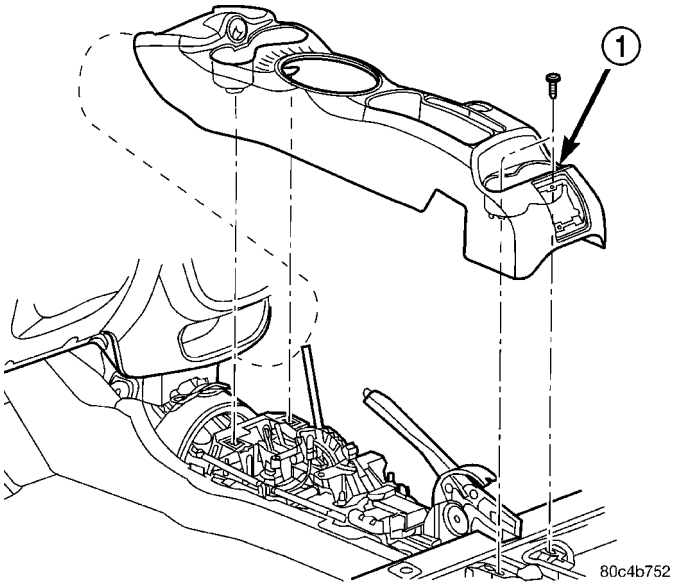

Fig. 214 Center Console Removal/Installation

1 - CENTER CONSOLE

(3) Remove shifter bezel (Fig. 215).

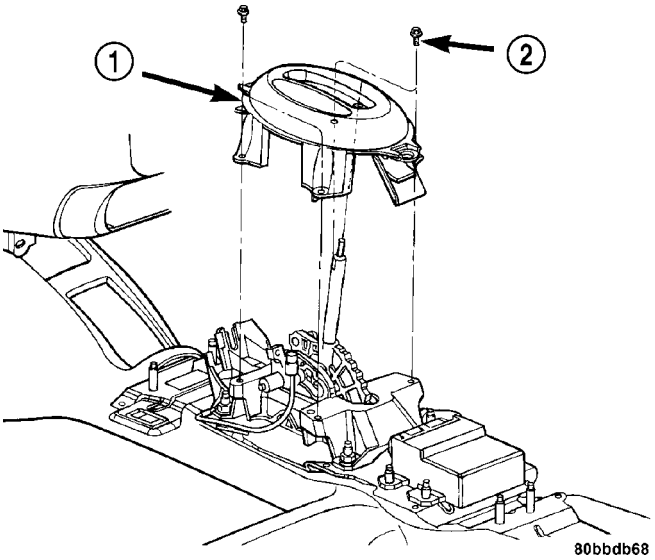

Fig. 215 Shifter Bezel Removal/Installation

1 - BEZEL
2 - SCREW (4)

(4) Disconnect shift cable from shifter mechanism as shown in (Fig. 216).

(5) Remove three grommet plate to floor pan nuts as shown in (Fig. 216).

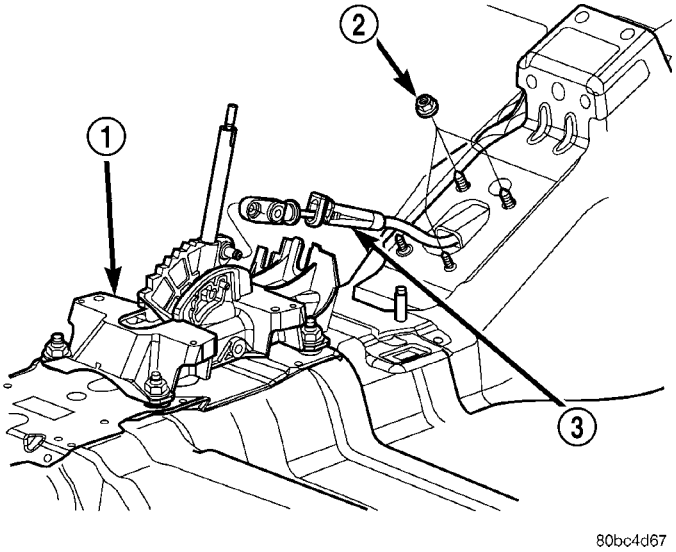

Fig. 216 Gearshift Cable at Shifter Assembly

1 - SHIFTER ASSEMBLY
2 - GROMMET PLATE NUT
3 - SHIFT CABLE

(6) Remove air cleaner assembly (Fig. 217).

(8) Remove battery tray (Fig. 219) from bracket.

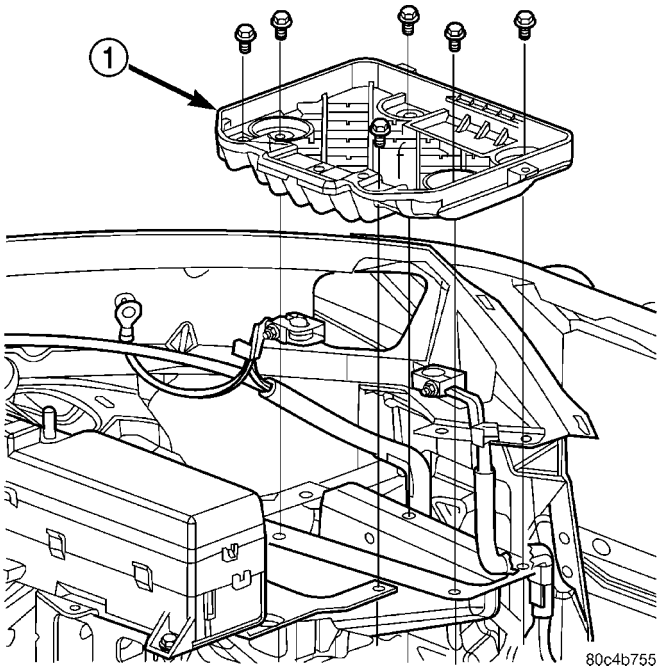

Fig. 219 Battery Tray Removal/Installation

1 - BATTERY TRAY

(9) Disconnect shifter cable from shift lever and remove from bracket (Fig. 220).

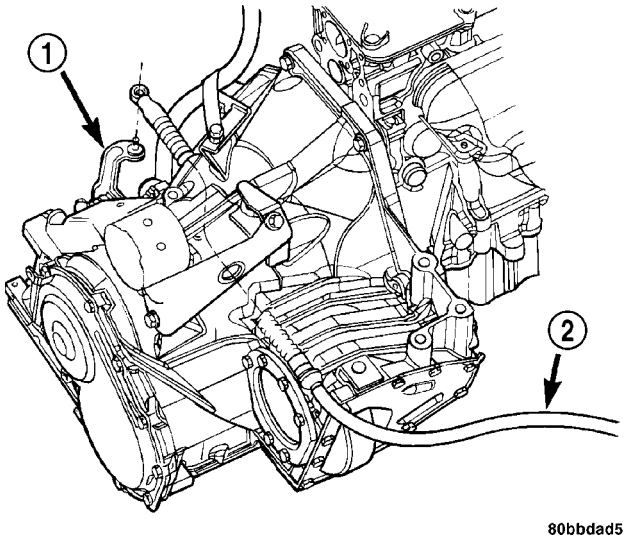

Fig. 220 Gear Shift Cable at Transaxle

1 - SHIFT LEVER
2 - SHIFT CABLE

(10) Raise vehicle on hoist.

(11) Remove catalytic converter heat shield (Fig. 221).

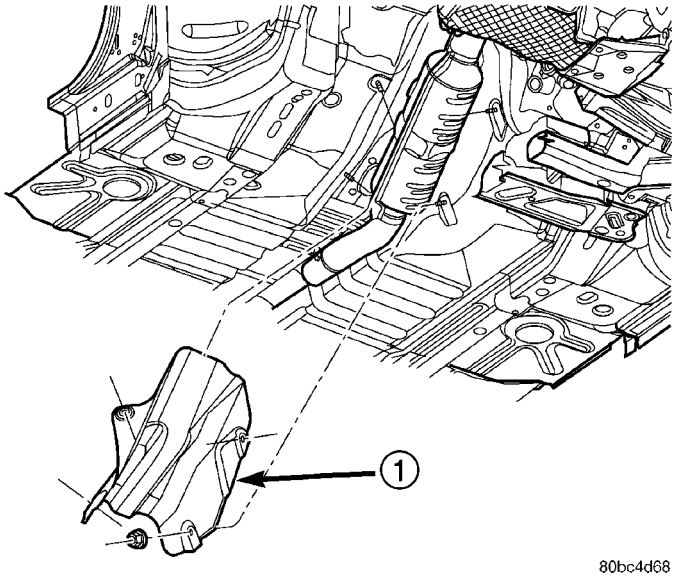

Fig. 221 Catalytic Converter Heat Shield

1 - CONVERTER HEAT SHIELD

GEAR SHIFT CABLE (Continued)

(12) Remove remaining grommet plate screw and remove cable assembly from vehicle (Fig. 222).

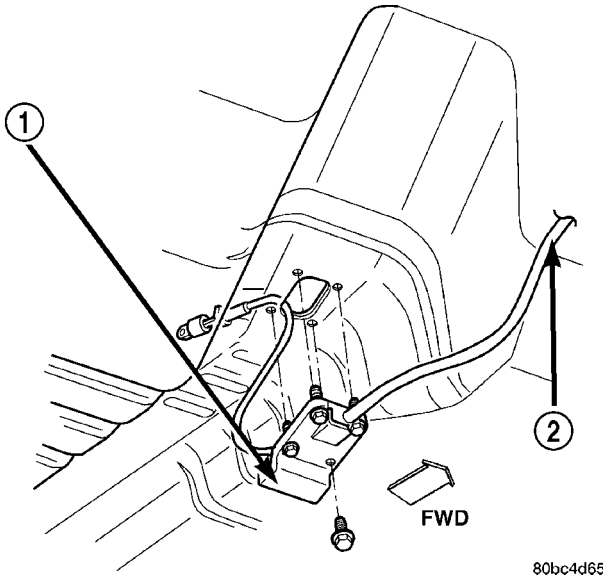

Fig. 222 Grommet Plate/Shift Cable at Floor Pan

1 - GROMMET PLATE
2 - SHIFT CABLE

INSTALLATION

(1) Install cable assembly through floor pan opening and secure to floor pan with grommet plate and one screw (Fig. 222). Make sure the three grommet plate studs protrude through cable assembly and floor pan and tighten screw to 7 N·m (60 in. lbs.).

(2) Route transaxle end of cable assembly into engine compartment and over transaxle assembly.

(3) Install catalytic converter heat shield (Fig. 221).

(4) Install gear shift cable to bracket and connect to shift lever (Fig. 220).

(5) Lower vehicle.

(6) Install and tighten the three grommet plate-to-floor pan nuts. Tighten to 6 N·m (50 in. lbs.) torque.

(7) Connect gearshift cable to shifter assembly as shown in (Fig. 216).

(8) Install shifter bezel (Fig. 215).

(9) **Adjust gearshift cable as follows:**

(a) Place gearshift lever in the PARK (P) position.

(b) Loosen shift cable adjustment screw (Fig. 223).

(c) Verify transaxle is in the PARK (P) position and the shifter lever is in gated PARK..

(d) Tighten shift cable adjustment screw to 8 N·m (70 in. lbs.) torque.

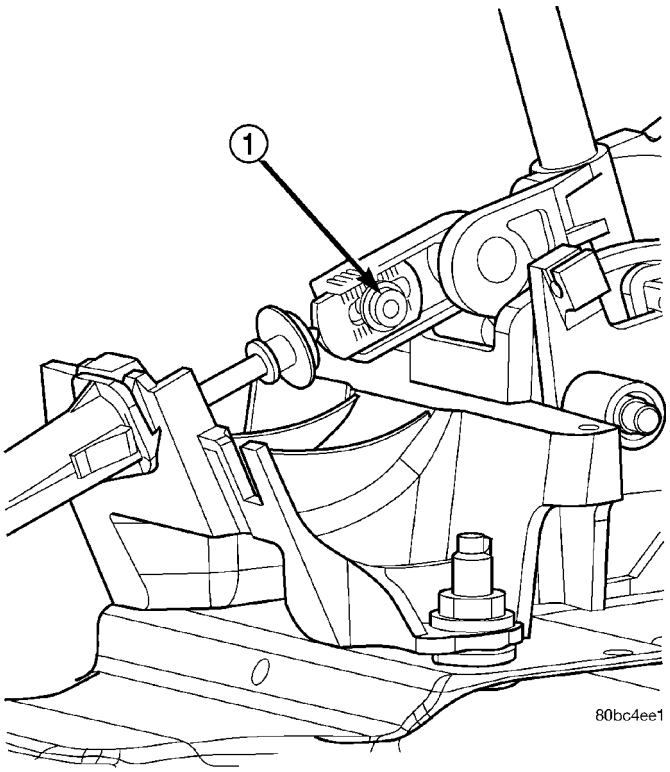

Fig. 223 Gearshift Cable Adjustment Screw

1 - GEARSHIFT CABLE ADJUSTMENT SCREW

(10) Install battery tray (Fig. 219).

(11) Install battery and hold down clamp (Fig. 218).

(12) Install the air cleaner assembly (Fig. 217).

(13) Install center console assembly (Fig. 214).

(14) Install gearshift knob and tighten set screw to 2 N·m (17 in. lbs.) torque (Fig. 213).

(15) Connect battery cables.

(16) Verify that engine starter operates in both PARK (P) and NEUTRAL (N). Starter should not operate in any other gear position.

ADJUSTMENTS

GEARSHIFT CABLE

The engine starter should only operate when the transaxle shift lever is in the PARK (P) or NEUTRAL (N) positions. If the engine starts in any other gear position, or the vehicle rolls when the shifter is in gated PARK (P), a gearshift cable adjustment is necessary.

GEAR SHIFT CABLE (Continued)

ADJUSTMENT

(1) Loosen set screw and remove knob from shifter handle (Fig. 224).

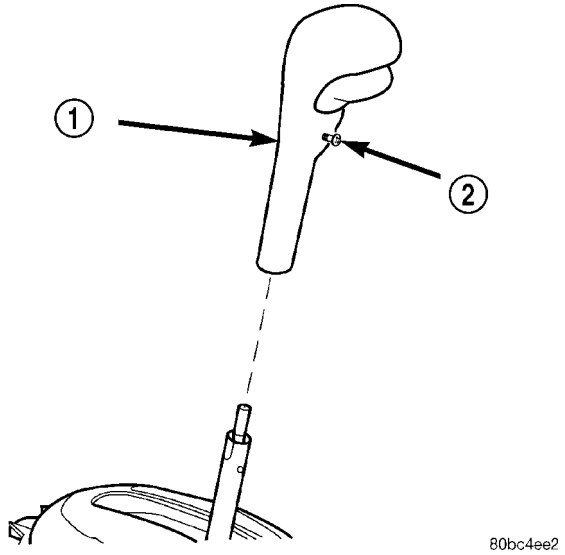

Fig. 224 Gearshift Knob Removal/Installation

1 - SHIFTER KNOB
2 - SET SCREW

(2) Remove the center console assembly as shown in (Fig. 225).

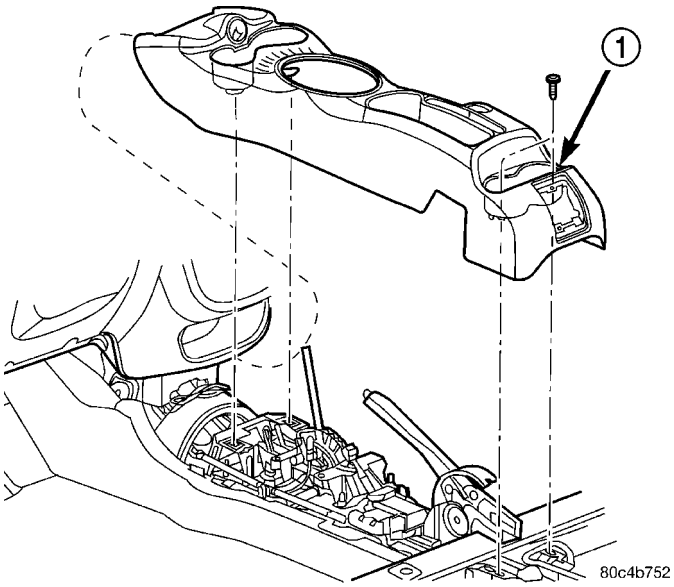

Fig. 225 Center Console Removal/Installation

1 - CENTER CONSOLE

(3) **Adjust gearshift cable as follows:**

(a) Place gearshift lever in the PARK (P) position.

(b) Loosen shift cable adjustment screw (Fig. 226).

(c) Move transaxle manual lever to the PARK. Verify transaxle is in PARK by attempting to roll vehicle in either direction.

(d) Tighten shift cable adjustment screw to 8 N·m (70 in. lbs.) torque.

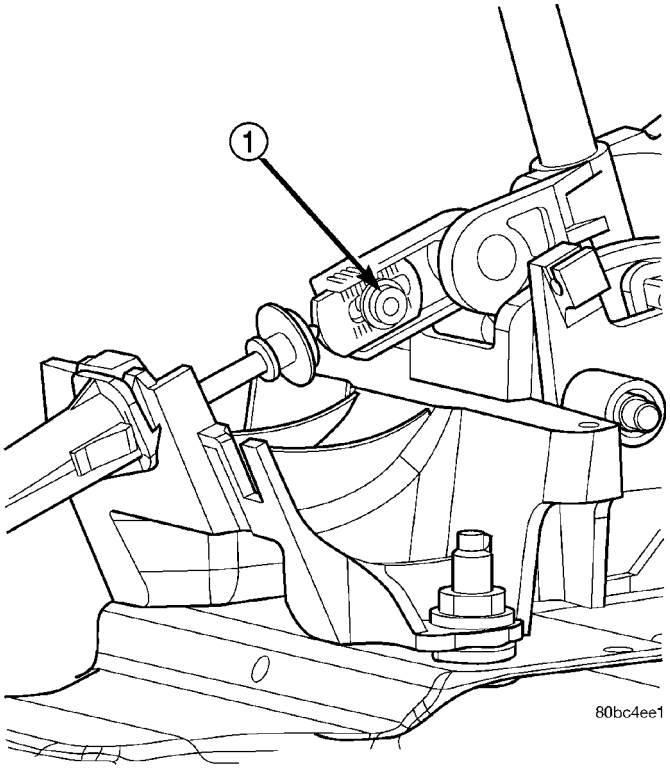

Fig. 226 Gearshift Cable Adjustment Screw

1 - GEARSHIFT CABLE ADJUSTMENT SCREW

(4) Verify proper cable adjustment. Engine should start with the shifter lever in PARK (P) and NEUTRAL (N) positions ONLY.

(5) Install center console assembly (Fig. 225).

(6) Install gearshift knob and tighten set screw to 2 N·m (17 in. lbs.) torque (Fig. 224).

GEAR SHIFT KNOB

REMOVAL

(1) Loosen set screw and remove knob from shifter handle (Fig. 227).

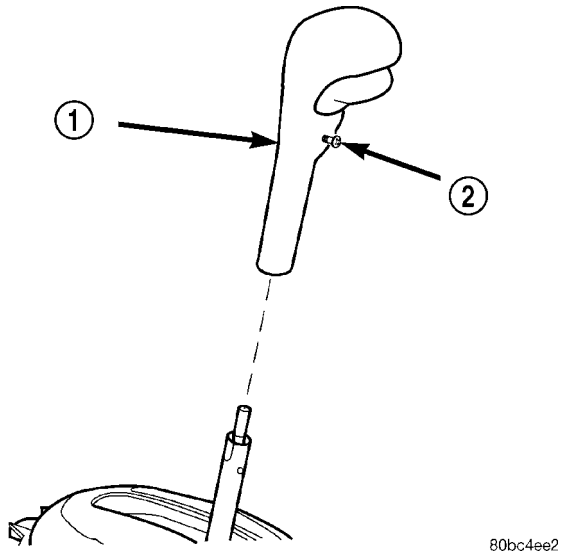

Fig. 227 Gearshift Knob Removal/Installation

1 - SHIFTER KNOB
2 - SET SCREW

INSTALLATION

(1) Install gearshift knob and tighten set screw to 2 N·m (17 in. lbs.) torque (Fig. 227).

HOLDING CLUTCHES

DESCRIPTION

Two hydraulically applied multi-disc clutches are used to hold planetary geartrain components stationary while the input clutches drive others. The 2/4 and Low/Reverse clutches are considered holding clutches and are contained at the rear of the transaxle case. (Fig. 228).

OPERATION

NOTE: Refer to the "Elements In Use" chart in Diagnosis and Testing for a collective view of which clutch elements are applied at each position of the selector lever.

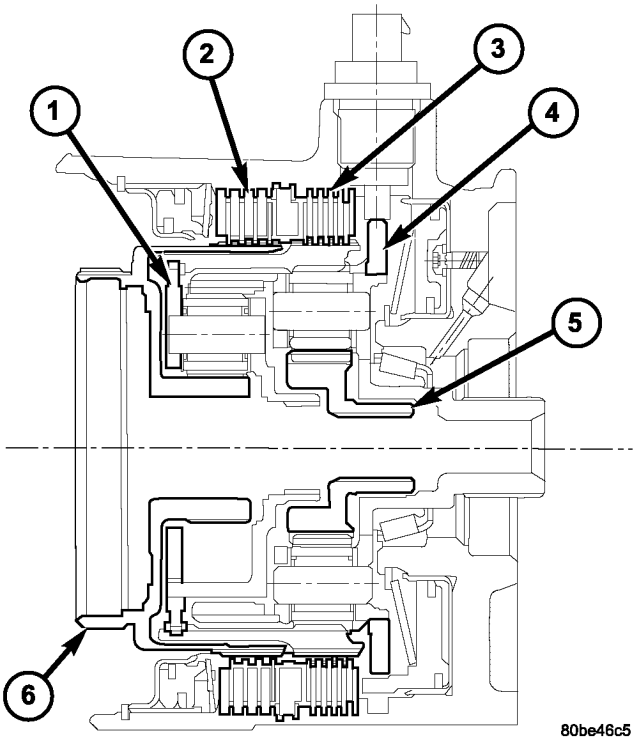

Fig. 228 2/4 and Low/Reverse Clutches

1 - FRONT PLANET CARRIER/REAR ANNULUS
2 - 2/4 CLUTCH
3 - L/R CLUTCH
4 - REAR PLANET CARRIER/FRONT ANNULUS
5 - REAR SUN GEAR
6 - FRONT SUN GEAR ASSEMBLY

2/4 CLUTCH

The 2/4 clutch is hydraulically applied in second and fourth gears by pressurized fluid against the 2/4 clutch piston. When the 2/4 clutch is applied, the front sun gear assembly is held or grounded to the transaxle case.

LOW/REVERSE CLUTCH

The Low/Reverse clutch is hydraulically applied in park, reverse, neutral, and first gears by pressurized fluid against the Low/Reverse clutch piston. When the Low/Reverse clutch is applied, the front planet carrier/rear annulus assembly is held or grounded to the transaxle case.

INPUT CLUTCH ASSEMBLY

DISASSEMBLY

(1) Mount input clutch assembly to Input Clutch Pressure Fixture (Tool 8391).

(2) Tap down reverse clutch reaction plate to release pressure from snap ring (Fig. 229).

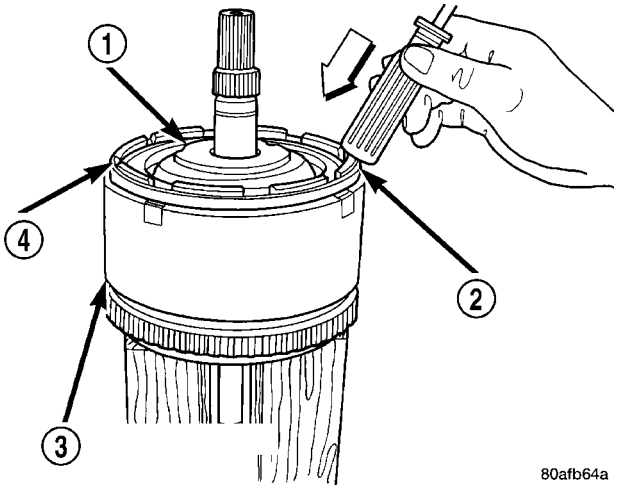

Fig. 229 Tapping Reaction Plate

1 - #4 THRUST PLATE (SELECT)
2 - TAP DOWN REVERSE CLUTCH REACTION PLATE TO REMOVE OR INSTALL SNAP RING

INPUT CLUTCH ASSEMBLY (Continued)

(15) Install input clutch assembly to the Input Clutch Pressure Fixture–Tool 8391 (Fig. 265).

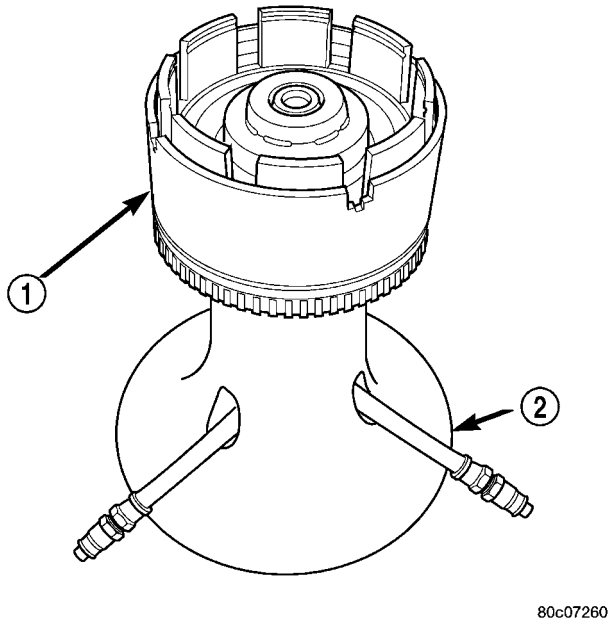

Fig. 265 Input Clutch Assembly on Pressure Fixture Tool 8391

1 - INPUT CLUTCH ASSEMBLY
2 - INPUT CLUTCH PRESSURE FIXTURE 8391

(16) Set up dial indicator on the UD clutch pack as shown in (Fig. 266).

(17) Using moderate pressure, press down and hold (near indicator) the UD clutch pack with screwdriver or suitable tool and zero dial indicator (Fig. 267). When releasing pressure on clutch pack, indicator reading should advance 0.005–0.010.

CAUTION: Do not apply more than 30 psi (206 kPa) to the underdrive clutch pack.

(18) Apply 30 psi (206 kPa) to the underdrive hose on Tool 8391 and measure UD clutch clearance. Measure and record UD clutch pack measurement in four (4) places, 90° apart.

(19) Take average of four measurements and compare with UD clutch pack clearance specification. **Underdrive clutch pack clearance must be 0.94-1.50 mm (0.037-0.059 in.).**

(20) If necessary, select the proper reaction plate to achieve specifications:

UNDERDRIVE REACTION PLATE THICKNESS	
4659939AB	5.837-5.937 mm (0.230-0.234 in.)
4659940AB	6.147-6.248 mm (0.242-0.246 in.)
4659941AB	6.457-6.557 mm (0.254-0.258 in.)

6 - INPUT CLUTCH ASSEMBLY

INPUT CLUTCH ASSEMBLY (Continued)

(25) Measure OD clutch pack clearance. Set up dial indicator on top of the OD/Reverse pressure plate as shown in (Fig. 273).

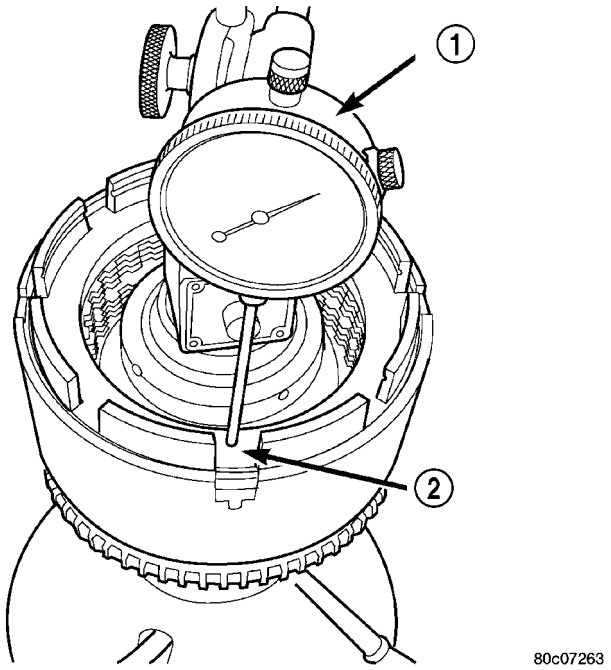

Fig. 273 Measure OD Clutch Pack Clearance

1 - DIAL INDICATOR
2 - OD/REVERSE REACTION PLATE

(26) Zero dial indicator and apply 30 psi (206 kPa) air pressure to the overdrive clutch hose on Tool 8391. Measure and record OD clutch pack measurement in four (4) places, 90° apart.

(27) Take average of four measurements and compare with OD clutch pack clearance specification. **The overdrive (OD) clutch pack clearance is 1.07-3.25 mm (0.042-0.128 in.).**

If not within specifications, the clutch is not assembled properly. There is no adjustment for the OD clutch clearance.

(28) Install reverse clutch pack (two frictions/one steel) (Fig. 274).

(29) Install reverse clutch reaction plate with the flat side down towards reverse clutch (Fig. 275).

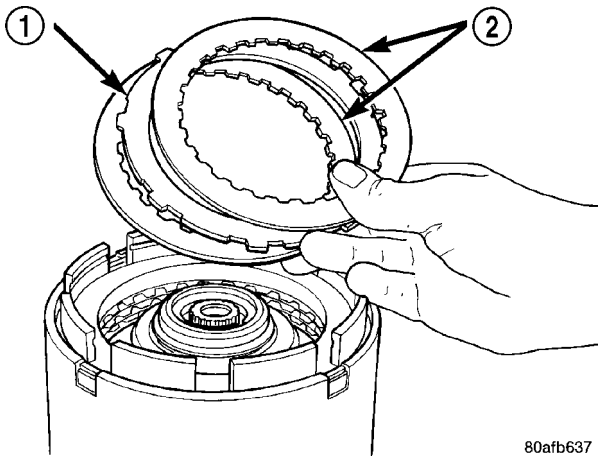

Fig. 274 Install Reverse Clutch Pack

1 - REVERSE CLUTCH PLATE
2 - REVERSE CLUTCH DISCS

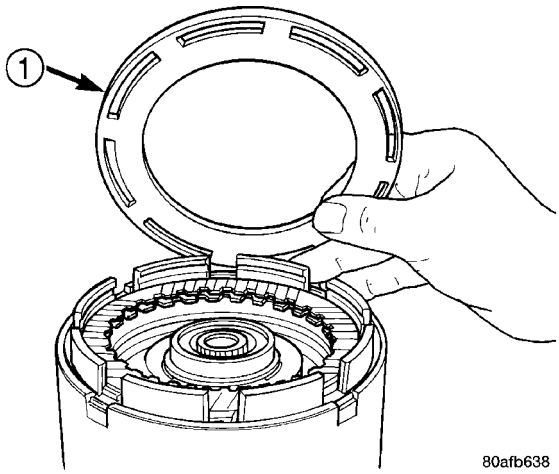

Fig. 275 Install Reaction Plate

1 - REVERSE CLUTCH REACTION PLATE (FLAT SIDE DOWN)

OIL PUMP

DESCRIPTION

The oil pump is located in the pump housing inside the bell housing of the transaxle case (Fig. 287). The oil pump consists of an inner and outer gear, a housing, and a cover that also serves as the reaction shaft support.

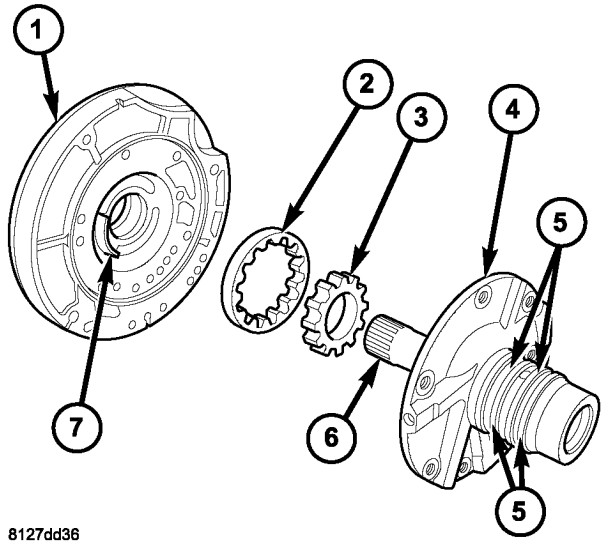

Fig. 287 Oil Pump Assembly

1 - PUMP BODY
2 - OUTER GEAR
3 - INNER GEAR
4 - REACTION SHAFT SUPPORT
5 - SEAL RINGS (4)
6 - REACTION SHAFT
7 - CRESCENT

OPERATION

As the torque converter rotates, the converter hub rotates the inner and outer gears. As the gears rotate, the clearance between the gear teeth increases in the crescent area, and creates a suction at the inlet side of the pump. This suction draws fluid through the pump inlet from the oil pan. As the clearance between the gear teeth in the crescent area decreases, it forces pressurized fluid into the pump outlet and to the valve body.

DISASSEMBLY

When disassembling the transaxle it is necessary to inspect the oil pump for wear and damage.

(1) Remove the reaction shaft support-to-pump body bolts (Fig. 288).

(2) Remove reaction shaft support from pump housing (Fig. 289).

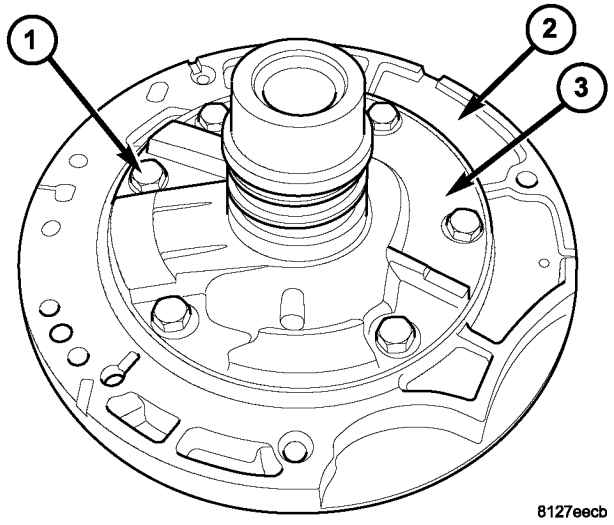

Fig. 288 Reaction Support-to-Pump Body Bolts

1 - BOLT (6)

4 - INNER GEAR

OIL PUMP (Continued)

(8) Position an appropriate piece of Plastigage across both pump gears.

(9) Align the Plastigage to a flat area on the reaction shaft support housing.

(10) Install the reaction shaft to the pump housing (Fig. 288). Tighten the bolts to 27 N·m (20 ft. lbs.).

(11) Remove bolts and carefully separate the housings. Measure the Plastigage following the instructions supplied.

(12) Clearance between both gear end faces and the reaction shaft support should be 0.020-0.046 mm (0.0008-0.0018 in.).

ASSEMBLY

(1) Assemble oil pump as shown in (Fig. 294).

PLANETARY GEARTRAIN

DESCRIPTION

The planetary geartrain is located between the input clutch assembly and the rear of the transaxle case. The planetary geartrain consists of two sun gears, two planetary carriers, two annulus (ring) gears, and one output shaft (Fig. 296).

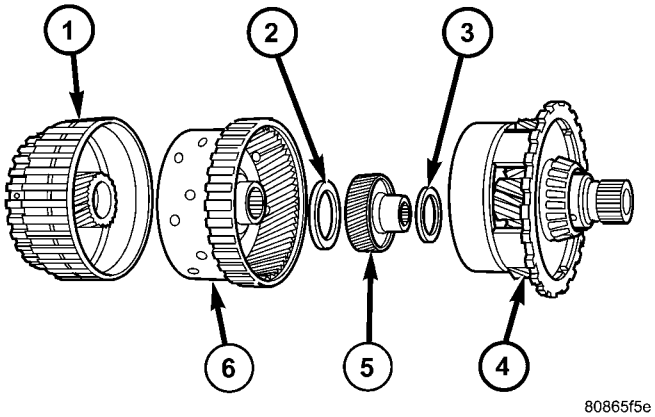

Fig. 296 Planetary Geartrain

1 - FRONT SUN GEAR ASSEMBLY
2 - #6 THRUST BEARING
3 - #7 THRUST BEARING
4 - REAR CARRIER/FRONT ANNULUS ASSEMBLY
5 - REAR SUN GEAR
6 - FRONT CARRIER/REAR ANNULUS ASSEMBLY

OPERATION

The planetary geartrain utilizes two planetary gear sets that connect the transmission input shaft to the output shaft. Input and holding clutches drive or lock different planetary members to change output ratio or direction.

SEAL - OIL PUMP

REMOVAL

(1) Remove transaxle from vehicle (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 41TE - REMOVAL).

(2) Using Tool C-3981-B, remove oil pump seal (Fig. 297).

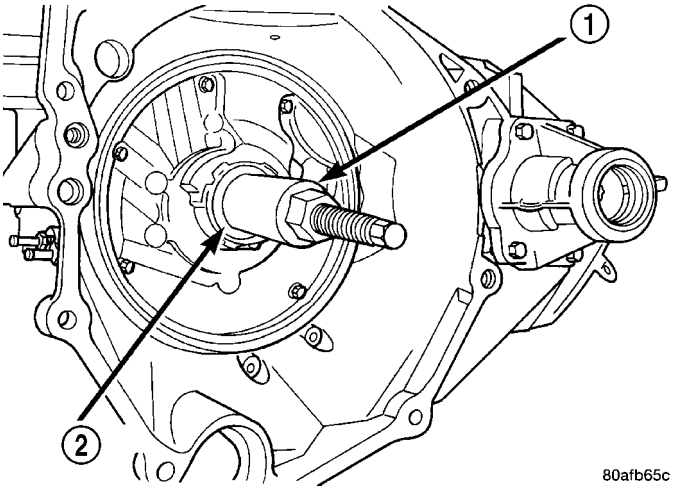

Fig. 297 Remove Oil Pump Seal

1 - TOOL C-3981–B
2 - OIL PUMP SEAL

INSTALLATION

(1) Using Tool C-4193, install oil pump seal (Fig. 298).

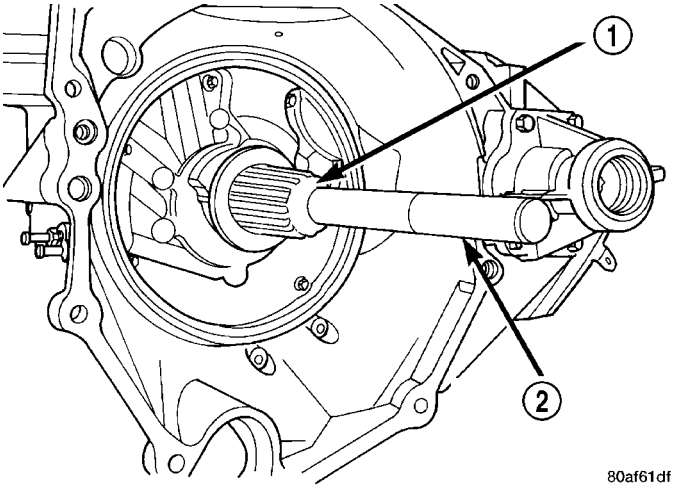

Fig. 298 Install Oil Pump Seal

1 - TOOL C-4193
2 - HANDLE TOOL C-4171

(2) Install transaxle to vehicle (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 41TE - INSTALLATION).

SHIFT INTERLOCK CABLE

REMOVAL

(1) Disconnect the battery negative cable.

(2) Loosen set screw and remove knob from shifter handle (Fig. 299).

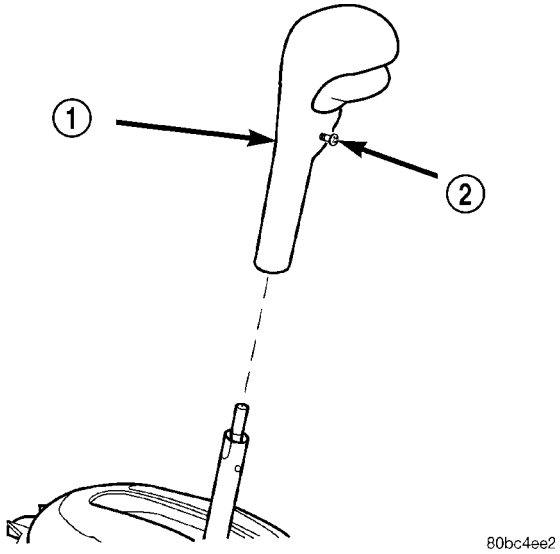

Fig. 299 Gearshift Knob Removal/Installation

1 - SHIFTER KNOB
2 - SET SCREW

(3) Remove the center console assembly as shown in (Fig. 300).

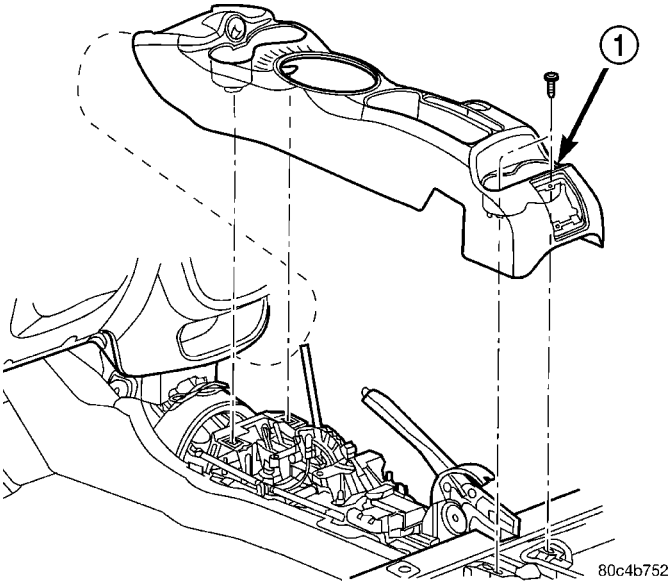

Fig. 300 Center Console Removal/Installation

1 - CENTER CONSOLE

(4) Remove shifter bezel (Fig. 301).

(5) Disconnect the shifter/ignition interlock cable from the shifter lever and bracket as shown in (Fig.

SHIFT INTERLOCK CABLE (Continued)

(9) Rotate the ignition key to the “OFF” or “ON/RUN” position (Fig. 306).

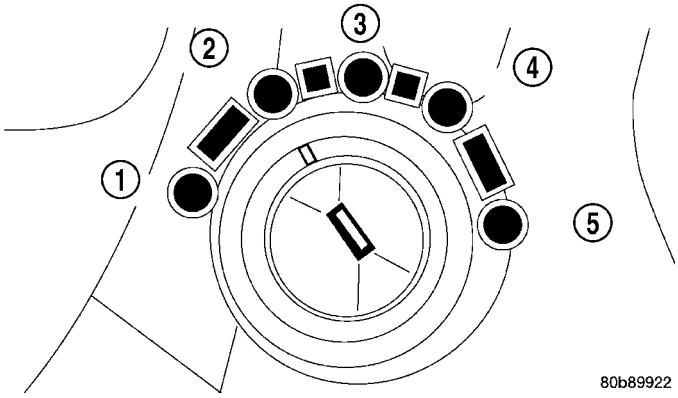

Fig. 306 Ignition Key/Switch Positions

1 - ACC
2 - LOCK
3 - OFF
4 - ON/RUN
5 - START

(10) Squeeze the interlock cable locking tab. Remove the cable from the interlock housing (Fig. 307).

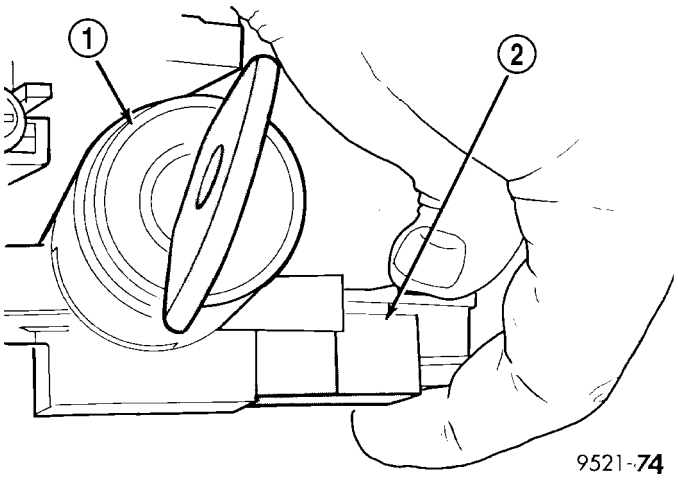

Fig. 307 Interlock Cable and Connector

1 - IGNITION LOCK CYLINDER
2 - INTERLOCK CABLE

(11) Release cable from retaining clips and remove through opening under steering column.

INSTALLATION

CAUTION: When installing interlock cable assembly, care must be taken not to bend exposed cable wire and slug at shifter end of cable.

(1) Route interlock cable through hole in instrument panel below steering column and around to gear shifter assembly.

(2) Turn the ignition key to the “OFF” or “ON/RUN” position (Fig. 306).

(3) Install the interlock cable into the interlock housing at the steering column (Fig. 308). Verify the cable snaps into the housing and is fully seated.

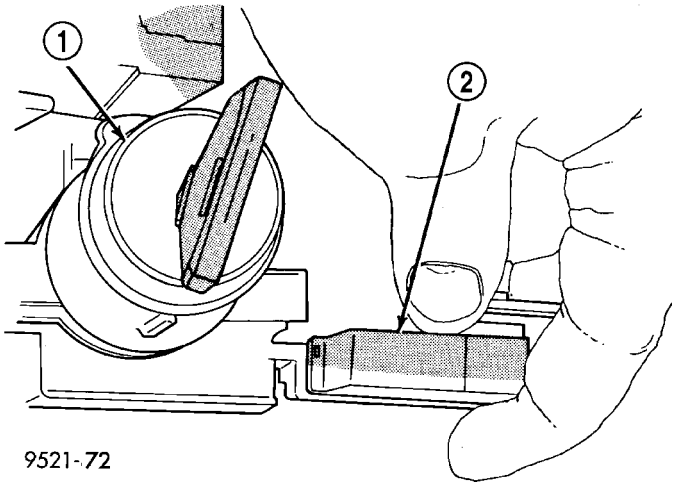

Fig. 308 Interlock Cable at Interlock Housing

1 - IGNITION SWITCH
2 - INTERLOCK CABLE

SHIFT INTERLOCK CABLE (Continued)

(4) Return the ignition key to the “LOCK” position (Fig. 306).

(5) Connect the BTSI solenoid connector (Fig. 305).

(6) Install steering column upper and lower shrouds (Fig. 304).

(7) Install steering column lower cover (Fig. 303).

(8) Verify that shifter is in gated “PARK”.

(9) Install the cable core end to the plastic cam of the shifter mechanism. Snap the shifter/ignition interlock cable end fitting into the groove in the gear-shift mechanism as shown in (Fig. 302).

(10) **Adjust interlock cable/system as follows:** If interlock cable is being replaced, it will come with an adjustment pin. Remove the pin from the cable and allow the cable to “self-adjust”. Lock cable adjustment by pressing down on the adjuster lock until bottomed at the cable housing. If interlock cable is being re-used, no pin will be provided. Pry up on cable adjuster lock to release and allow cable to “self-adjust”. Lock cable adjustment by pressing down on the adjuster lock until bottomed at the cable housing.

(11) **Connect battery negative cable and verify interlock system operation as follows:**

ACTION	EXPECTED RESPONSE
1. Turn key to the ″OFF″ position.	1. Shifter CAN be shifted out of park.
2. Turn key to the ″ON/RUN″ position.	2. Shifter CANNOT be shifted out of park.
3. Turn key to the ″ON/RUN″ position and depress the brake pedal.	3. Shifter CAN be shifted out of park.
4. Leave shifter in any gear and try to return key to the ″LOCK″ or ″ACC″ position.	4. Key cannot be returned to the ″LOCK″ or ″ACC″ position.
5. Return shifter to ″PARK″ and try to remove the key.	5. Key can be removed (after returning to ″LOCK″ position).
6. With the key removed, try to shift out of ″PARK″.	6. Shifter cannot be shifted out of ″PARK″.
NOTE: Any failure to meet these expected responses requires system adjustment or repair.	

(12) Install shifter bezel (Fig. 301).

(13) Install center console assembly (Fig. 300).

(14) Install gearshift knob and tighten set screw to 2 N·m (17 in. lbs.) torque (Fig. 299).

(15) Connect battery negative cable.

SHIFT INTERLOCK MECHANISM

REMOVAL

(1) Remove the steering column lower cover (Fig. 309).

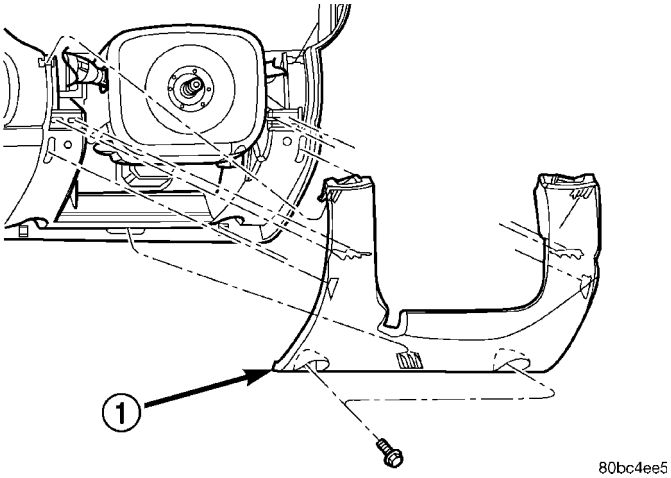

Fig. 309 Steering Column Lower Cover

1 - LOWER COVER

SHIFT INTERLOCK SYSTEM

DESCRIPTION

The Brake Transmission Shifter/Ignition Interlock (BTSI) is a cable and solenoid operated system that prevents the transmission gear shifter from being moved out of PARK without a driver in place.

Refer to the following chart that expected shifter response, depending on ignition key/switch (Fig. 314) and brake pedal positions.

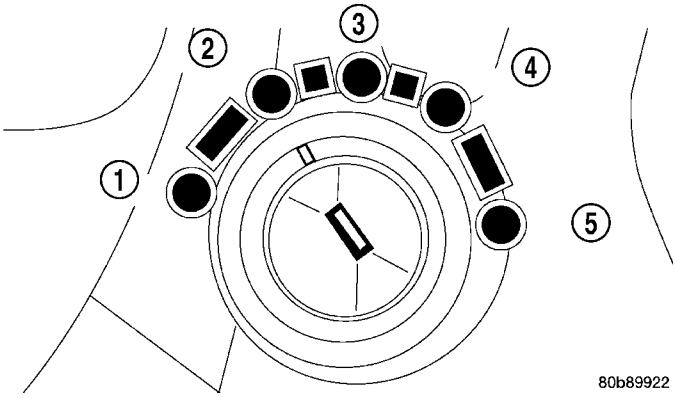

Fig. 314 Ignition Key/Switch Positions

1 - ACC
2 - LOCK
3 - OFF
4 - ON/RUN
5 - START

SHIFT INTERLOCK SYSTEM (Continued)

DIAGNOSIS AND TESTING - BRAKE/ TRANSMISSION SHIFT INTERLOCK SYSTEM

The following chart describes the normal operation of the Brake Transmission Shift Interlock (BTSI) system. If the “expected response” differs from the vehicle’s response, then system repair and/or adjustment is necessary.

Refer to the following chart that expected shifter response, depending on ignition key/switch (Fig. 315) and brake pedal positions.

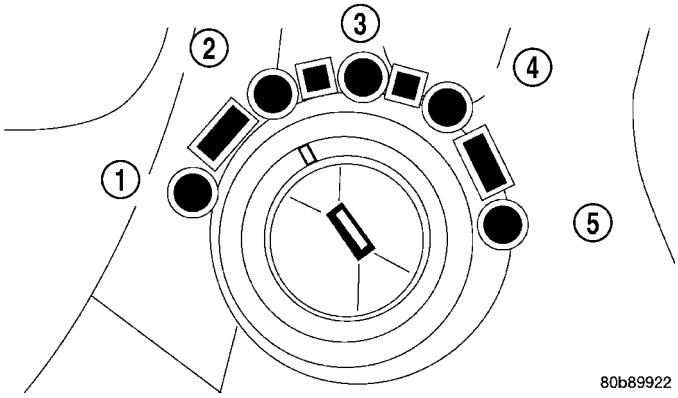

Fig. 315 Ignition Key/Switch Positions

1 - ACC
2 - LOCK
3 - OFF
4 - ON/RUN
5 - START

ACTION	EXPECTED RESPONSE
1. Turn key to the ″OFF″ position.	1. Shifter CAN be shifted out of park.
2. Turn key to the ″ON/RUN″ position.	2. Shifter CANNOT be shifted out of park.
3. Turn key to the ″ON/RUN″ position and depress the brake pedal.	3. Shifter CAN be shifted out of park.
4. Leave shifter in any gear and try to return key to the ″LOCK″ or ″ACC″ position.	4. Key cannot be returned to the ″LOCK″ or ″ACC″ position.
5. Return shifter to ″PARK″ and try to remove the key.	5. Key can be removed (after returning to ″LOCK″ position).
6. With the key removed, try to shift out of ″PARK″.	6. Shifter cannot be shifted out of ″PARK″.
NOTE: Any failure to meet these expected responses requires system adjustment or repair.	

ADJUSTMENTS

BRAKE/TRANSMISSION SHIFT INTERLOCK SYSTEM

VERIFICATION

The following chart describes the normal operation of the Brake Transmission Shift Interlock (BTSI) system. If the “expected response” differs from the vehicle’s response, then system repair and/or adjustment is necessary.

ACTION	EXPECTED RESPONSE
1. Turn key to the ″OFF″ position.	1. Shifter CAN be shifted out of park.
2. Turn key to the ″ON/RUN″ position.	2. Shifter CANNOT be shifted out of park.
3. Turn key to the ″ON/RUN″ position and depress the brake pedal.	3. Shifter CAN be shifted out of park.
4. Leave shifter in any gear and try to return key to the ″LOCK″ or ″ACC″ position.	4. Key cannot be returned to the ″LOCK″ or ″ACC″ position.
5. Return shifter to ″PARK″ and try to remove the key.	5. Key can be removed (after returning to ″LOCK″ position).
6. With the key removed, try to shift out of ″PARK″.	6. Shifter cannot be shifted out of ″PARK″.
NOTE: Any failure to meet these expected responses requires system adjustment or repair.

(6) Remove four (4) shift mechanism-to-floor pan nuts. Remove shift mechanism.

SHIFT MECHANISM (Continued)

INSTALLATION

(1) Install shift mechanism into position. Install mechanism-to-floor pan nuts and torque to 12 N·m (105 in. lbs.).

(2) Install gearshift cable to shift mechanism (Fig. 323).

(3) Adjust gearshift cable. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 40TE/GEAR SHIFT CABLE - ADJUSTMENTS)

(4) Connect shift bezel lamp socket. Install shift bezel and torque screws to 2 N·m (17 in. lbs.) (Fig. 321).

(5) Install and secure BTSI cable to shift mechanism (Fig. 322).

(6) Adjust BTSI cable. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 40TE/SHIFT INTERLOCK SYSTEM - ADJUSTMENTS)

(7) Install center console assembly (Fig. 320).

(8) Install gear shift knob. Torque set screw to 2 N·m (17 in. lbs.).

SOLENOID/PRESSURE SWITCH ASSY

DESCRIPTION

The Solenoid/Pressure Switch Assembly (Fig. 324) is external to the transaxle and mounted to the transaxle case. The assembly consists of four solenoids that control hydraulic pressure to the LR/CC, 2/4, OD, and UD friction elements. The reverse clutch is controlled by line pressure from the manual valve in the valve body. The solenoids are contained within the Solenoid/Pressure Switch Assembly, and can only be serviced by replacing the assembly.

The solenoid assembly also contains pressure switches that monitor and send hydraulic circuit information to the PCM/TCM. Likewise, the pressure switches can only be service by replacing the assembly.

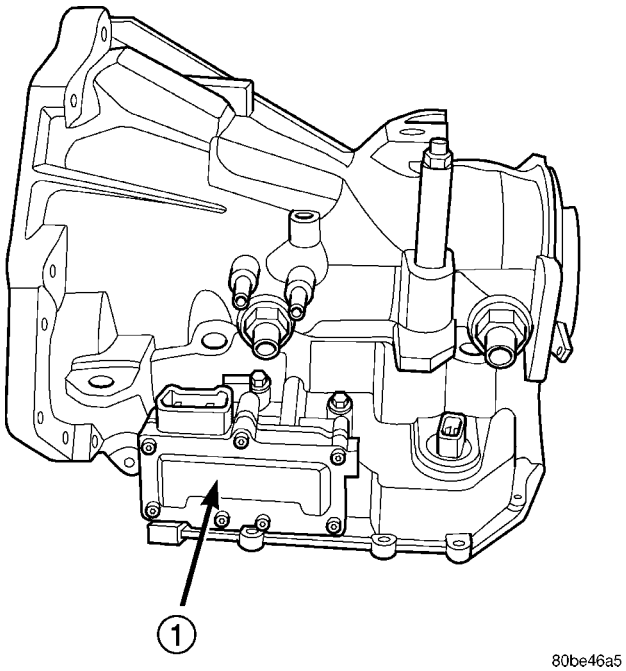

Fig. 324 Solenoid/Pressure Switch Assembly

1 - SOLENOID AND PRESSURE SWITCH ASSEMBLY

OPERATION

SOLENOIDS

The solenoids receive electrical power from the Transmission Control Relay through a single wire. The PCM/TCM energizes or operates the solenoids individually by grounding the return wire of the solenoid needed. When a solenoid is energized, the solenoid valve shifts, and a fluid passage is opened or closed (vented or applied), depending on its default operating state. The result is an apply or release of a frictional element.

The 2/4 and UD solenoids are normally applied, which by design allow fluid to pass through in their relaxed or “off” state. This allows transaxle limp-in (P,R,N,2) in the event of an electrical failure.

The continuity of the solenoids and circuits are periodically tested. Each solenoid is turned on or off depending on its current state. An inductive spike should be detected by the PCM/TCM during this test. It no spike is detected, the circuit is tested again to verify the failure. In addition to the periodic testing, the solenoid circuits are tested if a speed ratio or pressure switch error occurs.

SOLENOID/PRESSURE SWITCH ASSY (Continued)

PRESSURE SWITCHES

The PCM/TCM relies on three pressure switches to monitor fluid pressure in the L/R, 2/4, and OD hydraulic circuits. The primary purpose of these switches is to help the PCM/TCM detect when clutch circuit hydraulic failures occur. The range for the pressure switch closing and opening points is 11-23 psi. Typically the switch opening point will be approximately one psi lower than the closing point. For example, a switch may close at 18 psi and open at 17 psi. The switches are continuously monitored by the PCM/TCM for the correct states (open or closed) in each gear as shown in the following chart:

PRESSURE SWITCH STATES

GEAR	L/R	2/4	OD
R	OP	OP	OP
P/N	CL	OP	OP
1st	CL	OP	OP
2nd	OP	CL	OP
D	OP	OP	CL
OD	OP	CL	CL

OP = OPEN

CL = CLOSED

A Diagnostic Trouble Code (DTC) will set if the PCM/TCM senses any switch open or closed at the wrong time in a given gear.

The PCM/TCM also tests the 2/4 and OD pressure switches when they are normally off (OD and 2/4 are tested in 1st gear, OD in 2nd gear, and 2/4 in 3rd gear). The test simply verifies that they are operational, by looking for a closed state when the corresponding element is applied. Immediately after a shift into 1st, 2nd, or 3rd gear with the engine speed above 1000 rpm, the PCM/TCM momentarily turns on element pressure to the 2/4 and/or OD clutch circuits to identify that the appropriate switch has closed. If it doesn't close, it is tested again. If the switch fails to close the second time, the appropriate Diagnostic Trouble Code (DTC) will set.

REMOVAL

(1) Disconnect the battery cables.

(2) Remove air cleaner assembly (Fig. 325).

(3) Remove the battery hold down clamp and remove the battery (Fig. 326).

1 - SOLENOID/PRESSURE SWITCH ASSEMBLY
2 - GASKET

INSTALLATION

(1) Install solenoid/pressure switch assembly to case using a new gasket (Fig. 330).

SOLENOID/PRESSURE SWITCH ASSY (Continued)

(2) Install bolts and torque to 13 N·m (110 in. lbs.) (Fig. 329).
(3) Install 8-way connector and torque screw to 4 N·m (35 in. lbs.).
(4) Uncap and install transmission oil cooler lines.
(5) Install input speed sensor (Fig. 328) and torque to 27 N·m (20 ft. lbs.).
(6) Install the battery tray (Fig. 327).
(7) Install the battery and hold down clamp (Fig. 326).
(8) Install air cleaner assembly (Fig. 325).
(9) Connect battery cables.
(10) Perform Transaxle Quick Learn Procedure. Refer to SERVICE PROCEDURES.

SPEED SENSOR - INPUT

DESCRIPTION

The Input Speed Sensor is a two-wire magnetic pickup device that generates AC signals as rotation occurs. It is threaded into the transaxle case (Fig. 331), sealed with an o-ring (Fig. 332), and is considered a primary input to the Powertrain/Transmission Control Module.

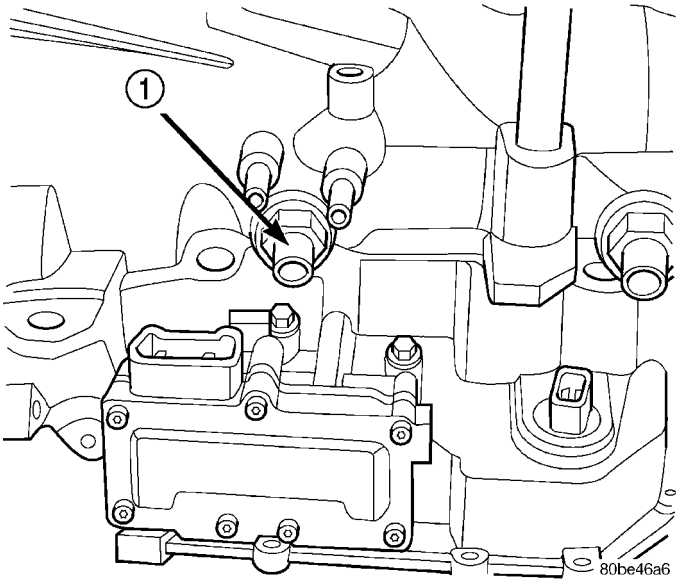

Fig. 331 Input Speed Sensor Location

1 - INPUT SPEED SENSOR

OPERATION

The Input Speed Sensor provides information on how fast the input shaft is rotating. As the teeth of the input clutch hub pass by the sensor coil (Fig. 333), an AC voltage is generated and sent to the PCM/TCM. The PCM/TCM interprets this information as input shaft rpm.

The PCM/TCM compares the input speed signal with output speed signal to determine the following:

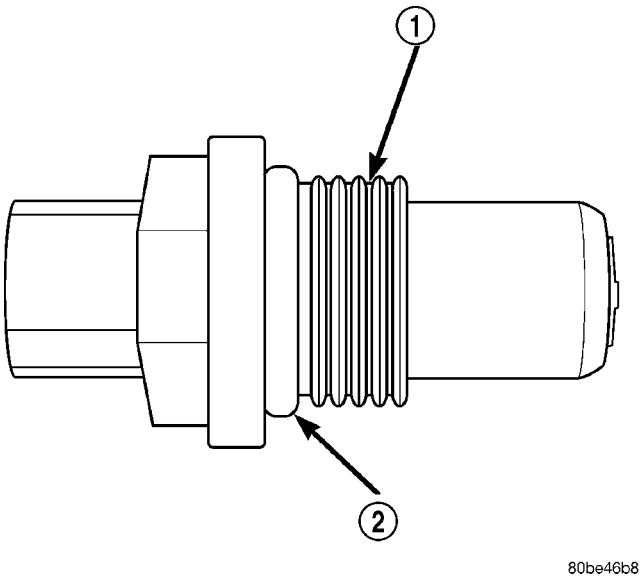

Fig. 332 O-Ring Location

1 - INPUT SPEED SENSOR
2 - O-RING

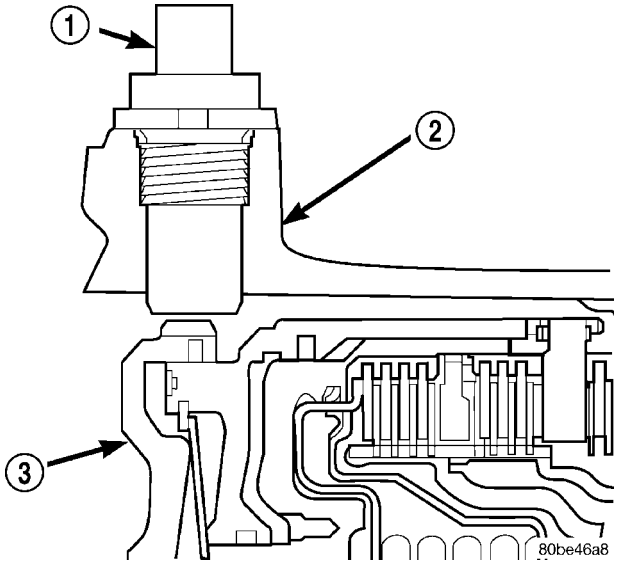

Fig. 333 Sensor Relation to Input Clutch Hub

1 - INPUT SPEED SENSOR

SPEED SENSOR - INPUT (Continued)

(5) Disconnect input speed sensor connector.
(6) Unscrew and remove input speed sensor (Fig. 337).
(7) Inspect speed sensor o-ring (Fig. 338) and replace if necessary.

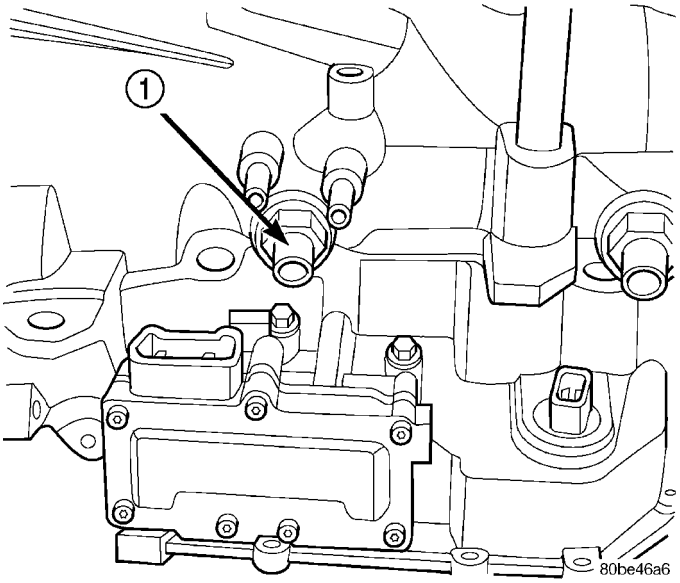

Fig. 337 Input (Turbine) Speed Sensor

1 - INPUT SPEED SENSOR

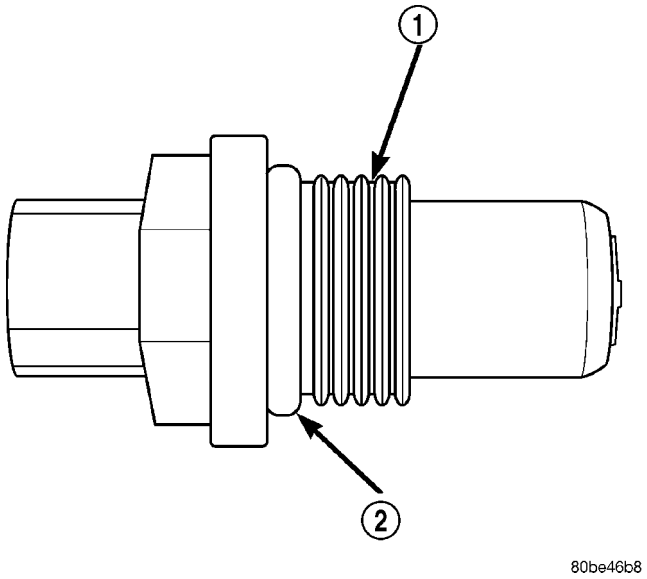

Fig. 338 O-Ring Location

1 - INPUT SPEED SENSOR
2 - O-RING

INSTALLATION

CAUTION: When disconnecting speed sensor connector, be sure that the connector weather seal does not fall off or remain in old sensor.

(1) Verify o-ring is installed into position.
(2) Install and tighten input speed sensor to 27 N·m (20 ft. lbs.).
(3) Connect speed sensor connector.
(4) Install the battery tray (Fig. 336).
(5) Install the battery and hold down clamp (Fig. 335).
(6) Install air cleaner assembly (Fig. 334).
(7) Connect battery cables.

SPEED SENSOR - OUTPUT

DESCRIPTION

The Output Speed Sensor is a two-wire magnetic pickup device that generates an AC signal as rotation occurs. It is threaded into the transaxle case (Fig. 339), sealed with an o-ring (Fig. 340), and is considered a primary input to the Powetrain/Transmission Control Module.

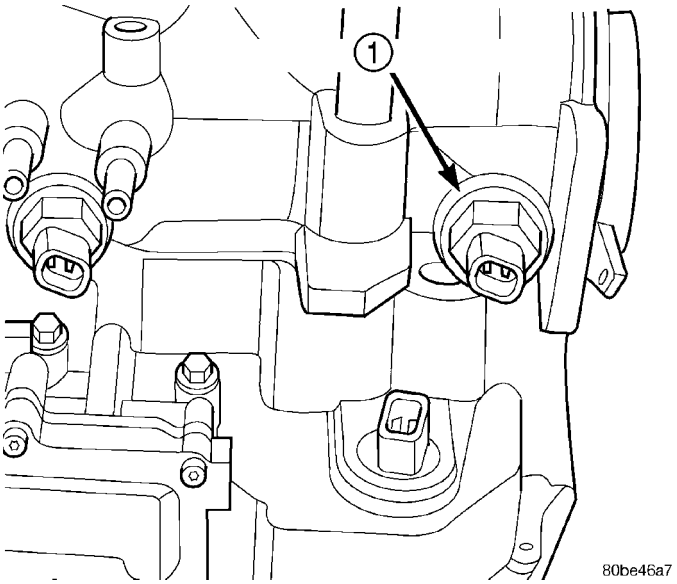

Fig. 339 Output Speed Sensor

1 - OUTPUT SPEED SENSOR

SPEED SENSOR - OUTPUT (Continued)

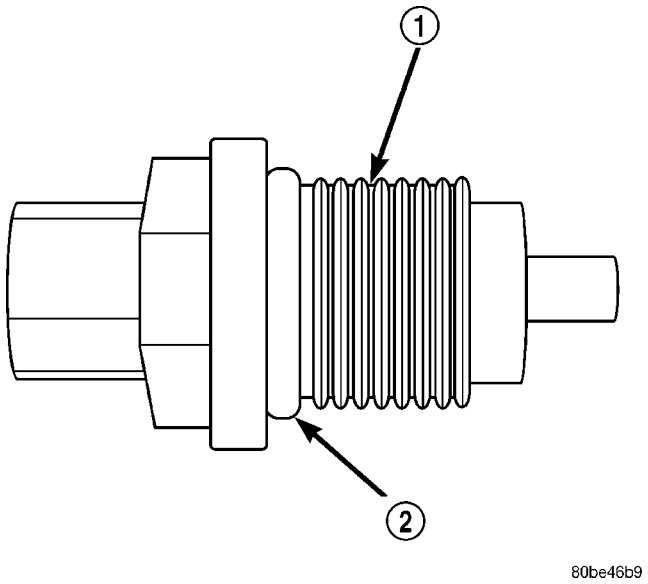

Fig. 340 O-Ring Location

1 - OUTPUT SPEED SENSOR
2 - O-RING

OPERATION

The Output Speed Sensor provides information on how fast the output shaft is rotating. As the rear planetary carrier park pawl lugs pass by the sensor coil (Fig. 341), an AC voltage is generated and sent to the PCM/TCM. The PCM/TCM interprets this information as output shaft rpm.

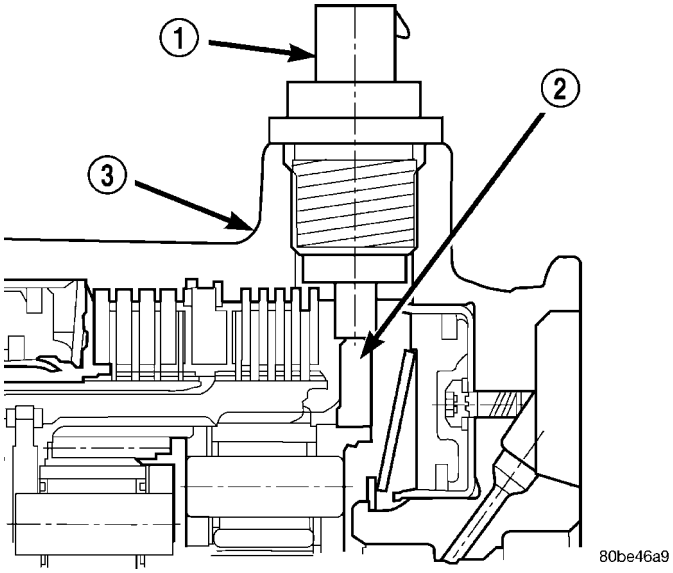

Fig. 341 Sensor Relation to Planet Carrier Park Pawl

1 - OUTPUT SPEED SENSOR
2 - REAR PLANET CARRIER/OUTPUT SHAFT ASSEMBLY
3 - TRANSAXLE CASE

The PCM/TCM compares the input and output speed signals to determine the following:

- Transmission gear ratio
- Speed ratio error detection
- CVI calculation

VEHICLE SPEED SIGNAL

The vehicle speed signal is taken from the Output Speed Sensor. The PCM converts this signal into a pulse per mile signal and sends the vehicle speed message across the communication bus to the BCM. The BCM sends this signal to the Instrument Cluster to display vehicle speed to the driver. The vehicle speed signal pulse is roughly 8000 pulses per mile.

REMOVAL

CAUTION: When disconnecting speed sensor connector, be sure that the connector weather seal does not fall off or remain in old sensor.

(1) Disconnect the battery cables.
(2) Remove air cleaner assembly (Fig. 342).

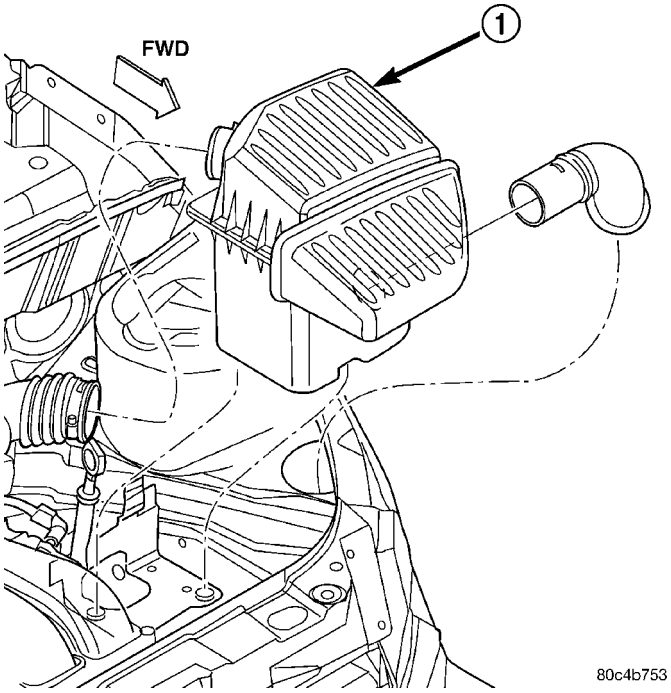

Fig. 342 Air Cleaner Assembly Removal/Installation

1 - AIR CLEANER ASSEMBLY

SPEED SENSOR - OUTPUT (Continued)

(3) Remove the battery hold down clamp and remove the battery (Fig. 343).

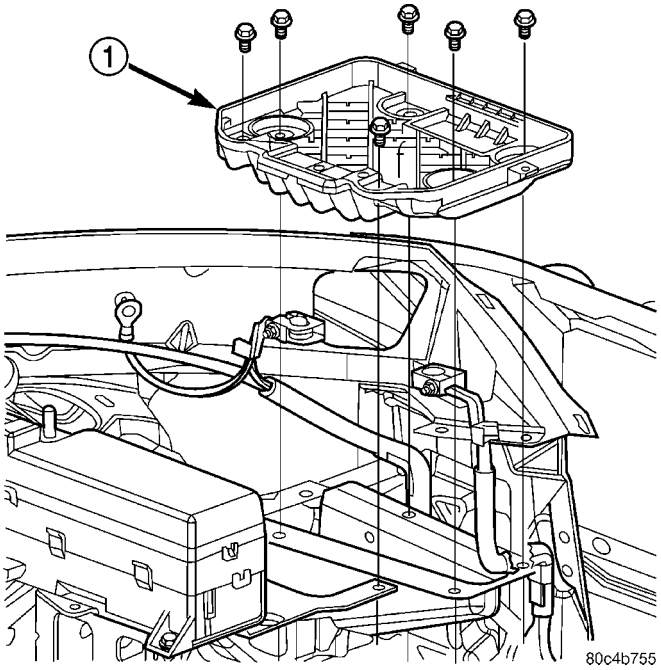

Fig. 344 Battery Tray Removal/Installation

1 - BATTERY TRAY

(5) Disconnect ouput speed sensor connector.

(6) Unscrew and remove output speed sensor (Fig. 345).

(7) Inspect speed sensor o-ring (Fig. 346) and replace if necessary.

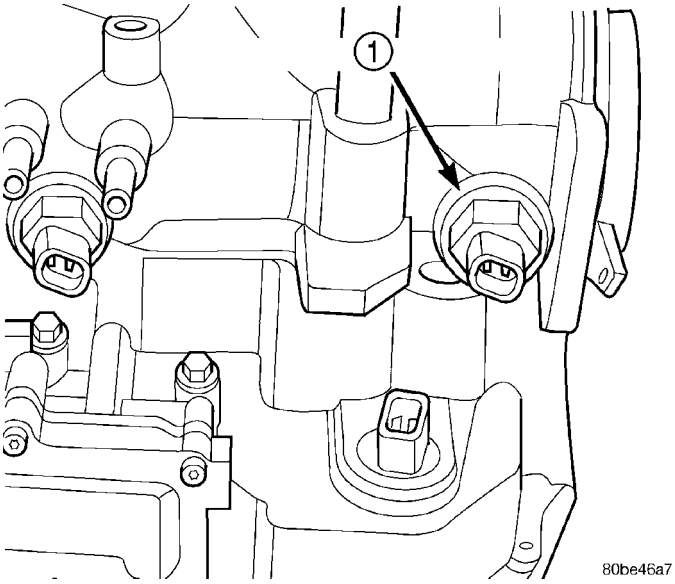

Fig. 345 Output Speed Sensor

1 - OUTPUT SPEED SENSOR

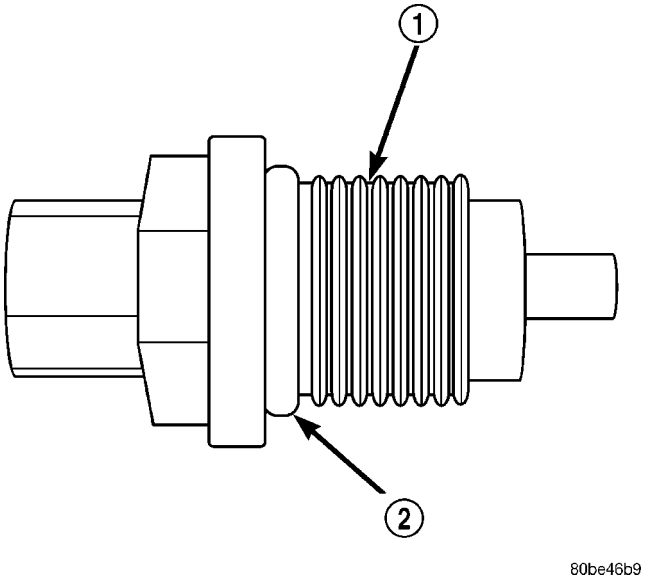

Fig. 346 O-Ring Location

1 - OUTPUT SPEED SENSOR
2 - O-RING

INSTALLATION

CAUTION: When disconnecting speed sensor connector, be sure that the connector weather seal does not fall off or remain in old sensor.

(1) Verify o-ring is installed into position (Fig. 346).

(2) Install and tighten output speed sensor to 27 N·m (20 ft. lbs.).

SPEED SENSOR - OUTPUT (Continued)

(3) Connect speed sensor connector.
(4) Install the battery tray (Fig. 344).
(5) Install the battery and hold down clamp (Fig. 343).
(6) Install air cleaner assembly (Fig. 342).

TORQUE CONVERTER

DESCRIPTION

The torque converter (Fig. 347) is a hydraulic device that couples the engine crankshaft to the transmission. The torque converter consists of an outer shell with an internal turbine, a stator, an overrunning clutch, an impeller and an electronically applied converter clutch. The converter clutch provides reduced engine speed and greater fuel economy when engaged. Clutch engagement also provides reduced transmission fluid temperatures. The converter clutch engages in third gear. The torque converter hub drives the transmission oil (fluid) pump.

The torque converter is a sealed, welded unit that is not repairable and is serviced as an assembly.

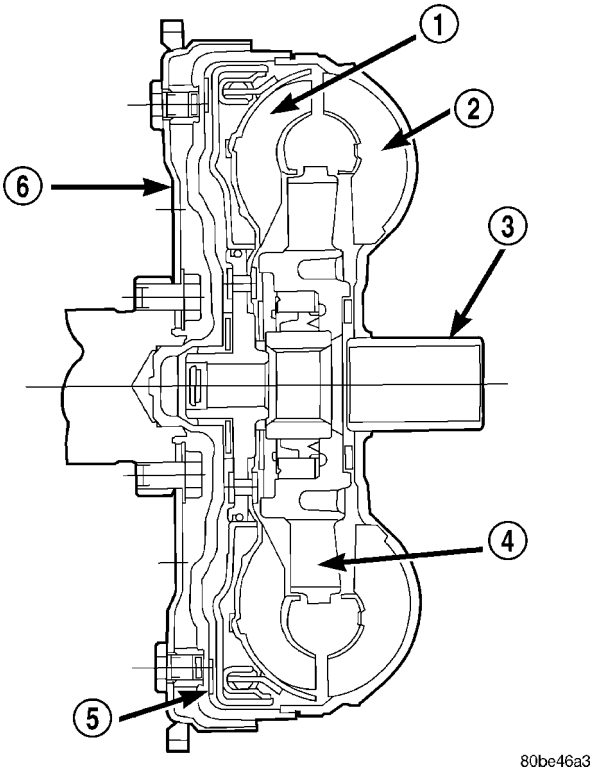

Fig. 347 Torque Converter Assembly

1 - TURBINE
2 - IMPELLER
3 - HUB
4 - STATOR
5 - CONVERTER CLUTCH DISC
6 - DRIVE PLATE

TORQUE CONVERTER (Continued)

IMPELLER

The impeller (Fig. 348) is an integral part of the converter housing. The impeller consists of curved blades placed radially along the inside of the housing on the transmission side of the converter. As the converter housing is rotated by the engine, so is the impeller, because they are one and the same and are the driving member of the system.

2 - OIL FLOW FROM IMPELLER SECTION INTO TURBINE SECTION
3 - IMPELLER VANES AND COVER ARE INTEGRAL
4 - ENGINE ROTATION
5 - ENGINE ROTATION

TORQUE CONVERTER (Continued)

TURBINE

The turbine (Fig. 349) is the output, or driven, member of the converter. The turbine is mounted within the housing opposite the impeller, but is not attached to the housing. The input shaft is inserted through the center of the impeller and splined into the turbine. The design of the turbine is similar to the impeller, except the blades of the turbine are curved in the opposite direction.

2 - ENGINE ROTATION
3 - INPUT SHAFT
4 - PORTION OF TORQUE CONVERTER COVER
5 - ENGINE ROTATION
6 - OIL FLOW WITHIN TURBINE SECTION

TORQUE CONVERTER (Continued)

STATOR

The stator assembly (Fig. 350) is mounted on a stationary shaft which is an integral part of the oil pump. The stator is located between the impeller and turbine within the torque converter case (Fig. 351). The stator contains an over-running clutch, which allows the stator to rotate only in a clockwise direction. When the stator is locked against the over-running clutch, the torque multiplication feature of the torque converter is operational.

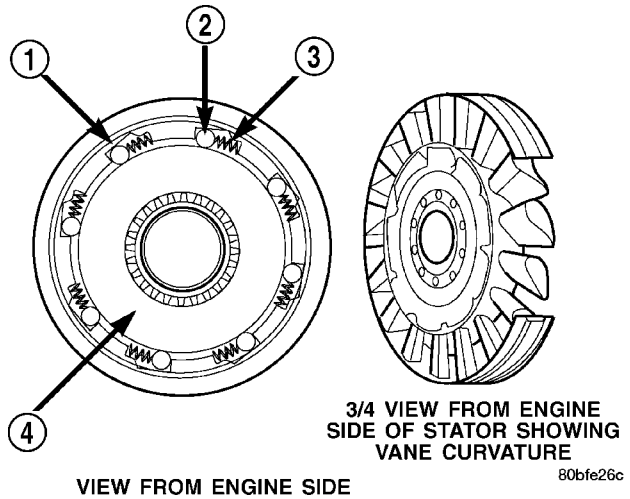

Fig. 350 Stator Components

1 - CAM (OUTER RACE)
2 - ROLLER
3 - SPRING
4 - INNER RACE

TORQUE CONVERTER CLUTCH (TCC)

The TCC (Fig. 352) was installed to improve the efficiency of the torque converter that is lost to the slippage of the fluid coupling. Although the fluid coupling provides smooth, shock–free power transfer, it is natural for all fluid couplings to slip. If the impeller and turbine were mechanically locked together, a zero slippage condition could be obtained. A hydraulic piston was added to the turbine, and a friction material was added to the inside of the front cover to provide this mechanical lock-up.

OPERATION

The converter impeller (Fig. 353) (driving member), which is integral to the converter housing and bolted to the engine drive plate, rotates at engine speed. The converter turbine (driven member), which reacts from fluid pressure generated by the impeller, rotates and turns the transmission input shaft.

TURBINE

As the fluid that was put into motion by the impeller blades strikes the blades of the turbine, some of the energy and rotational force is transferred into the turbine and the input shaft. This causes both of them (turbine and input shaft) to rotate in a clockwise direction following the impeller. As the fluid is leav-

2 - THE PISTON MOVES SLIGHTLY FORWARD
3 - RELEASE PRESSURE
4 - THE PISTON MOVES SLIGHTLY REARWARD

ing the trailing edges of the turbine's blades it continues in a "hindering" direction back toward the impeller. If the fluid is not redirected before it strikes the impeller, it will strike the impeller in such a direction that it would tend to slow it down.

STATOR

Torque multiplication is achieved by locking the stator's over-running clutch to its shaft (Fig. 354). Under stall conditions (the turbine is stationary), the oil leaving the turbine blades strikes the face of the stator blades and tries to rotate them in a counter-clockwise direction. When this happens the over–running clutch of the stator locks and holds the stator from rotating. With the stator locked, the oil strikes the stator blades and is redirected into a "helping" direction before it enters the impeller. This circulation of oil from impeller to turbine, turbine to stator, and stator to impeller, can produce a maximum torque multiplication of about 2.4:1. As the turbine begins to match the speed of the impeller, the fluid that was hitting the stator in such as way as to cause it to lock–up is no longer doing so. In this condition of operation, the stator begins to free wheel and the converter acts as a fluid coupling.

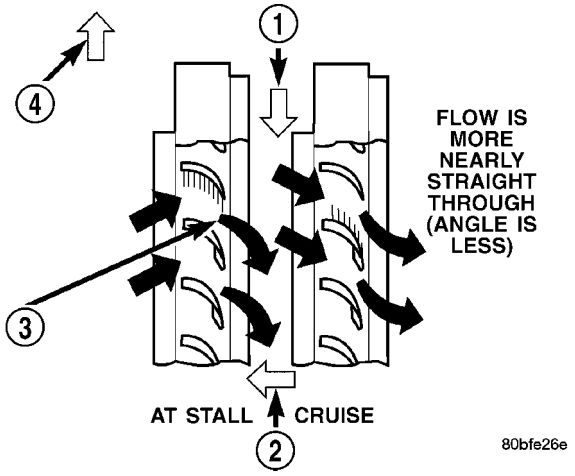

Fig. 354 Stator Operation

1 - DIRECTION STATOR WILL FREE WHEEL DUE TO OIL PUSHING ON BACKSIDE OF VANES
2 - FRONT OF ENGINE
3 - INCREASED ANGLE AS OIL STRIKES VANES
4 - DIRECTION STATOR IS LOCKED UP DUE TO OIL PUSHING AGAINST STATOR VANES

TORQUE CONVERTER (Continued)

TORQUE CONVERTER CLUTCH (TCC)

In a standard torque converter, the impeller and turbine are rotating at about the same speed and the stator is freewheeling, providing no torque multiplication. By applying the turbine's piston to the front cover's friction material, a total converter engagement can be obtained. The result of this engagement is a direct 1:1 mechanical link between the engine and the transmission.

The engagement and disengagement of the TCC are automatic and controlled by the Powertrain Control Module (PCM). The engagement cannot be activated in the lower gears because it eliminates the torque multiplication effect of the torque converter necessary for acceleration. Inputs that determine clutch engagement are: coolant temperature, vehicle speed and throttle position. The torque converter clutch is engaged by the clutch solenoid on the valve body. The clutch will engage at approximately 56 km/h (35 mph) with light throttle, after the shift to third gear.

REMOVAL

(1) Remove transmission and torque converter from vehicle. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 41TE - REMOVAL)

(2) Place a suitable drain pan under the converter housing end of the transmission.

CAUTION: Verify that transmission is secure on the lifting device or work surface, the center of gravity of the transmission will shift when the torque converter is removed creating an unstable condition. The torque converter is a heavy unit. Use caution when separating the torque converter from the transmission.

(3) Pull the torque converter forward until the center hub clears the oil pump seal.

(4) Separate the torque converter from the transmission.

INSTALLATION

Check converter hub and drive notches for sharp edges, burrs, scratches, or nicks. Polish the hub and notches with 320/400 grit paper or crocus cloth if necessary. The hub must be smooth to avoid damaging the pump seal at installation.

(1) Lubricate converter hub and oil pump seal lip with transmission fluid.

(2) Place torque converter in position on transmission.

CAUTION: Do not damage oil pump seal or bushing while inserting torque converter into the front of the transmission.

(3) Align torque converter to oil pump seal opening.

(4) Insert torque converter hub into oil pump.

(5) While pushing torque converter inward, rotate converter until converter is fully seated in the oil pump gears.

(6) Check converter seating with a scale and straightedge (Fig. 355). Surface of converter lugs should be 1/2 in. to rear of straightedge when converter is fully seated.

(7) If necessary, temporarily secure converter with C-clamp attached to the converter housing.

(8) Install the transmission in the vehicle. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 41TE - INSTALLATION)

(9) Fill the transmission with the recommended fluid. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 41TE/FLUID - STANDARD PROCEDURE)

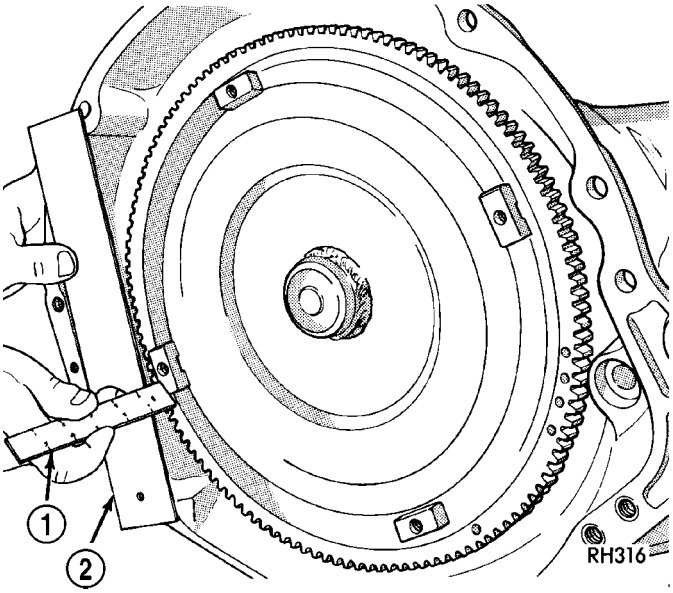

Fig. 355 Checking Torque Converter Seating

2 - STRAIGHTEDGE

TRANSMISSION CONTROL RELAY

DESCRIPTION

The transmission control relay is located in the Power Distribution Center (PDC) on the left side of the engine compartment between the brake master cylinder and the air cleaner assembly (Fig. 356).

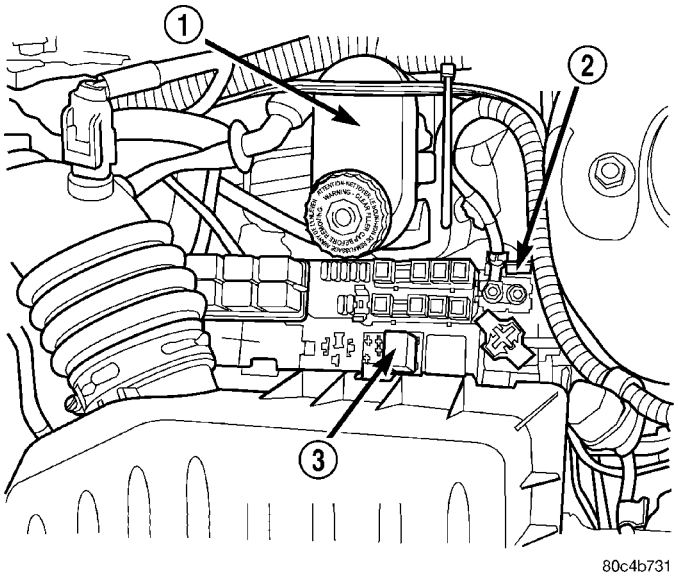

Fig. 356 Transmission Control Relay Location

1 - MASTER CYLINDER
2 - POWER DISTRIBUTION CENTER (PDC)
3 - TRANSMISSION CONTROL RELAY

OPERATION

The relay is supplied fused B+ voltage, energized by the PCM/TCM, and is used to supply power to the solenoid pack when the transmission is in normal operating mode. When the relay is “off”, no power is supplied to the solenoid pack and the transmission is in “limp-in” mode. After a controller reset (ignition key turned to the “run” position or after cranking engine), the PCM/TCM energizes the relay. Prior to this, the PCM/TCM verifies that the contacts are open by checking for no voltage at the switched battery terminals. After this is verified, the voltage at the solenoid pack pressure switches is checked. After the relay is energized, the PCM/TCM monitors the terminals to verify that the voltage is greater than 3 volts.

TRANSMISSION RANGE SENSOR

DESCRIPTION

The Transmission Range Sensor (TRS) is mounted to the top of the valve body inside the transaxle and can only be serviced by removing the valve body. The electrical connector extends through the transaxle case (Fig. 357).

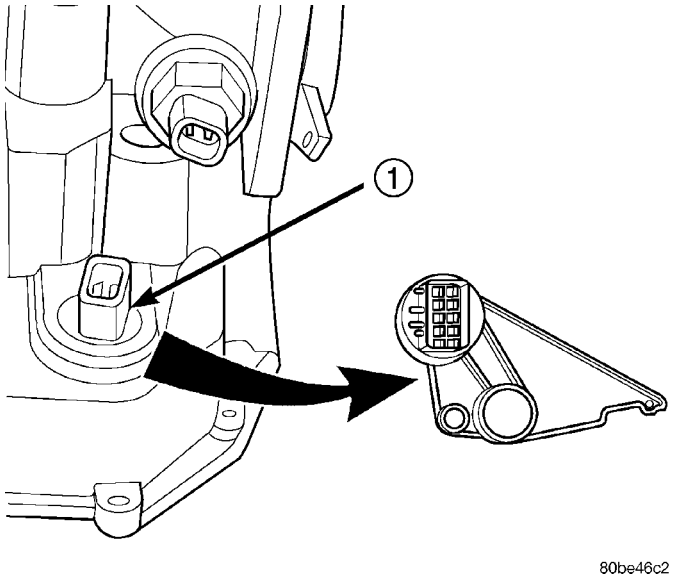

Fig. 357 Transmission Range Sensor (TRS) Location

1 - TRANSMISSION RANGE SENSOR

The Transmission Range Sensor (TRS) has four switch contacts that monitor shift lever position and send the information to the PCM/TCM.

The TRS also has an integrated temperature sensor (thermistor) that communicates transaxle temperature to the TCM and PCM (Fig. 358).

OPERATION

The Transmission Range Sensor (TRS) (Fig. 357) communicates shift lever position (SLP) to the PCM/TCM as a combination of open and closed switches. Each shift lever position has an assigned combination of switch states (open/closed) that the PCM/TCM receives from four sense circuits. The PCM/TCM interprets this information and determines the appropriate transaxle gear position and shift schedule.

Since there are four switches, there are 16 possible combinations of open and closed switches (codes). Seven of these codes are related to gear position and three are recognized as “between gear” codes. This results in six codes which should never occur. These are called “invalid” codes. An invalid code will result

TRANSMISSION RANGE SENSOR (Continued)

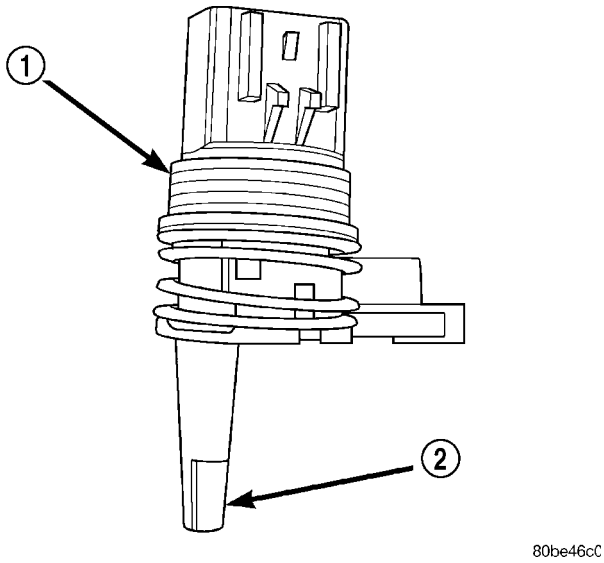

Fig. 358 Transmission Temperature Sensor

1 - TRANSMISSION RANGE SENSOR
2 - TEMPERATURE SENSOR

in a DTC, and the PCM/TCM will then determine the shift lever position based on pressure switch data. This allows reasonably normal transmission operation with a TRS failure.

TRS SWITCH STATES

SLP	T42	T41	T3	T1
P	CL	CL	CL	OP
R	CL	OP	OP	OP
N	CL	CL	OP	CL
OD	OP	OP	OP	CL
3	OP	OP	CL	OP
L	CL	OP	CL	CL

TRANSMISSION TEMPERATURE SENSOR

The TRS has an integrated thermistor (Fig. 358) that the PCM/TCM uses to monitor the transmission's sump temperature. Since fluid temperature can affect transmission shift quality and convertor lock up, the PCM/TCM requires this information to determine which shift schedule to operate in. The PCM also monitors this temperature data so it can energize the vehicle cooling fan(s) when a transmission "overheat" condition exists. If the thermistor circuit fails, the PCM/TCM will revert to calculated oil temperature usage.

CALCULATED TEMPERATURE

A failure in the temperature sensor or circuit will result in calculated temperature being substituted for actual temperature. Calculated temperature is a predicted fluid temperature which is calculated from a combination of inputs:

- Battery (ambient) temperature
- Engine coolant temperature
- In-gear run time since start-up

REMOVAL

The valve body assembly must be removed to gain access to and replace the transmission range sensor.

(1) Disconnect the battery cables.
(2) Remove air cleaner assembly (Fig. 359).

TRANSMISSION RANGE SENSOR (Continued)

INSTALLATION

The valve body assembly must be removed to gain access to and replace the transmission range sensor.

(1) Install transmission range sensor (Fig. 371).

(2) Tighten retaining screw (Fig. 370) to 5 N·m (45 in. lbs.).

(3) Install manual shaft seal (Fig. 369).

(4) Guide park rod rollers into guide bracket while installing valve body to the transaxle case (Fig. 367) (Fig. 368).

(5) Install the valve body-to-case bolts (Fig. 366) and torque to 12 N·m (105 in. lbs.).

(6) Install the oil filter (Fig. 365). Inspect the o-ring for damage and replace as necessary.

(7) Install an 1/8' bead of RTV as shown in (Fig. 364) and install pan to case.

(8) Install oil pan bolts (Fig. 363) and torque to 19 N·m (165 in. lbs.) torque.

(9) Lower vehicle.

(10) Connect transmission range sensor connector.

(11) Install manual valve lever to manual valve.

(12) Install gear shift cable to manual valve lever (Fig. 362).

(13) Install the battery tray (Fig. 361).

(14) Install the battery and hold down clamp (Fig. 360).

(15) Install air cleaner assembly (Fig. 359).

(16) Connect battery cables.

(17) Fill transaxle with ATF+4 (Automatic Transmission Fluid–Type 9602). Refer to Fluid Level and Condition in this Group.

VALVE BODY

DESCRIPTION

The valve body assembly consists of a cast aluminum valve body, a separator plate, and transfer plate. The valve body contains valves and check balls that control fluid delivery to the torque converter clutch, solenoid/pressure switch assembly, and frictional clutches. The valve body contains the following components (Fig. 372):

- Regulator valve
- Solenoid switch valve
- Manual valve
- Converter clutch switch valve
- Converter clutch control valve
- Torque converter regulator valve
- Low/Reverse switch valve

In addition, the valve body also contains the thermal valve, #2,3&4 check balls, the #5 (overdrive) check valve and the 2/4 accumulator assembly. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 41TE/VALVE BODY - DISASSEMBLY)

OPERATION

NOTE: Refer to the Hydraulic Schematics for a visual aid in determining valve location, operation and design.

REGULATOR VALVE

The regulator valve controls hydraulic pressure in the transaxle. It receives unregulated pressure from the pump, which works against spring tension to maintain oil at specific pressures. A system of sleeves and ports allows the regulator valve to work at one of three predetermined pressure levels. Regulated oil pressure is also referred to as “line pressure.”

SOLENOID SWITCH VALVE

The solenoid switch valve controls line pressure from the LR/CC solenoid. In one position, it allows the low/reverse clutch to be pressurized. In the other, it directs line pressure to the converter control and converter clutch valves.

MANUAL VALVE

The manual valve is operated by the mechanical shift linkage. Its primary responsibility is to send line pressure to the appropriate hydraulic circuits and solenoids. The valve has three operating ranges or positions.

CONVERTER CLUTCH SWITCH VALVE

The main responsibility of the converter clutch switch valve is to control hydraulic pressure applied to the front (off) side of the converter clutch piston. Line pressure from the regulator valve is fed to the torque converter regulator valve, where it passes through the valve, and is slightly regulated. The pressure is then directed to the converter clutch switch valve and to the front side of the converter clutch piston. This pressure pushes the piston back and disengages the converter clutch.

CONVERTER CLUTCH CONTROL VALVE

The converter clutch control valve controls the back (on) side of the torque converter clutch. When the PCM/TCM energizes or modulates the LR/CC solenoid to apply the converter clutch piston, both the converter clutch control valve and the converter control valve move, allowing pressure to be applied to the back side of the clutch.

T/C REGULATOR VALVE

The torque converter regulator valve slightly regulates the flow of fluid to the torque converter.

3 - L/R SWITCH VALVE
4 - CONVERTER CLUTCH CONTROL VALVE
5 - MANUAL VALVE
6 - CONVERTER CLUTCH SWITCH VALVE
7 - SOLENOID SWITCH VALVE
8 - REGULATOR VALVE

LOW/REVERSE SWITCH VALVE

The low/reverse clutch is applied from different sources, depending on whether low (1st) gear or reverse is selected. The low/reverse switch valve alternates positions depending on from which direction fluid pressure is applied. By design, when the valve is shifted by fluid pressure from one channel, the opposing channel is blocked. The switch valve alienates the possibility of a sticking ball check, thus providing consistent application of the low/reverse clutch under all operating conditions.

REMOVAL

(1) Disconnect the battery cables.
(2) Remove air cleaner assembly (Fig. 373).

INSTALLATION

NOTE: To ease installation of the valve body, turn the manual valve lever fully clockwise.

(1) Install overdrive and underdrive accumulators and springs as previously removed (Fig. 383).

(2) Guide park rod rollers into guide bracket while installing valve body to the transaxle case (Fig. 381) (Fig. 382).

(3) Install the valve body-to-case bolts (Fig. 380)and torque to 12 N·m (105 in. lbs.).

(4) Install the oil filter (Fig. 379). Inspect the o-ring for damage and replace as necessary.

(5) Install an 1/8' bead of RTV as shown in (Fig. 378)and install pan to case.

(6) Install oil pan bolts (Fig. 377) and torque to 19 N·m (165 in. lbs.) torque.

(7) Lower vehicle.

(8) Install manual valve lever to manual shaft (Fig. 376).

(9) Install gearshift cable to manual valve lever (Fig. 376).

(10) Install the battery tray (Fig. 375).

(11) Install the battery and hold down clamp (Fig. 374).

(12) Install air cleaner assembly (Fig. 373).

(13) Connect battery cables.

(14) Fill transaxle with fluid. Refer to SERVICE PROCEDURES for proper fluid fill procedure.

TIRES/WHEELS

DIAGNOSIS AND TESTING - TIRE AND WHEEL RUNOUT

NOTE: Runout should always be measured off the vehicle and on a suitable balance machine.

Radial runout is the difference between the high and low points on the outer edge of the tire or wheel.

Lateral runout is the total side-to-side wobble of the tire or wheel.

Radial runout of more than 1.5 mm (0.060 inch) measured at the center line of the tread may cause the vehicle to shake.

Lateral runout of more than 2.0 mm (0.080 inch) measured at the side of the tire as close to the tread as possible may cause the vehicle to shake.

Sometimes radial runout can be reduced by relocating the wheel and tire on the wheel studs (See Method 1). If this does not reduce runout to an acceptable level, the tire can be rotated on the wheel. (See Method 2).

TIRES/WHEELS (Continued)

METHOD 1 (RELOCATE WHEEL ON HUB)

Check accuracy of the wheel mounting surface; adjust wheel bearings (if applicable).

Drive vehicle a short distance to eliminate tire flat spotting from a parked position.

Verify all wheel nuts are tightened and torqued in the correct sequence (Fig. 1).

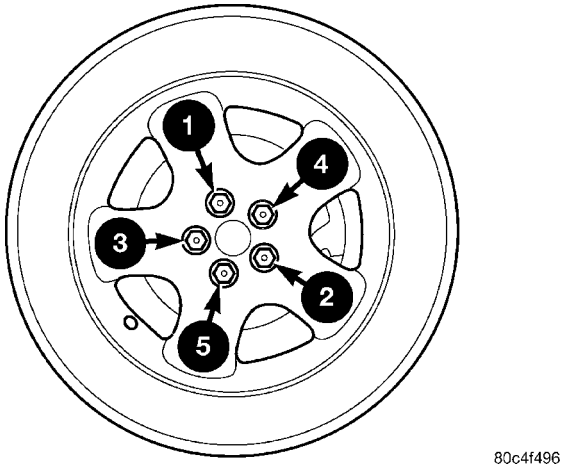

Fig. 1 Wheel Tightening Sequence

Use runout gauge D-128-TR to determine runout (Fig. 2).

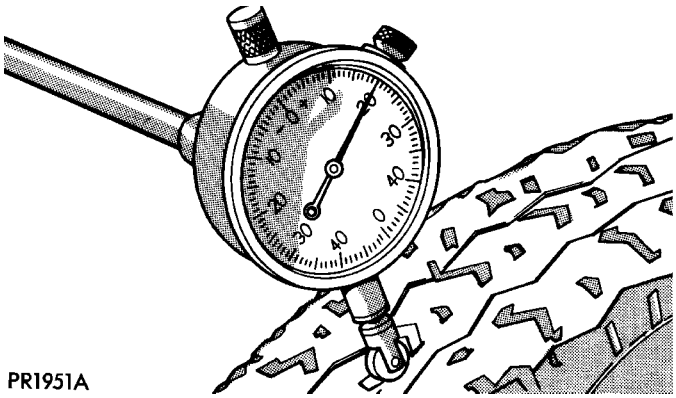

Fig. 2 Runout Gauge

Relocate the wheel on the mounting studs, two studs over from the original position.

Retighten wheel nuts until all are properly torqued. This will prevent brake distortion.

Check radial runout. If still excessive, mark tire sidewall, wheel, and stud at point of maximum runout (Fig. 3) and proceed to Method 2.

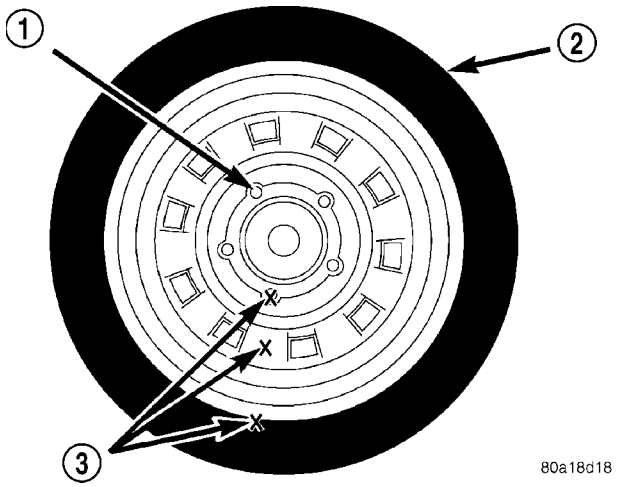

Fig. 3 Chalk Marking On Wheel, Tire And Stud

1 - STUD
2 - TIRE
3 - CHALK MARK LOCATIONS

METHOD 2 (RELOCATE TIRE ON WHEEL)

Rotating tire on wheel is particularly effective when there is runout in both tire and wheel.

Remove tire from wheel and remount wheel on hub in former position.

Check the radial runout of the wheel (Fig. 4). The radial runout should be no more than 0.762 mm (0.030 inch).

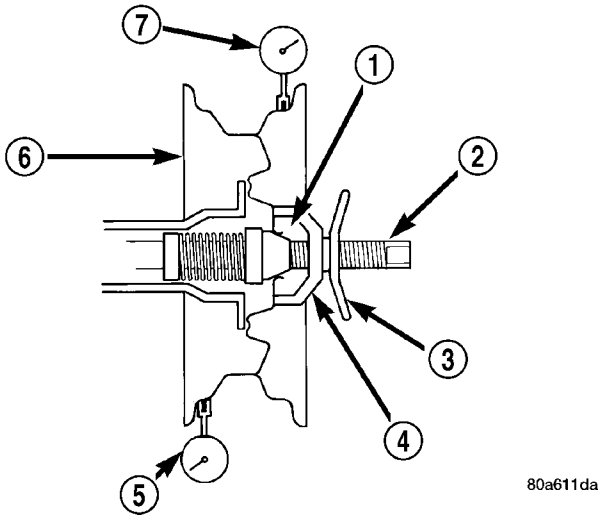

Fig. 4 Checking Wheel Radial Runout

1 - MOUNTING CONE
2 - SPINDLE SHAFT
3 - WING NUT
4 - PLASTIC CUP
5 - DIAL INDICATOR
6 - WHEEL
7 - DIAL INDICATOR

Check the lateral runout of the wheel (Fig. 5). The lateral runout should be no more than 0.762 mm (0.030 inch).

TIRES/WHEELS (Continued)

1 - MOUNTING CONE
2 - SPINDLE SHAFT
3 - WING NUT
4 - PLASTIC CUP
5 - DIAL INDICATOR
6 - WHEEL
7 - DIAL INDICATOR

If the point of greatest wheel radial runout is near the original chalk mark, remount the tire on the rim 180 degrees from its original position. Recheck the runout. If this does not reduce the runout to an acceptable level, replace the wheel or the tire.

STANDARD PROCEDURE

STANDARD PROCEDURE - TIRE AND WHEEL BALANCE

NOTE: Balance equipment must be calibrated and maintained per equipment manufacturer's specifications.

Wheel balancing can be accomplished with either on-vehicle or off-vehicle equipment.

NOTE: If using on-vehicle balancing equipment, on the driving axle, remove the opposite wheel and tire assembly.

It is recommended that a two-plane dynamic balancer be used when a wheel and tire assembly requires balancing. A static balancer should only be used when a two-plane balancer is not available.

Balance wheel and tire assemblies dynamically and statically to less than 0.25 (¼) ounce.

For static balancing, find location of heavy spot causing imbalance. Counter balance wheel directly opposite the heavy spot. Determine weight required to counterbalance the area of imbalance. Place half of this weight on the **inner** rim flange and the other half on the **outer** rim flange (Fig. 6).

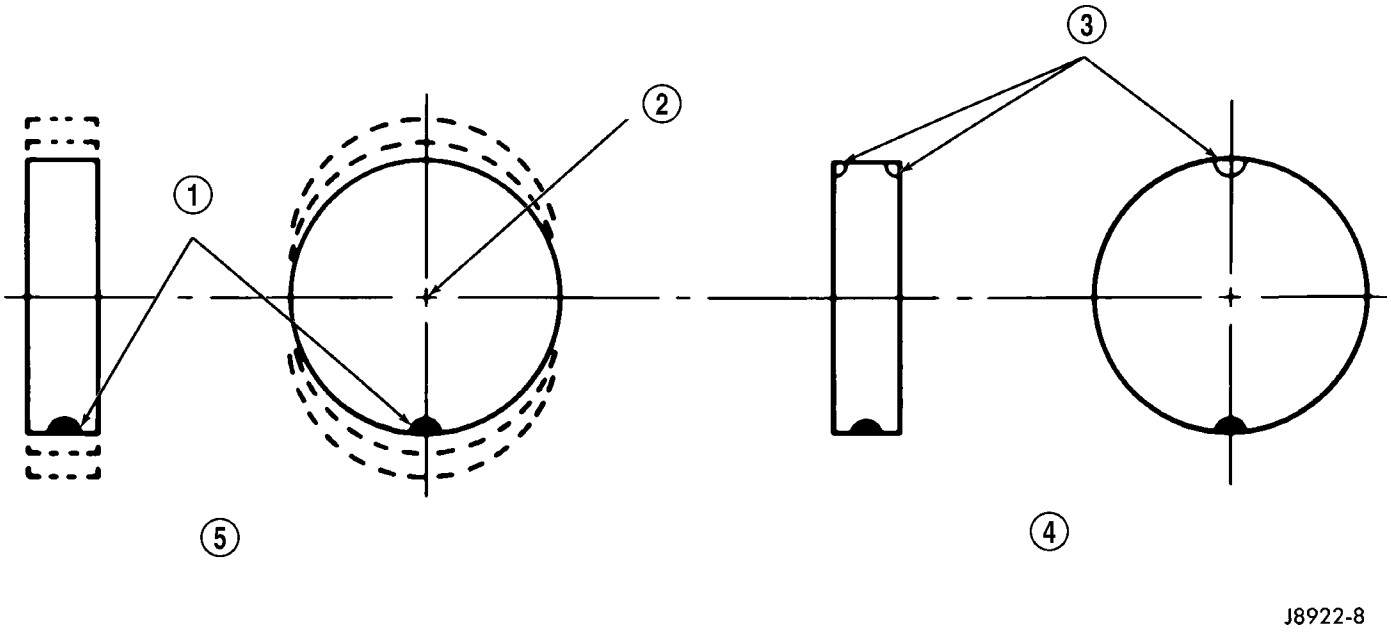

Fig. 6 Static Unbalance & Balance

1 - HEAVY SPOT
2 - CENTER LINE OF SPINDLE
3 - ADD BALANCE WEIGHTS HERE
4 - CORRECTIVE WEIGHT LOCATION
5 - TIRE OR WHEEL TRAMP, OR WHEEL HOP

TIRES/WHEELS (Continued)

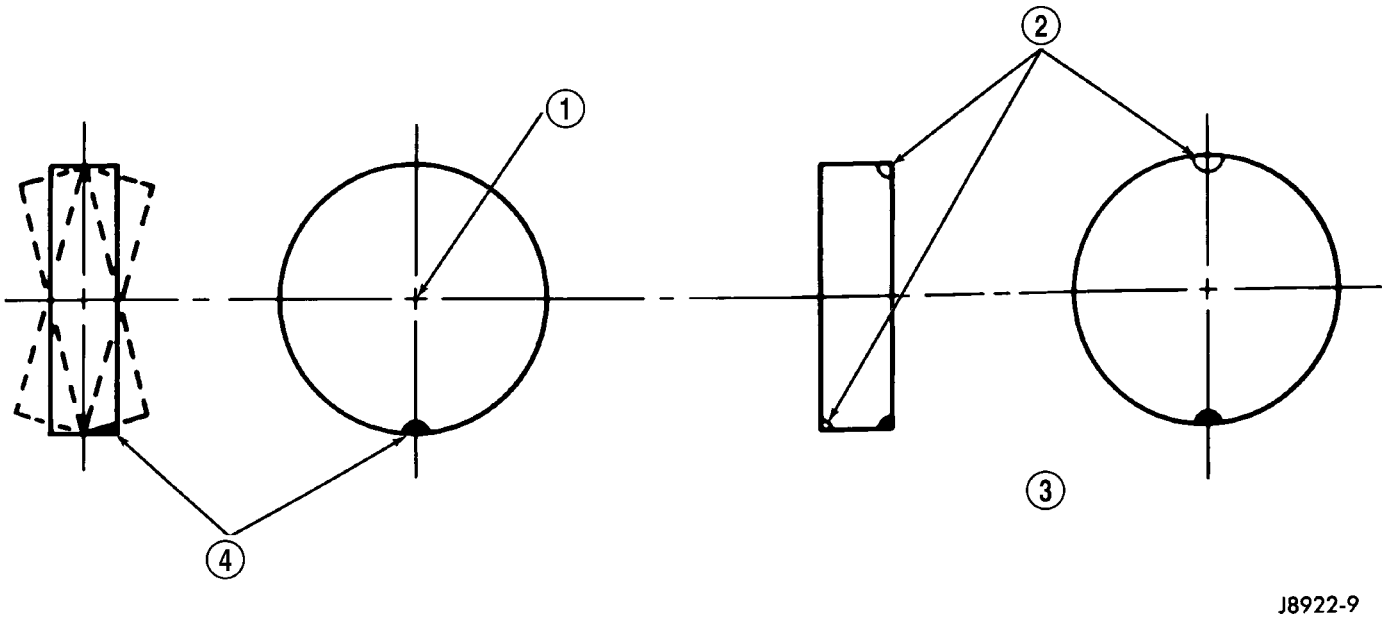

Fig. 7 Dynamic Unbalance & Balance

1 - CENTER LINE OF SPINDLE
2 - ADD BALANCE WEIGHTS HERE
3 - CORRECTIVE WEIGHT LOCATION
4 - HEAVY SPOT WHEEL SHIMMY AND VIBRATION

For dynamic balancing, the balance equipment is designed to indicate the location and amount of weight to be applied to both the inner and outer rim flanges (Fig. 7).

Aluminum wheels use unique wheel weights (Fig. 8). Each wheel weight is designed to fit the contoured surface of the wheel (Fig. 8). When balancing an aluminum wheel, the correct wheel weight must be used. Do not use any other type of wheel weight. It will not properly fit the contour of the wheel.

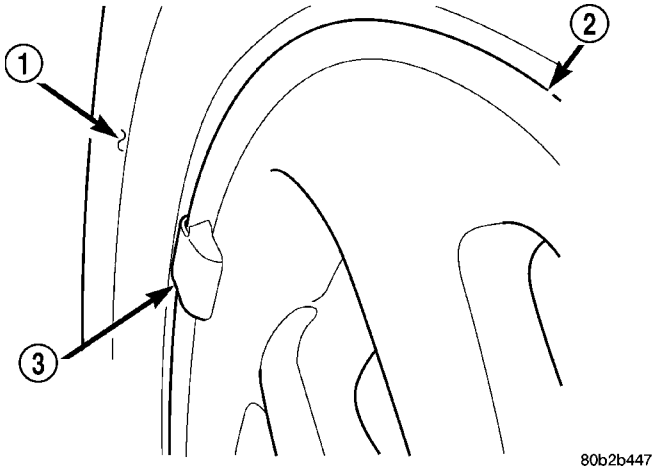

Fig. 8 Aluminum Wheel Weight

1 - TIRE
2 - WHEEL
3 - WHEEL WEIGHT

Always verify the Balance. When using off-vehicle equipment, rotate assembly 180 degrees on balance equipment to verify balance. Variation should not be more than 0.125 (⅛) ounce. If variation is more than 0.125 ounce, balancing equipment could be malfunctioning.

If difficult to balance, break down the wheel and tire assembly and check for loose debris inside tire. Prior to disassembly, mark (index) the tire at the valve stem. Use this mark in order to remount the tire in its original orientation with respect to the wheel.

STANDARD PROCEDURE - TIRE AND WHEEL MATCH MOUNTING

Steel wheels and tires are match mounted at the factory. This means that the high spot of the tire is matched to the low spot on the wheel rim. This technique is used to reduce runout in the wheel/tire assembly. The high spot on the tire is marked with a paint mark or a bright colored adhesive label on the outboard sidewall. The low spot on the rim is identified with a label on the outside of the rim and a dot or line in the drop well on the tire side of the rim. If the outside label has been removed the tire will have to be removed to locate the dot or line on the inside of the rim.

Before dismounting a tire from its wheel, a reference mark should be placed on the tire at the valve stem location. This reference will ensure that it is remounted in the original position on the wheel.

TIRES/WHEELS (Continued)

(1) Measure the total indicator runout on the center of the tire tread rib. Record the indicator reading. Mark the tire to indicate the high spot. Place a mark on the tire at the valve stem location (Fig. 9).

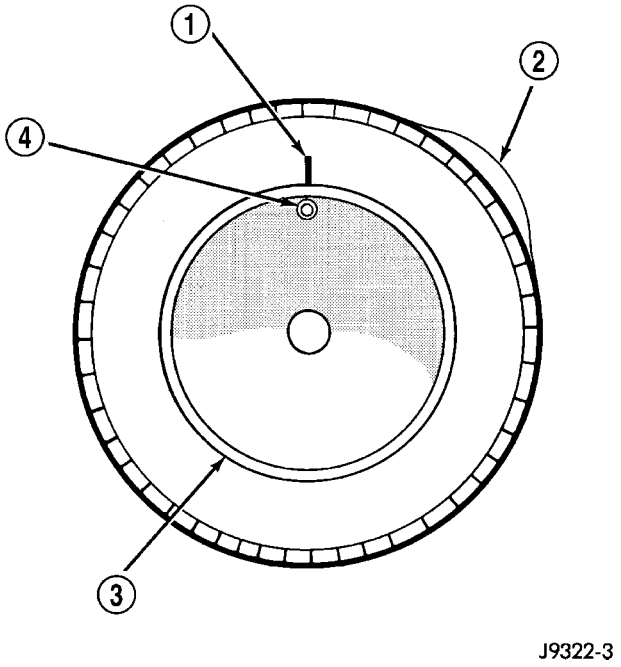

Fig. 9 First Measurement On Tire

1 - REFERENCE MARK
2 - 1ST MEASUREMENT

HIGH SPOT MARK TIRE AND RIM
3 - WHEEL
4 - VALVE STEM

(2) Break down the tire and remount it 180 degrees on the rim (Fig. 10).

(3) Measure the total indicator runout again. Mark the tire to indicate the high spot.

(4) If runout is still excessive (in excess of 1.524 mm or 0.060 in.), the following procedures must be done.

- If the new high spot is within 102 mm (4.0 in.) of the first spot on the tire and is still excessive, replace the tire.
- If the new high spot is within 102 mm (4.0 in.) of the first spot on the wheel, the wheel may be out of specifications. Refer to Tire and Wheel Runout.
- If the new high spot is NOT within 102 mm (4.0 in.) of either high spot, draw an arrow on the tread from new high spot to first. Break down the tire and remount it 90 degrees on rim in that direction (Fig. 11), then remeasure runout. This procedure will normally reduce the runout to an acceptable amount.

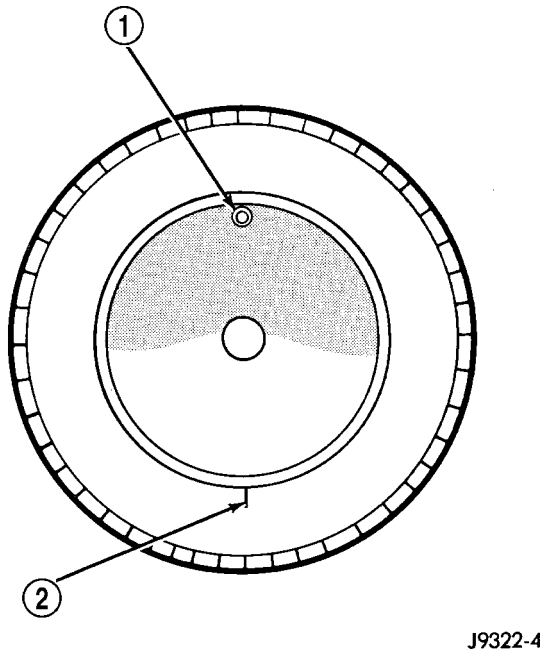

Fig. 10 Remount Tire 180 Degrees

1 - VALVE STEM
2 - REFERENCE MARK

2 - 1ST HIGH SPOT ON TIRE

TIRES/WHEELS (Continued)

STANDARD PROCEDURE - TIRE AND WHEEL ROTATION

NON-DIRECTIONAL TREAD PATTERN TIRES

Tires on the front and rear axles operate at different loads and perform different functions. For these reasons, they wear at unequal rates, and tend to develop irregular wear patterns. These effects can be reduced by timely rotation of tires. The benefits of rotation are especially worthwhile. Rotation will increase tread life, help to maintain mud, snow, and wet traction levels, and contribute to a smooth, quiet ride.

The suggested rotation method is the forward-cross tire rotation method (Fig. 12). This method takes advantage of current tire industry practice which allows rotation of radial-ply tires. Other rotation methods may be used, but may not have all the benefits of the recommended method.

NOTE: Only the 4 tire rotation method may be used if the vehicle is equipped with a low mileage or temporary spare tire.

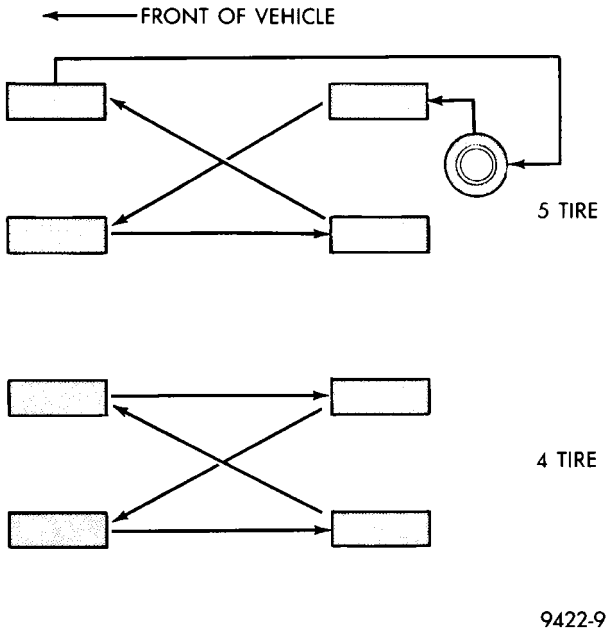

Fig. 12 Forward-Cross Tire Rotation Method

DIRECTIONAL TREAD PATTERN TIRES

Some vehicles are fitted with special high-performance tires having a directional tread pattern. These tires are designed to improve traction on wet pavement. To obtain the full benefits of this design, the tires must be installed so that they rotate in the correct direction. This is indicated by arrows on the tire sidewalls.

When wheels and tires are being installed, extra care is needed to ensure that this direction of rotation is maintained.

Refer to Owner's Manual for rotation schedule.

REMOVAL

REMOVAL - TIRE AND WHEEL ASSEMBLY (ALUMINUM WHEEL)

(1) Raise the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(2) If the wheel has a large center cap that covers the wheel mounting nuts, remove the cap by prying it off.

(3) Remove the wheel mounting nuts from the studs.

(4) Remove the tire and wheel assembly from the hub.

REMOVAL - TIRE AND WHEEL ASSEMBLY (STEEL WHEEL)

(1) Raise the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

CAUTION: When removing the bolt-on wheel cover, do not attempt to pry the wheel cover off the wheel.

(2) Unthread and remove the 5 nuts attaching the wheel and wheel cover to the vehicle (Fig. 13).

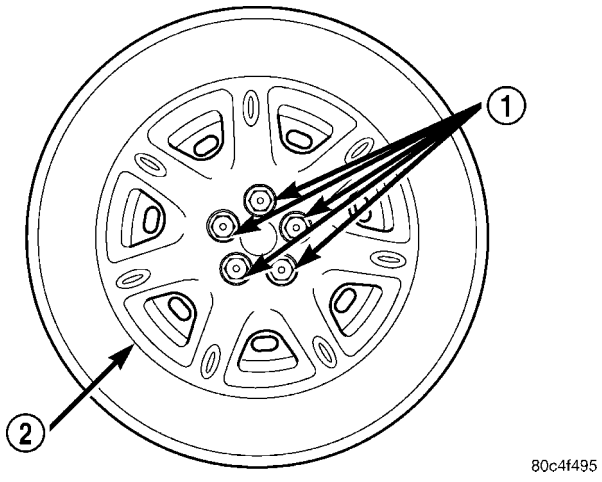

Fig. 13 Wheel And Cover Mounting

1 - WHEEL MOUNTING NUTS
2 - BOLT-ON WHEEL COVER

(3) Remove the wheel cover using care not to let the tire and wheel assembly fall off the vehicle.

