     Obtain a tire and wheel assembly and an additional 4 tires (without wheels) of the same size.
   - With the tire and wheel assembly on the bottom, stack the tires.
   - Securely tie all of the tires together.

tomsn048@gmail.com

2. Depower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

3. Remove the safety belt buckle or retractor. For additional information, refer to the appropriate procedure in Section 501-20A .
   - When deploying a safety belt buckle pretensioner, install a nut and bolt of sufficient length and of the same diameter as was used to retain it to the seat.

4. **NOTE:** If the safety belt buckle or retractor does not have a hard-wired pigtail, it will be necessary to cut the wires and connector(s) from the vehicle wire harness and reconnect to the safety belt buckle or retractor.

   Cut each of the safety belt buckle or retractor wires near the electrical connector that connects to the vehicle wire harness.

5. Remove any sheathing (if present) and strip the insulation from the ends of the cut wires.

6. Make a jumper harness to deploy the safety belt buckle or retractor.
   - Obtain 2 wires (20 gauge minimum) at least 9.14 m (30 ft) long and strip both ends of each wire.
   - At one end of the jumper harness, connect the wires together.

7. **NOTE:** Typical safety belt retractor pretensioner shown, other safety belt buckle pretensioners and load-limiting retractors similar.

   Using the end of the jumper harness that the wires are not connected together, attach each wire of the jumper harness to each wire of the safety belt buckle or retractor. Use tape or other insulating material to make sure that the leads do not make contact with each other.

8. **NOTE:** Make sure to maintain the connections to the safety belt buckle or retractor.

Tip the stack of tires on its side and place the safety belt buckle or retractor inside the center tire, making sure that there are 2 tires beneath the tire containing the safety belt buckle or retractor and 2 tires (including the tire and wheel assembly) above the tire containing the safety belt buckle or retractor.

9. Place the tire stack upright, with the wheel on top.

10. Remain at least 9.14 m (30 ft) away from the safety belt buckle or retractor.

11. From the end of the jumper harness that is not connected to the safety belt buckle or retractor, disconnect the 2 wires of the jumper harness from each other.

12. Deploy the safety belt buckle or retractor by touching the ends of the 2 wires of the jumper harness to the terminals of a 12-volt battery.

13. To allow for cooling, wait at least 10 minutes before approaching the deployed safety belt buckle or retractor.

14. Dispose of the deployed safety belt buckle or retractor in the same manner as any other part to be scrapped.

Safety Belt Buckle Pretensioners, Safety Belt Retractor Pretensioners and Load Limiting Safety Belt Retractors - In-Vehicle Deployment

⚠ WARNING: Never disassemble or tamper with safety belt buckle/retractor pretensioners, adaptive load limiting retractors, safety belt inflators, or probe the electrical connectors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners, adaptive load limiting retractors, or safety belt inflators, which increases the risk of serious personal injury or death.

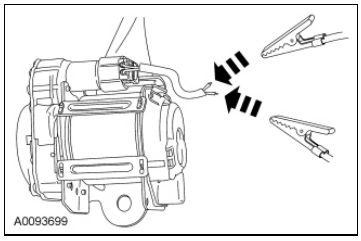
⚠ WARNING: Deploy all supplemental restraint system (SRS) devices (air bags, pretensioners, load limiters, etc.) outdoors with all personnel at least 9.14 meters (30 feet) away to make sure of personal safety. Due to the loud report which occurs when an SRS device is deployed, hearing protection is required. Failure to follow these instructions may result in serious personal injury.

NOTE: A typical safety belt buckle and retractor disposal is shown that is similar for all vehicles.

1. Depower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

tomsn048@gmail.com

2. Access the safety belt buckle or retractor electrical connectors. For additional information, refer to Section 501-20A .



3. Cut each of the safety belt buckle or retractor wires, leaving at least 101.6 mm (4 in) to work with.

4. Remove any sheathing (if present) and strip the insulation from the ends of the cut wires.

5. Make a jumper harness to deploy the safety belt buckle or retractor.
   - Obtain 2 wires (20 gauge minimum) at least 9.14 m (30 ft) long and strip both ends of each wire.
   - At one end of the jumper harness, connect the wires together.

6. **NOTE:** Typical safety belt retractor pretensioner shown, other safety belt buckle pretensioners and load-limiting retractors are similar.

   Using the end of the jumper harness that the wires are not connected together, attach each wire of the jumper harness to each wire of the safety belt buckle or retractor. Use tape or other insulating material to make sure that the leads do not make contact with each other.

7. Remain at least 9.14 m (30 ft) away from the safety belt buckle or retractor.

8. From the end of the jumper harness that is not connected to the safety belt buckle or retractor, disconnect the 2 wires of the jumper harness from each other.

9. Deploy the safety belt buckle or retractor by touching the ends of the 2 wires of the jumper harness to the terminals of a 12-volt battery.

10. To allow for cooling, wait at least 10 minutes before approaching the deployed safety belt buckle or retractor.

11. Dispose of the deployed safety belt buckle or retractor in the same manner as any other part to be scrapped.

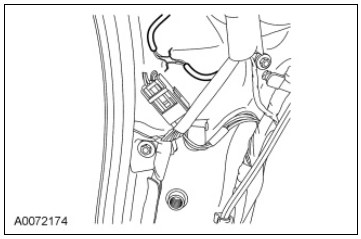
Safety Canopy® Modules and Side Air Curtain Modules - In-Vehicle Deployment

⚠ WARNING: Deploy all supplemental restraint system (SRS) devices (air bags, pretensioners, load limiters, etc.) outdoors with all personnel at least 9.14 meters (30 feet) away to make sure of personal safety. Due to the loud report which occurs when an SRS device is deployed, hearing protection is required. Failure to follow these instructions may result in serious personal injury.

NOTE: The Safety Canopy® module deployment for a scrapped vehicle will occur in its installed position in the vehicle.

NOTE: A typical Safety Canopy® module disposal is shown that is similar for all vehicles.

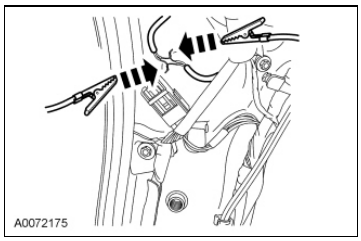
1. Depower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.



2. Access the Safety Canopy®/side air curtain module electrical connectors. For additional information, refer to the appropriate procedure in this section.

3. Cut each of the Safety Canopy®/side air curtain module wires leaving at least 101.6 mm (4 in) to work with.

4. Remove any sheathing (if present) and strip the insulation from the ends of the cut wires.



5. **NOTE:** Typical Safety Canopy®/side air curtain module with 2 loops shown, other Safety Canopy®/side air curtain modules with 2 loops are similar.

   For Safety Canopy®/side air curtain modules with multiple loops, twist together a wire from each loop then repeat for the remaining wires from each loop.

6. Make a jumper harness to deploy the Safety Canopy®/side air curtain module.
   - Obtain 2 wires (20 gauge minimum) at least 9.14 m (30 ft) long and strip both ends of each wire.
   - At one end of the jumper harness, connect the wires together.

7. Using the end of the jumper harness where the wires are not connected together, attach each wire of the jumper harness to each wire of the Safety Canopy®/side air curtain module or to the twisted-together wires if multiple loops. Use tape or other insulating material to make sure that the leads do not make contact with each other.

8. From the end of the jumper harness that is not connected to the Safety Canopy®/side air curtain module, disconnect the 2 wires of the jumper harness from each other.

9. Deploy the Safety Canopy®/side air curtain module by touching the ends of the 2 wires of the jumper harness to the terminals of a 12-volt battery.

10. To allow for cooling, wait at least 10 minutes before approaching the deployed Safety Canopy®/side air curtain module.

11. Dispose of the deployed Safety Canopy®/side air curtain module in the same manner as any other part to be scrapped.

tomsn048@gmail.com

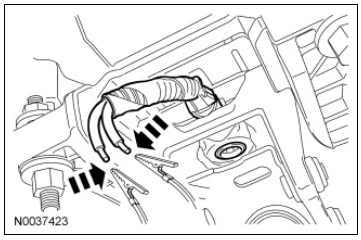
Deployable Steering Column - In-Vehicle Deployment

⚠ WARNING: Deploy all supplemental restraint system (SRS) devices (air bags, pretensioners, load limiters, etc.) outdoors with all personnel at least 9.14 meters (30 feet) away to make sure of personal safety. Due to the loud report which occurs when an SRS device is deployed, hearing protection is required. Failure to follow these instructions may result in serious personal injury.

1. Depower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

2. **NOTE:** It may be necessary to lower or remove the deployable steering column from the instrument panel to access the deployable steering column electrical connector.

   Access the deployable steering column electrical connector.



3. **NOTE:** If the deployable steering column does not have a hard-wired pigtail, it will be necessary to cut the wires and connector(s) from the vehicle wire harness and reconnect to the deployable steering column.

   Cut each of the deployable steering column wires, leaving at least 101.6 mm (4 in) to work with.

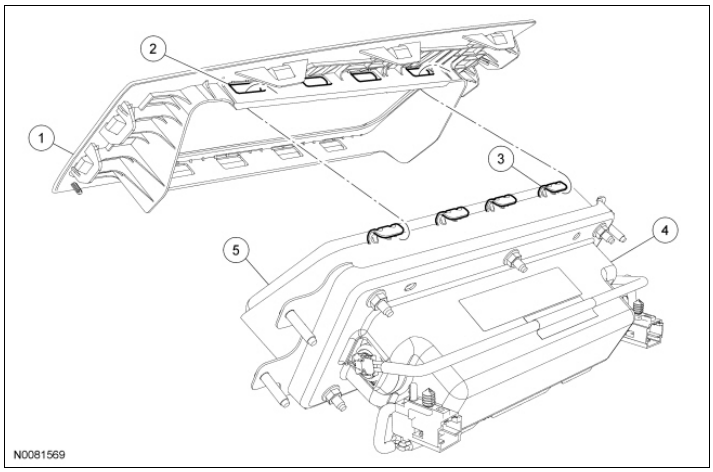
4. Remove any sheathing (if present) and strip the insulation from the ends of the cut wires.

5. Make a jumper harness to deploy the deployable steering column.
   - Obtain 2 wires (20 gauge minimum) at least 9.14 m (30 ft) long and strip both ends of each wire.
   - At one end of the jumper harness, connect the wires together.

6. Using the end of the jumper harness where the wires are not connected together, attach each wire of the jumper harness to each wire of the deployable steering column. Use tape or other insulating material to make sure that the leads do not make contact with each other.

7. Remain at least 9.14 m (30 ft) away from the deployable steering column.

8. From the end of the jumper harness that is not connected to the deployable steering column, disconnect the 2 wires of the jumper harness from each other.



9. Deploy the deployable steering column by touching the ends of the 2 wires of the jumper harness to the terminals of a 12-volt battery.

10. To allow for cooling, wait at least 10 minutes before approaching the deployed steering column.

11. Dispose of the deployed steering column in the same manner as any other part to be scrapped.

tomsn048@gmail.com

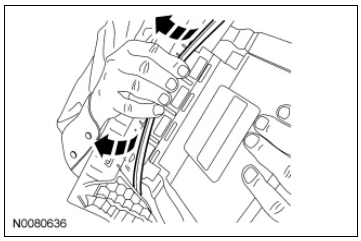
Air Bag Trim Cover - Passenger

Item	Part Number	Description
1	04338	Passenger air bag cover (part of kit)
2	-	Passenger air bag cover window (part of passenger air bag cover)
3	-	Passenger air bag canister hook (part of canister)
4	-	Passenger air bag canister (part of 044A74)
5	-	Passenger air bag soft pack (part of 044A74)

Removal

⚠ WARNING: Always carry or place a live air bag module with the air bag and deployment door/trim cover/tear seam pointed away from the body. Do not set a live air bag module down with the deployment door/trim cover/tear seam face down. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

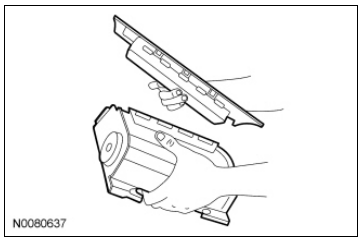
⚠ WARNING: Do not use any sharp tools to separate the passenger air bag module trim cover from the passenger air bag module canister. Sharp tools may damage the passenger air bag module. Failure to follow this instruction may result in the passenger air bag module deploying incorrectly and increases the risk of serious personal injury or death in a crash.



⚠ WARNING: Do not unpack or unroll the passenger air bag module soft pack. If the soft pack becomes unpacked or unrolled, install a new passenger air bag module assembly. Failure to follow these instructions may result in the passenger air bag module deploying incorrectly and increases the risk of serious personal injury or death in a crash.

⚠ WARNING: Do not manipulate or compromise the passenger air bag module hooks during the removal or installation procedure. Failure to follow this instruction may result in the passenger air bag module deploying incorrectly and increases the risk of serious personal injury or death in a crash.

1. Remove the passenger air bag module. For additional information, refer to Passenger Air Bag Module in this section.



2. Place a mark on top of the passenger air bag module canister for correct installation.

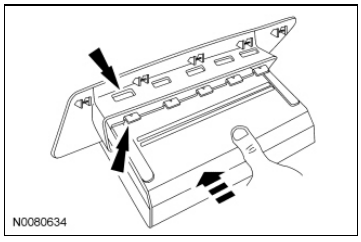
3. Carefully lift the passenger air bag module cover from the bottom of the air bag module canister, separating the windows from the canister hooks.

4. **NOTE:** Place an X mark on the old air bag cover to avoid reinstalling.

   Remove the passenger air bag cover from the canister, separating the top windows from the canister hooks.

Installation

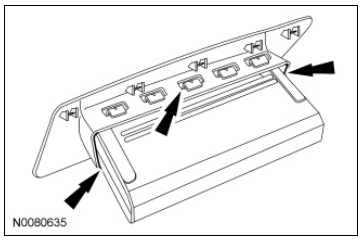
1. Place the passenger air bag cover on a clean work surface once it is removed from the shipping package.



2. ⚠ **WARNING: Carefully inspect the passenger air bag trim cover, canister and soft pack before assembly. If any foreign objects are found, remove them before attaching the passenger air bag trim cover to the canister. If the canister or soft pack is damaged, install a new passenger air bag module assembly. Failure to follow this instruction may result in the passenger air bag module deploying incorrectly, which increases the risk of serious personal injury or death in a crash.**

   Match the number of cover windows to the number of canister hooks before attaching the passenger air bag cover to the canister.

3. Match the top of the passenger air bag cover with the canister mark from the removal procedure.

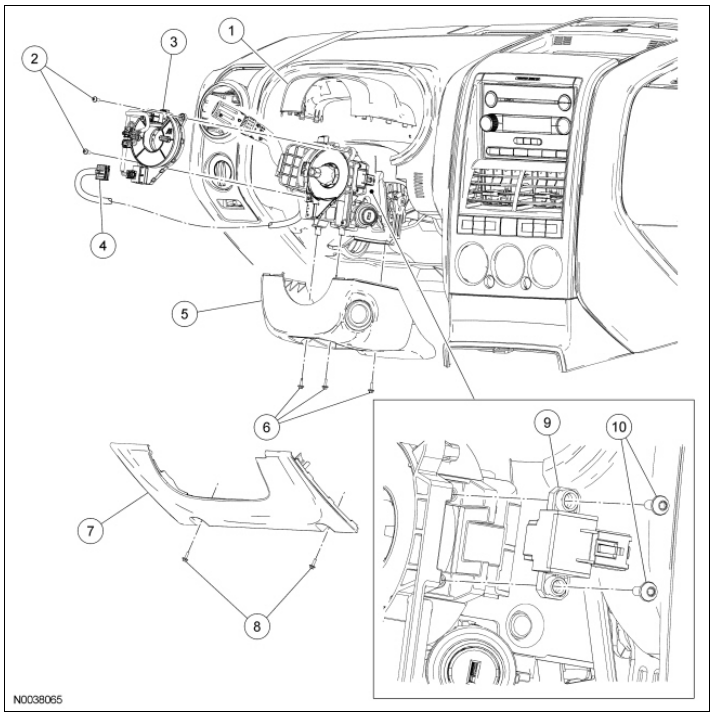


4. Position the canister onto the passenger air bag cover and engage the bottom hooks into the air bag cover windows.

5. Push the top of the passenger air bag cover to engage the top canister hooks.

tomsn048@gmail.com

6. Inspect the passenger air bag cover windows-to-canister hooks to verify that every window has a hook installed and the sides are not tucked or folded against the air bag canister.



7. Install the passenger air bag module. For additional information, refer to Passenger Air Bag Module in this section.

8. **NOTE:** The video procedure utilizes a Fusion/Milan passenger air bag module assembly. It also applies to vehicles with similar passenger air bag module designs.

   An animated version of this procedure is available on-line.

Clockspring

Item	Part Number	Description
1	3530	Upper steering column shroud
2	W506942	Clockspring screws
3	14A644	Clockspring
4	-	Clockspring electrical connector (part of 14401)
5	3K512	Lower steering column shroud
6	W707658	Lower steering column shroud screws
7	04459	Instrument panel lower steering column opening cover
8	-	Instrument panel lower steering column opening cover screws
9	3F818	Steering wheel rotation sensor
10	W506942	Steering wheel rotation sensor screws

Removal

NOTE: The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is removed and the ignition is ON.

NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

1. Remove the driver air bag module. For additional information, refer to Driver Air Bag Module in this section.

tomsn048@gmail.com

2. Remove the steering wheel. For additional information, refer to Section 211-04 .
3. Remove the 2 screws and instrument panel lower steering column opening cover.
4. Remove the 3 screws and lower steering column shroud.
5. Remove the upper steering column shroud.
6. Disconnect the clockspring electrical connector.
7. Remove the 2 screws and position aside the steering wheel rotation sensor.
8. Remove the 2 clockspring screws and remove the clockspring.

Installation

1. ***NOTICE:*** **If installing a new clockspring, do not remove the clockspring anti-rotation key until the steering wheel is installed. If the anti-rotation key has been removed before installing the steering wheel, the clockspring must be centered. Failure to follow this instruction may result in component damage and/or system failure.**

   Install the clockspring and 2 screws.
2. Install the steering wheel rotation sensor and 2 screws.
3. Connect the clockspring electrical connector.
4. Install the upper steering column shroud.
5. Install the lower steering column shroud and 3 screws.
6. Install the instrument panel lower steering column opening cover and 2 screws.
7. ⚠ **WARNING: If the clockspring is not correctly centralized, it may fail prematurely. If in doubt, repeat the centralizing procedure. Failure to follow these instructions may increase the risk of serious personal injury or death in a crash.**

   NOTICE: **To prevent component damage and/or system failure, when reusing a clockspring it must be centered.**

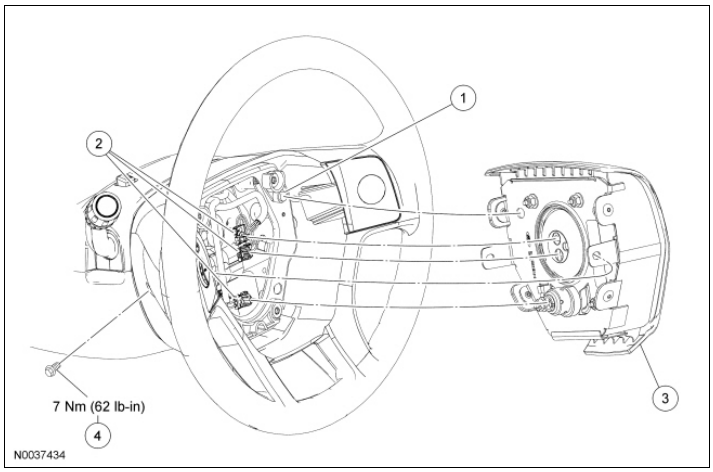
   NOTICE: **Do not over-rotate the clockspring inner rotor. The internal ribbon wire is connected to the clockspring rotor. The internal ribbon wire acts as a stop and can be broken from its internal connection. Failure to follow this instruction may result in component damage and/or system failure.**

   If a new clockspring was installed and the anti-rotation key has not been removed, **GO to Step 9.**
   If a new clockspring was installed and the anti-rotation key has been removed before the steering wheel is installed or the same clockspring is being installed, rotate the clockspring inner rotor **counterclockwise** and carefully feel for the ribbon wire to run out of length with slight resistance. Stop rotating the clockspring inner rotor at this point.
8. Starting with the clockspring inner rotor, wiring and connector in the 12 o'clock position, rotate the inner rotor **clockwise** through 2 revolutions to center the clockspring.
   - The clockspring inner rotor, wiring and connector must be in the 12 o'clock position.

9. *NOTICE:* **To prevent damage to the clockspring, make sure the road wheels are in the straight-ahead position.**

   NOTE: The clockspring inner rotor, wiring and connector must be in the 12 o'clock position to install the steering wheel.

   Install the steering wheel. For additional information, refer to Section 211-04 .



10. If a new clockspring was installed, remove the anti-rotation key.

11. Install the driver air bag module. For additional information, refer to Driver Air Bag Module in this section.

---

tomsn048@gmail.com

Driver Air Bag Module

Item	Part Number	Description
1	-	Steering wheel locator pin
2	-	Electrical connectors (part of 14A664) (3 required)
3	043B13	Driver air bag module
4	-	Driver air bag module bolt (2 required)

Removal

⚠ WARNING: Always carry or place a live air bag module with the air bag and deployment door/trim cover/tear seam pointed away from the body. Do not set a live air bag module down with the deployment door/trim cover/tear seam face down. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

⚠ WARNING: Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

NOTE: The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is removed and the ignition is ON.

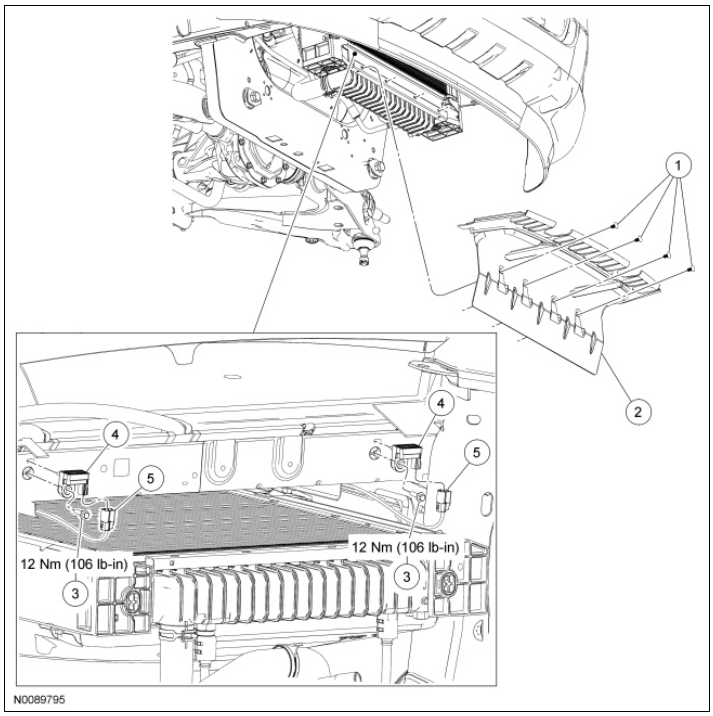
NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

1. Depower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

2. Remove the 2 driver air bag module bolts.
   - To install, tighten to 7 Nm (62 lb-in).

3. **NOTE:** Match the position of the locator holes in the back of the driver air bag module and locator tabs on the steering wheel for installation.

   Disconnect the 3 electrical connectors and remove the driver air bag module.



4. To install, reverse the removal procedure.

5. Repower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

---

tomsn048@gmail.com

Front Impact Severity Sensor

Item	Part Number	Description
1	W705589	Pin-type retainers
2	8349	Lower radiator air deflector
3	W505256	Bolts
4	14B004	Front impact severity sensors
5	-	Electrical connectors (part of 14398)

⚠ WARNING: If a vehicle has been in a crash, inspect the restraints control module (RCM) and the impact sensor (if equipped) mounting areas for deformation. If damaged, restore the mounting areas to the original production configuration. A new RCM and sensors must be installed whether or not the air bags have deployed. Failure to follow these instructions may result in serious personal injury or death in a crash.

NOTE: The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is removed and the ignition is ON.

NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

1. Depower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

2. Remove the 4 pin-type retainers and lower radiator air deflector.

3. Disconnect the electrical connector.

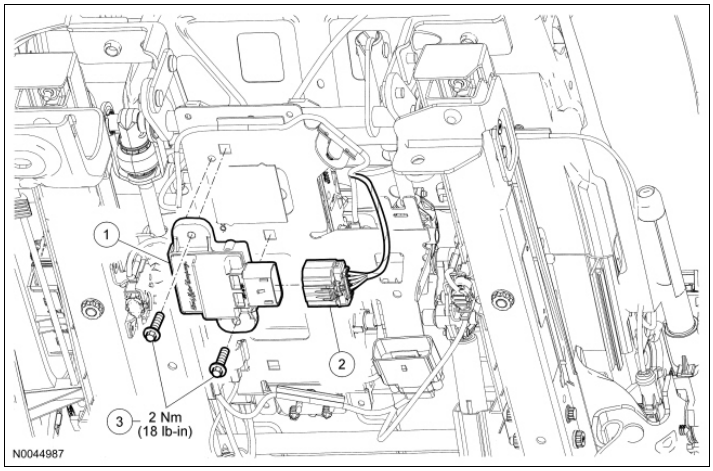
4. ⚠ **WARNING: Always tighten the fasteners of the restraints control module (RCM) and impact sensor (if equipped) to the specified torque. Failure to do so may result in incorrect restraint system operation, which increases the risk of personal injury or death in a crash.**

   NOTE: Make sure the radiator support and front impact severity sensor mating surfaces are clean and free of foreign material.

   Remove the bolt and front impact severity sensor.

   - To install, tighten to 12 Nm (106 lb-in).

5. To install, reverse the removal procedure.



6. Repower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

---

tomsn048@gmail.com

Occupant Classification System Module (OCSM)

NOTE: Power seat shown, manual seat similar.

Item	Part Number	Description
1	14B422	Occupant Classification System Module (OCSM)
2	-	OCSM electrical connector (part of 14A699)
3	-	OCSM screws

Removal

NOTE: The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is removed and the ignition is ON.

NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

1. Depower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

2. Disconnect the Occupant Classification System Module (OCSM) electrical connector underneath the front of the passenger seat.

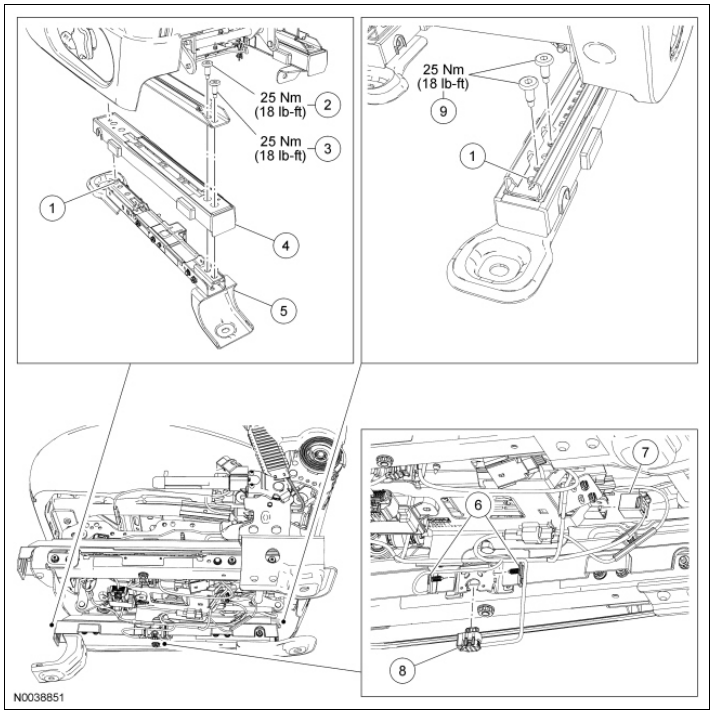
3. **NOTE:** Note the position of the locator tab on the OCSM for installation.

   Remove the 2 screws and the OCSM .

4. To install, reverse the removal procedure.

5. Repower the SRS . **Do not prove out the SRS at this time.** For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

6. Carry out the appropriate procedure after installation of an Occupant Classification System (OCS) system component.



- If installing the original OCS system component, carry out the OCS System Zero Seat Weight Test and prove out the SRS . For additional information, refer to Occupant Classification Sensor (OCS) System Zero Seat Weight Test in this section.
- If installing a new OCS system component, carry out the OCS Reset and prove out the SRS . For additional information, refer to Occupant Classification Sensor (OCS) System Reset in this section.

---

tomsn048@gmail.com

Occupant Classification Sensor

NOTE: Outboard Occupant Classification System (OCS) rail shown, inboard similar.

Item	Part Number	Description
1	-	Occupant Classification System (OCS) rail locator tab (part of 61708)
2	-	OCS rail front mounting position rear bolt (part of 61708)
3	-	OCS rail front mounting position front bolt (part of 61708)
4	62126	OCS rail shield
5	61708	OCS rail
6	-	OCS rail wiring retainers (part of 14A699)
7	-	Power seat track motor electrical connector (part of 14A699)
8	-	OCS rail electrical connector (part of 14A699)
9	-	OCS rail rear bolts (part of 61708)

Removal

⚠ WARNING: Use care when handling an Occupant Classification System (OCS) sensor rail before and after it is installed to the front passenger seat or seat track assembly. Dropping or subjecting the rails to impact may cause the OCS sensor rails to operate incorrectly. Failure to follow these instructions may result in incorrect operation of the OCS and increase the risk of serious personal injury or death in a crash.

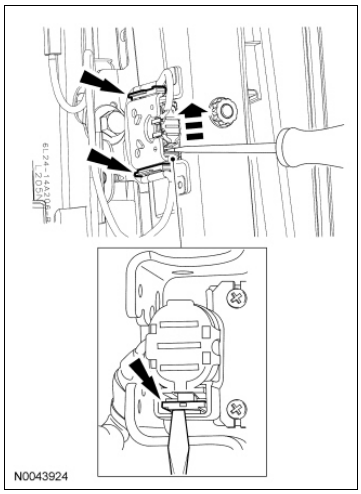
⚠ WARNING: Do not disassemble the occupant classification system (OCS) sensor rail or tighten or loosen any of the nuts and bolts installed to the OCS rail body. Only the 8 bolts that attach the 2 OCS sensor rails to the seat track may be removed and installed. Failure to follow these instructions may result in incorrect operation of the OCS and increase the risk of serious personal injury or death in a crash.

⚠ WARNING: Never allow oil, grease, water or foreign contaminants to get on/in the occupant classification system (OCS) components or electrical connectors. Failure to follow this instruction may result in incorrect operation of the OCS and increases the risk of serious personal injury or death in a crash.

⚠ WARNING: Use care when handling the front passenger seat and track assembly. Dropping the assembly, placing excessive weight on or sitting on a front passenger seat that is not secured in the vehicle may result in damaged seat components. Failure to follow these instructions may result in incorrect operation of the occupant classification system (OCS) and increases the risk of serious personal injury or death in a crash.

NOTICE: **Prevent oil and/or grease from getting on the Occupant Classification System (OCS) rail bolts as this can lead to tightening beyond the specified torque value. Failure to follow this instruction may result in damaged or broken OCS rail bolts.**

NOTE: The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is removed and the ignition is ON.



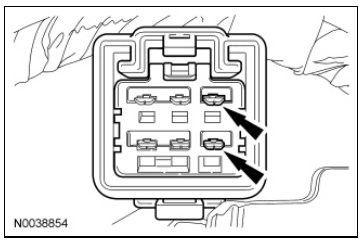
NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

1. Remove the front passenger seat. For additional information, refer to Section 501-10 .

2. *NOTICE:* **Before releasing the Occupant Classification System (OCS) rail electrical connector, push only on the tip of the connector release tab to release the electrical connector. Do not insert the tool too deep into the OCS rail electrical connector or damage to the electrical connector may occur.**

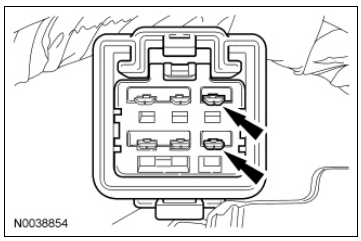
   NOTE: Note the Occupant Classification System (OCS) rail position, electrical wiring routing, wiring, connector and wiring retainers for installation.

   On the affected side, detach the 2 OCS rail wiring retainers and using a suitable tool, release the tab and disconnect the OCS rail electrical connector.



tomsn048@gmail.com

3. If equipped, disconnect the power seat track motor electrical connector.



4. Move the seat to the forward stop position.
   - If equipped with a power seat track, apply power and ground to the pins shown.

5. Remove the 2 rear bolts from the OCS rail.

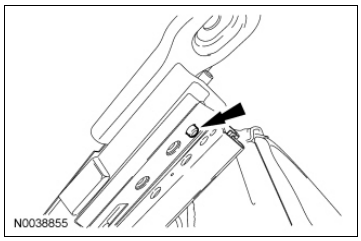
6. Move the seat to the rearward stop position.
   - If equipped with a power seat track, apply power and ground to the pins shown.

7. **NOTE:** Note the locator tab position where the OCS rail goes through the rail shield and into the rear seat track mounting point for installation.

   Remove the 2 front bolts and OCS rail and shield.

Installation

NOTE: If installing a new seat track, position the seat track where the seat will be in the full rearward position before installing the OCS rails.

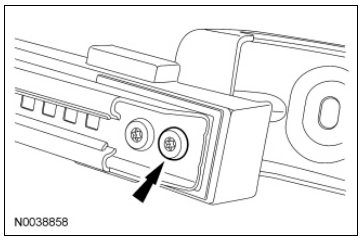


NOTE: To make sure of correct installation, the OCS rail bolts must be installed in the sequence shown.

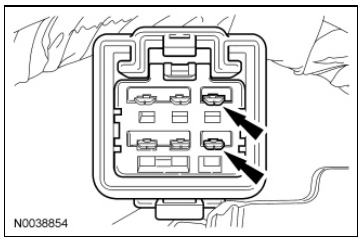
1. ⚠ **WARNING: To prevent foreign material and contaminants from entering the occupant classification system (OCS) sensor rail, make sure the OCS rail shield is present, is not damaged and is correctly installed to the OCS rail. Failure to follow these instructions may result in incorrect operation of the OCS and increases the risk of serious personal injury or death in a crash.**

   NOTICE: **Prevent oil and/or grease from getting on the Occupant Classification System (OCS) rail bolts as this can lead to tightening beyond the specified torque value. Failure to follow this instruction may result in damaged or broken OCS rail bolts.**

NOTE: Make sure the OCS rail shield is seated correctly on the OCS rail.



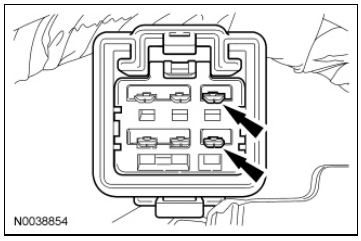
Install the shield on the OCS rail, and install the OCS rail and shield on the seat track with the locator tab aligned correctly as shown.



2. Hold the OCS rail and shield firmly in position and install the front mounting position rear bolt.
   - Tighten to 25 Nm (18 lb-ft).

3. Hold the OCS rail and shield firmly in position and install the front mounting position front bolt.
   - Tighten to 25 Nm (18 lb-ft).

4. Move the seat to the forward stop position.
   - If equipped with a power seat track, apply power and ground to the pins shown.



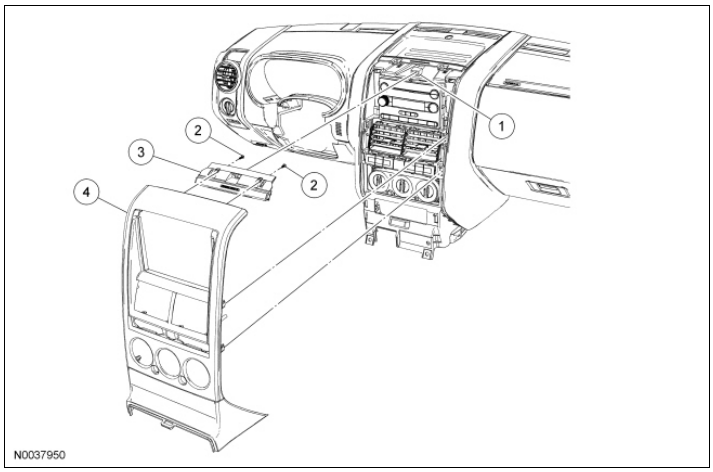
5. Install the 2 rear OCS rail bolts.
   - Tighten to 25 Nm (18 lb-ft).

6. **NOTE:** Make sure to route the OCS rail wiring and install the 2 wiring retainers as noted during removal.

   Connect the OCS rail electrical connector, route the wiring and attach the 2 wiring retainers.

7. Center the seat track to the seat cushion frame.
   - If equipped with a power seat track, apply power and ground to the pins shown.

tomsn048@gmail.com



8. If equipped, connect the power seat track motor electrical connector.

9. Install the passenger seat. **Do not prove out the SRS at this time.** For additional information, refer to Section 501-10 .

10. Carry out the appropriate procedure after installation of an OCS system component.
    - If installing the original OCS system component, carry out the Occupant Classification System (OCS) System Zero Seat Weight Test and prove out the SRS . For additional information, refer to Occupant Classification Sensor (OCS) System Zero Seat Weight Test in this section.
    - If installing a new OCS system component, carry out the Occupant Classification System (OCS) System Reset procedure and prove out the SRS . For additional information, refer to Occupant Classification Sensor (OCS) System Reset in this section.

Passenger Air Bag Deactivation (PAD) Indicator

Item	Part Number	Description
1	-	Electrical connector (part of 14401)
2	W711659	Passenger Air Bag Deactivation (PAD) indicator screws
3	14B418	PAD indicator
4	4302	Instrument panel center finish panel

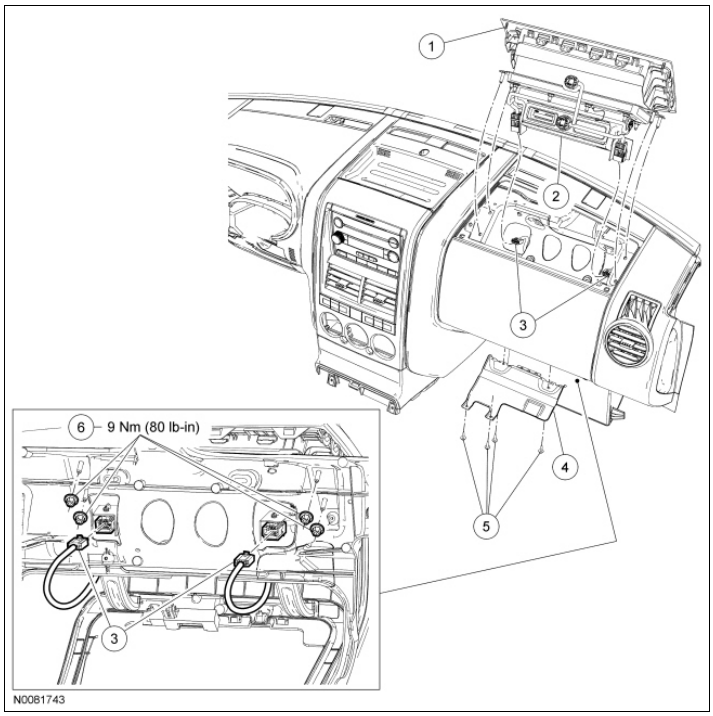
Removal and Installation

1. **NOTE:** Ignition must be OFF if disconnecting the Passenger Air Bag Deactivation (PAD) indicator electrical connector. Otherwise, a DTC will be set in the Restraints Control Module (RCM) memory and must be cleared before releasing the vehicle.

   Turn the ignition OFF and wait at least one minute.

2. Remove the floor console. For additional information, refer to Section 501-12 .

3. Gently pull outward to release the clips on the instrument panel center finish panel.



4. Disconnect the PAD indicator electrical connector.

5. Remove the 2 screws and PAD indicator.

6. To install, reverse the removal procedure.

tomsn048@gmail.com

Passenger Air Bag Module

Item	Part Number	Description
1	04338	Passenger air bag cover
2	044A74	Passenger air bag module assembly
3	-	Passenger air bag module electrical connectors (part of 14401) (2 required)
4	-	Passenger air bag module heat shield
5	N807122	Passenger air bag module heat shield bolts
6	-	Passenger air bag module nuts

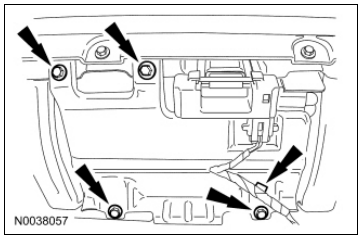
Removal and Installation

⚠ WARNING: Always carry or place a live air bag module with the air bag and deployment door/trim cover/tear seam pointed away from the body. Do not set a live air bag module down with the deployment door/trim cover/tear seam face down. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

⚠ WARNING: Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

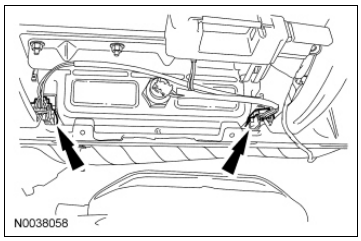
NOTICE: **Do not install a new passenger air bag module assembly due to a damaged or discolored passenger air bag cover. The passenger air bag cover can be serviced separately from the passenger air bag module assembly. For additional information, refer to Air Bag Trim Cover - Passenger in this section.**

tomsn048@gmail.com



NOTE: The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is removed and the ignition is ON.

NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.



1. Depower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

2. Open and lower the glove compartment door.

3. Release the wiring retainer, 4 bolts and passenger air bag module heat shield.

4. Disconnect the 2 passenger air bag module electrical connectors.

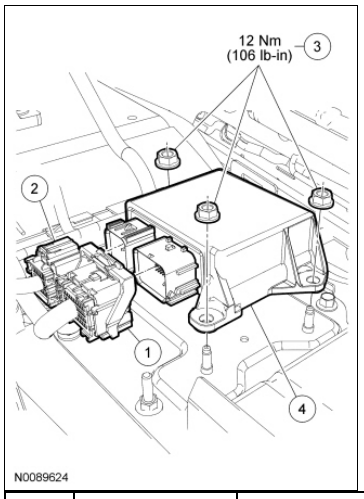
5. Remove the 4 passenger air bag module nuts.
   - To install, tighten to 9 Nm (80 lb-in).

6. ***NOTICE:*** **Do not handle the passenger air bag module by grabbing the edges of the passenger air bag cover. Damage to the air bag module may occur.**

   Push up to release the passenger air bag cover clips from the instrument panel and remove the passenger air bag module.

7. **NOTE:** During passenger air bag module installation, make sure all of the air bag trim cover clips are fully seated into the instrument panel.

   To install, reverse the removal procedure.



8. Repower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

tomsn048@gmail.com

Restraints Control Module (RCM)

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Item	Part Number	Description
1	-	Large Restraints Control Module (RCM) electrical connector (part of 14A488)
2	-	Small RCM electrical connector (part of 14401)
3	W701838	RCM nuts
4	14B321	RCM

Removal

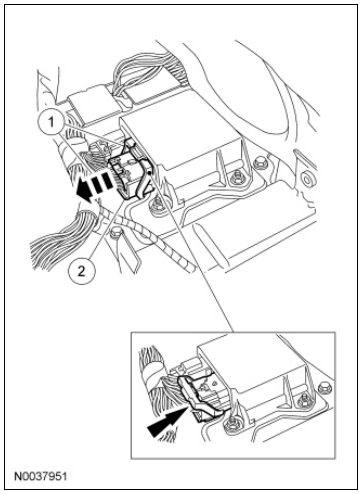
⚠ WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the Safety Canopy® and cause serious personal injury or death.

⚠ WARNING: If a vehicle has been in a crash, inspect the restraints control module (RCM) and the impact sensor (if equipped) mounting areas for deformation. If damaged, restore the mounting areas to the original production configuration. A new RCM and sensors must be installed whether or not the air bags have deployed. Failure to follow these instructions may result in serious personal injury or death in a crash.

NOTICE: **When installing a new Restraints Control Module (RCM), it is necessary to carry out Programmable Module Installation (PMI). For additional information, refer to Section 418-01 . Failure to follow these instructions may result in component damage and/or system failure.**

NOTE: When installing a new Restraints Control Module (RCM), always make sure the correct RCM is being installed. If an incorrect RCM is installed, erroneous DTCs will result.

NOTE: The air bag warning indicator illuminates when the correct RCM fuse is removed and the ignition is ON.



NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

1. If installing a new RCM , carry out the steps necessary to prepare for Programmable Module Installation (PMI). For additional information, refer to Section 418-01 .

2. Depower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

3. Remove the front floor console. For additional information, refer to Section 501-12 .

4. Disconnect the large RCM electrical connector.
    1. Pinch the thumb tab and pivot the large RCM electrical connector position assurance lever all the way back until it stops.
    2. Pull out and disconnect the large RCM electrical connector.

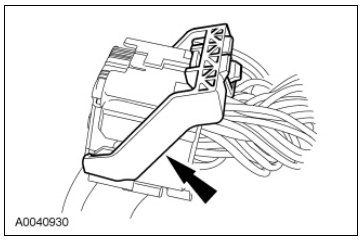
5. Press to release the locking tab and disconnect the small RCM electrical connector.

6. Remove the 3 RCM nuts.

7. Remove the RCM .

Installation

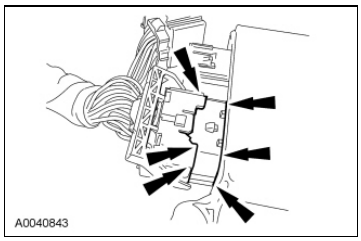
1. Install the RCM .



2. Install the 3 RCM nuts.
    - Tighten to 12 Nm (106 lb-in).

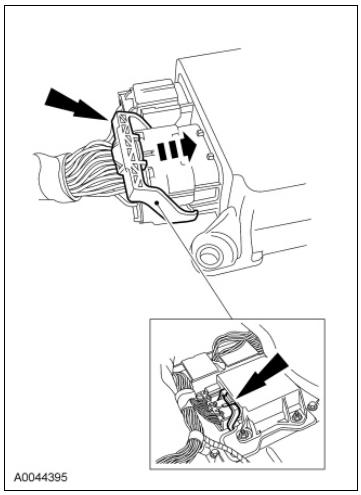
3. Connect the small RCM electrical connector.

4. **NOTE:** The RCM has been removed for clarity.



tomsn048@gmail.com

On the large RCM electrical connector, place the connector position assurance lever in the full release position.



5. ***NOTICE:*** **Putting the large electrical connector into the Restraints Control Module (RCM) on an angle may cause bad electrical connections and damage components.**

   Position the large electrical connector into the RCM .

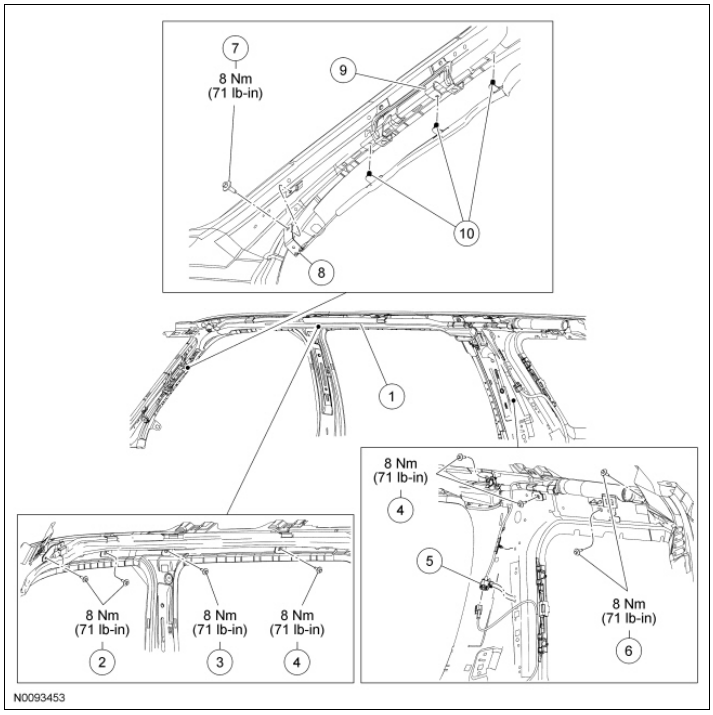
6. Connect the large RCM connector.
   - ***NOTICE:*** **Do not push the connector to the point where the lever pivots and seats itself. Light pressure is needed to get the connector into position on the Restraints Control Module (RCM), before using the lever to fully seat the connector. Damage to the connector or component may occur.**

     With the large electrical connector uniformly aligned to the RCM , lightly push in until a subtle audible click is heard and a slight resistance is felt.
   - Using the connector position assurance lever, pivot it toward the RCM , drawing the connector into the RCM . Make sure the thumb tab is engaged to the retainer on the RCM and locked in place.

7. Install the front floor console. For additional information, refer to Section 501-12 .

8. Repower the SRS . **Do not** prove out the SRS at this time. For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

9. When installing a new RCM , carry out the steps necessary to complete Programmable Module Installation (PMI). For additional information, refer to Section 418-01 .



10. Prove out the SRS as follows:
    Turn the ignition switch from ON to OFF. Wait 10 seconds, then turn the ignition switch back to ON and visually monitor the air bag warning indicator with the air bag modules installed. The air bag warning indicator will light continuously for approximately 6 seconds and then turn off. If an SRS fault is present, the air bag warning indicator will:
    - fail to light.
    - remain lit continuously.
    - flash at a 5 Hz rate (RCM not configured).
    The air bag warning indicator might not light until approximately 30 seconds after the ignition switch has been turned from the OFF to the ON position. This is the time required for the RCM to complete the testing of the SRS . If the air bag warning indicator is inoperative and an SRS fault exists, a chime will sound in a pattern of 5 sets of 5 beeps. If this occurs, the air bag warning indicator and any SRS fault discovered must be diagnosed and repaired.
    Clear all continuous DTCs from the RCM and Occupant Classification System Module (OCSM) using a scan tool.

tomsn048@gmail.com

Safety Canopy Module - Explorer, Mountaineer

NOTE: RH shown, LH similar.

Item	Part Number	Description
1	042D94	Safety Canopy® module
2	W503924	Safety Canopy® module front bolts
3	W503924	Safety Canopy® module B-pillar bolt
4	W503924	Safety Canopy® module C-pillar bolts
5	-	Safety Canopy® module electrical connector (part of 042D94)
6	W503924	Safety Canopy® module rear bracket bolts
7	W503924	Safety Canopy® module front tether bracket bolt
8	-	Safety Canopy® module front tether bracket (part of 042D94)
9	-	A-pillar trim bracket
10	-	Front tether pin-type retainers (part of 042D94)

Removal

⚠ WARNING: Anytime the Safety Canopy® or side air curtain module has deployed, a new headliner and new A-, B-, C- and D-pillar upper trim panels and attaching hardware must be installed. Remove any other damaged components and hardware and install new components and hardware as needed. Failure to follow these instructions may result in the Safety Canopy® or side air curtain module deploying incorrectly and increases the risk of serious personal injury or death in a crash.

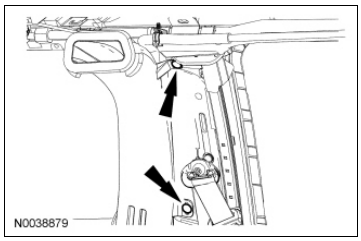
⚠ WARNING: Always carry or place a live Safety Canopy®, or side air curtain module, with the module and tear seam pointed away from your body. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.

⚠ WARNING: Do not obstruct or place objects in the deployment path of the Safety Canopy® or side air curtain module. Failure to follow this instruction may result in the Safety Canopy® or side air curtain module deploying incorrectly and increases the risk of serious personal injury or death in a crash.

⚠ WARNING: Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

NOTE: The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is removed and the ignition is ON.

NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.



All vehicles

1. Depower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

2. Remove the headliner. For additional information, refer to Section 501-05 .

Vehicles with auxiliary climate control

3. Remove the 2 retainers and auxiliary climate control headliner duct from the C-pillar.

All vehicles

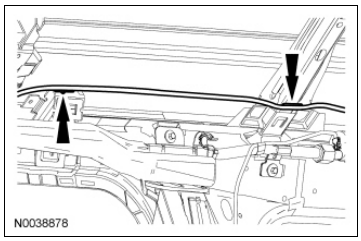
4. **NOTE:** Note the Safety Canopy® module wiring harness routing for installation.

   Disconnect the Safety Canopy® module electrical connector and detach the connector and wiring pin-type retainers from the C-pillar.

Vehicles with moon roof

5. **NOTE:** Note the position of the 2 rear moon roof drain hose routing clips for installation.

   Disconnect the rear moon roof drain tube and detach the 2 rear moon roof drain hose routing clips.



tomsn048@gmail.com

Vehicles with entertainment system

6. **NOTE:** Note the position and routing of the entertainment system wiring for installation.

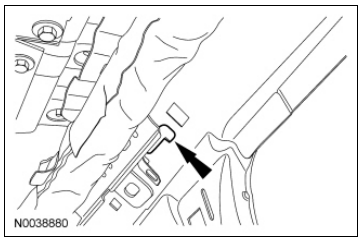
   Detach the 2 entertainment system wiring retainers and position wiring aside.

All vehicles

7. **NOTE:** Note the locator tab on the front tether anchor bracket to the A-pillar sheet metal for installation.

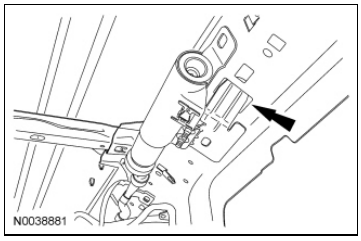
   Remove the bolt and front tether anchor bracket.

8. Detach the 3 Safety Canopy® module front tether pin-type retainers from the A-pillar.



9. Remove the Safety Canopy® module front 2 bolts.

10. Remove the Safety Canopy® module 3 bolts near the C-pillar.



11. Remove the Safety Canopy® module 2 rear bracket bolts.

12. Remove the Safety Canopy® module bolt at the B-pillar.

13. Gently lift the Safety Canopy® module up and inward at the B-pillar to release the bracket hook from the sheet metal.

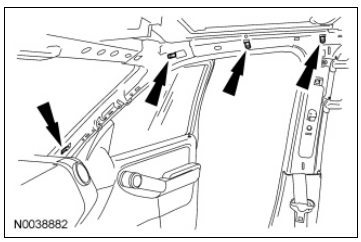
14. Move the Safety Canopy® module forward to release the rear bracket hook from the sheet metal and remove the Safety Canopy® module.

Installation

⚠ WARNING: Never put any type of fastener or tie strap around any part of a Safety Canopy® module, side air curtain module or interior trim panel. This will prevent the Safety Canopy® or side air curtain module from deploying correctly. Failure to follow this instruction may increase the risk of serious personal injury or death in a crash.

⚠ WARNING: Always carry or place a live Safety Canopy®, or side air curtain module, with the module and tear seam pointed away from your body. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.

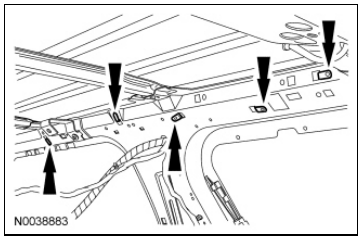
⚠ WARNING: When installing a new headliner on a vehicle equipped with Safety Canopy® or side air curtain modules, make sure the headliner has the word AIRBAG on the headliner where it meets each B-pillar trim panel. Otherwise, you have the wrong headliner. Failure to follow this instruction may result in the Safety Canopy® or side air curtain module not deploying or deploying incorrectly, increasing the risk of personal injury or death in a crash.



⚠ WARNING: Always use new torque-prevailing type J-nuts when installing the Safety Canopy® in the vehicle. Use of these J-nuts is mandatory to reduce the risk of loss of fastener effectiveness. Failure to follow this instruction may result in the Safety Canopy® module deploying incorrectly and increases the risk of serious personal injury or death in a crash.

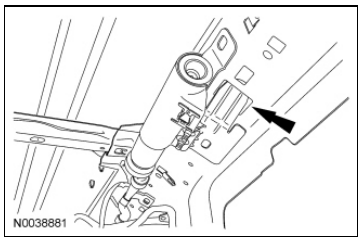
⚠ WARNING: Before installing a Safety Canopy® or side air curtain module, inspect the roofline for any damage. If necessary, the sheet metal must be reworked to its original condition and structural integrity. Install new fasteners if damaged and remove foreign material. Failure to follow these instructions may result in the Safety Canopy® or side air curtain deploying incorrectly, which increases the risk of serious personal injury or death in a crash.

⚠ WARNING: Inspect a Safety Canopy® or side air curtain module before installation. If the module is damaged, the cover has separated or the Safety Canopy® or side air curtain material has been exposed, install a new module. Do not attempt to repair the module. Failure to follow these instructions may result in the Safety Canopy® or side air curtain deploying incorrectly, which increases the risk of serious personal injury or death in a crash.

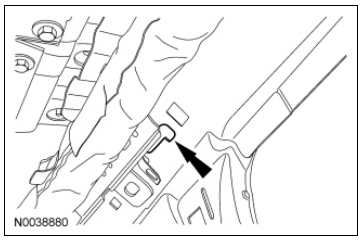


All vehicles

1. Remove the 4 front J-nuts and install new.



2. Remove the 5 rear J-nuts and install new.



tomsn048@gmail.com

3. Position Safety Canopy® module by moving it rearward installing the rear bracket hook in the sheet metal.

4. Install the Safety Canopy® module B-pillar bracket hook in the sheet metal.

5. **NOTE:** Make sure all Safety Canopy® module bolt holes line up with all J-clips.

   Install the Safety Canopy® module front 2 bolts with the forward most bolt first.

   - Tighten to 8 Nm (71 lb-in).

6. Install the Safety Canopy® module B-pillar bolt.
   - Tighten to 8 Nm (71 lb-in).

7. Install the 3 C-pillar Safety Canopy® module bolts.
   - Tighten to 8 Nm (71 lb-in).

8. Install the 2 Safety Canopy® module rear bracket bolts.
   - Tighten to 8 Nm (71 lb-in).

9. Attach the 3 Safety Canopy® module front tether pin-type retainers to the A-pillar.

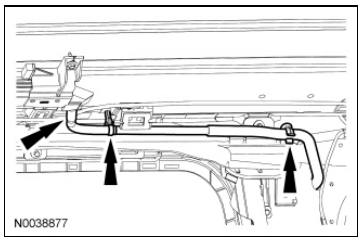
10. **NOTE:** Make sure the Safety Canopy® module front tether bracket locator tab is correctly installed in the A-pillar sheet metal.

    Install the Safety Canopy® module front tether bracket and bolt.

    - Tighten to 8 Nm (71 lb-in).

Vehicles with entertainment system

11. **NOTE:** Make sure to route the entertainment system wiring as noted during removal.

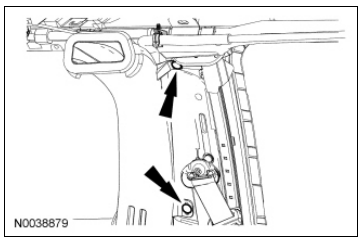


Attach the 2 entertainment system wiring retainers.

Vehicles with moon roof

12. **NOTE:** Make sure to route the moon roof drain hose as noted during removal.

    Connect the rear moon roof drain tube and attach the 2 rear moon roof drain hose clips.



All vehicles

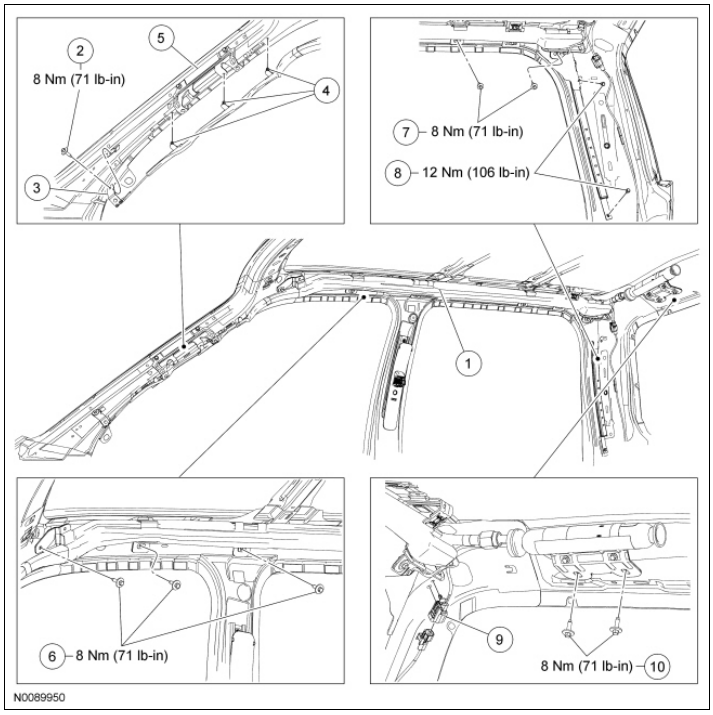
13. **NOTE:** Make sure to route the Safety Canopy® module wiring harness as noted during removal.

    Connect the Safety Canopy® module electrical connector and attach the connector and wiring pin-type retainers to the C-pillar.

Vehicles with auxiliary climate control

14. Install the auxiliary climate control headliner duct and 2 retainers to the C-pillar.

All vehicles



15. Install the headliner. For additional information, refer to Section 501-05 .

16. Repower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

tomsn048@gmail.com

Safety Canopy Module - Explorer Sport Trac

NOTE: RH shown, LH similar.

Item	Part Number	Description
1	042D94	Safety Canopy® module
2	W503924	Safety Canopy® module front tether bracket bolt
3	-	Safety Canopy® module front tether bracket (part of 042D94)
4	-	Front tether pin-type retainers (part of 042D94)
5	-	A-pillar trim bracket
6	W503924	Safety Canopy® module front bolts
7	W503924	Safety Canopy® module C-pillar bolts

9	-	Safety Canopy® module electrical connector (part of 042D94)
10	W503924	Safety Canopy® module rear bracket bolts

Removal

⚠ WARNING: Anytime the Safety Canopy® or side air curtain module has deployed, a new headliner and new A-, B-, C- and D-pillar upper trim panels and attaching hardware must be installed. Remove any other damaged components and hardware and install new components and hardware as needed. Failure to follow these instructions may result in the Safety Canopy® or side air curtain module deploying incorrectly and increases the risk of serious personal injury or death in a crash.

tomsn048@gmail.com

⚠ WARNING: Always carry or place a live Safety Canopy®, or side air curtain module, with the module and tear seam pointed away from your body. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.

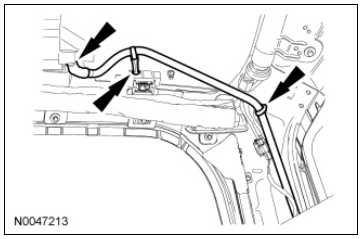
⚠ WARNING: Do not obstruct or place objects in the deployment path of the Safety Canopy® or side air curtain module. Failure to follow this instruction may result in the Safety Canopy® or side air curtain module deploying incorrectly and increases the risk of serious personal injury or death in a crash.

⚠ WARNING: Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

NOTE: The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is removed and the ignition is ON.

NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

All vehicles



1. Depower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

2. Remove the headliner. For additional information, refer to Section 501-05 .

Vehicles with moon roof

3. **NOTE:** Note the position of the 2 rear moon roof drain hose routing clips for installation.

   Disconnect the rear moon roof drain tube and detach the 2 rear moon roof drain hose routing clips.

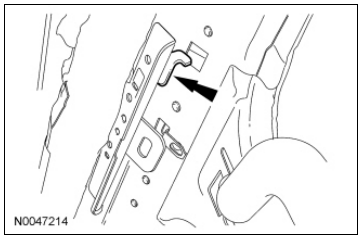
All vehicles

4. Disconnect the Safety Canopy® module electrical connector and detach the connector pin-type retainer from the C-pillar.

5. **NOTE:** Note the locator tab on the front tether anchor bracket to the A-pillar sheet metal for installation.

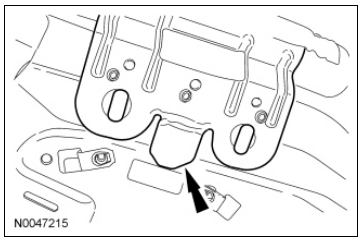
   Remove the bolt and the front tether anchor bracket.

6. Detach the 3 Safety Canopy® module front tether pin-type retainers from the A-pillar.



7. Remove the 3 front bolts from the Safety Canopy® module.

8. Remove the 2 rear bracket bolts from the Safety Canopy® module.



9. Remove the 2 bolts and the Safety Canopy® module C-pillar tether bracket.

10. Remove the 2 Safety Canopy® module bolts near the C-pillar.

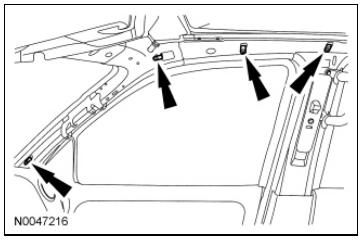
11. Gently lift the Safety Canopy® module up and inward at the B-pillar to release the bracket hook from the sheet metal.

12. Move the Safety Canopy® module forward to release the rear bracket hook from the sheet metal and remove the Safety Canopy® module.

Installation

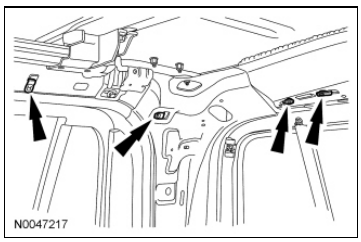
⚠ WARNING: Never put any type of fastener or tie strap around any part of a Safety Canopy® module, side air curtain module or interior trim panel. This will prevent the Safety Canopy® or side air curtain module from deploying correctly. Failure to follow this instruction may increase the risk of serious personal injury or death in a crash.

⚠ WARNING: When installing a new headliner on a vehicle equipped with Safety Canopy® or side air curtain modules, make sure the headliner has the word AIRBAG on the headliner where it meets each B-pillar trim panel. Otherwise, you have the wrong headliner. Failure to follow this instruction may result in the Safety Canopy® or side air curtain module not deploying or deploying incorrectly, increasing the risk of personal injury or death in a crash.



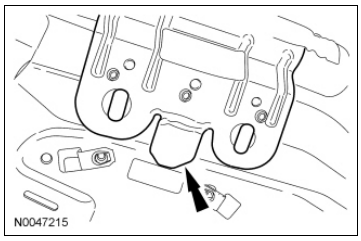
⚠ WARNING: Always use new torque-prevailing type J-nuts when installing the Safety Canopy® in the vehicle. Use of these J-nuts is mandatory to reduce the risk of loss of fastener effectiveness. Failure to follow this instruction may result in the Safety Canopy® module deploying incorrectly and increases the risk of serious personal injury or death in a crash.

⚠ WARNING: Before installing a Safety Canopy® or side air curtain module, inspect the roofline for any damage. If necessary, the sheet metal must be reworked to its original condition and structural integrity. Install new fasteners if damaged and remove foreign material. Failure to follow these instructions may result in the Safety Canopy® or side air curtain deploying incorrectly, which increases the risk of serious personal injury or death in a crash.

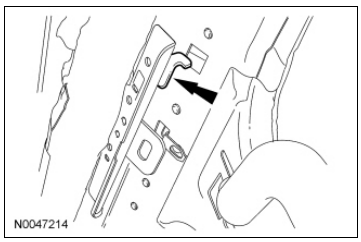


All vehicles

1. Remove the front 4 J-nuts and install new.



tomsn048@gmail.com



2. Remove the rear 4 J-nuts and install new.

3. Position the Safety Canopy® module by moving it rearward, installing the rear bracket hook in the sheet metal.

4. Install the Safety Canopy® module B-pillar bracket hook in the sheet metal.

5. **NOTE:** Make sure all Safety Canopy® module bolt holes line up with all J-clips.

   Install the 2 Safety Canopy® module bolts near the C-pillar.

   - Tighten to 8 Nm (71 lb-in).

6. Install the Safety Canopy® module C-pillar tether bracket and the 2 bolts.
   - Tighten to 12 Nm (106 lb-in).

7. Install the 2 Safety Canopy® module rear bracket bolts.
   - Tighten to 8 Nm (71 lb-in).

8. Install the Safety Canopy® module front 3 bolts.
   - Tighten to 8 Nm (71 lb-in).

9. Attach the 3 Safety Canopy® module front tether pin-type retainers to the A-pillar.

10. **NOTE:** Make sure the Safety Canopy® module front tether bracket locator tab is correctly installed in the A-pillar sheet metal.

    Install the Safety Canopy® module front tether bracket and bolt.

    - Tighten to 8 Nm (71 lb-in).

11. Connect the Safety Canopy® module electrical connector and attach the connector pin-type retainer to the C-pillar.

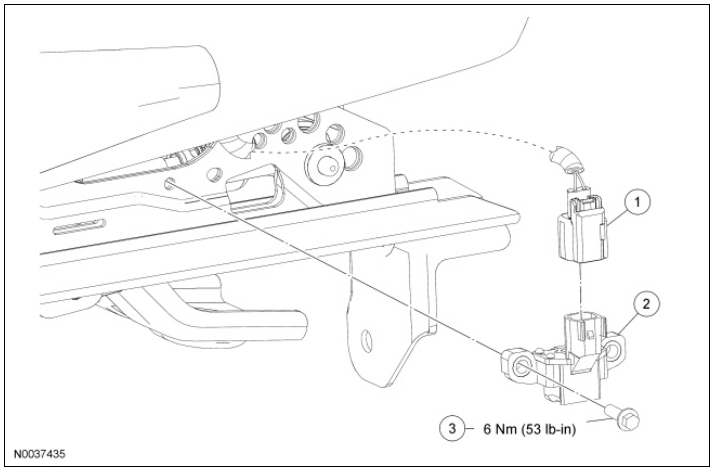
Vehicles with moon roof

12. **NOTE:** Make sure to route the moon roof drain hose as noted during removal.

    Connect the rear moon roof drain tube and attach the 2 rear moon roof drain hose clips.

All vehicles

13. Install the headliner. For additional information, refer to Section 501-05 .



14. Repower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

tomsn048@gmail.com

Seat Position Sensor

NOTE: Power seat shown, manual seat similar.

Item	Part Number	Description
1	-	Seat position sensor electrical connector (part of 14C719)
2	14B416	Seat position sensor
3	-	Seat position sensor bolt

⚠ WARNING: Never disassemble or tamper with safety belt buckle/retractor pretensioners, adaptive load limiting retractors, safety belt inflators, or probe the electrical connectors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners, adaptive load limiting retractors, or safety belt inflators, which increases the risk of serious personal injury or death.

⚠ WARNING: Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

NOTE: The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is removed and the ignition is ON.

NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

1. Position the front seat to the rearmost and upward position.

2. Depower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

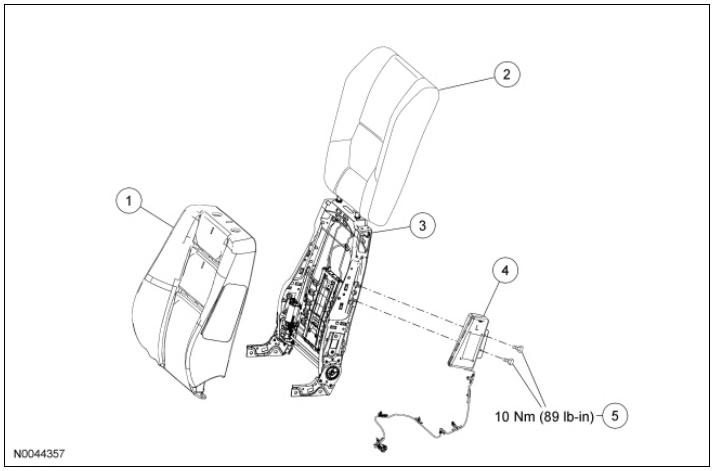
3. Disconnect the seat position sensor electrical connector.

4. **⚠ WARNING: Always tighten the seat position sensor retaining bolt to specified torque. Failure to do so may result in incorrect restraint system operation, which increases the risk of personal injury or death in a crash.**

Remove the bolt and seat position sensor.

- To install, tighten to 6 Nm (53 lb-in).

5. To install, reverse the removal procedure.



6. Repower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

---

tomsn048@gmail.com

Side Air Bag Module

NOTE: Driver seat shown, passenger similar.

Item	Part Number	Description
1	64811	Seat backrest foam pad
2	62901	Seat backrest trim cover
3	61018	Seat backrest frame
4	611D11	Side air bag module
5	-	Side air bag module bolts

Removal

⚠ WARNING: Always carry or place a live air bag module with the air bag and deployment door/trim cover/tear seam pointed away from the body. Do not set a live air bag module down with the deployment door/trim cover/tear seam face down. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

⚠ WARNING: Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

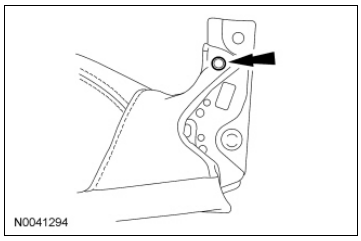
⚠ WARNING: If the seat side air bag cover has been damaged or separated from its mounting, or if the air bag material has been exposed, install a new seat side air bag module. Never try to repair the seat side air bag module. Failure to follow these instructions may result in the seat side air bag deploying incorrectly, which increases the risk of serious personal injury or death in a crash.

⚠ WARNING: Front seat backrest trim covers installed on seats equipped with seat side air bags cannot be repaired. A new trim cover must be installed. Cleaning is permissible. Failure to follow these instructions may result in the seat side air bag module deploying incorrectly and increase the risk of serious personal injury or death in a crash.

NOTICE: **Use care when handling the seat and track assembly. Dropping the assembly or sitting on a seat not secured in the vehicle may result in damaged components.**

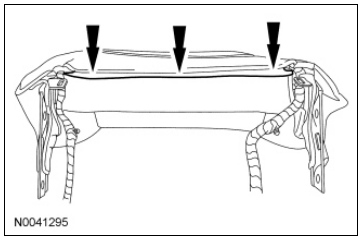
NOTE: When replacing the side air bag after deployment, refer to Section 501-10 for additional information concerning the installation of a new side air bag module.

The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is removed and the ignition is ON.



NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

1. Remove the front seat. For additional information, refer to Section 501-10 .



2. Remove the seat backrest. For additional information, refer to Section 501-10 .

3. **NOTE:** RH shown, LH similar.

   Remove the 2 plastic rivets attaching the backrest trim cover to the inboard and outboard recliners on the seat backrest frame.

4. Release the seat back lower outer trim cover J-clip.

5. Release the seat back lower inner trim cover J-clip.

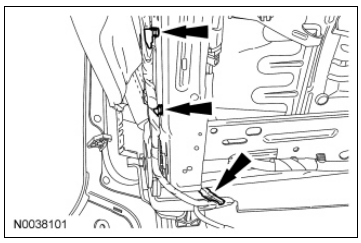
6. ⚠ **WARNING: Front seat backrest trim covers installed on seats equipped with seat side air bags cannot be repaired. A new trim cover must be installed. Cleaning is permissible. Failure to follow these instructions may result in the seat side air bag module deploying incorrectly and increase the risk of serious personal injury or death in a crash.**

   NOTICE: **Use care when separating the seat backrest trim cover from the hook-and-loop strips, or the hook-and-loop strip can be torn from the seat backrest foam pad.**

   Place a hand between the seat backrest trim cover and foam pad and carefully separate the hook-and-loop strips, then carefully roll up the seat back trim cover in an inside out fashion to the first

tomsn048@gmail.com

row of hog rings in the front.



7. Remove the first row of hog rings.

8. Detach the hook-and-loop strips and invert the seat backrest trim cover up enough to expose the side air bag.

9. **NOTE:** Note the position and the routing of the side air bag module wiring harness for installation.

   Detach the side air bag wiring harness retainers from the seat backrest frame.

10. Position out the seat backrest foam pad.

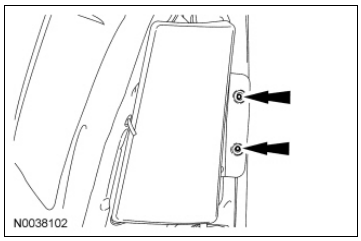
11. Remove the 2 bolts and the side air bag module.

Installation

⚠ WARNING: Inspect the seat side air bag module and mounting surfaces for any damage or foreign material before installing the seat side air bag module. If any damage is found, install new components. If any foreign material is found, remove it. Failure to follow these instructions may result in the seat side air bag module deploying incorrectly and increase the risk of serious personal injury or death in a crash.

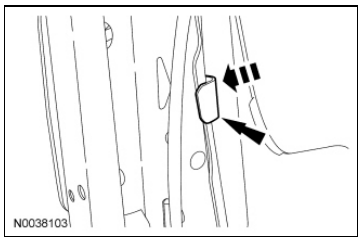
⚠ WARNING: Before installing the seat side air bag module/deployment chute assembly:

- Inspect the side air bag module and mounting surfaces for any damage or foreign material.
- Remove any foreign material from the mounting surfaces of the deployment chute, the seat backrest frame mounting bracket and the air bag module cavity in the seat backrest foam pad.
- Install new parts if damaged.



Failure to follow these instructions may result in the seat side air bag deploying incorrectly, which increases the risk of serious personal injury or death in a crash.

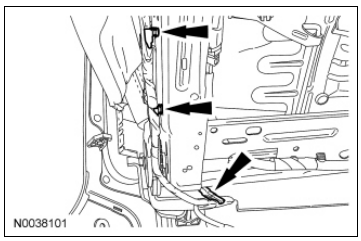
⚠ WARNING: If the seat side air bag cover has been damaged or separated from its mounting, or if the air bag material has been exposed, install a new seat side air bag module. Never try to repair the seat side air bag module. Failure to follow these instructions may result in the seat side air bag deploying incorrectly, which increases the risk of serious personal injury or death in a crash.



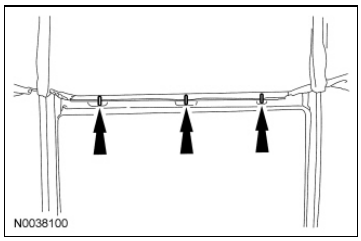
NOTICE: **Make sure the side air bag module wiring harness is not pinched between the side air bag**

module and the backrest frame. Damage to the wire harness may occur.

1. Align the holes of the side air bag module bracket to the U-nuts on the backrest frame.
   - Install new U-nuts if installing a new side air bag module.



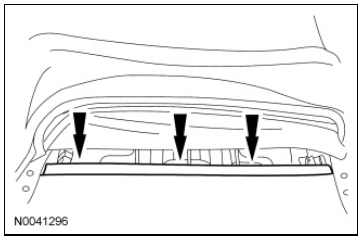
2. Slide the side air bag module onto the backrest frame so the bracket hook wraps around the backrest frame.



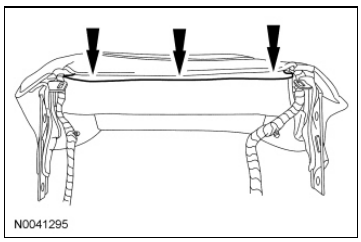
3. Install the side air bag module and the bolts.
   - Tighten to 10 Nm (89 lb-in).

4. Position back the seat backrest foam pad.

5. Attach the side air bag wiring harness retainers to the seat backrest frame.

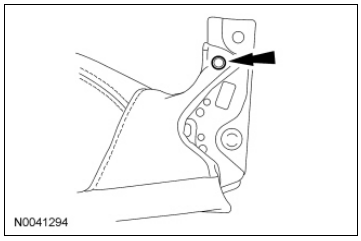


6. Attach the hook-and-loop strips, and roll the seat back trim cover down and install the first row of hog rings.



7. Attach the hook-and-loop strips, and roll the seat back trim cover down and attach the seat back lower inner trim cover J-clip.

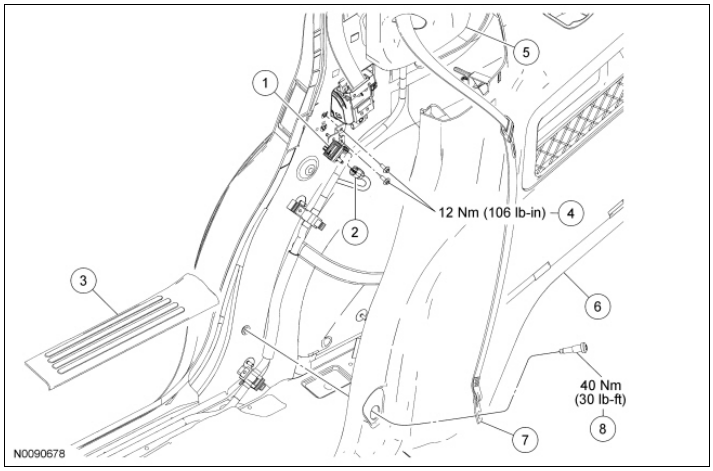
tomsn048@gmail.com



8. Attach the seat back lower outer trim cover J-clip.

9. **NOTE:** RH shown, LH similar.

   Fold the backrest trim cover over on each side of the inboard and outboard recliner. Install the plastic rivets attaching the backrest trim cover to the inboard and outboard recliners on the seat backrest frame.



10. Install the seat backrest. For additional information, refer to Section 501-10 .

11. Install the front seat. For additional information, refer to Section 501-10 .

tomsn048@gmail.com

Side Impact Sensor - C-Pillar, Explorer, Mountaineer

NOTE: RH shown, LH similar.

Item	Part Number	Description
1	14B345	Side impact sensor and bracket assembly
2	-	Electrical connector (part of 14A488)
3	13229	Rear door scuff plate
4	W707722	C-pillar side impact sensor bolts
5	31004	Upper C-pillar trim panel
6	31012	Quarter trim panel
7	-	Safety belt anchor (part of 611B68)
8	W708473	Safety belt anchor bolt

⚠ WARNING: If a vehicle has been in a crash, inspect the restraints control module (RCM) and the impact sensor (if equipped) mounting areas for deformation. If damaged, restore the mounting areas to the original production configuration. A new RCM and sensors must be installed whether or not the air bags have deployed. Failure to follow these instructions may result in serious personal injury or death in a crash.

NOTE: The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is removed and the ignition is ON.

NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: The LH and RH C-pillar mounted side impact sensors are not interchangeable.

1. Depower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

2. Remove the rear door scuff plate.

3. Remove the bolt and safety belt anchor.
   - To install, tighten to 40 Nm (30 lb-ft).

4. Detach the upper C-pillar trim panel and position aside.

5. Position aside the quarter trim panel.
   - Pull out on the quarter trim panel at the C-pillar to release the retaining clips and access the C-pillar side impact sensor.

6. Disconnect the electrical connector.

7. **NOTE:** Note the position of the sensor and bracket locating tab for installation.

   NOTE: Make sure the C-pillar and side impact severity sensor mating surfaces are clean and free of foreign material.

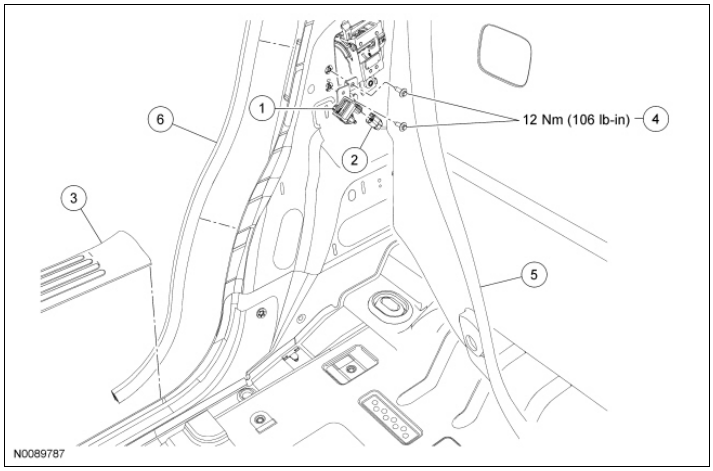
   Remove the 2 bolts and side impact sensor.

   - To install, tighten to 12 Nm (106 lb-in).

8. ⚠ **WARNING: Always tighten the fasteners of the restraints control module (RCM) and impact sensor (if equipped) to the specified torque. Failure to do so may result in incorrect restraint system operation, which increases the risk of personal injury or death in a crash.**

   NOTE: Make sure the safety belt webbing is not twisted prior to installation.

   To install, reverse the removal procedure.



9. Repower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

Side Impact Sensor - C-Pillar, Explorer Sport Trac

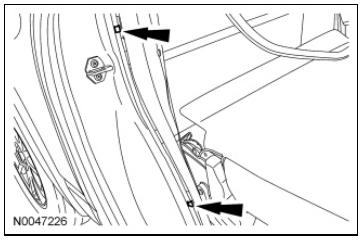
NOTE: RH shown, LH similar.

Item	Part Number	Description
1	14B345	Side impact sensor assembly
2	-	Electrical connector (part of 14A488)
3	13228	Rear door scuff plate
4	W707722	C-pillar side impact sensor bolts
5	253A10	Lower C-pillar trim panel
6	-	Rear door weatherstrip

⚠ WARNING: If a vehicle has been in a crash, inspect the restraints control module (RCM) and the impact sensor (if equipped) mounting areas for deformation. If damaged, restore the mounting areas to the original production configuration. A new RCM and sensors must be installed whether or not the air bags have deployed. Failure to follow these instructions may result in serious personal injury or death in a crash.

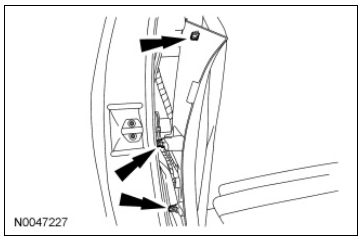
NOTE: The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is removed and the ignition is ON.

NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.



NOTE: The RH and LH C-pillar mounted side impact sensors are not interchangeable.

1. Depower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.



2. Remove the rear door scuff plate.

3. Detach the rear door weatherstrip.

4. Remove the 2 lower C-pillar trim panel retaining clips from the rear door opening sheet metal.

5. Position aside the lower C-pillar trim panel.
    - Pull out on the quarter trim panel at the C-pillar to release the 3 retaining clips and access the C-pillar side impact sensor.

6. **NOTE:** Note the position of the sensor and bracket locating tab for installation.

   NOTE: Make sure the C-pillar and side impact sensor mating surfaces are clean and free of foreign material.

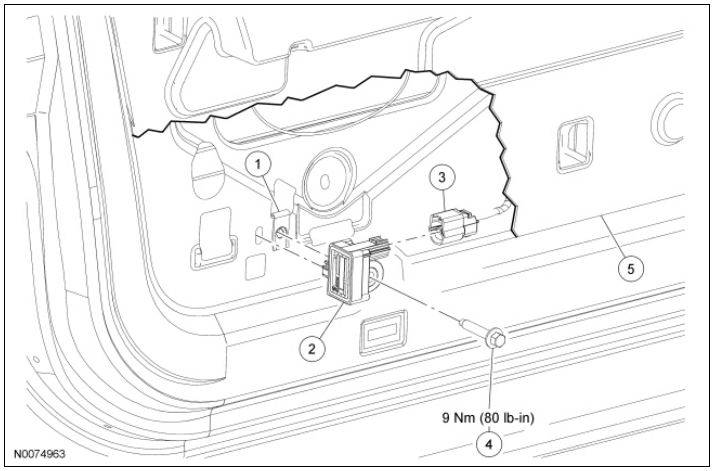
   Remove the 2 bolts from the side impact sensor and bracket assembly.

    - To install, tighten to 12 Nm (106 lb-in).

7. Disconnect the electrical connector and remove the side impact sensor.

8. ⚠ **WARNING: Always tighten the fasteners of the restraints control module (RCM) and impact sensor (if equipped) to the specified torque. Failure to do so may result in incorrect restraint system operation, which increases the risk of personal injury or death in a crash.**

   To install, reverse the removal procedure.



9. Repower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

Side Impact Sensor - Front Door

NOTE: LH side shown, RH similar.

Item	Part Number	Description
1	W705958	J-clip retaining nut
2	14B345	Side impact sensor (pressure sensor)
3	-	Electrical connector (part of 14631)
4	W500300	Side impact sensor bolt
5	237A05	Weathershield

Removal and Installation

⚠ **WARNING: If a vehicle has been in a crash, inspect the restraints control module (RCM) and the impact sensor (if equipped) mounting areas for deformation. If damaged, restore the mounting areas to the original production configuration. A new RCM and sensors must be installed whether or not the air bags have deployed. Failure to follow these instructions may result in serious personal injury or death in a crash.**

NOTE: The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is removed and the ignition is ON.

NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

1. Depower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

2. Remove the front interior door trim panel. For additional information, refer to Section 501-05 .

3. Detach the rearward lower corner of the weathershield on the door to access the side impact sensor (pressure sensor).

4. Disconnect the electrical connector.

tomsn048@gmail.com

5. Remove the bolt and side impact sensor.
    - To install, tighten to 9 Nm (80 lb-in).

6. ⚠ **WARNING: Always tighten the fasteners of the restraints control module (RCM) and impact sensor (if equipped) to the specified torque. Failure to do so may result in incorrect restraint system operation, which increases the risk of personal injury or death in a crash.**

   To install, reverse the removal procedure.

7. Repower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

Descriptions of Ford Steel Families

Grade	Alloy Content	Heat Treatment	Typical Applications	Comments
Mild steel, bake hardened, solid solution strengthened	Low	Fully annealed/dead soft	Body panels (closures, floor pan, dash panel)	-
High-Strength Low Alloy (HSLA)	Low	Fully annealed/dead soft	Rails, structural members	Strengthened with fine particles and small grain size
Dual Phase	Medium (Manganese Silicon, Molybdenum Chromium)	Fully annealed/partially hardened	Rails, structural members	15-50% of structure is hard martensite
Ultra High Strength Steel (UHSS) (Martensitic, Boron)	Low	Fully hardened	Rocker reinforcements, door beams, bumper beams	100% of structure is hard martensite
Transformation Induced Plasticity steel	High (Manganese, Phosophorus, Silicon, Aluminum)	Fully annealed/ partially hardened	To be determined	Complex microstructure for high strength and ductility

Ford Recommended Steel Repairability Matrix

Grade	Trade Descrip-tions	Welding Method			Cold Repairs	Use of Heat for Repair	Temp-erature Range	Max-imum Heat

High- Strength Low Alloy (HSLA)	HSLA 250, HSLA 350, HSLA 550						Up to 650°C (1200°F)	90 sec. x 2
Dual Phase = 600 MPa Ultimate Tensile Strength (UTS)	DP 500, DP 600	Yes	Yes	Yes	Yes [a]	No	NA	NA
Dual Phase = 600 MPa Ultimate Tensile Strength (UTS) particular to 780 and 980 grades) [b]	DP 700, DP 780, DP 900	Yes [c]	Yes	Yes	No	No	NA	NA
Ultra High Strength Steel (UHSS) (Martensitic, Boron) [d]	Boron	Yes [a]	Yes	Yes	No	No	NA	NA
Trans- formation Induced Plasticity Steel (TRIP)	TRIP 590, TRIP 780, TRIP 980	NA	NA	NA	NA	NA	NA	NA

[a] Cold repairs can be performed if damage excludes kinks. May section only if approved procedure in workshop manual.

[b] Dual phase steels DP 700, DP 780 and DP 980 must be replaced at factory joints, no sectioning unless approved procedure in workshop manual.

[c] For DP 980, use MIG plug welding only, no stitch welding.

[d] Boron components must be replaced at factory joints, no sectioning allowed.

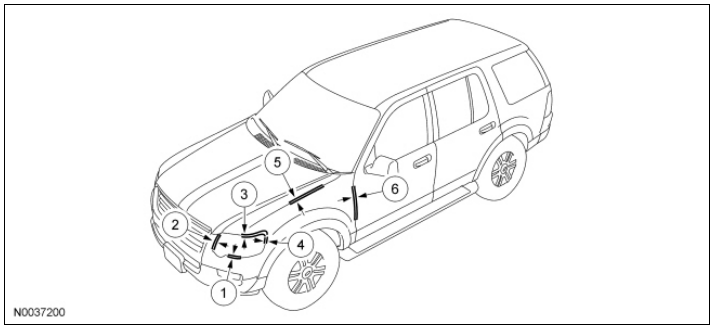
Body

⚠ WARNING: Collision damage repair must conform to the instructions contained in this workshop manual. Replacement components must be new, genuine Ford Motor Company parts. Recycled, salvaged, aftermarket or reconditioned parts (including body parts, wheels or safety restraint components) are not authorized by Ford.

Departure from the instructions provided in this manual, including alternate repair methods or the use of substitute components, risks compromising crash safety. Failure to follow these instructions may adversely affect structural integrity and crash safety performance, which could result in serious personal injury to vehicle occupants in a crash.

The body consists of the following:

- Body-on full-frame design
- High-Strength Low Alloy (HSLA), High-Strength Steel (HSS) and mild steels
- Explorer hood constructed of aluminum
- Mountaineer hood constructed of lightweight steel
- Steel radiator support
- Lightweight steel welded panel construction
- Bolted, removable front fenders, hinged doors, liftgate and hood
- Mountaineer fenders constructed of Sheet-Molded Composite (SMC)
- Explorer and Mountaineer have unique headlamp assemblies and grille
- Explorer and Mountaineer have unique front fascias
- Bolt-on HSS front bumper beam
- Welded-on HSS rear bumper beam
- Steel liftgate
- Explorer Sport Trac hood constructed of aluminum
- Explorer Sport Trac front structure common with Explorer
- Explorer Sport Trac has modified roof line aft of the B-pillar
- Explorer Sport Trac pick-up box has SMC inner and outer panel construction
- Explorer Sport Trac fenders constructed of steel
- Fascias constructed of Thermoplastic Olefin (TPO)
- Explorer Sport Trac tailgate constructed of steel



For dimensional information, refer to the following illustrations:

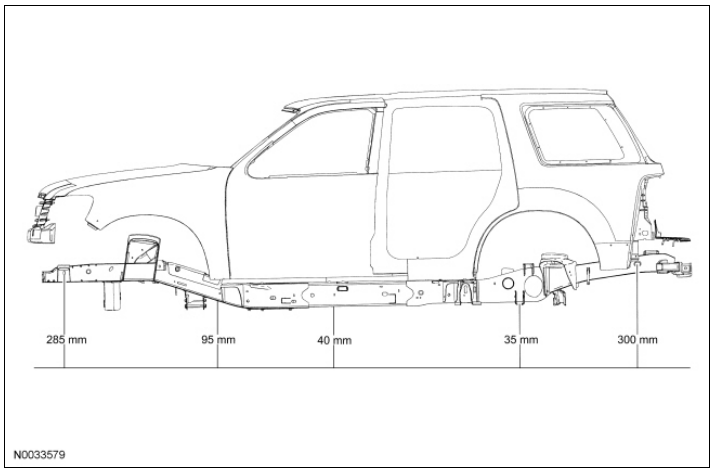
Body Rear Opening Dimensions - Explorer/Mountaineer

NOTE: Measurements are obtained on center, unless otherwise indicated.

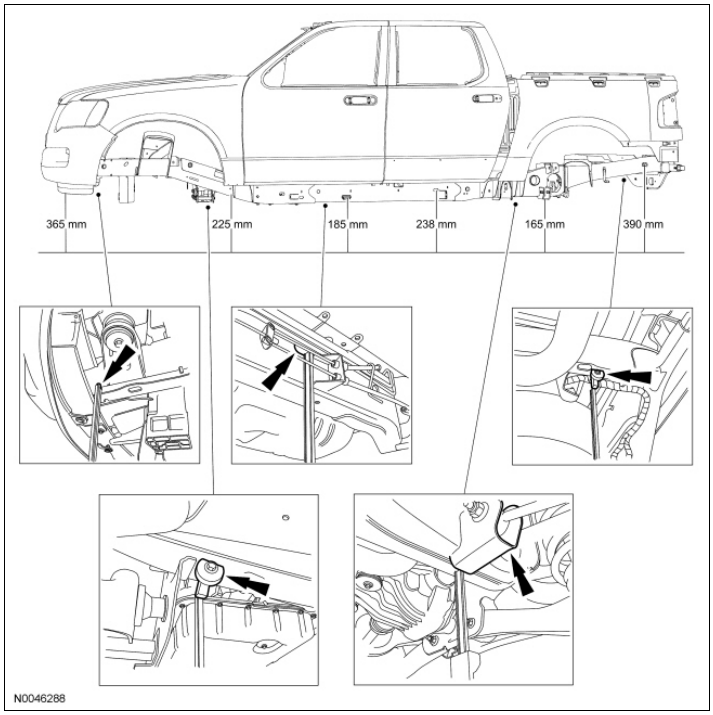
Tailgate Opening Dimensions - Explorer Sport Trac



NOTE: Measurements are obtained on center, unless otherwise indicated.

Underbody Dimensions

Frame Datum Height - Explorer/Mountaineer

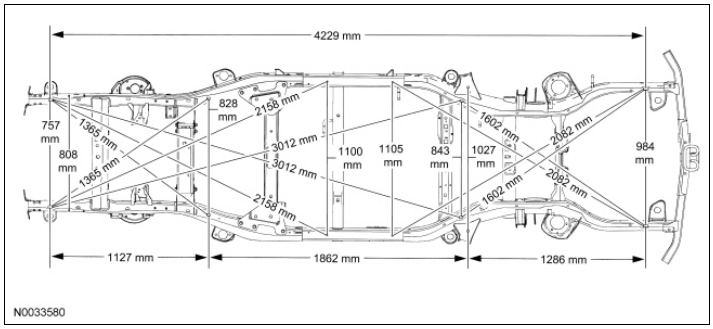


NOTE: The gauge for the No. 2 datum measurement is located 90 mm (3.54 in) from the front transmission crossmember flange. The gauge for the No. 3 datum measurement is located 610 mm (24.01 in) from the rear transmission mount, rear bolt (on center). Measurements indicated from the front (No. 1) to the rear (No. 5).

Frame Datum Height - Explorer Sport Trac

NOTE: Measurements indicated from the front (No. 1) to the rear (No. 6). No. 2 measurement obtained on frame at No. 2 crossmember flange.

tomsn048@gmail.com

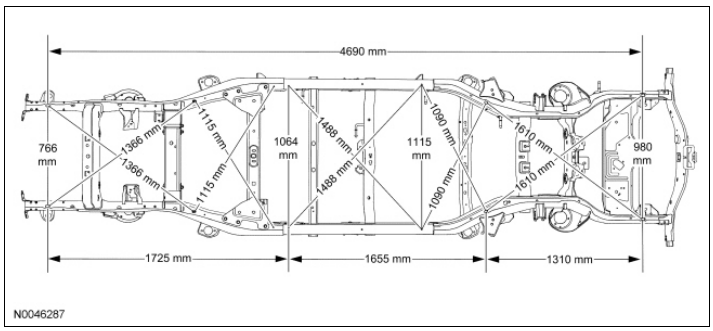


Frame Dimensions - Explorer/Mountaineer

⚠ WARNING: Frame rail crush zones absorb crash energy during a collision and must be replaced if damaged. Prior to replacement of frame rail crush zones, straighten damaged frame rails to correct frame dimensions. Failure to follow these instructions may adversely affect frame rail crush zone performance and may result in serious personal injury to vehicle occupants in a crash.

NOTE: A structural frame rail service kit is available for this vehicle. It is mandatory to carry out repairs per the instructions in the Frame Members procedure and instruction kit supplied with the service replacement part. The frame must maintain original dimensions. Refer to Frame Members in this section.

NOTE: Measurements are obtained on center, unless otherwise indicated.



Frame Dimensions - Explorer Sport Trac

⚠ WARNING: Frame rail crush zones absorb crash energy during a collision and must be replaced if damaged. Prior to replacement of frame rail crush zones, straighten damaged frame rails to correct frame dimensions. Failure to follow these instructions may adversely affect frame rail crush zone performance and may result in serious personal injury to vehicle occupants in a crash.

NOTE: A structural frame rail service kit is available for this vehicle. It is mandatory to repair per the instructions in the procedure and instruction kit supplied with the service replacement part. The frame must

maintain original dimensions. Refer to Frame Members in this section.

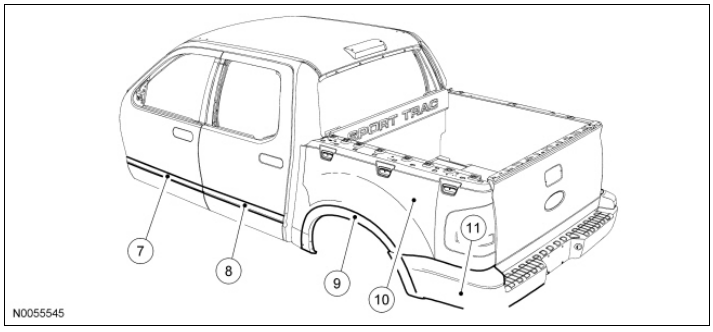
Plastic Components

Exterior Plastic Components - Painted

⚠ WARNING: Always refer to Material Safety Data Sheet (MSDS) when handling chemicals and wear protective equipment as directed. Examples may include but are not limited to respirators and chemically resistant gloves. Failure to follow these instructions may result in serious personal injury.



NOTE: The following illustration(s) are not all-inclusive of trim levels available. The actual trim level of the vehicle will determine the viability of carrying out a plastic repair.

NOTE: Explorer/Mountaineer shown, front bumper cover common with Explorer Sport Trac.

Item	Part Number	Description
1	17D957A	Bumper cover (front) - Thermoplastic Olefin (TPO)
2	16039 A/B LH/ 16038 A/B RH	Wheel arch moulding (front) - TPO
3	20879 LH/ 20878 RH	Door moulding (front) - TPO
4	25557 LH/ 25556 RH	Door moulding (rear) - TPO
5	29165 LH/ 29164 RH	Wheel arch moulding (rear) - TPO
6	17K835	Bumper cover (rear) - TPO

Explorer Sport Trac

Item	Part Number	Description
7	20879 LH/ 20878 RH	Door moulding (front) - TPO
8	25557 LH/ 25556 RH	Door moulding (rear) - TPO
9	29165 A/B LH/ 29164 A/B RH	Wheel arch moulding (rear) - TPO
10	27841 LH/ 27840 RH	Body side panel assembly - Sheet-Molded Composite (SMC)
11	17K835	Bumper cover (rear) - TPO

Several considerations will determine viability of plastic repair procedure(s):

- Is the damage cosmetic or structural?
- Can the repair be carried out on the vehicle?
- Is the part readily available?
- Is component repair the most cost effective method?
- Can the component be economically restored to original strength and appearance?
- Will the repair provide for the fastest, highest quality repair?

Several types of plastic are in use for automotive application. However, all plastics will fall into 2 primary categories of thermoplastic or thermosetting plastic.

Thermosetting Plastic

Generally, thermosetting plastics are made with 2-part thermosetting resins. When mixed together, heat is generated, producing a cure that is irreversible. Because of this, thermosetting plastics will require the use of a 2-part adhesive for repair.

Sheet-Molded Composite (SMC)

Sheet-Molded Composite (SMC) is a type of thermosetting plastic that uses glass fibers or nylon fibers in combination with thermosetting polyester resins. When fully cured, SMC is strong and rigid.

SMC is similar to, but not identical to fiberglass. Ford Motor Company uses SMC in components such as fenders, hoods and liftgates.

Thermoplastic Compounds

Thermoplastic compounds are manufactured by a process that is reversible. Thermoplastics can be remolded repeatedly by reheating. This characteristic of thermoplastics makes plastic welding a possible repair alternative. A repair of thermoplastic compounds is still possible through the use of 2-part adhesive and filler repair materials and reinforcements as needed. Thermoplastics are widely used in interior trim components, wheel flares, body side cladding and bumper covers.

Polyolefin

Polyolefins fall into the family of thermoplastics with one unique characteristic: An oily or waxy feel to the material when sanded or ground. Polyolefin lends itself very well to remolding through the use of heat. Because of this, components made of this material lend themselves well to the possibility of plastic welding. Most adhesive repair materials and paint will not bond to surface of a polyolefin unless an adhesion promoter specially formulated for plastic is first applied to the exposed raw surface. Otherwise, polyolefins are repaired like most other thermoplastics. Some typical uses of polyolefins are:

- bumper covers.
- fan shrouds.
- wheel housings.

tomsn048@gmail.com

Proper identification of the various types of plastic is necessary to select the appropriate repair method(s) to carry out high quality plastic repairs. Refer to Plastics Identification in this section.

Welding Precautions - Steel

Material

Item	Specification
Motorcraft Premium Undercoating PM-25-A	-
Motorcraft Rust Inhibitor Aerosol PM-24-A	-

General Specifications -Welding Specifications

Item	Specification
Plug Weld Hole	8 mm (0.31 in)
Weld Wire ER70S-3 or equivalent	0.9-1.1 mm (0.035-0.045 in)

General Equipment
3 Phase Inverter Spot Welder 254-00002
Compuspot 700F Welder 190-50080
I4 Inverter Spot Welder 254-00014
Inverter Welder with MIG Welder 254-00015

⚠ WARNING: Invisible ultraviolet and infrared rays emitted in welding can injure unprotected eyes and skin. Always use protection such as a welder's helmet with dark-colored filter lenses of the correct density. Electric welding will produce intense radiation, therefore, filter plate lenses of the deepest shade providing adequate visibility are recommended. It is strongly recommended that persons working in the weld area wear flash safety goggles. Also wear protective clothing. Failure to follow these instructions may result in serious personal injury.

tomsn048@gmail.com

⚠ WARNING: Always wear protective equipment including eye protection with side shields, and a dust mask when sanding or grinding. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: On vehicles equipped with Safety Canopy® options, prior to carrying out any sectioning repairs near the roof line or sail panel areas of the vehicle, remove the Safety Canopy® module and related components. Failure to comply may result in accidental deployment or damage to the Safety Canopy®. Refer to Section 501-20B . Failure to follow these instructions may result in serious injury to technician or vehicle occupant(s).

NOTICE: **Disconnect the instrument cluster module, Powertrain Control Module (PCM), Engine Control Module (ECM), fuel pump driver module (gas only), Anti-lock Brake System (ABS) module and diesel Fuel Injection Control Module (FICM), if equipped. Electronic modules and related wiring may be damaged when exposed to heat from welding procedures.**

NOTE: When it is necessary to carry out weld-bonding procedures, refer to Weld-Bonding in this section.

The correct equipment and settings must be used when welding mild or high-strength steel. Metal Inert Gas (MIG) and Squeeze-Type Resistance Spot Welding (STRW) are the preferred methods. Surfaces must be clean and free of foreign materials.

- Do not use gas welding equipment.
- Adequate ventilation must be provided to avoid accumulation of poisonous gases.
- A test weld should always be carried out on a test sample. Refer to the Weld Nugget Chart in Specifications for Ford-approved weld nugget information.
- Use cleaning brushes and abrasive grinding wheels dedicated to the type of materials being welded.
- Follow the equipment manufacturer's prescribed procedures and equipment settings for the type of welder being used. ER70S-2 or ER70S-6 wire are typically used for MIG welding steel.
- Disconnect the battery(s). Refer to Section 414-01 .
- Replace spot-welded components by spot welding where possible.
- Corrosion protection must be restored whenever bare metal repairs are made. Refer to Restoring Corrosion Protection Following Repair in this section.
- Adequate power supply needs to be used to make sure of correct equipment performance.
- Factory spot welds may be substituted with either STRW or MIG plug welds. Spot/plug welds should equal factory welds in both location and quantity. Do not place a new spot weld directly over an original weld location. Plug weld hole should equal 8 mm (0.31 in) diameter.

- Components made of high-strength steel should not be heated to straighten or repair. If components are severely bent or kinked, new components should be installed.

When MIG or arc welding frame components, the following guidelines should be followed:

NOTICE: **When welding low carbon steel side rails (35,000 psi yield strength), emphasis should be placed upon weld application techniques to avoid excessive heat affected zones that may adversely affect frame operating stresses. When welding within 100 mm (3.93 in) of any crossmember that contains rivets, remove the rivets and install new SAE grade 8 bolts/nuts.**

NOTE: Do not weld on any reinforcement. Use compression type fasteners when attaching any component to the frame in the reinforcement area.

- A temperature indicating crayon calibrated below 650°C (1,200°F) should be used to avoid overheating and weakening the metal.
- Attach the ground clamp as close as possible to the work area.
- Choose welding electrodes according to the type of steel, thickness and polarity of the arc welder AC

or DC.

- Do not use water or compressed air to cool welding. This can cause the metal to become brittle and weak.
- Where frame wax coating and the bracket E-coat have been removed, apply anti-corrosion coating to all affected surfaces of the frame, bracket and weld areas.
- Clean the welded areas with a wire brush.
- Use a wax and grease remover for a final cleaning of the weld areas.

---

Sealers

⚠ WARNING: Always refer to Material Safety Data Sheet (MSDS) when handling chemicals and wear protective equipment as directed. Examples may include but are not limited to respirators and chemically resistant gloves. Failure to follow these instructions may result in serious personal injury.

The correct sealing of joints is essential to repairing the vehicle correctly. Sealers are used to prevent wind noise, water leaks, exhaust fumes and dust from entering the vehicle. They also provide anti-corrosion barriers. Sealers are applied to areas such as door and rear compartment hem flanges, wheelhouse, quarter outer, floor, cowl, roof and other panel-to-panel attaching points. The following joint sealers are recommended for use depending upon the application:

- Brushable Seam Sealer - A sealer intended to restore the original brushed seam appearance. It is used to seal lap joints in sheet metal that are spot welded (for example, floorpans and cowls). Use a product obtained locally.
- Roof Ditch Sealer - A self-leveling sealer used for drip rails, roof seams, quarter panels to rear deck and for water leaks.
- Seam Sealer - Heavy-bodied, non-sag adhesive/sealer for use on standing cosmetic seams, truck bed seams, tooled door skin seams and floor pans. Also used for water leaks and noise concerns.

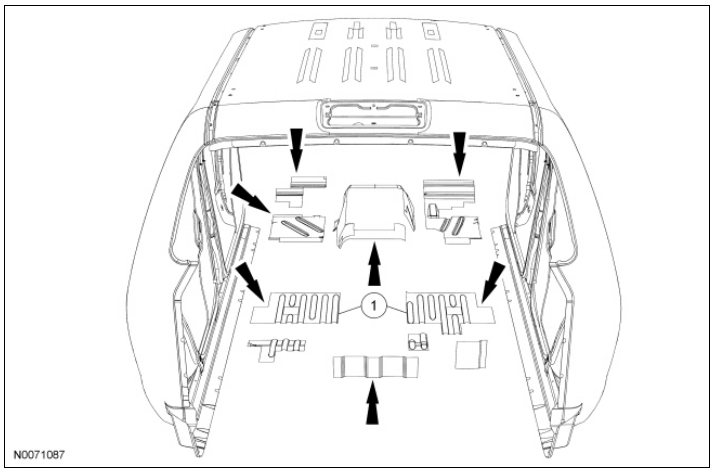
Sealers should remain flexible after curing and must be paintable. Follow the manufacturer's directions for correct application of these materials.

Any damage to originally sealed joints should be repaired by resealing. Along with attaching points of new panels, open joints that require bridging of sealer to close a gap should be sealed using a heavy-bodied sealer.

Sound Deadeners and Insulators

⚠ WARNING: Always refer to Material Safety Data Sheet (MSDS) when handling chemicals and wear protective equipment as directed. Examples may include but are not limited to respirators and chemically resistant gloves. Failure to follow these instructions may result in serious personal injury.

NOTICE: **Mastic is made of a combustible material and should be removed prior to carrying out welding procedures to the area. Heat zones from welding near the mastic may cause the mastic material to burn.**



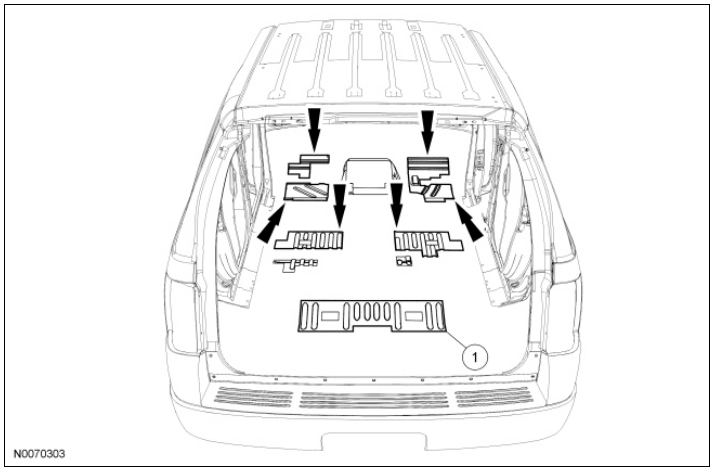
NOTICE: **Corrosion protection must be restored to the area AFTER the mastic material is applied. Corrosion protection products may be wax based and loss of adhesion may occur.**

NOTE: The following illustrations serve as a reference to indicate mastic patch (butyl pad) locations. Additional insulators and sound deadeners are used beyond those indicated in the illustration.

NOTE: To restore the vehicle to design intent, missing or damaged sound deadeners and insulators should be installed new with the correct service replacement component.

Explorer Sport Trac

NOTE: Mastic material is applied from the factory in a pumpable form. All locations indicated in the illustration are this material with a common base part number.



Item	Part Number	Description
1	99P30A2	Mastic insulators

Explorer/Mountaineer

NOTE: Mastic material is applied from the factory in a pumpable form. All locations indicated in the illustration are this material with a common base part number.

tomsn048@gmail.com

Item	Part Number	Description
1	99P30A2	Mastic insulators

1. **NOTE:** In applications where mastic material is applied as a pumpable material at the factory, replacement of missing or damaged mastic is acceptable in the form of cut-to-fit butyl pad(s) or pumpable mastic material(s) when carrying out repairs.

   Whenever replacement of an existing mastic insulator is carried out, the surface must be thoroughly cleaned to make sure correct adhesion will occur. The surface should be 10°C (50°F) or greater before applying the mastic. The use of a heat gun to warm the metal surface will aid in adhesion.

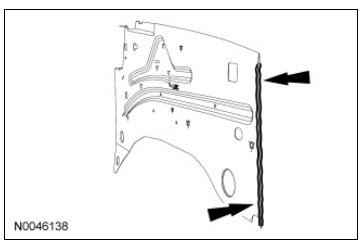
Adhesives

Material

Item	Specification
Clear Silicone Rubber TA-32	ESB-M4G92-A
Metal Bonding Adhesive TA-1	-
Plastic Bonding Adhesive TA-9	-
Trim and Weatherstrip Adhesive TA-14-A	-

⚠ WARNING: Always refer to Material Safety Data Sheet (MSDS) when handling chemicals and wear protective equipment as directed. Examples may include but are not limited to respirators and chemically resistant gloves. Failure to follow these instructions may result in serious personal injury.

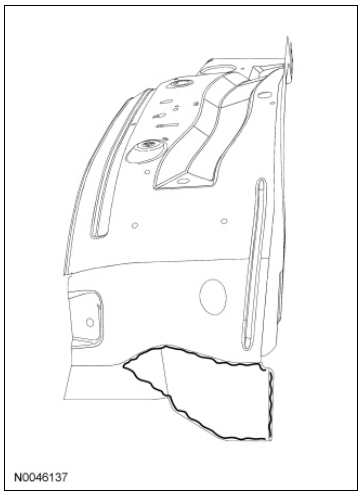
Adhesives are used in a variety of applications. Typical uses for adhesives include roof panels, door skins and quarter panels. Trim applications include body side mouldings, emblems, stationary glass and weatherstripping. Combination sealer/adhesives are also used. Surface preparation is critical to a high quality repair. Following the label instructions for the product is essential.



Work in a well-ventilated area and protect adjacent surfaces when working with adhesives. The use of eye protection and protective clothing is also recommended when working with adhesives. Carry out a trial fit, mark and align the surfaces before bonding the materials together.

Seam sealers and corrosion protection may be necessary once the adhesive(s) has cured, depending on the application. The following is a list of adhesives recommended for certain types of applications:

- Metal Bonding Adhesive - For bonding cold-rolled steel, galvanized steel, aluminum and correctly prepared E-coat. It is used for door skin and roof panel replacement and OEM structural adhesive replacement.
- Plastic Bonding Adhesive - For bonding a variety of plastics to plastics and plastics to primed, painted or E-coated metals. Also for general purpose bonding of trim components.
- Trim and Weatherstrip Adhesive - For use on body side moulding, emblems, trim, bumper impact strips and carpeting.
- Clear Silicone Rubber - Used for sealing water leaks, noise concerns, remounting trim and repairing torn weatherstripping.



NOTE: The following illustrations identify structural adhesive locations.

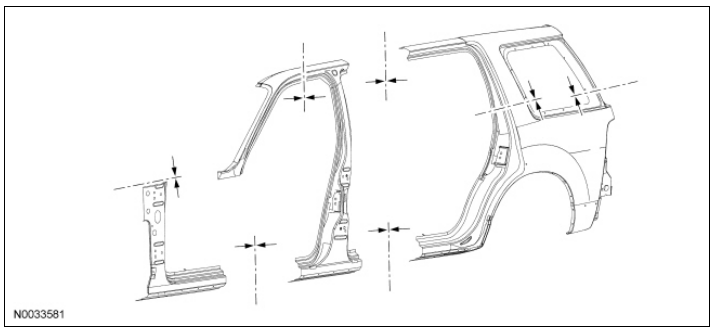
Premium Undercoating ValuGardâ ¢ VG101, VG101A (aerosol)	â
Rust Inhibitor ValuGardâ ¢ VG104, VG104A (aerosol)	â
Seam Sealer TA-2	â

Body Side ï¿½ Explorer/Mountaineer

⚠ WARNING: Invisible ultraviolet and infrared rays emitted in welding can injure unprotected eyes and skin. Always use protection such as a welder's helmet with dark-colored filter lenses of the correct density. Electric welding will produce intense radiation, therefore, filter plate lenses of the deepest shade providing adequate visibility are recommended. It is strongly recommended that persons working in the weld area wear flash safety goggles. Also wear protective clothing. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: On vehicles equipped with Safety CanopyÂ® options, prior to carrying out any sectioning repairs near the roof line or sail panel areas of the vehicle, remove the Safety CanopyÂ® module and related components. Failure to comply may result in accidental deployment or damage to the Safety CanopyÂ®. Refer to Section 501-20B . Failure to follow these instructions may result in serious injury to technician or vehicle occupant(s).

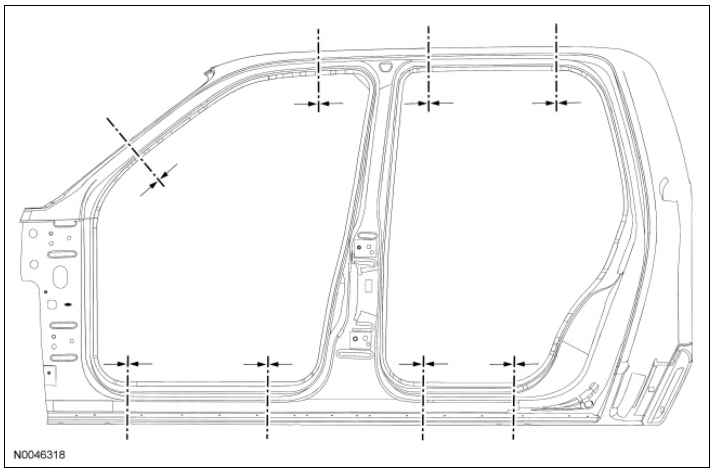
⚠ WARNING: Do not carry out body side sectioning repairs in areas of laser welds. Factory laser welds cannot be duplicated with conventional welding equipment and structural integrity may be compromised. Failure to follow this instruction may result in serious injury to vehicle occupant(s).



⚠ WARNING: Do not carry out body side sectioning repairs in areas of door hinge or striker anchoring points. Welding within 50 mm (1.96 in) of door hinge or striker locations may compromise structural integrity during a collision. Failure to follow these instructions may result in serious injury to vehicle occupant(s).

tomsn048@gmail.com

NOTE: Factory spot welds may be substituted with either resistance spot welds or Metal Inert Gas (MIG) plug welds. Spot/plug welds should equal factory welds in both location and quantity. Do not place a new spot weld directly over an original weld location. Plug weld hole should equal 8 mm (0.31 in) diameter.



NOTE: When it is necessary to carry out weld-bonding procedures, refer to Weld-Bonding in this section.

NOTE: Left side shown, right side similar.

Body Side ï¿½ Explorer Sport Trac

NOTE: Left side shown, right side similar.

⚠ WARNING: Collision damage repair must conform to the instructions contained in this workshop manual. Replacement components must be new, genuine Ford Motor Company parts. Recycled, salvaged, aftermarket or reconditioned parts (including body parts, wheels or safety restraint components) are not authorized by Ford.

Departure from the instructions provided in this manual, including alternate repair methods or the use of substitute components, risks compromising crash safety. Failure to follow these instructions may adversely affect structural integrity and crash safety performance, which could result in serious personal injury to vehicle occupants in a crash.

1. Drill out the spot welds of the damaged panel to be sectioned. Using a cut-off wheel, reciprocating saw or plasma cutter, cut through the damaged area of the outer panel only and remove the section to be replaced.

2. When welding overlapping surfaces or substrates, apply weld-through primer between the surfaces prior to welding.

3. Make sure horizontal joints and flanges are correctly sealed with seam sealer to prevent moisture intrusion. Water and moisture migrate to horizontal joints and corrosion tends to occur more rapidly in these areas. Metal surfaces must be clean and dry before applying seam sealer.

4. Proceed with the refinishing process following Ford-approved paint recommendations. Apply corrosion protection material to the exterior surfaces or substrates after refinishing.

tomsn048@gmail.com

Restoring Corrosion Protection Following Repair

Special Tool(s)

 ST3049-A	Rust Inhibitor Installation Kit 286-00002
 ST3048-A	Undercoating Spray Gun 286-00001

Material

Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	-
Premium Undercoating ValuGardTM VG101, VG101A (aerosol)	-
Rust Inhibitor ValuGardTM VG104, VG104A (aerosol)	-

⚠ WARNING: Always refer to Material Safety Data Sheet (MSDS) when handling chemicals and wear protective equipment as directed. Examples may include but are not limited to respirators and chemically resistant gloves. Failure to follow these instructions may result in serious personal injury.

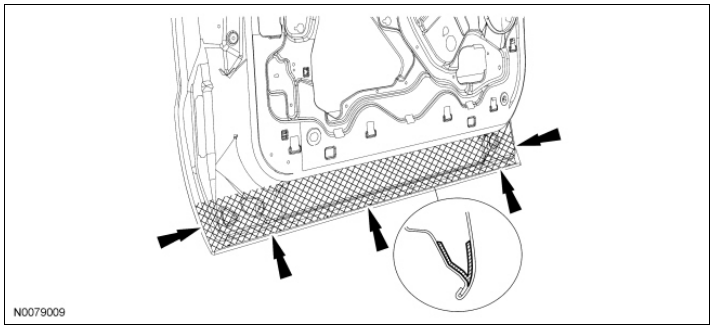
⚠ WARNING: Always wear protective equipment including eye protection with side shields, and a dust mask when sanding or grinding. Failure to follow these instructions may result in serious personal injury.

NOTICE: **Drilling access holes in body panels is not recommended. Drilling holes will break the original paint finish and promote corrosion.**

NOTE: Corrosion protection needs to be restored whenever it is necessary to sand or grind through painted surfaces or E-coat, or when bare metal repairs are made.

NOTE: Refer to product label for preparation and handling instructions.

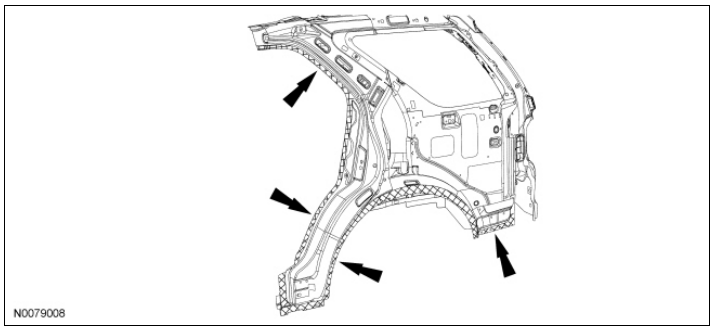
1. The surfaces must be free of oil, dirt and other foreign material. Carry out the process in the following sequence.
    1. Thoroughly clean and degrease metal surfaces using metal surface prep to remove wax and grease.
    2. For best results, the vehicle should be at room temperature. Attach the rust inhibitor canister to the Rust Inhibitor Installation Kit 286-00002.
    3. Rust inhibitor should be applied after the welding and refinishing process. Product cannot be welded through.
    4. Air pressure setting for applicator gun is 448-517 kPa (65-75 psi).



- Use the long wand when spraying enclosed areas. The spray nozzle provides a 360-degree spray pattern. Insert the wand as far as possible into the access hole, pull the trigger and wait 2-3 seconds and slowly pull the wand out of the access hole.
- The short, hook-shaped wand sprays in one direction and must be rotated to provide complete coverage.
- Apply the material in light mist coats.
- Material displaces moisture.

5. Clean up any overspray with a mild solvent such as mineral spirits or bug and tar remover.

NOTE: The following illustrations provide typical applications of body seams and spot welded flanges and are not vehicle specific.



2. **NOTE:** Door assembly lower view.

   Apply rust inhibitor as shown to the inside of the door shell on all the interior metal surfaces using the most suitable applicator wand. Apply material to the exposed edges after carrying out the welding process. Make sure horizontal surfaces are well protected as they are more susceptible to corrosion. Keep door drain holes clear to prevent moisture buildup.

3. **NOTE:** Quarter panel inner view.

   Apply rust inhibitor to the closed channel portion of the spot weld flange areas using the short, hook-shaped wand. Apply material to the exposed edges after carrying out the welding process. Make sure horizontal surfaces are well protected as they are more susceptible to corrosion.

4. **NOTE:** Door frame opening view.

   Apply rust inhibitor to the closed channel portion of the spot weld flange areas using the short, hook-shaped wand. Make sure horizontal surfaces are well protected as they are more susceptible to corrosion.

tomsn048@gmail.com

Body and Frame Undercoating

1. ⚠ **WARNING: Always refer to Material Safety Data Sheet (MSDS) when handling chemicals and wear protective equipment as directed. Examples may include but are not limited to respirators and chemically resistant gloves. Failure to follow these instructions may result in serious personal injury.**

   ⚠ **WARNING: Always wear protective equipment including eye protection with side shields, and a dust mask when sanding or grinding. Failure to follow these instructions may result in serious personal injury.**

   NOTICE: **Do not allow undercoating on powertrain components. Failure to follow these instructions may result in incorrect operation of these components.**

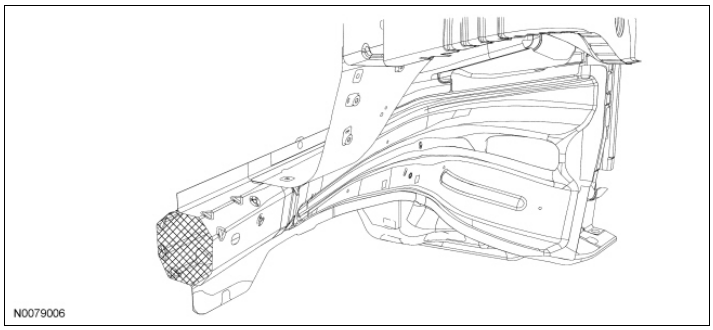
   NOTE: Refer to product label for preparation and handling instructions.

   NOTE: Avoid high-pressure water spray cleaning to treated underbody area for 24 hours.

   Wire brush the area and make sure the surfaces are free of oil, dirt and other foreign material. Carry out the undercoating process in the following sequence.

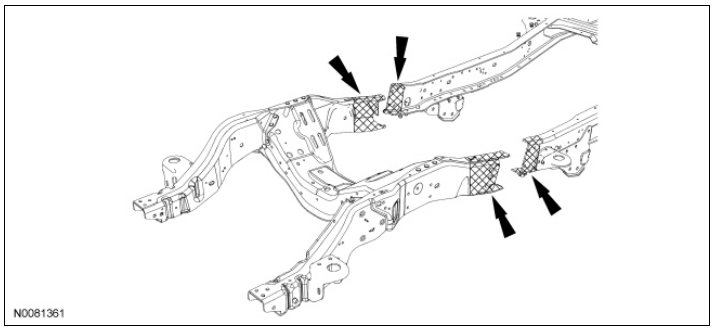
   1. Thoroughly clean and degrease metal surfaces using metal surface prep to remove wax and grease.
   2. For best results, the vehicle should be at room temperature.
      - ♦ Canister attaches directly to the dispensing gun. Attach the undercoating canister to the Undercoating Spray Gun 286-00001.
   3. Undercoat should be applied after the welding and refinishing process. Product cannot be welded through.
   4. Air pressure setting for applicator gun is 552-621 kPa (80-90 psi).
      - ♦ Apply light mist coats, applicator sprays in fogging pattern.
      - ♦ Material displaces moisture.
   5. Clean up any overspray with a mild solvent such as mineral spirits or bug and tar remover.

NOTE: The following illustrations provide typical applications to frame rails and are not vehicle specific.



2. **NOTE:** Frame rail exterior spot-weld flange view.

   Apply undercoat material to the exterior exposed edges after carrying out the welding and refinishing process.



3. **NOTE:** Cross section view of typical unibody frame rail shown.

   Apply rust inhibitor to the inner surfaces of the rail after carrying out welding process. Use the long wand and insert as far as possible, depress trigger and wait 2-3 seconds and slowly pull the wand to make sure the area is completely fogged.

4. **NOTE:** Full frame vehicle, front rail-to-mid rail section repair shown.

   Apply undercoat material to the exposed surfaces after carrying out the welding process. Make sure to completely cover any bare metal areas.

tomsn048@gmail.com

Refinishing - Environmental Damage

Material

Item	Specification
Motorcraft® Acid Neutralizer ZC-1-A	-
Motorcraft® Alkaline Neutralizer ZC-2-A	-
3MTM Perfect-ItTM Show Car Liquid Wax 39026	-
Motorcraft® Detail Wash ZC-3-A	-

Iron Oxide (Rail Dust) or Acid Rain Decontamination

⚠ WARNING: Always refer to Material Safety Data Sheet (MSDS) when handling chemicals and wear protective equipment as directed. Examples may include but are not limited to respirators and chemically resistant gloves. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Always wear protective equipment including eye protection with side shields, and a dust mask when sanding or grinding. Failure to follow these instructions may result in serious personal injury.

NOTICE: **In extreme cases of contamination, the vehicle may require refinishing. To avoid paint failure, follow the appropriate decontamination procedure prior to carrying out any panel refinishing procedure.**

NOTE: Iron oxide contamination appears as tiny rust spots on horizontal surfaces and in severe cases can be felt. This damage is typically caused from rail shipment, storage near railroad tracks or fallout from industrial manufacturing facilities.

NOTE: Acid rain contamination can be identified as water spotting and, in severe cases, staining within the water spots.

1. ***NOTICE:*** **Never paint over iron particles as rust spots will reoccur. Use only the recommended decontamination procedure detailed below.**

   Rinse any dust, dirt and foreign material from the vehicle body with cold water. Flush liberally.

2. Prepare the acid neutralizer by mixing 8 parts of water to 1 part neutralizer in a bucket.

3. ***NOTICE:*** **To avoid paint failure, do not allow the product to dry on the vehicle.**

   NOTE: Use a separate wash mitt for each product applied to the vehicle.

tomsn048@gmail.com

Working quickly and beginning at the top of the vehicle and working to the sides, apply the acid neutralizer mix to the entire vehicle. Keep the vehicle wet with the solution and lightly agitate for 5 to 7 minutes. Continue around the vehicle 4 to 5 times. For severe conditions, work the product for up to 8 minutes.

4. Rinse the vehicle completely with cold water to remove the product.
5. Dry only the horizontal surfaces of the vehicle, do not dry the glass at this time.
6. ***NOTICE:*** **To avoid damage to the paint surface, do not apply the alkaline neutralizer directly to the vehicle plastic trim.**

   NOTE: Use a separate wash mitt for each product applied to the vehicle.

   NOTE: Alkaline neutralizer is a ready-to-use product. Do not mix with water.

   Pour the alkaline neutralizer into a squirt bottle and apply the solution to a clean wash mitt.
7. ***NOTICE:*** **To avoid paint failure, do not allow the alkaline neutralizer to dry on the vehicle.**

   Apply the product to the vehicle keeping the solution wet and lightly agitate for 5 to 7 minutes. For severe conditions, work the product for up to 8 minutes.
8. Rinse the vehicle completely with cold water to remove the product.
9. Prepare the detail wash by mixing 29.5 ml (1 oz) with 3.78L (1 gal) of water.
10. Using a clean wash mitt, shampoo the entire vehicle and rinse with cold water. Dry the vehicle completely.
11. Visually inspect the paint surface for any remaining evidence of ferrous metal particles. Repeat procedure as necessary.

Surface Finishing Following Decontamination

1. ***NOTICE:*** **When attempting to affect a repair by buffing, polishing or color sanding, do not remove an excess of 0.3 mil of paint film or refinishing will be required.**

   NOTE: Acid rain discoloring or etching may require color sanding in addition to buffing and polishing. In extreme cases, refinishing may be required if the following procedure does not restore the vehicle finish.

   NOTE: Do not intermix buffing products. Use only one manufacturer's product.

   NOTE: Always follow the manufacturer's product usage sequence. Use the appropriate buffing or polishing pad at the recommended buffing speed as specified by the product manufacturer.

   Apply rubbing compound to the vehicle surface as recommended by the product manufacturer.
2. Apply machine glaze to the vehicle surface as recommended by the product manufacturer.
3. Use an alcohol and water mixture (1 to 1) to clean the buffed and polished areas. Verify removal of scratches and swirls before the application of the final polish.

4. Apply a final polish material by hand, with a dual-action sander and foam pad, or with an orbital polisher and appropriate polishing bonnet.

5. Wash and dry the vehicle.

---

tomsn048@gmail.com

Refinishing - Manufacturing Damage

Material

Item	Specification
3MTM Perfect-ItTM Show Car Liquid Wax 39026	-
Motorcraft® Detail Wash ZC-3-A	-

⚠ WARNING: Always refer to Material Safety Data Sheet (MSDS) when handling chemicals and wear protective equipment as directed. Examples may include but are not limited to respirators and chemically resistant gloves. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Always wear protective equipment including eye protection with side shields, and a dust mask when sanding or grinding. Failure to follow these instructions may result in serious personal injury.

NOTICE: **To avoid overspray damage to adjacent panels, protect adjacent areas/substrates when preparing for and during refinishing.**

NOTE: Peeling/delamination concerns can be described as lack of adhesion, either between the substrate and topcoats or between individual coats of paint.

1. Wash the repair area with detail wash or pH-neutral soap and water.
2. Remove any trim, emblems and hardware from the area to be repaired.
3. **NOTE:** All delamination must be removed.

   Sand or media blast the damaged surface, keeping the repair area as minimal as possible.
4. Treat any bare metal surface to prevent flash corrosion, and prime and block sand as necessary prior to refinishing.
5. Mask the adjacent panels to protect from overspray.
6. Spot repair the base coat as necessary, following the paint manufacturer's prescribed procedures.
7. Following the paint manufacturer's prescribed procedure, apply clear coat to the entire panel.

Weld-Bonding - Squeeze-Type Resistance Spot Welding (STRW) Method

⚠ WARNING: Collision damage repair must conform to the instructions contained in this workshop manual. Replacement components must be new, genuine Ford Motor Company parts. Recycled, salvaged, aftermarket or reconditioned parts (including body parts, wheels or safety restraint components) are not authorized by Ford.

Departure from the instructions provided in this manual, including alternate repair methods or the use of substitute components, risks compromising crash safety. Failure to follow these instructions may adversely affect structural integrity and crash safety performance, which could result in serious personal injury to vehicle occupants in a crash.

⚠ WARNING: Invisible ultraviolet and infrared rays emitted in welding can injure unprotected eyes and skin. Always use protection such as a welder's helmet with dark-colored filter lenses of the correct density. Electric welding will produce intense radiation, therefore, filter plate lenses of the deepest shade providing adequate visibility are recommended. It is strongly recommended that persons working in the weld area wear flash safety goggles. Also wear protective clothing. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Always refer to Material Safety Data Sheet (MSDS) when handling chemicals and wear protective equipment as directed. Examples may include but are not limited to respirators and chemically resistant gloves. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Always wear protective equipment including eye protection with side shields, and a dust mask when sanding or grinding. Failure to follow these instructions may result in serious personal injury.

NOTE: Corrosion protection needs to be restored whenever it is necessary to grind through painted surfaces or E-coat, or when bare metal repairs are made. For additional information, refer to Restoring Corrosion Protection Following Repair in this section.

NOTE: On door shells that are manufactured with structural adhesives only, weld bonding door skins is not recommended. Only metal bonding adhesive should be used.

NOTE: Weld-bonding is a method used to join metals using Squeeze-Type Resistance Spot Welding (STRW) or Metal Inert Gas (MIG) and structural adhesive. The steps listed in this procedure apply to both types of welding. STRW is the preferred method. MIG welding should only be used when areas to be welded cannot be accessed using STRW -type machinery.

NOTE: Factory spot welds should be substituted with STRW or MIG welds. Spot/plug welds should equal factory welds in both location and quantity. Do not place a new spot weld directly over an original weld location. Plug weld hole should equal 8 mm (0.31 in) diameter.

1. Verify the vehicle is dimensionally correct on a frame machine. Straighten if necessary.

2. Remove damaged panels with an air saw or air chisel. Remove only large portions of the damaged panel. Avoid cutting into mating flanges or adjacent parts.

3. Drill out the spot welds using an appropriate spot-weld cutter and remove the remaining portions of the panel to be replaced.

4. Prepare any damaged flanges on the vehicle using a hammer and a dolly.

5. Grind the mating surface of the original flanges not greater than 25 mm (0.98 in) where the metal bonding adhesive will be applied.
   - Be sure to remove galvanizing on metal. Metal should have a shiny appearance.
   - Be careful not to damage the corners or thin the metal. The E-coat should also be removed on the opposite side of the flange only where the spot welds are to be placed.

6. Dry-fit and clamp the replacement service parts to verify a correct fit.
   - Remove the service part after verifying correct fit and alignment.

7. **NOTE:** The ends of welding clamps should be insulated on the ends using tape or similar material when welding is carried out.

   Follow manufacturer's prescribed welding procedures and settings. For additional information, refer to Welding Precautions - Steel in this section.

8. Prepare the adhesive. Dispense a small amount of metal bonding adhesive from the cartridge to make sure of an even flow of both components. Attach the mixing tip and dispense a mixing tip length of adhesive to make sure of a correct mix ratio.

9. **NOTE:** Welding can be carried out anytime during the adhesive curing process or after the adhesive is fully cured. Welder settings will vary when welding through wet adhesive versus welding through fully cured adhesive. Refer to welder manufacturer's recommended settings for welding through fully cured adhesive. It is recommended to place a shunt weld in an area with no adhesive to make sure of conductivity, particularly when welding through fully cured adhesive.

tomsn048@gmail.com

NOTE: Refer to product label for preparation and handling instructions.

Create a test sample.

1. Prepare the metal and adhesive as described. Apply a 6-9 mm (0.23-0.35 in) bead of adhesive and weld the sample.
2. Place the welded sample in a vise and carry out destructive weld tests by peeling the scrap metal apart using large lock-type pliers. Measure the weld nugget to determine that the nugget meets Ford weld nugget requirements. If the weld nugget does not meet required size, adjust welder settings until the correct weld nugget size is achieved.
3. When the correct weld nugget size is achieved, the service part can be weld-bonded. For additional information, refer to Specifications in this section.

10. Apply a 6-9 mm (0.23-0.35 in) bead of metal bonding adhesive to the vehicle prepared flange surface.

11. Place the service part(s) in the correct position on the vehicle.
    - When positioned, do not pull the component away from the vehicle. If repositioning is necessary, slide the service part(s). This will make sure of correct contact between the components and adhesive.

12. Clamp evenly and tightly. The adhesive contains glass beads which will prevent over-clamping the component.

13. **NOTE:** If welding will not be carried out immediately, allow a minimum of 1.5 to 2 hours of adhesive cure time at 21°C (70°F) before removing clamps. Cure time at lower temperatures should be increased. Clamps may be removed immediately after the component is welded.

    Wipe excess adhesive from the panel before it cures.

14. Finish any cosmetic section seams with fiber-filled body filler. Rough sand the filler, after the adhesive cures, apply conventional body filler and block-sand the area.

15. Use seam sealer wherever a cosmetic seam sealer is required.

16. Mix and apply primer surfacer per paint manufacturer's recommendations.

17. Mix and apply basecoat per Ford-approved paint recommendations.

18. Mix and apply clearcoat per Ford-approved paint recommendations. Refinishing materials may be force-dried following paint manufacturer's recommendations.

19. Apply corrosion protection to the repair area as required.

Weld-Bonding - Metal Inert Gas (MIG) Welding Method

⚠ WARNING: Invisible ultraviolet and infrared rays emitted in welding can injure unprotected eyes and skin. Always use protection such as a welder's helmet with dark-colored filter lenses of the correct density. Electric welding will produce intense radiation, therefore, filter plate lenses of the deepest shade providing adequate visibility are recommended. It is strongly recommended that persons working in the weld area wear flash safety goggles. Also wear protective clothing. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Always refer to Material Safety Data Sheet (MSDS) when handling chemicals and wear

protective equipment as directed. Examples may include but are not limited to respirators and chemically resistant gloves. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Always wear protective equipment including eye protection with side shields, and a dust mask when sanding or grinding. Failure to follow these instructions may result in serious personal injury.

NOTE: MIG weld-bonding can be substituted as an alternative to STRW . It may only be used to weld areas that are inaccessible to STRW machinery. However, when accessible, STRW is the preferred method.

NOTE: Corrosion protection needs to be restored whenever it is necessary to grind through painted surfaces or E-coat, or when bare metal repairs are made. For additional information, refer to Restoring Corrosion Protection Following Repair in this section.

NOTE: On door shells that are manufactured with structural adhesives only, weld-bonding door skins is not recommended. Only metal bonding adhesive should be used.

NOTE: Factory spot welds should be substituted with STRW welds or MIG plug welds. Spot/plug welds should equal factory welds in both location and quantity. Do not place a new spot weld directly over an original weld location. Plug weld hole should equal 8 mm (0.31 in) diameter.

1. Remove damaged panels with an air saw or air chisel. Remove only large portions of the damaged panel. Avoid cutting into mating flanges or adjacent parts.
    - Drill out the spot welds using an appropriate spot-weld cutter and remove the remaining portions of the panel to be replaced.

2. After removing the damaged sheet metal panel(s), repair any damaged flanges on the vehicle using a hammer and dolly.

3. Using an appropriate grinder, carefully grind around the entire receiving flange area following the original welds. Be sure to remove all E-coat, paint or galvanized coating from the mating surfaces of the joint.
    - Be sure to remove galvanizing on metal. Metal should have a shiny appearance.
    - Be careful not to damage the corners or thin the metal. The E-coat should also be removed on the opposite side of the flange only where the spot welds are to be placed.

4. Repeat Step 3 on the mating surface of the replacement service part(s).

5. Prepare the new service panel for plug welds.
    - Using the original panel as a reference, drill or punch 8 mm (0.31 in) diameter holes in the exact number as the original spot welds. The holes should be positioned as close as possible to the original spot weld locations, without lining up exactly on top of an original spot weld site.
    - To make sure of correct weld performance, grind the immediate perimeter of plug weld hole. Grind only in the area of the plug weld, this will keep corrosion to a minimum.

6. Dry-fit and clamp the replacement service parts to verify a correct fit and alignment.
    - Remove the service part after verifying correct fit and alignment.

7. The vehicle prepared flange areas where plug welds will be located must be kept free of adhesive. Apply 25 mm (0.98 in) tape to the plug weld areas to prevent contamination from the adhesive.

8. Prepare the adhesive. Dispense a small amount of metal bonding adhesive from the cartridge to make sure of an even flow of both components. Attach the mixing tip and dispense a mixing tip length of

tomsn048@gmail.com

adhesive to make sure of correct mix ratio.

9. **NOTE:** Refer to product label for preparation and handling instructions.

   Apply a 6-9 mm (0.23-0.35 in) bead of adhesive to the vehicle prepared flange surface. Remove the tape from the plug weld areas.

10. Place the service part(s) in the correct position on the vehicle.
    - When positioned, do not pull the component away from the vehicle. If repositioning is necessary, slide the service part(s). This will make sure of correct contact between the components and adhesive.

11. Clamp evenly and tightly. The adhesive contains glass beads which will prevent over-clamping the component.

12. **NOTE:** Welding can be carried out anytime during the adhesive curing process or after the adhesive is fully cured.

    NOTE: If welding will not be carried out immediately, allow a minimum of 1.5 to 2 hours of adhesive cure time at 21°C (70°F) before removing clamps. Cure time at lower temperatures should be increased. Clamps may be removed immediately after the component is welded.

    Wipe excess adhesive from the panel before it cures.

13. Finish any cosmetic section seams with fiber-filled body filler. Rough sand the filler, apply conventional body filler after the adhesive cures and block-sand the area.

14. Use seam sealer wherever a cosmetic seam sealer is required.

15. Mix and apply primer surfacer per paint manufacturer's recommendations.

16. Mix and apply basecoat per Ford-approved paint recommendations.

17. Mix and apply clearcoat per Ford-approved paint recommendations. Refinishing materials may be force-dried following paint manufacturer's recommendations.

18. Apply corrosion protection to the repair area as required.

---

tomsn048@gmail.com

Plastics Identification

⚠ WARNING: Always refer to Material Safety Data Sheet (MSDS) when handling chemicals and wear protective equipment as directed. Examples may include but are not limited to respirators and chemically resistant gloves. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Always wear protective equipment including eye protection with side shields, and a dust mask when sanding or grinding. Failure to follow these instructions may result in serious personal injury.

NOTE: Identification of the various plastic types is necessary to select the appropriate repair methods to make high quality plastic repairs. Plastics can generally be broken down into 2 categories, thermoplastics and thermosetting plastics. Thermoplastics can be remolded by heating. This makes plastic welding a possible repair alternative.

1. **NOTE:** In some instances, a code or material designation is stamped indicating the plastic type.

   Thermoplastics are solvent reactive. Types of thermoplastics include Thermoplastic Olefin (TPO), Polyvinyl Chloride (PVC) and Acrylonitrile Butadiene Styrene (ABS). Polyolefins have an oily or waxy appearance. Examples include some bumper covers, stone shields, fender aprons and fan shrouds. Polyolefins require an adhesion promoter prior to carrying out any refinish procedure.

   - To determine if the part is a polyolefin, grind the damaged area in an out-of-sight area. Grinding a polyolefin will melt and smear the plastic and leave a ragged edge. If the part is non-polyolefin, the area will grind or sand smoothly, producing a powdery dust.

Rigid Plastic Parts

Code	Family Name	Common Trade Name	Typical Application
ABS	Acrylonitrile Butadiene Styrene	ABS, Cycolac, Lustran, Kralistic	A-Pillars, Consoles, Grilles
SMC	Sheet Molded Composite	SMC	Body Panels

Flexible Plastic Parts

Code	Family Name	Common Trade Name	Typical Application
RRIM	Reinforced Reaction Injection-Mold Material PUR	RRIM	Fascias, Body Panels, Body Trims
TPO	Thermoplastic Polyolefin	Polytrope, Renflex, Santropren Telcar, Vistaflex, ETA, Apex, TPO	Bumpers, End Caps, Rubber Strips, Sight Shields, Claddings, Interior B-Post

2. Polyolefin plastic can also be identified by placing a small sliver in a container of water, if the sample floats, it is a polyolefin plastic. A non-polyolefin will sink when placed in a container of water.

3. Generally, thermosetting plastics are rigid or semi-rigid. Sheet-Molded Composite (SMC) is reinforced with glass and other fibers and are strong and rigid. SMC is used for large panels such as hoods, liftgates, fenders and quarter panels.
    - A burn test can be a reliable method to determine if a plastic is a thermosetting plastic. Extreme care must be exercised when using this method.
        - ***NOTICE:*** **The component must be isolated away from the vehicle and all combustible materials to perform this test.**

          Apply an open flame to the corner of the damaged component. If the material crystallizes and becomes hard, it is a thermosetting plastic.

tomsn048@gmail.com

Plastics Repair

Material

Item	Specification
Plastic Bonding Adhesive TA-9	-

⚠ WARNING: Always wear protective equipment including eye protection with side shields, and a dust mask when sanding or grinding. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Always refer to Material Safety Data Sheet (MSDS) when handling chemicals and wear protective equipment as directed. Examples may include but are not limited to respirators and chemically resistant gloves. Failure to follow these instructions may result in serious personal injury.

1. In deciding whether to repair or install a new component, follow these guidelines.
   - Is a part readily available?
   - Can the damaged part be economically returned to its original strength and appearance, or will the labor cost exceed the cost of a new component?
   - Will repair provide for the fastest, highest quality repair?

2. ***NOTICE:*** **Never apply solvents such as lacquer thinner or reducer at any stage of plastic repair. Solvents, cleaners and water are absorbed by many types of plastics and by the glass fibers used for reinforcements. If this occurs, the plastic may swell in the area of repair and cause the repair to fail. Remove cleaners and water quickly and use air and heat to speed up drying.**

   NOTICE: **During the repair of many plastics and particularly polyolefin plastics, an adhesion promoter must be applied to the substrate to allow repair materials and paint to bond correctly. Reapplication is required when grinding or sanding through the sealer or primered layers.**

   NOTE: When possible, it is recommended to carry out as much of the plastic repair as possible on the vehicle. Parts mounted on the vehicle are held in correct alignment throughout the repair. Attempting to repair the part off the vehicle may cause misalignment. This could lead to failure of the repair.

   Select the correct repair method by identifying the type of plastic being repaired. For additional information, refer to Plastics Identification in this section to determine the type of plastic being repaired.

3. **NOTE:** Always refer to the manufacturer's label directions for the type of repair materials, fillers and bonding agents being used as they are material specific.

   Determine whether a reinforcement piece is needed as a backer on large repairs.

   - Construct a reinforcement piece from a scrap piece of the type of plastic being repaired and follow manufacturer's label directions for the type of system being used.
   - When repairing Sheet-Molded Composite (SMC), a reinforcement piece can be constructed using several layers of glass cloth saturated with resin or structural adhesive. The weave of the cloth or screening should be loose enough to allow the resin to thoroughly penetrate. Reinforcement should cover the entire area of damage and extend outward beyond the

damage or joint area.

Sheet-Molded Composite (SMC) Panel Repair

NOTE: The following procedure applies to repair of structural cracks and large gouges. If damage is cosmetic, use of reinforcing cloth may not be necessary.

1. Panels to be repaired should be dry and at room temperature 18°C (65°F) to 24°C (75°F) prior to carrying out any repairs. Both sides of the panel must be thoroughly cleaned before sanding or grinding.

2. Cover the break in the SMC (front and back) with masking tape. This protects the damaged area from absorbing the prep cleaner and eliminates wicking of the cleaner through the fibers into the SMC .

3. Remove all waxes, silicones, dirt and road oils from the area surrounding both sides of the damaged area with a plastics wax and grease remover.
    - Remove the tape and sand the back of the repair area with an angle grinder, Dual Action (D/A) sander or by hand using 80-grit sandpaper. Remove all dust with a vacuum and tack cloth.

4. Create a reinforcing patch using a piece of scrap SMC that conforms well to the back of the damaged area or form a patch from fiberglass cloth.
    - Cut a section of cloth large enough to cover the repair, plus 25.4 mm (1 in) around the repair area.
    - Cut a section of plastic film backing approximately 25.4 mm (1 in) larger than the cloth. Lay the plastic on a smooth, flat surface where it will be used to create a pyramid patch.

5. Follow manufacturer's directions and apply plastic repair adhesive to the plastic film backing and smooth with plastic spreader to recommended thickness. Place the pre-cut fiberglass cloth on the adhesive-coated plastic film. Cover the cloth with a coat of repair adhesive and spread to the recommended thickness.

6. Apply the prepared patch to the backside of the panel and compress. Follow manufacturer's instructions for adhesive cure. Remove plastic film after adhesive cures and sand as necessary to remove roughness.

7. Remove masking tape from the front side of damaged area and grind down to the backing patch. Use an angle grinder with a 30- to 40-grit wheel. Make a gradual taper in the area, this will prevent bull's-eyes or read-through in the finished repair. Sand prepared area with a D/A sander or hand-sand with 80-grit sandpaper.

8. Build a pyramid patch using fiberglass cloth or equivalent and plastic repair adhesive. Following manufacturer's directions, apply patch to damaged area.

9. Rough-grind area to remove excess adhesive. Sand repair area with 80-grit sandpaper, making sure to cut slightly below the SMC finished surface. This will allow for a finish coat of plastic body repair material.

10. Apply a finish coat of plastic repair filler material per manufacturer's directions.

11. Finish-sand, prime and topcoat using Ford-approved paint systems.

tomsn048@gmail.com

Thermoplastic Compounds

1. In deciding whether to repair or install a new component, follow these guidelines.
   - Is a part readily available?
   - Can the damaged part be economically returned to its original strength and appearance, or will the labor cost exceed the cost of a new component?
   - Will repair provide for the fastest, highest quality repair?

2. **NOTE:** The following steps are to be used as a guideline. Depending on what brand of adhesives or patch materials are used, procedures may vary slightly.

   Thoroughly clean the damaged area with wax and grease remover formulated for use with plastics.

3. Hand sand the repair area with 80-grit sandpaper and remove any foreign material with compressed air.

4. Apply a plastics adhesion promoter per label directions to the repair area.

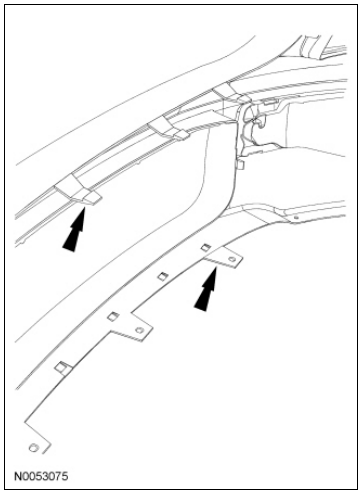
5. For small repairs, a plastic adhesive filler can be applied to the damaged area. Follow manufacturer's directions and build layers to form a thickness above the damaged area. This will allow the area to be sanded smooth.

6. To repair large holes or cracks, measure and cut a piece of fiberglass cloth or equivalent 25.4 mm (1 in) larger than the crack or hole.
   - Apply plastic repair adhesive to the damaged area and immediately apply fiberglass cloth into plastic adhesive for reinforcement. Apply additional plastic repair adhesive for strength and shape as required.

7. Contour and shape the repair as necessary with a D/A sander. Avoid sanding through the repair.

8. Finish-sand the area and carry out any required paint operations using Ford-approved paint systems.

Tab Repair - Bumper



1. **NOTE:** Inspect the bumper cover to determine if part of it can be repaired to an acceptable level of quality of appearance, fit and durability. Will labor and material cost of the repair meet or exceed the cost of a new replacement bumper cover? If the bumper cover is determined to be repairable, proceed to the following steps.

   NOTE: The following steps are to be used as a guideline. Depending on what brand of adhesives or patch materials are used, procedures may vary slightly.

   Remove the affected bumper. For additional information, refer to Section 501-19 .

NOTE: Illustration is not vehicle specific.

2. Clean the broken tab(s) with a plastics wax and grease remover.

3. Hand sand the repair area with 80-grit sandpaper and remove any foreign material with compressed air.

4. Apply a plastics adhesion promoter per label directions to the repair area.

5. Measure and cut a patch of fiberglass cloth or equivalent large enough to form the front of the tab, then slope back in a wedge shape approximately 51 mm (2 in) from original tab.

6. Prepare the repair adhesive cloth patch per manufacturer's instructions and apply to the affected area.
    - Immediately position the plastic repair material patch to form the tab shape.

7. Allow appropriate cure time and shape the repair tab using a small angle sander. Use extreme care to not sand through the exterior surface.

8. Carry out any required paint repair operations to the bumper cover using Ford-approved paint systems.

9. Reassemble and install the bumper cover. For additional information, refer to Section 501-19 .

tomsn048@gmail.com

Plastics Refinishing

All Components

⚠ WARNING: Always refer to Material Safety Data Sheet (MSDS) when handling chemicals and wear protective equipment as directed. Examples may include but are not limited to respirators and chemically resistant gloves. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Do not paint any air bag module trim covers or deployment doors. Paint may cause the air bag to deploy incorrectly. Failure to follow this instruction may increase the risk of serious personal injury or death in a crash.

NOTE: When using any Ford-approved refinishing product, it is recommended to stay within the same paint system throughout the process. For example, do not use one manufacturer's primers and another manufacturer's topcoats.

1. **NOTE:** Care must be used if applying heat to parts. Thermoplastics soften and tend to lose their shape when heated.

   The first step for any repair or refinish procedure is to identify the type of plastic. Is it thermosetting or thermoplastic, grained or smooth? This will determine how it should be cleaned and prepared for refinishing. For additional information, refer to Plastics Identification in this section.

   - It is essential that the correct cleaner is used, depending on which painting system is employed, solvent-based or water-based.
   - Clean part with warm water/mild detergent, then with plastic cleaner to remove wax, silicone and other contaminants. Do not allow parts to remain wet for extended periods.
   - As a general rule, if water beads on the part, it requires additional cleaning as all the manufacturing release agents have not been removed.

2. New parts may require baking in a spray booth or heating with heat lamps to release trapped solvents or mold release agents used in the manufacturing processes.

Non-grained components

3. After cleaning, lightly sand with 600-grit or finer sandpaper. Remove sanding residue with plastic cleaner and wipe dry.

Grained components

4. After cleaning, light use of a gray scuff pad is permissible providing the graining not be flattened. Remove sanding residue with plastic cleaner and wipe dry.

All components

5. Apply a plastics adhesion promoter to any bare plastic part following manufacturer's recommendation. Throughout the refinish procedure, any time bare plastic is exposed for any reason, it is essential that adhesion promoter be reapplied to that area.

6. A sealer may be required to prevent wrinkling and lifting of the topcoat prior to carrying out the refinish procedure.

7. Flexible and non-flexible components should be refinished separately as a flex additive may be required when refinishing flexible parts (refer to the paint manufacturer's recommendation).

8. It is recommended to carry out refinishing of exterior components on-vehicle (after cut-in) to control color match and blending to adjacent panels.

9. Proceed with the refinish process and follow the Ford-approved paint system procedures. Steps may vary between paint manufacturers.

Front Frame Rail

NOTE: Cut lines shown in illustration are approximate, refer to the following procedure for specific cut locations.

Item	Part Number	Description
1	5D059 LH/ 5D058 RH	Frame rail sectioning kit

⚠ WARNING: Invisible ultraviolet and infrared rays emitted in welding can injure unprotected eyes and skin. Always use protection such as a welder's helmet with dark-colored filter lenses of the correct density. Electric welding will produce intense radiation, therefore, filter plate lenses of the deepest shade providing adequate visibility are recommended. It is strongly recommended that persons working in the weld area wear flash safety goggles. Also wear protective clothing. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Frame rail crush zones absorb crash energy during a collision and must be replaced if damaged. Prior to replacement of frame rail crush zones, straighten damaged frame rails to correct frame dimensions. Failure to follow these instructions may adversely affect frame rail crush zone performance and may result in serious personal injury to vehicle occupants in a crash.

⚠ WARNING: Collision damage repair must conform to the instructions contained in this workshop manual. Replacement components must be new, genuine Ford Motor Company parts. Recycled, salvaged, aftermarket or reconditioned parts (including body parts, wheels or safety restraint components) are not authorized by Ford.

Departure from the instructions provided in this manual, including alternate repair methods or the use of substitute components, risks compromising crash safety. Failure to follow these instructions may adversely affect structural integrity and crash safety performance, which could result in serious personal injury to vehicle occupants in a crash.

NOTICE: **The front frame rail kit and No. 6 crossmember are the only serviceable components of the frame assembly. Follow the manufacturer's prescribed procedure included with the service replacement kit.**

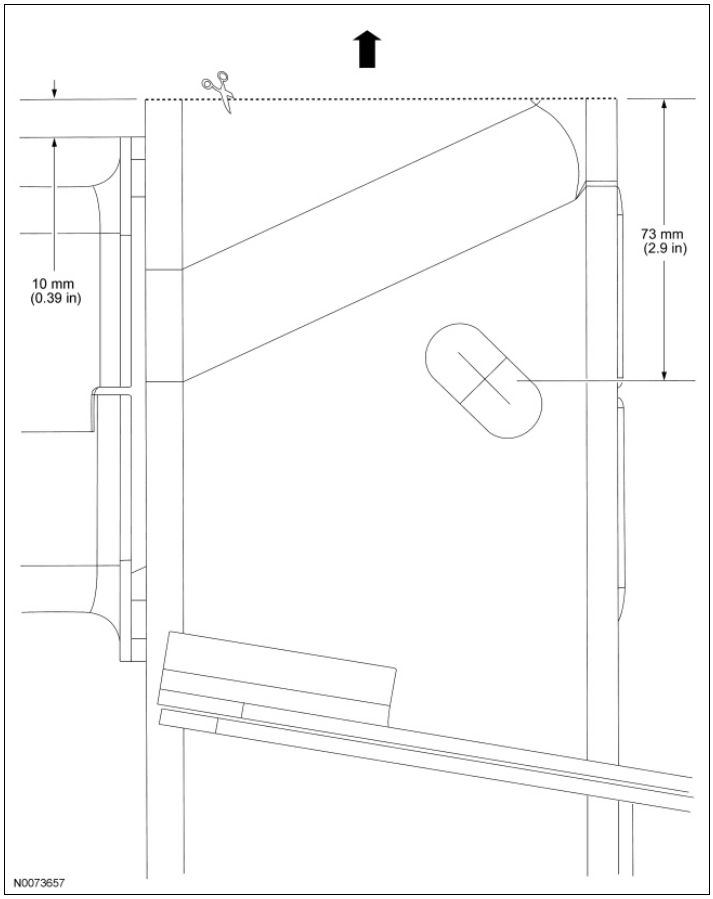
NOTE: Corrosion protection needs to be restored whenever it is necessary to sand or grind through painted surfaces or E-coat, or when bare metal repairs are made. For additional information, refer to Restoring Corrosion Protection Following Repair in this section.

NOTE: Observe prescribed welding procedures when carrying out repairs to the frame assembly. For additional information, refer to Welding Precautions â Steel in this section.

1. **NOTE:** To make sure of correct fit and alignment of replacement components, the vehicle should be rough straightened to restore it to pre-accident dimensions before removal of structural or welded components.

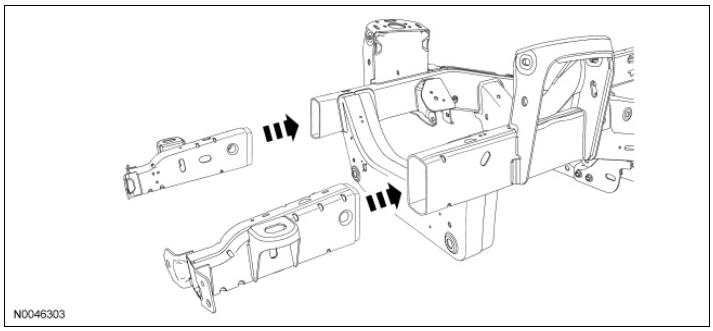
   Position the vehicle on a frame rack following the manufacturer's recommendations. Measure the vehicle to determine body and frame alignment. For additional information, refer to Body in this section for dimensional information.

2. Remove the front bumper. For additional information, refer to Section 501-19 .



3. Unbolt the LH and RH front stabilizer bar brackets.

4. Remove the Front End Sheet Metal (FESM) body mount bolts and mounts on the side the repair is being carried out.

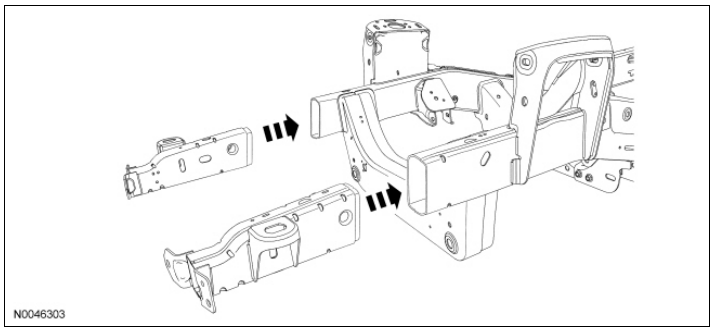


5. **NOTE:** It is recommended to create a clear vinyl copy of this template. Template must be applied to frame with arrow to front of vehicle in horizontal position.

   Scribe cutting lines on the damaged front frame section using the template above.

tomsn048@gmail.com

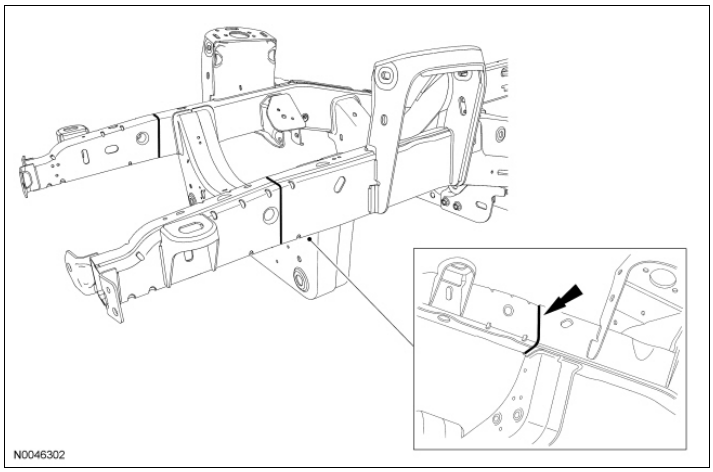
6. Using a plasma cutter, reciprocating saw or die-grinder, remove the damaged front frame horn section. DO NOT cut directly along the scribe line. Leave enough material on the forward side of the scribe line to allow the edge to be ground back exactly to the scribe line. This is required to make sure of correct fit up between the frame and the replacement section.



NOTICE: **Do not thin out the frame rail. The material must maintain a minimum thickness of 3.4 mm (0.13 in) after grinding.**

7. Grind off the excess frame in front of the scribed line on the existing frame horn.
    - Sand off as much of the frame coating as possible using 36 to 60 grit sandpaper on the inner and outer surfaces within a minimum of 20 mm (0.78 in) of the repair joint-including the overlap.

8. Use a wire brush to remove any foreign material from the frame within 25 mm (0.98 in) of the repair joint. Use metal surface prep or equivalent to remove the remaining coating on the inner and outer surfaces within 20 mm (0.78 in) of the joint.
    - Apply a zinc-rich weld-through primer to the exposed inner and outer mating surfaces.



9. Make sure that the frame and service replacement part have attained a minimum room temperature of 10ï¿½C (50ï¿½F) before beginning the weld procedure. A Metal Inert Gas (MIG) welder capable of producing 185-250 amps must be used. Use 0.035 to 0.045 inch ER70S-3 or equivalent weld wire that is compatible with SAE 1010 steel. Shielding gas must be 100% carbon dioxide or 75% carbon dioxide and 25% argon.

10. Install the replacement frame section onto the frame. Slide the replacement frame section all the way into the frame rail until it touches the rail. Support the replacement frame section in position. Verify that the FESM mount bracket lines up with sheet metal hole. The holes should line up so that the FESM mount can be installed and the FESM mount bolt can be installed.

11. Tack weld the frame horn replacement section into the existing frame at 4 small points centered on the flats between the corners. This will hold the section in place to check the fit up prior to completely welding up the section.

12. Make sure the frame section replacement is correctly aligned.
    - Carry out the remainder of the welding procedure.
    - After welding is complete, grind off any excess weld material.

13. Use a dye penetrant to determine if any cracks or large voids exist in the weld joint after the welding process has been completed.
    - If any cracks or other defects exist, grind out the defect and repair it until the imperfection is corrected.

14. Clean the repaired area(s) and any exposed metal surfaces. Restore corrosion protection to the interior and exterior surfaces of the repaired area(s) to the extent possible.

15. Install the components removed during the repair procedure.

Underbody Center and Rear ï¿½ Explorer Sport Trac

Item	Part Number	Description
1	10124	Floor side member (RH) ï¿½ High-Strength Low Alloy (HSLA) 350 steel
2	10110	Floor side member assembly (RH) ï¿½ mild steel
3	11218	Floor pan assembly ï¿½ mild steel
4	10608	Rear floor crossmember ï¿½ mild steel
5	111C32	Rear floor reinforcement ï¿½ HSLA 350 steel
6	10125	Floor side member (LH) ï¿½ HSLA 350 steel
7	10111	Floor side member assembly (LH) ï¿½ mild steel
8	617C50	Reinforcement ï¿½ mild steel

⚠ WARNING: Collision damage repair must conform to the instructions contained in this workshop manual. Replacement components must be new, genuine Ford Motor Company parts. Recycled, salvaged, aftermarket or reconditioned parts (including body parts, wheels or safety restraint components) are not authorized by Ford.

Departure from the instructions provided in this manual, including alternate repair methods or the use of substitute components, risks compromising crash safety. Failure to follow these instructions may adversely affect structural integrity and crash safety performance, which could result in serious personal injury to vehicle occupants in a crash.

⚠ WARNING: Invisible ultraviolet and infrared rays emitted in welding can injure unprotected eyes and skin. Always use protection such as a welder's helmet with dark-colored filter lenses of the correct density. Electric welding will produce intense radiation, therefore, filter plate lenses of the deepest shade providing adequate visibility are recommended. It is strongly recommended that persons working in the weld area wear flash safety goggles. Also wear protective clothing. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Do not cut or grind body side components within 50 mm (1.96 in) of restraint anchoring points. Welding within 50 mm (1.96 in) of restraint anchoring points may result in incorrect operation of restraint devices. For additional restraints anchoring location information, refer to Section 501-20A and Section 501-20B . Failure to follow these instructions may result in serious injury to vehicle occupant(s).

⚠ WARNING: Do not carry out body side sectioning repairs in areas of door hinge or striker anchoring points. Welding within 50 mm (1.96 in) of door hinge or striker locations may compromise

tomsn048@gmail.com

structural integrity during a collision. Failure to follow these instructions may result in serious injury to vehicle occupant(s).

⚠ WARNING: On vehicles equipped with Safety CanopyÂ® options, prior to carrying out any sectioning repairs near the roof line or sail panel areas of the vehicle, remove the Safety CanopyÂ® module and related components. Failure to comply may result in accidental deployment or damage to the Safety CanopyÂ®. Refer to Section 501-20B . Failure to follow these instructions may result in serious injury to technician or vehicle occupant(s).

⚠ WARNING: Do not carry out body side sectioning repairs in areas of laser welds. Factory laser welds cannot be duplicated with conventional welding equipment and structural integrity may be compromised. Failure to follow this instruction may result in serious injury to vehicle occupant(s).

NOTE: Factory spot welds may be substituted with either resistance spot welds or Metal Inert Gas (MIG) plug welds. Spot/plug welds should equal factory welds in both location and quantity. Do not place a new spot weld directly over an original weld location. Plug weld hole should equal 8 mm (0.31 in) diameter.

Observe prescribed welding procedures when carrying out any body side section repair. For additional information, refer to Welding Precautions â Steel in this section.

NOTE: When it is necessary to carry out weld-bonding procedures, refer to Weld-Bonding in this section.

1. Remove the outer body sheet metal from the affected area prior to carrying out any body side reinforcing panel replacement. For additional information, refer to Sectioning Guidelines in this section. Clean the repair area with metal surface prep or equivalent to remove any grease or contaminants prior to welding.

2. Where possible, create a backer piece using a portion of the old panel. This will create a stronger joint.

3. **NOTE:** Corrosion protection needs to be restored whenever it is necessary to sand or grind through painted surfaces or E-coat, or when bare metal repairs are carried out. For additional information, refer to Restoring Corrosion Protection Following Repair in this section.

   When welding overlapping surfaces or substrates, apply a weld-through primer between the surfaces prior to welding. When the surfaces have been welded, apply corrosion protection material to the exterior surfaces or substrates.

   - Make sure horizontal joints and flanges are correctly sealed with seam sealer to prevent moisture intrusion. Water and moisture migrate to horizontal joints and corrosion tends to occur more rapidly in these areas. Metal surfaces must be clean and dry before applying seam sealer.

4. Proceed with refinishing procedures following Ford-approved paint guidelines. Apply corrosion protection to the repair area as required.

tomsn048@gmail.com

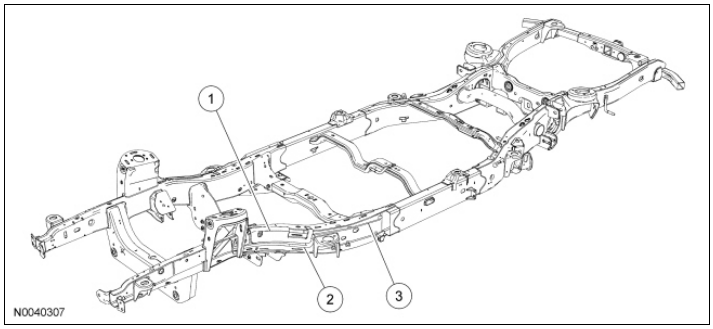
Frame and Body Mounting

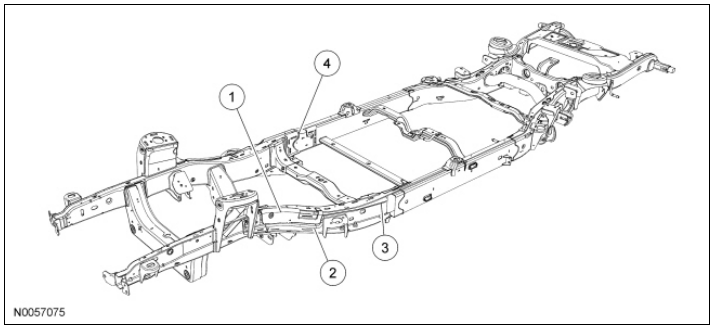
The frame consists of 2 steel-channel rails, 10 crossmembers for Explorer Sport Trac or 8 crossmembers for Explorer/Mountaineer including a front crossmember, transmission support crossmember and a rear crossmember (trailer hitch). New side rails and welded crossmembers, including the trailer hitch, are not installed separately. A front frame rail repair kit is available if the front rail is to be repaired and a rear crossmember (hitch) repair kit is available if the rear crossmember or rail is to be repaired.



The 1B crossmember and transmission crossmember are included in assembly to the frame, but can be serviced separately. For any frame repair, refer to Section 501-35 .

Frame-Mounted Heat Shields

The frame-mounted heat shields are attached to the top of the frame and crossmembers with bolts. The body must be lifted off the frame enough for access to the bolts that attach the heat shields to the top of the frame.



Structural Enhancement - Explorer

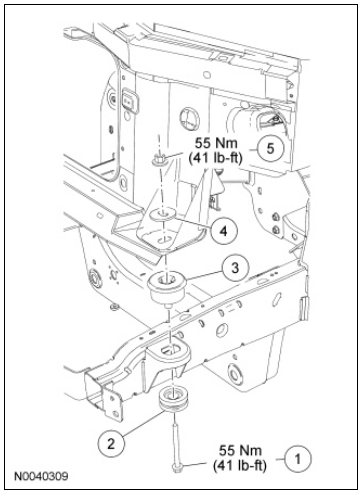
NOTE: Portions of the frame are removed from this drawing to show the location of the inserts.

Item	Part Number	Description
1	-	Exterior frame reinforcement
2	-	Fore reinforcement
3	-	Aft reinforcement

Structural Enhancement - Explorer Sport Trac

Item	Part Number	Description
1	-	Exterior frame reinforcement
2	-	Fore reinforcement
3	-	Aft reinforcement
4	-	External reinforcement

The purpose of these inserts is to enhance the structural rigidity of the frame in this area. Inserts cannot be repaired or installed new.

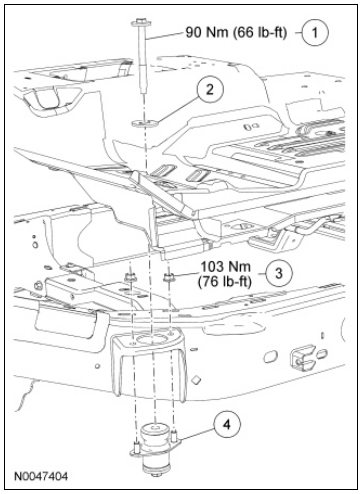


NOTICE: **When removing upper body mounts, enough adjacent body mount support bolts and nuts must be removed to prevent damage occurring to the vehicle.**

NOTE: Body mounts must be held with a wrench on the bottom while loosening the bolt from the top.

NOTE: Do not reuse body support mounting fasteners. New fasteners must be installed for each fastener that has been removed or loosened.

NOTE: No lubricants of any kind are to be used during body mount support installation.



Body Support - Front End Sheet Metal (FESM)

Item	Part Number	Description
1	W710231	Body support bolt

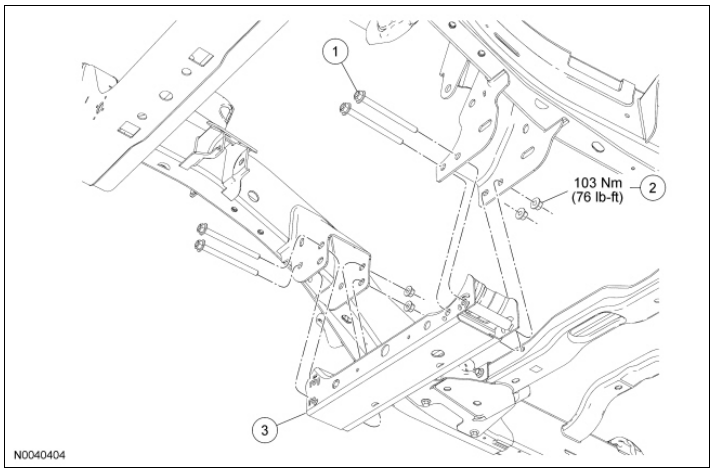
Frame Drilling



1. Holes that would weaken the frame sidemember should not be drilled in the frame.

2. Holes are not to be drilled in the sidemember's top or bottom flange.

3. Holes to mount brackets, out-riggers and supports may be drilled in the vertical frame side rail web with the following restrictions:
    - Material between edge of hole and inside of upper or lower flange must not be less than 38.1 mm (1.50 in) for low carbon steel (36,000 psi yield).
    - The minimum edge distance between any 2 holes up to 15.74 mm (0.625 in) diameter must be 25.4 mm (1.00 in). For larger than 15.74 mm (0.625 in) diameter holes, the minimum edge distance must be 1.5 times the diameter of the largest hole.
    - No holes will be allowed to exceed 19.05 mm (0.75 in) in diameter.
    - Avoid close vertical succession of fasteners.
    - All attaching fasteners, including flat washers, must be of high-strength steel (Grade 8).

tomsn048@gmail.com

Crossmember - 1B

Item	Part Number	Description
1	W709834	1B crossmember bolt (4 required)
2	W520114	1B crossmember nut (4 required)
3	5E138	1B crossmember

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the 4 crossmember bolts.

3. Remove the 4 crossmember nuts.
   - To install, tighten to 103 Nm (76 lb-ft).

4. Remove the 1B crossmember.

5. To install, reverse the removal procedure.

tomsn048@gmail.com

Trailer Hitch

Material

Item	Specification
High Temperature Anti-Corrosion Coating PM-13-A	-

Removal and Installation

NOTE: The factory rear trailer hitch crossmember is welded to the frame. The service replacement rear trailer hitch crossmember will be bolted to the frame.

All vehicles

1. Remove the spare tire.

2. Remove the rear bumper cover. For additional information, refer to Section 501-19 .

3. Disconnect the trailer wiring harness.

Explorer/Mountaineer

4. Cut the rear rails vertically at least 10-18 mm (0.39-0.70 in) behind the rear body/box mount leg.
   - Use Explorer/Mountaineer template No. 1. Refer to the trailer hitch procedure on the PTS website.

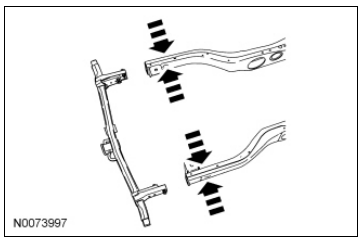
5. Drill 18 mm (0.688 in) diameter holes for the inboard and outboard attachments to each frame rail.
   - For the inboard side use Explorer/Mountaineer template No. 2. Refer to the trailer hitch procedure on the PTS website.
   - For the outboard side use Explorer/Mountaineer template No. 3. Refer to the trailer hitch procedure on the PTS website.

Explorer Sport Trac

6. Cut the rear rails vertically at least 10-18 mm (0.39-0.70 in) behind the rear body/box mount leg.
   - Use Sport Trac template No. 1. Refer to the trailer hitch procedure on the PTS website.

7. Drill 18 mm (0.688 in) diameter holes for the inboard and outboard attachments to each frame rail.
   - Use Sport Trac Template No. 2. Refer to the trailer hitch procedure on the PTS website.
   - Use Sport Trac template No. 3. Refer to the trailer hitch procedure on the PTS website.

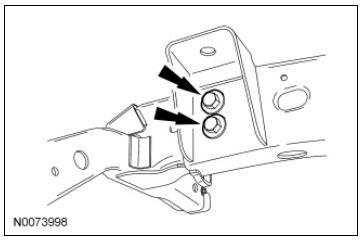
All vehicles



8. Deburr the cut edges of the frame rail and the drilled holes.

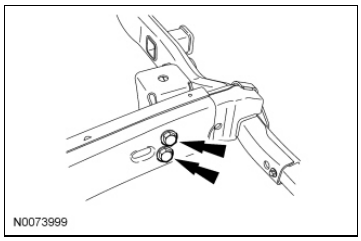
9. Clean the inner and outer surfaces of the frame rails, making sure all mating surfaces are free of foreign material.

10. Apply 3 even coats of the specified anti-corrosion coating onto the inner and outer surfaces of the frame rails where bare metal is present.



11. **NOTE:** It may be necessary to spread apart or pull together the frame rails slightly to get the brackets to fit.

    Insert the new trailer hitch crossmember assembly into the frame.

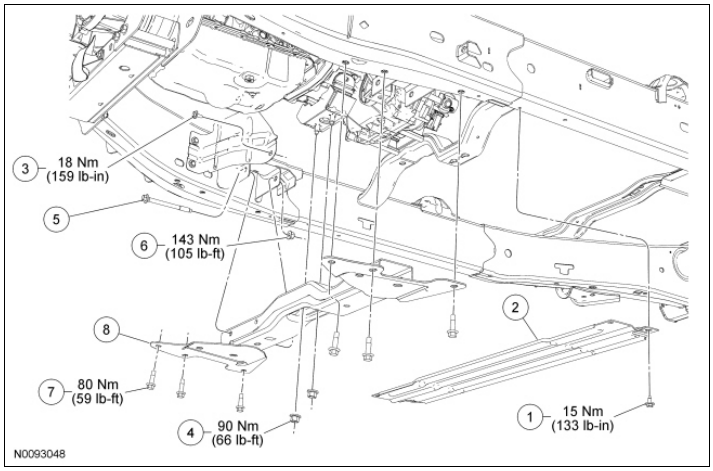


12. Hand-start all 8 bolts into the weld nuts in the hitch brackets.

13. Tighten the inboard bolts.
    - Tighten to 235 Nm (174 lb-ft).

14. Tighten the outboard bolts.
    - Tighten to 235 Nm (174 lb-ft).

15. Install the trailer wiring harness.



16. Install the rear bumper cover. For additional information, refer to Section 501-19 .

17. Install the spare tire.

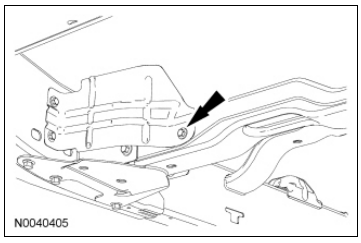
tomsn048@gmail.com

Transmission Support Crossmember

NOTE: Explorer/Mountaineer shown, Explorer Sport Trac similar.

Item	Part Number	Description
1	W707079	Transfer case skid plate bolt (4 required)
2	7E063	Transfer case skid plate
3	W710617	Heat shield bolt (3 required)
4	N621945	Transmission mount nut (2 required)
5	W705049	Transmission crossmember upper bolt (2 required)
6	W520114	Transmission crossmember upper nut (2 required)
7	W506442	Transmission crossmember lower bolt (6 required)
8	5025	Transmission crossmember

Removal and Installation



1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the 4 transfer case skid plate bolts and remove the transfer case skid plate.
   - To install, tighten to 15 Nm (133 lb-in).

3. **NOTE:** Explorer/Mountaineer shown, Explorer Sport Trac similar.

   Remove the heat shield bolt from the RH heat shield.

   - To install, tighten to 18 Nm (159 lb-in).

tomsn048@gmail.com

4. Remove the heat shield bolt from the LH heat shield.
    - To install, tighten to 18 Nm (159 lb-in).

5. Support the transmission with a suitable jack.

6. Remove the 2 transmission mount nuts.
    - To install, tighten to 90 Nm (66 lb-ft).

7. Remove the 6 transmission crossmember lower bolts.
    - To install, tighten to 80 Nm (59 lb-ft).

8. **NOTE:** Tighten the nut side of the joint.

   Remove the 2 upper nuts and 2 bolts from the transmission crossmember.

    - To install, tighten to 143 Nm (105 lb-ft).

9. Remove the transmission crossmember.

10. To install, reverse the removal procedure.

Engine

⚠ **WARNING: Do not operate the engine with the hood open until the fan blade has been examined for possible cracks and separation. A damaged fan can separate during operation. Failure to follow this instruction may result in serious personal injury.**

NOTICE: **When repairing engines, all parts must be contamination free. If contamination/foreign material is present when repairing an engine, premature engine failure may occur.**

NOTE: This section contains information, steps and procedures that may not be specific to every engine.

NOTE: If a component fails to meet the specifications, repair or install a new component as necessary.

NOTE: Refer to the appropriate Section 303-01 for the specification.

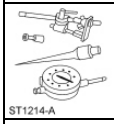
This section covers general procedures and diagnosis and testing of the engine system, except for exhaust emission control devices, the diagnosis of which are covered in the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

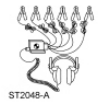
The engine incorporates the following features:

- a closed PCV system. For service, refer to Section 303-08 .
- an exhaust emission control system. For service, refer to Section 303-08 .
- an Evaporative Emission (EVAP) control system. For service, refer to Section 303-13 .

Some engines incorporate a fail-safe cooling system. Refer to the appropriate section in Group 303 for the procedure.

The engine, fuel system, ignition system, emissions system and exhaust system all affect exhaust emission levels and must be maintained according to the maintenance schedule. Refer to the scheduled Maintenance Guide.





Correct engine identification is required to order parts. Refer to the appropriate section in Group 303 for the procedure.

For complete vehicle and engine identification codes, refer to Section 100-01 .

There are 2 diagnostic paths that can be followed depending on the type of engine concern. Carry out the Inspection and Verification - Engine Performance or Inspection and Verification - Engine NVH.

Inspection and Verification - Engine Performance

1. Verify the customer concern by operating the engine to duplicate the condition.

2. Visually inspect for obvious signs of mechanical damage. Refer to the following chart.

Visual Inspection Chart

Mechanical
• Engine coolant leaks • Engine oil leaks • Fuel leaks • Damaged or severely worn parts • Loose mounting bolts, studs and nuts

3. If the inspection reveals obvious concerns that can be readily identified, repair as necessary.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM .
   - refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record Continuous Memory Diagnostic Trouble Codes (CMDTCs).

8. Clear the CMDTCs and carry out the self-test diagnostics for the PCM.

9. If the DTCs retrieved are related to the concern, refer to Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart - Engine Performance .

Inspection and Verification - Engine NVH

1. Engine NVH symptoms should be identified using the diagnostic tools and techniques that are available. For a list of these techniques, tools, an explanation of their uses and a glossary of common terms, refer to Section 100-04 .

2. Verify the customer concern by operating the engine to duplicate the condition.

3. Inspect the engine for installation of an aftermarket oil filter. Review oil and filter maintenance history to make sure that the vehicle has not gone beyond the standard Ford recommended oil change interval.

4. Check the engine oil level and check the oil for contamination. Low engine oil level or contaminated oil are common causes of engine noise. If the oil is contaminated, the source of the contamination must be identified and repaired as necessary.

5. Visually inspect for obvious signs of mechanical damage. Refer to the following chart.

Visual Inspection Chart

Mechanical
• Loose mounting bolts, studs and nuts • Damaged or leaking powertrain mounts • Damaged or disconnected vacuum hoses • Damaged or disconnected air intake components • Obstruction of cooling fan • Obstruction of Front End Accessory Drive (FEAD) • Obstruction of Rear End Accessory Drive (READ), if equipped

6. If the inspection reveals obvious concerns that can be readily identified, repair as necessary.

7. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

8. **NOTE:** The Vehicle Communication Module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM .
   - refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

9. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.

tomsn048@gmail.com

- verify the scan tool operation with a known good vehicle.
- refer to Section 418-00 to diagnose no response from the PCM.

10. Carry out the network test.
    - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
    - If the network test passes, retrieve and record CMDTCs .

11. Clear the CMDTCs and carry out the self-test diagnostics for the PCM.

12. If the DTCs retrieved are related to the concern, refer to Section 419-10 .

13. If no DTCs related to the concern are retrieved, continue the inspection and verification if a noise concern is related to the engine. For vibration concerns and noise concerns such as powertrain mounts, air intake system and starter GO to Symptom Chart - Engine NVH .

In some cases, a noise may be a normal characteristic of that engine type. In other cases the noise may require further investigation. Comparing the noise to a similar year/model vehicle equipped with the same engine will aid in determining if the noise is normal or abnormal.

Once a customer concern has been identified as an abnormal engine noise, it is critical to determine the location of the specific noise. Use the EngineEAR/ChassisEAR or stethoscope (the noise will always be louder closer to the noise source) to isolate the location of the noise to one of the following areas.

- Upper end of engine
- Lower end of engine
- Front of engine
- Rear of engine

Upper end engine noise

Common sources of upper end engine noise (ticking, knocking or rattle) include the fuel injectors, camshaft phaser sprocket(s), camshaft(s) and valve train. Upper end engine noise can be determined using the EngineEAR/ChassisEAR or stethoscope on the valve cover bolts. If the noise is loudest from the valve cover bolts, then the noise is upper end. The EngineEAR/ChassisEAR or stethoscope can be used to further isolate the noise to the specific cylinder bank and cylinder. Removal of the valve covers will be required to pinpoint the source of the noise.

- Fuel Injector Noise
    - A common source of an engine ticking noise can be related to the fuel injector(s). This is normal engine noise that can be verified by listening to another vehicle. If the injector noise is excessive or irregular, use the EngineEAR/ChassisEAR or stethoscope to isolate the noise to a specific fuel injector.
- Camshaft Phaser and Sprocket Noise [Variable Camshaft Timing (VCT) Engines Only]
    - The camshaft phaser and sprocket may emit a light knock in normal operation and is audible only at idle speed, with a hot engine (gear selector in park/neutral). If the camshaft phaser and sprocket noise is excessive or irregular, use the EngineEAR/ChassisEAR or stethoscope to isolate the noise to the LH or RH cylinder head. This normal noise is not prevalent at cold temperature, the engine may require a cold soak overnight for a full diagnosis to effectively be made at hot idle.
- Valve Train
    - Lash adjusters can make an engine ticking or tapping noise noticeable at any engine rpm or temperature and is audible through the wheel well or an open hood. However, with the hood down, lash adjuster noise can be heard as a light tapping noise through the wheel well and is considered normal. The EngineEAR/ChassisEAR or stethoscope can be used to further isolate

the noise to the specific cylinder bank and cylinder, some disassembly of the engine may be required to inspect for damage or wear.

Lower end engine noise

A common source of lower end engine noise (ticking or knocking) include the crankshaft, connecting rod(s) and bearings. Lower end noises can be determined by using the oil pan or cylinder block lug bosses. If the noise is loudest from these areas then the noise is lower end. If an engine noise is isolated to the lower end, some disassembly of the engine may be required to inspect for damage or wear.

Front of engine noise

A common source of noise from the front of the engine (squeal, chirp, whine or hoot) is the Front End Accessory Drive (FEAD) components. To isolate FEAD noise, carry out the Engine Accessory Test, refer to Section 100-04 .

Some other noises from the front of the engine (ticking, tapping or rattle) may be internal to the engine. Use the EngineEAR/ChassisEAR or stethoscope on the engine front cover to determine if the noise is internal to the engine. Removal of the engine front cover may be necessary to inspect internal engine components.

Rear of engine noise

A common source of noise from the rear of the engine (knocking) is the flywheel/flexplate. Inspection of the flywheel/flexplate will be necessary.

14. After the noise is localized, note the characteristics of the noise, including type of noise, frequency and conditions when the noise occurs and GO to Symptom Chart - Engine NVH .

Symptom Chart - Engine Performance

Symptom Chart - Engine Performance

Symptom Chart - Engine NVH

Symptom Chart - Engine NVH
NOTE: NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to Section 100-04 . Since it is possible that any one of multiple systems may be the cause of the symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to Section 100-04 for the next likely system and continue diagnosis.

ConditionPossible SourcesAction

- Drone type noise
- Powertrain mount(s)
- CARRY OUT the Powertrain/Drivetrain Mount Neutralizing procedure in this section.

tomsn048@gmail.com

- Drumming noise - occurs inside the vehicle during idle or high idle, hot or cold. Very low-frequency drumming is very rpm dependent
- Engine vibration excites the body resonances inducing interior noise
- CARRY OUT the Powertrain/Drivetrain Mount Neutralizing procedure in this section.
- Engine drumming noise - accompanied by vibration
- Powertrain mount(s)
- CARRY OUT the Powertrain/Drivetrain Mount Neutralizing procedure in this section.
- Rattle - occurs at idle or at light acceleration from a stop
- Powertrain mount(s)
- CHECK the powertrain mounts for damage. INSTALL new mounts as necessary. For engine, Refer to the appropriate section in Group 303 for the procedure. For automatic transmission, Refer to the appropriate section in Group 307 for the procedure.
- Whine/moan type noise - pitch increases or changes with vehicle speed
- Powertrain mount(s)
- CHECK the powertrain mounts for damage. INSTALL new mounts as necessary. For engine, Refer to the appropriate section in Group 303 for the procedure. For automatic transmission, Refer to the appropriate section in Group 307 for the procedure.
- Clunk - occurs when shifting from PARK or between REVERSE and DRIVE
- Powertrain mounts
- CHECK the powertrain/drivetrain mounts for damage. INSTALL new mounts as necessary. For engine, Refer to the appropriate section in Group 303 for the procedure. For automatic transmission, Refer to the appropriate section in Group 307 for the procedure.
- Idle speed is too high
- CHECK for the correct idle speed.
- Accessory drive bearing hoot - occurs at idle or high idle in cold temperatures of approximately +4°C (+40°F) or colder at the first start of the day
- Accessory drive idler or tensioner pulley bearing is experiencing stick/slip between ball bearings and the bearing race
- CARRY OUT the engine cold soak procedure. REFER to Section 100-04 .
- PLACE the EngineEAR probe directly on the idler/tensioner center post or bolt to verify which bearing is making the noise. INSTALL new parts as necessary. Refer to the appropriate section in Group 303 for the procedure.
- Accessory drive belt noise, squeal or chirping

- Defective/worn or incorrect accessory drive belt
- Misaligned pulley(s)
- Pulley runout
- Damaged or worn accessory drive component or idler
- Fluid contamination of the accessory drive belt or pulleys
- Damaged or worn accessory drive belt tensioner
- Damaged pulley grooves

- CARRY OUT the Engine Accessory Test. REFER to Section 100-04 . INSPECT components and INSTALL new parts as necessary. Refer to the appropriate section in Group 303 for the procedure.

- Clunking noise

- Coolant pump has excessive end play or imbalance

- CHECK the coolant pump for excessive end play. INSPECT the coolant pump for imbalance with the drive belt off. INSTALL a new coolant pump as necessary. Refer to the appropriate section in Group 303 for the procedure.

- Whine or moaning noise

- Air intake system

- CHECK the air cleaner and ducts for correct fit. INSPECT the air intake system for leaks or damage. REPAIR as necessary.Refer to the appropriate section in Group 303 for the procedure.

- Whistling noise - normally accompanied with poor idle condition

- Air intake system

- CHECK the air intake ducts, Air Cleaner (ACL), Throttle Body (TB) and vacuum hoses for leaks and correct fit. REPAIR or ADJUST as necessary.Refer to the appropriate section in Group 303 for the procedure.

- Hissing noise - occurs during idle or high idle that is apparent with the hood open

- Vacuum leak noise

- USE the EngineEAR to locate the source. SCAN the air intake system from the inlet to each cylinder intake port. DISCARD the leaking parts, and INSTALL a new component.

- Vehicles with a plastic intake manifold

- Acceptable condition. Some plastic manifolds exhibit this noise, which is the effect of the plastic manifold.

- Grinding noise - occurs during engine cranking

- Incorrect starter motor mounting

- INSPECT the starter motor for correct mounting. REPAIR as necessary. Refer to the appropriate section in Group 303 for the procedure.

- Starter motor

tomsn048@gmail.com

- CHECK the starter motor. INSTALL a new starter motor as necessary. Refer to the appropriate section in Group 303 for the procedure.

- Incorrect starter motor drive engagement

- INSPECT the starter motor drive for wear or damage. INSTALL a new starter motor as necessary. Refer to the appropriate section in Group 303 for the procedure.
- INSPECT the flywheel/flexplate for wear or damage. INSTALL a new flywheel/flexplate as necessary. Refer to the appropriate section in Group 303 for the procedure.

- Engine noise, front of engine - knocking noise from lower front of engine

- Damaged or separated crankshaft pulley/damper

- CHECK for obvious signs of damage or wobble during operation. INSTALL new as necessary. Refer to the appropriate section in Group 303 for the procedure.

- Engine noise, front of engine - ticking, tapping or rattling noise from the front of the engine

- Timing drive components

- REMOVE the accessory drive belt. Refer to the appropriate section in Group 303 for the procedure.
- USE the EngineEAR to isolate the noise to the engine front cover.
- REMOVE the engine front cover and INSPECT the timing drive components. INSTALL new parts as necessary. Refer to the appropriate section in Group 303 for the procedure.

- Engine noise, upper end - ticking noise near the fuel rail and intake manifold

- Fuel rail clip

- CHECK for loose or damaged fuel rail clip(s). REPAIR as necessary. Refer to the appropriate section in Group 303 for the procedure.

- Fuel injector

- USE the EngineEAR to isolate the noisy injector(s). INSTALL new injector(s) as necessary. Refer to the appropriate section in Group 303 for the procedure.

- Engine noise, upper end - ticking, knocking or rattle noise that occurs during idle or high idle during the first cold start of the day and may disappear as the engine warms

- Valve train noise (bled down lifter/lash adjuster)

- CARRY OUT the Valve Train Analysis Component Test in this section. INSTALL new parts as necessary. Refer to the appropriate section in Group 303 for the procedure.

- Engine noise, upper end - occurs mostly with a warm engine at light/medium acceleration

- Worn or damaged spark plugs

- REMOVE the spark plugs. INSPECT and INSTALL new as necessary. Refer to the appropriate section in Group 303 for the procedure.

- Carbon accumulation in combustion chamber

- INSPECT the cylinder using a Bore scope. ELIMINATE carbon buildup.
- Engine noise, upper end - rattling noise from the valve train. Worse when the engine is cold
- Low oil level
- CHECK the oil level. FILL as necessary.
- Worn valve train components
- CARRY OUT the Valve Train Analysis Component Test in this section. INSTALL new parts as necessary. Refer to the appropriate section in Group 303 for the procedure.
- Worn valve guides
- CARRY OUT the Valve Guide Inner Diameter procedure in this section.
- Excessive runout of the valve seats on the valve face
- CARRY OUT the Valve Seat Inspection procedure in this section.
- Engine noise, upper end - pinging noise
- Gasoline octane too low
- VERIFY with customer the type of gasoline used. CORRECT as necessary.
- Knock Sensor (KS) operation
- CHECK the KS . INSTALL a new KS as necessary. Refer to the appropriate section in Group 303 for the procedure.
- Incorrect spark timing
- REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
- High operating temperature
- INSPECT the cooling system for leaks. CHECK the coolant level. REFILL as necessary. CHECK the coolant for the correct mix ratio. DRAIN and REFILL as needed. VERIFY the engine operating temperature is within specifications. REPAIR as necessary. Refer to the appropriate section in Group 303 for the procedure.
- Spark plug
- CHECK the spark plugs. REPAIR or INSTALL new spark plugs as necessary. Refer to the appropriate section in Group 303 for the procedure.
- Catalytic converter
- Acceptable noise.
- Engine noise, upper end - knocking or ticking noise, occurs mostly with a warm engine at idle

tomsn048@gmail.com

- Low oil level
- CHECK the oil level. FILL as necessary.
- Thin or diluted oil
- INSPECT the oil for contamination. If the oil is contaminated, CHECK for the source. REPAIR as necessary. CHANGE the oil and filter.
- Damaged or incorrect oil filter
- INSPECT the oil filter. INSTALL a new oil filter as necessary.
- Low oil pressure
- CARRY OUT the oil pressure test.
- Camshaft phaser and sprocket(s) [VCT engines only]
- GO to Pinpoint Test A .
- Engine noise, lower end - ticking or knocking noise near the oil filter adapter
- Oil pump
- USE the EngineEAR to verify the oil pump as the source of the noise at low rpm. REPAIR as necessary. Refer to the appropriate section in Group 303 for the procedure.
- Engine noise, lower end - light knocking noise, also described as piston slap. Noise is most noticeable when the engine is cold with light to medium acceleration. The noise disappears as the engine warms
- Excessive clearance between the piston and the cylinder wall
- CARRY OUT the Piston To Cylinder Bore Clearance procedure in this section.
- Engine noise, lower end - light double knock or sharp rap sound. Occurs mostly with a warm engine at idle or low speeds in drive. Increases in relation to engine load. Associated with a poor lubrication history
- Excessive clearance between the piston and the piston pin
- CARRY OUT the Piston Pin Bore Diameter procedure and the Piston Pin Diameter procedure in this section.
- Engine noise, lower end - light knocking noise. The noise is most noticeable when the engine is warm. The noise tends to decrease when the vehicle is coasting or in NEUTRAL
- Excessive clearance between the connecting rod bearings and the crankshaft
- CARRY OUT the Connecting Rod Bearing Journal-to-Bearing Clearance procedure in this section.
- Engine noise, lower end - deep knocking noise. The noise is most noticeable when the engine is warm, at lower rpm and under a light load and then at float

- Worn or damaged crankshaft main bearings
- CARRY OUT the Crankshaft Main Bearing Journal-to-Bearing Clearance procedure in this section.
- Engine noise, rear of engine - knocking noise at rear of engine
- Damaged flywheel/flexplate
- CARRY OUT the Flexplate Inspection procedure in this section.
- Engine vibration - vibration felt at all times
- Excessive crankshaft pulley runout
- CARRY OUT the Engine Accessory Test. INSTALL a new crankshaft pulley as necessary. Refer to the appropriate section in Group 303 for the procedure.
- Damaged or worn accessory component
- CARRY OUT the Engine Accessory Test. REPAIR or INSTALL a new component as necessary.
- Engine vibration - at idle, a low-frequency vibration (5-20 Hz) or mild shake that is felt through the seat/floorpan
- Cylinder misfire
- CARRY OUT the cylinder power balance and the relative compression test using the scan tool. REPAIR as necessary. Refer to the appropriate section in Group 303 for the procedure.
- Engine or torque converter out of balance
- VERIFY the torque converter to crankshaft pilot clearance is correct. REPAIR as necessary. RE-INDEX the torque converter on the flexplate by 120 degrees for a 3-bolt converter or 180 degrees for a 4-bolt converter. Refer to the appropriate section in Group 307 for the procedure.
- Engine vibration - is felt with increases and decreases in engine rpm
- Powertrain mount(s)
- CHECK the powertrain mounts for damage. INSTALL new mounts as necessary. For engine, Refer to the appropriate section in Group 303 for the procedure. For automatic transmission, Refer to the appropriate section in Group 307 for the procedure.
- Engine or transmission contacting the chassis
- INSPECT the powertrain/drivetrain for correct clearances. REPAIR as necessary.
- Engine vibration - increases intensity as the engine rpm is increased
- Engine out-of-balance
- CARRY OUT the Neutral Engine Run-Up (NERU) Test. REFER to Section 100-04 . ROTATE the torque converter, 120 degrees for 3-bolt or 180 degrees for 4-bolt. INSPECT the torque converter pilot outer diameter to crankshaft pilot inner diameter. REPAIR as necessary. Refer to the appropriate

tomsn048@gmail.com

section in Group 307 for the procedure.

- Engine vibration - mostly at coast/neutral coast. Condition improves with vehicle acceleration
- Combustion instability
- CHECK the ignition system. INSTALL new components as necessary. Refer to the appropriate section in Group 303 for the procedure.
- Engine vibration or shudder - occurs with light to medium acceleration above 56 km/h (35 mph)
- Worn or damaged spark plugs
- INSPECT the spark plugs for cracks, high resistance or broken insulators. INSTALL a new spark plug(s) as necessary. Refer to the appropriate section in Group 303 for the procedure.
- Plugged fuel injector
- INSTALL a new fuel injector as necessary. Refer to the appropriate section in Group 303 for the procedure.
- Contaminated fuel
- INSPECT the fuel for contamination. DRAIN the fuel system and refill.

Pinpoint Tests

Pinpoint Test A: Engine Noise, Upper End - Camshaft Phaser and Sprocket(s) [Variable Camshaft Timing (VCT) Engines Only]

This pinpoint test is intended to diagnose the following:
- Camshaft phaser and sprocket noise

PINPOINT TEST A: ENGINE NOISE, UPPER END - CAMSHAFT PHASER AND SPROCKET(S) [VCT ENGINES ONLY]

Test Step	Result / Action to Take
A1 VERIFY THE CAMSHAFT PHASER AND SPROCKET(S) NOISE	
• Ignition OFF. • Disconnecting the RH and LH Variable Camshaft Timing (VCT) solenoid electrical connectors. • Start the vehicle and elevate the engine rpm and then return to idle. • **Is the camshaft phaser and sprocket noise still audible?**	**Yes** The concern is not VCT related. GO to Symptom Chart - Engine NVH . **No** GO to A2 .

A2 CHECK THE ENGINE MINIMUM OIL PRESSURE	
• Check the engine oil pressure. Carry out the oil pressure test. • **Is the oil pressure reading within the minimum specification?**	**Yes** GO to A3 . **No** GO to Pinpoint Test B .
A3 CHECK THE VCT HOUSING OIL SCREEN FOR DEBRIS	
• Remove the VCT housing oil screen and inspect for debris. • **Is the VCT oil screen clean and free of debris?**	**Yes** INSPECT the VCT camshaft phaser and sprockets and REPAIR as necessary. REFER to Camshaft Phaser and Sprocket Inspection in this section. **No** REMOVE the VCT housing, Refer to the appropriate section in Group 303 for the procedure. CLEAN and INSPECT the VCT housing. REFER to Variable Camshaft Timing (VCT) Housing Cleaning and Inspection in the section.

Pinpoint Test B: Low Oil Pressure

Normal Operation

Oil is drawn into the oil pump through the oil pump screen and pickup tube in the sump of the oil pan. Oil is pumped through the oil filter on the left front side of the cylinder block then enters the main gallery where it is distributed to the crankshaft main journals and to both cylinder heads. From the main journals, the oil is routed through cross-drilled passages in the crankshaft to lubricate the connecting rod bearings. Controlled leakage through the crankshaft main bearings and connecting rod bearings is slung radially outward to cool and lubricate the cylinder walls as well as the entire connecting rod, piston and piston ring assembly. The left cylinder head is fed from a drilling into the supply passage feeding the main gallery at the front of the cylinder block. The right cylinder head is fed from a drilling into the rear of the main gallery. Main gallery pressure is reduced as it enters the cylinder head galleries through fixed serviceable orifices, located at the upper part of the feed passages. It is this reduced pressure in the cylinder head galleries which feed the camshaft journals, the hydraulic lash adjusters and the primary and secondary timing chain tensioners. On Variable Camshaft Timing (VCT) equipped engines, the oil pressure feed for the VCT solenoids, VCT housings and camshaft phaser and sprockets is not reduced. The camshaft lobe and roller followers are lubricated by splash created through valve train operation.

This pinpoint test is intended to diagnose the following:

- Excessive crankshaft end play
- Excessive main bearing clearance
- Excessive connecting rod bearing clearance
- Excessive camshaft bearing cap clearance
- Loose camshaft phaser and sprocket bolt(s) [VCT engines only]
- Loose oil galley plugs
- Loose timing chain tensioner bolts
- Loose VCT housing bolts [VCT engines only]
- Oil pump screen and pickup tube
- Restricted oil flow passages
- Worn or damaged oil pump

tomsn048@gmail.com

PINPOINT TEST B: LOW OIL PRESSURE

Test Step	Result / Action to Take
B1 CHECK THE CRANKSHAFT END PLAY	
• Check the crankshaft end play. Refer to Crankshaft End Play in this section. • **Is the crankshaft end play within specification?**	**Yes** GO to B2 . **No** REPAIR as necessary. Refer to the appropriate section in Group 303 for the procedure.
B2 VERIFY THE CAMSHAFT BEARING CAPS ARE NOT DAMAGED AND TIGHT	
• Check that the camshaft bearing caps are not damaged and the bolts are properly tightened. Refer to the Specification chart in the appropriate engine section. • **Are the camshaft bearing caps loose or damaged?**	**Yes** REPAIR as necessary. Refer to the appropriate section in Group 303 for the procedure. **No** If the engine is equipped with VCT , GO to B3 ; for all other engines, GO to B5 .
B3 VERIFY THE CAMSHAFT PHASER AND SPROCKET BOLT(S) ARE TIGHT	
• Check that the camshaft phaser and sprocket bolt(s) are tight. Refer to the Specification chart in the appropriate engine section. • **Are the camshaft phaser and sprocket bolt(s) loose?**	**Yes** REPAIR as necessary. Refer to the appropriate section in Group 303 for the procedure. **No** GO to B4 .
B4 VERIFY THE VCT HOUSING BOLT(S) ARE TIGHT [VCT ENGINES ONLY]	
• Check that the VCT housing bolts are tight. Refer to the Specification chart in the appropriate engine section. • **Are the VCT housing bolts loose?**	**Yes** REPAIR as necessary. Refer to the appropriate section in Group 303 for the procedure. **No** GO to B5 .
B5 CHECK CAMSHAFT JOURNAL-TO-BEARING CLEARANCE	
• Check the camshaft journal-to-bearing clearance. Refer to the Specification chart in the appropriate engine section. • **Is camshaft journal-to-bearing clearance within specification?**	**Yes** GO to B6 . **No** REPAIR as necessary. Refer to the appropriate section in Group 303 for the procedure.
B6 CHECK FOR RESTRICTED OIL FLOW	
	Yes

• Verify the oil supply and return passages are not plugged and clean of debris. Refer to the oil flow chart in the appropriate engine section. • **Is oil flow restricted?**	REPAIR as necessary. Refer to the appropriate section in Group 303 for the procedure. **No** GO to B7 .
B7 CHECK THE TIMING CHAIN TENSIONERS FOR DAMAGE AND VERIFY THE BOLTS ARE TIGHT	
• Check that the timing chain tensioners are not damaged or the bolts are loose. Refer to the Specification chart in the appropriate engine section. • **Are the timing chain tensioners damaged or bolts loose?**	**Yes** REPAIR as necessary. Refer to the appropriate section in Group 303 for the procedure. **No** GO to B8 .
B8 CHECK THE OIL PUMP PICKUP TUBE AND SCREEN FOR DAMAGE	
• Check that the oil pump pickup tube and screen is not plugged, cracked or that the bolts are loose. Refer to the Specification chart in the appropriate engine section. • **Is the oil pump screen and pickup tube damaged or loose?**	**Yes** REPAIR as necessary. Refer to the appropriate section in Group 303 for the procedure. **No** GO to B9 .
B9 CHECK THE OIL PUMP FOR DAMAGE	
• Verify the oil pump is not damaged. • **Is oil pump damaged?**	**Yes** REPAIR as necessary. Refer to the appropriate section in Group 303 for the procedure. **No** GO to B10 .
B10 CHECK CRANKSHAFT MAIN BEARING JOURNAL-TO-BEARING CLEARANCE	
• Check the crankshaft main bearing journal-to-bearing clearance. Refer to the Specification chart in the appropriate engine section. • **Is crankshaft main bearing journal-to-bearing clearance within specification?**	**Yes** GO to B11 . **No** REPAIR as necessary. Refer to the appropriate section in Group 303 for the procedure.
B11 CHECK CONNECTING ROD BEARING JOURNAL-TO-BEARING CLEARANCE	
• Check the connecting rod bearing journal-to-bearing clearance. Refer to the Specification chart in the appropriate engine section. • **Is connecting rod bearing journal-to-bearing clearance within specification?**	**Yes** The concern may have been caused by debris or an incorrect assembly. REPEAT the oil pressure test. **No** REPAIR as necessary. Refer to the appropriate section in Group 303 for the procedure.

tomsn048@gmail.com

Component Tests

The following component tests are used to diagnose engine concerns.

Engine Oil Leaks

NOTICE: **If an overnight drive is done, the fan air or road air blast may cause erroneous readings.**

NOTE: When diagnosing engine oil leaks, the source and location of the leak must be positively identified prior to repair.

Prior to carrying out this procedure, clean the cylinder block, cylinder heads, valve covers, oil pan and flywheel with a suitable solvent to remove all traces of oil.

Engine Oil Leaks - Fluorescent Oil Additive Method

Use the 12 Volt Master UV Diagnostic Inspection Kit to carry out the following procedure for oil leak diagnosis.

1. Add 29.6 ml (1 oz) of gasoline engine oil dye to a minimum of 0.47L (1/2 qt) and a maximum of 0.95L (1 qt) engine oil and fill through the engine oil fill. If the oil is not premixed, the gasoline engine oil dye will not have enough time to reach the crankcase, oil galleries and seal surfaces during this particular 15 minute test. The gasoline engine oil dye must be mixed with oil and added through the oil fill. Check the level on the oil level indicator to determine what amount of oil to premix. If it is in the middle of the crosshatch area or below the full mark, use 0.95L (1 qt). If it is at the full mark, use 0.47L (1/2 qt).

2. Run the engine for 15 minutes. Stop the engine and inspect all seal and gasket areas for leaks using the UV Diagnostic Inspection Kit. A clear bright yellow or orange area will identify the leak. For extremely small leaks, several hours may be required for the leak to appear.

3. At the end of test, make sure the oil level is within the upper and lower oil indicator marks. Remove oil as necessary if it registers above the full mark.

Leakage Points - Underhood

Examine the following areas for oil leakage:

- Valve cover gaskets
- Cylinder head gaskets
- Oil cooler, if equipped
- Oil filter adapter
- Engine front cover
- Oil filter adapter and filter body
- Oil level indicator tube connection
- Engine Oil Pressure (EOP) sensor

Leakage Points - Under Engine, With Vehicle on Hoist

Examine the following areas for oil leakage:

- Oil pan gaskets

- Oil pan sealer
- Engine front cover gasket
- Crankshaft front seal
- Crankshaft rear oil seal
- Oil filter adapter and filter body
- Oil cooler, if equipped

Leakage Points - With Transmission and Flywheel Removed

Examine the following areas for oil leakage:

- Crankshaft rear seal
- Crankshaft rear seal retainer
- Rear main bearing cap parting line
- Flexplate mounting bolt holes (with flexplate installed)
- Pipe plugs at the end of oil passages

Oil leaks at crimped seams in sheet metal parts and cracks in cast or stamped parts can be detected when using the Gasoline Engine Oil Dye method.

Compression Test - Compression Gauge Check

1. Make sure the oil in the crankcase is of the correct viscosity and at the correct level and that the battery is correctly charged. Operate the vehicle until the engine is at normal operating temperature. Turn the ignition switch to the OFF position, then remove all the spark plugs.

2. Set the throttle plates in the wide-open position.

3. Install a compression gauge in the No. 1 cylinder.

4. Install an auxiliary starter switch in the starting circuit. With the ignition switch in the OFF position, and using the auxiliary starter switch, crank the engine a minimum of 5 compression strokes and record the highest reading. Note the approximate number of compression strokes required to obtain the highest reading.

5. Repeat the test on each cylinder, cranking the engine approximately the same number of compression strokes.

Compression Test - Test Results

The indicated compression pressures are considered within specification if the lowest reading cylinder is at least 75% of the highest reading. Refer to the Compression Pressure Limit Chart.

Compression Pressure Limit Chart

tomsn048@gmail.com

Maximum Recorded Cylinder Pressure	Minimum Recorded Cylinder Pressure	Maximum Recorded Cylinder Pressure	Minimum Recorded Cylinder Pressure	Maximum Recorded Cylinder Pressure	Minimum Recorded Cylinder Pressure	Maximum Recorded Cylinder Pressure	Minimum Recorded Cylinder Pressure
924 kPa (134 psi)	696 kPa (101 psi)	1,131 kPa (164 psi)	848 kPa (123 psi)	1,338 kPa (194 psi)	1,000 kPa (145 psi)	1,544 kPa (224 psi)	1,158 kPa (168 psi)

N0096835

If one or more cylinders reads low, squirt approximately one tablespoon of engine oil on top of the pistons in the low-reading cylinders. Repeat the compression pressure check on these cylinders.

Compression Test - Interpreting Compression Readings

1. If compression improves considerably, piston rings are faulty.

2. If compression does not improve, valves are sticking or seating incorrectly.

3. If 2 adjacent cylinders indicate low compression pressures and squirting oil on each piston does not increase compression, the head gasket may be leaking between cylinders. Engine oil or coolant in cylinders could result from this condition.
   Use the Compression Pressure Limit Chart when checking cylinder compression so that the lowest reading is within 75% of the highest reading.

Cylinder Leakage Detection

When a cylinder produces a low reading, use of a cylinder leakage tester will be helpful in pinpointing the exact cause.

The leakage tester is inserted in the spark plug hole, the piston is brought up to dead center on the compression stroke and compressed air is admitted.

Once the combustion chamber is pressurized, the leakage tester gauge will read the percentage of leakage. Leakage exceeding 20% is excessive.

While the air pressure is retained in the cylinder, listen for the hiss of escaping air. A leak at the intake valve will be heard in the Throttle Body (TB). A leak at the exhaust valve can be heard at the tail pipe. Leakage past the piston rings will be audible at the PCV connection. If air is passing through a blown head gasket to an adjacent cylinder, the noise will be evident at the spark plug hole of the cylinder into which the air is leaking. Cracks in the cylinder block or gasket leakage into the cooling system may be detected by a stream of bubbles in the radiator.

Excessive Engine Oil Consumption

Nearly all engines consume oil, which is essential for normal lubrication of the cylinder bore walls and pistons and rings. Determining the level of oil consumption may require testing by recording how much oil is being added over a given set of miles.

Customer driving habits greatly influence oil consumption. Mileage accumulated during towing or heavy loading generates extra heat. Frequent short trips, stop-and-go type traffic or extensive idling, prevent the engine from reaching normal operating temperature. This prevents component clearances from reaching specified operating ranges.

The following diagnostic procedure may be utilized to determine internal oil consumption. Make sure that the concern is related to internal oil consumption, and not external leakage, which also consumes oil. Verify there are no leaks before carrying out the test. Once verified, the rate of internal oil consumption can be tested.

A new engine may require extra oil in the early stages of operation. Internal piston-to-bore clearances and sealing characteristics improve as the engine breaks in. Engines are designed for close tolerances and do not require break-in oils or additives. Use the oil specified in the Owner's Literature. Ambient temperatures may determine the oil viscosity specification. Verify that the correct oil is being used for the vehicle in the geographic region in which it is driven.

Basic Pre-checks

1. For persistent complaints of oil consumption, interview the customer to determine the oil consumption characteristics. If possible, determine the brand and grade of oil currently in the oil pan. Look at the oil filter or oil-change station tags to determine if Ford-recommended maintenance schedules have been followed. Make sure that the oil has been changed at the specified mileage intervals. If vehicle mileage is past the first recommended drain interval, the OEM production filter should have been changed.

2. Ask how the most current mileage was accumulated. That is, determine whether the vehicle was driven under the following conditions:
    - Extended idling or curbside engine operation
    - Stop-and-go traffic or taxi operation
    - Towing a trailer or vehicle loaded heavily
    - Frequent short trips (engine not up to normal operating temperature)
    - Excessive throttling or high engine-rpm driving

3. Verify that there are no external leaks. If necessary, review the diagnostic procedure under Engine Oil Leaks in the Diagnosis and Testing portion of this section.

4. Inspect the crankcase ventilation system for:
    - disconnected hoses at the valve cover or TB .
    - loose or missing valve cover fill cap.
    - missing or incorrectly seated engine oil level indicator.
    - incorrect or dirty PCV valve.
    - a PCV valve grommet unseated in the valve cover (if so equipped).

5. Inspect for signs of sludge. Sludge affects PCV performance and can plug or restrict cylinder head drainback wells. It can also increase oil pressure by restricting passages and reducing the drainback capability of piston oil control rings.

6. Inspect the air filter for dirt, sludge or damage. A hole in the filter element will allow unfiltered air to

tomsn048@gmail.com

bypass into the air induction system. This can cause premature internal wear (engine dusting), allowing oil to escape past rings, pistons, valves and guides.

7. If the engine is hot or was recently shut down, wait at least 5 minutes to allow the oil to drain back. Ask the customer if this requirement has been followed. Adding oil without this wait period can cause an overfill condition, leading to excessive oil consumption and foaming which may cause engine damage.

8. Make sure the oil level indicator (dipstick) is correctly and fully seated in the indicator tube. Remove the oil level indicator and record the oil level.

Detailed Pre-checks

1. Check the thermostat opening temperature to make sure that the cooling system is operating at the specified temperature. If it is low, internal engine parts are not running at specified internal operating clearances.

2. Verify the spark plugs are not oil saturated. Oil leaking into one or more cylinders will appear as an oil soaked condition on the plug. If a plug is saturated, a compression check may be necessary at the conclusion of the oil consumption test.

Oil Consumption Test

Once all of the previous conditions are met, carry out an oil consumption test.

1. Drain the engine oil and remove the oil filter. Install a new manufacturer-specified oil filter. Make sure the vehicle is positioned on a level surface. Refill the oil pan to a level **one liter (quart) less** than the specified fill level, using manufacturer-specified oil.

2. Run the engine for 3 minutes (if hot) or 10 minutes (if cold). Allow for a minimum 5-minute drainback period and then record the oil level shown on the oil level indicator. Place a mark on the backside of the oil level indicator noting the oil level location.

3. Add the final 0.95L (1 qt) to complete the normal oil fill. Restart the engine and allow it to idle for 2 minutes. Shut the engine down.

4. After a 5-minute drainback period, record the location of the oil level again. Mark the oil level indicator with the new oil level location. (Note: Both marks should be very close to the MIN-MAX upper and lower limits or the upper and lower holes on the oil level indicator. These marks will exactly measure the engine's use of oil, with a one quart differential between the new marks.) Demonstrate to the customer that the factory-calibrated marks on the oil level indicator are where the oil should fall after an oil change with the specified fill amount. Explain however, that this may vary slightly between MIN-MAX or the upper and lower holes on the oil level indicator.

5. Record the vehicle mileage.

6. Advise the customer that oil level indicator readings must be taken every 320 km (200 mi) or weekly, using the revised marks as drawn. Remind the customer that the engine needs a minimum 5-minute drainback for an accurate reading and that the oil level indicator must be firmly seated in the tube prior to taking the reading.

7. When the subsequent indicator readings demonstrate a full quart (liter) has been used, record the vehicle mileage. The mileage driven between the 2 readings should not be less than 2,414 km (1,500 mi). The drive cycle the vehicle has been operated under must be considered when making this

calculation. It may be necessary to have the customer bring the vehicle in for a periodic oil level indicator reading to closely monitor oil usage.

Post Checks, Evaluation and Corrective Action

1. If test results indicate excessive oil consumption, carry out a cylinder compression test. The cylinder compression test should be carried out with a fully charged battery and all spark plugs removed. See the Compression Test Chart in this section for pressure range limits.

2. Compression should be consistent across all cylinders. Refer to the Compression Testing portion of this section. If compression tested within the specifications found in this section, the excessive oil consumption may be due to wear on the valve guides, valves or valve seals.

3. A cylinder leak detection test can be carried out using a cylinder leakage tester. This can help identify valves, piston rings, or worn valve guides/valve stems, inoperative valve stem seals or other related areas as the source of oil consumption.

NOTE: An oil-soaked appearance on the porcelain tips of the spark plugs also indicates excessive oil use. A typical engine with normal oil consumption will exhibit a light tan to brown appearance. See Spark Plug Analysis in this section for details. A single or adjoining, multiple cylinder leak can be traced by viewing the tips.

4. If an internal engine part is isolated as the root cause, determine if the repair will exceed cost limits and proceed with a repair strategy as required.

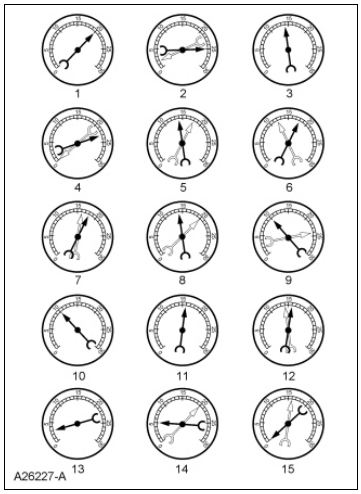
5. Once corrective action to engine is complete and verifying that all pre-check items were eliminated in the original diagnosis, repeat the Oil Consumption Test as described above and verify consumption results.

Intake Manifold Vacuum Test

Bring the engine to normal operating temperature. Connect the Vacuum/Pressure Tester to the intake manifold. Run the engine at the specified idle speed.

The vacuum gauge should read between 51-74 kPa (15-22 in-Hg) depending upon the engine condition and the altitude at which the test is performed. Subtract 4.0193 kPa (1 in-Hg) from the specified reading for every 304.8 m (1,000 ft) of elevation above sea level.

The reading should be steady. If necessary, adjust the gauge damper control (where used) if the needle is fluttering rapidly. Adjust the damper until the needle moves easily without excessive flutter.



Intake Manifold Vacuum Test - Interpreting Vacuum Gauge Readings

A careful study of the vacuum gauge reading while the engine is idling will help pinpoint trouble areas. Always conduct other appropriate tests before arriving at a final diagnostic decision. Vacuum gauge readings, although helpful, must be interpreted carefully.

Most vacuum gauges have a normal band indicated on the gauge face.

The following are potential gauge readings. Some are normal; others should be investigated further.

tomsn048@gmail.com

1. NORMAL READING: Needle between 51-74 kPa (15-22 in-Hg) and holding steady.

2. NORMAL READING DURING RAPID ACCELERATION AND DECELERATION: When the engine is rapidly accelerated (dotted needle), the needle will drop to a low reading (not to zero). When the throttle is suddenly released, the needle will snap back up to a higher than normal figure.

3. NORMAL FOR HIGH-LIFT CAMSHAFT WITH LARGE OVERLAP: The needle will register as low as 51 kPa (15 in-Hg), but will be relatively steady. Some oscillation is normal.

4. WORN RINGS OR DILUTED OIL: When the engine is accelerated (dotted needle), the needle drops to 0 kPa (0 in-Hg). Upon deceleration, the needle runs slightly above 74 kPa (22 in-Hg).

5. STICKING VALVES: When the needle (dotted) remains steady at a normal vacuum, but occasionally flicks (sharp, fast movement) down and back about 13 kPa (4 in-Hg), one or more valves may be sticking.

6. BURNED OR WARPED VALVES: A regular, evenly-spaced, downscale flicking of the needle indicates one or more burned or warped valves. Insufficient hydraulic lash adjuster or hydraulic lash adjuster clearance will also cause this reaction.

7. POOR VALVE SEATING: A small but regular downscale flicking can mean one or more valves are not seating.

8. WORN VALVE GUIDES: When the needle oscillates over about a 13 kPa (4 in-Hg) range at idle speed, the valve guides could be worn. As engine speed increases, the needle will become steady if guides are responsible.

9. WEAK VALVE SPRINGS: When the needle oscillation becomes more violent as engine rpm is increased, weak valve springs are indicated. The reading at idle could be relatively steady.

10. LATE VALVE TIMING: A steady but low reading could be caused by late valve timing.

11. IGNITION TIMING RETARDING: Retarded ignition timing will produce a steady, but somewhat low, reading.

12. INSUFFICIENT SPARK PLUG GAP: When spark plugs are gapped too close, a regular, small pulsation of the needle can occur.

13. INTAKE LEAK: A low, steady reading can be caused by an intake manifold or throttle body gasket leak.

14. BLOWN HEAD GASKET: A regular drop of fair magnitude can be caused by a blown head gasket or warped cylinder head-to-cylinder block surface.

15. RESTRICTED EXHAUST SYSTEM: When the engine is first started and is idled, the reading may be normal, but as the engine rpm is increased, the back pressure caused by a clogged muffler, kinked tail pipe or other concerns will cause the needle to slowly drop to 0 kPa (0 in-Hg). The needle then may slowly rise. Excessive exhaust clogging will cause the needle to drop to a low point even if the engine is only idling.

16. When vacuum leaks are indicated, search out and correct the cause. Excess air leaking into the system will upset the fuel mixture and cause concerns such as rough idle, missing on acceleration or burned valves. If the leak exists in an accessory unit such as the power brake booster, the unit will not function correctly. Always fix vacuum leaks.

Oil Pressure Test

NOTICE: **Inspect the engine for installation of an aftermarket oil filter. Review oil and filter maintenance history to make sure that the vehicle has not gone beyond the standard Ford recommended oil change intervals. Check the engine oil level and check the oil for contamination. If the oil is contaminated, engine damage can occur. The source of the contamination must be identified and repaired as necessary.**

1. Disconnect and remove the Engine Oil Pressure (EOP) switch from the engine. Refer to the appropriate section in Group 303 for the procedure.

2. Connect the Oil Pressure Gauge to the oil pressure port.

3. Run the engine until normal operating temperature is reached.

4. With the engine at idle record the gauge reading.

5. Run the engine at 2,000 rpm and record the gauge reading.

6. The oil pressure should be within specifications; refer to the specifications in the appropriate engine section.

7. If the pressure is not within specification, GO to Pinpoint Test B .

Valve Train Analysis

The following component tests are used to diagnose valve train concerns.

Valve Train Analysis - Engine Off - Valve Cover Removed

Check for damaged or severely worn parts and correct assembly. Make sure correct parts are used with the static engine analysis as follows.

Valve Train Analysis - Engine Off, Camshaft Roller Followers and Hydraulic Lash Adjusters, Overhead Camshaft

- Check for loose mounting bolts on camshaft carriers.
- Check for plugged oil feed in the camshaft roller followers, lash adjusters or cylinder heads.

tomsn048@gmail.com

Valve Train Analysis - Engine Off, Camshaft - Engines

- Check for broken or damaged parts.

Valve Train Analysis - Valve Springs

- Check for broken or damaged parts.

Valve Train Analysis - Engine Off, Valve Spring Retainer and Valve Spring Retainer Keys

- Check for correct seating of the valve spring retainer key on the valve stem and in valve spring retainer.
- Check for correct seating on the valve stem.

Valve Train Analysis - Engine Off, Valves and Cylinder Head

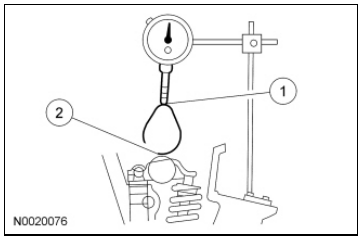
- Check for plugged oil drain back holes.
- Check for worn or damaged valve tips.
- Check for missing or damaged guide-mounted valve stem seal.
- Check for damaged hydraulic lash adjuster.
- Check installed valve spring height.
- Check for missing or worn valve spring seats.
- Check for plugged oil metering orifice in cylinder head oil reservoir (if equipped).

Static checks (engine off) are to be made on the engine prior to the dynamic procedure.

Valve Train Analysis - Engine Running, Valves and Cylinder Head

- Check for plugged oil drain back holes.
- Check for missing or damaged valve stem seals or guide mounted valve stem seals.
- Check for a plugged oil metering orifice in the cylinder head oil reservoir.

If insufficient oiling is suspected, check oil passages for blockage, then accelerate the engine to 1,200 rpm with the transmission in NEUTRAL and the engine at normal operating temperature. Oil should spurt from the rocker arm oil holes such that valve tips and camshaft roller followers are well oiled. With the valve covers off, some oil splash may overshoot camshaft roller followers.



Valve Train Analysis - Camshaft Lobe Lift

Check the lift of each camshaft lobe in consecutive order and make a note of the readings.

1. Remove the spark plugs.

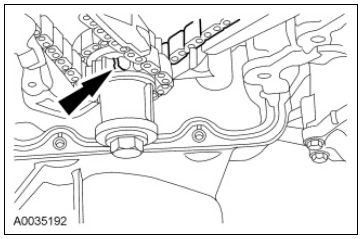
2. Install the Dial Indicator Gauge with Holding Fixture so the rounded tip of indicator is on top of the camshaft lobe.

3. Rotate the crankshaft using a breaker bar and socket attached to the crankshaft pulley retainer bolt. Rotate the crankshaft until the base circle of the camshaft lobe is reached.

4. Zero the Dial Indicator Gauge. Continue to rotate the crankshaft until the (1) high-lift point of the camshaft lobe is in the fully-raised position (highest indicator reading).

5. To check the accuracy of the original indicator reading, continue to rotate crankshaft until the (2) base circle is reached. The indicator reading should be zero. If zero reading is not obtained, repeat the measurement.

6. If the lift on any lobe is below specified service limits, install a new camshaft and camshaft roller followers.



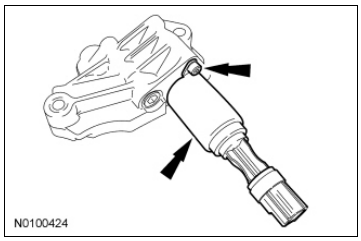
7. Install the spark plugs.

---

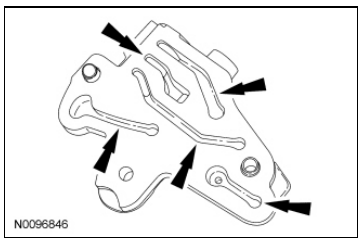
tomsn048@gmail.com

Sprockets

1. Inspect the sprockets for cracks and worn or chipped teeth.



Variable Camshaft Timing (VCT) Housing Cleaning and Inspection

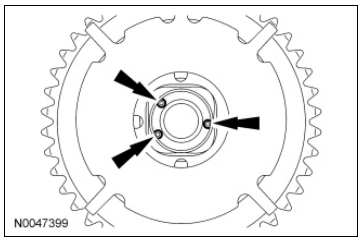


Material

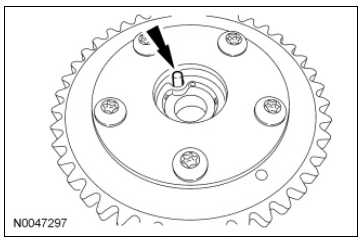
Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	-

1. Remove the screw and the Variable Camshaft Timing (VCT) oil control solenoid.
   - To install, tighten to 5 Nm (44 lb-in).

2. Clean the mating surfaces and oil passages with metal surface prep. Follow the directions on the packaging.

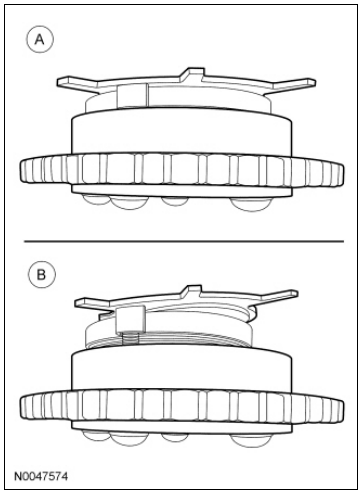


3. Inspect the VCT housing for pitting, cracks or damaged sealing surfaces. Install a new VCT housing if damaged.



tomsn048@gmail.com

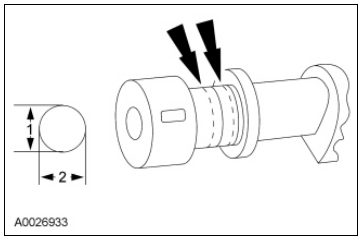
Camshaft Phaser and Sprocket Inspection



1. Inspect the front of the camshaft phaser and sprocket for missing or damaged roll pins.
   - If the roll pins are missing or damaged, a new camshaft phaser and sprocket must be installed.

2. Inspect the rear of the camshaft phaser and sprocket for a deformed or damaged location pin.
   - If the location pin is deformed or damaged, a new camshaft phaser and sprocket must be installed.

3. Visually inspect the camshaft phaser and sprocket for squareness (A). If the trigger wheel or spring is deformed or damaged (B), install a new camshaft phaser and sprocket.



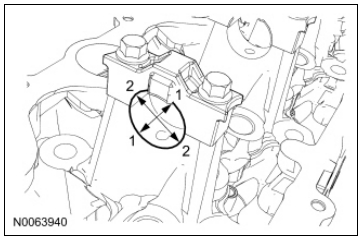
tomsn048@gmail.com

Camshaft Bearing Journal Diameter

NOTE: Refer to the appropriate Section 303-01 for the specification.

1. Measure each camshaft journal diameter in 2 directions.

tomsn048@gmail.com



Camshaft Journal to Bearing Clearance - OHC Engines

NOTE: Refer to the appropriate Section 303-01 for the specification.

1. **NOTE:** The camshaft journals must meet specifications before checking camshaft journal clearance.

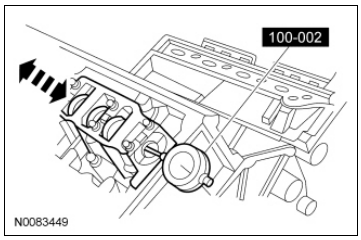
   Measure each camshaft bearing in 2 directions.

   - Subtract the camshaft journal diameter from the camshaft bearing diameter.

Camshaft End Play - OHC Engines

Special Tool(s)

 ST1214-A	Dial Indicator Gauge with Holding Fixture 100-002 (TOOL-4201-C) or equivalent

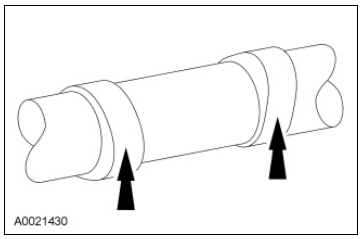


NOTE: Refer to the appropriate Section 303-01 for the specification.

1. Using the Dial Indicator Gauge with Holding Fixture, measure the camshaft end play.

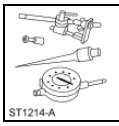
2. Position the camshaft to the rear of the cylinder head.

3. Zero the Dial Indicator Gauge.



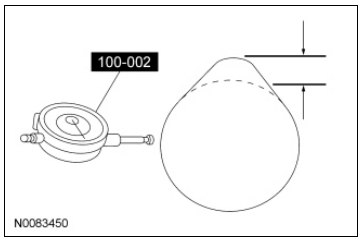
4. Move the camshaft to the front of the cylinder head. Note and record the camshaft end play.
   - If camshaft end play exceeds specifications, install a new camshaft and recheck end play.
   - If camshaft end play exceeds specification after camshaft installation, install a new cylinder head.

tomsn048@gmail.com



Camshaft Surface Inspection

1. Inspect camshaft lobes for pitting or damage in the contact area. Minor pitting is acceptable outside the contact area.