(4) Remove the tire and wheel assembly from the hub.

TIRES/WHEELS (Continued)

INSTALLATION

INSTALLATION - TIRE AND WHEEL ASSEMBLY (ALUMINUM WHEEL)

CAUTION: Installing the wheel mounting nuts without having good metal-to-metal contact between the back of the wheel and the hub mounted brake disc or drum could cause the wheel to bind and eventually cause loosening of the wheel mounting nuts.

(1) Install the tire and wheel assembly on the hub studs against the hub mounted brake disc or drum using the hub pilot as a guide.

CAUTION: When installing the tire and wheel assembly, never use oil or grease on studs or nuts.

(2) Install and lightly tighten the wheel mounting nuts in the proper sequence (Fig. 14).

(3) Lower the vehicle.

(4) Progressively tighten the 5 wheel mounting nuts in the proper sequence until tightened to half of the specified torque (Fig. 14). Finally, tighten the wheel nuts in the proper sequence to a torque of 135 N·m (100 ft. lbs.).

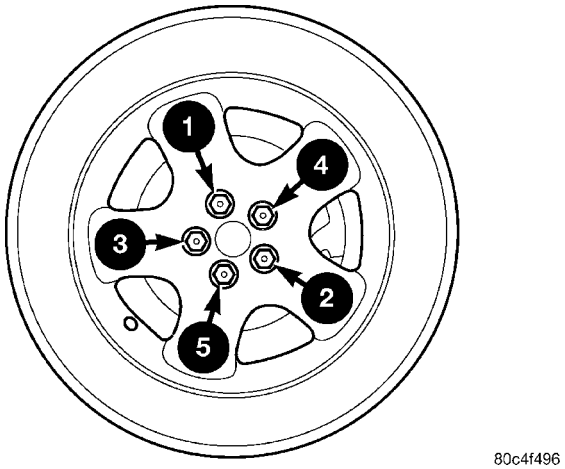

Fig. 14 Wheel Tightening Sequence

(5) If the wheel has a large center cap to cover the wheel mounting nuts, install the cap.

INSTALLATION - TIRE AND WHEEL ASSEMBLY (STEEL WHEEL)

CAUTION: Installing the wheel mounting nuts without having good metal-to-mental contact between the back of the wheel and the hub mounted brake disc or drum could cause the wheel to bind and eventually cause loosening of the wheel mounting nuts.

CAUTION: When installing the tire and wheel assembly, never use oil or grease on studs or nuts.

(1) Install the tire and wheel assembly on the wheel studs, up against the hub mounted brake disc or drum, using the hub pilot as a guide.

(2) Align the valve notch in the wheel cover with the valve stem on the wheel and install the wheel cover on the hub mounted studs.

(3) Install and lightly tighten the wheel mounting nuts in the proper sequence (Fig. 15).

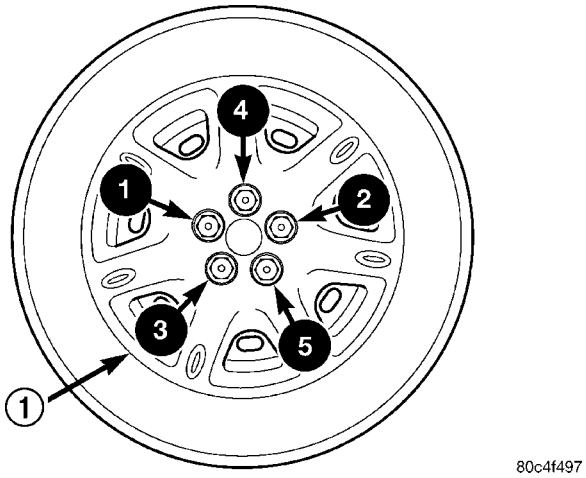

Fig. 15 Nut Tightening Sequence

1 - BOLT-ON WHEEL COVER

(4) Lower the vehicle.

(5) Progressively tighten the 5 wheel mounting nuts in the proper sequence until tightened to half of the specified torque (Fig. 15). Finally, tighten the wheel mounting nuts in the proper sequence to 135 N·m (100 ft. lbs.) torque.

TIRES

DESCRIPTION

DESCRIPTION - TIRE

Original equipment tires are designed and engineered for each specific vehicle. They provide the best overall performance for normal operation. The ride and handling characteristics match the vehicle's requirements. With proper care they will give excellent reliability, traction, skid resistance, and tread life.

Driving habits have more effect on tire life than any other factor. Careful drivers will obtain, in most cases, much greater mileage than severe use or careless drivers. A few of the driving habits which will shorten the life of any tire are:

- Rapid acceleration
- Severe application of brakes
- High-speed driving
- Taking turns at excessive speeds
- Striking curbs and other obstacles
- Operating vehicle with over or under inflated tire pressures

Radial ply tires are more prone to irregular tread wear. It is important to follow the tire rotation interval shown in the section on Tire And Wheel Rotation. This will help to achieve a greater tread-life potential.

TIRE IDENTIFICATION

Tire type, size, aspect ratio and speed rating are encoded in the letters and numbers imprinted on the side wall of the tire. Refer to the figure (Fig. 16) to interpret the tire identification code.

Performance tires will have a speed rating letter after the aspect ratio number. For example, the letter "S" indicates that the tire is speed rated up to 112 mph (180 km/h). The speed rating is not always printed on the tire sidewall.

- Q - up to 100 mph (160 km/h)
- S - up to 112 mph (180 km/h)
- T - up to 118 mph (190 km/h)
- U - up to 124 mph (200 km/h)
- H - up to 130 mph (210 km/h)
- V - up to 149 mph (240 km/h)
- Z - more than 149 mph (240 km/h) (consult the tire manufacturer for the specific speed rating)

An All Season type tire will have either M + S, M & S or M-S (indicating mud and snow traction) imprinted on the side wall.

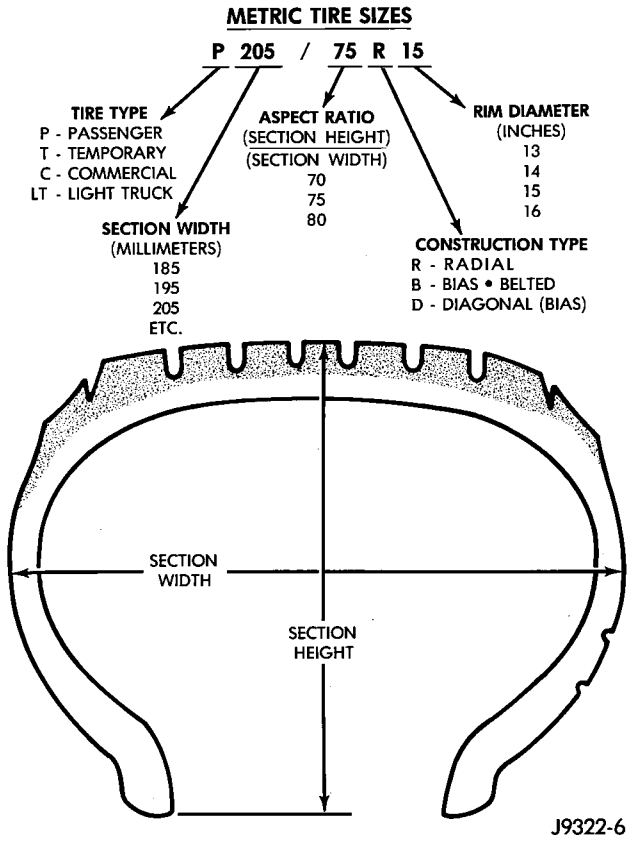

Fig. 16 TIRE IDENTIFICATION (TYPICAL)

TIRE CHAINS

Refer to the owners manual supplied with the vehicle to determine whether the use of tire chains is permitted on this vehicle.

DESCRIPTION - RADIAL-PLY TIRES

Radial-ply tires improve handling, tread life and ride quality, and decrease rolling resistance.

Radial-ply tires must always be used in sets of four. Under no circumstances should they be used on the front only. They may be mixed with temporary spare tires when necessary. A maximum speed of 80 km/h (50 mph) is recommended while a temporary spare is in use.

Radial-ply tires have the same load-carrying capacity as other types of tires of the same size. They also use the same recommended inflation pressures.

The use of oversized tires, either in the front or rear of the vehicle, can cause vehicle drive train failure. This could also cause inaccurate wheel speed signals when the vehicle is equipped with Antilock Brakes.

The use of tires from different manufactures on the same vehicle is NOT recommended. The proper tire pressure should be maintained on all four tires.

TIRES (Continued)

DESCRIPTION - REPLACEMENT TIRES

WARNING: FAILURE TO EQUIP THE VEHICLE WITH TIRES HAVING ADEQUATE SPEED CAPABILITY CAN RESULT IN SUDDEN TIRE FAILURE.

WARNING: IN ORDER TO MAINTAIN THE SPEED CAPABILITY OF THE VEHICLE, REPLACEMENT TIRES MUST HAVE SPEED RATINGS EQUAL TO OR HIGHER THAN THOSE FITTED TO THE VEHICLE AS ORIGINAL EQUIPMENT. IF TIRES WITH LOWER SPEED RATINGS ARE FITTED, THE VEHICLE'S HANDLING MAY BE AFFECTED AND THE SPEED CAPABILITY OF THE VEHICLE MAY BE LOWERED TO THE MAXIMUM SPEED CAPABILITY OF THE REPLACEMENT TIRES. TO AVOID AN ACCIDENT RESULTING IN SEVERE OR FATAL INJURY, CONSULT THE TIRE MANUFACTURER IN REGARDS TO MAXIMUM SPEED RATINGS.

It is recommended that tires equivalent to the original equipment tires be used when replacement is needed.

Failure to use equivalent replacement tires may adversely affect the safety and handling of the vehicle.

The original equipment tires provide a proper combination of many characteristics such as:

- Ride
- Noise
- Handling
- Durability
- Tread life
- Traction
- Rolling resistance
- Speed capability

The use of tires smaller than the minimum tire size approved for the vehicle can result in tire overloading and failure.

Use tires that have the approved load rating for the vehicle and never overload them. Failure to equip the vehicle with tires having adequate speed capability can result in sudden tire failure and loss of vehicle control.

The use of oversize tires may cause interference with vehicle components. Under extremes of suspension and steering travel, interference with vehicle components may cause tire damage.

DESCRIPTION - SPARE TIRE (TEMPORARY)

The compact temporary spare tire is designed for emergency use only. The original tire should be repaired or replaced at the first opportunity, then reinstalled. Do not exceed speeds of 80 km/h (50 mph) when using the temporary spare tire. Refer to Owner's Manual for complete details.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - TIRE NOISE OR VIBRATION

Radial-ply tires are sensitive to force impulses caused by improper mounting, vibration, wheel defects, or possibly tire imbalance.

To find out if tires are causing the noise or vibration, drive the vehicle over a smooth road at varying speeds. Note the noise level during acceleration and deceleration. The engine, differential and exhaust noises will change as speed varies, while the tire noise will usually remain constant.

DIAGNOSIS AND TESTING - TIRE WEAR PATTERNS

Under inflation will cause wear on the shoulders of tire. Over inflation will cause wear at the center of tire.

Excessive camber causes the tire to run at an angle to the road. One side of tread is then worn more than the other (Fig. 17).

Excessive toe-in or toe-out causes wear on the tread edges and a feathered effect across the tread (Fig. 17).

DIAGNOSIS AND TESTING - TREAD WEAR INDICATORS

Tread wear indicators are molded into the bottom of the tread grooves. When tread depth is 1.6 mm (1/16 in.), the tread wear indicators will appear as a 13 mm (1/2 in.) band (Fig. 18).

Tire replacement is necessary when indicators appear in two or more grooves or if localized balding occurs.

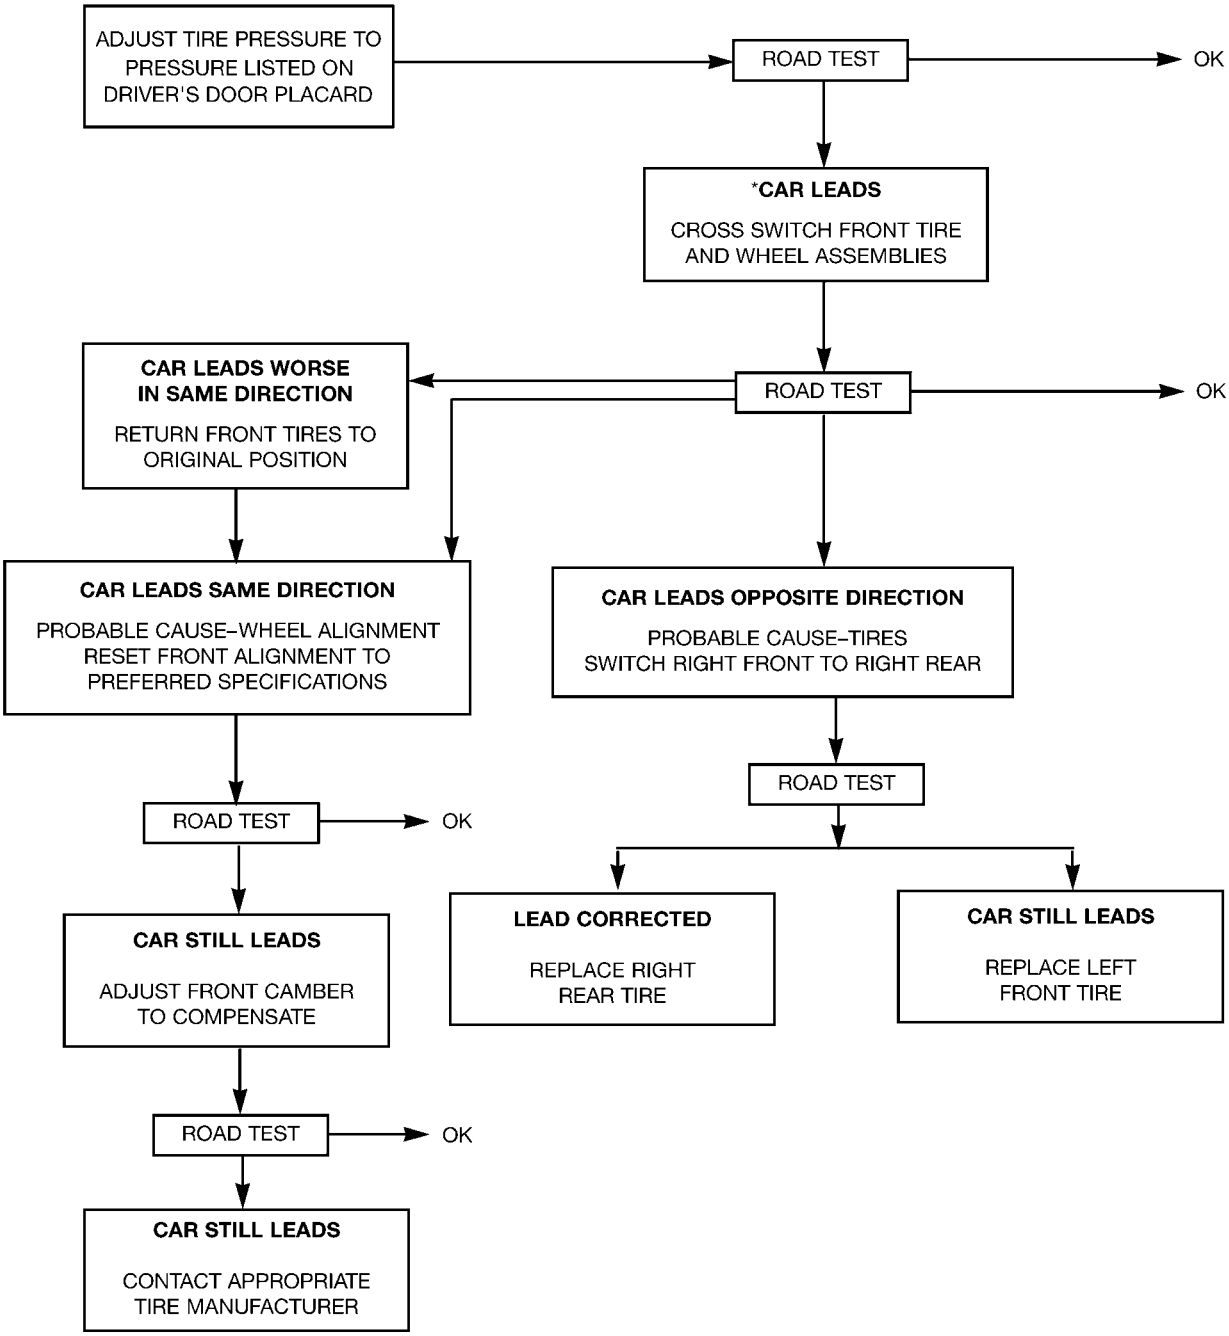
1 - TREAD ACCEPTABLE
2 - TREAD UNACCEPTABLE
3 - WEAR INDICATOR

DIAGNOSIS AND TESTING - VEHICLE LEAD DIAGNOSIS AND CORRECTION

Use the following chart to diagnose a vehicle that has a complaint of a drift or lead condition. The use of this chart will help to determine if the lead condition is the result of a bad tire or is caused by the wheel alignment.

TIRES (Continued)

VEHICLE LEAD DIAGNOSIS AND CORRECTION PROCEDURE



*NOTE: VERIFY THAT LEAD IS NOT RELATED TO STEERING WHEEL NOT CENTERED

TIRES (Continued)

STANDARD PROCEDURE

STANDARD PROCEDURE - TIRE INFLATION PRESSURES

The specified tire pressures have been chosen to provide safe operation, vehicle stability, and a smooth ride. The proper tire pressure specification can be found on the Tire Inflation Pressure Label provided with the vehicle (usually on the driver's side B-pillar).

A quality air pressure gauge is recommended to check tire air pressure. Tire pressure should be checked cold once per month. Check tire pressure more frequently when the weather temperature varies widely. Tire pressure will decrease when the outdoor temperature drops. After checking the air pressure, replace valve cap finger tight.

Inflation pressures specified on the Tire Inflation Pressure Label are always the cold inflation pressure of the tire. Cold inflation pressure is obtained after the vehicle has not been operated for at least 3 hours, or the vehicle is driven less than one mile after being inoperative for 3 hours. Tire inflation pressures may increase from 2 to 6 pounds per square inch (psi) during operation. Do not reduce this normal pressure buildup.

Improper inflation can cause:

- Uneven wear patterns
- Reduced tread life
- Reduced fuel economy
- Unsatisfactory ride
- The vehicle to drift.

WARNING: OVER OR UNDER INFLATED TIRES CAN AFFECT VEHICLE HANDLING. THE TIRE CAN FAIL SUDDENLY, RESULTING IN LOSS OF VEHICLE CONTROL.

Under inflation causes rapid shoulder wear, tire flexing, and can result in tire failure (Fig. 19).

Over inflation causes rapid center wear and loss of the tire's ability to cushion shocks (Fig. 20).

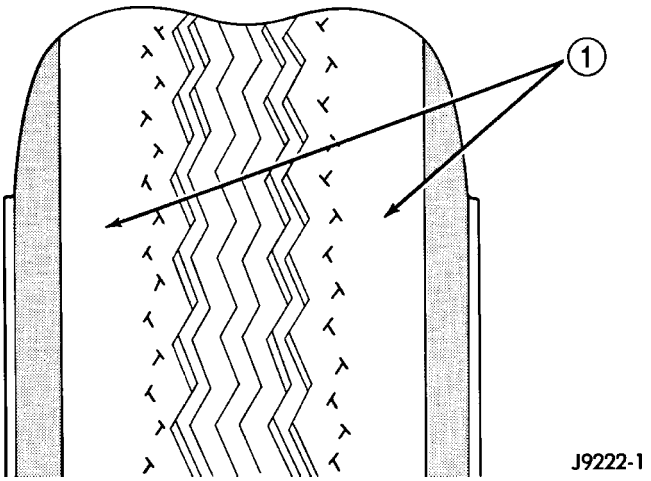

Fig. 19 Under Inflation Wear

1 - THIN TIRE TREAD AREAS

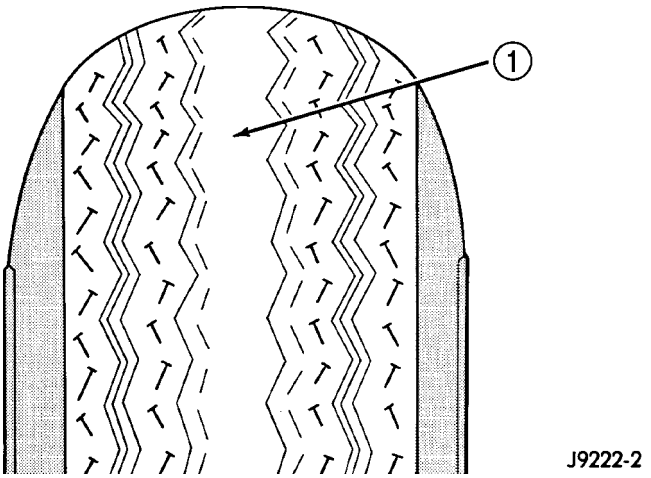

Fig. 20 Over Inflation Wear

1 - THIN TIRE TREAD AREA

STANDARD PROCEDURE - TIRE PRESSURE FOR HIGH SPEED OPERATION

DaimlerChrysler Corporation advocates driving at safe speeds within posted speed limits. Where speed limits allow the vehicle to be driven at high speeds, correct tire inflation pressure is very important. Vehicles loaded to maximum capacity should not be driven at continuous speeds over 120 km/h (75 mph). Never exceed the maximum speed capacity of the tire. For information on tire identification and speed ratings, (Refer to 22 - TIRES/WHEELS/TIRES - DESCRIPTION).

TIRES (Continued)

STANDARD PROCEDURE - TIRE LEAK REPAIRING

For proper repairing, a radial tire must be removed from the wheel. Repairs should only be made if the defect, or puncture, is in the tread area (Fig. 21). The tire should be replaced if the puncture is located in the sidewall.

Deflate tire completely before attempting to dismount the tire from the wheel. **Use a lubricant such as a mild soap solution when dismounting or mounting tire.** Use tools free of burrs or sharp edges which could damage the tire or wheel rim.

Before mounting tire on wheel, make sure all rust is removed from the rim bead and repaint if necessary.

Install wheel on vehicle, and progressively tighten the 5 wheel nuts to a torque of 135 N·m (100 ft. lbs.).

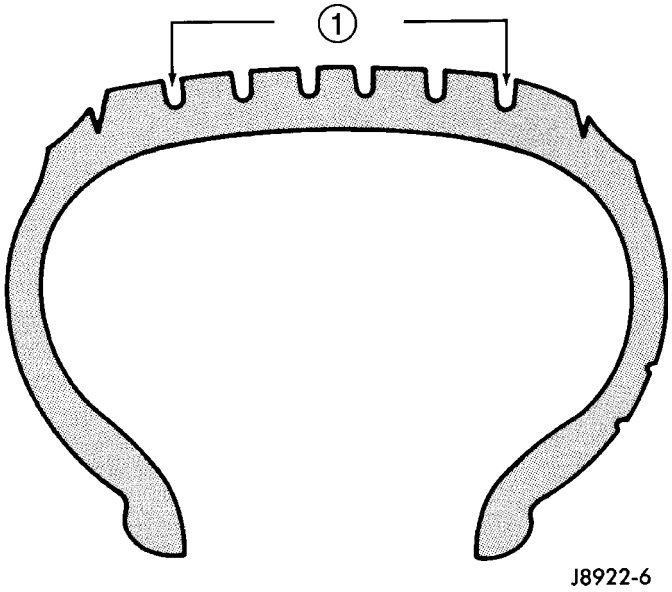

Fig. 21 Tire Repair Area

1 - REPAIRABLE AREA

CLEANING - TIRES

Before delivery of a vehicle, remove the protective coating on the tires with white sidewalls or raised white letters. To remove the protective coating, apply warm water and let it soak for a few minutes. Afterwards, scrub the coating away with a soft bristle brush. Steam cleaning may also be used to remove the coating.

CAUTION: DO NOT use gasoline, mineral oil, oil-based solvent or a wire brush for cleaning.

WHEELS

DESCRIPTION - WHEEL

Original equipment wheels are designed for proper operation at all loads up to the specified maximum vehicle capacity.

All models use steel or cast aluminum drop center wheels. Every wheel has raised sections between the rim flanges and rim drop well called safety humps (Fig. 22).

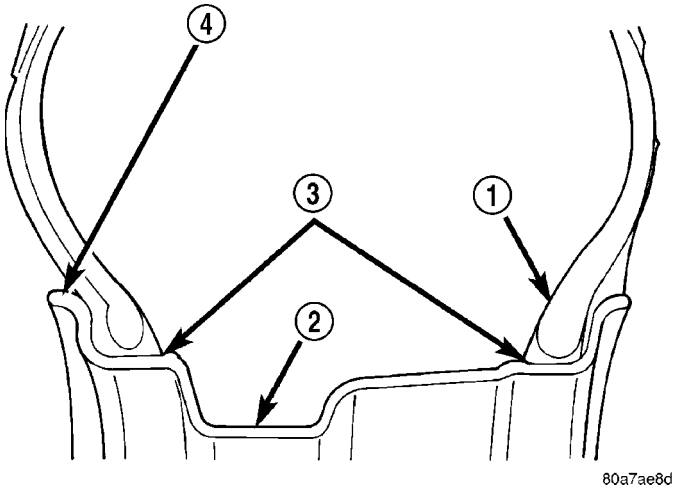

Fig. 22 Safety Rim

1 - TIRE
2 - WELL
3 - SAFETY HUMPS
4 - FLANGE

Initial inflation of the tires forces the bead over these raised sections. In case of air loss the raised sections help hold the tire in position on the wheel until the vehicle can be brought to a safe stop.

Cast aluminum wheels require special balance weights to fit the contour of the wheel flange (Fig. 23).

The wheel mounting studs and nuts are designed for specific wheel applications and must be replaced with equivalent parts. Do not use replacement parts of lesser quality or of a substitute design. All aluminum wheels use wheel mounting nuts with an enlarged nose. This enlarged nose is necessary to ensure proper retention of the wheels.

Vehicles that are equipped with bolt-on wheel covers use the wheel mounting nuts to retain the wheel cover.

WHEELS (Continued)

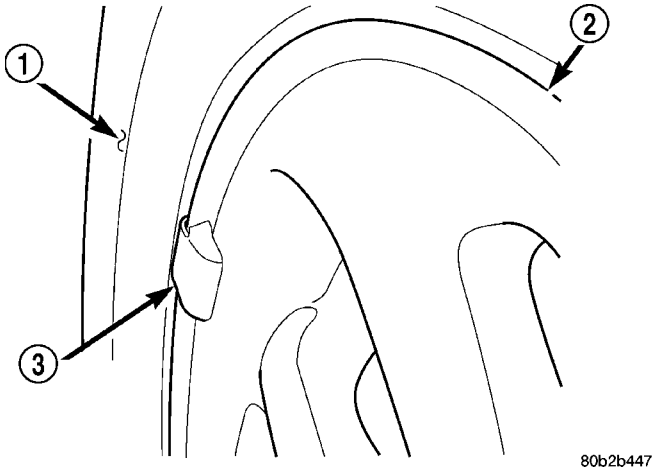

Fig. 23 Aluminum Wheel Weight

1 - TIRE
2 - WHEEL
3 - STYLED WHEEL WEIGHT

DIAGNOSIS AND TESTING - WHEEL INSPECTION

Inspect wheels for:

- Excessive runout
- Dents, cracks or irregular bends
- Damaged wheel stud (lug) holes
- Air Leaks

NOTE: Do not attempt to repair a wheel by hammering, heating or welding.

If a wheel is damaged, an original equipment replacement wheel should be used. When obtaining replacement wheels, they must be equivalent in load carrying capacity. The diameter, width, offset, pilot hole and bolt circle of the wheel should be the same as the original wheel.

WARNING: FAILURE TO USE EQUIVALENT REPLACEMENT WHEELS MAY ADVERSELY AFFECT THE SAFETY AND HANDLING OF THE VEHICLE.

WARNING: REPLACEMENT WITH USED WHEELS IS NOT RECOMMENDED. THE SERVICE HISTORY OF THE WHEEL MAY HAVE INCLUDED SEVERE TREATMENT OR VERY HIGH MILEAGE. THE RIM COULD FAIL WITHOUT WARNING.

CLEANING

WHEEL AND WHEEL TRIM CARE

All wheels and wheel trim, especially aluminum and chrome plated, should be cleaned regularly using mild soap and water to maintain their luster and to prevent corrosion. Wash them with the same soap solution recommended for the body of the vehicle.

When cleaning extremely dirty wheels, care must be taken in the selection of tire and wheel cleaning chemicals and equipment to prevent damage to the wheels. Mopar® Wheel Treatment or Mopar® Chrome Cleaner is recommended. Any of the “DO NOT USE” items listed below can damage wheels and wheel trim.

DO NOT USE:

- Any abrasive cleaner
- Any abrasive cleaning pad (such as steel wool) or abrasive brush
- Any cleaner that contains an acid which can react with and discolor the chrome surface. **Many wheel cleaners contain acids that can harm the wheel surface.**
- Oven cleaner
- A car wash that uses carbide-tipped wheel cleaning brushes or acidic solutions.

SPECIFICATIONS

WHEEL

Wheel Mounting Stud Size	M12 x 1.5 mm

TORQUE SPECIFICATIONS

DESCRIPTION	N·m	Ft. Lbs.	In. Lbs.
Wheel Mounting (Lug) Nut	135	100	—

WHEEL COVER

REMOVAL

(1) Raise the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

CAUTION: When removing the bolt-on wheel cover, do not attempt to pry the wheel cover off the wheel.

(2) Unthread and remove the 5 nuts attaching the wheel and wheel cover to the vehicle (Fig. 24).

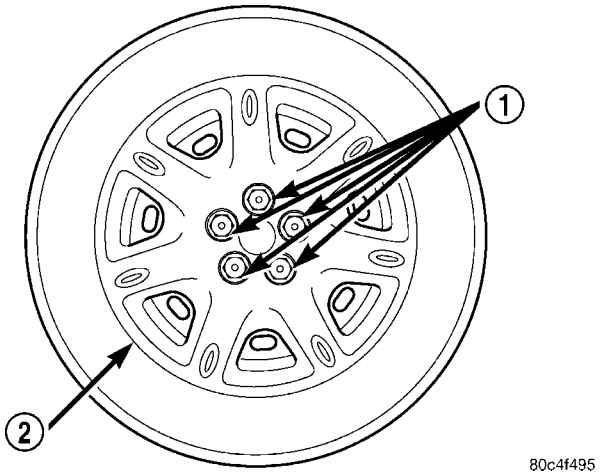

Fig. 24 Wheel And Cover Mounting

1 - WHEEL MOUNTING NUTS
2 - BOLT-ON WHEEL COVER

(3) Remove the wheel cover using care not to let the tire and wheel assembly fall off the vehicle.

INSTALLATION

CAUTION: Installing the wheel mounting nuts without having good metal-to-mental contact between the back of the wheel and the hub mounted brake disc or drum could cause the wheel to bind and eventually cause loosening of the wheel mounting nuts.

CAUTION: Never use oil or grease on wheel studs or wheel mounting nuts.

(1) With the tire and wheel assembly positioned on the wheel studs without the wheel mounting nuts installed, align the valve notch in the wheel cover with the valve stem on the wheel and install the wheel cover on the hub mounted studs.

(2) Install and lightly tighten the wheel mounting nuts in the proper sequence (Fig. 25).

(3) Lower the vehicle.

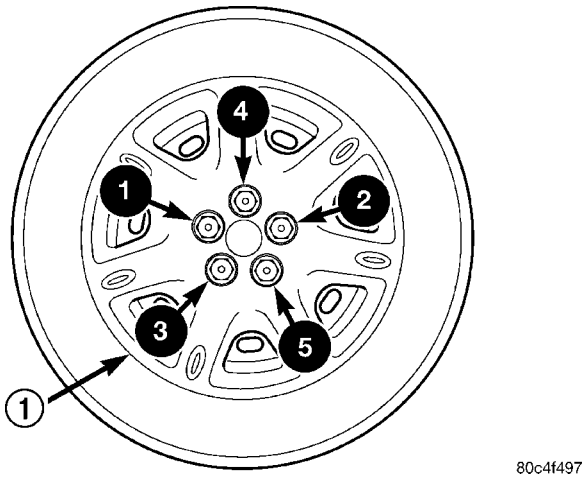

Fig. 25 Nut Tightening Sequence

1 - BOLT-ON WHEEL COVER

(4) Progressively tighten the 5 wheel mounting nuts in the proper sequence until tightened to half of the specified torque (Fig. 25). Finally, tighten the wheel mounting nuts in the proper sequence to 135 N·m (100 ft. lbs.) torque.

WHEEL MOUNTING STUDS - FRONT

REMOVAL

Use the following procedure to remove and install one of five studs on one wheel hub.

(1) Raise the vehicle. Refer to Hoisting in Lubrication And Maintenance.

(2) Remove the front tire and wheel assembly.

(3) Remove the two guide pin bolts securing the front disc brake caliper to the steering knuckle (Fig. 26).

(4) Remove the disc brake caliper from the steering knuckle. The caliper is removed by first tipping either the top (right side) or bottom (left side) of the caliper away from the brake rotor, then pulling the caliper off the opposite end's caliper slide abutment (on the knuckle) and rotor.

(5) Hang the caliper out of the way using a wire hanger or cord. Do not support the caliper by letting it hang by the hydraulic hose.

(6) Remove any retainer clips from the wheel mounting studs. Remove the brake rotor from the front hub (Fig. 26).

CAUTION: Do not hammer wheel mounting studs out of the hub. Damage to the wheel bearing will occur, leading to premature bearing failure.

WHEEL MOUNTING STUDS - FRONT (Continued)

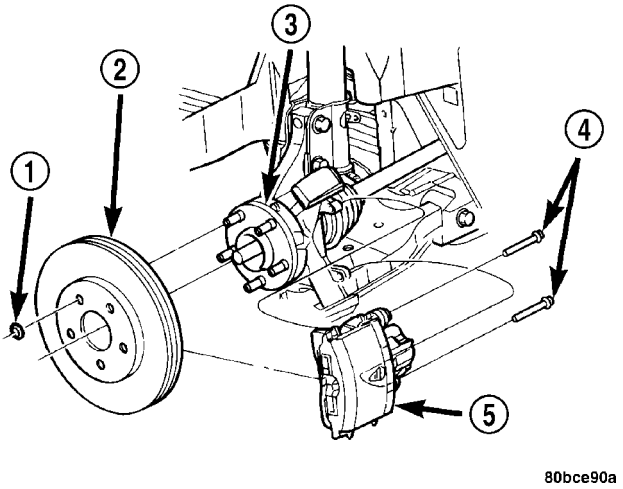

Fig. 26 Brake Caliper And Rotor

1 - RETAINER CLIP
2 - BRAKE ROTOR
3 - HUB
4 - GUIDE PIN BOLTS
5 - DISC BRAKE CALIPER

(7) Install a wheel mounting nut on the wheel mounting stud being removed from the hub far enough so the threads on the stud are even with end of lug nut. Rotate the hub so the stud requiring removal is aligned with notch cast into front of the steering knuckle. Install Remover, Special Tool C-4150A, on hub flange and wheel stud (Fig. 27).

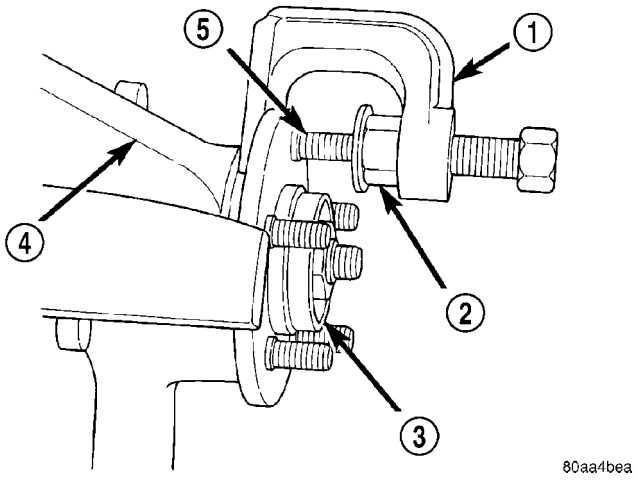

Fig. 27 Wheel Stud Removal

1 - SPECIAL TOOL C-4150A
2 - LUG NUT
3 - HUB/BEARING
4 - STEERING KNUCKLE
5 - WHEEL STUD

(8) Tighten the remover, pushing the wheel mounting stud out the rear of the hub flange. When the shoulder of the stud is past the flange, remove the remover from the hub. Remove the nut from the stud, then remove the stud from the flange.

INSTALLATION

Use the following procedure to remove and install one of five studs on one wheel hub.

(1) Install the wheel mounting stud in the flange of hub from the rear side. Install several washers and a wheel mounting nut on the stud (Fig. 28). The wheel mounting nut must be installed with the flat side of the wheel mounting nut against the washers to eliminate binding.

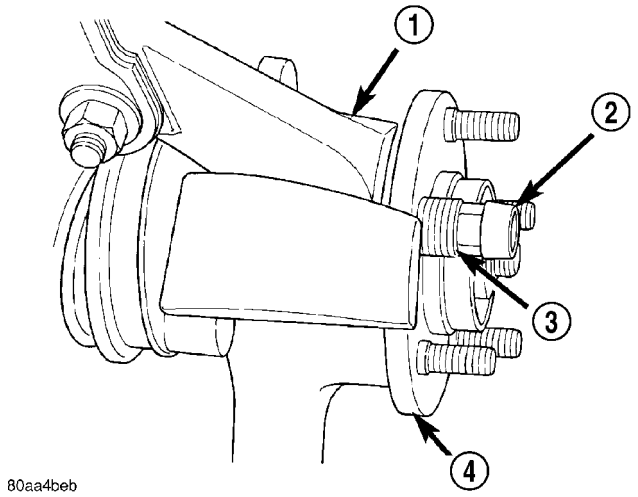

Fig. 28 Installing Wheel Stud

1 - STEERING KNUCKLE
2 - WHEEL LUG NUT
3 - WASHERS
4 - HUB/BEARING

(2) Tighten the wheel mounting nut. This will pull the wheel mounting stud into the flange of the hub. When the head of the stud is fully seated against the rear of the hub flange, remove the wheel mounting nut and washers from the stud.

(3) Install the brake rotor on the hub (Fig. 26).

(4) Install the disc brake caliper (with pads) on the brake rotor and steering knuckle. The left side caliper is installed by first sliding the top of the caliper past the top abutment on the steering knuckle to hook the top edge of the caliper, then pushing the lower end of the caliper into place against the knuckle (Fig. 29). The right side caliper is installed by first sliding the bottom edge of the caliper past the lower abutment on the steering knuckle to hook the lower edge of the caliper, then pushing the top of the caliper into place against the steering knuckle.

(5) Install the two guide pin bolts securing the front disc brake caliper to the steering knuckle (Fig. 26). Tighten the guide pin bolts to a torque of 22 N·m (192 in. lbs.).

(6) Install the tire and wheel assembly. Install the wheel mounting nuts and tighten them to a torque of 135 N·m (100 ft. lbs.).

(7) Lower the vehicle.

WHEEL MOUNTING STUDS - FRONT (Continued)

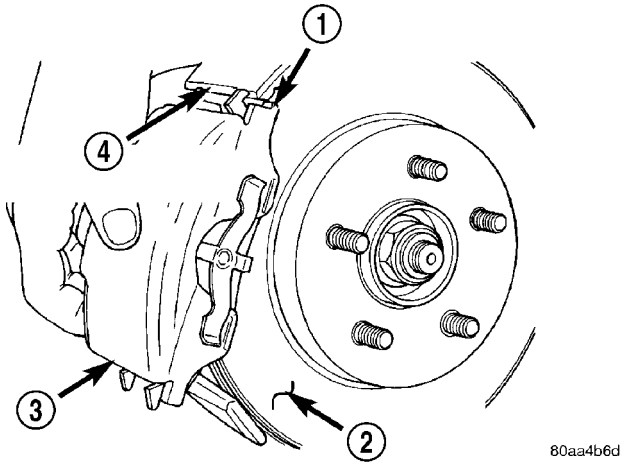

Fig. 29 Brake Caliper Installation

1 - SLIDE TOP OF BRAKE CALIPER UNDER TOP ABUTMENT OF STEERING KNUCKLE AS SHOWN
2 - BRAKING DISC
3 - DISC BRAKE CALIPER
4 - STEERING KNUCKLE BRAKE ABUTMENT

WHEEL MOUNTING STUDS - REAR

REMOVAL

CAUTION: DO NOT hammer studs out of the hub flange. If a stud is removed by hammering it out of the bearing flange, damage to the hub and bearing assembly will occur leading to premature bearing failure.

(1) Remove the hub and bearing from the vehicle. (Refer to 2 - SUSPENSION/REAR/HUB / BEARING - REMOVAL)

CAUTION: Take care to keep hub and bearing assembly from falling during stud removal. Damage to the hub and bearing could result.

(2) Position the hub and bearing assembly under a hydraulic press ram, supported by a 21 mm deep-well impact socket under the stud to be replaced (Fig. 30).

(3) Press the stud out of the hub flange and into the socket well.

(4) Remove the hub and bearing assembly from the press.

(5) Remove the stud from the socket.

INSTALLATION

CAUTION: DO NOT hammer studs into the hub flange. If a stud is installed in such a manner, damage to the hub and bearing assembly may occur leading to premature bearing failure.

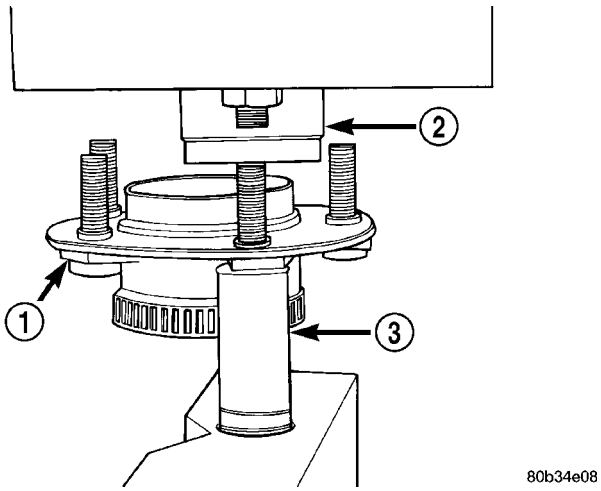

Fig. 30 Wheel Stud Removal

1 - HUB AND BEARING ASSEMBLY
2 - PRESS RAM
3 - 21mm IMPACT SOCKET

(1) Install wheel stud into stud hole in hub and bearing assembly.

(2) Position the hub and bearing assembly face down with stud pointing down into the well of the 21 mm socket. The hydraulic press ram must line up with the stud (Fig. 31).

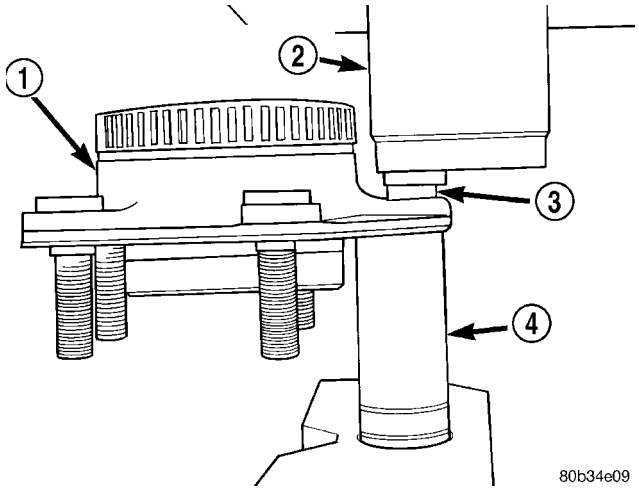

Fig. 31 Wheel Stud Installation

1 - HUB AND BEARING ASSEMBLY
2 - PRESS RAM
3 - WHEEL STUD
4 - 21mm IMPACT SOCKET

(3) Press the stud into the hub flange until it bottoms.

(4) Remove the hub and bearing assembly from the press.

(5) Install the hub and bearing on the vehicle. (Refer to 2 - SUSPENSION/REAR/HUB / BEARING - INSTALLATION)

BODY

DESCRIPTION - VEHICLE IDENTIFICATION

Throughout this group, references to the DaimlerChrysler Corporation vehicle family identification code are used when describing a procedure that is unique to that vehicle. Refer to Introduction Group of this manual for detailed information on vehicle identification. If a procedure is common to all vehicles covered in this manual, no reference will be made to a vehicle family code.

WARNING

SAFETY PRECAUTIONS AND WARNINGS

WARNING: USE A OSHA APPROVED BREATHING FILTER WHEN SPRAYING PAINT OR SOLVENTS IN A CONFINED AREA. PERSONAL INJURY CAN RESULT.
AVOID PROLONGED SKIN CONTACT WITH PETROLEUM OR ALCOHOL – BASED CLEANING SOLVENTS. PERSONAL INJURY CAN RESULT.
DO NOT STAND UNDER A HOISTED VEHICLE THAT IS NOT PROPERLY SUPPORTED ON SAFETY STANDS. PERSONAL INJURY CAN RESULT.

CAUTION: When holes must be drilled or punched in an inner body panel, verify depth of space to the outer body panel, electrical wiring, or other components. Damage to vehicle can result.
Do not weld exterior panels unless combustible material on the interior of vehicle is removed from the repair area. Fire or hazardous conditions, can result.
Always have a fire extinguisher ready for use when welding.
Disconnect the negative (-) cable clamp from the battery when servicing electrical components that are live when the ignition is OFF. Damage to electrical system can result.
Do not use abrasive chemicals or compounds on painted surfaces. Damage to finish can result.
Do not use harsh alkaline based cleaning solvents on painted or upholstered surfaces. Damage to finish or color can result.
Do not hammer or pound on plastic trim panel when servicing interior trim. Plastic panels can break.

DIAGNOSIS AND TESTING

WATER LEAKS

Water leaks can be caused by poor sealing, improper body component alignment, body seam porosity, missing plugs, or blocked drain holes. Centrifugal and gravitational force can cause water to drip from a location away from the actual leak point, making leak detection difficult. All body sealing points should be water tight in normal wet-driving conditions. Water flowing downward from the front of the vehicle should not enter the passenger or luggage

BODY (Continued)

compartment. Moving sealing surfaces will not always seal water tight under all conditions. At times, side glass or door seals will allow water to enter the passenger compartment during high pressure washing or hard driving rain (severe) conditions. Overcompensating on door or glass adjustments to stop a water leak that occurs under severe conditions can cause premature seal wear and excessive closing or latching effort. After completing a repair, water test vehicle to verify leak has stopped before returning vehicle to use.

VISUAL INSPECTION BEFORE WATER LEAK TESTS

Verify that floor and body plugs are in place, body drains are clear, and body components are properly aligned and sealed. If component alignment or sealing is necessary, refer to the appropriate section of this group for proper procedures.

WATER LEAK TESTS

WARNING: DO NOT USE ELECTRIC SHOP LIGHTS OR TOOLS IN WATER TEST AREA. PERSONAL INJURY CAN RESULT.

When the conditions causing a water leak have been determined, simulate the conditions as closely as possible.

- If a leak occurs with the vehicle parked in a steady light rain, flood the leak area with an open-ended garden hose.
- If a leak occurs while driving at highway speeds in a steady rain, test the leak area with a reasonable velocity stream or fan spray of water. Direct the spray in a direction comparable to actual conditions.
- If a leak occurs when the vehicle is parked on an incline, hoist the end or side of the vehicle to simulate this condition. This method can be used when the leak occurs when the vehicle accelerates, stops or turns. If the leak occurs on acceleration, hoist the front of the vehicle. If the leak occurs when braking, hoist the back of the vehicle. If the leak occurs on left turns, hoist the left side of the vehicle. If the leak occurs on right turns, hoist the right side of the vehicle. For hoisting recommendations (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE).

WATER LEAK DETECTION

To detect a water leak point-of-entry, do a water test and watch for water tracks or droplets forming on the inside of the vehicle. If necessary, remove interior trim covers or panels to gain visual access to the leak area. If the hose cannot be positioned without being held, have someone help do the water test.

Some water leaks must be tested for a considerable length of time to become apparent. When a leak appears, find the highest point of the water track or drop. The highest point usually will show the point of entry. After leak point has been found, repair the leak and water test to verify that the leak has stopped.

Locating the entry point of water that is leaking into a cavity between panels can be difficult. The trapped water may splash or run from the cavity, often at a distance from the entry point. Most water leaks of this type become apparent after accelerating, stopping, turning, or when on an incline.

MIRROR INSPECTION METHOD

When a leak point area is visually obstructed, use a suitable mirror to gain visual access. A mirror can also be used to deflect light to a limited-access area to assist in locating a leak point.

BRIGHT LIGHT LEAK TEST METHOD

Some water leaks in the luggage compartment can be detected without water testing. Position the vehicle in a brightly lit area. From inside the darkened luggage compartment inspect around seals and body seams. If necessary, have a helper direct a drop light over the suspected leak areas around the luggage compartment. If light is visible through a normally sealed location, water could enter through the opening.

PRESSURIZED LEAK TEST METHOD

When a water leak into the passenger compartment cannot be detected by water testing, pressurize the passenger compartment and soap test exterior of the vehicle. To pressurize the passenger compartment, close all doors and windows, start engine, and set heater control to high blower in HEAT position. If engine can not be started, connect a charger to the battery to ensure adequate voltage to the blower. With interior pressurized, apply dish detergent solution to suspected leak area on the exterior of the vehicle. Apply detergent solution with spray device or soft bristle brush. If soap bubbles occur at a body seam, joint, seal or gasket, the leak entry point could be at that location.

WIND NOISE

Wind noise is the result of most air leaks. Air leaks can be caused by poor sealing, improper body component alignment, body seam porosity, or missing plugs in the engine compartment or door hinge pillar areas. All body sealing points should be airtight in normal driving conditions. Moving sealing surfaces will not always seal airtight under all conditions. At times, side glass or door seals will allow wind noise to be noticed in the passenger compartment during high cross winds. Over compensating on door or glass

BODY (Continued)

adjustments to stop wind noise that occurs under severe conditions can cause premature seal wear and excessive closing or latching effort. After a repair procedure has been performed, test vehicle to verify noise has stopped before returning vehicle to use.

VISUAL INSPECTION BEFORE TESTS

Verify that floor and body plugs are in place and body components are aligned and sealed. If component alignment or sealing is necessary, refer to the appropriate section of this group for proper procedures.

ROAD TESTING WIND NOISE

(1) Drive the vehicle to verify the general location of the wind noise.

(2) Apply 50 mm (2 in.) masking tape in 150 mm (6 in.) lengths along weatherstrips, weld seams or moldings. After each length is applied, drive the vehicle. If noise goes away after a piece of tape is applied, remove tape, locate, and repair defect.

POSSIBLE CAUSE OF WIND NOISE

- Moldings standing away from body surface can catch wind and whistle.
- Gaps in sealed areas behind overhanging body flanges can cause wind-rushing sounds.
- Misaligned movable components.
- Missing or improperly installed plugs in pillars.
- Weld burn through holes.

STANDARD PROCEDURE

STANDARD PROCEDURE - PLASTIC BODY PANEL REPAIR

There are many different types of plastics used in today's automotive environment. We group plastics in three different categories: Rigid, Semi-Rigid, and Flexible. Any of these plastics may require the use of an adhesion promoter for repair. These types of plastic are used extensively on DaimlerChrysler Motors vehicles. Always follow repair material manufacturer's plastic identification and repair procedures.

Rigid Plastics:

Examples of rigid plastic use: Fascias, Hoods, Doors, and other Body Panels, which include SMC, ABS, and Polycarbonates.

Semi-Rigid Plastics:

Examples of semi-rigid plastic use: Interior Panels, Under Hood Panels, and other Body Trim Panels.

Flexible Plastics:

Examples of flexible plastic use: Fascias, Body Moldings, and upper and lower Fascia Covers.

Repair Procedure:

The repair procedure for all three categories of plastics is basically the same. The one difference is the material used for the repair. The materials must be specific for each substrate, rigid repair material for rigid plastic repair, semi-rigid repair material for semi-rigid plastic repair and flexible repair material for flexible plastic repair.

Adhesion Promoter/Surface Modifier:

Adhesion Promoters/Surface Modifiers are required for certain plastics. All three categories may have plastics that require the use of adhesion promoter/surface modifiers. Always follow repair material manufacturer's plastic identification and repair procedures.

SAFETY PRECAUTION AND WARNINGS

WARNING:

- **EYE PROTECTION SHOULD BE USED WHEN SERVICING COMPONENTS. PERSONAL INJURY CAN RESULT.**
- **USE AN OSHA APPROVED BREATHING MASK WHEN MIXING EPOXY, GRINDING, AND SPRAYING PAINT OR SOLVENTS IN A CONFINED AREA. PERSONAL INJURY CAN RESULT.**
- **AVOID PROLONGED SKIN CONTACT WITH RESIN, PETROLEUM, OR ALCOHOL BASED SOLVENTS. PERSONAL INJURY CAN RESULT.**
- **DO NOT VENTURE UNDER A HOISTED VEHICLE THAT IS NOT PROPERLY SUPPORTED ON SAFETY STANDS. PERSONAL INJURY CAN RESULT.**

NOTE:

- **When holes must be drilled or cut in body panels, verify locations of internal body components and electrical wiring. Damage to vehicle can result.**
- **Do not use abrasive chemicals or compounds on undamaged painted surfaces around repair areas. Damage to finish can result.**

BODY (Continued)

PANEL SECTIONING

If it is required to section a large panel for a plastic repair, it will be necessary to reinforce the panel (Fig. 1). To bond two plastic panels together, a reinforcement must overlap both panels. The panels must be "V'd" at a 20 degree angle. The area to be reinforced should be washed, then sanded. Be sure to wipe off any excess soap and water when finished. Lightly sand or abrade the plastic with an abrasive pad or sandpaper. Blow off any dust with compressed air or wipe with a clean dry rag.

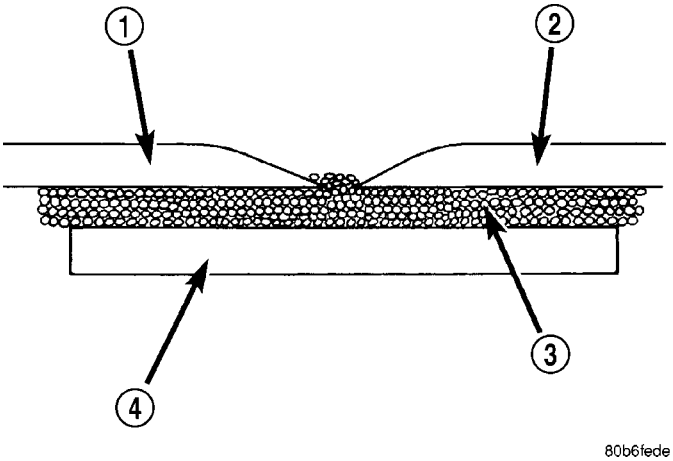

Fig. 1 PANEL SECTIONING

1 - EXISTING PANEL
2 - NEW PANEL
3 - PANEL ADHESIVE
4 - BONDING STRIP

When bonding plastic panels, Follow repair material manufacturers recommendations. Be sure that enough adhesive has been applied to allow squeeze out and to fill the full bond line. Once the pieces have been brought together, do not move them until the adhesive is cured. The assembly can be held together with clamps, rivets, etc. A faster cure can be obtained by heating with a heat lamp or heat gun. After the parts have been bonded and have had time to cure, rough sand the seam and apply the final adhesive filler to the area being repaired. Smooth the filler with a spreader, wooden tongue depressor, or squeegee. For fine texturing, a small amount of water can be applied to the filler surface while smoothing. The cured filler can be sanded as necessary and, as a final step, cleanup can be done with soapy water. Wipe the surface clean with a dry cloth allowing time for the panel to dry before moving on with the repair.

PANEL REINFORCEMENT

Structural repair procedures for rigid panels with large cracks and holes will require a reinforcement backing. Reinforcements can be made with several applications of glass cloth saturated with structural adhesive. Semi-rigid or flexible repair materials should be used for semi-rigid or flexible backing reinforcement (Fig. 2) and (Fig. 3). Open meshed fiberglass dry wall tape can be used to form a reinforcement. The dry wall tape allows the resin to penetrate through and make a good bond between the panel and the adhesive. Structurally, the more dry wall tape used, the stronger the repair.

Another kind of repair that can be done to repair large cracks and holes is to use a scrap piece of similar plastic and bond with structural adhesive. The reinforcement should cover the entire break and should have a generous amount of overlap on either side of the cracked or broken area.

When repairing plastic, the damaged area is first "V'd" out, or beveled. Large bonding areas are desirable when repairing plastic because small repairs are less likely to hold permanently. Beveling the area around a crack at a 20 degree angle will increase the bonding surface for a repair (Fig. 4). It is recommended that sharp edges be avoided because the joint may show through after the panel is refinished.

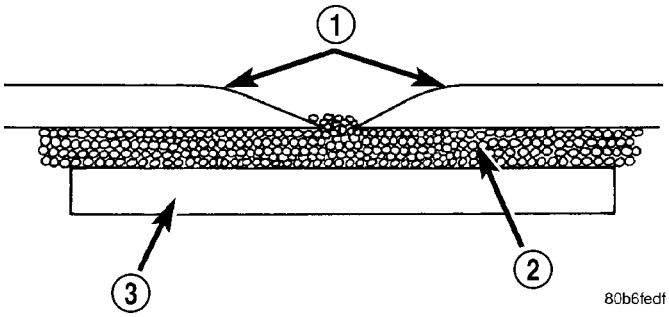

Fig. 2 SOFTENED EDGES

1 - SOFTENED EDGES
2 - PANEL ADHESIVE
3 - BONDING STRIP

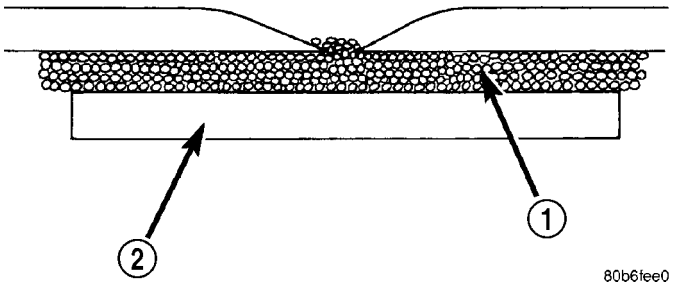

Fig. 3 PANEL REINFORCEMENT

1 - PANEL ADHESIVE
2 - REINFORCEMENT

- Panel repair for both flexible and rigid panels are basically the same. The primary difference between flexible panel repair and rigid panel repair is in the adhesive materials used (Fig. 5).

BODY (Continued)

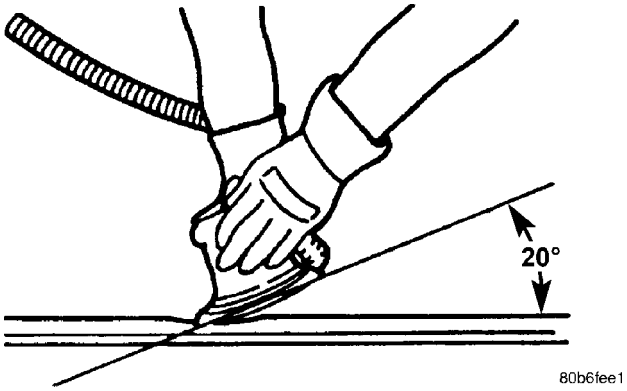

Fig. 4 BEVELING ANGLE - 20 DEGREE

- The technician should first decide what needs to be done when working on any type of body panel. One should determine if it is possible to return the damage part to its original strength and appearance without exceeding the value of the replacement part.
- When plastic repairs are required, it is recommended that the part be left on the vehicle when ever possible. That will save time, and the panel will remain stationary during the repair. Misalignment can cause stress in the repair areas and can result in future failure.

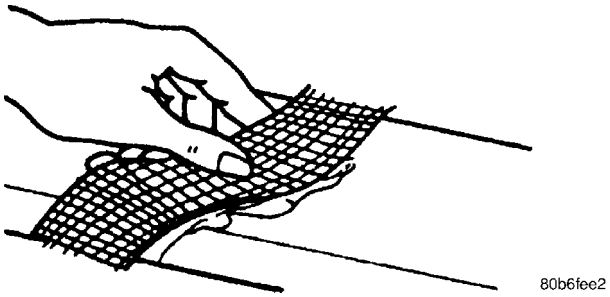

Fig. 5 FIBERGLASS TAPE

VISUAL INSPECTION

Composite materials can mask the severity of an accident. Adhesive bond lines, interior structure of the doors, and steel structures need to be inspected carefully to get a true damage assessment. Close inspection may require partial removal of interior trim or inner panels.

Identify the type of repair: Puncture or Crack - Damage that has penetrated completely through the panel. Damage is confined to one general area; a panel section is not required. However, a backer panel, open fiberglass tape, or matted material must be bonded from behind (Fig. 7) (Fig. 6).

PANEL SURFACE PREPARATION

If a body panel has been punctured, cracked, or crushed, the damaged area must be removed from the panel to achieve a successful repair. All spider web cracks leading away from a damaged area must be stopped or removed. To stop a running crack in a panel, drill a 6 mm (0.250 in.) hole at the end of the crack farthest away from the damage. If spider web cracks can not be stopped, the panel would require replacement. The surfaces around the damaged area should be stripped of paint and freed from wax and oil. Scuff surfaces around repair area with 360 grit wet/dry sandpaper, or equivalent, to assure adhesion of repair materials.

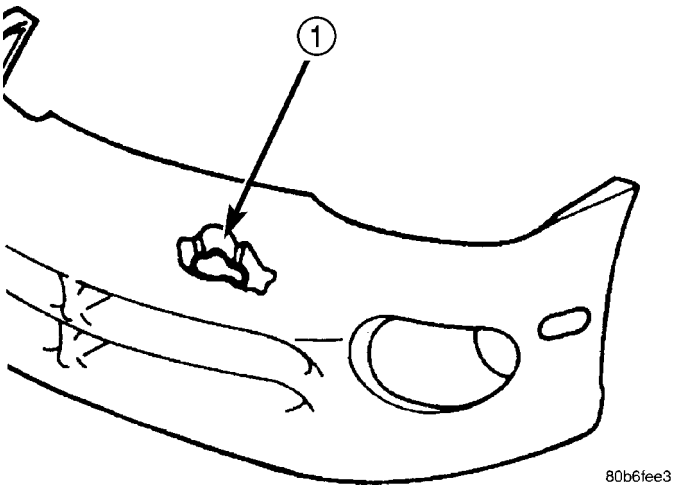

Fig. 6 DAMAGE COMPONENT

1 - PUNCTURE

PATCHING PANELS

An panel that has extensive puncture type damage can be repaired by cutting out the damaged material (Fig. 7). Use a suitable reciprocating saw or cut off wheel to remove the section of the panel that is damaged. The piece cut out can be used as a template to shape the new patch. It is not necessary to have access to the back of the panel to install a patch. Bevel edges of cutout at 20 degrees to expose a larger bonding area on the outer side. This will allow for an increased reinforcement areas.

PANEL PATCH FABRICATIONS

A patch can be fabricated from any rigid fiberglass panel that has comparable contour with the repair area. Lift gates and fenders can be used to supply patch material. If existing material is not available or compatible, a patch can be constructed with adhesive and reinforcement mesh (dry wall tape). Perform the following operation if required:

(1) Cover waxed paper or plastic with adhesive backed nylon mesh (dry wall tape) larger than the patch required (Fig. 8).

(2) Tape waxed paper or plastic sheet with mesh to a surface that has a compatible contour to the repair area.

BODY (Continued)

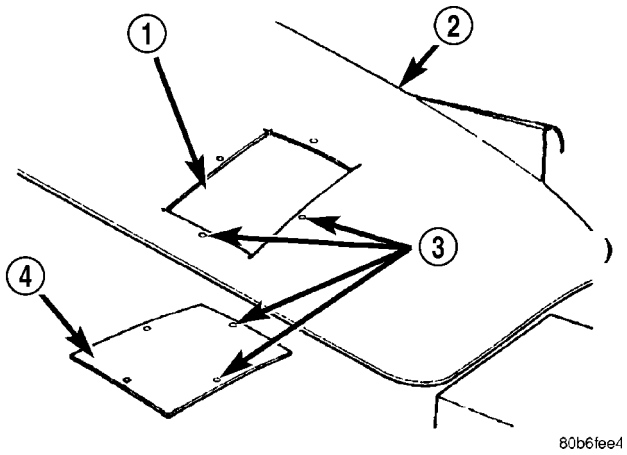

Fig. 7 DAMAGED PANEL CUTOUT AND PATCH

1 - CUTOUT
2 - DAMAGED BODY PANEL
3 - 4 MM (0.160 IN.) HOLES
4 - PATCH CUT TO SIZE

(3) Apply a liberal coat of adhesive over the reinforcement mesh (Fig. 8). If necessary apply a second or third coat of adhesive and mesh after first coat has cured. The thickness of the patch should be the same as the repair area.

(4) After patch has cured, peel waxed paper or plastic from the back of the patch.

(5) If desired, a thin film coat of adhesive can be applied to the back of the patch to cover mesh for added strength.

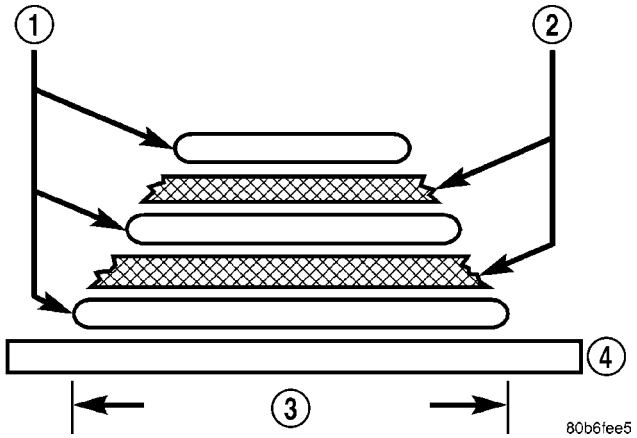

Fig. 8 FABRICATED PANEL

1 - STRUCTURAL ADHESIVE
2 - FIBERGLASS CLOTH OR FIBERGLASS MESH TAPE
3 - WIDTH OF V-GROOVE
4 - WAXED PAPER

PANEL PATCH INSTALLATION

(1) Make a paper or cardboard pattern the size and shape of the cutout hole in the panel.

(2) Trim 3 mm (0.125 in.) from edges of pattern so patch will have a gap between connecting surfaces.

(3) Using the pattern as a guide, cut the patch to size.

(4) Cut scrap pieces of patch material into 50 mm (2 in.) squares to use as patch supports to sustain the patch in the cutout.

(5) Drill 4 mm (0.160 in.) holes 13 mm (0.5 in.) in from edge of cutout hole (Fig. 7).

(6) Drill 4 mm (0.160 in.) holes 13 mm (0.5 in.) away from edge of patch across from holes drilled around cutout.

(7) Drill 3 mm (0.125 in.) holes in the support squares 13 mm (0.5 in.) from the edge in the center of one side.

(8) Scuff the backside of the body panel around the cutout hole with a scuff pad or sandpaper.

(9) Mix enough adhesive to cover one side of all support squares.

(10) Apply adhesive to cover one side of all support squares.

(11) Using number 8 sheet metal screws, secure support squares to back side of body panel with adhesive sandwiched between the panel and squares (Fig. 9).

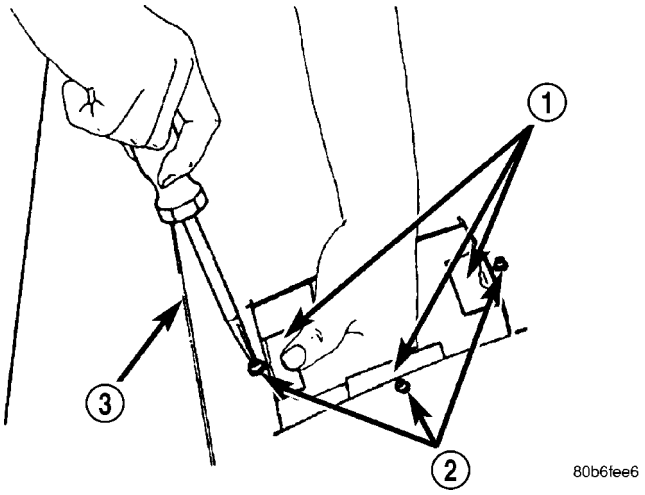

Fig. 9 SECURE SUPPORT SQUARES TO BODY PANEL

1 - SUPPORT SQUARES
2 - SCREWS
3 - DAMAGED BODY PANEL

(12) Position patch in cutout against support squares and adjust patch until the gap is equal along all sides (Fig. 10).

(13) Drill 3 mm (0.125 in.) holes in the support squares through the pre-drilled holes in the patch.

(14) Apply a coat of adhesive to the exposed ends of the support squares (Fig. 11).

(15) Install screws to hold the patch to support squares (Fig. 12). Tighten screws until patch surface is flush with panel surface.

(16) Allow adhesive to cure, and remove all screws.

BODY (Continued)

(17) Using a 125 mm (5 in.) 24 grit disc grinder, grind a 50 mm (2 in.) to 75 mm (3 in.) wide and 2 mm (0.080 in.) deep path across the gaps around the patch (Fig. 13). With compressed air, blow dust from around patch.

(18) Apply adhesive backed nylon mesh (dry wall tape) over gaps around patch (Fig. 14).

(19) Mix enough adhesive to cover the entire patch area.

(20) Apply adhesive over the mesh around patch, and smooth epoxy with a wide spreader to reduce finish grinding. Use two to three layers of mesh and adhesive to create a stronger repair (Fig. 15).

2 - GAP
3 - DISC GRINDER

PATCHED PANEL SURFACING

After patch panel is installed, the patch area can be finished using the same methods as finishing other types of body panels. If mesh material is exposed in the patched area, grind surface down, and apply a coat of high quality rigid plastic body filler. Prime, block sand, and paint as required.

STANDARD PROCEDURE - HEAT STAKING

(1) Remove trim panel.

(2) Bend or move the trim panel components at the heat staked joints. Observe the heat staked locations and/or component seams for looseness.

(3) Heat stake the components.

(a) If the heat staked or component seam location is loose, hold the two components tightly together and using a soldering gun with a flat tip, melt the material securing the components together. Do not over heat the affected area, damage to the exterior of the trim panel may occur.

(b) If the heat staked material is broken or missing, use a hot glue gun to apply new material to the area to be repaired. The panels that are being heat staked must be held together while the applying the glue. Once the new material is in place, it may be necessary to use a soldering gun to melt the newly applied material. Do not over heat the affected area, damage to the exterior of the trim panel may occur.

(4) Allow the repaired area to cool and verify the repair.

(5) Install trim panel.

SPECIFICATIONS

BODY LUBRICATION

LUBRICATION REQUIREMENTS

Body mechanisms and linkages should be inspected, cleaned, and lubricated, as required, to maintain ease of operation and to provide protection against rust and wear. When performing other under hood services, the hood latch release mechanism and safety catch should be inspected, cleaned, and lubricated. During the winter season, external door lock cylinders should be lubricated to assure proper operation when exposed to water and ice.

Prior to the application of any lubricant, the parts concerned should be wiped clean to remove dust and grit. If necessary, a suitable solvent can be used to clean the item to be lubricated. After lubricating a component, any excess oil or grease should be removed.

LUBRICANT APPLICATION

DOOR LOCK CYLINDERS

(1) Apply a small amount of lubricant directly into the lock cylinder.

(2) Apply a small amount of lubricant to the key.

(3) Insert key into lock cylinder and cycle the mechanism from the locked to the unlocked position.

NOTE: Do not add more lubricant.

(4) Cycle the lock cylinder mechanism several times to allow the lubricant to flow throughout the cylinder.

(5) Wipe all lubricant from exterior of lock cylinder and key.

ALL OTHER BODY MECHANISMS

(1) Clean component as described above.

(2) Apply specified lubricant to all pivoting and sliding contact areas of component.

CONVERTIBLE TOP

ADJUSTMENTS

ADJUSTMENT

Reasons to adjust the folding top assembly

(1) Pull-down and latching efforts are too high.

(2) Wrinkles appear in the canopy.

(3) Header “slap” when the folding top is raised, prior to pull down.

(4) Dowel pin alignment.

NOTE: No adjustments should be done at the internal folding top adjustment screws on the Main Pivot Bracket of the folding top (these screws are only for initial settings at the supplier).

Adjustment of the floating bow tension strap barrels (to add or relieve tension to the canopy).

(1) The folding top should be in a raised position and latched at the header.

(2) The tension straps are located in the most rearward point of the trunk compartment (Fig. 1).

(3) From inside the trunk area (1 per side) adjust the tension barrels clockwise to tighten the canopy and counter clockwise to reduce canopy tension. The left tension barrel bolt has access. The right tension bolt must be accessed through the jack storage door opening.

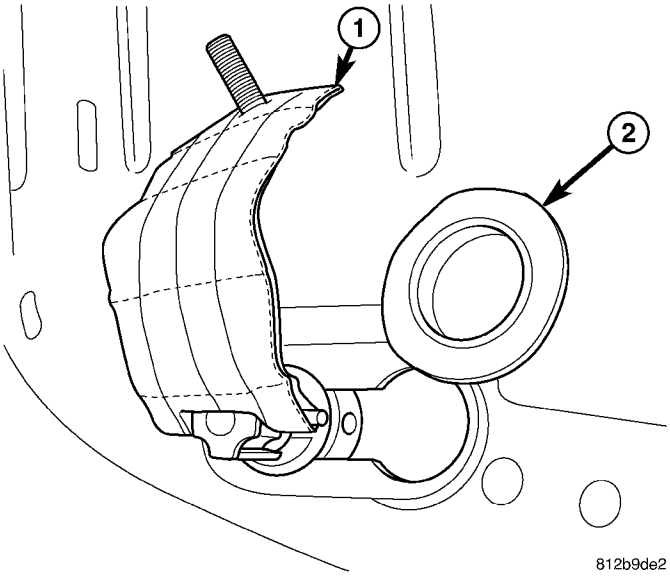

Fig. 1 TENSION STRAP BARREL LOCATION

1 - TENSION STRAP BARREL
2 - RUBBER PLUG

(4) The 10 mm hex screw located on the bottom side of each barrel adjusts the tension barrels. Turn the screw counter clockwise to loosen the canopy. Turn the screw clockwise to tighten the canopy. Each screw turn represents 1.25 mm (0.05 in) of adjustment.

(5) It is recommended that the barrels be adjusted no more than 2.5 mm (0.10 in.).

CONVERTIBLE TOP (Continued)

(6) After the barrels have been adjusted, cycle the folding top to the fully stowed position and then raise it back up and latch it at the header.

Adjustment of the C-link stop-screws (to align the dowel pins on the folding top with the dowel pin receptacles in the windshield frame mounted strikers)

(1) The folding top should be in a raised position and unlatched at the header.

(2) Visually inspect the fore/aft alignment of the dowel pin to the dowel pin receptacles in the windshield frame mounted strikers (the center line axis of the dowel pins should be aligned with the center line axis of the dowel pin receptacles). Measure the amount of misalignment.

(3) Lower the folding top to the stowed position.

(4) Locate the stop-screw at the base of the C-link to the main pivot bracket (1 per side) between the quarter window and the interior quarter trim (they are only visible when the folding top is in the stowed position) (Fig. 2) and (Fig. 3).

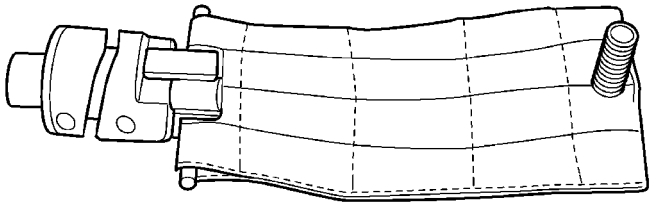

Fig. 2 TENSION STRAP BARREL

(5) Turn the stop-screw(s) (13 mm jam nut - torx ® 40 the amount required. One half clockwise rotation (turn to the right) of the screw will move the folding top forward 2.0 mm (0.08 in), and one half counterclockwise rotation (turn to the left) of the screw will move the folding top rearward 2.0 mm (0.08 in).

(6) Raise the folding top and pull down on the handle. The dowel pins should fall into the center of the dowel pin receptacles. There should be no rubbing or noise from the dowel pins when the dowel pins enter the dowel pin receptacles.

(7) Repeat steps 1 through 6 as required.

NOTE: The folding top dowel pins can be shifted side to side by turning one side stop-screw out and the opposite side stop-screw in.

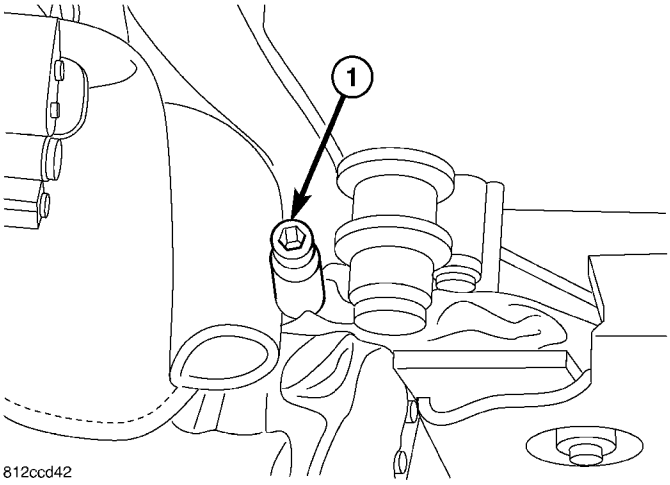

Fig. 3 UP STOP ADJUSTMENT

1 - UP STOP SCREW

BACKLITE ASSEMBLY

REMOVAL

(1) Mask the folding top canopy around the backlite opening (outside) to prevent canopy contamination during repair of the backlite.

(2) Unlatch the folding top but leave in the raised position.

(3) Detach the headliner retainer by pulling the retainer away from the backlite ring.

(4) Disconnect the two rear window defogger connectors.

(5) Cut out the broken glass taking care not to contact the canopy with the blade.

INSTALLATION

(1) Apply a new bead of urethane to the centerline of the flange (on the steel backlite ring on the folding top) over the original urethane bead (insure that the rear window defogger pigtails are taped onto the backlite surface).

(2) Install the new backlite glass, pressing it evenly around the perimeter to achieve a consistent flush or under flush condition to the canopy.

(3) Verify that the glass is centered in the opening, allowing for an even gap to the canopy.

(4) Connect the two rear windows pigtails (1 per side) to the wire harness.

(5) Press the headliner retainer onto flange on the backlite ring ensuring each rear window defogger pigtail is routed through the notches in the backlite frame.

(6) Remove the protective tape from the canopy that was install around the backlite opening (outside) to prevent canopy contamination during repair of the backlite.

BACKLITE ASSEMBLY (Continued)

(7) Allow the adhesive to cure for a minimum of 24 hours before raising or lowering the folding top.

NOTE: Failure to allow the urethane to cure for a minimum of 24 hours before raising or lowering the folding top will result in a failure of the backlite system.

(8) After 24 hours latch the top and water test the backlite.

FOLDING TOP ASSEMBLY

REMOVAL

NOTE: The entire folding top assembly should never be adjusted at its mounting points. The folding top has been fixture set to correlate with the location of the side glass. This section describes the process to replace the folding by locating the new folding top in the same position as the part requiring replacement.

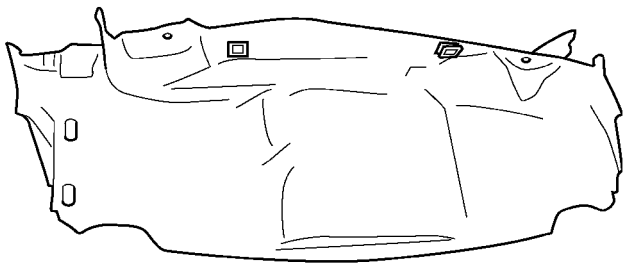
(1) Begin with the folding top in the raised position.

(2) Remove the rear seat cushion. (Refer to 23 - BODY/SEATS/SEAT CUSHION - REMOVAL).

(3) Remove the interior quarter trim panels. (Refer to 23 - BODY/INTERIOR/QUARTER PANEL TRIM - REMOVAL).

(4) Remove the rear seat back. (Refer to 23 - BODY/SEATS/SEAT BACK - REMOVAL).

(5) Remove the well liner (Fig. 4) and (Fig. 5).



812b9e5d

2 - MOTOR/HYDRAULIC PUMP RELAY
3 - MOTOR/HYDRAULIC PUMP RELAY CONNECTOR

(9) Detach the water trough from the folding top floating bow (Fig. 9).

(10) Lower the folding top into the stowed position.

(11) Disconnect the wire harness from the main body harness at the left side support bracket (between the main pivot bracket and the rear seat back support)

(12) Remove the support brackets (Fig. 10).

(13) Remove the exterior belt molding (Fig. 11) and (Fig. 12).

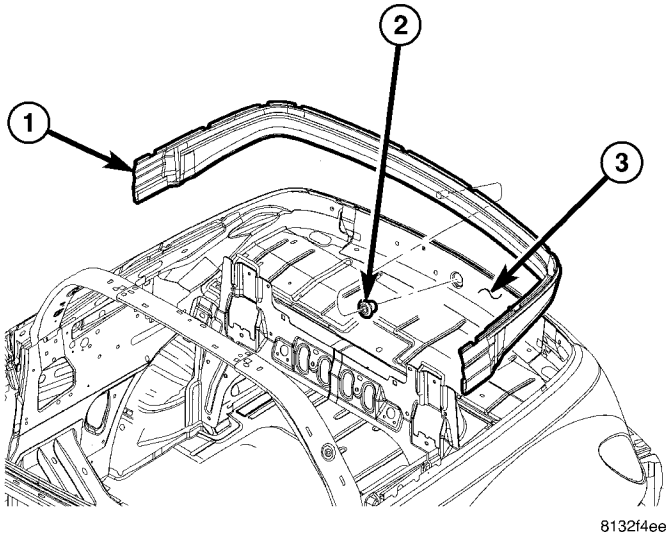

Fig. 9 DRAIN TROUGH

1 - SHELF TROUGH
2 - REAR CLOSURE GROMMET
3 - SHELF PANEL

(14) Find 3 bolts attaching each main pivot bracket to the vehicle body but do not remove the bolts at this time.

(15) Remove one bolt from the main pivot bracket and mark the position of the main pivot bracket hole to the body (paint, a marker or a scribe are suggested) (Fig. 13).

(16) Replace the bolt and snug until later.

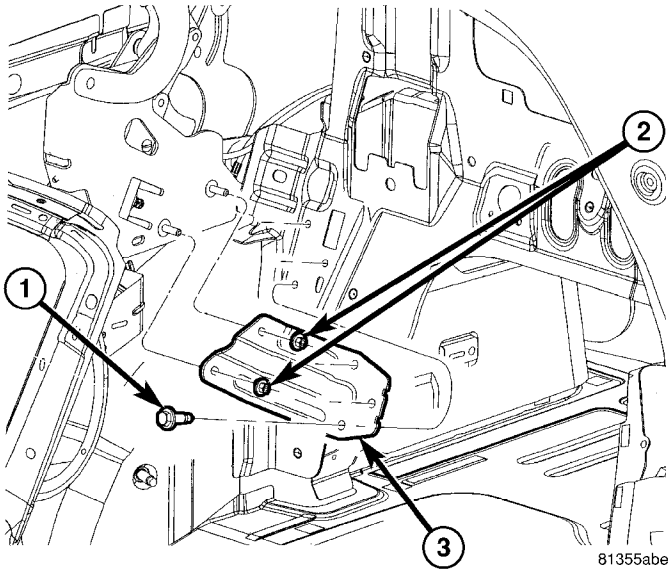

Fig. 10 SHELF SEAT BRACKET

2 - FOLDING TOP PIVOT BRACKET TO QUARTER INNER REINFORCEMENT ATTACHING SCREWS
3 - HYDRAULIC PUMP ATTACHING NUTS
4 - REAR SHELF PANEL

FOLDING TOP ASSEMBLY (Continued)

INSTALLATION

NOTE: The entire folding top assembly should never be adjusted at its mounting points. The folding top has been fixture set to correlate with the location of the side glass. This section describes the process to replace the folding by locating the new folding top in the same position as the part requiring replacement.

(1) Install the new folding top into the vehicle (Fig. 15).

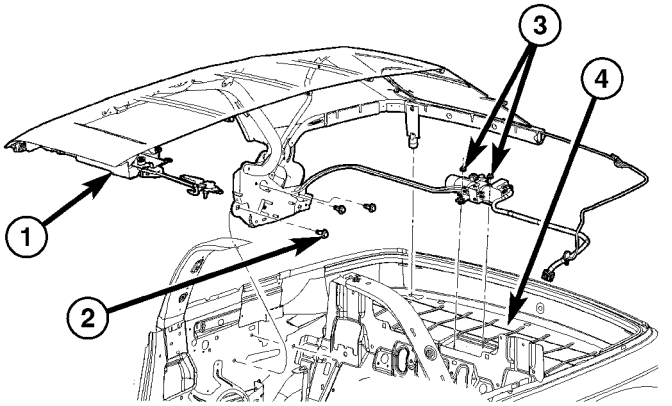

Fig. 15 FOLDING TOP ASSEMBLY

1 - FOLDING TOP ASSEMBLY
2 - FOLDING TOP PIVOT BRACKET TO QUARTER INNER REINFORCEMENT ATTACHING SCREWS
3 - HYDRAULIC PUMP ATTACHING NUTS
4 - REAR SHELF PANEL

(2) Align the main pivot bracket attaching points with the marked position of the original folding top.

(3) Install 1 main pivot bracket bolt at a time while visually verifying the position is the same as the original folding top.

(4) Install the support brackets (Fig. 16).

(5) Install the exterior belt molding (Fig. 17). (Fig. 18).

(6) Install three bolts attaching each main pivot bracket to the vehicle body (Fig. 19).

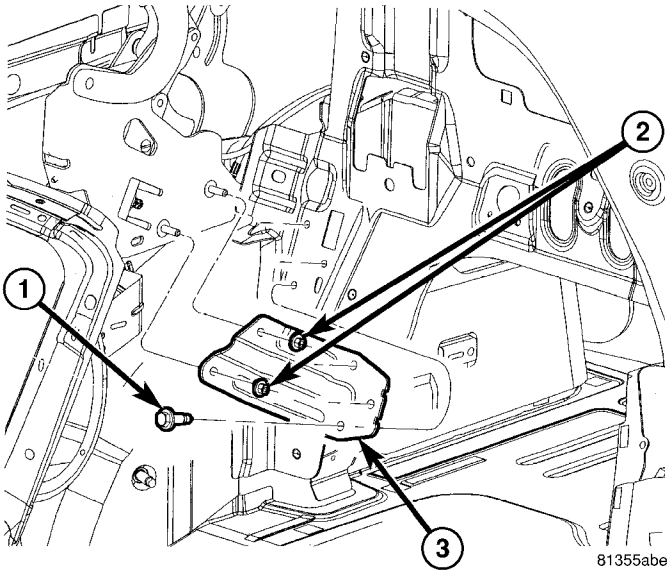

Fig. 16 SHELF SEAT BRACKET

1 - TENSION STRAP PLUG
2 - SHELF PANEL
3 - PROTECTIVE COVER
4 - HYDRAULIC PUMP

(13) Install the rear seat back. (Refer to 23 - BODY/SEATS/REAR SEAT BACK - INSTALLATION).

(14) Install the well liner (Fig. 24) and (Fig. 25).

(15) Install the rear quarter trim panels. (Refer to 23 - BODY/INTERIOR/REAR QUARTER PANEL TRIM - INSTALLATION).

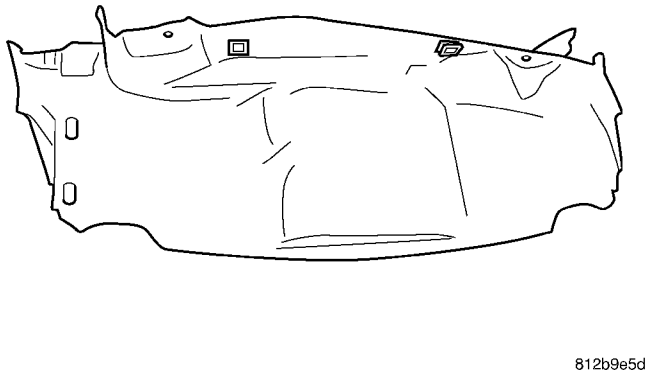

Fig. 24 WELL LINER

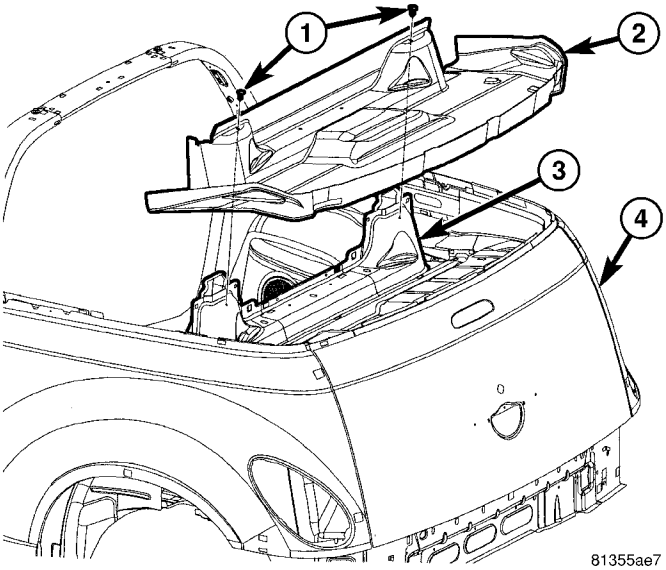

Fig. 25 CONVERTIBLE TOP WELL

1 - PUSH PIN FASTENERS, IF EQUIPPED
2 - CONVERTIBLE TOP WELL
3 - REAR SEAT BACK PANEL
4 - BODY

(16) Install the rear seat cushion. (Refer to 23 - BODY/SEATS/SEAT CUSHION - INSTALLATION).

(17) Verify that the dowel pins are properly aligned with the dowel pin receptacles in the windshield frame mounted strikers). If required, adjust the C-link stop-screws as described in Adjustments of the C-link Stop Screws. (Refer to 23 - BODY/CONVERTIBLE TOP - ADJUSTMENTS).

FOLDING TOP COVER ASSEMBLY

REMOVAL

(1) Open the folding top to half position that each area is able to access (Fig. 26).

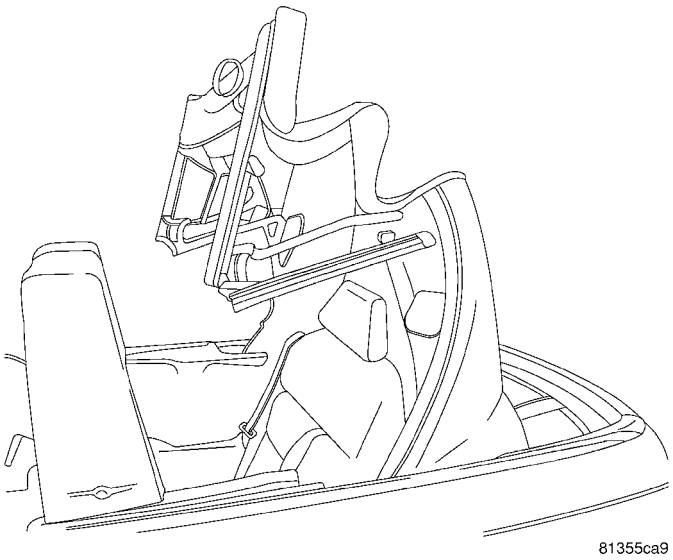

Fig. 26 PARTIAL UP POSITION

(2) Unscrew 12 screws to remove Canopy from front header (Fig. 27).

(3) Remove canopy adhesive tape from the front header edges.

(4) Remove tension cable with two spring clips on each side (Fig. 28) and (Fig. 29).

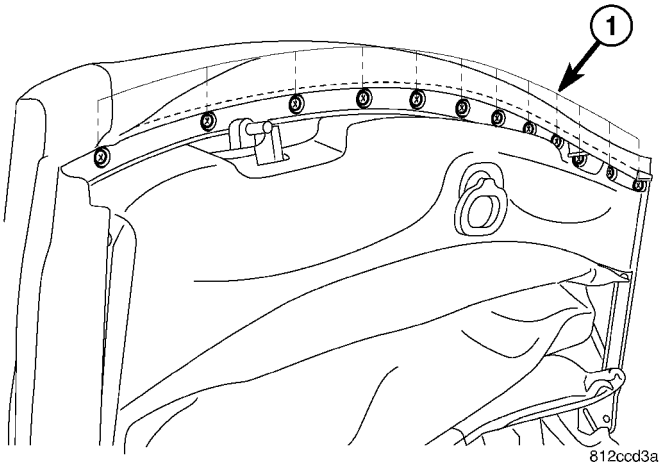

Fig. 27 TOP COVER FRONT HEADER

1 - ATTACHING SCREWS (12)

(5) Fold the canopy back to the B-Bow (Fig. 30).

(6) Unscrew nine screws to remove the headliner from the front header.

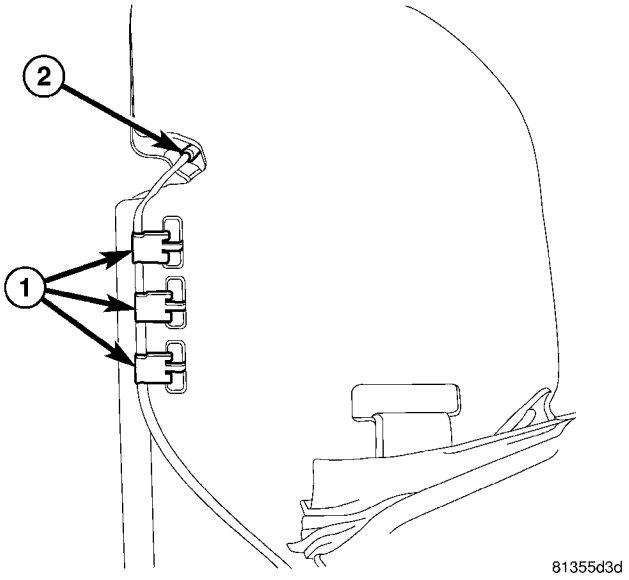

Fig. 28 CABLE

1 - THREE CLIPS
2 - CABLE END

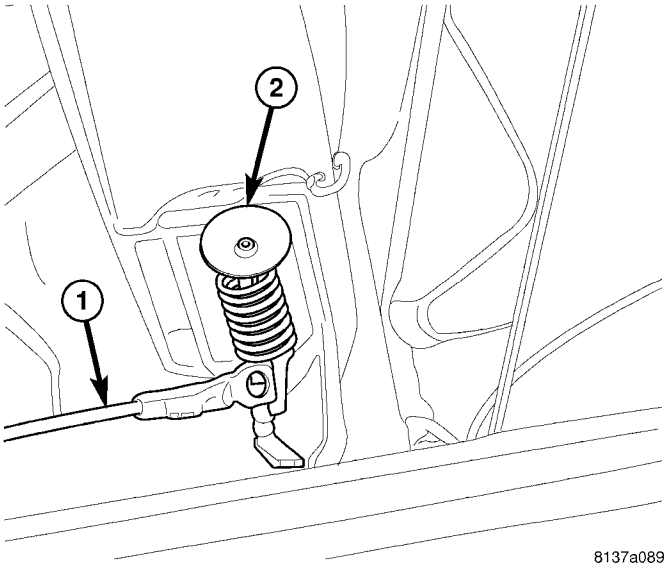

Fig. 29 TENSION CABLE SPRING

1 - CABLE
2 - SPRING

(7) Remove five screws from each bow strip (Fig. 31).

(8) Remove the headliner attachments (elastic straps) from the folding top frame.

(9) Remove C-Post flaps from the C-Post stamping (two expanding two rivets per side).

(10) Remove screws from the floating bow to detach the headliner (Fig. 32).

FOLDING TOP COVER ASSEMBLY (Continued)

FOLDING TOP COVER ASSEMBLY (Continued)

(11) Remove the headliner extrusion profile from the backlite frame (Fig. 33).

(12) Remove five screws from the edge bow strip (Fig. 34).

(13) The headliner is now loose. Store it in a clean place.

(14) Detach the hook and loop strips from the framework (Fig. 35).

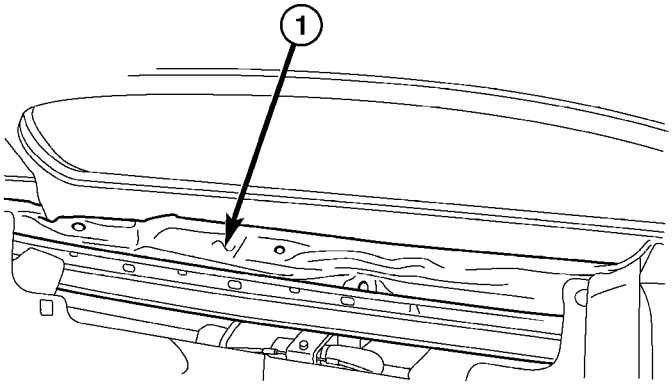

Fig. 33 WATER TROUGH

1 - WATER TROUGH

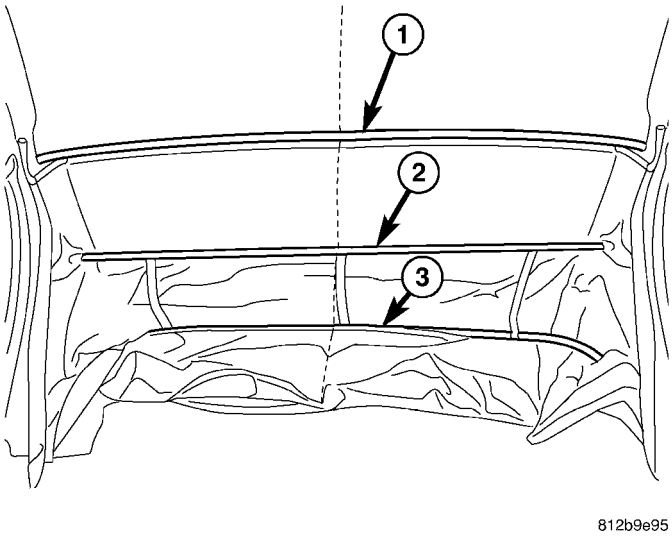

Fig. 34 E-BOW

1 - C-BOW
2 - D-BOW
3 - E-BOW (EDGE BOW)

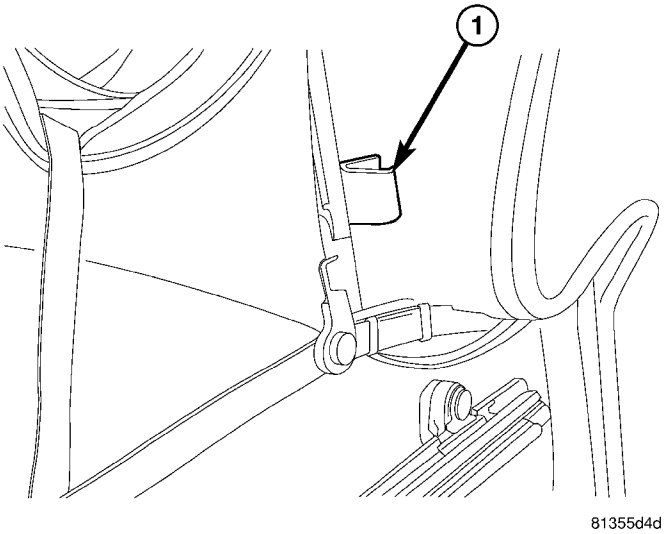

Fig. 35 HOOK AND LOOP STRIP

1 - HOOK AND LOOP STRIP

(15) Detach the rear window defogger wire connectors from the rear window defogger pigtails (1 per side) and pull them through the wire slings.

(16) Open the C-Post seal and drill the four rivets out.

(17) The C-Post seal gets loose together with the seal retainer and the canopy cover itself.

INSTALLATION

(1) Place top cover into position (Fig. 36).

(2) Position C-Post seal with the seal retainer and the canopy cover itself (Fig. 37).

(3) Open the C-Post seal and install the 4 rivets (using new rivets).

(4) Feed the rear window defogger wire connectors from the rear window defogger pigtails (1 per side) and pull them through the wire slings into position.

(5) Attach the hook and loop strips to the framework (Fig. 38).

(6) Set headliner into position to be installed at the same time as the top cover.

(7) Install five screws from the edge bow strip (Fig. 39).

(8) Install the headliner extrusion profile to the backlite frame (Fig. 40).

(9) Install screws to the floating bow attaching the headliner.

FOLDING TOP COVER ASSEMBLY (Continued)

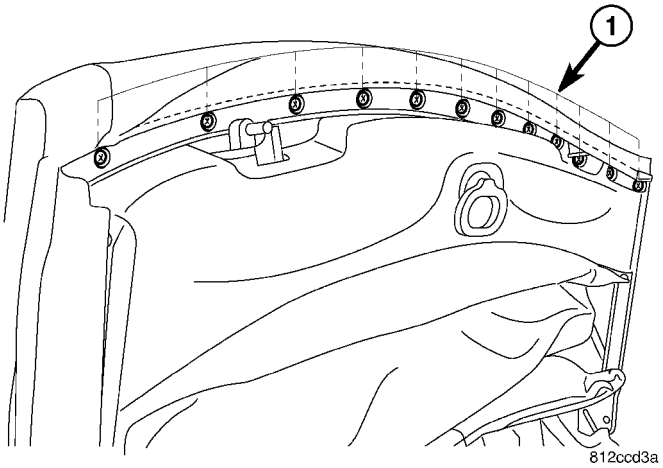

Fig. 68 TOP COVER FRONT HEADER

1 - ATTACHING SCREWS (12)

MOTOR/HYDRAULIC PUMP ASSEMBLY

REMOVAL

(1) Start with the folding top in the raised and latched position.

(2) Disconnect the battery negative cable.

(3) Remove the well liner/carpet from the folding top well.

(4) Remove the rear quarter trim panels, (Refer to 23 - BODY/INTERIOR/QUARTER PANEL TRIM - REMOVAL).

NOTE: Place a reference mark along the outer edge of the shelf seat brackets to ensure they are installed back to the original position.

(5) Remove the seat back support brackets (Fig. 69)

(6) Remove the motor/hydraulic pump foam cover.

(7) Remove the six cable tie straps (three per side) and clip the three on the left side to separate the wire harness.

(8) Remove the two motor/hydraulic pump retaining nuts (Fig. 70).

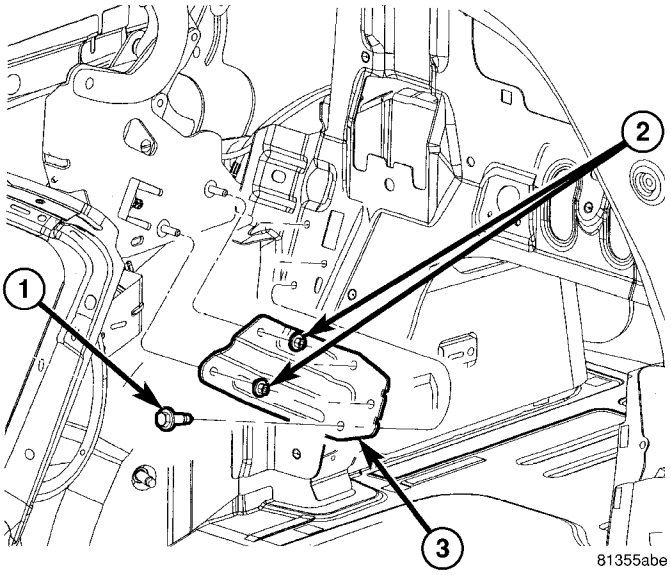

Fig. 69 SHELF SEAT BRACKET

1 - ATTACHING SCREWS (3 PER SIDE)

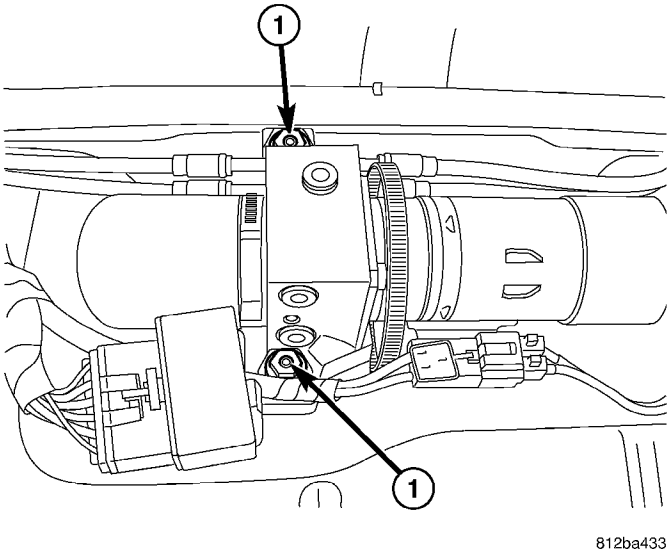

Fig. 70 PUMP MOUNTING

1 - MOTOR/HYDRAULIC PUMP RETAINING NUTS

MOTOR/HYDRAULIC PUMP ASSEMBLY (Continued)

(9) Remove the two retaining bolts for each hydraulic cylinder (Fig. 71).

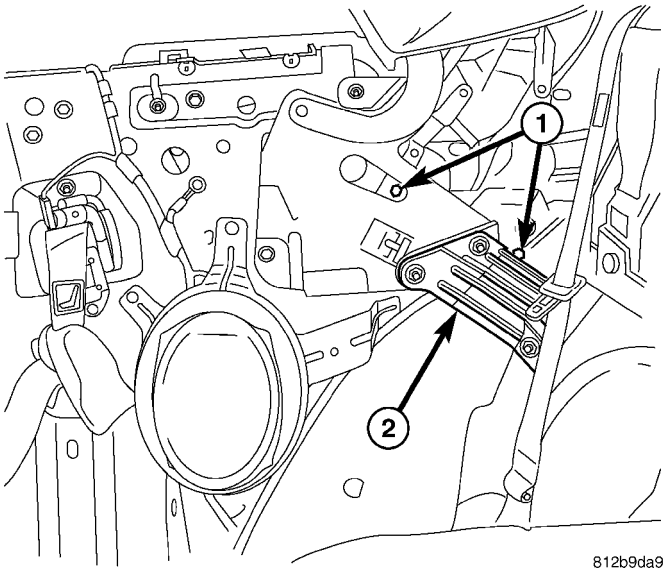

Fig. 71 CYLINDER BOLTS

1 - HYDRAULIC CYLINDER RETAINING BOLTS
2 - SEAT BACK SUPPORT BRACKET

(10) Remove the hydraulic cylinders from the main pivot brackets (Fig. 72).

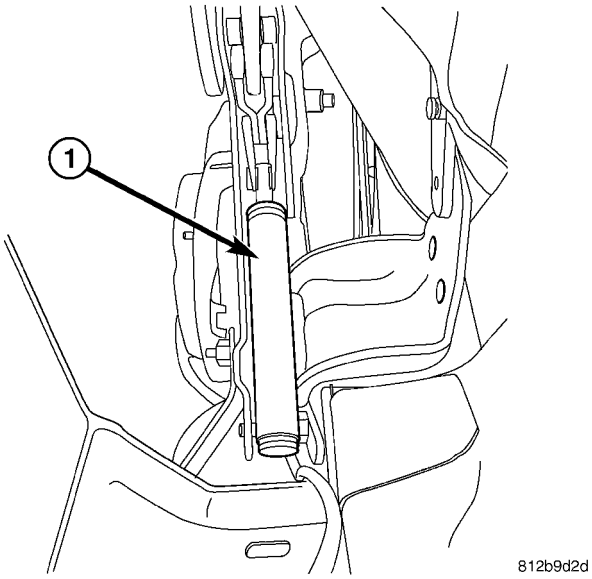

Fig. 72 CYLINDER LOCATION

1 - HYDRAULIC CYLINDER

(11) Disconnect the relay and motor connectors.

(12) Remove the motor/hydraulic pump assembly from the vehicle.

INSTALLATION

(1) Position the motor/hydraulic pump assembly in the vehicle.

(2) Connect the relay and motor connectors (Fig. 73).

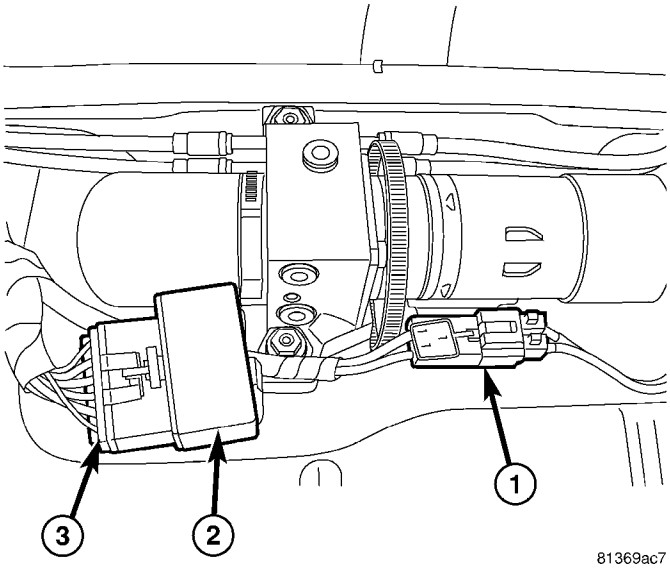

Fig. 73 MOTOR/HYDRAULIC PUMP ASSEMBLY

1 - MOTOR/HYDRAULIC PUMP CONNECTOR
2 - MOTOR/HYDRAULIC PUMP RELAY
3 - MOTOR/HYDRAULIC PUMP RELAY CONNECTOR

(3) Install the hydraulic cylinders to the main pivot brackets (Fig. 74).

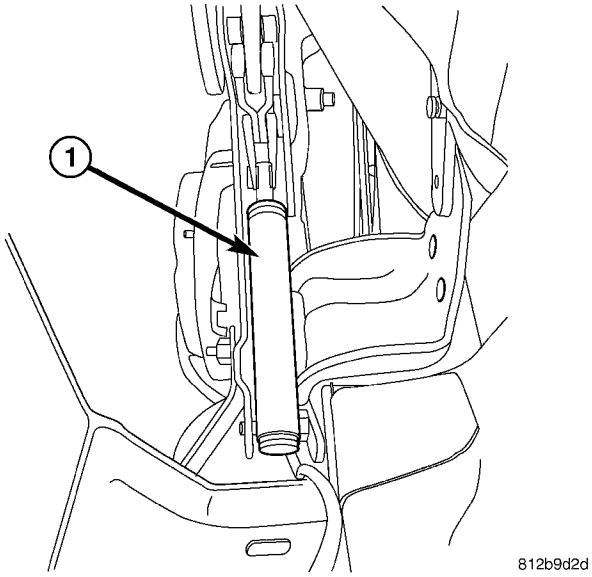

Fig. 74 CYLINDER LOCATION

1 - HYDRAULIC CYLINDER

MOTOR/HYDRAULIC PUMP ASSEMBLY (Continued)

(4) Install the two retaining bolts for each hydraulic cylinder (Fig. 75).

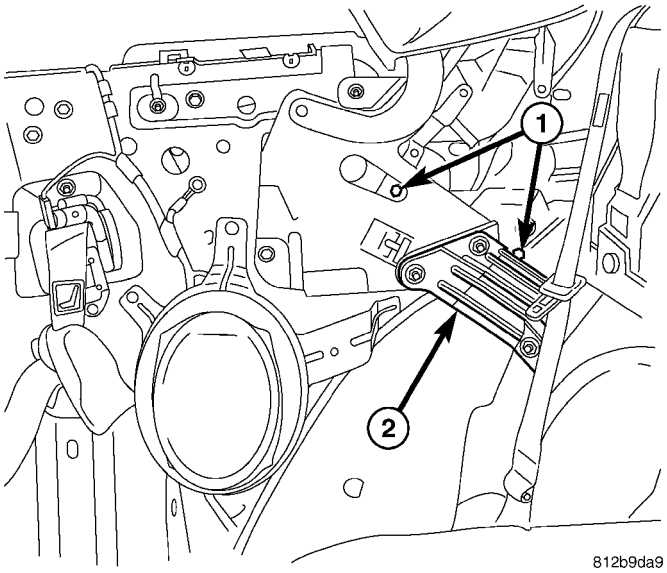

Fig. 75 CYLINDER BOLTS

1 - HYDRAULIC CYLINDER RETAINING BOLTS
2 - SEAT BACK SUPPORT BRACKET

(5) Install the two motor/hydraulic pump retaining nuts (Fig. 76).

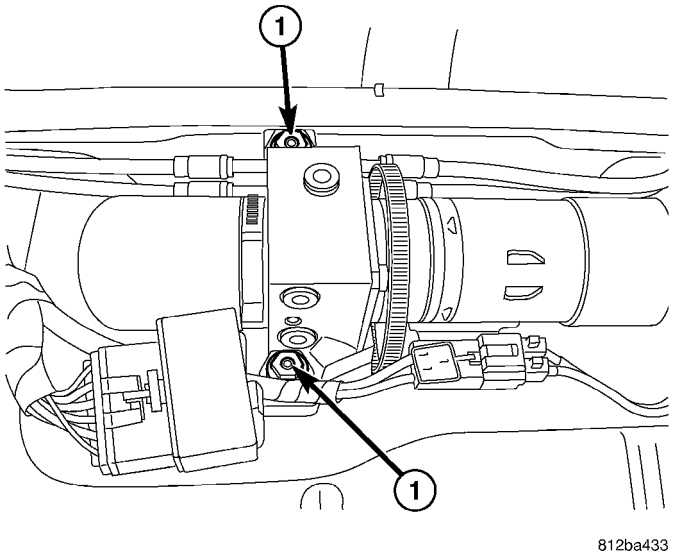

Fig. 76 PUMP MOUNTING

1 - MOTOR/HYDRAULIC PUMP RETAINING NUTS

(6) Install the six cable tie straps (three per side) to secure the wire harness.

(7) Install the motor/hydraulic pump foam cover.

NOTE: Take note of the reference marks along the outer edge of the shelf seat brackets to ensure they are installed back to the original position.

(8) Install the seat back support brackets (Fig. 77).

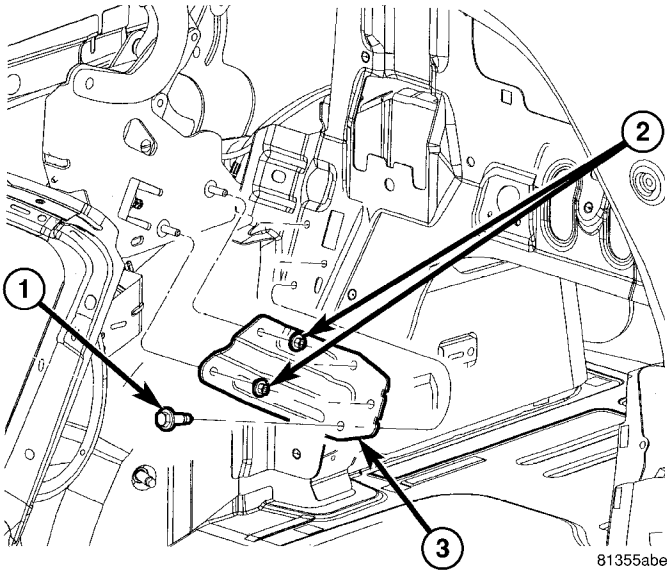

Fig. 77 SHELF SEAT BRACKET

1 - ATTACHING SCREWS
2 - ATTACHING NUTS
3 - SEAT BACK SUPPORT BRACKET TO PIVOT FOLDING TOP BRACKET

(9) Install the rear quarter trim panels, (Refer to 23 - BODY/INTERIOR/QUARTER PANEL TRIM - INSTALLATION).

(10) Install the well liner/carpet into the folding top well.

(11) Connect the battery negative cable.

(12) Verify normal power top system operation and check for hydraulic oil leaks. Adjust power top as necessary, (Refer to 23 - BODY/CONVERTIBLE TOP - ADJUSTMENTS).

LATCH SYSTEM

REMOVAL

(1) Unlatch the folding top to allow access to the latch system.

(2) Remove the screw from the D-Handle and set the D-Handle and washer aside (Fig. 78).

(3) Remove the front rail seal. There is shims at each attaching screw.

(4) Remove 12 screws attaching canopy to front header and remove canopy (Fig. 79).

(5) Remove the canopy adhesive tape from the front header edges.

(6) Remove tension cable with two spring clips on each side.

(7) Fold canopy back to the B-Bow.

(8) Remove nine headliner attaching screws from the front header.

LATCH SYSTEM (Continued)

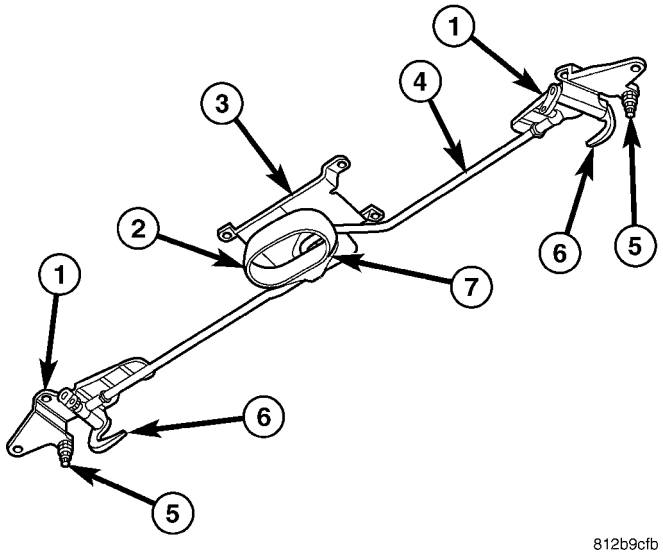

Fig. 78 LATCH SYSTEM

1 - LATCH BASE PLATE
2 - D - HANDLE
3 - LATCH HANDLE BASE PLATE
4 - TIE ROD AND BALL SOCKET
5 - DOWEL PIN
6 - LATCH HOOK AND LEVER
7 - SHAFT BUSHING AND TURN STILE

(9) Remove nine screws to attaching front header trim panel and remove front header trim panel.

(10) Mark the position of the latch hook base plates both Left Hand/Right Hand side (Fig. 80).

(11) Remove the three screws attaching latch hook base plate, remove four screws attaching center plate and remove latch assembly.

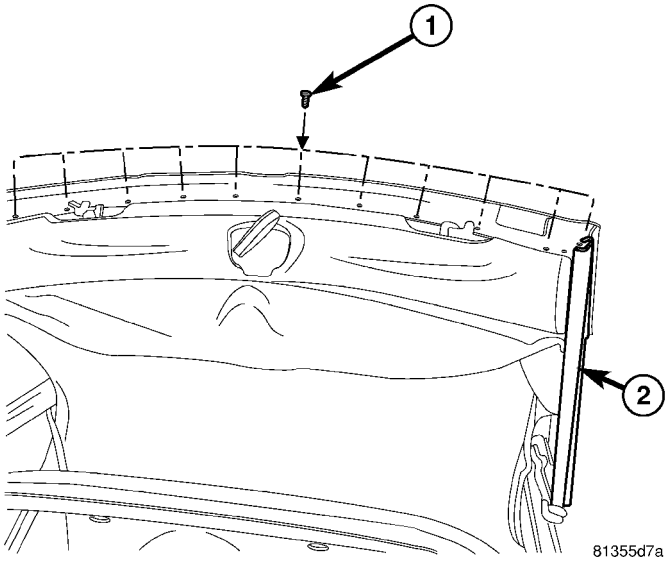

Fig. 79 CANOPY ATTACHING SCREWS

1 - CANOPY HEADER ATTACHING SCREWS
2 - FRONT SEAL CONTOUR BOW

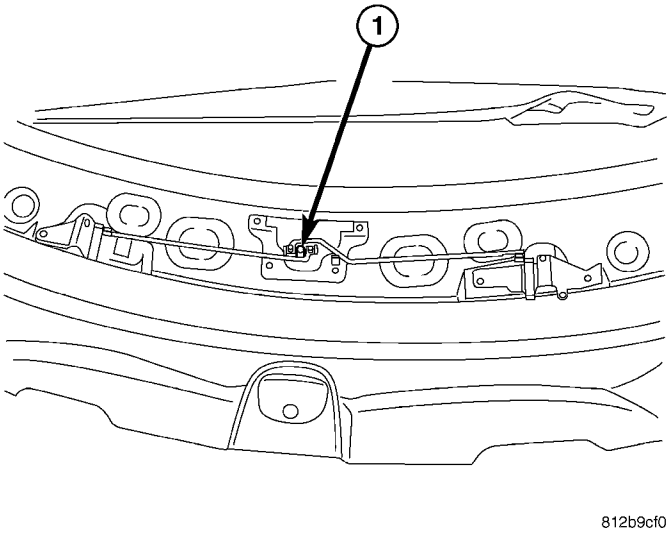

Fig. 80 HEADER AND LATCH

1 - LATCH SYSTEM

INSTALLATION

(1) Place latch assembly into position.

(2) Install the three screws attaching latch hook base plates, install four screws attaching center plate. Align all latch hook base plates marks and secure screws.

(3) Adjust the latch hook in relation to the dowel pin with the ball socket. The center line of the dowel pin and center line of the of the 10 mm (0.39 in) diameter roller is 44.90 (1.77 in) (Fig. 80) and (Fig. 78).

(4) Secure the ball socket with the hexagon nut.

(5) Secure the connection between the ball socket and the ball stud with the collateral

(6) Install the D-Handle and secure with the set screw.

(7) Close the folding top to check the correct position of the dowel pin and hook.

(8) If necessary adjust the bracket hook lever assembly

(9) When adjustment is correct, remove the D-Handle and assembly the folding top assembly

(10) Install nine screws to attaching front header trim panel and install front header trim panel (Fig. 79).

(11) Install nine headliner attaching screws to the front header.

(12) Place canopy into proper position.

(13) Install cable with two spring clips on each side.

(14) Install Canopy adhesive tape onto the front header edges.

(15) Place canopy into position.

LATCH SYSTEM (Continued)

(16) Install 12 screws attaching canopy to front header.

(17) Install washer and setscrew for the D-Handle.

(18) Latch the folding top ensure proper fit and operation.

RAIL SEALS-FRONT AND CENTER

REMOVAL

(1) Before removing the seal assemblies determine the correct number of shims that will be needed when installing the new seal assemblies. Count the existing number of shims used in each position.

(2) Adhere tape to the side glass and mark the position of each seal in the fore/aft and up/down direction. This step is critical for repositioning the new seals

(3) Remove the old seal and retainer assemblies.

INSTALLATION

(1) Align front seal assembly to the marks from on the tape.

(2) Use the same number of shims in each position as was used on the old seal assembly.

(3) Install rail seals screws. Tighten each screw to 5.5 N·m (49 in. lbs.) Torque

(4) Remove the tape from the side glass.

RAIL SEALS-REAR

REMOVAL

(1) Using a 04.0 mm drill bit and drill motor, drill out the four rivets on each rear rail seal.

(2) Remove the seal and retainer assembly

INSTALLATION

(1) Place the new seal and retainer in position.

(2) Verify that the holes in the canopy are lined up with the holes in the seal retainer.

(3) Attach the new seal and retainer assembly using the blind rivets (four per side).

WIRE HARNESS

REMOVAL

(1) Remove rear seat back.

(2) Remove left side quarter trim panel.

(3) Remove well liner/carpet.

(4) Remove foam pump cover from over pump.

(5) Disconnect the wire connectors to the rear window defogger on backlite one on each side and pull wire through the wire slings.

(6) Remove the tie straps between the pump assembly and the left side main pivot bracket.

(7) Disconnect the wire connectors to the pump motor, relay, and main body harness

(8) Remove wire harness.

INSTALLATION

(1) Place wire harness into position.

(2) Connect the wire connectors to the pump motor, relay, and main body harness.

(3) Install tie straps (6) between the pump assembly and the left side main pivot bracket.

(4) Pull wire through the wire slings and connect the wire connectors to the rear window defogger on the backlite one on each side.

(5) Place the foam pump cover over pump.

(6) Install the well liner/carpet.

(7) Install left side quarter trim panel.

(8) Install rear seat back.

REMOVAL	42
INSTALLATION	42

DECKLID - PT-27

REMOVAL

(1) Release decklid latch and open decklid.

(2) Remove decklid trim panel. (Refer to 23 - BODY/DECKLID/DECKLID TRIM PANEL - REMOVAL).

(3) Disconnect decklid wire harness from body wire harness.

(4) Support decklid on a suitable lifting device.

(5) Disengage clips attaching gas prop rod supporting decklid. (Refer to 23 - BODY/DECKLID/GAS PROP ROD - REMOVAL).

(6) Remove bolts attaching decklid hinge to decklid (Fig. 1) and (Fig. 2).

(7) With assistance, remove liftgate from vehicle.

INSTALLATION

(1) With assistance, place decklid in position on vehicle (Fig. 1) and (Fig. 2).

(2) Install bolts attaching decklid hinge to decklid. Tighten bolts to 33 N·m (24 ft. lbs.) torque.

(3) Install gas prop rods. (Refer to 23 - BODY/DECKLID/GAS PROP ROD - INSTALLATION).

(4) Remove lifting device from under decklid.

(5) Connect decklid wire harness into body wire harness.

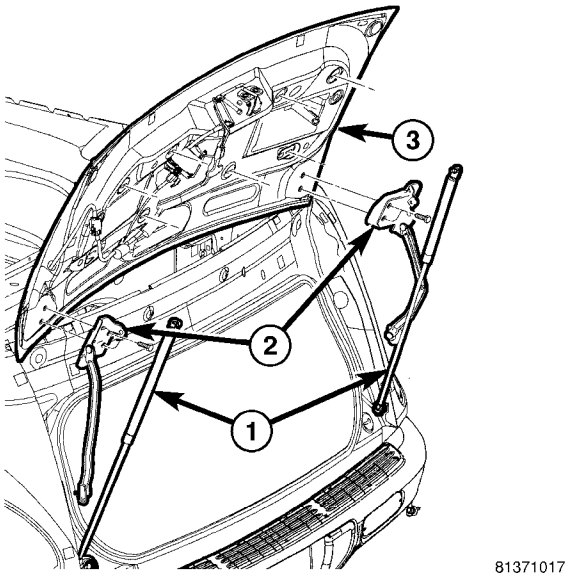

Fig. 1 DECKLID HINGE

1 - GAS PROP ROD
2 - DECKLID HINGE
3 - DECKLID

(6) Install decklid trim panel. (Refer to 23 - BODY/DECKLID/DECKLID TRIM PANEL - INSTALLATION).

DECKLID - PT-27 (Continued)

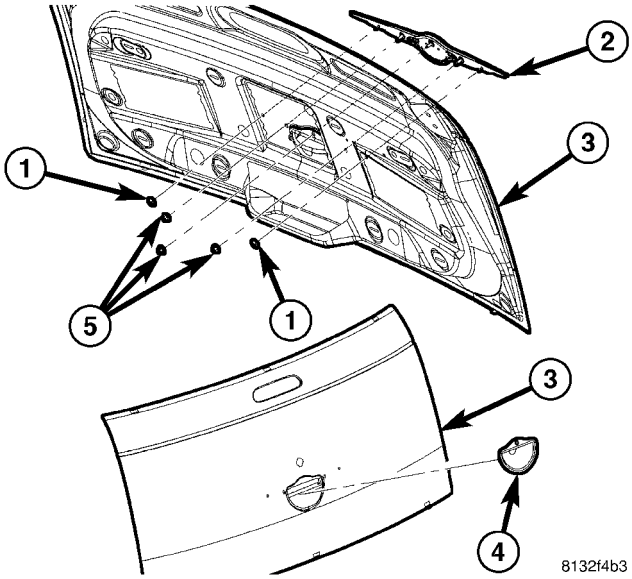

Fig. 2 DECKLID

1 - DECKLID EMBLEM SPRING NUT(S)
2 - DECKLID OUTSIDE CHROME HANDLE
3 - DECKLID
4 - DECKLID OUTSIDE BEZEL
5 - DECKLID HANDLE ATTACHING NUT(S)

(7) Verify decklid alignment. The decklid should have a gap to adjacent panels and fit flush across the gaps. The gap is;

- 7 mm (0.280 in.) to the fascia,
- 6 mm (0.240 in.) to the decklid header,
- 4 mm (0.160 in.) to the body side.

DECKLID GAS PROP - PT-27

REMOVAL

(1) Open decklid.
(2) Remove the gas prop rod lock clips (Fig. 3).
(3) Remove gas prop-rod from mounting studs.

INSTALLATION

(1) Install gas prop rod to mounting studs (Fig. 3).
(2) Install the gas prop-rod lock clips.
(3) Close decklid.

DECKLID HANDLE - PT-27

REMOVAL

(1) Release decklid latch and open decklid.
(2) Remove decklid trim panel. (Refer to 23 - BODY/DECKLID/DECKLID TRIM PANEL - REMOVAL).
(3) Disconnect cylinder link and handle to latch link by unsnapping the retainer clip and rolling it clear of link.

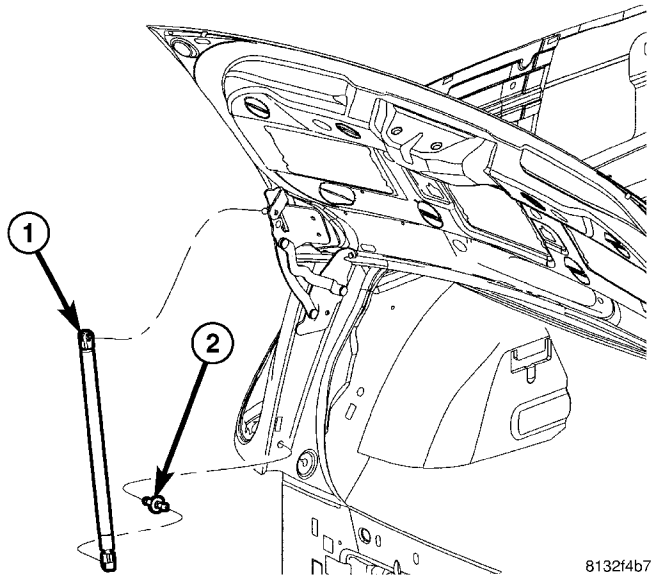

Fig. 3 DECKLID GAS PROP ROD

1 - DECKLID GAS PROP ROD
2 - BALL STUD(S)

(4) Remove the emblem spring nuts (Fig. 4).
(5) Remove the handle attaching nuts.
(6) Remove handle from decklid.