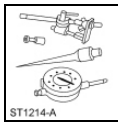


Camshaft Lobe Lift

Special Tool(s)

 ST1214-A	Dial Indicator Gauge with Holding Fixture 100-002 (TOOL-4201-C) or equivalent

NOTE: Refer to the appropriate Section 303-01 for the specification.



1. Use the Dial Indicator Gauge with Holding Fixture to measure camshaft intake/exhaust lobe lift.
   - Rotate the camshaft and subtract the lowest Dial Indicator Gauge reading from the highest Dial Indicator Gauge reading to figure the camshaft lobe lift.

tomsn048@gmail.com

Camshaft Runout

Special Tool(s)

 ST1214-A	Dial Indicator Gauge with Holding Fixture 100-002 (TOOL-4201-C) or equivalent

NOTE: Refer to the appropriate Section 303-01 for the specification.

1. **NOTE:** Camshaft journals must be within specifications before checking runout.

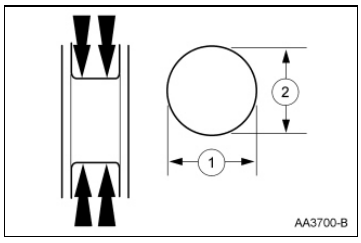
   Using the Dial Indicator Gauge with Holding Fixture, measure the camshaft runout.

   - Camshaft must be supported on the first and last camshaft bearing journal.
   - Rotate the camshaft and subtract the lowest Dial Indicator Gauge reading from the highest Dial Indicator Gauge reading.

Crankshaft Main Bearing Journal Diameter

NOTE: Refer to the appropriate Section 303-01 for the specification.

1. Measure each of the crankshaft main bearing journal diameters in at least 2 directions.

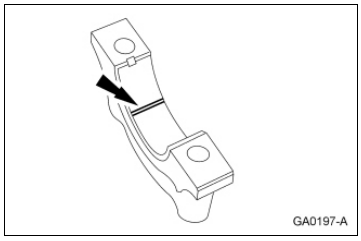


tomsn048@gmail.com

Crankshaft Main Bearing Journal Taper and Out-of-Round

NOTE: Refer to the appropriate Section 303-01 for the specification.

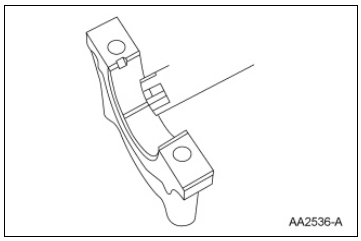
1. Measure each of the crankshaft main bearing journal diameters in at least 2 directions at each end of the main bearing journal.



Crankshaft Main Bearing Journal-to-Bearing Clearance

NOTE: Refer to the appropriate Section 303-01 for the specification.

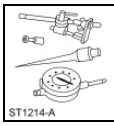
NOTE: Crankshaft main bearing journals must be within specifications before checking journal clearance.



1. Remove the crankshaft main bearing caps and crankshaft main bearing.
2. Lay a piece of Plastigage across the face of each crankshaft main bearing surface.

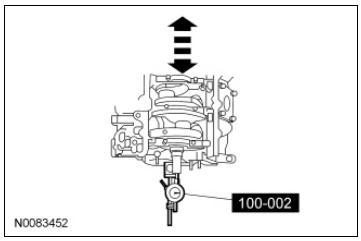
3. **NOTE:** Do not turn the crankshaft while carrying out this procedure.

   Install and remove the crankshaft main bearing cap.



4. Verify the crankshaft journal clearance.

tomsn048@gmail.com

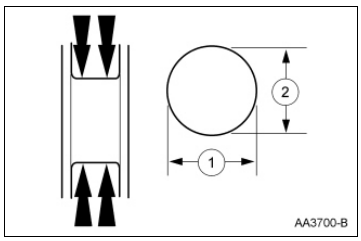


Crankshaft End Play

Special Tool(s)

 ST1214-A	Dial Indicator Gauge with Holding Fixture 100-002 (TOOL-4201-C) or equivalent

NOTE: Refer to the appropriate Section 303-01 for the specification.

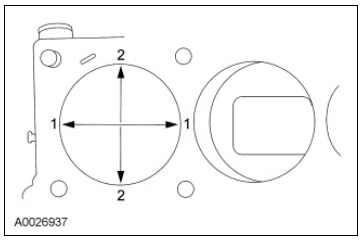


1. Install the Dial Indicator Gauge with Holding Fixture.
2. Position the crankshaft to the rear of the cylinder block.
3. Zero the Dial Indicator Gauge.
4. Move the crankshaft to the front of the cylinder block. Note and record the crankshaft end play.

Connecting Rod Bearing Journal Taper and Out-of-Round

NOTE: Refer to the appropriate Section 303-01 for the specification.

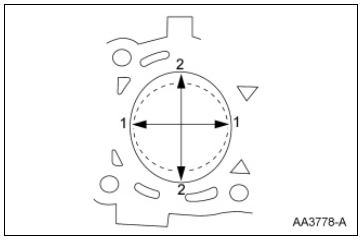
1. Measure the crankshaft connecting rod journal diameters in 2 directions perpendicular to one another at each end of the connecting rod journal. The difference in the measurements from one end to the other is the taper. Verify measurement is within the wear limit.



tomsn048@gmail.com

Cylinder Bore Taper

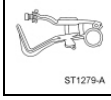
NOTE: Refer to the appropriate Section 303-01 for the specification.



1. Measure the cylinder bore at the top, middle and bottom of piston ring travel in 2 directions as indicated. Verify the cylinder bore is within the wear limit. The difference indicates the cylinder bore taper. If the cylinder bore taper does not meet specification, bore the cylinder to the next oversize limit.

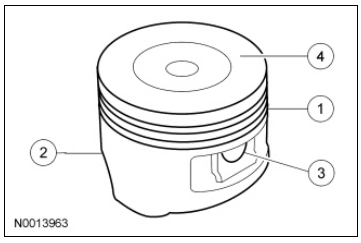
Cylinder Bore Out-of-Round

NOTE: Refer to the appropriate Section 303-01 for the specification.



1. Measure the cylinder bore in 2 directions. The difference is the out-of-round.

tomsn048@gmail.com



Piston Inspection

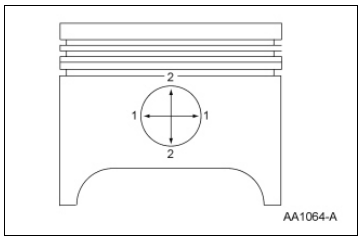
Special Tool(s)

 ST1279-A	Scraper, Piston Ring Groove 303-D033 (D81L-6002-D) or equivalent

NOTICE: **Do not use a caustic cleaning solution or a wire brush to clean the pistons or damage can occur.**

1. Clean and inspect the (1) ring lands, (2) skirts, (3) pin bosses and the (4) tops of the pistons. If wear marks, scores or glazing is found on the piston skirt, check for a bent or twisted connecting rod.

2. Use the Piston Ring Groove Scraper to clean the piston ring grooves.
   - Make sure the oil ring holes are clean.



tomsn048@gmail.com

Piston Pin Bore Diameter

NOTE: Refer to the appropriate Section 303-01 for the specification.

1. **NOTE:** Piston and piston pins are a matched set and should not be interchanged.

   Measure the piston pin bore diameter in 2 directions on each side. Verify the diameter is within specification.

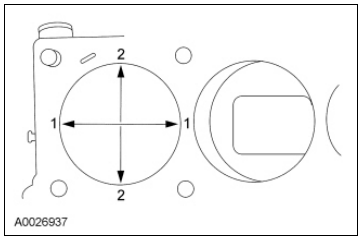
Piston Diameter

NOTE: Refer to the appropriate Section 303-01 for the specification.

1. Measure the piston diameter 90 degrees from the piston pin and 42 mm (1.65 in) down from the top of the piston at the point indicated.

tomsn048@gmail.com

Piston To Cylinder Bore Clearance

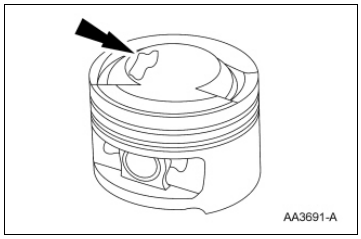


NOTE: Refer to the appropriate Section 303-01 for the specification.

1. Subtract the piston diameter from the cylinder bore diameter to find the piston-to-cylinder bore clearance.

Piston Selection

NOTE: The cylinder bore must be within the specifications for taper and out-of-round before fitting a piston.



1. Select a piston size based on the cylinder bore.

2. **NOTE:** For precision fit, new pistons are divided into 3 categories within each size range based on their relative position within the range. A paint spot or specific size grade on a new piston indicates the position within the size range.

   Choose the piston with the correct paint color or specific size grade.

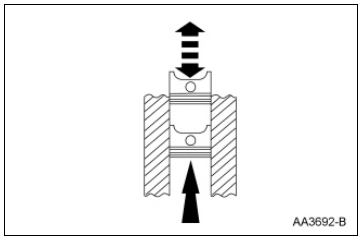
   - Refer to the appropriate section in Group 303 for the procedure.

tomsn048@gmail.com

Piston Ring End Gap

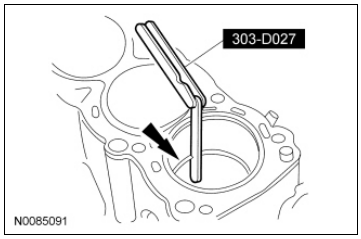
Special Tool(s)

 ST1271-A	Feeler Gauge Set 303-D027 (D81L-4201-A) or equivalent



NOTICE: **Use care when fitting piston rings to avoid possible damage to the piston ring or the cylinder bore.**

NOTE: Piston rings should not be transferred from one piston to another.



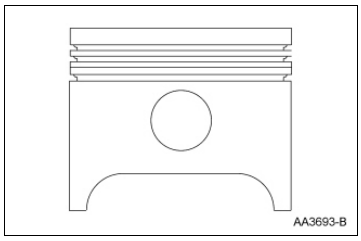
NOTE: Refer to the appropriate Section 303-01 for the specification.

NOTE: The cylinder bore must be within specification for taper and out-of-round.

1. Use a piston without rings to push a piston ring in a cylinder to the bottom of ring travel.

2. Use the Feeler Gauge Set to measure the top piston ring end gap and the second piston ring end gap.

tomsn048@gmail.com



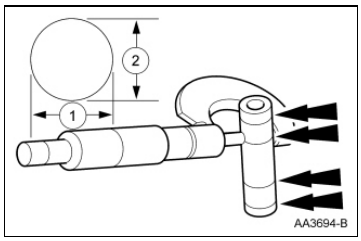
Piston Ring-to-Groove Clearance

Special Tool(s)

 ST1271-A	Feeler Gauge Set 303-D027 (D81L-4201-A) or equivalent

NOTE: Refer to the appropriate Section 303-01 for the specification.

1. Inspect the piston for ring land damage or accelerated wear.

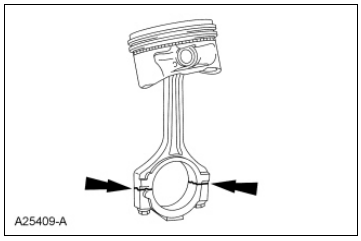


2. Using the Feeler Gauge Set, measure the piston ring-to-groove clearance.

Piston Pin Diameter

NOTE: Refer to the appropriate Section 303-01 for the specification.

1. Measure the piston pin diameter in 2 directions at the points shown. Verify the diameter is within specification.



tomsn048@gmail.com

Connecting Rod Cleaning

NOTICE: **Do not use a caustic cleaning solution or damage to connecting rods can occur.**

1. **NOTE:** The connecting rod large end is a matched set. The connecting rod cap must be installed on the original connecting rod in the original position. Do not reverse the cap. Parts are not interchangeable.

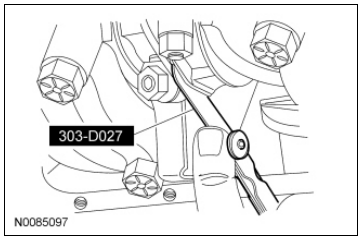
   Mark and separate the parts and clean with solvent. Clean the oil passages.

Connecting Rod Large End Bore

NOTE: Refer to the appropriate Section 303-01 for the specification.

1. Tighten the bolts to specification, then measure the bore in 2 directions. The difference is the connecting rod bore out-of-round. Verify the out-of-round is within specification.

tomsn048@gmail.com

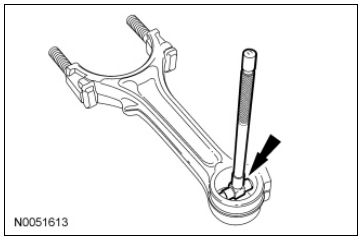


Connecting Rod to Crankshaft Side Clearance

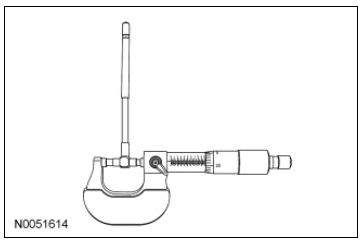
Special Tool(s)

 ST1271-A	Feeler Gauge Set 303-D027 (D81L-4201-A) or equivalent

NOTE: Refer to the appropriate Section 303-01 for the specification.



1. Using the Feeler Gauge Set, measure the clearance between the connecting rod and the crankshaft. Verify the measurement is within specification.



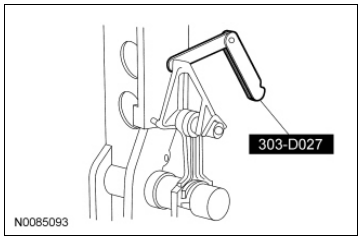
Connecting Rod Bushing Diameter

NOTE: Refer to the appropriate Section 303-01 for the specification.

1. Use a telescoping gauge to determine the ID of the connecting rod bushing, if equipped.

2. Measure the telescoping gauge with a micrometer. Verify the diameter is within specification.

tomsn048@gmail.com



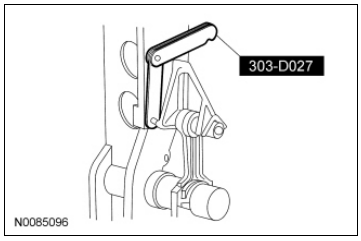
Connecting Rod Bend

Special Tool(s)

 ST1271-A	Feeler Gauge Set 303-D027 (D81L-4201-A) or equivalent

NOTE: Refer to the appropriate Section 303-01 for the specification.

1. Using the Feeler Gauge Set, measure the connecting rod bend on a suitable alignment fixture. Follow the instructions of the fixture manufacturer. Verify the bend measurement is within specification.



Connecting Rod Twist

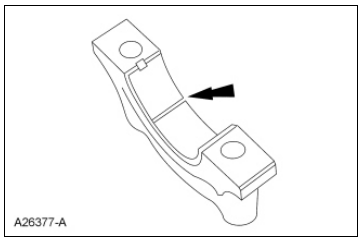
Special Tool(s)

 ST1271-A	Feeler Gauge Set 303-D027 (D81L-4201-A) or equivalent

NOTE: Refer to the appropriate Section 303-01 for the specification.

1. Using the Feeler Gauge Set, measure the connecting rod twist on a suitable alignment fixture. Follow the instructions of the fixture manufacturer. Verify the measurement is within specification.

tomsn048@gmail.com

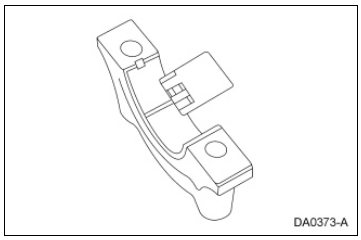


Connecting Rod Bearing Journal-to-Bearing Clearance

NOTE: Refer to the appropriate Section 303-01 for the specification.

NOTE: The crankshaft connecting rod journals must be within specifications to check the connecting rod bearing journal clearance.

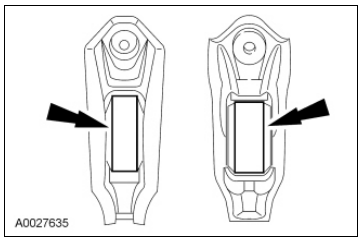
1. Remove the connecting rod bearing cap.



2. Position a piece of Plastigage across the bearing surface.

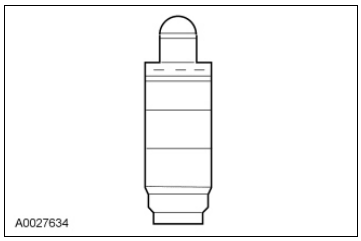
3. **NOTE:** Do not turn the crankshaft during this step.

   Install and tighten to specifications, then remove the connecting rod bearing cap.



4. Measure the Plastigage to get the connecting rod bearing journal clearance. The Plastigage should be smooth and flat. A changing width indicates a tapered or damaged connecting rod or connecting rod bearing.

tomsn048@gmail.com

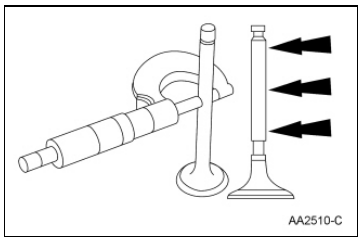


Roller Follower Inspection

1. Inspect the roller follower for flat spots or scoring. If any damage is found, inspect the camshaft lobes and hydraulic lash adjuster for damage.

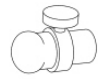
Hydraulic Lash Adjuster Inspection

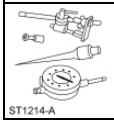
1. Inspect the hydraulic lash adjuster and roller follower for damage. If any damage is found, inspect the camshaft lobes and valves for damage.



tomsn048@gmail.com

Valve Stem Diameter





NOTE: Refer to the appropriate Section 303-01 for the specification.

1. Measure the diameter of each intake and exhaust valve stem at the points shown. Verify the diameter is within specification.

Valve Stem to Valve Guide Clearance

Special Tool(s)

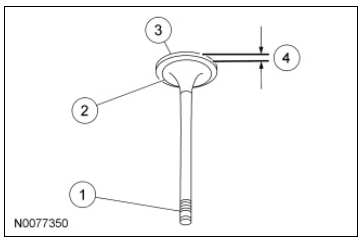
 ST1251-A	Clearance Gauge, Valve Guide 303-004 (TOOL-6505-E) or equivalent
 ST1214-A	Dial Indicator Gauge with Holding Fixture 100-002 (TOOL-4201-C) or equivalent

NOTE: Refer to the appropriate Section 303-01 for the specification.

NOTE: The valve stem diameter must be within specifications before checking valve stem-to-valve guide clearance.

1. **NOTE:** If necessary, use a magnetic base.

   Install a Valve Guide Clearance Gauge on the valve stem and install a Dial Indicator Gauge with Holding Fixture. Lower the valve until the clearance gauge contacts the upper surface of the valve guide.

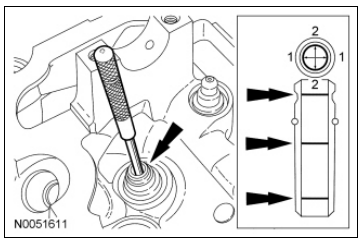


2. Move the Valve Guide Clearance Gauge toward the Dial Indicator Gauge with Holding Fixture and zero the Dial Indicator Gauge. Move the Valve Guide Clearance Gauge away from the Dial Indicator Gauge with Holding Fixture and note the reading. The reading will be DOUBLE the valve stem-to-valve guide clearance.

tomsn048@gmail.com

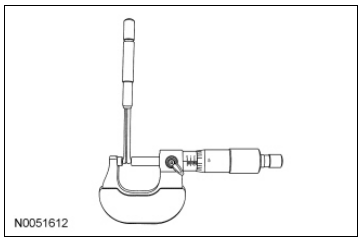
Valve Inspection

1. Inspect the following valve areas:
    1. The end of the stem for grooves or scoring.
    2. The valve face and the edge for pits, grooves or scores.
    3. The valve head for signs of burning, erosion, warpage and cracking.
    4. The valve margin for wear.



tomsn048@gmail.com

Valve Guide Inner Diameter

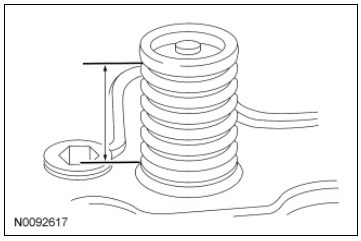


NOTE: Refer to the appropriate Section 303-01 for the specification.

1. **NOTE:** Valve guides tend to wear in an hourglass pattern. The ball gauge can be inserted into the combustion chamber side of the valve guide, if necessary.

   Use a ball gauge to determine the inside diameter of the valve guides in 2 directions at the top, middle and bottom of the valve guide.

2. Measure the ball gauge with a micrometer.

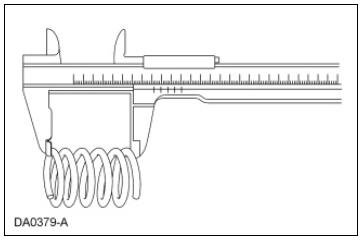


3. If the valve guide is not within specifications, install a new cylinder head assembly.

Valve Spring Installed Length

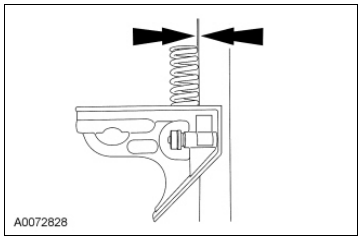
NOTE: Refer to the appropriate Section 303-01 for the specification.

1. Measure the installed length of each valve spring.



tomsn048@gmail.com

Valve Spring Free Length



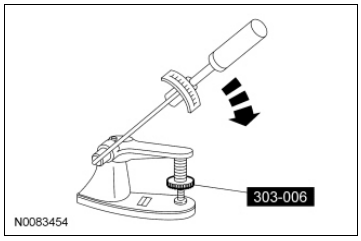
NOTE: Refer to the appropriate Section 303-01 for the specification.

1. Measure the free length of each valve spring.

Valve Spring Squareness

1. Measure the out-of-square on each valve spring.
    - Turn the valve spring and observe the space between the top of the valve spring and the square.

tomsn048@gmail.com



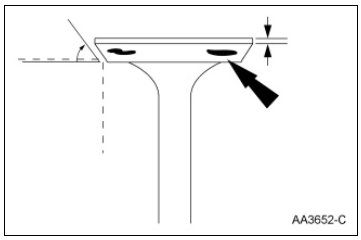
Valve Spring Strength

Special Tool(s)

 ST1278-A	Pressure Gauge, Valve/Clutch Spring 303-006 (TOOL-6513-DD) or equivalent

NOTE: Refer to the appropriate Section 303-01 for the specification.

1. Use the Valve/Clutch Spring Pressure Gauge to check the valve spring for correct strength at the specified valve spring length.



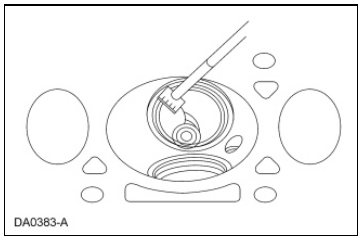
Valve Seat Inspection

Valve and Seat Refacing Measurements

NOTE: Refer to the appropriate Section 303-01 for the specification.

NOTE: After grinding valves or valve seats, check valve clearance.

1. Check the valve head and seat.
   - Check valve angles.
   - Check margin width.
   - Be sure margin width is within specification.

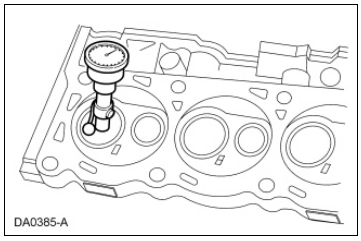


2. Inspect for abnormalities on the valve face and seat. Install a new cylinder head assembly if abnormalities are found.

tomsn048@gmail.com

Valve Seat Width

NOTE: Refer to the appropriate Section 303-01 for the specification.



1. Measure the valve seat width. If necessary, grind the valve seat to specification.
    - Measure the intake valve seat width.
    - Measure the exhaust valve seat width.
    - Recheck the valve spring installed length after the seats have been ground, and shim the valve springs as necessary to achieve the correct installed spring length.
    - Depending on the engine, check the valve lash. Refer to General Procedures in Section 303-01.

Valve Seat Runout

NOTE: Refer to the appropriate Section 303-01 for the specification.

1. Use a valve seat runout gauge to check valve seat runout.

Cylinder Head Distortion

Special Tool(s)

 ST1271-A	Feeler Gauge Set 303-D027 (D81L-4201-A) or equivalent

NOTE: Refer to the appropriate Section 303-01 for the specification.

1. **NOTE:** Make sure all cylinder head surfaces are clear of any gasket material, silicone sealant, oil and coolant. The cylinder head surface must be clean and dry before running a flatness check.

   NOTE: Use a Straightedge that is calibrated by the manufacturer to be flat within 0.005 mm (0.0002 in) per running foot of length, such as Snap-On® GA438A or equivalent. For example, if the Straightedge is 61 cm (24 in) long, the machined edge must be flat within 0.010 mm (0.0004 in) from end to end.

   Using a Straightedge and a Feeler Gauge Set, inspect the cylinder head for flatness in the sequence shown.

Cylinder Bore Cleaning

Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A
Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-30 Super Premium Motor Oil (Canada) XO-5W30-QSP (US); CXO-5W30-LSP12 (Canada); or equivalent	WSS-M2C946-A, 5W30;

1. ***NOTICE:*** **If these procedures are not followed, rusting of the cylinder bores may occur.**

   Clean the cylinder bores with soap or detergent and water.

2. Thoroughly rinse with clean water and wipe dry with a clean, lint-free cloth.

3. Use a clean, lint-free cloth and lubricate the cylinder bores.
   - Use clean engine oil.

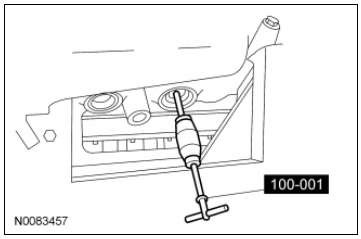
Core Plug Replacement

Special Tool(s)

 ST1185-A	Slide Hammer 100-001 (T50T-100-A)

Material

Item	Specification
High Temperature Retaining Compound Loctite® 620TM/Permatex® 62050, or equivalent; obtain locally	WSK-M2G349-A9
Threadlock 262 TA-26	WSK-M2G351-A6



NOTICE: **It is necessary to use High Temperature Retaining Compound Loctite® 620TM/Permatex® 62050 or equivalent on all 3 valve modular engine cylinder head cup plugs. If not used, the cylinder head cup plugs could leak or seep, causing serious engine damage.**

NOTE: Use threadlock 262 on all other applications.

All core plugs

1. **NOTE:** Cylinder block core plug shown, cylinder head core plug similar.

   Use the Slide Hammer and a freeze plug remover to remove the core plug.

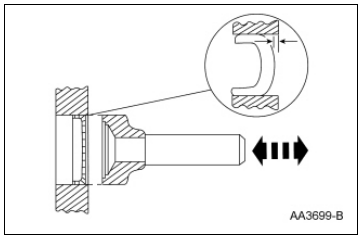
2. **NOTE:** Oversize plugs are identified by the OS stamped in the flat located on the cup side of the plug.

   Inspect the core plug bore for any damage that would interfere with the correct sealing of the plug. If the core plug bore is damaged, bore for the next oversize plug.

Cup-type

3. ***NOTICE:*** **Use care during this procedure so as not to disturb or distort the cup sealing surface.**

NOTE: When installed, the flanged edge must be below the chamfered edge of the bore to effectively seal the bore.



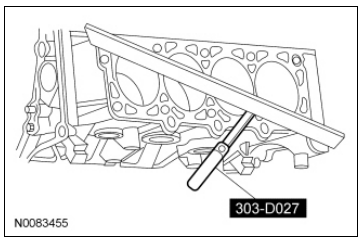
Coat the cup-type core plug and bore lightly with sealant and install the core plug using a freeze plug installer.

Expansion-type

4. ***NOTICE:*** **Do not contact the crown when installing an expansion-type core plug. This could expand the plug before seating and result in leakage.**

   Coat the expansion-type core plug and bore lightly with sealant and install the core plug using a freeze plug installer.

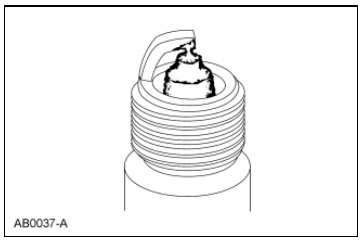
Cylinder Block Distortion



Special Tool(s)

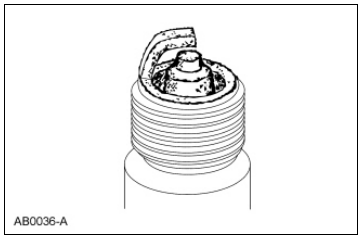
 ST1271-A	Feeler Gauge Set 303-D027 (D81L-4201-A) or equivalent

NOTE: Refer to the appropriate Section 303-01 for the specification.

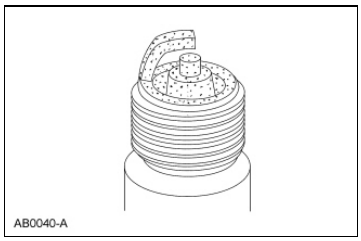


1. **NOTE:** Use a Straightedge that is calibrated by the manufacturer to be flat within 0.005 mm (0.0002 in) per running foot of length, such as Snap-On® GA438A or equivalent. For example, if the Straightedge is 61 cm (24 in) long, the machined edge must be flat within 0.010 mm (0.0004 in) from end to end.

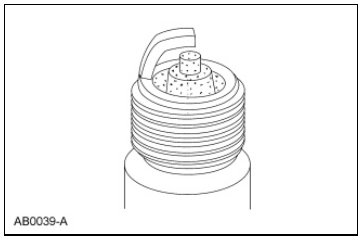
   Use a Straightedge and a Feeler Gauge Set to inspect the cylinder block for flatness.



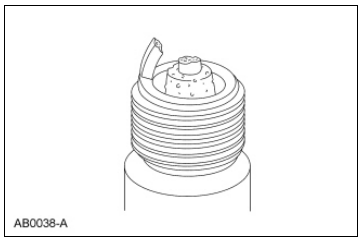
Spark Plug Inspection



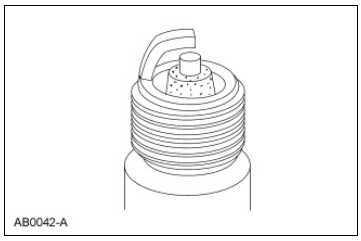
1. Inspect the spark plug for a bridged gap.
    - Check for deposit build-up closing the gap between the electrodes. Deposits are caused by oil or carbon fouling.
    - Install a new spark plug.



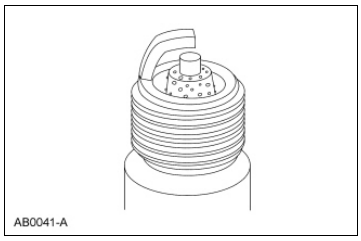
2. Check for oil fouling.
    - Check for wet, black deposits on the insulator shell bore electrodes, caused by excessive oil entering the combustion chamber through worn rings and pistons, excessive valve-to-guide clearance or worn or loose bearings.
    - Correct the oil leak concern.
    - Install a new spark plug.



3. Inspect for carbon fouling. Look for black, dry, fluffy carbon deposits on the insulator tips, exposed shell surfaces and electrodes, caused by a spark plug with an incorrect heat range, dirty air cleaner, too rich a fuel mixture or excessive idling.
    - Install new spark plugs.



4. Inspect for normal burning.
    - Check for light tan or gray deposits on the firing tip.



5. Inspect for pre-ignition, identified by melted electrodes and a possibly damaged insulator. Metallic deposits on the insulator indicate engine damage. This may be caused by incorrect ignition timing, wrong type of fuel or the unauthorized installation of a heli-coil insert in place of the spark plug threads.
    - Install a new spark plug.

6. Inspect for overheating, identified by white or light gray spots and a bluish-burnt appearance of electrodes. This is caused by engine overheating, wrong type of fuel, loose spark plugs, spark plugs with an incorrect heat range, low fuel pump pressure or incorrect ignition timing.
    - Install a new spark plug.

7. Inspect for fused deposits, identified by melted or spotty deposits resembling bubbles or blisters. These are caused by sudden acceleration.
    - Install new spark plugs.

Exhaust Manifold Cleaning and Inspection

Special Tool(s)

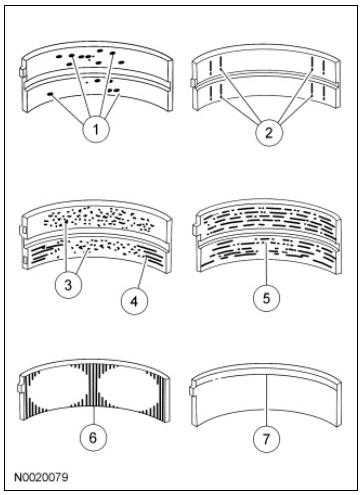
 ST1271-A	Feeler Gauge Set 303-D027 (D81L-4201-A) or equivalent

1. Clean the exhaust manifold using a suitable solvent. Use a plastic scraping tool to clean the gasket sealing surfaces.

2. **NOTE:** New exhaust manifold gaskets, studs, nuts and/or bolts must be installed when an exhaust manifold is serviced.

   NOTE: Use a Straightedge that is calibrated by the manufacturer to be flat within 0.005 mm (0.0002 in) per running foot of length, such as Snap-On® GA438A or equivalent. For example, if the Straightedge is 61 cm (24 in) long, the machined edge must be flat within 0.010 mm (0.0004 in) from end to end.

   Using the Straightedge and a Feeler Gauge Set, check the exhaust manifold sealing surface for warpage. If the warpage is greater than 0.76 mm (0.0299 in), install a new exhaust manifold.



Flexplate Inspection

1. Inspect the flexplate for:
    1. any cracks.
    2. worn ring gear teeth.
    3. chipped or cracked ring gear teeth.

Bearing Inspection

1. Inspect bearings for the following defects:
    1. Cratering - fatigue failure
    2. Spot polishing - incorrect seating
    3. Imbedded dirty engine oil
    4. Scratching - dirty engine oil
    5. Base exposed - poor lubrication
    6. Both edges worn - journal damaged
    7. One edge worn - journal tapered or bearing not seated

Powertrain/Drivetrain Mount Neutralizing

NOTE: Refer to the appropriate section and procedure for special instructions on loosening and tightening mount fasteners.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Loosen, but do not remove, the powertrain/drivetrain mount fasteners.
3. Lower the vehicle.
4. ***NOTICE:*** **Do not twist or strain the powertrain/drivetrain mounts or damage to the mounts may occur.**

   Start the vehicle and move it in forward 0.6-1.2 m (2-4 ft). Then move the vehicle in reverse the same distance.
5. Raise and support the vehicle.
6. Tighten the powertrain/drivetrain mount fasteners.
7. Lower the vehicle.
8. Test the system for normal operation.

General Specifications

Item	Specification
Engine	
Displacement	4.0L (244 CID)
Number of cylinders	6
Bore	100.4 mm (3.953 in)
Stroke	84.4 mm (3.32 in)
Firing order	1-4-2-5-3-6
Oil pressure minimum at 2,000 rpm (engine at normal operating temperature)	103 kPa (15 psi)
Engine weight (without accessory drive components or flexplate)	189 kg (417 lb)
Cylinder Head and Valve Train	

Cylinder head gasket surface flatness	0.08 mm (0.003 in) total
Combustion chamber volume	65.197 ± 2.068-2.018 cc
Valve arrangement (front to rear) - LH	I-E-I-E-I-E
Valve arrangement (front to rear) - RH	E-I-E-I-E-I
Valve guide bore diameter	7.00-7.018 mm (0.276 in)
Valve stem diameter - intake	6.965-6.98 mm (0.274-0.275 in)
Valve stem diameter - exhaust	6.95-6.965 mm (0.27-0.274 in)
Valve stem-to-guide clearance - intake	0.020-0.053 mm (0.001-0.002 in)
Valve stem-to-guide clearance - exhaust	0.035-0.068 mm (0.001-0.003 in)
Valve head diameter - intake	45.9-46.1 mm (1.807-1.815 in)
Valve head diameter - exhaust	38.9-39.1 mm (1.531-1.539 in)
Valve face runout	0.03 mm (0.001 in)
Valve face angle	45 degrees
Valve seat width - intake	1.273-2.121 mm (0.05-0.083 in)
Valve seat width - exhaust	1.556-2.404 mm (0.061-0.095 in)
Valve seat runout	0.059 mm (0.002 in)
Valve seat angle	45 degrees
Valve spring free length	43.1 mm (1.7 in)
Valve spring squareness	± 1.5 degrees
Valve spring compression pressure @ specified height (lb)	275-305 N @ 35.9-36.7 mm (202.84-224.968 lb @ 1.413-1.445 in)
Valve spring installed height	39.86-40.86 mm (1.569-1.609 in)
Valve spring installed pressure	320 N (72 lb)
Roller follower ratio	1.98:1
Camshaft	
Theoretical valve lift @ 0 lash	11.93 mm (0.472 in)
Lobe lift	6.584 mm (0.259 in)
Allowable lobe lift loss	0.127 mm (0.005 in)
Journal diameter	27.935-27.96 mm (1.099-1.101 in)
Camshaft journal bore inside diameter	28.0-28.03 mm (1.102-1.104 in)
Camshaft journal-to-bearing clearance	0.04-0.095 mm (0.002-0.004 in)
Runout	0.05 mm (0.002 in)
End play	0.075-0.185 mm (0.003-0.007 in)
Cylinder Block	
Cylinder bore diameter	100.4 mm (3.953 in)
Cylinder bore maximum taper	0.025 mm (0.001 in)
Cylinder bore maximum out-of-round	0.025 mm (0.001 in)
Main bearing bore inside diameter	60.620-60.634 mm (2.387-2.387 in)
Head gasket surface flatness	0.1 mm (0.004 in) overall
Crankshaft	
Main bearing journal diameter	56.980-57.0 mm (2.243-2.244 in)
Main bearing journal maximum taper	0.008 mm (0.0003 in)
Main bearing journal maximum out-of-round	0.008 mm (0.0003 in)
Main bearing journal-to-cylinder block clearance	0.008-0.062 mm (0.0003-0.0024 in)

Connecting rod journal diameter	53.98-54.0 mm (2.125-2.126 in)
Connecting rod journal maximum taper	0.008 mm (0.0003 in)
Connecting rod journal maximum out-of-round	0.008 mm (0.0003 in)
Crankshaft maximum end play	0.05-0.32 mm (0.002-0.0126 in)
Main Bearings	
Clearance to crankshaft	0.015-0.053 mm (0.0006-0.002 in)
Bearing wall thickness	1.8-1.806 mm (0.0709-0.0711 in)
Piston and Connecting Rod	
Piston diameter - coded standard	100.360-100.400 mm (3.951-3.9528 in)
Piston diameter - coded 0.5	100.880-100.900 mm (3.971-3.972 in)
Piston diameter - coded 1.0	101.390-101.400 mm (3.991-3.992 in)
Piston-to-cylinder bore clearance	0.030-0.050 mm (0.0012-0.002 in)
Piston ring end gap - top	0.250-0.400 mm (0.009-0.015 in)
Piston ring end gap - bottom	0.40-0.65 mm (0.016-0.028 in)
Piston ring groove width - top	1.23-1.25 mm (0.0484-0.0492 in)
Piston ring groove width - bottom	1.52-1.54 mm (0.0598-0.0606 in)
Piston ring groove width - oil ring	3.01-3.03 mm (0.1185-0.1193 in)
Piston ring width - top	1.170-1.190 mm (0.0460-0.0469 in)
Piston ring width - bottom	1.472-1.490 mm (0.0580-0.0587 in)
Piston ring-to-groove clearance - top	0.040-0.075 mm (0.0016-0.0030 in)
Piston ring-to-groove clearance - bottom	0.030-0.065 mm (0.0012-0.0026 in)
Piston pin bore diameter	24.009-24.013 mm (0.9452-0.9453 in)
Piston pin diameter	23.997-24.000 mm (0.9447-0.9448 in)
Piston pin length	71.8-72.3 mm (2.826-2.846 in)
Piston pin-to-piston fit	0.009-0.016 mm (0.0003-0.0006 in)
Connecting rod pin bore diameter	23.958-23.976 mm (0.943-0.944 in)
Connecting rod length (center-to-center)	145.965-146.035 mm (5.747-5.749 in)
Connecting rod maximum allowed bend	0.0125 mm (0.0004 in) per 25.4 mm (1.000 in)
Connecting rod maximum allowed twist	0.038 mm (0.0015 in) per 25.4 mm (1.000 in)
Connecting rod bearing bore diameter	56.82 mm-56.84 mm (2.237 in-2.238 in)
Connecting rod bearing-to-crankshaft clearance	0.022-0.064 mm (0.0008-0.0025 in)
Connecting rod side clearance	0.092-0.318 mm (0.0036-0.0125 in)

Torque Specifications

Oil pump screen cover and tube bolts	10	-	89
Power steering fluid reservoir bolt	7	-	62
Power steering fluid reservoir-to-power steering pump hose bracket bolt	11	-	97
Power Steering Pressure (PSP) hose bracket bolt	11	-	97
Power steering pump bolts	25	18	-
Power steering pump pulley bolts	25	18	-
Radiator fan shroud bolts	7	-	62
Spark plugs	20	-	177
Starter B-terminal nut	12	-	106
Starter S-terminal nut	6	-	53
Thermostat housing bolts	11	-	97
Transmission cooler tube bracket nut	23	17	-
Transmission-to-cylinder block cradle bolts	47	35	-
Upper cooling fan shroud bolts	7	-	62
Valve cover bolts	10	-	89
Wiring harness-to-front cover bracket nut	20	-	177
Wiring harness-to-RH cylinder head bracket bolt	47	35	-
Wiring harness-to-throttle body bracket nut	9	-	80

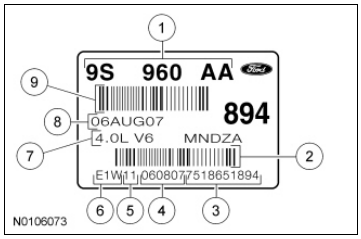
[a] Refer to the procedure in this section.
[b] Also used for Engine Lifting Bracket.

Engine

The 4.0L SOHC engine consists of the following:

- Single overhead camshafts
- Sequential Multi-Port Fuel Injection (SFI)
- Distributorless ignition system
- Aluminum cylinder heads
- Cast-iron, 60-degree V cylinder block
- Jackshaft
- Unique engine timing configuration

The 4.0L engine is a 2-valve-per-cylinder, overhead camshaft engine. The engine features a jackshaft located in the cylinder block above the crankshaft and driven by the crankshaft via a sprocket and chain assembly. The jackshaft drives the 2 camshafts via 2 timing chain cassettes, the LH located on the front of the engine and the RH located on the rear of the engine. The oil pump is driven by the crankshaft via a sprocket and chain. The piston assembly is an aluminum piston with a powdered metal connecting rod. The engine uses a distributorless ignition system.

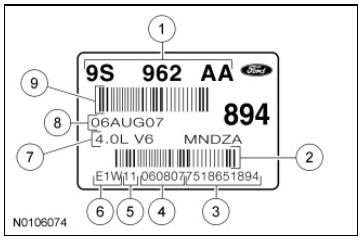


Engine Identification

Always refer to these labels when installation of new parts is necessary or when checking engine calibrations. The engine parts often differ within a CID family. Verification of the identification codes will make sure that the correct parts are obtained. These codes contain all the pertinent information relating to the dates, optional equipment and revisions. The Ford Catalog AdvantageTM or equivalent contains a complete listing of the codes and their applications.

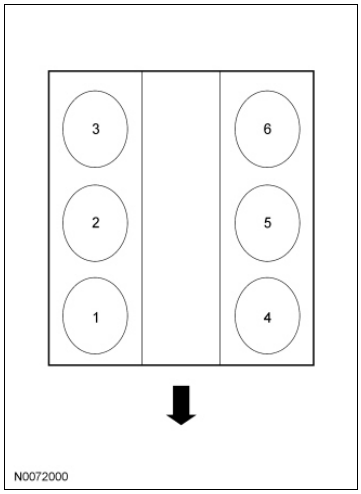
Engine Code Information Label

The engine code information label is located on the side of the LH valve cover. It contains the following:



Without Oil Cooler

Item	Description
1	Engine part number
2	Bar code
3	Running number
4	Engine build date (DDMMYY)



5	Plant shift assembly line
6	Cologne engine plant
7	Engine displacement
8	Engine build date (DDMMYY)
9	Bar code

With Oil Cooler

Item	Description
1	Engine part number
2	Bar code
3	Running number
4	Engine build date (DDMMYY)
5	Plant shift assembly line
6	Cologne engine plant
7	Engine displacement
8	Engine build date (DDMMYY)
9	Bar code

Engine Cylinder Identification

Exhaust Emission Control System

Operation and required maintenance of the exhaust emission control devices used on this engine is covered in the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Induction System

The SFI provides the fuel/air mixture needed for combustion in the cylinders. The 6 solenoid-operated fuel injectors:

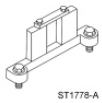
- are mounted in the cylinder heads.
- meter fuel to the air intake stream in accordance with engine demand.
- are positioned so their tips direct fuel just ahead of the engine intake valves.

PCV System

All engines are equipped with a closed-type PCV system recycling the crankcase vapors to the intake manifold.

Lubrication System

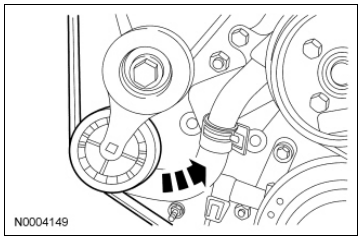
The engine lubrication system operates as follows:



- Oil is drawn into the oil pump through the oil pump screen cover and tube in the sump of the oil pan.
- Oil is pumped through the oil filter on the right front side of the cylinder block.
- Oil enters the main gallery where it is distributed to the crankshaft main journals and to the cylinder head.
- From the main journals, the oil is routed through cross-drilled passages in the crankshaft to lubricate the connecting rod bearings. Controlled leakage through the crankshaft main bearings and connecting rod bearings is slung radially outward to cool and lubricate the cylinder walls as well as the entire connecting rod, piston and piston ring assembly.

Engine

For basic engine mechanical concerns, refer to Section 303-00 . For driveability concerns, refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

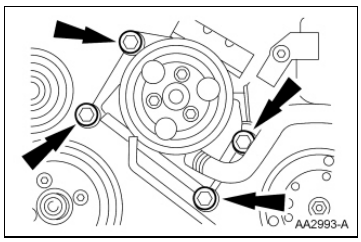


Camshaft Timing

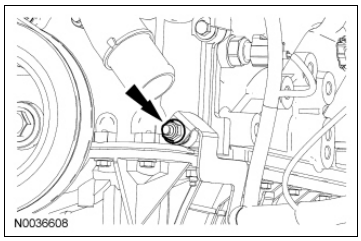
Special Tool(s)

 ST1776-A	Adapter for 303-564 303-578 (T97T-6256-C)
 ST1779-A	Adapter for 303-577 303-576 (T97T-6256-D)
 ST1780-A	Extension, Torque Wrench 303-575 (T97T-6256-F)
 ST1778-A	Holding Tool, Camshaft 303-577 (T97T-6303-C)
 ST1777-A	Holding Tool, Camshaft Sprocket 303-564 (T97T-6256-B)
 ST1781-A	Socket, Camshaft Sprocket Nut 303-565 (T97T-6256-G)
 ST1438-A	Strap Wrench 303-D055 (D85L-6000-A) or equivalent
 ST1774-A	Tensioner, Timing Chain 303-571 (T97T-6K254-A)
 ST1775-A	Timing Tool, Crankshaft TDC 303-573 (T97T-6303-A)

1. Remove the camshaft roller followers. For additional information, refer to Camshaft Roller Follower in this section.

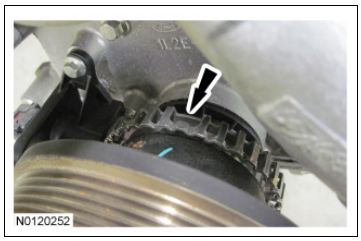


2. If necessary, rotate the accessory drive belt tensioner counterclockwise and remove the accessory drive belt.

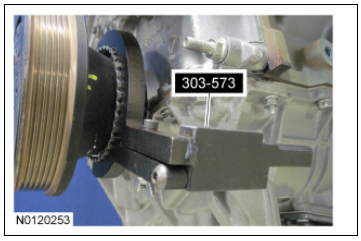


3. If necessary, remove the 3 bolts and position the generator aside.

4. If necessary, remove the 4 bolts and position the A/C compressor and power steering pump bracket aside.

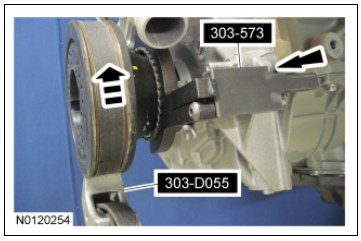


5. Remove the nut and position the wiring harness aside.

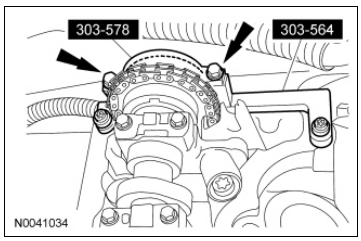


6. **NOTE:** The LH and RH camshafts must be retimed when either camshaft is disturbed.

   Turn the crankshaft pulley clockwise until the crankshaft pulley timing ring slot is at the 12 o'clock position.



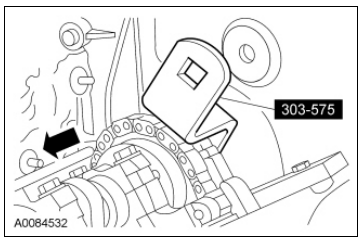
7. Install the Crankshaft TDC Timing Tool on the crankshaft pulley timing ring.



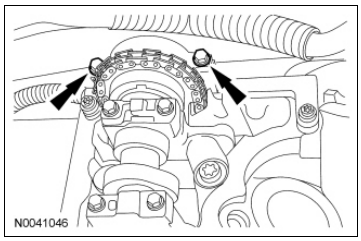
8. ***NOTICE:*** **While turning the crankshaft pulley, take care to not overturn the crankshaft pulley or damage to the crankshaft pulley timing ring may occur.**

NOTE: The Crankshaft TDC Timing Tool must be installed on the crankshaft pulley and should contact the engine block. This positions the engine at TDC .

Using the Strap Wrench, slowly turn the crankshaft counterclockwise until the TDC Timing Tool contacts the engine block in the slot shown.

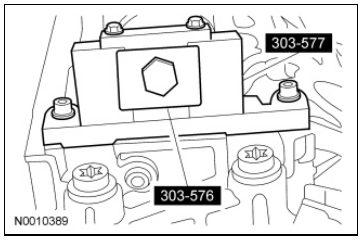


9. Install the Camshaft Sprocket Holding Tool and the Adapter for 303-564 to the RH cylinder head and tighten the 2 top clamp bolts to 10 Nm (89 lb-in).

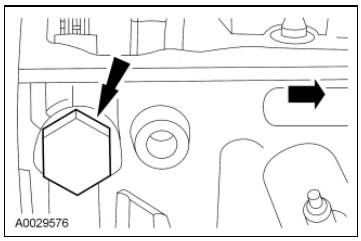


10. ***NOTICE:*** **The RH camshaft sprocket bolt is a LH-threaded bolt. Turning the bolt in the wrong direction can damage the bolt.**

    Using the Torque Wrench Extension with the Camshaft Sprocket Nut Socket 303-565, loosen the RH camshaft sprocket bolt.



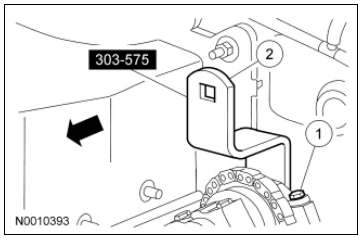
11. Loosen the top 2 Camshaft Sprocket Holding Tool clamp bolts.



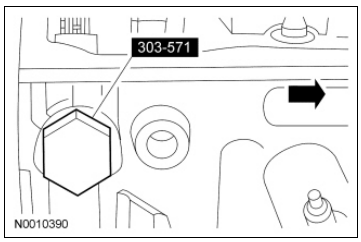
12. **NOTE:** The camshaft timing slots are off-center.

    Position the camshaft timing slots below the centerline of the camshaft and install the Camshaft Holding Tool and the Adapter for 303-577 on the front of the RH cylinder head.

13. Remove the RH hydraulic timing chain tensioner.
    - Discard the washer.



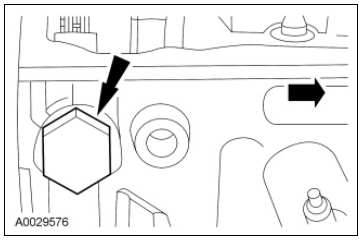
14. Install the Timing Chain Tensioner.



15. ***NOTICE:*** **The RH camshaft sprocket bolt is a LH-threaded bolt. Turning the bolt in the wrong direction can damage the bolt.**

    Tighten the bolts.

    1. Tighten the Camshaft Sprocket Holding Tool top 2 clamp bolts to 10 Nm (89 lb-in).
    2. Calculate the correct torque wrench setting for the following torque. Refer to the Torque Wrench Adapter Formulas in the Appendix.
       Using the Torque Wrench Extension with the Camshaft Sprocket Nut Socket 303-565, tighten the camshaft bolt to 85 Nm (63 lb-ft).

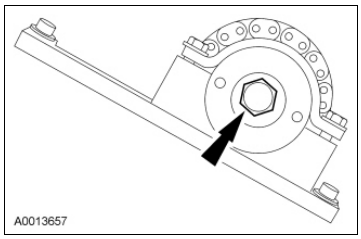


16. Remove the Timing Chain Tensioner.

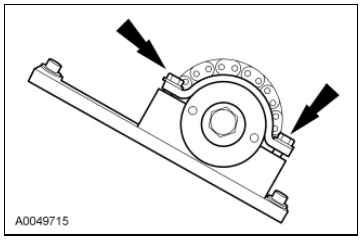
17. **NOTE:** Install a new washer on the tensioner.

    Install the RH hydraulic timing chain tensioner.

    - Tighten to 44 Nm (32 lb-ft).

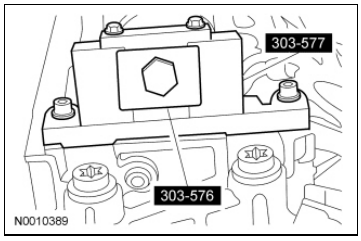


18. Remove the Camshaft Holding Tool, the Adapter for 303-577, the Camshaft Sprocket Holding Tool and the Adapter for 303-564 from the RH cylinder head.

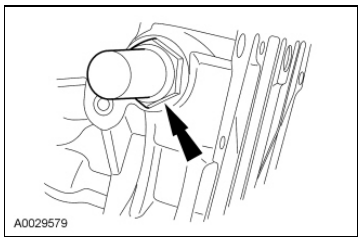


19. Install the Camshaft Sprocket Holding Tool and the Adapter for 303-564 on the front of the LH cylinder head and tighten the top 2 clamp bolts to 10 Nm (89 lb-in).

20. Loosen the LH camshaft sprocket bolt.

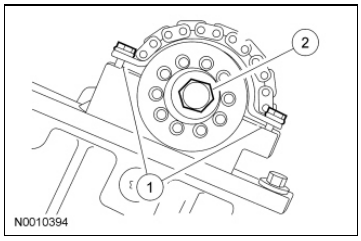


21. Loosen the top 2 clamp bolts on the Camshaft Sprocket Holding Tool to allow the camshaft sprocket to rotate freely.

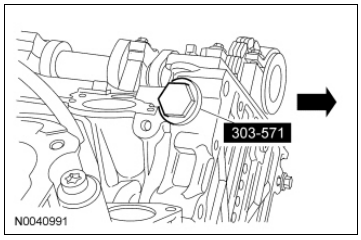


22. **NOTE:** The camshaft timing slots are off-center.

    Position the camshaft timing slots below the centerline of the camshaft and install the Camshaft Holding Tool and the Adapter for 303-577 on the rear of the LH cylinder head.

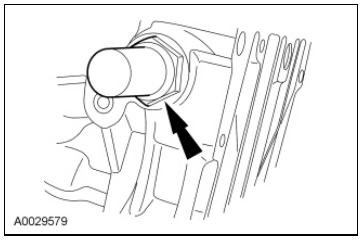


23. Remove the LH hydraulic timing chain tensioner.
    - Discard the washer.



24. Install the Timing Chain Tensioner.

25. Tighten the bolts.
    1. Tighten the Camshaft Sprocket Holding Tool top 2 clamp bolts to 10 Nm (89 lb-in).
    2. Tighten the LH camshaft bolt to 85 Nm (63 lb-ft).

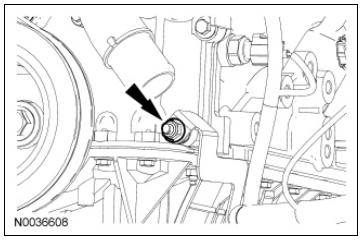


26. Remove the Timing Chain Tensioner.

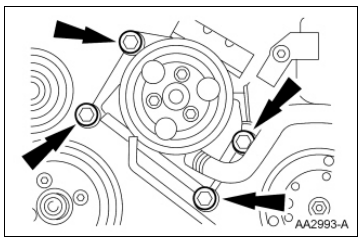
27. **NOTE:** Install a new washer on the tensioner.

    Install the LH hydraulic timing chain tensioner.

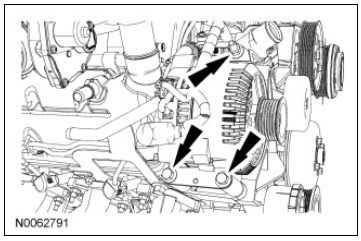
    - Tighten to 44 Nm (32 lb-ft).



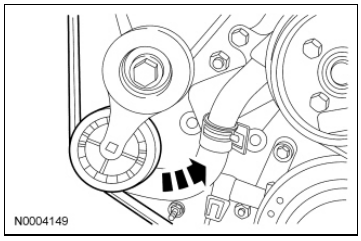
28. Remove the Camshaft Holding Tool, the Adapter for 303-577, the Camshaft Sprocket Holding Tool and the Adapter for 303-564 from the LH cylinder head.



29. Remove the Crankshaft TDC Timing Tool.

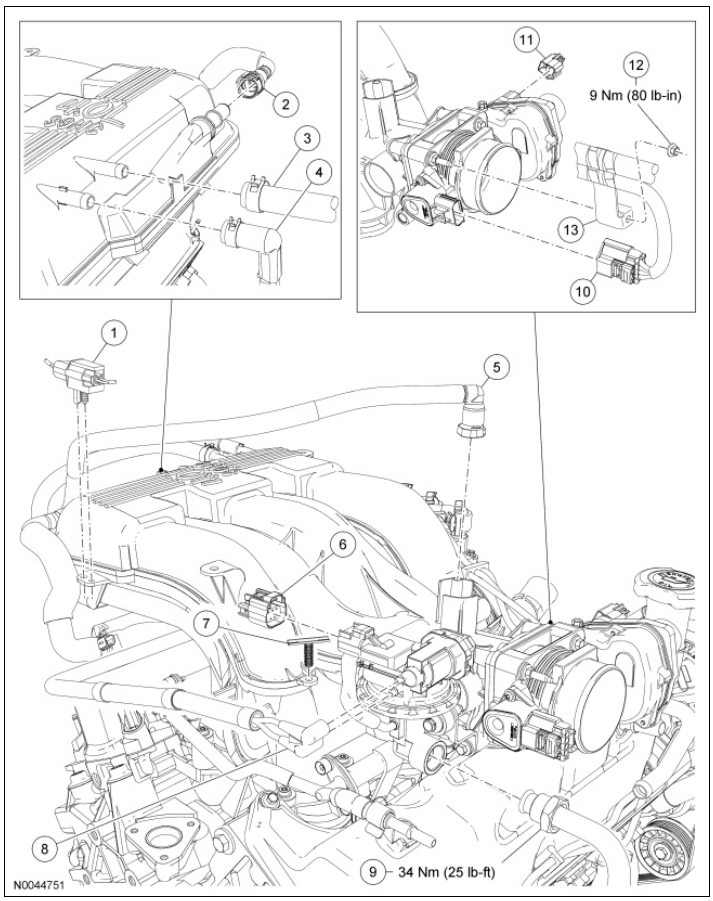


30. Position the battery cable bracket and install the nut.
    - Tighten to 20 Nm (177 lb-in).



31. If necessary, position the A/C compressor and power steering pump bracket and install the 4 bolts.
    - Tighten to 42 Nm (31 lb-ft).

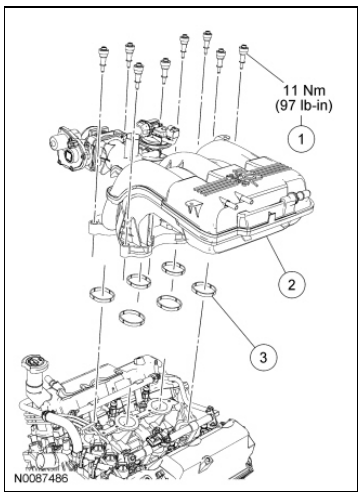
32. If necessary, position the generator and install the 3 bolts.
    - Tighten to 47 Nm (35 lb-ft).



33. If necessary, rotate the accessory drive belt tensioner counterclockwise and install the accessory drive belt.

34. Install the camshaft roller followers. For additional information, refer to Camshaft Roller Follower in this section.

Intake Manifold



Intake Manifold Connections

Item	Part Number	Description
1	-	Knock Sensor (KS) electrical connector
2	6K817	PCV tube
3	9C482	Brake booster vacuum supply hose
4	9E499	Engine main vacuum harness-to-intake manifold fitting (part of 9E498)
5	9D289	Evaporative Emission (EVAP) tube
6	14A464	EGR system module electrical connector (part of 12B637)
7	-	Wiring harness pin-type retainer (part of 12B637)
8	9E499	EGR system module vacuum fitting (part of 9E498)
9	9J471	Exhaust manifold-to-EGR system module tube fitting (part of 9E469)
10	14A464	Throttle Position (TP) sensor electrical connector (part of 12B637)
11	14A464	

		Electronic Throttle Body (ETB) electrical connector (part of 12B637)
12	-	Wiring harness nut
13	-	Wiring harness bracket

Intake Manifold

Item	Part Number	Description
1	9K479	Intake manifold bolt (8 required)
2	9424	Intake manifold
3	9461	Intake manifold gasket (6 required)

Removal and Installation

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

1. Remove the Air Cleaner (ACL) outlet pipe. For additional information, refer to Section 303-12 .
2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
3. Detach the Knock Sensor (KS) electrical connector from the intake manifold.
4. Disconnect the PCV tube from the intake manifold.
5. Disconnect the brake booster vacuum hose from the intake manifold.

6. Disconnect the main vacuum harness fitting from the intake manifold.

7. Disconnect the Evaporative Emission (EVAP) tube from the intake manifold.

8. Disconnect the EGR system module electrical connector.

9. Detach the wiring harness retainer.

10. Disconnect the EGR system module vacuum fitting.

11. Loosen the fitting and disconnect the exhaust manifold-to-EGR system module tube from the EGR system module.
    - To install, tighten to 34 Nm (25 lb-ft).

12. Disconnect the Throttle Position (TP) sensor electrical connector.

13. Disconnect the Electronic Throttle Body (ETB) electrical connector.

14. Remove the nut and detach the wiring harness bracket from the ETB .
    - To install, tighten to 9 Nm (80 lb-in).

15. Remove the 8 bolts, the intake manifold and the 6 gaskets.
    - To install, tighten to 11 Nm (97 lb-in).

16. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools can cause scratches and gouges which can make leak paths. Use a plastic scraping tool to remove all traces of the old intake manifold gaskets.**

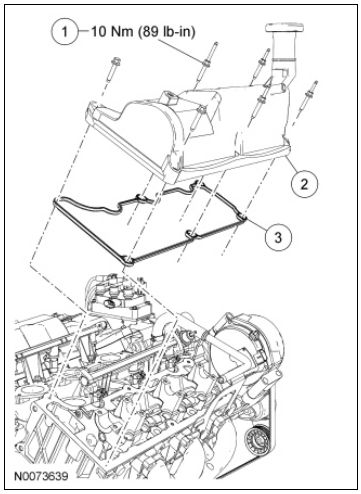
    Clean the sealing surfaces and inspect the gaskets. Install new gaskets if necessary.

17. ***NOTICE:*** **If the engine is repaired or replaced because of upper engine failure, typically including valve or piston damage, check the intake manifold for metal debris. If metal debris is found, install a new intake manifold. Failure to follow these instructions can result in engine damage.**

    To install, reverse the removal procedure.

Valve Cover - RH

Material



Item	Specification
Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil XO-5W30-QSP (US); Motorcraft® SAE 5W-30 Super Premium Motor Oil CXO-5W30-LSP12 (Canada); or equivalent	WSS-M2C929-A

Heater Hose Tube, Spark Plug Wires, Fuel Supply Tube and Crankcase Ventilation Tube

Item	Part Number	Description
1	W500023	Heater hose tube bracket rear bolt
2	W500041	Heater hose tube bracket front bolt
3	9E469	EGR system module tube fitting
4	W500204	Fuel supply tube-to-valve cover bracket bolt
5	W708086	Fuel supply tube bolts (4 required)
6	9E964	Fuel supply tube
7	12297	Spark plug wire retainers
8	6758	Crankcase ventilation tube

RH Valve Cover

Item	Part Number	Description
1	6C519	RH valve cover fastener (6 required)
2	6582	RH valve cover
3	6584	RH valve cover gasket

Removal and Installation

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

1. Disconnect the spring lock coupling from the fuel supply tube. For additional information, refer to Section 310-00 .

2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

3. Remove the intake manifold. For additional information, refer to Intake Manifold in this section.

4. Remove the heater hose tube bracket rear bolt.
   - To install, tighten to 23 Nm (17 lb-ft).

5. Remove the heater hose tube bracket front bolt.
   - To install, tighten to 34 Nm (25 lb-ft).

6. Loosen the exhaust manifold-to-EGR system module tube lower fitting and remove the tube.
   - To install, tighten to 34 Nm (25 lb-ft).

7. ***NOTICE:*** **Use O-ring seals that are made of special fuel-resistant material. Use of ordinary O-ring seals may cause the fuel system to leak.**

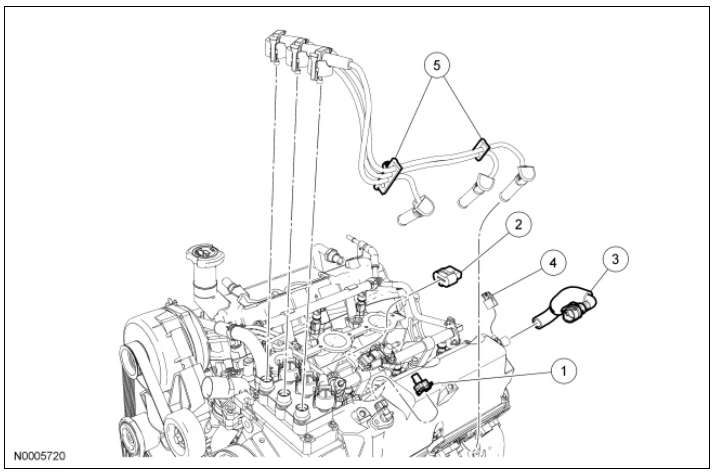
Remove the fuel supply tube-to-valve cover bracket bolt, the 4 fuel supply tube bolts and the fuel supply tube. Remove and discard the O-ring seals.

- Install new O-ring seals and lubricate them with clean engine oil.
- To install, tighten to 6 Nm (53 lb-in).

8. Detach the spark plug wire retainers and position the spark plug wires aside.

9. Remove the crankcase ventilation tube.

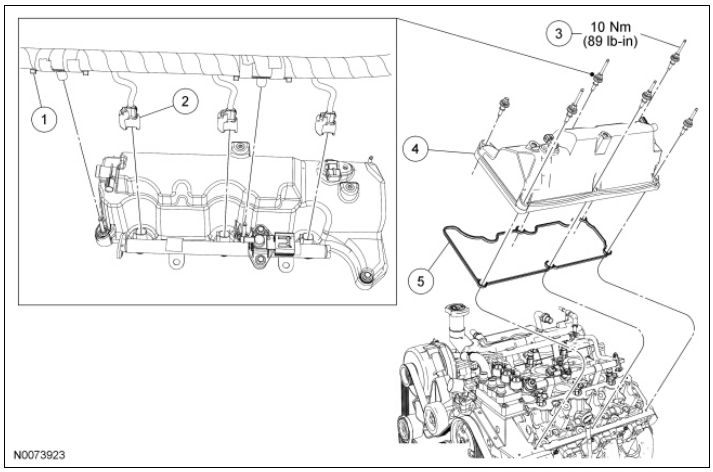
10. Remove the 6 bolts and the valve cover.
    - To install, tighten to 10 Nm (89 lb-in).



11. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean sealing surfaces. These tools cause scratches which make leak paths. Use a plastic scraping tool to remove all traces of the old valve cover gasket.**

    Clean and inspect the sealing surfaces and the gasket. Install a new gasket if necessary.

12. To install, reverse the removal procedure.



Valve Cover - LH

Ignition and PCV Components, and Camshaft Position (CMP) Sensor

Item	Part Number	Description
1	14A464	Camshaft Position (CMP) sensor electrical connector (part of 180101)
2	12B637	Ignition coil electrical connector
3	6K817	PCV valve tube
4	14A464	PCV valve electrical connector (part of 12A580)
5	-	Spark plug wire retainers

LH Valve Cover

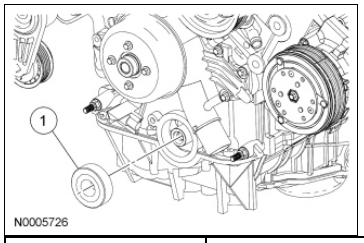
Item	Part Number	Description
1	13A506	Wiring harness retainer (2 required)
2	14A464	Fuel injector electrical connector (3 required)

3	6C519	Valve cover fastener (6 required)
4	6A505	LH valve cover
5	6584	LH valve cover gasket

Removal and Installation

1. Remove the intake manifold. For additional information, refer to Intake Manifold in this section.
2. Disconnect the Camshaft Position (CMP) sensor electrical connector.
3. Disconnect the ignition coil electrical connector. Detach the wiring harness retainer.
4. Disconnect the 3 fuel injector electrical connectors. Detach the wiring harness retainers.
5. Remove the PCV valve tube.
6. Disconnect the PCV valve electrical connector.
7. Detach the spark plug wire retainers.
8. Remove the 6 bolts and the valve cover.
    - To install, tighten to 10 Nm (89 lb-in).
9. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of the old valve cover gasket.**

   Clean and inspect the sealing surfaces and the gasket. Install a new gasket if necessary.
10. To install, reverse the removal procedure.

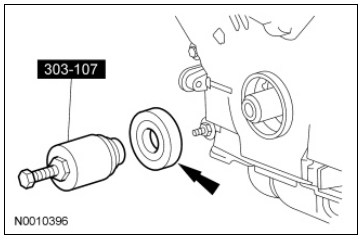


Crankshaft Front Seal

Special Tool(s)

 ST2439-A	Aligner, Front Cover 303-093 (T74P-6019-A)
 ST2428-A	Installer, Crankshaft Vibration Damper 303-102 (T74P-6316-B)
 ST1288-A	Remover, Crankshaft Front Oil Seal 303-107 (T74P-6700-A)

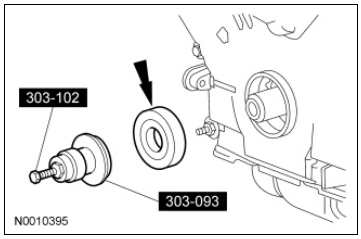
Material



Item	Specification
Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil XO-5W30-QSP (US); Motorcraft® SAE 5W-30 Super Premium Motor Oil CXO-5W30-LSP12 (Canada); or equivalent	WSS-M2C929-A

Item	Part Number	Description
1	6700	Front crankshaft seal

Removal



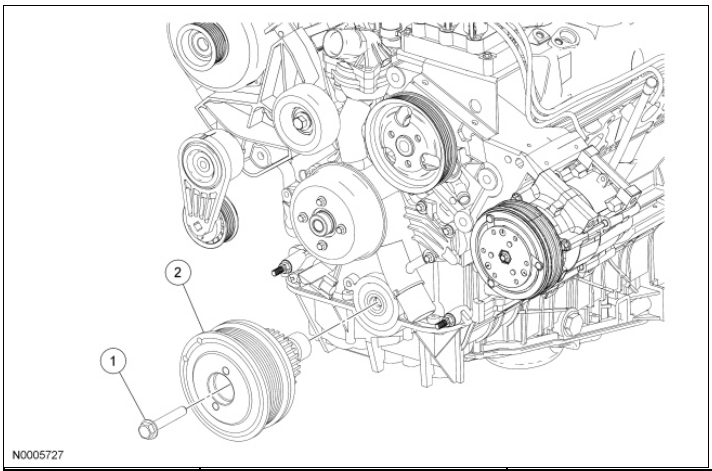
1. Remove the crankshaft pulley. For additional information, refer to Crankshaft Pulley in this section.
2. Using the Crankshaft Front Oil Seal Remover, remove and discard the crankshaft front seal.

Installation

1. **NOTE:** Lubricate the new front seal with clean engine oil.

   Using the Front Cover Aligner and the Crankshaft Vibration Damper Installer, install a new crankshaft front seal.

2. Install the crankshaft pulley. For additional information, refer to Crankshaft Pulley in this section.



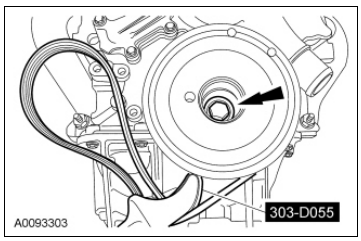
Crankshaft Pulley

Special Tool(s)

 ST2428-A	Installer, Crankshaft Vibration Damper 303-102 (T74P-6316-B)
 ST1784-A	Remover, Crankshaft Vibration Damper 303-101 (T74P-3616-A)
 ST2697-A	Remover, Crankshaft Vibration Damper 303-773
 ST1438-A	Strap Wrench 303-D055 (D85L-6000-A) or equivalent

General Equipment

8-mm x 1.25 x 100-mm bolts (2 required)



Item	Part Number	Description
1	E800511	Crankshaft pulley bolt
2	6B321	Crankshaft pulley

Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the fan shroud. For additional information, refer to Section 303-03 .
3. Remove the accessory drive belt. For additional information, refer to Section 303-05 .

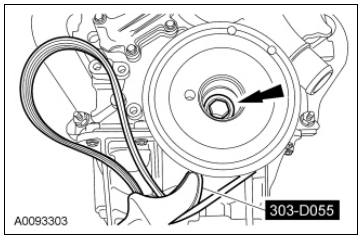
4. **NOTE:** This bolt is torque-to-yield and cannot be reused.

   Using the Strap Wrench to hold the crankshaft pulley, remove the bolt.

5. **NOTE:** If the pulley bolt is not installed, the tool will bottom out before the pulley is off.

   Install the crankshaft pulley bolt 2 to 3 turns. Using the 2 Crankshaft Vibration Damper Removers and the two 8-mm bolts, remove the crankshaft pulley.

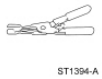
   - Discard the crankshaft pulley bolt.



Installation

1. Using the Crankshaft Vibration Damper Installer, install the crankshaft pulley.

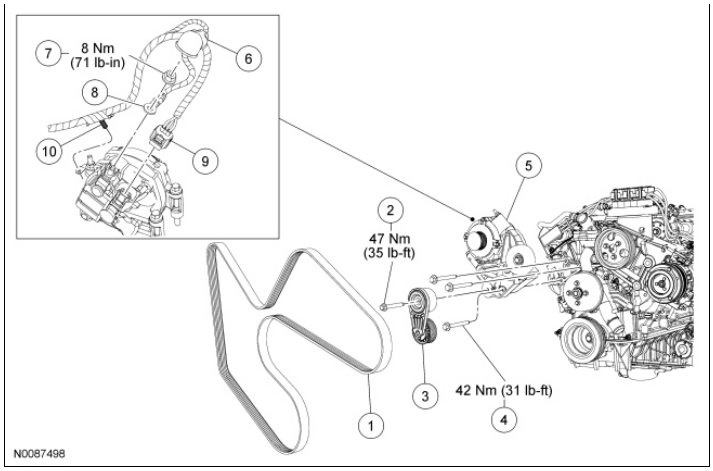
2. Using the Strap Wrench to hold the crankshaft pulley, install a new crankshaft pulley bolt. Tighten the bolt in 2 stages.
   - Stage 1: Tighten to 55 Nm (41 lb-ft).
   - Stage 2: Tighten an additional 85 degrees.



3. Install the accessory drive belt. For additional information, refer to Section 303-05 .

4. Install the fan shroud. For additional information, refer to Section 303-03 .

Cylinder Head

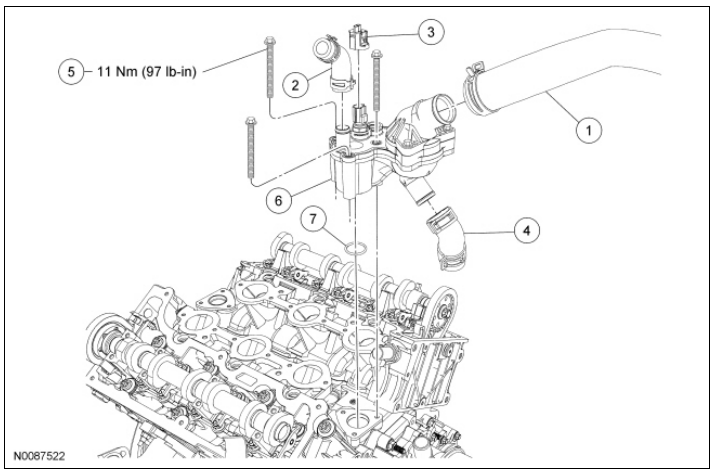


Special Tool(s)

 ST1776-A	Adapter for 303-564 303-578 (T97T-6256-A) or equivalent
 ST1777-A	Holding Tool, Camshaft Sprocket 303-564 (T97T-6256-B) or equivalent
 ST1394-A	Remover, Spark Plug Wire 303-106 (T74P-6666-A)
 ST1781-A	Socket, Camshaft Sprocket Nut 303-565 (T97T-6256-G) or equivalent
 ST1780-A	Torque Wrench Extension 303-575 (T97T-6256-F) or equivalent

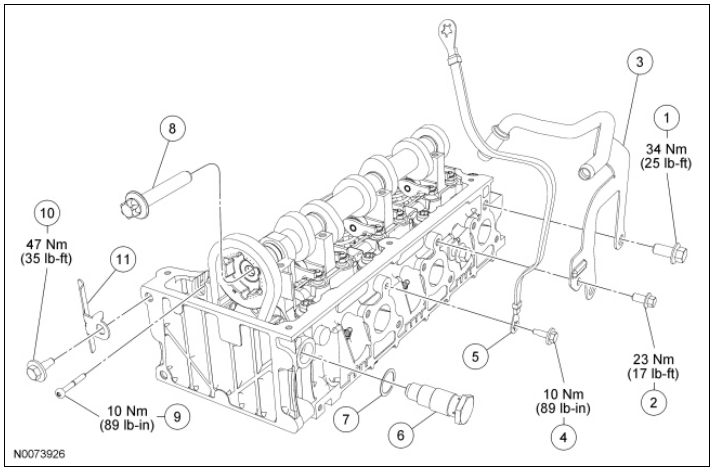
Material

Item	Specification
Silicone Brake Caliper Grease and Dielectric Compound XG-3-A	ESE-M1C171-A



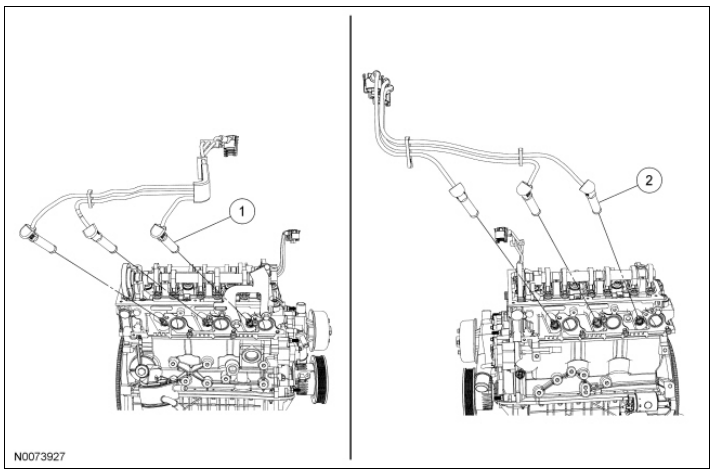
Accessory Drive Belt, Tensioner and Generator Bracket

Item	Part Number	Description
1	8620	Accessory drive belt



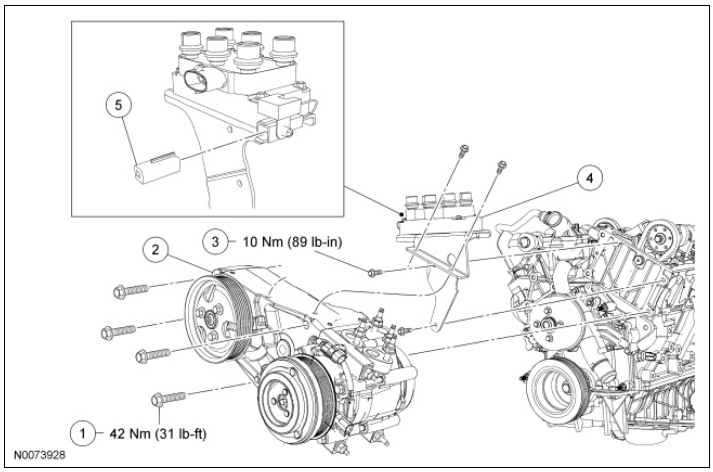
2	W500325	Accessory drive belt tensioner bolt
3	6B209	Accessory drive belt tensioner
4	N807938	Generator bracket bolt (3 required)
5	10239	Generator bracket
6	14A240	Generator B+ terminal cover (part of 12A280)
7	-	Generator B+ terminal nut
8	14463	Generator B+ terminal (part of 14A280)
9	14A464	Generator electrical connector (part of 14A280)
10	13A506	Wiring harness retainer (part of 14A280)

Thermostat Housing



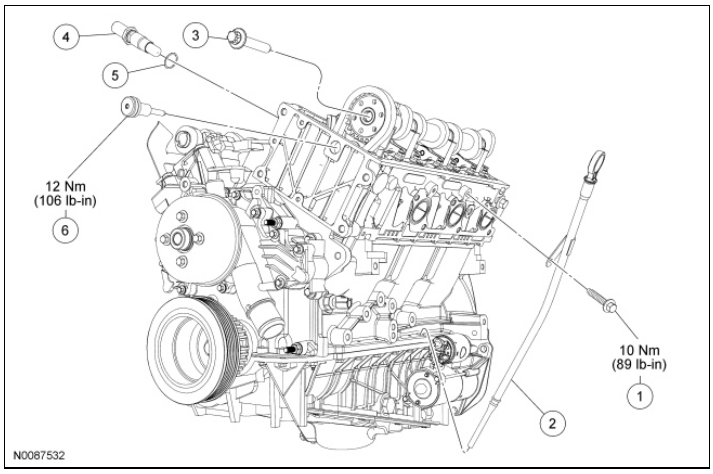
Item	Part Number	Description
1	8B274	Upper radiator hose
2	18472	Heater hose
3	14A464	Engine Coolant Temperature (ECT) sensor electrical connector (part of 12B637)
4	8548	Bypass hose
5	W702527	Thermostat housing bolt (3 required)
6	9K478	Thermostat housing
7	8255	O-ring seal

RH Cylinder Head Attachments



Item	Part Number	Description
1	W500041	Heater tube assembly front bolt
2	W500022	Heater tube assembly rear bolt
3	18696	Heater tube assembly
4	W505421	Engine ground strap bolt
5	19A095	Engine ground strap
6	6K254	RH hydraulic timing chain tensioner
7	-	RH hydraulic timing chain tensioner washer
8	6M276	RH camshaft sprocket bolt
9	6U000	RH timing cassette-to-cylinder head bolt
10	W505430	Wiring harness retainer bolt
11	14C508	Wiring harness retainer (part of 12B637)

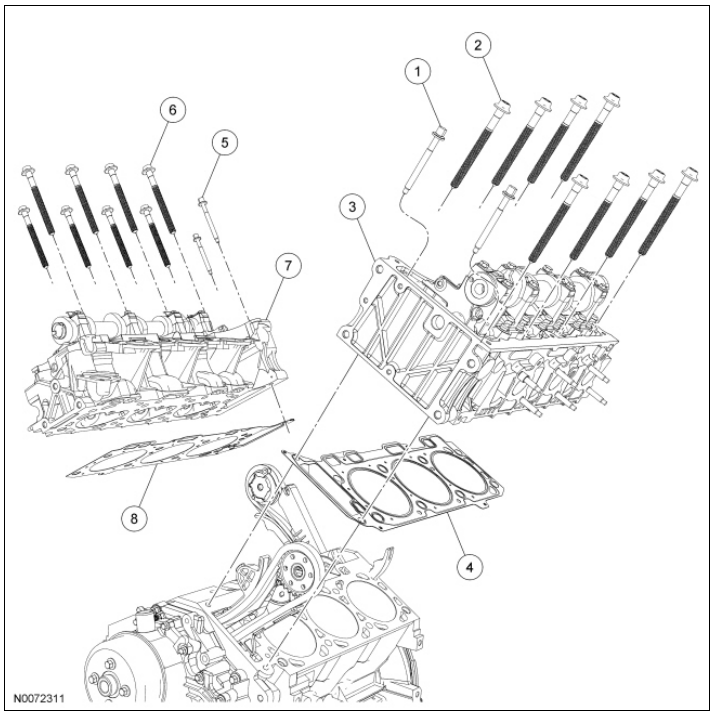
Spark Plug Wires



Item	Part Number	Description
1	12280	RH spark plug wire (3 required)
2	12281	LH spark plug wire (3 required)

Power Steering Pump and A/C Compressor Bracket and Ignition Coil

Item	Part Number	Description
1	N807938	A/C compressor and power steering pump bracket bolt (4 required)
2	19E708	A/C compressor and power steering pump bracket
3	-	Ignition coil and bracket assembly bolt (4 required)
4	12A310	Ignition coil and bracket assembly
5	14A464	Radio ignition interference capacitor electrical connector (part of 12B637)

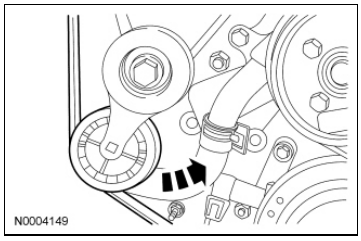


LH Cylinder Head Attachments

Item	Part Number	Description
1	-	Oil level indicator tube assembly bolt
2	6754	Oil level indicator tube assembly
3	6M276	LH camshaft sprocket bolt
4	6K254	LH hydraulic timing chain tensioner
5	-	LH hydraulic timing chain tensioner washer

6	6U001	LH timing cassette-to-cylinder head bolt

Cylinder Heads

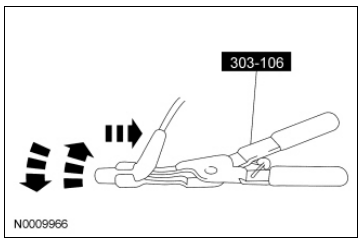


Item	Part Number	Description
1	6065	LH cylinder head bolt (M8) (2 required)
2	6065	LH cylinder head bolt (M12) (8 required)
3	6M099	LH cylinder head
4	6083	LH cylinder head gasket
5	6065	RH cylinder head bolt (M8) (2 required)
6	6065	RH cylinder head bolt (M12) (8 required)
7	6049	RH cylinder head
8	6051	RH cylinder head gasket

Removal

Both sides

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Drain the engine cooling system. For additional information, refer to Section 303-03 .
3. Remove the roller followers. For additional information, refer to Camshaft Roller Follower in this section.
4. Rotate the accessory drive belt tensioner counterclockwise and remove the accessory drive belt.

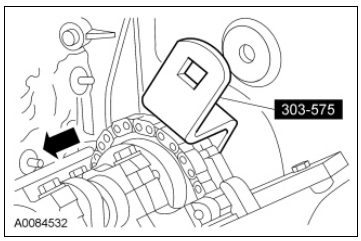


RH side

5. Remove the 2 bolts and position the heater hose tube bracket aside.
6. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
7. Disconnect the generator electrical connections.
8. Remove the bolt and the accessory drive belt tensioner.
9. Remove the 3 bolts and the generator mounting bracket assembly.
10. Disconnect the heater hose from the thermostat housing.
11. Disconnect the Engine Coolant Temperature (ECT) sensor electrical connector.
12. Disconnect the upper radiator hose from the thermostat housing.
13. Position the bypass hose clamp aside.
14. Remove the 3 bolts and the thermostat housing.
15. Remove the bolt and position the engine wiring harness aside.
16. Remove the engine ground strap.
17. ***NOTICE:*** **It is important to twist the spark plug wire boot while pulling upward to avoid damage to the spark plug wire.**

    NOTE: Spark plug wires must be connected to the correct spark plug. Mark the spark plug wires for installation reference.

    With a twisting motion, use the Spark Plug Wire Remover to pull the spark plug wires from the RH spark plugs.

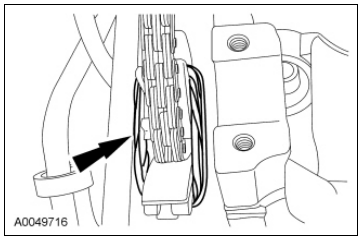


18. Remove the RH exhaust manifold. For additional information, refer to Exhaust Manifold - RH in this section.
19. Remove the RH hydraulic timing chain tensioner.

20. Install the Camshaft Sprocket Holding Tool and the Adapter for 303-564.
    - Tighten to 10 Nm (89 lb-in).

21. ***NOTICE:*** **The RH camshaft sprocket bolt is a LH-threaded bolt. Turning the bolt in the wrong direction can damage the bolt.**

    Using the Torque Wrench Extension with the Camshaft Sprocket Nut Socket, remove the RH camshaft bolt.



22. Remove the RH side cassette-to-cylinder head bolt.

23. ***NOTICE:*** **Remove the camshaft sprocket from the timing chain to gain clearance to remove the cylinder head. Leaving the sprocket in place can damage the cassette and prevent the cylinder head from being removed.**

    NOTE: Hold the timing chain and cassette with a rubber band to aid in removal and to prevent the timing chain from falling into the cylinder block.

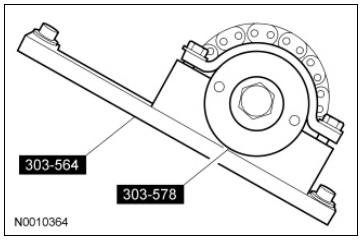
    Remove the RH camshaft sprocket from the timing chain. Install a rubber band around the cassette and the timing chain.

LH side

24. Disconnect the radio ignition interference capacitor electrical connector.

25. Remove the 2 ignition coil and bracket assembly-to-A/C compressor and power steering pump bracket bolts.

26. Remove the 4 bolts and position the A/C compressor and power steering pump bracket aside.



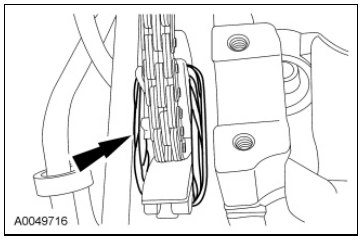
27. Remove the 2 ignition coil and bracket assembly-to-cylinder head bolts and the ignition coil and bracket assembly.

28. Remove the bolt and the oil level indicator tube.

29. Remove the LH exhaust manifold. For additional information, refer to Exhaust Manifold - LH in this section.

30. Remove the LH hydraulic timing chain tensioner.

31. Install the Camshaft Sprocket Holding Tool and the Adapter for 303-564.
    - Tighten the top clamp bolts to 10 Nm (89 lb-in).



32. Remove the LH side camshaft sprocket bolt.

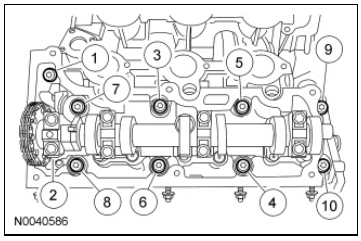
33. Remove the LH timing cassette-to-cylinder head bolt.

34. ***NOTICE:*** **Remove the camshaft sprocket from the timing chain to gain clearance to remove the cylinder head. Leaving the sprocket in place can damage the cassette and prevent the cylinder head from being removed.**

    NOTE: Hold the timing chain and cassette with a rubber band to aid in removal and to prevent the timing chain from falling into the cylinder block.

    Remove the LH camshaft sprocket from the timing chain. Install a rubber band around the cassette and the timing chain.

Both sides



35. ***NOTICE:*** **To avoid damage to the timing chain cassette, an assistant will be required to help lift the cylinder head from the vehicle.**

    NOTICE: **On the RH side, when lifting the cylinder head, be careful to avoid contacting the Air Conditioning (A/C) tube or the A/C tube can be damaged.**

    NOTE: New cylinder head bolts must be installed. They are a torque-to-yield design and cannot be reused.

    Remove the cylinder heads.

    - Remove the 10 bolts from each cylinder head in the sequence shown. Discard all bolts.
    - Remove and discard the head gasket.

36. *NOTICE:* **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. Use a plastic scraping tool to remove all traces of the head gasket.**

    Clean and inspect the mating surfaces.

37. Support the cylinder heads on a bench with the head gasket side up. Check the cylinder head distortion and the cylinder block distortion. For additional information, refer to Section 303-00 .

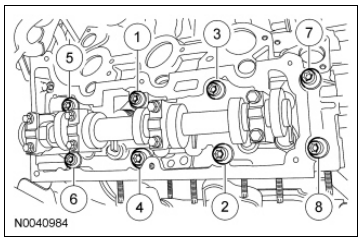
Installation

Both sides

1. Clean the cylinder head bolt holes in the cylinder block. Make sure all coolant, oil or other foreign material is removed.

2. Position the cylinder head gasket on the block.

RH side



3. *NOTICE:* **To avoid damage to the timing chain cassette, an assistant will be required to help position the cylinder head in the vehicle.**

   NOTICE: **On the RH side, when positioning the cylinder head, be careful to avoid contacting the Air Conditioning (A/C) tube or the A/C tube can be damaged.**

   NOTE: New cylinder head bolts must be installed. They are a torque-to-yield design and cannot be reused.

   Install the cylinder head. Install 8 new 12-mm bolts and tighten in the sequence shown in 2 stages.

   - Stage 1: Tighten to 12 Nm (106 lb-in).
   - Stage 2: Tighten to 25 Nm (18 lb-ft).

4. Install 2 new 8-mm bolts.
   - Tighten to 32 Nm (24 lb-ft).

5. Tighten the 8 new 12-mm bolts in the sequence shown in 2 stages.
   - Stage 1: Tighten 90 degrees.
   - Stage 2: Tighten an additional 90 degrees.

6. ***NOTICE:*** **The camshaft gear must turn freely on the camshaft. DO NOT tighten the bolt at this time. Tightening the bolt can result in incorrect engine timing.**

   NOTICE: **The RH camshaft sprocket bolt is a LH-threaded bolt. Turning the bolt in the wrong direction can damage the bolt.**

   Remove the rubber band. Install the camshaft sprocket and bolt.

7. Install the RH timing cassette-to-cylinder head bolt.
   - Tighten to 10 Nm (89 lb-in).

8. Install the RH exhaust manifold. For additional information, refer to Exhaust Manifold - RH in this section.

9. **NOTE:** Apply silicone brake caliper grease and dielectric compound to the inside of the spark plug boots.

   Connect the spark plug wires to the RH spark plugs.

10. Install the engine ground strap and the bolt.
    - Tighten to 10 Nm (89 lb-in).

11. Position the engine wiring harness and install the bolt.
    - Tighten to 47 Nm (35 lb-ft).

12. **NOTE:** Inspect the O-ring seal. Install a new O-ring seal if necessary.

    Install the thermostat housing and the 3 bolts.

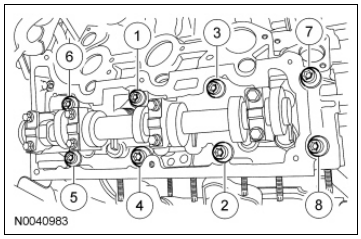
    - Tighten to 11 Nm (97 lb-in).

13. Position the coolant bypass hose clamp.

14. Install the upper radiator hose to the thermostat housing.

15. Connect the Engine Coolant Temperature (ECT) sensor electrical connector.

16. Connect the heater hose to the thermostat housing.



LH side

17. ***NOTICE:*** **To avoid damage to the timing chain cassette, an assistant will be required to help position the cylinder head in the vehicle.**

    NOTE: New cylinder head bolts must be installed. They are a torque-to-yield design and cannot be reused.

    Install the cylinder head. Install 8 new 12-mm bolts and tighten in the sequence shown in 2 stages.

    - Stage 1: Tighten to 12 Nm (106 lb-in).
    - Stage 2: Tighten to 25 Nm (18 lb-ft).

18. Install 2 new 8-mm bolts.
    - Tighten to 32 Nm (24 lb-ft).

19. Tighten the 8 new 12-mm bolts in the sequence shown in 2 stages.
    - Stage 1: Tighten 90 degrees.
    - Stage 2: Tighten an additional 90 degrees.

20. ***NOTICE:*** **The camshaft gear must turn freely on the camshaft. DO NOT tighten the bolt at this time. Tightening the bolt can result in incorrect engine timing.**

    Remove the rubber band. Install the camshaft sprocket and bolt.

21. Install the LH timing cassette-to-cylinder head bolt.
    - Tighten to 12 Nm (106 lb-in).

22. Install the LH exhaust manifold. For additional information, refer to Exhaust Manifold - LH in this section.

23. **NOTE:** Apply silicone brake caliper grease and dielectric compound to the inside of the spark plug boots.

    Connect the spark plug wires to the LH spark plugs.

24. Install the oil level indicator tube and the bolt.
    - Tighten to 10 Nm (89 lb-in).

Both sides

25. Time the camshafts. For additional information, refer to Camshaft Timing in this section.

RH side

26. Install the generator mounting bracket assembly and the 3 bolts.
    - Tighten to 42 Nm (31 lb-ft).

27. Position the accessory drive belt tensioner and install the bolt.
    - Tighten to 47 Nm (35 lb-ft).

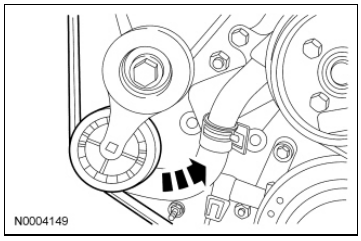
28. Connect the generator electrical connections.
    - Tighten to 8 Nm (71 lb-in).

29. Connect the battery ground cable. For additional information, refer to Section 414-01 .

30. Position the heater hose tube bracket and install the 2 bolts.
    - Tighten the rear bolt to 23 Nm (17 lb-ft).
    - Tighten the front bolt to 34 Nm (25 lb-ft).

LH side

31. Position the ignition coil and bracket assembly and install the 2 bracket-to-cylinder head bolts.
    - Tighten to 10 Nm (89 lb-in).



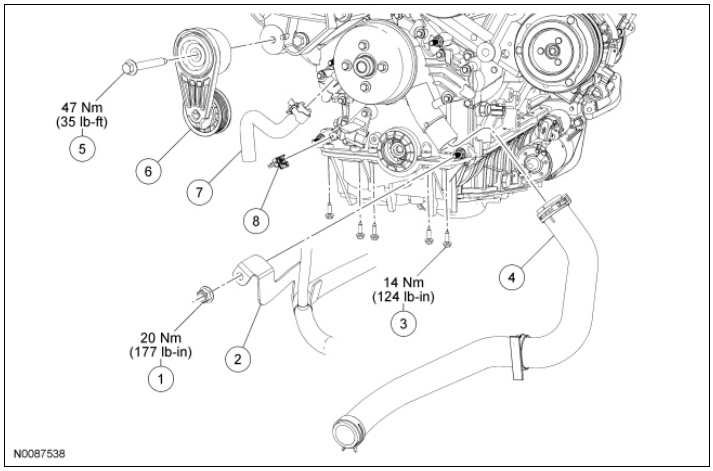
32. Position the A/C compressor and power steering pump bracket and install the 4 bolts.
    - Tighten to 42 Nm (31 lb-ft).

33. Install the 4 ignition coil bracket-to-A/C compressor and power steering pump bracket bolts.
    - Tighten to 10 Nm (89 lb-in).

34. Connect the radio ignition interference capacitor electrical connector.

Both sides

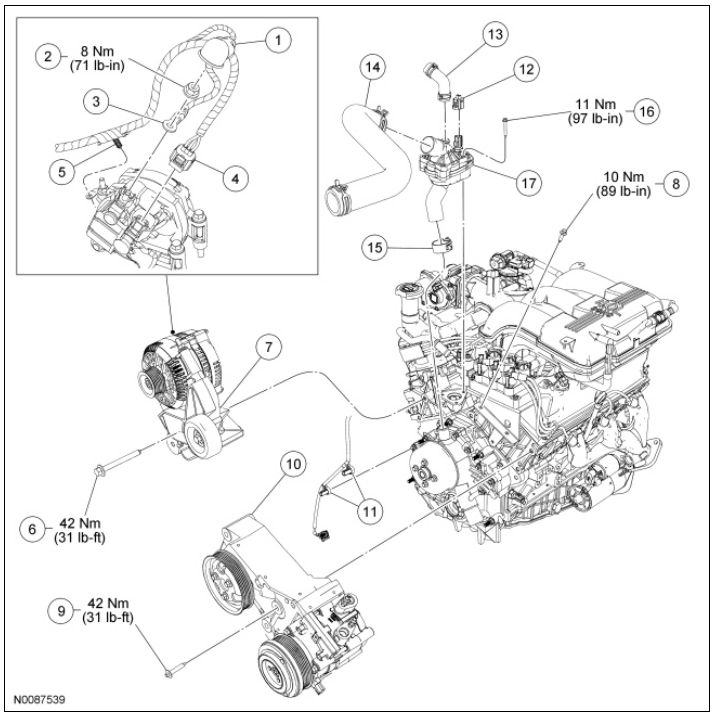
35. Rotate the accessory drive belt tensioner counterclockwise and install the accessory drive belt.



36. Fill and bleed the engine cooling system. For additional information, refer to Section 303-03 .

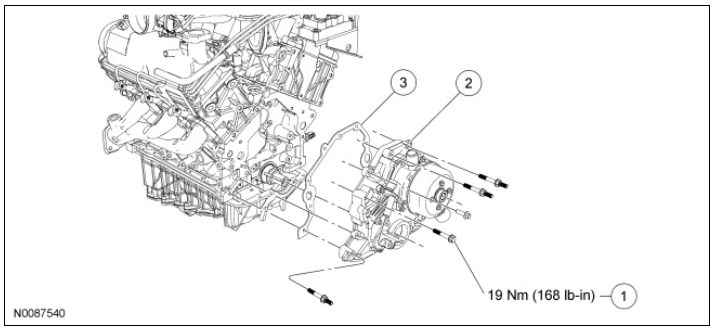
Engine Front Cover

Material



Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	-
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4
Motorcraft® Silicone Gasket Remover ZC-30	-

Lower End Components



Item	Part Number	Description
1	W520102	Wiring harness bracket nut
2	10A779	Wiring harness bracket (part of 14A280)
3	W503275	Cylinder block cradle-to-front cover bolt (5 required)
4	8260	Lower radiator hose
5	-	Accessory drive belt tensioner bolt
6	6B209	Accessory drive belt tensioner
7	-	Heater hose
8	14A464	Crankshaft Position (CKP) sensor electrical connector

Accessory Drive Brackets

Item	Part Number	Description
1	14A240	Generator B+ terminal cover (part of 12A280)
2	-	Generator B+ terminal nut
3	14463	Generator B+ terminal (part of 14A280)
4	14A464	Generator electrical connector (part of 14A280)
5	13A506	Wiring harness retainer (part of 14A280)
6	-	Generator bracket bolt (3 required)
7	-	Generator bracket
8	-	Ignition coil bracket-to-A/C compressor and power steering pump bracket bolt
9	-	A/C compressor and power steering pump bracket bolt (4 required)
10	-	A/C compressor and power steering pump bracket
11	-	Wiring harness routing clips
12	-	Engine Coolant Temperature (ECT) sensor electrical connector
13	18472	Heater hose
14	8260	Upper radiator hose
15	-	Bypass hose clamp
16	-	Thermostat housing bolt (3 required)
17	-	Thermostat housing

Engine Front Cover

Item	Part Number	Description
1	-	Engine front cover bolt (10 required)
2	-	Engine front cover
3	-	Gasket

Removal

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
2. Drain the cooling system. For additional information, refer to Section 303-03 .
3. Remove the crankshaft front seal. For additional information, refer to Crankshaft Front Seal in this section.
4. Remove the nut and detach the wiring harness bracket from the front cover.
5. Remove the 5 oil pan-to-front cover bolts.
6. Disconnect the lower radiator hose.
7. Remove the bolt and the drive belt tensioner.
8. Disconnect the heater hose from the coolant pump.
9. Disconnect the Crankshaft Position (CKP) sensor electrical connector.
10. Remove the nut and disconnect the generator B+ terminal.
11. Disconnect the generator electrical connector and detach the wiring harness retainer.
12. Remove the 3 generator bracket bolts and the generator bracket.
13. Remove the coil bracket-to-A/C compressor and power steering pump bracket bolt.
14. Remove the 4 bolts and the A/C compressor and power steering pump bracket.
15. Remove and discard the CKP sensor wiring harness retainers.
16. Disconnect the Engine Coolant Temperature (ECT) sensor electrical connector.
17. Disconnect the upper radiator hose from the thermostat housing.
18. Disconnect the heater hose from the thermostat housing.

19. **NOTE:** The bypass hose will be removed with the thermostat housing.

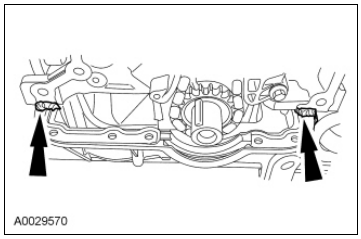
    Release the bypass hose clamp from the coolant pump end.

20. Remove the 3 bolts and the thermostat housing.

21. **NOTE:** Note the positions of the stud bolts for installation reference.

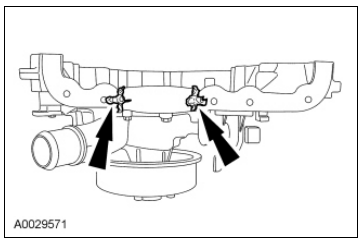
    Remove the 10 bolts, the engine front cover and the gasket. Discard the gasket.

Installation



1. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of the old front cover gasket and the silicone sealer.**

   Clean and inspect the gasket mating surfaces. Use silicone gasket remover and metal surface prep and a plastic scraping tool. Follow the directions on the packaging.



2. Position the front cover gasket.

NOTICE: **If not secured within 4 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Follow the directions on the packaging. Failure to follow this procedure can cause future oil leakage.**

3. Apply silicone gasket and sealant to the oil pan and engine block mating surfaces.

4. Apply silicone gasket and sealant to the front cover in 2 places as shown.

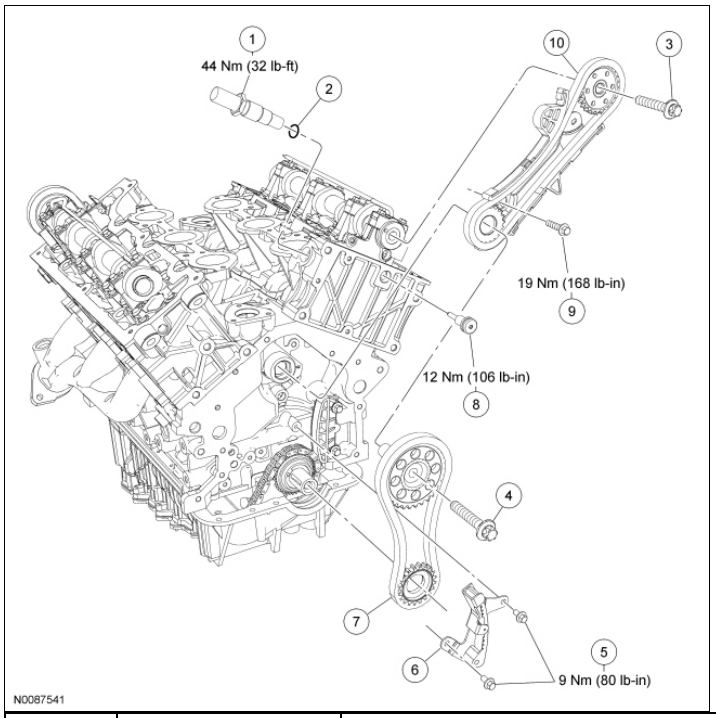
5. **NOTE:** Make sure the stud bolts are installed in their original positions.

   Position the engine front cover and install the 10 bolts.

   - Tighten to 19 Nm (168 lb-in).

6. **NOTE:** Make sure the coolant bypass hose is attached to the coolant pump.

   Position the thermostat housing and install the 3 bolts.



- Tighten to 11 Nm (97 lb-in).

7. Position the bypass hose clamp.
8. Connect the upper radiator hose to the thermostat housing.
9. Connect the heater hose to the thermostat housing.
10. Connect the ECT sensor electrical connector.
11. Install new wiring harness retainers and position the CKP sensor wiring.
12. Connect the CKP sensor electrical connector.
13. Position the A/C compressor and power steering pump bracket and install the 4 bolts.
    - Tighten to 42 Nm (31 lb-ft).
14. Install the ignition coil bracket-to-A/C compressor and power steering pump bracket bolt.
    - Tighten to 10 Nm (89 lb-in).
15. Position the generator bracket and install the 3 bolts.
    - Tighten to 42 Nm (31 lb-ft).
16. Connect the generator electrical connector and attach the wiring harness retainer.
17. Connect the generator B+ terminal and install the nut.
    - Tighten to 8 Nm (71 lb-in).
18. Connect the heater hose to the coolant pump.
19. Position the accessory drive belt tensioner and install the bolt.
    - Tighten to 47 Nm (35 lb-ft).
20. Connect the lower radiator hose.
21. Install the 5 cylinder block cradle-to-front cover bolts.
    - Tighten to 14 Nm (124 lb-in).
22. Position the wiring harness bracket and install the nut.
    - Tighten to 20 Nm (177 lb-in).
23. Install the crankshaft front seal. For additional information, refer to Crankshaft Front Seal in this section.
24. Connect the battery ground cable. For additional information, refer to Section 414-01 .
25. Fill the engine cooling system. For additional information, refer to Section 303-03 .

Camshaft Drive Cassette - LH

Special Tool(s)

 ST1776-A	Adapter for 303-564 303-578 (T97T-6256-A)
 ST1777-A	Holding Tool, Camshaft Sprocket 303-564 (T97T-6256)
 ST2694-A	Holding Tool, Crankshaft 303-674

Item	Part Number	Description
1	6K254	Hydraulic chain tensioner
2	-	Hydraulic chain tensioner washer
3	6M276	Camshaft sprocket bolt
4	6M276	Jackshaft sprocket bolt
5	W500011	Jackshaft chain tensioner bolts (2 required)
6	6M271	Jackshaft chain tensioner
7	-	Jackshaft chain and sprocket assembly
8	6U001	LH cassette upper bolt
9	W500110	LH cassette lower bolt

10	6M289	LH cassette

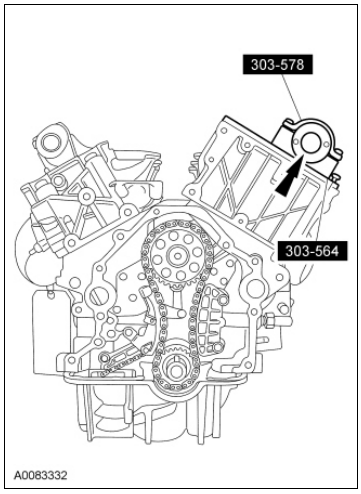
Removal

1. Remove the valve covers. For additional information, refer to Valve Cover - RH and Valve Cover - LH in this section.

2. Remove the fuel rail. For additional information, refer to Section 303-04A .

3. Remove the engine front cover. For additional information, refer to Engine Front Cover in this section.

4. Remove the thermostat housing. For additional information, refer to Section 303-03 .



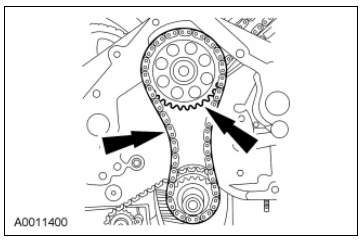
5. Remove all of the roller followers. For additional information, refer to Camshaft Roller Follower in this section.

6. **NOTE:** The LH and RH camshafts must be retimed when either camshaft is disturbed.

   Turn the crankshaft clockwise to position the No. 1 cylinder at Top Dead Center (TDC).

7. Remove the LH hydraulic chain tensioner.
   - Discard the washer.

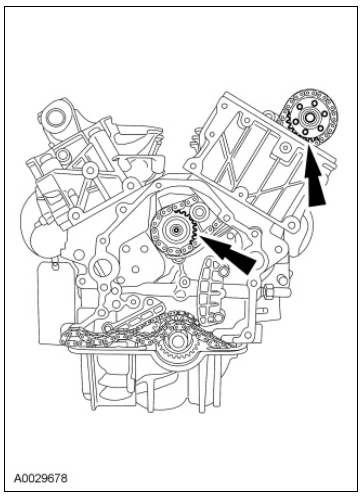
8. Remove the LH camshaft sprocket bolt.
   - Install the Camshaft Sprocket Holding Tool and the Adapter for 303-564 and tighten the bolts to 10 Nm (89 lb-in).
   - Remove the LH camshaft sprocket bolt.



9. Using the Crankshaft Holding Tool to prevent the crankshaft from turning, remove the jackshaft sprocket bolt.

10. Remove the 2 bolts and the primary chain tensioner.

11. Remove the primary chain and sprockets as an assembly.



12. Remove the LH cassette upper bolt.

13. Remove the LH cassette lower bolt and the LH cassette.

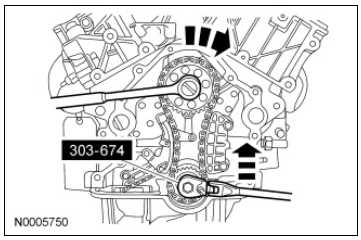
Installation

1. **NOTE:** The camshaft chain sprockets must be oriented correctly.

   Position the LH cassette.

2. Install the LH cassette lower bolt.
   - Tighten to 19 Nm (168 lb-in).

3. Install the LH cassette upper bolt.
   - Tighten to 12 Nm (106 lb-in).



4. Install the jackshaft chain and sprockets as an assembly.

5. Install the jackshaft chain tensioner and the 2 bolts.
   - Tighten to 9 Nm (80 lb-in).

6. Using the Crankshaft Holding Tool to prevent the crankshaft from turning, tighten the jackshaft sprocket bolt in 2 stages.

- Stage 1: Tighten to 45 Nm (33 lb-ft).
- Stage 2: Tighten an additional 90 degrees.

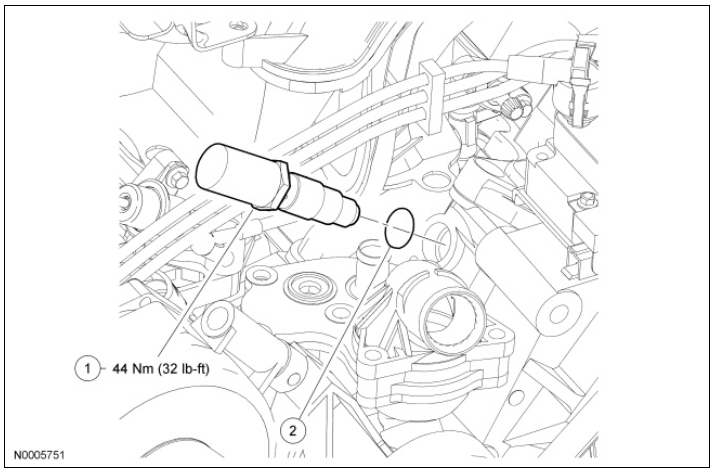
7. Loosely install the camshaft sprocket bolt.

8. Install the engine front cover. For additional information, refer to Engine Front Cover in this section.

9. **NOTE:** The LH and RH camshafts must be retimed when either camshaft is disturbed.

   NOTE: Install the LH hydraulic chain tensioner during camshaft timing.

   Retime the LH and RH camshafts. For additional information, refer to Camshaft Timing in this section.



10. Install the camshaft roller followers. For additional information, refer to Camshaft Roller Follower in this section.

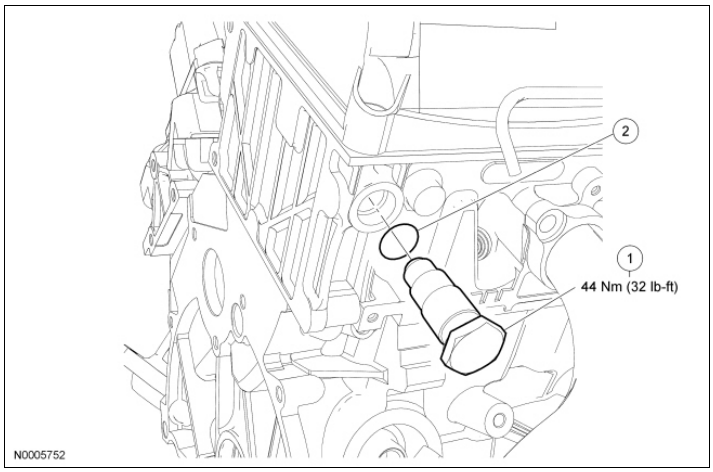
11. Install the fuel rail. For additional information, refer to Section 303-04A .

12. Install the valve covers. For additional information, refer to Valve Cover - RH and Valve Cover - LH in this section.

13. Fill and bleed the engine cooling system. For additional information, refer to Section 303-03 .

Hydraulic Timing Chain Tensioner - LH

Item	Part Number	Description
1	6K524	LH hydraulic timing chain tensioner
2	-	LH hydraulic timing chain tensioner washer



Removal and Installation

1. Remove the hydraulic timing chain tensioner.
   - To install, tighten to 44 Nm (32 lb-ft).

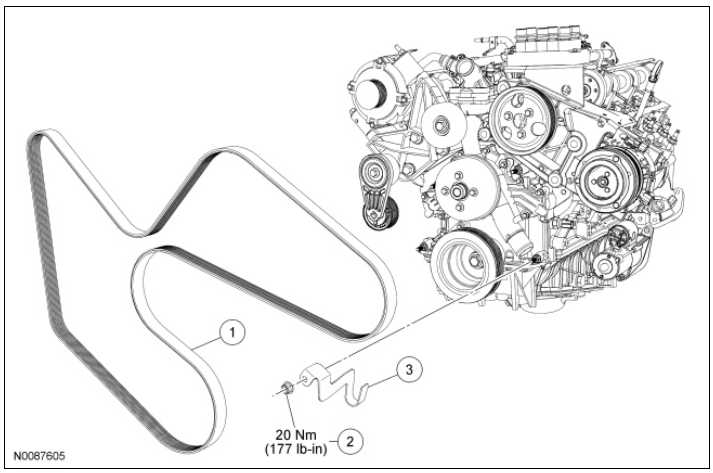
2. Remove and discard the washer.

3. To install, reverse the removal procedure.
   - Install a new hydraulic timing chain tensioner washer.

Hydraulic Timing Chain Tensioner - RH

Item	Part Number	Description
1	6K254	RH hydraulic timing chain tensioner
2	-	RH hydraulic timing chain tensioner washer

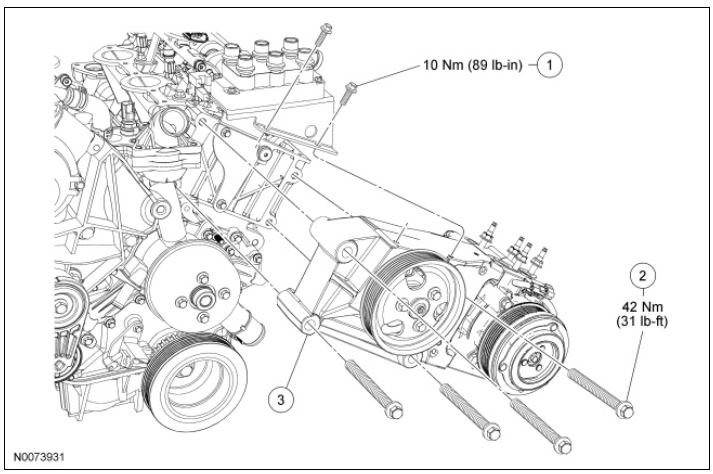
Removal and Installation



1. Remove the hydraulic timing chain tensioner.
   - To install, tighten to 44 Nm (32 lb-ft).

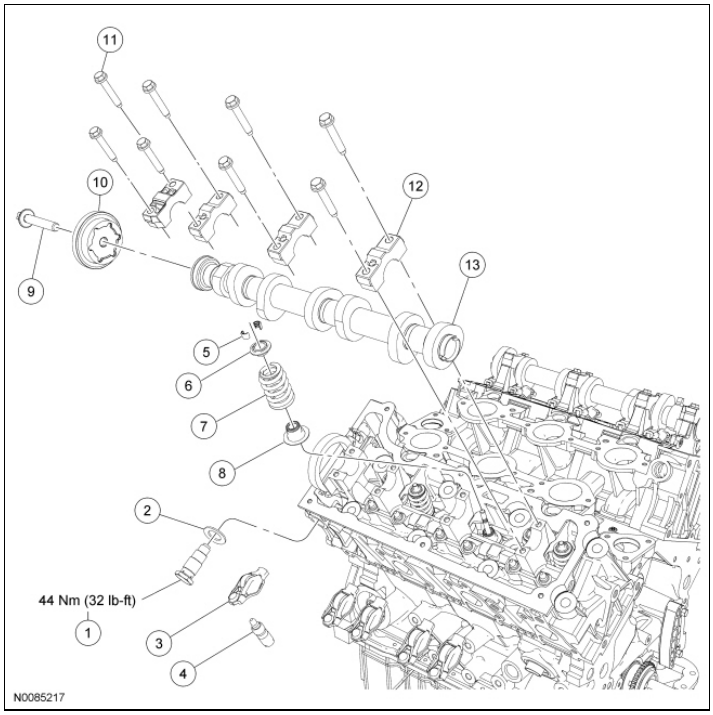
2. Remove and discard the washer.

3. To install, reverse the removal procedure.
   - Install a new hydraulic timing chain tensioner washer.



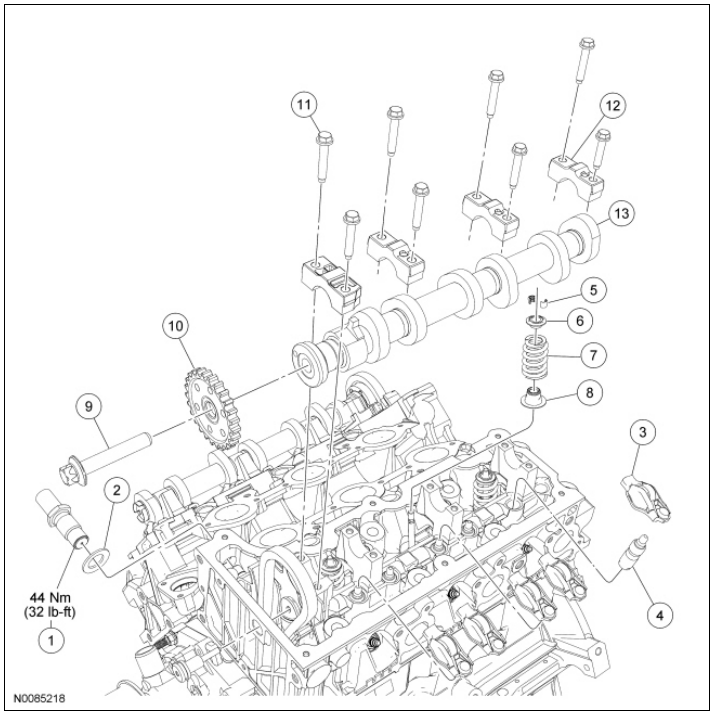
Valve Train Components - Exploded View

Accessory Drive Belt and Wiring Harness Bracket



Item	Part Number	Description
1	8620	Accessory drive belt
2	W520102	Wiring harness bracket nut
3	10A779	Wiring harness bracket (part of 14A280)

A/C Compressor and Power Steering Pump Bracket



Item	Part Number	Description
1	-	Ignition coil bracket-to-A/C compressor and power steering pump bracket bolt (2 required)
2	N807938	A/C compressor and power steering pump bracket bolt (4 required)
3	19E708	A/C compressor and power steering pump bracket

Valve Train Components - RH

Item	Part Number	Description
1	6K254	RH hydraulic timing chain tensioner
2	-	RH hydraulic timing chain tensioner washer
3	6529	Camshaft roller follower (6 required)
4	6C501	Hydraulic lash adjuster
5	6518	Valve spring retainer key (12 required)
6	6A536	Valve spring retainer (6 required)
7	6513	Valve spring (6 required)
8	6571	Valve seal (6 required)
9	6M276	RH camshaft sprocket bolt
10	6256	RH camshaft sprocket
11	W702341	Camshaft bearing cap bolt (8 required)
12	6A258	Camshaft bearing cap (4 required)
13	6250	RH camshaft

Valve Train Components - LH

Item	Part Number	Description
1	6K254	LH hydraulic timing chain tensioner
2	-	LH hydraulic timing chain tensioner washer
3	6529	Camshaft roller follower (6 required)
4	6C501	Hydraulic lash adjuster
5	6518	Valve spring retainer key (12 required)
6	6A536	Valve spring retainer (6 required)
7	6513	Valve spring (6 required)
8	6571	Valve seal (6 required)
9	6M276	LH camshaft sprocket bolt
10	6M267	LH camshaft sprocket
11	W702341	Camshaft bearing cap bolt (8 required)
12	6A258	Camshaft bearing cap (4 required)
13	6A274	LH camshaft

1. For additional information, refer to the procedures in this section.

Camshafts

Special Tool(s)

 ST1776-A	Adapter for 303-564 303-578 (T97T-6256-A) or equivalent
 ST1780-A	Extension, Torque Wrench 303-575 (T97T-6256-F) or equivalent
 ST1777-A	Holding Tool, Camshaft Sprocket 303-564 (T97T-6256-B) or equivalent
 ST1781-A	Socket, Camshaft Sprocket Nut 303-565 (T97T-6256-G)
 ST1775-A	Timing Tool, Crankshaft TDC 303-573 (T97T-6303-A) or equivalent

Material

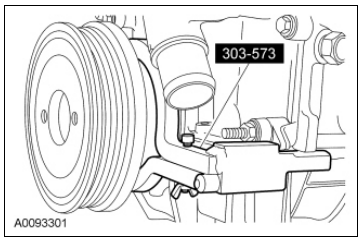
Item	Specification
Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil XO-5W30-QSP (US); Motorcraft® SAE 5W-30 Super Premium Motor Oil CXO-5W30-LSP12 (Canada); or equivalent	WSS-M2C929-A

Removal

Both sides

1. Remove the camshaft roller followers. For additional information, refer to Camshaft Roller Follower in this section.

2. Remove the nut and position the wiring harness bracket aside.

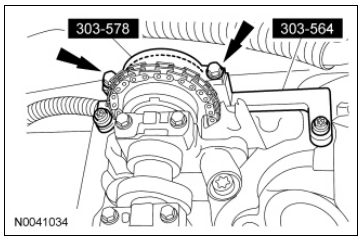


3. **NOTE:** Carry out the RH and LH camshaft timing procedure when either camshaft is serviced.

   Rotate the crankshaft clockwise to position the No. 1 cylinder at Top Dead Center (TDC).

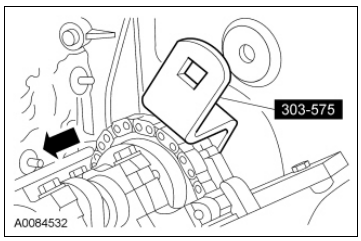
4. ***NOTICE:*** **Do not rotate the engine counterclockwise. Rotating the engine counterclockwise will result in damage to the damper crankshaft sensor speed wheel and incorrect timing of the engine.**

NOTE: The Crankshaft TDC Timing Tool must be installed on the damper and should contact the engine block. This positions the piston at TDC .



Install the Crankshaft TDC Timing Tool.

RH side

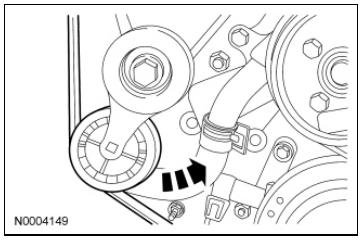


5. Remove the RH hydraulic timing chain tensioner.
   - Discard the washer.

6. Install the Camshaft Sprocket Holding Tool and the Adapter for 303-564 on the rear of the RH cylinder head and tighten the top 2 clamp bolts to 10 Nm (89 lb-in).

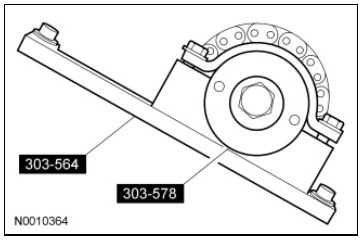
7. ***NOTICE:*** **The RH camshaft sprocket bolt is a LH-threaded bolt. Turning the bolt in the wrong direction can damage the bolt.**

   Using the Torque Wrench Extension and the Camshaft Sprocket Nut Socket, loosen the camshaft sprocket bolt.



8. Remove the bolt and position the camshaft sprocket aside.

LH side

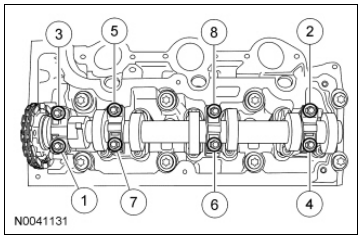


9. Remove the LH hydraulic timing chain tensioner.
   - Discard the washer.

10. Rotate the accessory drive belt tensioner counterclockwise and detach the accessory drive belt from the A/C compressor and power steering pump pulleys.

11. Remove the bolts and position the A/C compressor and power steering pump bracket aside.

12. Install the Camshaft Sprocket Holding Tool and the Adapter for 303-564 on the front of the LH camshaft and tighten the 2 top clamp bolts to 10 Nm (89 lb-in).



13. Remove the bolt and position the camshaft sprocket aside.

Both sides

14. **NOTE:** Mark the position of the camshaft bearing caps so they can be installed in their original positions.

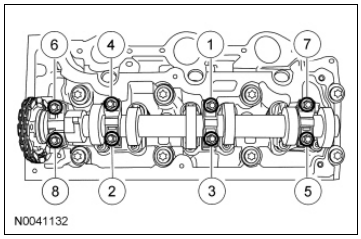
    Remove the 8 bolts for each set of camshaft bearing caps in the sequence shown and remove the camshaft bearing caps.

15. Remove the camshaft.

Installation

NOTE: Lubricate the camshaft journal bearing surfaces on the cylinder head, the camshaft journals and the camshaft bearing caps with clean engine oil.

Both sides



1. Install the camshaft.

2. **NOTE:** The camshaft bearing caps must be installed in their original positions.

   NOTE: After installing the bolts, check the camshaft for free rotation.

   Position the camshaft bearing caps and the 8 bolts for each set of camshaft bearing caps.

- Tighten the bolts in the sequence shown in 2 stages.
  - ♦ Stage 1: Tighten to 6 Nm (53 lb-in).
  - ♦ Stage 2: Tighten to 16 Nm (142 lb-in).

RH side

3. ***NOTICE:*** **The camshaft gear must turn freely on the camshaft. DO NOT tighten the bolt at this time. Tightening the bolt may result in incorrect engine timing.**

   NOTICE: **The RH camshaft sprocket bolt is a LH-threaded bolt. Turning the bolt in the wrong direction can damage the bolt.**

   Install the camshaft sprocket and loosely install the bolt.

LH side

4. ***NOTICE:*** **The camshaft gear must turn freely on the camshaft. DO NOT tighten the bolt at this time. Tightening the bolt may result in incorrect engine timing.**

   Install the camshaft sprocket and loosely install the bolt.

Both sides

5. Time the camshafts. For additional information, refer to Camshaft Timing in this section.

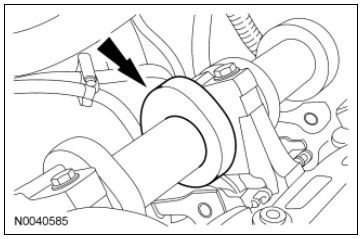
Camshaft Roller Follower

Special Tool(s)

 ST1330-A	Compressor, Valve Spring 303-581 (T97T-6565-A)

Material

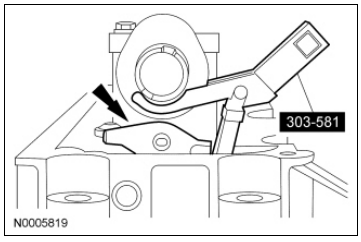
Item	Specification
Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil XO-5W30-QSP (US); Motorcraft® SAE 5W-30 Super Premium Motor Oil CXO-5W30-LSP12 (Canada); or equivalent	WSS-M2C929-A



Removal and Installation

1. Remove the LH and RH valve covers. For additional information, refer to Valve Cover - RH and Valve Cover - LH in this section.

2. Remove the fuel rail. For additional information, refer to Section 303-04A .



3. Remove the cooling fan. For additional information, refer to Section 303-03 .

4. Rotate the crankshaft until the camshaft for the cylinder being serviced is at base circle.

5. **NOTE:** Mark each camshaft roller follower to make sure it is returned to its original position.

   Using the Valve Spring Compressor, remove the camshaft roller followers.

6. **NOTE:** The camshaft roller followers must be installed in their original positions.

   NOTE: Lubricate the camshaft roller followers with clean engine oil.

   To install, reverse the removal procedure.

Valve Springs

Special Tool(s)

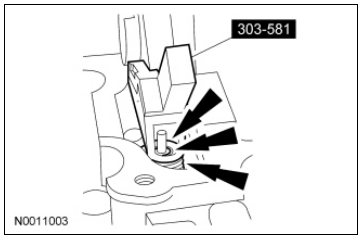
 ST1330-A	Compressor, Valve Spring 303-581 (T97T-6565-A)

Material

Item	Specification
Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil XO-5W30-QSP (US); Motorcraft® SAE 5W-30 Super Premium Motor Oil CXO-5W30-LSP12 (Canada); or equivalent	WSS-M2C929-A

Removal and Installation

1. Remove the camshaft roller followers. For additional information, refer to Camshaft Roller Follower in this section.



2. Position the piston of the cylinder being serviced at Top Dead Center (TDC).

3. ***NOTICE:*** **If air pressure has forced the piston to the bottom of the cylinder, any loss of air pressure will allow the valve to fall into the cylinder. If air pressure must be removed, support the valve prior to removal.**

   Hold the valves in the cylinder head.

   - Remove the spark plug of the cylinder being serviced.
   - Use a suitable tool to apply air pressure to the cylinder.

4. Using the Valve Spring Compressor, remove the valve spring retainer keys, the valve spring retainers and the valve springs.

5. **NOTE:** Lubricate the valve springs, the retainers and the retainer keys with clean engine oil.

   To install, reverse the removal procedure.

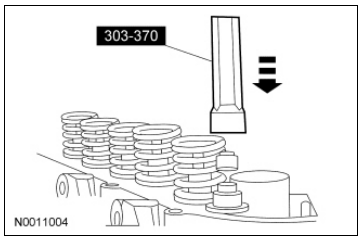
Valve Seals

Special Tool(s)

 ST1824-A	Installer, Valve Stem Seal 303-370 (T90T-6571-A)

Material

Item	Specification
Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil XO-5W30-QSP (US); Motorcraft® SAE 5W-30 Super Premium Motor Oil CXO-5W30-LSP12 (Canada); or equivalent	WSS-M2C929-A



Removal

1. Remove the valve springs. For additional information, refer to Valve Springs in this section.
2. Remove the valve seals.

Installation

1. **NOTE:** Lubricate the valve seals with clean engine oil.

   Using the Valve Stem Seal Installer, install the valve seal.

2. Install the valve springs. For additional information, refer to Valve Springs in this section.

Hydraulic Lash Adjuster

Material

Item	Specification
Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil XO-5W30-QSP (US); Motorcraft® SAE 5W-30 Super Premium Motor Oil CXO-5W30-LSP12 (Canada); or equivalent	WSS-M2C929-A

Removal and Installation

1. Remove the camshaft roller followers. For additional information, refer to Camshaft Roller Follower in this section.

2. **NOTE:** Mark each hydraulic lash adjuster to make sure it is returned to its original position.

   Remove the hydraulic lash adjusters.

3. **NOTE:** The hydraulic lash adjusters must be installed in their original positions.

   NOTE: Lubricate the hydraulic lash adjusters with clean engine oil.

   To install, reverse the removal procedure.

Exhaust Manifold - LH

Item	Part Number	Description
1	W701706	Exhaust manifold-to-dual converter Y-pipe nuts (4 required)
2	5F250	Dual converter Y-pipe
3	W701706	LH exhaust manifold nut (6 required)
4	9431	LH exhaust manifold
5	9448	LH exhaust manifold gasket
6	W705495	LH exhaust manifold stud (6 required)

Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

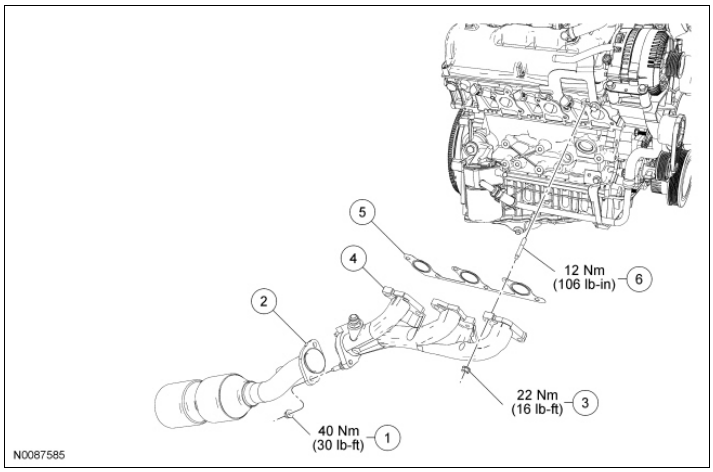
2. Remove the 4 exhaust manifold-to-dual converter Y-pipe nuts and position the dual converter Y-pipe aside.
   - Discard the nuts.

3. Remove the 6 nuts, the LH exhaust manifold and the gasket.
   - Discard the nuts and the gasket.

4. Remove and discard the 6 LH exhaust manifold studs.

Installation

1. Inspect the LH exhaust manifold gasket surfaces for flatness. For additional information, refer to Section 303-00 .



2. Install 6 new LH exhaust manifold studs.
   - Tighten to 12 Nm (106 lb-in).

3. Position a new gasket, the LH exhaust manifold and install 6 new nuts.

- Tighten to 22 Nm (16 lb-ft).

4. Position the dual converter Y-pipe and install 4 new nuts.
   - Tighten to 40 Nm (30 lb-ft).

Exhaust Manifold - RH

Item	Part Number	Description
1	W701706	Exhaust manifold-to-dual converter Y-pipe nut (4 required)
2	5F250	Dual converter Y-pipe
3	W701706	RH exhaust manifold nut (6 required)
4	9430	RH exhaust manifold
5	9448	RH exhaust manifold gasket
6	W705495	RH exhaust manifold stud (6 required)

Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the EGR tube. For additional information, refer to Section 303-08 .

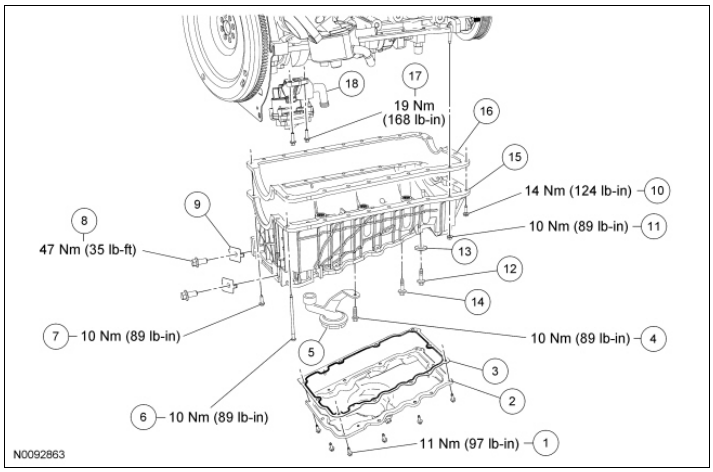
3. Remove the 4 exhaust manifold-to-dual converter Y-pipe nuts and position the dual converter Y-pipe aside.
   - Discard the nuts.

4. Remove the 6 nuts, the RH exhaust manifold and the gasket.
   - Discard the nuts and the gasket.

5. Remove and discard the 6 RH exhaust manifold studs.

Installation

1. Inspect the RH exhaust manifold gasket surfaces for flatness. For additional information, refer to Section 303-00 .



2. Install 6 new RH exhaust manifold studs.
   - Tighten to 12 Nm (106 lb-in).

3. Position a new gasket, the RH exhaust manifold and install 6 new nuts.
    - Tighten to 22 Nm (16 lb-ft).

4. Position the dual converter Y-pipe and install 4 new nuts.
    - Tighten to 40 Nm (30 lb-ft).

5. Install the EGR tube. For additional information, refer to Section 303-08 .

Engine Lubrication Components - Exploded View

Item	Part Number	Description
1	E802185	Oil pan bolt (10 required)
2	6675	Oil pan
3	6710-A	Oil pan gasket
4	W500214	Oil pump screen and pickup tube bolt
5	6617	Oil pump screen and pickup tube
6	E804588	Cylinder block cradle Torx bolt
7	W709198-S437	Cylinder block cradle Torx bolt
8	E802185	Transmission-to-cylinder block cradle bolt (2 required)
9	6C629	Bell housing-to-cylinder block cradle spacer (2 required)
10	W503275	Cylinder block cradle bolt (outside) (20 required)
11	E822125	Cylinder block cradle nut (2 required)
12	W702323	Cylinder block cradle bolt (inside) (2 required)
13	6734	Washer (2 required)
14	W702323	Cylinder block cradle bolt (inside) (6 required)
15	6F092	Cylinder block cradle
16	6710	Cylinder block cradle gasket
17	W708582	Oil pump bolt (2 required)
18	6600	Oil pump

1. For additional information, refer to the procedures in this section.

Oil Pan

Material

Item	Specification
Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil XO-5W30-QSP (US); Motorcraft® SAE 5W-30 Super Premium Motor Oil CXO-5W30-LSP12 (Canada); or equivalent	WSS-M2C929-A

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

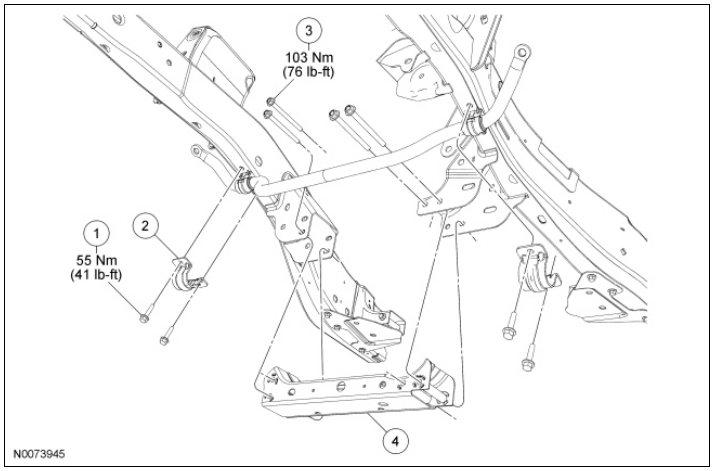
2. Remove the drain plug and drain the engine oil.
   - To install, tighten to 26 Nm (19 lb-ft).

3. Remove the 10 bolts, the oil pan and the gasket. Discard the gasket.
   - To install, tighten to 11 Nm (97 lb-in).

4. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of the old oil pan gasket.**

   Clean and inspect the sealing surfaces.

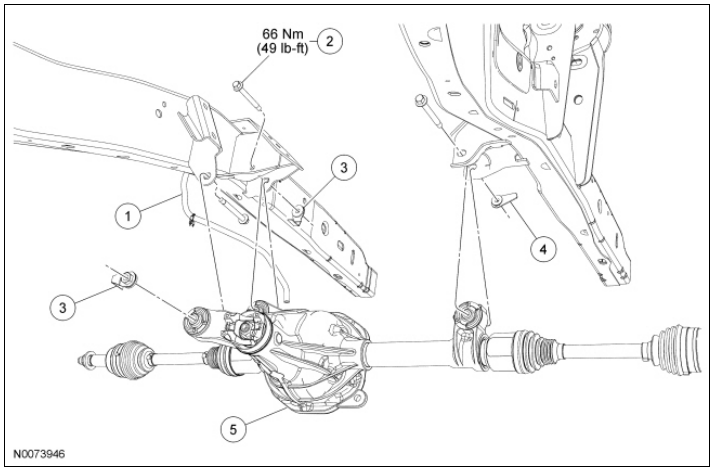
5. To install, reverse the removal procedure.



6. Fill the engine with clean engine oil.

Cylinder Block Cradle

Material



Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	-
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4
Motorcraft® Silicone Gasket Remover ZC-30	-

Stabilizer Bar and Crossmember

Item	Part Number	Description
1	W707472	Stabilizer bar bracket bolt (4 required)
2	3B353	Stabilizer bar bracket (2 required)
3	5D120	Crossmember bolt (4 required)
4	5E138	Crossmember

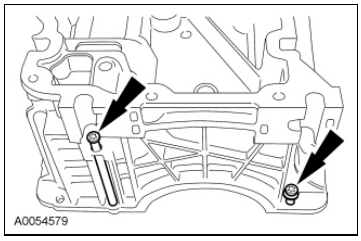
Front Axle - Four-Wheel Drive (4WD) Vehicles

Item	Part Number	Description
1	3B476	Axle housing vent hose
2	W506549	Axle housing bolt (3 required)
3	W706348	Axle housing flagnuts (2 required)
4	W708348	Axle housing flagnut
5	3002	Axle housing

Removal

All vehicles

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
3. Remove the starter. For additional information, refer to Section 303-06 .
4. Remove the oil pump screen and pickup tube. For additional information, refer to Oil Pump Screen and Pickup Tube in this section.



All-Wheel Drive (AWD) vehicles

5. Remove the 4 bolts and the 2 stabilizer bar brackets.
6. Remove the 4 bolts and the crossmember.

All vehicles

7. Remove the 2 transmission-to-cylinder block cradle bolts.
8. **NOTE:** Cylinder block cradle is shown removed for clarity. Note the location of the 2 Torx head bolts at the rear of the cylinder block cradle.

   Remove the 2 cylinder block cradle rear bolts.

9. Remove the 20 bolts and 2 nuts along the outside of the cylinder block cradle.

10. **NOTE:** Note the location of the 2 silver-colored bolts that have washer seals. They must be installed in the same position with new washer seals.

    Remove the 8 cylinder block cradle inner bolts and the 2 washer seals.

    - Discard the washer seals.

AWD vehicles

11. ⚠ **WARNING: Secure the assembly to the jack. Avoid any obstructions while lowering and raising the jack. Contact with obstructions may cause the assembly to fall off the jack, which may result in serious personal injury.**

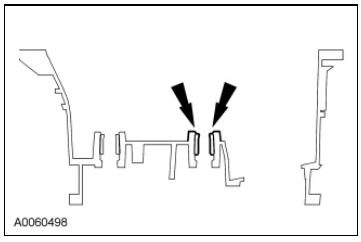
    Support the front axle with a suitable transmission jack.

12. Disconnect the vent hose from the axle housing vent tube.

13. ***NOTICE:*** **Any time bolts, washers, spacers or nuts are loosened in the axle housing for any reason, install new components to prevent damage.**

    Remove and discard the 3 axle housing bolts and 3 flagnuts. Lower the axle.

All vehicles



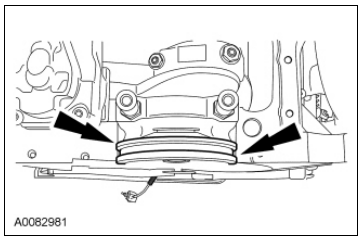
14. Remove the cylinder block cradle.

Installation

All vehicles

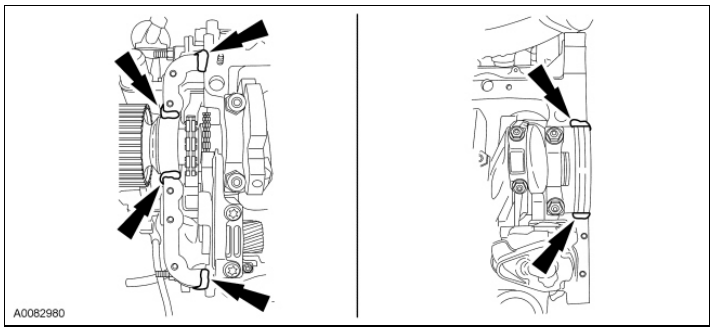
1. ***NOTICE:*** **Failure to back off the set screws may result in damage to the cylinder block cradle.**

   Back the set screws off until they are below the cylinder block cradle boss.



2. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of the old cylinder block cradle gasket and**

sealant.



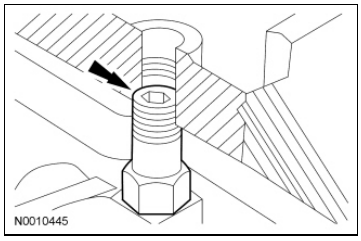
NOTE: Gasket material as well as silicone sealant may be present in the cavities in the main bearing cap. This material must be removed completely prior to assembly.

Clean the gasket mating surfaces, making sure all the sealant is removed from the cavities on the rear main bearing cap. To clean the sealing area, use a plastic scraping tool, silicone gasket remover and metal surface prep. Follow the directions on the packaging.

3. **NOTE:** If not secured within 4 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Follow the directions on the packaging. Failure to follow this procedure may cause future oil leakage.

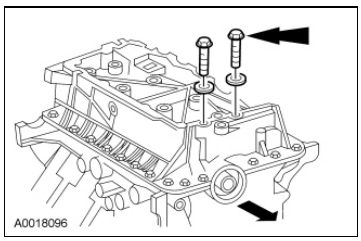
   Apply silicone in the 6 places shown.

4. Position a new gasket and the cylinder block cradle. Install the outer 20 bolts and 2 nuts finger-tight.



5. Install the 2 cylinder block cradle rear Torx bolts finger-tight.

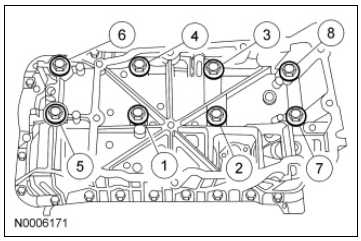
6. Install the 2 transmission-to-cylinder block cradle bolts.
   - Tighten to 47 Nm (35 lb-ft).



7. Tighten the outer 20 bolts and 2 nuts.
   - Tighten the nuts to 10 Nm (89 lb-in).
   - Tighten the bolts to 14 Nm (124 lb-in).

8. Tighten the 2 cylinder block cradle rear Torx bolts.
   - Tighten to 10 Nm (89 lb-in).

9. Tighten the 8 inserts.
   - Tighten to 3 Nm (27 lb-in).



10. Install the 2 silver-colored bolts and new washer seals finger-tight.

11. Install the 6 remaining inner bolts finger-tight.

12. Tighten the 8 inner bolts in the sequence shown in 2 stages.
    - Stage 1: Tighten to 15 Nm (133 lb-in).
    - Stage 2: Tighten to 34 Nm (25 lb-ft).

AWD vehicles

13. ***NOTICE:*** **Any time bolts, washers, spacers or nuts are loosened in the axle housing for any reason, install new components to prevent damage.**

    Raise the axle housing into position and install 3 new bolts and nuts.

    - Tighten to 66 Nm (49 lb-ft).

14. Connect the vent hose to the differential housing vent tube.

15. Position the crossmember and install the 4 bolts.
    - Tighten to 103 Nm (76 lb-ft).

16. Position the 2 stabilizer bar brackets and install the 4 bolts.
    - Tighten to 55 Nm (41 lb-ft).

All vehicles

17. Install the oil pump screen and pickup tube. For additional information, refer to Oil Pump Screen and Pickup Tube in this section.

18. Install the starter. For additional information, refer to Section 303-06 .

19. Connect the battery ground cable. For additional information, refer to Section 414-01 .

Oil Pump

Material

Item	Specification
Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil XO-5W30-QSP (US); Motorcraft® SAE 5W-30 Super Premium Motor Oil CXO-5W30-LSP12 (Canada); or equivalent	WSS-M2C929-A

1. Remove the cylinder block cradle. For additional information, refer to Cylinder Block Cradle in this section.

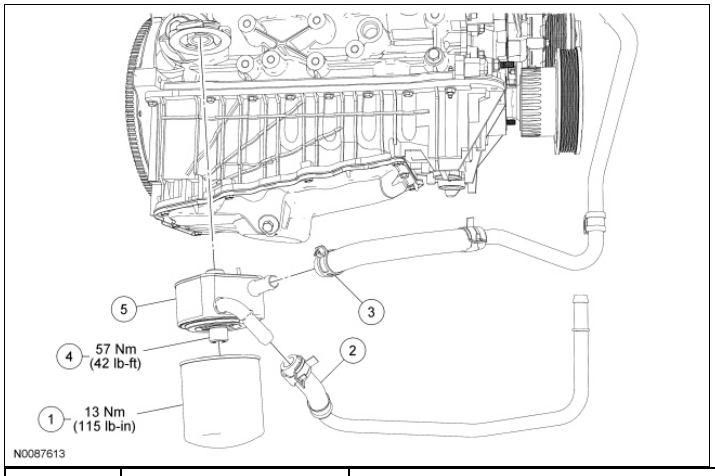
2. Remove the 2 bolts and the oil pump.
   - To install, tighten to 19 Nm (168 lb-in).

3. To install, reverse the removal procedure.
   - Lubricate the oil pump with clean engine oil.

Oil Pump Screen and Pickup Tube

Removal and Installation

1. Remove the oil pan. For additional information, refer to Oil Pan in this section.



2. Remove the bolt and the oil pump screen and pickup tube.
   - To install, tighten to 10 Nm (89 lb-in).

3. To install, reverse the removal procedure.

Oil Cooler

Material

Item	Specification
Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil XO-5W30-QSP (US); Motorcraft® SAE 5W-30 Super Premium Motor Oil CXO-5W30-LSP12 (Canada); or equivalent	WSS-M2C929-A

Item	Part Number	Description
1	6714	Oil filter
2	6N867	Oil cooler inlet hose
3	84947	Heater hose
4	-	Oil cooler threaded insert (part of 6A642)
5	6A642	Oil cooler

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

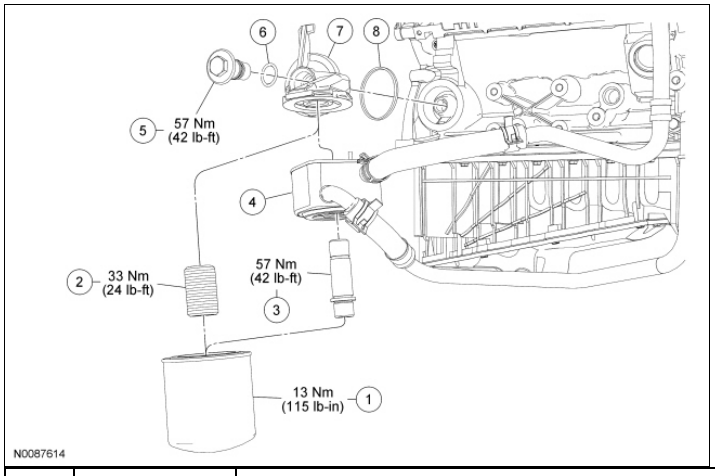
2. Drain the cooling system. For additional information, refer to Section 303-03 .

3. Remove and discard the oil filter.
   - To install, tighten to 13 Nm (115 lb-in).

4. Disconnect the oil cooler inlet hose from the oil cooler.

5. Disconnect the heater hose from the oil cooler.

6. Loosen the threaded insert and remove the oil cooler.



- To install, tighten to 57 Nm (42 lb-ft).

7. To install, reverse the removal procedure.
   - Install a new oil filter.
   - Check the engine oil and fill as necessary.

Oil Filter Adapter

Material

Item	Specification
Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil XO-5W30-QSP (US); Motorcraft® SAE 5W-30 Super Premium Motor Oil CXO-5W30-LSP12 (Canada); or equivalent	WSS-M2C929-A

Item	Part Number	Description
1	6714	Oil filter
2	6890	Oil filter adapter threaded insert (vehicles without an oil cooler)
3	-	Oil cooler threaded insert (part of 6A642) (oil cooler equipped vehicles only)
4	6A642	Oil cooler (oil cooler equipped vehicles only)
5	6895	Oil filter adapter bolt
6	E853188	Oil filter adapter bolt O-ring seal
7	6884	Oil filter adapter
8	6L621	Oil filter adapter gasket

Removal and Installation

All vehicles

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the RH exhaust manifold. For additional information, refer to Exhaust Manifold - RH in this section.

3. Remove and discard the oil filter.
   - To install, tighten to 13 Nm (115 lb-in).

Vehicles equipped with an oil cooler

4. **NOTE:** The oil cooler threaded insert is part of the oil cooler and is not removed.

   Loosen the oil cooler threaded insert and position the oil cooler aside.

   - To install, tighten to 57 Nm (42 lb-ft).

All vehicles

5. Remove the bolt and the oil filter adapter.
   - To install, tighten to 57 Nm (42 lb-ft).

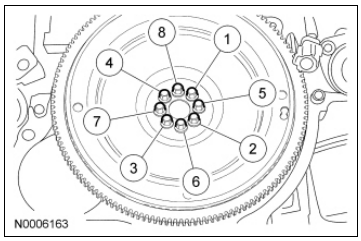
6. To install, reverse the removal procedure.
   - Install a new oil filter.
   - Check the engine oil and fill as necessary.

Flexplate

Item	Part Number	Description
1	6379	Flexplate bolt (8 required)
2	6375	Flexplate

Removal

1. Remove the transmission. For additional information, refer to Section 307-01A .



2. Remove the 8 bolts and the flexplate.
   - Discard the bolts.

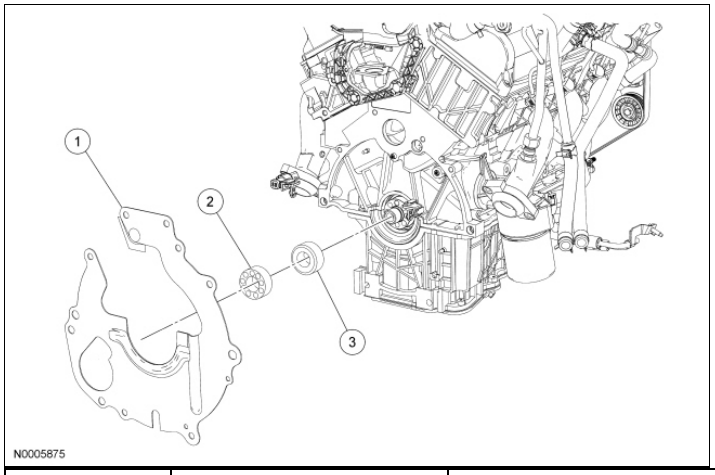
Installation

1. **NOTE:** New flexplate bolts must be installed. They are a torque-to-yield design and cannot be reused.

   Install the flexplate. Tighten the 8 new bolts in 3 stages in the sequence shown.

   - Stage 1: Tighten to 13 Nm (115 lb-in).
   - Stage 2: Tighten to 50 Nm (37 lb-ft).
   - Stage 3: Tighten an additional 90 degrees.

2. Install the transmission. For additional information, refer to Section 307-01A .



Crankshaft Rear Seal

Special Tool(s)

 ST3078-A	Adapter for 303-579 303-527 (T95T-6701-A3)
 ST2132-A	Installer, Crankshaft Rear Oil Seal 303-579 (T97T-6701-A)
 ST1385-A	Remover, Oil Seal 303-409 (T92C-6700-CH)
 ST3077-A	Screws, Crankshaft Rear Oil Seal 303-528 (T95T-6701-A4)

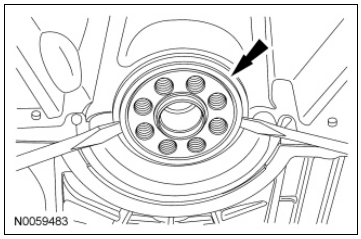
Material

Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	-
Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil XO-5W30-QSP (US); Motorcraft® SAE 5W-30 Super Premium Motor Oil CXO-5W30-LSP12 (Canada); or equivalent	WSS-M2C929-A

Item	Part Number	Description
1	6A373	Spacer plate
2	6434	Flexplate-to-crankshaft spacer

3	6701	Crankshaft rear seal

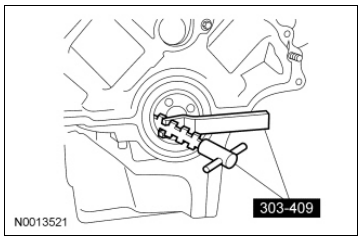
Removal



1. Remove the flexplate. For additional information, refer to Flexplate in this section.

2. Remove the spacer plate.

3. Remove the flexplate-to-crankshaft spacer.

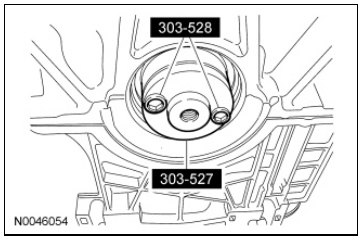


4. **NOTE:** The original crankshaft rear seal does not have a metal speedy sleeve. Replacement rear crankshaft seals come with a speedy sleeve. If present, this sleeve must be removed before attempting to remove the seal.

   If necessary, remove the speedy sleeve using 2 screwdrivers or small pry bars.

5. ***NOTICE:*** **Avoid scratching or damaging the crankshaft rear seal running surface during removal of the crankshaft rear seal. Scratches or other damage to the crankshaft may cause oil leaks.**

   Using the Oil Seal Remover, remove the crankshaft rear seal.

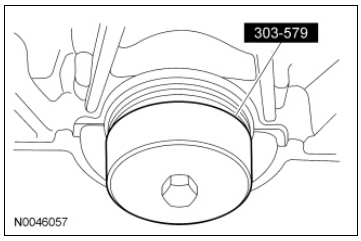


Installation

1. **NOTE:** The new replacement crankshaft rear seal comes with a speedy sleeve. The speedy sleeve must be installed with the crankshaft rear seal.

   NOTE: Be sure the crankshaft rear sealing surface is clean and free of any rust or corrosion. To clean the crankshaft rear seal surface area, use extra-fine emery cloth or extra-fine 0000 steel wool with metal surface prep.

   Lubricate the crankshaft rear oil seal with clean engine oil.



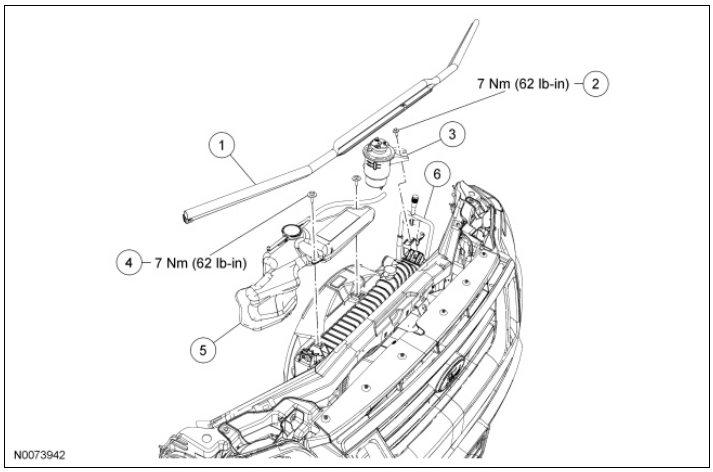
2. Install the Adapter for 303-579 and the Crankshaft Rear Oil Seal Screws.

3. Position the crankshaft rear seal with speedy sleeve on the Adapter for 303-579 and the Crankshaft Rear Oil Seal Screws.

4. Using the Crankshaft Rear Oil Seal Installer, install the crankshaft rear seal with speedy sleeve.

5. Install the flexplate-to-crankshaft spacer.

6. Install the spacer plate.



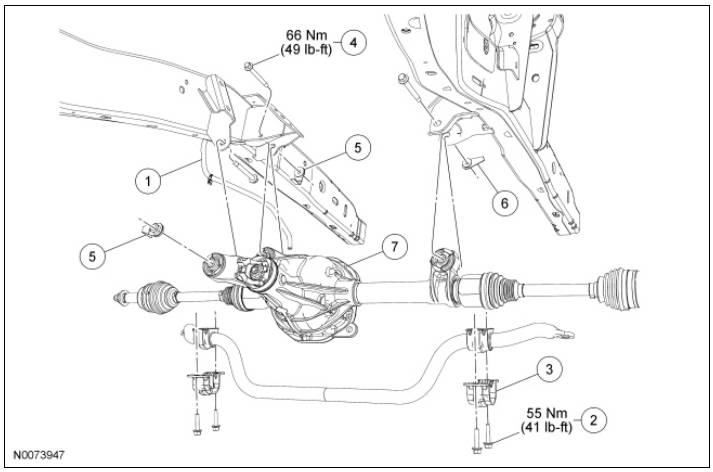
7. Install the flexplate. For additional information, refer to Flexplate in this section.

Engine Support Insulators

Special Tool(s)

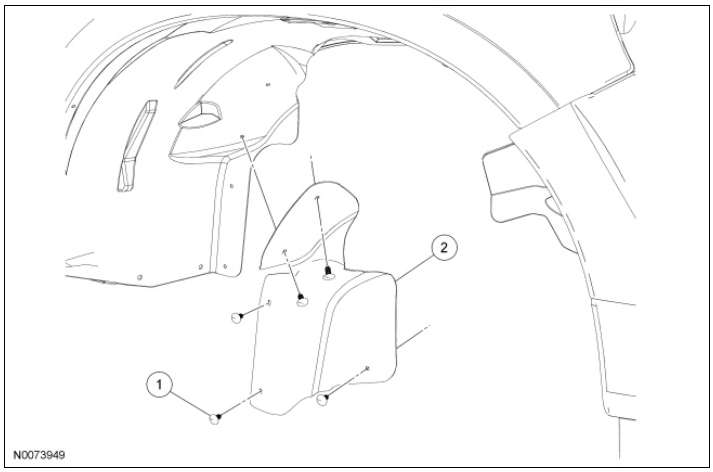
 ST2378-A	Adapter for 303-290A 303-290-01
 ST2379-A	Adapter for 303-290A 303-290A-03A
 ST1595-A	Lifting Bracket, Engine 303-050 (T70P-6000)
 ST2363-A	Support Bar, Engine 303-290A

Front End Components



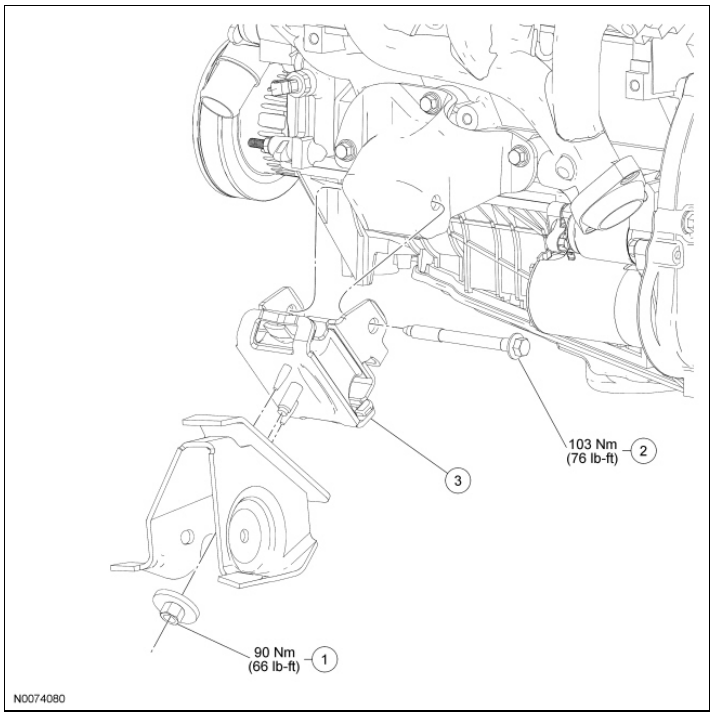
Item	Part Number	Description
1	16C824	Weatherstrip
2	W503924	Power steering fluid reservoir bolt
3	3R700	Power steering fluid reservoir
4	W709027	Coolant expansion tank bolt (2 required)
5	8C045	Coolant expansion tank
6	19972	A/C tube

Upper Cooling Fan Shroud



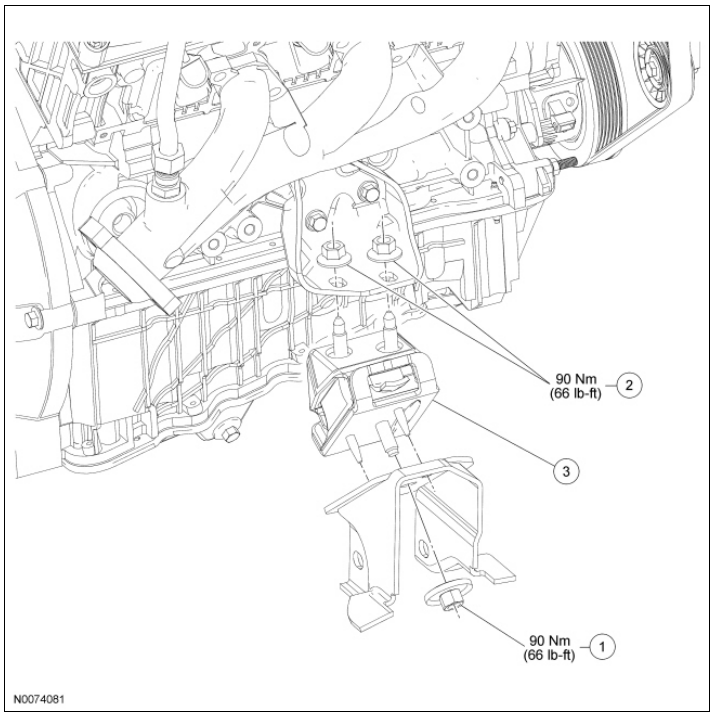
Item	Part Number	Description
1	W713417	Upper cooling fan shroud bolt (2 required)
2	8K618	Upper cooling fan shroud

Front Axle - Four-Wheel Drive (4WD) Vehicles



Item	Part Number	Description
1	3B476	Axle housing vent hose
2	W707472	Stabilizer bar bracket bolt (4 required)
3	3B353	Stabilizer bar bracket (2 required)
4	W506549	Axle housing bolt (3 required)
5	W706348	Axle housing flagnuts (2 required)
6	W708348	Axle housing flagnut
7	3010	Axle housing

RH Inner Fender Splash Shield



Item	Part Number	Description
1	388577	Inner fender splash shield pushpin (5 required)
2	16034	Inner fender splash shield

Engine Support Insulator - LH

Item	Part Number	Description
1	N802330	LH engine support insulator nut
2	W705694	LH engine support insulator through bolt
3	6038B	LH engine support insulator

Engine Support Insulator - RH

Item	Part Number	Description
1	N802330	RH engine support insulator lower nut
2	N802653	RH engine support insulator upper nuts (2 required)
3	6038A	RH engine support insulator

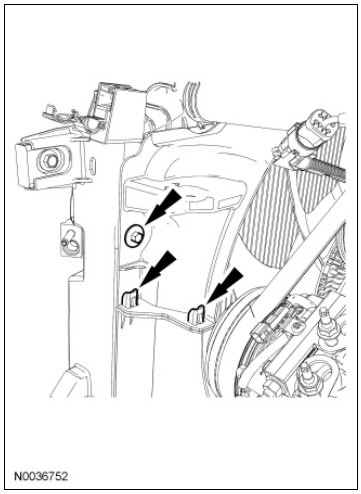
Removal and Installation

All vehicles

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

3. Remove the weatherstrip.

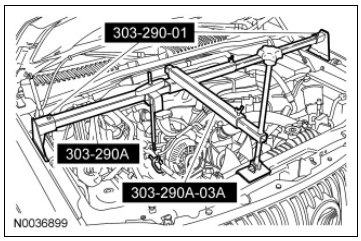


4. Remove the bolt and position the power steering fluid reservoir aside.
   - To install, tighten to 7 Nm (62 lb-in).

5. ***NOTICE:*** **Allow the engine to cool before removing the coolant expansion tank. The radiator draws coolant from the coolant expansion tank as the engine cools. If the coolant expansion tank is removed before the engine cools, the radiator will draw air into the system, resulting in possible engine damage.**

   Disconnect the coolant overflow hose. Remove the 2 bolts and the coolant expansion tank.

   - To install, tighten to 7 Nm (62 lb-in).



6. Remove the 2 bolts, unclip the clips and remove the upper fan shroud.
   - To install, tighten to 7 Nm (62 lb-in).

7. Remove the bolt and install the Engine Lifting Bracket.
    - Tighten to 42 Nm (31 lb-ft).

8. Install the Engine Support Bar and the 2 Adapters for 303-290A.

9. Remove the LH engine support insulator through bolt.
    - To install, tighten to 103 Nm (76 lb-ft).

10. Remove the 5 pushpins and the RH inner fender splash shield.

11. Remove the 3 RH engine support insulator nuts.
    - To install, tighten to 90 Nm (66 lb-ft).

12. Raise the engine approximately 60 mm (2.36 in).

13. Remove the RH engine support insulator.

All-Wheel Drive (AWD) vehicles

14. Remove the 4 bolts and the 2 stabilizer bar brackets. Allow the stabilizer bar to hang freely.
    - To install, tighten to 55 Nm (41 lb-ft).

15. ⚠ **WARNING: Secure the assembly to the jack. Avoid any obstructions while lowering and raising the jack. Contact with obstructions may cause the assembly to fall off the jack, which may result in serious personal injury.**

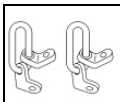
Support the axle housing with a suitable jack.

16. Disconnect the axle housing vent hose from the axle housing vent tube.

17. ***NOTICE:*** **Any time bolts, washers, spacers or nuts are loosened in the axle housing for any reason, install new components to prevent damage.**

    Remove and discard the 3 axle housing bolts and 3 flagnuts. Lower the axle housing approximately 25 mm (1 in).

    - To install, tighten to 66 Nm (49 lb-ft).



All vehicles

18. Remove the nut and the LH engine support insulator.
    - To install, tighten to 90 Nm (66 lb-ft).

19. To install, reverse the removal procedure.

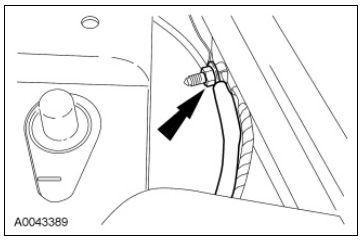
Engine

Special Tool(s)

 ST1595-A	Lifting Bracket, Engine 303-050 (T70P-6000)
 ST2673-A	Spreader Bar 303-D701 or equivalent

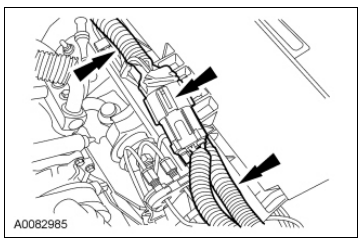
Removal

NOTICE: **Rotating the crankshaft pulley bolt counterclockwise could cause a reduction in clamp load on the crankshaft pulley and timing sprocket, which could cause severe engine damage.**



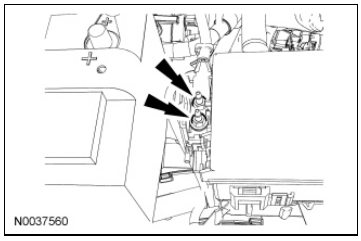
NOTICE: **If the fuel rail is used as a leverage device, it can be damaged. Care must be taken when working around the fuel rail.**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .



2. Disconnect the fuel supply tube spring lock coupling. For additional information, refer to Section 310-00 .

3. Disconnect the battery cables. For additional information, refer to Section 414-01 .



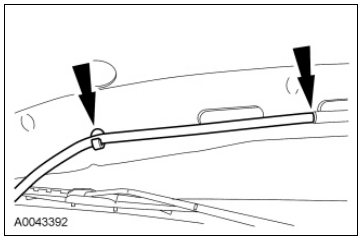
4. Remove the nut and disconnect the ground wire.

A0043389

5. Disconnect the electrical connector and detach the wiring harness retainers.

A0082985

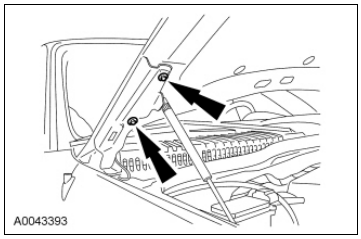
6. Lift the cover, remove the 2 nuts and disconnect the battery cable connector.
   - Lay the wiring harness on top of the engine.



7. Recover the A/C system. For additional information, refer to Section 412-00 .

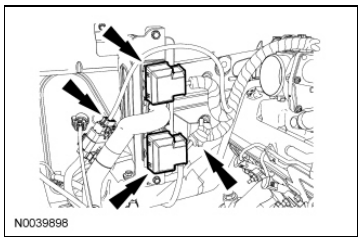
8. Drain the cooling system. For additional information, refer to Section 303-03 .

9. Remove the cooling fan. For additional information, refer to Section 303-03 .



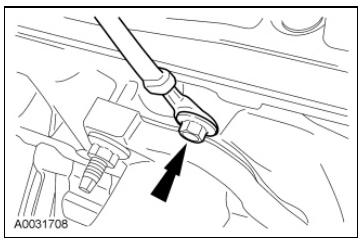
10. Remove the Air Cleaner (ACL) and the ACL outlet pipe. For additional information, refer to Section 303-12 .

11. Disconnect the windshield washer hose.

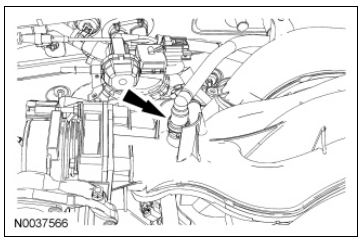


12. **NOTE:** Mark the hinge locations for installation reference.

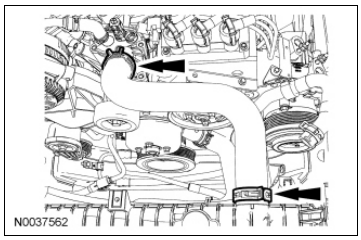
    Remove the 4 bolts and the hood.



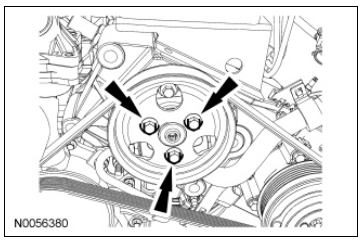
13. Disconnect the wiring harness electrical connector and the engine wiring harness-to-PCM electrical connectors. Detach the wiring harness retainer.



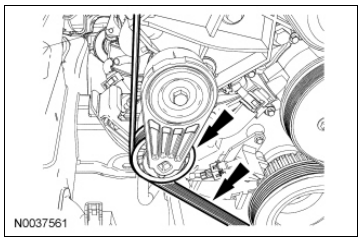
14. Disconnect the heater hoses and the vacuum hose.
    - Disconnect the heater control valve vacuum hose.



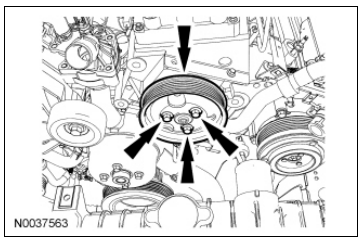
15. Remove the bolt and position the ground wire aside.



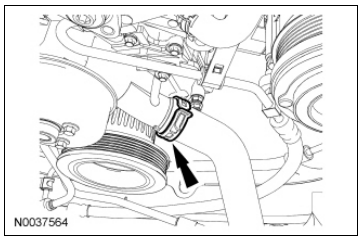
16. Disconnect the Evaporative Emission (EVAP) hose.



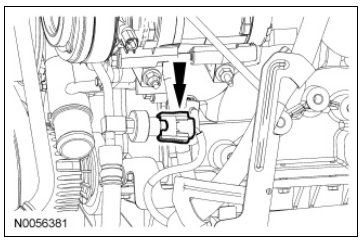
17. Remove the upper radiator hose.



18. Loosen the 3 power steering pump pulley bolts.

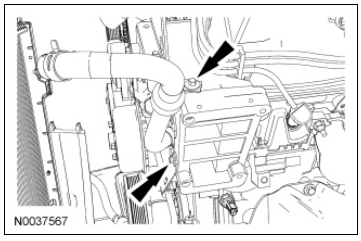


19. Rotate the accessory drive belt tensioner counterclockwise and remove the accessory drive belt.

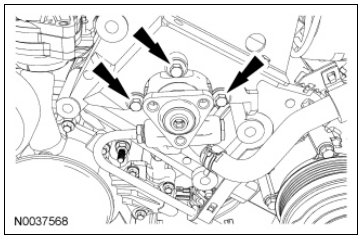


20. Remove the 3 bolts and the power steering pump pulley.

21. Disconnect the lower radiator hose from the coolant pump.

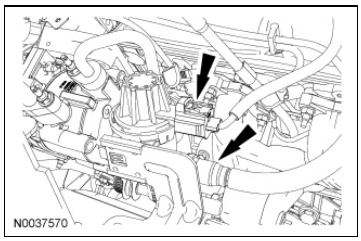


22. Disconnect the Power Steering Pressure (PSP) switch electrical connector.

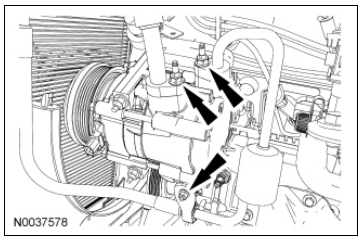


23. **NOTE:** A/C compressor removed from art for clarity.

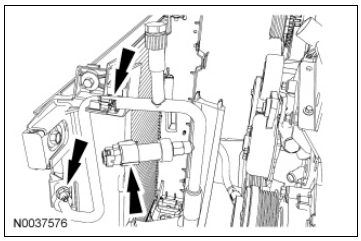
    Remove the PSP hose and the 2 power steering reservoir-to-power steering pump supply hose bracket bolts.



24. Remove the 3 bolts and position the power steering pump aside.

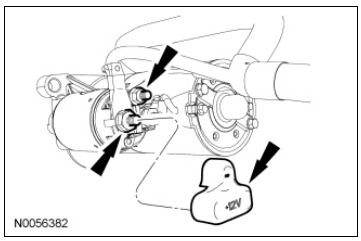


25. Disconnect the brake booster vacuum hose.

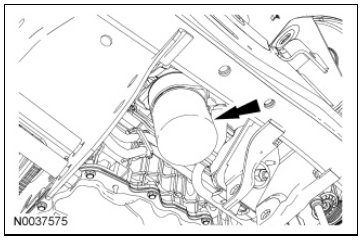


26. Disconnect the EVAP canister purge valve electrical connector. Disconnect and remove the EVAP hose.

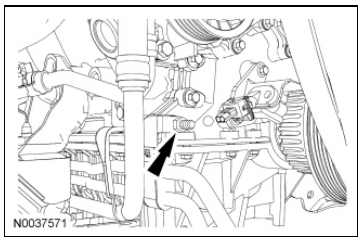
27. Remove the 2 nuts and detach the A/C tubes.



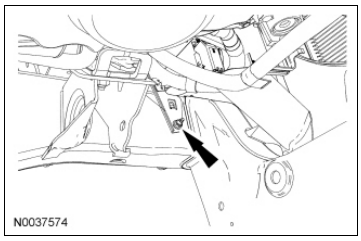
28. Disconnect the A/C high pressure switch, remove the nut, open the retaining clip and remove the A/C tube.



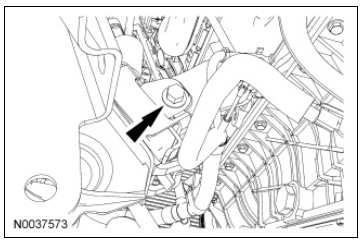
29. Remove the transmission. For additional information, refer to Section 307-01A .



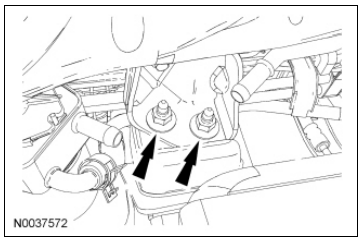
30. Remove the terminal cover. Remove the 2 nuts, detach the wires and remove the starter.



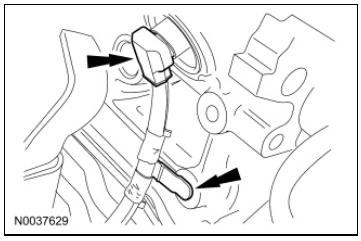
31. Remove the oil filter.



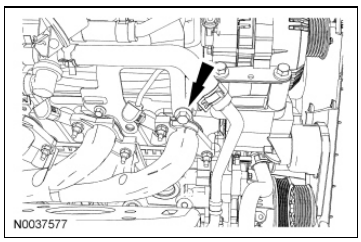
32. Remove the nut and detach the transmission cooler tube bracket.
    - Support the transmission cooler tubes with mechanic's wire.



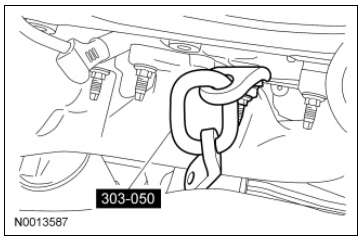
33. Remove the nut and detach the battery cable harness bracket from the frame rail.



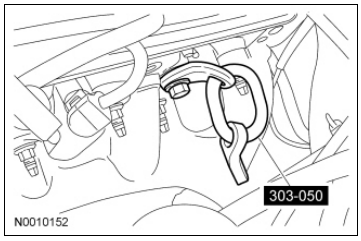
34. Remove the LH engine support insulator through bolt.



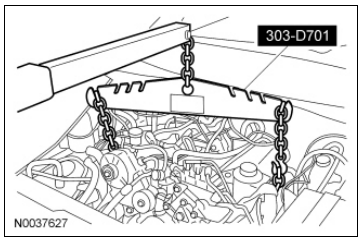
35. Remove the 2 RH engine support insulator nuts.



36. If equipped, disconnect the block heater electrical connector and wiring harness retainer.



37. Remove the heater tube bracket bolt.



38. Install the Engine Lifting Bracket on the RH side of the engine.
    - Tighten to 37 Nm (27 lb-ft).

39. Install the Engine Lifting Bracket on the LH side of the engine.

40. Attach the Spreader Bar and using a suitable floor crane, remove the engine.

Engine

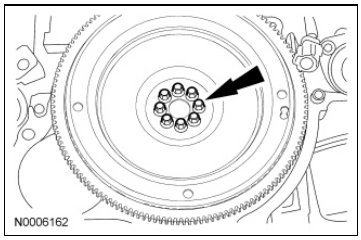
General Equipment

8 mm x 1.25 x 100 mm bolts (2 required)

Material

Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	-

Motorcraft® Silicone Gasket Remover ZC-30	-

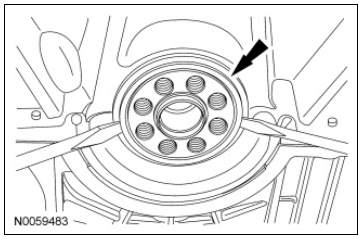


NOTICE: **Remove the cylinder heads before removing the crankshaft. Failure to do so may result in engine damage.**

NOTICE: **If the fuel rail is used as a leverage device, it may be damaged. Care must be taken when working around the fuel rail.**

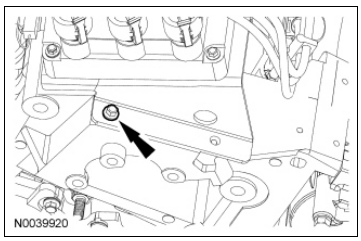
NOTE: During the repair or replacement of fuel-related components, cap, tape or otherwise appropriately protect all liquid and vapor fuel openings to prevent the ingress of dirt or foreign material. Remove all caps, tape and other protective materials prior to installation.

NOTE: For additional information, refer to the exploded views under Engine in the Assembly portion of this section.



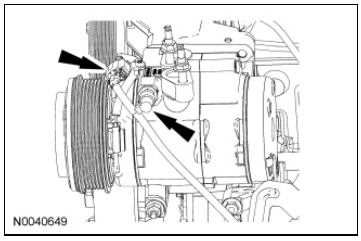
1. Remove the 8 bolts and the flexplate.
   - Discard the bolts.

2. Remove the spacer plate and the flexplate spacer.

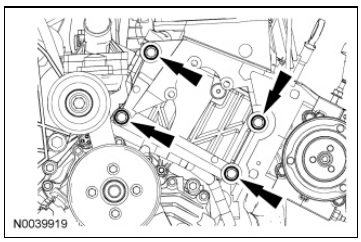


3. **NOTE:** The original crankshaft rear seal does not have a metal speedy sleeve. Replacement crankshaft rear seals come with a speedy sleeve. If present, this sleeve must be removed before attempting to remove the seal.

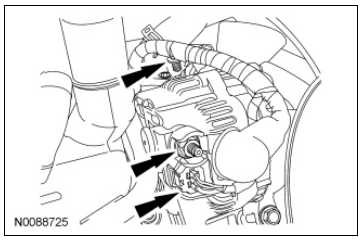
   If necessary, remove the speedy sleeve using 2 screwdrivers or small pry bars.



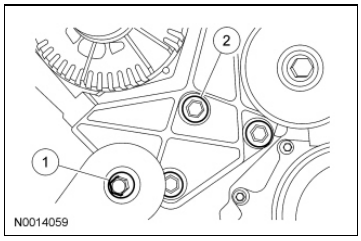
4. Install the engine on a suitable stand. Remove the engine lifting equipment and the Engine Lifting Brackets.



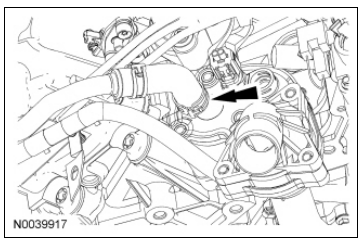
5. Remove the bolt.



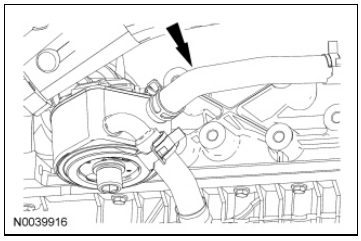
6. Disconnect the A/C compressor electrical connector and wire harness retainer.



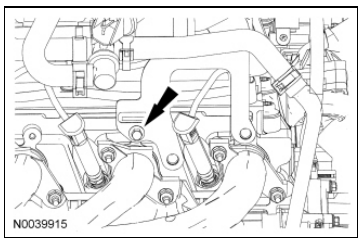
7. Remove the 4 bolts and the A/C compressor and power steering pump bracket.



8. Remove the nut and disconnect the generator B+ cable and the electrical connector and detach the wiring harness retainer.

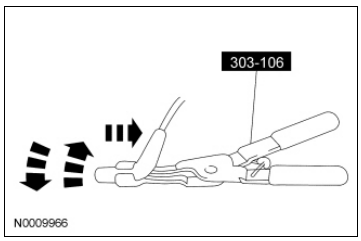


9. Remove the generator mounting bracket.
    1. Remove the bolt and the drive belt tensioner.
    2. Remove the 3 generator mounting bracket bolts.

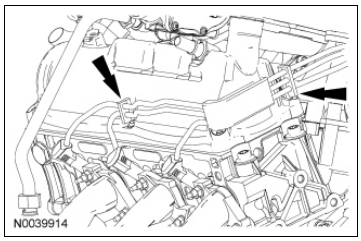


10. Disconnect the heater hose from the thermostat housing.

11. Disconnect the hose from the oil cooler.



12. Remove the bolt, the heater hose tube bracket and the hoses as an assembly.

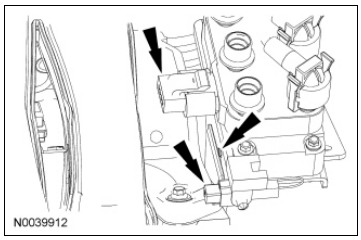


13. ***NOTICE:*** **It is important to twist the spark plug wire boots while pulling upward to avoid possible damage to the spark plug wires.**

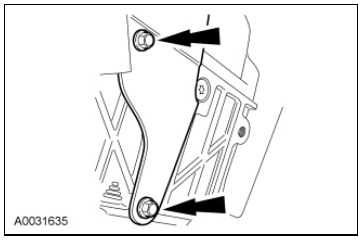
    NOTE: Spark plug wires must be connected to the correct ignition coil terminal. Mark spark plug wire locations before removing them.

    Using the Spark Plug Wire Remover, disconnect the spark plug wires from the spark plugs.

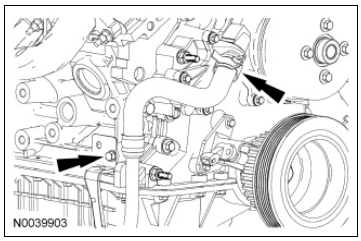
14. Detach the RH spark plug wire retainers.



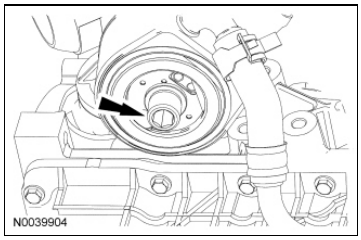
15. Detach the LH spark plug wire retainers.



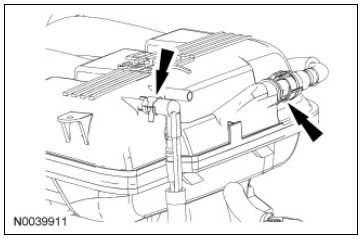
16. **NOTE:** RH spark plug wires removed for clarity.



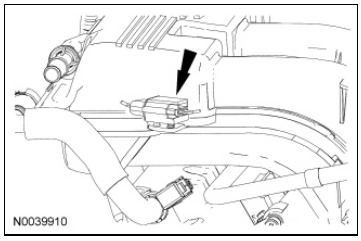
Disconnect the coil and the radio interference capacitor electrical connectors and detach the wiring harness retainer.



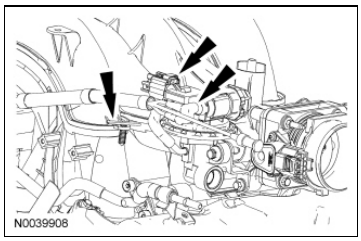
17. Remove the 2 bolts. Remove the coil, bracket and spark plug wires as an assembly.



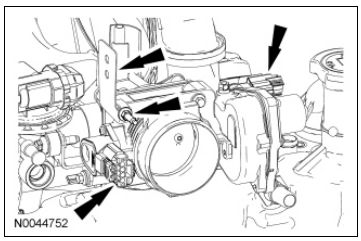
18. Remove the oil cooler hose bracket bolt, if equipped. Disconnect the oil cooler or heater hose.



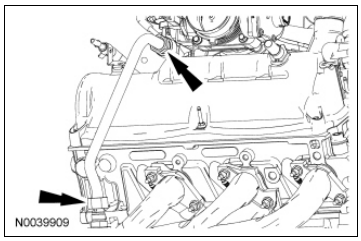
19. If equipped, remove the oil cooler and hose.



20. Disconnect the vacuum and PCV hoses from the intake manifold.

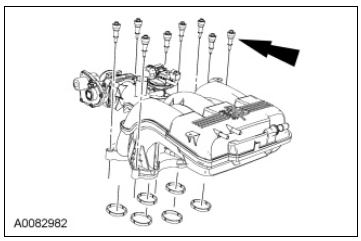


21. Disconnect the Knock Sensor (KS) electrical connector.
    - Detach the wiring harness pin-type retainer.

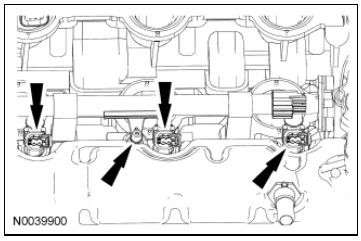


22. Disconnect the EGR system module vacuum hose and electrical connector. Detach the wiring harness pin-type retainer.

23. Disconnect the Electronic Throttle Body (ETB) and Throttle Position (TP) sensor electrical connectors. Remove the nut and detach the wiring harness bracket.

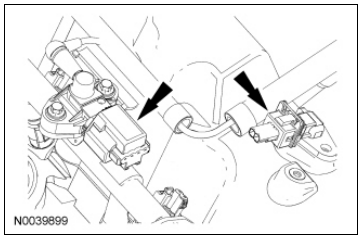


24. Remove the exhaust manifold-to-EGR system module tube.

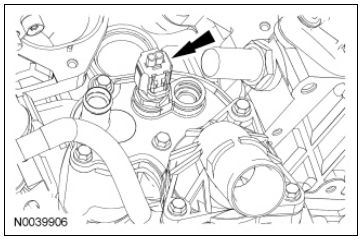


25. ***NOTICE:*** **If the engine is repaired or replaced because of upper engine failure, typically including valve or piston damage, check the intake manifold for metal debris. If metal debris is found, install a new intake manifold. Failure to follow these instructions can result in engine damage.**

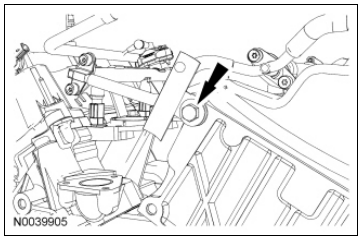
    Remove the 8 bolts and the intake manifold and 6 gaskets.



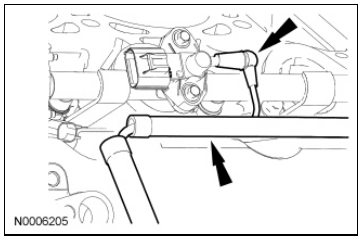
26. Disconnect the 6 fuel injector electrical connectors and detach the wiring harness retainers.



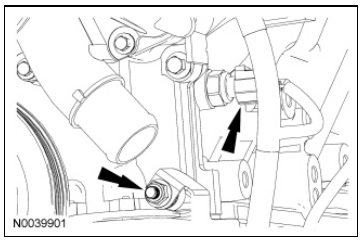
27. Disconnect the Crankshaft Position (CKP) sensor electrical connector and the wiring anchors. Discard the wiring anchors.



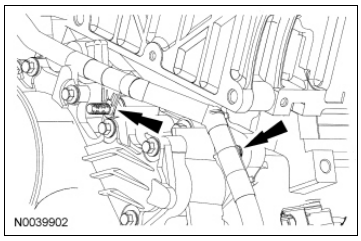
28. Disconnect the fuel rail pressure and temperature sensor and the Camshaft Position (CMP) sensor electrical connectors.



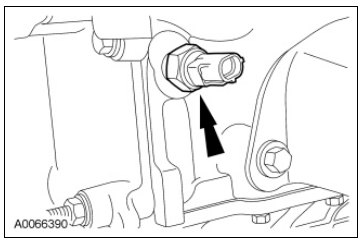
29. Disconnect the Engine Coolant Temperature (ECT) sensor electrical connector.



30. Remove the engine wiring harness retainer bolt and remove the engine wiring harness.

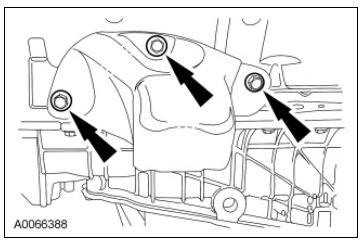


31. Disconnect the fuel pressure and temperature sensor vacuum hose fitting.
    - Remove the vacuum harness.

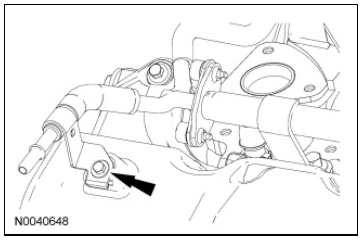


32. Disconnect the Engine Oil Pressure (EOP) switch electrical connector, remove the nut and detach the battery cable and harness bracket.

33. Detach the retainers and remove the battery cable and harness.

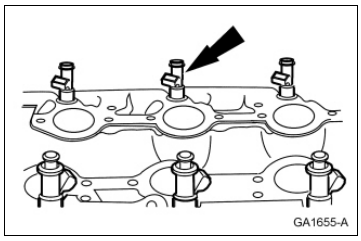


34. Remove the EOP switch.

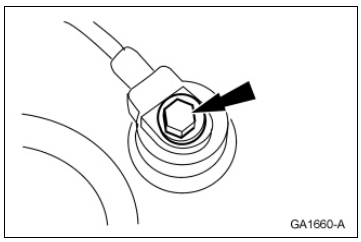


35. **NOTE:** LH shown, RH similar.

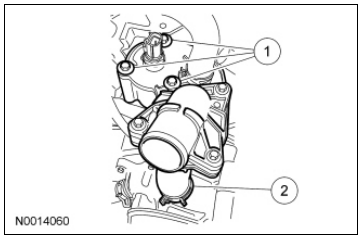
    Remove the 3 RH and the 3 LH insulator bolts and brackets.



36. Remove the fuel supply tube bolt.

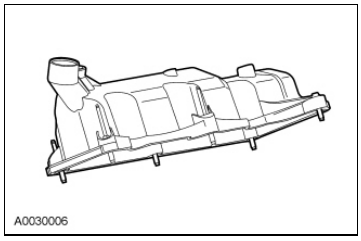


37. Remove the 4 bolts and the fuel rail.

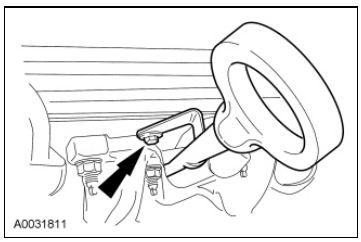


38. Remove the fuel injectors.
    - Remove and discard the O-ring seals.

39. Remove the bolt and the KS .

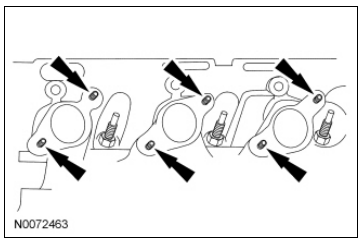


40. Remove the thermostat housing.
    1. Remove the 3 bolts.
    2. Release the bypass hose clamp and remove the thermostat housing.

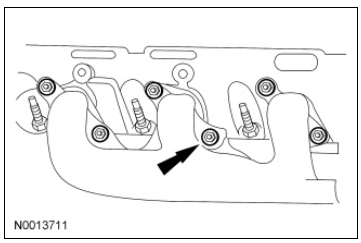


41. **NOTE:** RH shown, LH similar.

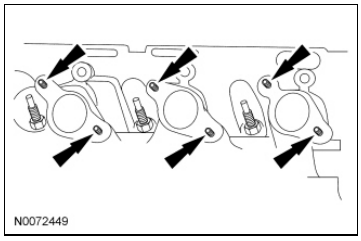
    Loosen the 12 bolts and remove the valve covers.



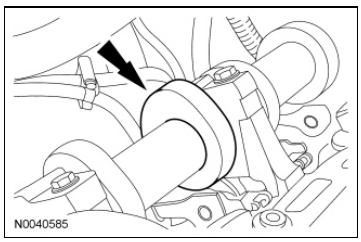
42. Remove the bolt and the oil level indicator tube.



43. Remove the 6 nuts and the RH exhaust manifold and gasket.
    - Discard the nuts and the gasket.

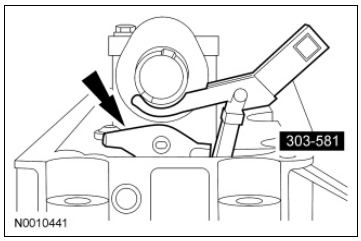


44. Remove and discard the 6 RH exhaust manifold studs.

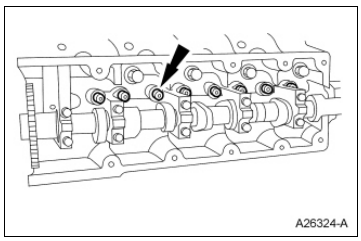


45. Remove the 6 nuts and the LH exhaust manifold and gasket.
    - Discard the nuts and the gasket.

46. Remove and discard the 6 LH exhaust manifold studs.

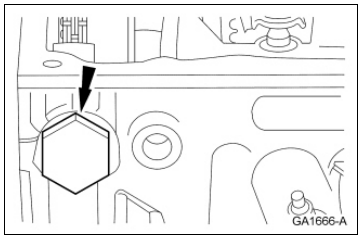


47. Rotate the crankshaft until the cam lobe of the cylinder being serviced is in the up position.



48. **NOTE:** Mark each camshaft roller follower to make sure it is installed in its original position during reassembly.

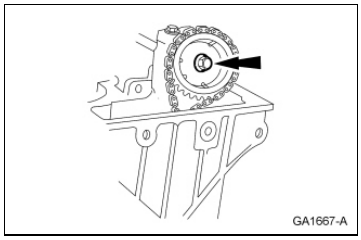
    Using the Valve Spring Compressor, remove the camshaft roller followers.



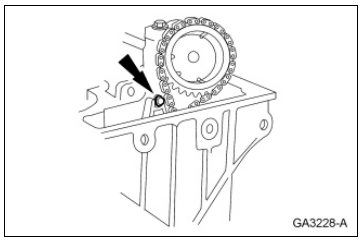
49. **NOTE:** Mark each hydraulic lash adjuster to make sure it is installed in its original position.

    Remove the hydraulic lash adjuster.

50. Remove the RH hydraulic chain tensioner.

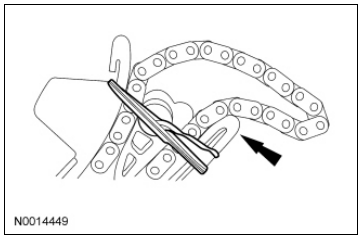


51. Install the Camshaft Sprocket Holding Tool and the Adapter for 303-564 on the RH cylinder head and tighten the top 2 clamp bolts.
    - Tighten to 10 Nm (89 lb-in).

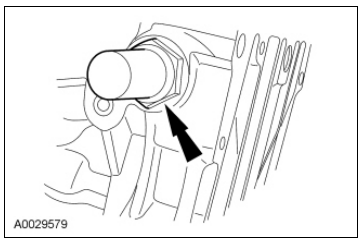


52. *NOTICE:* **The RH camshaft sprocket bolt is a LH-threaded bolt. Turning the bolt in the wrong direction can damage the bolt.**

    Remove the RH camshaft sprocket bolt.



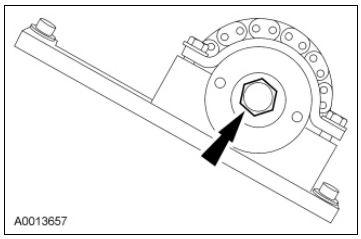
53. Remove the bolt.



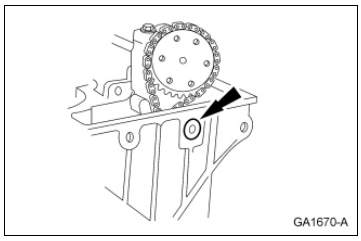
54. **NOTE:** Remove the camshaft sprocket from the timing chain to gain clearance to remove the cylinder head.

    NOTE: Hold the timing chain and cassette with a rubber band to aid in removal and to prevent the timing chain from falling into the cylinder block.

    Remove the RH camshaft sprocket from the timing chain. Install a rubber band around the cassette and the timing chain.

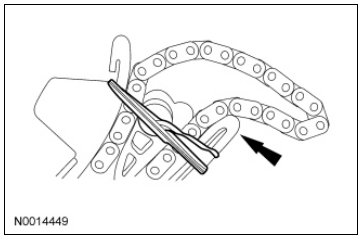


55. Remove the LH hydraulic chain tensioner.



56. Install the Camshaft Sprocket Holding Tool and the Adapter for 303-564 on the LH cylinder head.

57. Remove the LH camshaft sprocket bolt.



58. Remove the bolt.

59. **NOTE:** Remove the camshaft sprocket from the timing chain to gain clearance to remove the cylinder head.

    NOTE: Hold the timing chain and cassette with a rubber band to aid in removal and to prevent the timing chain from falling into the cylinder block.

    Remove the LH camshaft sprocket from the timing chain. Install a rubber band around the cassette and the timing chain.

60. **NOTE:** New cylinder head bolts must be installed. They are a torque-to-yield design and cannot be reused.

    Remove the 10 bolts in the sequence shown and remove the cylinder heads.

    - Discard the gaskets and the bolts.

61. ***NOTICE:*** **Make sure all coolant residue and foreign material are cleaned from the block surface and cylinder bore. Failure to follow these instructions may result in engine damage.**

    NOTICE: **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. Use a plastic scraping tool to remove all traces of the head gaskets.**

    NOTE: Observe all warnings and cautions and follow all application directions contained on the packaging of the silicone gasket remover and the metal surface prep.

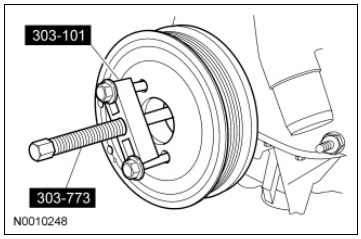
    NOTE: If there is no residual gasket material present, metal surface prep can be used to clean and prepare the surfaces.

    Clean the cylinder head-to-cylinder block mating surface of both the cylinder head and the cylinder block in the following sequence.

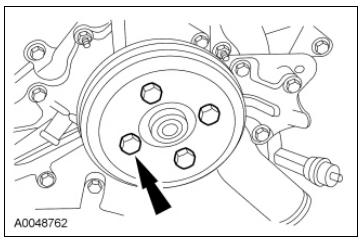
    1. Remove any large deposits of silicone gasket material with a plastic scraper.
    2. Apply silicone gasket remover, following package directions, and allow to set for several minutes.
    3. Remove the silicone gasket remover with a plastic scraper. A second application of silicone gasket remover may be required if residual traces of silicone or gasket material remain.
    4. Apply metal surface prep, following package directions, to remove any traces of oil or coolant and to prepare the surfaces to bond with the new gasket. Do not attempt to make the metal shiny. Some staining of the metal surfaces is normal.

62. Support the cylinder head on a bench with the head gasket side up. Check the cylinder head distortion and the cylinder block distortion. For additional information, refer to Section 303-00 .

63. Remove the 2 bolts and the CKP sensor.



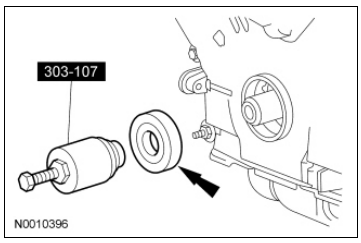
64. Using the Strap Wrench to hold the crankshaft pulley, remove the bolt.



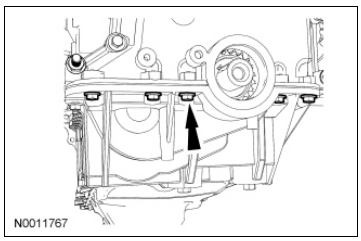
65. **NOTE:** If the pulley bolt is not installed, the tool will bottom out before the pulley is off.

    Install the crankshaft pulley bolt 2 to 3 turns. Using the 2 Crankshaft Vibration Damper Removers and the two 8-mm bolts, remove the crankshaft pulley.

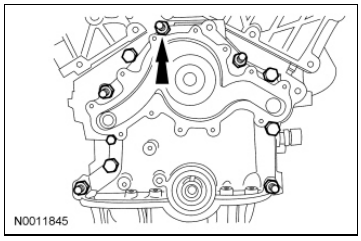
    - Discard the crankshaft pulley bolt.



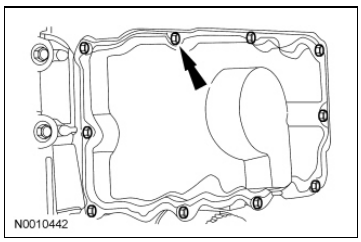
66. Remove the 4 bolts and the coolant pump pulley.



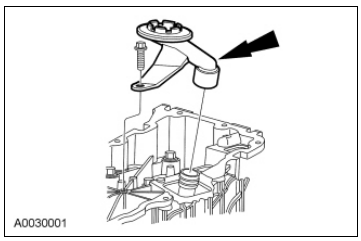
67. Remove the 13 bolts and the coolant pump.



68. Using the Crankshaft Front Oil Seal Remover, remove the crankshaft front oil seal.

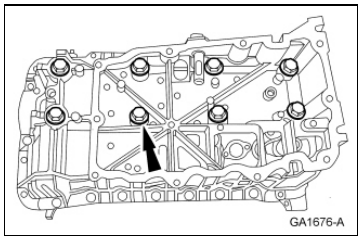


69. Remove the 5 cylinder block cradle-to-engine front cover bolts.

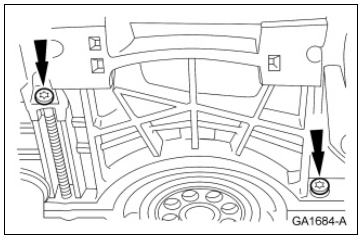


70. Remove the 5 bolts, 5 stud bolts and the engine front cover.

71. Remove the 10 bolts and the oil pan.

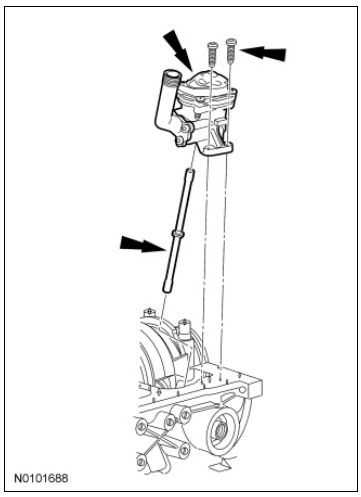


72. Remove the bolt and the oil pump screen cover and tube.

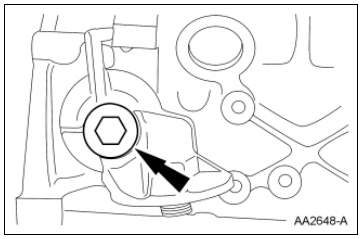


73. **NOTE:** Note the location of the 2 silver-colored bolts with the washer seals. These bolts must be installed in the same position from which they were removed with new washer seals.

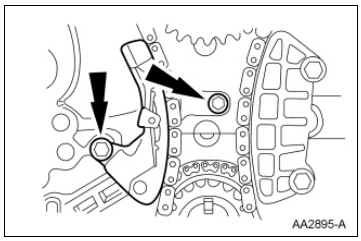
    Remove the 8 cylinder block cradle inner bolts. Remove and discard the 2 washer seals.



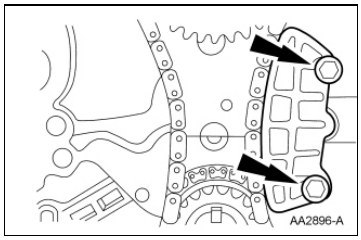
74. Remove the 2 cylinder block cradle Torx bolts.



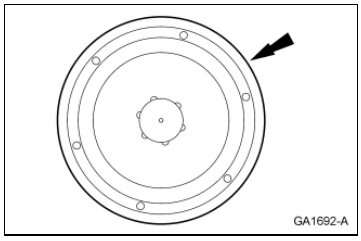
75. Remove the 15 bolts and the 2 nuts. Remove the cylinder block cradle.



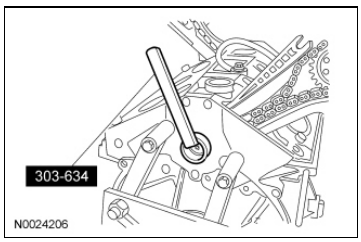
76. Remove the 2 bolts, the oil pump pickup tube, the oil pump and the oil pump intermediate shaft.



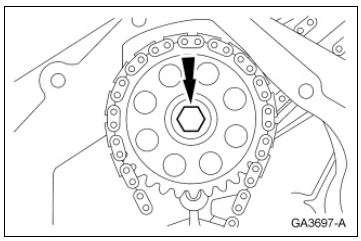
77. Remove the bolt and the oil filter adapter.



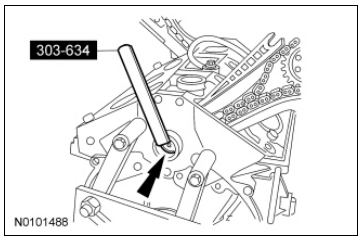
78. Remove the 2 bolts and the jackshaft chain tensioner.



79. Remove the 2 bolts and the jackshaft chain guide.

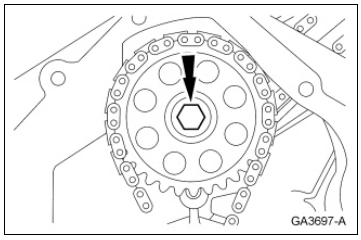


80. Remove the jackshaft rear plug.

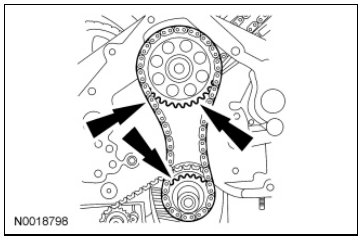


81. Install the Rear Jack Shaft Socket on the rear of the jackshaft.

82. Using the Rear Jack Shaft Socket to hold the jackshaft, loosen the jackshaft sprocket bolt.

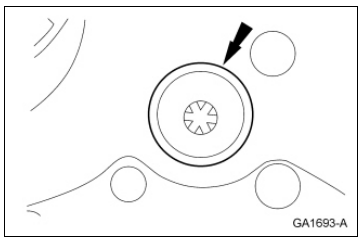


83. Using the Rear Jack Shaft Socket to hold the jackshaft, loosen the rear jackshaft sprocket bolt.



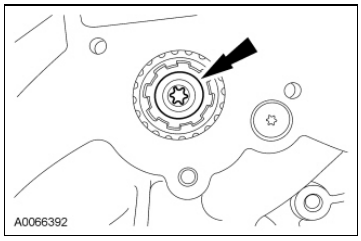
84. **NOTE:** It may be necessary to hold the oil pump intermediate shaft, using an E-12 external Torx socket, in order to remove the bolt if the bolt does not turn out easily at this time.

    Remove the jackshaft sprocket bolt.

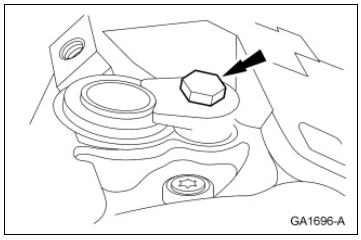


85. Remove the jackshaft and crankshaft sprockets and the chain.
    - Remove the crankshaft key.

86. Remove the bolt and the LH camshaft drive cassette.

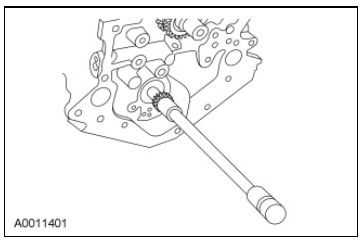


87. Remove the RH camshaft drive cassette bolt and spacer.

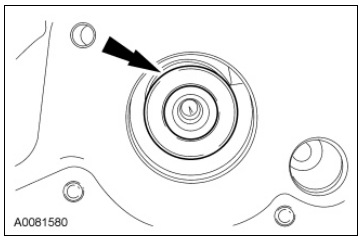


88. **NOTE:** It may be necessary to hold the oil pump intermediate shaft, using an E-12 external Torx socket, in order to remove the bolt if the bolt does not turn out easily at this time.

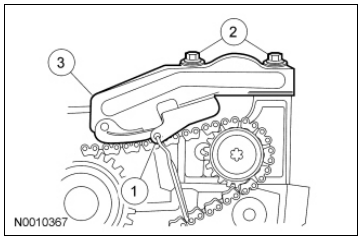
    Remove the rear jackshaft sprocket bolt and remove the RH camshaft drive cassette.



89. Remove the bolt, the hold down and the oil pump drive.

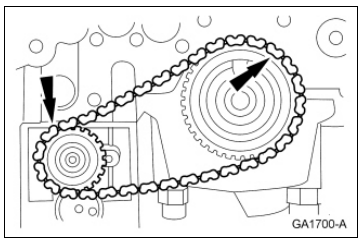


90. Remove the 2 bolts and the jackshaft thrust plate.



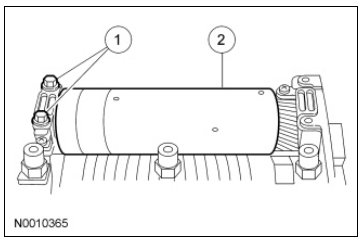
91. Remove the jackshaft.

92. Remove the jackshaft spacer.



93. Remove the balance shaft tensioner.
    1. Install a pin in the balance shaft tensioner.
    2. Remove the 2 bolts.
    3. Remove the balance shaft tensioner.

94. Remove the 2 bolts and the balance shaft chain guide.

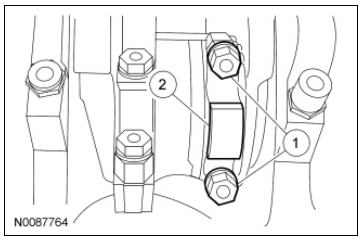


95. **NOTE:** DO NOT remove the balance shaft sprocket bolt.

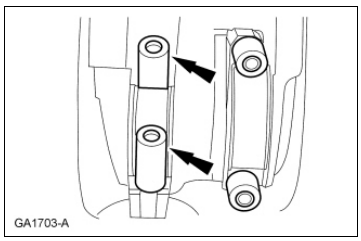
    Remove the balance shaft chain and crankshaft sprocket.

96. Remove the balance shaft.
    1. Remove the 2 bolts.

2. Remove the balance shaft.



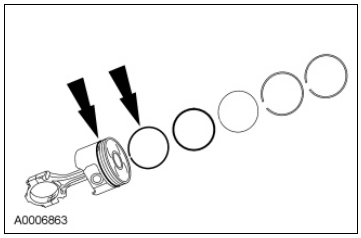
97. Before removing the pistons, inspect the top of the cylinder bores. If necessary, remove the ridge or carbon deposits from each cylinder using an abrasive pad or equivalent, following the manufacturer's instructions.



98. **NOTE:** Clearly mark the connecting rods and rod caps in numerical order for correct reassembly.

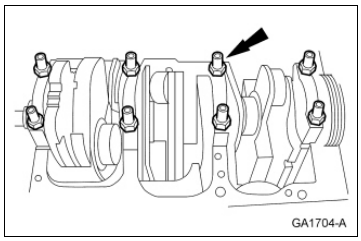
    Remove the connecting rod caps.

    1. Remove the 2 connecting rod nuts from each connecting rod.
    2. Remove the connecting rod cap.



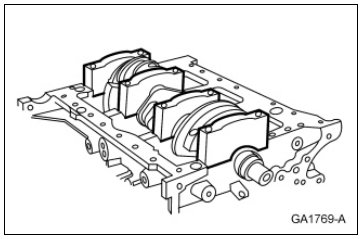
99. Install rubber hose pieces on the bolts to protect the crankshaft and remove the pistons.

100. Remove the connecting rod bearings.



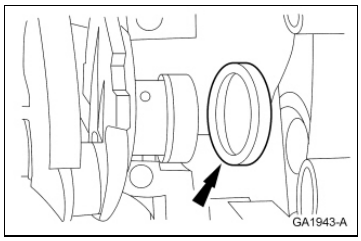
101. Remove the piston rings.

102. Clean and inspect the pistons. For additional information, refer to Section 303-00 .



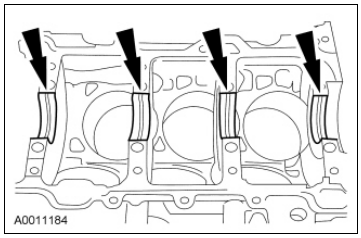
103. ***NOTICE:*** **Remove the cylinder heads before removing the crankshaft. Failure to do so can result in engine damage.**

    Remove the 8 bolts.



104. **NOTE:** Number (or mark) the crankshaft bearing caps before removing them.

    Remove the 4 crankshaft main bearing caps.

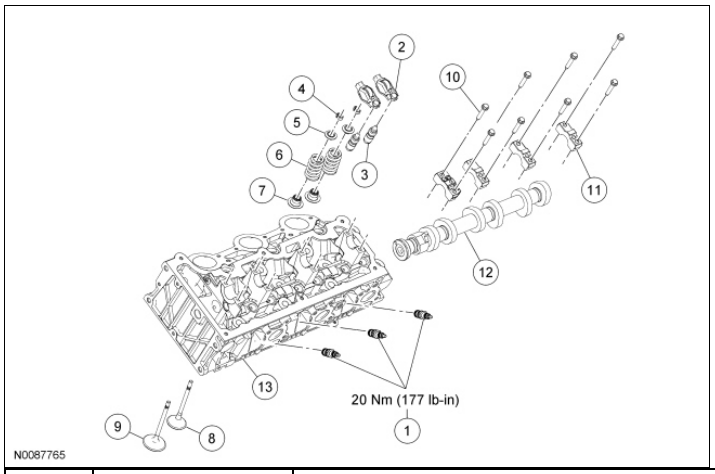


105. Remove the crankshaft rear oil seal from the crankshaft.

106. Remove the crankshaft.

107. Remove the crankshaft main bearings and the thrust bearing.

A0011184



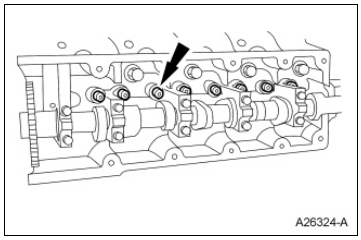
Cylinder Head

Special Tool(s)

 ST1330-A	Compressor, Valve Spring 303-581 (T97T-6565-A)
 ST1824-A	Installer, Valve Stem Oil Seal 303-370 (T90T-6571-A)

Material

Item	Specification
Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil XO-5W30-QSP (US); Motorcraft® SAE 5W-30 Super Premium Motor Oil CXO-5W30-LSP12 (Canada); or equivalent	WSS-M2C929-A



Item	Part Number	Description
1	12405	Spark plugs
2	6529	Camshaft roller follower
3	6C501	Hydraulic lash adjuster
4	6518	Valve spring retainer key (12 required)
5	6A536	Valve spring retainer
6	6513	Valve spring (6 required)
7	6571	Valve seal (6 required)
8	6505	Exhaust valve

9	6507	Intake valve
10	W702341	Camshaft bearing cap mounting bolt (8 required)
11	6A258	Camshaft bearing cap (4 required)
12	6A274	LH camshaft
13	6050	Cylinder head

Disassembly

1. Remove the spark plugs.
2. **NOTE:** Mark each hydraulic lash adjuster to make sure it is installed in its original position.

   Remove the hydraulic lash adjusters.

3. **NOTE:** Keep the valves, valve springs, retainers and retainer keys in order so they can be installed in their original positions.

   Using the Valve Spring Compressor, remove the valve spring retainer keys, the valve spring and the retainer. Remove the valve.

   - Repeat the procedure until all of the valves are removed.

4. Remove and discard the valve seals.
5. **NOTE:** Mark the position of the camshaft bearing caps so they can be installed in their original positions.

   Remove the 8 bolts in the sequence shown and remove the 4 camshaft bearing caps.

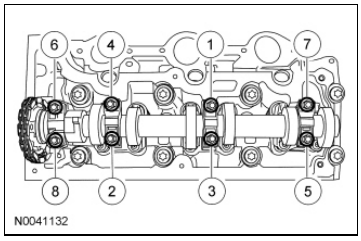
6. Remove the camshaft.

Assembly

NOTE: Lubricate all parts with clean engine oil prior to assembly.

NOTE: Install the camshaft roller followers only after the cylinder head is installed in the vehicle and the timing procedure has been carried out.

1. Inspect the cylinder head. For additional information, refer to Section 303-00 .



2. Position the camshaft.

3. **NOTE:** The camshaft bearing caps must be installed in their original positions.

   NOTE: After installing the bolts, check the camshaft for free rotation.

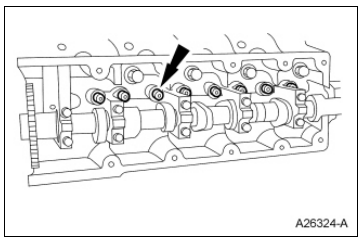
   Position the 4 camshaft bearing caps and the 8 bolts. Tighten the bolts in the sequence shown in 2 stages.

   - Stage 1: Tighten to 6 Nm (53 lb-in).
   - Stage 2: Tighten to 16 Nm (142 lb-in).

4. **NOTE:** Valves must be installed in the position from which they were removed.

   Install the valve.

5. Using the Valve Stem Oil Seal Installer, install new valve stem seals.



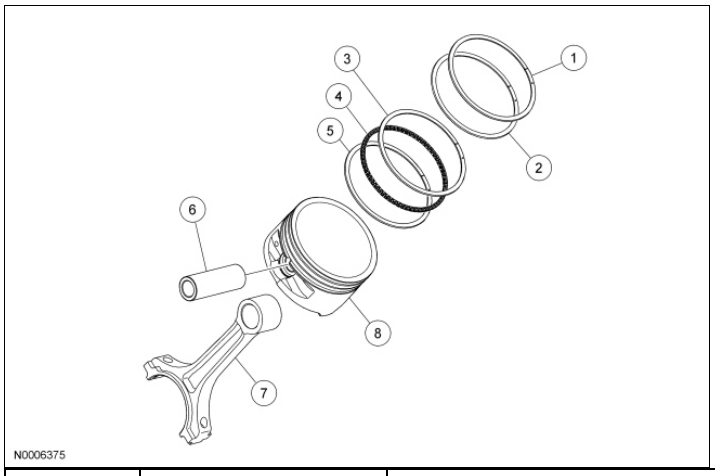
6. **NOTE:** The valve springs, retainers and retainer keys must be installed in the positions from which they were removed.

   Using the Valve Spring Compressor, install the valve spring, the retainer and the retainer keys.

7. **NOTE:** Install the hydraulic lash adjusters in the same positions from which they were removed.

Install the hydraulic lash adjusters.

8. Install the spark plugs.
    - Tighten to 20 Nm (177 lb-in).



Piston

Special Tool(s)

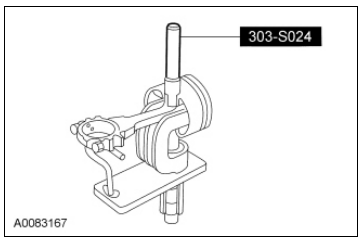
 ST1336-A	Service Set, Piston Pin 303-S024 (T68P-6135-A)

Material

Item	Specification
Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil XO-5W30-QSP (US); Motorcraft® SAE 5W-30 Super Premium Motor Oil CXO-5W30-LSP12 (Canada); or equivalent	WSS-M2C929-A

Item	Part Number	Description
1	6150	Piston compression upper ring
2	6152	Piston compression lower ring
3	6159	Piston oil control upper segment ring
4	6161	Piston oil control spacer
5	6159	Piston oil control lower segment ring
6	6135	Piston pin
7	6200	Connecting rod
8	6110	Piston

Disassembly



NOTE: The connecting rod bolts and nuts cannot be reused.

NOTE: Mark the position of the parts, so they can be installed in their original positions.

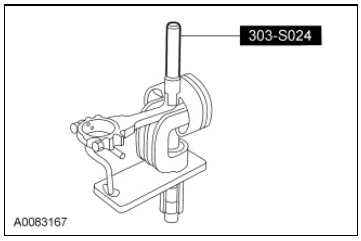
1. Remove the connecting rod bearings from the connecting rod and cap.

2. Remove the piston rings from the piston.

3. Using the Piston Pin Service Set, press the piston pin out of the connecting rod and piston assembly.

Assembly

NOTE: Lubricate all parts with clean engine oil.



NOTE: Install the piston in the connecting rod with the cylinder number side of the rod and the indentation notch in the piston on the same side.

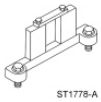
NOTE: The oil hole in the connecting rod must face the RH side of the cylinder block and the arrow on the piston must face the front of the engine block.

1. **NOTE:** If the piston pin is removed from the piston, a new piston and piston pin must be used. Do not reuse the piston or the piston pin.

   Gradually heat the pin bore side of the connecting rod to approximately 232°C-316°C (467°F-626°F) and immediately install the piston pin.

2. Using the Piston Pin Service Set, press the piston pin into the piston and connecting rod assembly.

3. Install the piston rings.



4. Make sure the ring gaps (oil spacer-A, oil ring-B, compression ring-C) are correctly spaced around the circumference of the piston.

5. Install the connecting rod bearings in the connecting rod and cap.

Engine

Special Tool(s)

 ST1776-A	Adapter for 303-564 303-578 (T97T-6256-A)
 ST1779-A	Adapter for 303-577 303-576 (T97T-6256-D)
 ST3078-A	Adapter for 303-579 303-527 (T95T-6701-A3)
 ST2439-A	Aligner, Front Cover 303-093 (T74P-6019-A)
 ST1380-A	Compressor, Piston Ring 303-D032 (D81L-6002-C)
 ST1330-A	Compressor, Valve Spring 303-581 (T97T-6565-A)
 ST1778-A	Holding Tool, Camshaft 303-577 (T97T-6256-C)
 ST1777-A	Holding Tool, Camshaft Sprocket 303-564 (T97T-6256-B)
 ST2132-A	Installer, Crankshaft Rear Oil Seal 303-579 (T97T-6701-A)
 ST1287-A	Installer, Crankshaft Vibration Damper 303-102 (T74P-6316-B)
 ST1595-A	Lifting Bracket, Engine 303-050 (T70P-6000)

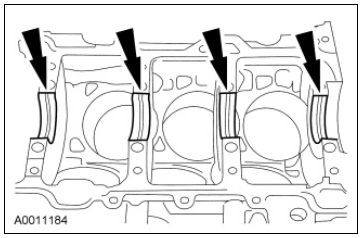
Upper End - 4.0L SOHC Engine

Item	Part Number	Description
1	9K479	Intake manifold
2	6A505	Valve cover, LH
3	6A274	Camshaft, LH
4	6050	Cylinder head, LH
5	6M296	Spacer
6	6M262	Jackshaft
7	6M272	Jackshaft chain guide
8	6M271	Jackshaft chain tensioner
9	6M264	Jackshaft sprocket
10	6M270	Jackshaft chain assembly
11	6A311	Balance shaft
12	6K355	Balance shaft chain tensioner
13	6A364	Balance shaft chain
14	6M289	LH cassette
15	6M290	RH cassette
16	6049	Cylinder head, RH
17	6250	Camshaft, RH
18	6582	Valve cover, RH

Lower End - 4.0L SOHC Engine

Item	Part Number	Description
1	6675	Oil pan
2	6617	Tube assembly oil pickup
3	6F092	Cylinder block cradle
4	-	Crankshaft main bearing caps
5	6A338	Crankshaft lower main bearings
6	6303	Crankshaft
7	6306	Jackshaft sprocket
8	6K350	Balance shaft sprocket
9	6010	Cylinder block
10	6A339	Crankshaft lower thrust main bearing

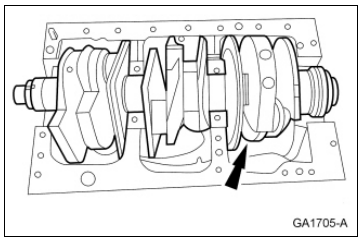


All vehicles

NOTICE: **If used as a leverage device, the fuel rail may be damaged. Care must be taken when working around the fuel rail.**

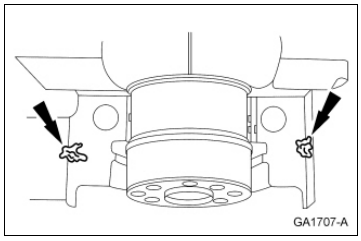
NOTE: During engine assembly it may be necessary to check the bearing clearances and crankshaft end play. For additional information, refer to Section 303-00 .

NOTE: Before engine assembly, use silicone gasket remover and metal surface prep and a suitable plastic or wooden scraper to clean the sealing surfaces. Follow the directions on the packaging. All sealing surfaces must be clean. Make sure coolant and oil passages are clear.



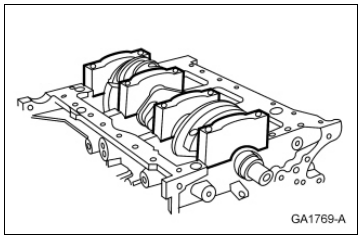
1. Install the crankshaft main bearings and the thrust bearing.
    - Lubricate the crankshaft main bearings with clean engine oil.

2. Install the lower main bearings in the bearing caps.



3. **NOTE:** The crankshaft main bearings are precision selective fit. Inspect the bearing clearance. For additional information, refer to Section 303-00 .

   Install the crankshaft.

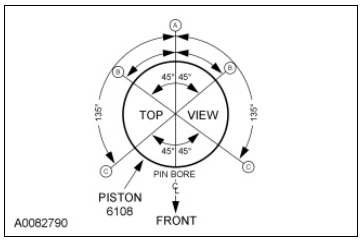


4. **NOTE:** If not secured within 4 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Follow the directions on the packaging. Failure to follow this procedure can cause future oil leakage.

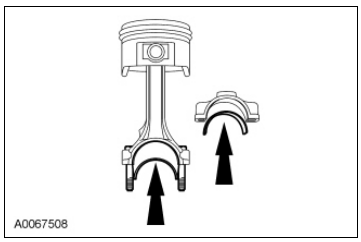
   Apply silicone gasket and sealant to the rear main bearing cap to cylinder block parting line.

5. Install the 4 main bearing caps in the same position from which they were removed.

6. Tighten the 8 bolts in the sequence shown in 2 stages.
   - Stage 1: Tighten to 35 Nm (26 lb-ft).
   - Stage 2: Tighten an additional 57 degrees.

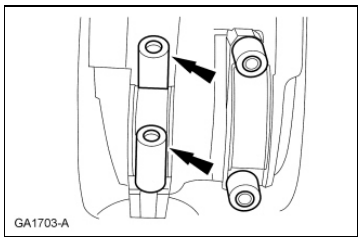


7. Check the piston to cylinder bore and ring clearance. For additional information, refer to Section 303-00 .



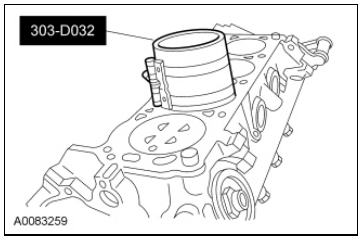
8. **NOTE:** Lubricate the piston rings with clean engine oil.

   Install the piston rings.



9. Make sure the ring gaps (oil spacer-A, oil ring-B, compression ring-C) are correctly spaced around the circumference of the piston.

10. Install the connecting rod bearings.

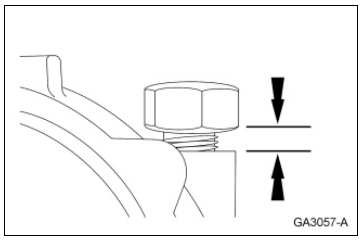


11. Install rubber hose pieces on the connecting rod bolts to protect the crankshaft.

12. **NOTE:** Position the piston with the indentation arrow toward the front of the cylinder block.

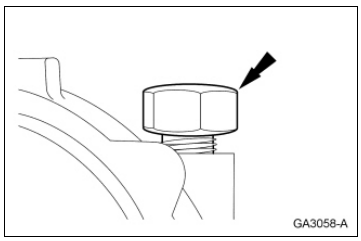
    Using the Piston Ring Compressor, install the pistons.

    - Rotate the crankshaft as necessary.



13. **NOTE:** The old nuts and bolts are used for checking clearances. New nuts and bolts must be used for reassembly.

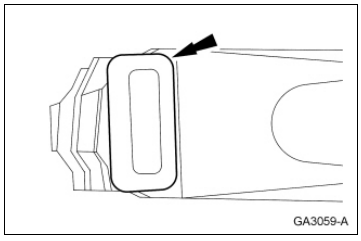
    Check the clearance of each connecting rod bearing. For additional information, refer to Section 303-00 .



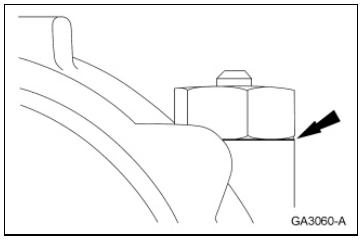
14. Rotate the crankshaft until the piston is at the bottom of its stroke.

15. **NOTE:** For cylinders 1, 2 and 3, remove the connecting rod nut at the oil split hole side first. For cylinders 4, 5 and 6, remove the opposite nut first.

    Loosen the first nut until the face is approximately 2 mm (0.08 in) over the end of the bolt.



16. Tap on the nut until the bolt can be removed by hand.

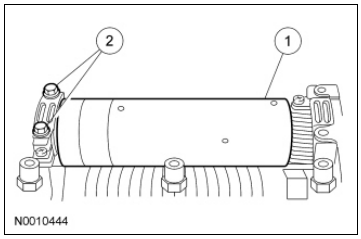


17. Repeat the previous 2 steps for the opposite bolt.

18. Install the 2 new bolts, making certain that the bolt head is parallel to the sideward face of the connecting rod.

19. Install the connecting rod cap in the original position.

20. Install and tighten the 2 connecting rod nuts finger-tight.

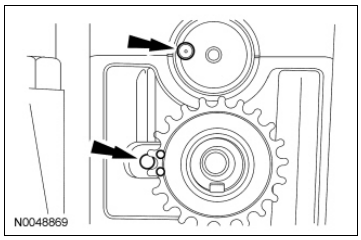


21. Tighten the 2 connecting rod nuts in 2 stages.
    - Stage 1: Tighten to 20 Nm (177 lb-in).
    - Stage 2: Tighten an additional 90 degrees.

22. Repeat the previous 4 steps for the remaining connecting rods.

23. Rotate the crankshaft until the No. 1 piston is at Top Dead Center (TDC).

24. Install the balance shaft.
    1. Install the balance shaft assembly.
    2. Install the 2 bolts and tighten in 2 stages.
        - Stage 1: Tighten to 15 Nm (133 lb-in).
        - Stage 2: Tighten an additional 90 degrees.

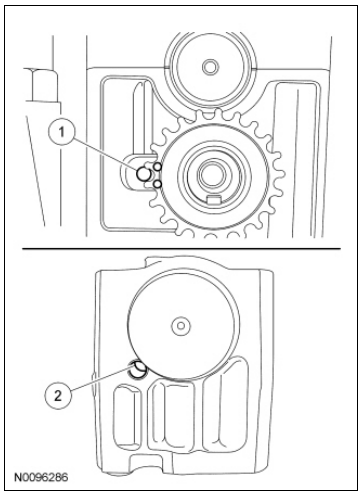


Early build vehicles

25. **NOTE:** Due to the gear ratio between the reversal shaft and the balance shaft, up to 7 complete turns of the balance shaft may be required to find the correct position.

    Align the timing marks.

    - Install a 4 mm (0.16 in) pin to hold the shaft in place.



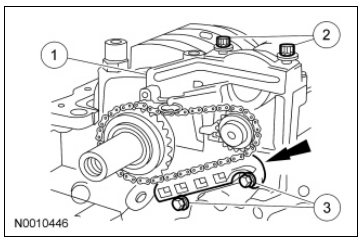
Late build vehicles

26. **NOTE:** Due to the gear ratio between the reversal shaft and the balance shaft, up to 7 complete turns of the balance shaft may be required to find the correct position.

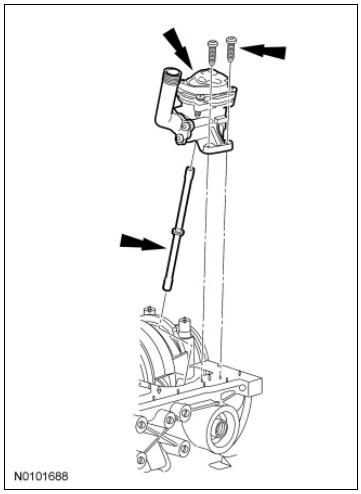
    Align the timing marks.

    1. Align the front balance shaft gear alignment marks with the hole in the balance shaft housing.

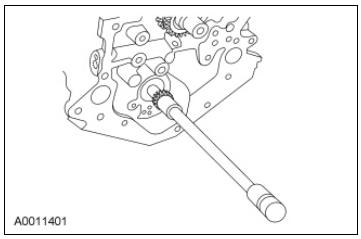
2. From the rear of the balance shaft, make sure the balance shaft gear alignment mark is visible through the hole in the balance shaft housing.



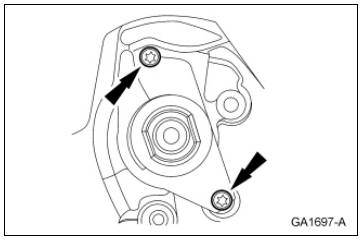
All vehicles



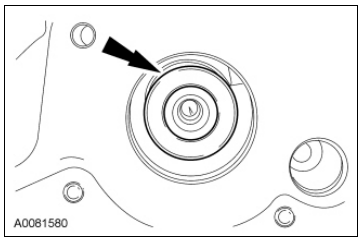
27. Install the balance shaft chain and crankshaft sprocket.



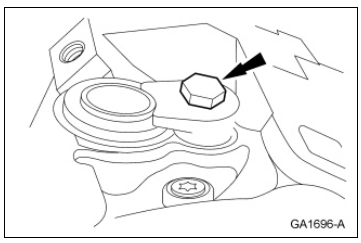
28. Install the balance shaft tensioner and chain guide.
    1. Install the balance shaft tensioner.
    2. Install the 2 bolts and tighten to 29 Nm (21 lb-ft).
    3. Position the balance shaft chain guide, install the 2 bolts and tighten to 10 Nm (89 lb-in).
    - Remove the pins from the tensioner and, if installed, the sprocket.



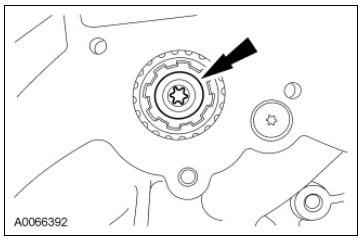
29. Install the oil pump intermediate shaft, the oil pump and the 2 bolts.
    - Tighten to 19 Nm (168 lb-in).



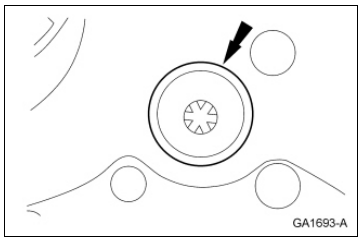
30. Install the jackshaft.



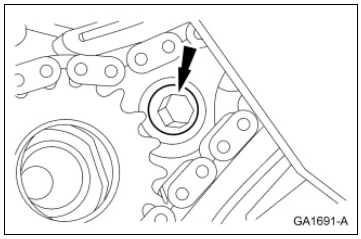
31. Install the jackshaft thrust plate and bolts.
    - Tighten to 11 Nm (97 lb-in).



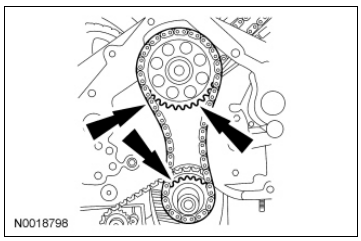
32. Install the jackshaft spacer.



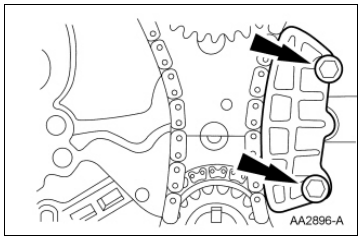
33. Install the oil pump drive and the hold down.
    - Tighten to 19 Nm (168 lb-in).



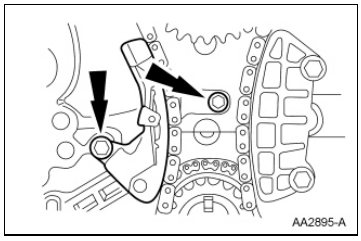
34. Position the RH camshaft drive cassette and install the sprocket bolt. Do not tighten the bolt at this time.



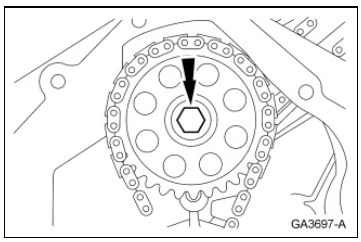
35. Install the RH drive cassette bolt and spacer.
    - Tighten to 18 Nm (159 lb-in).



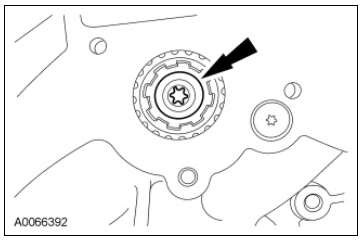
36. Install the LH cassette and the bolt.
    - Tighten to 19 Nm (168 lb-in).



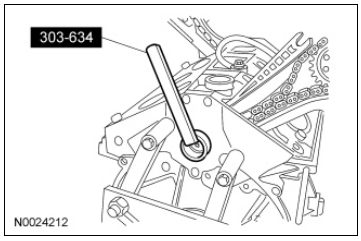
37. Install the crankshaft key. Position the jackshaft and crankshaft sprockets and the chain.



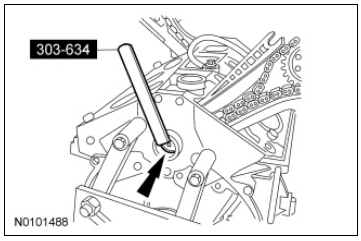
38. Install the chain guide and the 2 bolts.
    - Tighten to 19 Nm (168 lb-in).



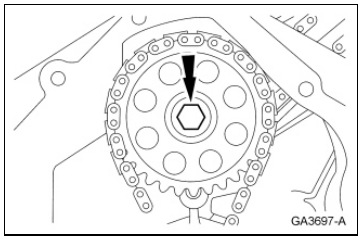
39. Install the chain tensioner and the 2 bolts.
    - Tighten to 9 Nm (80 lb-in).



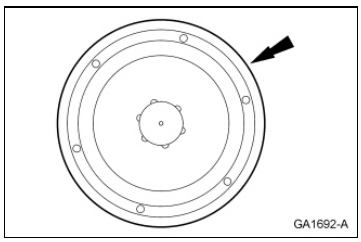
40. Install the jackshaft sprocket bolt. Do not tighten the bolt at this time.



41. While holding the front jackshaft sprocket bolt secure, tighten the rear bolt.
    - Tighten to 20 Nm (177 lb-in).

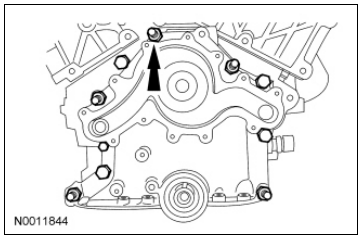


42. Install the Rear Jack Shaft Socket on the rear of the jackshaft.

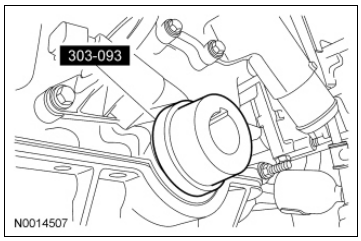


43. Using the Rear Jack Shaft Socket to hold the jackshaft, tighten the rear jackshaft bolt an additional 90 degrees.

44. Using the Rear Jack Shaft Socket to hold the jackshaft, tighten the front sprocket bolt in 2 stages.
    - Tighten to 45 Nm (33 lb-ft).
    - Tighten an additional 90 degrees.



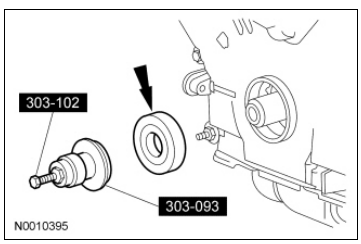
45. Remove the Rear Jack Shaft Sprocket and install the rear jackshaft plug.



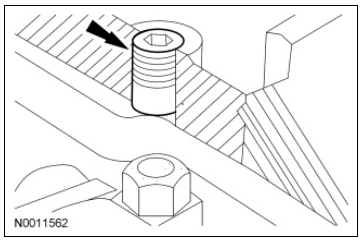
46. Position a new engine front cover gasket on the cylinder block.

47. **NOTE:** Apply thread sealant to the stud bolts and make sure that the stud bolts are installed in their original positions.

    Position the front cover and loosely install the 5 bolts and the 5 stud bolts.

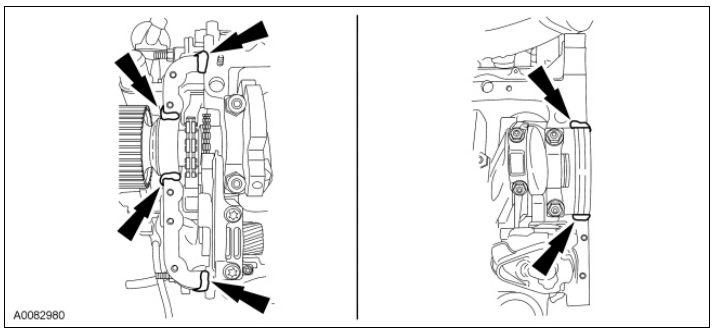


48. Install the Front Cover Aligner and tighten the 5 bolts and 5 stud bolts.
    - Tighten to 19 Nm (168 lb-in).



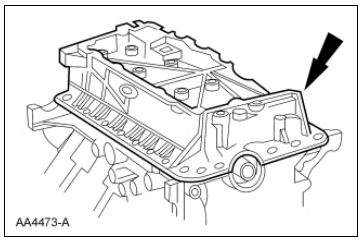
49. **NOTE:** Lubricate the seal lip with clean engine oil.

    Using the Front Cover Aligner and the Crankshaft Vibration Damper Installer, install the crankshaft front oil seal.



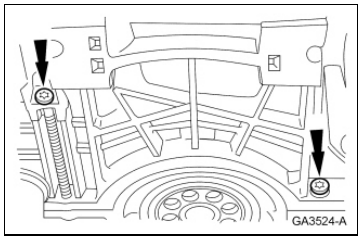
50. ***NOTICE:*** **The cylinder block cradle inserts must be loosened completely or damage to the cylinder block cradle or oil leaks can result.**

    Loosen the 8 cylinder block cradle inserts.



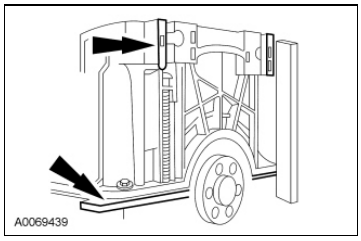
51. **NOTE:** If not secured within 4 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Follow the directions on the packaging. Failure to follow this procedure can cause future oil leakage.

    Apply silicone gasket and sealant in the 6 places shown.

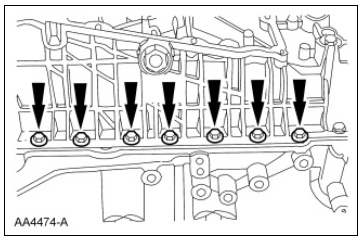


52. Position the cylinder block cradle and a new gasket assembly.

53. Install and finger-tighten the 20 bolts and 2 nuts.

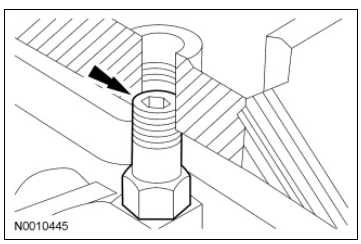


54. Install and finger-tighten the 2 Torx bolts.

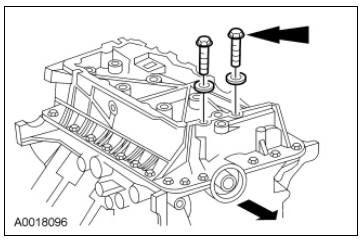


55. **NOTE:** The cylinder block cradle to the cylinder block alignment must be within a maximum mismatch of 0.25 mm (0.01 in) cylinder block cradle underflush or 0.05 mm (0.00196 in) cylinder block cradle protrusion.

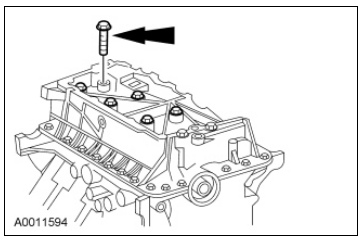
    Using a straightedge, align the transmission face of the cylinder block cradle with the rear face of the cylinder block.



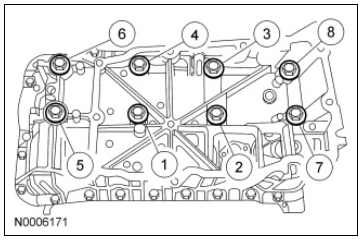
56. Tighten the 20 bolts and the 2 nuts.
    - Tighten the nuts to 10 Nm (89 lb-in).
    - Tighten the bolts to 14 Nm (124 lb-in).



57. Tighten the Torx bolts.
    - Tighten to 10 Nm (89 lb-in).

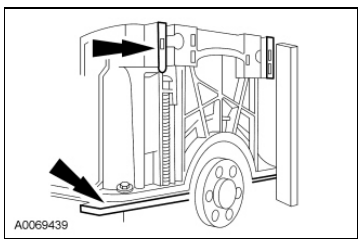


58. Tighten the 8 inserts.
    - Tighten to 3 Nm (27 lb-in).

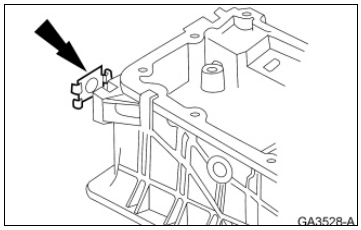


59. Install new seals on the 2 silver bolts and position them in the cylinder block cradle.

60. Position the 6 remaining bolts.



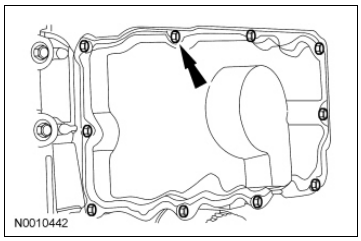
61. Tighten the 8 cylinder block cradle inner bolts in the sequence shown in 2 stages.
    - Stage 1: Tighten to 15 Nm (133 lb-in).
    - Stage 2: Tighten to 34 Nm (25 lb-ft).



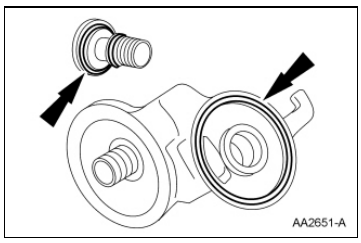
62. **NOTE:** The cylinder block cradle to the cylinder block alignment must be within a maximum mismatch of 0.25 mm (0.01 in) cylinder block cradle underflush or 0.05 mm (0.00196 in) cylinder block cradle protrusion.

    Measure the step between the rear face of the cylinder block and the transmission face of the cylinder block cradle.

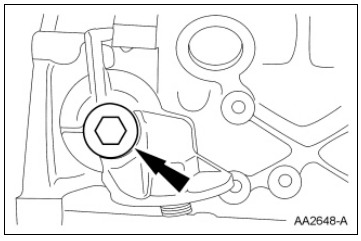
    - Cradles that exceed protrusion specification must be removed and the appropriate assembly steps repeated.
    - Cradles that exceed the underflush specification may be repaired by installing shims (next step).



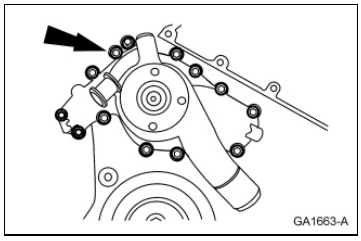
63. Repair all assemblies that exceed underflush specification by installing shims on one or both sides of the cylinder block cradle.



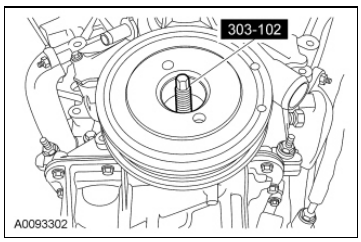
64. Install the oil pump screen cover and tube and the bolt.
    - Tighten to 10 Nm (89 lb-in).



65. Install the gasket, the oil pan and the 10 bolts.
    - Tighten to 11 Nm (97 lb-in).

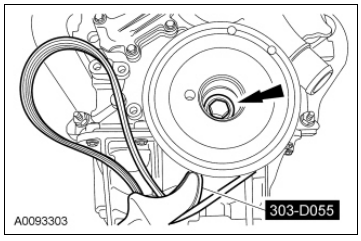


66. Inspect and install new oil filter adapter O-ring seals if necessary.

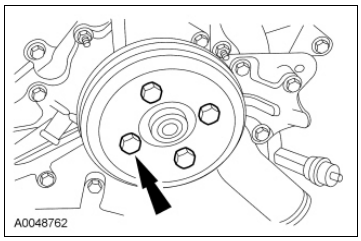


67. Install the oil filter adapter and the bolt.
    - Tighten to 57 Nm (42 lb-ft).

68. Install a new gasket, the coolant pump and the 13 bolts.
    - Tighten to 10 Nm (89 lb-in).



69. Using the Crankshaft Vibration Damper Installer, install the crankshaft pulley.

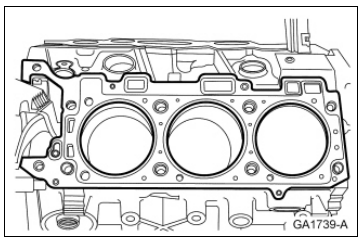


70. **NOTE:** A new bolt must be used each time it is removed.

    Using the Strap Wrench, tighten the bolt in 2 stages.

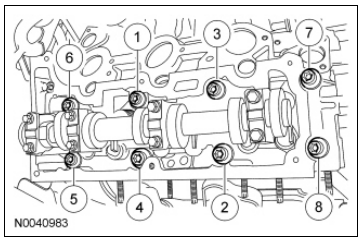
    - Stage 1: Tighten to 55 Nm (41 lb-ft).
    - Stage 2: Rotate an additional 85 degrees.

71. Install the coolant pump pulley and the 4 bolts.
    - Tighten to 25 Nm (18 lb-ft).

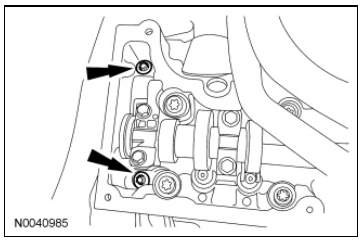


72. Position the Crankshaft Position (CKP) sensor and install the 2 bolts.
    - Tighten to 10 Nm (89 lb-in).

73. **NOTE:** LH shown, RH similar.



Install the cylinder head gaskets.

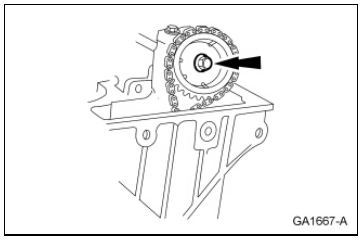


74. **NOTE:** New cylinder head bolts must be installed. They are a torque-to-yield design and cannot be reused.

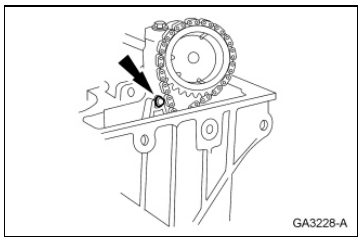
    Install the RH cylinder head. Install 8 new 12-mm bolts and tighten in the sequence shown in 2 stages.

    - Stage 1: Tighten to 12 Nm (106 lb-in).
    - Stage 2: Tighten to 25 Nm (18 lb-ft).

75. Install 2 new 8-mm bolts.
    - Tighten to 32 Nm (24 lb-ft).



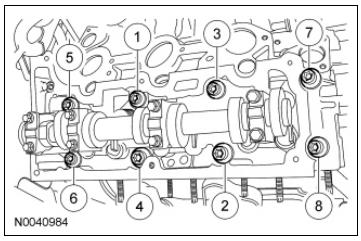
76. Tighten the 8 new 12-mm bolts in the sequence shown in 2 stages.
    - Stage 1: Rotate 90 degrees.
    - Stage 2: Rotate an additional 90 degrees.



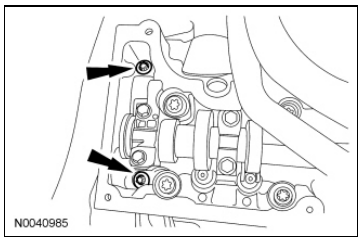
77. ***NOTICE:*** **The RH camshaft sprocket bolt is a LH-threaded bolt. Turning the bolt in the wrong direction can damage the bolt.**

    NOTE: The camshaft sprocket must turn freely on the camshaft. Do not tighten the bolt.

    Loosely install the RH camshaft sprocket bolt.



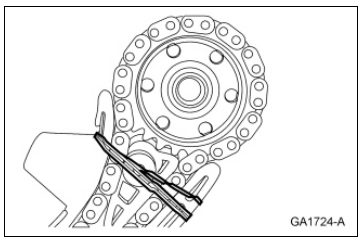
78. Install the RH cassette-to-cylinder head bolt.
    - Tighten to 10 Nm (89 lb-in).



79. **NOTE:** New cylinder head bolts must be installed. They are a torque-to-yield design and cannot be reused.

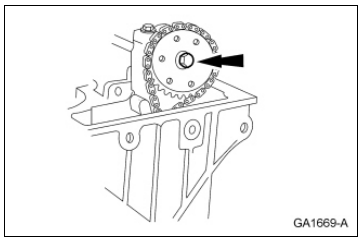
    Install the LH cylinder head and tighten the 8 new 12-mm bolts in the sequence shown in 2 stages.

    - Stage 1: Tighten to 12 Nm (106 lb-in).
    - Stage 2: Tighten to 25 Nm (18 lb-ft).

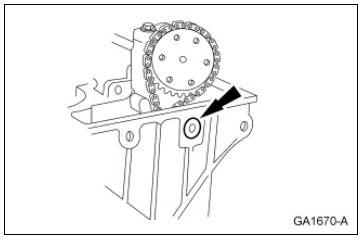


80. Install 2 new 8-mm bolts.
    - Tighten to 32 Nm (24 lb-ft).

81. Tighten the 8 new 12-mm bolts in the sequence shown in 2 stages.
    - Stage 1: Rotate 90 degrees.
    - Stage 2: Rotate an additional 90 degrees.



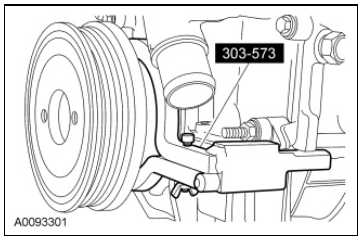
82. Position the LH camshaft sprocket.



83. **NOTE:** The camshaft sprocket must turn freely on the camshaft. Do not tighten the bolt.

    Loosely install the LH camshaft sprocket bolt.

84. Install the LH cassette-to-cylinder head bolt.
    - Tighten to 12 Nm (106 lb-in).



85. Turn the crankshaft one revolution clockwise.

86. ***NOTICE:*** **Do not rotate the engine counterclockwise. Rotating the engine counterclockwise will result in incorrect timing of the engine.**

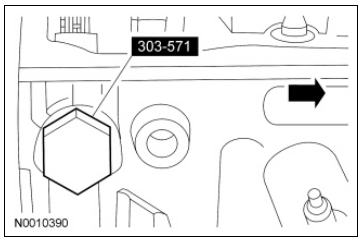
    NOTE: The Crankshaft TDC Timing Tool must be installed on the damper and should contact the engine block. This positions the engine at Top Dead Center (TDC).

    Install the Crankshaft TDC Timing Tool.

87. **NOTE:** Camshaft timing slots are off-center.

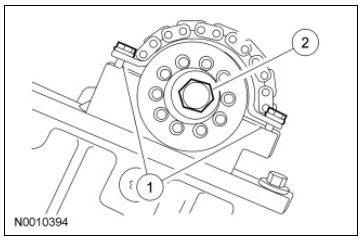
    NOTE: Position the camshaft timing slots below centerline of camshaft.

    Install the Camshaft Holding Tool and the Adapter for 303-577 on the front of the RH cylinder head.

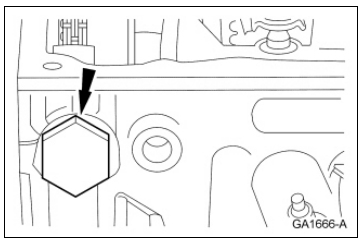


88. **NOTE:** Leave the top 2 Camshaft Sprocket Holding Tool clamp bolts loose.

    Install the Camshaft Sprocket Holding Tool and the Adapter for 303-564 on the rear of the RH cylinder head.



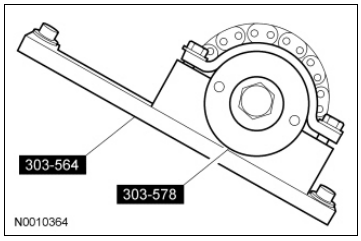
89. Install the Timing Chain Tensioner.



90. ***NOTICE:*** **The RH camshaft sprocket bolt is a LH-threaded bolt. Turning the bolt in the wrong direction can damage the bolt.**

    Tighten the bolts.

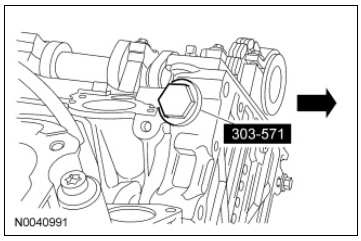
    1. Tighten the Camshaft Sprocket Holding Tool top 2 clamp bolts to 10 Nm (89 lb-in).
    2. Tighten the camshaft bolt to 85 Nm (63 lb-ft).



91. Install a new washer and the RH timing chain tensioner.
    - Tighten to 44 Nm (32 lb-ft).

92. **NOTE:** Do not tighten the Camshaft Sprocket Holding Tool top 2 clamp bolts. The camshaft sprocket must rotate freely.

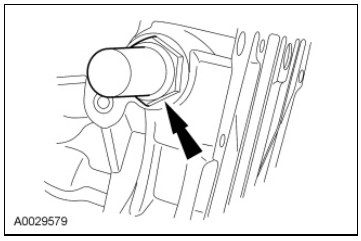
    Install the Camshaft Sprocket Holding Tool and the Adapter for 303-564 on the front of the LH cylinder head.



93. **NOTE:** Camshaft timing slots are off-center.

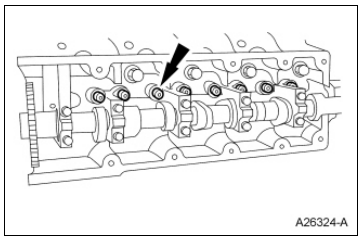
    NOTE: Position the camshaft timing slots below centerline of camshaft.

    Install the Camshaft Holding Tool and the Adapter for 303-577 on the front of the LH cylinder head.

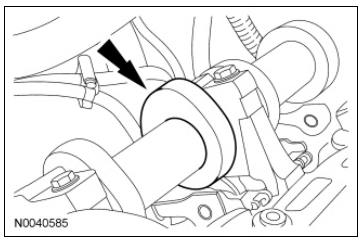


94. Install the Timing Chain Tensioner.

95. Tighten the bolts.
    1. Tighten the Camshaft Sprocket Holding Tool top 2 clamp bolts to 10 Nm (89 lb-in).
    2. Tighten the camshaft bolt to 85 Nm (63 lb-ft).

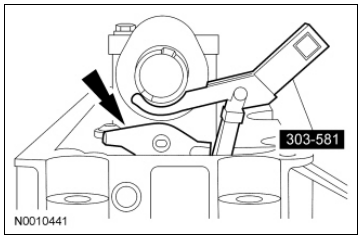


96. Install a new washer and the LH timing chain tensioner.
    - Tighten to 44 Nm (32 lb-ft).

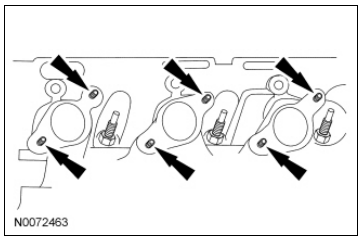


97. **NOTE:** Install the hydraulic lash adjuster in the same positions from which they were removed.

    Install the hydraulic lash adjusters.

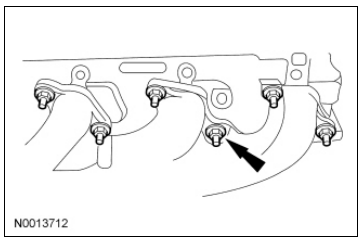


98. Rotate the crankshaft until the cam lobe on the cylinder being serviced is in the up position.



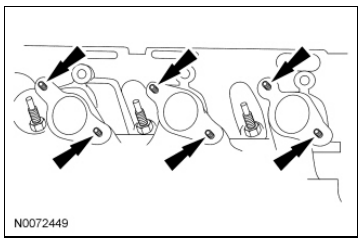
99. **NOTE:** Lubricate the parts with clean engine oil.

    Using the Valve Spring Compressor, install the roller followers in their original positions.

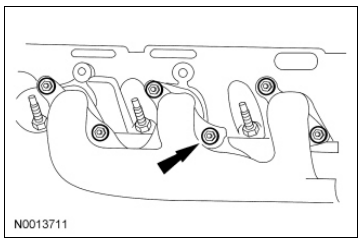


100. Inspect the RH and LH exhaust manifold gasket mating surfaces for flatness. For additional information, refer to Section 303-00 .

101. Install 6 new RH exhaust manifold studs.
     - Tighten to 12 Nm (106 lb-in).

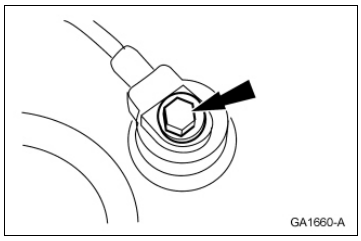


102. Install a new gasket, the RH exhaust manifold and the 6 new nuts.

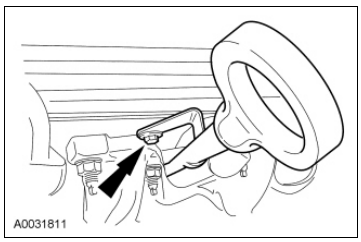


- Tighten to 22 Nm (16 lb-ft).

103. Install 6 new LH exhaust manifold studs.
    - Tighten to 12 Nm (106 lb-in).



104. Install a new gasket, the LH exhaust manifold and the 6 new nuts.
    - Tighten to 22 Nm (16 lb-ft).

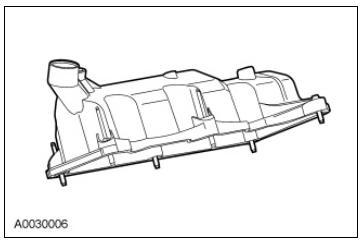


105. **NOTE:** Prior to installation, use metal surface prep to clean mating surfaces. Follow the directions on the packaging.

    Install the Knock Sensor (KS) and the bolt.

    - Tighten to 20 Nm (177 lb-in).

106. Install the oil level indicator tube and the bolt.
    - Tighten to 10 Nm (89 lb-in).

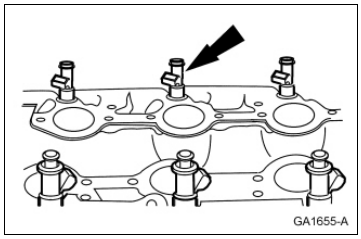


107. Position the thermostat housing and bypass hose on the coolant pump.
    1. Install the 3 bolts.
        - ♦ Tighten to 11 Nm (97 lb-in).
    2. Position the bypass hose clamp.

108. **NOTE:** RH valve cover shown, LH similar.

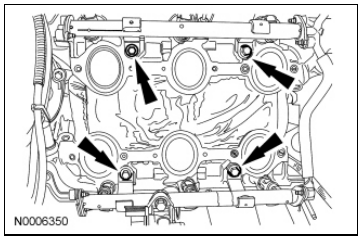
    Install the valve covers and tighten the 12 bolts.

    - Tighten to 10 Nm (89 lb-in).



109. ***NOTICE:*** **Use O-ring seals that are made of special fuel-resistant material. Use of ordinary O-rings seals may cause the fuel system to leak. Do not reuse the O-ring seals.**

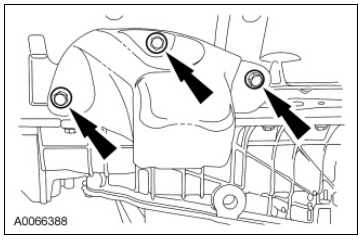
    Install new O-ring seals on each of the fuel injectors.



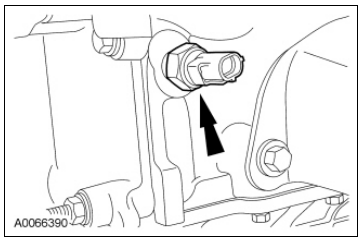
110. **NOTE:** Lubricate the fuel injector O-ring seals with clean engine oil.

    Install the fuel injectors.

111. Install the fuel rail and the 4 bolts.
    - Tighten to 24 Nm (18 lb-ft).



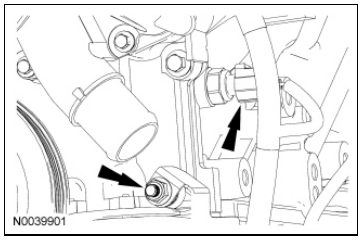
112. Position the fuel supply tube and install the bolt.
    - Tighten to 6 Nm (53 lb-in).



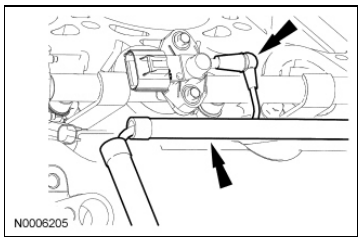
113. **NOTE:** LH shown, RH similar.

    Install the LH and RH insulator brackets and the 6 bolts.

    - Tighten to 80 Nm (59 lb-ft).

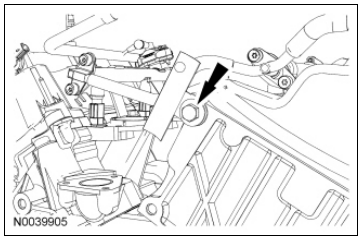


114. Install the oil pressure switch.
    - Tighten to 13 Nm (115 lb-in).

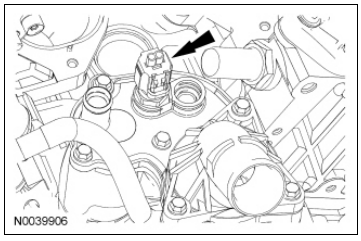


115. Position the battery cable and harness and attach the retainers.

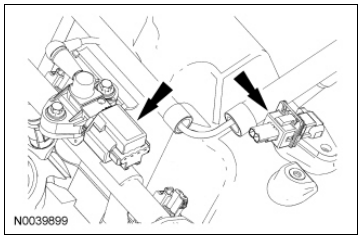
116. Connect the oil pressure switch electrical connector. Position the battery cable and harness bracket and install the nut.
    - Tighten to 20 Nm (177 lb-in).



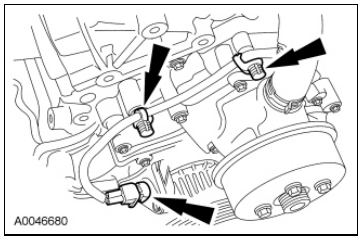
117. Position the vacuum harness on the engine and connect the fuel pressure and temperature sensor vacuum hose fittings.



118. Position the engine wiring harness on the engine.

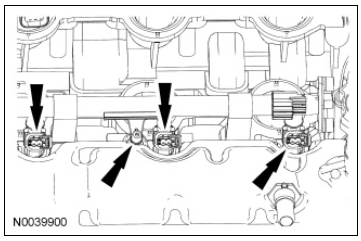


119. Position the engine wiring harness retainer and install the bolt.
    - Tighten to 47 Nm (35 lb-ft).



120. Connect the Engine Coolant Temperature (ECT) sensor electrical connector.

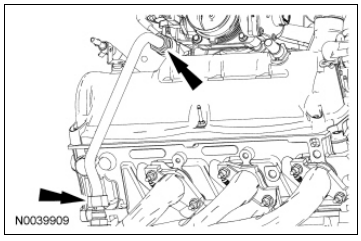
121. Connect the fuel rail pressure and temperature sensor and the Camshaft Position (CMP) sensor electrical connector.



122. Connect the Crankshaft Position (CKP) sensor electrical connectors and new wiring anchors.

123. **NOTE:** RH shown, LH similar.

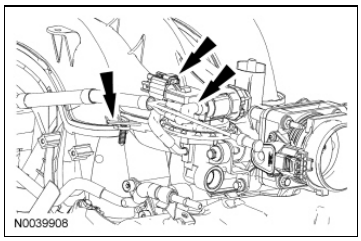
    Connect the 6 fuel injector electrical connectors and attach the wiring harness retainers.



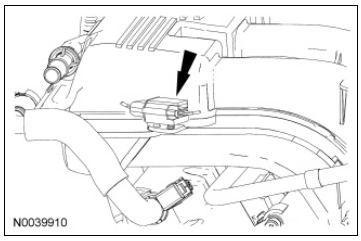
124. ***NOTICE:*** **If the engine is repaired or replaced because of upper engine failure, typically including valve or piston damage, check the intake manifold for metal debris. If metal debris is found, install a new intake manifold. Failure to follow these instructions can result in engine damage.**

    Install the gaskets, the intake manifold and the 8 bolts.

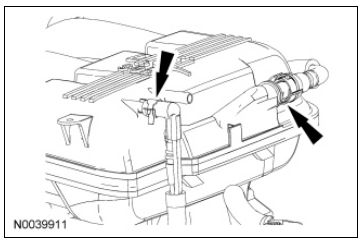
    - Tighten to 11 Nm (97 lb-in).



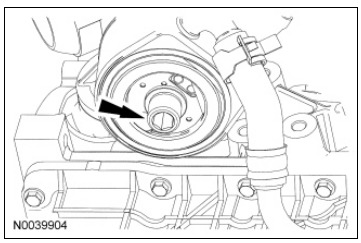
125. Install the exhaust manifold-to-EGR system module tube.
    - Tighten to 34 Nm (25 lb-ft).



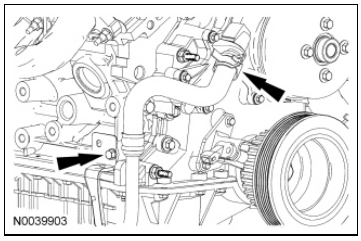
126. Connect the Electronic Throttle Body (ETB) and Throttle Position (TP) sensor electrical connectors. Attach the wiring harness bracket and install the nut.
    - Tighten to 9 Nm (80 lb-in).



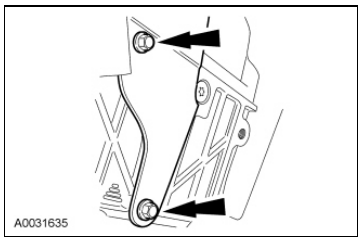
127. Connect the EGR system module vacuum hose and electrical connector. Attach the wiring harness pin-type retainer.



128. Attach the wiring harness pin-type retainer and connect the KS electrical connector.

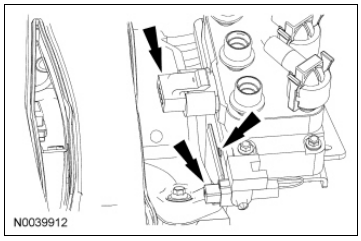


129. Connect the vacuum and PCV hoses to the intake manifold.



130. Install the oil cooler and hose.
    - Tighten to 57 Nm (42 lb-ft).

131. Connect the oil cooler hose. Position the oil cooler hose bracket and install the bolt.
    - Tighten to 25 Nm (18 lb-ft).



132. Position the ignition coil, bracket and spark plug wires as an assembly and install the 2 bolts.
    - Tighten to 10 Nm (89 lb-in).

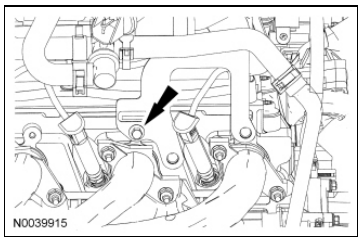
133. **NOTE:** RH spark plug wires removed for clarity.

    Attach the wiring harness retainer and connect the coil and radio interference capacitor electrical connectors.

134. ***NOTICE:*** **Make sure to orient the spark plug boots so the spark plug wires do not contact the exhaust manifold or the spark plug wires may be damaged.**

    NOTE: Apply silicone dielectric compound to the inside of the spark plug boots.

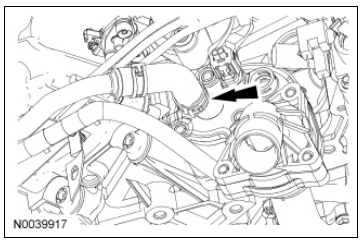
    Attach the LH spark plug wire retainers and connect the LH spark plug wires to the spark plugs.



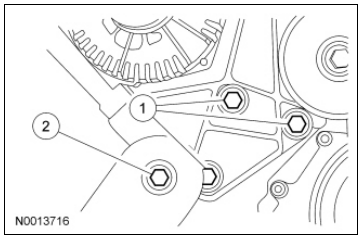
135. ***NOTICE:*** **Make sure to orient the spark plug boots so the spark plug wires do not contact the exhaust manifold or the spark plug wires may be damaged.**

    NOTE: Apply silicone dielectric compound to the inside of the spark plug boots.

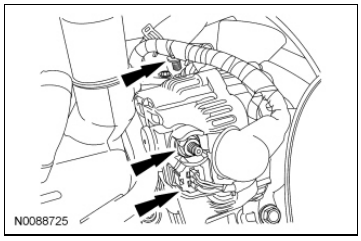
    Attach the RH spark plug wire retainers and connect the RH spark plug wires to the spark plugs.



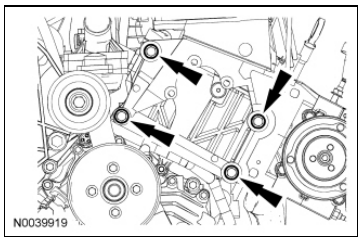
136. Position the heater hose tube bracket and the hoses as an assembly and install the bolt.
    - Tighten to 23 Nm (17 lb-ft).



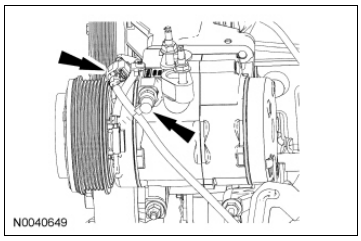
137. Connect the hose to the oil cooler.



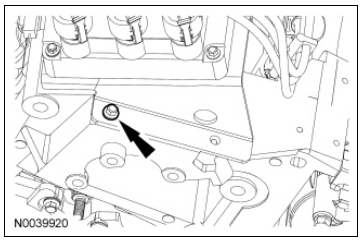
138. Connect the heater hose to the thermostat housing.



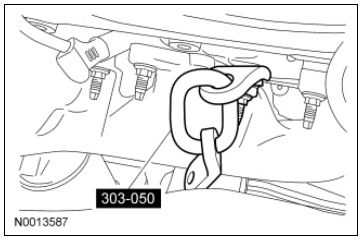
139. Install the generator mounting bracket.
    1. Install the 3 generator mounting bracket bolts.
        - ♦ Tighten to 42 Nm (31 lb-ft).
    2. Install the drive belt tensioner and bolt.
        - ♦ Tighten to 47 Nm (35 lb-ft).



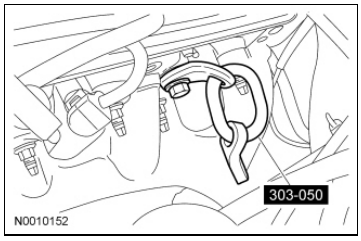
140. Attach the wire harness retainer, connect the generator electrical connector and the B+ cable and install the nut.
    - Tighten to 9 Nm (80 lb-in).



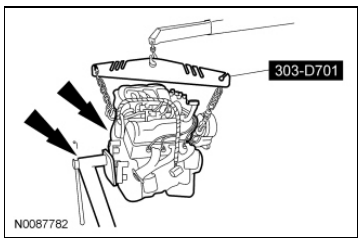
141. Install the A/C compressor and power steering pump bracket and the 4 bolts.
    - Tighten to 42 Nm (31 lb-ft).



142. Connect the A/C compressor electrical connector and wire harness retainer.



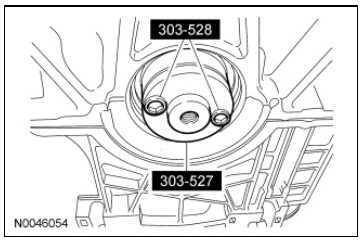
143. Install the ignition coil bracket bolt.
    - Tighten to 10 Nm (89 lb-in).



144. Install the right side Engine Lifting Bracket.

145. Install the left side Engine Lifting Bracket.

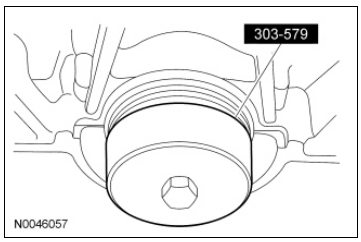
146. Using the Spreader Bar and a floor crane, remove the engine from the engine stand.



147. **NOTE:** The new replacement crankshaft rear seal comes with a speedy sleeve. The speedy sleeve must be installed with the crankshaft rear seal.

    NOTE: Be sure that the crankshaft rear sealing surface is clean and free of any rust or corrosion. To clean the crankshaft rear sealing surface, use an extra-fine emery cloth or an extra-fine steel wool with metal surface prep.

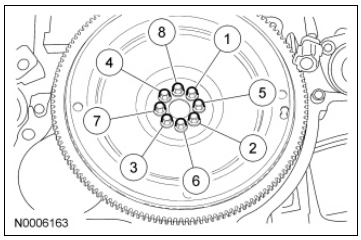
    Lubricate the crankshaft rear oil seal with engine oil.



148. Install the Adapter for 303-579 and the Crankshaft Rear Oil Seal Screws.

149. Position the crankshaft rear seal with speedy sleeve on the Adapter for 303-579 and the Crankshaft Rear Oil Seal Screws.

150. Using the Crankshaft Rear Oil Seal Installer, install the crankshaft rear oil seal with speedy sleeve.



151. Install the spacer plate.

152. Install the flexplate-to-crankshaft spacer.

153. **NOTE:** New flexplate bolts must be installed. They are a torque-to-yield design and cannot be reused.

    Install the flexplate.

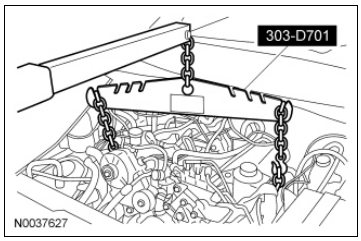
    - Tighten the 8 new bolts in the sequence shown in 3 stages.
    - Stage 1: Tighten to 13 Nm (115 lb-in).
    - Stage 2: Tighten to 50 Nm (37 lb-ft).
    - Stage 3: Tighten an additional 90 degrees.

Engine

Special Tool(s)

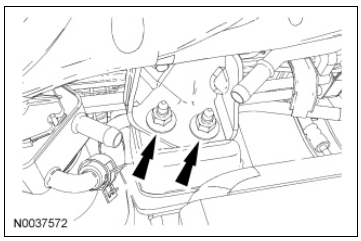
 ST1595-A	Engine Lifting Bracket 303-050 (T70P-6000)
 ST2673-A	Spreader Bar 303-D701 or equivalent

Material



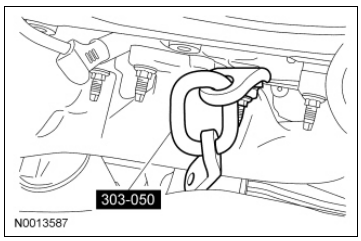
Item	Specification
Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil XO-5W30-QSP (US); Motorcraft® SAE 5W-30 Super Premium Motor Oil CXO-5W30-LSP12 (Canada); or equivalent	WSS-M2C929-A

Installation

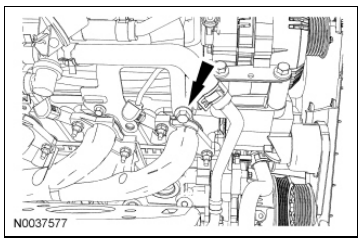


NOTICE: **Rotating the crankshaft pulley bolt counterclockwise could cause a reduction in clamp load on the crankshaft pulley and timing sprocket, which could cause severe engine damage.**

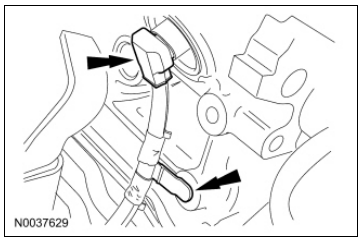
NOTICE: **If used as a leverage device, the fuel rail can be damaged. Care must be taken when working around the fuel rail.**



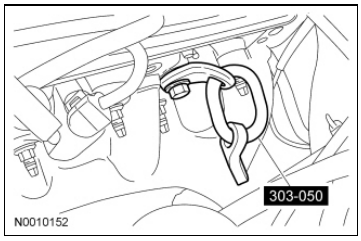
1. Position the engine in the vehicle and remove the floor crane and the Spreader Bar.



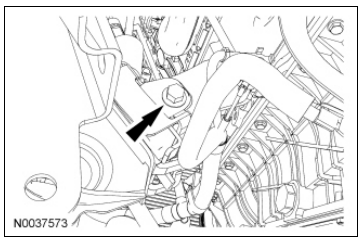
2. Install the 2 RH engine support insulator nuts.
   - Tighten to 90 Nm (66 lb-ft).



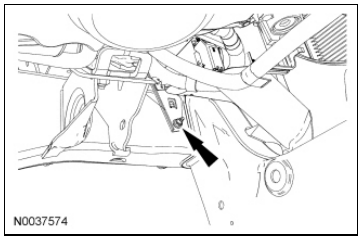
3. Remove the Engine Lifting Bracket from the RH side of the engine.



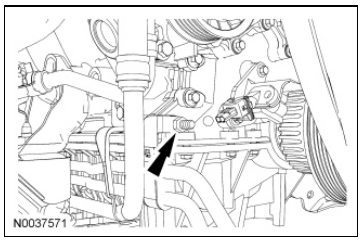
4. Install the heater tube bracket front bolt.
   - Tighten to 34 Nm (25 lb-ft).



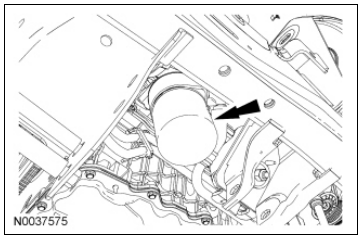
5. If equipped, connect the block heater electrical connector and the wiring harness retainer.



6. Remove the Engine Lifting Bracket from the LH side of the engine.

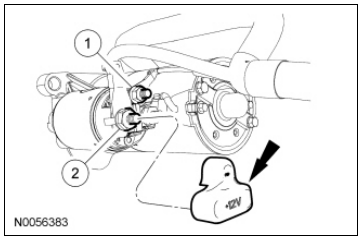


7. Install the LH engine support insulator through bolt.
   - Tighten to 103 Nm (76 lb-ft).

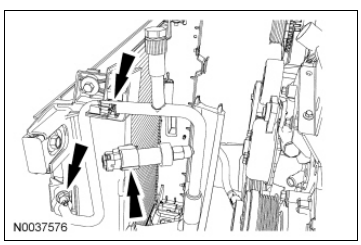


8. Position the battery cable harness bracket and install the nut.
   - Tighten to 15 Nm (133 lb-in).

9. Position the transmission cooler tubes and install the nut.
   - Tighten to 23 Nm (17 lb-ft).

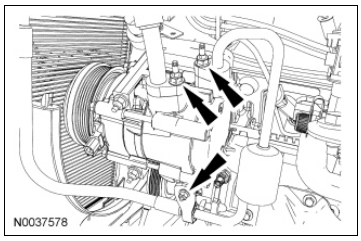


10. Install the oil filter.
    - Tighten to 13 Nm (115 lb-in).

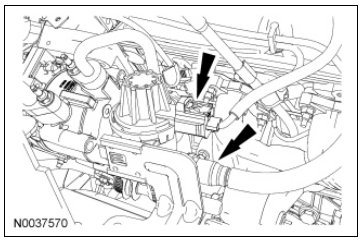


11. Install the transmission. For additional information, refer to Section 307-01A .

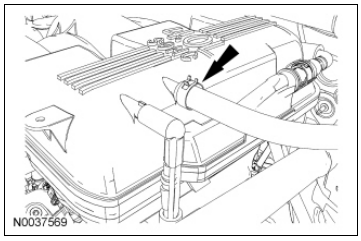
12. Attach the starter wiring and install the nuts. Install the terminal cover.
    1. Tighten the S-terminal nut to 6 Nm (53 lb-in).
    2. Tighten the B-terminal nut to 12 Nm (106 lb-in).



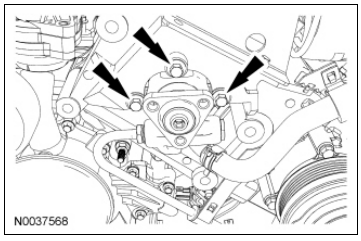
13. Install a new gasket and a new O-ring seal. Position the A/C tube, install the A/C line fitting nut, close the latch and connect the A/C high pressure cutoff switch electrical connector.
    - Tighten to 15 Nm (133 lb-in).



14. Install new gaskets and new O-ring seal. Position the A/C tubes and install the 3 nuts.

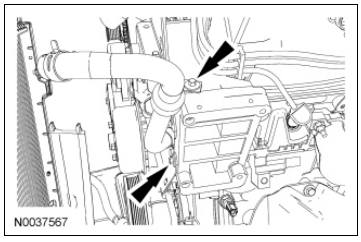


- Tighten the 2 A/C fitting nuts to 15 Nm (133 lb-in).
- Tighten the A/C tube bracket nut to 10 Nm (89 lb-in).

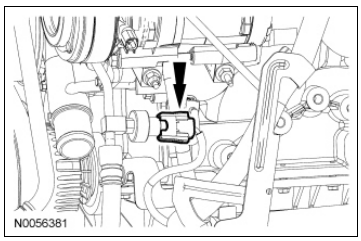


15. Position the Evaporative Emission (EVAP) hose and connect it to the EVAP canister purge valve. Connect the EVAP canister purge valve electrical connector.

16. Connect the brake booster vacuum hose.



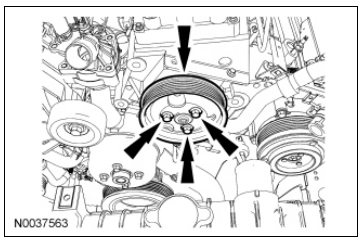
17. Position the power steering pump and install the 3 bolts.
    - Tighten to 25 Nm (18 lb-ft).



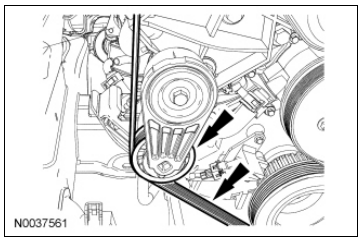
18. **NOTE:** A/C compressor removed from art for clarity.

    Position the Power Steering Pressure (PSP) hose and the power steering reservoir-to-power steering pump hoses and install the 2 bolts.

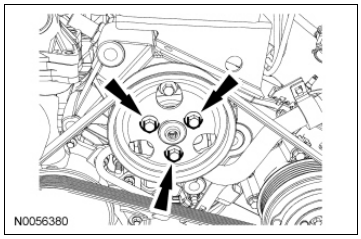
    - Tighten to 11 Nm (97 lb-in).



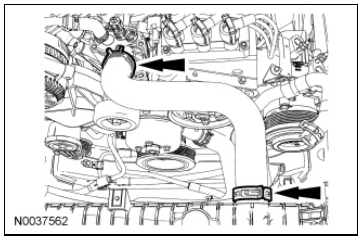
19. Connect the PSP switch electrical connector.



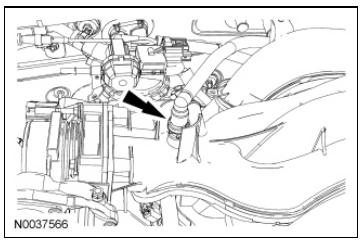
20. Connect the lower radiator hose to the coolant pump.



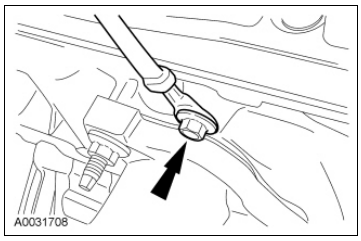
21. Position the power steering pump pulley and install the 3 bolts finger-tight.



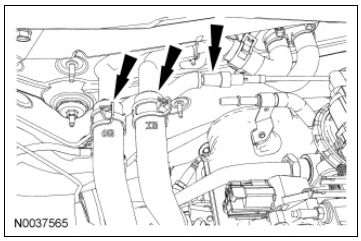
22. Rotate the accessory drive belt counterclockwise and install the accessory drive belt.



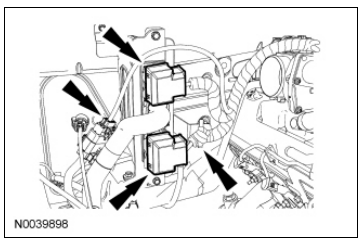
23. Tighten the 3 power steering pump pulley bolts.
    - Tighten to 25 Nm (18 lb-ft).



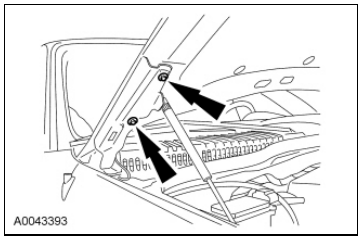
24. Install the upper radiator hose.



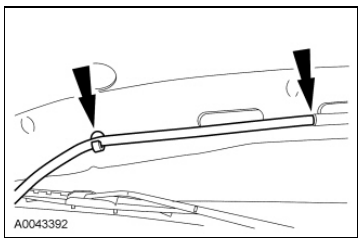
25. Connect the EVAP hose.



26. Position the ground strap to the RH cylinder head and install the bolt.
    - Tighten to 10 Nm (89 lb-in).

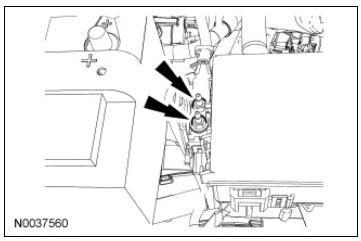


27. Connect the heater hoses and the vacuum hose.
    - Connect the heater control valve vacuum hose.

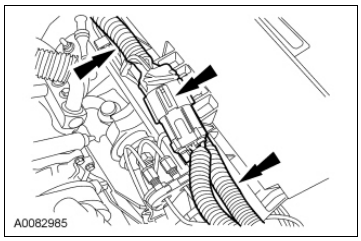


28. Connect the engine wiring harness-to-PCM electrical connectors and the wiring harness electrical connector. Attach the wiring harness retainer.

29. Position the hood and install the 4 bolts.
    - Tighten to 12 Nm (106 lb-in).

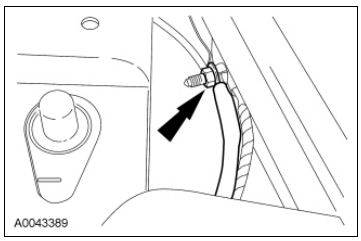


30. Connect the windshield washer hose.



31. Install the Air Cleaner (ACL) and the ACL outlet pipe. For additional information, refer to Section 303-12 .

32. Install the cooling fan. For additional information, refer to Section 303-03 .



33. Connect the battery cable connectors and install the 2 nuts. Close the cover.
    - Tighten to 12 Nm (106 lb-in).

34. Connect the electrical connector and attach the wiring harness retainers.

35. Position the ground wire and install the nut.
    - Tighten to 9 Nm (80 lb-in).

36. Connect the battery cables. For additional information, refer to Section 414-01 .

37. Connect the fuel supply tube spring lock coupling. For additional information, refer to Section 310-00 .

38. Fill the engine with clean engine oil.

39. Fill the cooling system. For additional information, refer to Section 303-03 .

40. Recharge the A/C system. For additional information, refer to Section 412-00 .

41. Start the engine and check for leaks. Stop the engine and check all fluid levels.

42. Carry out the fluid level check for the transmission. For additional information, refer to Section 307-01A .

General Specifications

Item	Specification
Engine	
Displacement	4.6L (281 CID)
Number of cylinders	8
Bore	90.2 mm (3.55 in)
Stroke	90.0 mm (3.54 in)
Firing order	1-3-7-2-6-5-4-8
Spark plugs	HJFS-24FP
Minimum oil pressure at idle (engine at normal operating temperature)	172 kPa (25 psi)
Oil pressure minimum at 2,000 rpm (engine at normal operating temperature)	517 kPa (75 psi)
Compression ratio	9.8:1

Engine weight (without accessory drive components or flexplate)	220 kg (485 lb)
Cylinder Head and Valve Train	
Combustion chamber volume	48.1-51.1 cc (2.94-3.12 cu in)
Valve arrangement (front to rear) - LH	I-E-I-I-E-I-I-E-I-I-E-I
Valve arrangement (front to rear) - RH	I-E-I-I-E-I-I-E-I-I-E-I
Valve guide bore diameter	6.015-6.044 mm (0.237-0.238 in)
Valve stem diameter - intake	5.975-5.995 mm (0.235-0.236 in)
Valve stem diameter - exhaust	5.95-5.97 mm (0.234-0.235 in)
Valve stem-to-guide clearance - intake	0.020-0.069 mm (0.001-0.003 in)
Valve stem-to-guide clearance - exhaust	0.045-0.094 mm (0.002-0.004 in)
Valve head diameter - intake	33.62-33.98 mm (1.324-1.338 in)
Valve head diameter - exhaust	37.32-37.68 mm (1.469-1.483 in)
Valve face runout	0.05 mm (0.002 in)
Valve face angle	45.5 degrees
Valve seat width - intake	1.2-1.4 mm (0.047-0.055 in)
Valve seat width - exhaust	1.4-1.6 mm (0.055-0.063 in)
Valve seat angle	44.5-45.0 degrees
Valve spring free length	56.5 mm (2.22 in)
Valve spring compression pressure (maximum lift)	760 N (171 lb) ± 39.0 N (8.8 lb) @ 31.04 mm (1.22 in)
Valve spring installed height	42.04 mm (1.66 in)
Valve spring installed pressure	350 N (79 lb) ± 17.5 N (4 lb) @ 42.04 mm (1.66 in)
Head gasket surface flatness	0.025 mm (0.001 in) in any 25 mm (1 in) x 25 mm (1 in) area; 0.05 mm (0.002 in) in any 150 mm (6 in) x 150 mm (6 in) area; 0.1 mm (0.004 in) overall
Hydraulic Lash Adjuster	
Diameter	15.988-16.000 mm (0.6294-0.6299 in)
Clearance-to-bore	0.018-0.069 mm (0.0007-0.0027 in)
Service limit	-
Collapsed lash adjuster gap	0.45-0.85 mm (0.018-0.033 in)
Camshaft	
Theoretical valve lift @ 0 lash - intake	11.166 mm (0.439 in)
Theoretical valve lift @ 0 lash - exhaust	11.066 mm (0.436 in)
Lobe lift - intake	5.520 mm (0.217 in)
Lobe lift - exhaust	5.506 mm (0.217 in)
Allowable lobe lift loss	0.00127 mm (0.00005 in)
Journal diameter	28.607-28.633 mm (1.126-1.127 in)
Camshaft journal bore inside diameter	28.657-28.682 mm (1.128-1.129 in)
Camshaft journal-to-bearing clearance	0.024-0.075 mm (0.001-0.003 in)

Runout	0.03 mm (0.001 in)
End play	0.027-0.190 mm (0.001-0.007 in)
Cylinder Block	
Cylinder bore diameter - grade 1	90.200-90.210 mm (3.5512-3.5516 in)
Cylinder bore diameter - grade 2	90.210-90.220 mm (3.5516-3.5520 in)
Cylinder bore diameter - grade 3	90.220-90.230 mm (3.5520-3.5524 in)
Cylinder bore maximum taper	0.006 mm (0.0002 in)
Cylinder bore maximum out-of-round	0.020 mm (0.0008 in)
Main bearing bore inside diameter	72.400-72.424 mm (2.850-2.851 in)
Head gasket surface flatness	0.03 mm (0.001 in) in any 40 mm (1.5 in) x 40 mm (1.5 in) area; 0.05 mm (0.002 in) in any 150 mm (6 in) x 150 mm (6 in) area; 0.15 mm (0.006 in) overall
Crankshaft	
Main bearing journal diameter	67.481-67.505 mm (2.6567-2.6576 in)
Main bearing journal maximum taper	0.004 mm (0.0002 in)
Main bearing journal maximum out-of-round	0.0075 mm (0.0003 in) between cross sections
Main bearing journal-to-cylinder block clearance	0.048-0.024 mm (0.0019-0.0009 in)
Connecting rod journal diameter	53.003-52.983 mm (2.0867-2.0859 in)
Connecting rod journal maximum taper	0.004 mm (0.0002 in)
Connecting rod journal maximum out-of-round	0.0075 mm (0.0003 in) between cross sections
Crankshaft maximum end play	0.075-0.377 mm (0.0030-0.0148 in)
Piston and Connecting Rod	
Piston diameter - grade 1 (at right angle to pin bore) (uncoated)	90.182-90.167 mm (3.5504-3.5499 in)
Piston diameter - grade 2 (at right angle to pin bore) (uncoated)	90.196-90.179 mm (3.551-3.5503 in)
Piston diameter - grade 3 (at right angle to pin bore) (uncoated)	90.208-90.193 mm (3.5515-3.551 in)
Piston-to-cylinder bore clearance (at grade size)	0.017-0.047 mm (0.0007-0.0019 in)
Piston ring end gap - top	0.15-0.30 mm (0.006-0.012 in)
Piston ring end gap - intermediate	0.25-0.50 mm (0.0098-0.0197 in)
Piston ring end gap - oil control	0.15-0.65 mm (0.0059-0.0256 in)
Piston ring groove width - top	1.52-1.54 mm (0.0598-0.0606 in)
Piston ring groove width - intermediate	1.52-1.54 mm (0.0598-0.0606 in)
Piston ring groove width - oil control	3.030-3.056 mm (0.1193-0.1203 in)
Piston ring width - top and intermediate	1.50-1.48 mm (0.0590-0.0582 in)
Piston ring-to-groove clearance - top	0.020-0.060 mm (0.0008-0.0020 in)
Piston ring-to-groove clearance - intermediate	0.020-0.060 mm (0.0008-0.0020 in)
Piston pin bore diameter	22.0125-22.0175 mm (0.8666-0.8668 in)
Piston pin diameter	22.0010-22.0030 mm (0.8662-0.8663 in)
Piston pin length	61.8 mm (2.433 in)

Piston pin-to-piston fit	0.0095-0.023 mm (0.0004-0.0009 in)
Connecting rod-to-pin clearance	0.009-0.023 mm (0.0004-0.0009 in)
Connecting rod pin bore diameter	22.012-22.024 mm (0.8666-0.8671 in)
Connecting rod length (center-to-center)	150.7 mm (5.933 in)
Connecting rod maximum allowed bend	± 0.038 mm (0.0015 in)
Connecting rod maximum allowed twist [a]	± 0.05 mm (0.0020 in)
Connecting rod bearing bore diameter (with assembled liners)	53.049-53.027 mm (2.0885-2.0877 in)
Connecting rod bearing-to-crankshaft clearance	0.024-0.066 mm (0.0009-0.0026 in)
Connecting rod side clearance	0.5-0.15 mm (0.02-0.006 in)

[a] The pin bore and crank bearing bore must be parallel and in the same vertical plane within the specified total difference when measured at the ends of a 203 mm bar, 105.5 mm on each side of rod centerline.

Heater supply tube stud bolt	10	-	89
Hood hinge bolts	12	-	106
Ignition coil bolts	6	-	53
Intake manifold bolts [a]	-	-	-
Knock Sensor (KS) bolts	20	-	177
Oil drain splash shield	12	-	106
Oil filter adapter bolts	25	18	-
Oil level indicator tube bolt	10	-	89
Oil pan bolts [a]	-	-	-
Oil pan drain plug	23	17	-
Oil pump bolts	10	-	89
Oil pump screen and pickup tube spacer	25	18	-
Oil pump screen and pickup tube-to-oil pump bolts	10	-	89
Oil pump screen and pickup tube-to-spacer bolt	25	18	-
Power Steering Pressure (PSP) hose-to-battery cable bracket nut	10	-	89
Power steering pump stud bolts	25	18	-
Radio interference capacitor nuts	25	18	-
Spark plugs	12	-	106
Stabilizer bar bracket bolts	55	41	-
Steering intermediate shaft coupling bolt	48	35	-
Throttle Body (TB) bolts	10	-	89
Timing chain guide bolts	10	-	89
Timing chain hydraulic tensioner bolts	25	18	-
Transmission cooler tube bracket-to-engine front cover nut	12	-	106
Valve cover bolts [a]	-	-	-
Variable Camshaft Timing (VCT) housing bolts	10	-	89
Wiring harness bracket nuts	10	-	89

Wiring harness terminals-to-Power Distribution Box (PDB) nuts	12	-	106

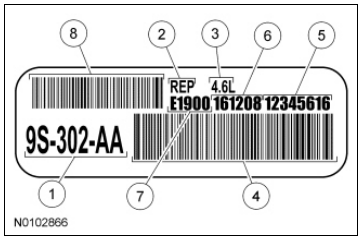
[a] Refer to the procedure in this section.

Engine

NOTE: For information, refer to the exploded views under Engine in the Assembly portion of this section.

The 4.6L (3V) is a V-8 engine with the following features:

- Single overhead camshafts
- Three valves per cylinder
- Sequential Multi-Port Fuel Injection (SFI)
- Aluminum cylinder heads
- Aluminum cylinder block
- Variable Camshaft Timing (VCT)
- Individually chain-driven camshafts with a hydraulic timing chain tensioner on each timing chain
- Distributorless ignition system
- Electronic returnless fuel system

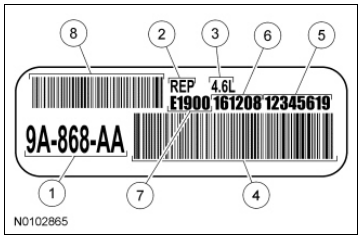


Identification

Always refer to these labels when installation of new parts is necessary or when checking engine calibrations. The engine parts often differ within a CID family. Verification of the identification codes will make sure that the correct parts are obtained. These codes contain all of the pertinent information relating to the dates, optional equipment and revisions. The Ford Catalog AdvantageTM or equivalent contains a complete listing of the codes and their applications.

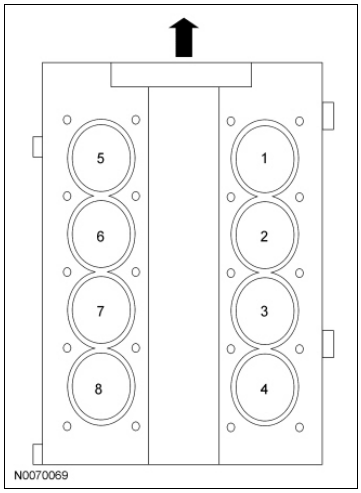
Engine Code Information Label

The engine code information label is located on the side of the LH valve cover, it contains the following:



Explorer/Mountaineer

Item	Description
1	Engine part number
2	Romeo engine plant
3	Engine displacement
4	Bar code
5	Running number
6	Engine build date (DDMMYY)
7	Plant shift line



8	Bar code

Explorer Sport Trac

Item	Description
1	Engine part number
2	Romeo engine plant
3	Engine displacement
4	Bar code
5	Running number
6	Engine build date (DDMMYY)
7	Plant shift line
8	Bar code

Engine Cylinder Identification

Induction System

The SFI provides the fuel/air mixture needed for combustion in the cylinders. The 8 solenoid-operated fuel injectors:

- are mounted in the intake manifold.
- meter fuel into the air intake stream in accordance with engine demand.
- are positioned so that their tips direct fuel just ahead of the engine intake valves.

- are connected in series with the fuel rail pressure and temperature sensor.
- supply fuel from the fuel tank with a fuel pump mounted in the fuel tank.

A constant fuel pressure is maintained across the fuel injectors by the fuel rail pressure and temperature sensor. The fuel rail pressure and temperature sensor is positioned upstream from the fuel injectors on the fuel rail.

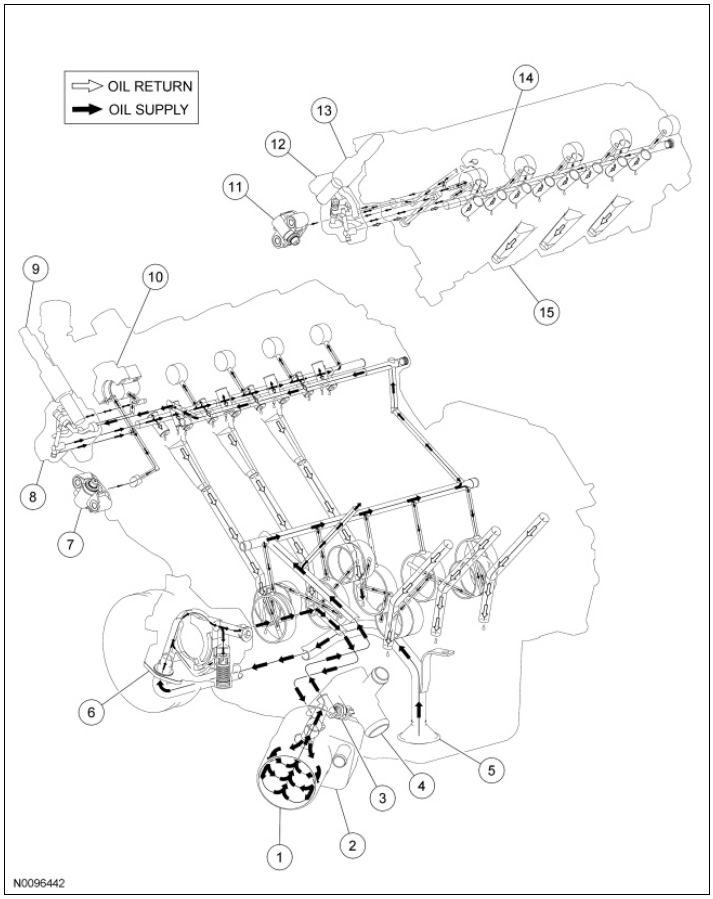
Valve Train

The valve train operates as follows:

- Ball-tip hydraulic lash adjusters provide automatic lash adjustment.
- Roller followers ride on the camshaft lobe, transferring the up-and-down motion of the camshafts to the valves in the cylinder heads.

Positive Crankcase Ventilation System

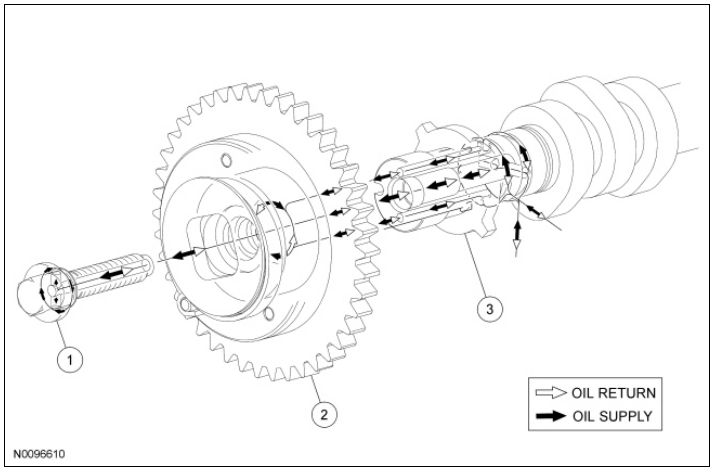
All engines are equipped with a closed-type positive crankcase ventilation system recycling the crankcase vapors to the upper intake manifold.



Lubrication System

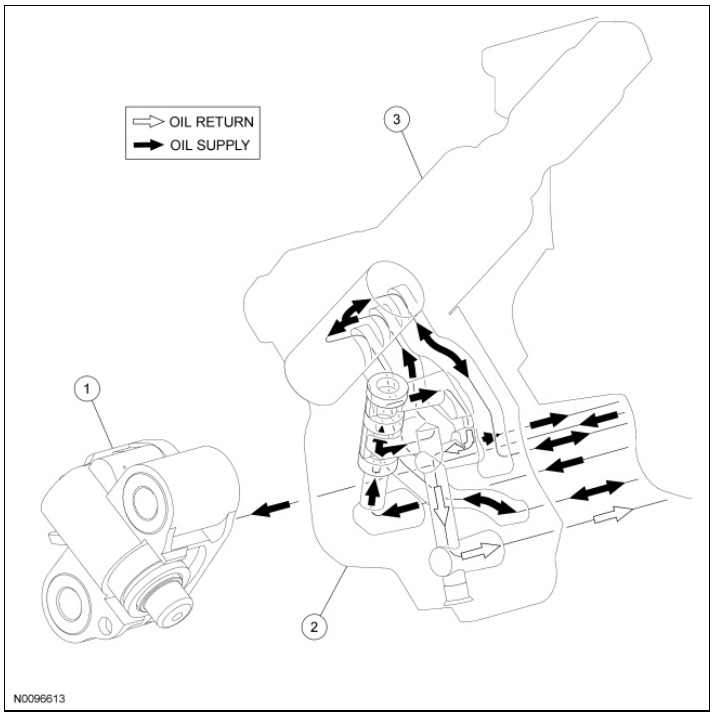
The engine lubrication system operates as follows:

- Oil is drawn into the oil pump through the oil pump screen cover and tube in the sump of the oil pan.
- Oil is pumped through the oil filter on the left front side of the cylinder block.
- Oil enters the main gallery where it is distributed to the crankshaft main journals and to both cylinder heads.
- From the main journals, the oil is routed through cross-drilled passages in the crankshaft to lubricate the connecting rod bearings. Controlled leakage through the crankshaft main bearings and connecting rod bearings is slung radially outward to cool and lubricate the cylinder walls as well as the entire connecting rod, piston and piston ring assembly.
- The left cylinder head is fed from a drilling into the supply passage feeding the main gallery at the front of the cylinder block. The right cylinder head is fed from a drilling into the rear of the main gallery. Main gallery pressure is reduced as it enters the cylinder head galleries through fixed serviceable orifices, located at the upper part of the feed passages. It is this reduced pressure in the cylinder head galleries which feeds the camshaft journals, the hydraulic lash adjusters and the primary and secondary timing chain tensioners.
- The oil pressure feed for the Variable Camshaft Timing (VCT) solenoids, VCT housings and camshaft phaser and sprockets is not reduced.
- The camshaft lobe and roller followers are lubricated by splash created through valve train operation.



Engine Oil Flow Illustrations

Engine Assembly



Item	Part Number	Description
1	6714	Oil filter
2	6A642	Oil cooler (if equipped)
3	9278	Engine Oil Pressure (EOP) switch
4	6884	Oil filter adapter
5	6622	Oil pump screen and pickup tube
6	6621	Oil pump
7	6L266A	Timing chain tensioner - RH
8	6C260	Variable Camshaft Timing (VCT) housing - RH
9	6M280	VCT oil control solenoid assembly - RH
10	6B284	Front camshaft bearing cap - RH
11	6L266B	Timing chain tensioner - LH
12	6C261	VCT housing - LH
13	6M280	VCT oil control solenoid assembly - LH

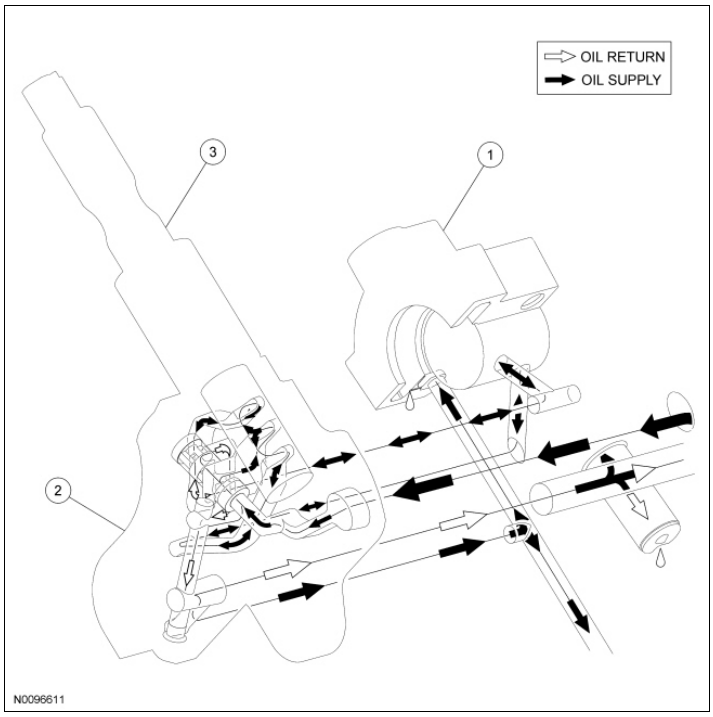
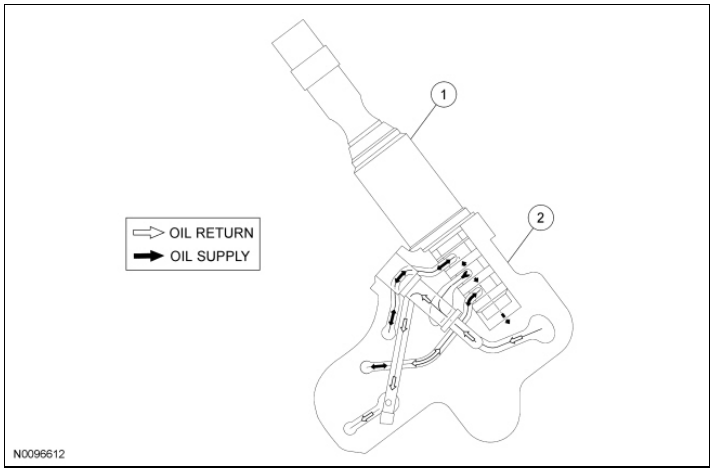
15	6050	Cylinder head - LH

Camshaft Phaser and Sprocket, Camshaft Phaser and Sprocket Bolt and Camshaft



Item	Part Number	Description
1	6279	Camshaft phaser and sprocket bolt
2	6256	Camshaft phaser and sprocket
3	-	Camshaft

LH Variable Camshaft Timing (VCT) Housing, VCT Solenoid and Timing Chain Tensioner



Item	Part Number	Description
1	6L266B	Timing chain tensioner - LH
2	6C261	Variable Camshaft Timing (VCT) housing - LH
3	6M280	VCT oil control solenoid assembly - LH

RH Variable Camshaft Timing (VCT) Housing and VCT Solenoid

Item	Part Number	Description
1	6M280	Front camshaft bearing cap - RH
2	6C261	Variable Camshaft Timing (VCT) housing - RH
3	6C260	VCT oil control solenoid assembly - RH

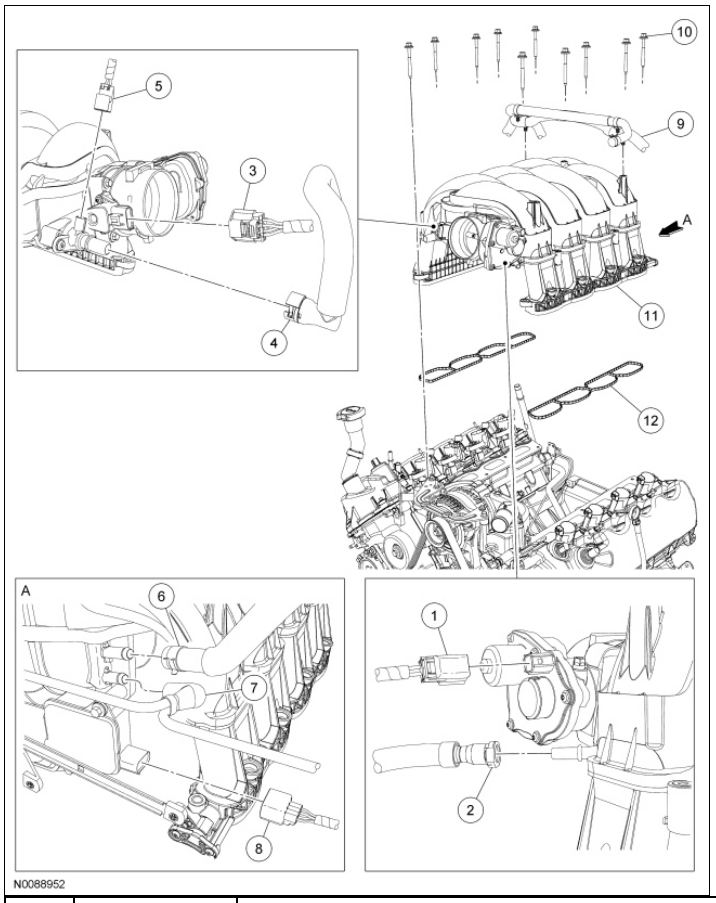
Variable Camshaft Timing (VCT) Housing

Item	Part Number	Description
1	-	Variable Camshaft Timing (VCT) oil control solenoid assembly
2	-	VCT housing

Oil Pump

The lubrication system is designed to provide optimum oil flow to critical components of the engine through its entire operating range. The heart of the system is a positive displacement internal gear oil pump using top seal rotors. Generically this design is known as a gerotor pump, which operates as follows:

- The oil pump is mounted on the front face of the cylinder block.
- The inner rotor is piloted on the crankshaft post and is driven through flats on the crankshaft.
- System pressure is limited by an integral, internally-vented relief valve which directs the bypassed oil back to the inlet side of the oil pump.
- Oil pump displacement has been selected to provide adequate volume to make sure of correct oil pressure, both at hot idle and maximum speed.
- The relief valve calibration protects the system from excessive pressure during high-viscosity conditions.
- The relief valve is designed to provide adequate connecting rod bearing lubrication under high-temperature and high-speed conditions.



Engine

For basic engine mechanical concerns, refer to Section 303-00 . For driveability concerns, refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Intake Manifold

Material

Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	-

Item	Part Number	Description
1	14A464	Electronic Throttle Body (ETB) electrical connector (part of 12B637)
2	9D289	Evaporative Emission (EVAP) hose
3	14A464	Throttle Position (TP) sensor electrical connector (part of 12B637)
4	6K817	PCV hose
5	14A464	Heated PCV fitting electrical connector (part of 12B637)
6	9C482	Brake booster vacuum hose
7	4E498	Vacuum hose

8	14A464	Charge Motion Control Valve (CMCV) electrical connector (part of 12B637)
9	13A506	Wiring harness retainers (part of 12B637)
10	W709552	Intake manifold bolt (10 required)
11	9425	Intake manifold
12	9439	Intake manifold gasket (2 required)

Removal

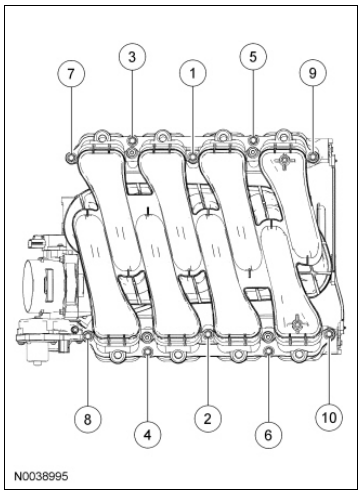
⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

1. Release the fuel system pressure. For additional information, refer to Section 310-00 .
2. Remove the Air Cleaner (ACL) outlet pipe. For additional information, refer to Section 303-12 .
3. Remove the fuel rail and injectors. For additional information, refer to Section 303-04B .
4. Disconnect the Electronic Throttle Body (ETB) electrical connector.
5. Disconnect the Evaporative Emission (EVAP) tube from the intake manifold.
6. Disconnect the Throttle Position (TP) sensor electrical connector.
7. Disconnect the PCV hose from the heated PCV fitting on the intake manifold.
8. Disconnect the heated PCV fitting electrical connector.
9. Detach the wiring harness retainers from the intake manifold.
10. Disconnect the Charge Motion Control Valve (CMCV) electrical connector.
11. Remove the 10 bolts and position the intake manifold forward.
12. Disconnect the brake booster vacuum hose from the rear of the intake manifold.
13. Disconnect the vacuum hose from the rear of the intake manifold.
14. Remove the intake manifold and the gaskets.
    - Discard the gaskets.

Installation

1. ***NOTICE:*** **If the engine is repaired or replaced because of upper engine failure, typically including valve or piston damage, check the intake manifold for metal debris. If metal debris is found, install a new intake manifold. Failure to follow these instructions can result in engine damage.**



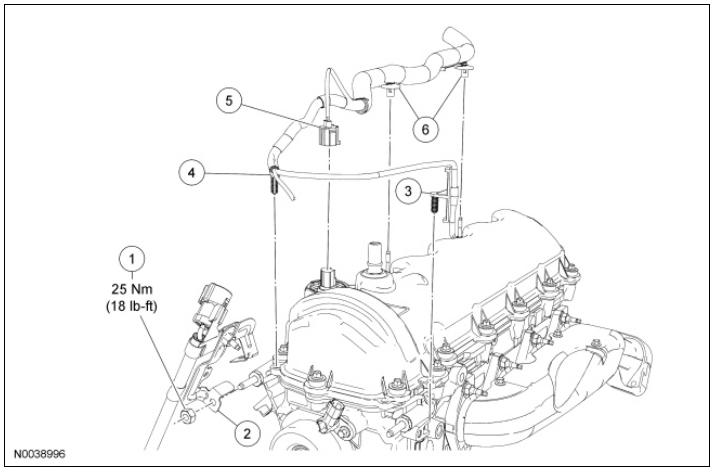
NOTICE: **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old gaskets.**

NOTE: Clean and inspect the sealing surfaces with metal surface prep. Follow the directions on the packaging.

NOTE: Electrical and vacuum harnesses must not restrict movement of the CMCV control rods at the rear of the intake manifold. Use extreme care during the installation of the intake manifold to prevent any pinching of electrical and vacuum harnesses.

Using new intake manifold gaskets, position the intake manifold.

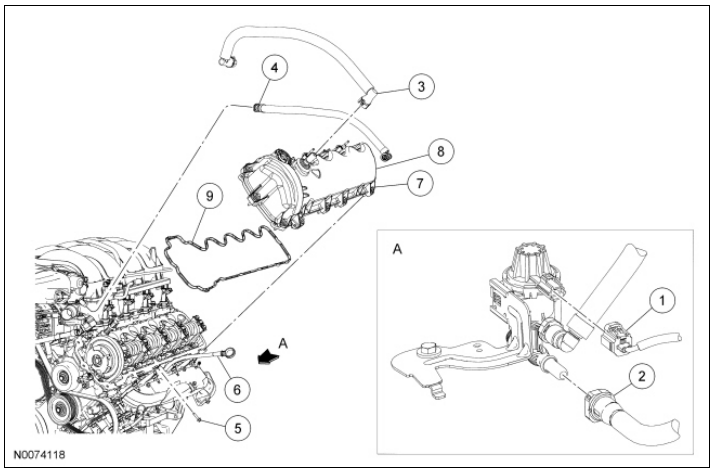
2. Connect the vacuum hose to the rear of the intake manifold.
3. Connect the brake booster hose to the rear of the intake manifold.
4. Install the 10 intake manifold bolts and tighten the bolts in the sequence shown in 2 stages.
   - Stage 1: Tighten to 2 Nm (18 lb-in).
   - Stage 2: Tighten to 10 Nm (89 lb-in).



5. Connect the CMCV electrical connector.
6. Attach the wiring harness retainers to the intake manifold.
7. Connect the heated PCV fitting electrical connector.
8. Connect the PCV hose to the heated PCV fitting on the intake manifold.
9. Connect the TP sensor electrical connector.
10. Connect the EVAP hose to the intake manifold.
11. Connect the ETB electrical connector.
12. Install the fuel rail and injectors. For additional information, refer to Section 303-04B .
13. Install the ACL outlet pipe. For additional information, refer to Section 303-12 .

Valve Cover - LH

Material



Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	-
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4
Motorcraft® Silicone Gasket Remover ZC-30	-

Electrical Connectors and Wiring Harnesses

Item	Part Number	Description
1	N804758	Electric cooling fan clutch wiring harness bracket nut
2	14W163	Electric cooling fan clutch wiring harness bracket
3	13A506	Wiring harness retainer (part of 12B637)
4	13A506	Wiring harness retainer (part of 12B637)
5	14A464	LH Variable Camshaft Timing (VCT) solenoid electrical connector (part of 12B637)
6	14A163	Wiring harness retainers (part of 12B637) (2 required)

LH Valve Cover

Item	Part Number	Description
1	14A464	Evaporative Emission (EVAP) canister purge valve electrical connector
2	9D676	EVAP canister-to- EVAP canister purge valve hose
3	6K817	PCV hose
4	9D289	EVAP tube
5	N806155	Oil level indicator tube bracket bolt
6	-	Oil level indicator tube (part of 6754)
7	6C519	LH valve cover bolt (10 required)
8	6A513	LH valve cover
9	6A559	LH valve cover gasket

Removal

1. Remove the LH ignition coils. For additional information, refer to Section 303-07B .
2. Remove the bolt and position the oil level indicator and tube aside.
3. Disconnect the Evaporative Emission (EVAP) tube from the intake manifold.
4. Disconnect the PCV hose from the valve cover.
5. Remove the nut and position the cooling fan wiring harness bracket aside.
6. Disconnect the 2 pin-type retainers from the valve cover.
7. Disconnect the Variable Camshaft Timing (VCT) solenoid electrical connector.
8. Detach the wiring harness retainers from the valve cover studs.
9. Disconnect the EVAP canister purge valve electrical connector.
10. Disconnect the EVAP canister-to- EVAP canister purge valve EVAP hose from the EVAP canister purge valve.
11. Loosen the 10 bolts and remove the LH valve cover and gasket.

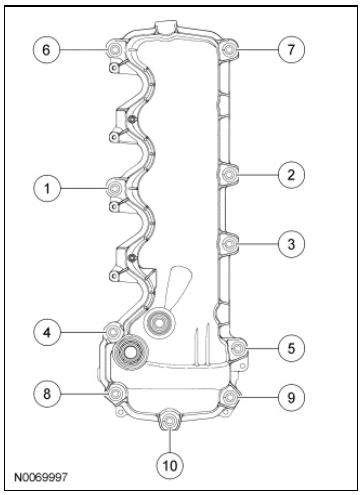
- Discard the gasket.

Installation

1. *NOTICE:* **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

   Clean the gasket mating surfaces.

   - Clean the valve cover mating surface of the cylinder head with silicone gasket remover and metal surface prep. Follow the directions on the packaging.
   - Clean the valve cover gasket groove in the valve cover with soap and water or a suitable solvent.



2. Install a new gasket on the LH valve cover.

3. **NOTE:** If the valve cover is not secured within 4 minutes, the sealant must be removed and the sealing area cleaned with metal surface cleaner. Failure to follow this procedure may cause future oil leakage.

   Apply a bead of silicone gasket and sealant in 2 places where the engine front cover meets the cylinder head.

4. Position the 10 LH valve cover with a new gasket and tighten the 10 bolts in the sequence shown.
   - Tighten to 10 Nm (89 lb-in).

5. Connect the EVAP canister-to- EVAP canister purge valve EVAP hose to the EVAP canister purge valve.

6. Connect the EVAP canister purge valve electrical connector.

7. Attach the wiring harness retainers to the valve cover studs.

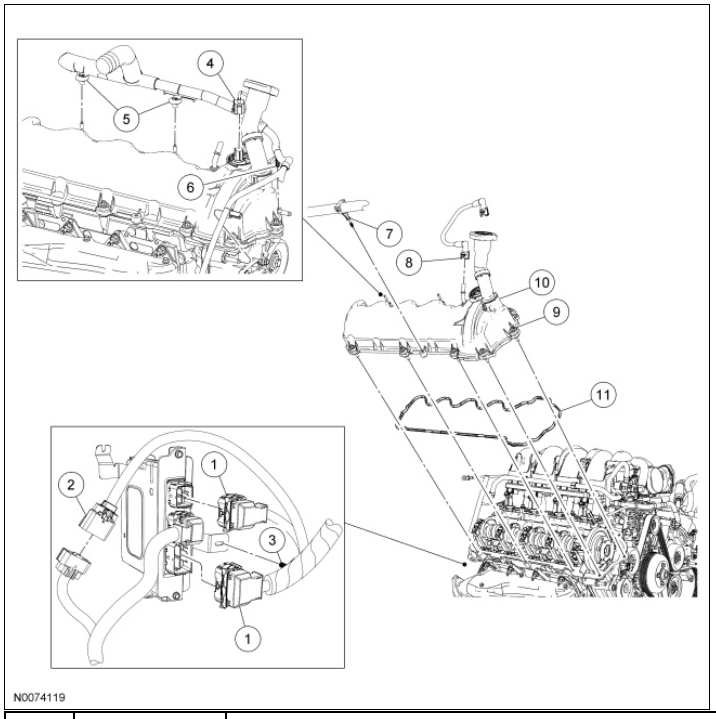
8. Connect the VCT solenoid electrical connector.

9. Connect the 2 pin-type retainers to the valve cover.

10. Position the cooling fan wiring harness bracket and install the nut.
    - Tighten to 25 Nm (18 lb-ft).

11. Connect the PCV hose to the valve cover.

12. Connect the EVAP tube to the intake manifold.



13. Position the oil level indicator tube and install the bolt.
    - Tighten to 10 Nm (89 lb-in).

14. Install the LH ignition coils. For additional information, refer to Section 303-07B .

Valve Cover - RH

Material

Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	-
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4
Motorcraft® Silicone Gasket Remover ZC-30	-

Item	Part Number	Description
1	14A464	Engine wiring harness-to-PCM electrical connectors (part of 12B637) (2 required)
2	14A624	Engine wiring harness in-line electrical connector (part of 12B637)
3	13A506	Wiring harness pin-type retainer (part of 12B637)
4	14A464	RH Variable Camshaft Timing (VCT) oil control solenoid electrical connector (part of 12B637)
5	14A163	Wiring harness retainers (part of 12B637) (3 required)
6	13A506	Wiring harness pin-type retainer (part of 12B637)
7	8W287	Heater hose retainer

8	6758	Crankcase breather tube
9	6C519	RH valve cover bolt (9 required)
10	6583	RH valve cover
11	6584	RH valve cover gasket

Removal

1. Remove the Air Cleaner (ACL) and the ACL outlet pipe. For additional information, refer to Section 303-12 .

2. Remove the RH ignition coils. For additional information, refer to Section 303-07B .

3. Disconnect the engine wiring harness from the PCM.
   - Disconnect the 2 PCM electrical connectors.
   - Disconnect the in-line electrical connector.
   - Detach the wiring harness retainer from the PCM bracket and position the wiring harness aside.

4. Disconnect the RH Variable Camshaft Timing (VCT) oil control solenoid electrical connector.

5. Detach the 2 wiring harness retainers from the RH valve cover studs.

6. Detach the wiring harness pin-type retainer from the front of the RH valve cover.

7. Detach the heater hose retainer from the RH valve cover.

8. Disconnect the crankcase breather tube from the RH valve cover.

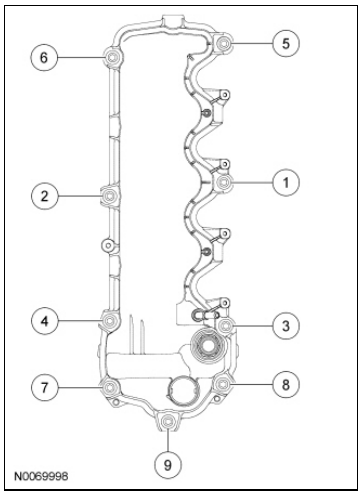
9. Loosen the 9 RH valve cover bolts and remove the RH valve cover and the RH valve cover gasket.
   - Discard the gasket.

Installation

1. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

   Clean the gasket mating surfaces.

   - Clean the valve cover mating surface of the RH cylinder head with silicone gasket remover and metal surface prep. Follow the directions on the packaging.
   - Clean the RH valve cover gasket groove with soap and water or a suitable solvent.



2. Install a new gasket on the RH valve cover.

3. **NOTE:** If the RH valve cover is not secured within 4 minutes, the sealant must be removed and the sealing area cleaned with metal surface cleaner. Failure to follow this procedure may cause future oil leakage.

   Apply a bead of silicone gasket and sealant in 2 places where the engine front cover meets the RH cylinder head.

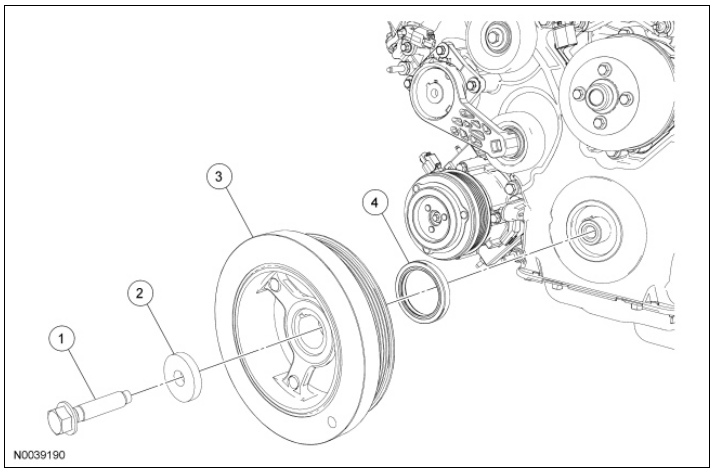
4. Position the RH valve cover with a new gasket on the cylinder head and tighten the 9 bolts in the sequence shown.
    - Tighten to 10 Nm (89 lb-in).

5. Connect the crankcase breather tube to the RH valve cover.

6. Attach the heater hose retainer to the RH valve cover.

7. Attach the wiring harness pin-type retainer to the front of the RH valve cover.

8. Attach the wiring harness retainers to the RH valve cover studs.



9. Connect the RH VCT oil control solenoid electrical connector.

10. Connect the engine wiring harness to the PCM.
    - Position the wiring harness and attach the wiring harness pin-type retainer to the PCM bracket.
    - Connect the in-line electrical connector.
    - Connect the 2 PCM electrical connectors.

11. Install the RH ignition coils. For additional information, refer to Section 303-07B .

12. Install the ACL and the ACL outlet pipe. For additional information, refer to Section 303-12 .

Lower End Components - Exploded View, Crankshaft Pulley and Crankshaft Front Seal

Item	Part Number	Description
1	W701512	Crankshaft pulley bolt
2	N806165	Crankshaft pulley bolt washer
3	6316	Crankshaft pulley
4	6700	Crankshaft front oil seal

1. For additional information, refer to the procedures in this section.

Crankshaft Pulley

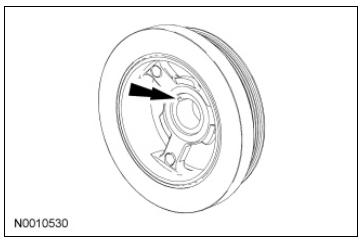
Special Tool(s)

 ST1184-A	3 Jaw Puller 303-D121
 ST1287-A	Installer, Crankshaft Vibration Damper 303-102 (T74P-6316-B)

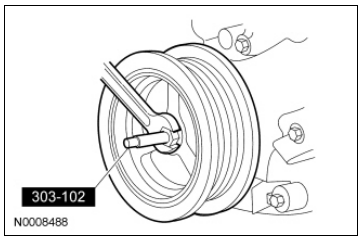
Material

Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	-
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4
Motorcraft® Silicone Gasket Remover ZC-30	-

Removal



1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the cooling fan shroud. For additional information, refer to Section 303-03 .
3. Remove the accessory drive belt. For additional information, refer to Section 303-05 .
4. Remove and discard the crankshaft pulley bolt and washer.
5. Using the 3 Jaw Puller, remove the crankshaft pulley.



Installation

1. **NOTE:** If not secured within 4 minutes, the sealant must be removed and the sealing area cleaned with metal surface prep and silicone gasket remover. Allow to dry until there is no sign of wetness, or 4 minutes, whichever is longer. Failure to follow this procedure can cause future oil leakage.

Apply silicone gasket and sealant to the Woodruff key slot in the crankshaft pulley.

2. Using the Crankshaft Vibration Damper Installer, install the crankshaft pulley.

3. Using a new crankshaft pulley bolt, install the bolt and washer and tighten the bolt in 4 stages.
   - Stage 1: Tighten to 120 Nm (89 lb-ft).
   - Stage 2: Loosen 360 degrees.
   - Stage 3: Tighten to 50 Nm (37 lb-ft).
   - Stage 4: Tighten an additional 90 degrees.

4. Install the accessory drive belt. For additional information, refer to Section 303-05 .

5. Install the cooling fan shroud. For additional information, refer to Section 303-03 .

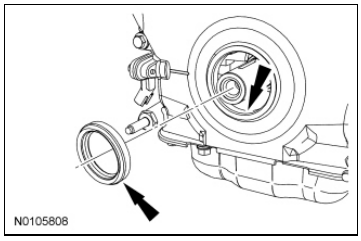
Crankshaft Front Seal

Special Tool(s)

 ST2197-A	Installer, Crankshaft Front Seal 303-635
 ST1287-A	Installer, Crankshaft Vibration Damper 303-102 (T74P-6316-B)
 ST1328-A	Installer, Front Cover Seal 303-335 (T88T-6701-A)
 ST1288-A	Remover, Crankshaft Front Seal 303-107 (T74P-6700-A)

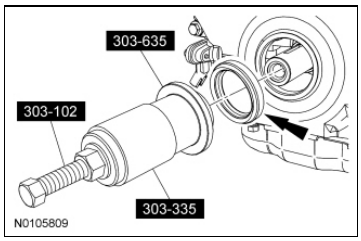
Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A



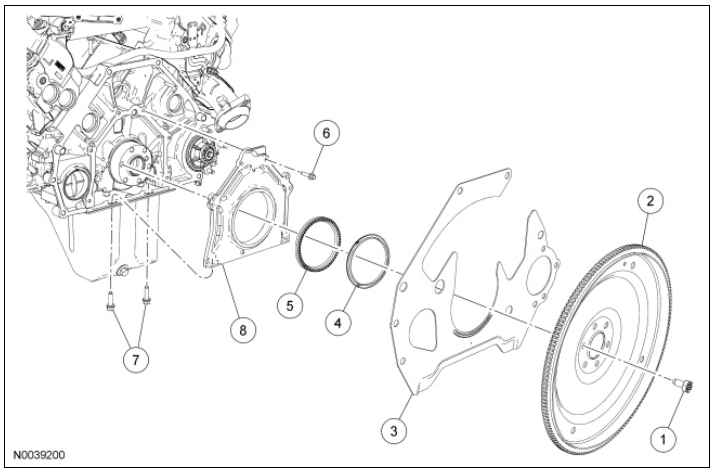
Removal

1. Remove the crankshaft pulley. For additional information, refer to Crankshaft Pulley in this section.
2. Using the Crankshaft Front Seal Remover, remove the crankshaft front seal.



Installation

1. Lubricate the engine front cover and the crankshaft front seal inner lip with clean engine oil.

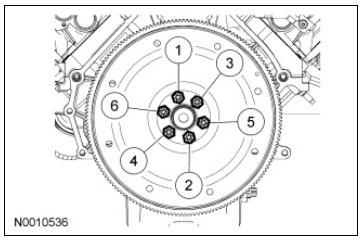


2. Using the Crankshaft Vibration Damper Installer, the Front Cover Seal Installer and the Crankshaft Front Seal Installer, install the crankshaft front seal.

3. Install the crankshaft pulley. For additional information, refer to Crankshaft Pulley in this section.

Flexplate or Flywheel and Crankshaft Rear Seal - Exploded View

Item	Part Number	Description
1	N806168	Flexplate bolt (6 required)
2	6375	Flexplate
3	6A373	Engine-to-transmission spacer plate
4	6310	Crankshaft oil slinger
5	6701	Crankshaft rear seal
6	N806155	Crankshaft rear seal retainer plate bolt (6 required)
7	W701605	Oil pan bolts (2 required)
8	6K318	Crankshaft rear seal retainer plate



1. For additional information, refer to the procedures in this section.

Flexplate

Removal and Installation

1. Remove the transmission. For additional information, refer to Section 307-01B .

2. Remove the 6 bolts and the flexplate.
   - To install, tighten to 80 Nm (59 lb-ft) in the sequence shown.

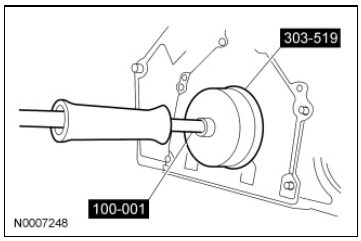
3. To install, reverse the removal procedure.

Crankshaft Rear Seal

Special Tool(s)

 ST1482-A	Installer, Crankshaft Rear Oil Slinger 303-517 (T95P-6701-CH)
 ST1479-A	Installer, Crankshaft Rear Seal 303-516 (T95P-6701-BH)
 ST1480-A	Installer, Crankshaft Rear Seal 303-518 (T95P-6701-DH)
 ST1481-A	Remover, Crankshaft Rear Oil Slinger 303-514 (T95P-6701-AH)
 ST1382-A	Remover, Crankshaft Rear Seal 303-519 (T95P-6701-EH)
 ST1185-A	Slide Hammer 100-001 (T50T-100-A)

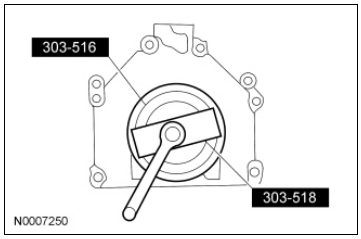
Material



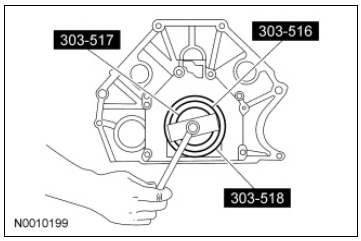
Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

Removal

1. Remove the flexplate. For additional information, refer to Flexplate in this section.
2. Remove the engine-to-transmission spacer plate.
3. Using the Slide Hammer and the Crankshaft Rear Oil Slinger Remover, remove the crankshaft oil slinger.
    - Discard the crankshaft oil slinger.



4. Using the Slide Hammer and the Crankshaft Rear Seal Remover, remove the crankshaft rear seal.
   - Discard the crankshaft rear seal.



Installation

1. **NOTE:** Lubricate the inner lip of the crankshaft rear seal with clean engine oil.

   Using the 2 Crankshaft Rear Seal Installers, install the crankshaft rear seal.

2. Using the 2 Crankshaft Rear Seal Installers and the Crankshaft Rear Oil Slinger Installer, install the crankshaft rear oil slinger.

3. Install the engine-to-transmission spacer plate.

4. Install the flexplate. For additional information, refer to Flexplate in this section.

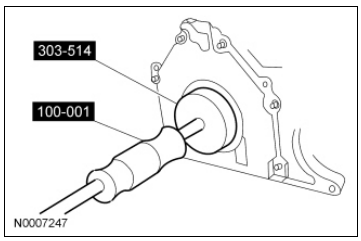
Crankshaft Rear Seal with Retainer Plate

Special Tool(s)

 ST1482-A	Installer, Crankshaft Rear Oil Slinger 303-517 (T95P-6701-CH)
 ST1479-A	Installer, Crankshaft Rear Seal 303-516 (T95P-6701-BH)
 ST1480-A	Installer, Crankshaft Rear Seal 303-518 (T95P-6701-DH)
 ST1481-A	Remover, Crankshaft Rear Oil Slinger 303-514 (T95P-6701-AH)
 ST1382-A	Remover, Crankshaft Rear Seal 303-519 (T95P-6701-EH)
 ST1185-A	Slide Hammer 100-001 (T50T-100-A)

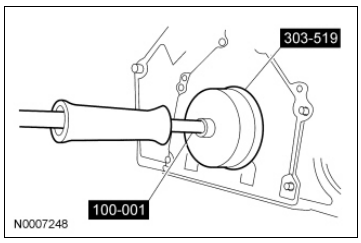
Material

Item	Specification
Gasket Maker TA-16	WSK-M2G348-A5
Motorcraft® Metal Surface Prep ZC-31-A	-
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A
Motorcraft® Silicone Gasket Remover ZC-30	-



Removal

1. Remove the flexplate. For additional information, refer to Flexplate in this section.



2. Remove the engine-to-transmission spacer plate.

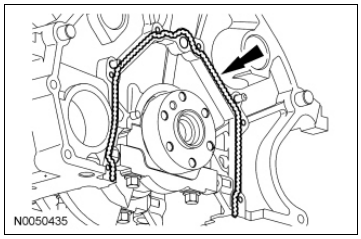
3. Remove the oil pan. For additional information, refer to Oil Pan in this section.

4. Using the Slide Hammer and the Crankshaft Rear Oil Slinger Remover, remove the crankshaft oil slinger.
    - Discard the crankshaft oil slinger.

5. Using the Slide Hammer and the Crankshaft Rear Seal Remover, remove the crankshaft rear seal.
    - Discard the crankshaft rear seal.

6. Remove the 6 bolts and the crankshaft rear seal retainer plate.

Installation



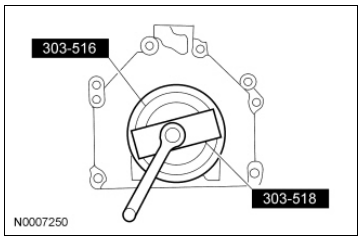
1. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

   NOTE: Clean the sealing surfaces with silicone gasket remover and metal surface prep. Follow the directions on the packaging. Failure to follow this procedure can cause future oil leakage.

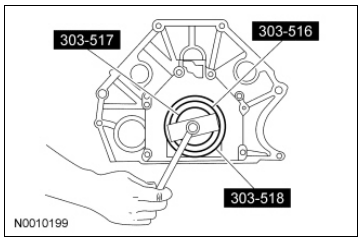
   Clean and inspect the mating surfaces.

2. **NOTE:** The crankshaft rear seal retaining plate does not have a sealant groove. Gasket maker must be applied to the crankshaft rear seal retainer plate mating surface on the engine block.

   Apply a bead of gasket maker to the crankshaft rear seal retainer plate mating surface on the engine block.



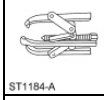
3. Install the crankshaft rear seal retainer plate and the 6 bolts in the sequence shown.
    - Tighten to 10 Nm (89 lb-in).



4. **NOTE:** Lubricate the inner lip of the crankshaft rear seal with clean engine oil.

   Using the 2 Crankshaft Rear Seal Installers, install the crankshaft rear seal.

5. Using the 2 Crankshaft Rear Seal Installers and the Crankshaft Rear Oil Slinger Installer, install the crankshaft rear oil slinger.



6. Install the oil pan. For additional information, refer to Oil Pan in this section.

7. Install the engine-to-transmission spacer plate.

8. Install the flexplate. For additional information, refer to Flexplate in this section.

Engine Front Cover

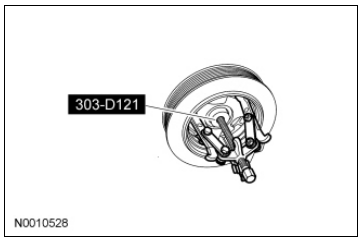
Accessory Drive Components and Wiring Harness Brackets

Item	Part Number	Description
1	W701512	Crankshaft pulley bolt
2	N806165	Crankshaft pulley washer
3	8316	Crankshaft pulley
4	6700	Crankshaft front seal
5	7R081	Transmission cooler tube bracket nut
6	BK0001728	Transmission cooler tube bracket (part of 7H420)
7	N805320	Power Steering Pressure (PSP) hose bracket nut
8	81396	PSP hose bracket (part of 3A719)
9	W520101	Battery cable bracket nut
10	10A779	Battery cable bracket (part of 14A280)
11	N805403	Battery cable bracket nuts (2 required)
12	10W652	Battery cable bracket (part of 14A280)
13	14A163	Wiring harness retainer (part of 12B637)
14	W707225	Power steering pump bolt (3 required)
15	3A696	Power steering pump
16	N806282	Coolant pump pulley bolt (4 required)
17	8A528	Coolant pump pulley

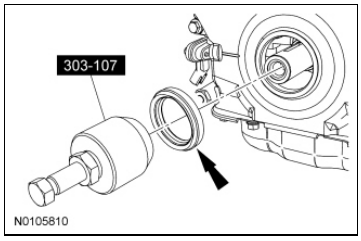
Engine Front Cover

Item	Part Number	Description
1	14A464	LH Camshaft Position (CMP) sensor electrical connector (part of 12B637)
2	N804758	Cooling fan wiring harness bracket nut
3	14W163	Cooling fan wiring harness bracket
4	N804758	LH radio interference capacitor nut
5	18801	LH radio interference capacitor
6	14A464	RH CMP sensor electrical connector (part of 12B637)
7	N804758	RH radio interference capacitor nut
8	18801	RH radio interference capacitor
9	14A464	Crankshaft Position (CKP) sensor electrical connector (part of 12B637)
10	W701605	Oil pan-to-engine front cover bolts (4 required)
11	W706508	Engine front cover stud bolt
12	N806177	Engine front cover bolt (8 required)
13	N808294	Engine front cover bolt
14	N806300	Engine front cover stud bolt (5 required)
15	6D080	Engine front cover
16	6D081	Engine front cover gasket (3 required)



Removal

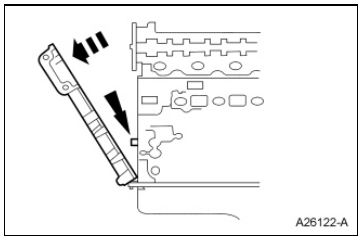
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .



2. Remove the drain plug and drain the engine oil.
   - To install, tighten to 23 Nm (17 lb-ft).

3. Remove the cooling fan shroud. For additional information, refer to Section 303-03 .

4. Remove the RH side idler pulley. For additional information, refer to Section 303-05 .
5. Remove the RH valve cover. For additional information, refer to Valve Cover - RH in this section.
6. Remove the LH valve cover. For additional information, refer to Valve Cover - LH in this section.
7. Remove the nut and position the RH radio interference capacitor aside.
8. Disconnect the RH Camshaft Position (CMP) sensor electrical connector.
9. Remove the nut and the cooling fan wiring harness bracket.
10. Remove the nut and position the LH radio interference capacitor aside.
11. Disconnect the LH CMP sensor electrical connector.
12. Remove the 4 bolts and the coolant pump pulley.
13. Remove the 2 nuts and detach the battery cable bracket from the power steering pump stud bolts.
14. Detach the wiring harness retainer from the power steering pump stud bolt.
15. Remove the 3 stud bolts and position the power steering pump aside.
    - Support the power steering pump with a length of mechanic's wire.
16. Remove the nut and detach the Power Steering Pressure (PSP) hose bracket from the battery cable bracket.
17. Remove the nut and detach the battery cable bracket from the engine front cover.
18. Remove the nut and detach the transmission cooler tube bracket from the engine front cover.
19. Disconnect the Crankshaft Position (CKP) sensor electrical connector.
20. Remove the crankshaft pulley bolt and washer.
    - Discard the crankshaft pulley bolt.
21. Using the 3 Jaw Puller, remove the crankshaft pulley.



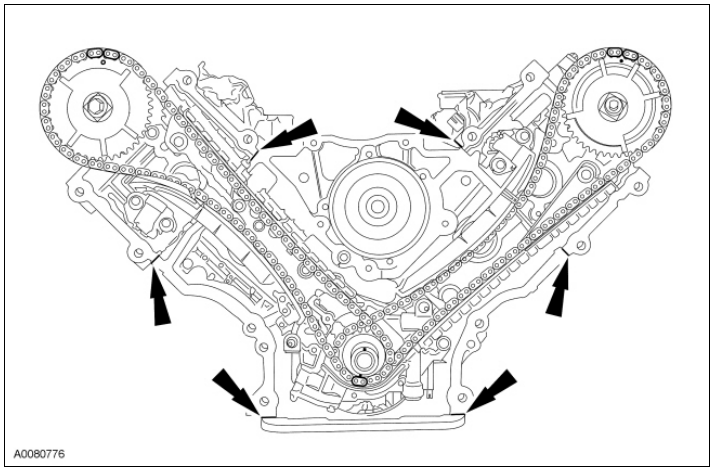
22. Using the Crankshaft Front Seal Remover, remove the crankshaft front seal.
    - Discard the crankshaft front seal.

23. Remove the 4 oil pan-to-engine front cover bolts.

24. Remove the 15 engine front cover bolts and stud bolts.

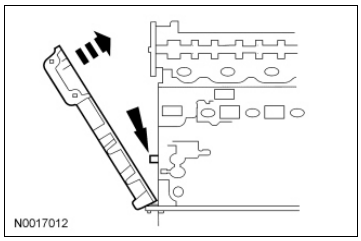
25. Remove the engine front cover from the engine front cover-to-cylinder block dowel.
    - Remove and discard the engine front cover gaskets.

Installation



1. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

   Clean the mating surfaces with silicone gasket remover, metal surface prep and a plastic scraping tool. Follow the directions on the packaging.

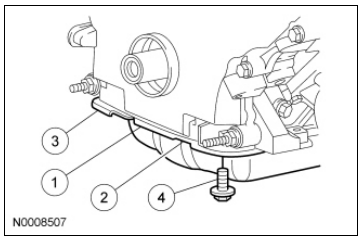


2. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

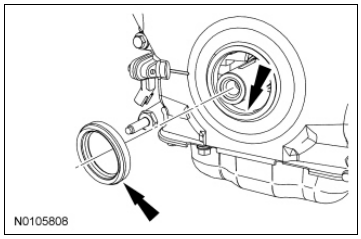
   NOTE: If the engine front cover is not secured within 4 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Follow the directions on the packaging. Failure to follow this procedure can cause future oil leakage.

   Apply a bead of silicone gasket and sealant along the cylinder head-to-cylinder block mating surface and the oil pan-to-cylinder block mating surface at the locations shown.

3. Install new engine front cover gaskets on the engine front cover. Position the engine front cover onto the dowels. Install the 15 fasteners finger-tight.

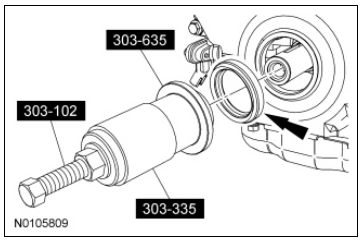


4. Tighten the 15 engine front cover fasteners in the sequence shown to 25 Nm (18 lb-ft).



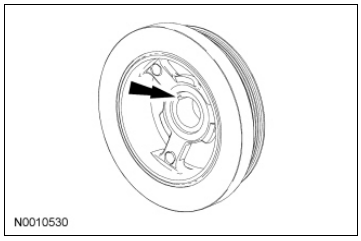
Item	Part Number	Description
1	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 53
2	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 53
3	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 53
4	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 53
5	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 53
6	W706508	Stud, Hex Shoulder Pilot, M8 x 1.25 x 50 - M6 x 1 x 10
7	N806300	Stud, Hex Shoulder Pilot, M8 x 1.25 x 1.25 x 91.1
8	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 53
9	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 53

10	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 53
11	N808294	Bolt, Hex Head Pilot, M8 x 1.25 x 53
12	N806300	Stud, Hex Shoulder Pilot, M8 x 1.25 x 1.25 x 91.1
13	N806300	Stud, Hex Shoulder Pilot, M8 x 1.25 x 1.25 x 91.1
14	N806300	Stud, Hex Shoulder Pilot, M8 x 1.25 x 1.25 x 91.1
15	N806300	Stud, Hex Shoulder Pilot, M8 x 1.25 x 1.25 x 91.1

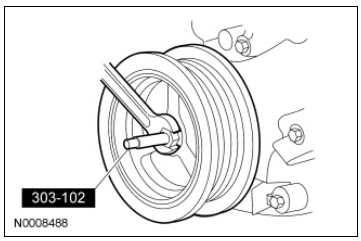


5. Loosely install the 4 oil pan-to-engine front cover bolts, then tighten the bolts in 2 stages in the sequence shown.
    - Stage 1: Tighten to 20 Nm (177 lb-in).
    - Stage 2: Tighten an additional 60 degrees.

6. Lubricate the engine front cover and a new crankshaft front seal inner lip with clean engine oil.



7. Using the 2 Crankshaft Front Seal Installers and the Crankshaft Vibration Damper Installer, install the crankshaft front seal.



8. **NOTE:** If not secured within 4 minutes, the sealant must be removed and the sealing area cleaned with silicone gasket remover and metal surface prep. Follow the directions on the packaging. Failure to follow this procedure can cause future oil leakage.

   Apply silicone gasket sealant to the Woodruff key slot in the crankshaft pulley.

9. Using the Crankshaft Vibration Damper Installer, install the crankshaft pulley.

10. Using a new crankshaft pulley bolt, install the bolt and washer and tighten the bolt in 4 stages.
    - Stage 1: Tighten to 120 Nm (89 lb-ft).
    - Stage 2: Loosen 360 degrees.
    - Stage 3: Tighten to 50 Nm (37 lb-ft).
    - Stage 4: Tighten an additional 90 degrees.

11. Connect the CKP sensor electrical connector.

12. Attach the transmission cooler tube bracket to the engine front cover and install the nut.
    - Tighten to 12 Nm (106 lb-in).

13. Attach the battery cable bracket to the front cover and install the nut.
    - Tighten to 10 Nm (89 lb-in).

14. Attach the PSP hose bracket to the battery cable bracket and install the nut.
    - Tighten to 10 Nm (89 lb-in).

15. Position the power steering pump and install the stud bolts.
    - Tighten to 25 Nm (18 lb-ft).

16. Attach the wiring harness retainer to the power steering pump stud bolt.

17. Position the battery cable bracket on the power steering pump stud bolts and install the nuts.
    - Tighten to 10 Nm (89 lb-in).

18. Position the coolant pump pulley and install the bolts.
    - Tighten the bolts to 25 Nm (18 lb-ft).

19. Connect the LH CMP sensor electrical connector.

20. Position the LH radio interference capacitor and install the nut.
    - Tighten to 25 Nm (18 lb-ft).

21. Position the cooling fan wiring harness bracket and install the nut.

22. Connect the RH CMP sensor electrical connector.

23. Position the RH radio interference capacitor and install the nut.
    - Tighten to 25 Nm (18 lb-ft).

24. Install the LH valve cover. For additional information, refer to Valve Cover - LH in this section.

25. Install the RH valve cover. For additional information, refer to Valve Cover - RH in this section.

26. Install the RH side idler pulley. For additional information, refer to Section 303-05 .

27. Install the cooling fan shroud. For additional information, refer to Section 303-03 .

28. Fill the engine with clean engine oil.

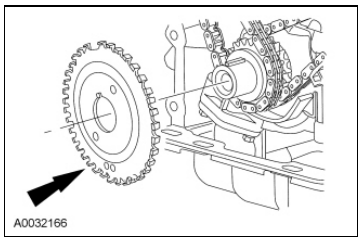
Timing Drive Components

Special Tool(s)

 ST2804-A	Compressor, Valve Spring 303-1039
 ST2807-A	Locking Tool, Cam Phaser 303-1046

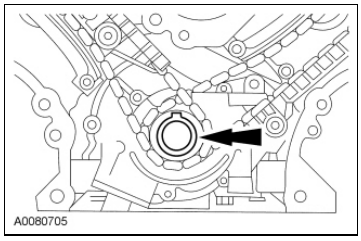
General Equipment

Hydraulic Chain Tensioner Retaining Clip 1L3Z-6P250-AA



Material

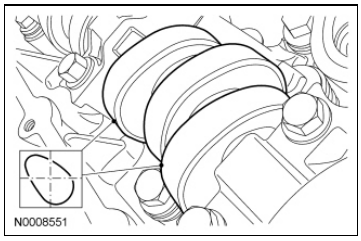
Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A



Removal

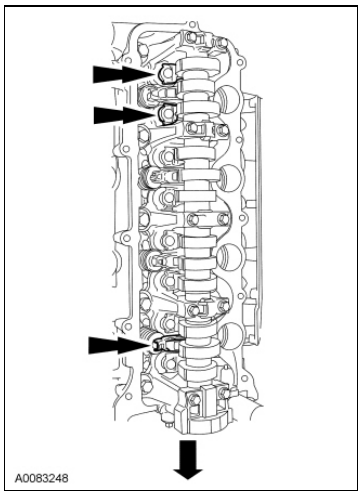
1. Remove the engine front cover. For additional information, refer to Engine Front Cover in this section.

2. Remove the crankshaft sensor ring from the crankshaft.



A0032166

3. Position the crankshaft keyway at the 12 o'clock position.



4. **NOTE:** If the camshaft lobes are not exactly positioned as shown, the crankshaft will require one full additional rotation to 12 o'clock.

   The No. 1 cylinder must be coming up on the exhaust stroke with the crankshaft keyway at the 12 o'clock position. Verify by noting the position of the 2 intake lobes and the exhaust lobe on the No. 1 cylinder.

5. ***NOTICE:*** **If the components are to be reinstalled, they must be installed in their original positions. Mark the components for installation into their original locations. Failure to follow these instructions may result in engine damage.**

   Remove only the 3 roller followers shown in the illustration from the RH cylinder head.

6. **NOTE:** Do not allow the valve keepers to fall off the valve or the valve may drop into the cylinder. If a valve drops into the cylinder, the cylinder head must be removed. For additional information, refer to Cylinder Head in this section.

   NOTE: It may be necessary to push the valve down while compressing the spring.

   Using the Valve Spring Compressor, remove the 3 roller followers designated in the previous step from the RH cylinder head.

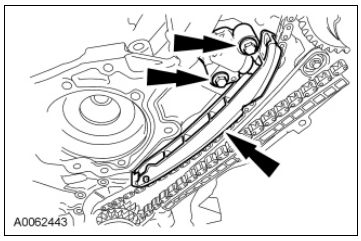
7. *NOTICE:* **If the components are to be reinstalled, they must be installed in their original positions. Mark the components for installation into their original locations. Failure to follow these instructions may result in engine damage.**

   Remove only the 3 roller followers shown in the illustration from the LH cylinder head.

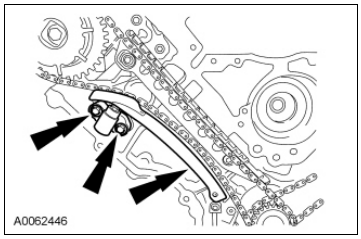
8. **NOTE:** Do not allow the valve keepers to fall off the valve or the valve may drop into the cylinder. If a valve drops into the cylinder, the cylinder head must be removed. For additional information, refer to Cylinder Head in this section.

   NOTE: It may be necessary to push the valve down while compressing the spring.

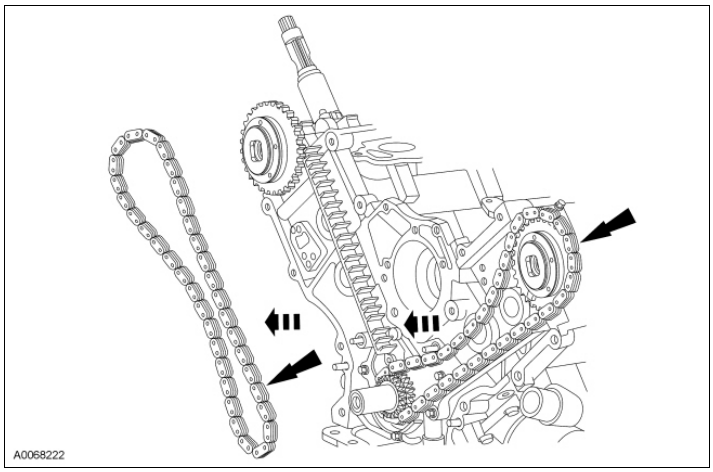
   Using the Valve Spring Compressor, remove the 3 roller followers designated in the previous step from the LH cylinder head.



9. *NOTICE:* **The crankshaft cannot be moved past the 6 o'clock position once set or engine damage may occur.**

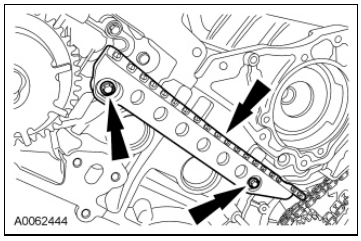


Rotate the crankshaft clockwise and position the crankshaft keyway at the 6 o'clock position.



10. Remove the bolts, the LH timing chain tensioner and tensioner arm.

11. Remove the bolts, the RH timing chain tensioner and tensioner arm.

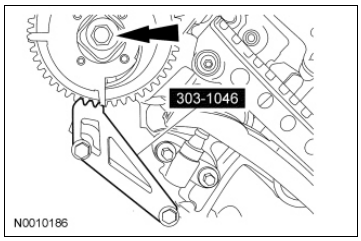


12. Remove the RH and LH timing chains and the crankshaft sprocket.
    - Remove the RH timing chain from the camshaft sprocket.
    - Remove the RH timing chain from the crankshaft sprocket.
    - Remove the LH timing chain from the camshaft sprocket.
    - Remove the LH timing chain and crankshaft sprocket.

13. **NOTE:** RH shown, LH similar.

    Remove the LH and RH timing chain guides.

    - Remove the bolts.
    - Remove both timing chain guides.

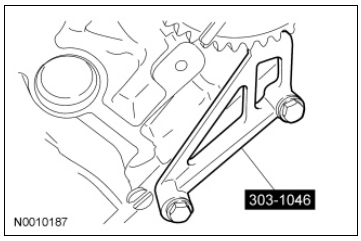


14. ***NOTICE:*** **Damage to the camshaft phaser sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**

    NOTICE: **Only use hand tools to remove the camshaft phaser sprocket assembly or damage may occur to the camshaft or camshaft phaser unit.**

    Using the Cam Phaser Locking Tool, remove the bolt and the RH camshaft phaser sprocket assembly.

    - Discard the camshaft phaser sprocket bolt.

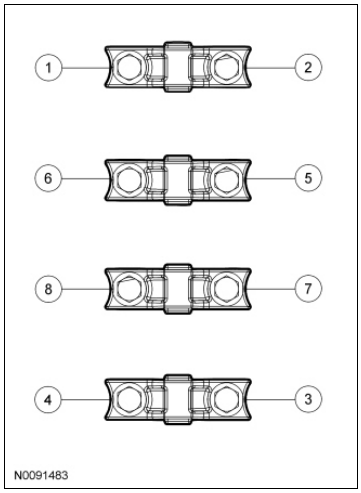


15. ***NOTICE:*** **Damage to the camshaft phaser sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**

    NOTICE: **Only use hand tools to remove the camshaft phaser sprocket assembly or damage may occur to the camshaft or camshaft phaser unit.**

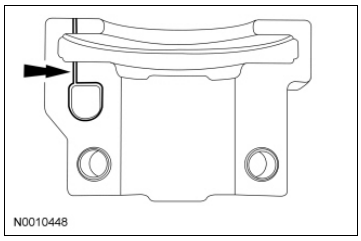
    Using the Cam Phaser Locking Tool, remove the bolt and the LH camshaft phaser sprocket assembly.

    - Discard the camshaft phaser sprocket bolt.



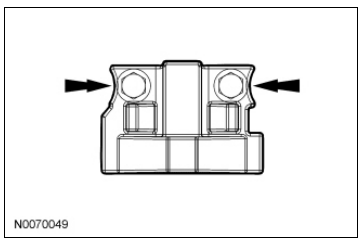
16. ***NOTICE:*** **Remove the front thrust camshaft bearing cap straight upward from the bearing towers or the bearing cap may be damaged from side loading.**

    Remove the 2 bolts and the RH cylinder head camshaft front bearing cap.



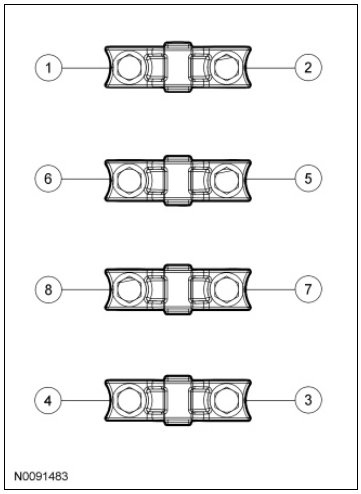
17. ***NOTICE:*** **The camshaft bearing caps must be installed in their original locations. Record camshaft bearing cap locations. Failure to follow these instructions may result in engine damage.**

    Remove the remaining bolts in the sequence shown and remove the RH cylinder head camshaft bearing caps.



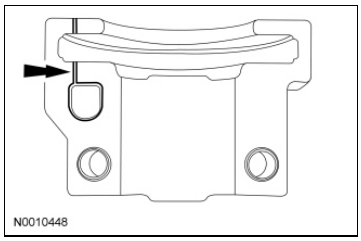
18. Clean and inspect the RH camshaft bearing caps.
    - The camshaft front thrust bearing cap contains an oil metering groove. Make sure the groove is free of foreign material.

19. Remove the RH camshaft.



20. ***NOTICE:*** **Remove the front thrust camshaft bearing cap straight upward from the bearing towers or the bearing cap may be damaged from side loading.**

    Remove the 2 bolts and the LH cylinder head camshaft front bearing cap.



21. ***NOTICE:*** **The camshaft bearing caps must be installed in their original locations. Record camshaft bearing cap locations. Failure to follow these instructions may result in engine damage.**

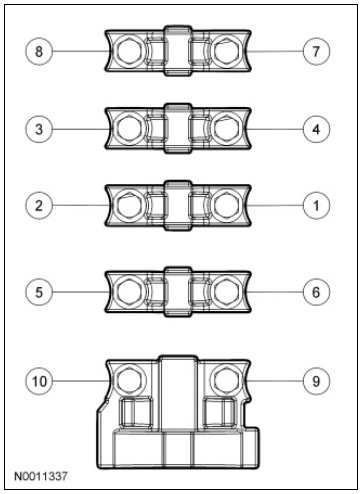
    Remove the remaining bolts in the sequence shown and remove the LH cylinder head camshaft bearing caps.

22. Clean and inspect the LH camshaft bearing caps.
    - The camshaft front thrust bearing cap contains an oil metering groove. Make sure the groove is free of foreign material.

23. Remove the LH camshaft.

24. ***NOTICE:*** **If the components are to be reinstalled, they must be installed in their original positions. Mark the components for installation into their original locations. Failure to follow these instructions may result in engine damage.**

    Remove all of the remaining roller followers from the cylinder heads.



Installation

1. Install the LH and RH camshafts.
    - Lubricate the camshaft and camshaft journals with clean engine oil prior to installation.

2. **NOTE:** LH shown, RH similar.

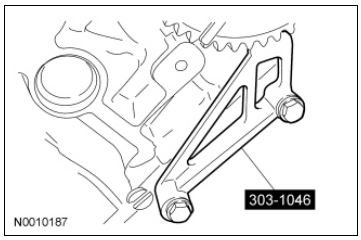
    Install the LH and RH camshaft bearing caps in their original locations.

    - Lubricate the camshaft bearing caps with clean engine oil.
    - Position the front camshaft bearing cap.
    - Position the remaining camshaft bearing caps.
    - Install the bolts loosely.
    - Tighten to 10 Nm (89 lb-in) in the sequence shown.

3. ***NOTICE:*** **Damage to the camshaft phaser sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**

   NOTE: LH shown, RH similar.

   Install the camshaft phaser sprockets and new camshaft phaser bolts finger-tight.



4. ***NOTICE:*** **Damage to the camshaft phaser sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**

   NOTICE: **Only use hand tools to remove the camshaft phaser sprocket assembly or damage may occur to the camshaft or camshaft phaser unit.**

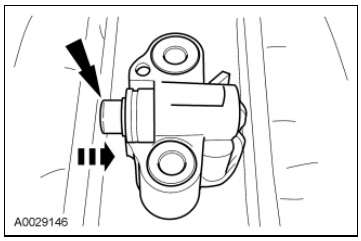
   NOTE: LH shown, RH similar.

   Using the Cam Phaser Locking Tool, tighten the LH and RH camshaft phaser sprocket bolts in 2 stages.

   - Stage 1: Tighten to 40 Nm (30 lb-ft).
   - Stage 2: Tighten an additional 90 degrees.

5. Install the crankshaft sprocket, making sure the flange faces forward.

6. Rotate the crankshaft to position the crankshaft sprocket timing mark in the 6 o'clock position.



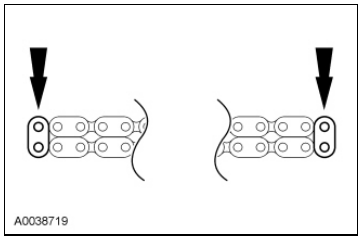
7. ***NOTICE:*** **If one or both of the tensioner mounting bolts are loosened or removed, the tensioner-sealing bead must be inspected for seal integrity. If cracks, tears, separation from the tensioner body or permanent compression of the seal bead is observed, install a new tensioner or engine damage may occur.**

   Inspect the RH and LH timing chain tensioners.

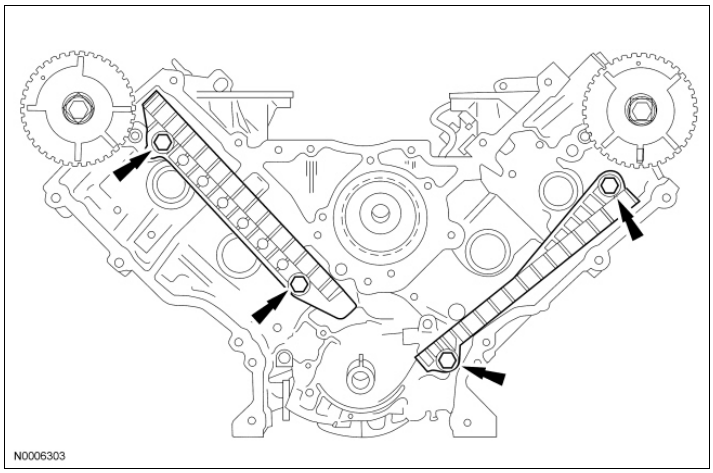
   - Install new tensioners as necessary.

8. ***NOTICE:*** **Timing chain procedures must be followed exactly or damage to valves and pistons will result.**

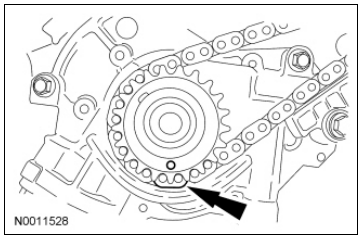
   Compress the tensioner plunger, using a vise.



9. Install a retaining clip on the tensioner to hold the plunger in during installation.

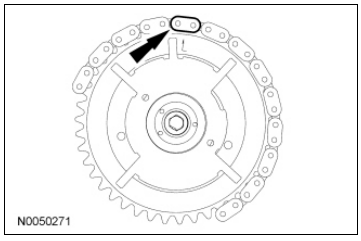


10. Remove the tensioner from the vise.



11. If the colored links are not visible, mark one link on one end and one link on the other end and use as timing marks.

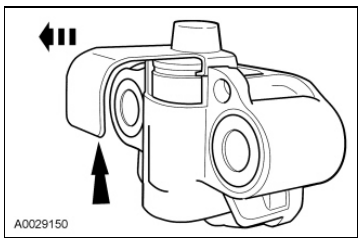
12. Install the 4 bolts and the LH and RH timing chain guides.
    - Tighten to 10 Nm (89 lb-in).



13. Position the lower end of the LH (inner) timing chain on the crankshaft sprocket, aligning the timing mark on the outer flange of the crankshaft sprocket with the single colored (marked) link on the chain.

14. **NOTE:** Make sure the upper half of the timing chain is below the tensioner arm dowel.

    Position the LH timing chain on the camshaft sprocket. Make sure the camshaft sprocket timing mark is aligned with the colored (marked) chain link.

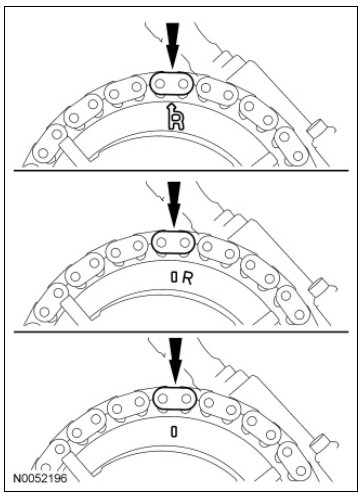


15. **NOTE:** The LH timing chain tensioner arm has a bump near the dowel hole for identification.

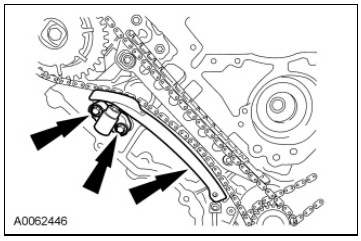
    Position the LH timing chain tensioner arm on the dowel pin and install the LH timing chain tensioner and bolts.

    - Tighten to 25 Nm (18 lb-ft).

16. Remove the retaining clip from the LH timing chain tensioner.



17. Position the lower end of the RH (outer) timing chain on the crankshaft sprocket, aligning the timing mark on the sprocket with the single colored (marked) chain link.

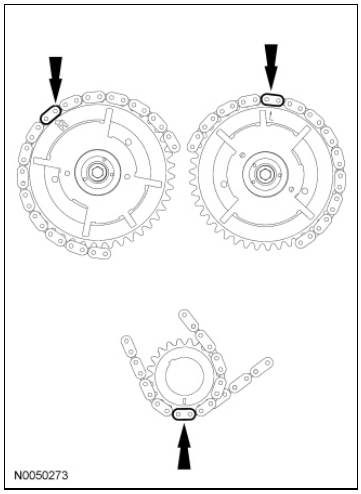


18. **NOTE:** The camshaft phaser and sprocket will be stamped with one of the illustrated timing marks for the RH camshaft.

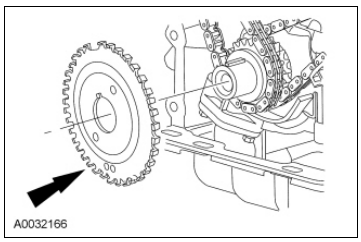
    NOTE: The lower half of the timing chain must be positioned above the tensioner arm dowel.

    Position the RH timing chain on the camshaft sprocket. Make sure the camshaft sprocket timing mark is aligned with the colored (marked) chain link.

19. Position the RH timing chain tensioner arm on the dowel pin and install the RH timing chain tensioner and bolts.
    - Tighten to 25 Nm (18 lb-ft).

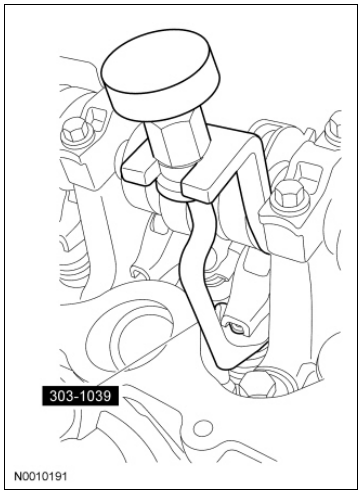


20. Remove the retaining clip from the RH timing chain tensioner.



21. **NOTE:** The RH and LH camshaft phaser sprockets are similar. Refer to the single timing mark to identify the RH camshaft phaser sprocket and the L timing mark to identify the LH camshaft phaser sprocket.

    As a post-check, verify correct alignment of all timing marks. Make sure the timing marks on the sprockets correspond to the above note.



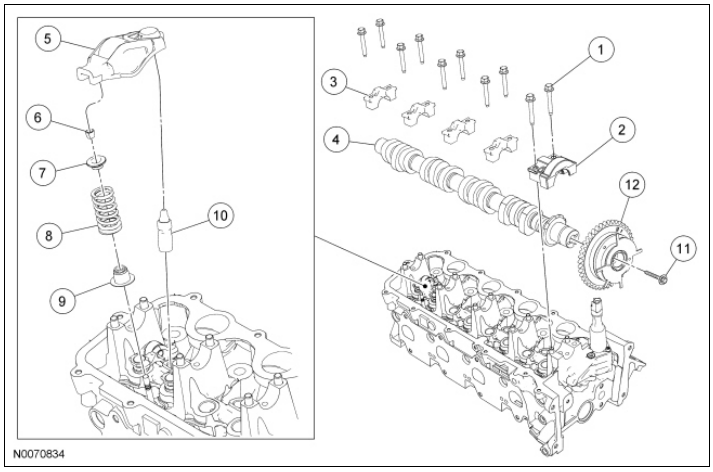
22. Install the crankshaft sensor ring on the crankshaft.

23. **NOTE:** It is necessary to rotate the engine to position the camshaft lobes at base circle to install the roller followers.

    Using the Valve Spring Compressor, install all of the camshaft roller followers.

    - Lubricate the roller followers with clean engine oil prior to installation.

24. Install the engine front cover. For additional information, refer to Engine Front Cover in this section.



Valve Train Components - Exploded View

LH Side

Item	Part Number	Description
1	N807834	Camshaft bearing cap bolt (10 required)
2	6B284	Camshaft front bearing cap
3	6B280	Camshaft bearing cap (4 required)
4	6C255	Camshaft
5	6529	Camshaft roller follower (12 required)
6	6518	Valve spring retainer key (24 required)
7	6514	Valve spring retainer (12 required)
8	6513	Valve spring (12 required)
9	6A517	Valve seal (12 required)
10	6C501	Hydraulic lash adjuster (12 required)
11	6279	Camshaft phaser and sprocket bolt
12	6C524	Camshaft phaser and sprocket

RH Side

Item	Part Number	Description
1	N807834	Camshaft bearing cap bolt (10 required)
2	6B284	Camshaft front bearing cap
3	6B280	Camshaft bearing cap (4 required)
4	6251	Camshaft
5	6529	Camshaft roller follower (12 required)

10	6C501	Hydraulic lash adjuster (12 required)
11	6279	Camshaft phaser and sprocket bolt
12	6C524	Camshaft phaser and sprocket

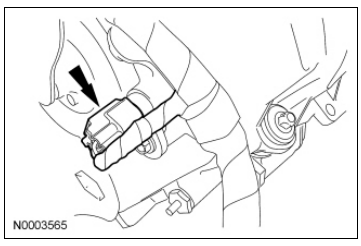
1. For additional information, refer to the procedures in this section.

Camshaft - LH

Special Tool(s)

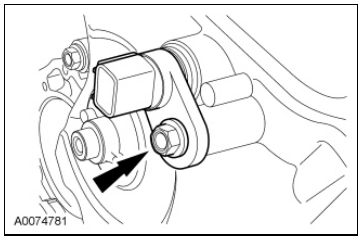
 ST2804-A	Compressor, Valve Spring 303-1039
 ST2969-A	Locking Tool, Timing Chain 303-1175

Material



Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

Removal

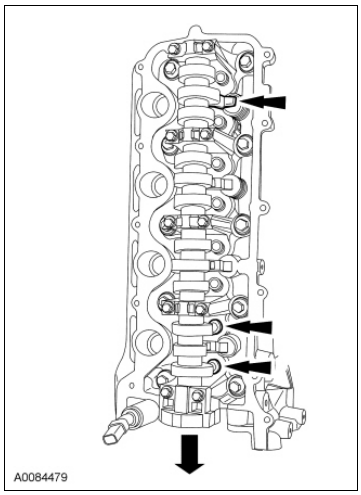


NOTICE: **The camshaft procedure must be followed exactly or damage to the valves and pistons will result.**

1. Remove the LH valve cover. For additional information, refer to Valve Cover - LH in this section.
2. ***NOTICE:*** **Damage to the camshaft phaser and sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**

   Loosen and back off the LH camshaft phaser and sprocket bolt one full turn.
3. Disconnect the LH Camshaft Position (CMP) sensor electrical connector.

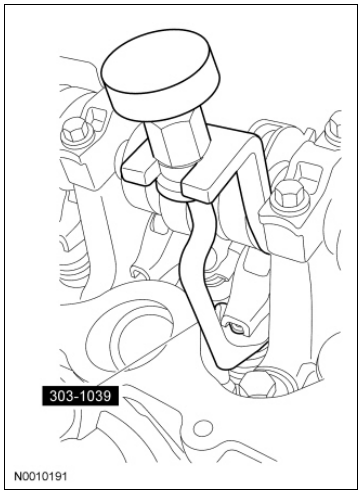
N0003565



4. Remove the LH CMP sensor and the bolt.

5. Rotate the crankshaft clockwise until the No. 5 cylinder camshaft exhaust lobe opens the valve and the 2 intake lobes are in the 3 o'clock position as shown.

6. Remove only the 3 camshaft roller followers shown in the illustration.



7. ***NOTICE:*** **The camshaft roller followers must be installed in their original locations. Record camshaft roller follower locations. Failure to follow these instructions may result in engine damage.**

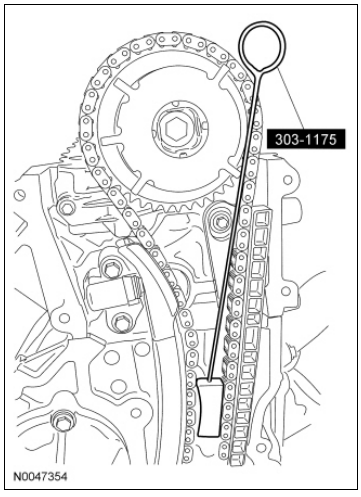
   NOTE: Do not allow the valve keepers to fall off the valve or the valve may drop into the cylinder. If a valve drops into the cylinder, the cylinder head must be removed. For additional information, refer to Cylinder Head in this section.

   NOTE: It may be necessary to push the valve down while compressing the spring.

   Using the Valve Spring Compressor, remove only the 3 designated camshaft roller followers from the previous step.

8. ***NOTICE:*** **The crankshaft cannot be moved once set or engine damage may occur.**

   Rotate the crankshaft a half turn clockwise, as viewed from the front, positioning the No. 5 cylinder camshaft exhaust lobe at the 11 o'clock position as shown.

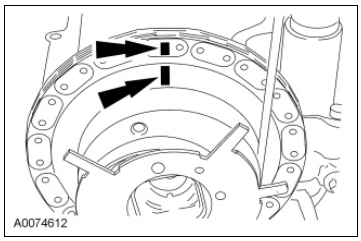


9. ***NOTICE:*** **Engine is not freewheeling. Camshaft procedure must be followed exactly or damage to valves and pistons will result.**

   NOTE: The Timing Chain Locking Tool must be installed square to the timing chain and the engine block.

   NOTE: Engine front cover removed from art for clarity.

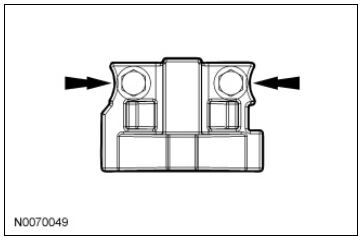
   Install the Timing Chain Locking Tool in the LH timing chain as shown.



10. ***NOTICE:*** **Do not remove the Timing Chain Locking Tool at any time during assembly. If the Timing Chain Locking Tool is removed or out of placement, the engine front cover must be**

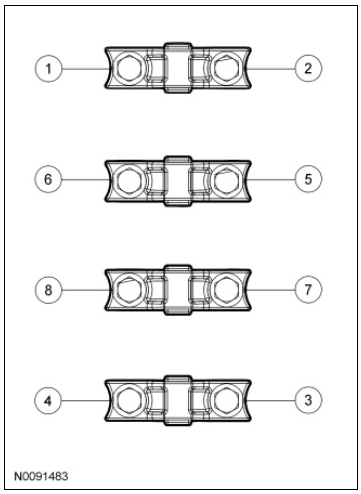
removed and the engine must be retimed. For additional information, refer to Timing Drive Components in this section. Failure to follow this instruction can result in damage to the valves and pistons.

NOTICE: **The timing chain must be installed in its original position onto the camshaft phaser and sprocket using the scribed marks, or damage to valves and pistons will result.**



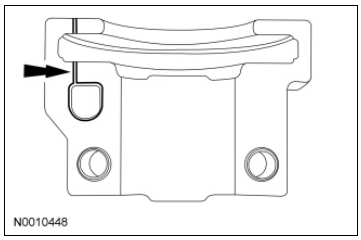
NOTE: RH shown, LH similar.

Scribe a location mark on the timing chain and the camshaft phaser and sprocket assembly.



11. ***NOTICE:*** **Remove the front thrust camshaft bearing cap straight upward from the bearing towers or the bearing cap may be damaged from side loading.**

    Remove the 2 bolts and the LH cylinder head camshaft front bearing cap.

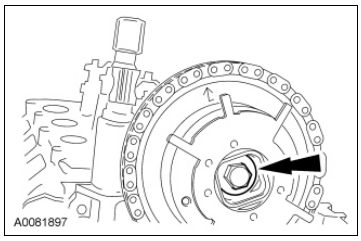


12. ***NOTICE:*** **The camshaft bearing caps must be installed in their original locations. Record camshaft bearing cap locations. Failure to follow these instructions may result in engine damage.**

    Remove the remaining bolts in the sequence shown and remove the LH cylinder head camshaft bearing caps.

13. Clean and inspect the LH camshaft bearing caps.

- The camshaft front thrust bearing cap contains an oil metering groove. Make sure the groove is free of foreign material.



14. ***NOTICE:*** **Damage to the camshaft phaser and sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**

    NOTICE: **Only use hand tools to remove the camshaft phaser and sprocket bolt or damage may occur to the camshaft or camshaft phaser and sprocket.**

    NOTICE: **Do not remove the Timing Chain Locking Tool at any time during assembly. If the Timing Chain Locking Tool is removed or out of placement, the engine front cover must be removed and the engine must be retimed. For additional information, refer to Timing Drive Components in this section. Failure to follow this instruction can result in damage to the valves and pistons.**

    Remove the bolt and the camshaft phaser and sprocket assembly from the camshaft.

    - Discard the bolt and washer.

15. Remove the camshaft.

16. Remove and inspect the camshaft phaser and sprocket for damage. For additional information, refer to Section 303-00 .

Installation

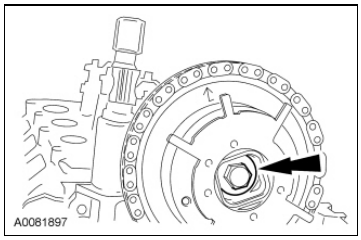
1. **NOTE:** Do not allow the camshaft roller followers to move out of position when installing the camshaft.

   Lubricate the camshaft and camshaft journals with clean engine oil and install the camshaft.

2. ***NOTICE:*** **Do not remove the Timing Chain Locking Tool at any time during assembly. If the Timing Chain Locking Tool is removed or out of placement, the engine front cover must be removed and the engine must be retimed. For additional information, refer to Timing Drive Components in this section. Failure to follow this instruction can result in damage to the valves and pistons.**

   NOTICE: **The timing chain must be installed in its original position onto the camshaft phaser and sprocket using the scribed marks, or damage to valves and pistons will result.**

NOTE: If replacement of the camshaft phaser and sprocket is necessary, transfer the scribe mark to the new camshaft phaser and sprocket.

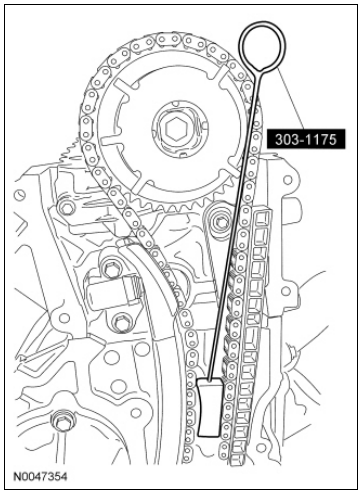


Position the camshaft phaser and sprocket into the timing chain with the timing chain scribe marks in alignment.

3. ***NOTICE:*** **Do not remove the Timing Chain Locking Tool at any time during assembly. If the Timing Chain Locking Tool is removed or out of placement, the engine front cover must be removed and the engine must be retimed. For additional information, refer to Timing Drive Components in this section.**

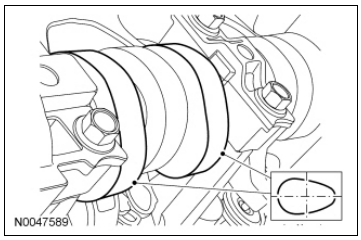
   NOTICE: **Damage to the camshaft phaser and sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**

   Install the camshaft phaser and sprocket assembly onto the camshaft and install a new camshaft phaser and sprocket bolt finger-tight.



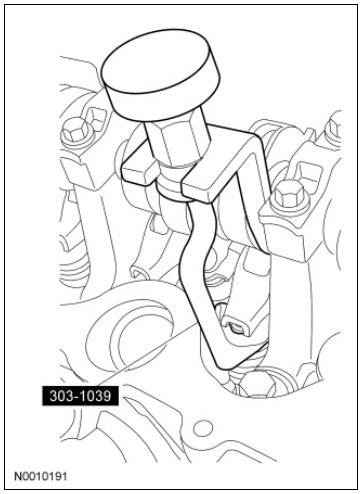
4. Install the camshaft bearing caps in their original locations.
   - Lubricate the camshaft bearing caps with clean engine oil.
   - Position the front camshaft bearing cap.
   - Position the remaining camshaft bearing caps.
   - Install the bolts loosely.

5. Tighten the bolts in the sequence shown.
   - Tighten to 10 Nm (89 lb-in).

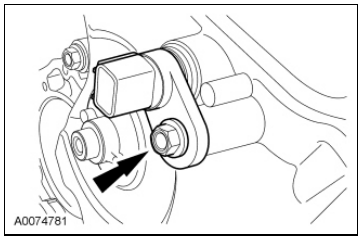


6. **NOTE:** Engine front cover removed from art for clarity.

   Remove the Timing Chain Locking Tool.



7. Rotate the crankshaft a half turn counterclockwise until the No. 5 cylinder camshaft exhaust lobe opens the valve and the 2 intake lobes are in the 3 o'clock position as shown.



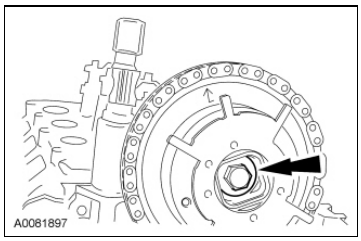
8. **NOTE:** Do not allow the valve keepers to fall off of the valve or the valve may drop into the cylinder. If a valve drops into the cylinder, the cylinder head must be removed. For additional information, refer to Cylinder Head in this section.

   NOTE: It may be necessary to push the valve down while compressing the spring.

   Using the Valve Spring Compressor, install the 3 originally removed camshaft roller followers.

9. Install the CMP sensor and the bolt.
   - Tighten to 10 Nm (89 lb-in).

10. Connect the CMP electrical connector.



11. ***NOTICE:*** **Only use hand tools to install the camshaft phaser and sprocket assembly or damage may occur to the camshaft or camshaft phaser and sprocket.**

    NOTICE: **Damage to the camshaft phaser and sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**

    Tighten the camshaft phaser and sprocket bolt in 2 stages:

    - Stage 1: Tighten to 40 Nm (30 lb-ft).
    - Stage 2: Tighten an additional 90 degrees.

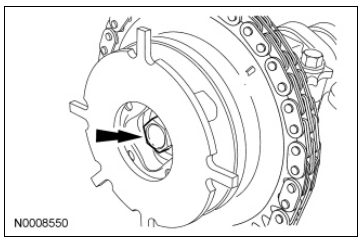
12. Install the LH valve cover. For additional information, refer to Valve Cover - LH in this section.

Camshaft - RH

Special Tool(s)

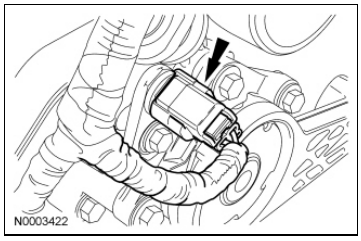
 ST2804-A	Compressor, Valve Spring 303-1039
 ST2969-A	Locking Tool, Timing Chain 303-1175

Material



Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

Removal

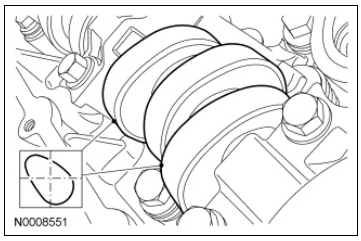


NOTICE: **The camshaft procedure must be followed exactly or damage to the valves and pistons will result.**

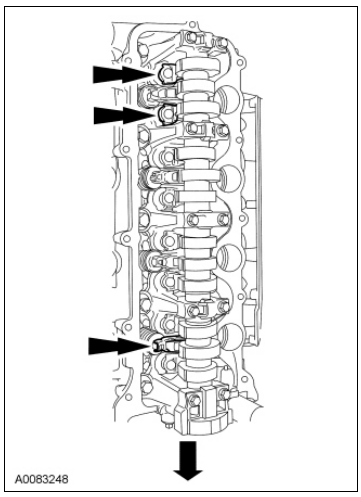
1. Remove the RH valve cover. For additional information, refer to Valve Cover - RH in this section.
2. ***NOTICE:*** **Damage to the camshaft phaser and sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**

   Loosen and backoff the RH camshaft phaser and sprocket bolt one full turn.

N0008550



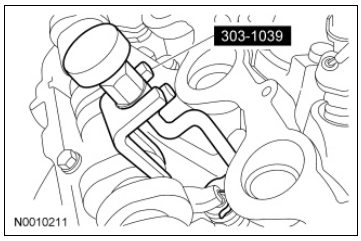
3. Disconnect the RH Camshaft Position (CMP) sensor electrical connector.



4. Remove the bolt and the RH CMP sensor.

5. Rotate the crankshaft clockwise until the No. 1 cylinder camshaft exhaust lobe is coming up on the exhaust stroke and the 2 intake lobes are positioned between 10 and 11 o'clock as shown.

6. Remove only the 3 camshaft roller followers shown in the illustration.



7. *NOTICE:* **The camshaft roller followers must be installed in their original locations. Record camshaft roller follower locations. Failure to follow these instructions may result in engine damage.**

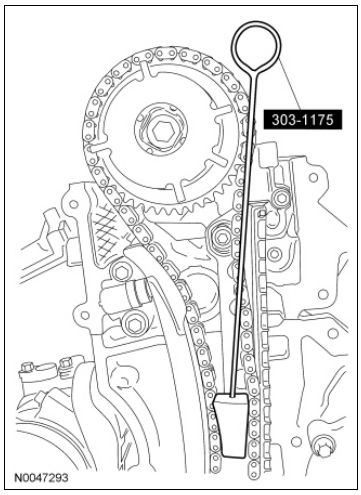
   NOTE: Do not allow the valve keepers to fall off the valve or the valve may drop into the cylinder. If a valve drops into the cylinder, the cylinder head must be removed. For additional information, refer to Cylinder Head in this section.

   NOTE: It may be necessary to push the valve down while compressing the spring.

Using the Valve Spring Compressor, remove only the 3 designated camshaft roller followers from the previous step.

8. ***NOTICE:*** **The crankshaft cannot be moved once set or engine damage may occur.**

   Rotate the crankshaft a half turn clockwise, as viewed from the front, positioning the No. 1 cylinder camshaft intake lobes at the 1 o'clock position as shown.



9. ***NOTICE:*** **Engine is not freewheeling. Camshaft procedure must be followed exactly or damage to valves and pistons will result.**

   NOTE: The Timing Chain Locking Tool must be installed square to the timing chain and the engine block.

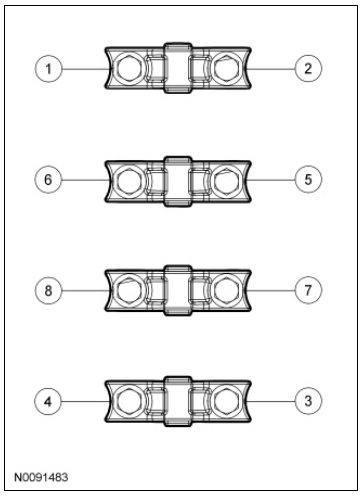
   NOTE: Engine front cover removed for clarity.

   Install the Timing Chain Locking Tool in the RH timing chain as shown.

10. ***NOTICE:*** **Do not remove the Timing Chain Locking Tool at any time during assembly. If the Timing Chain Locking Tool is removed or out of placement, the engine front cover must be removed and the engine must be retimed. For additional information, refer to Timing Drive Components in this section.**

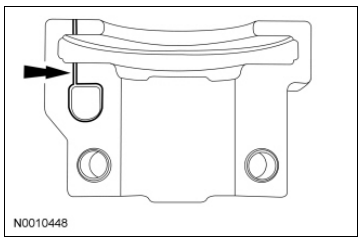
    NOTICE: **The timing chain must be installed in its original position onto the camshaft phaser and sprocket using the scribed marks, or damage to valves and pistons will result.**

Scribe a location mark on the timing chain and the camshaft phaser and sprocket assembly.



11. ***NOTICE:*** **Remove the front thrust camshaft bearing cap straight upward from the bearing towers or the bearing cap may be damaged from side loading.**

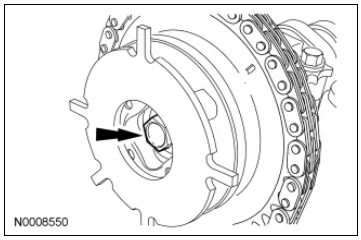
    Remove the 2 bolts and the RH cylinder head camshaft front bearing cap.



12. ***NOTICE:*** **The camshaft bearing caps must be installed in their original locations. Record camshaft bearing cap locations. Failure to follow these instructions may result in engine damage.**

    Remove the remaining bolts in the sequence shown and remove the RH cylinder head camshaft bearing caps.

13. Clean and inspect the RH camshaft bearing caps.
    - The camshaft front thrust bearing cap contains an oil metering groove. Make sure the groove is free of foreign material.



14. ***NOTICE:*** **Damage to the camshaft phaser and sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**

    NOTICE: **Only use hand tools to remove the camshaft phaser and sprocket bolt or damage may occur to the camshaft or camshaft phaser and sprocket.**

    NOTICE: **Do not remove the Timing Chain Locking Tool at any time during assembly. If the Timing Chain Locking Tool is removed or out of placement, the engine front cover must be removed and the engine must be retimed. For additional information, refer to Timing Drive Components in this section.**

    Remove the bolt and the camshaft phaser and sprocket assembly from the camshaft.

    - Discard the bolt and washer.

15. Remove the camshaft.

16. Remove and inspect the camshaft phaser and sprocket for damage. For additional information, refer to Section 303-00 .

Installation

1. **NOTE:** Do not allow the camshaft roller followers to move out of position when installing the camshaft.

   Lubricate the camshaft and camshaft journals with clean engine oil and install the camshaft.

2. ***NOTICE:*** **Do not remove the Timing Chain Locking Tool at any time during assembly. If the Timing Chain Locking Tool is removed or out of placement, the engine front cover must be removed and the engine must be retimed. For additional information, refer to Timing Drive Components in this section.**

   NOTICE: **The timing chain must be installed in its original position onto the camshaft phaser and sprocket using the scribed marks, or damage to valves and pistons will result.**

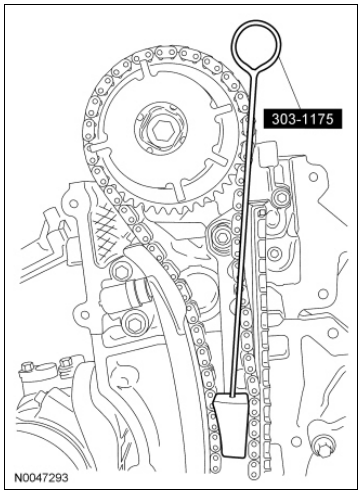
   NOTE: If replacement of the camshaft phaser and sprocket is necessary, transfer the scribe mark to the new camshaft phaser and sprocket.

   Position the camshaft phaser and sprocket into the timing chain with the timing chain scribe marks in alignment.

3. ***NOTICE:*** **Do not remove the Timing Chain Locking Tool at any time during assembly. If the Timing Chain Locking Tool is removed or out of placement, the engine front cover must be removed and the engine must be retimed. For additional information, refer to Timing Drive Components in this section.**

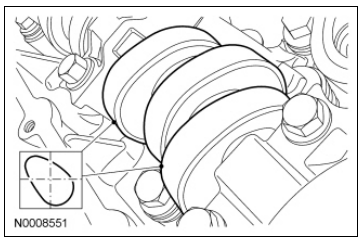
   NOTICE: **Damage to the camshaft phaser and sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**

   Install the camshaft phaser and sprocket assembly onto the camshaft and install a new camshaft phaser and sprocket bolt finger-tight.



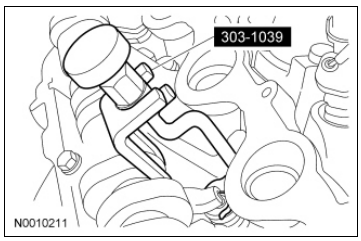
4. Install the camshaft bearing caps in their original locations.
   - Lubricate the camshaft bearing caps with clean engine oil.
   - Position the front camshaft bearing cap.
   - Position the remaining camshaft bearing caps.
   - Install the bolts loosely.

5. Tighten the bolts in the sequence shown.
   - Tighten to 10 Nm (89 lb-in).

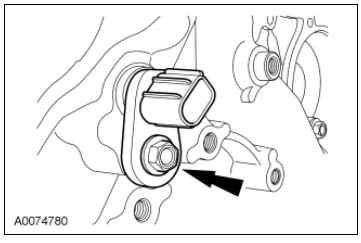


6. **NOTE:** Engine front cover removed for clarity.

   Remove the Timing Chain Locking Tool.



7. Rotate the crankshaft a half turn counterclockwise until the No. 1 cylinder camshaft intake lobes are positioned between 10 and 11 o'clock as shown.



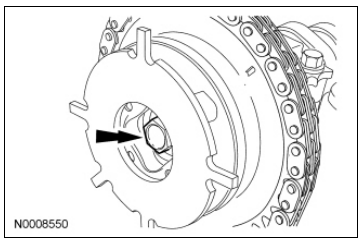
8. **NOTE:** Do not allow the valve keepers to fall off of the valve or the valve may drop into the cylinder. If a valve drops into the cylinder, the cylinder head must be removed. For additional information, refer to Cylinder Head in this section.

   NOTE: It may be necessary to push the valve down while compressing the spring.

   Using the Valve Spring Compressor, install the 3 originally removed camshaft roller followers.

9. Install the CMP sensor and the bolt.
   - Tighten to 10 Nm (89 lb-in).

10. Connect the CMP electrical connector.



11. ***NOTICE:*** **Only use hand tools to install the camshaft phaser and sprocket assembly or damage may occur to the camshaft or camshaft phaser and sprocket.**

    NOTICE: **Damage to the camshaft phaser and sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**

    Tighten the new camshaft phaser and sprocket bolt in 2 stages:

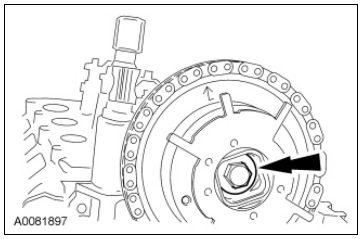
    - Stage 1: Tighten to 40 Nm (30 lb-ft).
    - Stage 2: Tighten an additional 90 degrees.

12. Install the RH valve cover. For additional information, refer to Valve Cover - RH in this section.

Camshaft Phaser and Sprocket - LH

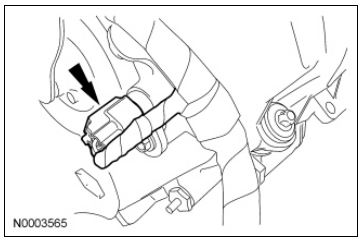
Special Tool(s)

 ST2804-A	Compressor, Valve Spring 303-1039
 ST2969-A	Locking Tool, Timing Chain 303-1175



Removal

NOTICE: **This procedure must be followed exactly or damage to the valves and pistons will result.**

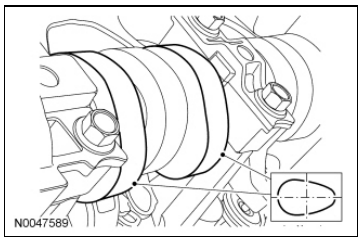


1. Remove the LH valve cover. For additional information, refer to Valve Cover - LH in this section.
2. ***NOTICE:*** **Damage to the camshaft phaser and sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**

   NOTICE: **Only use hand tools to remove the camshaft phaser and sprocket assembly or damage may occur to the camshaft or camshaft phaser and sprocket.**

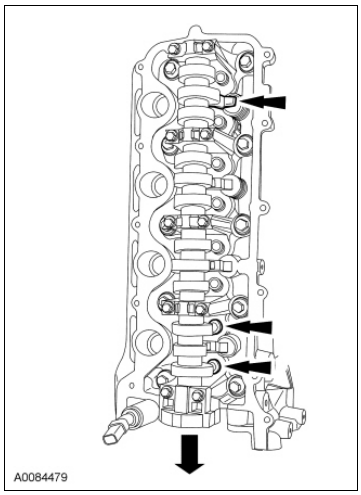
   Loosen and back off the LH camshaft phaser and sprocket bolt one full turn.

A0081897



3. Disconnect the LH Camshaft Position (CMP) sensor electrical connector.

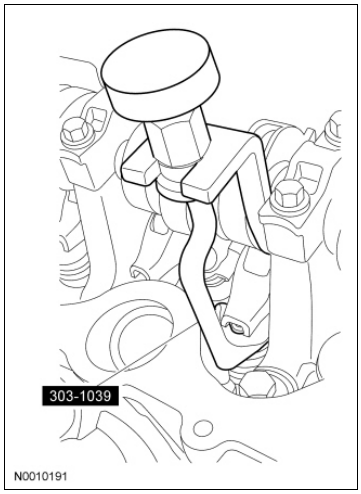
N0003565



4. Remove the bolt and the LH CMP sensor.

5. Rotate the crankshaft clockwise until the No. 5 cylinder camshaft exhaust lobe opens the valve and the 2 intake lobes are in the 3 o'clock position as shown.

6. Remove only the 3 camshaft roller followers shown in the illustration.



7. *NOTICE:* **The camshaft roller followers must be installed in their original locations. Record camshaft roller follower locations. Failure to follow these instructions may result in engine damage.**

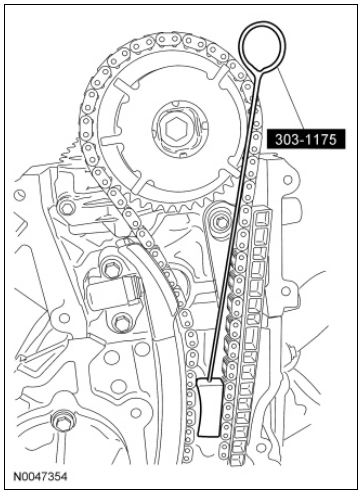
   NOTE: Do not allow the valve keepers to fall off the valve or the valve may drop into the cylinder. If a valve drops into the cylinder, the cylinder head must be removed. For additional information, refer to Cylinder Head in this section.

   NOTE: It may be necessary to push the valve down while compressing the spring.

   Using the Valve Spring Compressor, remove only the 3 designated camshaft roller followers from the previous step.

8. ***NOTICE:*** **The crankshaft cannot be moved once set or engine damage may occur.**

   Rotate the crankshaft a half turn clockwise, as viewed from the front, positioning the No. 5 cylinder camshaft exhaust lobe at the 11 o'clock position as shown.

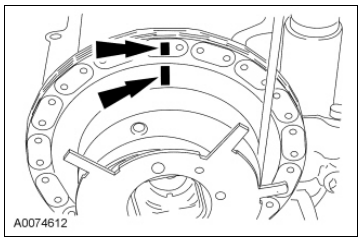


9. ***NOTICE:*** **The engine is not freewheeling. The camshaft procedure must be followed exactly or damage to valves and pistons will result.**

   NOTE: The Timing Chain Locking Tool must be installed square to the timing chain and the engine block.

   NOTE: Engine front cover removed from art for clarity.

   Install the Timing Chain Locking Tool in the LH timing chain as shown.



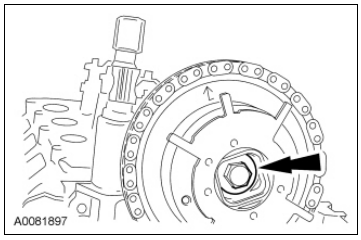
10. ***NOTICE:*** **Do not remove the Timing Chain Locking Tool at any time during assembly. If the Timing Chain Locking Tool is removed or out of placement, the engine front cover must be**

removed and the engine must be retimed. For additional information, refer to Timing Drive Components in this section. Failure to follow this instruction can result in damage to the valves and pistons.

NOTICE: **The timing chain must be installed in its original position onto the camshaft phaser and sprocket using the scribed marks, or damage to valves and pistons will result.**

NOTE: RH shown, LH similar.

Scribe a location mark on the timing chain and the camshaft phaser and sprocket assembly.



11. ***NOTICE:*** **Damage to the camshaft phaser and sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**

    NOTICE: **Only use hand tools to remove the camshaft phaser and sprocket bolt or damage may occur to the camshaft or camshaft phaser and sprocket.**

    NOTICE: **Do not remove the Timing Chain Locking Tool at any time during assembly. If the Timing Chain Locking Tool is removed or out of placement, the engine front cover must be removed and the engine must be retimed. For additional information, refer to Timing Drive Components in this section. Failure to follow this instruction can result in damage to the valves and pistons.**

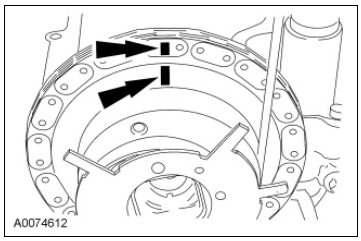
    Remove the bolt and remove the camshaft phaser and sprocket assembly from camshaft and then from the timing chain.

    - Discard the bolt and washer.

12. **NOTE:** If replacement of the camshaft phaser and sprocket is necessary, transfer the scribe mark to the new camshaft phaser and sprocket.

    Inspect the camshaft phaser and sprocket for damage. For additional information, refer to Section 303-00 .

Installation



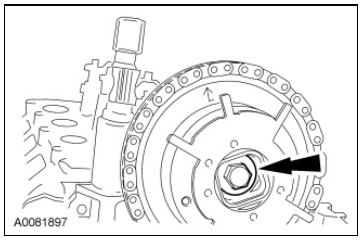
1. ***NOTICE:*** **Do not remove the Timing Chain Locking Tool at any time during assembly. If the Timing Chain Locking Tool is removed or out of placement, the engine front cover must be removed and the engine must be retimed. For additional information, refer to Timing Drive**

Components in this section. Failure to follow this instruction can result in damage to the valves and pistons.

NOTICE: **The timing chain must be installed in its original position onto the camshaft phaser and sprocket using the scribed marks, or damage to valves and pistons will result.**

NOTE: RH shown, LH similar.

Position the camshaft phaser and sprocket into the timing chain with the timing chain scribe marks in alignment.

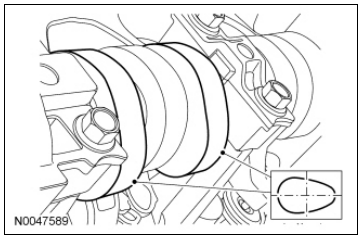


2. ***NOTICE:*** **Do not remove the Timing Chain Locking Tool at any time during assembly. If the Timing Chain Locking Tool is removed or out of placement, the engine front cover must be removed and the engine must be retimed. For additional information, refer to Timing Drive Components in this section. Failure to follow this instruction can result in damage to the valves and pistons.**

   NOTICE: **Damage to the camshaft phaser and sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**

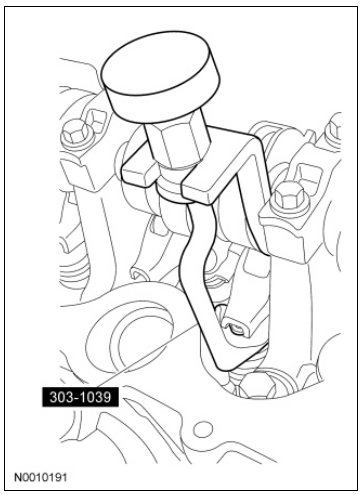
   NOTICE: **Only use hand tools to install the camshaft phaser and sprocket bolt or damage may occur to the camshaft or camshaft phaser and sprocket.**

   Position the camshaft phaser and sprocket onto the camshaft. Install a new camshaft phaser and sprocket bolt finger-tight.

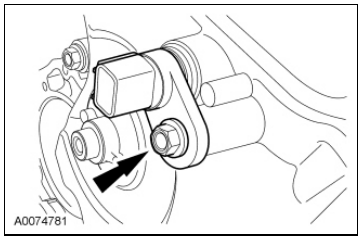


3. **NOTE:** Engine front cover removed from art for clarity.

   Remove the Timing Chain Locking Tool.



4. Rotate the crankshaft a half turn counterclockwise until the No. 5 cylinder camshaft exhaust lobe opens the valve and the 2 intake lobes are in the 3 o'clock position as shown.



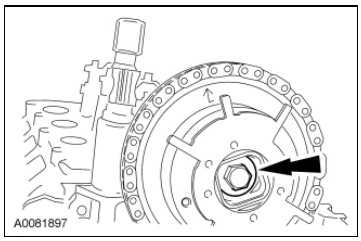
5. **NOTE:** Do not allow the valve keepers to fall off the valve or the valve may drop into the cylinder. If a valve drops into the cylinder, the cylinder head must be removed. For additional information, refer to Cylinder Head in this section.

   NOTE: It may be necessary to push the valve down while compressing the spring.

   Using the Valve Spring Compressor, install the 3 originally removed camshaft roller followers.

6. Install the CMP sensor and the bolt.
   - Tighten to 10 Nm (89 lb-in).

7. Connect the CMP electrical connector.



8. ***NOTICE:*** **Only use hand tools to install the camshaft phaser and sprocket assembly or damage may occur to the camshaft or camshaft phaser and sprocket.**

   NOTICE: **Damage to the camshaft phaser and sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**

   Tighten the camshaft phaser and sprocket bolt in 2 stages:

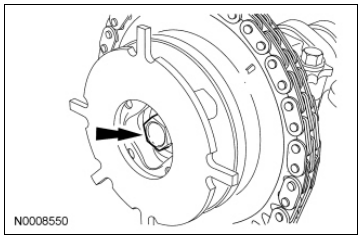
   - Stage 1: Tighten to 40 Nm (30 lb-ft).
   - Stage 2: Tighten an additional 90 degrees.

9. Install the LH valve cover. For additional information, refer to Valve Cover - LH in this section.

Camshaft Phaser and Sprocket - RH

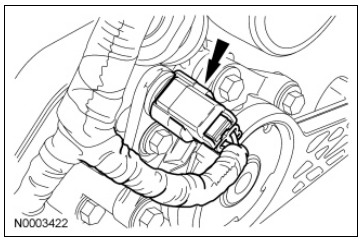
Special Tool(s)

 ST2804-A	Compressor, Valve Spring 303-1039
 ST2969-A	Locking Tool, Timing Chain 303-1175



Removal

NOTICE: **This procedure must be followed exactly or damage to the valves and pistons will result.**

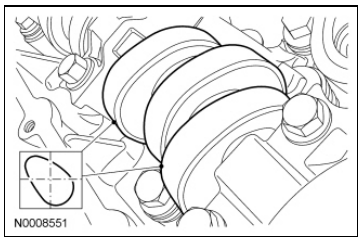


1. Remove the RH valve cover. For additional information, refer to Valve Cover - RH in this section.
2. ***NOTICE:*** **Damage to the camshaft phaser and sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**

   NOTICE: **Only use hand tools to remove the camshaft phaser and sprocket assembly or damage may occur to the camshaft or camshaft phaser and sprocket.**

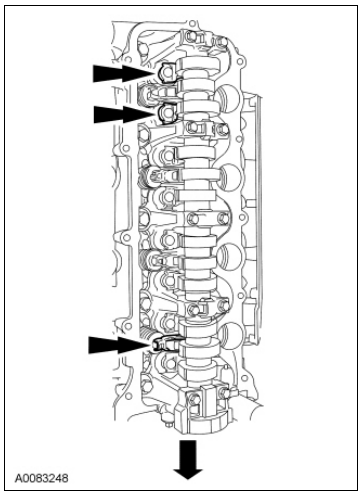
   Loosen and backoff the RH camshaft phaser and sprocket bolt one full turn.

N0008550



3. Disconnect the RH Camshaft Position (CMP) sensor electrical connector.

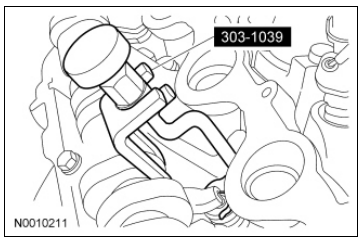
N0003422



4. Remove the bolt and the RH CMP sensor.

5. Rotate the crankshaft clockwise until the No. 1 cylinder camshaft exhaust lobe is coming up on the exhaust stroke and the 2 intake lobes are positioned between 10 and 11 o'clock as shown.

6. Remove only the 3 camshaft roller followers shown in the illustration.



7. *NOTICE:* **The camshaft roller followers must be installed in their original locations. Record camshaft roller follower locations. Failure to follow these instructions may result in engine damage.**

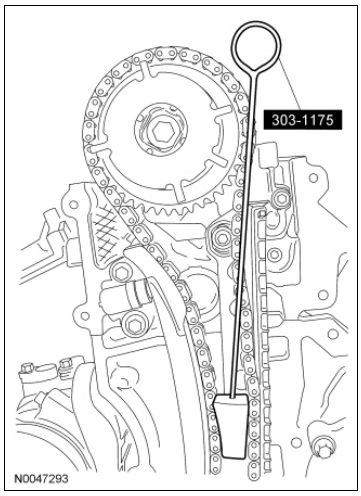
   NOTE: Do not allow the valve keepers to fall off of the valve or the valve may drop into the cylinder. If a valve drops into the cylinder, the cylinder head must be removed. For additional information, refer to Cylinder Head in this section.

   NOTE: It may be necessary to push the valve down while compressing the spring.

   Using the Valve Spring Compressor, remove only the 3 designated camshaft roller followers from the previous step.

8. ***NOTICE:*** **The crankshaft cannot be moved once set or engine damage may occur.**

   Rotate the crankshaft a half turn clockwise, as viewed from the front, positioning the No. 1 cylinder intake lobes at the 1 o'clock position as shown.



9. ***NOTICE:*** **Engine is not freewheeling. Camshaft procedure must be followed exactly or damage to valves and pistons will result.**

   NOTE: The Timing Chain Locking Tool must be installed square to the timing chain and the engine block.

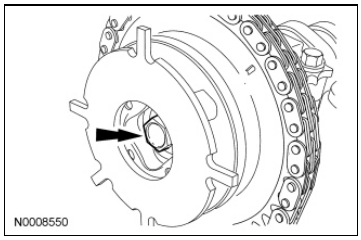
   NOTE: Engine front cover removed for clarity.

   Install the Timing Chain Locking Tool in the RH timing chain as shown.

10. ***NOTICE:*** **Do not remove the Timing Chain Locking Tool at any time during assembly. If the Timing Chain Locking Tool is removed or out of placement, the engine front cover must be removed and the engine must be retimed. For additional information, refer to Timing Drive Components in this section.**

    NOTICE: **The timing chain must be installed in its original position onto the camshaft phaser and sprocket using the scribed marks, or damage to valves and pistons will result.**

    Scribe a location mark on the timing chain and the camshaft phaser and sprocket assembly.



11. ***NOTICE:*** **Damage to the camshaft phaser and sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**

    NOTICE: **Only use hand tools to remove the camshaft phaser and sprocket bolt or damage may occur to the camshaft or camshaft phaser and sprocket.**

    NOTICE: **Do not remove the Timing Chain Locking Tool at any time during assembly. If the Timing Chain Locking Tool is removed or out of placement, the engine front cover must be removed and the engine must be retimed. For additional information, refer to Timing Drive Components in this section.**

    Remove the bolt and remove the camshaft phaser and sprocket assembly from camshaft and then from the timing chain.

    - Discard the bolt and washer.

12. **NOTE:** If replacement of the camshaft phaser and sprocket is necessary, transfer the scribe mark to the new camshaft phaser and sprocket.

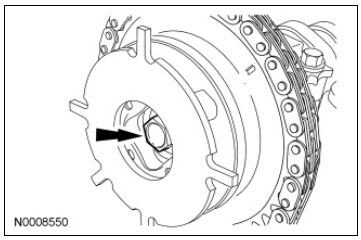
    Inspect the camshaft phaser and sprocket for damage. For additional information, refer to Section 303-00 .

Installation

1. ***NOTICE:*** **Do not remove the Timing Chain Locking Tool at any time during assembly. If the Timing Chain Locking Tool is removed or out of placement, the engine front cover must be removed and the engine must be retimed. For additional information, refer to Timing Drive Components in this section.**

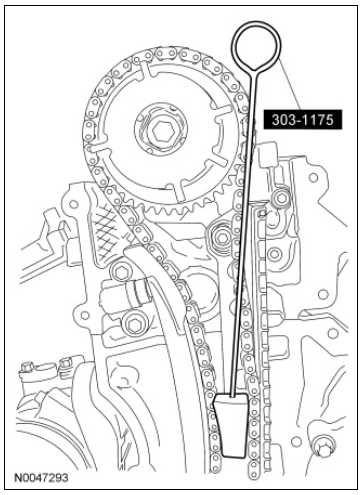
   NOTICE: **The timing chain must be installed in its original position onto the camshaft phaser and sprocket using the scribed marks, or damage to valves and pistons will result.**

   Position the camshaft phaser and sprocket into the timing chain with the timing chain scribe marks in alignment.



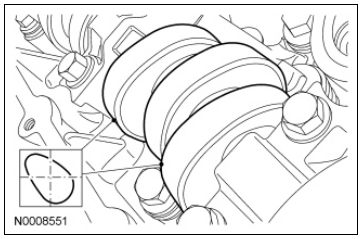
2. ***NOTICE:*** **Do not remove the Timing Chain Locking Tool at any time during assembly. If the Timing Chain Locking Tool is removed or out of placement, the engine front cover must be removed and the engine must be retimed. For additional information, refer to Timing Drive Components in this section.**

NOTICE: **Damage to the camshaft phaser and sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**



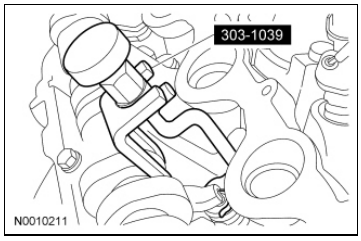
NOTICE: **Only use hand tools to install the camshaft phaser and sprocket bolt or damage may occur to the camshaft or camshaft phaser and sprocket.**

Position the camshaft phaser and sprocket assembly onto the camshaft. Install a new camshaft phaser and sprocket bolt finger-tight.

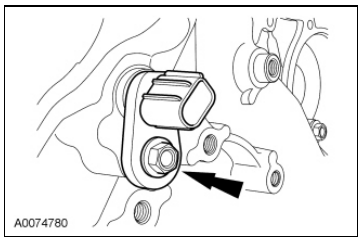


3. **NOTE:** Engine front cover removed for clarity.

   Remove the Timing Chain Locking Tool.



4. Rotate the crankshaft a half turn counterclockwise until the No. 1 cylinder camshaft intake lobes are positioned between 10 and 11 o'clock as shown.



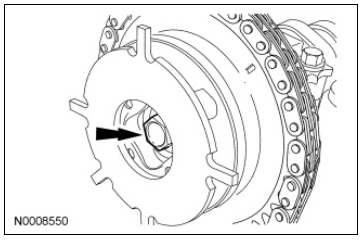
5. **NOTE:** Do not allow the valve keepers to fall off of the valve or the valve may drop into the cylinder. If a valve drops into the cylinder, the cylinder head must be removed. For additional information, refer to Cylinder Head in this section.

   NOTE: It may be necessary to push the valve down while compressing the spring.

   Using the Valve Spring Compressor, install the 3 originally removed camshaft roller followers.

6. Install the CMP sensor and the bolt.
   - Tighten to 10 Nm (89 lb-in).

7. Connect the CMP electrical connector.



8. ***NOTICE:*** **Only use hand tools to install the camshaft phaser and sprocket assembly or damage may occur to the camshaft or camshaft phaser and sprocket.**

   NOTICE: **Damage to the camshaft phaser and sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**

   Tighten the new camshaft phaser and sprocket bolt in 2 stages:

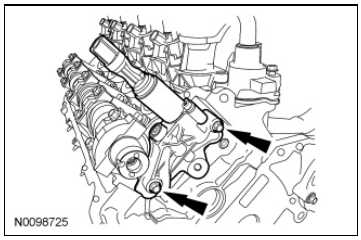
   - Stage 1: Tighten to 40 Nm (30 lb-ft).
   - Stage 2: Tighten an additional 90 degrees.

9. Install the RH valve cover. For additional information, refer to Valve Cover - RH in this section.

Variable Camshaft Timing (VCT) Housing

Material

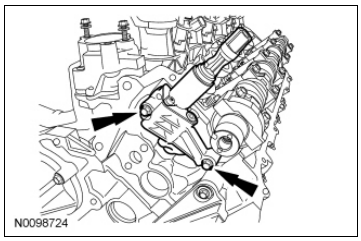
Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	-



Removal

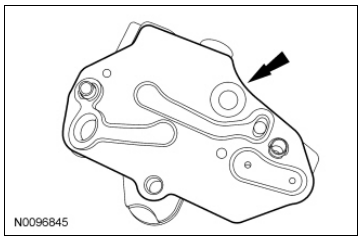
All Variable Camshaft Timing (VCT) housings

1. Remove the timing drive components. For additional information, refer to Timing Drive Components in this section.



RH VCT housing

2. Remove the 2 bolts and the RH Variable Camshaft Timing (VCT) housing.



LH VCT housing

3. Remove the 2 bolts and the LH VCT housing.

All VCT housings

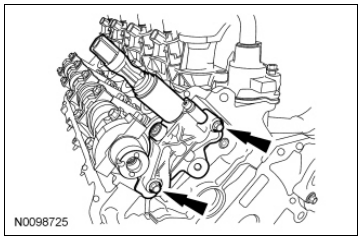
4. Remove and discard the VCT housing gasket.

5. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

   Clean and inspect the cylinder head sealing surfaces with metal surface prep. Follow the directions on the packaging.

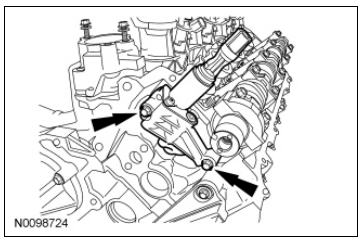
6. Clean and inspect the VCT housing. For additional information, refer to Section 303-00 .

Installation



All VCT housing

1. Install a new gasket onto the VCT housing.

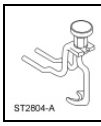


RH VCT housing

2. Position the RH VCT housing and install the 2 bolts.
   - Tighten to 10 Nm (89 lb-in).

LH VCT housing

3. Position the LH VCT housing and install the 2 bolts.
   - Tighten to 10 Nm (89 lb-in).



All VCT housings

4. Install the timing drive components. For additional information, refer to Timing Drive Components in this section.

Camshaft Roller Follower

Special Tool(s)

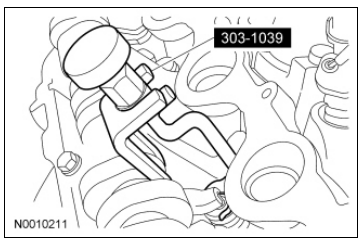
 ST2804-A	Compressor, Valve Spring 303-1039

Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

Removal

1. Depending on the roller follower being serviced, remove the LH or RH valve cover. For additional information, refer to Valve Cover - LH or Valve Cover - RH in this section.



2. Rotate the crankshaft until the piston for the valve being serviced is at the top of its stroke with the intake valve and the exhaust valves closed.

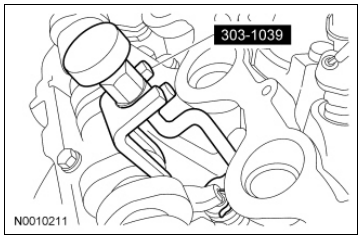
3. ***NOTICE:*** **If the components are to be reinstalled, they must be installed in their original positions. Mark the components for installation into their original locations. Failure to follow these instructions may result in engine damage.**

   NOTE: Do not allow the valve keepers to fall off of the valve or the valve may drop into the cylinder. If a valve drops into the cylinder, the cylinder head must be removed. For additional information, refer to Cylinder Head in this section.

   NOTE: It may be necessary to push the valve down while compressing the spring.

   Using the Valve Spring Compressor, compress the valve spring and remove the camshaft roller follower.

4. Repeat the previous 2 steps for each roller follower being serviced.



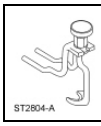
5. Inspect the roller follower. For additional information, refer to Section 303-00 .

Installation

1. ***NOTICE:*** **If the components are to be reinstalled, they must be installed in their original positions. Mark the components for installation into their original locations. Failure to follow these instructions may result in engine damage.**

   NOTE: Lubricate the roller follower with clean engine oil.

   Using the Valve Spring Compressor, compress the valve spring and install the camshaft roller follower.



2. Repeat the previous step for each roller follower being serviced.

3. Depending on the valve being serviced, install the LH or RH valve cover. For additional information, refer to Valve Cover - LH or Valve Cover - RH in this section.

Valve Springs

Special Tool(s)

 ST2804-A	Compressor, Valve Spring 303-1039

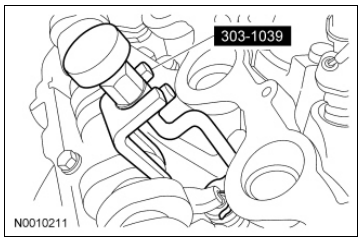
Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

Removal

1. Depending on the valve spring being serviced, remove the LH or RH valve cover. For additional information, refer to Valve Cover - LH or Valve Cover - RH in this section.

2. Remove the spark plug. For additional information, refer to Section 303-07B .



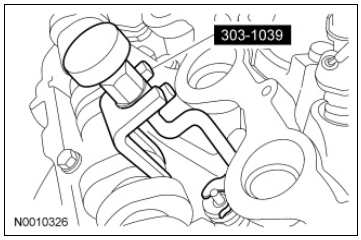
3. Rotate the crankshaft until the piston for the valve spring being serviced is at the top of its stroke with the intake valve and the exhaust valves closed.

4. ***NOTICE:*** **If the components are to be reinstalled, they must be installed in their original positions. Mark the components for installation into their original locations. Failure to follow these instructions may result in engine damage.**

   NOTE: Do not allow the valve keepers to fall off of the valve or the valve may drop into the cylinder. If a valve drops into the cylinder, the cylinder head must be removed. For additional information, refer to Cylinder Head in this section.

   NOTE: It may be necessary to push the valve down while compressing the spring.

   Using the Valve Spring Compressor, compress the valve spring and remove the camshaft roller follower.

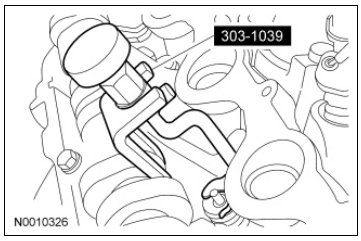


5. Use compressed air in the cylinder to hold both valves in position.
    - Apply a minimum of 965 kPa (140 psi) of compressed air into the cylinder.

6. ***NOTICE:*** **If the components are to be reinstalled, they must be installed in their original positions. Mark the components for installation into their original locations. Failure to follow these instructions may result in engine damage.**

   NOTE: If air pressure has forced the piston to the bottom of the cylinder, any loss of air pressure will allow the valve to fall into the cylinder. If air pressure must be removed, support the valve prior to removal. If a valve drops into the cylinder, remove the cylinder head. For additional information, refer to Cylinder Head in this section.

   Using the Valve Spring Compressor, compress the valve spring and remove the valve spring retainer keys.



7. Remove the valve spring retainer and the valve spring.

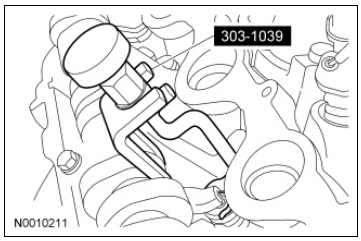
8. Inspect the valve spring. For additional information, refer to Section 303-00 .

Installation

1. ***NOTICE:*** **If the components are to be reinstalled, they must be installed in their original positions. Mark the components for installation into their original locations. Failure to follow these instructions may result in engine damage.**

   Using the Valve Spring Compressor, install the valve spring, the valve spring retainer and the valve spring retainer keys.

2. Relieve the air pressure from the cylinder.

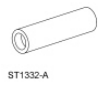


3. ***NOTICE:*** **If the components are to be reinstalled, they must be installed in their original positions. Mark the components for installation into their original locations. Failure to follow these instructions may result in engine damage.**

   NOTE: Do not allow the valve keepers to fall off of the valve or the valve may drop into the cylinder. If a valve drops into the cylinder, the cylinder head must be removed. For additional information, refer to Cylinder Head in this section.

   NOTE: It may be necessary to push the valve down while compressing the spring.

NOTE: Lubricate the camshaft roller followers with clean engine oil prior to installation.



Using the Valve Spring Compressor, compress the valve spring and install the camshaft roller follower.

4. Install the spark plug. For additional information, refer to Section 303-07B .
5. Depending on the valve spring being serviced, install the LH or RH valve cover. For additional information, refer to Valve Cover - LH or Valve Cover - RH in this section.

Valve Seals

Special Tool(s)

 ST2804-A	Compressor, Valve Spring 303-1039
 ST1332-A	Installer, Valve Stem Oil Seal 303-383 (T91P-6571-A)

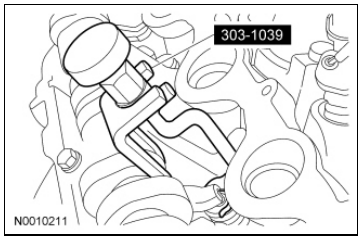
Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

Removal

1. Depending on the valve seal being serviced, remove the LH or RH valve cover. For additional information, refer to Valve Cover - LH or Valve Cover - RH in this section.

2. Remove the spark plug. For additional information, refer to Section 303-07B .



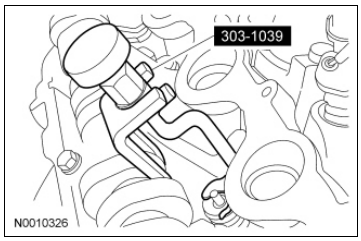
3. Rotate the crankshaft until the piston for the valve seal being serviced is at the top of its stroke with the intake valve and the exhaust valves closed.

4. ***NOTICE:*** **If the components are to be reinstalled, they must be installed in their original positions. Mark the components for installation into their original locations. Failure to follow these instructions may result in engine damage.**

   NOTE: Do not allow the valve keepers to fall off of the valve or the valve may drop into the cylinder. If a valve drops into the cylinder, the cylinder head must be removed. For additional information, refer to Cylinder Head in this section.

   NOTE: It may be necessary to push the valve down while compressing the spring.

   Using the Valve Spring Compressor, compress the valve spring and remove the camshaft roller follower.



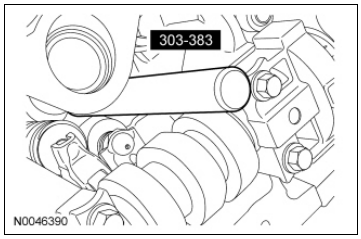
5. Use compressed air in the cylinder to hold both valves in position.
    - Apply a minimum of 965 kPa (140 psi) of compressed air into the cylinder.

6. ***NOTICE:*** **If the components are to be reinstalled, they must be installed in their original positions. Mark the components for installation into their original locations. Failure to follow these instructions may result in engine damage.**

   NOTE: If air pressure has forced the piston to the bottom of the cylinder, any loss of air pressure will allow the valve to fall into the cylinder. If air pressure must be removed, support the valve prior to removal. If a valve drops into the cylinder, remove the cylinder head. For additional information, refer to Cylinder Head in this section.

   Using the Valve Spring Compressor, compress the valve spring and remove the valve spring retainer keys.

7. Remove the valve spring retainer, the valve spring and the valve seal.
    - Discard the valve seal.



8. Inspect the components. For additional information, refer to Section 303-00 .

Installation

1. **NOTE:** Lubricate the valve seal and valve stem with clean engine oil prior to installation.

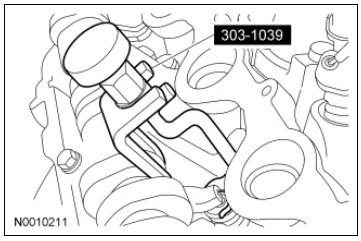
   Position a new valve seal onto the valve stem.

2. Using the Valve Stem Oil Seal Installer, install the new valve seal.

3. ***NOTICE:*** **If the components are to be reinstalled, they must be installed in their original positions. Mark the components for installation into their original locations. Failure to follow these instructions may result in engine damage.**

Using the Valve Spring Compressor, install the valve spring, the valve spring retainer and the valve spring retainer keys.

4. Relieve the air pressure from the cylinder.



5. ***NOTICE:*** **If the components are to be reinstalled, they must be installed in their original positions. Mark the components for installation into their original locations. Failure to follow these instructions may result in engine damage.**

   NOTE: Do not allow the valve keepers to fall off of the valve or the valve may drop into the cylinder. If a valve drops into the cylinder, the cylinder head must be removed. For additional information, refer to Cylinder Head in this section.

   NOTE: It may be necessary to push the valve down while compressing the spring.

   NOTE: Lubricate the camshaft roller followers with clean engine oil prior to installation.

   Using the Valve Spring Compressor, compress the valve spring and install the camshaft roller follower.

6. Install the spark plug. For additional information, refer to Section 303-07B .

7. Depending on the valve seal being serviced, install the LH or RH valve cover. For additional information, refer to Valve Cover - LH or Valve Cover - RH in this section.

Hydraulic Lash Adjuster

Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

Removal and Installation

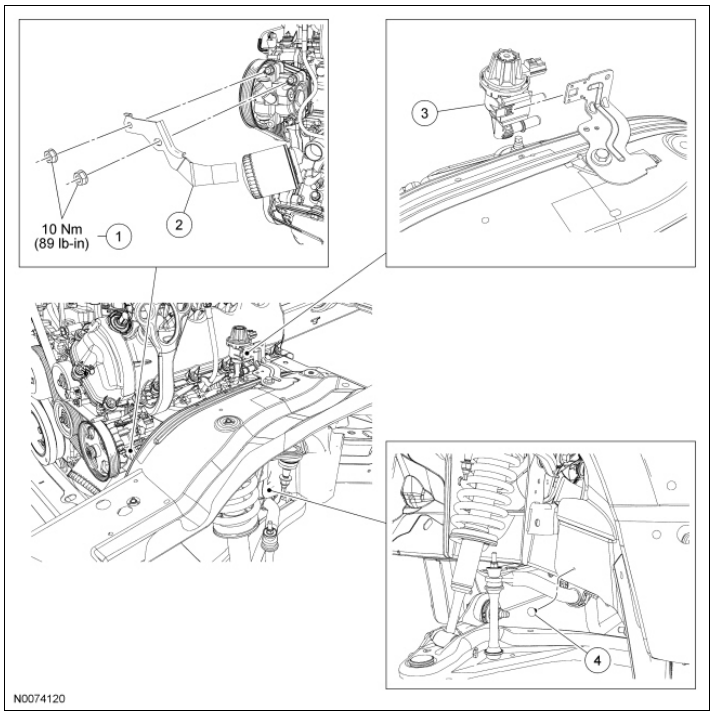
1. Remove the camshafts. For additional information, refer to Valve Train Components - Exploded View , Camshaft - LH and Camshaft - RH in this section.

2. Remove the remaining roller followers from the cylinder head being serviced.

3. ***NOTICE:*** **If the components are to be reinstalled, they must be installed in their original positions. Mark the components for installation into their original locations. Failure to follow these instructions may result in engine damage.**

   Remove the hydraulic lash adjusters that are being serviced.

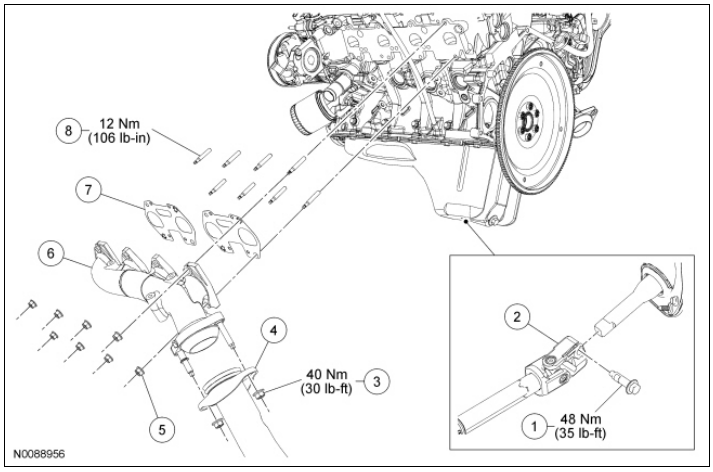
4. Inspect the hydraulic lash adjusters. For additional information, refer to Section 303-00 .



5. **NOTE:** Lubricate each of the hydraulic lash adjusters with clean engine oil prior to installation.

   To install, reverse the removal procedure.

Exhaust Manifold - LH



Removal

Wiring Harness Bracket, Evaporative Emission (EVAP) Canister Purge Valve and Splash Shield Pushpin

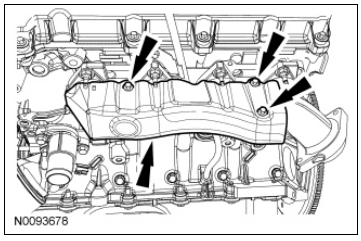
Item	Part Number	Description
1	N805403	Battery cable bracket nuts (2 required)
2	10W652	Battery cable bracket (part of 14A280)
3	9G641	Evaporative Emission (EVAP) canister purge valve
4	388577	Splash shield pushpin

LH Exhaust Manifold

Item	Part Number	Description
1	W710570	Intermediate steering shaft pinch bolt
2	3C662	Intermediate steering shaft
3	W705443	Dual converter Y-pipe flange nut (4 required)
4	5F250	Dual converter Y-pipe
5	W701706	LH exhaust manifold nut (8 required)
6	9431	LH exhaust manifold
7	9Y431	LH exhaust manifold gasket (2 required)
8	W707747	LH exhaust manifold stud (8 required)

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

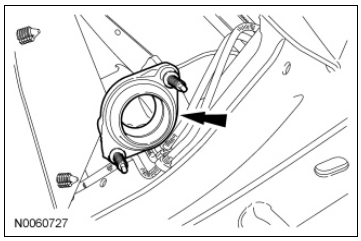
2. Detach the Evaporative Emission (EVAP) canister purge valve from the bracket and position the valve aside.



3. ***NOTICE:*** **Do not allow the lower steering column shaft to rotate while it is disconnected from the gear or the clockspring may be damaged. If there is evidence that the lower steering column shaft has rotated, the clockspring must be removed and recentered. For additional information, refer to Section 501-20B .**

   Remove the intermediate steering shaft pinch bolt and disconnect the intermediate steering shaft from the lower steering column shaft.

4. Remove the 4 nuts and disconnect the dual converter Y-pipe from the exhaust manifolds.

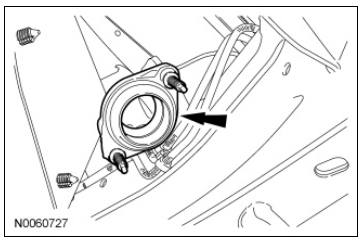


5. Remove the 2 nuts and position the battery cable bracket aside.

6. Remove the 3 bolts and the LH exhaust manifold heat shield.

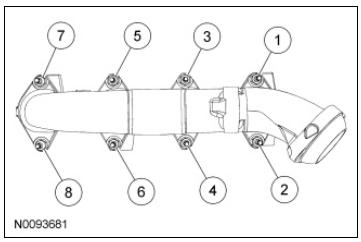
7. Remove and discard the pushpin.

8. Remove the 8 nuts, the LH exhaust manifold and the 2 gaskets.
    - Deflect the inner fender splash shield and remove the manifold between the splash shield and the frame rail.
    - Discard the nuts and the gaskets.



9. Remove and discard the 8 LH exhaust manifold studs.

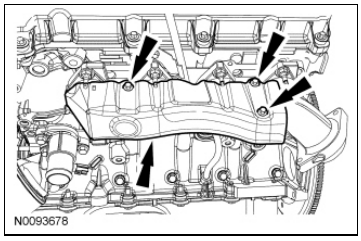
Installation



1. Clean and inspect the LH exhaust manifold. For additional information, refer to Section 303-00 .

2. Install 8 new LH exhaust manifold studs.
    - Tighten to 12 Nm (106 lb-in).

3. Position the 2 new gaskets, the LH exhaust manifold and install 8 new nuts finger-tight.
    - Deflect the inner fender splash shield and insert the exhaust manifold between the splash shield and the frame rail.

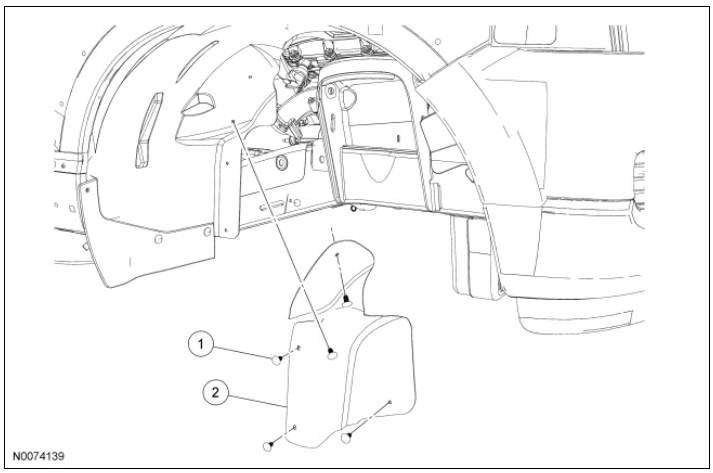


4. Tighten the exhaust manifold nuts in the sequence shown.
    - Tighten to 25 Nm (18 lb-ft).

5. Position the inner fender splash shield and install a new pushpin.

6. Install the heat shield and the 3 bolts.
    - Tighten to 10 Nm (89 lb-in).

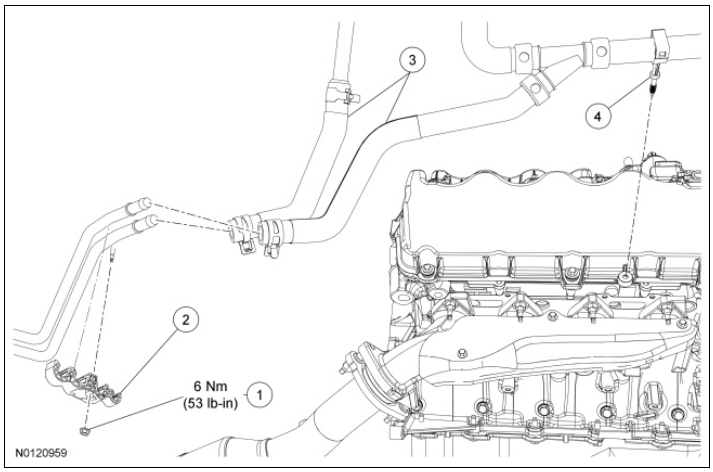
7. Position the battery cable bracket to the power steering pump and install the 2 nuts.
   - Tighten to 10 Nm (89 lb-in).



8. Connect the dual converter Y-pipe to the exhaust manifolds and install the 4 nuts.
   - Tighten to 40 Nm (30 lb-ft).

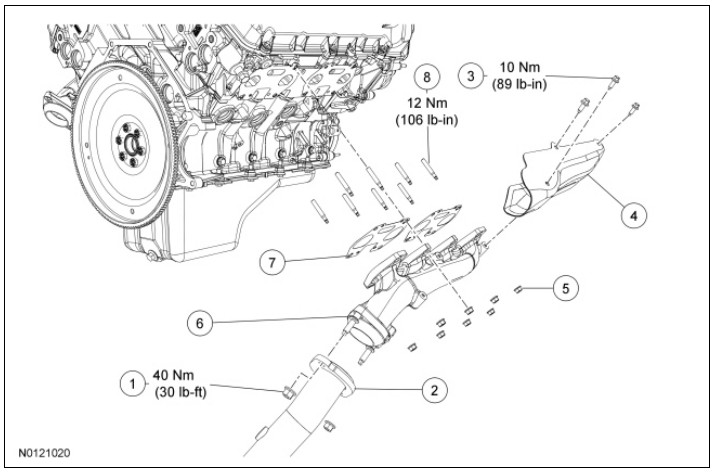
9. Connect the intermediate steering shaft to the lower steering column shaft and install the pinch bolt.
   - Tighten to 48 Nm (35 lb-ft).

10. Attach the EVAP canister purge valve to the bracket.



Exhaust Manifold - RH

RH Splash Shield



Item	Part Number	Description
1	388577	RH splash shield pushpin (5 required)
2	16034	RH splash shield

Vehicles with auxiliary climate control

Item	Part Number	Description
1	W520512	Auxiliary line bracket nut
2	18N332	Auxiliary line bracket
3	18K470	Heater core hose assembly
4	-	Heater core hose assembly retainer

RH Exhaust Manifold

Item	Part Number	Description
1	W705443	Dual converter Y-pipe flange nut (4 required)
2	5F250	Dual converter Y-pipe
3	W707130	RH exhaust manifold heat shield bolts (3 required)
4	9A462	RH exhaust manifold heat shield
5	W701706	RH exhaust manifold nut (8 required)
6	9430	RH exhaust manifold
7	9Y431	RH exhaust manifold gasket (2 required)
8	W707747	RH exhaust manifold stud (8 required)

Removal

All vehicles

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

Vehicles with auxiliary climate control

2. Drain the cooling system. For additional information, refer to Section 303-03 .
3. Detach the heater core hose assembly retainer from the RH valve cover.
4. Remove the RH front fender splash shield. For additional information, refer to Section 501-02 .
5. Disconnect the 2 heater hoses and position aside.
6. Remove the auxiliary line bracket nut.
7. Remove the auxiliary line bracket.

All vehicles

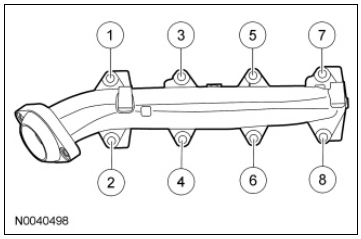
8. Remove the 4 nuts and disconnect the dual converter Y-pipe from the exhaust manifolds.
9. Remove the 3 bolts and the RH exhaust manifold heat shield.

10. Remove the 5 pushpins and the RH splash shield.

11. Remove the 8 nuts, the RH exhaust manifold and the 2 gaskets.
    - Discard the nuts and the gaskets.

12. Remove and discard the 8 RH exhaust manifold studs.

Installation



All vehicles

1. Inspect the exhaust manifold gasket mating surfaces for flatness. For additional information, refer to Section 303-00 .

2. Install 8 new RH exhaust manifold studs.
    - Tighten to 12 Nm (106 lb-in).

3. Position the 2 new gaskets, the RH exhaust manifold and install 8 new nuts finger-tight.

4. Tighten the nuts in the sequence shown.
    - Tighten to 25 Nm (18 lb-ft).

5. Position the RH splash shield and install the 5 pushpins.

6. Position the heat shield and install the 3 bolts.
    - Tighten to 10 Nm (89 lb-in).

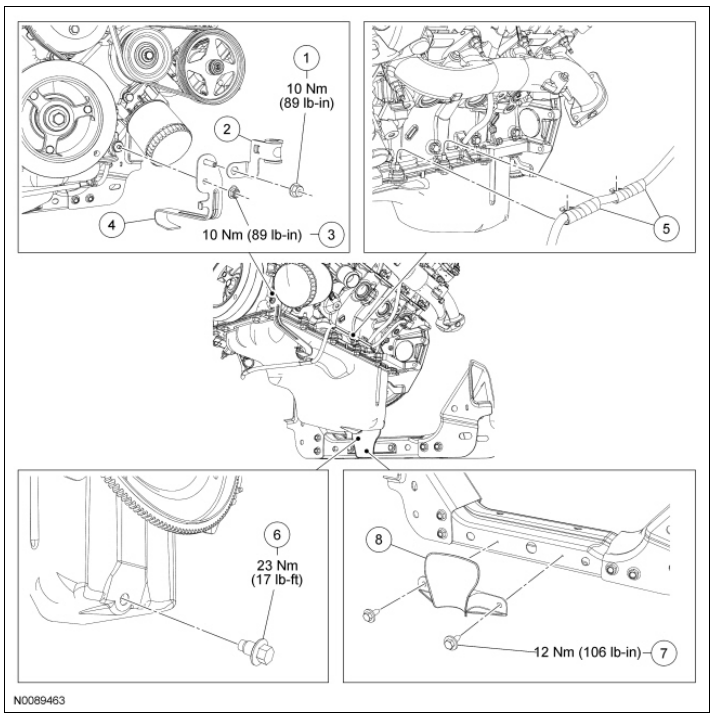
7. Connect the dual converter Y-pipe to the exhaust manifolds and install the 4 nuts.
    - Tighten to 40 Nm (30 lb-ft).

Vehicles with auxiliary climate control

8. Install the auxiliary line bracket.

9. Install the auxiliary line bracket nut.
    - Tighten to 6 Nm (53 lb-in).

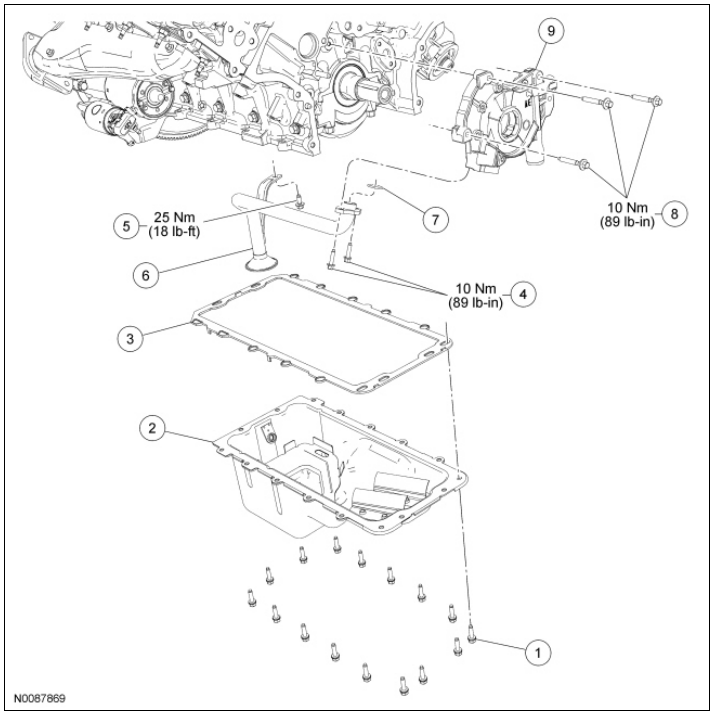
10. Position and connect the 2 heater hoses.



11. Install the RH front fender splash shield. For additional information, refer to Section 501-02 .

12. Attach the heater core hose assembly retainer to the RH valve cover.

13. Fill the cooling system. For additional information, refer to Section 303-03 .



Engine Lubrication Components - Exploded View

Brackets, Oil Drain Plug and Oil Splash Shield

Item	Part Number	Description
1	W805320	Power Steering Pressure (PSP) hose bracket nut
2	81396	PSP hose bracket (part of 3A719)
3	W520101	Battery cable bracket-to-engine front cover nut
4	10A779	Battery cable bracket (part of 14A280)
5	13506	Engine block heater wiring harness retainers (2 required)
6	6730	Oil pan drain plug
7	W710617	Oil splash shield bolt (2 required)
8	5D121	Oil splash shield

Engine Lubrication Components

Item	Part Number	Description
1	W701605	Oil pan bolt (16 required)
2	6675	Oil pan
3	6710	Oil pan gasket
4	N806155	Oil pump screen and pickup tube-to-oil pump bolts (2 required)
5	N605904	Oil pump screen and pickup tube support bracket bolt
6	6622	Oil pump screen and pickup tube
7	6625	Oil pump screen and pickup tube O-ring seal
8	N806183	Oil pump bolts (3 required)
9	6621	Oil pump

1. For additional information, refer to the procedures in this section.

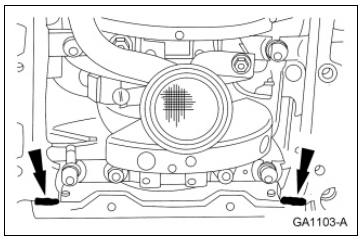
Oil Pan

Material

Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	-
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4
Motorcraft® Silicone Gasket Remover ZC-30	-

Removal

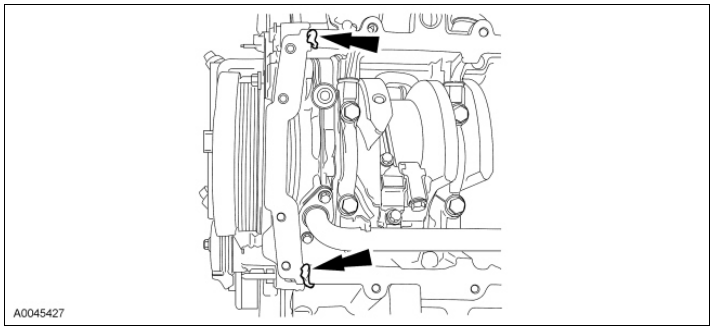
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the front drive axle, if equipped. For additional information, refer to Section 205-03 .
3. Remove the stabilizer bar. For additional information, refer to Section 204-01A .
4. Remove the drain plug and drain the engine oil. Install the drain plug when finished.
   - Tighten to 23 Nm (17 lb-ft).
5. Remove the nut and position the Power Steering Pressure (PSP) hose bracket aside.
6. Remove the nut and position the battery cable bracket aside.
7. Remove the 2 bolts and the oil drain splash shield.
8. If equipped with a block heater, detach the block heater wiring harness retainers from the LH side oil pan bolts.
9. Remove the 16 bolts, the oil pan and the gasket.
   - Discard the gasket.



Installation

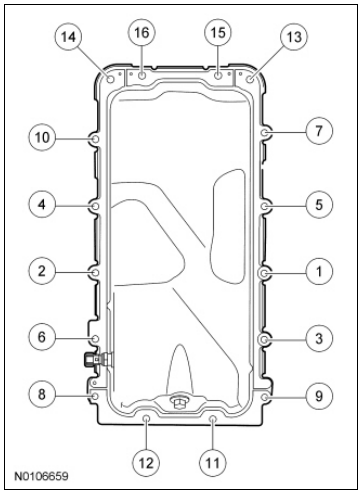
1. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These may cause scratches and gouges resulting in leak paths. Use a plastic scraper to clean the sealing surfaces. Failure to follow these directions can cause future oil leaks.**

   Clean and inspect the sealing surfaces with silicone gasket remover, metal surface prep and a plastic scraper. Follow the directions on the packaging.



2. **NOTE:** If the oil pan and gasket are not secured within 4 minutes of sealer application, the sealant must be removed and the sealing surfaces cleaned with silicone gasket remover and metal surface prep. Follow the directions on the packaging.

   Apply silicone gasket and sealant in 2 places as shown.



3. **NOTE:** If the oil pan and gasket are not secured within 4 minutes of sealer application, the sealant must be removed and the sealing surfaces cleaned with silicone gasket remover and metal surface prep. Follow the directions on the packaging.

   Apply silicone gasket and sealant in 2 places as shown.

4. Position a new oil pan gasket and the oil pan and install the 16 bolts finger-tight.

5. Tighten the bolts in 3 stages in the sequence shown.
   - Stage 1: Tighten to 2 Nm (18 lb-in).
   - Stage 2: Tighten to 20 Nm (177 lb-in).
   - Stage 3: Tighten an additional 60 degrees.

6. If equipped with a block heater, attach the block heater wiring harness retainers to the LH oil pan bolts.

7. Position the oil drain splash shield and install the 2 bolts.
   - Tighten to 12 Nm (106 lb-in).

8. Attach the battery cable bracket to the engine front cover and install the nut.
   - Tighten to 10 Nm (89 lb-in).

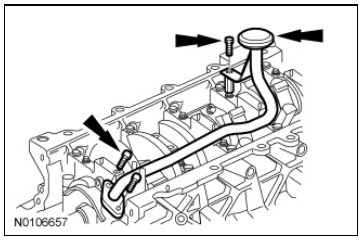
9. Attach the PSP hose bracket and install the nut.
   - Tighten to 10 Nm (89 lb-in).

10. Install the stabilizer bar. For additional information, refer to Section 204-01A .

11. Install the front axle, if equipped. For additional information, refer to Section 205-03 .

12. Fill the engine with clean engine oil.

Oil Pump Screen and Pickup Tube



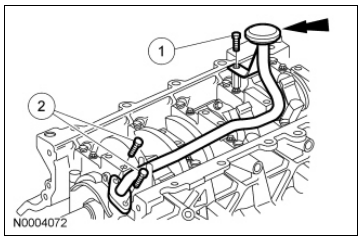
Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

Removal

1. Remove the oil pan. For additional information, refer to Engine Lubrication Components - Exploded View and Oil Pan in this section.

2. Remove the bolts and the oil pump screen and pickup tube.



Installation

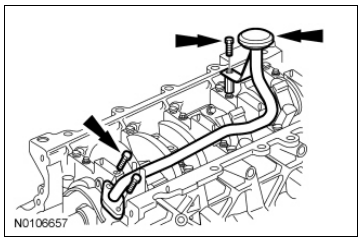
1. *NOTICE:* **Make sure the O-ring seal is in place and not damaged. A missing or damaged O-ring seal can cause foam in the lubrication system, low oil pressure and severe engine damage.**

   NOTE: Clean and inspect the mating surfaces and install a new O-ring seal. Lubricate the O-ring seal with clean engine oil prior to installation.

   Position the oil pump screen and pickup tube and install the bolts.

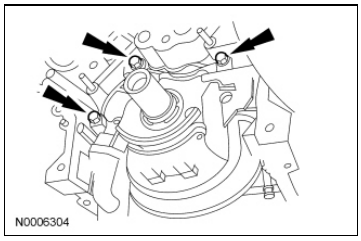
   1. Tighten the oil pump screen and pickup tube-to-spacer bolt to 25 Nm (18 lb-ft).
   2. Tighten the oil pump screen and pickup tube-to-oil pump bolts to 10 Nm (89 lb-in).

2. Install the oil pan. For additional information, refer to Engine Lubrication Components - Exploded View and Oil Pan in this section.



Oil Pump

Material

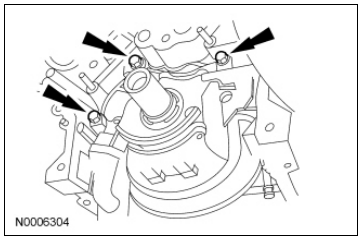


Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	-
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

Removal

1. Remove the oil pan. For additional information, refer to Engine Lubrication Components - Exploded View and Oil Pan in this section.
2. Remove the timing drive components. For additional information, refer to Timing Drive Components in this section.
3. Remove the bolts and the oil pump screen and pickup tube.