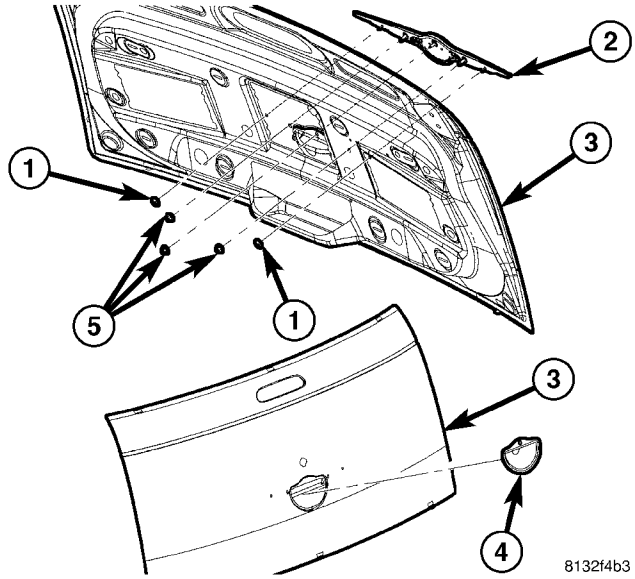

Fig. 4 DECKLID

1 - DECKLID EMBLEM SPRING NUT(S)
2 - DECKLID OUTSIDE CHROME HANDLE
3 - DECKLID
4 - DECKLID OUTSIDE BEZEL
5 - DECKLID HANDLE ATTACHING NUT(S)

INSTALLATION

(1) Place decklid handle into position (Fig. 4).
(2) Install the handle attaching nuts.
(3) Install the emblem spring nuts.

DECKLID HANDLE - PT-27 (Continued)

(4) Place cylinder link and handle to latch link into position. Connect the retainer clip by rolling clip over and snapped into position.

(5) Install decklid trim panel. (Refer to 23 - BODY/DECKLID/DECKLID TRIM PANEL - INSTALLATION).

(6) Verify decklid operation.

DECKLID HINGE - PT-27

REMOVAL

(1) Release decklid latch and open decklid.

(2) Support decklid on a suitable lifting device.

(3) Disengage clips attaching gas prop rod supporting decklid. (Refer to 23 - BODY/DECKLID/GAS PROP ROD - REMOVAL).

(4) Remove bolts attaching decklid hinge to decklid and to body side (Fig. 5).

(5) Remove hinge from vehicle.

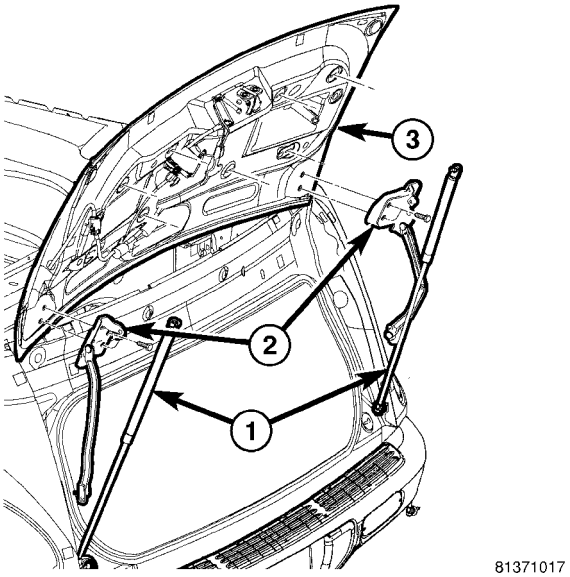

Fig. 5 DECKLID HINGE

1 - GAS PROP ROD
2 - DECKLID HINGE
3 - DECKLID

INSTALLATION

(1) Place hinge into position.

(2) Install bolts attaching decklid hinge to decklid and to body side (Fig. 5).

(3) Engage clips attaching gas prop rod supporting decklid. (Refer to 23 - BODY/DECKLID/GAS PROP ROD - INSTALLATION).

(4) Remove support decklid on a suitable lifting device.

(5) Release decklid latch and open decklid.

(6) Verify decklid alignment. The decklid should have a gap to adjacent panels and fit flush across the gaps. The gap is;

- 7 mm (0.280 in.) to the fascia,
- 6 mm (0.240 in.) to the decklid header,
- 4 mm (0.160 in.) to the body side.

DECKLID LATCH - PT-27

REMOVAL

(1) Release decklid latch and open decklid.

(2) Remove decklid trim panel. (Refer to 23 - BODY/DECKLID/DECKLID TRIM PANEL - REMOVAL).

(3) Disconnect decklid latch wire harness from body wire harness.

(4) Disconnect cylinder link and handle to latch link by unsnapping the retainer clip and rolling it clear of link releasing links (Fig. 6).

(5) Remove attaching screws.

(6) Remove decklid latch assembly from vehicle.

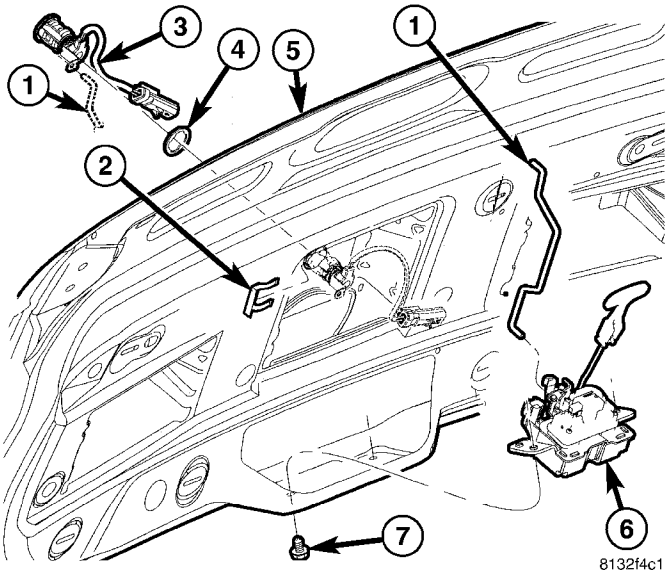

Fig. 6 DECKLID LOCK ASSEMBLY

1 - LOCK CYLINDER LINK
2 - LOCK CYLINDER RETAINER
3 - DECKLID LOCK ASSEMBLY
4 - LOCK CYLINDER GASKET
5 - DECKLID
6 - DECKLID LATCH ASSEMBLY
7 - ATTACHING SCREWS

INSTALLATION

(1) Place decklid latch assembly into position.

(2) Install attaching screws (Fig. 6).

(3) Place cylinder link and handle to latch link into position on latch. Connect the retainer clip by rolling clip over and snapped into position.

DECKLID LATCH - PT-27 (Continued)

(4) Connect decklid latch wire harness to body wire harness.

(5) Install decklid trim panel. (Refer to 23 - BODY/DECKLID/DECKLID TRIM PANEL - INSTALLATION).

DECKLID LATCH STRIKER - PT-27

REMOVAL

(1) Open decklid.

(2) Mark outline of striker on sill to aid installation.

(3) Remove screws attaching striker to sill (Fig. 7).

(4) Remove striker from vehicle.

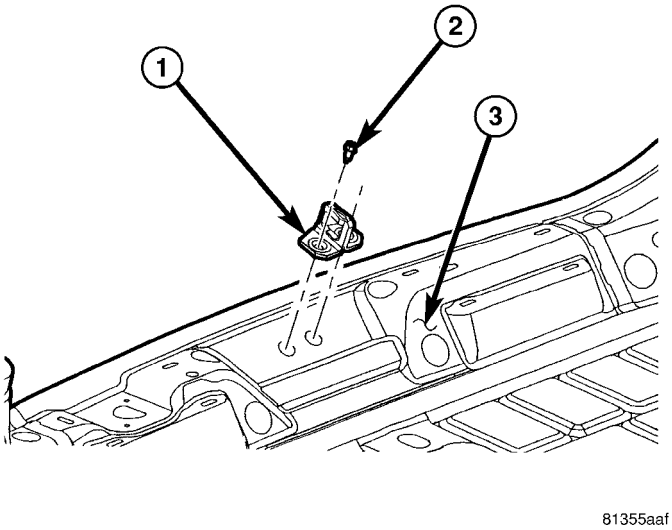

Fig. 7 DECKLID LATCH STRIKER

1 - DECKLID LATCH STRIKER
2 - ATTACHING SCREW(S)
3 - DECKLID OPENING LOWER PANEL

INSTALLATION

(1) Place striker in position on vehicle (Fig. 7).

(2) Align striker to outline mark on sill.

(3) Install screws attaching striker to sill. Tighten screws to 28 N·m (21 ft. lbs.) torque.

(4) Verify decklid alignment and operation.

DECKLID LOCK CYLINDER - PT-27

REMOVAL

(1) Release decklid latch and open decklid.

(2) Remove decklid trim panel. (Refer to 23 - BODY/DECKLID/DECKLID TRIM PANEL - REMOVAL).

(3) Disconnect lock assembly wire harness from decklid wire harness.

(4) Disconnect cylinder link by unsnapping the retainer clip and rolling it clear of link.

(5) Remove lock cylinder clip from lock assembly (Fig. 8).

(6) Remove lock cylinder assembly from decklid.

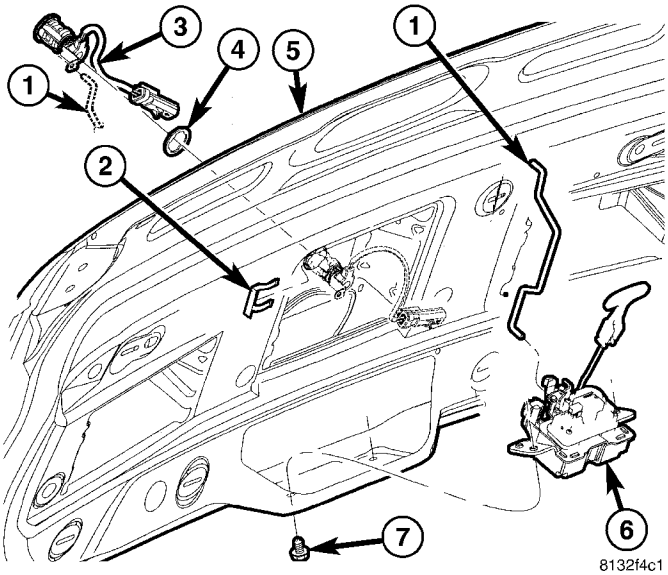

Fig. 8 DECKLID LOCK ASSEMBLY

1 - LOCK CYLINDER LINK
2 - LOCK CYLINDER RETAINER
3 - DECKLID LOCK ASSEMBLY
4 - LOCK CYLINDER GASKET
5 - DECKLID
6 - DECKLID LATCH ASSEMBLY
7 - ATTACHING SCREWS

INSTALLATION

(1) Place lock cylinder assembly into position.

(2) Install lock cylinder clip onto lock assembly (Fig. 8).

(3) Place cylinder link into position on latch. Connect the retainer clip by rolling clip over and snapped into position.

(4) Connect lock assembly wire harness to decklid wire harness.

(5) Install decklid trim panel. (Refer to 23 - BODY/DECKLID/DECKLID TRIM PANEL - INSTALLATION).

(6) Verify decklid alignment and operation.

DECKLID TRIM PANEL - PT-27

REMOVAL

(1) Open decklid.

(2) Using a trim stick (C-4755), disengage clips attaching decklid trim panels (Fig. 9).

(3) Remove decklid trim panel trim from vehicle.

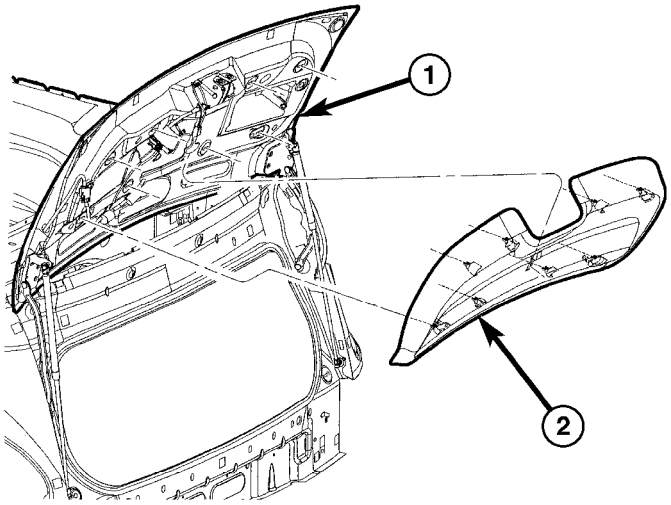

Fig. 9 DECKLID TRIM PANEL

1 - DECKLID
2 - DECKLID TRIM PANEL

INSTALLATION

(1) Place decklid trim panel into position (Fig. 9).

(2) Press tabs into position to attaching decklid trim panel to decklid.

(3) Install emergency release handle in opening in Decklid Trim Panel.

(4) Close decklid.

FRONT DOOR APPLIQUE

REMOVAL

(1) Open front door.

(2) Remove screw attaching outside belt weatherstrip and remove from door (Fig. 1).

(3) Remove glass run weatherstrip as necessary to access the three screws attaching applique (Fig. 2).

(4) Remove the three screws attaching applique and remove applique from door (Fig. 3).

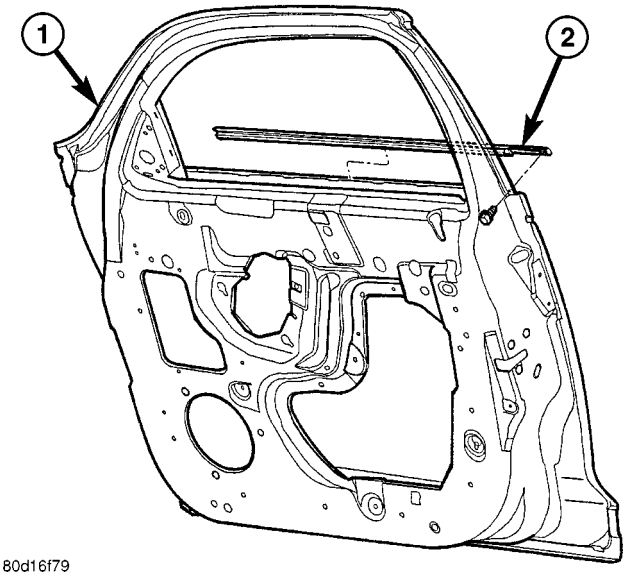

Fig. 1 GLASS RUN WEATHERSTRIP

1 - FRONT DOOR
2 - FRONT DOOR OUTSIDE BELT WEATHERSTRIP

INSTALLATION

(1) Place applique into position.

(2) Install the three attaching screws (Fig. 3).

(3) Install glass run weatherstrip into position (Fig. 2).

(4) Place outside belt weatherstrip into position and install attaching screw (Fig. 1).

(5) Close door

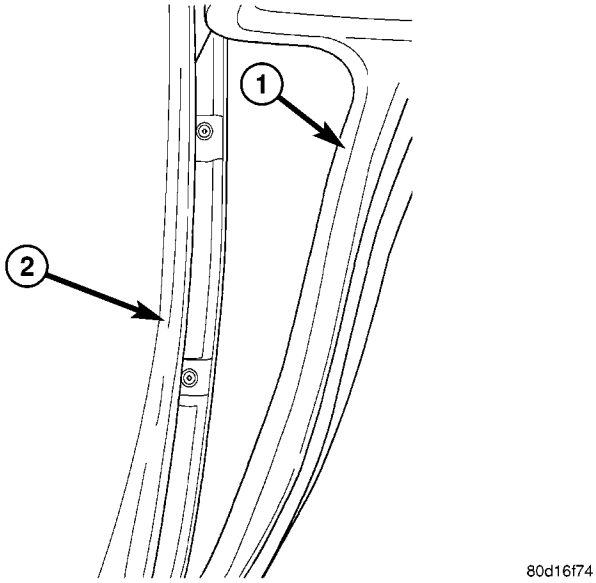

Fig. 2 FRONT DOOR OUTSIDE BELT WEATHERSTRIP

1 - GLASS RUN WEATHERSTRIP
2 - UPPER DOOR FRAME

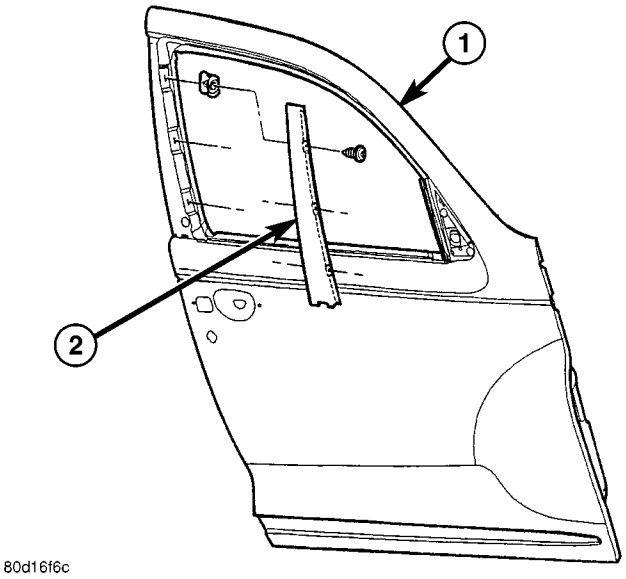

Fig. 3 FRONT DOOR B-PILLAR APPLIQUE

1 - FRONT DOOR
2 - FRONT DOOR B-PILLAR APPLIQUE

FRONT DOOR CHECK STRAP

REMOVAL

(1) Remove door trim panel and water dam.
(2) Remove bolt attaching check strap to hinge pillar.
(3) Remove door speaker.
(4) Remove glass run.
(5) Remove bolts attaching check strap to door end frame.
(6) Remove check strap and cover from vehicle.

INSTALLATION

NOTE: Do not grease check strap.

(1) Assemble check strap cover to check strap.
(2) Position door check on vehicle and install bolts attaching strap to door end frame.
(3) Install glass run.
(4) Install door speaker, if so equipped.
(5) Install bolt attaching door check strap to hinge pillar.
(6) Install door trim panel and water dam.

FRONT DOOR

REMOVAL

REMOVAL

NOTE: The retaining clips used on the door hinge pins are not to be reused. Verify availability prior to proceeding.

(1) Open and support door on a suitable lifting device.
(2) Disconnect wire connector at hinge pillar, if necessary.
(3) Mark the location of the hinge.
(4) Remove bolts attaching door check strap to hinge pillar (Fig. 4).
(5) Remove bolts attaching lower hinge to door.
(6) Remove bolts attaching upper hinge to door.
(7) Remove door from vehicle.

REMOVAL - PT-27 ONLY

(1) Open and support door on a suitable lifting device.
(2) Disconnect wire connector at hinge pillar, if necessary.
(3) Mark the location of the hinge.
(4) Remove bolts attaching door check strap to hinge pillar (Fig. 5).
(5) Remove bolts attaching lower hinge to door.

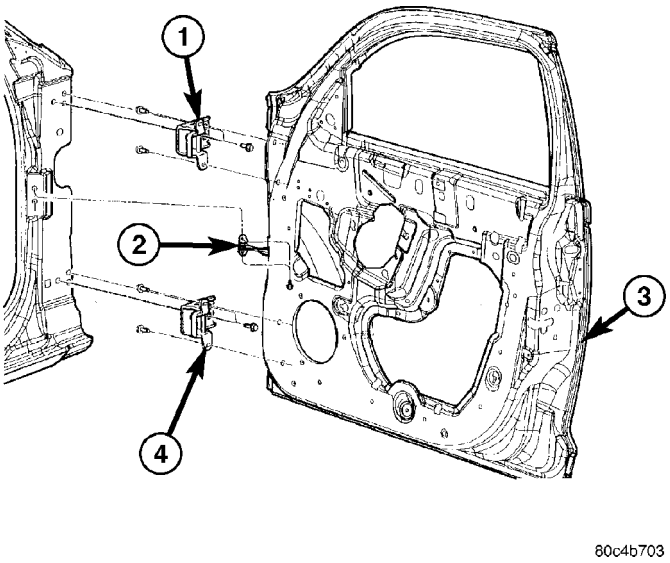

Fig. 4 FRONT DOOR HINGES

1 - FRONT DOOR UPPER HINGE
2 - FRONT DOOR CHECK STRAP
3 - FRONT DOOR
4 - FRONT DOOR LOWER HINGE

(6) Remove bolts attaching upper hinge to door.
(7) Remove door from vehicle.

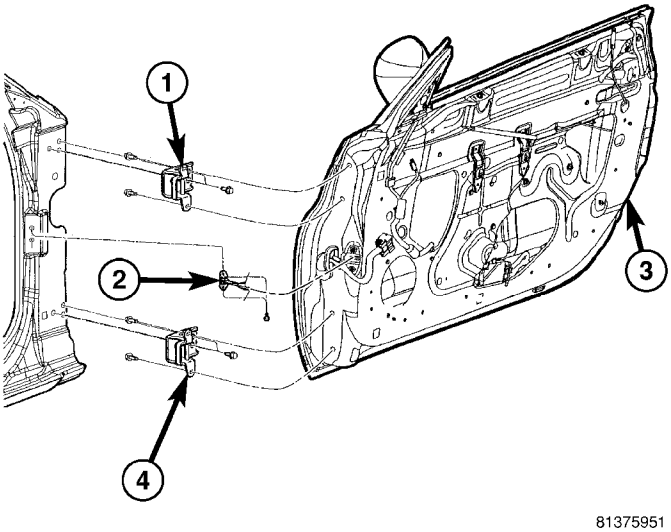

Fig. 5 FRONT DOOR - PT-27

1 - FRONT DOOR UPPER HINGE
2 - FRONT DOOR CHECK STRAP
3 - FRONT DOOR
4 - FRONT DOOR LOWER HINGE

INSTALLATION

INSTALLATION

(1) Align the hinge marks and position door to the hinges on vehicle (Fig. 4).

FRONT DOOR (Continued)

(2) Install bolt into hinge top hole on the right side or bottom hole left side (smallest hole).
(3) Install bolt into hinge bottom hole on the right side or top hole left side (slotted hole).
(4) Install bolts attaching door check strap to hinge pillar.
(5) Connect wire connector at hinge pillar, if necessary.
(6) Verify door flush and gap measurements, adjust as necessary.

INSTALLATION - PT-27 ONLY

(1) Align the hinge marks and position door to the hinges on vehicle (Fig. 5).
(2) Install bolt into hinge top hole on the right side or bottom hole left side (smallest hole).
(3) Install bolt into hinge bottom hole on the right side or top hole left side (slotted hole).
(4) Install bolts attaching door check strap to hinge pillar.
(5) Connect wire connector at hinge pillar, if necessary.
(6) Verify door flush and gap measurements, adjust as necessary. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - PT-27 - SPECIFICATIONS).

FRONT DOOR GLASS

REMOVAL

REMOVAL

(1) Remove door trim panel and water dam.
(2) Remove inner door belt weatherstrip (Fig. 6).
(3) Lower door glass to bottom of door to gain access to attaching bolts.
(4) Loosen bolts attaching door glass to window regulator lift plates.
(5) Disengage door glass from regulator.
(6) Lift door glass upward, tilting down at the front and up at the back, out of the opening at the top of door.

REMOVAL - PT-27 ONLY

(1) Remove door trim panel.
(2) Remove door speaker.
(3) Remove inside handle link
(4) Remove water dam.
(5) Remove inner door belt weatherstrip.
(6) Loosen inner belt stabilizer (Fig. 7).
(7) Lower door glass to access glass attachment bolts through inner panel (third way down).

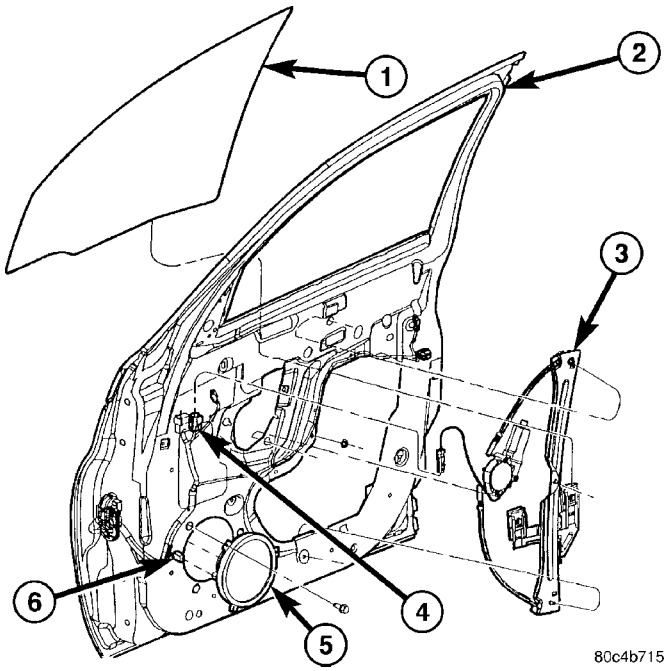

Fig. 6 FRONT DOOR GLASS - POWER WINDOW

2 - FRONT DOOR
3 - FRONT DOOR WINDOW POWER REGULATOR
4 - POWER WINDOW REGULATOR WIRING CONNECTOR
5 - FRONT DOOR SPEAKER
6 - SPEAKER WIRE CONNECTOR

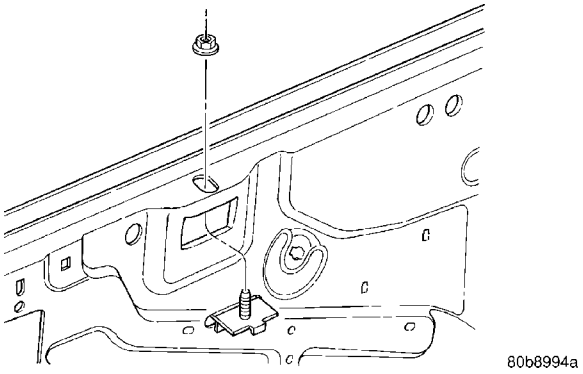

Fig. 7 INNER BELT STABILIZER

(8) Remove bolts attaching regulator lift channel to door glass (Fig. 8).
(9) Remove bolts attaching rear rail assembly lift plate to door glass.
(10) Remove rear rail assembly lift plate from door glass.
(11) Lift door glass upward and out of opening at top of door (Fig. 9).

FRONT DOOR GLASS (Continued)

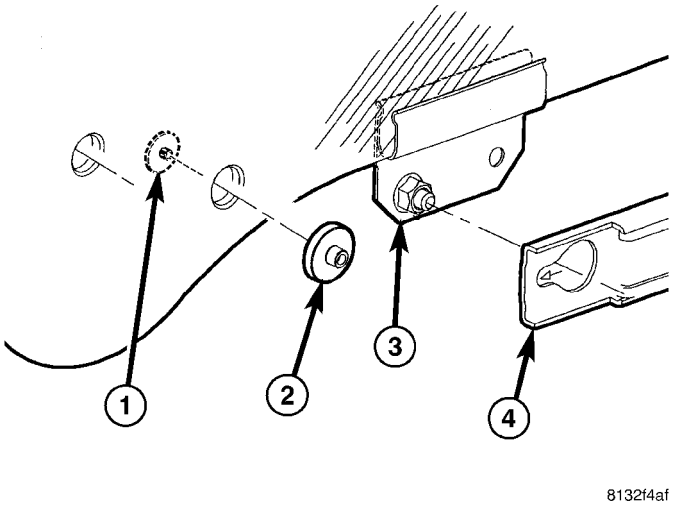

Fig. 8 DOOR GLASS RETAINER

1 - DOOR GLASS RETAINER AND NUT ASSEMBLY
2 - DOOR GLASS TO LIFT PLATE BUSHING
3 - DOOR GLASS LIFT BRACKET
4 - REGULATOR WITH SMART REGULATOR ASSEMBLY

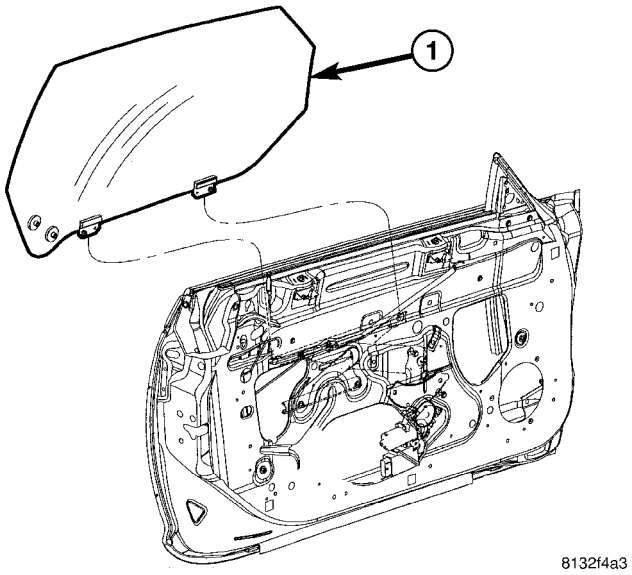

Fig. 9 DOOR WINDOW GLASS

1 - DOOR WINDOW GLASS

INSTALLATION

INSTALLATION

(1) Carefully lower door glass through opening in top of door.

(2) Position door glass into window regulator lift plates (Fig. 6).

(3) Install bolts door glass to lift plates and do not tighten.

(4) Raise glass to the full up position and then tighten the lift plate bolts.

(5) Install inner door belt weatherstrip.

(6) Install door trim panel and water dam.

INSTALLATION - PT-27

(1) Carefully lower door glass through opening in top of door. Verify that the front edge of the glass is in the mirror flag glass channel (Fig. 9).

(2) Install nuts attaching regulator lift channel to door glass (Fig. 8).

(3) Position rear rail assembly onto door glass and install bolts.

(4) Tighten all door glass fasteners to 7.3 N·m (65 in. lbs.).

(5) Tighten window inner belt stabilizer (Fig. 7).

(6) Install inner door belt weatherstrip. (Refer to 23 - BODY/WEATHERSTRIP/SEALS/FRONT DOOR INNER BELT WEATHERSTRIP - INSTALLATION).

(7) Install the water dam. (Refer to 23 - BODY/DOOR - FRONT/WATER DAM - INSTALLATION).

(8) Install door speaker. (Refer to 8 - ELECTRICAL/AUDIO/SPEAKER - INSTALLATION).

(9) Install inside handle link an clip in door inner panel.

(10) Install door trim panel.

ADJUSTMENTS

ADJUSTMENT - PT-27 ONLY

FRONT DOOR ADJUSTMENT

NOTE: Verify that the door is properly adjusted to the body prior to adjusting the door glass.

NOTE: Lower quarter glass to the full down position while making door glass adjustments, unless otherwise instructed.

TOP OF GLASS – INBOARD/OUTBOARD ADJUSTMENTS

(1) Remove the access covers. Disengage front cover by prying at its rear edge. Disengage rear cover by prying at notch at bottom of reflector.

(2) Using a 10 mm socket, loosen the jack screw nuts.

(3) Using a 3 mm allen wrench, rotate the jack screw to achieve the proper alignment between the door glass and the weatherstrip. Tighten all fasteners prior to measuring the gaps.

(4) Cycle the glass fully down and up, open and close the door. Verify that the top edge of the door glass meets dimension.

(5) Install access covers.

FRONT DOOR GLASS (Continued)

UP-STOP ADJUSTMENTS

(1) Remove door trim panel. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL)

(2) Remove water dam.

(3) Apply tape to outboard top surface of glass and close door with top closed.

(4) Mark outboard seal contact to glass on tape.

(5) Measure marking to edge of glass and see if meets dimensions (Fig. 10).

(6) Lower glass so up stop is visible through door inner panel.

(7) Adjust the up stop to achieve the proper glass to weatherstrip dimensions.

(8) Cycle the glass fully down and up, open and close the door. Verify that the top edge of the door glass meets dimensions.

NOTE: Verify that the forward edge of the glass is flush with the mirror flag edge. Adjust the mirror flag as necessary to achieve a flush condition. (Fig. 11)

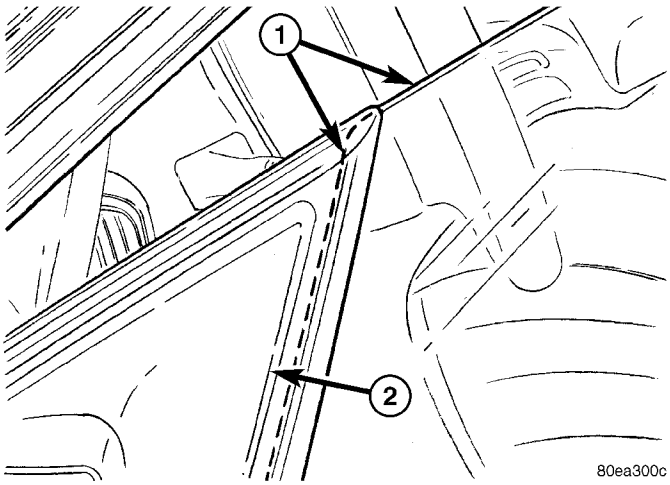

Fig. 11 MIRROR FLAG

1 - GLASS EDGE
2 - MIRROR FLAG

		MEASUREMENT LOCATIONS AND THEIR VALUES	
		SECTION A-A	SECTION B-B
			SEQUENCE	ADJUSTMENT	W	Y
1 UP/DOWN		8.0mm ±2mm	8.0mm ±2mm

NOTE: Forward / Rearward and Up/Down adjustment are to be made at the same time.

81397381

Fig. 10 FRONT DOOR GLASS ADJUSTMENT SPECIFICATIONS

FRONT DOOR GLASS (Continued)

GLASS - FRONT/REAR ADJUSTMENT

(1) Remove the rear upper corner of watershield (Refer to 23 - BODY/DOOR - FRONT/WATERSHIELD - REMOVAL).

(2) Lower door glass slightly (2 mm or 5/64 inch) to gain access to glass attachments and relieve pressure from up stops.

(3) Loosen two rearward glass attachment bolts.

(4) Raise door glass and position correctly (Fig. 12).

(5) Tighten the one accessible glass fasteners in the full up position.

(6) Lower door glass and tighten the remaining glass fasteners.

(7) Raise glass to top of travel and verify positioning.

(8) To verify proper fit of the door glass to the header/A-pillar weatherstrip,

(a) Lower door glass slightly.

(b) Place a paper strip between the glass and weatherstrip near mirror flag and another near the front upper corner of the door glass (Fig. 13).

(c) Raise glass to full up position.

(d) Pull the strip from between the door glass and the weatherstrip. There should be slight tension on the paper.

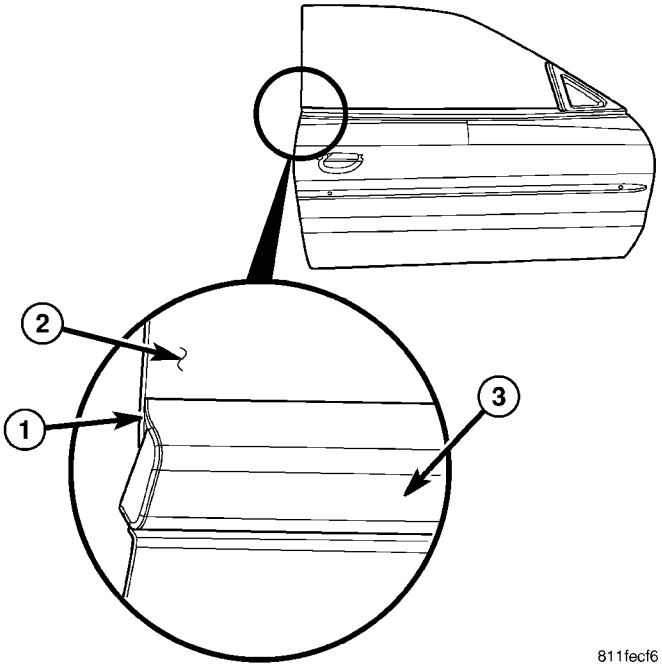

Fig. 13 GLASS ALIGNMENT AT REAR OF GLASS

5 - MIRROR STANCHION
6 - DOOR

FRONT DOOR GLASS (Continued)

DOOR GLASS ALIGNMENT VERIFICATION

NOTE: Door Glass Alignment Verification procedure must be done whenever the door glass is adjusted and after all adjustments are made.

(1) Raise quarter glass to full up position.
(2) Close door and cycle door glass between full up and full down positions.
(3) Verify that door glass operates smoothly and maintains correct alignment to convertible top and quarter glass.
(4) Verify that quarter glass weatherstrip fully contacts door glass.
(5) Ensure that the weatherstrip and door glass are in proper alignment.
(6) If any of the above conditions are found,
(a) Adjust quarter glass (Refer to 23 - BODY/ADJUSTABLE QUARTER GLASS - ADJUSTMENTS).
(b) Readjust the door glass as necessary to cure the condition.
(7) Repeat steps 1 through 6 with the top down.

QUARTER GLASS ADJUSTMENT

NOTE: The door glass must be properly adjusted prior to performing any quarter glass adjustments. (Refer to 23 - BODY/DOOR - FRONT/DOOR GLASS - ADJUSTMENTS)

UP-STOP ADJUSTMENTS

(1) Remove quarter trim panel. (Refer to 23 - BODY/INTERIOR/QUARTER PANEL TRIM - REMOVAL).
(2) Remove water dam.
(3) Apply tape to outboard top and seal surface of glass and raise glass with top closed.
(4) Mark outboard seal contact to glass on tape.
(5) Measure markings to edge of glass and see if it meets specifications, refer to the specification chart.
(6) Loosen up-stop nut (Fig. 14).
(7) Adjust quarter glass.
(8) Tighten up stop nut.
(9) Cycle quarter glass between full up and full down positions. Verify operation and adjust as necessary.
(10) Install the water dam.
(11) Install quarter trim panel. (Refer to 23 - BODY/INTERIOR/QUARTER PANEL TRIM - INSTALLATION).

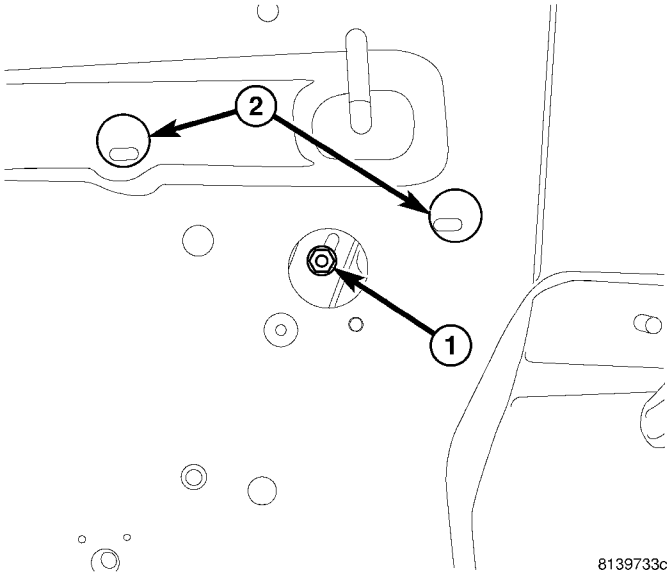

Fig. 14 GLASS BOLT OPENINGS

1 - UP Stop Bolt Opening
2 - Glass Attachment Bolt Openings

BOTTOM OF GLASS – INBOARD/OUTBOARD ADJUSTMENTS

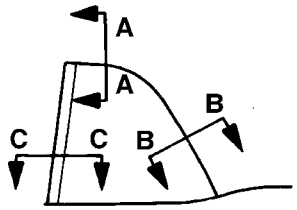
(1) Remove the quarter trim panel. (Refer to 23 - BODY/INTERIOR/QUARTER PANEL TRIM - REMOVAL).
(2) Remove water dam.
(3) Using a suitable offset wrench, loosen the upper forward jack screw set nut.
(4) Using a suitable allen wrench, rotate the upper forward jack screw to achieve the proper gap between the door glass and the quarter glass seal (Fig. 15). Tighten jack screw prior to measuring the gaps.
(5) Using a suitable allen wrench, rotate the upper rearward jack screw to achieve the proper gap between the top seal and the quarter glass. Tighten jack screw nut prior to measuring the gaps.
(6) Install water dam.
(7) Install quarter trim panel. (Refer to 23 - BODY/INTERIOR/QUARTER PANEL TRIM - INSTALLATION).

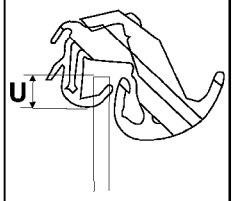
TOP OF GLASS – INBOARD/OUTBOARD ADJUSTMENTS

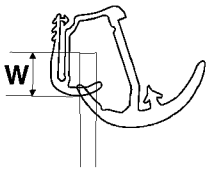
(1) Remove quarter trim panel. (Refer to 23 - BODY/INTERIOR/QUARTER PANEL TRIM - REMOVAL).
(2) Remove water dam.

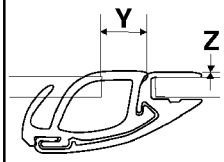
NOTE: Alternatively, the lower adjustment can be accessed through a hole at the bottom of the quarter trim panel. This hole can be located by removing the rear seat cushion. (Refer to 23 - BODY/SEATS/SEAT CUSHION - REMOVAL)

FRONT DOOR GLASS (Continued)

			MEASUREMENT LOCATIONS AND THEIR VALUES			
			SECTION A-A	SECTION B-B	SECTION C-C	
						








SEQUENCE		ADJUSTMENT	U	W	Y	Z
1	IN/OUT		—	—	—	FLUSH ±2mm
2	FORWARD/ REARWARD		—	11.5mm ±3mm	9.0mm ±1mm	—
	UP/DOWN		8.0mm ±2mm	—	—	—

NOTE: Forward / Rearward and Up/Down adjustment are to be made at the same time.

8139732e

Fig. 15 QUARTER GLASS ADJUSTMENT SPECIFICATIONS

(3) Using a suitable wrench, loosen the lower jack screw nuts.

(4) Raise quarter glass.

(5) Using a suitable allen wrench, rotate jack-screws to achieve the proper gap between the quarter glass, door glass, and top.

(6) Verify that the quarter glass maintains even contact with the outer belt weatherstrip.

(7) Cycle quarter glass between full up and full down positions. Verify operation and adjust as necessary.

(8) Tighten all fasteners.

(9) Install water dam.

(10) Install quarter trim panel. (Refer to 23 - BODY/INTERIOR/QUARTER PANEL TRIM - INSTALLATION).

GLASS – FRONT/REAR ADJUSTMENT

(1) Remove quarter trim panel. (Refer to 23 - BODY/INTERIOR/QUARTER PANEL TRIM - REMOVAL).

(2) Remove water dam.

(3) Loosen three glass attachment bolts. For access move glass to the full up position loosen two bolts and lower glass slightly down to access the third bolt.

(4) Raise quarter glass and ensure glass is in the proper position (Fig. 15).

(5) Tighten two adjustment bolts with glass in the full up position.

(6) Lower quarter glass approximately 64 mm (2.5 inches) and tighten third bolt.

(7) Cycle quarter glass between full up and full down positions. Verify operation and adjust as necessary.

(8) Install water dam.

(9) Install quarter trim panel. (Refer to 23 - BODY/INTERIOR/QUARTER PANEL TRIM - INSTALLATION)

FRONT DOOR GLASS (Continued)

QUARTER GLASS ALIGNMENT VERIFICATION

(1) Raise door glass to full up position.

(2) Cycle quarter glass between full up and full down positions.

(3) Verify that quarter glass operates smoothly and maintains correct alignment to convertible top and door glass.

NOTE: The alignment to door glass can be checked with the "paper strip test". Place a piece of paper on the quarter glass seal and close the door. Slide the paper along the length of the seal - there should be some resistance to pulling the paper out. (Fig. 16)

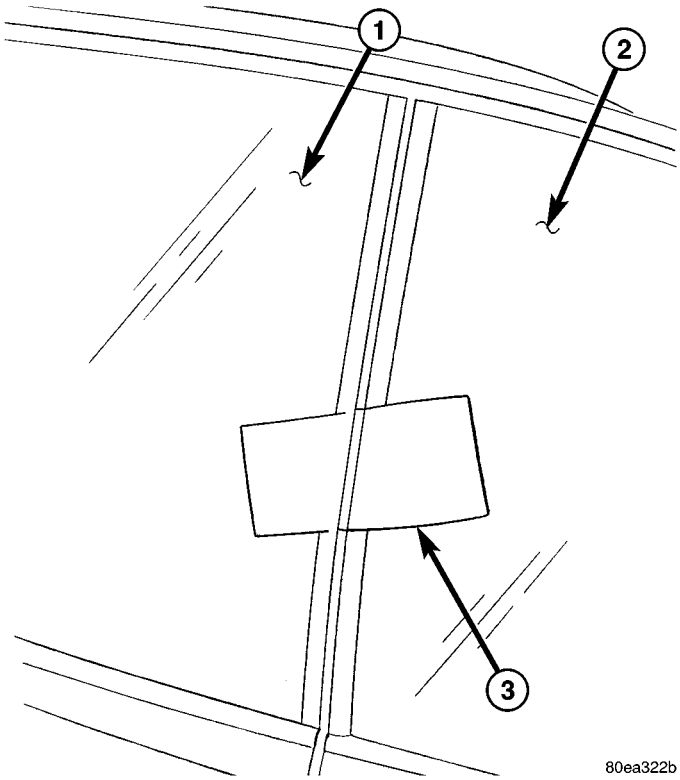


Fig. 16 QUARTER GLASS ADJUSTMENT VERIFICATION

1 - DOOR GLASS
2 - QUARTER GLASS
3 - PAPER STRIP

(4) Verify that quarter glass weatherstrip fully contacts door glass.

(5) Verify that no scissoring of the door glass and weatherstrip occurs.

(6) If any of the above conditions are found, adjust quarter glass and/or adjust door glass as necessary. Repeat Quarter Glass Alignment Verification.

CONDITION - HEIGHT MISMATCH BETWEEN DOOR GLASS AND QUARTER GLASS WITH TOP DOWN

(1) Verify that the door glass and quarter glass adjustment procedures have been checked.

(2) Apply masking tape to outside of glass surface in locations (10), (11), and (12)

(3) Close and latch top.

(4) With vehicle's engine running, raise quarter glass full up and then raise door glass up then turn engine off.

(5) Mark tape at all three locations (Fig. 17).

(6) Lower top and raise all glass full up.

(7) Measure all three tape locations. Location (10), (11), and (12) should be between 5 to 8 mm.

(8) Adjust up stop screw (2), if locations (11) and (12) are not within range of 5 to 8 mm.

(9) Adjust up stop bracket, (5), if location (10) is not within the range of 5 to 8 mm.

(10) With vehicle engine running, lower, all glasses and then raise quarter glasses full up and then raise door glasses full up then turn engine off.

(11) Remark and measure, if adjustment is not within range of 5 to 8 mm repeat Steps 8 though 11.

(12) If adjustment can not be made, refer to CONDITION - Door Glass Noise Along A-Pillar When Closing Door And/Or Door Glass Touching Quarter Glass Metal Seal Retainer And/Or Wind Noise/Water Leak Along Quarter Glass Seal.

FRONT DOOR GLASS (Continued)

FRONT DOOR GLASS (Continued)

CONDITION - DOOR GLASS NOISE ALONG A-PILLAR WHEN CLOSING DOOR AND/OR DOOR GLASS TOUCHING QUARTER GLASS METAL SEAL RETAINER AND/OR WIND NOISE/WATER LEAK ALONG QUARTER GLASS SEAL.

(1) Verify that the door glass and quarter glass adjustment procedures have been checked.

(2) Apply masking tape to outside of glass surface in locations (10), (11), (12), and (13)

(3) Close and latch top.

(4) With vehicle's engine running, raise quarter glass full up and then raise door glass up then turn engine off (Fig. 18).

(5) Mark tape at all four locations.

(6) Lower top and raise all glass full up.

(7) Measure all four tape locations. Location (13) should be between 5 to 7 mm. Location (11) and (12) should be between 5 to 12 mm. Location (10) should be between 10 to 16 mm.

(8) Loosen both fore and aft screws (4) and move glass fore/aft as necessary, and then tighten to 8.5 N·m (75 in. lbs.). Verify glass attachments did not loosen to glass.

(9) If location (13) is not within range 5 to 7 mm, loosen fore and aft screw (9), and drop glass approximately 80 mm. Loosen the three fore and aft screws then raise glass and move fore/aft and tighten to 8.5 N·m (75 in. lbs.). Verify glass attachments did not loosen to glass.

(10) If locations (11) and (12) are not within the range of 5 to 12 mm. Adjust location (5) up stop bracket (up and down) and location (2) up stop screw.

(11) If location (10) is not within the range of 10 to 16 mm, verify CONDITION - Height Mismatch Between Door Glass And Quarter Glass With Top Down is not present.

(12) With vehicle engine running, lower, all glasses and then raise quarter glasses full up and then raise door glasses full up then turn engine off.

(13) Remark and measure, if adjustment is not within range of 10 to 16 mm repeat Steps 8 though 13.

FRONT DOOR GLASS (Continued)

CONDITION - DOOR GLASS NOT DRIVING INTO THE TOP IN FULL UP POSITION

(1) Verify that the door glass and quarter glass adjustment procedures have been checked.

(2) Close and latch top.

(3) With vehicle's engine running, raise door glass full up (Fig. 19).

(4) Adjust cross car screw (3), if the door glass is not going into the top seal.

(5) With vehicle's engine running, lower door glass and then raise door glass full up. Verify that glass is going into the top seal. If adjustment is still required repeat Steps 3 though 6.

(6) With vehicle's engine running, lower door glass and then raise quarter glass full up, and then raise door glass full up and verify that the door glass is going into the top seal. If adjustment is still required repeat Steps 3 though 7.

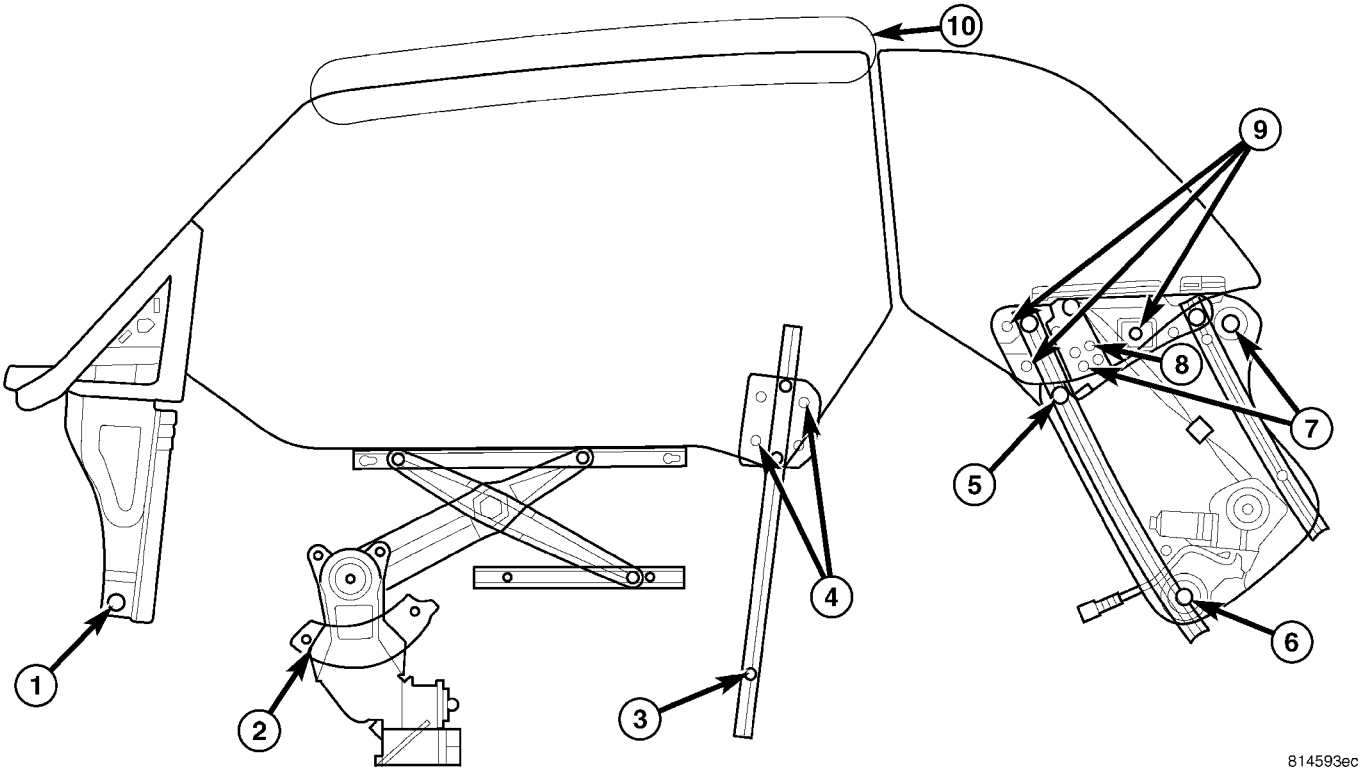

Fig. 19 DOOR GLASS NOT DRIVING TO THE FULL UP POSITION

1 - CROSS CAR SCREW - IN AND OUT ADJUSTMENT
2 - UP STOP SCREWS
3 - CROSS CAR SCREW IN - AND OUT ADJUSTMENT
4 - FORE AND AFT GLASS ADJUSTMENT SCREWS
5 - UP STOP BRACKET - UP AND DOWN ADJUSTMENT
6 - CROSS CAR SCREW - IN AND OUT ADJUSTMENT
7 - CROSS CAR SCREW - IN AND OUT ADJUSTMENT
8 - CROSS CAR SCREW - IN AND OUT ADJUSTMENT
9 - FORE AND AT GLASS ADJUSTMENT SCREWS
10 - CHECK DOOR GLASS IF GOING INTO TOP SEAL

FRONT DOOR GLASS (Continued)

CONDITION - QUARTER GLASS NOT DRIVING INTO THE TOP IN FULL UP POSITION

(1) Verify that the door glass and quarter glass adjustment procedures have been checked.

(2) Close and latch top.

(3) With vehicle's engine running, raise quarter glass full up.

(4) Adjust cross car screw (6), if the front of the quarter glass is not going into the top seal (Fig. 20).

(5) Adjust cross car screw (7), if the rear of the quarter glass is not going into the top seal.

(6) With vehicle's engine running, lower quarter glass and then raise quarter glass full up. Verify that glass is going into the top seal. If adjustment is still required repeat Steps 3 though 6.

(7) With vehicle's engine running, lower quarter glass and then raise door glass full up, and then raise quarter glass full up and verify that the quarter glass is going into the top seal. If adjustment is still required repeat Steps 3 though 7.

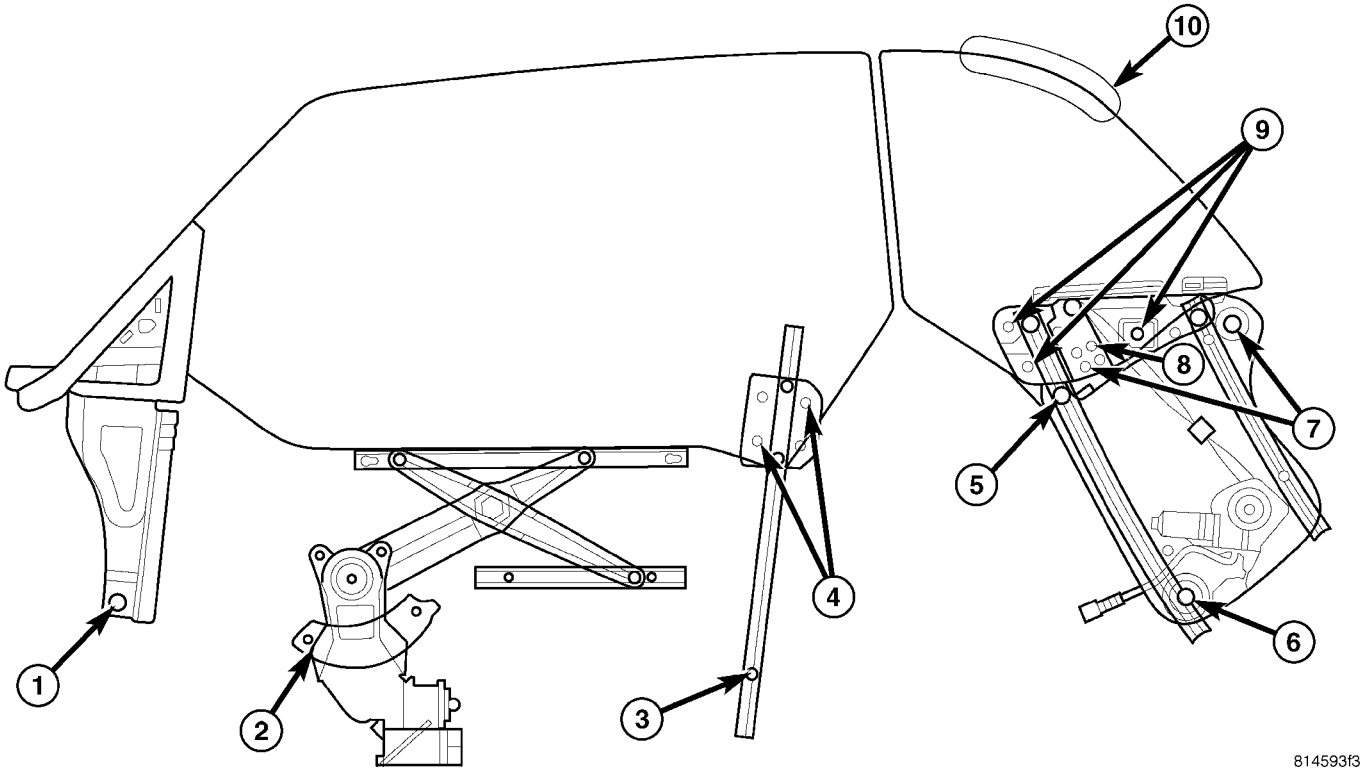

Fig. 20 QUARTER GLASS NOT DRIVING IN TO THE FULL UP POSITION

1 - CROSS CAR SCREW - IN AND OUT ADJUSTMENT
2 - UP STOP SCREWS
3 - CROSS CAR SCREW IN - AND OUT ADJUSTMENT
4 - FORE AND AFT GLASS ADJUSTMENT SCREWS
5 - UP STOP BRACKET - UP AND DOWN ADJUSTMENT
6 - CROSS CAR SCREW - IN AND OUT ADJUSTMENT
7 - CROSS CAR SCREW - IN AND OUT ADJUSTMENT
8 - CROSS CAR SCREW - IN AND OUT ADJUSTMENT
9 - FORE AND AT GLASS ADJUSTMENT SCREWS
10 - CHECK QUARTER GLASS IF GOING INTO TOP SEAL

FRONT DOOR GLASS (Continued)

CONDITION - SLAPPING NOISE BETWEEN THE DOOR AND QUARTER GLASS WITH THE TOP DOWN DURING DRIVING OF THE VEHICLE

(1) Verify that the door glass and quarter glass adjustment procedures have been checked.

(2) Drop top.

(3) Adjust cross car screw (8) (Fig. 21) to add additional interference between the door glass and the quarter glass sash seal at the belt line when in the full up position. Cross car measurement should be between 2 to 3 mm of the quarter glass under flush to the door glass.

(4) Verify with drive evaluation on rough road that issue has been resolved and verify quarter glass cycling time unchanged and no stalling of regulator.

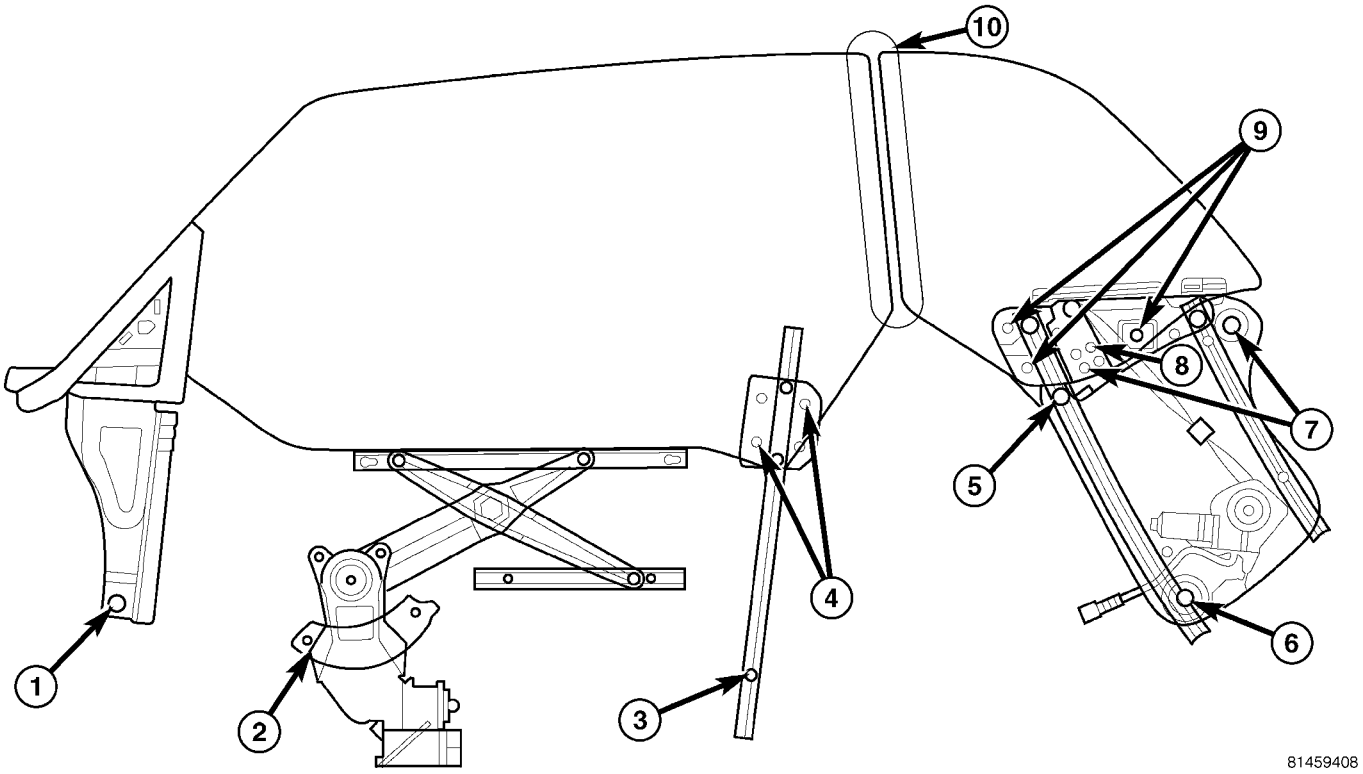

Fig. 21 SLAPPING NOISE BETWEEN THE DOOR AND QUARTER GLASS

1 - CROSS CAR SCREW - IN AND OUT ADJUSTMENT
2 - UP STOP SCREWS
3 - CROSS CAR SCREW IN - AND OUT ADJUSTMENT
4 - FORE AND AFT GLASS ADJUSTMENT SCREWS
5 - UP STOP BRACKET - UP AND DOWN ADJUSTMENT
6 - CROSS CAR SCREW - IN AND OUT ADJUSTMENT
7 - CROSS CAR SCREW - IN AND OUT ADJUSTMENT
8 - CROSS CAR SCREW - IN AND OUT ADJUSTMENT
9 - FORE AND AT GLASS ADJUSTMENT SCREWS
10 - DOOR GLASS AND QUARTER GLASS SASH SEAL

FRONT DOOR GLASS (Continued)

CONDITION - NON-PARALLEL GAP BETWEEN DOOR AND QUARTER GLASSES

(1) Verify that the door glass and quarter glass adjustment procedures have been checked.

(2) Apply masking tape to outside glass surface in locations (10) (Fig. 22).

(3) Mark tape at the two locations and then drop top.

(4) With vehicle running, drive quarter glass full up and then drive door glass up and mark tape at the two locations (10).

(5) If gap not parallel to within 1.5 mm, loosen cross car screw (8), cross car screw (7) and cross car screw (6) and rotate quarter glass regulator with quarter glass to body and then tighten to 8.5 N·m (75 in. lbs.).

(6) Repeat test using Steps 3 thought 5, if still can not get parallelism within 1.5 mm then proceed to Step 7.

(7) Remove quarter glass regulator with glass and increase slot size, forward 2.0 mm at cross car screw location (6) only.

(8) Install the quarter glass regulator with glass and repeat Step 1 thought 5.

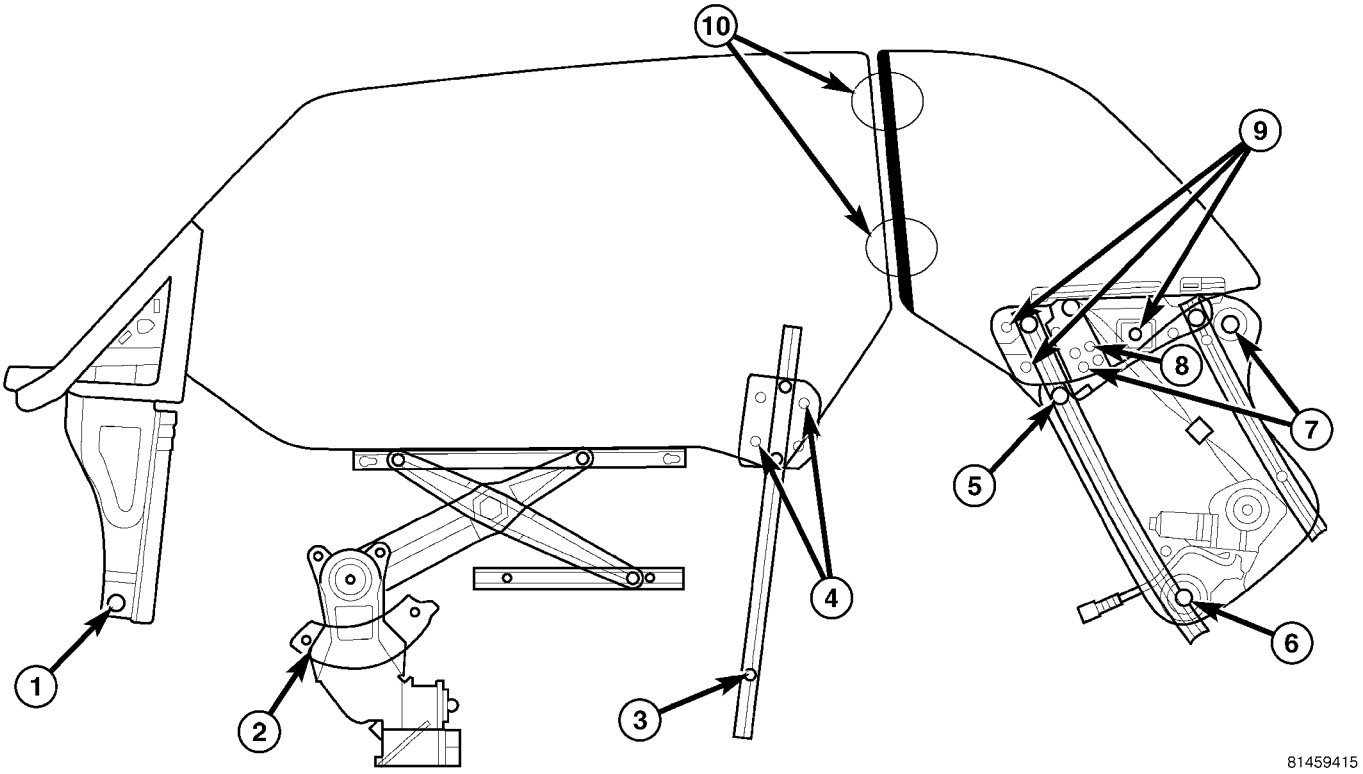

Fig. 22 CHECK DISTANT

9 - FORE AND AT GLASS ADJUSTMENT SCREWS
10 - CHECK DISTANT

FRONT DOOR GLASS (Continued)

CONDITION - QUARTER GLASS SEAL FOLD OVER DURING TRAVEL WITH DOOR GLASS FULL UP AND TOP UP OR DOWN

(1) Verify that the door glass and quarter glass adjustment procedures have been checked.

(2) With vehicle running, drive door glass full up and then cycle quarter glass full up to full down and repeat several times with the top down.

(3) Check the quarter glass seal for fold over (Fig. 23) and (Fig. 24).

(4) Adjust cross car screw (6) counterclockwise one rotation.

(5) With vehicle running, cycle quarter glass full up to full down and repeat several times with the top down and door glass up. If adjustment is still required repeat Step 3

(6) With vehicle running, top up and door glass up and cycle quarter glass full up to full down and repeat several times. If adjustment is still required repeat Steps 3 thought 5.

10 - QUARTER GLASS SEAL

FRONT DOOR GLASS (Continued)

CONDITION - INTERMEDIATE REAR OF DOOR GLASS NOT DRIVING INTO THE TOP SEAL AND/OR NOISE AT REAR BOTTOM OF THE DOOR

(1) Remove door trim panel.

(2) Inspect bracket assembly clinch/weld nut to verify not damaged (loose from bracket, allowing screw to move cross car) at door cross car screw (3) (Fig. 25).

(3) If bracket assembly is damaged, replace part.

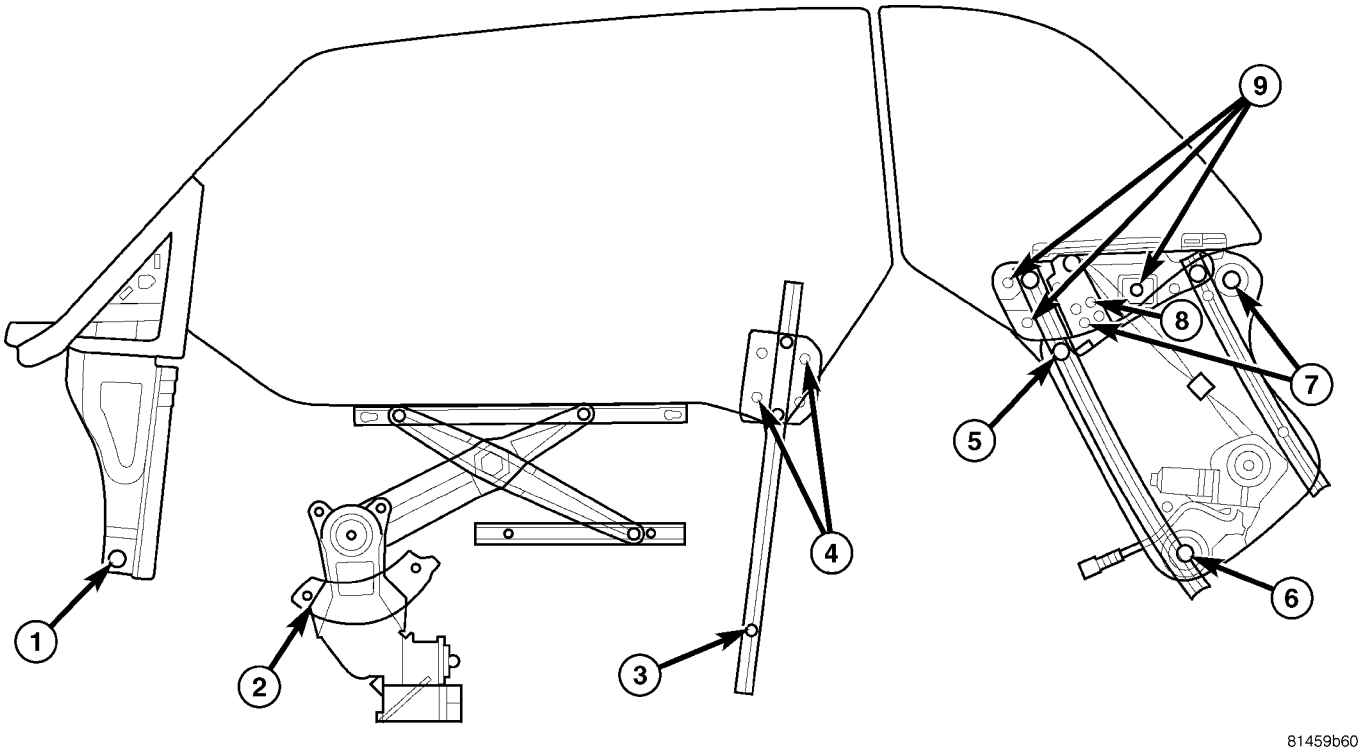

Fig. 25 DOOR GLASS NOT DRIVING INTO THE TOP SEAL

FRONT DOOR OUTSIDE HANDLE

REMOVAL

REMOVAL

(1) Remove door trim panel and water dam.
(2) Move door glass to the up position.
(3) Disconnect outside door handle link to latch.
(4) Remove nut attaching outside door handle to outer door panel (Fig. 26).
(5) Remove door handle from vehicle.

REMOVAL - PT-27 ONLY

(1) Remove door trim panel and water dam.
(2) Move door glass to the up position.
(3) Disconnect outside door handle link to latch.
(4) Remove nut attaching outside door handle to outer door panel (Fig. 27).
(5) Remove door handle from vehicle.

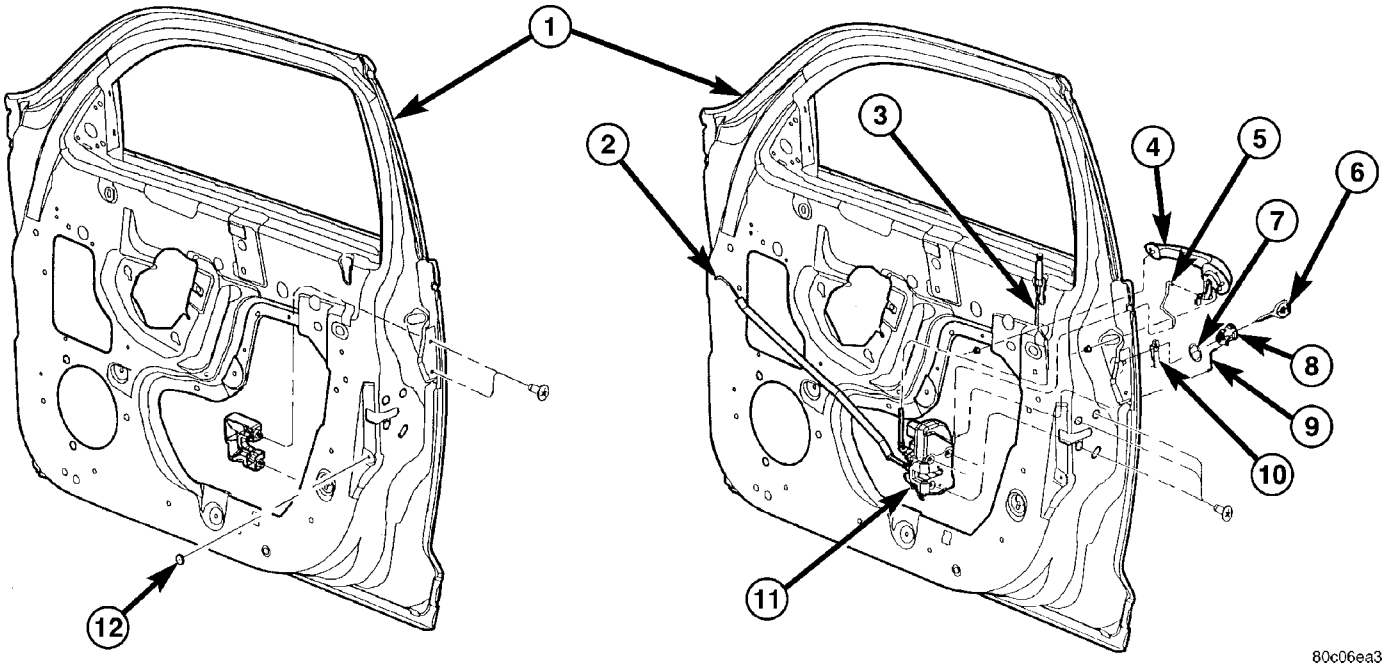

Fig. 26 FRONT DOOR OUTSIDE HANDLE

4 - HANDLE NUT
5 - OUTSIDE HANDLE
6 - OUTSIDE HANDLE TO LATCH LINK
7 - FRONT DOOR
8 - LATCH ATTACHING SCREW(S)
9 - DOOR LATCH

INSTALLATION

INSTALLATION

(1) Install door handle latch link to handle.
(2) Position door handle into door (Fig. 26).
(3) Install fasteners attaching door handle to outer door panel.
(4) Connect lock and latch rods to door latch.
(5) Install door trim panel and water dam.

INSTALLATION - PT-27 ONLY

(1) Install door handle latch link to handle.
(2) Position door handle into door (Fig. 27).
(3) Install fasteners attaching door handle to outer door panel.
(4) Connect lock and latch rods to door latch.
(5) Install door trim panel and water dam.

FRONT DOOR HINGE

REMOVAL

REMOVAL

(1) Open and support door on a suitable lifting device.
(2) Remove bolts attaching door check strap to lower A-pillar for greater access, if necessary (Fig. 4).
(3) Mark position of hinge on both the door end frame and lower A-pillar to ease installation.
(4) Remove bolts attaching hinge to door end frame.
(5) Remove bolts attaching hinge to lower A-pillar.
(6) Remove door hinge from vehicle.

FRONT DOOR HINGE (Continued)

REMOVAL - PT-27 ONLY

(1) Open and support door on a suitable lifting device.

(2) Remove bolts attaching door check strap to lower A-pillar for greater access, if necessary (Fig. 28).

(3) Mark position of hinge on both the door end frame and lower A-pillar to ease installation.

(4) Remove bolts attaching hinge to door end frame.

(5) Remove bolts attaching hinge to lower A-pillar.

(6) Remove door hinge from vehicle.

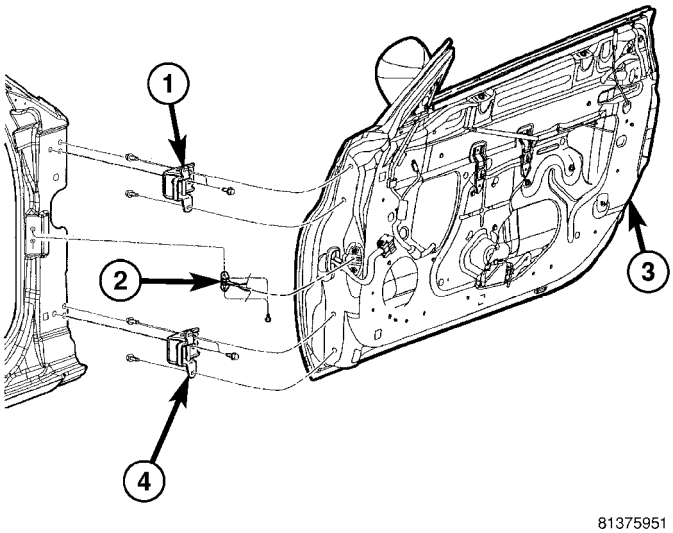

Fig. 28 FRONT DOOR - PT-27

1 - FRONT DOOR UPPER HINGE
2 - FRONT DOOR CHECK STRAP
3 - FRONT DOOR
4 - FRONT DOOR LOWER HINGE

INSTALLATION

INSTALLATION

CAUTION: When installing a new hinge, make sure that the head of each hinge pin is fully seated into the door hinge. Also, remove the plastic shipping clip and replace it with the correct metal retaining clip once the hinge pin is seated.

(1) If necessary, paint new door hinge prior to installation.

(2) Position door hinge on vehicle (Fig. 4).

(3) Loosely install bolts attaching hinge to lower A-pillar.

(4) Loosely install bolts attaching hinge to door end frame.

(5) Align hinge to marks made previously and tighten all bolts.

(6) Install bolts attaching door check strap to lower A-pillar, if removed previously.

(7) Verify door fit and operation. Adjust door hinge for proper door alignment, if necessary.

INSTALLATION - PT-27 ONLY

CAUTION: When installing a new hinge, make sure that the head of each hinge pin is fully seated into the door hinge. Also, remove the plastic shipping clip and replace it with the correct metal retaining clip once the hinge pin is seated.

(1) If necessary, paint new door hinge prior to installation.

(2) Position door hinge on vehicle (Fig. 28).

(3) Loosely install bolts attaching hinge to lower A-pillar.

(4) Loosely install bolts attaching hinge to door end frame.

(5) Align hinge to marks made previously and tighten all bolts.

(6) Install bolts attaching door check strap to lower A-pillar, if removed previously.

(7) Verify door fit and operation. Adjust door hinge for proper door alignment, if necessary.

FRONT DOOR INSIDE HANDLE ACTUATOR

REMOVAL

(1) Remove the door trim panel.

CAUTION: Do not use a drill to remove the heat stakes.

(2) Remove the heat stakes using a razor knife or equivalent and remove the door handle. (Fig. 29)

(3) Remove the front door inside remote handle/ power door lock switch bezel.

INSTALLATION

NOTE: Clean the excess heat staking off of the studs to aid installation.

(1) Install the new inside door handle, install the screws and hand tighten. (Fig. 30)

(2) If necessary renew the upper heat stake. Refer to page 23-28 for heat staking procedure. (Fig. 30)

FRONT DOOR INSIDE HANDLE ACTUATOR (Continued)

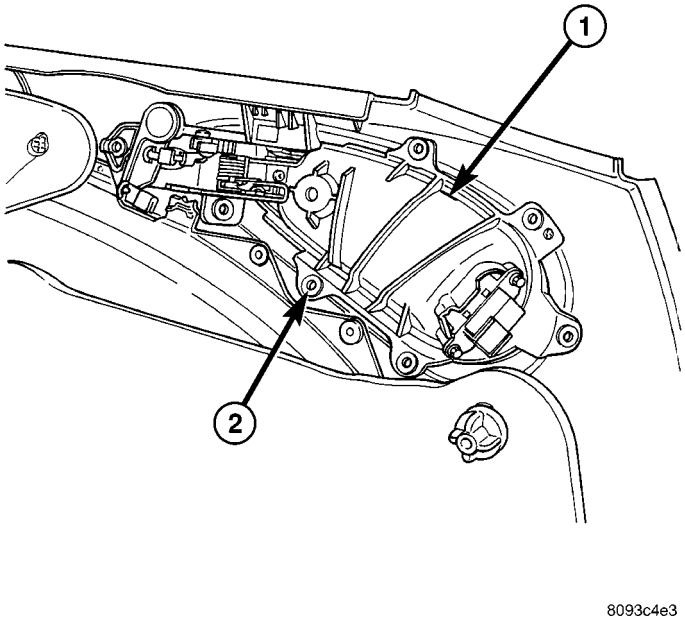

Fig. 29 INSIDE HANDLE ACTUATOR

1 - INSIDE HANDLE ACTUATOR
2 - HEAT STAKES

(3) Install the remote handle/power door lock switch bezel.

(4) Install the door trim panel.

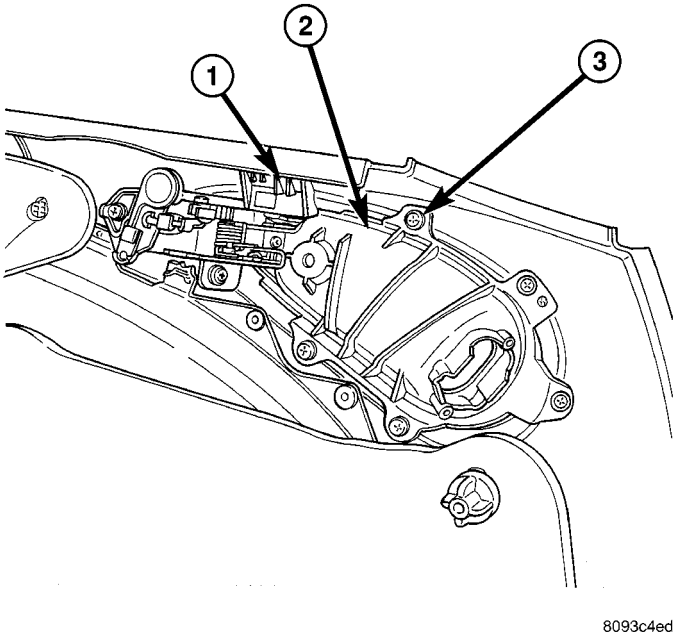

Fig. 30 FRONT DOOR INSIDE HANDLE ACTUATOR

1 - HEAT STAKE LOCATION
2 - INSIDE HANDLE ACTUATOR
3 - PHILLIPS TYPE SCREWS

FRONT DOOR LATCH

REMOVAL

REMOVAL

(1) Remove door trim panel and water shield.

(2) Raise door glass.

(3) Disconnect lock and latch rods from door latch (Fig. 26)and (Fig. 31).

(4) Disengage wire connector from power door lock motor, if equipped.

(5) Remove screws attaching latch to door end frame.

(6) Remove door latch from vehicle.

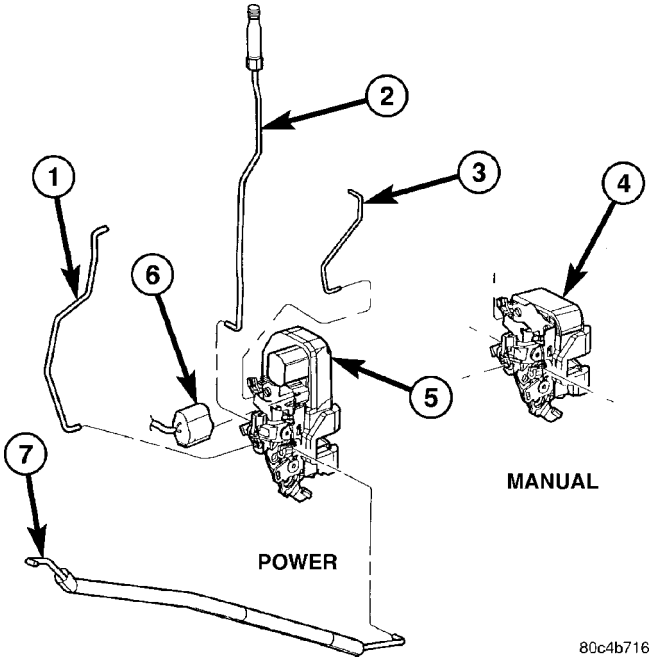

Fig. 31 FRONT DOOR LATCH

1 - FRONT DOOR OUTSIDE HANDLE TO LATCH LINK
2 - FRONT DOOR LOCK KNOB TO LATCH LINK
3 - FRONT DOOR KEY CYLINDER TO LATCH LINK

5 - FRONT DOOR OVERRIDE POWER LOCK LATCH
6 - FRONT DOOR OVERRIDE POWER LOCK LATCH CONNECTION
7 - FRONT DOOR INSIDE REMOTE HANDLE LINK AND SLEEVE TO LATCH

FRONT DOOR LATCH (Continued)

REMOVAL - PT-27 ONLY

(1) Remove door trim panel and water shield.
(2) Raise door glass.
(3) Disconnect lock and latch rods from door latch (Fig. 32)and (Fig. 33).
(4) Disengage wire connector from power door lock motor, if equipped.
(5) Remove screws attaching latch to door end frame.
(6) Remove door latch from vehicle.

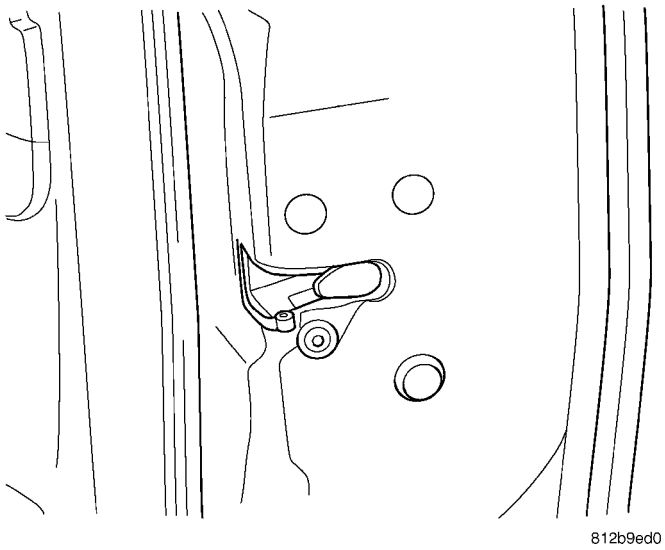

Fig. 32 DOOR LATCH

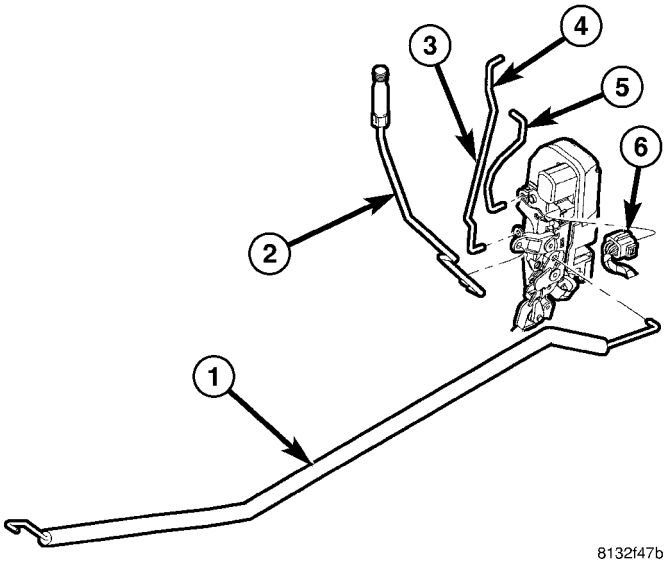

Fig. 33 DOOR LATCH

2 - DOOR LATCH LOCKING KNOB AND ROD
3 - DOOR OUTSIDE HANDLE TO LATCH
4 - DOOR KEY CYLINDER TO LATCH LINK
5 - DOOR WITH POWER LOCK, WITH DOOR AJAR LATCH
6 - WIRING CONNECTOR, DOOR LOCK

INSTALLATION

INSTALLATION

CAUTION: Do not close door before adjusting the door latch. Door may fail to open.

(1) Position door latch inside door and install screws holding latch to door end frame (Fig. 26) and (Fig. 31).
(2) Engage wire connector into power door lock motor, if so equipped.
(3) Connect latch and lock rods to door latch.
(4) Install door trim panel and water shield.
(5) Adjust door latch using procedure in this section.

INSTALLATION - PT-27 ONLY

CAUTION: Do not close door before adjusting the door latch. Door may fail to open.

(1) Position door latch inside door and install screws attaching latch to door end frame (Fig. 32)and (Fig. 33).
(2) Engage wire connector into power door lock motor, if so equipped.
(3) Connect latch and lock rods to door latch.
(4) Install door trim panel and water shield.
(5) Adjust door latch using procedure in this section.

ADJUSTMENTS

FRONT DOOR LATCH ADJUSTMENT

(1) Insert a Torx®-wrench through the elongated hole in the door end frame near the latch striker opening.
(2) Loosen Torx® head screw on the side of the latch linkage.
(3) Push button on outside door handle and release it.
(4) Tighten Torx® head screw on latch.
(5) Verify latch operation.

ADJUSTMENT - PT-27 ONLY

(1) Insert a Torx® wrench through the elongated hole in the door end frame near the latch striker opening.
(2) Loosen Torx® head screw on the side of the latch linkage.
(3) Push button on outside door handle and release it.
(4) Tighten Torx® head screw on latch.
(5) Verify latch operation.

FRONT DOOR LATCH STRIKER

REMOVAL

REMOVAL

(1) Mark outline of door latch striker on B-pillar to aid installation.

(2) Remove screws attaching door latch striker to B-pillar (Fig. 34).

REMOVAL - PT-27 ONLY

(1) Mark outline of door latch striker on B-pillar to aid installation.

(2) Remove screws attaching door latch striker to B-pillar (Fig. 35).

INSTALLATION

INSTALLATION

(1) Install door latch striker into the door (Fig. 34).

(2) Install screws attaching door latch striker to B-pillar loosely.

(3) Align door latch striker to outline marks on the B-pillar

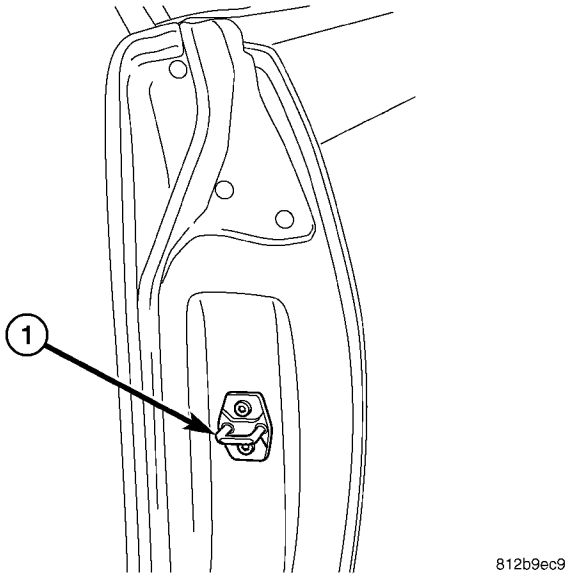

Fig. 35 LATCH STRIKER

1 - DOOR LATCH STRIKER

(4) Tighten screws attaching door latch striker to B-pillar.

(5) Check door alignment and adjust as necessary.

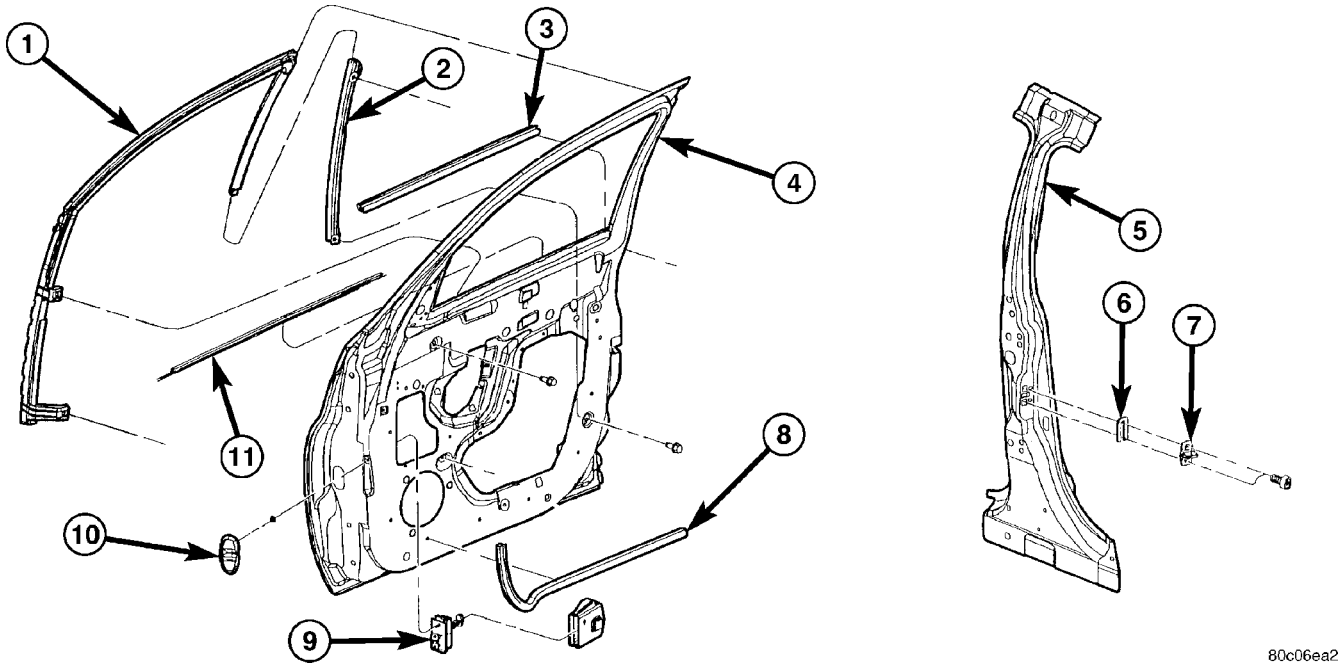

Fig. 34 FRONT DOOR WEATHERSTRIP AND LATCH STRIKER

7 - FRONT DOOR LATCH STRIKER
8 - FRONT DOOR SILL WEATHERSTRIP
9 - FRONT DOOR CHECK STRAP AND COVER
10 - FRONT DOOR CHECK STRAP SEAL
11 - FRONT DOOR OUTER BELT WEATHERSTRIP

FRONT DOOR LATCH STRIKER (Continued)

INSTALLATION - PT-27 ONLY

(1) Install door latch striker into the door (Fig. 35).
(2) Install screws attaching door latch striker to B-pillar loosely.
(3) Align door latch striker to outline marks on the B-pillar
(4) Tighten screws attaching door latch striker to B-pillar.
(5) Check door alignment and adjust as necessary.

FRONT DOOR LOCK CYLINDER

REMOVAL

REMOVAL

(1) Remove door trim panel and water dam.
(2) Raise door glass.
(3) Disconnect door lock rod from latch (Fig. 26).
(4) Disengage wiring from lock cylinder if so equipped.
(5) Remove fasteners attaching lock cylinder retainer to door.
(6) Remove lock cylinder retainer.
(7) Pull lock cylinder from door handle.

REMOVAL - PT-27 ONLY

(1) Remove door trim panel and water dam.
(2) Raise door glass.
(3) Disconnect door lock rod from latch (Fig. 36).
(4) Disengage wiring from lock cylinder if so equipped.
(5) Remove fasteners attaching lock cylinder retainer to door.
(6) Remove lock cylinder retainer.
(7) Pull lock cylinder from door handle.

INSTALLATION

INSTALLATION

(1) Place lock cylinder and gasket into door outer panel (Fig. 26).
(2) Install cylinder retainer to door.
(3) Connect door lock rod from latch.
(4) Engage wiring connectors, if equipped.
(5) Install door trim panel and water dam.

INSTALLATION - PT-27 ONLY

(1) Place lock cylinder and gasket into door outer panel (Fig. 36).
(2) Install cylinder retainer to door.
(3) Connect door lock rod from latch.

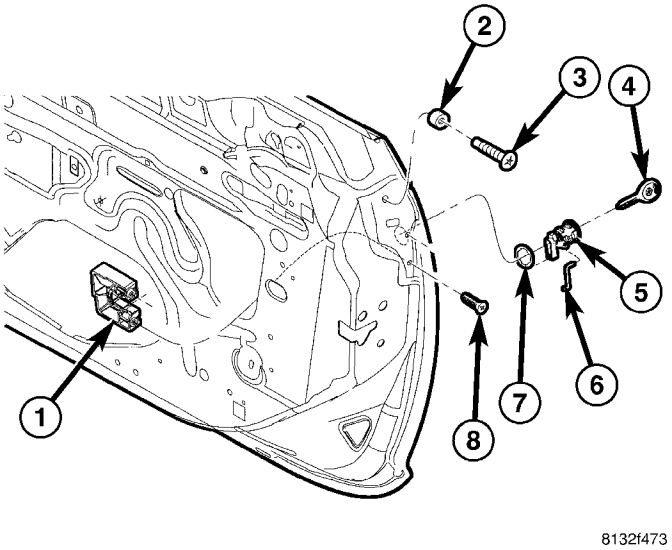

Fig. 36 DOOR HARDWARE

1 - DOOR LOCK CYLINDER WITHOUT REMOTE KEYLESS ENTRY RETAINER
2 - DOOR OFFSET STRIKER SEAL
3 - DOOR OFFSET STRIKER BOLT
4 - KEY
5 - LOCK CYLINDER
6 - DOOR KEY CYLINDER TO LATCH LINK
7 - DOOR LOCK CYLINDER TO LATCH LINK
8 - LOCK CYLINDER RETAINER SCREW

(4) Engage wiring connectors, if equipped.
(5) Install door trim panel and water dam.

FRONT DOOR VERTICAL GUIDE BAR

REMOVAL

(1) Remove door trim panel and water dam.
(2) Remove door speaker, if equipped.
(3) Remove front lift guide.
(4) Remove bolt attaching top of front guide bar to inner door panel.
(5) Using a Snap-on® flare-nut socket (FRXM10) and a hex wrench, remove nut attaching bottom of guide bar to door panel while holding jack screws.

INSTALLATION

(1) Install nut attaching bottom of guide bar to door panel.
(2) Install bolt attaching top of front guide bar to inner door panel.
(3) Install front lift guide.
(4) Install door speaker, if equipped.
(5) Verify door glass alignment, adjust if necessary.
(6) Install door trim panel and water dam.

FRONT DOOR SIDE VIEW MIRROR FLAG - PT-27

REMOVAL

REMOVAL

(1) Disengage clips attaching side view mirror trim bezel to stanchion. Left side only with manual mirrors .

(2) Remove mirror bezel from vehicle.

REMOVAL - PT-27 ONLY

(1) Disengage clips attaching side view mirror trim flag to stanchion. Left side only with manual mirrors (Fig. 37).

(2) Remove mirror bezel from vehicle.

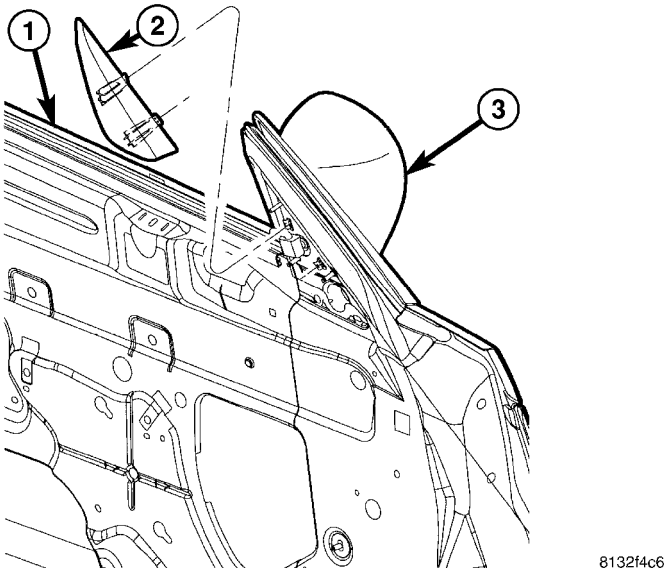

Fig. 37 INSIDE MIRROR FLAG

1 - FRONT DOOR
2 - INSIDE DOOR MIRROR FLAG
3 - OUTSIDE MIRROR ASSEMBLY

INSTALLATION

INSTALLATION

(1) Place mirror trim bezel in position.

(2) Engage clips attaching side view mirror trim bezel to stanchion.

INSTALLATION - PT-27 ONLY

(1) Place mirror trim flag in position (Fig. 37).

(2) Engage clips attaching side view mirror trim flag to stanchion.

FRONT DOOR TRIM PANEL

REMOVAL

REMOVAL

(1) Release door latch and open door.

(2) Lower door glass.

(3) Remove screw from inside arm rest pull cup (Fig. 38).

(4) Remove fasteners from door trim panel.

(5) Remove screw from behind inside remote handle.

(6) Disengage push-in fasteners attaching trim to door panel around perimeter of trim panel.

(7) Tilt trim panel outward to clear locator pins on backside of trim panel.

(8) Disconnect trim panel from retainer channel in inner belt weatherstrip at top of door by lifting while gently jiggling.

(9) Move trim panel away from door and disengage clip attaching inside remote handle link.

(10) Remove inside remote handle link.

CAUTION: Do not allow door trim panel to hang by the wire connector or wiring.

(11) Disconnect wire connector from power door lock switch, mirror switch, and power window switch if so equipped.

(12) Remove trim panel from door.

REMOVAL - PT-27 ONLY

(1) Release door latch and open door.

(2) Lower door glass.

(3) Remove screw from inside arm rest pull cup (Fig. 39).

(4) Remove fasteners from door trim panel.

(5) Remove screw from behind inside remote handle.

(6) Disengage push-in fasteners attaching trim to door panel around perimeter of trim panel.

(7) Tilt trim panel outward to clear locator pins on backside of trim panel.

(8) Disconnect trim panel from retainer channel in inner belt weatherstrip at top of door by lifting while gently jiggling.

(9) Move trim panel away from door and disengage clip attaching inside remote handle link.

(10) Remove inside remote handle link.

CAUTION: Do not allow door trim panel to hang by the wire connector or wiring.

FRONT DOOR TRIM PANEL (Continued)

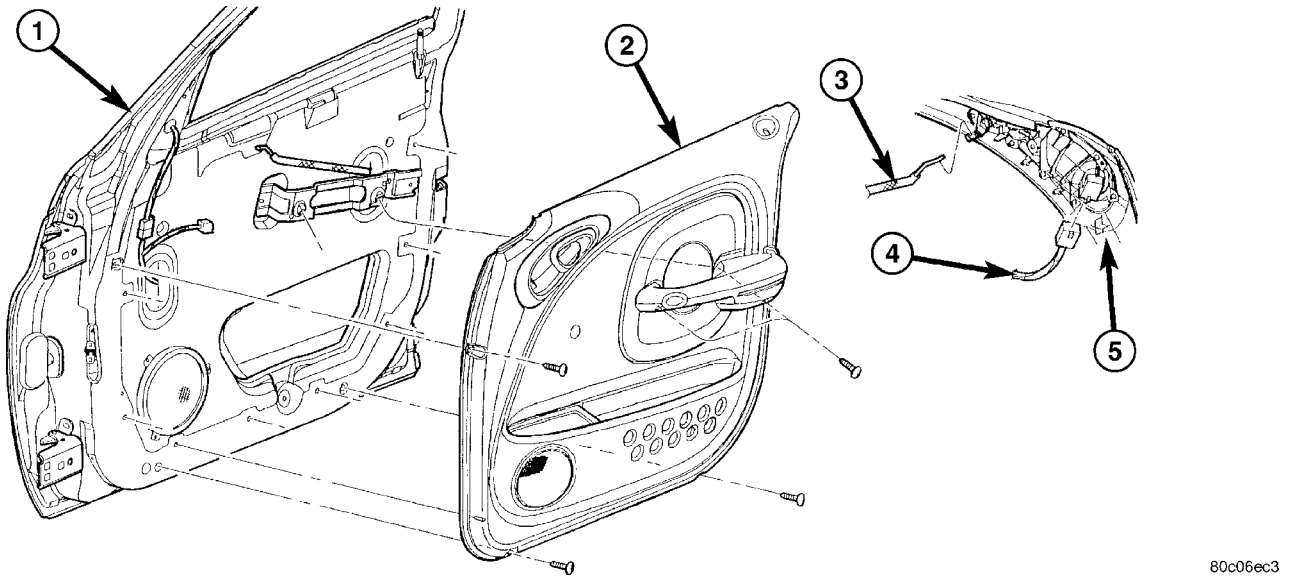

Fig. 38 FRONT DOOR TRIM

1 - FRONT DOOR
2 - FRONT DOOR TRIM PANEL
3 - FRONT DOOR INSIDE REMOTE HANDLE LINK AND SLEEVE TO LATCH
4 - FRONT DOOR WIRE CONNECTOR
5 - FRONT DOOR INSIDE REMOTE HANDLE/POWER DOOR LOCK SWITCH BEZEL

(11) Disconnect wire connector from power door lock switch, mirror switch, and power window switch if so equipped.

(12) Remove trim panel from door.

INSTALLATION

INSTALLATION

(1) Replace any damaged or missing push in fasteners from around perimeter of door trim panel (Fig. 38).

(2) Place trim panel near door.

(3) Connect wire connector into power door lock switch, mirror switch, and power window switch, if so equipped.

(4) Insert inside remote handle link into handle and engage clip.

(5) Install trim panel over lock knob and into inner belt retainer channel at top of door and push down to seat.

(6) Locate door trim panel to inner door panel by aligning locating pins on backside of trim panel to mating holes in inner door panel.

(7) Install push in fasteners to hold trim to door panel around perimeter of trim panel.

(8) Install screw behind inside remote handle.

(9) Install screw inside arm rest pull cup.

INSTALLATION - PT-27 ONLY

(1) Replace any damaged or missing push in fasteners from around perimeter of door trim panel (Fig. 39).

(2) Place trim panel near door.

(3) Connect wire connector into power door lock switch, mirror switch, and power window switch, if so equipped.

(4) Insert inside remote handle link into handle and engage clip.

(5) Install trim panel over lock knob and into inner belt retainer channel at top of door and push down to seat.

(6) Locate door trim panel to inner door panel by aligning locating pins on backside of trim panel to mating holes in inner door panel.

(7) Install push in fasteners to hold trim to door panel around perimeter of trim panel.

FRONT DOOR TRIM PANEL (Continued)

1 - PLASTIC NUT
2 - DOOR ASSEMBLY
3 - DOOR TRIM PANEL
4 - DOOR LINK AND SLEEVE ASSEMBLY
5 - WIRE HARNESS
6 - REMOTE HANDLE ATTACHING SCREW
7 - DOOR TRIM AND ARM REST SCREW

(8) Install screw behind inside remote handle.
(9) Install screw inside arm rest pull cup.

FRONT DOOR WATER DAM

REMOVAL

REMOVAL

(1) Remove door trim panel.
(2) Remove door speaker, if equipped.
(3) Remove armrest to inner panel bracket.
(4) Disconnect outside power mirror and power window regulator connectors, if equipped.
(5) Peel water dam away from adhesive around perimeter of inner door panel (Fig. 40).

REMOVAL - PT-27 ONLY

(1) Remove door trim panel. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL).
(2) Remove door speaker, if equipped.
(3) Remove armrest to inner panel bracket (Fig. 41).
(4) Disconnect outside power mirror and power window regulator connectors, if equipped.
(5) Peel water dam away from adhesive around perimeter of inner door panel.

INSTALLATION

INSTALLATION

(1) Insure that enough adhesive remains to securely retain the water dam. Replace as necessary (Fig. 40).
(2) Place the water dam into position and press securely to adhesive making sure to properly route wiring and linkages.
(3) Engage clip attaching lock linkage to lock button bell-crank.
(4) Install door trim pull cup mount bracket.
(5) Install door speaker, if equipped.
(6) Install door trim panel.

FRONT DOOR WATER DAM (Continued)

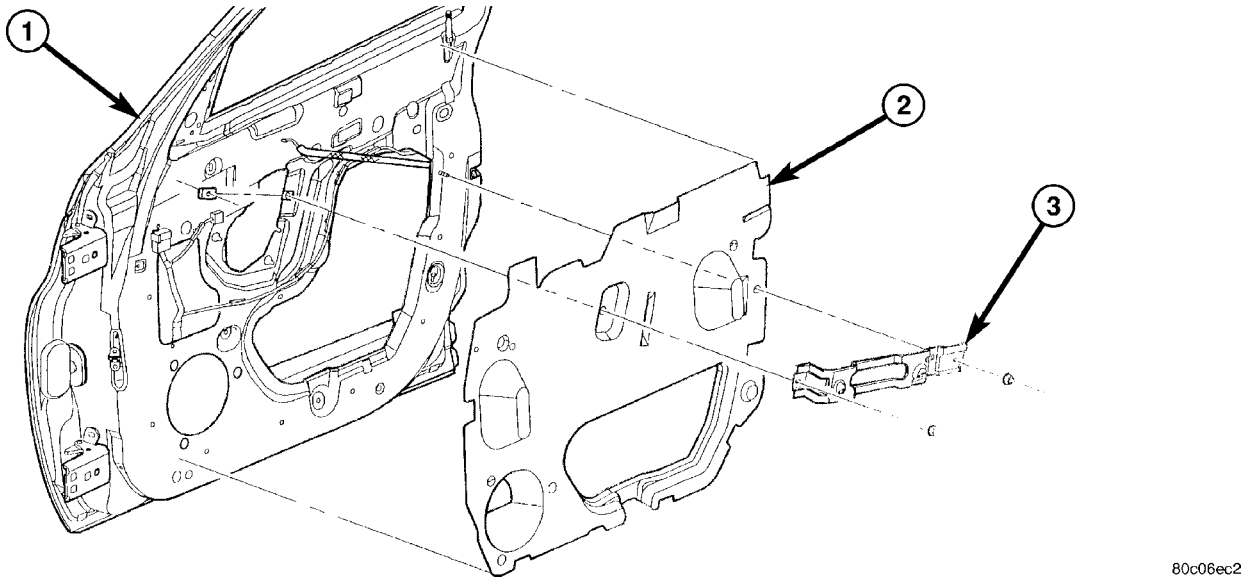

Fig. 40 WATER DAM

1 - FRONT DOOR
2 - FRONT DOOR WATER DAM
3 - FRONT DOOR ARMREST TO INNER PANEL ATTACHING BRACKET

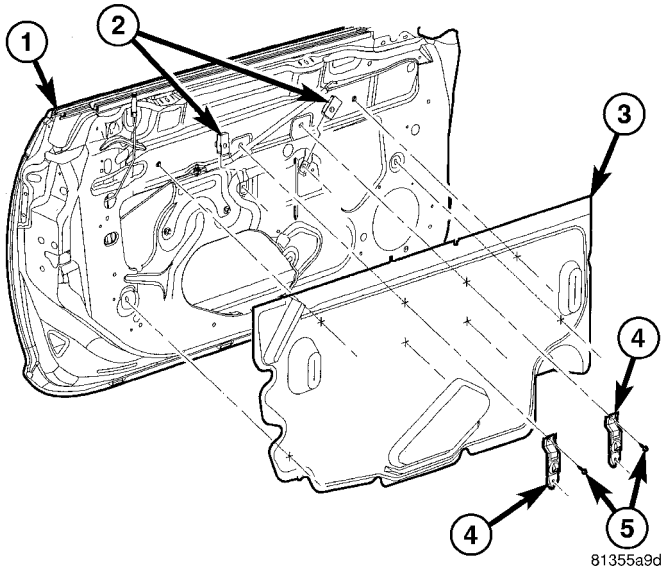

Fig. 41 DOOR WATER DAM

1 - DOOR ASSEMBLY
2 - U-NUTS
3 - WATER DAM
4 - ARM REST BRACKET
5 - ARM REST BRACKET ATTACHING SCREWS

INSTALLATION - PT-27 ONLY

(1) Insure that enough adhesive remains to securely retain the water dam. Replace as necessary (Fig. 41).

(2) Place the water dam into position and press securely to adhesive making sure to properly route wiring and linkages.

(3) Engage clip attaching lock linkage to lock button bell-crank.

(4) Install door trim pull cup mount bracket.

(5) Install door speaker, if equipped.

(6) Install door trim panel. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION).

FRONT DOOR WINDOW REGULATOR

REMOVAL

REMOVAL

(1) Remove front door trim panel.

(2) Remove front door glass from regulator channel.

(3) Loosen screws attaching window regulator channel and crank housing to door panel (Fig. 6).

(4) Disengage screw and bolt heads from keyhole slots in door panel.

(5) Loosen bolts attaching window regulator to door panel.

(6) Disengage regulator from door panel, and crank housing.

(7) Slide regulator rearward and rotate forward end of roller channel through access hole in door panel,

(8) Remove window regulator from door through access hole in inner panel.

FRONT DOOR WINDOW REGULATOR (Continued)

REMOVAL - PT-27 ONLY

NOTE: For power window motor removal procedures, (Refer to 8 - ELECTRICAL/POWER WINDOWS/WINDOW MOTOR - REMOVAL).

(1) Remove door trim panel and water dam.
(2) Disconnect wire connector to power window motor.
(3) Remove nuts attaching regulator lift channel to door glass (Refer to 23 - BODY/DOOR - FRONT/DOOR GLASS - REMOVAL).
(4) Secure door glass in upward position.
(5) Remove nuts attaching rear of stabilizer channel to door panel (Fig. 42).
(6) Remove stabilizer channel from door panel.
(7) Loosen bolts attaching window regulator, base plate to door inner panel.
(8) Remove window regulator through large hole in inner door panel.
(9) Remove power window motor from regulator (Refer to 8 - ELECTRICAL/POWER WINDOWS/WINDOW MOTOR - REMOVAL).

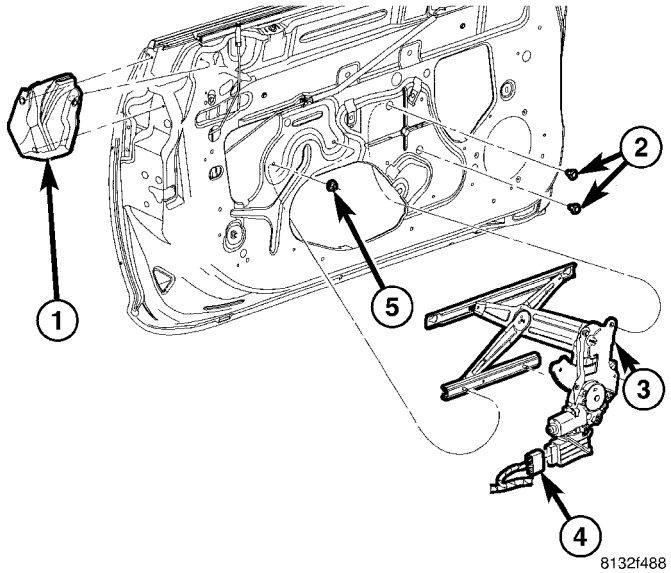

Fig. 42 SMART MODULE REGULATOR

1 - BELT SEAL
2 - ATTACHING SCREW(S)
3 - SMART MODULE REGULATOR
4 - FRONT DOOR WIRE CONNECTOR
5 - ATTACHING NUT(S)

INSTALLATION

INSTALLATION

(1) Position window regulator and crank housing on door panel through access hole in door panel (Fig. 6).
(2) Tighten bolts attaching window regulator to door panel.
(3) Engage window regulator bolt heads on channel to key hole slots in door panel.
(4) Tighten screw attaching window regulator channel and crank housing.
(5) Position glass to regulator roller channel.
(6) Tighten fasteners attaching door glass to roller channel.
(7) Install door trim panel.

INSTALLATION - PT-27 ONLY

NOTE: For power window motor installation procedures, (Refer to 8 - ELECTRICAL/POWER WINDOWS/WINDOW MOTOR - INSTALLATION).

(1) Move window regulator into position in door and engage bolt heads into key hole slots in door inner panel.
(2) Install stabilizer channel to door panel (Fig. 42).
(3) Install nuts to stabilizer channel.
(4) Tighten rear and front nuts of roller channel.
(5) Install bolts attaching window regulator base plate to door inner panel.
(6) Tighten top forward bolt, bottom rearward bolt, top rearward and then bottom forward bolt attaching window regulator base plate.
(7) Install nuts attaching regulator lift channel to door glass.
(8) Connect wire connector to power window motor.
(9) Verify glass fit and operation. Adjust door glass, if necessary.
(10) Install door water dam (Refer to 23 - BODY/DOOR - FRONT/WATER DAM - INSTALLATION) and trim panel (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION).

DOOR GLASS INNER BELT STABILIZER - PT-27

REMOVAL - PT-27 ONLY

(1) Remove door trim panel.

(2) Remove nut attaching inner belt stabilizer to door panel.

(3) Remove inner belt stabilizer from door (Fig. 43).

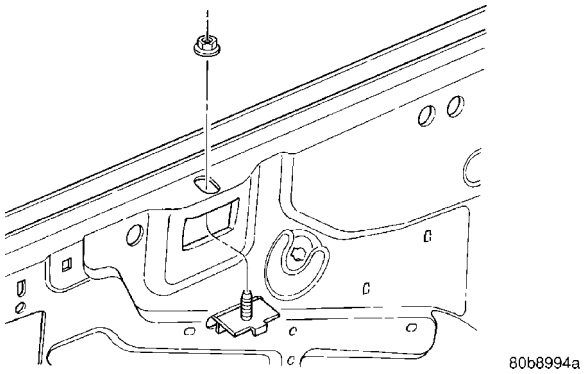

Fig. 43 INNER BELT STABILIZER

INSTALLATION - PT-27 ONLY

(1) Place inner belt stabilizer into position (Fig. 43).

(2) Install nut attaching inner belt stabilizer to door panel. Adjust inner belt stabilizer against glass with enough tension to allow free up and down movement.

(3) Install door trim panel.

REAR RAIL ASSEMBLY - PT-27

REMOVAL - PT-27 ONLY

(1) Remove door trim panel and water dam.

(2) Remove the lift plate attaching screws (Fig. 44).

(3) Remove bolt attaching top of rear rail assembly to inner door panel.

(4) Using a suitable allen wrench, hold jack screw stationary while removing nut attaching bottom of rear rail assembly to inner door panel.

(5) Remove rear rail assembly from vehicle and remove through access hole in inner door panel.

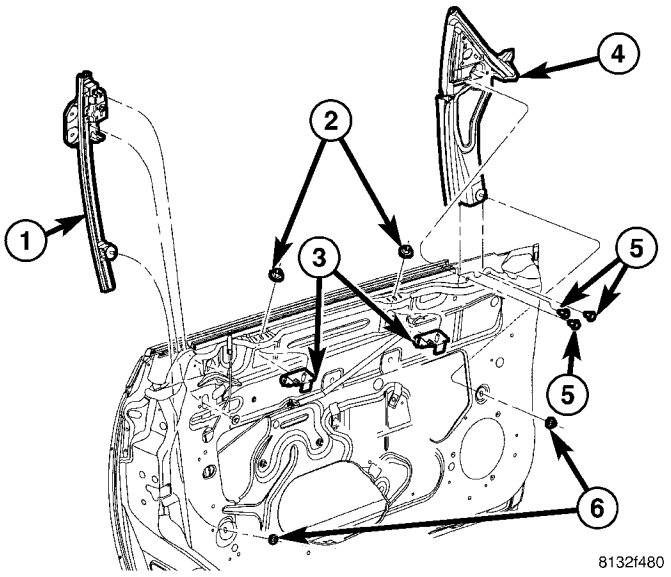

Fig. 44 DOOR GLASS CHANNEL

1 - DOOR GLASS RAIL
2 - STABILIZER NUTS
3 - FRONT DOOR INNER TO GLASS STABILIZER
4 - DOOR GLASS CHANNEL
5 - ATTACHING SCREW(S)
6 - ATTACHING NUT

INSTALLATION - PT-27 ONLY

(1) If a new rear rail assembly is being installed, preset bottom jack screw using old rear rail assembly as a reference (Fig. 44).

(2) Position rear rail assembly on vehicle.

(3) Using a suitable allen wrench, hold jack screw stationary while installing nut attaching bottom of rear rail assembly to inner door panel.

(4) Install nut attaching top of rear rail assembly to inner door panel.

(5) Verify glass fit and operation. Adjust door glass as necessary.

(6) Install door trim panel and water dam.

REAR DOOR APPLIQUE

REMOVAL

(1) Open rear door.

(2) Lower door window to the lowest position (Fig. 1).

(3) Remove front and rear screws attaching outside belt weatherstrip and remove from door (Fig. 2).

(4) Remove glass run weatherstrip as necessary to access the three screws in the B-pillar applique. The glass run weatherstrip will need to be free of the glass on forward edge, so that the front edge of the glass can push outward to access the lower screw (Fig. 3).

(5) Place a shop towel between the tract and glass so that screw(s) do not fall in to the door opening.

(6) Remove screws attaching B-pillar applique.

(7) Remove B-pillar applique from door.

(8) To remove C-pillar applique pull glass run weatherstrip down as necessary to access the three screws in the C-pillar applique (Fig. 4).

(9) Remove screws attaching C-pillar applique.

(10) Remove C-pillar from door.

1 - UPPER DOOR FRAME
2 - DOOR RUN WEATHERSTRIP

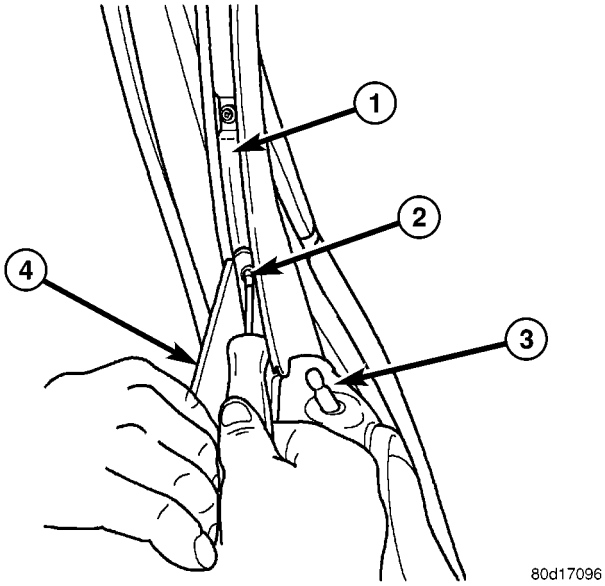

Fig. 3 REMOVE LOWER SCREW

1 - UPPER DOOR FRAME
2 - LOWER SCREW
3 - SHOP TOWEL
4 - DOOR WINDOW GLASS

INSTALLATION

(1) Position C-pillar applique on door.
(2) Install attaching screws to C-pillar.
(3) Install C-pillar applique glass run weatherstrip into position (Fig. 4).
(4) Position B-pillar applique on door.
(5) With shop towel between the tract and glass so that screw(s) do not fall in to the door opening.
(6) Install attaching screws to B-pillar applique.
(7) Install glass run weatherstrip into position on the door frame (Fig. 3).
(8) Place outside belt weatherstrip into position.
(9) Install front and rear screws attaching outside belt weatherstrip (Fig. 2).
(10) Raise door window glass.
(11) Close door.

REAR DOOR CHECK STRAP

REMOVAL

(1) Raise glass to full up position.
(2) Remove door trim panel.
(3) Remove bolts attaching check strap to hinge pillar (Fig. 5).
(4) Remove check strap seal from door end frame.
(5) Remove bolts attaching check strap to door end frame.
(6) Remove check strap from vehicle.

INSTALLATION

CAUTION: Do not close door before adjusting the door latch. Door may fail to open.

(1) Position door check strap on door.
(2) Install check strap attaching bolts to the door end frame (Fig. 5).

REAR DOOR CHECK STRAP (Continued)

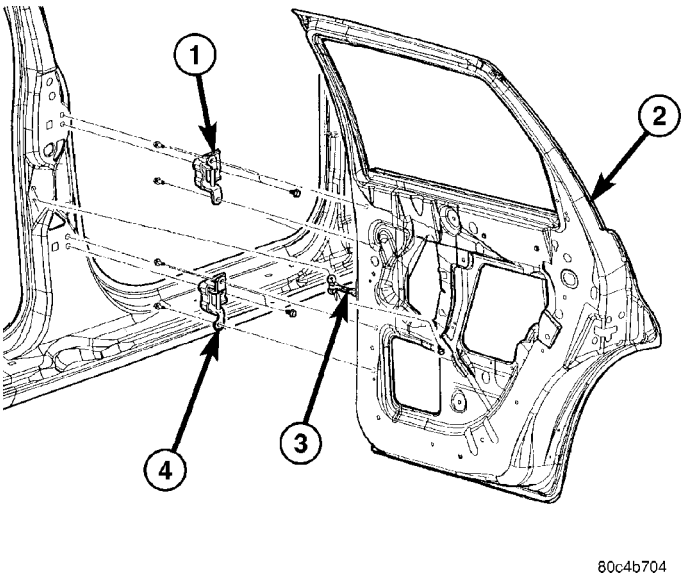

Fig. 5 REAR DOOR CHECK STRAP

1 - REAR DOOR UPPER HINGE
2 - REAR DOOR
3 - REAR DOOR CHECK STRAP
4 - REAR DOOR LOWER HINGE

(3) Install check strap seal. If seal is damaged or worn replace seal.

(4) Install check strap attaching bolts to the hinge pillar.

(5) Install water shield and door trim panel.

REAR DOOR

REMOVAL

(1) Open door and support on a suitable lifting device.

(2) Disconnect the wire connector at the hinge pillar.

(3) Remove bolts attaching door check strap to B-pillar.

(4) Mark door hinges for reinstallation.

(5) Remove bolts attaching lower hinge to door (Fig. 5).

(6) Remove bolts attaching upper hinge to door.

INSTALLATION

(1) Install bolts to the upper hinge to door (Fig. 5).

(2) Install bolts to the lower hinge to door.

(3) Connect the wire connector at the B-pillar.

(4) Remove lifting device.

(5) Install door check strap bolts.

(6) Adjust door as necessary.

REAR DOOR GLASS

REMOVAL

(1) Remove door trim panel and inner belt weatherstrip.

(2) Lower the window to 50 mm (2 ins.) from bottom of travel.

(3) Loosen bolts attaching rear lower run channel to inner door panel (Fig. 6).

(4) Remove rear run channels from door.

(5) Loosen screws attaching window regulator to glass.

(6) Remove glass.

(7) Lift door glass upward out of the opening at the top of door.

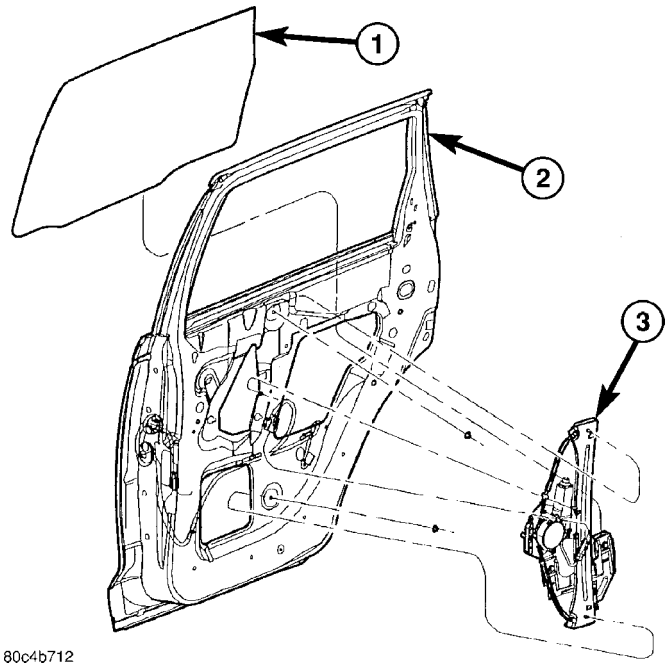

Fig. 6 REAR DOOR GLASS

1 - REAR DOOR WINDOW GLASS
2 - REAR DOOR
3 - REAR DOOR WINDOW POWER REGULATOR

INSTALLATION

(1) Lower door glass through opening in top of door and into position in the window regulator (Fig. 6).

(2) Raise window glass and regulator to full up position.

(3) Tighten screws attaching window regulator to glass.

(4) Install lower belt brackets.

(5) Install inner door belt door trim panel and inner belt weatherstrip.

(6) Install outer belt weatherstrip.

(7) Operate window and check for interference. Adjust glass as necessary.

REAR DOOR OUTSIDE HANDLE

REMOVAL

(1) Remove door trim panel.
(2) Raise door glass.
(3) Disengage clips attaching linkage rods to door latch.
(4) Remove nuts attaching outside handle to door (Fig. 7).
(5) Remove outside handle.

INSTALLATION

(1) Connect lock and latch rods to door handle.
(2) Position door outside handle in opening (Fig. 7).
(3) Tighten attaching nuts.
(4) Connect linkage rods to latch.
(5) Install door trim panel.

REAR DOOR HINGE

REMOVAL

NOTE: If both hinges on one door are to be replaced, remove and install one hinge completely prior to beginning the second hinge.

(1) With rear door closed apply tape to secure door into body.
(2) Open front door.
(3) Mark position of hinge on both the door end frame and lower B-pillar to ease installation.
(4) Remove B-pillar lower trim panel.
(5) Remove bolts attaching hinge to door end frame (Fig. 5).
(6) Remove bolts attaching hinge to lower B-pillar.
(7) Remove door hinge from vehicle.

INSTALLATION

NOTE: If both hinges on one door are to be replaced, remove and install one hinge completely prior to beginning the second hinge.

NOTE: Do not grease door hinges.

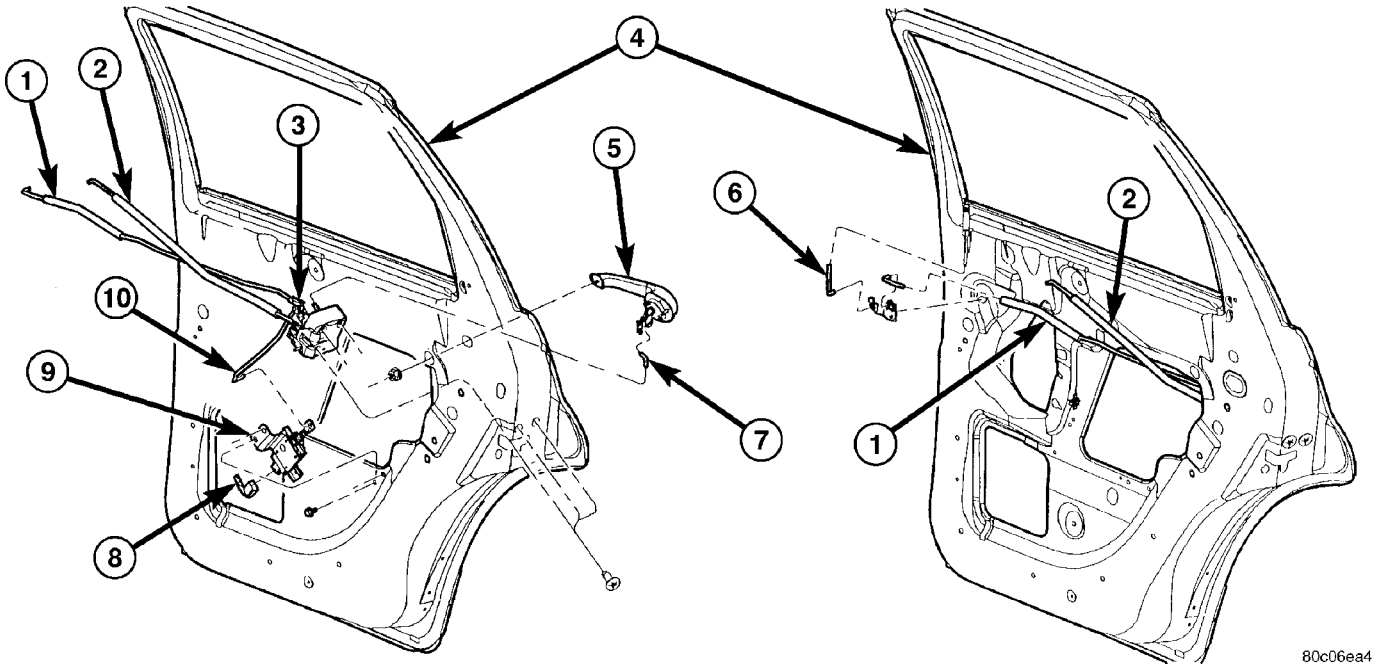

Fig. 7 REAR DOOR OUTSIDE HANDLE

1 - REAR DOOR BELLCRANK TO LATCH LINK AND SLEEVE

7 - REAR DOOR OUTSIDE HANDLE LINK TO LATCH
8 - REAR DOOR WIRE POWER LOCK CONNECTOR
9 - REAR DOOR POWER LOCK MOTOR AND BRACKET
10 - REAR DOOR POWER LOCK ACTUATOR TO LATCH LINK

REAR DOOR HINGE (Continued)

(1) If necessary, paint new door hinge prior to installation.
(2) Position door hinge on vehicle (Fig. 5).
(3) Loosely install bolts attaching hinge to lower B-pillar.
(4) Loosely install bolts attaching hinge to door end frame.
(5) Align hinge to marks made previously and tighten all bolts.
(6) Verify door fit and operation. Adjust door hinge for proper door alignment, if necessary.
(7) Install B-pillar lower trim panel.

REAR DOOR LATCH

REMOVAL

(1) Remove door trim panel.
(2) Raise door glass to full up position.
(3) Remove lower rear run channel.
(4) Disconnect clips attaching linkage rods to door latch.
(5) Remove linkage rods from latch (Fig. 8).
(6) Remove screws attaching latch to door end frame
(7) Remove door latch from vehicle.

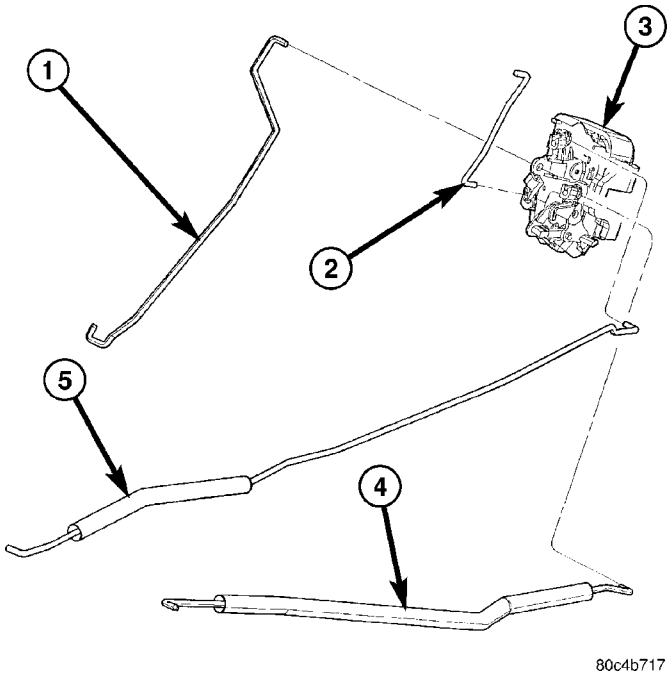

Fig. 8 REAR DOOR LATCH

1 - REAR DOOR POWER LOCK ACTUATOR TO LATCH LINK
2 - REAR DOOR OUTSIDE HANDLE TO LATCH LINK
3 - REAR DOOR LOCK LATCH
4 - REAR DOOR INSIDE ROD TO LATCH LINK AND SLEEVE
5 - REAR DOOR BELLCRANK TO LATCH LINK AND SLEEVE

INSTALLATION

CAUTION: Do not close door before adjusting the door latch. Door may fail to open.

(1) Position door latch on vehicle and install screws attaching latch to door end frame (Fig. 8).
(2) Connect linkage rods to latch.
(3) Connect lock and latch rods to door latch.
(4) Install lower rear run channel.
(5) Install door trim panel.

ADJUSTMENTS

REAR DOOR LATCH ADJUSTMENT

(1) Insert a Torx® wrench through the elongated hole in the door end frame near the latch striker opening.
(2) Loosen screw on the side of the latch linkage.
(3) Push button on outside door handle and release it.
(4) Tighten screw on latch.
(5) Verify latch operation.

REAR DOOR LATCH STRIKER

REMOVAL

(1) Mark outline of door latch striker on B-pillar to aid installation (Fig. 9).
(2) Remove screws attaching door latch striker to B-pillar.
(3) Remove door latch striker from vehicle.

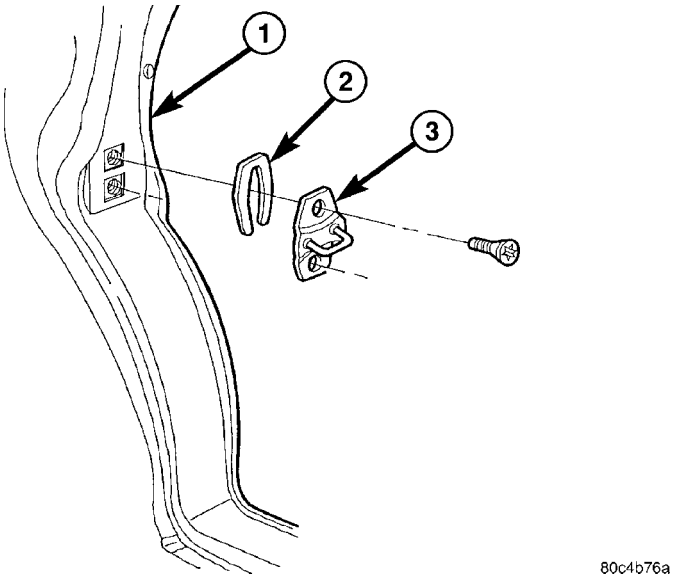

Fig. 9 REAR DOOR LATCH STRIKER

1 - C-PILLAR
2 - SPACER
3 - REAR DOOR STRIKER

REAR DOOR LATCH STRIKER (Continued)

INSTALLATION

(1) Install door latch striker from vehicle (Fig. 9).
(2) Install screws attaching door latch striker to B-pillar.
(3) Align marked outline of door latch striker on B-pillar to aid installation.

REAR DOOR TRIM PANEL

REMOVAL

(1) Release door latch and open door.
(2) Lower window glass.
(3) Remove screw from inside arm rest pull cup (Fig. 10).
(4) Remove screw from behind inside latch release handle.
(5) Remove fasteners from door trim panel.
(6) Disengage push in fasteners attaching trim to door panel around perimeter of trim panel.
(7) Disengage push-in metal spring clip attaching trim in sail flag area.
(8) Lift trim panel up off belt weatherstrip.
(9) Tilt top of trim panel away from door and disengage clip attaching latch rod to handle.
(10) Remove latch rod from handle.
(11) Remove trim panel from door.

INSTALLATION

(1) Replace any damaged or missing push in fasteners from around perimeter of door trim panel.
(2) Place trim panel in position on door (Fig. 10).
(3) Insert latch rod into handle and engage clip.
(4) Engage trim panel into retainer channel at top of door.
(5) Locate door trim panel to inner door panel by aligning locating pins on backside of trim panel to mating holes in inner door panel.
(6) Engage push in fasteners attaching trim to door panel around perimeter of trim panel.
(7) Install fasteners in door trim panel.
(8) Install screw behind inside latch release handle.
(9) Install screw inside arm rest pull cup.

REAR DOOR WATER DAM

REMOVAL

(1) Remove door trim panel.
(2) Remove door speaker, if equipped (Fig. 11).
(3) Remove door trim pull cup mount bracket.
(4) Disconnect clip attaching lock linkage to lock button bell-crank.
(5) Peel water dam away from adhesive around perimeter of inner door panel.

INSTALLATION

(1) Insure that enough adhesive remains to securely retain the water dam. Replace as necessary.
(2) Place the water dam into position and press securely to adhesive making sure to properly route wiring and linkages (Fig. 11).

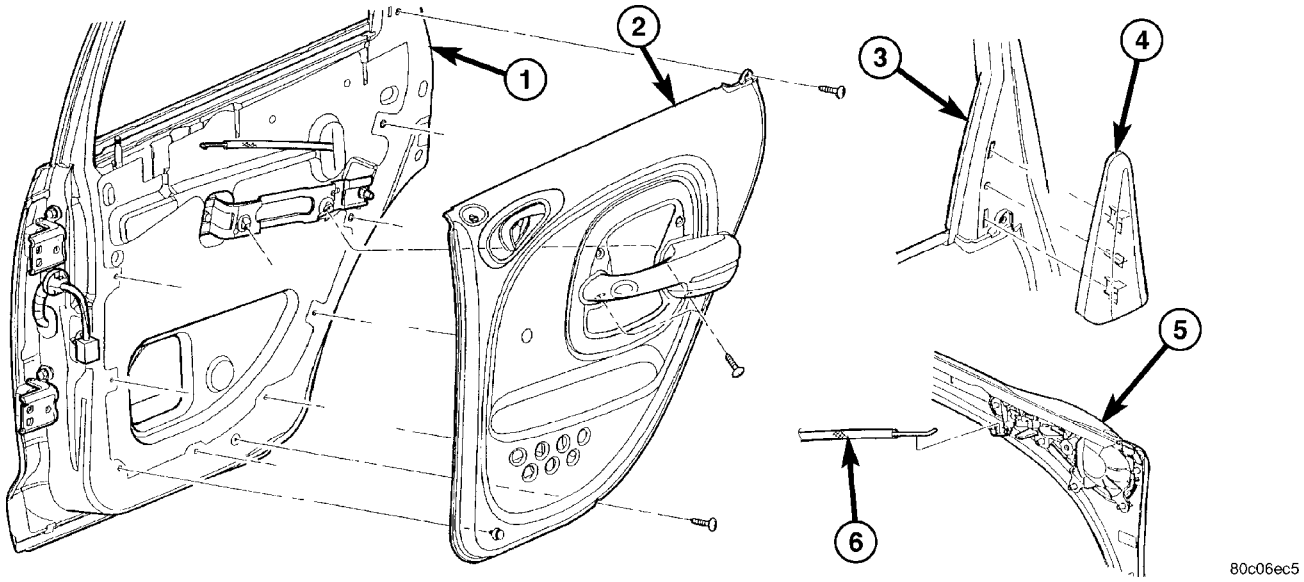

Fig. 10 REAR DOOR TRIM PANEL

REAR DOOR WATER DAM (Continued)

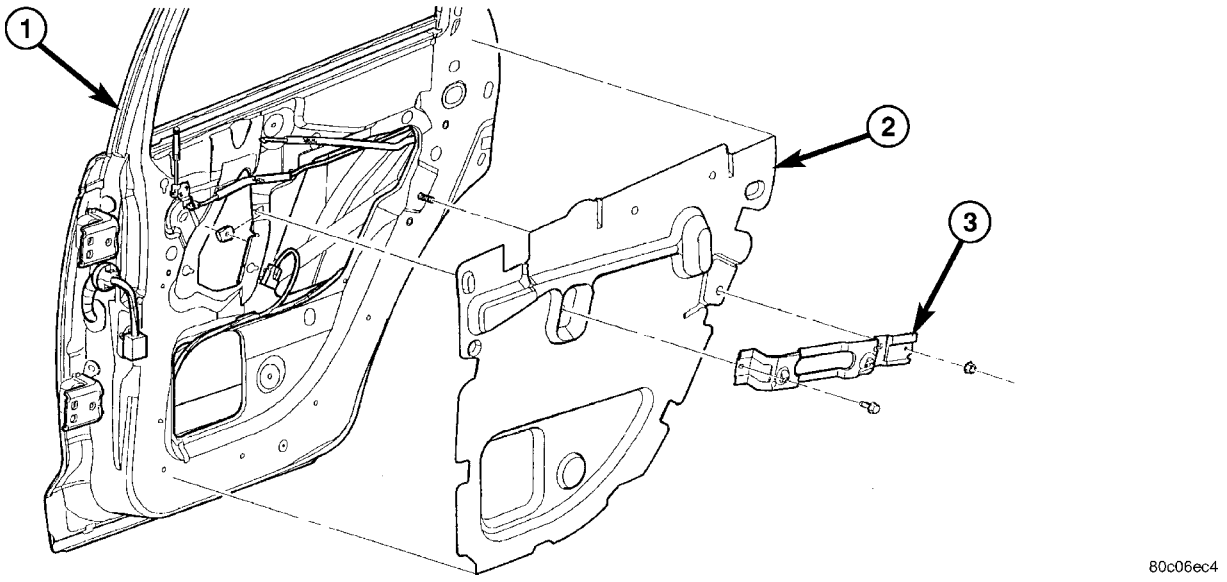

Fig. 11 WATER DAM

1 - REAR DOOR
2 - REAR DOOR WATER DAM
3 - REAR DOOR ARMREST TO INNER PANEL ATTACHING BRACKET

(3) Engage clip attaching lock linkage to lock button bell-crank.
(4) Install door trim pull cup mount bracket.
(5) Install door speaker, if equipped.
(6) Install door trim panel.

REAR DOOR WINDOW REGULATOR

REMOVAL

(1) Remove door trim panel and watershield.
(2) Remove door glass from regulator channel. Secure glass in the door frame in the “UP” position.
(3) Remove fasteners attaching window regulator channel and crank motor to door panel (Fig. 6).
(4) Disengage wiring at clip.
(5) Disengage regulator from door panel, and motor housing.
(6) Slide regulator rearward and rotate forward end of channel through access hole in door panel.
(7) Remove window regulator from door through access hole in inner panel.

INSTALLATION

(1) Position window regulator and motor housing on door panel through access hole in door panel (Fig. 6).
(2) Install fasteners attaching window regulator to door panel.
(3) Position glass to regulator roller channel.
(4) Tighten fasteners attaching door glass to lift plate.
(5) Engage electrical wiring.
(6) Position watershield, and install door trim panel.

BODY SIDE MOLDINGS

REMOVAL

REMOVAL

(1) Using a grease pencil or equivalent, mark the location of the molding for reference during installation.

(2) Warm the body side molding and body metal to approximately 38°C (100°F) using a suitable heat lamp or heat gun.

(3) Pull the molding from the vehicle.

(4) Clean off all traces of adhesive tape residue from the panel(s) with a general purpose adhesive remover.

REMOVAL - PT-27 ONLY

(1) Mark reference points before removing.

(2) Using a heat gun gently apply heat in a circular motion to loosen the adhesive bond (Fig. 1).

(3) Using a nonmetallic prying device, such as a plastic or wood trim stick gently pry up at corners and remove.

(4) Clean off all traces of adhesive or double sided tape from the panel with a general purpose adhesive remover.

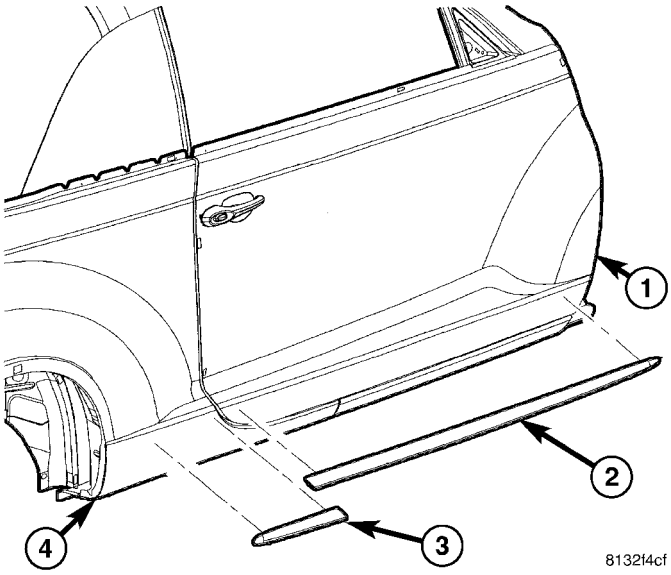

Fig. 1 BODY SIDE APERTURE MOLDING

1 - FRONT DOOR
2 - FRONT DOOR BODY SIDE MOLDING
3 - BODY SIDE APERTURE MOLDING
4 - QUARTER OUTER PANEL

INSTALLATION

INSTALLATION

(1) Clean panel surface with isopropyl alcohol and wipe surface dry with a lint free cloth.

(2) Remove the protective cover from the tape on the back of the molding and apply to the body according to the reference points marked previously.

(3) Firmly press the molding to the body surface to insure adhesion.

INSTALLATION - PT-27 ONLY

(1) Clean panel surface with isopropyl alcohol.

(2) Align aperture molding to reference points (Fig. 1).

(3) Install and press securely to full adhesive contact

(4) Clean away any reference points.

COWL GRILLE SCREEN

REMOVAL

(1) Remove wiper arms (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER ARMS - REMOVAL).

(2) Open hood.

(3) Remove screws attaching right cowl grille screen (Fig. 2).

(4) Remove right cowl grille screen from vehicle.

(5) Remove screws attaching left cowl grille screen.

(6) Remove left cowl grille screen from vehicle.

INSTALLATION

(1) Open hood.

(2) Place left cowl grille screen into position (Fig. 2).

(3) Install attaching screws.

(4) Place right cowl grille screen into position.

(5) Install attaching screws

(6) Install wiper arms (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER ARMS - INSTALLATION).

(7) Close hood.

COWL GRILLE SCREEN (Continued)

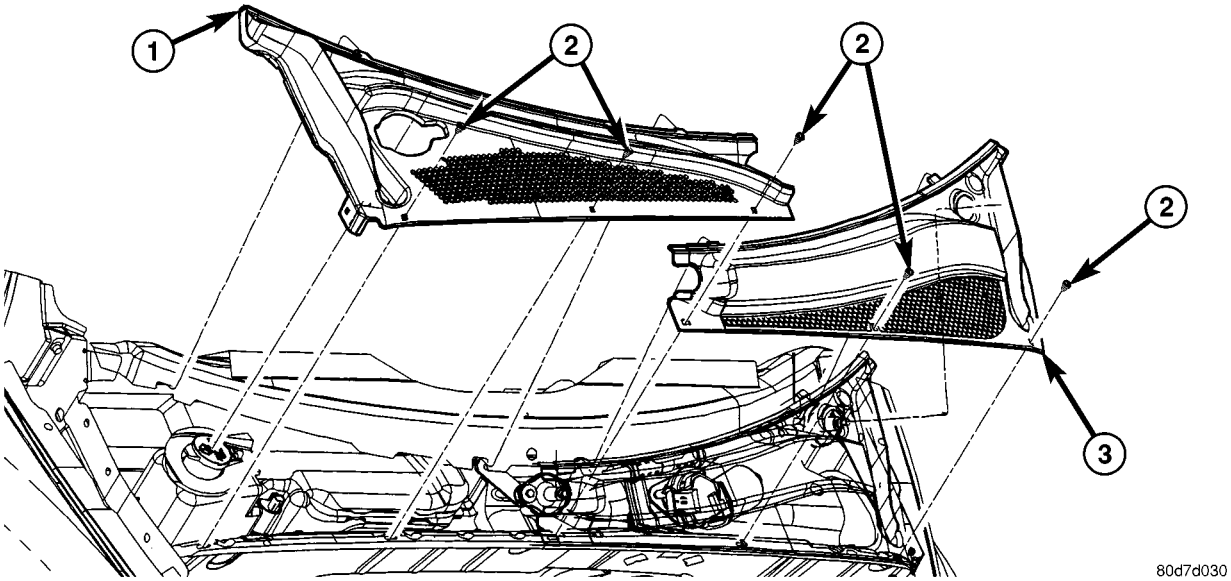

Fig. 2 COWL GRILLE SCREEN

1 - RIGHT COWL GRILLE SCREEN
2 - ATTACHING SCREWS
3 - LEFT COWL GRILLE SCREEN

DECK UPPER BELT MOLDING - PT-27

REMOVAL - PT-27 ONLY

(1) Adjust top open/close to access deck upper belt molding screws (Fig. 3).

(2) Remove deck upper belt molding attaching screws.

(3) Remove molding from vehicle.

INSTALLATION - PT-27 ONLY

(1) Adjust top open/close to access deck upper belt molding screws (Fig. 3).

(2) Install deck upper belt molding attaching screws starting with round (4-way) hole making sure to center molding before tightening screw then install other screws.

(3) Raise top.

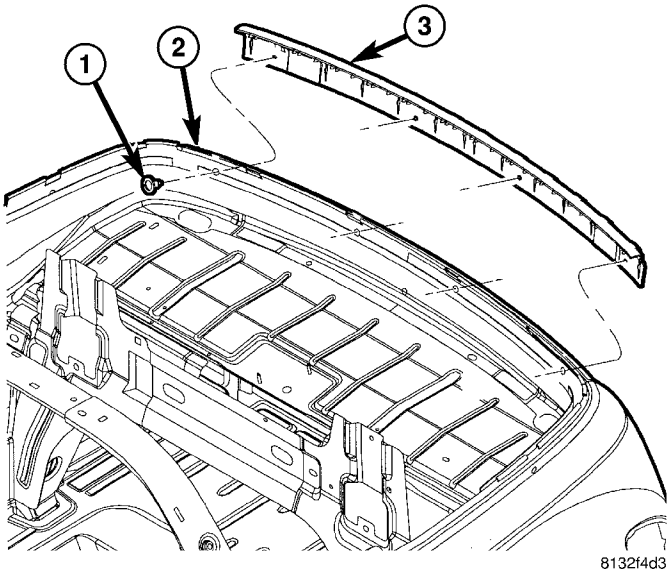

Fig. 3 DECK UPPER PANEL MOLDING

1 - ATTACHING SCREWS
2 - QUARTER OUTER RIGHT PANEL
3 - DECK UPPER BELT MOLDING

ENGINE COMPARTMENT LOWER SILENCER

REMOVAL

(1) Raise vehicle.
(2) Remove push pin fasteners (Fig. 4).
(3) Remove side shield attaching screws.
(4) Remove under tray attaching screws.
(5) Remove engine compartment lower silencer.
(6)

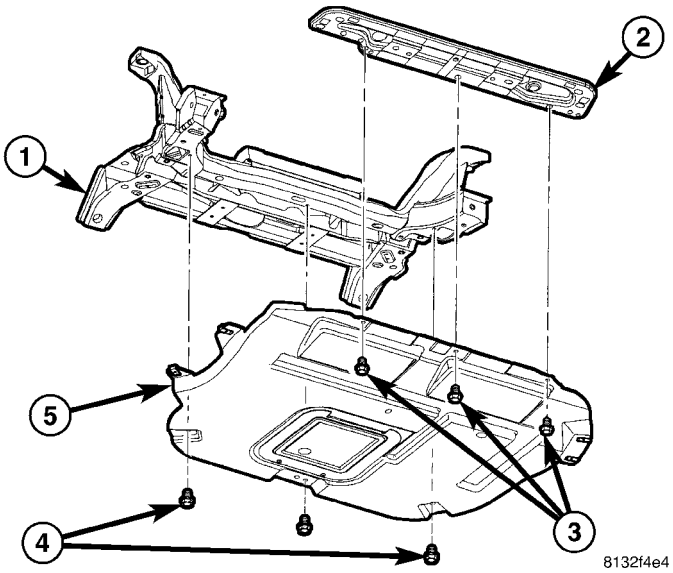

Fig. 4 ENGINE COMPARTMENT LOWER SILENCER

1 - SUSPENSION ASSEMBLY
2 - CROSSMEMBER ASSEMBLY
3 - ATTACHING UNDER TRAY AND SIDE SHIELD SCREWS
4 - PUSH PIN FASTENERS
5 - ENGINE COMPARTMENT LOWER SILENCER

INSTALLATION

(1) Place engine compartment lower silencer in position.
(2) Install under tray attaching screws.
(3) Install side shield attaching screws.
(4) Install push pins fasteners.
(5) Lower vehicle.

EXTERIOR NAME PLATES

REMOVAL

REMOVAL - EXTERIOR BADGING

(1) Mark reference points before removing.
(2) Using a heat gun gently apply heat in a circular motion to loosen the adhesive bond.
(3) Using a nonmetallic prying device, such as a plastic or wood trim stick gently pry up at corners and remove.
(4) Clean off all traces of adhesive or double sided tape from the panel with a general purpose adhesive remover.

REMOVAL - BADGING/TAPE

(1) Mark reference points before removing.
(2) Using a heat gun gently apply heat in a circular motion to loosen the adhesive bond.
(3) With your fingernail lift up and peel away badging/tape from panel, using a heat gun as you go.
(4) Clean off all traces of adhesive from the panel(s) with a general purpose adhesive remover.

INSTALLATION

INSTALLATION - EXTERIOR BADGING

(1) Clean panel surface with isopropyl alcohol.
(2) Align badging to reference points.
(3) Install and press securely to full adhesive contact
(4) Clean away any reference points.

INSTALLATION - BADGING/TAPE

(1) Clean panel surface with isopropyl alcohol.
(2) Remove paper carrier and align badging/tape to reference points or adjacent panel.
(3) Install and press securely, using a plastic spreader to eliminate all air bubbles.
(4) Remove top protective carrier.
(5) Clean away any reference points.

FRONT FENDER

REMOVAL

(1) Remove headlamp housing.
(2) Right side of vehicle remove front side rail access pulley splash shield.
(3) Remove splash shield.
(4) Remove fender to fascia nuts.
(5) Remove fender bolt to lower rocker panel (Fig. 5).
(6) Remove fender bolt to lower cowl.
(7) Pull fascia away from fender.
(8) Remove bolts attaching fender to upper rail.
(9) Remove fender from vehicle.

INSTALLATION

(1) Place fender in position on vehicle (Fig. 5).
(2) Start the center upper rail bolt.
(3) From inside engine compartment, install all the bolts attaching fender to upper rail and tighten.

FRONT FENDER (Continued)

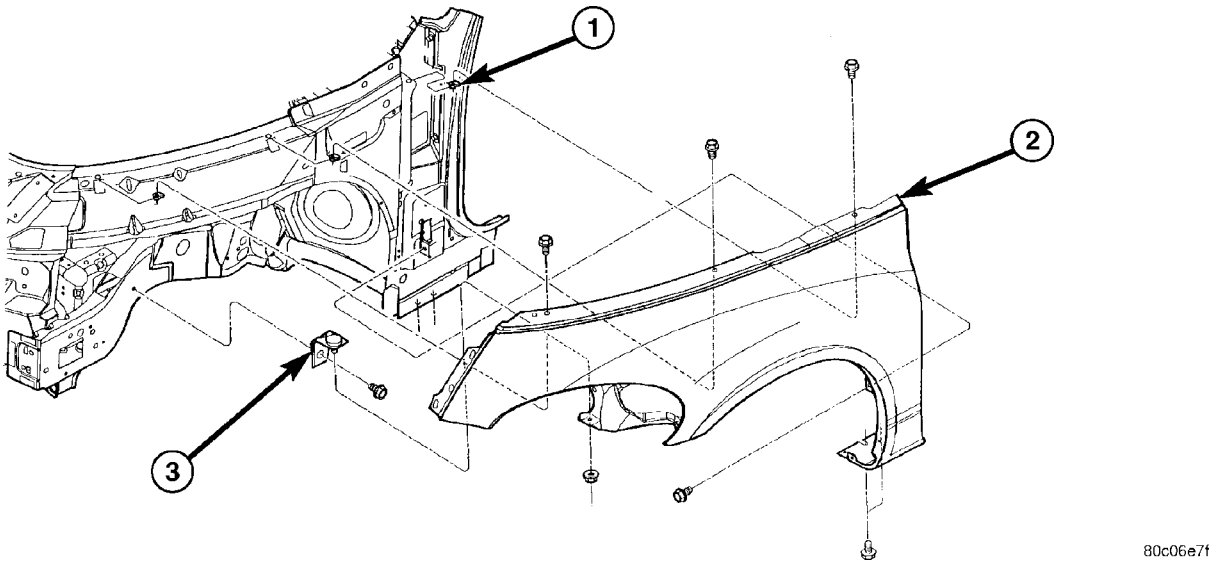

Fig. 5 FENDER

1 - U-NUTS
2 - FRONT FENDER
3 - FRONT FENDER SUPPORT

(4) Install lower cowl panel bolt to fender.
(5) Install rocker panel bolt to fender.
(6) Place fascia into position.
(7) Install fender to fascia nuts.
(8) Install inner splash shield.
(9) Install right side pulley splash shield.
(10) Install headlamp assembly.
(11) Check fender for flush and gap.

FRONT SIDE RAIL ACCESS PULLEY SPLASH SHIELD

REMOVAL

(1) Hoist and support vehicle on safety stands.
(2) Remove front wheel.
(3) Remove fasteners attaching lower fascia and air dam. Pull fascia forward to access fastener attaching front edge of the splash shield.
(4) Remove push-in fasteners attaching side rail access pulley splash shield to frame rail forward of suspension (Fig. 6).
(5) Remove side rail access pulley splash shield from vehicle.

INSTALLATION

(1) Place side rail access pulley splash shield in position on vehicle (Fig. 6).
(2) Install fasteners attaching side rail access pulley splash shield to frame rail.

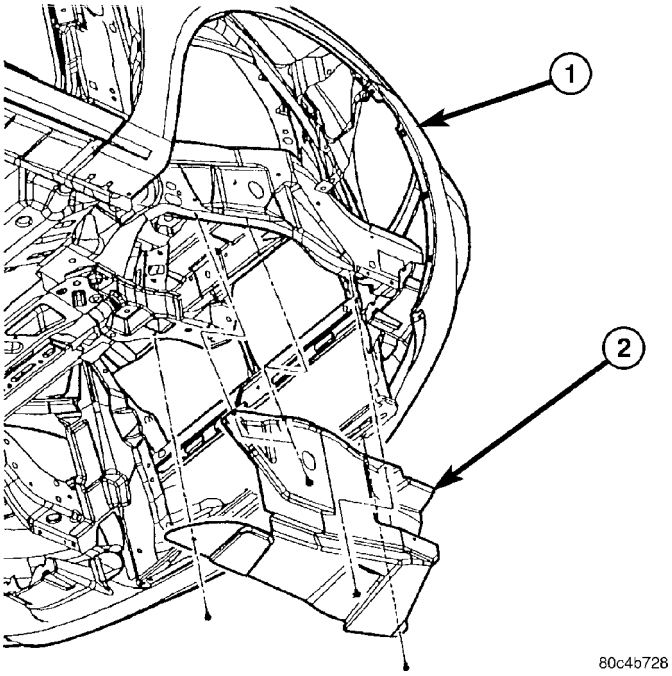

Fig. 6 FRONT SIDE RAIL ACCESS PULLEY SPLASH SHIELD

1 - FRONT FENDER
2 - FRONT SIDE RAIL ACCESS PULLEY SPLASH SHIELD

(3) Install fasteners attaching fascia and air dam.
(4) Install front wheel.
(5) Lower vehicle.

FRONT WHEELHOUSE SPLASH SHIELDS

REMOVAL

(1) Hoist and support vehicle on safety stands.
(2) Remove front wheel.
(3) Remove push-in fasteners attaching splash shield to frame rail forward of suspension (Fig. 7).
(4) Remove push in fasteners attaching splash shield to frame rail rearward of suspension.
(5) Remove screws attaching wheelhouse splash shield to front fender.
(6) Remove splash shield from vehicle.

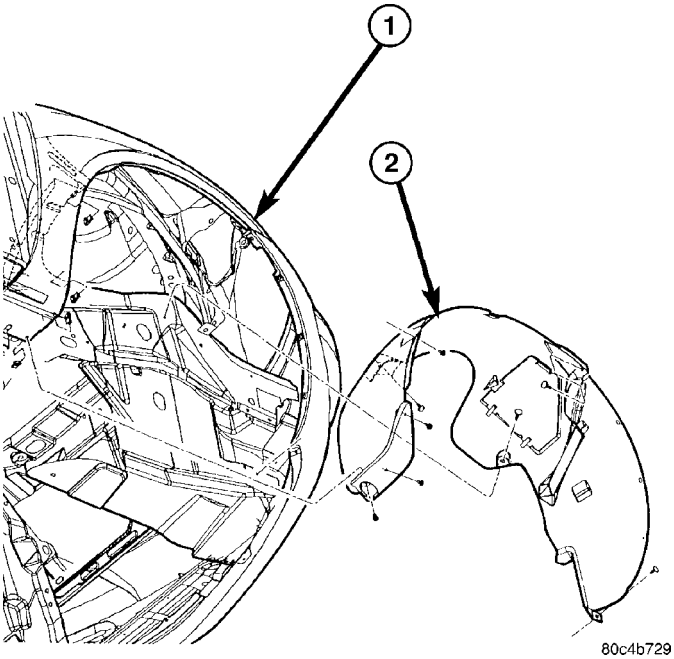

Fig. 7 FRONT WHEELHOUSE SPLASH SHIELD

1 - FRONT FENDER
2 - FRONT FENDER SPLASH SHIELD

INSTALLATION

(1) Place splash shield in position on vehicle (Fig. 7).
(2) Install screws attaching wheelhouse splash shield to front fender.
(3) Install push in fasteners attaching splash shield to frame rail rearward of suspension.
(4) Install push in fasteners attaching splash shield to frame rail forward of suspension.
(5) Install front wheel.
(6) Lower vehicle.

FUEL FILL DOOR

REMOVAL

(1) Open the fuel filler door.
(2) Remove the screws attaching the door to the quarter panel (Fig. 8).
(3) Remove the door from the panel.

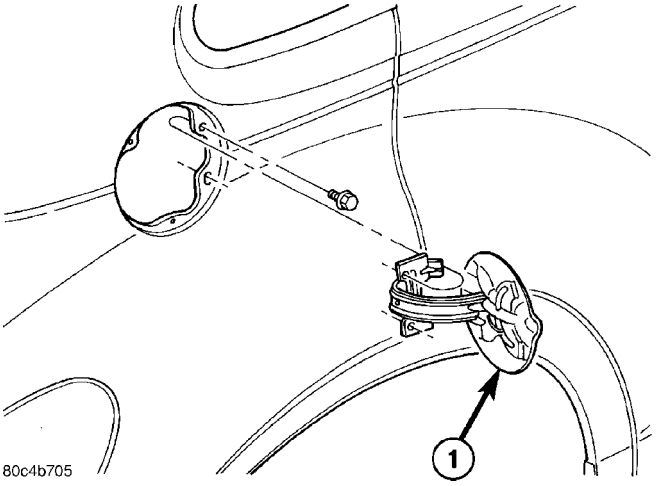

Fig. 8 FUEL FILLER DOOR

1 - FUEL FILLER DOOR

INSTALLATION

(1) Position the fuel filler door on the quarter panel with the screw holes aligned (Fig. 8).
(2) Install the screws attaching the fuel filler door to the quarter panel.

GRILLE

REMOVAL

(1) Open hood and support hood on prop rod.
(2) Remove screws attaching grille to fender and radiator closure panel (Fig. 9).
(3) Pull top of grille up and outward to disengage hooks from fender.
(4) Remove grille from vehicle.
(5) Remove chrome strips, if necessary. Using a small flat blade tool to release chrome strips tabs (Fig. 10).

GRILLE (Continued)

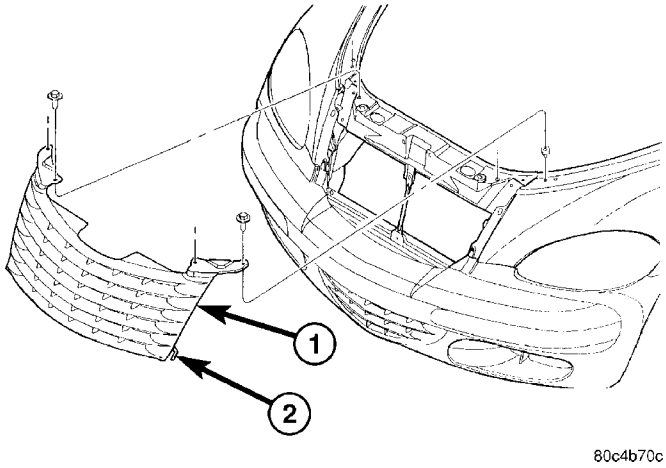

Fig. 9 GRILLE

1 - GRILLE
2 - RETAINER

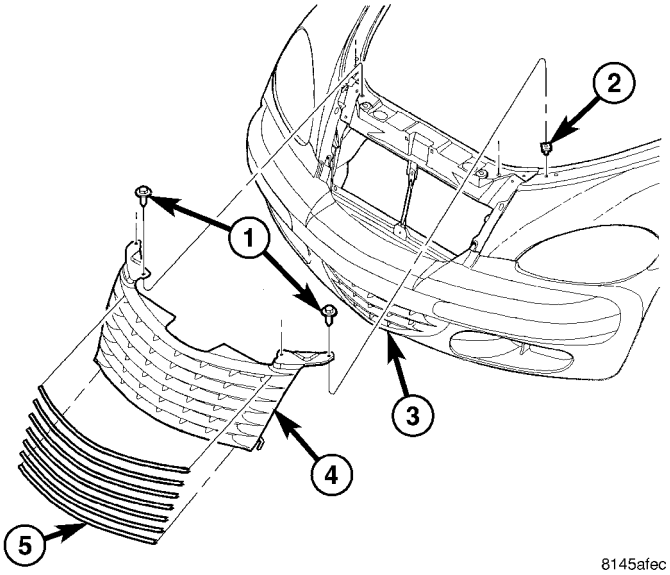

Fig. 10 GRILLE - WITH CHROME STRIPS

2 - SPRING NUT (4)
3 - LOWER RADIATOR GRILLE AND FASCIA
4 - RADIATOR GRILLE
5 - CHROME STRIPS (7)

INSTALLATION

(1) Install the chrome strips to grille (7), if equipped (Fig. 11). Place chrome strip into position, and press on chrome strip until it is locked into position.

(2) Place grille into position on vehicle, engage lower hook into fascia first, then set top of grille on to the radiator closure panel (Fig. 12).

(3) Install screw (4) attaching grille to radiator closure panel.

(4) Close hood.

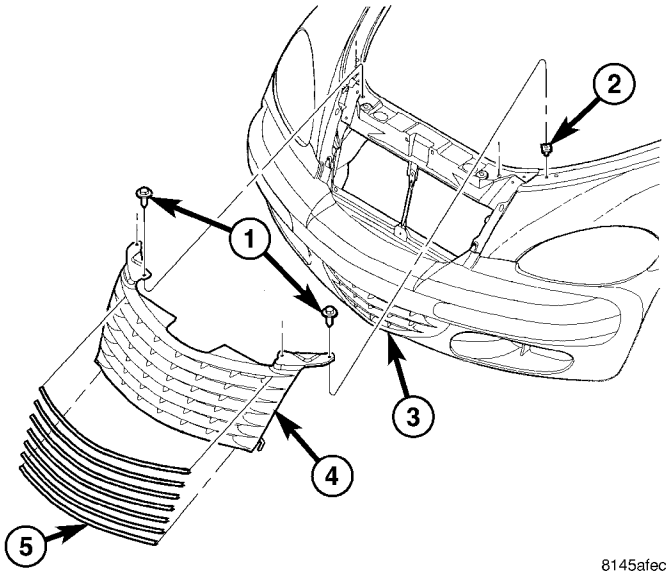

Fig. 11 GRILLE - WITH CHROME STRIPS

1 - SCREWS (4) ATTACHING GRILLE TO FENDER AND RADIATOR CLOSURE PANEL

4 - RADIATOR GRILLE
5 - CHROME STRIPS (7)

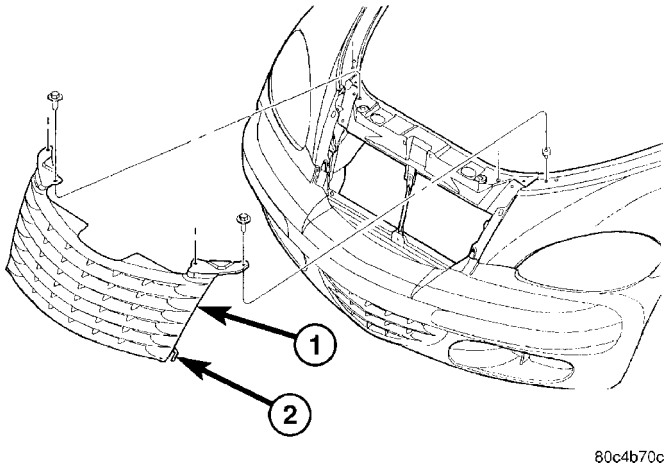

Fig. 12 GRILLE

1 - GRILLE
2 - RETAINER

HEADER MOLDING - PT-27

REMOVAL - PT-27 ONLY

(1) Lower top.
(2) Disengage clips attaching header molding panel to upper windshield surround frame (Fig. 13).
(3) Remove header molding from vehicle.

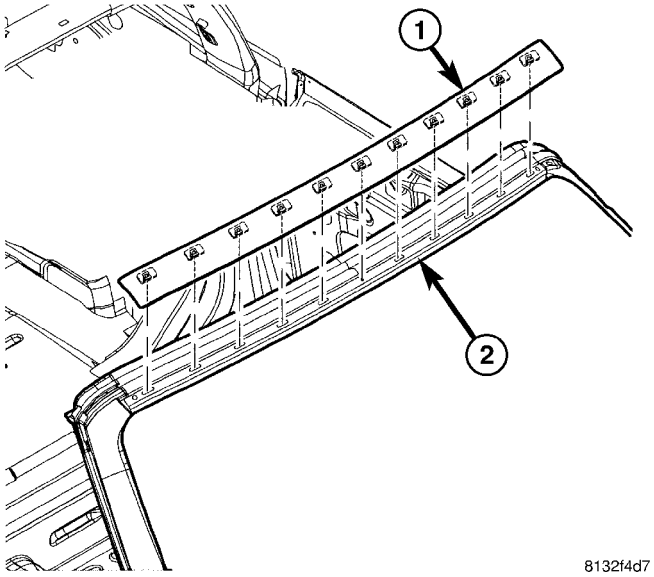

Fig. 13 HEADER MOLDING

1 - HEADER MOLDING
2 - WINDSHIELD OPENING FRAME

INSTALLATION - PT-27 ONLY

NOTE: Use a brand new header molding or replace the clips as needed on the header molding.

(1) Place header molding into position (Fig. 13).
(2) Align clips to mating holes in the windshield surround frame.
(3) Push clips on header molding into the seated position.

LUGGAGE RACK CROSSBAR

REMOVAL

(1) Loosen the end cap set screws on both side rails and remove end caps. (Fig. 14)
(2) Release the cross bars and slide off the side rails.

INSTALLATION

(1) Install the crossbars onto the side rails.
(2) Install the end caps and tighten the set screws.
(3) Place the cross bars into the far rear position and lock down.

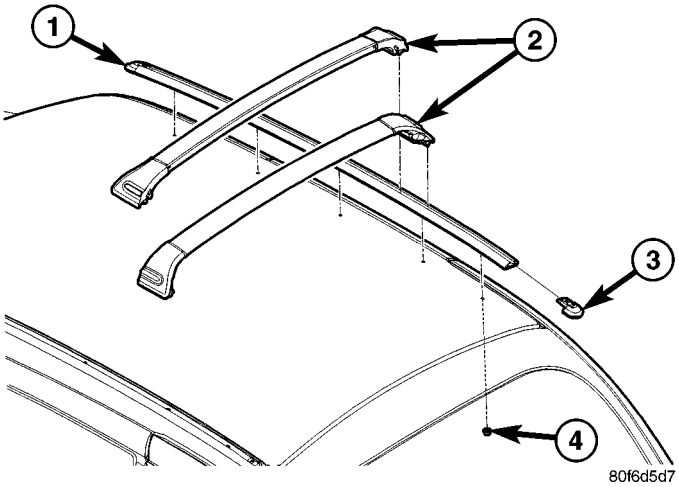

Fig. 14 LUGGAGE RACK

1 - SIDE RAILS
2 - CROSSBARS
3 - END CAPS
4 - NUTS (5 PER SIDE)

LUGGAGE RACK SIDE RAIL

REMOVAL

(1) Remove the crossbars. (Refer to 23 - BODY/EXTERIOR/LUGGAGE RACK CROSSBAR - REMOVAL)
(2) Disconnect and isolate the battery negative cable.

NOTE: Remove the following trim panels from the same side as the side rail only.

(3) Remove the a-pillar trim. (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - REMOVAL)
(4) Remove the sunvisor and holder. (Refer to 23 - BODY/INTERIOR/SUN VISOR - REMOVAL)
(5) Partially remove the sunroof trim lace. (Refer to 23 - BODY/SUNROOF/OPENING TRIM LACE - REMOVAL)
(6) Remove the upper b-pillar trim. (Refer to 23 - BODY/INTERIOR/B-PILLAR TRIM - REMOVAL)
(7) Remove the front and rear assist handles.
(8) Remove the upper c-pillar trim. (Refer to 23 - BODY/INTERIOR/C-PILLAR TRIM - REMOVAL)
(9) Remove the upper d-pillar trim. (Refer to 23 - BODY/INTERIOR/D-PILLAR TRIM - REMOVAL)
(10) Remove push pin fastener at the rear of the head liner.
(11) Lower headliner to gain access to the side rail nuts.
(12) Remove the five side rail nuts and remove the side rail.

LUGGAGE RACK SIDE RAIL (Continued)

INSTALLATION

(1) Install the side rail and side rail bolts.

(2) Apply a suitable body sealer to the bolt threads and install the nuts.

(3) Raise the headliner and install the push pin fastener at the rear.

(4) Install the upper d-pillar trim. (Refer to 23 - BODY/INTERIOR/D-PILLAR TRIM - INSTALLATION)

(5) Install the upper c-pillar trim. (Refer to 23 - BODY/INTERIOR/C-PILLAR TRIM - INSTALLATION)

(6) Install the assist handles.

(7) Install the upper b-pillar trim. (Refer to 23 - BODY/INTERIOR/B-PILLAR TRIM - INSTALLATION)

(8) Install the sunroof trim lace. (Refer to 23 - BODY/SUNROOF/OPENING TRIM LACE - INSTALLATION)

(9) Install the sunvisor. (Refer to 23 - BODY/INTERIOR/SUN VISOR - INSTALLATION)

(10) Install the a-pillar trim. (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - INSTALLATION)

(11) Reconnect the battery.

(12) Install the crossbars. (Refer to 23 - BODY/EXTERIOR/LUGGAGE RACK CROSSBAR - INSTALLATION)

RADIATOR CLOSURE PANEL

REMOVAL

(1) Open hood.

(2) Mark bolt locations on the upper radiator closure panel (Fig. 15).

(3) Remove fasteners attaching radiator closure panel to fenders.

(4) Move temperature sensor as necessary.

(5) Remove bolt attaching lower radiator closure panel to the upper radiator closure panel.

(6) For replacement of upper radiator closure panel, remove hood latch, and any other hardware.

INSTALLATION

(1) Place in position the upper radiator closure panel (Fig. 15).

(2) Install bolts attaching upper radiator closure panel to fenders. Check bolt alignment marks.

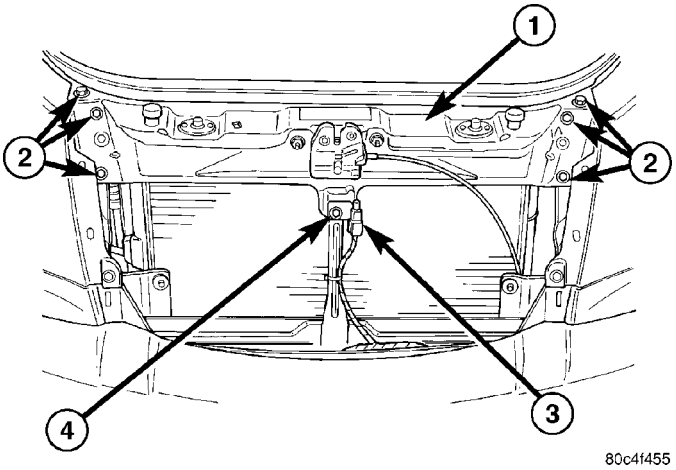

Fig. 15 RADIATOR CLOSURE PANEL

1 - UPPER RADIATOR CLOSURE PANEL
2 - UPPER CLOSURE ATTACHING FASTENERS
3 - TEMPERATURE SENSOR
4 - FASTENER ATTACHING LOWER CLOSURE PANEL TO UPPER CLOSURE PANEL

(3) Install bolt attaching the lower radiator closure panel to upper radiator closure panel.

(4) Place in position temperature sensor in position.

(5) Install hood latch and cable.

(6) Check hood latch operation.

SIDE VIEW MIRROR

REMOVAL

REMOVAL

(1) Disengage the clips retaining the side mirror bezel to stanchion. (Left side only with manual mirror).

(2) Remove door trim panel if necessary.

(3) Remove nuts attaching mirror to door inner panel (Fig. 16)or (Fig. 17).

(4) Manual mirrors snap left side manual remote from bezel.

(5) Electrical mirrors disconnect wire connector.

(6) Remove mirror from vehicle.

SIDE VIEW MIRROR (Continued)

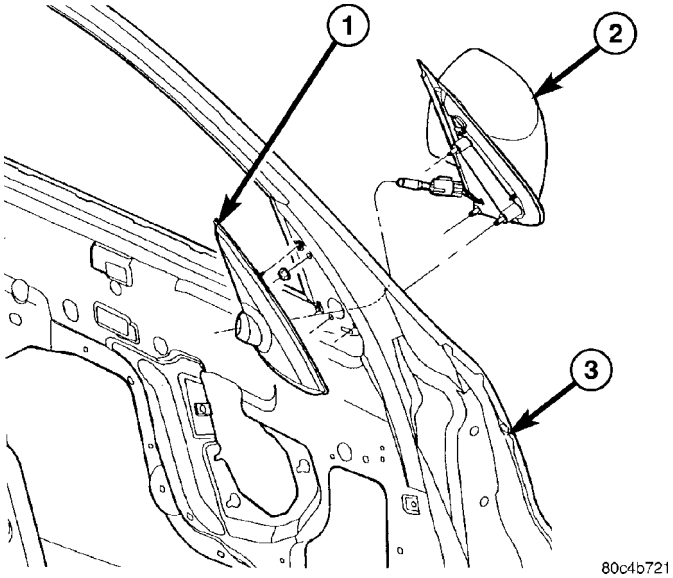

Fig. 16 MANUAL SIDE VIEW MIRROR

1 - INSIDE REMOTE CONTROL MIRROR BEZEL
2 - FRONT DOOR OUTSIDE REMOTE CONTROL MIRROR
3 - FRONT DOOR

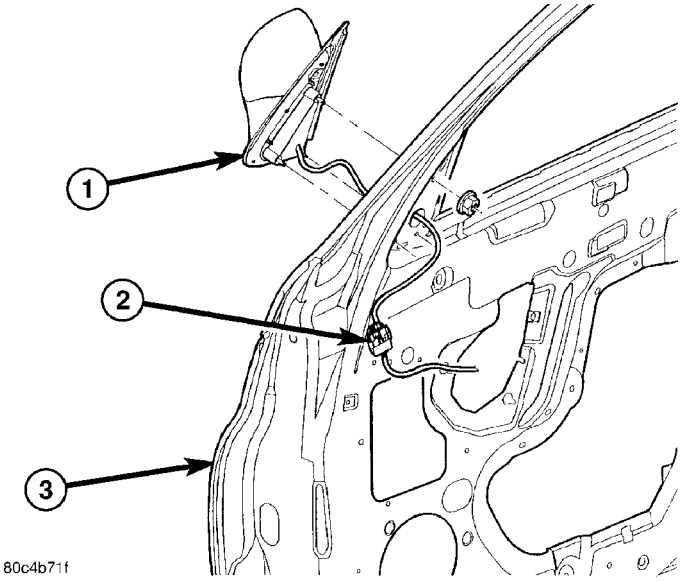

Fig. 17 POWER SIDE VIEW MIRROR

1 - MIRROR
2 - WIRING CONNECTOR
3 - FRONT DOOR

REMOVAL - PT-27 ONLY

(1) Disengage the clips retaining the side mirror flag to stanchion. (Left side only with manual mirror).

(2) Remove door trim panel if necessary.

(3) Remove nuts attaching mirror to door inner panel (Fig. 18).

(4) Manual mirrors snap left side manual remote from bezel.

(5) Electrical mirrors disconnect wire connector.

(6) Remove mirror from vehicle.

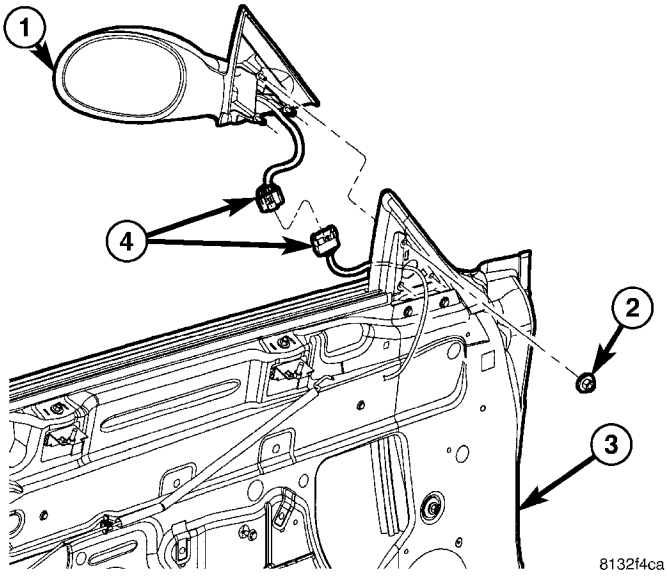

Fig. 18 SIDE VIEW MIRROR ASSEMBLY

1 - MIRROR ASSEMBLY
2 - ATTACHING NUTS
3 - FRONT DOOR
4 - WIRE CONNECTORS

INSTALLATION

INSTALLATION

(1) Connect electrical mirror wire connector.

(2) Position side view mirror on vehicle (Fig. 16) or (Fig. 17).

(3) Install nuts attaching mirror.

(4) Install mirror bezel or door trim panel as necessary.

INSTALLATION - PT-27 ONLY

(1) Connect electrical mirror wire connector.

(2) Position side view mirror on vehicle (Fig. 18).

(3) Install nuts attaching mirror.

(4) Install mirror flag or door trim panel as necessary.

SIDE VIEW MIRROR GLASS

REMOVAL

WARNING: ALWAYS WEAR EYE AND HAND PROTECTION WHEN SERVICING THE MIRROR ASSEMBLY. FAILURE TO OBSERVE THESE WARNINGS MAY RESULT IN PERSONAL INJURY FROM BROKEN GLASS.

(1) Push mirror glass to the fully inboard position (Fig. 19).

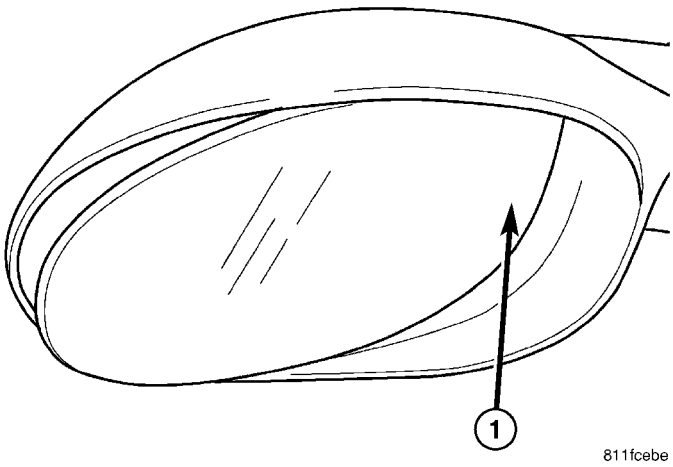

Fig. 19 POSITION MIRROR

1 - PUSH MIRROR FULLY INBOARD

(2) Carefully pull/pry mirror glass away from mirror assembly until glass separates (Fig. 20).

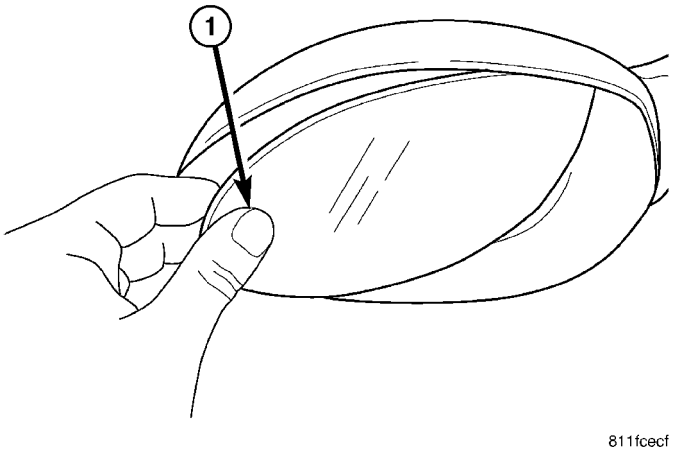

Fig. 20 REMOVE MIRROR GLASS

1 - FROM UNDERNEATH GLASS, PULL AWAY FROM MIRROR ASSEMBLY

(3) Disconnect the heated mirror electrical connectors from the terminals on the mirror glass holder, if equipped.

INSTALLATION

(1) Center the power pack pivot (Fig. 21).

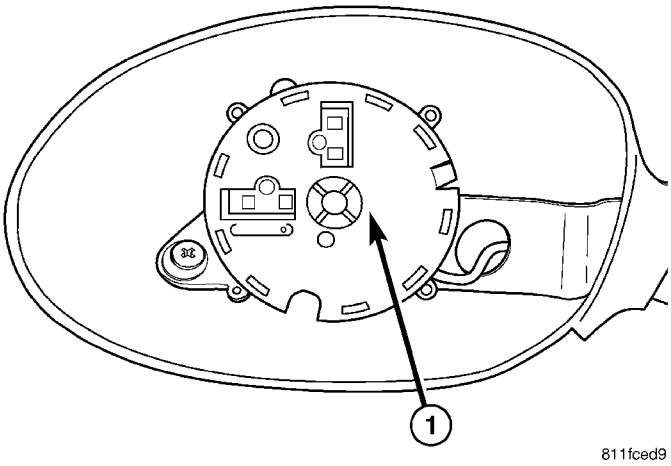

Fig. 21 CENTER POWER PIVOT

1 - CENTER PIVOT

(2) Place new mirror glass into position on mirror assembly. Verify glass is centered on the power pack base and in the correct position.

(3) Firmly press on the center of mirror glass until a “pop” is heard and glass is fully seated (Fig. 22).

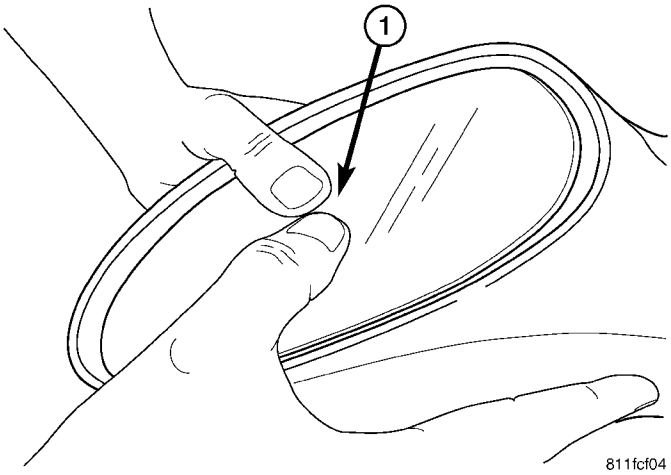

Fig. 22 INSTALL MIRROR GLASS

1 - PRESS ON CENTER OF GLASS TO SEAT MIRROR GLASS

(4) Verify retention of the mirror glass by gently pulling outward on the mirror glass.

WINDSHIELD A-PILLAR TRIM MOLDING - PT-27

REMOVAL - PT-27 ONLY

(1) Remove header and A-piller weatherstrip as necessary. (Refer to 23 - BODY/WEATHERSTRIP/SEALS/HEADER/HEADER AND A-PILLAR WEATHERSTRIP - REMOVAL).

(2) Remove screws attaching A-pillar weatherstrip retainer and A-pillar molding to side of windshield surround frame, the bottom screw which is hidden by a piece of foam (Fig. 23), and remove the part by disengaging the clips. (Refer to 23 - BODY/WEATHERSTRIP/SEALS/A-PILLAR WEATHERSTRIP RETAINER - REMOVAL).

(3) Remove A-pillar molding from vehicle.

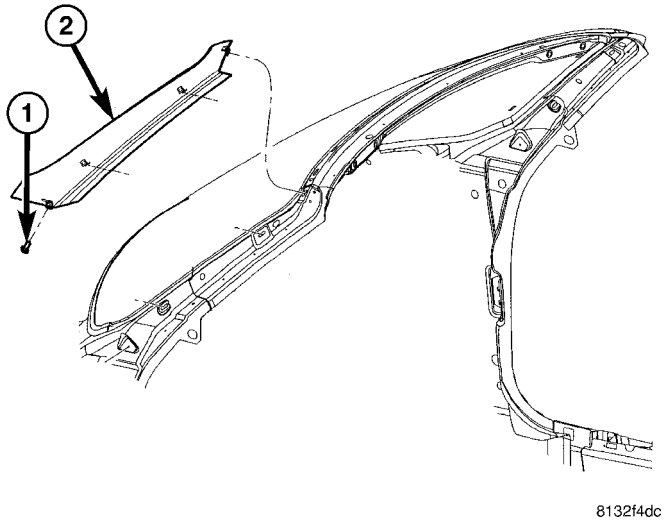

Fig. 23 A-PILLAR MOLDING

1 - ATTACHING SCREW
2 - A-PILLAR MOLDING

INSTALLATION - PT-27 ONLY

NOTE: A new A-pillar molding is used or replace the clips that are damaged.

(1) Place A-pillar weatherstrip retainer and A-pillar molding into position (Fig. 23).

(2) Engage clips attaching A-pillar weatherstrip retainer and A-pillar molding to windshield surround frame.

(3) Install screw attaching A-pillar weatherstrip retainer and A-pillar molding (Refer to 23 - BODY/WEATHERSTRIP/SEALS/A-PILLAR WEATHERSTRIP RETAINER - INSTALLATION).

(4) Install header and A-piller weatherstrip. (Refer to 23 - BODY/WEATHERSTRIP/SEALS/HEADER/HEADER AND A-PILLAR WEATHERSTRIP - INSTALLATION).

(5) Raise top.

WOOD GRAIN/FLAME DECALS

REMOVAL

(1) Using a grease pencil or equivalent, mark the location of the decals to aid installation.

(2) Using a heat gun, gently apply heat in a circular motion to loosen the adhesive bond.

(3) Using your fingernail, plastic or wood trim stick, lift up and peel away the decal from the body panel applying heat as you go (Fig. 24) or (Fig. 25).

(4) Clean off all traces of adhesive from the panel(s) with a general purpose adhesive remover.

INSTALLATION

Surface Preparation

(1) Clean vehicle surfaces, removing any grease/oil marks using a 50 percent mixture of a isopropyl alcohol and water or 3M® High Performance Cloth.

(2) Dry surface using a lint free cloth.

WOOD GRAIN/FLAME DECALS (Continued)

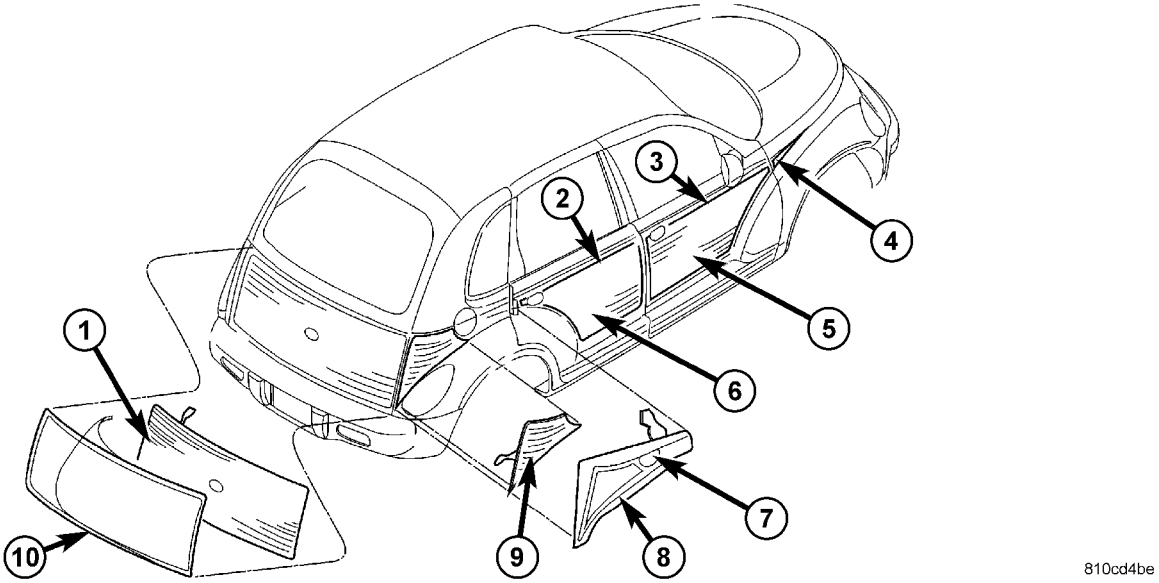

Fig. 24 WOOD GRAIN OVERLAYS AND MOLDINGS

1 - LIFTGATE OVERLAY
2 - REAR DOOR OVERLAY
3 - FRONT DOOR OVERLAY
4 - FRONT FENDER MOLDING
5 - FRONT DOOR MOLDING
6 - REAR DOOR MOLDING
7 - FUEL FILLER DOOR MOLDING
8 - QUARTER PANEL OVERLAY
9 - QUARTER PANEL MOLDING
10 - LIFTGATE MOLDING

Application

NOTE: Decal and vehicle temperatures should be between 13°C - 32°C (55°F - 90°F).

NOTE: Vehicle surface must be free of wax, grease, oil, etc.

NOTE: Use detergent that is free of any lanolin or lotions.

(1) Peel back liner from the decal by flicking a corner of the decal to separate the backing liner. Pull the liner away at a 180° angle – taking care not to let adhesive side of the decal touch clothing or fold back on itself.

NOTE: For wood grain decals, do not allow the back of the liner to get wet before peeling back film. Pieces of wet liner paper will stick to the adhesive.

NOTE: Decals that have locating tabs: At times the paper liner will remain on these tabs when removing the liner from the decals. This liner piece can be left on the tabs, as it will not affect the locating ability of the tab and the tab will eventually be removed.

(2) Using a detergent water solution made of 2-3 drops of detergent per liter (quart) of water, spray decal application area and decal liberally.

(3) Apply the decal using the reference marks made previously (Fig. 24) or (Fig. 25).

(4) Using a squeegee, start at the center of the decal and squeegee out the wrinkles and liquid, fanning out to the edges so as not to trap liquid and air. Use one hand to squeegee and the other to keep the decal from sliding on initial squeegee stroke. If the decal has locating tabs, remove and discard the tabs after the decal has been secured sufficiently.

(5) Wipe the surface with a cloth to remove the any excess water. This may be helpful during the squeegee process to visually inspect for bubbles and wrinkles.

(6) Inspect the decal in good lighting conditions from all angles for bubbles. Use the squeegee to push bubbles to edges of the decal, forcing out air or water. If bubbles do not move, the adhesive has already been wetted out. A pin or equivalent tool may be used as an air release tool to pop the bubble and release the air and or wetting solution. Gently use a squeegee over the area to release the water after using the air release tool.

WOOD GRAIN/FLAME DECALS (Continued)

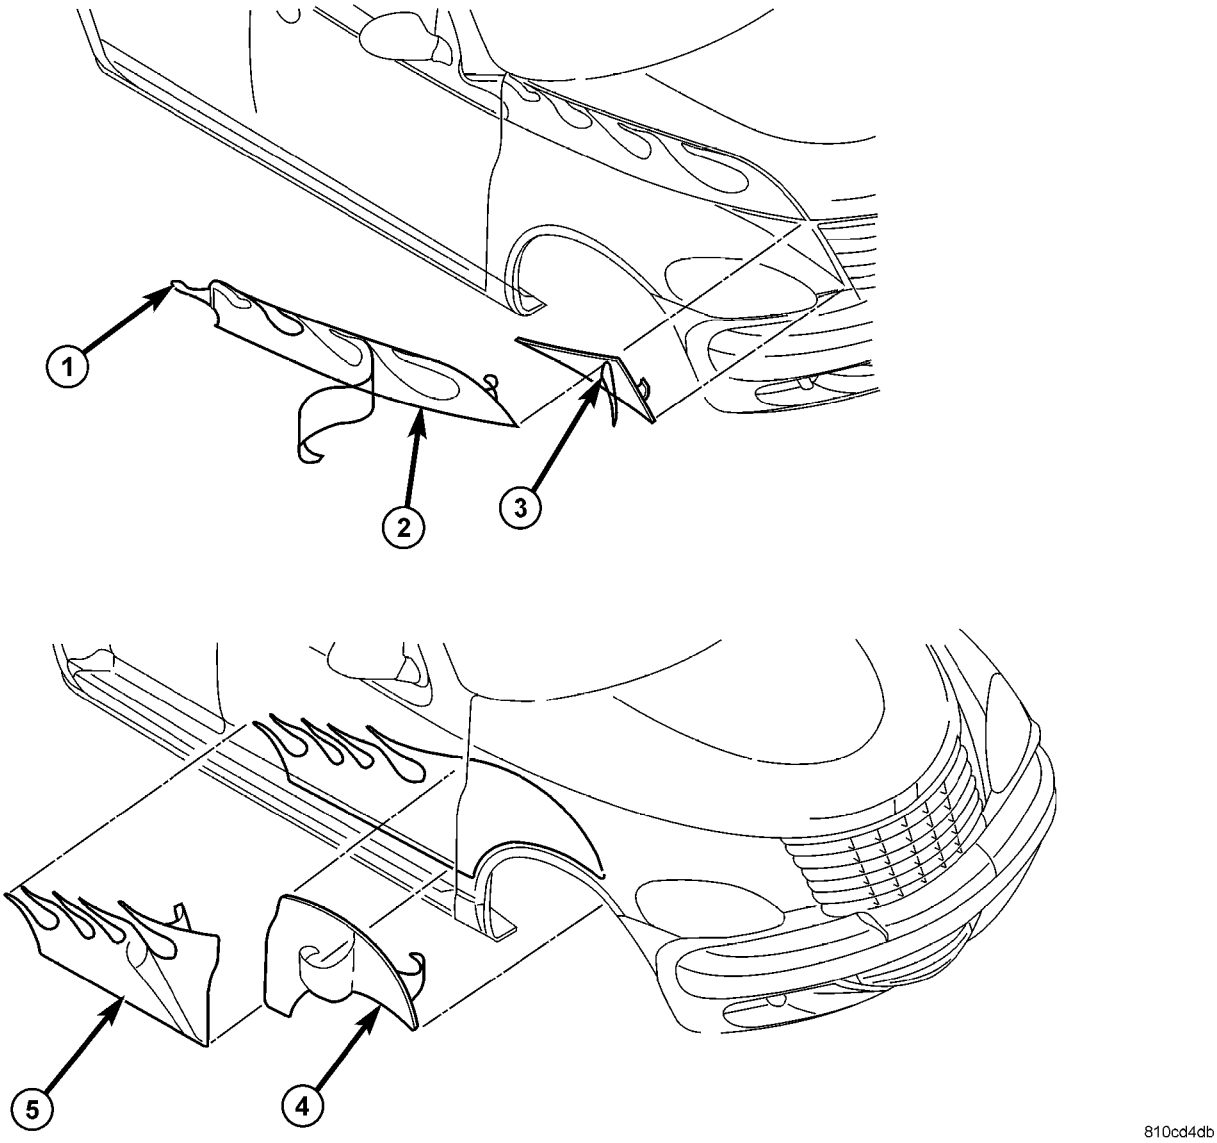

Fig. 25 FLAME DECALS

1 - FRONT FENDER DECAL
2 - HOOD DECAL
3 - A-PILLAR DECAL
4 - REAR FENDER DECAL
5 - FRONT DOOR DECAL

(7) **WOOD GRAIN LIFTGATE DECAL ONLY:** apply moderate heat to film overlapping the recess area of the opening for the liftgate handle. Use a cloth wrapped squeegee or fingers to mold the film into the recess and seal the film. It is important to remove trapped air and/or water around this area before applying heat, as the heat will seal off the handle opening and preclude air and water from escaping in that direction.

GRILLE - LOWER RADIATOR

REMOVAL

(1) Remove front fascia (Fig. 26). (Refer to 13 - FRAME & BUMPERS/BUMPERS/FRONT FASCIA - REMOVAL).

(2) Remove the upper push pin fastener from the fascia.

(3) Remove the spring nuts (6) attaching grille to fascia.

Remove lower grille from fascia.

(4) Remove the chrome strips, if necessary. Using a small flat blade tool to release chrome strips tabs.

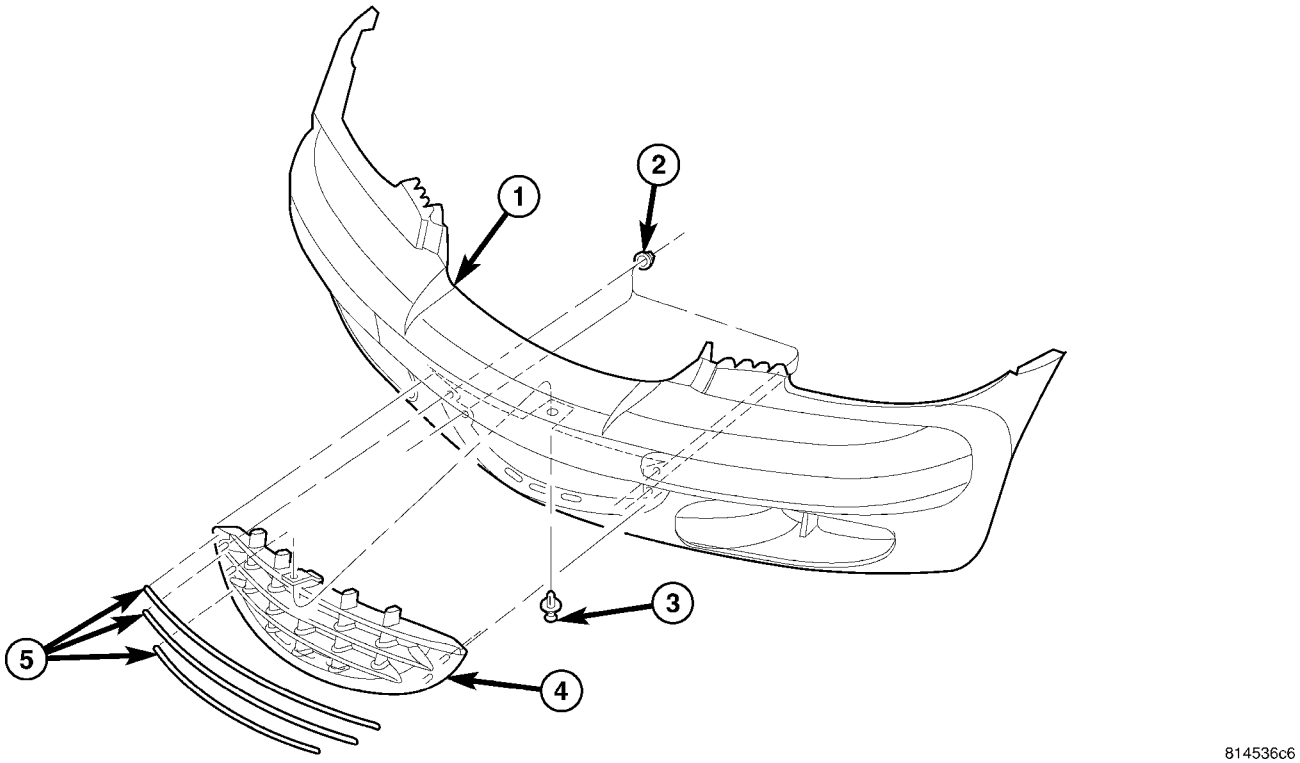

Fig. 26 FRONT FASCIA - LOWER GRILLE CHROME A

1 - FRONT FASCIA
2 - SPRING NUTS (6)
3 - PUSH PIN FASTENER
4 - LOWER RADIATOR GRILLE
5 - CHROME STRIPS

GRILLE - LOWER RADIATOR (Continued)

INSTALLATION

(1) Install the chrome strips to grille, if necessary (Fig. 27). Place chrome strip into position, and press on chrome strip until it is locked into position.

(2) Place fascia on a work bench.

(3) Place lower grille into position on fascia. Install the spring nuts (6) attaching grille to fascia.

(4) Install the upper push pin fastener to fascia.

(5) Install front fascia. (Refer to 13 - FRAME & BUMPERS/BUMPERS/FRONT FASCIA - INSTALLATION).

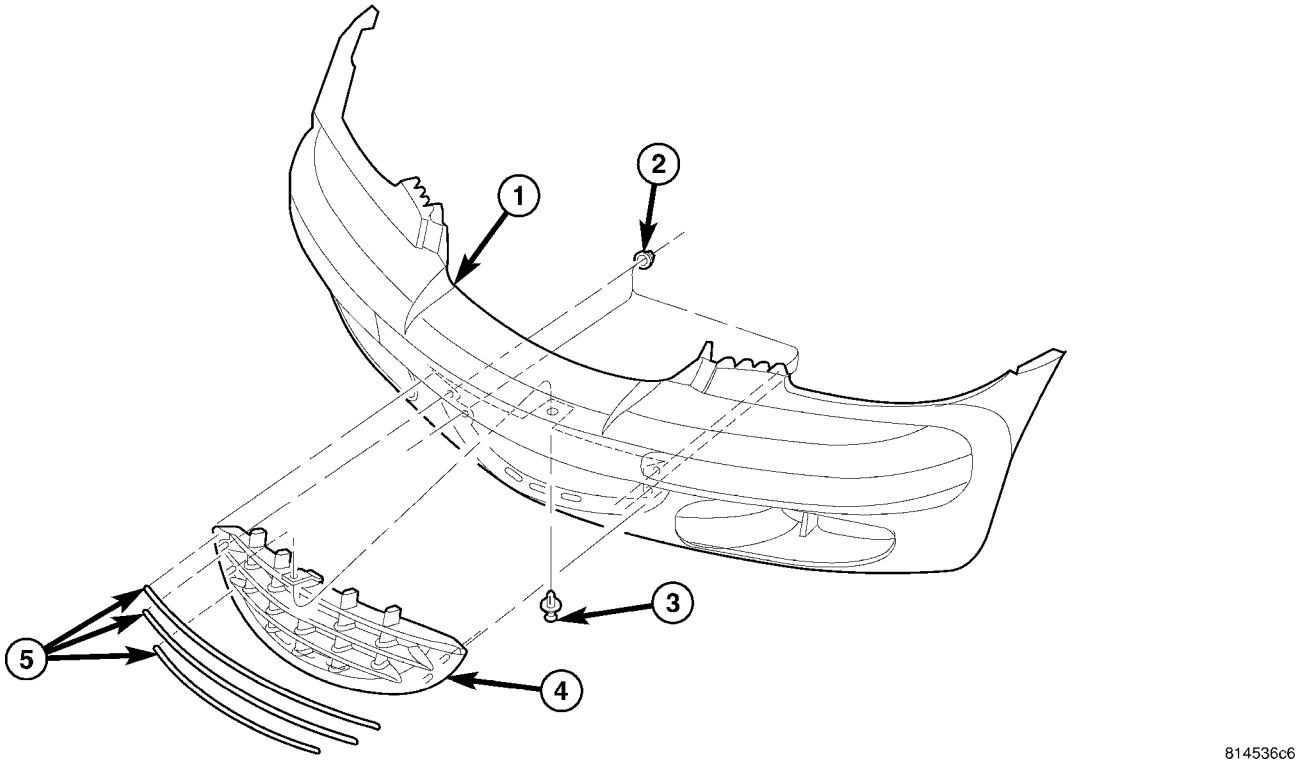

Fig. 27 FRONT FASCIA - LOWER GRILLE CHROME A

1 - FRONT FASCIA

HOOD HINGE

REMOVAL

(1) Support hood on the side that requires hinge replacement.

(2) Mark all bolt and hinge attachment locations with a grease pencil or other suitable device to provide reference marks for installation.

(3) Remove bolts holding hood to hinge (Fig. 1).

(4) Remove bolts holding hood hinge to load beam flange and remove hinge from vehicle. If necessary, paint new hinge before installation.

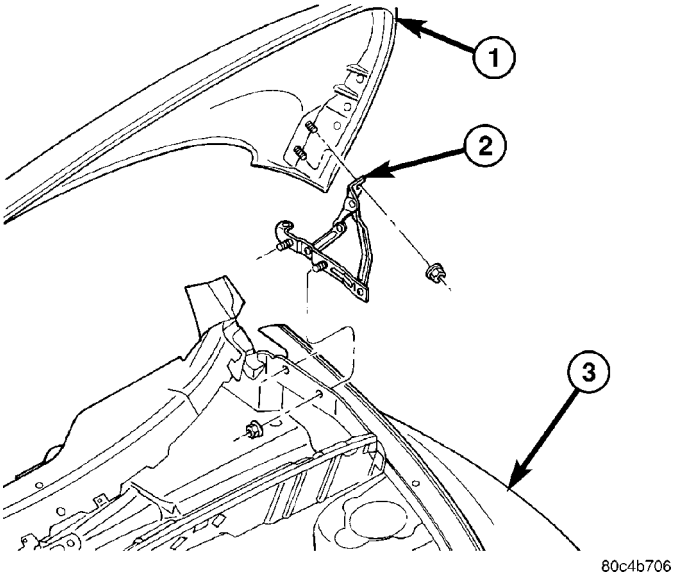

Fig. 1 HOOD HINGE

1 - HOOD
2 - HOOD HINGE
3 - FRONT FENDER

INSTALLATION

(1) If necessary, paint new hinge before installation.

(2) Place hinge in position on vehicle (Fig. 1).

(3) Install bolts to hold hood hinge to front fender flange.

(4) Install bolts to hold hood to hinge.

(5) Align all marks and secure bolts. The hood should be aligned to 4 mm (0.160 in.) gap to the front fenders and flush across the top surfaces along fenders. Shims can be added or removed under hood hinge to achieve proper hood height.

(6) Remove support from under hood and verify hood operation.

HOOD

REMOVAL

(1) Raise hood to full up position (Fig. 2).

(2) Mark all bolt and hinge attachment locations with a grease pencil or other suitable device to provide reference marks for installation.

(3) Remove the top bolts attaching hood to hinge and loosen the bottom bolts until they can be removed by hand.

(4) With assistance from a helper at the opposite side of the vehicle to support the hood, remove bottom bolts attaching hood to hinge.

(5) Remove the hood from the vehicle.

INSTALLATION

(1) Place hood in position on vehicle. With assistance from a helper at the opposite side of the vehicle to support the hood, install bottom bolts to hold hood to hinge finger tight (Fig. 2).

(2) Install top bolts attaching hood to hinge finger tight.

HOOD (Continued)

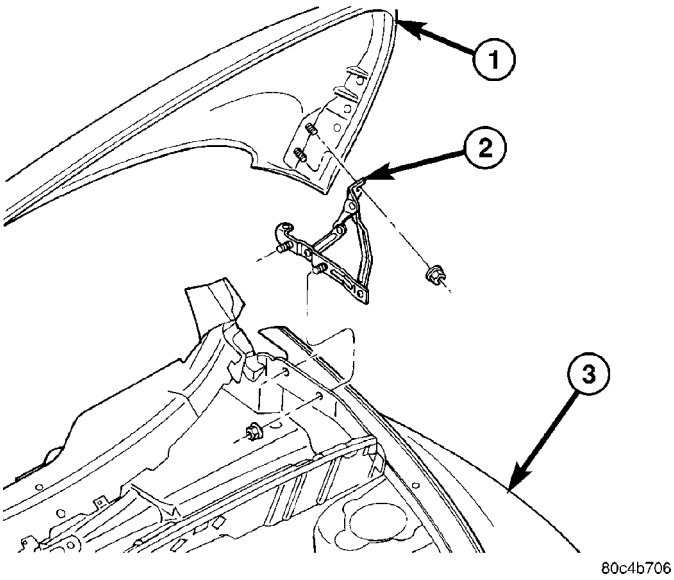

Fig. 2 HOOD

1 - HOOD
2 - HOOD HINGE
3 - FRONT FENDER

(3) When installing hood, align all marks and secure bolts. The hood should be aligned to 4 mm (0.160 in.) gap to the front fenders and flush across the top surfaces along fenders.

(4) Verify hood operation and alignment.

HOOD LATCH

REMOVAL

(1) Release hood latch and open hood.

(2) Support hood on prop rod.

(3) Remove grille.

(4) Remove screws attaching hood latch to radiator closure panel (Fig. 3).

(5) Remove hood latch from closure panel.

(6) Disengage remote release cable from latch (Fig. 4).

INSTALLATION

(1) Engage remote release cable into latch (Fig. 4).

(2) Place hood latch onto radiator closure panel (Fig. 3).

(3) Install bolts attaching latch to closure panel.

(4) Install grille.

(5) Close hood and verify alignment of hood and that latch is securely engaged.

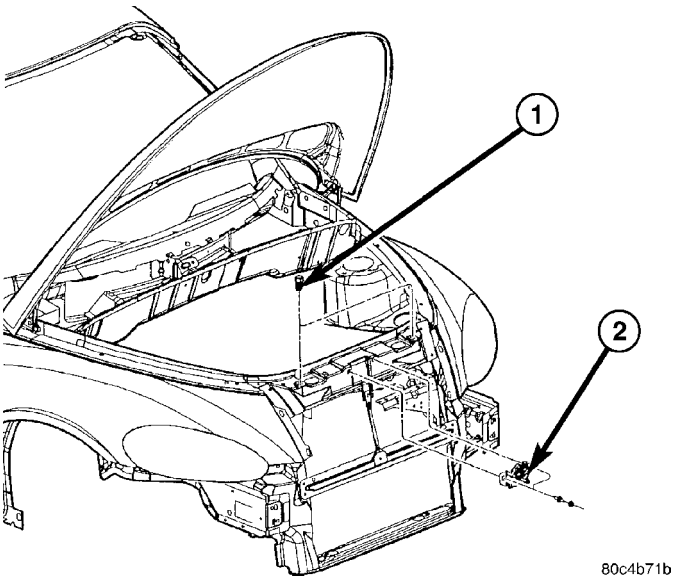

Fig. 3 HOOD LATCH

1 - HOOD ADJUSTER BUMPER
2 - HOOD LATCH

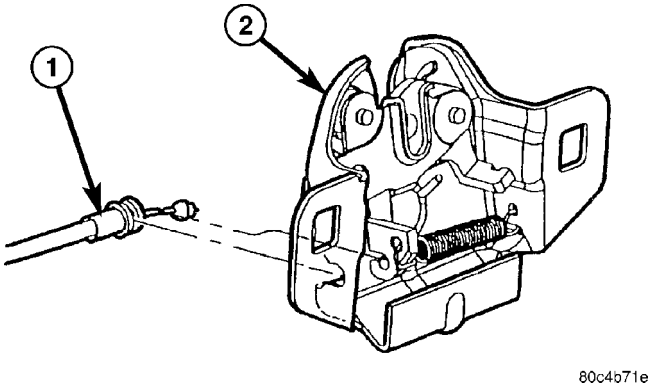

Fig. 4 HOOD LATCH RELEASE CABLE

1 - HOOD LATCH RELEASE CABLE
2 - HOOD LATCH

HOOD LATCH RELEASE CABLE

REMOVAL

(1) Remove hood latch.
(2) Disconnect remote hood release cable from hood latch (Fig. 4).
(3) Remove left front cowl trim panel.
(4) Remove screws attaching hood release handle to cowl panel.
(5) Disconnect rubber grommet from dash panel behind instrument panel.
(6) Pull release cable through hole in dash panel.
(7) Remove cable and handle from vehicle.

INSTALLATION

(1) Assemble cable and handle onto vehicle.
(2) Push release cable through hole in dash panel.
(3) Connect rubber grommet into dash panel.
(4) Install screws attaching hood release handle to cowl panel.
(5) Install left front cowl trim panel.
(6) Connect remote hood release cable to hood latch (Fig. 4).
(7) Install hood latch.
(8) Close hood and verify operation.

HOOD LATCH STRIKER

REMOVAL

(1) Release hood latch and open hood.
(2) Remove bolts attaching striker to inside of hood (Fig. 5).
(3) Remove hood latch striker from vehicle.

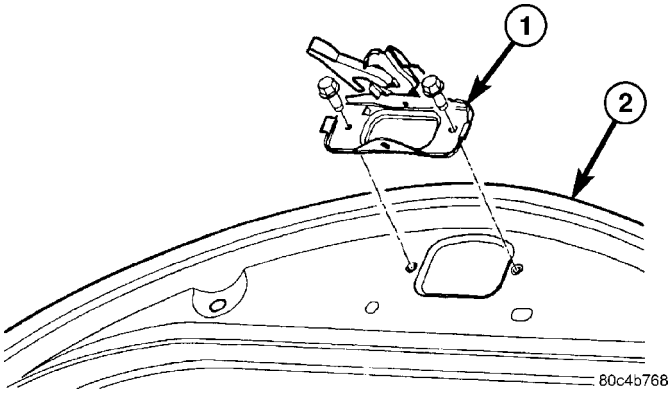

Fig. 5 HOOD STRIKER

1 - HOOD STRIKER
2 - HOOD

INSTALLATION

(1) Position hood latch striker on vehicle (Fig. 5).
(2) Install bolts attaching hood latch striker to hood.
(3) Align hood latch striker to engage smoothly into hood latch.
(4) Verify hood operation and alignment. Adjust as necessary.
(5) Tighten attaching bolts to 13.5 N·m (10 ft. lbs.) torque.

SILENCER PAD

REMOVAL

(1) Open hood.
(2) Remove fasteners attaching hood silencer to hood (Fig. 6).
(3) Remove hood silencer from vehicle.

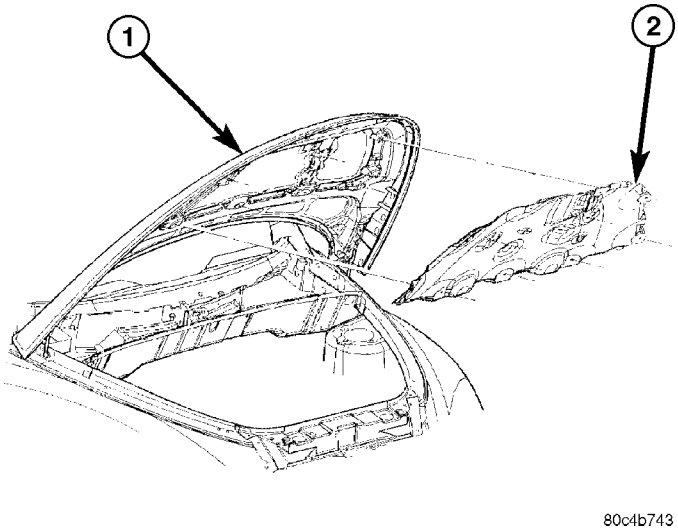

Fig. 6 HOOD SILENCER

1 - HOOD
2 - HOOD INNER PANEL SILENCER

INSTALLATION

(1) Place hood silencer in position on hood (Fig. 6).
(2) Install fastener attaching hood silencer to hood.
(3) Close hood.

ACCESSORY SWITCH BEZEL

REMOVAL

NOTE: The accessory switches are serviced separately, but the cigar lighter/power outlet is not (Fig. 1).

(1) Open hood.

(2) Disconnect and isolate the battery negative cable (Fig. 2).

(3) Remove the instrument panel center bezel. Refer to Removal and Installation, Instrument Panel Center Bezel in this section.

(4) Remove two screws retaining the accessory switch bezel (Fig. 3).

(5) Disconnect the harness connectors to the following (Fig. 4):

- Rear Window Defogger Switch (if equipped)
- Traction Control Switch (if equipped)
- Cigar Lighter/Power Outlet
- Rear Windshield Washer/Wiper Switch

(6) To remove switches from bezel, use both thumbs and slightly pull out on the two walls that are holding the switches (Fig. 5).

INSTALLATION

NOTE: The accessory switches are serviced separately, but the cigar lighter/power outlet is not.

If replacing the accessory switch bezel, you must transfer the switches to the new bezel.

(1) Reconnect accessory switch bezel connectors (Fig. 4).

(2) Reinstall switch bezel into instrument panel opening and install two retaining screws (Fig. 3).

(3) Reinstall instrument panel center bezel. Refer to Removal and Installation, Instrument Panel Center Bezel in this section.

(4) Reconnect the battery negative cable (Fig. 2).

(5) Close the hood.

(6) Verify vehicle and system operation.

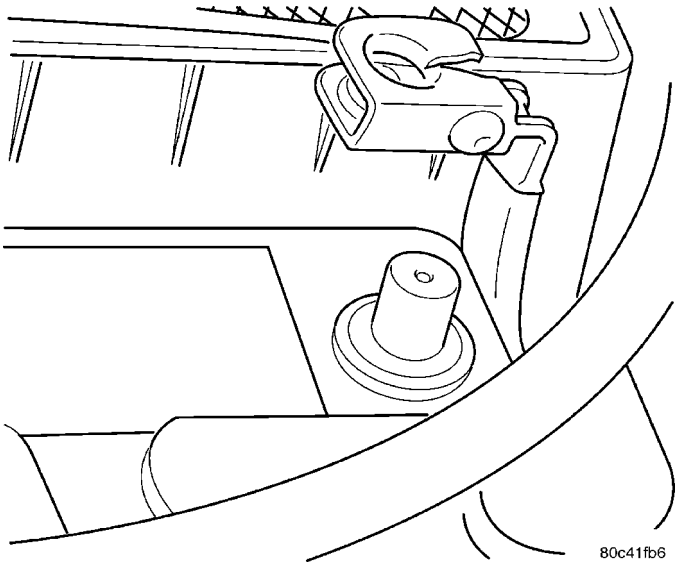

Fig. 2 DISCONNECT AND ISOLATE BATTERY NEGATIVE CABLE

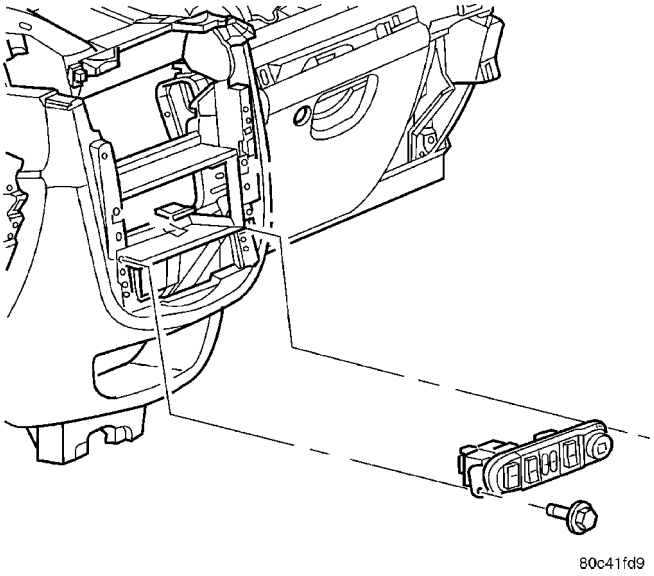

Fig. 3 ACCESSORY SWITCH BEZEL

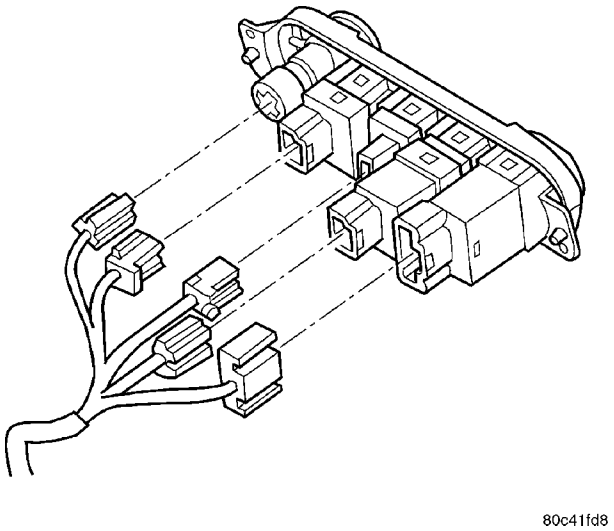

Fig. 4 ACCESSORY SWITCH BEZEL CONNECTORS

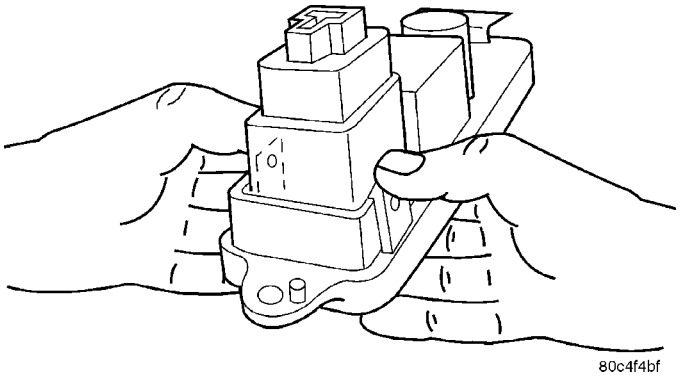

Fig. 5 ACCESSORY SWITCH BEZEL SWITCH

CLUSTER BEZEL

REMOVAL

(1) Open hood.

(2) Disconnect and isolate the battery negative cable (Fig. 2).

(3) Remove the instrument panel top cover. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - REMOVAL)

(4) Remove the steering column cover. (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - REMOVAL)

(5) Remove the left instrument panel end cap. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL END CAP - REMOVAL)

(6) Grab the sides of the instrument cluster bezel and gently give a quick pull to unsnap the cluster bezel (Fig. 6).

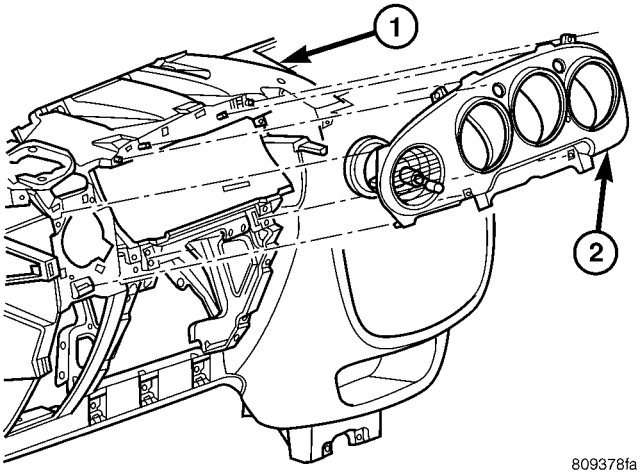

Fig. 6 INSTRUMENT CLUSTER BEZEL

1 - INSTRUMENT PANEL
2 - CLUSTER BEZEL

(7) Disconnect the turn signal lamps from the instrument cluster bezel (Fig. 7).

(8) Remove bezel from vehicle.

If replacing the instrument cluster bezel, the A/C outlet housing assembly must be transferred to the new bezel. Refer to Removal and Installation, A/C Outlet Housing Assembly in this section.

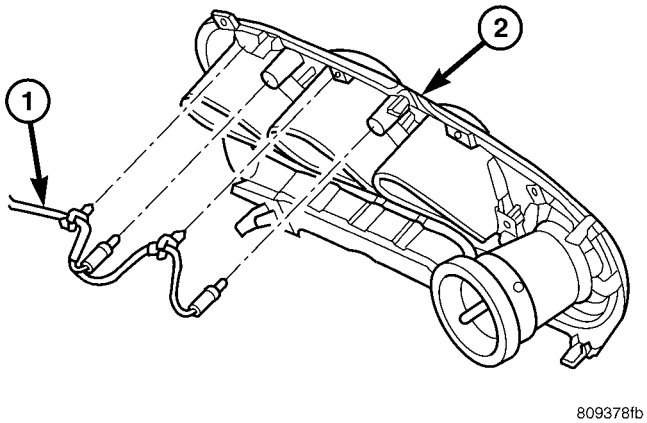

Fig. 7 TURN SIGNAL INDICATOR LAMPS

1 -CLUSTER BEZEL
2 - TURN SIGNAL LAMPS AND WIRE HARNESS

INSTALLATION

(1) Insert turn signal lamps into the instrument cluster bezel (Fig. 7).

(2) Position instrument cluster bezel in position making sure all fasteners are lined up with their respective slots.

(3) Gently, but forcefully, snap the instrument cluster bezel into place (Fig. 6).

(4) Install the left instrument panel end cap. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL END CAP - INSTALLATION)

(5) Install the steering column cover. (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - INSTALLATION)

(6) Install the instrument panel top cover. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - INSTALLATION)

(7) Connect the battery negative cable (Fig. 2).

(8) Close the hood.

(9) Verify vehicle and system operation.

GLOVE BOX

REMOVAL

(1) Open front passenger door.

(2) Open glove box door, push in on box/bin sides to release the glove box (Fig. 8).

(3) Allow the glove box to drop down. With a firm quick motion, twist the glove box assembly off the hinge pins.

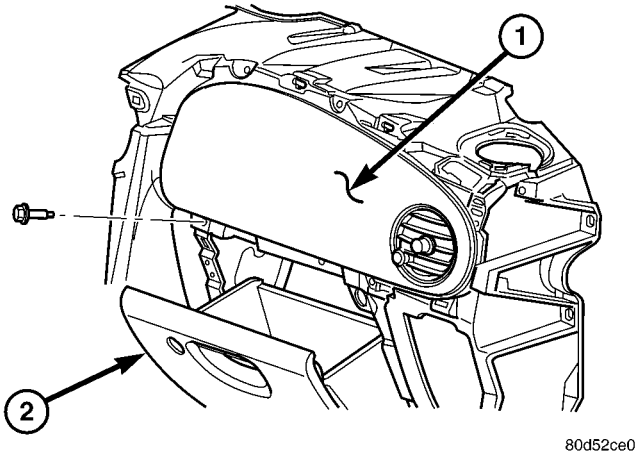

Fig. 8 GLOVE BOX

1 - INSTRUMENT PANEL PASSENGER AIRBAG COVER
2 - GLOVE BOX

INSTALLATION

(1) Place glove box assembly in position and make sure the orientation of the hinge is correct and rotate glove box assembly hinge into place (Fig. 9).

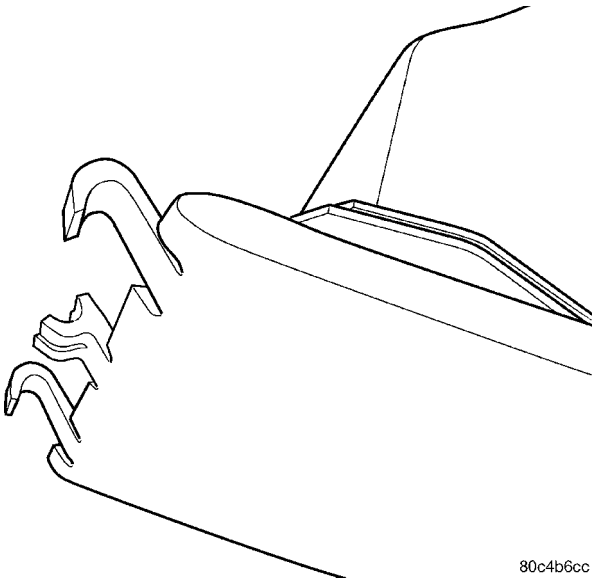

Fig. 9 GLOVE BOX ASSEMBLY HINGE

(2) Lift glove box assembly up, push in on the box/bin sides to allow the glove box to pass by the instrument panel (Fig. 8).

(3) Close glove box.

(4) Shut passenger door.

GLOVE BOX LATCH

REMOVAL

(1) Open front passenger door.

(2) Remove glove box assembly. Refer to Removal and Installation, Glove Box Assembly in this section.

(3) With glove box assembly on bench, remove eleven glove box assembly screws (Fig. 10).

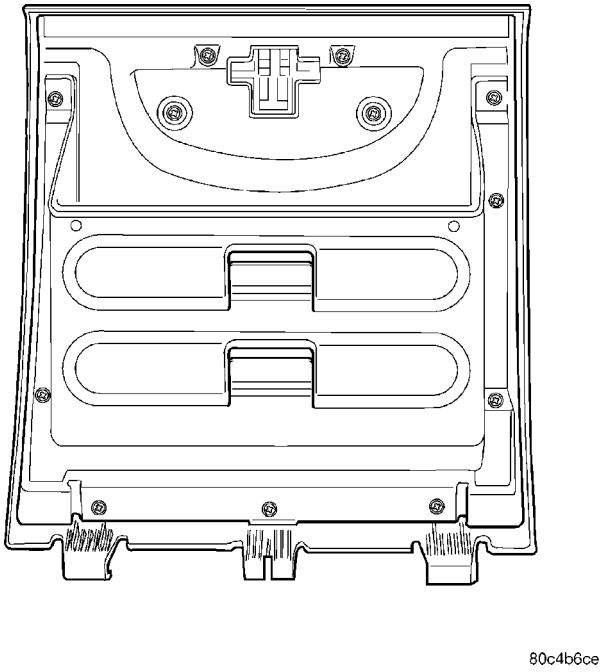

Fig. 10 GLOVE BOX ASSEMBLY SCREWS

INSTALLATION

(1) Reassemble glove box assembly (Fig. 10) and (Fig. 11).

(2) Install glove box assembly. Refer to Removal and Installation, Glove Box Assembly in this section.

(3) Close passenger door.

GLOVE BOX LATCH (Continued)

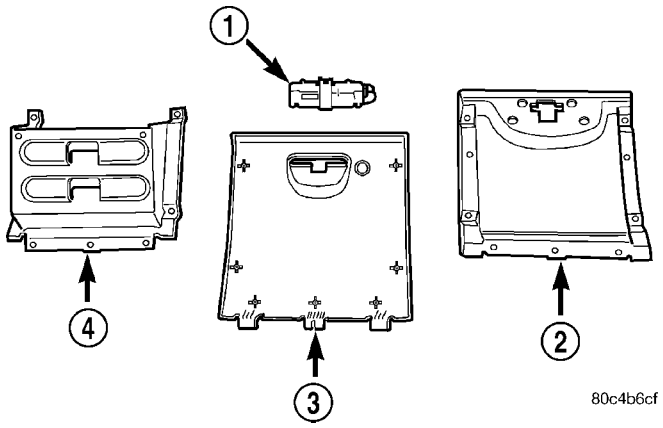

Fig. 11 GLOVE BOX ASSEMBLY BREAKDOWN

1 - LATCH
2 - INNER DOOR
3 - OUTER DOOR
4 - BOX

GLOVE BOX LOCK CYLINDER

REMOVAL

(1) Open passenger door.

(2) Remove and disassemble glove box assembly. Refer to Removal and Installation, Glove Box Door/Bin/Latch in this section.

(3) Insert key into glove box lock cylinder. Using a small pocket screwdriver or equivalent, push in on retaining tab as you turn the lock cylinder 90° and pull out lock cylinder (Fig. 12) and (Fig. 13).

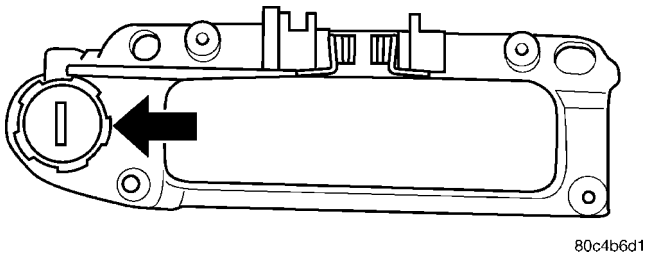

Fig. 12 GLOVE BOX LOCK CYLINDER RELEASE TAB LOCATION

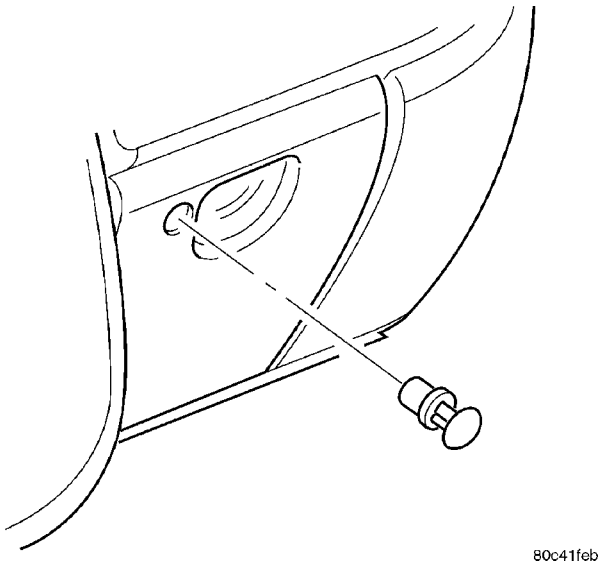

Fig. 13 GLOVE BOX LOCK CYLINDER

INSTALLATION

(1) Insert key into lock cylinder.

(2) Push lock cylinder into latch and turn to straight up and down position.

(3) Remove key.

(4) Reassemble glove box assembly and reinstall into vehicle. Refer to Removal and Installation, Glove Box Door/Bin/Latch in this section.

INSTRUMENT PANEL ASSEMBLY

REMOVAL

(1) Open hood.

(2) Disconnect and isolate the battery negative cable (Fig. 14).

(3) Remove the instrument panel top cover (Fig. 15).

(a) Using a trim stick (special tool #C-4755) or equivalent, gently pry off the left and right A-pillar trim.

(b) Using a trim stick or equivalent, gently pry out the front power window switch from the instrument panel center bezel. Disconnect the harness connector and remove.

(c) Remove the one center bezel retaining screw.

(d) Pull off the HVAC control knobs.

(e) Using a trim stick or equivalent, gently pry off the center bezel and remove.

(f) Remove the two top cover retaining screws.

(g) Gently pull rearward on the top cover and unlatch it from the instrument panel and remove.

(4) Remove two screws retaining HVAC control.

(5) Pull the HVAC control out of instrument panel, disconnect the one wiring connector, the one vacuum harness connector, and disconnect the two control cables. Remove HVAC control from vehicle.

(6) Remove the two retaining screws to the upper and lower steering column shrouds.

(7) Gently pry the upper and lower shrouds apart and remove from steering column.

(8) Remove the steering column cover. Pull top down, lower to floor and twist steering column cover off instrument panel hinge pins.

(9) Disconnect the steering column wire connectors:

(a) Ignition Switch

(b) Multi-Function Switch

(c) Clockspring

CAUTION: Lock the steering wheel in the straight ahead position. This will prevent clockspring damage when the steering wheel rotates freely.

(10) Remove steering column:

(a) Remove the steering column pinch bolt at the base of the lower coupler.

(b) Remove the four retaining nuts to the steering column.

(c) Pull column rearward and out of instrument panel opening and remove from vehicle.

(11) Remove the two brake pedal support bracket, instrument panel retaining bolts (Fig. 16).

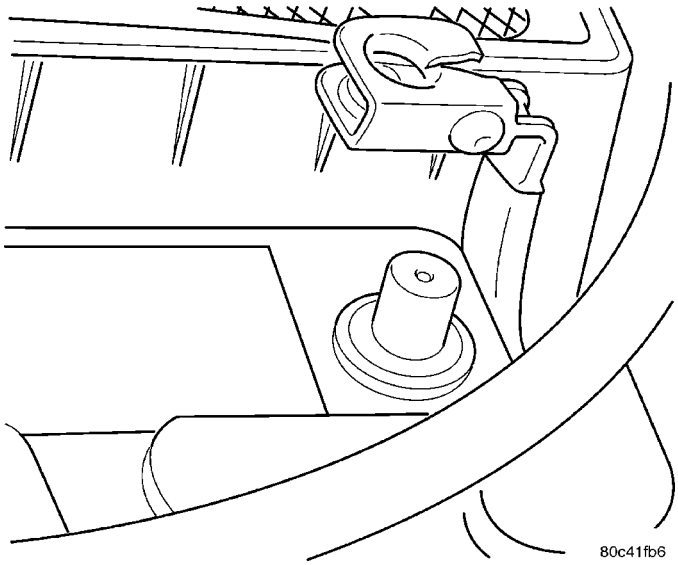

Fig. 14 BATTERY NEGATIVE CABLE REMOVAL/ INSTALLATION

(12) Remove two screws to the left instrument panel end cap.

(13) Pull the left end cap rearward to unsnap and remove it from vehicle.

(14) Disconnect the five left side wiring connectors:

(a) Data Link Connector

(b) Two main instrument panel connectors.

(c) Brake Switch

(d) Left Side Body Harness

(e) Left Door Harness

INSTRUMENT PANEL ASSEMBLY (Continued)

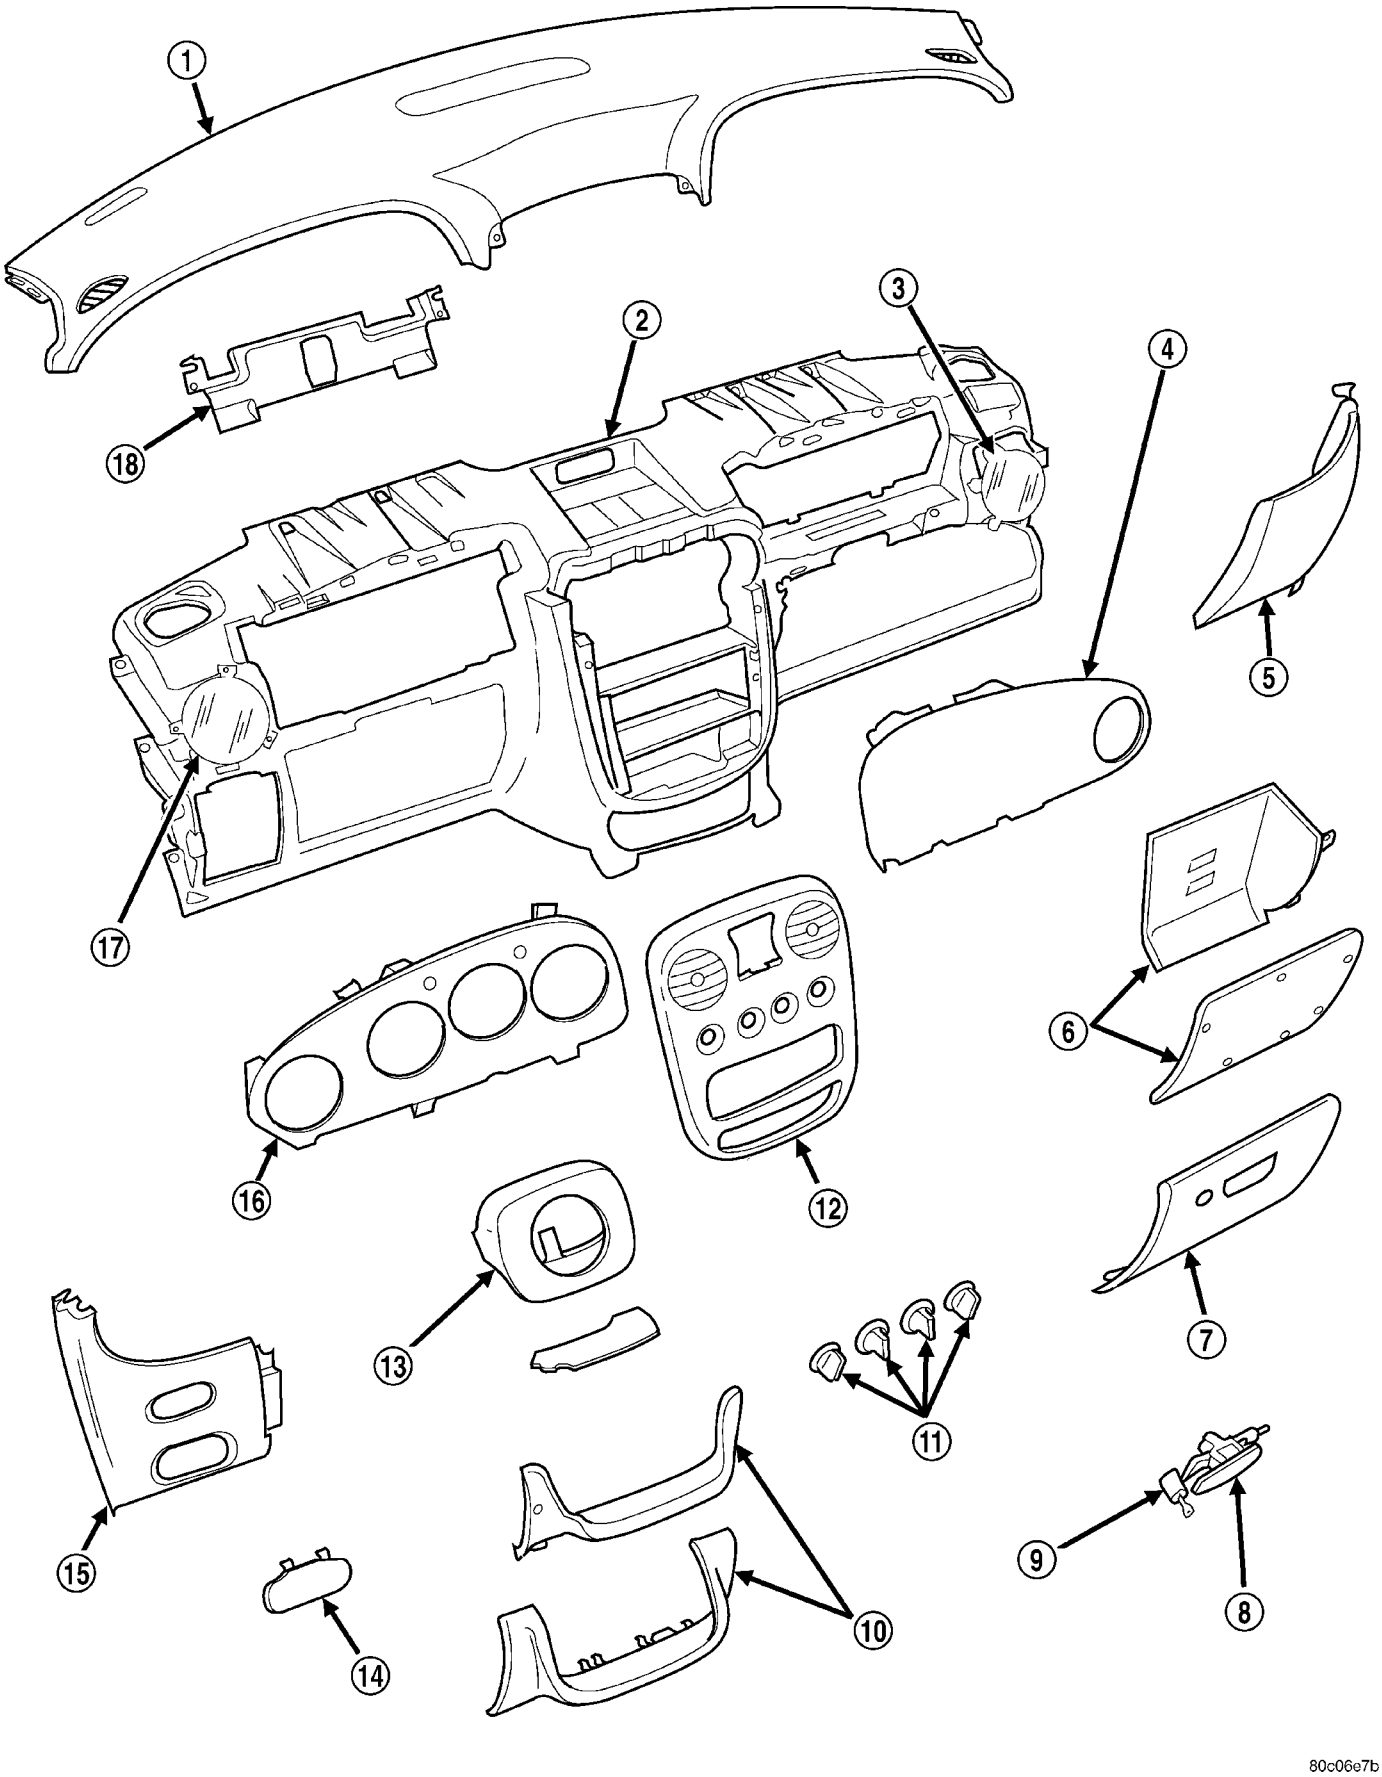

Fig. 15 INSTRUMENT PANEL ASSEMBLY

18 - CLUSTER SUPPORT PANEL

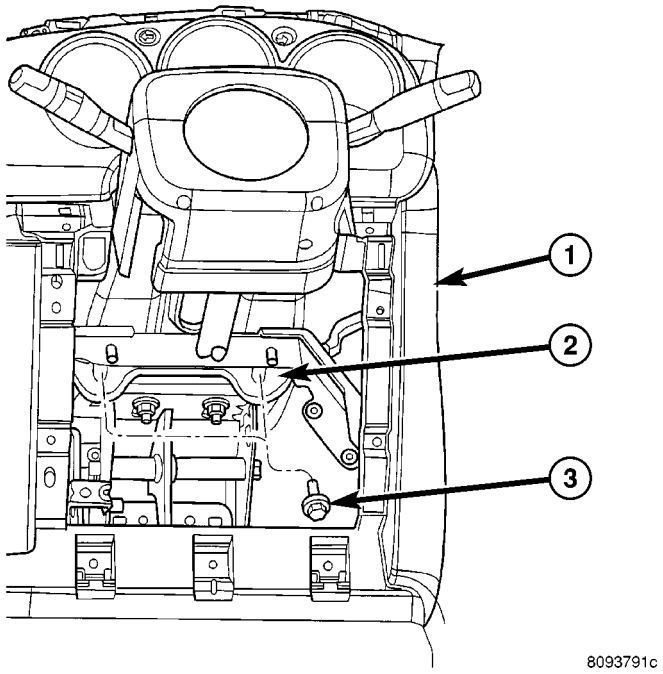

Fig. 16 BRAKE PEDAL SUPPORT BRACKET, INSTRUMENT PANEL RETAINING BOLTS

1 - INSTRUMENT PANEL
2 - FLOOR PAN BRACKET
3 - ATTACHING SCREW(S)

(15) Remove the two left side A-pillar, instrument panel retaining bolts and one nut. (Fig. 17)

(16) Remove two retaining bolts at the left side of the center support bracket (Fig. 18).

(17) Remove four screws to center console.

(18) Using a trim stick or equivalent, gently pry rear power window switch out of console and disconnect wiring and remove.

(19) Pull parking brake handle all the way up.

(20) Lift up the front of the center console to gain access to the power outlet connector.

(21) Disconnect one wire connector to console mounted auxiliary power outlet.

(22) Pull up on rear of console first to clear parking brake handle and remove from vehicle.

(23) If equipped with an automatic, remove the shifter handle and shifter bezel.

(a) **Shifter Handle** - Loosen the set screw retaining the shifter handle and pull up on handle to remove.

(b) **Shifter Bezel** - Pull upward on edge of shifter bezel, disconnect the illumination lamp and remove bezel.

(24) Disconnect and remove the two remaining center console wiring connectors:

(a) Occupant Restraint Controller (ORC) connector

(b) Park Brake Switch connector

(25) Remove two retaining bolts at the right side of the center support bracket (Fig. 18).

NOTE: The center console wiring is routed underneath the rear floor heat duct. Loosen the retainers holding down the heat duct and you can maneuver the wiring from underneath it without removal.

(26) Remove glove box assembly:

(a) Open glove box and push in on the sides of the glove box bin to allow the retainers to clear the instrument panel.

(b) Let the glove box drop down and give it quick pull downward to disengage the hinge.

(27) Remove two screws to the right instrument panel end cap.

(28) Pull end cap rearward to unsnap and remove from vehicle.

INSTRUMENT PANEL ASSEMBLY (Continued)

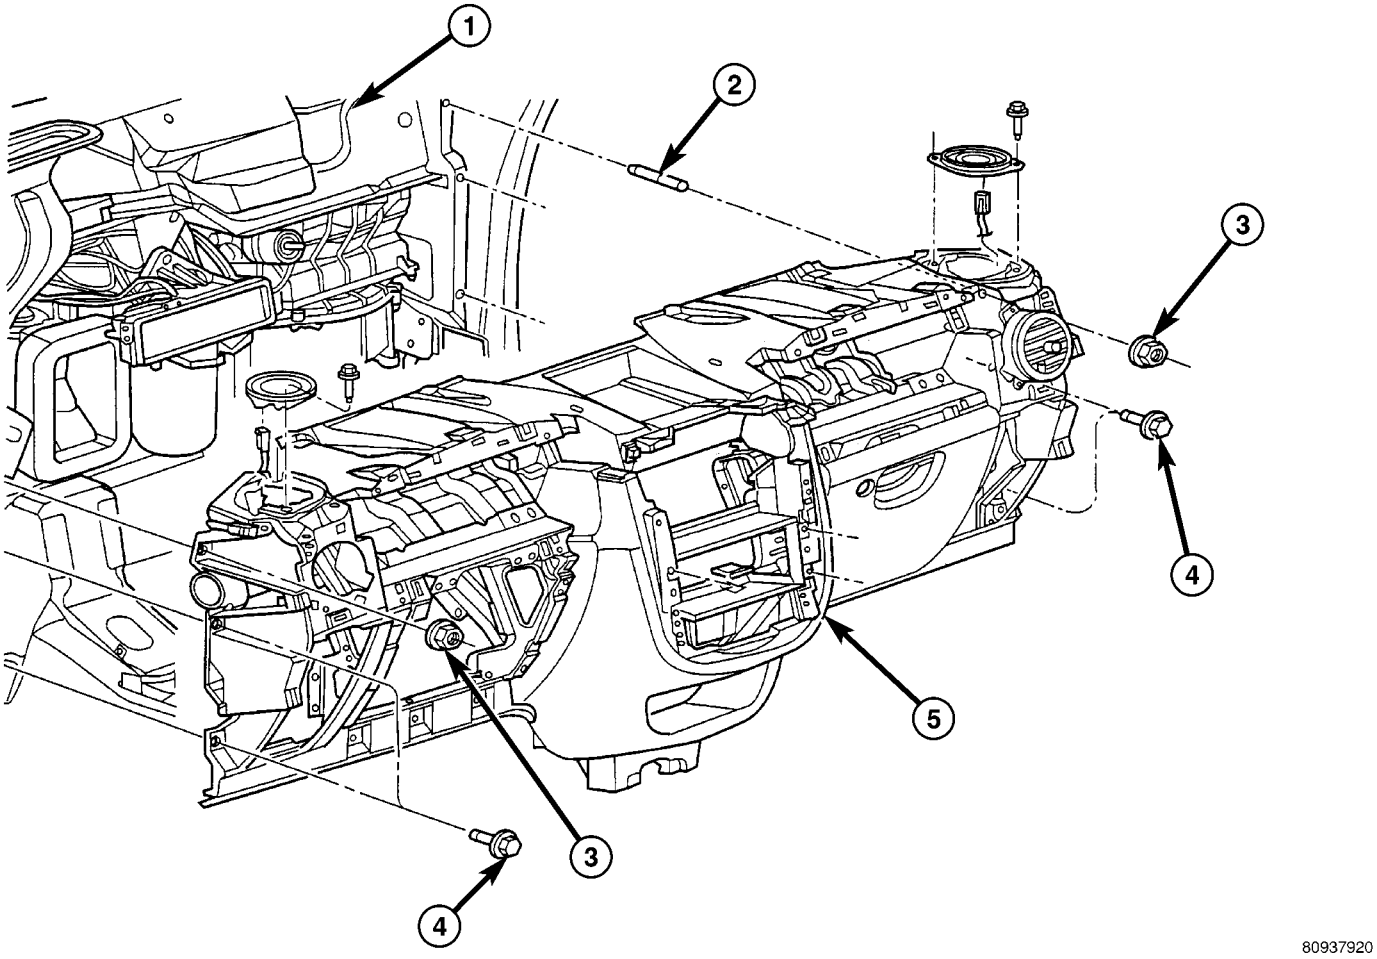

Fig. 17 INSTRUMENT PANEL

1 - WINDSHIELD COWL
2 - INSTRUMENT PANEL TO COWL STUD RT/LT
3 - INSTRUMENT PANEL TO COWL NUT(S)
4 - INSTRUMENT PANEL TO COWL SCREW(S)
5 - INSTRUMENT PANEL

(29) Remove the two right side A-pillar, instrument panel retaining bolts and one nut (Fig. 17).