4. Remove the 3 bolts and the oil pump.

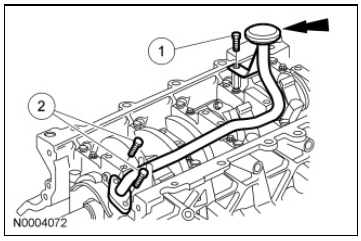


Installation

1. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

Clean the sealing surfaces with metal surface prep. Follow the directions on the packaging. Inspect the mating surfaces.

2. Position the oil pump and install the bolts.
    - Tighten to 10 Nm (89 lb-in).

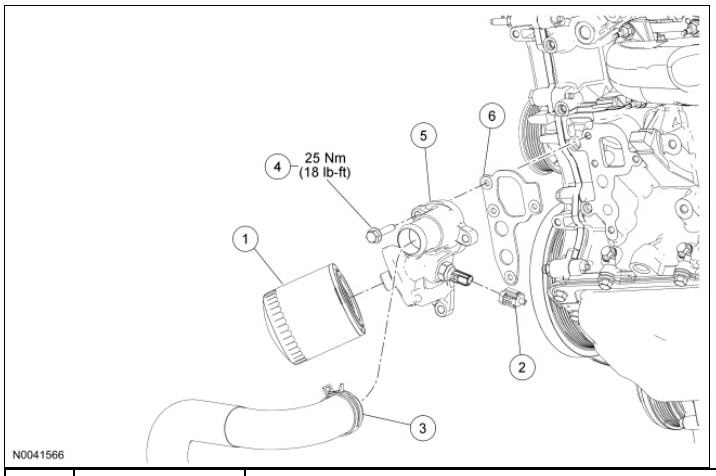


3. ***NOTICE:*** **Make sure the O-ring seal is in place and not damaged. A missing or damaged O-ring seal can cause foam in the lubrication system, low oil pressure and severe engine damage.**

   NOTE: Clean and inspect the mating surfaces and install a new O-ring seal. Lubricate the O-ring seal with clean engine oil prior to installation.

   Position the oil pump screen and pickup tube and install the bolts.

    1. Tighten the oil pump screen and pickup tube-to-spacer bolt to 25 Nm (18 lb-ft).
    2. Tighten the oil pump screen and pickup tube-to-oil pump bolts to 10 Nm (89 lb-in).



4. Install the timing drive components. For additional information, refer to Timing Drive Components in this section.

5. Install the oil pan. For additional information, refer to Engine Lubrication Components - Exploded View and Oil Pan in this section.

Oil Filter Adapter

Material

Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	-
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A
Motorcraft® Silicone Gasket Remover ZC-30	-

Item	Part Number	Description
1	6714	Oil filter
2	14A464	Engine oil pressure switch electrical connector (part of 12B637)
3	8B273	Lower radiator hose
4	W705128	Oil filter adapter bolt (4 required)
5	6881	Oil filter adapter
6	6A636	Oil filter adapter gasket

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Drain the engine cooling system. For additional information, refer to Section 303-03 .

3. Drain the engine oil.
    - Install the drain plug and tighten to 23 Nm (17 lb-ft).

4. Disconnect the engine oil pressure switch electrical connector.

5. Disconnect the lower radiator hose and position it aside.

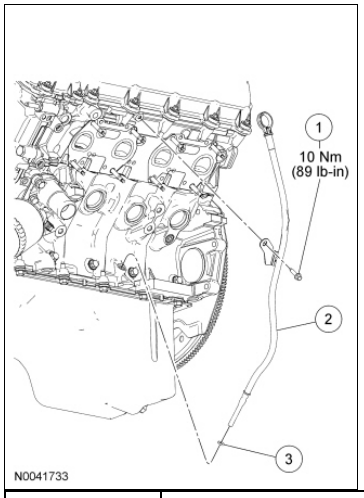
6. Remove and discard the engine oil filter.
    - To install, lubricate the oil filter gasket with clean engine oil and tighten until the seal makes contact.
        - ♦ Using an oil filter strap wrench, tighten the filter an additional 270 degrees.

7. Remove the 4 bolts and the oil filter adapter.
    - To install, tighten to 25 Nm (18 lb-ft).

8. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These may cause scratches and gouges resulting in leak paths. Use a plastic scraper to clean the sealing surfaces.**

   Remove and discard the oil filter adapter gasket.

    - Clean the sealing surfaces with silicone gasket remover and metal surface prep. Follow the directions on the packaging.
    - Inspect the mating surfaces.



9. To install, reverse the removal procedure.
    - Fill the engine with clean engine oil.

10. Fill and bleed the engine cooling system. For additional information, refer to Section 303-03 .

Oil Level Indicator and Tube

Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

Item	Part Number	Description
1	N806155	Oil level indicator and tube bolt
2	6754	Oil level indicator and tube
3	-	O-ring seal (part of 6754)

Removal and Installation

1. Remove the LH exhaust manifold. For additional information, refer to Exhaust Manifold - LH in this section.

2. Remove the oil level indicator and tube bolt.
   - To install, tighten to 10 Nm (89 lb-in).

3. Remove the oil level indicator and tube from the cylinder block.

4. Remove and discard the O-ring seal.

5. **NOTE:** Install a new oil level indicator tube O-ring seal and lubricate it with clean engine oil prior to installation.

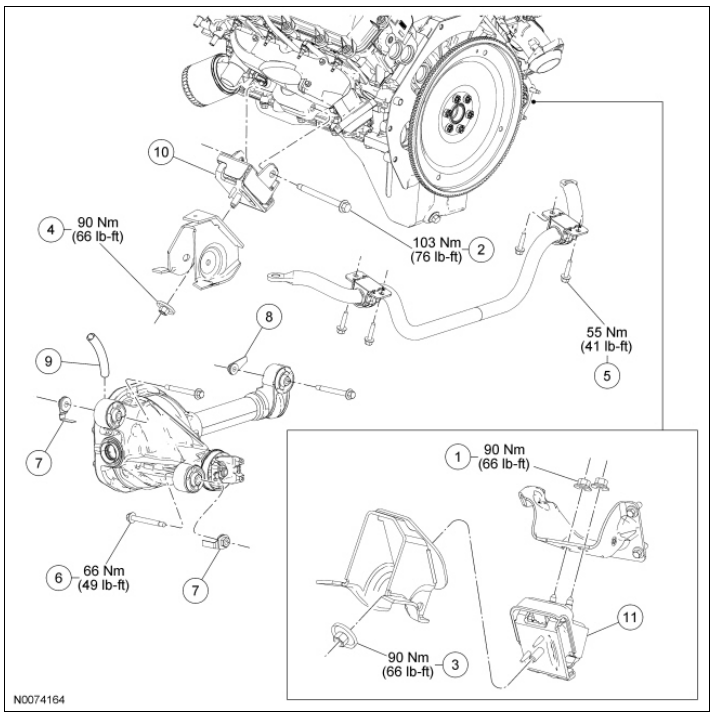
   To install, reverse the removal procedure.

Engine Support Insulators

Special Tool(s)

 ST2176-A	3-Bar Engine Support 303-F070
 ST2592-A	Engine Support Bracket 303-639

Intake Manifold Connections

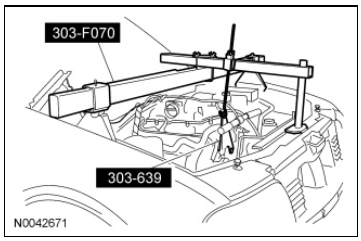


Item	Part Number	Description
1	6K817	PCV valve hose
2	14A464	Heated PCV fitting electrical connector (part of 12B37)
3	W506975	Heated PCV fitting bolt (2 required)
4	9F624	Heated PCV fitting
5	9L479	Heated PCV fitting O-ring seal
6	9D289	Evaporative Emission (EVAP) hose

RH Splash Shield

Item	Part Number	Description
1	388577	RH splash shield pushpin (5 required)
2	16034	RH splash shield

Engine Support Insulators



Item	Part Number	Description
1	N807479	RH engine support insulator nut (2 required)
2	W708103	LH engine support insulator through bolt
3	N802330	RH engine support insulator nut
4	N802330	LH engine support insulator nut
5	W707472	Stabilizer bar bracket bolt (4 required)
6	W506549	Differential housing bolt (if equipped) (3 required)
7	W706348	Differential housing flagnuts (2 required)
8	W708348	Differential housing flagnut

9	3B476	Differential housing vent hose
10	6B032	LH engine support insulator
11	6038	RH engine support insulator

Removal and Installation

All vehicles

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the engine cooling fan. For additional information, refer to Section 303-03 .
3. Remove the Electronic Throttle Body (ETB). For additional information, refer to Section 303-04B .
4. Remove the generator. For additional information, refer to Section 414-00 .
5. Disconnect the PCV valve hose from the heated PCV fitting.
6. Disconnect the heated PCV fitting electrical connector.
7. Remove the 2 bolts the heated PCV fitting.
8. Disconnect the Evaporative Emission (EVAP) hose from the intake manifold.
9. Remove the 5 pushpins and the splash shield.
10. Remove the 2 RH engine support insulator upper nuts.
    - To install, tighten to 90 Nm (66 lb-ft).
11. Remove the LH engine support insulator through bolt.
    - To install, tighten to 103 Nm (76 lb-ft).
12. Install the 3-Bar Engine Support and the Engine Support Bracket and raise the engine approximately 70 mm (2.75 in).

RH side

13. Remove the RH engine support insulator lower nut.
    - To install, tighten to 90 Nm (66 lb-ft).
14. Remove the RH engine support insulator.

Four-Wheel Drive (4WD) vehicles

15. Remove the stabilizer bar bracket bolts and allow the stabilizer bar to hang freely.
    - To install, tighten to 55 Nm (41 lb-ft).

16. ⚠ **WARNING: Secure the assembly to the jack. Avoid any obstructions while lowering and raising the jack. Contact with obstructions may cause the assembly to fall off the jack, which may result in serious personal injury.**

    Support the differential housing with a suitable jackstand.

17. Disconnect the vent hose from the differential housing vent tube.

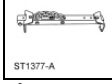
18. ***NOTICE:*** **Any time bolts, washers, spacers or nuts are loosened in the differential support for any reason, install new components to prevent damage.**

    Remove and discard the 3 differential housing bolts and flagnuts.

    - To install, tighten to 66 Nm (49 lb-ft).

19. Lower the differential housing approximately 25 mm (1 in).

LH side



20. Remove the LH engine support insulator nut.
    - To install, tighten to 90 Nm (66 lb-ft).

21. Remove the LH engine support insulator.

22. To install, reverse the removal procedure.
    - If equipped, install new differential housing bolts and flagnuts.

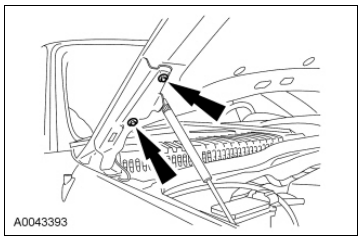
Engine

Special Tool(s)

 ST1377-A	Modular Engine Lift Bracket 303-F047 (014-00073) or equivalent

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.



1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Disconnect the windshield washer hose.

A0043392

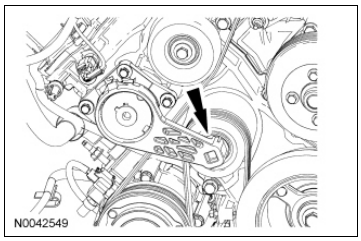
3. **NOTE:** Index-mark the hood hinge location to aid in hood installation.

   Remove the 4 bolts and the hood.

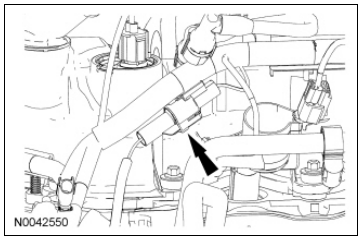
A0043393

4. ***NOTICE:*** **If the engine is repaired or replaced because of upper engine failure, typically including valve or piston damage, check the intake manifold for metal debris. If metal debris is found, install a new intake manifold. Failure to follow these instructions can result in engine damage.**

   Remove the intake manifold. For additional information, refer to Intake Manifold in this section.

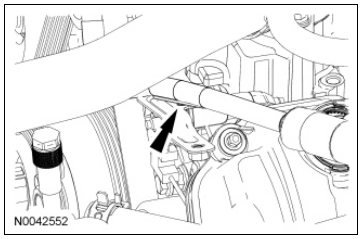


5. Open the cover, remove the 2 nuts and disconnect the wiring harness terminals.

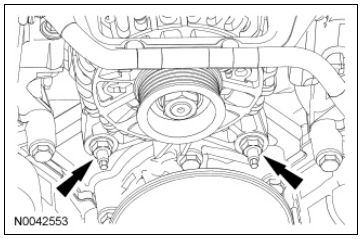


6. Remove the cooling fan. For additional information, refer to Section 303-03 .

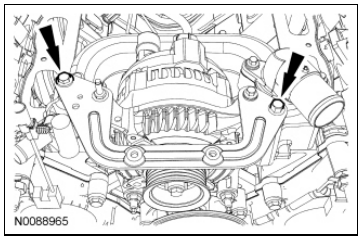
7. Drain the cooling system. For additional information, refer to Section 303-03 .



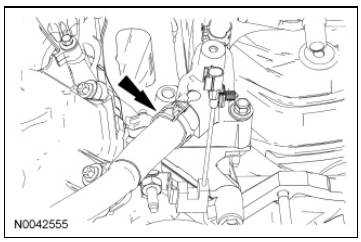
8. Rotate the accessory drive belt tensioner clockwise and remove the accessory drive belt.



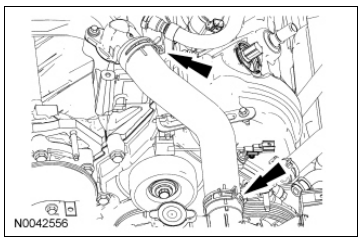
9. Disconnect the electrical connector.



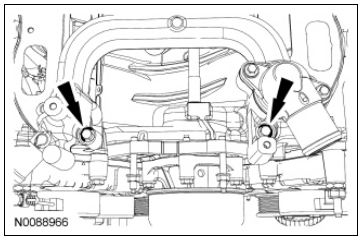
10. Detach the wiring harness retainer from the cooling fan wiring harness bracket.



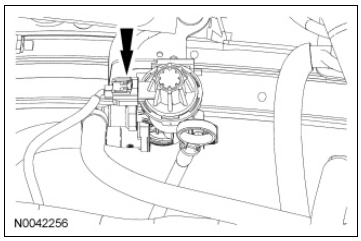
11. Loosen the 2 nuts.



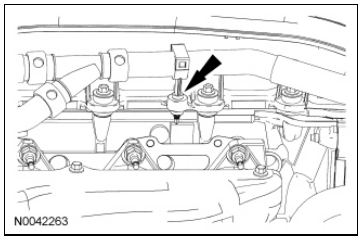
12. Remove the 2 bolts and the alternator, the alternator bracket and the wiring harness as an assembly.



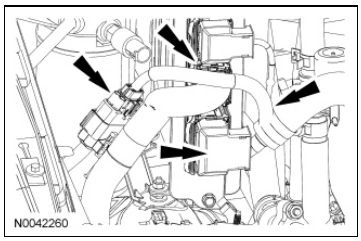
13. Disconnect the heater hose.



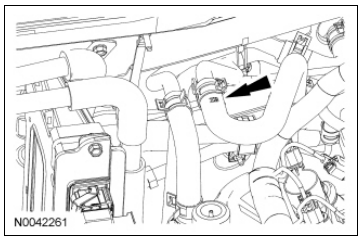
14. Remove the upper radiator hose.



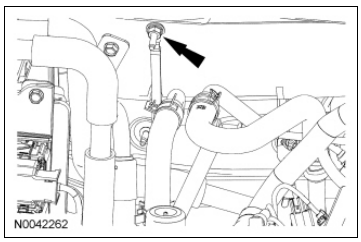
15. Remove the 2 bolts, the coolant crossover manifold and the 2 gaskets.
    - Discard the gaskets.



16. Disconnect the Evaporative Emission (EVAP) canister purge valve electrical connector.

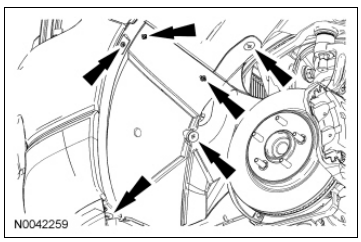


17. Detach the heater hose retainer from the RH valve cover.

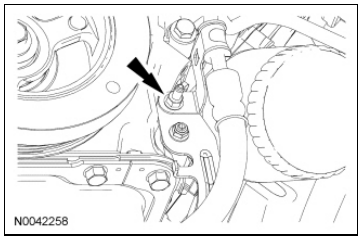


18. Disconnect the in-line electrical connector and the 2 PCM electrical connectors, and detach the wiring harness pin-type retainer.

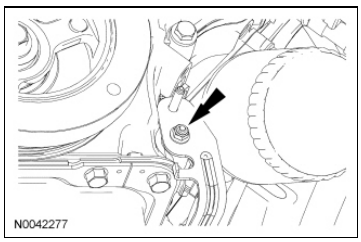
19. Disconnect the heater hose.



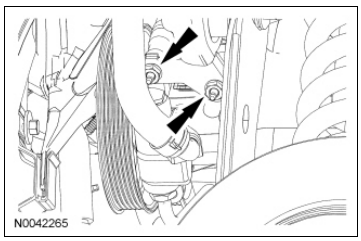
20. Remove the nut and disconnect the ground wire.



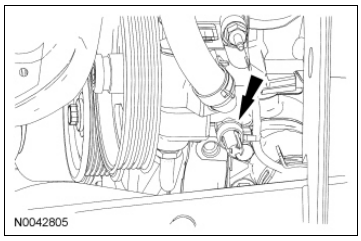
21. Remove the transmission. For additional information, refer to Section 307-01B .



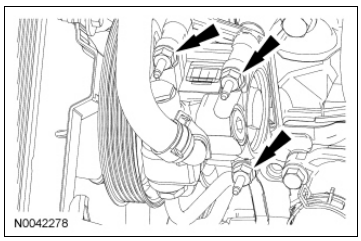
22. Remove the 3 screws, the 3 pushpins and the inner fender splash shield.



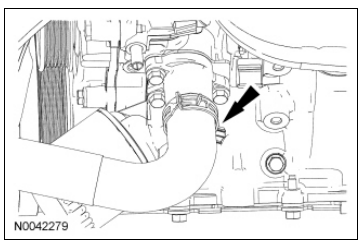
23. Remove the nut and detach the Power Steering Pressure (PSP) hose bracket.



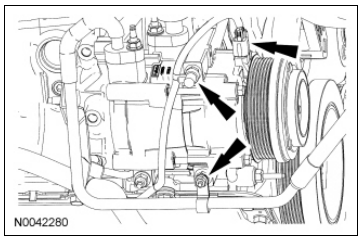
24. Remove the nut and detach the wiring harness bracket.



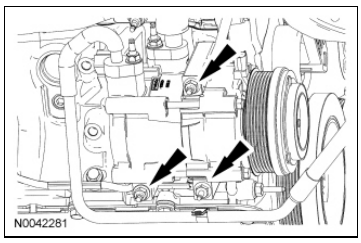
25. Remove the 2 nuts and detach the wiring harness bracket.



26. Detach the wiring harness retainer from the power steering pump stud bolt.

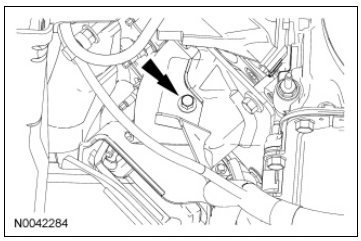


27. Remove the 3 stud bolts and position the power steering pump aside.

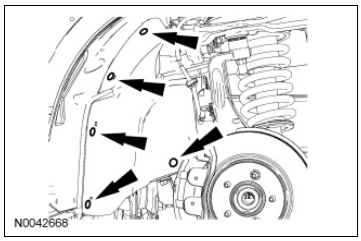


28. Disconnect the lower radiator hose from the oil filter adapter.

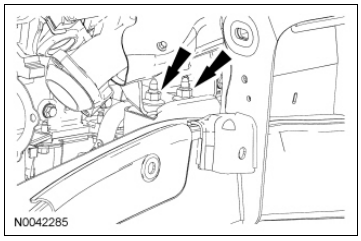
29. Disconnect the A/C clutch electrical connector and detach the wiring harness retainer. Remove the nut and detach the A/C hose bracket.



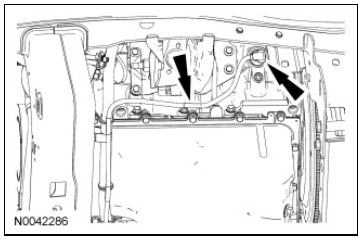
30. Remove the 2 nuts, the stud bolt and position the A/C compressor aside.



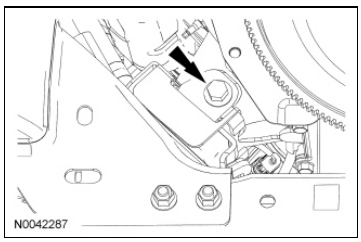
31. Remove the oil drain plug and drain the engine oil. Install the drain plug when finished.
    - Tighten to 23 Nm (17 lb-ft).



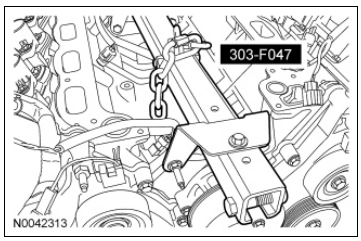
32. Remove the bolt and detach the wiring harness bracket from the RH engine support insulator bracket.



33. Remove the 5 pushpins and the RH splash shield.

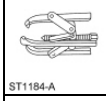


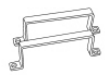
34. Remove the 2 RH engine support insulator nuts.



35. If equipped, disconnect the block heater electrical connector and detach the wiring harness retainers.

36. Remove the LH engine support insulator through bolt.





37. Install the Modular Engine Lift Bracket.

38. Attach a suitable floor crane to the Modular Engine Lift Bracket and remove the engine from the vehicle.

Cylinder Head

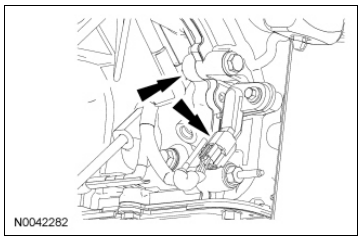
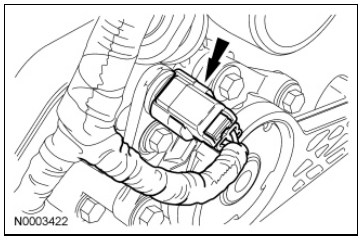
 ST1377-A	Modular Engine Lift Bracket 303-F047 (014-00073) or equivalent
 ST1730-A	Remover, Crankshaft Front Seal 303-107 (T74P-6700-A)
 ST1668-A	Remover/Installer, Cylinder Head 303-572 (T97T-6000-A)

Material



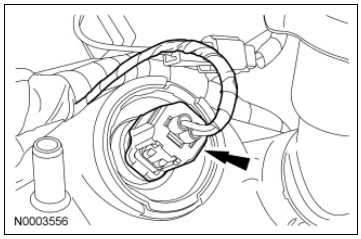
Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	-
Motorcraft® Silicone Gasket Remover ZC-30	-

All cylinder heads

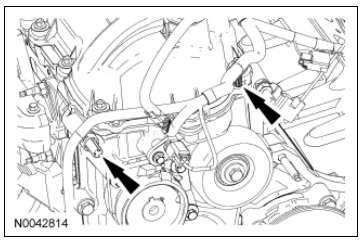


1. Remove the engine. For additional information, refer to Engine in this section.
2. Mount the engine on a suitable work stand.
3. Remove the Modular Engine Lift Bracket.

4. Disconnect the Crankshaft Position (CKP) sensor electrical connector and detach the wiring harness retainer.

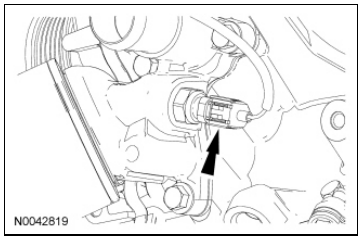


5. Disconnect the RH Camshaft Position (CMP) sensor electrical connector.

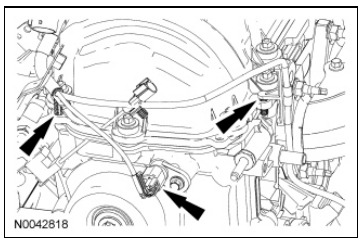


6. **NOTE:** RH shown, LH similar.

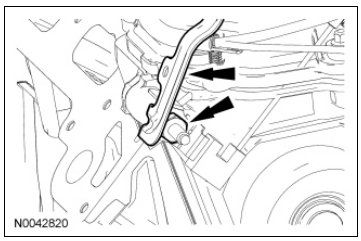
   Disconnect the RH and LH Variable Camshaft Timing (VCT) solenoid electrical connectors.



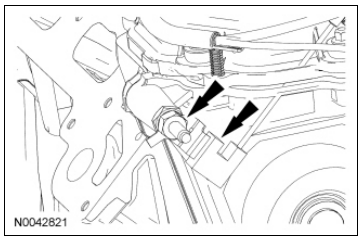
7. Detach the wiring harness retainers.



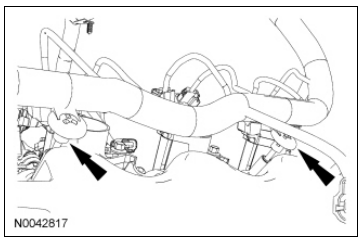
8. Remove the nut and the RH radio ignition interference capacitor.



9. Disconnect the Engine Oil Pressure (EOP) sensor electrical connector.

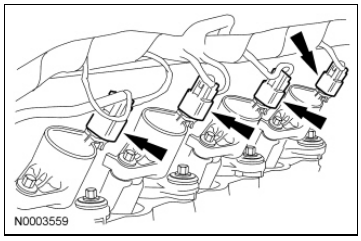


10. Disconnect the LH CMP sensor electrical connector and detach the wiring harness retainers.

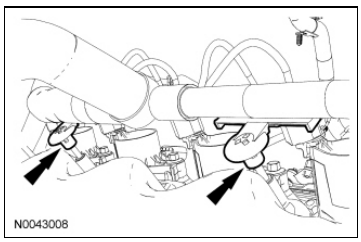


11. Remove the nut and the cooling fan wiring harness bracket.

12. Remove the nut and detach the LH radio interference capacitor.

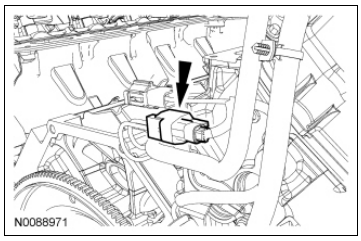


13. Detach the wiring harness retainers from the LH valve cover studs.

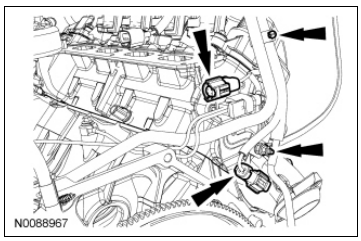


14. **NOTE:** RH shown, LH similar.

    Disconnect the 4 RH and 4 LH ignition coil electrical connectors.

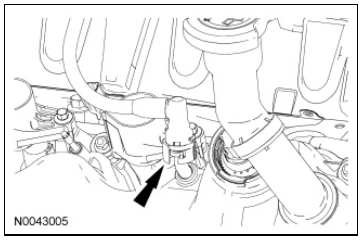


15. Detach the wiring harness retainers from the RH valve cover studs.



16. Disconnect the Cylinder Head Temperature (CHT) sensor electrical connector.

17. Disconnect the Knock Sensor (KS) electrical connector.



18. Detach the electrical connector and wiring harness retainers and remove the engine wiring harness.

19. **NOTE:** When reusing liquid or vapor tube connectors, make sure to use compressed air to remove any foreign material from the connector retaining clip area before separating from the tube.

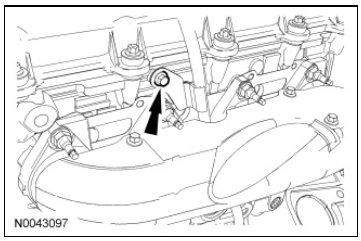
    Remove the breather tube from the RH valve cover.

    - Disconnect the quick connect fittings.
        - ♦ Push the connector toward the valve cover to release pressure.
        - ♦ Push the release tab clockwise.
        - ♦ Disconnect the quick connect fitting.

20. **NOTE:** When reusing liquid or vapor tube connectors, make sure to use compressed air to remove any foreign material from the connector retaining clip area before separating from the tube.

    Remove the PCV tube from the LH valve cover.

    - Disconnect the quick connect fittings.
        - ♦ Push the connector toward the valve cover to release pressure.
        - ♦ Push the release tab clockwise.
        - ♦ Disconnect the quick connect fitting.

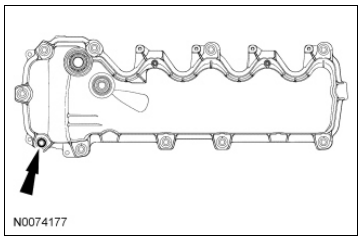


21. Remove and discard the oil filter.

22. **NOTE:** LH shown, RH similar.

    Remove the 8 bolts and the 8 ignition coils.

23. Remove the bolt and position the oil level indicator aside.



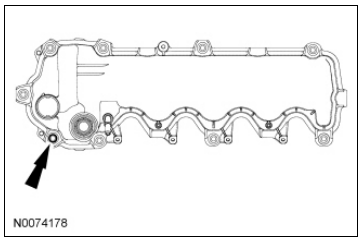
24. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

    NOTICE: **Remove the valve cover carefully, or the Variable Camshaft Timing (VCT) solenoid may be damaged.**

NOTE: The bolts are part of the valve cover and should not be removed.

Loosen the 10 bolts and remove the LH valve cover.

- Clean the valve cover mating surface of the cylinder head with silicone gasket remover and metal surface prep. Follow the directions on the packaging.
- Inspect the valve cover gasket. If the gasket is damaged, remove and discard the gasket. Clean the valve cover gasket groove with soap and water or a suitable solvent.



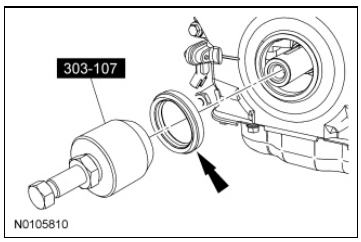
25. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

    NOTICE: **Remove the valve cover carefully, or the Variable Camshaft Timing (VCT) solenoid may be damaged.**

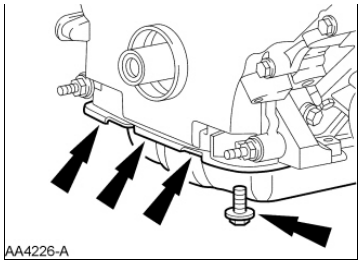
    NOTE: The bolts are part of the valve cover and should not be removed.

    Loosen the 9 bolts and remove the RH valve cover.

    - Clean the valve cover mating surface of the cylinder head with silicone gasket remover and metal surface prep. Follow the directions on the packaging.
    - Inspect the valve cover gasket. If the gasket is damaged, remove and discard the gasket. Clean the valve cover gasket groove with soap and water or a suitable solvent.

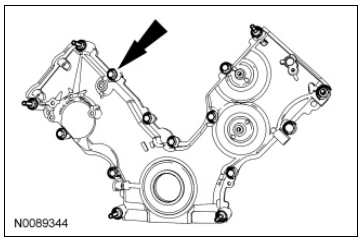


26. Remove the 5 bolts, the coolant pump pulley and the RH side accessory drive belt idler pulley.

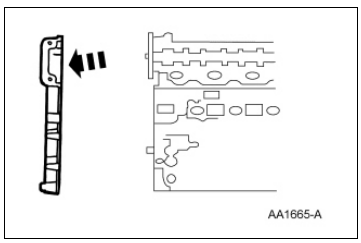


27. Remove and discard the crankshaft pulley bolt. Using the 3 Jaw Puller, remove the crankshaft pulley.

28. Using the Crankshaft Front Seal Remover, remove the crankshaft seal.

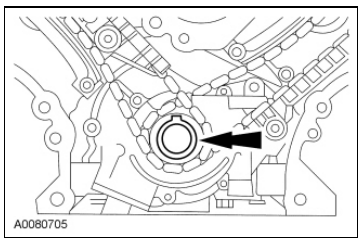


29. Remove the 4 oil pan-to-engine front cover bolts.



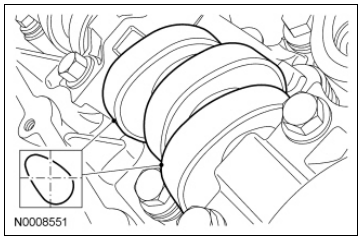
30. **NOTE:** Correct fastener location is essential for the assembly procedure. Record fastener location.

    Remove the 15 engine front cover fasteners.

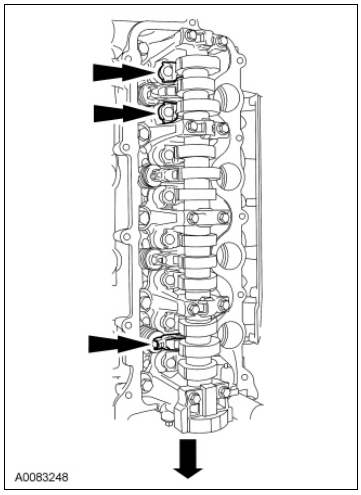


31. Remove the engine front cover from the cylinder block.

32. Remove the crankshaft sensor ring from the crankshaft.



33. Position the crankshaft keyway at the 12 o'clock position.



34. **NOTE:** If the camshaft lobes are not exactly positioned as shown, the crankshaft will require one full additional rotation to the 12 o'clock position.

    The No. 1 cylinder camshaft exhaust lobe must be coming up on the exhaust stroke. Verify by noting the position of the 2 intake lobes and the exhaust lobe on the No. 1 cylinder.

35. **NOTE:** If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into their original locations.

    Remove only the 3 roller followers shown in the illustration from the RH cylinder head.

36. ***NOTICE:*** **Do not allow the valve keepers to fall off the valve or the valve may drop into the cylinder.**

    NOTE: It may be necessary to push the valve down while compressing the spring.

Using the Valve Spring Compressor, remove the 3 roller followers designated in the previous step from the RH cylinder head.

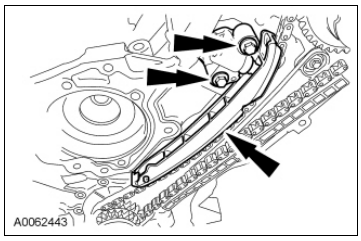
37. **NOTE:** If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into their original locations.

    Remove only the 3 roller followers shown in the illustration from the LH cylinder head.

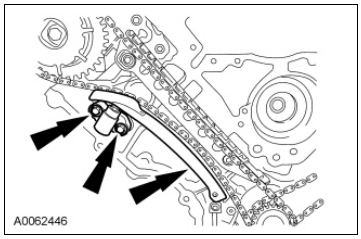
38. ***NOTICE:*** **Do not allow the valve keepers to fall off the valve or the valve may drop into the cylinder.**

    NOTE: It may be necessary to push the valve down while compressing the spring.

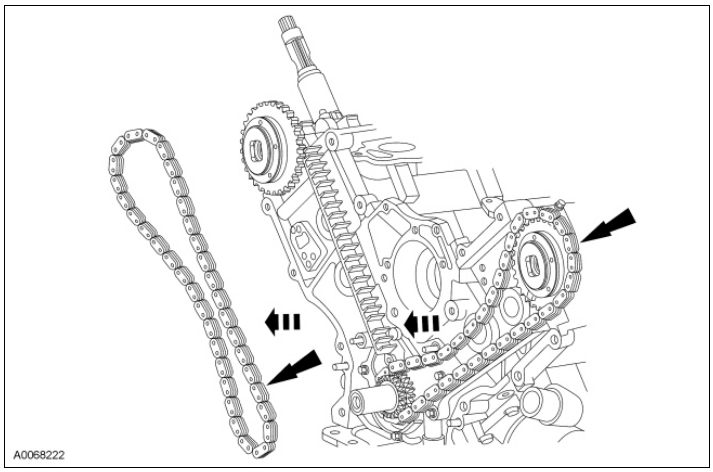
    Using the Valve Spring Compressor, remove the 3 roller followers designated in the previous step from the LH cylinder head.



39. **NOTE:** The crankshaft cannot be moved past the 6 o'clock position once set.

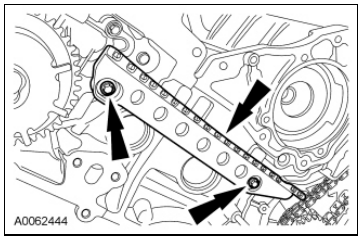


Rotate the crankshaft clockwise and position the crankshaft keyway at the 6 o'clock position.



40. Remove the 2 bolts, the LH timing chain tensioner and tensioner arm.

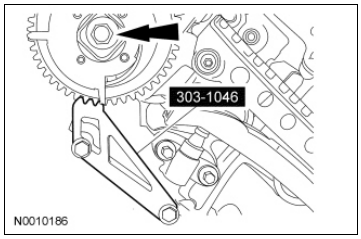
41. Remove the 2 bolts, the RH timing chain tensioner and tensioner arm.



42. Remove the RH and LH timing chains and the crankshaft sprocket.
    - Remove the RH timing chain from the camshaft sprocket.
    - Remove the RH timing chain from the crankshaft sprocket.
    - Remove the LH timing chain from the camshaft sprocket.
    - Remove the LH timing chain and crankshaft sprocket.

43. **NOTE:** RH shown, LH similar.

    Remove the 4 bolts and the LH and RH timing chain guides.



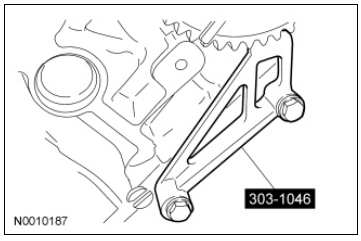
44. ***NOTICE:*** **Damage to the camshaft phaser sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**

    NOTICE: **Only use hand tools to remove the camshaft phaser sprocket assembly or damage may occur to the camshaft or camshaft phaser unit.**

    NOTICE: **Damage to the camshaft phaser sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**

    Using the Camshaft Phaser Sprocket Holding Tool, remove the bolt and the RH camshaft phaser sprocket assembly.

    - Discard the camshaft phaser sprocket bolt.



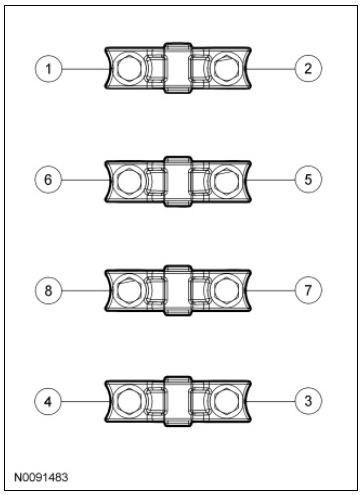
45. ***NOTICE:*** **Damage to the camshaft phaser sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**

    NOTICE: **Only use hand tools to remove the camshaft phaser sprocket assembly or damage may occur to the camshaft or camshaft phaser unit.**

    NOTICE: **Damage to the camshaft phaser sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**

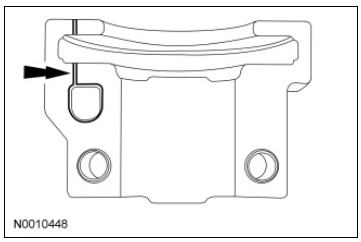
    Using the Camshaft Phaser Sprocket Holding Tool, remove the bolt and the LH camshaft phaser sprocket assembly.

    - Discard the camshaft phaser sprocket bolt.



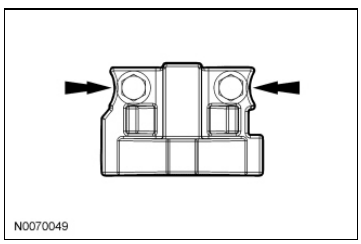
46. ***NOTICE:*** **Remove the front thrust camshaft bearing cap straight upward from the bearing towers or the bearing cap may be damaged from side loading.**

    Remove the 2 bolts and the RH cylinder head camshaft front bearing cap.



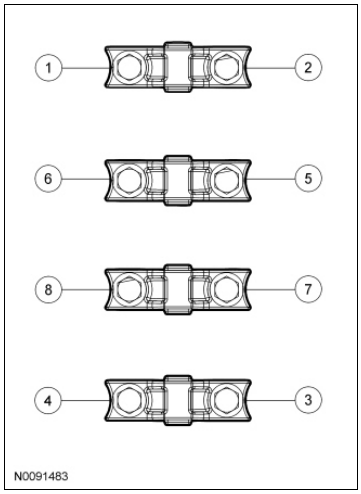
47. ***NOTICE:*** **The camshaft bearing caps must be installed in their original locations. Record camshaft bearing cap locations. Failure to follow these instructions may result in engine damage.**

    Remove the 8 bolts in the sequence shown and remove the RH cylinder head camshaft bearing caps.



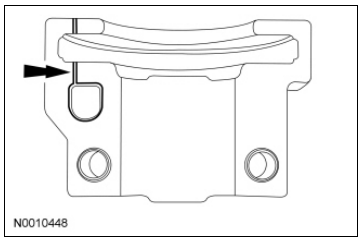
48. Clean and inspect the RH camshaft bearing caps.
    - The camshaft front thrust bearing cap contains an oil metering groove. Make sure the groove is free of foreign material.

49. Remove the RH camshaft.



50. ***NOTICE:*** **Remove the front thrust camshaft bearing cap straight upward from the bearing towers or the bearing cap may be damaged from side loading.**

    Remove the 2 bolts and the LH cylinder head camshaft front bearing cap.



51. ***NOTICE:*** **The camshaft bearing caps must be installed in their original locations. Record camshaft bearing cap locations. Failure to follow these instructions may result in engine damage.**

    Remove the 8 bolts in the sequence shown and remove the LH cylinder head camshaft bearing caps.

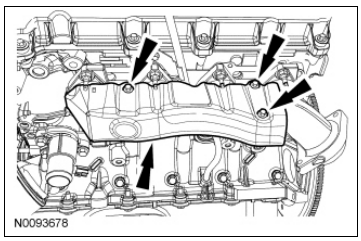
52. Clean and inspect the LH camshaft bearing caps.
    - The camshaft front thrust bearing cap contains an oil metering groove. Make sure the groove is free of foreign material.

53. Remove the LH camshaft.

54. **NOTE:** If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into their original locations.

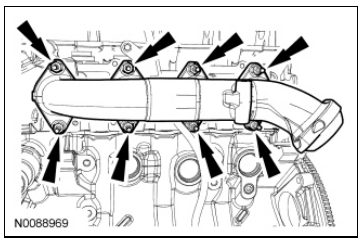
    Remove all of the remaining roller followers from the cylinder heads.

LH cylinder head



55. **NOTE:** If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into their original locations.

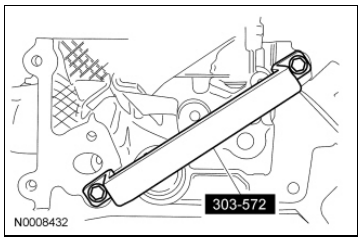
    Remove the hydraulic lash adjusters from the LH cylinder head.



56. Install the Cylinder Head Remover/Installer onto the LH cylinder head.

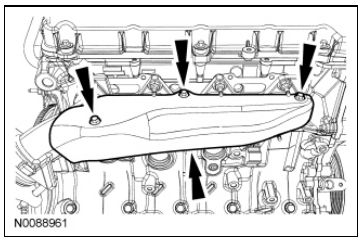
57. Remove the 3 bolts and the LH exhaust manifold heat shield.

58. Remove the 8 nuts, the LH exhaust manifold and the 2 gaskets.
    - Discard the nuts and the gaskets.



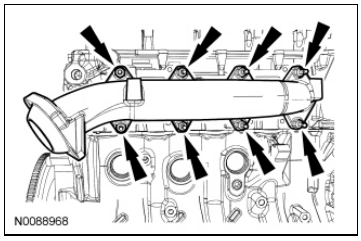
59. Remove and discard the 8 LH exhaust manifold studs.

RH cylinder head



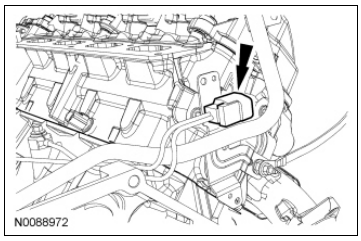
60. **NOTE:** If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into their original locations.

    Remove the hydraulic lash adjusters from the RH cylinder heads.

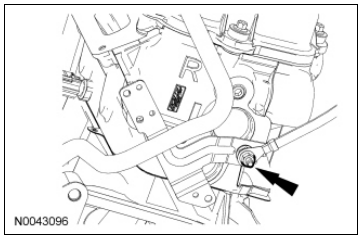


61. Install the Cylinder Head Remover/Installer onto the RH cylinder head.

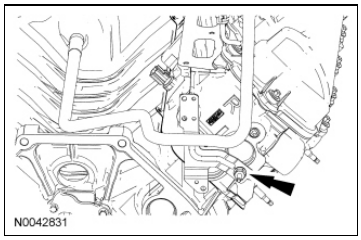
62. Remove the 3 bolts and the RH exhaust manifold heat shield.



63. Remove the 8 nuts, the RH exhaust manifold and the 2 gaskets.
    - Discard the nuts and the gaskets.



64. Remove and discard the 8 RH exhaust manifold studs.



65. Detach the Knock Sensor (KS) electrical connector retainer.

66. Remove the nut and the ground strap.

67. Remove the stud bolt and the heater supply tube and hoses as an assembly.
    - Discard the O-ring seals.

All cylinder heads

68. ***NOTICE:*** **The cylinder head must be cool before removing it from the engine. Cylinder head warpage may result if a warm or hot cylinder head is removed.**

    NOTICE: **Place clean shop towels over exposed engine cavities. Carefully remove the towels so foreign material is not dropped into the engine.**

    NOTICE: **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. Use a plastic scraping tool to remove all traces of the head gasket.**

    NOTICE: **Aluminum surfaces are soft and can be scratched easily. Never place the cylinder head gasket surface, unprotected, on a bench surface, or the cylinder head may be damaged.**

NOTE: The cylinder head bolts must be discarded and new bolts must be installed. They are a tighten-to-yield design and cannot be reused.

NOTE: RH shown, LH similar.

Remove the 20 bolts and the cylinder heads.

- Discard the cylinder head gaskets.
- Discard the cylinder head bolts.

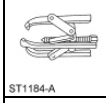
69. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. Use a plastic scraping tool to remove all traces of the head gasket.**

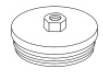
    NOTE: Observe all warnings or cautions and follow all application directions contained on the packaging of the silicone gasket remover and the metal surface prep.

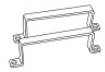
    NOTE: If there is no residual gasket material present, metal surface prep can be used to clean and prepare the surfaces.

    Clean the cylinder head-to-cylinder block mating surfaces of both the cylinder head and the cylinder block in the following sequence.

    1. Remove any large deposits of silicone or gasket material with a plastic scraper.
    2. Apply silicone gasket remover, following package directions and allow to set for several minutes.
    3. Remove the silicone gasket remover with a plastic scraper. A second application of silicone gasket remover may be required if residual traces of silicone or gasket material remain.
    4. Apply metal surface prep, following package directions, to remove any remaining traces of oil or coolant and to prepare the surfaces to bond with the new gasket. Do not attempt to make the metal shiny. Some staining of the metal surfaces is normal.







70. **NOTE:** LH shown, RH similar.

    Support the cylinder heads on a bench with the head gasket side up. Check the cylinder head distortion and the cylinder block distortion, paying particular attention to the oil pressure feed area. For additional information, refer to Section 303-00 .

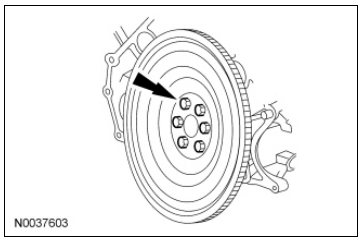
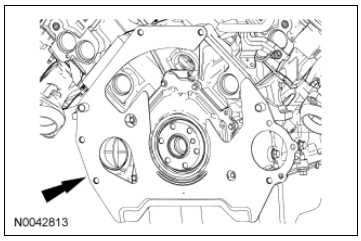
Material

Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	-
Motorcraft® Silicone Gasket Remover ZC-30	-



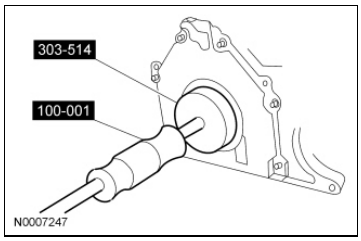
NOTICE: **Remove the cylinder heads before removing the crankshaft. Failure to do so may result in engine damage.**

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, may cause engine failure.**

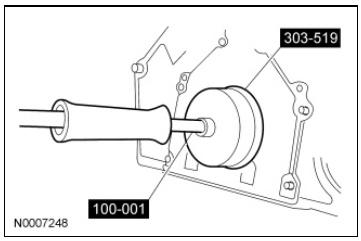


NOTE: The flexplate, the spacer plate, the crankshaft rear seal, the crankshaft rear oil slinger and the rear seal retainer plate must be removed before mounting the engine on the engine stand.

NOTE: For additional information, refer to the exploded views under the Assembly procedure in this section.

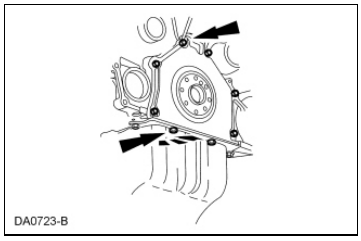


1. Remove the 6 bolts and the flexplate.

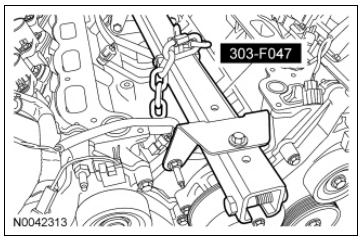


2. Remove the spacer plate.

3. Using the Crankshaft Rear Slinger Remover and the Slide Hammer, remove the crankshaft rear oil slinger.

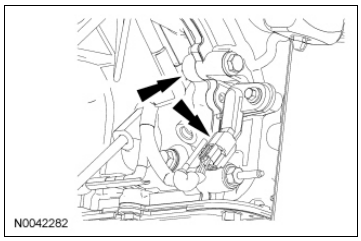


4. Using the Crankshaft Rear Seal Remover and the Slide Hammer, remove the crankshaft rear seal.

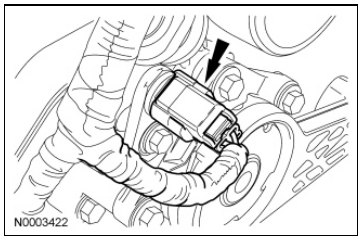


5. Remove the 8 bolts and the crankshaft rear seal retainer plate.
   - ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

     Clean and inspect the sealing surfaces.

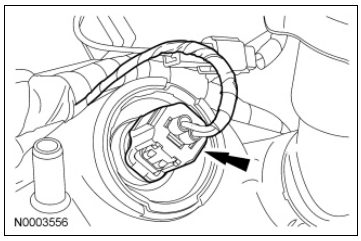


6. Mount the engine on a suitable work stand.

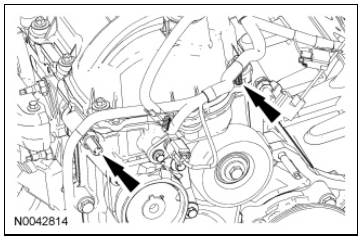


7. Remove the Modular Engine Lift Bracket.

8. Disconnect the Crankshaft Position (CKP) sensor electrical connector and detach the wiring harness retainer.

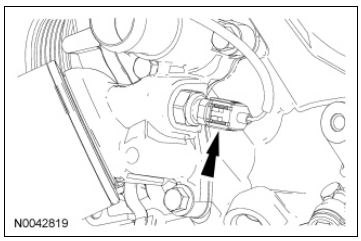


9. Disconnect the RH Camshaft Position (CMP) sensor electrical connector.

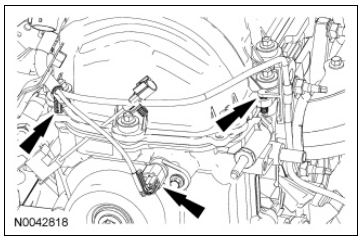


10. **NOTE:** RH shown, LH similar.

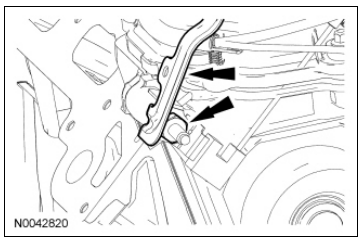
    Disconnect the RH and LH Variable Camshaft Timing (VCT) solenoid electrical connectors.



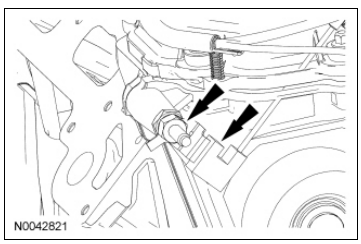
11. Detach the wiring harness retainers.



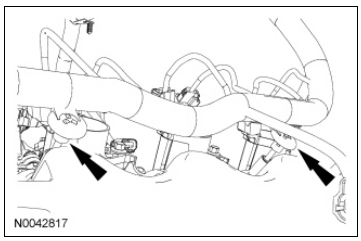
12. Remove the nut and the RH radio ignition interference capacitor.



13. Disconnect the Engine Oil Pressure (EOP) sensor electrical connector.

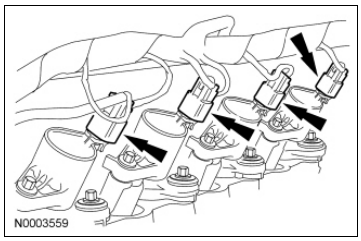


14. Disconnect the LH CMP sensor electrical connector and detach the wiring harness retainers.

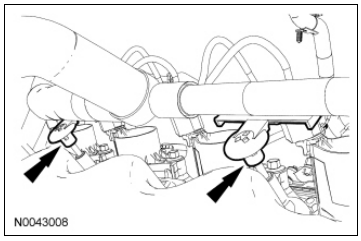


15. Remove the nut and the cooling fan wiring harness bracket.

16. Remove the nut and detach the LH radio interference capacitor.

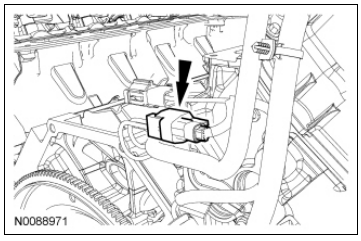


17. Detach the wiring harness retainers from the LH valve cover studs.

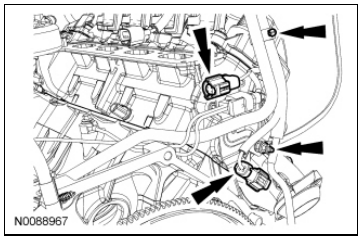


18. **NOTE:** RH shown, LH similar.

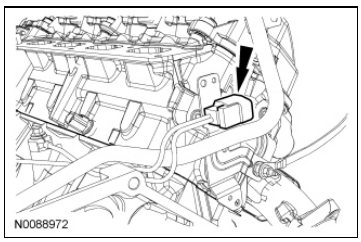
    Disconnect the 4 RH and 4 LH ignition coil electrical connectors.



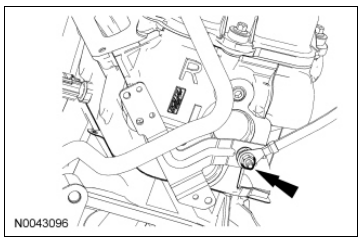
19. Detach the wiring harness retainers from the RH valve cover studs.



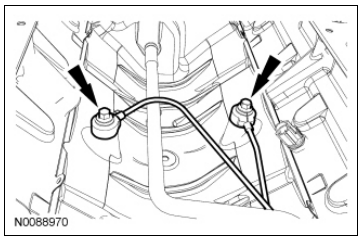
20. Disconnect the Cylinder Head Temperature (CHT) sensor electrical connector.



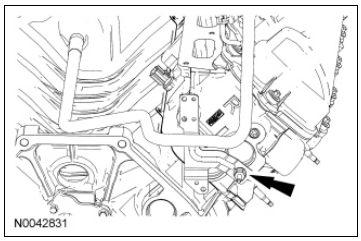
21. Disconnect the Knock Sensor (KS) electrical connector.



22. Detach the electrical connector and wiring harness retainers and remove the engine wiring harness.



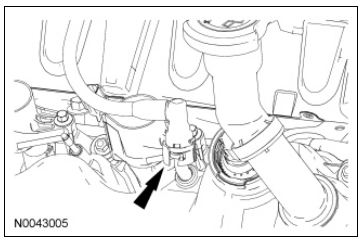
23. Detach the KS electrical connector retainer.



24. Remove the nut and the ground strap.

25. Remove the 2 bolts and the KS .

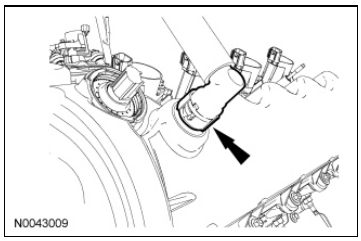
26. Remove the stud bolt and the heater supply tube and hose as an assembly.
    - Discard the O-ring seals.



27. **NOTE:** When reusing liquid or vapor tube connectors, make sure to use compressed air to remove any foreign material from the connector retaining clip area before separating from the tube.

    Remove the breather tube from the RH valve cover.

    - Disconnect the quick connect fittings.
        - ♦ Push the connector toward the valve cover to release pressure.
        - ♦ Push the release tab clockwise.

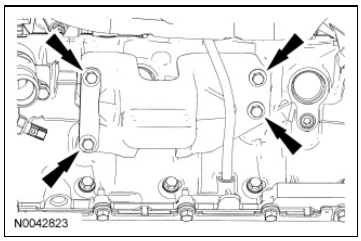


♦ Disconnect the quick connect fitting.

28. **NOTE:** When reusing liquid or vapor tube connectors, make sure to use compressed air to remove any foreign material from the connector retaining clip area before separating from the tube.

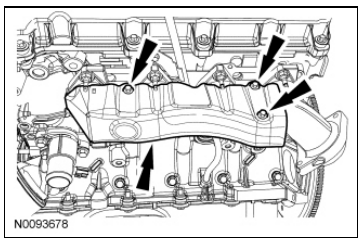
    Remove the PCV tube from the LH valve cover.

    - Disconnect the quick connect fittings.
        - ♦ Push the connector toward the valve cover to release pressure.
        - ♦ Push the release tab clockwise.
        - ♦ Disconnect the quick connect fitting.

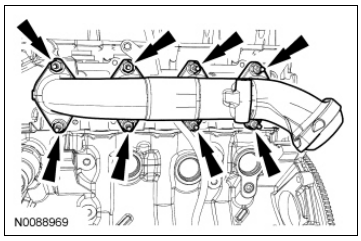


29. **NOTE:** LH shown, RH similar.

    Remove the 8 bolts and the 8 ignition coils.

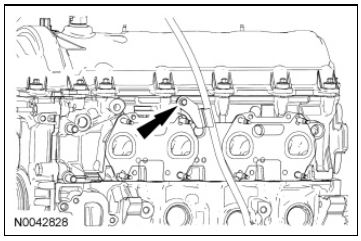


30. Remove the 4 bolts and the LH engine support insulator bracket.

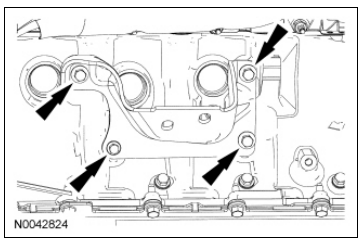


31. Remove and discard the oil filter. Remove the 4 bolts and the oil filter adapter.

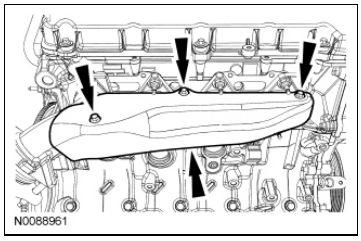
32. Remove the 3 bolts and the LH exhaust manifold heat shield.



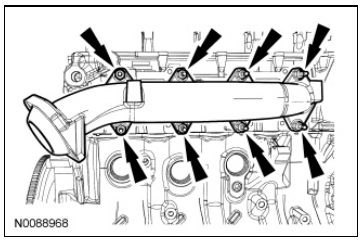
33. Remove the 8 nuts, the LH exhaust manifold and the 2 gaskets.
    - Discard the nuts and the gaskets.



34. Remove and discard the 8 LH exhaust manifold studs.



35. Remove the bolt and the oil level indicator tube.

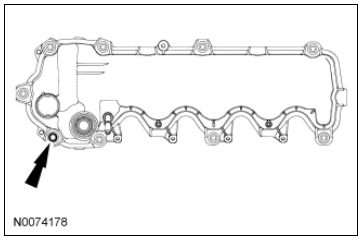


36. Remove the 4 bolts and the RH engine support insulator bracket.

37. Remove the 3 bolts and the RH exhaust manifold heat shield.

38. Remove the 8 nuts, the RH exhaust manifold and the 2 gaskets.
    - Discard the nuts and the gaskets.

39. Remove and discard the 8 RH exhaust manifold studs.



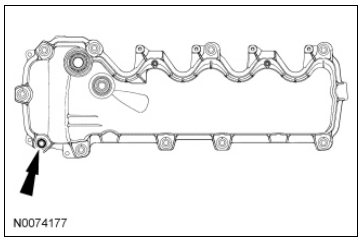
40. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

    NOTICE: **Remove the valve covers carefully, or the Variable Camshaft Timing (VCT) solenoid may be damaged.**

    NOTE: The bolts are part of the valve cover and should not be removed.

    Loosen the 9 bolts and remove the RH valve cover.

    - Clean the valve cover mating surface of the cylinder head with silicone gasket remover and metal surface prep. Follow the directions on the packaging.
    - Inspect the valve cover gasket. If the gasket is damaged, remove and discard the gasket. Clean the valve cover gasket groove with soap and water or a suitable solvent.

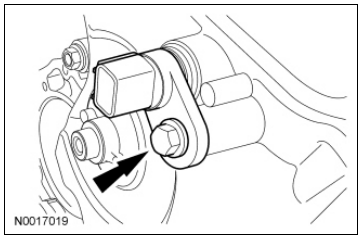


41. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

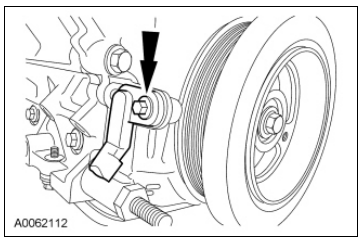
    NOTICE: **Remove the valve covers carefully, or the Variable Camshaft Timing (VCT) solenoid may be damaged.**

    NOTE: The bolts are part of the valve cover and should not be removed.

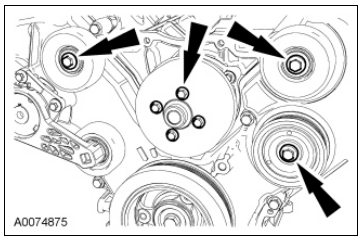
    Loosen the 10 bolts and remove the LH valve cover.



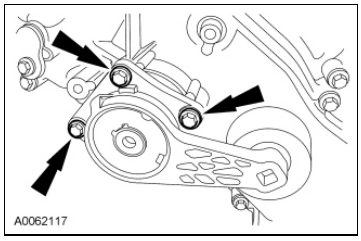
- Clean the valve cover mating surface of the cylinder head with silicone gasket remover and metal surface prep. Follow the directions on the packaging.
- Inspect the valve cover gasket. If the gasket is damaged, remove and discard the gasket. Clean the valve cover gasket groove with soap and water or a suitable solvent.



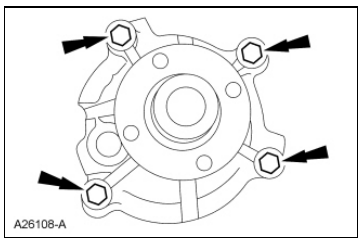
42. Remove the bolt and the RH CMP sensor.



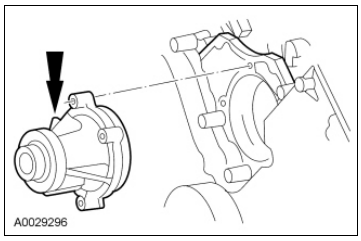
43. Remove the bolt and the LH CMP sensor.



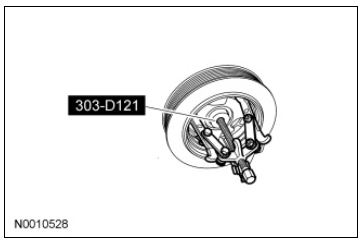
44. Remove the bolt and the CKP sensor.



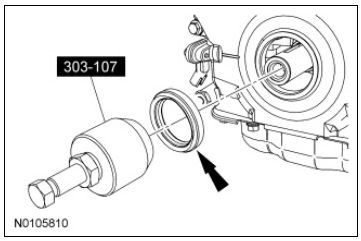
45. Remove the 7 bolts, the coolant pump pulley and the 3 accessory drive belt idler pulleys.



46. Remove the 3 bolts and the accessory drive belt tensioner.

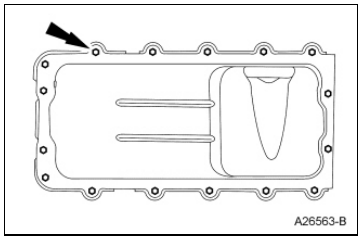


47. Remove the 4 coolant pump bolts.

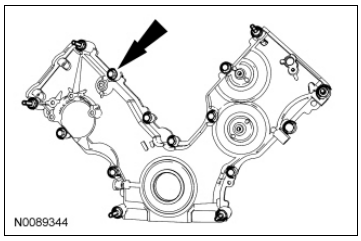


48. Remove the coolant pump from the cylinder block.
    - Discard the O-ring seal.

49. Remove and discard the crankshaft pulley bolt. Using the 3 Jaw Puller, remove the crankshaft pulley.

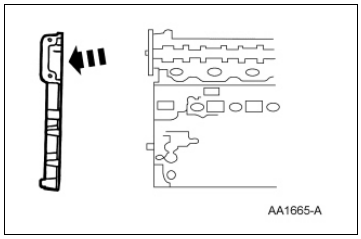


50. Using the Crankshaft Front Seal Remover, remove the crankshaft front seal.



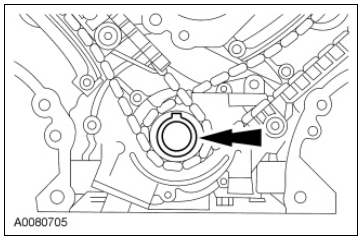
51. Remove the 16 bolts, the oil pan and the oil pan gasket.
    - ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

      Clean and inspect the sealing surfaces with silicone gasket remover and metal surface prep. Follow the directions on the packaging.



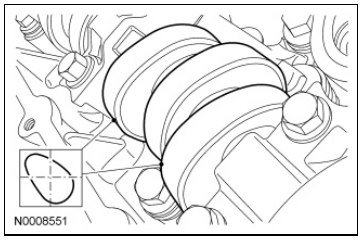
52. **NOTE:** Correct fastener location is essential for the assembly procedure. Record fastener location.

    Remove the 15 engine front cover fasteners.

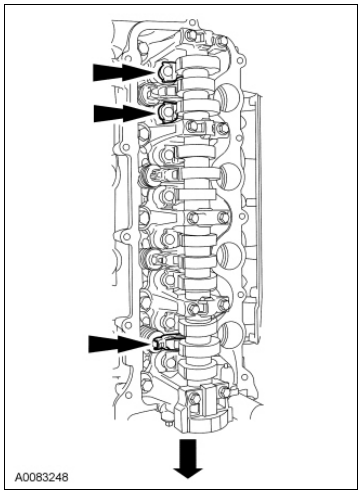


53. Remove the engine front cover from the cylinder block.

54. Remove the crankshaft sensor ring from the crankshaft.



55. Position the crankshaft keyway at the 12 o'clock position.



56. **NOTE:** If the camshaft lobes are not exactly positioned as shown, the crankshaft will require one full additional rotation to the 12 o'clock position.

    The No. 1 cylinder camshaft exhaust lobe must be coming up on the exhaust stroke. Verify by noting the position of the 2 intake lobes and the exhaust lobe on the No. 1 cylinder.

57. **NOTE:** If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into their original locations.

    Remove only the 3 roller followers shown in the illustration from the RH cylinder head.

58. ***NOTICE:*** **Do not allow the valve keepers to fall off the valve or the valve may drop into the cylinder.**

    NOTE: It may be necessary to push the valve down while compressing the spring.

    Using the Valve Spring Compressor, remove the 3 roller followers designated in the previous step from the RH cylinder head.

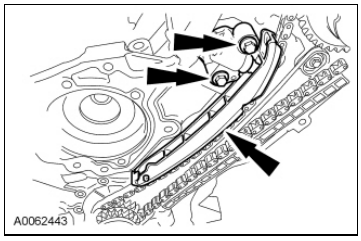
59. **NOTE:** If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into their original locations.

    Remove only the 3 roller followers shown in the illustration from the LH cylinder head.

60. ***NOTICE:*** **Do not allow the valve keepers to fall off the valve or the valve may drop into the cylinder.**

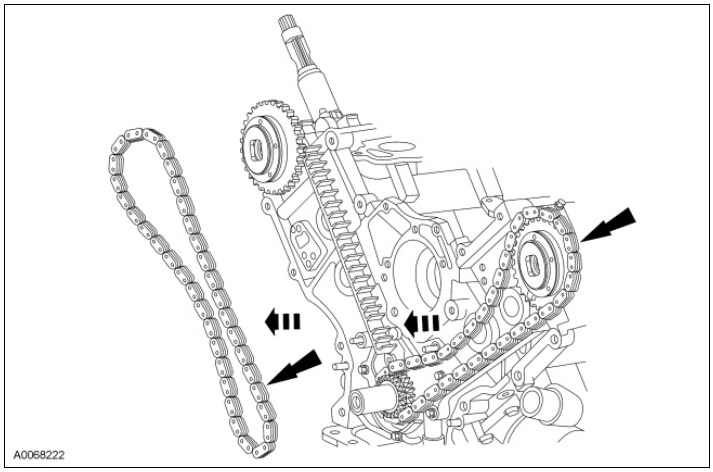
    NOTE: It may be necessary to push the valve down while compressing the spring.

    Using the Valve Spring Compressor, remove the 3 roller followers designated in the previous step from the LH cylinder head.



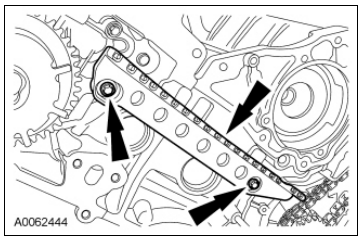
61. ***NOTICE:*** **The crankshaft cannot be moved past the 6 o'clock position once set, or the engine may be damaged.**

    Rotate the crankshaft clockwise and position the crankshaft keyway at the 6 o'clock position.



62. Remove the 2 bolts, the LH timing chain tensioner and tensioner arm.

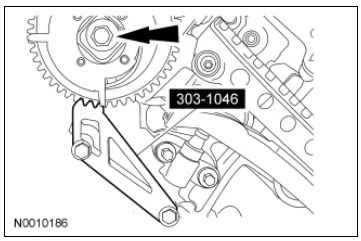
63. Remove the 2 bolts, the RH timing chain tensioner and tensioner arm.



64. Remove the RH and LH timing chains and the crankshaft sprocket.
    - Remove the RH timing chain from the camshaft sprocket.
    - Remove the RH timing chain from the crankshaft sprocket.
    - Remove the LH timing chain from the camshaft sprocket.
    - Remove the LH timing chain and crankshaft sprocket.

65. **NOTE:** RH shown, LH similar.

    Remove the 4 bolts and the LH and RH timing chain guides.



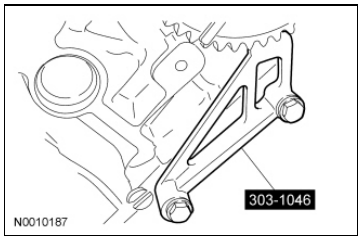
66. ***NOTICE:*** **Damage to the camshaft phaser sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**

    NOTICE: **Only use hand tools to remove the camshaft phaser sprocket assembly or damage may occur to the camshaft or camshaft phaser unit.**

NOTICE: **Damage to the camshaft phaser sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**

Using the Camshaft Phaser Sprocket Locking Tool, remove the bolt and the RH camshaft phaser sprocket assembly.

- Discard the camshaft phaser sprocket bolt.



67. ***NOTICE:*** **Damage to the camshaft phaser sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**

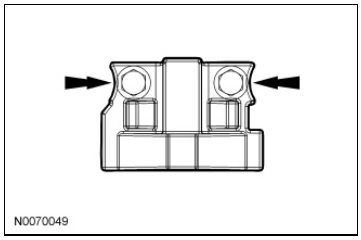
    NOTICE: **Only use hand tools to remove the camshaft phaser sprocket assembly or damage may occur to the camshaft or camshaft phaser unit.**

    NOTICE: **Damage to the camshaft phaser sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**

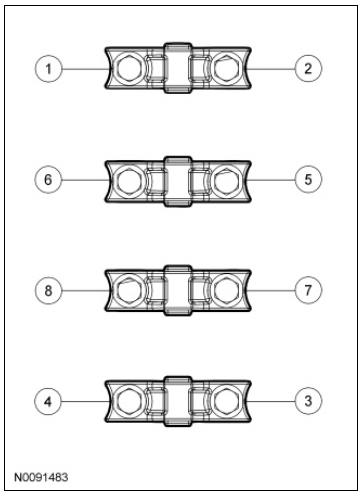
    Using the Camshaft Phaser Sprocket Locking Tool, remove the bolt and the LH camshaft phaser sprocket assembly.

    - Discard the camshaft phaser sprocket bolt.

68. Install the Cylinder Head Remover/Installer onto the LH cylinder head.

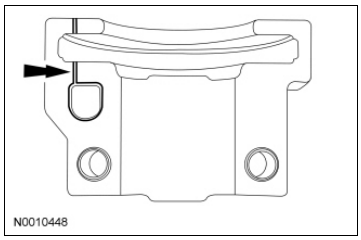


69. Install the Cylinder Head Remover/Installer onto the RH cylinder head.



70. ***NOTICE:*** **Remove the front thrust camshaft bearing cap straight upward from the bearing towers or the bearing cap may be damaged from side loading.**

    Remove the 2 bolts and the RH cylinder head camshaft front bearing cap.



71. ***NOTICE:*** **The camshaft bearing caps must be installed in their original locations. Record camshaft bearing cap locations. Failure to follow these instructions may result in engine damage.**

    Remove the 8 bolts in the sequence shown and remove the RH cylinder head camshaft bearing caps.

72. Clean and inspect the RH camshaft bearing caps.
    - The camshaft front thrust bearing cap contains an oil metering groove. Make sure the groove is free of foreign material.

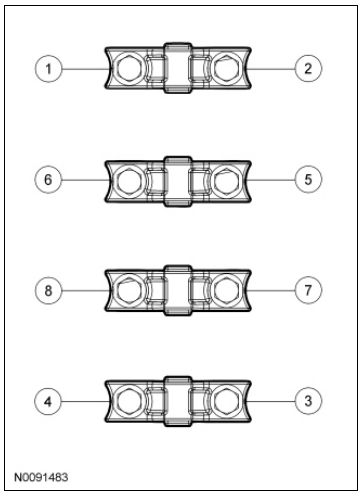
73. Remove the RH camshaft.

74. **NOTE:** If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into their original locations.

    Remove the remaining roller followers from the RH cylinder head.

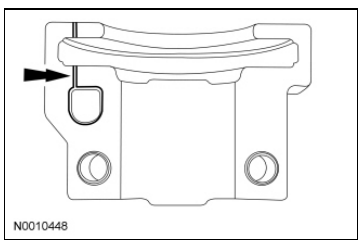
75. **NOTE:** If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into their original locations.

    Remove the hydraulic lash adjusters from the RH cylinder head.



76. ***NOTICE:*** **Remove the front thrust camshaft bearing cap straight upward from the bearing towers or the bearing cap may be damaged from side loading.**

    Remove the 2 bolts and the LH cylinder head camshaft front bearing cap.



77. ***NOTICE:*** **The camshaft bearing caps must be installed in their original locations. Record camshaft bearing cap locations. Failure to follow these instructions may result in engine damage.**

    Remove the 8 bolts in the sequence shown and remove the LH cylinder head camshaft bearing caps.

78. Clean and inspect the LH camshaft bearing caps.
    - The camshaft front thrust bearing cap contains an oil metering groove. Make sure the groove is free of foreign material.

79. Remove the LH camshaft.

80. **NOTE:** If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into their original locations.

    Remove the remaining roller followers from the LH cylinder head.

81. **NOTE:** If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into their original locations.

    Remove the hydraulic lash adjusters from the LH cylinder head.

82. ***NOTICE:*** **The cylinder head must be cool before removing it from the engine. Cylinder head warpage may result if a warm or hot cylinder head is removed.**

    NOTICE: **Place clean shop towels over exposed engine cavities. Carefully remove the towels so foreign material is not dropped into the engine. Failure to follow these instructions may result in engine damage.**

    NOTICE: **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. Use a plastic scraping tool to remove all traces of the head gasket.**

    NOTICE: **Aluminum surfaces are soft and can be scratched easily. Never place the cylinder head gasket surface, unprotected, on a bench surface, or the cylinder head may be damaged.**

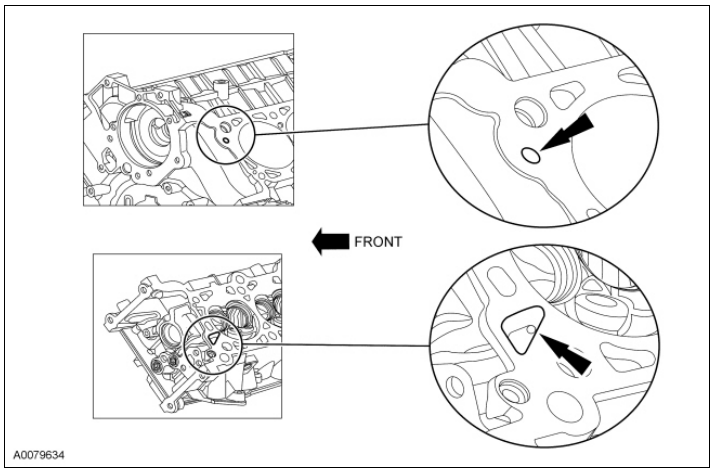
    NOTE: RH shown, LH similar.

    Remove the 20 bolts and the cylinder heads.

    - Discard the cylinder head gaskets.
    - Discard the cylinder head bolts.

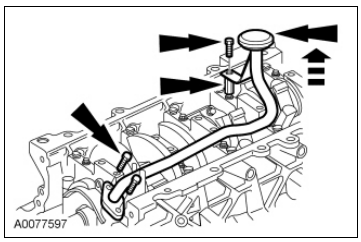
83. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. Use a plastic scraping tool to remove all traces of the head gasket.**

    NOTE: Observe all warnings or cautions and follow all application directions contained on the packaging of the silicone gasket remover and the metal surface prep.



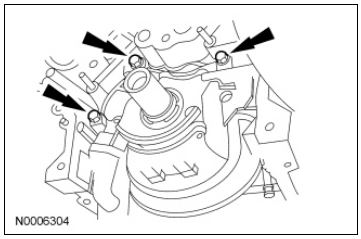
NOTE: If there is no residual gasket material present, metal surface prep can be used to clean and prepare the surfaces.

Clean the cylinder head-to-cylinder block mating surfaces of both the cylinder head and the cylinder block in the following sequence.



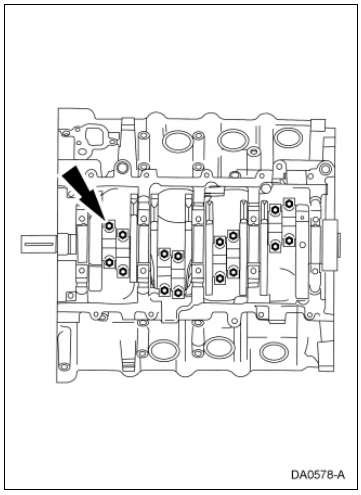
1. Remove any large deposits of silicone or gasket material with a plastic scraper.
2. Apply silicone gasket remover, following package directions and allow to set for several minutes.
3. Remove the silicone gasket remover with a plastic scraper. A second application of silicone gasket remover may be required if residual traces of silicone or gasket material remain.
4. Apply metal surface prep, following package directions, to remove any remaining traces of oil or coolant and to prepare the surfaces to bond with the new gasket. Do not attempt to make the metal shiny. Some staining of the metal surfaces is normal.

84. **NOTE:** LH shown, RH similar.



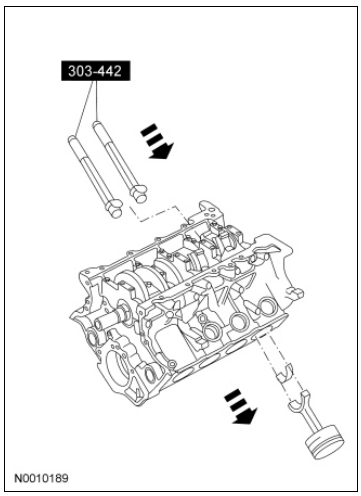
Support the cylinder heads on a bench with the head gasket side up. Check the cylinder head distortion and the cylinder block distortion, paying particular attention to the oil pressure feed area. For additional information, refer to Section 303-00 .

85. Remove the 3 bolts, the oil pump screen and pickup tube and the spacer.



86. Remove the 3 bolts and the oil pump.

87. Before removing the pistons, inspect the top of the cylinder bores. If necessary, remove the ridge or carbon deposits from each cylinder using an abrasive pad or equivalent, following the manufacturer's instructions.

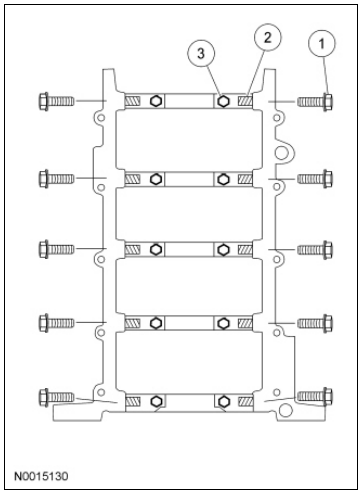


88. ***NOTICE:*** **Verify that the connecting rods and rod caps have orientation numbers cast into them. If not, number the connecting rods and rod caps for correct orientation. If the connecting rods and caps are assembled incorrectly, the engine may be damaged.**

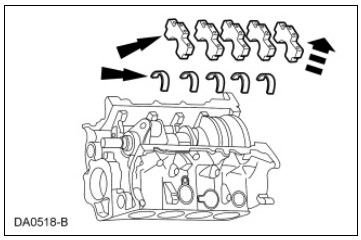
    Remove the 16 bolts and the connecting rod caps. Discard the bolts.

89. ***NOTICE:*** **Remove the piston and connecting rod assemblies carefully, or the cylinder walls or crankshaft journals may be damaged.**

    Use the Connecting Rod Installer to push the piston through the top of the cylinder block.



90. Disassemble the 8 pistons. For additional information, refer to Piston in this section.

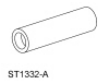


91. **NOTE:** Note the location of the stud bolt for assembly reference.

    Remove the fasteners.

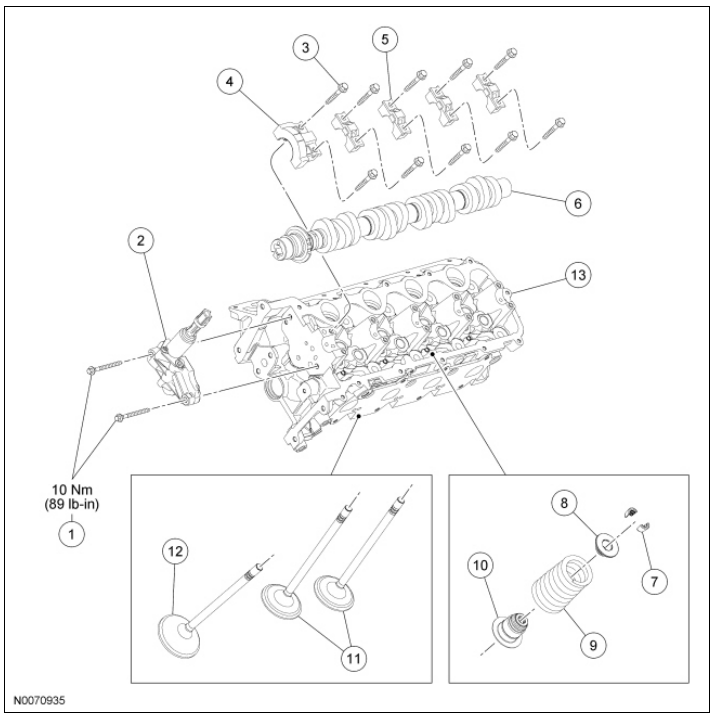
    1. Remove and discard the 10 cross-mounted main cap bolts.
    2. Loosen the 10 jack screws.
    3. Remove and discard the 9 main bearing cap bolts and the stud bolt.

92. Remove the 5 main bearing caps, the lower crankshaft main bearings and the lower thrust washer.



93. Remove the crankshaft, the upper crankshaft main bearings and the upper thrust washers from the cylinder block.

Cylinder Head



Special Tool(s)

 ST2604-A	Compressor, Valve Spring 303-1039
 ST1332-A	Installer, Valve Stem Oil Seal 303-383 (T91T-6571-A)

Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

NOTE: LH side shown, RH side similar.

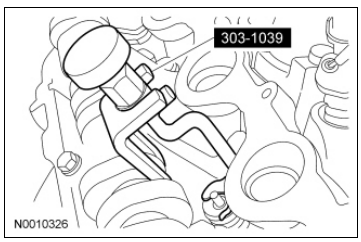
Item	Part Number	Description

1	W701520	Variable Camshaft Timing (VCT) housing assembly bolts (2 required)
2	6C261 LH/ 6C260 RH	VCT housing assembly
3	N807834	Camshaft bearing cap bolt (10 required)
4	6B284	Camshaft front bearing cap
5	6B280	Camshaft bearing cap (4 required)
6	6C255 LH/ 6251 RH	Camshaft
7	6518	Valve spring retainer key (24 required)
8	6514	Valve spring retainer (12 required)
9	6513	Valve spring (12 required)
10	6A517	Valve seal (12 required)
11	6507	Intake valves (8 required)
12	6505	Exhaust valve (4 required)
13	6050 LH/ 6049 RH	Cylinder head

Disassembly

1. Remove the bolts and the Variable Camshaft Timing (VCT) housing.
   - Discard the gasket.

2. Lubricate the camshaft and camshaft journals with clean engine oil and install the camshaft.



3. **NOTE:** The camshaft must be installed in the head to use the Valve Spring Compressor to compress the valve springs.

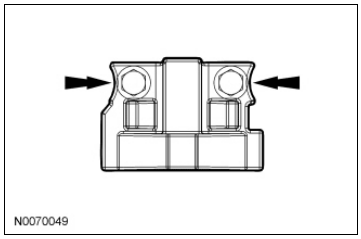
   NOTE: Lubricate the camshaft bearing caps with clean engine oil.

   Install the camshaft bearing caps in their original locations.

   - Position the front camshaft bearing cap.
   - Position the remaining camshaft bearing caps.
   - Install the bolts finger-tight.

4. Using the Valve Spring Compressor, compress the valve spring and remove the valve spring retainer keys.

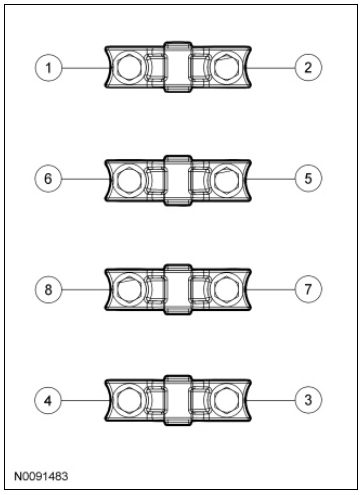
5. Remove the valve spring retainer, the valve spring and the valve seal.
   - Discard the valve seal.



6. Remove the valve from the cylinder head.

7. Repeat the previous 3 steps for each valve.

8. Inspect the components. For additional information, refer to Section 303-00 .



9. ***NOTICE:*** **Remove the front thrust camshaft bearing cap straight upward from the bearing towers or the bearing cap may be damaged from side loading.**

   Remove the 2 bolts and the cylinder head camshaft front bearing cap.

10. ***NOTICE:*** **The camshaft bearing caps must be installed in their original locations. Record camshaft bearing cap locations. Failure to follow these instructions may result in engine damage.**

    Remove the remaining bolts in the sequence shown and remove the cylinder head camshaft bearing caps.

11. Remove the camshaft.

12. Check the cylinder head for distortion. For additional information, refer to Section 303-00 .

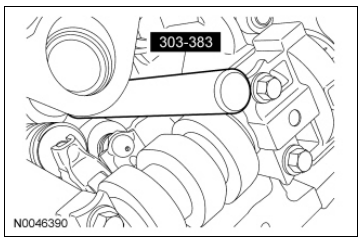
Assembly

1. Lubricate the camshaft and camshaft journals with clean engine oil and install the camshaft.

2. **NOTE:** Lubricate the camshaft bearing caps with clean engine oil.

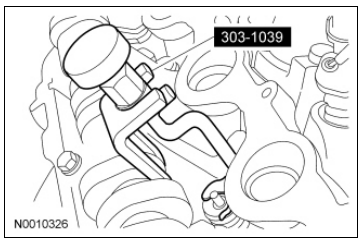
   Install the camshaft bearing caps in their original locations.

   - Position the front camshaft bearing cap.
   - Position the remaining camshaft bearing caps.
   - Install the bolts finger-tight.



3. **NOTE:** Lubricate the valve stem with clean engine oil prior to installation.

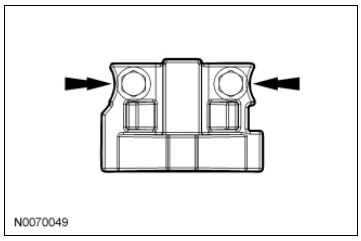
Install the valve into the cylinder head.



4. **NOTE:** Lubricate the valve seal and valve stem with clean engine oil prior to installation.

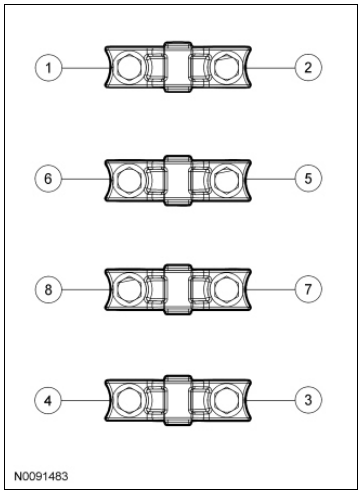
   Position a new valve seal onto the valve stem.

5. Using the Valve Stem Oil Seal Installer, install the new valve seal.



6. Using the Valve Spring Compressor, install the valve spring, the valve spring retainer and the valve spring retainer keys.

7. Repeat the previous 2 steps for each valve.

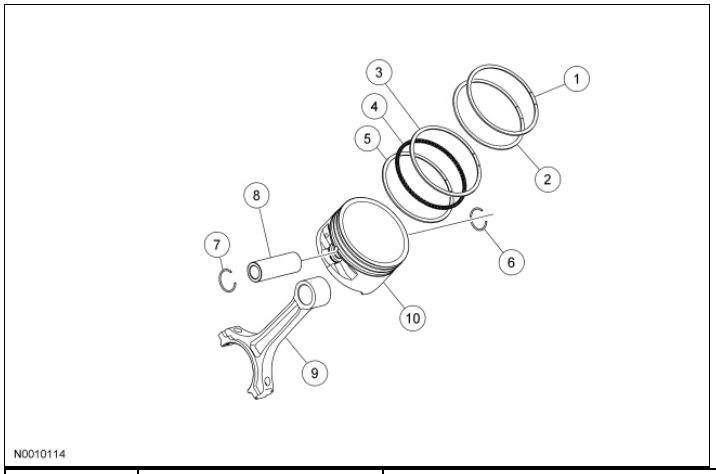


8. ***NOTICE:*** **Remove the front thrust camshaft bearing cap straight upward from the bearing towers or the bearing cap may be damaged from side loading.**

   Remove the 2 bolts and the cylinder head camshaft front bearing cap.

9. ***NOTICE:*** **The camshaft bearing caps must be installed in their original locations. Record camshaft bearing cap locations. Failure to follow these instructions may result in engine damage.**

   Remove the remaining bolts in the sequence shown and remove the cylinder head camshaft bearing caps.



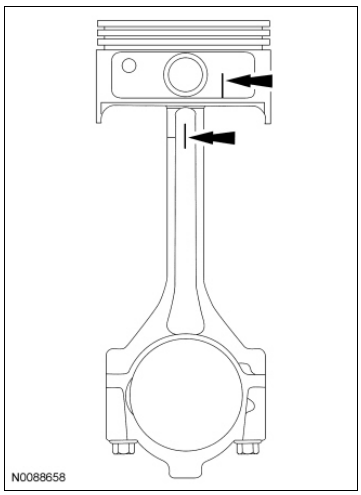
10. Remove the camshaft.

11. Install a new gasket, the VCT housing and the bolts.
    - Tighten to 10 Nm (89 lb-in).

Piston

Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A



Item	Part Number	Description
1	6150	Piston compression ring, upper
2	6152	Piston compression ring, lower
3	6159	Piston oil control segment ring, upper
4	6161	Piston oil control spacer
5	6159	Piston oil control segment ring, lower
6	6140	Piston pin retainer
7	6140	Piston pin retainer
8	6135	Piston pin
9	6200	Connecting rod
10	6110	Piston

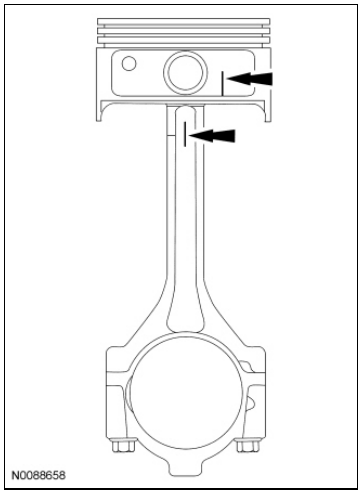
Disassembly

⚠ WARNING: Since the retainer ring has a tendency to spring out, cover the end of the pin bore with a hand or shop rag when removing the ring. Wear eye protection. Failure to follow these instructions may result in serious personal injury.

1. Remove the piston rings from the piston.
    - Discard the piston rings.

2. Mark the piston and the connecting rod on the same side for assembly reference.

3. Remove the piston pin retainers and the piston pin.



4. Separate the piston from the connecting rod.

5. Clean and inspect the piston and connecting rod. For additional information, refer to Section 303-00 .

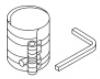
Assembly

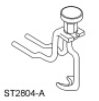
1. **NOTE:** The connecting rod must be installed into the piston with the marks made during disassembly on the same side. If a new piston or connecting rod is being installed, it can be installed in either direction.

   Position the connecting rod in the piston.

2. Lubricate the piston pin and pin bore with clean engine oil.

3. Install the piston pin in the piston and connecting rod assembly.





4. Install the piston pin retaining clips in the piston.

5. Lubricate the piston and the new piston rings with clean engine oil.

6. Install the piston rings onto the piston.

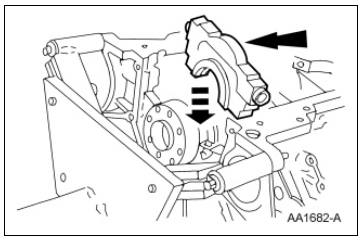
31	N806180	Oil pump screen and pickup tube spacer
32	6A636	Oil filter adapter gasket
33	6325	Crankshaft main bearing cap (5 required)
34	6A338	Lower crankshaft bearing (4 required)
35	6210	Connecting rod cap (8 required)
36	6211	Connecting rod lower bearing (8 required)
37	6K302	Lower crankshaft thrust washer
38	6303	Crankshaft
39	6333	Upper crankshaft bearing (5 required)
40	6A341	Upper crankshaft thrust washer
41	6621	Oil pump
42	6010	Cylinder block
43	6211	Connecting rod upper bearing (8 required)
44	6110	Piston (8 required)
45	6159	Outer oil control ring (8 required)
46	6159	Outer oil control ring (8 required)
47	6150	Upper compression ring (8 required)
48	6152	Lower compression ring (8 required)
49	6161	Inner oil control ring (8 required)

1. **NOTE:** Before assembling the cylinder block, all sealing surfaces must be free of chips, dirt, paint and foreign material. Also, make sure the coolant and oil passages are clear.

   Install the crankshaft main bearings.

   - Install the crankshaft upper main bearings into the cylinder block.
   - Install the crankshaft lower main bearings into the bearing caps.
   - Make sure all oil passages are aligned.
   - Lubricate all main bearings with clean engine oil.

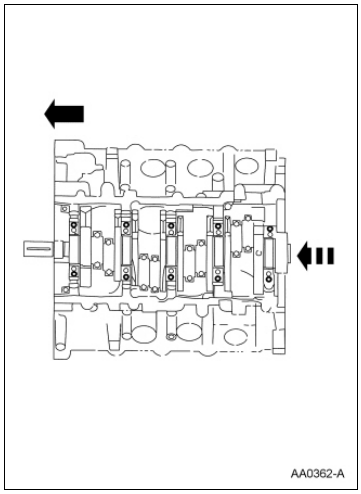
2. Lubricate the crankshaft bearing journals with clean engine oil. Install the crankshaft onto the upper crankshaft main bearings.



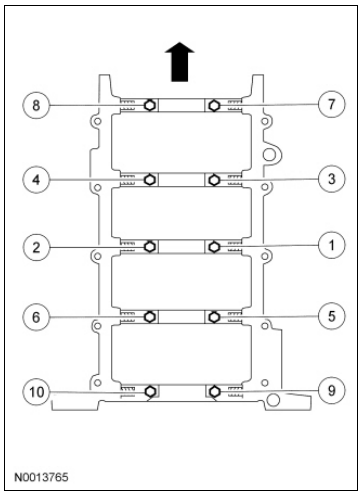
3. **NOTE:** The oil groove on the thrust washer must face toward the rear of the engine (against the crankshaft thrust surface).

   Push the crankshaft rearward and install the rear crankshaft upper thrust washer at the back of the No. 5 main boss.

NOTE: Rotate the 10 jackscrews into the main bearing caps enough to provide clearance to the cylinder block prior to installing the bearing caps.

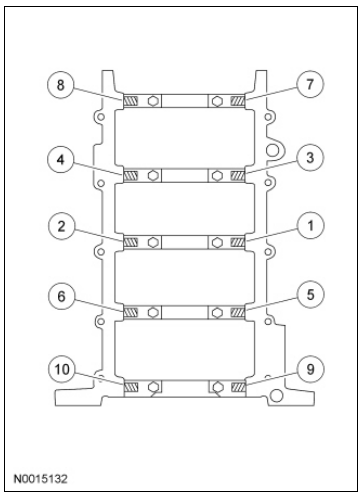


4. Install the thrust washer on the rear (No. 5) main bearing cap and install the rear (No. 5) main bearing cap.

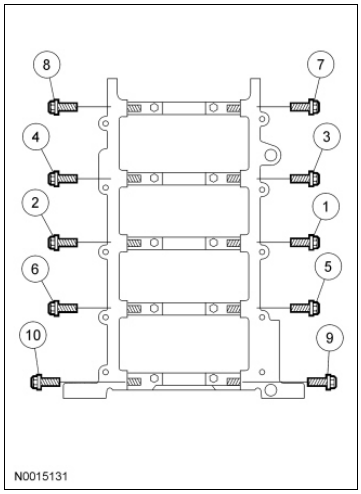


5. **NOTE:** Install the stud bolt in the same position from which it was removed.

   Install the crankshaft lower main bearings into the main bearing caps and lubricate them with clean engine oil. Locate the main bearing cap on the cylinder block and, keeping the cap as square as possible, alternately draw the cap down evenly using the cap fasteners.



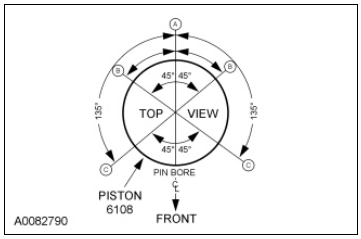
6. Push the crankshaft forward to seat the crankshaft thrust washer. Hold the crankshaft in the forward position.



7. Tighten the 10 vertical main bearing cap fasteners in the sequence shown, in 2 stages.
    - Stage 1: Tighten to 40 Nm (30 lb-ft).
    - Stage 2: Tighten an additional 90 degrees.

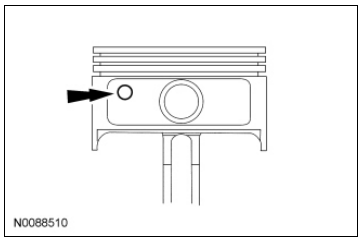
8. Tighten the 10 jackscrews against the cylinder block in the sequence shown in 2 stages.
    - Stage 1: Tighten to 5 Nm (44 lb-in).
    - Stage 2: Tighten to 10 Nm (89 lb-in).

9. Install the 10 side bolts and tighten them in the sequence shown.
    - Tighten to 21 Nm (15 lb-ft).



10. Check the crankshaft end play. For additional information, refer to Section 303-00 .

11. Check that crankshaft torque-to-turn does not exceed 6 Nm (53 lb-in).

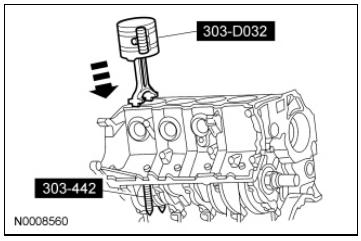


12. Check the piston-to-cylinder block and piston ring clearances. For additional information, refer to Section 303-00 .

13. Assemble the pistons. For additional information, refer to Piston in this section.

14. Make sure the ring gaps (oil spacer-A, oil ring-B and compression ring-C) are correctly spaced around the circumference of the piston.

15. Make sure the dimple in the piston faces the front of the engine.



16. ***NOTICE:*** **Install the piston and connecting rod assemblies carefully, or the cylinder walls or crankshaft journals may be damaged.**

    NOTE: The following piston installation steps are for all 8 connecting rods, rod bearings and pistons. Only one connecting rod, rod bearing and piston shown.

    Use the Piston Ring Compressor and the Connecting Rod Installer to install the connecting rod with the upper connecting rod bearing in place.

    - Lubricate the piston and ring with clean engine oil.
    - Lubricate the rod bearings with clean engine oil.

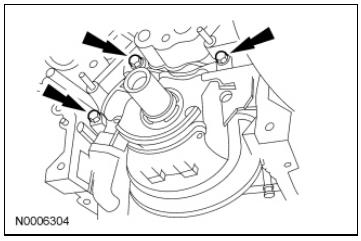
17. ***NOTICE:*** **Remove the Connecting Rod Installer carefully, or the crankshaft journals may be damaged.**

    Once the connecting rod is seated on the crankshaft journal, remove the Connecting Rod Installer.

18. ***NOTICE:*** **The rod cap installation must keep the same orientation as marked during disassembly, or the engine may be damaged.**

    NOTE: The connecting rod caps are of the "cracked" design and must mate with the connecting rod ends. Excessive bearing clearance will result if not mated correctly.

    Position the lower bearing and connecting rod and install the 2 new bolts loosely.



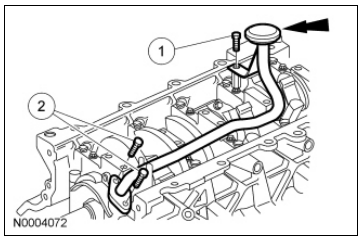
19. **NOTE:** Main bearing caps removed from art for clarity.

    Tighten the 16 connecting rod cap bolts in 2 stages, in the sequence shown.

    - Stage 1: Tighten to 43 Nm (32 lb-ft).
    - Stage 2: Tighten an additional 105 degrees.

20. Position the oil pump and install the 3 bolts.
    - Tighten to 10 Nm (89 lb-in).

21. Install the pickup tube spacer.
    - Tighten to 25 Nm (18 lb-ft).



22. ***NOTICE:*** **Make sure the O-ring is in place and not damaged. A missing or damaged O-ring may cause foam in the lubrication system, low oil pressure and severe engine damage.**

    NOTE: Clean and inspect the mating surfaces and install a new O-ring. Lubricate the O-ring with clean engine oil.

    Position the oil pump screen and pickup tube and install the 3 bolts.

    1. Tighten to 25 Nm (18 lb-ft).
    2. Tighten to 10 Nm (89 lb-in).

23. ***NOTICE:*** **Make sure all coolant residue and foreign material are cleaned from the block surface and cylinder bore, or the engine may be damaged.**

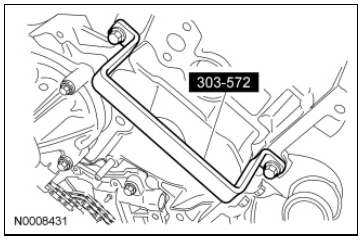
    NOTE: The use of sealing aids (aviation cement, copper spray and glue) is not permitted. The gasket must be installed dry.

    NOTE: The cylinder head bolts must be discarded and new bolts installed. They are a tighten-to-yield design and cannot be reused.

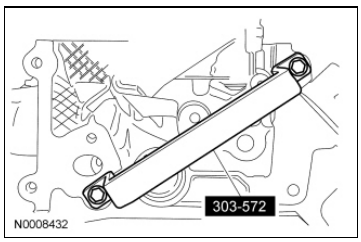
    NOTE: Do not turn the crankshaft until instructed to do so.

    NOTE: LH shown, RH similar.

    Using the Cylinder Head Alignment Pins, position the cylinder head gaskets and cylinder heads over the dowels and install the 20 cylinder head bolts loosely.

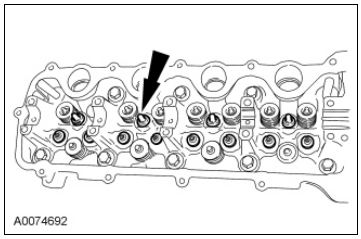


24. Tighten the 10 LH cylinder head bolts in 6 stages, in the sequence shown.
    - Stage 1: Tighten to 40 Nm (30 lb-ft).
    - Stage 2: Tighten an additional 90 degrees.
    - Stage 3: Loosen all 10 bolts a minimum of one full turn (360 degrees).
    - Stage 4: Tighten to 40 Nm (30 lb-ft).
    - Stage 5: Tighten an additional 90 degrees.
    - Stage 6: Tighten an additional 90 degrees.



25. Tighten the 10 RH cylinder head bolts in 6 stages, in the sequence shown.
    - Stage 1: Tighten to 40 Nm (30 lb-ft).
    - Stage 2: Tighten an additional 90 degrees.
    - Stage 3: Loosen all 10 bolts a minimum of one full turn (360 degrees).
    - Stage 4: Tighten to 40 Nm (30 lb-ft).
    - Stage 5: Tighten an additional 90 degrees.
    - Stage 6: Tighten an additional 90 degrees.

26. Remove the Cylinder Head Remover/Installer from the LH cylinder head.



27. Remove the Cylinder Head Remover/Installer from the RH cylinder head.

28. **NOTE:** Lubricate the hydraulic lash adjusters with clean engine oil prior to installation.

    Install the hydraulic lash adjusters into the RH and LH cylinder heads.

29. **NOTE:** Lubricate the camshaft and camshaft journals with clean engine oil prior to installation.

    Install the LH and RH camshafts.

30. **NOTE:** LH shown, RH similar.

    NOTE: Lubricate the camshaft bearing caps with clean engine oil.

    Install the LH and RH camshaft bearing caps in their original locations.

    - Position the front camshaft bearing cap.
    - Position the remaining camshaft bearing caps.
    - Install the 20 bolts loosely.
    - Tighten to 10 Nm (89 lb-in) in the sequence shown.

31. ***NOTICE:*** **Damage to the camshaft phaser sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**

    NOTE: LH shown, RH similar.

    Position the camshaft phaser sprockets and install 2 new camshaft phaser bolts finger-tight.

32. ***NOTICE:*** **Damage to the camshaft phaser sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**

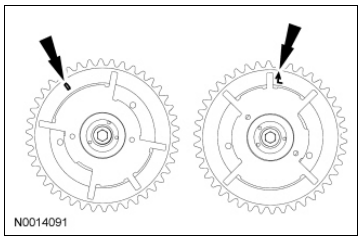
    NOTICE: **Only use hand tools to remove the camshaft phaser sprocket assembly or damage may occur to the camshaft or camshaft phaser unit.**

    NOTICE: **Damage to the camshaft phaser sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**

    NOTE: LH shown, RH similar.

    Using the Camshaft Phaser Sprocket Locking Tool, tighten the LH and RH camshaft phaser sprocket bolts in 2 stages.

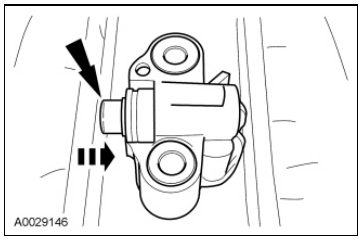
    - Stage 1: Tighten to 40 Nm (30 lb-ft).
    - Stage 2: Tighten an additional 90 degrees.



33. Install the crankshaft sprocket, making sure the flange faces forward.

34. Rotate the crankshaft to position the crankshaft sprocket timing mark in the 6 o'clock position.

35. Rotate the camshaft sprockets to position the RH camshaft sprocket timing mark in the 11 o'clock position and the LH camshaft sprocket timing mark in the 12 o'clock position.



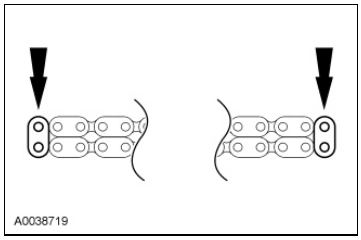
36. ***NOTICE:*** **If one or both tensioner mounting bolts are loosened or removed, the tensioner-sealing bead must be inspected for seal integrity. If cracks, tears, cuts or separation from the tensioner body, or permanent compression of the seal bead is observed, install a new tensioner, or engine damage may occur.**

    Inspect the RH and LH timing chain tensioners.

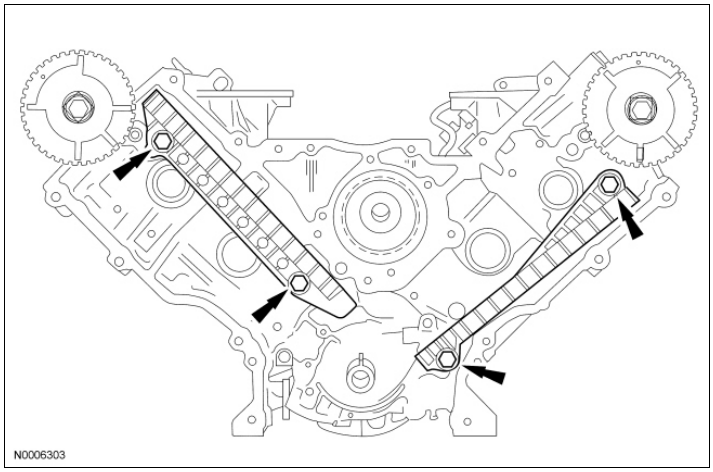
    - Install new tensioners as necessary.

37. ***NOTICE:*** **Timing chain procedures must be followed exactly or damage to valves and pistons will result.**

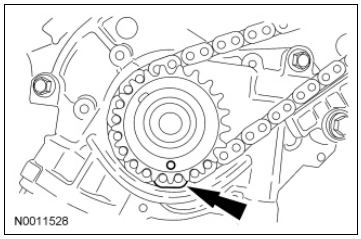
    Compress the tensioner plunger, using a vise.



38. Install a retaining clip on the tensioner to hold the plunger in during installation.

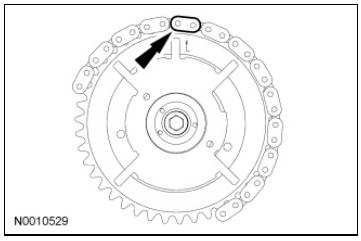


39. Remove the tensioner from the vise.



40. If the copper links are not visible, mark one link on one end and one link on the other end and use as timing marks.

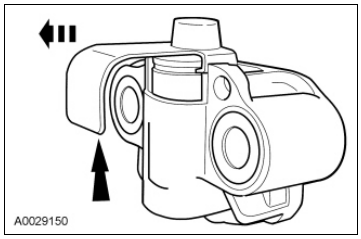
41. Install the LH and RH timing chain guides and the 4 bolts.
    - Tighten to 10 Nm (89 lb-in).



42. Position the lower end of the LH (inner) timing chain on the crankshaft sprocket, aligning the timing mark on the outer flange of the crankshaft sprocket with the single copper (marked) link on the chain.

43. **NOTE:** Make sure the upper half of the timing chain is below the tensioner arm dowel.

    Position the LH timing chain on the camshaft sprocket. Make sure the camshaft sprocket timing mark is aligned with the copper (marked) chain link.

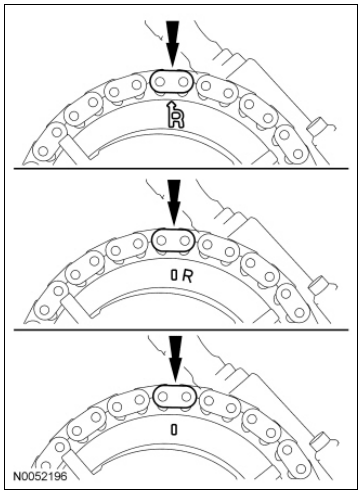


44. **NOTE:** The LH timing chain tensioner arm has a bump near the dowel hole for identification.

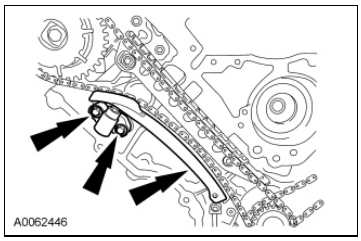
    Position the LH timing chain tensioner arm on the dowel pin and install the LH timing chain tensioner and the 2 bolts.

    - Tighten to 25 Nm (18 lb-ft).

45. Remove the retaining clip from the LH timing chain tensioner.



46. Position the lower end of the RH (outer) timing chain on the crankshaft sprocket, aligning the timing mark on the sprocket with the single copper (marked) chain link.

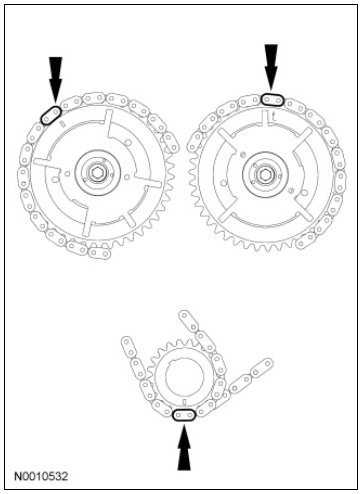


47. **NOTE:** The lower half of the timing chain must be positioned above the tensioner arm dowel.

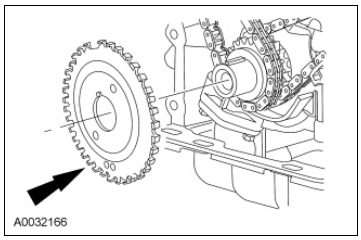
    NOTE: The camshaft phaser and sprocket will be stamped with one of the illustrated timing marks for the RH camshaft.

    Position the RH timing chain on the camshaft sprocket. Make sure the camshaft sprocket timing mark is aligned with the copper (marked) chain link.

48. Position the RH timing chain tensioner arm on the dowel pin and install the RH timing chain tensioner and 2 bolts.
    - Tighten to 25 Nm (18 lb-ft).

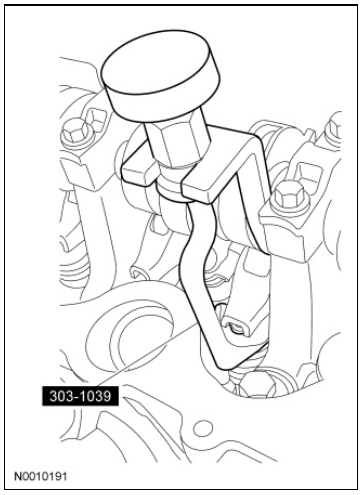


49. Remove the retaining clip from the RH timing chain tensioner.



50. **NOTE:** The RH and LH camshaft phaser sprockets are similar. Refer to the single timing mark to identify the RH camshaft phaser sprocket and the L timing mark to identify the LH camshaft phaser sprocket.

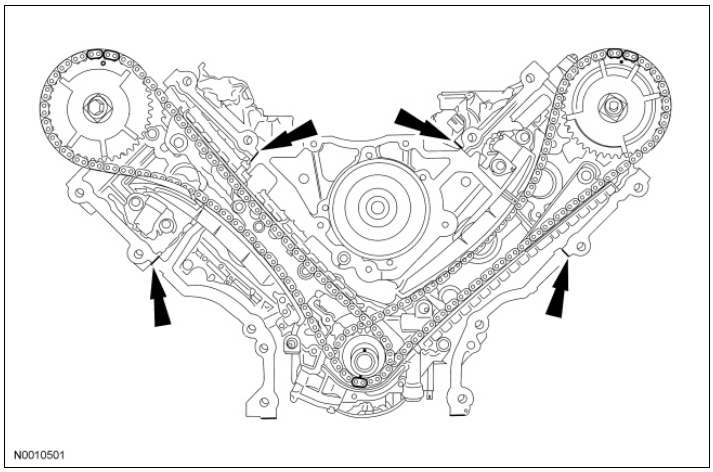
    As a post-check, verify correct alignment of all timing marks. Make sure the timing marks on the sprockets correspond to the above note.



51. Install the crankshaft sensor ring on the crankshaft.

52. **NOTE:** Lubricate the roller followers with clean engine oil prior to installation.

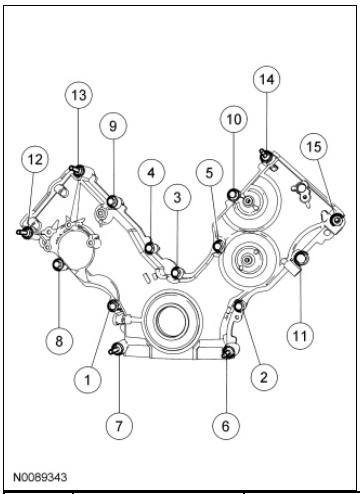
    Using the Valve Spring Compressor, install all of the camshaft roller followers.



53. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

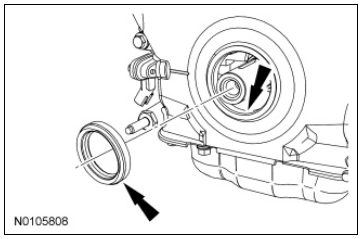
    NOTE: If the engine front cover is not secured within 4 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Follow the directions on the packaging. Failure to follow this procedure can cause future oil leakage.

    NOTE: Make sure that the engine front cover gasket is in place on the engine front cover before installation.

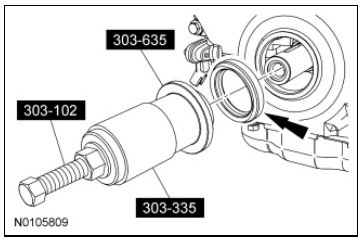


Apply a bead of silicone gasket and sealant along the cylinder head-to-cylinder block surface at the locations shown.

54. Install a new engine front cover gasket on the engine front cover. Position the engine front cover onto the dowels. Install the 15 fasteners finger-tight.



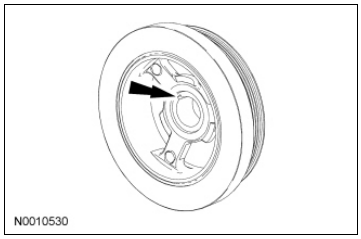
55. Tighten the 15 engine front cover fasteners in the sequence shown to 25 Nm (18 lb-ft).



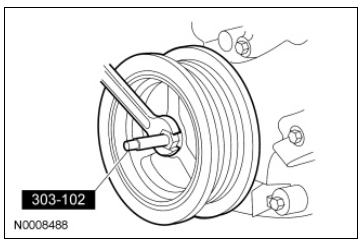
Item	Part Number	Description
1	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 53
2	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 53
3	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 53
4	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 53
5	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 53
6	W706508	Stud, Hex Shoulder Pilot, M8 x 1.25 x 50 - M6 x 1 x 10

7	N806300	Stud, Hex Shoulder Pilot, M8 x 1.25 x 1.25 x 91.1
8	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 53
9	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 53
10	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 53
11	N808294	Bolt, Hex Head Pilot, M8 x 1.25 x 53
12	N806300	Stud, Hex Shoulder Pilot, M8 x 1.25 x 1.25 x 91.1
13	N806300	Stud, Hex Shoulder Pilot, M8 x 1.25 x 1.25 x 91.1
14	N806300	Stud, Hex Shoulder Pilot, M8 x 1.25 x 1.25 x 91.1
15	N806300	Stud, Hex Shoulder Pilot, M8 x 1.25 x 1.25 x 91.1

56. Lubricate the engine front cover and the crankshaft front oil seal inner lip with clean engine oil.



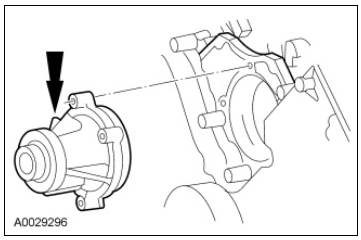
57. Using the Crankshaft Front Seal Installer, the Front Cover Seal Installer and the Crankshaft Vibration Damper Installer, install the crankshaft front oil seal into the engine front cover.



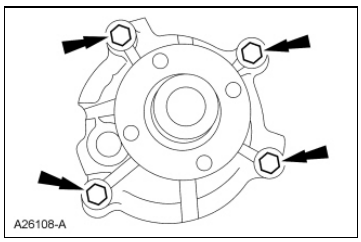
58. **NOTE:** If not secured within 4 minutes, the sealant must be removed and the sealing area cleaned with metal surface prep and silicone gasket remover. Allow to dry until there is no sign of wetness, or 4 minutes, whichever is longer. Failure to follow this procedure can cause future oil leakage.

    Apply silicone gasket and sealant to the Woodruff key slot in the crankshaft pulley.

59. Using the Crankshaft Vibration Damper Installer, install the crankshaft pulley.



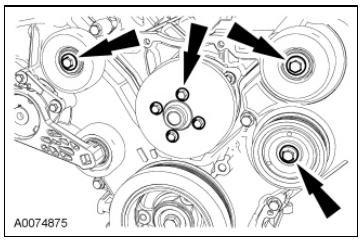
60. Using a new crankshaft pulley bolt, install the bolt and washer and tighten the bolt in 4 stages.
    - Stage 1: Tighten to 120 Nm (89 lb-ft).
    - Stage 2: Loosen 360 degrees.
    - Stage 3: Tighten to 50 Nm (37 lb-ft).
    - Stage 4: Tighten an additional 90 degrees.



61. ***NOTICE:*** **Do not rotate the coolant pump housing once the coolant pump has been positioned in the cylinder block. Damage to the O-ring seal will occur.**

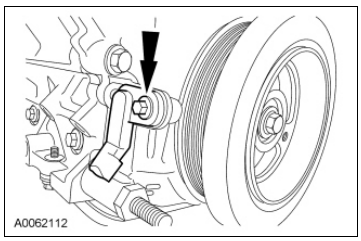
    NOTE: Lubricate the new O-ring seal using clean engine coolant and install the O-ring seal onto the coolant pump.

    Position the coolant pump and install the 4 bolts loosely.

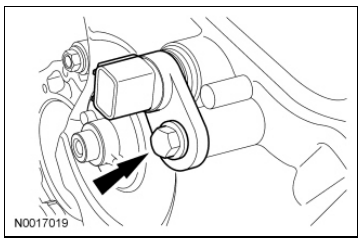


62. Tighten the 4 coolant pump bolts.
    - Tighten to 25 Nm (18 lb-ft).

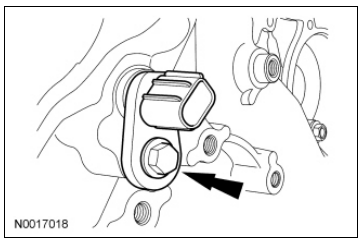
63. Position the accessory drive belt tensioner and install the 3 bolts.
    - Tighten to 25 Nm (18 lb-ft).



64. Install the 3 accessory drive belt idler pulleys, the coolant pump pulley and the 7 bolts.
    - Tighten to 25 Nm (18 lb-ft).

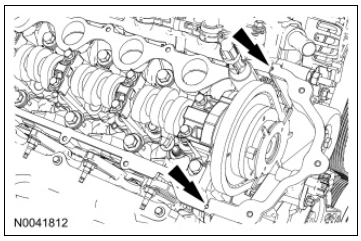


65. Install the Crankshaft Position (CKP) sensor and the bolt.



- Tighten to 10 Nm (89 lb-in).

66. Install the LH Camshaft Position (CMP) sensor and the bolt.
    - Tighten to 10 Nm (89 lb-in).



67. Install the RH CMP sensor and the bolt.
    - Tighten to 10 Nm (89 lb-in).

68. **NOTE:** If not secured within 4 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Follow the directions on the packaging. Failure to follow this procedure can cause future oil leakage.

    Apply silicone gasket and sealant in 2 places where the engine front cover meets the RH cylinder head.

69. ***NOTICE:*** **Install the valve cover carefully, or the Variable Camshaft Timing (VCT) solenoid may be damaged.**

    Position the RH valve cover and gasket on the cylinder head and tighten the 9 bolts in the sequence shown.

    - Tighten to 10 Nm (89 lb-in).

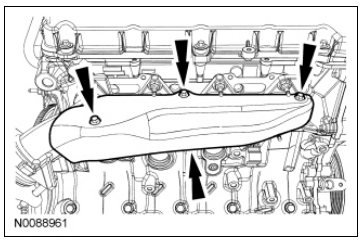
70. **NOTE:** If not secured within 4 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Follow the directions on the packaging. Failure to follow this procedure can cause future oil leakage.

    Apply silicone gasket and sealant in 2 places where the engine front cover meets the LH cylinder head.

71. ***NOTICE:*** **Install the valve cover carefully, or the Variable Camshaft Timing (VCT) solenoid may be damaged.**

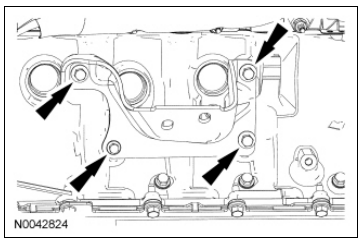
    Position the LH valve cover and gasket on the cylinder head and tighten the 10 bolts in the sequence shown.

    - Tighten to 10 Nm (89 lb-in).

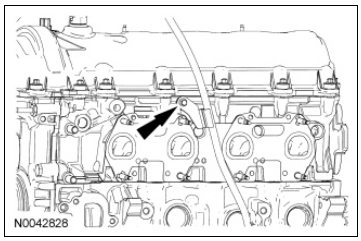


72. Inspect the RH exhaust manifold for flatness. For additional information, refer to Section 303-00 .

73. Install 8 new RH exhaust manifold studs.
    - Tighten to 12 Nm (106 lb-in).

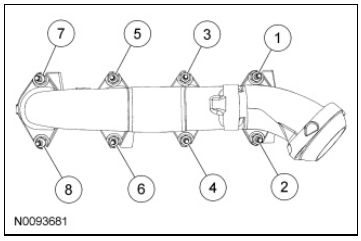


74. Position new gaskets, the RH exhaust manifold and tighten the 8 new nuts in the sequence shown.
    - Tighten to 25 Nm (18 lb-ft).

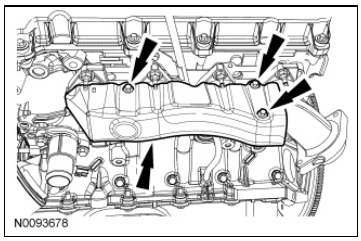


75. Position the RH heat shield and install the 3 bolts.
    - Tighten to 10 Nm (89 lb-in).

76. Position the RH engine support insulator bracket and install the 4 bolts.
    - Tighten to 72 Nm (53 lb-ft).



77. Position the oil level indicator tube and install the bolt.
    - Install a new O-ring seal and lubricate the O-ring seal with clean engine oil prior to installation.
    - Tighten to 10 Nm (89 lb-in).



78. Inspect the LH exhaust manifold for flatness. For additional information, refer to Section 303-00 .

79. Install 8 new LH exhaust manifold studs.
    - Tighten to 12 Nm (106 lb-in).

80. Position new gaskets, the LH exhaust manifold and tighten the 8 new nuts in the sequence shown.
    - Tighten to 25 Nm (18 lb-ft).

81. Position the LH exhaust manifold heat shield and install the 3 bolts.
    - Tighten to 10 Nm (89 lb-in).

82. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These may cause scratches and gouges resulting in leak paths. Use a plastic scraper to clean the sealing surfaces.**

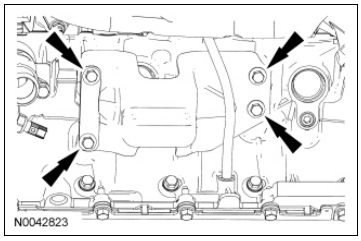
    Clean the oil filter adapter sealing surfaces using silicone gasket remover, metal surface prep and a plastic scraping tool. Follow the directions on the packaging.

83. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

    NOTE: Clean and inspect the mating surfaces and install new gaskets.

    Position the oil filter adapter and install the 4 bolts.

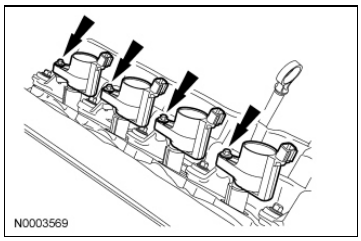
    - Tighten to 25 Nm (18 lb-ft).



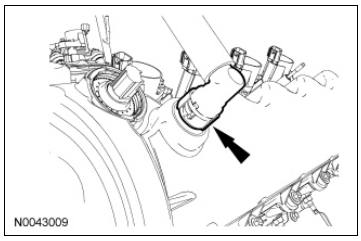
84. **NOTE:** Lubricate the oil filter gasket with clean engine oil.

    Install a new oil filter.

- Tighten the oil filter until the gasket makes contact, then use an oil filter strap wrench to tighten the filter an additional 270 degrees.



85. Position the LH engine support insulator bracket and install the 4 bolts.
    - Tighten to 72 Nm (53 lb-ft).

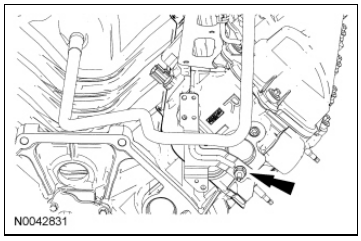


86. **NOTE:** LH shown, RH similar.

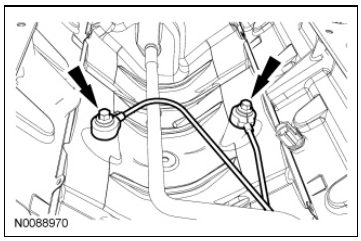
    Install the 8 ignition coils and the 8 bolts.

    - Tighten to 6 Nm (53 lb-in).

87. Connect the PCV hose to the LH valve cover.



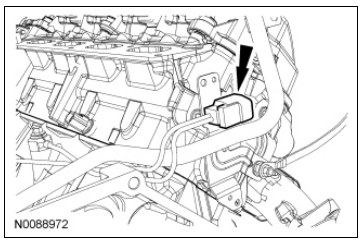
88. Connect the breather tube to the RH valve cover.



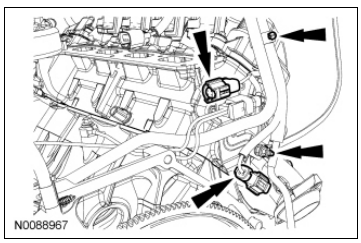
89. **NOTE:** Install new O-ring seals and lubricate the O-ring seals with clean engine coolant.

    Position the heater supply tube and the hoses as an assembly and install the stud bolt.

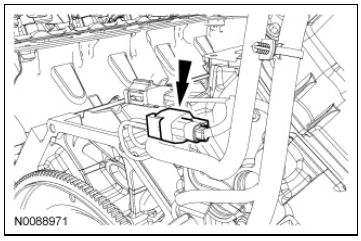
    - Tighten to 10 Nm (89 lb-in).



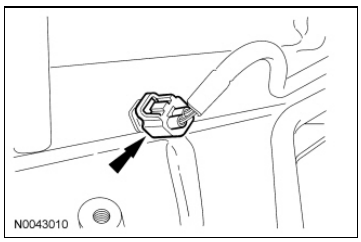
90. Position the Knock Sensor (KS) and install the 2 bolts.
    - Tighten to 20 Nm (177 lb-in).



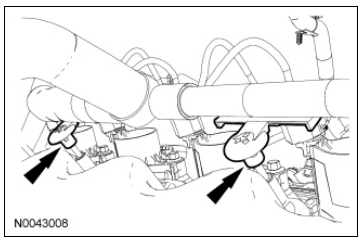
91. Position the ground strap and install the nut.



92. Attach the KS electrical connector retainer.

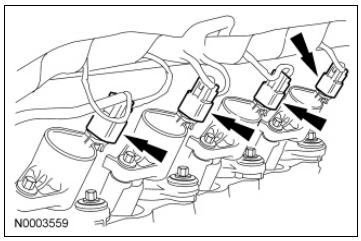


93. Position the wiring harness and attach the electrical connector and wiring harness retainers to the heater supply tube.

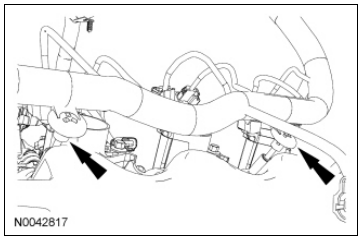


94. Connect the KS electrical connector.

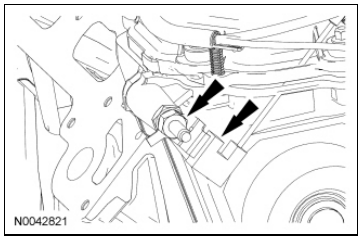
95. Connect the Cylinder Head Temperature (CHT) sensor electrical connector.



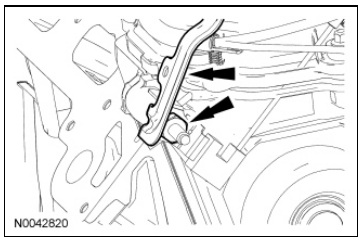
96. Attach the wiring harness retainers to the RH valve cover studs.



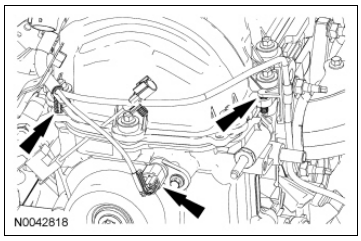
97. **NOTE:** RH shown, LH similar.



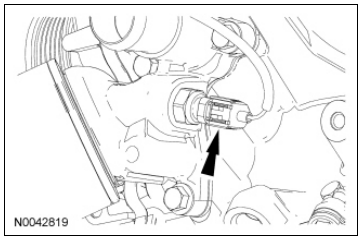
Connect the 4 RH and 4 LH ignition coil electrical connectors.



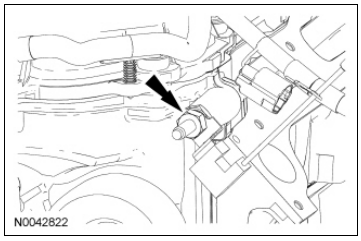
98. Attach the wiring harness retainers to the LH valve cover studs.



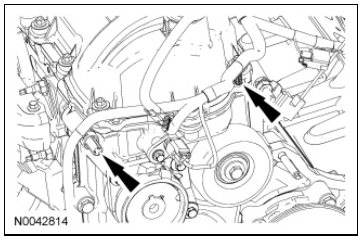
99. Position the LH radio interference capacitor and install the nut.
    - Tighten to 25 Nm (18 lb-ft).



100. Position the cooling fan wiring harness and install the nut.
    - Tighten to 25 Nm (18 lb-ft).

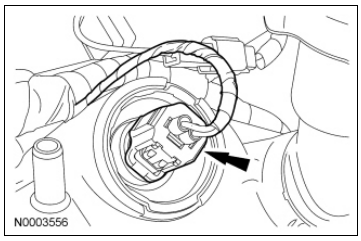


101. Connect the LH Camshaft Position (CMP) sensor and attach the wiring harness retainers.

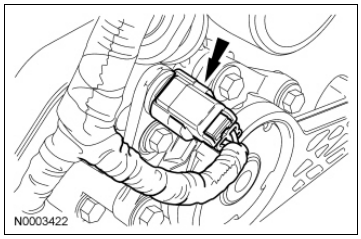


102. Connect the Engine Oil Pressure (EOP) sensor electrical connector.

103. Position the RH radio interference capacitor and install the nut.
    - Tighten to 25 Nm (18 lb-ft).

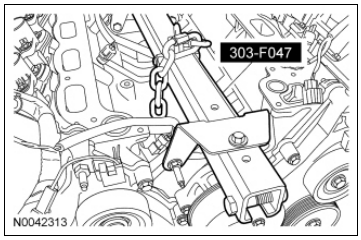


104. Attach the wiring harness retainers.



105. **NOTE:** RH shown, LH similar.

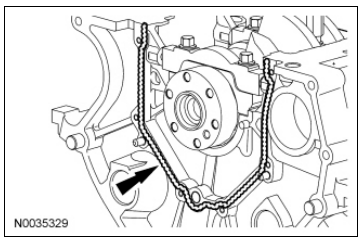
    Connect the RH and LH Variable Camshaft Timing (VCT) solenoid electrical connectors.



106. Connect the RH CMP sensor electrical connector.

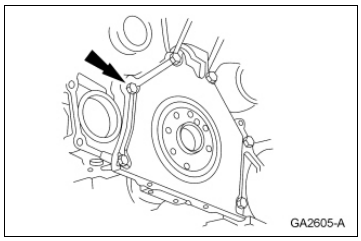
107. Connect the CKP sensor electrical connector and attach the wiring harness retainer.

108. Install the Modular Engine Lift Bracket.



109. Using a suitable floor crane, remove the engine from the engine stand.

110. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the aluminum retainer plate. These tools cause scratches and gouges, which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**



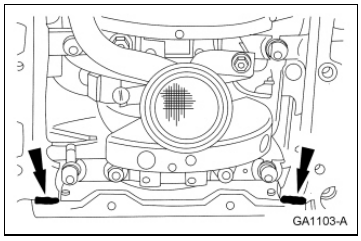
Inspect the crankshaft rear seal retainer plate. Clean the mating surface for the rear seal retainer plate with silicone gasket remover and metal surface prep. Follow the directions on the packaging.

111. **NOTE:** The crankshaft rear seal retainer plate does not have a sealant groove. Gasket maker must be applied to the crankshaft rear seal retainer plate mating surface on the engine block.

    Apply a bead of gasket maker to the crankshaft rear seal retainer mating surface on the engine block.

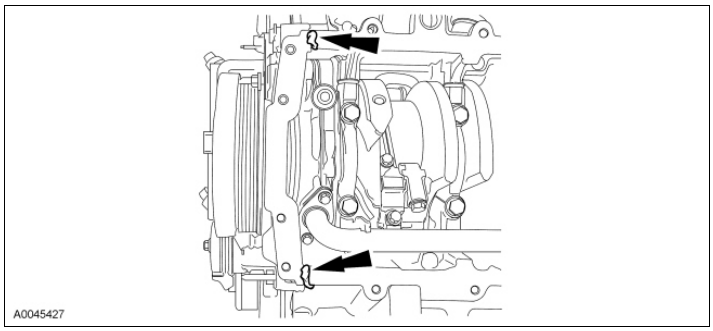
112. Install the crankshaft rear seal retainer plate and loosely install the 6 bolts.

113. Tighten the 6 bolts in the sequence shown.
    - Tighten to 10 Nm (89 lb-in).



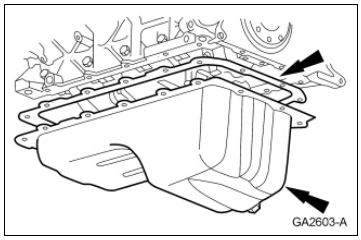
114. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges, which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

    Inspect the oil pan. Clean the mating surface for the oil pan with silicone gasket remover and metal surface prep. Follow the directions on the packaging.



115. **NOTE:** If not secured within 4 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Follow the directions on the packaging. Failure to follow this procedure can cause future oil leakage.

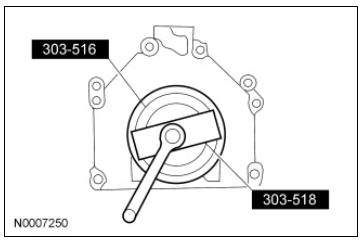
    Apply silicone gasket and sealant at the crankshaft rear seal retainer plate-to-cylinder block sealing surface.



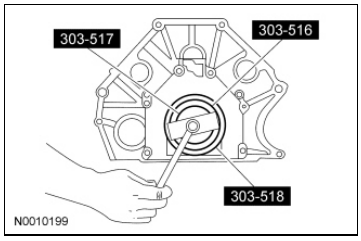
116. **NOTE:** If not secured within 4 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Follow the directions on the packaging. Failure to follow this procedure can cause future oil leakage.

    Apply silicone gasket and sealant at the engine front cover-to-cylinder block sealing surface.

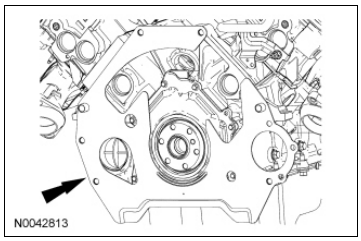
117. Install the oil pan gasket and the oil pan and loosely install the 16 bolts.



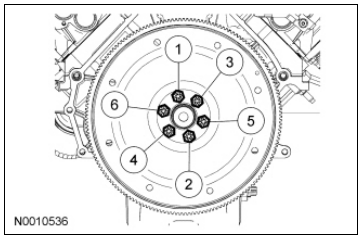
118. Tighten the 16 bolts in 3 stages, in the sequence shown.
    - Stage 1: Tighten to 2 Nm (18 lb-in).
    - Stage 2: Tighten to 20 Nm (177 lb-in).
    - Stage 3: Tighten an additional 60 degrees.



119. **NOTE:** Lubricate the inner lip of the crankshaft rear seal with clean engine oil.

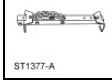


Using the 2 Crankshaft Rear Seal Installers, install a new crankshaft rear seal.



120. Using the 2 Crankshaft Rear Seal Installers and the Crankshaft Oil Slinger Installer, install the crankshaft rear oil slinger.

121. Install the spacer plate.



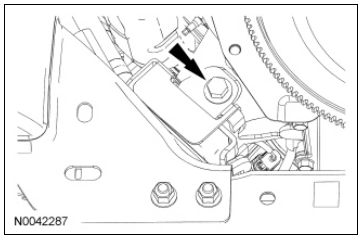
122. Position the flexplate and install the 6 bolts in the sequence shown.
    - Tighten to 80 Nm (59 lb-ft).

Engine

Special Tool(s)

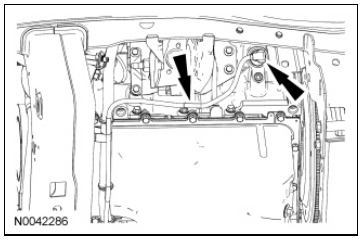
 ST1377-A	Modular Engine Lift Bracket 303-F047 (014-00073) or equivalent

Material

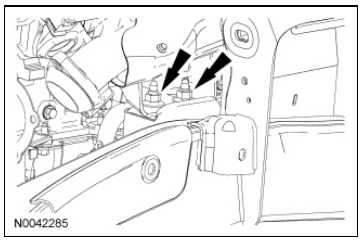


Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

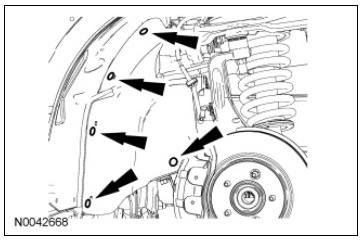
1. Position the engine in the vehicle and remove the floor crane.



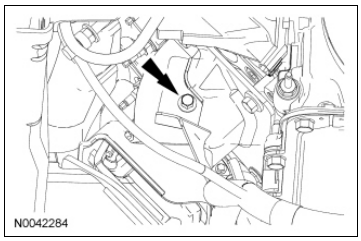
2. Remove the Modular Engine Lift Bracket.



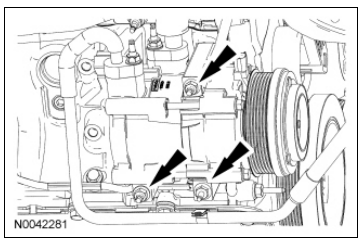
3. Install the LH engine support insulator through bolt.
   - Tighten to 103 Nm (76 lb-ft).



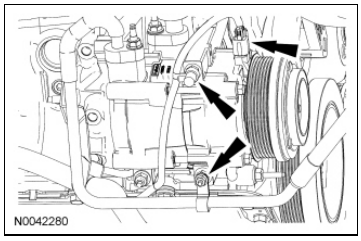
4. If equipped, attach the block heater wiring harness retainers and connect the block heater electrical connector.



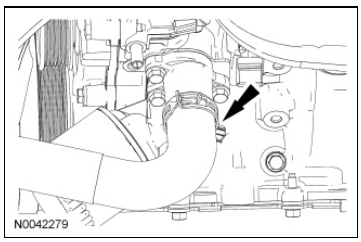
5. Install the 2 RH engine support insulator nuts.
    - Tighten to 90 Nm (66 lb-ft).



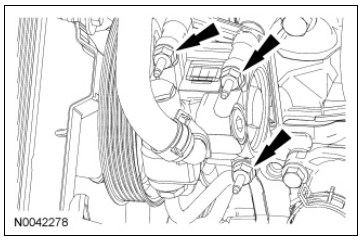
6. Position the RH splash shield and install the 5 pushpins.



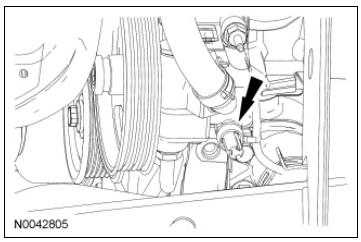
7. Position the battery cable bracket on the RH engine support insulator bracket and install the bolt.
    - Tighten to 15 Nm (133 lb-in).



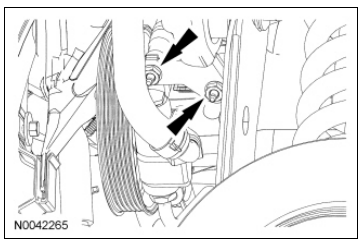
8. Position the A/C compressor and install the 2 nuts and the stud bolt.
    - Tighten to 25 Nm (18 lb-ft).



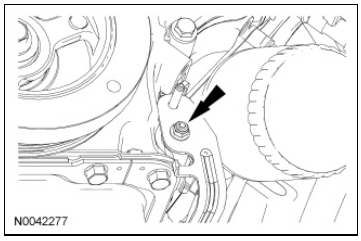
9. Position the A/C hose bracket and install the nut. Attach the wiring harness retainer and connect the A/C clutch electrical connector.
    - Tighten to 20 Nm (177 lb-in).



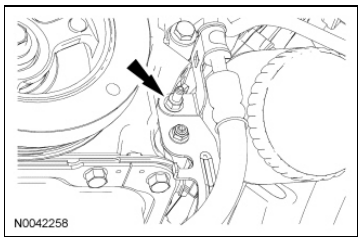
10. Connect the lower radiator hose to the oil filter adapter.



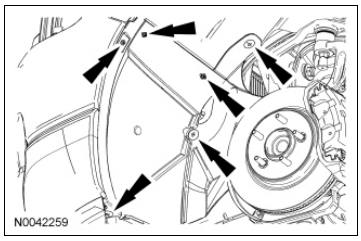
11. Position the power steering pump and install the 3 stud bolts.
    - Tighten to 25 Nm (18 lb-ft).



12. Attach the wiring harness retainer to the power steering pump stud bolt.

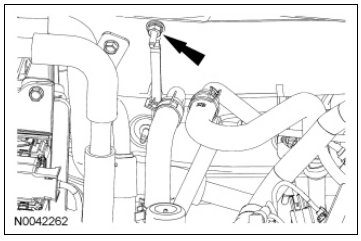


13. Position the wiring harness bracket and install the 2 nuts.
    - Tighten to 10 Nm (89 lb-in).

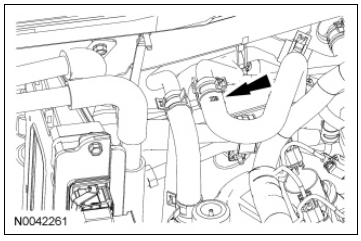


14. Position the wiring harness bracket and install the nut.
    - Tighten to 10 Nm (89 lb-in).

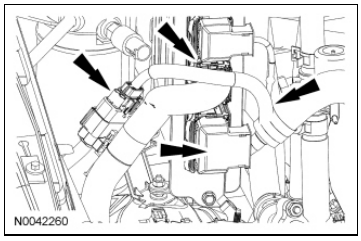
15. Position the power steering pressure hose bracket and install the nut.
    - Tighten to 10 Nm (89 lb-in).



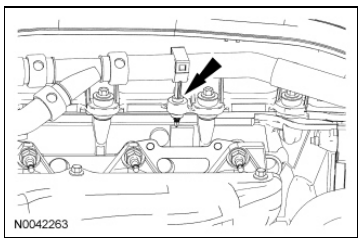
16. Position the inner fender splash shield and install the 3 pushpins and 3 screws.



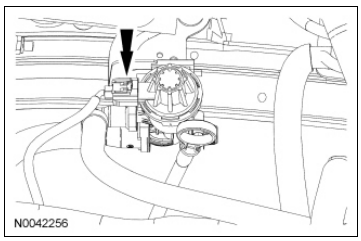
17. Install the transmission. For additional information, refer to Section 307-01B .



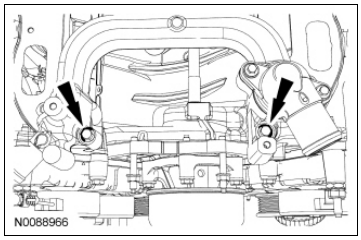
18. Position the ground wire on the cowl and install the nut.
    - Tighten to 12 Nm (106 lb-in).



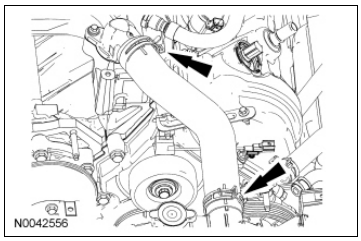
19. Connect the heater hose.



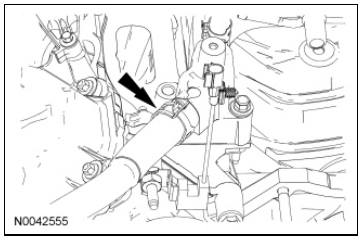
20. Attach the wiring harness pin-type retainer, and connect the 2 PCM electrical connectors and the in-line electrical connector.



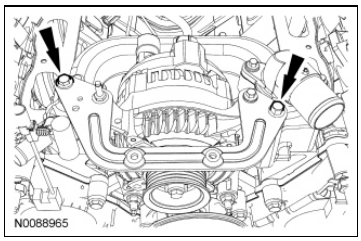
21. Attach the heater hose retainer to the RH valve cover.



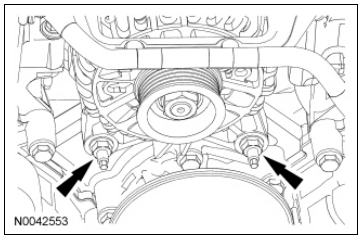
22. Connect the Evaporative Emission (EVAP) canister purge valve electrical connector.



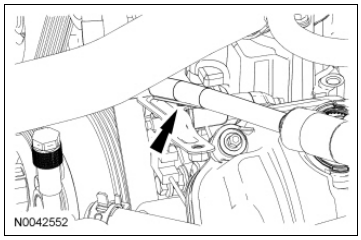
23. Position 2 new gaskets, the coolant crossover and install the 2 bolts.
    - Tighten to 10 Nm (89 lb-in).



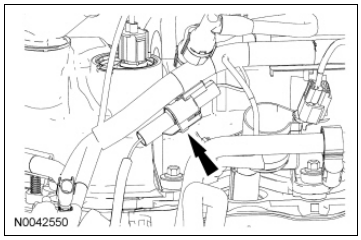
24. Install the upper radiator hose.



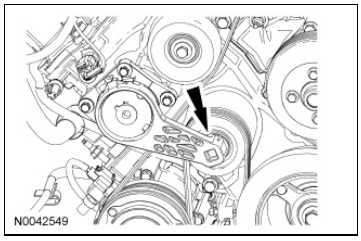
25. Connect the heater hose.



26. Position the alternator, alternator bracket and the wiring harness as an assembly and install the 2 bolts.
    - Tighten to 10 Nm (89 lb-in).

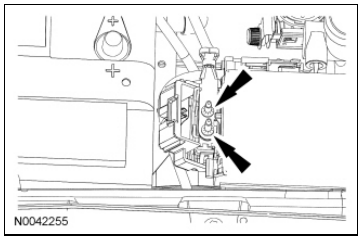


27. Tighten the 2 nuts
    - Tighten to 25 Nm (18 lb-ft).



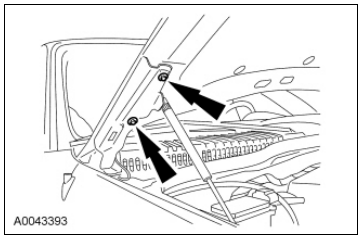
28. Attach the wiring harness retainer to the cooling fan wiring harness bracket.

29. Connect the electrical connector.

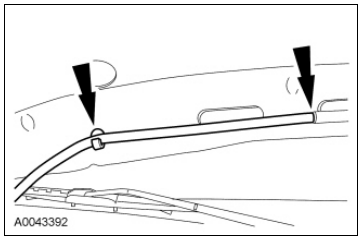


30. Rotate the accessory drive belt tensioner clockwise and install the accessory drive belt.

31. Install the cooling fan. For additional information, refer to Section 303-03 .



32. Connect the wiring harness terminals, install the 2 nuts and close the cover.
    - Tighten to 12 Nm (106 lb-in).

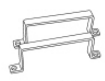


33. ***NOTICE:*** **If the engine is repaired or replaced because of upper engine failure, typically including valve or piston damage, check the intake manifold for metal debris. If metal debris is found, install a new intake manifold. Failure to follow these instructions can result in engine damage.**

    Install the intake manifold. For additional information, refer to Intake Manifold in this section.

34. Position the hood and install the 4 bolts.
    - Tighten to 12 Nm (106 lb-in).

35. Connect the windshield washer hose.



36. Fill the engine with clean engine oil.

37. Fill and bleed the cooling system. For additional information, refer to Section 303-03 .

38. Carry out the fluid level check for the transmission. For additional information, refer to Section 307-01B .

Cylinder Head

Special Tool(s)

Material

Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	-
Motorcraft® Premium Gold Engine Coolant VC-7-B (US); CVC-7-B (Canada); or equivalent	WSS-M97B51-A1
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor	WSS-M2C930-A

Oil XO-5W20-QSP (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4
Motorcraft® Silicone Gasket Remover ZC-30	-

All cylinder heads

1. ***NOTICE:*** **Make sure all coolant residue and foreign material are cleaned from the block surface and cylinder bore. Failure to follow this instruction may result in engine damage.**

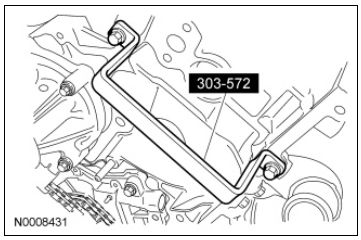
   NOTE: The use of sealing aids (aviation cement, copper spray and glue) is not permitted. The gasket must be installed dry.

   NOTE: The cylinder head bolts must be discarded and new bolts installed. They are a tighten-to-yield design and cannot be reused.

   NOTE: Do not turn the crankshaft until instructed to do so.

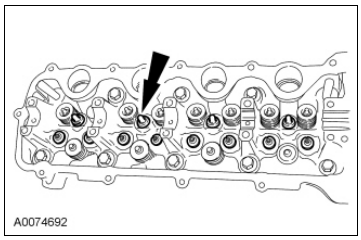
   NOTE: LH shown, RH similar.

   Using the Cylinder Head Alignment Pins, position the cylinder head gaskets and cylinder heads over the dowels and install the 20 cylinder head bolts loosely.



LH cylinder head

2. Tighten the 10 LH cylinder head bolts in 6 stages, in the sequence shown.
   - Stage 1: Tighten to 40 Nm (30 lb-ft).
   - Stage 2: Tighten an additional 90 degrees.
   - Stage 3: Loosen all 10 bolts a minimum of one full turn (360 degrees).
   - Stage 4: Tighten to 40 Nm (30 lb-ft).
   - Stage 5: Tighten an additional 90 degrees.
   - Stage 6: Tighten an additional 90 degrees.

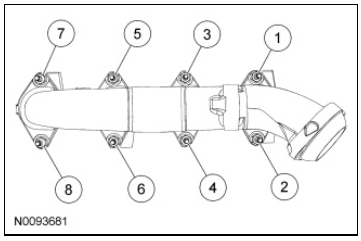


3. Remove the Cylinder Head Remover/Installer from the LH cylinder head.

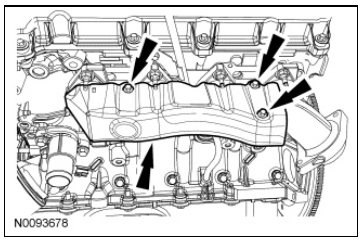
4. **NOTE:** Lubricate the hydraulic lash adjusters with clean engine oil prior to installation.

   NOTE: The hydraulic lash adjusters must be installed in their original locations.

   Install the hydraulic lash adjusters into the LH cylinder head.



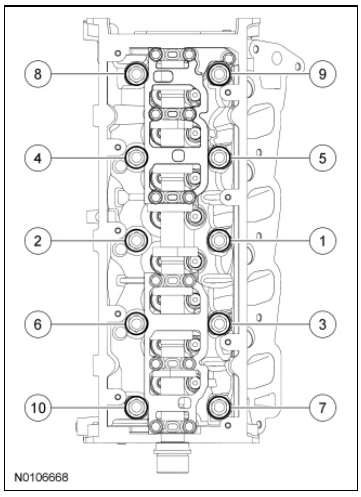
5. Remove the oil level indicator tube, install a new O-ring seal, and lubricate the O-ring seal with clean engine oil. Position the oil level indicator tube loosely in the engine block before installing the LH exhaust manifold.



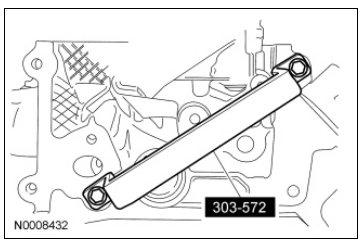
6. Clean and inspect the LH exhaust manifold. For additional information, refer to Section 303-00 .

7. Install 8 new LH exhaust manifold studs.
   - Tighten to 12 Nm (106 lb-in).

8. Position 2 new gaskets, the LH exhaust manifold and tighten the 8 new nuts in the sequence shown.
   - Tighten to 25 Nm (18 lb-ft).

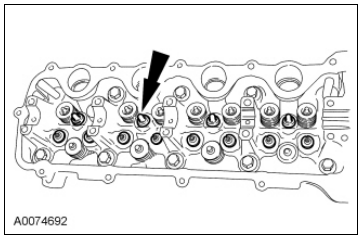


9. Position the LH exhaust manifold heat shield and install the 3 bolts.
   - Tighten to 10 Nm (89 lb-in).



RH cylinder head

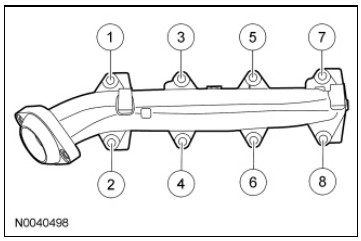
10. Tighten the 10 RH cylinder head bolts in 6 stages, in the sequence shown.
    - Stage 1: Tighten to 40 Nm (30 lb-ft).
    - Stage 2: Tighten an additional 90 degrees.
    - Stage 3: Loosen all 10 bolts a minimum of 1 full turn (360 degrees).
    - Stage 4: Tighten to 40 Nm (30 lb-ft).
    - Stage 5: Tighten an additional 90 degrees.
    - Stage 6: Tighten an additional 90 degrees.



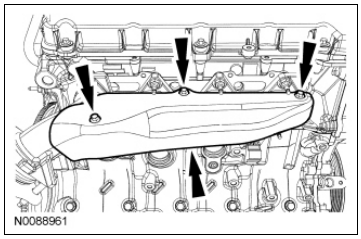
11. Remove the Cylinder Head Remover/Installer from the RH cylinder head.

12. **NOTE:** Lubricate the hydraulic lash adjusters with clean engine oil prior to installation.

NOTE: The hydraulic lash adjusters must be installed in their original locations.



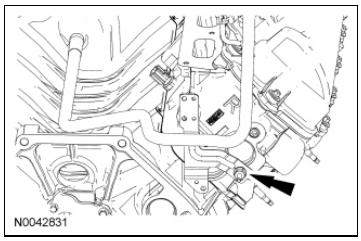
Install the hydraulic lash adjusters into the RH cylinder head.



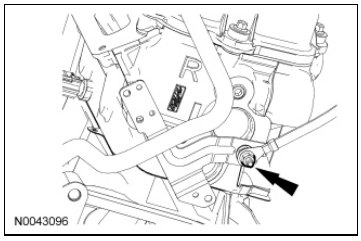
13. Clean and inspect the RH exhaust manifold. For additional information, refer to Section 303-00 .

14. Install 8 new RH exhaust manifold studs.
    - Tighten to 12 Nm (106 lb-in).

15. Position 2 new gaskets, the RH exhaust manifold and tighten the 8 new nuts in the sequence shown.
    - Tighten to 25 Nm (18 lb-ft).



16. Position the RH heat shield and install the 3 bolts.
    - Tighten to 10 Nm (89 lb-in).



17. **NOTE:** Install new O-ring seals and lubricate the O-ring seals with clean engine coolant.

    Position the heater supply tube and the hose as an assembly and install the stud bolt.

    - Tighten to 10 Nm (89 lb-in).

18. Position the ground strap and install the nut.
    - Tighten to 10 Nm (89 lb-in).

19. Attach the Knock Sensor (KS) electrical connector retainer.

All cylinder heads

20. **NOTE:** Lubricate the camshaft and camshaft journals with clean engine oil prior to installation.

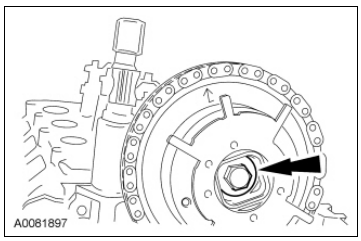
    Install the LH and RH camshafts.

21. **NOTE:** LH shown, RH similar.

    NOTE: Lubricate the camshaft bearing caps with clean engine oil.

    Install the LH and RH camshaft bearing caps in their original locations.

    - Position the front camshaft bearing cap.
    - Position the remaining camshaft bearing caps.
    - Install the 20 bolts loosely.
    - Tighten to 10 Nm (89 lb-in) in the sequence shown.



22. *NOTICE:* **Damage to the camshaft phaser sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**

    NOTE: The RH and LH camshaft phaser sprockets are similar. Refer to the single timing mark to identify the RH camshaft phaser sprocket and the L timing mark to identify the LH camshaft phaser sprocket.

NOTE: LH shown, RH similar.

Install the camshaft phaser sprockets and new camshaft phaser bolts finger-tight.

23. ***NOTICE:*** **Damage to the camshaft phaser sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**

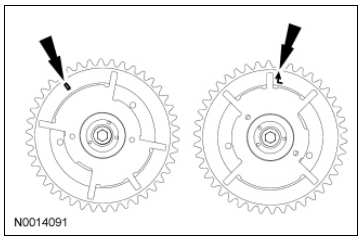
    NOTICE: **Only use hand tools to remove the camshaft phaser sprocket assembly or damage may occur to the camshaft or camshaft phaser unit.**

    NOTICE: **Damage to the camshaft phaser sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**

    NOTE: LH shown, RH similar.

    Using the Camshaft Phaser Sprocket Locking Tool, tighten the 2 camshaft phaser sprocket bolts in 2 stages.

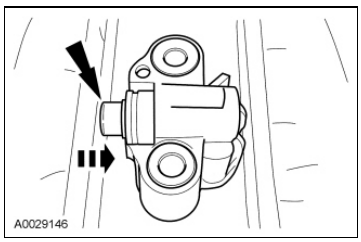
    - Stage 1: Tighten to 40 Nm (30 lb-ft).
    - Stage 2: Tighten an additional 90 degrees.



24. Install the crankshaft sprocket, making sure the flange faces forward.

25. Rotate the crankshaft to position the crankshaft sprocket timing mark in the 6 o'clock position.

26. Rotate the camshaft sprockets to position the RH camshaft sprocket timing mark in the 11 o'clock position and the LH camshaft sprocket timing mark in the 12 o'clock position.



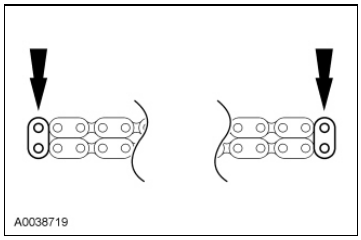
27. ***NOTICE:*** **If one or both tensioner mounting bolts are loosened or removed, the tensioner-sealing bead must be inspected for seal integrity. If cracks, tears, cuts or separation from the tensioner body, or permanent compression of the seal bead, is observed, install a new tensioner, or engine damage may occur.**

    Inspect the RH and LH timing chain tensioners.

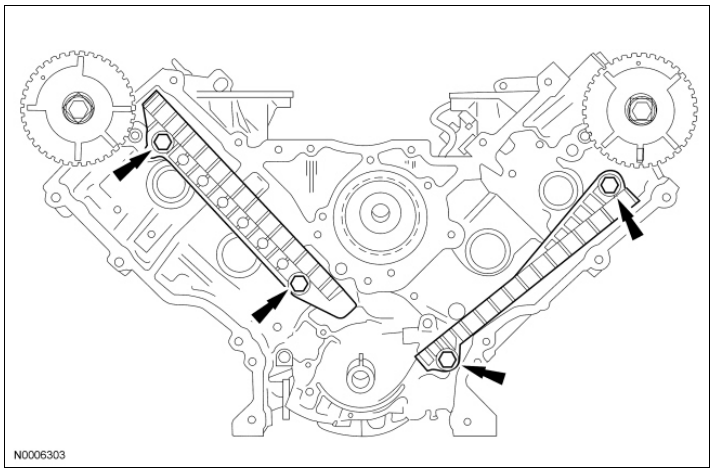
    - Install new tensioners, as necessary.

28. ***NOTICE:*** **Timing chain procedures must be followed exactly or damage to valves and pistons will result.**

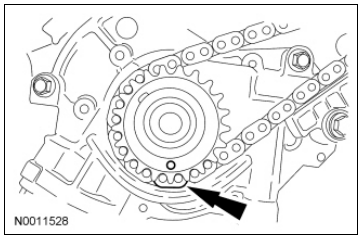
    Compress the tensioner plunger, using a vise.



29. Install a retaining clip on the tensioner to hold the plunger in during installation.

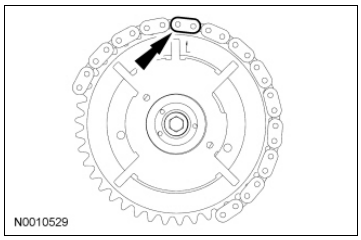


30. Remove the tensioner from the vise.



31. If the copper links are not visible, mark one link on one end and one link on the other end and use as timing marks.

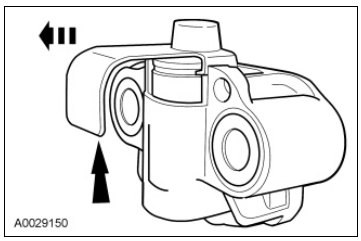
32. Install the LH and RH timing chain guides and the 4 bolts.
    - Tighten to 10 Nm (89 lb-in).



33. Position the lower end of the LH (inner) timing chain on the crankshaft sprocket, aligning the timing mark on the outer flange of the crankshaft sprocket with the single copper (marked) link on the chain.

34. **NOTE:** Make sure the upper half of the timing chain is below the tensioner arm dowel.

    Position the LH timing chain on the camshaft sprocket. Make sure the camshaft sprocket timing mark is aligned with the copper (marked) chain link.

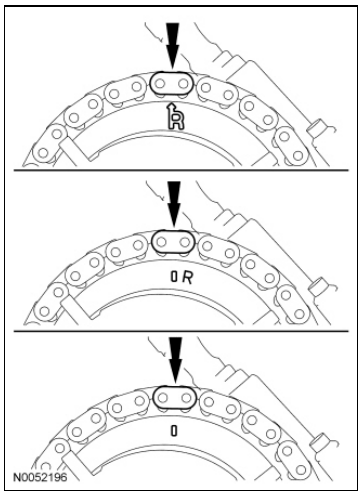


35. **NOTE:** The LH timing chain tensioner arm has a bump near the dowel hole for identification.

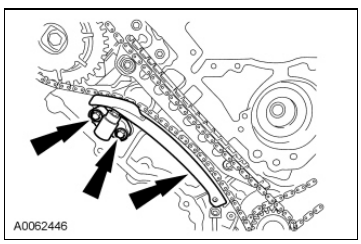
    Position the LH timing chain tensioner arm on the dowel pin and install the LH timing chain tensioner and 2 bolts.

    - Tighten to 25 Nm (18 lb-ft).

36. Remove the retaining clip from the LH timing chain tensioner.



37. Position the lower end of the RH (outer) timing chain on the crankshaft sprocket, aligning the timing mark on the sprocket with the single copper (marked) chain link.

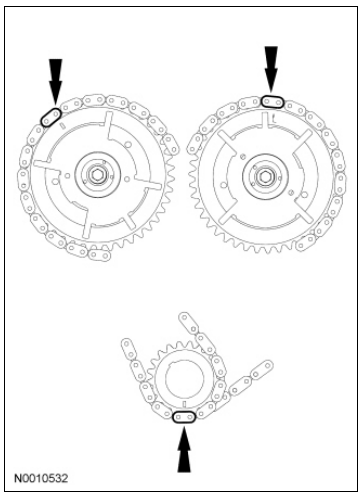


38. **NOTE:** The lower half of the timing chain must be positioned above the tensioner arm dowel.

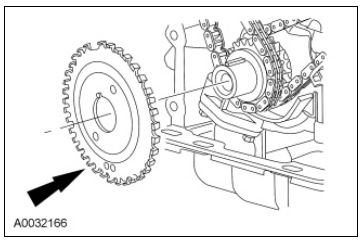
    NOTE: The camshaft phaser and sprocket will be stamped with one of the illustrated timing marks for the RH camshaft.

    Position the RH timing chain on the camshaft sprocket. Make sure the camshaft sprocket timing mark is aligned with the copper (marked) chain link.

39. Position the RH timing chain tensioner arm on the dowel pin and install the RH timing chain tensioner and 2 bolts.
    - Tighten to 25 Nm (18 lb-ft).

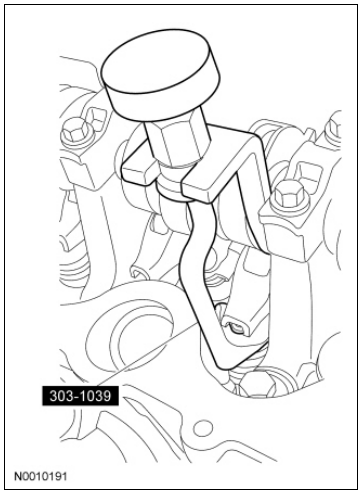


40. Remove the retaining clip from the RH timing chain tensioner.



41. **NOTE:** The RH and LH camshaft phaser sprockets are similar. Refer to the single timing mark to identify the RH camshaft phaser sprocket and the L timing mark to identify the LH camshaft phaser sprocket.

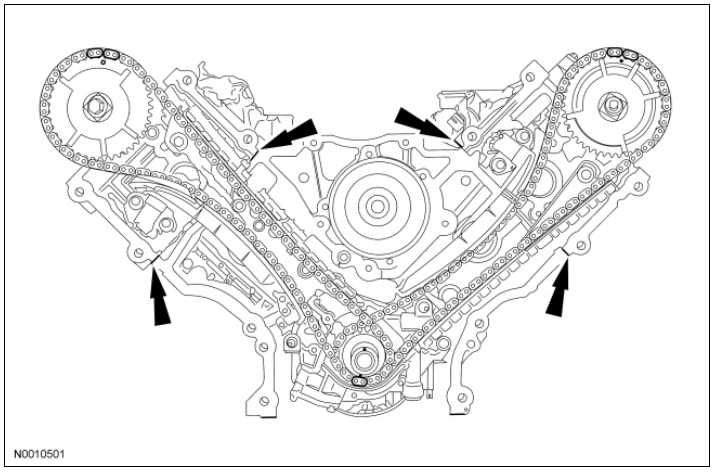
    As a post-check, verify correct alignment of all timing marks. Make sure the timing marks on the sprockets correspond to the above note.



42. Install the crankshaft sensor ring on the crankshaft.

43. **NOTE:** Lubricate the roller followers with clean engine oil prior to installation.

    Using the Valve Spring Compressor, install all of the camshaft roller followers.



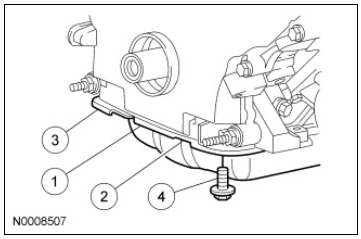
44. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

    NOTE: If the engine front cover is not secured within 4 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Follow the directions on the packaging. Failure to follow this procedure can cause future oil leakage.

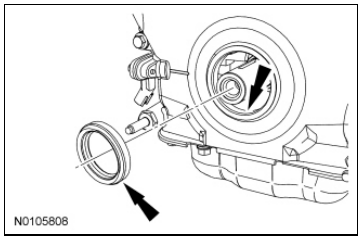
    NOTE: Make sure that the engine front cover gasket is in place on the engine front cover before installation.

    Apply a bead of silicone gasket and sealant along the cylinder head-to-cylinder block surface at the locations shown.

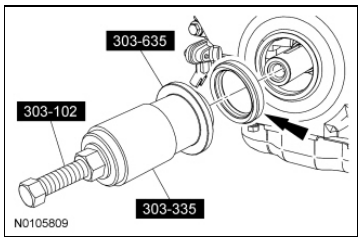
45. Install a new engine front cover gasket on the engine front cover. Position the engine front cover onto the dowels. Install the 15 fasteners finger-tight.



46. Tighten the 15 engine front cover fasteners in the sequence shown to 25 Nm (18 lb-ft).

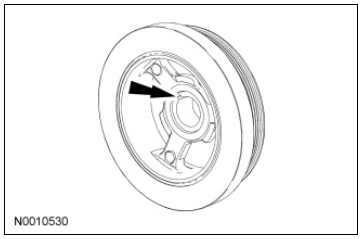


Item	Part Number	Description
1	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 53
2	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 53
3	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 53
4	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 53
5	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 53
6	W706508	Stud, Hex Shoulder Pilot, M8 x 1.25 x 50 - M6 x 1 x 10
7	N806300	Stud, Hex Shoulder Pilot, M8 x 1.25 x 1.25 x 91.1
8	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 53
9	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 53
10	N806177	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 53
11	N808294	Bolt, Hex Head Pilot, M8 x 1.25 x 53
12	N806300	Stud, Hex Shoulder Pilot, M8 x 1.25 x 1.25 x 91.1
13	N806300	Stud, Hex Shoulder Pilot, M8 x 1.25 x 1.25 x 91.1
14	N806300	Stud, Hex Shoulder Pilot, M8 x 1.25 x 1.25 x 91.1
15	N806300	Stud, Hex Shoulder Pilot, M8 x 1.25 x 1.25 x 91.1

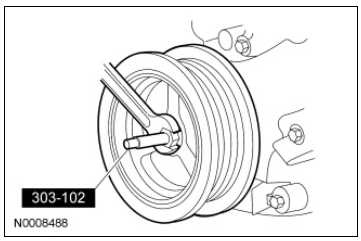


47. Loosely install the 4 bolts, then tighten the bolts in 2 stages, in the sequence shown.
    - Stage 1: Tighten to 20 Nm (177 lb-in).
    - Stage 2: Tighten an additional 60 degrees.

48. Lubricate the engine front cover and the crankshaft seal inner lip with clean engine oil.

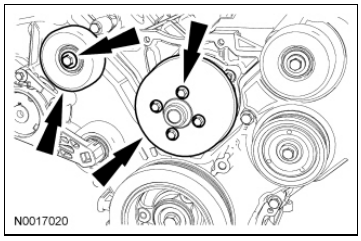


49. Using the Crankshaft Front Seal Installer, the Front Cover Seal Installer and the Crankshaft Vibration Damper Installer, install the crankshaft front oil seal into the engine front cover.



50. **NOTE:** If not secured within 4 minutes, the sealant must be removed and the sealing area cleaned with metal surface prep and silicone gasket remover. Allow to dry until there is no sign of wetness, or 4 minutes, whichever is longer. Failure to follow this procedure can cause future oil leakage.

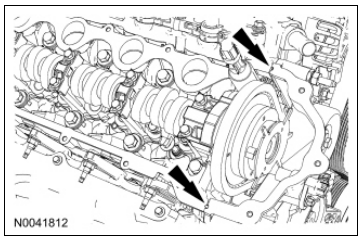
    Apply silicone gasket and sealant to the Woodruff key slot in the crankshaft pulley.



51. Using the Crankshaft Vibration Damper Installer, install the crankshaft pulley.

52. Using a new crankshaft pulley bolt, install the bolt and washer and tighten the bolt in 4 stages.
    - Stage 1: Tighten to 120 Nm (89 lb-ft).
    - Stage 2: Loosen 360 degrees.
    - Stage 3: Tighten to 50 Nm (37 lb-ft).
    - Stage 4: Tighten an additional 90 degrees.

53. Install the RH side accessory drive belt idler pulley, the coolant pump pulley and the 5 bolts.
    - Tighten to 25 Nm (18 lb-ft).



54. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

    Clean the valve cover mating surface with silicone gasket remover and metal surface prep. Follow the directions on the packaging.

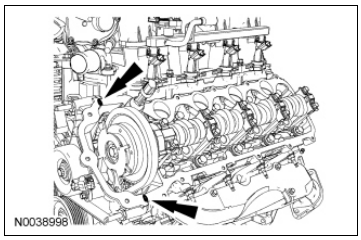
55. **NOTE:** If not secured within 4 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Follow the directions on the packaging. Failure to follow this procedure can cause future oil leakage.

    Apply silicone gasket and sealant in 2 places where the engine front cover meets the cylinder head.

56. ***NOTICE:*** **Install the valve cover carefully, or the Variable Camshaft Timing (VCT) solenoid may be damaged.**

    Position the RH valve cover and gasket on the cylinder head and tighten the 9 bolts in the sequence shown.

    - Tighten to 10 Nm (89 lb-in).

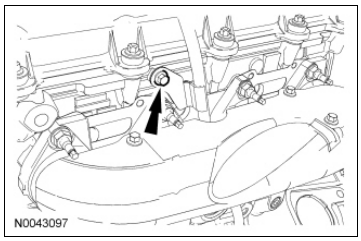


57. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

Clean the valve cover mating surface with silicone gasket remover and metal surface prep. Follow the directions on the packaging.

58. **NOTE:** If not secured within 4 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Follow the directions on the packaging. Failure to follow this procedure can cause future oil leakage.

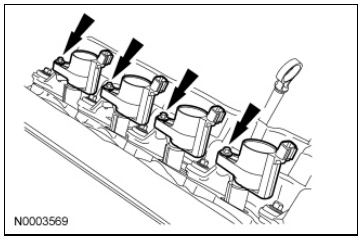
    Apply silicone gasket and sealant in 2 places where the engine front cover meets the cylinder head.



59. ***NOTICE:*** **Install the valve cover carefully, or the Variable Camshaft Timing (VCT) solenoid may be damaged.**

    Position the LH valve cover and gasket on the cylinder head and tighten the 10 bolts in the sequence shown.

    - Tighten to 10 Nm (89 lb-in).

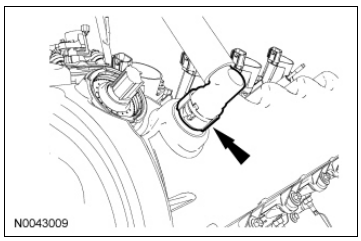


60. Position the oil level indicator tube and install the bolt.
    - Tighten to 10 Nm (89 lb-in).

61. **NOTE:** LH shown, RH similar.

    Install the 8 ignition coils and the 8 bolts.

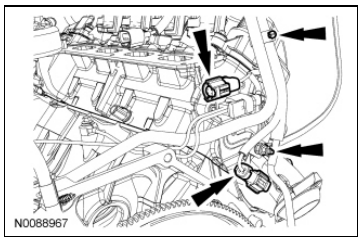
    - Tighten to 6 Nm (53 lb-in).



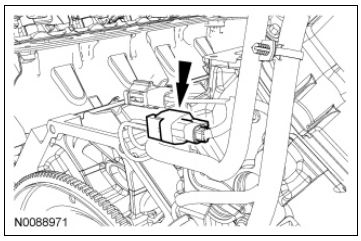
62. **NOTE:** Lubricate the oil filter gasket with clean engine oil.

    Install a new oil filter.

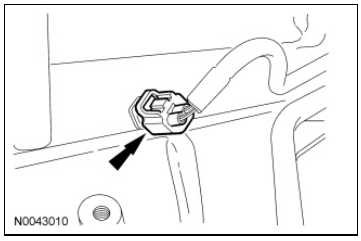
    - Tighten the oil filter until the gasket makes contact, then use an oil filter strap wrench to tighten the filter an additional 270 degrees.



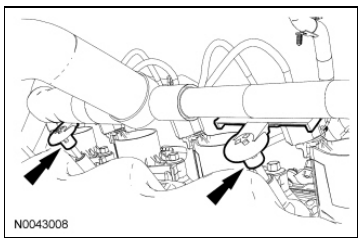
63. Connect the PCV hose to the LH valve cover.



64. Connect the breather tube to the RH valve cover.

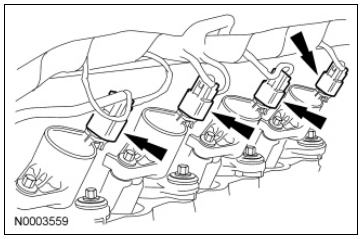


65. Position the engine wiring harness and attach the electrical connector and wiring harness retainers to the heater supply tube.

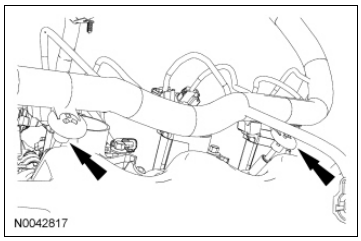


66. Connect the KS electrical connector.

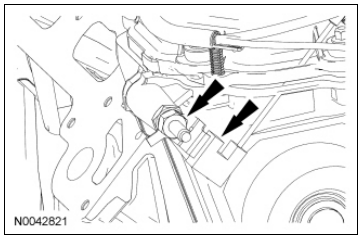
67. Connect the Cylinder Head Temperature (CHT) sensor electrical connector.



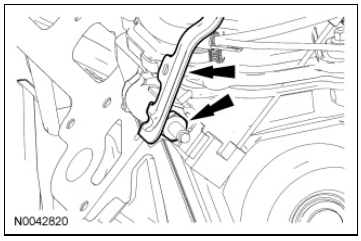
68. Attach the wiring harness retainers to the RH valve cover studs.



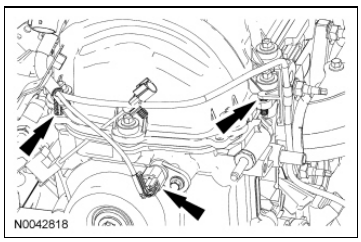
69. **NOTE:** RH shown, LH similar.



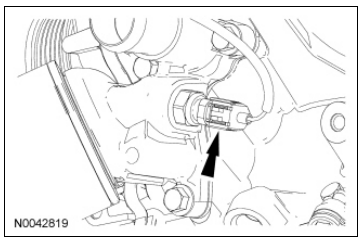
Connect the 4 RH and 4 LH ignition coil electrical connectors.



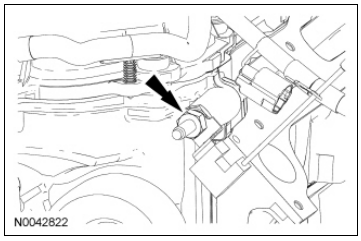
70. Attach the wiring harness retainers to the LH valve cover studs.



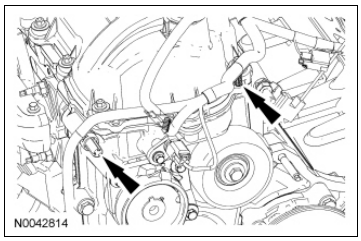
71. Position the LH radio interference capacitor and install the nut.
    - Tighten to 25 Nm (18 lb-ft).



72. Position the cooling fan wiring harness and install the nut.
    - Tighten to 25 Nm (18 lb-ft).

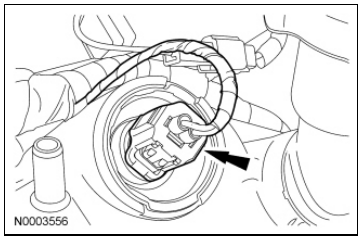


73. Connect the LH Camshaft Position (CMP) and attach the wiring harness retainers.

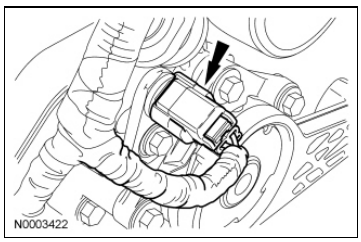


74. Connect the Engine Oil Pressure (EOP) sensor electrical connector.

75. Position the RH radio interference capacitor and install the nut.
    - Tighten to 25 Nm (18 lb-ft).

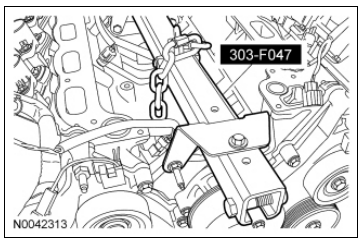


76. Attach the wiring harness retainers.



77. **NOTE:** RH shown, LH similar.

    Connect the RH and LH Variable Camshaft Timing (VCT) solenoid electrical connectors.



78. Connect the RH CMP sensor electrical connector.

79. Connect the Crankshaft Position (CKP) sensor electrical connector and attach the wiring harness retainer.

80. Install the Modular Engine Lift Bracket.

81. Using a suitable floor crane, remove the engine from the engine stand.

82. Install the engine. For additional information, refer to Engine in this section.

Engine Cooling

NOTICE: **All vehicles are filled with Motorcraft® Premium Gold Engine Coolant. Do not mix coolant types. Mixing coolant types degrades the coolant's corrosion protection.**

NOTE: If cooling system stop leak pellets are used, Motorcraft® Premium Gold Engine Coolant may darken from yellow to golden tan.

The engine cooling system consists of the following:

- Block heater
- Fan blade and clutch
- Fan shroud
- Coolant expansion tank
- Thermostat
- Thermostat housing assembly (4.0L SOHC)
- Coolant pump
- Radiator
- Radiator cap
- Radiator hose
- Heater tube assembly (4.0L SOHC)

The radiator allows excess engine heat to be transferred to the air.

The coolant pump forces coolant to flow through the cooling system.

The thermostat is a control valve actuated by coolant temperature. When the thermostat is closed, coolant flow bypasses the radiator circuit and returns to the coolant pump. When the thermostat is opened, coolant is allowed to flow through the radiator circuit in order to transfer engine generated heat to the outside air.

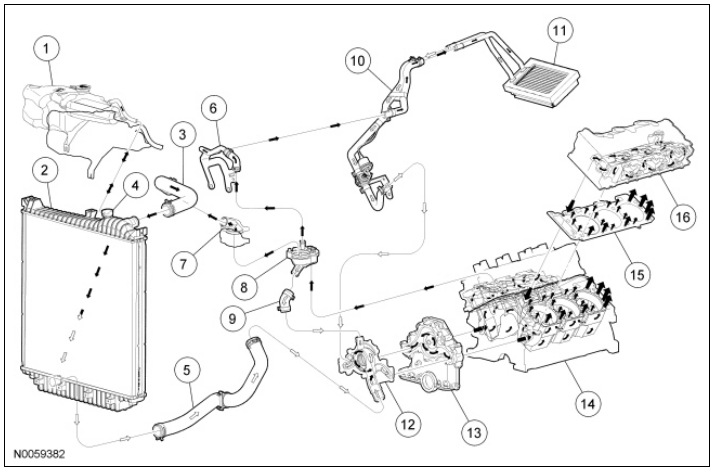
The radiator cap serves as the location for filling the cooling system and provides for a controlled pressure in the cooling system. When the pressure reaches a predetermined level, a valve in the radiator cap opens to allow coolant to flow into the coolant expansion tank. As the engine cools, a valve in the radiator cap allows for coolant to flow from the coolant expansion tank back into the radiator.

The coolant expansion tank holds surplus coolant, allows for coolant expansion and replenishes coolant to the cooling system. It is equipped with a non-pressurized cap which allows coolant to be added to keep it filled to prescribed levels.

The electronically controlled fan clutch is controlled by the PCM based upon requests for airflow to cool the engine, transmission and A/C condenser. If no cooling is required, the electronics permit the fan to spin at a slower speed yielding improved fuel economy.

The optional block heater keeps the engine coolant warm during cold weather. The electrical heating element is installed in a core plug opening and uses a standard 110V electrical supply.

Engine coolant provides freeze protection, boil protection, cooling efficiency and corrosion protection to the engine and cooling components. In order to obtain these protections, the engine coolant must be maintained at the correct concentration and fluid level in the coolant expansion tank.

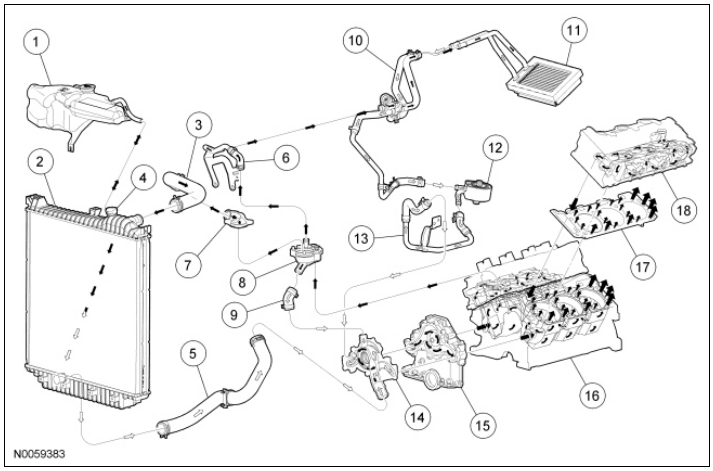


When adding engine coolant, use a 50/50 mixture of engine coolant and distilled water.

To maintain the integrity of the coolant and the cooling system:

- add Motorcraft® Premium Gold Engine Coolant. Do not mix coolant types.
- do not add orange-colored Motorcraft® Specialty Orange Engine Coolant. Mixing coolants may degrade the coolant's protection rating.
- do not add alcohol or methanol or any engine coolants mixed with alcohol or methanol antifreeze. These can cause engine damage from overheating or freezing.
- do not mix with recycled coolant. Use of such a coolant may harm the engine and cooling system components.

Coolant Flow Diagram, 4.0 SOHC Without Oil Cooler and Without Auxiliary Heater



NOTE: Black arrows indicate hot, white arrows indicate cold.

Item	Part Number	Description

Material

Item	Specification
MotorcraftÂ® Premium Gold Engine Coolant VC-7-B (US); CVC-7-B (Canada)	WSS-M97B51-A1

Principles of Operation

Engine coolant flows primarily from the engine to the radiator circuit and back to the coolant pump. From the coolant pump, coolant is sent through the engine block and cylinder heads. A separate circuit from the engine also feeds the heater core with coolant. The coolant pump is operated by engine rotation through a pulley which is driven by the accessory drive belt to circulate the coolant. The coolant thermostat is a control valve actuated by coolant temperature. When the thermostat is closed, coolant flow bypasses the radiator circuit and returns to the coolant pump. When the thermostat is opened, coolant is allowed to flow through the radiator circuit in order to transfer engine generated heat to the outside air.

The coolant expansion tank holds surplus coolant, allows for coolant expansion and replenishes coolant to the cooling system. It is equipped with a non-pressurized cap which allows coolant to be added to the tank to keep it filled to prescribed levels.

The cooling fan draws air through the radiator to help cool the system coolant as it passes through the radiator.

The thermostat monitor is a function of the PCM and is designed to verify correct thermostat operation. The monitor will be executed once per drive cycle and has a monitor run duration of 300-800 seconds. If a malfunction occurs, DTC P0125 or P0128 is set, and the Malfunction Indicator Lamp (MIL) will be illuminated.

For engine specific information, refer to Engine Cooling in the Description and Operation portion of this

section.

Inspection and Verification

⚠ WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.

NOTICE: **The engine cooling system is filled with MotorcraftÂ® Premium Gold Engine Coolant. Do not mix coolant types. Mixing coolant types degrades the corrosion protection of MotorcraftÂ® Premium Gold Engine Coolant. Failure to follow these instructions may result in engine or cooling system damage.**

1. Verify the customer concern.
2. Visually check the engine coolant level at the coolant expansion tank when the system is cold.
3. Make sure the pressure relief cap is installed correctly.
4. Record any cooling system DTCs retrieved. Refer to the PCM DTC Chart in this section for DTC descriptions.
5. **NOTE:** Take note of any coolant odor or steam coming from cooling system components.

   If the system coolant is filled correctly and no DTCs associated with fail-safe cooling are retrieved, verify the customer's concern by operating the engine to duplicate the condition.
6. **NOTE:** Refer to the coolant flow diagram in the Description and Operation Engine Cooling portion of this section.

   Inspect to determine if any of the following mechanical or electrical concerns apply.

Visual Inspection Chart

Mechanical	Electrical
• Leaks or weeps at: ♦ Hoses ♦ Tubes ♦ Clamp joints ♦ Gaskets ♦ O-rings ♦ Thermostat housing ♦ Radiator ♦ Pressure relief cap ♦ Coolant pump ♦ Heater core (wet floor or coolant odor in vehicle) ♦ Heater control valve	• Inoperative or damaged: ♦ Electronically actuated fan clutch ♦ Electronically actuated fan clutch controller ♦ Wiring, connectors, relays or modules ♦ Engine Coolant Temperature (ECT) sensor (4.0L SOHC) ♦ Cylinder Head Temperature (CHT) sensor (4.6L [3V]) ♦ Mass Air Flow (MAF) sensor ♦ Vehicle Speed Sensor (VSS)

♦ Coolant crossover manifold assembly (4.6L [3V]) ♦ Oil cooler ♦ Coolant expansion tank ♦ Cylinder block core plugs ♦ Cylinder head core plugs ♦ Block heater (if equipped)	

Visual Inspection Chart

Mechanical	Electrical
• Cracked or damaged: ♦ Hoses ♦ Tubes ♦ Hose clamps ♦ Heater control valve ♦ Thermostat housing ♦ Radiator ♦ Pressure relief cap ♦ Cooling fan ♦ Fan clutch ♦ Coolant pump ♦ Coolant expansion tank ♦ Oil cooler ♦ Coolant crossover manifold assembly (4.6L [3V]) ♦ Cylinder block core plugs ♦ Cylinder head core plugs ♦ Block heater (if equipped) • Restricted airflow through the A/C condenser/radiator • Drive belt loose, worn or installed incorrectly • Broken or weak drive belt tensioner • Excessive white or light gray exhaust smoke (may have burnt coolant odor) • Coolant in engine oil • Engine oil in coolant • Coolant in automatic transmission fluid • Automatic transmission fluid in coolant	â

7. If the inspection reveals an obvious concern that can be readily identified, repair it as necessary. Test the system for normal operation.

8. Inspect the coolant condition in the following sequence:
    1. Inspect the coolant color.
        - ♦ If MotorcraftÂ® Premium Gold Engine Coolant has a clear or pale yellow color, this indicates higher water content than required. Test the engine coolant freezing point range with the Coolant/Battery Refractometer. The freezing point should be in the range -45Â°C to -23Â°C (-49Â°F to -9Â°F). If the vehicle is driven in cold climates less than -36Â°C (-33Â°F), it may be necessary to increase the coolant concentration to get adequate freeze protection. Recommended coolant concentration is 50/50

ethylene glycol to distilled water.
- A pale green color indicates incorrect coolant (green in color) may have been added to the system. Use of incorrect (green in color) coolant degrades the corrosion protection of MotorcraftÂ® Premium Gold Engine Coolant. Flush the system and refill with the correct mixture of distilled water and MotorcraftÂ® Premium Gold Engine Coolant.
- **NOTE:** If cooling system stop leak pellets are used, MotorcraftÂ® Premium Gold Engine Coolant may darken from yellow to golden tan.

  Dark brown could indicate a commercially available stop leak may have been used. Flush the system and refill with the correct mixture of distilled water and MotorcraftÂ® Premium Gold Engine Coolant.
- A light or reddish brown color indicates that rust may be present in the cooling system. Flush the system and refill with the correct mixture of distilled water and MotorcraftÂ® Premium Gold Engine Coolant.
- An iridescent sheen on top of the coolant could indicate a trace of oil is entering the system. For information on engine diagnosis, refer to Section 303-00 .
- A milky brown color may indicate that engine oil is entering the cooling system. Pressure test the cooling system. Refer to component tests in this section. If engine oil is suspected, the cause of the leak may be internal to the engine. Refer to Section 303-00 .
- A red, orange or light green colored sheen on top of the coolant may indicate that transmission fluid is entering the cooling system. The cause may be a leaky radiator. Pressure test the cooling system. Refer to the component tests in this section.

2. If the engine coolant appearance is acceptable, test the engine coolant freezing point range with the Coolant/Battery Refractometer. The freezing point should be in the range -45Â°C to -23Â°C (-49Â°F to -9Â°F). If the vehicle is driven in cold climates less than -36Â°C (-33Â°F), it may be necessary to increase the coolant concentration to get adequate freeze protection. Recommended coolant concentration is 50/50 ethylene glycol to distilled water.
   - Maximum coolant concentration is 60/40 for cold weather areas.
   - Minimum coolant concentration is 40/60 for warm weather areas.
3. Adjust coolant range and level if necessary:
   - If coolant is low, add specified coolant mixture only.
   - If the engine coolant tests too weak, remove some of the engine coolant and add undiluted engine coolant until the readings are within acceptable levels.
   - If the engine coolant tests strong, remove some of the engine coolant and add distilled water until the readings are within acceptable levels.

9. If an obvious cause for an observed or reported concern is found, correct the cause and test the system for normal operation before proceeding to the next step.

10. **NOTE:** Make sure to use the latest scan tool software release.

    If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

11. **NOTE:** The Vehicle Communication Module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM .

    If the scan tool does not communicate with the VCM :

    - check the VCM connection to the vehicle.
    - check the scan tool connection to the VCM .
    - refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

12. If the scan tool does not communicate with the vehicle:
    - verify the ignition key is in the ON position.
    - verify the scan tool operation with a known good vehicle.
    - refer to Section 418-00 to diagnose no response from the PCM.

13. Carry out the network test.
    - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
    - If the network test passes, retrieve and record continuous memory DTCs.

14. Clear the continuous DTCs and carry out the self-test diagnostics PCM.

15. If the DTCs recovered are related to the concern, go to the PCM DTC Chart. For all other DTCs, refer to Section 419-10 .

16. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

DTC Charts

Symptom Chart

Pinpoint Tests

Pinpoint Test A: Loss of Coolant

Normal Operation

The engine cooling system is a closed system that provides for coolant expansion and contraction and also changes in pressure as coolant warms and cools with engine operation. Various gaskets, seals, hoses and clamps are used to contain coolant within the cooling system and keep other fluids and contaminants from entering the cooling system.

Coolant loss can be attributed to either external or internal leaks anywhere within the cooling system.

For vehicle/engine specific information, refer to Engine Cooling in the Description and Operation portion of this section.

This pinpoint test is intended to diagnose the following:

- Coolant hoses or tubes
- Hose clamps
- Thermostat O-ring seal or gasket
- Coolant pump O-ring seal or gasket
- Thermostat housing
- Heater control valve
- Radiator
- Transmission fluid cooler (in radiator)
- Pressure relief cap
- Coolant pump leaking from weep hole
- Heater core
- Coolant crossover manifold assembly (4.6L [3V])
- Engine gaskets
- Oil cooler
- Coolant expansion tank
- Cylinder block core plugs
- Cylinder head core plugs
- Block heater (if equipped)
- Engine Coolant Temperature (ECT) sensor (4.0L SOHC)

PINPOINT TEST A: LOSS OF COOLANT

⚠ **WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.**

Test Step	Result / Action to Take
A1 CARRY OUT INSPECTION AND VERIFICATION	
• Carry out the Inspection and Verification procedure in this section. • **Were any concerns found?**	**Yes** REPAIR as needed. TEST the system for normal operation. **No** GO to A2 .
A2 CHECK THE ENGINE COOLANT LEVEL	
	Yes GO to A3 .

NOTE: Allow the engine to cool before checking the engine coolant level. • Ignition OFF. • Visually inspect the engine coolant level at the coolant expansion tank. • **Is the engine coolant level within specifications?**	**No** ADJUST the engine coolant level as necessary. GO to A3 .
A3 PRESSURE TEST THE ENGINE COOLING SYSTEM	
• Pressure test the engine cooling system. Refer to Component Tests, Cooling System Pressure Test in this section. • **Does the engine cooling system leak externally?**	**Yes** REPAIR or INSTALL new components. TEST the system for normal operation. **No** GO to A4 .
A4 CHECK THE PRESSURE RELIEF CAP	
• Carry out the pressure relief cap pressure test. Refer to Component Test, Pressure Relief Cap Pressure Test in this section. • **Is the pressure relief cap OK?**	**Yes** GO to A5 . **No** INSTALL a new pressure relief cap. TEST the system for normal operation.
A5 CHECK THE ENGINE COOLANT FOR AN INTERNAL LEAK	
• Inspect the engine coolant in the coolant expansion tank for signs of engine oil or transmission fluid. • **Is engine oil or transmission fluid evident in the coolant?**	**Yes** If engine oil is evident, GO to Section 303-00 for engine diagnosis. If transmission fluid is evident, INSTALL a new radiator. REPAIR the transmission as necessary. Refer to the appropriate section in Group 307 for the procedure. TEST the system for normal operation. **No** GO to A6 .
A6 CHECK THE ENGINE OIL AND TRANSMISSION FLUID FOR COOLANT	
• Remove the oil level indicators from the engine and the transmission. • **Is coolant evident in the oil or transmission fluid?**	**Yes** If coolant is in the engine oil, GO to Section 303-00 . If coolant is in the transmission fluid, INSTALL a new radiator. REPAIR the transmission as necessary. Refer to the appropriate section in Group 307 for the procedure. **No** GO to A7 .
A7 CHECK THE COOLING SYSTEM FOR COMBUSTION GASES	

• **NOTE:** Use UViewÂ® Combustion Leak Tester part number UVU560000-R or equivalent. • Using a cooling system combustion gas leak tester, following the instructions supplied with the tester, check the coolant for combustion gases. • **Are combustion gases present?**	**Yes** GO to Section 303-00 for engine diagnosis. **No** The cooling system is operational.

Pinpoint Test B: The Engine Overheats

Normal Operation

The engine cooling system functions to maintain engine temperatures during operation. Correct coolant flow through the engine, radiator and remainder of cooling system passages and components is essential to maintaining a correct engine temperature.

Engine coolant flows primarily from the engine to the radiator circuit and back to the coolant pump. From the coolant pump, coolant is sent through the engine block and cylinder heads. A separate circuit from the engine also feeds the heater core with coolant. The coolant pump is operated by engine rotation through a pulley which is driven by the accessory drive belt to circulate the coolant. The coolant thermostat is a control valve actuated by coolant temperature. When the thermostat is closed, coolant flow bypasses the radiator circuit and returns to the coolant pump. When the thermostat is opened, coolant is allowed to flow through the radiator circuit in order to transfer engine generated heat to the outside air.

Engine overheating generally occurs when there is a disruption in the ability to control either coolant flow at the correct rate, the inability to transfer heat from the engine through the coolant (including low coolant) or an inability to transfer engine generated heat to the outside air through the radiator.

For engine specific information, refer to Engine Cooling in the Description and Operation portion of this section.

- DTC P0217 (Engine Coolant Overtemperature Condition) â Indicates an engine overheat condition was detected by the engine temperature sensor Cylinder Head Temperature (CHT) sensor [4.6L (3V)] or Engine Coolant Temperature (ECT) sensor [4.0L SOHC]).
- DTC P1285 (Cylinder Head Overtemperature Condition) â Indicates an engine overheat condition was sensed by the CHT sensor.
- DTC P1299 (Cylinder Head Overtemperature Protection Active) â Indicates an engine overheat condition was detected by the CHT sensor. A failure mode effects management strategy called fail-safe cooling was activated to cool the engine.

This pinpoint test is intended to diagnose the following:

- Low coolant level
- External engine coolant leak
- Airlock in system
- Pressure relief cap installation
- Restricted airflow through the A/C condenser/radiator
- Internal engine coolant leak
- Coolant condition/concentration
- Accessory drive components
- Non-OEM engine enhancement components

- Cooling fan blade
- Cooling fan clutch
- ECT indicator system (gauge)
- ECT sensor (4.0L SOHC)
- CHT sensor (4.6L [3V])
- Heater core
- Coolant pump
- Coolant flow restriction

PINPOINT TEST B: THE ENGINE OVERHEATS

⚠ WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.

Test Step	Result / Action to Take
B1 CARRY OUT INSPECTION AND VERIFICATION	
• Carry out the Inspection and Verification procedure in this section. • **Were any concerns found?**	**Yes** REPAIR as needed. TEST the system for normal operation. **No** GO to B2 .
B2 CHECK FOR DTCs	
• Check for DTC P0217, P1285 or P1299. • **Is DTC P0217, P1285 or P1299 present?**	**Yes** GO to B3 . **No** Actual engine overheating has not been verified. CHECK the ECT gauge operation. REFER to Section 413-01 . If any other DTCs are retrieved, REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
B3 CHECK FOR AN AIRFLOW OBSTRUCTION	
• Check the radiator or A/C condenser for an external obstruction such as leaves or cardboard. • **Is an obstruction present?**	**Yes** REMOVE the obstruction. TEST the system for normal operation. **No** GO to B4 .
B4 CHECK THE ENGINE COOLANT LEVEL	
NOTE: Allow the engine to cool before checking the coolant level. • Ignition OFF.	**Yes** GO to B5 . **No** ADJUST the engine coolant level as necessary. GO

• Visually check the engine coolant level in the coolant expansion tank. • **Is the engine coolant level within specification?**	to B5 .
B5 PRESSURE TEST THE ENGINE COOLING SYSTEM	
• Pressure test the engine cooling system. Refer to Component Tests, Cooling System Pressure Test in this section. • **Does the engine cooling system leak externally?**	**Yes** REPAIR or INSTALL new components. TEST the system for normal operation. **No** GO to B6 .
B6 CHECK THE PRESSURE RELIEF CAP	
• Carry out the pressure relief cap pressure test. Refer to Component Test, Pressure Relief Cap Pressure Test in this section. • **Is the pressure relief cap OK?**	**Yes** GO to B7 . **No** INSTALL a new pressure relief cap. TEST the system for normal operation.
B7 CHECK THE ENGINE COOLANT FOR AN INTERNAL LEAK	
• Inspect the engine coolant in the coolant expansion tank for signs of engine oil or transmission fluid. • **Is engine oil or transmission fluid evident in the coolant?**	**Yes** If engine oil is evident, GO to Section 303-00 for engine diagnosis. If transmission fluid is evident, INSTALL a new radiator. REPAIR the transmission as necessary. Refer to the appropriate section in Group 307 for the procedure. TEST the system for normal operation. **No** GO to B8 .
B8 CHECK THE ENGINE OIL AND TRANSMISSION FLUID FOR COOLANT	
• Remove the oil level indicators from the engine and the transmission. • **Is coolant evident in the oil or transmission fluid?**	**Yes** If coolant is in the engine oil, GO to Section 303-00 . If coolant is in the transmission fluid, INSTALL a new radiator. REPAIR the transmission as necessary. Refer to the appropriate section in Group 307 for the procedure. **No** GO to B9 .
B9 CHECK THE COOLING SYSTEM FOR COMBUSTION GASES	
• **NOTE:** Use UViewÂ® Combustion Leak Tester part number UVU560000-R or equivalent. • Using a cooling system combustion gas leak tester, following the instructions supplied with the tester, check the coolant for combustion gases.	**Yes** GO to Section 303-00 for engine diagnosis. **No** GO to B10 .

• **Are combustion gases present?**	
B10 CHECK COOLANT CONDITION	
• Check the coolant for dirt, rust or contamination and check the coolant concentration. • **Is the coolant condition OK?**	**Yes** GO to B11 . **No** FLUSH the engine cooling system. REFER to Cooling System Flushing in this section. TEST the system for normal operation.
B11 CHECK THE COOLING FAN OPERATION	
• Ignition OFF. • Check the cooling fan operation. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. • **Is the cooling fan operation OK?**	**Yes** GO to B12 . **No** INSTALL a new fan clutch. TEST the system for normal operation.
B12 CHECK THE COOLANT PUMP OPERATION	
• Start the engine. • Allow the engine to run for 10 minutes. Place the climate control function selector in the MAX HEAT position. Feel the heater outlet hose. • **Is the heater outlet hose hot?**	**Yes** GO to B13 . **No** INSTALL a new coolant pump. TEST the system for normal operation.
B13 CHECK THE THERMOSTAT OPERATION	
• Start the engine. • Allow the engine to run for 10 minutes. Feel the upper radiator hose. • **Is the upper radiator hose hot?**	**Yes** CHECK the Engine Coolant Temperature (ECT) gauge operation. REFER to Section 413-01 . **No** GO to B14 .
B14 VISUALLY INSPECT THE THERMOSTAT	
• Carry out the Thermostat Visual Inspection in the Component Tests portion of this section. • **Is the thermostat damaged?**	**Yes** INSTALL a new thermostat. TEST the system for normal operation. **No** INSTALL a new thermostat. TEST the system for normal operation. If the engine still overheats, INSTALL a new radiator. TEST the system for normal operation.

Pinpoint Test C: The Engine Does Not Reach Normal Operating Temperature

Normal Operation

The engine cooling system functions to maintain engine temperatures during operation. Correct coolant flow through the engine, radiator and remainder of cooling system passages and components is essential to maintaining a correct engine temperature.

Engine coolant flows primarily from the engine to the radiator circuit and back to the coolant pump. From the coolant pump, coolant is sent through the engine block and cylinder heads. A separate circuit from the engine also feeds the heater core with coolant. The coolant pump is operated by engine rotation through a pulley which is driven by the accessory drive belt to circulate the coolant. The coolant thermostat is a control valve actuated by coolant temperature. When the thermostat is closed, coolant flow bypasses the radiator circuit and returns to the coolant pump. When the thermostat is opened, coolant is allowed to flow through the radiator circuit in order to transfer engine generated heat to the outside air.

Concerns of engine inability to reach normal operating temperature typically occur when the rate of coolant flow through some coolant circuits (radiator, heater core) is more than expected given the conditions or the fan clutch is always engaged. Heat is not allowed to build in the engine because a heat exchanger is removing too much heat, including the radiator, heater core and oil cooler. In addition, perceived concerns that the engine does not reach normal operating temperature can be related to a low coolant level or trapped air which does not allow for hot coolant to be available at the heater core, an inoperative climate control system, or for concerns perceived or related to an incorrect engine temperature gauge indication.

For engine specific information, refer to Engine Cooling in the Description and Operation portion of this section.

- DTC P0125 (Insufficient Coolant Temp for Closed Loop Fuel Control) â Indicates the Engine Coolant Temperature (ECT) sensor (4.0L SOHC) or the Cylinder Head Temperature (CHT) sensor (4.6L [3V]) has not achieved the required temperature level to enter closed loop operating conditions within a specified amount of time after starting the engine.
- DTC P0128 (Coolant Thermostat (Coolant Temp Below Thermostat Regulating Temperature)) â Indicates the thermostat monitor has not achieved the required engine operating temperature within a specified amount of time after starting the engine.

This pinpoint test is intended to diagnose the following:

- Low coolant level
- Thermostat
- Engine Coolant Temperature (ECT) indicator system (gauge)
- Engine cooling fan

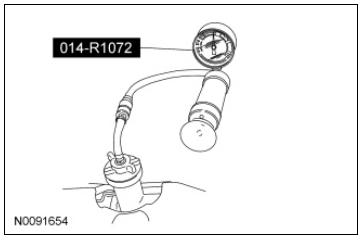
PINPOINT TEST C: THE ENGINE DOES NOT REACH NORMAL OPERATING TEMPERATURE

⚠ WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.

Test Step	Result / Action to Take
C1 CARRY OUT INSPECTION AND VERIFICATION	
	Yes REPAIR as needed. TEST the system for normal operation.

• Carry out the Inspection and Verification procedure in this section. • **Were any concerns found?**	**No** GO to C2 .
C2 CHECK FOR DTC P0125 or P0128	
• Check for DTC P0125 or P0128. • **Is DTC P0125 or P0128 present?**	**Yes** GO to C3 . **No** The cooling system is operational. If an inoperative engine coolant temperature gauge is suspected, CHECK the engine coolant temperature gauge operation. REFER to Section 413-01 . If an inoperative climate control system is suspected, CHECK the climate control system operation. REFER to Section 412-00 . If any other DTCs are retrieved, REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
C3 CHECK THE COOLING FAN OPERATION	
• Check the cooling fan clutch operation. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. • **Is the cooling fan clutch OK?**	**Yes** GO to C4 . **No** INSTALL a new cooling fan clutch. TEST the system for normal operation.
C4 CHECK THE COOLANT LEVEL	
• **NOTE:** Allow the engine to cool before checking the coolant level. • Visually check the engine coolant level in the coolant expansion tank. • **Is the engine coolant level within specification?**	**Yes** INSTALL a new thermostat. TEST the system for normal operation. **No** GO to Pinpoint Test A to diagnose a coolant leak.

Component Tests



Coolant System Pressure Test

⚠ WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system

is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.

1. Turn the engine OFF.

2. Remove the pressure relief cap. Top off the radiator as needed.

3. Fit the Radiator/Heater Core Pressure Tester from the Pressure Test Kit to the radiator fill neck using the correct adapter.

4. ***NOTICE:*** **Do not pressurize the cooling system beyond the maximum pressure listed in the specification table in this section or cooling system components may be damaged.**

   NOTE: If the plunger of the Pressure Test Kit is depressed too fast, an incorrect pressure reading will result.

   Pump the cooling system to the maximum allowed pressure and hold for 2 minutes. If the pressure drops within this time, inspect for leaks and repair as necessary.

5. If no leaks are found and the pressure drops, the leak may be internal to the radiator transmission cooler. Inspect the coolant for transmission fluid and the transmission fluid for coolant. Repair as necessary.

6. If there is no contamination of the coolant or transmission fluid, the leak may be internal to the engine. Inspect the coolant for engine oil and the engine oil for coolant. Refer to Section 303-00 to diagnose the engine.

Cap

1. Inspect the pressure relief cap and seals for damage or deterioration. Install a new pressure relief cap if necessary.

2. Fit the pressure relief cap to the Pressure Test Kit using the correct adapter.

3. **NOTE:** If the plunger of the pressure tester is depressed too fast, an incorrect pressure reading will result.

   Slowly pump the Pressure Test Kit until the pressure gauge stops increasing and note the highest pressure reading. Release the pressure and repeat the test. Install a new pressure relief cap if the pressure is not within specification. Refer to the Specifications.

Thermostat

A new thermostat should be installed only after the following tests and checks have been carried out:

- Pinpoint Test A, B or C
- Thermostat Visual Inspection

Thermostat Visual Inspection

1. Remove the thermostat.

2. Examine the thermostat for signs of damage including:
    - Valve not fully seated (light visible through the valve)
    - Foreign material lodged in the main valve
    - Bent or broken frame or flange
    - Bent or broken spring
    - Bent or broken valve or valve stem
    - Wax leaking from wax reservoir or a bulge in the reservoir
    - Any other damage or distortion

3. **NOTE:** If no damage is found during the inspection, do not attempt to open the thermostat using hot water or other heat sources. This method is not an accurate means to test the function of the thermostat and may damage the thermostat.

   If damage is found during the inspection, remove any foreign material or broken pieces and install a new thermostat.

4. If no damage is found during the inspection, continue troubleshooting the system concern. Go to the Symptom Chart for further instructions.

Radiator Leak Test, Removed From Vehicle

NOTICE: **Never leak test an aluminum radiator in the same water that copper/brass radiators are tested in. Flux and caustic cleaners may be present in the cleaning tank and they will damage aluminum radiators.**

NOTE: Always install plugs in the oil cooler fittings before leak testing or cleaning any radiator.

NOTE: Clean the radiator before leak testing to avoid contamination of tank.

1. Leak test the radiator in clean water with pressurized air to the maximum pressure listed in specifications.

Cooling System Draining, Filling and Bleeding

Special Tool(s)

 ST2818-A	RADIATOR REFILLER 078-00592

Material

Item	Specification
Motorcraft® Premium Gold Engine Coolant VC-7-B (US); CVC-7-B (Canada)	WSS-M97B51-A1

Draining

⚠ **WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.**

NOTICE: **The coolant must be recovered in a suitable, clean container for reuse. If the coolant is contaminated, it must be recycled or disposed of correctly. The use of contaminated coolant may damage the cooling system.**

NOTICE: **All vehicles are filled with Motorcraft® Premium Gold Engine Coolant. Do not mix coolant types. Mixing coolant types may degrade the coolant's corrosion protection.**

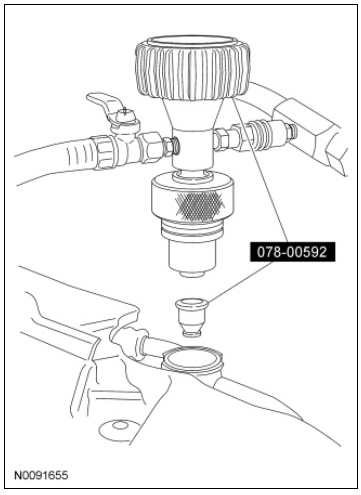
NOTE: If cooling system stop leak pellets are used, Motorcraft® Premium Gold Engine Coolant may darken from yellow to golden tan.

NOTE: Less than 80 percent of the coolant capacity can be recovered with the engine in the vehicle. Dirty, rusty or contaminated coolant requires replacement.

1. Make sure the engine is cool.
2. Wrap a thick cloth around the radiator cap. Slowly turn the cap counterclockwise (left) until the pressure begins to release.
3. Step back while the pressure releases.
4. When you are sure all the pressure has been released, use the cloth to turn and remove the cap.
5. Place a suitable container below the radiator draincock. Drain the coolant.
    - Tighten the radiator draincock when finished.

Filling and Bleeding with RADIATOR REFILLER

NOTICE: **All air must be removed from the cooling system. Failure to remove all the air from the cooling system may result in engine damage.**



NOTICE: **Turn the radiator cap clockwise until it stops (approximately 135 degrees). Failure to tighten the radiator cap may result in engine damage.**

NOTE: Engine coolant provides freeze protection, boil protection, cooling efficiency and corrosion protection to the engine and cooling components. In order to obtain these protections, the engine coolant must be maintained at the correct concentration and fluid level.

To maintain the integrity of the coolant and the cooling system:

- Add Motorcraft® Premium Gold Engine Coolant. Always fill the cooling system with the same type of coolant that was drained from the system. Do not mix coolant types.
- Do not add orange-colored Motorcraft® Specialty Orange Engine Coolant. Mixing coolants may degrade the coolant's corrosion protection.
- Do not add alcohol, methanol or brine, or any engine coolants mixed with alcohol or methanol antifreeze. These can cause engine damage from overheating or freezing.
- Do not mix with recycled coolant. Use of such coolants may harm the engine and cooling system components.

1. Connect the RADIATOR REFILLER body and the appropriate rubber adapter to the radiator.

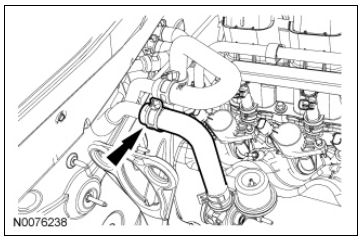
2. Follow the RADIATOR REFILLER manufacturer's instructions to fill and bleed the cooling system.
    - Recommended coolant concentration is 50/50 ethylene glycol to distilled water.
        - ♦ Maximum coolant concentration is 60/40 for cold weather areas.
        - ♦ Minimum coolant concentration is 40/60 for warm weather areas.

Filling and Bleeding without RADIATOR REFILLER

NOTICE: **All air must be removed from the cooling system. Failure to remove all the air from the cooling system may result in engine damage.**

NOTICE: **Turn the radiator cap clockwise until it stops (approximately 135 degrees). Failure to tighten the radiator cap may result in engine damage.**

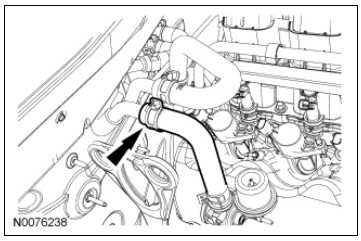
NOTE: Engine coolant provides freeze protection, boil protection, cooling efficiency and corrosion protection to the engine and cooling components. In order to obtain these protections, the engine coolant must be maintained at the correct concentration and fluid level.



To maintain the integrity of the coolant and the cooling system:

- Add Motorcraft® Premium Gold Engine Coolant. Always fill the cooling system with the same type of coolant that was drained from the system. Do not mix coolant types.
- Do not add orange-colored Motorcraft® Specialty Orange Engine Coolant. Mixing coolants may degrade the coolant's corrosion protection.
- Do not add alcohol, methanol or brine, or any engine coolants mixed with alcohol or methanol antifreeze. These can cause engine damage from overheating or freezing.
- Do not mix with recycled coolant. Use of such coolants may harm the engine and cooling system components.

4.6L (3V) engine



1. Remove the thermostat. For additional information, refer to Thermostat - 4.6L (3V) in this section.

2. Disconnect the heater hose and insert the end of the heater hose into a suitable container.

3. Fill the engine through the thermostat housing until coolant flows from the heater hose.
    - Recommended coolant concentration is 50/50 ethylene glycol to distilled water.
        - ♦ Maximum coolant concentration is 60/40 for cold weather areas.
        - ♦ Minimum coolant concentration is 40/60 for warm weather areas.

4. Connect the heater hose.

5. Install the thermostat. For additional information, refer to Thermostat - 4.6L (3V) in this section.

All engines

6. Fill the radiator through the radiator filler neck until the coolant level is at the bottom of the filler neck.
    - Recommended coolant concentration is 50/50 ethylene glycol to distilled water.
        - ♦ Maximum coolant concentration is 60/40 for cold weather areas.
        - ♦ Minimum coolant concentration is 40/60 for warm weather areas.

7. Install the radiator cap.

8. Fill the coolant expansion tank until the coolant reaches the COLD FILL mark.

9. Select the maximum heater temperature and blower motor speed settings. Position the control to discharge air from the A/C vents.

10. ***NOTICE:*** **If the air discharge remains cool and the engine coolant temperature gauge does not move, the engine coolant level is low in the engine and must be filled. Stop the engine, allow it to cool and fill the cooling system. Failure to follow this instruction may result in damage to the engine.**

    Run the engine until it reaches normal operating temperature.

11. Turn the engine off and allow the engine to cool.

12. Add more coolant mixture to the coolant expansion tank until the coolant level is at the COLD FILL mark.

13. Start the engine and allow it to idle. While the engine is idling, feel for hot air from the A/C vents.
    - Hot air should discharge from the A/C vents. The engine coolant temperature gauge should maintain a stabilized reading in the middle of the NORMAL range and the upper radiator hose should feel hot to the touch.

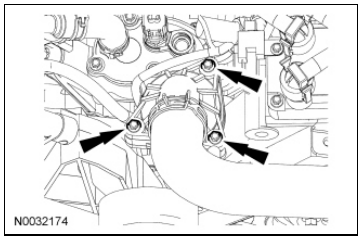
14. Check the engine coolant level in the coolant expansion tank and fill it as necessary.

15. Repeat previous 5 steps as necessary.

Cooling System Flushing

Material

Item	Specification
Motorcraft® Premium Cooling System Flush VC-1	ESR-M14P7-A

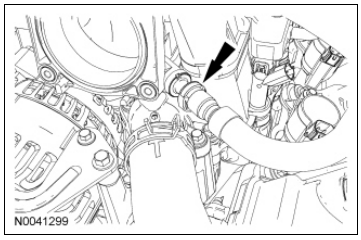


All vehicles

1. ⚠ **WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.**

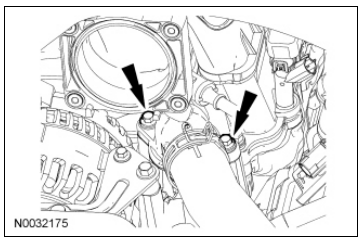
   Drain the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

Vehicles equipped with a 4.0L SOHC engine



2. Remove the bolts, thermostat housing cover and thermostat. Install the thermostat housing cover and bolts without the thermostat.
   - Tighten to 10 Nm (89 lb-in).

Vehicles equipped with a 4.6L (3V) engine



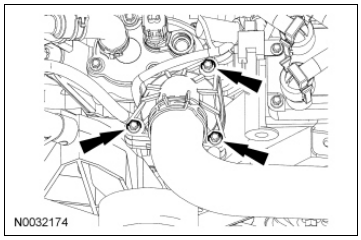
3. Remove the Throttle Body (TB). For additional information, refer to Section 303-04B .

4. Disconnect the fuel vapor hose.

5. Remove the bolts, thermostat housing cover and thermostat. Install the thermostat housing cover, the O-ring seal and the bolts without the thermostat.

- Tighten to 10 Nm (89 lb-in).

All vehicles



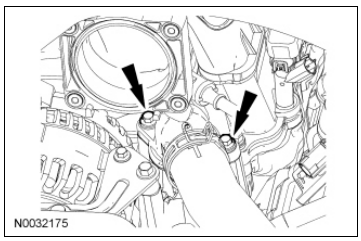
6. Using a suitable cooling system flushing tool, flush the engine and radiator.
   - Use cooling system flush.

Vehicles equipped with a 4.0L SOHC engine

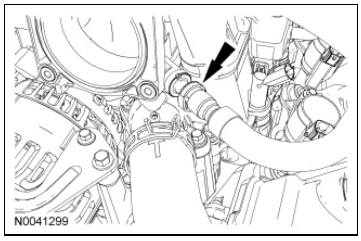
7. **NOTE:** Prior to installing the thermostat, inspect the thermostat housing cover O-ring seal and install a new O-ring seal if necessary.

   Install the thermostat, O-ring seal, thermostat housing cover and bolts.

   - Tighten to 10 Nm (89 lb-in).



Vehicles equipped with a 4.6L (3V) engine



8. **NOTE:** Prior to installing the thermostat, inspect the thermostat housing cover O-ring seal and install a new O-ring seal if necessary.

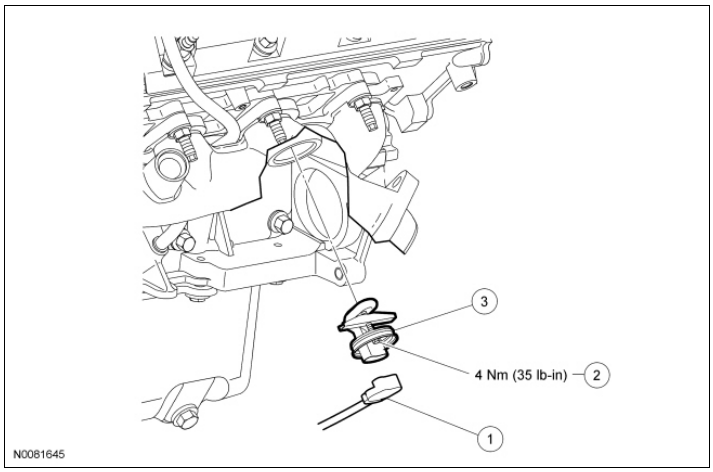
   Install the thermostat, O-ring seal, thermostat housing cover and bolts.

   - Tighten to 10 Nm (89 lb-in).

9. Connect the fuel vapor hose.

10. Install the TB . For additional information, refer to Section 303-04B .

All vehicles



11. Fill and bleed the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

Block Heater

Material

Item	Specification
Motorcraft® Premium Gold Engine Coolant VC-7-B (US); CVC-7-B (Canada)	WSS-M97B51-A1

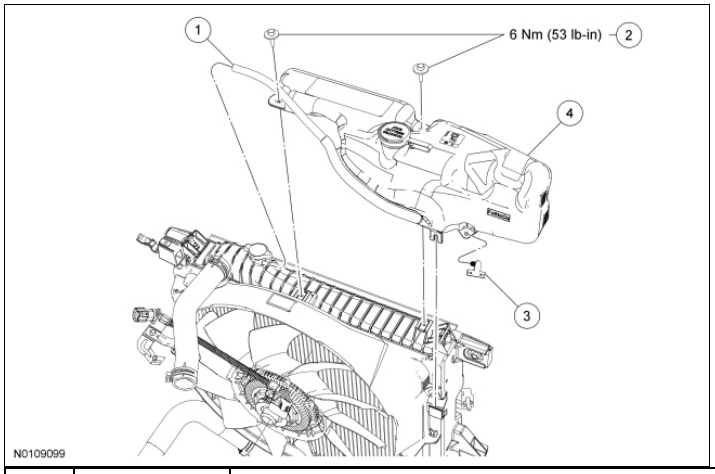
Removal and Installation

Item	Part Number	Description
1	6B019	Block heater power cable
2	6A051	Block heater retaining screw
3	6A051	Block heater

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Drain the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.
3. Disconnect the block heater power cable.
4. **NOTE:** Do not loosen the block heater retaining screw more than necessary for removal.

   Loosen the screw and remove the block heater.

   - To install, tighten to 4 Nm (35 lb-in).
5. Clean and inspect the engine block mating surface. Lubricate the block heater seal and the cylinder block hole with clean engine coolant.



6. ***NOTICE:*** **Make sure the power cable is routed and secured away from rotating or hot components or the cable may be damaged.**

To install, reverse the removal procedure.

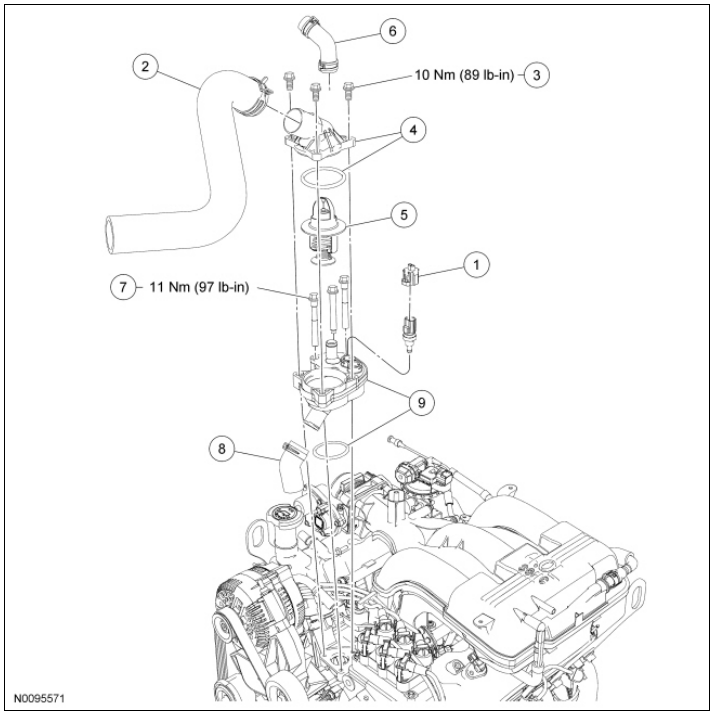
Coolant Expansion Tank

Material

Item	Specification
Motorcraft® Premium Gold Engine Coolant VC-7-B (US); CVC-7-B (Canada)	WSS-M97B51-A1

Item	Part Number	Description
1	8N029	Coolant overflow hose
2	W713417	Coolant expansion tank bolts
3	13A506	Mass Air Flow (MAF) sensor wiring harness retainer (4.6L [3V] engine only) (part of 12B637)
4	8C045	Coolant expansion tank

NOTICE: **Allow the engine to cool before removing the coolant expansion tank. The radiator draws coolant from the coolant expansion tank as the engine cools. If the coolant expansion tank is removed before the engine cools, the radiator will draw air into the system, resulting in possible engine damage.**



1. Disconnect the coolant overflow hose.

2. If equipped, detach the Mass Air Flow (MAF) sensor wiring harness retainer.

3. Remove the bolts and the coolant expansion tank.
   - To install, tighten to 6 Nm (53 lb-in).

4. To install, reverse the removal procedure.
   - Fill the coolant expansion tank with a 50/50 mixture of coolant and clean, drinkable water.

Thermostat and Thermostat Housing - Exploded View, 4.0L SOHC

Item	Part Number	Description
1	14A464	Engine Coolant Temperature (ECT) sensor electrical connector
2	8260	Upper radiator hose
3	W500015	Thermostat housing cover bolt (3 required)
4	8A586	Thermostat housing cover with O-ring seal
5	8575	Thermostat
6	18472	Heater hose
7	W702527	Thermostat housing bolt (3 required)
8	8548	Bypass hose
9	8A586	Thermostat housing with O-ring seal

1. For additional information, refer to the procedures in this section.

Thermostat - 4.0L SOHC

Removal and Installation

1. Drain the engine cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

2. Release the clamp and disconnect the upper radiator hose from the thermostat housing cover.

3. Remove the bolts and the thermostat housing cover.
   - To install, tighten to 10 Nm (89 lb-in).

4. Remove the thermostat.

5. **NOTE:** Inspect the thermostat housing cover O-ring seal. Install a new O-ring seal if necessary.

   To install, reverse the removal procedure.

Thermostat Housing - 4.0L SOHC

Removal and Installation

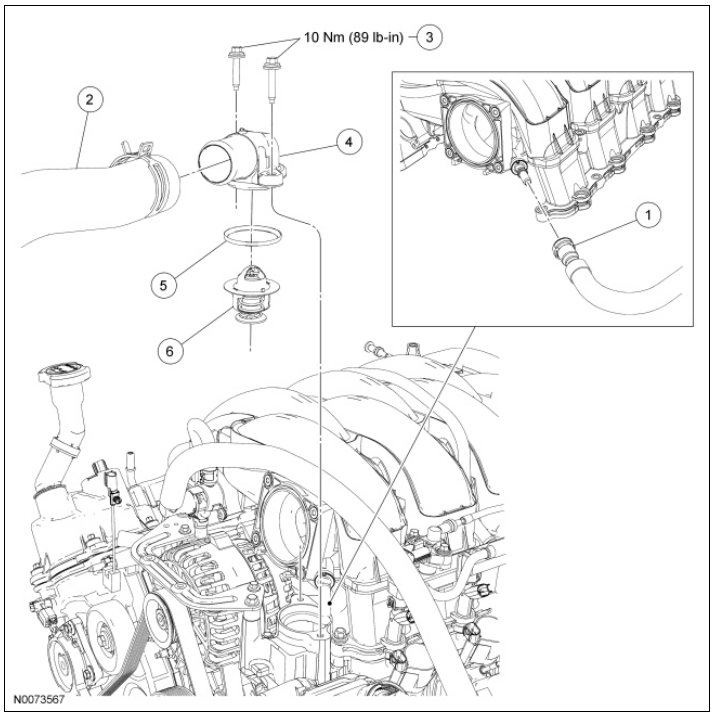
1. Drain the engine cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

2. Disconnect the Engine Coolant Temperature (ECT) sensor electrical connector.

3. Release the clamp and disconnect the upper radiator hose.

4. Release the clamp and disconnect the heater hose.

5. Release the bypass hose clamp and position it down the hose.



6. Remove the bolts and the thermostat housing.
   - To install, tighten to 11 Nm (97 lb-in).

7. Inspect the thermostat housing O-ring seal. Install a new O-ring seal if necessary.

8. To install, reverse the removal procedure.

Thermostat - 4.6L (3V)

Removal and Installation

Item	Part Number	Description
1	9D289	Fuel vapor tube
2	8260	Upper radiator hose
3	W503279	Thermostat housing bolt (2 required)
4	8594	Thermostat housing cover
5	N806807	Thermostat O-ring seal
6	8575	Thermostat

1. Drain the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.
2. Remove the Throttle Body (TB). For additional information, refer to Section 303-04B .
3. Disconnect the fuel vapor tube.
4. Remove the bolts and position the thermostat housing cover aside.
5. Remove the O-ring seal and the thermostat.

Installation

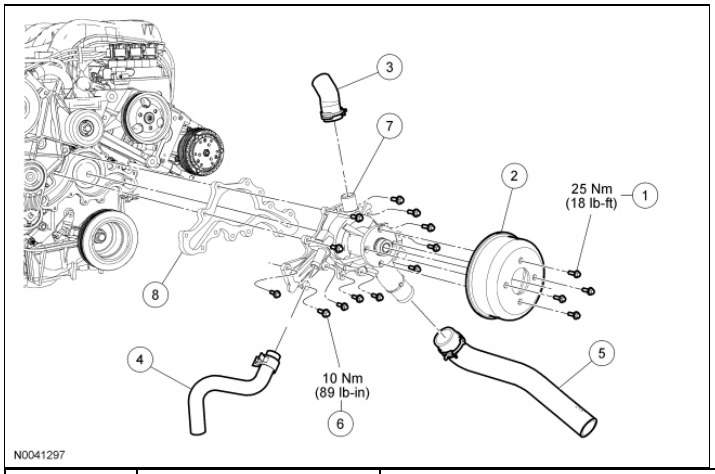
1. Install the thermostat with the spring facing down.

2. **NOTE:** Inspect the thermostat housing cover O-ring seal. Install a new O-ring seal, if necessary.

   Install the O-ring seal.

3. Position the thermostat housing cover and the bolts.
   - Tighten to 10 Nm (89 lb-in).

4. Connect the fuel vapor hose.



5. Install the TB . For additional information, refer to Section 303-04B .

6. Fill and bleed the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

Coolant Pump - 4.0L SOHC

Material

Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	-

Item	Part Number	Description
1	N605784	Coolant pump pulley bolt (4 required)
2	8509	Coolant pump pulley
3	8548	Coolant pump bypass hose
4	-	Heater hose (part of 6N867)
5	8286	Lower radiator hose
6	500014	Coolant pump bolt (12 required)
7	8501	Coolant pump
8	8507	Coolant pump gasket

Removal and Installation

1. Drain the engine cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

2. Remove the cooling fan. For additional information, refer to Cooling Fan in this section.

3. Remove the accessory drive belt. For additional information, refer to Section 303-05 .

4. Remove the bolts and the coolant pump pulley.
   - To install, tighten to 25 Nm (18 lb-ft).

5. Release the clamp and disconnect the coolant pump bypass hose.

6. Release the clamp and disconnect the heater hose.

7. Release the clamp and disconnect the lower radiator hose.

8. Remove the bolts, the coolant pump and the gasket.
    - To install, tighten to 10 Nm (89 lb-in).

9. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of the old gasket.**

   Clean the mating surfaces with a plastic scraper and metal surface prep. Follow the directions on the packaging.