(30) Disconnect the right side instrument panel wire connectors:

(a) Antenna
(b) Overhead Systems (Fig. 19)
(c) Blower Motor
(d) Left Door Harness
(e) Body Harness

(31) Remove the four fence line instrument panel retaining bolts (Fig. 20).

(32) With the help of an assistant, carefully remove the instrument panel from the vehicle being careful not to damage the instrument panel or vehicle interior.

NOTE: If the instrument panel is being replaced, all the components left on the assembly must be transferred.

This would include:

- Passenger Airbag
- Instrument Cluster and Cluster Bezel
- Cluster Area Support Panel
- Remote Keyless Entry Module (if equipped)
- Radio
- Accessory Switch Bezel
- Left and Right Instrument Panel Speakers
- Instrument Panel Wire Harness
- Right Instrument Panel A/C Outlet Housing Assembly
- All A/C and Heat Duct work and Plumbing

INSTRUMENT PANEL ASSEMBLY (Continued)

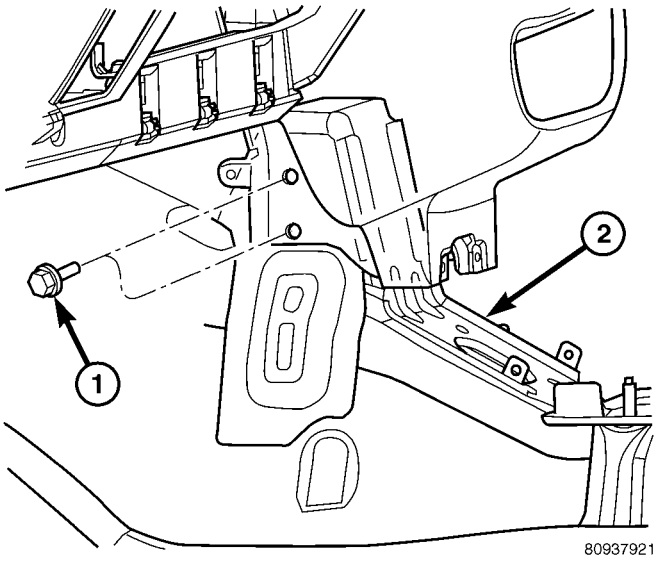

Fig. 18 INSTRUMENT PANEL CENTER SUPPORT RETAINING BOLTS

1 - ATTACHING SCREW(S)
2 - FLOOR PAN BRACKET

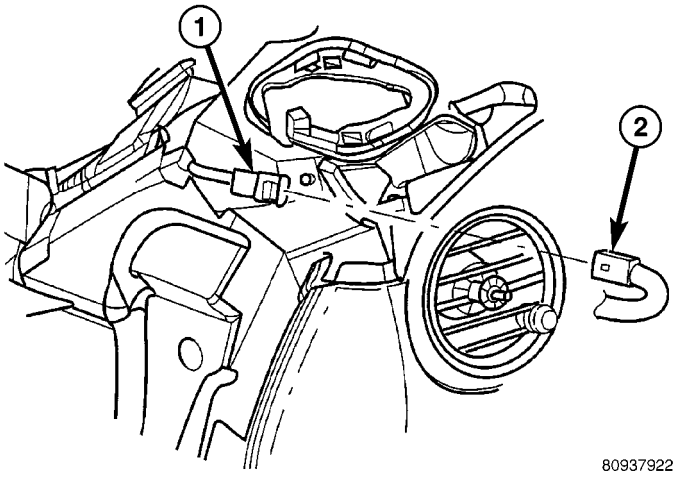

Fig. 19 INSTRUMENT PANEL TO OVERHEAD SYSTEMS JUMPER HARNESS CONNECTOR - TYPICAL LEFT OR RIGHT

1 - INSTRUMENT PANEL
2 - HEADLINER CONNECTOR

INSTALLATION

(1) With the help of an assistant, carefully install the instrument panel in the vehicle being careful not to damage the instrument panel or vehicle interior.

(2) Install the four fence line instrument panel retaining bolts (Fig. 20).

(3) Connect the right side instrument panel wire connectors:

(a) Antenna
(b) Overhead Systems (Fig. 19)
(c) Blower Motor
(d) Left Door Harness
(e) Body Harness

(4) Install the two right side A-pillar, instrument panel retaining bolts and one nut (Fig. 17).

(5) Place the right end cap in position and snap into place.

(6) Install two screws to the right instrument panel end cap.

(7) Install glove box assembly:

(a) Place glove box assembly in position and make the orientation of the hinge is correct and snap glove box assembly hinge into place (Fig. 9).

(b) Lift glove box assembly up, push in on the box/bin sides to allow the glove box to pass by the instrument panel.

(c) Close glove box.

NOTE: The center console wiring is routed underneath the rear floor heat duct. You can maneuver the wiring underneath the rear seat heat duct without removal.

(8) Install two retaining bolts at the right side of the center support bracket (Fig. 18).

(9) Connect the following two center console wiring connectors:

(a) Occupant Restraint Controller (ORC) connector

(b) Park Brake Switch connector

(10) If equipped with an automatic, install the shifter handle and shifter bezel.

(a) **Shifter Bezel** - Connect the illumination lamp, place in position and snap into place.

(b) **Shifter Handle** - Place the shifter handle on the shifter assembly, tighten the set screw retaining the shifter handle.

INSTRUMENT PANEL ASSEMBLY (Continued)

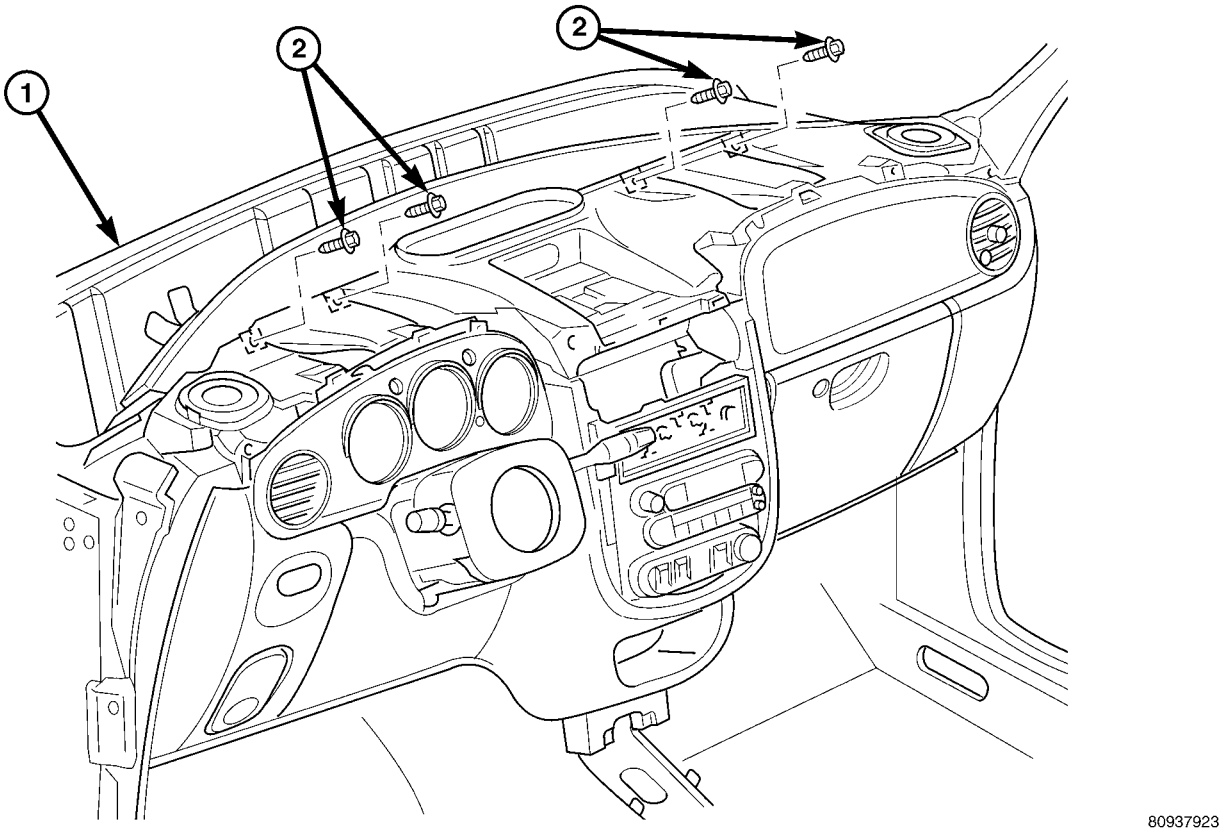

Fig. 20 INSTRUMENT PANEL FENCE LINE RETAINING BOLTS

1 - WINDSHIELD COWL
2 - INSTRUMENT PANEL COWL ATTACHING SCREW(S)

(11) Place front of console into place and then rear over parking brake handle.

(12) Lift up the front of the console and connect one wire connector to console mounted auxiliary power outlet.

(13) Release parking brake handle.

(14) Connect wiring to rear power window switch and snap into rear of center console.

(15) Install four screws to center console.

(16) Install two retaining bolts at the left side of the center support bracket (Fig. 18).

(17) Install the two left side A-pillar, instrument panel retaining bolts and one nut (Fig. 17).

(18) Connect the five left side wiring connectors:

(a) Data Link Connector

(b) Two main instrument panel connectors.

(c) Brake Switch

(d) Left Side Body Harness

(e) Left Door Harness

(19) Place the left end cap in position and snap into place.

(20) Install two screws to the left instrument panel end cap.

(21) Install the two brake pedal support bracket, instrument panel retaining bolts (Fig. 16).

(22) Install steering column:

(a) Place column in instrument panel opening.

(b) Install the four retaining nuts to the steering column.

(c) Install the steering column pinch bolt at the base of the lower coupler.

(23) Connect the steering column wire connectors:

(a) Ignition Switch

(b) Multi-Function Switch

(c) Clockspring

(24) Place steering column cover in position and make sure the orientation of the hinge is correct and snap bezel hinge into place

(25) Rotate steering column cover upward and snap into place.

(26) Place upper and lower steering column shrouds into place and snap together.

(27) Install the two retaining screws to the upper and lower steering column shrouds.

(28) Place HVAC control head into place in instrument panel.

INSTRUMENT PANEL ASSEMBLY (Continued)

(29) Connect the following onto the HVAC control head:
(a) Two control cables
(b) Vacuum harness connector
(c) One wiring connector
(30) Install the two screws retaining the HVAC control head.
(31) Install the instrument panel top cover.
(a) Place the top cover into place. Line up the fasteners with each slot and firmly snap into place.
(b) Install the two top cover retaining screws.
(c) Place the center bezel into position, lining up the fasteners with the slots and snap into place.
(d) Install the HVAC control knobs.
(e) Install the one center bezel retaining screw.
(f) Connect the harness connector to the front power window switch. Align the front power window switch into the instrument panel center bezel opening and snap into place.
(g) Install the left and right A-pillar trim.
(32) Connect the battery negative cable (Fig. 14).
(33) Close hood.
(34) Verify vehicle and system operation.

INSTRUMENT PANEL CENTER BEZEL

REMOVAL

(1) Open hood.
(2) Disconnect and isolate the battery negative cable (Fig. 14).
(3) Using a trim stick (special tool #C-4755) or equivalent, gently pry out the front power window switch from the instrument panel switch bezel (Fig. 21) and disconnect the switch electrical connector.
(4) Remove HVAC control knobs from control head (Fig. 22).
(5) Remove one retaining screw to center bezel inside window switch opening (Fig. 23).
(6) Using a trim stick or equivalent, gently pry the center bezel out of the instrument panel and remove (Fig. 23) from vehicle.

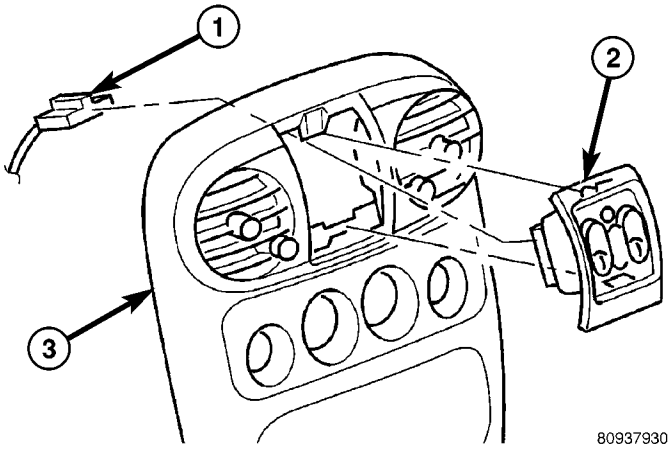

Fig. 21 FRONT POWER WINDOW SWITCH

1 - FRONT POWER WINDOW SWITCH CONNECTOR
2 - FRONT POWER WINDOW SWITCH
3 - INSTRUMENT PANEL BEZEL

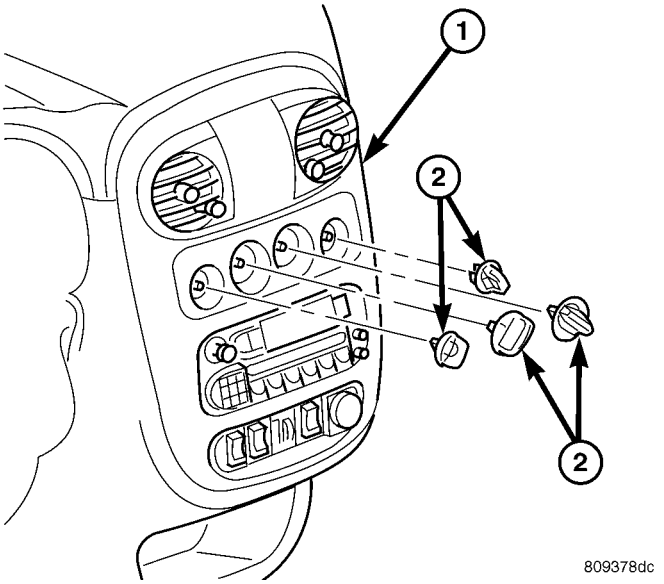

Fig. 22 HVAC CONTROL KNOBS

1 - CENTER BEZEL
2 - HVAC KNOB(S)

INSTRUMENT PANEL CENTER BEZEL (Continued)

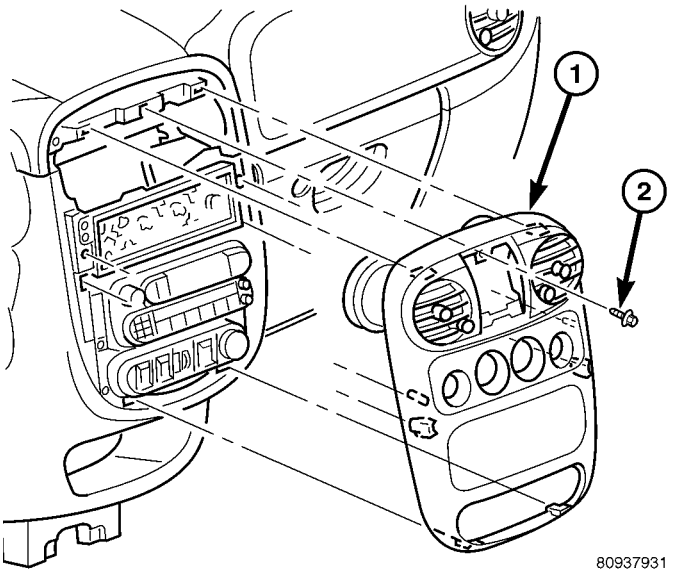

Fig. 23 INSTRUMENT PANEL CENTER BEZEL AND RETAINING SCREW

1 - CENTER BEZEL
2 - ATTACHING SCREW

INSTALLATION

(1) Place center bezel over opening. Align the retaining clips and press firmly into place (Fig. 23).
(2) Install one center bezel retaining screw.
(3) Reconnect the front power window switch connector and reinstall into center bezel opening (Fig. 21).
(4) Install the four HVAC control knobs (Fig. 22).
(5) Reconnect the battery negative cable (Fig. 14).
(6) Close hood.
(7) Verify operation of vehicle and systems.

INSTRUMENT PANEL CENTER BEZEL CONTROL KNOBS

REMOVAL

(1) Open door.
(2) Pull off the HVAC control knobs (Fig. 22).

INSTALLATION

(1) Install the HVAC control knobs (Fig. 22).
(2) Close door.
(3) Verify vehicle and system operation.

INSTRUMENT PANEL END CAP

REMOVAL

LEFT END CAP

(1) Remove the left lower instrument panel bezel. Pull top rearward, lower to floor and with a quick pulling motion remove off instrument panel.
(2) Remove two screws to the left instrument panel end cap.
(3) Pull the left end cap rearward to unsnap (Fig. 24). Maneuver it out from underneath the left A-pillar trim and top cover. Removal of these components is not necessary.

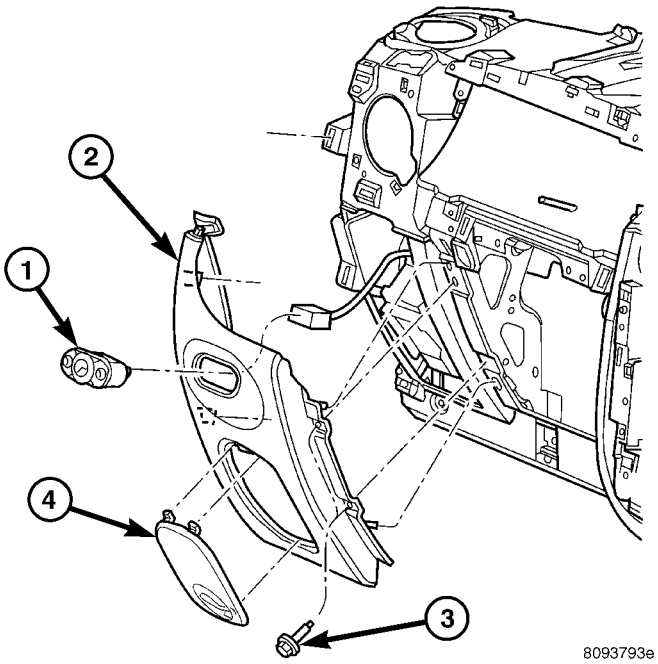

Fig. 24 LEFT INSTRUMENT PANEL END CAP - TYPICAL RT & LT SIDE

1 - POWER MIRROR SWITCH
2 - INSTRUMENT PANEL LEFT END CAP
3 - ATTACHING SCREW(S)
4 - INSTRUMENT PANEL FUSE ACCESS COVER

(4) Disconnect the power mirror switch wiring connector (if equipped) and remove from vehicle.

INSTRUMENT PANEL END CAP (Continued)

RIGHT END CAP

(1) Remove glove box assembly:

(2) Open glove box and push in on the sides of the glove box bin to allow the retainers to clear the instrument panel.

(3) Let the glove box drop down to the floor.

(4) Remove two screws to the right instrument panel end cap.

(5) Pull end cap rearward to unsnap and remove from vehicle. Maneuver it out from underneath the right A-pillar trim and top cover. Removal of these components is not necessary.

INSTALLATION

LEFT END CAP

(1) Connect the power mirror switch wiring connector (if equipped).

(2) Place the left end cap in position and snap into place. Make sure that it is underneath the A-pillar trim and top cover.

(3) Install two screws to the left instrument panel end cap.

(4) Place left lower instrument panel bezel in position and make sure the orientation of the hinge is correct and snap bezel hinge into place

(5) Roll bezel upward and snap into place.

RIGHT END CAP

(1) Place the right end cap in position and snap into place. Make sure that it is underneath the A-pillar trim and top cover.

(2) Install two screws to the right instrument panel end cap.

(3) Lift glove box assembly up, push in on the box/bin sides to allow the glove box retainers to pass by the instrument panel.

(4) Close glove box door.

INSTRUMENT PANEL TOP COVER

REMOVAL

(1) Open hood.

(2) Disconnect and isolate the battery negative cable (Fig. 14).

(3) Using a trim stick (special tool #C-4755) or equivalent, gently pry off the left and right A-pillar trim.

(4) Using a trim stick or equivalent, gently pry out the front power window switch from the instrument panel center bezel. Disconnect the harness connector and remove (Fig. 21).

(5) Remove the one center bezel retaining screw (Fig. 23).

(6) Pull off the HVAC control knobs (Fig. 22).

(7) Using a trim stick or equivalent, gently pry off the center bezel and remove (Fig. 23).

(8) Remove the two top cover attaching screws (Fig. 25).

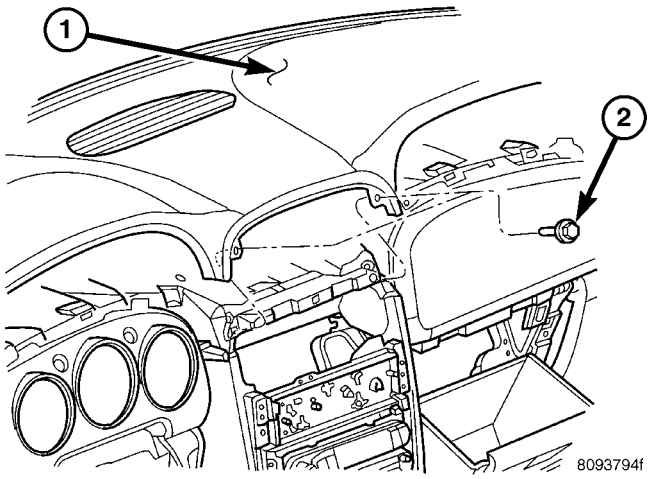

Fig. 25 TOP COVER RETAINING SCREWS

1 - INSTRUMENT PANEL TOP COVER
2 - ATTACHING SCREW(S)

(9) Gently pull rearward on the top cover and unlatch it from the instrument panel and remove (Fig. 26).

INSTALLATION

(1) Place the top cover into place. Line up the fasteners with each slot and firmly, pushing forward, snap into place (Fig. 14).

(2) Install the two top cover attaching screws (Fig. 25).

(3) Place the center bezel into position, lining up the fasteners with the slots and snap into place (Fig. 23).

(4) Install the HVAC control knobs (Fig. 22).

(5) Install the one center bezel retaining screw (Fig. 23).

INSTRUMENT PANEL TOP COVER (Continued)

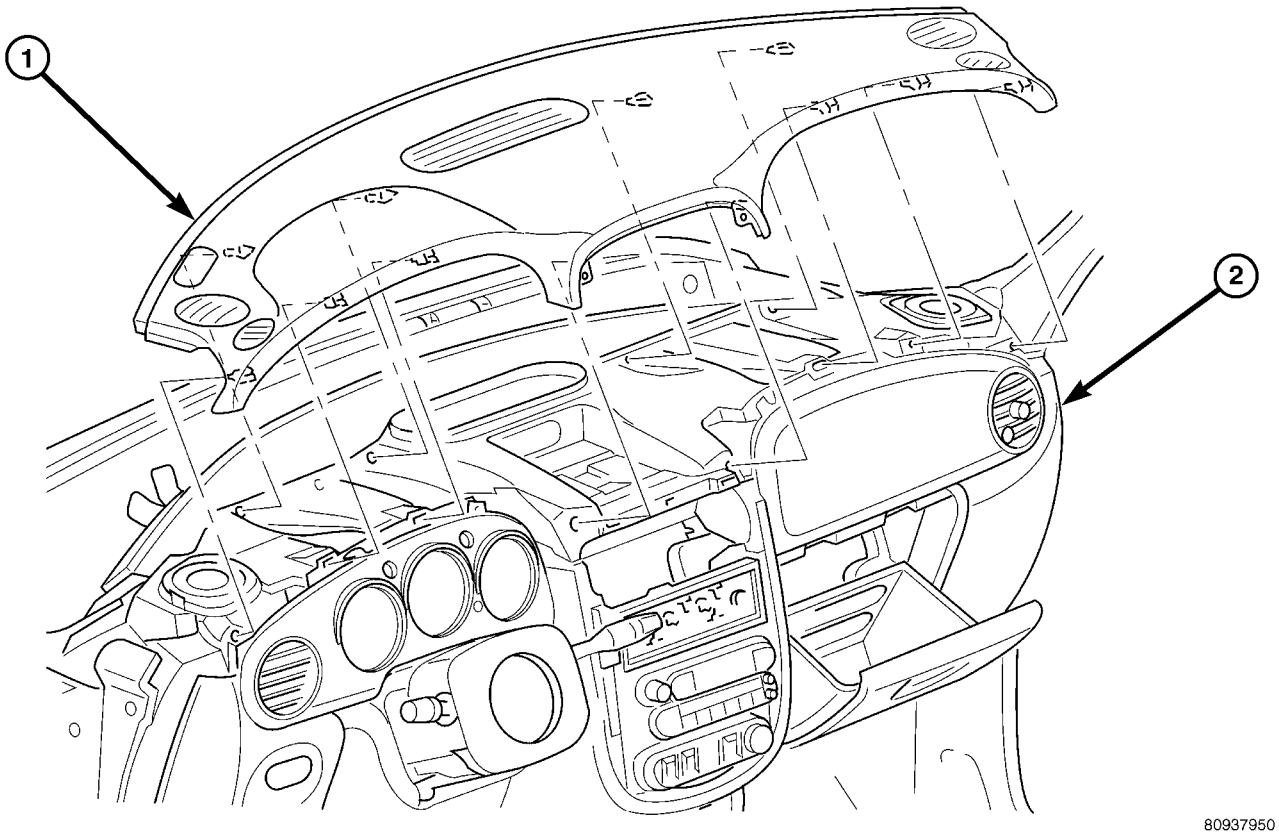

Fig. 26 INSTRUMENT PANEL TOP COVER

1 - INSTRUMENT PANEL TOP COVER
2 - INSTRUMENT PANEL

(6) Connect the harness connector to the front power window switch. Align the front power window switch into the instrument panel center bezel opening and snap into place (Fig. 21).

(7) Install the left and right A-pillar trim.

(8) Connect the battery negative cable (Fig. 14).

(9) Close hood.

(10) Verify vehicle and system operation.

STEERING COLUMN OPENING COVER

REMOVAL

(1) Pull the top of the steering column cover down.
(2) Swing top of steering column cover to floor.
(3) Rotate steering column cover off instrument panel hinge pins (Fig. 27).

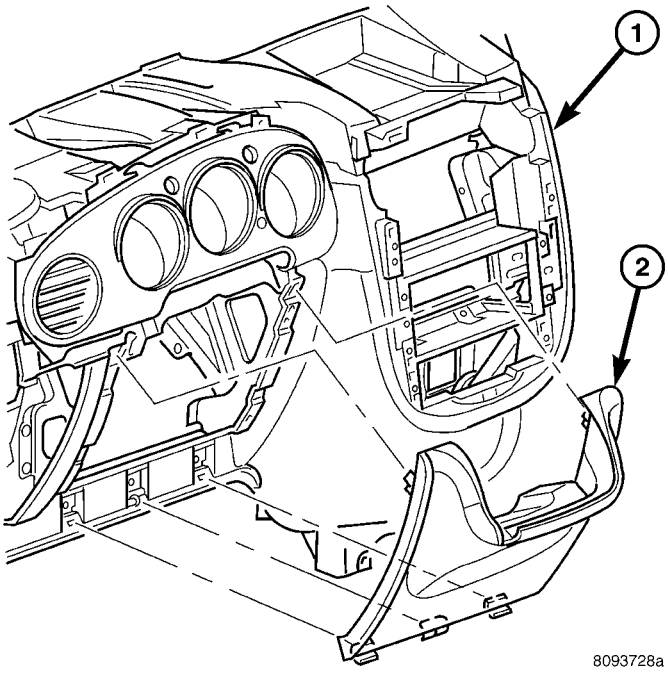

Fig. 27 STEERING COLUMN OPENING COVER

1 - INSTRUMENT PANEL
2 - INSTRUMENT PANEL STEERING COLUMN COVER

INSTALLATION

(1) Place the steering column cover into position and make sure the orientation of the hinge is correct and rotate the cover into place (Fig. 28).

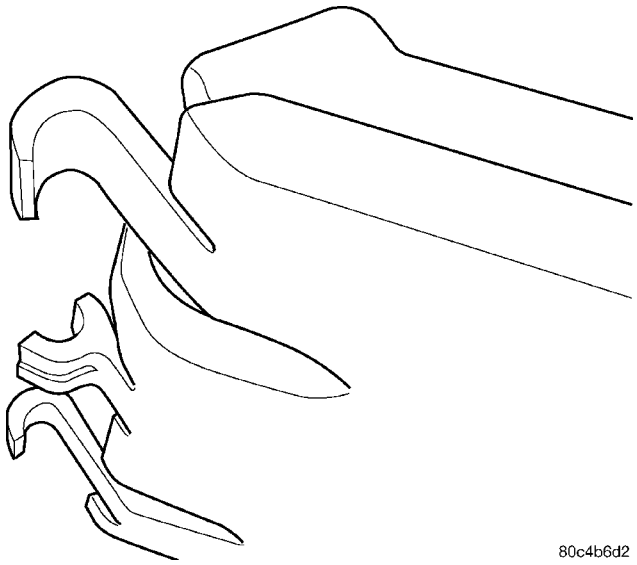

Fig. 28 STEERING COLUMN COVER HINGE

(2) Rotate the cover upward and snap into place (Fig. 27).

A-PILLAR TRIM

REMOVAL

REMOVAL

(1) Disengage clips attaching trim to A-pillar.
(2) Remove A-pillar trim from vehicle (Fig. 1).

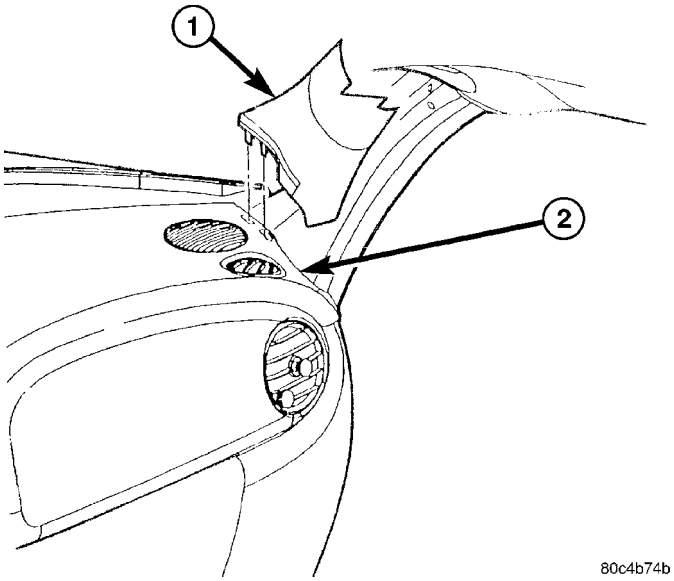

Fig. 1 A-PILLAR TRIM

1 - WINDSHIELD (A-PILLAR) SIDE GARNISH TRIM
2 - INSTRUMENT PANEL TOP COVER

REMOVAL - PT-27 ONLY

(1) Remove sun visor retainers and sun visors. (Refer to 23 - BODY/INTERIOR/SUN VISOR - REMOVAL).
(2) Remove center header trim molding from the windshield surround header. (Refer to 23 - BODY/INTERIOR/WINDSHIELD HEADER TRIM MOLDING - REMOVAL).
(3) Using a trim stick, remove A-pillar trim panel (Fig. 2).

INSTALLATION

INSTALLATION

(1) Position A-pillar trim panel to A-pillar (Fig. 1).
(2) Align locating pins on backside of trim panel to mating holes in A-pillar.
(3) Push clips on trim panel into slots in A-pillar.

INSTALLATION - PT-27 ONLY

(1) Place A-pillar trim panel into position (Fig. 2).
(2) Push clips on A-pillar trim panel to the seated position.

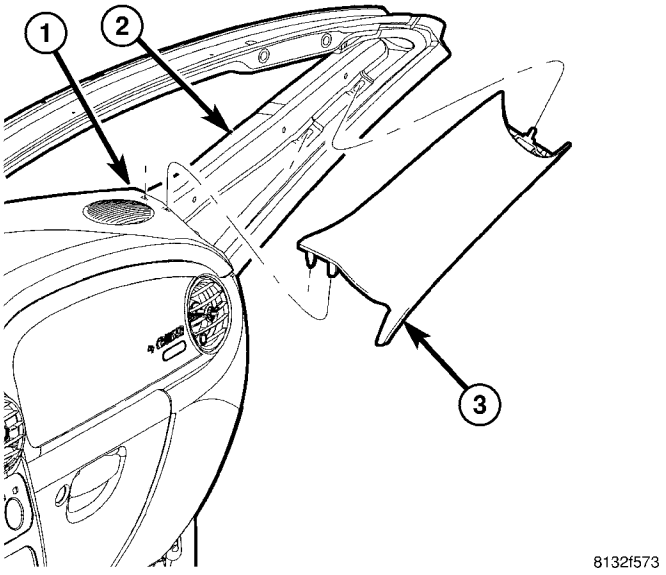

Fig. 2 A-PILLAR TRIM PANEL

1 - INSTRUMENT PANEL TOP COVER
2 - WINDSHIELD FRAME
3 - A-PILLAR TRIM PANEL

(3) Install center header trim molding to the windshield surround frame. (Refer to 23 - BODY/INTERIOR/WINDSHIELD HEADER TRIM MOLDING - INSTALLATION).
(4) Install sun visor retainers and sun visors. (Refer to 23 - BODY/INTERIOR/SUN VISOR - INSTALLATION).

B-PILLAR TRIM

REMOVAL

(1) Remove front and rear door sill trim
(2) Remove shoulder belt height control knob.
(3) Remove bolt attaching turning loop to belt adjuster (Fig. 3).
(4) Remove bolt attaching lower seat belt anchor to floor pan kick- up.
(5) Remove access cover from B-pillar trim.
(6) Disengage clips attaching trim to B-pillar.
(7) Feed seat belt turning loop and seat belt through trim panel.
(8) Remove lower B-pillar trim from vehicle.
(9) Remove upper B-pillar trim.

INSTALLATION

NOTE: Tighten all seat belt bolts to 40 N·m (30 ft. lbs.) torque.

(1) Align height adjuster to hole in B-pillar slider.
(2) Install upper B-pillar trim.

B-PILLAR TRIM (Continued)

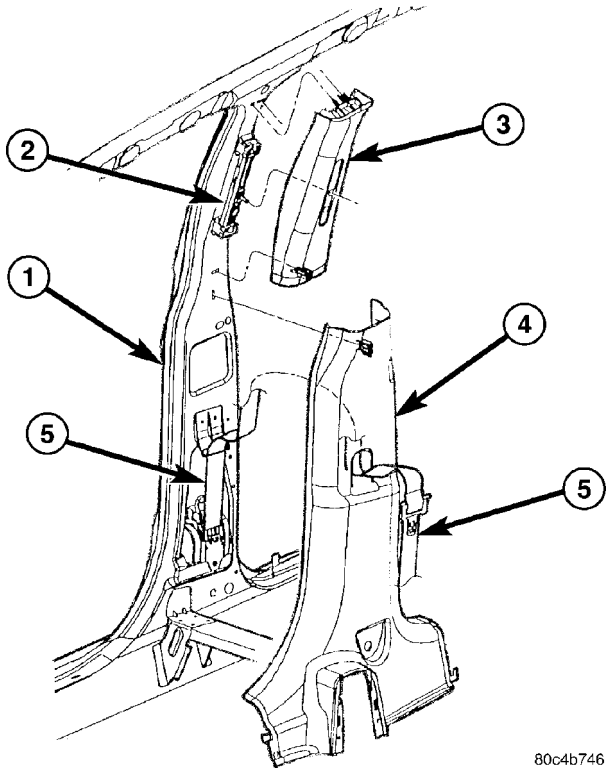

Fig. 3 B-PILLAR TRIM

1 - B-PILLAR
2 - SEAT BELT ADJUSTER
3 - B-PILLAR UPPER TRIM COVER
4 - B-PILLAR LOWER TRIM COVER
5 - SEAT BELT ASSEMBLY

(3) Position lower B-pillar trim panel near B-pillar (Fig. 3).

(4) Feed seat belt turning loop and seat belt through trim panel.

(5) Align locating pins on backside of trim panel to mating holes in B-pillar.

(6) Push clips on trim panel into slots in B-pillar.

(7) Install access cover to B-pillar trim.

(8) Install bolt attaching turning loop to belt adjuster.

(9) Install shoulder belt height control knob.

(10) Install bolt attaching lower seat belt anchor to floor pan kick-up.

(11) Install front and rear door sill trim.

BODY VENT

REMOVAL

(1) Hoist rear end of vehicle and support on safety stands.

(2) From behind rear bumper fascia below quarter panel, disengage clips attaching body vent to wheel well.

(3) Remove body vent from vehicle (Fig. 4).

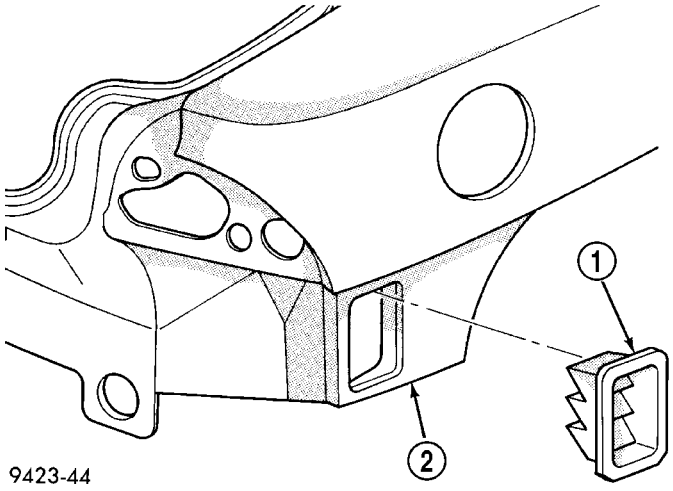

Fig. 4 BODY VENT

1 - BODY VENT
2 - TRUNK WELL SIDE PANEL

INSTALLATION

(1) Place body vent in vehicle.

(2) From behind rear bumper fascia below quarter panel, engage clips attaching body vent to wheel well.

(3) Lower vehicle.

DECKLID SILL SCUFF PLATE

REMOVAL

(1) Open decklid to gain access to sill trim.
(2) Remove decklid sill scuff plate cover (Fig. 5).
(3) Remove decklid sill trim from vehicle

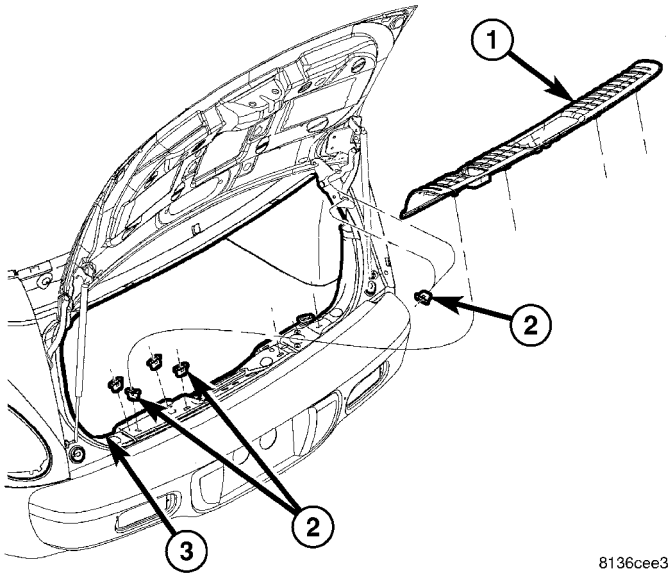

Fig. 5 DECKLID SILL SCUFF PLATE - PT-27

1 - DECKLID SILL SCUFF PLATE
2 - PLASTIC NUT(S)
3 - DECKLID OPENING

INSTALLATION

(1) Place decklid sill scuff plate into position (Fig. 5).
(2) Press on decklid sill scuff clips to seat them.

DOOR SILL TRIM

REMOVAL

REMOVAL

(1) Open door to gain access to sill trim.
(2) Disengage clips attaching sill trim to door sill and door opening flange.
(3) Remove door sill trim from vehicle (Fig. 6).

REMOVAL - PT-27 ONLY

(1) Open door to gain access to sill trim.
(2) Remove door sill scuff plate cover (Fig. 7).
(3) Disengage clips attaching sill trim to door sill and door opening flange (Fig. 8).
(4) Remove door sill trim from vehicle

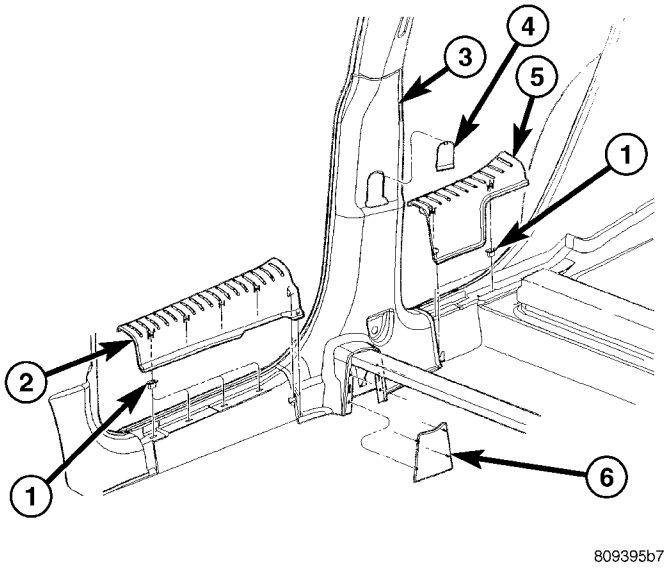

Fig. 6 DOOR SILL TRIM

5 - REAR DOOR SILL SCUFF PLATE
6 - CLOSE OUT COVER

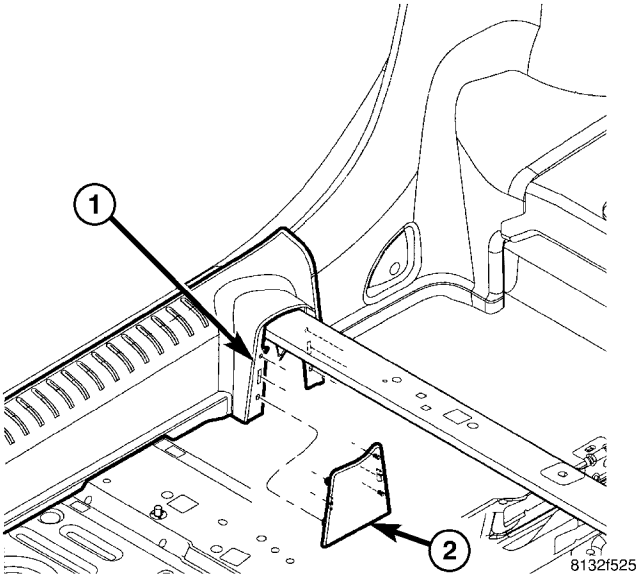

Fig. 7 DOOR SILL SCUFF PLATE COVER

1 - DOOR SILL SCUFF PLATE
2 - COVER

INSTALLATION

INSTALLATION

(1) Position door sill trim on door sill (Fig. 6).
(2) Align locating pins on backside of trim panel to holes in door sill.
(3) Engage clips on trim panel into slots in door sill.

DOOR SILL TRIM (Continued)

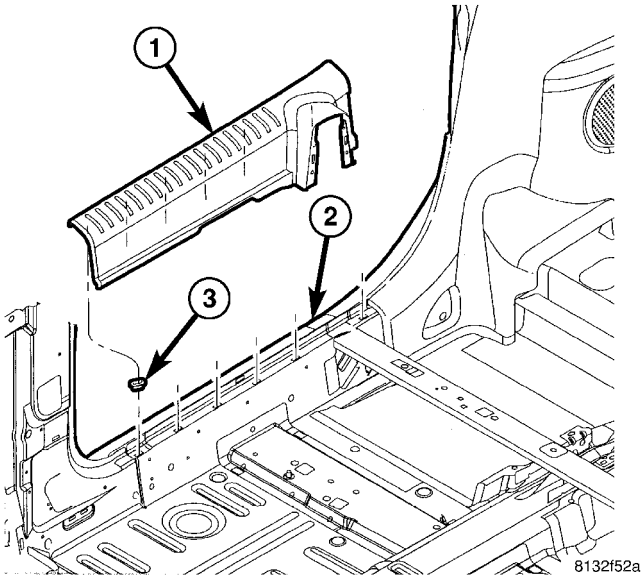

Fig. 8 DOOR SILL SCUFF PLATE

1 - DOOR SILL SCUFF PLATE
2 - BODY SIDE
3 - PLASTIC NUT

(4) Engage clips on trim panel onto tabs on lower B-pillar and cowl trim.

(5) Press downward on trim panel to fully engage all clips.

INSTALLATION - PT-27 ONLY

(1) Place door sill scuff plate into position (Fig. 8).
(2) Push clips into the seated position
(3) Install door sill scuff plate cover (Fig. 7).

FLOOR CARPET

REMOVAL

(1) Remove front seats.
(2) Remove rear seats from vehicle (Fig. 9)
(3) Remove door sill trim covers.
(4) Remove cowl trim covers.
(5) Remove center floor console.
(6) Remove rear seat pivot bezels and striker bezel.
(7) Remove lower fasteners from B-pillar trim panel.
(8) Remove rear floor pan cargo and flat tire tie down loop attaching screw (Fig. 10).
(9) Pull carpet from behind quarter trim panel.
(10) Fold carpet in half toward rear seat.
(11) Remove carpet through rear door opening.

INSTALLATION

(1) Install carpet through liftgate opening.
(2) Unfold carpet.
(3) Tuck carpet behind quarter trim panel (Fig. 9).
(4) Install lower fasteners holding B-pillar trim panel.

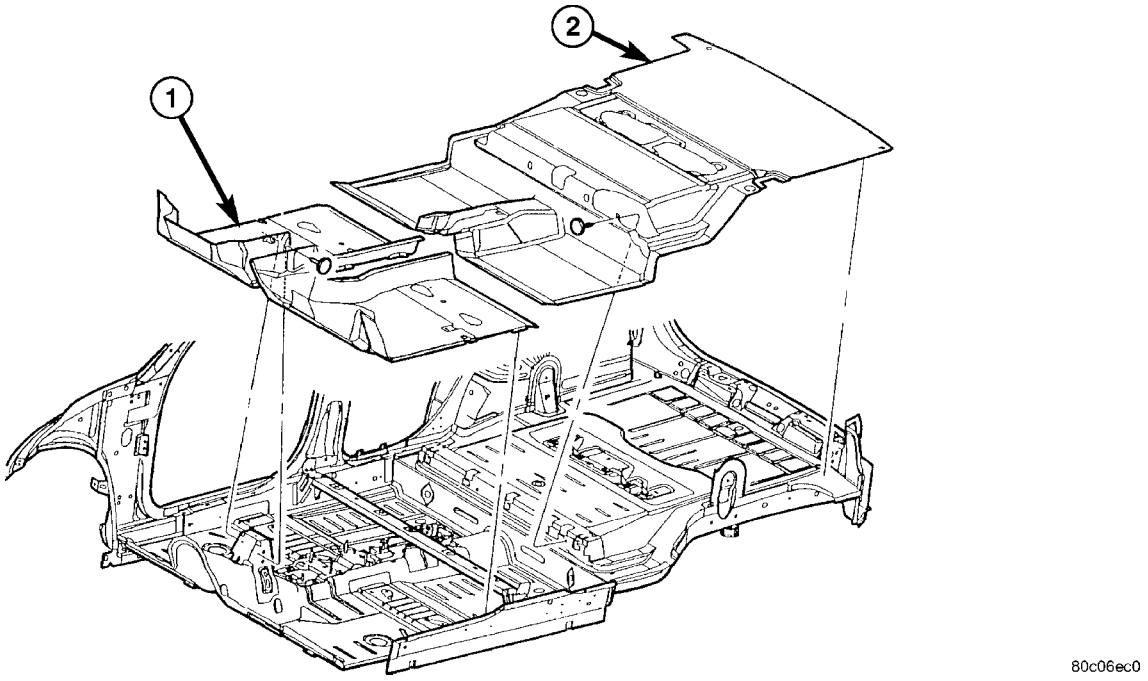

Fig. 9 CARPET

1 - PASSENGER FLOOR CARPET

FLOOR CARPET (Continued)

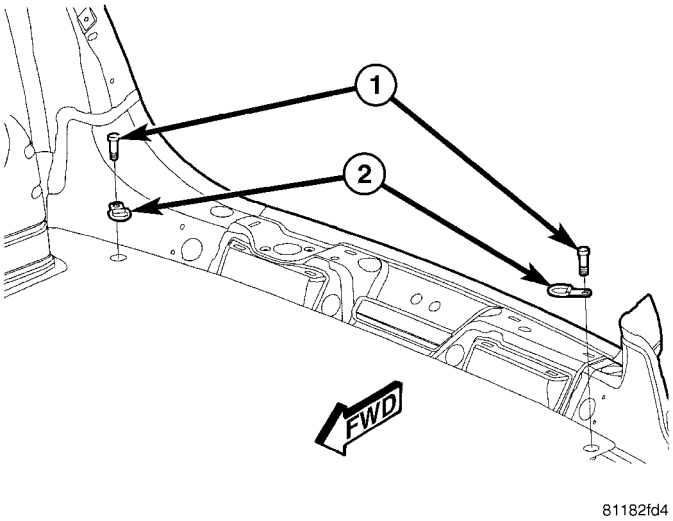

Fig. 10 TIE DOWN LOOP

1 - ATTACHING SHOULDER SCREW
2 - REAR FLOOR PAN CARGO AND FLAT TIRE TIE DOWN LOOP

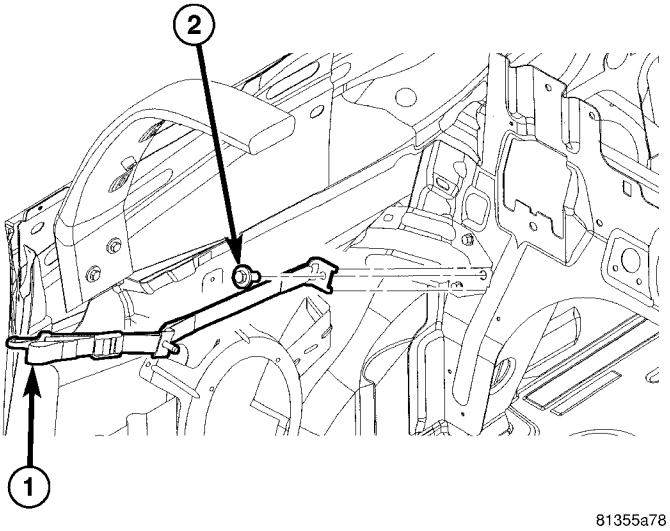

Fig. 11 CHECK STRAP

1 - CHECK STRAP
2 - ATTACHING SCREW

(5) Install center floor console.
(6) Install cowl trim covers.
(7) Install rear seat pivot bezels and striker bezel.
(8) Install door sill trim covers.
(9) Install bolts attaching front seat belt lower anchors to floor. Tighten all seat belts to 40 N·m (30 ft. lbs.) torque.
(10) Install front seats.
(11) Install rear floor pan cargo and flat tire tie down loop attaching screw (Fig. 10). Tighten screw to 12 N·m (105 in. lbs.) torque.
(12) Install rear seats

CARGO AREA FLOOR CARPET - PT-27

REMOVAL - PT-27 ONLY

(1) Fold down both rear seats.
(2) Release rear seat latch from inside of the trunk.
(3) Remove attaching screw from left and right rear seat fold forward check strap (Fig. 11).
(4) Remove rear seat pivot bezels (Fig. 12).
(5) Remove rear seats. (Refer to 23 - BODY/SEATS/SEAT - REMOVAL).
(6) Remove left and right seat belt anchor for the rear seat.
(7) Remove rear floor pan cargo and flat tire tie down loop attaching screw.
(8) Remove push pin fasteners from front edge of the carpet (Fig. 13).
(9) Remove cargo scuff plate.
(10) Pull carpet from behind quarter trim panel and cargo trim panel.
(11) Fold carpet in half.
(12) Remove carpet from vehicle (Fig. 14).

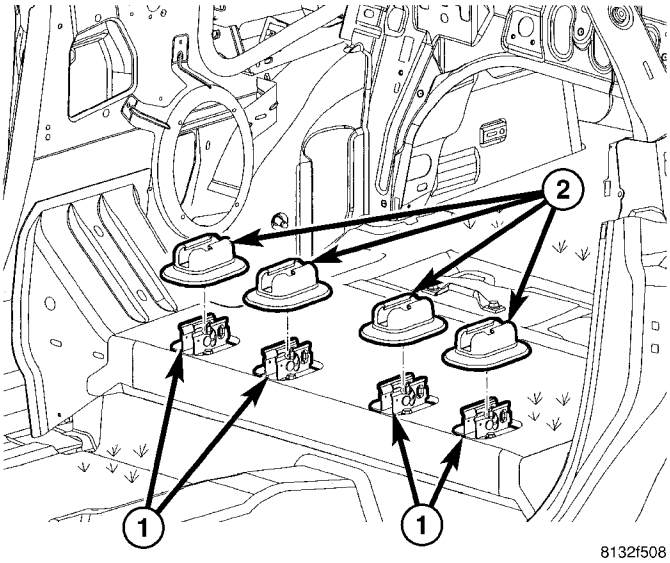

Fig. 12 PIVOT COVER BEZEL

1 - REAR SEAT PIVOT BRACKET
2 - PIVOT COVER BEZEL

INSTALLATION - PT-27 ONLY

(1) Place carpet into position (Fig. 14).
(2) Slip carpet under quarter trim panel and Cargo trim panel.
(3) Install push pin fasteners in front edge of the carpet (Fig. 13).

CARGO AREA FLOOR CARPET - PT-27 (Continued)

1 - FLOOR PAN
2 - PUSH PIN FASTENER(S)
3 - CARGO CARPET

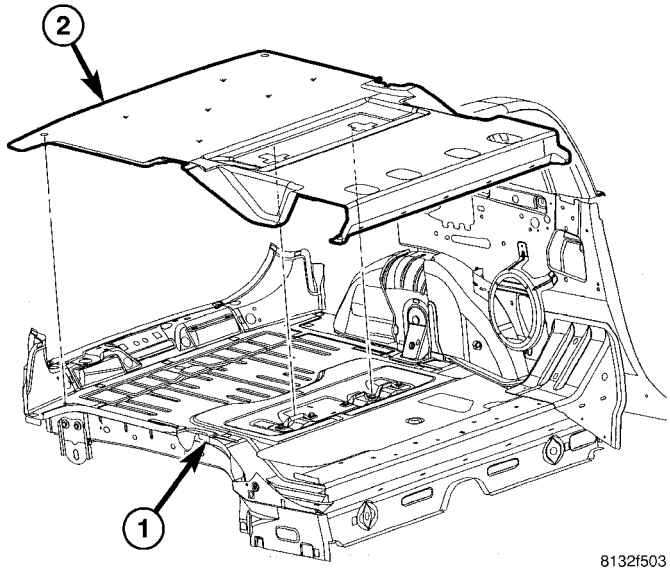

Fig. 14 CARGO FLOOR CARPET

1 - FLOOR PANEL
2 - CARGO FLOOR CARPET

(4) Install rear floor pan cargo and flat tire tie down loop attaching screw.

(5) Install cargo scuff plate.

(6) Install left and right seat belt anchor for the rear seat.

(7) Install rear seats. (Refer to 23 - BODY/SEATS/SEAT - INSTALLATION).

(8) Install rear seat pivot bezels (Fig. 12).

(9) Install attaching screw for left and right rear seat fold forward check strap (Fig. 11).

(10) Place seat in the up right position.

FRONT FLOOR CARPET RIGHT/LEFT SIDE -PT-27

REMOVAL - PT-27 ONLY

(1) Remove front seats. (Refer to 23 - BODY/SEATS/SEAT - REMOVAL).

(2) Remove door sill trim covers. (Refer to 23 - BODY/INTERIOR/DOOR SILL TRIM - REMOVAL).

(3) Remove cowl trim covers. (Refer to 23 - BODY/INTERIOR/COWL TRIM - REMOVAL).

(4) Remove center floor console. (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - REMOVAL).

(5) Remove push pin fasteners (Fig. 15).

(6) Remove carpet from vehicle.

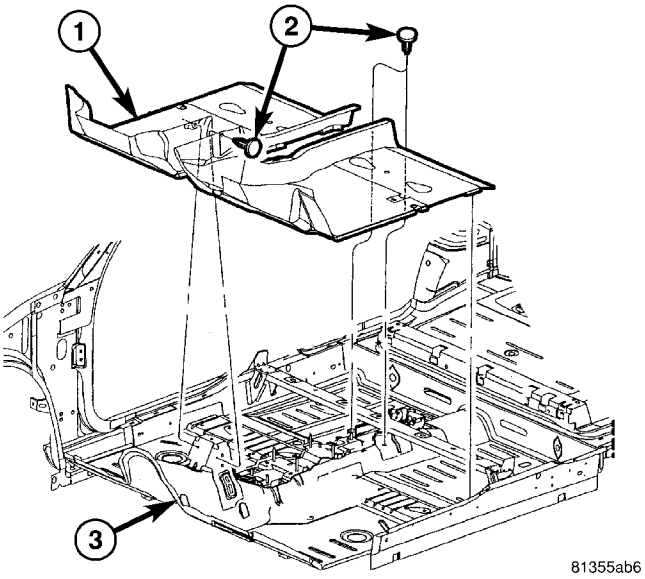

Fig. 15 FRONT FLOOR CARPET

1 - FRONT FLOOR CARPET
2 - PUSH PIN FASTENER(S)
3 - FLOOR PANEL

INSTALLATION - PT-27 ONLY

(1) Place carpet into position (Fig. 15).

(2) Install push pin fasteners.

(3) Install center floor console. (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - INSTALLATION).

(4) Install cowl trim covers. (Refer to 23 - BODY/INTERIOR/COWL TRIM - INSTALLATION).

(5) Install door sill trim covers. (Refer to 23 - BODY/INTERIOR/DOOR SILL TRIM - INSTALLATION).

(6) Install front seats. (Refer to 23 - BODY/SEATS/SEAT - INSTALLATION).

REAR CARPET - PT-27

REMOVAL - PT-27 ONLY

(1) Remove front seats. (Refer to 23 - BODY/SEATS/SEAT - REMOVAL).

(2) Remove door sill trim covers. (Refer to 23 - BODY/INTERIOR/DOOR SILL TRIM - REMOVAL).

(3) Remove center floor console. (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - REMOVAL).

(4) Remove push pin fasteners at console area and rear edge of carpet (Fig. 16).

(5) Remove rear floor carpet from vehicle.

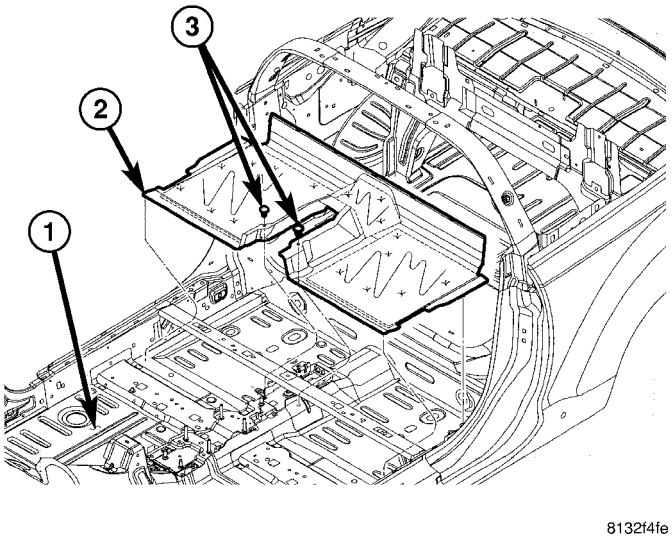

Fig. 16 REAR CARPET

1 - FLOOR PANEL
2 - REAR FLOOR CARPET
3 - PUSH PIN FASTENERS

INSTALLATION - PT-27 ONLY

(1) Place rear floor carpet into position (Fig. 16).

(2) Install push pin fasteners at console area and rear edge of carpet.

(3) Install center floor console. (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - INSTALLATION).

(4) Install door sill trim covers. (Refer to 23 - BODY/INTERIOR/DOOR SILL TRIM - INSTALLATION).

(5) Install front seats. (Refer to 23 - BODY/SEATS/SEAT - INSTALLATION).

UPPER D-PILLAR TRIM

REMOVAL

(1) Disengage clips attaching trim to D-pillar and quarter trim (Fig. 37).

(2) Remove upper trim panel from vehicle.

INSTALLATION

(1) Place D-pillar trim panel in position (Fig. 37).

(2) Push clips on trim panel into slots in upper D-pillar panel and slots in the quarter trim.

HEADER LATCH RETAINER - PT-27

REMOVAL - PT-27 ONLY

(1) Place convertible top in the partial up position (Fig. 17).

(2) Remove header end molding as necessary. (Refer to 23 - BODY/INTERIOR/REAR HEADER TRIM - REMOVAL).

(3) Remove two screws attaching header latch retainer to windshield surround frame (Fig. 18).

(4) Remove header latch retainer from vehicle.

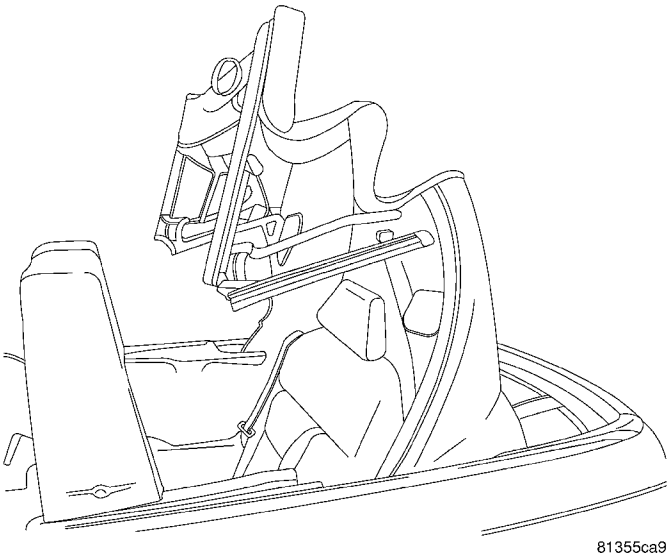

Fig. 17 PARTIAL UP POSITION

HEADER LATCH RETAINER - PT-27 (Continued)

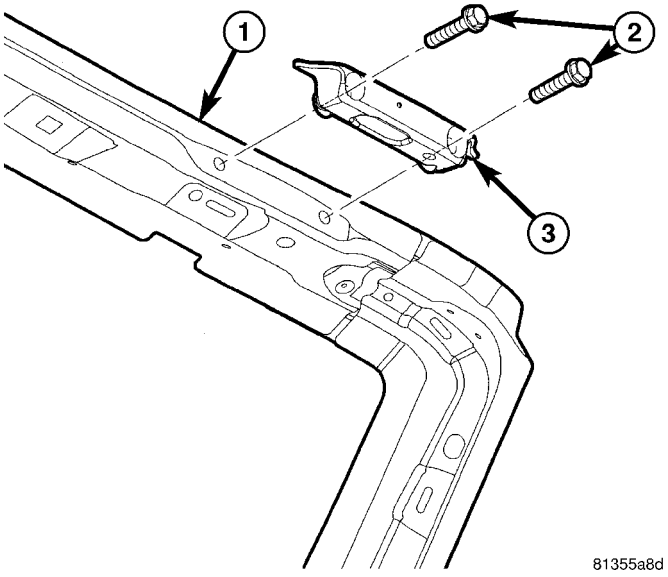

Fig. 18 HEADER LATCH RETAINER

1 - WINDSHIELD SURROUND FRAME
2 - ATTACHING SCREWS
3 - HEADER LATCH RETAINER

INSTALLATION - PT-27 ONLY

(1) Place header latch retainer into position on the windshield surround frame (Fig. 18).

(2) Install two screws attaching header latch retainer to the windshield surround frame. Tighten screws to 28 N·m (21 ft. lbs.) torque.

(3) Install header end molding. (Refer to 23 - BODY/INTERIOR/HEADER END MOLDING - INSTALLATION)

(4) Raise top. Latch the folding top. Ensure proper fit and operation. (Refer to 23 - BODY/CONVERTIBLE TOP/LATCH SYSTEM - INSTALLATION) for adjustment procedures.

(5) Place convertible top in the partial up position (Fig. 17).

HEADLINER

REMOVAL

(1) Fully recline front seats and fold rear seats forward.

(2) Remove screws attaching sun visors to roof header panel (Fig. 19).

(3) Disconnect wire connector from lighted vanity mirror, if so equipped.

(4) Remove trim lace, if equipped with sun roof.

(5) Remove sun visors from vehicle.

(6) Remove A-pillar trim covers.

(7) Remove B-pillar trim panels.

(8) Remove C-pillar and D-pillar trim panels.

(9) Remove assist handle, if so equipped.

(10) Remove sun visor hooks.

(11) Remove coat hooks, if so equipped.

(12) Remove two push in fasteners at rear of headliner.

(13) Disengage wire connector, at base of A-pillar.

(14) Remove push in fastener attaching wiring to A-pillar.

(15) Remove headliner through rear hatch.

INSTALLATION

(1) Load headliner through rear hatch (Fig. 19).

(2) Install sun visor hooks, if so equipped.

(3) Install two push in fastener at rear of headliner.

(4) Install coat hooks, if so equipped.

(5) Install assist handles, if so equipped.

(6) Install push in fastener attaching headliner wiring to A-pillar.

(7) Connect wire connector, at base of A-pillar.

(8) Install C and D-pillar trim.

(9) Install B-pillar trim panels.

(10) Install A-pillar trim covers.

HEADLINER (Continued)

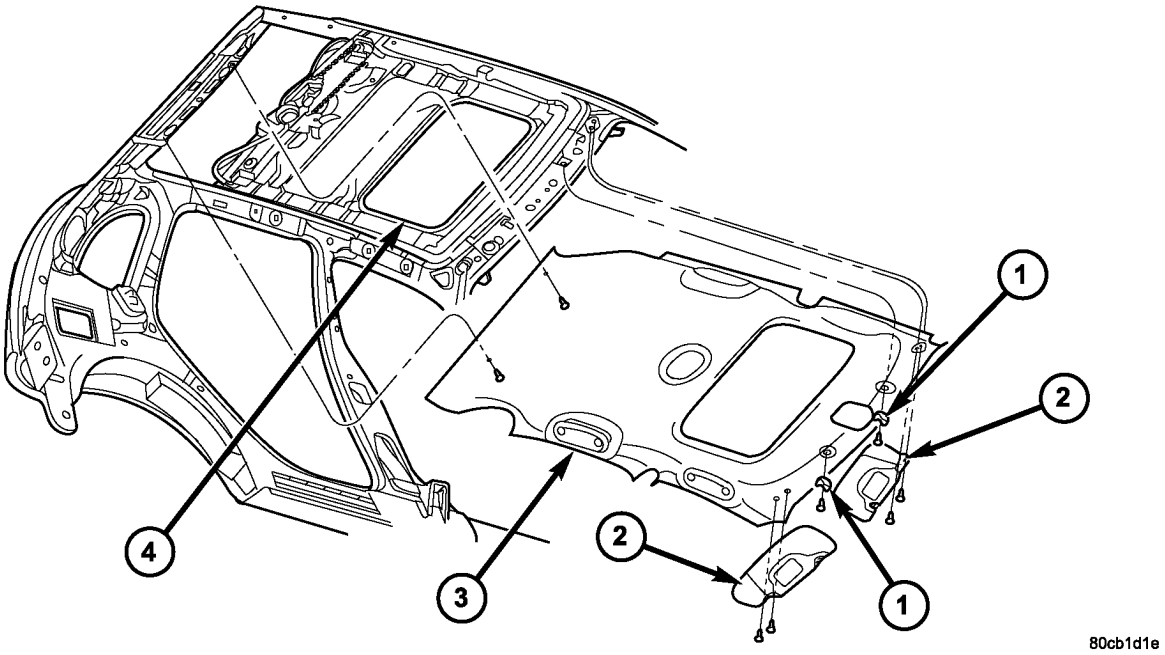

Fig. 19 HEADLINER WITH SUN ROOF - TYPICAL

1 - HEADLINER VISOR RECEPTACLE
2 - SUN VISOR
3 - HEADLINER PANEL ASSEMBLY
4 - SUN ROOF ASSEMBLY

(11) Install trim lace, if equipped with sun roof.

(12) Install sun visors, lighted vanity mirror wire connector, if so equipped, and screws attaching sun visors to roof header panel.

INSIDE REAR VIEW MIRROR

REMOVAL

REMOVAL

(1) Loosen the mirror base set screw (Fig. 20).

(2) Slide the mirror base upward and off the bracket.

REMOVAL - PT-27 ONLY

(1) Loosen the mirror base set screw (Fig. 21).

(2) Slide the mirror base upward and off the bracket.

(3) Disconnect wire harness, if equipped.

INSTALLATION

INSTALLATION

(1) Position the mirror base at the bracket and slide it downward onto the support bracket (Fig. 20).

(2) Tighten the setscrew 1 N·m (15 in. lbs.) torque.

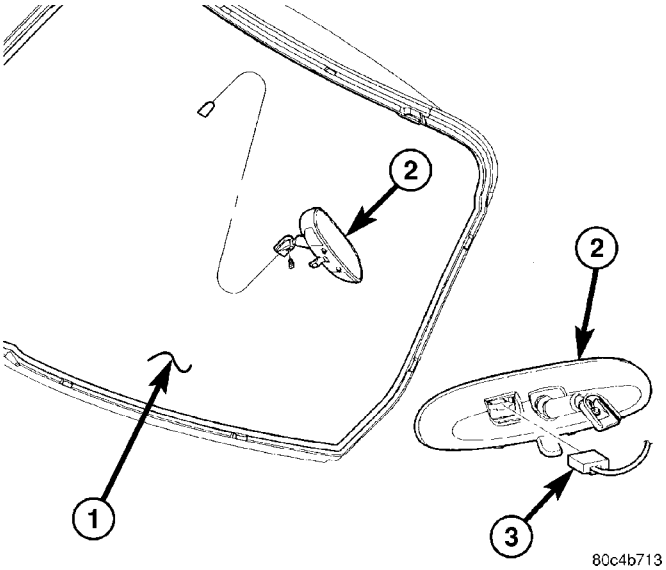

Fig. 20 REAR VIEW MIRROR

1 - WINDSHIELD
2 - REAR VIEW MIRROR
3 - REAR VIEW MIRROR CONNECTOR

INSTALLATION - PT-27 ONLY

(1) Connect wire harness, if equipped (Fig. 21).

(2) Slide the mirror base downward and onto the bracket.

(3) Tighten the mirror base set screw.

INSIDE REAR VIEW MIRROR (Continued)

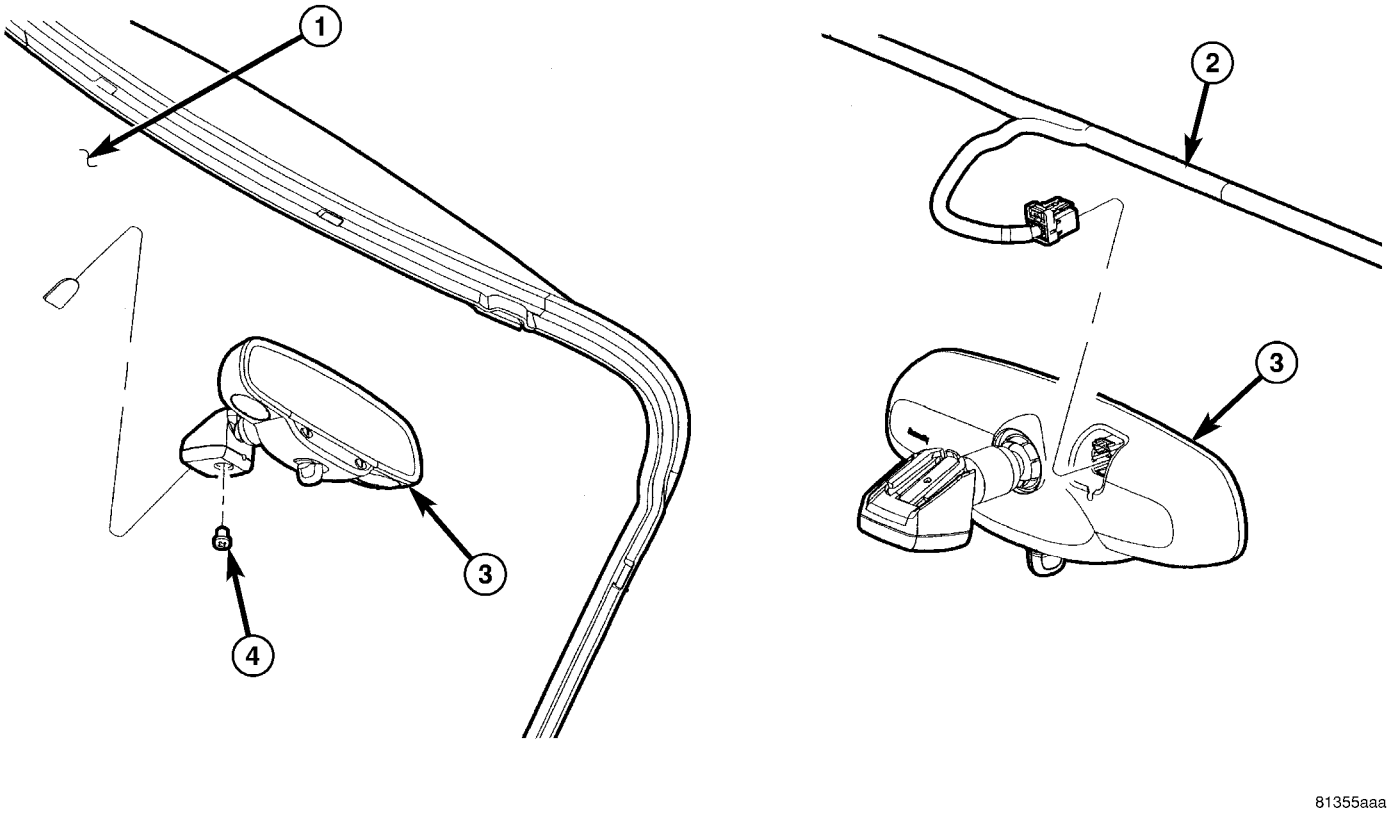

Fig. 21 REAR VIEW MIRROR

1 - WINDSHIELD GLASS
2 - WIRE HARNESS
3 - MIRROR
4 - ATTACHING SCREW

LOWER QUARTER TRIM PANEL

REMOVAL

(1) Remove C-pillar and D-pillar trim (Fig. 22).
(2) Remove liftgate sill scuff plate.
(3) Remove cargo tie down loops and quarter trim attaching screws.
(4) Disengage wiring connector for cargo lamp and power outlet, if equipped.
(5) Remove lower quarter trim from vehicle.

INSTALLATION

(1) Position lower quarter trim panel to vehicle (Fig. 22).
(2) Align locating pins on backside of trim panel to mating holes in inner quarter panel.
(3) Press clips on trim panel into slots in inner quarter panel.
(4) Install quarter trim attaching screws and cargo tie down loops.
(5) Install upper C-pillar and D-pillar trim.

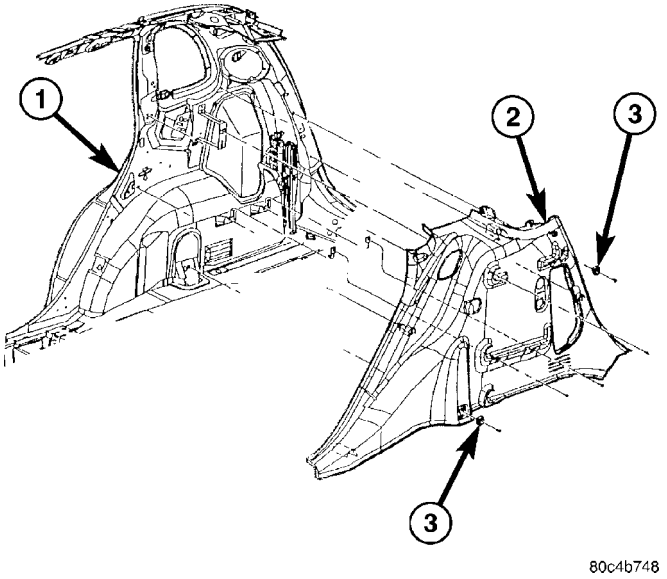

Fig. 22 LOWER QUARTER TRIM PANEL

1 - REAR QUARTER PANEL
2 - REAR QUARTER TRIM PANEL
3 - CARGO TIE DOWN QUARTER TRIM LOWER LOOP

REAR QUARTER PANEL TRIM - PT-27

REMOVAL - PT-27 ONLY

(1) Fold rear seats flat.

(2) Remove attaching screw from left and right rear seat fold forward check strap (Fig. 23).

(3) Remove rear seat pivot bezels and striker bezel (Fig. 24).

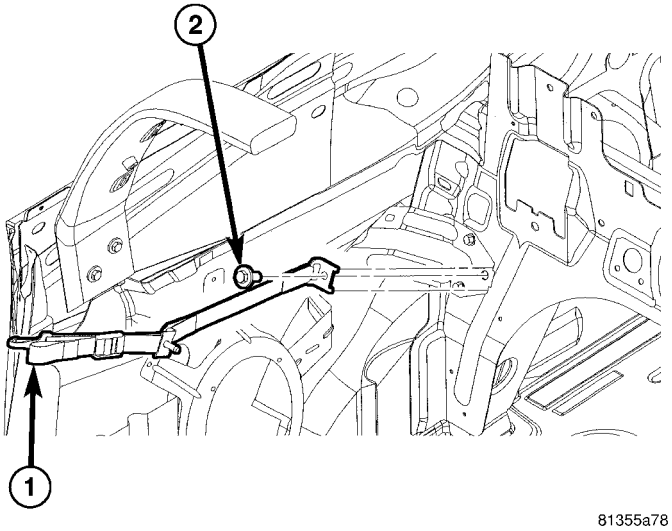

Fig. 23 CHECK STRAP

1 - CHECK STRAP
2 - ATTACHING SCREW

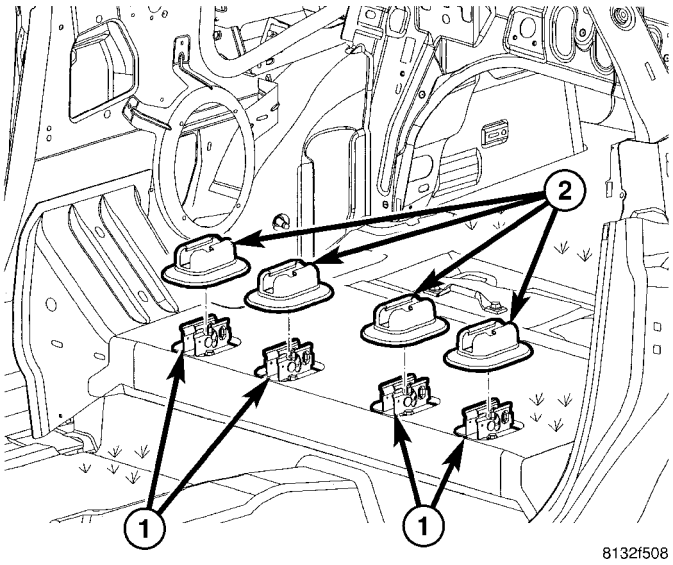

Fig. 24 PIVOT COVER BEZEL

1 - REAR SEAT PIVOT BRACKET
2 - PIVOT COVER BEZEL

(4) Remove rear seat. (Refer to 23 - BODY/SEATS/SEAT - REMOVAL).

(5) Remove rear seat lower seat belt anchor attaching bolt.

(6) Release J-strap at upper seat back slingwell.

(7) Remove bolster from rear seat back support and move bolster out of the way. (Refer to 23 - BODY/SEATS/REAR SEAT BOLSTER - REMOVAL).

(8) Remove lower seat belt anchor at B-pillar.

(9) Remove turning loop anchor attaching bolt.

(10) Move door sill scuff plate to allow removal of quarter trim panel.

(11) Remove screws attaching quarter trim panel (Fig. 25).

(12) Remove quarter trim panel.

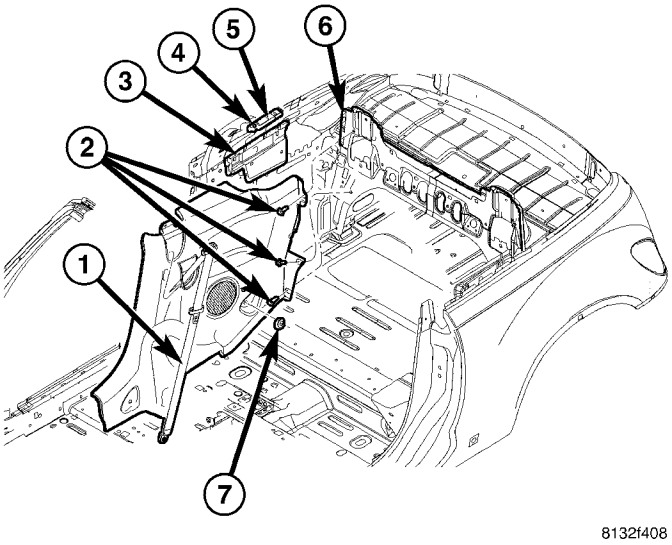

Fig. 25 QUARTER TRIM PANEL

1 - SEAT BELT
2 - ATTACHING SCREW(S)
3 - FOLDING TOP PIVOT BRACKET
4 - QUARTER TRIM BRACKET NUT
5 - QUARTER TRIM BRACKET
6 - REAR SEAT SUPPORT
7 - LOWER ANCHOR ATTACHING NUT

INSTALLATION - PT-27 ONLY

(1) Place quarter trim panel into position (Fig. 25).

(2) Install screws attaching quarter trim panel.

(3) Install door sill scuff plate.

(4) Install turning loop anchor attaching bolt.

(5) Install lower seat belt anchor at B-pillar.

(6) Install bolster to rear seat back support. (Refer to 23 - BODY/SEATS/REAR SEAT BOLSTERS - INSTALLATION).

(7) Connect J-strap at upper seat back slingwell.

(8) Install rear seat lower seat belt anchor attaching bolt.

(9) Install rear seat. (Refer to 23 - BODY/SEATS/SEAT - INSTALLATION).

REAR QUARTER PANEL TRIM - PT-27 (Continued)

(10) Install rear seat pivot bezels and striker bezel (Fig. 24).

(11) Install attaching screw to left and right rear seat fold forward check strap (Fig. 23).

(12) Place rear seat in the upright position.

SEAT BACK SUPPORT BRACKET - PT-27

REMOVAL - PT-27 ONLY

(1) Remove quarter trim panel. (Refer to 23 - BODY/INTERIOR/QUARTER TRIM PANEL - REMOVAL).

(2) Remove two nut attaching to pivot folding top bracket (Fig. 26).

(3) Remove three bolt attaching to rear seat support.

(4) Remove seat back support bracket from vehicle.

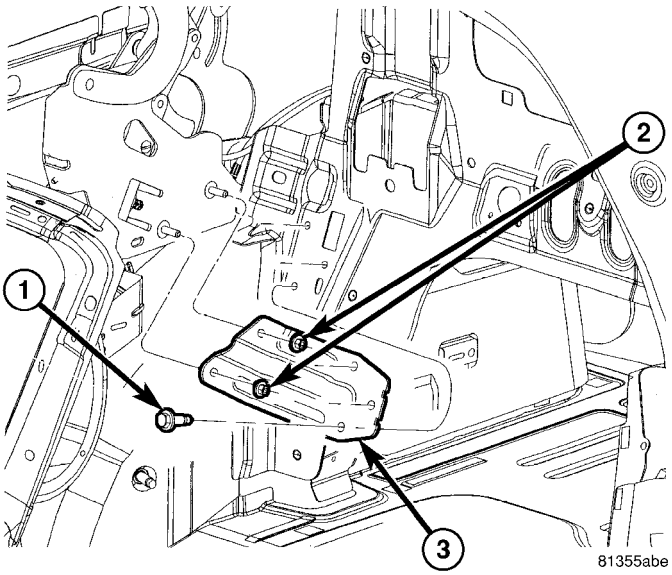

Fig. 26 SEAT BACK SUPPORT BRACKET

1 - ATTACHING SCREW(S)
2 - ATTACHING NUT(S)
3 - SEAT BACK SUPPORT BRACKET TO PIVOT FOLDING TOP BRACKET

INSTALLATION - PT-27 ONLY

(1) Place seat back support bracket into position (Fig. 26).

(2) Install three bolt attaching to rear seat support

(3) Install two nut attaching to pivot folding top bracket.

(4) Install quarter trim panel. (Refer to 23 - BODY/INTERIOR/QUARTER PANEL TRIM - INSTALLATION).

SIDE COWL TRIM PANEL

REMOVAL

(1) Disengage clips attaching cowl side trim panel to inner cowl panel.

(2) Remove cowl side trim panel from vehicle (Fig. 27).

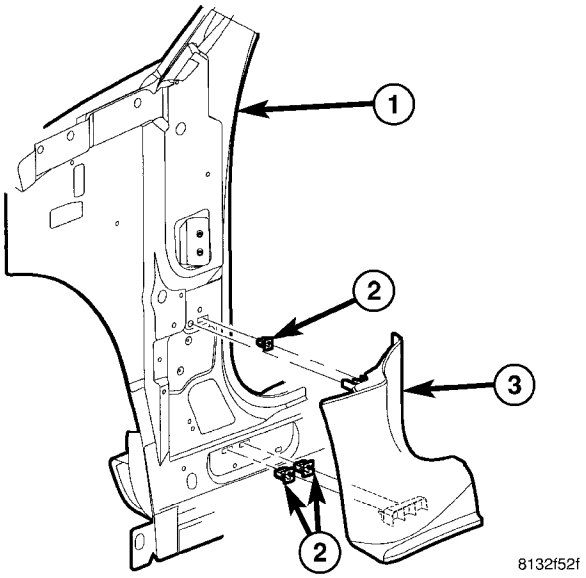

Fig. 27 COWL SIDE TRIM PANEL

1 - INNER COWL PANEL
2 - PLASTIC NUT(S)
3 - COWL SIDE TRIM PANEL

INSTALLATION

(1) Position cowl trim panel to inner cowl panel (Fig. 27).

(2) Align locating pins on backside of cowl trim panel to mating holes in inner cowl panel.

(3) Push clips on trim panel into slots in inner cowl panel.

SPORT BAR - PT-27

REMOVAL - PT-27 ONLY

(1) Remove rear seats. (Refer to 23 - BODY/SEATS/REAR SEAT - REMOVAL).

(2) Remove both rear quarter trim panel. (Refer to 23 - BODY/INTERIOR/QUARTER TRIM PANEL - REMOVAL).

(3) Remove inner covers from sport bar. (Refer to 23 - BODY/INTERIOR/SPORT BAR INNER COVERS - REMOVAL).

(4) Remove outer cover from sport bar. (Refer to 23 - BODY/INTERIOR/SPORT BAR OUTER COVER - REMOVAL).

(5) Remove two bolts on each side of sport bar rail (Fig. 28) and (Fig. 29).

SPORT BAR - PT-27 (Continued)

(6) Remove sport bar rail from vehicle.

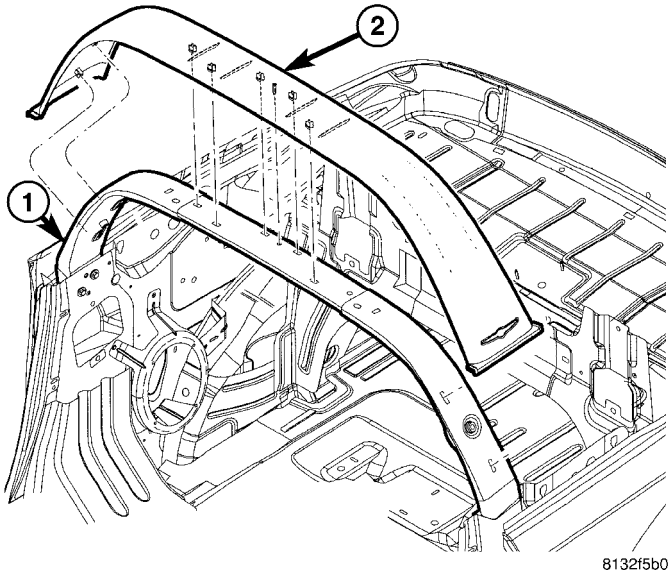

Fig. 28 SPORT BAR COVER

1 - SPORT BAR RAIL
2 - SPORT BAR COVER

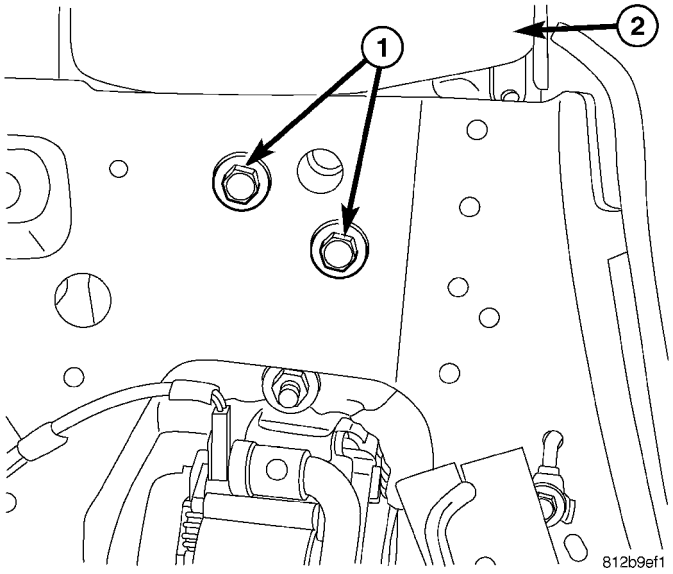

Fig. 29 SPORT BAR

1 - ATTACHING BOLTS
2 - SPORT BAR RAIL

INSTALLATION - PT-27 ONLY

(1) Place sport bar rail into position (Fig. 28) and (Fig. 29).

(2) Install two bolts on each side of sport bar rail.

(3) Install outer cover onto sport bar. (Refer to 23 - BODY/INTERIOR/SPORT BAR OUTER COVER - INSTALLATION).

(4) Install inner covers onto sport bar. (Refer to 23 - BODY/INTERIOR/SPORT BAR INNER COVERS - INSTALLATION).

(5) Install both rear quarter trim panel. (Refer to 23 - BODY/INTERIOR/QUARTER PANEL TRIM - INSTALLATION).

(6) Install rear seats. (Refer to 23 - BODY/SEATS/REAR SEAT - INSTALLATION).

SPORT BAR INNER COVERS - PT-27

REMOVAL - PT-27 ONLY

(1) Remove dome lamps. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - INTERIOR/DOME LAMP - REMOVAL).

NOTE: Use care not damage sport bar welt while removing covers.

(2) Using a trim stick or pulling on sport bar inner center cover, remove sport bar inner center cover from the sport bar rail (Fig. 30).

(3) Remove right and left seat belt turning loops

(4) Using a trim stick or pulling on sport bar inner side covers, remove sport bar inner side cover from the sport bar rail (Fig. 30). Remove right and left seat belt turning loops

(5) Remove sport bar welt from sport outer cover.

INSTALLATION - PT-27 ONLY

(1) Place sport bar side cover into position on sport bar rail.

(2) Press clips on sport bar side cover to the seated position. Repeat operation for the other side.

(3) Place sport bar center cover into position on sport bar rail. Use care to ensure that the sport bar welt is position between covers.

(4) Press clips on sport bar center cover to the seated position.

(5) Install sport bar welt, goes between interior and cover. (Fig. 30).

(6) Install dome lamps. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - INTERIOR/DOME LAMP - INSTALLATION).

SPORT BAR OUTER COVER - PT-27

REMOVAL - PT-27 ONLY

(1) Remove right and left seat belt turning loops.

(2) Remove sport bar inner covers. (Refer to 23 - BODY/INTERIOR/SPORT BAR INNER COVERS - REMOVAL).

SPORT BAR OUTER COVER - PT-27 (Continued)

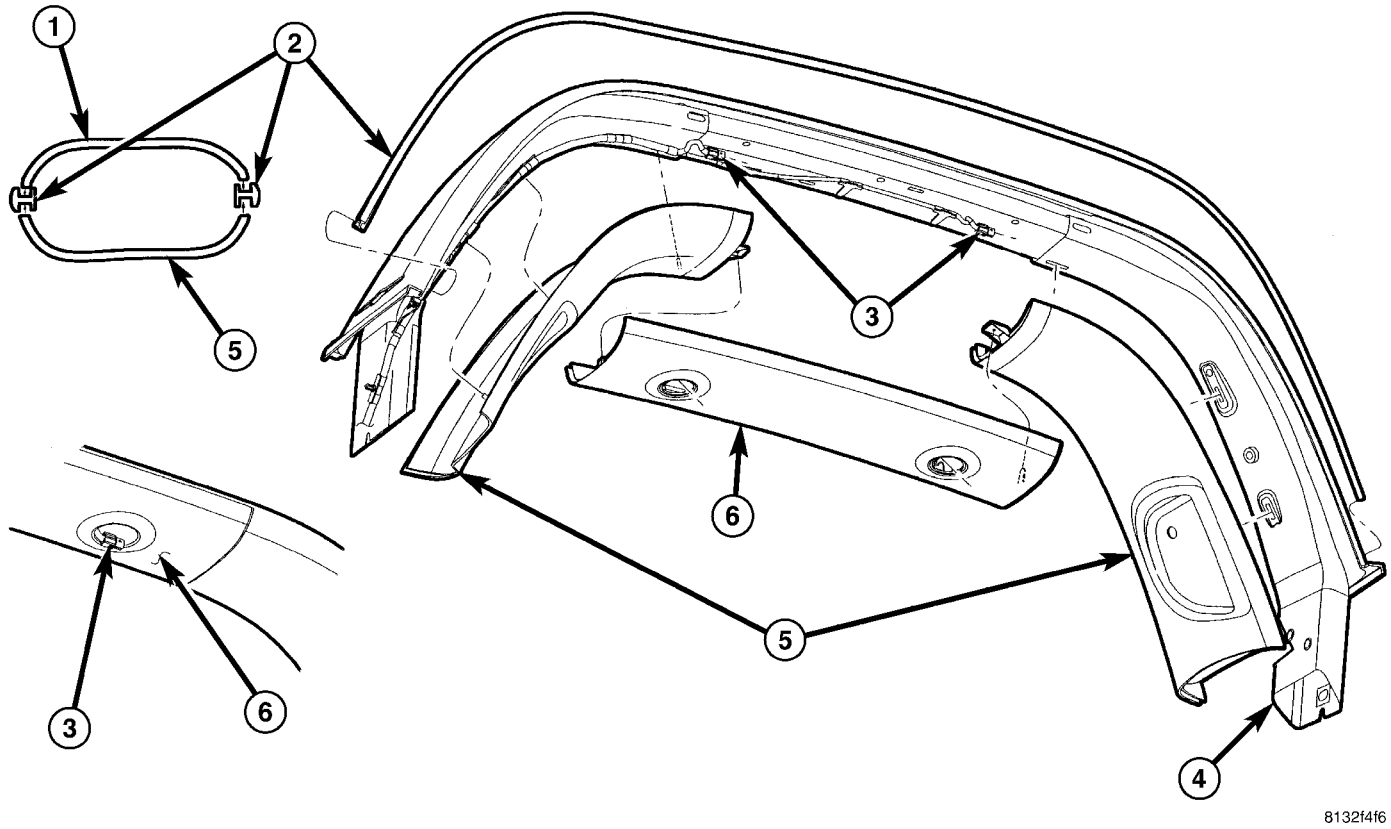

Fig. 30 SPORT BAR MOLDING

1 - SPORT BAR OUTER COVER
2 - SPORT BAR WELT
3 - DOME WIRING CONNECTORS
4 - SPORT BAR RAIL
5 - SPORT BAR INNER SIDE COVERS
6 - SPORT BAR INNER CENTER COVER

(3) Remove seal that is between the inner and outer covers (Fig. 31).

(4) Pull straight up on the sport bar outer to release the attachments.

(5) Remove sport bar outer cover from vehicle.

INSTALLATION - PT-27 ONLY

(1) Place sport bar outer cover into position (Fig. 31).

(2) Press clips on sport bar cover to the seated position.

(3) Install sport bar inner covers. (Refer to 23 - BODY/INTERIOR/SPORT BAR INNER COVERS - INSTALLATION).

(4) Install seal between sport bar interior and cover.

(5) Install right and left seat belt turning loops.

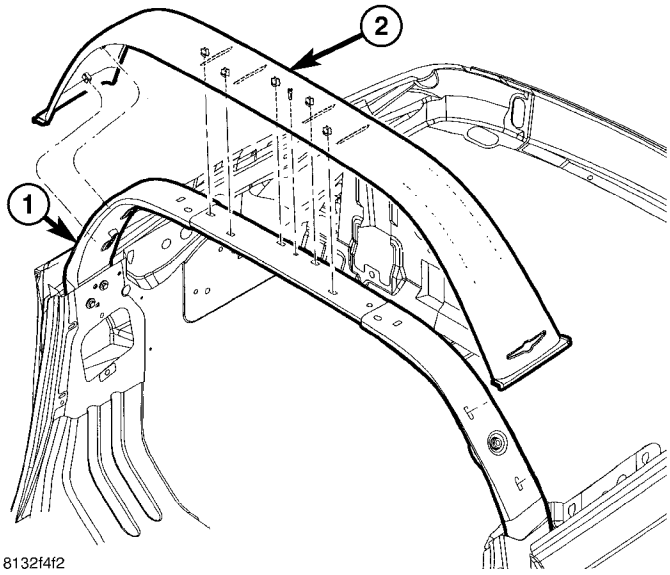

Fig. 31 SPORT BAR RAIL

1 - SPORT BAR RAIL

SUN VISOR

REMOVAL

PT

WARNING: ALL VEHICLES WITH DRIVER AND PASSENGER SIDE AIRBAGS MUST HAVE A COLORED CODED FIVE BULLET POINT AIRBAG WARNING LABEL APPLIED TO THE SUN VISOR, VERIFY LABEL AVAILABILITY AND ENSURE THE LABEL IS INSTALLED.

(1) Remove sun visor from center support.
(2) Remove screws attaching sun visor to roof header.
(3) Remove sun visor from header.
(4) If equipped, disconnect wire connector from body harness.
(5) Remove sun visor from vehicle.

REMOVAL - PT-27 ONLY

(1) Remove sun visor from sun visor retainer (Fig. 32).
(2) Remove screw attaching sun visor retainer.
(3) Remove retainer.
(4) Remove two screws attaching sun visor to windshield surround frame.
(5) Lower sun visor and disconnect wire connector, if equipped.
(6) Remove sun visor from vehicle.

INSTALLATION

PT

WARNING: ALL VEHICLES WITH DRIVER AND PASSENGER SIDE AIRBAGS MUST HAVE A COLORED CODED FIVE BULLET POINT AIRBAG WARNING LABEL APPLIED TO THE SUN VISOR, VERIFY LABEL AVAILABILITY AND ENSURE THE LABEL IS INSTALLED.

(1) Place sun visor in position.
(2) If equipped, connect wire connector from body harness.
(3) Install screws attaching sun visor to header.
(4) Install sun visor into center support.

INSTALLATION - PT-27 ONLY

(1) Place sun visor into position and connect wire connector, if equipped (Fig. 32).
(2) Install two screws attaching sun visor to windshield surround frame.
(3) Place retainer into position.

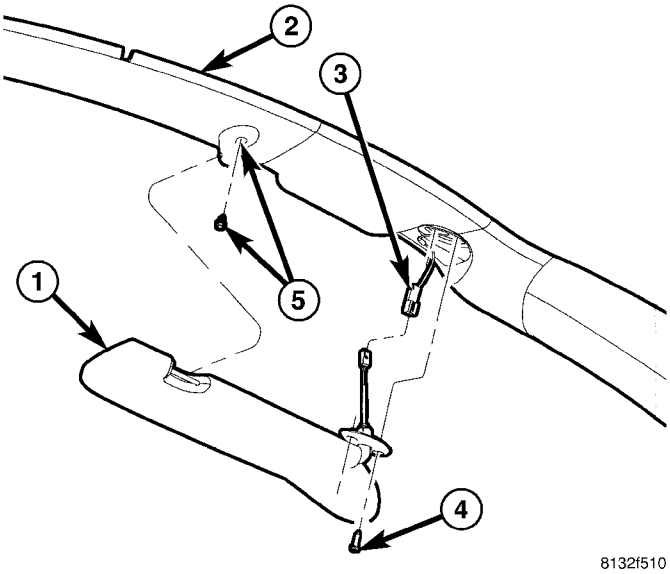

Fig. 32 SUNVISOR

1 - SUN VISOR
2 - WINDSHIELD SURROUND FRAME
3 - WIRE HARNESS CONNECTOR
4 - ATTACHING SCREW(S)
5 - SUN VISOR RETAINER AND SCREW

(4) Install screw attaching retainer.
(5) Attach sun visor to sun visor retainer.

TRUNK TRIM PANEL - PT-27

REMOVAL - PT-27 ONLY

(1) Remove decklid sill scuff plate (Fig. 33). (Refer to 23 - BODY/INTERIOR/DECKLID SILL SCUFF PLATE - REMOVAL).
(2) Disconnect power outlet/cargo lamp, if equipped (Fig. 34).
(3) Remove push pin fastener attaching trunk side trim panel (Fig. 35).
(4) Pull inward on trunk side trim panel to disengage clips.
(5) Remove trunk side trim panel from vehicle. Repeat operation for other side.

INSTALLATION - PT-27 ONLY

(1) Place trunk side trim panel into position (Fig. 35).
(2) Push clips on trunk side trim panel to the seated position.
(3) Install push pin fastener.
(4) Connect power outlet/cargo lamp, if equipped (Fig. 34).
(5) Disconnect power outlet/cargo lamp, if equipped.

TRUNK TRIM PANEL - PT-27 (Continued)

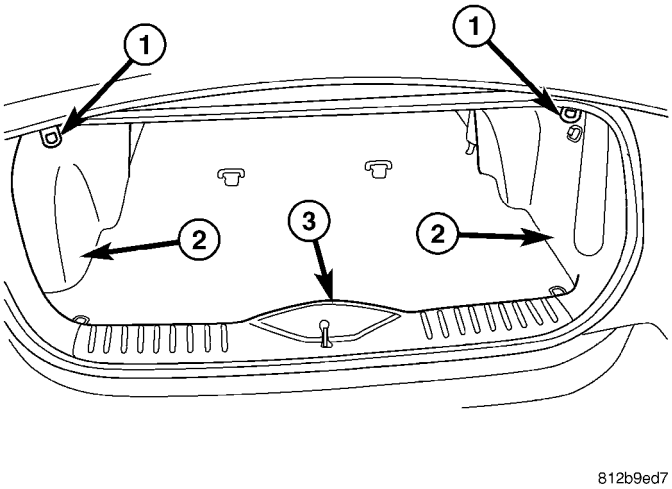

Fig. 33 TRUNK TRIM

(6) Install decklid sill scuff plate (Fig. 33). (Refer to 23 - BODY/INTERIOR/DOOR SILL SCUFF PLATE - INSTALLATION).

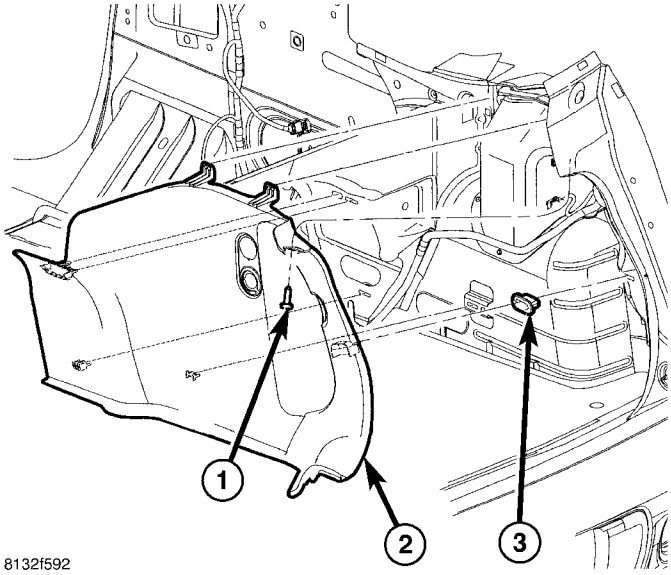

Fig. 35 TRUNK TRIM PANEL

1 - PUSH PIN FASTENER
2 - TRUNK TRIM PANEL
3 - PLASTIC NUT

TRUNK WELT - PT-27

REMOVAL - PT-27 ONLY

(1) Fold rear seats forward

(2) Start at a lower edge of welt and pull welt from rear seat back support (Fig. 36).

(3) Remove pass through welt from vehicle.

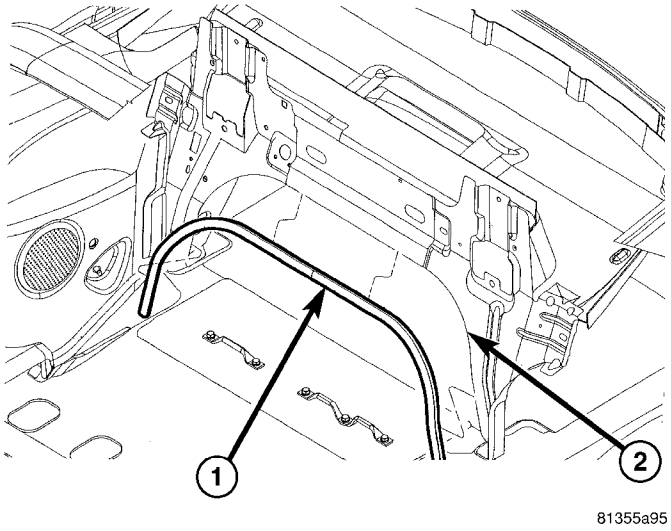

Fig. 36 TRUNK PASS THROUGH WELT

1 - PASS THROUGH WELT
2 - REAR SEAT BACK SUPPORT

TRUNK WELT - PT-27 (Continued)

INSTALLATION - PT-27 ONLY

(1) Place pass through welt into position (Fig. 36).

(2) Align paint dot on welt to BIW welt joint at top of pass through opening, and press onto flange. Trim welt over quarter trim as necessary.

(3) Move rear seats to the upright position.

UPPER C-PILLAR TRIM

REMOVAL

(1) Remove bolt attaching seat belt turning loop

(2) Disengage clips attaching trim to C-pillar (Fig. 37).

(3) Remove upper trim panel from vehicle.

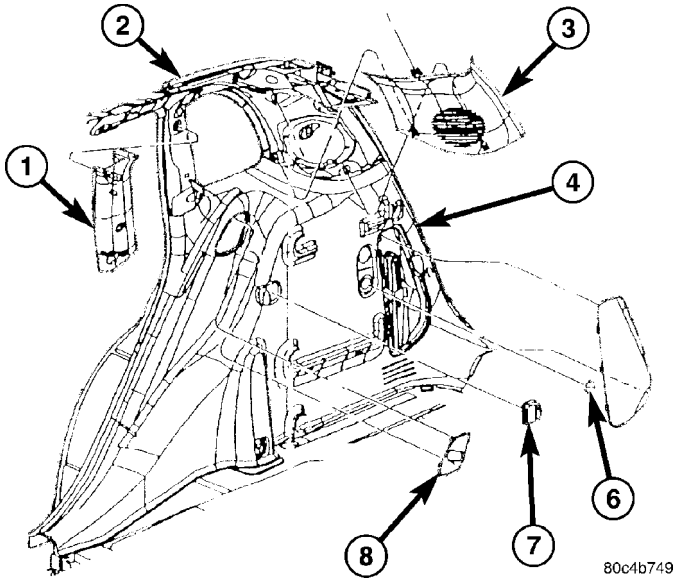

Fig. 37 UPPER C-PILLAR TRIM PANEL

1 - C-PILLAR UPPER TRIM PANEL
2 - REAR QUARTER PANEL
3 - D-PILLAR UPPER TRIM PANEL
4 - QUARTER LOWER TRIM PANEL
5 - JACK STORAGE ACCESS DOOR
6 - QUARTER TRIM PANEL LOWER PLUG
7 - VERTICAL BUMPER
8 - STRIKER ADJUSTMENT PLATE BEZEL

INSTALLATION

(1) Place C-pillar trim panel in position (Fig. 37).

(2) Push clips on trim panel into slots in upper C-pillar panel.

(3) Install bolt attaching seat belt turning loop. Tighten seat belt turning loop attaching bolt to 40 N·m (30 ft. lbs.) torque.

WINDSHIELD HEADER MOLDING -PT-27

REMOVAL - PT-27 ONLY

(1) Remove sun visor retainer and sun visor. (Refer to 23 - BODY/INTERIOR/SUN VISOR - REMOVAL) (Fig. 39).

(2) Using a trim stick, remove the header center molding from the windshield surround frame (Fig. 38).

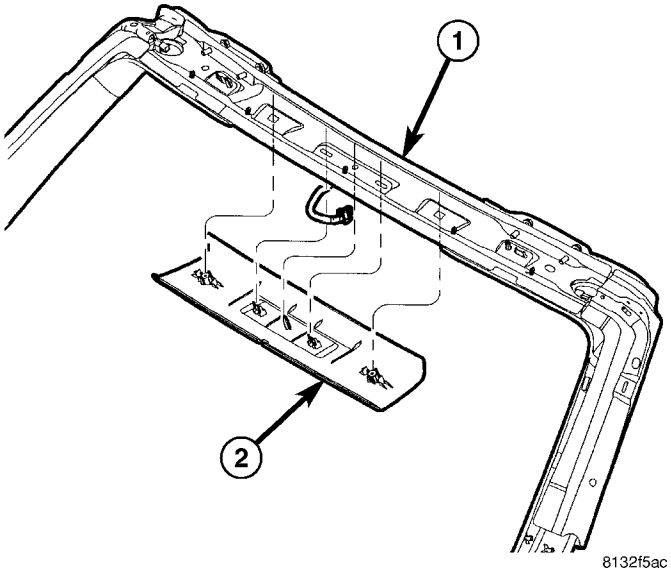

Fig. 38 HEADER CENTER MOLDING

LIFTGATE CHMSL ACCESS PANEL

REMOVAL

(1) Using a trim stick (C-4755), disengage clips holding CHMSL cover trim to liftgate (Fig. 1).

(2) Remove CHMSL cover trim from vehicle.

INSTALLATION

(1) Place CHMSL cover trim in position on vehicle (Fig. 1).

(2) Press tabs into position to hold CHMSL cover trim to liftgate.

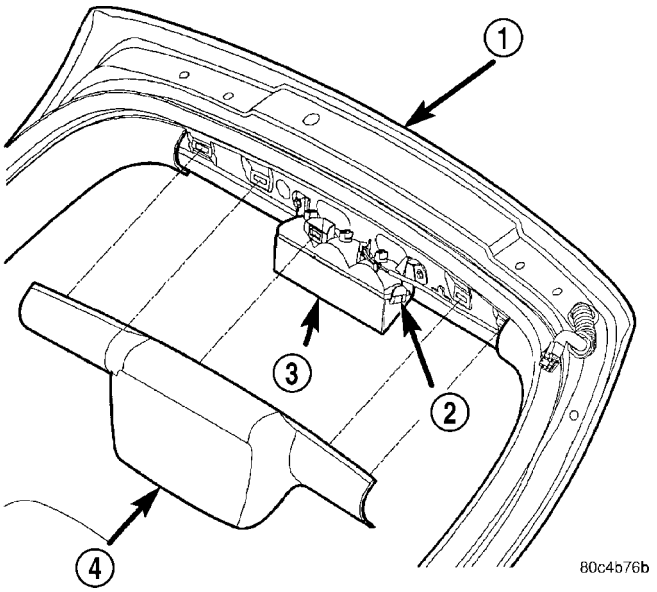

Fig. 1 CHMSL COVER TRIM

1 - LIFTGATE
2 - SNAP
3 - CHMSL LAMP
4 - CHMSL COVER

LIFTGATE OUTSIDE HANDLE

REMOVAL

(1) Remove liftgate trim (Fig. 3).

(2) Disconnect latch linkage and electrical connectors from liftgate control assembly (Fig. 2).

(3) Remove liftgate control assembly from liftgate.

(4) Remove fasteners attaching liftgate outside handle.

(5) Using a heat gun, apply heat to the wings to loosen the double sided tape for removal of the handle.

(6) Clean surface of any residua.

INSTALLATION

(1) Place liftgate outside handle into position. Remove protected cover from the two side tape (Fig. 3).

(2) Install handle fasteners. Tighten two nuts to 7 N·m (60 in. lbs.).

(3) Install liftgate control assembly onto liftgate.

LIFTGATE OUTSIDE HANDLE (Continued)

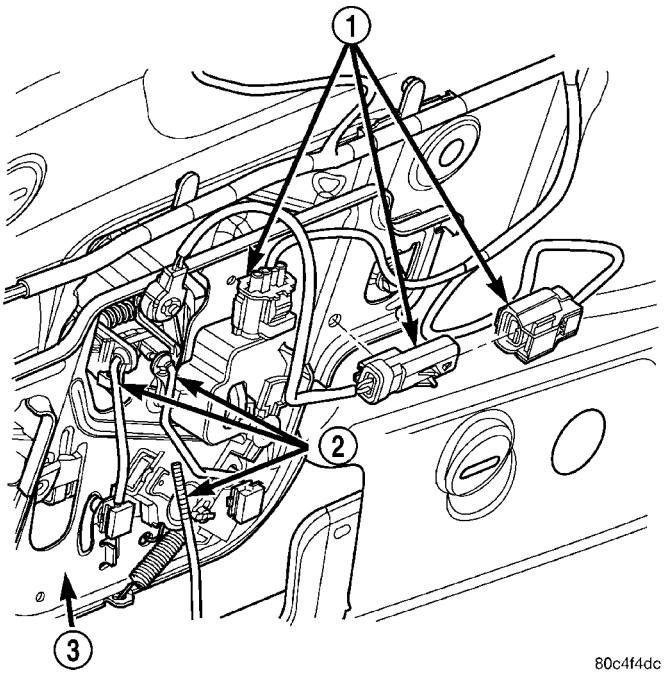

Fig. 2 LINKAGE AND ELECTRICAL CONNECTORS REMOVAL/INSTALLATION

1 - ELECTRICAL WIRING CONNECTORS

3 - LIFTGATE
4 - ATTACHING PUSH NUTS
5 - ATTACHING NUTS

(4) Connect latch linkages and electrical connectors (Fig. 2).

(5) Install liftgate trim panel.

LIFTGATE HINGE

REMOVAL

(1) Release liftgate latch and open liftgate.

(2) Support liftgate on a suitable lifting device in the full open position.

(3) Apply several layers of duct tape on the outside of to roof across the gap to the lift gate to hold the liftgate in position.

(4) Remove bolts attaching liftgate hinge to roof header.

(5) Remove bolts attaching hinge to liftgate (Fig. 4).

(6) Remove hinge from vehicle.

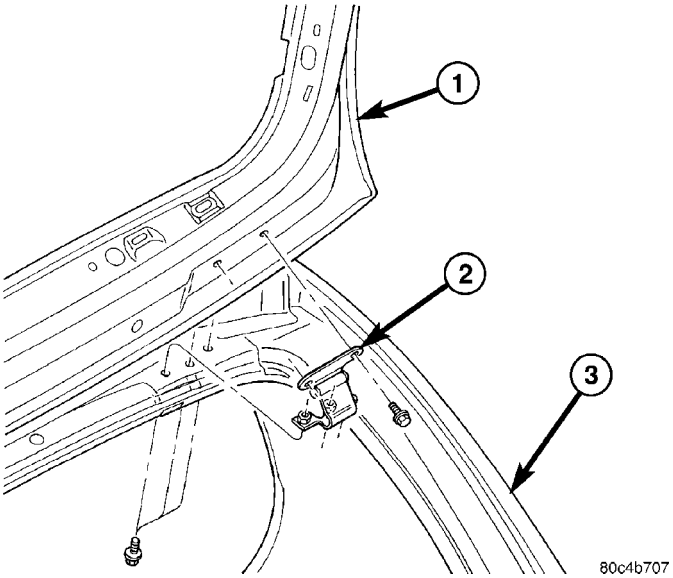

Fig. 4 LIFTGATE HINGE

1 - LIFTGATE
2 - LIFTGATE HINGE
3 - LIFTGATE OPENING

INSTALLATION

(1) If necessary, paint replacement hinge before installation.

(2) Place hinge in position on vehicle (Fig. 4).

(3) Align hinge to marks on liftgate.

(4) Install bolts attaching hinge to liftgate. Tighten bolts to 33 N·m (24 ft. lbs.) torque.

(5) Align hinge to marks on roof header.

(6) Install bolts attaching liftgate hinge to roof header. Tighten outer two bolts to 33 N·m (24 ft. lbs.) torque. The sheet medal screw at center 12 N·m (105 in. lbs.)

(7) Remove duct tape from roof and liftgate.

(8) Verify liftgate alignment. Refer to Liftgate Remove and Installation for proper gap measurements.

LIFTGATE LATCH

REMOVAL

(1) Remove liftgate trim panel.
(2) Disengage outside handle link from clip on latch.
(3) Disconnect wire connector from liftgate ajar switch (Fig. 5).
(4) Remove screws attaching latch to liftgate.
(5) Remove latch from vehicle.

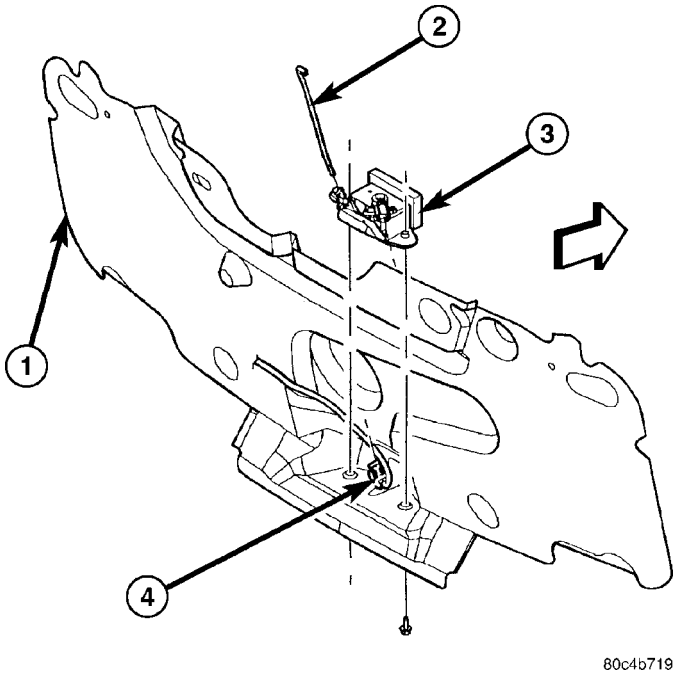

Fig. 5 LIFTGATE LATCH

1 - WATER SHIELD LIFTGATE INNER PANEL
2 - CONTROL ASSEMBLY TO LIFTGATE LATCH LINK
3 - LIFTGATE LATCH
4 - WIRING CONNECTOR

INSTALLATION

(1) Place latch in position on vehicle.
(2) Install screws attaching latch to liftgate. Tighten to 16 N·m (12 ft. lbs.) torque (Fig. 5).
(3) Pull downward on outside handle link and engage link to clip on latch.
(4) Connect wire connector to liftgate ajar switch.
(5) Verify liftgate fit and operation. Adjust as necessary.
(6) Install liftgate trim panel.

LIFTGATE INNER CONTROL ASSEMBLY PANEL

REMOVAL

(1) Remove liftgate trim panel.
(2) Disconnect linkage (Fig. 6).
(3) Remove fasteners attaching control assembly inner panel.
(4) Remove control assembly inner panel from vehicle.

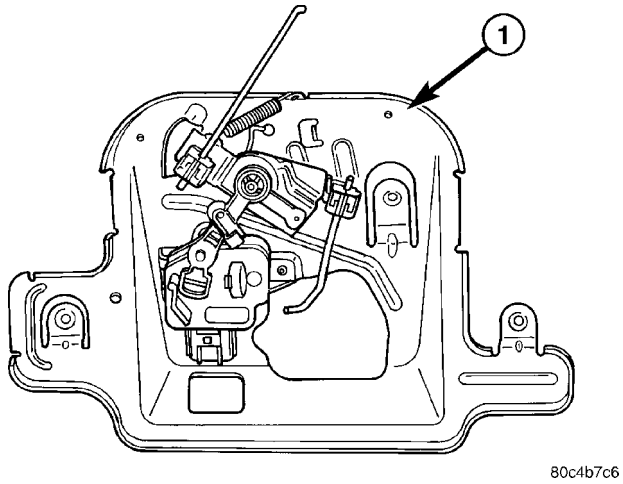

Fig. 6 LIFTGATE CONTROL ASSEMBLY INNER PANEL

1 - LIFTGATE CONTROL ASSEMBLY INNER PANEL

INSTALLATION

(1) Place into position control assembly inner panel (Fig. 6).
(2) Tighten control assembly inner panel fasteners.
(3) Verify liftgate operation.

LATCH STRIKER

REMOVAL

(1) Open liftgate.
(2) Mark outline of striker on sill to aid installation.
(3) Remove screws attaching striker to sill (Fig. 7).
(4) Remove striker from vehicle.

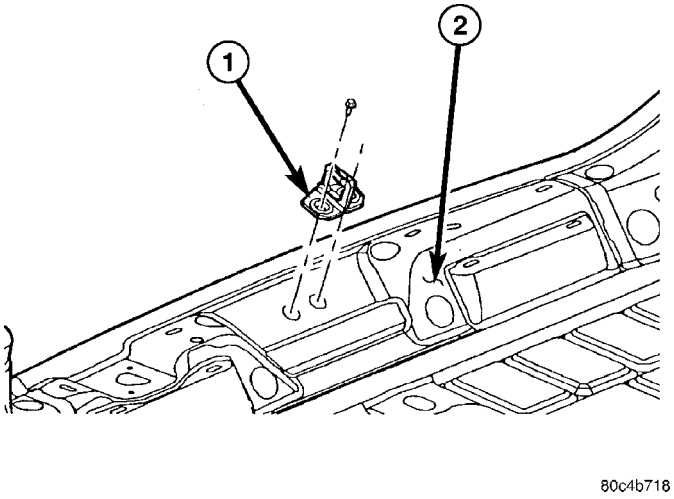

Fig. 7 LIFTGATE LATCH STRIKER

1 - LIFTGATE LATCH STRIKER
2 - LIFTGATE OPENING LOWER CENTER PANEL

INSTALLATION

(1) Place striker in position on vehicle (Fig. 7).
(2) Align striker to outline mark on sill.
(3) Install screws attaching striker to sill. Tighten screws to 28 N·m (21 ft. lbs.) torque.
(4) Verify liftgate alignment and operation.

LIFTGATE

REMOVAL

(1) Release liftgate latch and open liftgate.
(2) Remove screws attaching liftgate wire connector to rear header.
(3) Disconnect liftgate wire harness from body wire harness.
(4) Remove liftgate upper frame molding.
(5) Disconnect rear window washer hose from spray nozzle.
(6) Support liftgate on a suitable lifting device.
(7) Remove screws attaching support cylinders to liftgate.
(8) Remove bolts attaching liftgate hinge to roof header (Fig. 8).
(9) With assistance, remove liftgate from vehicle.

INSTALLATION

(1) With assistance, place liftgate in position on vehicle.
(2) Install bolts attaching liftgate hinge to roof header. Tighten bolts to 33 N·m (24 ft. lbs.) torque (Fig. 8).
(3) Install screws attaching support cylinders to liftgate. Tighten bolts to 28 N·m (21 ft. lbs.) torque.
(4) Remove lifting device from under liftgate.
(5) Connect liftgate wire harness into body wire harness.
(6) Install screws attaching wire connector to rear header.
(7) Connect rear window washer hose onto spray nozzle.
(8) Install liftgate upper frame molding.

LIFTGATE (Continued)

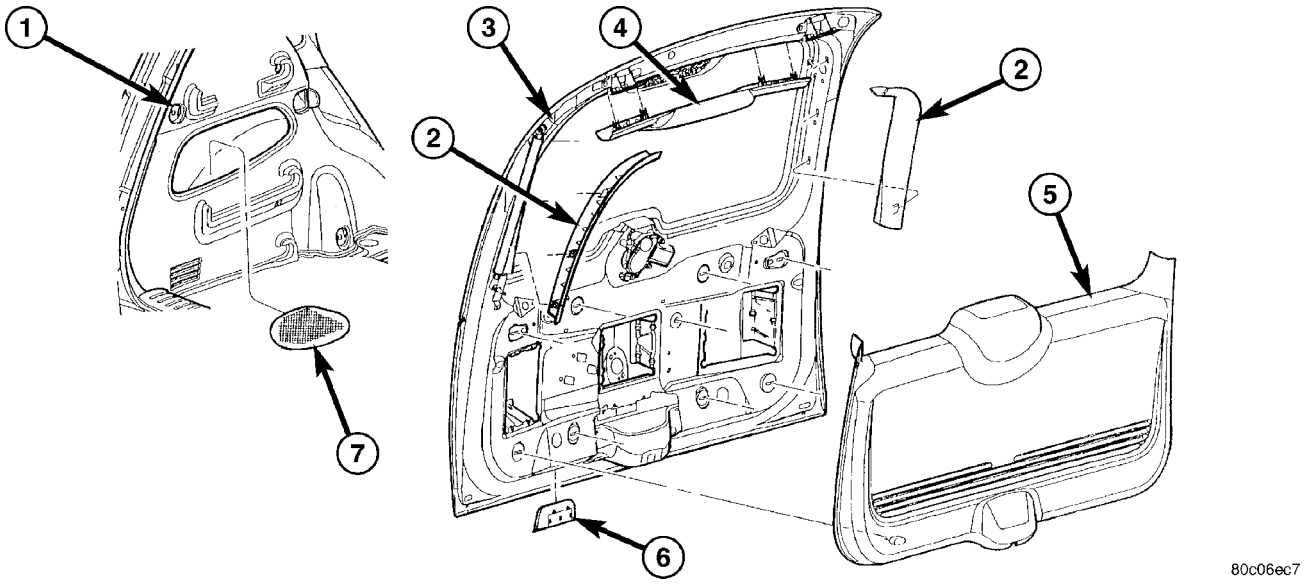

Fig. 8 LIFTGATE

1 - EDGE OF LIFTGATE TROUGH
2 - LIFTGATE HALO
3 - LIFTGATE
4 - CHMSL COVER TRIM
5 - LIFTGATE TRIM PANEL
6 - LIFTGATE PULL CUP
7 - REAR CONVENIENCE BEZEL

(9) Verify liftgate alignment. The liftgate should have a gap to adjacent panels and fit flush across the gaps. The gap is;

- 7 mm (0.280 in.) to the fascia,
- 6 mm (0.240 in.) to the roof,
- 4 mm (0.160 in.) to the aperture.

LIFTGATE LOCK CYLINDER

REMOVAL

NOTE: Do not remove E-clip.

(1) Remove outside liftgate handle.
(2) Remove lock cylinder clip from handle (Fig. 9).
(3) Remove lock cylinder and arm from handle.

INSTALLATION

(1) Install lock cylinder clip into liftgate (Fig. 9).
(2) Push lock cylinder into handle until clip engages groove in lock cylinder with an audible click.
(3) Install outside liftgate handle.
(4) Verify lock cylinder operation.

LIFTGATE SUPPORT ROD

REMOVAL

(1) Release liftgate latch and open liftgate.
(2) Support liftgate on a suitable lifting device in the full open position.

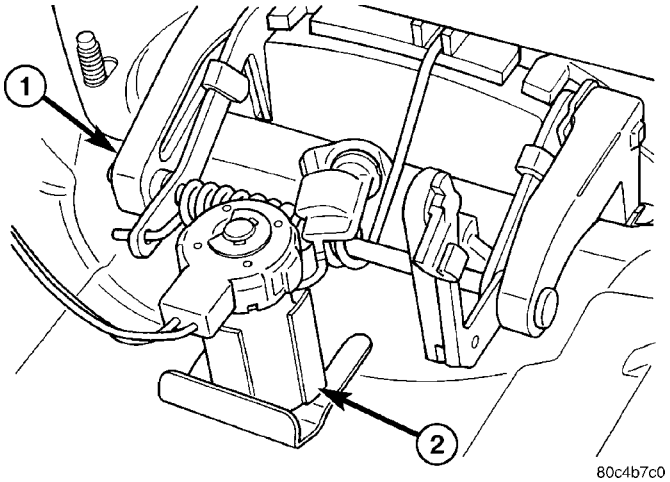

Fig. 9 LOCK CYLINDER REMOVAL

1 - LIFTGATE HANDLE
2 - LIFTGATE LOCK CYLINDER

(3) Pull liftgate opening weatherstrip from D-pillar flange next to prop assembly end pivot.
(4) Remove bolt attaching end pivot to D-pillar (Fig. 10).
(5) Remove bolt attaching prop assembly to liftgate.
(6) Remove prop assembly from vehicle.

INSTALLATION

Ensure that the cylinder end is attached to the D-pillar and the shaft end is attached to the liftgate (Fig. 10).

LIFTGATE SUPPORT ROD (Continued)

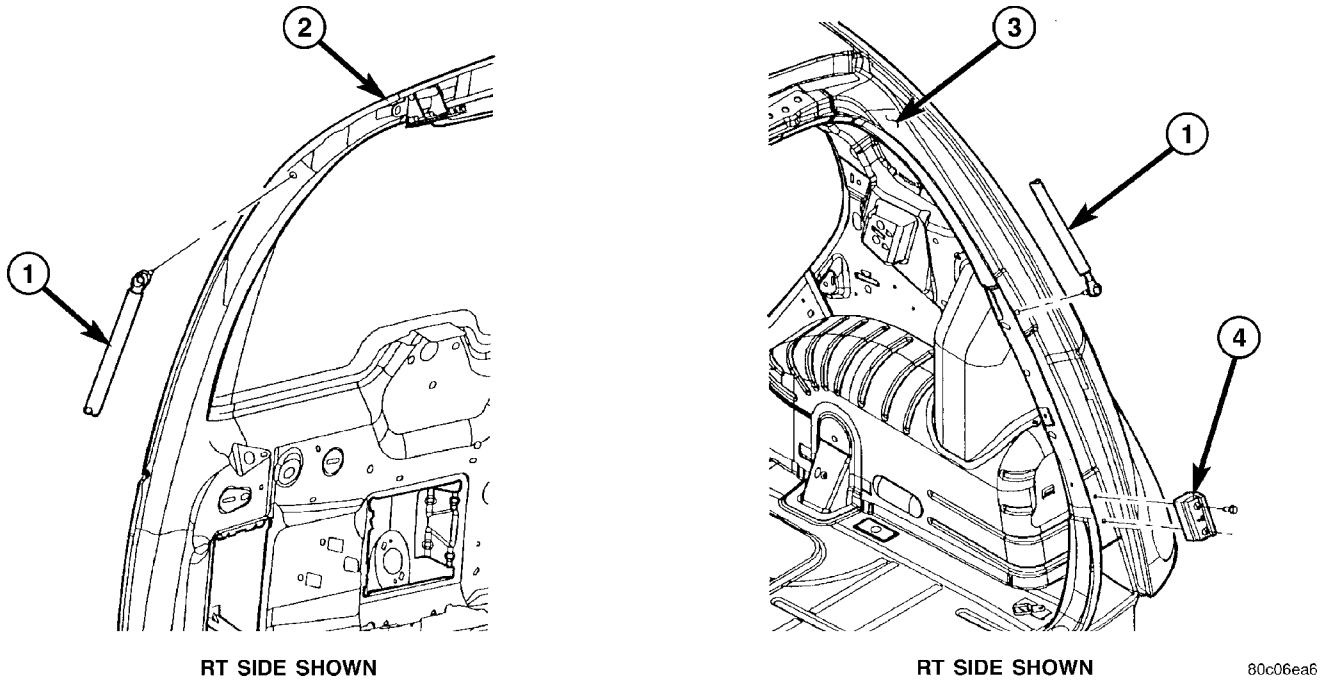

Fig. 10 LIFTGATE PROP ASSEMBLY

1 - LIFTGATE GAS PROP ROD
2 - LIFTGATE ASSEMBLY
3 - LIFTGATE SIDE DRAIN TROUGH
4 - DRAIN TROUGH OUTER STABLE BUMPER

(1) Place prop assembly position.
(2) Install bolt attaching prop assembly to liftgate.
(3) Install bolt attaching end pivot to D-pillar. Tighten bolts to 28 N·m (21 ft. lbs.) torque.
(4) Install liftgate opening weatherstrip to D-pillar flange next to prop assembly end pivot.
(5) Close liftgate. Check liftgate operation.

LIFTGATE TRIM PANEL

REMOVAL

(1) Open liftgate.
(2) Using a trim stick (C-4755), disengage clips attaching CHMSL cover trim to liftgate (Fig. 1).
(3) Remove CHMSL cover trim from vehicle.
(4) Using a trim stick (C-4755), disengage clips attaching liftgate halo trim panels both sides (Fig. 8).
(5) Remove halo trim panels trim from vehicle.
(6) Using a trim stick (C-4755), disengage clips attaching liftgate trim panel (Fig. 8).
(7) Remove liftgate trim panel trim from vehicle.

INSTALLATION

(1) Place liftgate trim panel in position on vehicle (Fig. 8).
(2) Press tabs into position to attaching liftgate trim panel to liftgate.
(3) Place liftgate halo trim panels in position on vehicle, both sides (Fig. 8).
(4) Press tabs into position to attaching liftgate halo trim panels to liftgate.
(5) Place CHMSL cover trim in position on vehicle (Fig. 1).
(6) Press tabs into position to hold CHMSL cover trim to liftgate.
(7) Close liftgate.

BASECOAT/CLEARCOAT FINISH

DESCRIPTION

On most vehicles a two-part paint application (basecoat/clearcoat) is used. Color paint that is applied to primer is called basecoat. The clearcoat protects the basecoat from ultraviolet light and provides a durable high-gloss finish.

CAUTION: Do not use abrasive chemicals or compounds on painted surfaces. Damage to finish can result.
Do not use harsh alkaline based cleaning solvents on painted surfaces. Damage to finish or color can result.

PAINT CODE

DESCRIPTION

Exterior vehicle body colors are identified on the Body Code plate. (Refer to VEHICLE DATA/VEHICLE INFORMATION/BODY CODE PLATE - DESCRIPTION). The paint code is also identified on the Vehicle Safety Certification Label which is located on the drivers door shut face. The first digit of the paint code listed on the vehicle indicates the sequence of application, i.e.: P = primary coat, Q = secondary coat. The codes listed in the Color Code Chart are used for manufacturing purposes.

PAINT TOUCH-UP

DESCRIPTION

When a painted metal surface has been scratched or chipped, it should be touched up as soon as possible to avoid corrosion. For best results, use Mopar® Scratch Filler/Primer, Touch Up Paints and Clear Top Coat. (Refer to VEHICLE DATA/VEHICLE INFORMATION/BODY CODE PLATE - DESCRIPTION).

WARNING: USE AN OSHA APPROVED RESPIRATOR AND SAFETY GLASSES WHEN SPRAYING PAINT OR SOLVENTS IN A CONFINED AREA. PERSONAL INJURY CAN RESULT.

TOUCH UP PROCEDURE

(1) Scrape loose paint and corrosion from inside scratch or chip.

(2) Clean affected area with Mopar® Tar/Road Oil Remover, and allow to dry.

(3) Fill the inside of the scratch or chip with a coat of filler/primer. Do not overlap primer onto good surface finish. The applicator brush should be wet enough to puddle-fill the scratch or chip without running. Do not stroke brush applicator on body surface. Allow the filler/primer to dry hard.

(4) Cover the filler/primer with color touch up paint. Do not overlap touch up color onto the original color coat around the scratch or chip. Butt the new color to the original color, if possible. Do not stroke applicator brush on body surface. Allow touch up paint to dry hard.

(5) On vehicles without clearcoat, the touch up color can be lightly finesse sanded (1500 grit) and polished with rubbing compound.

(6) On vehicles with clearcoat, apply clear top coat to touch up paint with the same technique as described in Step 4. Allow clear top coat to dry hard. If desired, Step 5 can be performed on clear top coat.

WARNING: AVOID PROLONGED SKIN CONTACT WITH PETROLEUM OR ALCOHOL – BASED CLEANING SOLVENTS. PERSONAL INJURY CAN RESULT.

FINESSE SANDING/BUFFING & POLISHING

DESCRIPTION

Minor acid etching, orange peel, or smudging in clearcoat or single-stage finishes can be reduced with light finesse sanding, hand buffing, and polishing. **If the finish has been finesse sanded in the past, it cannot be repeated. Finesse sanding operation should be performed by a trained automotive paint technician.**

CAUTION: Do not remove clearcoat finish, if equipped. Basecoat paint must retain clearcoat for durability.

ADJUSTMENT 143

QUARTER GLASS - PT-27

REMOVAL

(1) Raise quarter glass to full up position, if possible, to aid in removal.

(2) Remove quarter trim panel. (Refer to 23 - BODY/INTERIOR/QUARTER PANEL TRIM - REMOVAL).

(3) Lower convertible top.

(4) Remove water dam.

(5) Disconnect wire connector to power window motor.

(6) Remove fasteners attaching quarter window module to inner quarter panel (Fig. 1).

(7) Lift quarter window module upward and out opening at top of quarter panel.

(8) Separate quarter glass from quarter window module.

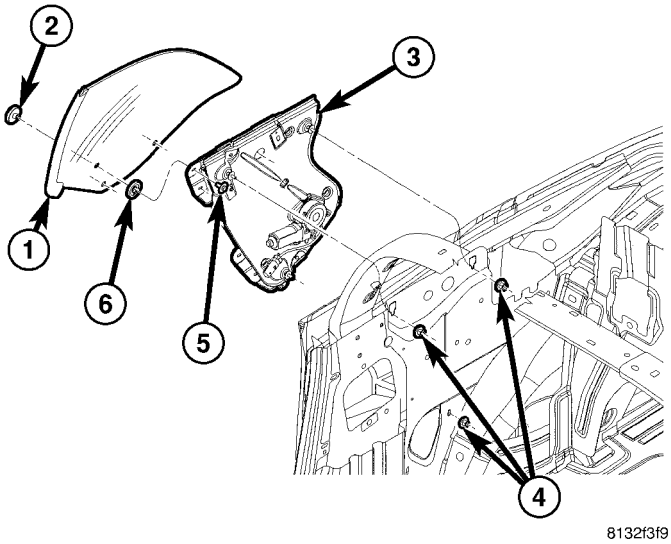

Fig. 1 QUARTER WINDOW REGULATOR

1 - QUARTER WINDOW GLASS
2 - QUARTER GLASS RETAINER AND NUT
3 - QUARTER WINDOW REGULATOR
4 - REGULATOR ATTACHING NUTS
5 - QUARTER GLASS ATTACHING SCREW
6 - GLASS TO LIFT PLATE BUSHING

INSTALLATION

(1) Raise glass lift channel to full up position.

(2) Position quarter glass on quarter window module (Fig. 1).

(3) Loosely install fasteners holding quarter glass to quarter window module.

(4) Lower convertible top.

(5) Lower quarter window module into position through opening in top of quarter panel.

(6) Install fasteners holding quarter window module to inner quarter panel.

(7) Connect wire connector to power window motor.

(8) Adjust quarter glass as necessary (Refer to 23 - BODY/ADJUSTABLE QUARTER GLASS - ADJUSTMENTS).

(9) Install water dam. (Refer to 23 - BODY/DOOR - FRONT/WATER DAM - INSTALLATION).

(10) Install quarter trim panel. (Refer to 23 - BODY/INTERIOR/QUARTER PANEL TRIM - INSTALLATION).

ADJUSTMENTS

ADJUSTMENT

Refer to Front Door Glass - Adjustments PT-27 for proper adjustment procedures. (Refer to 23 - BODY/DOOR - FRONT/DOOR GLASS - ADJUSTMENTS).

CHILD SEAT TETHER ANCHOR BEZEL

REMOVAL

(1) Lay rear seat back down (Fig. 1).

(2) Remove screws attaching Child Tether anchor bezel.

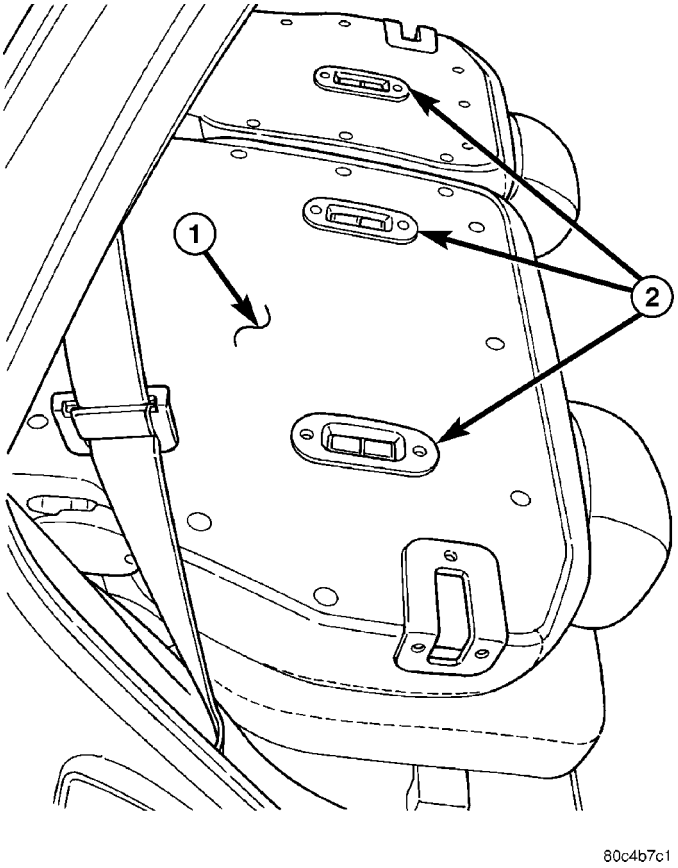

Fig. 1 CHILD TETHER ANCHOR BEZEL

1 - REAR SEAT BACK
2 - CHILD TETHER ANCHOR BEZEL

INSTALLATION

(1) Place Child Tether anchor bezel in position (Fig. 1).

(2) Install screws attaching bezels.

FRONT SEAT

REMOVAL

WARNING: BEFORE SERVICING THE SEAT THE AIRBAG SYSTEM MUST BE DISARMED. FAILURE TO DO SO MAY RESULT IN ACCIDENTAL DEPLOYMENT OF THE AIRBAG AND POSSIBLE PERSONAL INJURY. REFER TO RESTRAINT SYSTEMS FOR SERVICE PROCEDURES.

(1) Move seat to forward position.

(2) Remove bolts attaching rear of the seat track.

(3) Move seat to rearward position.

(4) Remove bolts attaching front of seat track to floor (Fig. 2).

(5) Disengage electrical connectors, if equipped.

(6) Remove seat from vehicle.

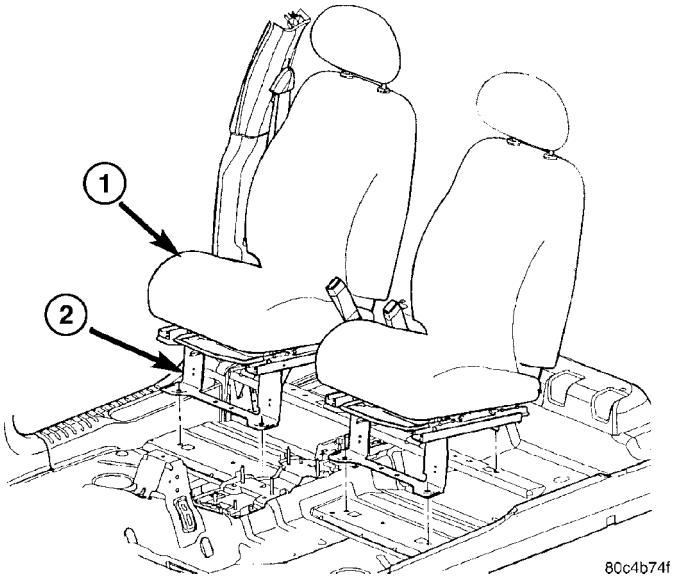

Fig. 2 FRONT SEAT

1 - FRONT SEAT ASSEMBLY
2 - FRONT SEAT RISER

INSTALLATION

WARNING: BEFORE SERVICING THE SEAT THE AIRBAG SYSTEM MUST BE DISARMED. FAILURE TO DO SO MAY RESULT IN ACCIDENTAL DEPLOYMENT OF THE AIRBAG AND POSSIBLE PERSONAL INJURY. REFER TO RESTRAINT SYSTEMS FOR SERVICE PROCEDURES.

(1) Place seat into position in vehicle. Do not use the head restraint, side shield, recliner handle, or the adjuster lift bar to move the seat (Fig. 2).

(2) Engage electrical connectors, if equipped.

(3) Install bolts attaching seat track to floor crossmember. Tighten front seat bolt to 55 N·m (40 ft. lbs.) torque.

(4) Install rear seat track attaching bolts. Tighten rear seat bolts to 55 N·m (40 ft. lbs.) torque.

FRONT SEAT BACK - WITH FRONT SEAT BACK PANEL

REMOVAL

WARNING: BEFORE SERVICING THE SEAT BACK THE AIRBAG SYSTEM MUST BE DISARMED. FAILURE TO DO SO MAY RESULT IN ACCIDENTAL DEPLOYMENT OF THE AIRBAG AND POSSIBLE PERSONAL INJURY. REFER TO RESTRAINT SYSTEMS FOR SERVICE PROCEDURES.

CAUTION: Do not reuse the recliner assembly attaching bolts.

(1) Remove seat from vehicle (Refer to 23 - BODY/SEATS/SEAT - REMOVAL).

(2) Remove the inner seat cushion shield (Fig. 3).

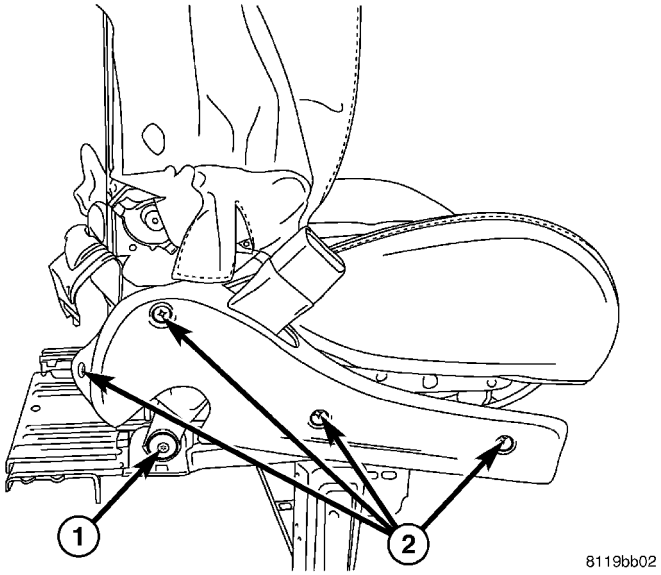

Fig. 3 SEAT SIDE SHIELD - INBOARD

INSTALLATION

INSTALLATION

(1) Position cover at the top of seat back.
(2) Carefully roll cover down to the area that hog rings are to be installed.
(3) Install hog rings.
(4) Roll cover downward.
(5) Engage the J-strap retainer
(6) Install new head restraint sleeve guides.
(7) Install seat back to seat cushion. Tighten bolts to 40 N·m (30 ft. lbs.) torque.
(8) Install seat in vehicle.
(9) Install head restraint.
(10) Check seat back and headrest operation.

INSTALLATION - PT-27 ONLY

(1) Place seat back panel on to the foam. Roll seat cover onto the back panel and foam (Fig. 230) and (Fig. 231).

REAR SEAT CUSHION

REMOVAL

REMOVAL

(1) Remove seat from vehicle.
(2) Remove rear seat cushion side shields.
(3) Remove seat back.
(4) Remove rear seat and track assembly.
(5) Disengage J-strap attaching seat cover from the seat cushion frame.
(6) Pull cover off to the hog rings.
(7) Cut hog rings attaching seat cover to seat cushion pad.
(8) Remove seat cushion cover from seat cushion.

REMOVAL - PT-27 ONLY

(1) Remove seat from vehicle (Refer to 23 - BODY/SEATS/SEAT - REMOVAL).
(2) Remove rear seat back (Refer to 23 - BODY/SEATS/REAR SEAT BACK - REMOVAL).
(3) Remove seat cushion.

INSTALLATION

INSTALLATION

(1) Position seat cover on cushion.
(2) Align seat cover with cushion alignment indentations.
(3) Install hog rings.
(4) Engage J-strap attaching seat cover to cushion frame.
(5) Install rear seat and track assembly. Tighten front track to pan bolts to 12 N·m (9 ft. lbs.) torque.
(6) Install seat back.
(7) Install rear seat cushion side shields.
(8) Install seat in vehicle.

INSTALLATION - PT-27 ONLY

(1) Place seat cushion position.
(2) Install seat back. (Refer to 23 - BODY/SEATS/REAR SEAT BACK - INSTALLATION).
(3) Install seat in vehicle. (Refer to 23 - BODY/SEATS/REAR SEAT - INSTALLATION).

REAR SEAT BACK CUSHION / COVER

REMOVAL

(1) Remove seat from vehicle.
(2) Remove rear seat cushion side shields.
(3) Remove seat back.
(4) Remove track assembly.
(5) Disengage J-strap attaching seat cover from the seat cushion frame.
(6) Pull cover off to the hog rings.
(7) Cut hog rings attaching seat cover to seat cushion pad.
(8) Remove seat cushion cover from seat cushion.

INSTALLATION

(1) Position seat cover on cushion.
(2) Align seat cover with cushion alignment indentations.
(3) Install hog rings.
(4) Engage J-strap attaching seat cover to front of seat cushion frame.
(5) Install track assembly. Tighten front track to pan bolts to 12 N·m (9 ft. lbs.) torque.
(6) Install seat back.
(7) Install rear seat cushion side shields.
(8) Install seat in vehicle.

REAR SEAT LATCH COVER

REMOVAL

(1) Fold the rear seats forward.
(2) Press the locking tabs down on each side of the latch cover (Fig. 255).

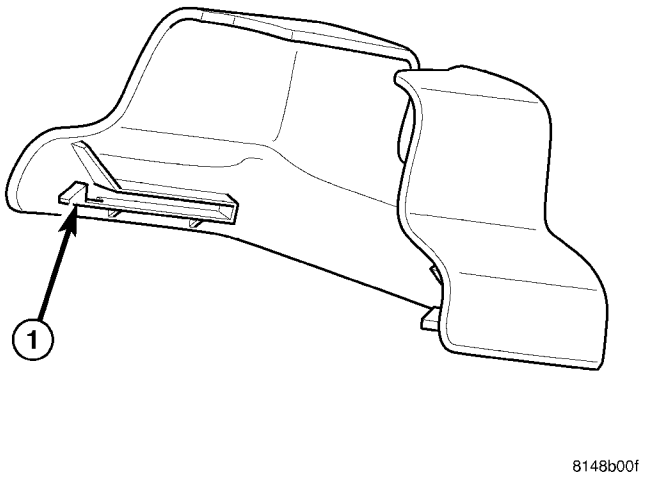

Fig. 255 REAR SEAT LATCH COVER

1 - LOCKING TAB

(3) Slide the latch cover forward to remove it from the latch (Fig. 256).
(4) Remove latch cover from vehicle.

REAR SEAT LATCH COVER (Continued)

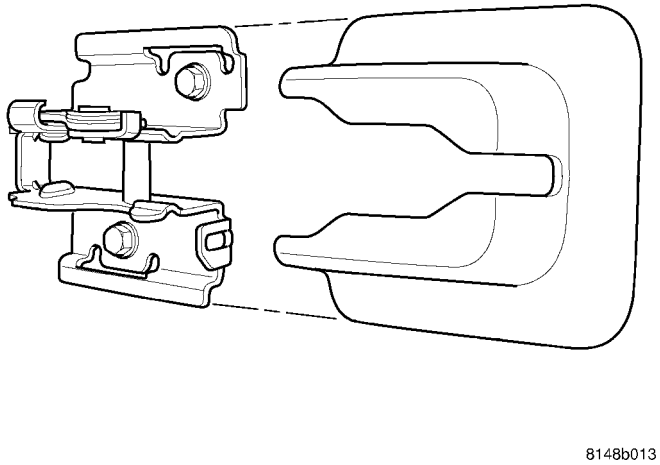

Fig. 256 REAR SEAT LATCH AND COVER

INSTALLATION

(1) Place latch cover in front of the latch (Fig. 257).

(2) Slide the latch cover rearward on to the latch.

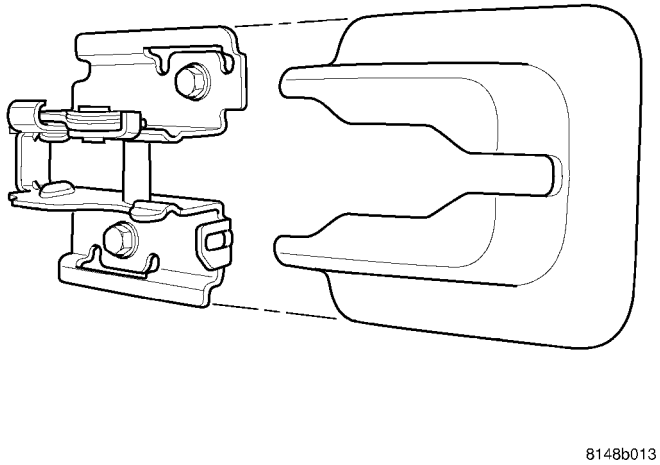

Fig. 257 REAR SEAT LATCH AND COVER

(3) Ensure locking tabs are locked into position (Fig. 258).

(4) Fold the rear seats rearward into position.

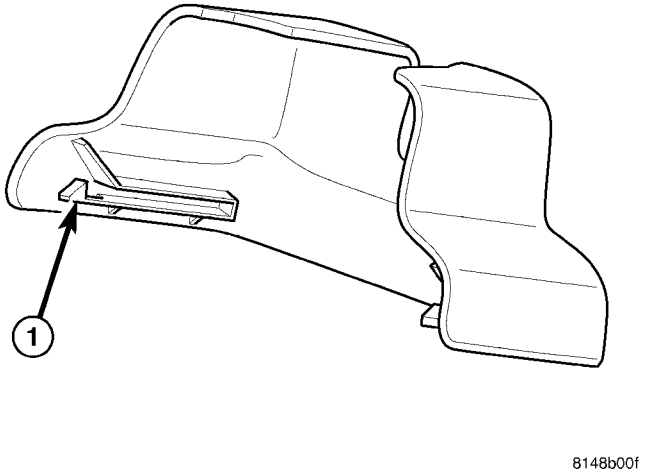

Fig. 258 REAR SEAT LATCH COVER

1 - LOCKING TAB

UNDER SEAT STORAGE BIN

REMOVAL

(1) Open cargo bin.

(2) Pull cargo bin out until it reaches the end of the guide (Fig. 259).

(3) Lift upward on cargo bin and remove.

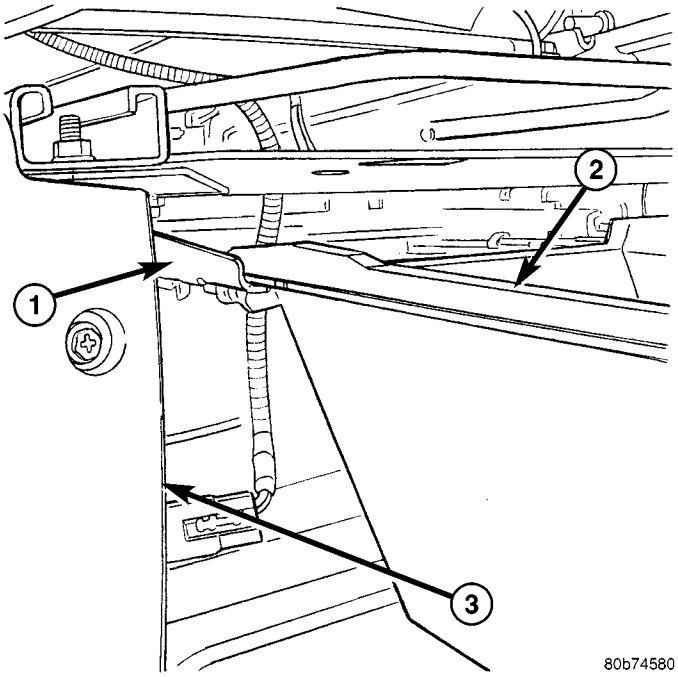

Fig. 259 CARGO BIN

1 - CARGO BIN TRACK
2 - CARGO BIN
3 - SEAT TRIM

UNDER SEAT STORAGE BIN (Continued)

INSTALLATION

(1) Position cargo bin into cargo bin guides.

(2) Lift upward on front of cargo bin to engage cargo bin stop.

(3) Slide cargo bin to the fully closed position (Fig. 260).

REMOVAL

WARNING: DO NOT OPERATE THE VEHICLE WITHIN 24 HOURS OF WINDSHIELD INSTALLATION. IT TAKES AT LEAST 24 HOURS FOR URETHANE ADHESIVE TO CURE. IF IT IS NOT CURED, THE WINDSHIELD MAY NOT PERFORM PROPERLY IN AN ACCIDENT. BE SURE TO REFER TO THE URETHANE MANUFACTURER'S DIRECTIONS FOR CURING TIME SPECIFICATIONS, AND DO NOT USE ADHESIVE AFTER ITS EXPIRATION DATE.
CAUTION: Open the left front door glass before installing the rear window to avoid pressurizing the passenger compartment if a door is slammed before the urethane bonding is fully cured. Water leaks can result

Refer to the Windshield Removal procedure for a description of tools and adhesive systems that are recommended for use in this procedure.

(1) Remove liftgate trim panels (Fig. 1).

(2) Disconnect wire connectors from rear window defogger (Fig. 2)

(3) Disconnect and remove CHMSL lamp.

WARNING: WEAR EYE AND HAND PROTECTION WHEN HANDLING SAFETY GLASS. PERSONAL INJURY CAN RESULT.

CAUTION: Do not damage body or trim finish when cutting out glass or applying fence primer.

(4) Cut the urethane around the perimeter of the rear window glass. Refer to Windshield for proper procedures.

(5) Remove the rear window from the vehicle.

(6) Prepare the work area, window fence, and glass the same way as described in the Windshield Installation procedure.

INSTALLATION

WARNING: DO NOT OPERATE THE VEHICLE WITHIN 24 HOURS OF WINDSHIELD INSTALLATION. IT TAKES AT LEAST 24 HOURS FOR URETHANE ADHESIVE TO CURE. IF IT IS NOT CURED, THE WINDSHIELD MAY NOT PERFORM PROPERLY IN AN ACCIDENT. BE SURE TO REFER TO THE URETHANE MANUFACTURER'S DIRECTIONS FOR CURING TIME SPECIFICATIONS, AND DO NOT USE ADHESIVE AFTER ITS EXPIRATION DATE.

CAUTION: OPEN THE LEFT FRONT DOOR GLASS BEFORE INSTALLING THE REAR WINDOW TO AVOID PRESSURIZING THE PASSENGER COMPARTMENT IF A DOOR IS SLAMMED BEFORE THE URETHANE BONDING IS FULLY CURED. WATER LEAKS CAN RESULT.

3 - LIFTGATE GLASS MOLDING
4 - LIFTGATE INNER PANEL

Refer to the Windshield Removal procedure for a description of tools and adhesive systems that are recommended for use in this procedure.

(1) Install the Liftgate window molding on glass.

(2) Apply a 10 mm (0.4 in.) bead of urethane around the perimeter of the glass.

(3) Place liftgate window glass into position (Fig. 3)

(4) Install the glass in the same manner described in the Windshield Install.

(5) Connect rear window defogger wiring (Fig. 2)

(6) After urethane has cured, water test rear window to verify repair. Verify rear window defogger operation.

(7) Install and connect the CHMSL lamp.

(8) Install liftgate trim panels (Fig. 1).

QUARTER WINDOW

REMOVAL

Refer to the Windshield Removal procedure for a description of tools and adhesive systems that are recommended for use in this procedure.

(1) Open liftgate

(2) Remove C & D Pillar upper trim panel (Fig. 4).

(3) Remove lower quarter trim panel as necessary (Fig. 5).

(4) Remove nuts attaching quarter window glass. (Fig. 6).

WARNING: WEAR EYE AND HAND PROTECTION WHEN HANDLING SAFETY GLASS. PERSONAL INJURY CAN RESULT.

CAUTION: Do not damage body or trim finish when cutting out glass or applying fence primer.

(5) Remove the quarter window glass from the vehicle by pushing on glass from inside of vehicle.

INSTALLATION

(1) Prepare window fence by removing existing butyl.

(2) Remove butyl release paper on quarter glass.

(3) Place quarter window glass into position.

(4) Install quarter window glass attaching nuts.

(5) Water test quarter window glass to verify repair.

(6) Install lower quarter trim, and C& D-Pillar trim (Fig. 4) and (Fig. 5).

(7) Close liftgate.

WINDSHIELD

DESCRIPTION

Windshields are made of two pieces of glass with a plastic inner layer. Windshields and selected stationary glass are structural members of the vehicle. The windshield glass is bonded to the windshield frame with urethane adhesive.

Windshields and other stationary glass protect the occupants from the effects of the elements. Windshields are also used to retain some airbags in position during deployment.

The windshield is attached to the window frame with urethane adhesive. The urethane adhesive is applied cold and seals the surface area between the window opening and the glass. The primer adheres the urethane adhesive to the windshield.

It is difficult to salvage a windshield during the removal operation. The windshield is part of the structural support for the roof. The urethane bonding used to secure the windshield to the fence is difficult to cut or clean from any surface. If the moldings are set in urethane, it would also be unlikely they could be salvaged. Before removing the windshield, check the availability of the windshield and moldings from the parts supplier.

3 - BUTYL
4 - BUTYL RELEASE PAPER

WINDSHIELD (Continued)

RECOMMENDED TOOLS AND ADHESIVE

- Fein® Power Cutout Knife
- Equalizer® Magnum, Interior Auto Glass Cut Out Knife

ADHESIVE, PRIMER AND CLEANER

The urethane adhesive holding the windshield to the opening pinch weld (fence) can be cut using a sharp cold knife from the exterior of the vehicle. Using the cold knife method is effective if the windshield is already broken. If the glass must be salvaged, cutting the urethane adhesive from the interior of the vehicle using a reciprocating or oscillating power knife is recommended.

RECOMMENDED TOOLS AND ADHESIVE

The following urethane adhesive systems are OEM certified and conform to the FMVSS 212 windshield retention standard and the FMVSS 216 roof crush standard.

WARNING

WINDSHIELD SAFETY PRECAUTIONS

WARNING: DO NOT OPERATE THE VEHICLE WITHIN 24 HOURS OF WINDSHIELD INSTALLATION. IT TAKES AT LEAST 24 HOURS FOR URETHANE ADHESIVE TO CURE. IF IT IS NOT CURED, THE WINDSHIELD MAY NOT PERFORM PROPERLY IN AN ACCIDENT.
URETHANE ADHESIVES ARE APPLIED AS A SYSTEM. USE GLASS CLEANER, GLASS PREP SOLVENT, GLASS PRIMER, AND PINCH WELD (FENCE) PRIMER PROVIDED BY THE ADHESIVE MANUFACTURER. IF NOT, STRUCTURAL INTEGRITY COULD BE COMPROMISED.
DAIMLERCHRYSLER DOES NOT RECOMMEND GLASS ADHESIVE BY BRAND. TECHNICIANS SHOULD REVIEW PRODUCT LABELS AND TECHNICAL DATA SHEETS, AND USE ONLY ADHESIVES THAT THEIR MANUFACTURES WARRANT WILL RESTORE A VEHICLE TO THE REQUIREMENTS OF FMVSS 212. TECHNICIANS SHOULD ALSO INSURE THAT PRIMERS AND CLEANERS ARE COMPATIBLE WITH THE PARTICULAR ADHESIVE USED.
BE SURE TO REFER TO THE URETHANE MANUFACTURER'S DIRECTIONS FOR CURING TIME SPECIFICATIONS, AND DO NOT USE ADHESIVE AFTER ITS EXPIRATION DATE.
VAPORS THAT ARE EMITTED FROM THE URETHANE ADHESIVE OR PRIMER COULD CAUSE PERSONAL INJURY. USE THEM IN A WELL-VENTILATED AREA.
SKIN CONTACT WITH URETHANE ADHESIVE SHOULD BE AVOIDED. PERSONAL INJURY MAY RESULT.
ALWAYS WEAR EYE AND HAND PROTECTION WHEN WORKING WITH GLASS.

CAUTION: Protect all painted and trimmed surfaces from coming in contact with urethane or primers. Be careful not to damage painted surfaces when removing moldings or cutting urethane around windshield.

REMOVAL

REMOVAL - EXTERIOR METHOD

The urethane adhesive holding the windshield to the opening pinch weld (fence) can be cut using a sharp cold knife from the exterior of the vehicle. Using the cold knife method is effective if the windshield is already broken. If the glass must be salvaged, cutting the urethane adhesive from the interior of the vehicle using a reciprocating or oscillating power knife is recommended.

(1) Remove inside rear view mirror.
(2) Remove windshield wiper arms.
(3) Remove cowl cover.
(4) Place protective covers over instrument panel and hood.
(5) Remove windshield A-pillar trim and header.
(6) Using a sharp cold knife, cut urethane adhesive holding the windshield to the A-pillars, roof header and cowl pinch weld fences (Fig. 7). A power cutting device can be used if available.
(7) Remove windshield from vehicle.

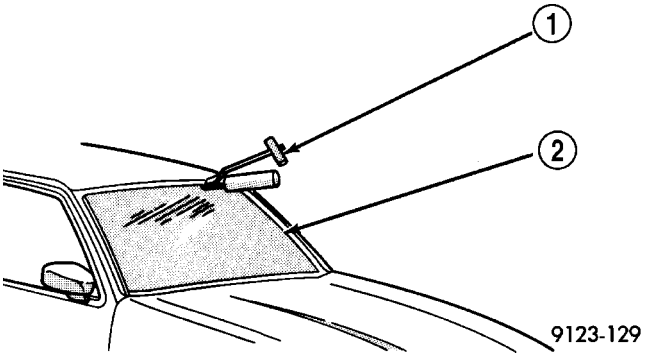

Fig. 7 CUT URETHANE AROUND WINDSHIELD

1 - COLD KNIFE
2 - WINDSHIELD ASSEMBLY WITH ENCAPSULATION

WINDSHIELD (Continued)

REMOVAL - INTERIOR METHOD

The urethane adhesive holding the windshield to the opening pinch weld (fence) can be cut using a sharp cold knife from the exterior of the vehicle. Using the cold knife method is effective if the windshield is already broken. If the glass must be salvaged, cutting the urethane adhesive from the interior of the vehicle using a reciprocating or oscillating power knife is recommended.

(1) Remove inside rear view mirror.

(2) Remove instrument panel top cover, refer to Instrument Panel.

(3) Remove A-pillar trim.

(4) Place protective covers over instrument panel and hood.

(5) Using a reciprocating or oscillating power knife, cut urethane adhesive holding the windshield to the A-pillars, roof header and cowl pinch weld fences. Refer to instructions provided with the equipment being used.

(6) Remove windshield from vehicle.

REMOVAL - EXTERIOR METHOD - PT-27 ONLY

The urethane adhesive holding the windshield to the opening pinch weld (fence) can be cut using a sharp cold knife from the exterior of the vehicle. Using the cold knife method is effective if the windshield is already broken. If the glass must be salvaged, cutting the urethane adhesive from the interior of the vehicle using a reciprocating or oscillating power knife is recommended.

(1) Remove inside rear view mirror.

(2) Remove windshield wiper arms.

(3) Remove cowl cover.

(4) Place protective covers over instrument panel and hood.

(5) Remove windshield header and A-pillar trim and header.

(6) Using a sharp cold knife, cut urethane adhesive holding the windshield to the A-pillars, roof header and cowl pinch weld fences (Fig. 8). A power cutting device can be used if available.

(7) Remove windshield from vehicle.

REMOVAL - INTERIOR METHOD - PT-27 ONLY

The urethane adhesive holding the windshield to the opening pinch weld (fence) can be cut using a sharp cold knife from the exterior of the vehicle. Using the cold knife method is effective if the windshield is already broken. If the glass must be salvaged, cutting the urethane adhesive from the interior of the vehicle using a reciprocating or oscillating power knife is recommended.

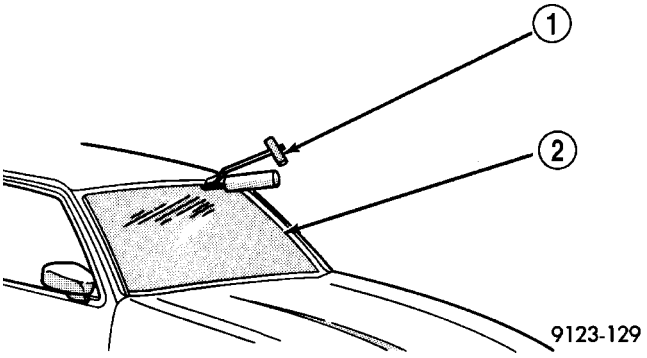

Fig. 8 CUT URETHANE AROUND WINDSHIELD

1 - COLD KNIFE
2 - WINDSHIELD ASSEMBLY WITH ENCAPSULATION

(1) Remove inside rear view mirror.

(2) Remove instrument panel top cover, refer to Instrument Panel.

(3) Remove header and A-pillar trim.

(4) Place protective covers over instrument panel and hood.

(5) Using a reciprocating or oscillating power knife, cut urethane adhesive holding the windshield to the A-pillars, roof header and cowl pinch weld fences. Refer to instructions provided with the equipment being used.

(6) Remove windshield from vehicle.

INSTALLATION

INSTALLATION

CAUTION: Open the left front door glass before installing windshield to avoid pressurizing the passenger compartment. If a door is slammed before urethane bonding is cured, water leaks can result. Allow the urethane at least 24 hours to cure before returning the vehicle to use.

To avoid stressing the replacement windshield, the urethane bonding material on the windshield fence should be smooth and consistent to the shape of the replacement windshield. The support spacers should be cleaned and properly installed on weld studs or repair screws at bottom of windshield opening.

WINDSHIELD (Continued)

(1) Verify support spacers in windshield opening. If not present, install spacers as indicated. (Fig. 10)

(2) Verify squeak tape on roof panel hooks. If not present, install squeak tape. (Fig. 10) Section C-C.

(3) Verify replacement windshield has squeak tape and anti-squeak lube. If not present, install squeak tape and anti-squeak lube. (Fig. 9)

(4) Position windshield into opening by installing encapsulation locator pin then loading the encapsulation hooks onto the panel hooks. (Fig. 11)

(5) Verify glass encapsulation lays evenly along roof panel and that there is no gapping of the encapsulation squeak tape to the windshield opening. If gaps are present, the pinch weld fence must be formed to the shape of the new glass.

(6) Remove replacement windshield from opening.

(7) Position the windshield inside up on a suitable work surface with two padded, wood 10 cm by 10 cm by 50 cm (4 in. by 4 in. by 20 in.) blocks, placed parallel 75 cm (2.5 ft.) apart. (Fig. 12)

WARNING: DO NOT USE SOLVENT BASED GLASS CLEANER TO CLEAN WINDSHIELD BEFORE APPLYING GLASS PREP AND PRIMER. POOR ADHESION CAN RESULT.

(8) Clean inside of windshield with ammonia based glass cleaner and lint-free cloth.

(9) Apply Glass Prep adhesion promoter 25 mm (1 in.) wide around perimeter of windshield and wipe with clean/dry lint-free cloth until no streaks are visible.

(10) Apply Glass Primer 25 mm (1 in.) wide around perimeter of windshield. Allow at least three minutes drying time.

(11) Apply a bead of urethane on windshield glass as indicated. (Fig. 12)

(12) With the aid of a helper, position the windshield over the windshield opening and install encapsulation locator pin then load encapsulation hooks onto the roof panel hooks.

(13) Push windshield into opening until no gap encapsulation lays evenly along roof panel and there is no gapping of encapsulation squeak tape to the windshield opening

(14) Clean excess urethane from exterior with Mopar, Super clean or equivalent.

(15) Apply tape to windshield assembly as required if gap exists around windshield opening.

(16) After urethane has cured, remove tape strips and water test windshield to verify repair.

(17) Install cowl covers.

(18) Install inside rear view mirror.

(19) Allow urethane to cured for 10–12 hours. Remove tape strips and water test windshield.

WINDSHIELD (Continued)

(1) Verify support spacers in windshield opening. If not present, install spacers as indicated. (Fig. 14)

(2) Position windshield into opening by contacting header spacers then loading the glass hooks onto the panel hooks. (Fig. 15)

(3) Verify glass encapsulation lays evenly along roof panel and that there is no gapping of the glass to spacers in the windshield opening. If gaps are present, the pinch weld fence must be formed to the shape of the new glass.

(4) Remove replacement windshield from opening.

(5) Position the windshield inside up on a suitable work surface with two padded, wood 10 cm by 10 cm by 50 cm (4 in. by 4 in. by 20 in.) blocks, placed parallel 75 cm (2.5 ft.) apart. (Fig. 16)

WARNING: DO NOT USE SOLVENT BASED GLASS CLEANER TO CLEAN WINDSHIELD BEFORE APPLYING GLASS PREP AND PRIMER. POOR ADHESION CAN RESULT.

(6) Clean inside of windshield with ammonia based glass cleaner and lint-free cloth.

(7) Apply Glass Prep adhesion promoter 25 mm (1 in.) wide around perimeter of windshield and wipe with clean/dry lint-free cloth until no streaks are visible (Fig. 13).

(8) Apply Glass Primer 25 mm (1 in.) wide around perimeter of windshield. Allow at least three minutes drying time.

(9) Apply a bead of urethane on windshield glass as indicated. (Fig. 16)

(10) With the aid of a helper, position the windshield over the windshield opening and install contacting header spacers then load glass hooks onto the roof panel hooks.

(11) Push windshield into opening until there is glass to spacers in the windshield opening

(12) Clean excess urethane from exterior with Mopar, Super clean or equivalent.

(13) Apply tape to windshield assembly as required if gap exists around windshield opening.

(14) After urethane has cured, remove tape strips and water test windshield to verify repair.

(15) Install cowl covers, A-pillar trim and header trim molding.

(16) Install inside rear view mirror.

(17) Allow urethane to cured for 10 to 12 hours. Remove tape strips and water test windshield.

SUNROOF

DESCRIPTION

WARNING: Keep fingers and other body parts out of sunroof opening at all times.

The sunroof features a power sliding glass panel and a sunshade which can be manually positioned anywhere along its travel, rearward of glass panel front edge.

The sunroof is electrically operated from two switches located on the windshield header, rearward of the map lamp. To operate the sunroof the ignition switch must be in either the Accessory or On/Run position. One switch (vent) is a push button type and opens the sunroof to the vent position only. The other switch (open/close) is a rocker type for opening and closing the sunroof. Pressing and releasing the open button once the sunroof will express open and the wind deflector will rise. If the button is pressed a second time the sunroof will stop in that position. Pressing and holding the close button will close the sunroof. If the close button is released the sunroof will stop in that position.

DIAGNOSIS AND TESTING - SUNROOF

Before beginning sunroof diagnostics verify that all other power accessories are in proper operating condition. Refer to Sunroof Diagnostic Chart for possible causes. If not, a common electrical problem may exist. Refer to Wiring Diagrams, in this publication for circuit, splice and component descriptions. Check the condition of the circuit protection (20 amp circuit breaker in cavity 19 of the Junction Block). Inspect all wiring connector pins for proper engagement and continuity. Check for battery voltage at the power sunroof controller, refer to Wiring Diagrams, for circuit information. If battery voltage of more than 10 volts is detected at the controller, proceed with the following tests (the controller will not operate at less than 10 volts).

Before beginning diagnosis for wind noise or water leaks, verify that the problem was not caused by releasing the control switch before the sunroof was fully closed. The sunroof module has a water-management system. If however, the sunroof glass is in a partial closed position, high pressure water may be forced beyond the water management system boundaries and onto the headlining.

SUNROOF (Continued)

SUNROOF DIAGNOSIS CHART

SYMPTOM	POSSIBLE CAUSE
Sunroof motor inoperative.	Faulty control switch. Faulty circuit ground between sunroof electronics module, control switch, and body harness. Faulty power circuit between sunroof electronics module, control switch, and body harness. Faulty sunroof drive motor. Faulty sunroof electronics module. Faulty sunroof drive motor or electronics module.
Audible whine when switch is depressed, sunroof does not operate.	Faulty sunroof drive motor. Binding cable.
Audible clicking or ratcheting when switch is pressed, sunroof does not operate.	Broken or worn drive cable. Worn drive motor gear. Mechanisms not synchronized.
Sunroof vents and opens, but does not close.	Broken or disengaged trough guide Binding cable. Faulty circuit. Faulty control switch. Faulty sunroof electronic module. Faulty drive motor.
Sunroof vents, but does not open.	Binding cable or mechanism. Faulty circuit. Faulty switch. Faulty sunroof electronic module.
Sunroof does not vent	Binding cable or mechanism. Faulty circuit. Faulty control switch. Faulty sunroof electronic module.
Sunroof water leak.	Drain tubes clogged or kinked or disconnected from the sunroof. Glass panel improperly adjusted. Faulty glass panel seal.
Gurgling sound from sunroof	Low spot in drain hose routing, allowing water to stand.
Wind noise from sunroof.	Front of glass panel too high or rear too low. Wind deflector not deploying. Glass not centered in opening. Faulty glass panel seal.
Rattles from open sunroof while driving	Loose or broken attaching hardware. Worn or broken mechanism.

SUNROOF (Continued)

WATER DRAINAGE AND WIND NOISE DIAGNOSIS

The sliding glass panel is designed to seal water entry with a snug fit between the roof and the seal. The fit can be checked by inserting a piece of paper between the roof and the seal. The piece of paper should have some resistance when pulled out when the glass panel is in the closed position. The sunroof housing will drain off a minimum amount of water. Excessive wind noise could result if the gap clearances are exceeded. The sunroof glass panel may need to be adjusted. Refer to Sunroof Glass Panel Adjustment for proper procedures.

Adequate drainage is provided by a drain trough in the sunroof housing which encircles the sliding glass panel and leads to drain hoses. If a wet headliner or other water leak complaints are encountered, before performing any adjustments, first ensure that the drainage system is not plugged or disconnected. Use a pint container to pour water into the sunroof housing drain trough. If water flow is restricted, use compressed air to blow out any material plugging the drain system. Retest system again.

To further check for a disconnected drain hose:

(1) Remove A-pillar trim, sun visors, and map lamps/mini console.

(2) Remove sunroof opening trim lace. Refer to Sunroof Opening Trim Lace.

(3) Lower headliner as necessary to gain access to sunroof housing drain tubes. Refer to Headlining Removal and Installation for proper procedures.

(4) Repair as necessary.

SUNROOF MODULE ASSEMBLY - VEHICLES BUILT BEFORE 9/23/02

REMOVAL- VEHICLES BUILT BEFORE 9/23/02

(1) Move glass panel to the fully closed position.

(2) Disconnect battery negative cable.

(3) Recline both front seats.

(4) Remove sunroof opening trim lace (Refer to 23 - BODY/SUNROOF/OPENING TRIM LACE - REMOVAL).

(5) Remove control switch (Refer to 23 - BODY/SUNROOF/CONTROL SWITCH - REMOVAL).

(6) Remove headliner (Refer to 23 - BODY/INTERIOR/HEADLINER - REMOVAL) and disconnect sunroof wire harness.

(7) Disconnect the four drain tubes from sunroof housing.

(8) Loosen fasteners attaching sunroof module assembly.

(9) Remove the two bracket screws at the rear of the module.

(10) With the aid of a helper, support the sunroof and remove the remaining six fasteners attaching sunroof module assembly to roof panel (Fig. 1).

(11) Remove sunroof module from vehicle.

INSTALLATION- VEHICLES BUILT BEFORE 9/23/02

(1) Raise sunroof module assembly and guide it carefully into position.

(2) While supporting the sunroof module tighten the six module attaching screws (Fig. 1). Tighten to 9.5 N·m (84 in. lbs.) torque.

(3) Install the two bracket screws at the rear of the module. Tighten to 9.5 N·m (84 in. lbs.) torque.

(4) Connect the drain tubes to the sunroof.

(5) Connect wire harness.

(6) Install headliner (Refer to 23 - BODY/INTERIOR/HEADLINER - INSTALLATION).

(7) Install sunroof control switch (Refer to 23 - BODY/SUNROOF/CONTROL SWITCH - INSTALLATION).

(8) Connect battery negative cable.

(9) Test sunroof operation, adjust as necessary (Refer to 23 - BODY/SUNROOF/GLASS PANEL - ADJUSTMENTS).

(10) Install sunroof opening trim lace position (Refer to 23 - BODY/SUNROOF/OPENING TRIM LACE - INSTALLATION).

SUNROOF MODULE ASSEMBLY - VEHICLES BUILT BEFORE 9/23/02 (Continued)

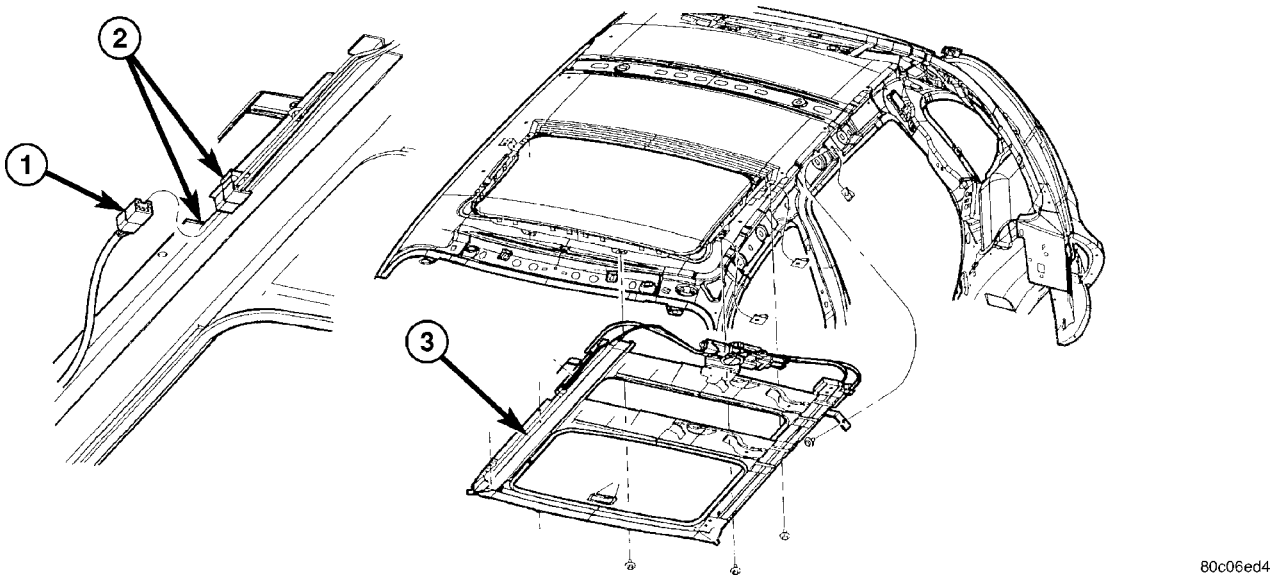

Fig. 1 SUNROOF MODULE ASSEMBLY

1 - SUNROOF WIRING CONNECTOR
2 - SIDE RAIL
3 - SUNROOF MODULE

ELECTRONIC CONTROL MODULE - VEHICLE BUILT BEFORE 9/10/02

REMOVAL

(1) Remove sunroof module assembly (Refer to 23 - BODY/SUNROOF/MODULE ASSEMBLY - REMOVAL).

(2) Cut wire retaining tape near motor being careful not to cut wires.

(3) Disconnect drive motor's wire harness.

(4) Remove three motor assembly retaining screws from bottom side of motor, and remove motor assembly (Fig. 2).

(5) From top side of module assembly, remove one attaching screw from control module.

(6) Disconnect the two wire connectors from electronic control module assembly.

(7) Remove control module.

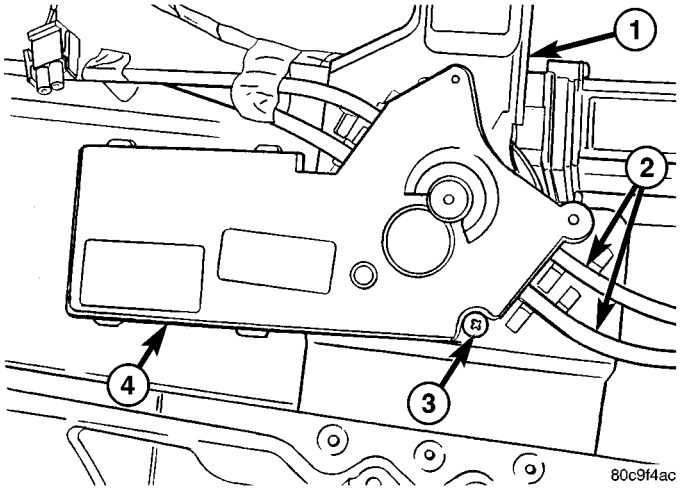

Fig. 2 CONTROL MODULE

1 - MOTOR BRACKET
2 - CABLES
3 - SCREW
4 - CONTROL MODULE

INSTALLATION

(1) Check glass assembly position. Adjust to full closed position. Insert pin into holes in lift arm assembly to check position (Fig. 3).

(2) Check electronics module and ensure it's in the full closed position.

(3) Set new electronic module in position on top side of motor mounting bracket engaging drive cables with pinion gear in electronics module.

(4) Install one screw to attach electronics module to motor bracket. Tighten screw to 3 N·m (27 in. lbs.) torque.

(5) Install motor assembly to motor bracket and electronics module with three screws. Tighten screw to 3 N·m (27 in. lbs.) torque.

(6) Connect electrical connectors to module assembly wire harness. Secure any loose wires.

ELECTRONIC CONTROL MODULE - VEHICLE BUILT BEFORE 9/10/02 (Continued)

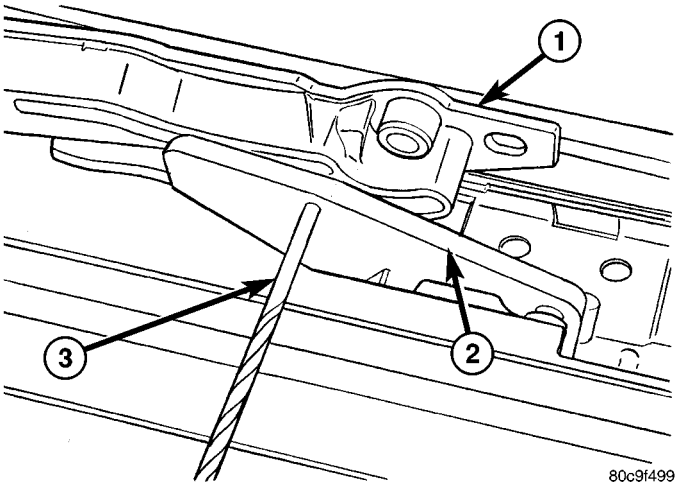

Fig. 3 LIFT ARM POSITIONING

1 - GLASS BRACKET
2 - LIFT ARM
3 - ALIGNMENT PIN

(7) Install sunroof module assembly (Refer to 23 - BODY/SUNROOF/MODULE ASSEMBLY - INSTALLATION).

SUNROOF DRIVE MOTOR

REMOVAL

REMOVAL

(1) Remove sunroof opening trim lace (Refer to 23 - BODY/SUNROOF/OPENING TRIM LACE - REMOVAL).

(2) Remove sunroof control switch (Refer to 23 - BODY/SUNROOF/CONTROL SWITCH - REMOVAL).

(3) Remove headliner (Refer to 23 - BODY/INTERIOR/HEADLINER - REMOVAL) and disconnect sunroof wire connector.

(4) Cut wire retaining tape near motor being careful not to cut wires.

(5) Disengage wire harness from motor (Fig. 4).

(6) Remove three motor assembly attaching screws from bottom side of motor assembly.

(7) Remove motor assembly.

REMOVAL - VEHICLES BUILT ON 9/23/02 AND LATER

(1) Remove headliner. (Refer to 23 - BODY/INTERIOR/HEADLINER - REMOVAL)

(2) Disconnect the electrical connector (Fig. 5).

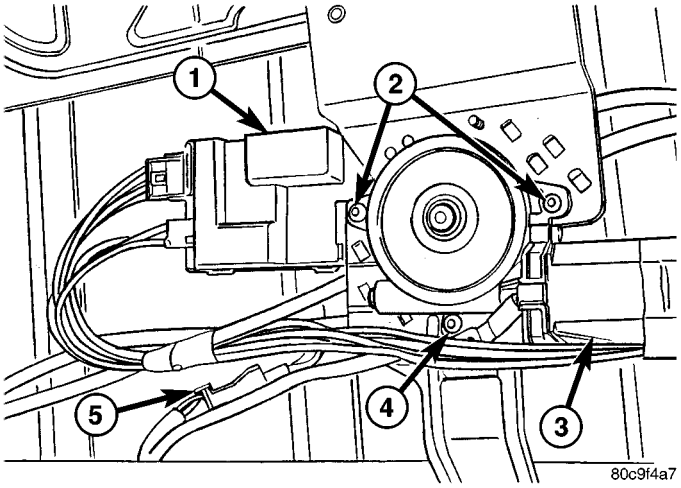

Fig. 4 DRIVE MOTOR ASSEMBLY

1 - CONTROL MODULE
2 - SCREWS
3 - DRIVE MOTOR
4 - SCREW
5 - ELECTRICAL CONNECTOR

(3) Remove three motor assembly attaching screws from bottom side of motor assembly.

(4) Remove motor assembly from the motor bracket.

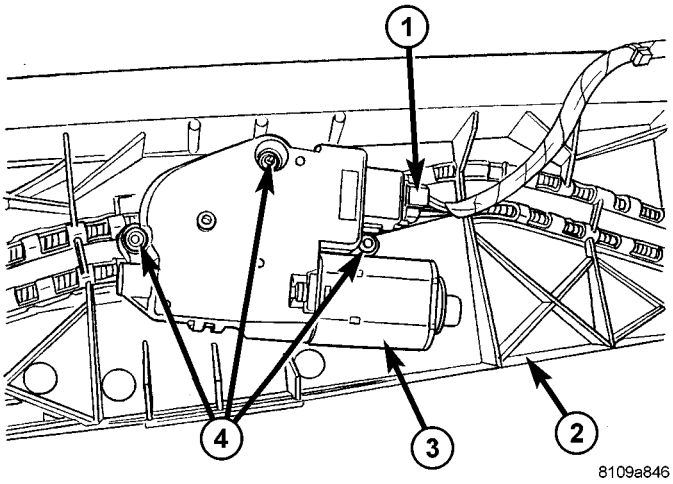

Fig. 5 DRIVE MOTOR

1 - ELECTRICAL CONNECTOR
2 - MODULE ASSEMBLY
3 - DRIVE MOTOR
4 - MOUNTING SCREWS

SUNROOF DRIVE MOTOR (Continued)

INSTALLATION

INSTALLATION

(1) Place motor into position (Fig. 4).

(2) Install three screws attaching motor to bracket. Tighten screws to 3 N·m (27 in. lbs.) torque.

NOTE: Hold electronics module to motor bracket when inserting motor shaft to avoid disengaging drive cables.

(3) Connect sunroof electrical connector.

(4) Tape wires to drive cables to prevent rattles.

(5) Install headliner (Refer to 23 - BODY/INTERIOR/HEADLINER - INSTALLATION).

(6) Install sunroof control switch (Refer to 23 - BODY/SUNROOF/CONTROL SWITCH - INSTALLATION).

(7) Test sunroof operation, adjust sunroof glass as necessary (Refer to 23 - BODY/SUNROOF/GLASS PANEL - INSTALLATION).

(8) Install sunroof opening lace (Refer to 23 - BODY/SUNROOF/OPENING TRIM LACE - INSTALLATION).

INSTALLATION - VEHICLES BUILT ON 9/23/02 AND LATER

(1) If sunroof was open when drive motor was removed, carefully move glass panel into closed position and remove glass panel. (Refer to 23 - BODY/SUNROOF/GLASS PANEL - REMOVAL)

(2) Set lifter arm timing by manually sliding the mechanisms in the track until timing holes in the trollies are aligned with the timing holes in the lifter arm cams and insert pins into the mechanisms to hold mechanisms in closed position. (Fig. 6)

(3) Place motor into position and install screws attaching motor to bracket.

(4) Tighten the screws to 3 N·m (26 in. lbs.).

(5) If sunroof glass panel was removed previously, remove the timing pins and install the sunroof glass panel. (Refer to 23 - BODY/SUNROOF/GLASS PANEL - INSTALLATION)

(6) Temporarily install sunroof switch and perform the sunroof motor teach procedure. (Refer to 23 - BODY/SUNROOF/DRIVE MOTOR - STANDARD PROCEDURE - TEACH PROCEDURE)

(7) Test sunroof operation, adjust glass as necessary. (Refer to 23 - BODY/SUNROOF/GLASS PANEL - ADJUSTMENTS)

(8) Install headliner. (Refer to 23 - BODY/INTERIOR/HEADLINER - INSTALLATION)

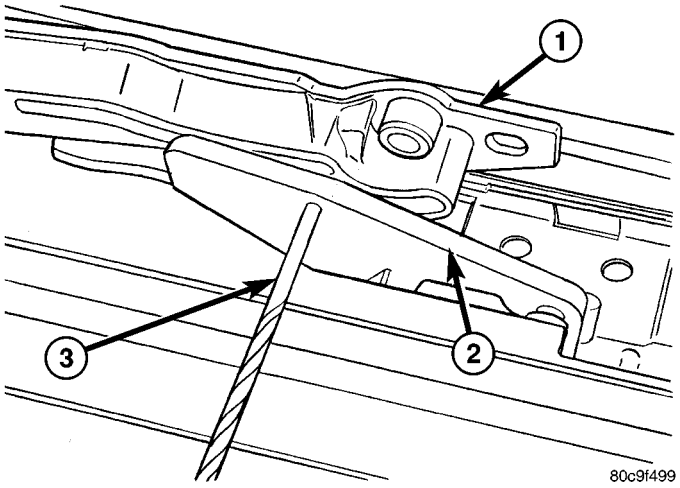

Fig. 6 LIFT ARM POSITIONING

1 - LIFTER ARM
2 - TROLLEY
3 - ALIGNMENT PIN

SUNROOF CONTROL SWITCH

REMOVAL

(1) Using a flat blade tool, release switch from the headliner.

(2) Disconnect the wire connector from the control switch.

INSTALLATION

(1) Connect the wire connector to the control switch.

(2) Install control switch into headliner.

(3) Test sunroof operation.

WIND DEFLECTOR

REMOVAL

(1) Fully open sunroof glass panel.

(2) Remove two screws attaching wind deflector straps to front crossmember (Fig. 7).

(3) Rotate wind deflector into the vertical, 90° to the roof.

(4) Push wind deflector arms down and rearward to disengage arms from spring hooks.

(5) Remove wind deflector.

INSTALLATION

(1) Place wind deflector in position 90° to roof.

(2) Push arms down and forward to engage spring hooks.

(3) Rotate wind deflector forward into correct position. Depress wind deflector down onto front crossmember to check spring function.

WIND DEFLECTOR (Continued)

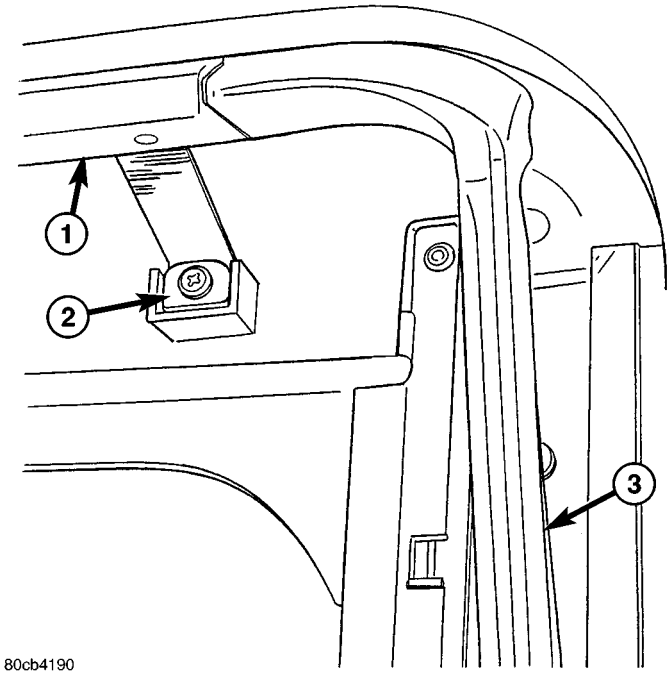

Fig. 7 SUNSHADE

1 - WIND DEFLECTOR
2 - SCREW
3 - SPRING

(4) Install two screw attaching wind deflector straps to front crossmember (Fig. 7). Tighten screws to 1 N·m (9 in. lbs.) torque.

GLASS PANEL

REMOVAL

(1) Move the glass panel to the closed position.
(2) Slide sunshade rearward to the open position.
(3) Remove the four glass panel screws (Fig. 8).
(4) Lift off glass panel and remove from vehicle.

INSTALLATION

(1) Position glass panel on to mechanism lift arms.
(2) Start the four attaching screws, do not fully tighten (Fig. 8).
(3) Adjust sunroof glass (Refer to 23 - BODY/SUNROOF/GLASS PANEL - ADJUSTMENTS).
(4) Verify sunroof operation and alignment.

ADJUSTMENTS

SUNROOF GLASS PANEL ADJUSTMENT

(1) Move the sunshade rearward to the open position.
(2) Move the sunroof glass panel to the fully closed position.

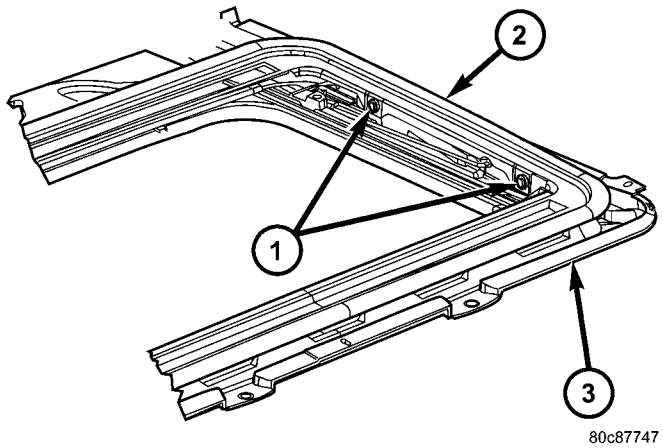

Fig. 8 GLASS PANEL

1 - SCREWS
2 - GLASS PANEL
3 - MODULE ASSEMBLY

(3) Loosen the forward attaching screws on each side enough to make the front of the glass to adjust up or down (Fig. 8).
(4) Adjust the front surface of the sunroof glass panel 1.75 mm to 2.75 mm (0.07 in. to 0.11 in.) below the top surface of the roof.

NOTE: Top of the glass seal is 2.5 mm (0.1 in.) higher than the surface of the sunroof glass. Measure at 300 mm (11.8 in.) outboard of the center line of the vehicle.

(5) Tighten the front glass panel attaching two screws to 3.5 N·m (31 in. lbs.) torque (Fig. 8).
(6) Loosen the rear screws on each side enough to make the rear adjustment (Fig. 8).
(7) Adjust the rear surface of the sunroof glass panel 0.75 mm to .75 mm (0.03 in. to 0.07 in.) below the top surface of the roof.
(8) Tighten the rear glass panel attaching two screws to 3.5 N·m (31 in. lbs.) torque (Fig. 8).
(9) Check for proper fit. If not OK, repeat glass panel adjustment.

SUNROOF SUNSHADE

REMOVAL

(1) Remove sunroof glass panel (Refer to 23 - BODY/SUNROOF/GLASS PANEL - REMOVAL).
(2) From the top of the vehicle through the roof opening remove the two screws (one LH and one RH side) attaching trough assembly to trough guides (Fig. 9).
(3) Remove trough assembly.

SUNROOF SUNSHADE (Continued)

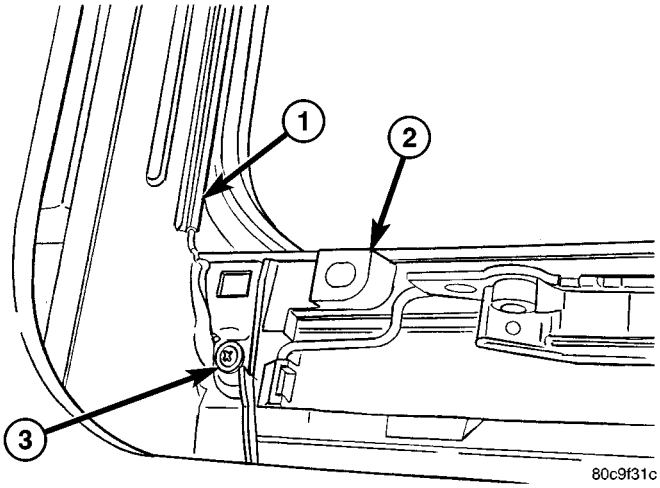

Fig. 9 GUIDE ASSEMBLY TROUGH

1 - TROUGH
2 - TROUGH GUIDE
3 - SCREW

(4) From the top of the vehicle through roof opening slide the sunshade forward, disengaging sunshade front guide feet through front opening in tracks.

(5) Continue to pull the sunshade forward and rotate sunshade until rear guide feet are disengaged from tracks and sunshade is completely free from the sunroof assembly.

CAUTION: Use care not to crease the sunshade when removing or installing.

INSTALLATION

(1) From top of the vehicle through roof opening place sunshade into position, rotating rear guide feet of sunshade into opening of track.

(2) Guide front sunroof feet through front opening and into the track grooves.

(3) Set trough assembly in position on sunroof assembly. Ensure that the trough crosses over the top of the sunshade.

(4) Install two screws attaching trough guide to trough assembly. Tighten screw to 1 N·m (9 in. lbs.) torque (Fig. 9).

SUNROOF GLASS PANEL SEAL

REMOVAL

(1) Remove sunroof glass panel (Refer to 23 - BODY/SUNROOF/GLASS PANEL - REMOVAL).

(2) Place glass panel on a clean work area with the top side up. Support the glass assembly from under side to avoid bending or otherwise damaging the mounting tabs.

(3) Grasp the seal and pull seal away from the glass panel. The seal is a one piece seal.

INSTALLATION

NOTE: Always position seal seam on center side of the passenger side of glass panel.

(1) Place seal into position.

(2) Install seal on glass panel. Using care working the seal around the glass, being careful not to stretch the seal while installing.

(3) Replace sunroof glass panel (Refer to 23 - BODY/SUNROOF/GLASS PANEL - INSTALLATION).

(4) Verify sunroof operation and alignment (Refer to 23 - BODY/SUNROOF/GLASS PANEL - ADJUSTMENTS).

OPENING TRIM LACE

REMOVAL

(1) Remove lace by starting at the joint center of the opening on driver's side.

(2) Pull one end of the lace away from the headliner until the entire lace is removed.

INSTALLATION

(1) Place trim lace into position starting at center of the opening on driver's side.

(2) Push lace into position.

(3) Ensure that the corner radii is fully engage.

(4) Once trim lace is attached to sunroof module begin tucking the headline under the lip on the trim lace working all the way around the opening.

SUNROOF TROUGH GUIDE ASSEMBLY

REMOVAL

(1) Remove the sunroof glass panel (Refer to 23 - BODY/SUNROOF/GLASS PANEL - REMOVAL).

(2) Place sunroof into the vent position.

(3) Remove screws from the trough assembly one on each side (Fig. 9).

(4) Remove trough.

(5) Disconnect the guide link (Fig. 10).

(6) Slide trough guide forward and disengage the sliders through the notches in guide channels (Fig. 11).

SUNROOF TROUGH GUIDE ASSEMBLY (Continued)

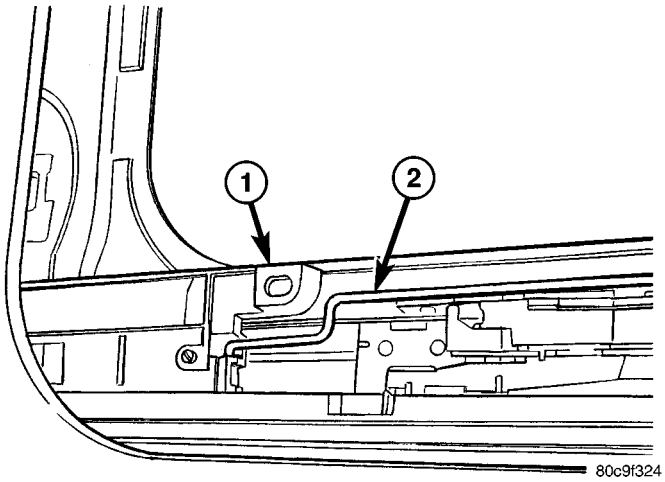

Fig. 10 TROUGH GUIDES

1 - TROUGH GUIDE
2 - GUIDE LINK

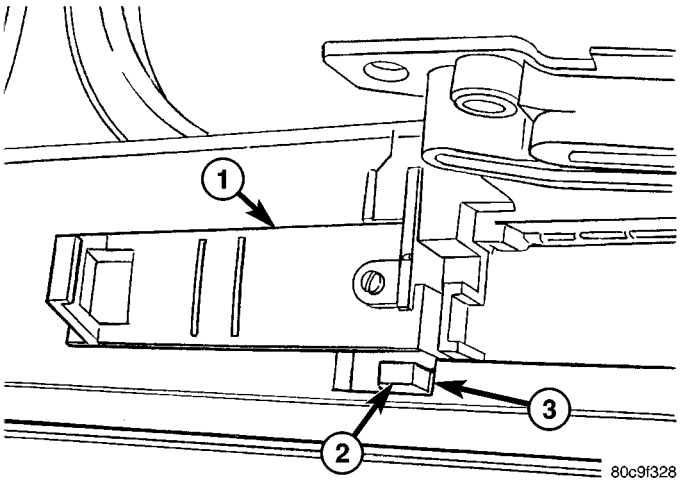

Fig. 11 TROUGH GUIDE REMOVAL

1 - TROUGH GUIDE
2 - NOTCH
3 - SLIDER

INSTALLATION

(1) Carefully twist trough guide through small slot (cut out) on track to install (Fig. 11).

(2) Connect the trough guide wire to the lifter arm (Fig. 10).

(3) Place the trough into position on sunroof. Ensure that the trough crosses over the top of the sunshade.

(4) Install the two screws that attach the trough to the trough guides (Fig. 9). Tighten screws to 1 N·m (9 in. lbs.) torque.

(5) Install sunroof glass panel (Refer to 23 - BODY/SUNROOF/GLASS PANEL - INSTALLATION).

DRAIN TUBE

REMOVAL

FRONT DRAIN TUBE

(1) Move glass panel to the fully closed position.

(2) Remove sunroof opening trim lace (Refer to 23 - BODY/SUNROOF/OPENING TRIM LACE - REMOVAL).

(3) Disconnect the control switch and wire connector.

(4) Remove headliner (Refer to 23 - BODY/INTERIOR/HEADLINER - REMOVAL).

(5) Disconnect the drain tube from the sunroof housing (Fig. 12).

(6) Drain any liquid from tube connection, if necessary.

(7) Attach new drain tube to old tube with tape that is to be replaced.

(8) Work the old tube back and forth to loosen the sealer.

(9) Use care and pull the old tube out through the bottom and the new tube through.

REAR HOUSING TUBE

(1) Move glass panel to the fully closed position.

(2) Remove sunroof opening trim lace (Refer to 23 - BODY/SUNROOF/OPENING TRIM LACE - REMOVAL).

(3) Disconnect the control switch and wire connector.

(4) Remove headliner (Refer to 23 - BODY/INTERIOR/HEADLINER - REMOVAL).

(5) Disconnect the drain tube from the sunroof housing (Fig. 13).

(6) Drain any liquid from tube connection, if necessary.

(7) Attach new drain tube to old tube with tape that is to be replaced.

(8) Work the old tube back and forth to loosen the sealer.

(9) Use care and pull the old tube out through the bottom and the new tube through.

INSTALLATION

FRONT TUBE

(1) Connect the new drain tube to the sunroof housing and test drainage (Fig. 12).

(2) Install headliner (Refer to 23 - BODY/INTERIOR/HEADLINER - INSTALLATION).

(3) Install sunroof opening trim lace (Refer to 23 - BODY/SUNROOF/OPENING TRIM LACE - INSTALLATION).

(4) Connect the control switch wire connector and install control switch.

DRAIN TUBE (Continued)

1 - SUNROOF MODULE
2 - SUNROOF FRONT DRAIN TUBE
3 - CLIPS

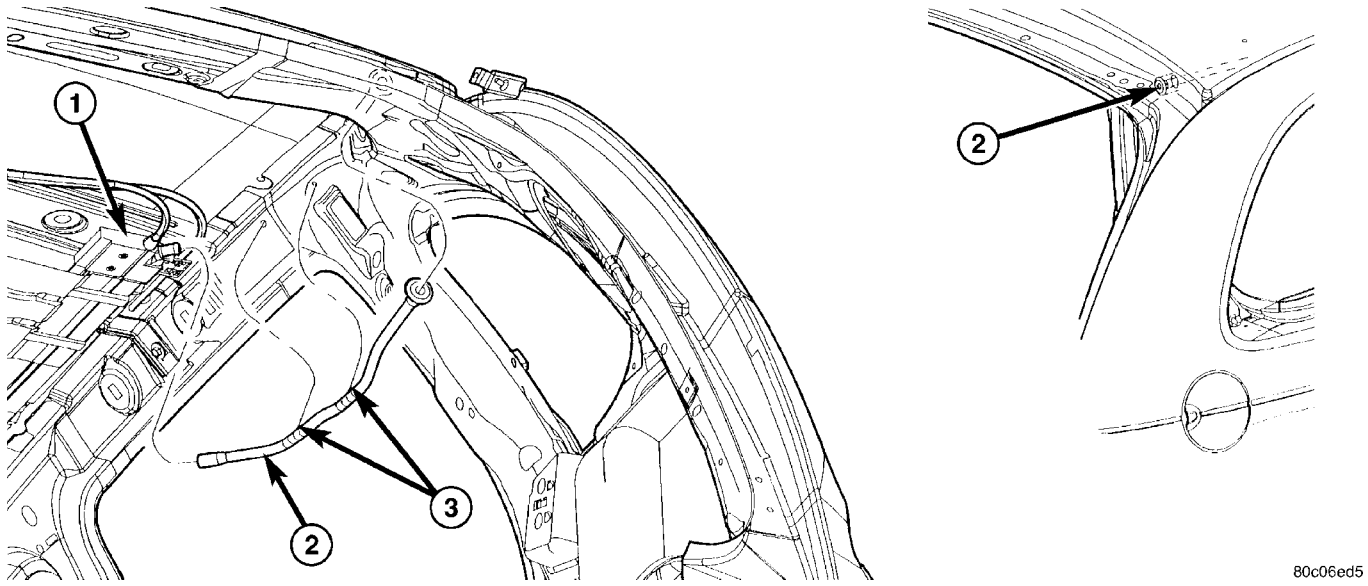

Fig. 13 REAR DRAIN TUBE

1 - SUNROOF MODULE
2 - SUNROOF REAR DRAIN TUBE
3 - CLIPS

(5) Verify sunroof operation and alignment (Refer to 23 - BODY/SUNROOF/GLASS PANEL - ADJUSTMENTS).

REAR HOUSING TUBE

(1) Connect the new drain tube to the sunroof housing and test drainage (Fig. 13).

(2) Install headliner (Refer to 23 - BODY/INTERIOR/HEADLINER - INSTALLATION).

(3) Install sunroof opening trim lace (Refer to 23 - BODY/SUNROOF/OPENING TRIM LACE - INSTALLATION).

(4) Connect the control switch wire connector and install control switch.

(5) Verify sunroof operation and alignment (Refer to 23 - BODY/SUNROOF/GLASS PANEL - ADJUSTMENTS).

A-PILLAR WEATHERSTRIP RETAINER - PT-27

REMOVAL - PT-27 ONLY

(1) Remove header and A-piller weatherstrip as necessary. (Refer to 23 - BODY/WEATHERSTRIP/SEALS/HEADER/HEADER AND A-PILLAR WEATHERSTRIP - REMOVAL).

(2) Remove screws attaching A-pillar weatherstrip retainer to side of windshield surround frame.

(3) Remove A-pillar weatherstrip retainer from vehicle.

INSTALLATION - PT-27 ONLY

(1) Place A-pillar weatherstrip retainer into position (Fig. 1).

(2) Install screws attaching A-pillar weatherstrip retainer to side of windshield surround frame.

(3) Install header and A-piller weatherstrip. (Refer to 23 - BODY/WEATHERSTRIP/SEALS/HEADER/HEADER AND A-PILLAR WEATHERSTRIP - INSTALLATION).

DECK LID OPENING WEATHERSTRIP - PT-27

REMOVAL - PT-27 ONLY

(1) Open decklid.

(2) Remove decklid opening weatherstrip, pull outward on the weatherstrip. (Fig. 2)

(3) Remove weatherstrip from vehicle.

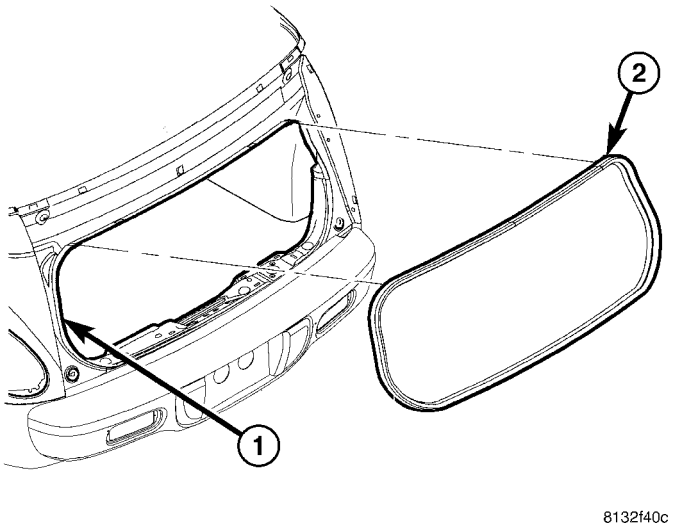

Fig. 2 DECKLID OPENING WEATHERSTRIP

1 - DECKLID OPENING
2 - DECKLID OPENING WEATHERSTRIP

INSTALLATION - PT-27 ONLY

(1) Starting at bottom center, press decklid opening weatherstrip into position (Fig. 2).

(2) Open and close decklid and check for interference.

FRONT AND REAR DOOR OPENING WEATHERSTRIP

REMOVAL

REMOVAL

(1) Open front/rear door.

(2) Remove door opening sill plate.

(3) Pull body mounted weatherstrip from fence around door opening (Fig. 3).

REMOVAL - PT-27 ONLY

(1) Remove door sill scuff plate. (Refer to 23 - BODY/INTERIOR/DOOR SILL TRIM - REMOVAL).

(2) Remove four push pin fasteners at the B-pillar end the weatherstrip (Fig. 4).

(3) Pull weatherstrip from vehicle.

INSTALLATION

INSTALLATION

(1) Position weatherstrip at the B-pillar upper corner (Fig. 3).

(2) Engage front/rear weatherstrip on the fence at upper B-pillar and work down the B-pillar.

(3) Engage weatherstrip along the header and down the A-pillar/C-pillar.

(4) Engage weatherstrip along the sill. There may be slack material work it to the front of the opening.

(5) Verify weatherstrip sealing.

INSTALLATION - PT-27 ONLY

(1) Place weatherstrip into position (Fig. 4).

(2) Ensure weatherstrip is set in place.

(3) Install four push pin fasteners at the B-pillar end the weatherstrip.

(4) Install door sill scuff plate. (Refer to 23 - BODY/INTERIOR/DOOR SILL TRIM - INSTALLATION).

FRONT AND REAR DOOR OPENING WEATHERSTRIP (Continued)

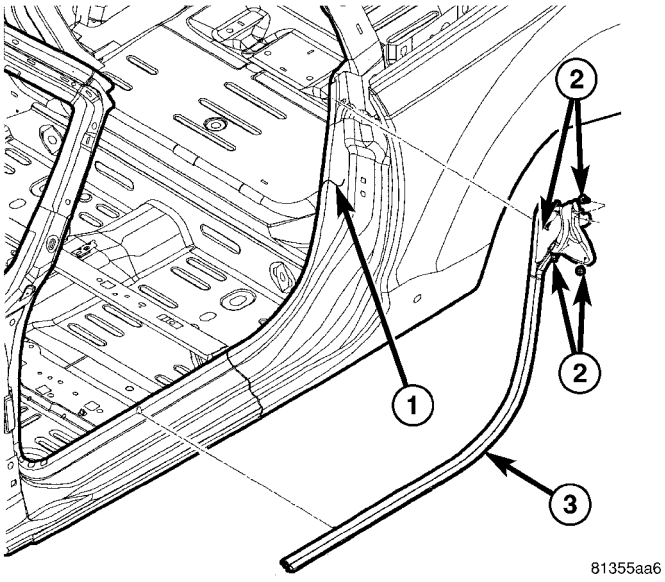

Fig. 4 FRONT DOOR OPENING WEATHERSTRIP

1 - BODY SIDE APERTURE PANEL
2 - PUSH PIN FASTENERS
3 - FRONT DOOR OPENING WEATHERSTRIP

FRONT AND REAR DOOR UPPER SECONDARY WEATHERSTRIP

REMOVAL

(1) Open the front/rear door.

(2) Using a wide blade flat tool, unseat the push pin at the base of the “A” pillar.

(3) Pull the weatherstrip off the vehicle.

INSTALLATION

(1) Clean off any remain butyl residue on the body.

(2) Push seal into position under the quarter window glass and along the door opening.

(3) Locate the push pins at the base of the “A” pillar and push into place.

(4) Install the remainder of the seal.

FRONT DOOR GLASS RUN WEATHERSTRIP

REMOVAL

(1) Remove flag cover, door trim panel, water dam as necessary.
(2) Remove door glass.
(3) Loosen side view mirror, as necessary.
(4) Remove weatherstrip fasteners (Fig. 5).
(5) Pull weatherstrip from lower front channel above door latch.
(6) Pull run weatherstrip from window frame channel.

INSTALLATION

(1) Clean butyl material from door flange area.
(2) Place door run weatherstrip in position on window frame channel (Fig. 5).
(3) Starting in the corners, push door run weatherstrip into window frame channel.
(4) Push weatherstrip into lower front channel above door latch.
(5) Install weatherstrip fasteners.
(6) Install door glass.
(7) Tighten side view mirror.
(8) Install pull cup support bracket, water shield, door trim panel and flag trim.

FRONT DOOR INNER BELT WEATHERSTRIP

REMOVAL

REMOVAL

(1) Remove door trim panel.
(2) Remove inner belt weatherstrip from door. If necessary, use a rubber mallet and a block of wood, tapping upward at each clip attaching the molding to the door (Fig. 5).

REMOVAL - PT-27 ONLY

(1) Remove door trim panel. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL).
(2) Pull upward on rear edge of inner belt weatherstrip (Fig. 6).
(3) Remove weatherstrip from vehicle.

FRONT DOOR INNER BELT WEATHERSTRIP (Continued)

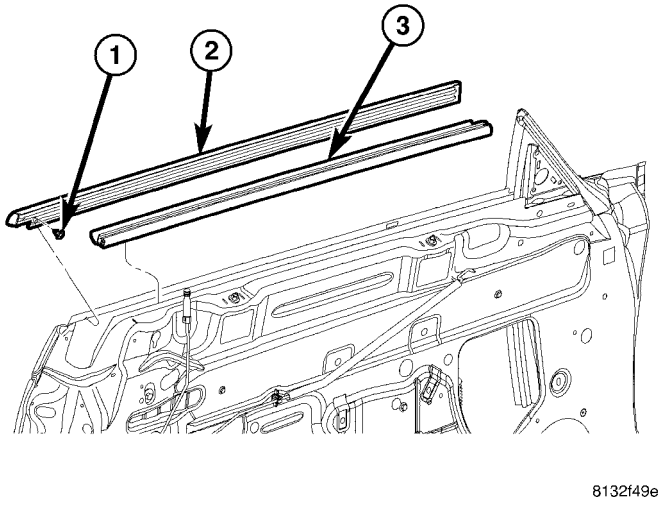

Fig. 6 OUTER BELT WEATHERSTRIP

1 - ATTACHING SCREW
2 - OUTER BELT WEATHERSTRIP
3 - INNER BELT WEATHERSTRIP

INSTALLATION

INSTALLATION

(1) Align the weatherstrip to the “A” and “B” pillars. Push down on weatherstrip to engage channel to door panel (Fig. 5).

(2) Install door trim panel.

INSTALLATION - PT-27 ONLY

(1) Start leading edge of weatherstrip on vehicle (Fig. 6).

(2) Press the leading edge of the weatherstrip forward until edge is tight to the mirror flag.

(3) Press weatherstrip into position on door panel.

(4) Install door trim panel. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION).

FRONT DOOR OUTER BELT WEATHERSTRIP

REMOVAL

REMOVAL

(1) Open door glass.

(2) Remove weatherstrip screw at the rearward edge of door (Fig. 7).

(3) Pull upward at rear end of outer belt weatherstrip.

(4) Remove outer belt weatherstrip from vehicle.

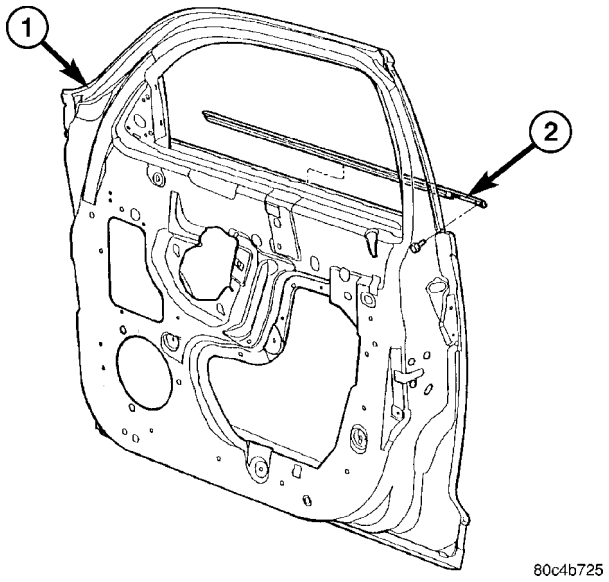

Fig. 7 DOOR OUTER BELT WEATHERSTRIP

1 - FRONT DOOR
2 - DOOR OUTER BELT WEATHERSTRIP

REMOVAL - PT-27 ONLY

(1) Open door glass.

(2) Remove weatherstrip screw at the rearward edge of door (Fig. 8).

(3) Pull upward at rear end of outer belt weatherstrip.

(4) Remove outer belt weatherstrip from vehicle.

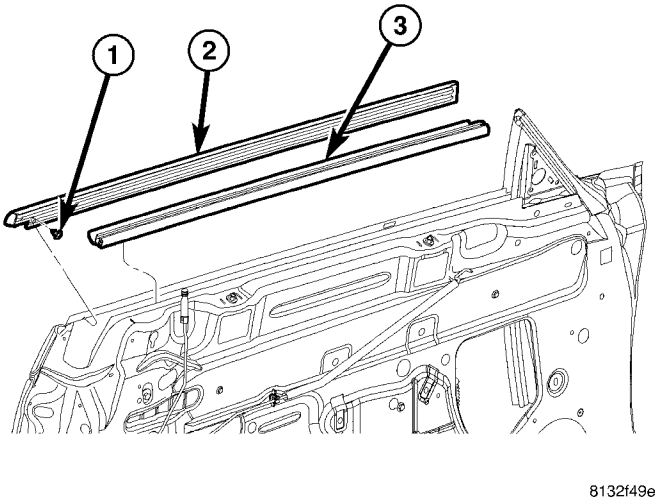

Fig. 8 INNER/OUTER BELT WEATHERSTRIP

1 - ATTACHING SCREW
2 - OUTER BELT WEATHERSTRIP
3 - INNER BELT WEATHERSTRIP

FRONT DOOR OUTER BELT WEATHERSTRIP (Continued)

INSTALLATION

INSTALLATION

(1) Starting at leading edge of door, press weatherstrip into position (Fig. 7).
(2) Install screw into weatherstrip.
(3) Operate window and check for interference.

INSTALLATION - PT-27 ONLY

(1) Place belt molding in position (Fig. 8).
(2) Starting at leading edge of door, press weatherstrip into position
(3) Install screw into weatherstrip.
(4) Operate window and check for interference.

HEADER WEATHERSTRIP SEAL RETAINER - PT-27

REMOVAL

(1) Remove header and A-piller weatherstrip. (Refer to 23 - BODY/WEATHERSTRIP/SEALS/HEADER/HEADER AND A-PILLAR WEATHERSTRIP - REMOVAL).
(2) Remove screws attaching weatherstrip header seal retainer to windshield surround frame (Fig. 9).
(3) Remove weatherstrip header seal retainer from vehicle.

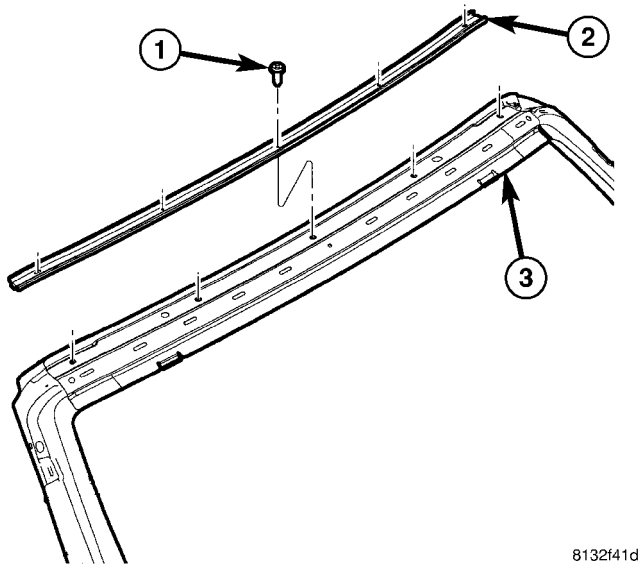

Fig. 9 WEATHERSTRIP HEADER SEAL RETAINER

1 - ATTACHING SCREWS
2 - WEATHERSTRIP HEADER SEAL RETAINER
3 - WEATHERSTRIP SURROUND FRAME

INSTALLATION

(1) Place weatherstrip header seal retainer into position (Fig. 9).
(2) Install screws attaching weatherstrip header seal retainer to windshield surround frame.
(3) Install header and A-piller weatherstrip. (Refer to 23 - BODY/WEATHERSTRIP/SEALS/HEADER/HEADER AND A-PILLAR WEATHERSTRIP - INSTALLATION).

LIFTGATE WEATHERSTRIP

REMOVAL

(1) Open liftgate.
(2) Remove weatherstrip, pull outward on the weatherstrip. (Fig. 10)
(3) Remove outer belt weatherstrip from vehicle.

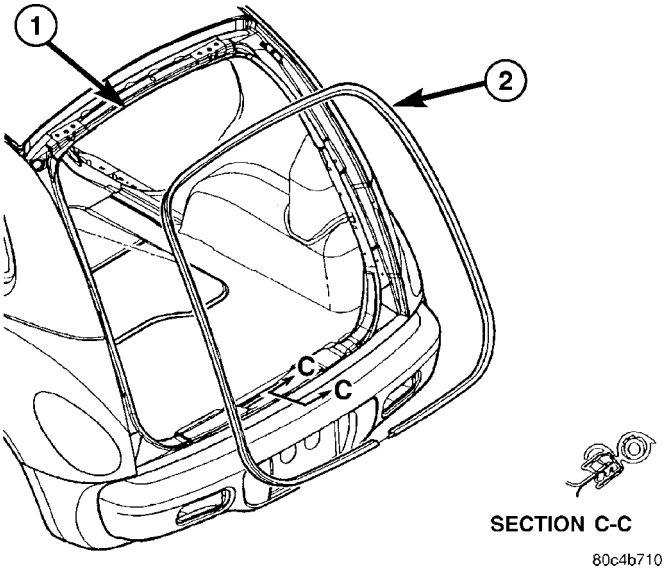

Fig. 10 DOOR OUTER BELT WEATHERSTRIP

1 - LIFTGATE OPENING
2 - LIFTGATE OPENING WEATHERSTRIP

INSTALLATION

(1) Starting at bottom center, press weatherstrip into position (Fig. 10).
(2) Open and close liftgate and check for interference.

QUARTER PANEL OUTER BELT WEATHERSTRIP - PT-27

REMOVAL - PT-27 ONLY

(1) Lower top.

(2) Remove sport bar inner and outer covers (Refer to 23 - BODY/INTERIOR/SPORT BAR INNER COVER - REMOVAL), and (Refer to 23 - BODY/INTERIOR/SPORT BAR OUTER COVER - REMOVAL).

(3) Remove inner belt weatherstrip attaching screws at sport bar, and remove (Fig. 11).

(4) Adjust top open/close to access outer belt screws (Fig. 12).

(5) Remove attaching screws at outer belt weatherstrip.

(6) Remove outer weatherstrip quarter panel from decklid.

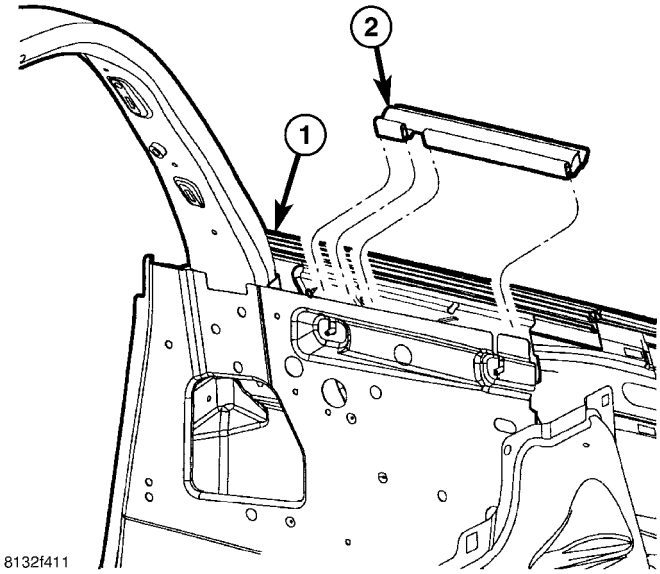

Fig. 11 REAR QUARTER WEATHERSTRIP

1 - BODY ASSEMBLY
2 - REAR QUARTER WEATHERSTRIP

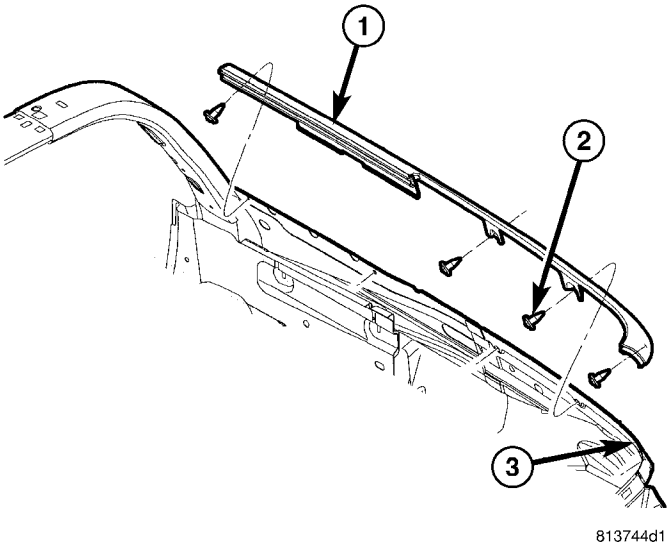

Fig. 12 QUARTER PANEL OUTER BELT WEATHERSTRIP

1 - QUARTER PANEL OUTER BELT WEATHERSTRIP
2 - ATTACHING SCREWS
3 - BODY ASSEMBLY

INSTALLATION - PT-27 ONLY

(1) Place outer weatherstrip quarter panel into position (Fig. 12).

(2) Adjust top open/close to access outer belt screws.

(3) Install attaching screws to outer belt weatherstrip - starting at 1st (forward) hole, then 4th, 3rd and 2nd. Make sure to press down on weatherstrip while tightening screws.

(4) Install inner belt weatherstrip attaching screws at sport bar (Fig. 11).

(5) Install sport bar inner and outer covers. (Refer to 23 - BODY/INTERIOR/SPORT BAR - INSTALLATION), and (Refer to 23 - BODY/INTERIOR/SPORT BAR - INSTALLATION).

(6) Raise top.

REAR DOOR GLASS RUN WEATHERSTRIP

REMOVAL

(1) Remove door trim panel, water shield as necessary.
(2) Remove door glass.
(3) Pull weatherstrip from flange.
(4) Pull run weatherstrip from window frame channel.

INSTALLATION

(1) Clean butyl material from door flange area.
(2) Place door run weatherstrip in position on window frame channel corners first (Fig. 13).
(3) Push door run weatherstrip into window frame channel.
(4) Install door glass.
(5) Install pull cup support bracket, water dam, and door trim panel.

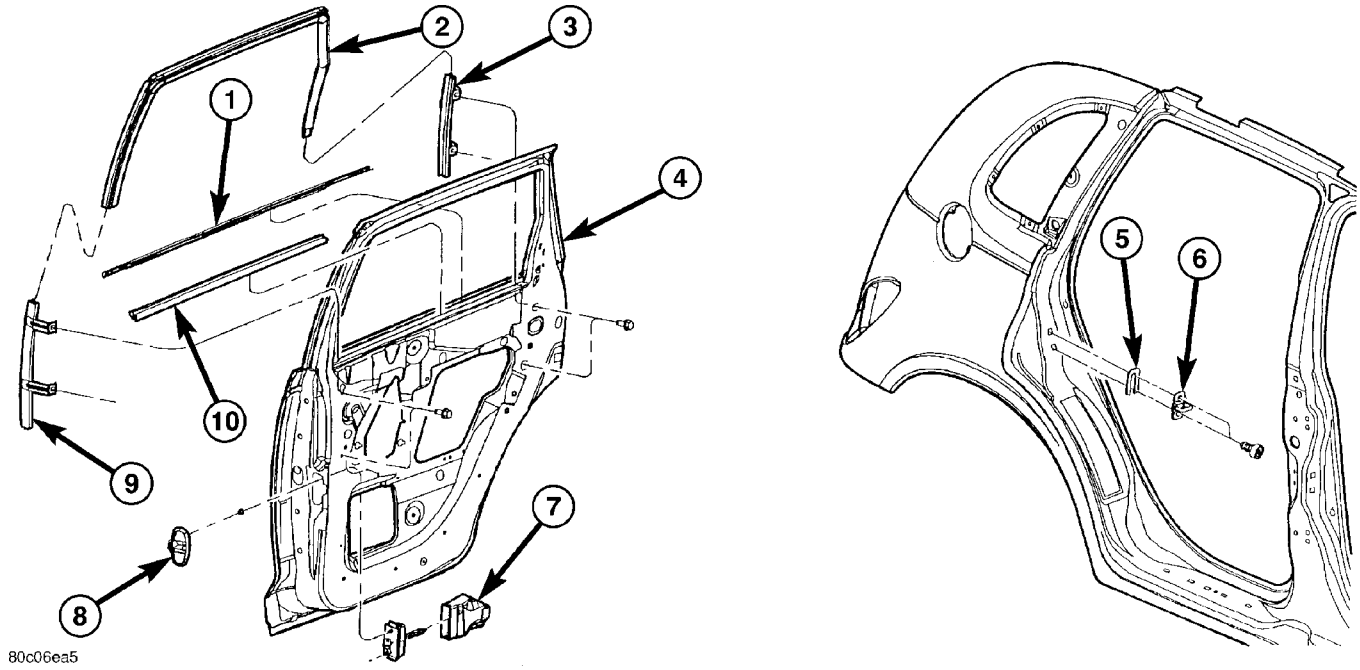

Fig. 13 Rear Door Striker

10 - REAR DOOR INNER BELT WEATHERSTRIP

REAR DOOR INNER BELT WEATHERSTRIP

REMOVAL

(1) Remove door trim panel.

(2) Remove inner belt weatherstrip from door. If necessary, use a rubber mallet and a block of wood, tapping upward at each clip attaching the molding to the door (Fig. 14).

INSTALLATION

(1) Align the weatherstrip to the “B” and “C” pillars. Push down on weatherstrip to engage channel to door panel (Fig. 14).

(2) Install door trim panel.

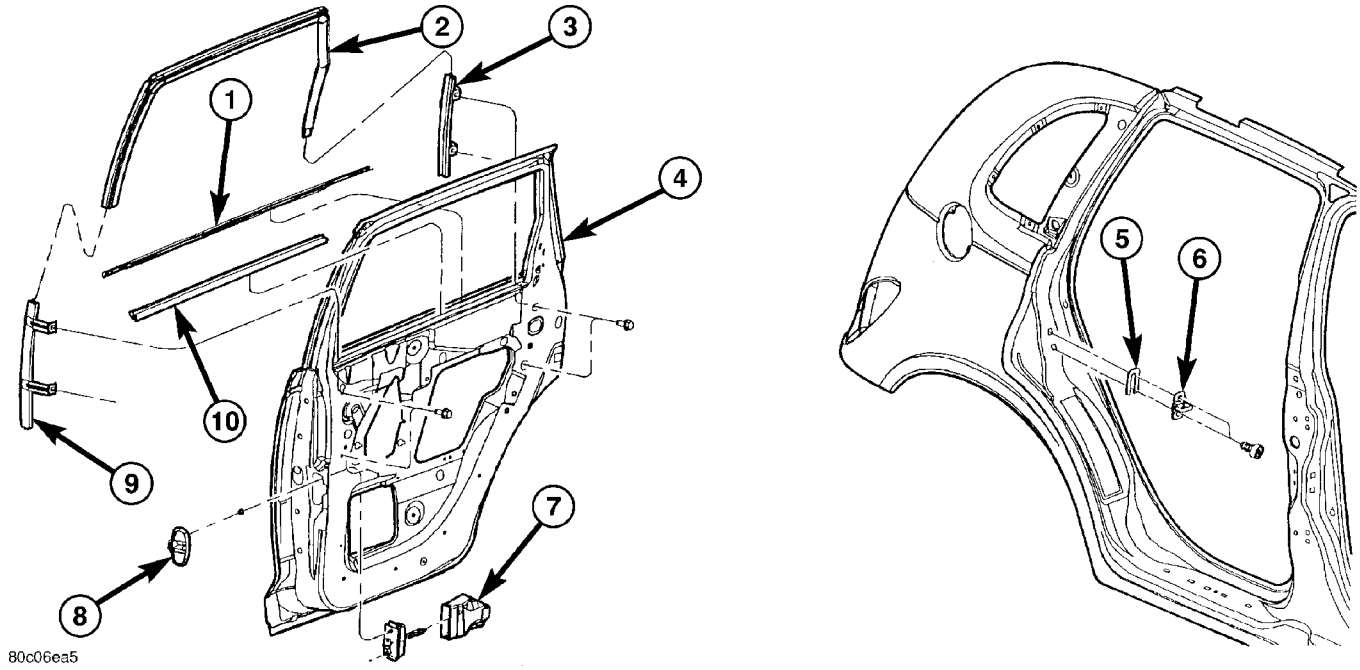

Fig. 14 REAR DOOR WEATHERSTRIP

1 - REAR DOOR OUTER BELT WEATHERSTRIP
2 - REAR DOOR GLASS RUN WEATHERSTRIP

7 - REAR DOOR CHECK STRAP AND COVER
8 - REAR DOOR CHECK STRAP SEAL
9 - REAR DOOR GLASS LOWER CHANNEL FRONT
10 - REAR DOOR INNER BELT WEATHERSTRIP

SILL SECONDARY WEATHERSTRIP

REMOVAL

(1) Using a fork-type prying tool, disengage push in fasteners attaching sill secondary weatherstrip to door (Fig. 15).

(2) Remove weatherstrip from door.

INSTALLATION

(1) Position weatherstrip to door (Fig. 15).

(2) Press sill secondary weatherstrip fasteners into position.

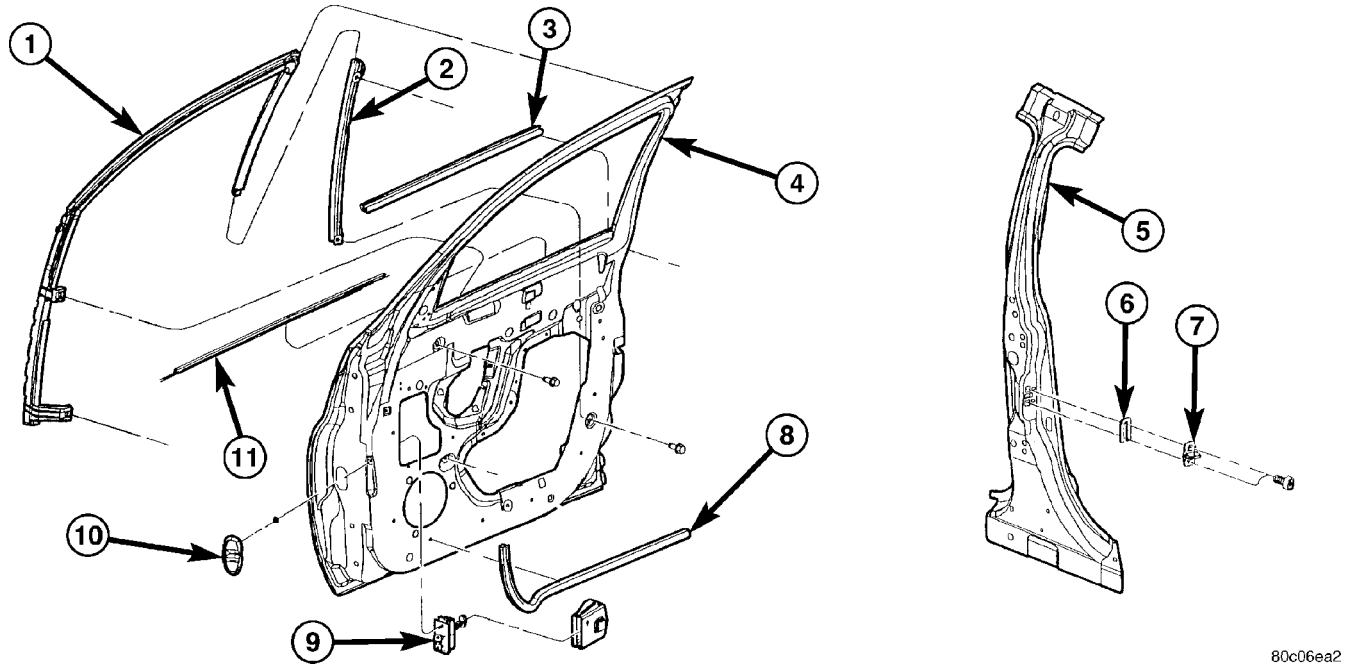

Fig. 15 Front/Rear Sill Secondary Weatherstrip

1 – FRONT DOOR GLASS RUN WEATHERSTRIP
2 – FRONT DOOR GLASS LOWER REAR CHANNEL

11 – FRONT DOOR OUTER BELT WEATHERSTRIP

HEADER / A-PILLAR WEATHERSTRIP -PT-27

REMOVAL - PT-27 ONLY

(1) Lower convertible top.
(2) Remove door sill scuff plate. (Refer to 23 - BODY/INTERIOR/DOOR SILL TRIM - REMOVAL).
(3) Starting on left side of vehicle (Fig. 16).
(4) Remove header molding. (Refer to 23 - BODY/EXTERIOR/MOLDING - REMOVAL).
(5) Remove two screws on the top of header.
(6) Pull weatherstrip away to access weatherstrip retainer.
(7) Remove four screws and weatherstrip retainer at A-pillar.
(8) Remove one screw attaching windshield molding.
(9) Right side of vehicle.
(10) Remove two screws on the top of header.
(11) Pull weatherstrip away to access weatherstrip retainer.
(12) Remove four screws and weatherstrip retainer at A-pillar.
(13) Remove one screw attaching windshield molding.
(14) Pull weatherstrip away from vehicle.

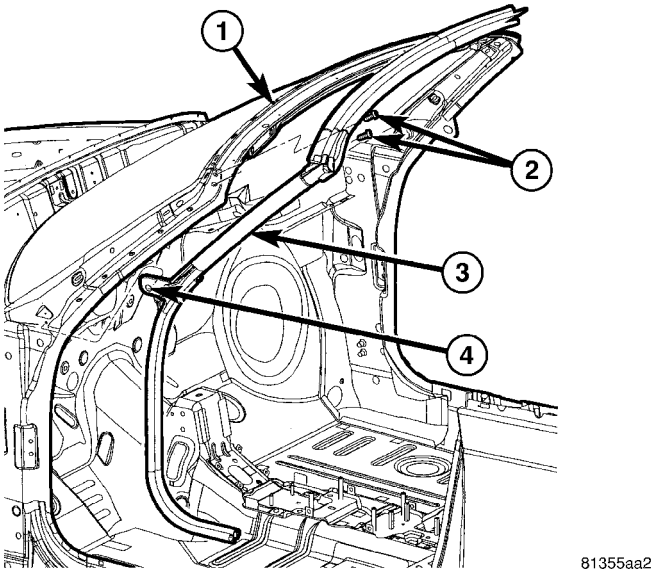

Fig. 16 HEADER AND A-PILLAR WEATHERSTRIP

1 - WINDSHIELD OPENING FRAME
2 - ATTACHING SCREWS
3 - HEADER AND A-PILLAR WEATHERSTRIP
4 - PUSH PIN FASTENER

INSTALLATION - PT-27 ONLY

(1) Place header and A-pillar weatherstrip into position (Fig. 16).
(2) Starting on left side of vehicle.
(3) Install one screw attaching windshield molding.
(4) Install four screws and weatherstrip retainer at A-pillar.
(5) Install two screws on the top of header.
(6) Right side of vehicle.
(7) Install one screw attaching windshield molding.
(8) Install four screws and weatherstrip retainer A-pillar.
(9) Install two screws on the top of header.
(10) Install header molding. (Refer to 23 - BODY/EXTERIOR/MOLDING - INSTALLATION).
(11) Install door sill scuff plate. (Refer to 23 - BODY/INTERIOR/DOOR SILL TRIM - INSTALLATION).
(12) Raise convertible top.

FRONT DOOR SILL WEATHERSTRIP - PT-27

REMOVAL - PT-27 ONLY

(1) Open front door.
(2) Using a trim stick, remove door sill weatherstrip (Fig. 17).

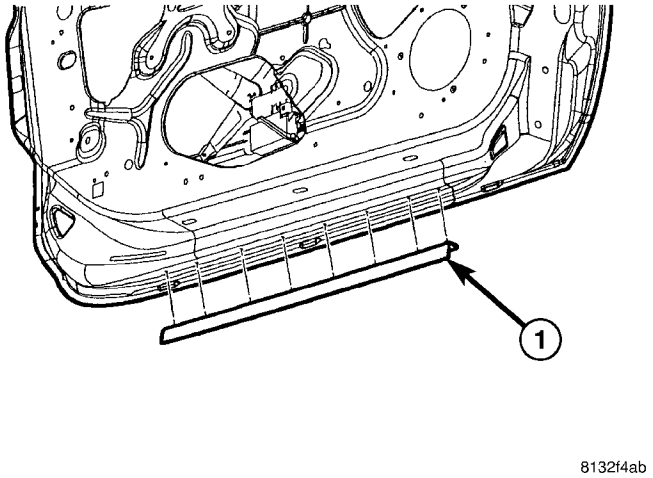

Fig. 17 DOOR TO ROCKER SEAL

1 - FRONT DOOR SILL WEATHERSTRIP

INSTALLATION

(1)
(2) Engage weatherstrip along lower door sill (Fig. 17).
(3) Verify weatherstrip sealing.

HEATING & AIR CONDITIONING

DESCRIPTION

ENGINE COOLING SYSTEM

To maintain the performance level of the heating-A/C system, the engine cooling system must be in proper working order. The use of a bug screen is not recommended. Any obstructions in front of the radiator or A/C condenser will reduce the performance of the A/C and engine cooling systems.

The engine cooling system includes the radiator, thermostat, radiator hoses and the engine coolant pump. Refer to Cooling for more information before opening or attempting any service to the engine cooling system.

HEATER AND AIR CONDITIONER SYSTEM

A manually controlled single zone type heating-air conditioning system or a manually controlled heater-only system is available as standard equipment on this model (depending on market).

All vehicles are equipped with a common heater, ventilation and air conditioning (HVAC) housing (Fig. 1). The system combines air conditioning, heating and ventilation capabilities in a single unit mounted within the passenger compartment under the instrument panel. The HVAC housing includes:

- Blower motor
- Blower motor resistor
- Recirculation-air door and actuator (A/C system only)
- Heater core
- A/C evaporator (A/C system only)
- Mode-air door

On heater-only systems, the evaporator coil is omitted from the housing and is replaced with an air restrictor plate.

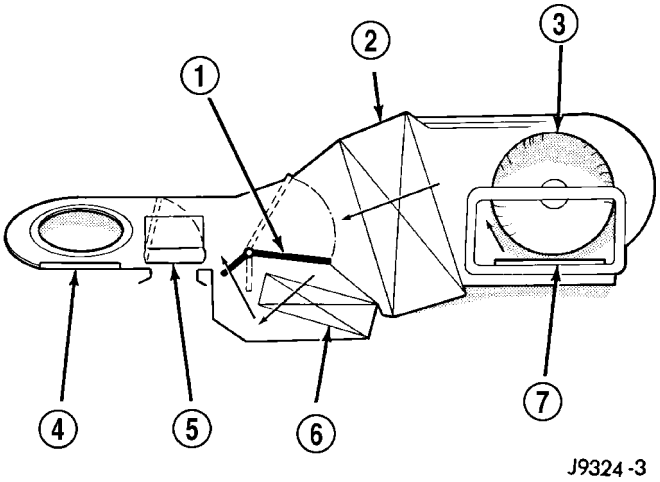

Fig. 1 Blend-Air HVAC System-Typical

1 - BLEND-AIR DOOR
2 - A/C EVAPORATOR
3 - BLOWER MOTOR
4 - PANEL/DEFROST-AIR DOOR
5 - HEAT/DEFROST-AIR DOOR
6 - HEATER CORE
7 - RECIRCULATION-AIR DOOR

Based upon the system mode selected, conditioned air can exit the standard heater-only or optional heater-A/C unit housing through one or a combination of the three main housing outlets: defrost, panel or floor. The defrost outlet is located on the top of the housing, the panel outlet is located on the face of the housing and the floor outlet is located on the bottom of the housing. Once the conditioned air exits the unit housing, it is further directed through molded plastic ducts to the various outlets in the vehicle interior. These outlets and their locations are as follows:

- **Defroster Outlet** - A single large defroster outlet is located in the center of the instrument panel top cover, near the base of the windshield.
- **Side Window Demister Outlets** - There are two side window demister outlets, one is located at

each outboard end of the instrument panel top cover, near the belt line at the A-pillars.

- **Panel Outlets** - There are four panel outlets in the instrument panel, one located near each outboard end of the instrument panel facing the rear of the vehicle and two located near the top of the instrument panel center bezel.
- **Front Floor Outlets** - There are four front floor outlets, two located above each side of the floor panel center tunnel near the dash panel.
- **Rear Floor Outlets** - There are two rear floor outlets, one located on each side of the floor panel center tunnel near the front of each rear seat foot well.

A heater booster is used to aid in warming the engine coolant on vehicles equipped with the 2.2 liter diesel engine. The heater booster system is switched on while the vehicle is being driven to help the engine reach its normal operating temperature quickly and to help aid in heating up the air within the passenger compartment quickly when requested by the operator (Refer to 24 - HEATING & AIR CONDITIONING/CABIN HEATER - DESCRIPTION).

OPERATION

The heating-A/C system pulls outside (ambient) air through the cowl opening at the base of the windshield, then into the plenum chamber above the heating, ventilation and air conditioning (HVAC) housing. On models equipped with A/C, the air passes through the A/C evaporator. Air flow can be directed either through or around the heater core. This is done by adjusting the blend-air door with the temperature control located on the A/C-heater control in the instrument panel. The air flow can then be directed from the panel, floor and defrost outlets in various combinations using the mode control. There are 17 different mode selections possible. Air flow velocity can be adjusted with the blower speed control.

On models equipped with A/C, the ambient air intake can be controlled by opening and closing the recirculating air door. When placed in the Recirculation position, air that is inside the vehicle is continuously recirculated through the HVAC housing. Ambient air cannot be controlled on vehicles without A/C. The system uses outside air at all times.

The A/C compressor can be engaged by turning the blower motor control counterclockwise from the Off position. It can also be engaged by placing the mode control in the Mix to Defrost positions. This will remove heat and humidity from the air before it is directed through or around the heater core.

The defroster outlet receives airflow from the HVAC housing through the molded plastic defroster duct, which is snapped onto the HVAC housing defroster outlet and secured by two tabs to mounting slots in the instrument panel top cover. The airflow from the defroster outlet is directed by fixed vanes in the defroster outlet grille and cannot be adjusted. The defroster outlet grille is integral to the instrument panel top cover.

The side window demister outlets receive airflow from the HVAC housing through the air outlet distribution duct, two molded plastic demister hoses and, on the right side only, an intermediate duct. The air outlet distribution duct is secured to the instrument panel with screws and receives airflow through the panel outlet of the HVAC housing. The airflow from the side window demister outlets is directed by fixed vanes in the demister outlet grilles and cannot be adjusted. The side window demister outlet grilles are integral to the instrument panel top cover. The demisters direct air from the HVAC housing through the outlets located on the top corners of the instrument panel. The demisters operate when the mode control is anywhere between floor and defrost settings. Some air may be noticeable from the demister outlets when the mode control is in the bi-level to floor positions.

The panel outlets also receive airflow from the HVAC housing through the air outlet distribution duct. Molded plastic panel outlet ducts and, on the left side only, an intermediate elbow direct airflow from the distribution duct to the outboard panel outlets, while a center air outlet duct directs airflow from the distribution duct to the two center panel outlets. The airflow from each of the panel outlets is adjustable. A knob in the center of each panel outlet grille is used in a joystick fashion to adjust a center diffuser that changes the airflow direction, and a knob on the outer edge of each panel outlet grille opens or closes a shutter to turn airflow on or off through that outlet.

The front and rear floor outlets receive airflow from the HVAC housing through the floor distribution duct. The front floor outlets are integral to the molded plastic floor distribution duct, which is secured to the bottom of the HVAC housing. A molded plastic rear seat duct elbow is fitted to the bottom of the floor distribution duct and directs airflow through a molded plastic duct beneath the carpet on the right side of the floor panel center tunnel to the right rear floor outlet. The right floor duct also features a crossover fitting that joins the right floor duct to the left floor duct over the top of the floor panel center tunnel to direct airflow to the left rear floor outlet. None of the floor outlets can be adjusted.

HEATING & AIR CONDITIONING (Continued)

DIAGNOSIS AND TESTING

A/C PERFORMANCE

The A/C system is designed to remove heat and humidity from the air entering the passenger compartment. The A/C evaporator, located in the HVAC housing, is cooled to temperatures near the freezing point. As warm damp air passes over the fins in the evaporator, moisture in the air condenses to water, dehumidifying the air. Condensation on the evaporator fins reduces the A/C evaporators ability to absorb heat. During periods of high heat and humidity, an A/C system will be less effective. With the HVAC mode control set to RECIRC, only air from the passenger compartment passes through the A/C evaporator. As the passenger compartment air dehumidifies, A/C performance levels rise.

A/C PERFORMANCE TEST

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.

Air temperature in test room and on vehicle must be 21° C (70°F) minimum for this test.

NOTE: When connecting the service equipment coupling to the line fitting, verify that the valve of the coupling is fully closed. This will reduce the amount of effort required to make the connection.

(1) Connect a tachometer and manifold gauge set.

(2) Set control to A/C, RECIRC, and PANEL, temperature lever on full cool and blower on high.

(3) Start engine and hold at 1000 rpm with A/C clutch engaged.

(4) Engine should be warmed up with doors closed and windows open.

(5) Insert a thermometer in the left center A/C panel outlet and operate the engine for five minutes. The A/C clutch may cycle depending on ambient conditions. If the clutch cycles, unplug the low pressure cycling clutch switch wire harness connector from the switch located on the accumulator. Place a jumper wire across the terminals of the low pressure cycling clutch switch wire harness connector.

(6) With the A/C compressor clutch engaged, compare the air temperature at the center panel outlet and the compressor discharge pressure to the A/C Performance Temperature and Pressure chart. The compressor clutch may cycle, depending upon the ambient temperature and humidity. If the clutch cycles, use the readings obtained before the clutch disengaged.