10. To install, reverse the removal procedure.
    - Install a new coolant pump gasket.

Coolant Pump - 4.6L (3V)

Material

Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	-
Motorcraft® Premium Gold Engine Coolant VC-7-B (US); CVC-7-B (Canada)	WSS-M97B51-A1

Item	Part Number	Description
1	N806282	Coolant pump pulley bolts (4 required)
2	8A528	Coolant pump pulley
3	N806177	Coolant pump bolts (4 required)
4	8501	Coolant pump
5	391108	Coolant pump O-ring seal

Removal and Installation

1. Drain the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

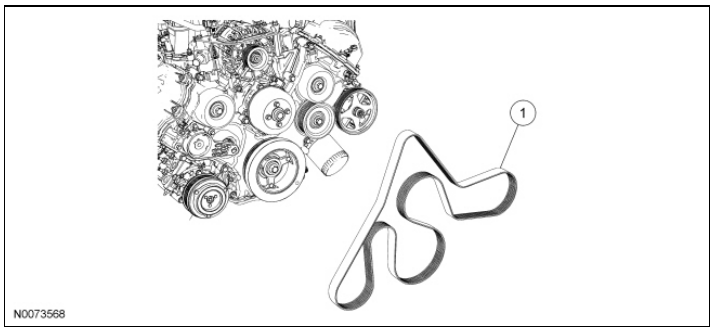
2. Remove the cooling fan. For additional information, refer to Cooling Fan in this section.

3. Remove the accessory drive belt. For additional information, refer to Section 303-05 .

4. Remove the bolts and the coolant pump pulley.
   - To install, tighten to 25 Nm (18 lb-ft).

5. Remove the bolts and the coolant pump.
   - To install, tighten to 25 Nm (18 lb-ft).

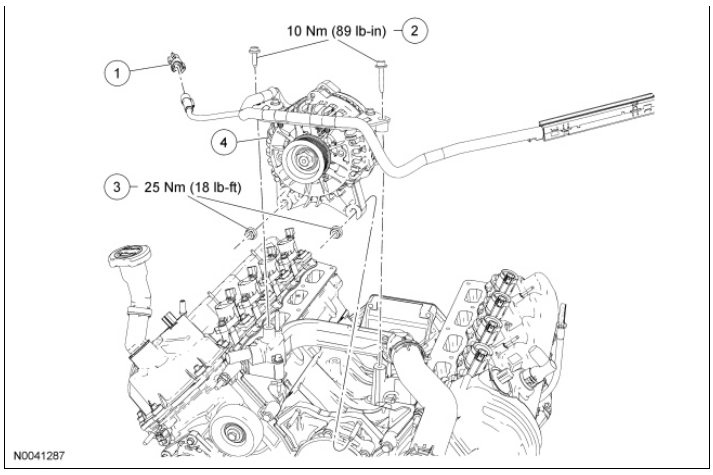
6. Remove and discard the coolant pump O-ring.



7. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of the old O-ring.**

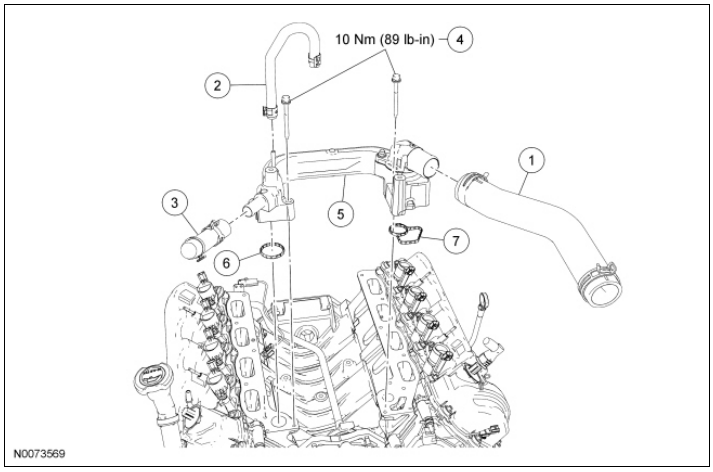
   If necessary, clean the mating surfaces with a plastic scraper and metal surface prep. Follow the directions on the packaging.

8. To install, reverse the removal procedure.
   - Install a new coolant pump O-ring. Lubricate the O-ring with clean engine coolant.



Coolant Crossover Manifold Assembly

Accessory Drive Belt

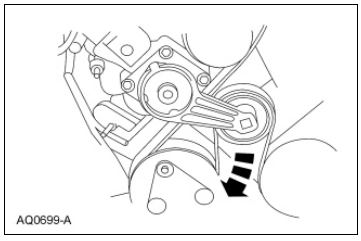


Item	Part Number	Description
1	8620	Accessory drive belt

Generator

Item	Part Number	Description
1	14489	Electrical connector (part of 12B637)
2	N807309	Generator bracket bolts (2 required)
3	N804178	Generator nuts (2 required)
4	10300	Generator

Coolant Crossover Manifold Assembly



Item	Part Number	Description
1	8260	Upper radiator hose
2	18465	PCV heater hose
3	18C266	Heater hose
4	W710925	Coolant crossover manifold assembly bolts (2 required)
5	8C368	Coolant crossover manifold assembly
6	8C387	RH coolant crossover manifold assembly gasket
7	8C388	LH coolant crossover manifold assembly gasket

Removal and Installation

1. Drain the engine cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

2. Remove the intake manifold. For additional information, refer to Section 303-01B .

3. Rotate the accessory drive belt tensioner clockwise and detach the belt from the generator pulley.

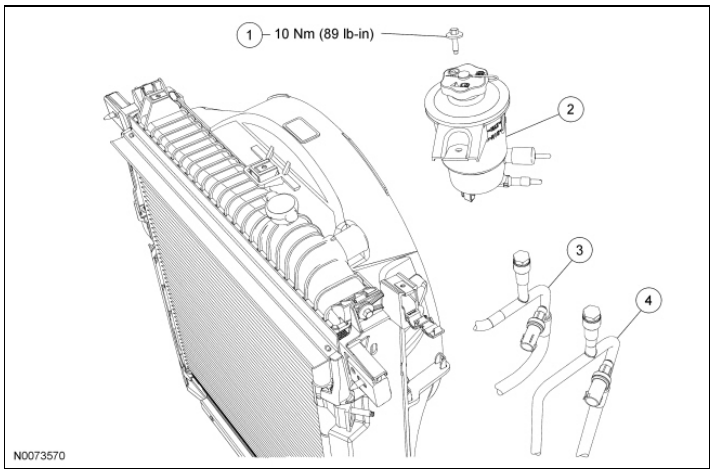
4. Disconnect the electrical connector.

5. Loosen the generator nuts.
   - To install, tighten to 25 Nm (18 lb-ft).

6. Remove the generator bracket-to-coolant crossover bolts, and position the generator, bracket and wiring harness aside as an assembly.
   - To install, tighten to 10 Nm (89 lb-in).

7. Disconnect the PCV heater hose from the coolant crossover manifold assembly.

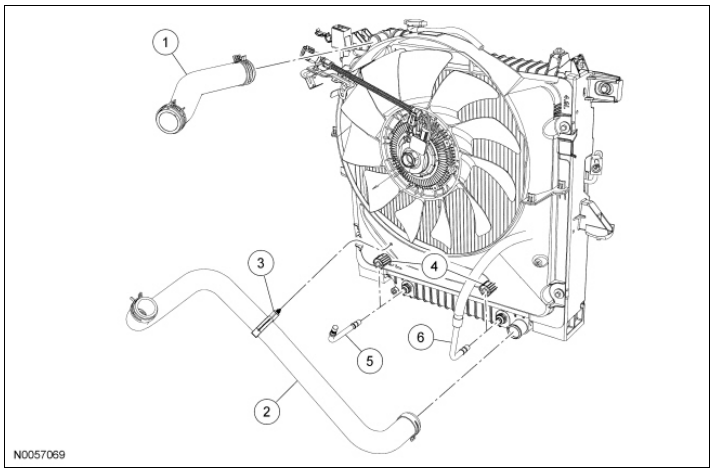
8. Disconnect the heater hose from the coolant crossover manifold assembly.



9. Disconnect the upper radiator hose from the coolant crossover manifold assembly.

10. Remove the bolts, the coolant crossover manifold assembly and the gaskets. Discard the gaskets.
    - To install, tighten to 10 Nm (89 lb-in).

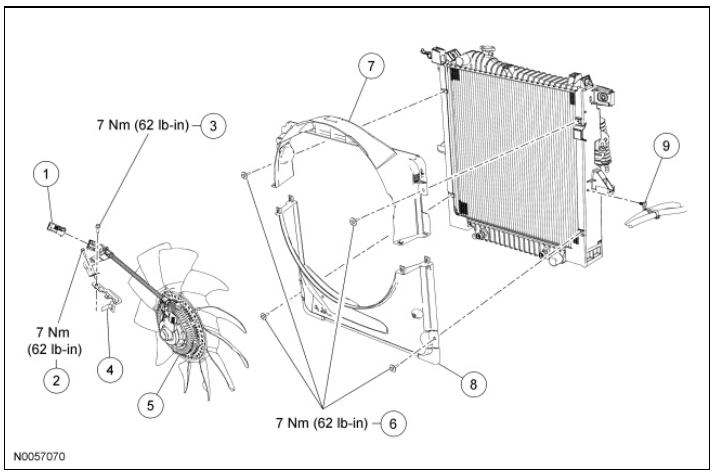
11. To install, reverse the removal procedure.
    - Install new gaskets.



Radiator and Cooling Fan - Exploded View

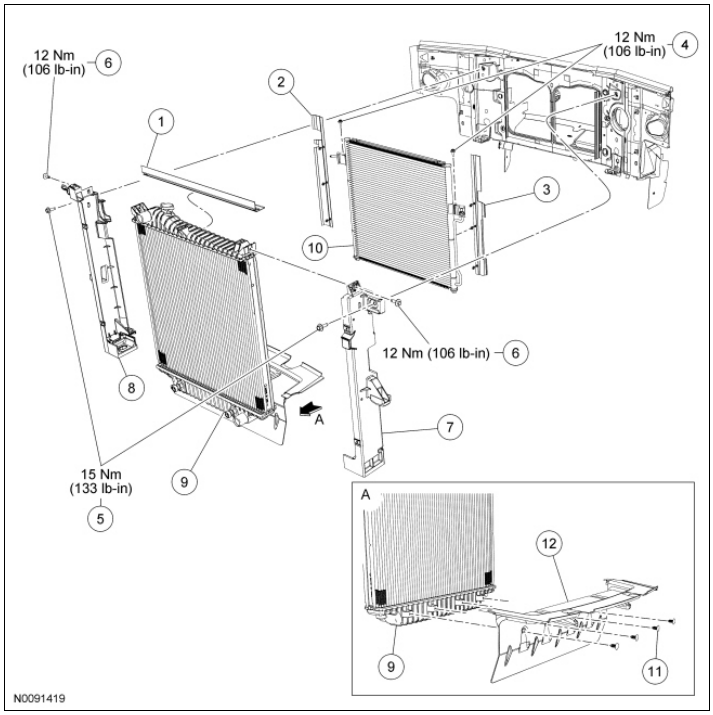
Power Steering Fluid Reservoir and A/C Tubes

Item	Part Number	Description
1	N503924	Power steering fluid reservoir bolt
2	3R700	Power steering fluid reservoir
3	19972	A/C tube - 4.6L (3V)
4	19972	A/C tube - 4.0L SOHC



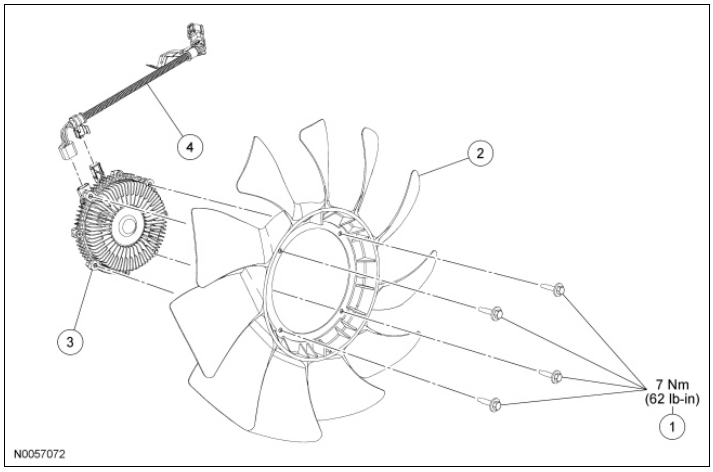
Radiator Hoses and Transmission Fluid Tubes

Item	Part Number	Description
1	8260	Upper radiator hose
2	8286	Lower radiator hose
3	8W287	Lower radiator hose retainer



4	7J081	Transmission fluid cooler tube latch assemblies (2 required)
5	7H420	Transmission-to-cooler tube
6	7890	Transmission fluid cooler hose

Cooling Fan and Shroud



Item	Part Number	Description
1	14A624	Fan clutch electrical connector
2	W500214	Fan clutch wiring harness bracket bolt - 4.0L SOHC
3	W500214	Fan clutch wiring harness bracket bolt - 4.6L (3V)
4	14W163	Fan clutch wiring harness retaining bracket - 4.6L (3V) only
5	8A616	Fan clutch
6	W709027	Fan shroud bolts (4 required)
7	8K618	Upper fan shroud
8	8K619	Lower fan shroud
9	7N291	Transmission fluid cooler tube retainer

Radiator, Support Brackets and Seals

Item	Part Number	Description
1	19T558	Radiator top seal
2	19T557	LH A/C condenser seal
3	19T556	RH A/C condenser seal
4	W711343	Radiator support bracket-to-A/C condenser bolts
5	W707665	Radiator support bracket-to-radiator support bolts (2 required)
6	W503932	Radiator support bracket-to-radiator bolts (2 required)
7	8B265	RH radiator support bracket
8	8B266	LH radiator support bracket
9	8005	Radiator
10	19710	A/C condenser
11	W705589	Pushpin (4 required)
12	8B384	Radiator lower air deflector

Cooling Fan and Electronic Fan Clutch

Item	Part Number	Description
1	W505425	Fan-to-electronic fan clutch bolts (4 required)
2	8600	Fan
3	8A616	Electronic fan clutch
4	8C290	Electronic fan clutch wiring assembly

1. For additional information, refer to the procedures in this section.

Radiator

Special Tool(s)

 ST2935A	Disconnect Tool, Transmission Cooler Line 307-569
 ST2133-A	Holding Wrench, Fan Pulley 303-239 (T84T-6312-C)
 ST2175-A	Wrench, Fan Clutch Nut 303-240 (T84T-6312-D)

Removal and Installation

All vehicles

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Drain the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

Vehicles equipped with a 4.6L (3V) engine

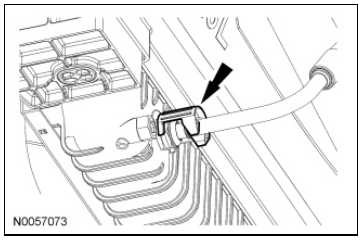
3. Remove the Air Cleaner (ACL) outlet pipe. For additional information, refer to Section 303-12 .

All vehicles

4. Remove the coolant expansion tank. For additional information, refer to Coolant Expansion Tank in this section.

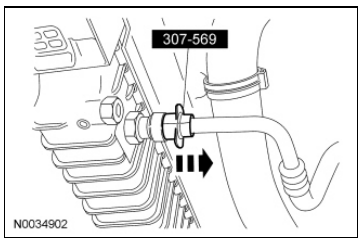
5. Remove the bolt and position the power steering fluid reservoir aside.
    - To install, tighten to 10 Nm (89 lb-in).

6. Release the clamp and disconnect the upper radiator hose.



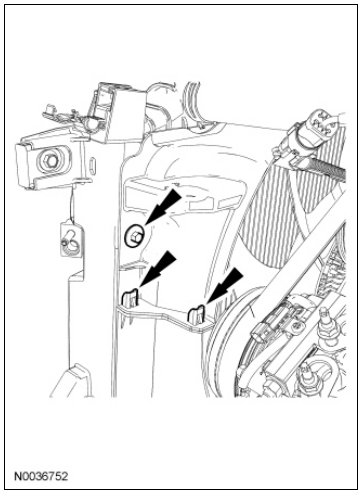
7. Release the clamp and disconnect the lower radiator hose.

8. Detach the lower radiator hose retainer from the lower fan shroud.



9. Detach the transmission cooler hose retainer from the RH radiator support bracket.

10. Remove the 4 lower radiator air deflector pushpins and position the air deflector aside.

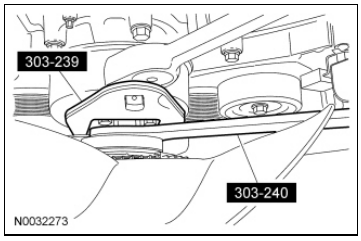


11. Remove the 2 latch assemblies from the transmission cooler tubes.

12. Using the Transmission Cooler Line Disconnect Tool, disconnect the 2 transmission cooler tubes.

13. Remove the 2 upper fan shroud bolts, then unclip the upper fan shroud from the lower fan shroud and remove the upper fan shroud.
    - To install, tighten to 7 Nm (62 lb-in).

14. Disconnect the fan clutch electrical connector.



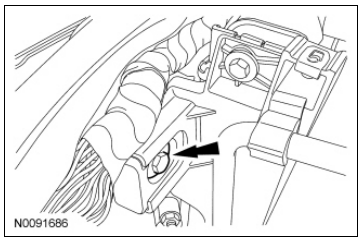
15. Remove the fan clutch wiring harness bracket bolt.
    - To install, tighten to 7 Nm (62 lb-in).

16. ***NOTICE:*** **Do not side load the cooling fan clutch coil or the cooling fan clutch coil may be damaged.**

    NOTE: 4.6L (3V) engine shown, 4.0L SOHC engine similar.

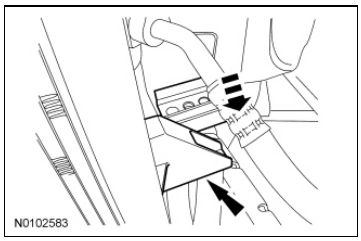
    Using the Fan Pulley Holding Wrench and the Fan Clutch Nut Wrench, remove the cooling fan.

    - To install, tighten to 55 Nm (41 lb-ft).



17. Remove the 2 bolts and the lower fan shroud.

18. Detach the A/C tube from the retainer on the radiator support bracket.

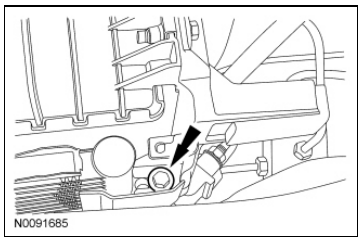


19. **NOTE:** LH shown RH similar.

    Remove the 2 radiator support bracket-to-radiator support bolts.

    - To install, tighten to 15 Nm (133 lb-in).

20. Lift the radiator and A/C condenser assembly off the frame supports and move the assembly toward the front of the engine.



21. Remove the radiator top seal.

22. **NOTE:** Do not remove the A/C condenser seals.

    NOTE: LH shown RH similar.

    Deflect the A/C condenser seals and remove the 2 A/C condenser-to-radiator support bracket bolts.

    - To install, tighten to 12 Nm (106 lb-in).

23. Lift the A/C condenser off the supports and move the A/C condenser toward the front of the vehicle.

24. Remove the radiator and the radiator support brackets as an assembly.
    - Move the LH radiator support bracket past the ABS module before removing the radiator from the vehicle.

25. Remove the 4 bolts and separate the 2 radiator support brackets and the radiator.
    - To install, tighten to 12 Nm (106 lb-in).

26. To install, reverse the removal procedure.

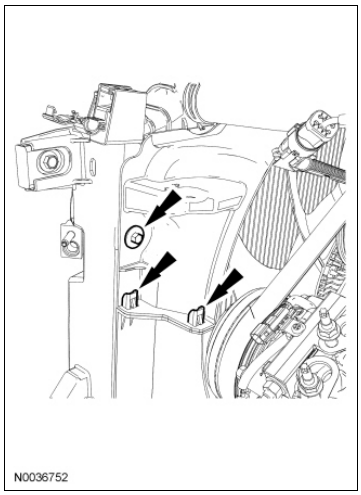
Cooling Fan

Special Tool(s)

 ST2133-A	Holding Wrench, Fan Pulley 303-239 (T84T-6312-C)
 ST2175-A	Wrench, Fan Clutch Nut 303-240 (T84T-63112-D)

Removal and Installation

Vehicle equipped with a 4.6L (3V)



1. Remove the Air Cleaner (ACL) outlet pipe. For additional information, refer to Section 303-12 .

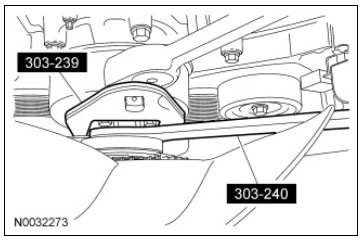
All vehicles

2. Remove the coolant expansion tank. For additional information, refer to Coolant Expansion Tank in this section.

3. Remove the bolt and position the power steering fluid reservoir aside.
   - To install, tighten to 10 Nm (89 lb-in).

4. Remove the 2 bolts, then unclip the upper fan shroud from the lower fan shroud and remove the upper fan shroud.
   - To install, tighten to 7 Nm (62 lb-in).

5. Disconnect the fan clutch electrical connector.



6. Remove the fan clutch wiring harness bracket bolt.
   - To install, tighten to 7 Nm (62 lb-in).

7. ***NOTICE:*** **Do not side load the cooling fan clutch coil or the cooling fan clutch coil may be damaged.**

   NOTE: 4.6L (3V) engine shown, 4.0L SOHC engine similar.

   Using the Fan Pulley Holding Wrench and the Fan Clutch Nut Wrench, remove the cooling fan.

   - To install, tighten to 55 Nm (41 lb-ft).

8. Remove the 4 bolts and separate the fan from the fan clutch.
   - To install, tighten to 7 Nm (62 lb-in).
9. If necessary, unclip and disconnect the fan clutch wiring harness.
10. To install, reverse the removal procedure.

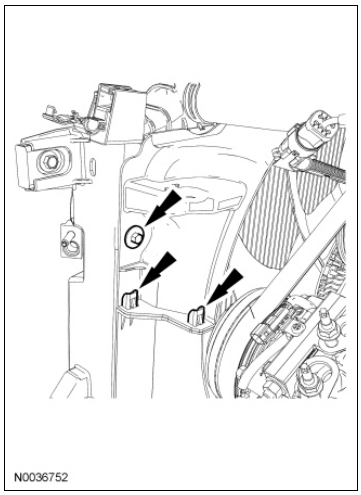
Cooling Fan Shroud

Special Tool(s)

 ST2133-A	Holding Wrench, Fan Pulley 303-239 (T84T-6312-C)
 ST2175-A	Wrench, Fan Clutch Nut 303-240 (T84T-63112-D

Removal and Installation

Vehicles equipped with a 4.6L (3V) engine



1. Remove the Air Cleaner (ACL) outlet pipe. For additional information, refer to Section 303-12 .

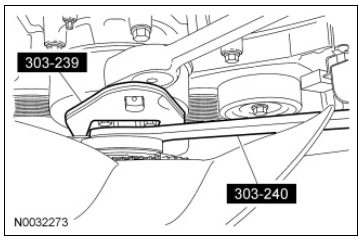
All vehicles

2. Remove the coolant expansion tank. For additional information, refer to Coolant Expansion Tank in this section.

3. Remove the bolt and position the power steering fluid reservoir aside.
   - To install, tighten to 10 Nm (89 lb-in).

4. Remove the 2 bolts, then unclip the upper fan shroud from the lower fan shroud and remove the upper fan shroud.
   - To install, tighten to 7 Nm (62 lb-in).

5. Disconnect the fan clutch electrical connector.



6. Remove the fan clutch wiring harness bracket bolt.
   - To install, tighten to 7 Nm (62 lb-in).

7. ***NOTICE:*** **Do not side load the cooling fan clutch coil or the cooling fan clutch coil may be damaged.**

   NOTE: 4.6L (3V) engine shown, 4.0L SOHC engine similar.

   Using the Fan Pulley Holding Wrench and the Fan Clutch Nut Wrench, remove the cooling fan.

   - To install, tighten to 55 Nm (41 lb-ft).

8. Remove the 2 bolts and the lower fan shroud.
   - To install, tighten to 7 Nm (62 lb-in).

9. To install, reverse the removal procedure.

Material

Item	Specification	Fill Capacity
Motorcraft SAE 5W-30 Premium Synthetic Blend Motor Oil XO-5W30-QSP (US); Motorcraft SAE 5W-30 Super Premium Motor Oil CXO-5W30-LSP12 (Canada); or equivalent	WSS-M2C929-A	-

Torque Specifications

Description	Nm	lb-ft	lb-in
Fuel Pump Driver Module (FPDM) bolts	10	-	89
Fuel rail bolts	23	17	-
Fuel supply tube bolts	6	-	53
Fuel supply tube bracket bolt	8	-	71
Fuel temperature and pressure sensor bolts	6	-	53
Throttle Body (TB) bolts	9	-	80
Wiring harness bracket nut	9	-	80

Fuel Charging and Controls

The fuel charging and control system consists of the:

- Throttle Body (TB)
- Fuel supply tube
- Fuel rails
- Fuel injectors
- Fuel pressure and temperature sensor

The fuel charging and controls system is:

- a Sequential Multi-Port Fuel Injection (SFI).
- pulse-width modulated.
- Mass Air Flow (MAF) controlled.

Throttle Body (TB)

The TB :

- controls air supply to the intake manifold by electronically positioning the throttle plate.
- is not adjustable.

Fuel Supply Tube

The fuel supply tube:

- supplies fuel to the 2 fuel rails.

Fuel Rails

The fuel rails:

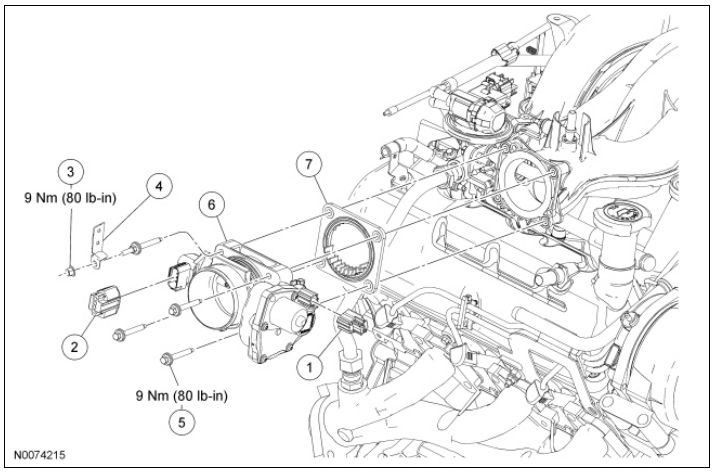
- deliver fuel to the individual fuel injectors.

Fuel Injectors

The fuel injectors:

- are electrically operated by the PCM.
- atomize the fuel as the fuel is delivered.
- are deposit-resistant and self-cleaning.
- each have an internal solenoid which opens a needle valve to inject fuel into the cylinder heads.

Fuel Pressure and Temperature Sensor



The fuel pressure and temperature sensor:

- supplies the PCM with signals indicating fuel pressure and fuel temperature.

Fuel Charging and Controls

Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Throttle Body

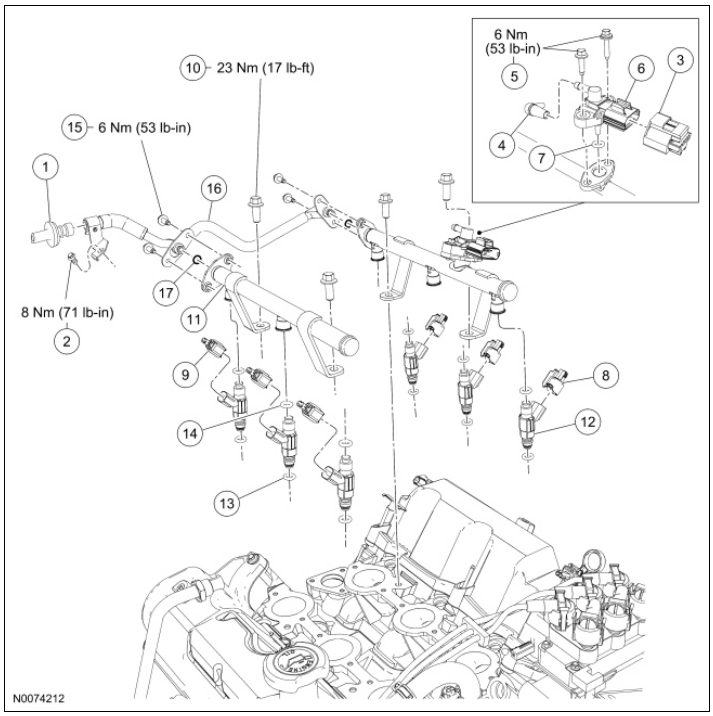
Item	Part Number	Description
1	14A464	Throttle Body (TB) electrical connector
2	14A464	Throttle Position (TP) sensor electrical connector
3	-	Wiring harness bracket nut
4	-	Wiring harness bracket (part of 12B637)
5	W704380	TB bolt (4 required)
6	9E926	TB
7	9E936	TB gasket

Removal and Installation

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

1. Remove the Air Cleaner (ACL) outlet tube. For additional information, refer to Section 303-12 .

2. Disconnect the Throttle Body (TB) electrical connector.



3. Disconnect the Throttle Position (TP) sensor electrical connector.

4. Remove the nut and position the wiring harness bracket aside.
   - To install, tighten to 9 Nm (80 lb-in).

5. Remove the 4 bolts, the TB and the gasket. Discard the gasket.
   - To install, tighten to 9 Nm (80 lb-in).

6. To install, reverse the removal procedure.
   - Install a new TB gasket.

Fuel Rail and Fuel Injector - Exploded View

Item	Part Number	Description
1	9J338	Fuel tube spring lock coupling
2	W500204	Fuel supply tube bracket bolt
3	14A464	Fuel pressure and temperature sensor electrical connector
4	-	Fuel pressure and temperature sensor vacuum hose
5	W709515	Fuel rail pressure and temperature sensor bolts (2 required)
6	9G756	Fuel rail pressure and temperature sensor
7	-	Fuel rail pressure and temperature sensor O-ring seal (part of 9G756)
8	14A464	Fuel injector electrical connector (LH side) (3 required)
9	14A464	Fuel injector electrical connector (RH side) (3 required)
10	W500023-S	Fuel rail bolt (4 required)
11	9D280	Fuel rail
12	9F593	Fuel injector (6 required)
13	9229	Fuel injector-to-cylinder head O-ring seal (6 required)
14	9229	Fuel injector-to-fuel rail O-ring seal (6 required)

15	W711782	Fuel supply tube bolt (4 required)
16	9E964	Fuel supply tube
17	9229	Fuel supply tube O-ring seal (2 required)

1. For additional information, refer to the procedures in this section.

Fuel Rail

Material

Item	Specification
Motorcraft SAE 5W-30 Premium Synthetic Blend Motor Oil XO-5W30-QSP (US); Motorcraft SAE 5W-30 Super Premium Motor Oil CXO-5W30-LSP12 (Canada); or equivalent	WSS-M2C929-A

Removal and Installation

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

⚠ WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

NOTICE: **If used as a leverage device, the fuel rail may be damaged. Care must be taken when working around the fuel rail.**

NOTE: During the repair or replacement of fuel-related components, cap, tape or otherwise appropriately protect all liquid and vapor fuel openings to prevent the ingress of dirt or other contamination. Remove all caps, tape and other protective materials prior to installation.

1. Release the fuel system pressure. For additional information, refer to Section 310-00 .
2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
3. Disconnect the spring lock coupling. For additional information, refer to Section 310-00 .
4. Remove the intake manifold. For additional information, refer to Section 303-01A .
5. Remove the fuel supply tube bracket bolt.
   - To install, tighten to 8 Nm (71 lb-in).
6. Disconnect the 6 fuel injector electrical connectors.
7. Disconnect the fuel pressure and temperature sensor electrical and vacuum connectors.

8. Remove the 4 bolts and the fuel rail and injectors as an assembly.
    - To install, tighten to 23 Nm (17 lb-ft).

9. Remove the fuel injectors. Remove and discard the O-ring seals.

10. ***NOTICE:*** **O-ring seals are made of special fuel-resistant material. Fuel will damage ordinary O-ring seals and may cause the fuel system to leak.**

    NOTICE: **Do not reuse O-ring seals. The removal and installation process may damage the used O-ring seals, and cause the fuel system to leak.**

    NOTE: Install new fuel injector O-ring seals and lubricate them with clean engine oil.

    To install, reverse the removal procedure.

Fuel Injectors

Removal and Installation

1. The fuel injectors are serviced with the fuel rail. For additional information, refer to Fuel Rail and Fuel Injector - Exploded View and Fuel Rail in this section.

Fuel Rail Supply Tube

Material

Item	Specification
Motorcraft SAE 5W-30 Premium Synthetic Blend Motor Oil XO-5W30-QSP (US); Motorcraft SAE 5W-30 Super Premium Motor Oil CXO-5W30-LSP12 (Canada); or equivalent	WSS-M2C929-A

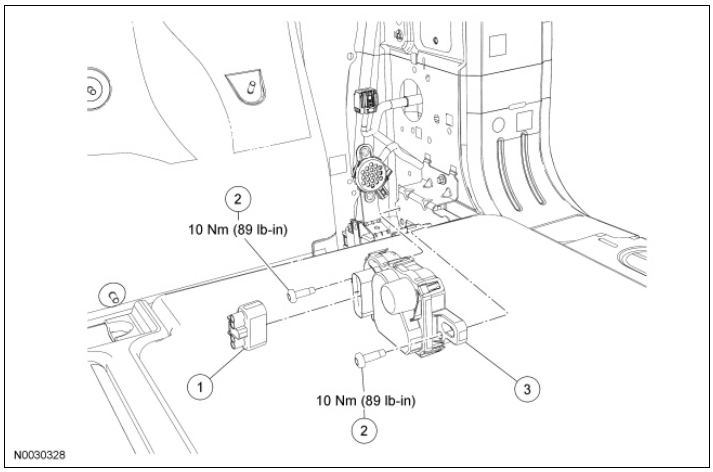
Removal and Installation

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

⚠ WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

NOTE: During the repair or replacement of fuel-related components, cap, tape or otherwise appropriately protect all liquid and vapor fuel openings to prevent the ingress of dirt or other contamination. Remove all caps, tape and other protective materials prior to installation.



1. Release the fuel system pressure. For additional information, refer to Section 310-00 .
2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
3. Remove the intake manifold. For additional information, refer to Section 303-01A .
4. Disconnect the fuel rail supply tube spring lock coupling. For additional information, refer to Section 310-00 .
5. Remove the fuel rail supply tube bracket bolt.
   - To install, tighten to 8 Nm (71 lb-in).
6. Remove the 4 bolts and the fuel rail supply tube.
   - To install, tighten to 6 Nm (53 lb-in).
7. ***NOTICE:*** **O-ring seals are made of special fuel-resistant material. Fuel will damage ordinary O-ring seals and may cause the fuel system to leak.**

NOTICE: **Do not reuse O-ring seals. The removal and installation process may damage the used O-ring seals, and cause the fuel system to leak.**

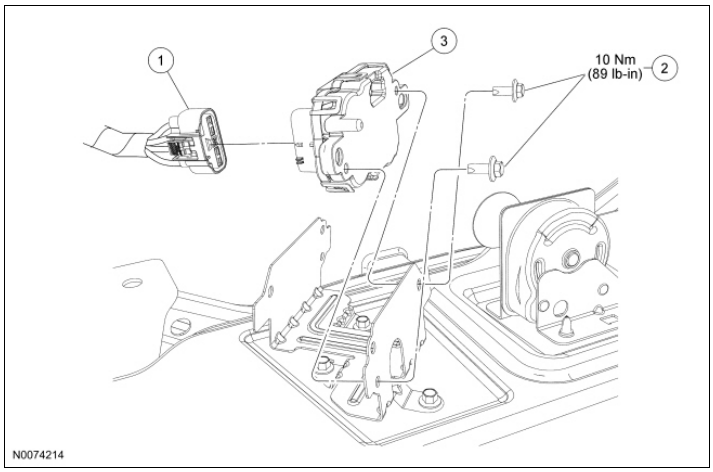
Remove and discard the fuel rail supply tube O-ring seals.

8. To install, reverse the removal procedure.
    - Lubricate the new O-ring seals with clean engine oil prior to installation.

Fuel Pump Driver Module (FPDM) - Explorer, Mountaineer

Item	Part Number	Description
1	14A464	Fuel Pump Driver Module (FPDM) electrical connector
2	W504755	FPDM bolts (2 required)
3	9D370	FPDM

Removal and Installation



1. Remove the RH rear quarter trim panel. For additional information, refer to Section 501-05 .

2. Disconnect the Fuel Pump Driver Module (FPDM) electrical connector.

3. Remove the 2 bolts and the FPDM .
   - To install, tighten to 10 Nm (89 lb-in).

4. To install, reverse the removal procedure.

Fuel Pump Driver Module (FPDM) - Explorer Sport Trac

Item	Part Number	Description
1	14A464	Fuel Pump Driver Module (FPDM) electrical connector
2	W504755	FPDM bolts (2 required)
3	9D370	FPDM

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Disconnect the Fuel Pump Driver Module (FPDM) electrical connector.

3. Remove the 2 bolts and the FPDM .
   - To install, tighten to 10 Nm (89 lb-in).

Material

Item	Specification	Fill Capacity
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A	-

Torque Specifications

Description	Nm	lb-in
Fuel Pump Driver Module (FPDM) bolts	10	89
Fuel rail bolts	10	89
Throttle Body (TB) bolts	10	89

Fuel Charging and Controls

Sequential Multi-Port Fuel Injection (SFI)

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

The fuel charging and controls system consists of the following:

- Throttle Body (TB)
- Fuel injectors
- Fuel rail
- Fuel rail pressure and temperature sensor
- Fuel Pump Driver Module (FPDM)

The fuel charging and controls system is:

- a Sequential Multi-Port Fuel Injection (SFI) system.
- pulse-width modulated.
- Mass Air Flow (MAF) controlled.

Fuel is metered into each intake port in a sequential firing order. Fuel injectors pulse to follow engine firing order, in accordance with engine demand on a tuned intake manifold.

The PCM controls the fuel injection system. Injector pulse width is varied to control the amount of fuel flow. Varying fuel pump output controls fuel pressure. The PCM commands the fuel pump driver module, which directly controls the fuel pump. The TB is electronically controlled by the engine management system. Throttle plate angle is changed electronically in response to throttle pedal movements initiated by the driver.

Throttle Body (TB)

The TB :

- controls air supply to the intake manifold by electronically positioning the throttle plate.
- is not adjustable.

Refer to Throttle Body in this section.

Fuel Injectors

The fuel injectors:

- are electronically operated by the PCM.
- atomize the fuel as the fuel is delivered.
- each have an internal solenoid that opens a needle valve, which injects fuel into the intake port in the cylinder head.

- are deposit resistant.

For removal and installation, refer to Fuel Rail and Fuel Injector - Exploded View and Fuel Rail in this section.

Fuel Rail

NOTICE: **The fuel injectors and the fuel rail must be handled with extreme care to prevent damage to sealing areas and sensitive fuel-metering orifices.**

The fuel rail:

- receives fuel from the fuel supply tube.
- delivers fuel to the fuel injectors.

For removal and installation, refer to Fuel Rail and Fuel Injector - Exploded View and Fuel Rail in this section.

Fuel Rail Pressure and Temperature Sensor

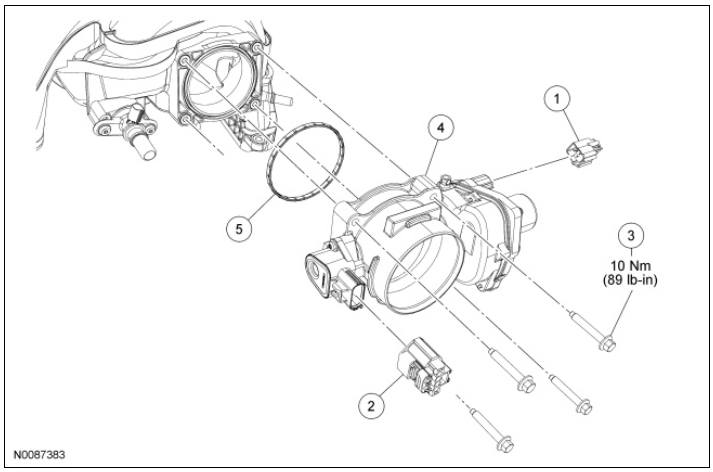
The fuel rail pressure and temperature sensor:

- measures the pressure and temperature of the fuel rail and sends these signals to the PCM.
- uses intake manifold vacuum as a pressure reference.

For removal and installation, refer to Section 303-14 .

Fuel Pump Driver Module (FPDM)

The FPDM :



- receives signals from the PCM.
- duty cycles the fuel pump.

For removal and installation, refer to Fuel Pump Driver Module (FPDM) - Explorer, Mountaineer or Fuel Pump Driver Module (FPDM) - Explorer Sport Trac in this section.

Fuel Charging and Controls

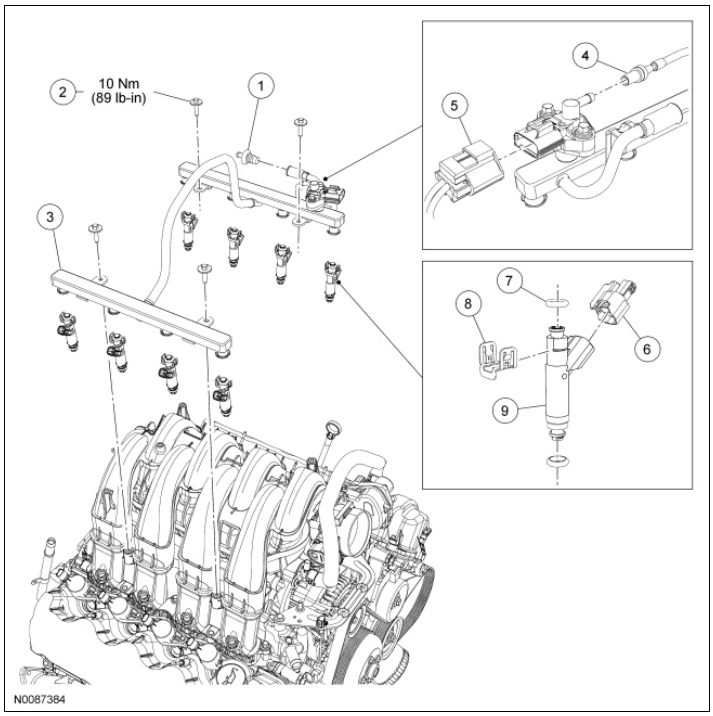
Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Throttle Body

Item	Part Number	Description
1	14A464	Electronic throttle control electrical connector (part of 12B637)
2	14A464	Throttle Position (TP) sensor electrical connector (part of 12B637)
3	N806154	Throttle Body (TB) bolt (4 required)
4	9F991	TB
5	9E936	TB gasket

Removal and Installation

1. Remove the Air Cleaner (ACL) outlet pipe. For additional information, refer to Section 303-12 .



2. Disconnect the electronic throttle control electrical connector.

3. Disconnect the Throttle Position (TP) sensor electrical connector.

4. Remove the 4 bolts, the Throttle Body (TB) and the TB gasket. Discard the gasket.
   - To install, tighten to 10 Nm (89 lb-in).

5. To install, reverse the removal procedure.

Fuel Rail and Fuel Injector - Exploded View

Item	Part Number	Description
1	9J274	Fuel supply tube spring lock coupling
2	N705800	Fuel rail bolt (4 required)
3	9F792	Fuel rail
4	9E498	Vacuum hose
5	14A464	Fuel rail pressure and temperature sensor electrical connector (part of 12B637)
6	14A464	Fuel injector electrical connector (8 required) (part of 12B637)
7	9229	O-ring seal (16 required)
8	9C995	Fuel injector retaining clip (8 required)
9	9F593	Fuel injector

1. For additional information, refer to the procedures in this section.

Fuel Rail

Material

Item	Specification
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

Removal and Installation

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

⚠ WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

NOTE: During the repair or installation of new fuel-related components, cap, tape or otherwise appropriately protect all liquid and vapor fuel openings to prevent the ingress of dirt or other contamination. Remove caps, tape and other protective materials prior to installation.

1. Release the fuel system pressure. For additional information, refer to Section 310-00 .
2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
3. Disconnect the fuel supply tube spring lock coupling. For additional information, refer to Section 310-00 .
4. Disconnect the fuel rail pressure and temperature sensor electrical connector and vacuum hose.
5. Disconnect the 8 fuel injector electrical connectors.
6. Remove the 4 fuel rail bolts.
   - To install, tighten to 10 Nm (89 lb-in).
7. Remove the fuel rail and fuel injectors as an assembly from the intake manifold.
8. **NOTE:** The fuel injector clip can be reused if it is not damaged during removal. If the clip is reused, the 2 sides of the clip should be squeezed back into shape by placing it between index finger and

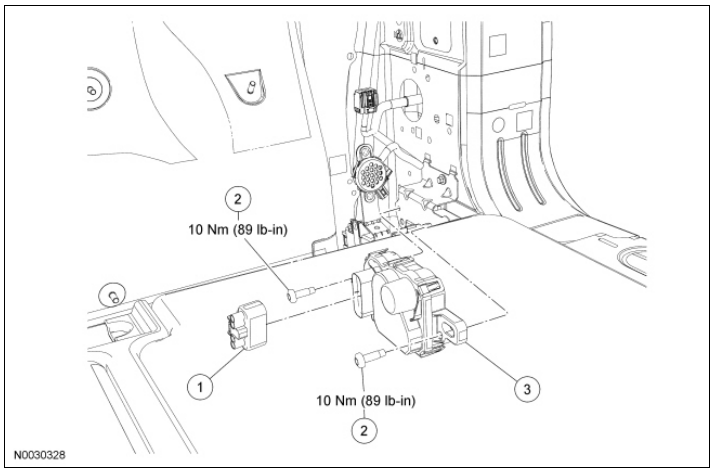
thumb.

Remove the retaining clips and fuel injectors from the fuel rail.

9. ***NOTICE:*** **O-ring seals are made of special fuel-resistant material. Fuel will damage ordinary O-ring seals and may cause the fuel system to leak.**

   NOTICE: **Do not reuse O-ring seals. The removal and installation process may damage the used O-ring seals, and cause the fuel system to leak.**

   Remove and discard the fuel injector O-ring seals.



10. To install, reverse the removal procedure.
    - Lubricate the new upper and lower fuel injector O-ring seals with clean engine oil prior to installation.

Fuel Injectors

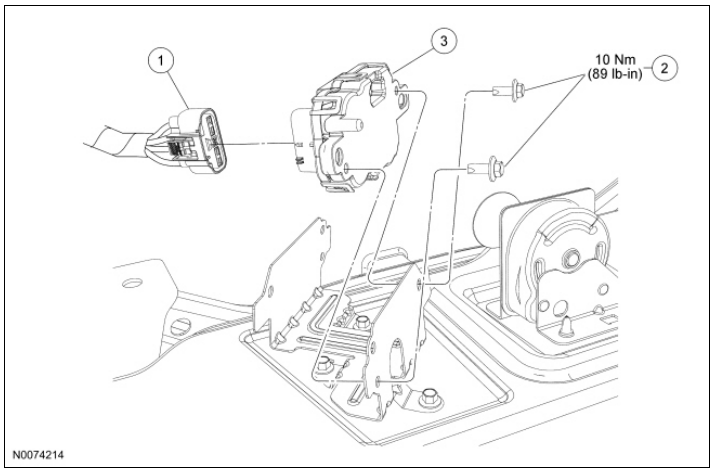
Removal and Installation

1. The fuel injectors are serviced with the fuel rail. For additional information, refer to Fuel Rail and Fuel Injector - Exploded View and Fuel Rail in this section.

Fuel Pump Driver Module (FPDM) - Explorer, Mountaineer

Item	Part Number	Description
1	14A464	Fuel Pump Driver Module (FPDM) electrical connector
2	W504755	FPDM bolts (2 required)
3	9D370	FPDM

Removal and Installation



1. Remove the RH rear quarter trim panel. For additional information, refer to Section 501-05 .

2. Disconnect the Fuel Pump Driver Module (FPDM) electrical connector.

3. Remove the 2 bolts and the FPDM .
   - To install, tighten to 10 Nm (89 lb-in).

4. To install, reverse the removal procedure.

Fuel Pump Driver Module (FPDM) - Explorer Sport Trac

Item	Part Number	Description
1	14A464	Fuel Pump Driver Module (FPDM) electrical connector
2	W504755	FPDM bolts (2 required)
3	9D370	FPDM

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Disconnect the Fuel Pump Driver Module (FPDM) electrical connector.

3. Remove the 2 bolts and the FPDM .
   - To install, tighten to 10 Nm (89 lb-in).

General Specifications

Item	Specification
Accessory drive belt	6 ribs

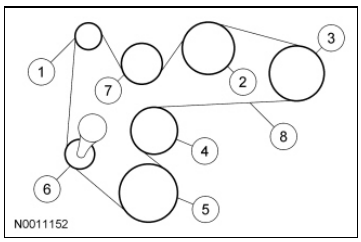
Torque Specifications

Description	Nm	lb-ft
Accessory drive belt idler pulley bolt, 4.0L SOHC	47	35
Accessory drive belt idler pulley bolt, 4.6L (3V)	25	18
Accessory drive belt tensioner bolt, 4.0L SOHC	47	35
Accessory drive belt tensioner bolt, 4.6L (3V)	25	18

Accessory Drive

The accessory drive consists of the following:

- Drive belt
- Idler pulley(s)
- Belt tensioner
- Crankshaft pulley
- A/C clutch pulley
- Generator pulley
- Coolant pump pulley
- Power steering pump pulley

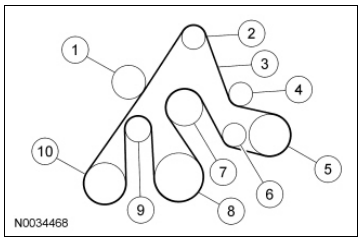


The accessory drive:

- has a single serpentine drive.
- has one idler pulley on the 4.0L SOHC engine.
- has 2 idler pulleys on the 4.6L (3V) engine.
- has automatic tensioning.
- is not adjustable.

The accessory drive system provides power to operate components which power other systems. These could include components such as the generator, power steering pump and A/C compressor. Each of these components is equipped with a pulley which is driven by the accessory drive belt. The accessory drive belt is driven by the engine crankshaft pulley. One or more idler pulleys may be provided to facilitate belt routing and alignment. The automatic belt tensioner maintains correct belt tension and compensates for component wear and changes in system load. System load changes can be caused by the A/C compressor clutch engaging or disengaging, or demand changes on other systems powered by the accessory drive belt. To maintain correct operation of this system, it is critical that the correct length drive belt be installed. The pulleys must also be correctly aligned and kept clean.

Accessory Drive Belt Routing



Front End Accessory Drive (FEAD) - 4.0L SOHC

Item	Part Number	Description
1	10300	Generator pulley
2	3A733	Power steering pump pulley
3	19D629	A/C compressor pulley

4	8509	Coolant pump pulley
5	6B321	Crankshaft damper
6	6B209	Drive belt tensioner pulley
7	6C348	Belt idler pulley
8	8620	Drive belt

Front End Accessory Drive (FEAD) - 4.6L (3V)

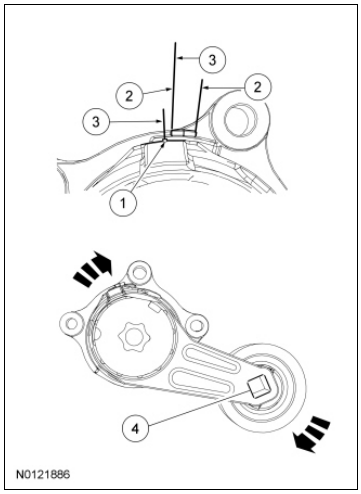
Item	Part Number	Description
1	19A216	Belt idler pulley
2	10300	Generator pulley
3	8620	Drive belt
4	19A216	Belt idler pulley
5	3A733	Power steering pump pulley
6	6C348	Belt idler pulley
7	8509	Coolant pump pulley
8	6316	Crankshaft pulley
9	6B209	Drive belt tensioner pulley
10	19D629	A/C compressor pulley

Accessory Drive

Inspection and Verification

NOTICE: **Under no circumstances should the accessory drive belt, tensioner or pulleys have any fluids or belt dressing applied to them as damage to the belt material and tensioner damping mechanism may occur.**

1. Verify the customer concern by operating the system.
2. Visually inspect for obvious signs of mechanical damage.



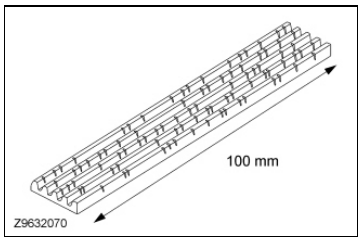
Visual Inspection Chart

Mechanical
• Drive belt cracking/chunking/wear • Belt/pulley contamination • Incorrect accessory drive belt • Incorrectly routed accessory drive belt • Pulley misalignment or excessive pulley runout • Loose or mislocated hardware • Incorrectly routed power steering tubes (rubbing) • Loose accessory drive belt • Damaged pulleys • Tensioner arm misalignment

Belt Tensioner With Belt Length Indicator

NOTE: Belt tensioner is shown in the free-state position against the arm travel stops.

NOTE: 6.2L engine accessory drive belt tensioner shown, other accessory drive belt tensioners similar.

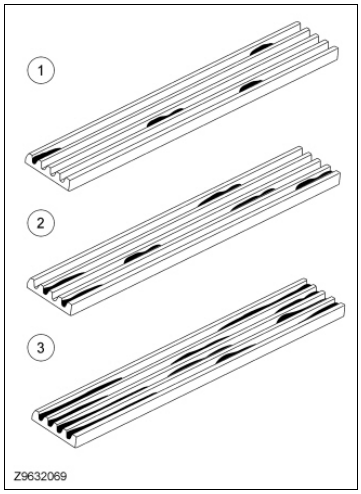


Item	Description
1	Belt length indicator
2	Acceptable belt installation and wear range
3	Belt replacement range
4	Belt tension relief point

3. Check that the belt length indicator, if equipped, on the belt tensioner is in the acceptable belt installation and wear range. If the indicator is in the belt replacement range, either an incorrect belt is installed or the belt is worn beyond the service limit. Install a new belt as necessary.

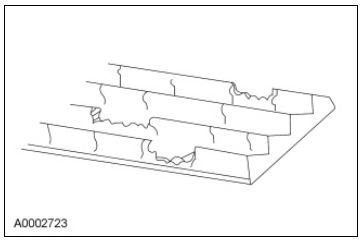
4. Eliminate all other non-belt related noises that could cause belt misdiagnosis, such as A/C compressor engagement chirp, A/C slugging noise, power steering cavitations at low temperatures, Variable Camshaft Timing (VCT) tick or generator whine.

5. If a concern is found, correct the condition before proceeding to the next step.



V-Ribbed Serpentine Drive Belt With Cracks Across Ribs

6. Check the belt for cracks. Up to 15 cracks in a rib over a distance of 100 mm (4.0 in) can be considered acceptable. If cracks exceed this standard, install a new belt.



V-Ribbed Serpentine Belt With Piling

NOTE: Piling is an excessive buildup in the V-grooves of the belt.

7. The condition of the V-ribbed drive belt should be compared against the illustration and appropriate action taken.
    1. Small scattered deposits of rubber material. This is not a concern, therefore, installation of a new belt is not required.
    2. Longer deposit areas building up to 50% of the rib height. This is not considered a durability concern, but it can result in excessive noise. If noise is apparent, install a new belt.
    3. Heavy deposits building up along the grooves resulting in a possible noise and belt stability concern. If heavy deposits are apparent, install a new belt.

V-Ribbed Serpentine Belt With Chunks of Rib Missing

8. There should be no chunks missing from the belt ribs. If the belt shows any evidence of this, install a new accessory drive belt.

9. If the concern is not visually evident, verify the symptom and GO to Symptom Chart .

Symptom Chart

Symptom Chart

Component Tests

Drive Belt - Noise/Flutter

NOTICE: **Under no circumstances should the accessory drive belt, tensioner or pulleys have any fluids or belt dressing applied to them as damage to the belt material and tensioner damping mechanism may occur.**

Drive belt chirp occurs due to pulley misalignment or excessive pulley runout. It can be the result of a damaged or incorrectly aligned grooved pulley.

To correct, determine the area where the noise comes from. Check each of the pulleys in that area with a straightedge to the crankshaft pulley. Look for accessory pulleys out of position in the fore/aft direction or at an angle to the straightedge.

Drive belt squeal may be an intermittent or constant noise that occurs when the drive belt slips on an accessory pulley under certain conditions.

A short intermittent squeal may occur during engine start up and shut down or during very rapid engine acceleration and decelerations, such as:

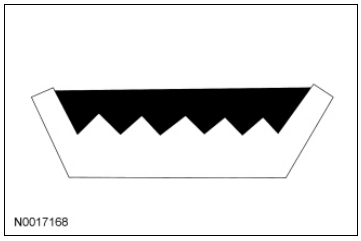
- Wide Open Throttle (WOT) 1-2 and 2-3 shifts or 2-3 and 3-4 back-out shifts on automatic transmissions.
- WOT 1-2 and 2-3 shifts and any combination of rapid downshifting on manual transmissions.

These special short-term transient events are expected, and are due to the higher system inertias required to meet the electrical and cooling demands on today's vehicle systems. Constant or reoccurring drive belt squeal can occur:

- if the A/C discharge pressure goes above specifications:
  - ♦ the A/C system is overcharged.
  - ♦ the A/C condenser core airflow is blocked.
  - ♦ the A/C anti-slugging strategy executes after a long hot heat soak.
- if the A/C off equalized pressure (the common discharged and suction pressure that occurs after several minutes) exceeds specifications.
- if any of the accessories or idler pulley(s) are damaged or have a worn or damaged bearing. All accessories should be rotatable by hand in the unloaded condition. If not, inspect the accessory.
- if there is evidence of fluid contamination on the accessory drive belt. When the drive belt has been exposed to fluid contamination during vehicle operation, such as leaks from the power steering system, A/C system or cooling system, clean all pulleys with soap and water, rinse with clean water and install a new accessory drive belt. If the drive belt has been exposed to fluids in a localized area during routine vehicle service, such as replacement of hoses or fluids, the drive belt and pulleys should be washed with soap and water immediately (prior to starting the engine), and rinsed with clean water.
- if the accessory drive belt is too long. A drive belt that is too long will allow the accessory drive belt tensioner arm to go all the way to the arm travel stop under certain load conditions, which will release tension to the drive belt. If the accessory drive belt tensioner indicator is outside the normal installation wear range window, install a new accessory drive belt.
- **NOTE:** The accessory drive belt tensioner arm should rotate freely without binding.

  Install a new accessory drive belt tensioner if the drive belt tensioner is worn or damaged.

Drive Belt - Incorrect Installation



NOTICE: **Incorrect accessory drive belt installation will cause excessive drive belt wear and may cause the drive belt to come off the pulleys.**

Non-standard accessory drive belts can track differently or incorrectly. If an accessory drive belt tracks incorrectly, install a new accessory drive belt to avoid performance failure or loss of the drive belt.

Incorrect Installation

Correct Installation

With the engine running, check accessory drive belt tracking on all pulleys. If the edge of the accessory drive belt rides beyond the edge of the pulleys, noise and premature wear will occur. Make sure the accessory drive belt rides correctly on the pulley. If an accessory drive belt tracking condition exists, proceed with the following:

- Visually check the accessory drive belt tensioner for damage and wear, especially the mounting pad surface and arm alignment. If the accessory drive belt tensioner is not installed correctly, the mounting surface pad will be out of position. If the tensioner arm is worn, the arm will be out of alignment. Either of these conditions will result in chirp and squeal noises.
- With the engine running, visually observe the grooves in the pulleys (not the pulley flanges or the pulley forward faces) for excessive wobble. Install new components as necessary.
- Check all accessories, mounting brackets and the accessory drive belt tensioner for any interference that would prevent the component from mounting correctly. Correct any interference condition and recheck the accessory drive belt tracking.
- Tighten all accessories, mounting brackets and accessory drive belt tensioner retaining hardware to specification. Recheck the accessory drive belt tracking.

Belt Tensioner - Mechanical

The only mechanical check that needs to be made is a check for tensioner stick, grab or bind.

1. With the engine off, check routing of the accessory drive belt. Refer to the illustrations under Accessory Drive in the Description and Operation portion of this section.

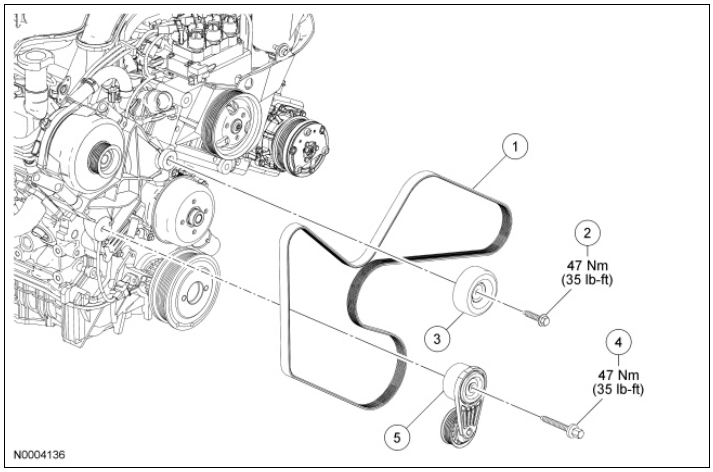
2. **NOTE:** The accessory drive belt tensioner spring is very strong and requires substantial force to release.

   Release the tension on the belt and detach the accessory drive belt from the tensioner. Carry out the following tests:

   - Move the tensioner from its relaxed position, through its full stroke and back to the relaxed position to make sure there is no stick, grab or bind, and to make sure that there is tension on the tensioner spring.

- Rotate the tensioner pulley by hand and check for a binding, contaminated or seized condition.
- Inspect the area surrounding the accessory drive belt tensioner for oil leaks or contamination and repair any leaks.

3. If the accessory drive belt tensioner does not meet the criteria in the previous step, install a new tensioner. If the accessory drive belt tensioner meets the criteria in the previous step, proceed to testing the tensioner dynamically.



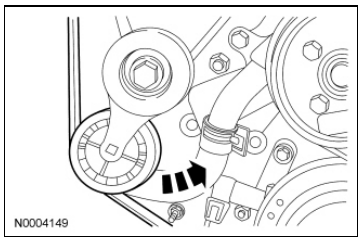
4. If the tensioner is saturated with oil and grease internally, install a new tensioner.

Belt Tensioner - Dynamics

The accessory drive belt tensioner can be checked dynamically as follows:

1. With the engine running, observe the accessory drive belt tensioner movement. The accessory drive tensioner should move (respond) when the A/C clutch cycles (if equipped), or when the engine is accelerated rapidly. If the accessory drive belt tensioner movement is excessive without A/C clutch cycling or engine acceleration, check belt rideout. Excessive belt rideout (uneven depth of grooves in the belt) can cause excessive accessory drive belt tensioner movement. Check rideout condition by installing a new belt. If excessive accessory drive belt tensioner movement still exists, install a new accessory drive belt tensioner.

Front End Accessory Drive (FEAD) - Exploded View, 4.0L SOHC



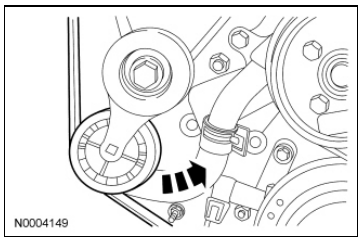
Item	Part Number	Description
1	8620	Accessory drive belt
2	-	Accessory drive belt idler pulley bolt
3	6C348	Accessory drive belt idler pulley
4	W500326-S437	Accessory drive belt tensioner bolt
5	6B209	Accessory drive belt tensioner

1. For additional information, refer to the procedures in this section.

Accessory Drive Belt - 4.0L SOHC

Removal and Installation

1. Rotate the accessory drive belt tensioner counterclockwise and remove the drive belt.

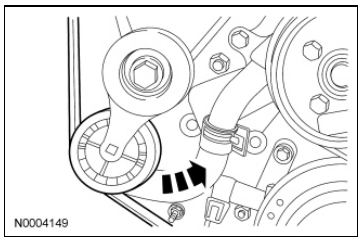


2. To install, reverse the removal procedure.
    - For correct belt routing, refer to Accessory Drive , Accessory Drive Belt Routing, Front End Accessory Drive (FEAD) - 4.0L SOHC in the Description and Operation portion of this section.

Accessory Drive Belt Idler Pulley - 4.0L SOHC

Removal and Installation

1. Rotate the accessory drive belt tensioner counterclockwise and remove the drive belt.

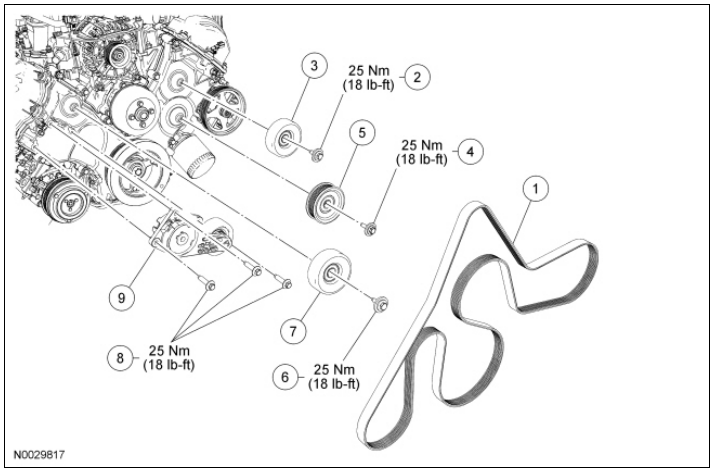


2. Remove the bolt and the accessory drive belt idler pulley.
   - To install, tighten to 47 Nm (35 lb-ft).

3. To install, reverse the removal procedure.
   - For correct belt routing, refer to Accessory Drive , Accessory Drive Belt Routing, Front End Accessory Drive (FEAD) - 4.0L SOHC in the Description and Operation portion of this section.

Accessory Drive Belt Tensioner - 4.0L SOHC

Removal and Installation



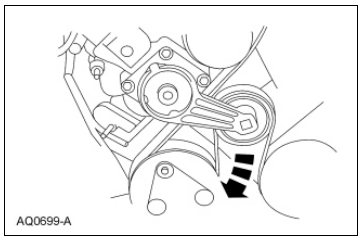
1. Rotate the accessory drive belt tensioner counterclockwise and remove the drive belt.

2. Remove the bolt and the accessory drive belt tensioner.
   - To install, tighten the bolt to 47 Nm (35 lb-ft).

3. To install, reverse the removal procedure.
   - For correct belt routing, refer to Accessory Drive , Accessory Drive Belt Routing, Front End Accessory Drive (FEAD) - 4.0L SOHC in the Description and Operation portion of this section.

Front End Accessory Drive (FEAD) - Exploded View, 4.6L (3V)

Item	Part Number	Description
1	8620	Accessory drive belt
2	N808102	Accessory drive belt idler pulley bolt
3	19A216	Accessory drive belt idler pulley
4	W707288	Accessory drive belt idler pulley bolt
5	6C348	Accessory drive belt idler pulley
6	N808102	Accessory drive belt idler pulley bolt
7	19A216	Accessory drive belt idler pulley
8	N808920	Accessory drive belt tensioner bolts (3 required)
9	6B209	Accessory drive belt tensioner



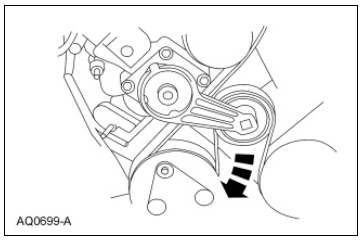
1. For additional information, refer to the procedures in this section.

Accessory Drive Belt - 4.6L (3V)

Removal and Installation

1. Remove the air cleaner outlet pipe. For additional information, refer to Section 303-12 .

2. Rotate the accessory drive belt tensioner clockwise and remove the accessory drive belt.



3. To install, reverse the removal procedure.
   - For correct belt routing, refer to Accessory Drive , Accessory Drive Belt Routing, Front End Accessory Drive (FEAD) - 4.6L (3V) in the Description and Operation portion of this section.

Accessory Drive Belt Idler Pulley - 4.6L (3V)

Removal and Installation

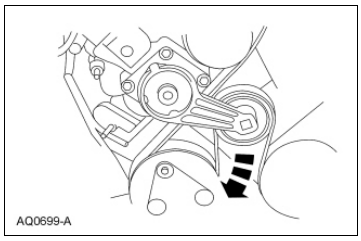
1. Remove the air cleaner outlet pipe. For additional information, refer to Section 303-12 .

2. Rotate the accessory drive belt tensioner clockwise and remove the drive belt.

3. **NOTE:** The 4.6L (3V) has 3 idler pulleys, an upper RH, an upper LH and a lower LH.

   Remove the bolt and the accessory drive belt idler pulley.

   - To install, tighten to 25 Nm (18 lb-ft).



4. To install, reverse the removal procedure.
   - For correct belt routing, refer to Accessory Drive , Accessory Drive Belt Routing, Front End Accessory Drive (FEAD) - 4.6L (3V) in the Description and Operation portion of this section.

Accessory Drive Belt Tensioner - 4.6L (3V)

Removal and Installation

1. Remove the air cleaner outlet pipe. For additional information, refer to Section 303-12 .

2. Rotate the accessory drive belt tensioner clockwise and remove the accessory drive belt.

3. Remove the bolts and the accessory drive belt tensioner.
   - To install, tighten to 25 Nm (18 lb-ft).

4. To install, reverse the removal procedure.
   - For correct belt routing, refer to Accessory Drive , Accessory Drive Belt Routing, Front End Accessory Drive (FEAD) - 4.6L (3V) in the Description and Operation portion of this section.

General Specifications

Item	Specification
Normal engine cranking speed	140-220 rpm
Starter motor no load current draw	60-80 amps
Starter motor normal load current draw	130-220 amps
Starter motor maximum load current draw	800 amps
Starter motor minimum stall torque (at 5 volts)	14.7 Nm (10.8 lb-ft)
Starter circuit maximum voltage drop (engine at normal operating temperature)	0.5 volt

Torque Specifications

Description	Nm	lb-ft	lb-in
Ground cable nut - 4.0L SOHC	20	-	177
Starter motor bolts and stud bolts	25	18	-
Starter solenoid B-terminal nut	12	-	106
Starter solenoid S-terminal nut	6	-	53

Starting System

The starting system consists of the following:

- Starter motor
- Starter solenoid
- Starter drive
- Starter relay
- Ignition switch
- Digital Transmission Range (TR) sensor
- Battery
- PCM
- Start diode (part of the One-Touch Integrated Start (OTIS) system)

The function of the starting system is to crank the engine at a speed fast enough to permit the engine to start.

When the ignition switch is turned to the START position, current flows to the starter relay. On 4.0L SOHC engines, the current first goes through the TR sensor, and the PCM provides a ground for the starter relay. On 4.6L (3V) engines, if the transmission sends a signal to the PCM indicating a PARK or NEUTRAL position, the PCM will ground the starter relay. When the starter relay is energized, current flows to the starter solenoid.

When the starter solenoid is energized, a magnetic field is created in the starter solenoid windings. The iron plunger core is drawn into the starter solenoid coil, and a drive lever and pin connected to the starter drive engages the drive pinion gear to the flexplate ring gear. When the plunger is pulled all the way in, the contact disc closes the circuit between the battery and the motor feed terminals. This sends current to the motor and the drive pinion gear cranks the flexplate to start the engine. When current flows to the starter motor, the starter solenoid pull-in coil is bypassed, and the hold-in coil keeps the drive pinion gear engaged with the flexplate.

One-Touch Integrated Start (OTIS)

The vehicle is equipped with OTIS , a computer-assisted cranking system. This feature assists in starting the engine. If the ignition key is turned to the START position and released when the engine begins cranking, the engine may continue cranking for up to 10 seconds or until the vehicle starts.

Once the ignition is turned to the START position and the vehicle is in NEUTRAL or PARK, the PCM reads starter motor request from the ignition switch and gains control of the starter engagement. The customer is no longer in the loop after the initial crank request, and the customer may release the key to the RUN position. The PCM will disengage the starter motor based on the following events:

- The engine is started (rpm threshold)
- A set time has been exceeded (calibrated)
- The ignition key has been turned to the OFF position

Starting System

Special Tool(s)

 ST2574-A	Flex Probe Kit 105-R025D or equivalent
 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Principles of Operation

The starting system is electronically controlled by the Passive Anti-Theft System (PATS). PATS is controlled by the instrument cluster. PATS recognizes the correct electronically coded ignition key and the instrument cluster will send a message to the PCM to provide a ground for the starter relay. The energized relay provides voltage to the starter solenoid with the key in the START position, thereby allowing the starter motor to activate.

Inspection and Verification

⚠ WARNING: Always disconnect the battery ground cable at the battery before disconnecting the starter motor battery terminal lead. If a tool is shorted at the starter motor battery terminal, the tool can quickly heat enough to cause a skin burn. Failure to follow this instruction may result in serious personal injury.

NOTE: When working on the starter system, make sure the anti-theft system is deactivated, if equipped.

1. Verify the customer concern by operating the starting system.
2. Remove the accessory drive belt. Refer to Section 303-05 . Verify the crankshaft and each of the components driven by the accessory drive belt rotate and are not seized or damaged.
3. Visually inspect for obvious signs of mechanical and electrical damage. Refer to the following chart:

Visual Inspection Chart

Mechanical	Electrical
	• Battery

• Starter motor • Brackets	• Failed fuse 11 (30A) • Damaged wiring harness • Loose or corroded connections • Starter relay • Anti-theft system

4. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

5. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

6. **NOTE:** The Vehicle Communication Module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM .
   - refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

7. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00 to diagnose no response from the PCM.

8. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record continuous memory DTCs.

9. Clear the continuous DTCs and carry out the self-test diagnostics for the PCM.

10. If the DTCs retrieved are related to the concern, go to PCM DTC Chart in this section For all other DTCs, refer to Section 419-10 .

11. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

PCM DTC Chart

PCM DTC Chart

DTC	Description	Action
P0512	Starter Request Circuit - Circuit has Power With the Ignition in the OFF Position	CARRY OUT the Ignition Switch Component Test. Refer to Wiring Diagrams Cell 149 for component testing. If necessary, INSTALL a new ignition switch. If the ignition switch passed the component test, REPAIR circuit CDC35 (BU/WH) for a short to power.
P0705	TR Sensor Circuit Failure	Refer to the appropriate section in Group 307 for the procedure.

P0706	TR Sensor Circuit Failure	Refer to the appropriate section in Group 307 for the procedure.
P0708	TR Sensor Circuit Failure	Refer to the appropriate section in Group 307 for the procedure.
P0709	TR Sensor Circuit Failure	Refer to the appropriate section in Group 307 for the procedure.

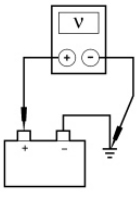
Symptom Chart

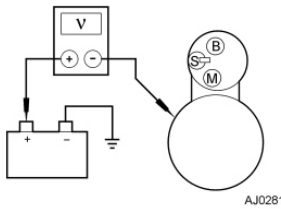
Symptom Chart

Pinpoint Tests

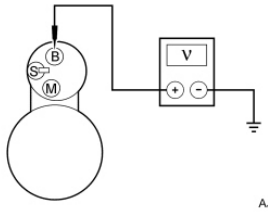
Pinpoint Test A: The Engine Does Not Crank/The Relay Does/Does Not Click

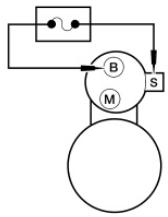
Refer to Wiring Diagrams Cell 20 , Starting System for schematic and connector information.



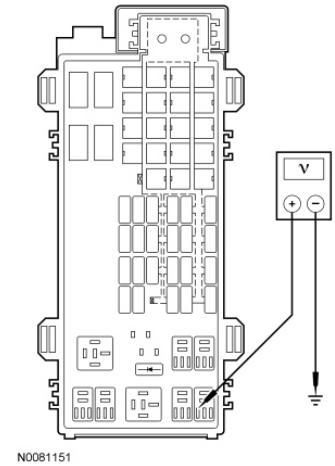


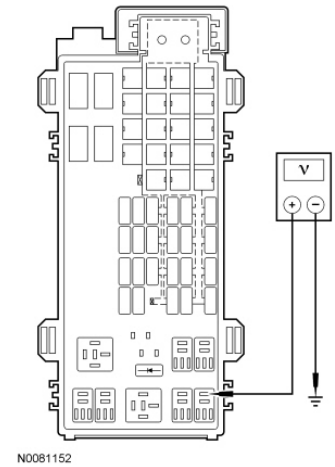
Under normal operation, constant power is supplied to the starter motor relay from Battery Junction Box (BJB) fuse 11 (30A). When the ignition switch is turned in the START position and held, power flows to the start diode through circuit CDC35 (BU/WH). Power then flows to the digital Transmission Range (TR) sensor (4.0L SOHC engines only) and to the starter motor relay through circuit CDC38 (WH/VT). On vehicles equipped with a 4.6L 3V engine, the PCM will receive a voltage signal from the transmission when the vehicle is in Park or Neutral through circuit CET40 (GN/OG). A ground is supplied through circuit CDC12 (YE) from the PCM, causing the starter motor relay coil to energize and the relay contacts to close. This allows power to be supplied from the starter motor relay contacts which then flows through circuit CDC25 (BN/GN) to the starter solenoid. The solenoid is grounded at the starter motor. Energizing the starter solenoid engages the starter drive into the ring gear and closes the solenoid contacts, allowing power directly from the battery through circuit SDC02 (RD) to the starter motor to start the engine.



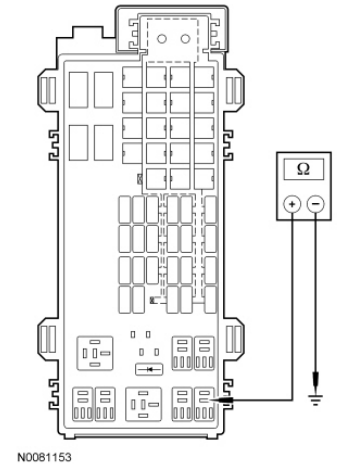


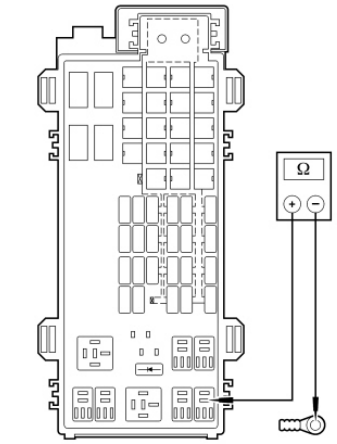
This pinpoint test is intended to diagnose the following:



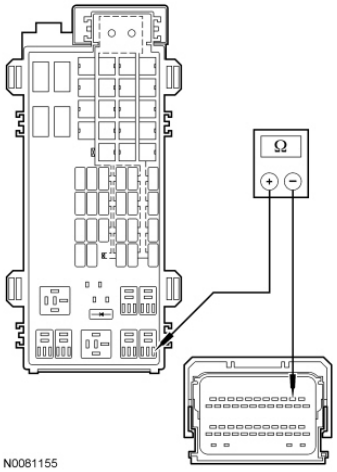


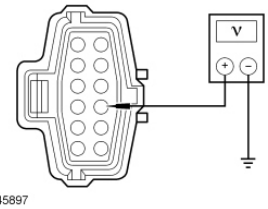
- Battery
- Starter motor
- Passive Anti-Theft System (PATS)
- Starter relay
- Ignition switch
- Digital TR sensor (4.0L SOHC only)
- Circuitry
- PCM
- Start diode
- Park/Neutral switch signal (integral to the mechatronics unit - 4.6L 3V only)





PINPOINT TEST A: THE ENGINE DOES NOT CRANK/THE RELAY DOES/DOES NOT CLICK





Test Step	Result / Action to Take
A1 CHECK THE BATTERY	
• Check the battery condition and charge. Refer to Section 414-00 . • **Is the battery OK?**	**Yes** GO to A2 . **No**

	CHARGE or INSTALL a new battery as required. TEST the system for normal operation.
A2 CHECK THE PCM FOR DTCs	
• Check for PCM DTCs. • **Were any PCM DTCs retrieved?**	**Yes** If PCM DTC P1260 is retrieved, REFER to Section 419-01 . All other PCM DTCs, REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** GO to A3 .
A3 CHECK THE BATTERY GROUND CABLE	
• Measure the voltage between the positive battery post and the battery ground cable connection at the cylinder block.  AJ0280-A • **Is the voltage reading greater than 10 volts?**	**Yes** GO to A4 . **No** INSTALL a new battery ground cable. TEST the system for normal operation.
A4 CHECK THE STARTER MOTOR GROUND	
• Measure the voltage between the positive battery post and the starter motor case.  AJ0281-A • **Is the voltage reading greater than 10 volts?**	**Yes** GO to A5 . **No** CLEAN the starter motor mounting flange and make sure the starter motor is correctly mounted. TEST the system for normal operation.
A5 CHECK THE POWER SUPPLY TO THE STARTER MOTOR	
• Ignition OFF. • Measure the voltage at the starter motor B-terminal.	**Yes** GO to A6 . **No** CLEAN, TIGHTEN or INSTALL a new positive battery cable. TEST the system for normal operation.

 AJ0278-A • **Is the voltage reading greater than 10 volts?**	
A6 CHECK THE STARTER MOTOR	
• Connect one end of a fused jumper wire to the B-terminal of the starter motor and momentarily connect the other end to the starter solenoid S-terminal.  N0076529 • **Does the starter motor engage and the engine crank?**	**Yes** GO to A7 . **No** INSTALL a new starter motor. REFER to Starter Motor - 4.0L SOHC or Starter Motor - 4.6L (3V) in this section. TEST the system for normal operation.
A7 CHECK THE START INPUT TO THE STARTER MOTOR	
• Disconnect: Starter S-Connector. • Measure the voltage at the starter motor solenoid S-connector with the key in the START position. • **Is the voltage reading greater than 10 volts?**	**Yes** CLEAN the starter solenoid S-terminal and connector. CHECK the wiring and the starter motor for a loose or intermittent connection. TEST the system for normal operation. **No** GO to A8 .
A8 CHECK THE START INPUT TO THE STARTER RELAY	
• Disconnect: Starter Relay. • Measure the voltage at starter relay pin 1, circuit CDC38 (WH/VT) with the key in the START position.	**Yes** GO to A9 . **No** If the vehicle is equipped with a 4.0L SOHC engine, GO to A14 . If the vehicle is equipped with a 4.6L (3V) engine, GO to A24 .

 N0081151 • **Is the voltage reading greater than 10 volts?**	
A9 CHECK THE BATTERY SUPPLY TO THE STARTER RELAY	
• Ignition OFF. • Measure the voltage at starter relay pin 3, circuit SBB11 (BU/RD).  N0081152 • **Is the voltage reading greater than 10 volts?**	**Yes** GO to A10 . **No** REPAIR circuit SBB11 (BU/RD) for an open. TEST the system for normal operation.
A10 CHECK CIRCUIT CDC25 (BN/GN) FOR A SHORT TO GROUND	
• Disconnect: Starter S-Connector. • Measure the resistance between starter relay pin 5, circuit CDC25 (BN/GN) and ground.	**Yes** REPAIR circuit CDC25 (BN/GN) for a short to ground. TEST the system for normal operation. **No** GO to A11 .

 N0081153 • **Is the resistance reading less than 10,000 ohms?**	
A11 CHECK CIRCUIT CDC25 (BN/GN) FOR AN OPEN	
• Measure the resistance of circuit CDC25 (BN/GN) between starter relay pin 5 and the starter S-connector.  N0081154 • **Is the resistance reading less than 5 ohms?**	**Yes** GO to A12 . **No** REPAIR circuit CDC25 (BN/GN) for an open. TEST the system for normal operation.
A12 CHECK CIRCUIT CDC12 (YE) FOR AN OPEN	
• Disconnect: PCM C175B. • Measure the resistance between starter relay pin 2, circuit CDC12 (YE) and PCM C175B pin 2, circuit CDC12 (YE).	**Yes** GO to A13 . **No** REPAIR circuit CDC12 (YE) for an open. TEST the system for normal operation.

 • **Is the resistance less than 5 ohms?**	
A13 CHECK THE STARTER RELAY	
• Carry out the Starter Mini ISO Relay Component Test. Refer to Wiring Diagrams Cell 149 for component testing. • **Is the starter relay good?**	**Yes** DIAGNOSE the PCM. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** INSTALL a new starter relay. TEST the system for normal operation.
A14 CHECK THE START INPUT TO THE DIGITAL TR SENSOR - 4.0L SOHC	
• Disconnect: TR Sensor C167. • Measure the voltage at the digital TR sensor C167-10, circuit CDC38 (WH/VT) with the key in the START position.  • **Is the voltage reading greater than 10 volts?**	**Yes** GO to A15 . **No** GO to A18 .
A15 CHECK CIRCUIT CDC38 (WH/VT) FOR A SHORT TO GROUND - 4.0L SOHC	
• Measure the resistance between digital TR sensor C167-12, circuit CDC38 (WH/VT) and ground.	**Yes** REPAIR circuit CDC38 (WH/VT) for a short to ground. TEST the system for normal operation. **No** GO to A16 .

 N0073975 • **Is the resistance reading less than 10,000 ohms?**	
A16 CHECK CIRCUIT CDC38 (WH/VT) FOR AN OPEN - 4.0L SOHC	
• Measure the resistance between starter relay pin 1, circuit CDC38 (WH/VT) and digital TR sensor C167-12, circuit CDC38 (WH/VT).  N0081156 • **Is the resistance less than 5 ohms?**	**Yes** GO to A17 . **No** REPAIR circuit CDC38 (WH/VT) for an open. TEST the system for normal operation.
A17 CHECK DIGITAL TR SENSOR ADJUSTMENT - 4.0L SOHC	
• Carry out the digital TR sensor adjustment. Refer to Section 307-01A . • **Is the digital TR sensor adjusted correctly?**	**Yes** INSTALL a new digital TR sensor. TEST the system for normal operation. **No** ADJUST the digital TR sensor as necessary. TEST the system for normal operation.
A18 CHECK FOR BATTERY POWER AT THE START DIODE - 4.0L SOHC	
• Disconnect: Start Diode. • Measure the voltage at the input side of the start diode circuit CDC35 (BU/WH).	**Yes** GO to A19 . **No** GO to A21 .

 N0081157 • **Is the voltage reading greater than 10 volts?**	
A19 CHECK CIRCUIT CDC38 (WH/VT) FOR AN OPEN - 4.0L SOHC	
• Measure the resistance between start diode output side, circuit CDC38 and digital TR sensor C167-10, circuit CDC38 (WH/VT). • **Is the resistance less than 5 ohms?**	**Yes** GO to A20 . **No** REPAIR circuit CDC38 (WH/VT). TEST the system for normal operation.
A20 CHECK CIRCUIT CDC38 FOR A SHORT TO GROUND - 4.0L SOHC	
• Measure the resistance between digital TR sensor C167-10, circuit CDC38 (WH/VT) and ground.  N0073988 • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new start diode. TEST the system for normal operation. **No** REPAIR circuit CDC38 (WH/VT) for a short to ground. TEST the system for normal operation.
A21 CHECK FOR BATTERY POWER AT THE IGNITION SWITCH - 4.0L SOHC	
• Disconnect: Ignition Switch C250. • Measure the voltage at ignition switch C250 pin 4, circuit SBP08 (VT/RD).	**Yes** GO to A22 . **No** REPAIR circuit SBP08 (VT/RD). TEST the system for normal operation.

 N0045923 • **Is the voltage reading greater than 10 volts?**	
A22 CHECK CIRCUIT CDC35 (BU/WH) FOR AN OPEN - 4.0L SOHC	
• Check the resistance between ignition switch C250 pin 7, circuit CDC35 (BU/WH) and start diode input side, circuit CDC35 (BU/WH).  N0081158 • **Is the resistance reading less than 5 ohms?**	**Yes** GO to A23 . **No** REPAIR circuit CDC35 (BU/WH) for an open. TEST the system for normal operation.
A23 CHECK CIRCUIT CDC35 (BU/WH) FOR A SHORT TO GROUND - 4.0L SOHC	
• Measure the resistance between ignition switch C250 pin 7, circuit CDC35 (BU/WH) and ground.  N0045925 • **Is the resistance reading greater than 10,000 ohms?**	**Yes** INSTALL a new ignition switch. TEST the system for normal operation **No** REPAIR circuit CDC35 (BU/WH) for a short to ground. TEST the system for normal operation.
A24 CHECK FOR VOLTAGE ON CIRCUIT CET40 (GN/OG) AT PCM CONNECTOR - 4.6L (3V)	

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.** • Ignition OFF. • Disconnect: PCM C175T. • Ignition ON. • Measure the voltage between PCM C175T-19, circuit CET40 (GN/OG), harness side and ground while moving the selector lever from PARK to NEUTRAL.  N0080106 • **Is the voltage greater than 10 volts with the selector lever in PARK and NEUTRAL?**	**Yes** GO to A27 . **No** GO to A25 .
A25 CHECK CIRCUIT CET40 (GN/OG) FOR A SHORT TO GROUND - 4.6L (3V)	
NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.** • Measure the resistance between C175B-30, circuit CET40 (GN/OG), harness side and ground.  N0080105 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to A26 . **No** REPAIR circuit CET40 (GN/OG). TEST the system for normal operation.
A26 CHECK CIRCUIT CET40 (GN/OG) FOR AN OPEN - 4.6L (3V)	
NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.** • Ignition OFF. • Disconnect: PCM C1575. • Measure the resistance between PCM C175T-19, circuit CET40 (GN/OG), harness side and transmission C1575-10, circuit CET40 (GN/OG), harness side.	**Yes** Replace the transmission mechatronics unit. REFER to Section 307-01B . TEST the system for normal operation. **No** REPAIR circuit CET40 (GN/OG). TEST the system for normal operation.

 • **Is the resistance less than 5 ohms?**	
A27 CHECK FOR BATTERY POWER AT THE START DIODE - 4.6L (3V)	
• Measure the voltage at the start diode input side, circuit CDC35 (BU/WH).  • **Is the voltage 10 volts or greater?**	**Yes** GO to A28 . **No** GO to A30 .
A28 CHECK CIRCUIT CDC38 (WH/VT) FOR AN OPEN - 4.6L (3V)	
• Measure the resistance between starter relay pin 1, circuit CDC38 (WH/VT) and start diode output side circuit CDC38 (WH/VT).	**Yes** GO to A29 . **No** REPAIR circuit CDC38 (WH/VT) for an open. TEST the system for normal operation.

 N0081159 • **Is the resistance less than 5 ohms?**	
A29 CHECK CIRCUIT CDC38 (WH/VT) FOR A SHORT TO GROUND - 4.6L (3V)	
• Measure the resistance between starter relay pin 1, circuit CDC38 (WH/VT) and ground.  N0081160 • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new start diode. TEST the system for normal operation. **No** REPAIR circuit CDC38 (WH/VT) for a short to ground. TEST the system for normal operation.
A30 CHECK FOR BATTERY POWER AT THE IGNITION SWITCH - 4.6L (3V)	
• Disconnect: Ignition Switch C250. • Measure the voltage at ignition switch C250 pin 4, circuit SBP08 (VT/RD).  N0045923	**Yes** GO to A31 . **No** REPAIR circuit SBP08 (VT/RD). TEST the system for normal operation.

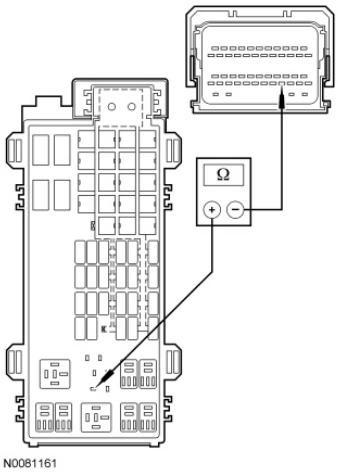
• **Is the voltage reading greater than 10 volts?**	
A31 CHECK CIRCUIT CDC35 (BU/WH) FOR AN OPEN - 4.6L (3V)	
• Measure the resistance between ignition switch C250 pin 7, circuit CDC35 (BU/WH) and start diode input side, circuit CDC35 (BU/WH)  • **Is the resistance less than 5 ohms?**	**Yes** GO to A32 . **No** REPAIR circuit CDC35 (BU/WH) for an open. TEST the system for normal operation.
A32 CHECK CIRCUIT CDC35 (BU/WH) FOR A SHORT TO GROUND - 4.6L (3V)	
• Measure the resistance between ignition switch C250 pin 7, circuit CDC35 (BU/WH) and ground.  • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new ignition switch. TEST the system for normal operation. **No** REPAIR circuit CDC35 (BU/WH) for a short to ground. TEST the system for normal operation.

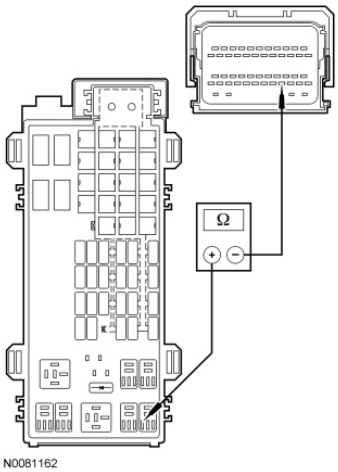
Pinpoint Test B: One-Touch Integrated Start (OTIS) Does Not Operate Correctly

Refer to Wiring Diagrams Cell 20 , Starting System for schematic and connector information.

Normal Operation

When the ignition switch is turned in the START position and released, the PCM receives a starter motor request signal through circuit CDC35 (BU/WH). With the vehicle in PARK or NEUTRAL, power flows from the PCM to the starter motor relay through circuit CDC38 (WH/VT). A ground is supplied through circuit CDC12 (YE) from the PCM causing the starter motor relay coil to energize and the relay contacts close. This allows power from starter motor relay through circuit CDC25 (BN/GN) to the starter solenoid. The solenoid is



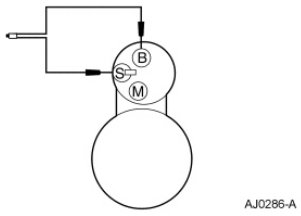


grounded at the starter motor. Energizing the starter solenoid will engage the starter drive into the ring gear and close the solenoid contacts, allowing power directly from the battery through circuit SDC02 (RD) to the starter motor to start the engine. The customer is no longer in the loop after the initial crank request, and the customer may release the key to the RUN position. The PCM will disengage the starter motor based on engine running (rpm threshold), a set crank time has been exceeded or the ignition switch has been turned to the OFF position.

This pinpoint test is intended to diagnose the following:

- Circuitry
- PCM

PINPOINT TEST B: ONE-TOUCH INTEGRATED START (OTIS) DOES NOT OPERATE CORRECTLY



Test Step	Result / Action to Take
B1 CHECK THE STATUS OF OTIS (OTS_STAT) PID	
• Enter the following diagnostic mode on the scan tool: PCM DataLogger/PID. • Monitor the PCM PID OTS_STAT with the ignition switch in the RUN position. • **Is the OTIS PID enabled?**	**Yes** GO to B2 . **No** ENABLE OTIS TEST the system for normal operation. If OTIS will not enable, INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation.
B2 CHECK THE KEY POSITION FOR START INDICATED (START_KEY) PID	
• Enter the following diagnostic mode on the scan tool: PCM DataLogger/PID. • Monitor the PCM PID START_KEY with the ignition switch in the START position. • **Does the PID change from OFF to ON?**	**Yes** GO to B4 . **No** GO to B3 .
B3 CHECK CIRCUIT CDC38 (WH/VT)	
• Disconnect: Start Diode. • Disconnect: PCM C175B. • Measure the resistance between the start diode, circuit CDC38 (WH/VT), harness side and PCM C175B-38, circuit CDC38 (WH/VT), harness side.	**Yes** INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation. **No** REPAIR circuit CDC38 (WH/VT). TEST the system for normal operation.

 N0081161 • **Is the resistance less than 5 ohms?**	
B4 CHECK THE STARTER MOTOR RELAY ENABLE (STRT_RLY) PID	
• Enter the following diagnostic mode on the scan tool: PCM DataLogger/PID. • Monitor the PCM PID STRT_RLY with the ignition switch in the START position. • **Does the PID change from DISABLED to ENABLED?**	**Yes** GO to B6 . **No** GO to B5 .
B5 CHECK THE CIRCUIT CDC38 (WH/VT) BETWEEN THE STARTER RELAY AND THE PCM	
• Ignition OFF. • Disconnect: PCM C175B. • Disconnect: Smart Junction Box (SJB) C2280B. • Measure the resistance between the starter motor relay pin 1, circuit CDC38 (WH/VT), harness side and PCM C175b-38, circuit CDC38 (WH/VT), harness side.  N0081162 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation. **No** REPAIR circuit CDC38 (WH/VT). TEST the system for normal operation.

B6 CHECK THE STARTER MOTOR CONTROL OUTPUT DETECTED (SMC_MON) PID	
• Enter the following diagnostic mode on the scan tool: PCM DataLogger/PID. • Monitor the PCM PID SMC_MON with the ignition switch in the START position. • **Does the PID change from OFF to ON?**	**Yes** REPAIR circuit CDC12 (YE). TEST the system for normal operation. **No** INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation.

Pinpoint Test C: Unusual Starter Noise

PINPOINT TEST C: UNUSUAL STARTER NOISE

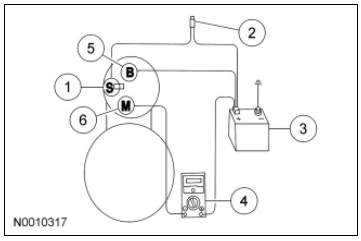
Test Step	Result / Action to Take
C1 CHECK THE STARTER MOUNTING	
• Inspect the starter mounting bolts and brackets for looseness, and the starter housing to confirm a flush, tight fit to the rear cover plate. • **Is the starter motor mounted correctly?**	**Yes** GO to C2 . **No** INSTALL the starter motor correctly. REFER to Starter Motor - 4.0L SOHC or Starter Motor - 4.6L (3V) in this section. TEST the system for normal operation.
C2 CHECK FOR ENGINE NOISE	
• Ignition OFF. • Connect a remote starter switch between the starter solenoid B- and S-terminals.  AJ0286-A • Engage the starter motor and verify that the noise is due to the starter operation. • **Is the noise due to the starter motor engagement?**	**Yes** GO to C3 . **No** REFER to Section 303-00 to continue the diagnosis.
C3 CHECK FOR UNUSUAL WEAR	
• Remove the starter motor. Refer to Starter Motor - 4.0L SOHC or Starter Motor - 4.6L (3V) in this section.	**Yes** INSTALL a flexplate. REFER to Section 303-01A for 4.0L SOHC engines or Section 303-01B for 4.6L (3V) engines. EXAMINE the starter pinion teeth. If damaged, INSTALL a new starter motor.

• Inspect the ring gear for damaged or worn teeth. • **Is the noise due to ring gear tooth damage?**	REFER to Starter Motor - 4.0L SOHC or Starter Motor - 4.6L (3V) in this section. TEST the system for normal operation. **No** INSTALL a new starter motor. REFER to Starter Motor - 4.0L SOHC or Starter Motor - 4.6L (3V) in this section. TEST the system for normal operation.

Component Tests

Starter Motor - Voltage Drop Test

⚠ **WARNING: Always disconnect the battery ground cable at the battery before disconnecting the starter motor battery terminal lead. If a tool is shorted at the starter motor battery terminal, the tool can quickly heat enough to cause a skin burn. Failure to follow this instruction may result in serious personal injury.**



NOTICE: **A protective cap or boot is provided over the battery input terminal on all vehicle lines and must be installed after servicing, or the vehicle may be damaged.**

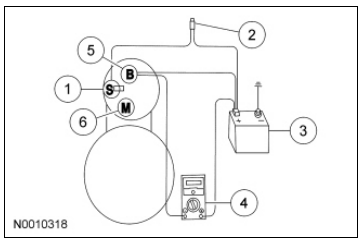
Always make the Rotunda 73 Digital Multimeter connections at the component terminal rather than at the wiring end connector. Making a connection at the wiring end connector could result in false readings because the meter will not pick up a high resistance between the wiring connector and the component.

Starter Motor - Motor Feed Circuit

1. Make sure the battery is fully charged. Refer to Section 414-00 .
2. Disconnect the Inertia Fuel Shutoff (IFS) switch.
3. Connect a remote starter switch between the starter solenoid S-terminal and the battery positive (+) terminal.
4. Connect the Rotunda 73 Digital Multimeter positive lead to the battery positive (+) post. Connect negative lead to the starter solenoid M-terminal.

Motor Feed Circuit

Item	Part Number	Description
1	-	S-terminal (part of 11002)
2	-	Remote starter switch
3	10653	Battery
4	-	Rotunda 73 Digital Multimeter



5	-	B-terminal (part of 11002)
6	-	M-terminal (part of 11002)

5. Engage the remote starter switch. Read and record the voltage. The voltage reading should be 0.5 volt or less.

6. If the voltage reading is 0.5 volt or less, go to the Starter Motor - Motor Ground Circuit component test in this section.

7. If the voltage reading is greater than 0.5 volt, indicating excessive resistance, move the Rotunda 73 Digital Multimeter negative lead to the starter solenoid B-terminal and repeat the test. If the voltage reading at the B-terminal is lower than 0.5 volt, the concern is either in the connections at the starter solenoid or in the solenoid contacts.

Motor Feed Circuit

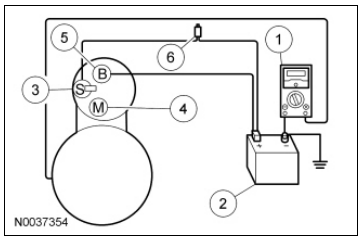
Item	Part Number	Description
1	-	S-terminal (part of 11002)
2	-	Remote starter switch
3	10653	Battery
4	-	Rotunda 73 Digital Multimeter
5	-	B-terminal (part of 11002)
6	-	M-terminal (part of 11002)

8. Remove the cables from solenoid B-, S- and M-terminals. Clean the cables and connections and reinstall the cables to the correct terminals. Repeat Steps 3 through 6. If the voltage drop reading is still greater than 0.5 volt when checked at the M-terminal and less than 0.5 volt when checked at the B-terminal, the concern is in the solenoid contacts. Install a new starter motor.

9. If the voltage reading taken at the solenoid B-terminal is still greater than 0.5 volt after cleaning the cables and connections at the solenoid, the concern is either in the positive (+) battery cable connection or in the positive battery cable itself.

10. By moving the Rotunda 73 Digital Multimeter negative lead toward the battery and checking each mechanical connection point, the excessive voltage drop can be located. When the high reading disappears, the last mechanical point that was checked is the concern. Repair or install a new connection as required.

Starter Motor - Motor Ground Circuit



A slow cranking condition can be caused by resistance in the ground or return portion of the cranking circuit. Check the voltage drop in the ground circuit as follows:

1. Disconnect the IFS switch.

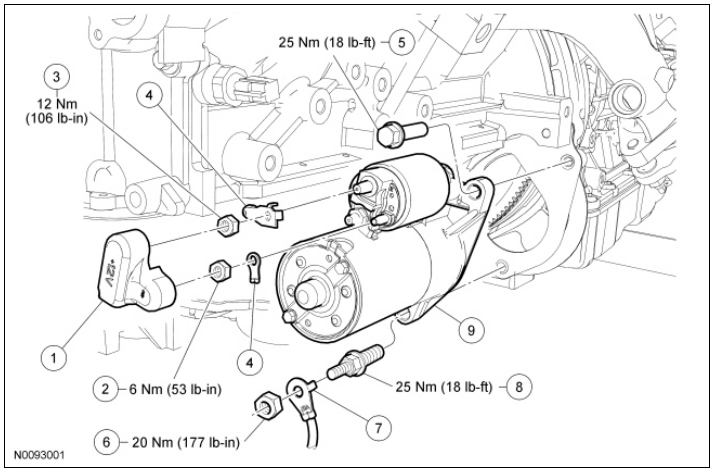
2. Connect a remote starter switch between the starter solenoid S-terminal and the battery positive (+) terminal.

3. Connect the Rotunda 73 Digital Multimeter positive lead to the starter motor housing (the connection must be clean and free of rust or grease). Connect the negative lead to the negative (-) battery terminal.

Motor Ground Circuit

Item	Part Number	Description
1	-	Rotunda 73 Digital Multimeter
2	10653	Battery
3	-	S-terminal (part of 11002)
4	-	M-terminal (part of 11002)
5	-	B-terminal (part of 11002)
6	-	Remote starter switch

4. Engage the remote starter switch and crank the engine. Read and record the voltage reading. The reading should be 0.5 volt or less.



5. If the voltage drop is more than 0.5 volt, clean the negative cable connections at the battery and body connections, and retest.

6. If the voltage drop is greater than 0.5 volt, determine which way the current is flowing in the cable. Connect the Rotunda 73 Digital Multimeter positive lead to the end of the cable nearest battery positive.

7. Connect the multimeter negative lead to the terminal at the other end of the cable.

8. Crank the engine and observe the voltage reading. The voltage reading should be 0.5 volt or lower. If the voltage drop is too high, clean the terminal ends. Retest, and if still high, install a new cable. If the voltage reading is less than 0.5 volt and the engine still cranks slowly, install a new starter motor.

Starter Motor - 4.0L SOHC

Item	Part Number	Description
1	11N087	Starter motor solenoid terminal cover
2	W705790	Starter motor S-terminal nut
3	-	Starter motor B-terminal nut
4	14A280	Starter motor solenoid cables
5	W500320	Starter motor bolt
6	N802001	Ground cable nut
7	-	Ground cable
8	W710601	Starter motor stud bolt
9	11002	Starter motor

Removal and Installation

⚠ WARNING: Always disconnect the battery ground cable at the battery before disconnecting the starter motor battery terminal lead. If a tool is shorted at the starter motor battery terminal, the tool can quickly heat enough to cause a skin burn. Failure to follow this instruction may result in serious personal injury.

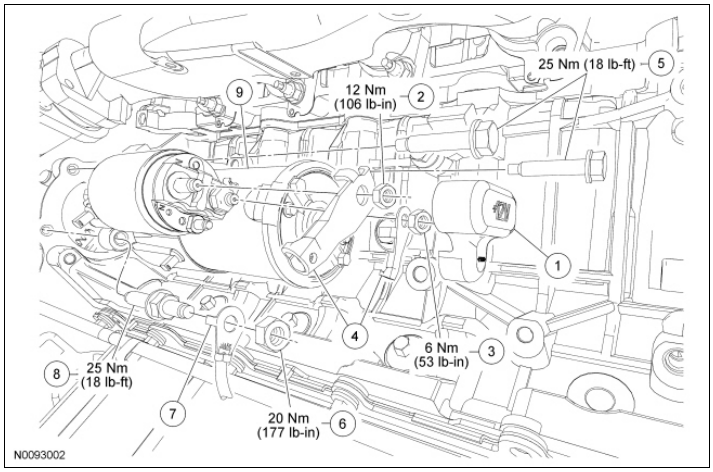
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

3. Remove the starter motor solenoid terminal cover.

4. Remove the B-terminal nut and disconnect the cable.
   - To install, tighten to 12 Nm (106 lb-in).

5. Remove the S-terminal nut and disconnect the cable.
   - To install, tighten to 6 Nm (53 lb-in).



6. Remove the nut and position the ground cable aside.

- To install, tighten to 20 Nm (177 lb-in).

7. Remove the bolt, the stud bolt and the starter.
   - To install, tighten to 25 Nm (18 lb-ft).

8. To install, reverse the removal procedure.
   - Tighten the upper bolt before tightening the lower fastener.

Starter Motor - 4.6L (3V)

Item	Part Number	Description
1	11N078	Starter motor solenoid terminal cover
2	-	B-terminal nut
3	W705790	S-terminal nut
4	14463	Starter motor solenoid cables
5	W704942	Starter motor bolts (2 required)
6	N802001	Ground cable nut
7	-	Ground cable
8	W704941	Starter motor stud bolt
9	11000	Starter motor

Removal and Installation

⚠ WARNING: Always disconnect the battery ground cable at the battery before disconnecting the starter motor battery terminal lead. If a tool is shorted at the starter motor battery terminal, the tool can quickly heat enough to cause a skin burn. Failure to follow this instruction may result in serious personal injury.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

3. Remove the starter solenoid terminal cover.

4. Remove the B-terminal nut and disconnect the cable.
   - To install, tighten to 12 Nm (106 lb-in).

5. Remove the S-terminal nut and disconnect the cable.
   - To install, tighten to 6 Nm (53 lb-in).

6. Remove the nut and disconnect the ground cable from the stud bolt.

- To install, tighten to 20 Nm (177 lb-in).

7. Remove the bolts, the stud bolt and the starter.
   - To install, tighten to 25 Nm (18 lb-ft).

8. To install, reverse the removal procedure.
   - Tighten the upper bolt before tightening the lower fasteners.

Material

Item	Specification	Fill Capacity
Silicone Brake Caliper Grease and Dielectric Compound XG-3-A	ESE-M1C171-A	-

General Specifications

Item	Specification
Base ignition timing	10 degrees Before Top Dead Center (BTDC), Non-adjustable
Firing order	1-4-2-5-3-6
Spark plug gap	1.32-1.42 mm (0.052-0.056 in)
Spark plug type	AGSF24N

Torque Specifications

Description	Nm	lb-in
Ignition coil bolts	6	53
Spark plugs	17	150

Engine Ignition

The ignition system consists of the following:

- Crankshaft Position (CKP) sensor
- Ignition coil
- Spark plug wires
- Spark plugs

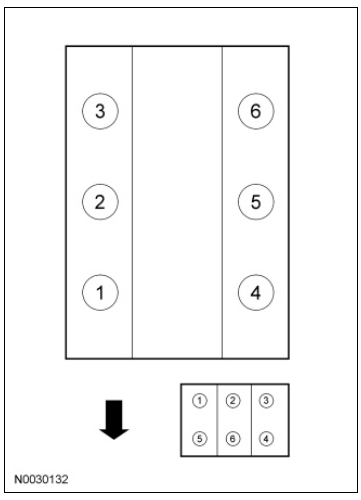
The CKP sensor:

- is a variable reluctance sensor.
- is mounted on the engine front cover.
- is triggered by a 36-minus-1 tooth trigger wheel located on the crankshaft damper pulse ring.
- provides ignition timing and crankshaft speed to the PCM.

The ignition coil:

- changes low-voltage pulses from the PCM to high-voltage pulses.
- fires 2 spark plugs simultaneously.
- has 3 transformers.
    - One transformer fires the spark plugs for cylinders 1 and 5
    - One transformer fires the spark plugs for cylinders 2 and 6
    - One transformer fires the spark plugs for cylinders 3 and 4

Spark plug wires:

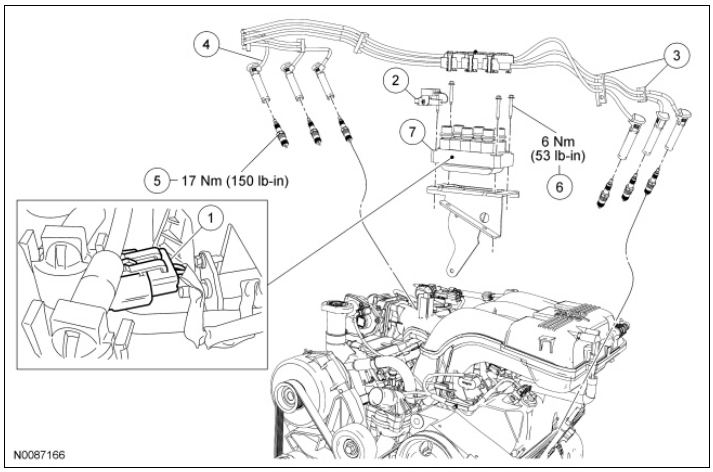


- carry high-voltage pulses from the ignition coil to the spark plugs.

The spark plugs:

- change high-voltage pulses to spark at the gap, which ignites the fuel and air mixture.

The firing order is 1-4-2-5-3-6.



Coil Terminal-to-Cylinder Relationship

Engine Ignition

Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Engine Ignition Components - Exploded View

Item	Part Number	Description
1	14A464	Ignition coil electrical connector
2	14489	Radio noise suppressor electrical connector
3	12297	Spark plug wire retainers
4	12286	Spark plug wire (6 required)
5	12405	Spark plug (6 required)
6	W706216-S	Ignition coil bolt (4 required)
7	12029	Ignition coil

1. For additional information, refer to the procedures in this section.

Ignition Coil

Material

Item	Specification
Silicone Brake Caliper Grease and Dielectric Compound XG-3-A	ESE-M1C171-A

Removal and Installation

1. Disconnect the ignition coil electrical connector.

2. Disconnect the radio noise suppressor electrical connector.

3. ***NOTICE:*** **It is important to twist the spark plug wire boot while pulling upward to avoid possible damage to the spark plug wire.**

   NOTE: Spark plug wires must be connected to the correct ignition coil terminal. For additional information, refer to the Cylinder-to-Coil Terminal Relationship, Engine Ignition in the Description and Operation portion of this section.

   Squeeze the tabs and twist, while pulling upward to disconnect the 6 spark plug wires from the ignition coil.

4. Remove the 4 bolts and the ignition coil.
   - To install, tighten to 6 Nm (53 lb-in).

5. **NOTE:** Apply silicone dielectric compound to the inside of the ignition coil boots.

   To install, reverse the removal procedure.

Spark Plug Wires

Special Tool(s)

 ST1394-A	Remover, Spark Plug Wire 303-106 (T74P-6666-A)

Material

Item	Specification
Silicone Brake Caliper Grease and Dielectric Compound XG-3-A	ESE-M1C171-A

Removal and Installation

1. ***NOTICE:*** **It is important to twist the spark plug wire boot while pulling upward to avoid possible damage to the spark plug wire.**

   NOTE: Spark plug wires must be connected to the correct ignition coil terminal. For additional information, refer to the Cylinder-to-Coil Terminal Relationship, Engine Ignition in the Description and Operation portion of this section.

   Squeeze the locking tabs and twist while pulling upward to disconnect the 6 spark plug wires from the ignition coil.

2. Detach the spark plug wires from the spark plug wire retainers.

3. ***NOTICE:*** **It is important to twist the spark plug wire boot while pulling upward to avoid possible damage to the spark plug wire.**

   NOTE: Spark plug wires must be connected to the correct spark plug.

   With a twisting motion, use the Spark Plug Wire Remover to pull the spark plug wires from the spark plugs.

4. **NOTE:** Apply silicone dielectric compound to the inside of the spark plug wire boots.

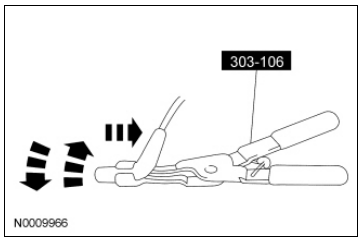
   To install, reverse the removal procedure.

Spark Plugs

Special Tool(s)

 ST1394-A	Remover, Spark Plug Wire 303-106 (T74P-6666-A)

Material



Item	Specification
Silicone Brake Caliper Grease and Dielectric Compound XG-3-A	ESE-M1C171-A

Removal and Installation

1. ***NOTICE:*** **It is important to twist the spark plug wire boot while pulling upward to avoid possible damage to the spark plug wire.**

   NOTE: Spark plug wires must be connected to the correct spark plug. Refer to the Cylinder-to-Coil Terminal Relationship, Engine Ignition in the Description and Operation portion of this section.

   With a twisting motion, use the Spark Plug Wire Remover to pull the spark plug wire from the spark plug.

2. **NOTE:** Use compressed air to remove any foreign material from the spark plug wells before removing the spark plugs.

   Remove the spark plugs.

   - To install, tighten to 17 Nm (150 lb-in).

3. Use a suitable spark plug gap tool to check and adjust the spark plug gap.

4. **NOTE:** Apply silicone dielectric compound to the inside of the spark plug wire boots.

   To install, reverse the removal procedure.

Engine Ignition

The electronic ignition system is a coil-on-plug ignition system. The coil-on-plug ignition system consists of the following components:

- Crankshaft Position (CKP) sensor
- Ignition coils
- Spark plugs

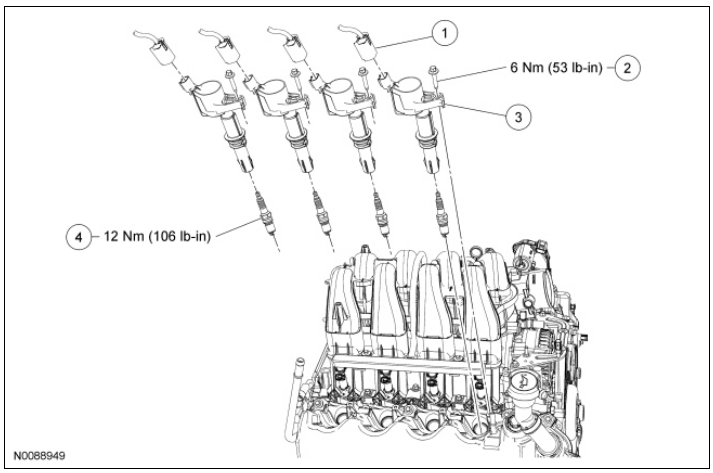
The CKP sensor:

- is a variable reluctance sensor.
- is triggered by a 36-minus-1 tooth sensor ring mounted on the crankshaft.
- provides base timing and crankshaft speed (rpm) to the PCM.

The 8 separate ignition coils:

- change low voltage to high voltage pulses based on signals from the PCM.
- produce the high voltage pulses to the spark plugs.
- are connected directly to each spark plug.

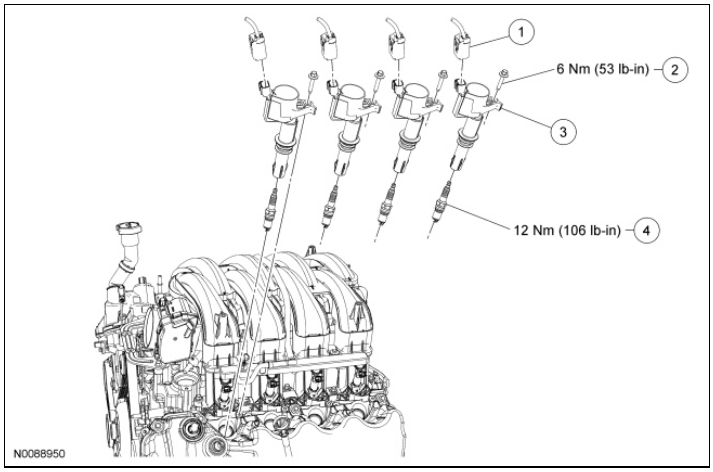
The spark plugs:



- change high voltage pulses into a spark which ignites the fuel and air mixture.
- originally equipped on the vehicle have a platinum-enhanced active electrode for long life.

Engine Ignition

Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.



Engine Ignition Components - Exploded View

Ignition Components RH Side

Item	Part Number	Description
1	14A464	Ignition coil-on-plug electrical connector (part of 12B637) (4 required)
2	W706175	Ignition coil-on-plug bolt (4 required)
3	12A366	Ignition coil-on-plug (4 required)
4	12405	Spark plug (4 required)

Ignition Components LH Side

Item	Part Number	Description
1	14A464	Ignition coil-on-plug electrical connector (4 required) (part of 12B637)

2	W706175	Ignition coil-on-plug bolt (4 required)
3	12A366	Ignition coil-on-plug (4 required)
4	12405	Spark plug (4 required)

1. For additional information, refer to the procedures in this section.

Ignition Coil-On-Plug

Material

Item	Specification
Silicone Brake Caliper Grease and Dielectric Compound XG-3-A	ESE-M1C171-A

Removal and Installation

1. Disconnect the 8 ignition coil electrical connectors.

2. Remove the 8 ignition coil bolts.
   - To install, tighten to 6 Nm (53 lb-in).

3. **NOTE:** When removing the ignition coils, a slight twisting motion will break the seal and ease removal.

   Remove the 8 ignition coils.

4. To install, reverse the removal procedure.
   - Apply a light film of brake caliper grease to the inside of the coil boots before installation.

Spark Plugs

Removal

NOTICE: **The spark plug procedure must be followed exactly or damage to the cylinder head and spark plug will result.**

NOTICE: **Do not remove the spark plugs when the engine is hot or cold soaked. Spark plug thread or cylinder head damage can occur. Make sure the engine is warm (hand touch after cooling down) prior to spark plug removal.**

1. Remove the ignition coil-on-plug. For additional information, refer to Ignition Coil-On-Plug in this section.

2. ***NOTICE:*** **Only use hand tools when removing or installing the spark plugs or damage can occur to the cylinder head or spark plug.**

   NOTE: Use compressed air to remove any foreign material from the spark plug well before removing the spark plugs.

   Remove the spark plug.

3. Inspect the spark plug. For additional information, refer to Section 303-00 .

Installation

1. Adjust the spark plug gap as necessary. For the correct spark plug gap specification, refer to Specifications in this section.

2. ***NOTICE:*** **Only use hand tools when removing or installing the spark plugs or damage can occur to the cylinder head or spark plug.**

   Install the spark plug.

   - Tighten to 12 Nm (106 lb-in).

3. Install the ignition coil-on-plug. For additional information, refer to Ignition Coil-On-Plug in this section.

Torque Specifications

Description	Nm	lb-ft
Exhaust manifold-to-EGR system module tube fittings - 4.0L SOHC	40	30
EGR system module bolts - 4.0L SOHC	25	18

Engine Emission Control

NOTICE: **Do not remove any part of the engine emission control system. Operating the engine without the engine emission control system will reduce fuel economy and engine ventilation. This will weaken engine performance and shorten engine life.**

The engine emission control system consists of the following:

- PCV system
- EGR system (4.0L SOHC only)

PCV System

The PCV system consists of the following:

- PCV valve
- Hoses

The PCV system uses intake manifold vacuum to ventilate the crankcase and return the fumes to the intake manifold for combustion.

The PCV valve:

- controls the amount of ventilating air and blow-by gases going to the intake manifold.
- is integral to the LH valve cover on the 4.6L (3V) engine. If a new PCV valve must be installed, a new valve cover must be installed on a 4.6L (3V) engine. Refer to Section 303-01B .

EGR System

The EGR system consists of the following:

- EGR system module which incorporates the following components in one unit:
  - EGR valve
  - EGR system module transducer
  - EGR vacuum regulator solenoid
- Exhaust manifold-to-EGR system module tube

NOTE: Only the 4.0L SOHC engine is equipped with an EGR system. The 4.6L (3V) engine uses a variable camshaft timing system.

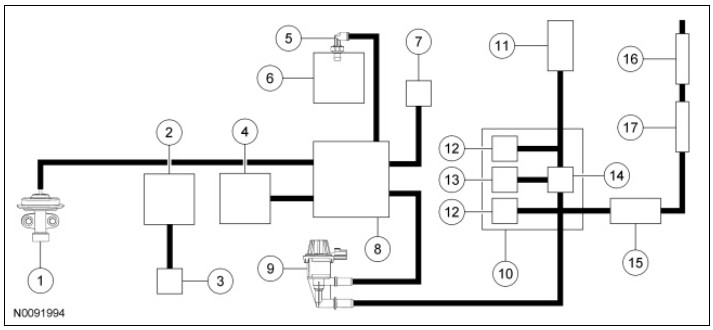
The EGR system returns a portion of the exhaust gas to the intake manifold to reduce the combustion temperature. This results in lower Nitrogen Oxides (NOX) formation.

The PCM controls the EGR system module. When the EGR system module valve opens, exhaust gas flows to the intake manifold.

The EGR valve controls the amount of exhaust gas flowing into the intake manifold.

The EGR system module transducer:

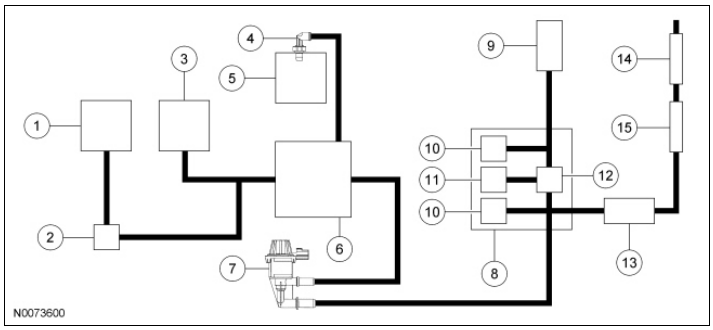
- monitors the EGR system module flow rate through the EGR valve.
- sends an EGR system module flow rate signal to the PCM.



The EGR vacuum regulator solenoid uses input from the PCM to change the EGR system module operation.

The exhaust manifold-to-EGR system module tube:

- connects the exhaust manifold to the EGR valve.



Evaporative Emission (EVAP), EGR and PCV Vacuum Routing

4.0L SOHC Engine

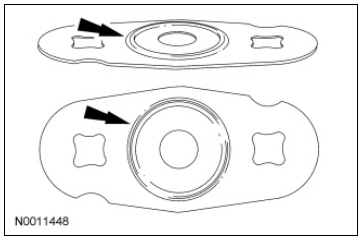
Exhaust Gas Recirculation (EGR) System Components - Exploded View, 4.0L SOHC

Item	Part Number	Description
1	-	EGR system module electrical connector (part of 12B637)
2	9E498	Engine vacuum harness
3	-	EGR system module-to-exhaust manifold tube upper fitting (part of 9E469)
4	-	EGR system module-to-exhaust manifold tube lower fitting (part of 9E469)
5	9E469	EGR system module-to-exhaust manifold tube
6	W506024	EGR system module bolts (2 required)
7	9D475	EGR system module
8	9D476	EGR system module gasket

1. For additional information, refer to the procedures in this section.

Exhaust Gas Recirculation (EGR) System Module - 4.0L SOHC

Removal and Installation



1. Disconnect the EGR system module electrical and vacuum connectors.

2. Disconnect the EGR system module-to-exhaust manifold tube upper fitting.
   - To install, tighten to 40 Nm (30 lb-ft).

3. **NOTE:** When installing the new EGR module gasket, install with the side with the raised circle facing the intake manifold.

   Remove the 2 bolts, the EGR system module and the gasket. Discard the gasket.

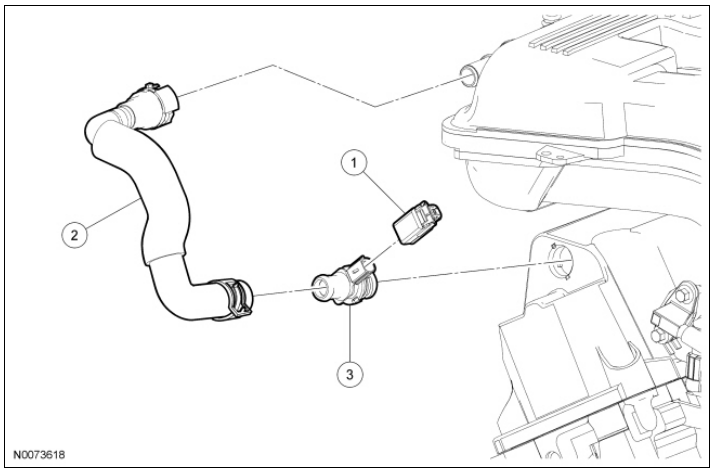
   - To install, tighten to 25 Nm (18 lb-ft).

4. **NOTE:** The EGR system module sealing surfaces are soft metals.

   Carefully clean the EGR system module sealing surfaces.

5. To install, reverse the removal procedure.
   - Install a new EGR system module gasket.

Exhaust Gas Recirculation (EGR) System Module Tube - 4.0L SOHC



Removal and Installation

1. Disconnect the EGR system module-to-exhaust manifold tube upper fitting.
   - To install, tighten to 40 Nm (30 lb-ft).

2. Disconnect the EGR system module-to-exhaust manifold tube lower fitting and remove the tube.
   - To install, tighten to 40 Nm (30 lb-ft).

3. To install, reverse the removal procedure.

Positive Crankcase Ventilation (PCV) Valve - 4.0L SOHC

Item	Part Number	Description
1	14A464	PCV valve electrical connector (part of 12B637)
2	6K817	PCV valve hose
3	6A666	PCV valve

Removal and Installation

1. Disconnect the PCV valve electrical connector.
2. Disconnect the PCV valve hose.
3. **NOTE:** If the PCV valve is removed from the valve cover, a new PCV valve must be installed.

   Rotate the PCV valve counterclockwise and remove it from the valve cover.
4. To install, reverse the removal procedure.

Torque Specifications

Description	Nm	lb-in
Coolant expansion tank bolts	6	53

Intake Air Distribution and Filtering

The air induction system consists of the following:

- Air Cleaner (ACL)
- ACL element
- ACL outlet pipe
- Mass Air Flow (MAF) sensor
- Throttle Body (TB)

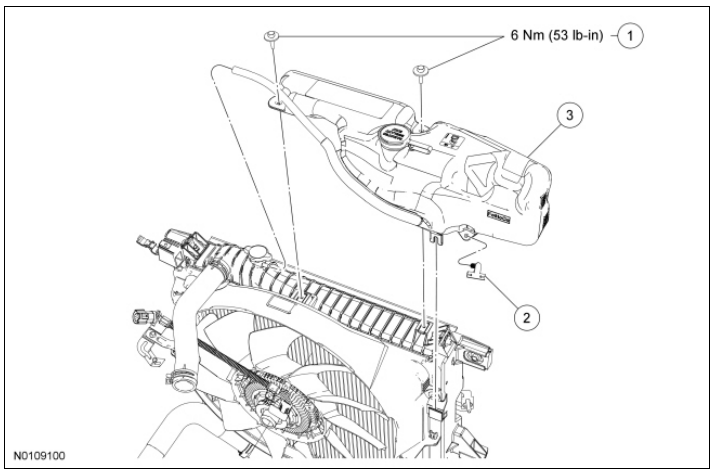
The air induction system supplies filtered air to the engine to mix with the fuel for combustion purposes.

The ACL provides a sealed container for the ACL element.

The ACL element is chemically treated, pleated paper which filters the engine intake air.

The ACL outlet pipe connects the ACL to the TB .

The MAF sensor is attached to the ACL and measures the volume of air delivered to the engine. The MAF sensor has an integrated Intake Air Temperature (IAT) sensor which measures the temperature of the incoming air. For information on servicing the MAF sensor, refer to Section 303-14 .



The TB varies the amount of air entering the engine based on driver input to the accelerator pedal. For information on servicing the TB , refer to Section 303-04A (4.0L SOHC engines) or Section 303-04B (4.6L [3V] engines).

Intake Air Distribution and Filtering

Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

12	9P686	Grommets (2 required)
13	9P686	Grommets (2 required)

Intake Air System Components - 4.6L (3V)

Item	Part Number	Description
1	6758	Crankcase breather hose
2	9C482	Brake booster vacuum hose
3	9C632	Air Cleaner (ACL) outlet pipe clamp
4	9C632	ACL outlet pipe clamp
5	9B659	ACL outlet pipe
6	14A464	Mass Air Flow (MAF) sensor electrical connector (part of 12B637)
7	9628	ACL cover retaining clips (3 required) (part of 9A612)
8	9661	ACL cover
9	9601	ACL element
10	9A612	ACL tray
11	9E931	Rubber bell mouth
12	9P686	Grommets (2 required)
13	9P686	Grommets (2 required)

1. For additional information, refer to the procedures in this section.

Air Cleaner

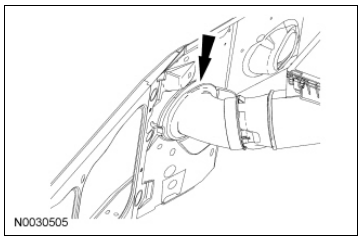
Removal

1. Loosen the clamp and disconnect the Air Cleaner (ACL) outlet pipe from the ACL .
2. Disconnect the Mass Air Flow (MAF) sensor electrical connector.
3. **NOTE:** It is not necessary to disconnect the coolant expansion tank hose.

   Remove the 2 bolts and, if equipped with a 4.6L (3V) engine, detach the wiring harness retainer. Position the coolant expansion tank aside.
4. **NOTE:** The grommets that go into the inner fender will come out with the ACL .

   Lift the ACL out of the grommets in the wheel well and out of the inner fender.

Installation



1. ***NOTICE:*** **Use a sponge or shop towel to apply the soap and water solution. Spraying the soap and water solution may damage the Mass Air Flow (MAF) sensor.**

   Apply a soap and water solution to the face and the LH side of the rubber bell mouth.

2. **NOTE:** Make sure the 2 grommets that go into the inner fender are in place on the ACL .

   Push the ACL into the 2 grommets in the wheel well and into the inner fender.
3. Make sure the bell mouth is correctly installed. The face of the rubber bell mouth should be against the inside of the sheet metal. No part of the rubber bell mouth should protrude through the air intake hole in the sheet metal.

4. Position the coolant expansion tank, install the 2 bolts and, if equipped with a 4.6L (3V) engine, attach the wiring harness retainer.
   - Tighten to 6 Nm (53 lb-in).

5. Connect the MAF sensor electrical connector.

6. Connect the ACL outlet pipe to the ACL and tighten the clamp.

Air Cleaner Element

Removal and Installation

NOTE: Do not disconnect the Mass Air Flow (MAF) sensor electrical connector.

Vehicles equipped with a 4.0L (SOHC) engine

1. Detach the wiring harness retainer from the Air Cleaner (ACL) outlet pipe.

Vehicles equipped with a 4.6L (3V) engine

2. Detach the wiring harness retainer from the coolant expansion tank.

All vehicles

3. Loosen the clamp and disconnect the ACL outlet pipe from the ACL .
4. Unclip and remove the ACL cover.
5. Remove the ACL element.
6. **NOTE:** Clean the inside of the ACL tray.

   To install, reverse the removal procedure.

Air Cleaner Outlet Pipe

Removal and Installation

Vehicles equipped with a 4.0L SOHC engine

1. Detach the wiring harness retainer from the Air Cleaner (ACL) outlet pipe.

Vehicles equipped with a 4.6L (3V) engine

2. Disconnect the brake booster vacuum hose from the ACL outlet pipe.

All vehicles

3. Disconnect the crankcase breather hose from the ACL outlet pipe.

4. Loosen the clamps and remove the ACL outlet pipe.

5. To install, reverse the removal procedure.

Torque Specifications

Description	Nm	lb-ft	lb-in
Dust separator mounting bolt	9	-	80
Evaporative Emission (EVAP) canister purge valve nuts	25	18	-

Evaporative Emissions

NOTE: The vehicle vacuum routing diagrams are contained in the Description and Operation subsection of the Engine Emission Control section. Refer to Section 303-08 .

The Evaporative Emission (EVAP) system consists of the following components:

- Dust separator (located on the RH frame rail behind the fuel tank)
- EVAP canister (located on the top of the fuel tank)
- EVAP canister purge valve
- Fuel vapor vent valve (located on the RH frame rail behind the fuel tank)
- Fuel Tank Pressure (FTP) sensor (located on the top of the fuel tank)
- Vapor tubes
- Vapor hoses

The EVAP system:

- prevents hydrocarbon emissions from reaching the atmosphere.
- stores fuel vapors in the EVAP canister that are generated during vehicle operation or hot soak, until they can be consumed by the engine during normal engine operation.
- routes the stored fuel vapors to the engine during engine operation.
- is controlled by the PCM which, using various sensor inputs, calculates the desired amount of purge flow. The PCM regulates the purge flow, induced by the application of intake manifold vacuum, by varying the duty cycle applied to the EVAP canister purge valve.

The fuel vapors are routed:

- from the fuel tank through the fill limit vent valve and fuel vapor vent valve. The fuel vapor vent valves are part of the fuel tank assembly and cannot be serviced separately.
- to the EVAP canisters through a vapor line.
- to the engine when the EVAP canister purge valve is opened by the PCM.

The FTP sensor:

- monitors the pressure levels in the fuel tank.
- communicates the pressure reading to the PCM during the On-Board Diagnostic (OBD) II leak test.

The EVAP canister:

- is located on top of the fuel tank.
- contains activated carbon.
- stores fuel vapors.

Fuel tank filler cap (Explorer Sport Trac) and the Easy Fuel ™ fuel tank filler pipe (Explorer/Mountaineer):

- relieves system vacuum below 3.8 kPa (15.26 in H_2O).

The canister vent solenoid:

- is normally open.

- seals the EVAP system for the inspection and maintenance (I/M 240) test and OBD II leak and pressure tests.

The EVAP canister purge valve:

- is normally closed.
- regulates the purging of the EVAP canister.
- is electronically controlled by the PCM.

The dust separator:

- prevents suspended dust and dirt particles from entering the evaporative emission system.
- is serviced as a separate item.

The EVAP system monitor:

- is a self-test strategy within the PCM which tests the integrity of the EVAP system.
- monitors the EVAP system for leaks.
- monitors electronic EVAP components for irrationally high or low voltages.
- monitors for correct EVAP system operation.
- uses negative leak test methods to test and activate the EVAP system.
- has an engine malfunction light that will be displayed by the message center if the EVAP system fails the test.

The engine ON EVAP leak-check monitor:

- is executed by the individual components of the enhanced EVAP system. Intake manifold vacuum is utilized to reach a target vacuum on the EVAP system. The FTP sensor is used by the engine ON EVAP leak-check monitor to determine if the target vacuum necessary to carry out the leak-check on the EVAP system has been reached. Once target vacuum on the EVAP system is achieved, the change in EVAP system vacuum over a calibrated period of time determines if a leak exists.

The Engine Off Natural Vacuum (EONV) EVAP leak-check monitor is executed:

- once the engine ON EVAP leak-check monitor is completed and the key is turned OFF. The EONV EVAP leak-check monitor determines if a leak is present when the naturally occurring change in the fuel tank pressure or vacuum does not exceed a calibrated limit during a calibrated amount of time. A separate, low-power consuming microprocessor in the PCM manages the EONV leak-check. The engine OFF EVAP leak-check monitor is executed by the individual components of the enhanced EVAP system.

Evaporative Emissions

Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Evaporative Emission System Leak Test

Special Tool(s)

 ST2817-A	VACUTEC Smoke Machine Fuel Evaporative Emission System Tester 218-0002 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Phase 1 - Leak Verification

1. Run the EVAP Test with the scan tool.
2. **NOTE:** Some small leaks may not be detected using the EVAP Test. If the system has passed the test but a leak is still suspected, then proceed to Phase 2.

   If the Evaporative Emission (EVAP) system failed the EVAP Test, then proceed to Phase 2.

Phase 2 - System Leak Check

NOTE: Some vehicles utilize a conventional fuel tank filler pipe cap and filler pipe assembly, and some vehicles utilize an Easy Fuel ™ (capless) fuel tank filler pipe assembly.

All vehicles

1. Disconnect the upper vapor tube-to- EVAP canister purge valve quick connect coupling. For additional information, refer to Section 310-00 .
2. Connect the VACUTEC Smoke Machine Fuel Evaporative Emission System Tester to the upper EVAP canister purge valve fitting. For additional information, refer to the manufacturer's instructions.
3. **NOTE:** The battery ground cable was previously disconnected in the vapor tube quick connect coupling procedure.

   Connect the battery ground cable. For additional information, refer to Section 414-01 .
4. **NOTE:** In the scan tool, the EVAP canister purge valve is referred to as the EVAP vapor management valve.

   Open the EVAP canister purge valve with the scan tool.
5. Close the canister vent solenoid with the scan tool.

Vehicles equipped with a fuel tank filler pipe cap

6. Carefully turn the fuel tank filler pipe cap counterclockwise until the thread disengages and position aside.

Vehicles equipped with a capless fuel tank filler pipe assembly

7. **NOTE:** The supplemental refueling adapter is located in the jack storage compartment.

   Install the supplemental refueling adapter into the Easy Fuel ™ (capless) fuel tank filler pipe assembly.

All vehicles

8. **NOTE:** If smoke does not exit the fuel tank filler pipe neck area after the system is pressurized, open the canister vent solenoid with the scan tool to allow the air to purge. Once smoke is seen at the canister vent solenoid, close the canister vent solenoid with the scan tool.

   Introduce smoke from the VACUTEC Smoke Machine Fuel Evaporative Emission System Tester into the EVAP system and verify that smoke is exiting the fuel tank filler pipe neck area. For additional information, refer to the manufacturer's instructions.

Vehicles equipped with a fuel tank filler pipe cap

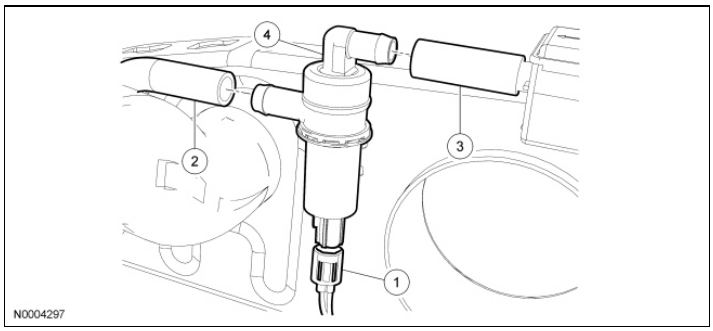
9. Install the fuel tank filler cap once smoke is observed exiting the fuel tank filler pipe neck area.

Vehicles equipped with a capless fuel tank filler pipe assembly

10. Remove the supplemental refueling adapter once smoke is observed exiting the fuel tank filler pipe neck area.

All vehicles

11. Continue to enter smoke into the system for 60 seconds to obtain pressure.



12. Press and release the remote start button in intervals of 15 seconds ON and 15 seconds OFF while checking for exiting smoke.

13. Use the halogen light provided with the VACUTEC Smoke Machine Fuel Evaporative Emission System Tester to follow the EVAP system path and look for smoke exiting at the source of the leak(s).

14. Repair any leaks as necessary.

15. Repeat the leak test until the system passes.

Fuel Vapor Vent Valve

Item	Part Number	Description
1	-	Evaporative Emission (EVAP) canister fuel vapor vent valve electrical connector (part of 14407)
2	9K318	Fuel vapor hose
3	9S321	Fuel vapor hose
4	9F945	Fuel vapor vent valve

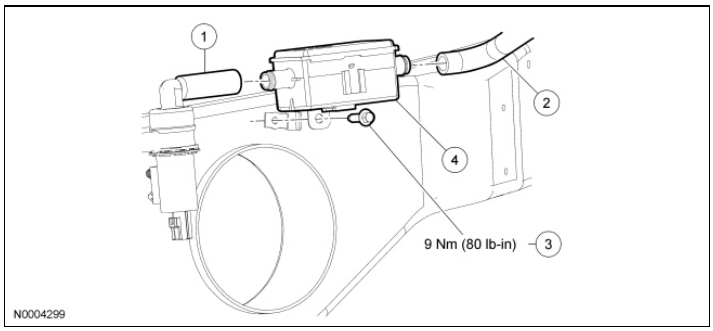
Removal and Installation

⚠ WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

NOTE: Use only water-based lubricants on the vapor hoses.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .



2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

3. Disconnect the fuel vapor vent valve electrical connector.

4. Disconnect the fuel vapor hoses from the fuel vapor vent valve and remove the fuel vapor vent valve.

5. To install, reverse the removal procedure.
   - Lubricate the vapor hoses with a water-based lubricant to ease installation.
   - Carry out the Evaporative Emission System Leak Test. For additional information, refer to Evaporative Emission System Leak Test in this section.

Dust Separator

Item	Part Number	Description
1	9S321	Fuel vapor hose
2	-	Fuel filler pipe vapor hose (part of 9034)
3	W506414	Bolt
4	9B328	Dust separator

Removal and Installation

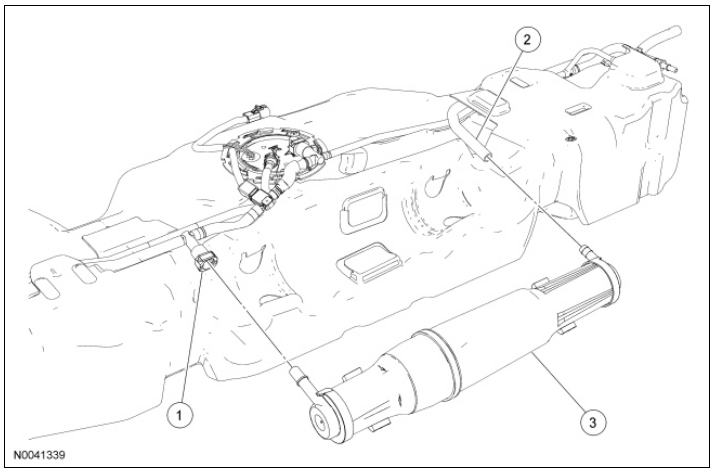
⚠ WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

NOTE: Use only water-based lubricants on the vapor hoses.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .



3. Disconnect the fuel vapor hose from the dust separator.

4. Disconnect the fuel filler pipe vapor hose from the dust separator.

5. Remove the bolt and the dust separator.
   - To install, tighten to 9 Nm (80 lb-in).

6. To install, reverse the removal procedure.
   - Lubricate the vapor hoses with a water-based lubricant to ease installation.
   - Carry out the Evaporative Emission System Leak Test. For additional information, refer to Evaporative Emission System Leak Test in this section.

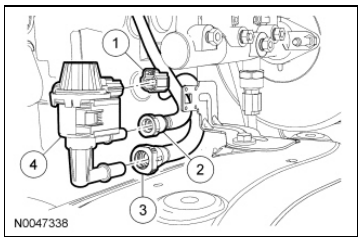
Evaporative Emission Canister

Item	Part Number	Description
1	-	Fuel Tank Pressure (FTP) sensor and vapor tube assembly quick connect coupling (part of 9E616)
2	9K318	Vapor hose
3	9D653	Evaporative Emission (EVAP) canister

Removal and Installation

⚠ WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.



NOTE: Use only water-based lubricants on the vapor hoses.

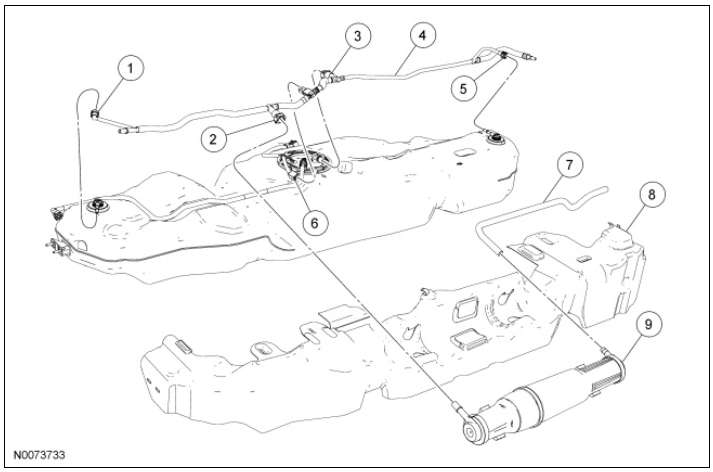
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
3. Remove the fuel tank. For additional information, refer to Section 310-01 .
4. Detach the Evaporative Emission (EVAP) canister from the fuel tank to gain access to the quick connect coupling.
5. Disconnect the Fuel Tank Pressure (FTP) sensor and vapor tube assembly quick connect coupling from the EVAP canister. For additional information, refer to Section 310-00 .
6. Disconnect the vapor hose from the EVAP canister.

7. Remove the EVAP canister.

8. To install, reverse the removal procedure.
    - Lubricate the vapor hoses with a water-based lubricant to ease installation.
    - Carry out the Evaporative Emission System Leak Test. For additional information, refer to Evaporative Emission System Leak Test in this section.

Evaporative Emission Canister Purge Valve

Item	Part Number	Description
1	-	Evaporative Emission (EVAP) canister purge valve electrical connector (part of 14A464)
2	-	Vapor tube quick connect coupling (part of 9D289)
3	-	Vapor tube quick connect coupling (part of 9J338)
4	9G641	EVAP canister purge valve



Removal and Installation

⚠ WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
3. Disconnect the Evaporative Emission (EVAP) canister purge valve electrical connector.
4. Disconnect the 2 vapor tube quick connect couplings from the EVAP canister purge valve. For additional information, refer to Section 310-00 .
5. Detach the EVAP canister purge valve from the bracket and remove.
6. To install, reverse the removal procedure.
   - Carry out the Evaporative Emission System Leak Test. For additional information, refer to Evaporative Emission System Leak Test in this section.

Fuel Tank Pressure Sensor

Item	Part Number	Description
1	-	Fuel Tank Pressure (FTP) sensor and vapor tube assembly quick connect coupling (part of 9E616)
2	-	FTP sensor and vapor tube assembly quick connect coupling (part of 9E616)
3	-	FTP sensor and vapor tube assembly quick connect coupling (part of 9E616)
4	9E616	FTP sensor and vapor tube assembly
5	-	FTP sensor and vapor tube assembly quick connect coupling (part of 9E616)
6	14A464	FTP sensor electrical connector
7	9K318	Vapor hose
8	9A032	Fuel tank shield
9	9D653	Evaporative Emission (EVAP) canister

Removal and Installation

⚠ WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

1. Remove the Evaporative Emission (EVAP) canister. For additional information, refer to Evaporative Emission Canister in this section.

2. Remove the fuel tank shield from the fuel tank.

3. Disconnect the Fuel Tank Pressure (FTP) sensor electrical connector.

4. Disconnect the 3 FTP sensor and vapor tube assembly quick connect couplings from the Fuel Pump (FP) module and the vapor vent valves. For additional information, refer to Section 310-00 .

5. Remove the FTP sensor and vapor tube assembly.

6. To install, reverse the removal procedure.
    - Carry out the Evaporative Emission System Leak Test. For additional information, refer to Evaporative Emission System Leak Test in this section.

Material

Item	Specification	Fill Capacity
High Temperature Nickel Anti-Seize Lubricant XL-2	ESE-M12A4-A	-
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A	-
Motorcraft SAE 5W-30 Premium Synthetic Blend Motor Oil XO-5W30-QSP (US); Motorcraft SAE 5W-30 Super Premium Motor Oil CXO-5W30-LSP12 (Canada); or equivalent	WSS-M2C929-A	-
Penetrating and Lock Lubricant (US); Penetrating Fluid (Canada) XL-1 (US); CXC-51-A (Canada)	-	-

Torque Specifications

Description	Nm	lb-ft	lb-in
A/C compressor bolts, 4.6L (3V)	25	18	-
A/C tube bracket nut	7	-	62
Camshaft Position (CMP) sensor bolt, 4.0L SOHC	6	-	53
CMP sensor bolt, 4.6L (3V)	10	-	89
Catalyst Monitor Sensor (CMS)	41	30	-
Charge Motion Control Valve (CMCV) bolts	10	-	89
Crankshaft Position (CKP) sensor bolt	10	-	89
Cylinder Head Temperature (CHT) sensor, 4.6L (3V)	10	-	89
Fuel rail temperature and pressure sensor bolts	6	-	53
Heated Oxygen Sensor (HO2S)	41	30	-
Knock Sensor (KS) bolt	20	-	177
Mass Air Flow (MAF) bolts	2	-	18
Oil pan drain plug	26	19	-
PCM bolts	10	-	89
Throttle Position (TP) sensor screws	3	-	27
Variable Camshaft Timing (VCT) oil control solenoid bolt	5	-	44

Electronic Engine Controls

The electronic engine controls consist of the following:

- PCM
- Throttle Position (TP) sensor
- Engine Coolant Temperature (ECT) sensor (4.0L SOHC)
- Cylinder Head Temperature (CHT) sensor (4.6L [3V])
- Camshaft Position (CMP) sensor
- Crankshaft Position (CKP) sensor
- Mass Air Flow (MAF) sensor
- Heated Oxygen Sensor (HO2S)
- Catalyst Monitor Sensor (CMS)
- Knock Sensor (KS).
- Charge Motion Control Valve (CMCV) (4.6L [3V])
- Variable Camshaft Timing (VCT) oil control solenoid (4.6L [3V])

The PCM:

- accepts input from various engine sensors to compute the fuel flow rate necessary to maintain a prescribed air/fuel ratio throughout the entire engine operational range.
- outputs a command to the fuel injectors to meter the appropriate quantity of fuel.
- switches the PCV valve heat ON and OFF.

The TP sensor:

- sends the PCM a signal indicating the throttle plate angle.
- is the main input to the PCM from the driver.

The ECT sensor (4.0L SOHC):

- sends the PCM a signal indicating engine temperature.
- voltage decreases as coolant temperature increases.

The CHT sensor (4.6L [3V]):

- is mounted to the wall of the cylinder head and is not connected to any coolant passages.

The CMP sensor:

- sends the PCM a signal indicating camshaft position used for fuel synchronization.

The CKP sensor:

- sends the PCM a signal indicating crankshaft position.
- is essential for calculating spark timing.

The MAF sensor:

- uses a hot wire sensing element to measure the amount of air entering the engine. Air passing over the hot wire causes it to cool.

The HO2S :

- creates a voltage signal dependent on exhaust oxygen content.
- provides feedback information to the PCM used to calculate fuel delivery.

The CMS :

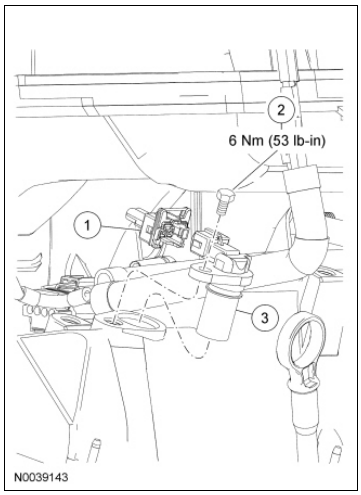
- monitors oxygen content after it flows through the catalytic converter.
- provides a voltage to the PCM used to calculate catalytic converter integrity.

The KS :

- is used to detect engine detonation.
- sends a voltage signal to the PCM.
- is able to provide a signal which retards the ignition timing, as necessary.

The 4.6L (3V) air induction system improves engine performance by using the CMCV assemblies as follows:

- The intake manifold has 2 runners per cylinder, feeding each of the intake ports in the cylinder heads.
- The CMCV assemblies are located between the intake manifold and the cylinder heads, providing 2 air passages for each cylinder.
- One air passage is always open and the other passage switches from closed to open by means of a valve plate.
- The valve plates are opened and closed by the CMCV electric actuator, which is controlled by the PCM.



The VCT oil control solenoid:

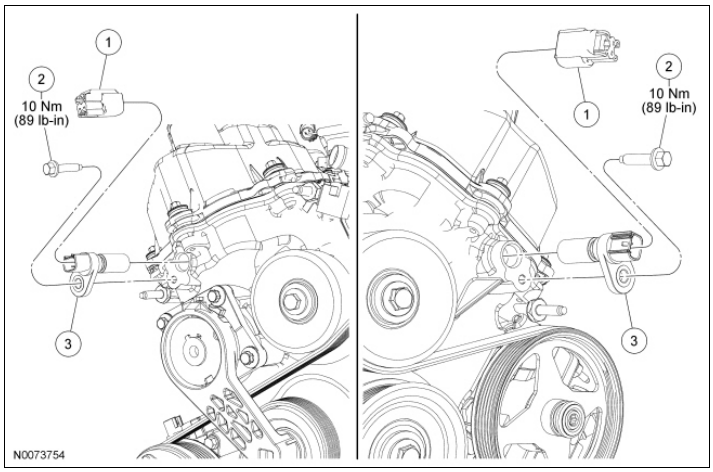
- is an electrically controlled hydraulic valve that directs engine oil to the variable camshaft. Once the PCM transmits a signal, the solenoid moves a valve spool, directing oil into the camshaft phaser cavity. This action changes valve timing by either inducing an advance or retard condition. The camshaft is thereby repositioned in relation to crankshaft timing and allows for optimum engine performance and lower emissions.

Electronic Engine Controls

Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Camshaft Position (CMP) Sensor - 4.0L SOHC

Item	Part Number	Description
1	14A464	Camshaft Position (CMP) sensor electrical connector
2	W500204	CMP sensor bolt
3	6B288	CMP sensor



Removal and Installation

1. Disconnect the Camshaft Position (CMP) sensor electrical connector.

2. Remove the bolt and the CMP sensor.
   - To install, tighten to 6 Nm (53 lb-in).

3. To install, reverse the removal procedure.

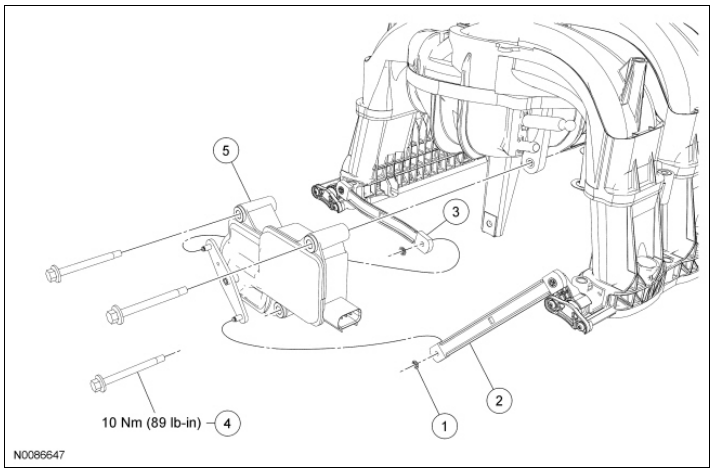
Camshaft Position (CMP) Sensor - 4.6L (3V)

Item	Part Number	Description
1	14A464	Camshaft Position (CMP) electrical connector (part of 12B637)
2	N806155	CMP sensor bolt (2 required)
3	6B288	CMP sensor (2 required)

Removal and Installation

RH side

1. Remove the Air Cleaner (ACL) outlet pipe. For additional information, refer to Section 303-12 .



Both sides

2. Disconnect the Camshaft Position (CMP) sensor electrical connector.

3. Remove the bolt and the CMP sensor.
   - To install, tighten to 10 Nm (89 lb-in).

4. To install, reverse the removal procedure.

Charge Motion Control Valve (CMCV) - 4.6L (3V)

Item	Part Number	Description
1	9424	E-clip (2 required)
2	9G770	RH Charge Motion Control Valve (CMCV) linkage
3	9G771	LH CMCV linkage
4	W506104	CMCV bolt (3 required)
5	9G730	CMCV

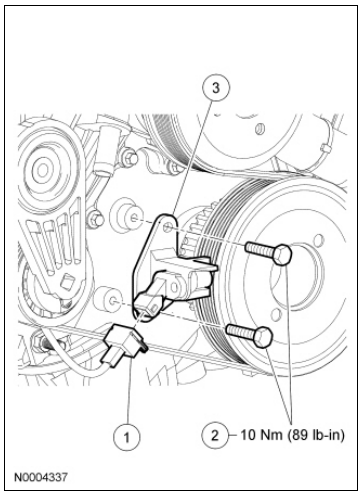
Removal

1. Remove the intake manifold. For additional information, refer to Section 303-01B .
2. **NOTE:** Do not disconnect the linkages at the intake manifold unless a new intake manifold is being installed.

   Remove and discard the 2 E-clips and disconnect the Charge Motion Control Valve (CMCV) linkages from the CMCV .
3. Remove the 3 bolts and the CMCV .
4. **NOTE:** A bent shaft or damaged components will require a new intake manifold.

   Rotate each CMCV shaft by hand to verify that they do not stick or bind.

Installation



1. Position the CMCV and loosely install the 3 bolts.
   - Do not tighten the bolts at this time.
2. Rotate each CMCV shaft so that the plates are in the closed position.
3. Connect the CMCV linkages to the CMCV and install 2 new E-clips.
4. Tighten the 3 CMCV bolts.

- Tighten to 10 Nm (89 lb-in).

5. Install the intake manifold. For additional information, refer to Section 303-01B .

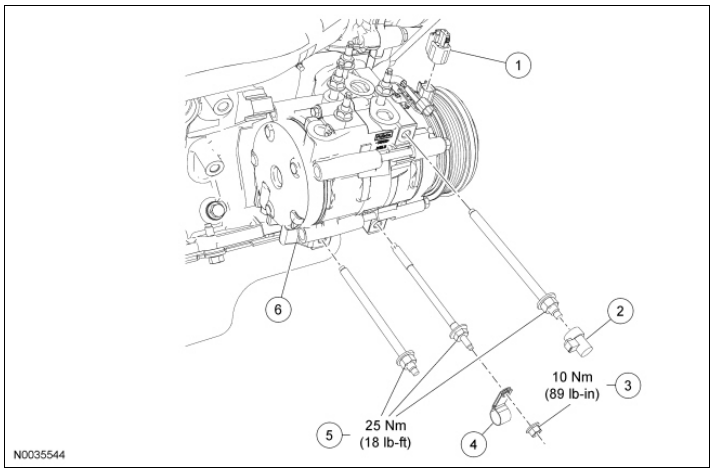
6. Carry out the Key ON Engine OFF (KOEO) self-test. For additional information, refer to Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Crankshaft Position (CKP) Sensor - 4.0L SOHC

Item	Part Number	Description
1	14A464	Crankshaft Position (CKP) sensor electrical connector
2	W500213	CKP sensor bolts (2 required)
3	6C315	CKP sensor

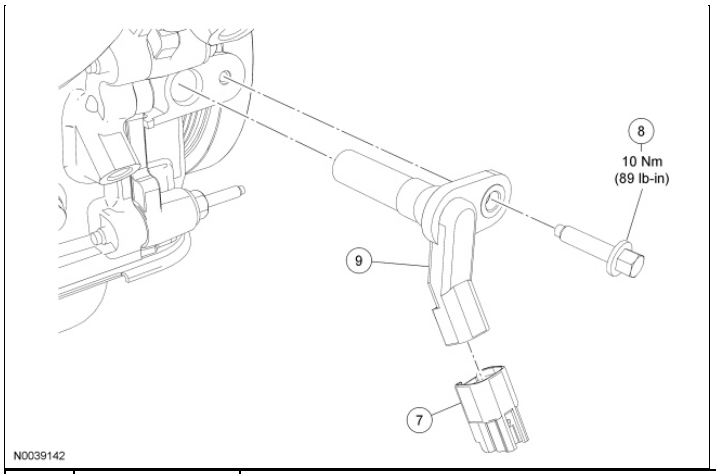
Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .



2. Disconnect the Crankshaft Position (CKP) sensor electrical connector.

3. Remove the 2 bolts and the CKP sensor.
   - To install, tighten to 10 Nm (89 lb-in).



4. **NOTE:** Be sure the sensor wiring is routed away from the battery cable.

   To install, reverse the removal procedure.

Crankshaft Position (CKP) Sensor - 4.6L (3V)

Item	Part Number	Description
1	14A464	A/C compressor clutch electrical connector (part of 14A280)
2	14A163	Battery cable retainer (part of 14A280)
3	W520111	A/C tube bracket nut
4	19N704	A/C tube bracket
5	W707821	A/C compressor stud bolts (3 required)
6	19703	A/C compressor

Item	Part Number	Description
7	14A464	Crankshaft Position (CKP) sensor electrical connector (part of 12B637)
8	N806155	CKP sensor bolt
9	6C315	CKP sensor

Removal and Installation

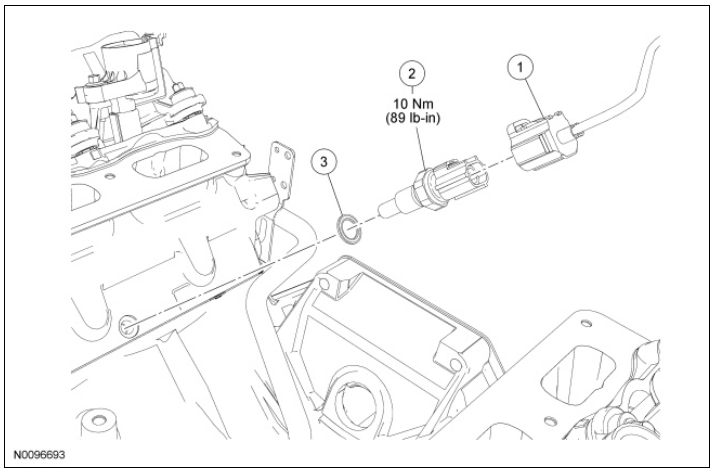
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the accessory drive belt. For additional information, refer to Section 303-05 .

3. Disconnect the A/C compressor coil electrical connector.

4. Detach the battery cable retainer from the A/C compressor stud bolts.

5. Remove the nut and detach the A/C tube bracket.
   - To install, tighten to 10 Nm (89 lb-in).



6. Remove the stud bolts and position the A/C compressor aside.
   - To install, tighten to 25 Nm (18 lb-ft).

7. Disconnect the Crankshaft Position (CKP) sensor electrical connector.

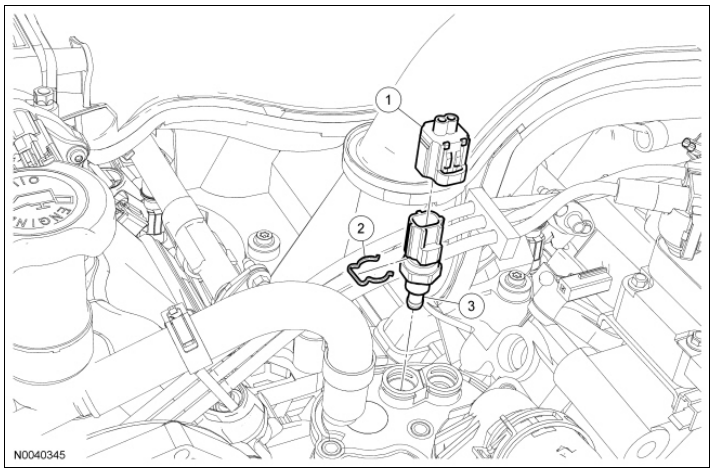
8. Remove the bolt and the CKP sensor.
   - To install, tighten to 10 Nm (89 lb-in).

9. To install, reverse the removal procedure.

Cylinder Head Temperature (CHT) Sensor - 4.6L (3V)

Item	Part Number	Description
1	030305	Cylinder Head Temperature (CHT) sensor electrical connector
2	6G004	CHT sensor
3	12A676	CHT sensor O-ring seal

Removal and Installation



1. Remove the intake manifold. For additional information, refer to Section 303-01B .

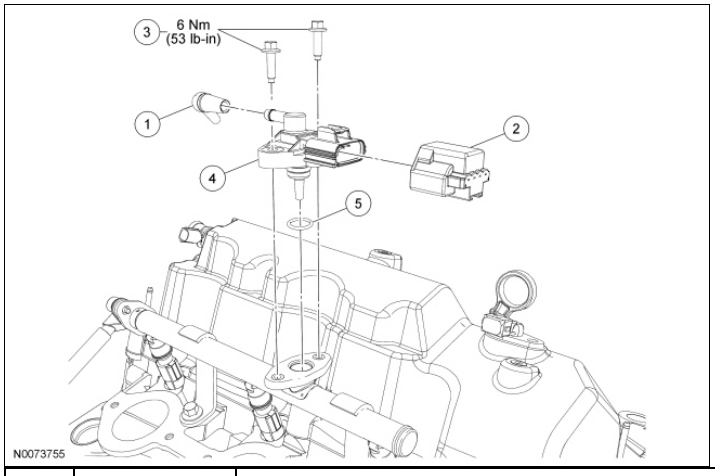
2. Disconnect the Cylinder Head Temperature (CHT) sensor electrical connector.

3. Remove and discard the CHT sensor.
   - To install, tighten to 10 Nm (89 lb-in).

4. To install, reverse the removal procedure.
   - Do not reuse the CHT sensor. Install a new sensor.

Engine Coolant Temperature (ECT) Sensor - 4.0L SOHC

Item	Part Number	Description
1	14A464	Engine Coolant Temperature (ECT) sensor electrical connector
2	-	Retaining clip
3	12A648	ECT sensor



Removal and Installation

1. Drain the cooling system. For additional information, refer to Section 303-03 .
2. Disconnect the Engine Coolant Temperature (ECT) sensor electrical connector.
3. Remove the clip and the ECT sensor.
4. To install, reverse the removal procedure.

Fuel Rail Pressure and Temperature Sensor - 4.0L SOHC

Material

Item	Specification
Motorcraft SAE 5W-30 Premium Synthetic Blend Motor Oil XO-5W30-QSP (US); Motorcraft SAE 5W-30 Super Premium Motor Oil CXO-5W30-LSP12 (Canada); or equivalent	WSS-M2C929-A

Item	Part Number	Description
1	9E499	Fuel rail pressure and temperature sensor vacuum hose connector
2	14A464	Fuel rail pressure and temperature sensor electrical connector (part of 12B637)
3	W709515	Fuel rail pressure and temperature sensor bolts (2 required)
4	9G756	Fuel rail pressure and temperature sensor
5	-	Fuel rail pressure and temperature sensor O-ring seal

Removal and Installation

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

⚠ **WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.**

1. Release the fuel system pressure. For additional information, refer to Section 310-00 .
2. Disconnect the battery ground cable. For additional information, refer to Section 412-01 .
3. Remove the intake manifold. For additional information, refer to Section 303-01A .
4. Disconnect the fuel rail pressure and temperature sensor vacuum and electrical connectors.
5. Remove the 2 bolts and the fuel rail pressure and temperature sensor.
   - To install, tighten to 6 Nm (53 lb-in).
6. Remove and discard the O-ring seal.
7. ***NOTICE:*** **Use an O-ring seal made of special fuel resistant material. Fuel will damage ordinary O-ring seals and may cause the fuel system to leak.**

   NOTICE: **Do not reuse the O-ring seal. The removal and installation process may damage the used O-ring seals and cause the fuel system to leak.**

   To install, reverse the removal procedure.

   - Lubricate the new O-ring seal with clean engine oil.

Fuel Rail Pressure and Temperature Sensor - 4.6L (3V)

Material

Item	Specification
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

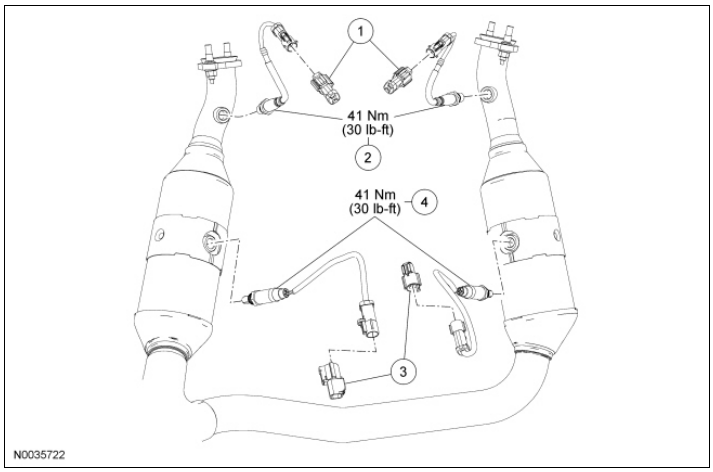
Item	Part Number	Description
1	14A464	Fuel rail pressure and temperature sensor electrical connector (part of 12B637)
2	9E498	Vacuum hose connector
3	W705870	Fuel rail pressure and temperature sensor bolts (2 required)
4	9G756	Fuel rail pressure and temperature sensor
5	-	O-ring seal (part of 9G756)

Removal and Installation

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

⚠ **WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.**

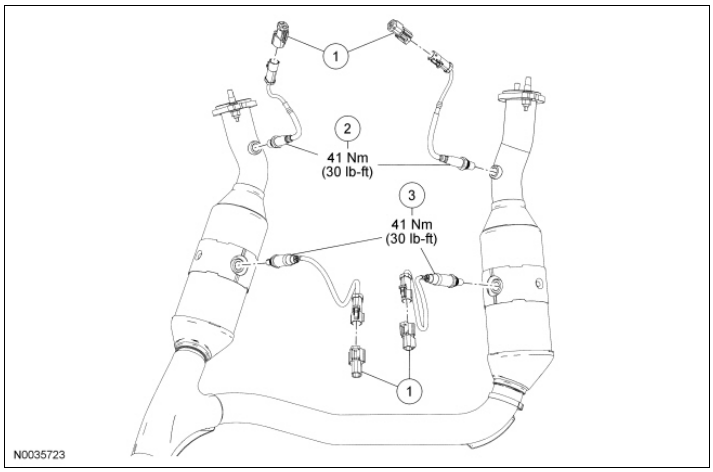


1. Release the fuel system pressure. For additional information, refer to Section 310-00 .
2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
3. Disconnect the fuel rail pressure and temperature sensor electrical connector.
4. Disconnect the fuel rail pressure and temperature sensor vacuum hose connector.
5. Remove the 2 bolts and the fuel rail pressure and temperature sensor.
   - To install, tighten to 6 Nm (53 lb-in).
6. Remove and discard the O-ring seal.
7. ***NOTICE:*** **Use an O-ring seal made of special fuel resistant material. Fuel will damage ordinary O-ring seals and may cause the fuel system to leak.**

   NOTICE: **Do not reuse the O-ring seal. The removal and installation process may damage the used O-ring seals and cause the fuel system to leak.**

   To install, reverse the removal procedure.

   - Lubricate the new O-ring seal with clean engine oil.

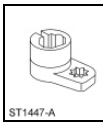


Heated Oxygen Sensor (HO2S) and Catalyst Monitor Sensor - Exploded View, 4.0L SOHC

Item	Part Number	Description
1	14A464	Heated Oxygen Sensor (HO2S) electrical connectors (2 required) (part of 12B637)
2	9F472	HO2S (2 required)
3	14489	Catalyst Monitor Sensor (CMS) electrical connectors (2 required) (part of 12B637)
4	9G444	CMS (2 required)

1. For additional information, refer to the procedures in this section.

Heated Oxygen Sensor (HO2S) and Catalyst Monitor Sensor - Exploded View, 4.6L (3V)



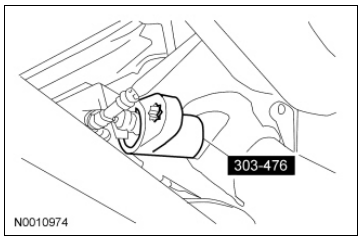
Item	Part Number	Description
1	14A464	Heated Oxygen Sensor (HO2S) and Catalyst Monitor Sensor (CMS) electrical connectors (4 required) (part of 12B637)
2	9F472	HO2S (2 required)
3	9G444	CMS (2 required)

1. For additional information, refer to the procedures in this section.

Heated Oxygen Sensor (HO2S)

Special Tool(s)

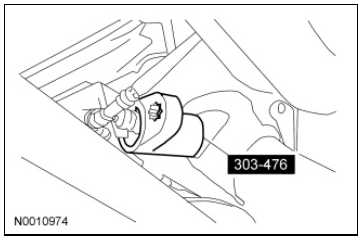
 ST1447-A	Socket, Exhaust Gas Oxygen Sensor 303-476 (T94P-9472-A)



Material

Item	Specification
High Temperature Nickel Anti-Seize Lubricant XL-2	ESE-M12A4-A
Penetrating and Lock Lubricant (US); Penetrating Fluid (Canada) XL-1 (US); CXC-51-A (Canada)	-

Removal

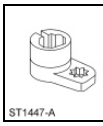


1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. If the RH Heated Oxygen Sensor (HO2S) is being serviced, remove the 2 bolts and position the heat shield aside.
3. Disconnect the HO2S electrical connector.
4. **NOTE:** If necessary, lubricate the HO2S with penetrating and lock lubricant to ease removal.

   Using the Exhaust Gas Oxygen Sensor Socket, remove the HO2S .

Installation

1. Apply a light coat of nickel anti-seize lubricant to the threads of the HO2S .
2. Using the Exhaust Gas Oxygen Sensor Socket, install the HO2S .
   - Calculate the correct torque wrench setting for the following torque. Refer to the Torque Wrench Adapter Formulas in the Appendix.
   - Using the Exhaust Gas Oxygen Sensor Socket, tighten to 41 Nm (30 lb-ft).



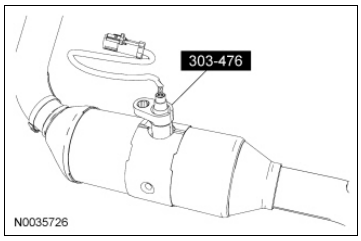
3. Connect the HO2S electrical connector.

4. If the RH HO2S is being serviced, position the heat shield and install the 2 bolts.
   - Tighten to 20 Nm (177 lb-in).

Catalyst Monitor Sensor

Special Tool(s)

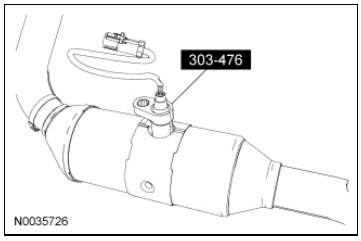
 ST1447-A	Socket, Exhaust Gas Oxygen Sensor 303-476 (T94P-9472-A)



Material

Item	Specification
High Temperature Nickel Anti-Seize Lubricant XL-2	ESE-M12A4-A
Penetrating and Lock Lubricant (US); Penetrating Fluid (Canada) XL-1 (US); CXC-51-A (Canada)	-

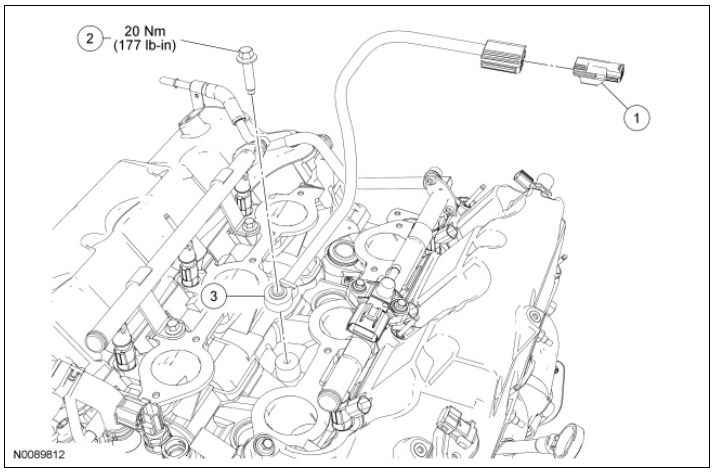
Removal



1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. If the RH Catalyst Monitor Sensor (CMS) is being serviced, remove the 2 bolts and position the heat shield aside.
3. Disconnect the CMS electrical connector.
4. **NOTE:** If necessary, lubricate the CMS with penetrating and lock lubricant to ease removal.

   Using the Exhaust Gas Oxygen Sensor Socket, remove the CMS .

Installation



1. Apply a light coat of anti-seize lubricant to the threads of the CMS .
2. Using the Exhaust Gas Oxygen Sensor Socket, install the CMS .
   - Calculate the correct torque wrench setting for the following torque. Refer to the Torque Wrench Adapter Formulas in the Appendix.
   - Using the Exhaust Gas Oxygen Sensor Socket, tighten to 41 Nm (30 lb-ft).

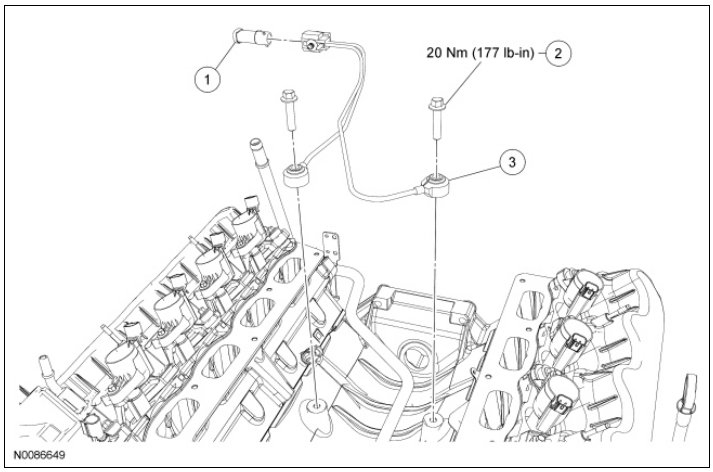
3. Connect the CMS electrical connector.

4. If the RH CMS is being serviced, position the heat shield and install the 2 bolts.
   - Tighten to 20 Nm (177 lb-in).

Knock Sensor (KS) - 4.0L SOHC

Item	Part Number	Description
1	14A624	Knock Sensor (KS) electrical connector (part of 12B637)
2	W500225	KS bolt
3	12A699	KS

Removal and Installation



1. Remove the intake manifold. For additional information, refer to Section 303-01A .

2. Disconnect the Knock Sensor (KS) electrical connector.

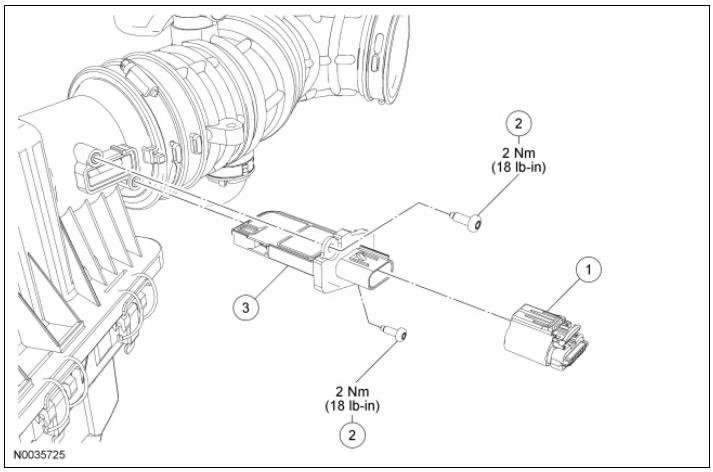
3. Remove the bolt and the KS .
   - To install, tighten to 20 Nm (177 lb-in).

4. To install, reverse the removal procedure.

Knock Sensor (KS) - 4.6L (3V)

Item	Part Number	Description
1	14A624	Knock Sensor (KS) electrical connector (part of 12C508)
2	W500110	KS bolt (2 required)
3	12A699	KS

Removal and Installation



1. Remove the intake manifold. For additional information, refer to Section 303-01B .

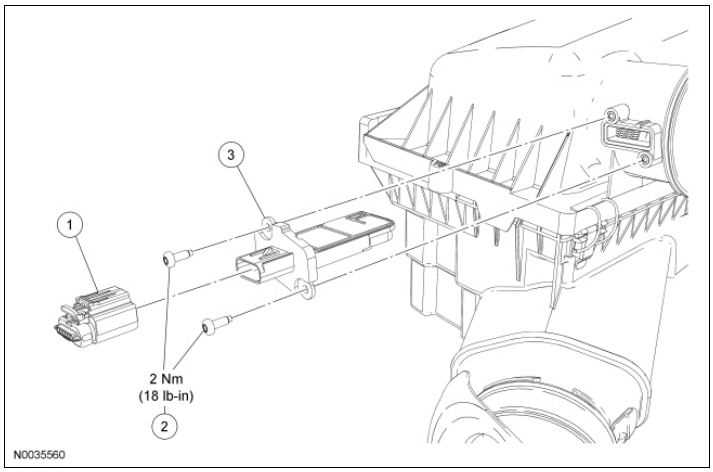
2. Disconnect the Knock Sensor (KS) electrical connector.

3. Remove the bolts and the KS .
   - To install, tighten to 20 Nm (177 lb-in).

4. To install, reverse the removal procedure.

Mass Air Flow (MAF) Sensor - 4.0L SOHC

Item	Part Number	Description
1	14A464	Mass Air Flow (MAF) sensor electrical connector (part of 12B637)
2	W705761	MAF sensor bolts (2 required)
3	12B579	MAF sensor



Removal and Installation

1. Disconnect the Mass Air Flow (MAF) sensor electrical connector.

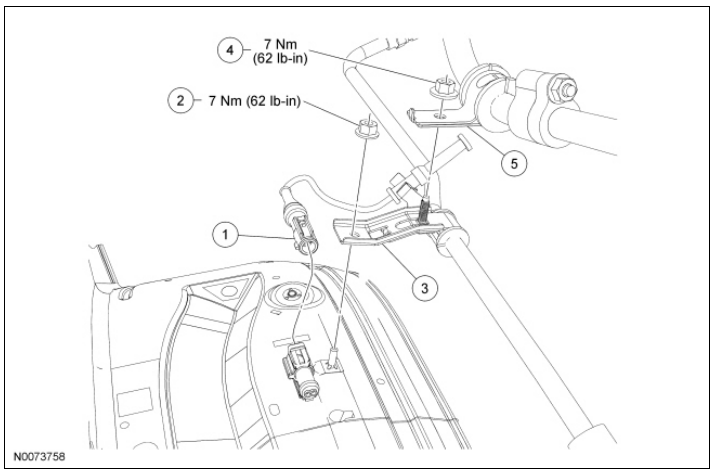
2. Remove the 2 bolts and the MAF sensor.
   - To install, tighten to 2 Nm (18 lb-in).

3. To install, reverse the removal procedure.

Mass Air Flow (MAF) Sensor - 4.6L (3V)

Item	Part Number	Description
1	14A464	Mass Air Flow (MAF) sensor electrical connector (part of 12B637)
2	N709287	MAF sensor bolts (2 required)
3	12B579	MAF sensor

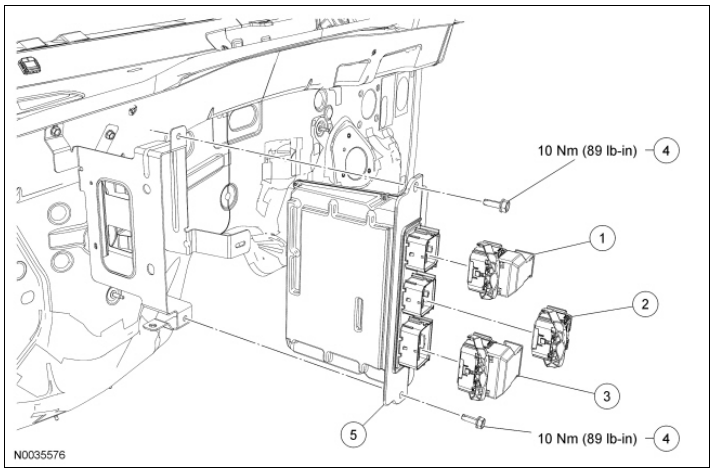
Removal and Installation



1. Disconnect the Mass Air Flow (MAF) sensor electrical connector.

2. Remove the bolts and the MAF sensor.
   - To install, tighten to 2 Nm (18 lb-in).

3. To install, reverse the removal procedure.



Powertrain Control Module (PCM)

A/C Tube Brackets

Item	Part Number	Description
1	2C204	RH front wheel speed sensor electrical connector
2	N621905	A/C tube bracket nut
3	-	A/C tube bracket (part of 19N651)
4	N705760	A/C tube bracket nut (4.6L [3V] only)
5	-	A/C tube bracket (part of 19N617) (4.6L [3V] only)

PCM

Item	Part Number	Description
1	14A464	PCM electrical connector (part of 12B637)
2	14A464	PCM electrical connector (part of 14398)
3	14A464	PCM electrical connector (part of 12B637)
4	N806972	PCM bolts (2 required)

5	12A651	PCM

Removal

All vehicles

1. **NOTE:** PCM installation DOES NOT require new keys.

   Retrieve the module configuration. Carry out the module configuration retrieval steps of the Programmable Module Installation (PMI) procedure. For additional information, refer to Section 418-01 .

Vehicles equipped with a 4.6L (3V) engine

2. Remove the Air Cleaner (ACL). For additional information, refer to Section 303-12 .

All vehicles

3. Disconnect the RH front wheel speed sensor electrical connector. Remove the nut(s) and position the A/C tube bracket(s) and wiring harness aside.

4. Disconnect the PCM connectors.

5. Remove the 2 bolts and the PCM.

Installation

All vehicles

1. Install the PCM and the 2 bolts.
   - Tighten to 10 Nm (89 lb-in).

2. Connect the PCM electrical connectors.

3. Position the wiring harness and the A/C tube bracket(s) and install the nut(s). Connect the RH front wheel speed sensor electrical connector.
   - Tighten to 7 Nm (62 lb-in).

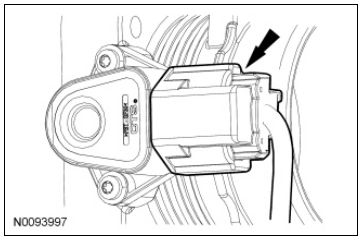
Vehicles equipped with a 4.6L (3V) engine

4. Install the ACL . For additional information, refer to Section 303-12 .

All vehicles

5. Restore the module configuration. Carry out the module configuration restore steps of the Programmable Module Installation (PMI) procedure. For additional information, refer to Section 418-01 .

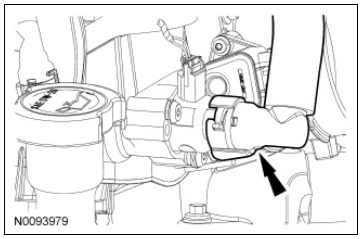
6. Reprogram the Passive Anti-Theft System (PATS). Carry out the Parameter Reset procedure. For additional information, refer to Section 419-01 .



Throttle Position (TP) Sensor

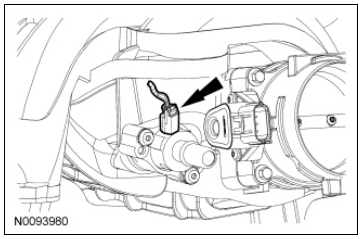
Removal

All vehicles

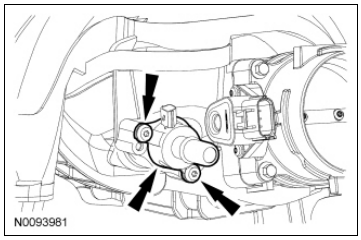


1. Remove the Air Cleaner (ACL) outlet pipe. For additional information, refer to Section 303-12 .

2. Disconnect the Throttle Position (TP) sensor electrical connector.



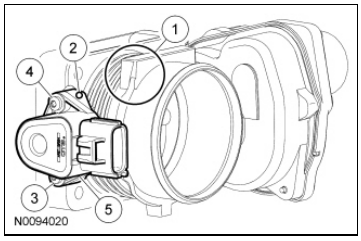
Vehicles equipped with a 4.6L (3V) engine



3. Disconnect the PCV hose from the heated PCV fitting.

4. Disconnect the heated PCV fitting electrical connector.

5. Remove the 2 bolts and the heated PCV fitting.
   - Remove and discard the heated PCV fitting O-ring seal.



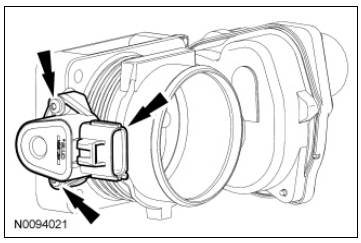
All vehicles

6. ***NOTICE:*** **Do not put direct heat on the Throttle Position (TP) sensor or any other plastic parts because heat damage may occur. Damage may also occur if Electronic Throttle Body (ETB) temperature exceeds 120°C (248°F).**

   NOTE: Do not use power tools.

   Remove the TP sensor.

   1. Using a suitable heat gun, apply heat to the top of the Electronic Throttle Body (ETB) until the top TP sensor bolt ear reaches approximately 55°C (130°F), this should take no more than 3 minutes using a 1100-watt heat gun. The heat gun should be about an 25.4 mm (1 in) away from the ETB .
   2. Monitor the temperature of the top TP sensor bolt ear on the ETB with a suitable temperature measuring device, such as a digital temperature laser or infrared thermometer, while heating the ETB .
   3. Using hand tools, quickly remove the bolt farthest from the heat source first and discard.
   4. Using hand tools, remove the remaining bolt and discard.
   5. Remove and discard the TP sensor.



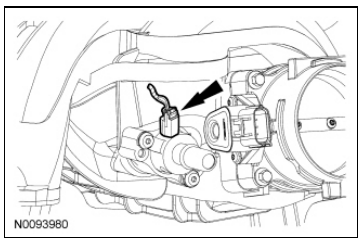
Installation

All vehicles

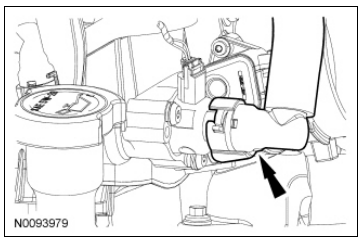
1. **NOTE:** Do not use power tools.

   Install the new TP sensor.

   - Using hand tools, install the 2 new bolts.
     - ♦ Tighten to 3 Nm (27 lb-in).

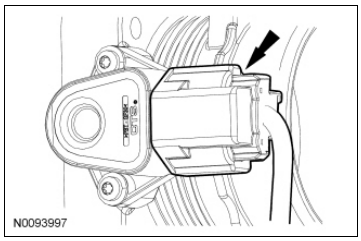


Vehicles equipped with a 4.6L (3V) engine

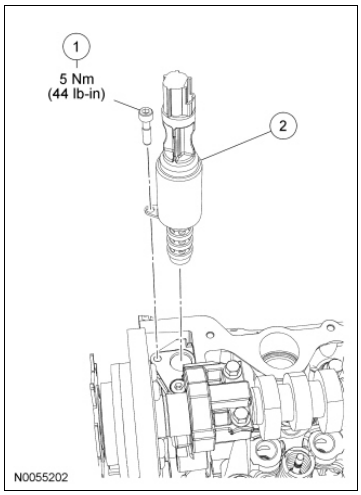


2. Install a new O-ring seal and position the heated PCV fitting and install the 2 bolts.

3. Connect the heated PCV fitting electrical connector.



4. Connect the PCV hose to the heated PCV fitting.



All vehicles

5. Connect the TP sensor electrical connector.

6. Install the ACL outlet pipe. For additional information, refer to Section 303-12 .

Variable Camshaft Timing (VCT) Oil Control Solenoid

Item	Part Number	Description
1	6C260	Variable Camshaft Timing (VCT) oil control solenoid bolt
2	6B297	VCT oil control solenoid

Removal and Installation

1. Remove the valve cover. For additional information, refer to Section 303-01B .

2. Remove the bolt and the Variable Camshaft Timing (VCT) oil control solenoid.
   - To install, tighten to 5 Nm (44 lb-in).

3. To install, reverse the removal procedure.

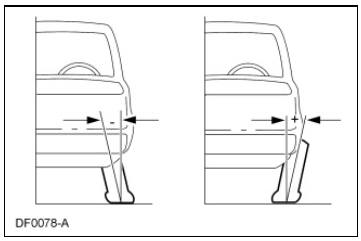
Alignment Specifications

Item	LH	RH	Total/ Split
Front			
Camber	-0.5° ± 0.75°	-0.5° ± 0.75°	0° ± 0.75°
Caster (Explorer, Mountaineer)	4.4° ± 0.75°	4.6° ± 0.75°	-0.2° ± 0.75°
Caster (Sport Trac)	4.3° ± 0.75°	4.7° ± 0.75°	-0.4° ± 0.75°
Toe (positive value is toe in, negative value is toe out)	-	-	0.20° ± 0.20°
Rear			
Camber	-0.5° ± 0.75°	-0.5° ± 0.75°	0° ± 0.75°
Toe (positive value is toe in, negative value is toe out)	0.05° ± 0.20°	0.05° ± 0.20°	0.10° ± 0.20°

General Specifications

Item	Specification
Ball Joint Deflection	
Lower	0-0.8 mm (0-0.032 in)
Upper	0-0.2 mm (0-0.008 in)
Ride Height (With Full Fluids)	
Front (Explorer, Mountaineer)	16 mm (0.63 in) ± 8 mm (0.31 in)
Front (Sport Trac)	21 mm (0.83 in) ± 8 mm (0.31 in)
Rear (Explorer, Mountaineer)	95 mm (3.74 in) ± 10 mm (0.39 in)
Rear (Sport Trac)	98 mm (3.86 in) ± 10 mm (0.39 in)
Thrust Angle (Dogtracking)	
Thrust Angle - maximum (centerline of front tires compared to centerline of rear tires)	± 0.5°
Vehicle Lean (Side-to-Side Height Differences)	
Front - maximum	7 mm (0.28 in)
Rear - maximum	8 mm (0.32 in)

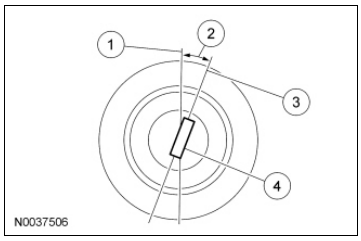
Torque Specifications



Description	Nm	lb-ft
Front upper arm bolt	150	111
Lower arm rearward nut	200	148
Rear upper arm inboard nut	250	185
Tie-rod jam nut	70	52
Toe link inboard nut	275	202

Suspension System

The front camber and caster are adjusted by loosening the upper control arm bolts which will allow the upper arm to be moved in the slotted frame holes. The LF caster can be adjusted by loosening the lower control arm rearward nut to allow the lower arm to be moved in the slotted frame hole. Front toe is adjusted by the use of the front wheel spindle tie rods. The rear camber is adjusted by replacing the upper arm inboard flagnut with a non-flagnut to allow the arm to be adjusted in the slotted frame holes. The rear toe is adjusted through the use of the rear toe link cam bolt.

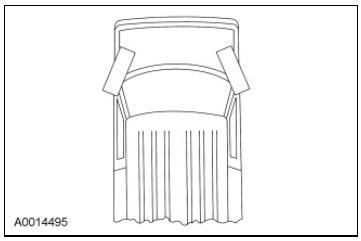


Camber

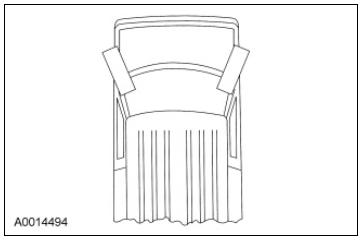
Negative and Positive Camber

Camber is the vertical tilt of the wheel when viewed from the front. Camber can be positive or negative and has a direct effect on tire wear.

Caster



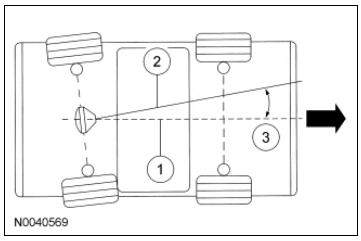
Item	Description
1	True vertical
2	Positive caster
3	Ball joint center line
4	Pivot center line



Caster is the deviation from vertical of an imaginary line drawn through the ball joints when viewed from the side. The caster specifications in this section will give the vehicle the best directional stability characteristics when loaded and driven. The caster setting is not related to tire wear.

Toe

Positive Toe (Toe In)



Negative Toe (Toe Out)

The vehicle toe setting:

- affects tire wear and directional stability.
- must be checked after adding aftermarket equipment, such as a snowplow.

Incorrect Thrust Angle (Dogtracking)

Item	Description
1	Vehicle centerline
2	Axle centerline
3	Thrust angle

Wander

Wander is the tendency of the vehicle to require frequent, random left and right steering wheel corrections to maintain a straight path down a level road.

Shimmy

Shimmy, as observed by the driver, is large, consistent, rotational oscillations of the steering wheel resulting from large, side-to-side (lateral) tire/wheel movements.

Shimmy is usually experienced near 64 km/h (40 mph), and can begin or be amplified when the tire contacts

pot holes or irregularities in the road surface.

Nibble

Sometimes confused with shimmy, nibble is a condition resulting from tire interaction with various road surfaces and observed by the driver as small rotational oscillations of the steering wheel. For wheel and tire diagnosis, refer to Section 204-04 .

Poor Returnability/Sticky Steering

Poor returnability and sticky steering is used to describe the poor return of the steering wheel to center after a turn or the steering correction is completed.

Drift/Pull

Pull is a tugging sensation, felt by the hands on the steering wheel, that must be overcome to keep the vehicle going straight.

Drift describes what a vehicle with this condition does with hands off the steering wheel.

- A vehicle-related drift/pull, on a flat road, will cause a consistent deviation from the straight-ahead path and require constant steering input in the opposite direction to counteract the effect.
- Drift/pull may be induced by conditions external to the vehicle, such as wind or road camber.

Suspension System

Inspection and Verification

1. Road test.
   - If any suspension alignment or ride height concerns are present, GO to Symptom Chart - Suspension System .
   - Verify the customer concern by carrying out a road test on a smooth road. If any vibrations are present, GO to Symptom Chart - NVH .

2. Inspect tires.
   - Check the tire pressure with all normal loads in the vehicle and with the tires cold. Refer to the Vehicle Certification (VC) label.
   - Verify that all tires are sized to specification. Refer to Section 204-04 .
   - Inspect the tires for incorrect wear and damage. Refer to Section 204-04 .

3. Inspect chassis and underbody.
   - Remove any excessive accumulation of mud, dirt or road deposits from the chassis and underbody.

4. Inspect for aftermarket equipment.
   - Check for aftermarket changes to the steering, suspension, wheel and tire components (such as competition, heavy duty, etc.) The specifications shown in this manual do not apply to vehicles equipped with aftermarket equipment.

Visual Inspection Chart

Mechanical
• Front wheel bearing(s) • Loose or damaged front or rear suspension components • Loose, damaged or missing suspension fastener(s) • Incorrect spring usage • Damaged or sagging spring(s) • Damaged or leaking shock absorber(s) • Worn or damaged suspension bushing(s) • Loose, worn or damaged steering system components • Damaged axle components

5. If an obvious cause for an observed or reported condition is found, correct the cause (if possible) before proceeding to the next step.

6. If the fault is not visually evident, GO to Symptom Chart - Suspension System or GO to Symptom Chart - NVH .

Symptom Chart - Suspension System

Symptom Chart - Suspension System

Symptom Chart - NVH

Symptom Chart - NVH

NOTE: NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to Section 100-04 . Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to Section 100-04 for the next likely system and continue diagnosis.

ConditionPossible SourcesAction

- Squeak or grunt - noise from the front suspension, occurs more in cold ambient temperatures. More noticeable over rough roads or when turning
- Front stabilizer bar insulators
- Under these conditions, the noise is acceptable. CHECK TSBs.
- Clunk - noise from the front suspension, occurs in and out of turns
- Loose front shocks
- INSPECT for shock absorber fasteners. TIGHTEN to specifications. Refer to the appropriate section in Group 204 for the procedure.
- Clunk - noise from the rear suspension, occurs when shifting from REVERSE to DRIVE
- Loose or damaged rear suspension components
- INSPECT for loose or damaged rear suspension components. REPAIR or INSTALL new components as necessary. Refer to the appropriate section in Group 204 for the procedure.
- Click or pop - noise from the front suspension. More noticeable over rough roads or over bumps
- Worn or damaged ball joint(s)
- INSPECT the front ball joints. REFER to the Ball Joint Inspection Component Test in this section. INSTALL new ball joints as necessary.
- Front suspension noise - a squeak, creak or rattle noise. Occurs mostly over bumps or rough roads
- Loose or bent front shock absorber(s)

- Damaged spring or spring mount(s)
- Damaged or worn control/radius arm bushing(s)
- Worn or damaged stabilizer bar bushings or link(s)

- INSPECT the front suspension. INSTALL new components as necessary. Refer to the appropriate section in Group 204 for the procedure.

- Rear suspension noise - a squeak, creak or rattle noise. Occurs mostly over bumps or rough roads

- Loose or bent rear shock absorber(s)
- Damaged spring or spring mount(s)
- Damaged or worn bushing(s)
- Worn or damaged stabilizer bar bushing(s) or link(s)

- INSPECT the rear suspension. INSTALL new components as necessary. Refer to the appropriate section in Group 204 for the procedure.

- Shudder - occurs during acceleration from a slow speed or stop

- Incorrect ride height causing incorrect driveline angle

- REFER to Section 205-00 for driveline angle diagnosis.

- Shimmy

- Loose wheel nut(s)

- TIGHTEN the nut(s) to specification. REFER to Section 204-04 .

- Loose front suspension fastener(s)

- TIGHTEN the fastener(s) to specification. Refer to the appropriate section in Group 204 for the procedure.

- Loose front wheel bearing(s)

- INSPECT the front wheel bearing(s). Refer to the appropriate section in Group 204 for the procedure. INSTALL new bearing(s) as necessary.

- Shock absorber(s)

- INSTALL new shock absorbers as necessary. Refer to the appropriate section in Group 204 for the procedure.

- Shimmy - most noticeable on coast/deceleration. Also hard steering condition

- Excessive positive caster

- CHECK the front caster and ADJUST as necessary. REFER to Camber and Caster Adjustment - Front in this section.

- Rough/harsh ride

- Shock absorber(s)

- INSTALL new shock absorber(s) as necessary. Refer to the appropriate section in Group 204 for the procedure.
- Spring(s)
- INSTALL new spring(s) as necessary. Refer to the appropriate section in Group 204 for the procedure.

Pinpoint Tests

Pinpoint Test A: Vehicle Drifts/Pulls

This pinpoint test is intended to diagnose the following:

- Unevenly loaded vehicle
- Tire pressure
- Tire forces
- Brake drag
- Incorrect vehicle alignment
- Steering system

PINPOINT TEST A: VEHICLE DRIFTS/PULLS

Test Step	Result / Action to Take
A1 CHECK FOR UNEVENLY LOADED VEHICLE	
• Visually check the vehicle for an uneven loading condition. • **Is the vehicle unevenly loaded?**	**Yes** ADVISE the customer of uneven loading condition. **No** GO to A2 .
A2 CHECK THE TIRE PRESSURES AND TIRE CONDITIONS	
• Check the tire pressures. Refer to the Vehicle Certification (VC) label located on the driver door jamb. Check the tires for uneven/abnormal wear. Refer to Diagnosis and Testing - Wheels and Tires in Section 204-04 . • **Are the tire pressures and tire conditions OK?**	**Yes** GO to A3 . **No** ADJUST the tire pressures to the specified pressure or INSTALL new tires as necessary.
A3 ISOLATE TIRE DRIFT/PULL CONDITION	
• Cross the front wheel and tire assemblies from left-to-right. Refer to Section 204-04 . • **Does the vehicle drift/pull?**	**Yes** If the vehicle drifts/pulls in the opposite direction, tire forces are causing the drift/pull. ROTATE the wheel and tire assemblies front-to-rear. REFER to Section 204-04 . If the vehicle drifts/pulls in the

	same direction, GO to A4 . **No** Tire forces were causing the drift/pull and the concern has been corrected.
A4 CHECK FOR BRAKE DRAG	
• Spin all 4 wheel and tire assemblies by hand and check for brake drag. • **Do the wheels spin freely?**	**Yes** GO to A5 . **No** REFER to Section 206-00 to diagnose brake drag condition.
A5 CHECK THE WHEEL ALIGNMENT	
• Using alignment equipment and the manufacturer's instructions, check the wheel alignment. • **Is the wheel alignment out of specification?**	**Yes** ADJUST the alignment as necessary. REFER to General Procedures in this section. **No** REFER to Section 211-00 to diagnose steering system drift/pull/wander condition.

Component Tests

Ball Joint Inspection

1. Prior to inspecting the ball joints for wear, inspect the wheel bearings. Refer to Section 100-04 .

2. **NOTE:** In order to obtain accurate measurements, the suspension must be in full rebound with the weight of the vehicle supported by the frame.

   Raise and support the vehicle by the frame to allow the wheels to hang in the rebound position.

3. Inspect the ball joint and ball joint boot for damage.
   - If the ball joint or ball joint boot is damaged, install a new ball joint as necessary. Refer to Section 204-01A for Rear Wheel Drive (RWD) vehicles and Section 204-01B for Four-Wheel Drive (4WD) vehicles.

NOTE: Carry out Steps 4 through 6 to inspect the lower ball joint. Carry out Steps 7 through 9 to inspect the upper ball joint.

4. ***NOTICE:*** **Do not use any tools or equipment to move the wheel and tire assembly or suspension components while checking for relative movement. Suspension damage may occur. The use of tools or equipment will also create relative movement that may not exist when using hand force. Relative movement must be measured using hand force only.**

   NOTE: The weight of the wheel and tire assembly must be overcome to obtain an accurate measurement on the dial indicator.

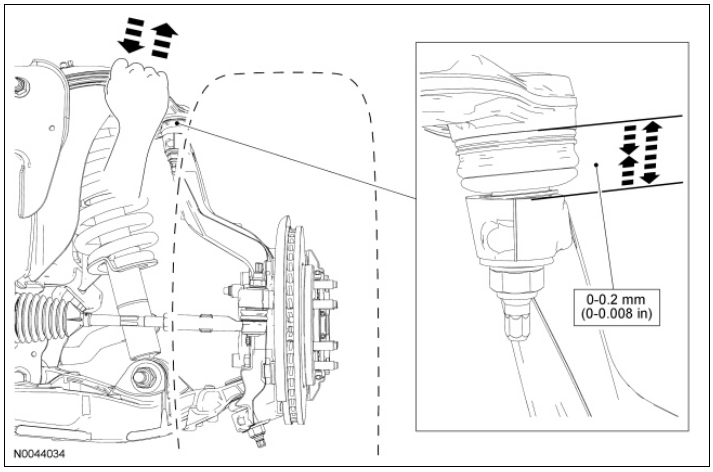
   Inspect the ball joint for relative movement by alternately pulling downward and pushing upward on the wheel and tire assembly by hand. Note any relative vertical movement between the wheel knuckle and lower arm at the lower ball joint.

- If relative movement is not felt or seen, the ball joint is OK. Do not install a new ball joint.
- If relative movement is found, continue with Step 5.

5. **NOTE:** In order to obtain an accurate measurement, the dial indicator should be aligned as close as possible with the vertical axis (center line) of the ball joint.

   To measure ball joint deflection, attach a suitable dial indicator with a flexible arm between the lower control arm and the wheel knuckle or ball joint stud.

6. Measure the ball joint deflection while an assistant pushes up and pulls down on the wheel and tire assembly by hand.
   - If the deflection exceeds the specification, a new ball joint must be installed. Refer to Section 204-01A for RWD vehicles and Section 204-01B for 4WD vehicles.
   - If the deflection meets the specification, continue with the procedure.



7. ***NOTICE:*** **Do not use any tools or equipment to move the wheel and tire assembly or suspension components while checking for relative movement. Suspension damage may occur. The use of tools or equipment will also create relative movement that may not exist when using hand force. Relative movement must be measured using hand force only.**

   Inspect the ball joint for relative movement by alternately pulling downward and pushing upward on the upper control arm by hand. Note any relative vertical movement between the wheel knuckle and upper arm at the upper ball joint.

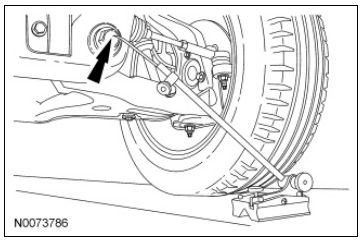
   - If relative movement is not felt or seen, the ball joint is OK. Do not install a new ball joint.
   - If relative movement is found, continue with Step 8.

8. **NOTE:** In order to obtain an accurate measurement, the dial indicator should be aligned as close as possible with the vertical axis of the ball joint.

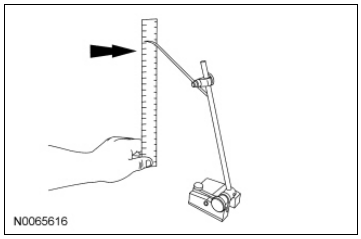
   To measure ball joint deflection, attach a suitable dial indicator with a flexible arm between the upper control arm and the wheel knuckle or ball joint stud.

9. Measure the ball joint deflection while an assistant pushes up and then pulls down on the upper control arm by hand.
    - If the deflection exceeds the specification, a new ball joint must be installed. For additional information, refer to Section 204-01A for RWD vehicles and Section 204-01B for 4WD vehicles.
    - If the deflection meets the specification, no further action is required.

Ride Height Measurement

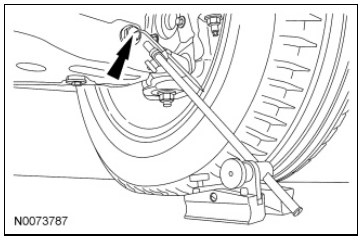


Front Ride Height Measurement

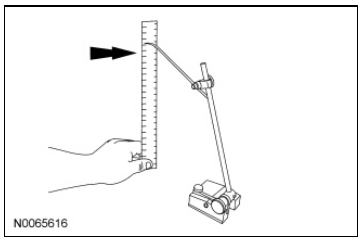


Item	Description
1	Ride height = 2-3
2	Measurement 2
3	Measurement 3

NOTE: Make sure that the vehicle is positioned on a flat, level surface and the tires are inflated to the correct pressure. Vehicle should have a full tank of fuel.

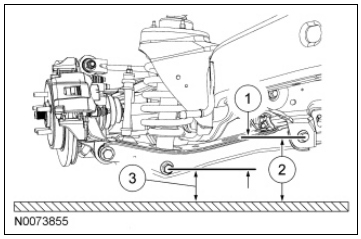


1. Position a suitable surface gauge (such as Starrett 57D Surface Gauge), on a flat, level surface and adjust the gauge arm until the scriber point is located in the center of the lower arm inboard bolt.
   - Lock the surface gauge in this position.



2. With the surface gauge positioned on a flat, level surface, record the measurement of the surface gauge position (measurement 2).

3. Position the surface gauge on the same flat, level surface as used in Step 1, adjust the gauge arm until the scriber point is located in the center of the shock absorber lower bolt.
   - Lock the surface gauge in this position.



4. With the surface gauge positioned on a flat, level surface, record the measurement of the surface gauge position (measurement 3).

5. Subtract measurement 3 from measurement 2 to obtain the front ride height.
    - Refer to Specifications in this section.

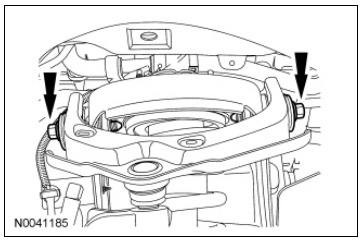
Rear Ride Height Measurement

Item	Description
1	Ride height = 2-3
2	Measurement 2
3	Measurement 3

NOTE: Make sure that the vehicle is positioned on a flat, level surface and the tires are inflated to the correct pressure. Vehicle should have a full tank of fuel.

1. Measure the distance between the flat level surface and the center of the lower arm inboard bolt (measurement 2).

2. Measure the distance between the flat level surface and the center of the shock absorber lower bolt (measurement 3).



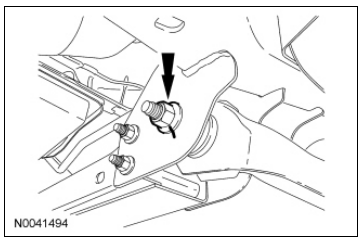
3. Subtract measurement 3 from measurement 2 to obtain the rear ride height.
    - Refer to Specifications in this section.

Camber and Caster Adjustment - Front

1. Using alignment equipment and the manufacturer's instructions, measure the front caster and camber.

2. Loosen the upper arm bolt(s) and adjust the caster and camber settings. Refer to the following chart.
   - When making adjustments that require moving both the front and the rear of the upper arm, move both ends of the arm equally.

Adjustment	Front of Upper Arm	Rear of Upper Arm
Increase caster	Out	In
Decrease caster	In	Out
Increase camber	Out	Out
Decrease camber	In	In
Increase caster and camber simultaneously	Out	-
Decrease caster and camber simultaneously	In	-



3. **NOTE:** Make sure that the weight of the vehicle is on the wheels and that the caster and camber settings are not disturbed while tightening the bolt(s).

   Tighten the upper arm bolt(s) to 150 Nm (111 lb-ft).

4. **NOTE:** A caster split adjustment can be made by loosening the LF lower arm rearward nut and adjusting the rear of the LF lower arm.

   Remove and discard the LF lower control arm rearward nut.

5. **NOTE:** Do not fully tighten the nut and bolt at this time.

   Install a new LF lower arm rearward nut.

6. Position the LF lower arm until the caster split is within specification.

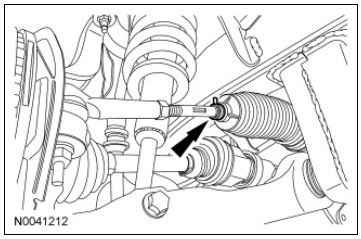
7. **NOTE:** Make sure that the weight of the vehicle is on the wheels and that the caster settings are not disturbed while tightening the nut.

   Tighten the LF lower arm rearward nut to 200 Nm (148 lb-ft).

8. Recheck the camber and caster, adjust as necessary.

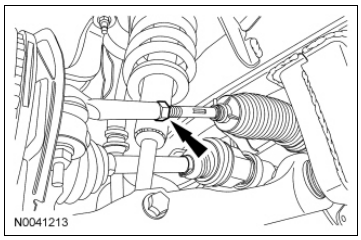
9. Check and, if necessary, adjust the front toe.

Toe Adjustment - Front



1. Using alignment equipment and the manufacturer's instructions, measure the front toe.

2. Start the engine and center the steering wheel.



3. Turn the engine OFF and, using a suitable holding device, lock the steering wheel in the straight ahead position.

4. **NOTE:** Do not allow the steering gear bellows to twist when the front wheel inner tie rod is rotated.

   Remove the clamps.

5. Loosen the tie-rod jam nuts.

6. Rotate the front wheel inner tie rods until the toe setting is within specification.

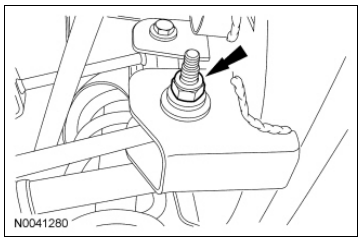
7. ***NOTICE:*** **Make sure to hold the tie-rod end stationary while tightening the nut or damage to the steering gear bellows can occur.**

   NOTE: Make sure that the toe settings are not disturbed while tightening the nuts.

   Tighten the tie-rod jam nuts to 70 Nm (52 lb-ft).

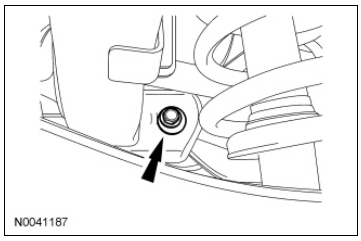
8. Install the clamps.

9. Recheck the toe settings and adjust if necessary.



Toe Adjustment - Rear

1. Using alignment equipment and the manufacturer's instructions, measure the rear toe.



2. Start the engine and center the steering wheel.

3. Turn the engine OFF and, using a suitable holding device, lock the steering wheel in the straight ahead position.

4. Loosen the rear toe link inboard nut.

5. Rotate the rear toe link cam bolt until the toe setting is within specification.

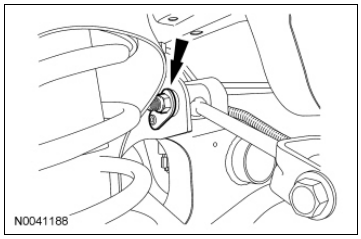
6. **NOTE:** Make sure the toe settings are not disturbed while tightening the nut.

   While holding the adjustment cam bolt, tighten the toe link inboard nut.

   - Tighten to 275 Nm (202 lb-ft).

7. Recheck the toe settings and adjust if necessary.

Camber Adjustment - Rear

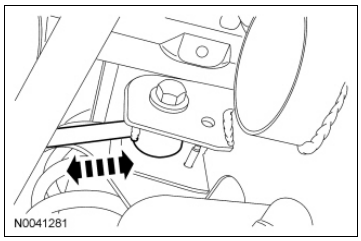


1. Index-mark the upper arm inboard bolt to the frame.

2. **NOTE:** The upper arm inboard flagnut must be removed and replaced with a non-flagnut to allow for the adjustment of the arm in the frame slot.

   Remove and discard the upper arm inboard bolt and flagnut.

   - Install a new non-flagnut.



3. Using alignment equipment and the manufacturer's instructions, measure the rear camber.

4. **NOTE:** The weight of the vehicle must be off of the wheels in order to adjust the rear camber.

   NOTE: For camber adjustment, 1 mm (0.03 in) of movement equals 0.24 degrees of camber.

   NOTE: To decrease the camber, move the upper arm inward. To increase the camber, move the upper arm outward.

   Position the upper arm until the camber setting is within specification.

5. **NOTE:** Make sure that the camber settings are not disturbed while tightening the nut.

   Tighten the upper arm inboard nut to 250 Nm (185 lb-ft).

6. Recheck the camber settings and adjust as necessary.

7. Check and, if necessary, adjust the rear toe.

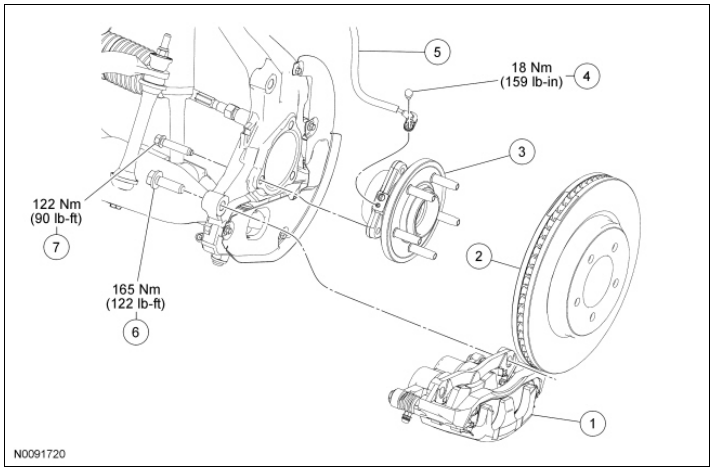
Torque Specifications

Description	Nm	lb-ft	lb-in
Brake caliper anchor plate bolt	165	122	-
Brake disc shield bolt	8	-	71
Lower arm forward nut	400	296	-
Lower arm rearward nut	200	148	-
Lower ball joint nut	150	111	-
Shock absorber lower bolt and flag nut	350	258	-
Shock absorber rod nut	65	48	-
Shock absorber upper mount nut	30	22	-
Stabilizer bar bracket bolt	55	41	-
Stabilizer bar link nut and grommet	35	26	-
Tie-rod end nut	103	76	-
Upper arm bolt and flag nut	150	111	-
Upper ball joint nut	55	41	-
Wheel bearing and wheel hub bolt	122	90	-
Wheel speed sensor bolt	18	-	159
Wheel speed sensor harness bracket bolt	8	-	71

Front Suspension

The Rear Wheel Drive (RWD) front suspension consists of the following components:

- Lower arms
- Shock absorber and spring assemblies
- Stabilizer bar links, bushings and brackets
- Upper arms
- Wheel bearing and wheel hub
- Wheel knuckles
- Wheel studs



The front suspension utilizes an upper and lower arm and is an independent suspension design. This type of suspension uses 2 parallel arms. Each arm has 2 mounting positions to the chassis and one ball joint attachment at the wheel knuckle. The shock absorber mounts to the lower arm and along with the spring, controls vertical movement. A stabilizer bar and links are included to control suspension lean/sway during turns. Double-arm designs allow for carefully controlled motion of the wheel throughout suspension travel, controlling such parameters as camber angle, caster angle and toe.

Front Suspension

Refer to Section 204-00 .

Wheel Bearing and Wheel Hub

Removal and Installation

Item	Part Number	Description
1	2B120 RH/ 2B121 LH	Brake caliper assembly
2	1125	Brake disc
3	1104	Wheel bearing and hub assembly
4	W500212	Wheel speed sensor bolt
5	2C204	Wheel speed sensor
6	2027	Brake caliper anchor plate bolt (2 required)
7	1107	Wheel bearing and hub assembly bolt (3 required)

NOTICE: **Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.**

1. Remove the wheel and tire. For additional information, refer to Section 204-04 .

2. ***NOTICE:*** **Do not allow the caliper and anchor plate assembly to hang from the brake hose or damage to the hose can occur.**

   Remove the bolts and position the caliper, pads and anchor plate assembly aside.

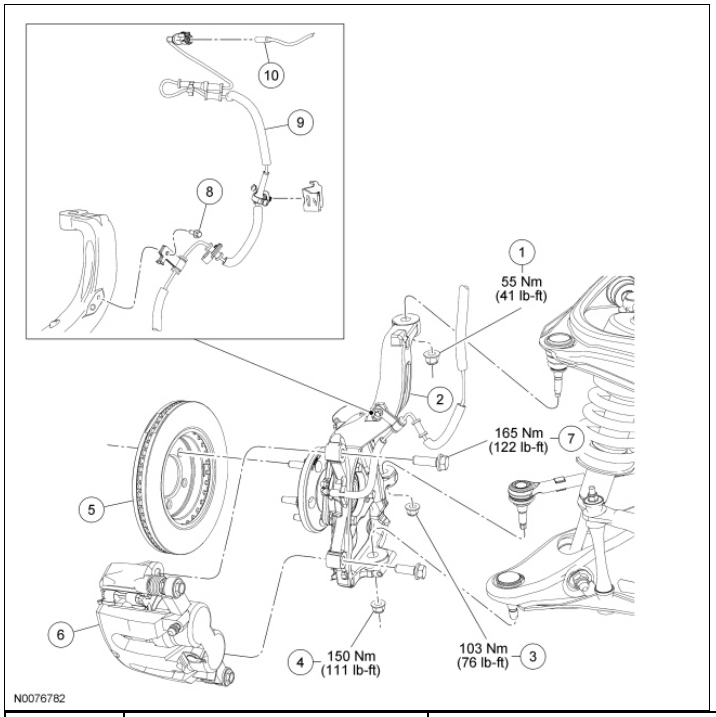
   - Discard the bolts.
   - Support the caliper and anchor plate assembly using mechanic's wire.
   - To install, tighten the new bolts to 165 Nm (122 lb-ft).

3. Remove the brake disc.

4. **NOTE:** Inspect and if necessary, clean area around wheel speed sensor before removing it from the wheel bearing and hub.

   Remove the wheel speed sensor bolt and disconnect the wheel speed sensor from the wheel bearing and hub assembly.

   - To install, tighten to 18 Nm (159 lb-in).



5. Remove the 3 bolts and the wheel bearing and wheel hub.
   - Discard the bolts.
   - To install, tighten the new bolts to 122 Nm (90 lb-ft).

6. To install, reverse the removal procedure.

Wheel Knuckle

Special Tool(s)

 ST2026-A	2-Jaw Puller 205-D072 (D97L-4221-A) or equivalent
 ST1494-A	C-Frame and Screw 211-023 (T74P-3044-A1)

Item	Part Number	Description
1	W520214	Upper ball joint nut
2	3C489 RH/ 3C459 LH	Wheel knuckle
3	W707251	Tie-rod end nut
4	W710046	Lower ball joint nut
5	1125	Brake disc
6	2B120 RH/ 2B121 LH	Brake caliper assembly
7	2027	Brake caliper anchor plate bolt (2 required)
8	W500212	Wheel speed sensor harness bracket bolt
9	2C204	Wheel speed sensor harness (part of 2C204)
10	-	Wheel speed sensor electrical connector (part of 14398)

Removal and Installation

NOTICE: **Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.**

1. Remove the wheel and tire. For additional information, refer to Section 204-04 .

2. ***NOTICE:*** **Do not allow the caliper and anchor plate assembly to hang from the brake hose or damage to the hose can occur.**

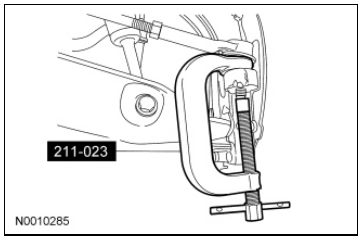
   Remove the bolts and position the caliper, pads and anchor plate assembly aside.

   - Discard the bolts.
   - Support the caliper and anchor plate assembly using mechanic's wire.
   - To install, tighten the new bolts to 165 Nm (122 lb-ft).

3. Remove the brake disc.

4. Disconnect the wheel speed sensor harness pin-type retainers.

5. Disconnect the wheel speed sensor electrical connector.



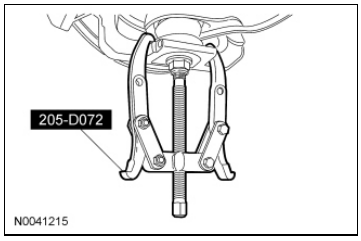
6. Remove the wheel speed sensor harness bracket bolt from the wheel knuckle.
   - To install, tighten to 8 Nm (71 lb-in).

7. Remove and discard the tie-rod end nut.
   - To install, tighten the new nut to 103 Nm (76 lb-ft).

8. ***NOTICE:*** **Do not use a hammer to separate the tie rod from the wheel knuckle or damage to the wheel knuckle can result.**

   NOTICE: **Do not damage the tie-rod boot while installing the C-Frame and Screw.**

   Using the C-Frame and Screw, separate the tie-rod end from the wheel knuckle.

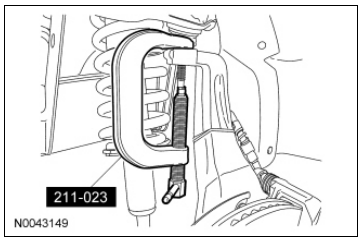


9. Remove and discard the lower ball joint nut.
   - To install, tighten the new nut to 150 Nm (111 lb-ft).

10. ***NOTICE:*** **Do not use a hammer to separate the ball joint from the wheel knuckle or damage to the wheel knuckle can result.**

    NOTICE: **Do not damage the ball joint boot while installing the 2-Jaw Puller.**

    Using the 2-Jaw Puller, separate the lower ball joint from the wheel knuckle.

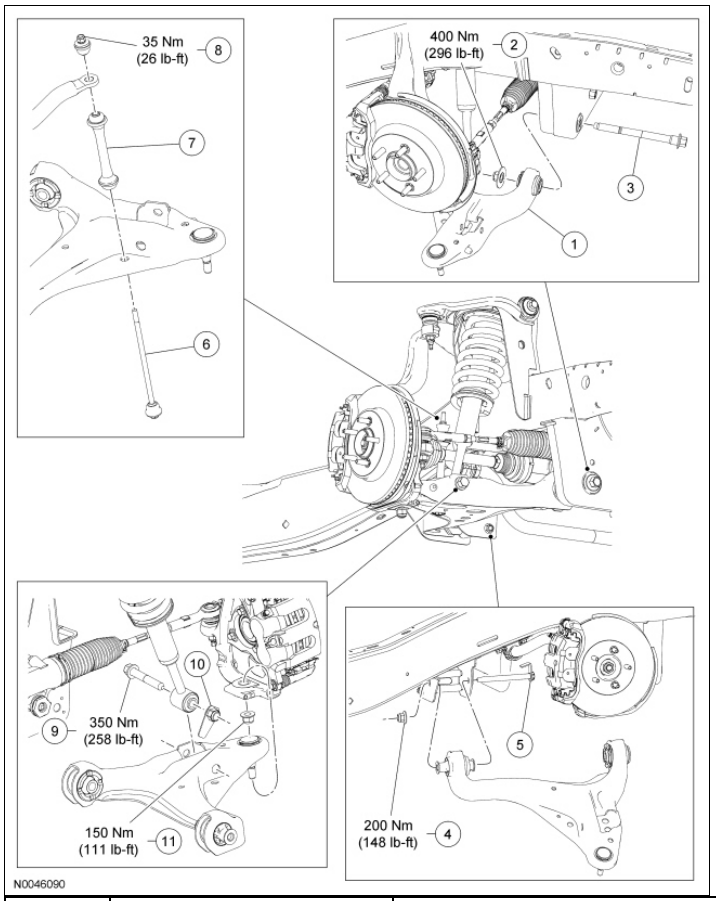


11. Remove and discard the upper ball joint nut.
    - To install, tighten the new nut to 55 Nm (41 lb-ft).

12. ***NOTICE:*** **Do not use a hammer to separate the ball joint from the wheel knuckle or damage to the wheel knuckle can result.**

    NOTICE: **Do not damage the ball joint boot while installing the C-Frame and Screw.**

    Using the C-Frame and Screw, separate the upper ball joint and remove the wheel knuckle.

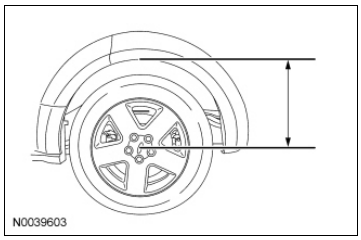


13. To install, reverse the removal procedure.
    - Check and, if necessary, align the front end. For additional information, refer to Section 204-00 .

Lower Arm

Special Tool(s)

 ST2026-A	2-Jaw Puller 205-D072 (D97L-4221-A) or equivalent



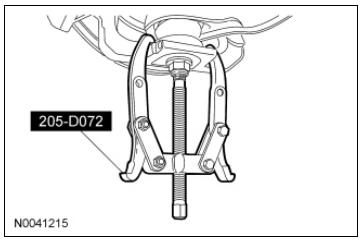
Item	Part Number	Description
1	3042 RH/ 3051 LH	Lower arm
2	W710796	Lower arm forward nut
3	W711505	Lower arm forward bolt
4	W707254	Lower arm rearward nut
5	W711533	Lower arm rearward bolt
6	5495	Stabilizer bar link stud (part of 5K183)
7	5K483	Stabilizer bar link assembly
8	5C491	Stabilizer bar link nut and grommet
9	W710775	Shock absorber lower bolt
10	W710747	Shock absorber lower flag nut
11	W710046	Lower ball joint nut

Removal

NOTICE: **Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.**

NOTICE: **Orientation of the suspension fasteners is important. Make sure the fasteners are installed in the same direction as when removed or incorrect clamp load and damage to components may occur.**

1. Measure the distance from the center of the hub to the lip of the fender with the vehicle in a level, static ground position (curb height).



2. Remove the wheel and tire. For additional information, refer to Section 204-04 .

3. Remove and discard the lower ball joint nut.

4. ***NOTICE:*** **Do not use a hammer to separate the ball joint from the wheel knuckle or damage to the wheel knuckle can result.**

   NOTICE: **Do not damage the ball joint boot while installing the 2-Jaw Puller.**

   Using the 2-Jaw Puller, separate the lower ball joint from the wheel knuckle.

5. Remove and discard the stabilizer bar link nut and grommet.

6. Remove the stabilizer bar link.

7. Remove and discard the shock absorber lower bolt and flag nut.

8. Remove and discard the lower arm forward nut and bolt.

9. Remove the lower arm rearward nut and bolt and the lower control arm.
   - Discard the nut and bolt.

Installation

NOTICE: **Before tightening any suspension bushing fasteners, use a suitable jack to raise the**

suspension until the distance between the center of the hub and the lip of the fender is equal to the measurement taken in Step 1 (curb height). This will prevent incorrect clamp load and bushing damage.

1. **NOTE:** Do not tighten the bolt at this time.

   Position the lower arm and install the new lower arm rearward bolt and nut.

2. **NOTE:** Do not tighten the bolt at this time.

   Install the new lower arm forward bolt and nut.

3. **NOTE:** Do not tighten the bolt at this time.

   Install the new shock absorber lower bolt and flag nut.

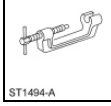
4. Position the stabilizer bar link and install the new nut.
   - Tighten the nut to 35 Nm (26 lb-ft).

5. Connect the lower ball joint to the wheel knuckle and install the new lower ball joint nut.
   - Tighten to 150 Nm (111 lb-ft).

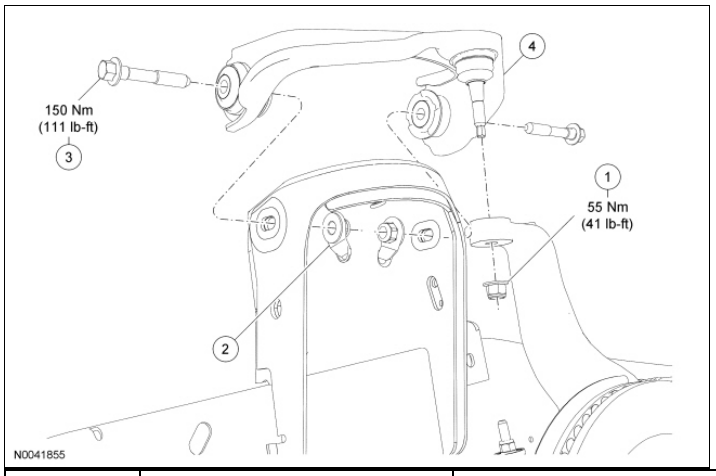
6. Using a suitable jack, raise the suspension until the distance between the center of the hub and the lip of the fender is equal to the measurement taken in Step 1 (curb height).

7. Tighten the shock absorber lower bolt to 350 Nm (258 lb-ft).

8. Tighten the lower arm forward nut to 400 Nm (296 lb-ft).



9. Tighten the lower arm rearward nut to 200 Nm (148 lb-ft).



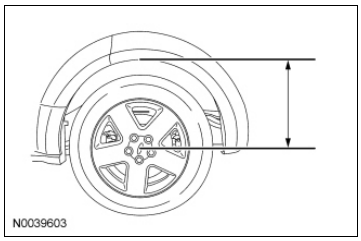
10. Install the wheel and tire. For additional information, refer to Section 204-04 .

11. Check and if necessary, align the front end. For additional information, refer to Section 204-00 .

Upper Arm

Special Tool(s)

 ST1494-A	C-Frame and Screw 211-023 (T74P-3044-A1)



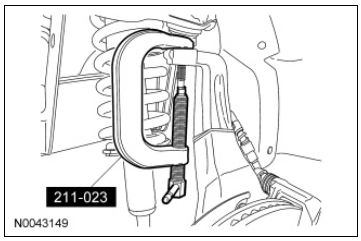
Item	Part Number	Description
1	W520214	Upper ball joint nut
2	W711223	Upper arm flag nut (2 required)
3	W711504	Upper arm bolt (2 required)
4	3084 RH/ 3091 LH	Upper arm

Removal

NOTICE: **Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.**

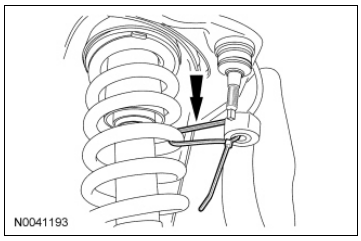
1. Measure the distance from the center of the hub to the lip of the fender with the vehicle in a level, static ground position (curb height).

2. Remove the wheel and tire. For additional information, refer to Section 204-04 .



3. Using a suitable jack support the lower control arm near the lower ball joint.

4. Remove and discard the upper ball joint nut.



5. ***NOTICE:*** **Do not use a hammer to separate the ball joint from the wheel knuckle or damage to the wheel knuckle can result.**

   NOTICE: **Do not damage the ball joint boot while installing the C-Frame and Screw.**

   Using the C-Frame and Screw, separate the upper ball joint from the wheel knuckle.

6. Using a plastic tie strap, support the suspension at the wheel knuckle.

7. Remove and discard the 2 upper arm bolts and flag nuts and remove the upper arm.

Installation

NOTICE: **Before tightening any suspension bushing fasteners, use a suitable jack to raise the suspension until the distance between the center of the hub and the lip of the fender is equal to the measurement taken in Step 1 (curb height). This will prevent incorrect clamp load and bushing damage.**

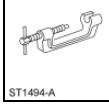
1. **NOTE:** Do not tighten the bolt at this time.

   Position the upper arm and install the 2 new upper arm bolts and flag nuts.

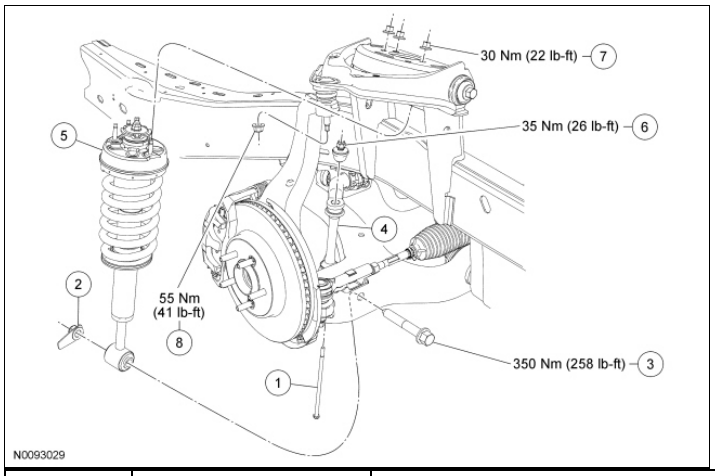
2. Remove the plastic tie strap.

3. Connect the upper ball joint to the wheel knuckle and install the new upper ball joint nut.
   - Tighten to 55 Nm (41 lb-ft).

4. Using a suitable jack, raise the suspension until the distance between the center of the hub and the lip of the fender is equal to the measurement taken in Step 1 (curb height).



5. Tighten the 2 upper arm bolts to 150 Nm (111 lb-ft).



6. Install the wheel and tire. For additional information, refer to Section 204-04 .

7. Check and if necessary, align the front end. For additional information, refer to Section 204-00 .

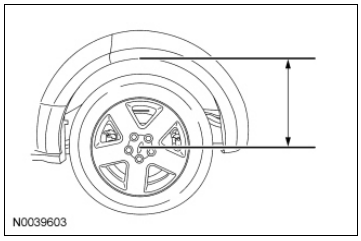
Shock Absorber and Spring Assembly

Special Tool(s)

 ST1494-A	C-Frame and Screw 211-023 (T74P-3044-A1)

Item	Part Number	Description
1	5495	Stabilizer bar link stud (part of 5K483)
2	W710747	Shock absorber lower flag nut
3	W710775	Shock absorber lower bolt
4	5K483	Stabilizer bar link assembly
5	18B036	Shock absorber and spring assembly
6	5C491	Stabilizer bar link nut and grommet
7	W704790	Shock absorber upper nuts (3 required)
8	W520214	Upper ball joint nut

Removal



⚠ WARNING: Do not apply heat or flame to the shock absorber or strut tube. The shock absorber and strut tube are gas pressurized and could explode if heated. Failure to follow this instruction may result in serious personal injury.

⚠ WARNING: Keep all body parts clear of shock absorbers or strut rods. Shock absorbers or struts can extend unassisted. Failure to follow this instruction may result in serious personal injury.

NOTICE: **Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.**

NOTICE: **Orientation of the suspension fasteners is important. Make sure the fasteners are installed in the same direction as when removed or incorrect clamp load and damage to components may occur.**

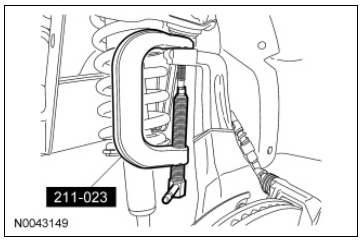
1. Measure the distance from the center of the hub to the lip of the fender with the vehicle in a level, static ground position (curb height).

2. Remove and discard the 3 shock absorber upper mount nuts.

3. Remove the wheel and tire. For additional information, refer to Section 204-04 .

4. Using a suitable jack, support the lower control arm near the lower ball joint.

5. Remove and discard the stabilizer bar link nut and grommet and then remove the stabilizer bar link.



6. Remove and discard the shock absorber lower bolt and flag nut.

7. Remove and discard the upper ball joint nut.

8. ***NOTICE:*** **Do not use a hammer to separate the ball joint from the wheel knuckle or damage to the wheel knuckle can result.**

   NOTICE: **Do not damage the ball joint boot while installing the C-Frame and Screw.**

   Using the C-Frame and Screw, separate the upper ball joint from the wheel knuckle.

9. While lowering the suspension, remove the shock and spring assembly.

Installation

NOTICE: **Before tightening any suspension bushing fasteners, use a suitable jack to raise the suspension until the distance between the center of the hub and the lip of the fender is equal to the measurement taken in Step 1 (curb height). This will prevent unequal clamp load and bushing damage.**

NOTE: For additional information on the disassembly and assembly of the shock absorber and spring assembly, refer to Shock Absorber and Spring Assembly in this section.

1. Install the shock absorber and spring assembly.

2. Connect the upper ball joint to the wheel knuckle and install the new upper ball joint nut.

- Tighten to 55 Nm (41 lb-ft).

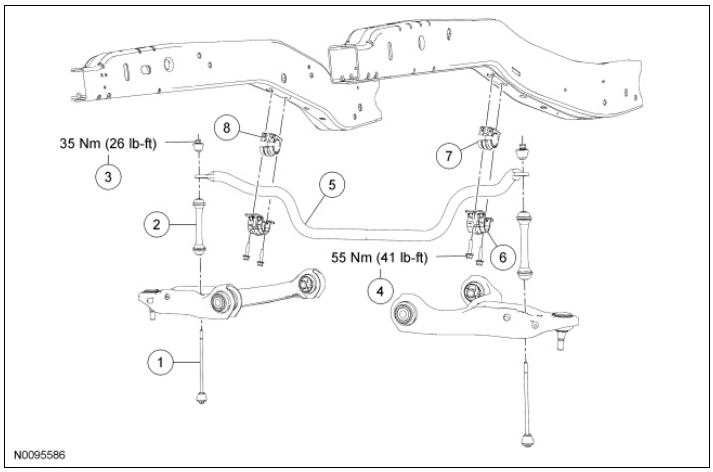
3. **NOTE:** Do not tighten the bolt at this time.

   Install the new shock absorber lower bolt and flag nut.

4. Using a suitable jack, raise the suspension until the distance between the center of the hub and the lip of the fender is equal to the measurement taken in Step 1 (curb height).

5. Position the stabilizer bar link and install the new nut.
   - Tighten to 35 Nm (26 lb-ft).

6. Tighten the shock absorber lower bolt to 350 Nm (258 lb-ft).



7. Install the 3 new shock absorber upper mount nuts.
   - Tighten to 30 Nm (22 lb-ft).

8. Remove the jack.

9. Install the wheel and tire. For additional information, refer to Section 204-04 .

10. Check and if necessary, align the front end. For additional information, refer to Section 204-00 .

Stabilizer Bar and Link

Item	Part Number	Description
1	5495	Stabilizer link stud (2 required) (part of 5K483)
2	5K483	Stabilizer bar link assembly (2 required)
3	5C491	Stabilizer bar link nut and grommet (2 required)
4	W707472	Stabilizer bar bracket bolt (4 required)
5	5494	Stabilizer bar
6	3B353	Stabilizer bar bracket (2 required)
7	5484	Stabilizer bar bushing LH
8	5G484	Stabilizer bar bushing RH

Removal and Installation

NOTICE: **Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.**

NOTICE: **Orientation of the suspension fasteners is important. Make sure the fasteners are installed in the same direction as when removed or incorrect clamp load and damage to components may occur.**

1. Remove the wheel and tire. For additional information, refer to Section 204-04 .

2. Remove and discard the 2 stabilizer bar nuts and grommets.
   - To install, tighten the new nuts to 35 Nm (26 lb-ft) at curb height.

3. Remove and discard the 2 stabilizer bar studs.

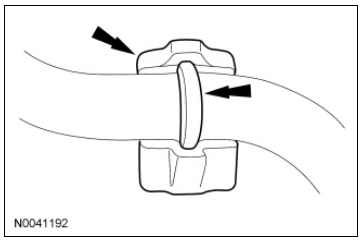
4. Remove the 2 stabilizer bar links.

5. **NOTE:** Inspect and clean the mating surfaces and the internal threads. Make sure all mating surfaces are free of foreign material and remove any thread locking compound from the internal threads.

NOTE: Rotate the stabilizer bar and pull outward to remove.

Remove the 4 stabilizer bar bracket bolts and the stabilizer bar, and the brackets and bushings.

- Discard the bolts.
- To install, tighten the new bolts to 55 Nm (41 lb-ft) at curb height.



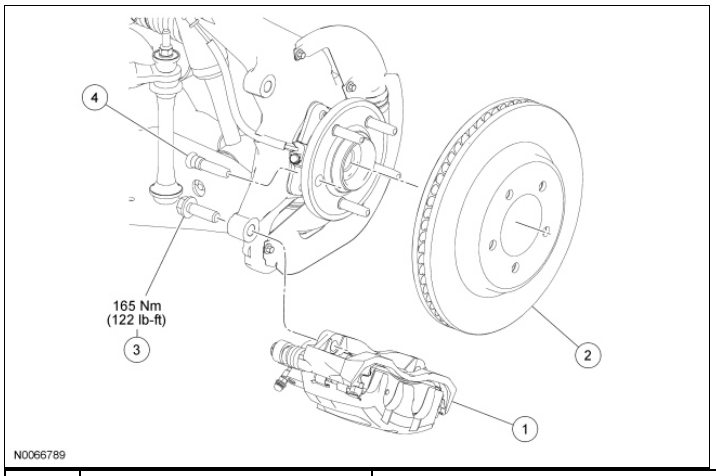
6. ***NOTICE:*** **The LH and RH side stabilizer bar bushings are different and are not interchangeable. Make sure the bushings are installed on the correct side or damage to the bushings will occur.**

   NOTE: When installing the LH side sway bar bushings onto the sway bar, match the groove in the bushing to the upset on the sway bar.

   NOTE: Inspect the stabilizer bar bushings for wear or damage. Install new bushings as necessary.

   NOTE: Tighten LH side first.

   Remove the 2 stabilizer bar bushings.



7. To install, reverse the removal procedure.

Wheel Studs

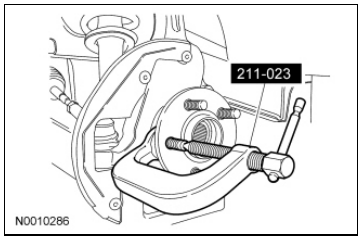
Special Tool(s)

 ST1494-A	C-Frame and Screw 211-023 (T74P-3044-A1)

Item	Part Number	Description
1	2B120 RH/ 2B121 LH	Brake caliper assembly
2	1125	Brake disc
3	2027	Brake caliper anchor plate bolt (2 required)
4	1107	Wheel stud

Removal

1. Remove the wheel and tire. For additional information, refer to Section 204-04 .



2. ***NOTICE:*** **Do not allow the caliper and anchor plate assembly to hang from the brake hose or damage to the hose can occur.**

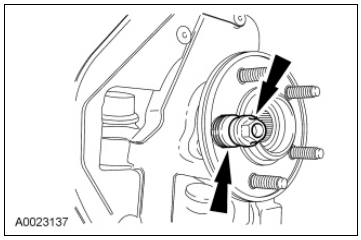
   Remove the bolts and position the caliper, pads and anchor plate assembly aside.

   - Discard the bolts.
   - Support the caliper and anchor plate assembly using mechanic's wire.
   - To install, tighten the new bolts to 165 Nm (122 lb-ft).

3. Remove the brake disc.

4. Using the C-Frame and Screw, remove the wheel stud.

Installation



1. ***NOTICE:*** **Do not use power tools to install the wheel stud. The serrations on the stud can be stripped.**

   NOTE: Do not use the wheel nut that came with the vehicle.

   NOTE: Make sure to use washers that have an ID that is larger than the OD of the wheel stud serrations. Use enough washers (approximately 4) to allow the wheel stud to fully seat against the hub flange.

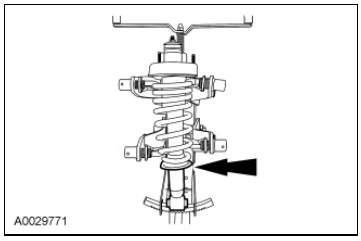
   Install approximately 4 washers and a new wheel nut on the wheel stud and tighten the nut until the stud seats against the flange.

   - Discard the wheel nut and washers.

Shock Absorber and Spring Assembly

Item	Part Number	Description
1	-	Coil spring insulator (part of 5415)
2	5310	Coil spring
3	-	Insulator (part of 5415)
4	-	Supporter (part of 5415)
5	18183	Upper shock mount
6	-	Upper mount bushings (part of 18198)
7	-	Upper washer (part of 18198)
8	-	Shock absorber rod nut (part of 18198)
9	18124	Shock absorber

Disassembly and Assembly



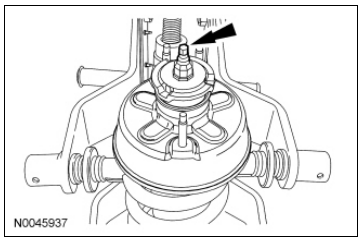
⚠ WARNING: Do not apply heat or flame to the shock absorber or strut tube. The shock absorber and strut tube are gas pressurized and could explode if heated. Failure to follow this instruction may result in serious personal injury.

⚠ WARNING: Keep all body parts clear of shock absorbers or strut rods. Shock absorbers or struts can extend unassisted. Failure to follow this instruction may result in serious personal injury.

NOTICE: **Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.**

1. Remove the shock absorber and spring assembly. For additional information, refer to Shock Absorber and Spring Assembly in this section.

2. Using a suitable spring compressor, compress the spring until the tension is released from the shock absorber.



3. ***NOTICE:*** **When installing the shock rod nut, make sure the shock rod and bushing are centered in the upper mount before tightening the nut or damage to the shock or bushing may occur.**

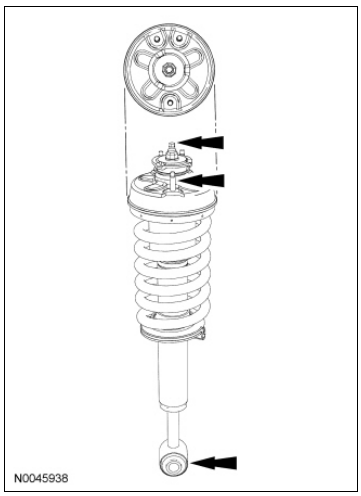
   NOTE: Use the holding feature to prevent the shock absorber rod from turning while removing and installing the nut.

   Remove and discard the shock absorber rod nut.

   - To install, tighten the new nut to 65 Nm (48 lb-ft).

4. Remove the shock absorber.

5. Remove the washer and upper mount bushing.



6. Remove the upper shock absorber mount.

7. Remove the dust boot.

8. Carefully release the spring compressor and remove the coil spring.

9. ***NOTICE:*** **Make sure that the upper shock mount stud, shock rod and shock lower bushing are aligned before tightening shock absorber rod nut or damage to the bushing may occur.**

   To assemble, reverse the disassembly procedure.

Torque Specifications

Description	Nm	lb-ft	lb-in
Brake caliper anchor plate bolt	165	122	-
Brake disc shield bolt	8	-	71
Halfshaft nut	250	184	-
Lower arm forward bolt	400	296	-
Lower arm rearward nut	200	148	-
Lower ball joint nut	150	111	-
Shock absorber bolt and flagnut	350	258	-
Shock absorber rod nut	65	48	-
Shock absorber upper mount nut	30	22	-
Stabilizer bar bracket bolt	55	41	-
Stabilizer bar link nut and grommet	35	26	-
Tie-rod end nut	103	76	-
Upper arm bolt	150	111	-
Upper ball joint nut	55	41	-
Wheel hub bolt	122	90	-
Wheel speed sensor bolt	18	-	159
Wheel speed sensor bracket bolt	8	-	71

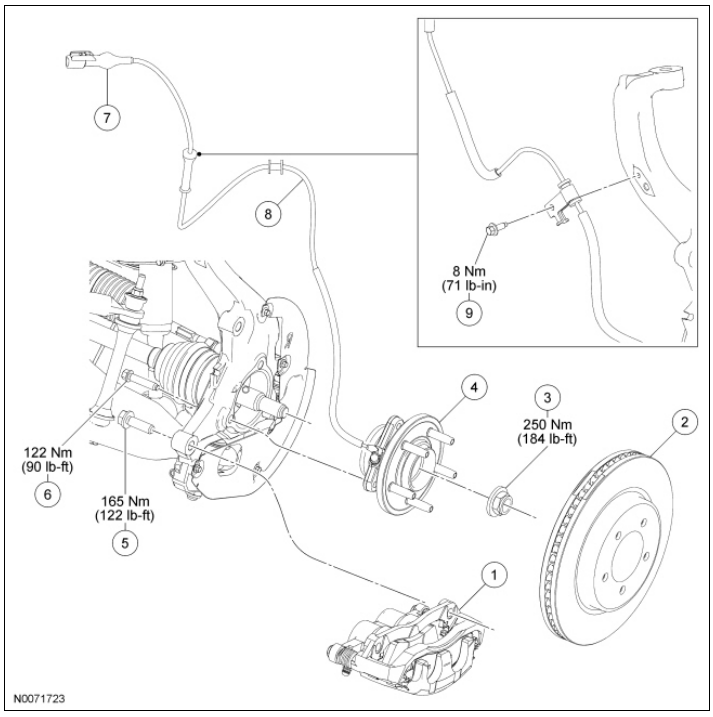
Front Suspension

The Four-Wheel Drive (4WD) front suspension consists of the following components:

- Lower arms
- Shock absorber and spring assemblies
- Stabilizer bar, bushings and brackets
- Stabilizer bar links
- Upper arms
- Wheel bearing and wheel hub
- Wheel knuckles
- Wheel studs

The front suspension utilizes an upper and lower arm and is an independent suspension design. This type of suspension uses 2 parallel arms. Each arm has 2 mounting positions to the chassis and one ball joint attachment at the wheel knuckle. The shock absorber mounts to the lower arm and along with the spring, controls vertical movement. A stabilizer bar and links are included to control suspension lean/sway during turns. Double-arm designs allow for carefully controlled motion of the wheel throughout suspension travel, controlling such parameters as camber angle, caster angle and toe.

Front Suspension



Refer to Section 204-00 .

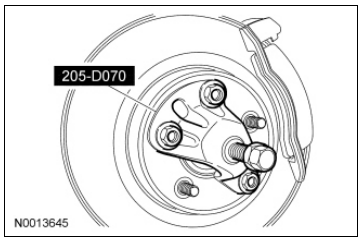
Wheel Bearing and Wheel Hub

Special Tool(s)

 ST2272-A	Remover, Front Wheel Hub 205-D070 (D93P-1175-B) or equivalent

Removal and Installation

Item	Part Number	Description
1	2B120 RH/ 2B121 LH	Brake caliper assembly
2	1125	Brake disc
3	W706540	Halfshaft nut
4	1104	Wheel bearing and hub assembly
5	2027	Brake caliper anchor plate bolt (2 required)
6	1107	Wheel bearing and hub bolt (3 required)
7	-	Wheel speed sensor electrical connector (part of 2C216 LH/ 2C190 RH)
8	2C216 LH/ 2C190 RH	Wheel speed sensor
9	W500212	Wheel speed sensor harness bracket bolt



NOTICE: **Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the**

same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

1. Remove the wheel and tire. For additional information, refer to Section 204-04 .

2. Remove and discard the halfshaft nut.
   - To install, tighten the new nut to 250 Nm (184 lb-ft).

3. Using the Front Wheel Hub Remover, separate the outboard CV joint from the wheel hub.

4. ***NOTICE:*** **Do not allow the caliper and anchor plate assembly to hang from the brake hose or damage to the hose can occur.**

   Remove the bolts and position the caliper, pads and anchor plate assembly aside.

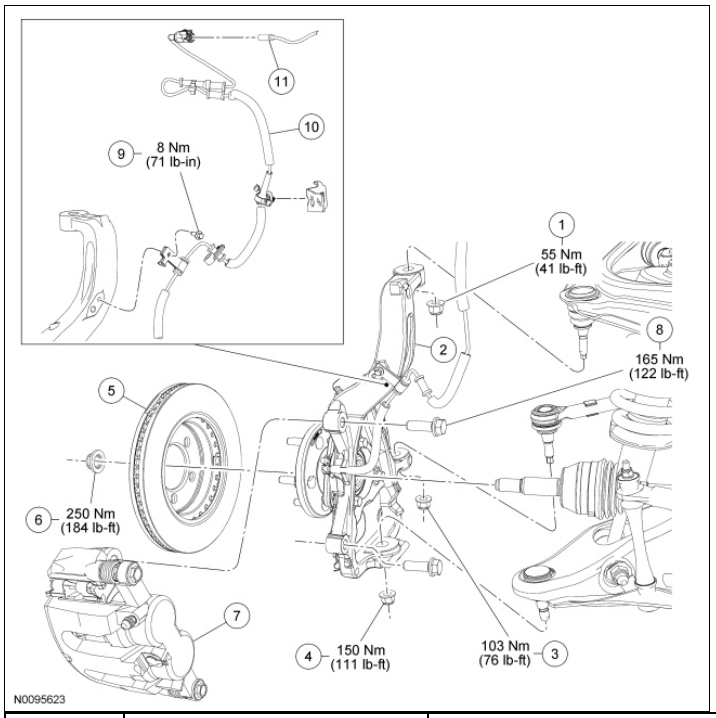
   - Discard the bolts.
   - Support the caliper and anchor plate assembly using mechanic's wire.
   - To install, tighten the new bolts to 165 Nm (122 lb-ft).

5. Remove the brake disc.

6. **NOTE:** A new wheel bearing and wheel hub comes with the wheel speed sensor installed.

   Disconnect the wheel speed sensor harness electrical connector and remove and discard the wheel speed sensor harness bracket bolt.

   - To install, tighten to 8 Nm (71 lb-in).



7. Remove the 3 bolts and the wheel bearing and hub assembly.
   - Discard the bolts.
   - To install, tighten the new bolts to 122 Nm (90 lb-ft).

8. To install, reverse the removal procedure.

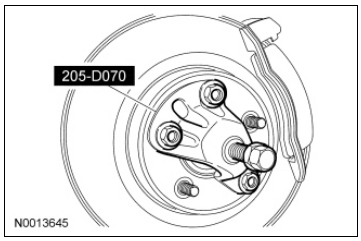
Wheel Knuckle

Special Tool(s)

 ST2026-A	2-Jaw Puller 205-D072 (D97L-4221-A) or equivalent
 ST1494-A	C-Frame and Screw 211-023 (T74P-3044-A1)
 ST2272-A	Remover, Front Wheel Hub 205-D070 (D93P-1175-B) or equivalent

Item	Part Number	Description
1	W520214	Upper ball joint nut
2	3C489 RH/ 3C459 LH	Wheel knuckle
3	W707251	Tie-rod end nut
4	W710046	Lower ball joint nut
5	1125	Brake disc
6	W706540	Halfshaft nut
7	2B120 RH/ 2B121 LH	Brake caliper assembly
8	2027	Brake caliper anchor plate bolt (2 required)
9	W500212	Wheel speed harness bracket bolt

10	2C204	Wheel speed sensor harness (part of 2C204)
11	-	Wheel speed sensor electrical connector (part of 14398)



Removal and Installation

NOTICE: **Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.**

1. Remove the wheel and tire. For additional information, refer to Section 204-04 .

2. Remove and discard the halfshaft nut.
   - To install, tighten to 250 Nm (184 lb-ft).

3. Using the Front Wheel Hub Remover, separate the outboard CV joint from the wheel hub.

4. ***NOTICE:*** **Do not allow the caliper and anchor plate assembly to hang from the brake hose or damage to the hose can occur.**

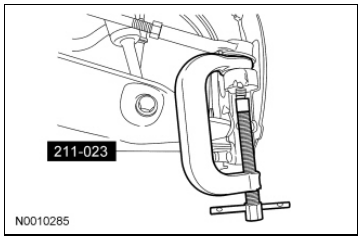
   Remove the bolts and position the caliper, pads and anchor plate assembly aside.

   - Discard the bolts.
   - Support the caliper and anchor plate assembly using mechanic's wire.
   - To install, tighten to 165 Nm (122 lb-ft).

5. Remove the brake disc.

6. Remove the wheel speed sensor harness bracket bolt from the wheel knuckle.
   - To install, tighten to 8 Nm (71 lb-in).

7. Disconnect the wheel speed sensor harness pin-type retainers.



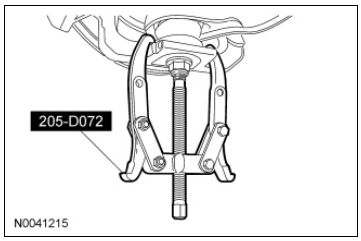
8. Disconnect the wheel speed sensor electrical connector.

9. Remove and discard the tie-rod end nut.
   - To install, tighten the new nut to 103 Nm (76 lb-ft).

10. ***NOTICE:*** **Do not use a hammer to separate the tie rod from the wheel knuckle or damage to the wheel knuckle can result.**

    NOTICE: **Do not damage the tie-rod boot while installing the C-Frame and Screw.**

    Using the C-Frame and Screw, separate the tie-rod end from the wheel knuckle.

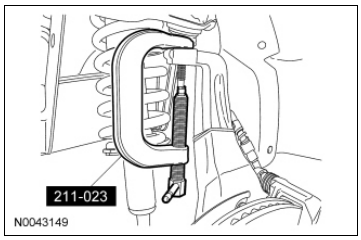


11. Remove and discard the lower ball joint nut.
    - To install, tighten the new nut to 150 Nm (111 lb-ft).

12. ***NOTICE:*** **Do not use a hammer to separate the ball joint from the wheel knuckle or damage to the wheel knuckle can result.**

    NOTICE: **Do not damage the ball joint boot while installing the 2-Jaw Puller.**

    Using the 2-Jaw Puller, separate the lower ball joint from the wheel knuckle.



13. Remove and discard the upper ball joint nut.
    - To install, tighten the new nut to 55 Nm (41 lb-ft).

14. ***NOTICE:*** **Do not use a hammer to separate the ball joint from the wheel knuckle or damage to the wheel knuckle can result.**

    NOTICE: **Do not damage the ball joint boot while installing the C-Frame and Screw.**

    Using the C-Frame and Screw, separate the upper ball joint and remove the wheel knuckle.

15. To install, reverse the removal procedure.
    - Check and if necessary, align the front end. For additional information, refer to Section 204-00 .

Lower Arm

Removal and Installation

For additional information, refer to Section 204-01A .

Upper Arm

Removal and Installation

For additional information, refer to Section 204-01A .

Shock Absorber and Spring Assembly

Removal and Installation

For additional information, refer to Section 204-01A .

Stabilizer Bar and Link

Removal and Installation

For additional information, refer to Section 204-01A .

Wheel Studs

Removal and Installation

For additional information, refer to Section 204-01A .

Shock Absorber and Spring Assembly

Disassembly and Assembly

1. For additional information, refer to Section 204-01A .

Torque Specifications

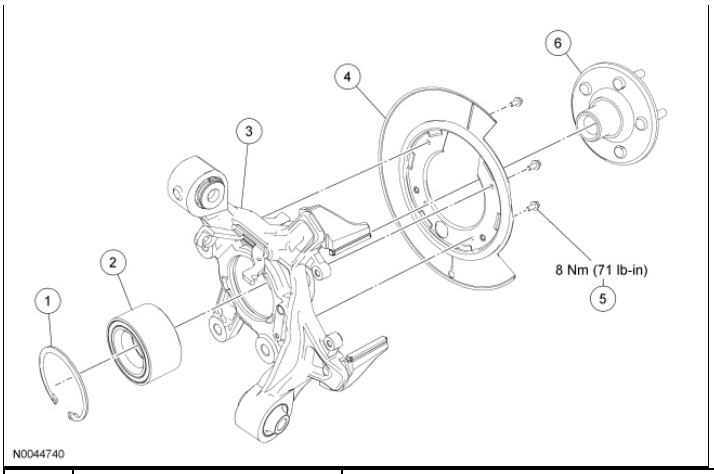
Description	Nm	lb-ft	lb-in
Brake caliper guide pin bolt	32	24	-
Brake disc shield bolt	8	-	71
Fuel tank filler pipe bracket bolt	15	-	133
Fuel tank filler pipe hose clamps	3	-	27
Halfshaft nut and washer	275	203	-
Lower arm inboard bolt	250	185	-
Lower arm outboard bolt	275	203	-
Parking brake cable bracket bolt	10	-	89
Shock absorber lower bolt	275	203	-
Shock absorber rod nut	65	48	-
Shock absorber upper mount nut	30	22	-
Stabilizer bar bracket nut	48	35	-
Stabilizer bar link nut and grommet	30	22	-
Toe link cam adjuster nut	275	203	-
Toe link outboard bolt	325	240	-
Trailing arm bolt	300	222	-
Upper arm outboard bolt	225	166	-
Upper arm inboard nut	250	185	-
Wheel speed sensor bolt	8	-	71
Wheel knuckle bolt	275	203	-

Rear Suspension

The rear suspension consists of the following components:

- Lower control arms
- Shock absorber and spring assemblies
- Stabilizer bar
- Stabilizer bar bushings and brackets
- Stabilizer bar links
- Toe links
- Trailing arms
- Upper control arms (camber adjustment)
- Wheel bearings
- Wheel hubs
- Wheel knuckles
- Wheel studs

The rear suspension utilizes an independent short/long arm design. This suspension system incorporates a separate wheel knuckle for each wheel and allows the wheels to react to road imperfections independent of each other. This independent action offers improved isolation from the effects of jounce and rebound.



Rear Suspension

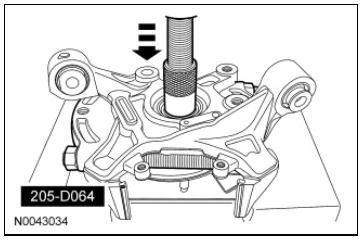
Refer to Section 204-00 .

Wheel Bearing and Wheel Hub

Special Tool(s)

 ST1895-A	Puller, Bearing 205-D064 (D84L-1123-A) or equivalent

Item	Part Number	Description
1	1A124	Snap ring
2	1215	Wheel bearing
3	5B759 LH/ 5B758 RH	Wheel knuckle assembly
4	2C029 LH/ 2C028 RH	Brake disc shield
5	W500212	Brake disc shield bolt (3 required) (part of 2C028)
6	1109	Wheel hub



Removal and Installation

NOTICE: **Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.**

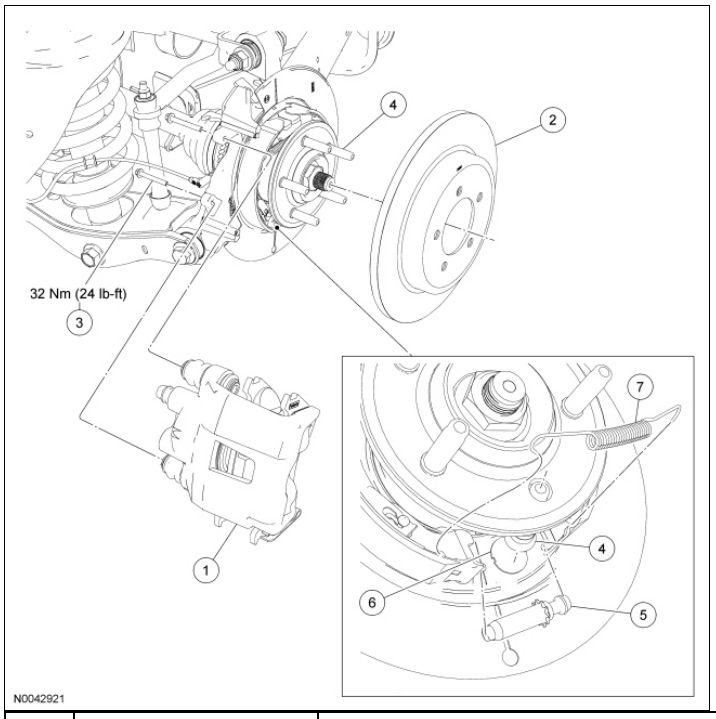
1. Remove the wheel knuckle. For additional information, refer to Wheel Knuckle in this section.

2. Remove the 3 brake disc shield bolts.
   - To install, tighten to 8 Nm (71 lb-in).

3. Using the Bearing Puller and a suitable press, remove the wheel hub.

4. Remove the snap ring.

5. Using a suitable press and adapters, remove the wheel bearing.



6. To install, reverse the removal procedure.

7. Install the wheel knuckle. For additional information, refer to Wheel Knuckle in this section.

Wheel Studs

Special Tool(s)

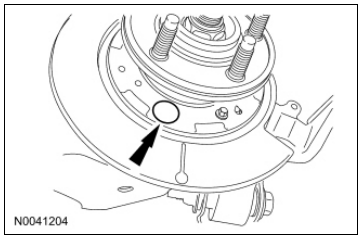
 ST1494-A	C-Frame and Screw 211-023 (T74P-3044-A1)

Item	Part Number	Description
1	2553 LH/ 2552 RH	Brake caliper
2	2C026	Brake disc
3	2333	Brake caliper bolt (2 required)
4	1107	Wheel stud
5	2041	Parking brake shoe adjuster
6	-	Brake disc shield access hole cover
7	-	Parking brake shoe adjuster spring (part of 2648)

Removal

NOTICE: **Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.**

NOTICE: **Orientation of the suspension fasteners is important. Make sure the fasteners are installed in the same direction as they were in when removed, or incorrect clamp load and component damage may occur.**



1. Remove the wheel and tire. For additional information, refer to Section 204-04 .
2. ***NOTICE:*** **Care must be used when servicing rear brake components without disconnecting the parking brake cable from the brake caliper lever. Carefully position the caliper aside using a suitable support or damage to the parking brake cable end fittings can occur.**

   NOTICE: **Do not allow the caliper and anchor plate assembly to hang from the brake hose or damage to the hose can occur.**

   Remove the bolts and position the brake caliper aside.

   - Support the caliper using mechanic's wire.
3. Remove the brake disc.
4. Remove the parking brake shoe adjuster spring and adjuster.
5. **NOTE:** The brake shield has an access hole knockout that must be removed to allow for the removal of the wheel stud.

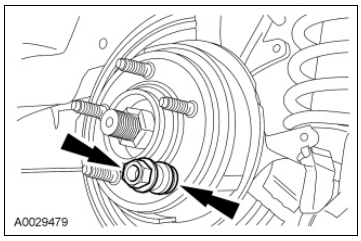
   Using a suitable punch, remove the access hole cover from the brake shield.

6. **NOTE:** Make sure that the wheel stud is aligned with the recessed area of the wheel knuckle.

   Using the C-Frame and Screw, press the wheel stud until it makes contact with the edge of the wheel knuckle.

7. Route the wheel stud through the access hole and discard the wheel stud.

Installation



1. Position the new wheel stud aligning the serrations in the wheel hub made by the original wheel stud.
2. ***NOTICE:*** **Do not use power tools to install the wheel stud. The serrations on the stud can be stripped.**

NOTE: Do not use the wheel nut that came with the vehicle.

NOTE: Make sure to use washers that have an ID that is larger than the OD of the wheel stud serrations. Use enough washers (approximately 4) to allow the wheel stud to fully seat against the hub flange.

Place approximately 4 flat washers over the outside end of the wheel stud and thread a standard wheel nut with the flat side against the washers. Tighten the wheel nut until the wheel stud seats against the back side of the wheel extension.

- Discard the wheel nut and washers.

3. ***NOTICE:*** **A plug must be installed in place of the knockout to prevent contamination to the parking brake shoe assemblies.**

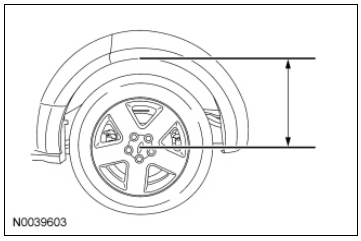
   Install a plug into the access hole on the brake shield.

4. Install the parking brake shoe adjuster and spring.

5. Install the brake disc.

6. Position the brake caliper and install the bolts.
   - Tighten to 32 Nm (24 lb-ft).

Upper Arm



Item	Part Number	Description
1	W711444	Upper arm outboard bolt
2	5A994	Upper arm
3	W520216	Upper arm outboard nut
4	W707254	Upper arm inboard nut
5	W711444	Upper arm inboard bolt

Removal

NOTICE: **Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.**

NOTICE: **Orientation of the suspension fasteners is important. Make sure the fasteners are installed in the same direction as they were in when removed, or incorrect clamp load and component damage may occur.**

1. Measure the distance from the center of the hub to the lip of the fender with the vehicle in a level, static ground position (curb height).

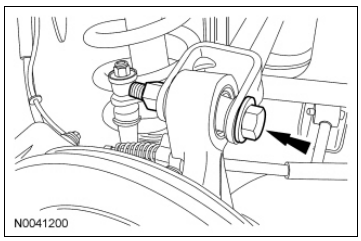
2. Remove the wheel and tire. For additional information, refer to Section 204-04 .

3. Position a suitable jack under the wheel knuckle and raise the suspension until the distance between the center of the hub and the lip of the fender is equal to the measurement taken in Step 1.

4. Remove and discard the upper arm outboard nut and bolt.

5. **NOTE:** The inboard nut that is installed at the assembly plant is a flagnut. This flagnut is used to set and maintain the rear camber settings. Discard the flagnut and install a non-flagnut to allow the rear camber to be adjusted.

   Remove and discard the upper arm inboard bolt and flagnut and remove the upper arm.



Installation

1. Position the upper arm and install a new inboard bolt and non-flagnut.
   - Tighten to 250 Nm (185 lb-ft).

2. ***NOTICE:*** **The upper arm outboard bolt must be installed with the bolt head toward the front of the vehicle or wheel damage can occur.**

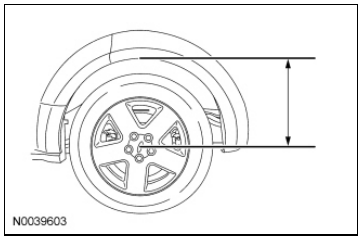
   Install a new outboard bolt and nut with the bolt head toward the front of the vehicle.

   - Tighten to 225 Nm (166 lb-ft).

3. Lower the suspension and remove the jack.

4. Check and, if necessary, align the rear end. For additional information, refer to Section 204-00 .

Lower Arm



Item	Part Number	Description
1	-	Stabilizer bar link stud (part of 5K484)
2	W711444	Lower arm outboard bolt
3	W711608	Shock absorber lower bolt
4	W712412	Lower arm outboard flagnut
5	5B530	Lower arm
6	W711444	Lower arm inboard bolt
7	W520216	Lower arm inboard nut
8	W520216	Shock absorber lower nut
9	5K484	Stabilizer bar link assembly
10	5C491	Stabilizer bar link nut and grommet

Removal

NOTICE: **Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.**

NOTICE: **Orientation of the suspension fasteners is important. Make sure the fasteners are installed in the same direction as they were in when removed, or incorrect clamp load and component damage may occur.**

1. Measure the distance from the center of the hub to the lip of the fender with the vehicle in a level, static ground position (curb height).

2. Remove the wheel and tire. For additional information, refer to Section 204-04 .

3. Position a suitable jack under the wheel knuckle and raise the suspension until the distance between the center of the hub and the lip of the fender is equal to the measurement taken in Step 1.

4. Remove and discard the lower arm outboard bolt and flagnut.

5. Remove the stabilizer bar link nut and grommet and the stabilizer bar link.
   - Discard the nut and grommet.

6. Lower the suspension and remove the jack.

7. Remove and discard the shock absorber lower nut and bolt.

8. Remove and discard the lower arm inboard nut and bolt and remove the lower arm.

Installation

1. **NOTE:** Do not tighten the lower arm inboard nut at this time.

   Position the lower arm and install a new lower arm inboard bolt and nut.

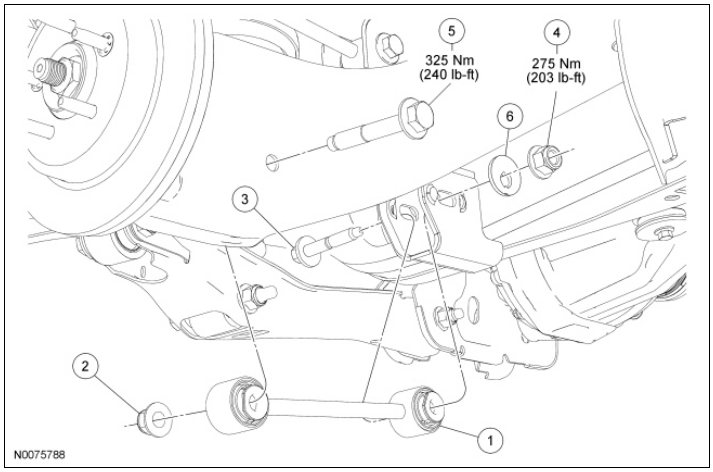
2. **NOTE:** Do not tighten the shock absorber lower nut at this time.

   Position the lower arm and install a new shock absorber lower bolt and nut.

3. Position a suitable jack under the wheel knuckle and raise the suspension until the distance between the center of the hub and the lip of the fender is equal to the measurement taken in Step 1.

4. Install the stabilizer link and a new nut and grommet.
   - Tighten to 30 Nm (22 lb-ft).

5. Install a new lower arm outboard bolt and flagnut.
   - Tighten the bolt to 275 Nm (203 lb-ft).



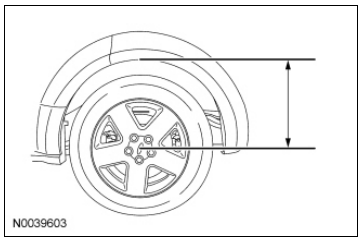
6. Tighten the lower arm inboard bolt to 250 Nm (185 lb-ft).

7. Tighten the shock absorber lower bolt to 275 Nm (203 lb-ft).

8. Lower the suspension and remove the jack.

9. Install the wheel and tire. For additional information, refer to Section 204-04 .

Toe Link

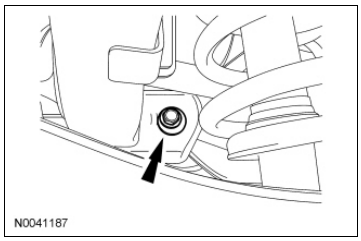


Item	Part Number	Description
1	5A972	Toe link
2	W520216	Toe link outboard nut
3	5K978	Cam bolt
4	W707254	Cam adjuster nut
5	W711444	Toe link outboard bolt
6	5K751	Adjustment cam

Removal

NOTICE: **Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.**

NOTICE: **Orientation of the suspension fasteners is important. Make sure the fasteners are installed in the same direction as they were in when removed or incorrect clamp load and component damage may occur.**



1. Measure the distance from the center of the hub to the lip of the fender with the vehicle in a level, static ground position (curb height).

2. Remove the wheel and tire. For additional information, refer to Section 204-04 .

3. Position a suitable jack under the wheel knuckle and raise the suspension until the distance between the center of the hub and the lip of the fender is equal to the measurement taken in Step 1.

4. Index-mark the toe link cam bolt to the subframe.

5. Remove the toe link cam adjuster nut, cam adjuster and cam bolt.
   - Discard the nut.

6. Remove and discard the toe link outboard nut and bolt and remove the toe link.

Installation

1. Position the toe link and install a new outboard bolt and nut.
   - Tighten to 325 Nm (240 lb-ft).

2. **NOTE:** Do not tighten the cam adjuster nut at this time.

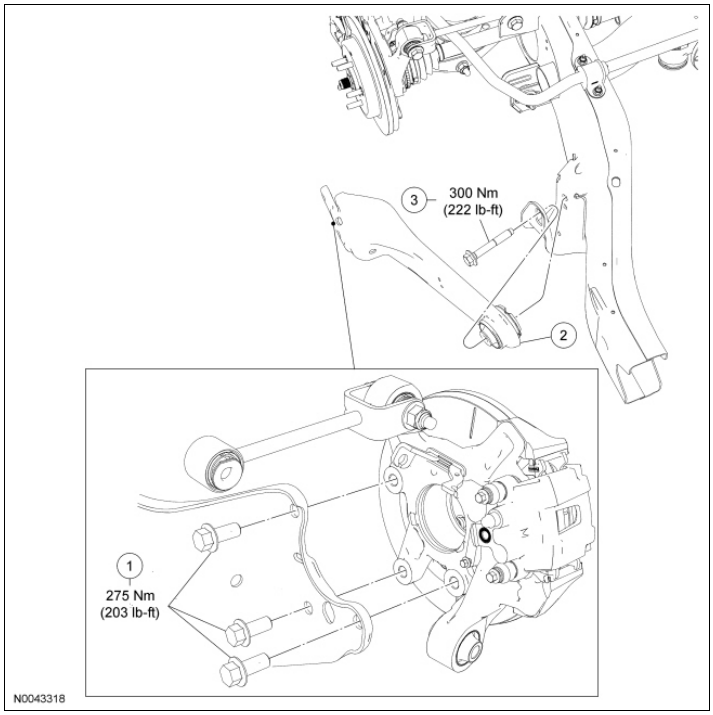
   NOTE: The cam adjuster must be installed with the small tooth facing toward the frame bracket.

   Install the toe link cam bolt, cam adjuster and a new nut.

3. **NOTE:** Make sure the cam bolt and the adjustment cam are seated between the offsets before tightening the nut.

   Align the index mark on the cam bolt with the index mark on the subframe and tighten the nut.

   - Tighten to 275 Nm (203 lb-ft).



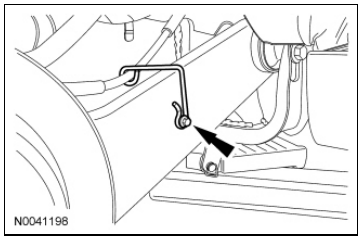
4. Lower the suspension and remove the jack.

5. Install the wheel and tire. For additional information, refer to Section 204-04 .

6. Check and, if necessary, adjust the rear toe. For additional information, refer to Section 204-00 .

Trailing Arm

Item	Part Number	Description
1	W710678	Wheel knuckle bolts (3 required)
2	5B731 LH/ 5B730 RH	Trailing arm
3	W711046	Trailing arm bolt



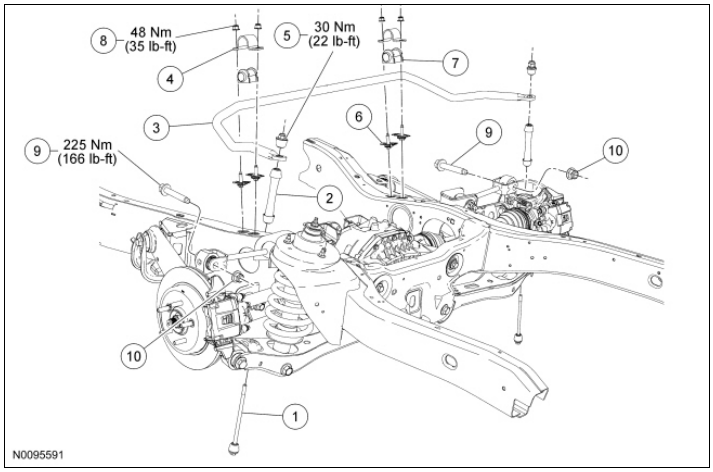
Removal

NOTICE: **Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.**

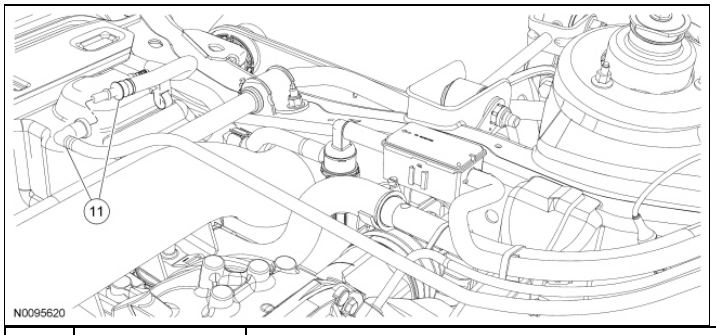
NOTICE: **Orientation of the suspension fasteners is important. Make sure the fasteners are installed in the same direction as they were in when removed or incorrect clamp load and damage to components may occur.**

1. Remove the toe link. For additional information, refer to Toe Link in this section.

2. Remove the parking brake cable bracket bolt.
   - To install, tighten to 10 Nm (89 lb-in).



3. Remove and discard the trailing arm bolt.
    - To install, tighten the new bolt to 300 Nm (222 lb-ft) at curb height.

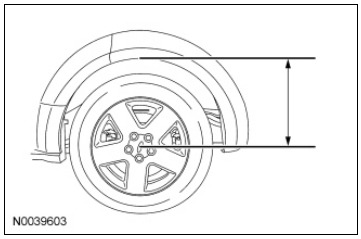


4. Remove the 3 wheel knuckle bolts and the trailing arm.
    - Discard the bolts.
    - To install, tighten the new bolts to 275 Nm (203 lb-ft).

5. To install, reverse the removal procedure.

Stabilizer Bar and Link - Explorer, Mountaineer

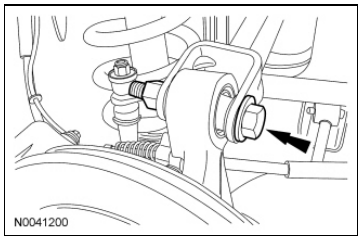
Item	Part Number	Description
1	-	Stabilizer bar link stud (2 required) (part of 5K484)
2	5K484	Stabilizer bar link assembly (2 required)
3	5A772	Stabilizer bar
4	5B491	Stabilizer bar bracket (2 required)
5	5C491	Stabilizer bar link nut and grommet (2 required) (part of 5K484)
6	W711295	Stabilizer bar bracket stud (4 required)
7	4A037	Stabilizer bar bushing (2 required)
8	W520213	Stabilizer bar bracket nut (4 required)
9	W711444	Upper arm outboard bolts
10	W520216	Upper arm outboard nuts



Item	Part Number	Description
11	-	Fuel filler pipe tube-to-fuel pressure sensor line (part of 9034)

Removal

NOTICE: **Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.**

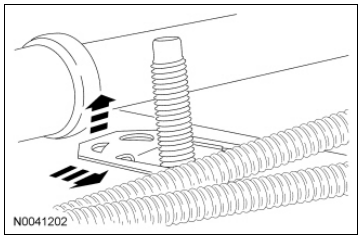


NOTICE: **Orientation of the suspension fasteners is important. Make sure the fasteners are installed in the same direction as they were in when removed or incorrect clamp load and damage to components may occur.**

1. Measure the distance from the center of the hub to the lip of the fender with the vehicle in a level, static ground position (curb height).

2. Remove the wheel and tire. For additional information, refer to Section 204-04 .

3. Remove and discard the outboard nut and bolt from both upper arms.

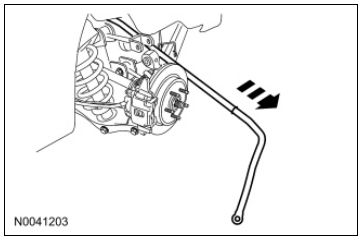


4. Remove the stabilizer bar link nut and grommet and the stabilizer bar link.
   - Discard the nut and grommet.

5. Remove and discard the 4 stabilizer bar bracket nuts.

6. Remove the 2 stabilizer bar brackets and the 2 stabilizer bar bushings.

7. Remove the 4 stabilizer bar bracket studs.
   - For the front studs, push the stud down and slide the stud toward the rear of the vehicle.
   - For the rear studs, push the stud down and slide the stud toward the front of the vehicle.

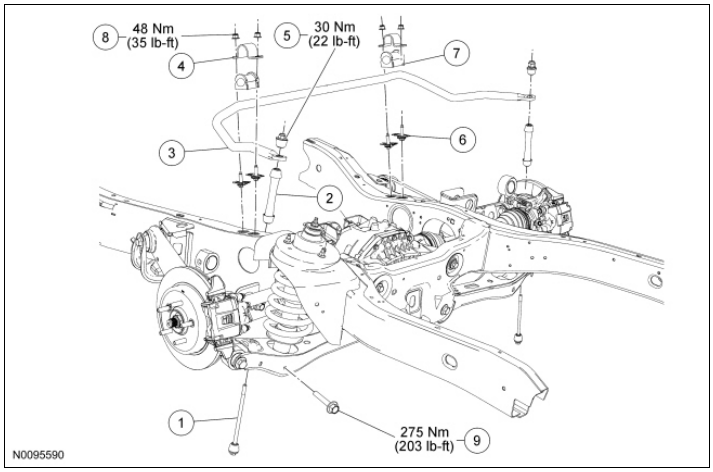


8. Disconnect the fuel filler pipe tube-to-fuel pressure sensor line quick connect coupling.

9. Unclip the fuel filler pipe tube-to-fuel pressure sensor line from the fuel tank and position aside.

10. ***NOTICE:*** **Extreme care must be exercised when removing and installing the stabilizer bar on vehicles equipped with rear Air Conditioning (A/C) and/or rear heating or damage to the A/C lines and rear heater hoses can occur.**

    With the aid of an assistant, remove the stabilizer bar from the LH side of the vehicle.



Installation

1. With the aid of an assistant, install the stabilizer bar into the LH side of the vehicle.
2. Connect the fuel filler pipe tube-to-fuel sensor line.
3. Connect the fuel filler pipe tube-to-fuel pressure sensor line quick connect coupling.
4. Install the 4 stabilizer bar bracket studs.
5. Install the 2 stabilizer bar bushings and the 2 stabilizer bar brackets.
6. Install the 4 new stabilizer bar bracket nuts.
   - Tighten to 48 Nm (35 lb-ft).
7. Using the jack, raise the suspension until the distance between the center of the hub and the lip of the fender is equal to the measurement taken in Step 1 (curb height) in Removal.
8. Install the stabilizer bar link and new link nut and grommet.
   - Tighten the nut to 30 Nm (22 lb-ft).
9. ***NOTICE:*** **The upper arm outboard bolts must be installed with the bolt head toward the front of the vehicle or wheel damage may occur.**

   Install the 2 new upper arm outboard bolts and the 2 new upper arm outboard nuts.

   - Tighten to 225 Nm (166 lb-ft).
10. Remove the jack.
11. Install the wheel and tire. For additional information, refer to Section 204-04 .

Stabilizer Bar and Link - Explorer Sport Trac

Item	Part Number	Description
1	-	Stabilizer bar link stud (2 required) (part of 5K484)
2	5K484	Stabilizer bar link assembly (2 required)
3	5A772	Stabilizer bar
4	5B491	Stabilizer bar bracket (2 required)
5	5C491	Stabilizer bar link nut and grommet (2 required) (part of 5K484)
6	W711295	Stabilizer bar bracket stud (4 required)
7	4A037	Stabilizer bar bushing (2 required)
8	W520213	Stabilizer bar bracket nut (4 required)
9	W711608	Shock absorber lower bolt

Item	Part Number	Description
10	-	Fuel filler pipe tube-to-fuel pressure sensor line (part of 9034)
11	9037	Fuel filler pipe hose
12	-	Fuel filler pipe hose clamps (2 required)
13	-	Evaporative Emission (EVAP) canister vent valve electrical connector (part of 14407)
14	-	Wiring harness clip (part of 9034)
15	-	Fuel tank filler pipe bracket (part of 14407)
16	W704901	Fuel tank filler pipe bracket bolt
17	-	Wiring harness retainer caps (part of 14407)

Removal

NOTICE: **Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.**

NOTICE: **Orientation of the suspension fasteners is important. Make sure the fasteners are installed in the same direction as they were in when removed or incorrect clamp load and damage to components may occur.**

1. Remove both upper arms. For additional information, refer to Upper Arm in this section.

2. **NOTE:** Removal of the LH shock absorber lower bolt will allow more movement of the wheel knuckle when installing the stabilizer bar.

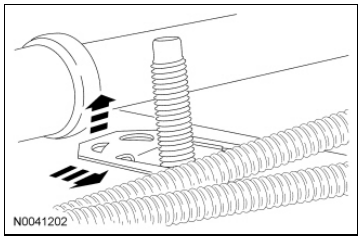
   Remove the LH shock absorber lower bolt.

3. Disconnect the Evaporative Emission (EVAP) canister vent valve electrical connector.

4. Unclip the wiring harness from the frame.

5. Remove the fuel tank filler pipe bracket bolt.

6. Loosen the fuel tank filler pipe hose clamps and disconnect the hose.



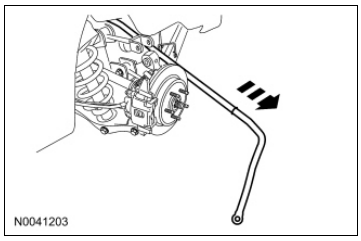
7. Remove the stabilizer bar link nut and grommet and the stabilizer bar link.
   - Discard the nut and grommet.

8. Remove the wiring harness retainer caps from the stabilizer bar bracket studs.

9. Remove and discard the 4 stabilizer bar bracket nuts.

10. Remove the 2 stabilizer bar brackets and the 2 stabilizer bar bushings.

11. Remove the 4 stabilizer bar bracket studs.
    - For the front studs, push the stud down and slide the stud toward the rear of the vehicle.
    - For the rear studs, push the stud down and slide the stud toward the front of the vehicle.



12. Disconnect the fuel filler pipe tube-to-fuel pressure sensor line quick connect coupling.

13. Unclip the fuel filler pipe tube-to-fuel pressure sensor line from the fuel tank and position aside.

14. ***NOTICE:*** **When removing the stabilizer bar, care must be taken to avoid damage to the wiring harness, fuel lines, fuel filler tube and body.**

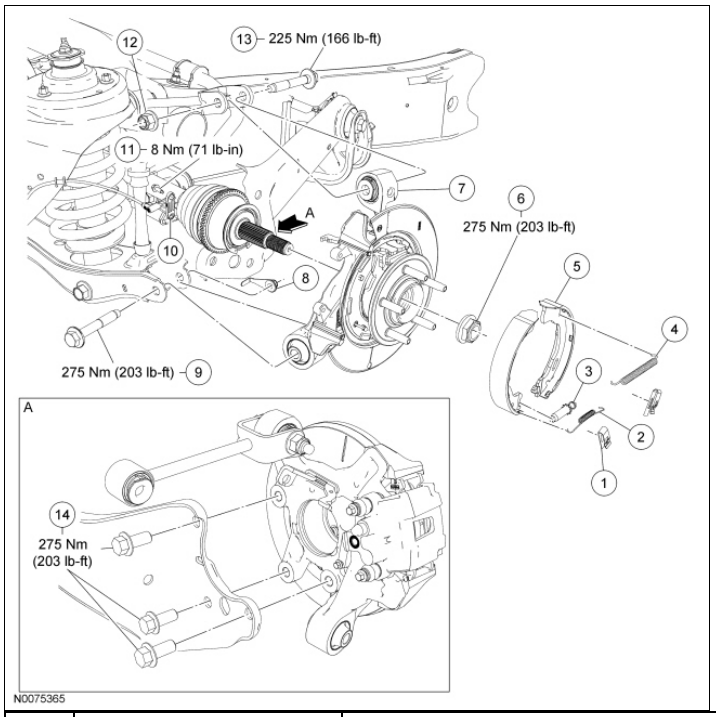
    NOTICE: **Extreme care must be exercised when removing and installing the stabilizer bar on vehicles equipped with rear Air Conditioning (A/C) and/or rear heating, or damage to the A/C lines and rear heater hoses can occur.**

    With the aid of an assistant, remove the stabilizer bar from the LH side of the vehicle.

Installation

NOTICE: **When installing the stabilizer bar, care must be taken to avoid damage to the wiring harness, fuel lines, fuel filler tube and body.**

NOTICE: **Extreme care must be exercised when removing and installing the stabilizer bar on vehicles equipped with rear Air Conditioning (A/C) and/or rear heating, or damage to the A/C lines and rear**



heater hose may occur.

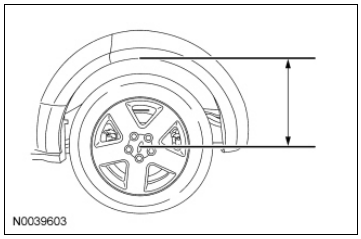
1. With the aid of an assistant, install the stabilizer bar into the LH side of the vehicle.
2. Connect the fuel filler pipe tube-to-fuel sensor line.
3. Connect the fuel filler pipe tube-to-fuel pressure sensor line quick connect coupling.
4. Install the 4 stabilizer bar bracket studs.
5. Install the 2 stabilizer bar bushings and the 2 stabilizer bar brackets.
6. Install the 4 new stabilizer bar bracket nuts.
   - Tighten to 48 Nm (35 lb-ft).
7. Install the wiring harness retaining caps onto the stabilizer bar studs.
8. Use the jack to raise the suspension until the distance between the center of the hub and the lip of the fender is equal to the measurement taken in Step 1 of the Upper Arm procedure in this section.
9. Install the stabilizer bar link, the new link nut and the grommet.
   - Tighten to 30 Nm (22 lb-ft).
10. Connect the fuel tank filler hose.
    - Tighten the 2 filler pipe hose clamps to 3 Nm (27 lb-in).
11. Install the fuel tank filler pipe bracket bolt.
    - Tighten to 15 Nm (133 lb-in).
12. Connect the wiring harness clip to the frame.
13. Connect the EVAP canister vent electrical connector.
14. Install the new LH shock absorber lower bolt.
    - Tighten to 275 Nm (203 lb-ft).
15. Install both upper arms. For additional information, refer to Upper Arm in this section.

Wheel Knuckle

Special Tool(s)

 ST2272-A	Remover, Front Wheel Hub 205-D070 (D93P-1175-B) or equivalent

Item	Part Number	Description
1	-	Parking brake shoe clip (2 required) (part of 2648)
2	-	Parking brake shoe adjuster spring (part of 2648)
3	2041	Parking brake shoe adjuster
4	-	Parking brake shoe retracting spring (part of 2648)
5	-	Parking brake shoe (2 required) (part of 2648)
6	N808405	Halfshaft nut
7	5B758 LH/ 5B759 RH	Wheel knuckle
8	W710808	Lower arm outboard flagnut
9	W712412	Lower arm outboard bolt
10	2C024	Wheel speed sensor
11	-	Wheel speed sensor bolt (part of 2C024)



12	W520216	Upper arm outboard nut
13	W711444	Upper arm outboard bolt
14	W710678	Wheel knuckle bolts (3 required)

Removal

NOTICE: **Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.**

NOTICE: **Orientation of the suspension fasteners is important. Make sure the fasteners are installed in the same direction as they were in when removed or incorrect clamp load and damage to components may occur.**

1. Measure the distance from the center of the hub to the lip of the fender with the vehicle in a level, static ground position (curb height).

2. If equipped, remove the wheel speed sensor bolt and position the sensor aside.

3. ***NOTICE:*** **Do not loosen the halfshaft nut and washer until the wheel and tire are removed from the vehicle. Wheel bearing damage will occur if the wheel bearing is unloaded with the weight of the vehicle applied.**

   NOTE: Apply the brake to keep the halfshaft from rotating.

   NOTE: Do not discard the halfshaft nut at this time.

   Remove the halfshaft nut.

4. Remove the parking brake shoes. For additional information, refer to Section 206-05 .

5. ***NOTICE:*** **Do not use a hammer to separate the halfshaft from the hub. Damage to the threads and internal Constant Velocity (CV) joint components may result.**

   Using the Front Wheel Hub Remover, press the halfshaft from the hub.

6. Position a suitable jack under the wheel knuckle and raise the suspension until the distance between the center of the hub and the lip of the fender is equal to the measurement taken in Step 1.

7. Remove and discard the toe link outboard nut and bolt.

8. Remove and discard the upper arm outboard nut and bolt.

9. Remove and discard the lower arm outboard nut and bolt.

10. Remove and discard the 3 wheel knuckle bolts and remove the wheel knuckle.

11. If a new wheel knuckle is being installed, remove the wheel bearing and wheel hub. For additional information, refer to Wheel Bearing and Wheel Hub in this section.

Installation

1. Position the wheel knuckle and install 3 new wheel knuckle bolts.
   - Tighten to 275 Nm (203 lb-ft).

2. Install a new lower arm outboard bolt and flagnut.
   - Tighten the nut to 275 Nm (203 lb-ft).

3. ***NOTICE:*** **The upper arm outboard bolt must be installed with the bolt head toward the front of the vehicle or wheel damage may occur.**

   Install a new upper arm outboard bolt and nut with the bolt head toward the front of the vehicle.

   - Tighten to 225 Nm (166 lb-ft).

4. Position the toe link and install a new toe link outboard bolt and nut.
   - Tighten to 325 Nm (240 lb-ft).

5. Lower the suspension and remove the jack.

6. Install the parking brake shoes. For additional information, refer to Section 206-05 .

7. Position the wheel speed sensor and install the bolt.
   - Tighten to 8 Nm (71 lb-in).

8. ***NOTICE:*** **Do not tighten the rear halfshaft nut with the vehicle on the ground. The nut must be tightened to specification before the vehicle is lowered to the ground. Wheel bearing damage will occur if the wheel bearing is loaded with the weight of the vehicle applied.**

   NOTE: Apply the brake to keep the halfshaft from rotating.

   Position the halfshaft in the hub and use the previously removed halfshaft nut to seat the halfshaft.

   - Tighten to 275 Nm (203 lb-ft).
   - Remove and discard the nut.

9. ***NOTICE:*** **Install and tighten the new halfshaft nut to specification within 5 minutes of starting it on the threads. Always install a new halfshaft nut after loosening or when not tightening within the specified time or damage to the components may occur.**

   Install a new halfshaft nut.

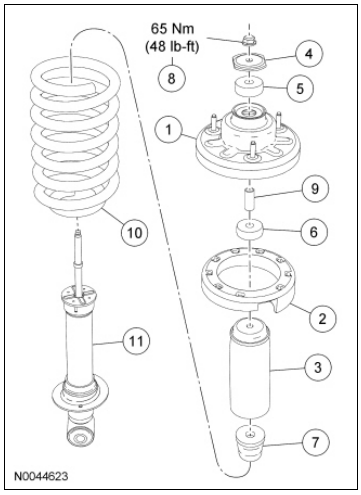
   - Tighten to 275 Nm (203 lb-ft).

Shock Absorber and Spring Assembly

Item	Part Number	Description
1	W704790	Shock absorber upper mount nut (3 required)
2	18W002	Shock absorber and spring assembly

Removal

NOTICE: **Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.**



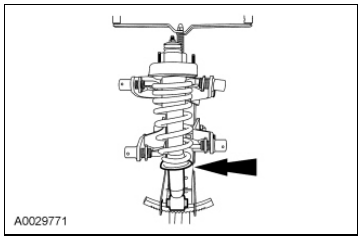
1. Remove the lower arm. For additional information, refer to Lower Arm in this section.

2. Remove and discard the 3 shock absorber upper mount nuts and remove the shock absorber and spring assembly.
   - To install, tighten the new nuts to 30 Nm (22 lb-ft).

3. For additional information on the disassembly and assembly of the shock absorber and spring assembly, refer to Shock Absorber and Spring Assembly in this section.

4. To install, reverse the removal procedure.

Shock Absorber and Spring Assembly

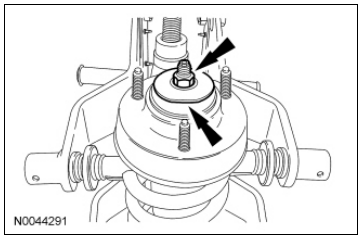


Item	Part Number	Description
1	18178	Shock absorber upper mount
2	5536	Spring upper seat
3	-	Dust boot (part of 18125)
4	-	Upper washer (part of 18A103)
5	-	Mount upper bushing (part of 18A103)
6	-	Mount lower bushing (part of 18A103)
7	-	Jounce bumper (part of 18125)
8	-	Shock absorber rod nut
9	-	Crush sleeve (part of 18A103)
10	5560	Coil spring
11	18125	Shock absorber

Disassembly and Assembly

1. Remove the shock absorber and spring assembly. For additional information, refer to Shock Absorber and Spring Assembly in this section.

2. Using a suitable spring compressor, compress the spring until the tension is released from the shock absorber.



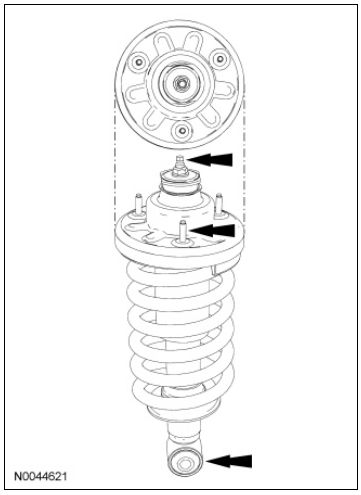
3. ***NOTICE:*** **When installing the shock rod nut, make sure the shock rod and bushing are centered in the upper mount before tightening the nut or damage to the shock bushing may occur.**

NOTE: Use the hex-holding feature to prevent the shock absorber rod from turning while removing and installing the nut.

Remove and discard the shock absorber rod nut.

- To install, tighten the new nut to 65 Nm (48 lb-ft).

4. Remove the shock absorber.



5. Remove the shock absorber upper mount.

6. Remove the upper mount bushing.

7. Carefully release the spring compressor and remove the coil spring.

8. **NOTE:** Make sure the upper shock mount stud, shock rod and shock lower bushing are aligned before tightening the shock rod nut.

   To assemble, reverse the disassembly procedure.

Wheels And Tires

Safety Precautions

⚠ WARNING: Vehicle may have multiple drive wheels. Do not use engine to power the driveline unless all drive wheels are elevated off the ground. Drive wheels in contact with ground could cause unexpected vehicle movement. Failure to follow this instruction may result in serious personal injury.

⚠ WARNING: Always match the tire size to the wheel size during assembly. Incorrect matching can result in tire bead damage or tire separation from the wheel. Failure to follow this instruction may result in serious personal injury to technician or vehicle occupant(s).

⚠ WARNING: Before servicing any tire, ask the customer if anyone injected a tire sealant into the tire. Tire sealants may be flammable and can burn or explode if exposed to an ignition source. Failure to follow this instruction may result in serious personal injury.

⚠ WARNING: Replacement wheels must be equivalent to the original equipment wheels in:

- load carrying capacity.
- diameter, width and offset.
- pilot hole and bolt circle.

Combined load carrying capacity of replacement wheels for a given axle, must be equal to or greater than that axle's gross axle weight rating (GAWR) identified on the vehicle's Safety Compliance Certification label. All other specifications should be evaluated by measurement of both the original wheel and the replacement wheel. If specifications are not equivalent, the safety and handling of the vehicle may be degraded, which may result in serious injury to the vehicle occupant(s).

⚠ WARNING: Never use wheels different than the original equipment. Additionally, never use wheel nuts different than the original equipment. Failure to follow these instructions may result in damage to the wheel or mounting system. This damage could cause the wheel to come off while the vehicle is being driven, which could result in serious personal injury or death to vehicle occupant(s).

⚠ WARNING: Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.

⚠ WARNING: Keep eyes away from valve stem when deflating tires. Reduce air pressure in tire as much as possible by pushing in valve core plunger prior to removing the core. Escaping air can carry particles that can injure the eyes. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Only use replacement tires that are the same size, load index, speed rating and type (such as P-metric versus LT-metric or all-season versus all-terrain) as those originally provided by Ford. The recommended tire and wheel size may be found on either the Safety Compliance Certification Label or the Tire Label, which is located on the B-pillar or edge of the driver's door. If the information is not found on these labels, consult a Ford dealer. Use of any tire or wheel not recommended by Ford can affect the safety and performance of the vehicle, which could result in an increased risk of loss of vehicle control, vehicle rollover, personal injury and death. Additionally, the use of non-recommended tires and wheels could cause steering, suspension, axle or transfer case/power

transfer unit failure.

NOTICE: **Do not clean aluminum wheels with steel wool, abrasive-type cleaners or strong detergents or damage to the wheel finish may occur. Use Wheel and Tire Cleaner ZC-27-A or -B or equivalent.**

Factory-installed tires and wheels are designed to operate satisfactorily with loads up to and including full-rated load capacity when inflated to recommended inflation pressures.

Correct tire pressure and driving techniques have an important influence on tire life. Heavy cornering, excessively rapid acceleration and unnecessary sharp braking increase tire wear.

To equalize tire wear, the tires should be rotated at recommended intervals.

Tire Pressure Monitoring System (TPMS)

NOTE: The Smart Junction Box (SJB) is also identified as the Generic Electronic Module (GEM).

The Tire Pressure Monitoring System (TPMS) includes:

- the SJB , TPMS functionality is integrated within the SJB .
- four tire pressure sensors.
- four tire pressure sensor cradles.
- four tire pressure sensor straps.
- an Instrument Cluster (IC) indicator.
- a message center (if equipped).

Tire Pressure Monitoring System (TPMS) Module

The SJB contains the TPMS functionality. Refer to Tire Pressure Monitoring System in Diagnosis and Testing for TPMS fault diagnosis and repair.

The SJB compares the information of each tire pressure sensor transmission against a pressure limit. If the SJB determines that the tire pressure has fallen below the low limit, the SJB communicates this to the IC on the vehicle communication bus.

Tire Pressure Monitoring System (TPMS) Pressure Sensor

The SJB monitors the air pressure in the 4 road tires with tire pressure sensors. The sensors transmit radio frequency signals to the SJB approximately every 60 seconds when the vehicle speed exceeds 32 km/h (20 mph).

The tire pressure sensors are battery operated and are mounted to metal brackets (called cradles) on the wheels inside the tires. The sensors are mounted 180 degrees from the valve stem.

The tire pressure sensor can be serviced separately from the cradle and the strap.

Tire Pressure Monitoring System (TPMS) Pressure Sensor Cradle

The tire pressure sensor cradles are mounted to the wheels with metal straps and have an adhesive strip to aid in their retention to the wheel.

The sensor cradle is available with the strap in a kit. To service the sensor cradle, the strap must be removed and discarded.

Tire Pressure Monitoring System (TPMS) Pressure Sensor Strap

The sensor strap keeps the sensor and the cradle retained to the wheel. A factory-installed strap is joined together with a one-time-use buckle and a dealer-installed strap is joined together with a worm gear (similar to a radiator hose clamp). Both straps should be discarded after removal and should not be reused.

The cradle and strap are available as a strap kit. There are several different strap kits available based on wheel diameter.

Instrument Cluster (IC) and Message Center

The IC illuminates the TPMS indicator when it receives a message from the SJB to do so and displays the appropriate message(s) in the message center (if equipped).

The IC and message center are diagnosed and serviced in their own respective workshop manual sections. Refer to the appropriate section in Group 413 for the procedure.

Wheels And Tires

Special Tool(s)

 ST2869-A	Digital Tire Pressure Gauge 204-354
 ST3058-A	Hunter Road Force® Wheel Balancer GSP9700 Series

Inspection and Verification

⚠ WARNING: Vehicle may have multiple drive wheels. Do not use engine to power the driveline unless all drive wheels are elevated off the ground. Drive wheels in contact with ground could cause unexpected vehicle movement. Failure to follow this instruction may result in serious personal injury.

Verify the customer concern by carrying out a road test on a smooth road. If any vibrations are apparent, GO to Symptom Chart - NVH .

To maximize tire performance, inspect for signs of incorrect inflation and uneven wear, which may indicate a need for balancing, rotation or front suspension alignment.

Correct tire pressure and driving techniques have an important influence on tire life. Heavy cornering, excessively rapid acceleration and unnecessary sharp braking increase tire wear.

Replacement tires must follow the recommended:

- tire sizes.
- speed rating.
- load range.
- tire construction type.

The use of any other tire/wheel size, load range or type can seriously affect:

- ride.
- handling.
- speedometer/odometer calibration.
- vehicle ground clearance.
- tire clearance between the body and chassis.
- wheel bearing life.
- braking performance.

New wheels need to be installed when the vehicle wheels:

- are bent.
- are cracked.
- are dented.

- are heavily corroded.
- are leaking.
- have elongated wheel hub bolt holes.
- have excessive lateral or radial runout.

It is mandatory to use only the tire sizes recommended on the tire label located on the driver door or door pillar attached to the vehicle. Larger or smaller tires can damage the vehicle, affect durability and require changing the speedometer calibration. Make sure wheel size and offsets match those recommended for the tire in use.

1. Inspect the tires for signs of uneven wear. Refer to the following descriptions to identify the type of wear and GO to Symptom Chart - Tire Wear for the appropriate repair action to be carried out.

2. Check the tires for:
   - cuts.
   - stone bruises.
   - abrasions.
   - blisters.
   - embedded objects.

3. Check the valve stems for:
   - cracks.
   - cuts.

Install a new valve stem when damage is found or anytime a new tire is installed.

4. Tread wear indicators are molded into the bottom of the tread grooves. Install a new tire when the indicator bands become less than 2/32 inch.

Tire Wear

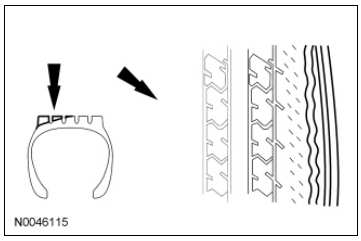
Tire wear is commonly defined as a loss of tread depth. Tire tread wear occurs due to friction with the contact surface (road/pavement). The tread should wear down uniformly all the way around the circumference of the tire and all the way across the tread face. When this does not occur, the tire may have abnormal/incorrect wear.

Normal Tire Wear

Normal tire wear is identified as even wear around and across the tread. Because there are many factors (driving style, road surfaces, type of vehicle, type of tire) that can affect tire wear, there is no absolute mileage expectation for a normal wear condition. A tire is considered worn-out when the tread has worn to the level of the tread-wear indicators.

Abnormal/Incorrect Tire Wear

Abnormal/incorrect tire wear is identified as tire wear that is not even around or across the tread and that creates performance-related issues.

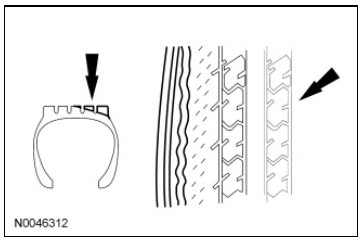


Abnormal/incorrect wear can be caused by numerous factors, some of which include driving style (aggressive, passive), climate (hot, cold), road conditions, vehicle loading and maintenance (correct tire pressure, rotation intervals and balance). It is important to determine the root cause of wear on a vehicle before carrying out repair. Tires exhibiting abnormal/incorrect tire wear may still be serviceable provided that the minimum tread depth is greater than 2/32 inch and the tire is not causing a vehicle performance (noise/vibration) concern.

Some abnormal/incorrect wear patterns look the same all the way around the tread of the tire, other wear patterns are not consistent and can occur in various spots on the tread area. The underlying causes of the 6 wear categories are different. Refer to the following descriptions to identify the type of wear and GO to Symptom Chart - Tire Wear for the appropriate repair action to be carried out.

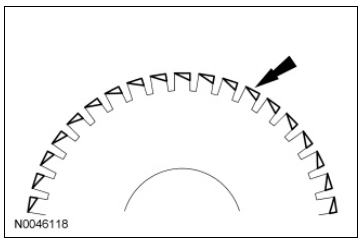
Inner Edge/Shoulder Wear

Inner edge (or shoulder) wear occurs on the inside edge of the tire and is usually caused by excessive toe out and/or excessive negative camber. If the tread depth of the outer shoulder is at least 50% greater than the tread depth of the inner shoulder, the tire is experiencing inner edge/shoulder wear. To determine whether tires have this type of wear, visually inspect the tires. In some instances, it may be necessary to measure the tread depth of each rib and compare it to that of the shoulder.



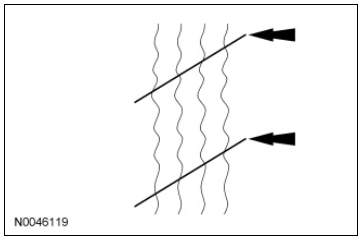
NOTE: RF tire shown, others similar.

Outer Edge/Shoulder Wear



Outer edge (or shoulder) wear occurs on the outside edge of the tire and is usually caused by excessive toe in and/or excessive positive camber. If the tread depth of the inner shoulder is at least 50% greater than the tread depth of the outer shoulder, the tire is experiencing outer edge/shoulder wear. To determine whether tires have this type of wear, visually inspect the tires. In some instances, it may be necessary to measure the tread depth of each rib and compare it to that of the shoulder.

NOTE: RF tire shown, others similar.



Heel/Toe Wear

Heel/toe wear (also known as feathering) occurs along the outside or inside edge/shoulder of the tire. To determine whether tires have this type of wear, visually inspect the tires in both the inside and outside shoulder ribs. In some instances, it may be necessary to measure the difference in tread depth of leading versus trailing edge of each lug in the inside and outside shoulder rib.

Diagonal Wear

Diagonal wear occurs diagonally across the tread area and around the circumference of the tire. To determine whether tires have this type of wear, visually inspect the tires to determine if the wear pattern runs diagonally across the tread and around the circumference of the tire. In some instances, the difference in tread depth along the diagonal wear pattern may need to be measured.

Symptom Chart - Tire Wear

Symptom Chart - Tire Wear
NOTE: For suspension system and additional alignment diagnosis, refer to Section 204-00 .

ConditionPossible SourcesAction

- Inner edge/shoulder wear
- Excessive toe out and/or negative camber
- GO to Pinpoint Test A .
- Incorrect wheel and tire assembly rotation intervals
- GO to Pinpoint Test A .
- High-speed cornering
- GO to Pinpoint Test A .
- Outer edge/shoulder wear
- Excessive toe in and/or positive camber
- GO to Pinpoint Test B .
- Incorrect wheel and tire assembly rotation intervals
- GO to Pinpoint Test B .
- High-speed cornering
- GO to Pinpoint Test B .
- Heel/toe wear

- Excessive toe in/out
- Incorrect wheel and tire assembly rotation intervals

- ROTATE the wheel and tire assemblies. CHECK the alignment, ADJUST as necessary.

- Diagonal wear

- Excessive toe in/out

- GO to Pinpoint Test C .

- Incorrect tire rotation intervals

- GO to Pinpoint Test C .

- Loose, worn or damaged suspension components

- REFER to Section 204-00 .

Symptom Chart - NVH

Symptom Chart - NVH
NOTE: NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to Section 100-04 . Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to Section 100-04 for the next likely system and continue diagnosis.

ConditionPossible SourcesAction

- Wobble or shimmy

- Bent wheel

- INSTALL a new wheel as necessary.

- Damaged tire

- INSTALL a new tire as necessary.

- Loose wheel nuts

- TIGHTEN to specification.

- High-speed shake

- Tires/wheels

- REFER to Wheel and Tire Runout Component Tests in this section.

- Vehicle vibration

- Tires/wheels
- REFER to Wheel and Tire Runout Component Tests in this section.

Pinpoint Tests

For a description of the various tire wear patterns, refer to Inspection and Verification.

Pinpoint Test A: Inner Edge/Shoulder Wear

This pinpoint test is intended to diagnose the following:
- Excessive toe out
- Incorrect wheel and tire rotation

PINPOINT TEST A: INNER EDGE/SHOULDER WEAR

Test Step	Result / Action to Take
A1 MEASURE THE TREAD DEPTH	
• Using a tread depth gauge or similar tool, measure the inside edge/shoulder tread depth. • **Is the tread depth greater than 2/32 inch?**	**Yes** ROTATE the wheel and tire assemblies. CHECK and ADJUST the toe to nominal +0.15 degrees (toe in). CHECK and ADJUST caster and camber to nominal. REFER to Section 204-00 . **No** INSTALL a new tire(s). CHECK and ADJUST the toe to nominal. CHECK and ADJUST caster and camber to nominal. REFER to Section 204-00 .

Pinpoint Test B: Outer Edge/Shoulder Wear

This pinpoint test is intended to diagnose the following:
- Excessive toe in
- Incorrect wheel and tire rotation

PINPOINT TEST B: OUTER EDGE/SHOULDER WEAR

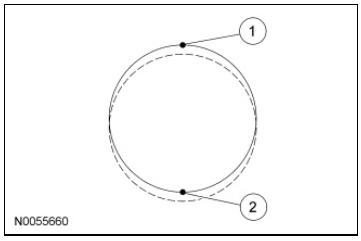
Test Step	Result / Action to Take
B1 MEASURE THE TREAD DEPTH	
• Using a tread depth gauge or similar tool, measure the outside edge/shoulder tread depth.	**Yes** ROTATE the wheel and tire assemblies. CHECK and ADJUST the toe to nominal -0.15 degrees (toe

• **Is the tread depth greater than 2/32 inch?**	out). CHECK and ADJUST caster and camber to nominal. REFER to Section 204-00 . **No** INSTALL a new tire(s). CHECK and ADJUST the toe to nominal. CHECK and ADJUST caster and camber to nominal. REFER to Section 204-00 .

Pinpoint Test C: Diagonal Wear

This pinpoint test is intended to diagnose the following:

- Incorrect wheel and tire rotation
- Excessive toe in/out
- Incorrect tire inflation
- Loose, worn or damaged suspension components



PINPOINT TEST C: DIAGONAL WEAR

Test Step	Result / Action to Take
C1 MEASURE THE TREAD DEPTH	
• Using a tread depth gauge or similar tool, measure the tread depth of the wear pattern. • **Is the tread depth greater than 2/32 inch?**	**Yes** If no performance concerns (noise/vibration) are present, the tire can remain in service. CHECK the air pressure in the tires, ADJUST as necessary. ROTATE the wheel and tire assemblies. INSPECT for loose, worn or damaged suspension components. INSTALL new components as necessary. CHECK the alignment and ADJUST as necessary. REFER to Section 204-00 . **No** INSTALL a new tire(s). CHECK the air pressure in the tires, ADJUST as necessary. ROTATE the wheel and tire assemblies. INSPECT for loose, worn or damaged suspension components. INSTALL new components as necessary. CHECK the alignment and ADJUST as necessary. REFER to Section 204-00 .

Component Tests

Radial Runout

Radial runout is the egg-shaped deviation from a perfect circle and is measured perpendicular to the circumference. On a wheel and tire assembly, this means measuring the center tire tread rib. The center rib is indicative of the condition of the tire as a whole. Total runout is the difference between the maximum-to-minimum gauge reading. The high spot is the location of maximum runout.

Item	Description
1	High spot
2	Low spot

Loaded Runout Measurement (Hunter Road Force® 9700 Series Wheel Balancer)

NOTE: Diagnosis of tire/wheel vibration should not be performed on tires with less than 320 km (200 mi). Some initial tire/wheel vibration issues (such as flat spotting) will correct themselves after the tires have been in service for 320 km (200 mi).

This procedure is intended to assist with the diagnosis of wheel and tire assembly runout and/or force variation issues.

The Hunter Road Force® 9700 Series Wheel Balancer measures the wheel and tire assembly's loaded runout and the tire's radial spring rate. The balancer then converts the runout into pounds of force (termed as Road Force®). Measuring loaded runout (Road Force®) is more effective than measuring unloaded runout using a dial indicator.

1. Using a tire crayon, record the vehicle position on the inward sidewall of all 4 tires.

2. Remove the wheel and tire assemblies. For additional information, refer to Wheel and Tire in this section.

3. **NOTE:** Use only the Digital Tire Pressure Gauge any time tire pressures are measured to be sure that accurate values are obtained.

   Make sure that the tire pressures are set to the correct pressure as indicated on the Vehicle Certification (VC) label.

4. ***NOTICE:*** **Make sure that the correct wheel balancer adapters are used when mounting the assembly to the wheel balancer or damage to the wheel may occur.**

   NOTE: Make sure that the wheel and tire assembly is clean and free of foreign material prior to installation on the balancer.

   NOTE: The wheel balancer inflation station must be turned OFF for tires with inflation pressures of 414 kPa (60 psi) or above.

   Mount the wheel and tire assembly on a suitable wheel balancer using the correct wheel balancer adapters as shown. Refer to the list of recommended wheel balancer adapters on the PTS website.

Item	Description
1	Wheel balancer
2	Cone
3	Wheel and tire assembly
4	Finger plate
5	Balancer wing nut

5. Measure the Road Force®.
    - Temporarily mark the high spot and the Road Force® value on the sidewall of the tire. If the wheel and tire assembly Road Force® value is greater than 11 kg (25 lb), carry out the Match Mounting procedure to optimize the wheel and tire assembly.
    - If the wheel and tire assembly Road Force® value is 11 kg (25 lb) or less, permanently mark the high spot and the Road Force® value on the inward sidewall of the tire for reference during future wheel and tire service. Balance the assembly and install the wheel and tire on the vehicle using the Wheel-to-Hub Optimization procedure.

Runout Measurement (Dial Indicator)

NOTE: Diagnosis of tire/wheel vibration should not be performed on tires with less than 320 km (200 mi). Some initial tire/wheel vibration issues (such as flat spotting) will correct themselves after the tires have been in service for 320 km (200 mi).

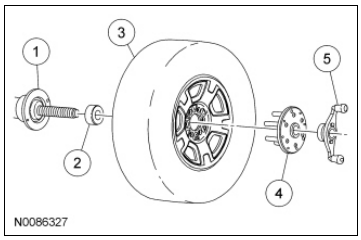
NOTE: Loaded run-out measurements are the preferred method for verifying tire serviceability. While a dial indicator can be used to optimize the position of the tire on the wheel the unloaded run-out measurement cannot accurately determine if the tire should be removed from service.

The following procedures should be used if normal diagnostics leads to a potential runout issue.

Some vehicles may exhibit a wheel and tire vibration caused by excessive runout. Radial runout measurements can be taken using a dial indicator and should be measured with the wheel and tire assembly mounted on a suitable wheel balancer. The dial indicator should be mounted securely to eliminate gauge movement when measuring runout.

1. **NOTE:** Use only the Digital Tire Pressure Gauge any time tire pressures are measured to be sure that accurate values are obtained.

   Make sure that the tire pressures are set to the correct pressure as indicated on the VC label.



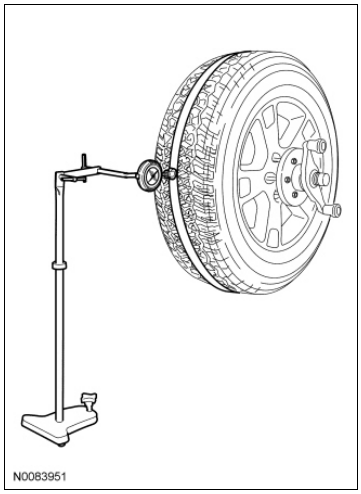
2. Using a tire crayon, record the vehicle position on the inward sidewall of all 4 tires.

3. Remove the wheel and tire assemblies. Refer to Wheel and Tire in this section.

4. *NOTICE:* **Make sure that the correct wheel balancer adapters are used when mounting the assembly to the wheel balancer or damage to the wheel may occur.**

   NOTE: Make sure that the wheel and tire assembly is clean and free of foreign material prior to installation on the balancer.

   Mount the wheel and tire assembly on a suitable wheel balancer using the correct wheel balancer adapters as shown. Refer to the list of recommended wheel balancer adapters on the PTS website.



Item	Description
1	Wheel balancer
2	Cone
3	Wheel and tire assembly
4	Finger plate
5	Balancer wing nut

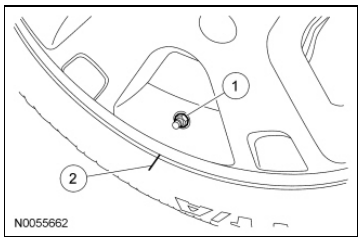
5. **NOTE:** Masking tape can be applied on the center tread rib to allow for a smoother measuring surface. Some fluctuation of the gauge reading is expected. Observe the overall sweep of the gauge from the highest to the lowest spot on the tire.

   Position the dial indicator and stand with the dial indicator on the center tread rib.

   - Rotate the wheel and tire assembly (or wheel) to locate the low spot.
   - Adjust the runout gauge to read 0.
   - Rotate the wheel and tire assembly one complete revolution to make sure that the low spot has been found and that the dial indicator returns to a 0 reading.

6. While slowly and constantly rotating the wheel and tire assembly (or wheel), measure the radial runout.

- Note the variance (runout) from 0 on the dial of the gauge.
- If the runout reading of a wheel and tire assembly is greater than 1.14 mm (0.045 in), locate and temporarily mark the high spot and runout reading on the sidewall of the tire and carry out the Match Mounting procedure to optimize the wheel and tire assembly.
- If the runout reading of a wheel and tire assembly is 1.14 mm (0.045 in) or less, permanently mark the high spot and the runout reading on the inward sidewall of the tire for reference during future wheel and tire service. Balance the assembly and install the wheel and tire on the vehicle using the Wheel-to-Hub Optimization procedure.



Match Mounting

NOTE: Road Force® values in illustrations are shown in pounds.

Match mounting is a technique used to reduce radial runout or road force on wheel and tire assemblies. Excessive runout is a source of ride quality complaints and match mounting can be used to minimize the runout. Match mounting can be accomplished by changing the position of the tire on the wheel.

1. Position the wheel and tire assembly on a tire machine and put a reference mark on the tire sidewall at the valve stem position.

Item	Description
1	Valve stem
2	Reference mark

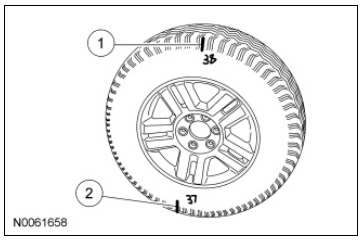
2. ***NOTICE:*** **For tires equipped with a Tire Pressure Monitoring System (TPMS), the sensor, cradle and strap may be damaged by incorrect tire mounting or dismounting. Dismount the tire from the wheel as instructed in the Disassembly and Assembly procedure. Failure to follow these instructions may result in TPMS component damage.**

   NOTE: Always make sure that the final high spot and measurement values are permanently marked on the inward sidewall of the tire for reference during future wheel and tire service.

   Using a suitable tire machine, separate the tire beads from the wheel.

   - Lubricate the tire beads using a suitable fast drying, corrosion inhibiting tire bead lubricant.

- Position the tire 180 degrees (half-way around) on the rim so the valve stem reference mark is now opposite the valve stem.

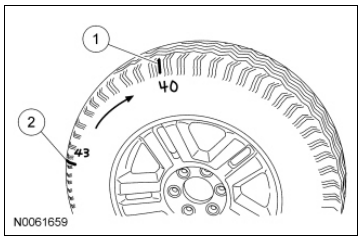


3. Re-inflate the wheel and tire assembly to the specified air pressure and measure the assembly again using the dial indicator or Hunter Road Force® 9700 Series Wheel Balancer. Mark the second high spot on the tire.
    - If the runout or Road Force® is reduced to within specifications, the concern has been resolved. Balance the assembly and install on the vehicle using the Wheel-to-Hub Optimization procedure.

4. If the second runout or Road Force® measurement is still not within specification and both high spots are close to each other (within 101.6 mm [4 in]), the root cause is probably the tire (the high spot followed the tire).
    - To be **SURE** that the tire is causing the high runout, it is necessary to have 2 runout or Road Force® measurements that are not within specification and the high spots must be in approximately the same location on the tire's sidewall. If the tire is the cause, install a new tire, balance the assembly and install on the vehicle using the Wheel-to-Hub Optimization procedure.
    - If the second high spot is not within 101.6 mm (4 in) of the first high spot, proceed to the next step.

Item	Description
1	First high spot on the tire
2	Second high spot on the tire

5. If the second high spot is still above specification and is within 101.6 mm (4 in) of being opposite the first high spot on the wheel, the root cause is probably the wheel (the high spot followed the wheel). Dismount the tire from the wheel, mount the wheel on a balancer and check the wheel runout. If the wheel runout exceeds 1.14 mm (0.045 in), install a new wheel, balance the assembly and install on the vehicle using the Wheel-to-Hub Optimization procedure.

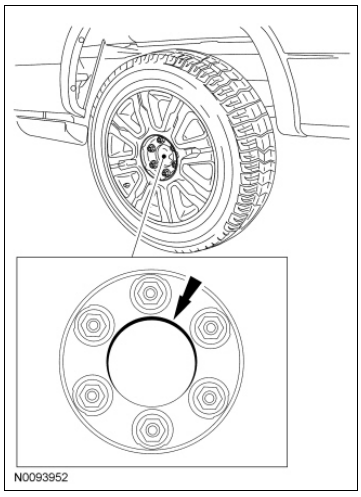


Item	Description
1	First high spot on the tire
2	Second high spot on the tire

6. **NOTE:** If the second high spot did not follow the wheel or the tire and the runout is still not within specification, improvements may be made by rotating the tire 90 degrees (one-fourth turn).

   Draw an arrow on the tire sidewall from the second high spot towards the first high spot (in the shortest direction).

   - Separate the tire beads from the wheel and rotate the tire 90 degrees (one-fourth turn) in the direction of the arrow.



Item	Description
1	First high spot on the tire
2	Second high spot on the tire

Wheel-to-Hub Optimization

Wheel-to-hub optimization is important. Clearance between the wheel and hub can be used to offset or neutralize the Road Force® or run-out of the wheel and tire assembly. For every 0.001 in of wheel-to-hub clearance, the Road Force® can be affected between 1 and 3 pounds depending on the tire stiffness.

NOTE: The example below illustrates how the clearance between the wheel and the hub can be used to offset the high spot of radial run-out or Road Force®. Following the procedure will ensure the best optimization.

1. Position the wheel and tire assembly on the vehicle so that the high spot location is at the 6 o'clock position and install the wheel nuts by hand until snug.

2. **NOTE:** Do not allow the full weight of the vehicle to rest on the tires while tightening the wheel nuts.

   Lower the vehicle until the tires make contact with the ground, slightly loading the suspension. Tighten the wheel nuts as described in Wheel and Tire in this section.

Tire Pressure Monitoring System

Special Tool(s)

 ST2941-A	Activation Tool, Tire Pressure Monitor 204-363
 ST2869-A	Digital Tire Pressure Gauge 204-354
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Principles of Operation

NOTE: The Smart Junction Box (SJB) is also referred to as the Generic Electronic Module (GEM).

The Tire Pressure Monitoring System (TPMS) monitors the air pressure of all 4 road tires. The wheel-mounted tire pressure sensors transmit via radio frequency signals, to the SJB . TPMS functionality is integral to the SJB . These transmissions are sent approximately every 60 seconds when the vehicle speed exceeds 32 km/h (20 mph). The TPMS function compares each tire pressure sensor transmission against a low-pressure limit. If it has been determined that the tire pressure has fallen below this limit, the SJB communicates this on the vehicle communication bus to the instrument cluster. The instrument cluster then illuminates the TPMS indicator and displays the appropriate message(s) in the message center (if equipped).

For vehicles with different front and rear tire pressures (such as the E-Series and certain F-Series), the tire pressures must be adjusted and the tire pressure sensors must be trained following a tire rotation. Failure to train the sensors will cause the TPMS indicator to illuminate.

For vehicles with the same tire pressures for front and rear tires, tire rotation will not affect the system.

Ambient Temperature Change and Tire Pressure

⚠ WARNING: The tire pressure monitoring system (TPMS) sensor battery may release hazardous chemicals if exposed to extreme mechanical damage. If these chemicals contact the skin or eyes, flush immediately with water for a minimum of 15 minutes and get prompt medical attention. If any part of the battery is swallowed, contact a physician immediately. When disposing of TPMS sensors, follow the correct procedures for hazardous material disposal. Failure to follow these instructions may result in serious personal injury.

NOTICE: **Do not inflate tire higher than maximum pressure stamped on tire sidewall. Premature tire wear or damage to the tire may result.**

Tire pressures fluctuate with temperature changes. For this reason, tire pressure must be set to specification when tires are at outdoor ambient temperatures. If the vehicle is allowed to warm up to shop temperatures, and the outside temperature is less than shop temperature, the tire inflation pressure must be adjusted accordingly.

If the tires are inflated to specification at shop temperatures, and the vehicle is moved outdoors when the outdoor ambient temperature is significantly lower, the tire pressure may drop enough to be detected by the TPMS and activate the TPMS indicator.

As the ambient temperature decreases by 6°C (10°F), tire pressure decreases 7 kPa (1 psi). Adjust the tire pressure by 7 kPa (1 psi) for each 6°C (10°F) ambient temperature drop as necessary to keep the tire at the specified Vehicle Certification (VC) label pressure. Refer to the following tables to adjust the tire pressure indoors for colder outside temperatures.

Table 1. Use Table to Adjust Tire Pressure Inside Garage for Colder Outside Temperature[1]
** Do Not Inflate Tire Higher than Maximum Pressure Stamped on Tire Sidewall. **

Table is based on a Garage Temperature of 70˚F. Max Pressure Adjustment is 7 psi.

[1]When Outside (Ambient) Temperature is greater than 21˚C (70˚F), Inflate tires to placard pressure.
[1]Use the table to adjust tire pressure for P-metric and LT tires only.
[1]Do NOT use table for Commercial Truck Tires (i.e. 19.5 inch tires for F450 & F550). See F-Super Duty Service Manual for tire inflation procedure.

N0057700

Tire Pressure Monitoring System (TPMS) Indicator and Message Center Messages

The TPMS indicator and vehicle message center (if equipped) sometimes displays faults that cannot be resolved by the customer. Treat these messages as TPMS faults that must be serviced.

Tire Pressure Monitoring System (TPMS) Indicator Illuminates Continuously

NOTE: If the spare tire is in use, the damaged road tire must be repaired and installed on the vehicle to restore complete TPMS functionality before carrying out any diagnosis.

NOTE: For vehicles with different front and rear tire pressures (such as E-Series and certain F-Series), the tire pressure sensors must be trained following a tire rotation. Failure to train the sensors will result in a false low tire pressure event, which will cause the TPMS indicator to illuminate.

1. The TPMS indicator remains on continuously for the following condition:
    - Low Tire Pressure - The TPMS indicator is illuminated solid and the message center displays LOW TIRE PRESSURE (if equipped). This is displayed when any of the tire pressures are low. When this condition exists, the tire pressure must be adjusted to the recommended cold

pressure as indicated on the VC label.

2. **NOTE:** The TPMS sensors do not transmit when the vehicle is stationary. If the vehicle has been stationary for more than 30 minutes, it will be necessary to wake up the sensors so they will transmit the latest tire pressure information to the SJB .

   If the vehicle has been stationary for more than 30 minutes, carry out the Tire Pressure Monitoring System (TPMS) Sensor Activation procedure in this section.

Tire Pressure Monitoring System (TPMS) Indicator Flashes

The TPMS indicator flashes for 70 seconds, then remains ON solid when the ignition switch is turned to the ON position, for the following conditions:

1. Tire Pressure Sensor Fault - If equipped, the message center will display TIRE PRESSURE SENSOR FAULT when a tire pressure sensor is malfunctioning. GO to Symptom Chart .

2. No communication with the SJB (TPMS is integral to the SJB) - The TPMS indicator is illuminated when the Instrument Cluster (IC) has not received any signals from the SJB for more than 5 seconds. If equipped, the message center displays TIRE PRESSURE MONITOR FAULT. GO to Symptom Chart .

3. Tire Pressure Monitor Fault - If equipped, the message center will display TIRE PRESSURE MONITOR FAULT when the TPMS is malfunctioning or communication with the IC has been lost. GO to Symptom Chart .

Tire Pressure Monitoring System (TPMS) PID Definitions and Intermittent Troubleshooting

TPMS Status (TP_STAT) PID

The SJB monitors the TPMS status. The current status can be viewed by accessing the TPMS status PID: TP_STAT using the scan tool. This helps identify the current system status and may aid in diagnosing the system. The PID has 4 valid states:

1. TP_STAT = SENSOR FAULT.
   - If the module has not received the tire pressure status from 1 to 3 TPMS sensors for 20 minutes when the vehicle speed is above 32 km/h (20 mph), the PID displays SENSOR FAULT.

2. TP_STAT = SYSTEM FAULT.
   - If the module has not received the tire pressure status from **all** 4 TPMS sensors for 20 minutes and the vehicle speed is above 32 km/h (20 mph), the PID displays SYSTEM FAULT.

3. TP_STAT = LOW.
   - If the module has detected that at least 1 TPMS sensor is reporting low tire pressure, the PID displays LOW.

4. TP_STAT = SYSTEM ACTIVE.
   - If the TPMS is functioning normally, the PID displays SYSTEM ACTIVE.

TPMS Last Warning Event PID Definitions

The TPMS uses the TPMS last warning event PIDs to store detailed information about the last 5 times the TPMS warning indicator was activated. These PIDs can be used to acquire more information about a particular TPMS event.

EVT1_IGN through EVT5_IGN

The number of key cycles since the TPMS warning indicator was activated. This PID cycles from zero to 255 and then starts over from zero again. This can be used to determine how long ago a TPMS event occurred and the time (in key cycles) between events.

EVT1_TLOC through EVT5_TLOC

This is the last programmed location for the sensor identifier causing each TPMS event. Due to tire rotation, the sensor may no longer be at the original location. It is suggested that all the PIDs be recorded, the system retrained, and then the sensor identifier PIDs be used to pinpoint the actual location of each sensor.

EVT1_PSI through EVT5_PSI

This is the tire pressure associated with each TPMS warning indicator event. This can be used along with the function code to clearly identify the TPMS events that were strictly due to low pressure. It can also be used to determine when a sensor is transmitting inaccurate tire pressure.

EVT1_STAT through EVT5_STAT

Describes the warning status of each TPMS event by using the information received from the TPMS status (TP_STAT) PID. If there is a communication issue, the status could be Normal.

- Unknown
- Normal (normal operation)
- Low (low pressure event)
- Fault (sensor fault or system fault)

EVT1_TxID through EVT5_TxID

This is the identifier of the sensor involved in each TPMS event. EVT1 is the most recent event that triggered the TPMS warning indicator.

Wheel Rotation and Sensor Training Techniques

Moving a Problem Sensor/Wheel to a Different Position

If a sensor in a certain location has caused several events, yet the sensor trains and seems to operate normally, moving that particular wheel to a different location on the vehicle is a good way to isolate the issue to a certain sensor/wheel location. Rotate the wheels and road test the vehicle. This can be done in an attempt to replicate the issue. This determines if the issue followed the sensor or remained in the original sensor location.

Training Sensors in a Different Order

This is a technique to get past a left front sensor that may not be responding to determine if the remaining sensors train to the module. This can help save time determining if other sensors are having issues or if the module is experiencing training difficulties with a certain location.

Training Known Good Sensors From Another Vehicle

Training known good sensors from another vehicle cannot differentiate between a faulted module and Radio Frequency Interference (RFI), as some noise source could be preventing the module from receiving the tire

pressure status from the original sensors as well as the known good sensors. This technique that can be used to differentiate between a sensor and module issue. If the module in the vehicle cannot train any of its own sensors, and likewise cannot train known good sensors from another vehicle, then the issue is with the module or the RFI , and not with the original sensors. The original sensors should not be replaced.

Items That Cause RFI

Non-OEM Equipment

The following equipment has been found to sometimes cause RFI :

- Video equipment has been found to cause RFI especially when the video and power supply lines are near the TPMS .
- Car alarms (even those installed by dealerships) have been found to create enough RFI to cause the TPMS to malfunction or lose considerable range. These car alarms can sometimes be difficult to locate, as they are usually hidden somewhere out of the way for reduced accessibility.
- Many different in-vehicle cell phone chargers have been found to cause considerable RFI . The vehicles with the power point closest to the TPM are the most affected. It must be noted that most cell phone chargers do not produce high levels of RFI all the time. This depends on the state of charge of the cell phone battery. The phone must be almost completely discharged in some cases.
- Power supplies and DC/AC inverters typically create a lot of RFI . Most consumer grade equipment has very little filtering or shielding.

OEM Modules

In some cases, the RFI may actually be caused by a module or ground on the vehicle. Depending on the severity of the issue, a dirty ground, improperly built ground shield or module can disable the system. Modules that have microcontrollers using clock circuits to create the timing pulses for the microprocessor may radiate RFI .

Using Customer's Electronics to Pinpoint the Radio Frequency Interference (RFI) Source

This can be a way to determine the cause of an issue well before the sensors and module are replaced with little or no affect on the system performance. Since this takes more up-front work, it relies on working with the customer to determine what equipment was being used at the time of the event.

Options for Eliminating Intermittent TPMS Conditions Caused by RFI

- If an OEM component or customer device is causing an RFI issue, replace the device.
- If a phone charger is causing an RFI issue, the customer should consult their cell phone provider to acquire a different phone charger.
- If a device such as a dealer-installed alarm is causing an RFI issue, move the device to another location on the vehicle. In the case of a portable device, move the power cord to another power point location.

In summary, if the RFI source is present and cannot be moved or replaced, the intermittent issue remains. The vehicle owner must accept RFI and the unwanted system operation it can cause.

Inspection and Verification

1. **NOTE:** The tire pressure sensors are not designed to be used with aftermarket wheels.

   NOTE: The use of run-flat tires (tires with steel body cord plies in the tire sidewall) where not originally equipped, may cause the Tire Pressure Monitoring System (TPMS) to malfunction and is

therefore not recommended.

Verify the customer concern by inspecting the vehicle and observing the message center (if equipped) and the TPMS indicator.

2. **NOTE:** The valve-mounted TPMS sensors and the strap-mounted TPMS sensors are not compatible. Swapping wheels from one vehicle to another with the different systems will set a TPMS fault.

   NOTE: Swapping wheels between vehicles with the same TPMS will cause a TPMS fault to be set if the sensors are not trained. Refer to Tire Pressure Monitoring System (TPMS) Sensor Training in this section.

   NOTE: Non-OEM modifications made to the vehicle may result in false TPMS warnings.

   Inspect to determine if one of the following mechanical or electrical concerns apply:

Visual Inspection Chart

Mechanical	Electrical
• Low tire pressure • Tire Pressure Monitoring System (TPMS) sensor damaged or missing • Spare tire installed as a road wheel • Incorrect TPMS sensor installed • TPMS sensor installed incorrectly • Sensors not trained after a tire rotation on vehicles with different front and rear tire pressures • Non-OEM wheels installed (aftermarket rims) • Non-OEM equipped run-flat tires installed • Other non-OEM modifications (roll cages, service barriers, part racks, ladder racks)	• Wiring, terminals or connectors • Smart Junction Box (SJB) damaged • Aftermarket electronic accessories

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM .
   - refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:

- verify the ignition key is in the ON position.
- verify the scan tool operation with a known good vehicle.
- refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record Continuous Memory Diagnostic Trouble Codes (CMDTCs).

8. Clear the CMDTCs and carry out the self test diagnostics for the SJB (the TPMS is part of the SJB).

9. If the DTCs retrieved are related to the concern, GO to the Tire Pressure Monitoring System (TPMS) DTC Chart. For all other DTCs, refer to the Master DTC Chart in Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

DTC Charts

Tire Pressure Monitoring System (TPMS) DTC Chart

DTC	Description	Source	Action
B106A	Pressure Sensor Range Bit Incorrect State	Smart Junction Box (SJB)	GO to Pinpoint Test G .
B106B	Tire Pressure Sensor Low Battery	SJB	DTC B106B can be set during SJB configuration. GO to Pinpoint Test H .
B106D	Tire Pressure Monitoring System (TPMS) Initiators Not Configured	SJB	DTC B106D is only present when a new SJB is installed, the SJB is incorrectly flashed or the SJB is incorrectly configured. Successfully configuring the SJB is the only way to clear this DTC. VERIFY the SJB is correctly configured. If DTC B106D is still present, REFER to Section 418-01 .
B2477	Module Configuration Failure/Mismatch	SJB	DTC B2477 is only present when a new SJB is installed, the SJB is incorrectly flashed or the SJB is incorrectly configured. Successfully configuring the SJB is the only way to clear this DTC. MAKE SURE the SJB is configured correctly. If DTC B2477 is still present, REFER to Section 418-01 .
B2868	LF Tire Pressure Sensor Fault	SJB	DTC B2868 is only present when a new SJB is installed, the SJB is flashed or the SJB is reconfigured. TRAIN the tire pressure sensors. REFER to Tire Pressure Monitoring System (TPMS) Sensor Training in this section.
B2869	RF Tire Pressure Sensor Fault	SJB	DTC B2869 is only present when a new SJB is installed, the SJB is flashed or the SJB is reconfigured. TRAIN the tire pressure sensors. REFER to Tire Pressure Monitoring System (TPMS) Sensor Training in this section.
B2870	RR Tire Pressure Sensor Fault	SJB	DTC B2870 is only present when a new SJB is installed, the SJB is flashed or the SJB is reconfigured. TRAIN the tire pressure sensors. REFER to Tire Pressure Monitoring System (TPMS) Sensor Training in this section.
B2871		SJB	

	LR Tire Pressure Sensor Fault		DTC B2871 is only present when a new SJB is installed, the SJB is flashed or the SJB is reconfigured. TRAIN the tire pressure sensors. REFER to Tire Pressure Monitoring System (TPMS) Sensor Training in this section.
B2872	Tire Pressure Sensor Fault	SJB	**NOTE:** If the vehicle has been stationary for more than 30 minutes, the sensors will go into a "sleep mode" to conserve battery power. It will be necessary to wake them up so they will transmit the latest tire pressure information to the SJB . ACTIVATE the TPMS sensors. REFER to Tire Pressure Monitoring System (TPMS) Sensor Activation in this section. GO to Pinpoint Test F .
B287A	Tire Pressure System Fault	SJB	GO to Pinpoint Test F .
C2780	ECU in Manufacturing Mode	SJB	DTC C2780 is only present when a new SJB is installed, the SJB is flashed or the SJB is reconfigured. TRAIN the tire pressure sensors. REFER to Tire Pressure Monitoring System (TPMS) Sensor Training in this section.
U0155	Lost Communication with Instrument Cluster	SJB	REFER to Section 418-00 to diagnose the no communication problem.
All other SJB DTCs	-	SJB	REFER to the Master DTC Chart in Section 419-10 .

Symptom Chart

Symptom Chart
NOTE: For vehicles with different front and rear tire pressure (such as E-Series and certain F-Series), the tire pressures must be adjusted and the tire pressure sensors must be trained following a tire rotation. Failure to train the sensors will result in a false low tire pressure event, which will cause the Tire Pressure Monitoring System (TPMS) indicator to illuminate.

For vehicles with the same tire pressure for front and rear tires, tire rotation will not affect the system.

Failure of a TPMS component may not cause the message center to display a fault message or a DTC to be stored. The Symptom Chart is a starting point to begin diagnosis of these concerns.

ConditionPossible SourcesAction

- Tire Pressure Monitoring System (TPMS) indicator ON solid and message center (if equipped) displays LOW TIRE PRESSURE
- Spare tire currently in use
- INSTALL the repaired road wheel/tire in place of the spare tire.
- Air pressure not set to specifications listed on the Vehicle Certification (VC) label
- GO to Pinpoint Test D .

- Sensors not trained following tire rotation

- ADVISE customer that on vehicles with different front and rear tire pressure, the sensors must be trained as directed in their Owner's Literature.

- Smart Junction Box (SJB) will not enter sensor training mode when using the TPMS sensor training procedure

- Brake ON/OFF switch
- Ignition switch
- Vehicle communication bus
- SJB

- GO to Pinpoint Test E .

- TPMS indicator FLASHES for 70 seconds and then remains ON solid when the ignition key is turned to the ON position, the message center (if equipped) displays TIRE PRESSURE SENSOR FAULT and DTC B2872 is present

- Intermittent TPMS operation due to Radio Frequency Interference (RFI)
- TPMS sensors not trained
- Not all TPMS sensors are installed
- TPMS sensor(s)
- SJB

- **NOTE:** If the vehicle has been stationary for more than 30 minutes, the sensors will go into a "sleep mode" to conserve battery power. It will be necessary to wake them up so they will transmit the latest tire pressure information to the SJB .

  ACTIVATE the TPMS sensors. REFER to Tire Pressure Monitoring System (TPMS) Sensor Activation in this section. GO to Pinpoint Test F .

- TPMS indicator FLASHES for 70 seconds and then remains ON solid when the ignition key is turned to the ON position, the message center (if equipped) displays TIRE PRESSURE MONITOR FAULT and DTC B287A is present

- TPMS sensors not trained
- Not all TPMS sensors are installed

- **NOTE:** If the vehicle has been stationary for more than 30 minutes, the sensors will go into a "sleep mode" to conserve battery power. It will be necessary to wake them up so they will transmit the latest tire pressure information to the SJB .

  ACTIVATE the TPMS sensors. REFER to Tire Pressure Monitoring System (TPMS) Sensor Activation in this section. GO to Pinpoint Test F .

- TPMS indicator FLASHES for 70 seconds and then remains ON solid when the ignition key is turned to the ON position, the message center (if equipped) displays TIRE PRESSURE MONITOR FAULT and there are no DTCs present

- Vehicle communication issue between the SJB and the Instrument Cluster (IC)

- REFER to Section 418-00 to diagnose the no communication concern.

- SJB

- REFER to Section 419-10 to diagnose the SJB .

- One or more sensors will not train

- TPMS sensor(s)
- Vehicle communication issue
- SJB

- RETRIEVE and RECORD DTCs. REFER to Tire Pressure Monitoring System (TPMS) DTC Chart.

- One or more sensors will not train and no DTCs are present

- TPMS sensor(s)

- TRAIN all 4 tire pressure sensors. REFER to Tire Pressure Monitoring System (TPMS) Sensor Training in this section.
- For any sensor(s) that did not train, ATTEMPT to activate the same sensor with the activation tool. If the sensor still does not respond, MOVE the vehicle to rotate the wheels at least one-fourth turn and ATTEMPT to activate the same sensor again.
- If the sensor(s) fail to train a second time, INSTALL a new sensor(s). REFER to Tire Pressure Monitoring System (TPMS) Sensor in this section.

Pinpoint Tests

Pinpoint Test D: Tire Pressure Monitoring System (TPMS) Indicator ON Solid and Message Center (if equipped) Displays LOW TIRE PRESSURE

Normal Operation

The Tire Pressure Monitoring System (TPMS) monitors the air pressure of all 4 road tires. The wheel-mounted tire pressure sensors transmit via radio frequency signals, to the Smart Junction Box (SJB). TPMS functionality is integral to the SJB . These transmissions are sent approximately every 60 seconds when the vehicle speed exceeds 32 km/h (20 mph). The TPMS function (integral to the SJB) compares each tire pressure sensor transmission against a low-pressure limit. If it has been determined that the tire pressure has fallen below this limit, the SJB communicates this on the vehicle communication bus to the Instrument Cluster (IC). The IC then illuminates the TPMS indicator and displays the appropriate message(s) in the message center (if equipped).

This symptom can also be caused by a spare tire currently being used in place of a road tire. Make sure that the spare tire is not currently in use. On vehicles with different front and rear tire pressures, if the sensors are not trained following a tire rotation, this symptom will also be present. Advise the customer that on vehicles with different front and rear tire pressures, the sensors must be trained as directed in the Owner's Literature.

This pinpoint test is intended to diagnose the following:
- Low air pressure in tire(s)
- Tire pressure sensor(s)

PINPOINT TEST D: TPMS INDICATOR ON SOLID AND MESSAGE CENTER (IF EQUIPPED) DISPLAYS LOW TIRE PRESSURE

NOTE: Use only the Digital Tire Pressure Gauge any time tire pressures are measured to be sure that accurate values are obtained.

NOTE: If a warranty case is opened for an actual TPMS fault, document and include the actual tire pressure data in all warranty communications.

Test Step	Result / Action to Take
D1 CHECK THE TIRE PRESSURE	
• Measure and record the air pressure in all 4 road tires. • Adjust the air pressure for those found to be below the specification listed on the Vehicle Certification (VC) label. • **NOTE:** If the vehicle has been stationary for more than 30 minutes, activate each TPMS sensor. Refer to Tire Pressure Monitoring System (TPMS) Sensor Activation in this section. The TPMS sensor does not transmit when the vehicle is stationary. • Verify system operation. • **Have the TPMS indicator and the message center (if equipped) warnings gone out?**	**Yes** The system is functioning normally, diagnosis is complete. INFORM the customer of correct tire pressure maintenance as instructed in the scheduled maintenance guide and the Owner's Literature. **No** GO to D2 .
D2 CHECK THE SYSTEM COMPONENTS	
• Train all 4 tire pressure sensors. Refer to Tire Pressure Monitoring System (TPMS) Sensor Training in this section. • Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger SJB . • Read and record the following PIDs: ♦ Left Front Tire Pressure (LF_PRES) ♦ Right Front Tire Pressure (RF_PRES) ♦ Left Rear Outer Tire Pressure (LRO_PRES) ♦ Right Rear Outer Tire Pressure (RRO_PRES) • Compare the air pressure readings recorded from the function test to those recorded in D1. • **Do the compared tire pressure values match within ±5 psi, and have the TPMS indicator and the message**	**Yes** The system is functioning normally, diagnosis complete. **No** **Before installing a new sensor(s):** If a sensor(s) does not respond to the Tire Pressure Monitor Activation Tool, ATTEMPT to activate the same sensor(s) with the Tire Pressure Monitor Activation Tool. If the sensor(s) still does not respond, MOVE the vehicle to rotate the wheels at least one-fourth turn and ATTEMPT to activate the same sensor(s) again. INSTALL new tire pressure sensors for those with discrepancies or those that fail to activate. REFER to Tire Pressure Monitoring System (TPMS) Sensor in this section.

center (if equipped) warnings gone out?	

Pinpoint Test E: SJB Will Not Enter Sensor Training Mode When Using the TPMS Sensor Training Procedure

Normal Operation

For the Smart Junction Box (SJB) to enter Tire Pressure Monitoring System (TPMS) sensor training mode, the SJB must receive valid inputs from the Brake Pedal Position (BPP) switch (OFF-ON-OFF) and ignition switch (both OFF and RUN), and it must receive valid vehicle speed sensor input (0 km/h [0 mph]). Refer to Tire Pressure Monitoring System (TPMS) Sensor Training in this section for the complete sensor training procedure.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Brake ON/OFF switch
- Ignition switch
- SJB

PINPOINT TEST E: SJB WILL NOT ENTER SENSOR TRAINING MODE WHEN USING THE TPMS SENSOR TRAINING PROCEDURE

Test Step	Result / Action to Take
E1 CHECK THE SJB BRAKE ON/OFF (GEM_BOO) PID	
• Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger SJB . • Monitor the GEM_BOO PID (SJB reads the brake switch directly). • Press and release the brake pedal while monitoring the PID. • **Do the brake pedal PID values match the brake pedal positions?**	**Yes** GO to E2 . **No** REFER to Section 417-01 to continue diagnosis of the stoplamp switch.
E2 CHECK THE SJB IGNITION SWITCH PIDs	
• Monitor the following ignition switch PIDs: ♦ Ignition Switch Off (IGN_O_ECU) ♦ Ignition Switch RUN (IGN_R_ECU) • Cycle the ignition switch to the RUN and OFF position while monitoring the PIDs (SJB reads the ignition switch directly).	**Yes** GO to E3 . **No** REFER to Section 211-05 to continue diagnosis of the ignition switch.

• **Do the ignition switch status PID values match the ignition switch positions?**	
E3 CHECK THE SJB VEHICLE SPEED (VSS_GEM) PID	
• Monitor the VSS_GEM PID (SJB receives vehicle speed from the Instrument Cluster (IC)). • **Does the vehicle speed PID value match the speed of the vehicle?**	**Yes** GO to E4 . **No** REFER to Section 413-01 to diagnosis of the IC /vehicle speed concern.
E4 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check the connectors for: ♦ corrosion. ♦ pushed-out pins. ♦ spread terminals. • Connect all the SJB connectors and make sure that they are seated correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . CLEAR the DTCs. REPEAT the self-test. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test F: TPMS Indicator FLASHES for 70 Seconds and Then Remains ON Solid When the Ignition Key is Turned to the ON Position, the Message Center (if equipped) Displays TIRE PRESSURE SENSOR or MONITOR FAULT and DTC B2872 or B287A is Present

Normal Operation

If there is a fault with 1, 2 or 3 of the Tire Pressure Monitoring System (TPMS) sensors, DTC B2872 sets. The TPMS warning indicator flashes for 70 seconds and then remains ON continuously when the ignition switch is turned to the ON position and the message center (if equipped) displays TIRE PRESSURE SENSOR FAULT.

If the Smart Junction Box (SJB) does not get a response from **all** 4 of the TPMS sensors, DTC B287A sets and the message center (if equipped) displays TIRE PRESSURE MONITOR FAULT.

It should be noted that TPMS communication can be interrupted by Radio Frequency Interference (RFI), which can cause intermittent issues. RFI is generated by electrical motors and appliance operation, cellular telephones, remote transmitters, power inverters and portable entertainment equipment. Anytime the TPMS sensor training procedure is performed successfully, the warning indicator is extinguished and the vehicle must be driven for 18-20 minutes before the SJB initiates a self test to verify system operation.

- TP_STAT PID = SYSTEM FAULT is displayed if the SJB does not receive a signal transmission from **all** 4 TPMS sensors for 20 minutes and the vehicle speed is above 32 km/h (20 mph).
- TP_STAT PID = SENSOR FAULT is displayed if the SJB does not receive a signal transmission from 1, 2, or 3 TPMS sensors for 20 minutes and the vehicle speed is above 32 km/h (20 mph).

This pinpoint test is intended to diagnose the following:
- Intermittent TPMS operation due to RFI

- TPMS sensor(s) not trained
- Not all TPMS sensors are installed
- TPMS sensor(s)
- SJB

PINPOINT TEST F: TPMS INDICATOR FLASHES FOR 70 SECONDS AND THEN REMAINS ON SOLID WHEN THE IGNITION KEY IS TURNED TO THE ON POSITION, THE MESSAGE CENTER (IF EQUIPPED) DISPLAYS TIRE PRESSURE SENSOR OR MONITOR FAULT AND DTC B2872 OR B287A IS PRESENT

Test Step	Result / Action to Take
F1 CHECK THE HORN OPERATION	
• Press the steering wheel horn pad for 2 seconds. • **Does the horn sound?**	**Yes** GO to F2 . **No** For horn diagnosis, REFER to Section 413-06 .
F2 CHECK THE TPMS STATUS (TP_STAT) PID	
NOTE: Make sure that all aftermarket electronic equipment has been disconnected (if possible) and that the customer has been questioned about the kinds of electronic equipment they may have been using in the vehicle when this issue was identified. • Connect the scan tool. • **NOTE:** A spare tire cannot be programmed to the vehicle, even if equipped with a TPMS sensor. If a damaged road wheel is located in the trunk and the SJB cannot communicate with it, or if the damaged wheel has been dropped off at a dealership or repair shop, the SJB sets a TPMS sensor fault. • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger - SJB . • Monitor the TP_STAT PID. • **Does the PID display SENSOR FAULT?**	**Yes** GO to F3 . **No** If the TP_STAT PID displays **SYSTEM** FAULT, GO to F5 .
F3 CARRY OUT THE SENSOR TRAINING PROCEDURE	
• Train all 4 tire pressure sensors. Refer to Tire Pressure Monitoring System (TPMS) Sensor Training in this section. • **Did all of the tire pressure sensors transmit correctly and did the horn sound when each TPMS sensor transmitted to the SJB ?**	**Yes** The system is operating correctly at this time. The concern may have been caused by RFI . CLEAR the DTCs. REPEAT the self-test. TEST for normal operation. REFER to PID Definitions and Intermittent Troubleshooting in this section for information on locating sources of RFI . **No**

	GO to F4 .
F4 CHECK FOR CORRECT TPMS OPERATION	
• Move the vehicle to rotate the wheels at least one-fourth of a turn. Leave the vehicle doors open. • Train all 4 tire pressure sensors. Refer to Tire Pressure Monitoring System (TPMS) Sensor Training in this section. • **Did all of the tire pressure sensors transmit correctly and did the horn sound when each TPMS sensor transmitted to the SJB ?**	**Yes** The system is operating correctly at this time. The concern may have been caused by RFI . CLEAR the DTCs. REPEAT the self-test. TEST for normal operation. REFER to PID Definitions and Intermittent Troubleshooting in this section for information on locating sources of RFI . **No** GO to F5 .
F5 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB electrical connectors. • Check the connectors for: ♦ corrosion ♦ pushed-out pins ♦ bent pins ♦ spread terminals • Connect all the SJB connectors and make sure that they are seated correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** **NOTE:** The sensors may not be present. DISMOUNT the tire. REFER to Wheel and Tire in this section. VERIFY the sensors are present and mounted to the wheels. If missing, INSTALL new sensors. If the sensors are present, INSTALL a new SJB . REFER to Section 419-10 . CLEAR the DTCs. REPEAT the self-test. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test G: DTC B106A

Normal Operation

This DTC may be encountered if a sensor designed for a different application is installed. Low pressure applications utilize a black- or blue-colored sensor, while heavy duty applications utilize a green-colored sensor. The Smart Junction Box (SJB) will only allow one type of sensor to be trained using the Tire Pressure Monitoring System (TPMS) sensor training procedure. Make sure the correct sensors are used to avoid compatibility issues.

- DTC B106A (Pressure Sensor Range Bit Incorrect State) - When an attempt has been made to train a non-compatible sensor, the SJB will set DTC B106A.

This pinpoint test is intended to diagnose the following:

- Incorrect tire pressure sensor(s) installed

PINPOINT TEST G: DTC B106A

Test Step	Result / Action to Take
G1 DETERMINE IF THE VEHICLE IS EQUIPPED WITH AN INCORRECT SENSOR	
• Train all 4 tire pressure sensors. Refer to Tire Pressure Monitoring System (TPMS) Sensor Training in this section. • **Did all of the tire pressure sensors transmit correctly and did the horn sound when each tire pressure sensor transmitted to the SJB ?**	**Yes** CLEAR the DTCs. REPEAT the self test. VERIFY system operation. **No** **Before installing a new sensor(s)** : If a sensor(s) does not respond to the Tire Pressure Monitor Activation Tool, ATTEMPT to activate the same sensor(s) with the Tire Pressure Monitor Activation Tool. If the sensor(s) still does not respond, MOVE the vehicle to rotate the wheels at least one-fourth of a turn and ATTEMPT to activate the same sensor(s) again. If the sensor(s) fails to train a second time, INSTALL a new tire pressure sensor(s). REFER to Tire Pressure Monitoring System (TPMS) Sensor in this section.

Pinpoint Test H: DTC B106B

Normal Operation

If there is a fault in the Tire Pressure Monitoring System (TPMS), such as a damaged or missing sensor(s), damaged module or a communication issue within the vehicle, DTCs are set in the Smart Junction Box (SJB), the TPMS warning indicator will flash for 70 seconds and then remain ON solid when the ignition switch is turned to the ON position and the message center (if equipped) will display TIRE PRESSURE SENSOR FAULT.

The tire pressure sensor is battery powered.

This DTC may be set when attempting to train a tire pressure sensor(s) with a low battery.

This pinpoint test is intended to diagnose the following:

- Tire pressure sensor battery
- Tire pressure sensor(s)

PINPOINT TEST H: DTC B106B

Test Step	Result / Action to Take
H1 DETERMINE WHICH SENSOR HAS A LOW BATTERY	
• Train all 4 tire pressure sensors. Refer to Tire Pressure Monitoring System (TPMS) Sensor	**Yes** CLEAR the DTCs. REPEAT the self test. VERIFY system operation. **No**

Training in this section. • **Did all of the tire pressure sensors transmit correctly and did the horn sound when each tire pressure sensor transmitted to the SJB ?**	**Before installing a new sensor(s)** : If a sensor(s) does not respond to the Tire Pressure Monitor Activation Tool, ATTEMPT to activate the same sensor(s) with the Tire Pressure Monitor Activation Tool. If the sensor(s) still does not respond, MOVE the vehicle to rotate the wheels at least one-fourth of a turn and ATTEMPT to activate the same sensor(s) again. If the sensor(s) fails to train a second time, INSTALL a new tire pressure sensor(s). REFER to Tire Pressure Monitoring System (TPMS) Sensor in this section.

Tire Pressure Monitoring System (TPMS) Sensor Training

Special Tool(s)

 ST2941-A	Activation Tool, Tire Pressure Monitor 204-363
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

NOTE: If the vehicle has been stationary for more than 30 minutes, the sensors will go into a "sleep mode" to conserve battery power. It will be necessary to wake them up so they will transmit the latest tire pressure information to the Smart Junction Box (SJB). For additional information, refer to Tire Pressure Monitoring System (TPMS) Sensor Activation in this section.

NOTE: The tire pressure sensor training procedure must be done on a single vehicle, in an area without radio frequency noise and at least 1 m (3 ft) away from other vehicles equipped with a Tire Pressure Monitoring System (TPMS).

Radio frequency noise is generated by electrical motors and appliance operation, cellular telephones, remote transmitters, power inverters and portable entertainment equipment.

NOTE: If a sensor does not respond to the Tire Pressure Monitor Activation Tool, attempt to activate the same sensor with the Tire Pressure Monitor Activation Tool. If the sensor still does not respond, move the vehicle to rotate the wheels at least one-fourth of a turn and attempt to activate the same sensor again.

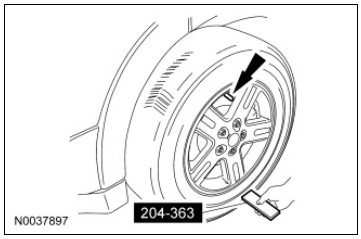
NOTE: The SJB has a 2-minute time limit between sensor responses. If the SJB does not recognize any 1 of the 4 tire pressure sensors during this time limit, the horn will sound twice and the message center (if equipped) will display TIRE NOT TRAINED REPEAT and the entire procedure must be repeated.

NOTE: For vehicles with different front and rear tire pressures (such as the E-Series and certain F-Series), the tire pressure sensors must be trained following a tire rotation. Failure to train the sensors will cause the TPMS indicator to illuminate. For vehicles with the same tire pressure for front and rear tires, tire rotation will not affect the system.

1. **NOTE:** An animated version of this procedure is available on-line.

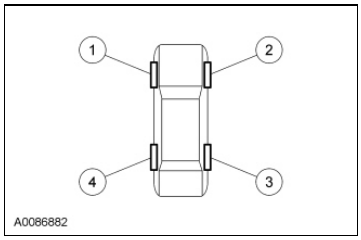
   Turn the ignition switch to the OFF position, then press and release the brake pedal.

2. Cycle the ignition switch from the OFF position to the RUN position 3 times, ending in the RUN position.



3. Press and release the brake pedal.

4. Turn the ignition switch to the OFF position.



5. Turn the ignition switch from the OFF position to the RUN position 3 times, ending in the RUN position.
    - The horn will sound once and the TPMS indicator will flash if the training mode has been entered successfully. If equipped, the message center will display TRAIN LF TIRE.

6. **NOTE:** It may take up to 6 seconds to activate a tire pressure sensor. During this time, the Tire Pressure Monitor Activation Tool must remain in place 180 degrees from the valve stem.

   Place the Tire Pressure Monitor Activation Tool on the LF tire sidewall opposite (180 degrees) from the valve stem. Press and release the test button on the Tire Pressure Monitor Activation Tool. The horn will sound briefly to indicate that the tire pressure sensor has been recognized by the SJB . An animated version of this procedure is available on-line.

7. Within 2 minutes of the horn sounding, place the Tire Pressure Monitor Activation Tool on the RF tire sidewall opposite (180 degrees) from the valve stem and press and release the test button to train the RF tire pressure sensor.

8. **NOTE:** Do not wait more than 2 minutes between training each sensor or the SJB will time out and the entire procedure must be repeated.

   Repeat Step 7 for the RR and LR tires.
   The procedure is completed after the last tire has been trained. When the training procedure is complete, the message center (if equipped) will display TIRE TRAINING COMPLETE.
   For vehicles not equipped with a message center, successful completion of the training procedure will be verified by turning the ignition switch to the OFF position without the horn sounding. If the horn sounds twice when the switch is turned to the OFF position, the training procedure was not successful.

9. Using the scan tool, locate the updated TPMS sensor identifiers trained to the SJB and document them on the applicable warranty claim.

10. **NOTE:** This step is required to clear DTC C2780, cause the SJB to exit the manufacturing mode and to make sure there are no other concerns with a newly programmed SJB .

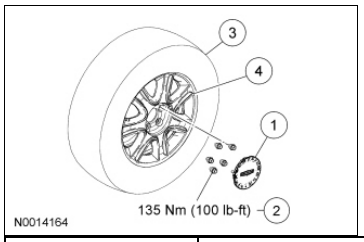
    If the sensors are being trained due to the installation of a new SJB , clear any DTCs and carry out the SJB On-Demand Self Test.

Tire Pressure Monitoring System (TPMS) Sensor Activation

Special Tool(s)

 ST2941-A	Activation Tool, Tire Pressure Monitor 204-363

NOTE: The tire pressure sensors will go into a "sleep mode" after 30 minutes of inactivity to conserve battery power. The sensors do not transmit information while in sleep mode. It will be necessary to wake them up so they will transmit the latest tire pressure information.



1. Turn the ignition switch to the ON position.
2. Position the Tire Pressure Monitor Activation Tool against the LF tire sidewall, 180 degrees from the tire valve stem.
3. **NOTE:** The Tire Pressure Monitor Activation Tool will provide feedback in the form of a flashing green light and a beep sound for each successful response from a tire pressure sensor.

   Press the test button on the Tire Pressure Monitor Activation Tool to activate the sensor, activate the sensor at least 2 times.
4. Repeat Steps 2 and 3 for the remaining tires.
5. If the Tire Pressure Monitoring System (TPMS) indicator remains illuminated after adjusting and activating each sensor, refer to the Symptom Chart in Diagnosis and Testing in this section.

Wheel and Tire

Material

Item	Specification
High Temperature Nickel Anti-Seize Lubricant XL-2	-
Motorcraft® Wheel and Tire Cleaner ZC-37-A	-

Item	Part Number	Description
1	1A096	Center cap
2	1012	Wheel nut (5 required)
3	1508	Tire
4	1007	Wheel

Removal

1. If equipped, remove the center cap.
2. ***NOTICE:*** **Do not use heat to loosen a seized wheel nut or damage to the wheel and wheel bearing can occur.**

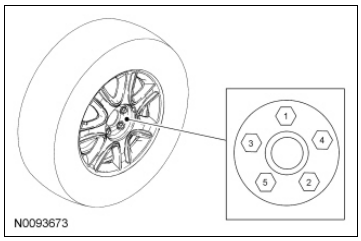
   With the weight of the vehicle on the wheels, loosen the wheel nuts.
3. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
4. Remove the wheel nuts and the wheel and tire assembly.

Installation

1. ⚠ **WARNING: When a wheel is installed, always remove any corrosion, dirt or foreign material present on the mounting surface of the wheel and the mounting surface of the wheel hub, brake drum or brake disc. Make sure that any fasteners that attach the rotor to the hub are secured so they do not interfere with the mounting surfaces of the wheel. Failure to follow these instructions when installing wheels may result in the wheel nuts loosening and the wheel coming off while the vehicle is in motion, which could result in loss of control, leading to serious injury or death to vehicle occupant(s).**

⚠ **WARNING: Retighten wheel nuts within 160 km (100 mi) after a wheel is reinstalled. Wheels can loosen after initial tightening. Failure to follow this instruction may result in serious injury to vehicle occupant(s).**

Clean the wheel-to-wheel hub mounting surface(s).



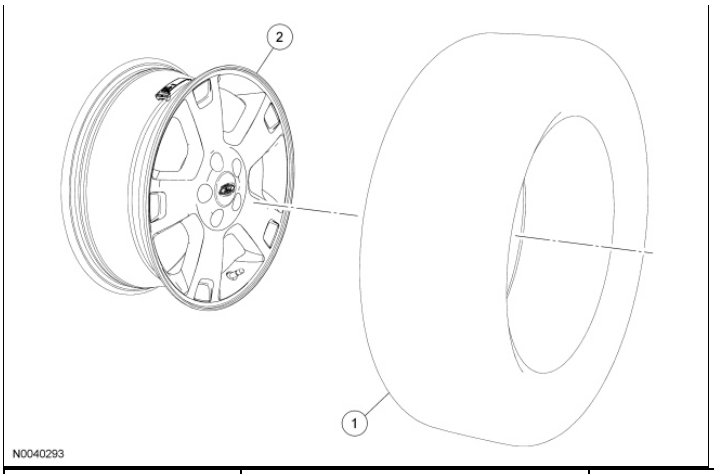
2. ***NOTICE:*** **Make sure to apply a thin coat of anti-seize lubricant only to the area of the wheel that contacts hub pilot surface. Do not allow the lubricant to make contact with the wheel studs, brake pads or brake disc. Brake component damage or incorrect wheel nut clamp load may occur.**

   Apply a thin coat of anti-seize lubricant to the wheel hub pilot surface.

3. Position the tire and wheel assembly and install the wheel nuts hand-tight, then lower the vehicle.

4. ***NOTICE:*** **Failure to tighten the wheel nuts in a star pattern can result in high brake disc runout, which will speed up the development of brake roughness, shudder and vibration.**

   Tighten the wheel nuts, using the pattern indicated, to 135 Nm (100 lb-ft).



5. If removed, install the center cap.

Wheel and Tire

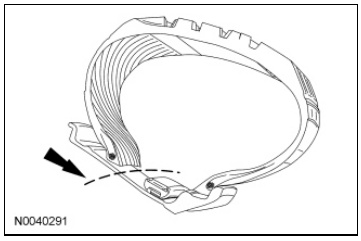
Special Tool(s)

 ST2869-A	Digital Tire Pressure Gauge 204-354

Item	Part Number	Description
1	1508	Tire
2	1007	Wheel

Disassembly

NOTICE: **Failure to follow the instructions below may result in damage to the Tire Pressure Monitoring System (TPMS) sensor.**



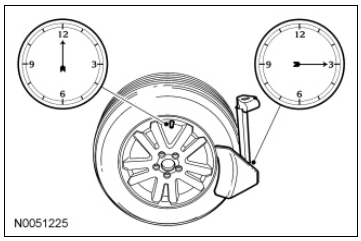
NOTE: Use only the Digital Tire Pressure Gauge any time tire pressures are measured to be sure that accurate values are obtained.

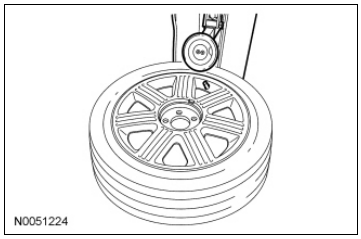
NOTE: A wheel and tire equipped with a Tire Pressure Monitoring System (TPMS) sensor will have the following verbiage stamped or cast on the wheel: SENSOR MAY BE INSIDE. An animated version of this procedure is available on-line.

NOTE: The TPMS sensor is mounted to the wheel 180 degrees opposite of the valve stem and is held in place by a stainless steel strap. The sensor is not mounted to the valve stem.

1. Remove the wheel and tire. For additional information, refer to Wheel and Tire in this section.

NOTICE: **Do not allow the tire beads to move beyond the wheel mid-plane (middle of the wheel) when separating the beads from the wheels, damage to the Tire Pressure Monitoring System (TPMS) sensor may occur.**



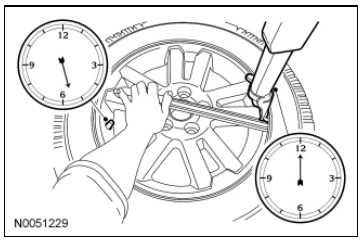


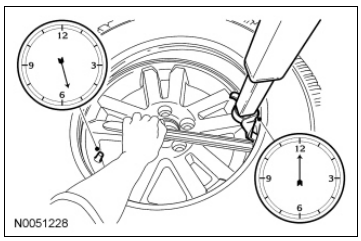
2. *NOTICE:* **Tire and valve stem position is critical to prevent damage to the Tire Pressure Monitoring System (TPMS) sensor when using a paddle-type bead separator. An animated version of this procedure is available on-line.**

   NOTE: Some machines may have a nylon roller bead separator at the 12 o'clock position instead of the paddle-type bead separator at the 3 o'clock position. An animated version of this procedure is available on-line.

   Position the wheel and tire assembly on a suitable tire machine and separate both beads of the tire from the wheel.

   - For a paddle-type tire machine, position the valve stem at the 12 o'clock or 6 o'clock position and the paddle at the 3 o'clock position.
   - For a roller-type tire machine, align the valve stem with the roller at any position.





3. **NOTE:** A video version of this procedure is available on-line.

   NOTE: Index-mark the valve stem and wheel weight positions on the tire.

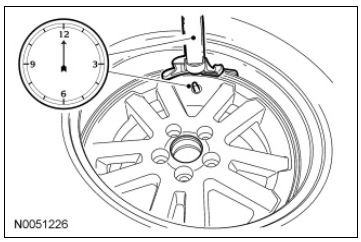
   Place the wheel and tire assembly on the turntable of the tire machine with the valve stem between the 5 o'clock and 6 o'clock positions and the machine arm at the 12 o'clock position and dismount the outer bead from the wheel.

4. Reset the wheel and tire assembly on the turntable of the tire machine with the valve stem between the 5 o'clock and 6 o'clock positions and the machine arm at the 12 o'clock position and dismount the inner bead from the wheel.

5. Inspect the TPMS sensor, cradle and strap for damage. Install new parts as necessary.
    - For information on removal and installation of the TPMS sensor, refer to Tire Pressure Monitoring System (TPMS) Sensor in this section.
    - When installing a new wheel, reuse the TPMS sensor from the previous wheel if possible. The TPMS will not have to be trained if the sensor is reused. The new wheel will not come with a sensor strap. A sensor strap kit will need to be ordered with the new wheel.

Assembly

NOTICE: **Damage to the Tire Pressure Monitoring System (TPMS) sensor may result if the tire mounting is not carried out as instructed.**



1. ***NOTICE:*** **Lubricate the tire beads using a suitable fast drying, corrosion-inhibiting tire bead lubricant. Use of anything other than tire bead lubricant may result in damage to the Tire Pressure Monitoring System (TPMS) sensor.**

   NOTE: Do not mount the tire at this time.

   NOTE: A video version of this procedure is available on-line.

   Position the wheel on the turntable of the tire machine, then lubricate and position the bottom bead of the tire on the wheel.

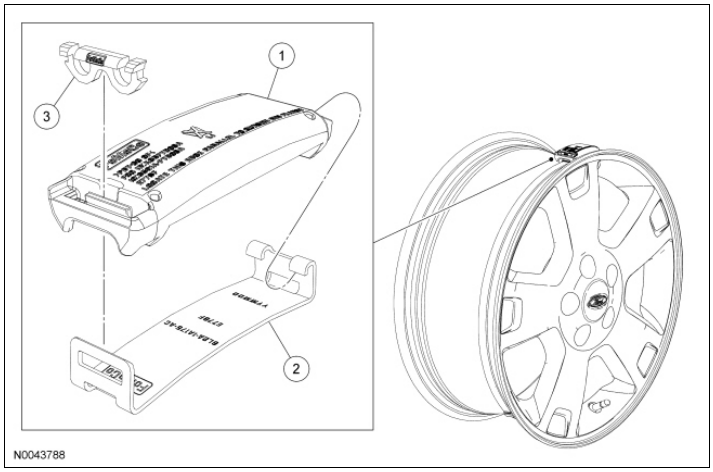
2. Position the wheel to align the valve stem with the machine arm at the 12 o'clock position and mount the bottom bead of the tire. A video version of this procedure is available on-line.

3. Reposition the wheel to align the valve stem with the machine arm at the 12 o'clock position and mount the top bead of the tire.

4. **NOTE:** Use only the Digital Tire Pressure Gauge any time tire pressures are measured to make sure that accurate values are obtained.

   Using the Digital Tire Pressure Gauge, inflate the tire to the pressure specified on the Vehicle Certification (VC) label located on the driver door or door pillar.

   - Proceed to Step 5 if the tire beads do not seat at the specified inflation pressure.



5. ⚠ **WARNING: If there is a need to exceed the maximum pressure indicated on the sidewall of the tire, in order to seat the beads, follow ALL the steps listed below. Failure to follow these steps may result in serious personal injury.**

   The following steps should only be carried out if the tire beads cannot be seated by inflating the tire up to the maximum inflation pressure listed on the tire sidewall.

   1. Relubricate the tire bead and wheel bead seat area.
   2. Install a remote valve and pressure gauge.
   3. Wear eye and ear protection and stand at a minimum of 3.65 m (12 ft) away from the wheel and tire assembly.
   4. Inflate tire using the remote valve and pressure gauge until the beads have seated or until the pressure gauge is 138 kPa (20 psi) more than maximum inflation pressure on tire sidewall. If beads have not seated, deflate the tire and proceed to the next step.
   5. Place the wheel and tire assembly in an OSHA-approved tire safety cage.
   6. Inflate the tire using the remote valve and pressure gauge until the beads have seated or until the pressure gauge is 276 kPa (40 psi) more than maximum inflation pressure on the tire sidewall. **Do not exceed 276 kPa (40 psi) above the maximum pressure on tire sidewall. Install a new tire if the beads do not seat at this pressure.**

6. Install the wheel and tire. For additional information, refer to Wheel and Tire in this section.

Tire Pressure Monitoring System (TPMS) Sensor

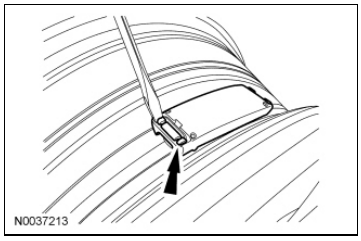
Item	Part Number	Description
1	1A150/1A189	Tire pressure sensor/sensor kit
2	1A175	Sensor cradle
3	14C202	Locking clip (also part of 1A189)

Disassembly

⚠ **WARNING: The tire pressure monitoring system (TPMS) sensor battery may release hazardous chemicals if exposed to extreme mechanical damage. If these chemicals contact the skin or eyes, flush immediately with water for a minimum of 15 minutes and get prompt medical attention. If any part of the battery is swallowed, contact a physician immediately. When disposing of TPMS sensors, follow the correct procedures for hazardous material disposal. Failure to follow these instructions may result in serious personal injury.**

NOTE: Tire pressure sensors are equipped with Lithium-ion batteries and must be disposed of accordingly.

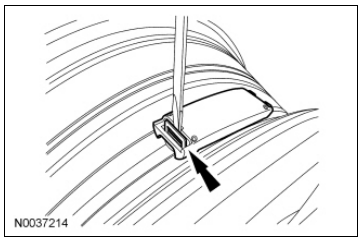
NOTE: Tire pressure sensors are manufactured in multiple colors based on their application. When installing a new sensor, make sure the color of the sensor being installed matches the color of the sensor that was removed. The different colored sensors are **not** interchangeable.



NOTE: The sensor can be removed and installed without removing the strap or the cradle.

1. ***NOTICE:*** **The sensor, cradle and strap may be damaged by incorrect tire mounting or dismounting. Dismount the tire only as instructed.**

   Remove the tire from the wheel. For additional information, refer to Wheel and Tire in this section.

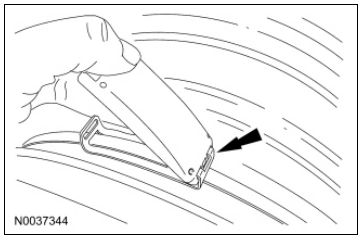


2. ***NOTICE:*** **Do not use a large screwdriver. Apply minimum force during removal or damage to the sensor locking clip may occur.**

   Using a pocket screwdriver or similar tool, remove the sensor locking clip. An animated version of this procedure is available on-line.

3. ***NOTICE:*** **Do not use a large screwdriver. Apply minimum force during removal or damage to the sensor may occur.**

   Using a pocket screwdriver or similar tool, detach the sensor from the cradle. An animated version of this procedure is available on-line.



4. Remove the sensor.

Assembly

1. ***NOTICE:*** **Damage to the sensor may occur if excessive force is applied during sensor installation.**

   NOTE: Make sure the sensor is fully seated into the cradle. The sensor will make a "click" noise when correctly seated.

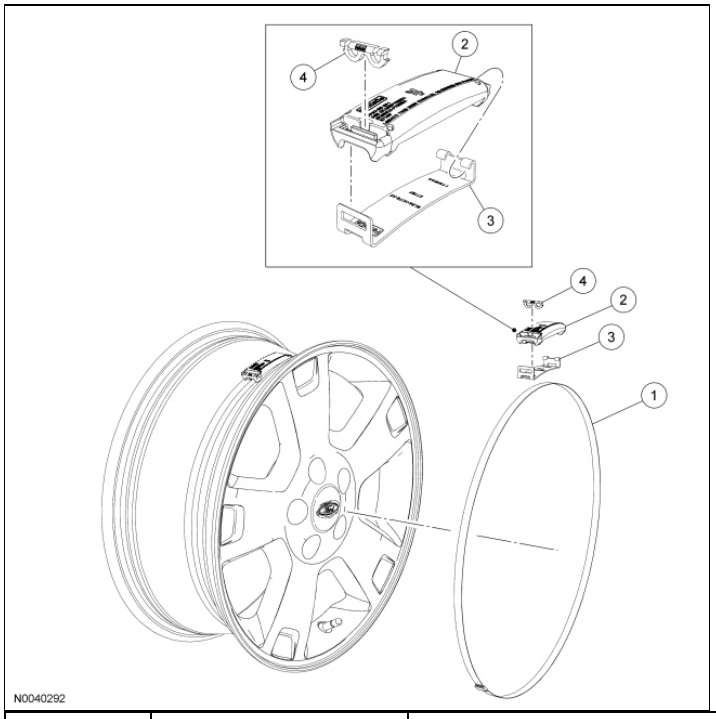
   Position the sensor into the cradle by inserting the hinge end of the sensor into the hook end of the cradle and pushing the opposite end of the sensor down onto the cradle.

2. **NOTE:** The locking clip can only be fully seated when installed in the correct orientation. If the sensor locking clip cannot be fully inserted, then the sensor may not be fully seated on the cradle or the locking clip may be inserted backward.

   Insert a new locking clip into the sensor.

3. *NOTICE:* **The sensor, cradle and strap may be damaged by incorrect tire mounting or dismounting. Mount the tire only as instructed.**

   Install the tire onto the wheel. For additional information, refer to Wheel and Tire in this section.



4. **NOTE:** A new tire pressure sensor is shipped in an off mode (or battery saver mode) and must be turned on before it can be trained. To turn the sensor on, install it on a wheel, mount the tire and inflate the tire to the recommended inflation pressure. Wait at least 2 minutes, then continue with the sensor training procedure.

   Train the tire pressure sensor(s). For additional information, refer to Tire Pressure Monitoring System (TPMS) Sensor Training in this section.

Tire Pressure Monitoring System (TPMS) Strap and Cradle

Material

Item	Specification
Motorcraft® Wheel and Tire Cleaner ZC-37-A	-

Item	Part Number	Description
1	1A177/1A193	Strap/strap kit
2	1A150/1A189	Tire pressure sensor/sensor kit
3	1A175	Sensor cradle (also part of 1A193)
4	14C202	Locking clip (also part of 1A189)

Disassembly

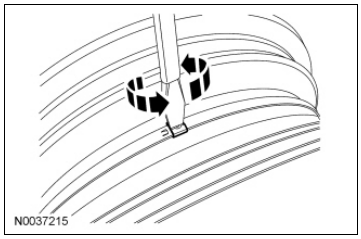
⚠ WARNING: The tire pressure monitoring system (TPMS) sensor battery may release hazardous chemicals if exposed to extreme mechanical damage. If these chemicals contact the skin or eyes, flush immediately with water for a minimum of 15 minutes and get prompt medical attention. If any part of the battery is swallowed, contact a physician immediately. When disposing of TPMS sensors, follow the correct procedures for hazardous material disposal. Failure to follow these instructions may result in serious personal injury.

NOTE: Tire pressure sensors are equipped with Lithium-ion batteries and must be disposed of accordingly.

NOTE: Tire pressure sensors are manufactured in multiple colors based on their application. When installing

a new sensor, make sure the color of the sensor being installed matches the color of the sensor that was removed. The different colored sensors are **not** interchangeable.

NOTE: The sensor is available separately, the cradle and strap are available as a strap kit. There are several different strap kits available based on wheel diameter, but all strap kits share the same base part number.



1. Remove the Tire Pressure Monitoring System (TPMS) sensor. For additional information, refer to Tire Pressure Monitoring System (TPMS) Sensor in this section.

2. ⚠ **WARNING: Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.**

   ⚠ **WARNING: Wear protective gloves when handling components or parts that have pointed or sharp edges. Failure to follow this instruction may result in serious personal injury.**

   Remove a factory-installed strap in the following sequence:

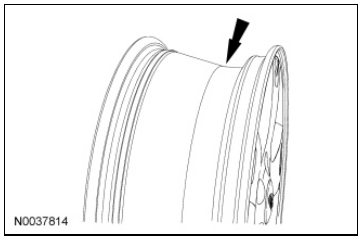
   1. Locate the strap buckle and secure the strap to the wheel using duct tape or a similar item on both sides of the buckle, approximately 25 mm (0.98 in) from the buckle.
   2. Using a large screwdriver and a twisting motion, unbuckle the strap.
   3. Discard the strap.

3. To remove a dealer-installed strap, turn the worm gear screw until the strap is fully released from the worm gear.
   - Discard the strap.

4. **NOTE:** To aid assembly, mark the location of the cradle prior to disassembly.

   Using a screwdriver, or similar tool, remove the cradle by inserting the screwdriver under the cradle and prying up. An animated version of this procedure is available on-line.

Assembly



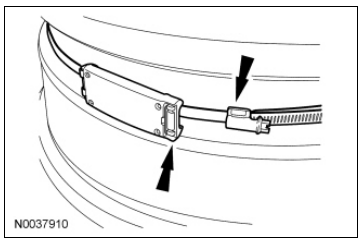
1. **NOTE:** Make sure the sensor is fully seated into the new cradle. The sensor will make a "click" noise when fully seated.

   Position the sensor into the new cradle by inserting the hinge end of the sensor into the hook end of the cradle and pushing the opposite end of the sensor down onto the cradle.

2. ***NOTICE:*** **Metal scrapers may damage the wheel. Use only plastic or non-metallic scrapers to remove the cradle adhesive strip residue.**

   NOTE: The sensor and cradle must be installed in the drop well of the wheel, 180 degrees from the valve stem.

   Using wheel and tire cleaner, clean the area where the sensor and cradle are to be installed.

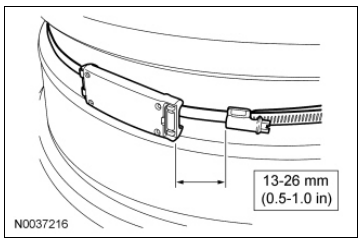


3. **NOTE:** The sensor and cradle must be positioned with the hinge side of the sensor on the RH side when viewed from the curb side (beauty side) of the wheel.

   NOTE: The sensor has raised markings indicating how to position the sensor.

   Remove the adhesive tape liner from the cradle and position the sensor and cradle into the wheel drop well 180 degrees from the valve stem. A video version of this procedure is available on-line.

4. Install the tapered end of the strap through the opening of the cradle on the hinge side of the sensor. This will position the worm gear on the locking clip side of the sensor. An animated version of this procedure is available on-line.



5. ***NOTICE:*** **Steel wheels have a "high spot" along their circumference. Make sure the strap and sensor are mounted at the lowest spot possible to avoid damaging the sensor during wheel and tire disassembly and assembly.**

   NOTE: Keep the strap parallel with the wheel flange while tightening the worm gear.

   Position the worm gear 13-26 mm (0.5-1.0 in) away from the sensor and tighten the worm gear.

   - Tighten to 3 Nm (27 lb-in).

6. ***NOTICE:*** **The sensor, cradle and strap may be damaged by incorrect tire mounting or dismounting. Mount the tire only as instructed.**

Install the tire onto the wheel. For additional information, refer to Wheel and Tire in this section.

7. **NOTE:** A new tire pressure sensor is shipped in an off mode (or battery saver mode) and must be turned on before it can be trained. To turn the sensor on, install it on a wheel, mount the tire and inflate the tire to the recommended inflation pressure. Wait at least 2 minutes, then continue with the sensor training procedure.

   Train the tire pressure sensor(s). For additional information, refer to Tire Pressure Monitoring System (TPMS) Sensor Training in this section.

Material

Item	Specification	Fill Capacity
Motorcraft® High Contrast Hypoid Gear Marking Compound XG-14	-	-
Threadlock and Sealer TA-25	WSK-M2G351-A5	-

Driveline Maximum Runout

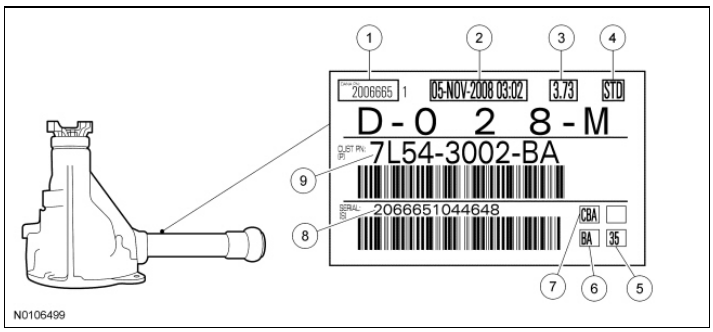
Description	Specification
Circular flange runout	0.203 mm (0.008 in)
Front driveshaft	0.381 mm (0.015 in)
Rear driveshaft (all)	0.508 mm (0.020 in)

Driveline System

The driveline consists of the following:

- Front driveshaft
- CV joints
- Front drive axle
- Front axle halfshafts
- Rear driveshafts
- U-joints and flanges
- Center support bearings
- Rear drive axle
- Rear axle halfshafts

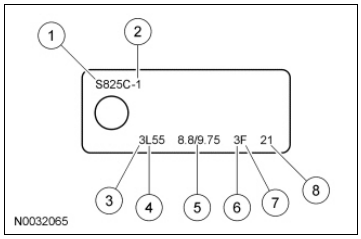
The source of the drivetrain's power is generated by the engine and delivered to the transmission. The driveline transfers the engine torque through the driveshaft to the axle and halfshafts. On Rear Wheel Drive (RWD) vehicles, power is transmitted through the transmission to the driveshaft, rear axle and halfshafts. On Four-Wheel Drive (4WD) vehicles, power is transmitted through the transmission and the transfer case. The transfer case directs the power to the rear driveshaft and then to the rear axle. When engaged, it also transmits power through the front driveshaft to the front axle and halfshafts. The axles are mounted to the vehicle in rubber isolators and the necessary changes in driveshaft length are provided in the CV joints or driveshaft slip joints. The engine torque enters the axle through the drive pinion, which rotates the ring gear. The ring gear is mounted to the differential case, which contains the gears that transmit power to the splined front or rear axle halfshafts or halfshafts and allow the halfshafts to turn at varying speeds as when cornering. These halfshafts rotate the drive wheels.



Axle Identification

The axle ratio may be verified by checking the printed label on the axle housing. If worn or not visible, the Vehicle Identification Number (VIN) can be typed in the service parts ordering system or the Vehicle Certification (VC) label may be used to correctly identify the axle and ratio. The VC label is located in the driver door jamb. The first 2 digits of the axle code indicate the rear axle and the third digit refers to the front axle, if so equipped. For information on the VC label, refer to Section 100-01 .

Vehicle Certification (VC) Label Example



Front Axle Identification Tag

Item	Description
1	Dana part number
2	Build date and time
3	Axle ratio
4	Differential type
5	Model number
6	Build level

 ST1266-A	Dial Indicator Gauge with Holding Fixture 100-D002 (D78P-4201-B) or equivalent
 ST1267-A	Runout Gauge, Drive Pinion Flange 205-319 (T92L-4851-B)

Material

Item	Specification
Motorcraft® High Contrast Hypoid Gear Marking Compound XG-14	-
Threadlock and Sealer TA-25	WSK-M2G351-A5

Principles of Operation

The driveline system enables the power generated by the engine and transferred through the transmission and, if applicable, transfer case, to place the vehicle in motion. Rotational torque received from the transmission or transfer case is delivered to the front and rear drive axles by way of the driveshafts. The U-joints or CV joints at the ends of the shafts allow the shafts to rotate smoothly in an allowable angle plane. The rotational torque is introduced into the axle drive pinion which drives the differential ring gear. The ring gear is bolted to the differential case flange on the differential. The differential divides the torque between the right and left halfshaft while permitting the halfshafts to turn at different speeds when required, such as when cornering.

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical damage.

Visual Inspection Chart

- Differential bearings
- Differential gear sets
- Pinion bearings

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. If the cause is not visually evident, verify the symptom and GO to Symptom Chart - Driveline or GO to Symptom Chart - NVH .

Symptom Chart - Driveline

Symptom Chart - Driveline

Symptom Chart - NVH

Symptom Chart - NVH

NOTE: NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to Section 100-04 . Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to Section 100-04 for the next likely system and continue diagnosis.

ConditionPossible SourcesAction

- Axle howling or whine - front or rear axle
- Axle lubricant low
- CHECK the lubricant level. FILL the axle to specification. REFER to Section 205-02 or Section 205-03 .
- Axle housing damage
- INSPECT the axle housing for damage. REPAIR or INSTALL a new axle as necessary. REFER to Section 205-02 or Section 205-03 .
- Damaged or worn wheel hub bearings

- CHECK for abnormal wheel hub bearing play or roughness. REFER to Section 204-01A , Section 204-01B or Section 204-02 .
- Damaged or worn differential ring and pinion
- INSPECT and INSTALL a new differential ring and pinion as necessary. REFER to Section 205-02 or Section 205-03 .
- Damaged or worn differential side or pinion bearings
- INSPECT and INSTALL new differential side or pinion bearings as necessary. REFER to Section 205-02 or Section 205-03 .
- Driveline clunk - loud clunk when shifting from REVERSE to DRIVE
- Incorrect axle lubricant level
- CHECK the lubricant level. FILL the axle to specification. REFER to Section 205-02 or Section 205-03 .
- Excessive backlash in the axle
- CHECK the ring gear backlash. REPAIR as necessary. REFER to Section 205-02 or Section 205-03 .
- Damaged or worn pinion bearings
- REPAIR or INSTALL new pinion bearings as necessary. REFER to Section 205-02 or Section 205-03 .
- Damaged or worn U-joints
- INSPECT the U-joints for wear or damage. INSTALL new U-joints or driveshaft as necessary. REFER to Section 205-01 .
- Driveline clunk - occurs as the vehicle starts to move forward following a stop
- Worn driveshaft CV joint or U-joints with excessive play
- INSPECT the CV joint and U-joints for a worn condition. INSTALL a new driveshaft or U-joints as necessary. REFER to Section 205-01 .
- Loose axle mount
- CHECK the axle for loose bolts. TIGHTEN to specification. REFER to Section 205-02 or Section 205-03 .
- Driveline clunk - occurs during acceleration or from cruise to coast/deceleration
- Damaged or worn CV joint
- INSPECT the CV joint and boot. INSTALL a new CV joint as necessary. REFER to Section 205-04 or Section 205-05 .
- Clicking, popping or grinding - occurs while the vehicle is turning

- Inadequate or contaminated lubrication in the CV joints
- CHECK the CV boots and joints for wear or damage. INSTALL new components as necessary. REFER to Section 205-04 or Section 205-05 .
- Another component contacting the halfshaft
- CHECK the halfshafts and the area around the halfshafts. REPAIR as necessary.
- High pitched chattering - noise from the axle when the vehicle is turning
- Incorrect or contaminated lubricant
- CHECK the vehicle by driving in tight circles (5 clockwise, 5 counterclockwise). FLUSH and REFILL the axle to specification. REFER to Section 205-02 or Section 205-03 .
- Damaged or worn differential (differential side gears and pinion gears)
- REPAIR or INSTALL new differential side gears or pinion gears as necessary. REFER to Section 205-02 or Section 205-03 .
- Buzz - buzzing noise is the same at cruise or coast/deceleration
- Incorrect driveline angles
- CHECK for correct driveline angles. REPAIR as necessary. REFER to Driveline Angle Measurement in this section.
- Rumble or boom - noise occurs at coast/deceleration, usually driveshaft speed-related and noticeable over a wide range of speeds
- Driveshaft is out-of-balance
- CHECK the driveshaft for damage, missing balance weights or undercoating. REFER to Driveshaft Runout and Balancing in this section.
- U-joints are binding or seized
- ROTATE the driveshaft and CHECK for rough operation or seized U-joints. INSTALL new U-joints or driveshaft as necessary. REFER to Section 205-01 .
- Grunting - normally associated with a shudder experienced during acceleration from a complete stop
- Driveshaft CV joint binding
- CLEAN the CV joint and INSTALL a new driveshaft as necessary. REFER to Section 205-01 .
- Loose axle mount bolts or suspension fasteners
- INSPECT the rear suspension and axle. TIGHTEN the fasteners to specification. REFER to Section 205-02 or Section 205-03 .
- Howl - can occur at various speeds and driving conditions. Affected by acceleration and deceleration

- Incorrect ring and pinion contact, incorrect bearing preload or gear damage
- INSPECT and REPAIR as necessary. REFER to Section 205-02 or Section 205-03 .
- Chuckle - heard at coast/deceleration. Also described as a knock
- Incorrect ring and pinion contact or damaged teeth on the coast side of the ring and pinion
- INSPECT and REPAIR as necessary. REFER to Section 205-02 or Section 205-03 .
- Knock - noise occurs at various speeds. Not affected by acceleration or deceleration
- Gear tooth damage to the drive side of the ring and pinion
- INSTALL a new ring and pinion. REFER to Section 205-02 or Section 205-03 .
- Scraping noise - a continuous low pitched noise starting at low speeds
- Worn or damaged pinion bearings
- INSPECT and REPAIR or INSTALL new pinion bearings. REFER to Section 205-02 or Section 205-03 .
- Driveline shudder - occurs during acceleration from a slow speed or stop
- Drive axle assembly mispositioned
- CHECK the axle mounts and the rear suspension for damage or wear. REPAIR as necessary. REFER to Section 205-02 or Section 205-03 .
- Loose axle bolts
- CHECK the axle for loose bolts. TIGHTEN the bolts to specification. REFER to Section 205-02 or Section 205-03 .
- Driveline angles out of specification
- CHECK for correct driveline angles. REFER to Driveline Angle Measurement in this section.
- U-joints binding or seized
- ROTATE the driveshaft and CHECK for rough operation or seized U-joints. INSTALL new U-joints or driveshaft as necessary. REFER to Section 205-01 .
- Binding or damaged driveshaft CV joint
- INSPECT the driveshaft CV joint and coupling shaft for wear or damage. INSTALL a new driveshaft as necessary. REPAIR as necessary. REFER to Section 205-01 .
- Transfer case
- REFER to Section 308-07A .
- Driveline vibration - occurs at cruising speeds

- Worn U-joints
- CHECK for wear or incorrect seating. INSTALL new U-joints or driveshaft as necessary. REFER to Section 205-01 .
- Worn or damaged driveshaft center bearing support
- CHECK the insulator for damage or wear. ROTATE the driveshaft and CHECK for rough operation. INSTALL a new driveshaft as necessary. REFER to Section 205-01 .
- Loose axle pinion flange bolts
- INSPECT the axle pinion flange. TIGHTEN the pinion flange bolts to specification. REFER to Section 205-01 .
- Excessive axle pinion flange runout
- CARRY OUT a Pinion Flange Runout Check. REPAIR as necessary. REFER to Pinion Flange Runout Check in this section.
- Driveshaft is out-of-balance
- CHECK the driveshaft for damage, missing balance weights or undercoating. CHECK the driveshaft balance. CARRY OUT a driveline vibration test. REFER to Driveshaft Runout and Balancing in this section.
- Binding or damaged driveshaft CV joint
- INSPECT the driveshaft CV joint for wear or damage. INSTALL a new driveshaft as necessary. REFER to Section 205-01 .
- Excessive driveshaft runout
- CARRY OUT a runout check. REFER to Driveshaft Runout and Balancing in this section.
- Driveline angles out of specification
- CHECK for correct driveline angles. REPAIR as necessary. REFER to Driveline Angle Measurement in this section.
- Incorrectly seated CV joint in the wheel hub
- CHECK the outer CV joint for correct seating into the hub. REPAIR as necessary. REFER to Section 205-04 for the front CV joints or Section 205-05 for the rear CV joints.

Analysis of Leakage

Clean up the leaking area enough to identify the exact source.

A plugged axle housing vent can cause excessive pinion seal lip wear due to internal pressure buildup.

Verify the lubricant level is at specification.

Axle Vent

A plugged vent will cause excessive seal lip wear due to internal pressure buildup. If a leak occurs, check the vent. If the vent cannot be cleared, install a new vent.

Drive Pinion Seal

Leaks at the drive pinion seal originate from the following causes:

- Damaged seal
- Worn seal journal surface

Any damage to the seal bore (dings, dents, gouges or other imperfections) distorts the seal casing and allows leakage past the outer edge of the drive pinion seal.

The drive pinion seal can be torn, cut or gouged if it is not installed correctly. The spring that holds the drive pinion seal against the pinion flange may be knocked out and allow fluid to pass the lip.

Metal chips trapped at the sealing lip can cause oil leaks. These can cause a wear groove on the drive pinion flange and result in pinion seal wear.

When a seal leak occurs, install a new drive pinion seal and check the vent to make sure it is clean and free of foreign material.

A new drive pinion flange must be installed if any of these conditions exist.

Drive Pinion Nut

NOTICE: **Install the drive pinion nut to the correct torque specifications or damage to the differential components may occur.**

On some high-mileage vehicles, oil may leak through the threads of the drive pinion nut. This condition can be corrected by installing a new nut and applying threadlock and sealer on the threads and nut face.

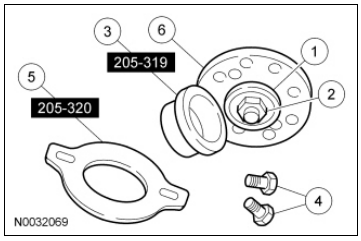
Differential Seals

NOTICE: **When installing shafts, do not allow splines to contact seals during installation or damage to the seals may occur.**

Halfshaft pilot bearing housing seals are susceptible to the same types of damage as drive pinion seals if incorrectly installed. The seal bore must be clean and the lip handled carefully to avoid cutting or tearing it. The seal journal surface must be free of nicks, gouges and rough surface texture.

For information on differential seals, refer to Section 205-02 .

Component Tests

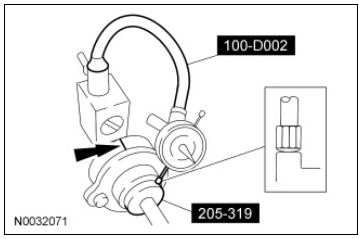


Pinion Flange Runout Check - Circular

NOTICE: **Pinion bearing preload must be reset if the pinion nut has been loosened or removed for pinion flange reindexing or replacement or damage to the component may occur.**

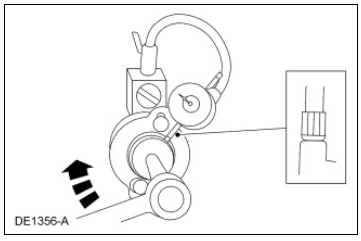
1. Remove the driveshaft. Refer to Section 205-01 .

2. Check the pinion flange for damage.



3. Position the Drive Pinion Flange Runout Gauge and Driveshaft Clamp Plate on the pinion flange.

Item	Part Number	Description
1	-	Pilot (part of 205-319) (T92L-4851-B)
2	354845	Pinion nut
3	205-319	Drive Pinion Flange Runout Gauge (T92L-4851-B)
4	-	Bolts (part of 205-320) (2 required) (T92L-4851-C)
5	205-320	Driveshaft Clamp Plate (T92L-4851-C)
6	4851	Pinion flange



4. Align the holes on the clamp plate with the holes in the pinion flange and install the bolts. Snug the bolts evenly.

5. Position the Dial Indicator Gauge with Holding Fixture as shown. Turn the Drive Pinion Flange Runout Gauge, and locate and mark the high spot on the pinion flange with yellow paint.

If the flange runout exceeds 0.203 mm (0.008 in), remove the pinion flange, reindex the flange one-half turn on the pinion, and reinstall it. Refer to Section 205-02 or Section 205-03 for the flange removal and installation procedures.

6. Check the runout again. If necessary, rotate the flange until an acceptable runout is obtained. If the flange runout is still more than 0.203 mm (0.008 in), install a new pinion flange.

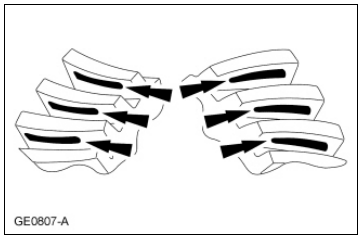
7. If excessive runout is still evident after replacement of the pinion flange, install a new ring and pinion. Repeat the above checks until the runout is within specifications.

8. Install the driveshaft. Refer to Section 205-01 .

Tooth Contact Pattern Check - Gearset

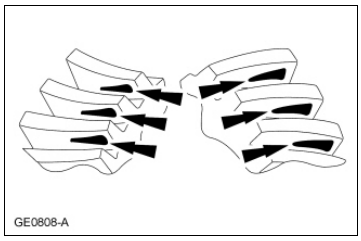
1. To check the gear tooth contact, paint the gear teeth with the special marking compound. A mixture that is too wet will run and smear; a mixture that is too dry cannot be pressed out from between the teeth.

2. Use a box wrench on the ring gear bolts as a lever to rotate the ring gear several complete revolutions in both directions or until a clear tooth contact pattern is obtained.



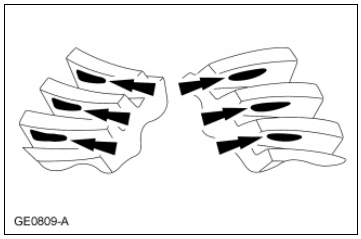
3. Certain types of gear tooth contact patterns on the ring gear indicate incorrect adjustment. Incorrect adjustment can be corrected by readjusting the ring gear or the pinion.

Contact Pattern Location

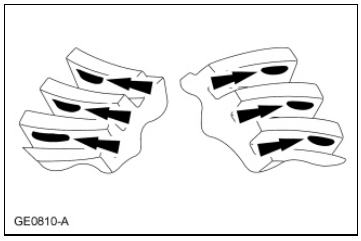


In general, desirable ring gear tooth patterns must have the following characteristics:

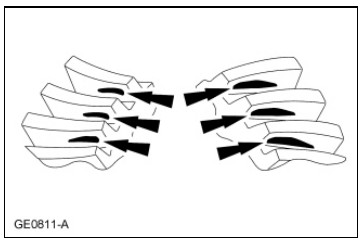
- Drive pattern on the drive side ring gear well centered on the tooth
- Coast pattern on the coast side ring gear well centered on the tooth
- Clearance between the pattern and the top of the tooth
- No hard lines where the pressure is high



Acceptable ring gear tooth patterns for all axles.

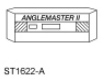


Correct backlash with a thinner pinion position shim required.



Correct backlash with a thicker pinion position shim required.

Correct pinion position shim that requires a decrease in backlash.



Correct pinion position shim that requires an increase in backlash.

Driveline Angle Measurement

Special Tool(s)

 ST1622-A	Anglemaster II Driveline Inclinometer/Protractor 164-R2402 or equivalent

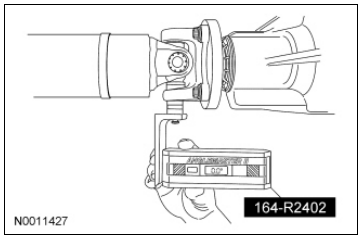
NOTE: This procedure does not apply to CV joints, flex couplers or double cardan joints that are used in some driveshafts. This check is for single-cross and roller-style joints found in the driveshafts.

NOTE: Prior to checking driveline angularity, inspect the U-joints for correct operation.

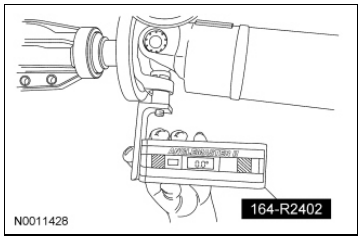
NOTE: An incorrect driveline angle can cause a vibration or shudder. For additional information, refer to Section 100-04 .

NOTE: Driveline angularity is the angular relationship between the engine crankshaft, the driveshaft and the rear axle pinion. Factors determining driveline angularity include ride height, rear spring and engine mounts.

All vehicles



1. Carry out the following preliminary setup steps:
   - Inspect the U-joints for correct operation.
   - Park the vehicle on a level surface such as a drive-on hoist, or back onto a front end alignment rack.
   - Verify the curb position ride height is within specifications with the vehicle unloaded and all of the tires are inflated to their normal operating pressures.
   - Calibrate the Anglemaster II Driveline Inclinometer/Protractor by placing it on a clean, flat level section of the frame rail and press the ALT-ZERO button.



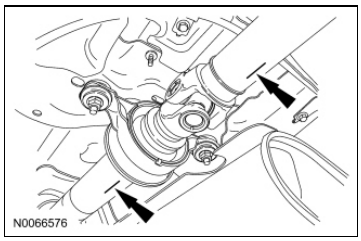
Vehicles with flat-flanged, split-pin or slip-flanged U-joints

2. **NOTE:** If equipped, remove the snap ring to allow access to the base of the U-joint cup. Make sure the Anglemaster II Driveline Inclinometer/Protractor is seated against the U-joint cup.

   NOTE: Rotate the driveshaft until the flange U-joint cup is parallel with the floor. This will simplify taking measurements.

   To check the U-joint operating angle, install the Anglemaster II Driveline Inclinometer/Protractor. Check and record the flange angle as angle A.

3. Using the Anglemaster II Driveline Inclinometer/Protractor, measure the slope of the connecting component. Record the measurement of the component angle as angle B.



Multiple piece driveshafts

4. **NOTE:** Repeat this step for each center support bearing on the driveshaft.

   NOTE: It is not necessary to remove the U-joint snap ring, if equipped, for these measurements.

   Using the Anglemaster II Driveline Inclinometer/Protractor, measure the slope of the components in front and behind the center support bearing U-joint in the area indicated. Record the front component as angle A and the rear component as angle B.

All vehicles

5. **NOTE:** When 2 connected components slope in the same direction, subtract the smallest number from the larger number to find the U-joint operating angle. When 2 connected components slope in the opposite direction, add the measurements to find the U-joint operating angle.

   Calculate the difference in the slope of the components to determine the U-joint operating angle.

   - The U-joint operating angle is the angle formed by 2 yokes connected by a cross and bearing kit. Ideally, the operating angles on each connection of the driveshaft must:
     - be equal or within one degree of each other.
     - have a 3 degree maximum operating angle.
     - have at least one-half of one degree continuous operating angle.

6. If the angle is not within specifications, repair or adjust to obtain the correct angle. Inspect the engine mounts, transmission mounts, center support bearing mounting, rear suspension, rear axle, rear axle mounting or the frame for wear or damage.

Driveshaft Runout and Balancing

Special Tool(s)

 ST1214-A	Dial Indicator Gauge with Holding Fixture 100-002 (TOOL-4201-C) or equivalent
 ST3025-A	Mastertech® Series MTS 4000 Driveline Balance and NVH Analyzer (Vetronix) 257-00018 or equivalent

Driveshaft Inspection

NOTE: Driveline vibration exhibits a higher frequency and lower amplitude than high-speed shake. Driveline vibration is directly related to the speed of the vehicle and is noticed at various speeds. Driveline vibration can be perceived as a tremor in the floorpan or heard as a rumble, hum or boom.

NOTE: Refer to Specifications in this section for all runout specifications.

1. **NOTE:** Do not make any adjustments before carrying out a road test. Do not change the tire pressure or the vehicle load.

   Carry out a visual inspection of the vehicle. Operate the vehicle and verify the condition by reproducing it during the road test.

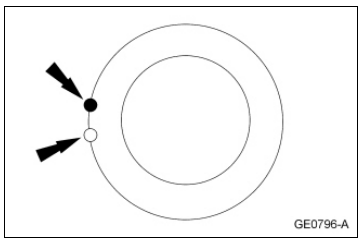
   - The concern should be directly related to vehicle road speed, not affected by acceleration or deceleration or could not be reduced by coasting in NEUTRAL.

2. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
   - The driveshaft should be kept at an angle equal to or close to the curb-weighted position. Use a twin-post hoist or a frame hoist with jackstands.

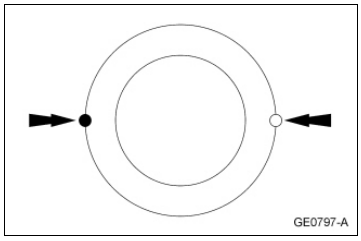
3. Inspect the driveshaft for damage, undercoating or incorrectly seated U-joints. Rotate the driveshaft slowly by hand and feel for binding or end play in the U-joint trunnions. Remove the driveshaft. For additional information, refer to Section 205-01 . Inspect the slip yoke splines for any galling, dirt, rust or incorrect lubrication. Clean the driveshaft or install new U-joints as necessary. Install a new driveshaft if damaged. After any corrections or new components are installed, recheck for the vibration at the road test speed.
   - If the vibration is gone, test drive the vehicle.
   - If the vibration persists or the driveshaft passes visual inspection, measure the driveshaft runout.

Driveshaft Runout

1. Install the Dial Indicator Gauge with Holding Fixture. Rotate the driveshaft by turning the axle and measure the runout at the front, the center and the rear of the driveshaft.



- If the runout exceeds 1 mm (0.040 in) at the front or center, install a new driveshaft.
- If the front and center is within 1 mm (0.040 in), but the rear runout is not, index-mark the rear runout high point and proceed to Step 2.
- If the runout is within 1 mm (0.040 in) at all points, recheck for vibration at road test speed. If the vibration persists, balance the driveshaft. For additional information, refer to Driveshaft Balancing in this procedure.



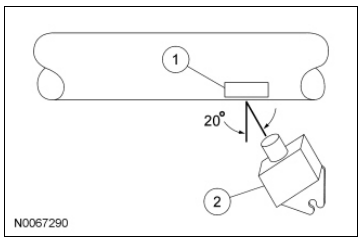
2. **NOTE:** Circular pinion flanges can be turned in 90 degree or one-fourth increments. Half-round pinion flanges are limited to 2 positions.

   Index-mark the driveshaft to the pinion flange. Disconnect the driveshaft and rotate it 180 degrees. Reconnect the driveshaft. Recheck the runout at the rear of the driveshaft.

   - If the runout is still over specification, mark the high point and proceed to Step 3.
   - If the runout is within specification, check for the vibration at the road test speed. If the vibration is still present, balance the driveshaft. For additional information, refer to Driveshaft Balancing in this procedure.

3. Excessive driveshaft runout can originate in the driveshaft itself or from the pinion flange. To find the source, compare the 2 high points previously determined.
   - If the index marks are close together, within 25 mm (1 in), the driveshaft is eccentric. Install a new driveshaft.
   - If the marks are on opposite sides of the driveshaft, 180 degrees apart, the slip yoke or pinion flange is responsible. Check the pinion flange runout. If the pinion flange runout exceeds specifications, a bent pinion is indicated.
   - If the pinion flange and pinion runouts are within specifications, road test and check for the vibration at the road test speed. If the vibration persists, balance the driveshaft. For additional information, refer to Driveshaft Balancing in this procedure.

Driveshaft Balancing - Using the Mastertech® Series MTS 4000 Driveline Balance and NVH Analyzer (Vetronix)

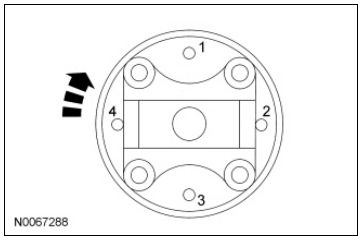


All vehicles

1. Install the Mastertech® Series MTS 4000 Driveline Balance and NVH Analyzer (Vetronix) to the vehicle.

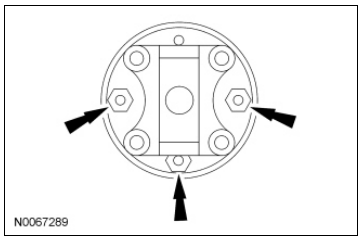
2. Working under the vehicle, install an accelerometer. The accelerometer can be attached and mounted

near either the transmission or differential end of the driveshaft.



3. Clean an area of the driveshaft and install the reflective tape, then install the photo-tachometer sensor. The sensor should be placed at approximately a 20-degree angle from perpendicular to the surface of the reflective tape. Make sure the sensor does not get moved during the balance procedure.
    1. Reflective tape.
    2. Photo-tachometer sensor.

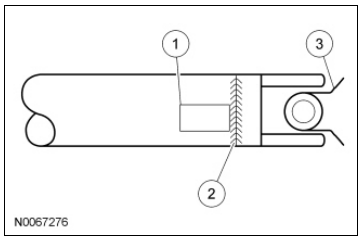
4. Using the Mastertech® Series MTS 4000 Driveline Balance and NVH Analyzer (Vetronix), run a driveshaft balance test with the driveshaft unmodified.



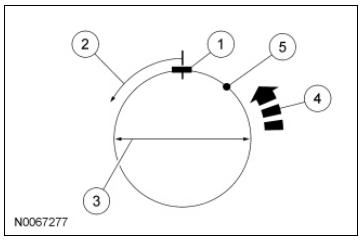
Vehicles with tapped pinion flanges

5. Label the tapped holes in the pinion flange numerically, starting at the top hole as 1. Mark the remaining holes 2, 3 and 4. Label in the direction of rotation.

6. Using the Mastertech® Series MTS 4000 Driveline Balance and NVH Analyzer (Vetronix), run a second test with the 12 mm (0.47 in) test weight set screw in the No. 1 hole, previously marked on the pinion flange.



7. Remove the test weight, then install the weight combination directed by the Mastertech® Series MTS 4000 Driveline Balance and NVH Analyzer (Vetronix).

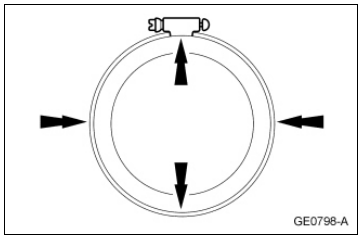


Vehicles without tapped pinion flanges

8. Using the Mastertech® Series MTS 4000 Driveline Balance and NVH Analyzer (Vetronix), run a second test with a test weight. Using a metal band, secure the test weight to the end of the driveshaft. The weight should be placed at the end of the driveshaft tube, as close to the tube-to-yoke weld seam as possible. Mark the location of the test weight on the driveshaft, as shown in the figure below.
    1. Test weight.
    2. Tube-to-yoke weld seam.
    3. Driveshaft pinion flange.

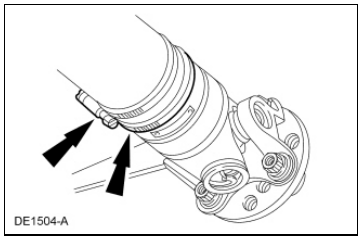
- Select the test weight based on driveshaft size. Larger driveshafts use 10 g (0.353 oz). Smaller driveshafts use 5 g (0.176 oz).

9. Remove the test weight, then install the recommended weight at the position directed by the Mastertech® Series MTS 4000 Driveline Balance and NVH Analyzer (Vetronix). Using a metal band and epoxy, secure the test weight to the driveshaft, as shown in the figure below.
    1. Test weight.
    2. Measure in this direction.
    3. Driveshaft diameter.
    4. Directional rotation.
    5. Balance weight relative to test weight centerline.
    - The results are displayed with respect to the location to where the test weight was placed.



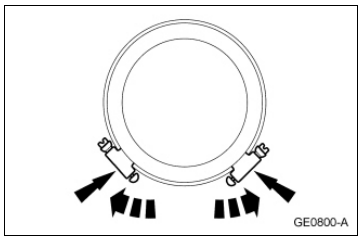
All vehicles

10. Using the Mastertech® Series MTS 4000 Driveline Balance and NVH Analyzer (Vetronix), run a third test to verify the repair.



Driveshaft Balancing - Hose Clamp Method

1. Install 1 or 2 hose clamps on the driveshaft, near the rear. Position of the hose clamp head(s) can be determined through trial and error.



2. Mark the rear of the driveshaft into 4 approximately equal sectors and number the marks 1 through 4. Install a hose clamp on the driveshaft with its head at position No. 1, as shown in the figure below. Check for vibration at road speed. Recheck with the clamp at each of the other positions to find the position that shows minimum vibration. If 2 adjacent positions show equal improvement, position the clamp head between them.

3. If the vibration persists, add a second clamp at the same position and recheck for vibration.

4. If no improvement is noted, rotate the clamps in opposite directions, equal distances from the best position determined in Step 2. Separate the clamp heads about 13 mm (1/2 in) and recheck for vibration at the road speed.

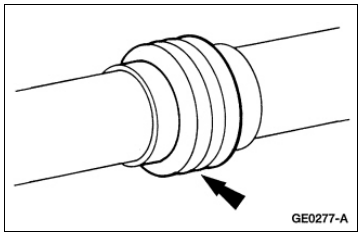
5. Repeat the process with increasing separation until the best combination is found or the vibration is reduced to an acceptable level.

Material

Item	Specification	Fill Capacity
Premium Long-Life Grease XG-1-C or XG-1-K (US); CXG-1-C (Canada)	ESA-M1C75-B	-
Threadlock and Sealer TA-25	WSK-M2G351-A5	-

Torque Specifications

Description	Nm	lb-ft	lb-in
CV flange bolts	30	22	-
Driveshaft center bearing bracket nuts	55	41	-
Driveshaft flange bolts	112	83	-
Driveshaft yoke bolt	37	27	-
U-joint strap bolts	19	-	168



Driveshaft

The driveshafts consist of the following:

- U-joint flanges
- U-joints
- Nylon thrust washers, located at each base of the bearing cup, which control end play, position the needle bearings and improve grease movement
- Lubed-for-life design and require no lubrication
- CV joint flanges
- CV joints
- Slip-yoke
- Slip-joint boots
- Traditional welded-on balance weights

Vehicles have the following types of driveshafts:

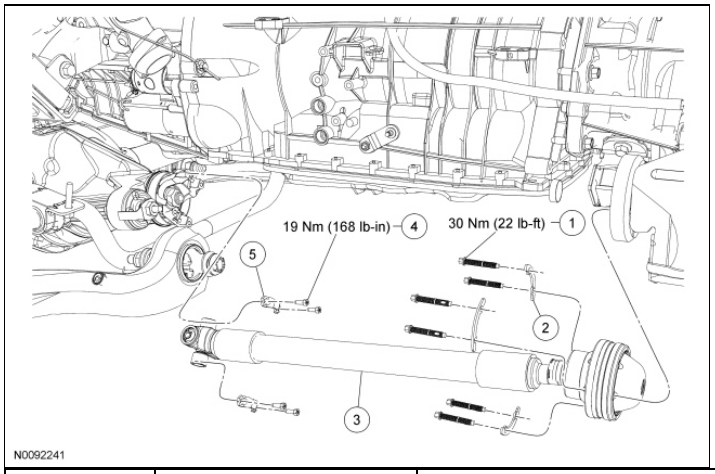
- One-piece rear driveshaft with 2 U-joints and a front slip-yoke
- One-piece front driveshaft with a front U-joint, a slip-yoke and a rear CV joint
- Two-piece rear driveshaft with 3 U-joints
- Two-piece rear driveshaft with 2 CV joints and one U-joint

NOTE: Whenever the vehicle is raised on a hoist, inspect the U-joint slip-yoke boot for rips or holes. Install new if required.

NOTE: All driveshafts are balanced. If undercoating the vehicle, protect the driveshaft and U-joints to prevent application of any undercoating material.

The driveshaft transfers input from the transmission or transfer case to the front or rear drive axles. The driveshaft is composed of the U-joints or CV joints, connecting shafts and attaching yokes. The driveshaft accommodates the change in length in the driveline system by sliding on the transmission output shaft with a slip-yoke or a slip-joint which is integral to the driveshaft. The shafts vary in diameter, length, number of coupling shafts and U-joints or CV joints, depending on vehicle application. The U-joints and CV joints allow the driveshaft to rotate smoothly through the changing angles between the transmission output shaft and the driveshaft, plus the changes between the rear axle pinion angle and the driveshaft. On 2-wheel drive vehicles, power is transmitted through the transmission to the driveshaft and then to the rear axle. On All-Wheel Drive (AWD) vehicles, power is transmitted from the transmission to the front and rear axles through the transfer case.

The engine angle is built into the engine mounts. If the driveshaft angles are out of specification, the engine mounts must be inspected for damage.



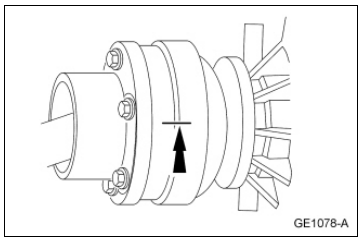
Driveshaft

Refer to Section 205-00 .

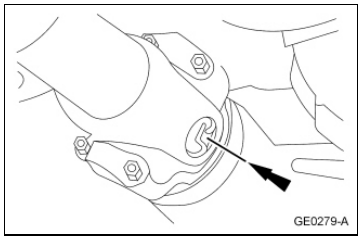
Driveshaft - Front

Material

Item	Specification
Threadlock and Sealer TA-25	WSK-M2G351-A5



Item	Part Number	Description
1	211982	CV joint bolt (6 required)
2	232715	CV joint bolt washer (3 required)
3	4602	Driveshaft assembly
4	389665-S	U-joint strap bolt (4 required)
5	4639	U-joint strap (2 required)

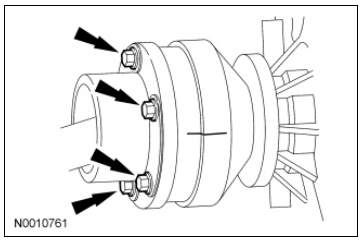


Removal and Installation

NOTICE: **Always disconnect the front driveshaft from the transfer case first. Otherwise, the weight of the driveshaft may pinch the boot between the driveshaft and damage the Constant Velocity (CV) joint flange which may cause the boot to tear.**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Index-mark the front driveshaft at both ends to maintain driveshaft balance.

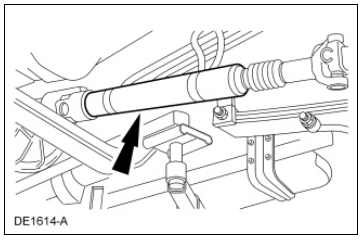


3. **NOTE:** The new CV flange bolts and washers are not available and the originals are not damaged, they can be reused if the threads are coated with threadlock and sealer.

   NOTE: If new U-joint strap bolts are not available and the original bolts are not damaged, they can be reused if the threads are coated with threadlock and sealer.

   Remove and discard the 6 CV flange bolts and 3 CV joint washers.

   - To install, tighten the new bolts to 30 Nm (22 lb-ft).

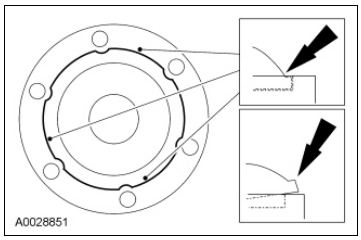


4. **NOTE:** If new U-joint strap bolts are not available and the original bolts are not damaged, they can be reused if the threads are coated with threadlock and sealer.

   Remove the 4 U-joint strap bolts and remove the 2 U-joint straps.

   - Discard the bolts.
   - To install, tighten the new bolts to 19 Nm (168 lb-in).

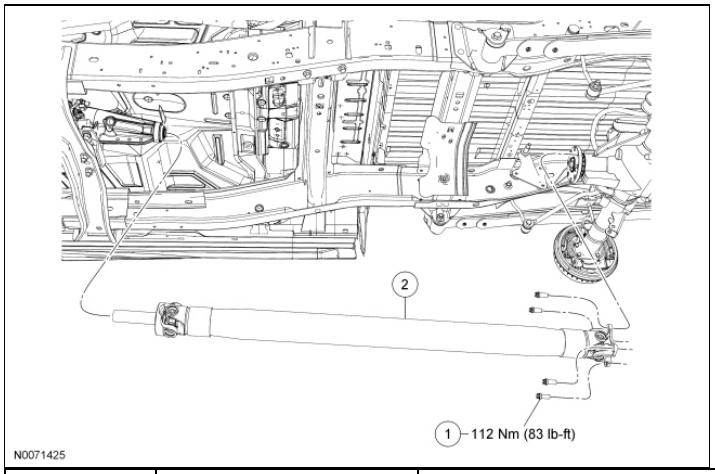
5. Remove the front driveshaft.



6. ***NOTICE:*** **Tighten the Constant Velocity (CV) joint bolts evenly in a cross pattern or damage will occur to the CV joint.**

NOTE: The can (domed CV joint housing cover) is pressed into the CV joint housing at the factory. When housed correctly, the can will appear as shown in the cut-away illustration (top box). Do not reseat the can in the CV joint housing if the can's flange is above the CV joint housing as shown in the cut-away illustration (bottom box), install a new driveshaft.

NOTE: The CV joint is not serviceable. Install a new driveshaft if damaged.



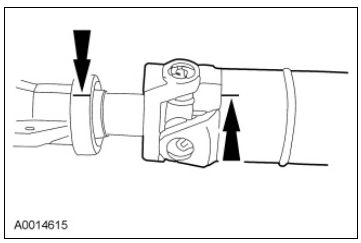
To install, reverse the removal procedure.

Driveshaft - Rear, One-Piece, 4.0L SOHC

Material

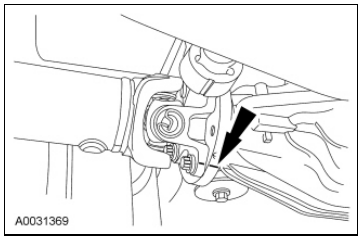
Item	Specification
Threadlock and Sealer TA-25	WSK-M2G351-A5

Item	Part Number	Description
1	N800594-S	Bolt-to-pinion flange (4 required)
2	4602	Driveshaft



Removal and Installation

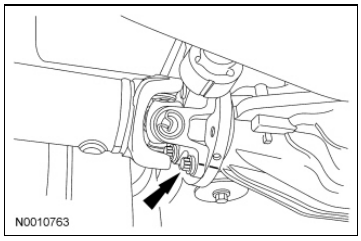
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .



2. **NOTE:** Make sure the index marks on the extension housing and driveshaft are aligned before separation.

   NOTE: After removing the driveshaft, place an index mark on the transmission output shaft that matches the transmission extension housing mark.

   Index-mark the driveshaft and the extension housing to maintain driveshaft balance.



3. Index-mark the driveshaft flange to the pinion flange to maintain driveshaft balance.

4. **NOTE:** If new pinion flange bolts are not available and the originals are not damaged, they can be reused if the threads are coated with threadlock and sealer.

   Remove and discard the 4 driveshaft pinion flange bolts.

   - To install, tighten the new bolts to 112 Nm (83 lb-ft).

5. **NOTE:** The driveshaft flange yoke fits tightly on the pinion flange pilot. Never hammer on the driveshaft, or any of its components, to disconnect the driveshaft flange from the pinion flange.

   Using a suitable tool, pry only in the area shown to separate the driveshaft flange yoke from the pinion flange and remove the driveshaft from the extension housing.

6. **NOTE:** The driveshaft flanges fit tightly on the pinion flange pilot. To make sure that the driveshaft flange seats squarely on the pinion flange, tighten the driveshaft flange bolts evenly in a cross pattern.

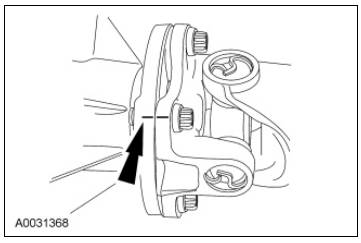
   NOTE: If new driveshaft flange bolts are not available, coat the threads of the original driveshaft flange bolts with threadlock and sealer.

   To install, reverse the removal procedure.

Driveshaft - Rear, One-Piece, 4.6L (3V)

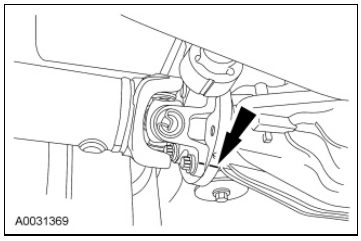
Material

Item	Specification
Threadlock and Sealer TA-25	WSK-M2G351-A5



Item	Part Number	Description
1	N800594	U-joint flange bolts (8 required)
2	4602	Driveshaft assembly

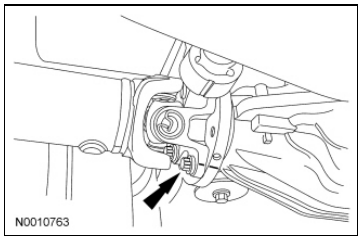
Removal and Installation



1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. If equipped, remove the skid plate.

3. Index-mark the driveshaft flange to the transfer case rear output flange to maintain driveshaft balance.



4. Index-mark the driveshaft flange to the pinion flange to maintain driveshaft balance.

5. **NOTE:** If new pinion flange bolts are not available and the originals are not damaged, they can be reused if the threads are coated with threadlock and sealer.

   Remove and discard the 4 driveshaft flange bolts.

   - To install, tighten the 4 new bolts to 112 Nm (83 lb-ft).

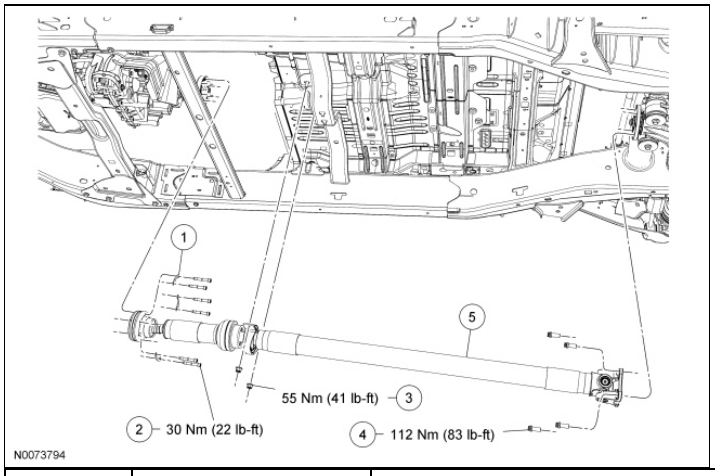
6. **NOTE:** If new pinion flange bolts are not available and the originals are not damaged, they can be reused if the threads are coated with threadlock and sealer.

   Remove and discard the 4 transfer case rear output flange bolts.

   - To install, tighten the 4 new bolts to 112 Nm (83 lb-ft).

7. **NOTE:** The driveshaft flange fits tightly on the axle pinion flange pilot and the transfer case output flange. Never hammer on the driveshaft, or any of its components, to disconnect the driveshaft flanges from the mating flanges. Pry only in the area shown with a suitable tool.

   Using a suitable tool as shown, disconnect the driveshaft flanges and remove the driveshaft.

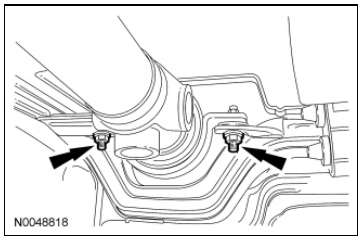


8. **NOTE:** The driveshaft flanges fit tightly on the pinion flange pilots. To make sure that the driveshaft flanges seat squarely on the pinion flanges, tighten the driveshaft flange bolts evenly in a cross pattern.

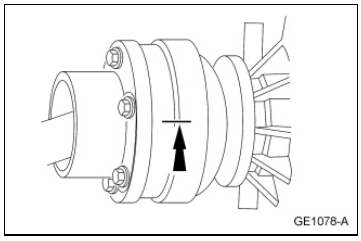
To install, reverse the removal procedure.

Driveshaft - Rear, Two-Piece, Four Wheel Drive (4WD)

Material

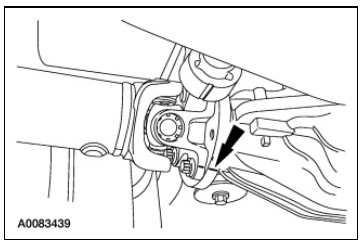


Item	Specification
Threadlock and Sealer TA-25	WSK-M2G351-A5



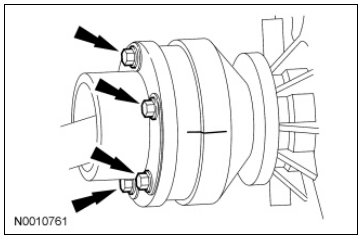
Item	Part Number	Description
1	4A467	Washer (3 required)
2	-	Bolt (part of 4A467) (6 required)
3	W520213-S	Center bearing support nut (2 required)
4	N800594	Driveshaft flange bolt (4 required)
5	4685	Driveshaft

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .



2. Remove the 2 nuts from the driveshaft center bearing bracket.
   - To install, tighten to 55 Nm (41 lb-ft).

3. Index-mark the CV joint to the transfer case output flange.



4. Index-mark the rear U-joint flange to the differential pinion flange.

5. **NOTE:** If new CV flange bolts and washers are not available and the originals are not damaged, they can be reused if the threads are coated with threadlock and sealer.

   Remove and discard the 6 CV joint bolts and 3 CV joint washers.

   - To install, tighten the 6 new bolts to 30 Nm (22 lb-ft).

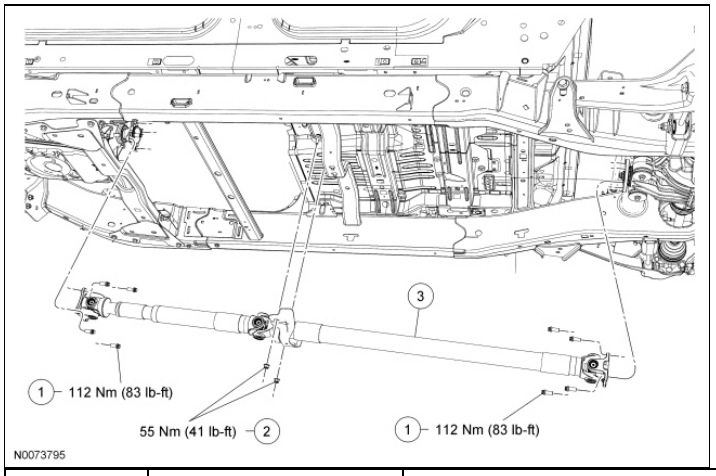
6. **NOTE:** If new flange bolts are not available and the originals are not damaged, they can be reused if the threads are coated with threadlock and sealer.

   Remove and discard the 4 driveshaft flange bolts.

   - To install, tighten the 4 new bolts to 112 Nm (83 lb-ft).

7. **NOTE:** Never hammer on the driveshaft, or any of its components, to disconnect the driveshaft flange from the differential pinion flange.

   Using a suitable tool, pry only in the area shown to separate the driveshaft flange and the differential pinion flange.



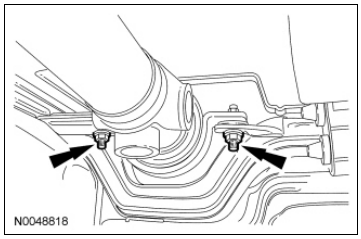
8. Slide the driveshaft toward the rear of the vehicle, while maneuvering the front section over the top of the vehicle frame crossmember and remove the driveshaft.

9. To install, reverse the removal procedure.

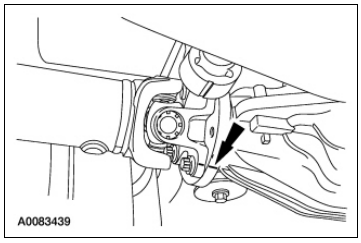
Driveshaft - Rear, Two-Piece, Rear Wheel Drive (RWD)

Material

Item	Specification
Threadlock and Sealer TA-25	WSK-M2G351-A5



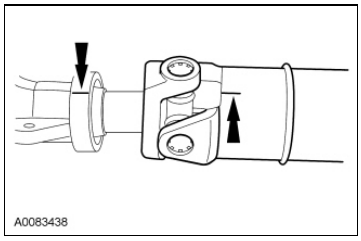
Item	Part Number	Description
1	N800594	Driveshaft flange bolts (8 required)
2	W520213-S	Center bearing support nuts
3	4685	Driveshaft assembly



All vehicles

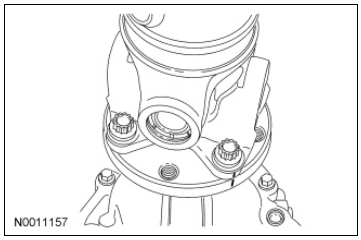
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the 2 nuts from the driveshaft center bearing bracket.
   - To install, tighten to 55 Nm (41 lb-ft).



3. Index-mark the rear U-joint flange to the differential pinion flange.

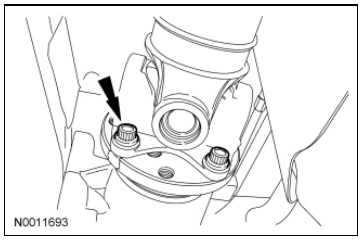
4.0L engine



4. **NOTE:** After removing the driveshaft, without rotating the driveshaft, place an index mark on the transmission output shaft that matches the transmission extension housing mark.

   Index-mark the driveshaft and the extension housing.

4.6L engine

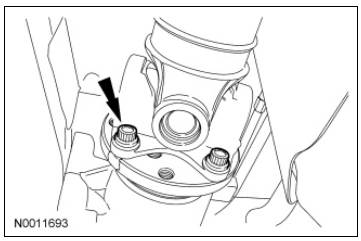


5. Index-mark the front U-joint flange to the transmission output flange.

6. **NOTE:** If new flange bolts are not available and the originals are not damaged, they can be reused if the threads are coated with threadlock and sealer.

   Remove and discard the 4 driveshaft flange bolts from the transmission output shaft flange.

   - To install, tighten the 4 new bolts to 112 Nm (83 lb-ft).



All vehicles

7. **NOTE:** If new flange bolts are not available and the originals are not damaged, they can be reused if the threads are coated with threadlock and sealer.

   Remove and discard the 4 driveshaft flange bolts from the drive pinion flange.

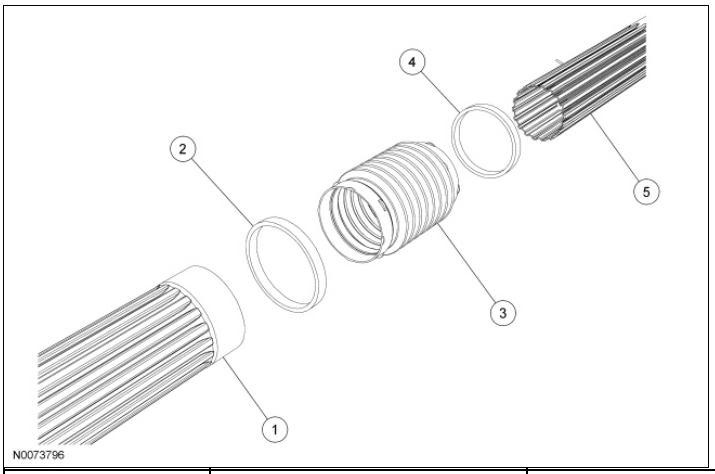
- To install, tighten the 4 new bolts to 112 Nm (83 lb-ft).

8. **NOTE:** Never hammer on the driveshaft, or any of its components, to disconnect the driveshaft flange from the differential pinion flange.

   Using a suitable tool, pry only in the area shown to separate the driveshaft flange and the differential pinion or transmission output flange.

9. Slide the driveshaft toward the rear of the vehicle, while maneuvering the front section over the top of the vehicle frame crossmember and remove the driveshaft.

10. To install, reverse the removal procedure.



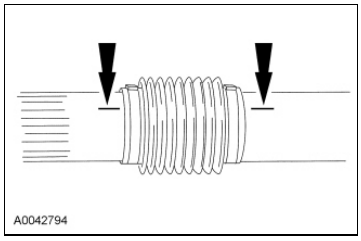
Driveshaft Slip Yoke Boot

Special Tool(s)

 ST1173-A	Installer, Keystone Clamp 211-002 (T63P-9171-A)

Material

Item	Specification
Premium Long-Life Grease XG-1-C or XG-1-K (US); CXG-1-C (Canada)	ESA-M1C75-B



Item	Part Number	Description
1	4685	Driveshaft tube
2	3B478	Slip boot clamp
3	4421	Driveshaft slip boot
4	3B478	Slip boot clamp
5	4685	Driveshaft tube

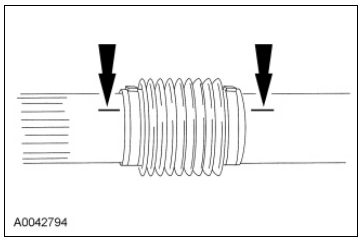
Removal

1. Remove the driveshaft. For additional information, refer to Driveshaft - Rear, One-Piece, 4.6L (3V) in this section.

2. Index-mark the driveshaft on both sides of the driveshaft slip yoke boot.

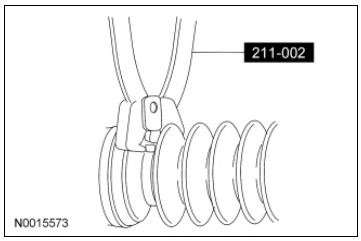
3. Remove and discard the 2 driveshaft slip yoke boot clamps.

4. Separate the driveshaft.



5. Remove the driveshaft slip yoke boot.

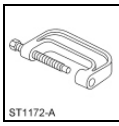
Installation



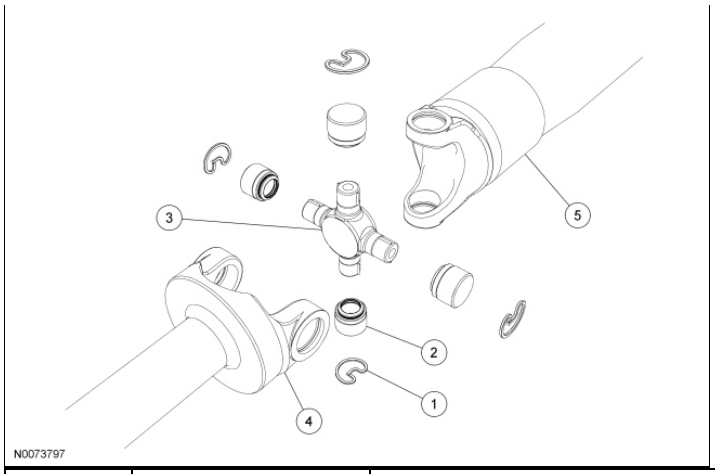
1. **NOTE:** Grease both ends of the driveshaft.

   Position the driveshaft slip yoke boot and the 2 driveshaft slip yoke boot clamps on one end of the driveshaft.

2. Align the index marks and connect the driveshaft.



3. Using the Keystone Clamp Installer, install the new driveshaft slip yoke boot.



4. Install the driveshaft. For additional information, refer to Driveshaft - Rear, One-Piece, 4.6L (3V) in this section.

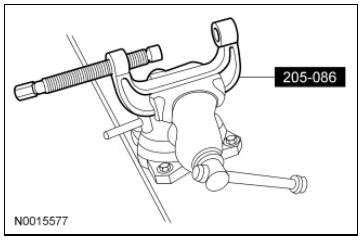
Driveshaft Universal Joint - Snap Ring Type

Special Tool(s)

 ST1172-A	Installer/Remover, C-Frame and Screw 205-086 (T74P-4635-C)

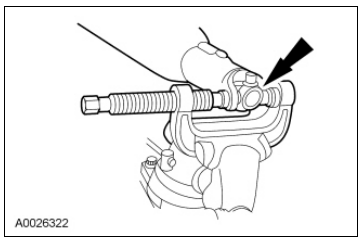
Item	Part Number	Description
1	-	Snap ring (part of 4635) (4 required)
2	-	Bearing cup (part of 4635) (4 required)
3	4635	U-joint
4	4841	Driveshaft slip yoke
5	4602	Driveshaft

Disassembly and Assembly



NOTE: The front driveshaft CV joint is not repairable.

1. Remove the driveshaft. For additional information, refer to Driveshaft - Rear, One-Piece, 4.0L SOHC , Driveshaft - Rear, One-Piece, 4.6L (3V) or Driveshaft - Front in this section.

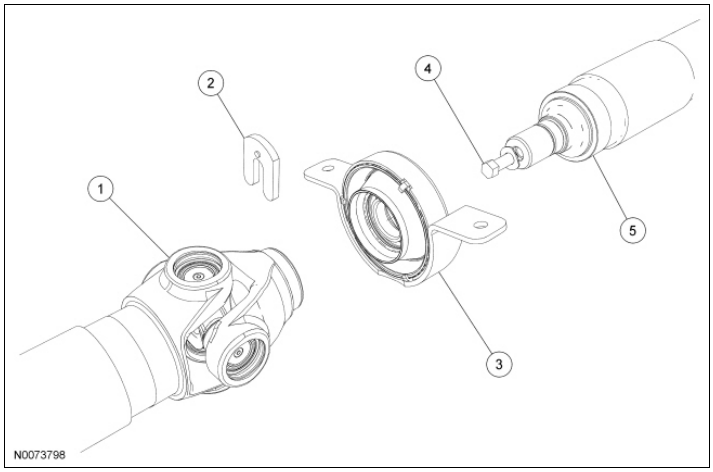


2. Index-mark the components at the U-joints for reassembly.

3. Remove and discard the 4 snap rings.

4. Position the driveshaft in the C-Frame and Screw Installer/Remover. Using the C-Frame and Screw Installer/Remover, press out a bearing cup.

5. If necessary, use a pair of pliers to remove the bearing cup if it cannot be pressed all the way out.
6. Rotate the driveshaft and press on the spider to remove the remaining bearing cup.
7. Remove the driveshaft flange.
8. Position the driveshaft in the C-Frame and Screw Installer/Remover. Using the C-Frame and Screw Installer/Remover, press out the bearing cup.



9. If necessary, use a pair of pliers to remove the bearing cup if it cannot be pressed all the way out.
10. Rotate the driveshaft and press on the spider to remove the remaining bearing cup.
11. Remove the spider.
12. **NOTE:** Clean the bearing cup bores.

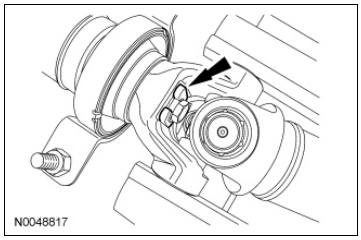
    NOTE: Check the U-joints for freedom of movement. If binding, strike the driveshaft flange with a brass or plastic hammer. Do not strike the U-joint.

    To assemble, reverse the disassembly procedure.

    - Use the yellow snap rings supplied in the kit to install the U-joint. If difficulty is encountered with the yellow snap rings, install the black snap rings, as required.

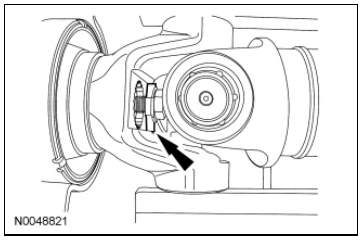
Driveshaft Center Bearing

Item	Part Number	Description
1	248-0014	Shaft end yoke
2	207-0171	C-washer
3	4K145	Driveshaft center bearing
4	105-0045	C-washer bolt
5	278-0470	Mid-ship stub shaft



Disassembly

NOTE: The driveshaft center bearing on driveshafts with CV joint flanges are not serviced. If the driveshaft center bearing is worn or damaged, install a new driveshaft.

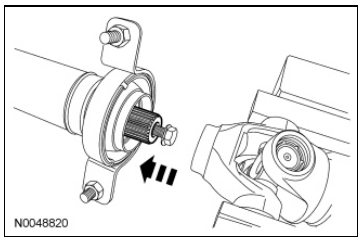


1. Remove the driveshaft. For additional information, refer to Driveshaft - Rear, Two-Piece, Four Wheel Drive (4WD) or Driveshaft - Rear, Two-Piece, Rear Wheel Drive (RWD) in this section.

2. ***NOTICE:*** **Do not clamp the driveshaft tube in a vise. Denting or localized fracturing may result causing driveshaft failure during vehicle operation.**

   Position the center U-joint yoke ears in a vise so that the C-washer is pointing up and the front section is free to move.

3. Loosen the bolt inside the center cardan joint enough to allow the C-washer to fall from under the bolt head.
   - To install, tighten to 37 Nm (27 lb-ft).



4. **NOTE:** Index-mark the front and rear driveshaft sections.

   NOTE: The rear section has a master splined shaft and yoke.

   NOTE: The bolt head will fit through the internal spline of the center cardan.

   Using a rubber mallet, separate the driveshaft sections.

5. Using a suitable puller, remove the driveshaft center bearing from the rear section.

6. **NOTE:** Install the new center bearing with the 3 bend tabs and dust seal lip facing the front of the vehicle.

   To install, reverse the removal process.

Driveshaft Universal Joint - Stake Type

1. The staked driveshaft U-joints are not serviced separately within the warranty period. Install a new driveshaft if worn or damaged.

2. U-joint service kits with instructions are available through a Ford authorized dealer for a high mileage repair.

Material

Item	Specification	Fill Capacity
Motorcraft® High Contrast Hypoid Gear Marking Compound XG-14	-	-

[a] Refer to the procedure in this section.

Rear Drive Axle and Differential

The rear drive axle and differential consist of the following:

- Cast aluminum differential housing and cover
- Differential housing cover that uses silicone sealant as a gasket
- Hypoid-design gearset that consists of an 8.8-inch differential ring gear and a drive pinion gear
- Two opposed pinion bearings that support the drive pinion gear in the differential housing
- Differential drive pinion collapsible spacer, located on the drive pinion gear shaft, that maintains pinion bearing preload
- Pinion nut that adjusts the preload
- Differential bearing shims between the differential bearing cups and the differential housing which adjust the differential ring gear backlash and the differential bearing preload
- Differential case with 2 openings to allow for assembly of the internal components and lubricant flow. Removable differential bearing caps retain the differential assembly in the differential housing
- Two opposed differential bearings that support the differential assembly in the differential housing
- Inside the differential assembly, the differential pinion shaft supports 2 differential pinion gears. The pinion gears engage the differential side gears to which the halfshafts are splined
- The differential pinion shaft lock bolt retains the differential pinion shaft in the differential assembly
- An embossed metal tag, bolted to the differential housing cover, contains rear axle identification. Refer to Section 205-00

The rear axle assembly receives rotational input from the driveshaft through a piloted pinion flange. The drive pinion drives the ring which is bolted to the differential case. The design of the differential allows the side gears in the case to rotate at different speeds. The axle halfshafts are splined to the side gears permitting the vehicle to manipulate corners without sliding the inside tire.

The axle identification tag identifies a particular axle design and specific ratio. In addition, the plant code will not change as long as that particular axle assembly never undergoes an external design change. If, however, an internal design change takes place during the production life of the axle and that internal change affects parts interchangeability, a dash and numerical suffix is added to the plant code. This means that as an assembly, both axles are interchangeable; however, internally they are different. Therefore, each requires different internal parts at the time of repair.

Rear Drive Axle and Differential

Refer to Section 205-00 .

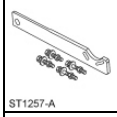
Differential Draining and Filling

Material

Item	Specification
Motorcraft® SAE 75W-140 Synthetic Rear Axle Lubricant XY-75W140-QL (US); CXY-75W140-1L (Canada)	WSL-M2C192-A and GL-5

Fluid Drain and Fill

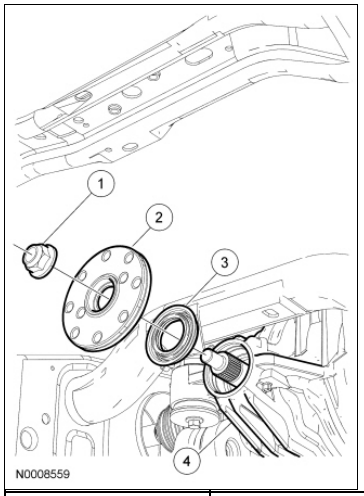
1. Remove both the fill plug and the drain plug.
   - Drain the axle assembly.



2. Clean and install the drain plug.
   - Tighten to 34 Nm (25 lb-ft).

3. Fill the axle with 1.65L (3.5 pt) of axle lubricant to the bottom of the fill plug hole.

4. Clean and install the fill plug.
   - Tighten to 34 Nm (25 lb-ft).



Drive Pinion Flange and Drive Pinion Seal

Special Tool(s)

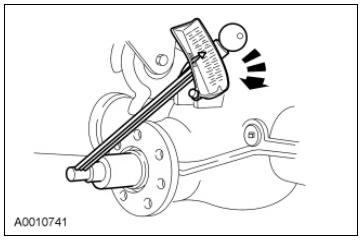
 ST2026-A	2 Jaw Puller 205-D072 (D97L-4221-A) or equivalent
 ST1257-A	Holding Fixture, Drive Pinion Flange 205-126 (T78P-4851-A)
	Installer, Drive Pinion Flange 205-002 (TOOL-4858-E)
 ST1325-A	Installer, Drive Pinion Oil Seal 205-208 (T83T-4676-A)

Material

Item	Specification
Premium Long-Life Grease XG-1-C or XG-1-K (US); CXG-1-C (Canada)	ESA-M1C75-B

Item	Part Number	Description
1	389546	Pinion nut
2	4851	Pinion flange
3	4676	Pinion seal
4	4010	Differential housing

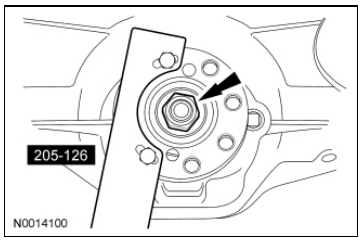
Removal



1. ***NOTICE:*** **The color on the rear face of the drive pinion nut is critical to this repair. Use the same color new drive pinion nut for installation. If a new collapsible spacer must be installed for pinion bearing preload reduction, install the nut supplied with the new spacer kit or damage to the component may occur.**

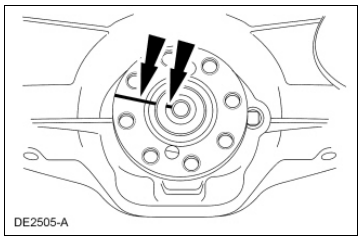
   With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the brake disc. For additional information, refer to Section 206-04 .

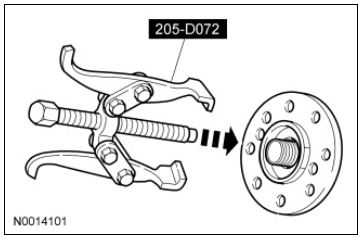


3. Remove the rear driveshaft. For additional information, refer to Section 205-01 .

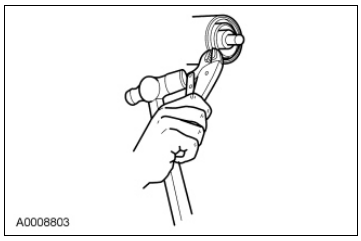
4. Install a Nm (lb-in) torque wrench on the pinion nut and record the torque necessary to maintain rotation of the drive pinion gear through several revolutions.



NOTICE: **The color on the rear face of the drive pinion nut is critical to this repair. Use the same color new drive pinion nut for installation or damage to the component may occur.**



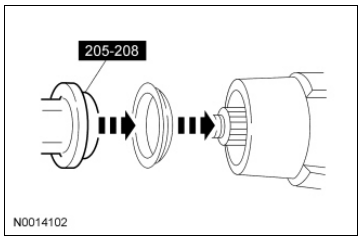
5. Using the Drive Pinion Flange Holding Fixture to hold the pinion flange, remove and discard the pinion nut.



6. Index-mark the pinion flange and drive pinion gear to maintain initial balance during installation.

7. Using the 2 Jaw Puller, remove the pinion flange.

8. Use a screwdriver to force up the metal flange of the pinion seal. Install gripping pliers and strike with a hammer to remove the drive pinion seal.

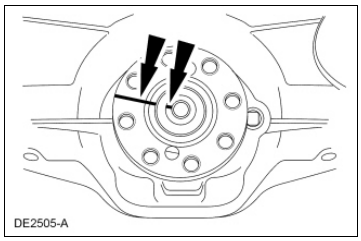


Installation

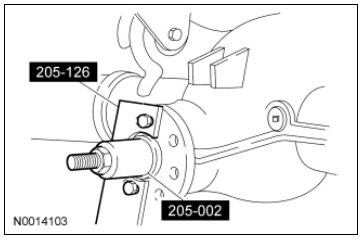
1. If removed, lubricate the lips of the new drive pinion seal with grease.

2. **NOTE:** If the drive pinion seal becomes misaligned during installation, remove the drive pinion seal and install a new drive pinion seal.

   If the drive pinion seal was removed, use the Drive Pinion Oil Seal Installer to install a new drive pinion seal.



3. Inspect the pinion flange seal journal for rust, nicks and scratches prior to installing the pinion flange. Polish the seal journal with fine crocus cloth, if necessary.

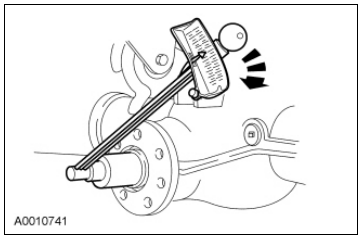


4. Lubricate the pinion flange splines with grease.

5. **NOTE:** Disregard the index marks if installing a new pinion flange.

   Position the pinion flange.

6. Using the Drive Pinion Flange Holding Fixture and Drive Pinion Flange Installer, install the pinion flange.



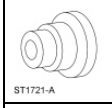
7. ***NOTICE:*** **The color on the rear face of the drive pinion nut is critical to this repair. Use the same color new drive pinion nut for installation or damage to the component may occur.**

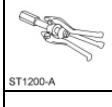
   Select the new pinion nut for installation. Install and hand-tighten the pinion nut.

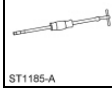
8. ***NOTICE:*** **Do not, under any circumstance, loosen the pinion nut to reduce drive pinion bearing preload. If it is necessary to reduce drive pinion bearing preload, install a new differential drive pinion collapsible spacer and pinion nut or component damage may occur. Install the new pinion nut that is included in the collapsible spacer kit.**

   Tighten the new pinion nut to set the drive pinion bearing preload.

   - Rotate the drive pinion gear occasionally to make sure the drive pinion bearings seat correctly. Take frequent drive pinion bearing preload readings by rotating the drive pinion gear with a Nm (lb-in) torque wrench.
   - Rotational torque must be at least the recorded original torque plus a maximum of 5 lb-in.

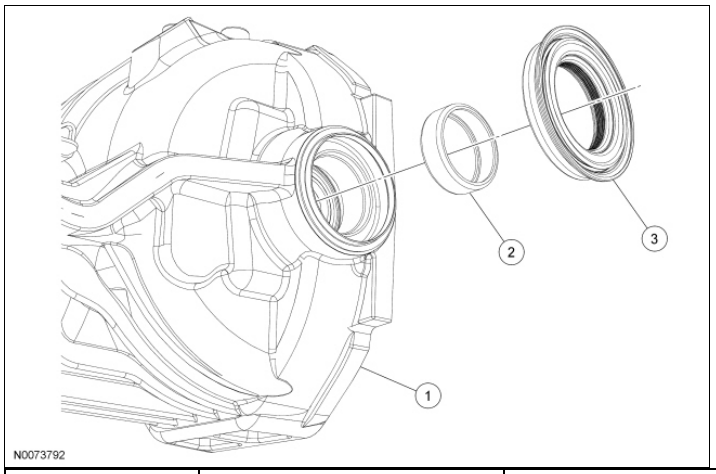






9. Install the brake disc. For additional information, refer to Section 206-04 .

10. Install the rear driveshaft. For additional information, refer to Section 205-01 .



Stub Shaft Pilot Bearing and Seal

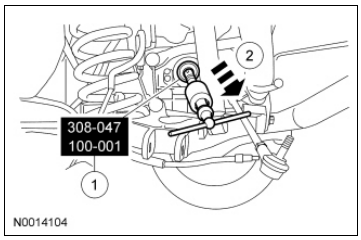
Special Tool(s)

 ST1326-A	Handle 205-D055 (D81L-4000-A) or equivalent
 ST1721-A	Installer, Halfshaft Pilot Bearing 205-504
 ST1200-A	Remover, Bearing Cup 308-047 (T77F-1102-A)
 ST1185-A	Slide Hammer 100-001 (T50T-100-A)

Material

Item	Specification
Motorcraft® SAE 75W-140 Synthetic Rear Axle Lubricant XY-75W140-QL (US); CXY-75W140-1L (Canada)	WSL-M2C192-A and GL-5

Item	Part Number	Description
1	4010	Rear axle housing
2	4B413	Stub shaft bearing
3	4B416	Stub shaft bearing seal



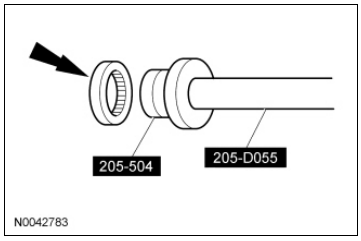
Removal

1. Remove the halfshaft assembly. For additional information, refer to Section 205-05 .

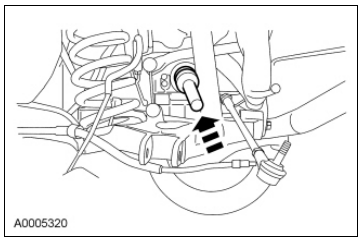
2. **NOTE:** If removing the stub shaft pilot bearing oil seal only, engage the tangs of the Bearing Cup Remover on the stub shaft pilot bearing oil seal.

   Using the Bearing Cup Remover and Slide Hammer, remove the stub shaft pilot bearing and stub shaft pilot bearing oil seal.

   1. Firmly engage the tangs of the Bearing Cup Remover on the stub shaft pilot bearing.
   2. Remove the stub shaft pilot bearing and stub shaft pilot bearing oil seal.



Installation

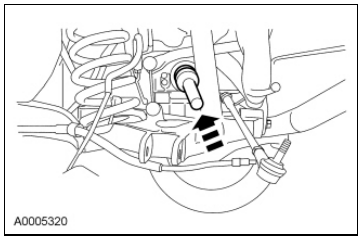


1. Using rear axle lubricant, lubricate the new stub shaft pilot bearing.

2. *NOTICE:* **Installation of the stub shaft pilot bearing or stub shaft pilot bearing oil seal without the correct tools can result in early stub shaft pilot bearing or stub shaft pilot bearing oil seal failure. If the stub shaft pilot bearing becomes cocked in the bore during installation, remove it and install a new stub shaft pilot bearing.**

   Place the stub shaft pilot bearing onto the Halfshaft Pilot Bearing Installer and Handle.

3. Install the stub shaft pilot bearing into the rear axle housing bore.



4. **NOTE:** Do not disassemble the new oil seal.

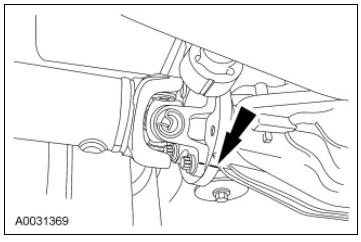
   NOTE: Use a tool like the Lisle LIS17850 to avoid interference with the suspension components.

   Install the stub shaft pilot bearing oil seal onto a suitable seal installer.

5. Carefully align the stub shaft pilot bearing oil seal with the housing bore and install the stub shaft pilot bearing oil seal flush in the differential housing.

6. Install the halfshaft assembly. For additional information, refer to Section 205-05 .

Axle Assembly

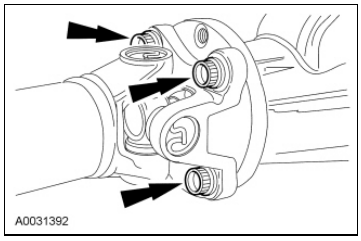


Item	Part Number	Description
1	W707356	Differential front lower insulator bolts
2	4B425	Lower differential bolt snubbers (2 required)
3	4000	Axle assembly
4	4B424	Differential front lower insulator (2 required)
5	4B425	Differential rear insulators (2 required)
6	W708096	Differential rear insulator bolts
7	4338	Axle vent tube

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the rear halfshafts. For additional information, refer to Section 205-05 .



3. Index-mark the driveshaft flange to the pinion flange.

4. **NOTE:** Align the index marks when installing the driveshaft.

   Remove and discard the 4 driveshaft flange bolts.

   - To install, tighten to 112 Nm (83 lb-ft).