A/C PERFORMANCE TEMPERATURE AND PRESSURE - (NON-TURBO ENGINES ONLY)

Ambient Temperature	21°C (70°F)	27°C (80°F)	32°C (90°F)	38°C (100°F)	43°C (110°F)
Air Temperature at Center Panel Outlet	-2 - 6°C (29-42°F)	2-10°C (37-49°F)	7-15°C (45-58°F)	11-19°C (52-65°F)	15-23°C (59-72°F)
Compressor Discharge Pressure	999-1206 kPa (145-175 PSI)	1033-1378 kPa (150-200 PSI	1240-1757 kPa (180-255 PSI)	1584-2136 kPa (230-310 PSI)	2067-2722 kPa (300-395 PSI)
Accumulator Out Pressure at Service Port	122-221 kPa (18-32 PSI)	137-235 kPa (20-34 PSI)	186-290 kpa (27-42 PSI)	220-324 kpa (32-47 PSI)	275-379 kPa (40-55 PSI)

HEATING & AIR CONDITIONING (Continued)

A/C PERFORMANCE TEMPERATURE AND PRESSURE - (2.4L TURBO ENGINE ONLY)

Ambient Temperature	21°C (70°F)	27°C (80°F)	32°C (90°F)	38°C (100°F)	43°C (110°F)
Air Temperature at Center Panel Outlet	6 - 16°C (43-60°F)	11-21°C (52-69°F)	16-25°C (60-76°F)	17-28°C (63-83°F)	19-32°C (67-89°F)
Compressor Discharge Pressure	1139-1795 kPa (165-260 PSI)	1828-2070 kPa (265-300 PSI	1932-2070 kPa (280-300 PSI)	1932-2484 kPa (280-360 PSI)	2104-2898 kPa (305-420 PSI)
Accumulator Out Pressure at Service Port	195-319 kPa (28-46 PSI)	257-381 kPa (37-55 PSI)	312-443 kpa (45-64 PSI)	332-512 kpa (48-74 PSI)	360-581 kPa (52-84 PSI)

(7) If the air outlet temperature fails to meet the specifications in the A/C Performance Temperature and Pressure chart, or if the compressor discharge pressure is high, refer to the A/C Pressure Diagnosis Chart.

A/C PRESSURE DIAGNOSIS

Condition	Possible Causes	Correction
Rapid A/C compressor clutch cycling (ten or more cycles per minute).	1. Low refrigerant system charge.	1. See Refrigerant System Leaks in this group. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required.
Equal pressures, but the compressor clutch does not engage.	1. No refrigerant in the refrigerant system.	1. See Refrigerant System Leaks in this group. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required.
	2. Faulty fuse.	2. Check the fuses in the Integrated Power Module. Repair the shorted circuit or component and replace the fuses, if required. Refer to Group 8.
	3. Faulty A/C compressor clutch coil.	3. See A/C Compressor Clutch Coil in this group. Test the compressor clutch coil and replace, if required.
	4. Faulty A/C compressor clutch relay.	4. See A/C Compressor Clutch Relay in this group. Test the compressor clutch relay and relay circuits. Repair the circuits or replace the relay, if required.
	5. Improperly installed or faulty A/C low pressure switch.	5. See A/C Low Pressure Switch in this group. Test the switch and replace, if required.
	6. Faulty A/C high pressure switch.	6. See A/C High Pressure Switch in this group. Test the switch and replace, if required.
	7. Faulty Powertrain Control Module (PCM).	7. Refer to the proper Diagnostic Procedures manual for testing of the PCM. Test the PCM and replace, if required.

HEATING & AIR CONDITIONING (Continued)

Condition	Possible Causes	Correction
Normal pressures, but A/C Performance Test air temperatures at center panel outlet are too high.	1. Excessive refrigerant oil in system.	1. See Refrigerant Oil Level in this group. Recover the refrigerant from the refrigerant system and inspect the refrigerant oil content. Restore the refrigerant oil to the proper level, if required.
	2. Temperature control cable improperly installed or faulty.	2. See Temperature Control Cable this group. Inspect the cable for proper adjustment and operation. Adjust or replace the cable as required.
	3. Blend door inoperative or sealing improperly.	3. See HVAC Housing in this group. Inspect the blend door for proper operation and sealing. Repair if required.
	4. Blend door not in full cold position.	4. See Temperature Control Cable this group. Inspect the cable for proper adjustment and operation. Adjust or replace the cable as required.
The low side pressure is normal or slightly low, and the high side pressure is too low.	1. Low refrigerant system charge.	1. See Refrigerant System Leaks in this group. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required.
	2. Refrigerant flow through the A/C evaporator is restricted.	2. See A/C Evaporator in this group. Replace the restricted A/C evaporator, if required.
	3. Faulty A/C compressor.	3. See A/C Compressor in this group. Replace the compressor, if required.
The low side pressure is normal or slightly high, and the high side pressure is too high.	1. A/C condenser air flow restricted.	1. Check the A/C condenser for damaged fins, foreign objects obstructing air flow through the condenser fins, and missing or improperly installed air seals. Clean, repair, or replace components as required.
	2. Refrigerant flow through the accumulator is restricted.	2. See Accumulator in this group. Replace the restricted accumulator, if required.
	3. Inoperative radiator cooling fan.	3. Test the radiator cooling fan and replace, if required. Refer to Group 7.
	4. Refrigerant system overcharged.	4. See Refrigerant System Charge in this group. Recover the refrigerant from the refrigerant system. Charge the refrigerant system to the proper level, if required.
	5. Air in the refrigerant system.	5. See Refrigerant System Leaks in this group. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required.
	6. Engine overheating.	6. Test the engine cooling system and repair, if required. Refer to Group 7.

HEATING & AIR CONDITIONING (Continued)

Condition	Possible Causes	Correction
The low side pressure is too high, and the high side pressure is too low.	1. Accessory drive belt slipping.	1. Inspect the accessory drive belt condition and tension. Tighten or replace the accessory drive belt, if required. Refer to Group 7.
	2. Faulty A/C variable orifice tube.	2. See A/C Variable Orifice Tube in this group. Replace if required.
	3. Faulty A/C compressor.	3. See A/C Compressor in this group. Replace the compressor, if required.
The low side pressure is too low, and the high side pressure is too high.	1. Restricted refrigerant flow through the refrigerant lines.	1. See Liquid Line, Suction Line and Discharge Line in this group. Inspect the refrigerant lines for kinks, tight bends or improper routing. Correct the routing or replace the refrigerant line, if required.
	2. Restricted refrigerant flow through the A/C variable orifice tube.	2. See A/C Variable Orifice Tube in this group. Replace if required.
	3. Restricted refrigerant flow through the A/C condenser.	3. See A/C Condenser in this group. Replace the restricted condenser, if required.

HEATER PERFORMANCE

WARNING: Review safety precautions and warnings in this group before performing this procedure (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.

Check the coolant level, drive belt tension, radiator air flow and fan operation. Start engine and allow to warm up to normal operating temperature.

WARNING: Do not remove radiator cap when engine is hot, personal injury can result.

If vehicle has been run recently, wait 15 minutes before removing the radiator cap. Place a rag over the cap and turn it to the first safety stop. Allow pressure to escape through the overflow tube. When the system pressure stabilizes, remove the cap completely.

MAXIMUM HEATER OUTPUT: TEST AND ACTION

Engine coolant is provided to the heater system by two heater hoses. With the engine idling at normal operating temperature, set the temperature control to maximum heat, the mode control to the floor position, and the blower in the highest speed position. Using a test thermometer, check the temperature of the air being discharged from the floor outlets. Compare the test thermometer reading to the Heater Temperature Reference chart.

HEATER TEMPERATURE REFERENCE

Ambient Temperature		Minimum Floor Outlet Temperature	
Celsius	Fahrenheit	Celsius	Fahrenheit
15.5°	60°	62.2°	144°
21.1°	70°	63.8°	147°
26.6°	80°	65.5°	150°
32.2°	90°	67.2°	153°

If the floor outlet air temperature is insufficient, refer to 7 - COOLING - DIAGNOSIS AND TESTING. Both heater hoses should be HOT to the touch (coolant return hose should be slightly cooler than the supply hose). If coolant return hose is much cooler than the supply hose, locate and repair engine coolant flow obstruction in heater system.

OBSTRUCTED COOLANT FLOW Possible locations or causes of obstructed coolant flow are as follows:

- Pinched or kinked heater hoses.
- Improper heater hose routing.
- Plugged heater hoses or supply and return ports at the cooling system connections.
- Plugged heater core.
- Air locked heater core.

If proper coolant flow through the cooling system is verified, and heater outlet air temperature is insufficient, a mechanical problem may exist.

MECHANICAL PROBLEMS

Possible causes of insufficient heat due to mechanical problems are as follows:

- Faulty engine thermostat.

HEATING & AIR CONDITIONING (Continued)

- Faulty temperature control cable.
- Obstructed fresh air intake.
- Obstructed heater system outlets.
- Faulty blend-air door.

TEMPERATURE CONTROL

If the heater outlet air temperature cannot be adjusted with the temperature control on the A/C-heater control panel, the following could require service:

- Faulty A/C-heater control.
- Faulty temperature control cable.
- Faulty related wiring harness or connectors.
- Faulty blend-air door.

A/C COMPRESSOR CLUTCH COIL

DESCRIPTION

The A/C compressor clutch assembly consists of a stationary electromagnetic A/C clutch field coil, a pulley bearing and pulley assembly, and a clutch plate (Fig. 1). These components provide the means to engage and disengage the A/C compressor from the engine accessory drive belt.

The A/C clutch field coil and the pulley bearing and pulley assembly are both retained on the nose of the A/C compressor with snap rings. The clutch plate is splined to the compressor shaft and secured with a bolt.

OPERATION

When the clutch coil is energized, it magnetically draws the clutch into contact with the pulley and drives the compressor shaft. When the coil is not energized, the pulley freewheels on the clutch hub bearing, which is part of the pulley. The compressor clutch and coil are the only serviced parts on the compressor.

A/C compressor clutch engagement is controlled by the following components:

- A/C-heater mode control switch
- A/C low pressure switch
- A/C high pressure switch
- A/C compressor clutch relay
- Powertrain Control Module (PCM)

A/C COMPRESSOR CLUTCH COIL (Continued)

1 - BOLT
2 - CLUTCH PLATE
3 - PULLEY AND BEARING
4 - FIELD COIL
5 - SNAP RING
6 - SNAP RING
7 - SHIMS

The PCM may delay compressor clutch engagement for up to thirty seconds.

DIAGNOSIS AND TESTING

A/C COMPRESSOR CLUTCH COIL

The A/C compressor clutch coil electrical circuit is controlled by the powertrain control module (PCM) through the A/C clutch relay. The A/C clutch coil can be tested by either measuring cluch field coil resistance or by measuring current draw. Begin testing of a suspected compressor clutch coil problem by performing the preliminary checks.

PRELIMINARY CHECKS

(1) If the A/C compressor clutch will not engage, check for diagnostic trouble codes (DTCs) in the A/C-heater control and the powertrain control module (PCM). If no diagnostic trouble codes (DTCs) are found in the A/C-heater control or the PCM, go to Step 2. If any DTCs are found, repair as required.

(2) If the A/C compressor clutch still will not engage, verify the refrigerant charge level (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - DIAGNOSIS AND TESTING - REFRIGERANT SYSTEM LEAKS). If the refrigerant charge level is OK, go to COIL RESISTANCE TEST and/or COIL CURRENT DRAW TEST. If the refrigerant charge level is not OK, adjust the refrigerant charge as required.

COIL RESISTANCE TEST

(1) Disconnect and isolate the negative battery cable.

(2) Disconnect the wire harness connector from the A/C clutch field coil lead connector.

(3) Use an ohm meter and measure the resistance of the clutch coil at the coil lead connector terminals.

(4) Refer to the A/C Clutch Coil Specifications chart for the acceptable A/C clutch coil resistance. Specifications apply for a work area temperature of 21° C (70° F).

(a) If the A/C clutch coil reading is below specifications, the coil is shorted and must be replaced.

(b) If the A/C clutch coil reading is above specifications, the coil is open and must be replaced.

COIL CURRENT DRAW TEST

(1) Verify the battery state of charge (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - DIAGNOSIS AND TESTING).

(2) Connect an ammeter (0 to 10 ampere scale selected) in series with the clutch coil feed terminal. Connect a voltmeter (0 to 20 volt scale selected) to measure voltage across the battery and the clutch coil.

(3) With the A/C-heater control in the A/C mode and the blower motor at low speed, start the engine and allow it to run at a normal idle speed.

(4) The A/C compressor clutch should engage immediately, and the clutch coil supply voltage should be within two volts of the battery voltage. If the coil supply voltage is OK, go to Step 5. If the coil supply voltage is not within two volts of battery voltage, test the clutch coil feed circuit for excessive voltage drop and repair as necessary.

(5) Refer to the A/C Clutch Coil Specifications chart for the acceptable A/C clutch coil current draw. Specifications apply for a work area temperature of 21° C (70° F). If voltage is more than 12.5 volts, add electrical loads by turning on electrical accessories until voltage reads below 12.5 volts.

(a) If the A/C clutch coil current reading is zero, the coil is open and must be replaced.

(b) If the A/C clutch coil current reading is above specifications, the coil is shorted and must be replaced.

A/C CLUTCH COIL SPECIFICATIONS

Compressor	Current Draw	Coil Resistance
Denso 10S17	3.3 amps @ 11.5 - 12.5 volts	3.6 ohms

A/C COMPRESSOR CLUTCH COIL (Continued)

STANDARD PROCEDURE

A/C CLUTCH INSPECTION

NOTE: The A/C clutch can be serviced in the vehicle. The refrigerant system can remain fully-charged during compressor clutch, pulley and bearing assembly, or coil replacement.

Examine the friction surfaces of the clutch pulley and the clutch plate for wear (Fig. 2). The pulley and plate should be replaced if there is excessive wear or scoring.

If the friction surfaces are oily, inspect the shaft and nose area of the A/C compressor for refrigerant oil. If refrigerant oil is found, the compressor shaft seal is leaking and the A/C compressor must be replaced.

Check the clutch pulley bearing for roughness or excessive leakage of grease. Replace the pulley and bearing assembly, if required.

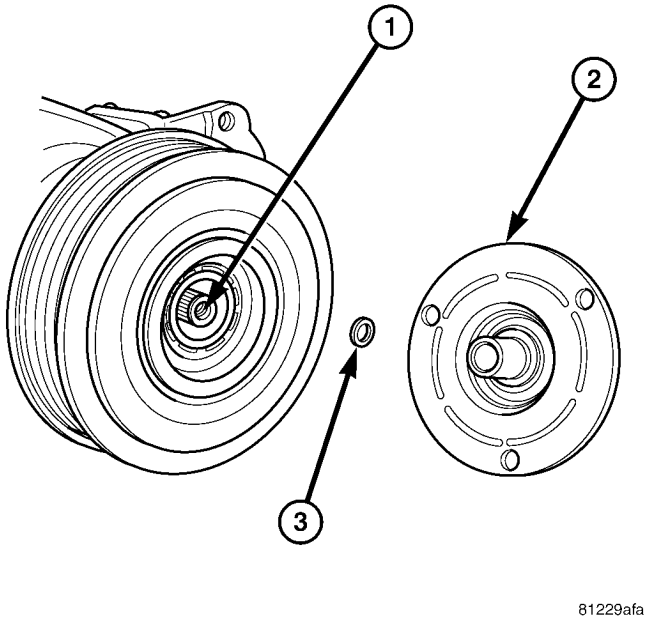

Fig. 2 Clutch Plate and Shim(s)

1 - A/C COMPRESSOR SHAFT
2 - CLUTCH PLATE
3 - SHIM

A/C CLUTCH BREAK-IN

After a new A/C compressor clutch has been installed, cycle the compressor clutch approximately twenty times (five seconds on, then five seconds off). During this procedure, set the A/C-heater controls to the A/C Recirculation Mode, the blower motor in the highest speed position, and the engine speed at 1500 to 2000 rpm. This procedure (burnishing) will seat the opposing friction surfaces and provide a higher compressor clutch torque capability.

REMOVAL

NOTE: The compressor clutch can be serviced in the vehicle. The refrigerant system can remain fully-charged during compressor clutch, pulley, or coil replacement.

(1) Disconnect and isolate the negative battery cable.

(2) Remove the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(3) Raise and support the vehicle.

(4) Disconnect the engine wire harness connector for the compressor clutch coil from the clutch coil pigtail wire connector on the top of the A/C compressor.

(5) Remove the bolts that secure the A/C compressor to the engine and support the A/C compressor.

(6) Remove the compressor shaft bolt (Fig. 3). A band-type oil filter wrench or a strap wrench may be used to secure the clutch during bolt removal.

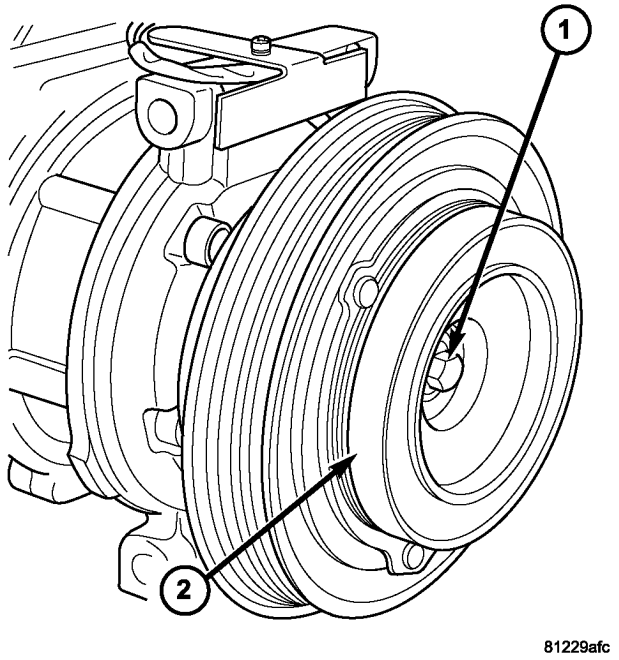

Fig. 3 A/C Compressor Shaft Bolt

1 - BOLT
2 - COMPRESSOR CLUTCH PLATE

(7) Tap the clutch plate lightly with a plastic mallet to release it from the splines on the compressor shaft. Remove the clutch plate and shim(s) from the compressor shaft (Fig. 4).

NOTE: Use care not to lose any of the shim(s).

A/C COMPRESSOR CLUTCH COIL (Continued)

CAUTION: Do not pry between the clutch plate unit and the pulley to remove the clutch plate from the compressor shaft as this may damage the clutch plate.

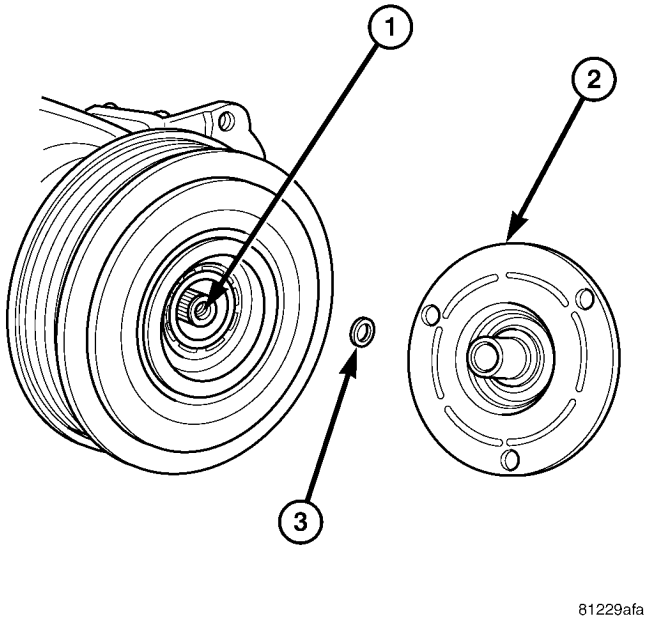

Fig. 4 Clutch Plate and Shim(s)

1 - A/C COMPRESSOR SHAFT
2 - CLUTCH PLATE
3 - SHIM

(8) Using snap ring pliers (Special Tool C-4574 or equivalent), remove the external snap ring that secures the pulley to the front cover of the compressor, then slide the pulley off of the compressor (Fig. 5).

(9) Remove the screw that secures the clutch coil pigtail wire connector bracket and ground clip to the top of the compressor housing.

(10) Using snap ring pliers (Special Tool C-4574 or equivalent), remove the external snap ring that secures the clutch coil to the front cover of the compressor housing, then slide the clutch coil off of the compressor (Fig. 6).

INSTALLATION

(1) Align the dowel pin on the back of the clutch coil with the hole in the compressor front cover and position the clutch coil onto the compressor. Be certain that the clutch coil pigtail wires are properly oriented and routed so that they are not pinched between the compressor front cover and the clutch coil.

NOTE: A new snap ring must be used to secure the clutch coil to the compressor. The bevel side of the snap ring must face outward.

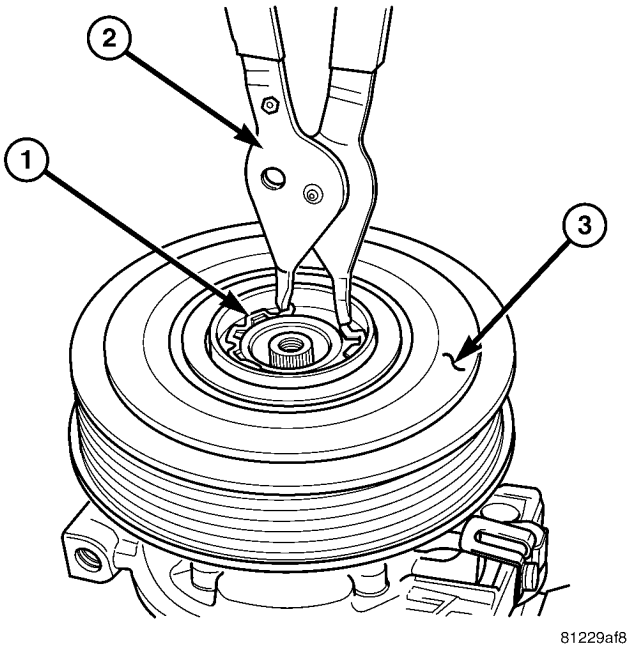

Fig. 5 Clutch Pulley Snap Ring

1 - SNAP RING
2 - SNAP RING PLIERS
3 - CLUTCH PULLEY AND BEARING

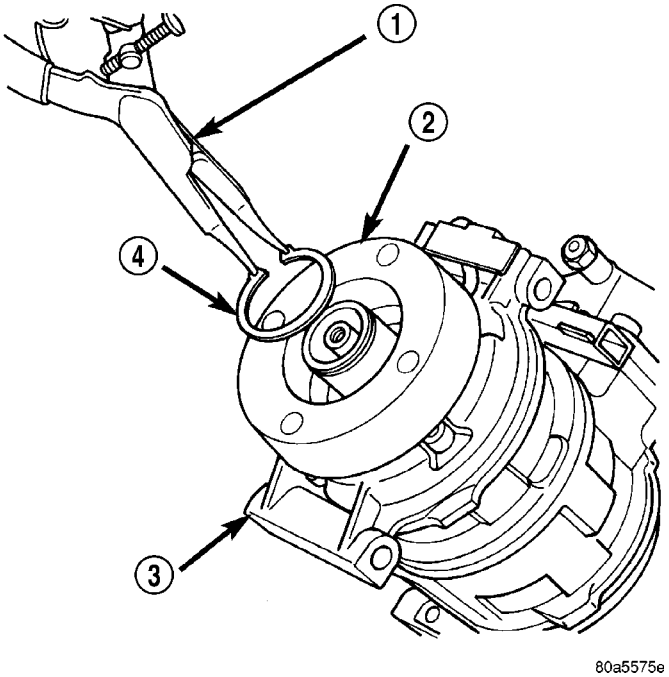

Fig. 6 Clutch Coil Snap Ring

1 - SNAP RING PLIERS
2 - CLUTCH FIELD COIL
3 - A/C COMPRESSOR
4 - SNAP RING

(2) Using snap ring pliers (Special Tool C-4574 or equivalent), install the external snap ring that secures the clutch coil to the front cover of the com-

A/C COMPRESSOR CLUTCH COIL (Continued)

pressor. The bevel side of the snap ring must face outward and both snap ring eyelets must be oriented to the right or the left of the clutch coil dowel pin location on the compressor. Be certain that the snap ring is fully and properly seated in the groove.

CAUTION: If the snap ring is not fully seated in the groove it will vibrate out, resulting in a clutch failure and severe damage to the compressor front cover.

(3) Install and securely tighten the screw that secures the clutch coil pigtail wire connector bracket and ground clip to the top of the compressor housing.

(4) Install the pulley onto the front cover of the compressor. If necessary, tap the pulley gently with a block of wood placed on the pulley friction surface (Fig. 7).

CAUTION: Do not mar the friction surfaces of the pulley.

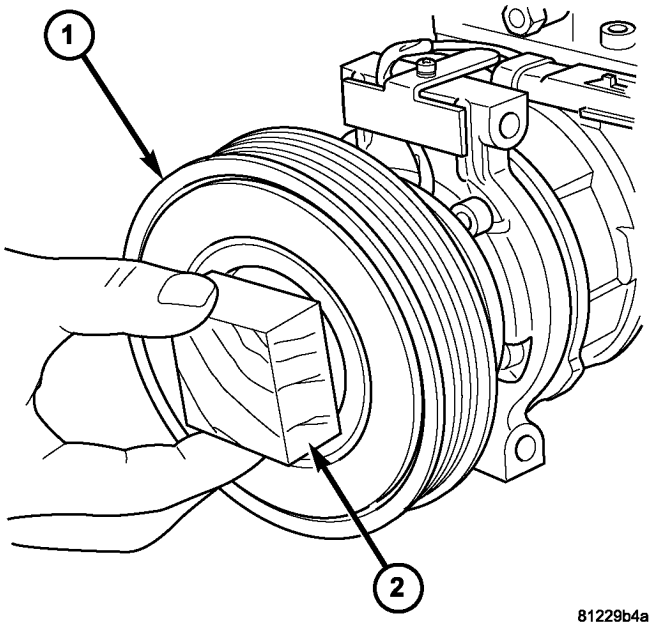

Fig. 7 Clutch Pulley - Installation

1 - PULLEY AND BEARING
2 - WOOD BLOCK

NOTE: A new snap ring must be used to secure the clutch pulley to the compressor. The bevel side of the snap ring must face outward.

(5) Using snap ring pliers (Special Tool C-4574 or equivalent), install the external snap ring (bevel side facing outward) that secures the clutch pulley to the front cover of the compressor. Be certain that the snap ring is fully and properly seated in the groove.

(6) If the original clutch plate and clutch pulley are to be reused, reinstall the original shim(s) on the compressor shaft against the shoulder. If a new clutch plate and/or clutch pulley are being used, install a trial stack of shims 2.54 mm (0.010 in.) thick on the compressor shaft against the shoulder.

(7) Install the clutch plate onto the compressor shaft.

NOTE: The shims may compress after tightening the shaft bolt. Check the air gap in four or more places to verify the air gap is still correct. Spin the pulley before performing a final check of the air gap.

(8) With the clutch plate assembly tight against the shim(s), measure the air gap between the clutch plate and the pulley face with feeler gauges. The air gap should be between 0.35 - 0.66 mm (0.014 - 0.026 in.). If the proper air gap is not obtained, add or subtract shims as needed until the desired air gap is obtained.

(9) Install the compressor shaft bolt. Tighten the bolt to 17.5 N·m (155 in. lbs.).

(10) Install the bolts that secure the A/C compressor to the engine. Tighten the bolts to 23 N·m (17 ft. lbs.).

(11) Connect the engine wire harness connector to the A/C compressor clutch coil.

(12) Install the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(13) Lower the vehicle.

(14) Reconnect the negative battery cable.

A/C CLUTCH RELAY

DESCRIPTION

The A/C clutch relay (Fig. 8) is a International Standards Organization (ISO) micro-relay. Relays conforming to the ISO specifications have common physical dimensions, current capacities, terminal functions and patterns. The ISO micro-relay terminal functions are the same as a conventional ISO relay. However, the ISO micro-relay terminal pattern (or footprint) is different, the current capacity is lower, and the physical dimensions are smaller than those of the conventional ISO relay.

The A/C clutch relay is located in the power distribution center (PDC) in the engine compartment.

A/C CLUTCH RELAY (Continued)

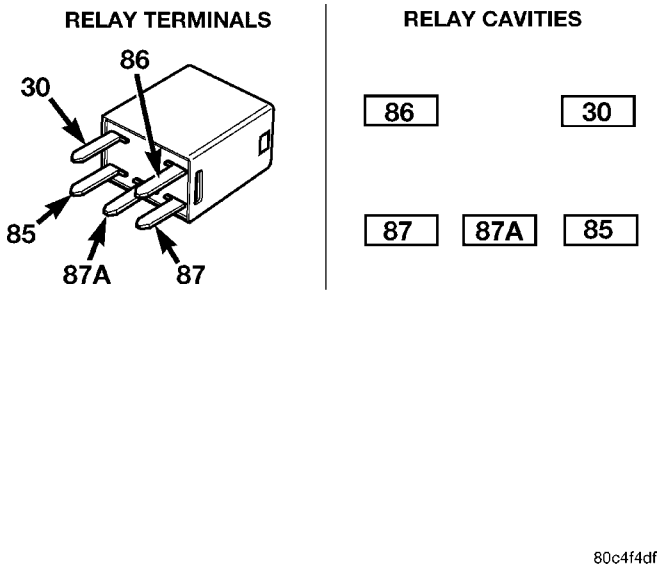

Fig. 8 A/C Clutch Relay

TERMINAL LEGEND	
NUMBER	IDENTIFICATION
30	COMMON FEED
85	COIL GROUND
86	COIL BATTERY
87	NORMALLY OPEN
87A	NORMALLY CLOSED

OPERATION

The A/C clutch relay is an electromechanical switch that uses a low current input controlled by the powertrain control module (PCM) to control the high current output to the A/C clutch field coil. The movable, common feed relay contact is held against the fixed, normally closed relay contact by spring pressure. When the electromagnetic relay coil is energized, it draws the movable common feed relay contact away from the fixed, normally closed relay contact and, holds it against the fixed, normally open relay contact. This action allows high current to flow to the A/C clutch field coil.

When the relay coil is de-energized, spring pressure returns the movable relay contact back against the fixed, normally closed contact point. The resistor or diode is connected in parallel with the relay coil, and helps to dissipate voltage spikes and electromagnetic interference that can be generated as the electromagnetic field of the relay coil collapses.

The A/C clutch relay terminals are connected to the vehicle electrical system through a receptacle in the power distribution center (PDC). The inputs and outputs of the A/C clutch relay include:

- The common feed terminal (30) receives a battery current input from a fuse in the PDC through a fused B(+) circuit at all times.
- The coil ground terminal (85) receives a ground input from the PCM through the A/C clutch relay control circuit only when the PCM electronically pulls the control circuit to ground.
- The coil battery terminal (86) receives a battery current input from a fuse in the fuse block module through a fused ignition switch output (run-start) circuit only when the ignition switch is in the On or Start positions.
- The normally open terminal (87) provides a battery current output to the compressor clutch coil through the A/C clutch relay output circuit only when the A/C compressor clutch relay coil is energized.
- The normally closed terminal (87A) is not connected to any circuit in this application, but provides a battery current output only when the A/C clutch relay coil is de-energized.

The A/C clutch relay cannot be repaired and, if faulty or damaged, it must be replaced. Refer to the appropriate wiring information for diagnosis and testing of the ISO-standard micro-relay and for complete HVAC wiring diagrams.

REMOVAL

(1) Disconnect and isolate the negative battery cable.

(2) Open the cover of the power distribution center (PDC) located in the engine compartment (Fig. 9).

NOTE: Refer to the fuse and relay layout map on the inside of the PDC cover for A/C clutch relay location.

(3) Remove the A/C clutch relay from the PDC.

INSTALLATION

NOTE: Refer to the fuse and relay layout map on the inside of the power distribution center (PDC) cover for A/C clutch relay location.

(1) Position the A/C clutch relay into the receptacle of the PDC.

(2) Align the A/C clutch relay terminals with the terminal cavities in the PDC receptacle and push down firmly on the relay until the terminals are fully seated.

A/C CLUTCH RELAY (Continued)

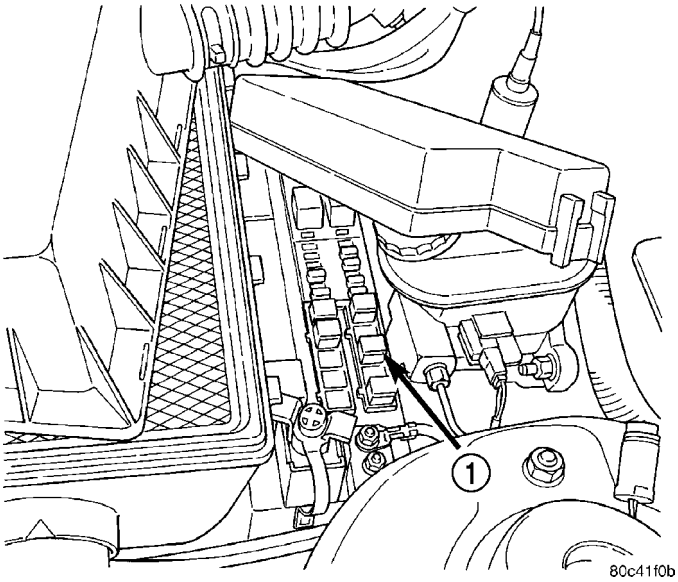

Fig. 9 Power Distribution Center - LHD Shown, RHD Typical

1 - PDC

(3) Close the cover of the PDC.
(4) Reconnect the negative battery cable.

A/C HEATER CONTROL

DESCRIPTION

Both the heater-only and heater-A/C systems use a combination of, electrical, cable, and vacuum controls. These controls provide the vehicle operator with a number of setting options to help control the climate and comfort within the vehicle.

The A/C-heater control for the heater-only or the heater-A/C system is located to the right of the instrument cluster in the instrument panel. The A/C-heater control contains rotary-type knobs. There is a blower motor speed switch, mode control switch, temperature control, and airflow control.

The A/C-heater control cannot be repaired and, if faulty or damaged, it must be replaced. The control knobs and the illumination lamps are available for service replacement.

DIAGNOSIS AND TESTING

VACUUM CONTROL SYSTEM

Use an adjustable Vacuum Test Set (Special Tool C-3707-B or equivalent) and a suitable vacuum pump to test the heater-A/C vacuum control system. With a finger placed over the end of the Vacuum Test Probe (Fig. 10), adjust the bleed valve on the Vacuum Test Gauge to obtain a vacuum of exactly 27 kPa (8 in. Hg.). Release and block the end of the Vacuum Test Probe several times to verify that the vacuum reading returns to the exact 27 kPa (8 in. Hg.) setting. Otherwise, a false reading will be obtained during testing.

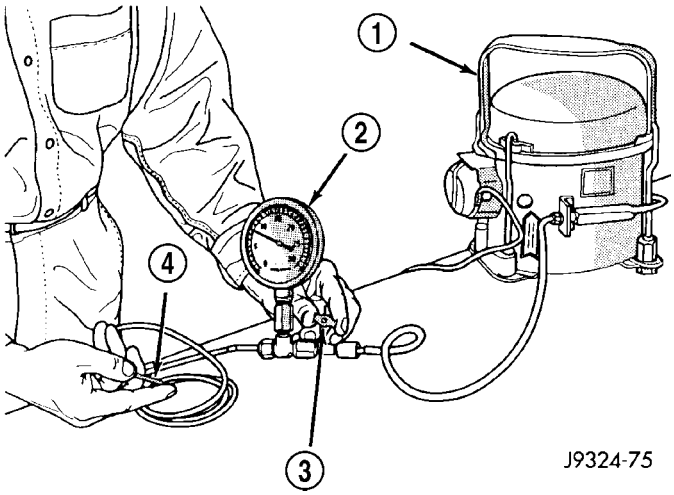

Fig. 10 Adjust Vacuum Test Bleed Valve

3 - BLEED VALVE
4 - PROBE

HEATER-A/C VACUUM SYSTEM DIAGNOSIS

Condition	Possible Causes	Correction
No Forced Air in Heat Position	1. Vacuum line pinched or leaking.	1. Locate and repair vacuum leak or pinched line.
	2. Faulty heat defroster or mode door.	2. Test actuators and door operation. Repair as necessary.
	3. Faulty selector switch.	3. Test selector switch and replace if necessary.
	4. Vacuum check valve.	4. Test check valve and replace if necessary.

A/C HEATER CONTROL (Continued)

Condition	Possible Causes	Correction
No Forced Air in Panel Position	1. Vacuum line pinched or leaking.	1. Locate and repair vacuum leak or pinched line.
	2. Faulty mode door.	2. Test actuator and door operation. Repair as necessary.
	3. Faulty selector switch.	3. Test selector switch and replace if necessary.
	4. Vacuum check valve.	4. Test check valve and replace if necessary.
No Forced Air in Defrost Position	1. Vacuum line pinched or leaking.	1. Locate and repair vacuum leak or pinched line.
	2. Faulty heat , defroster, or mode door.	2. Test actuators and door operation. Repair as necessary.
	3. Faulty selector switch.	3. Test selector switch and replace if necessary.
	4. Vacuum check valve.	4. Test check valve and replace if necessary.

ONE-WAY CHECK VALVE

(1) Disconnect the heating-A/C system vacuum supply (black) line in the engine compartment. This line passes through an opening in the dash panel.

(2) Remove the one-way vacuum check valve. The valve is located on the vacuum supply (black) line at the power brake booster.

(3) Connect the Vacuum Test Probe from the Vacuum Test Set to the heater side of the one-way vacuum check valve. When connected to this side of the check valve, no vacuum should pass and the Vacuum Test Gauge should return to the 27 kPa (8 in. Hg.) setting. If OK, go to step Step 4. If not OK, replace the faulty one-way vacuum check valve.

(4) Connect the Vacuum Test Probe from the Vacuum Test Set to the engine side of the one-way vacuum check valve. When connected to this side of the check valve, vacuum should flow through the valve without restriction. If not OK, replace the faulty one-way vacuum check valve.

A/C-HEATER CONTROLS

NOTE: The operation of the recirculation-air door can be viewed by removing the blower motor and looking up into the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/ BLOWER MOTOR - REMOVAL).

(1) Connect the Vacuum Test Probe to the vehicle vacuum supply (black) line. Position the Vacuum Test Gauge so it can be viewed from the passenger compartment.

(2) Start with the mode control in the Panel position and the recirculation control in the Outside-air position.

(3) Move the recirculation control to the Recirculation position (the recirculation-air door should move to the Recirculation position). After a short pause move the mode control to the Defrost position (the recirculation-air door should move to the Outside-air position). The Vacuum Test Gauge should return to the calibrated setting of 27 kPa (8 in. Hg.) after each selection is made. If the Vacuum Test Gauge cannot achieve the calibrated setting, the vacuum circuit or a component has a vacuum leak.

(4) If the Vacuum Test Gauge achieves the calibrated setting but the recirculation-air door does not move, there is either a pinched vacuum line or a failed recirculation door actuator.

LOCATING VACUUM LEAKS

(1) Connect the Vacuum Test Probe to the vehicle vacuum supply (black) line. Position the Vacuum Test Gauge so it can be viewed from the passenger compartment.

(2) Place the mode control in the Panel position and the recirculation control in the Recirculation position.

(3) Remove the center instrument panel bezel.

(4) Remove the center vent duct.

(5) Remove and block the vehicle vacuum supply (black) line at the A/C-heater control. The Vacuum Test Gauge should return to the calibrated setting of 27 kPa (8 in. Hg). If not, there is a leak in the vacuum supply line.

(6) If there is no leak in the vacuum supply (black) line, reconnect it to the A/C-heater control and remove the actuator vacuum feed (red) line from the A/C-heater control. Block the vacuum connection on the A/C-heater control from where the line was removed. The Vacuum Test Gauge should return to the calibrated setting of 27 kPa (8 in. Hg.). If not, there is a leak in the A/C-heater control.

NOTE: The vacuum port for the recirculation door actuator is accessible from behind the glove box.

A/C HEATER CONTROL (Continued)

(7) If there is no leak in the vacuum supply (black) line or the A/C-heater control, reconnect the actuator vacuum feed (red) line to the A/C-heater control. Remove and block the actuator vacuum feed line at the recirculation door actuator. The Vacuum Test Gauge should return to the calibrated setting of 27 kPa (8 in. Hg.). If not there is a leak in the actuator vacuum feed line.

(8) If there is no leak in the vacuum supply (black) line, A/C-heater control, or the actuator vacuum feed (red) line, the vacuum leak must be in the recirculation door actuator itself. Connect the Vacuum Test Probe directly to the recirculation door actuator to verify the leak.

LOCATING PINCHED VACUUM LINES

NOTE: The operation of the recirculation-air door can be viewed by removing the blower motor and looking up into the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/ BLOWER MOTOR - REMOVAL).

(1) Connect the Vacuum Test Probe to the vehicle vacuum supply (black) line. Position the Vacuum Test Gauge so it can be viewed from the passenger compartment.

(2) Place the mode control in the Panel position and the recirculation control in the Recirculation position.

(3) Remove the center instrument panel bezel.

(4) Remove the center vent duct.

(5) Disconnect the vacuum supply (black) line from the A/C-heater control. The Vacuum Test Gauge should drop, indicating free flow through the supply line. If not, there is a blockage in the supply line.

(6) If there is no blockage in the vacuum supply (black) line, reconnect it to the A/C-heater control. Remove the actuator vacuum feed (red) line from the A/C-heater control. The Vacuum Test Gauge should drop indicating free flow through the supply line and A/C-heater control. If not, the vacuum switch on the A/C-heater control is not functioning.

NOTE: The vacuum port for the recirculation door actuator is accessible from behind the glove box.

(7) If there is no blockage in the vacuum supply (black) line or the A/C-heater control, reconnect the actuator vacuum feed (red) line to the A/C-heater control. Disconnect the actuator vacuum feed line from the recirculation door actuator. The Vacuum Test Gauge should drop indicating free flow through the vacuum supply line, A/C-heater control, and the actuator vacuum feed line. If not, there is a blockage in the actuator vacuum feed line.

(8) If there is no blockage in the vacuum supply (black) line, A/C-heater control, or the actuator vacuum feed (red) line, the recirculation door actuator may have failed. Connect the Vacuum Test Probe directly to the recirculation door actuator to verify if it has failed. If the a recirculation door actuator is OK, then recirculation-air door is binding. Repair the recirculation-air door as necessary.

REMOVAL

(1) Remove the instrument panel center bezel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - REMOVAL).

(2) Remove the center air duct (Fig. 11) (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/AIR OUTLETS - REMOVAL).

(3) Remove the screws that secure the A/C-heater control to the instrument panel.

(4) Remove the A/C-heater control from the instrument panel to gain access to the vacuum harness, control cables and wire harness at the rear of the A/C-heater control.

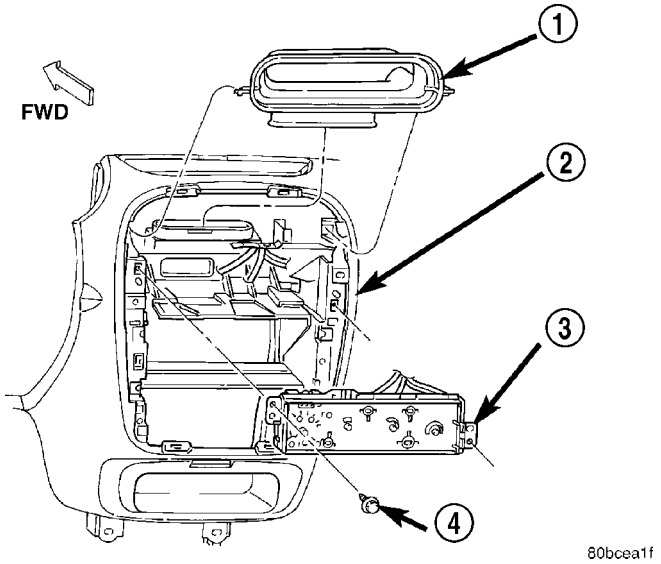

Fig. 11 A/C-Heater Control and Center Air Duct

1 - CENTER AIR DUCT
2 - INSTRUMENT PANEL
3 - A/C-HEATER CONTROL
4 - SCREW (2)

NOTE: To aid in reinstallation, note the installed position of the vacuum harness prior to removal.

(5) Disconnect the vacuum harness and wire harness from the rear of the A/C-heater control (Fig. 12).

NOTE: To aid in reinstallation, note the installed positions of the control cables prior to removal.

A/C HEATER CONTROL (Continued)

(6) Disconnect the control cables from the mode and temperature control levers at the rear of the A/C-heater control.

(7) Remove the A/C-heater control from the vehicle.

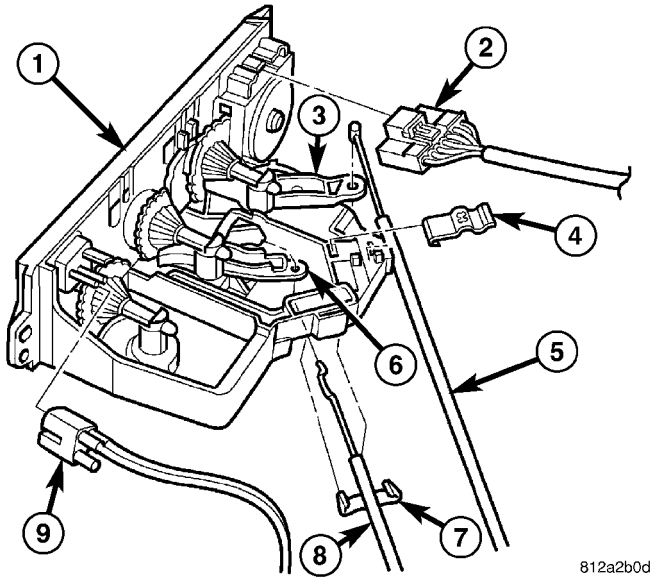

Fig. 12 Vacuum Harness, Control Cables and Wiring Harness

1 - A/C-HEATER CONTROL
2 - WIRE HARNESS CONNECTOR
3 - MODE CONTROL LEVER
4 - CABLE RETAINING CLIP
5 - MODE CONTROL CABLE
6 - TEMPERATURE CONTROL LEVER
7 - CABLE RETAINING CLIP
8 - TEMPERATURE CONTROL CABLE
9 - VACUUM HARNESS CONNECTOR

INSTALLATION

NOTE: Make sure to properly connect the vacuum harness to the A/C-heater control. Failure to properly connect the vacuum harness will cause the heating-A/C system to remain in the Recirculation mode, which will result in higher blower motor noise levels and possible condensation on the inside of the windows.

(1) Properly connect the vacuum harness, control cables and wire harness to the back of the A/C-heater control.

(2) Adjust the mode and temperature control cables. Refer to the following Cable Adjustment Procedure.

(3) Install the A/C-heater control to the instrument panel. Tighten the screws to 2 N·m (17 in. lbs.).

(4) Install the center air duct (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/AIR OUTLETS - INSTALLATION).

(5) Install the instrument panel center bezel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - INSTALLATION).

CABLE ADJUSTMENT PROCEDURE

(1) With the A/C-heater control removed from the instrument panel and the control cable retaining clips removed, turn the mode and the temperature controls completely counterclockwise.

(2) While holding the mode and the temperature controls in the counterclockwise position, pull on the gray casing of the control cables until all free play in the cables is removed and the air doors are indexed to the controls.

(3) Install the cable retaining clips. Make sure that the control cables are securely positioned by the retaining clips.

A/C HIGH PRESSURE SWITCH

DESCRIPTION

The A/C high pressure switch controls both A/C compressor clutch engagement/disengagement, and electric cooling fan operation. The A/C high pressure switch is mounted at the rear of the A/C compressor. The A/C high pressure switch turns off the A/C compressor if the refrigerant system pressure exceeds 3100 - 3375 kPa (450 - 490 psi).

OPERATION

The contacts in the A/C high pressure switch open and close causing the powertrain control module (PCM) or the engine control module (ECM) (depending on application) to turn the A/C compressor clutch on and off. This prevents A/C compressor operation when the discharge pressure approaches high levels, and also reduces electrical surging from A/C clutch engagement.

The A/C high pressure switch controls the electric cooling fan operation by monitoring refrigerant line pressures. When the discharge pressure rises above 1900 to 2200 kPa (280 to 320 psi) the fan will turn on. The cooling fan will turn off when the discharge pressure drops to 1600 kPa (235 psi).

The A/C high pressure switch contacts open when the discharge pressure rises above 3100 to 3375 kPa (450 to 490 psi). The A/C high pressure switch contacts close when the discharge pressure drops to 1860 to 2275 kPa (270 to 330 psi).

The A/C high pressure switch is factory-calibrated and cannot be adjusted or repaired. If the A/C high pressure switch is faulty or damaged, it must be replaced.

A/C HIGH PRESSURE SWITCH (Continued)

DIAGNOSIS AND TESTING

A/C HIGH PRESSURE SWITCH

Before performing diagnosis of the A/C high pressure switch, verify that the refrigerant system has the correct refrigerant charge (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE)

For circuit descriptions and diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

(1) Disconnect and isolate the negative battery cable.

(2) Disconnect the wire harness connector from the A/C high pressure switch.

(3) Check for continuity between both terminals of the A/C high pressure switch. There should be continuity. If there is not continuity, replace the faulty A/C high pressure switch. If there is continuity, test the A/C high pressure switch sense circuit (Refer to 8 - ELECTRICAL/WIRING DIAGRAM INFORMATION - DIAGNOSIS AND TESTING). Repair as required.

REMOVAL

WARNING: Review safety precautions and warnings in this group before performing this procedure (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.

(1) Disconnect and isolate the negative battery cable.

(2) Recover refrigerant from A/C system (Refer to 24 - HEATING & AIR CONDITIONING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).

(3) Raise and support the vehicle.

(4) Disconnect the wire harness connector from the A/C high pressure switch located at the rear of the A/C compressor (Fig. 13).

(5) Using snap ring pliers, remove the internal snap ring that secures the A/C high pressure switch to the A/C compressor.

(6) Pull the A/C high pressure switch out of the A/C compressor and remove and discard the O-ring seal.

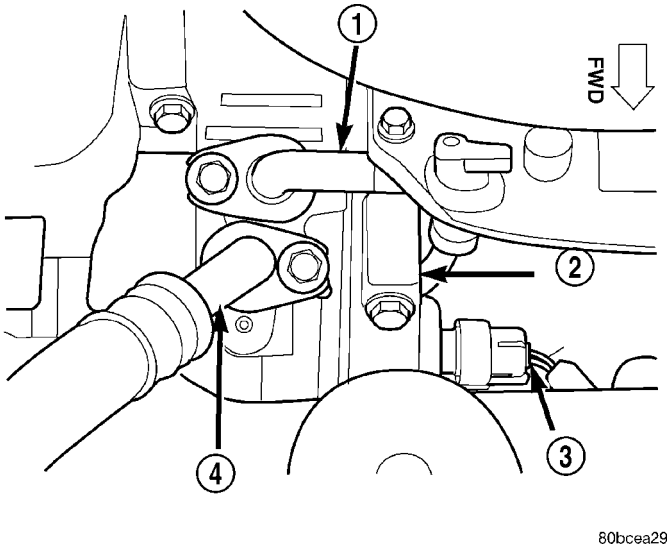

Fig. 13 A/C High Pressure Switch - Typical

1 - A/C DISCHARGE LINE
2 - A/C COMPRESSOR
3 - A/C HIGH PRESSURE SWITCH
4 - A/C SUCTION LINE

INSTALLATION

(1) Clean any foreign matter from the switch mounting bore.

(2) Remove the tape or plug from the switch port at the rear of the A/C compressor.

(3) Lubricate a new rubber O-ring seal with clean refrigerant oil and install it onto A/C high pressure switch. Use only the specified O-ring as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

(4) Install the A/C high pressure switch onto the rear of the A/C compressor.

(5) Using snap ring pliers, install the internal snap ring that secures the A/C high pressure switch to the A/C compressor.

(6) Connect the wire harness connector to the A/C high pressure switch.

(7) Lower the vehicle.

(8) Reconnect the negative battery cable.

(9) Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).

(10) Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

A/C LOW PRESSURE SWITCH

DESCRIPTION

The A/C low pressure switch is a single pole, single throw, pressure actuated switch that is used to control evaporator freeze up.

The A/C low pressure switch is mounted on a fitting located on the top of the A/C accumulator. The A/C low pressure switch fitting on the accumulator is equipped with an O-ring and contains a Schrader-type valve, which allows the switch to be serviced without discharging the refrigerant system.

OPERATION

The A/C low pressure switch is electrically connected in series with the A/C-heater control and the A/C high pressure switch, between ground and the powertrain control module (PCM) or the engine control module (ECM), depending on engine application.

The A/C low pressure switch contact opens or closes the path the ground, signaling the PCM or ECM to turn the A/C compressor clutch on and off. This regulates the refrigerant system pressure and controls evaporator coil temperature. Controlling the evaporator temperature prevents condensate water on the evaporator fins from freezing and obstructing air conditioning system air flow.

The A/C low pressure switch contacts are open when the A/C suction line pressure is approximately 152 kPa (22 psi) or lower. The A/C low pressure switch contacts will close when the A/C suction line pressure rises to approximately 234 to 262 kPa (34 to 38 psi) or above. Lower ambient temperatures, below approximately -1° C (30° F), will also cause the A/C low pressure switch contacts to open. This is due to the pressure/temperature relationship of the refrigerant in the system.

The A/C low pressure switch is factory-calibrated and cannot be adjusted or repaired. If the A/C low pressure switch is faulty or damaged, it must be replaced.

DIAGNOSIS AND TESTING

A/C LOW PRESSURE SWITCH

NOTE: Lower ambient temperatures, below about -1° C (30° F), during cold weather will open the A/C low pressure switch contacts and prevent A/C compressor operation due to the pressure/temperature relationship of the refrigerant.

Before performing diagnosis of the A/C low pressure switch, verify that the refrigerant system has the correct refrigerant charge (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE) and that the A/C low pressure switch is properly installed on the accumulator fitting. If the A/C low pressure switch is not properly installed, it may not open the Schrader-type valve in the accumulator fitting, which will prevent the switch from correctly monitoring the refrigerant system pressure.

For circuit descriptions and diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

(1) With gear selector in Park or Neutral and with park brake set, start the engine and allow it to idle.

(2) Place the A/C-heater mode control in any A/C position.

(3) Disconnect the wire harness connector from the A/C low pressure switch.

(4) Using a suitable jumper wire, install the jumper wire between the two terminals of the wire harness connector for the A/C low pressure switch. The A/C compressor clutch should engage. If the A/C clutch does engage, replace the faulty A/C low pressure switch. If the A/C clutch does not engage, the A/C clutch, A/C clutch relay, A/C-heater control, A/C high pressure switch, PCM or ECM (depending on engine application), fuses or related wiring circuits may be defective (Refer to 8 - ELECTRICAL/WIRING DIAGRAM INFORMATION - DIAGNOSIS AND TESTING). Repair as required.

REMOVAL

NOTE: Note: It is not necessary to discharge the refrigerant system to replace the A/C low pressure switch.

(1) Disconnect and isolate the battery negative cable.

(2) Disconnect the wire harness connector from the A/C low pressure switch (Fig. 14).

(3) Remove the A/C low pressure switch from the accumulator and remove and discard the O-ring seal.

INSTALLATION

NOTE: Replace the O-ring seal before installing the A/C low pressure switch.

(1) Lubricate a new O-ring seal with clean refrigerant oil and install it onto the accumulator fitting. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only

A/C LOW PRESSURE SWITCH (Continued)

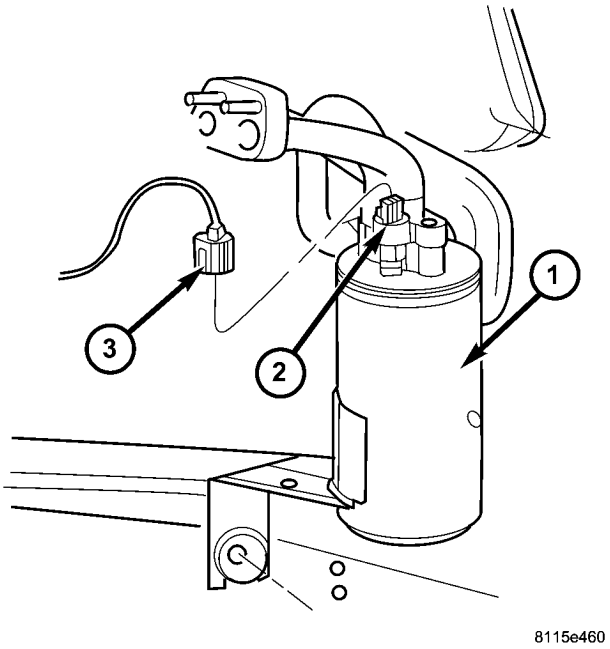

Fig. 14 A/C Low Pressure Switch - Typical

1 - ACCUMULATOR
2 - A/C LOW PRESSURE SWITCH
3 - WIRE HARNESS CONNECTOR

refrigerant oil of the type recommended for the A/C compressor in the vehicle.

(2) Install the A/C low pressure switch onto the accumulator. Hand-tightened the switch securely.

(3) Connect the wiring harness connector to the A/C low pressure switch.

(4) Reconnect the battery negative cable.

BLOWER MOTOR RESISTOR

DESCRIPTION

The blower motor resistor (Fig. 15) is located in the cowl, at the base of the windshield. There are two different blower motor resistors depending on whether the vehicle is equipped with A/C or not.

The blower motor resistor is mounted to the dash panel within the engine compartment. The resistor consists of a molded plastic mounting plate with an integral wire connector receptacle. Concealed behind the mounting plate are coiled resistor wires contained within a protective stamped steel cage. The blower motor resistor is accessed for service by removing the cowl top screen.

OPERATION

The blower motor resistor is connected to the vehicle electrical system through a dedicated take out and connector of the vehicle harness. The blower motor resistor has multiple resistor wires, each of

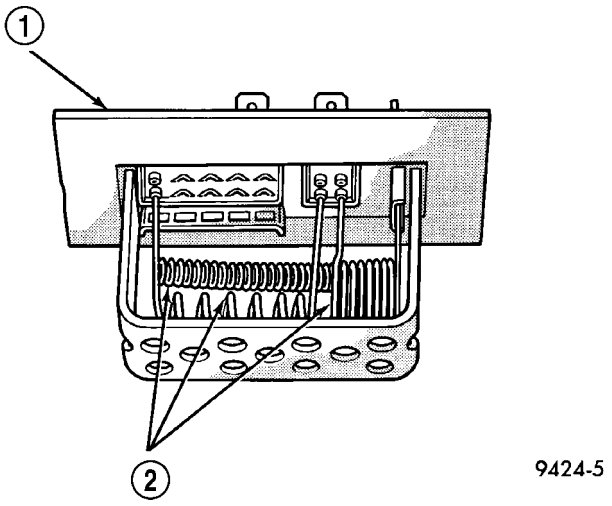

Fig. 15 Blower Motor Resistor

1 - BLOWER MOTOR RESISTOR
2 - RESISTORS

which will reduce the current flow through the blower motor to change the blower motor speed. The blower motor switch directs the ground path for the blower motor through the correct resistor wire to obtain the selected speed.

With the blower motor switch in the lowest speed position, the ground path for the motor is applied through all of the resistor wires. Each higher speed selected with the blower motor switch applies the blower motor ground path through fewer of the resistor wires, increasing the blower motor speed. When the switch is in the highest speed position, blower motor resistor is bypassed and the blower motor receives a direct path to ground.

The blower motor resistor cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

DIAGNOSIS AND TESTING

BLOWER MOTOR RESISTOR

WARNING: On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

BLOWER MOTOR RESISTOR (Continued)

NOTE: For circuit descriptions and diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

(1) Disconnect and isolate the negative battery cable.

(2) Disconnect the wire harness connector from the blower motor resistor (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/BLOWER MOTOR RESISTOR - REMOVAL).

(3) Using an ohmmeter, check for continuity between all of the blower motor resistor terminals. In each case there should be continuity. If OK, repair the wire harness circuits between the blower motor switch and the blower motor resistor or blower motor as required. If not OK, replace the faulty blower motor resistor.

REMOVAL

WARNING: The blower motor resistor may get very hot during normal operation. If the blower motor was turned on prior to servicing the blower motor resistor, wait five minutes to allow the blower motor resistors to cool before performing diagnosis or service. Failure to take this precaution can result in possible personal injury.

CAUTION: Do not operate the blower motor with the blower motor resistor removed from the circuit. Failure to take this precaution can result in vehicle damage.

(1) Disconnect and isolate the negative battery cable.

(2) Remove the windshield wipers (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER ARMS - REMOVAL).

(3) Remove the cowl top screen (Refer to 23 - BODY/EXTERIOR/COWL GRILLE SCREEN - REMOVAL).

(4) Disconnect the wire harness connector from the blower motor resistor (Fig. 16).

(5) Disengage the retaining clip and remove the blower motor resistor from the engine compartment.

INSTALLATION

(1) Position the blower motor resistor into the engine compartment.

(2) Install the blower motor resistor into the cowl and engage the retaining clip.

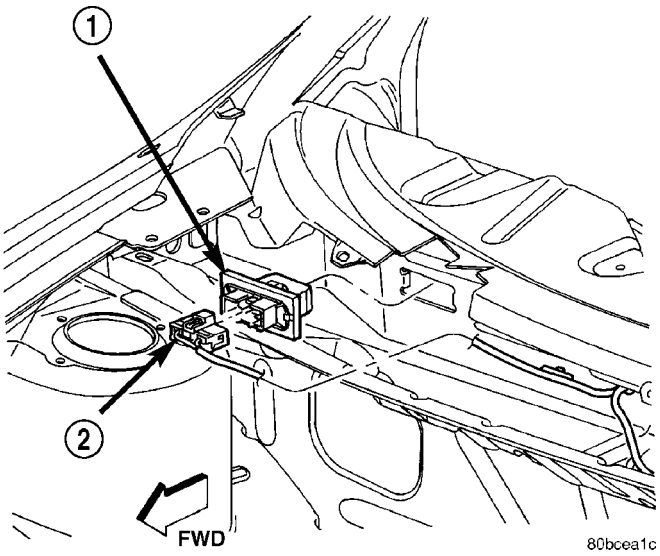

Fig. 16 Blower Motor Resistor - Typical

1 - BLOWER MOTOR RESISTOR
2 - ELECTRICAL CONNECTOR

(3) Connect the wire harness connector to the blower motor resistor.

(4) Install the cowl top screen (Refer to 23 - BODY/EXTERIOR/COWL GRILLE SCREEN - INSTALLATION).

(5) Install the windshield wipers (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER ARMS - INSTALLATION).

(6) Reconnect the negative battery cable.

MODE DOOR CABLE

REMOVAL

NOTE: The mode control cable can be removed and installed without having to remove the instrument panel from the vehicle.

(1) Disconnect and isolate the negative battery cable.

(2) Remove instrument panel center bezel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - REMOVAL).

(3) Remove the center air duct (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/AIR OUTLETS - REMOVAL).

(4) Remove the A/C-heater control (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/A/C HEATER CONTROL - REMOVAL).

(5) Reach through the center air duct opening in the instrument panel to access and remove the screw that secures the mode control cable housing to the top of the HVAC housing (Fig. 17).

MODE DOOR CABLE (Continued)

(6) Disconnect the mode control cable end from the mode-air door lever.

(7) Remove the mode control cable through the A/C-heater control opening in the instrument panel.

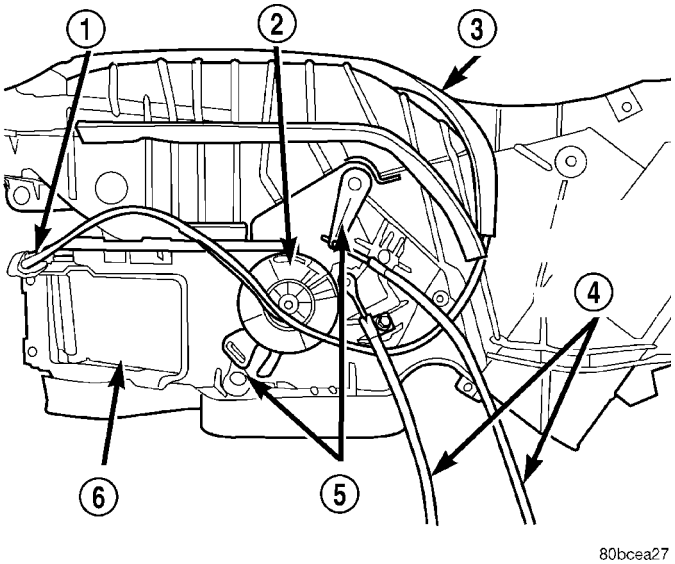

Fig. 17 HVAC Housing Cables - Typical

1 - VACUUM HARNESS
2 - DOOR CAM
3 - HVAC UPPER HOUSING
4 - HVAC CONTROL CABLES
5 - MODE DOOR LEVERS
6 - DEFROSTER DUCT OUTLET

INSTALLATION

(1) Position the mode control cable through the A/C-heater control opening in the instrument panel.

(2) Reach through the center air duct opening in the instrument panel to access and connect the mode control cable to the mode-air door lever.

(3) Install the screw that secures the mode control cable casing to the top of the HVAC housing. Tighten the screw to 2 N·m (17 in. lbs.).

(4) Install and adjust the mode control cable. Refer to the following Adjustment Procedure

(5) Install the A/C-heater control (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/A/C HEATER CONTROL - INSTALLATION).

(6) Install the center air duct (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/AIR OUTLETS - INSTALLATION).

(7) Install the instrument panel center bezel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - INSTALLATION).

(8) Reconnect the negative battery cable.

ADJUSTMENT PROCEDURE

(1) With the A/C-heater control removed from the instrument panel and the mode control cable retaining clip removed, turn the mode control completely counterclockwise.

(2) While holding the mode control in the counterclockwise position, pull on the gray casing of the mode control cable until all free play in the cable is removed and the mode-air door is indexed to the mode control.

(3) Install the cable retaining clip. Make sure that the control cable is securely positioned by the retaining clip.

RECIRCULATION DOOR ACTUATOR

DESCRIPTION

NOTE: This vehicle uses vacuum to operate only the recirculation door. All other controls are cable operated.

Vehicles equipped with A/C have a vaccum operated recirculation door actuator. When vacuum is supplied by the A/C-heater control to the recirculation door actuator, the recirculation door moves to the RECIRC position. The actuator is spring loaded so the door moves to the Outside-air position when there is no vacuum supplied. The operation of the door can be viewed by removing the blower motor and looking up into the HVAC housing.

OPERATION

Normally, vacuum is supplied to the actuator by placing the recirculation control knob in the RECIRC position. The mode and the recirculation controls are mechanically interlocked so the recirculation control cannot be placed in the RECIRC position if the mode control is at/or between the mix and defrost positions. Vacuum is supplied to the actuator only when recirculation control is at the RECIRC position. If the recirculation control is between the Outside-air position and RECIRC position the system will still be in the Outside-air position. If the recirculation control is in the RECIRC position and the mode control is moved from the Floor to the Defrost positions, the recirculation control will move from the RECIRC position, to the Outside-air position beginning at the Mix position. This is to help prevent window fogging.

The recirculation door actuator cannot be adjusted or repaired and, if damaged or faulty, it must be replaced.

REMOVAL

NOTE: The instrument panel must be removed from the vehicle to gain access to the recirculation door actuator.

RECIRCULATION DOOR ACTUATOR (Continued)

(1) Disconnect and isolate the battery negative cable.

(2) Remove instrument panel from vehicle (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - REMOVAL).

(3) Disconnect the vacuum line harness connector from the recirculation door actuator.

(4) Release the latch that secures the recirculation door actuator mount to the stanchion on the HVAC housing, and disengage the recirculation door actuator from the housing.

(5) Disconnect the recirculation door actuator linkage from the recirculation door lever (Fig. 18).

(6) Remove the recirculation door actuator from the HVAC housing.

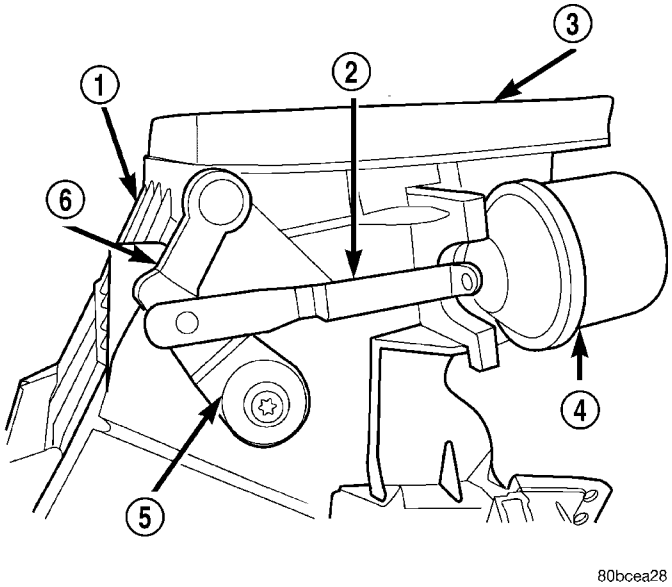

Fig. 18 Recirculation Door Actuator and Linkage - Typical

1 - OUTSIDE AIR/RECIRC DOOR HOUSING
2 - VACUUM ACTUATOR LINKAGE
3 - FOAM SEAL
4 - RECIRC DOOR VACUUM ACTUATOR
5 - DOOR LEVER
6 - DOOR LEVER

INSTALLATION

(1) Position the recirculation door actuator to the HVAC housing.

(2) Connect the recirculation door actuator linkage to the recirculation door lever.

(3) Align the recirculation door actuator mount to the stanchion on the HVAC housing, and press it onto the stanchion firmly to engage the latch.

(4) Connect the vacuum harness connector to the recirculation door actuator.

(5) Reinstall the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - INSTALLATION).

(6) Reconnect the battery negative cable.

TEMPERATURE CONTROL CABLE

REMOVAL

NOTE: The temperature control cable can be removed and installed without having to remove the instrument panel from the vehicle.

(1) Disconnect and isolate the negative battery cable.

(2) Remove the instrument panel center bezel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - REMOVAL).

(3) Remove the center air duct (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/AIR OUTLETS - REMOVAL).

(4) Remove the A/C-heater control (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/A/C HEATER CONTROL - REMOVAL).

(5) Reach through the center air duct opening in the instrument panel to access and remove the screw that secures the temperature control cable housing to the top of the HVAC housing (Fig. 19).

(6) Disconnect the temperature control cable from the blend-air door lever.

(7) Remove the temperature control cable through the A/C-heater control opening in the instrument panel.

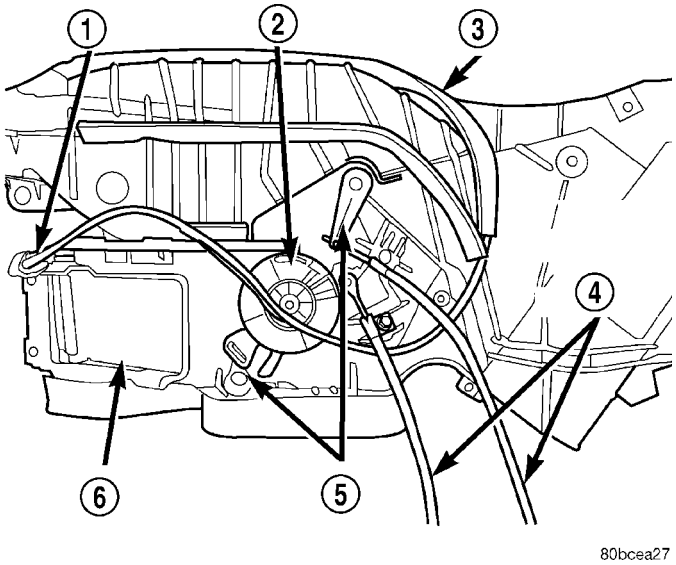

Fig. 19 HVAC Housing Cables - Typical

1 - VACUUM HARNESS
2 - DOOR CAM
3 - HVAC UPPER HOUSING
4 - HVAC CONTROL CABLES
5 - MODE DOOR LEVERS
6 - DEFROSTER DUCT OUTLET

TEMPERATURE CONTROL CABLE (Continued)

INSTALLATION

(1) Position the temperature control cable through the A/C-heater control opening in the instrument panel.

(2) Reach through the center air duct opening in the instrument panel to access and connect the temperature control cable to the blend-air door lever.

(3) Install the screw that secures the temperature control cable case to the top of the HVAC housing. Tighten the screw to 2 N·m (17 in. lbs.).

(4) Install and adjust the temperature control cable. Refer to the following Adjustment Procedure.

(5) Install the A/C-heater control (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/A/C HEATER CONTROL - INSTALLATION).

(6) Install the center air duct (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/AIR OUTLETS - INSTALLATION).

(7) Install the instrument panel center bezel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - INSTALLATION).

(8) Reconnect the negative battery cable.

ADJUSTMENT PROCEDURE

(1) With the A/C-heater control removed from the instrument panel and the temperature control cable retaining clip removed, turn the temperature control completely counterclockwise.

(2) While holding the temperature control in the counterclockwise position, pull on the gray casing of the temperature control cable until all free play in the cable is removed and the blend-air door is indexed to the temperature control.

(3) Install the cable retaining clip. Make sure that the control cable is securely positioed by the retaining clip.

VACUUM CHECK VALVE

DESCRIPTION

Vehicles equipped with A/C use vacuum to operate the recirculation door. A vacuum check valve is connected to the brake booster vacuum supply. The vacuum check valve is designed to allow vacuum to flow in only one direction through the accessory vacuum supply circuits and to stabilize the vacuum within the HVAC recirculation circuit whenever the vehicle is accelerating or engine vacuum varies due to operating conditions.

OPERATION

The use of a vacuum check valve helps to maintain the system vacuum needed to retain the selected heating-A/C mode settings. The check valve will prevent the engine from bleeding down system vacuum through the intake manifold during extended heavy engine load (low engine vacuum) operation.

The vacuum check valve cannot be repaired and, if faulty or damaged, it must be replaced.

REMOVAL

The vehicle uses vacuum to operate the recirculation door. A vacuum check valve is connected to the brake booster vacuum supply. The check valve is used to stabilize the vacuum within the HVAC recirculation circuit whenever the vehicle is accelerating or engine vacuum varies due to operating conditions.

(1) Disconnect the vacuum harness from the vacuum check valve (Fig. 20).

(2) Remove the vacuum check valve from the brake booster vacuum check valve.

(3) Remove the vacuum check valve from the engine compartment.

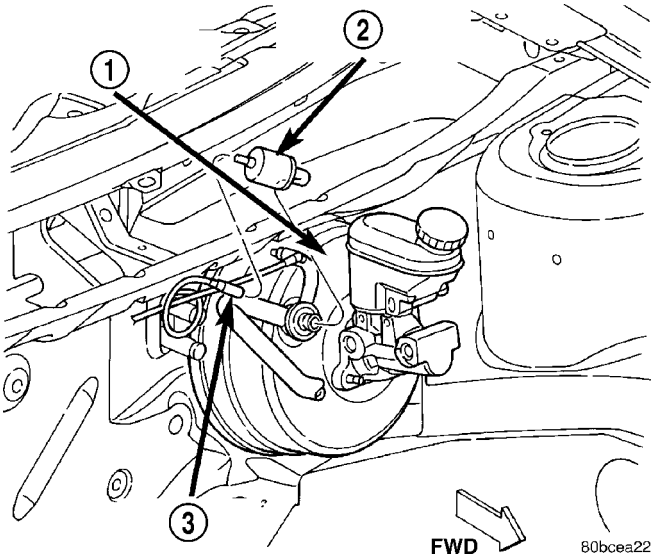

Fig. 20 Vacuum Check Valve

1 - BRAKE POWER BOOSTER
2 - VACUUM CHECK VALVE
3 - VACUUM HARNESS

INSTALLATION

(1) Install the vacuum check valve onto the brake booster vacuum check valve. Ensure correct vacuum flow.

(2) Connect the vacuum harness to the vacuum check valve.

AIR FILTER

DESCRIPTION

Some models are equipped with an air conditioning system air filter. The filter is mounted under the hood in the outside-air intake of the HVAC housing. The filter should be checked and replaced at least once every 24,000 km (15,000 miles) and checked if A/C-heater system performance seems lower than expected.

REMOVAL

(1) Remove the passenger side cowl grille screen (Refer to 23 - BODY/EXTERIOR/COWL GRILLE SCREEN - REMOVAL).

(2) Loosen the bolts that secure the windshield washer reservoir to the body.

NOTE: Removal of the reservoir is not necessary. Loosen reservoir just enough to allow access to the filter element.

(3) Remove the filter element by lifting the filter element up and out of the housing.

INSTALLATION

(1) Install filter element by inserting the element down directly into the element housing. The filter is held in place by friction between the filter element and the housing so no fasteners are used.

(2) Position windshield washer reservoir and tighten the retaining bolts to 8 N·m (70 in. lbs.).

(3) Install passenger side cowl grill screen (Refer to 23 - BODY/EXTERIOR/COWL GRILLE SCREEN - INSTALLATION).

AIR OUTLETS

REMOVAL

AIR OUTLET DISTRIBUTION DUCT

(1) Remove the instrument panel assembly from the vehicle (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - REMOVAL).

(2) Remove the screws that secure the air outlet distribution duct to the instrument panel (Fig. 1).

(3) Disengage the right demister hose from the integral retainer on the right side of the air outlet distribution duct.

(4) Disconnect the right demister hose from the right intermediate demister duct.

(5) Disconnect the left and right demister hoses from the air outlet distribution duct.

(6) Disengage the air outlet distribution duct from the left panel duct intermediate elbow.

(7) Disengage the air outlet distribution duct from the right panel duct.

(8) Remove the air outlet distribution duct from the instrument panel.

AIR OUTLETS (Continued)

AIR OUTLET CENTER DUCT

(1) Remove the dash panel top cover (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - REMOVAL).

(2) Remove the center bezel from the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/ INSTRUMENT PANEL CENTER BEZEL - REMOVAL).

(3) Remove the two screws that secure the A/C-heater control to the instrument panel and position the control out of the way (Fig. 2).

(4) Remove the screw that secures the air outlet center duct to the instrument panel.

(5) Disengage the air outlet center duct from the air outlet distribution duct.

(6) Remove the air outlet center duct from the instrument panel.

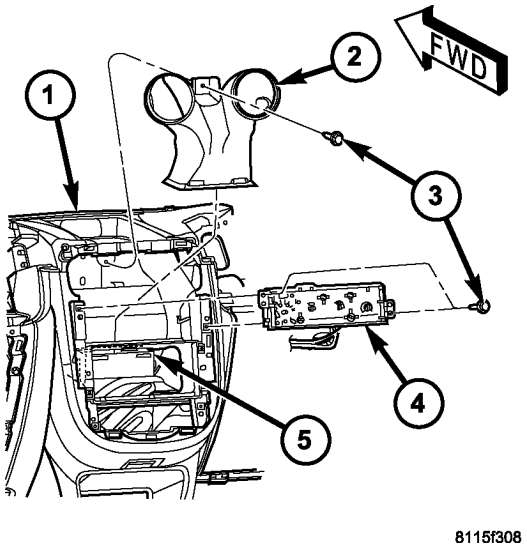

Fig. 2 Air Outlet Center Duct - LHD Shown, RHD Typical

1 - INSTRUMENT PANEL
2 - AIR OUTLET CENTER DUCT
3 - SCREW (3)
4 - A/C-HEATER CONTROL
5 - AIR OUTLET DISTRIBUTION DUCT

INSTALLATION

AIR OUTLET DISTRIBUTION DUCT

(1) Position the air outlet distribution duct into the instrument panel.

(2) Engage the air outlet distribution duct to the right panel duct.

(3) Engage the air outlet distribution duct to the left panel duct intermediate elbow.

(4) Connect the left and right demister hoses to the air outlet distribution duct.

AIR OUTLETS (Continued)

(5) Connect the right demister hose to the right intermediate demister duct.

(6) Engage the right demister hose to the integral retainer on the right side of the air outlet distribution duct.

(7) Install the screws that secure the air outlet distribution duct to the instrument panel. Tighten the screws to 2 N·m (17 in. lbs.).

(8) Install the instrument panel assembly (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - INSTALLATION).

AIR OUTLET CENTER DUCT

(1) Position the air outlet center duct to the instrument panel.

(2) Engage the air outlet center duct to the air outlet distribution duct.

(3) Install the screw that secures the air outlet center duct to the instrument panel. Tighten the screw to 2 N·m (17 in. lbs.).

(4) Position the A/C-heater control into the instrument panel and install the two retaining screws. Tighten the screws to 2 N·m (17 in. lbs.).

(5) Install the center bezel onto the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - INSTALLATION).

(6) Install the instrument panel top cover (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - INSTALLATION).

BLOWER MOTOR

DESCRIPTION

The blower motor is a 12-volt, Direct Current (DC) motor with a squirrel cage-type blower wheel that is secured to the blower motor shaft (Fig. 3). The blower motor and wheel are located near the passenger side end of the HVAC housing in the passenger compartment below the instrument panel. The blower motor and blower motor wheel are a factory balanced unit and cannot be adjusted or repaired. If faulty or damaged, the blower motor and blower wheel must be replaced as a unit (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/BLOWER MOTOR - REMOVAL).

OPERATION

The blower motor will operate whenever the ignition switch is in the On position, and the blower control switch is in any position except Off. The blower motor circuit is protected by a fuse in the instrument panel fuse block. The blower motor speed is controlled by regulating the battery feed through the blower control switch and the blower motor resistor.

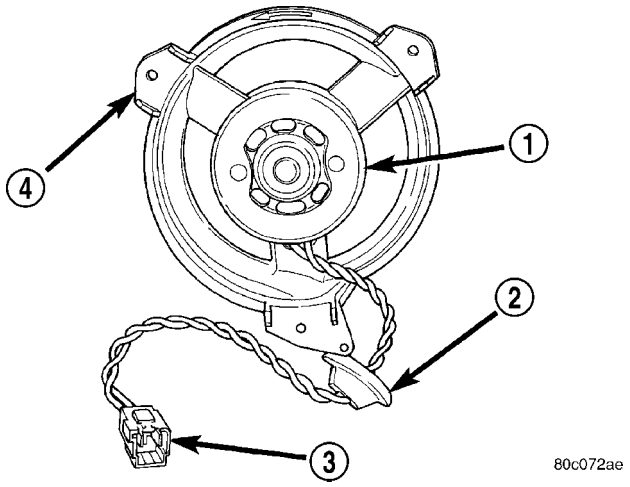

Fig. 3 Blower Motor

1 - BLOWER MOTOR
2 - RUBBER GROMMET
3 - BLOWER MOTOR CONNECTOR
4 - MOUNTING TABS

The blower motor and wheel are used to control the velocity of air moving through the heater-only or A/C-heater systems. The blower motor controls the velocity of the air flowing through the HVAC housing by spinning the blower wheel within the housing at the selected speed.

DIAGNOSIS AND TESTING

BLOWER MOTOR

WARNING: On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

NOTE: For circuit descriptions and diagrams, refer to Air Conditioning/Heater in Group 8W - Wiring Diagrams.

OPERATION

Possible causes of an inoperative blower motor or blower motor not operating in all speeds include:

- Faulty fuse
- Faulty blower motor resistor
- Faulty blower motor switch
- Faulty blower motor

BLOWER MOTOR (Continued)

• Faulty blower motor circuit wiring or wire harness connectors

VIBRATION

Possible causes of blower motor vibration include:
• Improper blower motor mounting
• Improper blower wheel mounting
• Deformed blower wheel
• Out of balance blower wheel due to foreign material in the wheel
• Faulty blower motor

NOISE

To determine if the blower motor is the source of the noise, simply switch the blower motor from Off to On. To verify that the blower motor is the source of the noise, unplug the blower motor wire harness connector and operate the heating-A/C system. If the noise goes away, possible causes include:
• Foreign material in the HVAC air inlet housing
• Improper blower motor mounting
• Improper blower wheel mounting
• Faulty blower motor

REMOVAL

NOTE: The blower motor is located on the bottom right side of the HVAC housing. The blower motor can be removed from the vehicle without having to remove the HVAC housing.

WITH AIR CONDITIONING

(1) Disconnect and isolate the negative battery cable.
(2) Remove the passenger side door sill scuff plate.
(3) Pull back the carpet to access the blower motor.
(4) Disconnect the blower motor wire harness connector.
(5) Remove the screws that secure the blower motor to the HVAC housing (Fig. 4).
(6) Remove the blower motor from the HVAC housing.

WITHOUT AIR CONDITIONING

(1) Disconnect and isolate the negative battery cable.
(2) Disconnect the blower motor wire harness connector.
(3) Grasp the blower motor while pulling down on the locking tab. Turn the blower motor approximately 1/8 turn counterclockwise (Fig. 5).
(4) Remove the blower motor from the HVAC housing.

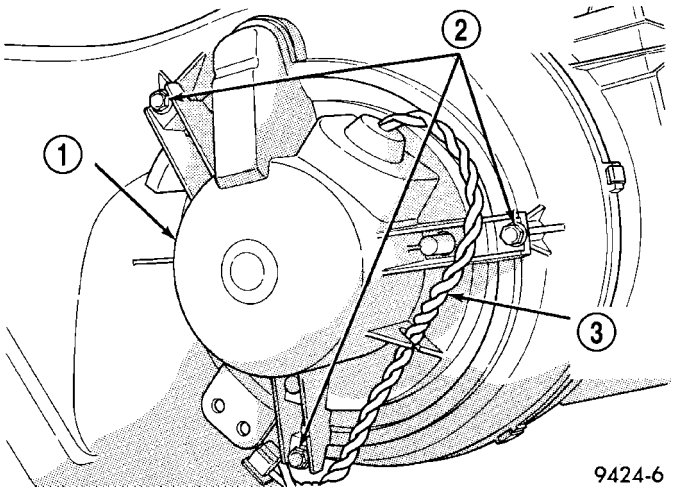

Fig. 4 Blower Motor - With A/C, Typical

1 - BLOWER MOTOR
2 - BLOWER MOTOR RETAINING SCREW (3)
3 - BLOWER MOTOR WIRING

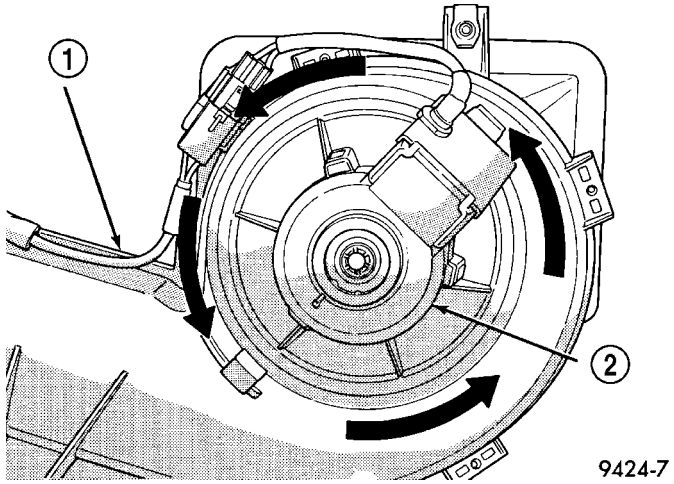

Fig. 5 Blower Motor - Without A/C, Typical

1 - HVAC HOUSING
2 - BLOWER MOTOR

INSTALLATION

WITH AIR CONDITIONING

(1) Position the blower motor into the HVAC housing.
(2) Install the blower motor retaining screws. Tighten the screws to 2 N·m (17 in. lbs.).
(3) Connect the blower motor wire harness connector.
(4) Reposition the carpet.
(5) Install the door sill scuff plate.
(6) Reconnect the negative battery cable.

WITHOUT AIR CONDITIONING

(1) Position the blower motor into the housing.

BLOWER MOTOR (Continued)

(2) Rotate the blower motor clockwise until the tab snaps into the locked position, approximately 1/8 turn.

(3) Connect the blower motor wire harness connector.

(4) Reconnect the negative battery cable.

DEFROSTER DUCT

REMOVAL

(1) Remove the instrument panel from the vehicle (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - REMOVAL).

(2) Remove the defroster duct from the top of the HVAC housing (Fig. 6).

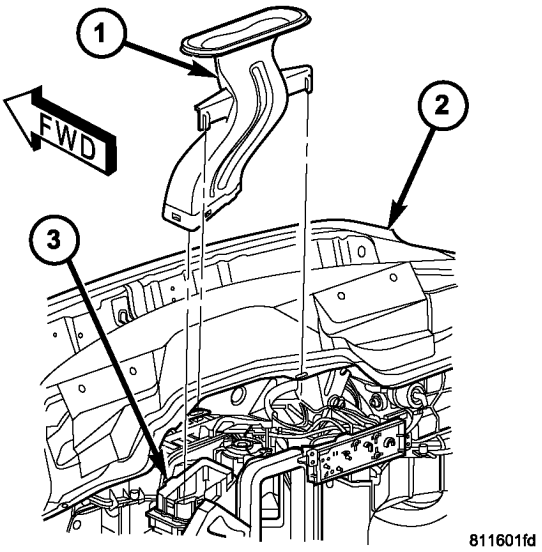

Fig. 6 Defroster Duct - LHD Shown, RHD Typical

1 - DEFROSTER DUCT
2 - COWL
3 - HVAC HOUSING

INSTALLATION

(1) Install the defroster duct onto the top of the HVAC housing. Snap the retainers into place.

(2) Install the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - INSTALLATION).

FLOOR DISTRIBUTION DUCTS

REMOVAL

(1) Remove the center floor console (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - REMOVAL).

(2) Remove the screws that secure the left and right floor distribution ducts to the floor (Fig. 7).

(3) Disengage the floor distribution ducts from each other.

(4) Disengage the floor distribution duct from the rear seat elbow duct located at the bottom of the HVAC housing.

(5) Remove both floor distribution ducts from the vehicle.

(6) If necessary, remove the rear seat elbow duct from the bottom of the HVAC housing.

INSTALLATION

(1) If removed, install the rear seat elbow duct to the bottom of the HVAC housing.

(2) Position both floor distribution ducts into the vehicle.

(3) Engage the floor distribution duct to the rear seat elbow duct located at the bottom of the HVAC housing.

(4) Engage the floor distribution ducts to each other.

(5) Install the screws that secure the left and right floor distribution ducts to the floor. Tighten the screws to 2 N·m (17 in. lbs.).

(6) Install the center floor console (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - INSTALLATION).

FLOOR DISTRIBUTION DUCTS (Continued)

HVAC HOUSING

REMOVAL

WARNING: On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in an accidental airbag deployment and possible personal injury or death.

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.

NOTE: The HVAC housing must be removed from the vehicle and the two halves of the housing separated for service access of the heater core, A/C evaporator and the mode, recirculation and blend-air doors.

(1) Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).

(2) Partially drain the engine cooling system (Refer to 7 - COOLING/ENGINE/COOLANT - STANDARD PROCEDURE - DRAINING COOLING SYSTEM).

(3) Disconnect and isolate the negative battery cable.

(4) Remove the coolant recovery container (Refer to 7 - COOLING/ENGINE/COOLANT RECOVERY CONTAINER - REMOVAL).

(5) Remove the screw that secures the accumulator mounting bracket to the body.

(6) Remove the two bolts securing the accumulator tubes to the evaporator terminal block and disconnect the tubes from the terminal block.

(7) Remove the seals from the refrigerant lines fittings and discard.

(8) Install plugs in, or tape over all of the opened refrigerant line fittings and evaporator tubes.

HVAC HOUSING (Continued)

(9) Disconnect the vacuum harness at the power brake booster (Fig. 8).

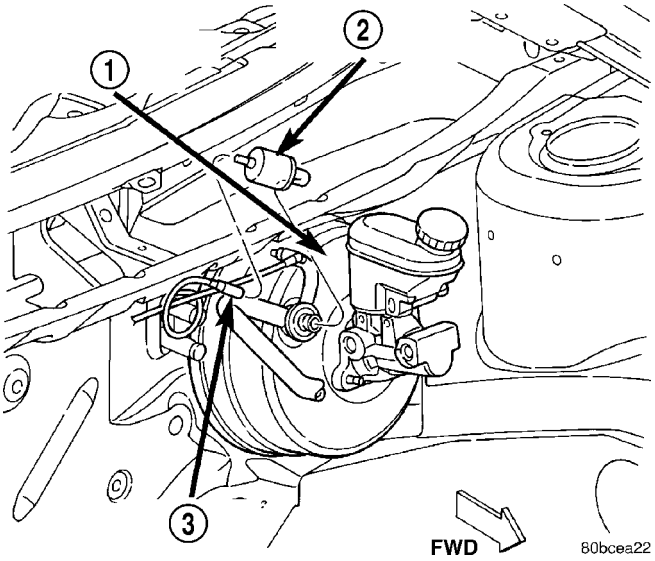

Fig. 8 A/C Vacuum Line - LHD Shown, RHD Typical

1 - BRAKE POWER BOOSTER
2 - A/C VACUUM CHECK VALVE
3 - VACUUM HARNESS

(10) Remove the rubber drain tube extension from the condensation drain tube (Fig. 9).

(11) Disconnect the heater hoses from the heater core tubes. Install plugs in, or tape over the opened heater core tubes to prevent coolant spillage during housing removal.

(12) Remove three HVAC housing retaining nuts located on the dash panel in the engine compartment.

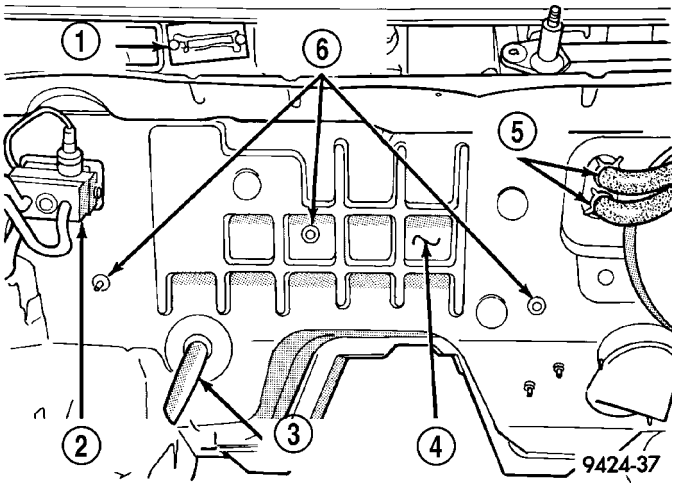

Fig. 9 Dash Panel - LHD Shown, RHD Typical

1 - BLOWER RESISTOR
2 - EVAPORATOR TAPPING PLATE
3 - DRAIN TUBE
4 - DASH PANEL
5 - HEATER HOSES
6 - RETAINING NUTS (3)

(13) Remove the instrument panel from vehicle (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - REMOVAL).

(14) Remove the mode door and temperature control cables from the mode door and blend-air door levers and the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/MODE DOOR CABLE - REMOVAL) and (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/TEMPERATURE CONTROL CABLES - REMOVAL).

(15) Remove the defroster and floor distribution ducts from the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/DEFROSTER DUCTS - REMOVAL) and (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/FLOOR DISTRIBUTION DUCTS - REMOVAL).

(16) Disconnect the wire harness connectors.

(17) Remove the outboard HVAC housing retaining screw located in the passenger compartment (Fig. 10).

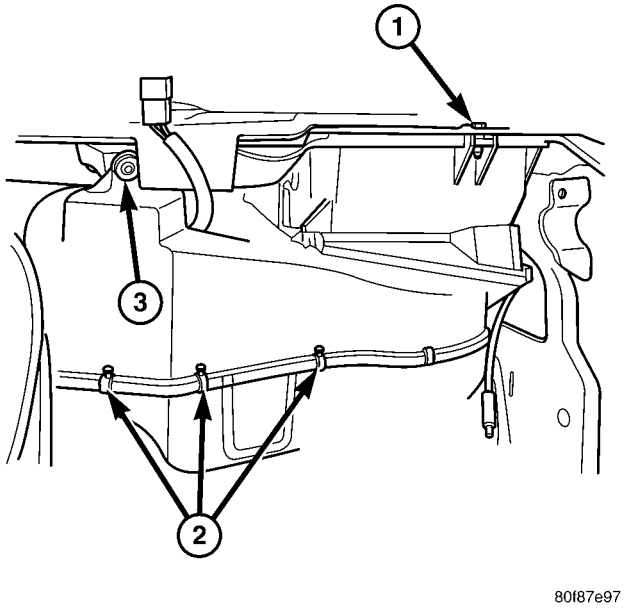

Fig. 10 Housing Screws-LHD Shown, RHD Typical

1 - OUTBOARD RETAINING SCREW
2 - HOUSING SCREW BOSSES
3 - DASH PANEL STUD AND NUT

(18) Remove the remaining nut located on the dash panel stud.

NOTE: Use care to ensure that the interior is covered in case of loss of residual fluids from the heater and evaporator cores.

(19) Remove the HVAC housing from the vehicle.

HVAC HOUSING (Continued)

DISASSEMBLY

(1) Remove the HVAC housing from the vehicle (Refer to 24 - HEATING & AIR CONDITIONING/ DISTRIBUTION/HVAC HOUSING - REMOVAL).

(2) Place the HVAC housing in the upright position on a workbench, making allowance for leakage of fluids.

(3) Separate the air distribution foam seals at the case parting line (Fig. 11).

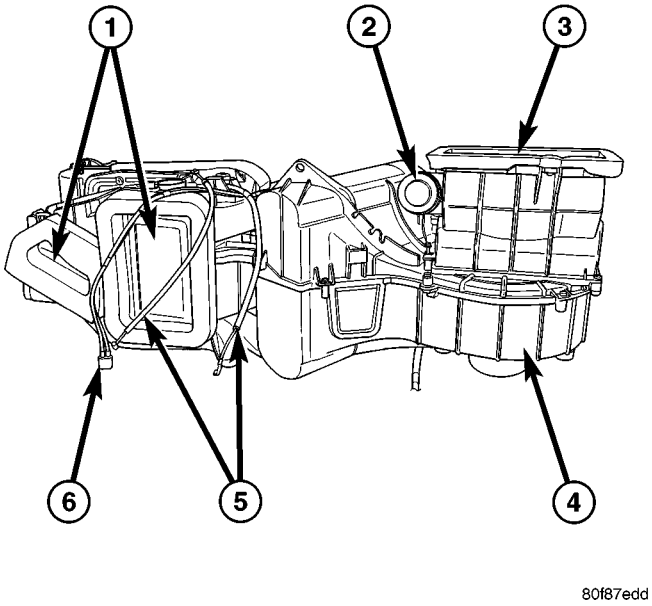

Fig. 11 HVAC Air Distribution Foam Seals - LHD Shown, RHD Typical

1 - AIR DISTRIBUTION
2 - RECIRCULATION DOOR VACUUM ACTUATOR
3 - AIR INLET
4 - BLOWER MOTOR
5 - CONTROL CABLES
6 - VACUUM HARNESS

(4) Remove the evaporator and heater core tube foam seals from the housing (Fig. 12).

(5) Remove the retaining clips and screws that hold the upper and lower housing together.

(6) Separate the two halves of the housing.

(7) Remove the heater core and evaporator from the lower housing as necessary.

ASSEMBLY

(1) Install the heater and evaporator cores into the case as necessary.

(2) Position the upper and lower HVAC housings together.

(3) Install the retaining clips and screws that secure the upper and lower case housings together. Tighten the screws to 2 N·m 17 in. lbs.).

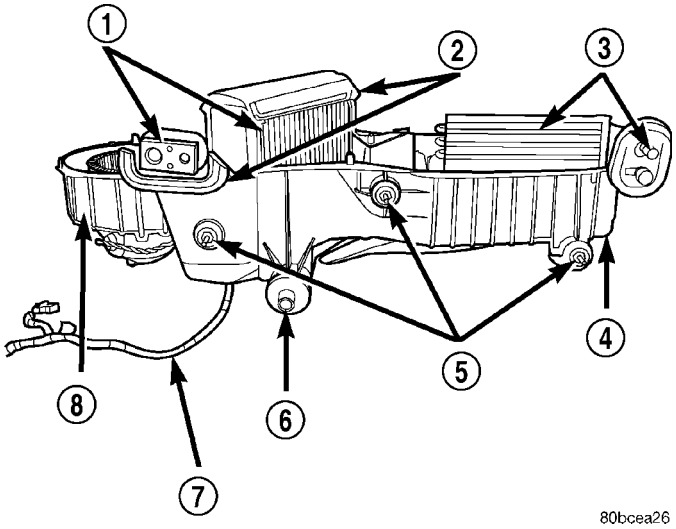

Fig. 12 Lower HVAC Housing - LHD Shown, RHD Typical

1 - EVAPORATOR AND CONNECTION
2 - FOAM SEALS
3 - HEATER CORE AND TUBES
4 - HVAC HOUSING LOWER CASE
5 - HOUSING MOUNTING STUDS
6 - HOUSING DRAIN
7 - WIRING
8 - BLOWER MOTOR AND WHEEL

(4) Install the evaporator and heater core tube foam seals onto the housing.

(5) Connect the air distribution outlet foam seals at the case parting line.

(6) Install the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - INSTALLATION).

INSTALLATION

NOTE: High pressures are produced in the refrigerant system when the A/C compressor is operating. Extreme care must be exercised to make sure that each of the refrigerant system connections is pressure-tight and leak free.

(1) Position the HVAC housing to the dash panel.

(2) Install the nut onto the dash panel stud. Tighten the nut to 4.5 N·m (40 in. lbs.).

(3) Install the outboard HVAC housing retaining bolt. Tighten the bolt to 4.5 N·m (40 in. lbs.).

(4) Connect the wire harness connectors.

(5) Install the defroster and floor distribution ducts onto the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/DEFROSTER DUCTS - INSTALLATION) and (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/FLOOR DISTRIBUTION DUCTS - INSTALLATION).

HVAC HOUSING (Continued)

(6) Loosely install the mode door and temperature control cables to the mode door and blend-air door levers and to the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/MODE DOOR CABLE - INSTALLATION) and (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/TEMPERATURE CONTROL CABLES - INSTALLATION).

(7) Install the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - INSTALLATION) and adjust the mode and temperature control cables.

(8) Install the three HVAC housing retaining nuts onto the housing studs in the engine compartment. Tighten the nuts to 4.5 N·m (40 in. lbs.).

(9) Unplug or remove the tape from the heater core hoses and tubes.

(10) Connect the heater hoses to the heater core tubes and install the heater hose clamps.

(11) Install the rubber drain tube extension onto the condensation drain tube.

(12) Connect the vacuum harness at the brake booster.

(13) Unplug or remove the tape from the opened refrigerant line fittings.

(14) Lubricate two new rubber O-ring seals with clean refrigerant oil and install them onto the accumulator tube fittings.

(15) Connect the accumulator tubes to the evaporator tapping block.

(16) Install the two bolts securing the accumulator tubes to the evaporator tapping block. Tighten the bolts to 11.3 N·m (100 in. lbs.).

(17) Install the bolt securing the accumulator mounting bracket. Tighten the bolt to 11.3 N·m (100 in. lbs.).

(18) Position and install the coolant recovery container (Refer to 7 - COOLING/ENGINE/COOLANT RECOVERY CONTAINER - INSTALLATION).

(19) Reconnect the negative battery cable.

(20) If the heater core is being replaced, flush the cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM CLEANING/REVERSE FLUSHING).

(21) Refill the engine cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE - COOLING SYSTEM FILL).

(22) Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).

(23) Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

INSTRUMENT PANEL DEMISTER DUCTS

REMOVAL

(1) Remove the instrument panel from the vehicle (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - REMOVAL).

(2) Remove the two screws securing the right intermediate demister duct to the instrument panel (Fig. 13).

(3) Disconnect the right intermediate demister duct from the right demister hose and right demister outlet.

(4) Remove the right intermediate demister duct from the instrument panel.

(5) Remove the right demister hose from the air outlet distribution duct.

(6) Remove the right demister hose from the instrument panel.

(7) Disconnect the retainer securing the left demister hose from the instrument panel.

(8) Disconnect the left demister hose from the air outlet distribution duct and left demister outlet.

(9) Remove the left demister hose from the instrument panel.

INSTALLATION

(1) Position the left demister hose into the instrument panel.

(2) Connect the left demister hose to the air outlet distribution duct and left demister outlet.

(3) Connect the retainer securing the left demister hose to the instrument panel.

(4) Position the right demister hose into the instrument panel.

(5) Install the right demister hose to the air outlet distribution duct.

(6) Position the right intermediate demister duct into the instrument panel.

(7) Connect the right intermediate demister duct to the right demister hose and right demister outlet.

(8) Install the two screws securing the right intermediate demister duct to the instrument panel. Tighten the screws to 2 N·m (17 in. lbs.).

(9) Install the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - INSTALLATION).

INSTRUMENT PANEL DEMISTER DUCTS (Continued)

INSTRUMENT PANEL DUCTS

REMOVAL

AIR OUTLET LEFT DUCT

(1) Remove the instrument panel top cover (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - REMOVAL).

(2) Remove the instrument cluster bezel (Refer to 23 - BODY/INSTRUMENT PANEL/CLUSTER BEZEL - REMOVAL).

(3) Remove lower left instrument panel end cap. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL END CAP - REMOVAL)

(4) Remove screws holding left air outlet duct.

(5) Remove left air outlet duct (Fig. 14)

AIR OUTLET RIGHT DUCT

(1) Remove the instrument panel top cover (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - REMOVAL).

(2) Remove screws holding airbag trim cover

NOTE: Removal of airbag assembly is not required, just removal of lower screws to allow access to air outlet duct retainer screws and to allow clearance for removal of duct.

(3) Remove lower right instrument panel end cap (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL END CAP - REMOVAL).

(4) Remove air outlet duct retainer screws.

(5) Carefully lift airbag cover and remove right air outlet duct (Fig. 14).

INSTALLATION

LEFT AIR OUTLET DUCT

(1) Install left air outlet duct.

(2) Install screws holding left outlet duct. Tighten the screws to 2 N·m (17 in. lbs.).

(3) Install lower left instrument panel end cap (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL END CAP - INSTALLATION).

(4) Install the instrument cluster bezel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - INSTALLATION).

INSTRUMENT PANEL DUCTS (Continued)

7 - LEFT DEMISTER HOSE
8 - INSTRUMENT PANEL
9 - RIGHT PANEL DUCT

(5) Install the instrument panel top cover (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - INSTALLATION).

RIGHT AIR OUTLET DUCT

(1) Carefully lift airbag cover and install right air outlet duct.

(2) Install left air outlet duct retaining screws. Tighten the screws to 2 N·m (17 in. lbs.).

(3) Install lower airbag cover retaining screws.

(4) Install lower right instrument panel end cap (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL END CAP - INSTALLATION).

(5) Close the glove box door.

(6) Install the instrument panel top cover (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - INSTALLATION).

PLUMBING

DESCRIPTION

The A/C refrigerant lines and hoses are used to carry the refrigerant between the various A/C system components. The refrigerant lines and hoses for the R-134a system on this vehicle consist of a barrier-hose design with a nylon tube sandwiched between rubber layers. The nylon tube helps to contain the R-134a refrigerant, which has a smaller molecular structure than R-12 refrigerant. The ends of the refrigerant lines are made from lightweight aluminum or steel, and commonly use braze-less fittings.

Any kinks or sharp bends in the refrigerant lines and hoses will reduce the capacity of the entire A/C

PLUMBING (Continued)

system and can reduce the flow of refrigerant in the system. The radius of all bends in the flexible hose refrigerant lines should be at least ten times the diameter of the hose and the refrigerant lines should be routed so they are at least 80 millimeters (3 inches) away from the exhaust manifold(s) and exhaust pipe(s).

OPERATION

High pressures are produced in the refrigerant system when the air conditioning compressor is operating. Extreme care must be exercised to make sure that each of the refrigerant system connections is pressure-tight and leak free. It is a good practice to inspect all flexible hose refrigerant lines at least once a year to make sure they are in good condition and properly routed.

The refrigerant lines and hoses are coupled with other components of the HVAC system with either O-rings or dual plane seals.

The refrigerant lines and hoses cannot be repaired and, if faulty or damaged, they must be replaced.

WARNINGS

WARNING: The A/C system contains refrigerant under high pressure. Repairs should only be performed by qualified service personnel. Severe personal injury or death may result from improper service procedures.

WARNING: Avoid breathing the refrigerant and refrigerant oil vapor or mist. Exposure may irritate the eyes, nose, and/or throat. Wear eye protection when servicing the A/C refrigerant system. Serious eye injury can result from direct contact with the refrigerant. If eye contact occurs, seek medical attention immediately.

WARNING: Do not expose the refrigerant to open flame. Poisonous gas is created when refrigerant is burned. An electronic leak detector is recommended. Severe personal injury or death may result from improper service procedures.

WARNING: If accidental system discharge occurs, ventilate the work area before resuming service. Large amounts of refrigerant released in a closed work area will displace the oxygen and cause suffocation and death.

WARNING: The evaporation rate of R-134a refrigerant at average temperature and altitude is extremely high. As a result, anything that comes in contact with the refrigerant will freeze. Always protect the skin or delicate objects from direct contact with the refrigerant.

WARNING: The R-134a service equipment or the vehicle refrigerant system should not be pressure tested or leak tested with compressed air. Some mixtures of air and R-134a have been shown to be combustible at elevated pressures. These mixtures are potentially dangerous, and may result in fire or explosion causing property damage, personal injury or death.

WARNING: The engine cooling system is designed to develop internal pressures of 97 to 123 kilopascals (14 to 18 pounds per square inch). Do not remove or loosen the coolant pressure cap, cylinder block drain plugs, radiator drain, radiator hoses, heater hoses, or hose clamps while the engine cooling system is hot and under pressure. Allow the vehicle to cool for a minimum of 15 minutes before opening the cooling system for service. Failure to observe this warning can result in serious burns from the heated engine coolant.

CAUTIONS

CAUTION: Never add R-12 to a refrigerant system designed to use R-134a. Do not use R-12 equipment or parts on a R-134a A/C system. These refrigerants are not compatible and damage to the A/C system will result.

CAUTION: Never use R-12 refrigerant oil in a A/C system designed to use R-134a refrigerant oil. These refrigerant oils are not compatible and damage to the A/C system will result.

CAUTION: The use of A/C system sealers may result in damage to A/C refrigerant recovery/evacuation/recharging equipment and/or A/C system. Many federal, state/provincial and local regulations prohibit the recharge of A/C systems with known leaks. DaimlerChrysler recommends the detection of A/C system leaks through the use of approved leak detectors and fluorescent leak detection dyes. Vehicles found with A/C system sealers should be treated as contaminated and replacement of the entire A/C refrigerant system is recommended. A/C systems found to be contaminated with A/C system sealers, A/C stop-leak products or seal conditioners voids the warranty for the A/C system.

PLUMBING (Continued)

CAUTION: Recover the refrigerant before opening any fitting or connection. Open the fittings with caution, even after the system has been discharged. Never open or loosen a connection before recovering the refrigerant.

CAUTION: If equipped, do not remove the secondary retention clip from any spring-lock coupler connection while the refrigerant system is under pressure. Recover the refrigerant before removing the secondary retention clip. Open the fittings with caution, even after the system has been discharged. Never open or loosen a connection before recovering the refrigerant.

CAUTION: The internal parts of the A/C system will remain stable as long as moisture-free refrigerant and refrigerant oil is used. Abnormal amounts of dirt, moisture or air can upset the chemical stability. This may cause operational troubles or even serious damage if present in more than very small quantities. Before disconnecting a component, clean the outside of the fittings thoroughly to prevent contamination from entering the refrigerant system. Keep service tools and the work area clean. Do not open the refrigerant system or uncap a replacement component until you are ready to service the system. Immediately after disconnecting a component from the refrigerant system, seal the open fittings with a cap or plug. This will prevent contamination from entering the A/C system.

CAUTION: Refrigerant oil will absorb moisture from the atmosphere if left uncapped. Do not open a container of refrigerant oil until you are ready to use it. Replace the cap on the oil container immediately after using. Store refrigerant oil only in a clean, airtight, and moisture-free container.

CAUTION: Do not overcharge the refrigerant system. Overcharging will cause excessive compressor head pressure and can cause compressor noise and A/C system failure.

STANDARD PROCEDURE

REFRIGERANT SYSTEM SERVICE EQUIPMENT

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.

WARNING: Eye protection must be worn when servicing an air conditioning refrigerant system. Turn off (rotate clockwise) all valves on the equipment being used, before connecting to or disconnecting from the refrigerant system. Failure to observe these warnings may result in personal injury or death.

When servicing the A/C system, a R-134a refrigerant recovery/recycling/charging station that meets SAE Standard J2210 must be used (Fig. 1). Contact an automotive service equipment supplier for refrigerant recovery/recycling/charging equipment. Refer to the operating instructions supplied by the equipment manufacturer for proper care and use of this equipment.

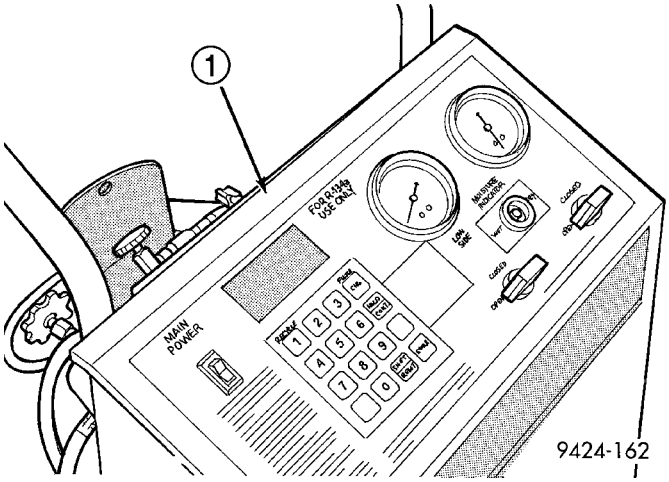

Fig. 1 Refrigerant Recovery/Recycling Station - Typical

1 - R-134 REFRIGERANT STATION

A manifold gauge set may be needed with some recovery/recycling/charging equipment (Fig. 2). The service hoses on the gauge set being used should have manual (turn wheel), or automatic back-flow valves at the service port connector ends. This will prevent refrigerant from being released into the atmosphere.

MANIFOLD GAUGE SET CONNECTIONS

CAUTION: Do not use an R-12 manifold gauge set on an R-134a system. The refrigerants are not compatible and system damage will result.

- **LOW PRESSURE GAUGE HOSE** - The low pressure hose (Blue with Black stripe) attaches to

PLUMBING (Continued)

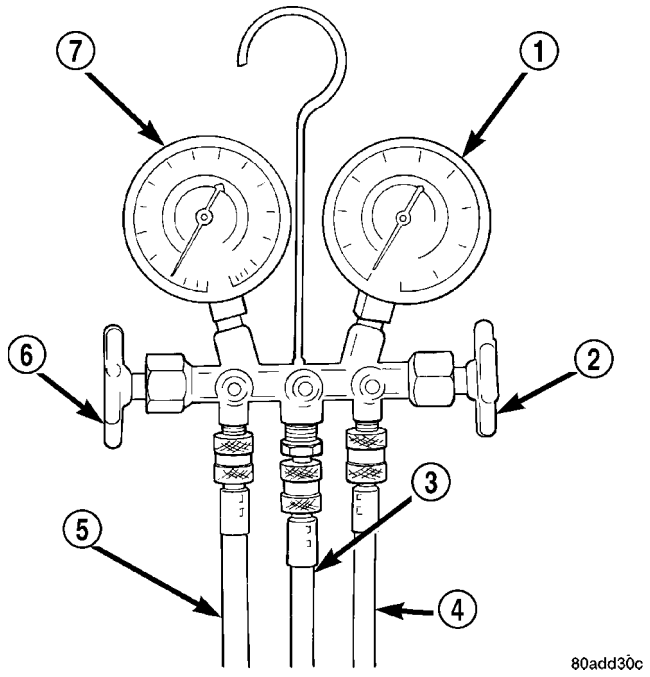

Fig. 2 Manifold Gauge Set - Typical

2 - VALVE
3 - VACUUM/REFRIGERANT HOSE (YELLOW W/ BLACK STRIPE)
4 - HIGH PRESSURE HOSE (RED W/ BLACK STRIPE)
5 - LOW PRESSURE HOSE (BLUE W/ BLACK STRIPE)
6 - VALVE
7 - LOW PRESSURE GAUGE

the low side service port. This port is located on the A/C liquid line near the accumulator tube tapping block.

- **HIGH PRESSURE GAUGE HOSE** - The high pressure hose (Red with Black stripe) attaches to the high side service port. This port is located on the A/C discharge line near the A/C compressor.
- **RECOVERY/RECYCLING/EVACUATION/ CHARGING HOSE** - The center manifold hose (Yellow, or White, with Black stripe) is used to recover, evacuate, and charge the refrigerant system. When the low or high pressure valves on the manifold gauge set are opened, the refrigerant in the system will escape through this hose.

REFRIGERANT SYSTEM CHARGE LEVEL

WARNING: Review safety precautions and warnings in this group before performing this procedure (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.

NOTE: Always refer to the A/C Underhood Specification Label for the refrigerant fill capacity of the vehicle being serviced.

(1) Use a manifold gauge and check the liquid line pressure.

(2) Attach a clamp-on thermocouple to the liquid line near the A/C condenser.

(3) The vehicle must be in the following modes:

- Automatic transaxle in park or manual transaxle in neutral.
- Engine at idle
- A/C controls set to outside air
- Panel mode
- A/C on full cool
- Blower motor on highest speed
- Vehicle windows closed

(4) Operate the A/C system for a couple of minutes to allow the system to stabilize.

(5) Observe liquid line pressure and temperature. Using the Charge Determination Chart (Fig. 3) determine where the A/C system is currently operating. If the A/C system is not in the proper range, reclaim all the refrigerant and recharge the refrigerant system.

PLUMBING (Continued)

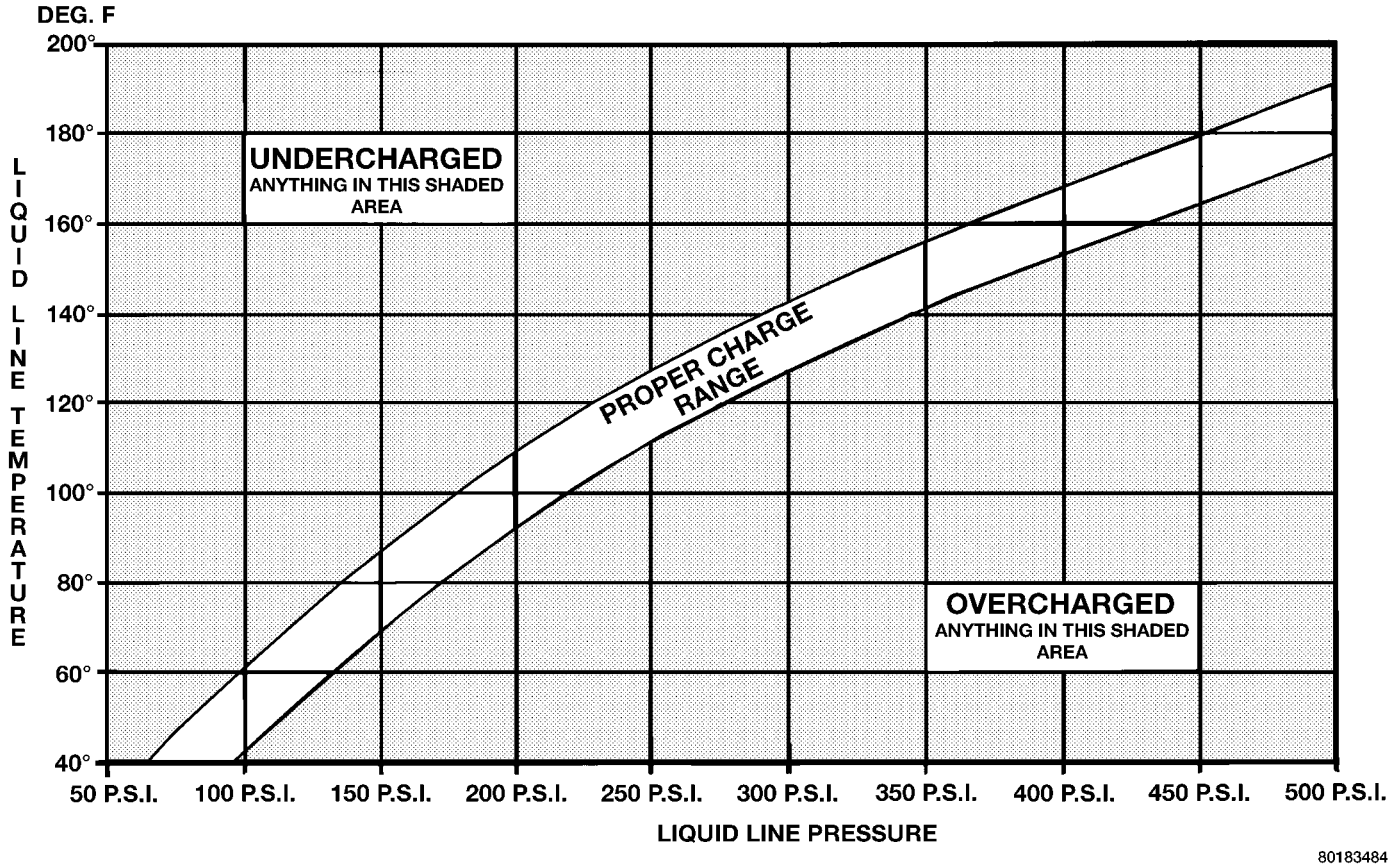

Fig. 3 Charge Determination Chart (Ambient Test Condition 85° F)

REFRIGERANT SYSTEM RECOVERY

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.

A R-134a refrigerant recovery/recycling/charging station that meets SAE Standard J2210 must be used to recover the refrigerant from an R-134a refrigerant system. Refer to the operating instructions supplied by the equipment manufacturer for the proper care and use of this equipment.

REFRIGERANT SYSTEM EVACUATE

NOTE: Special effort must be used to prevent moisture from entering the A/C system oil. Moisture in the oil is very difficult to remove and will cause a reliability problem with the compressor.

If an A/C compressor designed to use R-134a refrigerant is left open to the atmosphere for an extended period of time. It is recommended that the refrigerant oil be drained and replaced with new oil or a new A/C compressor be used. This will eliminate the possibility of contaminating the refrigerant system.

If the refrigerant system has been open to the atmosphere, it must be evacuated before the system can be filled. Moisture and air mixed with the refrigerant will raise the compressor head pressure above acceptable operating levels. This will reduce the performance of the air conditioner and damage the A/C compressor. Moisture will boil at near room temperature when exposed to vacuum. A R-134a refrigerant recovery/recycling/charging station that meets SAE Standard J2210 must be used to evacuate the refrigerant system. See the operating instructions supplied by the equipment manufacturer for proper care and use of this equipment. To evacuate the refrigerant system, use the following procedure:

NOTE: When connecting the service equipment couplings to the refrigerant system service ports, be certain that the valve of each coupling is fully closed. This will reduce the amount of effort required to make the connection.

(1) Recover the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING -

PLUMBING (Continued)

STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).

(2) Connect a suitable charging station, refrigerant recovery machine or a manifold gauge set with vacuum pump and refrigerant recovery equipment.

(3) Open the suction and discharge valves and start the vacuum pump. The vacuum pump should run a minimum of 45 minutes prior to charge to eliminate all moisture in system. When the suction gauge reads -88 kPa (-26 in. Hg) vacuum or greater for 30 minutes, close all valves and turn off vacuum pump. If the system fails to reach specified vacuum, the refrigerant system likely has a leak that must be corrected. If the refrigerant system maintains specified vacuum for at least 30 minutes, start the vacuum pump, open the suction and discharge valves. Then allow the system to evacuate an additional 10 minutes.

(4) Close all valves. Turn off and disconnect the vacuum pump.

(5) Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

REFRIGERANT SYSTEM CHARGE

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.

NOTE: Always refer to the A/C Underhood Specification Label for the refrigerant fill capacity of the vehicle being serviced.

After all refrigerant system leaks have been repaired and the refrigerant system has been evacuated, a refrigerant charge can be injected into the system. For the proper amount of the refrigerant charge, always refer to the A/C Underhood Specification Label located in the engine compartment. An R-134a refrigerant recovery/recycling/charging station that meets SAE Standard J2210 must be used to charge the refrigerant system with R-134a refrigerant. See the operating instructions supplied by the equipment manufacturer for proper care and use of this equipment.

CHARGING PROCEDURE

CAUTION: A small amount of refrigerant oil is removed from the A/C system each time the refrigerant system is recovered and evacuated. Before charging the A/C system, you MUST replenish any oil lost during the recovery process. Refer the equipment manufacturer instructions for more information.

(1) Evacuate the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).

(2) A manifold gauge set and a R-134a refrigerant recovery/recycling/charging station that meets SAE Standard J2210 should still be connected to the refrigerant system.

(3) Measure the proper amount of refrigerant and heat it to 52° C (125° F) with the charging station. See the operating instructions supplied by the equipment manufacturer for proper use of this equipment.

(4) Open both the suction and discharge valves, then open the charge valve to allow the heated refrigerant to flow into the system.

(5) When the transfer of refrigerant has stopped, close both the suction and discharge valves.

(6) If all of the refrigerant charge did not transfer from the dispensing device, open all of the windows in the vehicle and set the heater-air conditioner controls so that the compressor is engaged and the blower motor is operating at its lowest speed setting. Run the engine at a steady high idle (about 1400 rpm). If the compressor will not engage, test the compressor clutch control circuit and repair as required.

(7) Open the suction valve to allow the remaining refrigerant to transfer to the refrigerant system.

WARNING: Take care not to open the discharge (high pressure) valve at this time. Failure to follow this warning can result in possible personal injury or death.

(8) Close the suction valve and test the system performance. (Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING - A/C PERFORMANCE).

(9) Disconnect the charging station and manifold gauge set from the refrigerant system service ports.

(10) Reinstall the caps onto the refrigerant system service ports.

A/C COMPRESSOR

DESCRIPTION

A/C COMPRESSOR

The A/C compressor (Fig. 4) used on this vehicle can be one of two models, depending upon the transmission in the vehicle. Vehicles with a manual transmission use the Nippondenso 10S15 compressor, while vehicles with an automatic transmission use the Nippondenso 10S17 unit. These compressors use an aluminum swash plate, teflon coated pistons and aluminum sleeveless cylinder walls. A high pressure cut out switch is located on the back cover of the compressor.

The A/C compressor is secured to the lower front strut-to-engine bracket with four bolts. The lower front strut-to-engine bracket is located on the lower, forward skirt of the engine block which is located in the right front corner of the engine compartment.

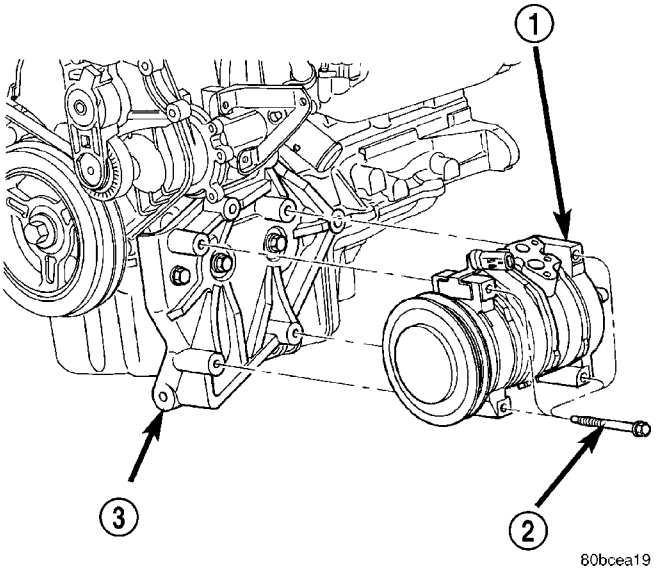

Fig. 4 A/C Compressor

1 - A/C COMPRESSOR
2 - MOUNTING BOLTS
3 - LOWER FRONT STRUT-TO-ENGINE BRACKET

HIGH PRESSURE RELIEF VALVE

The high pressure relief valve vents the system when a discharge pressure of 3445 to 4135 kPa (500 to 600 psi) or above is reached. The valve closes when a minimum discharge pressure of 2756 kPa (400 psi) is reached.

The high pressure relief valve vents only enough refrigerant to reduce the system pressure, and then re-seats itself. The majority of the refrigerant is conserved in the system. If the valve vents refrigerant, it does not mean that the valve is faulty.

The high pressure relief valve is only serviced as a part of the A/C compressor assembly and is factory-calibrated and cannot be adjusted or repaired and, must not be removed or otherwise disturbed.

OPERATION

A/C COMPRESSOR

The A/C compressor is driven by the engine through an electric clutch, drive pulley and belt arrangement. The compressor is lubricated by refrigerant oil that is circulated throughout the refrigerant system with the refrigerant.

The compressor draws in low-pressure refrigerant vapor from the evaporator through its suction port. It then compresses the refrigerant into a high-pressure, high-temperature refrigerant vapor. The compressor pumps the high-pressure refrigerant vapor to the condenser through the compressor discharge port.

The compressor cannot be repaired. If faulty or damaged, the entire compressor assembly must be replaced. The compressor clutch, pulley and clutch coil are available for service.

HIGH PRESSURE RELIEF VALVE

The high pressure relief valve vents the A/C system when a discharge pressure of 3445 to 4135 kPa (500 to 600 psi) or above is reached. The high pressure relief valve closes when a minimum discharge pressure of 2756 kPa (400 psi) is reached.

The high pressure relief valve vents only enough refrigerant to reduce the A/C system pressure, and then re-seats itself. The majority of the refrigerant is conserved in the A/C system. If the valve vents refrigerant, it does not mean that the valve is faulty.

The high pressure relief valve is factory-calibrated. The high pressure relief valve cannot be adjusted or repaired, and must not be removed or otherwise disturbed. The high pressure relief valve is only serviced as a part of the A/C compressor.

DIAGNOSIS AND TESTING

A/C COMPRESSOR NOISE

When investigating an A/C system related noise, you must first know the conditions under which the noise occurs. These conditions include: weather, vehicle speed, transmission in gear or neutral, engine speed, engine temperature, and any other special conditions. Noises that develop during A/C operation can often be misleading. For example: What sounds like a failed front main bearing or connecting rod, may be caused by loose bolts, nuts, mounting brackets, or a loose A/C clutch assembly.

A/C COMPRESSOR (Continued)

NOTE: Prior to a vehicle being removed from service or stored for more than two weeks, the A/C compressor should be operated to ensure adequate refrigerant oil distribution throughout the system components. Turn on the A/C for a minimum of five minutes with outside air and the highest blower speed selected.

Drive belts are speed sensitive. At different engine speeds and depending upon belt tension, belts can develop noises that are mistaken for an A/C compressor noise. Improper belt tension can cause a misleading noise when the A/C clutch is engaged, which may not occur when the A/C clutch is disengaged. Check the accessory drive belt condition and tension as described in Cooling before beginning this procedure.

(1) Select a quiet area for testing. Duplicate the complaint conditions as much as possible. Switch the A/C compressor on and off several times to clearly identify the compressor noise. Listen to the A/C compressor while the clutch is engaged and disengaged. Probe the A/C compressor with an engine stethoscope or a long screwdriver with the handle held to your ear to better localize the source of the noise.

(2) Loosen all of the compressor mounting hardware and retighten. Tighten the A/C clutch mounting bolt. Be certain that the clutch field coil is mounted securely to the A/C compressor, and that the clutch plate and pulley are properly aligned and have the correct air gap (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/A/C COMPRESSOR CLUTCH - INSTALLATION).

(3) To duplicate a high-ambient temperature condition (high head pressure), restrict the air flow through the A/C condenser. Install a manifold gauge set to be certain that the discharge pressure does not exceed 2760 kPa (400 psi).

(4) Check the refrigerant system plumbing for incorrect routing, rubbing or interference, which can cause unusual noises. Also check the refrigerant lines for kinks or sharp bends that will restrict refrigerant flow, which can cause noises.

(5) If the noise is from opening and closing of the high pressure relief valve, recover, evacuate, and recharge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE). If the high pressure relief valve still does not seat properly, replace the A/C compressor (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C COMPRESSOR - REMOVAL).

(6) If the noise is from liquid slugging on the A/C suction line, check the refrigerant oil level and the refrigerant system charge.

(7) If the noise continues, replace the A/C compressor and repeat Step 1.

REMOVAL

WARNING: Review safety precautions and warnings in this group before performing this procedure (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.

(1) Disconnect and isolate the negative battery cable.

(2) Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).

(3) Remove the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(4) Raise and support the vehicle.

(5) Remove the bolts that secure the A/C suction and discharge lines to the A/C compressor (Fig. 5).

(6) Disconnect the A/C suction and discharge lines from the A/C compressor and remove and discard the O-ring seals.

(7) Install plugs in, or tape over the opened refrigerant line fittings and compressor ports.

(8) Disconnect the engine wire harness connectors from the compressor clutch coil connector and the high pressure cut out switch (Fig. 6).

(9) Support the A/C compressor and remove the four A/C compressor mounting bolts.

(10) Remove the A/C compressor from the engine compartment.

INSTALLATION

NOTE: If a replacement A/C compressor is being installed, be certain to check the refrigerant oil level (refer to Refrigerant Oil in this group). Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

(1) Position the A/C compressor into the engine compartment.

(2) Install the four bolts that secure the A/C compressor to the mounting bracket. Tighten the bolts to 28 N·m (21 ft. lbs.).

(3) Remove the tape or plugs from the A/C compressor ports and refrigerant line fittings.

A/C COMPRESSOR (Continued)

6 - A/C COMPRESSOR
7 - BRACKET

(4) Lubricate new rubber O-ring seals with clean refrigerant oil and install them onto the refrigerant line fittings. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

(5) Connect the A/C suction and discharge lines to the A/C compressor.

(6) Install the bolts that secures the A/C suction and discharge lines to the A/C compressor. Tighten the bolts to 12 N·m (106 in. lbs.).

(7) Connect the wire harness connectors to the compressor clutch coil and the high pressure cut out switch.

(8) Lower the vehicle.

(9) Install the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(10) Reconnect the negative battery cable.

(11) Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).

(12) Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

A/C CONDENSER

DESCRIPTION

The A/C condenser is located in the front of the engine cooling radiator. The A/C condenser is a heat exchanger that allows the high-pressure refrigerant gas being discharged by the A/C compressor to give up its heat to the air passing over the condenser fins.

The A/C condenser is integral to the cooling module which includes the radiator, electric cooling fan, fan shroud, air seals and an automatic transmission oil cooler on models so equipped.

OPERATION

When air passes through the condenser fins, the high-pressure refrigerant gas within the A/C condenser gives up its heat. The refrigerant then condenses as it leaves the A/C condenser and becomes a high-pressure liquid. The volume of air flowing over the condenser fins is critical to the proper cooling performance of the air conditioning system. Therefore, it is important that there are no objects placed in front of the radiator grille openings at the front of the vehicle or foreign material on the condenser fins that might obstruct proper air flow. Also, any factory-installed air seals or shrouds must be properly reinstalled following radiator or A/C condenser service.

The A/C condenser cannot be repaired and, if faulty or damaged, it must be replaced.

A/C CONDENSER (Continued)

REMOVAL

WARNING: Review safety precautions and warnings in this group before performing this procedure (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.

(1) Disconnect and isolate the negative battery cable.

(2) Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).

(3) Remove the battery support strut.

(4) Remove the nut that secures the A/C liquid line from the A/C condenser.

(5) Disconnect the A/C liquid line from the A/C condenser and remove and discard the O-ring seal. (Fig. 7).

(6) Install plug in, or tape over the opened liquid line fitting and the condenser outlet port.

(7) Remove the nut that secures the A/C discharge line from the A/C condenser.

(8) Disconnect the A/C discharge line from the A/C condenser and remove and discard the O-ring seal.

(9) Install plug in, or tape over the opened discharge line fitting and the condenser inlet port.

(10) Remove upper radiator mounts (Refer to 7 - COOLING/ENGINE/RADIATOR - REMOVAL)

(11) Remove the condenser retaining screws.

(12) Tilt the radiator back and carefully remove the A/C condenser from the engine compartment.

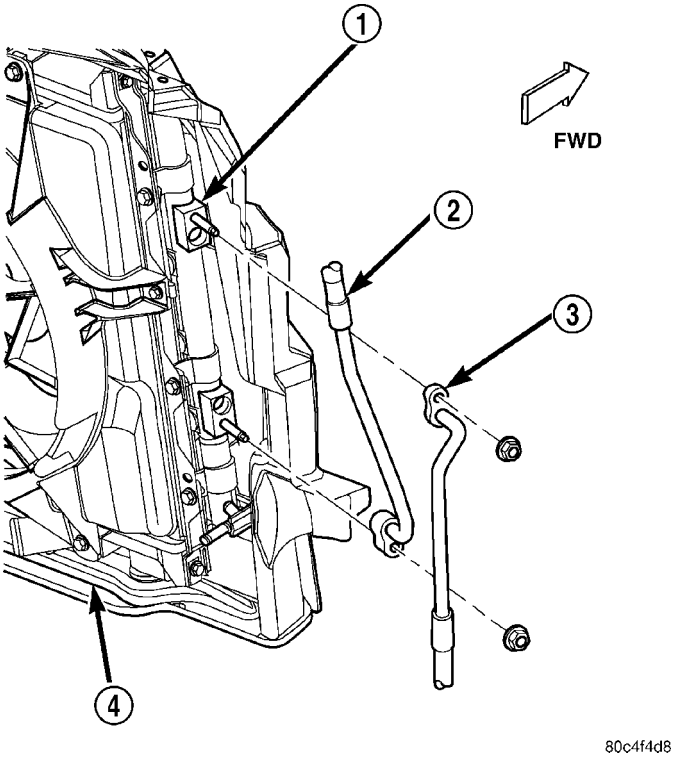

Fig. 7 A/C Condenser Refrigerant Lines - Typical

1 - A/C CONDENSER
2 - A/C LIQUID LINE
3 - A/C DISCHARGE LINE
4 - RADIATOR ASSEMBLY

INSTALLATION

NOTE: If the A/C condenser is being replaced, add 30 milliliters (1 fluid ounce) of refrigerant oil to the refrigerant system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

(1) Tilt the radiator back and position the A/C condenser into the engine compartment.

(2) Install the screws that secure the A/C condenser to the radiator. Tighten the screws to 2 N·m (17 in. lbs.).

(3) Install the upper radiator mounts (Refer to 7 - COOLING/ENGINE/RADIATOR - INSTALLATION).

(4) Remove the tape or plug from the condenser inlet port and the discharge line fitting.

(5) Lubricate a new rubber O-ring seal with clean refrigerant oil and install it on the discharge line fitting. Use only the specified O-ring as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the compressor in the vehicle.

(6) Connect the A/C discharge line to the A/C condenser.

(7) Install the nut that secures the A/C discharge line to the A/C condenser. Tighten the nut to 5 N·m (44 in. lbs.).

(8) Remove the tape or plug from the condenser outlet port and the liquid line fitting.

(9) Lubricate a new rubber O-ring seal with clean refrigerant oil and install it on the liquid line fitting. Use only the specified O-ring as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the compressor in the vehicle.

(10) Connect the A/C liquid line to the A/C condenser.

(11) Install the nut that secures the A/C liquid line to the A/C condenser. Tighten the nut to 5 N·m (44 in. lbs.).

(12) Install the battery support strut.

(13) Reconnect the negative battery cable.

(14) Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE)

A/C CONDENSER (Continued)

(15) Charge the A/C system (Refer to 24 - HEATING & AIR CONDITIONING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

A/C DISCHARGE LINE

DESCRIPTION

The A/C discharge line is the refrigerant line that goes from the A/C compressor to the A/C condenser and includes the high side service port. The A/C discharge line has no serviceable parts except for the rubber O-rings and the service port valve core.

The A/C discharge line cannot be repaired and, if leaking or damaged, it must be replaced.

REMOVAL

WARNING: Review safety precautions and warnings in this group before performing this procedure (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.

(1) Disconnect and isolate the negative battery cable.

(2) Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).

(3) Remove the bolt that secures the A/C discharge line to the A/C compressor (Fig. 8).

(4) Disconnect the A/C discharge line from the A/C compressor and remove and discard the O-ring seal.

(5) Install plug in, or tape over the opened discharge line fitting and the compressor discharge port.

(6) Raise and support the vehicle.

(7) Remove the nut that secures the A/C discharge line to the A/C condenser (Fig. 9).

(8) Disconnect the A/C discharge line from the A/C condenser and remove and discard the O-ring seal.

(9) Install plug in, or tape over the opened discharge line fitting and the condenser inlet port.

INSTALLATION

NOTE: Replacement of the refrigerant line O-ring seals is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals could result in a refrigerant system leak.

(1) Position the A/C discharge line into the engine compartment.

(2) Remove the tape or plugs from the discharge line fitting and the condenser port..

3 - A/C DISCHARGE LINE
4 - RADIATOR ASSEMBLY

A/C DISCHARGE LINE (Continued)

(3) Lubricate a new rubber O-ring seal with clean refrigerant oil and install it on the discharge line fitting. Use only the specified O-ring as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

(4) Connect the A/C discharge line to the A/C condenser.

(5) Install the nut that secures the A/C discharge line to the A/C condenser. Tighten the nut to 5 N·m (44 in. lbs.).

(6) Lower the vehicle.

(7) Remove the tape or plugs from the discharge line fitting and the compressor port.

(8) Lubricate a new rubber O-ring seal with clean refrigerant oil and install it on the discharge line fitting. Use only the specified O-ring as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

(9) Connect the A/C discharge line to the A/C compressor.

(10) Install the bolt that secures the A/C discharge line to the A/C compressor. Tighten the bolt to 12 N·m (106 in. lbs.).

(11) Reconnect the negative battery cable.

(12) Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).

(13) Recharge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

A/C EVAPORATOR

DESCRIPTION

The evaporator (Fig. 10) is located in the HVAC housing, behind the instrument panel. The evaporator is positioned in the housing so that all air that enters the housing must pass over the fins of the evaporator coils before it is distributed through the system ducts and outlets. However, air passing over the evaporator fins will only be conditioned when the compressor is engaged and circulating refrigerant through the evaporator tubes.

OPERATION

Refrigerant enters the evaporator from the variable orifice valve as a low-temperature, low-pressure liquid. As air flows over the fins of the evaporator, the humidity in the air condenses on the fins, and the heat from the air is absorbed by the refrigerant. Heat absorption causes the refrigerant to boil and vaporize. The refrigerant becomes a low-pressure gas when it leaves the evaporator.

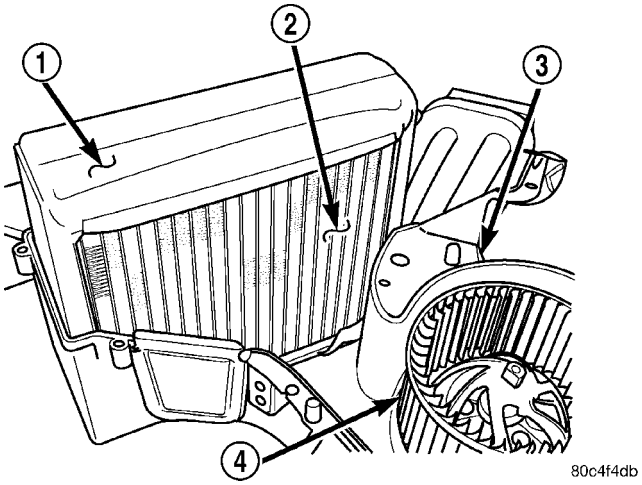

Fig. 10 Evaporator - LHD Shown, RHD Typical

1 - FOAM WRAP
2 - EVAPORATOR
3 - LOWER HVAC HOUSING
4 - BLOWER MOTOR AND WHEEL

The evaporator cannot be repaired and, if faulty or damaged, it must be replaced.

REMOVAL

WARNING: On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in an accidental airbag deployment and possible personal injury or death.

WARNING: Review safety precautions and warnings in this group before performing this procedure (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.

(1) Remove the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/ HVAC HOUSING - REMOVAL).

(2) Disassemble the HVAC housing to access the A/C evaporator (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - DISASSEMBLY).

A/C EVAPORATOR (Continued)

(3) Lift the A/C evaporator out of the lower half of the HVAC housing (Fig. 11).

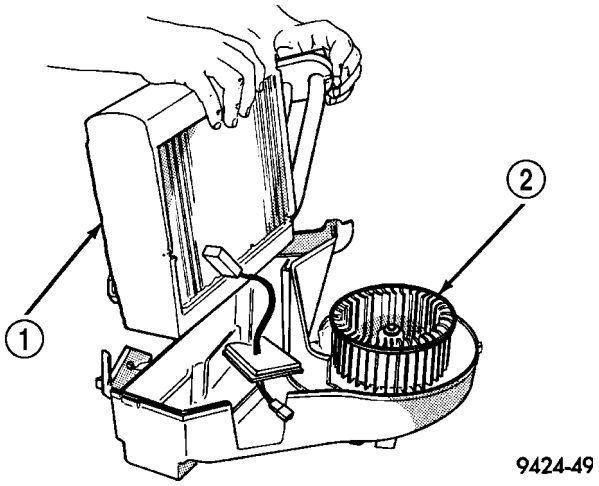

Fig. 11 A/C Evaporator - Typical

1 - A/C EVAPORATOR
2 - LOWER HVAC HOUSING

INSTALLATION

NOTE: If the evaporator is being replaced, add 60 milliliters (2 fluid ounces) of refrigerant oil to the refrigerant system.

(1) Install the evaporator coil into the bottom half of the HVAC housing.

(2) Assemble the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/ HVAC HOUSING - ASSEMBLY).

(3) Install the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - INSTALLATION).

A/C VARIABLE ORIFICE TUBE

DESCRIPTION

A variable orifice valve (VOV) is factory installed in the liquid line between the outlet of the condenser and the inlet of the evaporator (Fig. 12). The VOV is located in the end of the liquid line that is closest to the condenser. The inlet end of the VOV has a nylon mesh filter screen, which filters the refrigerant and helps to reduce the potential for blockage of the metering orifices by refrigerant system contaminants. The outlet end of the tube has a nylon mesh diffuser screen. The O-rings on the plastic body of the VOV seal the tube to the inside of the liquid line and prevent refrigerant from bypassing the metering orifices.

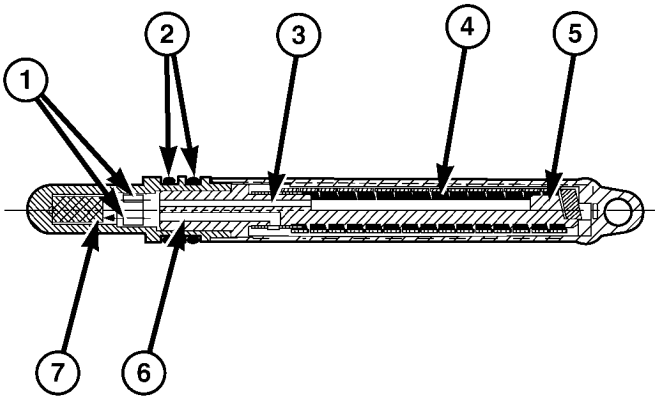

Fig. 12 Variable Orifice Valve

1 - FIXED AND VARIABLE ORIFICES
2 - O-RINGS
3 - FIXED PORT
4 - BIMETAL COIL
5 - INLET FILTER SCREEN
6 - VARIABLE PORT
7 - DIFFUSER SCREEN

OPERATION

The variable orifice valve (VOV) is used to meter the flow of liquid refrigerant into the evaporator coil. The high-pressure liquid refrigerant from the condenser expands into a low-pressure liquid as it passes through the metering orifices and diffuser screen of the VOV. There are two parallel flow paths integral to the VOV, a fixed port and a variable port. As the temperature of the refrigerant increases, the bimetal coil moves the variable port to the closed position. High temperature results in more restriction, and lower temperature results in less restriction. This design improves A/C cooling at high loads and or city traffic.

The VOV is not serviceable. It cannot be repaired, and if faulty or plugged, it must be replaced as part of the liquid line.

ACCUMULATOR

DESCRIPTION

The accumulator (Fig. 13) is mounted in the engine compartment between the evaporator outlet and the compressor suction port. An integral mounting bracket is used to secure the accumulator to the frame rail with a bolt. A threaded fitting on the top

ACCUMULATOR (Continued)

of the accumulator provides the port through which the A/C low pressure switch monitors the refrigerant system pressures.

The accumulator cannot be repaired and, if faulty or damaged, it must be replaced. The acummulator tapping block and refrigerant lines, the rubber O-rings and the A/C low pressure switch are available for service replacement.

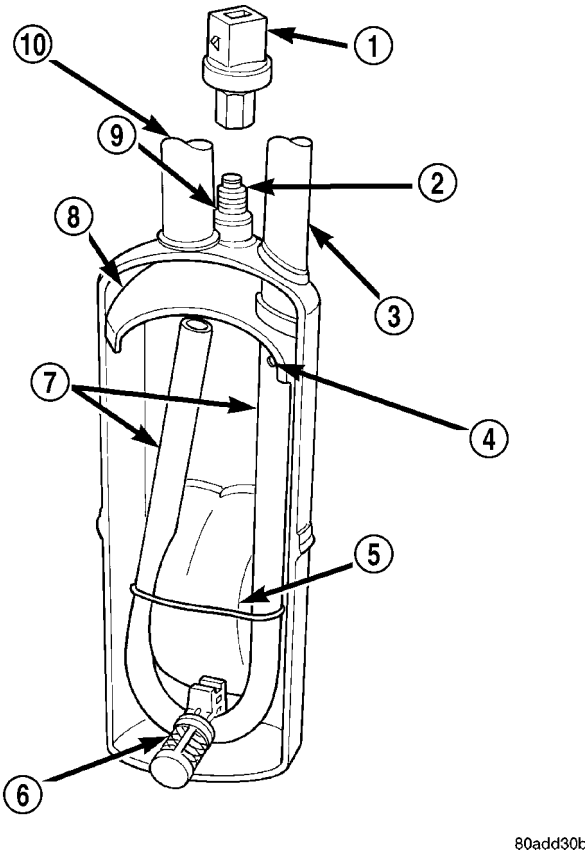

Fig. 13 Accumulator - Typical

1 - A/C LOW PRESSURE SWITCH
2 - PRESSURE SWITCH FITTING
3 - OUTLET TO COMPRESSOR
4 - ANTI-SIPHON HOLE
5 - DESICCANT BAG
6 - OIL RETURN ORIFICE FILTER
7 - VAPOR RETURN TUBE
8 - ACCUMULATOR DOME
9 - O-RING SEAL
10 - INLET FROM EVAPORATOR

OPERATION

Refrigerant enters the accumulator through the inlet tube as a low pressure vapor. Any liquid, oil-laden refrigerant falls to the bottom of the accumulator, which acts as a separator. A desiccant bag located inside the accumulator absorbs any moisture which may have entered and become trapped within the refrigerant system.

REMOVAL

WARNING: Review safety precautions and warnings in this group before performing this procedure (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.

NOTE: The Accumulator tubes can be serviced separately from the accumulator.

(1) Disconnect and isolate the negative battery cable.

(2) Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).

(3) If equipped, relocate the vehicle speed control servo as necessary to access the accumulator (Refer to 8 - ELECTRICAL/SPEED CONTROL/SERVO - REMOVAL).

(4) Disconnect the wire harness connector from the A/C low pressure switch (Fig. 14).

(5) Remove the nuts that secure the A/C suction line and the A/C liquid line to the accumulator tube tapping block.

(6) Disconnect the A/C suction line and the A/C liquid line from the accumulator tube tapping block and remove and discard the O-ring seals.

(7) Install plugs in, or tape over the opened suction and liquid line fittings and the accumulator tapping block ports.

(8) Remove the bolt that secures the accumulator bracket to the frame rail.

(9) Remove the two bolts securing the accumulator tubes to the evaporator tube tapping block.

(10) Disconnect the accumulator tubes from the evaporator tube tapping block and remove and discard the gasket.

(11) Install a plug in, or tape over the opened accumulator tube fittings and the evaporator ports.

(12) Remove the accumulator and evaporator tubes as an assembly from the engine compartment and place them on a workbench.

(13) Remove the bolts that secure the accumulator tubes to the accumulator.

(14) Disconnect the accumulator tubes from the accumulator and remove and discard the O-ring seals.

(15) Install plugs in, or tape over the opened accumulator tube fittings and the accumulator ports.

(16) Remove the A/C low pressure switch from the accumulator and remove and discard the O-ring seal.

ACCUMULATOR (Continued)

9 - BOLT (2)
10 - ACCUMULATOR
11 - BOLT
12 - WIRE HARNESS CONNECTOR

INSTALLATION

NOTE: If the accumulator is being replaced, add 30 milliliters (1 fluid ounce) of refrigerant oil to the refrigerant system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

NOTE: The Accumulator tubes can be serviced separately from the accumulator.

(1) Install the A/C low pressure switch onto the accumulator using a new O-ring seal. Hand-tighten the switch securely.

(2) Remove the tape or plugs from the opened accumulator tube fittings and the accumulator ports.

(3) Lubricate new rubber O-ring seals with clean refrigerant oil and install them onto the accumulator tube fittings. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

(4) Connect the accumulator tubes to the accumulator.

(5) Install the two bolts that secure the accumulator tubes to the accumulator. Tighten the bolts to 11 N·m (97 in. lbs.).

(6) Position the accumulator and accumulator tubes into the engine compartment as an assembly.

(7) Remove the tape or plugs from the opened accumulator tube fittings and the evaporator ports.

(8) Lubricate a new gasket with clean refrigerant oil and install it onto the evaporator tube tapping block. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

(9) Connect the accumulator tubes to the evaporator tube tapping block.

(10) Install the two bolts that secure the accumulator tubes to the evaporator tube tapping block. Tighten the bolts to 11 N·m (97 in. lbs.).

(11) Install the bolt that secures the accumulator bracket to the frame rail. Tighten the bolt to 10 N·m (89 in. lbs.).

(12) Remove the tape or plugs from the opened suction and liquid line fittings and the accumulator tube tapping block.

(13) Lubricate new rubber O-ring seals with clean refrigerant oil and install them on the suction and liquid line fittings. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

(14) Connect the A/C suction line and the A/C liquid line to the accumulator tube tapping block.

(15) Install the nuts that secure the A/C suction line and the A/C liquid line to the accumulator tube tapping block. Tighten the nuts to 5 N·m (44 in. lbs.).

(16) Connect the wire harness connector to the A/C low pressure switch.

(17) If equipped, reinstall the vehicle speed control servo (Refer to 8 - ELECTRICAL/SPEED CONTROL/ SERVO - INSTALLATION).

(18) Reconnect the negative battery cable.

(19) Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).

(20) Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

CONDENSATION DRAIN TUBE

DESCRIPTION

Condensation that accumulates in the HVAC housing is drained out of the housing through a tube and on to the ground. The condensation drain tube must

CONDENSATION DRAIN TUBE (Continued)

be kept open to prevent condensate water from collecting in the bottom of the HVAC housing.

The tapered end of the drain tube is designed to keep contaminants from entering the HVAC housing. If the tube is pinched or blocked, condensate cannot drain, causing water to back up and spill into the passenger compartment. It is normal to see condensate drainage below the vehicle in warm weather. If the tube is damaged, it should be replaced.

REMOVAL

(1) Raise vehicle on a hoist.

(2) Locate the condensate water drain tube on right side of dash panel under the hood (Fig. 15).

(3) Squeeze the retaining clamp and remove drain tube.

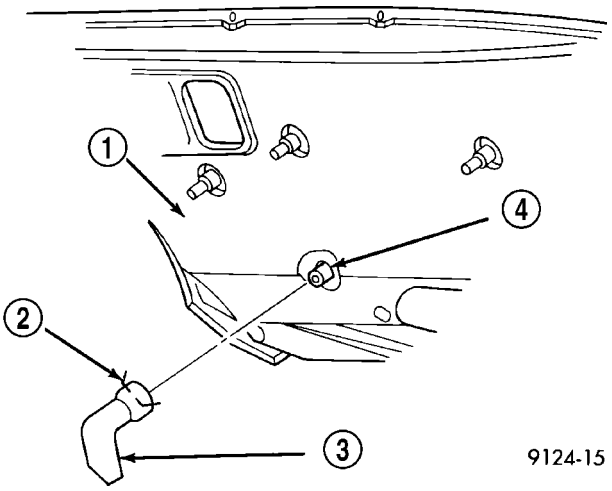

Fig. 15 Condensate Water Drain Tube – Typical

1 - DASH PANEL
2 - RETAINING CLAMP
3 - CONDENSATE WATER DRAIN TUBE
4 - HVAC HOUSING DRAIN

INSTALLATION

(1) Position the condensate water drain tube over the HVAC housing drain.

(2) Squeeze the retaining clamp and install the condensate water drain tube onto the HVAC housing drain.

(3) Lower the vehicle.

HEATER CORE

DESCRIPTION

The heater core (Fig. 16) is located in the HVAC housing, behind the instrument panel. It is a heat exchanger made of rows of tubes and fins. One end of the core is fitted with a molded plastic tank that includes the integral heater core tubes.

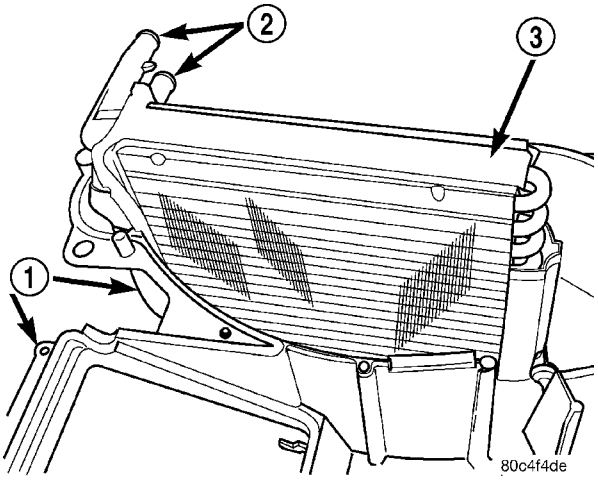

Fig. 16 Heater Core - LHD Shown, RHD Typical

1 - LOWER HVAC HOUSING
2 - HEATER CORE TUBES
3 - HEATER CORE

OPERATION

Engine coolant is circulated through the heater hoses and heater core at all times. As the coolant flows through the heater core, heat removed from the engine is transferred to the heater core fins and tubes. Air directed through the heater core picks up the heat from the heater core fins. The blend door allows control of the heater output air temperature by regulating the amount of air that is flowing through the heater core within the HVAC housing. The blower motor speed controls the volume of air flowing through the HVAC housing.

The heater core cannot be repaired and, if faulty or damaged, it must be replaced.

REMOVAL

WARNING: On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in an accidental airbag deployment and possible personal injury or death.

HEATER CORE (Continued)

WARNING: Review safety precautions and warnings in this group before performing this procedure (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.

(1) Remove the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/ HVAC HOUSING - REMOVAL).

(2) Disassemble the HVAC housing to access the heater core (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - DISASSEMBLY).

(3) Lift the heater core out of the lower half of the HVAC housing (Fig. 17).

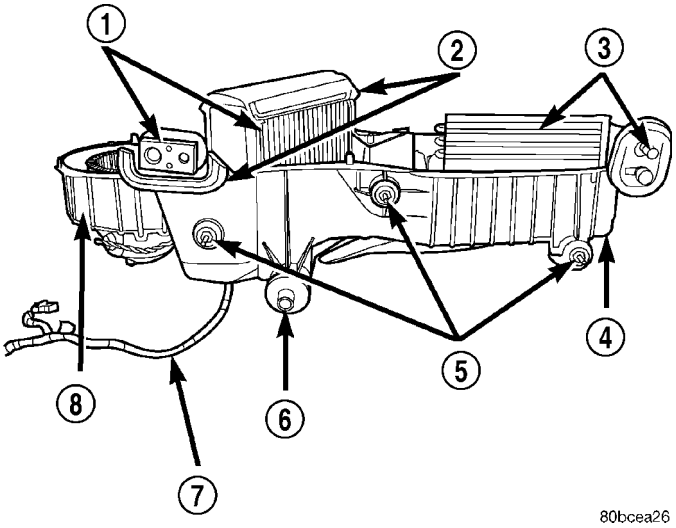

Fig. 17 Lower HVAC Housing - LHD Shown, RHD Typical

2 - FOAM SEALS
3 - HEATER CORE AND TUBES
4 - HVAC HOUSING LOWER CASE
5 - HOUSING MOUNTING STUDS
6 - HOUSING DRAIN
7 - WIRING
8 - BLOWER MOTOR AND WHEEL

INSTALLATION

(1) Install the heater core into the bottom half of the HVAC housing.

(2) Assemble the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/ HVAC HOUSING - ASSEMBLY).

NOTE: If the heater core is being replaced, flush the cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM CLEANING/REVERSE FLUSHING).

(3) Install the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - INSTALLATION).

HEATER INLET HOSE

REMOVAL

WARNING: Review safety precautions and warnings in this group before performing this procedure (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.

(1) Drain the engine cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE - DRAINING COOLING SYSTEM).

(2) Remove the heater hose retainer and separate the heater inlet and return hoses (Fig. 18).

(3) Using spring tension clamp pliers, compress and slide the clamps off of each end of the hose being removed.

CAUTION:
DO NOT apply excessive pressure on heater tubes or connections when removing heater hoses. Excessive pressure may damage or deform the tubes/heater core, causing an engine coolant leak.

(4) Disconnect each hose end by carefully twisting the hose back and forth on the tube, while gently pulling it away from the end of the tube.

(5) If necessary, carefully cut the hose end and peel the hose off of the tube.

NOTE:
Replacement of the heater inlet hose will be required if the hose ends are cut for removal.

(6) Remove the heater inlet hose from the engine compartment.

INSTALLATION

(1) Position the heater inlet hose into the engine compartment.

(2) Using spring tension clamp pliers, compress and slide each clamp away from the end of the hose being installed.

(3) Install each hose end by carefully twisting the hose back and forth while gently pushing it onto the tube.

(4) Using spring tension clamp pliers, compress and slide the clamps onto each end of the hose being installed.

HEATER INLET HOSE (Continued)

(5) Install the heater hose retainer.

(6) Refill the engine cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM REFILL).

HEATER RETURN HOSE

REMOVAL

WARNING: Review safety precautions and warnings in this group before performing this procedure (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.

(1) Drain the engine cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE - DRAINING COOLING SYSTEM).

(2) Remove the heater hose retainer and separate the heater inlet and return hoses (Fig. 19).

(3) Using spring tension clamp pliers, compress and slide the clamps off of each end of the hose being removed.

CAUTION:
DO NOT apply excessive pressure on heater tubes or connections when removing heater hoses. Excessive pressure may damage or deform the tubes/heater core, causing an engine coolant leak.

(4) Disconnect each hose end by carefully twisting the hose back and forth on the tube, while gently pulling it away from the end of the tube.

(5) If necessary, carefully cut the hose end and peel the hose off of the tube.

NOTE:
Replacement of the heater return hose will be required if the hose ends are cut for removal.

(6) Remove the heater return hose from the engine compartment.

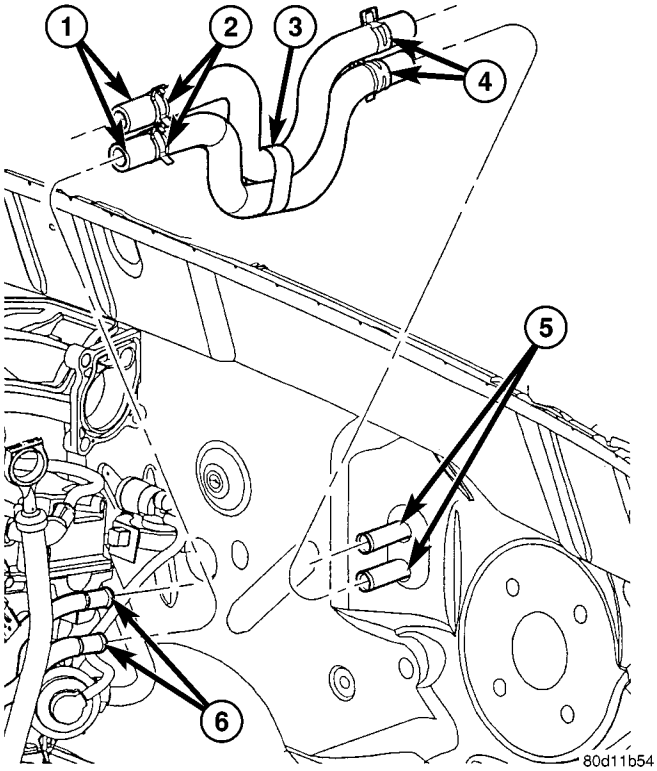

Fig. 19 Heater Hose Assembly- LHD 2.0L Shown, RHD Typical

HEATER RETURN HOSE (Continued)

INSTALLATION

(1) Position the heater return hose into the engine compartment.

(2) Using spring tension clamp pliers, compress and slide each clamp away from the end of the hose being installed.

(3) Install each hose end by carefully twisting the hose back and forth while gently pushing it onto the tube.

(4) Using spring tension clamp pliers, compress and slide the clamps onto each end of the hose being installed.

(5) Install the heater hose retainer.

(6) Refill the engine cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM REFILL).

LIQUID LINE

DESCRIPTION

The A/C liquid line is the refrigerant line that goes from the A/C condenser to the accumulator tube terminal block. The A/C liquid line contains the variable orifice valve (VOV) and is only serviced as an assembly, except for the rubber O-ring seals.

The A/C liquid line cannot be repaired and, if leaking or damaged, it must be replaced.

REMOVAL

WARNING: Review safety precautions and warnings in this group before performing this procedure (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.

(1) Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).

(2) Remove the nut that secures the A/C liquid line to the A/C condenser (lower port) (Fig. 20).

(3) Disconnect the A/C liquid line from the A/C condense and remove and discard the O-ring seal.

(4) Install plugs in, or tape over the opened liquid line fitting and the condenser outlet port.

(5) Remove the nut that secures the A/C liquid line (outboard fitting) to the accumulator tube tapping block (Fig. 21).

(6) Disconnect the A/C liquid line from the accumulator tube tapping block and remove and discard the O-ring seal.

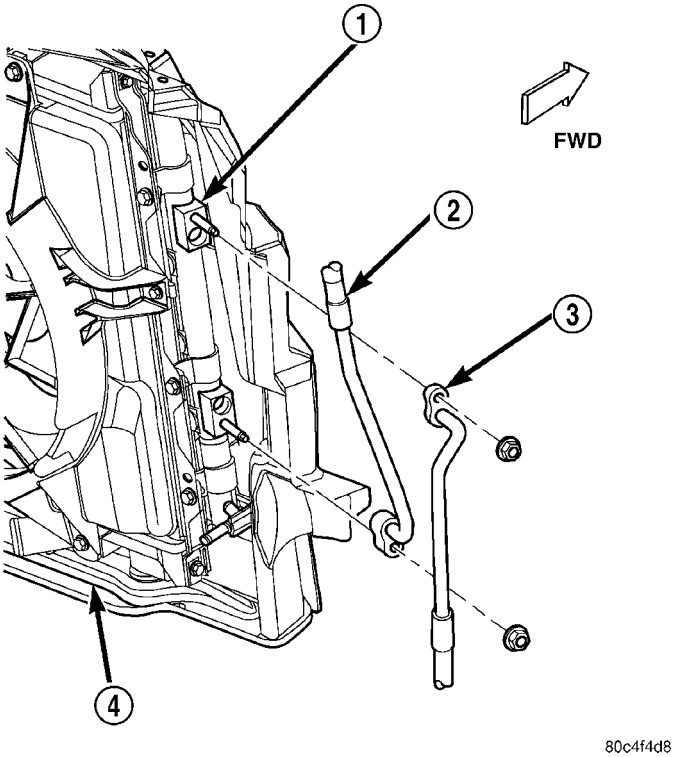

Fig. 20 A/C Condenser Refrigerant Lines - Typical

2 - A/C LIQUID LINE
3 - A/C DISCHARGE LINE
4 - RADIATOR ASSEMBLY

(7) Install plugs in, or tape over the opened liquid line fitting and the accumulator tube tapping block inlet port.

(8) Remove the A/C liquid line from the engine compartment.

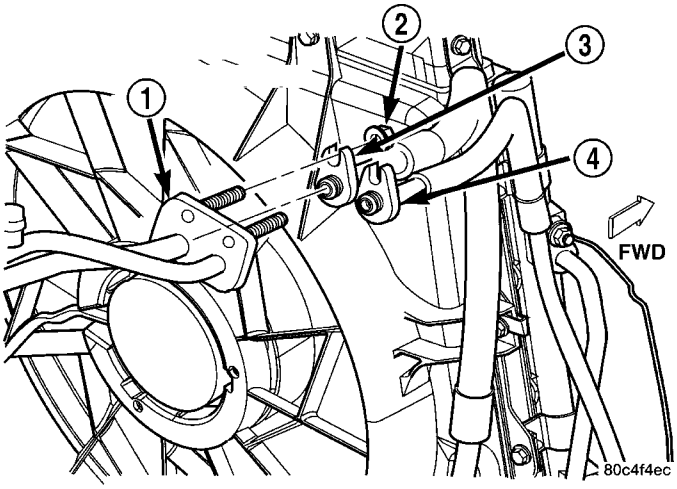

Fig. 21 A/C Refrigerant Lines - Typical

1 - ACCUMULATOR TUBE TAPPING BLOCK
2 - NUT (2)
3 - A/C SUCTION LINE
4 - A/C LIQUID LINE

LIQUID LINE (Continued)

INSTALLATION

NOTE: Replacement of the refrigerant line O-ring seals is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals could result in a refrigerant system leak.

(1) Position the A/C liquid line into the engine compartment.

(2) Remove the tape or plugs from the liquid line fitting and the accumulator tube tapping block port.

(3) Lubricate a new rubber O-ring seal with clean refrigerant oil and install it on the liquid line fitting. Use only the specified O-ring as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

(4) Connect the A/C liquid line to the accumulator tube.

(5) Install the nut that secures the A/C liquid to the accumulator tube. Tighten the nut to 5 N·m (44 in. lbs.).

(6) Remove the tape or plugs from the condenser outlet port and the liquid line fitting.

(7) Lubricate a new rubber O-ring seal with clean refrigerant oil and install it on the liquid line fitting. Use only the specified O-ring as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

(8) Connect the A/C liquid line to the A/C condenser.

(9) Install the nut that secures the A/C liquid line to the A/C condenser. Tighten the nut to 5 N·m (44 in. lbs.).

(10) Reconnect the negative battery cable.

(11) Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).

(12) Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

REFRIGERANT

DESCRIPTION

The refrigerant used in this air conditioning system is a HydroFluoroCarbon (HFC), type R-134a. Unlike R-12, which is a ChloroFluoroCarbon (CFC), R-134a refrigerant does not contain ozone-depleting chlorine. R-134a refrigerant is a non-toxic, non-flammable, clear, and colorless liquefied gas. Even though R-134a does not contain chlorine, it must be reclaimed and recycled just like CFC-type refrigerants. This is because R-134a is a greenhouse gas and can contribute to global warming.

OPERATION

R-134a refrigerant is not compatible with R-12 refrigerant in an air conditioning system. Even a small amount of R-12 added to an R-134a refrigerant system will cause compressor failure, refrigerant oil sludge or poor air conditioning system performance. In addition, the PolyAlkylene Glycol (PAG) synthetic refrigerant oils used in an R-134a refrigerant system are not compatible with the mineral-based refrigerant oils used in an R-12 refrigerant system.

R-134a refrigerant system service ports, service tool couplers and refrigerant dispensing bottles have all been designed with unique fittings to ensure that an R-134a system is not accidentally contaminated with the wrong refrigerant (R-12). There are also labels posted in the engine compartment of the vehicle and on the compressor identifying to service technicians that the air conditioning system is equipped with R-134a.

REFRIGERANT OIL

DESCRIPTION

The refrigerant oil used in R-134a refrigerant systems is a synthetic-based, PolyAlkylene Glycol (PAG), wax-free lubricant. Mineral-based R-12 refrigerant oils are not compatible with PAG oils, and should never be introduced to an R-134a refrigerant system.

There are different PAG oils available, and each contains a different additive package. The 10S15 and 10S17 compressors used in this vehicle is designed to use an ND-8 PAG refrigerant oil. Use only refrigerant oil of this same type to service the refrigerant system.

OPERATION

After performing any refrigerant recovery or recycling operation, always replenish the refrigerant system with the same amount of the recommended refrigerant oil as was removed. Too little refrigerant oil can cause compressor damage, and too much can reduce air conditioning system performance.

PAG refrigerant oil is much more hygroscopic than mineral oil, and will absorb any moisture it comes into contact with, even moisture in the air. The PAG oil container should always be kept tightly capped until it is ready to be used. After use, recap the oil container immediately to prevent moisture contamination.

REFRIGERANT OIL (Continued)

STANDARD PROCEDURE

REFRIGERANT OIL LEVEL

WARNING: Review safety precautions and warnings in this group before performing this procedure (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.

CAUTION: The oil used in the A/C compressor is ND-8 PAG R-134a refrigerant oil. Only refrigerant oil of the same type should be used to service the A/C system. Do not use any other refrigerant oil. The oil container should be kept tightly capped until it is ready for use and then tightly capped after use to prevent contamination from dirt and moisture. Refrigerant oil will quickly absorb any moisture it comes in contact with, therefore, special effort must be used to keep all R-134a system components moisture-free. Moisture in the refrigerant oil is very difficult to remove and will cause a reliability problem with the A/C compressor.

NOTE: Most reclaim/recycling equipment will measure the lubricant being removed during recovery. This amount of lubricant should be added back into the system. Refer to the reclaim/recycling equipment manufacturers instructions.

It will not be necessary to check the oil level in the A/C compressor or to add oil, unless there has been an oil loss. An oil loss may occur due to component replacement, or a rupture or leak from a refrigerant line, connector fitting, component or component seal. If a leak occurs, add 30 milliliters (1 fluid ounce) of the recommended refrigerant oil to the refrigerant system after the repair has been made. Refrigerant oil loss will be evident at the leak point by the presence of a wet, shiny surface around the leak.

Refrigerant oil must be added when an accumulator, A/C evaporator or A/C condenser is replaced. See the Refrigerant Oil Capacities chart. When an A/C compressor is replaced, the refrigerant oil must be drained from the old compressor and measured. Drain all of the refrigerant oil from the new A/C compressor, then fill the new compressor with the same amount of refrigerant oil that was drained out of the old compressor.

REFRIGERANT OIL CAPACITIES

Component	ml	oz
Total System Fill	180	6.1
Accumulator, receiver/ drier	30	1.0
Condenser	30	1.0
Evaporator	60	2.0
Compressor	Drain and measure the oil from the old compressor - see text.	

SUCTION LINE

DESCRIPTION

The A/C suction line is the refrigerant line that goes from the accumulator tube terminal block to the A/C compressor. The A/C suction line is only serviced as an assembly, except for the rubber O-ring seals.

The A/C suction line cannot be repaired and, if leaking or damaged, it must be replaced.

REMOVAL

WARNING: Review safety precautions and warnings in this group before performing this procedure (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.

(1) Disconnect and isolate the negative battery cable.

(2) Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).

(3) Remove the bolt that secures the A/C suction line to the top of the A/C compressor (Fig. 22).

(4) Disconnect the A/C suction line from the A/C compressor and remove and discard the O-ring seal.

(5) Install plugs in, or tape over the opened suction line fitting and the compressor inlet port.

(6) If equipped with the 2.4L Turbo engine, remove the nut that secures the suction line retaining bracket to the thermostat housing stud bolt.

(7) Remove the nut that secures the A/C suction line (inboard fitting) to the accumulator tube tapping block (Fig. 23).

SUCTION LINE (Continued)

2 - BOLT
3 - A/C COMPRESSOR
4 - BOLT
5 - A/C SUCTION LINE
6 - SUCTION LINE RETAINING BRACKET
7 - ACCESSORY DRIVE BELT

(8) Disconnect the A/C suction line from the accumulator tube tapping block and remove and discard the O-ring seal.

(9) Install plugs in, or tape over the opened suction line fitting and the accumulator tube tapping block outlet port.

(10) Remove the A/C suction line from the engine compartment.

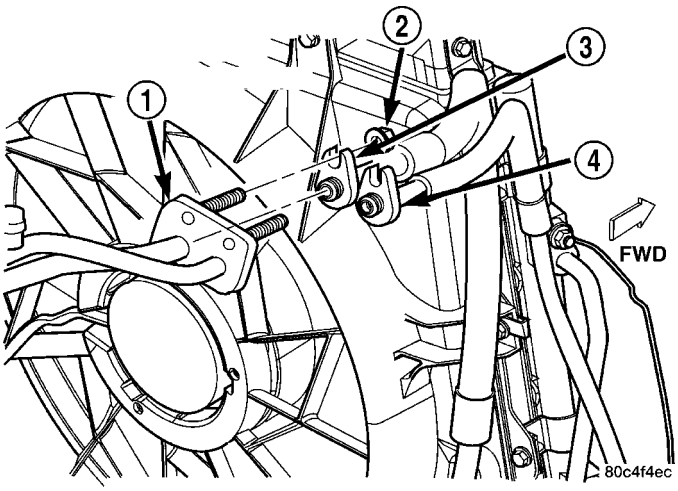

Fig. 23 A/C Refrigerant Lines - Typical

1 - ACCUMULATOR TUBE TAPPING BLOCK
2 - NUT (2)
3 - A/C SUCTION LINE
4 - A/C LIQUID LINE

INSTALLATION

NOTE: Replacement of the refrigerant line O-ring seals is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals could result in a refrigerant system leak.

(1) Position the A/C suction line into the engine compartment.

(2) Remove the tape or plugs from the suction line fitting and the accumulator tube tapping block.

(3) Lubricate a new rubber O-ring seal with clean refrigerant oil and install it on the suction line fitting. Use only the specified O-ring as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

(4) Connect the A/C suction line to the accumulator tube tapping block.

(5) Install the nut that secures the A/C suction line to the accumulator tube tapping block. Tighten the nut to 5 N·m (44 in. lbs.).

(6) If equipped with the 2.4L Turbo engine, install the nut that secures the suction line retaining bracket to the thermostat housing stud bolt. Tighten the nut to 2 N·m (17 in. lbs.).

(7) Remove the tape or plugs from the suction line fitting and the compressor port.

(8) Lubricate a new rubber O-ring seal with clean refrigerant oil and install it on the suction line fitting. Use only the specified O-ring as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

(9) Connect the A/C suction line to the A/C compressor.

(10) Install the bolt that secures the A/C suction line to the A/C compressor. Tighten the bolt to 12 N·m (106 in. lbs.).

(11) Reconnect the negative battery cable.

(12) Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).

(13) Recharge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

SERVICE PORT VALVE CORE

DESCRIPTION

The A/C service port valve cores are serviceable items (Fig. 24) and (Fig. 25). The low side valve is located on the liquid line near the accumulator. The

SERVICE PORT VALVE CORE (Continued)

high side valve is located on the discharge line near the compressor.

4 - BOLT
5 - ACCUMULATOR
6 - A/C LOW PRESSURE SWITCH

REMOVAL

WARNING: Review safety precautions and warnings in this group before performing this procedure (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.

(1) Remove the protective cap from the low and/or high side service port as necessary.

(2) Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).

(3) Using a standard Schrader-type valve core tool, remove the valve core from the service port as required.

(4) Install a plug in or tape over the opened service port.

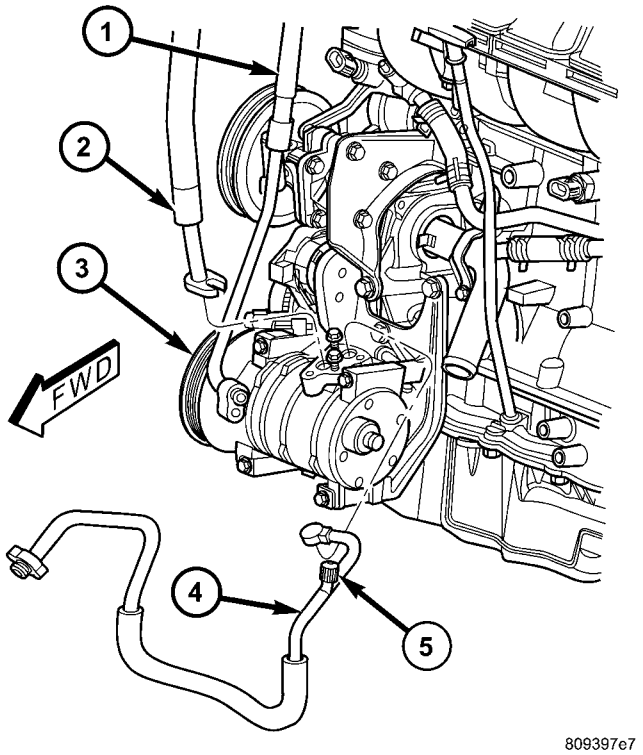

Fig. 25 High Side Service Port - Typical

1 - LIQUID LINE
2 - SUCTION LINE
3 - A/C COMPRESSOR
4 - DISCHARGE LINE
5 - HIGH SIDE SERVICE PORT

INSTALLATION

(1) Lubricate the A/C service port valve core with clean refrigerant oil prior to installation. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

(2) Remove the tape or plug from the A/C service port.

(3) Using a standard Schrader-type valve core tool, install and tighten the replacement valve core into the A/C service ports as required.

CAUTION: A valve core that is not fully seated in the A/C service port can result in damage to the valve during refrigerant system evacuation and charge. Such damage may result in a loss of system refrigerant while uncoupling the charge adapters.

(4) Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/REFRIGERANT - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).

(5) Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/REFRIGERANT - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

(6) Install the protective cap onto the A/C service ports as required.

DIESEL ENGINE COOLANT HEATER

DESCRIPTION

Vehicles equipped with the diesel engine are also equipped with a engine coolant heater system. This engine coolant heater is used to preheat the engine coolant to aid in cabin heating. Engine coolant is preheated using resistance heating. Current is supplied to the three glow plug type heating elements which reside in a single heater housing in the stream of engine coolant. As the coolant is routed from the engine, it passes over the ends of the glow plugs, the heat is transferred to the coolant and then to the heater core. This provides additional heat to the passenger compartment. The diesel engine coolant heater system is interfaced to the vehicles on-board computer system and DRBIII® diagnostics.

OPERATION

With the ignition turned to the On position, three temperature sensors record the ambient air in order to determine if it is cold enough to turn on the diesel engine coolant heater. One sensor is in the vehicle on the battery, under the driver's seat. The other two sensors are in the engine compartment (inlet air temperature and manifold temperature). Based in the lowest temperature of the three temperature sensors, a pre-determined coolant temperature set point is established at which the diesel engine coolant heaters will shut off.

For example, if the lowest recorded temperature from the three sensors is 0° C (32° F) or below, the heaters will shut off when the coolant temperature reaches 75° C (167° F). If the lowest ambient air temperature at key on is 10° C (50° F) or higher, then the heaters will not turn on.

There are three heating elements in the assembly: Plug 1 = 300 W, Plug 2 = 400 W and Plug 3 = 300 W. Plug 1 is tied to one relay, while plugs 2 and 3 are tied to a second relay. Because there are 3 plugs with only 2 relays, when the auxiliary diesel engine coolant heater is enabled by the engine controller, the firing sequence is as follows:

- a) Plug 1 only.
- b) Plugs 2 and 3 only.
- c) Plugs 1 to 3.

At each step, the powertrain control module (PCM) monitors loads on the electrical system to see if it is OK to proceed to the next phase of the firing sequence. The system will back out in the reverse order when a problem is encountered.

DIAGNOSIS AND TESTING

DIESEL ENGINE COOLANT HEATER

The DRB-III® scan tool is programmed to allow the technician to turn each diesel engine coolant heater relay on and off at a predetermined number of seconds. During this point, a voltage drop across each relay can be measured in order to determine whether they are functioning properly.

NOTE: This process should be performed anytime a vehicle is serviced for a significant coolant loss. Glow plug life is affected whenever the diesel engine coolant heater is operated with NO or LOW COOLANT FLOW across the glow plug tips.

Checking the glow plug heating element entails measuring the resistance across each glow plug at room temperature (appx. 23° C, 74° F). Unplug the 4–way heater wire connector from the headlamp/dash wiring harness at the rear of the engine (rearward in vehicle above the exhaust manifold). Using an ohmmeter, measure the resistance across each glow plug by touching one probe to the diesel engine coolant heater housing (ground) and the other probe to one of the terminals in the female heater connector corresponding to each plug (pin 1= glow plug 1, pin 2=glow plug 2, etc.). Each heating element is functioning properly if the measured resistance is between 250–800 mOhm (0.25–0.8 Ohm) at room temperature (23° C, 74° F).

DIESEL ENGINE COOLANT HEATER (Continued)

If one or more heating elements has a measured resistance outside this range and is not functioning properly then the entire diesel engine coolant heater must be replaced.

HEATER UNIT

REMOVAL

WARNING: Review safety precautions and warnings in this group before performing this procedure (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.

(1) Disconnect and isolate the negative battery cable.

(2) Drain the engine cooling system (Refer to 7 - COOLING/ENGINE/COOLANT - STANDARD PROCEDURE - DRAINING COOLING SYSTEM).

(3) Disconnect the wire harness connector for the diesel engine coolant heater from the engine wire harness connector and remove the heater connector from the connector locating bracket (Fig. 1).

(4) Remove the hose clamp from each end of the diesel engine coolant heater.

(5) Remove the hoses from each end of the diesel engine coolant heater.

(6) Remove the bolt that secures the diesel engine coolant heater bracket to the engine.

(7) Remove the diesel engine coolant heater from the engine compartment.

INSTALLATION

(1) Position the diesel engine coolant heater mounting bracket to the engine.

(2) Install the bolt that secures the mounting bracket to the engine. Tighten the bolt securely.

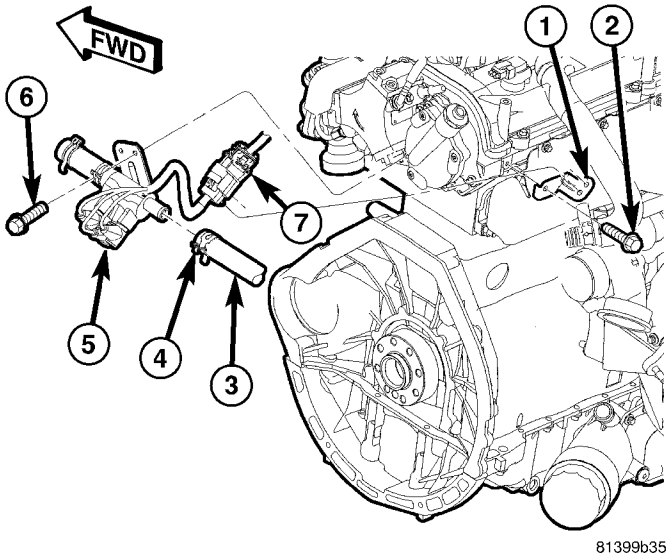

Fig. 1 Diesel Engine Coolant Heater

2 - BOLT
3 - HEATER HOSE (2)
4 - HOSE CLAMP (4)
5 - DIESEL ENGINE COOLANT HEATER
6 - BOLT
7 - ENGINE WIRE HARNESS CONNECTOR

(3) Install the heater hose onto each end of the diesel engine coolant heater.

(4) Install the hose clamp onto each end of the diesel engine coolant heater. Make sure the clamps are installed securely.

(5) Connect the wire harness connector for the diesel engine coolant heater to the engine wire harness and install the connector onto the locating bracket.

(6) Refill the engine cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE - COOLING SYSTEM FILL).

(7) Reconnect the negative battery cable.

EMISSIONS CONTROL

DESCRIPTION

DESCRIPTION - MONITORED COMPONENT

There are several components that will affect vehicle emissions if they malfunction. If one of these components malfunctions the Malfunction Indicator Lamp (Check Engine) will illuminate.

Some of the component monitors are checking for proper operation of the part. Electrically operated components now have input (rationality) and output (functionality) checks as well as continuity tests (opens/shorts). Previously, a component like the Throttle Position sensor (TPS) was checked by the PCM for an open or shorted circuit. If one of these conditions occurred, a DTC was set. Now there is a check to ensure that the component is working. This is done by watching for a TPS indication of a greater or lesser throttle opening than MAP and engine rpm indicate. In the case of the TPS, if engine vacuum is high and engine rpm is 1600 or greater and the TPS indicates a large throttle opening, a DTC will be set. The same applies to low vacuum and 1600 rpm.

Any component that has an associated limp in will set a fault after 1 trip with the malfunction present.

Refer to the Diagnostic Trouble Codes Description Charts in this section and the appropriate Powertrain Diagnostic Procedure Manual for diagnostic procedures.

The following is a list of the monitored components:

- Catalyst Monitor
- Comprehensive Components
- EGR (if equipped)
- Fuel Control (rich/lean)
- Oxygen Sensor Monitor
- Oxygen Sensor Heater Monitor
- Purge
- Misfire
- Natural Vacuum Leak Detection (NVLD)

COMPREHENSIVE COMPONENTS

Along with the major monitors, OBD II requires that the diagnostic system monitor any component that could affect emissions levels. In many cases, these components were being tested under OBD I. The OBD I requirements focused mainly on testing emissions-related components for electrical opens and shorts.

However, OBD II also requires that inputs from powertrain components to the PCM be tested for **rationality**, and that outputs to powertrain components from the PCM be tested for **functionality**. Methods for monitoring the various Comprehensive Component monitoring include:

(1) Circuit Continuity
- Open
- Shorted high
- Shorted to ground

(2) Rationality or Proper Functioning
- Inputs tested for rationality
- Outputs tested for functionality

NOTE: Comprehensive component monitors are continuous. Therefore, enabling conditions do not apply. All will set a DTC and illuminate the MIL in 1-trip.

Input Rationality—While input signals to the PCM are constantly being monitored for electrical opens and shorts, they are also tested for rationality. This means that the input signal is compared against other inputs and information to see if it makes sense under the current conditions.

PCM sensor inputs that are checked for rationality include:

- Manifold Absolute Pressure (MAP) Sensor
- Oxygen Sensor (O2S) (slow response)
- Engine Coolant Temperature (ECT) Sensor

EMISSIONS CONTROL (Continued)

- Camshaft Position (CMP) Sensor
- Vehicle Speed Sensor
- Crankshaft Position (CKP) Sensor
- Intake Air Temperature (IAT) Sensor
- Throttle Position (TPS) Sensor
- Ambient/Battery Temperature Sensors
- Power Steering Switch
- Oxygen Sensor Heater
- Engine Controller
- Brake Switch
- Natural Vacuum Leak Detection (NVLD)
- P/N Switch
- Trans Controls

Output Functionality—PCM outputs are tested for functionality in addition to testing for opens and shorts. When the PCM provides a voltage to an output component, it can verify that the command was carried out by monitoring specific input signals for expected changes. For example, when the PCM commands the Idle Air Control (IAC) Motor to a specific position under certain operating conditions, it expects to see a specific (target) idle speed (RPM). If it does not, it stores a DTC.

PCM outputs monitored for functionality include:

- Fuel Injectors
- Ignition Coils
- Torque Converter Clutch Solenoid
- Idle Air Control
- Purge Solenoid
- EGR Solenoid
- Radiator Fan Control
- Trans Controls

OXYGEN SENSOR (O2S) MONITOR

DESCRIPTION—Effective control of exhaust emissions is achieved by an oxygen feedback system. The most important element of the feedback system is the O2S. The O2S is located in the exhaust path. Once it reaches operating temperature 300° to 350°C (572° to 662°F), the sensor generates a voltage that is inversely proportional to the amount of oxygen in the exhaust. When there is a large amount of oxygen in the exhaust caused by a lean condition, misfire or exhaust leak, the sensor produces a low voltage, below 450 mV. When the oxygen content is lower, caused by a rich condition, the sensor produces a higher voltage, above 450mV.

The information obtained by the sensor is used to calculate the fuel injector pulse width. The PCM is programmed to maintain the optimum air/fuel ratio. At this mixture ratio, the catalyst works best to remove hydrocarbons (HC), carbon monoxide (CO) and nitrous oxide (NOx) from the exhaust.

The O2S is also the main sensing element for the EGR, Catalyst and Fuel Monitors, and purge.

The O2S may fail in any or all of the following manners:

- Slow response rate (Big Slope)
- Reduced output voltage (Half Cycle)
- Heater Performance

Slow Response Rate (Big Slope)—Response rate is the time required for the sensor to switch from lean to rich signal output once it is exposed to a richer than optimum A/F mixture or vice versa. As the PCM adjusts the air/fuel ratio, the sensor must be able to rapidly detect the change. As the sensor ages, it could take longer to detect the changes in the oxygen content of the exhaust gas. The rate of change that an oxygen sensor experiences is called 'Big Slope'. The PCM checks the oxygen sensor voltage in increments of a few milliseconds.

Reduced Output Voltage (Half Cycle)—The output voltage of the O2S ranges from 2.5 to 5 volt. A good sensor can easily generate any output voltage in this range as it is exposed to different concentrations of oxygen. To detect a shift in the A/F mixture (lean or rich), the output voltage has to change beyond a threshold value. A malfunctioning sensor could have difficulty changing beyond the threshold value. Many times the condition is only temporey and the sensor will recover. Under normal conditions the voltage signal surpasses the threshold, and a counter is incremented by one. This is called the Half Cycle Counter.

Heater Performance—The heater is tested by a separate monitor. Refer to the Oxygen Sensor Heater Monitor.

OPERATION—As the Oxygen Sensor signal switches, the PCM monitors the half cycle and big slope signals from the oxygen sensor. If during the test neither counter reaches a predetermined value, a malfunction is entered and a Freeze Frame is stored. Only one counter reaching its predetermined value is needed for the monitor to pass.

The Oxygen Sensor Signal Monitor is a two trip monitor that is tested only once per trip. When the Oxygen Sensor fails the test in two consecutive trips, the MIL is illuminated and a DTC is set. The MIL is extinguished when the Oxygen Sensor monitor passes in three consecutive trips. The DTC is erased from memory after 40 consecutive warm-up cycles without test failure.

Enabling Conditions—The following conditions must typically be met for the PCM to run the oxygen sensor monitor:

- Battery voltage
- Engine temperature
- Engine run time
- Engine run time at a predetermined speed
- Engine run time at a predetermined speed and throttle opening
- Transmission in gear (automatic only)

EMISSIONS CONTROL (Continued)

- Fuel system in Closed Loop
- Long Term Adaptive (within parameters)
- Power Steering Switch in low PSI (no load)
- Engine at idle
- Fuel level above 15%
- Ambient air temperature
- Barometric pressure
- Engine RPM within acceptable range of desired idle
- Closed throttle speed

Pending Conditions—The Task Manager typically does not run the Oxygen Sensor Signal Monitor if overlapping monitors are running or the MIL is illuminated for any of the following:

- Misfire Monitor
- Front Oxygen Sensor and Heater Monitor
- MAP Sensor
- Vehicle Speed Sensor
- Engine Coolant Temperature Sensor
- Throttle Position Sensor
- Engine Controller Self Test Faults
- Cam or Crank Sensor
- Injector and Coil
- Idle Air Control Motor
- EVAP Electrical
- EGR Solenoid Electrical
- Intake Air Temperature
- 5 Volt Feed

Conflict—The Task Manager does not run the Oxygen Sensor Monitor if any of the following conditions are present:

- A/C ON (A/C clutch cycling temporarily suspends monitor)
- Purge flow in progress
- Ethenal content learn is taking place and the ethenal used once flag is set

Suspend—The Task Manager suspends maturing a fault for the Oxygen Sensor Monitor if an of the following are present:

- Oxygen Sensor Heater Monitor, Priority 1
- Misfire Monitor, Priority 2

OXYGEN SENSOR HEATER MONITOR (NGC)

DESCRIPTION—If the Oxygen sensor (O2S) DTC as well as a O2S heater DTC is present, the O2S Heater DTC MUST be repaired first. After the O2S Heater is repaired, verify that the sensor circuit is operating correctly.

The voltage reading taken from the O2S are very temperature sensitive. The readings taken from the O2S are not accurate below 300 degrees C. Heating the O2S is done to allow the engine controller to shift to closed loop control as soon as possible. The heating element used to heat the O2S must be tested to ensure that it is heating the sensor properly. Starting with the introduction on the NGC module the strategy for checking the heater circuit has changed. The heater resistance is checked by the NGC almost immediately after the engine is started. The same O2S heater return pin used to read the heater resistance is capable of detecting an open circuit, a shorted high or shorted low condition.

OXYGEN SENSOR HEATER MONITOR (SBEC)

DESCRIPTION—If there is an oxygen sensor (O2S) DTC as well as a O2S heater DTC, the O2S heater fault MUST be repaired first. After the O2S fault is repaired, verify that the heater circuit is operating correctly.

The voltage readings taken from the O2S are very temperature sensitive. The readings are not accurate below 300°C. Heating of the O2S is done to allow the engine controller to shift to closed loop control as soon as possible. The heating element used to heat the O2S must be tested to ensure that it is heating the sensor properly.

The heater element itself is not tested directly. The sensor output is used to test the heater by isolating the effect of the heater element on the O2S output voltage from the other effects. The resistance is normally between 100 ohms and 4.5 megaohms. When oxygen sensor temperature increases, the resistance in the internal circuit decreases. The PCM sends a 5 volts biased signal through the oxygen sensors to ground this monitoring circuit. As the temperature increases, resistance decreases and the PCM detects a lower voltage at the reference signal. Inversely, as the temperature decreases, the resistance increases and the PCM detects a higher voltage at the reference signal. The O2S circuit is monitored for a drop in voltage.

OPERATION—The Oxygen Sensor Heater Monitor begins after the ignition has been turned OFF and the O2 sensors have cooled. The PCM sends a 5 volt bias to the oxygen sensor every 1.6 seconds. The PCM keeps it biased for 35 ms each time. As the sensor cools down, the resistance increases and the PCM reads the increase in voltage. Once voltage has increased to a predetermined amount, higher than when the test started, the oxygen sensor is cool enough to test heater operation.

When the oxygen sensor is cool enough, the PCM energizes the ASD relay. Voltage to the O2 sensor begins to increase the temperature. As the sensor temperature increases, the internal resistance decreases. The PCM continues biasing the 5 volt signal to the sensor. Each time the signal is biased, the PCM reads a voltage decrease. When the PCM detects a voltage decrease of a predetermined value for several biased pulses, the test passes.

The heater elements are tested each time the engine is turned OFF if all the enabling conditions

EMISSIONS CONTROL (Continued)

are met. If the monitor fails, the PCM stores a maturing fault and a Freeze Frame is entered. If two consecutive tests fail, a DTC is stored. Because the ignition is OFF, the MIL is illuminated at the beginning of the next key cycle, after the 2nd failure.

Enabling Conditions—The following conditions must be met for the PCM to run the oxygen sensor heater test:

- Engine run time of at least 5.1 minutes
- Key OFF power down
- Battery voltage of at least 10 volts
- Sufficient Oxygen Sensor cool down

Pending Conditions—There are not conditions or situations that prompt conflict or suspension of testing. The oxygen sensor heater test is not run pending resolution of MIL illumination due to oxygen sensor failure.

Suspend—There are no conditions which exist for suspending the Heater Monitor.

CATALYST MONITOR

To comply with clean air regulations, vehicles are equipped with catalytic converters. These converters reduce the emission of hydrocarbons, oxides of nitrogen and carbon monoxide.

Normal vehicle miles or engine misfire can cause a catalyst to decay. A meltdown of the ceramic core can cause a reduction of the exhaust passage. This can increase vehicle emissions and deteriorate engine performance, driveability and fuel economy.

The catalyst monitor uses dual oxygen sensors (O2S's) to monitor the efficiency of the converter. The dual O2S strategy is based on the fact that as a catalyst deteriorates, its oxygen storage capacity and its efficiency are both reduced. By monitoring the oxygen storage capacity of a catalyst, its efficiency can be indirectly calculated. The upstream O2S is used to detect the amount of oxygen in the exhaust gas before the gas enters the catalytic converter. The PCM calculates the A/F mixture from the output of the O2S. A low voltage indicates high oxygen content (lean mixture). A high voltage indicates a low content of oxygen (rich mixture).

When the upstream O2S detects a high oxygen condition, there is an abundance of oxygen in the exhaust gas. A functioning converter would store this oxygen so it can use it for the oxidation of HC and CO. As the converter absorbs the oxygen, there will be a lack of oxygen downstream of the converter. The output of the downstream O2S will indicate limited activity in this condition.

As the converter loses the ability to store oxygen, the condition can be detected from the behavior of the downstream O2S. When the efficiency drops, no chemical reaction takes place. This means the concentration of oxygen will be the same downstream as upstream. The output voltage of the downstream O2S copies the voltage of the upstream sensor. The only difference is a time lag (seen by the PCM) between the switching of the O2S's.

To monitor the system, the number of lean-to-rich switches of upstream and downstream O2S's is counted. The ratio of downstream switches to upstream switches is used to determine whether the catalyst is operating properly. An effective catalyst will have fewer downstream switches than it has upstream switches i.e., a ratio closer to zero. For a totally ineffective catalyst, this ratio will be one-to-one, indicating that no oxidation occurs in the device.

The system must be monitored so that when catalyst efficiency deteriorates and exhaust emissions increase to over the legal limit, the MIL (check engine lamp) will be illuminated.

Monitor Operation—To monitor catalyst efficiency, the PCM expands the rich and lean switch points of the heated oxygen sensor. With extended switch points, the air/fuel mixture runs richer and leaner to overburden the catalytic converter. Once the test is started, the air/fuel mixture runs rich and lean and the O2 switches are counted. A switch is counted when an oxygen sensor signal goes from below the lean threshold to above the rich threshold. The number of Rear O2 sensor switches is divided by the number of Front O2 sensor switches to determine the switching ratio.

The test runs for 20 seconds. As catalyst efficiency deteriorated over the life of the vehicle, the switch rate at the downstream sensor approaches that of the upstream sensor. If at any point during the test period the switch ratio reaches a predetermined value, a counter is incremented by one. The monitor is enabled to run another test during that trip. When the test fails three times, the counter increments to three, a malfunction is entered, and a Freeze Frame is stored. When the counter increments to three during the next trip, the code is matured and the MIL is illuminated. If the test passes the first, no further testing is conducted during that trip.

The MIL is extinguished after three consecutive good trips. The good trip criteria for the catalyst monitor is more stringent than the failure criteria. In order to pass the test and increment one good trip, the downstream sensor switch rate must be less than 80% of the upstream rate (60% for manual transmissions). The failure percentages are 90% and 70% respectively.

Enabling Conditions—The following conditions must typically be met before the PCM runs the catalyst monitor. Specific times for each parameter may be different from engine to engine.

- Accumulated drive time
- Enable time

EMISSIONS CONTROL (Continued)

- Ambient air temperature
- Barometric pressure
- Catalyst warm-up counter
- Engine coolant temperature
- Accumulated throttle position sensor
- Vehicle speed
- MAP
- RPM
- Engine in closed loop
- Fuel level

Pending Conditions—

- Misfire DTC
- Front Oxygen Sensor Response
- Front Oxygen Sensor Heater Monitor
- Front Oxygen Sensor Electrical
- Rear Oxygen Sensor Rationality (middle check)
- Rear Oxygen Sensor Heater Monitor
- Rear Oxygen Sensor Electrical
- Fuel System Monitor
- All TPS faults
- All MAP faults
- All ECT sensor faults
- Purge flow solenoid functionality
- Purge flow solenoid electrical
- All PCM self test faults
- All CMP and CKP sensor faults
- All injector and ignition electrical faults
- Idle Air Control (IAC) motor functionality
- Vehicle Speed Sensor
- Brake switch
- Intake air temperature

Conflict—The catalyst monitor does not run if any of the following are conditions are present:

- EGR Monitor in progress
- Fuel system rich intrusive test in progress
- EVAP Monitor in progress
- Time since start is less than 60 seconds
- Low fuel level
- Low ambient air temperature
- Ethanel content learn is taking place and the ethenal used once flag is set

Suspend—The Task Manager does not mature a catalyst fault if any of the following are present:

- Oxygen Sensor Monitor, Priority 1
- Upstream Oxygen Sensor Heater, Priority 1
- EGR Monitor, Priority 1
- EVAP Monitor, Priority 1
- Fuel System Monitor, Priority 2
- Misfire Monitor, Priority 2

DESCRIPTION - VEHICLE EMISSION CONTROL INFORMATION LABEL

All models have a Vehicle Emission Control Information (VECI) Label. Chrysler permanently attaches the label in the engine compartment. It cannot be removed without defacing information and destroying the label.

The label contains the vehicle's emission specifications and vacuum hose routings. All hoses must be connected and routed according to the label.

DESCRIPTION - TRIP DEFINITION

A "Trip" means vehicle operation (following an engine-off period) of duration and driving mode such that all components and systems are monitored at least once by the diagnostic system. The monitors must successfully pass before the PCM can verify that a previously malfunctioning component is meeting the normal operating conditions of that component. For misfire or fuel system malfunction, the MIL may be extinguished if the fault does not recur when monitored during three subsequent sequential driving cycles in which conditions are similar to those under which the malfunction was first determined.

Anytime the MIL is illuminated, a DTC is stored. The DTC can self erase only after the MIL has been extinguished. Once the MIL is extinguished, the PCM must pass the diagnostic test for the most recent DTC for 40 warm-up cycles (80 warm-up cycles for the Fuel System Monitor and the Misfire Monitor). A warm-up cycle can best be described by the following:

- The engine must be running
- A rise of 40°F in engine temperature must occur from the time when the engine was started
- Engine coolant temperature must crossover 160°F
- A "driving cycle" that consists of engine start up and engine shut off.

Once the above conditions occur, the PCM is considered to have passed a warm-up cycle. Due to the conditions required to extinguish the MIL and erase the DTC, it is most important that after a repair has been made, all DTC's be erased and the repair verified by running 1–good trip.

OPERATION - NON-MONITORED CIRCUITS

The PCM does not monitor all circuits, systems and conditions that could have malfunctions causing driveability problems. However, problems with these systems may cause the PCM to store diagnostic trouble codes for other systems or components. For example, a fuel pressure problem will not register a fault directly, but could cause a rich/lean condition or misfire. This could cause the PCM to store an oxygen sensor or misfire diagnostic trouble code.

The major non-monitored circuits are listed below along with examples of failures modes that do not directly cause the PCM to set a DTC, but for a system that is monitored.

EMISSIONS CONTROL (Continued)

FUEL PRESSURE

The fuel pressure regulator controls fuel system pressure. The PCM cannot detect a clogged fuel pump inlet filter, clogged in-line fuel filter, or a pinched fuel supply or return line. However, these could result in a rich or lean condition causing the PCM to store an oxygen sensor, fuel system, or misfire diagnostic trouble code.

SECONDARY IGNITION CIRCUIT

The PCM cannot detect an inoperative ignition coil, fouled or worn spark plugs, ignition cross firing, or open spark plug cables. The misfire will however, increase the oxygen content in the exhaust, deceiving the PCM in to thinking the fuel system is too lean. Also see misfire detection. There are DTC's that can detect misfire and Ionization shorts in the secondary ignition circuit, refer to the Powertrain Diagnostic manual for more information

CYLINDER COMPRESSION

The PCM cannot detect uneven, low, or high engine cylinder compression. Low compression lowers O2 content in the exhaust. Leading to fuel system, oxygen sensor, or misfire detection fault.

EXHAUST SYSTEM

The PCM cannot detect a plugged, restricted or leaking exhaust system. It may set a EGR (if equipped) or Fuel system or O2S fault.

FUEL INJECTOR MECHANICAL MALFUNCTIONS

The PCM cannot determine if a fuel injector is clogged, the needle is sticking or if the wrong injector is installed. However, these could result in a rich or lean condition causing the PCM to store a diagnostic trouble code for either misfire, an oxygen sensor, or the fuel system.

EXCESSIVE OIL CONSUMPTION

Although the PCM monitors engine exhaust oxygen content when the system is in closed loop, it cannot determine excessive oil consumption.

THROTTLE BODY AIR FLOW

The PCM cannot detect a clogged or restricted air cleaner inlet or filter element.

VACUUM ASSIST

The PCM cannot detect leaks or restrictions in the vacuum circuits of vacuum assisted engine control system devices. However, these could cause the PCM to store a MAP sensor diagnostic trouble code and cause a high idle condition.

PCM SYSTEM GROUND

The PCM cannot determine a poor system ground. However, one or more diagnostic trouble codes may be generated as a result of this condition. The module should be mounted to the body at all times, including when diagnostics are performed.

PCM CONNECTOR ENGAGEMENT

The PCM may not be able to determine spread or damaged connector pins. However, it might store diagnostic trouble codes as a result of spread connector pins.

DESCRIPTION - MONITORED SYSTEMS

There are new electronic circuit monitors that check fuel, emission, engine and ignition performance. These monitors use information from various sensor circuits to indicate the overall operation of the fuel, engine, ignition and emission systems and thus the emissions performance of the vehicle.

The fuel, engine, ignition and emission systems monitors do not indicate a specific component problem. They do indicate that there is an implied problem within one of the systems and that a specific problem must be diagnosed.

If any of these monitors detect a problem affecting vehicle emissions, the Malfunction Indicator (Check Engine) Lamp will be illuminated. These monitors generate Diagnostic Trouble Codes that can be displayed with the a DRBIII® scan tool.

The following is a list of the system monitors:

- EGR Monitor (if equipped)
- Misfire Monitor
- Fuel System Monitor
- Oxygen Sensor Monitor
- Oxygen Sensor Heater Monitor
- Catalyst Monitor
- Evaporative System Leak Detection Monitor (if equipped)

Following is a description of each system monitor, and its DTC.

Refer to the appropriate Powertrain Diagnostics Procedures manual for diagnostic procedures.

OXYGEN SENSOR (O2S) MONITOR

Effective control of exhaust emissions is achieved by an oxygen feedback system. The most important element of the feedback system is the O2S. The O2S is located in the exhaust path. Once it reaches operating temperatures of 300° to 350°C (572° to 662°F), the sensor generates a voltage that is inversely proportional to the amount of oxygen in the exhaust. The information obtained by the sensor is used to calculate the fuel injector pulse width. The PCM is programmed to maintain the optimum air/fuel ratio.

EMISSIONS CONTROL (Continued)

At this mixture ratio, the catalyst works best to remove hydrocarbons (HC), carbon monoxide (CO) and nitrous oxide (NOx) from the exhaust.

The O2S is also the main sensing element for the EGR (if equipped), Catalyst and Fuel Monitors.

The O2S may fail in any or all of the following manners:

- Slow response rate
- Reduced output voltage
- Dynamic shift
- Shorted or open circuits

Response rate is the time required for the sensor to switch from lean to rich once it is exposed to a richer than optimum A/F mixture or vice versa. As the sensor starts malfunctioning, it could take longer to detect the changes in the oxygen content of the exhaust gas.

The output voltage of the O2S ranges from 0 to 1 volt (voltages are offset by 2.5 volts on NGC vehicles). A good sensor can easily generate any output voltage in this range as it is exposed to different concentrations of oxygen. To detect a shift in the A/F mixture (lean or rich), the output voltage has to change beyond a threshold value. A malfunctioning sensor could have difficulty changing beyond the threshold value.

OXYGEN SENSOR HEATER MONITOR

If there is an oxygen sensor (O2S) DTC as well as a O2S heater DTC, the O2S heater fault MUST be repaired first. After the O2S fault is repaired, verify that the heater circuit is operating correctly.

Effective control of exhaust emissions is achieved by an oxygen feedback system. The most important element of the feedback system is the O2S. The O2S is located in the exhaust path. Once it reaches operating temperatures of 300° to 350°C (572 ° to 662°F), the sensor generates a voltage that is inversely proportional to the amount of oxygen in the exhaust. The information obtained by the sensor is used to calculate the fuel injector pulse width. This maintains a 14.7 to 1 Air Fuel (A/F) ratio. At this mixture ratio, the catalyst works best to remove hydrocarbons (HC), carbon monoxide (CO) and nitrogen oxide (NOx) from the exhaust.

The voltage readings taken from the O2S are very temperature sensitive. The readings are not accurate below 300°C. Heating of the O2S is done to allow the engine controller to shift to closed loop control as soon as possible. The heating element used to heat the O2S must be tested to ensure that it is heating the sensor properly.

The O2S circuit is monitored for a drop in voltage. The sensor output is used to test the heater by isolating the effect of the heater element on the O2S output voltage from the other effects.

EGR MONITOR (if equipped)

The Powertrain Control Module (PCM) performs an on-board diagnostic check of the EGR system.

The EGR monitor is used to test whether the EGR system is operating within specifications. The diagnostic check activates only during selected engine/driving conditions. When the conditions are met, the EGR is turned off (solenoid energized) and the O2S compensation control is monitored. Turning off the EGR shifts the air fuel (A/F) ratio in the lean direction. The O2S data should indicate an increase in the O2 concentration in the combustion chamber when the exhaust gases are no longer recirculated. While this test does not directly measure the operation of the EGR system, it can be inferred from the shift in the O2S data whether the EGR system is operating correctly. Because the O2S is being used, the O2S test must pass its test before the EGR test. Also looks at EGR linear potentiometer for feedback.

MISFIRE MONITOR

Excessive engine misfire results in increased catalyst temperature and causes an increase in HC emissions. Severe misfires could cause catalyst damage. To prevent catalytic convertor damage, the PCM monitors engine misfire.

The Powertrain Control Module (PCM) monitors for misfire during most engine operating conditions (positive torque) by looking at changes in the crankshaft speed. If a misfire occurs the speed of the crankshaft will vary more than normal.

FUEL SYSTEM MONITOR

To comply with clean air regulations, vehicles are equipped with catalytic converters. These converters reduce the emission of hydrocarbons, oxides of nitrogen and carbon monoxide. The catalyst works best when the air fuel (A/F) ratio is at or near the optimum of 14.7 to 1.

The PCM is programmed to maintain the optimum air/fuel ratio. This is done by making short term corrections in the fuel injector pulse width based on the O2S output. The programmed memory acts as a self calibration tool that the engine controller uses to compensate for variations in engine specifications, sensor tolerances and engine fatigue over the life span of the engine. By monitoring the actual air-fuel ratio with the O2S (short term) and multiplying that with the program long-term (adaptive) memory and comparing that to the limit, it can be determined whether it will pass an emissions test. If a malfunction occurs such that the PCM cannot maintain the optimum A/F ratio, then the MIL will be illuminated.

EMISSIONS CONTROL (Continued)

CATALYST MONITOR

To comply with clean air regulations, vehicles are equipped with catalytic converters. These converters reduce the emission of hydrocarbons, oxides of nitrogen and carbon monoxide.

Normal vehicle miles or engine misfire can cause a catalyst to decay. A meltdown of the ceramic core can cause a reduction of the exhaust passage. This can increase vehicle emissions and deteriorate engine performance, driveability and fuel economy.

The catalyst monitor uses dual oxygen sensors (O2S's) to monitor the efficiency of the converter. The dual O2S's strategy is based on the fact that as a catalyst deteriorates, its oxygen storage capacity and its efficiency are both reduced. By monitoring the oxygen storage capacity of a catalyst, its efficiency can be indirectly calculated. The upstream O2S is used to detect the amount of oxygen in the exhaust gas before the gas enters the catalytic converter. The PCM calculates the A/F mixture from the output of the O2S. A low voltage indicates high oxygen content (lean mixture). A high voltage indicates a low content of oxygen (rich mixture).

When the upstream O2S detects a lean condition, there is an abundance of oxygen in the exhaust gas. A functioning converter would store this oxygen so it can use it for the oxidation of HC and CO. As the converter absorbs the oxygen, there will be a lack of oxygen downstream of the converter. The output of the downstream O2S will indicate limited activity in this condition.

As the converter loses the ability to store oxygen, the condition can be detected from the behavior of the downstream O2S. When the efficiency drops, no chemical reaction takes place. This means the concentration of oxygen will be the same downstream as upstream. The output voltage of the downstream O2S copies the voltage of the upstream sensor. The only difference is a time lag (seen by the PCM) between the switching of the O2S's.

To monitor the system, the number of lean-to-rich switches of upstream and downstream O2S's is counted. The ratio of downstream switches to upstream switches is used to determine whether the catalyst is operating properly. An effective catalyst will have fewer downstream switches than it has upstream switches i.e., a ratio closer to zero. For a totally ineffective catalyst, this ratio will be one-to-one, indicating that no oxidation occurs in the device.

The system must be monitored so that when catalyst efficiency deteriorates and exhaust emissions increase to over the legal limit, the MIL (Check Engine lamp) will be illuminated.

NATURAL VACUUM LEAK DETECTION (NVLD) (if equipped)

The Natural Vacuum Leak Detection (NVLD) system is the next generation evaporative leak detection system that will first be used on vehicles equipped with the Next Generation Controller (NGC). This new system replaces the leak detection pump as the method of evaporative system leak detection. This is to detect a leak equivalent to a 0.020″ (0.5 mm) hole. This system has the capability to detect holes of this size very dependably.

The basic leak detection theory employed with NVLD is the ″Gas Law″. This is to say that the pressure in a sealed vessel will change if the temperature of the gas in the vessel changes. The vessel will only see this effect if it is indeed sealed. Even small leaks will allow the pressure in the vessel to come to equilibrium with the ambient pressure. In addition to the detection of very small leaks, this system has the capability of detecting medium as well as large evaporative system leaks.

The NVLD seals the canister vent during engine off conditions. If the EVAP system has a leak of less than the failure threshold, the evaporative system will be pulled into a vacuum, either due to the cool down from operating temperature or diurnal ambient temperature cycling. The diurnal effect is considered one of the primary contributors to the leak determination by this diagnostic. When the vacuum in the system exceeds about 1″ H2O (0.25 KPA), a vacuum switch closes. The switch closure sends a signal to the NGC. The NGC, via appropriate logic strategies (described below), utilizes the switch signal, or lack thereof, to make a determination of whether a leak is present.

The NVLD device is designed with a normally open vacuum switch, a normally closed solenoid, and a seal, which is actuated by both the solenoid and a diaphragm. The NVLD is located on the atmospheric vent side of the canister. The NVLD assembly may be mounted on top of the canister outlet, or in-line between the canister and atmospheric vent filter. The normally open vacuum switch will close with about 1″ H2O (0.25 KPA) vacuum in the evaporative system. The diaphragm actuates the switch. This is above the opening point of the fuel inlet check valve in the fill tube so cap off leaks can be detected. Submerged fill systems must have recirculation lines that do not have the in-line normally closed check valve that protects the system from failed nozzle liquid ingestion, in order to detect cap off conditions.

The normally closed valve in the NVLD is intended to maintain the seal on the evaporative system during the engine off condition. If vacuum in the evaporative system exceeds 3″ to 6″ H2O (0.75 to 1.5 KPA), the valve will be pulled off the seat, opening the seal. This will protect the system from excessive vacuum

EMISSIONS CONTROL (Continued)

as well as allowing sufficient purge flow in the event that the solenoid was to become inoperative.

The solenoid actuates the valve to unseal the canister vent while the engine is running. It also will be used to close the vent during the medium and large leak tests and during the purge flow check. This solenoid requires initial 1.5 amps of current to pull the valve open but after 100 ms. will be duty cycled down to an average of about 150 mA for the remainder of the drive cycle.

Another feature in the device is a diaphragm that will open the seal in the NVLD with pressure in the evaporative system. The device will ″blow off″ at about 0.5″ H2O (0.12 KPA) pressure to permit the venting of vapors during refueling. An added benefit to this is that it will also allow the tank to ″breathe″ during increasing temperatures, thus limiting the pressure in the tank to this low level. This is beneficial because the induced vacuum during a subsequent declining temperature will achieve the switch closed (pass threshold) sooner than if the tank had to decay from a built up pressure.

The device itself has 3 wires: Switch sense, solenoid driver and ground. It also includes a resistor to protect the switch from a short to battery or a short to ground. The NGC utilizes a high-side driver to energize and duty-cycle the solenoid.

DESCRIPTION - HIGH AND LOW LIMITS

The PCM compares input signal voltages from each input device with established high and low limits for the device. If the input voltage is not within limits and other criteria are met, the PCM stores a diagnostic trouble code in memory. Other diagnostic trouble code criteria might include engine RPM limits or input voltages from other sensors or switches that must be present before verifying a diagnostic trouble code condition.

OPERATION

OPERATION - SYSTEM

The Powertrain Control Module (PCM) monitors many different circuits in the fuel injection, ignition, emission and engine systems. If the PCM senses a problem with a monitored circuit often enough to indicate an actual problem, it stores a Diagnostic Trouble Code (DTC) in the PCM's memory. If the code applies to a non-emissions related component or system, and the problem is repaired or ceases to exist, the PCM cancels the code after 40 warmup cycles. Diagnostic trouble codes that affect vehicle emissions illuminate the Malfunction Indicator Lamp (MIL). Refer to Malfunction Indicator Lamp in this section.

Certain criteria must be met before the PCM stores a DTC in memory. The criteria may be a specific range of engine RPM, engine temperature, and/or input voltage to the PCM.

The PCM might not store a DTC for a monitored circuit even though a malfunction has occurred. This may happen because one of the DTC criteria for the circuit has not been met. **For example** , assume the diagnostic trouble code criteria requires the PCM to monitor the circuit only when the engine operates between 750 and 2000 RPM. Suppose the sensor's output circuit shorts to ground when engine operates above 2400 RPM (resulting in 0 volt input to the PCM). Because the condition happens at an engine speed above the maximum threshold (2000 rpm), the PCM will not store a DTC.

There are several operating conditions for which the PCM monitors and sets DTC's. Refer to Monitored Systems, Components, and Non-Monitored Circuits in this section.

NOTE: Various diagnostic procedures may actually cause a diagnostic monitor to set a DTC. For instance, pulling a spark plug wire to perform a spark test may set the misfire code. When a repair is completed and verified, use the DRBIII® scan tool to erase all DTC's and extinguish the MIL.

Technicians can display stored DTC's. For obtaining the DTC information, use the Data Link Connector with the DRBIII® scan tool (Fig. 1).

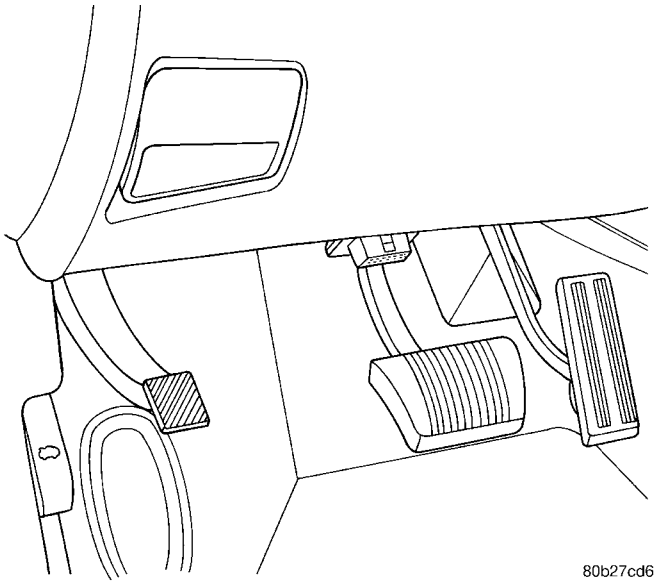

Fig. 1 Data Link Connector

EMISSIONS CONTROL (Continued)

DRB III® STATE DISPLAY TEST MODE

OPERATION

The switch inputs to the Powertrain Control Module (PCM) have two recognized states; HIGH and LOW. For this reason, the PCM cannot recognize the difference between a selected switch position versus an open circuit, a short circuit, or a defective switch. If the State Display screen shows the change from HIGH to LOW or LOW to HIGH, assume the entire switch circuit to the PCM functions properly. From the state display screen, access either State Display Inputs and Outputs or State Display Sensors.

EVAPORATIVE EMISSIONS

OPERATION - EVAPORATION CONTROL SYSTEM

The evaporation control system prevents the emission of fuel tank vapors into the atmosphere. When fuel evaporates in the fuel tank, the vapors pass through vent hoses or tubes to an activated carbon filled evaporative canister. The canister temporarily holds the vapors. The Powertrain Control Module (PCM) allows intake manifold vacuum to draw vapors into the combustion chambers during certain operating conditions (Fig. 1).

All engines use a proportional purge solenoid system. The PCM controls vapor flow by operating the purge solenoid. Refer to Proportional Purge Solenoid in this section.

NOTE: The evaporative system uses specially manufactured hoses. If they need replacement, only use fuel resistant hose. Also the hoses must be able to pass an Ozone compliance test.

NOTE: For more information on Onboard Refueling Vapor Recovery (ORVR), refer to the Fuel Delivery section.

EVAP/PURGE SOLENOID

DESCRIPTION

OPERATION

All vehicles use a proportional purge solenoid (Fig. 2). The solenoid regulates the rate of vapor flow from the EVAP canister to the throttle body. The PCM operates the solenoid.

During the cold start warm-up period and the hot start time delay, the PCM does not energize the solenoid. When de-energized, no vapors are purged.

The proportional purge solenoid operates at a frequency of 200 hz and is controlled by an engine controller circuit that senses the current being applied to the proportional purge solenoid and then adjusts that current to achieve the desired purge flow. The proportional purge solenoid controls the purge rate of fuel vapors from the vapor canister and fuel tank to the engine intake manifold.

REMOVAL

REMOVAL

(1) Remove the negative battery cable.
(2) Remove solenoid from bracket by pulling up on solenoid.
(3) Disconnect electrical connector from solenoid.
(4) Disconnect vacuum tubes from solenoid.

REMOVAL - 2.4L TURBO

(1) Disconnect the negative battery cable.
(2) Remove solenoid from mounting bracket by pressing tab and pulling of the solenoid from bracket (Fig. 3).
(3) Unlock and disconnect the electrical connector from the purge solenoid (Fig. 4).
(4) Remove the 2 vacuum lines (Fig. 4).
(5) Remove solenoid.

INSTALLATION

INSTALLATION

The top of the solenoid has TOP printed on it. The solenoid will not operate unless it is installed correctly.

(1) Connect vacuum tube to solenoid.
(2) Connect electrical connector to solenoid.
(3) Install solenoid on bracket.
(4) Install the negative battery cable.

INSTALLATION - 2.4L TURBO

(1) Install the 2 vacuum lines (Fig. 4).
(2) Connect and lock the electrical connector to the purge solenoid (Fig. 4).
(3) Install solenoid to the mounting bracket (Fig. 3).
(4) Connect the negative battery cable.

FUEL FILLER CAP

DESCRIPTION

The plastic fuel fill cap is threaded/quarter turn onto the end of the fuel filler tube. It's purpose is to retain vapors and fuel in the fuel tank.

OPERATION

The fuel filler cap incorporates a two-way relief valve that is closed to atmosphere during normal operating conditions. The relief valve is calibrated to open when a pressure of 17 kPa (2.5 psi) or vacuum of 2 kPa (0.6 in. Hg) occurs in the fuel tank. When the pressure or vacuum is relieved, the valve returns to the normally closed position.

CAUTION: Remove the fuel filler cap to release fuel tank pressure before disconnecting any fuel system component.

(2) Remove the air cleaner lid, disconnect the inlet air temperature sensor and makeup air hose.

(3) Remove the negative battery cable.

(4) Raise vehicle and support.

(5) Drain fuel tank, refer to Draining Fuel Tank in the Fuel Delivery section.

(6) Remove fuel tank and EVAP system (Fig. 6), refer to the Fuel Tank removal/installation section in the Fuel Delivery section (Fig. 5).

(7) Remove hoses from NVLD assembly.

(8) Remove the bolts from the NVLD Assembly.

INSTALLATION

(1) Install NVLD assembly to the bracket.

(2) Install assembly to the fuel tank.

(3) Install hoses and lines.

(4) Install the fuel tank and EVAP system, refer to the Fuel Tank removal/installation section in the Fuel Delivery section.

(5) Lower vehicle.

(6) Install the negative battery cable.

(7) Install the air cleaner lid, connect the inlet air temperature sensor and makeup air hose.

(8) Fill fuel tank. Use the DRBIII® scan tool to pressurize the fuel system. Check for leaks.

ORVR

DESCRIPTION

Onboard Refueling Vapor Recovery (ORVR) System Schematic and components (Fig. 7).

OPERATION

The emission control principle used in the ORVR system is that the fuel flowing into the filler tube (approx. 1” I.D.) creates an aspiration effect which draws air into the fill tube. During refueling, the fuel tank is vented to the vapor canister to capture escaping vapors. With air flowing into the filler tube, there are no fuel vapors escaping to the atmosphere. Once the refueling vapors are captured by the canister, the vehicle’s computer controlled purge system draws vapor out of the canister for the engine to burn. The vapors flow is metered by the purge solenoid so that there is no or minimal impact on driveability or tailpipe emissions.

As fuel starts to flow through the fill tube, it opens the normally closed check valve and enters the fuel tank. Vapor or air is expelled from the tank through the control valve to the vapor canister. Vapor is absorbed in the canister until vapor flow in the lines stops, either following shut-off or by having the fuel level in the tank rise high enough to close the control valve. The control valve contains a float that rises to seal the large diameter vent path to the canister. At this point in the fueling of the vehicle, the tank pressure increase, the check valve closes (preventing tank fuel from spiting back at the operator), and fuel then

ORVR (Continued)

rises up the filler tube to shut-off the dispensing nozzle.

If the engine is shut-off while the On-Board diagnostics test is running, low level tank pressure can be trapped in the fuel tank and fuel can not be added to the tank until the pressure is relieved. This is due to the leak detection pump closing the vapor outlet from the top of the tank and the one-way check valve not allowing the tank to vent through the fill tube to atmosphere. Therefore, when fuel is added, it will back-up in the fill tube and shut off the dispensing nozzle. The pressure can be eliminated in two ways: 1. Vehicle purge must be activated and for a long enough period to eliminate the pressure. 2. Removing the fuel cap and allowing enough time for the system to vent thru the recirulation tube.

DIAGNOSIS AND TESTING - VEHICLE DOES NOT FILL

CONDITION	POSSIBLE CAUSES	CORRECTION
Pre-Mature Nozzle Shut-Off	Defective fuel tank assembly components.	Fill tube improperly installed (sump) Fill tube hose pinched. Check valve stuck shut. Control valve stuck shut.
	Defective vapor/vent components.	Vent line from control valve to canister pinched. Vent line from canister to vent filter pinched. Canister vent valve failure (requires double failure, plugged to NVLD and atmosphere). Leak detection pump failed closed. Leak detection pump filter plugged.
	On-Board diagnostics evaporative system leak test just conducted.	Canister vent valve vent plugged to atmosphere. Engine still running when attempting to fill (System designed not to fill).
	Defective fill nozzle.	Try another nozzle.
Fuel Spits Out Of Filler Tube.	During fill.	See Pre-Mature Shut-Off.
	At conclusion of fill.	Defective fuel handling component. (Check valve stuck open).
		Defective vapor/vent handling component.
		Defective fill nozzle.

PCV VALVE

DESCRIPTION

It threads into the valve cover (Fig. 8).

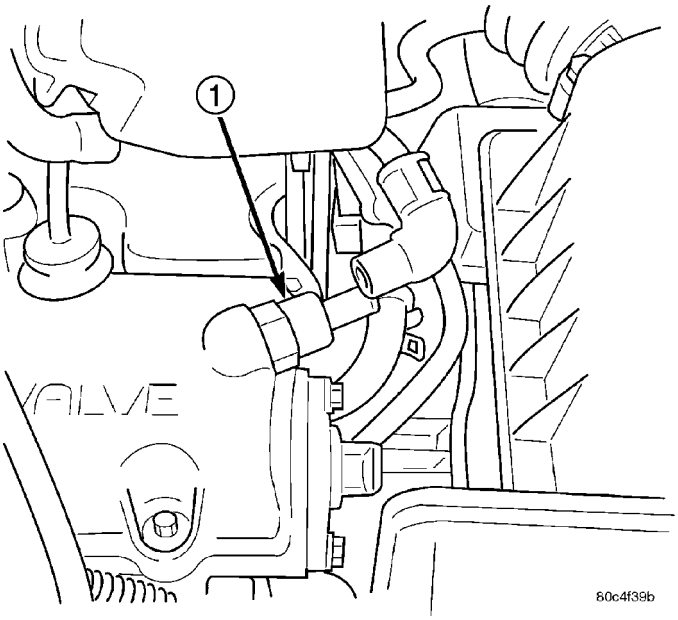

Fig. 8 PCV System—2.4L

1 - PCV VALVE

OPERATION

When the engine is not operating or during an engine backfire, the spring forces the plunger back against the seat. This prevents vapors from flowing through the valve (Fig. 9).

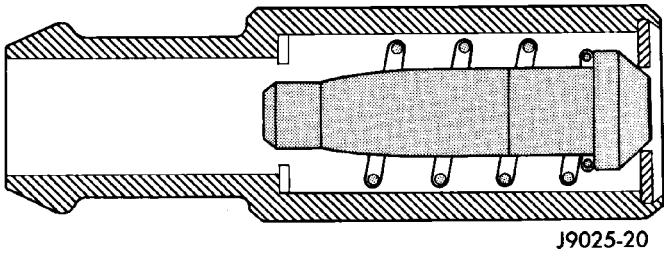

Fig. 9 Engine Off or Engine Backfire No Vapor Flow

When the engine is at idle or cruising, high manifold vacuum is present. At these times manifold vacuum is able to completely compress the spring and pull the plunger to the top of the valve (Fig. 10). In this position there is minimal vapor flow through the valve.

During periods of moderate intake manifold vacuum the plunger is only pulled part way back from the inlet. This results in maximum vapor flow through the valve (Fig. 11).

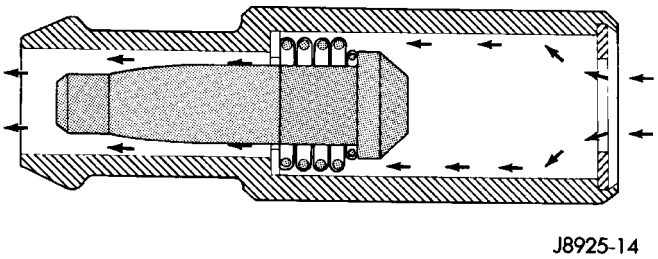

Fig. 10 High Intake Manifold Vacuum Minimal Vapor Flow

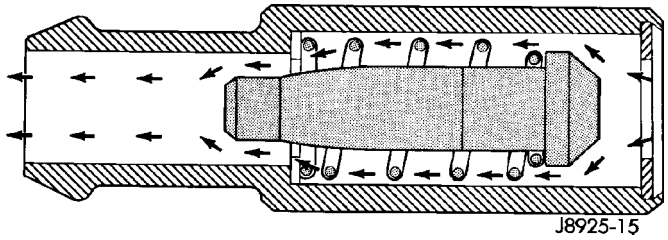

Fig. 11 Moderate Intake Manifold Vacuum Maximum Vapor Flow

DIAGNOSIS AND TESTING - PCV SYSTEM

WARNING: APPLY PARKING BRAKE AND/OR BLOCK WHEELS BEFORE PERFORMING ANY TEST OR ADJUSTMENT WITH THE ENGINE OPERATING.

(1) With engine idling, remove the hose from the PCV valve. If the valve is not plugged, a hissing noise will be heard as air passes through the valve. A strong vacuum should also be felt when a finger is placed over the valve inlet.

(2) Install hose on PCV valve. Remove the make-up air hose from the air plenum at the rear of the engine. Hold a piece of stiff paper (parts tag) loosely over the end of the make-up air hose.

(3) After allowing approximately one minute for crankcase pressure to reduce, the paper should draw up against the hose with noticeable force. If the engine does not draw the paper against the grommet after installing a new valve, replace the PCV valve hose.

(4) Turn the engine off. Remove the PCV valve from intake manifold. The valve should rattle when shaken.

(5) Replace the PCV valve and retest the system if it does not operate as described in the preceding tests. **Do not attempt to clean the old PCV valve.** If the valve rattles, apply a light coating of Loctite® Pipe Sealant With Teflon to the threads. Thread the PCV valve into the manifold plenum and tighten to 7 N·m (60 in. lbs.) torque.

PCV VALVE (Continued)

REMOVAL - 1.6L

(1) Remove the bolt for the PCV valve (Fig. 12).

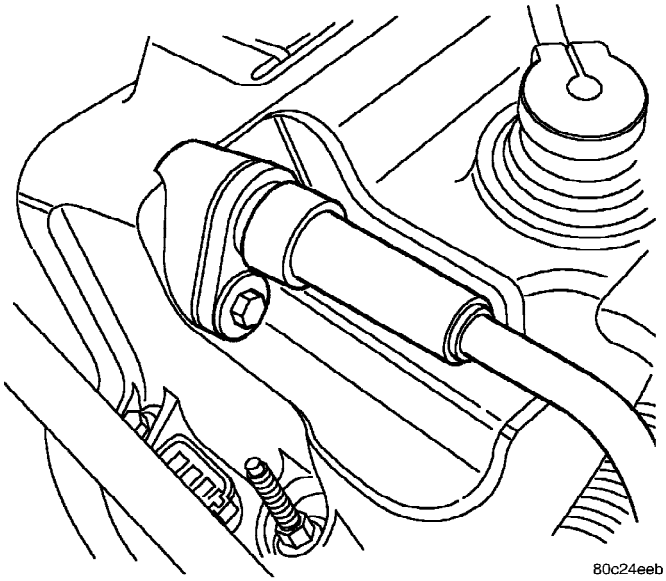

Fig. 12 PCV VALVE LOCATION - 1.6L

(2) Remove the hose.
(3) Remove the PCV (Fig. 13).

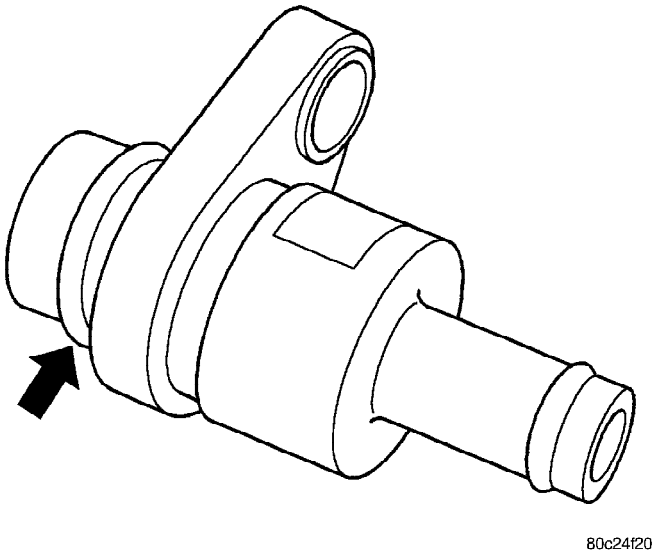

Fig. 13 PCV VALVE - 1.6L

INSTALLATION - 1.6L

(1) Lubericate the O-ring on the valve (Fig. 13).
(2) Install the PCV Valve (Fig. 12) and tighen the bolt to 8.1 N·m (72 in. lbs.).
(3) Install the hose.

VAPOR CANISTER

DESCRIPTION

The canister mounts to a bracket on top of the fuel tank in the rear of the vehicle (Fig. 14). The vacuum and vapor tube connect to the top of the canister.

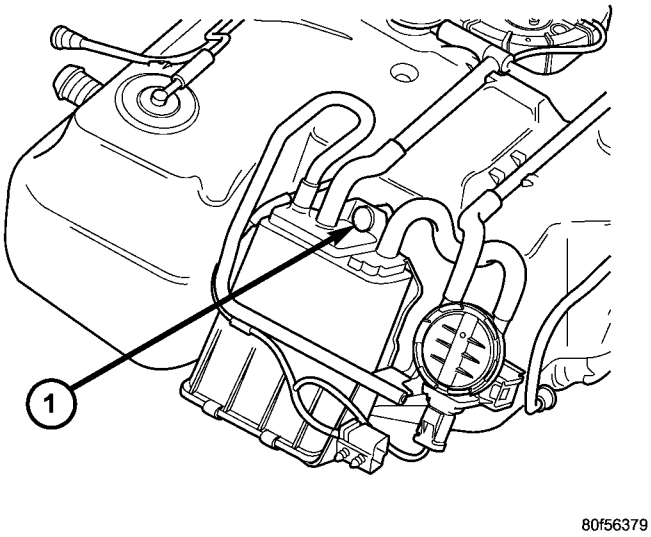

Fig. 14 EVAP Canister

1 - PUSH PIN

OPERATION

All vehicles use a maintenance free, evaporative (EVAP) canister. Fuel tank vapors vent into the canister. The canister temporarily holds the fuel vapors until intake manifold vacuum draws them into the combustion chamber. The Powertrain Control Module (PCM) purges the canister through the proportional purge solenoid. The PCM purges the canister at predetermined intervals and engine conditions.

Purge Free Cells

Purge-free memory cells are used to identify the fuel vapor content of the evaporative canister. Since the evaporative canister is not purged 100% of the time, the PCM stores information about the evaporative canister's vapor content in a memory cell.

The purge-free cells are constructed similar to certain purge-normal cells. The purge-free cells can be monitored by the DRB III® Scan Tool. The only difference between the purge-free cells and normal adaptive cells is that in purge-free, the purge is completely turned off. This gives the PCM the ability to compare purge and purge-free operation.

VAPOR CANISTER (Continued)

REMOVAL

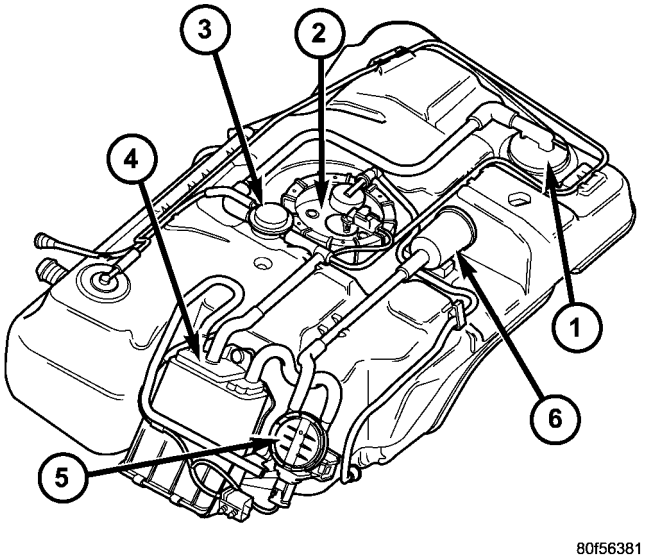

Fig. 15 Fuel Tank Assembly

1 - CONTROL VALVE
2 - FUEL PUMP
3 - FLOW MANAGEMENT VALVE
4 - EVAP CANISTOR
5 - NATURAL VACUUM LEAK DETECTION VALVE
6 - FILTER

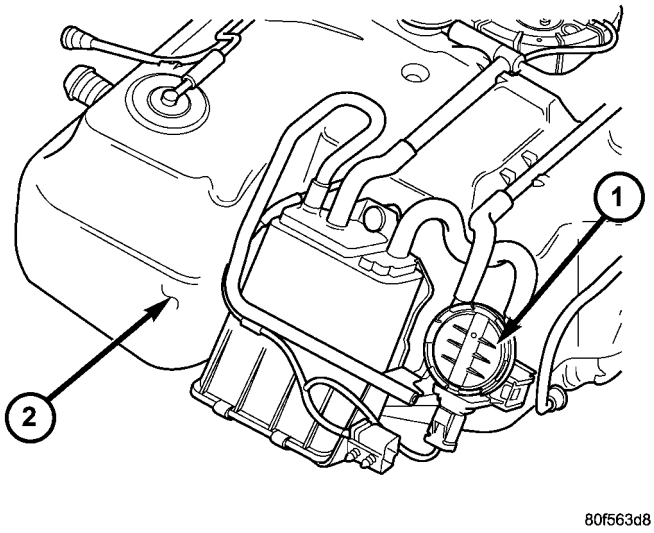

Fig. 16 EVAP System

1 - NVLD
2 - FUEL TANK

(1) Release fuel pressure, Refer to Fuel System Pressure Release Procedure in the Fuel Delivery section.

(2) Remove the air cleaner lid, disconnect the inlet air temperature sensor and makeup air hose.

(3) Remove the negative battery cable.

(4) Raise vehicle and support.

(5) Drain fuel tank, refer to Draining Fuel Tank in the Fuel Delivery section.

(6) Remove fuel tank and EVAP system, refer to the Fuel Tank removal/installation section in the Fuel Delivery section (Fig. 15).

(7) Remove the push pin (Fig. 17).

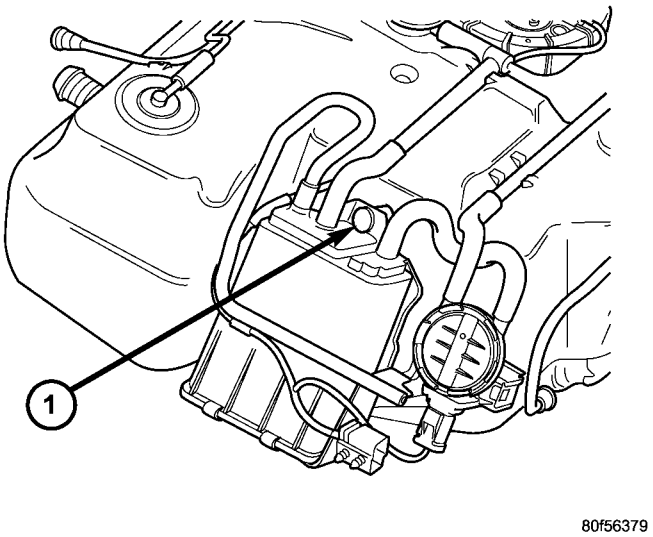

Fig. 17 EVAP Canister

1 - PUSH PIN

(8) Remove hoses from EVAP canister (Fig. 16).

(9) Spread spring clips (Fig. 18) on the side of EVAP canister and tip canister out and away from bracket tabs (Fig. 19).

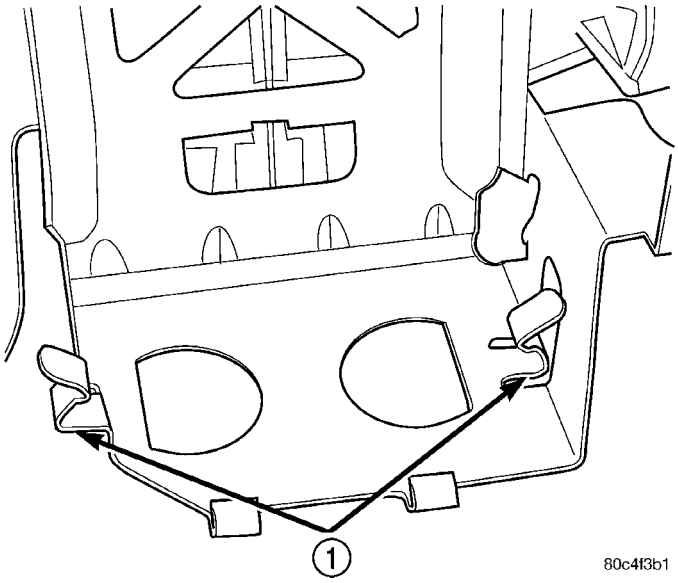

Fig. 18 Spring Clips

1 - SPRING CLIPS

VAPOR CANISTER (Continued)

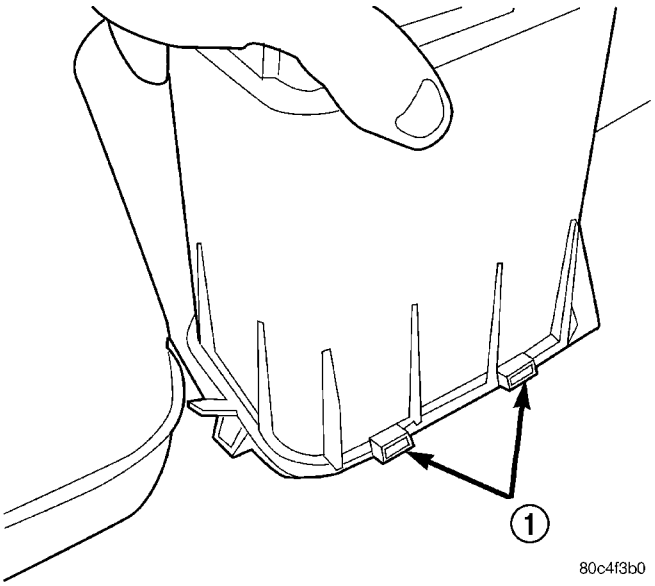

Fig. 19 Bracket Tabs

1 - TABS

INSTALLATION

(1) Install EVAP canister over bracket tabs (Fig. 19).

(2) Push canister back and into the bracket until the spring clips snap over the edge of the canister (Fig. 18).

(3) Install the push pin through the EVAP canister and the bracket and into the fuel tank (Fig. 17).

(4) Install hoses and lines.

(5) Install the fuel tank and EVAP system, refer to the Fuel Tank removal/installation section in the Fuel Delivery section.

(6) Lower vehicle.

(7) Install the negative battery cable.

(8) Install the air cleaner lid, connect the inlet air temperature sensor and makeup air hose.

(9) Fill fuel tank. Use the DRBIII® scan tool to pressurize the fuel system. Check for leaks.

ON-BOARD DIAGNOSTICS

TASK MANAGER
DESCRIPTION 21
OPERATION 21

TASK MANAGER

DESCRIPTION

The PCM is responsible for efficiently coordinating the operation of all the emissions-related components. The PCM is also responsible for determining if the diagnostic systems are operating properly. The software designed to carry out these responsibilities is call the “Task Manager”.

OPERATION

The Task Manager determines when tests happen and when functions occur. Many of the diagnostic steps required by OBD II must be performed under specific operating conditions. The Task Manager software organizes and prioritizes the diagnostic procedures. The job of the Task Manager is to determine if conditions are appropriate for tests to be run, monitor the parameters for a trip for each test, and record the results of the test. Following are the responsibilities of the Task Manager software:

- Test Sequence
- MIL Illumination
- Diagnostic Trouble Codes (DTCs)
- Trip Indicator
- Freeze Frame Data Storage
- Similar Conditions Window

Test Sequence

In many instances, emissions systems must fail diagnostic tests more than once before the PCM illuminates the MIL. These tests are known as ’two trip monitors.’ Other tests that turn the MIL lamp on after a single failure are known as ’one trip monitors.’ A trip is defined as ’start the vehicle and operate it to meet the criteria necessary to run the given monitor.’

Many of the diagnostic tests must be performed under certain operating conditions. However, there are times when tests cannot be run because another test is in progress (conflict), another test has failed (pending) or the Task Manager has set a fault that may cause a failure of the test (suspend).

- **Pending**

Under some situations the Task Manager will not run a monitor if the MIL is illuminated and a fault is stored from another monitor. In these situations, the Task Manager postpones monitors **pending** resolution of the original fault. The Task Manager does not run the test until the problem is remedied.

For example, when the MIL is illuminated for an Oxygen Sensor fault, the Task Manager does not run the Catalyst Monitor until the Oxygen Sensor fault is remedied. Since the Catalyst Monitor is based on signals from the Oxygen Sensor, running the test would produce inaccurate results.

- **Conflict**

There are situations when the Task Manager does not run a test if another monitor is in progress. In these situations, the effects of another monitor running could result in an erroneous failure. If this **conflict** is present, the monitor is not run until the conflicting condition passes. Most likely the monitor will run later after the conflicting monitor has passed.

For example, if the Fuel System Monitor is in progress, the Task Manager does not run the catalyst Monitor. Since both tests monitor changes in air/fuel ratio and adaptive fuel compensation, the monitors will conflict with each other.

- **Suspend**

Occasionally the Task Manager may not allow a two trip fault to mature. The Task Manager will **suspend** the maturing of a fault if a condition exists that may induce an erroneous failure. This prevents illuminating the MIL for the wrong fault and allows more precise diagnosis.

For example, if the PCM is storing a one trip fault for the Oxygen Sensor and the catalyst monitor, the Task Manager may still run the catalyst Monitor but will suspend the results until the Oxygen Sensor Monitor either passes or fails. At that point the Task Manager can determine if the catalyst system is actually failing or if an Oxygen Sensor is failing.

TASK MANAGER (Continued)

MIL Illumination

The PCM Task Manager carries out the illumination of the MIL. The Task Manager triggers MIL illumination upon test failure, depending on monitor failure criteria.

The Task Manager Screen shows both a Requested MIL state and an Actual MIL state. When the MIL is illuminated upon completion of a test for a good trip, the Requested MIL state changes to OFF. However, the MIL remains illuminated until the next key cycle. (On some vehicles, the MIL will actually turn OFF during the thirdgood trip) During the key cycle for the third good trip, the Requested MIL state is OFF, while the Actual MIL state is ON. After the next key cycle, the MIL is not illuminated and both MIL states read OFF.

Diagnostic Trouble Codes (DTCs)

With OBD II, different DTC faults have different priorities according to regulations. As a result, the priorities determine MIL illumination and DTC erasure. DTCs are entered according to individual priority. DTCs with a higher priority overwrite lower priority DTCs.

Priorities

- Priority 0 —Non-emissions related trouble codes.
- Priority 1 — One trip failure of a two trip fault for non-fuel system and non-misfire. (MIL Off)
- Priority 2 — One trip failure of a two trip fault for fuel system (rich/lean) or misfire. (MIL Off)
- Priority 3 — Two trip failure for a non-fuel system and non-misfire or matured one trip comprehensive component fault. (MIL On)
- Priority 4 — Two trip failure or matured fault for fuel system (rich/lean) and misfire or one trip catalyst damaging misfire. Catalyst damage misfire is a 2 trip MIL. The MIL flashes on the first trip when catalyst damage misfire levels are present. (MIL On)

Non-emissions related failures have no priority. One trip failures of two trip faults have low priority. Two trip failures or matured faults have higher priority. One and two trip failures of fuel system and misfire monitor take precedence over non-fuel system and non-misfire failures.

DTC Self Erasure

With one trip components or systems, the MIL is illuminated upon test failure and DTCs are stored.

Two trip monitors are components requiring failure in two consecutive trips for MIL illumination. Upon failure of the first test, the Task Manager enters a maturing code. If the component fails the test for a second time the code matures and a DTC is set.

After three good trips the MIL is extinguished and the Task Manager automatically switches the trip counter to a warm-up cycle counter. DTCs are automatically erased following 40 warm-up cycles if the component does not fail again.

For misfire and fuel system monitors, the component must pass the test under a Similar Conditions Window in order to record a good trip. A Similar Conditions Window is when engine RPM is within ±375 RPM and load is within ±20% of when the fault occurred.

NOTE: It is important to understand that a component does not have to fail under a similar window of operation to mature. It must pass the test under a Similar Conditions Window when it failed to record a Good Trip for DTC erasure for misfire and fuel system monitors.

DTCs can be erased anytime with a DRBIII®. Erasing the DTC with the DRBIII® erases all OBD II information. The DRBIII® automatically displays a warning that erasing the DTC will also erase all OBD II monitor data. This includes all counter information for warm-up cycles, trips and Freeze Frame.

Trip Indicator

The **Trip** is essential for running monitors and extinguishing the MIL. In OBD II terms, a trip is a set of vehicle operating conditions that must be met for a specific monitor to run. All trips begin with a key cycle.

Good Trip

The Good Trip counters are as follows:

- Global Good Trip
- Fuel System Good Trip
- Misfire Good Trip
- Alternate Good Trip (appears as a Global Good Trip on DRBIII®)
  - Comprehensive Components
  - Major Monitor
- Warm-Up Cycles

Global Good Trip

To increment a Global Good Trip, the Oxygen sensor and Catalyst efficiency monitors must have run and passed, and 2 minutes of engine run time.

Fuel System Good Trip

To count a good trip (three required) and turn off the MIL, the following conditions must occur:

- Engine in closed loop
- Operating in Similar Conditions Window
- Short Term multiplied by Long Term less than threshold
- Less than threshold for a predetermined time

If all of the previous criteria are met, the PCM will count a good trip (three required) and turn off the MIL.

TASK MANAGER (Continued)

Misfire Good Trip

If the following conditions are met the PCM will count one good trip (three required) in order to turn off the MIL:

- Operating in Similar Condition Window
- 1000 engine revolutions with no misfire

Alternate Good Trip

Alternate Good Trips are used in place of Global Good Trips for Comprehensive Components and Major Monitors. If the Task Manager cannot run a Global Good Trip because a component fault is stopping the monitor from running, it will attempt to count an Alternate Good Trip.

The Task Manager counts an Alternate Good Trip for Comprehensive components when the following conditions are met:

- Two minutes of engine run time, idle or driving
- No other faults occur

The Task Manager counts an Alternate Good Trip for a Major Monitor when the monitor runs and passes. Only the Major Monitor that failed needs to pass to count an Alternate Good Trip.

Warm-Up Cycles

Once the MIL has been extinguished by the Good Trip Counter, the PCM automatically switches to a Warm-Up Cycle Counter that can be viewed on the DRBIII®. Warm-Up Cycles are used to erase DTCs and Freeze Frames. Forty Warm-Up cycles must occur in order for the PCM to self-erase a DTC and Freeze Frame. A Warm-Up Cycle is defined as follows:

- Engine coolant temperature must start below and rise above 160° F
- Engine coolant temperature must rise by 40° F
- No further faults occur

Freeze Frame Data Storage

Once a failure occurs, the Task Manager records several engine operating conditions and stores it in a Freeze Frame. The Freeze Frame is considered one frame of information taken by an on-board data recorder. When a fault occurs, the PCM stores the input data from various sensors so that technicians can determine under what vehicle operating conditions the failure occurred.

The data stored in Freeze Frame is usually recorded when a system fails the first time for two trip faults. Freeze Frame data will only be overwritten by a different fault with a higher priority.

CAUTION: Erasing DTCs, either with the DRBIII®; or by disconnecting the battery, also clears all Freeze Frame data.

Similar Conditions Window

The Similar Conditions Window displays information about engine operation during a monitor. Absolute MAP (engine load) and Engine RPM are stored in this window when a failure occurs. There are two different Similar conditions Windows: Fuel System and Misfire.

FUEL SYSTEM

- **Fuel System Similar Conditions Window** — An indicator that 'Absolute MAP When Fuel Sys Fail' and 'RPM When Fuel Sys Failed' are all in the same range when the failure occurred. Indicated by switching from 'NO' to 'YES'.
- **Absolute MAP When Fuel Sys Fail** — The stored MAP reading at the time of failure. Informs the user at what engine load the failure occurred.
- **Absolute MAP** — A live reading of engine load to aid the user in accessing the Similar Conditions Window.
- **RPM When Fuel Sys Fail** — The stored RPM reading at the time of failure. Informs the user at what engine RPM the failure occurred.
- **Engine RPM** — A live reading of engine RPM to aid the user in accessing the Similar Conditions Window.
- **Adaptive Memory Factor** — The PCM utilizes both Short Term Compensation and Long Term Adaptive to calculate the Adaptive Memory Factor for total fuel correction.
- **Upstream O2S Volts** — A live reading of the Oxygen Sensor to indicate its performance. For example, stuck lean, stuck rich, etc.
- **SCW Time in Window (Similar Conditions Window Time in Window)** — A timer used by the PCM that indicates that, after all Similar Conditions have been met, if there has been enough good engine running time in the SCW without failure detected. This timer is used to increment a Good Trip.
- **Fuel System Good Trip Counter** — A Trip Counter used to turn OFF the MIL for Fuel System DTCs. To increment a Fuel System Good Trip, the engine must be in the Similar Conditions Window, Adaptive Memory Factor must be less than calibrated threshold and the Adaptive Memory Factor must stay below that threshold for a calibrated amount of time.
- **Test Done This Trip** — Indicates that the monitor has already been run and completed during the current trip.

MISFIRE

- **Same Misfire Warm-Up State** — Indicates if the misfire occurred when the engine was warmed up (above 160° F).

TASK MANAGER (Continued)

- **In Similar Misfire Window** — An indicator that 'Absolute MAP When Misfire Occurred' and 'RPM When Misfire Occurred' are all in the same range when the failure occurred. Indicated by switching from 'NO' to 'YES'.
- **Absolute MAP When Misfire Occurred** — The stored MAP reading at the time of failure. Informs the user at what engine load the failure occurred.
- **Absolute MAP** — A live reading of engine load to aid the user in accessing the Similar Conditions Window.
- **RPM When Misfire Occurred** — The stored RPM reading at the time of failure. Informs the user at what engine RPM the failure occurred.
- **Engine RPM** — A live reading of engine RPM to aid the user in accessing the Similar Conditions Window.
- **Adaptive Memory Factor** — The PCM utilizes both Short Term Compensation and Long Term Adaptive to calculate the Adaptive Memory Factor for total fuel correction.
- **200 Rev Counter** — Counts 0–100 720 degree cycles.
- **SCW Cat 200 Rev Counter** — Counts when in similar conditions.
- **SCW FTP 1000 Rev Counter** — Counts 0–4 when in similar conditions.
- **Misfire Good Trip Counter** — Counts up to three to turn OFF the MIL.