5. ***NOTICE:*** **The driveshaft flange fits tightly on the pinion flange pilot. Never hammer on the driveshaft or any of its components to disconnect the driveshaft flange from the pinion flange or damage to the component may occur.**

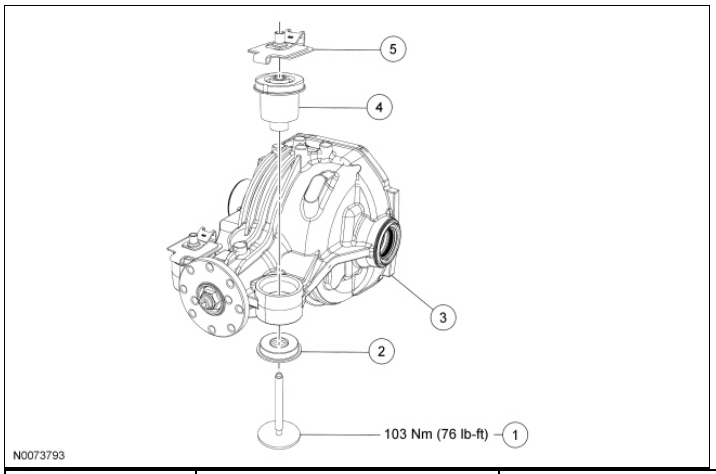
   Using a suitable tool as shown, disconnect the driveshaft flange from the pinion flange, then using mechanic's wire, position aside the driveshaft.

6. Position a suitable transmission jack to the axle housing.
   - Securely strap the jack to the axle.

7. Remove the 2 differential front lower insulator bolts.
   - To install, tighten to 103 Nm (76 lb-ft).

8. Remove the 2 differential rear insulator bolts.
   - To install, tighten to 150 Nm (111 lb-ft).

9. Disconnect the axle vent hose from the axle cover vent.



10. Lower the axle assembly from the vehicle.

11. To install, reverse the removal procedure.

Rear Axle Housing Support Insulator

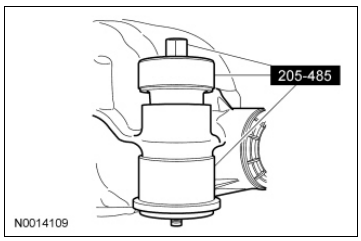
Special Tool(s)

 ST2543-A	Remover/Installer, Differential Bushing 205-485

Item	Part Number	Description
1	W712269-S	Lower insulator bolt
2	4B424	Lower isolator
3	4010	Axle housing
4	4B431	Upper isolator
5	W712984	Spring nut (Explorer)
5	W713381	Spring nut (Sport Trac)

Removal

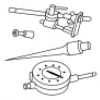
1. Remove the axle assembly. For additional information, refer to Axle Assembly in this section.
2. Using the Differential Bushing Remover/Installer, remove and discard the differential front lower insulator.



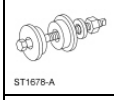
3. Using the Differential Bushing Remover/Installer, draw the differential rear insulator from the frame pocket.

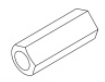
Installation

1. Using the Differential Bushing Remover/Installer, draw the differential rear insulator into the frame pocket.
    - There is no orientation requirement for the frame mounted differential rear insulator.



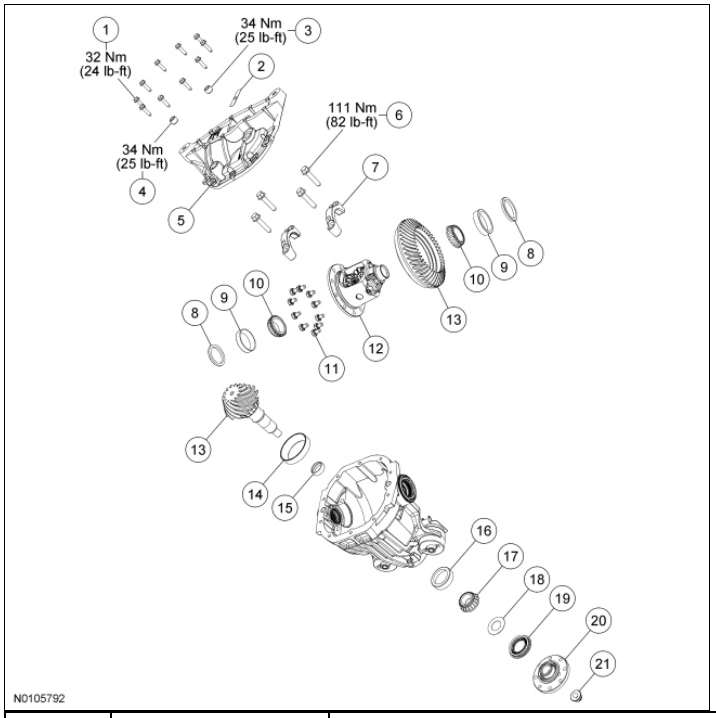
2. Using the Differential Bushing Remover/Installer, install the differential front lower insulator.





3. Install the rear axle assembly. For additional information, refer to Axle Assembly in this section.

Differential Ring And Pinion



Special Tool(s)

 ST2026-A	2 Jaw Puller 205-D072 (D97L-4221-A) or equivalent
 ST1743-A	Adapter for 205-S127 205-105 (T76P-4020-A3)

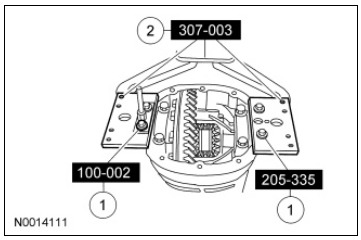
	Installer, Drive Pinion Flange 205-002 (TOOL-4858-E) or equivalent
 ST1325-A	Installer, Drive Pinion Oil Seal 205-208 (T83T-4676-A)
 ST1254-A	Plate, Bearing/Oil Seal 205-090 (T75L-1165-B)
 ST1744-A	Protector, Drive Pinion Thread 205-460
 ST1220-A	Remover, Differential Bearing 205-116 (T77F-4220-B1)
 ST1259-A	Spreader, Differential Carrier 205-001 (TOOL-4000-E) or equivalent
 ST1344-A	Spreader, Differential Housing (Plate) 205-335 (T93P-4000-A)
 ST1725-A	Step Plate 205-D061 (D83T-4205-C2) or equivalent

Material

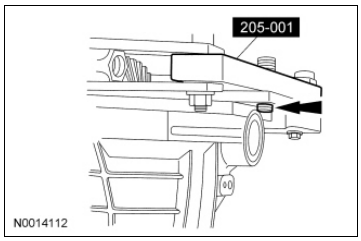
Item	Specification
Motorcraft® High Contrast Hypoid Gear Marking Compound XG-14	-
Premium Long-Life Grease XG-1-C or XG-1-K (US); CXG-1-C (Canada)	ESA-M1C75-B
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4



Item	Part Number	Description
1	390919	Differential housing cover bolt (10 required)
2	4121	Axle identification tag
3	19G406	Fill plug
4	19G406	Drain plug
5	4033	Differential housing cover
6	56187-S	Differential bearing cap bolt (4 required)
7	4224	Differential bearing cap (2 required)
8	4067	Differential bearing shims
9	4222	Differential bearing cups
10	4221	Differential bearings
11	4216	Ring gear bolt (10 required)
12	4205	Differential carrier assembly
13	4209	Differential ring gear and pinion set
14	4628	Inner pinion bearing cup
15	4662	Collapsible spacer
16	4616	Outer pinion bearing cup
17	4621	Outer pinion bearing
18	4670	Drive pinion shaft oil slinger
19	4676	Drive pinion oil seal
20	4851	Drive pinion flange
21	389546	Drive pinion nut

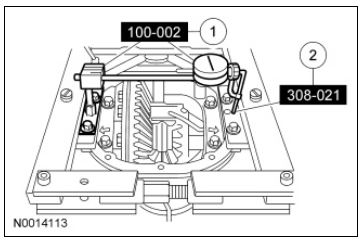
Removal

1. Remove the drain plug and drain the lubricant.
2. Remove the rear axle assembly. For additional information, refer to Axle Assembly in this section.
3. Remove the 10 differential housing cover bolts and cover.



4. Install the drain plug.
    - Tighten to 34 Nm (25 lb-ft).

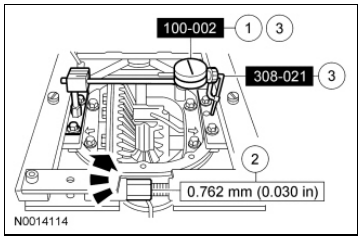
5. Using the Transmission Holding Fixture, mount the differential housing to a work bench.
    1. Attach the Differential Housing Spreader Plate and Dial Indicator Gauge with Holding Fixture to the differential housing with 4 differential housing cover bolts.
    2. Attach the Transmission Holding Fixture and Differential Housing Spreader Plates together with two 3/8-inch x 1-1/2-inch bolts.



6. ***NOTICE:*** **RH spreader set screw must not be adjusted further down than flush or the spreader rocks and damages the seal and the housing.**

    Install the Differential Carrier Spreader by placing the spreader pins in the hole in the housing spreader adapters.

7. Assemble the Dial Indicator Gauge with Holding Fixture and Clutch Housing Gauge.
    1. Install the Dial Indicator Gauge with Holding Fixture and Clutch Housing Gauge.
    2. Attach the Clutch Housing Gauge and position the tip in the housing spreader adapter hole.



8. ***NOTICE:*** **Overspreading may damage the differential housing.**

    NOTE: Tighten and loosen the Differential Carrier Spreader screw to normalize the housing spreader adapters prior to taking the final Dial Indicator Gauge reading.

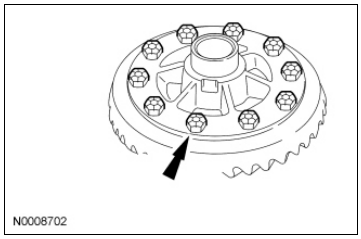
    Spread the differential housing to the specification.

    1. Adjust the Dial Indicator Gauge to zero.
    2. Tighten the screw until the differential housing is spread to the specification.
    3. Remove the Dial Indicator Gauge with Holding Fixture and Clutch Housing Gauge.

9. ***NOTICE:*** **Mark the position and location of the differential bearing caps. Always install the differential bearing caps in their original locations and positions or damage to the component may occur.**

   Remove the differential bearing caps.

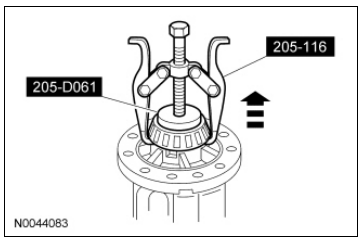
   1. Remove the 4 differential bearing cap bolts.
   2. Remove the 2 differential bearing caps.



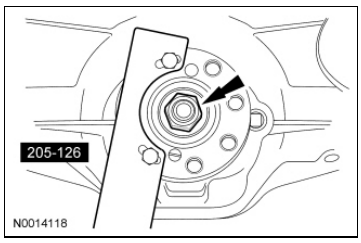
10. ***NOTICE:*** **Use wood blocks to avoid damaging the differential housing.**

    Remove the differential assembly.

    1. Position wood blocks at the top and bottom of the differential assembly.
    2. Pry the differential assembly and the 2 differential bearing shims out of the differential housing.
    3. Remove the Differential Carrier Spreader.

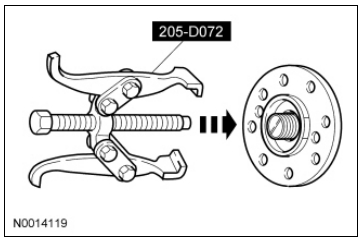


11. Remove and discard the 10 ring gear bolts.

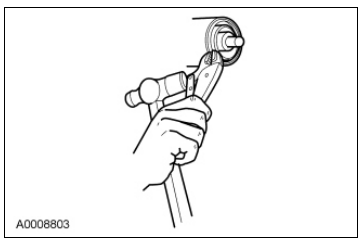


12. ***NOTICE:*** **Do not damage the ring gear bolt hole threads.**

    Insert a punch in the ring gear bolt holes and drive the differential ring gear off.

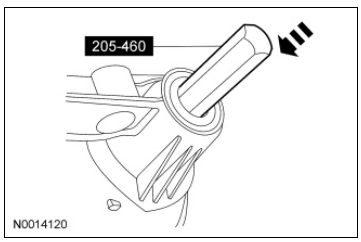


13. Using the Differential Bearing Remover and Step Plate, remove the 2 differential bearings.

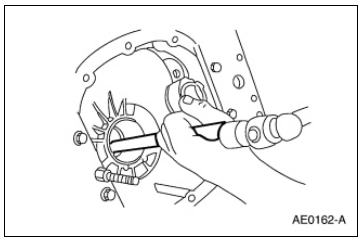


14. Using the Driver Pinion Flange Holding Fixture, hold the pinion flange to remove and discard the pinion nut.

15. Using the 2 Jaw Puller, remove the pinion flange.

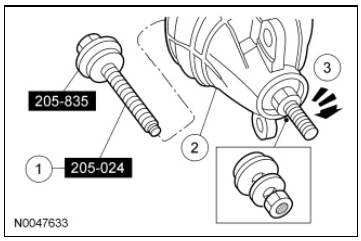


16. Use a screwdriver to force up the metal flange of the drive pinion oil seal. Install gripping pliers and strike with a hammer to remove the drive pinion oil seal.



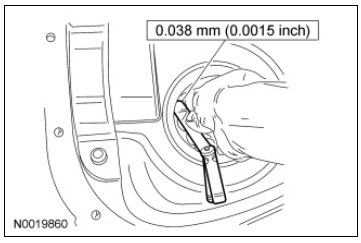
17. Remove the drive pinion oil seal deflector, drive pinion oil seal slinger, the outer pinion bearing and the drive pinion collapsible spacer.

18. Using the Drive Pinion Thread Protector and a soft-faced hammer, remove the differential pinion gear from the differential housing.



19. Using a brass drift and a hammer, remove the 2 differential drive pinion bearing cups from the differential housing. Tap alternately on each side of the cup to prevent them from cocking in the bore.

20. Inspect the differential case for wear or damage. If necessary, disassemble the differential case. For additional information, refer to Differential Case and Ring Gear in this section.



Installation

1. Using the Drive Pinion Bearing Cup Installers, install the inner and outer differential drive pinion bearing cups.
    1. Position the 2 bearing cups on the Drive Pinion Bearing Cup Installer.
    2. Position the Drive Pinion Bearing Cup Installer and the 2 differential drive pinion bearing cups in the differential housing.
    3. Tighten the Drive Pinion Bearing Cup Installer to fully seat the 2 differential drive pinion bearing cups in the bores.

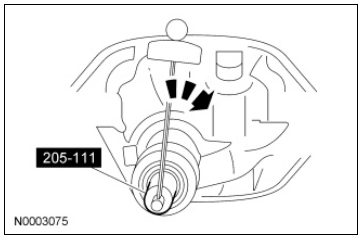
2. **NOTE:** If a feeler gauge of the specification shown can be inserted between a cup and the bottom of its bore at any point around the cup, the cup is not correctly seated.

   Make sure the 2 differential pinion bearing cups are correctly seated.

3. **NOTE:** Use the same drive pinion bearings and the drive pinion bearing adjustment shim from the drive pinion bearing adjustment shim selection procedure for final assembly.

   NOTE: Install new drive pinion bearings without any additional lubricant since the anti-rust oil provides adequate lubricant without upsetting the drive pinion bearing preload settings.

   Install the new drive pinion bearings and Adapters as shown.



Item	Part Number	Description
1	205-109	Adapter for 205-S127
2	205-105	Adapter for 205-S127
3	4630	Inner (rear) pinion bearing
4	205-129	Adapter for 205-S127
5	205-110	Adapter for 205-S127
6	4621	Outer (front) pinion bearing
7	205-111	Adapter for 205-S127

4. **NOTE:** This step duplicates drive pinion bearing preload.

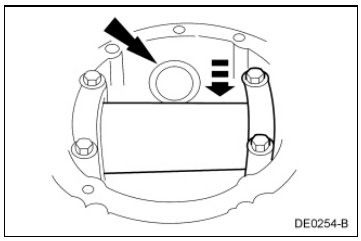
   Thread the Adapter onto the screw and tighten to the specification.

   - Tighten to 2.2 Nm (20 lb-in) rotational torque.

5. **NOTE:** Position the Adapter so it does not contact the housing.

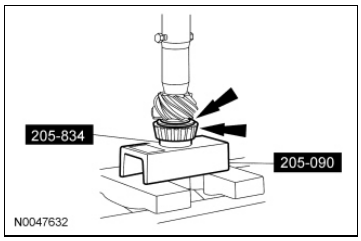
   NOTE: Offset the Adapter to obtain an accurate reading.

   Rotate the Adapter several half turns to seat the drive pinion bearings. Position the Adapter as shown.



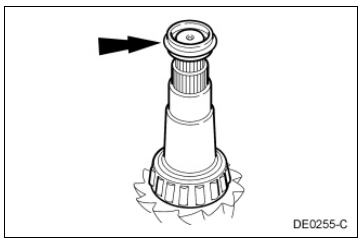
6. Install the Drive Pinion Gauge Tube.
   1. Position the Drive Pinion Gauge Tube on the differential housing differential bearing seat.

2. Install the 2 differential bearing caps.
3. Install the 4 differential bearing cap bolts.
    - Tighten to 111 Nm (82 lb-ft).



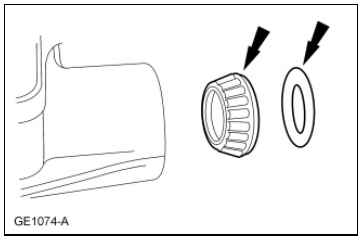
7. Use a drive pinion bearing adjustment shim as a gauge for shim selection. Check the drive pinion bearing adjustment shim thickness between the Adapter and the gauge tube. A slight drag indicates correct shim selection.

8. Remove the Drive Pinion Gauge Tube and Adapters.



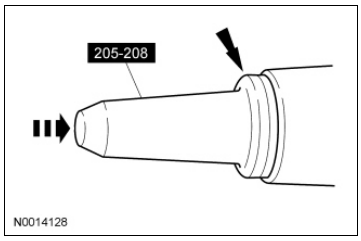
9. Position the selected drive pinion bearing adjustment shim and the inner pinion bearing on the drive pinion gear stem.

10. Using the Bearing/Oil Seal Plate and Drive Pinion Bearing Cone Installer and a suitable press, firmly seat the drive pinion bearing adjustment shim and inner pinion bearing on the drive pinion gear stem.

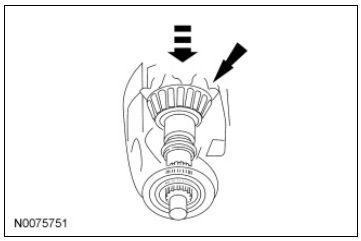


11. **NOTE:** Make sure the splines on the drive pinion gear stem are free of burrs. If burrs are evident, remove them using a fine crocus cloth.

    Place a new differential drive pinion collapsible spacer on the drive pinion gear stem against the pinion stem shoulder.

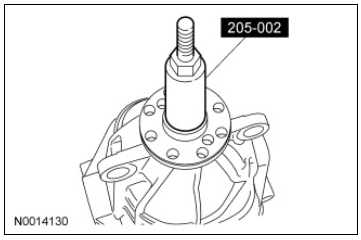


12. Install the outer pinion bearing and the drive pinion oil seal slinger.



13. **NOTE:** Coat the drive pinion seal lips with grease.

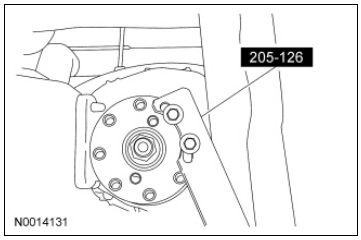
    Using the Drive Pinion Oil Seal Installer, install the new drive pinion seal.



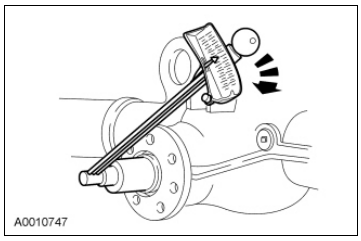
14. Install the drive pinion gear with the differential drive pinion collapsible spacer in the differential housing.

15. Position the pinion flange.
    1. Lubricate the pinion flange splines with grease.
    2. Position the pinion flange.

16. Using the Drive Pinion Flange Installer, install the pinion flange.

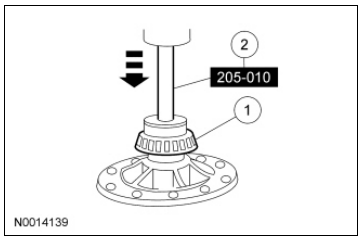


17. ***NOTICE:*** **Do not, under any circumstance, loosen the pinion nut to reduce drive pinion bearing preload. If it is necessary to reduce drive pinion bearing preload, install a new differential drive pinion collapsible spacer and pinion nut or damage to the component may occur.**

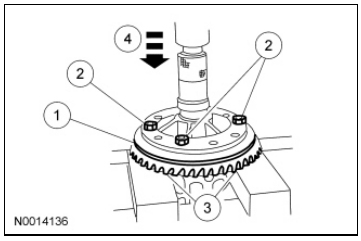


NOTE: Remove the Drive Pinion Flange Holding Fixture while taking drive pinion bearing preload readings with the Nm (lb-in) torque wrench.

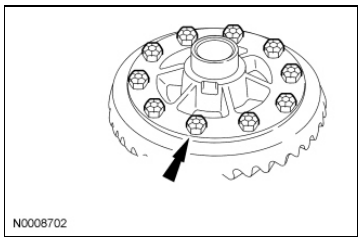
Use the Drive Pinion Flange Holding Fixture to hold the pinion flange while tightening the new pinion nut.



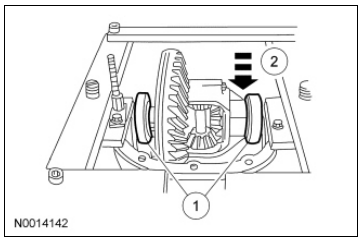
- Rotate the drive pinion gear occasionally to make sure the drive pinion bearings seat correctly. Take frequent drive pinion bearing preload readings by rotating the drive pinion gear with a Nm (lb-in) torque wrench.



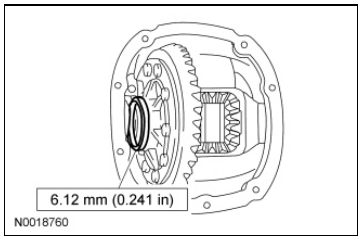
18. Tighten the pinion nut to set the drive pinion bearing preload. Refer to the torque specification for drive pinion bearings in the Specifications portion of this section.



19. Press the left and right differential bearing on the differential assembly.
    1. Position the 2 differential bearings.
    2. Using the Differential Side Bearing Installer, press the differential bearing on the differential assembly.

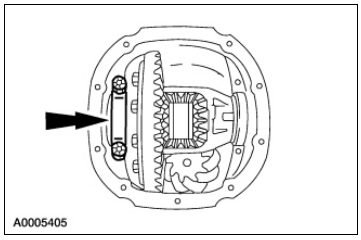


20. Install the differential ring gear.
    1. Place the differential ring gear on the differential assembly.
    2. Hand-start 3 new ring gear bolts to align the holes in the differential ring gear and the differential assembly.
    3. Place the differential assembly and differential ring gear onto the press bed blocks with the differential ring gear teeth facing downward.
    4. Press the differential ring gear into place.

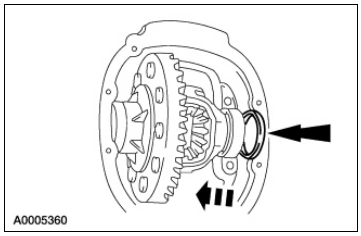


21. Install the 7 new ring gear bolts.
    - Tighten the 10 bolts to 127 Nm (94 lb-ft).

22. Install the differential assembly.
    1. Position the 2 differential bearing cups on the 2 differential bearings.
    2. Lower the differential assembly in place.

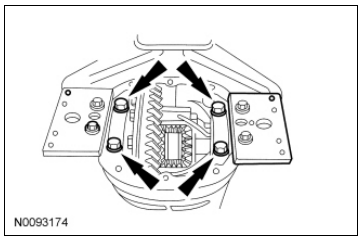


23. Install a differential bearing shim of the thickness shown on the LH side of the differential case.



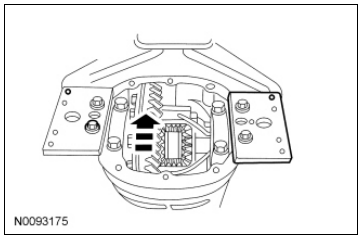
24. **NOTE:** Apply pressure toward the left side to make sure the left bearing cap is seated.

    Install the left bearing cap and loosely install the 2 bearing cap bolts.

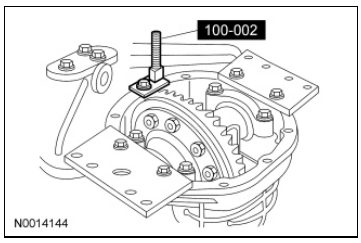


25. **NOTE:** Apply pressure toward the left side to make sure the left bearing cap is seated.

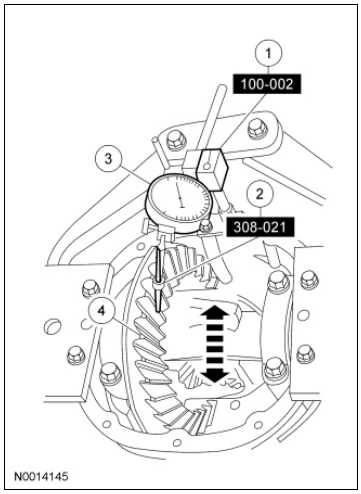
    Install progressively thicker differential bearing shims on the right side until the thickest differential bearing shim can be inserted by hand.



26. Install the right bearing cap and 2 bolts.



27. Tighten the 4 differential bearing cap bolts.
    - Tighten to 111 Nm (82 lb-ft).

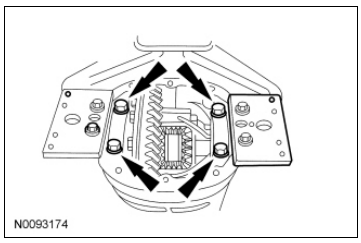


28. Rotate the differential case to make sure it turns freely.

29. Install the Dial Indicator Gauge with Holding Fixture at the 12 o'clock position.

30. Using the Dial Indicator Gauge with Holding Fixture and Clutch Housing Gauge, measure the differential ring gear backlash at 4 equally spaced points.
    1. Attach the Dial Indicator Gauge with Holding Fixture.
    2. Position the Clutch Housing Gauge tip centrally on a drive tooth.
    3. Zero the Dial Indicator Gauge.
    4. Turn the differential ring gear without turning the drive pinion gear. Record the Dial Indicator Gauge reading. The allowable backlash is 0.203 mm (0.008 in) to 0.305 mm (0.012 in) and must not vary more than 0.101 mm (0.004 in) between points measured. A backlash variation of more than 0.101 mm (0.004 in) between points checked indicates gear/case runout.
        - ♦ To correct for a high or low backlash, proceed as follows.

31. To correct for high or low backlash, increase the thickness of one differential bearing shim and decrease the thickness of the other differential bearing shim by the same amount. Refer to the following tables when adjusting the backlash.



Backlash Change Required		Thickness Change Required	
mm	**Inch**	**mm**	**Inch**
0.025	0.001	0.050	0.002
0.050	0.002	0.050	0.002

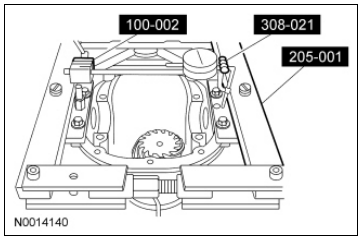
1 - RED	6.1214- 6.1341	0.2410- 0.2415

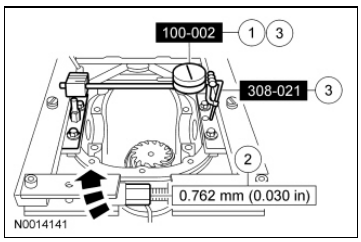


32. Remove the 4 differential bearing cap bolts.
    - Remove the differential assembly.

33. Measure the thickness of the selected right and left bearing shims.

34. To establish differential bearing preload, increase both the left and right differential bearing shim thickness by 0.203 mm (0.008 in).

35. Install the Differential Carrier Spreader, Dial Indicator Gauge with Holding Fixture and Clutch Housing Gauge.

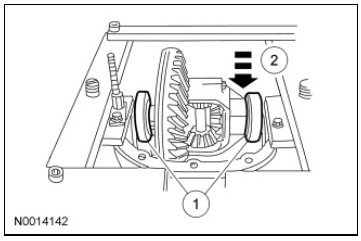


36. ***NOTICE:*** **Overspreading may damage the differential housing.**

    NOTE: Tighten and loosen the differential carrier spreader screw to normalize the housing spreader adapters prior to taking the final Dial Indicator Gauge reading.

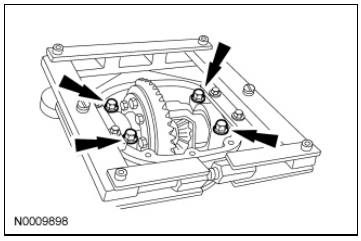
    Spread the differential housing to the specification.

    1. Adjust the Dial Indicator Gauge with Holding Fixture and Clutch Housing Gauge to zero.
    2. Tighten the screw until spreading the differential housing to the specification.
    3. Remove the Dial Indicator Gauge with Holding Fixture and Clutch Housing Gauge.

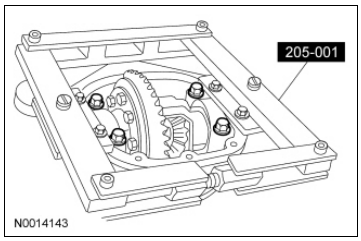


37. **NOTE:** To avoid galling the case, insert shims with a light coating of grease before installing the differential assembly.

    Place the 2 differential bearing shims in the differential housing.

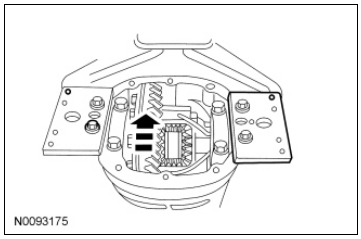


38. Install the differential assembly.
    1. Position the 2 differential bearing cups on the 2 differential bearings.
    2. Lower the differential assembly in place between the 2 differential bearing shims.

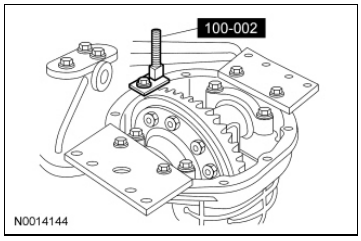


39. **NOTE:** Hand-tighten the 4 differential bearing cap bolts prior to releasing the carrier spreader.

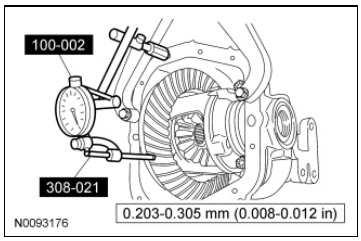
    Install the 2 differential bearing caps and the 4 differential bearing cap bolts in their original locations and positions.



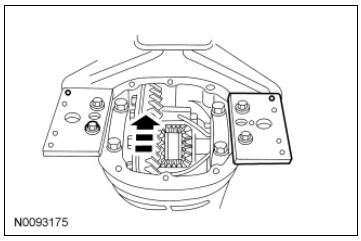
40. Loosen and remove the Differential Carrier Spreader.



41. Tighten the 4 differential bearing cap bolts.
    - Tighten to 111 Nm (82 lb-ft).



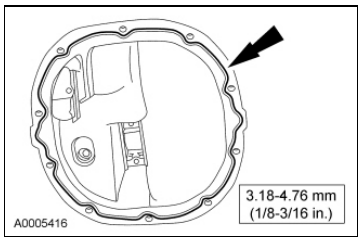
42. Rotate the differential case to make sure it turns freely.



43. Install the Dial Indicator Gauge with Holding Fixture at the 12 o'clock position.

44. Using the Dial Indicator Gauge with Holding Fixture and Clutch Housing Gauge, recheck the ring gear backlash.

45. Apply marking compound and rotate the differential assembly 5 complete revolutions.



46. Verify an acceptable pattern check.

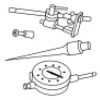
47. **NOTE:** The machined surfaces on the differential housing and the differential housing cover must be clean and free of oil before applying the new silicone sealant. Cover the inside of the axle before cleaning the machined surface to prevent contamination.

    NOTE: Install the differential housing cover within 15 minutes of applying the silicone material.

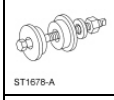
    NOTE: Allow the sealant to cure for one hour before filling the axle with lubricant.

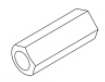
    Apply a continuous bead of silicone gasket and sealant, of the specified thickness, to the differential housing cover mounting surface as shown.

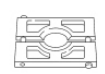
48. Install the differential housing cover and 10 differential cover bolts.
    - Tighten to 32 Nm (24 lb-ft).



49. Install the rear axle assembly. For additional information, refer to Axle Assembly in this section.







50. Remove the fill plug. Fill the axle assembly with the specified lubricant.

51. Install the fill plug.
    - Tighten to 34 Nm (25 lb-ft).

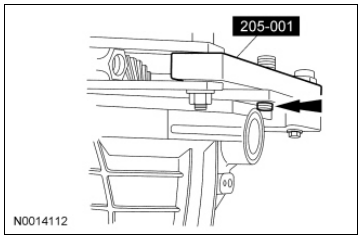
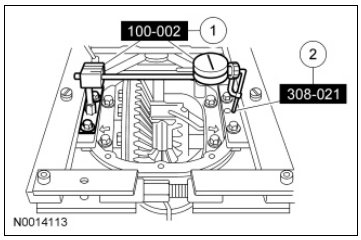
Removal

1. Remove the drain plug and drain the lubricant.
2. Remove the rear axle assembly.



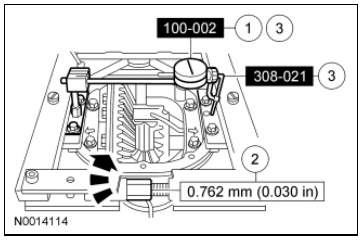
3. Remove the 10 differential housing cover bolts and the cover.

4. Using the Transmission Holding Fixture, mount the differential housing to a work bench.
    1. Attach the Differential Housing Spreader Plates and Dial Indicator Gauge with Holding Fixture to the differential housing with 4 differential housing cover bolts.
    2. Attach the Transmission Holding Fixture and Differential Housing Spreader Plates together with two 3/8-inch x 1-1/2-inch bolts.



5. ***NOTICE:*** **RH spreader set screw must not be adjusted further down than flush or the spreader rocks and damages the seal and the housing.**

    Install the Differential Carrier Spreader by placing the spreader pins in the hole in the housing spreader adapters.



6. Assemble the Dial Indicator Gauge with Holding Fixture and Clutch Housing Gauge.
    1. Install the Dial Indicator Gauge with Holding Fixture.
    2. Attach the Clutch Housing Gauge and position the tip in the housing spreader adapter hole.

7. **NOTE:** Tighten and loosen the differential carrier spreader screw to normalize the housing spreader adapters prior to taking the final Dial Indicator Gauge reading.

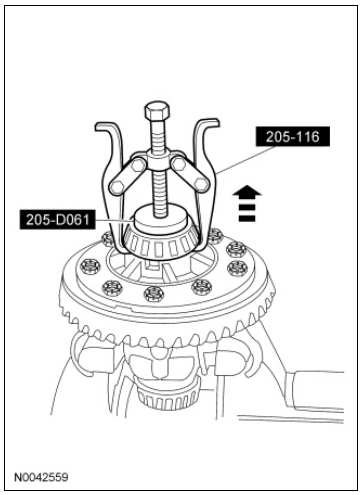
    Spread the differential housing to the specification.

    1. Adjust the Dial Indicator Gauge to zero.
    2. Tighten the screw until the differential housing is spread to the specification.
    3. Remove the Dial Indicator Gauge with Holding Fixture and Clutch Housing Gauge.

8. **NOTE:** Mark the position and location of the differential bearing caps. Always install the differential bearing caps in their original locations.

   Remove the 2 differential bearing caps.

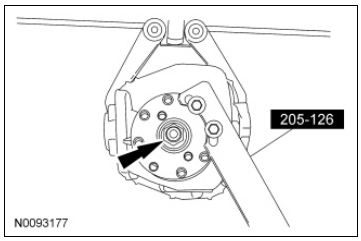
   1. Remove the 4 differential bearing cap bolts.
   2. Remove the 2 differential bearing caps.



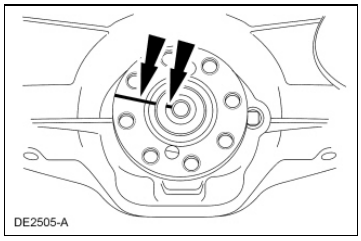
9. ***NOTICE:*** **Use wood blocks to avoid damaging the differential housing.**

   Remove the differential assembly.

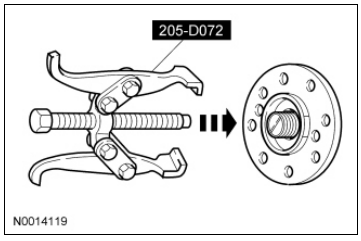
   1. Position wood blocks at the top and bottom of the differential assembly.
   2. Pry the differential assembly and the differential bearing shims out of the differential housing.
   3. Remove the Differential Carrier Spreader.



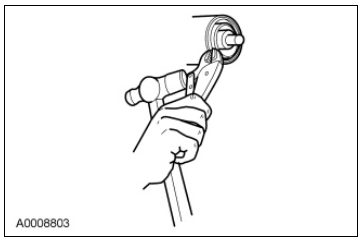
10. Using the Differential Bearing Remover and Step Plate, remove the 2 differential bearings.



11. If necessary, disassemble the differential assembly.

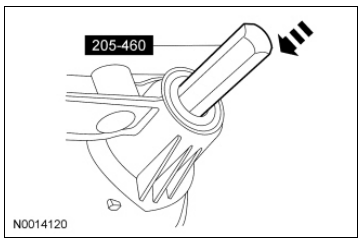


12. Using the Drive Pinion Flange Holding Fixture, hold the pinion flange to remove and discard the pinion nut.

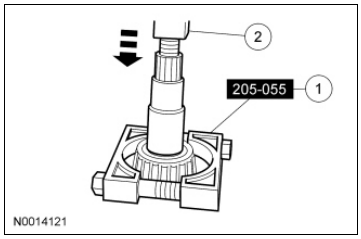


13. Index-mark the pinion flange to the drive pinion stem.

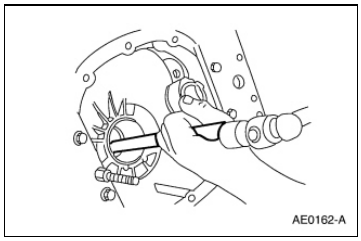
14. Using the 2 Jaw Puller, remove the pinion flange.



15. Use a screwdriver to force up the metal flange of the drive pinion oil seal. Install gripping pliers and strike with a hammer to remove the drive pinion oil seal.

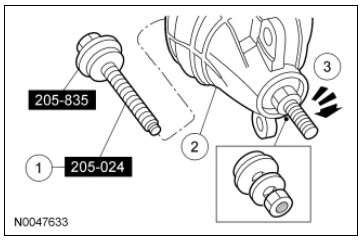


16. Remove the drive pinion oil seal deflector, drive pinion oil seal slinger, the outer pinion bearing and the drive pinion collapsible spacer.



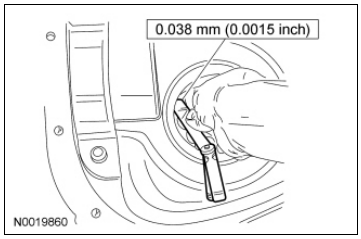
17. Using the Drive Pinion Thread Protector and a soft-faced hammer, remove the differential pinion gear from the differential housing.

18. Using the Bearing Remover and a press, remove the drive pinion inner bearing.
    1. Position the Bearing Remover under the drive pinion inner bearing.
    2. Using a press, remove the inner drive pinion bearing and shim.



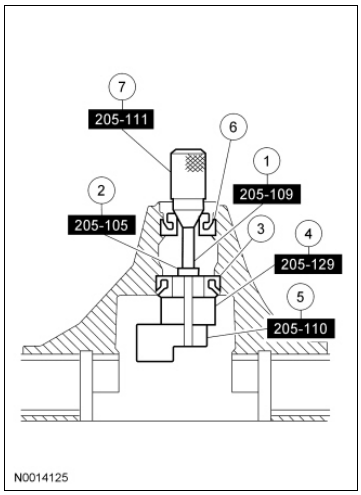
19. Using a brass drift and a hammer, remove the 2 differential drive pinion bearing cups from the differential housing. Tap alternately on each side of the cup to prevent them from cocking in the bore.

20. Inspect the differential case for wear or damage. If necessary, disassemble the differential case. For additional information, refer to Differential Case and Ring Gear in this section.



Installation

1. Using the Drive Pinion Bearing Cup Installers, install the 2 differential drive pinion bearing cups.
    1. Position the bearing cups on the Drive Pinion Bearing Cup Installers.
    2. Position the Drive Pinion Bearing Cup Installers and the 2 differential drive pinion bearing cups in the differential housing.
    3. Tighten the Drive Pinion Bearing Cup Installers to fully seat the differential drive pinion bearing cups in the bores.

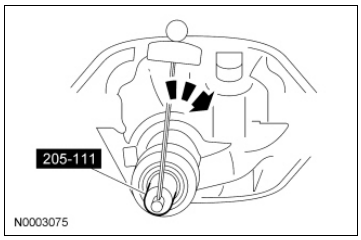


2. **NOTE:** If a feeler gauge of the specification shown can be inserted between a cup and the bottom of its bore at any point around the cup, the cup is not correctly seated.

   Make sure the 2 differential pinion bearing cups are correctly seated.

3. **NOTE:** Install new drive pinion bearings without any additional lubricant since the anti-rust oil provides adequate lubricant without upsetting the drive pinion bearing preload settings.

   Install the drive pinion bearings and Adapters as shown.

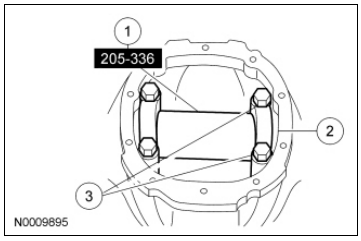


Item	Part Number	Description
1	205-109	Adapter for 205-S127
2	205-105	Adapter for 205-S127
3	4630	Inner (rear) pinion bearing
4	205-129	Adapter for 205-S127
5	205-110	Adapter for 205-S127
6	4621	Outer (front) pinion bearing
7	205-111	Adapter for 205-S127

4. **NOTE:** This step duplicates drive pinion bearing preload.

   Thread the Adapter onto the screw and tighten to the specification.

   - Tighten to 2.2 Nm (20 lb-in) rotational torque.

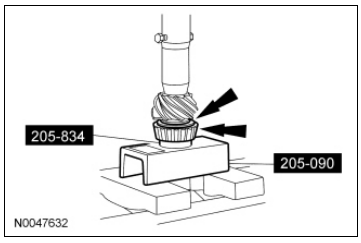


5. **NOTE:** Offset the Adapter to obtain an accurate reading.

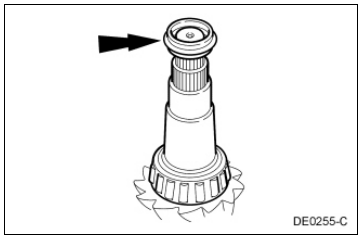
   Rotate the Adapter several half turns to seat the drive pinion bearings. Position the Adapter as shown.

6. Install the Drive Pinion Gauge Tube.
    1. Position the Drive Pinion Gauge Tube on the differential housing differential bearing seat.
    2. Install the 2 differential bearing caps.
    3. Install the 4 differential bearing cap bolts.
        - Tighten to 111 Nm (82 lb-ft).

7. Use a drive pinion bearing adjustment shim as a gauge for shim selection. Check the drive pinion bearing adjustment shim thickness between the gauge block and the gauge tube. A slight drag indicates correct shim selection.

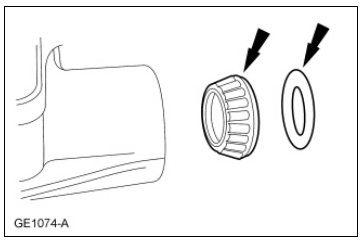


8. Remove the Adapters and Drive Pinion Gauge Tube.



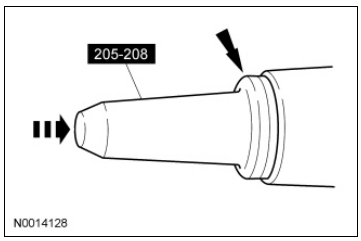
9. **NOTE:** Use the same drive pinion bearings and the drive pinion bearing adjustment shim from the drive pinion bearing adjustment shim selection procedure for final assembly.

   Position the drive pinion bearing adjustment shim and the inner pinion bearing on the drive pinion gear stem.

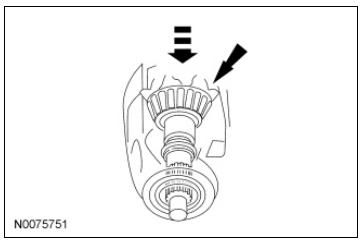


10. Using the Bearing/Oil Seal Plate and Drive Pinion Bearing Cone Installer and a suitable press, firmly seat the selected drive pinion bearing adjustment shim and inner pinion bearing on the drive pinion gear stem.

11. Place a new differential drive pinion collapsible spacer on the drive pinion gear stem against the pinion stem shoulder.



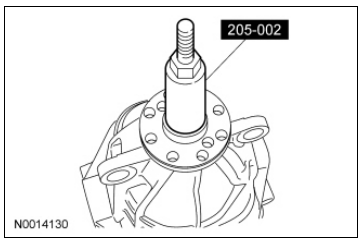
12. Install the outer pinion bearing and the drive pinion oil seal slinger.



13. **NOTE:** If the drive pinion seal becomes misaligned during installation, remove it and install a new drive pinion seal.

    NOTE: Coat the drive pinion seal lips with grease.

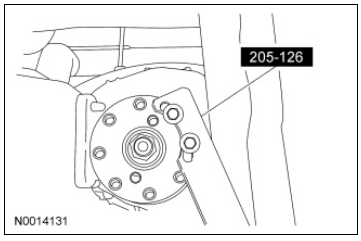
    Using the Drive Pinion Oil Seal Installer, install the new drive pinion seal.



14. Install the drive pinion gear with the differential drive pinion collapsible spacer in the differential housing.

15. Position the pinion flange.
    1. Lubricate the pinion flange splines with grease.
    2. Align the pinion flange.

16. Using the Drive Pinion Flange Installer, install the pinion flange.

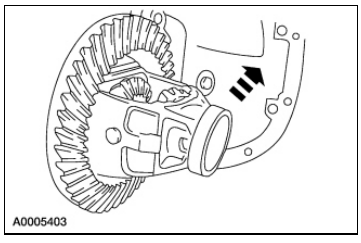


17. ***NOTICE:*** **Do not, under any circumstance, loosen the pinion nut to reduce drive pinion bearing preload or damage to the component may occur. If it is necessary to reduce drive pinion bearing preload, install a new differential drive pinion collapsible spacer and pinion nut.**

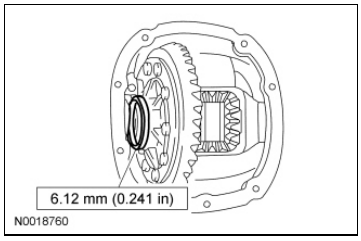
    NOTE: Remove the Drive Pinion Flange Holding Fixture while taking drive pinion bearing preload readings with the Nm (lb-in) torque wrench.

    Use the Drive Pinion Flange Holding Fixture to hold the pinion flange while tightening the pinion nut.

    - Rotate the drive pinion gear occasionally to make sure the drive pinion bearings seat correctly. Take frequent drive pinion bearing preload readings by rotating the drive pinion gear with a Nm (lb-in) torque wrench.

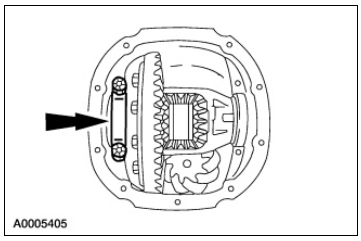


18. Tighten the pinion nut to set the drive pinion bearing preload. Refer to the torque specification for drive pinion bearings in the Specifications portion of this section.

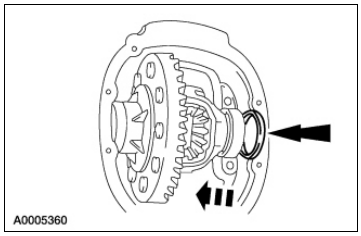


19. Press the left and right differential bearing on the differential assembly.
    1. Position the differential bearings.
    2. Using the Differential Side Bearing Installer, press the differential bearing on the differential assembly.

20. Install the differential assembly.

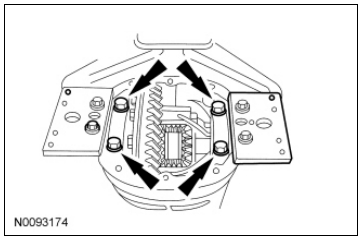


21. Install a differential bearing shim of the thickness shown on the LH side of the differential case.



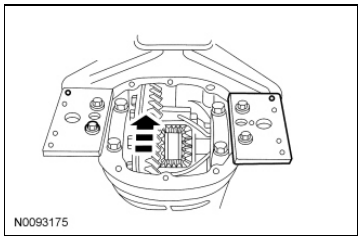
22. **NOTE:** Apply pressure toward the left side to make sure the left bearing cap is seated.

    Install the left bearing cap and loosely install the 2 bearing cap bolts.

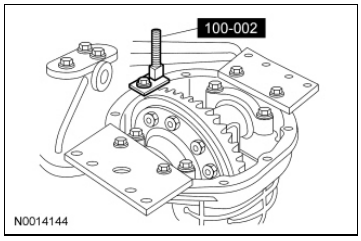


23. **NOTE:** Apply pressure toward the left side to make sure the left bearing cap is seated.

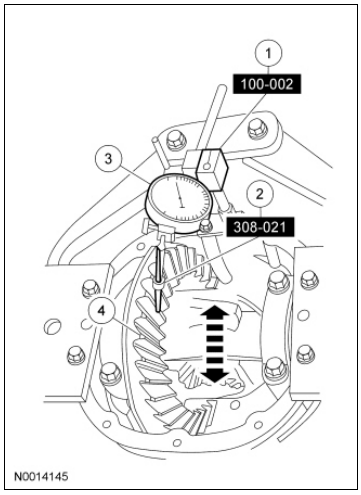
    Install progressively thicker differential bearing shims on the right side until the thickest differential bearing shim can be inserted by hand.



24. Install the right bearing cap and 2 bolts.



25. Tighten the 4 differential bearing cap bolts.
    - Tighten to 111 Nm (82 lb-ft).



26. Rotate the differential case to make sure it turns freely.

27. Install the Dial Indicator Gauge with Holding Fixture at the 12 o'clock position.

28. Using the Dial Indicator Gauge with Holding Fixture and Clutch Housing Gauge, measure the differential ring gear backlash at 4 equally spaced points.
    1. Attach the Dial Indicator Gauge.
    2. Position the Clutch Housing Gauge tip centrally on a drive tooth.
    3. Zero the Dial Indicator Gauge.
    4. Turn the differential ring gear without turning the drive pinion gear. Record the Dial Indicator Gauge reading. The allowable backlash is 0.203-0.305 mm (0.008-0.012 in) and must not vary more than 0.101 mm (0.004 in) between points measured. A backlash variation of more than 0.101 mm (0.004 in) between points checked indicates gear/case runout.
        - To correct for a high or low backlash, proceed as follows.

29. To correct for high or low backlash, increase the thickness of one differential bearing shim and decrease the thickness of the other differential bearing shim by the same amount. Refer to the following tables when adjusting the backlash.

Backlash Change Required		Thickness Change Required	
mm	**Inch**	**mm**	**Inch**
0.025	0.001	0.050	0.002
0.050	0.002	0.050	0.002
0.076	0.003	0.101	0.004
0.101	0.004	0.152	0.006

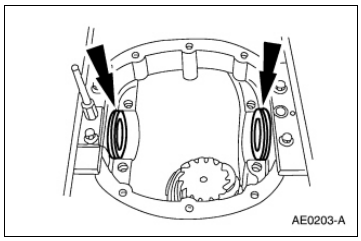
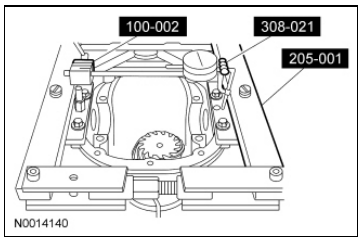
1 - RED	6.1214- 6.1341	0.2410- 0.2415

30. Remove the 4 differential bearing cap bolts.
    - Remove the differential assembly.



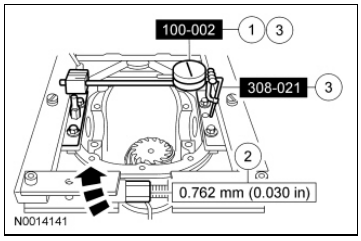
31. Measure the thickness of the selected right and left bearing shims.



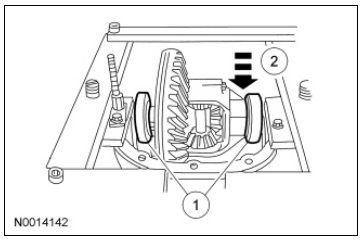
32. To establish differential bearing preload, increase both the left and right differential bearing shim thickness by 0.203 mm (0.008 in).

33. ***NOTICE:*** **To avoid galling the case, insert shims with a light coating of grease before installing the differential assembly. If not carried out in this order, the aluminum housing can be damaged.**

    Place the 2 differential bearing shims in the differential housing.



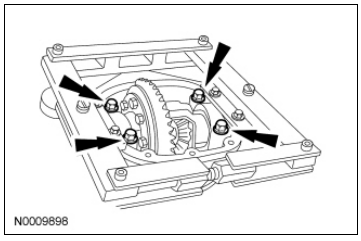
34. Install the Differential Carrier Spreader, Dial Indicator Gauge with Holding Fixture and Clutch Housing Gauge.



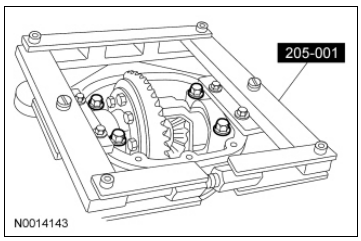
35. **NOTE:** Tighten and loosen the differential carrier spreader screw to normalize the housing spreader adapters prior to taking the final Dial Indicator Gauge reading.

    Spread the differential housing to the specification.

    1. Adjust the Dial Indicator Gauge to zero.
    2. Tighten the screw until spreading the differential housing to the specification.
    3. Remove the Dial Indicator Gauge with Holding Fixture and Clutch Housing Gauge.

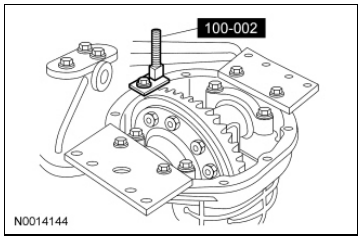


36. Install the differential assembly.
    1. Position the 2 differential bearing cups on the 2 differential bearings.
    2. Lower the differential assembly in place between the 2 differential bearing shims.

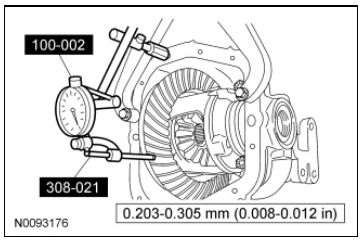


37. **NOTE:** Hand-tighten the differential bearing cap bolts prior to releasing the carrier spreader.

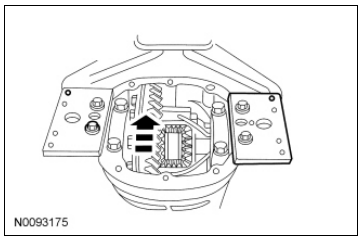
    Install the 2 differential bearing caps and the 4 differential bearing cap bolts in their original locations and positions.



38. Loosen and remove the Differential Carrier Spreader.



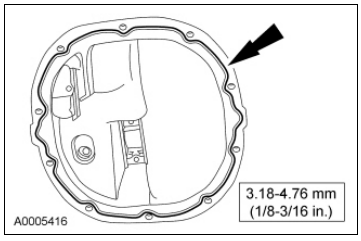
39. Tighten the 4 differential bearing cap bolts.
    - Tighten to 111 Nm (82 lb-ft).



40. Install the Dial Indicator Gauge with Holding Fixture at the 12 o'clock position.

41. Using the Dial Indicator Gauge with Holding Fixture and Clutch Housing Gauge, recheck the ring gear backlash.

42. Apply marking compound and rotate the differential assembly 5 complete revolutions.



43. Verify an acceptable pattern check.

44. **NOTE:** Install the differential housing cover within 15 minutes of applying the silicone material.

    NOTE: Allow the sealant to cure for one hour before filling the axle with lubricant.

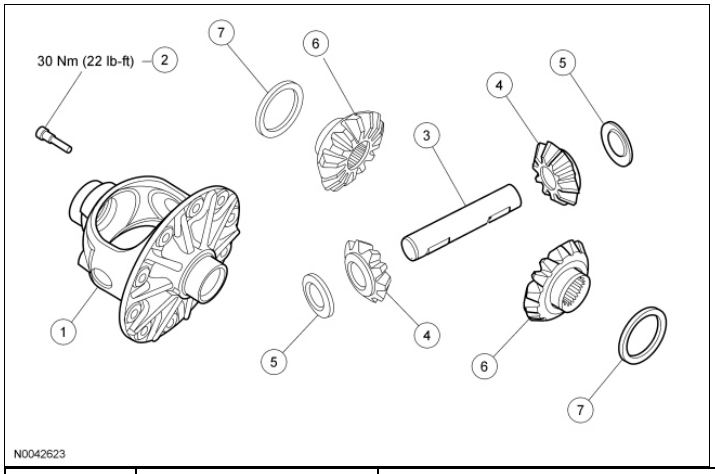
    Apply a continuous bead of silicone gasket and sealant, of the specified thickness, to the differential housing cover mounting surface as shown.

    - Use silicone gasket and sealant.

45. Install the differential housing cover and 10 housing cover bolts.

46. Install the rear axle assembly. For additional information, refer to Axle Assembly in this section.

47. Install the drain plug and remove the fill plug.
    - Tighten to 34 Nm (25 lb-ft).

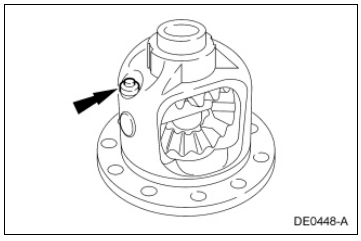


48. Fill the axle assembly with the specified lubricant.

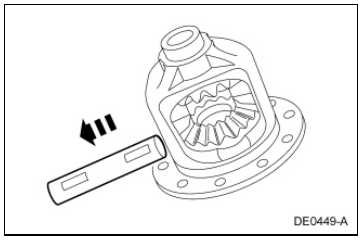
49. Install the fill plug.
    - Tighten to 34 Nm (25 lb-ft).

Differential Case and Ring Gear

Material

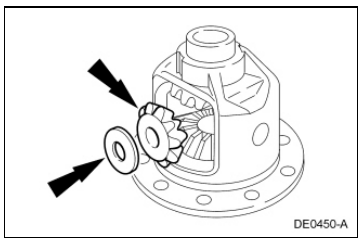


Item	Specification
Motorcraft® SAE 75W-140 Synthetic Rear Axle Lubricant XY-75W140-QL (US); CXY-75W140-1L (Canada)	WSL-M2C192-A and GL-5

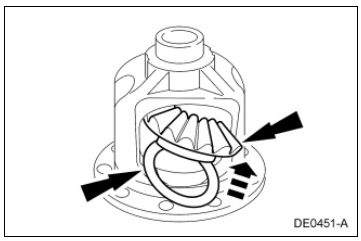


Item	Part Number	Description
1	4205	Differential assembly
2	387505	Differential pinion shaft lock bolt
3	4211	Differential pinion shaft
4	4215	Differential pinion gears
5	4230	Differential pinion gear thrust washers
6	4236	Differential side gears
7	4228	Differential side gear thrust washers

Disassembly

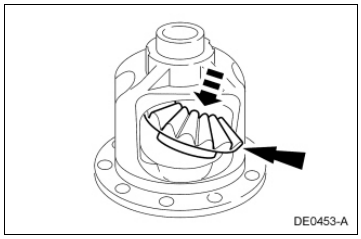


1. Remove and discard the differential pinion shaft lock bolt.



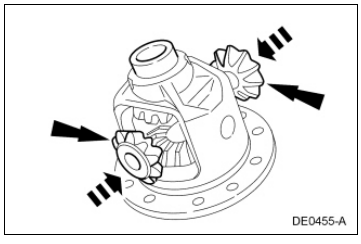
2. Remove the differential pinion shaft.

3. Rotate and remove the 2 differential pinion gears and 2 differential pinion gear thrust washers.



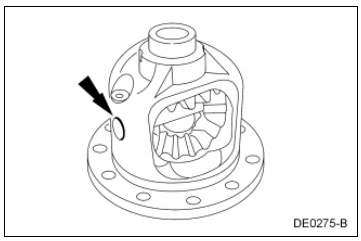
4. Remove the 2 differential side gears and the 2 differential side gear thrust washers.

Assembly



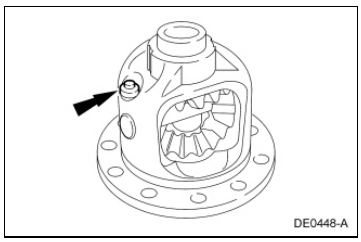
1. **NOTE:** Lubricate the differential side gears and differential side gear thrust washers with synthetic rear axle lubricant.

   Install the 2 differential side gears and the 2 differential side gear thrust washers.



2. **NOTE:** Lubricate the differential pinion gears and the differential pinion gear thrust washers with synthetic rear axle lubricant.

   Install and rotate the 2 differential pinion gears and the 2 differential pinion gear thrust washers.



3. **NOTE:** Align the hole in the differential pinion shaft with the hole in the differential case.

Install the differential pinion shaft.

4. Install a new differential pinion shaft lock bolt.
   - Tighten to 30 Nm (22 lb-ft).

Material

Item	Specification	Fill Capacity
Motorcraft® High Contrast Hypoid Gear Marking Compound XG-14	-	-
Motorcraft® SAE 80W-90 Premium Rear Axle Lubricant XY-80W90-QL (US); CXY-80W90-1L (Canada)	WSP-M2C197-A	1.3L (2.7 pt) to the bottom of the filler hole
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4	-

General Specifications

Item	Specification
Front Axle	
Available drive pinion bearing adjustment shim in steps of 0.05 mm (0.002 in)	1.35-1.85 mm (0.053-0.073 in)
Maximum backlash variation between points checked	0.050 mm (0.002 in)
Maximum spread of differential housing	0.381 mm (0.015 in)
Pinion bearing preload (original collapsible spacer)	0.56 Nm (5 lb-in) more than recorded disassembly torque
Pinion bearing preload (new collapsible spacer)	1.7-3.4 Nm (15-30 lb-in)
Ring gear backlash	0.13-0.20 mm (0.005-0.008 in)

Torque Specifications

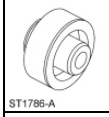
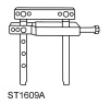
Differential bearing cap bolts	61	45	-
Differential housing cover bolts	29	21	-
Differential ring gear bolts	122	90	-
Fill plug	27	20	-

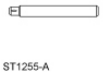
Front Drive Axle and Differential

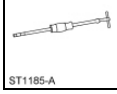
The front axle assembly contains the following:

- Full float axle design with turning capabilities
- Integral-type housing hypoid gear design
- Hypoid differential ring gear and pinion that consists of a 180.98 mm (7.125 in) ring gear and an overhung drive pinion, which is supported by 2 opposed tapered roller bearings
- Pinion bearing preload is maintained by a drive pinion collapsible spacer that is on the differential pinion shaft and adjusted by the pinion nut
- Axle housing assembly that is cast aluminum with a stamped differential housing cover
- Assembly that is mounted to the vehicle through 3 rubber isolators
- Differential housing cover that uses silicone sealant as a gasket
- Differential pinion shaft that is retained by a differential pinion shaft lock pin assembled to the differential case
- Differential case that is mounted in the rear axle housing between 2 opposing differential bearings that are retained in the rear axle housing by removable bearing caps
- Motorcraft 80W-90 Premium Rear Axle Lubricant XY-80W90-QL or equivalent meeting Ford specification WSP-M2C197-A is used in this assembly
- Differential bearing preload and ring gear backlash are adjusted by differential bearing shims that are located between the differential housing and the differential bearings
- Front axle identification that is on an mylar tag attached to differential housing





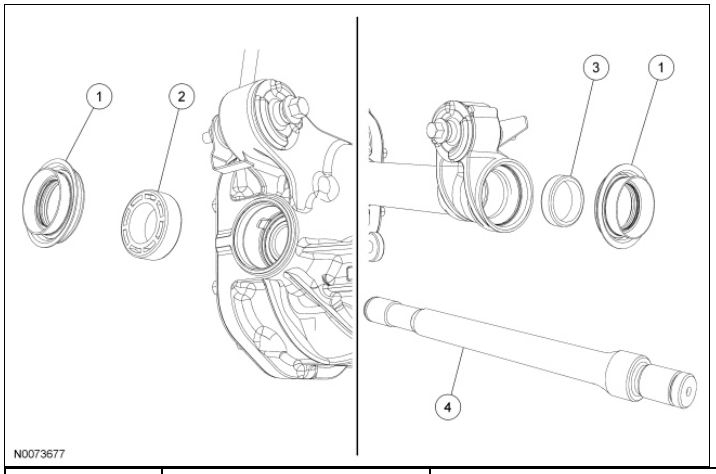




The front drive axle receives rotational torque from the front driveshaft. The direction of the rotation determines movement of the vehicle. The rotation enters the front drive axle through the drive pinion flange, turning the drive pinion and rotating the ring gear. The ring gear is bolted to the differential case. The differential case houses the pinion shaft upon which the differential pinion gears ride. The pinion gears are in mesh with the differential side gears with splined axle shafts. It is the unique arrangement of the differential that allows the axle shafts to be driven at different speed when needed, such as when driving around corners.

Front Drive Axle

Refer to Section 205-00 .



Stub Shaft Pilot Bearing and Seal

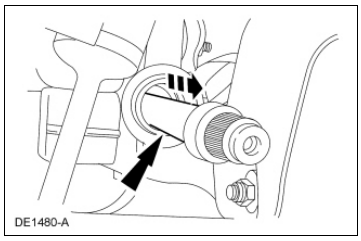
Special Tool(s)

 ST2472-A	Axle Bearing Replacer (RH) 205-345 (T95T-1175-B)
 ST1786-A	Axle Seal Replacer 205-350 (T95T-3010-A)
 ST1362-A	Bearing Remover 307-318 (T94P-77001-KH)
 ST1609A	Converter Oil Seal Remover 307-309 (T94P-77001-BH)
 ST1255-A	Handle 205-153 (T80T-4000-W)
 ST1768-A	Installer, Front Axle Bearing (LH) 205-347 (T95T-1175-D)
 ST1185-A	Slide Hammer 100-001 (T50T-100-A)

Material

Item	Specification
Motorcraft® SAE 80W-90 Premium Rear Axle Lubricant XY-80W90-QL (US); CXY-80W90-1L (Canada)	WSP-M2C197-A

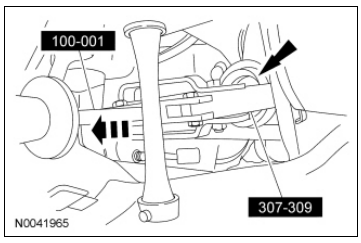
Item	Part Number	Description
1	4606	Stub shaft pilot bearing seal
2	2002806	Stub shaft pilot bearing bushing
3	2002805	Stub shaft pilot bearing
4	3A380	Axle shaft



Removal

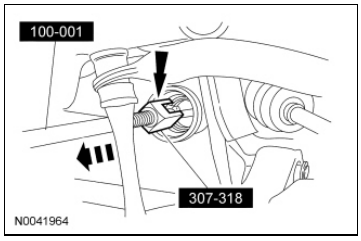
Both sides

1. Remove the halfshafts. For additional information, refer to Section 205-04 .



Right side

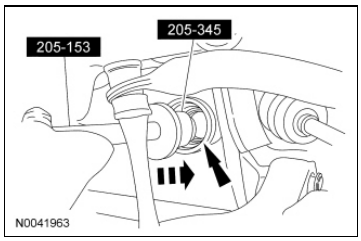
2. Remove the axle shaft.



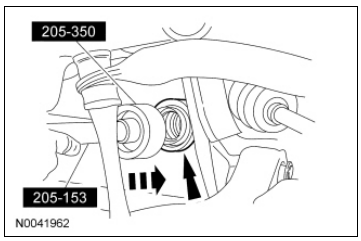
Both sides

3. Using the Converter Oil Seal Remover and a Slide Hammer, remove the stub shaft oil seals.

4. Using the Bearing Remover and a Slide Hammer, remove the stub shaft pilot bearings.

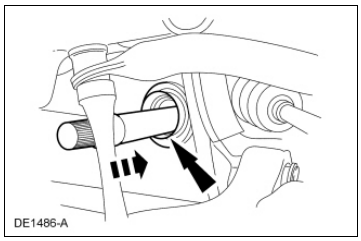


5. Clean the bearing and seal surfaces of any foreign material.



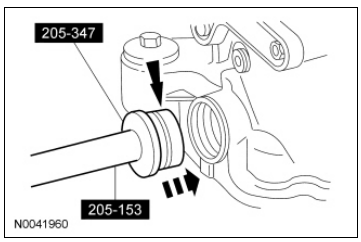
Installation

Right side

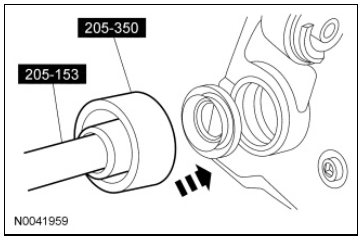


1. Using the Handle and Axle Bearing Replacer (RH), install the stub shaft pilot bearing.

2. Using the Handle and Axle Seal Replacer, install the stub shaft oil seals.



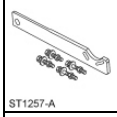
3. Install the axle shaft.

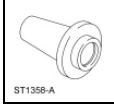


Left side

4. Using the Handle and Front Axle Bearing Installer (LH), install the stub shaft bearing.

5. Using the Handle and Axle Seal Replacer, install the stub shaft seal.

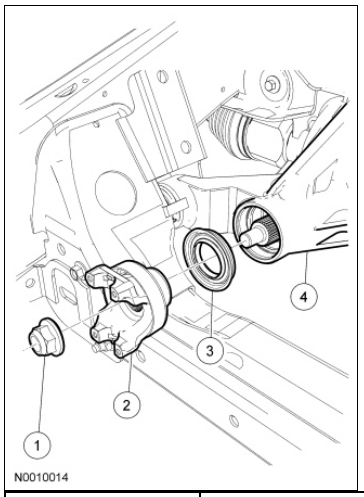




Both sides

6. Refill the front drive axle to the correct level with lubricant.

7. Install the halfshafts. For additional information, refer to Section 205-04 .



Drive Pinion Flange and Seal

Special Tool(s)

 ST2026-A	2 Jaw Puller 205-D072 (D97L-4221-A) or equivalent
 ST1257-A	Holding Fixture, Drive Pinion Flange 205-126 (T78P-4851-A)
 ST1600-A	Installer, Drive Pinion Flange 205-209 (T83T-4851-A)
 ST1358-A	Installer, Drive Pinion Oil Seal 205-133 (T79P-4676-A)

Material

Item	Specification
Motorcraft® SAE 80W-90 Premium Rear Axle Lubricant XY-80W90-QL (US); CXY-80W90-1L (Canada)	WSP-M2C197-A

Item	Part Number	Description
1	3T222	Pinion nut and washer
2	4851	Pinion flange
3	4676	Drive pinion oil seal
4	3010	Differential housing

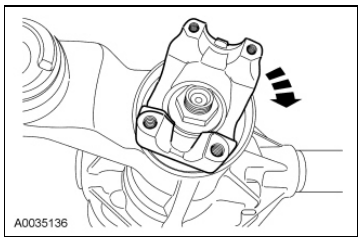
Removal

NOTE: This operation disturbs the pinion bearing preload. Carefully reset the pinion bearing preload during assembly.

1. **NOTE:** The front wheels and tires and brake calipers must be removed to prevent drag during the pinion bearing preload recording and adjustment.

   Remove the wheels and tires. For additional information, refer to Section 204-04 .

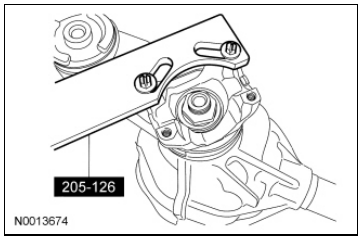
2. Remove the front driveshaft. For additional information, refer to Section 205-01 .



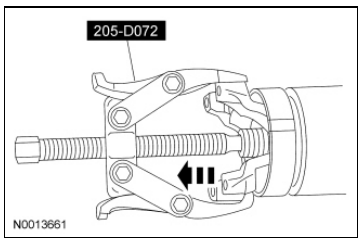
3. ***NOTICE:*** **Do not allow the caliper and anchor plate assembly to hang from the brake hose or damage to the hose can occur.**

   Remove the 4 brake caliper anchor bolts and position the caliper and anchor plate assemblies aside.

   - Support the caliper and anchor plate assembly using mechanic's wire.

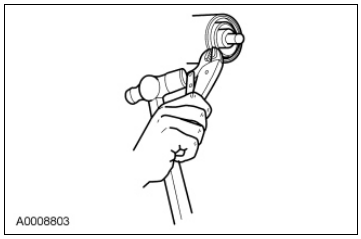


4. Measure and record the pinion bearing preload.
   - Using a Nm torque wrench, rotate the pinion gear. Measure the torque required to maintain pinion gear rotation.

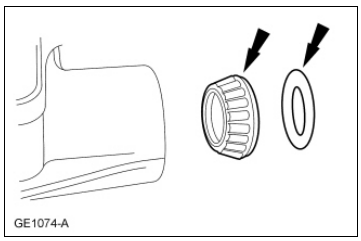


5. Index-mark the pinion flange and the pinion gear stem.

6. Using the Drive Pinion Flange Holding Fixture to hold the pinion flange, remove and discard the pinion nut.



7. Using the 2 Jaw Puller, remove the pinion flange.

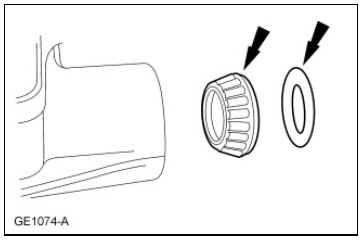


8. Inspect the pinion flange for burrs and damage. Inspect the end of the pinion flange that contacts the pinion bearing cone, pinion nut counterbore and drive pinion oil seal surface for nicks. Discard the pinion flange if damaged.

9. Use a screwdriver to force up the metal portion of the pinion seal. Using gripping pliers and a hammer, remove the drive pinion oil seal.

10. Remove the drive pinion oil slinger and the outer pinion bearing.

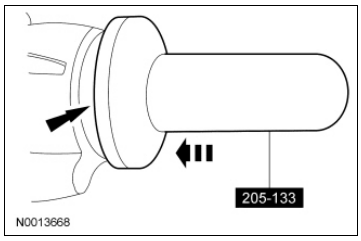
11. Remove and discard the collapsible spacer.



12. Verify the splines on the pinion stem are free of burrs. If burrs are evident, remove them with a fine crocus cloth.

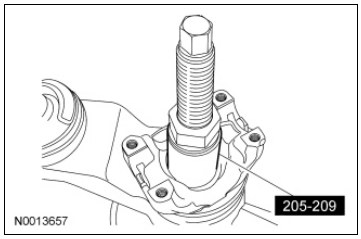
13. Clean the drive pinion oil seal bore.

Installation



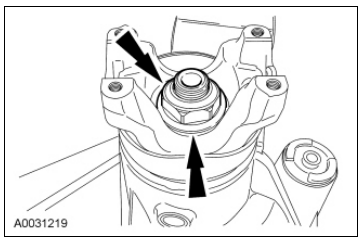
1. Install a new collapsible spacer.

2. Install the outer pinion bearing and the drive pinion oil slinger.



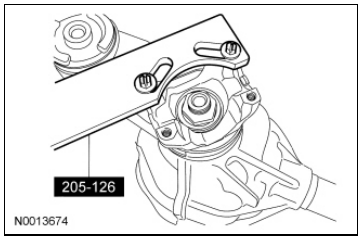
3. **NOTE:** Lubricate the drive pinion oil seal lips with axle lubricant.

   Using the Drive Pinion Oil Seal Installer, install the drive pinion oil seal.

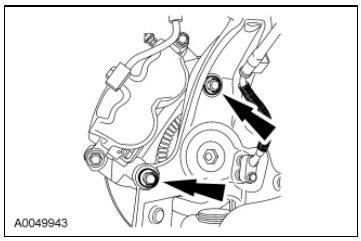


4. ***NOTICE:*** **Never install the pinion flange with power tools or damage to the component may occur.**

   Align the index marks and using the Drive Pinion Flange Installer, install the pinion flange.



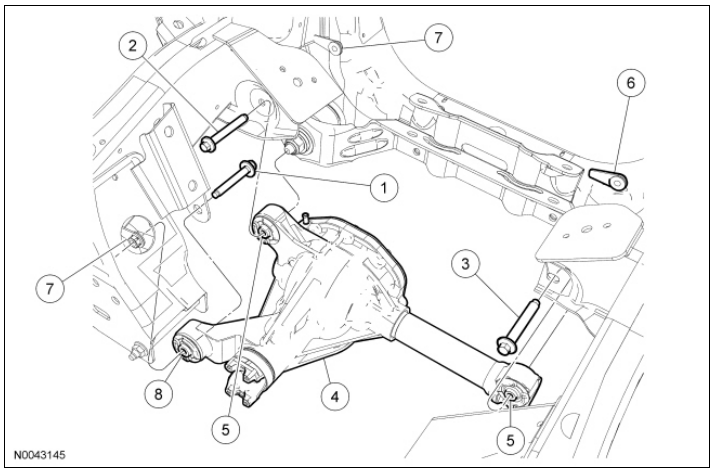
5. Install the new pinion nut. Only hand-tighten the pinion nut at this time.



6. ***NOTICE:*** **Do not loosen the pinion nut to reduce pinion bearing preload. Install a new collapsible spacer and pinion nut if pinion bearing preload reduction is necessary or damage to the component may occur.**

   Using the Drive Pinion Flange Holding Fixture to hold the pinion flange, tighten the pinion nut to set the pinion bearing preload.

   - Tighten the pinion nut, rotating the pinion occasionally to make sure the pinion bearings are seating correctly. Take frequent pinion bearing preload readings by rotating the pinion gear with a Nm torque wrench. The final reading must be 0.56 Nm (5 lb-in) more than the initial reading taken during removal.

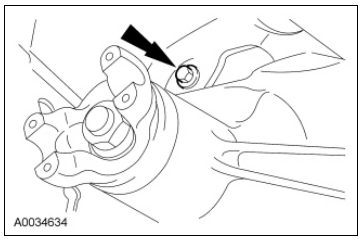


7. Position the brake caliper and anchor plate assemblies, then install the 4 bolts.
    - Tighten to 165 Nm (122 lb-ft).

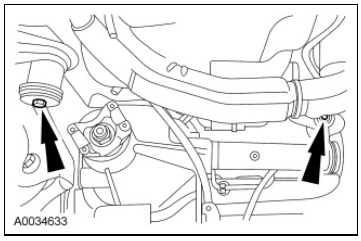
8. Install the front driveshaft. For additional information, refer to Section 205-01 .

9. Install the wheels and tires. For additional information, refer to Section 204-04 .

Axle Assembly



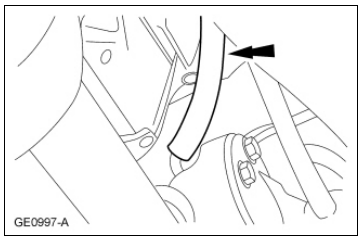
Item	Part Number	Description
1	W506549	Axle insulator bolt
2	W506549	Axle insulator bolt
3	W506549	Axle insulator bolt
4	3010	Axle assembly
5	3A443	Axle insulator bushings
6	W708348	Axle tube insulator bolt flag nut
7	W706348	Axle insulator bolt elbow flag nuts
8	3A443	Axle insulator bushing



Removal and Installation

1. Remove the front halfshafts. For additional information, refer to Section 205-04 .
2. Remove the front driveshaft. For additional information, refer to Section 205-01 .
3. **NOTE:** Securely strap the jack to the axle.

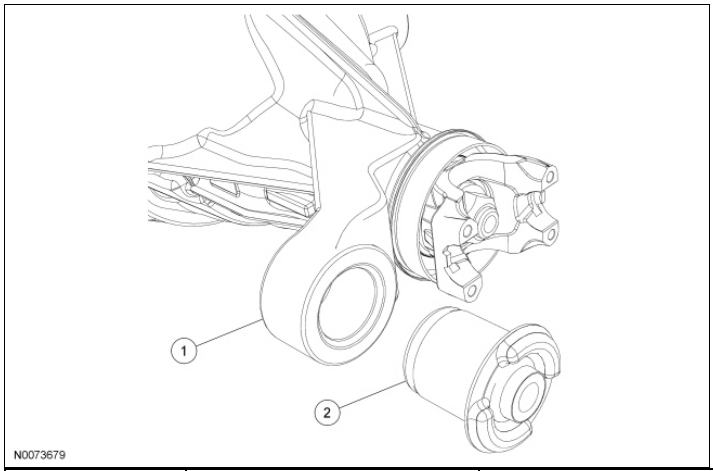
   Position a suitable hydraulic jack under the front axle.



4. Remove and discard the 3 axle insulator bolts.
   - Tighten the 3 new bolts to 100 Nm (74 lb-ft).

5. **NOTE:** Lower the axle to gain access to the axle vent hose.

   Disconnect the axle vent hose.



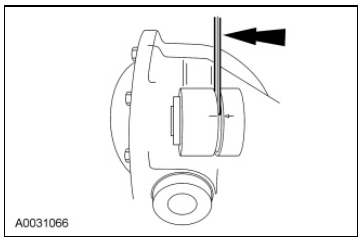
6. Lower the axle assembly from the vehicle.

7. To install, reverse the removal procedure.

Axle Carrier Bushing

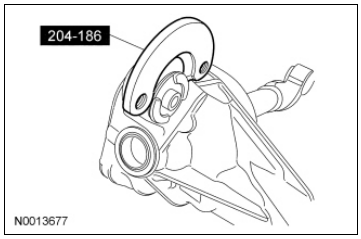
Special Tool(s)

 ST2588-A	Aligner, Front Differential Housing Bushing 204-188 (T95T-5638-CH)
 ST1162-A	Installer, Front Axle Mounting Bushing Drawbolt 205-374 (T96T-5638-H)
 ST2664A	Installer, Upper Arm Pivot Bushing 204-157 (T89P-5638-E)
 ST1155-A	Remover, Front Axle Mounting Bushing 205-376 (T96T-5638-K)
 ST2587-A	Remover, Front Differential Housing Bushing 204-186 (T95T-5638-AH)
 ST1516-A	Remover/Installer, Front Wheel Hub 204-069 (T81P-1104-C)

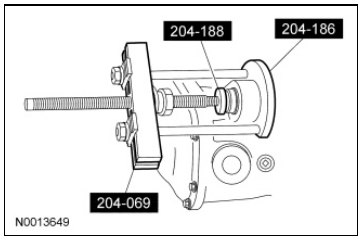


Item	Part Number	Description
1	3002	Front axle housing
2	46821	Front axle carrier bushing

Removal

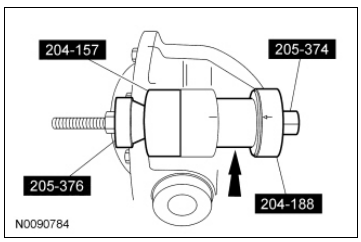


1. Remove the axle assembly. For additional information, refer to Axle Assembly in this section.
2. Place the Front Differential Housing Bushing Aligner on the insulator and index-mark the housing in line with the arrow on the special tool.

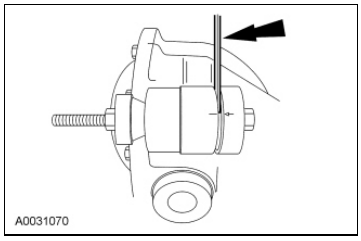


3. Using a feeler gauge, measure the gap between the insulator flange and the axle housing. Record the measurement.

4. Tap the Front Differential Housing Bushing Remover on between the axle housing and the insulator flange.

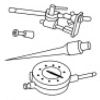


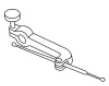
5. Assemble the Front Differential Housing Bushing, Front Differential Housing Bushing Remover and the Front Wheel Hub Remover/Installer. Remove and discard the insulator.



Installation

1. Set the new insulator in the housing bore and install the Front Axle Mounting Bushing Drawbolt, Front Differential Housing Bushing Aligner, Front Axle Mounting Bushing Remover and Upper Arm Pivot Bushing Installer. Align the arrow marks on the Front Differential Housing Bushing Aligner with the index mark on the axle housing.

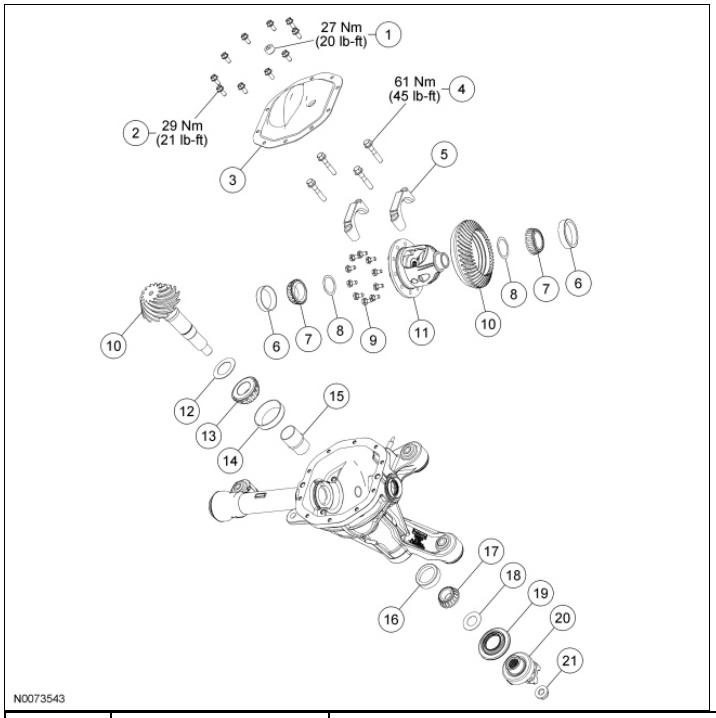




2. Draw the insulator into the housing to the measured gap earlier in this procedure.

3. Install the axle assembly. For additional information, refer to Axle Assembly in this section.

Differential Ring And Pinion



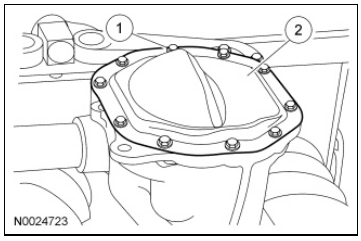
Special Tool(s)

 ST2026-A	2 Jaw Puller 205-D072 (D97L-4221-A) or equivalent
 ST1610-A	Adapter for 205-001 205-001-01
 ST1118-A	Adapter for 205-S127 205-093 (T75P-4020-A2)
ST1429-A	Adapter for 205-S127 205-109 (T76P-4020-A9)
 ST1431-A	Adapter for 205-S127 205-110 (T76P-4020-A10)
 ST1432-A	Adapter for 205-S127 205-111 (T76P-4020-A11)
 ST1214-A	Dial Indicator Gauge with Holding Fixture 100-002 (TOOL-4201-C)
 ST1869-A	Drawbar, Rear Axle 205-098 (T75T-1176-A)
 ST1348-A	Gauge, Clutch Housing 308-021 (T75L-4201-A)
 ST1548-A	Gauge, Differential Dummy Bearing 205-247 (T86T-4222-AH)
 ST1433-B	Gauge Disc (0.4782 inch) 205-D029 (D80T-4020-F44)
 ST1434-A	Gauge Tube (2.892 inch) 205-D034 (D80T-4020-F49) or equivalent
 ST1257-A	Holding Fixture, Drive Pinion Flange 205-126 (T78P-4851-A)

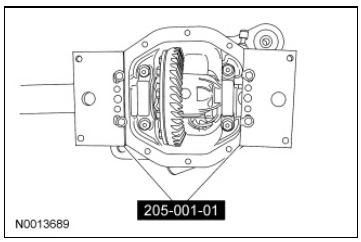
 ST1186-A	Holding Fixture, Transmission 307-003 (T57L-500-B)
 ST1484-A	Installer, Drive Pinion Bearing Cone 205-834
 ST1361-A	Installer, Drive Pinion Bearing Cup 205-014 (T60K-4616-A)
 ST1851-A	Installer, Drive Pinion Bearing Cup 205-835
 ST1800-A	Installer, Drive Pinion Flange 205-209 (T83T-4851-A)
 ST1358-A	Installer, Drive Pinion Oil Seal 205-133 (T79P-4676-A)
 ST1347-A	Puller, Drive Pinion/Differential Carrier 205-D036 (D81L-4220-A)
 ST1259-A	Spreader, Differential Carrier 205-001 (TOOL-4000-E)

Material

Item	Specification
Motorcraft® High Contrast Hypoid Gear Marking Compound XG-14	-
Motorcraft® SAE 80W-90 Premium Rear Axle Lubricant XY-80W90-QL (US); CXY-80W90-1L (Canada)	WSP-M2C197-A
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4

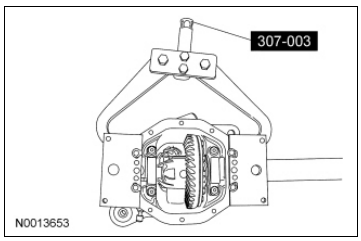


Item	Part Number	Description
1	2002748	Fill plug
2	40286-5	Differential housing cover bolt (10 required)
3	2002323	Differential housing cover
4	40284-1	Differential bearing cap bolt (4 required)
5	42769	Differential bearing cap (2 required)
6	550734	Differential carrier bearing cups
7	550433	Differential carrier bearing cones
8	30215	Differential carrier bearing shims
9	41221	Differential ring gear bolt (10 required)
10	3A410	Differential ring gear and pinion set
11	4205	Differential case
12	44453	Differential pinion bearing shim
13	NP310800	Differential pinion inner bearing cone
14	NP312191	Differential pinion inner bearing cup
15	2003879	Differential pinion collapsible spacer
16	2003899	Differential pinion outer bearing cup
17	2003898	Differential pinion outer bearing cone
18	42778	Differential oil slinger
19	3N296	Drive pinion seal
20	4851	Drive pinion flange
21	2002800	Drive pinion flange nut

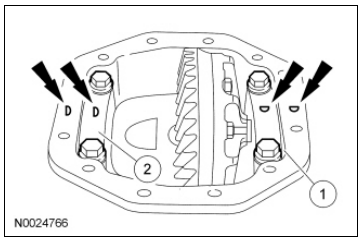


Removal

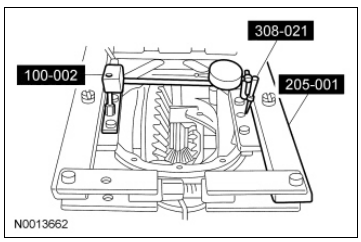
1. Remove the axle assembly. For additional information, refer to Axle Assembly in this section.



2. Drain the front axle assembly.
    1. Remove the 10 differential housing cover bolts.
    2. Remove the differential cover.



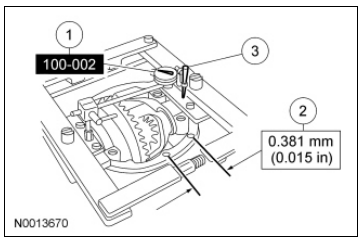
3. Install the Adapters on the differential housing.



4. Install the Transmission Holding Fixture on the Adapters and mount the assembly to a bench.

5. Remove the 2 differential bearing caps.
    1. Remove the 4 differential bearing cap bolts.
    2. Remove and identify the 2 differential bearing caps.

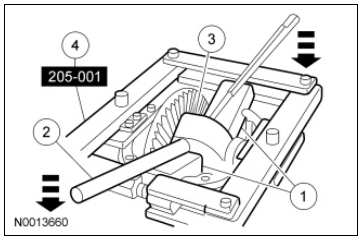
6. Install the Differential Carrier Spreader, Dial Indicator Gauge with Holding Fixture and Clutch Housing Gauge.



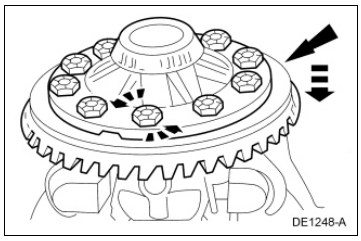
7. ***NOTICE:*** **Overspreading can damage the differential housing.**

    Spread the differential housing to the specification.

    1. Adjust the Dial Indicator Gauge to zero.
    2. Tighten the differential carrier spreader screw.

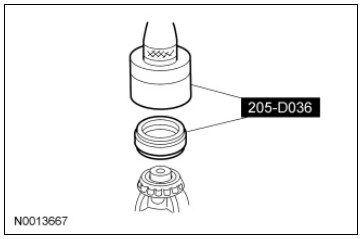


3. Remove the Dial Indicator Gauge.

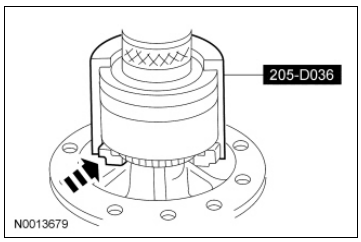


8. ***NOTICE:*** **Use wood blocks to avoid damaging the differential housing.**

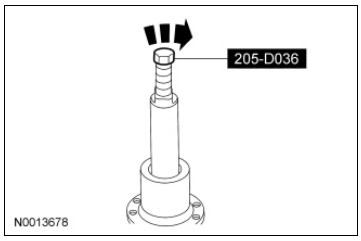
Remove the differential assembly from the housing.



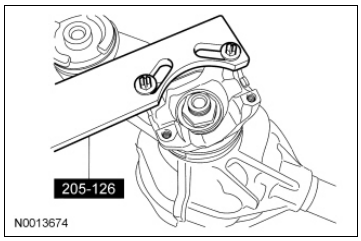
1. Position the wood blocks.
2. Push downward on the pry bars.
3. Remove the differential assembly.
4. Remove the Differential Carrier Spreader.



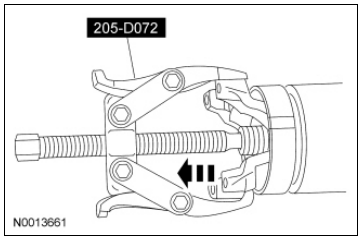
9. Remove and discard the 10 differential ring gear bolts and the differential ring gear.
   - Use a drift punch to separate the differential ring gear from the differential case.



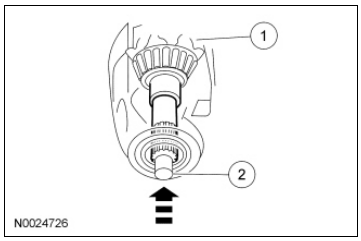
10. Assemble the Drive Pinion/Differential Carrier Puller.



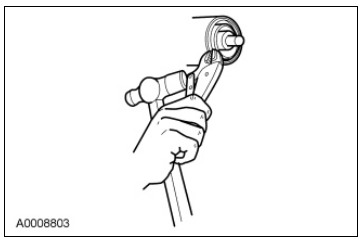
11. Position the Drive Pinion/Differential Carrier Puller on the differential bearing.



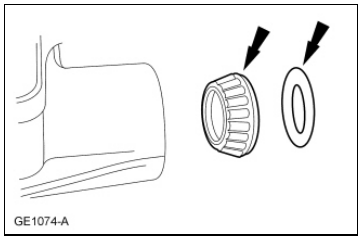
12. Using the Drive Pinion/Differential Carrier Puller, remove and discard the LH and RH differential bearings.



13. Using the Drive Pinion Flange Holding Fixture to hold the pinion flange, remove and discard the pinion nut.

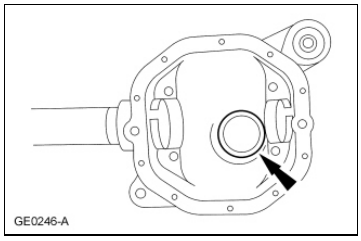


14. Using the 2 Jaw Puller, remove the pinion flange.

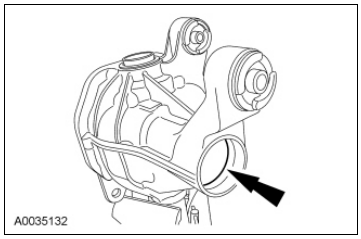


15. Using a soft-face hammer, remove the pinion from the differential housing.
    1. Hold the pinion inside the differential housing.
    2. Use a soft-face hammer to remove the pinion from the outer pinion bearing.

16. Use a screwdriver to force up the metal portion of the pinion seal. Using gripping pliers and a hammer, remove the drive pinion oil seal.

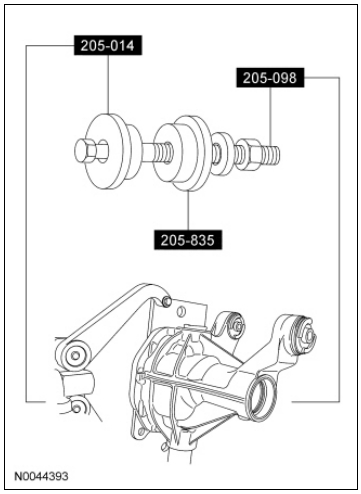


17. Remove the front axle drive pinion shaft oil slinger and the outer pinion bearing.
    - Discard the outer pinion bearing.



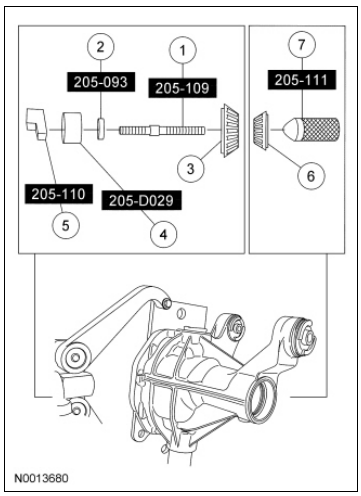
18. **NOTE:** To prevent it from becoming misaligned in the bore, remove the outer pinion bearing cup by tapping alternately on each side of the outer pinion bearing cup with a brass drift.

    Remove and discard the outer pinion bearing cup.



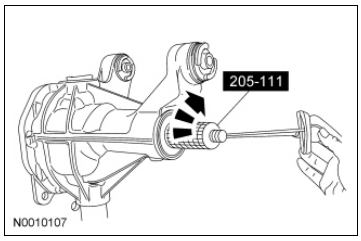
19. **NOTE:** To prevent it from becoming misaligned in the bore, remove the inner pinion bearing cup by tapping alternately on each side of the inner pinion bearing cup with a brass drift.

    Remove and discard the inner pinion bearing cup.



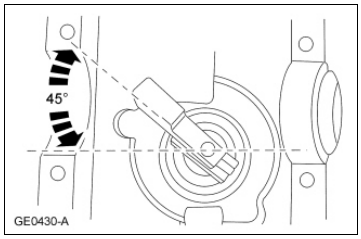
Installation

1. Install new drive pinion bearing cups.
   - Using the Rear Axle Draw Bar, Drive Pinion Bearing Cup Installers install the drive pinion bearing cups.

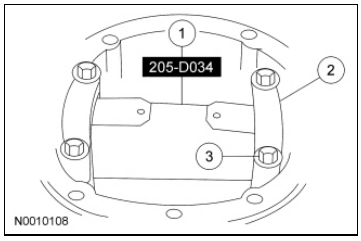


2. Assemble and position the following in the differential housing.

1. Position the Adapter.
2. Position the Adapter.
3. Position the inner pinion bearing.
4. Position the Gauge Disc.
5. Position the Adapter.
6. Position the outer pinion bearing.
7. Thread on the Adapter.

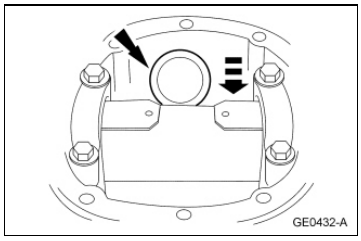


3. Using a Nm torque wrench, tighten the Adapter.
   - Tighten to 2.5 Nm (22 lb-in).



4. **NOTE:** Offset the Adapter to obtain an accurate reading.

   Rotate the Adapter several half turns to make sure the pinion bearings seat correctly. Position the Adapter as shown.

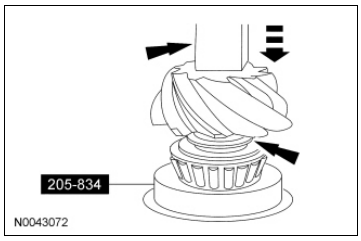


5. Install the Gauge Tube.
   1. Position the Gauge Tube.
   2. Install the 2 differential bearing caps.
   3. Install the 4 differential bearing cap bolts.
      - Tighten to 61 Nm (45 lb-ft).

6. **NOTE:** Selection of a drive pinion position shim that is too thick results in deep tooth contact at final assembly. Do not attempt to force the feeler gauge or drive pinion position shim between the Adapter and the Gauge Tube. A slight drag indicates a correct selection.

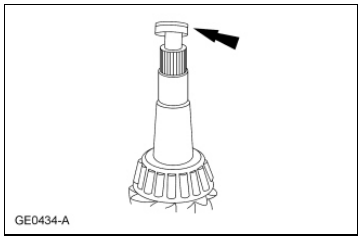
   Using a feeler gauge or a flat, clean drive pinion position shim, measure between the Adapter and the Gauge Tube. Record the measurement.

7. Select the correct thickness drive pinion position shim.
   - New drive pinion position shims are available in the following sizes:

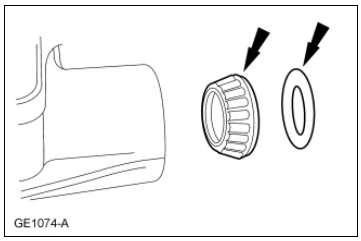


mm	Inch
1.35	0.053
1.40	0.055
1.45	0.057
1.50	0.059
1.55	0.061
1.60	0.063
1.65	0.065
1.70	0.067
1.75	0.069
1.80	0.071
1.85	0.073

   - Notice the plus (+), minus (-) or zero (0) etching on the new drive pinion, and adjust the thickness of the new drive pinion position shim. If etching is plus (+), subtract the number from the gauged drive pinion position shim thickness. If etching is minus (-), add the number to the gauged drive pinion position shim thickness.

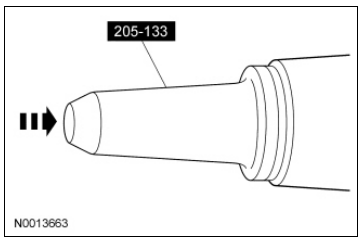


8. Install the selected drive pinion position shim and the new inner pinion bearing.

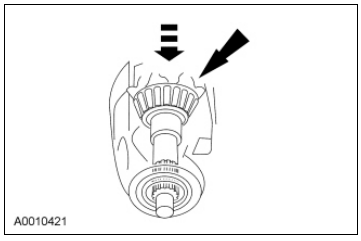


- Using the Drive Pinion Bearing Cone Installer and a suitable press, seat the inner pinion bearing firmly against the drive pinion position shim.

9. Install a new collapsible spacer.

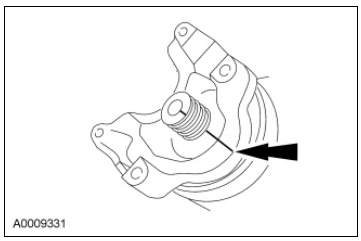


10. Install the new outer drive pinion bearing and the drive pinion oil slinger.



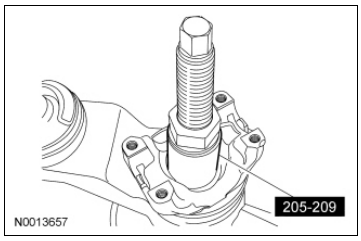
11. **NOTE:** Lubricate the drive pinion oil seal lips with rear axle lubricant.

    Using the Drive Pinion Oil Seal Installer, install the drive pinion oil seal.



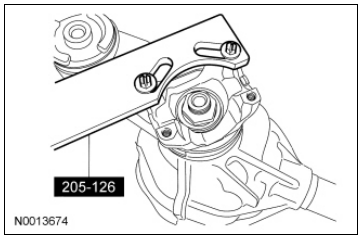
12. Lubricate the drive pinion gear splines with rear axle lubricant.

13. Install the drive pinion gear into the axle housing.

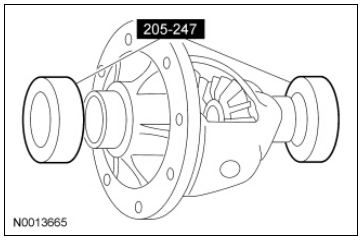


14. ***NOTICE:*** **Never use a metal hammer on the pinion flange or install the flange with power tools or damage to the component may occur.**

Position the pinion flange.



15. Using the Drive Pinion Flange Installer, install the pinion flange.

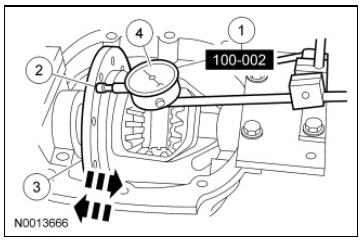


16. ***NOTICE:*** **Do not loosen the pinion nut to reduce pinion bearing preload. Install a new collapsible spacer and pinion nut if pinion bearing preload reduction is necessary or damage to the component may occur.**

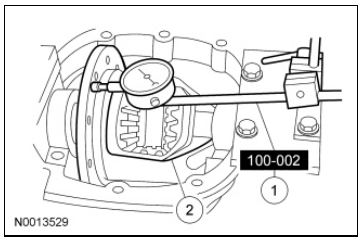
    Using the Drive Pinion Flange Holding Fixture to hold the pinion flange, tighten the new pinion nut to set the pinion bearing preload.

    - Tighten the pinion nut, rotating the pinion occasionally to make sure the pinion bearings are seating correctly. Take frequent pinion bearing preload readings by rotating the pinion with a Nm torque wrench. The final reading must be 1.7-3.4 Nm (15-30 lb-in).

17. Install the Differential Dummy Bearing Gauge.



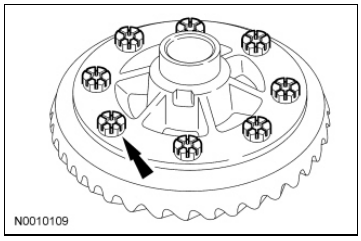
18. Position the differential assembly and Differential Dummy Bearing Gauge in the differential housing.



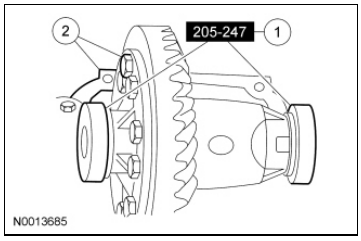
19. **NOTE:** Repeat this step until obtaining a consistent reading.

    Measure the total differential end play.

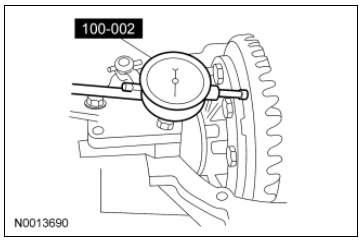
    1. Install the Dial Indicator Gauge with Holding Fixture.
    2. Force the differential assembly as far as possible away from the indicator. Position the Dial Indicator Gauge tip on the machined surface and adjust it to measure full travel. With force still applied, set the Dial Indicator Gauge to zero.
    3. Force the differential assembly as far as possible in the opposite direction.
    4. Record the total end play reading on the Differential Bearing Shim Selection Procedure Worksheet, Line A in this procedure.



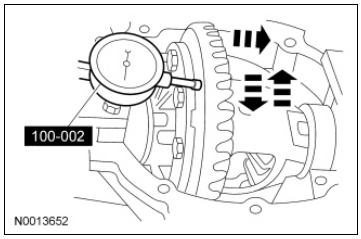
20. Remove the Dial Indicator Gauge with Holding Fixture, then remove the differential assembly.
    1. Remove the Dial Indicator Gauge with Holding Fixture.
    2. Remove the differential assembly.



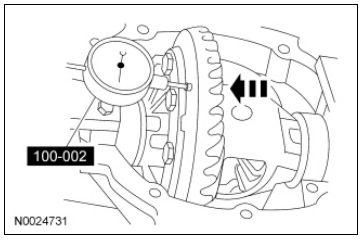
21. Using a suitable press, install the differential ring gear.
    1. Position the differential ring gear and the differential assembly. Start 3 new differential ring gear bolts to align the holes in the differential ring gear and the differential assembly.
    2. Using a suitable press, install the differential ring gear.



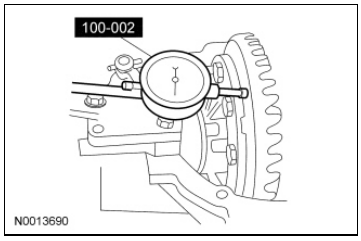
22. Install the remaining 7 new differential ring gear bolts.
    - Tighten to 122 Nm (90 lb-ft).



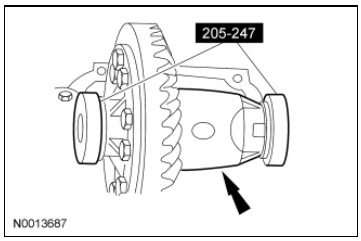
23. Install the Differential Dummy Bearing Gauge and position the differential assembly in the differential housing.
    1. Install the Differential Dummy Bearing Gauge.
    2. Position the differential assembly in the differential housing.



24. Position the Dial Indicator Gauge with Holding Fixture.



25. Force the differential ring gear into mesh with the pinion gear (zero backlash). With force still applied, set the Dial Indicator Gauge to zero.

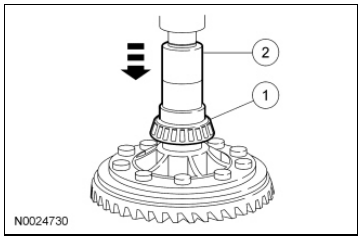


26. Force the differential ring gear away from the pinion gear as far as possible. Record the reading on the Differential Bearing Shim Selection Procedure Worksheet, Line D in this procedure.

27. Remove the Dial Indicator Gauge with Holding Fixture.

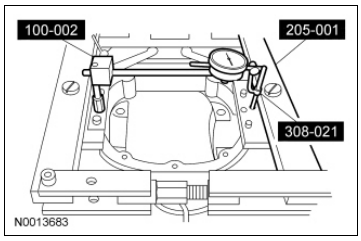
28. Remove the differential assembly from the differential housing. Remove the Differential Dummy Bearing Gauge from the differential assembly hubs.

29. Complete the worksheet and select the appropriate thickness differential bearing shims. New differential bearing shims are available in 0.0762 mm (0.003 in), 0.127 mm (0.005 in), 0.254 mm (0.010 in) and 0.762 mm (0.030 in) thickness.



Differential Bearing Shim Selection Procedure Worksheet

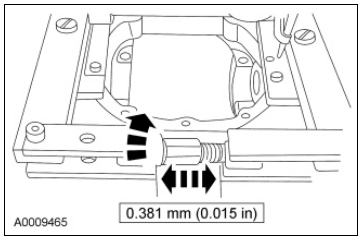
Line	Item	Result (actual) mm (in)	Result (example) mm (in)
A	Total end play reading (without gears)		2.032 (0.080)
B	Add preload	+0.2032 (+0.008)	+0.2032 (+0.008)
C	Total (add A and B)		2.2352 (0.088)
D	End play measurement (with gears)		1.0414 (0.041)
E	Subtract the shim thickness on the differential ring gear side	-0.0762 (-0.003)	-0.0762 (-0.003)
F	Total (subtract E from D) (thickness of shims to place on the differential ring gear side)		0.9652 (0.038)
G	Total (subtract F from C) (thickness of shims to place on the drive pinion side)		1.27 (0.050)



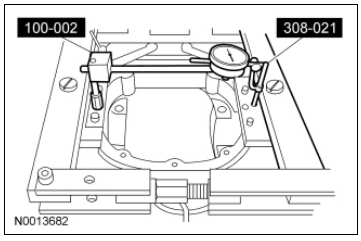
30. **NOTE:** Most axles will have the larger amount of shims on the differential ring gear side and the smaller amount on the case side.

    Install the selected differential bearing shims and the RH and LH differential bearings.

    1. Position the differential bearing shims and the differential bearing.
    2. Using a suitable press, install the differential bearing.
    - Repeat this step for the opposite side of the differential assembly.

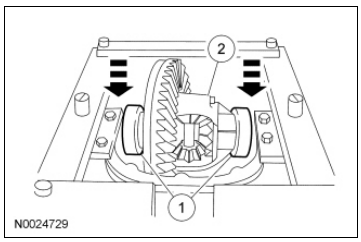


31. Install the Dial Indicator Gauge with Holding Fixture, Clutch Housing Gauge and Differential Carrier Spreader.
    - Position the Clutch Housing Gauge needle in the Differential Carrier Spreader adapter hole.



32. ***NOTICE:*** **Overspreading can damage the differential housing.**

    Spread the differential housing to specification.



33. Remove the Dial Indicator Gauge with Holding Fixture and the Clutch Housing Gauge.

34. **NOTE:** Push the differential assembly downward to fully seat the differential bearing cups in the differential housing.

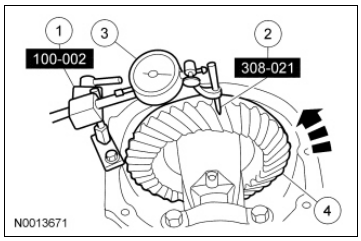
    Install the 2 differential bearing cups and the differential assembly in the differential housing.

    1. Position the 2 differential bearing cups on the differential bearings.
    2. Lower the differential assembly in place.

35. **NOTE:** Do not tighten the differential bearing cap bolts to specification at this time.

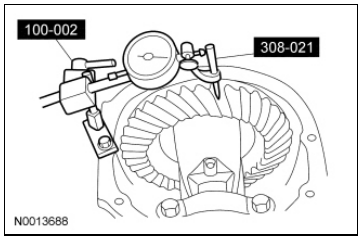
    Install the 2 differential bearing caps in their original positions.

    1. Position the 2 differential bearing caps.
    2. Install the 4 differential bearing cap bolts hand-tight.



36. Remove the Differential Carrier Spreader.

37. Tighten the 4 differential bearing cap bolts.
    - Tighten to 61 Nm (45 lb-ft).



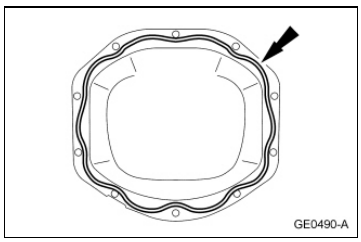
38. Verify that the differential assembly rotates freely.

39. Using the Dial Indicator Gauge with Holding Fixture and Clutch Housing Gauge, measure the backlash at 3 equally spaced points on the differential ring gear.
    1. Mount the Dial Indicator Gauge with Holding Fixture.
    2. Position the Clutch Housing Gauge.
    3. Zero the Dial Indicator Gauge.
    4. Turn the differential ring gear without turning the pinion gear. Record the measurement.
    - The backlash tolerance is 0.13 mm (0.005 in) to 0.20 mm (0.008 in) and cannot vary more than 0.05 mm (0.002 in) between points checked.
    - If the backlash is not within specification, correct by increasing the thickness of one differential bearing shim and decreasing the thickness of the other differential bearing shim by the same amount.

40. Remove the Dial Indicator Gauge with Holding Fixture and Clutch Housing Gauge.

41. Apply marking compound and rotate the differential assembly 5 complete revolutions.

42. Verify an acceptable pattern check. For additional information, refer to Section 205-00 .



43. Install the RH axle shaft.

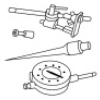
44. **NOTE:** The machined surfaces on the differential housing and the differential housing cover must be clean and free of oil before applying the new silicone sealant. Cover the inside of the axle before cleaning the machined surface to prevent contamination.

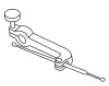
    NOTE: Install the differential housing cover within 15 minutes of applying the silicone material.

    NOTE: Allow the sealant to cure for one hour before filling the axle with lubricant.

    Apply a continuous bead of sealant, of the specified thickness, to the differential housing cover mounting surface as shown.

45. Install the differential housing cover and the 10 differential housing cover bolts.
    - Tighten to 29 Nm (21 lb-ft).





46. Install the axle assembly. For additional information, refer to Axle Assembly in this section.

47. Remove the fill plug and fill the axle with axle lubricant to 9.56 mm (0.38 in) below the bottom of the filler hole.

48. Install the fill plug.
    - Tighten to 27 Nm (20 lb-ft).

Differential Bearings

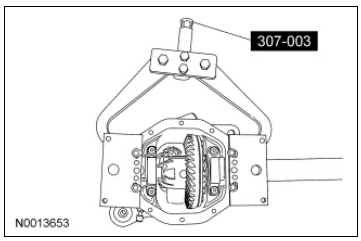
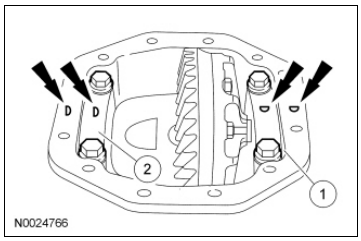
Removal

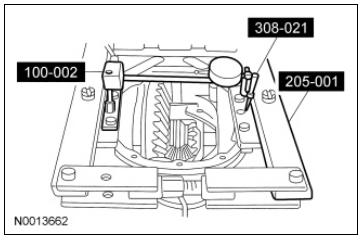
1. Remove the axle assembly. For additional information, refer to Axle Assembly in this section.



2. Drain the front axle assembly.
    1. Remove the 10 differential housing cover bolts.
    2. Remove the differential cover.



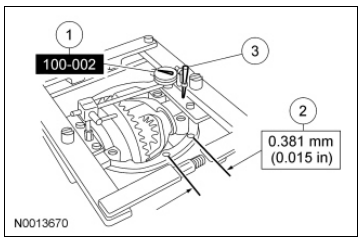
3. Install the Adapters on the differential housing.



4. Install the Transmission Holding Fixture on the Adapters and mount the assembly to the bench.

5. Remove the 2 differential bearing caps.
    1. Remove the 4 differential bearing cap bolts.
    2. Remove and identify the 2 differential bearing caps.

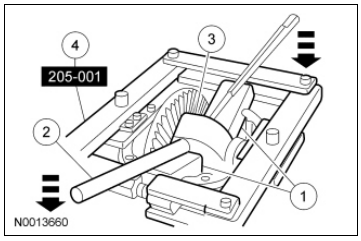
6. Install the Dial Indicator Gauge with Holding Fixture, Clutch Housing Gauge and Differential Carrier Spreader.



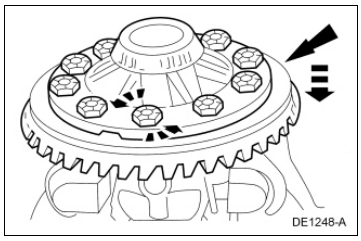
7. ***NOTICE:*** **Overspreading can damage the differential housing.**

    Spread the differential housing to the specification.

    1. Adjust the Dial Indicator Gauge to zero.
    2. Tighten the differential carrier spreader screw.



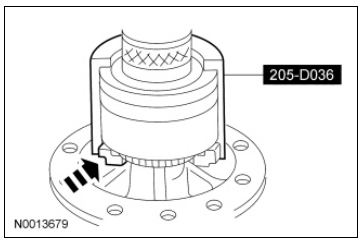
3. Remove the Dial Indicator Gauge.



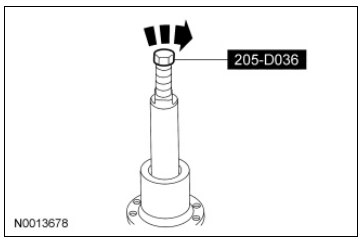
8. ***NOTICE:*** **Use wood blocks to avoid damaging the differential housing.**

   Remove the differential assembly from the housing.

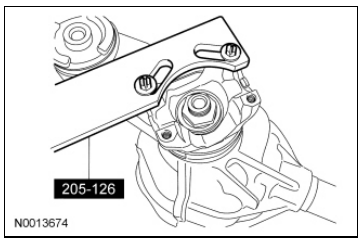
   1. Position the wood blocks.
   2. Push downward on the pry bars.
   3. Remove the differential assembly.
   4. Remove the Differential Carrier Spreader.



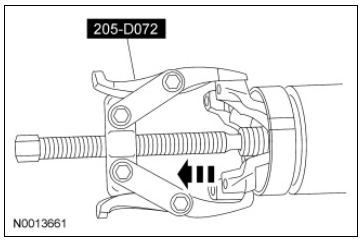
9. Remove and discard the 10 differential ring gear bolts and the differential ring gear.
   - Use a drift punch to separate the differential ring gear from the differential case.



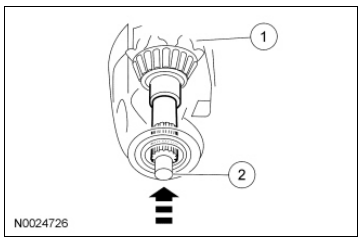
10. Assemble the Drive Pinion/Differential Carrier Puller.



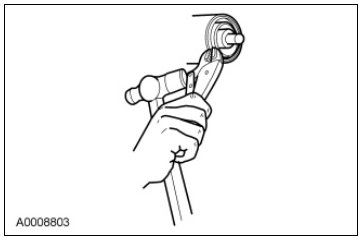
11. Position the Drive Pinion/Differential Carrier Puller on the differential bearing.



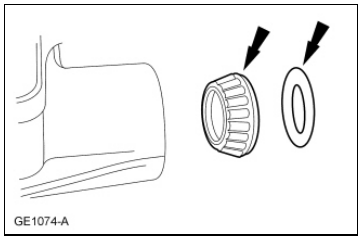
12. Using the Drive Pinion/Differential Carrier Puller, remove the RH and LH differential bearings.



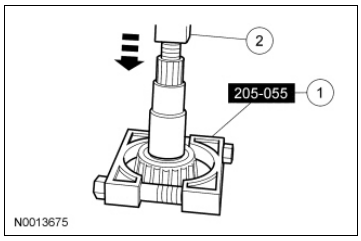
13. Using the Drive Pinion Flange Holding Fixture to hold the pinion flange, remove and discard the pinion nut and washer.



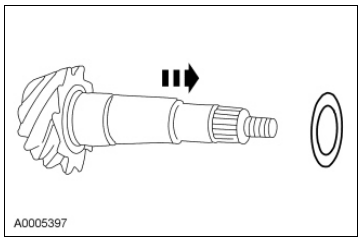
14. Using the 2 Jaw Puller, remove the pinion flange.



15. Using a soft-face hammer, remove the pinion from the differential housing.
    1. Hold the pinion inside the differential housing.
    2. Use a soft-face hammer to remove the pinion from the outer pinion bearing.

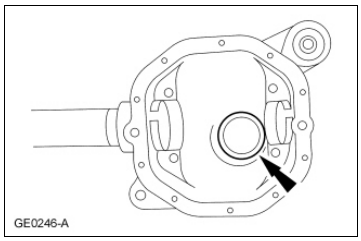


16. Use a screwdriver to force up the metal lip of the pinion seal. Using gripping pliers and a hammer, remove the pinion oil seal.

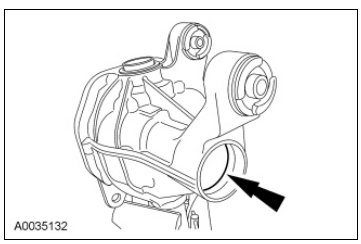


17. Remove the front axle drive pinion shaft oil slinger and the outer pinion bearing.

18. Remove the inner pinion bearing.
    1. Position the Bearing Remover under the bearing.
    2. Using a shop press, remove the inner pinion bearing.



19. Remove the drive pinion position shim.
    - Measure and record the thickness of the pinion position shim for reference during installation.

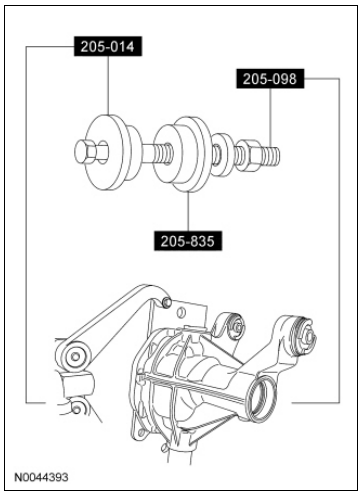


20. **NOTE:** To prevent it from becoming misaligned in the bore, remove the outer pinion bearing cup by tapping alternately on each side of the outer pinion bearing cup with a brass drift.

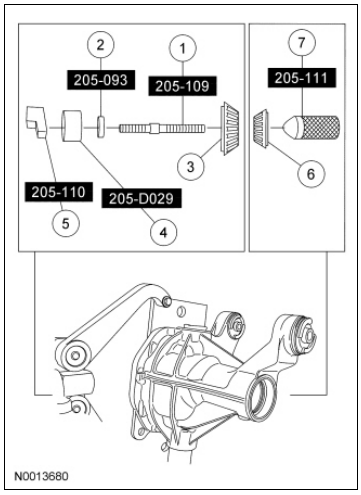
    Remove the outer pinion bearing cup.

21. **NOTE:** To prevent it from becoming misaligned in the bore, remove the inner pinion bearing cup by tapping alternately on each side of the inner pinion bearing cup with a brass drift.

    Remove the inner pinion bearing cup.



Installation

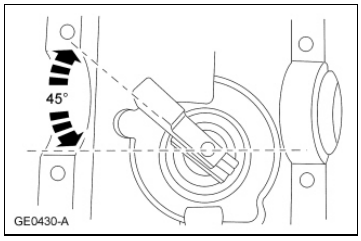


1. **NOTE:** Lubricate the new differential drive pinion bearing cups with rear axle lubricant.

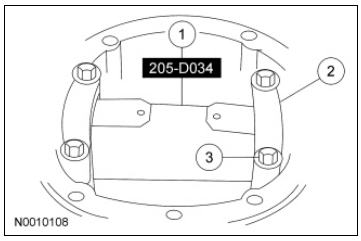
   Install the new inner and outer drive pinion bearing cups.

   - Using the Rear Axle Drawbar and Drive Pinion Bearing Cup Installers, install the new drive pinion bearing cups.

2. Assemble and position the following in the differential housing.
   1. Position the Adapter.
   2. Position the Adapter.
   3. Position the inner pinion bearing.
   4. Position the Gauge Disc.
   5. Position the Adapter.
   6. Position the outer pinion bearing.
   7. Thread on the Adapter.



3. Using a Nm torque wrench, tighten the Adapter.
   - Tighten to 2.5 Nm (22 lb-in).



4. **NOTE:** Offset the Adapter to obtain an accurate reading.

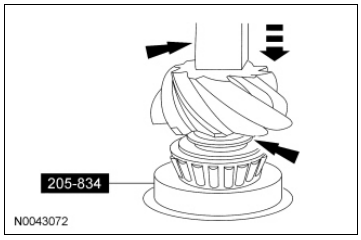
   Rotate the Adapter several half turns to make sure the pinion bearings seat correctly. Position the Adapter as shown.

5. Install the Gauge Tube.
   1. Position the Gauge Tube.
   2. Install the 2 differential bearing caps.
   3. Install the 4 differential bearing cap bolts.
      - Tighten to 61 Nm (45 lb-ft).

6. **NOTE:** Selection of a drive pinion position shim that is too thick results in deep tooth contact at final assembly. Do not attempt to force the feeler gauge or drive pinion position shim between the Adapter and the Gauge Tube. A slight drag indicates a correct selection.

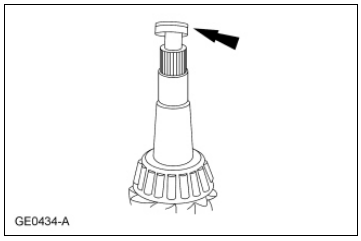
   Using a feeler gauge or a flat, clean drive pinion position shim, measure between the Adapter and the Gauge Tube. Record the measurement.

7. Select the correct thickness drive pinion position shim.
   - New drive pinion position shims are available in the following sizes:

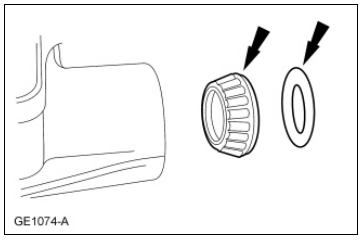


mm	Inch
1.35	0.053
1.40	0.055
1.45	0.057
1.50	0.059
1.55	0.061
1.60	0.063
1.65	0.065
1.70	0.067

1.75	0.069
1.80	0.071
1.85	0.073

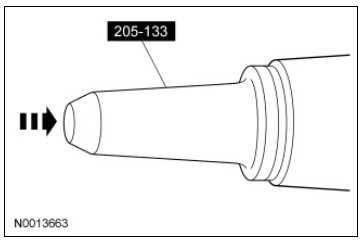


- Notice the plus (+), minus (-) or zero (0) etching on the drive pinion, and adjust the thickness of the new shim. If the etching is positive, subtract the number from the selected position shim. If the etching is negative, subtract the number from the selected position shim.
- The selected shim thickness should be very close to the recorded thickness of the original position shim.



8. Install the new selected drive pinion position shim and the new inner pinion bearing on the drive pinion.
    - Using the Drive Pinion Bearing Cone Installer and a suitable press, seat the inner pinion bearing firmly against the drive pinion position shim.

9. Install a new collapsible spacer.

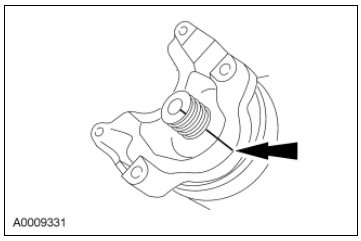


10. Install the new outer drive pinion bearing and the drive pinion oil slinger.

11. ***NOTICE:*** **The drive pinion oil seal must be fully seated all the way around or drive pinion oil seal damage will occur.**

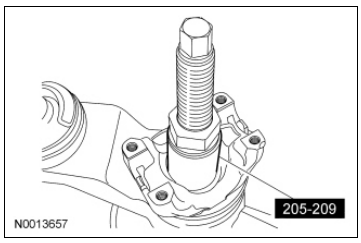
    NOTE: Lubricate the drive pinion oil seal lips with rear axle lubricant.

Using the Drive Pinion Oil Seal Installer, install the drive pinion oil seal.



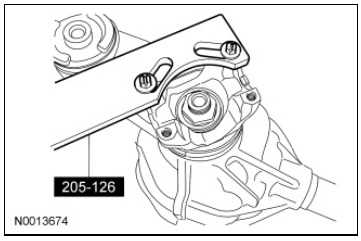
12. Lubricate the drive pinion gear splines with rear axle lubricant.

13. Install the drive pinion gear into the axle housing.

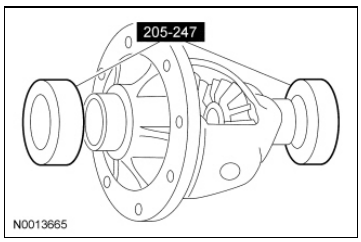


14. ***NOTICE:*** **Never use a metal hammer on the pinion flange or install the flange with power tools or damage to the component may occur.**

    Align the pinion flange.



15. Using the Drive Pinion Flange Installer, install the pinion flange.

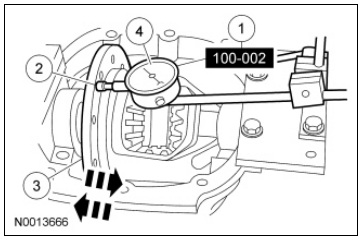


16. ***NOTICE:*** **Do not loosen the pinion nut to reduce pinion bearing preload or damage to the component may occur. Install a new collapsible spacer and pinion nut if pinion bearing preload reduction is necessary.**

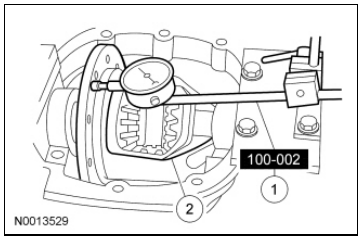
    Using the Drive Pinion Flange Holding Fixture to hold the pinion flange, tighten the pinion nut to set the pinion bearing preload.

    - Tighten the pinion nut, rotating the pinion occasionally to make sure the pinion bearings are seating correctly. Take frequent pinion bearing preload readings by rotating the pinion with a Nm torque wrench. The final reading must be 1.7-3.4 Nm (15-30 lb-in).

17. Install the Differential Dummy Bearing Gauge.



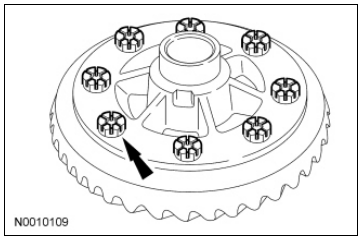
18. Position the differential assembly and the Differential Dummy Bearing Gauge in the differential housing.



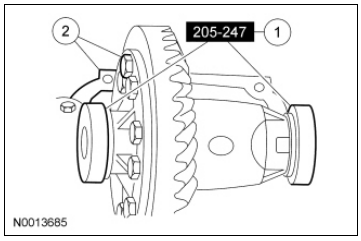
19. **NOTE:** Repeat this step until obtaining a consistent reading.

    Measure the total end play.

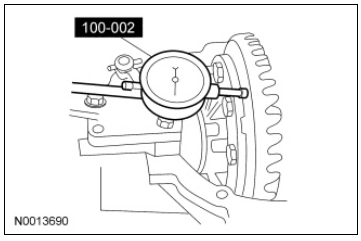
    1. Install the Dial Indicator Gauge with Holding Fixture.
    2. Force the differential assembly as far as possible away from the Dial Indicator Gauge. Position the Dial Indicator Gauge tip on the machined surface and adjust it to measure full travel. With force still applied, set the Dial Indicator Gauge to zero.
    3. Force the differential assembly as far as possible in the opposite direction.
    4. Record the total end play reading on the Differential Bearing Shim Selection Procedure Worksheet, Line A in this procedure.



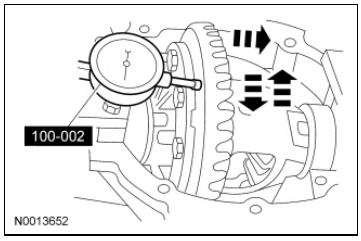
20. Remove the Dial Indicator Gauge with Holding Fixture, then remove the differential assembly.
    1. Remove the Dial Indicator Gauge with Holding Fixture.
    2. Remove the differential assembly.



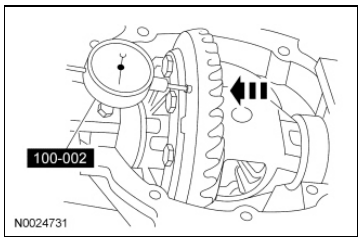
21. Using a suitable press, install the differential ring gear.
    1. Position the differential ring gear and the differential assembly. Start 3 new differential ring gear bolts to align the holes in the differential ring gear and the differential assembly.
    2. Using a suitable press, install the differential ring gear.



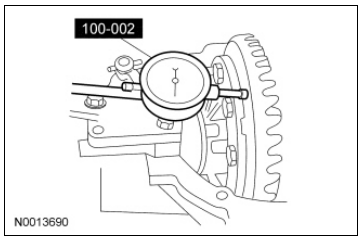
22. Install the 7 remaining new differential ring gear bolts.
    - Tighten to 122 Nm (90 lb-ft).



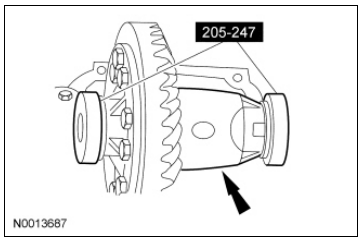
23. Install the Differential Dummy Bearing Gauge and position the differential assembly in the differential housing.
    1. Install the Differential Dummy Bearing Gauge.
    2. Position the differential assembly in the differential housing.



24. Position the Dial Indicator Gauge with Holding Fixture.



25. Force the differential ring gear into mesh with the pinion gear (zero backlash). With force still applied, set the Dial Indicator Gauge to zero.



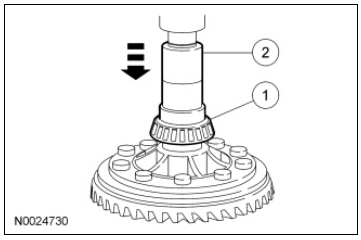
26. Force the differential ring gear away from the pinion gear as far as possible. Record the reading on the Differential Bearing Shim Selection Procedure Worksheet, Line D in this procedure.

27. Remove the Dial Indicator Gauge with Holding Fixture.

28. Remove the differential assembly from the differential housing. Remove the Differential Dummy Bearing Gauge from the differential assembly hubs.

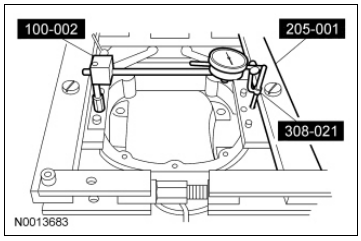
29. Complete the worksheet and select the appropriate thickness differential bearing shims. New differential bearing shims are available in 0.0762 mm (0.003 in), 0.127 mm (0.005 in), 0.254 mm (0.010 in) and 0.762 mm (0.030 in) thickness.

Differential Bearing Shim Selection Procedure Worksheet



Line	Item	Result (actual) mm (in)	Result (example) mm (in)
A	Total end play reading (without gears)		2.032 (0.080)
B	Add preload	+0.2032 (+0.008)	+0.2032 (+0.008)
C	Total (add A and B)		2.2352 (0.088)
D	End play measurement (with gears)		1.0414 (0.041)
E	Subtract the shim thickness on the differential ring gear side	-0.0762 (-0.003)	-0.0762 (-0.003)

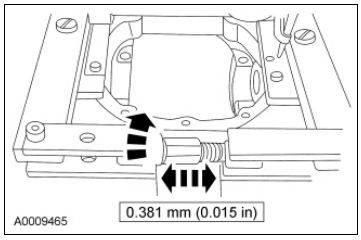
F	Total (subtract E from D) (thickness of shims to place on the differential ring gear side)		0.9652 (0.038)
G	Total (subtract F from C) (thickness of shims to place on the drive pinion side)		1.27 (0.050)



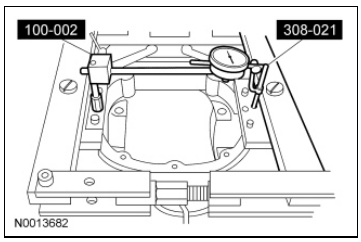
30. **NOTE:** Most axles will have the larger amount of shims on the differential ring gear side and the smaller amount on the case side.

    Install the selected differential bearing shims and the new LH and RH differential bearings.

    1. Position the differential bearing shims and the differential bearing.
    2. Using a suitable press, install the differential bearing.
    - Repeat this step for opposite side of the differential assembly.

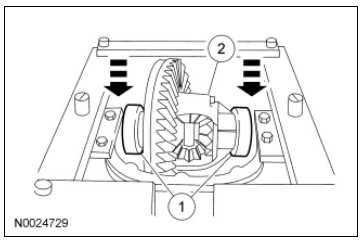


31. Install the Dial Indicator Gauge with Holding Fixture, Clutch Housing Gauge and Differential Carrier Spreader.
    - Position the Clutch Housing Gauge needle in the Differential Carrier Spreader adapter hole.



32. ***NOTICE:*** **Overspreading can damage the differential housing.**

    Spread the differential housing to specification.



33. Remove the Dial Indicator Gauge with Holding Fixture and the Clutch Housing Gauge.

34. **NOTE:** Push the differential assembly downward to fully seat the differential bearing cups in the differential housing.

    Install the 2 differential bearing cups and the differential assembly in the differential housing.

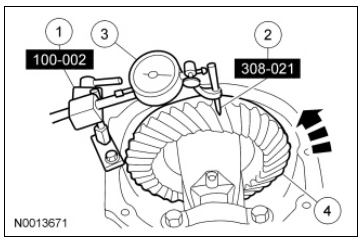
    1. Position the 2 differential bearing cups on the 2 differential bearings.
    2. Lower the differential assembly in place.

35. **NOTE:** Do not tighten the differential bearing cap bolts to specification at this time.

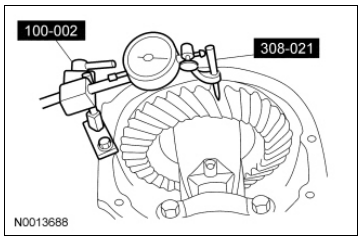
    Install the 2 differential bearing caps in their original positions.

    1. Position the 2 differential bearing caps.
    2. Install the 4 differential bearing cap bolts hand-tight.

36. Remove the Differential Carrier Spreader.



37. Tighten the 4 differential bearing cap bolts.
    - Tighten to 61 Nm (45 lb-ft).



38. Verify that the differential assembly rotates freely.

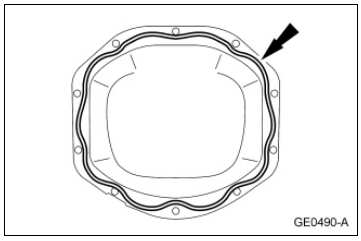
39. Using the Dial Indicator Gauge with Holding Fixture and the Clutch Housing Gauge, measure the backlash at 3 equally spaced points on the differential ring gear.
    1. Mount the Dial Indicator Gauge.
    2. Position the Clutch Housing Gauge.
    3. Zero the Dial Indicator Gauge.
    4. Turn the differential ring gear without turning the pinion gear. Record the measurement.
    - The backlash tolerance is 0.13 mm (0.005 in) to 0.20 mm (0.008 in) and cannot vary more than 0.05 mm (0.002 in) between points checked.
    - If the backlash is not within specification, correct by increasing the thickness of one differential bearing shim and decreasing the thickness of the other differential bearing shim

by the same amount.

40. Remove the Dial Indicator Gauge with Holding Fixture and Clutch Housing Gauge.

41. Apply marking compound and rotate the differential assembly 5 complete revolutions.

42. Verify an acceptable pattern check. For additional information, refer to Section 205-00 .



43. Install the RH axle shaft.

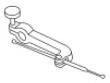
44. **NOTE:** The machined surfaces on the differential housing and the differential housing cover must be clean and free of oil before applying the new silicone sealant. Cover the inside of the axle before cleaning the machined surface to prevent contamination.

    NOTE: Install the differential housing cover within 15 minutes of applying the silicone material.

    NOTE: Allow the sealant to cure for one hour before filling the axle with lubricant.

    Apply a continuous bead of sealant, of the specified thickness, to the differential housing cover mounting surface as shown.

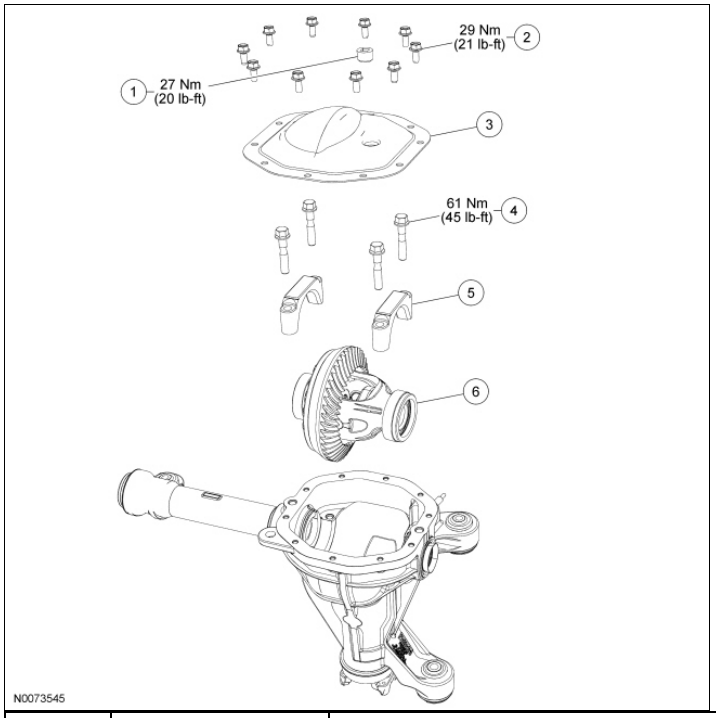
45. Install the differential housing cover and the 10 differential housing cover bolts.
    - Tighten to 29 Nm (21 lb-ft).



46. Install the axle assembly. For additional information, refer to Axle Assembly in this section.

47. Remove the fill plug and fill the axle with rear axle lubricant to 9.56 mm (0.38 in) below the bottom of the filler hole.

48. Install the fill plug.
    - Tighten to 27 Nm (20 lb-ft).



Differential Carrier

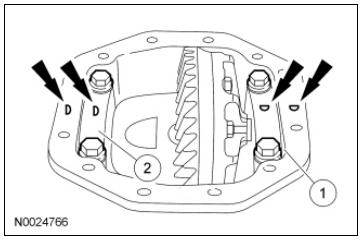
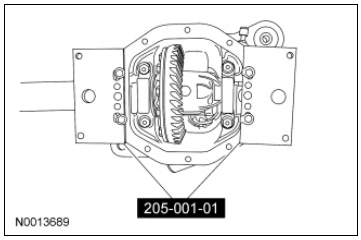
Motorcraft® SAE 80W-90 Premium Rear Axle Lubricant XY-80W90-QL (US); CXY-80W90-1L (Canada)	WSP-M2C197-A
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4



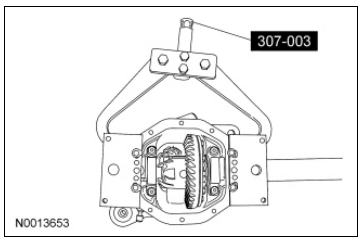
Item	Part Number	Description
1	2002748	Fill plug
2	40286-5	Differential housing cover bolt (10 required)
3	2002323	Differential housing cover
4	40284-1	Differential bearing cap bolt (4 required)
5	42769	Differential bearing cap (2 required)
6	80383	Differential carrier assembly

Removal

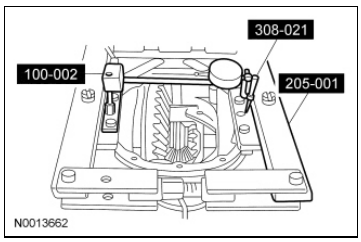


1. Remove the axle assembly. For additional information, refer to Axle Assembly in this section.

2. Remove the 10 differential housing cover bolts and the differential housing cover.

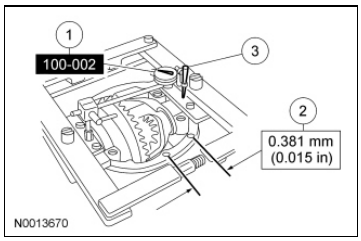


3. Remove the 2 differential bearing caps.
    1. Remove the 4 differential bearing cap bolts.
    2. Remove and identify the 2 differential bearing caps.



4. Install the Adapters.

5. Install the axle assembly and Transmission Holding Fixture into the bench fixture.



6. Install the Dial Indicator Gauge with Holding Fixture, Clutch Housing Gauge and Differential Carrier Spreader.

7. ***NOTICE:*** **Overspreading can damage the differential housing.**

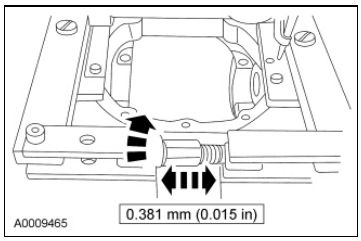
   Spread the differential housing to the specification.

   1. Adjust the Dial Indicator Gauge to zero.
   2. Tighten the Differential Carrier Spreader screw.
   3. Remove the Dial Indicator Gauge.

8. ***NOTICE:*** **Use wood blocks to avoid damaging the differential housing.**

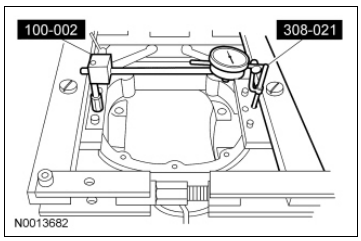
   Remove the differential assembly from the housing.

   1. Position the wood blocks.
   2. Push downward on the pry bars.
   3. Remove the differential assembly.
   4. Remove the Differential Carrier Spreader.



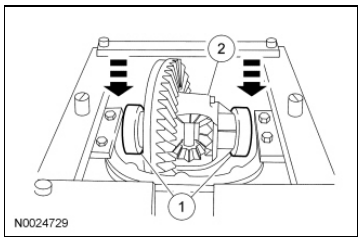
Installation

1. Install the Differential Carrier Spreader, Dial Indicator Gauge with Holding Fixture and Clutch Housing Gauge.
    - Position the Clutch Housing Gauge needle in the Differential Carrier Spreader adapter hole.



2. ***NOTICE:*** **Overspreading can damage the differential housing.**

    Spread the differential housing to the specification.



3. Remove the Dial Indicator Gauge with Holding Fixture and Clutch Housing Gauge.

4. **NOTE:** Push the differential assembly downward to fully seat the differential bearing cups in the differential housing.

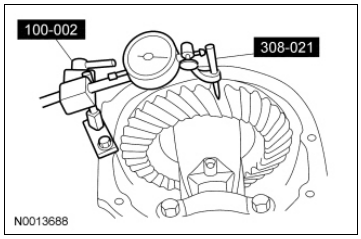
    Install the differential bearing cups and the differential assembly in the differential housing.

    1. Position the 2 differential bearing cups on the 2 differential bearings.
    2. Lower the differential assembly in place.

5. ***NOTICE:*** **Do not tighten the 4 differential bearing cap bolts to specification at this time.**

    Install the 2 differential bearing caps in their original positions.

    1. Position the 2 differential bearing caps.
    2. Install the 4 differential bearing cap bolts hand-tight.

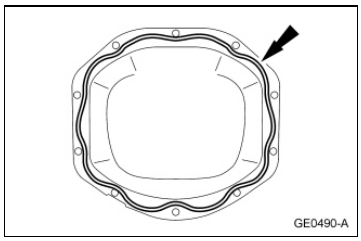


6. Remove the Differential Carrier Spreader.

7. Tighten the 4 differential bearing cap bolts.
   - Tighten to 61 Nm (45 lb-ft).

8. Verify that the differential assembly rotates freely.

9. Check the ring gear backlash and remove the Dial Indicator Gauge with Holding Fixture and Clutch Housing Gauge.



10. Install the RH axle shaft.

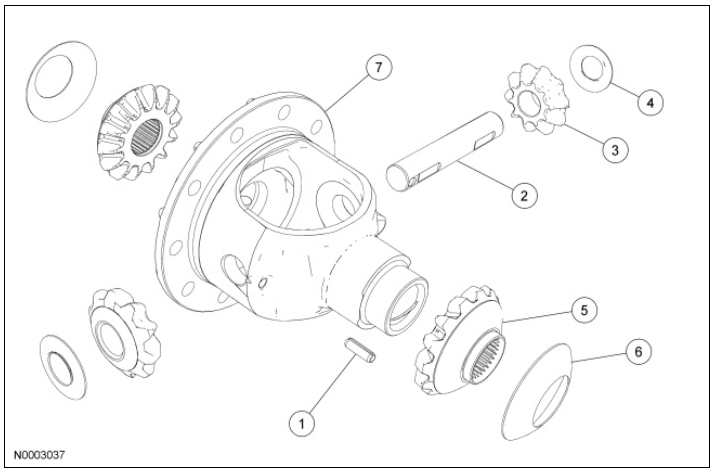
11. **NOTE:** The machined surfaces on the differential housing and the differential housing cover must be clean and free of oil before applying the new silicone sealant. Cover the inside of the axle before cleaning the machined surface to prevent contamination.

    NOTE: Install the differential housing cover within 15 minutes of applying the silicone material.

    NOTE: Allow the sealant to cure for one hour before filling the axle with lubricant.

    Apply a continuous bead of sealant, of the specified thickness, to the differential housing cover mounting surface as shown.

12. Install the differential housing cover and the 10 differential housing cover bolts.



- Tighten to 29 Nm (21 lb-ft).

13. Install the axle assembly. For additional information, refer to Axle Assembly in this section.

14. Remove the fill plug and fill the axle with rear axle lubricant to 9.56 mm (0.38 in) below the bottom of the filler hole.

15. Install the fill plug.
    - Tighten to 27 Nm (20 lb-ft).

Differential Case

Item	Part Number	Description
1	4241	Differential pinion shaft roll pin
2	4211	Differential pinion shaft
3	4215	Differential pinion gear
4	4230	Differential pinion gear thrust washer
5	4236	Differential side gear
6	4228	Differential side gear thrust washer
7	4205	Differential case

Disassembly and Assembly

1. Remove the differential case from the differential housing. For additional information, refer to Differential Carrier in this section.

2. **NOTE:** When the differential pinion shaft is removed from the differential case, drive the roll pin from the shaft.

   Use a drift punch to drive the roll pin into the differential pinion shaft until the roll pin bottoms against the differential case.

3. Remove the differential pinion shaft.

4. Remove the differential pinion gears and thrust washers.

5. Remove the differential side gears and thrust washers.

6. Inspect all parts.

7. **NOTE:** Align the differential pinion shaft hole with the hole in the differential case. Using a hammer, install the differential shaft roll pin in the differential case until the pin is flush with the case.

   To assemble, reverse the disassembly procedure.

General Specifications

Item	Specification
Front Axle	
LH halfshaft assembled length	685.3 mm (26.98 in)
RH halfshaft assembled length	615.3 mm (24.22 in)

Torque Specifications

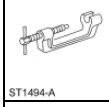
Description	Nm	lb-ft
Brake caliper anchor plate bolt	165	122
Halfshaft nut	250	184
Stabilizer bar link nut and grommet	35	26
Tie-rod nut	103	76
Upper ball joint nut	55	41

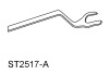
Front Drive Halfshafts

The front axle halfshafts consist of the following:

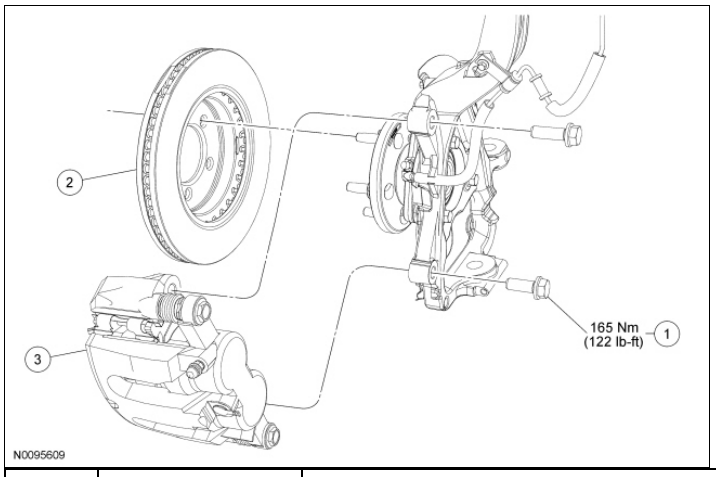
- Inner CV joints
- Outer CV joints
- Interconnecting shafts
- A circlip stopper that holds the cross-groove inboard race assembly (inboard CV joint) together
- A circlip that retains the splined inboard CV joint to the differential side gear on the LH halfshaft
- A circlip that retains the splined RH inboard CV joint to the intermediate shaft
- CV joint boot clamps
- Convoluted CV joint boots
- Tripod joint housings
- Ball and cage housings

The front axle halfshafts are driven by the differential side gears inside the front axle assembly or the RH axle shaft. Rotational torque is transferred from the stub shafts through the inner CV joint, intermediate shaft and outer CV joint to the outer stub shaft. The outboard stub shafts are splined to drive the wheel hubs. They are retained in the wheel hubs by special wheel hub nuts, which also control the wheel bearing preload. The LH halfshaft is splined on the inboard stub shaft and is retained in the differential side gear in the transaxle by a circlip. The RH halfshaft has internal splines which are driven by the axle shaft. The axle shaft has a circlip on the outboard end and is retained inside the inboard stub shaft. New circlips must be installed whenever they are removed. The CV joint mates the interconnecting shaft with the stub shaft. The joint allows for smooth rotation of the interconnecting shaft and the stub shafts. They also adjust for length variances and angle requirements as the vehicle goes through jounce and rebound. New halfshaft components are available as kits containing grease, boots and clamps.



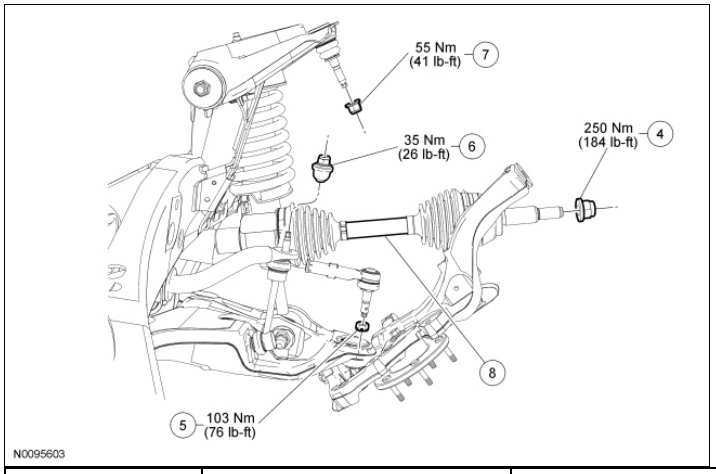


Handle all halfshaft components carefully during removal and installation and during various component disassembly and assembly procedures. Never pick up or hold the halfshaft only by the inboard or outboard CV joint. Do not overangle the CV joints. Damage will occur to an assembled inboard CV joint if it is overplunged outward from the joint housing. Never use a hammer to remove or install the halfshafts from the front hub. Never use the halfshaft assembly as a lever to position other components. Always support the free end of the halfshaft. Do not allow the boots to contact sharp edges or hot exhaust components. Handle the halfshaft only by the interconnecting shaft to avoid pull-apart and potential damage to the CV joints. Excessive pulling force on the interconnecting shaft between joints of the halfshaft will result in internal joint damage. Axial loads used in assisting removal must be applied through the inboard joint housing only. Do not drop assembled halfshafts. The impact will cut the boots from the inside without evidence of external damage. Do not remove the outer CV joint by pulling on the interconnecting shaft. Inspect all machined surfaces and splines for damage.



Front Drive Halfshafts

Refer to Section 205-00 .



Halfshaft

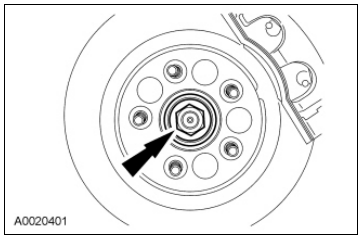
Special Tool(s)

 ST1494-A	C-Frame and Screw 211-023 (T74P-3044-A1)
 ST2272-A	Remover, Front Wheel Hub 205-D070 (D93P-1175-B) or equivalent
 ST2517-A	Remover, Halfshaft 205-291 (T89P-3514-A)
 ST2273-A	Remover, Steering Arm 211-003 (T64P-3590-F)

Item	Part Number	Description
1	2027	Brake caliper and anchor plate bolt (2 required)
2	1125	Brake disc
3	-	Brake caliper and anchor plate assembly

Item	Part Number	Description
4	W705967	Halfshaft nut
5	N800895-S	Tie-rod nut
6	N807144-S	Stabilizer bar link nut
7	W520214-S	Upper ball joint nut
8	3A427	Halfshaft assembly

Removal and Installation



Both halfshafts

1. ***NOTICE:*** **Do not loosen the front axle wheel end nut until after the wheel and tire assembly are removed from the vehicle. Wheel bearing damage will occur if the wheel bearing is unloaded with the weight of the vehicle applied.**

   With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the front wheel and tire. For additional information, refer to Section 204-04 .

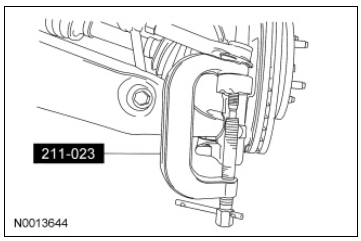
3. Remove and discard the halfshaft nut.
   - To install, tighten to 250 Nm (184 lb-ft).

4. ***NOTICE:*** **Do not allow the caliper and anchor plate assembly to hang from the brake hose or damage to the hose can occur.**

   Remove the bolts and position the caliper, pads and anchor plate assembly aside.

   - Discard the bolts.
   - Support the caliper and anchor plate assembly using mechanic's wire.
   - To install, tighten to 165 Nm (122 lb-ft).

5. ***NOTICE:*** **Do not use a hammer to separate the outboard Constant Velocity (CV) joint from the**

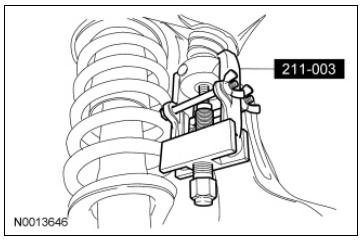


hub. Damage to the threads and internal CV joint components can result.

Using the Front Wheel Hub Remover, press the outboard CV joint until it is loose in the hub.

6. Remove and discard the tie-rod nut.
   - To install, tighten the new nut to 103 Nm (76 lb-ft).

7. Using the C-Frame and Screw, separate the tie rod from the knuckle.



8. Remove and discard the stabilizer bar link nut.
   - To install, tighten the new nut and grommet to 35 Nm (26 lb-ft).

9. Remove and discard the upper ball joint nut.
   - To install, tighten the new nut to 55 Nm (41 lb-ft).

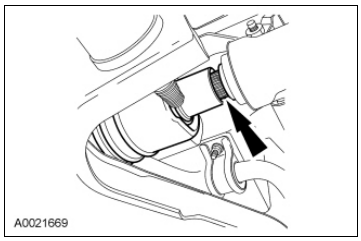
10. **NOTE:** Do not allow the knuckle to hang freely. It is possible to overextend and internally separate each inner CV joint from its housing.

    Using the Steering Arm Remover, disconnect the upper ball joint from the knuckle.

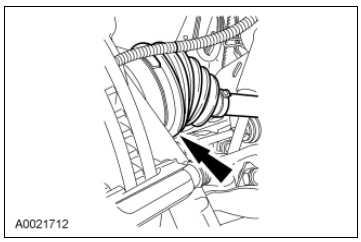
LH halfshaft

11. ***NOTICE:*** **Do not damage the axle shaft oil seal or the machined sealing surface on the inboard Constant Velocity (CV) joint housing.**

    Using the Halfshaft Remover, disengage the LH CV joint housing from the side gear.



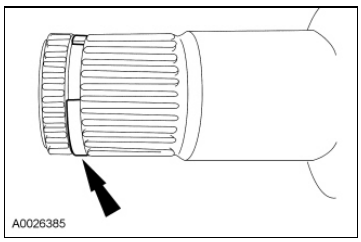
12. Remove the LH halfshaft.



RH halfshaft

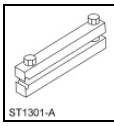
13. **NOTE:** Install a new retainer circlip on the outboard spline end of the axle shaft before reseating the axle shaft in the differential side gear.

    Pull the RH halfshaft and the axle shaft away from the axle tube, and separate the inboard CV joint housing from the axle shaft.



14. Remove the RH halfshaft.

Both halfshafts



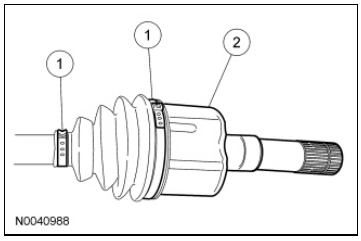
15. **NOTE:** Start one end of the circlip in the groove and work the circlip over the halfshaft and into the groove to prevent the circlip from overexpanding.

    To install, reverse the removal procedure.

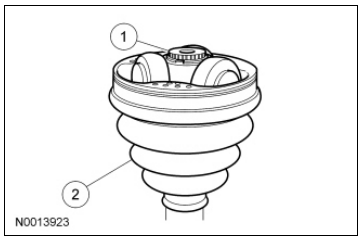
Halfshaft

Special Tool(s)

 ST1301-A	Installer, Constant Velocity Joint Boot Clamp 205-343 (T95P-3514-A)

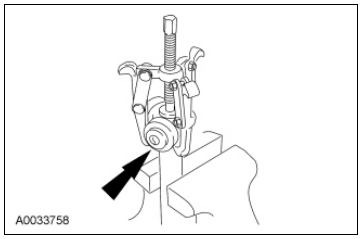


Item	Part Number	Description
1	3B418	Inboard CV joint housing
2	3B478	Inboard large boot clamp
3	3A331	Inboard CV joint boot
4	3B478	Inboard small boot clamp
5	4B422	Tri-lobe retainer
6	3W007A	Tri-lobe joint
7	3B478	Outboard small boot clamp
8	3A331	Outboard CV joint boot
9	3B478	Outboard large boot clamp
10	3B413	Intermediate shaft
11	20202	Wheel speed sensor ring
12	1175	Front wheel dust seal

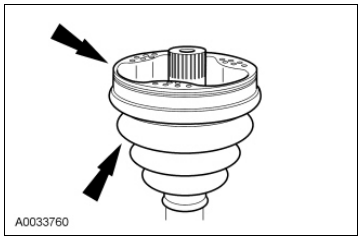


Disassembly

1. Remove the RH or LH halfshaft assembly. For additional information, refer to Halfshaft in this section.

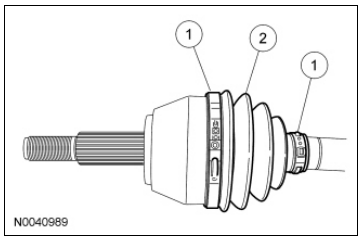


2. For the inboard CV joint, carry out the following:
    1. Remove and discard the 2 boot clamps.
    2. Remove the inboard CV joint housing.



3. For the inboard CV joint, carry out the following:
    1. Remove and discard the retainer circlip.
    2. Slide the boot away from the CV joint.

4. Using a suitable 3-jaw puller, remove the CV joint.

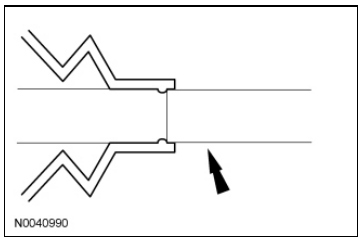


5. Remove and discard the inner CV boot.

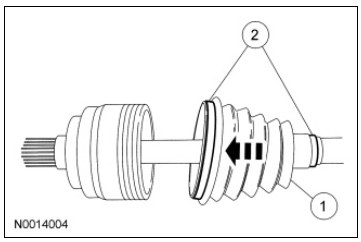
6. **NOTE:** The outboard CV joint is not removable from the halfshaft. The boot must be removed or installed from the inboard CV joint side of the shaft.

    For the outboard CV joint, carry out the following:

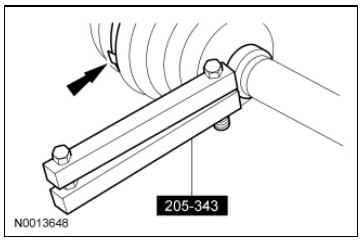
    1. Remove and discard the 2 boot clamps.
    2. Remove and discard the boot.



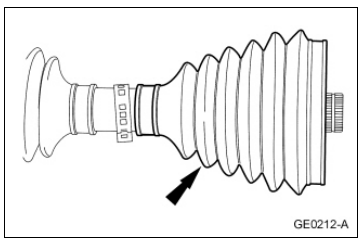
Assembly



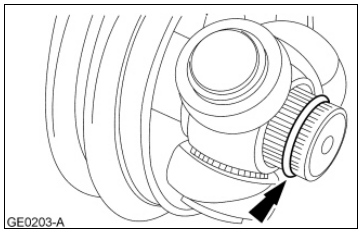
1. Lubricate the outboard CV joint.
    1. Pack the outboard CV joint with grease from the kit.
        - One-third of the grease must be installed in the joint with the remainder placed in the boot.
    2. Spread the remaining grease evenly inside the boot.



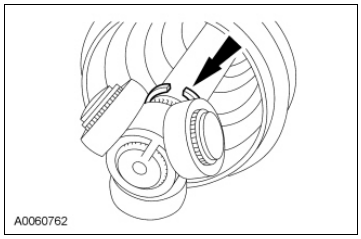
2. Position the boot so the rib on the boot is located in the groove of the shaft.



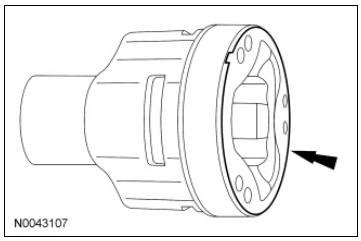
3. Position the outboard halfshaft boot and the outboard boot clamps.
    1. Position the boot.
    2. Position the 2 boot clamps.



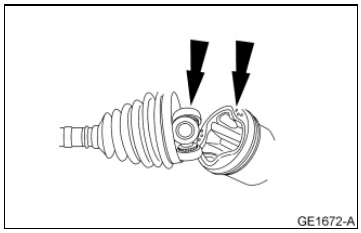
4. Using the Constant Velocity Joint Boot Clamp Installer, install the outboard CV boot clamps.



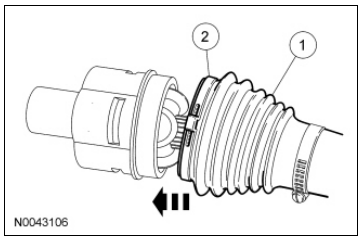
5. Position the inboard clamp and boot.



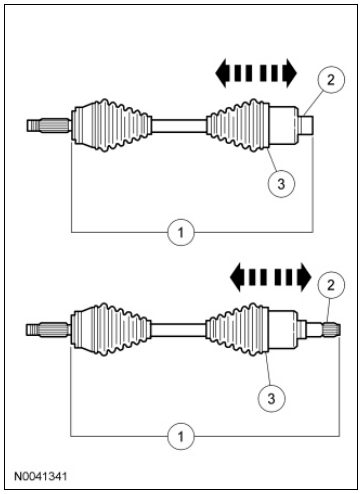
6. Install the CV joint and snap ring on the halfshaft.



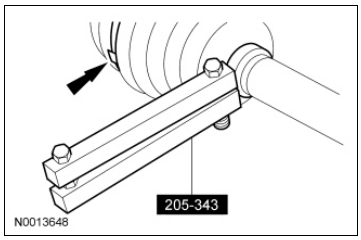
7. Install the stop ring.



8. Fill the inboard CV joint housing with grease from the kit.
    - One-half of the grease must be installed in the joint and the remainder placed in the boot.



9. Position the CV housing on the CV joint.



10. Position the inboard halfshaft boot and clamp.
    1. Position the boot in the housing groove.
    2. Position the boot clamp.

11. Set the halfshaft assembled length to specifications. For additional information, refer to Specifications in this section.
    1. Measure the entire assembly length.
    2. Push in or pull out on the inner joint as necessary to adjust the halfshaft assembled length.
    3. Hold the inner joint to prevent the assembled length from changing and insert a small flat-blade screwdriver between the boot and the joint to equalize the pressure.

12. Using the Constant Velocity Joint Boot Clamp Installer, install the boot clamps.

13. Install the RH or LH halfshaft assembly. For additional information, refer to Halfshaft in this section.

Material

Item	Specification	Fill Capacity
Constant Velocity Joint Grease (High Temperature) XG-5	WSS-M1C258-A1	Inboard joint 250 g (8.82 oz)
Constant Velocity Joint Grease (High Temperature) XG-5	WSS-M1C258-A1	Outboard joint 225 g (7.93 oz)

General Specifications

Item	Specification
Left rear halfshaft assembled length	843.7 mm (33.2 in)
Right rear halfshaft assembled length	872.7 mm (34.3 in)

Torque Specifications

Description	Nm	lb-ft	lb-in
Brake cable retaining screw	20	-	177
Lower arm outboard bolt	275	203	-
Halfshaft nut	275	203	-
Rear toe link outboard bolt	350	259	-
Upper arm outboard bolt	275	203	-
Wheel knuckle bolts	275	203	-

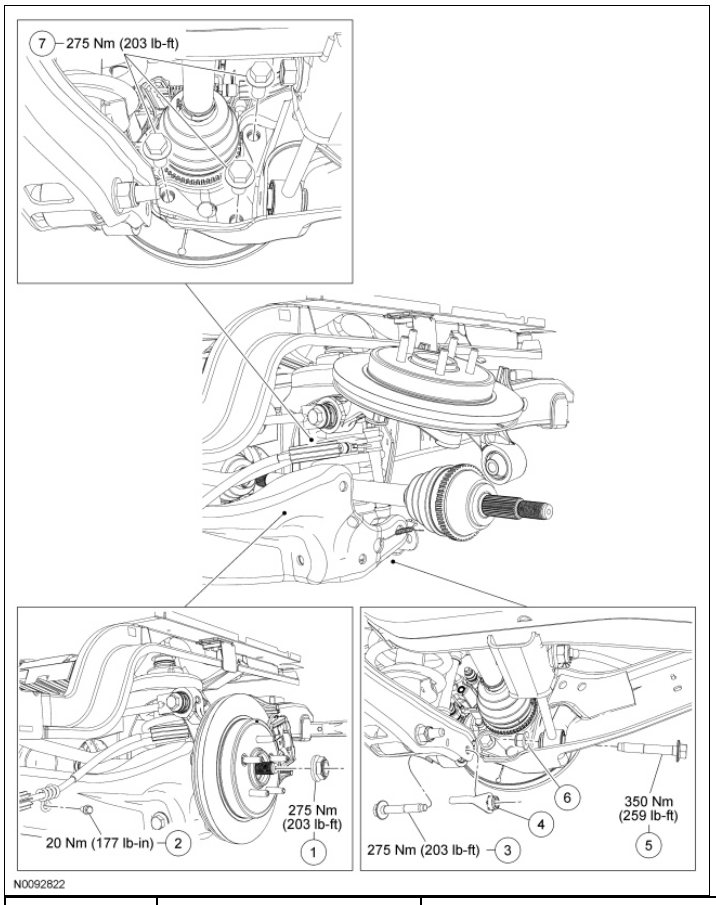
Rear Drive Halfshafts

The rear drive halfshafts consist of the following:

- Inner CV joints
- Outer CV joints
- Interconnecting shafts
- Convoluted CV joint boots
- CV joint boot clamps
- Special CV high-temperature grease
- Tripod joint housings
- Ball and cage housings
- A circlip stopper that holds the cross-groove inboard race assembly (inboard CV joint) together
- A circlip that retains the splined inboard CV joint to the differential side gear
- The RH and LH halfshafts are different lengths, with the LH halfshaft being the longer of the 2.

The rear drive halfshafts link the rear axle to the rear wheel hubs. The CV joints allow the halfshafts to rotate smoothly through the required changes in angles between the stationary axle and the varying angles of the rear wheels including jounce and rebound. The CV joints are either tri-lobed style or the caged ball type depending on inboard or outboard. New halfshaft components are available as kits containing grease, boots and clamps.

Handle all halfshaft components carefully during removal and installation and during various component disassembly and assembly procedures. Never pick up or hold the halfshaft only by the inboard or outboard CV joint. Do not overangle the CV joints. Damage will occur to an assembled inboard CV joint if it is overplunged outward from the joint housing. Never use a hammer to remove or install the halfshafts from the hub. Never use the halfshaft assembly as a lever to position other components. Always support the free end of the halfshaft. Do not allow the boots to contact sharp edges or hot exhaust components. Handle the halfshaft only by the interconnecting shaft to avoid pull-apart and potential damage to the CV joints. Excessive pulling force on the interconnecting shaft between joints of the halfshaft will result in internal joint damage. Axial loads used in assisting removal must be applied through the inboard joint housing only. Do not drop assembled halfshafts. The impact will cut the boots from the inside without evidence of external damage. Do not remove the outer CV joint by pulling on the interconnecting shaft. Inspect all machined surfaces and splines for damage.



Rear Drive Halfshafts

Refer to Section 205-00 .

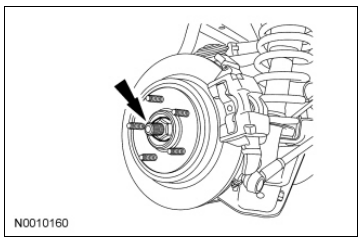
Halfshaft

Special Tool(s)

 ST1326-A	Handle 205-153 (T80T-4000-W)
 ST2272-A	Remover, Front Wheel Hub 205-D070 (D93P-1175-B) or equivalent
 ST2666-A	Remover, Halfshaft 205-529

Item	Part Number	Description
1	N808405	Halfshaft nut
2	W704911	Parking brake cable bracket bolt
3	W711444	Lower arm outboard bolt
4	W710808	Lower arm outboard flag nut
5	W711444	Toe link outboard bolt

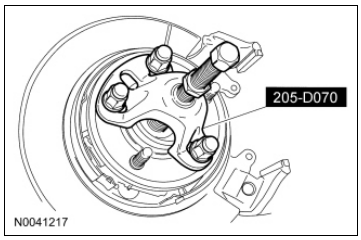
6	W520216	Toe link outboard nut
7	W710678	Wheel knuckle bolts (3 required)



Removal and Installation

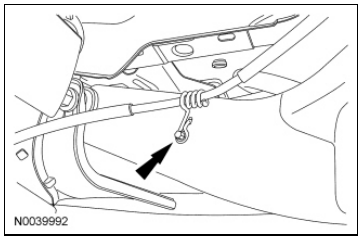
1. ***NOTICE:*** **Do not loosen the rear axle wheel end nut until after the wheel and tire assembly are removed from the vehicle. Wheel bearing damage will occur if the wheel bearing is unloaded with the weight of the vehicle applied.**

   With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .



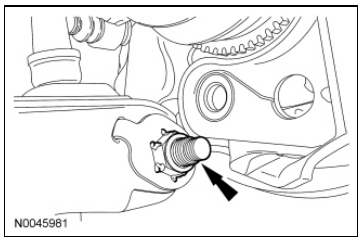
2. Remove the rear wheel and tire. For additional information, refer to Section 204-04 .

3. Remove the halfshaft nut.
   - To install, tighten to 275 Nm (203 lb-ft).

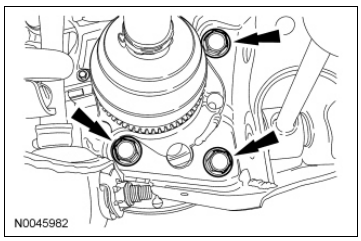


4. ***NOTICE:*** **Do not use a hammer to separate the rear axle halfshaft assembly from the hub. Damage to the threads and internal Constant Velocity (CV) joint components may result.**

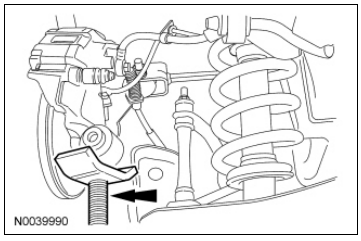
   Using the Front Wheel Hub Remover, press the outboard CV joint until it is loose in the hub.



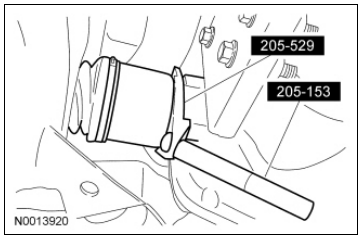
5. Remove the brake cable retainer screw.
   - To install, tighten to 20 Nm (177 lb-in).



6. Remove and discard the outboard toe link nut and back out the bolt for clearance.
   - To install, tighten to 350 Nm (259 lb-ft) at curb ride height.



7. Remove and discard the lower arm outboard bolt.
    - To install, tighten to 275 Nm (203 lb-ft) at curb ride height.



8. Remove and discard the 3 wheel knuckle bolts.
    - To install, tighten to 275 Nm (203 lb-ft).

9. Pivot the wheel knuckle assembly upward on the upper arm outboard bolt.
    - Loosen the upper arm bolt to prevent bushing damage.
        - ♦ To install, tighten to 275 Nm (203 lb-ft) at curb ride height.

10. Using the Halfshaft Remover and Handle, disengage the inboard CV joint housing from the differential side gear.

11. Remove the halfshaft assembly.

12. ***NOTICE:*** **Do not tighten the wheel hub nut with the vehicle on the ground. The nut must be tightened to specification before the vehicle is lowered onto the wheels. Wheel bearing damage**

will occur if the wheel bearing is loaded with the weight of the vehicle applied.

NOTE: Apply the brake to keep the halfshaft from rotating.

Position the halfshaft in the hub and use the previously removed hub nut to seat the halfshaft.

- Tighten to 350 Nm (258 lb-ft).
- Remove and discard the hub nut.

13. ***NOTICE:*** **The wheel hub nut contains a one-time locking chemical that is activated by the heat created when it is tightened. Install and tighten the new wheel hub nut to specification within 5 minutes of starting it on the threads. Always install a new wheel hub nut after loosening or when not tightened within the specified time or damage to the components can occur.**

    NOTE: Apply the brake to keep the halfshaft from rotating.

    Install a new hub nut.

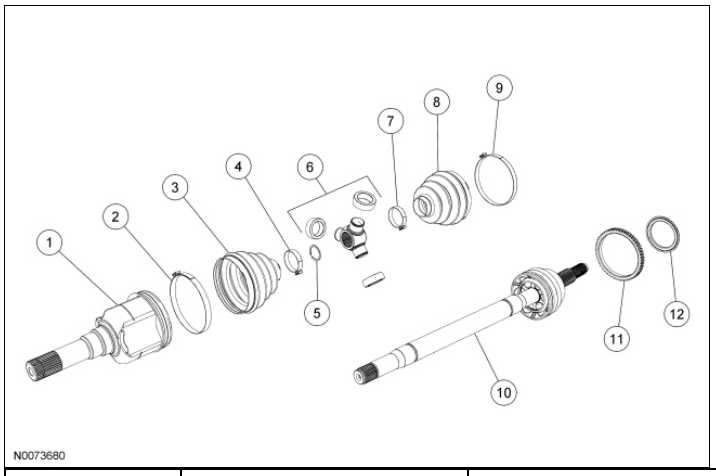
    - Tighten to 350 Nm (258 lb-ft).

14. **NOTE:** Always install a new differential stub shaft seal whenever the halfshaft is removed. For additional information, refer to Section 205-02 .

    NOTE: Make sure the halfshaft is completely seated in the differential side gear by pushing the halfshaft into the rear axle assembly until an audible click is heard or a leak may occur from the axle assembly.

    NOTE: Apply the brake to keep the halfshaft from rotating.

    To install, reverse the removal procedure.



Halfshaft Joint

Special Tool(s)

 ST1301-A	Installer, Constant Velocity Joint Boot Clamp 205-343 (T95P-3514-A)

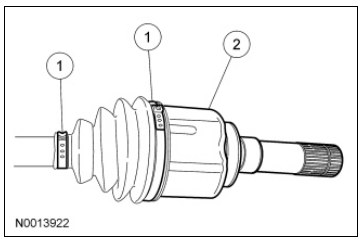
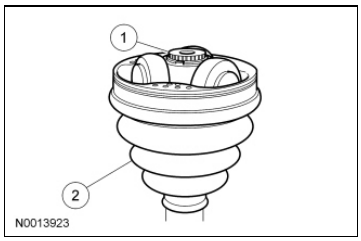
Material

Item	Specification
Constant Velocity Joint Grease (High Temperature) XG-5	WSS-M1C258-A1

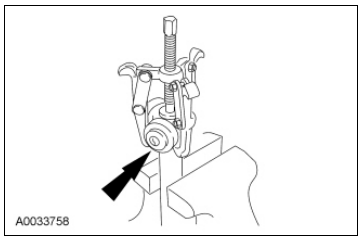


Item	Part Number	Description
1	3B418	Inboard CV joint housing
2	3B478	Inboard large boot clamp
3	3A331	Inboard CV joint boot
4	3B478	Inboard small boot clamp
5	4B422	Tri-lobe retainer
6	3W007A	Tri-lobe joint
7	3B413	Intermediate shaft
8	3B478	Outboard small boot clamp
9	3A331	Outboard CV joint boot
10	3B478	Outboard large boot clamp
11	20202	Wheel speed sensor ring
12	1175	Front wheel dust seal

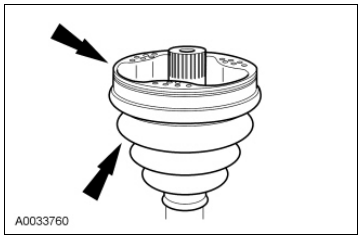


Disassembly

1. Remove the halfshaft assembly. For additional information, refer to Halfshaft in this section.

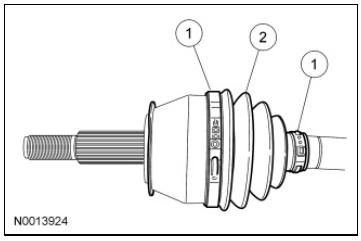


2. For the inboard CV joint, carry out the following:
    1. Remove and discard the boot clamps.
    2. Remove the inboard CV joint housing.



3. For the inboard CV joint, carry out the following:
    1. Remove and discard the retainer circlip.
    2. Slide the boot away from the CV joint.

4. Using a suitable 3-jaw puller, remove the CV joint.

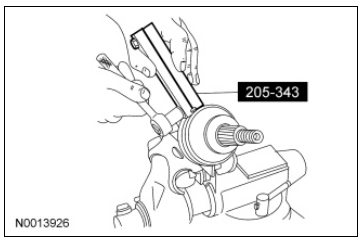


5. Remove and discard the tri-lobe insert and the boot.

6. **NOTE:** The outboard CV joint is not removable from the halfshaft. The boot must be removed or installed from the inboard CV joint side of the shaft.

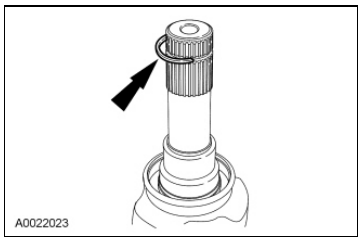
   For the outboard CV joint, carry out the following:

    1. Remove and discard the boot clamps.
    2. Remove and discard the boot.

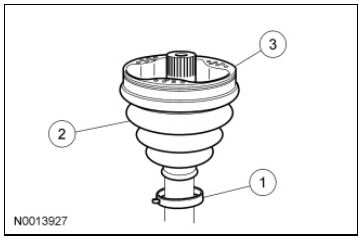


Assembly

1. For the outboard CV joint, carry out the following:
    1. Slide the boot on the interconnecting shaft.
    2. Pack the outboard CV joint with 225 g (7.93 oz) of grease.
    3. Spread any remaining grease evenly inside the boot.
    4. Install the boot by seating it in the groove in the CV joint housing.

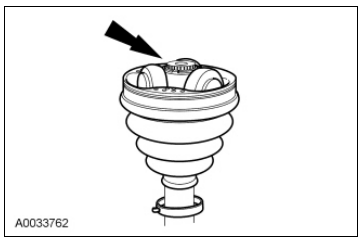


2. Using the Constant Velocity Joint Boot Clamp Installer, install the boot clamps.

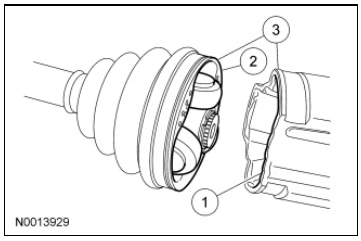


3. **NOTE:** Install a new circlip every time the halfshaft is removed from the axle.

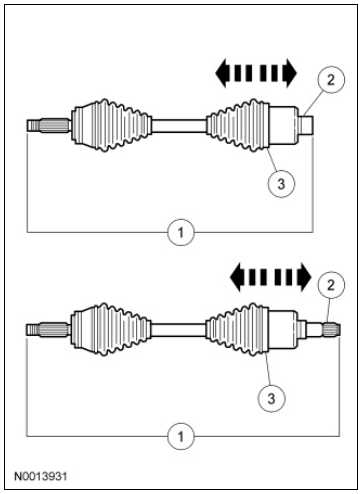
   Install a new retainer circlip.



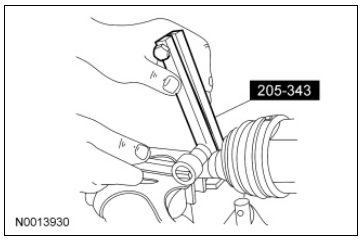
4. For the inboard CV joint, carry out the following:
    1. Position the clamp on the interconnecting shaft.
    2. Position the boot on the interconnecting shaft.
    3. Install the tri-lobe insert.



5. Using the Drive Pinion Oil Seal Installer, install the CV joint.



6. Install the retainer circlip.



7. For the inboard CV joint, carry out the following:
    1. Pack the inboard CV joint housing with 250 g (8.82 oz) of grease.
    2. Spread any remaining grease evenly inside the boot and CV joint.
    3. Install the inboard CV joint housing, seating the boot in the groove in the housing.

8. Set the halfshaft assembled length to specifications. For additional information, refer to Specifications in this section.
    1. Measure the entire assembly length.
    2. Push in or pull out on the inner joint as necessary to adjust the halfshaft assembled length.
    3. Hold the inner joint to prevent the assembled length from changing, and insert a soft, flat tool between the boot and the joint to equalize the pressure.

9. Using the Constant Velocity Joint Boot Clamp Installer, install both boot clamps.

10. Install the halfshaft assembly. For additional information, refer to Halfshaft in this section.

Material

Item	Specification	Fill Capacity
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1	1020 ml (2.15 pt)
Metal Brake Parts Cleaner PM-4-A or PM-4-B (US); CPM-4 (Canada)	-	-

Front brake caliper bleeder screws	11	-	97
Master cylinder brake tube fittings	18	-	159
Rear brake caliper bleeder screws	22	16	-

Brake System

The brake system consists of the following components:

- Front and rear disc brakes
- Cable/drum-in-hat actuated parking brake
- Brake master cylinder and fluid reservoir
- Vacuum-assisted power brake booster
- Four-wheel ABS
- Red brake warning indicator

The brake pedal is connected to the power brake booster, which is connected to the brake master cylinder. When the brake pedal is pressed, brake fluid is pushed through the double-walled steel tubes and flexible hoses to the front and rear disc brake calipers. The brake fluid enters the disc brake calipers, forcing the caliper pistons and brake pads outward against the brake disc friction surface, slowing or stopping rotation. When the brake pedal is released, brake fluid pressure is relieved, returning the front and rear disc brake caliper pistons and brake pads to the unapplied position.

For information on the following:

- Front disc brakes, refer to Section 206-03 .
- Rear disc brakes, refer to Section 206-04 .
- Parking brake actuation, refer to Section 206-05 .
- Hydraulic brake actuation, refer to Section 206-06 .
- Vacuum-assisted power brake booster, refer to Section 206-07 .
- ABS, refer to Section 206-09 .

Principles of Operation

Brake System

Applying the brake pedal uses lever action to push a rod into the brake booster, which through the use of vacuum, boosts the force of the rod and then transmits this force to the primary piston in the master cylinder. This produces hydraulic pressure in the master cylinder. This pressure builds in the master cylinder and brake tubes as the brake pedal is applied further. The pressure between the primary and secondary piston forces the secondary piston to compress, building pressure in its circuit. The hydraulic pressure is transmitted by brake fluid through the brake tubes to the ABS Hydraulic Control Unit (HCU), which then distributes that pressure to the individual brake calipers. The brake calipers use hydraulic pressure to apply the pads. The application of the brake pads will cause the rotation of the wheels to slow or stop, depending on how much brake pressure is applied. The parking brakes carry out the same function except that they are mechanically actuated by a cable that connects only to the rear brakes.

Brake Master Cylinder Compensator Ports

The purpose of the compensator ports in the brake master cylinder is to supply additional brake fluid from the master cylinder reservoir when needed by the brake system due to brake lining wear and allow brake fluid to return to the master cylinder reservoir when the brakes are released. The returning brake fluid creates a slight turbulence in the master cylinder reservoir. This is a normal condition and indicates that the compensator ports are not clogged. Clogged compensator ports may cause the brakes to hang up or not fully release.

Red Brake Warning Indicator

The red brake warning indicator alerts the driver to certain conditions that exist in the brake system. The Instrument Cluster (IC) performs a bulb check when the ignition key is turned to the RUN position. The conditions that cause the indicator to illuminate are low brake fluid level, the parking brake is applied or there is a fault in the ABS (if the yellow ABS warning indicator is also illuminated). To diagnose red brake warning indicator concerns, refer to Section 413-01 .

Inspection And Verification

Material

Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1

⚠ WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

⚠ WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

NOTICE: **Blistering or swelling of rubber brake components can indicate contamination of the brake fluid by a petroleum-based substance. The entire hydraulic brake system must be flushed with clean, specified brake fluid and contaminated rubber components must be replaced to prevent recontamination.**

NOTICE: **Do not spill brake fluid on painted or plastic surfaces or damage to the surface may occur. If brake fluid is spilled onto a painted or plastic surface, immediately wash the surface with water.**

The first indication that something may be wrong in the brake system is a change in the feeling through the brake pedal. The brake warning indicator in the Instrument Cluster (IC) and the brake fluid level in the brake master cylinder reservoir are also indicators of system concerns.

If a wheel is locked and the vehicle must be moved, open a bleeder screw at the locked wheel to let out enough fluid to relieve the pressure. Close the bleeder screw. If multiple wheels are locked, check the brake pedal free play to verify brake pedal is not partially applied. These operations may release the brakes, but will not correct the concern. If this does not relieve the locked wheel condition, repair the locked components before proceeding.

1. Verify the customer concern.
   - For parking brake concerns, refer to Section 206-05 .
   - For ABS concerns, refer to Section 206-09 .
   - For adjustable pedal concerns, refer to Section 206-06 .
   - For all other concerns, continue with the next step.

2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Brake fluid level and condition • Brake master cylinder • Brake master cylinder reservoir • Brake booster • Brake booster check valve • Brake booster vacuum hose • Brake hoses and tubes • Brake caliper, guide pins and anchor plate • Brake disc • Brake pads • Brake pedal, bracket and booster linkage • Aftermarket modifications	• Parking brake switch • Brake fluid level switch • Wiring, terminals or connectors

3. Visually inspect the suspension system and tires for obvious signs of wear or damage.
    - For suspension system concerns, refer to Section 204-00 .
    - For tire concerns, refer to Section 204-04 .

4. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

5. If the cause is not visually evident, GO to Symptom Chart - Brake System or GO to Symptom Chart - NVH in this section.

Symptom Chart

Symptom Chart - Brake System

Symptom Chart - Brake System

Symptom Chart - NVH

Symptom Chart - NVH

NOTE: NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to Section 100-04 . Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to Section 100-04 for the next likely system and continue diagnosis.

ConditionPossible SourcesAction

- Vibration when the brakes are applied
- Brake disc(s)
- Suspension components
- GO to Pinpoint Test A .
- Brake vibration/shudder - occurs when the brake pedal is released
- Brake drag
- GO to Symptom Chart - Brake System .
- Rear brake noise - occurs when the brake pedal is unapplied
- Parking brake component
- REFER to Section 206-05 to diagnose the parking brake system.
- Rattling noise
- Caliper guide pins or guide pin bolts
- CHECK the caliper guide pins and guide pin bolts. REFER to Brake System Inspection in this section.
- Missing or damaged anti-rattle clips or springs

- CHECK the brake pads for missing clips or broken springs. INSTALL new components as necessary. REFER to Section 206-03 for front disc brakes or Section 206-04 for rear disc brakes.

- Loose brake disc shield

- TIGHTEN the brake disc shield bolts to specification. REFER to Section 206-03 for front disc brakes or Section 206-04 for rear disc brakes.

- Squealing noise - occurs on first (morning) brake application

- Brake pads

- Acceptable condition. Caused by humidity and low brake pad temperature.

- Squealing noise - a continuous squeal

- Brake pads

- INSPECT the brake pads. REFER to Brake System Inspection in this section.

- Squealing noise - an intermittent squeal

- Brake pads

- Acceptable condition. Caused by cold, heat, water, mud or snow.

- Groaning noise - occurs at low speeds with brake lightly applied (creeping)

- Brake pads

- Acceptable condition.

- Grinding/moaning noise - continuous

- Brake pads
- Brake disc

- INSPECT the brake pads, brake discs and attaching hardware for damage. VERIFY brake components are within specifications. REFER to Brake System Inspection in this section.

Pinpoint Tests

Pinpoint Test A: Vibration When the Brakes are Applied

Normal Operation

During moderate to heavy braking, noise from the Hydraulic Control Unit (HCU) and pulsation in the brake pedal can be observed. Pedal pulsation coupled with noise during heavy braking or on loose gravel, bumps, wet or snowy surfaces is acceptable and indicates correct functioning of the ABS. Pedal pulsation or steering wheel nibble when the brakes are applied (frequency is proportioned to the vehicle speed) indicates a concern with a brake or suspension component.

PINPOINT TEST A: VIBRATION WHEN THE BRAKES ARE APPLIED

Test Step	Result / Action to Take
A1 ROAD TEST THE VEHICLE - LIGHT BRAKING	
• Road test the vehicle. Warm the brakes by slowing the vehicle from 80 to 32 km/h (50 to 20 mph) using light brake force. At highway speeds of 89-97 km/h (55-60 mph), apply the brake using light pedal force. • **Is there a vibration/shudder felt in the steering wheel, seat or brake pedal?**	**Yes** GO to A4 . **No** GO to A2 .
A2 ROAD TEST THE VEHICLE - MODERATE TO HEAVY BRAKING	
• Road test the vehicle. At highway speeds of 89-97 km/h (55-60 mph), apply the brake using a moderate to heavy pedal force. • **Is there a vibration/shudder?**	**Yes** GO to A3 . **No** The concern is not present at this time.
A3 CHECK ABS OPERATION	
• **NOTE:** During moderate to heavy braking, noise from the HCU and pulsation in the brake pedal can be observed. Pedal pulsation coupled with noise during heavy braking or on loose gravel, bumps, wet or snowy surfaces is acceptable and indicates correct operation of the ABS. Pedal pulsation or steering wheel nibble with the frequency proportional to vehicle speed indicates a concern with a brake or suspension component. • Road test the vehicle and apply the brakes on a dry, firm surface, then apply the brakes on a wet, snowy or loose surface (such as gravel). • **Is the vibration/shudder only present on a wet, snowy or loose surface?**	**Yes** This is a normal operating condition of the ABS. **No** GO to A5 .
A4 ISOLATE BRAKE VIBRATION	

• **NOTE:** This test is not applicable to vehicles with drum-in-hat type parking brakes. For vehicles with drum-in-hat parking brakes, proceed to the next test step. For all other vehicles, apply the parking brake to identify if the problem is in the front or rear brake. • Apply the parking brake to identify if the problem is in the front or rear brake. At highway speeds of 89-97 km/h (55-60 mph), lightly apply the parking brake until the vehicle slows down. Release the parking brake immediately after the test. • **Is there a vibration/shudder?**	**Yes** GO to A7 . **No** GO to A5 .
A5 CHECK THE FRONT SUSPENSION	
• Check the front suspension. Refer to Section 204-00 . • **Are all the suspension components in satisfactory condition?**	**Yes** GO to A6 . **No** REPAIR or INSTALL new components as necessary. TEST the system for normal operation.
A6 CHECK THE FRONT BRAKE DISCS	
• Inspect the front brake discs. Refer to Brake System Inspection in this section. • Road test the vehicle. • **Is the vibration/shudder present?**	**Yes** GO to A7 . **No** The concern has been repaired.
A7 CHECK THE REAR SUSPENSION	
• Check the rear suspension. Refer to Section 204-00 . • **Are all the suspension components in satisfactory condition?**	**Yes** INSPECT the rear brake discs. REFER to Brake System Inspection in this section. **No** REPAIR or INSTALL new components as necessary. TEST the system for normal operation.

Component Tests

Brake Booster

1. Disconnect the brake booster vacuum sensor/check valve from the brake booster and connect a suitable vacuum/pressure tester to the booster side of the vacuum sensor/check valve.

2. Apply the parking brake, start the engine and place the transmission in NEUTRAL.
   - Allow the engine to reach normal operating temperature.

3. **NOTE:** Subtract approximately 3.38 kPa (1 in-Hg) from the specified reading for every 304.8 m (1,000 ft) of elevation above sea level.

   Verify that vacuum is available at the vacuum sensor/check valve with engine running at normal idle speed.

   - The vacuum gauge should read between 51-74 kPa (15-22 in-Hg).
   - If specified vacuum is available, stop the engine, connect the vacuum sensor/check valve and continue with Step 5.
   - If specified vacuum is not available, continue with Step 4.

4. Disconnect the vacuum sensor/check valve from the vacuum hose and verify that the specified vacuum is available at the hose with the engine at idle speed and the transmission in NEUTRAL.
   - If specified vacuum is available, stop the engine, install a new vacuum sensor/check valve and continue with Step 5.
   - If specified vacuum is not available, stop the engine, connect the vacuum hose to the vacuum sensor/check valve and refer to Section 303-00 to diagnose the no/low vacuum condition.

5. Apply the brake pedal several times to exhaust all vacuum from the system.

6. Apply the brake pedal and hold it in the applied position. Start the engine and verify that the brake pedal moves downward after the engine starts.
   - If the brake pedal moves, the brake booster is operating correctly.
   - If the brake pedal does not move, install a new brake booster. Refer to Section 206-07 .

7. Operate the engine a minimum of 20 seconds at idle. Stop the engine and let the vehicle stand for 10 minutes, then apply the brake pedal. The brake pedal feel should be the same as that noted with the engine operating.
   - If the brake pedal feels hard (no power assist), install a new brake booster vacuum sensor/check valve and retest.
   - If condition still exists, install a new brake booster. Refer to Section 206-07 .
   - If the brake pedal feels the same as noted with the engine operating, the vacuum sensor/check valve is functioning properly.

Brake Master Cylinder - Bypass Condition

1. Inspect the master cylinder. Refer to Brake System Inspection in this section.

2. Disconnect the brake tubes from the master cylinder.

3. Plug the outlet ports of the master cylinder.

4. **NOTE:** Make sure that the outlet port plugs do not show signs of leakage.

   Lightly apply the brakes and hold for 10 seconds. Release the brakes and then reapply with heavy force. If brake pedal height cannot be maintained, the brake master cylinder has an internal leak and a new brake master cylinder must be installed.

   - If brake pedal height is maintained, reinstall brake tubes and tighten to specifications. Refer to Specifications in this section. After installation, bleed the brake system. Refer to Brake System Bleeding in this section.

Brake Master Cylinder - Compensator Port

1. Inspect the master cylinder. Refer to Brake System Inspection in this section.

2. With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 .

3. Apply and release the brakes.

4. With the brakes released, attempt to rotate each wheel and check for any brake drag.
   - If an excessive amount of brake drag exists at multiple wheels, continue to Step 5.
   - If an excessive amount of brake drag exists at only one wheel, it indicates a possible seized brake caliper, brake wheel cylinder or parking brake component. Repair or install new components as necessary.

5. Check the brake stoplamp switch and the brake pedal free play to verify that the brake pedal is not partially applied.

6. Loosen the brake master cylinder nuts and position the brake master cylinder away from the brake booster.

7. With the brakes released, attempt to rotate each wheel and check for any brake drag.
   - If the brake drag is no longer present, install a new brake booster. Refer to Section 206-07 .
   - If the brake drag is still present, install a new master cylinder. Refer to Section 206-06 .

Brake System Inspection

Material

Item	Specification
Metal Brake Parts Cleaner PM-4-A or PM-4-B (US); CPM-4 (Canada)	-
Silicone Brake Caliper Grease and Dielectric Compound XG-3-A	ESE-M1C171-A

Brake Pads

NOTE: It is not required to install new brake pads when the brake discs are machined.

1. Inspect the brake pad friction material for contamination.
   - If the friction material shows evidence of contamination, install new brake pads. For additional information, refer to Section 206-03 for front brake pads or Section 206-04 for rear brake pads.

2. Inspect and measure the thickness of the brake pad friction material. For additional information, refer to Specifications in this section.
   - Minor surface cracks do not require pad replacement, however, if there are missing chunks or cracks in the lining through to the backing plate, install new brake pads. For additional information, refer to Section 206-03 for front brake pads or Section 206-04 for rear brake pads.
   - If the thickness of the friction material is less than the specified thickness, install new brake pads. For additional information, refer to Section 206-03 for front brake pads or Section 206-04 for rear brake pads.
   - If the friction material shows taper wear that is not within specifications, install new brake pads and verify the caliper guide pins are functioning correctly. For additional information, refer to Brake Caliper Guide Pins inspection.

Brake Discs

NOTICE: **Using an impact tool without a torque socket will lead to unevenly tightened wheel nuts. This causes brake disc on-vehicle lateral runout and brake roughness.**

1. Inspect the brake discs and measure the brake disc thickness. Record the measurement. Refer to Specifications in this section.
   - If the brake disc is cracked or otherwise damaged, install a new brake disc. For additional information, refer to Section 206-03 for front brakes or Section 206-04 for rear brakes.
   - If the measurement is below the minimum thickness specification, install a new brake disc. For additional information, refer to Section 206-03 for front brakes or Section 206-04 for rear brakes.

- If the diagnosis has revealed vibration in the steering wheel, seat or pedal while braking that varies with vehicle speed, machine the brake disc. Heavily scored brake discs, similar to that caused by pads worn down to the backing plate, should also be machined. In order to machine, discs must be above the minimum thickness specification. For additional information, refer to Specifications and Brake Disc Machining in this section.

Brake Calipers

1. Inspect the brake calipers for leaks, damage to seals and piston corrosion or binding.
    - If the brake caliper is leaking or otherwise damaged, install a new brake caliper. For additional information, refer to Section 206-03 for front brake calipers or Section 206-04 for rear brake calipers.

Brake Caliper Guide Pins

1. The guide pins should slide with a reasonable amount of hand force. If the brake pads show taper wear or the guide pins are difficult to move, carry out the following steps.
    - Disassemble the brake caliper guide pins and inspect the guide pins and guide pin bores for wear, damage and corrosion. If the bore is worn or damaged, replace the damaged component.
    - Use a wire brush, rolled-up sandpaper or emery cloth to remove all corrosion and foreign material from the caliper guide pin bores. Clean any remaining foreign material from the bores with brake parts cleaner and compressed air.
    - Assemble the caliper seals, boots and guide pins. Use an ample amount of the specified grease to lubricate the bores and guide pins.
    - Inspect the brake pads. For additional information, refer to Brake Pads inspection in this section.

Brake Flexible Hoses and Tubes

NOTICE: **Never use copper tubing. It is subject to fatigue, cracking and corrosion, which may result in brake tube failure.**

NOTE: Double-wall steel tubing is used throughout the brake hydraulic system. All brake tube fittings must be correctly double flared to provide strong, leakproof connections. When bending tubing to fit the underbody or rear axle contours, be careful not to kink or crack the tube.

1. Inspect brake tubes for corrosion, cracks, leaks or any other signs of damage.
    - If a section of the brake tube is damaged, the entire section must be installed with a new tube of the same type, size, shape and length.
    - When installing the hydraulic brake tubing, hoses or connectors, tighten all connections to specifications. After installation, bleed the brake system. For additional information, refer to Brake System Bleeding in this section.

2. Inspect the brake flexible hoses for cracks, leaks and swelling during brake application or any other signs of damage.
    - Install a new brake flexible hose if the hose shows signs of softening, cracking or other damage. For additional information, refer to Section 206-03 for the front brake flexible hose or Section 206-04 for the rear brake flexible hose.

Brake Master Cylinder

NOTE: During normal operation of the brake master cylinder, the fluid level in the brake master cylinder reservoir will fall during brake application and rise during release. The returning brake fluid creates a slight turbulence in the master cylinder reservoir. This is a normal condition and indicates that the compensator ports are not clogged. Clogged compensator ports may cause the brakes to hang up or not fully release. The net fluid level (such as after brake application and release) will remain unchanged. Fluid level will decrease with pad wear.

NOTE: A trace of brake fluid will exist on the booster shell below the master cylinder mounting flange. This results from the normal lubricating action of the master cylinder bore and seal.

1. Inspect the brake master cylinder for fluid leaks.
    - Install a new master cylinder or brake fluid reservoir if signs of excessive leaking are present. For additional information, refer to Section 206-06 .
    - To check for correct brake master cylinder operation, refer to Component Tests in this section.

Brake Booster

1. Inspect the brake booster for excessive corrosion or damage. Inspect the vacuum hoses for leaks and kinks.
    - Install a new brake booster if signs of excessive corrosion or damage is found. For additional information, refer to Section 206-07 .
    - Repair or replace vacuum hoses as necessary.
    - To check for correct brake booster operation, refer to Component Tests in this section.

Brake Disc Machining

NOTE: Do not use a bench lathe to machine the brake discs. Use an on-vehicle brake lathe only. Read the entire operating manual and/or view the video shipped with the lathe before installing, operating or repairing the lathe.

NOTE: An on-vehicle brake lathe with an automatic runout adjustment feature is preferred. However, if the lathe is not self adjusting, the lathe oscillation must be adjusted using a dial indicator. The total indicated runout target is 0.000 mm (0.000 in). The maximum indicated runout should be no more than 0.050 mm (0.002 in). If the runout adjustment (automatic or manual) is carried out correctly prior to machining, then the final brake disc runout will be within specification and a runout measurement is not necessary after machining.

NOTE: Lateral runout and disc thickness variation measurements are not required because correct adjustment of the on-vehicle brake lathe will make sure that these dimensions are within specification.

1. Remove the wheel and tire. For additional information, refer to Section 204-04 .

2. ***NOTICE:*** **Do not allow the caliper to hang from the brake hose or damage to the hose may occur.**

   Remove the bolts and position the brake caliper or brake caliper and anchor plate assembly aside, as required.

   - Support the brake caliper using mechanic's wire.

3. Install the hub adapter using:
   - four wheel nuts on a 4-stud wheel hub.
   - five wheel nuts on a 5-stud wheel hub.
   - six wheel nuts on a 6-stud wheel hub.
   - four wheel nuts on a 7- or 8-stud wheel hub.
   - five wheel nuts on a 10-stud wheel hub.

4. Install the cutting lathe.

5. If the lathe is not self adjusting, adjust the lathe oscillation using a dial indicator. The total indicated runout target is 0.000 mm (0.000 in). The maximum indicated runout should be no more than 0.050 mm (0.002 in).

6. Center the cutting head, adjust the cutting bits and install the chip deflector/silencer.

7. **NOTE:** The depth of the cut should be between 0.10 and 0.40 mm (0.004 and 0.015 in). Lighter cuts will cause the bit to heat up and wear faster. Heavier cuts will cause poor brake disc surface finish.

   Machine the brake disc.

8. Remove the lathe and the silencer.

9. Remove the wheel nuts and hub adapter.

10. Remove the metal shavings.

11. Measure the brake disc thickness.
    - If the measurement is below the minimum specification, install a new brake disc. For additional information, refer to Section 206-03 for front disc brakes or Section 206-04 for rear disc brakes.

12. **NOTE:** It is not required to install new brake pads if friction material is within specifications. For additional information, refer to Specifications in this section.

    Position the brake caliper or brake caliper and anchor plate assembly.

    - Install the bolts.
    - For fastener torque specifications, refer to Section 206-03 for front disc brakes or Section 206-04 for rear disc brakes.

13. Install the wheel and tire. For additional information, refer to Section 204-04 .

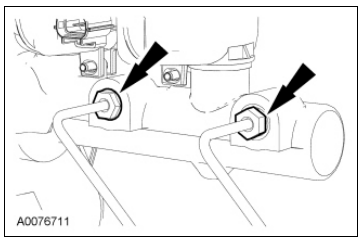
Component Bleeding

Material

Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1

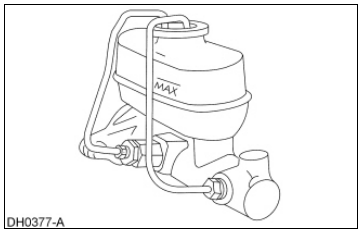
Master Cylinder

⚠ WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.



⚠ WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Do not allow the brake master cylinder to run dry during the bleeding operation. Master cylinder may be damaged if operated without fluid, resulting in degraded braking performance. Failure to follow this instruction may result in serious personal injury.



NOTICE: **Do not spill brake fluid on painted or plastic surfaces or damage to the surface may occur. If brake fluid is spilled onto a painted or plastic surface, immediately wash the surface with water.**

NOTE: When a new brake master cylinder has been installed, or the system is emptied or partially emptied, it should be primed to prevent air from entering the system.

1. Disconnect the brake tubes from the master cylinder.

2. Install short brake tubes with the ends submerged in the brake master cylinder reservoir.

3. Fill the brake master cylinder reservoir with clean, specified brake fluid.

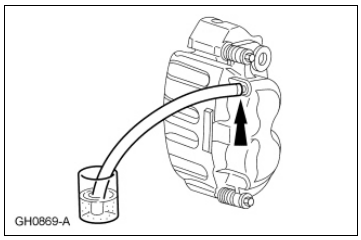
4. Have an assistant pump the brake pedal until clear fluid flows from both brake tubes, without air bubbles.

5. Remove the short brake tubes and install the brake outlet tubes.

6. Bleed the brake system. For additional information, refer to Brake System Bleeding in this section.

Brake Caliper

⚠ WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.



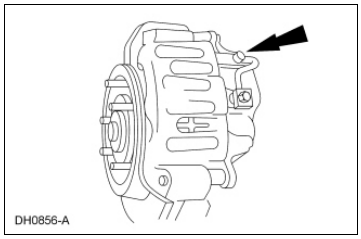
⚠ WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Do not allow the brake master cylinder to run dry during the bleeding operation. Master cylinder may be damaged if operated without fluid, resulting in degraded braking performance. Failure to follow this instruction may result in serious personal injury.

***NOTICE:* Do not spill brake fluid on painted or plastic surfaces or damage to the surface may occur. If brake fluid is spilled onto a painted or plastic surface, immediately wash the surface with water.**

1. **NOTE:** It is not necessary to do a complete brake system bleed if only the brake caliper was disconnected or installed new.

   Remove the bleeder screw cap and place a box-end wrench on the bleeder screw. Attach a rubber drain hose to the bleeder screw and submerge the free end of the hose in a container partially filled with clean, specified brake fluid.



2. Have an assistant pump the brake pedal at least 2 times and then hold firm pressure on the brake pedal.

3. Loosen the bleeder screw until a stream of brake fluid comes out. While the assistant maintains pressure on the brake pedal, tighten the bleeder screw.

- Repeat until clear, bubble-free fluid comes out.
- Refill the brake master cylinder reservoir as necessary.

4. Remove the rubber hose and tighten the bleeder screw to specifications. For additional information, refer to Specifications in this section.
    - Install the bleeder screw cap.

Brake System Bleeding

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

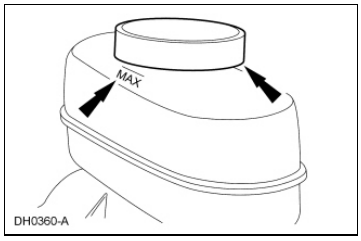
Material

Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1

Pressure

⚠ WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

⚠ WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.



⚠ WARNING: Do not allow the brake master cylinder to run dry during the bleeding operation. Master cylinder may be damaged if operated without fluid, resulting in degraded braking performance. Failure to follow this instruction may result in serious personal injury.

NOTICE: **Do not spill brake fluid on painted or plastic surfaces or damage to the surface may occur. If brake fluid is spilled onto a painted or plastic surface, immediately wash the surface with water.**

NOTE: The Hydraulic Control Unit (HCU) bleeding procedure must be carried out if the HCU or any components upstream of the HCU are installed new.

NOTE: Pressure bleeding the brake system is preferred to manual bleeding.

1. Clean all dirt from the brake master cylinder filler cap and remove the filler cap.
   - Fill the brake master cylinder with clean specified brake fluid.

2. **NOTE:** Master cylinder pressure bleeder adapter tools are available from various manufacturers of pressure bleeding equipment. Follow the instructions of the equipment manufacturer when installing the adapter.

   Install the bleeder adapter to the brake master cylinder reservoir and attach the bleeder tank hose to the fitting on the adapter.

3. **NOTE:** Make sure the bleeder tank contains enough clean, specified brake fluid to complete the bleeding operation.

   Open the valve on the bleeder tank.

   - Apply 207-345 kPa (30-50 psi) to the brake system.

4. Remove the RH rear bleeder cap and place a box-end wrench on the bleeder screw. Attach a rubber drain tube to the RH rear bleeder screw and submerge the free end of the tube in a container partially filled with clean, specified brake fluid.

5. Loosen the RH rear bleeder screw. Leave open until clear, bubble-free brake fluid flows, then tighten the RH rear bleeder screw and remove the rubber hose.
   - Tighten to specifications. For additional information, refer to Specifications in this section.
   - Install the bleeder screw cap.

6. Continue bleeding the system, going in order from the LH rear bleeder screw to the RH front bleeder screw ending with the LH front bleeder screw.

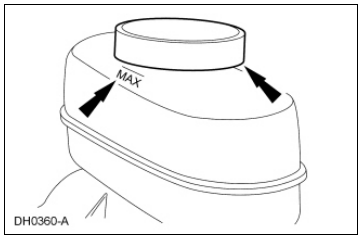
7. Release the bleeder tank pressure and close the bleeder tank valve. Remove the tank hose from the adapter and remove the adapter from the brake fluid reservoir.

Manual

⚠ WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

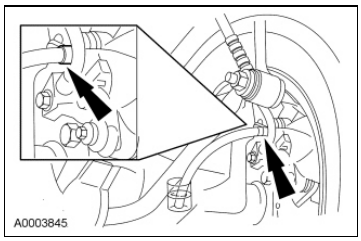
⚠ WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet

(MSDS) if available. Failure to follow these instructions may result in serious personal injury.



⚠ WARNING: Do not allow the brake master cylinder to run dry during the bleeding operation. Master cylinder may be damaged if operated without fluid, resulting in degraded braking performance. Failure to follow this instruction may result in serious personal injury.

NOTICE: **Do not spill brake fluid on painted or plastic surfaces or damage to the surface may occur. If brake fluid is spilled onto a painted or plastic surface, immediately wash the surface with water.**



NOTE: The HCU bleeding procedure must be carried out if the HCU or any components upstream of the HCU are installed new.

NOTE: Pressure bleeding the brake system is preferred to manual bleeding.

1. Clean all dirt from the brake master cylinder filler cap and remove the filler cap.
   - Fill the brake master cylinder with clean specified brake fluid.

2. Remove the bleeder screw cap and place a box-end wrench on the RH rear bleeder screw. Attach a rubber drain hose to the RH rear bleeder screw and submerge the free end of the hose in a container partially filled with clean, specified brake fluid.

3. Have an assistant pump the brake pedal at least 3 times and then hold firm pressure on the brake pedal.

4. Loosen the RH rear bleeder screw until a stream of brake fluid comes out. While the assistant maintains pressure on the brake pedal, tighten the RH rear bleeder screw.
   - Repeat until clear, bubble-free fluid comes out.
   - Refill the brake master cylinder reservoir as necessary.

5. Remove the rubber hose and tighten the bleeder screw to specifications. For additional information, refer to Specifications in this section.
   - Install the bleeder screw cap.

6. Repeat Steps 2 through 5 for the LH rear, RH front and LH front bleeder screws in this order.

Hydraulic Control Unit (HCU)

NOTE: The HCU bleeding procedure must be carried out if the HCU or any components upstream of the

HCU are installed new.

NOTE: Pressure bleeding the brake system is preferred to manual bleeding.

1. Follow the Pressure Bleeding or Manual Bleeding procedure steps to bleed the system.
2. Connect the scan tool and follow the ABS Service Bleed instructions.
3. Repeat the Pressure Bleeding or Manual Bleeding procedure steps to bleed the system.

Material

Item	Specification	Fill Capacity
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1	1,020 ml (2.15 pt)

Brake disc minimum thickness	28.5 mm (1.122 in)
Brake Pads	
Brake pad maximum taper wear (in any direction)	3.0 mm (0.118 in)
Brake pad minimum thickness	3.0 mm (0.118 in)

Torque Specifications

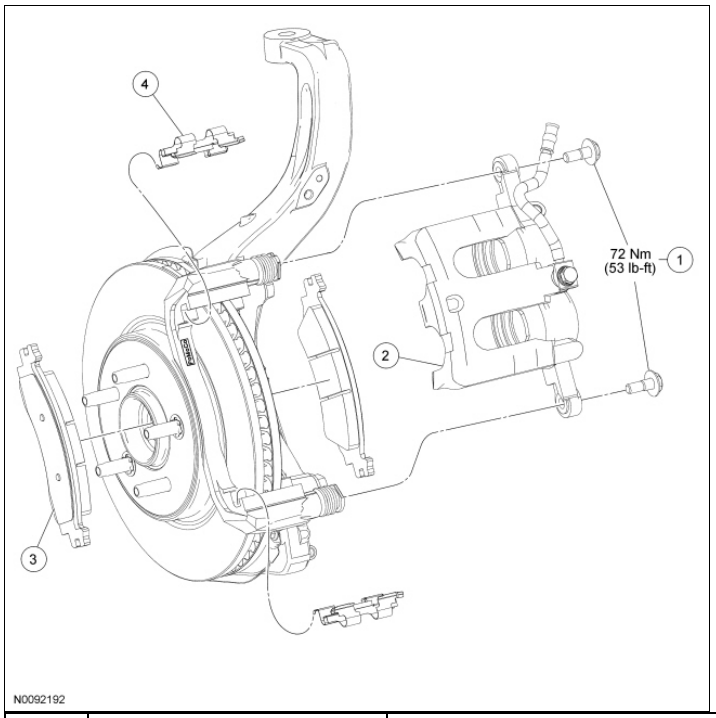
Description	Nm	lb-ft	lb-in
Brake caliper anchor plate bolts	165	122	-
Brake caliper bleeder screw	11	-	97
Brake caliper guide pin bolts	72	53	-
Brake disc shield bolts	8	-	71
Brake flexible hose flow bolt	35	26	-
Brake tube-to-brake hose fitting	18	-	159

Front Disc Brake

The front brake disc system consists of the following components:

- Brake pads
- Brake caliper anchor plate
- Brake caliper
- Brake disc
- Brake disc shield
- Brake flexible hose

When mechanical force is applied by the driver to the brake pedal, the force is converted into hydraulic pressure by the master cylinder. The hydraulic force is directed to the disc brake calipers and transferred to the brake pads. The brake pads are then forced against the brake friction surfaces by the brake caliper pistons. The friction of the brake pads on the brake disc causes the slowing of wheel rotation and the vehicle.



Front Disc Brake

Refer to Section 206-00 .

Brake Pads

Material

Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1

Item	Part Number	Description
1	2W303	Brake caliper guide pin bolts (2 required)
2	2B120 RH/ 2B121 LH	Brake caliper housing
3	2001	Brake pad (2 required)
4	-	Brake pad clip (part of 2001)

Removal

⚠ WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

⚠ WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Always install new brake shoes or pads at both ends of an axle to reduce the possibility of brakes pulling vehicle to one side. Failure to follow this instruction may result in uneven braking and serious personal injury.

NOTICE: **Do not spill brake fluid on painted or plastic surfaces or damage to the surface may occur. If brake fluid is spilled onto a painted or plastic surface, immediately wash the surface with water.**

1. Check the brake fluid level in the brake master cylinder reservoir.
   - If required, remove brake fluid until the brake master cylinder reservoir is one-half full.

2. Remove the wheel and tire. For additional information, refer to Section 204-04 .

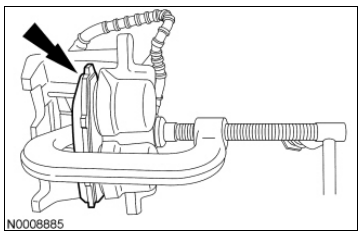
3. ***NOTICE:*** **Do not pry in the brake caliper sight hole to retract the pistons as this can damage the pistons and boots.**

   NOTICE: **Do not allow the brake caliper to hang from the brake hose or damage to the hose can occur.**

   Remove the 2 brake caliper guide pin bolts and position the brake caliper aside.

   - Support the caliper using mechanic's wire.

4. Remove the brake pads and clips.
   - Discard the clips.



Installation

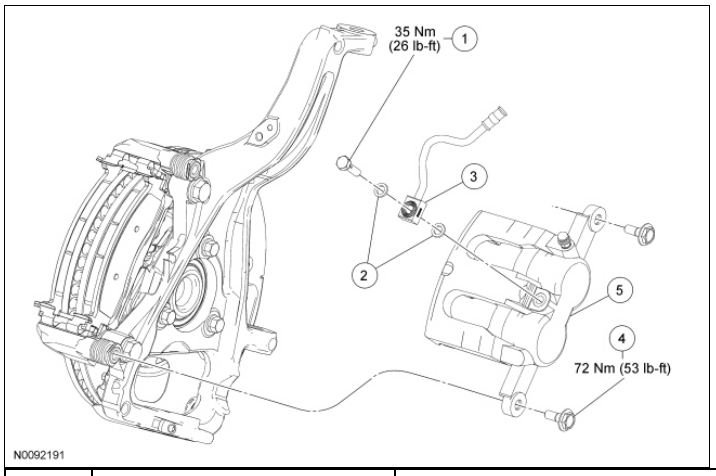
1. **NOTE:** One brake disc pad kit contains the pads and pad clips required for both sides.

   Install the new brake pad clips and the brake pads.

2. ***NOTICE:*** **Protect the piston and boots when pushing the caliper piston into the caliper piston bores or damage to components may occur.**

   Using a C-clamp and a worn brake pad, compress the disc brake caliper pistons into the caliper.

3. Position the brake caliper and install the 2 guide pin bolts.
   - Tighten to 72 Nm (53 lb-ft).



4. Fill the brake master cylinder reservoir with clean specified brake fluid.

5. Install the wheel and tire. For additional information, refer to Section 204-04 .
   - Apply brakes several times to verify correct brake operation.

Brake Caliper

Material

Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1

Item	Part Number	Description
1	385116	Brake flexible hose flow bolt
2	2149	Copper washers (2 required)
3	2078	Brake flexible hose
4	2W303	Brake caliper guide pin bolt (2 required)
5	2B120 RH/ 2B121 LH	Brake caliper housing

Removal

⚠ WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

⚠ WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

NOTICE: **Do not spill brake fluid on painted or plastic surfaces or damage to the surface may occur. If brake fluid is spilled onto a painted or plastic surface, immediately wash the surface with water.**

1. Remove the wheel and tire. For additional information, refer to Section 204-04 .

2. Remove the brake flexible hose flow bolt and position the brake hose aside.
    - Discard the 2 copper washers.
    - Cap the fluid ports.

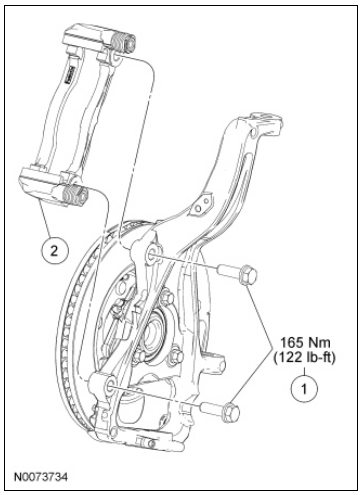
3. ***NOTICE:*** **Do not pry in the brake caliper sight hole to retract the pistons as this can damage the pistons and boots.**

   Remove the 2 brake caliper guide pin bolts and the brake caliper.

    - If leaks or damaged boots are found, install a new brake caliper.

Installation

1. Position the brake caliper and install the 2 guide pin bolts.
    - Tighten to 72 Nm (53 lb-ft).



2. Using 2 new copper washers, position the brake hose and install the brake hose flow bolt.
    - Tighten to 35 Nm (26 lb-ft).

3. Bleed the brake caliper. For additional information, refer to Section 206-00 Component Bleeding.

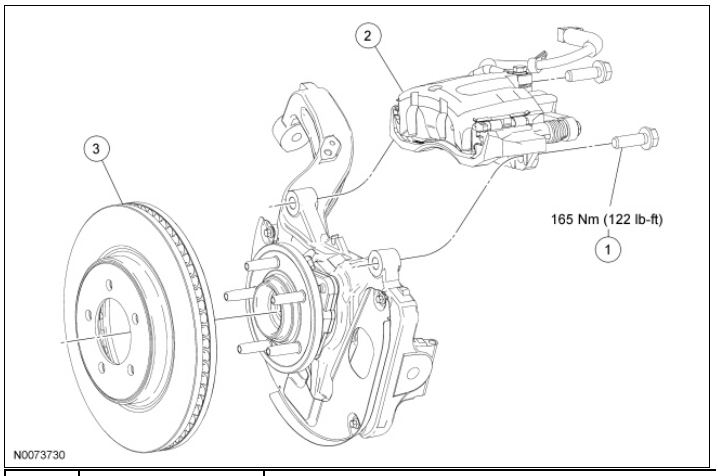
4. Install the wheel and tire. For additional information, refer to Section 204-04 .

Brake Caliper Anchor Plate

Removal and Installation

Item	Part Number	Description
1	2027	Brake caliper anchor plate bolts (2 required)
2	2B134 RH/ 2B292 LH	Brake caliper anchor plate

1. Remove the brake pads. For additional information, refer to Brake Pads in this section.



2. Remove and discard the 2 brake caliper anchor plate bolts and remove the brake caliper anchor plate.
   - To install, tighten to 165 Nm (122 lb-ft).

3. To install, reverse the removal procedure.

Brake Disc

Material

Item	Specification
High Temperature Nickel Anti-Seize Lubricant XL-2	ESE-M12A4-A
Metal Brake Parts Cleaner PM-4-A or PM-4-B (US); CPM-4 (Canada)	-
Penetrating and Lock Lubricant (US); Penetrating Fluid (Canada) XL-1 (US); CXC-51-A (Canada)	-

Item	Part Number	Description
1	2027	Brake caliper anchor plate bolt (2 required)
2	-	Brake caliper, brake pads and anchor plate assembly
3	1125	Brake disc

Removal

1. ***NOTICE:*** **Do not allow the brake caliper, brake pads and anchor plate assembly to hang from the brake hose or damage to the hose can occur.**

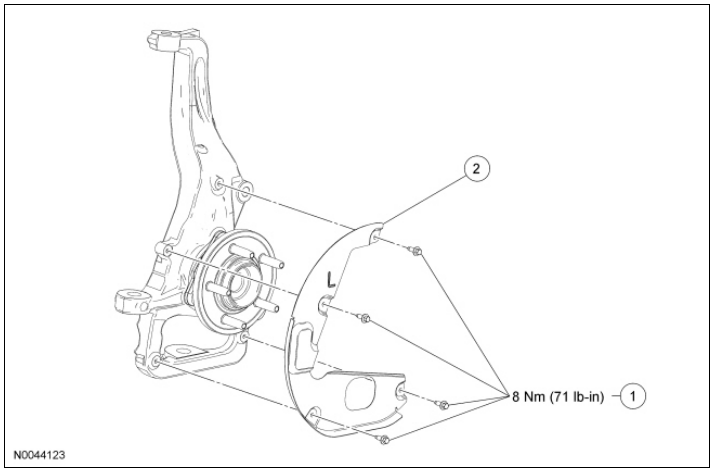
   Remove the 2 brake caliper anchor plate bolts and position the brake caliper, brake pads and anchor plate assembly aside.

   - Support the caliper, brake pads and anchor plate assembly using mechanic's wire.

2. **NOTE:** If the brake disc cannot be removed easily, apply specified rust penetrant on the brake disc-to-hub mating surfaces.

Remove the brake disc.

Installation



1. Clean any rust or foreign material from brake disc and wheel hub.
    - Use specified parts cleaner to clean the front brake disc and hub surfaces.

2. Apply a thin coat of specified anti-seize lubricant to the hub flange.

3. Install the brake disc.

4. Position the brake caliper, brake pads and brake caliper anchor plate assembly and install the 2 brake caliper anchor plate bolts.
    - Tighten to 165 Nm (122 lb-ft).

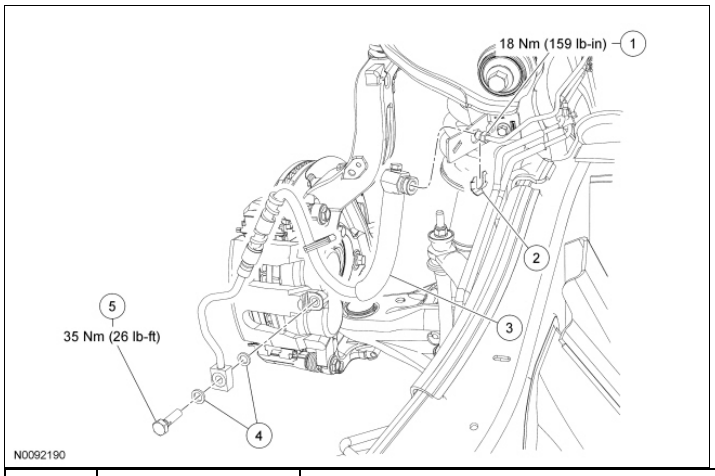
Brake Disc Shield

Item	Part Number	Description
1	W500212	Brake disc shield bolts (4 required)
2	2K004 RH/ 2K005 LH	Brake disc shield

Removal and Installation

1. Remove the brake disc. For additional information, refer to Brake Disc in this section.

2. Remove and discard the 4 brake disc shield bolts.
   - To install, tighten new bolts to 8 Nm (71 lb-in).



3. Remove the brake disc shield.

4. To install, reverse the removal procedure.

Brake Flexible Hose

Material

Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1

Item	Part Number	Description
1	-	Brake tube fitting (part of 2264 LF/ 2263 RF)
2	-	Brake flexible hose retaining clip (part of 2078)
3	2078	Brake flexible hose
4	2149	Copper washers (2 required)
5	385116	Brake caliper flow bolt

Removal and Installation

⚠ WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

⚠ WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

NOTICE: **Do not spill brake fluid on painted or plastic surfaces or damage to the surface may occur. If brake fluid is spilled onto a painted or plastic surface, immediately wash the surface with water.**

1. Remove the brake flexible hose flow bolt and discard the 2 copper washers.
    - To install, tighten to 35 Nm (26 lb-ft).

- Use 2 new copper washers.

2. Disconnect the brake tube fitting from the brake flexible hose.
   - To install, tighten to 18 Nm (159 lb-in).

3. Remove the brake flexible hose retaining clip and the brake flexible hose.

4. To install, reverse the removal procedure.
   - Bleed the brake caliper. For additional information, refer to Section 206-00 Component Bleeding.

Material

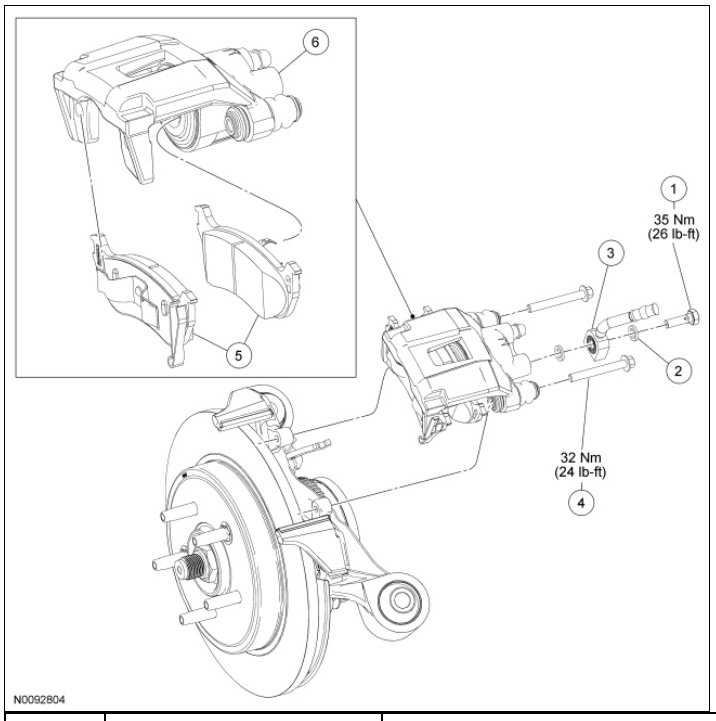
Brake tube-to-brake hose flexible fitting	18	-	159

Rear Disc Brake

The rear disc brake system consists of the following components:

- Brake caliper anchor plate
- Brake caliper
- Brake disc
- Brake flexible hose
- Brake pads

When mechanical force is applied by the driver to the brake pedal, the force is converted into hydraulic pressure by the master cylinder. The hydraulic force is directed to the disc brake calipers and transferred to the brake pads. The brake pads are then forced against the brake friction surfaces by the brake caliper pistons. The friction of the brake pads on the brake disc causes the slowing or stopping of wheel rotation and the vehicle.



Rear Disc Brake

Refer to Section 206-00 .

Brake Caliper

Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1

Item	Part Number	Description
1	385116	Brake flexible hose flow bolt
2	2149	Copper washer (2 required)
3	2282	Brake flexible hose
4	2333	Brake caliper guide pin bolt (2 required)
5	2200	Brake pads
6	2552 RH/ 2553 LH	Brake caliper

Removal

⚠ WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

⚠ WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products

call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

1. Remove the wheel and tire. For additional information, refer to Section 204-04 .

2. Remove the brake flow bolt and position the brake hose aside.
   - Discard the 2 copper washers.

3. Remove the 2 brake caliper guide pin bolts and remove the brake caliper.

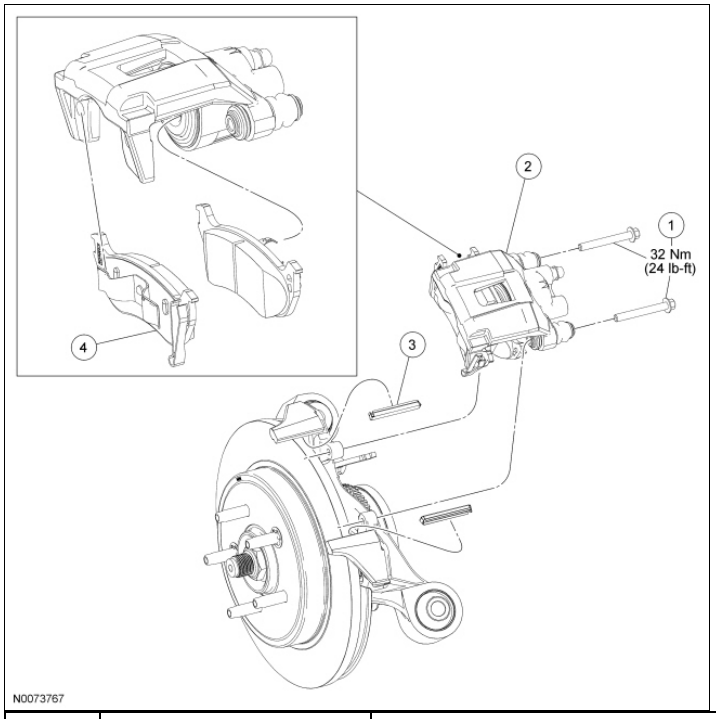
4. Remove the brake pads from the brake caliper.

Installation

1. Install the brake pads to the brake caliper.

2. Position the brake caliper and install the 2 guide pin brake caliper bolts.
   - Tighten to 32 Nm (24 lb-ft).

3. Using 2 new copper washers, position the brake hose and install the brake hose flow bolt.
   - Tighten to 35 Nm (26 lb-ft).



4. Bleed the brake caliper. For additional information, refer to Section 206-00 , Component Bleeding.

5. Install the wheel and tire. For additional information, refer to Section 204-04 .
   - Apply brakes several times to verify correct brake operation.

Brake Pads

Material

Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1

3	-	Brake pad clip (part of 2200) (2 required)
4	2200	Brake pad

Removal

⚠ WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

⚠ WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products

call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

⚠ **WARNING: Always install new brake shoes or pads at both ends of an axle to reduce the possibility of brakes pulling vehicle to one side. Failure to follow this instruction may result in uneven braking and serious personal injury.**

NOTICE: **Do not spill brake fluid on painted or plastic surfaces or damage to the surface may occur. If brake fluid is spilled onto a painted or plastic surface, immediately wash the surface with water.**

1. Check the brake fluid level in the brake master cylinder reservoir.
   - If required, remove the fluid until the brake master cylinder reservoir is half full.

2. Remove the wheel and tire. For additional information, refer to Section 204-04 .

3. ***NOTICE:*** **Do not pry in the caliper sight hole to retract the pistons, as this can damage the pistons and boots.**

   NOTICE: **Do not allow the brake caliper to hang from the brake hose or damage to the hose can occur.**

   Remove the 2 brake caliper guide pin bolts and position the caliper aside.

   - Support the caliper using mechanic's wire.

4. Remove the 2 brake pads.
   - Discard the brake pad clips.

Installation

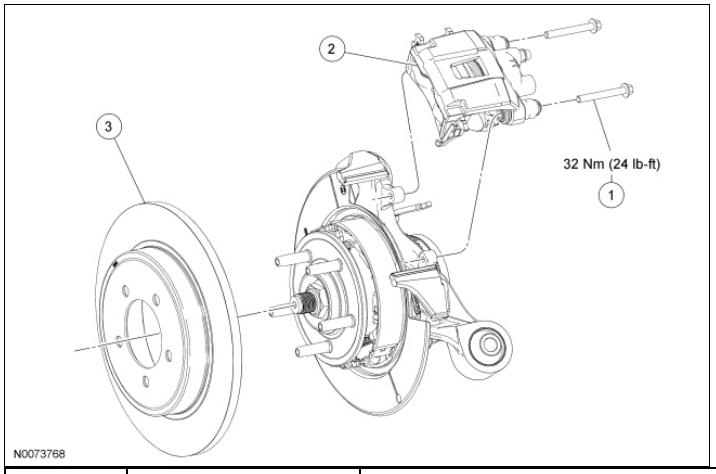
1. Apply a thin bead of the specified sealant to the center section of the inside of the brake pad clips.

2. Install the brake pad clips and brake pads.

3. ***NOTICE:*** **Protect the piston and boots when pushing the caliper piston into the caliper piston bores or damage to components may occur.**

   If installing new brake pads, using a suitable tool and a worn brake pad, compress the disc brake caliper pistons into the caliper.

4. Position the brake caliper and install the 2 brake caliper guide pin bolts.
   - Tighten to 32 Nm (24 lb-ft).



5. Fill the brake master cylinder reservoir with clean, specified brake fluid.

6. Install the wheel and tire. For additional information, refer to Section 204-04 .
   - Apply brakes several times to verify correct brake operation.

Brake Disc

Material

Item	Specification
Metal Brake Parts Cleaner PM-4-A or PM-4-B (US); CPM-4 (Canada)	-
Penetrating and Lock Lubricant (US); Penetrating Fluid (Canada) XL-1 (US); CXC-51-A (Canada)	-

Item	Part Number	Description
1	2333	Brake caliper guide pin bolt (2 required)
2	-	Brake caliper and brake pad assembly
3	2C026	Brake disc

Removal

1. Remove the wheel and tire. For additional information, refer to Section 204-04 .
2. ***NOTICE:*** **Do not pry in the caliper sight hole to retract the pistons, as this can damage the pistons and boots.**

   NOTICE: **Do not allow the brake caliper and brake pad assembly to hang from the brake hose or damage to the hose can occur.**

   Remove the 2 brake caliper guide pin bolts, position the caliper and pads aside as an assembly.

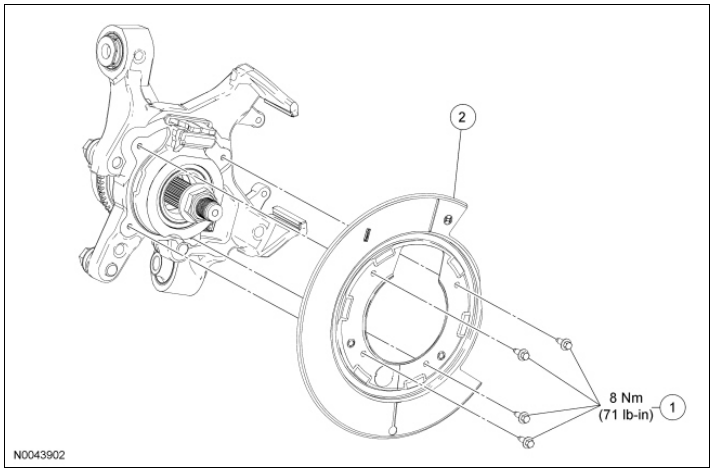
   - Support the caliper and brake pad assembly using mechanic's wire.
3. **NOTE:** If the brake disc binds on the parking brake shoe and lining, remove the adjustment hole knockout panel or access plug and contract the parking brake shoe and lining.

NOTE: If the brake disc cannot be removed easily, apply specified penetrating and lock lubricant on the brake disc-to-hub mating surfaces.

Remove the brake disc.

Installation

NOTE: If the adjustment hole knockout panel or access plug was removed, it is necessary to install an access plug to prevent the entry of contaminants.

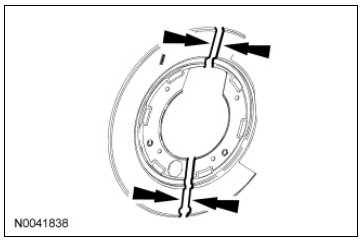


1. Clean any rust or foreign material from brake disc and wheel hub.
   - Use specified parts cleaner to clean the front brake disc and hub surfaces.

2. Install the brake disc.

3. Position the brake caliper and brake pad assembly. Install the 2 brake caliper guide pin bolts.
   - Tighten to 32 Nm (24 lb-ft).

4. Install the wheel and tire. For additional information, refer to Section 204-04 .
   - Apply brakes several times to verify correct brake operation.

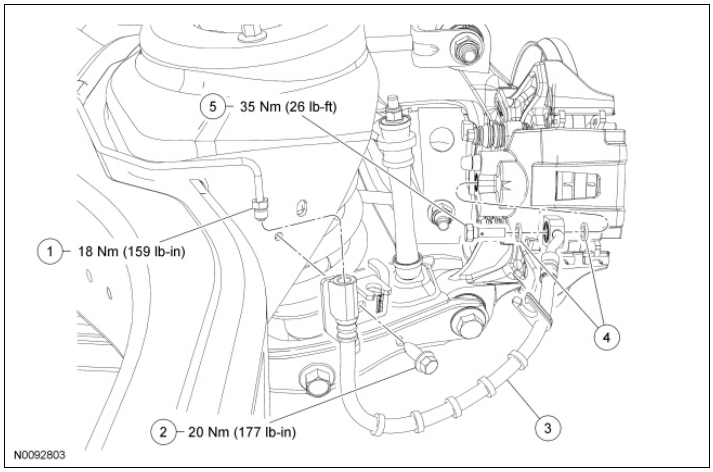


Brake Disc Shield

Item	Part Number	Description
1	W500212	Brake disc shield bolts
2	2C028 RH/ 2C029 LH	Brake disc shield

Removal

1. Remove the parking brake shoes. For additional information, refer to Section 206-05 .
2. Remove the brake disc shield bolts.
3. Cut the shield at the perforations and remove the brake disc shield halves.



Installation

1. **NOTE:** If installing a new brake disc shield, cut the new shield in half at the perforations.

   Position the brake disc shield halves and install 2 bolts in each half.

   - Tighten to 8 Nm (71 lb-in).
2. Install the parking brake shoes. For additional information, refer to Section 206-05 .

Brake Flexible Hose

Item	Part Number	Description
1	-	Brake tube fitting (part of 2C008)
2	-	Brake flexible hose bracket bolt (part of 2282)
3	2282	Brake flexible hose
4	2149	Copper washers
5	385116	Brake caliper flow bolt

Removal and Installation

⚠ WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

⚠ WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

NOTICE: **Do not spill brake fluid on painted or plastic surfaces or damage to the surface may occur. If brake fluid is spilled onto a painted or plastic surface, immediately wash the surface with water.**

1. Remove the wheel and tire. For additional information, refer to Section 204-04 .

2. Remove the brake caliper flow bolt and discard the 2 copper washers.
   - To install, tighten to 35 Nm (26 lb-ft).

3. Disconnect the brake tube fitting from the brake flexible hose.
   - To install, tighten to 18 Nm (159 lb-in).

4. Remove the brake flexible hose bracket bolt and the brake hose.
   - To install, tighten to 20 Nm (177 lb-in).

5. To install, reverse the removal procedure.
    - Bleed the brake caliper. For additional information, refer to Section 206-00 , Component Bleeding.

LH parking brake cable wire form bolt	23	17	-
Parking brake cable bracket-to-crossmember bolts	15	-	133
Parking brake control bolts	20	-	177
Parking brake release handle bolts	3	-	27
RH parking brake cable wire form bolt	15	-	133

Parking Brake

The parking brake and actuation system consists of the following components:

- Parking brake cables
- Parking brake control
- Parking brake shoes
- Red brake warning indicator

The parking brake system is a foot-operated/cable-actuated system that applies a drum-in-hat assembly within each rear brake disc. A red brake warning indicator is located in the instrument cluster and will illuminate when the system is actuated to alert the driver that the parking brakes are applied.

Parking Brake

Principles of Operation

The parking brake system is an independent cable-actuated system controlled by a foot-operated parking brake control that is self adjusting. The parking brake control applies tension to the front parking brake cable and conduit. The front parking brake cable is coupled to the LH rear parking brake cable and conduit which is coupled to the RH rear parking brake cable. The parking brake cable and conduits actuate the parking brake levers, engaging the parking brake shoes with the parking brake drum-in-hat assembly. The system is returned to the released position by pulling the parking brake control release handle. Springs in the parking brake system apply the necessary force to return the system to the unapplied position. The parking brake warning indicator is located in the instrument cluster. It illuminates to signal the driver that the parking brake is applied or to signal a low brake fluid condition. The warning indicator system is diagnosed in Section 413-01 .

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical damage.

Visual Inspection Chart

Mechanical
• Parking brake cable(s) • Parking brake cable equalizer • Parking brake control • Parking brake control release handle • Parking brake shoes and hardware

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the cause is not visually evident, GO to Symptom Chart .

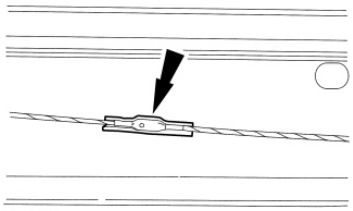
Symptom Chart

Symptom Chart

Pinpoint Tests

Pinpoint Test A: The Parking Brake Will Not Apply

Normal Operation



When the parking brake control is pressed, tension is applied to the intermediate parking brake cable. The intermediate cable is attached to both rear cables by an equalizer. The tension pulls equally on both rear parking brake cables, which are attached to the rear parking brake actuators and apply the parking brake shoes.

This pinpoint test is intended to diagnose the following:

- Parking brake cable(s)
- Parking brake control
- Rear brake hardware
- Rear brake shoes and linings

PINPOINT TEST A: THE PARKING BRAKE DOES NOT APPLY

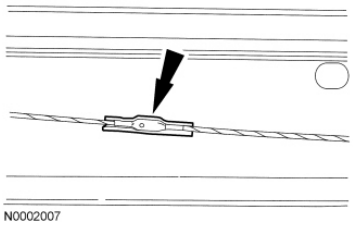
Test Step	Result / Action to Take
A1 CHECK THE PARKING BRAKE CONTROL	
• Press the parking brake control pedal. • **Does the parking brake control pedal move?**	**Yes** GO to A2 . **No** GO to A5 .
A2 CHECK FOR BROKEN CABLES	
• **NOTE:** Have an assistant press and release the parking brake pedal to help isolate disconnected cables or cables that do not move. • Inspect the following items for damage and correct connections. ♦ Front cable and conduit ♦ Intermediate cable ♦ LH rear cable and conduit ♦ RH rear cable and conduit ♦ Rear cable brackets • **Are the cables in good condition?**	**Yes** GO to A3 . **No** CONNECT the cable(s) or INSTALL new parking brake component(s) as necessary. TEST the system for normal operation.
A3 CHECK THE PARKING BRAKE SHOES, ACTUATOR LEVERS AND HARDWARE	
• Remove the rear brake disc, refer to Section 206-04 . Inspect the parking brake shoes, actuator levers and hardware.	**Yes** GO to A4 . **No** INSTALL new components as necessary. REFER

• **Are the parking brake shoes, actuator levers and hardware in good condition?**	to Parking Brake Shoes in this section. TEST the system for normal operation.
A4 CHECK THE PARKING BRAKE SHOE ADJUSTMENT	
• Check the parking brake shoe adjustment. Refer to Parking Brake Shoe Adjustment in this section. • **Are the parking brake shoes adjusted to specification?**	**Yes** INSTALL a new parking brake control. REFER to Parking Brake Control in this section. TEST the system for normal operation. **No** ADJUST the rear parking brake shoes. REFER to Parking Brake Shoe Adjustment in this section.
A5 ISOLATE THE PARKING BRAKE CONTROL AND FRONT PARKING BRAKE CABLE	
• Disconnect the front cable from the intermediate cable at the cable union.  N0002007 • Press the parking brake control pedal. • **Does the parking brake control pedal move?**	**Yes** GO to A6 . **No** GO to A8 .
A6 ISOLATE THE INTERMEDIATE PARKING BRAKE CABLE	
• Disconnect the LH and RH rear cables from the intermediate cable equalizer. • While holding the intermediate cable conduit, attempt to slide the intermediate cable inside the conduit. • **Does the intermediate cable slide freely inside the conduit?**	**Yes** GO to A7 . **No** INSTALL new intermediate brake cable. REFER to Parking Brake Cable - Intermediate in this section. TEST the system for normal operation.
A7 ISOLATE THE REAR PARKING BRAKE CABLES	
• Disconnect the rear parking brake cables from the brake shoe actuators. • While holding the rear cable conduit, attempt to slide the rear cable inside the conduit. • **Does the rear cable slide freely inside the conduit?**	**Yes** The system is operating normally at this time. The concern may have been caused by a seized or binding component. CLEAN and LUBRICATE the parking brake backing plate. CONNECT all cables and INSTALL all components. TEST the system for normal operation. **No** INSTALL new rear brake cable(s). REFER to

	Parking Brake Cable - Rear, LH and/or Parking Brake Cable - Rear, RH in this section. TEST the system for normal operation.
A8 ISOLATE THE FRONT PARKING BRAKE CABLE	
• Disconnect the front parking brake cable and conduit from the parking brake control. • While holding the cable conduit, attempt to slide the cable inside the conduit. • **Does the cable slide freely inside the conduit?**	**Yes** INSTALL a new parking brake control. REFER to Parking Brake Control in this section. TEST the system for normal operation. **No** INSTALL a new front parking brake cable. REFER to Parking Brake Cable - Front in this section. TEST the system for normal operation.

Pinpoint Test B: The Parking Brake Will Not Release

Normal Operation



A ratcheting mechanism in the parking brake control keeps the parking brake applied until the release handle is pulled. When the release handle is pulled, the ratcheting mechanism in the parking brake control is released and the return springs in the parking brake shoes, and on the parking brake cables, return the system to the released position.

This pinpoint test is intended to diagnose the following:

- Parking brake cable(s)
- Parking brake control
- Parking brake control release handle
- Parking brake shoes and hardware

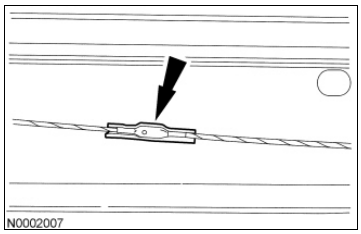
PINPOINT TEST B: THE PARKING BRAKE WILL NOT RELEASE

Test Step	Result / Action to Take
B1 CHECK THE PARKING BRAKE CONTROL RELEASE HANDLE	
• Verify that the release handle is connected to the parking brake control. • **Is the release handle connected?**	**Yes** GO to B2 . **No** CONNECT the handle. TEST the system for normal operation.
B2 ISOLATE THE PARKING BRAKE CONTROL	
• Disconnect the front cable from the intermediate cable at the cable union.	**Yes** GO to B4 . **No** GO to B3 .

 N0002007 • **Does the parking brake release?**	
B3 CHECK THE FRONT PARKING BRAKE CABLE	
• Disconnect the front parking brake cable conduit from the parking brake control and from the frame bracket, then pull the front cable conduit through the opening in the vehicle floor. • While holding the front cable, attempt to slide the front conduit on the cable. • **Does the conduit slide freely on the cable?**	**Yes** INSTALL a new parking brake control. REFER to Parking Brake Control in this section. TEST the system for normal operation. **No** INSTALL a new front cable. REFER to Parking Brake Cable - Front in this section. TEST the system for normal operation.
B4 ISOLATE THE INTERMEDIATE PARKING BRAKE CABLE	
• Disconnect the LH and RH rear cables from the intermediate cable equalizer. • While holding the intermediate cable conduit, attempt to slide the intermediate cable inside the conduit. • **Does the intermediate cable slide freely inside the conduit?**	**Yes** GO to B5 . **No** INSTALL new intermediate brake cable. REFER to Parking Brake Cable - Intermediate in this section. TEST the system for normal operation.
B5 ISOLATE THE REAR PARKING BRAKE CABLES	
• Disconnect the rear parking brake cables from the brake shoe actuators. • While holding the rear cable conduit, attempt to slide the rear cable inside the conduit. • **Does the rear cable slide freely inside the conduit?**	**Yes** GO to B6 . **No** INSTALL new rear brake cable(s). REFER to Parking Brake Cable - Rear, LH and/or Parking Brake Cable - Rear, RH in this section. TEST the system for normal operation.
B6 CHECK THE REAR BRAKE SHOES AND HARDWARE	
• Remove the rear brake disc. Refer to Section 206-04 . • Inspect the parking brake shoes, hardware and backing plate. • **Are the shoes, hardware and backing plate in good condition?**	**Yes** The system is operating normally at this time. The concern may have been caused by a seized or binding component. CLEAN and LUBRICATE the brake backing plate using the specified cleaner and grease. CONNECT all cables and INSTALL all components. TEST the system for normal operation. **No** INSTALL new components as necessary. REFER to Parking Brake Shoes in this section. TEST the

	system for normal operation.

Parking Brake Cable Tension Release



1. Remove the LH cowl side trim panel. For additional information, refer to Section 501-05 .

2. With the help of an assistant, release the parking brake cable tension by pulling down on the intermediate cable at the cable-to-cable connector clip until the parking brake control sector rotates to its stop and a 4 mm (0.15 in) x 150 mm (5.9 in) retainer pin can be inserted.

3. **NOTE:** Make sure the cable-to-cable connector clip is connected to the front and rear cable before removing the brake control retaining pin, and the cable tension is reloaded slowly.

   Disconnect the cable-to-cable connector clip.

4. To reload the tension on the parking brake cable, follow the release procedure in reverse.

Parking Brake Shoe Adjustment

Special Tool(s)

 ST1468-A	Brake Adjusting Gauge 206-D002 (D81L-1103-A) or equivalent

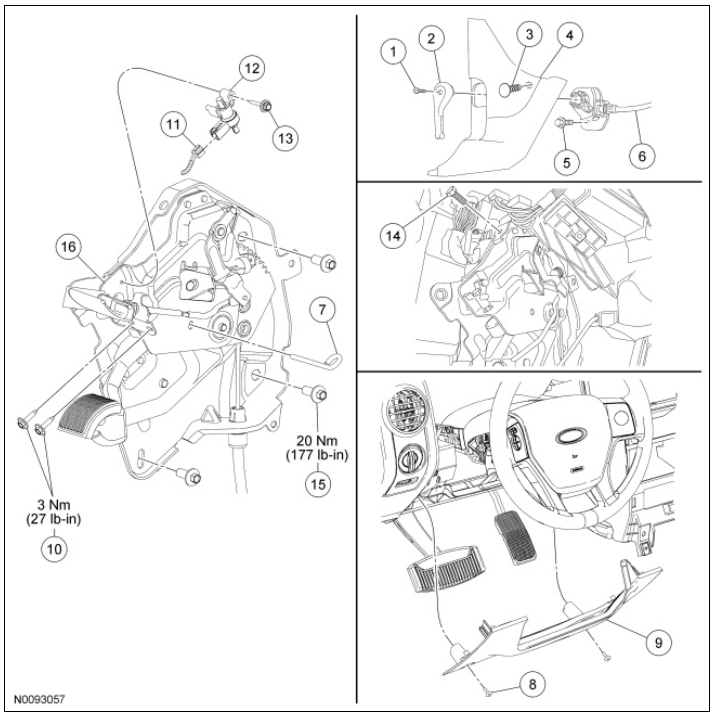
1. **NOTE:** Make sure the parking brake is fully released.

   Using the release handle, release the parking brake control.

2. Remove the rear brake disc. For additional information, refer to Section 206-04 .

3. Using the Brake Adjusting Gauge, measure the inside diameter of the drum portion of the rear brake disc and set the locking screw.
   - Record the measurement.

4. Place the Brake Adjusting Gauge over the widest diameter of the parking brake shoes.



5. Adjust the parking brake shoe clearance to 0.54 mm (0.021 in) less than the inside diameter of the drum portion of the rear brake disc.
   - Rotate the parking brake shoe adjuster to achieve the correct parking brake shoe-to-brake disc clearance.

6. Install the rear brake disc. For additional information, refer to Section 206-04 .

7. Test the parking brake for normal operation.

Parking Brake Control

Item	Part Number	Description
1	-	Hood latch release handle screw (part of assembly 16916A)
2	16916A	Hood latch release handle
3	-	Pin-type retainer (part of 78023344)
4	7802344	A-pillar lower trim panel
5	N805375	Hood latch release cable assembly screw
6	16916	Hood latch release cable assembly
7	-	Locking pin
8	W707628	Instrument panel steering column cover screw (2 required)
9	7804459	Instrument panel steering column cover
10	W707628	Parking brake release handle bolts (2 required)
11	-	Parking brake switch electrical connector (part of 14A488)
12	15A851	Parking brake switch
13	-	Parking brake switch bolt (part of 15A851)
14	W707491	Wiring harness bracket bolt
15	W505264	Parking brake control bolt (3 required)
16	2780	Parking brake control

Removal and Installation

1. Remove the screw and the hood latch release handle.

2. Remove the pin-type retainer and the LH A-pillar lower trim panel.

3. Remove the hood latch release cable assembly screw and position the release cable assembly aside.

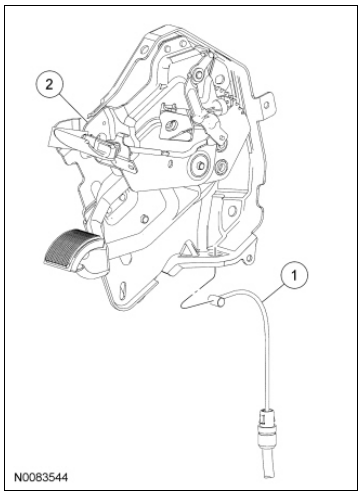
4. Release the tension on the parking brake cable. For additional information, refer to Parking Brake Cable Tension Release in this section.

5. Remove the 2 screws and the instrument panel steering column cover.

6. Remove the 2 parking brake release handle bolts from the bracket.
   - To install, tighten to 3 Nm (27 lb-in).

7. Disconnect the parking brake switch electrical connector.

8. Remove the wiring harness bracket screw and position the harness and bracket aside.



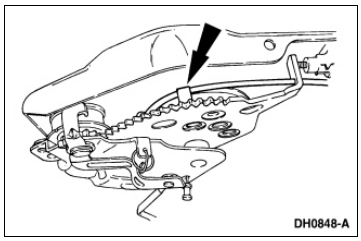
9. Remove the 3 bolts from the parking brake control.
   - To install, tighten to 20 Nm (177 lb-in).

10. Position the carpet aside and position the cable conduit grommet up through the floor.

11. Remove the parking brake control and cable assembly.

12. To install, reverse the removal procedure.
    - Test the parking brake system for correct operation.

Parking Brake Cable - Front



Item	Part Number	Description
1	2853	Front parking brake cable
2	2780	Parking brake control

Removal and Installation

1. Remove the parking brake control. For additional information, refer to Parking Brake Control in this section.

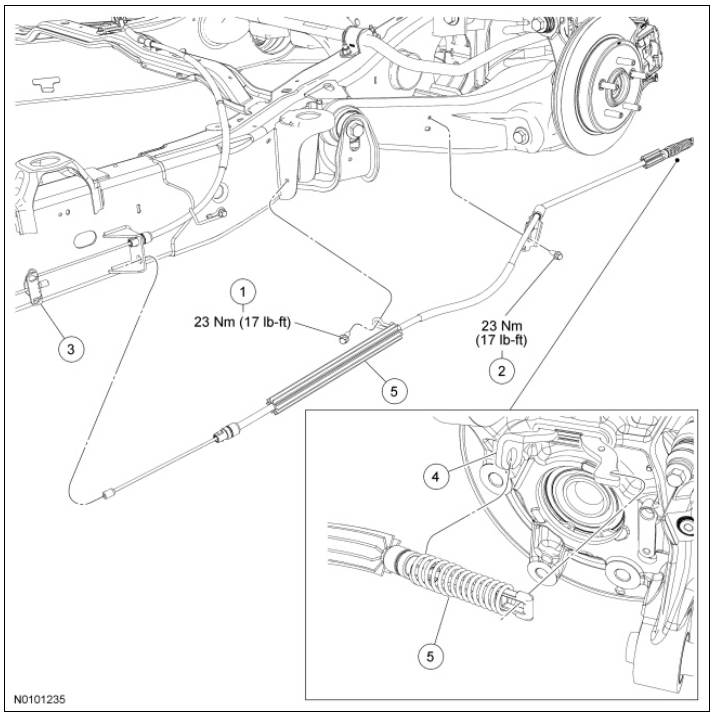
2. **NOTE:** The parking brake control take-up spool tab may need to be bent aside to allow the cable to be removed.

   Disconnect the front parking brake cable and conduit from the parking brake control.

3. To install, reverse the removal procedure.
   - Test the parking brake system for correct operation.

Parking Brake Cable - Intermediate

NOTE: The equalizer is integral to the intermediate cable.



Item	Part Number	Description
1	2853	Front parking brake cable
2	2A635	RH rear parking brake cable
3	2A635	LH rear parking brake cable
4	2A793	Intermediate parking brake cable

Removal and Installation

1. Release the tension on the parking brake cable. For additional information, refer to Parking Brake Cable Tension Release in this section.
2. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
3. Disconnect the intermediate parking brake cable from the front cable at the cable connector clip.
4. Disconnect the LH and RH rear parking brake cables from the intermediate parking brake cable at the equalizer.
5. Remove the intermediate parking brake cable.
6. To install, reverse the removal procedure.

Parking Brake Cable - Rear, LH

Item	Part Number	Description
1	W704911	Wire form bracket bolt
2	W704911	Bracket bolt
3	-	Equalizer (part of 2A793)
4	2A638 LH/ 2A637 RH	Parking brake lever
5	2A635	LH rear parking brake cable

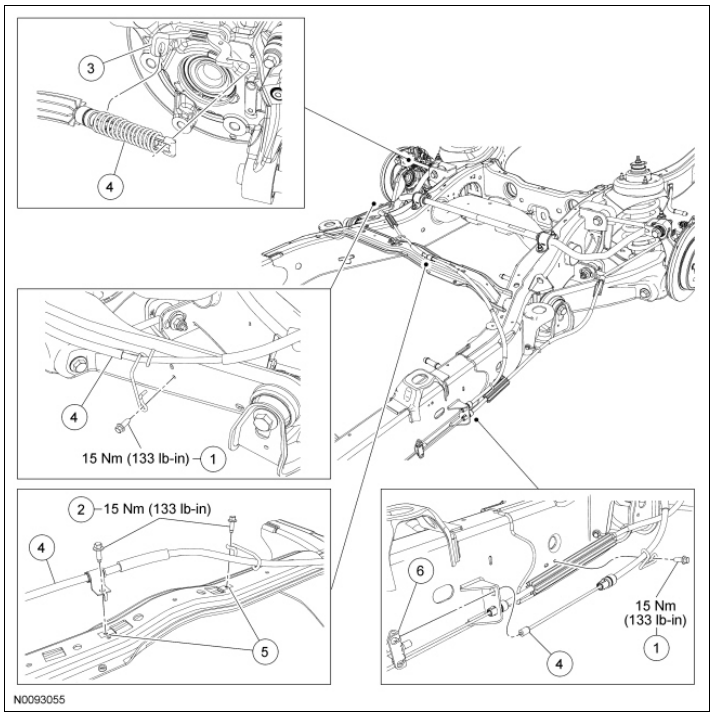
Removal and Installation

1. Release the parking brake cable tension. For additional information, refer to Parking Brake Cable Tension Release in this section.

2. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

3. Remove the wire form bolt.
   - To install, tighten to 23 Nm (17 lb-ft).

4. Remove the bracket bolt.
   - To install, tighten to 23 Nm (17 lb-ft).



5. Disconnect the intermediate cable from the LH rear cable at the cable equalizer.

6. Disconnect the front of the LH rear cable conduit at the frame bracket.

7. Disconnect the LH parking brake cable from the parking brake lever and remove the cable.

8. To install, reverse the removal procedure.
    - Test the parking brake system for correct operation.

Parking Brake Cable - Rear, RH

Item	Part Number	Description
1	W704911	Wire form bracket bolts (2 required)
2	W500213	Parking brake cable bracket-to-crossmember bolts (2 required)
3	W520802	Parking brake cable bracket-to-crossmember clip (2 required)
4	-	Equalizer (part of 2A793)
5	2A637 RH/ 2A638 LH	Parking brake lever
6	2A635	RH rear parking brake cable

Removal and Installation

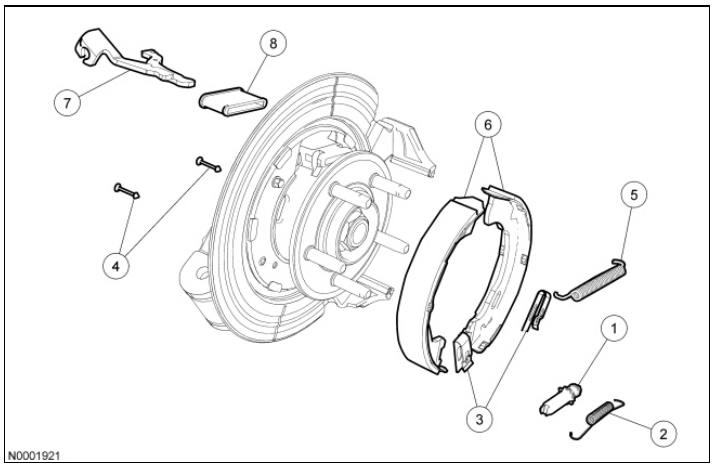
1. Release the parking brake cable tension. For additional information, refer to Parking Brake Cable Tension Release in this section.

2. With the vehicle in NEUTRAL position it on a hoist. For additional information, refer to Section 100-02 .

3. Remove the 2 wire form bolts.
   - To install, tighten to 15 Nm (133 lb-in).

4. Remove the 2 parking brake cable bracket-to-crossmember bolts.
   - To install, tighten to 15 Nm (133 lb-in).

5. Disconnect the intermediate parking brake cable from the RH rear parking brake cable at the parking



brake cable equalizer.

6. Disconnect the front of the RH parking brake cable conduit at the frame bracket.

7. Disconnect the RH parking brake cable from the parking brake lever and remove the parking brake cable.

8. To install, reverse the removal procedure.
    - Test the parking brake system for correct operation.

Parking Brake Shoes

Item	Part Number	Description
1	2041	Brake shoe adjusting screw
2	-	Brake shoe adjusting screw spring (part of 2648)
3	-	Brake shoe hold-down springs (part of 2648)
4	-	Brake shoe hold-down pins (part of 2648)
5	-	Brake shoe retracting spring (part of 2648)
6	2648	Parking brake shoes
7	2A637 RH/ 2A638 LH	Parking brake lever
8	2404	Parking brake lever boot

Removal

NOTE: A parking brake shoe kit contains the linings required for both the LH and RH side.

1. **NOTE:** Make sure the parking brake control is fully released.

   Release the tension on the parking brake cable. For additional information, refer to Parking Brake Cable Tension Release in this section.

2. Remove the rear brake disc. For additional information, refer to Section 206-04 .

3. Remove the parking brake shoe adjusting screw.

4. Remove the parking brake shoe adjusting screw spring.

5. Remove the 2 parking brake shoe hold-down springs and pins.

6. Remove the parking brake shoe retracting spring and the parking brake shoes.

Installation

1. Position the parking brake shoes and attach the retracting spring.
2. Install the 2 parking brake shoe hold-down pins and springs.
3. Install the parking brake shoe adjusting screw spring.
4. **NOTE:** Completely retract the parking brake adjusting screw before installation.

   Install the brake shoe adjusting screw.
5. Adjust the parking brake shoe. For additional information, refer to Parking Brake Shoe Adjustment in this section.
6. Reload the tension on the parking brake cable. For additional information, refer to Parking Brake Cable Tension Release in this section.

Material

Item	Specification	Fill Capacity
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1	1,020 ml (2.15 pt)

Brake pedal bracket bolts	22	16	-
Brake tube fittings	18	-	159
Steering column shaft bolt	30	22	-

Hydraulic Brake Actuation

The hydraulic brake actuation system consists of the following components:

- Brake master cylinder and fluid reservoir
- Brake tubes and hoses
- Brake pedal and bracket
- Hydraulic Control Unit (HCU)

The brake pedal is connected to the power brake booster, which is connected to the brake master cylinder. When the brake pedal is pressed, brake fluid is forced through the brake tubes and flexible hoses to the HCU . The brake fluid is then distributed to the front and rear brake calipers. The fluid enters the caliper, forcing the caliper pistons and brake pads outward against the brake disc friction surface. When the brake pedal is released, brake fluid pressure is relieved, returning the front and rear brake caliper pistons and brake pads to the unapplied position.

For information on the HCU , refer to Section 206-09 .

Adjustable Pedals

Adjustable brake and accelerator pedals are available as an optional feature on this vehicle. The brake pedal position can be changed in phase with the accelerator pedal to increase driver comfort. Two different adjustable pedal systems are available; one that is connected to the memory feature option and one that is not connected to the memory feature option.

Without Memory Feature

Adjustable brake pedals without memory feature consist of the following components:

- Adjustable brake pedal and bracket
- Adjustable accelerator pedal and bracket, refer to Section 310-02
- Adjustable pedal switch
- Adjustable pedal motor
- Adjustable pedal cables

The pedals are adjusted through the use of a rocker switch mounted on the instrument panel. When the switch is pressed, voltage is sent to the motor which spins a cable that is attached to the adjustable brake pedal, as the cable spins the pedals move either forward (away from the driver) or rearward (toward the driver) depending on how the switch is pressed.

With Memory Feature

Adjustable brake pedals with memory feature consist of the same components as a system without memory feature with the following additional components:

- Driver Seat Module (DSM), refer to Section 501-10 .
- Memory SET switch, refer to Section 501-10 .

- Remote Keyless Entry (RKE) transmitter, refer to Section 501-14 .

The pedals on a system with memory feature can be adjusted through the use of a rocker switch (mounted on the instrument panel), the memory SET switch (instrument panel center finish panel) or the RKE transmitter. When a switch is pressed or the transmitter is activated, a signal is sent to the DSM . The DSM then sends voltage to the adjustable pedal motor which operates in the same manner as the system without memory feature.

Principles of Operation

Hydraulic Brakes

To diagnose hydraulic brake concerns, refer to Section 206-00 .

Adjustable Pedals Without Memory Feature

The adjustable pedals without memory feature are controlled directly by the adjustable pedal switch. The adjustable pedal motor is attached to the LH side of the brake pedal bracket and controls the accelerator pedal and brake pedal directly through the use of 2 separate cables contained in sleeves. When the adjustable pedal switch is pressed, voltage is sent to the motor. The adjustable pedal motor will operate in both directions, forward and rearward, depending on which direction the switch is pressed. The end of the motor attached to the pedals will rotate the pinion of a worm gear set and cause the pedal to move. The pedals can be adjusted with the ignition switch in the OFF, ACC or RUN positions.

Adjustable Pedals With Memory Feature

The adjustable pedals with memory feature are controlled by the Driver Seat Module (DSM) and can be adjusted in 3 different ways:

- Using the adjustable pedal switch
- Using the memory SET switch
- Using the Remote Keyless Entry (RKE) transmitter

When the adjustable pedal switch is pressed, a voltage signal is sent to the DSM . When the DSM receives this signal, it will operate the adjustable pedal motor in the same manner as the system without memory.

When the memory SET switch or RKE transmitter is activated, a voltage signal is sent to the DSM . When the DSM receives this signal, it will send voltage to the adjustable pedal motor. The adjustable pedal motor will operate the same as when the adjustable pedal switch is used, as described above. The DSM monitors pedal position through the use of a Hall-effect switch that is built into the pedal motor. The pedal positions remain in memory as long as the DSM retains power. When a memory position is recalled through either the memory SET switch or the RKE transmitter, the DSM monitors the Hall-effect switch and stops sending voltage to the pedal motor once the stored memory position is reached. If the DSM receives a pedal position input during a memory position recall function, the module will stop the memory recall and respond to the new pedal position input. The pedals can be adjusted from the memory SET switch or the RKE transmitter with the ignition switch in the OFF, ACC or RUN position, but the transmission must be in the PARK or NEUTRAL position.

The DSM also controls the driver seat and the exterior mirrors. The DSM continually monitors the adjustable pedal motor and circuits, if an error is detected, the DSM is capable of setting DTCs.

For information on setting and recalling a memory pedal position, refer to Memory Position Programming in Section 501-10 .

Inspection And Verification

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

1. Verify the customer concern by operating the adjustable pedals.

2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Adjustable pedal cable • Adjustable pedal motor • Adjustable pedals • Foreign material	• Adjustable pedal switch • Driver Seat Module (DSM) • Memory position switch • Remote Keyless Entry (RKE) transmitter • Smart Junction Box (SJB) fuse 1 (20A) • Wiring, terminals or connectors

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM .
   - refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:

- verify the ignition is ON.
- verify the scan tool operation with a known good vehicle.
- refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record Continuous Memory Diagnostic Trouble Codes (CMDTCs).

8. Clear the continuous DTCs and carry out the self-test diagnostics for the Driver Seat Module (DSM).

9. If the DTCs retrieved are related to the concern, go to Driver Seat Module (DSM) DTC Chart. For all other DTCs, refer to the Master DTC Chart in Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart - Adjustable Pedals Without Memory Feature or GO to Symptom Chart - Adjustable Pedals With Memory Feature .

Diagnostic Trouble Code (DTC) Charts

Driver Seat Module (DSM) DTC Chart

DTC	Description	Action
B1987	Pedal Forward/Rearward Motor Stalled	GO to Pinpoint Test D .
B1988	Pedal Position Forward Switch Circuit Short to Battery	GO to Pinpoint Test B .
B1989	Pedal Position Rearward Switch Circuit Short to Battery	GO to Pinpoint Test B .
B1991	Pedal Forward/Rearward Potentiometer Feedback Circuit Short to Battery	GO to Pinpoint Test D .
B2275	Pedal Forward/Rearward Potentiometer Feedback Circuit Short to Ground	GO to Pinpoint Test D .
-	All Other DSM DTCs	REFER to Section 419-10 .

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Pinpoint Test A: Adjustable Brake Pedal is Inoperative/Does Not Operate Correctly (Without Memory Feature)

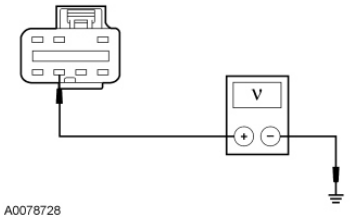
Refer to Wiring Diagrams Cell 127 , Adjustable Pedals for schematic and connector information.

Normal Operation

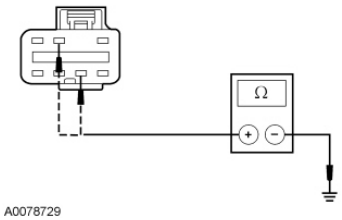
The adjustable pedal switch receives fused battery voltage from Smart Junction Box (SJB) fuse 1 (20A) along circuit SBP01 (RD).

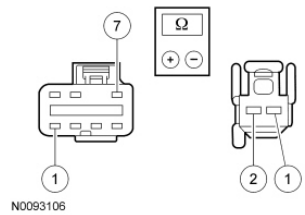
When the adjustable pedal switch is pressed in the forward position (away from the driver), the switch connects circuit SBP01 (RD) to circuit CPP09 (VT/OG) and the voltage is sent to the adjustable pedal motor along circuit CPP09 (VT/OG). The voltage returns to the switch along circuit CPP10 (BN/BU) and is grounded through the switch along circuit GD138 (BK/WH).

When the adjustable pedal switch is pressed in the rearward position (toward the driver), the switch connects circuit SBP01 (RD) to circuit CPP10 (BN/BU) and the voltage is sent to the adjustable pedal motor along circuit CPP10 (BN/BU). The voltage returns to the switch along circuit CPP09 (VT/OG) and is grounded through the switch along circuit GD138 (BK/WH).

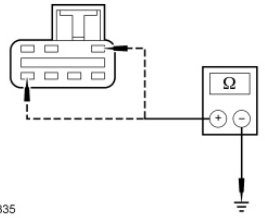


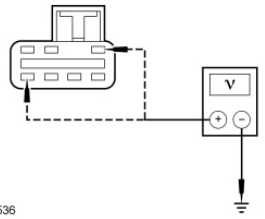
This pinpoint test is intended to diagnose the following:





- Fuse
- Wiring, terminals or connectors
- Foreign material
- Adjustable pedal cable
- Adjustable pedal switch
- Adjustable pedal motor
- Adjustable brake pedal assembly





- Adjustable accelerator pedal assembly

PINPOINT TEST A: ADJUSTABLE BRAKE PEDAL IS INOPERATIVE/DOES NOT OPERATE CORRECTLY (WITHOUT MEMORY FEATURE)

NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

Test Step	Result / Action to Take
A1 CHECK THE ADJUSTABLE PEDAL MOTOR AND CABLE INSTALLATION	
• Check the adjustable pedal motor and both cables for correct installation. • **Are the motor and cables correctly installed?**	**Yes** GO to A2 . **No** CORRECT the adjustable pedal motor and or cable installation. TEST the system for normal operation.
A2 INSPECT FOR FOREIGN MATERIAL	
• Inspect the adjustable brake pedal and accelerator assemblies for foreign material causing a binding condition. • **Are the pedal assemblies free from foreign material?**	**Yes** GO to A3 . **No** REMOVE the foreign material. TEST the system for normal operation.
A3 TEST THE ADJUSTABLE PEDAL SWITCH	
• Ignition OFF. • Disconnect: Adjustable Pedal Switch C2089. • Carry out the adjustable pedal switch component test. Refer to Wiring Diagrams Cell 149 for component testing. • **Does the adjustable pedal switch pass the component test?**	**Yes** GO to A4 . **No** INSTALL a new adjustable pedal switch. TEST the system for normal operation.
A4 CHECK FOR VOLTAGE TO THE ADJUSTABLE PEDAL SWITCH	
• Measure the voltage between adjustable pedal switch C2089-2, circuit SBP01 (RD), harness side and ground.  	**Yes** GO to A5 . **No** VERIFY SJB fuse 1 (20A) is OK. If OK, REPAIR circuit SBP01 (RD). If not OK, REFER to the Wiring Diagrams manual to identify the cause for the circuit short. TEST the system for normal operation.

• **Is the voltage greater than 10 volts?**	
A5 CHECK THE ADJUSTABLE PEDAL SWITCH GROUND CIRCUIT FOR AN OPEN	
• Measure the resistance between ground and: ♦ adjustable pedal switch C2089-3, circuit GD138 (BK/WH), harness side. ♦ adjustable pedal switch C2089-6, circuit GD138 (BK/WH), harness side.  • **Are the resistances less than 5 ohms?**	**Yes** GO to A6 . **No** REPAIR circuit GD138 (BK/WH). TEST the system for normal operation.
A6 CHECK THE ADJUSTABLE PEDAL MOTOR CIRCUITS FOR AN OPEN	
• Disconnect: Adjustable Pedal Motor C2003. • Measure the resistance between adjustable pedal switch C2089, harness side and adjustable pedal motor C2003, harness side as indicated in the following chart: **Adjustable Pedal Switch** / **Circuit** / **Adjustable Pedal Motor** C2089-7 / CPP10 (BN/BU) / C2003-2 C2089-1 / CPP09 (VT/OG) / C2003-2  • **Are the resistances less than 5 ohms?**	**Yes** GO to A7 . **No** REPAIR the affected circuit(s). TEST the system for normal operation.
A7 CHECK THE ADJUSTABLE PEDAL MOTOR CIRCUITS FOR A SHORT TO GROUND	

• Measure the resistance between ground and: ♦ adjustable pedal switch C2089-7, circuit CPP10 (BN/BU), harness side. ♦ adjustable pedal switch C2089-1, circuit CPP09 (VT/OG), harness side.  N0056335 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to A8 . **No** REPAIR the affected circuit(s). TEST the system for normal operation.
A8 CHECK THE ADJUSTABLE PEDAL MOTOR CIRCUITS FOR A SHORT TO VOLTAGE	
• Ignition ON. • Measure the voltage between ground and: ♦ adjustable pedal switch C2089-7, circuit CPP10 (BN/BU), harness side. ♦ adjustable pedal switch C2089-1, circuit CPP09 (VT/OG), harness side.  N0070536 • **Is any voltage present?**	**Yes** REPAIR the affected circuit(s). TEST the system for normal operation. **No** GO to A9 .
A9 CHECK THE ADJUSTABLE BRAKE PEDAL CABLE OPERATION	
• Ignition OFF. • Connect: Adjustable Pedal Motor C2003. • Connect: Adjustable Pedal Switch C2089. • Ignition OFF. • Disconnect the adjustable brake pedal cable from the adjustable brake pedal. • Operate the adjustable pedal control switch and observe the cable in the conduit. • **Does the adjustable brake pedal cable turn in the conduit?**	**Yes** INSTALL a new brake pedal assembly. REFER to Brake Pedal and Bracket in this section. TEST the system for normal operation. **No** GO to A10 .
A10 ISOLATE THE ADJUSTABLE ACCELERATOR PEDAL ASSEMBLY	
• Disconnect the adjustable brake pedal cable from the adjustable pedal motor. • Operate the adjustable pedal control switch and observe the accelerator pedal.	**Yes** INSTALL a new brake pedal motor. REFER to Brake Pedal Motor in this section. TEST the system for normal operation.

• **Does the adjustable accelerator pedal move according to switch position?**	**No** REPAIR the adjustable accelerator pedal system. REFER to Section 310-02 . TEST the system for normal operation.

Pinpoint Test B: Adjustable Brake Pedal is Inoperative/Does Not Operate Correctly - Using the Adjustable Pedal Switch (With Memory Feature)

Refer to Wiring Diagrams Cell 127 , Adjustable Pedals for schematic and connector information.

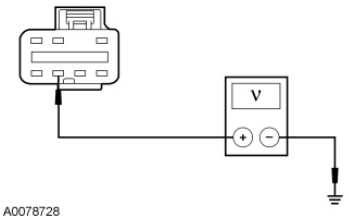
Normal Operation

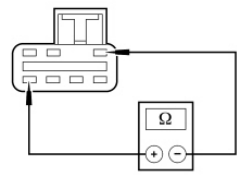
The adjustable pedal switch receives fused battery voltage from Smart Junction Box (SJB) fuse 1 (20A) along circuit SBP01 (RD).

When the adjustable pedal switch is pressed in the forward position (away from the driver), the switch connects circuit SBP01 (RD) to circuit CPP09 (VT/OG) and the voltage is sent to the Driver Seat Module (DSM) along circuit CPP09 (VT/OG). When the DSM receives this voltage input, it sends voltage to the adjustable pedal motor along circuit CPP01 (WH/OG) and the voltage returns to the DSM along circuit CPP02 (BN).

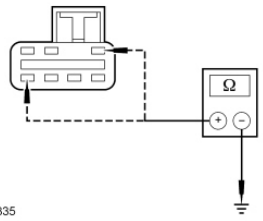
When the adjustable pedal switch is pressed in the rearward position (toward the driver), the switch connects circuit SBP01 (RD) to circuit CPP10 (BN/BU) and the voltage is sent to the DSM along circuit CPP10 (BN/BU). When the DSM receives this voltage input, it sends voltage to the adjustable pedal motor along circuit CPP02 (BN) and the voltage returns to the DSM along CPP01 (WH/OG).

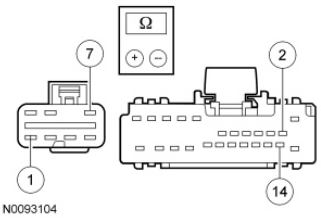
- DTC B1988 (Pedal Position Forward Switch Circuit Short to Battery) - If during normal operation the DSM detects voltage on circuit CPP09 (VT/OG) for more than 2 minutes or if the DSM detects voltage on circuit CPP09 (VT/OG) at all during an on-demand self test, DTC B1988 will be set.
- DTC B1989 (Pedal Position Rearward Switch Circuit Short to Battery) - If during normal operation the DSM detects voltage on circuit CPP10 (BU/BN) for more than 2 minutes or if the DSM detects voltage on circuit CPP10 (BU/BN) at all during an on-demand self test, DTC B1989 will be set.



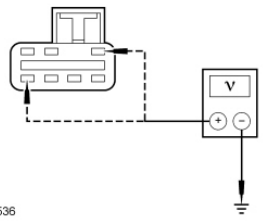


This pinpoint test is intended to diagnose the following:

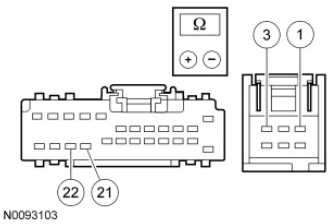


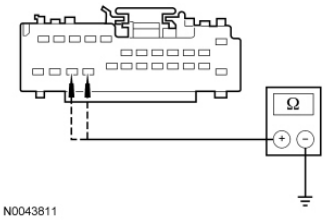


- Foreign material
- Fuse
- Wiring, terminals or connectors
- Adjustable pedal switch
- Adjustable pedal motor
- Adjustable pedal cable
- Brake pedal assembly
- DSM

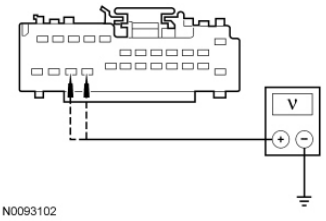


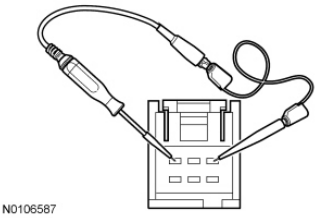
PINPOINT TEST B: ADJUSTABLE BRAKE PEDAL IS INOPERATIVE/DOES NOT OPERATE CORRECTLY - USING THE ADJUSTABLE PEDAL SWITCH (WITH MEMORY FEATURE)





NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**





Test Step	Result / Action to Take

B1 CHECK THE DSM DTCs	
• Review the DTCs retrieved during Inspection and Verification. • **Are DTCs B1988 and/or B1989 present?**	**Yes** GO to B7 . **No** GO to B2 .
B2 CHECK THE DSM ADJUSTABLE PEDAL SWITCH (PEDPOSSW) PID	
• Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger - DSM . • Monitor the PEDPOSSW PID while activating the adjustable pedal switch. • **Does the PID display match the switch position within one second of pressing the switch?**	**Yes** GO to B9 . **No** GO to B3 .
B3 CHECK FOR VOLTAGE AT THE ADJUSTABLE PEDAL SWITCH	
• Ignition OFF. • Disconnect: Adjustable Pedal Switch C2089 . • Measure the voltage between adjustable pedal switch C2089-2, circuit SBP01 (RD), harness side and ground.  A0078728 • **Is the voltage greater than 10 volts?**	**Yes** GO to B4 . **No** VERIFY SJB fuse 20 (15A) is OK. If OK, REPAIR circuit SBP01 (RD). If not OK, REFER to the Wiring Diagrams manual to identify the possible cause for the circuit short. TEST the system for normal operation.
B4 CHECK THE ADJUSTABLE PEDAL SWITCH CIRCUITS FOR A SHORT TOGETHER	
• Disconnect: DSM C341C. • Measure the resistance between adjustable pedal switch C2089-1, circuit CPP09 (VT/OG), harness side and C2089-7, circuit CPP10 (BN/BU), harness side.  N0093105 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to B5 . **No** REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.

B5 CHECK THE ADJUSTABLE PEDAL SWITCH CIRCUITS FOR A SHORT TO GROUND	
• Measure the resistance between ground and: ♦ adjustable pedal switch C2089-7, circuit CPP10 (BN/BU), harness side. ♦ adjustable pedal switch C2089-1, circuit CPP09 (VT/OG), harness side.  N0056335 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to B6 . **No** REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.
B6 CHECK THE ADJUSTABLE PEDAL SWITCH CIRCUITS FOR AN OPEN	
• Measure the resistance between adjustable pedal switch C2089, harness side and DSM C341C, harness side as indicated in the following chart: **Adjustable Pedal Switch** / **Circuit** / **DSM** C2089-7 / CPP10 (BN/BU) / C341C-2 C2089-1 / CPP09 (VT/OG) / C341C-14  N0093104 • **Are the resistances less than 5 ohms?**	**Yes** GO to B7 . **No** REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.
B7 CHECK THE ADJUSTABLE PEDAL SWITCH CIRCUITS FOR A SHORT TO VOLTAGE	
• Disconnect: DSM C341C (if not previously disconnected). • Disconnect: Adjustable Pedal Switch C2235 (if not previously disconnected). • Ignition ON. • Measure the voltage between ground and: ♦ adjustable pedal switch C2089-7, circuit CPP10 (BN/BU), harness side.	**Yes** REPAIR the affected circuit(s) for a short to voltage. CLEAR the DTCs. REPEAT the self-test. **No** GO to B8 .

♦ adjustable pedal switch C2089-1, circuit CPP09 (VT/OG), harness side.  • **Is any voltage present?**	
B8 ISOLATE THE ADJUSTABLE PEDAL SWITCH	
• Ignition OFF. • Carry out the adjustable pedal switch component test. Refer to Wiring Diagrams Cell 149 for component testing. • **Does the adjustable pedal switch pass the component test?**	**Yes** If DTCs B1988 and/or B1989 are not present, GO to B9 . If DTCs B1988 and/or B1989 are present, GO to B18 . **No** INSTALL a new adjustable pedal switch. CLEAR the DTCs. REPEAT the self-test.
B9 CHECK THE DSM ADJUSTABLE PEDAL ACTIVE COMMANDS	
• Connect: DSM C341C. • Select PARK. • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger - DSM . • **NOTE:** Toggling the active command ON will cause the pedal to move in the commanded direction for 2 seconds and then the pedal will stop. • Toggle the pedal forward (PEDAL_FWD) active command ON. • Toggle the PEDAL_FWD active command OFF. • Toggle the pedal rearward (PEDAL_RWD) active command ON. • Toggle the PEDAL_FWD active command OFF. • **Do the adjustable pedals respond correctly to the corresponding active commands?**	**Yes** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. **No** GO to B10 .
B10 CHECK THE ADJUSTABLE PEDAL MOTOR AND CABLE INSTALLATION	
• Check the adjustable pedal motor and both cables for correct installation. • **Are the motor and cables correctly installed?**	**Yes** GO to B11 . **No** CORRECT the adjustable pedal motor and/or cable installation. TEST the system for normal operation.

B11 INSPECT FOR FOREIGN MATERIAL	
• Inspect the adjustable brake pedal and accelerator assemblies for foreign material causing a binding condition. • **Are the pedal assemblies free from foreign material?**	**Yes** GO to B12 . **No** REMOVE the foreign material. TEST the system for normal operation.
B12 CHECK THE ADJUSTABLE PEDAL MOTOR CIRCUITS FOR AN OPEN	
• Ignition OFF. • Disconnect: Adjustable Pedal Motor C2159. • Disconnect: DSM C341C. • Measure the resistance between DSM C341C, harness side and adjustable pedal motor C2159, harness side as indicated in the following chart: **DSM** / **Circuit** / **Adjustable Pedal Motor** C341C-21 / CPP02 (BN) / C2159-3 C341C-22 / CPP01 (WH/OG) / C2159-1  N0093103 • **Are the resistances less than 5 ohms?**	**Yes** GO to B13 . **No** REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.
B13 CHECK THE ADJUSTABLE PEDAL MOTOR CIRCUITS FOR A SHORT TO GROUND	
• Measure the resistance between ground and: ♦ DSM C341C-21, circuit CPP02 (BN), harness side. ♦ DSM C341C-22, circuit CPP01 (WH/OG), harness side.  N0043811 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to B14 . **No** REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.

B14 CHECK THE ADJUSTABLE PEDAL MOTOR CIRCUITS FOR A SHORT TO VOLTAGE	
• Ignition ON. • Measure the voltage between ground and: ♦ DSM C341C-12, circuit CPP01 (WH/OG), harness side. ♦ DSM C341C-24, circuit CPP02 (BN), harness side.  N0093102 • **Is any voltage present?**	**Yes** REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test. **No** GO to B15 .
B15 CHECK FOR DSM OUTPUT	
NOTICE: **The following step uses a test light to simulate normal circuit loads. Use only the test light recommended in the Special Tools table at the beginning of this section. To avoid connector terminal damage, use the Flex Probe Kit for the test light probe connection to the vehicle. Do not use the test light probe directly on any connector.** • Connect: DSM C341C. • Connect: Adjustable Pedal Switch C2235. • Connect the positive lead of a test light to C2159-3, circuit CPP02 (BN), harness side. • Connect the negative lead of a test light to C2159-1, circuit CPP01 (WH/OG), harness side.  N0106587 • Press the adjustable pedal switch in the forward position and verify that the test light is illuminated. • Press the adjustable pedal switch in the rearward position and verify that the test light is illuminated. • **Does the test light illuminate when the adjustable pedal switch is pressed in each direction?**	**Yes** GO to B16 . **No** GO to B18 .
B16 INSPECT THE ADJUSTABLE BRAKE PEDAL CABLE	
• Inspect the ends of the brake pedal motor cable for wear or damage.	**Yes** GO to B17 .

• **Are the cable ends OK?**	**No** INSTALL a new brake pedal motor. REFER to Brake Pedal Motor in this section. TEST the system for normal operation.
B17 CHECK THE ADJUSTABLE BRAKE PEDAL CABLE OPERATION	
• Connect: Adjustable Pedal Switch C2235. • Connect: Adjustable Pedal Motor C2159. • Connect: DSM C341C. • Disconnect the adjustable brake pedal cable from the adjustable brake pedal. • Operate the adjustable pedal control switch and observe the cable in the conduit. • **Does the adjustable brake pedal cable turn in the conduit?**	**Yes** INSTALL a new brake pedal assembly. REFER to Brake Pedal and Bracket in this section. TEST the system for normal operation. **No** INSTALL a new brake pedal motor. REFER to Brake Pedal Motor in this section. TEST the system for normal operation.
B18 CHECK THE DSM FOR CORRECT OPERATION	
• Disconnect: DSM C341C (if not previously disconnected). • Check DSM C341C for: ♦ corrosion. ♦ pushed-out pins. ♦ spread terminals. • Connect: DSM C341C. • Make sure the connector seats correctly, then operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new DSM . REFER to Section 419-10 . CLEAR the DTCs. REPEAT the self-test. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test C: Adjustable Brake Pedal is Inoperative/Does Not Operate Correctly - Using the Memory SET Switch Buttons or the Remote Keyless Entry (RKE) Transmitter

Refer to Wiring Diagrams Cell 127 , Adjustable Pedals for schematic and connector information.

Normal Operation

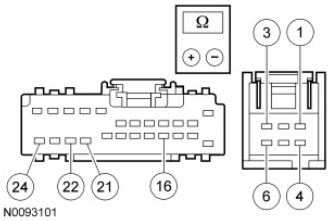
When the desired memory position is selected using the memory SET switch buttons or the remote transmitter, the Driver Seat Module (DSM) will send voltage to the adjustable pedal motor along circuit CPP01 (WH/OG) to move the pedals forward and along circuit CPP02 (BN) to move the pedals rearward. When voltage is sent to the motor along circuit CPP01 (WH/OG) it returns to the DSM along CPP02 (BN). Likewise, when the voltage is sent to the motor along circuit CPP02 (BN) it returns to the DSM along CPP01 (WH/OG).

The DSM uses a Hall-effect switch attached to the pedal motor to identify the current pedal position. The DSM sends a reference voltage along circuit LPP06 (YE/BU), through the Hall-effect switch and back to the DSM along the signal return circuit, RPP06 (GN).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Adjustable pedal motor

- DSM

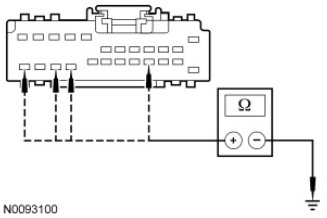


PINPOINT TEST C: ADJUSTABLE BRAKE PEDAL IS INOPERATIVE/DOES NOT OPERATE CORRECTLY - USING THE MEMORY SET SWITCH BUTTONS OR THE RKE TRANSMITTER

NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

Test Step	Result / Action to Take
C1 CHECK THE ADJUSTABLE PEDAL OPERATION WITH THE ADJUSTABLE PEDAL SWITCH	
• Press the adjustable pedal switch in each direction for more than one second and observe the adjustable pedals. • **Do the adjustable pedals operate for more than one second in the direction selected using the switch?**	**Yes** GO to C2 . **No** If the pedals do not move at all using the switch, GO to Pinpoint Test B . If the pedals only move in one second intervals regardless of button operation, GO to Pinpoint Test D .
C2 CHECK THE MEMORY SYSTEM OPERATION	
• Set a memory position for the driver seat, exterior mirrors and adjustable pedals to memory SET switch button 1. Refer to Memory Position Programming in Section 501-10 . • Select PARK. • Press the memory SET switch button 1 and observe the following items: ♦ Driver seat ♦ Exterior mirrors ♦ Adjustable pedals • **Do all 3 items move when the button is pressed?**	**Yes** GO to C3 . **No** If all 3 items do not move, REFER to Diagnosis and Testing in Section 501-10 to DIAGNOSE the memory SET switch. If **only** the adjustable pedals do not move, GO to C4 . If **only** the driver seat does not move, REFER to Diagnosis and Testing in Section 501-10 . If **only** the exterior mirrors do not move, REFER to Diagnosis and Testing in Section 501-09 .
C3 CHECK THE RKE TRANSMITTER OPERATION	
• Set a memory position in the Remote Keyless Entry (RKE) transmitter for the driver seat, exterior mirrors and adjustable pedals. Refer to Remote Memory Activation in Section 501-14 . • Select PARK.	**Yes** GO to C4 . **No** If all 3 items do not move, REFER to Diagnosis and Testing in Section 501-14 to DIAGNOSE the

• Press the unlock button on the RKE transmitter and observe the following items: ♦ Driver seat ♦ Exterior mirrors ♦ Adjustable pedals • **Do all 3 items move when the button is pressed?**	RKE transmitter. If **only** the adjustable pedals do not move, GO to C4 . If **only** the driver seat does not move, REFER to Diagnosis and Testing in Section 501-10 . If **only** the exterior mirrors do not move, REFER to Diagnosis and Testing in Section 501-09 .
C4 CHECK THE ADJUSTABLE PEDAL MOTOR AND CABLE INSTALLATION	
• Check the adjustable pedal motor and both cables for correct installation. • **Are the motor and cables correctly installed?**	**Yes** GO to C5 . **No** CORRECT the adjustable pedal motor and/or cable installation. TEST the system for normal operation.
C5 INSPECT FOR FOREIGN MATERIAL	
• Inspect the adjustable brake pedal and accelerator assemblies for foreign material causing a binding condition. • **Are the pedal assemblies free from foreign material?**	**Yes** GO to C6 . **No** REMOVE the foreign material. TEST the system for normal operation.
C6 CHECK THE DSM PEDAL MOTOR AND HALL-EFFECT CIRCUITS FOR AN OPEN	
• Disconnect: Adjustable Pedal Motor C2159. • Disconnect: DSM C341C. • Measure the resistance between DSM C341C, harness side and adjustable pedal motor C2159, harness side as indicated in the following chart:	**Yes** GO to C7 . **No** REPAIR the affected circuit(s). TEST the system for normal operation.



DSM	Circuit	Adjustable Pedal Motor
C341C-22	CPP01 (WH/OG)	C2159-1
C341C-21	CPP02 (BN)	C2159-3
C341C-24	RPP06 (GN)	C2159-6
C341C-16	LPP06 (YE/BU)	C2159-4

- **Are the resistances less than 5 ohms?**

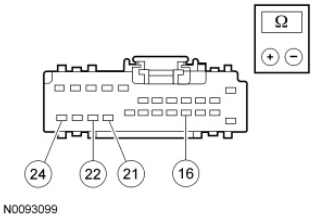
C7 CHECK THE DSM PEDAL MOTOR AND HALL-EFFECT CIRCUITS FOR A SHORT TO GROUND

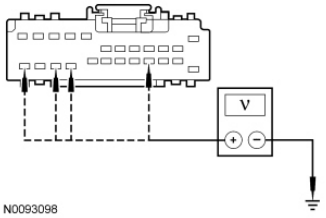
- Measure the resistance between ground and:
  - ♦ DSM C341C-16, circuit LPP06 (YE/BU), harness side.
  - ♦ DSM C341C-21, circuit CPP02 (BN), harness side.
  - ♦ DSM C341C-22, circuit CPP01 (WH/OG), harness side.
  - ♦ DSM C341C-24, circuit RPP06 (GN), harness side.

- **Are the resistances greater than 10,000 ohms?**

Yes
GO to C8 .

No
REPAIR the affected circuit(s). TEST the system for normal operation.





C8 CHECK THE DSM PEDAL MOTOR AND HALL-EFFECT CIRCUITS FOR A SHORT TOGETHER

- Measure the resistance between DSM C341C pins, harness side as indicated in the following chart:

DSM	Circuit	DSM	Circuit
C341C-16	LPP06 (YE/BU)	C341C-21	CPP02 (BN)
C341C-16	LPP06 (YE/BU)	C341C-22	CPP01 (WH/OG)
C341C-16	LPP06 (YE/BU)	C341C-24	RPP06 (GN)
C341C-21	CPP02 (BN)	C341C-22	CPP01 (WH/OG)
C341C-21	CPP02 (BN)	C341C-24	RPP06 (GN)
C341C-22	CPP01 (WH/OG)	C341C-24	RPP06 (GN)

Yes
GO to C9 .

No
REPAIR the affected circuit(s). TEST the system for normal operation.

 • **Are the resistance greater than 10,000 ohms?**	
C9 CHECK THE DSM PEDAL MOTOR AND HALL-EFFECT CIRCUITS FOR A SHORT TO VOLTAGE	
• Ignition ON. • Measure the voltage between ground and: ♦ DSM C341C-16, circuit LPP06 (YE/BU), harness side. ♦ DSM C341C-21, circuit CPP02 (BN), harness side. ♦ DSM C341C-22, circuit CPP01 (WH/OG), harness side. ♦ DSM C341C-24, circuit RPP06 (GN), harness side.  • **Is any voltage present?**	**Yes** REPAIR the affected circuit(s). TEST the system for normal operation. **No** INSTALL a new adjustable brake pedal assembly. REFER to Brake Pedal and Bracket in this section. TEST the system for normal operation.

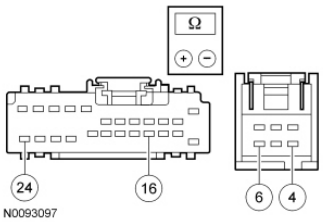
Pinpoint Test D: DTC B1987, B1991 or B2275

Refer to Wiring Diagrams Cell 127 , Adjustable Pedals for schematic and connector information.

Normal Operation

The Driver Seat Module (DSM) uses a Hall-effect switch attached to the pedal motor to identify the current pedal position. The DSM sends a reference voltage along circuit LPP06 (YE/BU), through the Hall-effect switch and back to the DSM along the signal return circuit, RPP06 (GN).

When 1 or more of the following DTCs are set, the adjustable pedals will enter a "jog mode". When the pedals are in jog mode, the memory system recall will not function from either the Remote Keyless Entry (RKE) transmitter or the memory SET switch buttons. When the pedals are operated using the adjustable pedal switch, the motor will move the pedals for one second in the direction selected regardless of the length of time the button is actually pressed.

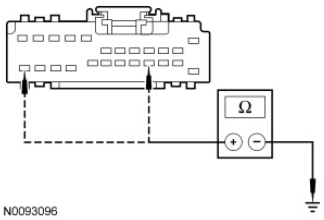


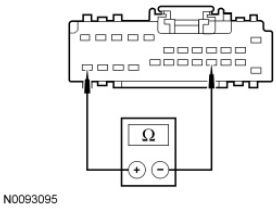
- DTC B1987 (Pedal Forward/Rearward Motor Stalled) - This DTC is only set during a DSM on-demand self test. During the self-test, the adjustable pedal motor will be commanded to move forward and then rearward. If the motor encounters a hard stop while moving, the DSM will attempt to move the pedals in the opposite direction. If the DSM does not see any pedal movement via the Hall-effect switch during this attempt, DTC B1987 will be set and the adjustable pedal system will be disabled.
- DTC B1991 (Pedal Forward/Rearward Potentiometer Feedback Circuit Short to Battery) - If the DSM detects a short to voltage on circuit LPP06 (YE/BU) during normal operation or an on-demand self

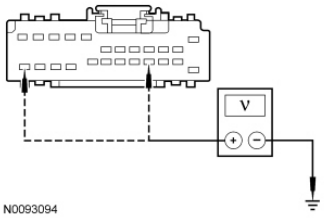
test and without any pedal switch input, DTC B1991 will be set.
- DTC B2275 (Pedal Forward/Rearward Potentiometer Feedback Circuit Short to Ground) - If the DSM detects a short to ground on circuit LPP06 (YE/BU) during normal operation or an on-demand self test and without any pedal switch input, DTC B2275 will be set.

This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- Adjustable pedal motor

PINPOINT TEST D: DTC B1987, B1991 OR B2275







NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

Brake Pedal and Bracket

NOTE: Adjustable pedals shown, fixed pedals similar.

Item	Part Number	Description
1	-	Adjustable pedal motor electrical connector (part of 14398)
2	-	Accelerator pedal electrical connector (part of 14398)
3	2L523	Booster push rod clevis locking pin
4	90907	Accelerator pedal bracket nut (3 required)
5	W520212	Brake booster nut (4 required)
6	W710343	Brake pedal bracket bolt (2 required)
7	2455/2C434	Brake pedal bracket (fixed/adjustable)
8	W705314	Steering column opening cover screw (2 required)
9	78044F08	Steering column opening cover

Removal

1. ***NOTICE:*** **Do not service the brake pedal without first removing the stoplamp switch and speed control deactivator switch. These switches must be removed with the brake pedal in the at-rest position. Switch plungers must be compressed for the switch to rotate in the bracket. Attempting to remove the switch when the plunger is extended (during pedal apply) will result**

in damage to the switch.

Remove the stoplamp switch. For additional information, refer to Section 417-01 .

2. If equipped, remove the speed control deactivator switch. For additional information, refer to Section 310-03 .

3. **NOTE:** If equipped with adjustable pedals, when removing the adjustable pedal assembly, make sure the pedals are adjusted to the full rearward position.

   NOTE: The booster push rod clevis locking pin is a one-time use only part. Anytime the booster push rod clevis locking pin is removed, a new booster push rod clevis locking pin should be used.

   NOTE: Remove the clevis locking pin by squeezing the locking tabs and pulling outward on the opposite end.

   Remove the booster push rod clevis locking pin and discard.

4. Disconnect the brake booster rod from the brake pedal and position aside.

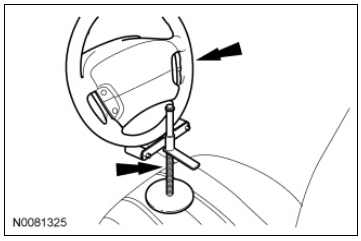
5. If equipped with power adjustable pedals, disconnect the adjustable pedal motor electrical connector.

6. If equipped with adjustable pedals, disconnect the accelerator pedal motor electrical connector.

7. Remove and discard the 2 brake pedal bracket bolts.

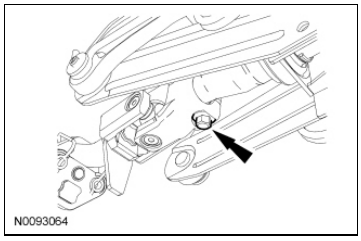
8. Remove and discard the 4 brake booster nuts.

9. Position the brake master cylinder and brake booster assembly forward to allow the brake pedal assembly to clear the studs.



10. Remove the 3 accelerator pedal bracket nuts.

11. Remove the 2 steering column opening cover screws and the steering column opening cover panel.



12. ***NOTICE:*** **Do not allow the steering wheel to rotate while the steering column intermediate shaft is disconnected or damage to the clockspring can result. If there is evidence the steering column shaft has rotated, the clockspring must be removed and centered. For additional information, refer to Section 501-20B .**

    NOTE: Use a steering wheel holding device (such as Hunter® 28-75-1 or equivalent).

    Using a suitable holding device, hold the steering wheel in the straight-ahead position.

13. Remove the steering column shaft bolt and disconnect the steering column shaft from the steering column.

14. Remove the brake pedal assembly from the vehicle.

Installation

1. Position the brake pedal assembly in the vehicle.

2. Position the brake master cylinder and brake booster assembly into the brake pedal bracket assembly.

3. Install the 4 new brake booster nuts.
   - Tighten to 22 Nm (16 lb-ft).

4. Install the 2 new brake pedal bracket bolts.
   - Tighten to 22 Nm (16 lb-ft).

5. Install the 3 accelerator pedal bracket nuts.
   - Tighten to 7 Nm (62 lb-in).

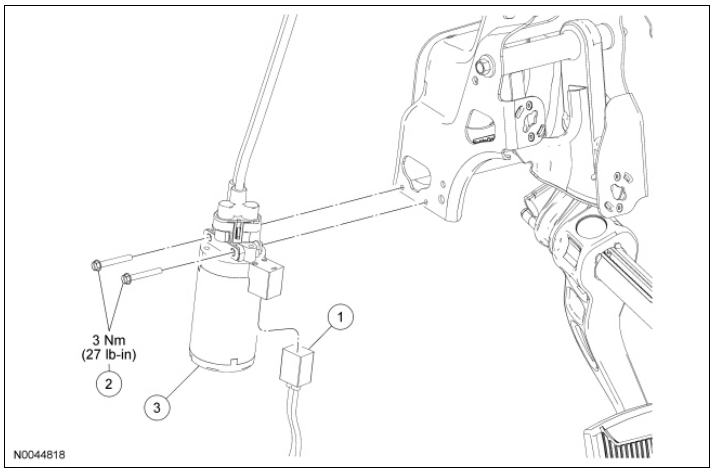
6. If equipped with power adjustable pedals, connect the adjustable pedal motor electrical connector.

7. If equipped with adjustable pedals, connect the accelerator pedal electrical connector.

8. Position the brake booster push rod to the brake pedal.

9. Install the new booster push rod clevis locking pin.

10. Connect the steering column to the steering column shaft and install the bolt.
    - Tighten to 30 Nm (22 lb-ft).



11. Position the steering column opening cover and install the 2 screws.

12. ***NOTICE:*** **Do not press, pull or otherwise move the brake pedal while installing the stoplamp switch or the speed control deactivator switch. These switches must be installed with the booster push rod attached to the brake pedal and with the brake pedal in the at-rest position. Installing these switches with the brake pedal in any other position will result in incorrect adjustment and may damage the switches.**

    Install the stoplamp switch. For additional information, refer to Section 417-01 .

13. If equipped, install the speed control deactivator switch. For additional information, refer to Section 310-03 .

Brake Pedal Motor

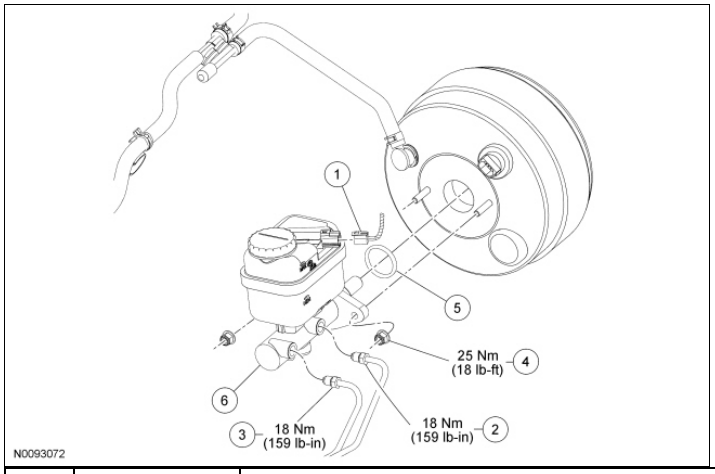
Item	Part Number	Description
1	-	Adjustable pedal motor electrical connector (part of 2B325)
2	-	Adjustable pedal motor screws (part of 2C429) (2 required)
3	2C429	Adjustable pedal motor

Removal and Installation

1. Disconnect the accelerator and brake pedal drive cables from the adjustable pedal motor.

2. Disconnect the adjustable pedal motor electrical connector.

3. Remove the 2 adjustable pedal motor screws and then remove the adjustable pedal motor and drive cables as an assembly.
   - To install, tighten to 3 Nm (27 lb-in).



4. **NOTE:** Make sure the brake pedal and the accelerator pedal are in the same position before connecting the drive cable to the adjustable pedals.

   To install, reverse the removal procedure.

Brake Master Cylinder

Material

Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1

Item	Part Number	Description
1	-	Brake fluid level warning switch electrical connector (part of 14289)
2	-	Primary brake tube fitting (part of 2234)
3	-	Secondary brake tube fitting (part of 2234)
4	W520212	Brake master cylinder nut (2 required)
5	-	Brake master cylinder-to-booster square cut seal (part of 2004)
6	2004	Brake master cylinder/reservoir assembly

Removal and Installation

⚠ WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

⚠ WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

NOTICE: **Do not spill brake fluid on painted or plastic surfaces or damage to the surface may occur. If brake fluid is spilled onto a painted or plastic surface, immediately wash the surface with water.**

1. With the engine off, press the brake pedal several times to deplete the brake booster vacuum.

2. Disconnect the brake fluid level warning switch electrical connector.

3. Disconnect the 2 brake tube fittings from the brake master cylinder.
   - To install, tighten to 18 Nm (159 lb-in).

4. Remove the 2 nuts, the brake master cylinder and the square cut seal.
   - To install, tighten to 25 Nm (18 lb-ft).

5. **NOTE:** Make sure that the square cut seal is properly installed or incorrect brake pedal feel can occur.

   To install, reverse the removal procedure.

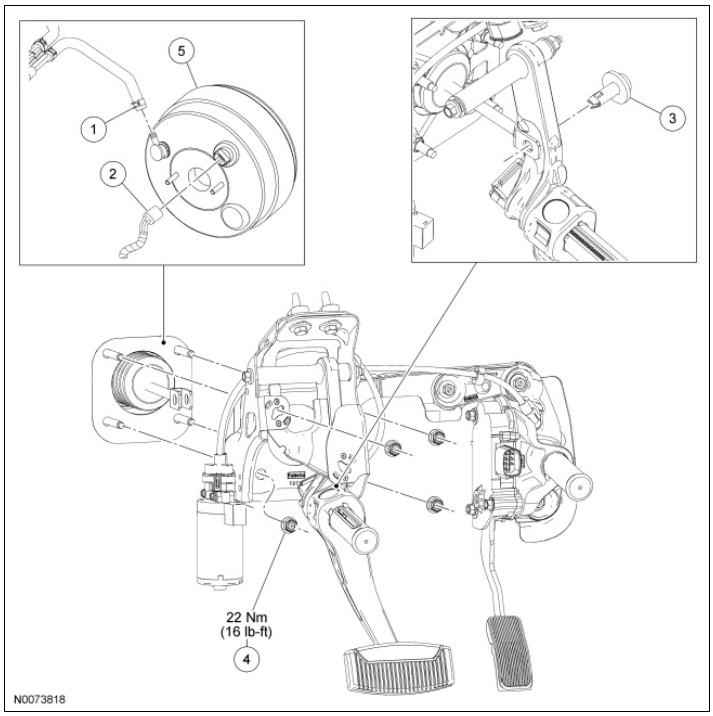
   - Bleed the master cylinder. For additional information, refer to Component Bleeding in Section 206-00 .

Torque Specifications

Description	Nm	lb-ft
Brake booster nuts	22	16

Brake Booster

The power brake actuation system consists of the following components:



- Brake booster
- Brake booster check valve
- Brake booster vacuum supply hose

The brake booster uses engine vacuum from the intake manifold to create a partial vacuum inside the vacuum booster on both sides of the diaphragm. When the brake pedal is pressed, the booster rod opens a valve, allowing air to enter the booster on one side of the diaphragm while sealing off the opposite side. This increases pressure on that side of the diaphragm so that it helps push the rod, which in turn pushes the piston in the master cylinder. As the brake pedal is released, the valve seals off the outside air supply while opening the vacuum valve. This restores vacuum to both sides of the diaphragm, allowing everything to return to its original position.

Power Brake System

Refer to Section 206-00 .

Brake Booster

Item	Part Number	Description
1	9C482	Brake booster vacuum hose
2	-	Brake booster solenoid and microswitch electrical connector (part of 14289)
3	2L523	Brake booster push rod clevis locking pin
4	W520212	Brake booster nut (4 required)
5	2005	Brake booster assembly

Removal and Installation

1. ***NOTICE:*** **The brake booster check valve must be disconnected from the brake booster prior to removing the master cylinder or the master cylinder seal may be drawn into the brake booster.**

   Disconnect the brake booster check valve from the brake booster to deplete the residual vacuum in the brake booster.

2. Remove the brake master cylinder. For additional information, refer to Section 206-06 .

3. ***NOTICE:*** **Do not service the brake pedal or brake booster without first removing the stoplamp switch. This switch must be removed with the brake pedal in the at-rest position. The switch plunger must be compressed for the switch to rotate in the bracket. Attempting to remove the switch when the plunger is extended (during pedal apply) will result in damage to the switch.**

   Remove the stoplamp switch. For additional information, refer to Section 211-04 .

4. **NOTE:** When the repair is complete, make sure that the brake booster solenoid electrical connector is connected, or use of the vehicle with key-on or vehicle running will result in DTCs being set.

   Disconnect the brake booster solenoid electrical connector.

5. **NOTE:** The booster push rod clevis locking pin is a one-time use only part. Anytime the booster push rod clevis locking pin is removed, a new booster push rod clevis locking pin should be used.

   Remove the booster push rod clevis locking pin and discard.

6. Disconnect the brake booster rod from the brake pedal and position aside.

7. Remove and discard the 4 brake booster nuts and the booster.
   - To install, tighten the new nuts to 22 Nm (16 lb-ft).

8. ***NOTICE:*** **Do not press, pull or otherwise move the brake pedal while installing the stoplamp switch. This switch must be installed with the booster push rod attached to the brake pedal and with the brake pedal in the at-rest position. Installing this switch with the brake pedal in any other position will result in incorrect adjustment and may damage the switch.**

   To install, reverse the removal procedure.

Anti-Lock Control

ABS with Traction Control and Roll Stability Control (RSC®)

The ABS consists of the following components:

- ABS module
- Hydraulic Control Unit (HCU)
- Front wheel speed sensors
- Front wheel speed sensors rings
- Rear wheel speed sensors
- Rear wheel speed sensor rings
- Stability control sensor cluster
- Stability traction control switch
- Steering wheel rotation sensor

The ABS prevents wheel lock-up by monitoring the wheel speed sensors and actuating the valves in the HCU which modulates the brake pressure to the brake calipers. By preventing the wheels from locking up, the driver is able to maintain steering control and stop in the shortest possible distance under most conditions. The traction control system utilizes the same components as the ABS to prevent wheel spin and help maintain vehicle control during acceleration. The Roll Stability Control (RSC®) system utilizes the same components as the ABS and the traction control systems and also monitors the steering wheel rotation sensor and the stability control sensor cluster to assist in stabilizing the vehicle during abrupt maneuvers.

The front wheel speed sensor rings are integral to the front hub and bearing assemblies. Refer to Section 204-01A or Section 204-01B .

The rear wheel speed sensor rings are integral to the rear halfshafts. Refer to Section 205-05 .

Anti-Lock Control

Special Tool(s)

 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2574-A	Flex Probe Kit 105-R025D or equivalent
 ST3030-A	Rotunda Active Wheel Speed Sensor Tester 105-R0110
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Principles of Operation

Anti-Lock Control

The standard ABS module manages anti-lock braking to maintain vehicle control during deceleration.

When the ignition switch is in the RUN position, the ABS module does a preliminary electrical check and, at approximately 40 km/h (25 mph), the hydraulic pump motor is turned on for approximately one half second. During this time, a buzzing or humming noise may be heard and a vibration may be felt in the brake pedal. This is a normal condition. Any malfunction of the ABS disables the stability control and the ABS warning indicator illuminates. However, the power-assist braking system functions normally.

The ABS module monitors and compares the rotational speed of each wheel. Wheel speeds are measured by the wheel speed sensor, which electrically senses each tooth of the sensor ring as it passes through the magnetic field of the sensor. When the ABS module detects an impending wheel lock, the ABS module commands the hydraulic pump motor on and commands the Hydraulic Control Unit (HCU) to open and close the appropriate solenoid valves to modulate the brake pressure to the individual brake caliper(s). Once the affected wheel(s) returns to the desired speed, the ABS module commands the HCU to return the solenoid valves to their normal position and normal base brake operation is restored.

The ABS module must be configured when a new ABS module is installed.

Electronic Brake Distribution (EBD)

The ABS incorporates a strategy called Electronic Brake Distribution (EBD). EBD uses the HCU as an electronic proportioning valve. On initial application of the brake pedal, full pressure is applied to the rear brakes. The ABS module uses wheel speed input to calculate an estimated rate of deceleration. Once vehicle

deceleration exceeds a certain threshold, the ABS module closes the appropriate isolation valves in the HCU to hold the rear brake pressure constant while allowing the front brake pressure to build. This creates a balanced braking condition between the front and rear wheels and minimizes the chance of rear wheel lockup during hard braking. As the vehicle decelerates the valves are opened to increase the rear brake pressure in proportion to the front brake pressure.

Some drivers may feel a slight bump sensation in the brake pedal when EBD is active.

If anti-lock braking is disabled due to DTCs being present in the ABS module, EBD will continue to function unless the DTCs are for 2 wheel speed sensors on the same axle or HCU faults.

ABS With Traction Control, Electronic Stability Control (ESC) and Roll Stability Control (RSC®)

The ABS module with traction control, Electronic Stability Control (ESC) and Roll Stability Control (RSC®) performs the same functions as the standard ABS module. It also performs additional functions specific to traction control, ESC and RSC® .

Traction Control

When the drive wheels lose traction and begin to spin, with vehicle speed under 100 km/h (62 mph), the ABS module commands the hydraulic pump motor on and commands the HCU to open and close the appropriate solenoid valves to modulate the brake pressure to the brake caliper(s) while simultaneously sending a request to the PCM over the High Speed Controller Area Network (HS-CAN) bus to reduce engine torque to maintain vehicle traction. The PCM accomplishes this by minor incremental timing changes and fewer fuel injector pulses until the ABS module ends the request. The request ends when the driven wheel speed returns to the desired speed. After the vehicle speed exceeds 100 km/h (62 mph), the traction control is accomplished only through the PCM torque control.

Electronic Stability Control (ESC)

The ESC system constantly monitors the vehicle motion relative to the intended course. This is done by using sensors to compare the steering input and the yaw rate sensor with that of the actual vehicle motion. The ESC system monitors information from the throttle position sensor, the steering wheel rotation sensor (steering wheel angle and rate of change) and a yaw rate sensor (integral to the stability control sensor cluster) that measures changes in vehicle direction. If the ESC system determines from all these inputs that the vehicle is unable to travel in the intended direction, the system adjusts the brake torque at specific wheels in response to direct measurement of the vehicle motion and reduces engine torque to allow the vehicle to follow the intended course.

When the ESC system activates, any of the following can occur:

- A rumble or grinding sound much like ABS or traction control
- A small deceleration or a reduction in the acceleration of the vehicle
- The stability/traction control indicator "sliding-car icon" flashes
- If the driver's foot is on the brake pedal, a vibration will be felt in the pedal much like ABS

Roll Stability Control (RSC®)

The RSC® system constantly monitors the vehicle roll motion relative to the intended course. This is done by using sensors to compare the steering input and brake application with that of the actual vehicle motion. The system does not activate when the vehicle is traveling in reverse; however, the standard ABS and traction control continue to function as usual. The RSC® system monitors information from the wheel speed sensors, the Throttle Position (TP) sensor, the steering wheel rotation sensor (steering wheel angle and rate of change) and a roll-rate sensor (integral to the stability control sensor cluster) that measures changes in vehicle motion.

If the RSC® system determines from all these inputs that conditions exist for a potential roll-over event, the system adjusts the brake torque at specific wheels in response to direct measurement of the vehicle roll motion and reduces engine torque to make the vehicle more stable. By adjusting brake torque, the system can reduce the cornering forces and, therefore, the total roll motion of the vehicle.

When the RSC® system activates, any of the following can occur:

- A rumble or grinding sound much like ABS or traction control
- A small deceleration or a reduction in the acceleration of the vehicle
- The stability/traction control indicator "sliding-car icon" flashes
- If the driver's foot is on the brake pedal, a vibration will be felt in the pedal much like ABS
- If the event is severe enough and the driver's foot is not on the brake, the brake pedal will move to apply higher brake forces. A whooshing sound can also be heard from under the instrument panel in an event this severe

Some drivers may notice a slight movement of the brake pedal when the system checks itself. The brake pedal moves when an active test of the brake booster is run. During this test a small amount of pressure is generated at the master cylinder, but no pressure is generated in the brake calipers.

Trailer Sway Control

Trailer sway control is a unique function of the RSC® system that uses information from the steering wheel rotation sensor and the yaw information from the stability control sensor cluster to determine if a trailer sway event is taking place. Trailer sway is the undesirable yaw force a trailer can apply to the towing vehicle. If it is determined that an event is taking place, the ABS module will modulate brake pressure to the appropriate brake caliper(s) by opening and closing the appropriate solenoid valves inside the HCU while the hydraulic pump motor is activated. At the same time, the ABS module sends a message over the HS-CAN bus that a trailer sway event is taking place. When the PCM receives this message, it will assist with trailer sway by adjusting engine timing and decreasing fuel injector pulses. When the Instrument Cluster (IC) receives this message, it will flash the stability/traction control message center indicator "sliding-car icon" and display TRAILER SWAY, REDUCE SPEED in the message center. Once the trailer sway has been corrected, the ABS module returns the solenoid valves in the HCU to their normal position, deactivates the hydraulic pump motor and sends another message over the HS-CAN bus indicating that the event has ended. The PCM returns engine timing and fuel injectors to normal operation and the IC extinguishes the "sliding-car icon".

Trailer sway control will only activate with vehicle speed greater than 64 km/h (40 mph). Any malfunction that disables the RSC® system will also disable trailer sway control. Trailer sway control can also be disabled by entering the setup menu in the message center. Refer to the Owner's Literature for the disabling/enabling procedure. Regardless of the chosen state (enabled or disabled), trailer sway control will be re-enabled at each ignition key cycle.

Stability/Traction Control Switch

Unlike the standard anti-lock control system, the individual systems of ESC with RSC® can be deactivated by the driver through the stability/traction control switch. The switch is hard-wired to the ABS module and when pressed sends a voltage signal to the module. The ABS module then sends a message over the HS-CAN bus indicating that the driver has requested that the system be deactivated and illuminates the stability/traction indicator "sliding-car icon". The circumstances present when the switch is pressed and the duration of the button press will determine what systems are disabled.

- Button pressed momentarily - engine traction control, ESC and RSC® systems are disabled and the "sliding-car icon" will illuminate solidly. Brake traction control will continue to function.
- Button pressed and held for more than 5 seconds with vehicle speed under 40 km/h (25 mph) - ESC , RSC® , engine traction control and brake traction control systems are all disabled and the "sliding-car

icon" will flash momentarily and then illuminate solidly.
- Vehicle speed exceeds 40 km/h (25 mph) **after** the button is pressed and held for more than 5 seconds - engine traction control, brake traction control, RSC® and ESC will be enabled, but the "sliding-car icon" will be illuminated solidly.
- Button pressed after deactivation - all systems will be enabled and the "sliding-car icon" will not be illuminated.

Once disabled, the systems will remain in that state until the driver presses the switch again, the ignition key is cycled or the vehicle speed reaches or exceeds 40 km/h (25 mph). Once the vehicle speed reaches or exceeds 40 km/h (25 mph), RSC® and ESC will re-activate but traction control will remain deactivated.

Stability/Traction Control Indicator "Sliding-Car Icon"

Status of the traction control, ESC and RSC® systems is indicated by a stability/traction control indicator "sliding-car icon" located in the Instrument Cluster (IC). The indicator will illuminate solidly when the driver disables the one or more of the systems through the use of the stability/traction control switch or if there are DTCs present in the ABS module directly related to the specific system. The indicator will flash when one or more of the systems is currently active.

Stability Control Sensor Cluster

The sensor cluster (also called the accelerometer) consists of the yaw rate sensor, roll rate sensor, lateral accelerometer and longitudinal accelerometer. The lateral accelerometer measures the acceleration that corresponds to the force involved when the vehicle slides sideways. This acceleration has 2 forms. The first is the centrifugal acceleration that is generated when the vehicle travels around in a circle. The second is the acceleration due to gravity. On level ground there is no contribution from this acceleration. However, if the vehicle is parked sideways on a bank or incline, the sensor measures some lateral acceleration due to gravity, even though the vehicle is not moving.

The longitudinal accelerometer measures the acceleration corresponding to the force involved when the vehicle moves forward and rearward in the horizontal plane, along the centerline of the vehicle's front and rear wheels.

The yaw rate sensor measures the relative vehicle motion about the vertical axis through its center of gravity.

The roll rate sensor measures the rate of rotation along the front to rear horizontal axis.

Steering Wheel Rotation Sensor

The steering wheel rotation sensor measures the rate of rotation of the steering wheel by monitoring the steering wheel rotation ring as it passes through the sensor gap. The rotation sensor uses 2 signal lines to transmit information to the ABS module about whether the steering wheel is being turned left or right and how far it is being turned. The rotation sensor does not indicate the position of the steering wheel relative to straight-ahead. The ESC / RSC® systems learns this position by comparing the steering wheel position with other signals and storing the position it has learned. The ESC / RSC® systems confirm this position and modifies it as necessary during every new driving cycle.

Active Brake Booster

The active brake booster functions like a conventional brake booster with the added feature that it can be actuated electrically by the ABS module. The actuation of the brake booster by the ABS module is necessary in severe stability assist events as it makes sure that the HCU can generate enough brake pressure to maintain vehicle stability. The brake assist from the brake booster is especially useful in cold weather because the HCU

cannot draw the brake fluid from the reservoir quickly at cold temperatures.

The ABS module controls a solenoid/air valve attached to the active brake booster to actuate the booster. The ABS module uses the brake booster pedal force switch (integral to the booster) and the brake pressure transducer (integral to the HCU) to determine if booster actuation is necessary. When actuation is necessary, the ABS module applies increasing current to the solenoid which opens the air valve which allows more air in and increases the boost provided by the brake booster. When actuation is no longer necessary, the ABS module decreases the current to the solenoid which closes the air valve and decreases the boost provided by the brake booster. When the ABS module is actuating the brake booster, the brake pedal will be pulled toward the front of the vehicle as the brake booster input rod moves. The ABS module will continue to actuate the brake booster until it receives brake pedal input from the driver.

Brake pedal input from the driver is determined using the brake booster pedal force switch and the stoplamp switch when all of the following conditions exist:

- The ignition key is in the RUN position
- The ABS module is **not** actuating the active brake booster
- There are no DTCs present in the ABS module

Brake pedal input from the driver is determined using **only** the stoplamp switch when one or more of the following conditions exist:

- The ignition key is in the OFF position
- The ABS module is actuating the active brake booster
- There are DTCs present in the ABS module

When the ignition switch is in the OFF position, failures cannot be detected. If there are failures, several layers of redundancy attempt to keep the driver brake pedal input signal accurate. Control of the stoplamp operation is also required because the stoplamp switch can change states during a stability assist event when the driver is not applying the brake pedal. The switch can also change states during the system check of the brake booster. Only the stability assist system can interpret these changed states and determine which are actually due to driver brake pedal input. Similarly, the stability assist system can take advantage of other sensors to detect stoplamp switch failures.

Stability Control Sensor Calibration

When an ABS system fault has been corrected or an ABS component has been replaced, it will be necessary to calibrate the ABS module. The calibration procedure is required for the stability control sensors to learn the "zero-position" of the vehicle which means the vehicle must be on a level surface and must not be moving.

If a DTC is logged for any component of the stability/traction control system, the DTC must be cleared or repaired before carrying out the calibration procedure except those DTCs indicating a need for calibration. The need to calibrate is also indicated by the stability/traction control indicator "sliding-car icon" flashing once every 2 seconds.

To carry out the calibration procedure, connect the scan tool, proceed to the IVD Initialization sequence and follow the scan tool instructions.

ABS Module Configuration

When a new ABS module is installed it must be configured. To configure the ABS module, refer to Programmable Module Installation (PMI) in Section 418-01 .

Inspection and Verification

NOTE: If a new ABS module is installed, it must be configured. Refer to Programmable Module Installation (PMI) in Section 418-01 .

1. Verify the customer concern.

2. Verify the stoplamps operate correctly by pressing and releasing the brake pedal with the ignition switch in the OFF position. If the stoplamps do not operate correctly, refer to Section 417-01 . If the stoplamps operate correctly, proceed to the next step.

3. Verify that the PRNDL operates correctly on the Instrument Cluster (IC). If the PRNDL does not operate correctly, refer to Section 307-01A . If the PRNDL operates correctly, proceed to the next step.

4. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Base brake system • Brake booster vacuum hose • Hydraulic Control Unit (HCU) • Steering components • Suspension components • Tire size • Wheel speed sensor ring	• ABS module • Battery Junction Box (BJB) fuse(s): ♦ 6 (40A) ♦ 33 (30A) • Brake booster release switch • Brake booster solenoid • Brake fluid level switch • Brake pressure transducer (integral to the ABS module) • Smart Junction Box (SJB) fuse(s): ♦ 18 (10A) ♦ 22 (15A) • Stability control sensor cluster • Stability/traction control switch • Steering wheel rotation sensor • Stoplamp switch • Wheel speed sensor • Wiring, terminals or connectors

5. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

6. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

7. **NOTE:** The Vehicle Communication Module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM .

If the scan tool does not communicate with the VCM :

- check the VCM connection to the vehicle.
- check the scan tool connection to the VCM .
- refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

8. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00 to diagnose no response from the PCM.

9. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record Continuous Memory Diagnostic Trouble Codes (CMDTCs).

10. Clear the continuous DTCs and carry out the self-test diagnostics for the ABS module.

11. If the DTCs retrieved are related to the concern, go to ABS Module DTC Chart. For all other DTCs, refer to the Master DTC Chart in Section 419-10 .

12. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

DTC Chart

ABS Module DTC Chart

NOTE: If DTC B2900, C1805 and U1900 are set at the same time, diagnose the concern for U1900 first.

DTC	Description	Source	Action
B1342	ECU is Faulted	ABS Module	**NOTE:** If other DTCs are present, REPAIR them before installing a new component. CLEAR the DTCs. CYCLE the ignition switch. RETRIEVE the DTCs. If DTC B1342 is retrieved, INSTALL a new module. REFER to Anti-Lock Brake System (ABS) Module in this section. REPEAT the self-test.

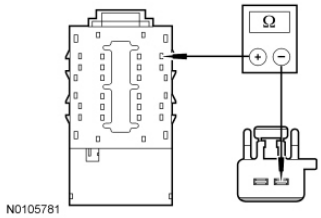
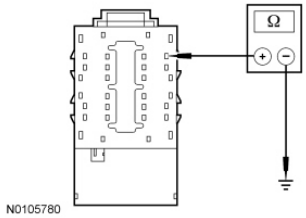
Refer to Wiring Diagrams Cell 42 , Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

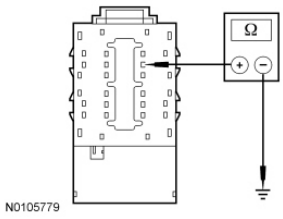
Fused battery voltage is supplied to the stoplamp switch from Smart Junction Box (SJB) fuse 22 (15A) along circuit SBP22 (BN/RD). When the brake pedal is pressed, the stoplamp switch supplies fused battery voltage to the ABS module, the PCM and the SJB along circuit CCB08 (VT/WH).

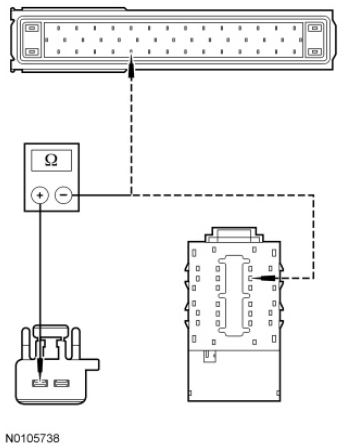
- DTC B1483 Brake Pedal Input Circuit Failure - The ABS module compares the stoplamp switch position to the booster pedal force switch and the brake pressure input. If the stoplamp switch position does not match the other 2 inputs, DTC B1483 will be set. Also, if the ABS module detects an open, a short to ground or a short to voltage on the brake pedal input circuit, DTC B1483 will be set.





This pinpoint test is intended to diagnose the following:





- Fuse
- Wiring, terminals or connectors
- Stoplamp switch
- ABS module

PINPOINT TEST A: DTC B1483

NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

Test Step	Result / Action to Take
A1 CHECK THE STOPLAMP OPERATION	
• Ignition OFF. • Observe the stoplamps while pressing and releasing the brake pedal. • **Do the stoplamps operate correctly?**	**Yes** GO to A2 . **No** REFER to Section 417-01 to diagnose the stoplamps. Clear the DTCs. REPEAT the self-test.
A2 CHECK THE ABS MODULE BRAKE ON/OFF (BOO_ABS) PID	
• Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger - ABS Module . • Monitor the BOO_ABS PID while pressing and releasing the brake pedal. • **Does the PID agree with the pedal position?**	**Yes** The system is operating correctly at this time. CLEAR the DTC. REPEAT the self-test. **No** GO to A3 .
A3 CHECK THE SJB BRAKE ON/OFF (GEM_BOO) PID	

• Enter the following diagnostic mode on the scan tool: DataLogger - SJB . • Monitor the GEM_BOO PID while pressing and releasing the brake pedal. • **Does the PID agree with the pedal position?**	**Yes** GO to A8 . **No** GO to A4 .
A4 CHECK THE STOPLAMP SWITCH	
NOTE: Stoplamp switch must be installed in the vehicle in order to obtain accurate test results. • Ignition OFF. • Remove the steering column opening trim panel. • Disconnect: Stoplamp Switch C278. • Measure the resistance between stoplamp switch C278 pin-1 and pin-4, component side, while pressing and releasing the brake pedal. • **Is the resistance less than 5 ohms with the pedal pressed and greater than 10,000 ohms with the pedal released?**	**Yes** GO to A5 . **No** INSTALL a new stoplamp switch. REFER to Stoplamp Switch in Section 417-01 . CLEAR the DTC. REPEAT the self-test.
A5 CHECK CIRCUIT SBP22 (BN/RD) FOR AN OPEN	
• Ignition OFF. • Disconnect: SJB C2280E. • Measure the resistance between SJB C2280E-28, circuit SBP22 (BN/RD), harness side and stoplamp switch C278-1, circuit SBP22 (BN/RD), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** GO to A6 . **No** VERIFY SJB fuse 22 (15A) is OK. If OK, REPAIR circuit SBP22 (BN/RD). If the fuse is not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short. CLEAR the DTC. REPEAT the self-test.
A6 CHECK CIRCUIT SBP22 (BN/RD) FOR A SHORT TO GROUND	
• Measure the resistance between SJB C2280E-28, circuit SBP22 (BN/RD), harness side and ground.  	**Yes** GO to A7 . **No** REPAIR circuit SBP22 (BN/RD). CLEAR the DTC. REPEAT the self-test.

• **Is the resistance greater than 10,000 ohms?**	
A7 CHECK CIRCUIT CCB08 (VT/WH) FOR A SHORT TO GROUND	
• Disconnect: ABS Module C155. • Disconnect: PCM C175B. • Measure the resistance between SJB C2280E-23, circuit CCB08 (VT/WH), harness side and ground.  • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to A8 . **No** REPAIR circuit CCB08 (VT/WH). CLEAR the DTC. REPEAT the self-test.
A8 CHECK CIRCUIT CCB08 (VT/WH) FOR AN OPEN	
• Ignition OFF. • Disconnect: SJB C2280E. • Disconnect: ABS Module C155. • Disconnect: Stoplamp Switch C278. • Measure the resistance between stoplamp switch C278-2, circuit CCB08 (VT/WH), harness side and: ♦ ABS module C155-6, circuit CCB08 (VT/WH), harness side. ♦ SJB C2280E-23, circuit CCB08 (VT/WH), harness side.  • **Are the resistances less than 5 ohms?**	**Yes** GO to A9 . **No** REPAIR circuit CCB08 (VT/WH). CLEAR the DTC. REPEAT the self-test.
A9 CHECK FOR CORRECT ABS MODULE OPERATION	

• Check ABS module C155 for: ♦ corrosion. ♦ pushed-out pins. ♦ spread terminals. • Connect: ABS Module C155. • Make sure the connector seats correctly, then operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test B: DTC B1676

Refer to Wiring Diagrams Cell 42 , Vehicle Dynamic Systems for schematic and connector information.

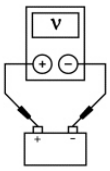
Normal Operation

The operating voltage required to operate the ABS module, hydraulic valves and pump motor is between 10 and 17 volts.

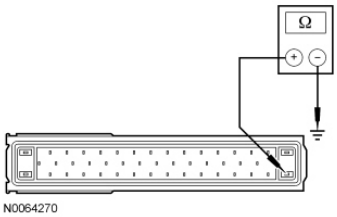
Fused battery voltage is supplied to the ABS module from Battery Junction Box (BJB) fuses 6 (40A) and 33 (30A) along circuits SBB06 (BN/RD) and SBB33 (RD) respectively. Fused ignition voltage is supplied to the ABS module from Smart Junction Box (SJB) fuse 18 (10A) along circuit CBP18 (GY/OG) and ground is provided along GD120 (BK/GN).

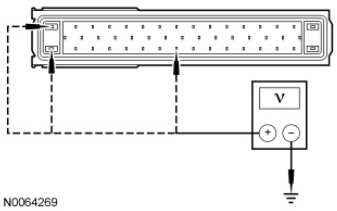
- DTC B1676 Battery Pack Voltage Out Of Range - If during normal operation battery voltage is less than 9.7 volts for more than 210 ms with vehicle speed greater than 20 km/h (12 mph) or if battery voltage is greater than 18 volts, DTC B1676 will be set. Also, if during the ABS module self-test battery voltage is greater than 18 volts, DTC B1676 will be set.

This pinpoint test is intended to diagnose the following:
- Fuse(s)
- Wiring, terminals or connectors
- Charging system
- ABS module



PINPOINT TEST B: DTC B1676





NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

NOTE: DTC B1317, B1318 or B1676 can be set if the vehicle has been recently jump started, the battery has been recently charged or the battery has been discharged. The battery may become discharged due to excessive load(s) on the charging system from aftermarket accessories or if the battery has been left unattended with the accessories on.

NOTE: Carry out a thorough inspection and verification before proceeding with the pinpoint test. Refer to Inspection and Verification in this section.

Test Step	Result / Action to Take

B1 RETRIEVE ALL CMDTCs IN ALL MODULES	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - All CMDTCs . • **Is B1317, B1318 or B1676 present in one or more modules AND P0563, P0620, P0625, P0626 or P065B present in the PCM?**	**Yes** REFER to Section 414-00 for diagnosis of the battery and charging system. **No** GO to B2 .
B2 CHECK BATTERY CONDITION	
• Ignition OFF. • Refer to Section 414-01 and carry out the Battery - Condition Test. • **Does the battery pass the condition test?**	**Yes** If the battery passed the condition test but required a recharge, REFER to Section 414-00 to diagnose the charging system. CLEAR all Continuous Memory Diagnostic Trouble Codes (CMDTCs). TEST the system for normal operation. If the battery passed the condition test and did not require a recharge, GO to B3 . **No** INSTALL a new battery. CLEAR all CMDTCs . TEST the system for normal operation.
B3 CHECK CHARGING SYSTEM VOLTAGE	
NOTE: Do not allow the engine speed to increase above 2,000 rpm while performing this step or the generator may self excite and result in default charging system output voltage. If engine speed goes above 2,000 rpm, shut the vehicle OFF and restart the engine before performing this step. • Start the engine. • Measure the voltage of the battery with and without a load on the charging system as follows: ♦ Turn off all accessories and run the engine at 1,500 rpm for a minimum of 2 minutes while measuring battery voltage. ♦ Turn on headlights and HVAC fan on high and run engine at 1,500 rpm for a minimum of 2 minutes while measuring battery voltage.  AJ0210-A	**Yes** GO to B4 . **No** REFER to Section 414-00 to diagnose the charging system. CLEAR all CMDTCs . TEST the system for normal operation.

• **Are the voltages between 13 and 15.2 volts?**	
B4 CHECK CIRCUIT GD120 (BK/GN) FOR AN OPEN	
• Ignition OFF. • Disconnect: ABS Module C155. • Measure the resistance between ABS module C155-16, circuit GD120 (BK/GN), harness side and ground. ♦ Repeat this measurement while wiggling the harness.  N0064270 • **Is the resistance less than 5 ohms?**	**Yes** GO to B5 . **No** REPAIR the circuit. CLEAR all CMDTCs . REPEAT the self-test.
B5 CHECK FOR VOLTAGE AT THE ABS MODULE	
• Ignition ON. • Measure the voltage between ground and: ♦ ABS module C155-1, circuit SBB06 (BN/RD), harness side. ♦ ABS module C155-8, circuit CBP18 (GY/OG), harness side. ♦ ABS module C155-32, circuit SBB33 (RD), harness side.  N0064269 • **Are the voltages greater than 10 volts?**	**Yes** GO to B6 . **No** VERIFY that BJB fuses 6 (40A) and 33 (30A) are OK, and SJB fuse SBP18 (10A) is OK. If OK, REPAIR the affected circuit(s). If the fuses are not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short. CLEAR the DTCs and REPEAT the self-test.
B6 CHECK FOR CORRECT ABS MODULE OPERATION	
• Ignition OFF. • Check the harness and component side connectors for: ♦ corrosion. ♦ pushed-out/bent pins. • Connect the ABS module and make sure the connector seats correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test C: DTC C1095

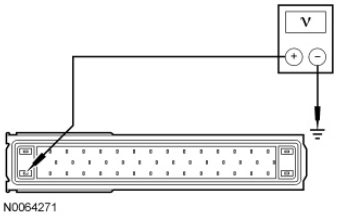
Refer to Wiring Diagrams Cell 42 , Vehicle Dynamic Systems for schematic and connector information.

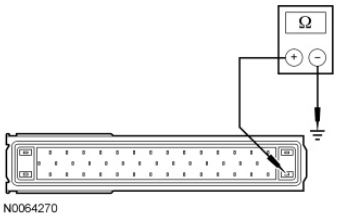
Normal Operation

The operating voltage required to operate the hydraulic pump motor is between 10 and 17 volts.

Fused battery voltage for the hydraulic pump motor is supplied to the ABS module from Battery Junction Box (BJB) fuse 6 (40A) along circuit SBB06 (BN/RD), ground is provided along GD120 (BK/GN).

- DTC C1095 ABS Hydraulic Pump Motor Circuit Failure - If a short to voltage or ground is detected, if a locked up pump motor is detected or if there is an internal failure of the ABS module, DTC C1095 will be set.





This pinpoint test is intended to diagnose the following:

- Fuse(s)
- Wiring, terminals or connectors
- Hydraulic Control Unit (HCU)
- ABS module

PINPOINT TEST C: DTC C1095

NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

Test Step	Result / Action to Take
C1 CHECK THE ABS PUMP MOTOR	
• Ignition ON. • **Is the ABS pump motor running all the time?**	**Yes** GO to C5 . **No** GO to C2 .
C2 CHECK THE ABS MODULE PUMP MOTOR (PMP_MOTOR) ACTIVE COMMAND	
• Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger - ABS Module . • Toggle the PMP_MOTOR active command ON. • **Does the ABS pump motor run for approximately 2 seconds?**	**Yes** TOGGLE the PMP_MOTOR active command OFF. CLEAR the DTCs. CHECK the yellow ABS warning indicator while driving the vehicle (brakes must not be applied) at greater than 40 km/h (25 mph). If the yellow ABS warning indicator illuminates, RETRIEVE the DTCs. If DTC C1095 is retrieved, GO to C5 . **No** TOGGLE the PMP_MOTOR output command OFF. GO to C3 .
C3 CHECK THE PUMP MOTOR VOLTAGE SUPPLY TO THE ABS MODULE	

• Ignition OFF. • Disconnect: ABS Module C155. • Measure the voltage between ABS module C155-1, circuit SBB06 (BN/RD), harness side and ground.  • **Is the voltage greater than 10 volts?**	**Yes** GO to C4 . **No** VERIFY that BJB fuse 6 (40A) is OK. If OK, REPAIR circuit SBB06 (BN/RD). If the fuse is not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the self-test.
C4 CHECK CIRCUIT GD120 (BK/GN) FOR AN OPEN	
• Measure the resistance between ABS module C155-16, circuit GD120 (BK/GN), harness side and ground.  • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new HCU . REFER to Hydraulic Control Unit (HCU) in this section. CLEAR the DTCs. REPEAT the self-test. **No** REPAIR circuit GD120 (BK/GN). CLEAR the DTCs. REPEAT the self-test.
C5 CHECK FOR CORRECT ABS MODULE OPERATION	
• Ignition OFF. • Disconnect: ABS Module C155. • Check the connector for: ♦ corrosion. ♦ pushed-out pins. ♦ spread terminals. • Connect: ABS Module C155. • Make sure the connector seats correctly, then operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test D: DTC C1145, C1155, C1165 or C1175

Refer to Wiring Diagrams Cell 42 , Vehicle Dynamic Systems for schematic and connector information.

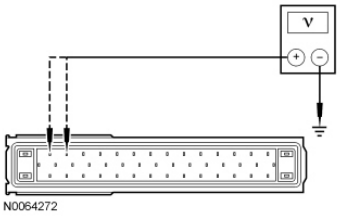
Normal Operation

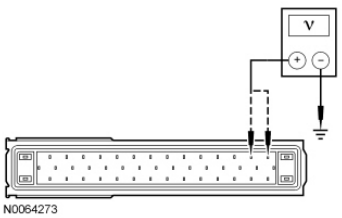
The active wheel speed sensor generates a signal that is sent to the ABS module. The wheel speed sensor circuitry connects to the ABS module connector C155 through 2 wires and a connector at each wheel speed sensor. When the ignition switch is turned to the RUN position, the ABS module carries out a self-test by sending a reference voltage through the right front wheel speed sensor and its circuitry to determine if they are functional.

Voltage is supplied to the active wheel speed sensors from the ABS module. The wheel speed sensor ground is supplied by the ABS module.

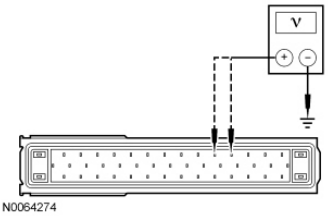
DTC Description	Fault Trigger Condition
• DTC C1145 RF Wheel Speed Sensor Input Circuit Failure • DTC C1155 LF Wheel Speed Sensor Input Circuit Failure • DTC C1165 RR Wheel Speed Sensor Input Circuit Failure • DTC C1175 LR Wheel Speed Sensor Input Circuit Failure	If during the ABS module on-demand self test or during normal operation, if the ABS module detects an open, short to ground or voltage or a defective wheel speed sensor input circuit, the appropriate DTC will be set. These DTCs are usually set by a damaged sensor or a circuit fault.

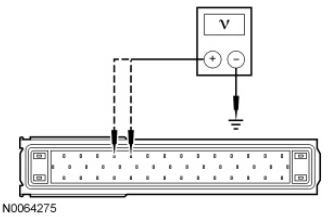
This pinpoint test is intended to diagnose the following:

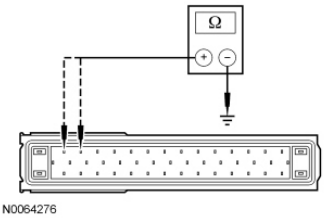




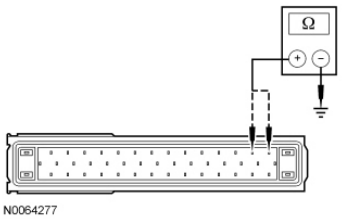
- Wiring, terminals or connectors
- Wheel speed sensor
- ABS module

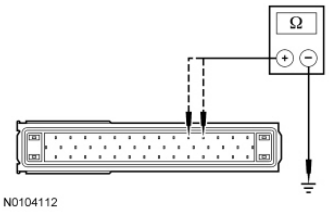


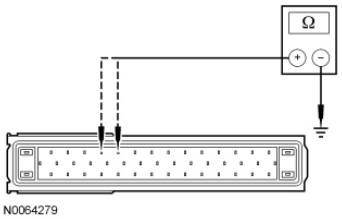




PINPOINT TEST D: DTC C1145, C1155, C1165 OR C1175







NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

Test Step	Result / Action to Take
D1 CHECK FOR FAULT REPEATABILITY	
NOTE: Both circuits must be checked for each DTC. • Connect the scan tool.	**Yes** If the active wheel speed sensor tool is not available, GO to D4 . If the active wheel speed sensor tool is available, GO to

• Enter the following diagnostic mode on the scan tool: Clear All CMDTCs . • Drive the vehicle at least 16 km/h (10 mph). • Retrieve and record continuous DTCs. • **Is DTC C1145, C1155, C1165 or C1175 retrieved?**	D2 . **No** INSPECT the wheel speed sensors, wheel speed sensor wiring and wheel speed sensor tone rings. REPAIR or INSTALL new as necessary. If any other DTCs are retrieved, GO to the ABS Module DTC Chart.
D2 CHECK THE ABS MODULE OUTPUT USING THE ACTIVE WHEEL SPEED SENSOR TESTER	
• Ignition OFF. • Disconnect: Suspect Wheel Speed Sensor. • Connect the active wheel speed sensor tester to the wheel speed sensor connectors. • Ignition ON. • Select the correct system polarity on the active wheel speed sensor tester and turn the power switch to the ON position. • **Is the module output LED illuminated?**	**Yes** GO to D3 . **No** GO to D6 .
D3 CHECK THE WHEEL SPEED SENSOR OUTPUT WITH THE ACTIVE WHEEL SPEED SENSOR TESTER	
• Raise the suspect wheel until it can spin freely. Refer to Section 100-02 . • While monitoring the active wheel speed sensor tester, slowly spin the suspect wheel. • **Do the sensor output LEDs illuminate and flash and is the current overload LED not illuminated?**	**Yes** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. **No** If the current level LED is not illuminated and the sensor output LEDs do not illuminate or if the current level LED is illuminated red, INSTALL a new wheel speed sensor. For the front wheel speed sensor, REFER to Wheel Speed Sensor - Front in this section. For the rear wheel speed sensor, REFER to Wheel Speed Sensor - Rear in this section. CLEAR the DTCs. REPEAT the self-test. If the current level LED is not illuminated and the sensor output LEDs illuminate green but do not flash, INSPECT the wheel speed sensor tone ring and INSTALL new if necessary. The front wheel speed sensor tone rings are integral to the front bearing and wheel hub assemblies. REFER to Section 204-01A or Section 204-01B . For the rear wheel speed sensor ring, REFER to Wheel Speed Sensor Ring - Rear in this section. If the tone ring is OK, INSTALL a new wheel speed

	sensor. For the front wheel speed sensor, REFER to Wheel Speed Sensor - Front in this section. For the rear wheel speed sensor, REFER to Wheel Speed Sensor - Rear in this section. CLEAR the DTCs. TEST the system for normal operation.
D4 CHECK THE WHEEL SPEED CIRCUITS FOR A SHORT TO VOLTAGE	
NOTICE: **No measurements should be taken with the wheel speed sensor connected. Damage to the wheel speed sensor will result.** **NOTE:** Both circuits must be checked for each DTC. • Ignition OFF. • Disconnect: ABS Module C155. • Disconnect: Suspect Wheel Speed Sensor. • Ignition ON. • **For DTC C1145** , measure the voltage between ground and: ♦ ABS module C155-34, circuit VCA05 (GY/VT), harness side. ♦ ABS module C155-33, circuit RCA19 (VT), harness side.  N0064272 • **For DTC C1155** , measure the voltage between ground and: ♦ ABS module C155-45, circuit VCA03 (VT/WH), harness side. ♦ ABS module C155-46, circuit RCA17 (YE), harness side.  N0064273 • **For DTC C1165** , measure the voltage between ground and:	**Yes** REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test. **No** GO to D5 .

♦ ABS module C155-43, circuit VCA06 (WH/OG), harness side. ♦ ABS module C155-42, circuit RCA20 (BN), harness side.  N0064274 • **For DTC C1175** , measure the voltage between ground and: ♦ ABS module C155-36, circuit VCA04 (BU/OG), harness side. ♦ ABS module C155-37, circuit RCA18 (BN/GN), harness side.  N0064275 • **Is any voltage present?**	
D5 CHECK THE WHEEL SPEED CIRCUITS FOR A SHORT TO GROUND	
NOTE: Both circuits must be checked for each DTC. • Ignition OFF. • **For DTC C1145** , measure the resistance between ground and: ♦ ABS module C155-34, circuit VCA05 (GY/VT), harness side. ♦ ABS module C155-33, circuit RCA19 (VT), harness side.  N0064276	**Yes** GO to D6 . **No** REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.

• **For DTC C1155** , measure the resistance between ground and: ♦ ABS module C155-45, circuit VCA03 (VT/WH), harness side. ♦ ABS module C155-46, circuit RCA17 (YE), harness side.  N0064277 • **For DTC C1165** , measure the resistance between ground and: ♦ ABS module C155-43, circuit VCA06 (WH/OG), harness side. ♦ ABS module C155-42, circuit RCA20 (BN), harness side.  N0104112 • **For DTC C1175** , measure the resistance between ground and: ♦ ABS module C155-36, circuit VCA04 (BU/OG), harness side. ♦ ABS module C155-37, circuit RCA18 (BN/GN), harness side.  N0064279 • **Are the resistances greater than 10,000 ohms?**	
D6 CHECK THE WHEEL SPEED CIRCUITS FOR AN OPEN	

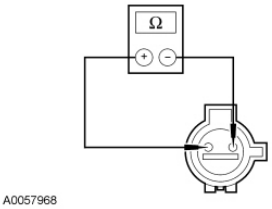
NOTE: Both circuits must be checked for each DTC.

- Ignition OFF.
- Disconnect: ABS Module C155.
- Disconnect: Suspect Wheel Speed Sensor.
- Measure the resistance between the ABS module connector, harness side and the suspect wheel speed sensor connector, harness side as indicated in the following chart:

ABS Module	Circuit	Wheel Speed Sensor
DTC C1145		
C155-34	VCA05 (GY/VT)	C160-2
C155-33	RCA19 (VT)	C160-1
DTC C1155		
C155-45	VCA03 (VT/WH)	C150-2
C155-46	RCA17 (YE)	C150-1
DTC C1165		
C155-43	VCA06 (WH/OG)	C426-2
C155-42	RCA20 (BN)	C426-1
DTC C1175		
C155-36	VCA04 (BU/OG)	C440-2
C155-37	RCA18 (BN/GN)	C440-1

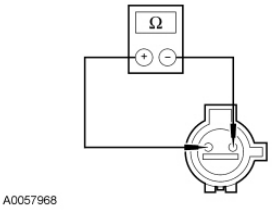
- **Are the resistances less than 5 ohms?**

Yes
GO to D7 .



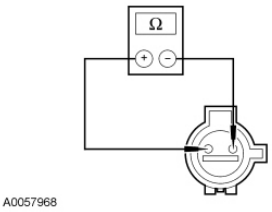
No
REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.

D7 CHECK FOR SHORTED WHEEL SPEED SENSOR CIRCUITS

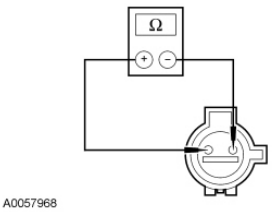


- **For DTC C1145** , measure the resistance between RF wheel speed sensor C160-1, circuit RCA19 (VT), harness side and RF wheel speed sensor C160-2, circuit VCA05 (GY/VT), harness side.

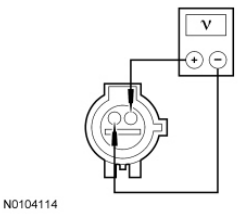
Yes
GO to D8 .



No
REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.



- **For DTC C1155** , measure the resistance between LF wheel speed sensor C150-1, circuit RCA17 (YE), harness side and LF wheel speed sensor C150-2, circuit VCA03 (VT/WH), harness side.



- **For DTC C1165** , measure the resistance between RR wheel speed sensor C426-1, circuit RCA20 (BN), harness side and RR wheel speed sensor C426-2, circuit VCA06 (WH/OG), harness side.

- **For DTC C1175** , measure the resistance between LR wheel speed sensor C440-1, circuit RCA18 (BN/GN), harness side and LR wheel speed sensor C440-2, circuit VCA04 (BU/OG), harness side.

• **Are the resistances greater than 10,000 ohms?**	
D8 CHECK THE ABS MODULE OUTPUT	
• Connect: ABS Module C155. • Ignition ON. • **For DTC C1145** , measure the voltage between RF wheel speed sensor C160-1, circuit RCA19 (VT), harness side and RF wheel speed sensor C160-2, circuit VCA05 (GY/VT), harness side. • **For DTC C1155** , measure the voltage between LF wheel speed sensor C150-1, circuit RCA17 (YE), harness side and LF wheel speed sensor C150-2, circuit VCA03 (VT/WH), harness side. • **For DTC C1165** , measure the voltage between RR wheel speed sensor C426-1, circuit RCA20 (BN), harness side and RR wheel speed sensor C426-2, circuit VCA06 (WH/OG), harness side. • **For DTC C1175** , measure the voltage between LR wheel speed sensor C440-1, circuit RCA18 (BN/GN), harness side and LR wheel speed sensor C440-2, circuit VCA04 (BU/OG), harness side.  N0104114 • **Are the voltages greater than 10 volts?**	**Yes** INSTALL a new wheel speed sensor. REFER to Wheel Speed Sensor - Front or Wheel Speed Sensor - Rear in this section. CLEAR the DTCs. REPEAT the self-test. **No** GO to D9 .
D9 CHECK FOR CORRECT ABS MODULE OPERATION	
• Ignition OFF. • Disconnect: ABS Module C155. • Check the connector for: ♦ corrosion. ♦ pushed-out pins. ♦ spread terminals. • Connect: ABS Module C155.	**Yes** INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

• Make sure the connector seats correctly, then operate the system and verify the concern is still present. • **Is the concern still present?**	

Pinpoint Test E: DTC C1233, C1234, C1235 or C1236

Refer to Wiring Diagrams Cell 42 , Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

The wheel speed sensor and sensor ring generate a signal to the ABS module that is proportional to the wheel speed. The ABS module compares the wheel speed inputs from all wheel speed sensors to determine an impending wheel lockup.

DTC Description	Fault Trigger Condition
• DTC C1233 LF Wheel Speed Sensor Input Signal Missing • DTC C1234 RF Wheel Speed Sensor Input Signal Missing • DTC C1235 RR Wheel Speed Sensor Input Signal Missing • DTC C1236 LR Wheel Speed Sensor Input Signal Missing	If the ABS module does not receive a signal from a wheel speed sensor when the vehicle speed is greater than 15 km/h (9 mph), the appropriate DTC will be set. If the difference of 2 wheel speed values is greater than 25 km/h (16 mph), the appropriate DTC will be set. These DTCs are usually set by a damaged wheel speed sensor or damaged sensor tone ring, they can also be set by wheels and/or tires of different sizes being installed on the vehicle.

This pinpoint test is intended to diagnose the following:

- Mismatched tire sizes
- Wheel speed sensor ring
- Wheel speed sensor
- ABS module

PINPOINT TEST E: DTC C1233, C1234, C1235 OR C1236

NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

Test Step	Result / Action to Take

E1 CHECK THE DTCs FROM THE SELF-TEST	
• Check the DTCs retrieved and recorded during Inspection and Verification. • **Is DTC C1145, C1155, C1165 or C1175 present?**	**Yes** GO to Pinpoint Test D . **No** GO to E2 .
E2 MONITOR THE WHEEL SPEED SENSOR PIDs	
• Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger - ABS Module . • Drive the vehicle at a speed greater than 20 km/h (12 mph) while monitoring the following PIDs: ♦ Left Front Wheel Speed Sensor (LF_WSPD) ♦ Right Front Wheel Speed Sensor (RF_WSPD) ♦ Left Rear Wheel Speed Sensor (LR_WSPD) ♦ Right Rear Wheel Speed Sensor (RR_WSPD) • **Are the wheel speed PIDs consistent with each other and the vehicle speed as indicated on the speedometer?**	**Yes** If the active wheel speed sensor tester is available, GO to E4 . If the active wheel speed sensor tester is not available, GO to E5 . **No** GO to E3 .
E3 CHECK FOR RETURNING ABS MODULE DTCs	
• Enter the following diagnostic mode on the scan tool: Clear All CMDTCs . • Drive the vehicle in a straight line at a speed greater than 40 km/h (25 mph) for at least 60 seconds. • Enter the following diagnostic mode on the scan tool: Self Test - ABS Module . • **Is DTC C1233, C1234, C1235 or C1236 present?**	**Yes** If the active wheel speed sensor tester is available, GO to E4 . If the active wheel speed sensor tester is not available, GO to E5 . **No** GO to E5 .

E4 CHECK THE WHEEL SPEED SENSOR OUTPUT WITH THE ACTIVE WHEEL SPEED SENSOR TESTER	
• Ignition OFF. • Disconnect: Suspect Wheel Speed Sensor. • Connect the Active Wheel Speed Sensor Tester to the wheel speed sensor connectors. • Ignition ON. • Select the correct system polarity on the Active Wheel Speed Sensor Tester and turn the power switch to the ON position. • Raise the suspect wheel until it can spin freely. Refer to Section 100-02 . • While monitoring the active wheel speed sensor tester, slowly spin the suspect wheel. • **Do the sensor output LEDs illuminate and flash and is the current overload LED not illuminated?**	**Yes** INSPECT the wheel speed sensor tone ring for damage and looseness. INSTALL new components as necessary. If the tone ring is OK, the concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. **No** If the current level LED is not illuminated and the sensor output LEDs do not illuminate or if the current level LED is illuminated red, INSTALL a new wheel speed sensor. For the front wheel speed sensor, REFER to Wheel Speed Sensor - Front in this section. For the rear wheel speed sensor, REFER to Wheel Speed Sensor - Rear in this section. CLEAR the DTCs. REPEAT the self-test. If the current level LED is not illuminated and the sensor output LEDs illuminate green but do not flash, INSPECT the wheel speed sensor tone ring and INSTALL new if necessary. The front wheel speed sensor tone rings are integral to the front bearing and wheel hub assemblies. REFER to Section 204-01A or Section 204-01B . For the rear wheel speed sensor ring, REFER to Wheel Speed Sensor Ring - Rear in this section. If the tone ring is OK, INSTALL a new wheel speed sensor. For the front wheel speed sensor, REFER to Wheel Speed Sensor - Front in this section. For the rear wheel speed sensor, REFER to Wheel Speed Sensor - Rear in this section. CLEAR the DTCs. TEST the system for normal operation.
E5 CHECK FOR CORRECT TIRE SIZE AND AIR PRESSURE	
• Verify that the tires are the correct size for the vehicle as indicated on the Vehicle Certification (VC) label. • Verify that the air pressure in all the tires is correct as indicated on the VC label. • **Are the tires OK?**	**Yes** GO to E6 . **No** INSTALL the correct tires or ADJUST tire pressure as necessary. CLEAR the DTCs. TEST the system for normal operation.
E6 INSPECT THE WHEEL SPEED SENSOR MOUNTING	
• Ignition OFF. • With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 . • Inspect the suspect wheel speed sensor for looseness.	**Yes** GO to E7 . **No** TIGHTEN the wheel speed sensor to specification. CLEAR the DTCs. TEST the system for normal operation.

• **Is the wheel speed sensor OK?**	
E7 INSPECT THE WHEEL SPEED SENSOR FOR DAMAGE	
• **NOTE:** Examine the wheel speed sensor wire carefully with a good light source. Failure to verify damage in the wheel speed sensor wire can lead to unnecessary installation of a new component. • Inspect the suspect wheel speed sensor for damage or contamination. • **Is the wheel speed sensor OK?**	**Yes** GO to E8 . **No** CLEAN the wheel speed sensor or INSTALL a new wheel speed sensor as necessary. REFER to Wheel Speed Sensor - Front or Wheel Speed Sensor - Rear in this section. CLEAR the DTCs. TEST the system for normal operation.
E8 INSPECT THE WHEEL SPEED SENSOR RING FOR DAMAGE	
• Inspect the suspect wheel speed sensor ring for damaged or missing teeth. Rotate the wheel to verify that no teeth are missing. • **Is the wheel speed sensor ring OK?**	**Yes** GO to E9 . **No** INSTALL a new wheel bearing and wheel hub (front sensor ring) or rear wheel speed sensor ring. REFER to Section 204-01A or Section 204-01B for the front sensor rings. For the rear wheel speed sensor ring, REFER to Wheel Speed Sensor Ring - Rear in this section. CLEAR the DTCs. TEST the system for normal operation.
E9 INSPECT THE WHEEL BEARING FOR DAMAGE	
• Inspect the wheel bearings for damage. Refer to Section 100-04 . • **Are the wheel bearings OK?**	**Yes** GO to E10 . **No** INSTALL a new wheel bearing and wheel hub as necessary. REFER to Section 204-01A or Section 204-01B . CLEAR the DTCs. TEST the system for normal operation.
E10 CHECK FOR CORRECT ABS MODULE OPERATION	
• Ignition OFF. • Disconnect: ABS Module C155. • Check the connector for: ♦ corrosion. ♦ pushed-out pins. ♦ spread terminals. • Connect: ABS Module C155.	**Yes** INSPECT the wheel speed sensor tone ring for damage and looseness. INSTALL new components as necessary. If the tone ring is OK, INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the

• Make sure the connector seats correctly, then operate the system and verify the concern is still present. • **Is the concern still present?**	DTCs. TEST the system for normal operation.

Pinpoint Test F: DTCs C1277, C1278 and C1963

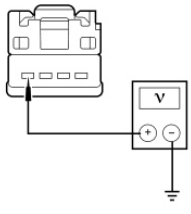
Refer to Wiring Diagrams Cell 42 , Vehicle Dynamic Systems for schematic and connector information.

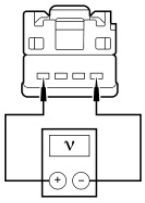
Normal Operation

The steering wheel rotation (in degrees) is sent to the ABS module along circuits VSC06 (GY/BN) and VSC07 (VT/OG). Voltage is supplied to the steering wheel angle sensor from the ABS module along circuit CCS01 (VT/WH) and ground is provided by the ABS module through circuit RSC02 (BU/WH).

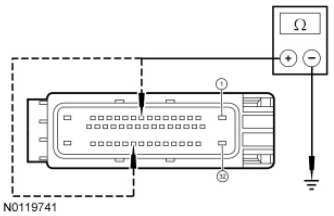
The steering wheel rotation sensor monitors the steering wheel position when the slotted wheel in the clockspring assembly rotates through the infrared light generated by the sensor.

- DTC C1277 Steering Wheel Angle 1 and 2 Circuit Failure - If during normal operation or the ABS module on-demand self test, the ABS module detects an open circuit, short to voltage or short to ground along circuits VCS06 (GY/BN) or VCS07 (VT/OG), DTC C1277 will be set. An internal failure of the steering wheel rotation sensor may also cause DTC C1277 to set.
- DTC C1278 Steering Wheel Angle 1 and 2 Signal Faulted - If during normal operation or the ABS module on-demand self test, the ABS module does not receive the steering wheel rotation sensor input or if the input received does not agree with the input from other sensors, DTC C1278 will be set.
- DTC C1963 Stability Assist Inhibit Warning - If conditions exist during normal operation that prevents the roll stability control system from operating, DTC C1963 will be set. This DTC is usually set due to the steering wheel rotation sensor or the stability control sensor cluster being damaged or installed incorrectly.





This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- Steering wheel rotation sensor



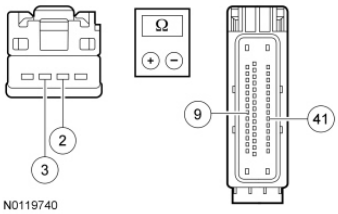
PINPOINT TEST F: DTCs C1277, C1278 AND C1963

NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

Test Step	Result / Action to Take
F1 MONITOR THE STEERING ROTATION SENSOR POSITION (SWA POS) PID	
• Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger - ABS Module. • Monitor the SWA POS PID while rotating the steering wheel clockwise and counterclockwise very slowly, from lock to lock.	**Yes** GO to F2 . **No** GO to F3 .

• **Does the PID move in intervals of 1.5 degrees?**	
F2 CHECK RETURNING DTCs	
• Using the scan tool, clear all ABS DTCs. • DRIVE the vehicle above 48 km/h (30 mph) with input from the steering wheel rotation sensor. • Enter the following diagnostic mode on the scan tool: Self Test - ABS module. • **Are any ABS DTCs present?**	**Yes** For DTC C1277 or C1278: GO to F17 . For DTC C1963: DIAGNOSE all other ABS DTCs before proceeding. If DTC C1963 is the only ABS DTC present, GO to F19 . **No** The system is operating correctly at this time.
F3 CHECK THE INSTALLATION AND CONDITION OF THE STEERING WHEEL ROTATION SENSOR	
• Ignition OFF. • Disconnect: Steering Wheel Rotation Sensor C226. • Inspect the steering wheel rotation sensor, for damage and correct installation. • Inspect the tone ring, for correct installation, damage and blocked or contaminated window openings. • Inspect the steering wheel rotation sensor electrical connector C226 for damage, contamination or pushed out pins. • **Is the steering wheel rotation sensor and electrical connector C226 correctly installed and free from damage, contamination and blockages?**	**Yes** GO to F5 . **No** For a steering wheel rotation sensor or tone ring concern REINSTALL or INSTALL a new steering wheel rotation sensor or tone ring as necessary. GO to F4 . For an electrical connector concern. REPAIR the electrical connector as necessary. TEST the system for normal operation.
F4 MONITOR THE STEERING ROTATION SENSOR POSITION (SWA POS) PID	
• Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger - ABS Module. • Monitor the SWA POS PID while rotating the steering wheel clockwise and counterclockwise very slowly, from lock to lock. • **Does the PID move in intervals of 1.5 degrees?**	**Yes** CLEAR the DTCs. DRIVE the vehicle above 48 km/h (30 mph) with input from the steering wheel rotation sensor. RETRIEVE the DTCs. If DTC C1277 or C1278 is still present, GO to F17 . If DTC C1963 is present, GO to F19 . **No** GO to F5 .
F5 CHECK THE VOLTAGE TO THE STEERING WHEEL ROTATION SENSOR	
• Ignition ON. • Measure the voltage between steering wheel rotation sensor C226-4, circuit CCS01 (VT/WH), harness side and ground.	**Yes** GO to F6 . **No** GO to F15 .

 N0043015 • **Is the voltage greater than 9.5 volts?**	
F6 CHECK THE STEERING WHEEL ROTATION SENSOR CIRCUIT VOLTAGE	
• Measure the voltage between steering wheel rotation sensor C226-4, circuit CCS01 (VT/WH), harness side and steering wheel rotation sensor C226-1, circuit RSC02 (BU/WH) harness side.  N0043016 • **Is the voltage greater than 9.5 volts?**	**Yes** GO to F7 . **No** GO to F12 .
F7 ELECTRICAL CONNECTOR CHECK	
• Disconnect: ABS Module C155. • Check the electrical connector for: ♦ corrosion. ♦ pushed-out pins. ♦ spread terminals. • **Is the connector free from damage, corrosion and pushed out pins?**	**Yes** GO to F8 . **No** REPAIR the electrical connector as necessary. TEST the system for normal operation.
F8 CHECK THE STEERING POSITION SENSOR CIRCUITS FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: ABS ModuleC155. • Measure the resistance between ground and: ♦ ABS module C155-40, circuit VSC06 (GY/BN), harness side. ♦ ABS module C155-41, circuit VSC06 (GY/BN), harness side. ♦ ABS module C155-9, circuit VSC07 (VT/OG), harness side.	**Yes** GO to F9 . **No** REPAIR the affected circuit(s). CLEAR the DTCs. RECALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. REPEAT the self-test.

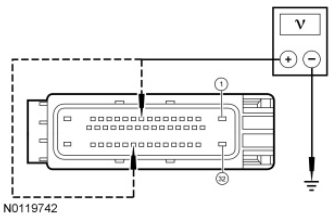


- **Are the resistances greater than 10,000 ohms?**

F9 CHECK THE STEERING POSITION SENSOR HARNESS FOR AN OPEN

- Measure the resistance between the ABS module connector, harness side and the steering wheel rotation sensor connector, harness side as indicated in the following chart:

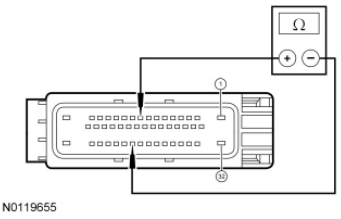
ABS Module	Circuit	Steering Wheel Rotation Sensor
C155-9	VCS07 (VT/OG)	C226-3
C155-41	VCS06 (GY/BN)	C226-2

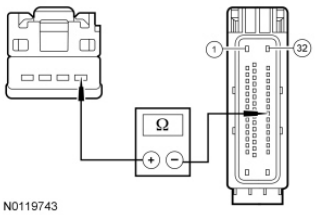


- **Are the resistances less than 5 ohms?**

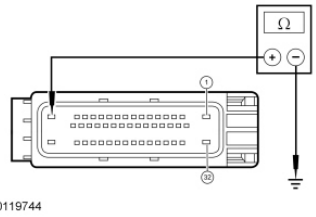
Yes
GO to F10 .

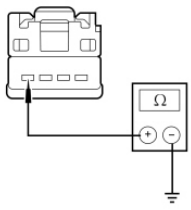
No
REPAIR the affected circuit(s). CLEAR the DTCs. RECALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. REPEAT the self-test.

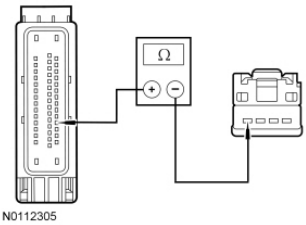




F10 CHECK THE STEERING POSITION SENSOR CIRCUITS FOR A SHORT TO VOLTAGE







- Ignition ON.
- Measure the voltage between ground and:
  - ABS module C155-41, circuit VSC06 (GY/BN), harness side.
  - ABS module C155-9, circuit VSC07 (VT/OG), harness side.

Yes
REPAIR the affected circuit(s). CLEAR the DTCs. RECALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. REPEAT the self-test.

No
GO to F11 .

• **Is any voltage present?**	
F11 CHECK THE STEERING POSITION SENSOR CIRCUITS FOR A SHORT TOGETHER	
• Ignition OFF. • Measure the resistance between ABS C155-41, circuit VSC06 (GY/BN), harness side and ABS C155-9, circuit VSC07 (VT/OG) harness side.  N0119655 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to F18 . **No** REPAIR the affected circuit(s). CLEAR the DTCs. RECALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. REPEAT the self-test.
F12 ELECTRICAL CONNECTOR CHECK	
• Disconnect: ABS Module C155. • Check the electrical connector for: ♦ corrosion. ♦ pushed-out pins. ♦ spread terminals. • **Is the connector free from damage, corrosion and pushed out pins?**	**Yes** GO to F13 **No** REPAIR the electrical connector as necessary. TEST the system for normal operation.
F13 CHECK THE STEERING WHEEL ROTATION SENSOR GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: ABS Module C155. • Measure the resistance between the steering wheel rotation sensor C226-1, circuit RCS02 (BL/WH) and ABS C155-40, circuit RCS02 (BL/WH).  N0119743 • **Is the resistance less than 5 ohms?**	**Yes** GO to F14 . **No** REPAIR the circuit RCS02 (BU/WH). CLEAR the DTCs. RECALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. REPEAT the self-test.
F14 CHECK THE ABS MODULE GROUND CIRCUIT FOR AN OPEN	

• Measure the resistance between ABS C155-16, circuit GD 120 (BK/GN) and ground.  N0119744 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. TEST the system for normal operation. **No** REPAIR the circuit GD120 (BK/GN). CLEAR the DTCs. RECALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. REPEAT the self-test.
F15 CHECK THE STEERING WHEEL ROTATION SENSOR SUPPLY CIRCUIT FOR SHORT TO GROUND	
• Ignition OFF. • Disconnect: ABS Module C155. • Measure the resistance between steering wheel rotation sensor C226-4, circuit CCS01 (VT/WH), harness side and ground.  N0118679 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to F16 . **No** REPAIR the circuit CCS01 (VT/WH). CLEAR the DTCs. RECALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. REPEAT the self-test.
F16 CHECK THE STEERING WHEEL ROTATION SENSOR SUPPLY CIRCUIT FOR AN OPEN	
• Measure the resistance between steering wheel rotation sensor C226-4, circuit CCS01 (VT/WH), harness side and C155-5 circuit CCS01 (VT/WH), harness side.  N0112305 • **Is the resistance less than 5 ohms?**	**Yes** GO to F18 . **No** REPAIR the affected circuit(s). CLEAR the DTCs. RECALIBRATE the ABS module. FOLLOW the scan tool directions for the calibration procedure. REPEAT the self-test.
F17 ELECTRICAL CONNECTOR CHECK	
• Disconnect: ABS Module C155. • Disconnect: Steering wheel rotation sensor C226. • Check the electrical connectors for:	**Yes** GO to F18 . **No**

♦ corrosion. ♦ pushed-out pins. ♦ spread terminals. • **Is the connector free from damage, corrosion and pushed out pins?**	REPAIR the electrical connector as necessary. TEST the system for normal operation.
F18 CHECK RETURNING DTCs	
• Connect: Steering wheel rotation sensor C226. • Connect: ABS ModuleC155. • Connect the scan tool. • Ignition ON. • Using the scan tool, clear all ABS DTCs. • DRIVE the vehicle above 48 km/h (30 mph) with input from the steering wheel rotation sensor. • Enter the following diagnostic mode on the scan tool: Self Test - ABS module. • **Are DTCs C1277 or C1278 present?**	**Yes** INSTALL a new steering wheel rotation sensor and TEST the system for normal operation. If the concern is still present INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. **No** The system is operating correctly at this time.
F19 CHECK THE STEERING WHEEL ROTATION SENSOR CONDITION AND INSTALLATION	
• Inspect the steering wheel rotation sensor, for damage and correct installation. Inspect the tone ring, for correct installation, damage and blocked or contaminated window openings. • **Is the steering wheel rotation sensor and tone ring correctly installed and free from damage or contamination?**	**Yes** GO to F20 . **No** REINSTALL or INSTALL new steering wheel rotation sensor or tone ring as necessary. TEST for normal operation.
F20 CHECK THE SENSOR CLUSTER CONDITION AND INSTALLATION	
• Inspect the stability control sensor cluster for damage and correct installation. Refer to Stability Control Sensor Cluster in this section. • **Is the stability control sensor cluster installed correctly and undamaged?**	**Yes** DIAGNOSE the stability control sensor cluster GO to Pinpoint Test G . **No** REINSTALL or INSTALL new as necessary, TEST for normal operation.

Pinpoint Test G: DTCs B2741, C2777, C2778 and U1901

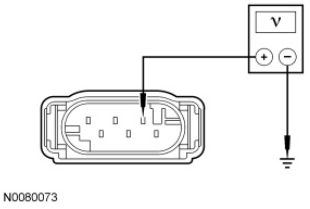
Refer to Wiring Diagrams Cell 42 , Vehicle Dynamic Systems for schematic and connector information.

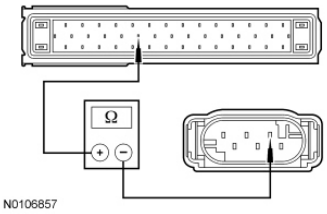
Normal Operation

The yaw rate sensor, roll rate sensor, lateral accelerometer and longitudinal accelerometer are contained in one module called the stability control sensor cluster. The sensor cluster measures the vehicle acceleration, roll rate and yaw rate, then sends the signal along a dedicated Controller Area Network (CAN) bus to the ABS module.

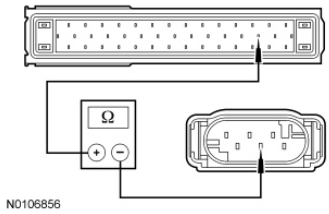
Voltage is supplied from the ABS module to the sensor cluster along circuit CCA09 (VT/BN) and ground is provided through the ABS module along circuit RCA09 (GN/VT). Circuits VCA23 (BU/WH) and VCA24 (GN/OG) make up the dedicated CAN bus between the ABS module and the sensor cluster.

DTC Description	Fault Trigger Conditions
• DTC B2741 Sensor Cluster is Defective	This DTC will be set if supply voltage to the sensor cluster is less than 7.5 volts or greater than 17 volts due to a circuit fault on circuit CCA09 (VT/BN) or RCA09 (GN/VT). A defective sensor cluster will also set this DTC.
• DTC C2777 Sensor Cluster Bus Failure • DTC U1901 CAN Network #2 Communication Bus Fault • DTC C2778 Sensor Cluster Power Supply Failure	If during normal operation with vehicle speed greater than 20 km/h (12 mph), the voltage sent to the sensor cluster exceeds 17 volts or drops below 7.5 volts, this DTC will be set. This DTC can also be set if the dedicated CAN circuits are open, shorted to ground or shorted to each other.



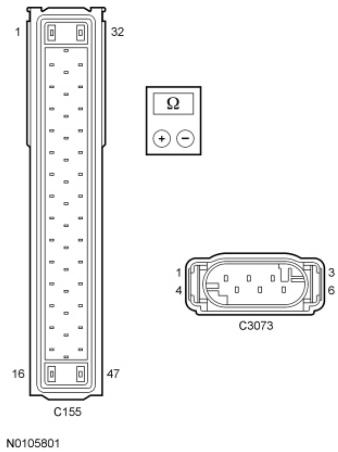


This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- Stability control sensor cluster
- ABS module

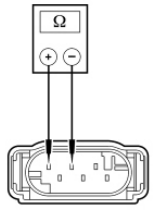


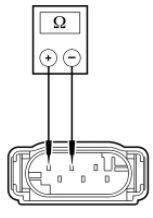
PINPOINT TEST G: DTCs B2741, C2777, C2778 and U1901

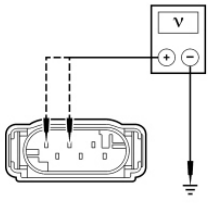
NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**



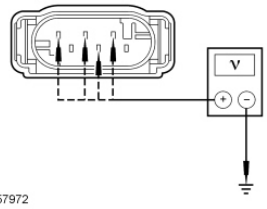
NOTE: The vehicle must be on level ground, not on a hoist and at a complete standstill. Any vehicle movement will result in false values for this test.

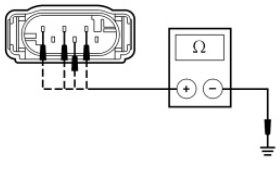






Test Step	Result / Action to Take
G1 CHECK FOR ABS MODULE DTCs	
• Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Clear All CMDTCs . • Drive the vehicle in a straight line at a speed greater than 40 km/h (25 mph) for at least 60 seconds. • Enter the following diagnostic mode on the scan tool: Self Test - ABS Module . • Retrieve and record any ABS module DTCs. • **Is DTC B2741, C2777, C2778 or U1901 present?**	**Yes** GO to G2 . **No** The concern is not present at this time. INSPECT the sensor cluster for damage. VERIFY that the sensor cluster is mounted properly. REPAIR or INSTALL new as necessary. TEST the system for normal operation.





G2 CHECK FOR VOLTAGE TO THE SENSOR CLUSTER	
NOTE: Turning the ignition ON with C3073 disconnected will cause additional DTCs to set in the ABS module. • Ignition OFF. • Disconnect: Sensor Cluster C3073. • Ignition ON. • Measure the voltage between sensor cluster C3073-3, circuit CCA09 (VT/BN), harness side and ground.  N0080073 • **Is the voltage between 7.5 volts and 17 volts?**	**Yes** GO to G4 . **No** GO to G3 .
G3 CHECK THE SENSOR CLUSTER POWER CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: ABS Module C155. • Measure the resistance between ABS module C155-22, circuit CCA09 (VT/BN), harness side and sensor cluster C3073-3, circuit CCA09 (VT/BN), harness side.  N0106857 • **Is the resistance less than 5 ohms?**	**Yes** GO to G4 . **No** REPAIR circuit CCA09 (VT/BN). CLEAR the DTCs. REPEAT the self-test.
G4 CHECK THE SENSOR CLUSTER GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: ABS Module C155. • Measure the resistance between ABS module C155-29, circuit RCA09 (GN/VT), harness side and sensor cluster C3073-5, circuit RCA09 (GN/VT), harness side.	**Yes** GO to G5 . **No** REPAIR circuit RCA09 (GN/VT). CLEAR the DTCs. REPEAT the self-test.

- **Is the resistance less than 5 ohms?**

G5 CHECK THE DEDICATED CAN BUS CIRCUITS FOR AN OPEN	
• Measure the resistance between the ABS module connector, harness side and the sensor cluster connector, harness side as indicated in the following chart: **ABS Module** / **Circuit** / **Sensor Cluster** C155-18 / VCA23 (BU/WH) / C3073-2 C155-19 / VCA24 (GN/OG) / C3073-1  • **Is the resistance less than 5 ohms?**	**Yes** GO to G6 . **No** REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.
G6 CHECK THE DEDICATED CAN BUS CIRCUITS FOR A SHORT TOGETHER	
• Measure the resistance between sensor cluster connection C3073-2, circuit VCA23 (BU/WH), harness side and C3073-1, circuit VCA24 (GN/OG), harness side.	**Yes** GO to G7 . **No** REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.

 N0093245 • **Is the resistance greater than 10,000 ohms?**	
G7 CHECK THE DEDICATED CAN BUS TERMINATING RESISTANCE	
• Connect: ABS Module C155. • Measure the resistance between sensor cluster connection C3073-2, circuit VCA23 (BU/WH), harness side and C3073-1, circuit VCA24 (GN/OG), harness side.  N0093245 • **Is the resistance approximately 120 ohms?**	**Yes** GO to G8 . **No** GO to G12 .
G8 CHECK THE DEDICATED CAN BUS VOLTAGE	
• Ignition ON. • Measure the voltage between ground and: ♦ sensor cluster connection C3073-2, circuit VCA23 (BU/WH), harness side. ♦ sensor cluster connection C3073-1, circuit VCA24 (GN/OG), harness side.  N0093246 • **Is the voltage between 1 and 3 volts?**	**Yes** GO to G11 . **No** GO to G9 .
G9 CHECK THE SENSOR CLUSTER CIRCUITS FOR A SHORT TO VOLTAGE	

• Ignition OFF. • Disconnect: ABS Module C155. • Ignition ON. • Measure the voltage between ground and: ♦ sensor cluster C3073-1, circuit VCA24 (GN/OG), harness side. ♦ sensor cluster C3073-2, circuit VCA23 (BU/WH), harness side. ♦ sensor cluster C3073-3, circuit CCA09 (VT/BN), harness side. ♦ sensor cluster C3073-5, circuit RCA09 (GN/VT), harness side.  N0057972 • **Is any voltage present?**	**Yes** REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test. **No** GO to G10 .
G10 CHECK THE SENSOR CLUSTER CIRCUITS FOR A SHORT TO GROUND	
• Ignition OFF. • Measure the resistance between ground and: ♦ sensor cluster C3073-1, circuit VCA24 (GN/OG), harness side. ♦ sensor cluster C3073-2, circuit VCA23 (BU/WH), harness side. ♦ sensor cluster C3073-3, circuit CCA09 (VT/BN), harness side. ♦ sensor cluster C3073-5, circuit RCA09 (GN/VT), harness side.  A0091341 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to G12 . **No** REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.
G11 CHECK THE SENSOR CLUSTER ELECTRICAL CONNECTION	
• Check sensor cluster C3073 for: ♦ corrosion. ♦ pushed-out pins. ♦ spread terminals. • Connect: Sensor Cluster C3073.	**Yes** INSTALL a new sensor cluster. REFER to Stability Control Sensor Cluster in this section. TEST the system for normal operation. **No**

• Make sure the connector seats correctly, clear all ABS module DTCs, then operate the system and verify the concern is still present. • **Is the concern still present?**	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.
G12 CHECK FOR CORRECT ABS MODULE OPERATION	
• Check ABS module C155 for: ♦ corrosion. ♦ pushed-out pins. ♦ spread terminals. • Connect: ABS Module C155. • Make sure the connector seats correctly, clear all ABS module DTCs, then operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test H: DTC C1285

Refer to Wiring Diagrams Cell 42 , Vehicle Dynamic Systems for schematic and connector information.

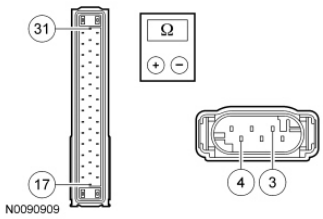
Normal Operation

The active brake booster has internal solenoids that assist driver brake applications or that can apply the brakes when needed if the driver loses control. The booster solenoid is part of the brake booster, if a new solenoid needs to be installed, a new brake booster must be installed.

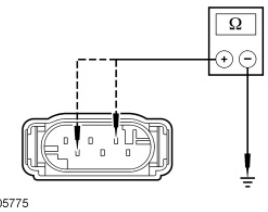
Voltage is supplied to the solenoid from the ABS module along circuit CCA22 (GY/YE) and ground is provided back to the ABS module along circuit VCA22 (GN/BN).

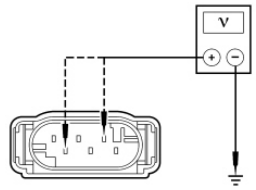
- DTC C1285 Booster Solenoid Circuit Failure - If the ABS module detects an open, a short to voltage or a short to ground on the booster solenoid circuits, DTC C1285 will be set.

This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- Active brake booster
- ABS module



PINPOINT TEST H: DTC C1285





NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

Test Step	Result / Action to Take
H1 CHECK THE DTCs FROM THE SELF-TEST	
• Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Clear All CMDTCs .	**Yes** If DTC C1285 is retrieved GO to H2 . If any other DTC is retrieved, GO to the ABS Module DTC Chart.

• Enter the following diagnostic mode on the scan tool: Self Test - ABS Module . • Retrieve and record any ABS module DTCs. • **Are any DTCs retrieved?**	**No** The system is operating correctly at this time.
H2 CHECK THE BRAKE BOOSTER SOLENOID	
NOTE: To access C149, position the Battery Junction Box (BJB) aside. • Ignition OFF. • Disconnect: Active Brake Booster C149. • Measure the resistance between active brake booster C149 pin-3 and pin-4, component side. • **Is the resistance between 1 and 2 ohms?**	**Yes** INSPECT C149 for corrosion, pushed-out pins and spread terminals. REPAIR as necessary. If C149 is OK, GO to H3 . **No** INSTALL a new active brake booster. REFER to Section 206-07 . CLEAR the DTC. REPEAT the self-test.
H3 CHECK CIRCUITS VCA22 (GN/BN) AND CCA22 (GY/YE) FOR AN OPEN	
• Disconnect: ABS Module C155. • Measure the resistance between the ABS module connector, harness side and the active brake booster connector, harness side as indicated in the following chart: • **Are the resistances less than 5 ohms?**	**Yes** GO to H4 . **No** REPAIR the affected circuit(s). CLEAR the DTC. REPEAT the self-test.
H4 CHECK CIRCUITS VCA22 (GN/BN) AND CCA22 (GY/YE) FOR A SHORT TO GROUND	
• Measure the resistance between ground and: ♦ active brake booster C149-4, circuit VCA22 (GN/BN), harness side. ♦ active brake booster C149-3, circuit CCA22 (GY/YE), harness side.	**Yes** GO to H5 . **No** REPAIR the affected circuit(s). CLEAR the DTC. REPEAT the self-test.

ABS Module	Circuit	Active Brake Booster
C155-17	CCA22 (GY/YE)	C149-3
C155-31	VCA22 (GN/BN)	C149-4

 N0105775 • **Are the resistances greater than 10,000 ohms?**	
H5 CHECK CIRCUITS VCA22 (GN/BN) AND CCA22 (GY/YE) FOR A SHORT TO VOLTAGE	
• Ignition ON. • Measure the voltage between ground and: ♦ active brake booster C149-4, circuit VCA22 (GN/BN), harness side. ♦ active brake booster C149-3, circuit CCA22 (GY/YE), harness side.  N0105774 • **Is any voltage present?**	**Yes** REPAIR the affected circuit(s). CLEAR the DTC. REPEAT the self-test. **No** GO to H6 .
H6 CHECK THE ACTIVE BRAKE BOOSTER SOLENOID FOR CORRECT OPERATION	
• Ignition OFF. • Connect: Active Brake Booster C149. • Connect: ABS Module C155. • Ignition ON. • Start the engine and wait approximately one minute to create vacuum in the brake booster and then turn the ignition switch to the OFF position. • Disconnect: ABS Module C155. • Connect a jumper wire between ABS module C155-31, circuit VCA22 (GN/BN), harness side and ground. • While observing the brake pedal for movement, connect a fused jumper wire for approximately 2 seconds between ABS module C155-17, circuit CCA22 (GY/YE), harness side and the positive battery post. • **Does the brake pedal move?**	**Yes** GO to H7 . **No** INSTALL a new active brake booster. REFER to Section 206-07 . CLEAR the DTC. REPEAT the self-test.
H7 CHECK FOR CORRECT ABS MODULE OPERATION	
• Check ABS module C155 for: ♦ corrosion. ♦ pushed-out pins. ♦ spread terminals. • Connect: ABS Module C155.	**Yes** INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. TEST the system for normal operation. **No**

• Make sure the connector seats correctly, then operate the system and verify the concern is still present. • **Is the concern still present?**	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

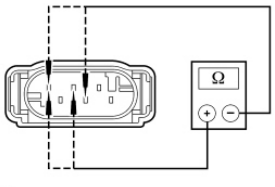
Pinpoint Test I: DTC C1287

Refer to Wiring Diagrams Cell 42 , Vehicle Dynamic Systems for schematic and connector information.

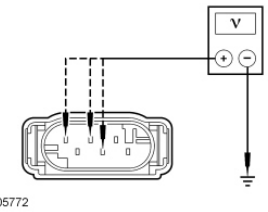
Normal Operation

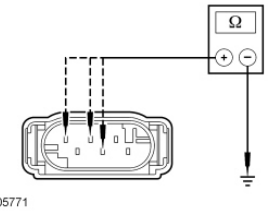
The active brake booster has a normally open and a normally closed pedal force switch that operates according to driver brake applications.

In the normally open position, the brake booster pedal force switch connects circuit CCA29 (GN/BU) to circuit CCA25 (VT/GY). In the normally closed position, the switch connects circuit CCA29 (GN/BU) to circuit CCA26 (BU/GY).



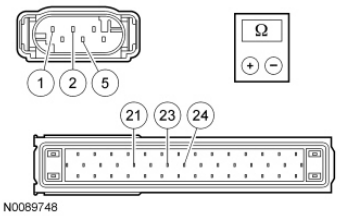
- DTC C1287 Brake Booster Pedal Force Switch Circuit Failure - If the ABS module detects an open, a short to voltage or a short to ground on the booster pedal force switch circuits, or if the switch input does not agree with other brake pedal inputs, DTC C1287 will be set.





This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- Active brake booster
- ABS module

PINPOINT TEST I: DTC C1287



NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

Test Step	Result / Action to Take
I1 CHECK THE DTCs FROM THE SELF-TEST	
• Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Clear All CMDTCs . • Enter the following diagnostic mode on the scan tool: Self Test - ABS Module . • Retrieve and record any ABS module DTCs. • **Are any DTCs retrieved?**	**Yes** If DTC C1287 is retrieved GO to I2 . If any other DTC is retrieved, GO to the ABS Module DTC Chart. **No** The system is operating correctly at this time.
I2 CHECK THE BRAKE BOOSTER PEDAL FORCE SWITCH NORMALLY CLOSED POSITION	
NOTE: To access C149, position the Battery Junction Box (BJB) aside.	**Yes** GO to I3 . **No**

• Ignition OFF. • Disconnect: Active Brake Booster C149. • Measure the resistance between active brake booster C149 pin-5 and pin-2, component side, while pressing and releasing the brake pedal. • **Is the resistance less than 5 ohms with the brake pedal released and greater than 10,000 ohms with the brake pedal applied?**	INSTALL a new active brake booster. REFER to Section 206-07 . CLEAR the DTC. REPEAT the self-test.
I3 CHECK THE BRAKE BOOSTER PEDAL FORCE SWITCH NORMALLY OPEN POSITION	
• Measure the resistance between active brake booster C149 pin-5 and pin-1, component side, while pressing and releasing the brake pedal. • **Is the resistance greater than 10,000 ohms with the brake pedal released and less than 5 ohms with the brake pedal applied?**	**Yes** GO to I4 . **No** INSTALL a new active brake booster. REFER to Section 206-07 . CLEAR the DTC. REPEAT the self-test.
I4 CHECK THE PEDAL FORCE SWITCH CIRCUITS FOR A SHORT TOGETHER	
• Disconnect: ABS Module C155. • Measure the resistance between: ♦ active brake booster C149-1, circuit CCA26 (BU/GY), harness side and active brake booster C149-2, circuit CCA25 (VT/GY), harness side. ♦ active brake booster C149-2, circuit CCA25 (VT/GY), harness side and active brake booster C149-5, circuit CCA29 (GN/BU), harness side. ♦ active brake booster C149-1, circuit CCA26 (BU/GY), harness side, and active brake booster C149-5, circuit CCA29 (GN/BU), harness side.  N0105773 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to I5 . **No** REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.
I5 CHECK THE PEDAL FORCE SWITCH CIRCUITS FOR A SHORT TO VOLTAGE	
• Ignition ON. • Measure the voltage between ground and: ♦ active brake booster C149-1, circuit CCA26 (BU/GY), harness side. ♦ active brake booster C149-2, circuit CCA25 (VT/GY), harness side.	**Yes** REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test. **No** GO to I6 .

♦ active brake booster C149-5, circuit CCA29 (GN/BU), harness side.  N0105772 • **Is any voltage present?**	
I6 CHECK THE PEDAL FORCE SWITCH CIRCUITS FOR A SHORT TO GROUND	
• Ignition OFF. • Measure the resistance between ground and: ♦ active brake booster C149-1, circuit CCA26 (BU/GY), harness side. ♦ active brake booster C149-2, circuit CCA25 (VT/GY), harness side. ♦ active brake booster C149-5, circuit CCA29 (GN/BU), harness side.  N0105771 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to I7 . **No** REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.
I7 CHECK THE PEDAL FORCE SWITCH CIRCUITS FOR AN OPEN	
• Ignition OFF. • Measure the resistance between the ABS module connector, harness side and the active brake booster connector, harness side as indicated in the following chart:	**Yes** GO to I8 . **No** REPAIR the affected circuit(s) for an open. CLEAR the DTCs. REPEAT the self-test.

Active Brake Booster	Circuit	ABS Module
C149-1	CCA26 (BU/GY)	C155-23
C149-2	CCA25 (VT/GY)	C155-24
C149-5	CCA29 (GN/BU)	C155-21

 • **Are the resistances less than 5 ohms?**	
I8 CHECK FOR CORRECT ABS MODULE OPERATION	
• Check ABS module C155 for: ♦ corrosion. ♦ pushed-out pins. ♦ spread terminals. • Connect: ABS Module C155. • Make sure the connector seats correctly, then operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test J: DTC C1288 and C1440

Refer to Wiring Diagrams Cell 42 , Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

The ABS module monitors the pressure of the hydraulic brake system through the use of a brake pressure transducer. The brake pressure transducer is internal to the Hydraulic Control Unit (HCU). The brake pressure transducer can not be serviced separately. If a new brake pressure transducer is needed, a new HCU must be installed.

- DTC C1288 Pressure Transducer Main / Primary Input Circuit Failure - If there is an improper connection between the ABS module and HCU , if the brake pressure transducer is faulted or if the ABS module is faulted internally, this DTC will set.
- DTC C1440 Pressure Transducer Main / Primary Signal Faulted - If there is an improper connection between the ABS module and the HCU , if there is air in the hydraulic brake system, if the brake pressure transducer is faulted or if the ABS module is faulted internally, this DTC will set.

This pinpoint test is intended to diagnose the following:

- HCU
- ABS module

PINPOINT TEST J: DTC C1288 AND C1440

NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

Test Step	Result / Action to Take
J1 MONITOR THE PCM BRAKE ON/OFF (BOO) PID	
• Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger - PCM. • Press and release the brake pedal while monitoring the BOO PID. • **Does the PID switch to ON with the brake pedal pressed and then to OFF with the brake pedal released?**	**Yes** GO to J2 . **No** RETRIEVE any PCM DTCs. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for non-communication DTCs and REFER to Section 418-00 for any communication DTCs.
J2 REVIEW THE ABS MODULE DTCs	
• Enter the following diagnostic mode on the scan tool: Clear All CMDTCs . • Enter the following diagnostic mode on the scan tool: Self Test - ABS Module . • Retrieve and record any ABS module DTCs. • **Is DTC C1288 or C1440 present?**	**Yes** GO to J4 . **No** GO to J3 .
J3 CHECK FOR RETURNING DTCs	
• Enter the following diagnostic mode on the scan tool: Clear All CMDTCs . • Drive the vehicle in a straight line at a speed greater than 40 km/h (25 mph) for at least 60 seconds. • Enter the following diagnostic mode on the scan tool: Self Test - ABS Module . • Retrieve and record any ABS module DTCs. • **Is DTC C1288 or C1440 present?**	**Yes** For DTC C1288, GO to J5 . For DTC C1440, GO to J4 . **No** The concern is not present at this time. TEST the vehicle for normal operation.
J4 CARRY OUT THE ABS SERVICE BLEED	
• Carry out the Brake System Service Bleed, Refer to Section 206-00 . Clear the DTCs. Repeat the self-test. • Ignition ON.	**Yes** GO to J6 . **No** The system is operating correctly at this time. The concern may have been caused by air trapped in the hydraulic brake system.

• Enter the following diagnostic mode on the scan tool: Clear All CMDTCs . • Drive the vehicle in a straight line at a speed greater than 40 km/h (25 mph) for at least 60 seconds. • Enter the following diagnostic mode on the scan tool: Self Test - ABS Module . • **Is DTC C1288 or C1440 present?**	TEST the system for normal operation.
J5 CHECK THE ABS TO HCU CONNECTION	
• Ignition OFF. • Disconnect: ABS Module C155. • Remove the ABS module. Refer to Anti-Lock Brake System (ABS) Module in this section. • Inspect the ABS module-to- HCU mating surfaces for damage or contamination. • **Are the ABS-to- HCU mating surfaces OK?**	**Yes** GO to J7 . **No** INSTALL a new ABS module and a new HCU . REFER to Hydraulic Control Unit (HCU) and Anti-Lock Brake System (ABS) Module in this section.
J6 CHECK THE ABS MAIN BRAKE PRESSURE (MPRETDR) PID	
• If not already done, separate the ABS module from the HCU . Refer to Anti-Lock Brake System (ABS) Module in this section. • With the ABS module separated from the HCU , connect ABS module C155. • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger - ABS Module . • Monitor the MPRETDR PID. • **Is the PID value between 21.13K and 22.59K?**	**Yes** INSTALL a new HCU . REFER Hydraulic Control Unit (HCU) in this section. CLEAR the DTCs. TEST the system for normal operation. **No** INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. CLEAR the DTCs. TEST the system for normal operation.
J7 CHECK FOR CORRECT ABS MODULE OPERATION	
• Check ABS module C155 for: ♦ corrosion. ♦ pushed-out pins. ♦ spread terminals. • Connect: ABS Module C155. • Make sure the connector seats correctly, then operate the system and verify the concern is still present.	**Yes** INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

• **Is the concern still present?**	

Pinpoint Test K: DTCs C1279, C1280, C1281, C1282, C1516, C1517, C2769 and C2770

Refer to Wiring Diagrams Cell 42 , Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

The yaw rate sensor, roll rate sensor, lateral accelerometer and longitudinal accelerometer are contained in one module called the stability control sensor cluster. The sensor cluster measures the vehicle acceleration, roll rate and yaw rate, then sends the signal along a dedicated Controller Area Network 2 (CAN2) bus to the ABS module.

Voltage is supplied from the ABS module to the sensor cluster along circuit CCA09 (VT/BN) and ground is provided through the ABS module along circuit RCA09 (GN/VT). Circuits VCA23 (BU/WH) and VCA24 (GN/OG) make up the CAN2 bus between the ABS module and the sensor cluster.

DTC Description	Fault Trigger Conditions
• DTC C1279 Yaw Rate Sensor Circuit Failure • DTC C1280 Yaw Rate Sensor Signal Fault • DTC C1281 Lateral Accelerometer Circuit Failure • DTC C1282 Lateral Accelerometer Signal Fault • DTC C1516 Roll Rate Sensor Signal Fault • DTC C1517 Roll Rate Sensor Circuit Failure • DTC C2769 Longitudinal Acceleration Sensor Electrical Failure • DTC C2770 Longitudinal Acceleration Sensor Plausibility Failure	If the sensor cluster is loose or not mounted correctly, if a signal from the sensor cluster is out of range or does not agree with input from the steering wheel rotation sensor or if the one of the sensors internal to the sensor cluster has faulted, the appropriate DTC will set.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Stability control sensor cluster

- ABS module

PINPOINT TEST K: DTCs C1279, C1280, C1281, C1282, C1516, C1517, C2769 AND C2770

NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

NOTE: The yaw rate sensor, roll rate sensor, lateral accelerometer and longitudinal accelerometer are integral to the sensor cluster.

NOTE: The vehicle must be on level ground, not on a hoist and at a complete standstill. Any vehicle movement will result in false values for this test.

Test Step	Result / Action to Take
K1 CHECK THE ABS MODULE DTCs	
• Review the ABS module DTCs retrieved and recorded during Inspection and Verification. • **Is DTC B2741, C1963, C2777 C2778 or U1901 also present?**	**Yes** GO to Pinpoint Test G . **No** GO to K2 .
K2 CHECK THE SENSOR CLUSTER INSTALLATION AND MOUNTING SURFACE	
• Inspect the sensor cluster installation and make sure that the nuts are fully seated and tightened correctly. Refer to Stability Control Sensor Cluster . • Inspect the mounting surface for damage, corrosion or dirt. • **Is the sensor cluster installed correctly and is the mounting surface clean and free from damage?**	**Yes** GO to K3 . **No** REPAIR or INSTALL new as necessary. CLEAR the DTC. REPEAT the self-test.
K3 CHECK THE STEERING WHEEL ROTATION SENSOR CONDITION AND INSTALLATION	
• Inspect the steering wheel rotation sensor and slotted-wheel for damage and correct installation. Refer to Steering Wheel Rotation Sensor in this section. • **Are the sensor and slotted-wheel installed correctly and undamaged?**	**Yes** GO to K4 . **No** REINSTALL or INSTALL new as necessary. CLEAR the DTCs. REPEAT the self-test.
K4 CHECK FOR RETURNING ABS MODULE DTCs	
• Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Clear All CMDTCs . • Drive the vehicle in a straight line at a speed greater than 40 km/h (25 mph) for at least 60 seconds. • Enter the following diagnostic mode on the scan tool: Self Test - ABS Module . • Retrieve and record any ABS module DTCs.	**Yes** GO to K5 . **No** The system is operating correctly at this time. TEST the system for normal operation.

• **Are any of the DTCs listed in Normal Operation for Pinpoint Test K retrieved?**	
K5 ISOLATE THE SENSOR CLUSTER	
• Disconnect: Sensor Cluster C3073. • Check sensor cluster C3073 for: ♦ corrosion. ♦ pushed-out pins. ♦ spread terminals. • Connect: Sensor Cluster C3073. • Make sure the connector seats correctly, then operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new sensor cluster. REFER to Stability Control Sensor Cluster in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test L: DTC B2900

Normal Operation

When the ignition is turned to the RUN position, the ABS module and the PCM share Vehicle Identification Number (VIN) information over the High Speed Controller Area Network (HS-CAN) bus.

- DTC B2900 VIN Mismatched - If the VIN information stored in the ABS module does not match the information transmitted by the PCM, DTC B2900 will set.

This pinpoint test is intended to diagnose the following:
- Module configuration
- ABS module

PINPOINT TEST L: DTC B2900

Test Step	Result / Action to Take
L1 VERIFY THE PCM VIN	
• Connect the scan tool. • Ignition ON. • Using the scan tool, carry out the Network Test. • Enter the following diagnostic mode on the scan tool: Log Viewer. • Compare the VIN in Log Viewer to the vehicle VIN plate. • **Does the VIN in Log Viewer match the vehicle VIN plate?**	**Yes** GO to L2 . **No** RECONFIGURE the PCM. FOLLOW the instructions on the scan tool. CLEAR the DTCs. CYCLE the ignition key. REPEAT the self-test.
L2 VERIFY THE ABS MODULE PART NUMBER	
• Retrieve and record the ABS module part number from Log Viewer and verify that the vehicle has the correct	**Yes** CONFIGURE the ABS module. REFER to Section 418-01 , Programmable Module Installation (PMI) Using the Integrated Diagnostic System (IDS) When the Original

ABS module installed. • **Is the correct ABS module installed in the vehicle?**	Module is NOT Available. CLEAR the DTC. CYCLE the ignition key. REPEAT the self-test. **No** INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. CLEAR the DTC. CYCLE the ignition key. REPEAT the self-test.

Pinpoint Test M: DTC C1996

Normal Operation

The ABS module uses information received from several sensors (wheel speed sensors, steering wheel rotation sensor, stability control sensor cluster) to determine if a vehicle instability event is about to occur. If an event is going to occur, the ABS module will adjust brake torque at specific wheels and the PCM will reduce engine torque to make the vehicle more stable. Once the ABS module has determined that the stability event has been corrected, it will return brake and engine torque to normal and continue to monitor the vehicle.

- DTC C1996 Active Yaw and/or Roll Control Disabled - The ABS module monitors the stability event and is programmed to set DTC C1996 and disable the stability control system if the stability event lasts longer than 15 seconds.

This pinpoint test is intended to diagnose the following:

- Steering wheel rotation sensor
- Stability control sensor cluster
- Wheel speed sensors
- ABS module

PINPOINT TEST M: DTC C1996

Test Step	Result / Action to Take
M1 CHECK THE WHEEL SPEED SENSOR PIDs	
• Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger - ABS Module . • While driving the vehicle, have an assistant monitor the following wheel speed sensor PIDs: ♦ Left Front Wheel Speed Sensor (LF_WSPD) ♦ Right Front Wheel Speed Sensor (RF_WSPD) ♦ Left Rear Wheel Speed Sensor (LR_WSPD) ♦ Right Rear Wheel Speed Sensor (RR_WSPD) • **Do all the PIDs match the vehicle speed and match each other?**	**Yes** GO to M6 . **No** GO to M2 .

M2 INSPECT THE WHEEL SPEED SENSOR MOUNTING	
• Ignition OFF. • With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 . • Verify the bolt of the suspect wheel speed sensor is tightened to specifications. • **Is the bolt tightened to specifications?**	**Yes** GO to M3 . **No** TIGHTEN the wheel speed sensor bolt to specification. REFER to Specifications in this section. CLEAR the DTCs.
M3 INSPECT THE WHEEL SPEED SENSOR AND HARNESS FOR DAMAGE	
• **NOTE:** Examine the wheel speed sensor harness carefully with a good light source. Failure to verify damage in the sensor harness can lead to unnecessary installation of a new component. • Inspect the suspect wheel speed sensor and harness for cuts, broken tabs, broken casing and/or corrosion. • **Are the wheel speed sensor and harness OK?**	**Yes** GO to M4 . **No** INSTALL a new wheel speed sensor. REFER to Wheel Speed Sensor - Front or Wheel Speed Sensor - Rear in this section. CLEAR the DTCs. REPEAT the self-test.
M4 INSPECT THE WHEEL SPEED SENSOR RING FOR DAMAGE	
• **NOTE:** Examine the wheel speed sensor ring carefully with a good light source. Failure to verify damage in the sensor ring can lead to unnecessary installation of a new component. • Inspect the suspect wheel speed sensor ring for cracks, chips or missing teeth. Rotate the wheel to verify that no teeth are missing. • **Is the wheel speed sensor ring OK?**	**Yes** GO to M5 . **No** INSTALL a new wheel hub and bearing assembly (wheel speed sensor rings are part of the wheel hub and bearing assembly). Refer to the appropriate section in Group 204 for the procedure. CLEAR the DTCs. REPEAT the self-test.
M5 INSPECT THE WHEEL BEARING FOR DAMAGE AND LOOSENESS	
• Verify that the wheel bearing has no end-play and is undamaged. • **Is the wheel bearing OK?**	**Yes** GO to M6 . **No** INSTALL a new wheel hub and bearing assembly. Refer to the appropriate section in Group 204 for the procedure. CLEAR the DTCs. REPEAT the self-test.
M6 CHECK THE ABS MODULE YAW RATE (YAWRATE) PID	
• **NOTE:** The vehicle must be on level ground and at a complete standstill. Any vehicle movement results in false values for this test. • Monitor the YAWRATE PID.	**Yes** GO to M7 . **No** GO to M10 .

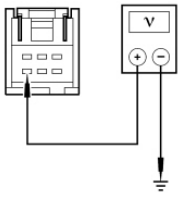
• **Is the YAWRATE PID value between -2.0 and +2.0?**	
M7 CHECK THE ABS MODULE LATERAL ACCELERATION (LAT_ACCL) PID	
• **NOTE:** The vehicle must be on level ground and at a complete standstill. Any vehicle movement results in false values for this test. • Monitor the LAT_ACCL PID. • **Is the LAT_ACCL PID value between -0.4 and 0.4?**	**Yes** GO to M8 . **No** GO to M10 .
M8 CHECK THE ABS MODULE LONGITUDINAL ACCELERATION (LONG_ACCL) PID	
• **NOTE:** The vehicle must be on level ground and at a complete standstill. Any vehicle movement results in false values for this test. • Monitor the LONG_ACCL PID. • **Is the LONG_ACCL PID value between -0.4 and 0.4?**	**Yes** GO to M9 . **No** GO to M10 .
M9 CHECK THE ABS MODULE ROLL RATE (ROLLRAT) PID	
NOTE: The vehicle must be on level ground and at a complete standstill. Any vehicle movement will result in false values for this test. • Monitor the ROLLRAT PID. • **Is the ROLLRAT PID value between -0.05 and 0.05?**	**Yes** GO to M11 . **No** GO to M10 .
M10 CHECK THE SENSOR CLUSTER INSTALLATION AND MOUNTING SURFACE	
• Inspect the sensor cluster installation and make sure that the nuts are fully seated and tightened correctly. Refer to Stability Control Sensor Cluster . • Inspect the mounting surface for damage, corrosion or dirt. • **Is the sensor cluster installed correctly and is the mounting surface clean and free from damage?**	**Yes** INSTALL a new sensor cluster. REFER to Stability Control Sensor Cluster in this section. CLEAR the DTC. REPEAT the self-test. **No** REPAIR or INSTALL new as necessary. CLEAR the DTC. REPEAT the self-test.
M11 CHECK THE STEERING WHEEL ANGLE SENSOR POSITION (SWA POS) PID	
• Monitor the SWA POS PID while rotating the steering wheel clockwise and	**Yes** GO to M12 .

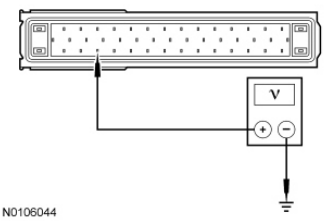
counterclockwise very slowly, from lock to lock. • **Does the PID change in intervals of 4.5 degrees and show a 360-degree increase for each complete revolution of the steering wheel?**	**No** INSTALL a new steering wheel rotation sensor. REFER to Steering Wheel Rotation Sensor in this section. CLEAR the DTCs. REPEAT the self-test.
M12 CHECK FOR CORRECT ABS MODULE OPERATION	
• Disconnect: ABS Module C155. • Check the connector for: ♦ corrosion. ♦ pushed-out pins. ♦ spread terminals. • Connect: ABS Module C155. • Make sure the ABS module electrical connector is fully seated, then operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. CLEAR the DTCs. REPEAT the self-test. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test N: The Traction Control, ESC and RSC® Systems Cannot Be Disabled

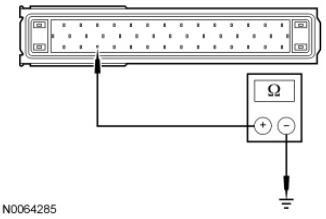
Refer to Wiring Diagrams Cell 42 , Vehicle Dynamic Systems for schematic and connector information.

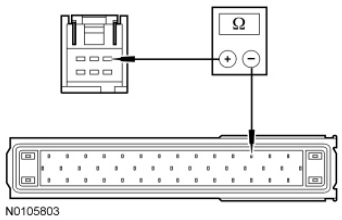
Normal Operation





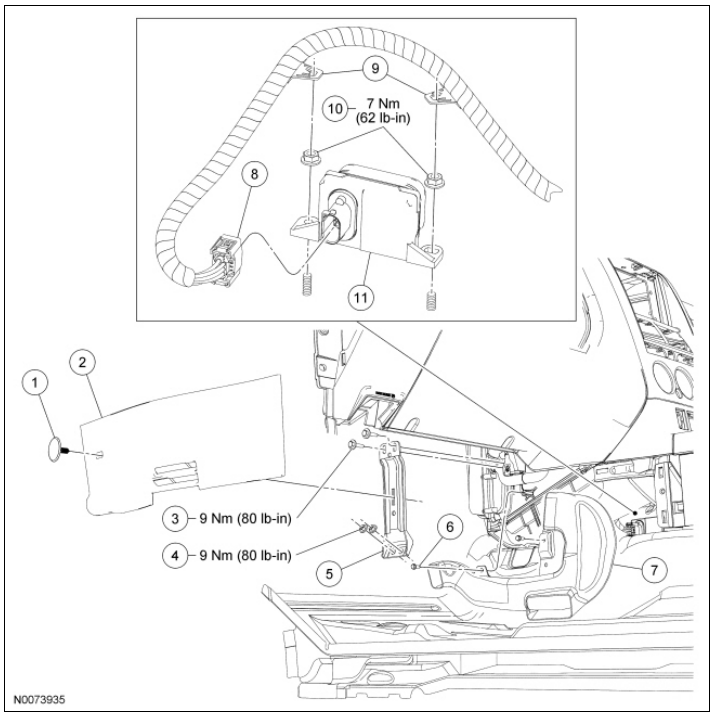
When one or more drive wheels lose traction and begin to spin, the ABS module sends a request to the PCM over the High Speed Controller Area Network (HS-CAN) bus to modulate the engine torque. This is achieved by regulating fuel and spark to the cylinders. At the same time, the ABS module operates the hydraulic pump motor and the appropriate hydraulic valves to actuate the brake calipers and sends a message to the Instrument Cluster (IC) along the HS-CAN bus to flash the stability/traction control indicator "sliding-car icon". The system can be disabled pressing the stability/traction control switch. When the switch is pressed, the ABS receives a voltage signal and will ignore any stability/traction control events until the switch is pressed again or the ignition switch is cycled.





Fused ignition voltage is sent to the stability/traction control switch from Smart Junction Box (SJB) fuse 18 (10A) along circuit CBP18 (GY/OG). When pressed, the switch closes and momentarily connects circuit CBP18 (GY/OG) to circuit CCA15 (YE/GY) sending the voltage to the ABS module along circuit CCA15 (YE/GY). The ABS module sends a message to the IC along the HS-CAN bus to illuminate the stability/traction control indicator.

This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- Stability traction control switch
- ABS module



PINPOINT TEST N: THE TRACTION CONTROL, ESC AND RSC® SYSTEMS CANNOT BE DISABLED

NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

Test Step	Result / Action to Take
N1 CHECK THE VOLTAGE TO THE STABILITY/TRACTION CONTROL SWITCH	
• Ignition OFF. • Disconnect: Stability/Traction Control Switch C280. • Ignition ON. • Measure the voltage between stability/traction control switch C280-6, circuit CBP18 (GY/OG), harness side and ground.  N0073750 • **Is the voltage greater than 10 volts?**	**Yes** GO to N2 . **No** VERIFY SJB fuse 18 (10A) is OK. If OK, REPAIR circuit CBP18 (GY/OG). If the fuse is not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short. TEST the system for normal operation.
N2 CHECK THE STABILITY TRACTION CONTROL SWITCH	
• Measure the resistance between stability/traction control switch C280 pin-1 and pin-6, component side while pressing and releasing the switch. • **Is the resistance less than 5 ohms with the switch pressed and greater than 10,000 ohms with the switch released?**	**Yes** GO to N3 . **No** INSTALL a new stability/traction control switch. REFER to Stability/Traction Control Switch in this section. TEST the system for normal operation.
N3 CHECK CIRCUIT CCA15 (YE/GY) FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: ABS Module C155. • Ignition ON. • Measure the voltage between ABS module C155-4, circuit CCA15 (YE/GY), harness side and ground.  N0106044 • **Is any voltage present?**	**Yes** REPAIR circuit CCA15 (YE/GY). TEST the system for normal operation. **No** GO to N4 .

N4 CHECK CIRCUIT CCA15 (YE/GY) FOR A SHORT TO GROUND	
• Ignition OFF. • Measure the resistance between ABS module C155-4, circuit CCA15 (YE/GY), harness side and ground.  N0064285 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to N5 . **No** REPAIR circuit CCA15 (YE/GY). TEST the system for normal operation.
N5 CHECK CIRCUIT CCA15 (YE/GY) FOR AN OPEN	
• Measure the resistance between ABS module C155-4, circuit CCA15 (YE/GY), harness side and stability/traction control switch C280-1, circuit CCA15 (YE/GY), harness side.  N0105803 • **Is the resistance less than 5 ohms?**	**Yes** GO to N6 . **No** REPAIR circuit CCA15 (YE/GY). TEST the system for normal operation.
N6 CHECK FOR CORRECT ABS MODULE OPERATION	
• Check ABS module C155 for: ♦ corrosion. ♦ pushed-out pins. ♦ spread terminals. • Connect: ABS Module C155. • Make sure the connector seats correctly, then operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Stability Control Sensor Cluster

Item	Part Number	Description
1	31172	Pin-type retainer
2	04608	LH floor console finish panel
3	W707491	LH instrument panel brace bolt (2 required)
4	W707137	LH instrument panel brace nut (2 required)
5	044F48	LH instrument panel brace
6	W707281	LH floor heater duct bolt
7	18C433A	LH floor heater duct
8	-	Stability control sensor cluster electrical connector (part of 2C011)
9	-	Stability control sensor cluster harness retainers (part of 2C011)
10	W700101	Stability control sensor cluster bracket nuts (2 required)
11	3C187	Stability control sensor cluster

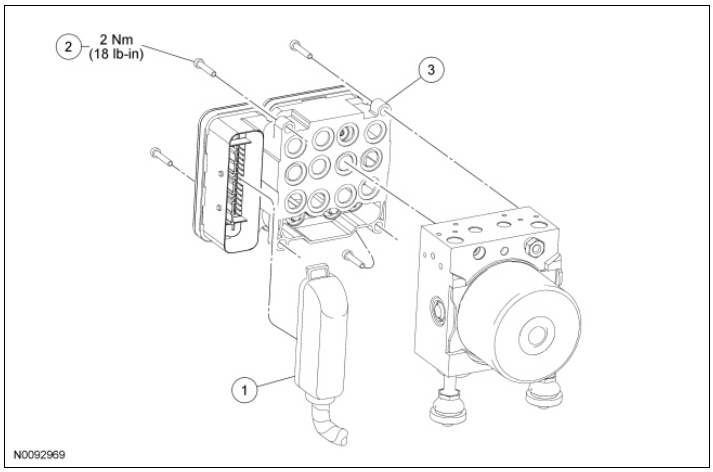
Removal and Installation

NOTE: When installing a new stability control sensor cluster, the ABS module must be calibrated. Follow the scan tool directions for the calibration procedures.

1. Remove the pin-type retainer and the LH floor console finish panel.

2. Remove the 2 bolts, 2 nuts and the LH instrument panel brace.
   - To install, tighten to 9 Nm (80 lb-in).

3. Remove the 2 bolts and LH floor heater duct.



4. Disconnect the stability control sensor cluster electrical connector.

5. Remove the stability control sensor cluster electrical harness retainers and position aside.

6. Remove the 2 stability control sensor cluster bracket nuts and the stability control sensor cluster.
    - To install, tighten to 7 Nm (62 lb-in).

7. To install, reverse the removal procedure.

Anti-Lock Brake System (ABS) Module

Item	Part Number	Description
1	-	ABS module electrical connector (part of 14398)
2	2M101	ABS module screw (4 required)
3	2C219	ABS module

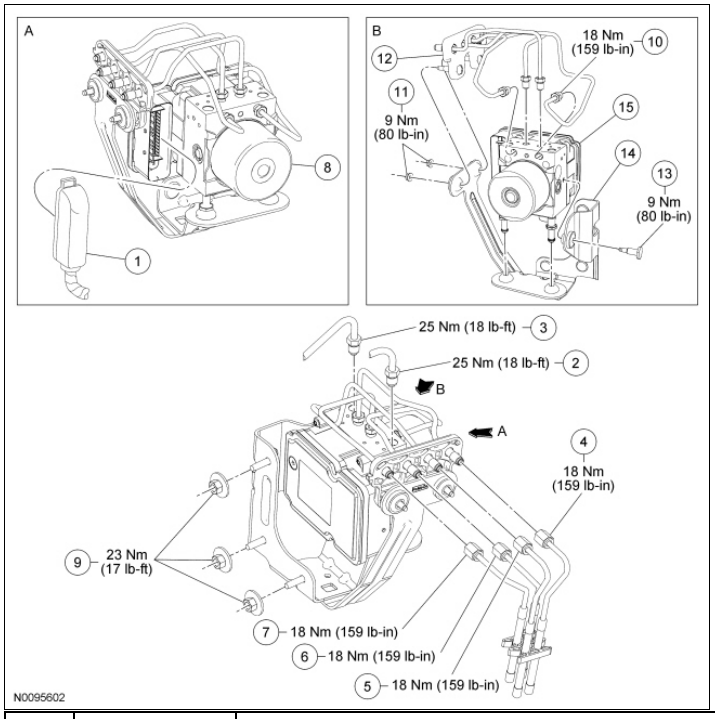
Removal and Installation

NOTICE: **Electronic modules are sensitive to electrical charges. The Anti-lock Brake System (ABS) module can be damaged if exposed to these charges.**

NOTE: When installing a new ABS module, it must be configured (using vehicle as-built data) and calibrated. Follow the scan tool directions for the calibration procedures. For module configuration, refer to Programmable Module Installation in Section 418-01 .

1. Remove the Hydraulic Control Unit (HCU). For additional information, refer to Hydraulic Control Unit (HCU) in this section.

2. Remove the 4 screws and the ABS module.
   - To install, tighten to 2 Nm (18 lb-in).



3. ***NOTICE:*** **Make sure that the Anti-lock Brake System (ABS) module is properly seated to the Hydraulic Control Unit (HCU) and that the torque of the ABS module screws is correct, or damage to the components can occur.**

   To install, reverse the removal procedure.

Hydraulic Control Unit (HCU)

Material

Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1

Item	Part Number	Description
1	-	ABS module electrical connector (part of 14398)
2	2234A	Master cylinder primary brake tube-to-Hydraulic Control Unit (HCU) fitting
3	2234B	Master cylinder secondary brake tube-to- HCU fitting
4	2263	RH front brake tube-to- HCU extension tube fitting
5	2264	LH front brake tube-to- HCU extension tube fitting
6	2C008A	RH rear brake tube-to- HCU extension tube fitting
7	2C008B	LH rear brake tube-to- HCU extension tube fitting
8	2C215	HCU assembly
9	W803826	HCU bracket-to-frame nuts (3 required)

11	N803826	HCU bracket-to- HCU extension tube retainer nuts

12	2C296	HCU extension tube retainer assembly
13	2M101B	HCU bracket-to- HCU bolt
14	2C304	HCU bracket
15	2C215	HCU

Removal and Installation

⚠ WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

⚠ WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

NOTICE: **Do not spill brake fluid on painted or plastic surfaces or damage to the surface may occur. If brake fluid is spilled onto a painted or plastic surface, immediately wash the surface with water.**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the battery tray. For additional information, refer to Section 414-01 .

3. Disconnect the ABS module electrical connector.

4. **NOTE:** The brake tubes must be installed in the same location as removed.

   Disconnect the master cylinder primary and secondary brake tube-to-Hydraulic Control Unit (HCU) fittings and position both brake tubes aside.

   - To install, tighten to 25 Nm (18 lb-ft).

5. **NOTE:** The brake tubes must be installed in the same location as removed.

   Disconnect the 4 brake tube-to- HCU extension tube fittings.

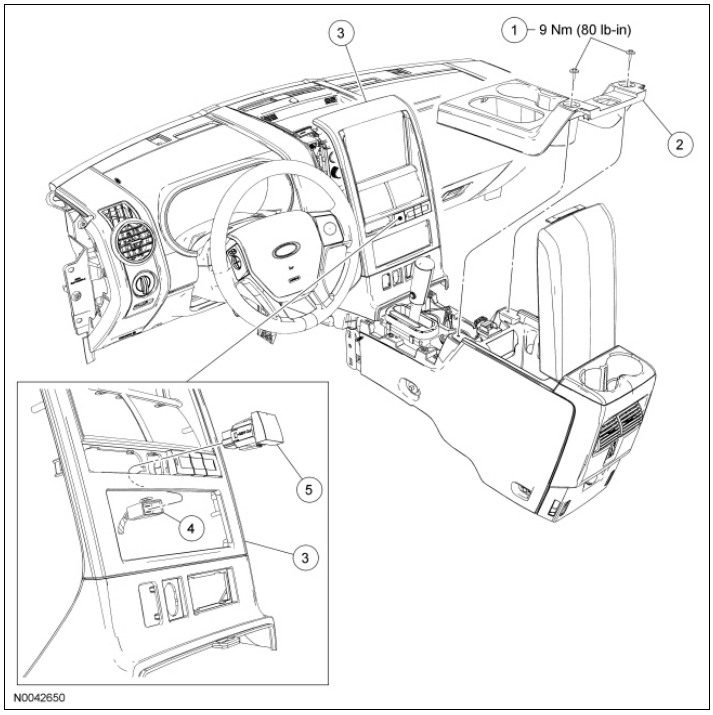
   - To install, tighten to 18 Nm (159 lb-in).

6. Remove the 3 HCU bracket-to-frame nuts and the HCU assembly.
   - To install, tighten the nuts to 23 Nm (17 lb-ft).

7. **NOTE:** The brake tubes must be installed in the same location as removed.

   Disconnect the 4 HCU extension tube-to- HCU fittings.

   - To install, tighten to 18 Nm (159 lb-in).



8. Remove the 2 HCU bracket-to- HCU extension tube retainer nuts and the extension tube retainer assembly.
   - To install, tighten the nuts to 9 Nm (80 lb-in).

9. Remove the HCU bracket-to- HCU bolt and the HCU bracket.
   - To install, tighten the bolts to 9 Nm (80 lb-in).

10. To install, reverse the removal procedure.
    - Bleed the brake system. For additional information, refer to Section 206-00 .

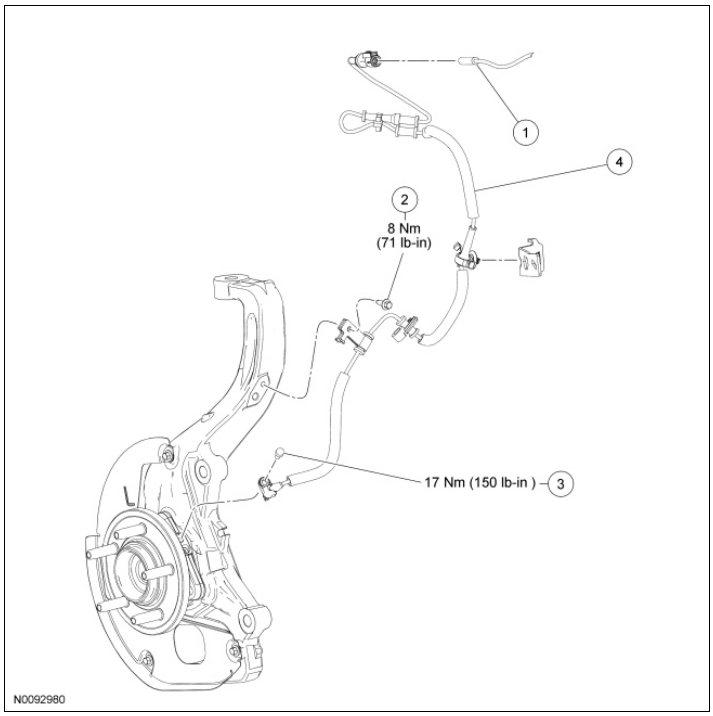
Stability/Traction Control Switch

Removal and Installation

Item	Part Number	Description
1	W705796	Floor console center finish panel screws
2	78045B44	Floor console center finish panel
3	7804302	Instrument panel center finish panel
4	-	Stability/traction control switch electrical connector (part of 14401)
5	14B079	Stability/traction control switch

1. Remove the 2 floor console center finish panel screws and the floor console center finish panel.
   - To install, tighten to 9 Nm (80 lb-in).

2. Apply the parking brake.



3. Move the gear selector lever to the D1 position.

4. Position the instrument panel center finish panel away from the instrument panel.

5. Disconnect the stability/traction control switch electrical connector and remove the stability/traction control switch from the instrument panel center finish panel.

6. To install, reverse the removal procedure.

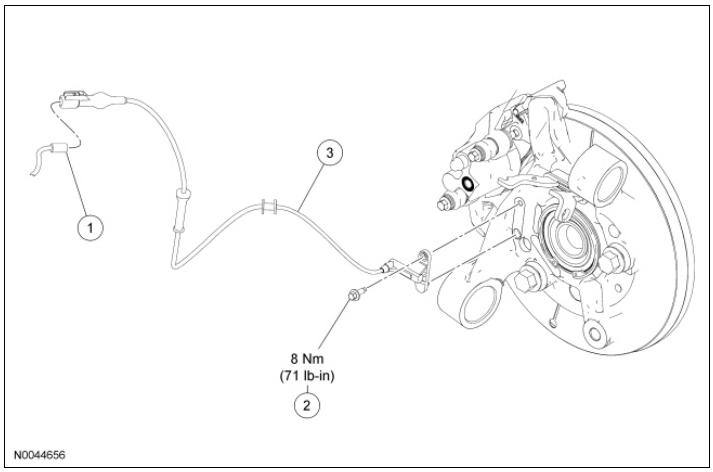
Wheel Speed Sensor - Front

Item	Part Number	Description
1	14398	Wheel speed sensor electrical connector
2	W500212	Wheel speed sensor harness bolt
3	-	Wheel speed sensor bolt (part of 2C204)
4	2C204	Wheel speed sensor

Removal and Installation

1. Remove the front brake disc. For additional information, refer to Section 206-03 .

2. Disconnect the wheel speed sensor electrical connector.



3. Remove the wheel speed sensor harness bolt.
   - To install, tighten to 8 Nm (71 lb-in).

4. Remove the wheel speed sensor harness pin-type retainers.

5. Remove the wheel speed sensor bolt and the wheel speed sensor.
   - To install, tighten the bolt to 17 Nm (150 lb-in).

6. To install, reverse the removal procedure.

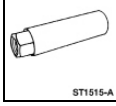
Wheel Speed Sensor - Rear

Item	Part Number	Description
1	-	Wheel speed sensor electrical connector (part of 14407)
2	W500212	Wheel speed sensor bolt
3	2C216 LH/ 2C190 RH	Wheel speed sensor

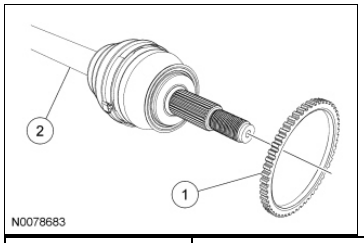
Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Disconnect the wheel speed sensor electrical connector.



3. Disconnect the wheel speed harness from the retainers.



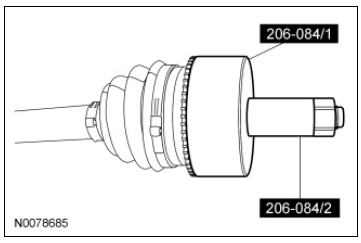
4. Remove the wheel speed sensor bolt and the wheel speed sensor.
   - To install, tighten to 8 Nm (71 lb-in).

5. To install, reverse the removal procedure.

Wheel Speed Sensor Ring - Rear

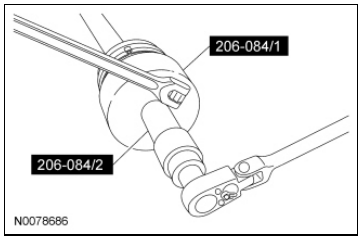
Special Tool(s)

 ST2132-A	Installer, Wheel Speed Sensor Ring 206-084/1
 ST1515-A	Installer, Wheel Speed Sensor Ring 206-084/2

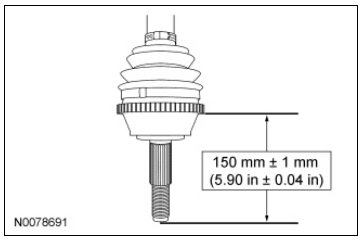


Item	Part Number	Description
1	2C182	Wheel speed sensor ring
2	4K138	Halfshaft

Removal

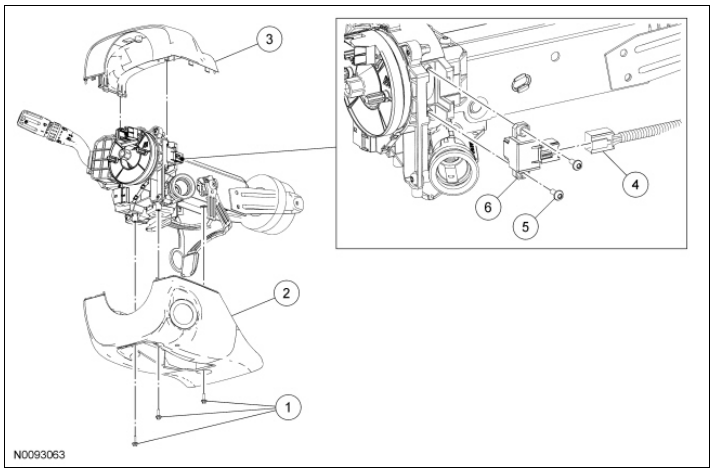


1. Remove the rear halfshaft. For additional information, refer to Section 205-05 .
2. Using a suitable driver, remove the ABS wheel speed sensor ring.



Installation

1. Install the new ABS wheel speed sensor and the Wheel Speed Sensor Ring Installers on the halfshaft as shown.



2. Using the Wheel Speed Sensor Ring Installers, install the ABS wheel speed sensor ring as shown.

Steering Wheel Rotation Sensor

Item	Part Number	Description
1	W707658	Lower steering column cover bolts
2	3F914	Lower steering column cover
3	3F914	Upper steering column cover
4	-	Steering wheel rotation sensor electrical connector (part of 14401)
5	N807493	Steering wheel rotation sensor screw (2 required)
6	3F818	Steering wheel rotation sensor

Removal and Installation

1. Remove the 3 lower steering column cover bolts and the lower steering column cover.
2. Remove the upper steering column cover.
3. Disconnect the steering wheel rotation sensor electrical connector.
4. Remove the 2 screws and the steering wheel rotation sensor.
5. To install, reverse the removal procedure.

Item	Specification
Transmission Fluid	
NOTICE: **Use transmission fluid that is recommended for this transmission, the use of any other transmission fluid may result in transmission failure.** • Normal maintenance: ♦ Transmission fluid change not necessary, filled for life. • Severe duty maintenance: ♦ Change the transmission fluid at 48,000 km (30,000 mi) intervals.	
NOTE: Approximate dry capacity, includes transmission fluid cooler and transmission fluid cooler tubes. Transmission fluid level procedures in this section should be used to determine actual transmission fluid requirements and transmission fluid specification. DO NOT OVERFILL. If it is necessary to add or change transmission fluid, use only transmission fluid that is recommended for this transmission.

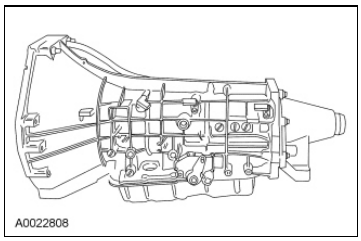
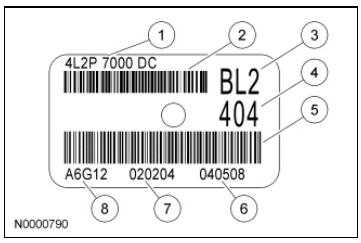
Transmission Description



This transmission has:

- five forward speeds.
- electronic shift, pressure and Torque Converter Clutch (TCC) controls.
- three planetary gearsets.
- three bands.
- three multi-plate clutches.
- two One-Way Clutch (OWC).

All hydraulic functions are directed by electronic solenoids. The solenoids control:

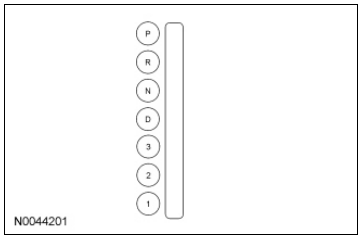


- static engagement feel.
- shift feel.
- shift scheduling.
- modulated TCC applications.
- engine braking utilizing the coast clutch and bands.
- manual 1st and 2nd timing.
- reverse inhibit timing.

Transmission View

Identification Tags

Identification Tag Located on Transmission Case



Item	Description
1	Transmission part number
2	Bar code 1
3	Transmission plant model code part 1
4	Transmission plant model code part 2
5	Bar code 2
6	Transmission serial number
7	Transmission build date (DD MM YY)
8	Assembly plant line shift

All vehicles come equipped with a Safety Compliance Certification Label. The location on the label marked TR is reserved for the transmission code. To determine the correct transmission for this vehicle, refer to the Owners's Literature, Transmission Code Designations. For transmission model, service identification level or build date information, refer to the transmission service identification tag located on the transmission case.

Range Selection

The transmission has 7 range positions: P, R, N, (D), 3, 2 and 1.

Park

In the PARK position:

- there is no power flow through the transmission.
- the park pawl locks the output shaft to the case.
- the engine may be started.
- the ignition key may be removed.

Reverse

In the REVERSE position:

- the vehicle may be operated in a rearward direction, at a reduced gear ratio.

Neutral

In the NEUTRAL position:

- there is no power flow through the transmission.
- the output shaft is not held and is free to turn.
- the engine may be started.

Drive - Overdrive (O/D) Enabled

OVERDRIVE is the normal position for most forward driving.

The (D) position provides:

- automatic shifts 1-5 and 5-1.
- apply and release of the Torque Converter Clutch (TCC).
- maximum fuel economy during normal operation.
- engine braking in 5th gear.

Drive - O/D Canceled

The OVERDRIVE position provides:

- automatic shifts 1-4 and 4-1.
- apply and release of the TCC .
- maximum fuel economy during normal operation.
- engine braking in 4th gear.

Position 3 - 3rd Gear

The 3rd position provides:

- third gear start and hold.
- TCC apply and release.
- improved traction on slippery roads.
- engine braking.

Position 2 - 2nd Gear

If this position is selected at normal road speeds, the transmission will downshift into the next lower gear and continue downshifting until the vehicle reaches 2nd gear.

The 2nd position provides:

- second gear start and hold.
- TCC apply and release.
- improved traction on slippery roads.
- engine braking.

Position 1 - 1st Gear

If this position is selected at normal road speeds, the transmission will downshift into the next lower gear and continue downshifting until the vehicle reaches 1st gear.

This position provides:

- first gear operation only.
- engine braking for descending steep grades.

Shift Patterns

Upshifts

Transmission upshifting is controlled by the PCM. The PCM receives inputs from various engine or vehicle sensors and driver demands to control shift scheduling, shift feel and Torque Converter Clutch (TCC) operation.

The PCM has an adaptive learn strategy to electronically control the transmission which will automatically adjust the shift feel. When the battery has been disconnected or a new battery installed, certain transmission operating parameters may be lost. The PCM must relearn these parameters. During this learning process you may experience slightly firm shifts, delayed or early shifts. This operation is considered normal and will not affect the function of the transmission. Normal operation will return once these parameters are stored by the PCM.

Downshifts

Under certain conditions the transmission will downshift automatically to a lower gear range (without moving the selector lever). There are 3 categories of automatic downshifts: coastdown, torque demand and forced or kickdown shifts.

Coastdown

The coastdown downshift occurs when the vehicle is coasting down to a stop.

Torque Demand

The torque demand downshift occurs (automatically) during part throttle acceleration when the demand for torque is greater than the engine can provide at that gear ratio. If applied, the transmission will disengage the TCC to provide added acceleration.

Kickdown

For maximum acceleration, the driver can force a downshift by pressing the accelerator pedal to the floor. A forced downshift into a lower gear is possible below calibrated speeds. Specifications for downshift speeds are subject to variations due to tire size and engine and transmission calibration requirements.

Torque Converter

The torque converter transmits and multiplies torque. The torque converter is a 4-element device:

- Impeller assembly
- Turbine and damper assembly
- Reactor assembly
- Clutch

The standard torque converter components operate as follows:

- Rotation of the converter housing and impeller set the transmission fluid in motion.
- The turbine reacts to the transmission fluid motion from the impeller, transferring rotation to the geartrain through the input shaft.
- The reactor redirects transmission fluid going back into the impeller, allowing for torque multiplication.
- The clutch and damper assembly dampens powertrain torsional vibration and provides a direct mechanical connection for improved efficiency.
- Power is transmitted from the torque converter to the planetary gearsets and other components through the input shaft.

Geartrain

Power is transmitted from the torque converter to the planetary gearsets through the input shaft. Bands and clutches are used to hold and drive certain combinations of gearsets. This results in 5 forward ratios and 1 reverse ratio, which are transmitted to the output shaft and differential.

Gear Ratio	
1st	3.22 to 1
2nd	2.29 to 1
3rd	1.55 to 1
4th	1.00 to 1
5th	0.71 to 1
Reverse	3.07 to 1

Planetary Gearset - Overdrive (O/D)

For component location, refer to Transmission in this section.

The planetary gear Overdrive (O/D) carrier is driven by the input shaft.

- The O/D planetary gearset carrier drives the center shaft via the O/D One-Way Clutch (OWC) in 1st, 3rd, 4th and REVERSE gears.
- In 2nd and 5th gears the O/D sun gear is held causing the pinion gears to rotate around the O/D sun gear.
- The pinion gears, in turn, drive the O/D ring gear resulting in the 5th (O/D) gear ratio.
- The O/D planetary gearset is internally splined to the coast clutch for engine braking.

Planetary Gearset - Forward

For component location, refer to Transmission in the Assembly portion of this section.

The forward planetary gearset is splined to the output shaft.

- The forward planetary gearset is driven by the forward ring gear when the forward clutch is applied.
- The forward planetary gearset pinions drive the forward sun gear.
- The forward sun gear is splined to the input shell.
- The forward carrier is splined to the output shaft.

Planetary Gearset - Low/Reverse

For component location, refer to Transmission in the Assembly portion of this section.

The low/reverse planetary gearset is connected to the reverse brake drum by lugs from the low/reverse brake drum to the lugs of the low/reverse planetary gearset.

- The low/reverse planetary gearset is driven by the forward sun gear which is splined to the input shell.
- The forward sun gear drives the pinions in the low/reverse planetary gearset.
- The pinions of the low/reverse planetary gearset drive the output shaft ring gear and output shaft hub which is splined to the output shaft.
- The low/reverse planetary gearset can be held by the low One-Way Clutch (OWC) in the low/reverse brake drum or by the low/reverse band.

Input Shaft

For component location, refer to Transmission in the Assembly portion of this section.

- The radial positioning of the input shaft is controlled by 2 bushings in the stator support.
- Axial positioning of the input shaft is controlled by the splines in the converter turbine hub and the retaining ring in the O/D planetary carrier.

Output Shaft

For component location, refer to Transmission in this Assembly portion of this section.

The output shaft is supported by a bearing in the case and by a bearing in the extension housing. End positioning is controlled by the park gear and by the reverse ring gear hub and snap ring.

Apply Components

Band - Overdrive (O/D)

For component location, refer to Transmission in the Assembly portion of this section.

During 2nd and 5th gear operation, hydraulic pressure is applied to the Overdrive (O/D) servo.

- This pressure causes the piston to move and apply force to the band.
- This action causes the O/D band to hold the O/D drum.
- This causes the O/D sun gear to be held stationary through the adapter plate and the O/D drum.

Band - Low/Reverse

For component location, refer to Transmission in the Assembly portion of this section.

During 2nd gear operation, 1st gear operation and REVERSE, hydraulic pressure is applied to the low/reverse servo.

- This pressure causes the servo to move and apply force to the low/reverse band.
- This action causes the low/reverse brake drum to be held.
- This action causes the low/reverse planetary assembly to be held stationary.

Band - Intermediate

For component location, refer to Transmission in the Assembly portion of this section.

During 3rd gear operation, hydraulic pressure is applied to the intermediate servo.

- This pressure causes the servo to move and apply force to the intermediate band.
- This action causes the direct clutch drum to be held.
- The intermediate band holds the intermediate brake and direct clutch drum to the case in 3rd gear.
- This causes the input shell and forward sun gear to be held stationary.

Clutches - Direct

For component location, refer to Transmission in the Assembly portion of this section.

The direct clutch is a multi-disc clutch made up of steel and friction plates.

- The direct clutch is applied with hydraulic pressure and disengaged by return springs and the exhaust of the hydraulic pressure.
- It is housed in the direct clutch drum.
- During 4th, 5th and REVERSE gear application, the direct clutch is applied transferring torque from the forward clutch cylinder to the direct clutch drum.
- This action causes the forward sun gear to drive the pinions of the low/reverse planetary carrier.

Clutches - Forward

For component location, refer to Transmission in the Assembly portion of this section.

The forward clutch is a multi-disc clutch made up of steel and friction plates.

- The forward clutch is applied with hydraulic pressure and disengaged by return springs and the exhaust of the hydraulic pressure.
- The forward clutch is applied in all forward gears.
- When applied, the forward clutch provides a direct mechanical coupling between the center shaft and the forward ring gear and hub.

Clutches - Coast

For component location, refer to Transmission in the Assembly portion of this section.

The coast clutch is a multi-disc clutch made up of steel and friction plates.

- The coast clutch is applied with hydraulic pressure and disengaged by return springs and the exhaust of the hydraulic pressure.
- The coast clutch is housed in the O/D drum.
- The coast clutch is applied when in manual 1st and 3rd, 4th with O/D canceled, and REVERSE positions.
- When applied, the coast clutch locks the O/D sun gear to the overdrive planetary carrier, thus preventing the one-way clutch from overrunning when the vehicle is coasting.
    - ♦ This allows the use of engine compression to help slow the vehicle and provide engine braking.

One-Way Clutch (OWC) - Low/Reverse

For component location, refer to Transmission in this section.

The low/reverse One-Way Clutch (OWC) is a sprag-type OWC .

- The low/reverse OWC holds the low/reverse drum and low/reverse planetary assembly to the case in 1st and 2nd gear.
- In all other gears the low/reverse OWC overruns.

OWC - O/D

For component location, refer to Transmission in this section.

The O/D OWC is a sprag-type OWC that connects the input shaft to the center shaft during drive operation.

The O/D OWC transmits torque in REVERSE, 1st, 3rd and 4th gears, as well as in manual 1st, manual 3rd and manual 4th gears.

- The input shaft connects through the O/D planetary carrier to the inner race.
- The outer race is part of the center shaft.
- The inner race contacts the assembly of sprags, and wedges them between the inner and outer races.

- The wedging action causes the input shaft and center shaft to be connected.

Hydraulic System

Transmission Fluid Pump

For component location, refer to Transmission in the Assembly portion of this section.

- The transmission fluid pump provides the transmission fluid pressure necessary to charge the torque converter, main control assembly, transmission cooling system, lubrication system and apply devices.
- The transmission fluid pump is a positive displacement, gear-type pump.
    - The transmission fluid pump is driven by the torque converter impeller hub.

Transmission Fluid Filter

For component location, refer to Transmission in the Assembly portion of this section.

- All transmission fluid drawn from the transmission fluid pan by the fluid pump passes through the transmission fluid filter.
- The transmission fluid filter and its accompanying seals are part of the transmission fluid path from the sump (pan) to the fluid pump.
    - The transmission fluid filter has a bypass section which allows transmission fluid vented at the main regulator valve to be recirculated to the fluid pump, without passing through the transmission fluid filter.

Main Control

For component location, refer to Transmission in the Assembly portion of this section.

- The main control assembly and related components are part of the pressure side of the hydraulic system.
- The main control assembly consists of the solenoids, the valve body assembly and the separator plate.
- These components combine to convert electrical signals into hydraulic actions.
    - All valves in the main control assembly are anodized aluminum and cannot be sanded, filed or dressed in any other way. If there is any damage to the valves that prevents or restricts their movement, install a new main control assembly.

Transmission Electronic Control System

Electronic System Description

The PCM and its input/output network control the following transmission operations:

- Shift timing
- Line pressure (shift feel)
- Torque Converter Clutch (TCC)

The transmission control strategy combined with the engine control provides optimum powertrain operation under all conditions. When determining the best operating strategy for transmission operation, the PCM uses input information from engine-related and driver-demand related sensors and switches.

In addition, the PCM receives input signals from transmission-related sensors and switches. The PCM also uses these signals when determining transmission operating strategy.

Using all of these input signals, the PCM can determine when the time and conditions are right for a shift or when to apply or release the TCC . It will also determine the pressure needed to optimize shift feel. To accomplish this, the PCM uses 3 pressure controls, 1 TCC and 4 shift solenoids to control transmission operation.

The following provides a brief description of each of the sensors and actuators used to control transmission operation.

PCM

The operation of the transmission is controlled by the PCM. Many input sensors provide information to the PCM. The PCM then controls the actuators which determine transmission operation.

A/C Clutch

An electromagnetic clutch is energized when the clutch cycling pressure switch closes. The switch is located on the suction accumulator/drier. The closing of the switch completes the circuit to the clutch and draws it into engagement with the compressor driveshaft. When the A/C is engaged, operating pressures are adjusted to compensate for additional load on the engine.

Brake Pedal Position (BPP) Switch

The Brake Pedal Position (BPP) switch tells the PCM when the brakes are applied. The TCC disengages when the brakes are applied. The BPP switch closes when the brakes are applied and opens when they are released. The BPP is also used to disengage the Brake Shift Interlock Actuator (BSIA) solenoid.

Engine Coolant Temperature (ECT) Sensor

The Engine Coolant Temperature (ECT) sensor detects temperature of engine coolant and provides this information to the PCM. The ECT sensor is used to control TCC operation.

Electronic Ignition (EI) System

The Electronic Ignition (EI) consists of a Crankshaft Position (CKP) sensor, ignition coils and the PCM. The EI control module operates by sending CKP from the CKP sensor to the EI control module. The EI control module generates a profile ignition pickup signal (engine rpm) and sends it to the PCM. The PCM uses profile ignition pickup signal in the transmission strategy, Wide Open Throttle (WOT) shift control, TCC control and operating pressures.

Intake Air Temperature (IAT) Sensor

The Intake Air Temperature (IAT) sensor provides the Sequential Multi-Port Fuel Injection (SFI) system mixture temperature information. The IAT sensor is used both as a density corrector for air flow calculation and to proportion cold enrichment fuel flow. The IAT sensor is installed in the Air Cleaner (ACL) outlet tube. The IAT sensor is also used in determining control pressures.

Mass Air Flow (MAF) Sensor

The Mass Air Flow (MAF) sensor measures the air flowing into the engine. The MAF sensor output signal is used by the PCM to calculate injector pulse width. For transmission strategies, the MAF sensor is used to regulate Electronic Pressure Control (EPC), shift scheduling and TCC control.

Transmission Control Switch (TCS)

The Transmission Control Switch (TCS) is a momentary contact switch that allows the driver to cancel operation of 5th gear.

The TCS is located on the end of the selector lever.

When the driver presses the TCS , a signal is sent to the PCM.

The PCM uses the shift solenoids to disengage/disable 5th gear operation and activate the coast clutch.

At the same time, the PCM illuminates the Transmission Control Indicator Lamp (TCIL) to notify the driver that 5th gear is canceled.

When the TCS is pressed again, 5th gear operation is enabled, the coast clutch is released and the TCIL is turned off.

Whenever the ignition is cycled, the TCS is turned off and 5th gear will be enabled, even if the TCS had been on when the ignition was cycled off.

Transmission Control Indicator Lamp (TCIL)

The TCIL is located in the Instrument Cluster (IC) and is labeled O/D OFF. It is illuminated in conjunction with the TCS .

Throttle Position (TP) Sensor

The Throttle Position (TP) sensor is a potentiometer mounted on the throttle body. The TP sensor detects the position of the throttle plate and provides this information to the PCM. The TP sensor is used for shift scheduling, EPC and TCC control.

Accelerator Pedal Position (APP) Sensor

The Accelerator Pedal Position (APP) sensor is mounted on the accelerator pedal. The APP sensor detects the position of the accelerator pedal and provides this information as a voltage signal to the PCM. The PCM uses the APP sensor information to aid in determining shift scheduling, EPC and TCC control.

Transmission Range (TR) Sensor

The Transmission Range (TR) sensor is located on the outside of the transmission at the manual control lever. The TR sensor completes the start circuit in PARK, NEUTRAL and the back-up lamp circuit in REVERSE. The TR sensor also opens and closes a set of 4 switches that are monitored by the PCM to determine the position of the manual control lever (P, R, N, (D), 3, 2, 1).

Turbine Shaft Speed (TSS) Sensor

The Turbine Shaft Speed (TSS) sensor is a magnetic pickup that sends the PCM torque converter turbine speed information.

The TSS sensor is mounted externally on the case.

The PCM uses TSS information to help determine appropriate operating pressures and TCC operation.

Output Shaft Speed (OSS) Sensor

The Output Shaft Speed (OSS) sensor is a magnetic pickup, located at the park gear trigger wheel assembly, that sends a signal to the PCM to indicate transmission output shaft speed. The OSS sensor is mounted externally on the case. The OSS is used for TCC control, shift scheduling and to determine line pressure.

Intermediate Shaft Speed Sensor

The intermediate shaft speed sensor is a magnetic pickup that sends planetary sun gear speed information to the PCM. It is mounted externally on the center of the case.

The PCM uses the intermediate shaft speed sensor information to aid in determining pressure requirements.

Pressure Control Solenoids

The pressure control solenoids are a Variable Force Solenoid (VFS) solenoid. The VFS -type solenoid is an electrohydraulic actuator combining a solenoid and a regulating valve.

The line pressure tap is used to verify output pressure from Pressure Control Solenoid A (PCA) or Pressure

Control Solenoid B (PCB) by turning either one off while verifying the output from the other solenoid. The second pressure tap is used to verify the output from the Pressure Control Solenoid C (PCC) solenoid.

There are 3 pressure control solenoids located in the solenoid body assembly used to control line pressure, band and clutch application pressure within the transmission.

The PCM varies the current to the pressure control solenoid.

The PCM has an adaptive learn strategy to electronically control the transmission which will automatically adjust the shift feel. When the battery has been disconnected or a new battery installed, certain transmission operating parameters may be lost. The PCM must relearn these parameters. During this learning process you may experience slightly firm shifts, delayed or early shifts. This operation is considered normal and will not affect the function of the transmission. Normal operation will return once these parameters are stored by the PCM.

Torque Converter Clutch (TCC) Solenoid

The TCC solenoid is a Pulse-Width Modulation (PWM) solenoid which is used to control the apply and release of the TCC .

Shift Solenoids - Shift Solenoid A (SSA), Shift Solenoid B (SSB), Shift Solenoid C (SSC), Shift Solenoid D (SSD)

Four ON/OFF shift solenoids allow the PCM to control shift scheduling.

- The solenoids are 3-way, normally closed.
- The shift solenoids, SSA , SSB , SSC and SSD , provide gear selection of 1st through 5th and REVERSE gears by directing fluid pressure to the appropriate elements.

Coast braking and manual gears are also controlled by the shift solenoids.

Transmission Fluid Temperature (TFT) Sensor

- The Transmission Fluid Temperature (TFT) sensor is a thermistor-type sensor that varies a reference voltage signal. The resistance in the TFT varies with temperature. The PCM monitors the voltage signal across the TFT and uses this information to determine the TFT .
- The TFT is located on the solenoid body.
- The PCM uses the TFT signal to determine shift scheduling, TCC control and pressure control requirements.

It sends a voltage signal to the PCM. The voltage signal varies with TFT . The PCM uses this signal to determine whether to use a cold start shift schedule. The shift schedule is compensated when the TFT is cold. The PCM also inhibits TCC operation at low TFT and uses it to determine pressure control solenoid operations.

Preliminary Inspection

Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V

The following items must be checked prior to beginning the diagnostic procedures:

Know and Understand the Concern

In order to correctly diagnose a concern, first understand the customer complaint or condition. Customer contact may be necessary in order to begin to verify the concern. Understand the condition as to when the concern occurs, for example:

- Hot or cold vehicle temperature
- Hot or cold ambient temperature
- Vehicle driving conditions
- Vehicle loaded/unloaded

After understanding when and how the concern occurs, proceed to verify the concern.

Verification of Condition

This section provides information that must be used in determining the actual cause of customer concerns and executing the appropriate procedures.

The following procedures must be used when verifying customer concerns for the engine.

Determine Customer Concern

NOTE: Some transmission conditions can cause engine concerns. An Electronic Pressure Control (EPC) short circuit can cause engine misfiring. The Torque Converter Clutch (TCC) not disengaging may cause the engine to stall.

Determine customer concerns relative to vehicle use and dependent driving conditions, paying attention to the following items:

- Hot or cold vehicle operating temperature
- Hot or cold ambient temperatures
- Type of terrain
- Vehicle loaded/unloaded
- City/highway driving
- Upshift

- Downshift
- Coasting
- Engagement
- Noise/vibration - check for dependencies, either rpm dependent, vehicle speed dependent, shift dependent, gear dependent, range dependent or temperature dependent.

Check Transmission Fluid Level and Condition

NOTICE: **The vehicle should not be driven if the transmission fluid level is low or internal failure may result.**

NOTE: If the vehicle has been operated for an extended period of time at highway speeds, in city traffic, in hot weather or while pulling a trailer, the transmission fluid needs to cool down 30 minutes to obtain an accurate reading.

This vehicle is not equipped with a transmission fluid level indicator. An incorrect transmission fluid level may affect the transmission operation and could result in transmission damage. To correctly check and add transmission fluid to the transmission, refer to Transmission Fluid Level Check in this section.

High Transmission Fluid Level

A transmission fluid level that is too high may cause the transmission fluid to become aerated due to the churning action of the rotating internal parts. This will cause erratic control pressure, foaming, loss of transmission fluid from the vent tube and possible transmission damage. Refer to Transmission Fluid Level Check in this section to correct a possible overfill condition.

Low Transmission Fluid Level

A low transmission fluid level can result in poor transmission engagement, slipping or damage. This can also indicate a leak in one of the transmission seals or gaskets.

Adding Transmission Fluid

NOTICE: **Do not use water-based cleaners, mineral spirits, brake cleaner or solvents that may contain acetone, xylene or heptane to clean and/or flush the transmission assembly, transmission components and the torque converter or transmission damage will occur. Use transmission fluid designated for the transmission/converter being serviced.**

NOTICE: **The use of any type of transmission fluid other than specified may result in transmission damage.**

If transmission fluid needs to be added, add transmission fluid in 0.25L (1/2 pt) increments through the transmission fluid level plug in the bottom of the transmission fluid pan. Do not overfill the transmission fluid. For transmission fluid filling, refer to Transmission Fluid Level Check in this section. For transmission fluid type, refer to General Specifications in this section.

Transmission Fluid Condition Check

1. Check the transmission fluid level. Only remove the small (center) plug for this procedure.

2. Observe the color and the odor of the transmission fluid. Under normal circumstances the color should be a dark red but not brown or black.

3. Allow the transmission fluid to drip onto a facial tissue and examine the stain.

4. If evidence of solid material is found, the transmission fluid pan should be removed for further inspection. Inspect the transmission fluid pan for any visible debris (metal particles or clutch material).

5. If transmission fluid contamination or transmission failure is confirmed by the sediment in the bottom of the transmission fluid pan, the transmission must be disassembled and completely cleaned. If the vehicle is equipped with an auxiliary transmission fluid cooler a new auxiliary transmission fluid cooler must be installed.

6. Carry out diagnostic checks and adjustments. Refer to Diagnosis By Symptom in this section.

Water in Transmission Fluid

To correctly repair an automatic transmission or transaxle that has had water or coolant introduced into the system, completely disassemble, clean and replace the following parts:

- All internal and external seals
- All friction material; clutches and bands
- Torque converter
- All parts with bonded seals
- All solenoids
- All transmission fluid filters

Prior to installing the transmission or transaxle, the transmission fluid cooler(s), transmission fluid cooler tubes and transmission fluid cooler hoses need to be flushed and cleaned.

Road Testing Vehicle

NOTE: Always drive the vehicle in a safe manner according to driving conditions and obey all traffic laws.

NOTE: When the battery has been disconnected or a new battery installed, certain transmission operating parameters may be lost. The PCM must relearn these parameters. During this learning process, slightly firm shifts, delayed or early shifts may be experienced. This operation is considered normal and will not affect the function of the transmission. Normal operation will return once these parameters are stored by the PCM.

The Shift Point Road Test and Torque Converter Clutch (TCC) Operation Test provide diagnostic information on transmission shift controls and torque converter operation.

Shift Point Road Test

This test verifies that the shift control system is operating correctly.

1. Bring engine and transmission up to normal operating temperature.
2. Operate the vehicle with the selector lever in the (D) position.
3. Apply minimum throttle and observe the speeds at which an upshift occurs and the torque converter engages. Refer to the following Shift Speeds chart.
4. Stop the vehicle. Press Transmission Control Switch (TCS) to cancel the Overdrive (O/D) range. Repeat Step 3. Transmission will make all upshifts except 4-5 and Torque Converter Clutch (TCC) apply should occur above 46 km/h (29 mph).
5. Press the accelerator pedal to the floor, Wide Open Throttle (WOT). The transmission should shift from 3rd to 2nd or 3rd to 1st, depending on vehicle speed and TCC should release.
6. With vehicle speed above 48 km/h (30 mph), move the selector lever from the (D) position to manual 1st gear position and release the accelerator pedal. The transmission should immediately downshift to 3rd gear. When vehicle speed drops below 32 km/h (20 mph), the transmission should downshift into 1st gear.
7. If transmission fails to upshift/downshift or TCC does not apply/release, refer to Diagnosis By Symptom in this section for possible causes.

Shift Speeds

Throttle Position	(D) Shift	Axle Ratio All Shift Speed
Closed	5-4	43-50 km/h (27-31 mph)
	4-3	27-31 km/h (17-19 mph)
	3-1	7-21 km/h (11-13 mph)
Minimum	1-2	19-23 km/h (12-14 mph)
Monitor PID:	2-3	27-31 km/h (17-19 mph)
TP volt-1.25	3-4	32-37 km/h (20-24 mph)
	4-5	37-63 km/h (23-39 mph)
Wide Open	1-2	66-72 km/h (41-45 mph)
	2-3	93-100 km/h (58-62 mph)
	3-4	140-150 km/h (87-93 mph)

Torque Converter Diagnosis

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Prior to installing a new torque converter, all diagnostic procedures must be followed. This is to prevent the unnecessary installation of a good torque converter. Only after a complete diagnostic evaluation can the decision be made to install a new or remanufactured torque converter.

Begin with the normal diagnostic procedures as follows:

1. Preliminary inspection.

2. Know and understand the customer concern.

3. Verify the concern - carry out the Torque Converter Clutch (TCC) Operation Test. Refer to Torque Converter Operation Test in this section.

4. Carry out diagnostic procedures.

- Run On-Board Diagnostic (OBD). See On-Board Diagnostics with Scan Tool. Refer to Diagnostics in this section.
  - ♦ Repair all non-transmission related DTCs first.
  - ♦ Repair all transmission DTCs.
  - ♦ Rerun OBD test to verify repair.
- Carry out the Line Pressure Test. Refer to Special Testing Procedures in this section.
- Carry out the Stall Speed Test. Refer to Special Testing Procedures in this section.
- Carry out the Diagnosis by Symptom Index. Refer to Diagnosis By Symptom in this section.
  - ♦ Use the index to locate the appropriate routine that best describes the symptom(s). The routine will list all possible components that may cause or contribute to the symptom. Check each component listed, diagnose and service as necessary before servicing the torque converter.

Torque Converter Operation Test

This test verifies that the TCC control system and the torque converter are operating correctly.

1. Carry out the Self Test. See On-Board Diagnostics with Scan Tool. Refer to Diagnostics in this section. Check for DTCs. Refer to the Diagnostic Trouble Code (DTC) Charts in this section.

2. Connect a scan tool to the vehicle and monitor engine rpm.

3. Bring the engine to normal operating temperature by driving the vehicle at highway speeds in the (D) position.

4. After normal operating temperature is reached, maintain a constant vehicle speed of about 80 km/h (50 mph) and tap the brake pedal with the left foot.

5. The engine rpm should increase when the brake pedal is tapped and decrease about 5 seconds after the pedal is released. If this does not occur, refer to Torque Converter Operation Concerns in Diagnosis By Symptom in this section.

6. If the vehicle stalls in (D) or MANUAL 2 at idle with the vehicle stopped, move the selector lever to MANUAL 1 position. If the vehicle stalls, refer to Diagnosis By Symptom , Torque Converter Operation Concerns in this section. Repair as necessary. If the vehicle does not stall in (D), refer to Diagnosis By Symptom in this section.

Visual Inspection

This inspection will identify modifications or additions to the vehicle operating system that may affect diagnosis. Inspect the vehicle for non-Ford factory add-on devices such as:

- Electronic add-on items:
  - A/C
  - generator (alternator)
  - engine turbo
  - cellular telephone
  - cruise control
  - CB radio
  - linear booster
  - backup alarm signal
  - computer
- Vehicle modification:
