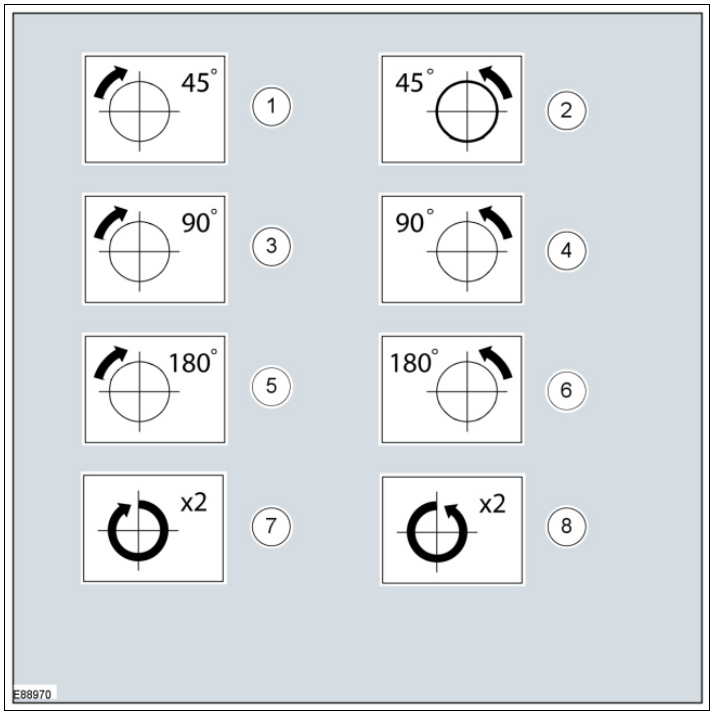
Symbols Glossary

Symbols are used inside the graphics and in the text area to enhance the information.

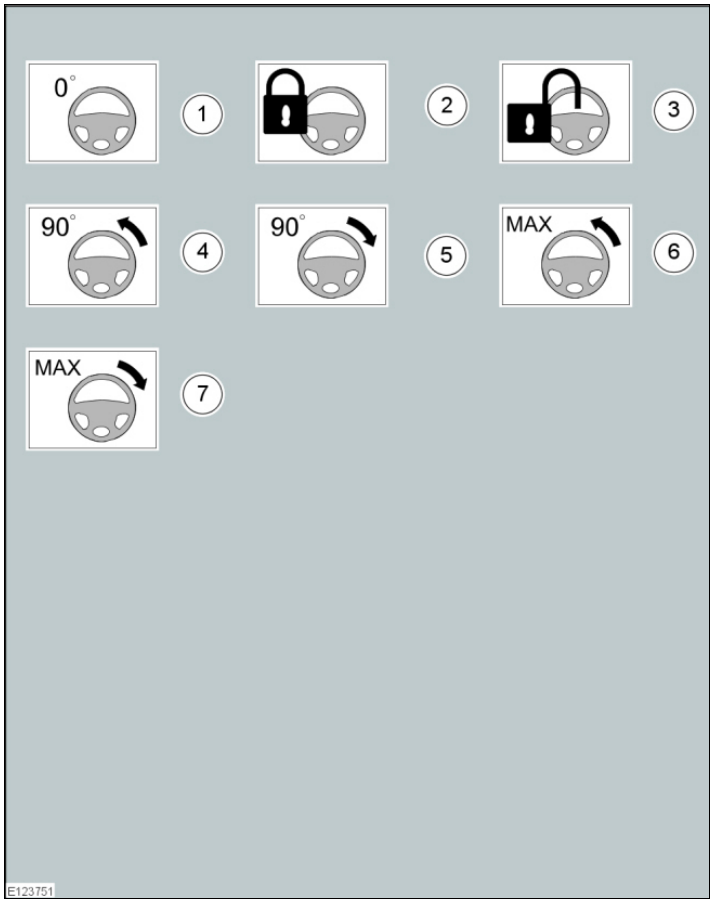
Movement Symbols



Movement symbols provide detailed information to a required component movement. These component movements can be rotational or 1-3 dimensional movements.

Item	Description
1	Minor component movement clockwise/counterclockwise
2	Major component movement clockwise/counterclockwise
3	Component movement to the left/right/up/down
4	Component movement towards/away
5	3 dimensional component movement
6	2 dimensional component movement
7	3 dimensional component rotation
8	3 dimensional component cycling

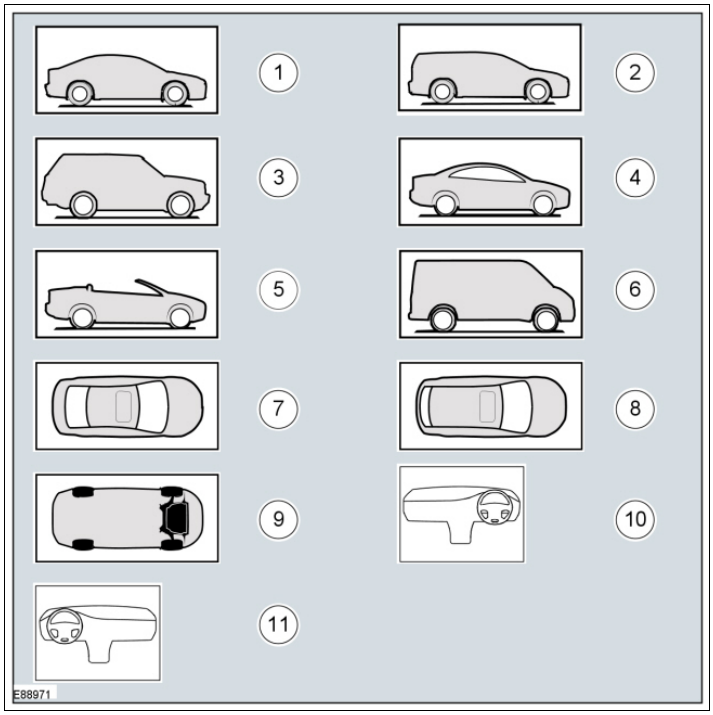
Turn Symbols



Turn symbols are used to provide further information on the direction or angle of component turns.

Item	Description
1	Turn the component clockwise through 45°
2	Turn the component counterclockwise through 45°
3	Turn the component clockwise through 90°
4	Turn the component counterclockwise through 90°
5	Turn the component clockwise through 180°
6	Turn the component counterclockwise through 180°
7	Turn the component clockwise through 2 complete turns
8	Turn the component counterclockwise through 2 complete turns

Steering Wheel Symbols

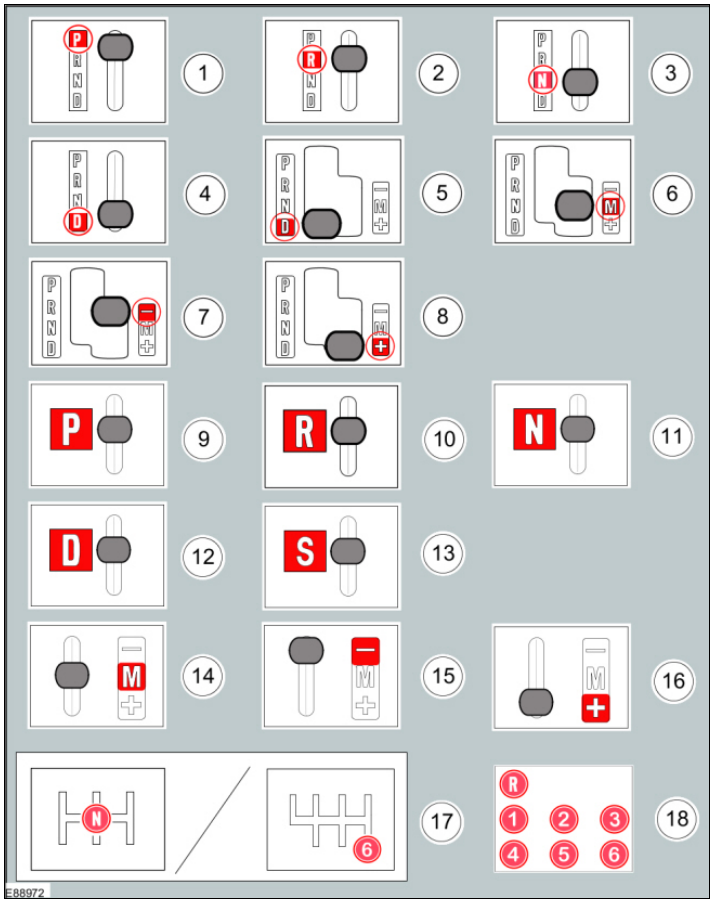


Steering wheel symbols are used to provide further information to a required steering wheel position or steering column lock status.

Item	Description
1	Steering wheel in straight ahead position
2	Steering column lock locked
3	Steering column lock unlocked
4	Turn the steering wheel to the 90° left position
5	Turn the steering wheel to the 90° right position
6	Turn the steering wheel to the left-hand end position
7	Turn the steering wheel to the right-hand end position

Body Types

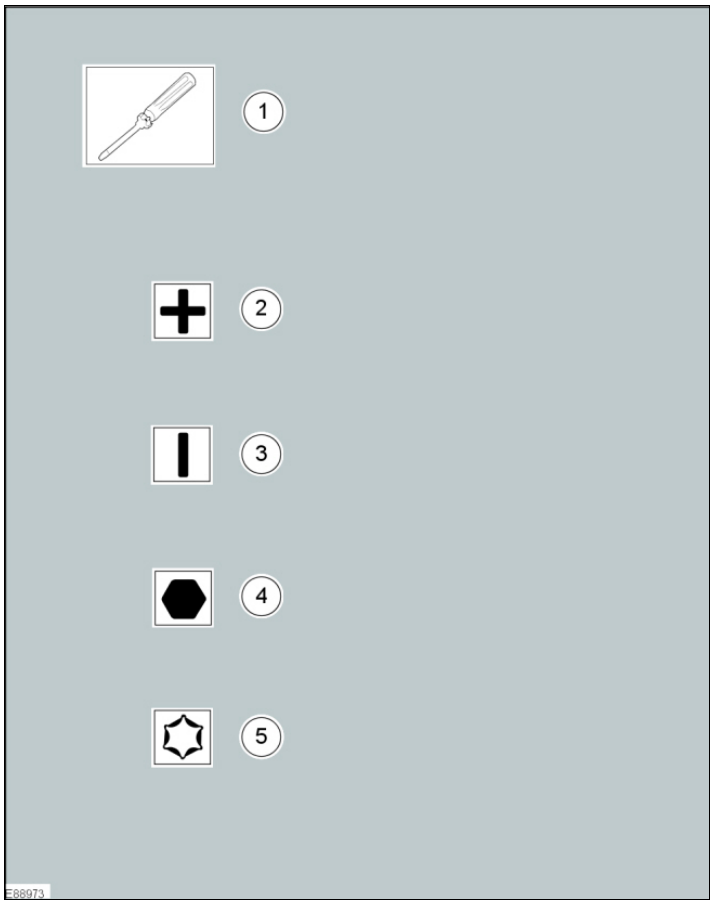
Body type symbols are used to identify different body configurations.



Item	Description
1	3, 4, 5-door body style
2	Wagon body style
3	Sport utility vehicle body style
4	Coupe body style
5	Convertible body style
6	Van body style
7	3, 4, 5-door body style - Top View
8	Wagon body style - Top View
9	Underbody view
10	Right-hand drive (RHD) vehicle
11	Left-hand drive (LHD) vehicle

Gearshift lever and selector lever position symbols

Gearshift lever and selector lever position symbols are used to show the lever position that is required to be selected to carry out a procedure step.

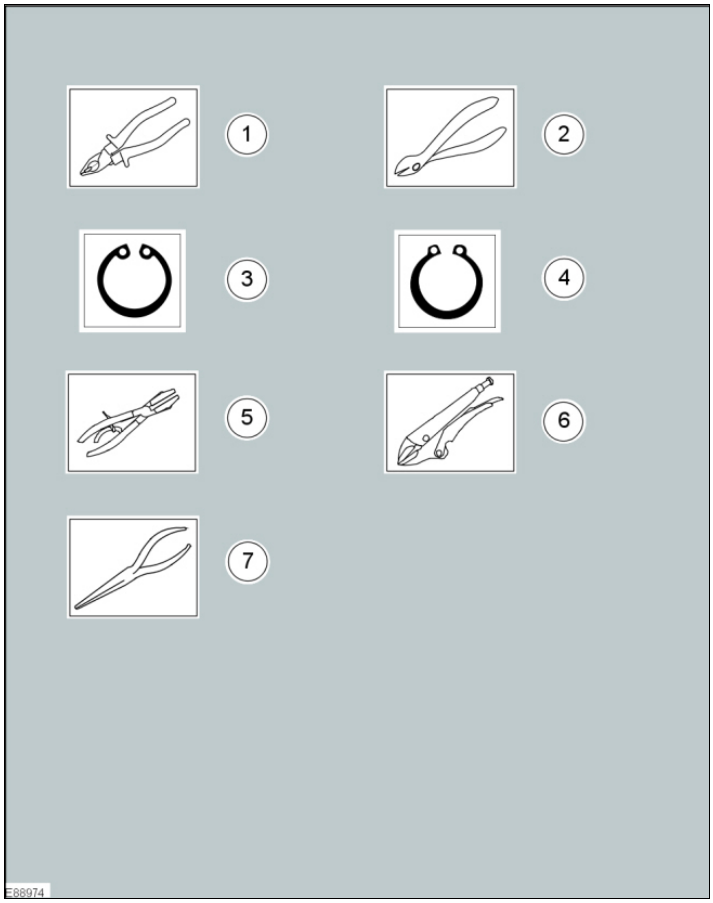


tomsn048@gmail.com

Item	Description
1	Replaced by symbol 9
2	Replaced by symbol 10
3	Replaced by symbol 11
4	Replaced by symbol 12
5	Replaced by symbol 12
6	Replaced by symbol 14
7	Replaced by symbol 15
8	Replaced by symbol 16
9	Set the selector lever to the park (P) position
10	Set the selector lever to the reverse (R) position
11	Set the selector lever to the neutral (N) position
12	Set the selector lever to the drive (D) position
13	Set the selector lever to the drive (S) position
14	Set the selector lever to the drive (M) position
15	Set the selector lever to the drive (-) position
16	Set the selector lever to the drive (+) position
17	Set the gearshift lever to the neutral (N) position
18	Further gearshift lever positions that may appear in Illustrations

Screwdriver symbols

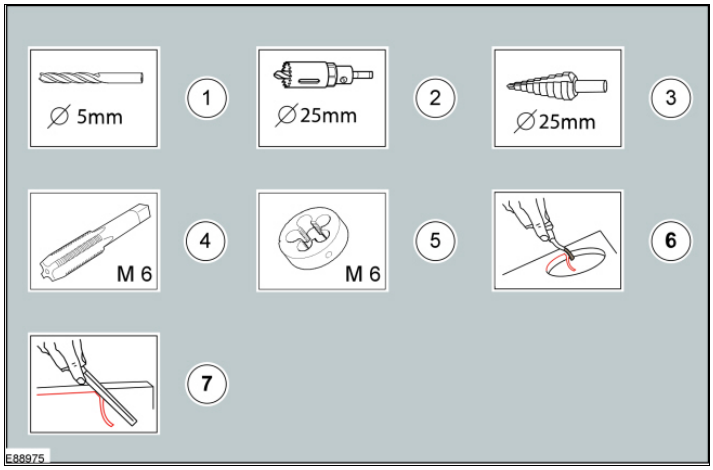
The screwdriver symbols are used to show which screwdriver bit is recommended to carry out a procedure step.



Item	Description
1	Screwdriver
2	Cross bladed screwdriver
3	Flat-bladed screwdriver
4	Hexagonal screwdriver
5	TORX screwdriver

Pliers Symbols

The plier symbols are used to show which pliers is recommended to carry out a procedure step.

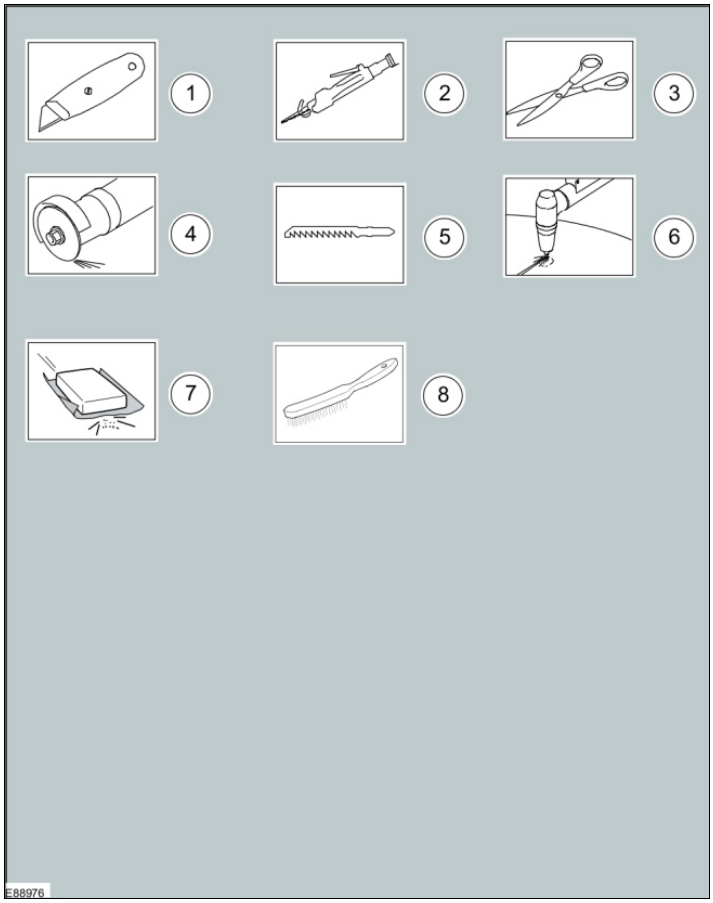


tomsn048@gmail.com

Item	Description
1	Combination pliers
2	Side cutter pliers
3	Securing ring - inner
4	Securing ring - outer
5	Hose clamp pliers
6	Locking pliers
7	Long nose pliers

Drill Symbols

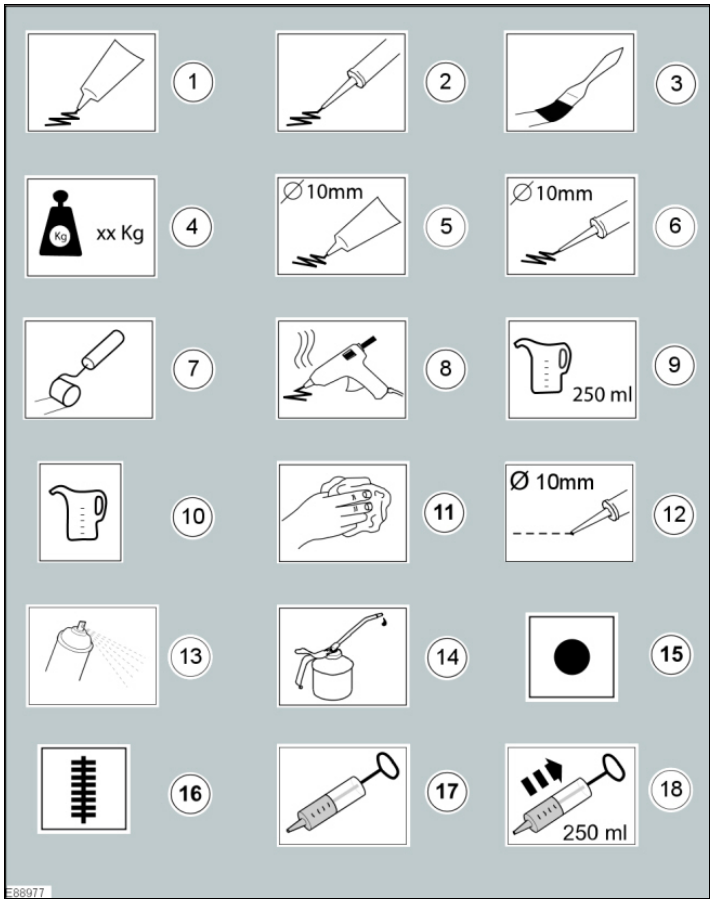
The drill symbols are used to show which type and size of drill bit is recommended to carry out a procedure step.



Item	Description
1	Drill bit with a specified diameter
2	Hole saw with a specified diameter
3	Stepped drill bit with a specified diameter
4	Tap with a specified diameter
5	Die with a specified diameter
6	Scraper for circular holes
7	Scraper for straight edges

Cutting Tool Symbols

The cutting tool symbols are used to show which type of cutting tool is recommended to carry out a procedure step.

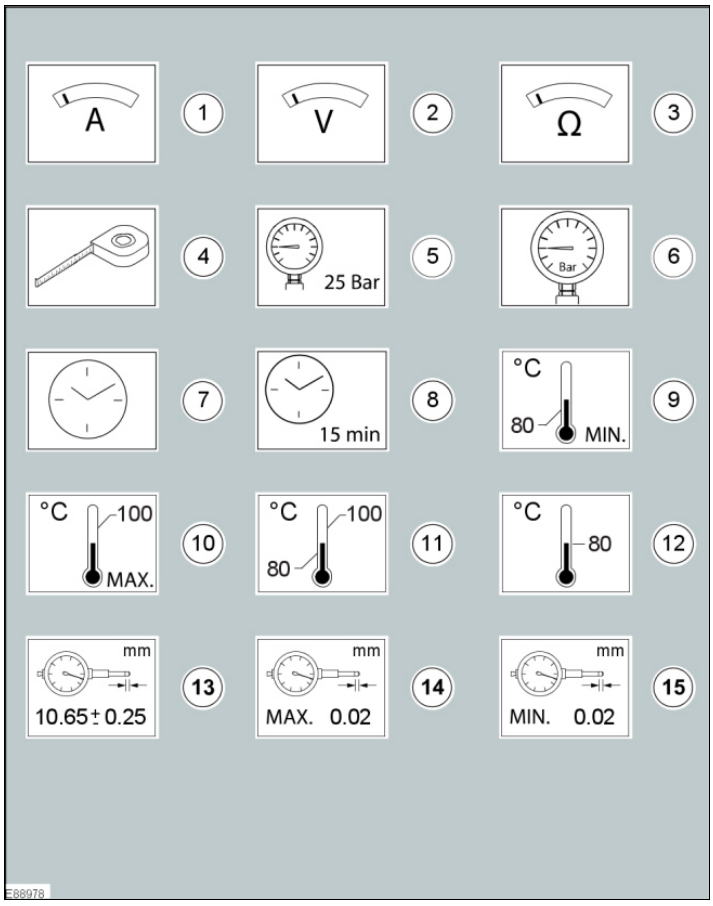


tomsn048@gmail.com

Item	Description
1	Cutting knife
2	Air body saw
3	Scissors
4	Grinder
5	Jig saw
6	Plasma cutter
7	Sanding Paper
8	Wire brush

Apply Chemical or load symbols

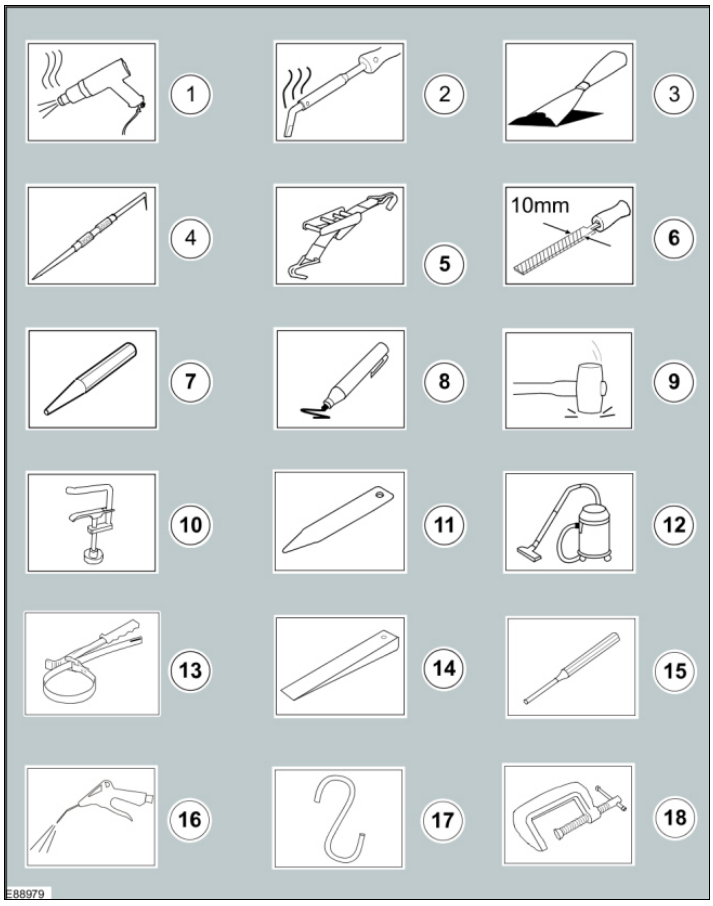
The apply chemical or load symbols are used to show where to apply which type of chemical or load to carry out a procedure step.



Item	Description
1	Apply the substance from the specified tube
2	Apply the substance from the specified cartridge
3	Apply the specified chemical with a brush
4	Apply the specified load to the specified component
5	Apply a bead with a specific diameter from the specified tube
6	Apply a bead with a specific diameter from the specified cartridge
7	Apply the specified chemical with a roller
8	Apply hot glue to the specified component
9	Apply the specified amount of fluid from the fluid can
10	Apply fluid from the fluid can
11	Clean the specified component with the specified material
12	Apply a broken bead from the specified tube
13	Apply the specified chemical from a spray can
14	Apply the specified lubricant to the specified component
15	Apply spot welds to the specified component
16	Apply a continuous weld to the specified component
17	Handle the fluid using a syringe
18	Extract the specified amount of fluid using a syringe

Measurement Symbols

tomsn048@gmail.com

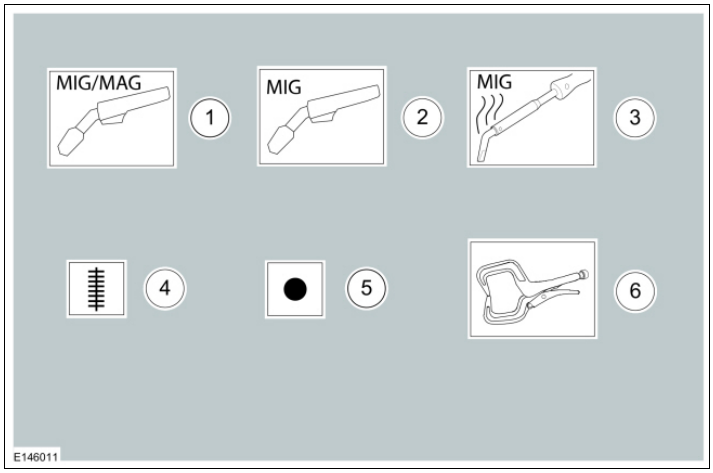


The measurement symbols are used to show where to measure which type of measurement to carry out a procedure step.

Item	Description
1	Measure the current using a digital multimeter
2	Measure the voltage using a digital multimeter
3	Measure the resistance using a digital multimeter
4	Measure the length/distance
5	Check that the specified pressure is available using a suitable pressure gauge
6	Measure the pressure at the specified port using a suitable pressure gauge
7	Measure the time using a suitable stopwatch
8	Wait for the specified period of time
9	The specified task requires the specified minimum temperature
10	The specified task requires the specified maximum temperature not to be exceeded
11	The specified task requires the specified temperature range
12	The specified task requires the specified temperature
13	Measure and check for the specified value using a dial indicator gauge
14	Measure and check for the specified MAX value using a dial indicator gauge
15	Measure and check for the specified MIN value using a dial indicator gauge

General equipment symbols

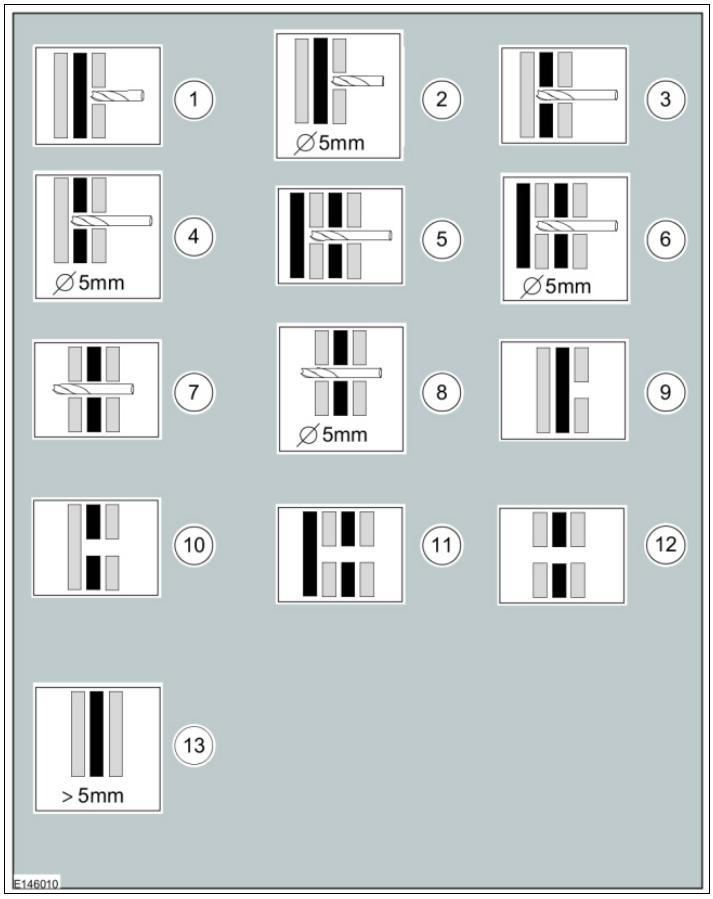
The general equipment symbols are used to show where to use which type of general equipment to carry out a procedure step.



Item	Description
1	Hot air gun
2	Soldering iron
3	Scraper
4	Scriber
5	Securing strap
6	File with specified size
7	Center punch
8	Marker
9	Mallet
10	Hose clamp
11	Interior trim remover
12	Vacuum cleaner
13	Strap wrench
14	Wedge
15	Pin punch
16	Air blow gun
17	Relocate and support the component

tomsn048@gmail.com

Welding Symbols

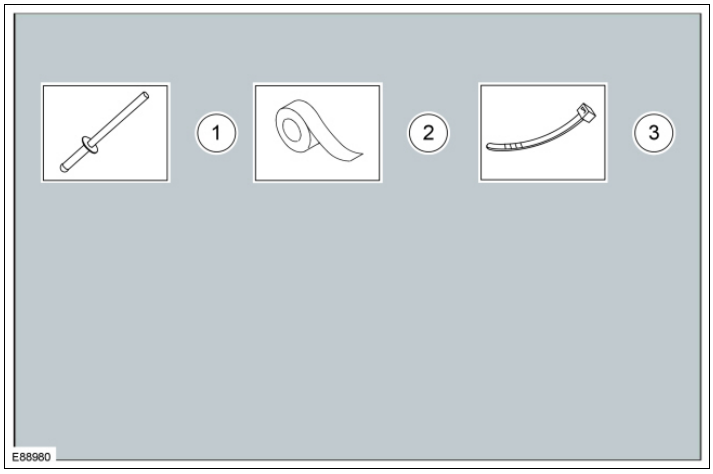


These symbols indicate the type of welding to be used.

Item	Description
1	Metal inert gas (MIG) / Metal active gas (MAG) welding equipment
2	Metal inert gas (MIG) welding equipment
3	Metal inert gas (MIG) brazing equipment
4	Apply a continuous weld to the specified component
5	Apply spot welds to the specified component
6	C-clamp

Drilling and grinding symbols

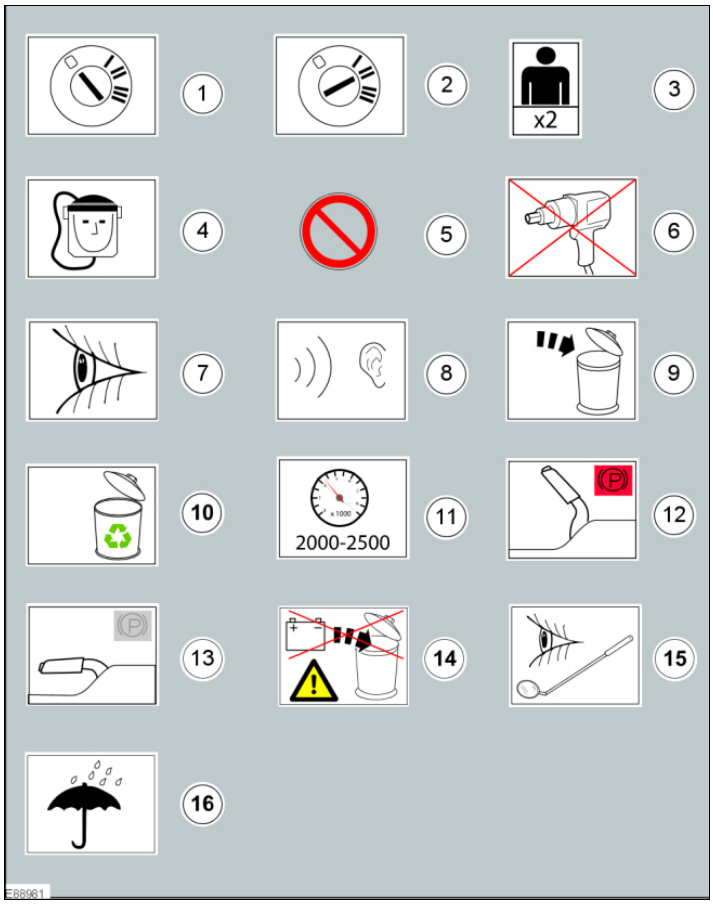
These symbols indicate the type of drilling or grinding to be used.



Item	Description
1	Drill through first body layer with a suitable diameter
2	Drill through first body layer with the specified diameter
3	Drill through the indicated number of body layers with a suitable diameter
4	Drill through the indicated number of body layers with the specified diameter
5	Drill through the indicated number of body layers with a suitable diameter
6	Drill through the indicated number of body layers with the specified diameter
7	Drill through all body layers with a suitable diameter
8	Drill through all body layers with the specified diameter
9	Grind one layer
10	Grind two layers
11	Grind to last layer
12	Grind all layers
13	Material thickness > Xmm

Material Symbols

The material symbols are used to show where to use which type of material to carry out a procedure step.

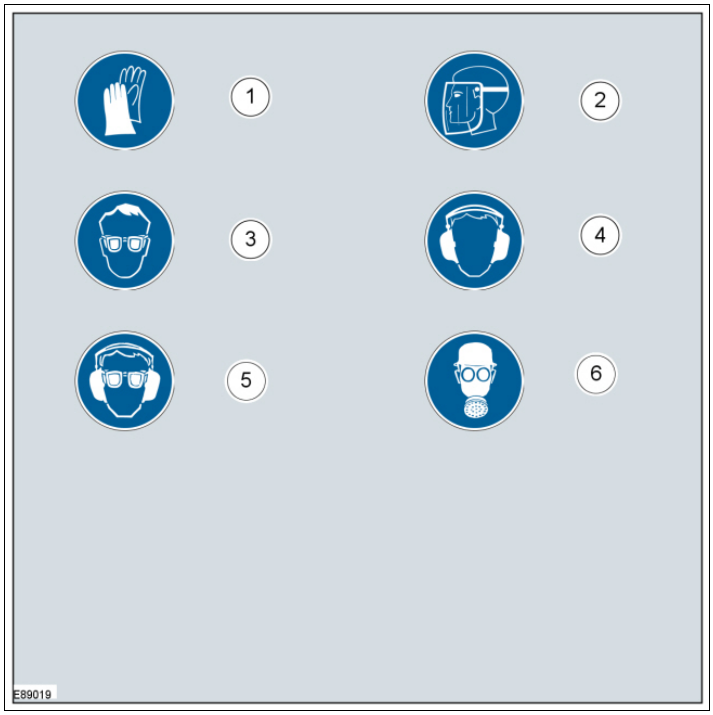


tomsn048@gmail.com

Item	Description
1	Remove/Install the specified blind rivet
2	Apply tape to the specified component/area
3	Remove/Install the specified cable tie

Miscellaneous Symbols

These symbols provide further information that is required to carry out a procedure step.

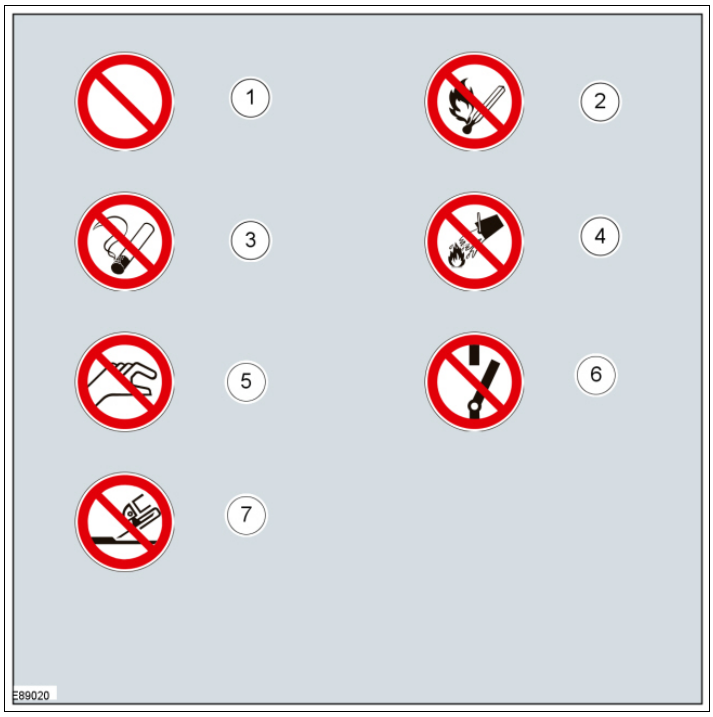


Item	Description

1	Set the ignition switch to the 0 position
2	Set the ignition switch to the II position
3	The procedure step requires the aid of the specified number of supporting technicians
4	Self contained breathing apparatus
5	General prohibition used in combination with another symbol
6	Do not use power tools
7	Visual check
8	Noise check
9	Dispose the specified component
10	Replaced by item 9 (Dispose the specified component)
11	Set the engine speed to the specified value
12	Fully apply the parking brake lever
13	Fully release the parking brake lever
14	Do not dispose of batteries into the waste bin
15	Visual check using a mirror
16	Area/component must be dry

Mandatory Protective Equipment - Health and safety symbols

The protective equipment symbols advise to use a mandatory protective equipment to avoid or at least reduce possible health and safety risks.

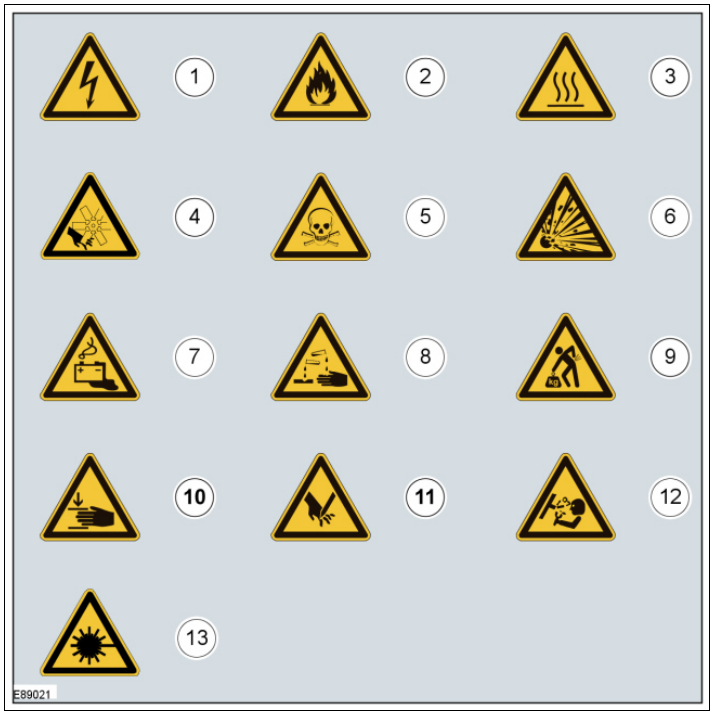


Item	Description
1	Wear protective gloves
2	Wear face guard
3	Wear safety goggles

tomsn048@gmail.com

4	Wear ear protectors
5	Wear safety goggles and ear protectors
6	Wear a respirator

Prohibition - Health and safety symbols and component damage

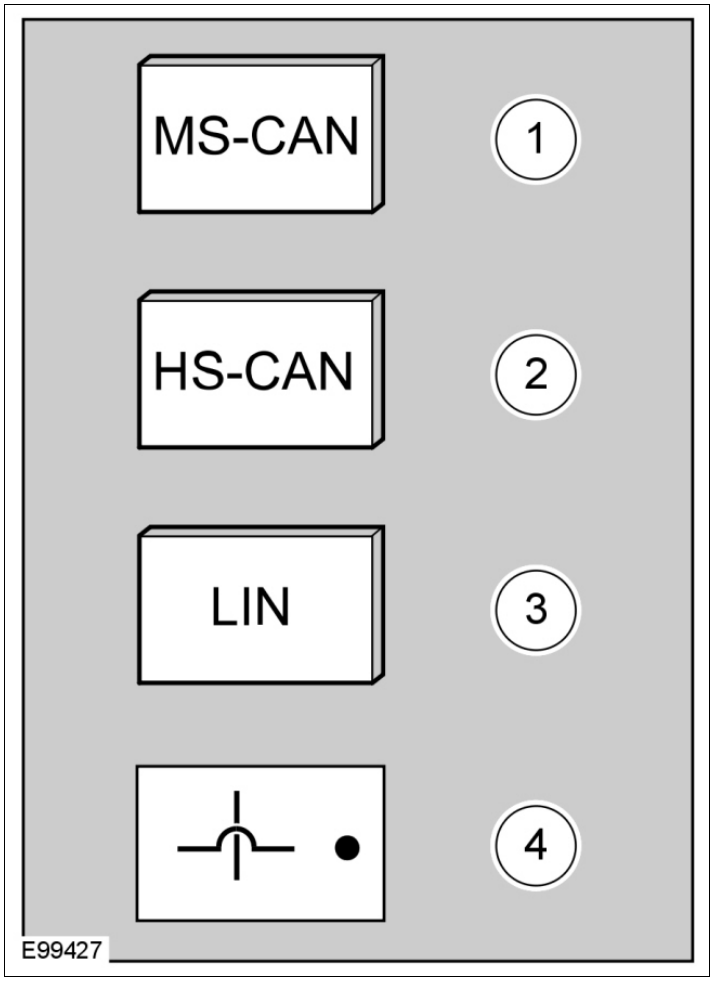


The prohibition symbols are used to prohibit the specified actions to avoid or at least reduce possible component damage and health and safety risks.

Item	Description
1	General Prohibition symbol
2	No naked flames
3	No smoking
4	No water
5	Do not touch
6	Do not switch
7	No grinding

Warning Symbols - Health and Safety Warnings and Component damage

The warning symbols are used to advise on hazardous conditions to avoid or at least reduce possible component damage and health and safety risks.



Item	Description
1	Hazardous voltage/Electrical shock/Electrocution
2	Fire hazard/Highly flammable
3	Burn hazard/Hot surface
4	Automatic start-up
5	Toxic
6	Explosive material
7	Battery hazard
8	Corrosive material
9	Lifting hazard
10	Hand crush/Force from above
11	Cutting of fingers or hand
12	Pressure hazard
13	Invisible laser radiation. Do not view directly with optical instruments (magnifiers). Class 1M laser product

Control Diagram symbols - Description and Operation procedures

These symbols provide further information on the type of connectivity, direction of flow or type of data bus of a system.

tomsn048@gmail.com

Item	Description
1	Medium Speed Controller Area Network
2	High Speed Controller Area Network
3	Local Interconnect Network
4	Wires cross but are not connected

tomsn048@gmail.com

Using This Manual

Introduction

This manual describes and directs repair procedures for this vehicle model year. It includes diagnostics for all vehicle systems except driveability and emission control. Refer to the separate Powertrain Control/Emissions Diagnosis (PC/ED) manual for driveability and emission control diagnostics.

Information is organized into groups, with sections that have subsections dividing them.

Warnings, Notices, and Notes in This Manual

Warnings provide information to avoid personal injury and to make sure service actions on critical safety systems are performed correctly.

Notices provide information to avoid damage to the vehicle or a component.

Notes provide information critical for a complete and effective repair.

Warnings that apply to an entire system or workshop manual section are located in section 100-00 Description and Operation Safety Warnings .

Warnings, Notices, or Notes that apply to an entire procedure will be placed at the beginning of the procedure.

Warnings, Notices, or Notes that apply to a single step are placed at the beginning of the step. Those that apply to a group of steps will be placed at the first step requiring it.

Vehicle and Engine Orientation Identifiers

LH and RH vehicle designations are oriented from the driver's seat position looking forward. LH and RH engine designations are oriented from the flywheel position looking towards the crankshaft pulley.

How to Use Diagnostic Information

DTC and Symptom Charts

Module DTC Charts are used to begin and direct the diagnosis of a DTC. Symptom Charts contain concern symptoms and direct solutions either in the chart or in a linked Diagnostic Routine. Both DTC and Symptom Charts may provide the solution within the chart, or provide a link to the appropriate Diagnostic Routine.

In some sections, the Symptom Chart is preceded by a Preliminary Inspection which must be followed prior to using the Symptom Chart

Using Module DTC Charts

This Workshop Manual contains diagnostics for DTCs set by vehicle modules. Driveability and emission DTCs are covered in the separate Powertrain Control/Emissions Diagnosis (PC/ED) manual. If a PCM-set DTC is not listed in the Workshop Manual, it is serviced in the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

DTC diagnostics are found in both on-line and printed publications and are used as follows:

- On-line publications: Using the left side menu, click on the Master DTC Chart link to view the vehicle module DTC charts. Each module has a chart with links or in-chart solutions for all DTCs diagnosed in the Workshop Manual.
- Printed publications: Use the DTC index in the rear of the book.

Diagnostic Methods

Diagnostic Methods provides information to support diagnosing Ford vehicles. Diagnostic strategies, diagnostic tool support information, and advanced circuit testing methods are included. REFER to Diagnostic Methods .

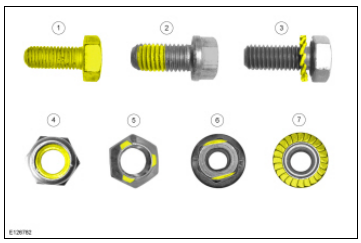
Diagnostic Routines

Diagnostic Routines provide information to determine the root cause of concerns addressed in either a DTC Chart or Symptom Chart. Each Diagnostic Routine contains:

- Diagnostic Overview
  - ♦ Wiring Diagram References (as applicable)
  - ♦ Normal Operation and Fault Conditions
  - ♦ Visual Inspection and Diagnostic Pre-checks
- Tool Table (as applicable)
- Material Table (as applicable)
- Pinpoint Test Steps

Component Tests

Component Tests are used to separately analyze a single common component in a system. The test will determine if the part is functioning correctly.



Mechanical Procedures Such As Removal and Installation

Reuse Of Fasteners, Seals, Or Gaskets

The following is a list of assumptions made in the reuse of fasteners, seals, or gaskets.

- Seals and gaskets must be replaced unless otherwise specified.
- Standard fasteners are reused unless otherwise specified.
- Fasteners with self-locking features must be replaced unless otherwise noted. Reminder text may or may not be included with the procedure step. Examples of fastener coatings or fasteners with mechanical locking (with the locking features highlighted yellow) are shown in illustration 1.
- Torque to yield bolts (bolts with more than one stage of tightening torque and a final torque angle specification) must be discarded and new torque to yield bolts installed unless otherwise stated within the procedure.

Illustration 1 - self-locking coatings or locking feature are highlighted yellow

tomsn048@gmail.com

Graphics

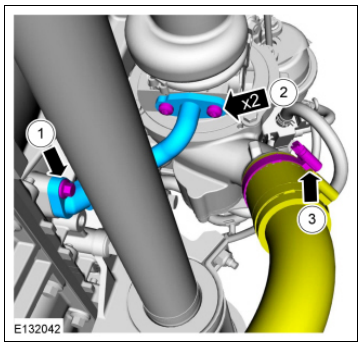
Illustrations in this manual may be used to replace written step instructions. Color-coding (see color scheme in this document) is used to communicate the required step action or actions. Service action icons (see Symbols Glossary) are used to add additional information regarding the required action.

- The color scheme in a step graphic (an illustration used in removal or installation steps) indicates servicing information as follows:
  - Fasteners (including panel retainers) or electrical connectors - Magenta (Purple)
  - Target component that is to be removed - Blue
  - Components that must be removed prior to the target component shown in blue - Brown or Green
  - Components placed aside for access, but not removed; highlighted areas such as inspection areas, adjustments or measurements - Yellow
  - Essential Special Service Tools (ESSTs) and other tools - Pale Blue
  - Chemical or Sealer apply areas - Alternating blue and white dashes (see illustration 4)
  - Sectioned or cut-away areas - Red
  - Remaining components - Grey

Callouts in graphics indicate removal (or tightening) order, or identify individual instructions in substeps of the same number (such as different torque values).

Arrows containing x numbers (Illustration 2) indicate the number of identical fasteners or connectors to be removed or installed in the graphic.

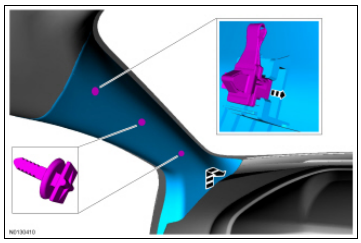
In Illustration 2, two identical fasteners are indicated by the x2 arrow, with another arrow illustrating a third fastener of a different type. Because the different fasteners require different torques, callouts are used to identify those two torque values in the associated step text. The hose clamp is another fastener to be removed. The yellow coloring of the hose indicates it is to be moved aside (not removed).



The following written steps would be necessary if the illustration did not have color coding:

1. Remove the engine oil pipe fastener at the engine connection.

2. Remove the two engine oil pipe fasteners from the turbocharger and remove the pipe.



3. Remove the air inlet hose from the turbocharger and position aside.

Illustration 2

Hidden fasteners, such as panel retainers, are identified in the illustration by a magenta disc. An inset detail view illustrating the fastener type may be included (Illustration 3).

Illustration 3 - Note motion arrow at panel bottom; it indicates to lift panel up, then move inward to remove

Symbols

Symbols may be used inside graphics or in the text area to communicate service actions. The following examples demonstrate the use of some of these symbols. REFER to Symbols Glossary for a complete symbols list with explanations.

In the Illustration 4 example, service action symbols are shown as used to direct the application of sealer, lubricant, weight, tape or cleaning detergent to a component. In this example a bead diameter of "xx" millimeters is prescribed. The blue and white dashes indicate where the material is applied.

Illustration 4

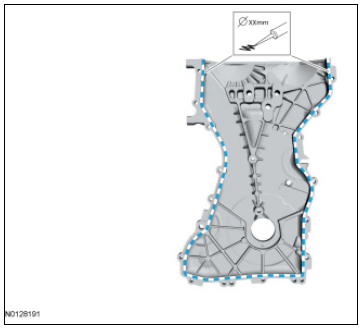


Illustration 5 is an example of location symbols used to show the location of a component or system within the vehicle.

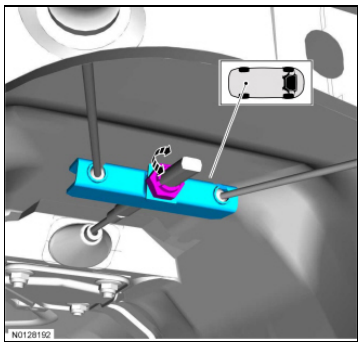
Illustration 5



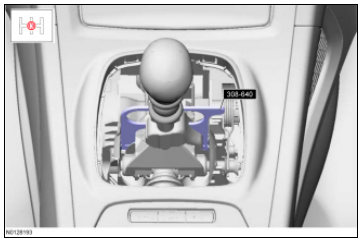


Illustration 6 shows how gearshift lever or selector lever position symbols may be used to indicate the gearshift lever or selector lever position required. The required Essential Special Service Tool to align the shift mechanism is shown in pale blue and identified by ESST number.

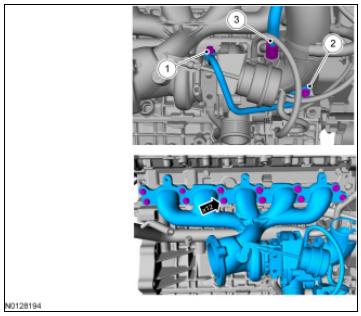

Illustration 6

tomsn048@gmail.com

Callouts or arrows may be used to identify components for supporting special information, such as a required sequence or to indicate a number of identical components. Illustration 7 shows a removal order in the top graphic and the bottom graphic indicates 12 identical bolts.

Illustration 7

Standard tool symbols direct the use of standard tools to perform a service action, such as the cutting of carpet shown in Illustration 8. Tool symbols may include dimensional values (for example, a drill with a specified diameter).

Illustration 8

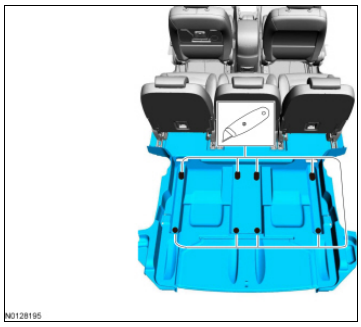

Illustration 8

tomsn048@gmail.com

Safety Warnings

Review carefully the General Service Health and Safety Precautions below before beginning any repair. Following these general service warnings are specific system warnings that must be carefully reviewed before beginning work on any listed system.

General Service Health and Safety Precautions

⚠ WARNING: Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.

⚠ WARNING: Wear protective gloves when handling components or parts that have pointed or sharp edges. Failure to follow this instruction may result in serious personal injury.

⚠ WARNING: Do not work under the hood of a vehicle with a damaged cooling fan, as it can separate during operation. With the ignition OFF, inspect all cooling fans for damage, cracks or separation and replace with a new fan as necessary. Failure to follow this instruction may result in serious personal injury.

⚠ WARNING: Vehicles with engine auto start-stop technology may start automatically with the ignition on. Make sure the ignition is off when servicing or working in close proximity to rotating engine parts. Failure to follow this instruction may result in serious personal injury.

⚠ WARNING: Before raising the vehicle on a hoist, make sure the hoist capacity is adequate for the vehicle weight, including any vehicle cargo or modifications. Always position the hoist lift arms as shown in the illustration. Do not use the engine to power the drive wheels unless all drive wheels are elevated off the ground. Incorrect hoist arm positioning or drive wheels in contact with the ground can cause unintended vehicle movement. Failure to follow these instructions may result in serious personal injury or death.

⚠ WARNING: Before lifting the vehicle with a jack, make sure the jack capacity is adequate for the vehicle weight, including any vehicle cargo or modifications. Identify the correct jacking points as shown in the illustration. Position the vehicle on a hard, level surface. After jacking, always support vehicle with jack stands. Never get under a vehicle supported only by a jack. Set the parking brake and block all wheels remaining on the ground. Failure to follow these instructions may result in unintended vehicle movement and serious personal injury or death.

⚠ WARNING: Turn off (disable) the power running boards (if equipped) before jacking, lifting or placing any object under the vehicle. Never place your hand between the power running board and the vehicle. Extended power running boards will retract when doors are closed. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Never support an engine by the intake or exhaust manifolds. The engine may drop suddenly. Failure to follow this instruction may result in serious personal injury.

⚠ WARNING: Disconnect the window regulator motor connector before working inside the vehicle doors. Service actions inside the door (such as door latch, handle or lock cylinder service) or operating the remote keyless entry (RKE) fob may activate the windows on vehicles equipped with global open/close. Serious injury to hands or arms may occur if a window motor is activated during service.

Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Do not apply heat or flame to the shock absorber or strut tube. The shock absorber and strut tube are gas pressurized and could explode if heated. Failure to follow this instruction may result in serious personal injury.

⚠ WARNING: Keep solvents away from ignition sources. Solvents may be flammable and can ignite or explode if not handled correctly. Failure to follow this instruction may result in serious personal injury.

⚠ WARNING: Use only a type-D fire extinguisher to extinguish magnesium fires. Never attempt to use a type-A, -B, -C extinguisher, or water, as these items are ineffective and may accelerate a magnesium fire. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Always secure transmission, transfer case, and axle assemblies to their service jack. Avoid obstructions while lowering and raising the jack. Improperly secured assemblies or contact with obstructions may cause the assembly to fall off the jack, which could result in serious personal injury.

⚠ WARNING: Always verify that the lockpin on a bench-mounted holding fixture is correctly secured to help prevent unexpected component rotation. Failure to follow this instruction may result in serious personal injury.

⚠ WARNING: Carefully read cautionary information on product label. For emergency medical information seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Use tools, not fingers, to hold flagnuts. Flagnuts may slip or spin unexpectedly when removing fasteners. Failure to follow this instruction may result in injured fingers.

Carefully review the following system safety warnings before beginning any service or repair work.

High Voltage System Health and Safety Precautions

⚠ WARNING: To prevent the risk of high-voltage shock, always follow precisely all warnings and service instructions, including instructions to depower the system. The high-voltage system utilizes approximately 300 volts DC, provided through high-voltage cables to its components and modules. The high-voltage cables and wiring are identified by orange harness tape or orange wire covering. All high-voltage components are marked with high-voltage warning labels with a high-voltage symbol. Failure to follow these instructions may result in serious personal injury or death.

⚠ WARNING: Never install the service disconnect plug when a high-voltage service cover is removed. Always install the cover prior to connecting the service disconnect plug. The cover prevents inadvertent contact with the high voltage which is present at several points under the cover. Failure to follow these instructions may result in serious personal injury or death.

⚠ WARNING: Turn OFF the ignition switch for a minimum of 5 minutes before removing high-voltage cables. High-voltage cables and wiring are orange in color. The nominal high-voltage traction battery voltage (HVTB) is 330 V DC. Failure to follow these instructions may result in serious personal injury or death.

Climate Control System Health and Safety Precautions

tomsn048@gmail.com

⚠ WARNING: Air conditioning R-134a liquid refrigerant is capable of harming eyes or freezing skin. Always wear safety goggles and avoid contact with liquid refrigerant. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Air conditioning R-134a refrigerant gas is capable of displacing the air necessary for breathing in a confined space and can produce toxic gasses if burned at high temperatures. Do not release a large quantity of R-134a gas within a confined space or allow it to be exposed to a high temperature flame (such as a torch). Consult the Material Safety Data Sheet for further information. Failure to follow these instructions may result in serious personal injury or death.

⚠ WARNING: Use extreme care and observe all safety and service precautions related to the use of refrigerants as outlined on refrigerant tank and on recovery and charging equipment. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Before disconnecting any heater water hoses, shut OFF the engine and wait until engine is fully cool. Failure to comply with this warning may result in serious injury or burns from hot liquid escaping from the engine cooling system.

⚠ WARNING: The electric booster heater may become hot during use and can burn unprotected skin. Allow enough time for the heater to cool before servicing. Failure to follow this instruction may result in serious personal injury.

Battery and Battery Charging System Health and Safety Precautions

⚠ WARNING: Batteries contain sulfuric acid and produce explosive gases. Work in a well-ventilated area. Do not allow the battery to come in contact with flames, sparks or burning substances. Avoid contact with skin, eyes or clothing. Shield eyes when working near the battery to protect against possible splashing of acid solution. In case of acid contact with skin or eyes, flush immediately with water for a minimum of 15 minutes, then get prompt medical attention. If acid is swallowed, call a physician immediately. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Always lift a plastic-cased battery with a battery carrier or with hands on opposite corners. Excessive pressure on the battery end walls may cause acid to flow through the vent caps, resulting in personal injury and/or damage to the vehicle or battery.

⚠ WARNING: Battery posts, terminals and related accessories contain lead and lead components. Wash hands after handling. Failure to follow these instructions may result in serious personal injury.

Brake System Health and Safety Precautions

⚠ WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

⚠ WARNING: Do not breathe dust or use compressed air to blow dust from storage containers or friction components. Remove dust using government-approved techniques. Friction component dust may be a cancer and lung disease hazard. Exposure to potentially hazardous components may occur if dusts are created during repair of friction components, such as brake pads and clutch discs. Exposure may also cause irritation to skin, eyes and respiratory tract, and may cause allergic reactions and/or may lead to other chronic health effects. If irritation persists, seek medical attention or advice. Failure to follow these instructions may result in serious personal injury.

Body Repair Health and Safety and General Precautions

⚠ WARNING: Always refer to Material Safety Data Sheet (MSDS) when handling chemicals and wear protective equipment as directed. Examples may include but are not limited to respirators and chemically resistant gloves. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Always wear protective equipment including eye protection with side shields, and a dust mask when sanding or grinding. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Do not carry out body side sectioning repairs in areas of door hinge or striker anchoring points. Welding within 50 mm (1.96 in) of door hinge or striker locations may compromise structural integrity during a collision. Failure to follow these instructions may result in serious injury to vehicle occupant(s).

⚠ WARNING: Invisible ultraviolet and infrared rays emitted in welding can injure unprotected eyes and skin. Always use protection such as a welder's helmet with dark-colored filter lenses of the correct density. Electric welding will produce intense radiation, therefore, filter plate lenses of the deepest shade providing adequate visibility are recommended. It is strongly recommended that persons working in the weld area wear flash safety goggles. Also wear protective clothing. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: All safety belt components must be inspected and corrected as part of any collision repair. Inspect all safety belt components as prescribed by Safety Belt Inspection and Repair After a Collision found in Section 501-20A General Procedures of this manual. Failure to follow this instruction may result in incorrect operation of the safety belt system and increase the risk of serious personal injury or death in a crash.

⚠ WARNING: If a vehicle has been in a crash, inspect the restraints control module (RCM) and the impact sensor (if equipped) mounting areas for deformation. If damaged, restore the mounting areas to the original production configuration. A new RCM and sensors must be installed whether or not the air bags have deployed. Failure to follow these instructions may result in serious personal injury or death in a crash.

Engine Cooling System Health and Safety Precautions

⚠ WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.

Gasoline and Gasoline-Ethanol Fuel System Health and Safety Precautions

⚠ WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

tomsn048@gmail.com

⚠ WARNING: Clean all fuel residue from the engine compartment. If not removed, fuel residue may ignite when the engine is returned to operation. Failure to follow this instruction may result in serious personal injury.

⚠ WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Remove the fuel filler cap slowly. The fuel system may be under pressure. If the fuel filler cap is venting vapor or if you hear a hissing sound, wait until it stops before completely removing the fuel filler cap. Otherwise, fuel may spray out. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Avoid contact with fuel during a visual inspection for fuel leaks with the engine running. Do not work on the fuel system until the pressure has been released and the engine has cooled. Fuel in the high-pressure fuel system is hot and under very high pressure. High-pressure fuel may cause cuts and contact with hot fuel may cause burns. Failure to follow these instructions may result in serious personal injury.

Diesel Fuel System Health and Safety Precautions

⚠ WARNING: Contact with exposed fuel injector wiring, if energized, may result in electric shock. Use care when working on or around energized fuel injector wiring. Fuel injector wiring supplies high voltage to operate the fuel injectors. Failure to follow this instruction may result in serious personal injury.

⚠ WARNING: Do not work on the fuel system until the pressure has been released and the engine has cooled. Fuel in the high-pressure fuel system is hot and under very high pressure. High-pressure fuel may cause cuts and contact with hot fuel may cause burns. Failure to follow these instructions may result in serious personal injury.

Safety Belt and Supplemental Restraint System (SRS) Health and Safety Precautions

⚠ WARNING: Always carry or place a live air bag module with the air bag and deployment door/trim cover/tear seam pointed away from the body. Do not set a live air bag module down with the deployment door/trim cover/tear seam face down. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

⚠ WARNING: Deploy all supplemental restraint system (SRS) devices (air bags, pretensioners, load limiters, etc.) outdoors with all personnel at least 9 meters (30 feet) away to make sure of personal safety. Due to the loud report which occurs when an SRS device is deployed, hearing protection is required. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Do not bleach or re-dye the safety belt webbing, as the webbing may weaken. Failure to

follow this instruction may increase the risk of serious personal injury or death in a crash.

⚠ WARNING: If a vehicle has been in a crash, inspect the restraints control module (RCM) and the impact sensor (if equipped) mounting areas for deformation. If damaged, restore the mounting areas to the original production configuration. A new RCM and sensors must be installed whether or not the air bags have deployed. Failure to follow these instructions may result in serious personal injury or death in a crash.

⚠ WARNING: All safety belt components must be inspected and corrected as part of any collision repair. Inspect all safety belt components as prescribed by Safety Belt Inspection and Repair After a Collision found in Section 501-20A General Procedures of this manual. Failure to follow this instruction may result in incorrect operation of the safety belt system and increase the risk of serious personal injury or death in a crash.

⚠ WARNING: Anytime the Safety Canopy or side air curtain module has deployed, a new headliner and new A-, B-, C-, and/or D-pillar upper trim panels and attaching hardware must be installed. Make sure the headliner includes the word AIRBAG where it meets each B-pillar trim panel. Remove any other damaged components/hardware, and install new components/hardware as required. Always use new torque-prevailing type J-nuts when installing the Safety Canopy. Failure to follow these instructions may result in the Safety Canopy or side air curtain module deploying incorrectly and increases the risk of serious personal injury or death in a crash.

⚠ WARNING: Do not repair or service restraint component connector terminals. If restraint connector terminals need repair, replace with the service connector pigtails. Failure to follow this instruction may result in incorrect operation of the vehicle safety restraint, which increases the risk of serious personal injury or death in a crash.

⚠ WARNING: Never disassemble or tamper with seat belt deployable components, including pretensioners, load limiters and inflators. Never back probe deployable device electrical connectors. Tampering or back probing may cause an accidental deployment and result in personal injury or death.

⚠ WARNING: Never tamper with, repair, or modify a Restraints Control Module (RCM) or any other Supplemental Restraint System (SRS) component. Failure to follow this instruction may result in incorrect operation of the Supplemental Restraint System (SRS), which increases the risk of serious personal injury or death in a crash.

⚠ WARNING: Never probe the electrical connectors on airbag, Safety Canopy® or side air curtain assemblies. Failure to follow this instruction may result in the accidental deployment of these assemblies, which increases the risk of serious personal injury or death.

⚠ WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the Safety Canopy® and cause serious personal injury or death.

⚠ WARNING: Do not obstruct or place objects in the deployment path of the Safety Canopy or side air curtain assembly. Never insert any type of fastener or tie strap around any portion of the Safety Canopy, side air curtain assembly, or related interior trim panel. Failure to follow this instruction may result in the Safety Canopy or side airbag curtain module deploying incorrectly and increases the risk of serious personal injury or death in a crash.

⚠ WARNING: Occupant Classification System (OCS) parts are calibrated as an assembly and must only be replaced in the configuration they are sold. Never separate parts of an assembly. Failure to

tomsn048@gmail.com

follow this instruction may result in incorrect operation of the OCS and increases the risk of serious personal injury or death in a crash.

⚠ WARNING: Never allow oil, grease, water or foreign contaminants to get on/in the occupant classification system (OCS) components or electrical connectors. Failure to follow this instruction may result in incorrect operation of the OCS and increases the risk of serious personal injury or death in a crash.

⚠ WARNING: Always tighten the fasteners of the restraints control module (RCM) and impact sensor (if equipped) to the specified torque. Failure to do so may result in incorrect restraint system operation, which increases the risk of personal injury or death in a crash.

⚠ WARNING: Always carry or place a live Safety Canopy®, or side air curtain module, with the module and tear seam pointed away from your body. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.

⚠ WARNING: Always carry out the Zero Seat Weight Test whenever the passenger seat has been removed from the vehicle or any seat component has been removed from the seat. Never drive a vehicle with any seat components removed from an occupant classification system (OCS) equipped seat. Failure to follow these instructions may result in incorrect operation of the occupant classification system (OCS), which increases the risk of serious personal injury or death in a crash.

⚠ WARNING: Do not paint any airbag trim covers or deployment doors. Paint may cause the airbag to deploy incorrectly. Failure to follow this instruction may increase the risk of serious personal injury or death in a crash.

Wheel and Tire Health and Safety Precautions

⚠ WARNING: Never inflate a tire that has been run flat without first removing the tire from the wheel to inspect for damage. A damaged tire can fail during inflation. Failure to follow this instruction may result in serious personal injury.

⚠ WARNING: Do not mount tube-type tires on tubeless wheels or tubeless tires on tube-type wheels. Incorrect combinations could result in tire separation from wheel and may result in serious injury to vehicle occupant(s).

⚠ WARNING: Cracked wheels can be dangerous. Deflate tires on cracked wheels prior to removal of wheels from the vehicle. Failure to follow this instruction may result in serious personal injury.

⚠ WARNING: Retighten wheel nuts within 160 km (100 mi) after a wheel is reinstalled. For dual rear wheel (DRW) only, a second retightening is required within 800 km (500 mi). Wheels can loosen after initial tightening. Failure to follow this instruction may result in serious injury to vehicle occupant(s).

⚠ WARNING: Always match the tire size to the wheel size during assembly. Incorrect matching can result in tire bead damage or tire separation from the wheel. Failure to follow this instruction may result in serious personal injury to technician or vehicle occupant(s).

⚠ WARNING: Do not weld or peen wheels. A wheel needing such repairs must have a new wheel installed. Failure to follow these instructions may result in wheel failure and serious personal injury.

tomsn048@gmail.com

Diagnostic Methods

Effective Diagnostic Techniques

The following diagnostic process is critical for consistently successful diagnoses. Random methods work inconsistently and often lead to multiple repairs and the accompanying frustration.

- Understand and verify the **symptom** .
  - Understanding a symptom requires understanding normal operation.
  - Duplicate the concern. Re-create the same conditions that demonstrated the original concern (road testing may be necessary).
- Determine the responsible **system** .
  - Gather data, such as a visual inspection and an OASIS report.
  - Perform system tests, such as pressure tests or DTC retrieval.
- Identify the responsible **component** .
  - Test the suspect component and related parts.
- Determine the root **cause**
  - Examine related components (wiring faults, misalignments, incorrect adjustments) that may be the actual cause or may have caused the component failure.
  - Repair all related faults to avoid repeat failures.
  - Verify the repair has corrected the concern (and not created any new ones) using the identical conditions that demonstrated the original concern.

Diagnostic Scan Tool Testing

Network Test

Performing a network test is always recommended for analysis of electronic system concerns. Always solve network issues before addressing individual symptoms or DTCs.

Recommended Practice: REFER to Symptom Chart in Section 418-00 to diagnose a network outage or no response from an individual module (or modules).

DTC Retrieval

Generally, a good diagnostic strategy is to resolve all on-demand codes related to the system concern. Retrieving all continuous DTCs can also be beneficial to understand historic issues or issues outside of the suspect system that may be affecting your concern. On-demand testing should be done to ensure the fault represented by a continuous DTC is still present.

Continuous Memory Diagnostic Trouble Codes (CMDTCs)

Modules that produce diagnostic trouble codes have a program that evaluates system conditions, normally while the vehicle or system is in use. Module inputs can be checked for values indicating an electrical fault with the monitoring circuit or component. Module outputs can be monitored for correct function. Codes are stored when predefined limits are exceeded and retained even if the ignition is turned off (generally DTC-retention is for 40+ ignition cycles). Not all continuous codes have a matching on-demand code - and vice versa; this varies with different modules. For example, some network communication codes are continuous only. It is important to note that the presence of a continuous DTC does not guarantee that the fault currently exists.

Ford On-Demand DTCs

Ford Motor Company modules have a unique feature that performs a special diagnostic program at the request of the technician (using a scan tool). This "On-demand" diagnostic program can exercise system outputs not normally running when the car is parked and record observed faults. These diagnostic codes are communicated to the scan tool; they are not recorded in module memory. An on-demand test is an effective tool for evaluating real input and output conditions during module activity - activity that might not normally be occurring during service bay conditions. For example, an air suspension module on-demand test can run the compressor, vent the system, and observe the report from the height sensor even when the car is already at correct trim height and not requiring height adjustment.

Network Communication DTCs

Network DTCs (U-prefix codes) are often a result of intermittent concerns such as damaged wiring or low battery voltage occurrences. Additionally, vehicle repair procedures (such as module reprogramming or diagnostics with modules disconnected) often set network DTCs. Replacing a module to resolve a network DTC is unlikely to resolve the concern. To prevent recurrence of intermittent network concerns, inspect all network wiring, especially in-line and module connectors; test the vehicle battery.

Recommended practice: Clear the DTC and retest. If the DTC repeats, test the vehicle communication network.

DTC Nomenclature (SAE J2012 and ISO 14229)

Many modules use 5-character DTCs followed by a 2-character failure-type code. The failure-type (sometimes called "fault byte") digits provide information about specific fault conditions such as opens or shorts to ground. Continuous memory DTCs have an additional 2-character DTC status code suffix to assist in determining DTC history.

Integrated Diagnostic System (IDS) Scan Tool Usage

If The IDS Scan Tool Does Not Communicate With The VCM

1. Check the VCM power; examine the connection to the vehicle.
   - The VCM LED illumination prove-out confirms power and ground from the DLC are provided to the VCM .
   - **Recommended Practice:** REFER to Section 418-00 , No Power to the Scan Tool, to diagnose no power to the VCM .
2. Check the scan tool connection to the VCM .
3. Follow scan tool instructions to retry.

If The IDS Scan Tool Does Not Communicate With The Vehicle

The IDS scan tool first attempts to communicate with the PCM. After establishing communication with the PCM, the scan tool then attempts to communicate with all other modules on the vehicle.

1. Verify the scan tool operation with a known good vehicle.
2. Verify the ignition is ON.
3. If an IDS session cannot be established with the vehicle (IDS may state "No communication can be established with the PCM"):

tomsn048@gmail.com

- Choose "NO" when the scan tool prompts to retry communication.
- Enter either a PCM part number, tear tag, or calibration number to identify the vehicle and start a session.
    - The PCM part number can be determined from OASIS -- choose "HVBoM" from the OASIS page and search for the PCM part number
    - The PCM part number and 4-character tear tag are printed on the PCM label.
- Establish a session based on the PCM information (above).

4. Using the tool box menu, run the network test.
    - Determine if all modules on the network are unresponsive or if only the PCM does not communicate.
    - **Recommended practice:** REFER to Symptom Chart in Section 418-00 to diagnose the network outage or no response from the PCM.

Measuring Automotive Circuits

Wiring Pin (Terminal) Fit And The Use Of Rotunda Flex Probes

- To avoid wiring pin (terminal) damage, Rotunda Flex Probes NUD105-R025D or equivalent must be used to connect test equipment or jumper wires to pins (terminals).
- Male to female pin (terminal) fit is critical for correct connection and durability.
    - Pin (terminal) fit may be checked by using the mating pin (terminal) to test for normal separation force (a damaged pin or terminal will have very low separation force from the mating pin or terminal)
    - Correctly checking the separation force of small pins (terminals) may require removal of the connector terminal guide/retainer if it adds drag to the pin (terminal) insertion or removal
- Replace damaged connectors or pins (terminals).
    - Use the Wiring Diagram connector view (cell 150) to identify the correct replacement connector with pigtail.
    - Use the Wire Harness Terminal Repair Guide to identify and order the correct replacement pin and pigtail. Available through Ford Dealers, REFER to FMC dealer website, or REFER to www.fcs.dealerconnection.com/wire .

Checking Power-Providing Circuits

- Measuring a power wire with the intended load disconnected using a DMM will only find open circuits (open fuse or wire).
- **Recommended practice:** Circuits carrying approximately 200-1000 mA* may be loaded with the specified test light SGT27000. Measure circuit voltage with a DMM while the test light is connected and illuminated. A reduction in the voltage present during test-light-loading indicates excessive circuit resistance.
- **Recommended practice:** Circuits carrying more than one ampere* should be loaded with a device requiring similar current (e.g., a headlamp bulb may be effective). A reduction in the voltage present during loading indicates excessive resistance.
- *Circuit current is matched to wire gauge/size; Examples:
    - Conductor sizes of 24 gauge (.5 mm) or smaller are generally used to carry approximately 1 ampere (1000 mA) or less. Use of the test light to load these circuits is appropriate.
    - Conductor sizes of 20 gauge (.8 mm) or larger are generally used to carry approximately 5 amperes (5000 mA) or more. Match the substitute load (measure substitute load current first as necessary) to this current level.

Checking Ground-Providing Circuits

- The best method of checking ground circuits is to measure the circuit voltage drop during component

operation (or attempted operation).
- An ohmmeter may be accurately used if the battery has been disconnected.
- **Recommended practice:** Expect less than 2 ohms for most small diameter (18 gauge and smaller) wires.
- Ohmmeter accuracy is limited to circuits carrying less than approximately 5 amperes (this is due to the fact that very small resistances, undetectable by a DMM , cause significant voltage loss in higher current circuits).
- DMM ohmmeter readings are easily corrupted by the normal voltage present (battery connected) in many ground circuits.
    - **Recommended practice:** Reverse the leads and check for changes in the measurement. Reversing the DMM lead connections should never change the resistance measurement (unless the circuit contains a semi-conductor). Measurement (non-semi-conductor) differences when leads are interchanged at the test points indicate invalid test results. The presence of voltage corrupts the reading, and causes the meter reading to change when the leads are reversed.

Checking Circuit Continuity

- **Recommended practice:** Expect less than 2 ohms of resistance for most wires.
- Ohmmeter low-resistance resolution (approximately 0.1 ohm) limits its use to circuits carrying less than approximately 5 amperes. This is due to the fact that very small resistances, below the resolution of a DMM , cause significant voltage loss in higher current circuits.
- The DMM applies a small amount of voltage to the circuit or component to calculate resistance. As a result, DMM ohmmeters are very sensitive to any level of voltage present. Voltage present in the circuit will corrupt the DMM reading.

Checking For Unintended Continuity (Shorts) To Other Circuits

- A DMM ohmmeter may be used to detect undesired circuit connections to:
    - Ground
    - Other unpowered circuits
- **Recommended practice:** Expect greater than 10,000 ohms of resistance between two separate circuits; the best result is an open circuit DMM ohmmeter indication (no detected resistance).
- Shorts to voltage are checked with a DMM voltmeter
- **Recommended practice:** Turn ignition on (with battery connected) and measure the circuit for any voltage present (none should be present)

Checking Circuits By Back-Probing A Connector

- Back-probing should be a testing method of last resort. It should only be employed where a diagnostic step requires a circuit to be tested under actual operating conditions. Back-probing is a risky testing method due to the uncertainty of the probe connection and the possibility of damaging terminals.
- Do not force test leads or other probes into connectors. Adequate care must be exercised to avoid connector terminal damage while ensuring that good electrical contact is made with the circuit or terminal. Failure to follow these instructions may cause damage to wiring, terminals, or connectors and subsequent electrical faults.
    - Use Rotunda Back-Probe Pins POMA6411 to assist in making a good test connection and to prevent connector or terminal damage during back-probing.
- Do not test for the presence of voltage at a single point where zero volts is a possible result (you cannot tell the difference between a bad probe contact and a zero volt result).
- Do not test for continuity/opens (using a DMM ohmmeter) between two points (you cannot tell the difference between bad probe contacts and an open circuit).
- Back-probing may be used where the circuit must be analyzed with the voltage-drop method (if the circuit carries greater than 5 amperes and no other means of testing will definitively eliminate circuit

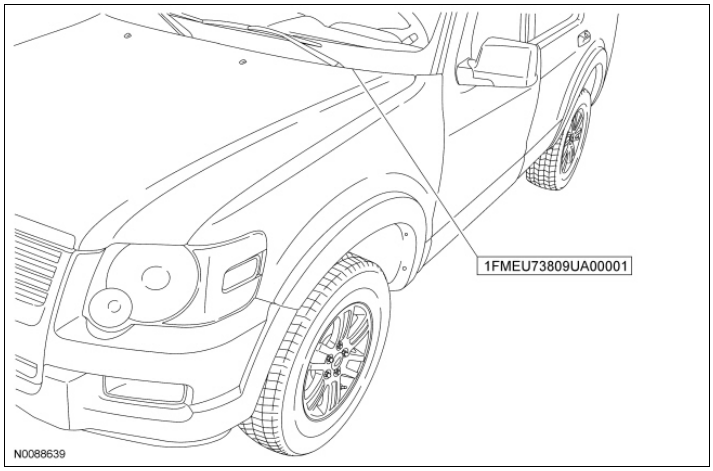
tomsn048@gmail.com

resistance as a possible fault). A zero-volt result indicates incorrect test conditions (no current flow) or bad back-probe connections.
- Occasionally, module failure mode behavior will change the operation of a circuit when it is opened for testing. Back-probing is an acceptable remedy for these testing dilemmas.

Circuit Analysis Using Jumper Wires (Creating Substitute Circuits)

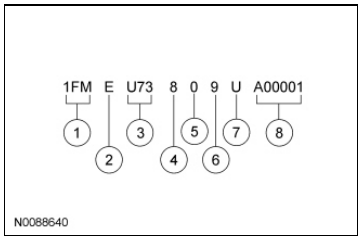
- Jumper wires may be employed for circuit analysis.
- **Cautions:**
  - ♦ Always use fused jumper wires - the recommended universal-testing jumper wire fuse is 2-5 amperes; larger fuse ratings should be used only in special circumstances.
  - ♦ Use flex probes or equivalent to prevent connector terminal damage (flex probes are not intended to carry higher currents necessary to operate motors such as a cooling fan or blower motor).
  - ♦ Follow workshop manual testing directions when using jumper wires to avoid component or harness damage due to incorrect jumper connections.
  - ♦ Never repair a circuit by adding a new wire in parallel to the old one (overlaying the circuit) without fully understanding what caused the circuit to fail. Always find, examine, and repair the fault to correct the root cause and to repair any adjacent wiring that has been damaged.

Checking Modules



- Generally, module failure rate is very low and therefore replacement modules usually do not resolve the root cause. Incorrect replacement of a module is often the result of inadequate testing.
  - ♦ Understand the correct module function.
  - ♦ Make sure programmable parameters are set correctly for the function in question (see the list in Section 418-01).
  - ♦ Resolve DTCs first - as directed by Diagnostic Routines.
  - ♦ Test all inputs, both hard-wired and networked.
  - ♦ Test outputs (see "Checking module switching circuits" below).
  - ♦ Check applicable TSBs for module software changes (flash programming).
- Checking module switching circuits.
  - ♦ Using the scan tool module-output command function (e.g., IDS Output State Control) to activate components is a fast way to confirm an output is capable of being switched on by the module. Testing that reveals normal module-output function confirms the need to analyze the module inputs.
  - ♦ Don't apply ground or power directly to module-switched components with jumper wires (unless directed by a workshop manual procedure), as the component can be damaged by a direct connection to ground/power.

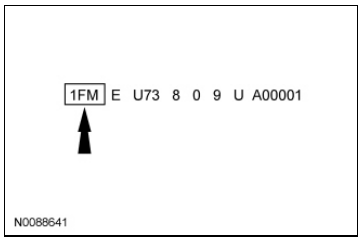
tomsn048@gmail.com



Identification Codes

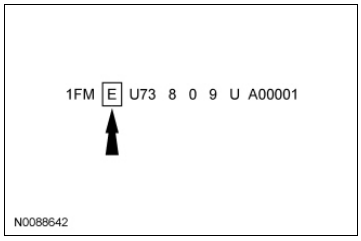
Vehicle Identification Number (VIN)

Vehicle Identification Number (VIN) Tag Locator



The Vehicle Identification Number (VIN) is a 17-digit combination of letters and numbers. The VIN is stamped on a metal tab riveted on the instrument panel, top upper left of the dash. The VIN is also found on the Vehicle Certification (VC) label. If the VIN plate requires replacement, authorized dealers must contact their respective regional office.

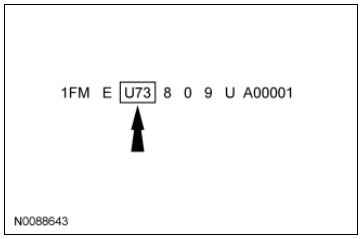
Item	Description
1	World Manufacturer Identifier (WMI)
2	Restraint type and Gross Vehicle Weight Rating (GVWR)
3	Vehicle line, series, body type
4	Engine type
5	Check digit
6	Model year
7	Assembly plant
8	Production sequence number



World Manufacturer Identifier (WMI)

The first 3 VIN positions are the World Manufacturer Identifier (WMI).

- 1FM - Ford Motor Company, USA, Multi-Purpose Vehicle (MPV)
- 4M2 - Ford Motor Company (Mercury), USA, MPV

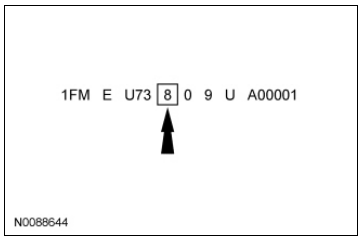


Restraint Type and Gross Vehicle Weight Rating (GVWR)

The fourth VIN position is the restraint brake type and Gross Vehicle Weight Rating (GVWR) code.

- E - 6,001-7,000 pounds GVWR with driver and front passenger air bags and side impact air canopy

Line, Series and Body Type

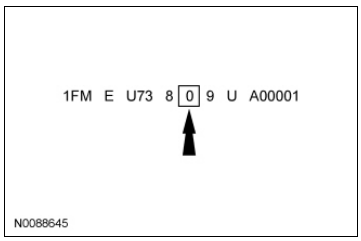


VIN positions 5 through 7 indicate the vehicle line, series and body type.

- U23 - Explorer Sport Trac, All-Wheel Drive (AWD), Limited
- U31 - Explorer Sport Trac, Rear Wheel Drive (RWD), XLT
- U33 - Explorer Sport Trac, RWD , Limited
- U37 - Mountaineer, RWD , Luxury
- U38 - Mountaineer, RWD , Premier
- U47 - Mountaineer, AWD , Luxury
- U48 - Mountaineer, AWD , Premier
- U51 - Explorer Sport Trac, Four-Wheel Drive (4WD), XLT
- U53 - Explorer Sport Trac, 4WD , Limited
- U63 - Explorer, RWD , XLT
- U64 - Explorer, RWD , Eddie Bauer
- U65 - Explorer, RWD , Limited
- U73 - Explorer, 4WD , XLT
- U74 - Explorer, 4WD , Eddie Bauer
- U75 - Explorer, 4WD , Limited

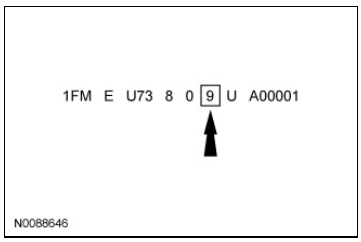
tomsn048@gmail.com

- U83 - Explorer, AWD , XLT
- U84 - Explorer, AWD , Eddie Bauer
- U85 - Explorer, AWD , Limited



Engine Type

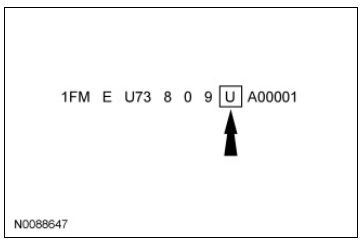
The eighth VIN position is the engine type (displacement and number of cylinders).



- E - 4.0L, SOHC, V6, electronic fuel injection (Cologne)
- 8 - 4.6L, 3-valve, V8, electronic fuel injection

Check Digit

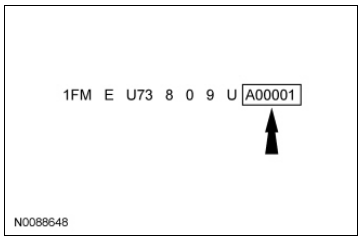
The ninth VIN position is a government-assigned, computer-generated check digit.



Model Year

The tenth VIN position is the model year code.

- 9 - 2009

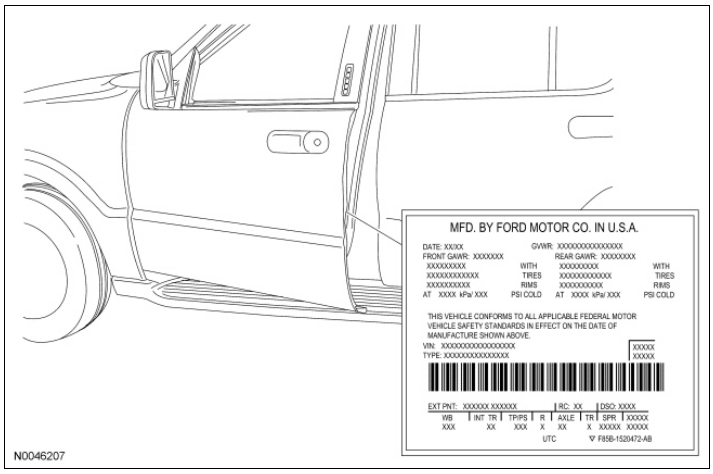


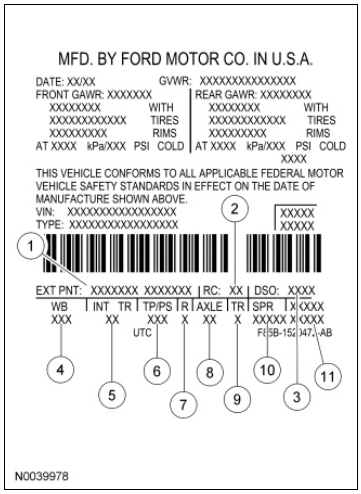
Assembly Plant

The eleventh VIN position is the assembly plant code.

- U - Louisville, Kentucky

Build Sequence





VIN positions 12 through 17 are an alphanumeric code for the vehicle build sequence. This is also the vehicle serial and warranty number. This serial number can also be found on the engine block, transmission and frame.

- A00001-E99999 - Ford
- J00001-L99999 - Mercury

Vehicle Certification (VC) Codes

Vehicle Certification (VC) Label Locator

Item	Description

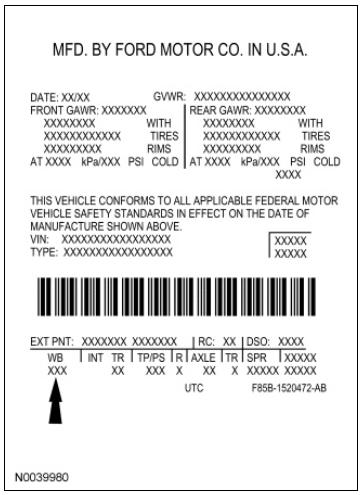
tomsn048@gmail.com

1	Exterior paint code
2	Region code
3	District Special Order (DSO)
4	Wheelbase code
5	Interior trim code
6	Tape/paint stripe code
7	Radio code
8	Axle code
9	Transmission code
10	Spring code
11	Powertrain calibration information

The Vehicle Certification (VC) label contains information on the manufacturer name, the month and year of manufacture, the certification statement and the Vehicle Identification Number (VIN). This label also includes Gross Vehicle Weight Rating (GVWR) information.

If a vehicle requires replacement of the VC label and is 4 years old or less, an authorized dealer must submit the VIN to their respective regional office. The regional office will submit a web form to the assembly plant for the replacement label. Once the label has been printed, a representative from the regional office will deliver the label to the dealer and witness installation on the vehicle. If a vehicle is more than 4 years old and requires a replacement label, the dealer must submit a request to the Department of Motor Vehicles.

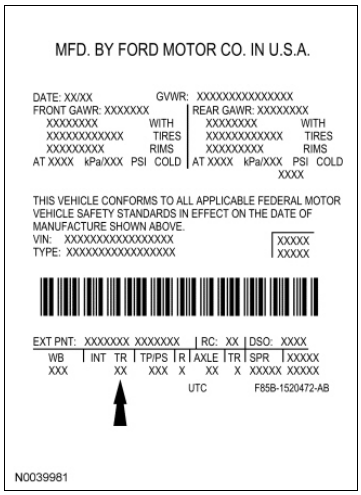
Exterior Paint



Exterior paint codes may be listed as a 2-part code. The first set of characters identify the primary body color. The second set of characters (if applicable) identify the vehicle accent or 2-tone body color. All colors are base coat/clear coat.

Primary Exterior Color Codes

- D3 - Colorado Red - Explorer/Explorer Sport Trac
- JV - Sangria Red - Explorer/Mountaineer/Explorer Sport Trac
- PV - White Chocolate (tri-coat) - Explorer/Mountaineer
- T5 - Dark Copper - Explorer/Explorer Sport Trac
- T9 - Monterrey Gray - Explorer/Mountaineer/Explorer Sport Trac
- U1 - Sport Blue - Explorer/Mountaineer/Explorer Sport Trac
- UA - Ebony - Explorer/Mountaineer/Explorer Sport Trac



- UI - Brilliant Silver Metallic - Explorer/Mountaineer/Explorer Sport Trac
- WS - White Suede - Explorer/Mountaineer/Explorer Sport Trac
- YZ - Oxford White - Explorer

Wheelbase

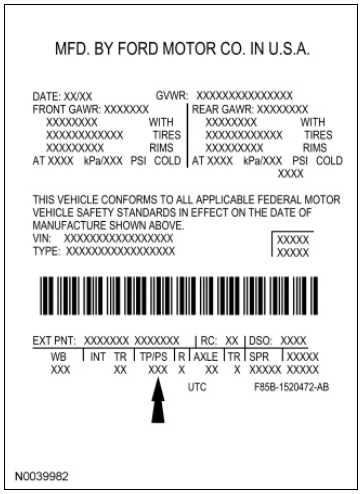
- 114 - 2,895 mm (114 in) - Explorer/Mountaineer
- 131 - 3,327 mm (131 in) - Explorer Sport Trac

Interior Trim

Interior trim codes are listed as a 2-part code. The first character identifies the interior trim type. The second character identifies the interior trim color.

Interior Trim Type

- M - Seat kit 15, leather trim - Explorer Sport Trac Adrenalin
- R - Seat kit 1, value cloth - Explorer XLT
- S - Seat kit 2, premium cloth - Explorer XLT/Mountaineer
- T - Seat kit 5, leather trim - Explorer Sport Trac Limited
- T - Seat kit 4, leather trim - Explorer XLT
- U - Seat kit 12, cloth bucket seats - Explorer Sport Trac XLT
- V - Seat kit 3, leather trim, Explorer XLT
- W - Seat kit 13, cloth bucket seats - Explorer Sport Trac XLT/Limited
- Z - Seat kit 8, leather - Explorer Eddie Bauer
- 3 - Seat kit 7, perforated leather - Mountaineer



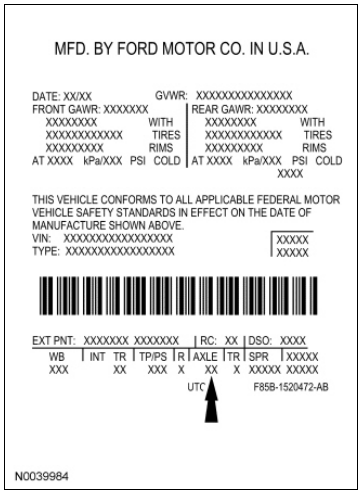
tomsn048@gmail.com

- 4 - Seat kit 10, leather - Mountaineer
- 5 - Seat kit 9, leather - Mountaineer
- 8 - Seat kit 11, embossed leather - Mountaineer

Interior Trim Color

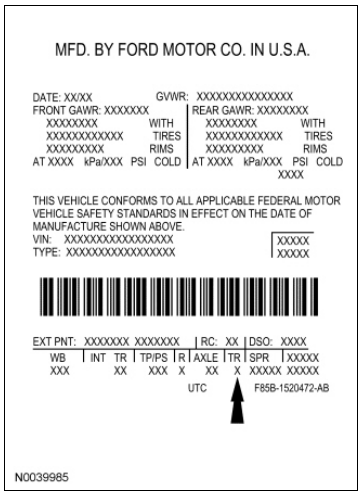
- C - Camel - Explorer/Mountaineer/Explorer Sport Trac
- W - Charcoal Black - Explorer/Mountaineer/Explorer Sport Trac

Tape/Paint Stripe



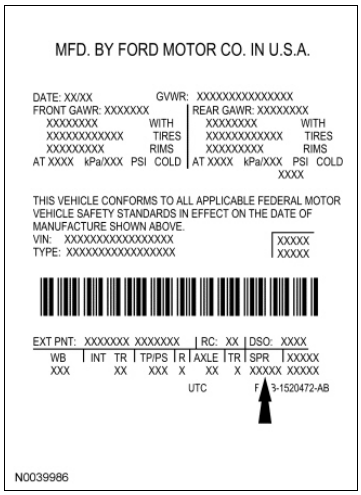
Tape and paint stripe codes do not apply.

Radio Type



- 3 - AM/FM stereo, 6-disc in-dash CD changer with MP3 capability
- A - AM/FM stereo, CD player with MP3 capability
- Q - AM/FM stereo, 6-disc in-dash CD changer and navigation system

Axle Type



- 45 - 3.55 non-limited slip
- 46 - 3.73 non-limited slip

Transmission Type

- V - 5-speed automatic, 5R55S
- 6 - 6-speed automatic, 6R80

Spring Code

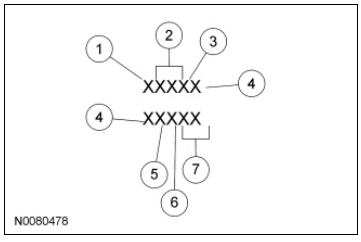
tomsn048@gmail.com

Spring codes are listed as a 2-part code. The first characters listed identifies the front springs. The second character listed identifies the rear springs.

Front Springs

- AA - 9LT-18B036-A - Explorer/Mountaineer
- BB - 9LT-18B036-B - Explorer/Mountaineer
- CC - 9LT-18B036-C - Explorer/Mountaineer
- AA - 9A24-18B036-A - Explorer Sport Trac
- BB - 9A24-18B036-B - Explorer Sport Trac
- CC - 9A24-18B036-C - Explorer Sport Trac
- DD - 9A24-18B036-D - Explorer Sport Trac
- EE - 9A24-18B036-E - Explorer Sport Trac
- FF - 9A24-18B036-F - Explorer Sport Trac

Rear Springs



- AA - 8L24-18W002-A - Explorer/Mountaineer
- BB - 8L24-18W002-B - Explorer/Mountaineer
- BB - 8A24-18W002-B - Explorer Sport Trac
- DD - 8A24-18W002-A - Explorer Sport Trac
- FF - 8A24-18W002-C - Explorer Sport Trac

Powertrain Calibration Information

NOTE: Powertrain calibration information is limited to a maximum of 5 characters per line on the Vehicle Certification (VC) label. Because of this, calibration identification consisting of more than 5 characters will wrap to the second line on the VC label.

Powertrain calibration information is printed in the lower right corner of the VC label. Only base calibration information is printed. Revision levels will not appear, however, they can be obtained through a scan tool using the most current software revision.

Item	Description
1	Model year (model year in which calibration strategy was first introduced)
2	Vehicle code
3	Transmission code
4	Unique calibration (designates different hardware to similar vehicles). Example: tires or drive ratios
5	Fleet code (describes fleet to which the vehicle belongs). Example: 6 - Evaporative Emission (EVAP)
6	Certification region (lead region where multiple regions are included in one calibration). Example: A - U.S. federal
7	Revision level (will advance as revisions occur). Not printed on label

The following offers a more detailed explanation of the coding strategy used.

Model Year

- 1 - 2001
- 2 - 2002
- 3 - 2003
- 4 - 2004
- 5 - 2005
- 6 - 2006
- 7 - 2007
- 8 - 2008
- 9 - 2009

Vehicle Line

- U5 - Explorer/Mountaineer
- UK - Explorer Sport Trac

Transmission

- 1 - Automatic transmission

Unique Calibration

The Emissions/Corporate Average Fuel Economy/CO2 Compliance Department is responsible for assigning these calibration numbers. Unique calibration identifications are assigned to cover similar vehicles to differentiate tires, drive configurations, final drive ratios and other calibration-significant factors.

These 2 characters are chosen by the analyst to provide identifiable information unique to each calibration. For example, using the number 2 to denote a 2-valve engine versus using the number 4 to denote a 4-valve engine, offers an easily identifiable difference.

Fleet Code

- 1 - Heavy Duty Gas Engine/Dyno
- 2 - Fast - Automobile Manufacturers Association, U.S.
- 3 - Alternative Durability Protocol, U.S.
- 4 - Not assigned
- 5 - Not assigned
- 6 - Evaporative Emission (EVAP)
- 7 - Mileage Accumulation, Aging Endurance Durability
- 8 - On-Board Diagnostic (OBD)
- 9 - Not assigned

Certification Region

tomsn048@gmail.com

- 5 - U.S. 50 states
- A - U.S. federal, including altitude, may include Canada and/or Mexico
- B - U.S. California, includes U.S. green states
- C - Canada
- D - China
- E - European Community (Austria, Belgium, Denmark, Finland, France, Germany, Greece, Ireland, Italy, Luxembourg, Netherlands, Portugal, Spain, Sweden, United Kingdom)
- F - Extended European Community (E plus Croatia, Czech Republic, Estonia, Hungary, Norway, Poland, Romania, Russian Federation, Slovakia, Slovenia, Switzerland, Yugoslavia)
- G - Gulf Cooperative Council (Bahrain, Kuwait, Oman, Qatar, Saudi Arabia, UAE)
- H - Hong Kong
- J - Japan
- K - Korea
- L - Malaysia

Jacking and Lifting

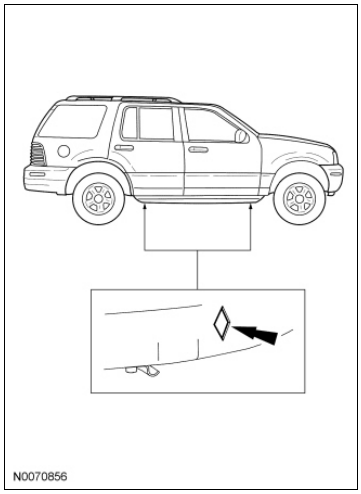
⚠ WARNING: Vehicle may have multiple drive wheels. Do not use engine to power the driveline unless all drive wheels are elevated off the ground. Drive wheels in contact with ground could cause unexpected vehicle movement. Failure to follow this instruction may result in serious personal injury.

⚠ WARNING: When jacking or lifting the vehicle, block all wheels remaining on the ground. Set the parking brake if the rear wheels will remain on the ground. These actions help prevent unintended vehicle movement. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Never get underneath a vehicle that is supported only by a jack. The jack could unintentionally lower. Always support vehicle with floor stands. Failure to follow these instructions may result in serious personal injury.

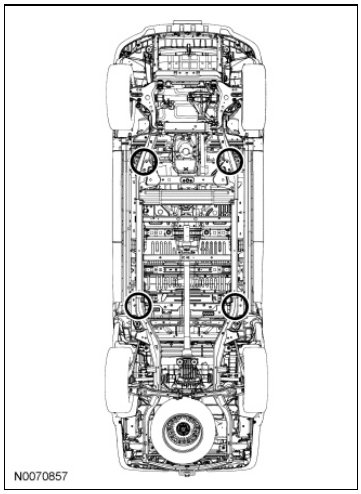
⚠ WARNING: Only raise the vehicle when positioned on a hard, level surface. Attempting to raise the vehicle on an uneven or soft surface may result in vehicle slipping or falling from the jack or jackstand. Failure to follow this instruction may result in serious personal injury.

⚠ WARNING: Identify the correct jacking points by locating the triangle stamped into the uni-body sheet metal or vehicle frame. Raising a vehicle in any other location may result in vehicle shifting or falling. Failure to follow this instruction may result in serious personal injury.



NOTICE: **The jack provided with the vehicle is intended to be used in an emergency for changing a deflated tire. To avoid damage to the vehicle, never use the jack to hoist the vehicle for any other purpose.**

NOTICE: **To prevent possible damage to the underbody, do not drive the vehicle onto the drive-on lift without first checking for possible interference.**



NOTICE: **When raising a vehicle on a twin-post hoist, use care when positioning the vehicle so that the hoisting forks do not interfere with the suspension components, mounting brackets or stabilizer mounting brackets, if equipped. In addition, use care in hoist positioning to avoid possible damage to the axle carrier or rear cover.**

NOTICE: **Damage to the suspension, exhaust or steering linkage components may occur if care is not exercised when positioning the hoist adapters prior to lifting the vehicle.**

Maintenance Schedules - Gasoline Engines

The maintenance schedule is designed to protect against major repairs resulting from neglect or inadequate maintenance and to prolong the life of the vehicle.

General Maintenance Information

NOTE: This is a generic maintenance schedule for all Ford, Lincoln and Mercury vehicles. There may be items listed that do not apply to all vehicles.

The Normal Schedule applies to operation of the vehicle under typical, everyday driving conditions. The maintenance frequency in this schedule typifies what the vast majority of vehicles will require. The listed services should be carried out at specified mileage, time or hours of operation, whichever occurs first. There are, however, additional services required that only the noted vehicles require.

If the vehicle is operated in one or more of the following special operating conditions, those additional services will be required. The special operating conditions are:

- Towing a trailer or using a camper or car-top carrier.
- Extensive idling and/or low-speed driving for long distances as in heavy commercial use such as delivery, taxi, patrol car or livery.
- Driving in dusty conditions such as unpaved or dusty roads.
- Off-road operation.
- Use of E85 fuel 50% of the time or greater (flex fuel vehicles only).

There are also exceptions to the Normal Schedule which will require more frequent maintenance for some components. Those exceptions are:

- Vehicle axle - maintenance and lubrication.
- Police and taxi vehicles - maintenance and lubrication.
- Engine oil and coolant - time-based and mileage-based intervals.
- Change brake fluid every 2 years (Class A Motorhome).

Engine Hour Meter

The vehicle may be equipped with an engine hour meter that registers the accumulated time the engine has been running. The engine hour meter is incorporated with the vehicle odometer. Depressing the odometer reset button once will display the trip odometer (miles followed by a T for trip odometer). Depressing the odometer reset button a second time will display the engine hour meter (hours followed by an H for hours). Displayed time is cumulative for the vehicle and it cannot be reset to zero. Emergency vehicles, such as police/fire and fleet vehicles, often experience long periods of idling, during which time the engine oil will continue to break down but mileage is not accumulated on the odometer.

To assist fleet managers in maintaining proper oil change intervals, the engine hour meter will help determine when an oil change is required. For every hour that the vehicle idles or runs, it has accumulated the equivalent of approximately 53 km (33 mi) of driving. Using the combination of the vehicle odometer and the engine hour meter allows the fleet manager to better determine when the oil needs to be changed.

Engine hour meter calculation:

- idle hours x 33 = miles equivalency
- miles driven + miles equivalency = oil change interval

Example: In metric units, this calculation would be 4,828 km + 3,233 (61 idle hours x 53 km/idle hour) = 8,061 km. When the odometer has accumulated 3,000 miles + 2,013 (61 hours x 33 miles/idle hour) = 5,013 mi, the oil change interval will have been reached.

Special Operating Condition Requirements

When towing a trailer or using a camper or car-top carrier:

- Change engine oil and install a new oil filter every 8,000 km (5,000 mi) or 6 months.
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise every 8,000 km (5,000 mi). Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.
- Change automatic transmission/transaxle fluid (not required on 6R60/6R75/6R80/TorqShift® transmissions) every 48,000 km (30,000 mi).
- Change transfer case fluid every 96,000 km (60,000 mi).
- Change manual transmission fluid every 96,000 km (60,000 mi).
- Inspect and lubricate control arms, steering linkage, steering ball joints, U-joints and driveshaft with zerk fittings as required.
- Replace wheel bearing grease and install new grease seals on Rear Wheel Drive (RWD) front wheel bearings (if non-sealed bearings) every 48,000 km (30,000 mi).

Extensive idling and/or low speed driving for long distances, as in heavy commercial use such as delivery, taxi, patrol car or livery:

- Change engine oil and install a new oil filter every 8,000 km (5,000 mi) or 6 months.
- Install a new cabin air filter as required (if equipped).
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise every 8,000 km (5,000 mi). Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.
- Inspect brake system every 8,000 km (5,000 mi).
- Inspect and lubricate control arms, steering linkage, steering ball joints, U-joints and driveshaft with zerk fittings every 8,000 km (5,000 mi) or 6 months (if equipped).
- Install a new fuel filter every 24,000 km (15,000 mi) (not required for Fusion, Milan, MKZ, Edge, MKX, Taurus X, Taurus, Sable, E-Series, Expedition and Navigator with short wheelbase, F-150, Flex, MKS, Escape and Mariner).
- Change automatic transmission fluid (not required on 6R60/6R75/6R80/TorqShift® transmissions) every 48,000 km (30,000 mi).
- Replace wheel bearing grease and install new grease seals on RWD front wheel bearings (if non-sealed bearings) every 48,000 km (30,000 mi).
- Install new spark plugs every 96,000 km (60,000 mi).
- Change transfer case fluid every 96,000 km (60,000 mi).

When operating in dusty conditions such as unpaved or dusty roads:

- Change engine oil and install a new oil filter every 8,000 km (5,000 mi) or 6 months.
- Install a new cabin air filter as required (if equipped).

tomsn048@gmail.com

- Install a new engine air filter as required.
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise every 8,000 km (5,000 mi). Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.
- Inspect and lubricate control arms, steering linkage, steering ball joints, U-joints and driveshaft with zerk fittings every 8,000 km (5,000 mi) or 6 months (if equipped).
- Install a new fuel filter every 24,000 km (15,000 mi) (not required for Fusion, Milan, MKZ, Edge, MKX, Taurus X, Taurus, Sable, E-Series, Expedition and Navigator with short wheelbase, F-150, Flex, MKS, Escape and Mariner).
- Change automatic transmission fluid (not required on 6R60/6R75/6R80/TorqShift® transmissions) every 48,000 km (30,000 mi).
- Replace wheel bearing grease and install new grease seals on RWD front wheel bearings (if non-sealed bearings) every 48,000 km (30,000 mi).
- Change manual transmission fluid every 80,000 km (50,000 mi).
- Change rear axle lubricant every 80,000 km (50,000 mi) (E-450 and F-450/550 only).
- Change transfer case fluid every 96,000 km (60,000 mi).

When operating in off-road conditions:

- Change engine oil and install a new oil filter every 8,000 km (5,000 mi) or 6 months.
- Install a new cabin air filter as required (if equipped).
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise every 8,000 km (5,000 mi). Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.
- Inspect and lubricate control arms, steering linkage, steering ball joints, U-joints and driveshaft with zerk fittings as required.
- Change automatic transmission fluid (not required on 6R60/6R75/6R80/TorqShift® transmissions) every 48,000 km (30,000 mi).
- Replace wheel bearing grease and install new grease seals on RWD front wheel bearings (if non-sealed bearings) every 48,000 km (30,000 mi).
- Change manual transmission fluid every 80,000 km (50,000 mi).
- Change rear axle lubricant every 80,000 km (50,000 mi) (E-450 and F-450/550 only).
- Change transfer case fluid every 96,000 km (60,000 mi).

Use of E85 fuel 50% of the time or greater (flex fuel vehicles only):

- Fill fuel tank with a full tank of regular unleaded fuel every 4,800 km (3,000 mi).
- Change engine oil and install a new oil filter every 8,000 km (5,000 mi) or 6 months.
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise every 8,000 km (5,000 mi). Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.

Checks and Services

Certain basic maintenance checks and inspections should be carried out at specified intervals. Any recognized adverse condition should be corrected as soon as possible.

Multi-Point Inspection

The following inspections are recommended at every service interval:

- Check and top off fluid levels for brakes, coolant, manual and automatic transmission (if equipped with a underhood fluid level indicator), power steering and window washer fluids.
- Inspect tires for wear and correct air pressure, including spare tire.
- Check exhaust system for leaks, damage, loose parts and foreign material.
- Check battery performance.
- Check operation of horn, exterior lamps, turn signals and hazard warning lights.
- Check radiator, coolers, heater and air conditioning hoses.
- Inspect windshield wiper spray and wiper operation.
- Check windshield for cracks, chips and pitting.
- Inspect for oil and fluid leaks.
- Inspect halfshaft dust boots (if equipped).
- Check shocks, struts and other suspension components for leaks and damage.
- Inspect steering and linkage.
- Inspect accessory drive belt(s).
- Inspect clutch operation (if equipped).

In-Line, Service-Installed Transmission Fluid Filter

Some vehicles may be equipped with an in-line, service-installed transmission fluid filter. This filter is installed in the transmission fluid cooler return line. If equipped, install a new in-line filter during transmission fluid change intervals.

Maximum Oil Change Interval (Normal Schedule)

- 12,000 km (7,500 mi) or 6 months.

Maximum Oil Change Interval (Special Operating Conditions)

- 8,000 km (5,000 mi), 6 months or 200 hours of engine operation.

Engine Coolant Change Interval

- 6 years or 169,000 km (105,000 mi).
- After initial change: 3 years or 73,000 km (45,000 mi).

Monthly Checks

Check each of the following items every month:

- All interior and exterior lights for correct operation.
- Tires for wear and correct air pressure, including spare tire.
- Engine oil fluid level.
- Windshield washer solvent fluid level.

Six Month Checks

Check each of the following items at least every 6 months:

- Lap/shoulder belts and seat latches for wear and function.
- External mounted spare tire is stowed correctly (tight to body).
- Power steering fluid level.
- Washer spray, wiper operation and clean all wiper blades (install new wiper blades as necessary).

tomsn048@gmail.com

- Parking brake for correct operation.
- Lubricate all hinges, latches, door check straps and outside locks.
- Lubricate upper and lower sliding door tracks (if equipped).
- Clean sliding door contact switches (if equipped).
- Lubricate door rubber weatherstrips.
- Clean body and door drain holes.
- Safety warning lamps (brake, ABS, air bag, safety belt) for correct operation.
- Coolant system fluid level and correct strength.
- Battery connections. Clean if necessary.
- Clutch fluid level, if equipped.

Normal Schedule

The following check procedures should be carried out for all cars, minivans, light trucks, sport utilities, vans and Four-Wheel Drive (4WD) vehicles.

- Retighten the wheel nuts to the specified torque at 160 km (100 miles) after any wheel disturbance (tire rotation, changing a flat tire or wheel removal).
- On vehicles equipped with dual rear wheels, retighten the wheel nuts to the specified torque at 160 km (100 mi) and again at 800 km (500 mi) of new vehicle operation or after any wheel disturbance (tire rotation, changing a flat tire or wheel removal).

12,000 Km (7,500 Mi)

- Change engine oil and install a new oil filter.
- Perform multi-point inspection (recommended).
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise. Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.

24,000 Km (15,000 Mi)

- Change engine oil and install a new oil filter.
- Perform multi-point inspection (recommended).
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise. Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.
- Install a new cabin air filter (if equipped).
- Inspect engine air filter (except Focus with the Partial Zero Emissions Vehicle (PZEV) engine).
- Inspect automatic transmission fluid level (if equipped with an underhood fluid level indicator).
- Inspect and lubricate control arms, steering linkage, steering ball joints, U-joints and driveshaft with zerk fittings (if equipped).
- Inspect halfshaft boots (if equipped).
- Inspect and lubricate 4WD front axle shaft U-joints (if equipped).
- Inspect brake pads, rotors, brake linings, drums, brake lines, hoses and parking brake system.
- Inspect engine cooling system and hoses.
- Inspect exhaust system and heat shields.

36,000 Km (22,500 Mi)

- Change engine oil and install a new oil filter.

- Perform multi-point inspection (recommended).
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise. Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.

48,000 Km (30,000 Mi)

- Change engine oil and install a new oil filter.
- Perform multi-point inspection (recommended).
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise. Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.
- Install a new cabin air filter (if equipped).
- Install a new engine air filter (except Focus with PZEV engine).
- Install new climate controlled seat cushion filters (if equipped).
- Install a new fuel filter (not required for Fusion, Milan, MKZ, Edge, MKX, Taurus X, Taurus, Focus, Sable, E-Series, Expedition and Navigator with short wheelbase, F-150, Flex, MKS, Escape and Mariner).
- Inspect automatic transmission/transaxle fluid level using the fluid level on all other vehicles (if equipped with an underhood fluid level indicator).
- Inspect and lubricate control arms, steering linkage, steering ball joints, U-joints and driveshaft with zerk fittings (if equipped).
- Inspect halfshaft boots (if equipped).
- Inspect and lubricate 4WD front axle shaft U-joints (if equipped).
- Inspect brake pads, rotors, brake linings, drums, brake lines, hoses and parking brake system.
- Inspect engine cooling system and hoses.
- Inspect exhaust system and heat shields.

60,000 Km (37,500 Mi)

- Change engine oil and install a new oil filter.
- Perform multi-point inspection (recommended).
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise. Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.

72,000 Km (45,000 Mi)

- Change engine oil and install a new oil filter.
- Perform multi-point inspection (recommended).
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise. Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.
- Install a new cabin air filter (if equipped).
- Inspect automatic transmission fluid level (if equipped with an underhood fluid level indicator).
- Inspect and lubricate control arms, steering linkage, steering ball joints, U-joints and driveshaft with zerk fittings (if equipped).
- Inspect halfshaft boots (if equipped).
- Inspect and lubricate 4WD front axle shaft U-joints (if equipped).
- Inspect brake pads, shoes, rotors, drums, brake lines, hoses and parking brake system.

tomsn048@gmail.com

- Inspect engine cooling system and hoses.
- Inspect exhaust system and heat shields.

84,000 Km (52,500 Mi)

- Change engine oil and install a new oil filter.
- Perform multi-point inspection (recommended).
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise. Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.

96,000 Km (60,000 Mi)

- Change engine oil and install a new oil filter.
- Perform multi-point inspection (recommended).
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise. Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.
- Install a new cabin air filter (if equipped).
- Install a new engine air filter (except Focus with the PZEV engine).
- Install new climate controlled seat cushion filters (if equipped).
- Install a new fuel filter (not required for Fusion, Milan, MKZ, Edge, MKX, Taurus X, Taurus, Focus, Sable, E-Series, Expedition and Navigator with short wheelbase, F-150, Flex, MKS, Escape and Mariner).
- Inspect automatic transmission/transaxle fluid level on all other vehicles (if equipped with an underhood fluid level indicator).
- Change automatic transmission/transaxle fluid on all vehicles equipped with the TorqShift® transmission.
- Install a new internal TorqShift® transmission fluid filter located inside the transmission bottom pan.
- Inspect and lubricate control arms, steering linkage, steering ball joints, U-joints and driveshaft with zerk fittings (if equipped).
- Inspect halfshaft boots (if equipped).
- Inspect and lubricate 4WD front axle shaft U-joints (if equipped).
- Replace wheel bearing grease and install new grease seals on RWD front wheel bearings (if non-sealed bearings).
- Inspect brake pads, shoes, rotors, drums, brake lines, hoses and parking brake system.
- Inspect engine cooling system and hoses.
- Inspect exhaust system and heat shields.

108,000 Km (67,500 Mi)

- Change engine oil and install a new oil filter.
- Perform multi-point inspection (recommended).
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise. Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.

120,000 Km (75,000 Mi)

- Change engine oil and install a new oil filter.
- Perform multi-point inspection (recommended).

- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise. Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.
- Install a new cabin air filter (if equipped).
- Inspect automatic transmission fluid level (if equipped with an underhood fluid level indicator).
- Inspect and lubricate control arms, steering linkage, steering ball joints, U-joints and driveshaft with zerk fittings (if equipped).
- Inspect and lubricate 4WD front axle shaft U-joints (if equipped).
- Inspect halfshaft boots (if equipped).
- Inspect brake pads, shoes, rotors, drums, brake lines, hoses and parking brake system.
- Inspect engine cooling system and hoses.
- Inspect exhaust system and heat shields.

132,000 Km (82,500 Mi)

- Change engine oil and install a new oil filter.
- Perform multi-point inspection (recommended).
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise. Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.

144,000 Km (90,000 Mi)

- Change engine oil and install a new oil filter.
- Perform multi-point inspection (recommended).
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise. Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.
- Install a new cabin air filter (if equipped).
- Install a new engine air filter (except Focus with PZEV engine).
- Install new climate controlled seat cushion filters (if equipped).
- Install a new fuel filter (not required for Fusion, Milan, MKZ, Edge, MKX, Taurus X, Taurus, Focus, Sable, E-Series, Expedition and Navigator with short wheelbase, F-150, Flex, MKS, Escape and Mariner).
- Install new spark plugs.
- Inspect automatic transmission/transaxle fluid level using the fluid level on all other vehicles (if equipped with an underhood fluid level indicator).
- Inspect and lubricate control arms, steering linkage, steering ball joints, U-joints and driveshaft with zerk fittings (if equipped).
- Inspect halfshaft boots (if equipped).
- Inspect and lubricate 4WD front axle shaft U-joints (if equipped).
- Inspect brake pads, brake linings, rotors, drums, brake lines, hoses and parking brake system.
- Inspect engine cooling system and hoses.
- Inspect accessory drive belt(s).
- Inspect exhaust system and heat shields.

156,000 Km (97,500 Mi)

- Change engine oil and install a new oil filter.
- Perform multi-point inspection (recommended).
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise.

tomsn048@gmail.com

Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.

168,000 Km (105,000 Mi)

- Change engine oil and install a new oil filter.
- Perform multi-point inspection (recommended).
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise. Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.
- Install a new cabin air filter (if equipped).
- Install a PCV valve on all cars and light trucks under 6,000 lb GVW (except 3V engines).
- Inspect automatic transmission fluid level (if equipped with an underhood fluid level indicator).
- Inspect and lubricate control arms, steering linkage, steering ball joints, U-joints and driveshaft with zerk fittings (if equipped).
- Inspect halfshaft boots (if equipped).
- Inspect and lubricate 4WD front axle shaft U-joints (if equipped).
- Change rear axle fluid on vehicles equipped with DANA axles which use synthetic lubricants.
- Inspect brake pads, rotors, brake linings, drums, brake lines, hoses and parking brake system.
- Change engine coolant.
- Inspect engine coolant system and hoses.
- Inspect exhaust system and heat shields.

180,000 Km (112,500 Mi)

- Change engine oil and install a new oil filter.
- Perform multi-point inspection (recommended).
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise. Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.

192,000 Km (120,000 Mi)

- Change engine oil and install a new oil filter.
- Perform multi-point inspection (recommended).
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise. Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.
- Install a new cabin air filter (if equipped).
- Install a new engine air filter (except Focus with PZEV engine).
- Install new climate controlled seat cushion filters (if equipped).
- Install a new fuel filter (not required for Fusion, Milan, MKZ, Edge, MKX, Taurus X, Taurus, Focus, Sable, E-Series, Expedition and Navigator with short wheelbase, F-150, Flex, MKS, Escape and Mariner).
- Install a new PCV valve on all cars and light trucks over 6,000 lb GVW (except 3V engines).
- Change automatic transmission/transaxle fluid on all vehicles equipped with the TorqShift® transmission.
- Install a new internal TorqShift® transmission fluid filter located inside the transmission bottom pan.
- Inspect automatic transmission/transaxle fluid level on all other vehicles (if equipped with an underhood fluid level indicator).

- Inspect and lubricate control arms, steering linkage, steering ball joints, U-joints and driveshaft with zerk fittings (if equipped).
- Replace wheel bearing grease and install new grease seals on RWD front wheel bearings (if non-sealed bearings).
- Inspect halfshaft boots (if equipped).
- Inspect and lubricate 4WD front axle shaft U-joints (if equipped).
- Inspect brake pads, rotors, brake linings, drums, brake lines, hoses and parking brake system.
- Inspect engine cooling system and hoses.
- Inspect accessory drive belts.
- Inspect exhaust system and heat shields.

204,000 Km (127,500 Mi)

- Change engine oil and install a new oil filter.
- Perform multi-point inspection (recommended).
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise. Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.

216,000 Km (135,000 Mi)

- Change engine oil and install a new oil filter.
- Perform multi-point inspection (recommended).
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise. Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.
- Install a new cabin air filter (if equipped).
- Inspect automatic transmission fluid level (if equipped with an underhood fluid level indicator).
- Inspect and lubricate control arms, steering linkage, steering ball joints, U-joints and driveshaft with zerk fittings (if equipped).
- Inspect halfshaft boots (if equipped).
- Inspect and lubricate 4WD front axle shaft U-joints (if equipped).
- Inspect brake pads, rotors, brake linings, drums, brake lines, hoses and parking brake system.
- Inspect engine cooling system and hoses.
- Inspect exhaust system and heat shields.

228,000 Km (142,500 Mi)

- Change engine oil and install a new oil filter.
- Perform multi-point inspection (recommended).
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise. Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor training must be done.

240,000 Km (150,000 Mi)

- Change engine oil and install a new oil filter.
- Perform multi-point inspection (recommended).
- Rotate tires, inspect tires for wear, measure tread depth and inspect wheel ends for end play and noise. Vehicles with dual rear wheels should only be rotated if unusual wear is noted. For vehicles with different front-to-rear tire pressures, the tire pressure must be adjusted and the tire pressure sensor

tomsn048@gmail.com

training must be done.
- Install a new cabin air filter (if equipped).
- Install a new engine air filter (except Focus with PZEV engine).
- Install new climate controlled seat cushion filters (if equipped).
- Install a new fuel filter (not required for Fusion, Milan, MKZ, Edge, MKX, Taurus X, Taurus, Focus, Sable, E-Series, Expedition and Navigator with short wheelbase, F-150, Flex, MKS, Escape and Mariner).
- Inspect PVC for flow (3V engines).
- Change automatic transmission/transaxle fluid (except TorqShift®).
- Install a new automatic transmission/transaxle filter (except for 6F35, 6F50, AWF-21, FNR5, and TorqShift® transmissions).
- Change manual transmission fluid (if equipped) (except Escape).
- Change transfer case fluid, 4WD (if equipped).
- Change front differential fluid, 4WD (if equipped).
- Replace rear axle lubricant on all RWD vehicles.
- Inspect and lubricate control arms, steering linkage, steering ball joints, U-joints and driveshaft with zerk fittings (if equipped).
- Inspect halfshaft boots (if equipped).
- Inspect and lubricate 4WD front axle shaft U-joints (if equipped).
- Install new front wheel bearings (if not sealed units).
- Inspect brake pads, rotors, brake linings, drums, brake lines, hoses and parking brake system.
- Change engine coolant.
- Inspect engine cooling system and hoses.
- Install a new accessory drive belt(s) (if a new belt(s) has not been installed within the last 160,000 km (100,000 mi).
- Inspect exhaust system and heat shields.

Exceptions To Normal Schedule

Maximum Oil Change Interval

- Normal schedule: 12,000 km (7,500 mi) or 6 months, whichever occurs first.
- Special operating conditions: 8,000 km (5,000 mi), 6 months or 200 hours of operation, whichever occurs first.

Motorcraft Coolant

- Change engine coolant at 6 years or 168,000 km (105,000 mi) of the vehicle's life, whichever occurs first.
- After the initial change, change coolant every 3 years or 72,000 km (45,000 mi) thereafter.

Normal Vehicle Axle Maintenance

Rear axles and transfer case/Power Transfer Unit (PTU) containing synthetic lubricant and light duty trucks equipped with Ford-design axles are lubricated for life. These lubricants are not to be checked or changed unless service is required, or if a leak is suspected or the axle assembly has been submerged in water.

The axle and transfer case/ PTU fluid should be changed anytime they have been submerged in water. Non-synthetic rear axle lubricants should be installed new every 4,800 km (3,000 mi) or 3 months, whichever occurs first, during extended trailer tow operation above 21°C (70°F) ambient and Wide Open Throttle (WOT) for extended periods above 72 km/h (45 mph).

The 3,000 mile lube change interval may be waived if the axle was filled with 75W-140 synthetic gear

lubricant. Add 118 ml (4 oz) of additive friction modifier for complete refill of Traction-Lok rear axles.

The axle lubricant should be changed anytime an axle has been submerged in water.

Police and Taxi Vehicle Axle Maintenance

Install new rear axle lubricant every 160,000 km (100,000 mi). Rear axle lubricant change may be waived if the axle was filled with 75W-140 synthetic gear lubricant. Add 118 ml (4 oz) of additive friction modifier for complete refill of Traction-Lok rear axles.

The axle lubricant should be changed anytime an axle has been submerged in water.

California Fuel Filter replacement

If the vehicle is registered in California, the California Air Resources Board has determined that the failure to perform this maintenance item will not nullify the emission warranty or limit recall liability prior to the completion of the vehicle's useful life. Ford Motor Company, however, urges you to have all recommended maintenance services performed at the specified intervals and to record all vehicle service.

Class A Motorhome

- Every 2 years - change brake fluid.
- Every 96,000 km (60,000 mi) change automatic transmission fluid.

---

tomsn048@gmail.com

Noise, Vibration and Harshness (NVH)

Noise is any undesirable sound, usually unpleasant in nature. Vibration is any motion, shaking or trembling, that can be felt or seen when an object moves back and forth or up and down. Harshness is a ride quality issue where the vehicle's response to the road transmits sharply to the customer. Harshness normally describes a firmer than usual response from the suspension system. NVH is a term used to describe these conditions, which result in varying degrees of dissatisfaction. Although a certain level of NVH caused by road and environmental conditions is normal, this section is designed to aid in the diagnosis, testing and repair of NVH symptoms.

Acceptable NVH

All internal combustion engines and drivelines produce some noise and vibration; operating in a real world environment adds noise that is not subject to control. Vibration isolators, mufflers and dampers reduce these to acceptable levels. A driver who is unfamiliar with a vehicle can think that some sounds are abnormal when actually the sounds are normal for the vehicle type. As a technician, it is very important to be familiar with vehicle features and know how they relate to NVH symptoms and their diagnosis. For example, if the vehicle has automatic overdrive, it is important to test drive the vehicle both in and out of overdrive mode.

Glossary of Terms

Amplitude

The quantity or amount of energy produced by a vibrating component (G-force). An extreme vibration has a high amplitude. A mild vibration has a low amplitude. See Intensity.

Boom

Low frequency or low pitched noise often accompanied by a vibration. Also refer to Drumming.

Buffet/Buffeting

Strong noise fluctuations caused by gusting winds. An example would be wind gusts against the side glass.

Buzz

A low-pitched sound like that from a bee. Often a metallic or hard plastic humming sound. Also describes a high-frequency vibration. Vibration feels similar to an electric razor.

Chatter

A pronounced series of rapidly repeating rattling or clicking sounds.

Chirp

A short-duration, high-pitched noise associated with a slipping drive belt.

Chuckle

A repetitious, low-pitched sound. A loud chuckle is usually described as a knock.

Click

A sharp, brief, non-resonant sound, similar to actuating a ball point pen.

Clonk

A hydraulic knocking sound. Sound occurs with air pockets in a hydraulic system. Also described as hammering.

Clunk/Driveline Clunk

A heavy or dull, short-duration, low-frequency sound. Occurs mostly on a vehicle that is accelerating or decelerating abruptly. Also described as a thunk.

Conductor

The components that carry (transmit) a vibration frequency from the originator to the reactor.

Cycles Per Second

Cycles per second. Same as hertz (Hz).

Cracks

A mid-frequency sound, related to squeak. Sound varies with temperature conditions.

Creak

A metallic squeak.

Cycle

The process of a vibrating component going through a complete range of motion and returning to the starting point.

Decibel (dB)

A unit of measurement, referring to sound pressure level, abbreviated dB.

Drone

A low-frequency, steady sound, like a freezer compressor. Also described as a moan.

Drumming

A cycling, low-frequency, rhythmic noise often accompanied by a sensation of pressure on the ear drums. Also described as a low rumble, boom or rolling thunder.

Flutter

Mid to high intermittent sound due to air flow. Similar to a flag flapping in the wind.

tomsn048@gmail.com

Frequency

The rate at which a cycle occurs within a given time.

G-force

The additional load or weight produced in an object during acceleration. When measuring the level or amplitude of a vibration without sound, the unit G is added to associate the force of the vibration to gravity. This is similar to measuring the weight of an object, which is also a function of gravity.

Gravelly Feel

A grinding or growl in a component, similar to the feel experienced when driving on gravel.

Grind

An abrasive sound, similar to using a grinding wheel, or rubbing sand paper against wood.

Hertz (Hz)

A unit of measure used to describe noise and vibration concerns expressed in cycles per second.

Hiss

Steady, high-frequency noise. Vacuum leak sound.

Hoot

A steady, low-frequency tone, sounds like blowing over a long neck bottle.

Howl

A mid-range frequency noise between drumming and whine. Also described as a hum.

Hum

Mid-frequency steady sound, like a small fan motor. Also described as a howl.

Intensity

The physical quality of sound that relates to the strength of the vibration (measured in decibels). The higher the sound's amplitude, the higher the intensity and vice versa. See Amplitude.

Knock

A heavy, loud, repetitious sound, like a knock on the door.

Moan

A constant, low-frequency tone. Also described as a hum.

Ping

A short-duration, high-frequency sound, which has a slight echo.

Pitch

The physical quality of sound that relates to its frequency. Pitch increases as frequency increases and vice versa.

Pumping Feel

A slow, pulsing movement.

Rattle

A random and momentary or short-duration noise.

Reactor

The component, or part, that receives a vibration from an originator and conductor and reacts to the vibration by moving.

Roughness

A medium-frequency vibration. A slightly higher frequency than a shake. This type of vibration is usually related to drivetrain components.

Rustling

Intermittent sound of varying frequency, sounds similar to shuffling through leaves.

Shake

A low-frequency vibration, usually with visible component movement. Usually relates to tires, wheels, brake drums or brake discs if it is vehicle speed sensitive, or engine if it is engine speed sensitive. Also referred to as a shimmy or wobble.

Shimmy

An abnormal vibration or wobbling, felt as a side-to-side motion of the steering wheel in the driveshaft rotation. Also described as waddle.

Shudder

A low-frequency vibration that is felt through the steering wheel or seat during light brake application.

Slap

A resonance from flat surfaces, such as safety belt webbing or door trim panels.

Squeak

A high-pitched transient sound, similar to rubbing fingers against a clean window.

Squeal

A long-duration, high-pitched noise.

tomsn048@gmail.com

Tap

A light, rhythmic or intermittent hammering sound, similar to tapping a pencil on a table edge.

Thump

A dull beat caused by 2 items striking together.

Tick

A rhythmic tap, similar to a clock noise.

Tip-In Moan

A light moaning noise heard during light vehicle acceleration, usually between 40-100 km/h (25-65 mph).

Transient

A noise or vibration that is momentary, a short duration.

Vibration

Any motion, shaking or trembling, that can be felt or seen when an object moves back and forth or up and down.

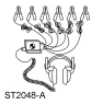
Whine

A constant, high-pitched noise. Also described as a screech.

Whistle

High-pitched noise with a very narrow frequency band. Examples of whistle noises are a turbocharger or air flow around an antenna.

Wind Noise



Any noise caused by air movement in, out or around the vehicle.

 ST2314-A	Ultrasonic Leak Detector 134-R0135 or equivalent

Diagnostic Theory

The shortest route to an accurate diagnosis results from:

- system knowledge, including comparison with a known good system.
- system history, including repair history and usage patterns.
- condition history, especially any relationship to repairs or sudden change.
- knowledge of possible sources.
- using a systematic diagnostic method that divides the system into related areas.

The diagnosis and correction of NVH symptoms requires:

- a road or system test to determine the exact nature of the symptom.
- an analysis of the possible causes.
- testing to verify the cause.
- repairing any symptoms found.
- a road test or system test to make sure the cause has been corrected or brought back to within an acceptable range.

Diagnostic Procedure Overview

Qualifying the symptom by the particular sensation present can help narrow down the cause. Always use the

"symptom" to "system" to "component" to "cause" diagnosis technique. This diagnostic method divides the problem into related areas to correct the customer concern.

- Verify the "symptom".
- Determine which "system(s)" can cause the "symptom" using the diagnostic tools described in this section.
- After determining the possible "system(s)", refer to the appropriate section in this manual to identify the worn or damaged "components".
- After identifying the "components", identify the "cause" of the failure.

Tools and Techniques

The diagnostic tools allow for a systematic collection of information that is necessary to accurately diagnose and repair NVH problems. Remember that the vibrating source component (originator) may only generate a small vibration. This small vibration can in turn cause a larger vibration/noise to emanate from another receiving component (reactor), due to contact with other components (transfer path). For the best results, carry out the test as follows:

a. Test drive the vehicle with the vibration sensor inside the vehicle.
b. Place the sensor in the vehicle according to feel.
    - ♦ If the condition is felt through the steering wheel, the source is most likely in the front of the vehicle.
    - ♦ A vibration that is felt in the seat or floor only will most likely be found in the driveline, drive axle or rear wheels and tires.
c. Record the readings. Also note when the condition begins, when it reaches maximum intensity and if it tends to diminish above/below a certain speed.
    - ♦ If a vibration symptom is vehicle speed related, the tire and wheel rpm/frequency and driveshaft frequency should be calculated.
    - ♦ If a vibration symptom is engine speed related, the engine, engine accessory and engine firing frequencies should be calculated.
    - ♦ Frequencies with an amplitude reading of 0.06 Gs or less are barely perceptible NVH levels. No corrective action is necessary.
d. Place the vibration sensor on or near the suspect area outside the vehicle.
e. Continue the road test, driving the vehicle at the speed the symptom occurs and take another reading.
f. Compare the readings.
    - ♦ A match in frequency indicates the problem component or area.
    - ♦ An unmatched test could indicate the symptom is caused by the engine, torque converter or engine accessory. Use the diagnostic tools in the rpm mode and check if symptom is rpm related.

The following diagnostic tools and techniques can be used separately or in conjunction with each other to aid in the diagnosis of NVH symptoms. They are listed in order of preference for ease in their use for locating these symptoms.

NVH Analyzer (Vetronix)

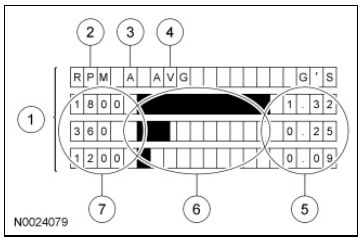
The Mastertech® Series MTS 4000 Driveline Balance and NVH Analyzer (Vetronix) and the MTS 4100 NVH analyzers are tools to aid in the identification and isolation of a noise, vibration or harshness symptom in a vehicle. They measure noise and vibration data and compare it with data obtained from the vehicle's PCM as well as vehicle variants that were entered by the user such as pulley size, axle ratio and tire size in order to provide possible sources. The Mastertech® Series MTS 4000 Driveline Balance and NVH Analyzer (Vetronix) and the MTS 4100 have the following characteristics:

- Interface with the vehicle's computer system

tomsn048@gmail.com

- Support and store vibration data input from 1 or 2 accelerometers
- Support and store noise data input from 2 microphones
- Provide a photo-tachometer for operation of the driveshaft balancing function
- Provide a strobe output capable of driving a standard timing light
- Contain a real-time clock circuit that provides time and date information which is used for tagging test data
- Have the capability to print to an external printer and interface with a PC
- Can be powered from a variety of power sources: cigarette lighter, AC power or the internal battery pack

The Mastertech® Series MTS 4000 Driveline Balance and NVH Analyzer (Vetronix) and the MTS 4100 NVH analyzers have 4 main operating modes. The first is for vibration diagnosis. This mode measures data from 1 or 2 accelerometers simultaneously while obtaining data from the vehicle. Then it carries out a frequency analysis on the accelerometer information and compares the vibration frequencies with the frequencies associated with various rotating components within the vehicle. The data can be presented in 4 different display modes: principle component, bar chart, frequency spectrum or waterfall. All display mode formats contain the same common elements, such as amplitude.



The second is for noise diagnosis. This mode measures noise from 1 or 2 microphones simultaneously. All noise measurements are in decibels (dBs). All frequency bands used for noise measurements are the same as for the vibration measurements, up to 1,000 Hz.

The third is driveshaft balancing. Driveshaft balancing is done using 1 or 2 accelerometers and a photo-tachometer. The accelerometers measure the vibration at both ends of the driveshaft, while the photo-tachometer measures the rotation speed and position reference. Refer to Section 205-00 .

The fourth is the strobe. A strobe or standard timing light can be connected to an analyzer, to provide a means for measuring rotation speed. The strobe function is used for isolating the source of a vibration.

Electronic Vibration Analyzer (EVA)

The Electronic Vibration Analyzer (EVA) is a hand-held electronic scan tool which will assist in locating the source of unacceptable vibrations. The vibration sensor can be remotely mounted anywhere in the vehicle for testing purposes. The unit displays the 3 most common vibration frequencies and their corresponding amplitudes simultaneously. A bar graph provides a visual reference of the relative signal strength (amplitude) of each vibration being displayed and its relative G-force. The keypad is arranged to make the EVA simple to program and use. Some of the functions include the ability to average readings as well as record, play back and freeze readings. The EVA has a strobe balancing function that can be used to detect imbalance on rotating components such as a driveshaft or engine accessories.

Item	Description
1	Electronic Vibration Analyzer (EVA) screen
2	Frequency mode displayed in rpm or Hz
3	Active sensor input (A or B)
4	Current active mode

5	G-force indicators or the strongest frequencies in descending strength of each vibration
6	Strength of each vibration
7	Frequency in rpm/Hz of each vibration

Record the readings taken with the diagnostic tool.

- ♦ Frequencies should be read in the "average" mode.
- ♦ Frequencies have a range of plus or minus 2 Hz. A reading of 10 Hz can be displayed as an 8 Hz through 12 Hz.

Vibrate Software®

Vibrate Software® (Rotunda tool number 215-00003) is a diagnostic aid which will assist in pinpointing the source of unacceptable vibrations. The engine's crankshaft is the point of reference for vibration diagnosis. Every rotating component will have an angular velocity that is faster, slower or the same as the engine's crankshaft. Vibrate Software® calculates the angular velocity of each component and graphically represents these velocities on a computer screen and on a printed vibration worksheet. The following steps outline how Vibrate Software® helps diagnose a vibration symptom:

- Enter the vehicle information. Vibrate will do all the calculations and display a graph showing tire, driveshaft and engine vibrations.
- Print a Vibration Worksheet graph. The printed graph is to be used during the road test.
- Road test the vehicle at the speed where the vibration is most noticeable. Record the vibration frequency rpm and the engine rpm on the worksheet graph. The point on the graph where the vibration frequency rpm reading and the engine rpm reading intersect indicates the specific component group causing the symptom.
    - ♦ A frequency measurement tool capable of measuring vibration frequency and engine rpm will be needed.
- Provides graphics of diagnostic procedures to aid in testing components.

Reed Tachometer

The Reed tachometer is a hand-held vibration sensor which will assist in locating the source of unacceptable vibrations. The vibration sensor can be placed anywhere in the vehicle for testing purposes. The Reed tachometer contains several reeds that are tuned to vibrate or resonate at different frequencies ranging from 10 to 80 Hz or 600 to 4,800 rpm. Though the Reed tachometer is able to measure multiple frequencies, it does not measure amplitude.

Sirometer

The Sirometer measures frequency in hertz and rpm. To use the Sirometer, place it on any vibrating component and slowly scroll the wire out by turning the knob. As the length of wire changes, so does its natural frequency. Find the length of wire that vibrates with the highest amplitude. This frequency will match that of the vibrating component. Read the frequency for that length of wire.

Combination EngineEAR/ChassisEAR

An electronic listening device used to quickly identify noise and the location under the chassis while the vehicle is being road tested. The ChassisEARs can identify the noise and location of damaged/worn wheel bearings, CV joints, brakes, springs, axle bearings or driveshaft carrier bearings.

tomsn048@gmail.com

EngineEAR Basic Unit

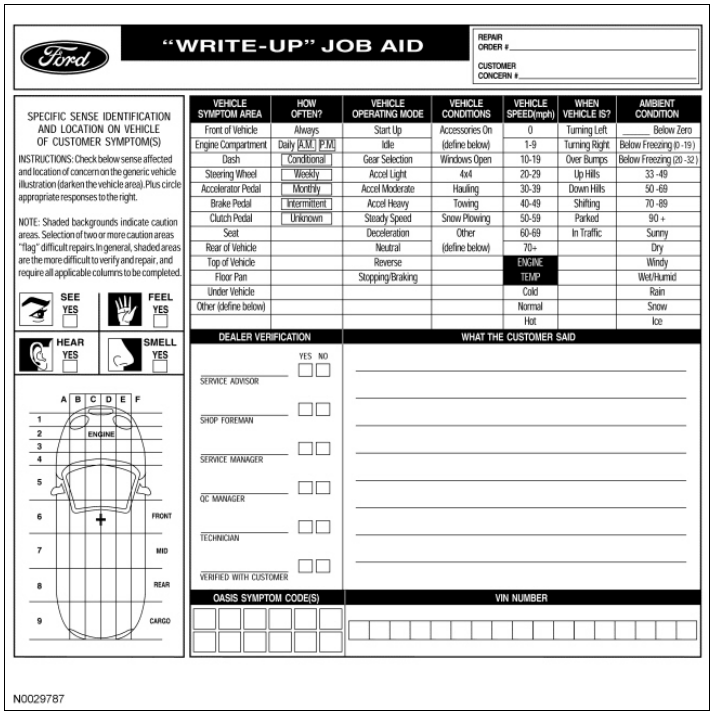
An electronic listening device used to detect even the faintest noises. The EngineEARs can detect the noise of damaged/worn bearings in generators, coolant pumps, A/C compressors and power steering pumps. They are also used to identify noisy lifters, exhaust manifold leaks, chipped gear teeth and for detecting wind noise. The EngineEAR has a sensing tip, amplifier and headphones. The directional sensing tip is used to listen to the various components. Point the sensing tip at the suspect component and adjust the volume with the amplifier. Placing the tip in direct contact with a component will reveal structure-borne noise and vibrations, generated by or passing through, the component. Various volume levels can reveal different sounds.

Mechanic's Stethoscope

A mechanic's stethoscope is an inexpensive tool for locating noises in engines and other moving parts. It can be used to help diagnose piston slap, worn gears, faulty valves, coolant pump failure, damaged gaskets, defective bearings and body squeaks.

Squeak and Rattle Repair Kit

The Squeak and Rattle Repair Kit (Rotunda tool number 164-R4900) contains lubricants and self-adhesive materials that can be used to eliminate interior and exterior squeaks and rattles. The kit consists of the following materials:



- PVC (soft foam) tape
- Urethane (hard foam) tape
- Flocked (black fuzzy) tape
- UHMW (frosted) tape
- Squeak and rattle oil tube
- Squeak and rattle grease tube

Ultrasonic Leak Detector

The Ultrasonic Leak Detector is used to detect wind noises caused by leaks and gaps in areas where there is weatherstripping or other sealing material. It is also used to identify A/C leaks, vacuum leaks and evaporative emission noises. The Ultrasonic Leak Detector includes a multi-directional transmitter (operating in the ultrasonic range) and a hand-held detector. The transmitter is placed inside the vehicle. On the outside of the vehicle, the hand-held detector is used to sweep the area of the suspected leak. As the source of the leak is approached, a beeping sound is produced which increases in both speed and frequency.

Write-Up Job Aid

To assist the service advisor and the technician, a Write-Up Job Aid used during the interview process is included with this material. The Write-Up Job Aid serves as a place to record all important symptom information.

1: Customer Interview

The diagnostic process starts with the customer interview. The service advisor must obtain as much information as possible about the symptom and take a test drive with the customer. There are many ways a customer will describe NVH symptoms and this will help minimize confusion arising from descriptive language differences. It is important that the symptom is correctly interpreted and the customer descriptions are recorded. During the interview, complete the write-up job aid and ask the following questions:

- When was it first noticed?
- Did it appear suddenly or gradually?
- Did any abnormal occurrence coincide with or precede its appearance?

Use the information gained from the customer to accurately begin the diagnostic process.

2: Pre-Drive Check

It is important to do a pre-drive check before road testing the vehicle. A pre-drive check verifies that the vehicle is relatively safe to drive and eliminates any obvious faults on the vehicle.

The pre-drive check consists of a brief visual inspection. During this brief inspection, take note of anything that will compromise safety during the road test and make those repairs/adjustments before taking the vehicle on the road.

3: Preparing for the Road Test

Observe the following when preparing for the road test:

- Review the information recorded on the write-up job aid. It is important to know the specific symptom the customer has with the vehicle.
- Do not be misled by the reported location of the noise/vibration. The cause can actually be some

tomsn048@gmail.com

distance away.
- Conduct the road test on a quiet street where it is safe to duplicate the vibration/noise. The ideal testing route is an open, low-traffic area where it is possible to operate the vehicle at the speed in which the condition occurs.
- While observing that they are not related to the symptom, eliminate the following:
    - ♦ If possible, lower the radio antenna in order to minimize turbulence.
    - ♦ Identify anything that could potentially make noise or be a source of wind noise.
    - ♦ Inspect the vehicle for add-on items that create vibration/noise.
    - ♦ Turn off the radio and the heating and cooling system blower.
- The engine speed is an important factor in arriving at a final conclusion. Therefore, connect a diagnostic tool, Vetronix, or an accurate tachometer to the engine, even if the vehicle has a tachometer. This will make sure of an exact engine speed reading.

4: Verify the Customer Concern

Verify the customer concern by carrying out a road test, an engine run-up test or both.

The decision to carry out a road test, an engine run-up test or both depends on the type of NVH symptom. A road test may be necessary if the symptom relates to the suspension system or is sensitive to torque. A Drive Engine Run-Up (DERU) or a Neutral Engine Run-Up (NERU) test identifies noises and vibrations relating to engine and drivetrain rpm. Remember, a condition will not always be identifiable by carrying out these tests, however, they will eliminate many possibilities if carried out correctly.

5: Road Test

NOTE: It may be necessary to have the customer ride along or drive the vehicle to point out the symptom. During the road test, take into consideration the customer's driving habits and the driving conditions. The customer's concern just may be an acceptable operating condition for that vehicle.

The following is a brief overview of each test in the order in which it appears. A review of this information helps to quickly identify the most appropriate process necessary to make a successful diagnosis. After reviewing this information, select and carry out the appropriate test(s), proceeding to the next step of this process.

- The Slow Acceleration Test is normally the first test to carry out when identifying an NVH symptom, especially when a road test with the customer is not possible.
- The Heavy Acceleration Test helps to determine if the symptom is torque-related.
- The Neutral Coast Down Speed Test helps to determine if the symptom is vehicle speed-related.
- The Downshift Speed Test helps to determine if the symptom is engine speed-related.
- The Steering Input Test helps to determine how the wheel bearings and other suspension components contribute to a vehicle speed-related symptom.
- The Brake Test helps to identify vibrations or noise that are brake related.
- The Road Test Over Bumps helps isolate a noise that occurs when driving over a rough or bumpy surface.
- The Engine Run-Up Tests consist of the Neutral Engine Run-Up (NERU) Test and the Drive Engine Run-Up (DERU) Load Test. These tests help to determine if the symptom is engine speed-related.
- The Neutral Engine Run-Up (NERU) Test is used as a follow-up test to the Downshift Speed Test when the symptom occurs at idle.
- The Drive Engine Run-Up (DERU) Load Test helps to identify vibration/noise sensitive to engine load or torque. It also helps to reproduce engine speed-related symptoms that cannot be duplicated when carrying out the Neutral Engine Run-Up (NERU) Test or the Neutral Coast Down Test.
- The Engine Accessory Test helps to locate faulty belts and accessories that cause engine speed-related

symptoms.
- The Vehicle Cold Soak Procedure helps to identify symptoms occurring during initial start-up and when an extended time lapse occurs between vehicle usage.

Slow Acceleration Test

To carry out this test, proceed as follows:

- Slowly accelerate to the speed where the reported symptom occurs. Note the vehicle speed, the engine rpm and, if possible, determine the vibration frequency.
- Attempt to identify from what part of the vehicle the symptom is coming.
- Attempt to identify the source of the symptom.
- If the source of the symptom has been identified as a result of this test, proceed to the appropriate section for further diagnosis and repair. If the source has not been identified, continue with the road test.

Heavy Acceleration Test

To carry out this test, proceed as follows:

- Accelerate hard from 0-64 km/h (0-40 mph).
- Decelerate in a lower gear.
- The symptom is torque-related if duplicated while carrying out this test.
- If the source of the symptom has been identified as a result of this test, proceed to the appropriate section for further diagnosis and repair. If the source has not been identified, continue with the road test.

Neutral Coast Down Speed Test

To carry out this test, proceed as follows:

- Drive at a higher rate of speed than where the symptom occurred when carrying out the Slow Acceleration Test.
- Place the transmission in NEUTRAL and coast down past the speed where the symptom occurs.
- The symptom is vehicle speed-related if duplicated while carrying out this test. This eliminates the engine and the torque converter as sources.
- If the symptom was not duplicated while carrying out this test, carry out the Downshift Speed Test to verify if the symptom is engine speed related.
- If the source of the symptom has been identified as a result of this test, proceed to the appropriate section for further diagnosis and repair. If the source has not been identified, continue with the road test.

Downshift Speed Test

To carry out this test, proceed as follows:

- Shift into a lower gear than the gear used when carrying out the Slow Acceleration Test.
- Drive at the engine rpm where the symptom occurs.
- The symptom is engine speed related if duplicated while carrying out this test. This eliminates the tires, wheels, brakes and the suspension components as sources.

tomsn048@gmail.com

- If necessary, repeat this test using other gears and NEUTRAL to verify the results.
- If the source of the symptom has been identified as a result of this test, proceed to the appropriate section for further diagnosis and repair. If the source has not been identified, continue with the road test.

Steering Input Test

To carry out this test, proceed as follows:

- Drive at the speed where the symptom occurs, while making sweeping turns in both directions.
- If the symptom goes away or gets worse, the wheel bearings, hubs, U-joints (contained in the axles of Four-Wheel Drive (4WD) applications), and tire tread wear are all possible sources.
- If the source of the symptom has been identified as a result of this test, proceed to the appropriate section for further diagnosis and repair. If the source has not been identified, continue with the road test.

Brake Test

To carry out this test, proceed as follows:

- With the brake released, accelerate the vehicle. While coasting (brake pedal released) to a stop in NEUTRAL, note any abnormal rate of deceleration. Abnormal deceleration could indicate a parking brake or service brake that is not fully releasing.
- Warm the brakes by slowing the vehicle a few times from 80-32 km/h (50-20 mph) using light braking applications.
- Accelerate to 89-97 km/h (55-60 mph). Moderately apply the brakes and slow the vehicle to a stop.
- A brake vibration can be felt in the steering wheel, seat or brake pedal. A brake noise can be heard upon brake application and should diminish when the brake is released. For vehicles with separate park brake shoes, noise or vibration from the parking brake system will not be affected by applying the hydraulic brakes. On these systems, the parking brake system requires inspection if a parking brake concern is suspected.
- If the source of the symptom has been identified as a result of this test, proceed to the appropriate brake section(s) for further diagnosis and repair. If the source has not been identified, continue with the road test.

Road Test Over Bumps

To carry out this test, proceed as follows:

- Drive the vehicle over a bump or rough surface one wheel at a time to determine if the noise is coming from the front or the back and the left or the right side of the vehicle.
- If the source of the symptom has been identified as a result of this test, proceed to the appropriate section for further diagnosis and repair. If the source has not been identified, continue with the road test.

Neutral Engine Run-Up (NERU) Test

To carry out this test, proceed as follows:

- Install a tachometer.

- Increase the engine rpm up from an idle to approximately 4,000 rpm while in PARK on Front Wheel Drive (FWD) vehicles with automatic transmissions, or NEUTRAL for all other vehicles. Note the engine rpm and, if possible, determine the vibration frequency.
- Attempt to identify what part of the vehicle the symptom is coming from.
- Attempt to identify the source of the symptom.
- If the source of the symptom has been identified as a result of this test, proceed to the appropriate section for further diagnosis and repair. If the source has not been identified, continue with the road test.

Drive Engine Run-Up (DERU) Load Test

To carry out this test, proceed as follows:

⚠ **WARNING: Block all wheels, set the parking brake and firmly apply the service brake to reduce the risk of vehicle movement during this procedure. Failure to follow these instructions may result in serious personal injury.**

NOTICE: **Do not carry out the Engine Load Test for more than 5 seconds or damage to the transmission or transaxle may result.**

- Block the front and rear wheels.
- Apply the parking brake and the service brake.
- Install a tachometer.
- Shift the transmission into DRIVE, and increase and decrease the engine rpm between an idle to approximately 2,000 rpm. Note the engine rpm and, if possible, determine the vibration frequency.
- Repeat the test in REVERSE.
- If the vibration/noise is duplicated when carrying out this test, inspect the engine and transmission or transaxle mounts.
- If the symptom is definitely engine speed-related, carry out the Engine Accessory Test to narrow down the source.
- If the source of the symptom has been identified as a result of this test, proceed to the appropriate section for further diagnosis and repair. If the source has not been identified, continue with the road test.

Engine Accessory Test

To carry out this test, proceed as follows:

⚠ **WARNING: Block all wheels, set the parking brake and firmly apply the service brake to reduce the risk of vehicle movement during this procedure. Failure to follow these instructions may result in serious personal injury.**

NOTICE: **Limit engine running time to one minute or less with belts removed or serious engine damage will result.**

NOTE: Use a frequency measurement tool to pinpoint accessory vibrations. A listening device, such as an EngineEAR, will also help to identify noises from specific accessories.

- Remove the accessory drive belt(s).
- Increase the engine rpm to where the symptom occurs.
- If the vibration/noise is duplicated when carrying out this test, the belt(s) and accessories are not sources.

tomsn048@gmail.com

- If the vibration/noise was not duplicated when carrying out this test, install the accessory belt(s), one at a time, to locate the source.
- If the source of the symptom has been identified as a result of this test, proceed to the appropriate section for further diagnosis and repair. If the source has not been identified, continue with the road test.

Vehicle Cold Soak Procedure

To carry out this procedure, proceed as follows:

- Test preparations include matching customer conditions (if known). If not known, document the test conditions: gear selection and engine rpm. Monitor the vibration/noise duration with a watch for up to 3 minutes.
- Park the vehicle where testing will occur. The vehicle must remain at or below the symptom temperature (if known) for 6-8 hours.
- Before starting the engine, conduct a visual inspection under the hood.
- Turn the key on, but do not start the engine. Listen for the fuel pump, ABS and air suspension system noises.
- Start the engine.
- Isolate the vibration/noise by carefully listening. Move around the vehicle while listening to find the general location of the vibration/noise. Then, search for a more precise location by using a stethoscope or EngineEAR.
- If the source of the symptom has been identified as a result of this test, proceed to the appropriate section for further diagnosis and repair. If the source has not been identified, continue with the road test.

Classify NVH Symptom

For NVH concerns, it is necessary to classify the customer's concern into one of the 3 categories: noise, vibration or harshness. The reason for this is that a customer concern may consist of a combination of symptoms involving noise and vibration, or vibration and harshness. In cases where there are combination symptoms, determine which diagnostic path to follow: noise, vibration or harshness. For example, if a customer has a concern involving a noise and a vibration, and it is determined that it is vehicle speed-related, follow the vibration diagnostic path.

Noise Symptoms

Once a symptom is classified as a noise, the particular conditions under which the noise occurs need to be identified. These conditions are identified and verified during the road test. For example, a noise may only occur while turning. The next step is to determine which systems on the vehicle are related to that condition. In this case, the steering system and wheel/tire system may be suspect. After identifying possible systems, a preliminary inspection of these systems should be done. If the source of noise is still unidentified, use a listening device (such as the ChassisEAR) to pinpoint the source. Once the source has been identified, determine if this source is related to the suspected system previously identified. If it is related, then complete the repair to resolve the customer concern. If it is unrelated, then it is possible that the source of the noise is a reactor to a noise being transmitted through a transfer path. If this is the case, repairing the reactor will not resolve the customer concern. The transfer path must be identified and a determination made if the noise is normal, but accentuated by the transfer path (conductor), or if the originator is the fault causing excessive noise to transfer to another component through a conductor. There is a relationship between systems identified as related to conditions and the noise transfer path. In some cases, the condition under which the noise occurs has nothing to do with the identified source. This relationship is important in the diagnosis of noise concerns.

It is the first clue that the identified source of noise might be a reactor and that further investigation is needed to diagnose a possible noise transfer path concern. Based on the results from the road test, make a determination of which action in the symptom chart to take first.

Vibration Symptoms

Most vibrations consist of movements back and forth or up and down that repeat. Every time the vibrating component goes through its complete range of motion and returns to the starting point is called a cycle. The rate at which these cycles occur within a given time is called the frequency. Frequency is measured in cycles per second or Hertz (Hz). One cycle per second equals one Hz. Once the frequency of a vibration is known, calculations can be done to determine the system that is the source of the concern.

Order of Vibration

The order of a vibration refers to how often the vibration is present in one revolution of the component. For example, a vibration that is present once each revolution of a component would be a first order vibration. A vibration present twice each revolution of the component would be a second order vibration. Vibration orders do not have to be whole numbers, they can have decimal values such as 1.5 order vibration or 3.08 order vibration.

The concept of order of vibration is important to remember when the measured frequency of a vibration does not seem to match the frequency calculations of any of the likely systems or components. As the order increases, the frequency of the vibration will also increase by a multiple of that number.

For example, vibration may be present where the frequency is measured at 14 Hz. After doing the necessary calculations it is determined the first order tire and wheel frequency is 7 Hz and the first order driveshaft frequency is 22 Hz. Based on this information it can be determined the vibration is most likely a second order tire and wheel vibration: 7 Hz (first order tire and wheel frequency) multiplied by 2 (second order) equals 14 Hz (second order tire and wheel frequency).

Relationship of Vibration Frequency to Order of Vibration

After carrying out the road test as described in this section, the vibration was determined to be either vehicle-speed related or engine-speed related. That determination will identify the vibration frequency calculations that should be done.

Vibration Type	Calculate
Vehicle-speed related	Tire-speed vibration frequency Driveshaft-speed vibration frequency
Engine-speed related	Engine vibration frequency Engine accessory vibration frequency Engine firing vibration frequency

tomsn048@gmail.com

In calculating and using frequency readings, it is important to remember the direct relationship between Hz and rpm. One Hz is equal to 60 rpm. This is easy to remember; think of Hz as cycles per second. There are 60 seconds in a minute, therefore multiply Hz reading by 60 to get rpm. Conversely, divide rpm by 60 to get Hz.

Use the Frequency and RPM Calculations Worksheet to calculate system/component frequencies. The worksheet provides the necessary steps to determine each system/component group frequency.

Frequency Calculations

Calculating Tire and Wheel Frequency

For a vibration concern, use the vehicle speed to determine tire/wheel frequency and rpm. Calculate tire and wheel rpm and frequency by carrying out the following:

- Measure the diameter of the tire.
- Record the speed at which the vibration occurs.
- Obtain the corresponding tire and wheel rpm and frequency from the Tire Speed and Frequency Chart.
- If the vehicle speed is not listed, calculate the tire and wheel frequency as follows:
    - Divide the vehicle speed at which the vibration occurs by 16 km/h (10 mph). Multiply that number by the 16 km/h (10 mph) tire rpm listed for that tire diameter in the chart. Then divide that number by 60.
    - For example, if calculating the frequency based on vehicle speed in km/h for a 64 km/h vibration with 835 mm tires, divide 64 km/h by 16 km/h = 4. Multiply 4 by 105 rpm = 420. Divide 420 by 60 seconds = 7 Hz at 64 km/h.
    - If calculating the frequency based on vehicle speed in mph for a 40 mph vibration with 33 inch tires, divide 40 mph by 10 mph = 4. Multiply 4 by 105 rpm = 420. Divide 420 by 60 seconds = 7 Hz at 40 mph.
    - The calculated frequency of 7 Hz is the first order tire and wheel vibration; the second order tire and wheel vibration would be twice this number at 14 Hz; the third order tire and wheel vibration would be 21 Hz; and so on.

Tire Speed and Frequency Chart

Tire Diameter	Tire RPM/Hz	Tire RPM/Hz	Tire RPM/Hz	Tire RPM/Hz
mm (in)	@ 16 km/h (10 mph)	@ 80 km/h (50 mph)	@ 97 km/h (60 mph)	@ 113 km/h (70 mph)
483 (19)	182	910/15	1,092/18	1,274/21
508 (20)	173	865/14	1,038/17	1,211/20
533 (21)	165	825/14	990/16	1,155/19
560 (22)	158	790/13	948/16	1,106/18
585 (23)	151	755/13	906/15	1,057/18
610 (24)	145	725/12	870/14	1,015/17
635 (25)	139	695/12	834/14	973/16
660 (26)	134	670/11	804/13	938/16
685 (27)	129	645/11	774/13	903/15

710 (28)	124	620/10	744/12	868/14
735 (29)	119	595/10	714/12	833/14
760 (30)	115	575/10	690/11	805/13
785 (31)	111	555/9	666/11	777/13
810 (32)	108	540/9	648/11	756/13
835 (33)	105	525/9	630/10	735/12
864 (34)	102	510/8	612/10	714/12

Calculating Driveshaft Frequency

Knowing the tire and wheel frequency allows for easy calculation of driveshaft frequency. The driveshaft drives the tires through the rear axle. Therefore, to determine driveshaft frequency, multiply tire and wheel frequency by the ratio of the rear axle. Calculate driveshaft frequency by performing the following steps:

- Obtain the axle ratio of the vehicle. Suppose the vehicle has a vibration problem at 64 km/h (40 mph) and a rear axle ratio of 2.93:1.
- Multiply the tire and wheel frequency of 7 Hz (calculated previously) with the rear axle ratio of 2.93:1. This results in a driveshaft frequency of 21 Hz at a vehicle speed of 64 km/h (40 mph).

The calculated frequency of 21 Hz is the first order driveshaft frequency; the second order frequency of the driveshaft is twice this number, or 42 Hz; and so on.

Calculating Engine Frequency

Use the engine rpm where the vibration symptom occurs to determine engine frequency. Calculate engine frequency by dividing the engine rpm by 60 (the number of seconds in a minute). For example, if the corresponding engine rpm of a vibration concern on a vehicle is 2,400 rpm, the resulting engine frequency is 40 Hz. Therefore, a 40 Hz vibration is a first order engine vibration. For purposes of vibration diagnosis, the engine also includes the torque converter and exhaust system.

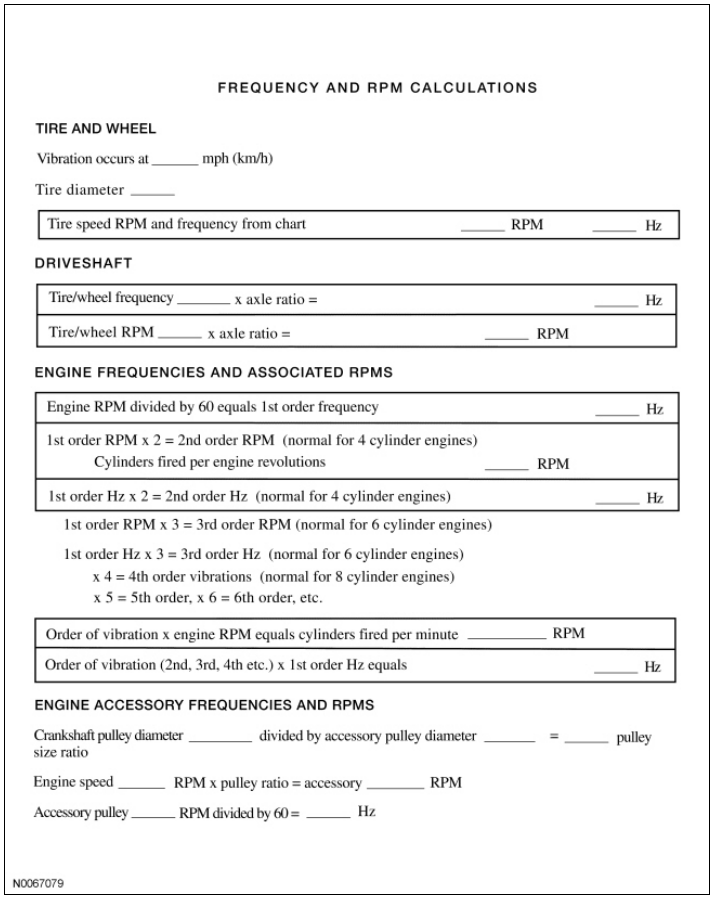
Calculating Engine Accessory Frequency

Belt-driven engine accessories often produce vibrations at different frequencies than the engine itself. This is because the drive ratio created by the different size pulleys causes them to rotate at different speeds. Determining engine accessory frequency is comparable to calculating driveshaft frequency.

Calculate engine accessory frequency by performing the following steps:

- Determine the size ratio factor between the accessory pulley and the crankshaft pulley. For example, if the diameter of the crankshaft pulley is 6 inches and the accessory pulley diameter is 2 inches, the accessory pulley rotates 3 times for every crankshaft rotation (6 divided by 2).
- Multiply the engine rpm where the vibration condition occurs by the number of times the accessory pulley is rotating per crankshaft revolution. For example, if the engine rpm is 2,400 rpm, the accessory is rotating at 7,200 rpm (2,400 rpm multiplied by 3).
- Divide the accessory rpm by 60 (the number of seconds in a minute). In this example, the engine accessory frequency is 120 Hz (7,200 divided by 60).

Calculating Engine Firing Frequency



tomsn048@gmail.com

Engine firing frequency is a term used to describe the pulses an engine creates from the firing of the cylinders. Engine firing frequency depends on how many cylinders an engine has. The number of times an engine fires a cylinder with each crankshaft revolution is equal to one-half the number of cylinders. A 4-cylinder engine fires 2 cylinders with each crankshaft revolution. Two revolutions of the crankshaft fire all 4 cylinders. A 6-cylinder engine fires 3 cylinders with each crankshaft revolution. An 8-cylinder engine fires 4 cylinders for each crankshaft revolution.

Calculate engine firing frequency by performing the following steps:

- Multiply the engine rpm where the vibration symptom occurs by the number of cylinders fired with each crankshaft revolution. For example, a vehicle with a 6-cylinder engine experiences a vibration concern at 2,400 rpm. The engine is firing the cylinders at 7,200 times per minute (3 multiplied by 2,400).
- Divide this number by 60 (the number of seconds in a minute) to obtain the engine firing frequency. In this example, the engine firing frequency is 120 Hz (7,200 divided by 60) at 2,400 rpm.

Frequency and RPM Calculations Worksheet

FREQUENCY AND RPM CALCULATIONS

TIRE AND WHEEL

Vibration occurs at _____ mph (km/h)

Tire diameter _____

Tire speed RPM and frequency from chart	_____ RPM	_____ Hz

DRIVESHAFT

Tire/wheel frequency _____ x axle ratio =	_____ Hz
Tire/wheel RPM _____ x axle ratio =	_____ RPM

ENGINE FREQUENCIES AND ASSOCIATED RPMS

Engine RPM divided by 60 equals 1st order frequency	_____ Hz
1st order RPM x 2 = 2nd order RPM (normal for 4 cylinder engines) Cylinders fired per engine revolutions	_____ RPM
1st order Hz x 2 = 2nd order Hz (normal for 4 cylinder engines)	_____ Hz

1st order RPM x 3 = 3rd order RPM (normal for 6 cylinder engines)

1st order Hz x 3 = 3rd order Hz (normal for 6 cylinder engines)
x 4 = 4th order vibrations (normal for 8 cylinder engines)
x 5 = 5th order, x 6 = 6th order, etc.

Order of vibration x engine RPM equals cylinders fired per minute	_____ RPM
Order of vibration (2nd, 3rd, 4th etc.) x 1st order Hz equals	_____ Hz

ENGINE ACCESSORY FREQUENCIES AND RPMS

Crankshaft pulley diameter _____ divided by accessory pulley diameter _____ = _____ pulley size ratio

Engine speed _____ RPM x pulley ratio = accessory _____ RPM

Accessory pulley _____ RPM divided by 60 = _____ Hz

Harshness Symptoms

Harshness is customer perception which gives the impression of no isolation from the tire/wheel and suspension system. Harshness may be caused by road conditions, temperature changes, component damage and/or incorrect customer modifications on original components/specifications. Customers usually experience harshness when the vehicle is driving over bumps or potholes and in cold weather conditions. Harshness can also be experienced with excessive tire pressure, sporty tires, heavy-duty springs and shocks, or other vehicle modifications. Some aftermarket tires, even with the correct size, may change vehicle behavior and produce

customer concerns. The first step in diagnosing a harshness concern is to determine if the concern was experienced only in certain specific operating conditions, such as large potholes or extremely cold weather. In these cases, harshness should be considered normal. A known good vehicle can be driven under the same conditions and the rides can be compared to determine whether the concern is normal or vehicle specific. The second step is to check tire pressure and make sure it was set within vehicle specifications. The third step is to inspect for aftermarket or modified components and determine if they are the cause of the harshness complaint. If the harshness concern persists after the above steps, it is possible that some components are damaged. Based on the results from the road test, make a determination of which action in the symptom chart to take first.

NVH Symptom Chart Categories

A good diagnostic process is a logical sequence of steps that lead to the identification of a causal system. Use the symptom and possible system categories as follows:

- Identify the operating condition that the vehicle is exhibiting.
- Match the operating condition to the symptom.
- Verify the symptom.
- Calculate the frequency and order of the symptom.
- Identify which category or system(s) could cause the symptom.
- Refer to the section indicated to identify and diagnose the symptom or confirm that the system is not the source of the condition.

Use the diagnostic instructions in this section along with the necessary listed tools to identify the vibration order and to isolate the symptom and the possible systems associated with that symptom. Then based on the results from the road test, make a determination of which action in the symptom chart to take first. Since it is possible any one of multiple systems may be the cause of the symptom, it may be necessary to use a process of elimination type diagnostic approach to pinpoint the concern. Refer to the section(s) indicated to identify and isolate the cause or rule that system out as being the causal system for the symptom.

Vehicle-Speed Related Vibrations

NOTE: Any assembly that is out of balance will only cause a first order vibration, it will not cause a higher order vibration.

When a vehicle-speed related vibration is present, both tire-speed related vibration and driveshaft-speed related vibration calculations should be carried out.

Insulation

Insulation is used as a sound-deadener to reduce exterior road and powertrain noises from the interior of the vehicle. Mastic insulators are also used as insulation. For information on the location of the mastic insulators, refer to Section 501-35 . Insulation is installed:

- under the hood.
- in front of the instrument panel.
- over and under the tunnel.
- over the front and rear floor pans.
- inside the B-, C- and D-pillars.
- on the wheel house/quarter panel.
- on the engine side dash insulator (behind the engine-car rearward).

It has heat-bondable mastic deadeners for improved NVH characteristics.

Body Sealer Types And Applications

Seam Sealer

Seam Sealer TA-2 or equivalent:

- is a heavy-bodied, non-sag adhesive/sealer for use on standing cosmetic seams, truck bed seams, tooled door skin seams and floor pans.
- can be used on water leaks and noise concerns.

Clear Silicone Rubber

Clear Silicone Rubber TA-32 or equivalent meeting Ford Specification ESB-M4G92-A:

- does not run.
- is fast drying.
- remains semi-elastic.
- can be used for sealing water leaks, noise concerns, remounting trim and repairing torn weatherstripping.

Silicone Gasket and Sealant

Silicone Gasket and Sealant TA-30 or equivalent meeting Ford specification WSE-M4G323-A4:

- is a form-in-place gasket and multi-purpose adhesive/sealant.
- is a room temperature curing silicone rubber.

Caulking Cord

3MTM Strip Caulk-Black 051135-08578 or equivalent meeting Ford specification WSB-M4G32-C:

- is a heavy-bodied, plastic base with a filler.
- is commonly known as perma-gum.
- is used on spot-weld holes and between surfaces not sealed with a gasket.

Weatherstrip Adhesive

Trim and Weatherstrip Adhesive TA-14-A or equivalent:

- is a quick drying, strong adhesive designed to hold weatherstripping onto all body panels and surrounding metal.

Silicone Lubricant

Silicone Spray Lubricant XL-6 or equivalent meeting Ford specification ESR-M13P4-A:

- is used to keep the door and the window weatherstrip pliable and soft.
- makes the door easier to close.
- retards weatherstrip squeaks.
- retards weatherstrip wear.

tomsn048@gmail.com

- helps retain door window alignment by reducing friction between the glass frame and the rubber weatherstrip.
- should not be used prior to painting.

Body System

Material

Item	Specification
Seam Sealer TA-2	-
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4

Inspection and Verification

Dust and Water Leaks

Most dust and water leaks occur due to missing or mis-installed body sealer or components. The source of the leak is detected by:

- pressurizing the vehicle and testing with soapy water.
  - ♦ Locate and tape off the body vents.
  - ♦ Turn the blower motor on the high position.
  - ♦ Turn the air recurculation to the off mode.
  - ♦ Close the windows and doors.
  - ♦ Open the hood and spray soapy water along body seams and grommets. Make sure to test the areas arround the A-pillar at the fender and the hood hinge area.
  - ♦ Check for bubbles.
- inspecting for a dust pattern or water path near and above the area in question.
- removing any trim or carpet in the general area of the leak.
- road testing or water-hose testing the vehicle.
- placing a bright light under the vehicle, removing any necessary trim or carpet and inspecting the interior of the body at joints and weld lines.

Wind Noise

Most wind noise leaks occur at the corners of the windows or in the doors. Wind noise is detected by driving the vehicle at highway speeds or at speeds as specified by the customer. The vehicle should be driven in 4 different directions, with all the windows CLOSED, the radio OFF and the A/C blower motor OFF.

Squeak and Rattle

Squeak and rattle noises are generally caused by loose parts, contact or relative movement between 2 surfaces or loose wires and connectors. The source of the noise can be detected by stopping movement of the suspect part by hand or by using dampening or low friction materials.

Symptom Chart - NVH

Symptom Chart - NVH

tomsn048@gmail.com

NOTE: NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to Section 100-04 . Since it is possible that any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to Section 100-04 for the next likely system and continue diagnosis.

ConditionPossible SourcesAction

- Draft/wind noise and water leak around door perimeter
- Loose fit seal
- PINCH seal carrier to improve retention on seal flange.
- Seal installed incorrectly
- REINSTALL the seal.
- Door misaligned
- REALIGN the door. CHECK door gaps and fit in door opening and ADJUST as necessary. REFER to Section 501-03 .
- Scuff plate installed incorrectly
- REINSTALL the scuff plate.
- Seal or seal pushpins damaged
- INSTALL a new seal/pushpins.
- Sheet metal joints in door or door opening
- SEAL leaks with Silicone Gasket and Sealant.
- Draft/wind noise and water leak around glass run
- Door glass misaligned
- ADJUST door glass.
- Glass run installed incorrectly
- REINSTALL glass run. INSERT foam in glass run carrier if necessary.
- Leak path behind glass run
- INSTALL foam rope behind glass run.
- Glass run channel spread wide
- PINCH glass run channel to reduce size of opening.
- Glass run damaged

- INSTALL a new glass run.
- Draft/wind noise and water leak at inner belt line
- Belt line seal installed incorrectly on flange
- ADJUST seal. (Do not bend the flange.)
- No contact with side glass
- ADJUST door glass.
- No contact with glass runs at both ends of belt line seal
- ADJUST belt line seal or ADD foam at seal ends.
- Belt line seal damaged
- INSTALL a new seal.
- Draft/wind noise and water leak at outer belt line
- Belt line seal installed incorrectly on flange (no glass contact)
- ADJUST seal.
- Belt line seal does not contact the glass
- ADJUST door glass.
- No contact with glass runs at both ends of belt line seal
- ADJUST belt line seal or ADD foam at seal ends.
- Belt line seal damaged
- INSTALL a new seal.
- Draft/wind noise at inner door handle/speaker opening
- Hole in weathershield
- SEAL hole with suitable tape.
- Weathershield misaligned
- REALIGN weathershield. INSTALL a new weathershield if pressure sensitive adhesive fails.
- Exterior door handle seal misaligned/damaged
- REALIGN or INSTALL a new seal as necessary. REFER to Section 501-14 .
- Speaker or speaker seal missing or damaged

tomsn048@gmail.com

- REPAIR speaker seal or INSTALL a new door speaker.
- Draft/wind noise and water leaks at floor pan and grommets
- Missing or damaged plugs/grommets
- CHECK plugs/grommets for correct installation or damage. INSTALL new plugs/grommets if necessary.
- Road noise
- Missing mastic insulators
- CHECK for missing mastic insulators. REFER to Section 501-35 .
- Missing body insulators
- CHECK for missing body insulators.
- Rattles in body/doors and instrument panel
- Loose wires/cables
- CHECK that all wires/cables are correctly routed and inserted in correct retainers.
- Loose objects/components in door wells, pillars quarter trim panels
- CHECK doors by carefully striking underside of doors with a rubber mallet while listening for rattles in doors and pillars. REMOVE or TIGHTEN loose objects/components.
- Buzz from instrument panel components
- IDENTIFY which components of the instrument panel are buzzing. SECURE/FASTEN components as necessary, ADD foam or felt as needed if rattle persists.
- Door drain holes collecting water
- Holes clogged with mud or road tar
- CLEAN drain holes of foreign material with a punch or screwdriver. CHECK drain holes regularly.
- Wind noise from exterior rear view mirror
- Exterior mirror housing misaligned
- REALIGN with edges shingled to airflow, with no gaps.
- Mirror sail gasket folded/misaligned
- REINSTALL with gasket unfolded and aligned correctly.
- Mirror housing trim cap installed incorrectly
- REINSTALL with edges shingled to airflow.

- Air leak through mirror housing hinge
- Fully ENGAGE mirror into its operating position. USE foam to block air path through hinge.
- Inner sail trim installed incorrectly
- REINSTALL sail trim. ADJUST door trim.
- Inner sail gasket/barrier installed incorrectly
- REINSTALL trim cover with gasket/barrier aligned correctly.
- Air path through wiring bundle/fastener access holes
- BLOCK air path(s) with foam/tape.
- Exposed fastener access hole on mirror housing/sail
- INSTALL a new cap if missing.
- Rattle/vibration from exterior rear view mirror
- Mirror glass adjustment screws loose
- REMOVE mirror glass and TIGHTEN mirror glass adjustment motor screws. REFER to Section 501-09 .
- Mirror mounting nuts loose
- TIGHTEN mirror mounting nuts. REFER to Section 501-09 .
- Aftermarket air deflector/stone shields
- If possible, REMOVE aftermarket air deflector/stone shield, then ROAD TEST vehicle. If concern is no longer present, ADVISE customer that aftermarket component was causing concern.
- If equipped with power fold mirrors, power fold mirrors folded/unfolded manually or are not synchronized
- If equipped with power fold mirrors, SYNCHRONIZE power fold mirrors. REFER to Section 501-09 .
- Draft/wind noise and water leak around perimeter of all fixed glass
- Gaps in the sealant bead
- APPLY approved sealant.
- Air traveling up windshield molding along A-pillar
- INSTALL foam rope full length of the A-pillar.
- Gaps in sealant bead of windshield/rear glass

tomsn048@gmail.com

- RESEAL windshield/rear glass. REFER to Section 501-11 .
- Windshield misaligned or not installed correctly
- REINSTALL windshield glass. REFER to Section 501-11 .
- Rear hood seal at base of windshield misaligned/damaged
- REALIGN or INSTALL a new seal as necessary.
- Draft noise at cowl
- Cowl seal misaligned/damaged
- REALIGN or INSTALL a new seal as necessary.
- Draft/wind noise and water leak around liftgate perimeter
- Loose fit seal
- PINCH seal carrier to improve retention on seal flange or INSERT foam in carrier.
- Seal misaligned or installed incorrectly
- REINSTALL seal.
- Liftgate misaligned
- REALIGN liftgate. CHECK liftgate fit in body opening and ADJUST as necessary.
- Scuff plate misaligned
- REINSTALL scuff plate.
- Seal or seal pushpins damaged
- INSTALL a new seal.
- Draft/water leak or noise from roof opening panel
- Roof opening panel/components
- REFER to Section 501-17 for diagnosis.
- Wind noise created by airflow over or behind body panels
- Fender splash shield misaligned
- REALIGN fender splash shield.
- Body panel misaligned (exposed edge)
- REALIGN appropriate body panel.

- Hood misaligned (front margin)
- CHECK hood gaps and fit. ADJUST hood as necessary.
- Front grille edge noise
- APPLY foam in hollow areas behind louvers.
- Wind noise created by grille opening panel
- Grille relationship to leading edge on hood
- If possible, ADJUST grille opening panel forward to eliminate wind noise.
- Sharp edges due to material imperfections
- REMOVE sharp edges (no damage to visible surface).
- Wind noise from air extractor (body vent)
- Roof rack rails or crossbars loose
- TIGHTEN fasteners.
- Roof rack fasteners missing
- INSTALL approved fasteners.
- Roof rack crossbars installed backward
- REINSTALL crossbars.
- Roof rack rub strips partially lifting from roof
- REAPPLY adhesive or fasteners or INSTALL new rub strips as necessary.
- Roof rack gaskets loose or misaligned
- REINSTALL gasket.
- Wind noise from bug shield/exterior windshield sun visor
- Turbulence created by location and shape
- Determine if an OEM part or aftermarket. If aftermarket advise customer accordingly. If OEM, verify correctly installed. If noise is abnormal repair or replace as required.
- Rattle from Sport Trac tailgate
- Loose tailgate latch
- If possible. ADJUST the tailgate latch. TIGHTEN the tailgate latch bolts. REFER to Section 501-14 .
- Loose or worn tailgate latch striker sleeve

tomsn048@gmail.com

- TIGHTEN or REPLACE the tailgate striker.

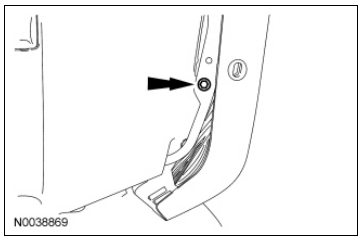
1. For additional information, refer to the procedures in this section.

tomsn048@gmail.com

Fender

Removal and Installation

1. Remove the wheel and tire. For additional information, refer to Section 204-04 .
2. Remove the front fender splash shield. For additional information, refer to Fender Splash Shield in this section.
3. Remove the headlamp assembly. For additional information, refer to Section 417-01 .
4. If removing the right front fender, remove the antenna mast and bolt, and position the antenna cable aside.

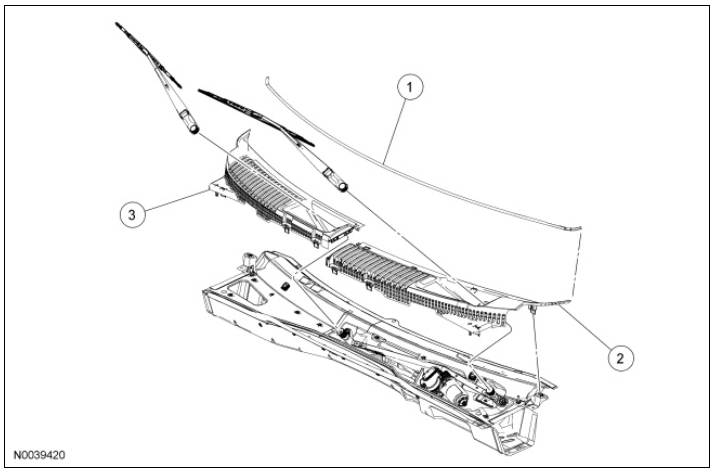


5. Remove the 2 grille opening panel bolts.
   - To install, tighten to 9 Nm (80 lb-in).
6. Remove the 4 top fender bolts.
   - For Explorer/Explorer Sport Trac, tighten to 9 Nm (80 lb-in).
   - For Mountaineer, tighten to 8 Nm (71 lb-in).
7. Remove the 2 upper A-pillar inner fender bolts.
   - To install, tighten to 9 Nm (80 lb-in).
8. Remove the 2 lower A-pillar inner fender bolts.
   - For Explorer/Explorer Sport Trac, tighten to 9 Nm (80 lb-in).
   - For Mountaineer, tighten to 8 Nm (71 lb-in).
9. Remove the fender.
10. To install, reverse the removal procedure.

tomsn048@gmail.com

Fender Splash Shield

Removal and Installation



1. Loosen the running board bolts and lower the running board to access the front fender moulding pin-type retainer.
    - To install, tighten to 23 Nm (17 lb-ft).
2. Remove the lower pin-type retainer from the front fender moulding.
3. Remove the 2 rear pin-type retainers from the front fender moulding.
4. Position the front fender moulding aside and remove the splash shield lower screw.

5. Remove the front splash shield screws.
6. Remove the front splash shield pin-type retainers.
7. Remove the front splash shield.
8. Remove the front fender splash shield.
9. To install, reverse the removal procedure.

tomsn048@gmail.com

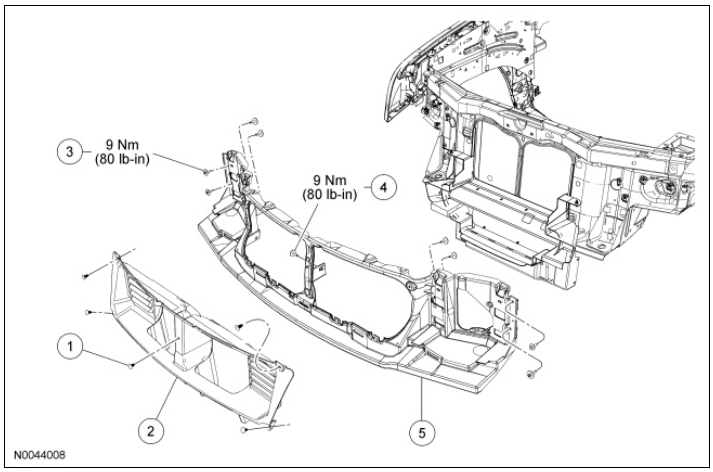
Cowl Panel Grille

Item	Part Number	Description
1	02824	Cowl panel seal
2	022A68	Cowl panel LH
3	022A68	Cowl panel RH

1. Remove the wiper pivot arms. For additional information, refer to Section 501-16 .

NOTICE: **To avoid breaking the retaining clips on the cowl panel, do not pull up on the rear of the cowl panel.**

2. Pry up on the front of the cowl panel to release it from the retaining clips.



3. Remove the cowl panel grille.

4. Separate the left cowl panel from the right cowl panel by releasing the retaining clips.

5. To install, reverse the removal procedure.

tomsn048@gmail.com

Radiator Grille Opening Panel

Item	Part Number	Description
1	W705589	Grille panel deflector pin-type retainer (5 required)
2	8C299	Grille panel deflector
3	W503925-S	Grille opening panel bolt (9 required)
4	W503925-S	Grille opening panel center bolt
5	8190	Grille opening panel

Removal and Installation

1. Remove the headlamp assemblies. For additional information, refer to Section 417-01 .

2. Remove the front bumper cover. For additional information, refer to Section 501-19 .

3. Remove the 5 grille panel deflector pin-type retainers.

4. Remove the grille panel deflector.

5. Remove the 8 grille opening panel bolts.
   - To install, tighten to 9 Nm (80 lb-in).

6. Remove the grille opening panel center bolt.
   - To install, tighten to 9 Nm (80 lb-in).

7. Remove the grille opening panel.

8. To install, reverse the removal procedure.

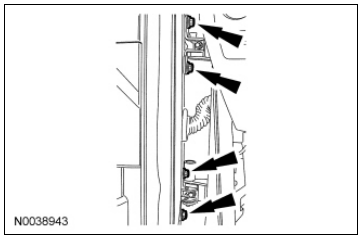
Door Alignment

Front and rear door

1. Depower the Supplemental Restraint System (SRS). For additional information, refer to Section 501-20B .

2. Remove the door latch striker plate.



Front door in and out, up and down adjustment

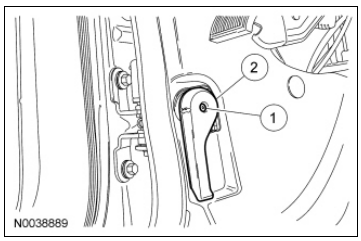
3. **NOTE:** The bolts securing the 2 hinge halves together are not to be removed or serviced. Remove the hinge-to-door or hinge-to-body bolts when removing or adjusting the front or rear doors.

   NOTE: Driver side shown, passenger side similar.

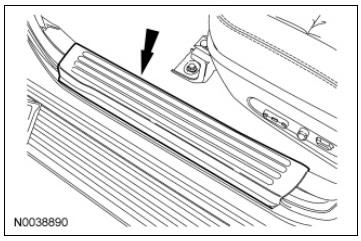
   Loosen, but do not remove, the front door hinge-to-front door fasteners enough to allow door adjustment.

Front door fore, aft and tilt adjustment

NOTE: Driver side shown, passenger side similar.



4. Loosen, but do not remove, the upper front door hinge-to-body fasteners enough to allow door adjustment.

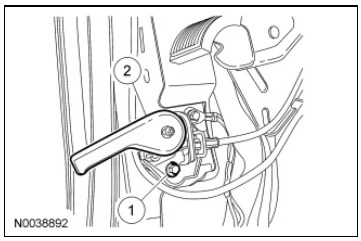


5. If adjusting the driver side, remove the hood release lever.
   1. Remove the screw.

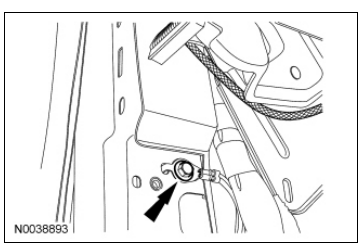
tomsn048@gmail.com

2. Position the hood release lever.

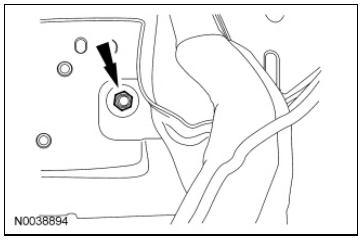
6. Remove the front door scuff plate.



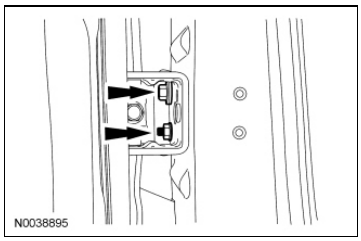
7. Partially remove the front door weatherstrip.



8. Remove the lower cowl trim panel.
    1. Remove the pin-type retainer.
    2. Remove the lower cowl trim panel.

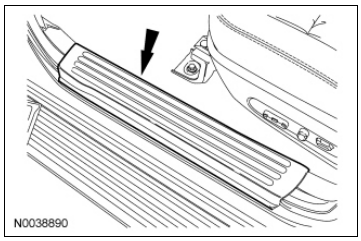


9. If adjusting the driver side, remove the hood release mechanism.
    1. Remove the screw.
    2. Position the hood release mechanism.

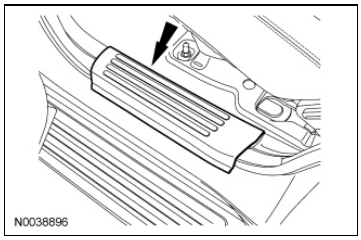


10. Disconnect the ground wires.

11. Position the weather shield and loosen, but do not remove, the front door lower hinge nut.

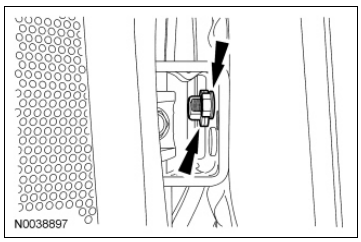


12. Loosen, but do not remove, the lower front door hinge-to-body fasteners enough to allow door adjustment.



Rear door fore, aft and tilt adjustment

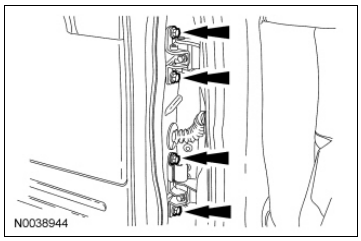
13. Remove the front door scuff plate.



14. Remove the rear door scuff plate.

15. Remove the lower B-pillar trim panel. For additional information, refer to Section 501-05 .

16. Remove the front safety belt retractor.
    - Remove the front safety belt retractor bolt.
        - ♦ To install, tighten to 40 Nm (30 lb-ft).
    - Remove the safety belt retractor and position aside.



17. Loosen, but do not remove, the rear door hinge-to-body fasteners enough to allow door adjustment.

tomsn048@gmail.com

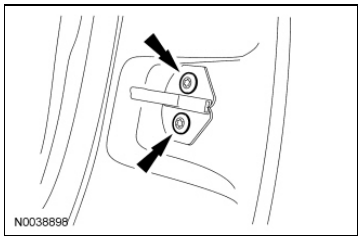
Rear door in and out, up and down adjustment

18. Loosen, but do not remove, the rear door hinge-to-rear door fasteners enough to allow door adjustment.

Front and rear door

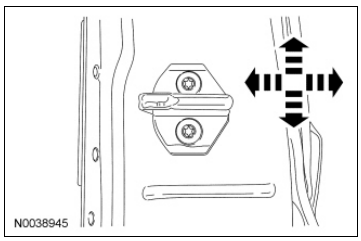
19. Adjust the door. For additional information, refer to Section 501-35 .

20. Tighten the door fasteners.
    - Tighten the front door hinge-to-front door fasteners to 30 Nm (22 lb-ft).
    - Tighten the front door hinge-to-body fasteners to 30 Nm (22 lb-ft).
    - Tighten the front door lower hinge nut to 30 Nm (22 lb-ft).
    - Tighten the rear door hinge-to-rear door fasteners to 30 Nm (22 lb-ft).
    - Tighten the rear door hinge-to-body fasteners to 30 Nm (22 lb-ft).



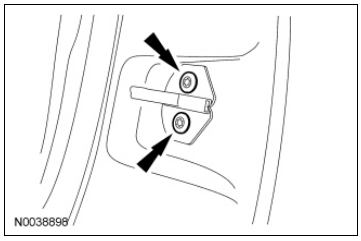
21. Reassemble the system.

22. Install and adjust the door striker as necessary.
    - Tighten the door latch striker plate screws to 25 Nm (18 lb-ft).



23. Repower the SRS . For additional information, refer to Section 501-20B .

Striker Adjustment

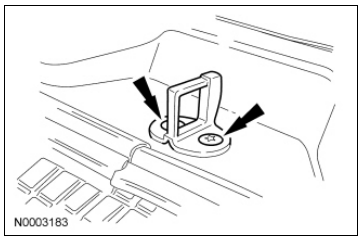


1. Loosen the door latch striker plate screws.

2. Adjust the door latch striker plate from side-to-side or up and down as necessary.

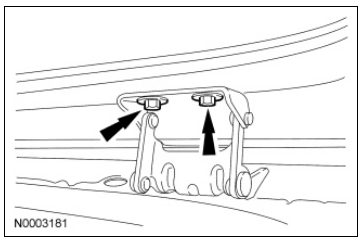
3. Tighten the door latch striker plate screws.
   - Tighten to 25 Nm (18 lb-ft).

tomsn048@gmail.com



Liftgate Alignment

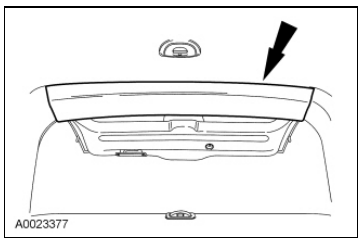
Liftgate left and right adjustment



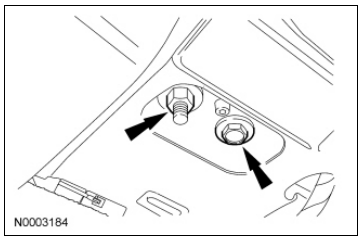
1. **NOTE:** Position the carpet for access to liftgate striker bolts.

   Remove the liftgate striker.

2. Loosen, but do not remove, the hinge-to-liftgate bolts enough to permit movement of the liftgate.



3. Adjust the liftgate so that the gaps are equal.



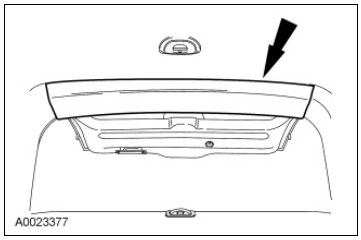
4. Tighten the liftgate hinge-to-liftgate bolts.
   - Tighten to 12 Nm (106 lb-in).

Liftgate in and out, up and down adjustment

5. Remove the headliner rear trim panel.

6. Loosen, but do not remove, the liftgate hinge-to-body fasteners enough to permit movement of the liftgate.

7. Adjust the liftgate so that the gaps are equal.

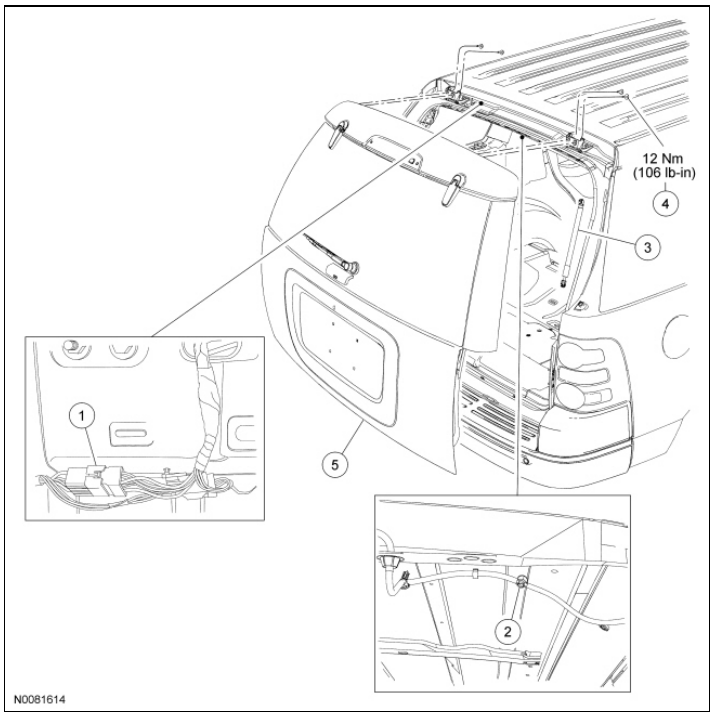


8. Tighten the liftgate hinge-to-body fasteners.
   - Tighten the liftgate hinge-to-body nuts to 35 Nm (26 lb-ft).
   - Tighten the liftgate hinge-to-body bolts to 32 Nm (24 lb-ft).

9. **NOTE:** Keep striker frame aligned fore/aft to the vehicle line. Avoid any twist in the striker frame relative to the vehicle.

   Install the liftgate striker, adjust as necessary.

   - Tighten to 30 Nm (22 lb-ft).

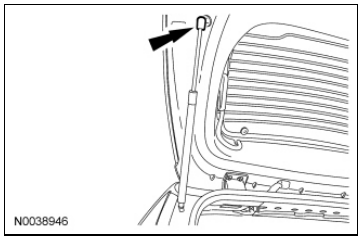


10. Install the headliner rear trim panel.

tomsn048@gmail.com

Liftgate

Liftgate Assembly



Item	Part Number	Description
1	14489A	Liftgate electrical connector
2	17A422A	Windshield washer hose nozzle
3	78406A11 LH/ 78406A10 RH	Liftgate strut
4	W709783	Liftgate hinge-to-liftgate bolt (4 required)
5	7840400	Liftgate

Removal and Installation

1. Remove the D-pillar trim panels. For additional information, refer to Section 501-00 .
2. Position the headliner to access the rear washer hose and the liftgate electrical harness connectors.
3. Disconnect the liftgate electrical connector.
4. Disconnect the windshield washer hose nozzle.
5. **NOTE:** Support the liftgate before removing the liftgate struts.

   Remove the liftgate struts.

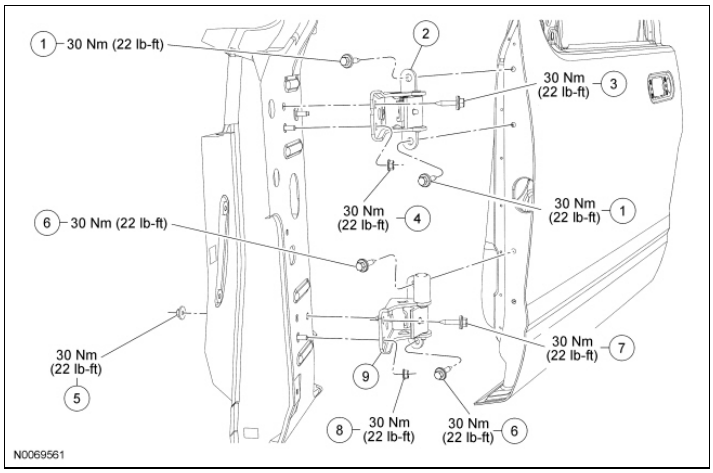
6. **NOTE:** With a wax pencil, mark the position of each hinge to aid in the installation of the liftgate.

   Remove the 4 liftgate hinge-to-liftgate bolts.

   - To install, tighten to 12 Nm (106 lb-in).

7. ***NOTICE:*** **To avoid damaging the liftgate, this step requires an assistant.**

   Remove the liftgate.



8. To install, reverse the removal procedure.
   - Transfer components as necessary.

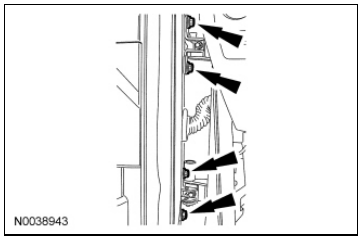
tomsn048@gmail.com

Door

Removal and Installation

NOTE: Front door shown, rear door similar.

Item	Part Number	Description
1	W709189	Front door upper hinge-to-door bolts
2	7822801 LH/ 7822800 RH	Front door upper hinge
3	W709189	Front door hinge-to-body bolt
4	W707665	Front door upper hinge-to-body nut
5	W707665	Front door lower hinge-to-body interior nut
6	W709189	Front door lower hinge-to-door bolts
7	W709189	Front door lower hinge-to-body bolt
8	W707665	Front door lower hinge-to-body nut
9	7822811 LH/ 7822810 RH	Front door lower hinge



1. Disconnect the front door electrical connector at the A-pillar.

2. ***NOTICE:*** **To minimize the possibility of cross threading, hand start all fasteners during the installation.**

   NOTICE: **To avoid damaging the door, this step requires an assistant.**

   Mark the position of each hinge and remove the hinge-to-door bolts.

   - To install, tighten to 30 Nm (22 lb-ft).

3. Remove the front door.

tomsn048@gmail.com

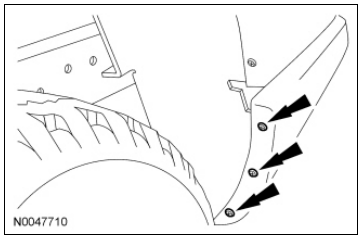
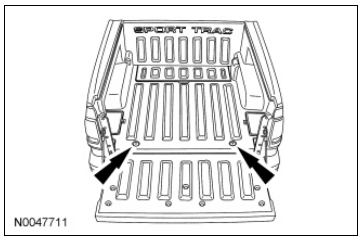
tomsn048@gmail.com



Pickup Bed

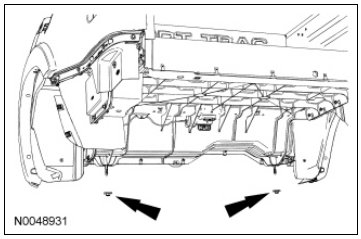
The pickup bed consists of the following components:



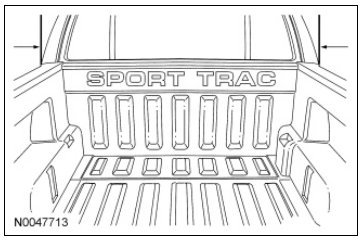
- Bed extender (optional)
- Box inner panel
- Body side outer moulding
- Body side outer panels
- Cargo divider (optional)
- Front/side storage compartments
- Fuel filler door
- Fuel filler housing
- Pickup bed inner tie-downs
- Pickup bed exterior tie-downs
- Pickup bed reinforcement assembly
- Power point receptacle
- Rear wheel house panels
- Tonneau cover (optional)
- Tailgate assembly
- Wiring harnesses

Pickup Bed Alignment

1. Remove the 6 bumper cover screws (3 each side).

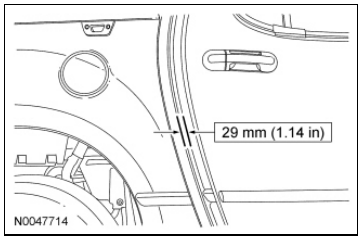


2. Loosen the pickup bed rear bolts.



3. **NOTE:** The nuts are loosened from under the vehicle.

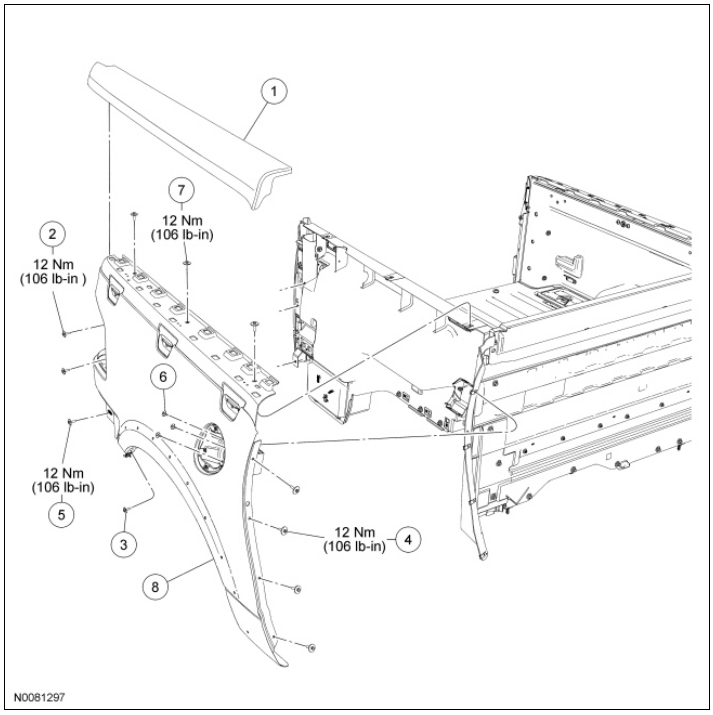
   Loosen the front pickup bed bolts.



4. Center the pickup bed to the rear of the cab.

5. Align the leading edge of the pickup bed and the rear of the cab to specifications.

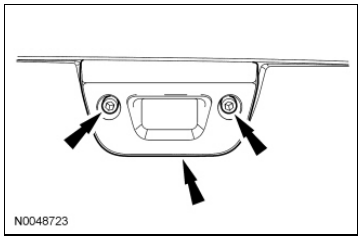
tomsn048@gmail.com



6. Tighten the pickup bed bolts and nuts.
    - To install, tighten to 62 Nm (46 lb-ft).

7. Install the 6 bumper cover screws (3 each side).

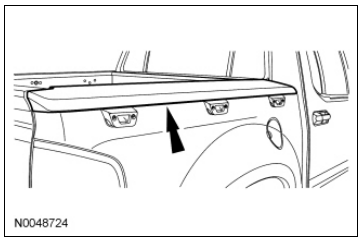
Pickup Bed Body Side



NOTE: RH shown, LH similar.

Item	Part Number	Description
1	7829141 LH/ 7829140 RH	Body side outer moulding
2	W710478-S	Rear body side outer bolt (2 required)
3	-	Pickup bed wheel house opening screw (4 required)
4	W710478-S	Front body side outer bolt (4 required)
5	W710478-S	Lower rear body side outer bolt
6	W711589-S	Fuel filler neck pipe screw (3 required)
7	W710478-S	Upper body side outer bolt (3 required)
8	9927841 LH/ 9927840 RH	Pickup bed body side outer panel

1. Remove the 3 exterior pickup bed tie-downs.
    - Remove the 6 bolts.
        - ♦ To install, tighten to 5 Nm (44 lb-in).
    - Remove the 3 tie-downs.

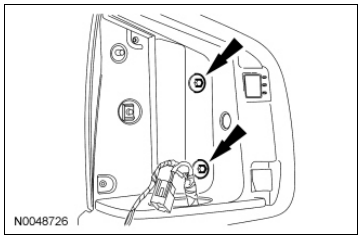


tomsn048@gmail.com

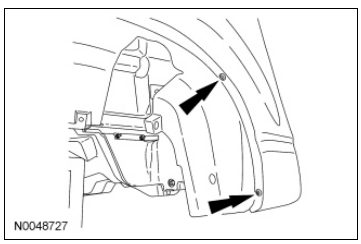
2. **NOTE:** RH shown, LH similar.

   Remove the body side outer moulding.

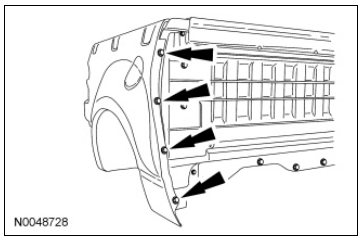
   - To release the moulding, start at the inside and roll the moulding to the outside.



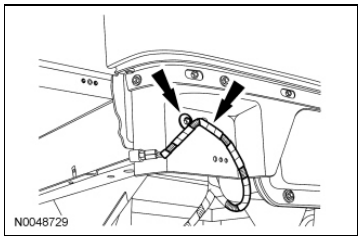
3. Remove the pickup bed. For additional information, refer to Pickup Bed in this section.



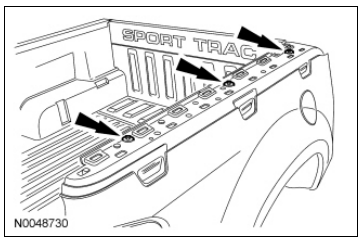
4. Remove the rear lamp assembly.
   1. Remove the bolts.
   2. Remove the rear lamp.
      - Disconnect the electrical connectors.



5. Remove the 2 body side outer rear bolts.
   - To install, tighten to 12 Nm (106 lb-in).



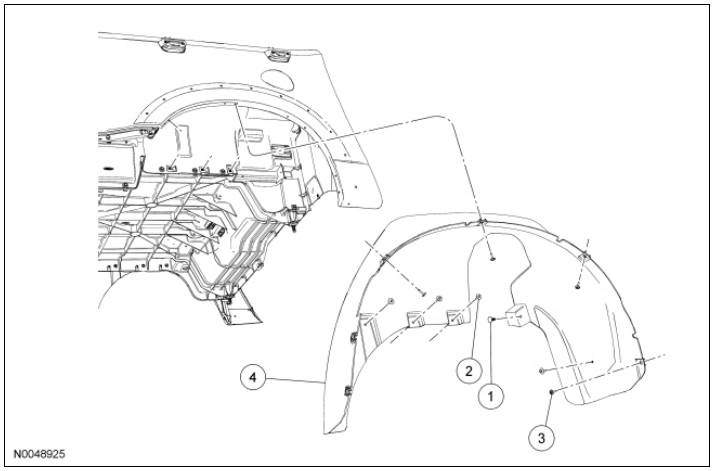
6. Remove the 4 pickup bed wheel house screws.



7. Remove the 4 body side outer front bolts.
    - To install, tighten to 12 Nm (106 lb-in).

8. Remove the lower rear body side outer bolt and disconnect the wiring harness from the body side outer panel.
    - To install, tighten to 12 Nm (106 lb-in).

9. Remove the 3 upper body side outer mounting bolts and remove the body side outer panel.
    - To install, tighten to 12 Nm (106 lb-in).

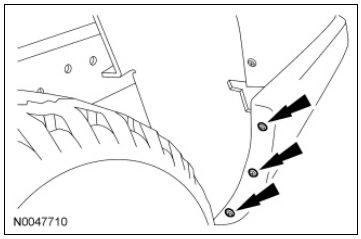


10. To install, reverse the removal procedure.

tomsn048@gmail.com

Pickup Bed Wheel House

NOTE: RH shown, LH similar.



Item	Part Number	Description
1	W711687-S	Wheel house pin-type retainer
2	N808650-S	Rear wheel house screw (4 required)
3	W706805-S	Rear wheel house-to-wheel house opening screw (4 required)
4	7827886 LH/ 7827887 RH	Rear wheel house

RH and LH

1. Remove the rear fender moulding. For additional information, refer to Section 501-08 .
2. **NOTE:** LH shown, RH similar.

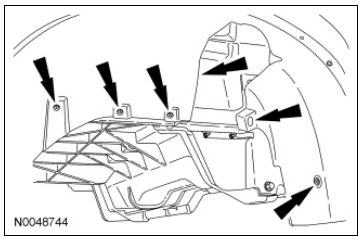
   Remove the 3 bumper cover screws.

3. **NOTE:** RH shown, LH similar.

   Remove the 4 rear wheel house-to-wheel house opening screws.

tomsn048@gmail.com

RH only



4. Remove the pin-type retainer.

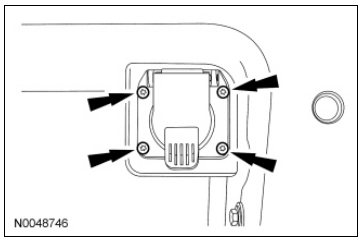
LH and RH

5. **NOTE:** RH shown, LH similar.

   Remove the rear wheel house.

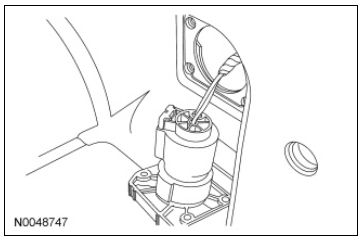
   - Remove the screws.
   - Remove the rear wheel house.

6. To install, reverse the removal procedure.



Pickup Bed Power Point

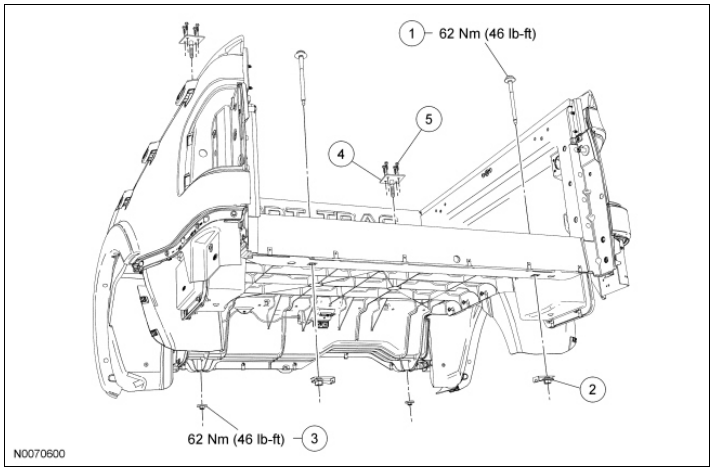
Removal and Installation



Item	Part Number	Description
1	W504696-S	Power point screw (4 required)
2	19G257	Power point receptacle
3	14A464	Power point wiring connector

1. Remove the 4 screws and the power point receptacle from the pickup bed side.

2. Disconnect the power point receptacle electrical connector and remove the power point receptacle.



3. To install, reverse the removal procedure.

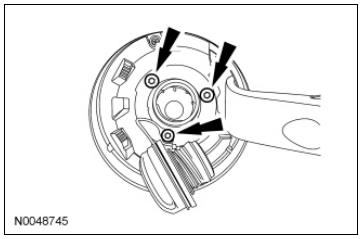
tomsn048@gmail.com

Pickup Bed

Removal and Installation

Item	Part Number	Description
1	W711319-S	Pickup bed rear bolt (2 required)
2	W709404-S	Pickup bed rear nut retainer (2 required)
3	W708731-S	Pickup bed front nut (2 required)
4	99286E44	Stud plate
5	W702065	Rivet (4 required)

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .



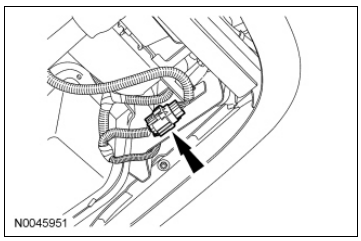
2. If equipped, remove the Tonneau cover.

3. If equipped, remove the cargo divider.

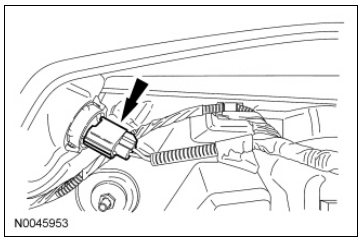
4. Remove the tailgate assembly.

5. Remove the fuel filler cap.

6. Remove the fuel filler pipe screws and position the filler pipe aside.
   - To install, tighten to 3 Nm (27 lb-in).

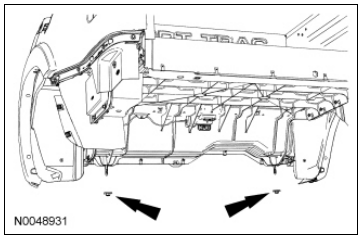


7. Remove the rear fender mouldings. For additional information, refer to Section 501-08 .

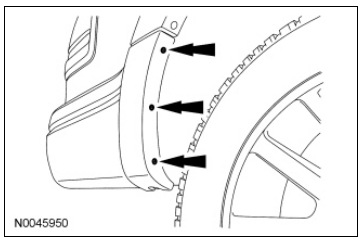


tomsn048@gmail.com

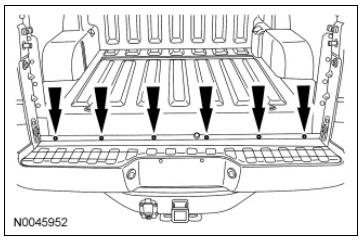
8. Raise the vehicle.



9. Disconnect the electrical connector.

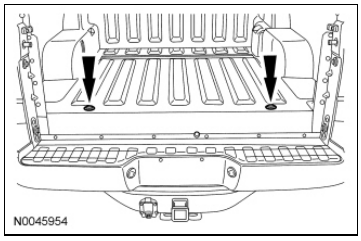


10. Disconnect the license plate lamp electrical connectors.



11. Remove the 2 pickup bed front nuts from under the vehicle (1 each side).
    - To install, tighten to 62 Nm (46 lb-ft).

12. Remove the 6 rear bumper cover screws (3 each side).



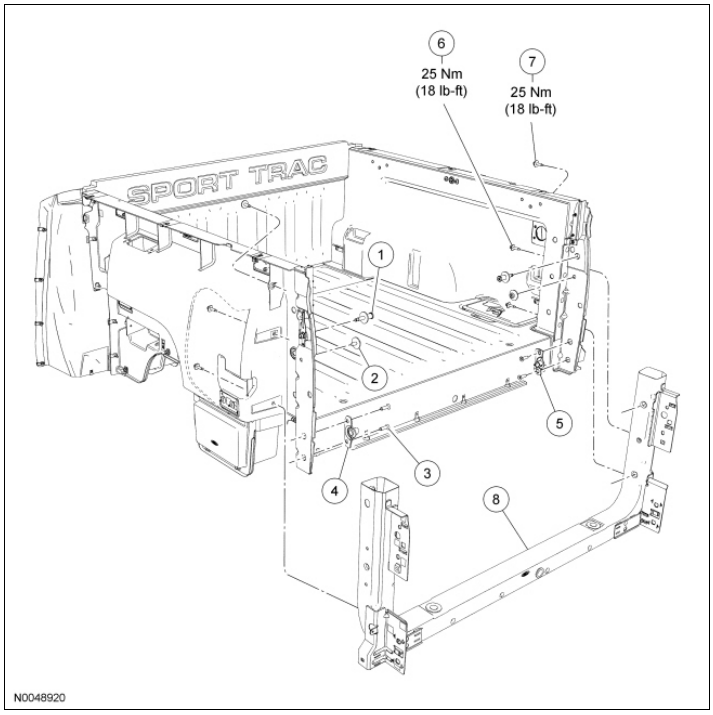
13. Remove the 6 rear bumper cover screws and the bumper cover.

14. Lower the vehicle.

15. Remove the 2 pickup bed rear bolts (1 each side).
    - To install, tighten to 62 Nm (46 lb-ft).

16. ***NOTICE:*** **Protect the paint on the pickup bed and cab as the pickup bed is lifted to avoid damage to the paint surface.**

    With the help of an assistant, remove the pickup bed and place it on a suitable support.



17. To install, reverse the removal procedure.

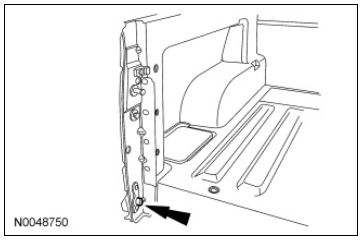
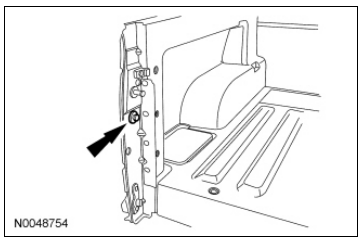
tomsn048@gmail.com

Pickup Bed Reinforcement

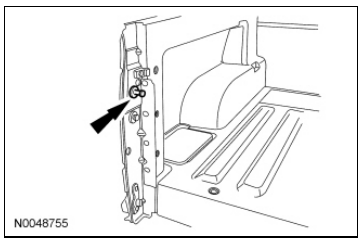


Removal and Installation

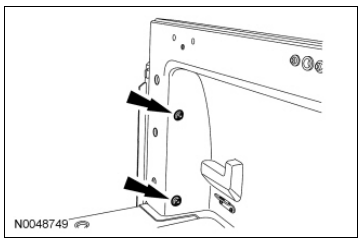


Item	Part Number	Description
1	99432A06	Tailgate striker (2 required)
2	N805156-S	Tailgate cable anchor (2 required)
3	W710261-S	Tailgate hinge bolt (4 required)
4	78430B39	LH tailgate hinge
5	78430B38	RH tailgate hinge
6	W706056-S	Reinforcement mounting bolt (4 required)
7	W706056-S	Reinforcement outer mounting bolt (2 required)
8	99281B44	Pickup bed reinforcement

1. Remove the LH and RH body side outer panels. For additional information, refer to Pickup Bed Body Side in this section.

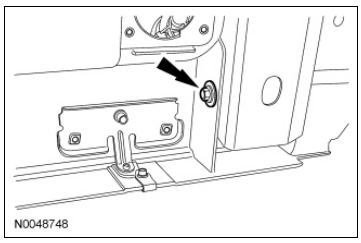


2. Remove the 2 tailgate hinge bolts (1 each side), and remove the hinges.
   - To install, tighten to 47 Nm (35 lb-ft).



3. Remove the 2 tailgate cable anchors (1 each side).

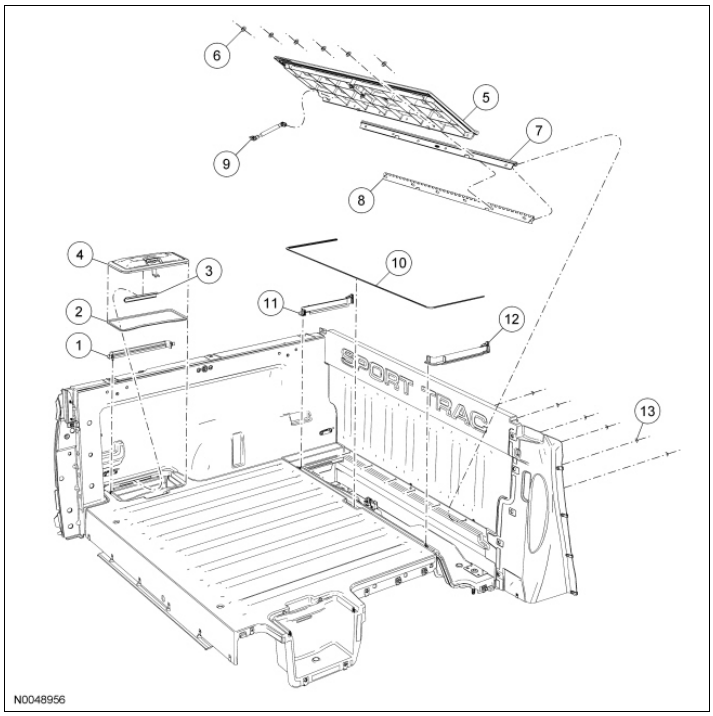
4. Remove the 2 tailgate strikers (1 each side).
    - To install, tighten to 40 Nm (30 lb-ft).



5. Remove the 4 reinforcement mounting bolts from the pickup bed (2 each side).
    - To install, tighten to 25 Nm (18 lb-ft).

6. Turn the pickup bed upside down on a suitable support.

7. Remove the 2 outer pickup bed reinforcement bolts and remove the reinforcement.
    - To install, tighten to 25 Nm (18 lb-ft).



8. Disconnect the wiring harness from the pickup bed reinforcement.

9. To install, reverse the removal procedure.

tomsn048@gmail.com

Pickup Bed Storage Compartment - Exploded View

Item	Part Number	Description
1	99286A30	Side storage compartment seal
2	99286E52	Side storage compartment lid seal
3	99461A30	Side storage compartment hinge
4	99461A30	Side storage compartment lid
5	99461A30	Front storage compartment lid
6	99286A30	Front storage compartment lid-to-hinge nut (6 required)
7	99286E46	Front storage compartment hinge seal
8	9928A32	Front storage compartment hinge
9	99286D18	Front compartment strut
10	99286A30	Front storage compartment seal
11	99286A30	Front storage compartment side seal LH
12	99286A30	Front storage compartment side seal RH
13	99286A30	Front storage compartment-to-box nut (6 required)

1. For additional information, refer to the procedures in this section.

tomsn048@gmail.com

Pickup Bed Storage Compartment Hinge - Side Compartment

1. Remove the side compartment lid. For additional information, refer to Pickup Bed Storage Compartment Lid - Side Compartment in this section.

2. **NOTE:** The side compartment hinge is installed prior to the storage compartment seal.

   NOTE: The surface of the compartment lid must be thoroughly cleaned before installing the new hinge.

   Remove the storage compartment hinge.

   - Remove the storage compartment seal.
   - Remove the storage compartment hinge.
   - Clean the lid surface of any residual seal material.
   - Scuff the seal surface area.
   - Apply adhesive promoter.
   - Apply pressure to the hinge surface with a roller and allow seal to cure before installation for one hour.

3. To install, reverse the removal procedure.

tomsn048@gmail.com

Pickup Bed Storage Compartment Hinge - Front Compartment

1. Remove the front compartment lid. For additional information, refer to Pickup Bed Storage Compartment Lid - Front Compartment in this section.

2. Remove the pickup bed. For additional information, refer to Pickup Bed in this section.

3. Remove the front compartment lid hinge nuts from the front of the pickup bed.
    - To install, tighten to 12 Nm (106 lb-in).

4. Remove the front compartment lid hinge from the pickup box.

5. To install, reverse the removal procedure.

Pickup Bed Storage Compartment Lid - Front Compartment

1. Open the storage compartment lid and disconnect the compartment lid struts from the door.

2. Remove the 6 storage compartment lid nuts.
   - To install, tighten to 12 Nm (106 lb-in).

3. Remove the storage compartment lid.

4. To install, reverse the removal procedure.

tomsn048@gmail.com

Pickup Bed Storage Compartment Lid - Side Compartment

1. Open the compartment lid and remove the pickup bed seal.
2. Remove the storage compartment door.
3. To install, reverse the removal procedure.

Pickup Bed Storage Compartment Seal - Side Compartment

1. Remove the side compartment lid. For additional information, refer to Pickup Bed Storage Compartment Lid - Side Compartment in this section.

2. **NOTE:** The storage compartment seal is installed over the hinge assembly.

   Remove the storage compartment seal from the storage compartment.

   - Remove any adhesive or residual seal material.
   - Clean the lid surface with a 50/50 solution of alcohol and water.
   - Apply adhesive promotor.
   - Apply seal.
   - Apply pressure to the seal with a roller and allow seal to cure before installation for one hour.

3. To install, reverse the removal procedure.

tomsn048@gmail.com

Pickup Bed Storage Compartment Seal - Front Compartment

1. Remove the front compartment lid. For additional information, refer to Pickup Bed Storage Compartment Lid - Front Compartment in this section.

2. Remove the storage compartment seal from the storage compartment.
   - Remove any adhesive or residual seal material.
   - Clean the lid surface with a 50/50 solution of alcohol and water.
   - Apply adhesive promotor.
   - Apply seal.
   - Apply pressure to the seal with a roller and allow seal to cure before installation for one hour.

3. To install, reverse the removal procedure.

1. For additional information, refer to the procedures in this section.

tomsn048@gmail.com

A-Pillar Trim Panel

Removal and Installation

1. Remove the 2 assist handle bolt covers.

2. Remove the 2 assist handle bolts.
   - To install, tighten to 10 Nm (89 lb-in).

3. Remove the assist handle.

4. Position the door opening weatherstrip aside.

5. **NOTE:** The clip on the LH A-pillar trim panel must remain in the sheet metal. The clip comes off the A-pillar trim panel when the panel is removed.

   Remove the A-pillar trim panel.

6. To install, reverse the removal procedure.

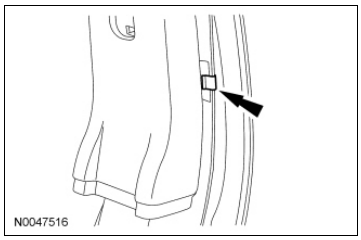
tomsn048@gmail.com

B-Pillar Lower Trim Panel

Removal and Installation

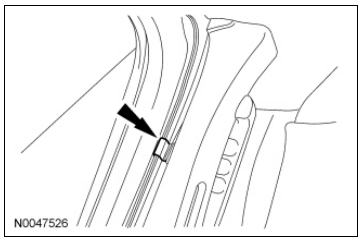
1. Remove the front and rear door scuff plates.
2. Position the door opening weatherstrip aside.
3. Remove the B-pillar lower trim panel.
4. To install, reverse the removal procedure.

B-Pillar Upper Trim Panel



Removal and Installation

1. Remove the B-pillar lower trim panel. For additional information, refer to B-Pillar Lower Trim Panel in this section.



2. Remove the D-ring safety belt anchor bolt.
   - To install, tighten to 40 Nm (30 lb-ft).

3. Position the door opening weatherstrip aside.

4. Remove the B-pillar upper trim panel retaining clip from the lower right corner of the panel.

5. Remove the B-pillar upper trim panel retaining clip from the upper left of the panel.

6. To install, reverse the removal procedure.
   - Be sure the hole on the back of the B-pillar upper trim panel is seated over the safety belt D-ring bolt.

tomsn048@gmail.com

C-Pillar Trim Panel - Explorer, Mountaineer

Removal and Installation

Second row bucket

1. Position the second row seat to the forward position.

Second row bench

2. Remove the second row seat. For additional information, refer to Section 501-10 .

All vehicles

3. Remove the C-pillar lower safety belt anchor bolt.
   - To install, tighten to 40 Nm (30 lb-ft).

4. Position the door opening weatherstrip aside.

5. Remove the C-pillar trim panel.

6. To install, reverse the removal procedure.
   - Be sure the hole on the back of the C-pillar upper trim panel is seated over the upper safety belt anchor bolt.

tomsn048@gmail.com

C-Pillar Upper Trim Panel - Explorer Sport Trac

1. Remove the C-pillar lower trim panel. For additional information, refer to C-Pillar Lower Trim Panel - Explorer Sport Trac in this section.

2. Remove the roof trim panel.

3. Remove the C-pillar upper trim panel.
    - Route the safety belt through the upper trim panel.

4. To install, reverse the removal procedures.

C-Pillar Lower Trim Panel - Explorer Sport Trac

1. Remove the rear seat. For additional information, refer to Section 501-10 .

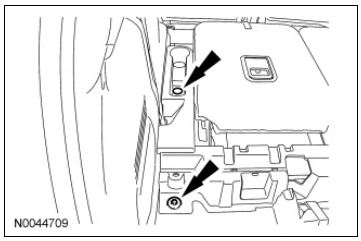
2. Remove the rear cab trim panel. For additional information, refer to Cab Rear Trim Panel in this section.

3. Remove the C-pillar lower safety belt anchor bolt.
   - To install, tighten to 40 Nm (30 lb-ft).

4. Position the door opening weatherstrip aside.

5. Remove the C-pillar lower trim panel.

6. To install, reverse the removal procedure.



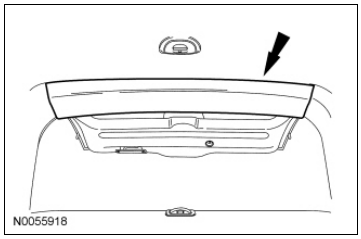
tomsn048@gmail.com

D-Pillar Trim Panel

Removal and Installation

Vehicles with third row seating

1. Remove the rear cargo management system.
   - Remove the screw.
   - Remove the pushpin.
   - Remove the system.



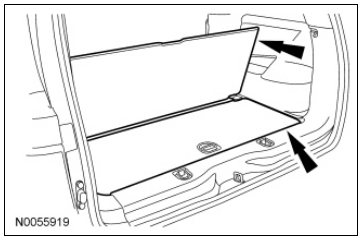
2. Remove the D-pillar lower safety belt anchor bolt.
   - To install, tighten to 40 Nm (30 lb-ft).

All vehicles

3. Position the liftgate opening weatherstrip aside.

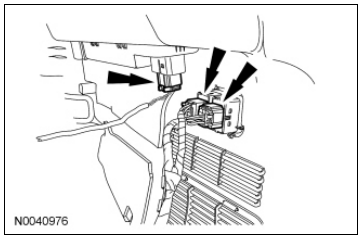
4. Remove the rear upper headliner trim panel.

5. Remove the D-pillar trim panel.



6. To install, reverse the removal procedure.

tomsn048@gmail.com



Quarter Trim Panel

Removal and Installation

1. Remove the rear door scuff plate.
2. Remove the C-pillar trim panel. For additional information, refer to C-Pillar Trim Panel - Explorer, Mountaineer in this section.
3. Remove the D-pillar trim panel. For additional information, refer to D-Pillar Trim Panel in this section.
4. Remove the liftgate scuff plate trim panel.
5. Remove the luggage compartment assembly cover, if equipped.

6. Remove the stowage compartment doors.
7. Position the carpet aside.
8. Remove the rear quarter trim panel.
9. Disconnect the electrical connectors, if necessary.

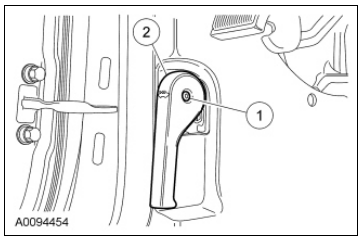
10. To install, reverse the removal procedure.

tomsn048@gmail.com

Cowl Side Trim Panel

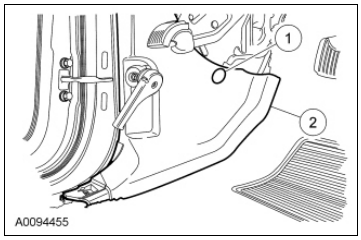
Removal and Installation

All vehicles



1. Remove the front door scuff plate.

Passenger side



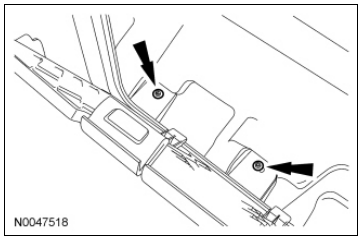
2. Remove the cowl trim panel.

Driver side

3. Remove the hood release lever.
    1. Remove the screw.
    2. Remove the hood release lever.

4. Remove the cowl trim panel.
    1. Remove the pin-type retainer.
    2. Remove the cowl trim panel.

All vehicles



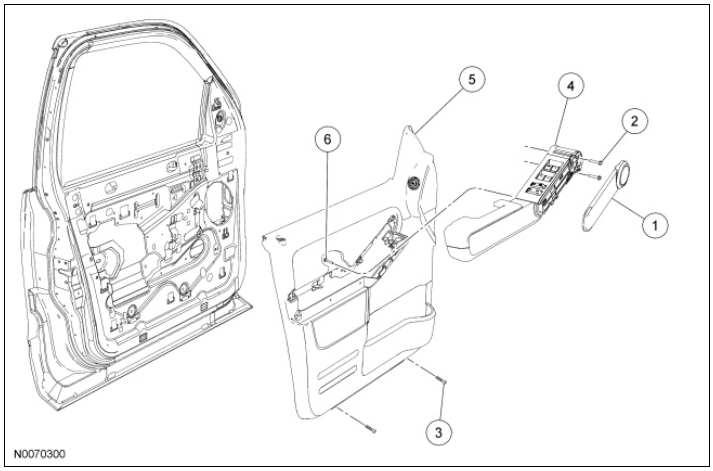
5. To install, reverse the removal procedure.

tomsn048@gmail.com

Cab Rear Trim Panel

1. Position the second row seat back forward.

2. Remove the 2 screws from the storage compartment.



3. **NOTE:** When removing the cab rear trim panel, start in the upper left corner, moving clockwise and remove the panel from the retaining clips.

   Remove the rear trim panel.

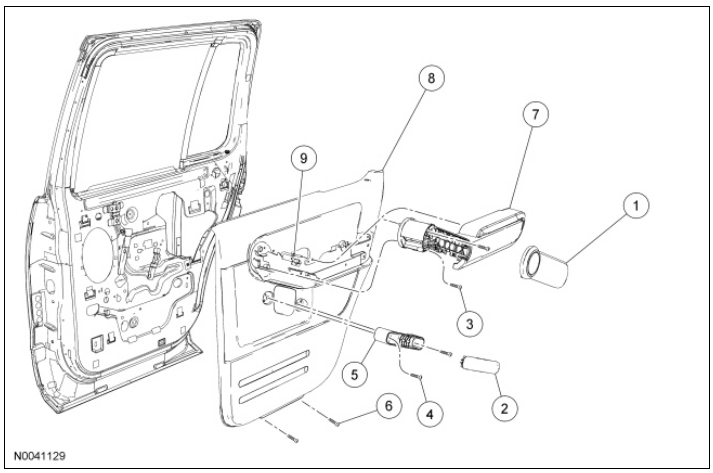
4. To install, reverse the removal procedures.

Door Trim Panel - Front

Removal and Installation

Item	Part Number	Description
1	226A38	Front door handle bezel screw cover
2	78226A56	Front door handle bezel screw (2 required)
3	N800481	Front door trim panel lower screw (2 required)
4	-	Front door handle (part of 23942)
5	23942	Front door trim panel
6	56907	Front door handle bezel rear screw (11 required)

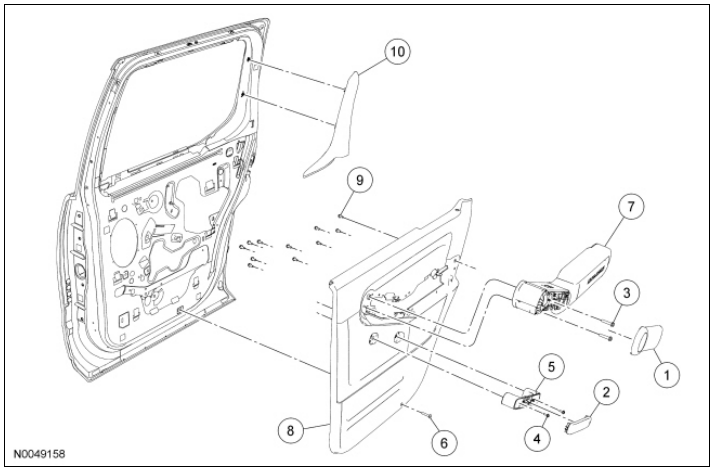
1. Remove the front door trim panel handle bezel cover.
2. Remove the front door trim panel handle bezel screws.
3. Remove the front door trim panel lower screws.



NOTICE: **To avoid damaging the front door trim panel, do not pull the bottom of the panel outward.**

4. Remove the front door trim panel by lifting upward on the armrest to disengage the panel clips.
5. Disconnect the electrical connectors.
6. Disconnect the lock rod cable from the front door trim panel.
7. Disconnect the door handle conduit and cable from the front door trim panel.
8. To install, reverse the removal procedure.

tomsn048@gmail.com



Door Trim Panel - Rear

Explorer/Mountaineer

Item	Part Number	Description
1	226A38	Rear door handle bezel screw cover
2	226A50	Rear door assist handle screw cover
3	W707364	Rear door handle bezel screw (2 required)
4	W707364	Rear door assist handle screw (2 required)
5	-	Rear door assist handle (part of 27406)
6	N800481	Rear door trim panel cover lower screw
7	-	Rear door handle (part of 27406)
8	27406	Rear door trim panel
9	56907	Rear door handle bezel rear screw (11 required)

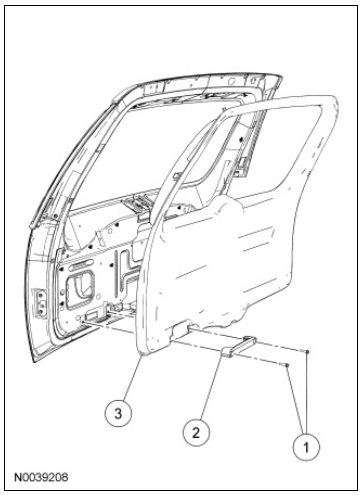
Explorer Sport Trac

Item	Part Number	Description

tomsn048@gmail.com

1	226A38	Rear door handle bezel screw cover
2	226A50	Rear door assist handle screw cover
3	78226A56	Rear door handle bezel screw (2 required)
4	W707364	Rear door assist handle screw (2 required)
5	-	Rear door assist handle (part of 27406)
6	N800481	Rear door trim panel cover lower screw
7	-	Rear door handle (part of 27406)
8	27406	Rear door trim panel
9	56907	Rear door handle bezel rear screw (11 required)
10	-	Rear door upper trim cover

Removal and Installation



1. Remove the rear door trim panel assist handle cover.
2. Remove the rear door trim panel assist handle screws.
3. Remove the rear door trim panel handle bezel cover.
4. Remove the rear door trim panel handle bezel screws.
5. Remove the rear door trim panel lower screw.
6. ***NOTICE:*** **To avoid damaging the trim panel, do not pull the bottom of the panel outward.**

   Remove the rear door trim panel by lifting upward on the armrest to disengage the panel clips.
7. Disconnect the electrical connectors.
8. Disconnect the rod cable from the rear door trim panel.
9. To install, reverse the removal procedure.

---

tomsn048@gmail.com

Liftgate Trim Panel

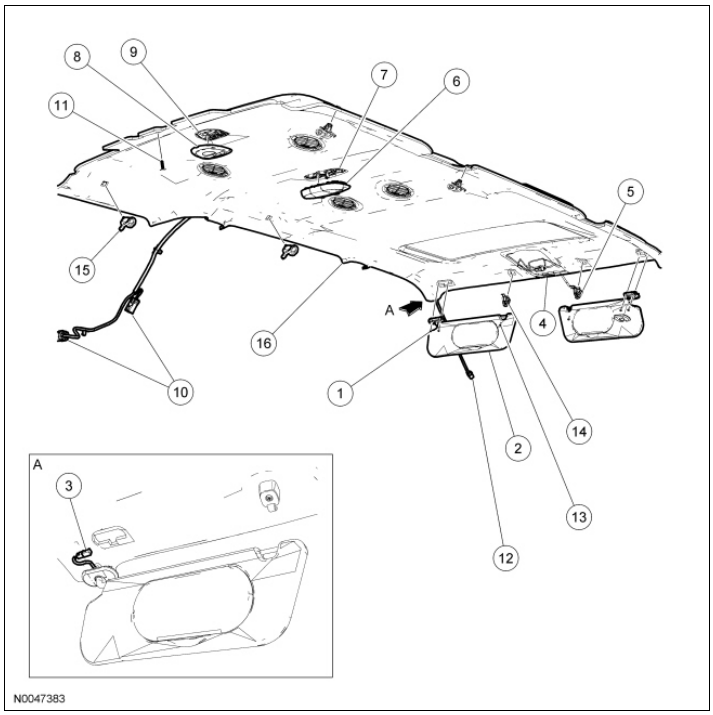
Item	Part Number	Description
1	W500015	Liftgate grab handle screws (2 required)
2	78434A14	Liftgate grab handle
3	7846404	Liftgate trim panel

Removal and Installation

1. Remove the 2 liftgate grab handle screws.
2. Remove the liftgate grab handle.
3. ***NOTICE:*** **To avoid damaging the trim panel, do not pull the bottom of the panel outward.**

   Lift the liftgate trim panel by lifting upward to disengage the clips and remove the panel.

   - Disconnect the liftgate trim panel electrical connector.

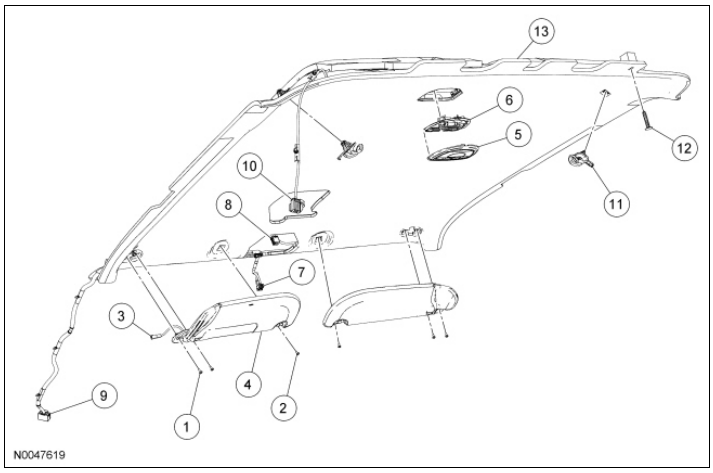


4. To install, reverse the removal procedure.

tomsn048@gmail.com

Headliner

Explorer/Mountaineer



NOTE: Headliner with roof opening panel shown, headliner without opening panel similar.

Item	Part Number	Description
1	W707364	Sun visor retainer screw (4 required)
2	04100	Sun visor
3	14334	Sun visor electrical connector
4	14334	Roof opening panel electrical connector
5	14334	Interior mirror electrical connector
6	19893	Dome lamp cover
7	14334	Dome lamp electrical connector
8	19893	Cargo lamp cover
9	14334	Cargo lamp electrical connector
10	14334	Headliner electrical connectors (rear)
11	51968	Pin-type retainer
12	14334	Headliner electrical connector (front)
13	W707364	Sun visor center retainer screw
14	041A20	Sun visor center retainer
15	29019	Garment hook (4 required)
16	51944	Headliner

Explorer Sport Trac

NOTE: Headliner without roof opening panel shown, headliner with opening panel similar.

Item	Part Number	Description
1	W707364	Sun visor retainer screw (4 required)
2	W707364	Sun visor center retainer screw (2 required)
3	14334	Sun visor electrical connector
4	04100	Sun visor
5	-	Dome lamp cover
6	-	Dome lamp
7	14334	Interior mirror electrical connector
8	14334	Overhead console electrical connector
9	14334	Headliner electrical connector (front)
10	14334	Headliner electrical connector (rear)
11	29019	Garment hook (2 required)
12	51968	Pin-type retainer
13	51944	Headliner

Explorer and Mountaineer only

1. If equipped, remove the rear entertainment system. For additional information, refer to Section 415-00 .

Explorer Sport Trac only

2. **NOTE:** The headliner is removed through the rear passenger door. To facilitate removal, the front passenger seat must be removed.

   Remove the front passenger seat. For additional information, refer to Section 501-10 .

All vehicles

3. Remove the overhead console. For additional information, refer to Section 501-12 .

4. Remove the A-pillar trim panel. For additional information, refer to A-Pillar Trim Panel in this section.

tomsn048@gmail.com

5. Position the B-pillar upper trim panel aside. For additional information, refer to B-Pillar Upper Trim Panel in this section.

Explorer and Mountaineer only

6. Remove the C-pillar trim panel. For additional information, refer to C-Pillar Trim Panel - Explorer, Mountaineer in this section.

7. Remove the D-pillar trim panel. For additional information, refer to D-Pillar Trim Panel in this section.

Explorer Sport Trac

8. Position the C-pillar upper trim panel aside. For additional information, refer to C-Pillar Upper Trim Panel - Explorer Sport Trac in this section.

All vehicles

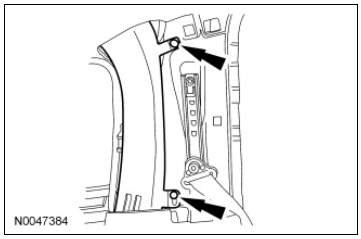
9. Remove the gimp around the roof opening panel, if equipped.

10. Remove the 4 sun visor retainer screws.

11. Remove the sun visors.

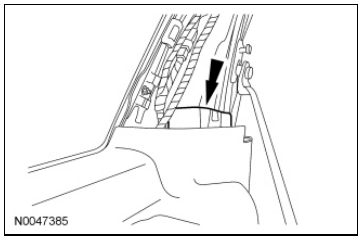
12. Carefully lower the headliner at the corner of the sun visor location to access the electrical connector and disconnect the electrical connector.

13. Disconnect the roof opening panel, if equipped.



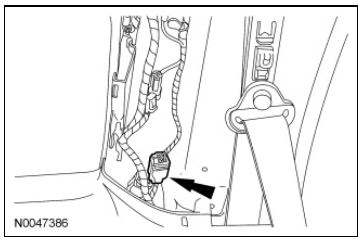
14. Disconnect the interior mirror electrical connector and electronic compass sensor connector, if equipped.

15. Use a thin-blade tool and carefully remove the dome lamp cover.

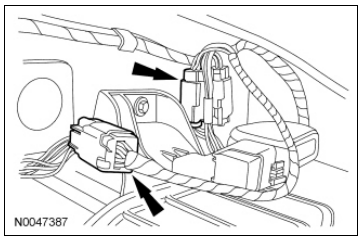


16. Disconnect the dome lamp electrical connectors.

Explorer and Mountaineer only

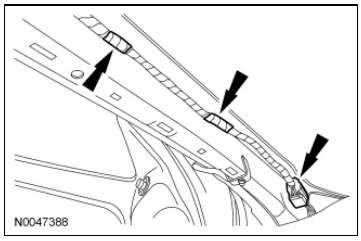


17. Remove the upper air duct.
    - Remove the pin-type retainers.
    - Push down on the duct, tilt the top outward and pull upward to remove.



18. Remove the lower air duct.

19. Disconnect the electrical connector located at the C-pillar.
    - Release the wiring harness pin-type retainers.



20. Disconnect all the electrical connectors.

All vehicles

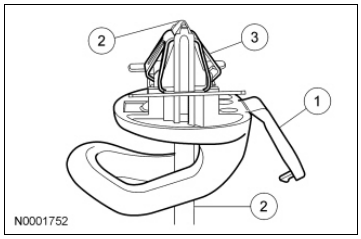
21. Disconnect the electrical connector and the wiring pin-type retainers on the A-pillar.

22. ***NOTICE:*** **To prevent bending or damaging the headliner, an assistant is required to support the headliner while carrying out the remaining steps.**

    Open the sun visor center retainer cover and remove the screw.

23. Remove the sun visor center retainer.

24. Remove the rear pin-type retainer.



25. ***NOTICE:*** **To prevent damaging the garment hanger retainer, use a 3/16-inch flat-blade screwdriver to carry out this step.**

    NOTE: The garment hanger is shown without the roof sheet metal screw to show the metal retainer clip. The metal retainer clip will remain engaged in the sheet metal after the garment hanger is removed.

tomsn048@gmail.com

Remove the garment hangers.

1. Open the access door.
2. Insert the flat-blade screwdriver fully into the garment hanger slot.
3. Rotate the screwdriver 90 degrees so that the screwdriver spreads the metal retainer clip. Remove the plastic garment hanger.

26. **NOTE:** The headliner is removed through the passenger rear door for Explorer Sport Trac.

    Remove the headliner.

27. To install, reverse the removal procedure.

PRB wedge screw	8	-	71
Running board retaining bolts	23	17	-

tomsn048@gmail.com

Exterior Trim

The exterior trim and ornamentation consists of:

- front fender wheel opening moulding.
- front door moulding.
- grille assembly.
- Power Running Boards (PRBs) (if equipped).
- PRB step
- PRB gap hider (if equipped)
- PRB module
- PRB motor and bracket assembly
- rear door moulding.
- rear quarter panel moulding.
- running boards.

If equipped, the PRBs automatically move when the doors are opened to assist entering and exiting the vehicle.

The PRB feature may be enabled/disabled through the message center. For information on how to access the PRB feature within the message center, refer to the Owner's Literature.

When the PRB is disabled (OFF), the PRB will immediately move to the stowed position regardless of the position of the doors.

When the PRB is enabled (AUTO), the PRBs will extend when the doors are opened and return to the stowed position 2 seconds after the doors are closed or vehicle speed is greater than 8 km/h (5 mph).

When the PRBs are manually set to the deployed position (OUT), they will return to the stowed position and (AUTO) mode when the vehicle speed is greater than 8 km/h (5 mph).

tomsn048@gmail.com

Power Running Board (PRB)

Special Tool(s)

 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Principles of Operation

The Power Running Boards (PRBs) are controlled by the Power Running Board (PRB) module. The PRB motors receive motor power and ground from the PRB module. The PRB module receives door ajar switch status and vehicle speed information from the Controller Area Network (CAN).

When in AUTO mode, the PRBs will deploy when a door on the same side of the vehicle is opened. When both doors on the same side are closed, the PRBs will retract after a 2 second delay.

When in OUT mode, both PRBs will stay deployed until OUT mode is deselected or reset to AUTO mode and vehicle speed is greater than 8 km/h (5 mph). Mode will automatically switch back to AUTO once above 8 km/h (5 mph).

When an obstacle is detected, the PRB will reverse direction. If a second obstacle is detected, the PRB will reverse direction again. If a third obstacle is detected, the PRB will stop against the third obstacle until the following conditions are met:

- Change in door ajar status
- Change in the message center status (AUTO, OUT, OFF)
- Vehicle speed greater than 8 km/h (5 mph)

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical and electrical damage.

Visual Inspection Chart

Mechanical	Electrical

• Power Running Board (PRB)	• Battery Junction Box (BJB) fuse 19 (30A)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM .
   - refer to Section 418-00 . No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00 to diagnose no response from the PRB module.

7. Carry out the network test.
   - If the scan tool responds with no communication from one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record the Continuous Memory Diagnostic Trouble Codes (CMDTCs).

8. Clear the CMDTCs and carry out the self-test diagnostics for the PRB .

9. If the DTCs retrieved are related to the concern, go the Power Running Board (PRB) Module DTC Chart. For all other DTCs, refer to Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

DTC Chart

Power Running Board (PRB) Module DTC Chart

DTC	Description	Action
B1162	Power Running Board Hall Effect Sensor Power Circuit Short to Battery	GO to Pinpoint Test E .
B1163	Left Power Running Board Hall Effect Sensor Failure	GO to Pinpoint Test E .
B1164	Power Running Board Hall Effect Sensor Power Circuit Short To Ground	GO to Pinpoint Test E .
B1167		GO to Pinpoint Test D .

	Left Power Running Board Deploy and/or Stow Circuit Short To Battery	
B1168	Left Power Running Board Stow Circuit Short To Ground	GO to Pinpoint Test D .
B1169	LH Motor Traveled Too Far	LH motor is freewheeling (broken geartrain linkage). INSTALL a new LH Power Running Board (PRB) bracket assembly. REFER to Power Running Board (PRB) Bracket in this section.
B116A	RH Motor Traveled Too Far	RH motor is freewheeling (broken geartrain linkage). INSTALL a new RH PRB bracket assembly. REFER to Power Running Board (PRB) Bracket in this section.
B116B	LH Power Running Board Motor Short	GO to Pinpoint Test D .
B116C	RH Power Running Board Motor Short	GO to Pinpoint Test D .
B116D	LH Power Running Board Motor Line Open	GO to Pinpoint Test D .
B116E	RH Power Running Board Motor Line Open	GO to Pinpoint Test D .
B1170	Right Power Running Board Hall Effect Sensor Failure	GO to Pinpoint Test E .
B1171	Left Power Running Board Hall Effect Signal Noisy	INSTALL a new LH PRB bracket assembly. REFER to Power Running Board (PRB) Bracket in this section.
B1172	Right Power Running Board Hall Effect Signal Noisy	INSTALL a new RH PRB bracket assembly. REFER to Power Running Board (PRB) Bracket in this section.
B1175	Right Power Running Board Stow Circuit Short To Ground	GO to Pinpoint Test D .
B1178	Right Power Running Board Deploy and/or Stow Circuit Short To Battery	GO to Pinpoint Test D .
B1317	Battery Voltage High	GO to Pinpoint Test F .
B1318	Battery Voltage Low	GO to Pinpoint Test F .
B1342	ECU is Faulted	INSTALL a new PRB module. REFER to Power Running Board (PRB) Module in this section.
B2139	Data Mismatch (receive data does not match what was expected)	RETRIEVE and FOLLOW Instrument Cluster (IC) and PCM DTCs. REFER to Section 419-10 and Powertrain Control/Emissions Diagnosis (PC/ED) manual.
B2813	LH Power Running Board Stow Time Fail	GO to Pinpoint Test B .
B2814	LH Power Running Board Deploy Time Fail	GO to Pinpoint Test B .
B2816	RH Power Running Board Stow Time Fail	GO to Pinpoint Test C .
B2817	RH Power Running Board Deploy Time Fail	GO to Pinpoint Test C .
U1900	CAN Communication Bus Fault - Receive Error	Do not install a new PRB module as part of the repair for a PRB DTC U1900 fault. The PRB is not the source of the fault when DTC U1900

		is present. REFER to Section 418-00 to diagnose the Medium Speed Controller Area Network (MS-CAN) concern.
U2050	No Application Present	INSTALL a new PRB module. REFER to Section 419-10 . REPEAT the self-test.

Symptom Chart

Symptom Chart

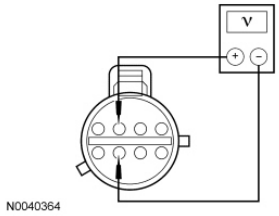
Pinpoint Tests

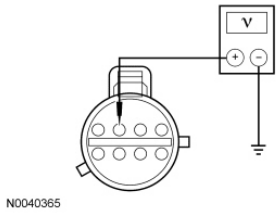
Pinpoint Test A: The Power Running Board (PRB) Does Not Operate Correctly - Both Running Boards

Refer to Wiring Diagrams Cell 109 , Power Liftgate/Running Boards for schematic and connector information.

Normal Operation

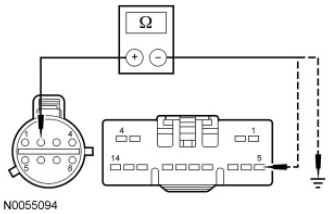
The Power Running Board (PRB) module receives power through circuit SBB19 (BU/RD) and ground through circuit GD151 (BK/GN). The LH and RH PRB motor Hall-effect sensors receive a regulated 10-volt power supply from the PRB module through circuit CPR47 (GY/BN). The Hall-effect ground is provided by the PRB module through circuit RPR47 (BU/GN). The PRB module receives door ajar and vehicle speed status over the Controller Area Network (CAN).

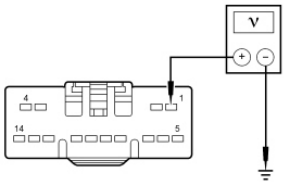


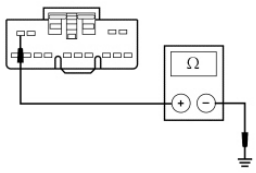


This pinpoint test is intended to diagnose the following:
- Fuse
- Wiring, terminals or connectors
- PCM
- Instrument Cluster (IC)
- PRB module

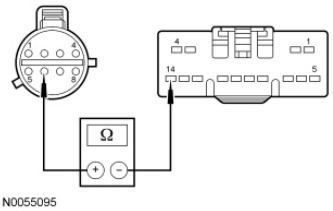
PINPOINT TEST A: THE PRB DOES NOT OPERATE CORRECTLY - BOTH RUNNING BOARDS

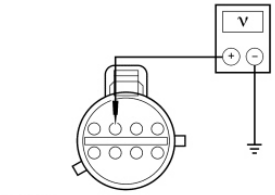






Test Step	Result / Action to Take
A1 RETRIEVE ALL CMDTCs IN ALL MODULES	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: ♦ Self-Test - ALL CMDTCs . • **Are any door ajar switch or Vehicle Speed Sensor (VSS) related DTCs present?**	**Yes** REFER to Section 419-10 to diagnose the door ajar switch or VSS related DTCs. **No** GO to A2 .
A2 CHECK THE OPERATION OF THE PRBs - AUTOMATIC MODE	
	Yes The system is operating as





tomsn048@gmail.com

• **NOTE:** There is a 2-second delay for the PRB to retract after the last door is closed. • Set the PRB system to the AUTO (enabled) mode, where the boards automatically deploy when a door on the same side is opened, and retract when the door is closed. • Open and close the LH front door. The LH PRB should deploy when the door is open, and retract when the door is closed. • Open and close the LH rear door. The LH PRB should deploy when the door is open, and retract when the door is closed. • Open and close the RH front door. The RH PRB should deploy when the door is open, and retract when the door is closed. • Open and close the RH rear door. The RH PRB should deploy when the door is open, and retract when the door is closed. • **Did both PRBs operate correctly, with no reversal of motion or noise while in motion?**	designed. REVIEW operation of the PRB system with the customer. **No** GO to A3 .
A3 CHECK THE OPERATION OF THE PRBs - MANUAL MODE	
• Set the PRB system to the OUT mode, where the boards are deployed all the time, regardless of door open/closed status and vehicle speed is less than 8 km/h (5 mph). • **Did both PRBs deploy?**	**Yes** GO to A5 . **No** GO to A4 .
A4 CHECK THE PRBs FOR FOREIGN MATERIAL	
• **NOTE:** If the system has false bounce-back, stops in mid travel, is noisy or will not deploy or stow completely, check to see if any foreign material is caught in the PRB hinge points, step area or door sill. If foreign material is found, clean the PRB hinge points, step area and door sill with a high-pressure washer. If the system operates correctly after cleaning, refer the customer to the Owner's Literature for correct cleaning instructions. • Check the PRB hinge points, step area and door sill of the LH and RH PRBs for foreign material or blockage. If any foreign material or blockage is found, remove it, and if necessary, set the PRB system to the OUT mode and clean the PRB hinge points, step area and door sill with a high-pressure washer. Avoid direct spray to the motor. • Set the PRB system to the AUTO (enabled) mode, where the boards automatically deploy when a door on the same side is opened, and retract when the door is closed. • Open and close the LH front door. The LH PRB should deploy when the door is open, and retract when the door is closed. • Open and close the RH front door. The RH PRB should deploy when the door is open, and retract when the door is closed. • **Does the PRB system operate normally during all test steps?**	**Yes** The system is operating normally. The concern may have been caused by foreign material or blockage in the PRB hinge points, step area or door sill. REFER the customer to the Owner's Literature for correct cleaning instructions. **No** GO to A5 .
A5 VERIFY THE DOOR AJAR SWITCH OPERATION	
• Open and close each door, verify the interior lights operate correctly and door ajar is noted on the vehicle message center. • **Do the interior lights turn ON when the door is opened, and OFF when the door is closed?**	**Yes** GO to A6 . **No** REFER to Section 417-02 to diagnose the interior lighting concern before attempting to diagnose the

	PRB concern.
A6 CHECK THE HALL-EFFECT SENSOR POWER AND GROUND	
• Disconnect: PRB LH Motor C3185. • Disconnect: PRB RH Motor C3186. • Ignition ON. • Measure the voltage between RH PRB motor C3186-2, circuit CPR47 (GY/BN), harness side and RH PRB motor C3186-6, circuit RPR47 (BU/GN), harness side.  N0040364 • Open RH door. • Voltage signal will only be present for less than one second. • **Is the voltage between 7 and 10.5 volts?**	**Yes** GO to A13 . **No** If the voltage was less than 7 volts, GO to A7 . If the voltage was greater than 10.5 volts, GO to A12 .
A7 CHECK HALL-EFFECT SENSOR POWER CIRCUIT FOR VOLTAGE	
• Measure the voltage between RH PRB motor C3186-2, circuit CPR47 (GY/BN), harness side and ground.  N0040365 • Open RH door. • Voltage signal will only be present for less than one second. • **Is the voltage between 7 and 10.5 volts?**	**Yes** GO to A11 . **No** GO to A8 .
A8 CHECK HALL-EFFECT POWER CIRCUIT FOR AN OPEN OR SHORT TO GROUND	
• Ignition OFF. • Disconnect: PRB Module C4322B. • Measure the resistance between RH PRB motor C3186-2, circuit CPR47 (GY/BN), harness side and PRB module C4322B-5, circuit CPR47 (GY/BN), harness side and between RH PRB motor C3186-2, circuit CPR47 (GY/BN), harness side and ground.	**Yes** GO to A9 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

tomsn048@gmail.com

 N0055094 • **Is the resistance less than 5 ohms between PRB motor and PRB module; and greater than 10,000 ohms between PRB motor and ground?**	
A9 CHECK THE PRB MODULE POWER CIRCUIT FOR VOLTAGE	
• Measure the voltage between PRB module C4322B-1, circuit SBB19 (BU/RD), harness side and ground.  N0055096 • **Is the voltage greater than 10.5 volts?**	**Yes** GO to A10 . **No** VERIFY Battery Junction Box (BJB) fuse 19 (30A) is OK. If OK, REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
A10 CHECK THE PRB MODULE GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Measure the resistance between the PRB module C4322B-4, circuit GD151 (BK/GN), harness side and ground.  N0060073 • **Is the resistance less than 5 ohms?**	**Yes** GO to A13 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
A11 CHECK THE HALL-EFFECT SENSOR GROUND CIRCUIT FOR AN OPEN	

• Ignition OFF. • Disconnect: PRB Module C4322B. • Measure the resistance between RH PRB motor C3186-6, circuit RPR47 (BU/GN), harness side and PRB module C4322B-14, circuit RPR47 (BU/GN), harness side.  N0055095 • **Is the resistance less than 5 ohms?**	**Yes** GO to A13 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
A12 CHECK HALL-EFFECT SENSOR POWER CIRCUIT FOR SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: PRB Module C4322B. • Ignition ON. • Measure the voltage between RH PRB motor C3186-2, circuit CPR47 (GY/BN), harness side and ground.  N0040365 • **Is any voltage present?**	**Yes** REPAIR the circuit. CLEAR The DTCs. REPEAT the self-test. **No** GO to A13 .
A13 CHECK THE PRB MODULE FOR CORRECT OPERATION	
• Connect: PRB LH Motor C3185. • Connect: PRB RH Motor C3186. • Visually inspect all PRB module connectors. • Check for: ♦ corrosion. ♦ pushed-out pins. • Connect all PRB module connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PRB module. REFER to Power Running Board (PRB) Module in this section. CLEAR the DTCs. REPEAT the self-test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

tomsn048@gmail.com

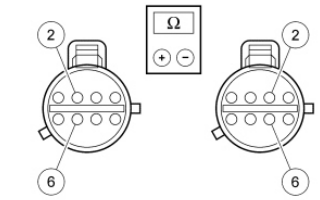
Pinpoint Test B: The Power Running Board (PRB) Does Not Operate Correctly - Left Running Board Does Not Deploy/Stow or Reverses Direction

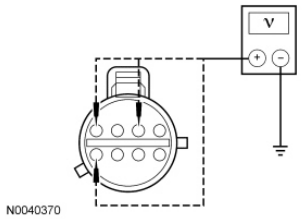
Refer to Wiring Diagrams Cell 109 , Power Liftgate/Running Boards for schematic and connector information.

Normal Operation

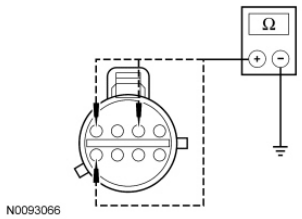
The Power Running Board (PRB) module receives door ajar and vehicle speed status over the Controller Area Network (CAN). During LH PRB deployment, the PRB module supplies power to the LH PRB motor through circuit CPR41 (BU/WH) and ground through circuit CPR42 (WH). The PRB stows the LH PRB by supplying power to the LH PRB motor through circuit CPR42 (WH) and ground through circuit CPR41 (BU/WH). The PRB module provides a regulated 10-volt power supply to the Hall-effect sensor (internal to the PRB motor) through circuit CPR47 (GY/BN). The Hall-effect ground is provided by the PRB module through circuit RPR47 (BU/GN). The PRB module monitors the LH PRB Hall-effect signal through circuit VPR43 (GY/BU). If the PRB module does not receive any signal from the Hall-effect sensor during operation, the PRB will stop.

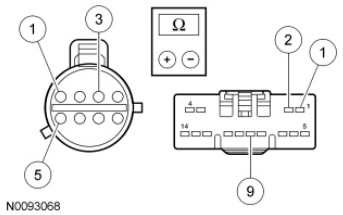
- B2813 (LH Power Running Board Stow Time Fail) - When the left running board takes greater than 4 seconds to stow.
- B2814 (LH Power Running Board Deploy Time Fail) - When the left running board takes greater than 4 seconds to deploy.





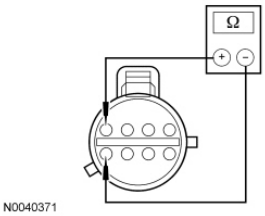
This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- Door ajar switch
- PRB module
- LH PRB bracket assembly





PINPOINT TEST B: THE PRB DOES NOT OPERATE CORRECTLY - LEFT RUNNING BOARD DOES NOT DEPLOY/STOW OR REVERSES DIRECTION

Test Step	Result / Action to Take
B1 CHECK THE OPERATION OF THE PRB - AUTOMATIC MODE	
• Set the PRB system to the AUTO (enabled) mode, where the boards automatically deploy when a door on the same side is opened, and retract when the door is closed. • Open and close the LH front door. The LH PRB should deploy when the door is open, and retract when the door is closed. • Open and close the LH rear door. The LH PRB should deploy when the door is open, and retract when the door is closed. • Open and close the RH front door. The RH PRB should deploy when the door is open, and retract when the door is closed. • Open and close the RH rear door. The RH PRB should deploy when the door is open, and retract when the door is closed. • **Did both PRBs operate correctly, with no reversal of motion, or noise while in motion?**	**Yes** The system is operating as designed. REVIEW operation of the PRBs system with the customer. **No** GO to B2 .
B2 CHECK THE OPERATION OF THE PRBs - MANUAL MODE	



• Set the PRB system to the OUT mode, where the boards are deployed all the time, regardless of door open/closed status and vehicle speed is less than 8 km/h (5 mph). • **Did both PRBs deploy?**	**Yes** GO to B5 . **No** GO to B3 .
B3 CHECK THE PRBs FOR FOREIGN MATERIAL	
• **NOTE:** If the system has false bounce-back, stops in mid travel, is noisy or will not deploy or stow completely, extend the PRB and check to see if any foreign material is caught in the PRB hinge points, step area or door sill. If foreign material is found, clean the PRB hinge points, step area and door sill with a high-pressure washer. If the system operates correctly after cleaning, refer the customer to the Owner's Literature for correct cleaning instructions. • Check the PRB hinge points, step area and door sill of the LH PRB for foreign material or blockage. If any foreign material or blockage is found, remove it, and if necessary, set the PRB system to the OUT mode and clean the PRB hinge points, step area and door sill with a high-pressure washer. Avoid direct spray to the motor. • Set the PRB system to the AUTO (enabled) mode, where the boards automatically deploy when either door on the same side is opened, and retract when the door is closed. • Open and close the LH front door. The LH PRB should deploy when the door is open, and retract 2 seconds after the door is closed. • **Does the LH PRB operate normally during all test steps?**	**Yes** The system is operating normally. The concern may have been caused by foreign material or blockage in the PRB hinge points, step area or door sill. REFER the customer to the Owner's Literature for correct cleaning instructions. **No** GO to B4 .
B4 CHECK IF DTCs ARE PRESENT	
• Use the recorded PRB module DTCs from the continuous and on-demand self tests. • **Is DTC B2813 or B2814 present?**	**Yes** INSTALL a new PRB bracket assembly. REFER to Power Running Board (PRB) Bracket in this section. CLEAR the DTCs. REPEAT the self-test. **No** GO to B6 .
B5 VERIFY THE DOOR AJAR SWITCH OPERATION	
• Open and close the LH front and LH rear door, and verify the interior lights operate correctly and door ajar is noted on the vehicle message center. • **Do the interior lights turn ON when the door is opened, and OFF when the door is closed?**	**Yes** GO to B6 . **No** REFER to Section 417-02 to diagnose the interior lighting concern before attempting to diagnose the PRB concern.
B6 CHECK FOR CONTINUITY BETWEEN LH AND RH PRB MOTORS ON THE HALL-EFFECT SENSOR POWER AND GROUND CIRCUITS	

tomsn048@gmail.com

• Disconnect: PRB LH Motor C3185. • Disconnect: PRB RH Motor C3186. • Ignition OFF. • Measure the resistance between LH PRB motor C3185, harness side and RH PRB motor C3186, harness side using the following chart: **LH PRB Motor / Circuit / RH PRB Motor** C3185-2 / CPR47 (GY/BN) / C3186-2 C3185-6 / RPR47 (BU/GN) / C3186-6  N0093067 • **Is the resistance less than 5 ohms?**	**Yes** GO to B7 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
B7 CHECK FOR SHORT TO VOLTAGE IN THE HALL-EFFECT SENSOR SIGNAL, DEPLOY OR STOW CIRCUIT	
• Ignition OFF. • Disconnect: PRB Module C4322A. • Disconnect: PRB Module C4322B. • Ignition ON. • Measure the voltage between LH PRB motor C3185-3, circuit VPR43 (GY/BU), harness side and ground; and between LH PRB motor C3185-1, circuit CPR41 (BU/WH), harness side and ground; and between LH PRB motor C3185-5, circuit CPR42 (WH), harness side and ground.  N0040370 • **Is any voltage present?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** GO to B8 .
B8 CHECK FOR A SHORT TO GROUND IN THE HALL-EFFECT SENSOR SIGNAL, DEPLOY OR STOW CIRCUIT	

• Ignition OFF. • Measure the resistance between LH PRB motor C3185-3, circuit VPR43 (GY/BU), harness side and ground; and between LH PRB motor C3185-1, circuit CPR41 (BU/WH), harness side and ground; and between RH PRB motor C3185-5, circuit CPR42 (WH), harness side and ground.  N0093066 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to B9 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
B9 CHECK FOR OPEN IN THE HALL-EFFECT SENSOR SIGNAL, DEPLOY OR STOW CIRCUIT	
• Measure the resistances between PRB module C4322A or C4322B, harness side and LH PRB motor C3185, harness side using the following chart: **LH Motor Connector** / **Circuit** / **PRB Module Connector** C3185-3 / VPR43 (GY/BU) / C4322B-9 C3185-1 / CPR41 (BU/WH) / C4322A-1 C3185-5 / CPR42 (WH) / C4322A-2  N0093068 • **Is the resistance less than 5 ohms?**	**Yes** GO to B10 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
B10 CHECK FOR SHORT BETWEEN THE STOW AND DEPLOY CIRCUITS	
• Measure the resistance between LH PRB motor C3185-1, circuit CPR41 (BU/WH), harness side and LH PRB motor C3185-5, circuit CPR42 (WH), harness side.	**Yes** INSTALL a new LH PRB bracket assembly. REFER to Power Running Board (PRB) Bracket in this section. CLEAR the DTCs. REPEAT the self-test. If the concern is still present, GO to B11 .

tomsn048@gmail.com

 N0040371 • **Is the resistance greater than 10,000 ohms?**	**No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
B11 CHECK THE PRB MODULE FOR CORRECT OPERATION	
• Connect: PRB LH Motor C3185. • Connect: PRB RH Motor C3186. • Visually inspect all PRB module connectors. • Check for: ♦ corrosion. ♦ pushed-out pins. • Connect all PRB module connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PRB module. REFER to Power Running Board (PRB) Module in this section. CLEAR the DTCs. REPEAT the self-test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test C: The Power Running Board (PRB) Does Not Operate Correctly - Right Running Board Does Not Deploy/Stow or Reverses Direction

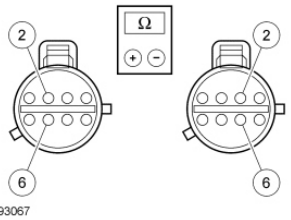
Refer to Wiring Diagrams Cell 109 , Power Liftgate/Running Boards for schematic and connector information.

Normal Operation

The Power Running Board (PRB) module receives door ajar and vehicle speed status over the Controller Area Network (CAN). During RH PRB deployment, the PRB module supplies power to the RH PRB motor through circuit CPR44 (BN/WH) and ground through circuit CPR45 (VT/GY). The PRB module stows the RH PRB by supplying power to the RH PRB motor through circuit CPR45 (VT/GY) and ground through circuit CPR44 (BN/WH). The PRB module provides a regulated 10-volt power supply to the Hall-effect sensor (internal to the PRB motor) through circuit CPR47 (GY/BN). The Hall-effect ground is provided by the PRB module through circuit RPR47 (BU/GN). The PRB module monitors the RH PRB Hall-effect signal through circuit VPR46 (GY/OG). If the PRB module does not receive any signal from the Hall-effect sensor during operation, the PRB will stop.

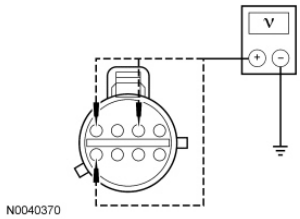
- B2816 (RH Power Running Board Stow Time Fail) - Right running board takes greater than 4 seconds to stow.
- B2817 (RH Power Running Board Deploy Time Fail) - Right running board takes greater than 4 seconds to deploy.

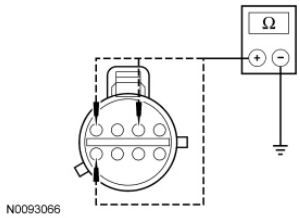
This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- Door ajar switch
- PRB module
- RH PRB bracket assembly



PINPOINT TEST C: THE PRB DOES NOT OPERATE CORRECTLY - RIGHT RUNNING BOARD DOES NOT DEPLOY/STOW OR REVERSES DIRECTION

Test Step	Result / Action to Take
C1 CHECK THE OPERATION OF THE PRB - AUTOMATIC MODE	
• Set the PRB system to the AUTO (enabled) mode, where the boards automatically deploy when a door on the same side is opened, and retract when the door is closed. • Open and close the LH front door. The LH PRB should deploy when the door is open, and retract when the door is closed. • Open and close the LH rear door. The LH PRB should deploy when the door is open, and retract when the door is closed. • Open and close the RH front door. The RH PRB should deploy when the door is open, and retract when the door is closed. • Open and close the RH rear door. The RH PRB should deploy when the door is open, and retract when the door is closed. • **Did both PRBs operate correctly, with no reversal of motion or noise while in motion?**	**Yes** The system is operating as designed. REVIEW operation of the PRBs system with the customer. **No** GO to C2 .
C2 CHECK THE OPERATION OF THE PRBs - MANUAL MODE	
• Set the PRB system to the OUT mode, where the boards are deployed all the time, regardless of door open/closed status and vehicle speed is less than 8 km/h (5 mph). • **Did both PRBs deploy?**	**Yes** GO to C5 . **No** GO to C3 .
C3 CHECK THE PRB FOR FOREIGN MATERIAL	
• **NOTE:** If the system has false bounce-back, stops in mid travel, is noisy or will not deploy or stow completely, extend the PRB and check to see if any foreign material is caught in the PRB hinge points, step area or door sill. If foreign material is found, clean the PRB hinge points, step area and door sill with a high-pressure washer. If the system operates correctly after cleaning, refer the customer to the Owner's Literature for correct cleaning instructions. • Check the PRB hinge points, step area and door sill of the RH PRB for foreign material or blockage. If any foreign material or blockage is found, remove it, and if necessary, set the PRB system to the OUT mode and clean the PRB hinge points, step area and door sill with a high-pressure washer. Avoid direct spray to the motor. • Set the PRB system to the AUTO (enabled) mode, where the boards automatically deploy when either door on the same side is opened, and retract when the door is closed. • Open and close the RH front door. The RH PRB should deploy when the door is open, and retract when the door is closed. • **Does the RH PRB operate normally during all test steps?**	**Yes** The system is operating normally. The concern may have been caused by foreign material or blockage in the PRB hinge points, step area or door sill. REFER the customer to the Owner's Literature for correct cleaning instructions. **No** GO to C4 .
C4 CHECK IF DTCs ARE PRESENT	

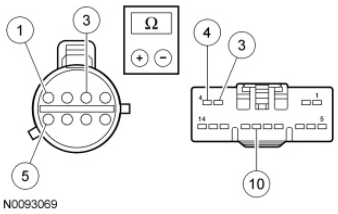




tomsn048@gmail.com

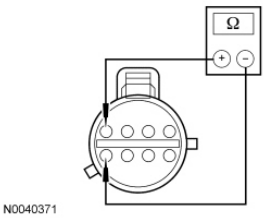
• Use the recorded PRB module DTCs from the continuous and on-demand self-tests. • **Is DTC B2816 or B2817 present?**	**Yes** INSTALL a new PRB bracket assembly. REFER to Power Running Board (PRB) Bracket in this section. CLEAR the DTCs. REPEAT the self-test. **No** GO to C6 .
C5 VERIFY THE DOOR AJAR SWITCH OPERATION	
• Open and close the RH front and RH rear door, and verify the interior lights operate correctly and door ajar is noted on the vehicle message center. • **Do the interior lights turn ON when the door is opened, and OFF when the door is closed?**	**Yes** GO to C6 . **No** REFER to Section 417-02 to diagnose the interior lighting concern before attempting to diagnose the PRB concern.
C6 CHECK FOR CONTINUITY BETWEEN LH AND RH MOTORS ON THE HALL-EFFECT SENSOR POWER AND GROUND CIRCUITS	
• Disconnect: PRB LH Motor C3185. • Disconnect: PRB RH Motor C3186. • Ignition OFF. • Measure the resistance between LH PRB motor C3185, harness side and RH PRB motor C3186, harness side using the following chart: • **Is the resistance less than 5 ohms?**	**Yes** GO to C7 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
C7 CHECK FOR SHORT TO VOLTAGE IN THE HALL-EFFECT SENSOR SIGNAL, DEPLOY OR STOW CIRCUIT	

LH PRB Motor	Circuit	RH PRB Motor
C3185-2	CPR47 (GY/BN)	C3186-2
C3185-6	RPR47 (BU/GN)	C3186-6



N0093067

• Ignition OFF. • Disconnect: PRB Module C4322A. • Disconnect: PRB Module C4322B. • Ignition ON. • Measure the voltage between RH PRB motor C3186-3, circuit VPR46 (GY/OG), harness side and ground; and between RH PRB motor C3186-1, circuit CPR44 (BN/WH), harness side and ground; and between RH PRB motor C3186-5, circuit CPR45 (VT/GY), harness side and ground.  N0040370 • **Is any voltage present?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** GO to C8 .
C8 CHECK FOR A SHORT TO GROUND IN THE HALL-EFFECT SENSOR SIGNAL, DEPLOY OR STOW CIRCUIT	
• Ignition OFF. • Measure the resistance between RH PRB motor C3186-5, circuit CPR45 (VT/GY), harness side and ground; and between RH PRB motor C3186-3, circuit VPR46 (GY/OG), harness side and ground; and between RH PRB motor C3186-1, circuit CPR44 (BN/WH), harness side and ground.  N0093066 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to C9 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
C9 CHECK FOR OPEN IN CIRCUITS VPR46 (GY/OG), CPR44 (BN/WH) OR CPR45 (VT/GY)	
• Measure the resistances between PRB module C4322A or C4322B, harness side and RH PRB motor C3186, harness side using the following chart:	**Yes** GO to C10 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.



RH PRB Motor Connector	Circuit	PRB Module Connector
C3186-3		C4322B-10

tomsn048@gmail.com

	VPR46 (GY/OG)	
C3186-1	CPR44 (BN/WH)	C4322A-4
C3186-5	CPR45 (VT/GY)	C4322A-3

- **Is the resistance less than 5 ohms?**

C10 CHECK FOR SHORT BETWEEN THE STOW AND DEPLOY CIRCUITS	
• Measure the resistance between RH PRB motor C3186-1, circuit CPR44 (BN/WH), harness side and RH PRB motor C3186-5, circuit CPR45 (VT/GY), harness side.  • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new RH PRB bracket assembly. REFER to Power Running Board (PRB) Bracket in this section. CLEAR the DTCs. REPEAT the self-test. If the concern is still present, GO to C11 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
C11 CHECK THE PRB MODULE FOR CORRECT OPERATION	
• Connect: PRB LH Motor C3185. • Connect: PRB RH Motor C3186. • Visually inspect all PRB module connectors. • Check for: ♦ corrosion. ♦ pushed-out pins. • Connect all PRB module connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PRB module. REFER to Power Running Board (PRB) Module in this section. CLEAR the DTCs. REPEAT the self-test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

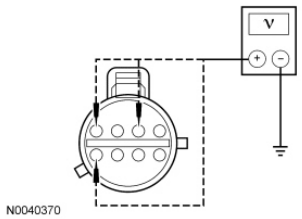
Pinpoint Test D: DTCs B1167, B1168, B1175, B1178, B116B, B116C, B116D and B116E

Refer to Wiring Diagrams Cell 109 , Power Liftgate/Running Boards for schematic and connector information.

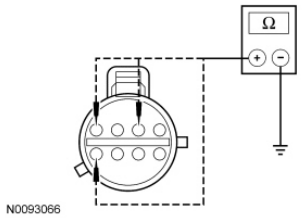
Normal Operation

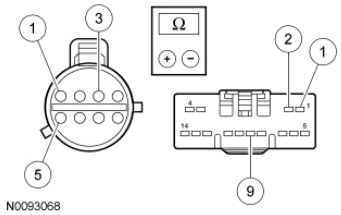
During Power Running Board (PRB) deployment, the PRB module supplies power to the PRB motor through circuit CPR41 (BU/WH) (LH) or CPR44 (BN/WH) (RH) and ground through circuit CPR42 (WH) (LH) or CPR45 (VT/GY) (RH). The PRB module stows the PRB by supplying power to the PRB motor through circuit CPR42 (WH) (LH) or CPR45 (VT/GY) (RH) and ground through circuit CPR41 (BU/WH) (LH) or CPR44 (BN/WH) (RH). The PRB module provides a regulated 10-volt power supply to the Hall-effect sensor (internal to the PRB motor) through circuit CPR47 (GY/BN). The Hall-effect ground is provided by the PRB module through circuit RPR47 (BU/GN). The PRB module monitors the PRB Hall-effect signal through circuit VPR43 (GY/BU) (LH) or VPR46 (GY/OG) (RH). If the PRB module does not receive any signal from the Hall-effect sensor during operation, the PRB will stop.

DTC Description	Fault Trigger Conditions
• B1167 - Left Power Running Board Deploy and/or Stow Circuit Short to Battery	The PRB module sets this DTC if a short to battery voltage is detected in the LH running board motor circuit(s).
• B1168 - Left Power Running Board Motor Circuit Short to Ground	The PRB module sets this DTC if a short to ground is detected in the motor circuit while attempting to retract/stow the LH running board.
• B1175 - Right Power Running Board Stow Circuit Short to Ground	The PRB module sets this DTC if a short to ground is detected in the motor circuit while attempting to retract/stow the RH running board.
• B1178 - Right Power Running Board Deploy and/or Stow Circuit Short to Battery	The PRB module sets this DTC if a short to battery voltage is detected in the RH running board motor circuit(s).
• B116B - LH Power Running Board Motor Short	The PRB module sets this DTC if it detects the LH running board motor circuit(s) are shorted together.
• B116C - RH Power Running Board Motor Short	The PRB module sets this DTC if it detects the RH running board motor circuit(s) are shorted together.
• B116D - LH Power Running Board Motor Line Open	The PRB module sets this DTC when it detects an open in the LH running board motor circuit(s).
• B116E - RH Power Running Board Motor Line Open	The PRB module sets this DTC when it detects an open in the RH running board motor circuit(s).



This pinpoint test is intended to diagnose the following:

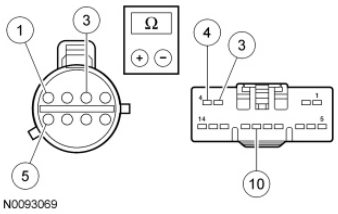




- Wiring, terminals or connectors
- LH or RH PRB bracket assembly

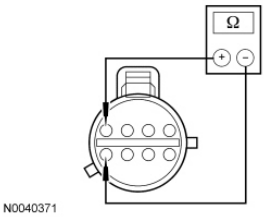
tomsn048@gmail.com

- PRB module



PINPOINT TEST D: DTCs B1167, B1168, B1175, B1178, B116B, B116C, B116D AND B116E

Test Step	Result / Action to Take
D1 CHECK FOR SHORT TO VOLTAGE IN THE HALL-EFFECT SENSOR SIGNAL, DEPLOY OR STOW CIRCUIT	
• Ignition OFF. • Disconnect: PRB Module C4322A. • Disconnect: PRB Module C4322B. • Disconnect: PRB LH Motor C3185. • Disconnect: PRB RH Motor C3186. • Ignition ON. • For DTC B1167, B1168, B116B or B116D, measure the voltage between LH PRB motor C3185-3, circuit VPR43 (GY/BU), harness side and ground; and between LH PRB motor C3185-1, circuit CPR41 (BU/WH), harness side and ground; and between LH PRB motor C3185-5, circuit CPR42 (WH), harness side and ground.  • For DTC B1175 or B1178, B116C or B116E, measure the voltage between RH PRB motor C3186-3, circuit VPR46 (GY/OG), harness side and ground; and between RH PRB motor C3186-1, circuit CPR44 (BN/WH), harness side and ground; and between RH PRB motor C3186-5, circuit CPR45 (VT/GY), harness side and ground. • **Is any voltage present?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** GO to D2 .
D2 CHECK FOR A SHORT TO GROUND IN THE HALL-EFFECT SENSOR SIGNAL, DEPLOY OR STOW CIRCUIT	
• Ignition OFF. • For DTC B1167, B1168, B116B or B116D, measure the resistance between LH PRB motor C3185-3, circuit VPR43 (GY/BU), harness side and ground; and between LH PRB motor C3185-1, circuit CPR41 (BU/WH), harness side and ground; and between LH PRB motor C3185-5, circuit CPR42 (WH), harness side and ground. • For DTC B1175, B1178, B116C or B116E, measure the resistance between RH PRB motor C3186-3, circuit VPR46 (GY/OG), harness side and ground; and between RH PRB motor	**Yes** GO to D3 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.



C3186-1, circuit CPR44 (BN/WH), harness side and ground; and between RH PRB motor C3186-5, circuit CPR45 (VT/GY), harness side and ground.  • **Is the resistance greater than 10,000 ohms?**	
D3 CHECK FOR OPEN IN THE HALL-EFFECT SENSOR SIGNAL, DEPLOY OR STOW CIRCUIT	
• Ignition OFF. • For DTC B1167, B1168, B116B or B116D, measure the resistances between PRB module C4322A or C4322B, harness side and LH PRB motor C3185, harness side using the following chart: **LH PRB Motor Connector** / **Circuit** / **PRB Module Connector** C3185-3 / VPR43 (GY/BU) / C4322B-9 C3185-1 / CPR41 (BU/WH) / C4322A-1 C3185-5 / CPR42 (WH) / C4322A-2  • For DTC B1175, B1178, B116C or B116E, measure the resistances between PRB module C4322A or C4322B, harness side and RH PRB motor C3186, harness side using the following chart: **RH PRB Motor Connector** / **Circuit** / **PRB Module Connector**	**Yes** GO to D4 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

C3186-3	VPR46 (GY/OG)	C4322B-10
C3186-1	CPR44 (BN/WH)	C4322A-4
C3186-5	CPR45 (VT/GY)	C4322A-3

- **Is the resistance less than 5 ohms?**

D4 CHECK FOR SHORT BETWEEN THE STOW AND DEPLOY CIRCUITS	
• For DTC B1167, B1168, B116B or B116D, measure the resistance between LH PRB motor C3185-1, circuit CPR41 (BU/WH), harness side and LH PRB motor C3185-5, circuit CPR42 (WH), harness side. • For DTC B1175, B1178, B116C or B116E, measure the resistance between RH PRB motor C3186-1, circuit CPR44 (BN/WH), harness side and C3186-5, circuit CPR45 (VT/GY), harness side.  • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to D5 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
D5 CHECK THE PRB MOTOR FOR AN OPEN CIRCUIT	
• For DTC B1167, B1168, B116B or B116D, measure the resistance between LH PRB motor C3185-1, circuit CPR41 (BU/WH), component side and LH PRB motor C3185-5, circuit CPR42 (WH), component side. • For DTC B1175, B1178, B116C or B116E, measure the resistance between RH PRB motor C3186-1, circuit CPR44 (BN/WH), component side and RH PRB motor C3186-5, circuit CPR45 (VT/GY), component side.	**Yes** GO to D6 . **No** INSTALL a new PRB bracket assembly. REFER to Power Running Board (PRB) Bracket in this section. CLEAR the DTCs. REPEAT the self-test.

 N0055108 • **Is any measurable continuity present?**	
D6 CHECK THE PRB MOTOR FOR A SHORT TO GROUND	
• For DTC B1167, B1168, B116B or B116D, measure the resistance between LH PRB motor C3185-1, circuit CPR41 (BU/WH), component side. • For DTC B1175, B1178, B116C or B116E, measure the resistance between RH PRB motor C3186-1, circuit CPR44 (BN/WH), component side and ground.  N0055109 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to D7 . **No** INSTALL a new PRB bracket assembly. REFER to Power Running Board (PRB) Bracket in this section. CLEAR the DTCs. REPEAT the self-test.
D7 CHECK THE PRB MODULE FOR CORRECT OPERATION	
• Connect: PRB LH Motor C3185. • Connect: PRB RH Motor C3186. • Visually inspect all PRB module connectors. • Check for: ♦ corrosion. ♦ pushed-out pins. • Connect all PRB module connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PRB module. REFER to Power Running Board (PRB) Module in this section. CLEAR the DTCs. REPEAT the self-test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test E: DTCs B1162, B1163, B1164 and B1170

Refer to Wiring Diagrams Cell 109 , Power Liftgate/Running Boards for schematic and connector information.

Normal Operation

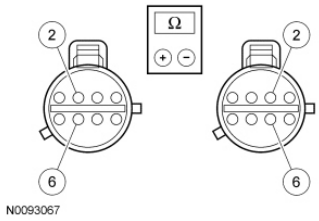
The Power Running Board (PRB) module provides a regulated 10-volt power supply to the Hall-effect sensor (internal to the PRB motor) through circuit CPR47 (GY/BN). The Hall-effect ground is provided by the PRB

tomsn048@gmail.com

module through circuit RPR47 (BU/GN). The PRB module monitors the PRB Hall-effect signal through circuit VPR43 (GY/BU) (LH) or VPR46 (GY/OG) (RH). If the PRB module does not receive any signal from the Hall-effect sensor during operation, the PRB will stop.

DTC Description	Fault Trigger Conditions
• B1162 - Power Running Board Hall-Effect Sensor Power Circuit Short to Battery	The PRB module sets this DTC if it detects the Hall-Effect sensor power circuit is shorted to battery voltage.
• B1163 - Left Power Running Board Hall-Effect Sensor Failure	The PRB module sets this DTC if it does not see any feedback from the Hall-Effect sensor during the stowing/deploying of the LH running board.
• B1164 - Power Running Board Hall-Effect Sensor Power Circuit Short to Ground	The PRB module sets this DTC if it detects the Hall-Effect sensor power circuit is shorted to ground.
• B1170 - Right Power Running Board Deploy and/or Stow Circuit Short to Battery	The PRB module sets this DTC if it does not see any feedback from the Hall-Effect sensor during the stowing/deploying of the RH running board.

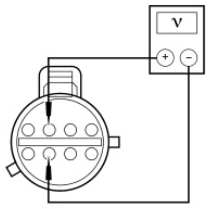
This pinpoint test is intended to diagnose the following:

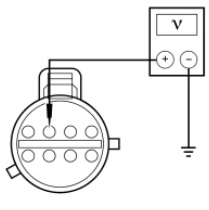


- Wiring, terminals or connectors
- PRB module
- LH or RH PRB bracket assembly

PINPOINT TEST E: DTCs B1162, B1163, B1164 AND B1170

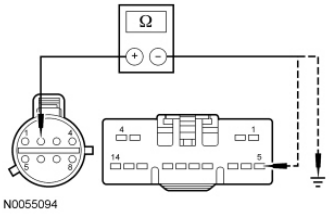
Test Step	Result / Action to Take
E1 CHECK CONTINUITY BETWEEN LH AND RH PRB MOTORS ON THE HALL-EFFECT SENSOR POWER AND GROUND CIRCUITS	
• Disconnect: PRB LH Motor C3185. • Disconnect: PRB RH Motor C3186. • Ignition OFF. • Measure the resistance between LH PRB motor C3185, harness side and RH PRB motor C3186, harness side using the following chart:	**Yes** GO to E2 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

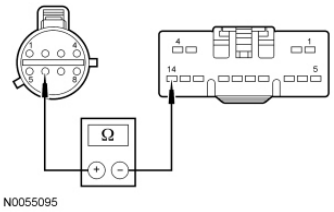


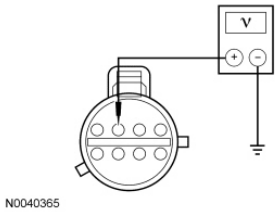


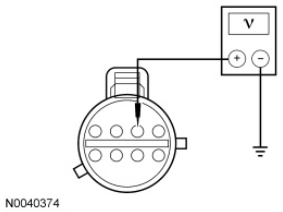
LH PRB Motor	Circuit	RH PRB Motor
C3185-2	CPR47 (GY/BN)	C3186-2

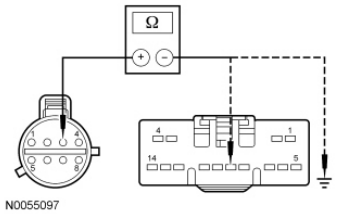
C3185-6	RPR47 (BU/GN)	C3186-6





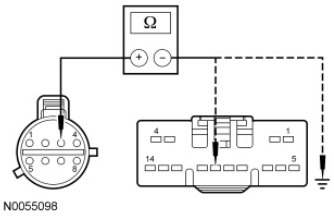






N0093067

- **Is the resistance less than 5 ohms?**



E2 CHECK THE HALL-EFFECT SENSOR POWER AND GROUND CIRCUITS	
• Ignition ON. • Measure the voltage between RH PRB motor C3186-2, circuit CPR47 (GY/BN), harness side and RH PRB motor C3186-6, circuit RPR47 (BU/GN), harness side.  N0040364 • Open RH door. • Voltage signal will only be present for less than one second. • **Is the voltage between 7 and 10.5 volts?**	**Yes** GO to E7 . **No** If the voltage was less than 7 volts, GO to E3 . If the voltage was greater than 10.5 volts, GO to E6 .
E3 CHECK THE HALL-EFFECT SENSOR POWER CIRCUIT FOR VOLTAGE	
• Measure the voltage between RH PRB motor C3186-2, circuit CPR47 (GY/BN), harness side and ground.  N0040365 • Open RH door. • Voltage signal will only be present for less than one second. • **Is the voltage between 7 and 10.5 volts?**	**Yes** GO to E5 . **No** GO to E4 .
E4 CHECK HALL-EFFECT SENSOR POWER CIRCUIT FOR AN OPEN OR SHORT TO GROUND	

tomsn048@gmail.com

• Ignition OFF. • Disconnect: PRB Module C4322B. • Measure the resistance between RH PRB motor C3186-2, circuit CPR47 (GY/BN), harness side and PRB module C4322B-5, circuit CPR47 (GY/BN), harness side and between RH PRB motor C3186-2, circuit CPR47 (GY/BN), harness side and ground.  N0055094 • **Is the resistance less than 5 ohms between the PRB motor and the PRB module; and greater than 10,000 ohms between the PRB motor and ground?**	**Yes** GO to E9 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
E5 CHECK THE HALL-EFFECT SENSOR GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: PRB Module C4322B. • Measure the resistance between RH PRB motor C3186-6, circuit RPR47 (BU/GN), harness side and PRB module C4322B-14, circuit RPR47 (BU/GN), harness side.  N0055095 • **Is the resistance less than 5 ohms?**	**Yes** GO to E9 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
E6 CHECK THE HALL-EFFECT SENSOR POWER CIRCUIT FOR SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: PRB Module C4322B. • Ignition ON. • Measure the voltage between RH PRB motor C3186-2, circuit CPR47 (GY/BN), harness side and ground.	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** GO to E9 .

 N0040365 • **Is any voltage present?**	
E7 CHECK THE HALL-EFFECT SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: PRB Module C4322B. • Ignition ON. • For DTC B1163, measure the voltage between LH PRB motor C3185-3, circuit VPR43 (GY/BU), harness side and ground. • For DTC B1170, measure the voltage between RH PRB motor C3186-3, circuit VPR46 (GY/OG), harness side and ground.  N0040374 • **Is any voltage present?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** GO to E8 .
E8 CHECK THE HALL-EFFECT SENSOR SIGNAL CIRCUIT FOR AN OPEN OR SHORT TO GROUND	
• Ignition OFF. • For DTC B1163, measure the resistance between LH PRB motor C3185-3, circuit VPR43 (GY/BU), harness side and PRB module C4322B-9, circuit VPR43 (GY/BU), harness side and between LH PRB motor C3185-3, circuit VPR43 (GY/BU), harness side and ground.  N0055097 • For DTC B1170, measure the resistance between RH PRB motor C3186-3, circuit VPR46 (GY/OG), harness side and PRB module C4322B-10, circuit VPR46 (GY/OG), harness side and between RH PRB motor C3186-3, circuit VPR46 (GY/OG), harness side and ground.	**Yes** GO to E10 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

tomsn048@gmail.com

 • **Is the resistance less than 5 ohms between the PRB motor and PRB module; and greater than 10,000 ohms between the PRB motor and ground?**	
E9 CHECK THE PRB MODULE FOR CORRECT OPERATION	
• Connect: PRB LH Motor C3185. • Connect: PRB RH Motor C3186. • Disconnect all PRB module connectors. • Check for: ♦ corrosion. ♦ pushed-out pins. • Connect all PRB module connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PRB module. REFER to Power Running Board (PRB) Module in this section. CLEAR the DTCs. REPEAT the self-test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.
E10 CHECK THE PRB MODULE FOR CORRECT OPERATION	
• Connect: PRB LH Motor C3185. • Connect: PRB RH Motor C3186. • Disconnect all PRB module connectors. • Check for: ♦ corrosion. ♦ pushed-out pins. • Connect all PRB module connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** GO to E11 . **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.
E11 CHECK THE PRBs FOR FOREIGN MATERIAL	
• **NOTE:** If the system has false bounce-back, stops in mid travel, is noisy or will not deploy or stow completely, extend the PRB and check to see if any foreign material is caught in the PRB hinge points, step area or door sill. If foreign material is found, clean the PRB hinge points, step area and door sill with a high-pressure washer. If the system operates correctly after cleaning, refer the customer to the Owner's Literature for correct cleaning instructions. • Check the PRB hinge points, step area and door sill of the PRBs for foreign material or blockage. If any foreign material	**Yes** The system is operating normally. The concern may have been caused by foreign material or blockage in the pivot areas or track guides. REFER the customer to the Owner's Literature for correct cleaning instructions. **No**

or blockage is found, remove it, and if necessary, set the PRB system to the OUT mode and clean the PRB hinge points, step area and door sill with a high-pressure washer. Avoid direct spray to the motor. • Set the PRB system to the AUTO (enabled) mode, where the boards automatically deploy when either door on the same side is opened, and retract when the door is closed. • Open and close the LH front door. The LH PRB should deploy when the door is open, and retract 2 seconds after the door is closed. • Open and close the RH front door. The RH PRB should deploy when the door is open, and retract 2 seconds after the door is closed. • **Do the LH and RH PRBs operate normally during all test steps?**	INSTALL a new PRB bracket assembly. REFER to Power Running Board (PRB) Bracket in this section. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test F: DTC B1317/B1318

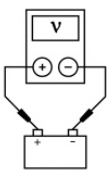
Refer to Wiring Diagrams Cell 109 , Power Liftgate/Retractable Running Boards for schematic and connector information.

NOTE: DTC B1317 or B1318 can be set if the vehicle has been recently jump started, the battery has been recently charged or the battery has been discharged. The battery may become discharged due to excessive load(s) on the charging system from aftermarket accessories or if the battery has been left unattended with the accessories on.

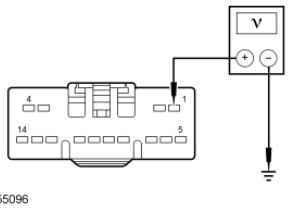
Normal Operation

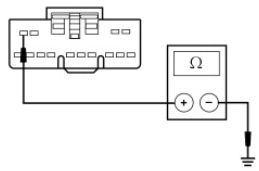
The Power Running Board (PRB) module continuously monitors the input voltage for correct operation. If the PRB module detects input voltage below 9.5 volts, it will store DTC B1318 in memory. If the PRB module detects input voltage greater than 16 volts, it will store DTC B1317 in memory. If the PRB module sets DTC B1317 or B1318, it will inhibit the PRB system operation.

- DTC B1317 (Battery Voltage High) - If the PRB module detects voltage above 16 volts while the running boards are in motion (deploy/stow), it will set this DTC. Once this DTC is set, the PRB system will be disabled until the battery voltage returns to normal.
- DTC B1318 (Battery Voltage Low) - If the PRB module detects voltage below 9.5 volts while the running boards are in motion (deploy/stow), it will set this DTC.



This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- PRB module





PINPOINT TEST F: DTC B1317/B1318

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

Test Step	Result / Action to Take
F1 RETRIEVE ALL CMDTCs IN ALL MODULES	

tomsn048@gmail.com

• Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - ALL CMDTCs . • **Is DTC B1317 or B1318 retrieved from one or more modules and P0563, P0620, P0626 or P065B retrieved from the PCM?**	**Yes** REFER to Section 414-00 to diagnose the charging system. CLEAR all Continuous Memory Diagnostic Trouble Codes (CMDTCs). REPEAT the PRB module self-test. **No** GO to F2 .
F2 TEST BATTERY CONDITION	
• Ignition OFF. • Carry out the Battery Condition Test. Refer to Section 414-01 . • **Did the battery pass the condition test?**	**Yes** If the battery passed the condition test but required a recharge, REFER to Section 414-00 to diagnose the charging system. CLEAR all CMDTCs . REPEAT the PRB module self-test. If the battery passed the condition test and did not require a recharge, GO to F3 . **No** INSTALL a new battery. CLEAR all CMDTCs . REPEAT the PRB module self-test.
F3 CHECK CHARGING SYSTEM VOLTAGE	
NOTE: Do not allow the engine speed to increase above 2,000 rpm while performing this step or the generator may self excite and result in default charging system output voltage. If engine speed goes above 2,000 rpm, shut the vehicle OFF and restart the engine before performing this step. • Measure the voltage of the battery: ♦ For DTC B1317, turn off all accessories and run the engine at 1,500 rpm for a minimum of 2 minutes while measuring battery voltage. ♦ For DTC B1318, turn on headlights and HVAC fan on high and run engine at 1,500 rpm for a minimum of 2 minutes while measuring battery voltage.  AJ0210-A • **Is the voltage between 13 and 15.2 volts?**	**Yes** For DTC B1318, GO to F4 . For DTC B1317, GO to F6 . **No** REFER to Section 414-00 to diagnose the charging system. CLEAR all CMDTCs . REPEAT the PRB module self-test.

F4 CHECK THE PRB MODULE POWER CIRCUIT	
• Measure the voltage between PRB module C4322B-1, circuit SBB19 (BU/RD), harness side and ground.  N0055096 • **Is the voltage greater than 10.5 volts?**	**Yes** GO to F5 . **No** VERIFY Battery Junction Box (BJB) fuse 19 (30A) is OK. If OK, REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
F5 CHECK THE PRB MODULE GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Measure the resistance between the PRB module C4322B-4, circuit GD151 (BK/GN), harness side and ground.  N0060073 • **Is the resistance less than 5 ohms?**	**Yes** GO to F6 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
F6 CHECK FOR PRB MODULE OPERATION	
• Check PRB module C4322A and C4322B for the following: ♦ corrosion. ♦ damaged pins. ♦ pushed-out pins. • Connect PRB module C4322A and C4322B and make sure the connectors seat correctly. • CLEAR all CMDTCs . • Operate the system to verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PRB module. REFER to Power Running Board (PRB) Module in this section. REPEAT the PRB module self-test. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the PRB module self-test.

tomsn048@gmail.com

Applique Repair

General Equipment

3 inch dual-action (DA) sander
3 inch polisher

NOTE: Appliques located on the front and rear window frames may experience minor scratches from vehicle shipment or car wash racks. These imperfections may be repaired instead of replacing the component by following the steps below.

NOTE: Scratches deep enough to cause a thumb nail to catch cannot be repaired and the component must be replaced.

1. Clean with a mild soap and water wash and dry the affected panels.

2. Apply protective masking to adjacent components.

3. Apply a small amount of clear coat and plastic formulated polishing compound (obtain locally) to a 3 inch polisher with an appropriate foam pad attached.

4. **NOTE:** Do not allow the polishing compound to dry while polishing the component.

   Thoroughly polish the component.

5. Reclean with a mild soap and water wash and dry the polished panels.
   - If the scratches are repaired return the vehicle.
   - If the scratches remain, continue with the following steps.

6. Choose a sandpaper appropriate to the scratch severity.
   - For very minor scratches, use a 3 inch 3000 grit sandpaper (obtain locally).
   - For minor scratches, use a 3 inch 1000 grit sandpaper (obtain locally).
   - For heavier scratches that do not catch a thumb nail when pulled across the scratch, use a 3 inch 800 grit sandpaper (obtain locally).
   - For scratches that are too deep to remove with 800 grit sandpaper, install a new component.

7. ***NOTICE:*** **Do not remove any more material than necessary or component replacement will be required.**

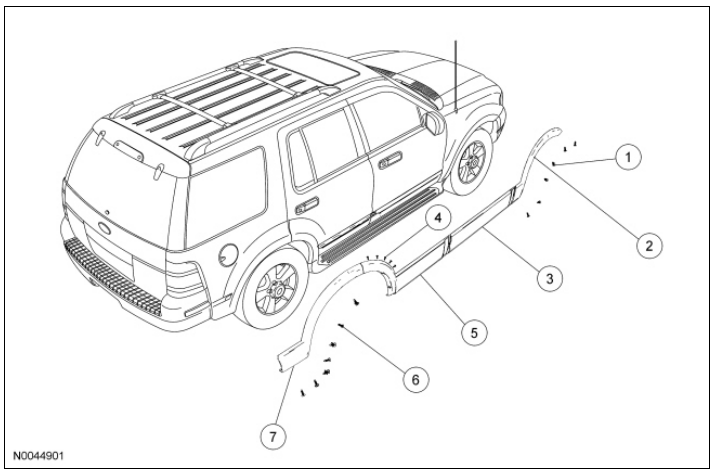
   Apply the appropriate sandpaper to a 3 inch dual-action (DA) sander and carefully sand the component until all the damage has been removed.

8. Apply progressively finer sandpaper to the 3 inch dual-action (DA) sander and repeat the process. Finish the sanding with 3000 grit sandpaper.

9. Apply a small amount of clear coat and plastic formulated rubbing compound (obtain locally) to a 3 inch polisher with an appropriate foam pad attached.

10. **NOTE:** Do not allow the rubbing compound to dry while polishing the component.

tomsn048@gmail.com

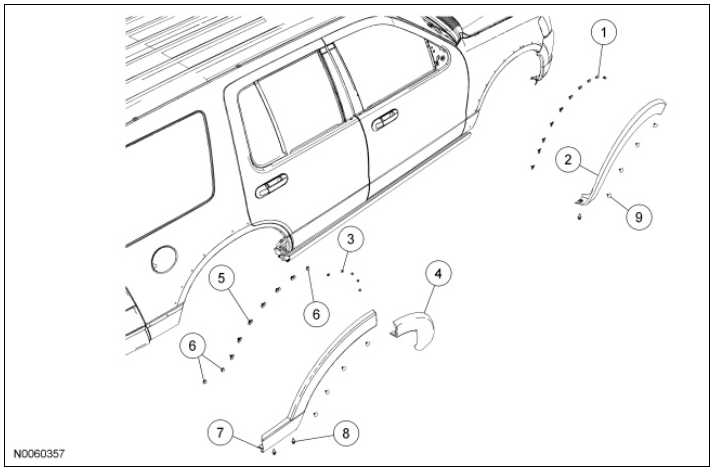


Buff the component until the sanding scratches have been completely removed.

11. Apply a small amount of clear coat and plastic formulated polishing compound (obtain locally) to a 3 inch polisher with an appropriate clean foam pad attached.
12. **NOTE:** Do not allow the polishing compound to dry while polishing the component.

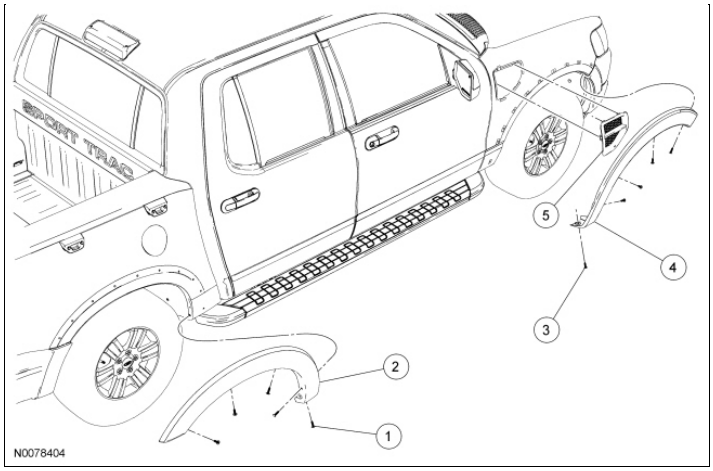
    Polish the component until the buffing swirl marks are removed.
13. Continue polishing the component until the original level of shine is present.
14. Apply a small amount of clear coat and plastic formulated hand glaze (obtain locally) to a soft and clean shop cloth and hand polish to remove swirl marks left by the 3 inch polisher.

Exterior Trim - Exploded View



Exterior Moulding - All Explorer and Mountaineer Vehicles

Item	Part Number	Description
1	W709837	Front fender moulding pin-type retainer (6 required)
2	16A074 LH/ 16A075 RH	Front fender moulding
3	20200 LH/ 20201 RH	Front door moulding
4	W710604	Rear door moulding retaining screw (5 required)
5	254A76 LH/ 254A77 RH	Rear door moulding
6	W709837	Rear quarter panel trim moulding pin-type retainer (6 required)
7	29C120 LH/ 29C121 RH	Rear quarter panel trim moulding



NOTE: Explorer XLT shown.

8	W709837	Rear quarter panel trim moulding pin-type retainer (6 required)
9	W709837	Front fender moulding pin-type retainer (6 required)

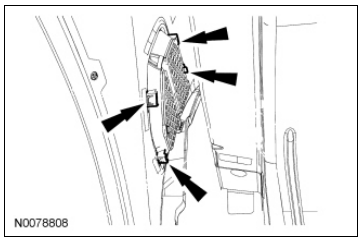
Exterior Moulding - Explorer Sport Trac

Item	Part Number	Description

1	W709837	Rear fender moulding pin-type retainer (5 required)
2	291C20 LH/ 291C20-1 RH	Rear fender moulding
3	W709837	Front fender moulding pin-type retainer (5 required)
4	16A074 LH/ 16A075 RH	Front fender moulding
5	16C027 LH/ 16C026 RH	Fender vent

1. For additional information, refer to the procedures in this section.

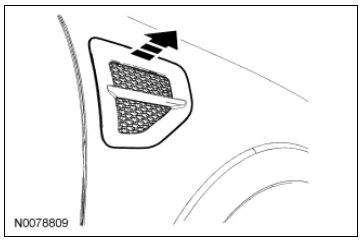
tomsn048@gmail.com



Fender Vent

Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .



2. Remove the fender splash shield. For additional information, refer to Section 501-02 .

3. Release the retainer clips on the back of the fender vent.

4. **NOTE:** Using a plastic putty knife or similar tool, start from the top of the fender vent.

   Pull gently on the fender vent to release the pressure sensitive tape from the fender and remove the fender vent.

5. Clean the fender vent mounting area with an appropriate cleaner.

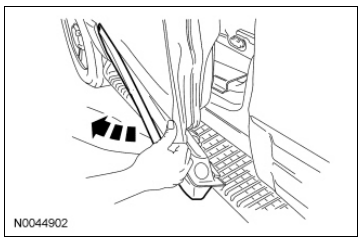
Installation

1. **NOTE:** The temperature of the mounting surface must be greater then 16°C (60°F).

   NOTE: Make sure to apply at least 30 psi to the fender vent for correct seating.

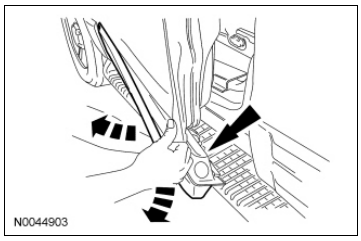
   Install the fender vent.

2. Install the fender splash shield. For additional information, refer to Section 501-02 .



tomsn048@gmail.com

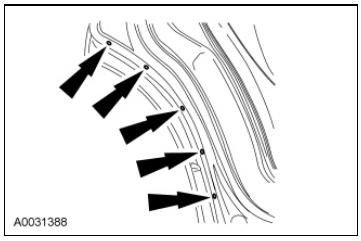
Door Moulding - Explorer



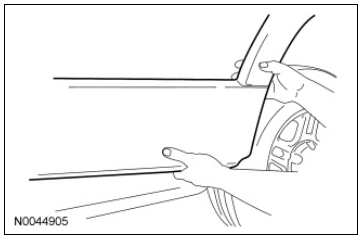
Removal

Front door moulding

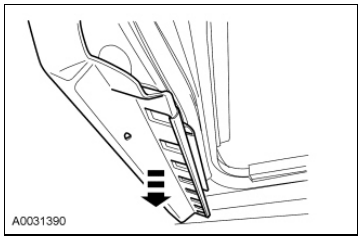
1. Pull the top of the front door moulding away from the door to release the tape.



2. Tilt the front door moulding downward to release from the bottom of the door.



Rear door moulding



3. Remove the 5 rear door moulding retaining screws.

4. Pull the rear door moulding away from the door to release the tape.

5. Tilt the rear door moulding down and remove the lower portion of the rear door moulding from the door.

6. Remove the rear door moulding.

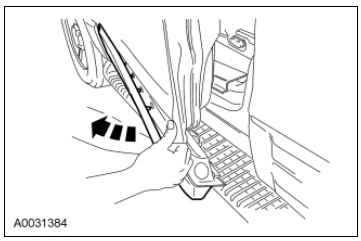
Installation

Front door moulding

1. Wipe the door tape surface with alcohol.
2. Release the tape liner on the cladding.
3. Hook the moulding to the bottom return flange on the door.
4. Align the locating pins on the cladding to the location holes on the door.
5. Press the tape into position. Make sure even pressure is applied to all of the taped area.

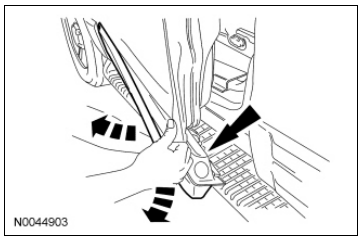
Rear door moulding

6. Wipe the door tape surface with alcohol.
7. Release the tape liner on the cladding.
8. Hook the moulding to the bottom return flange on the door.
9. Once the cladding is aligned on the door, press the tape into position. Make sure even pressure is applied to all of the taped area.
10. Install the 5 rear door moulding retaining screws.



tomsn048@gmail.com

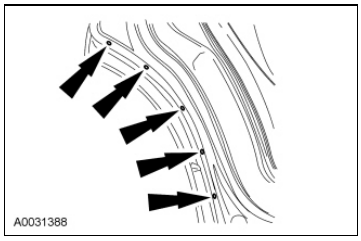
Door Moulding - Mountaineer



Removal and Installation

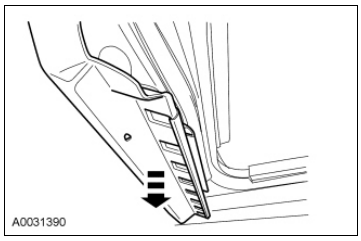
Front door moulding

1. Pull the top of the front door moulding away from the door to release the retaining clips.



2. Tilt the front door moulding downward to release from the bottom of the door.

Rear door moulding



3. Remove the 5 rear door moulding retaining screws.

Rear door moulding

4. Pull the rear door moulding away from the door to release the retaining clips.

5. Tilt the rear door moulding down and remove the lower portion of the rear door moulding from the door.

tomsn048@gmail.com

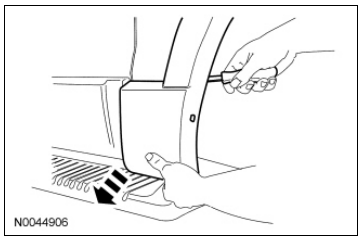
6. Remove the rear door moulding.

All door mouldings

7. **NOTE:** All clips must be installed on the front door moulding before installation.

   To install, reverse the removal procedure.

Fender Moulding - Front



Removal and Installation

NOTE: Explorer shown, Mountaineer and Explorer Sport Trac similar.

1. Remove the 6 (Ironman) or 5 (all others) front fender moulding pin-type retainers.

2. Pull the front fender moulding outward to release the retaining clips.

3. Remove the front fender moulding.

4. **NOTE:** All retainer clips must be installed onto the front fender moulding before installation.

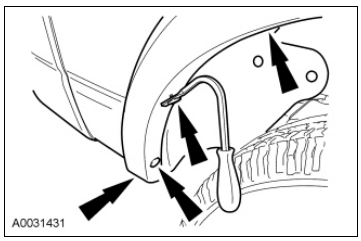
   To install, reverse the removal procedure.

tomsn048@gmail.com

Fender Moulding - Rear

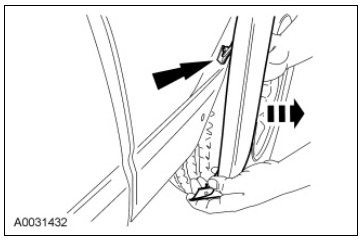
Removal and Installation

1. Remove the 5 pin-type retainers.
2. Pull the fender moulding outward to release the retaining clips.
3. To install, reverse the removal procedure.



tomsn048@gmail.com

Quarter Panel Moulding



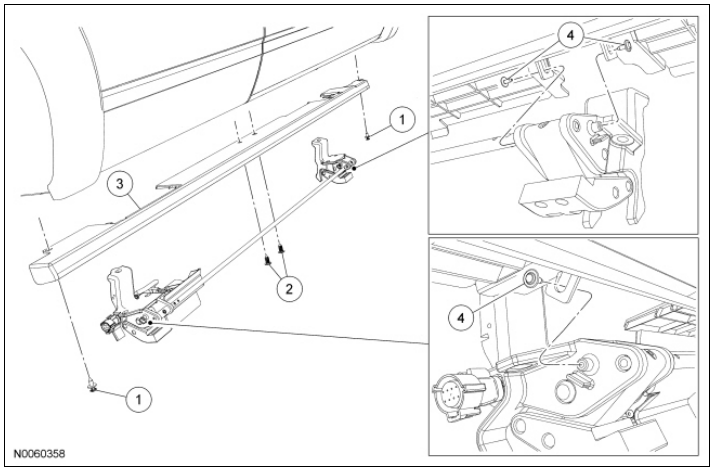
Removal and Installation

NOTE: Explorer shown, Mountaineer similar.

1. Remove the 6 rear quarter panel trim moulding pin-type retainers.

2. Pull the rear quarter panel trim moulding outward to release the retaining clips.

3. Remove the rear quarter panel trim moulding.



4. **NOTE:** All retainer clips must be installed onto the rear quarter panel trim moulding before installation.

   To install, reverse the removal procedure.

tomsn048@gmail.com

Power Running Board (PRB) Gap Hider

NOTE: RH shown, LH similar.

Item	Part Number	Description
1	N807389	Scrivets (2 required each side)
2	N804379	Pushpins (2 required each side)
3	-	Power Running Board (PRB) gap hider
4	-	Gap hider-to-bracket screws (3 required)

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

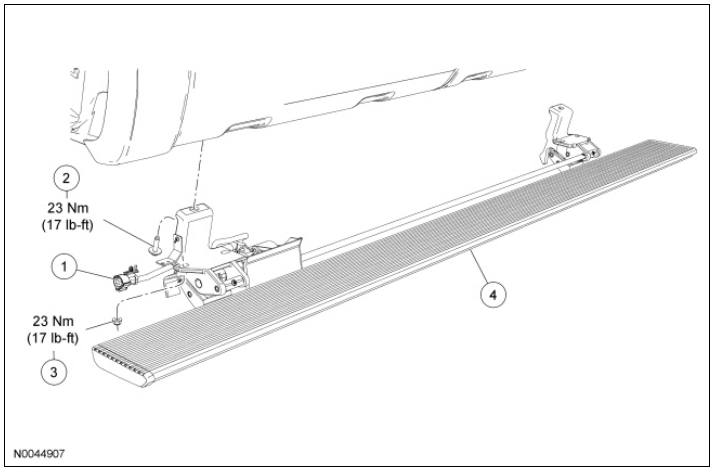
2. **NOTE:** If the Power Running Board (PRB) cannot be extracted, extend the running board by hand.

   Extend the PRB .

3. Remove the 2 pushpins and 2 scrivets.

4. Remove the 3 gap hider-to-bracket screws.

5. Remove the PRB gap hider.



6. To install, reverse the removal procedure.

tomsn048@gmail.com

Power Running Board (PRB)

NOTE: Mountaineer shown, Explorer similar.

NOTE: RH shown, LH similar.

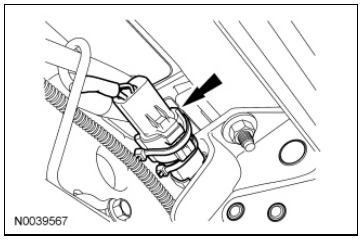
Item	Part Number	Description
1	-	Power Running Board (PRB) motor electrical connector
2	W709851	PRB retaining bolt (2 required per side)
3	N800911	PRB retaining nut (4 required per side)
4	16B46718	PRB assembly

Removal and Installation

Explorer only

1. Remove the Power Running Board (PRB) gap hider. For additional information, refer to Power Running Board (PRB) Gap Hider in this section.

Mountaineer only

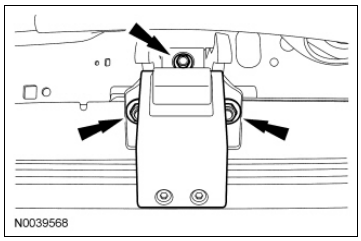


2. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

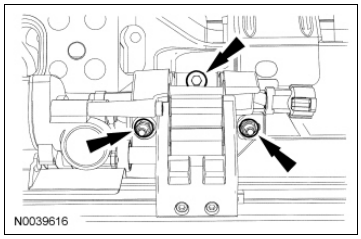
3. **NOTE:** If the PRB cannot be extracted, extend the running board by hand.

   Extend the PRB .

All vehicles



4. Remove the straps and disconnect the PRB motor electrical connector.

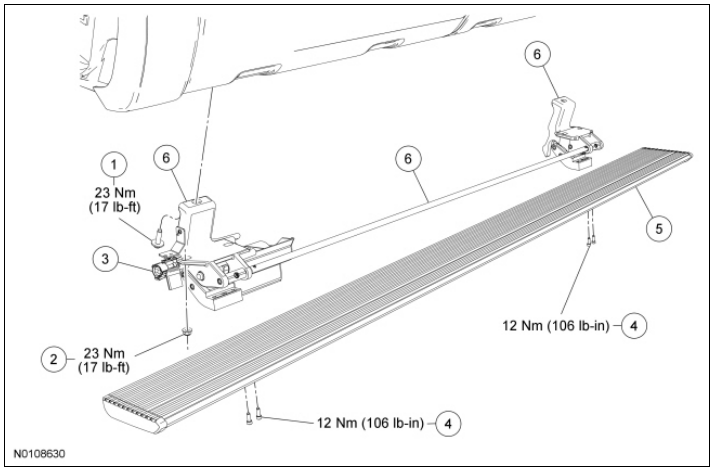


5. **NOTE:** An assistant is required to hold the PRB before removing the lower bolts.

   Remove the front PRB lower 2 nuts and bolt.

   - To install, tighten to 23 Nm (17 lb-ft).

6. Remove the rear PRB lower 2 nuts and bolt and remove the PRB assembly.
   - To install, tighten to 23 Nm (17 lb-ft).



7. To install, reverse the removal procedure.

tomsn048@gmail.com

Power Running Board (PRB) Bracket

NOTE: Mountaineer shown, Explorer similar.

NOTE: RH shown, LH similar.

Item	Part Number	Description
1	W709851	Power Running Board (PRB) retaining bolt (2 required per side)
2	N800911	PRB retaining nut (4 required per side)
3	-	PRB motor electrical connector
4	-	PRB step screws (4 required per side)
5	16490	PRB step assembly
6	T6A507	PRB bracket assembly

Removal and Installation

NOTE: The Power Running Board (PRB) motor and bracket assemblies cannot be serviced individually. The complete motor and bracket assembly and linkage must be serviced as a unit.

Explorer only

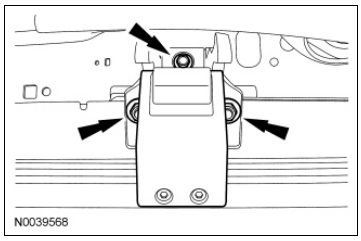
1. Remove the PRB gap hider. For additional information, refer to Power Running Board (PRB) Gap Hider in this section.

Mountaineer only

2. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

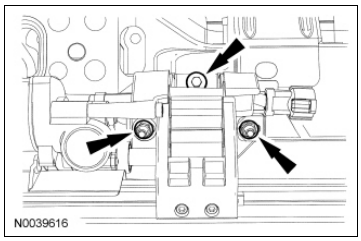
3. **NOTE:** If the PRB cannot be extracted, extend the running board by hand.

   Extend the retractable running board.



All vehicles

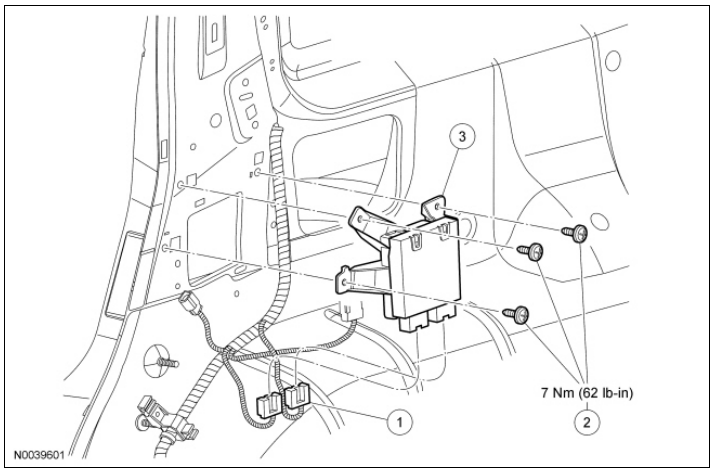
4. Remove the PRB step. For additional information, refer to Power Running Board (PRB) Step in this section.



5. **NOTE:** An assistant is required to hold the PRB motor and bracket assembly before removing the lower bolts.

   Remove the PRB front bracket lower 2 nuts and bolt.

   - To install, tighten to 23 Nm (17 lb-ft).



6. Remove the PRB rear bracket lower 2 nuts and bolt.
   - To install, tighten to 23 Nm (17 lb-ft).

7. To install, reverse the removal procedure.

tomsn048@gmail.com

Power Running Board (PRB) Module

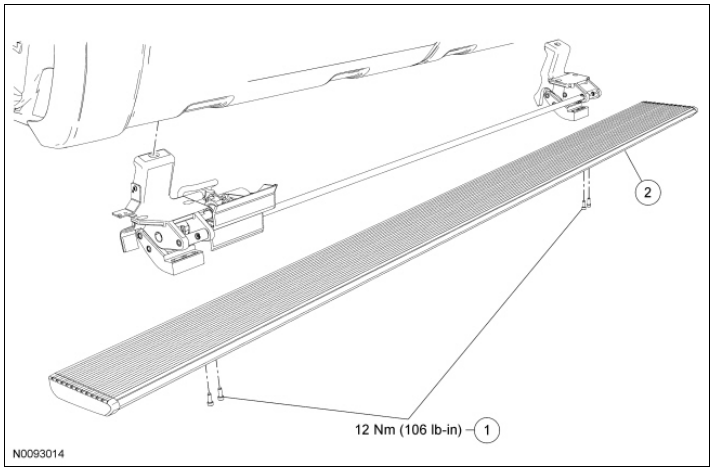
Item	Part Number	Description
1	14A488	Electrical connector
2	W500012	Power Running Board (PRB) module retaining screws (3 required)
3	14C177	PRB module assembly

Removal and Installation

1. Remove the RH C-pillar trim panel. For additional information, refer to Section 501-05 .

2. Disconnect the Power Running Board (PRB) module electrical connectors.

3. Remove the 3 screws and the PRB module assembly.
   - To install, tighten to 7 Nm (62 lb-in).



4. To install, reverse the removal procedure.

tomsn048@gmail.com

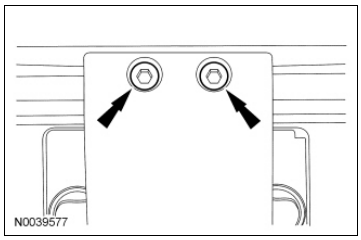
Power Running Board (PRB) Step

NOTE: Mountaineer shown, Explorer similar.

NOTE: RH shown, LH similar.

Item	Part Number	Description
1	-	Power Running Board (PRB) step screws (4 required per side)
2	16450	PRB step assembly

Removal and Installation



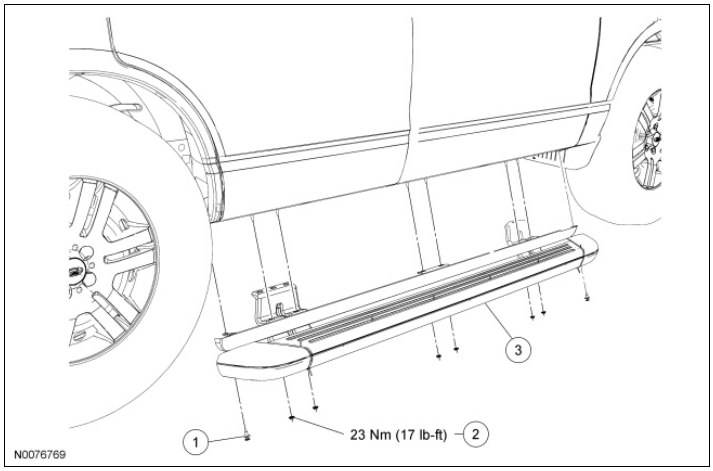
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Extend the Power Running Board (PRB).

3. **NOTE:** An assistant is required to hold the PRB before removing the bracket-to-step screws.

   Remove the 2 front and 2 rear bracket-to-step screws and the PRB step.

   - To install, align the step approximately 5 mm (0.20 in) away from the mini-mudflap that hangs down from the front splash shield. Tighten the screws to 12 Nm (106 lb-in).



4. To install, reverse the removal procedure.

tomsn048@gmail.com

Running Board

NOTE: Explorer Limited shown, all others similar.

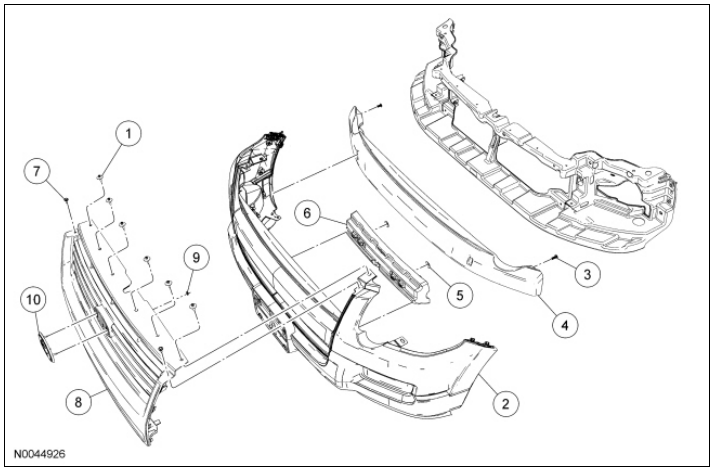
Item	Part Number	Description
1	W709837	Running board pin-type retainer (2 required)
2	N621940	Running board retaining nut (6 required)
3	16450 LH/ 16451 RH	Running board

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the 6 running board retaining nuts.
   - To install, tighten to 23 Nm (17 lb-ft).

3. Remove the 2 running board pin-type retainers.



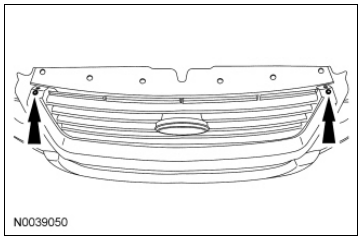
4. Remove the running board.

5. To install, reverse the removal procedure.

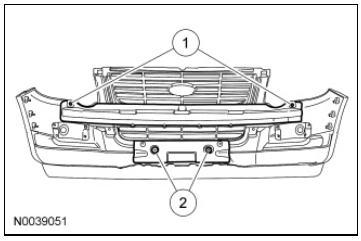
tomsn048@gmail.com

Radiator Grille - Explorer, Explorer Sport Trac

NOTE: For Mountaineer, refer to Radiator Grille - Mountaineer in this section.

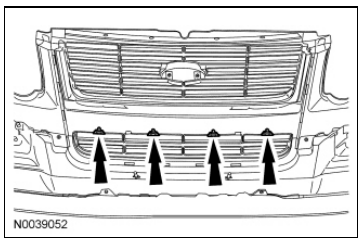


Item	Part Number	Description
1	W706207	Radiator grille scrivet (6 required)
2	-	Bumper cover
3	W709837	Pushpin retainer
4	17C882	Bumper isolator
5	-	Front bumper absorber retaining nut (2 required)
6	17C882	Front bumper absorber
7	-	Grille-to-bumper cover screw (2 required)
8	8200	Radiator grille
9	W707501	Emblem retaining nut (2 required)
10	8B262	Emblem



Removal and Installation

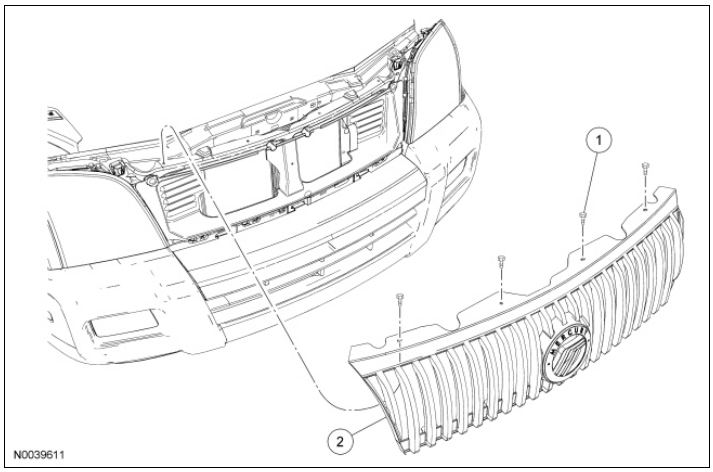
1. Remove the front bumper cover. For additional information, refer to Section 501-19 .



2. Remove the 2 grille-to-bumper cover screws.

3. Remove the front bumper isolator and absorber.
    1. Remove the 2 pushpins.
    2. Remove the 2 nuts.

4. Remove the 4 scrivets.



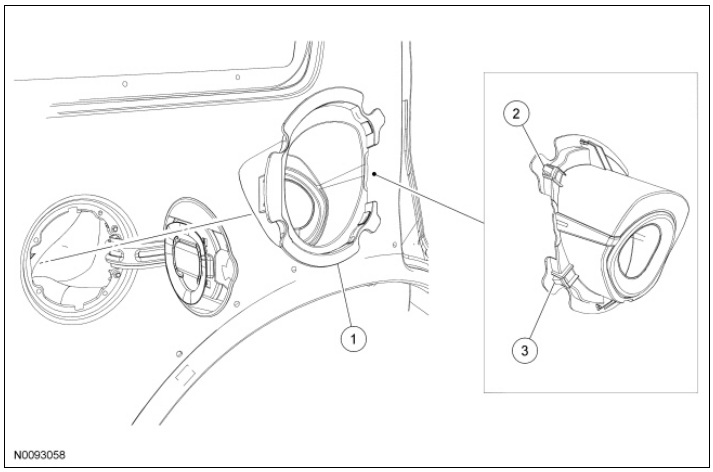
5. Carefully release the 14 clips and remove the grille assembly from the bumper cover.

6. To install, reverse the removal procedure.

---

tomsn048@gmail.com

Radiator Grille - Mountaineer

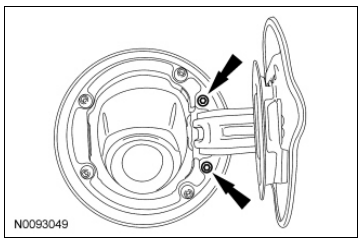


Item	Part Number	Description
1	W706207	Radiator grille scrivet (4 required)
2	8200	Radiator grille

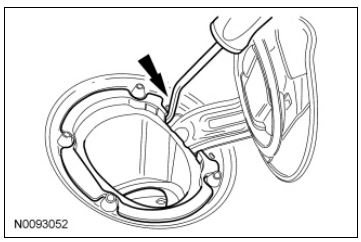
Removal and Installation

1. Remove the 4 radiator grille scrivets.
2. Lift the radiator grille upward and remove.
3. To install, reverse the removal procedure.

Fuel Filler Door Cup Bezel



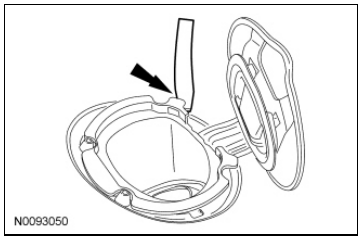
Item	Part Number	Description
1	9A212	Fuel filler door cup bezel
2	-	Fuel filler door cup bezel upper RH clip (part of 9A212)
3	-	Fuel filler door cup bezel lower RH clip (part of 9A212)



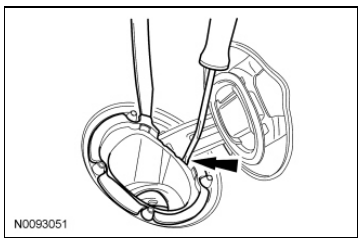
Removal

1. ***NOTICE:*** **Apply tape around the circumference of the fuel filler door. Failure to follow this direction may result in damage to the vehicle.**

   Remove the fuel filler door screws and reposition the fuel filler door.



2. Using a 90 degree pick tool, release the upper RH fuel filler door cup bezel clip from the body.



3. Using a non-marring body tool, prevent the fuel filler door cup bezel from re-attaching to the body.

tomsn048@gmail.com

4. Using a 90 degree pick tool, release the bottom RH fuel filler door cup bezel clip from the body.

5. Pull outward and upward to remove the fuel filler door cup bezel from the body.

Torque Specifications

Exterior mirror nuts (door mounted)	9	80
Exterior mirror nuts (hood mounted)	8	71

tomsn048@gmail.com

Rear View Mirrors

Exterior Mirrors

The main components of the exterior mirrors are:

- Exterior mirror control switch
- Exterior mirror glass adjustment motors (power mirrors only)
- Exterior mirror glass
- Exterior mirror plastic housing
- Interior rear view mirror

Power Exterior Mirrors

Power mirrors allow the LH or RH exterior mirror glass to be positioned electronically. The position of the power mirror glass is controlled by the exterior mirror control switch. Adjusting the exterior mirror control switch to the LH or RH position determines which power mirror glass will be controlled.

Heated Exterior Rear View Mirrors

The exterior rear view mirrors are equipped with a heated mirror glass feature, which heats the mirror glass to remove frost, snow, ice and condensation. The Explorer/Mountaineer uses the rear window defrost switch and the Sport Trac uses the heated mirror switch to control the operation of the heated exterior rear view mirrors.

Interior Mirror

The vehicle may be equipped with one of the following interior rear view mirrors:

- Interior rear view mirror
- Interior auto-dimming rear view mirror
- Interior auto-dimming rear view mirror
    - ♦ with microphone

Interior Rear View Mirror

The interior rear view mirror consists of a mirror glass and housing. The interior rear view mirror mounts to an interior rear view mirror bracket at the upper center of the windshield glass. The interior rear view mirror can be adjusted left, right, up and down using the 2 pivot points on the support arm. The interior rear view mirror can be adjusted from a day position to a night position to reduce unwanted glare caused by headlamps reflecting in the mirror. Adjusting the interior rear view mirror day/night tab, located at the bottom of the interior rear view mirror, rearward will adjust the interior mirror to the night position. Adjusting the interior rear view mirror day/night tab forward will adjust the interior mirror to the day position.

Interior Auto-Dimming Rear View Mirror

The interior rear view mirror may be equipped with an auto dimming feature. The interior auto-dimming rear view mirrors feature automatically reduces the glare caused by headlamps reflecting in the interior rear view mirror. The auto-dimming feature is activated when the ignition is in the RUN or ACC position. The interior auto-dimming rear view mirror adjusts the reflectance level of the interior rear view mirror glass to eliminate

unwanted glare. The reflectance level of the mirror glass is variable and depends on the amount of rear glare in relation to ambient light conditions in front of the interior mirror. To provide increased visibility when backing up, the interior rear view mirror will automatically return to a high reflectance mode whenever the vehicle is in REVERSE.

The interior rear view mirror may be equipped with an integrated microphone. For microphone information or diagnostics, refer to Section 415-00 .

tomsn048@gmail.com

Rear View Mirrors - Exterior

Special Tool(s)

 ST2574-A	Flex Probe Kit 300-NUD105-R025DE or equivalent
 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent

Principles of Operation

The movement of the LH and RH exterior mirror glass is controlled by the exterior mirror control switch and the LH and RH exterior mirror motors. Adjusting the exterior mirror switch to the LH or RH position determines which exterior mirror motor will be controlled. The exterior mirror control switch logic is the selected movement request from the exterior mirror control switch. When the exterior mirror control switch is adjusted to the left, right, up or down position, the exterior mirror control switch will supply voltage and ground to the selected exterior mirror motor to move the exterior mirror glass to the desired position.

The exterior mirrors use a jumper harness between the vehicle wire harness connector and the exterior mirror motor. The exterior mirror jumper harness is integral to the exterior mirror. Before replacing an exterior mirror or mirror motor, inspect the jumper harness for open and shorted circuits or damaged and pushed-out pins. If a concern with the exterior mirror jumper harness exists, attempt to repair the jumper harness.

Heated Exterior Rear View Mirror

The rear window defrost switch controls the operation of the heated exterior rear view mirrors. The heated exterior rear view mirrors only operate when the rear window defrost system is operating. The heated exterior mirror should become warm to the touch after 4 minutes of operation. The heated exterior rear view mirror power is supplied by the rear defroster relay through Smart Junction Box (SJB) fuse 13 (15A), which isolates the heated exterior mirrors from the rear window defroster system in the event of a concern.

Inspection and Verification

1. Verify the customer concern by operating the exterior mirrors.

2. Visually inspect for the following obvious signs of mechanical and electrical damage.

Visual Inspection Chart

Mechanical	Electrical

• Exterior mirror • Exterior mirror control switch • Exterior mirror glass	• Smart Junction Box (SJB) fuse 13 (15A) • Battery Junction Box (BJB) fuse(s): ♦ 32 (5A) ♦ 15 (40A) • Exterior mirror control switch • Exterior mirror motor • Exterior mirror • Heated exterior mirror glass • Loose or corroded connections • Wiring harness

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. If the concern is not visually evident, verify the symptom and GO to Symptom Chart - Exterior Mirrors or GO to Symptom Chart - NVH .

Symptom Chart - Exterior Mirrors

Symptom Chart - Exterior Mirrors

Symptom Chart - NVH

Symptom Chart - NVH

NOTE: NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to Section 100-04 . Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to Section 100-04 for the next likely system and continue diagnosis.

ConditionPossible SourcesAction

- The exterior mirror glass movement is restricted, erratic or jumpy
- Exterior mirror damper spring is out of the exterior mirror damper spring track
- CHECK to make sure that the exterior mirror damper springs are installed correctly in the exterior mirror damper spring track. REFER to Exterior Mirror Damper Spring Alignment in this section.
- Mirror vibrates/loose
- Exterior mirror mounting nuts loose
- TIGHTEN nuts to 9 Nm (80 lb-in).
- **NOTE:** Compare the LH and RH exterior mirror glass to verify that the exterior mirror glass is loose.

tomsn048@gmail.com

Mirror glass loose

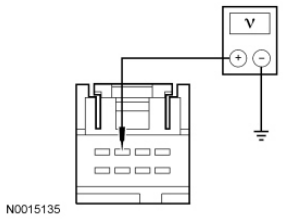
- PRESS the center of the exterior mirror glass up, down, left and right to make sure that the exterior mirror glass is seated correctly. If the exterior mirror glass is still loose, REMOVE the exterior mirror glass and INSPECT the exterior mirror backing plate for damage. If the exterior mirror backing plate is damaged, INSTALL a new exterior mirror glass. REFER to Exterior Mirror Glass in this section.
- Aftermarket air deflector/stone shields
- If possible, REMOVE aftermarket air deflector/stone shield, then ROAD TEST the vehicle. If concern is no longer present, ADVISE customer that aftermarket components were causing undesired vibration.
- Wind noise
- Foam gasket between the exterior mirror and door is damaged or misaligned
- VERIFY gasket is present and in good condition. If necessary, REPOSITION gasket between exterior mirror and door frame.
- Exterior mirror is not correctly fitted to the door
- VERIFY that there are no gaps between the exterior mirror and the door. If necessary, LOOSEN the exterior mirror nuts and REPOSITION the exterior mirror.

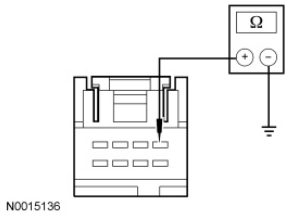
Pinpoint Test

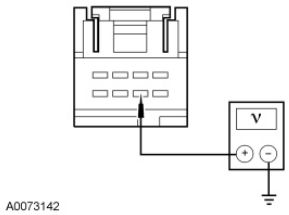
Pinpoint Test A: The Mirrors are Inoperative

Refer to Wiring Diagrams Cell 124 , Power Mirrors for schematic and connector information.

Normal Operation

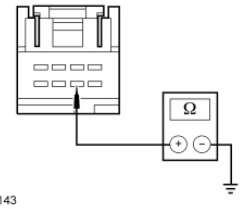


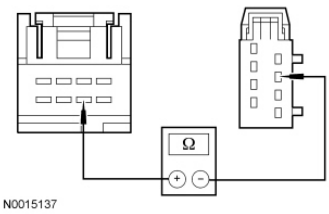




The exterior mirror control switch receives power from Battery Junction Box (BJB) fuse 32 (5A) through circuit SBB32 (VT/RD) and ground through circuit GD133 (BK). The exterior mirror control switch uses circuit CPM23 (GY) as the common circuit for both exterior mirror up/down and right/left movement.

This pinpoint test is intended to diagnose the following:
- Fuse
- Wiring, terminals or connectors
- Exterior mirror control switch





PINPOINT TEST A: THE MIRRORS ARE INOPERATIVE

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
A1 CHECK CIRCUIT SBB32 (VT/RD) FOR AN	

OPEN	
• Ignition OFF. • Disconnect: Exterior Mirror Control Switch C527. • Ignition ON. • Measure the voltage between exterior mirror control switch C527-3, circuit SBB32 (VT/RD), harness side and ground.  N0015135 • **Is the voltage greater than 10 volts?**	**Yes** GO to A2 . **No** VERIFY that BJB fuse 32 (5A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. TEST the system for normal operation.
A2 CHECK CIRCUIT GD133 (BK) FOR AN OPEN	
• Ignition OFF. • Measure the resistance between exterior mirror control switch C527-1, circuit GD133 (BK), harness side and ground.  N0015136 • **Is the resistance less than 5 ohms?**	**Yes** GO to A3 . **No** REPAIR the circuit. TEST the system for normal operation.
A3 CHECK CIRCUIT CPM23 (GY) FOR A SHORT TO VOLTAGE	
• Ignition ON. • Measure the voltage between exterior mirror control switch C527-6, circuit CPM23 (GY), harness side and ground.  A0073142	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to A4 .

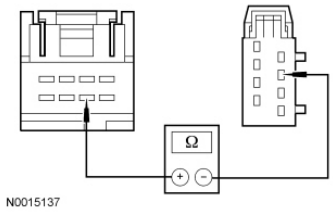
tomsn048@gmail.com

• **Is any voltage present?**	
A4 CHECK CIRCUIT CPM23 (GY) FOR A SHORT TO GROUND	
• Ignition OFF. • Measure the resistance between exterior mirror control switch C527-6, circuit CPM23 (GY), harness side and ground.  • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to A5 . **No** REPAIR the circuit. TEST the system for normal operation.
A5 CHECK CIRCUIT CPM23 (GY) FOR AN OPEN	
• Disconnect: LH Exterior Mirror C520. • Measure the resistance between exterior mirror control switch C527-6, circuit CPM23 (GY), harness side and LH exterior mirror C520-3, circuit CPM23 (GY), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new exterior mirror control switch. REFER to Exterior Mirror Control Switch in this section. TEST the system for normal operation. **No** REPAIR the circuit. TEST system for normal operation.

Pinpoint Test B: A Single Mirror is Inoperative

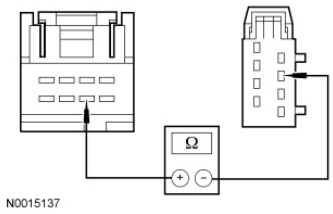
Refer to Wiring Diagrams Cell 124 , Power Mirrors for schematic and connector information.

Normal Operation



The exterior mirror control switch uses circuit CPM23 (GY) as the common circuit for both exterior mirror up/down and right/left movement.

This pinpoint test is intended to diagnose the following:



- Wiring, terminals or connectors
- Exterior mirror control switch
- Exterior mirror motor
- Exterior mirror

PINPOINT TEST B: A SINGLE MIRROR IS INOPERATIVE

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
B1 CHECK THE LH EXTERIOR MIRROR	
• Set the exterior mirror control switch to the LH mirror position. • Use the exterior mirror control switch to operate the LH exterior mirror. • **Does the LH exterior mirror operate?**	**Yes** GO to B2 . **No** GO to B4 .
B2 CHECK THE EXTERIOR MIRROR CONTROL SWITCH	
• Ignition OFF. • Disconnect: Exterior Mirror Control Switch C527. • Carry out the Exterior Mirror Control Switch component test. Refer to Wiring Diagrams Cell 149 for component testing. • **Did the exterior mirror control switch pass the component test?**	**Yes** GO to B3 . **No** INSTALL a new exterior mirror control switch. REFER to Exterior Mirror Control Switch in this section. TEST the system for normal operation.
B3 CHECK CIRCUIT CPM23 (GY) FOR AN OPEN	
• Disconnect: RH Exterior Mirror C601. • Measure the resistance between exterior mirror control switch C527-6, circuit CPM23 (GY), harness side and RH exterior mirror C601-3, circuit CPM23 (GY), harness side.  • **Is the resistance less than 5**	**Yes** CHECK the RH exterior mirror jumper harness between the vehicle harness and the exterior mirror motor for open circuits and damaged or pushed-out pins. If the jumper harness is not OK, REPAIR the jumper harness. If the jumper harness cannot be repaired, INSTALL a new exterior mirror. REFER to Exterior Mirror in this section. If the jumper harness is OK, INSTALL a new exterior mirror motor. REFER to Exterior Mirror Motor in this section. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.

tomsn048@gmail.com

ohms?	
B4 CHECK THE EXTERIOR MIRROR CONTROL SWITCH	
• Ignition OFF. • Disconnect: Exterior Mirror Control Switch C527 . • Carry out the Exterior Mirror Control Switch component test. Refer to Wiring Diagrams Cell 149 for component testing. • **Did the exterior mirror control switch pass the component test?**	**Yes** GO to B5 . **No** INSTALL a new exterior mirror control switch. REFER to Exterior Mirror Control Switch in this section. TEST the system for normal operation.
B5 CHECK CIRCUIT CPM23 (GY) FOR AN OPEN	
• Disconnect: LH Exterior Mirror C520. • Measure the resistance between exterior mirror control switch C527-6, circuit CPM23 (GY), harness side and LH exterior mirror C520-3, circuit CPM23 (GY), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** CHECK the LH exterior mirror jumper harness between the vehicle harness and the exterior mirror motor for open circuits and damaged or pushed-out pins. If the jumper harness is not OK, REPAIR the jumper harness. If the jumper harness cannot be repaired, INSTALL a new exterior mirror. REFER to Exterior Mirror in this section. If the jumper harness is OK, INSTALL a new exterior mirror motor. REFER to Exterior Mirror Motor in this section. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.

Pinpoint Test C: A Single Mirror Does Not Function With Switch Logic

Refer to Wiring Diagrams Cell 124 , Power Mirrors for schematic and connector information.

Normal Operation

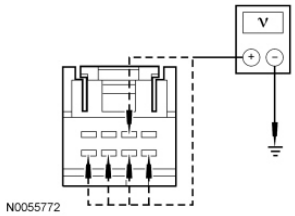
The exterior mirror control switch controls the LH exterior mirror movement by switching voltage and ground to circuits CPM14 (GY/BN), CPM16 (BN/BU) and CPM23 (GY). The exterior mirror switch controls the RH exterior mirror movement by switching voltage and ground to circuits CPM18 (GN/BN), CPM19 (GY/OG) and CPM23 (GY).

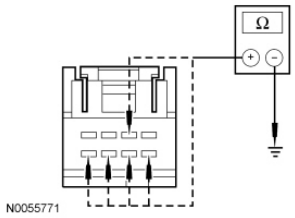
Mirror Movement

- When the LH/RH exterior mirror motor receives ground through circuit CPM16 (BN/BU)/CPM19 (GY/OG) and voltage through circuit CPM23 (GY), the LH/RH exterior mirror will operate leftward.

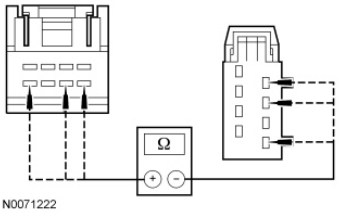
- When the LH/RH exterior mirror motor receives voltage through circuit CPM16 (BN/BU)/CPM19 (GY/OG) and ground through circuit CPM23 (GY), the LH/RH exterior mirror will operate rightward.
- When the LH/RH exterior mirror motor receives ground through circuit CPM14 (GY/BN)/CPM18 (GN/BN) and voltage through circuit CPM23 (GY), the LH/RH exterior mirror will operate downward.
- When the LH/RH exterior mirror motor receives voltage through circuit CPM14 (GY/BN)/CPM18 (GN/BN) and ground through circuit CPM23 (GY), the LH/RH exterior mirror will operate upward.

This pinpoint test is intended to diagnose the following:



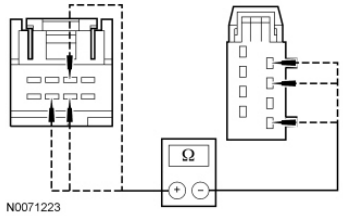


- Wiring, terminals or connectors
- Exterior mirror control switch
- Exterior mirror motor
- Exterior mirror



PINPOINT TEST C: A SINGLE MIRROR DOES NOT FUNCTION WITH SWITCH LOGIC

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**



Test Step	Result / Action to Take
C1 CHECK THE EXTERIOR MIRROR CONTROL CIRCUITS FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: Exterior Mirror Control Switch C527. • Ignition ON. • Measure the voltage between ground and exterior mirror control switch: ♦ C527-2, circuit CPM18 (GN/BN), harness side. ♦ C527-5, circuit CPM14 (GY/BN), harness side. ♦ C527-6, circuit CPM23 (GY), harness side. ♦ C527-7, circuit CPM19 (GY/OG), harness side. ♦ C527-8, circuit CPM16 (BN/BU), harness side.	**Yes** REPAIR the circuit(s). TEST the system for normal operation. **No** GO to C2 .

tomsn048@gmail.com

 • **Is any voltage present?**	
C2 CHECK THE EXTERIOR MIRROR CONTROL CIRCUITS FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: Exterior Mirror C520 (LH) or C601 (RH). • Measure the resistance between ground and exterior mirror control switch: ♦ C527-2, circuit CPM18 (GN/BN), harness side. ♦ C527-5, circuit CPM14 (GY/BN), harness side. ♦ C527-6, circuit CPM23 (GY), harness side. ♦ C527-7, circuit CPM19 (GY/OG), harness side. ♦ C527-8, circuit CPM16 (BN/BU), harness side.  • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to C3 . **No** REPAIR the circuit(s). TEST the system for normal operation.
C3 CHECK THE EXTERIOR MIRROR CONTROL CIRCUITS FOR AN OPEN	
• **LH exterior mirror:** Measure the resistance between exterior mirror control switch: ♦ C527-5, circuit CPM14 (GY/BN), harness side and LH	**Yes** CHECK the LH or RH exterior mirror jumper harness between the vehicle harness and the exterior mirror motor for open or shorted circuits and damaged or pushed-out pins. If the jumper harness is not OK, REPAIR the jumper harness. If the jumper harness cannot be repaired, INSTALL a new LH or RH exterior mirror. REFER to Exterior Mirror in this section. If the jumper

exterior mirror C520-1, circuit CPM14 (GY/BN), harness side. ♦ C527-6, circuit CPM23 (GY), harness side and LH exterior mirror C520-3, circuit CPM23 (GY), harness side. ♦ C527-8, circuit CPM16 (BN/BU), harness side and LH exterior mirror C520-7, circuit CPM16 (BN/BU), harness side.  N0071222 • **RH exterior mirror:** Measure the resistance between exterior mirror control switch: ♦ C527-2, circuit CPM18 (GN/BN), harness side and RH exterior mirror C601-1, circuit CPM18 (GN/BN), harness side. ♦ C527-6, circuit CPM23 (GY), harness side and RH exterior mirror C601-3, circuit CPM23 (GY), harness side. ♦ C527-7, circuit CPM19 (GY/OG), harness side and RH exterior mirror C601-7, circuit CPM19 (GY/OG), harness side.	harness is OK, INSTALL a new LH or RH exterior mirror motor. REFER to Exterior Mirror Motor in this section. TEST the system for normal operation. **No** REPAIR the circuit(s). TEST the system for normal operation.

tomsn048@gmail.com

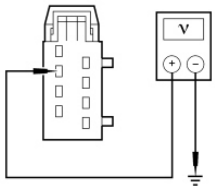
 • **Are the resistances less than 5 ohms?**	

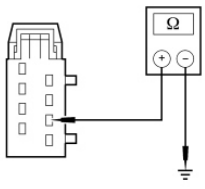
Pinpoint Test D: The Heated Exterior Mirror is Inoperative - Explorer/Mountaineer

Refer to Wiring Diagrams Cell 124 , Power Mirrors for schematic and connector information.

Normal Operation

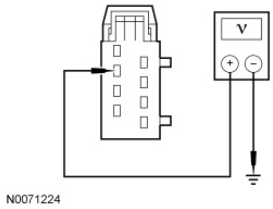
When the rear window defrost is ON, power is supplied to the heated exterior mirrors from the rear defrost relay through circuit CBP13 (GY/BN). Ground is supplied to the LH exterior mirror through circuit GD133 (BK) and to the RH exterior mirror through circuit GD151 (BK/GN). The heated exterior mirror should become warm to the touch after 4 minutes of operation.

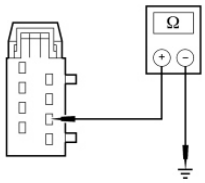




This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Exterior mirror glass
- Exterior mirror





PINPOINT TEST D: THE HEATED EXTERIOR MIRROR IS INOPERATIVE - EXPLORER/MOUNTAINEER

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
D1 CHECK THE REAR WINDOW DEFROST SYSTEM OPERATION	
• Ignition ON. • With the engine running, depress the rear window defrost switch to the ON position. • Place a hand on the rear window to verify that the rear window heats up. • **Does the heated rear window system operate?**	**Yes** GO to D2 . **No** REFER to Section 501-11 to diagnose the rear window defrost system.
D2 CHECK THE OPERATION OF THE LH EXTERIOR MIRROR	
• With the rear window defrost switch in the ON position, place a hand on the LH exterior mirror	**Yes** GO to D5 . **No**

to verify that the LH exterior mirror heats up. • **Does the LH exterior rear view mirror operate?**	GO to D3 .
D3 CHECK CIRCUIT CBP13 (GY/BN) FOR VOLTAGE	
• Ignition OFF. • Disconnect: LH Exterior Mirror C520. • Ignition ON. • With the engine running, depress the rear window defrost switch to the ON position. • Measure the voltage between LH exterior mirror C520-4, circuit CBP13 (GY/BN), harness side and ground.  N0071224 • **Is the voltage greater than 10 volts?**	**Yes** GO to D4 . **No** VERIFY that Smart Junction Box (SJB) fuse 13 (15A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. TEST the system for normal operation.
D4 CHECK CIRCUIT GD133 (BK) FOR AN OPEN	
• Ignition OFF. • Measure the resistance between LH exterior mirror C520-5, circuit GD133 (BK), harness side and ground.  N0071225 • **Is the resistance less than 5 ohms?**	**Yes** CHECK the LH exterior mirror jumper harness between the vehicle harness and the exterior mirror glass for open circuits and damaged or pushed-out pins. If the jumper harness is not OK, REPAIR the jumper harness. If the jumper harness cannot be repaired, INSTALL a new exterior mirror. REFER to Exterior Mirror in this section. If the jumper harness is OK, INSTALL a new exterior mirror glass. REFER to Exterior Mirror Glass in this section. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
D5 CHECK CIRCUIT CBP13 (GY/BN) FOR VOLTAGE	

tomsn048@gmail.com

• Ignition OFF. • Disconnect: RH Exterior Mirror C601. • Ignition ON. • With the engine running, depress the rear window defrost switch to the ON position. • Measure the voltage between RH exterior mirror C601-4, circuit CBP13 (GY/BN), harness side and ground.  N0071224 • **Is the voltage greater than 10 volts?**	**Yes** GO to D6 . **No** REPAIR the circuit. TEST the system for normal operation.
D6 CHECK CIRCUIT GD151 (BK/GN) FOR AN OPEN	
• Measure the resistance between RH exterior mirror C601-5, circuit GD151 (BK/GN), harness side and ground.  N0071225 • **Is the resistance less than 5 ohms?**	**Yes** CHECK the RH exterior mirror jumper harness between the vehicle harness and the exterior mirror glass for open circuits and damaged or pushed-out pins. If the jumper harness is not OK, REPAIR the jumper harness. If the jumper harness cannot be repaired, INSTALL a new exterior mirror. REFER to Exterior Mirror in this section. If the jumper harness is OK, INSTALL a new exterior mirror glass. REFER to Exterior Mirror Glass in this section. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.

Pinpoint Test E: The Heated Exterior Mirror is Inoperative - Sport Trac

Refer to Wiring Diagrams Cell 124 , Power Mirrors for schematic and connector information.

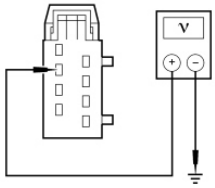
Normal Operation

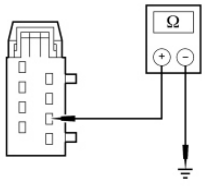
The heated exterior mirror feature only operates when the engine is running. The heated mirror switch is provided ground though circuit GD145 (BK/BU) and the indicator is supplied ground through circuit GD138 (BK/WH). When the switch is ON, ground is supplied to the Smart Junction Box (SJB) from the switch circuit CRD08 (GN/OG). When the SJB commands the heated exterior mirrors ON, the SJB supplies ground to the rear defrost relay coil and voltage to the heated mirror switch indicator though circuit CRD03 (BU/GN).

Voltage is supplied to the rear defrost relay though circuit SBB15 (WH/RD).

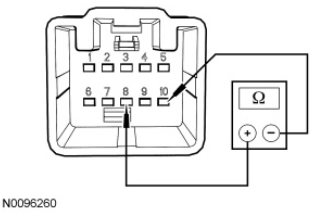
When the relay is energized, voltage is provided to the heated exterior mirrors through circuit CBP13 (GY/BN). The heated exterior mirrors are grounded though circuit (LH) GD133 (BK) and (RH) GD151 (BK/GN).

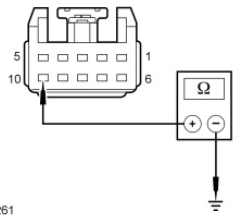
This pinpoint test is intended to diagnose the following:

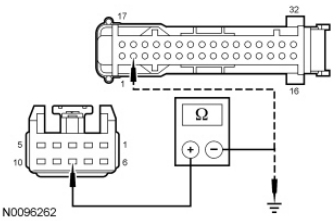




- Fuse
- Wiring, terminals or connectors
- Heated mirror switch
- SJB
- Heated exterior mirrors

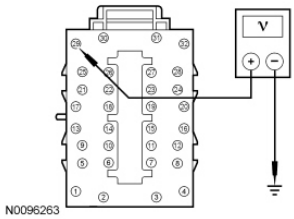






PINPOINT TEST E: THE HEATED EXTERIOR MIRROR IS INOPERATIVE - SPORT TRAC

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**



Test Step	Result / Action to Take
E1 CHECK THE HEATED EXTERIOR MIRROR OPERATION	
NOTE: The heated exterior mirror operation depends on the ambient temperature. The SJB will turn the heated exterior mirrors off after 4 minutes when the temperature is above 4°C (40°F) and 7 minutes when the temperature is below 4°C (40°F). • Ignition ON. • With the engine running, depress the heated mirror switch to the ON position. • Touch the heated exterior mirrors to verify that the heated exterior mirrors heat up. • **Do either of the mirrors heat up?**	**Yes** GO to E2 . **No** VERIFY that BJB fuse 15 (40A) is OK. If OK, GO to E4 . If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. REPAIR the circuit. TEST the system for normal operation.
E2 CHECK THE VOLTAGE TO THE LH OR RH HEATED EXTERIOR MIRROR	
• Ignition OFF. • Disconnect: Inoperative Heated Exterior Mirror C520 (LH) or C601 (RH). • Ignition ON. • With the engine running, depress the heated mirror switch to the ON position. • Measure the voltage between the inoperative heated exterior mirror	**Yes** GO to E3 . **No** REPAIR circuit CBP13 (GY/BN) for an open. TEST the system for normal operation.

tomsn048@gmail.com

connector and ground. ♦ For an inoperative LH heated exterior mirror, measure the voltage between LH heated exterior mirror C520-4, circuit CBP13 (GY/BN), harness side and ground. ♦ For an inoperative RH heated exterior mirror, measure the voltage between RH heated exterior mirror C601-4, circuit CBP13 (GY/BN), harness side and ground.  N0071224 • **Is the voltage greater than 10 volts?**	
E3 CHECK THE GROUND CIRCUITS TO THE LH OR RH HEATED EXTERIOR MIRROR FOR AN OPEN	
• Ignition OFF. • Measure the resistance between the inoperative heated exterior mirror connector and ground. ♦ For an inoperative LH heated exterior mirror, measure the resistance between heated exterior mirror C520-5, circuit GD133 (BK), harness side and ground. ♦ For an inoperative RH heated exterior mirror, measure the resistance between heated exterior mirror C601-5, circuit GD151 (BK/GN), harness side and ground.  N0071225 • **Is the resistance less than 5 ohms?**	**Yes** CHECK the inoperative heated exterior mirror jumper harness between the vehicle harness and the heated exterior mirror glass for open circuits and damaged or pushed-out pins. If the jumper harness is not OK, REPAIR the jumper harness. If the jumper harness cannot be repaired, INSTALL a new heated exterior mirror. REFER to Exterior Mirror in this section. If the jumper harness is OK, INSTALL a new heated exterior mirror glass. REFER to Exterior Mirror Glass in this section. TEST the system for normal operation. **No** REPAIR the inoperative ground circuit. TEST the system for normal operation.
E4 CHECK THE HEATED MIRROR SWITCH	

• Ignition OFF. • Disconnect: Heated Mirror Switch C2382. • Measure the resistance between pins 8 and 10, component side, of the heated mirror switch while holding the button.  N0096260 • **Is the resistance less than 5 ohms?**	**Yes** GO to E5 . **No** Replace the heated mirror switch. TEST the system for normal operation.
E5 CHECK CIRCUIT GD145 (BK/BU) FOR AN OPEN	
• Measure the resistance between heated mirror switch C2382-10, circuit GD145 (BK/BU), harness side and ground.  N0096261 • **Is the resistance less than 5 ohms?**	**Yes** GO to E6 . **No** REPAIR circuit GD145 (BK/BU). TEST the system for normal operation.
E6 CHECK CIRCUIT CRD08 (GN/OG) FOR AN OPEN	
• Disconnect: SJB C2280D. • Measure the resistance between heated mirror switch C2382-8, circuit CRD08 (GN/OG), harness side and SJB C2280D-2, circuit CRD08 (GN/OG), harness side.  N0096262 • **Is the resistance less than 5 ohms?**	**Yes** GO to E7 . **No** REPAIR circuit CRD08 (GN/OG). TEST the system for normal operation.

tomsn048@gmail.com

E7 CHECK CIRCUIT SBB15 (WH/RD) FOR VOLTAGE	
• Ignition OFF. • Disconnect: SJB C2280E. • **NOTE:** The rear defrost relay is internal to the SJB and cannot be replaced. • Measure the voltage between SJB C2280E-29, circuit SBB15 (WH/RD), harness side and ground.  • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** REPAIR circuit SBB15 (WH/RD) for an open. TEST the system for normal operation.

Rear View Mirrors - Interior

Special Tool(s)

 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent

Principles of Operation

The interior auto-dimming rear view mirror has 2 photoelectric sensors, a forward facing sensor and a rearward facing sensor, that detect forward and rearward light conditions. Based on these inputs, the automatic dimming feature adjusts the reflectance level of the interior rear view mirror glass to eliminate unwanted glare. The reflectance level of the mirror glass is variable and depends on the amount of rear glare in relation to ambient light conditions in front of the interior mirror.

When the forward sensor detects daytime conditions, the rearward sensor is inactive and the interior rear view mirror stays in a high reflectance mode. When the forward sensor detects nighttime conditions, the rearward sensor is active and detects glare from the headlights of vehicles approaching from the rear or other glare-producing light sources. To provide increased visibility when backing up, the interior rear view mirror will automatically return to a high reflectance mode whenever the vehicle is in REVERSE.

If the forward or rearward sensors are blocked, the interior auto-dimming rear view mirror might not work correctly.

Inspection and Verification

1. Verify the customer concern by operating the interior mirror.

2. Visually inspect for the following obvious signs of mechanical and electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Interior rear view mirror	• Smart Junction Box (SJB) fuse(s): ♦ 5 (5A) ♦ 18 (10A) • Interior auto-dimming rear view mirror • Loose or corroded connections • Wiring harness

tomsn048@gmail.com

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. If the concern is not visually evident, verify the symptom and GO to Symptom Chart - Interior Mirrors or GO to Symptom Chart - NVH .

Symptom Chart - Interior Mirrors

Symptom Chart - Interior Mirrors

Symptom Chart - NVH

Symptom Chart - NVH
NOTE: NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to Section 100-04 . Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to Section 100-04 for the next likely system and continue diagnosis.

ConditionPossible SourcesAction

- The interior mirror vibrates/loose
- Interior mirror mounting loose
- REMOVE the interior mirror. REFER to Interior Rear View Mirror in this section. INSPECT the interior mirror mount for damage. INSTALL the interior mirror, making sure that it is fully seated.

Pinpoint Test

Pinpoint Test F: The Auto-Dimming Mirror Does Not Operate Correctly

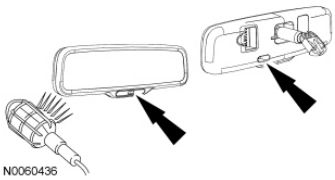
Refer to Wiring Diagrams Cell 124 , Power Mirrors for schematic and connector information.

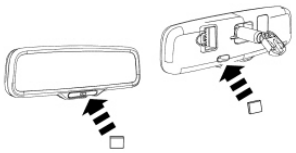
Normal Operation

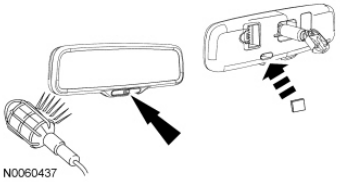
The interior auto-dimming mirror can be equipped with or without a microphone. An interior auto-dimming mirror, equipped without a microphone, receives voltage from Smart Junction Box (SJB) fuse 18 (10A) through circuit CBP18 (GY/OG) and ground from circuit GD133 (BK). An interior auto-dimming mirror, equipped with a microphone, receives voltage from SJB fuse 5 (5A) through circuit CBP05 (YE) and ground from circuit GD143 (BK/VT). Both interior auto-dimming mirrors will disable the auto-dimming feature when the selector lever is placed in REVERSE and voltage is sent to the interior auto-dimming mirror through circuit CBP15 (BN/BU). There are 2 photoelectric sensors: a forward facing sensor and a rearward facing sensor that detect forward and rearward light conditions. If the sensors are blocked, the interior auto-dimming feature might not work correctly. Always verify both sensors are not physically blocked before attempting to

diagnose interior auto-dimming mirror concerns.

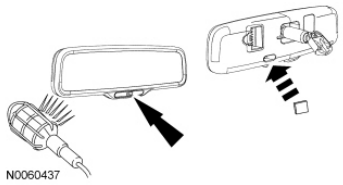
This pinpoint test is intended to diagnose the following:

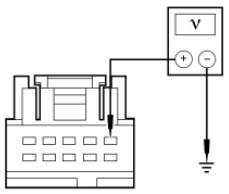






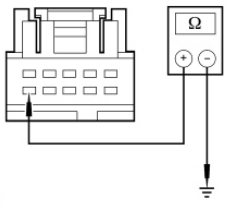
- Fuse
- Wiring, terminals or connectors
- Interior auto-dimming mirror

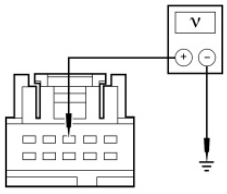


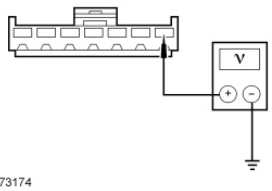


PINPOINT TEST F: THE AUTO-DIMMING MIRROR DOES NOT OPERATE CORRECTLY

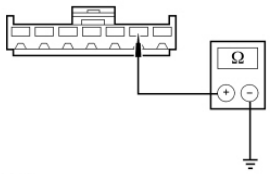
NOTE: If the Transmission Range (TR) sensor is malfunctioning and the backup lamps are on all the time or do not turn on, the interior auto-dimming mirror will not darken or return to normal view.

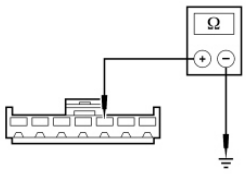


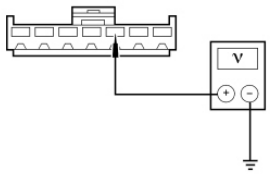




Test Step	Result / Action to Take
F1 CHECK THE OPERATION OF THE BACKUP LAMPS	
• Ignition ON. • Move the selector lever through the entire range. • **Do the backup lamps illuminate only in REVERSE?**	**Yes** GO to F2 . **No** REFER to Section 417-01 to diagnose the backup lamps.
F2 VERIFY THE FORWARD AND REARWARD FACING SENSORS ARE NOT BLOCKED	
• Visually verify the forward and rearward facing sensors are not blocked. Sources of blockage can include: ♦ stickers, window decals or tags. ♦ fold-down screens for TVs or DVD players. ♦ non-OEM window tinting. • **Were either of the sensors blocked?**	**Yes** If possible, REMOVE the blockage. TEST the system for normal operation. If it is not possible to remove the blockage, REVIEW the operation of the interior auto-dimming mirror with the customer. **No** GO to F3 .
F3 CHECK OPERATION OF THE INTERIOR AUTO-DIMMING MIRROR - DAYLIGHT CONDITIONS	
• Ignition ON. • Use a bright lamp to illuminate the forward facing sensor and the rearward facing sensor. The mirror should adjust to a high reflectance mode (mirror will be clear).	**Yes** GO to F4 . **No** INSTALL a new interior auto-dimming mirror. REFER to Interior Rear View Mirror in this section. TEST the system for normal operation.

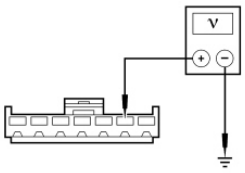






tomsn048@gmail.com

 N0060436 • **Does the mirror adjust to the high reflectance (clear) mode?**	
F4 CHECK OPERATION OF THE INTERIOR AUTO-DIMMING MIRROR - NIGHTTIME CONDITIONS WITHOUT GLARE	
• Ignition ON. • **NOTE:** Covering the sensor with a finger or hand is not adequate. • Simulate nighttime conditions without glare: ♦ cover the forward sensor with black electrical tape or other dark material. ♦ cover the rearward facing sensor. The mirror should adjust to the high reflectance mode.  N0060438 • **Did the mirror adjust to the high reflectance (clear) mode?**	**Yes** GO to F5 . **No** GO to F7 .
F5 CHECK OPERATION OF THE INTERIOR AUTO-DIMMING MIRROR - NIGHTTIME CONDITIONS WITH GLARE	
• Ignition ON. • **NOTE:** Covering the sensor with a finger or hand is not adequate. • Simulate nighttime conditions with glare: ♦ cover the forward sensor with black electrical tape or other dark material. ♦ illuminate the rearward facing sensor. The mirror should darken to a lower reflectance mode.  N0060437	**Yes** GO to F6 . **No** GO to F7 .



• **Did the mirror darken to a lower reflectance (darker) mode?**	
F6 CHECK OPERATION OF THE INTERIOR AUTO-DIMMING MIRROR - NIGHTTIME CONDITIONS WITH THE VEHICLE IN REVERSE	
• Ignition ON. • **NOTE:** Covering the sensor with a finger or hand is not adequate. • Simulate nighttime conditions with glare: ♦ cover the forward sensor with black electrical tape or other dark material. ♦ illuminate the rearward facing sensor.  N0060437 • Select REVERSE. • **Did the mirror adjust to a high reflectance (clear) mode?**	**Yes** The system is operating normally at this time. REVIEW operation of the interior auto-dimming mirror feature with the customer. **No** GO to F7 .
F7 CHECK THE INTERIOR MIRROR FOR A MICROPHONE	
• Check the interior mirror for a microphone. • **Is the interior mirror equipped with a microphone?**	**Yes** GO to F8 . **No** GO to F11 .
F8 CHECK CIRCUIT CBP05 (YE) FOR VOLTAGE	
• Ignition OFF. • Disconnect: Interior Auto-Dimming Mirror C9012. • Ignition ON. • Measure the voltage between interior auto-dimming mirror C9012-1, circuit CBP05 (YE), harness side and ground.  N0066902 • **Is the voltage greater than 10 volts?**	**Yes** GO to F9 . **No** VERIFY that SJB fuse 5 (5A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. TEST the system for normal operation.
F9 CHECK CIRCUIT GD143 (BK/VT) FOR AN OPEN	

tomsn048@gmail.com

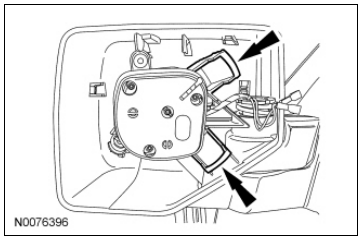
• Ignition OFF. • Measure the resistance between interior auto-dimming mirror C9012-10, circuit GD143 (BK/VT), harness side and ground.  N0066903 • **Is the resistance less than 5 ohms?**	**Yes** GO to F10 . **No** REPAIR the circuit. TEST the system for normal operation.
F10 CHECK CIRCUIT CBP15 (BN/BU) FOR VOLTAGE	
• Ignition ON. • Select REVERSE. • Measure the voltage between interior auto-dimming mirror C9012-3, circuit CBP15 (BN/BU), harness side and ground.  N0066904 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new interior auto-dimming mirror. REFER to Interior Rear View Mirror in this section. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
F11 CHECK CIRCUIT CBP18 (GY/OG) (EARLY BUILD VEHICLES) OR CIRCUIT CPB05 (YE) (LATE BUILD VEHICLES) FOR VOLTAGE	
• Ignition OFF. • Disconnect: Interior Auto-Dimming Mirror C911 . • Ignition ON. • Measure the voltage between ground and interior auto-dimming mirror C911-1, circuit CBP18 (GY/OG) (early build vehicles) or circuit CPB05 (YE) (late build vehicles), harness side.  A0073174 • **Is the voltage greater than 10 volts?**	**Yes** GO to F12 . **No** VERIFY SJB fuse 18 (10A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. TEST the system for normal operation.

F12 CHECK CIRCUIT GD133 (BK) (EARLY BUILD VEHICLES) OR CIRCUIT GD143 (BK/VT) (LATE BUILD VEHICLES) FOR AN OPEN	
• Ignition OFF. • Early build vehicles, measure the resistance between interior auto-dimming mirror C911-2, circuit GD133 (BK), harness side and ground.  A0073175 • Late build vehicles, measure the resistance between interior auto-dimming mirror C911-3, circuit GD143 (BK/VT), harness side and ground.  N0077172 • **Is the resistance less than 5 ohms?**	**Yes** GO to F13 . **No** REPAIR the circuit. TEST the system for normal operation.
F13 CHECK CIRCUIT CBP15 (BN/BU) FOR VOLTAGE	
• Ignition ON. • Select REVERSE. • Early build vehicles, measure the voltage between interior auto-dimming mirror C911-3, circuit CBP15 (BN/BU), harness side and ground.  A0073178 • Late build vehicles, measure the voltage between interior auto-dimming mirror C911-2, circuit CBP15 (BN/BU), harness side and ground.	**Yes** INSTALL a new interior auto-dimming mirror. REFER to Interior Rear View Mirror in this section. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.

tomsn048@gmail.com

 N0077173 • **Is the voltage greater than 10 volts?**	

Exterior Mirror Damper Spring Alignment



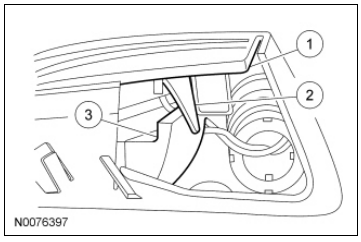
NOTE: The LH exterior mirror glass has 2 exterior mirror damper springs. The RH exterior mirror glass has 1 exterior mirror damper spring.

NOTE: LH exterior mirror shown, RH exterior mirror similar.

1. **NOTE:** The exterior mirror glass is removed for clarity.

   It is not necessary to remove the exterior mirror glass for this step.

   Position the exterior mirror glass to the full outboard position, so that the exterior mirror damper springs and the exterior mirror damper spring tracks are visible. To help locate the exterior mirror damper springs, refer to Exterior Mirrors - Exploded View in this section.



2. **NOTE:** An exterior mirror damper spring that is out of the exterior mirror damper spring track is shown.

   NOTE: It is not necessary to remove the exterior mirror glass for this step.

   Inspect between the exterior mirror housing and the exterior mirror glass backing plate to see if an exterior mirror damper spring is out of the exterior mirror damper spring track. Refer to the following:

   1. Exterior mirror glass
   2. Exterior mirror damper spring
   3. Exterior mirror damper spring track

3. **NOTE:** It is not necessary to remove the exterior mirror glass for this step.

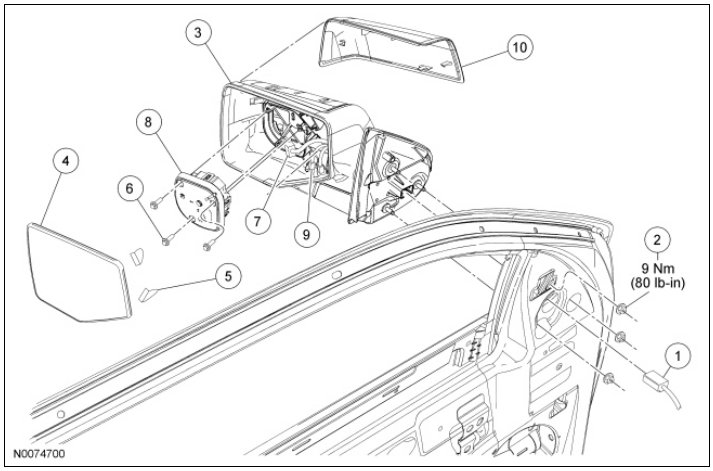
   For an exterior mirror damper spring that is not in the exterior mirror damper spring track perform the following:

   1. Gently lift the exterior mirror glass outward until the bottom tip of the exterior mirror damper spring is above the exterior mirror damper spring track.

tomsn048@gmail.com

- If an exterior mirror damper spring or the exterior mirror glass is damaged, replace the exterior mirror glass. Refer to Exterior Mirror Glass in this section.

2. Position the exterior mirror damper spring into the exterior mirror damper spring track and release the exterior mirror glass.



4. For exterior mirror damper springs that are in the exterior mirror glass dampener spring tracks, remove the exterior mirror glass, refer to Exterior Mirror Glass in this section.
   Check for a mechanical binding condition or damaged exterior mirror parts. Install new exterior mirror parts as needed. Refer to Exterior Mirrors - Exploded View in this section.

5. Operate the exterior mirror and check for correct operation.

Exterior Mirrors - Exploded View

NOTE: LH shown, RH similar.

Item	Part Number	Description
1	-	Exterior mirror electrical connector (part of 14631)
2	N621905	Exterior mirror nut (3 required)
3	17683 LH/ 17682 RH	Exterior mirror assembly
4	17K707	Exterior mirror glass
5	-	Exterior mirror damper spring (part of 17K707)
6	-	Exterior mirror motor screw (part of 17D696)
7	-	Exterior mirror motor electrical connector
8	17D696	Exterior mirror motor
9	-	Exterior mirror glass electrical connector (if equipped)
10	17D742 RH/ 17D743 LH	Exterior mirror cover

1. For additional information, refer to the procedures in this section.

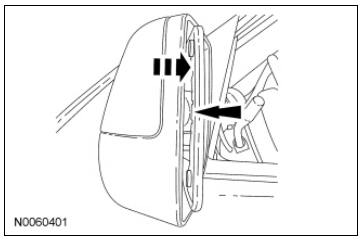
tomsn048@gmail.com

Exterior Mirror

Removal and Installation

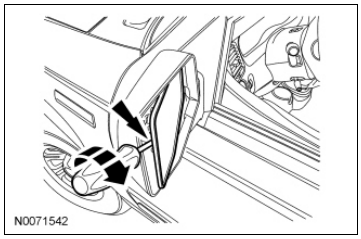
NOTE: Do not remove the exterior mirror when repairing an individual part. Individual components can be installed without removing the exterior mirror.

1. Remove the front door trim panel. For additional information, refer to Section 501-05 .
2. Remove the exterior mirror weather shield.
3. Disconnect the exterior mirror electrical connector.
4. Remove the 3 exterior mirror nuts.
    - To install, tighten to 9 Nm (80 lb-in).
5. Remove the exterior mirror.
6. To install, reverse the removal procedure.



tomsn048@gmail.com

Exterior Mirror Glass



Removal

NOTE: LH shown, RH similar.

1. Position the exterior mirror glass to the full inboard position and locate the notch at the bottom of the exterior mirror glass.

2. Release the exterior mirror glass.
   - Insert a long flat-blade screwdriver into the notch.
   - Gently turn the screwdriver until the 2 outboard glass backing plate hooks are released from the exterior mirror motor.

3. Remove the exterior mirror glass.
   - Using your fingers, carefully release the 2 inboard glass backing plate hooks from the exterior mirror motor.
   - If equipped, disconnect the electrical connectors from the exterior mirror glass.

Installation

1. Position the exterior mirror motor to the center position.

2. If equipped, connect the electrical connectors to the exterior mirror glass.

3. Position the exterior mirror glass onto the exterior mirror motor.

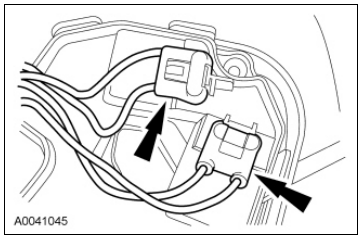
4. ⚠ **WARNING: Place a shop towel between the hands and the exterior mirror glass for protection in case of glass breakage during mirror service. Failure to follow this instruction may result in serious personal injury.**

   NOTE: Make sure the exterior mirror damper springs are located inboard of the damper spring tracks. Failure to do this will restrict exterior mirror glass movement.

Place a hand against the back of the exterior mirror housing and a hand flat against the exterior mirror glass. Press the exterior mirror glass until it is fully seated.

5. Operate the exterior mirror and check for correct exterior mirror movement. If the exterior mirror glass movement is restricted, refer to Exterior Mirror Damper Spring Alignment in this section.

---



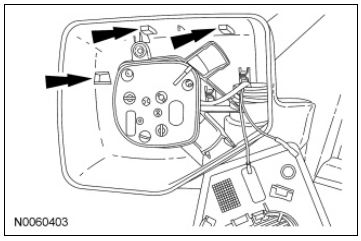
tomsn048@gmail.com

Exterior Mirror Motor

Removal and Installation

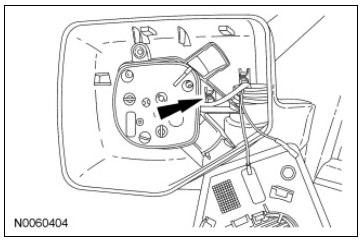
NOTE: RH shown, LH similar.

1. Remove the exterior mirror glass. For additional information, refer to Exterior Mirror Glass in this section.
2. Remove the exterior mirror motor screws.
3. Disconnect the exterior mirror motor electrical connectors.



4. To install, reverse the removal procedure.

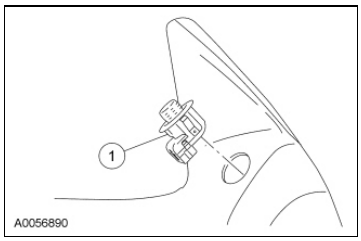
Exterior Mirror Cover



Removal and Installation

1. Remove the exterior mirror glass. For additional information, refer to Exterior Mirror Glass in this section.

2. Release the 3 exterior mirror cover upper retaining tabs by carefully pressing down until the tab is free.



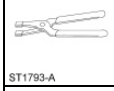
3. Release the exterior mirror cover lower inboard tag.

4. To install, reverse the removal procedure.
    - Rotate the exterior mirror glass in all directions after installation to make sure all clips are completely attached.

tomsn048@gmail.com

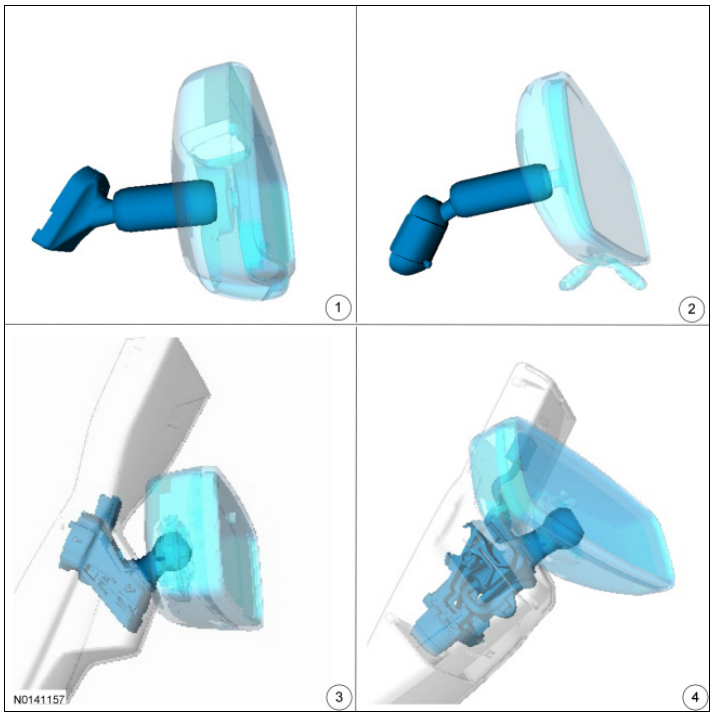
Exterior Mirror Control Switch

Item	Part Number	Description
1	17B676	Exterior mirror control switch



Removal and Installation

1. Remove the front door trim panel. For additional information, refer to Section 501-05 .
2. Depress the 2 retaining tabs and remove the exterior mirror control switch from the front door trim panel.
3. To install, reverse the removal procedure.



tomsn048@gmail.com

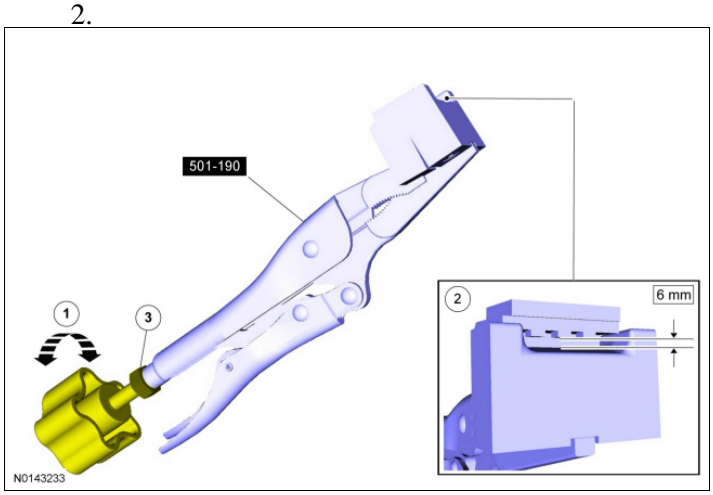
Removal

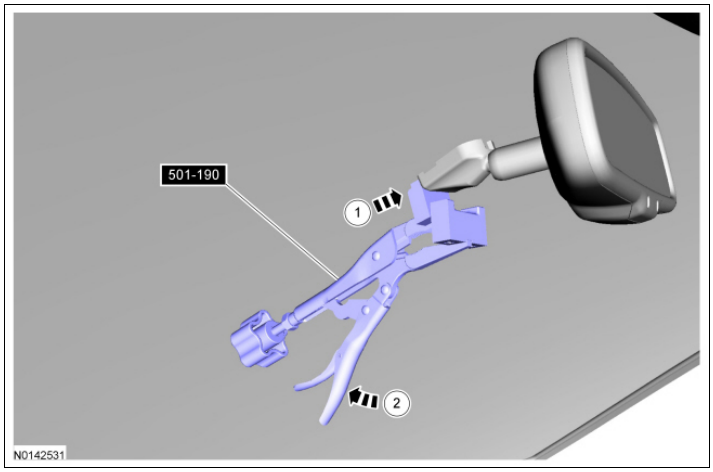
Mirror Type 1



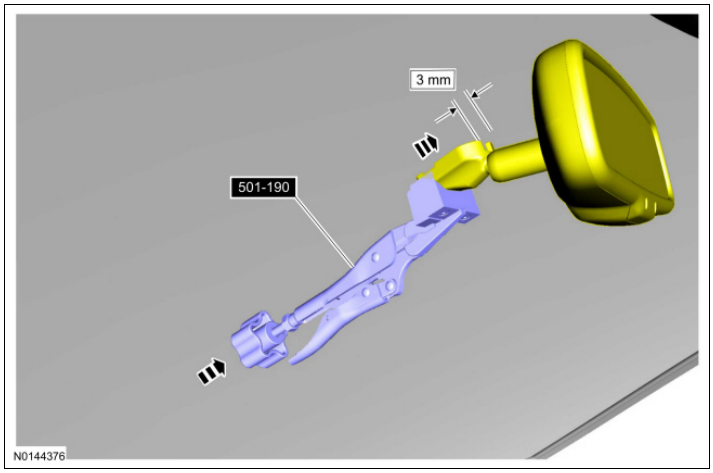
NOTICE: **The windshield must be at room temperature. Otherwise, damage to the windshield glass may occur.**

NOTE: Click here to view a video version of this procedure.

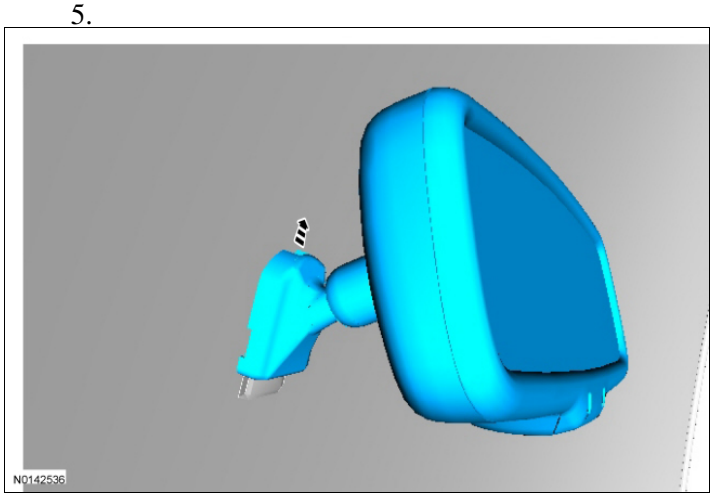
1. If equipped.



2.

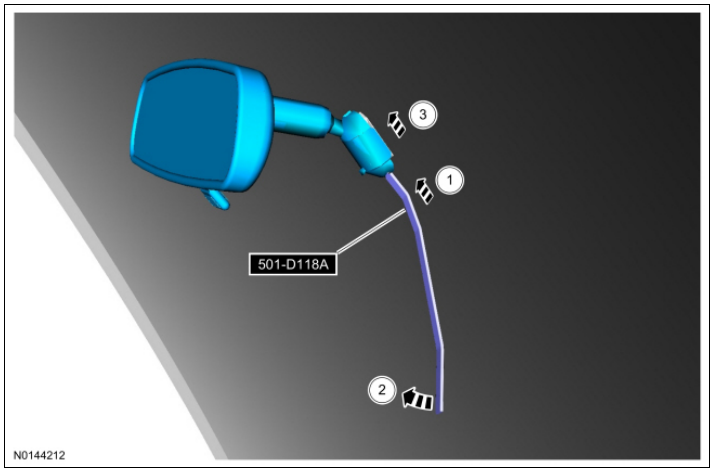


3. ***NOTICE:*** **Make sure the Mirror Remover is fully inserted into the interior rear view mirror mount access hole. Otherwise, damage to the windshield glass may occur.**

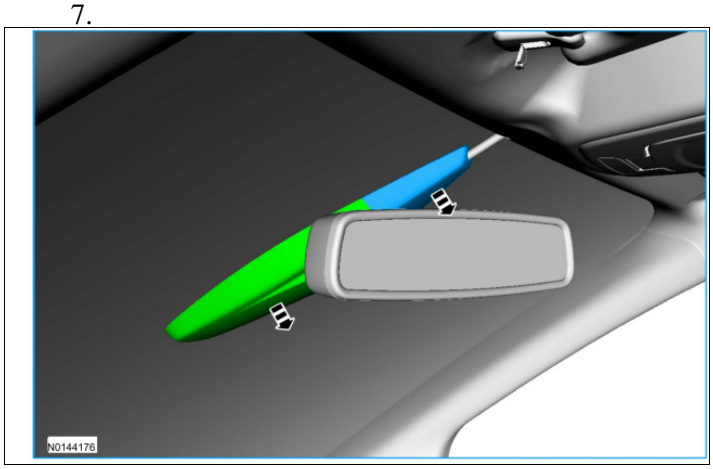


tomsn048@gmail.com

4. Using a closed hand, bump the adjustment handle of the Mirror Remover to slide the mirror upward on the mirror mount.

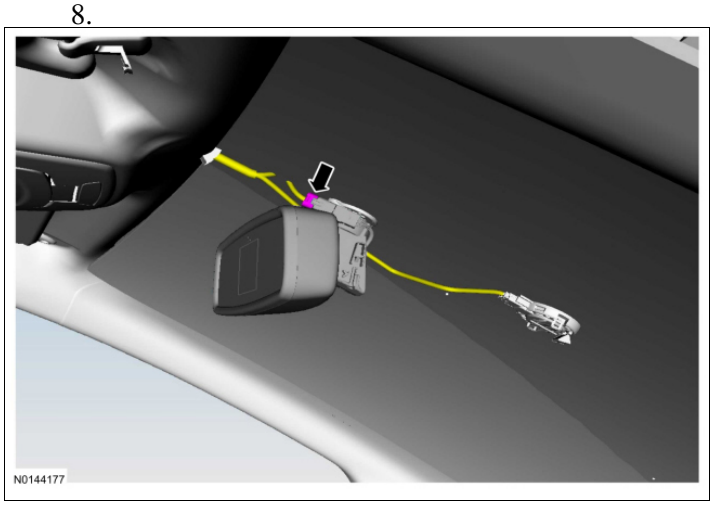


5.



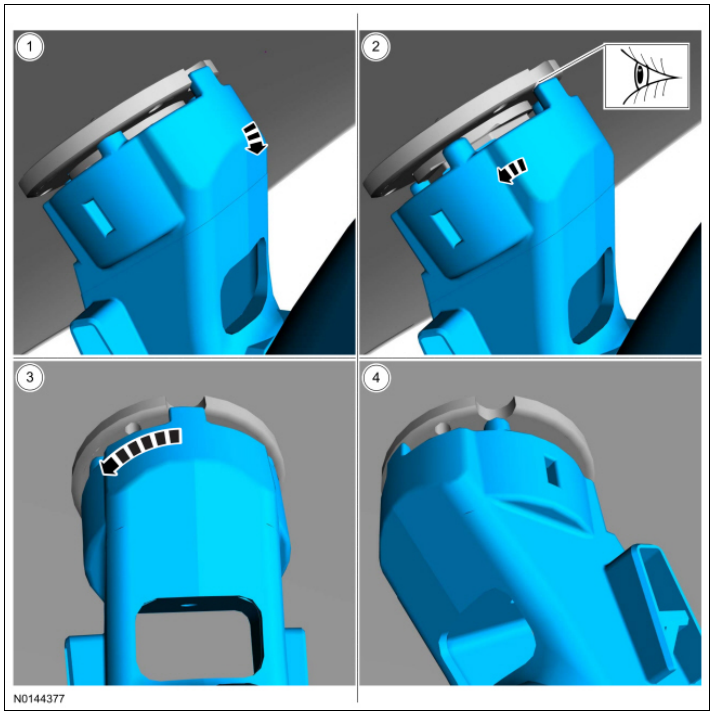
Mirror Type 2

6.

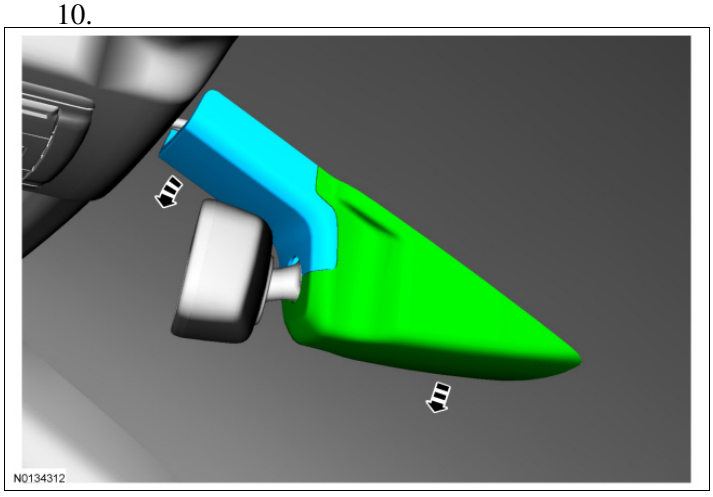


Mirror Type 3

7.

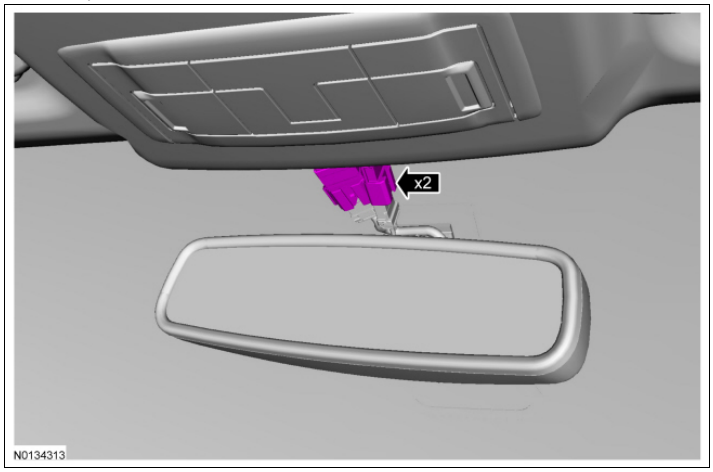


8.



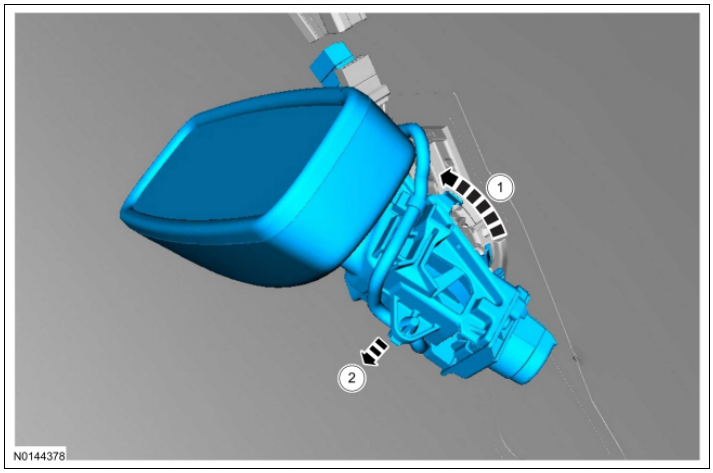
9.

tomsn048@gmail.com



Mirror Type 4

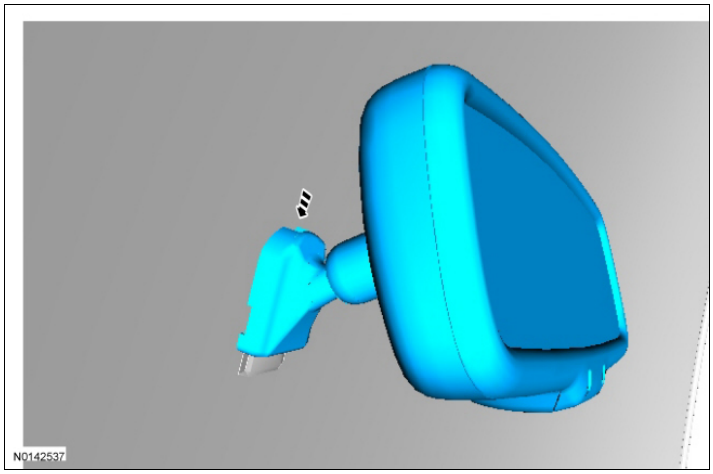
10.



11.

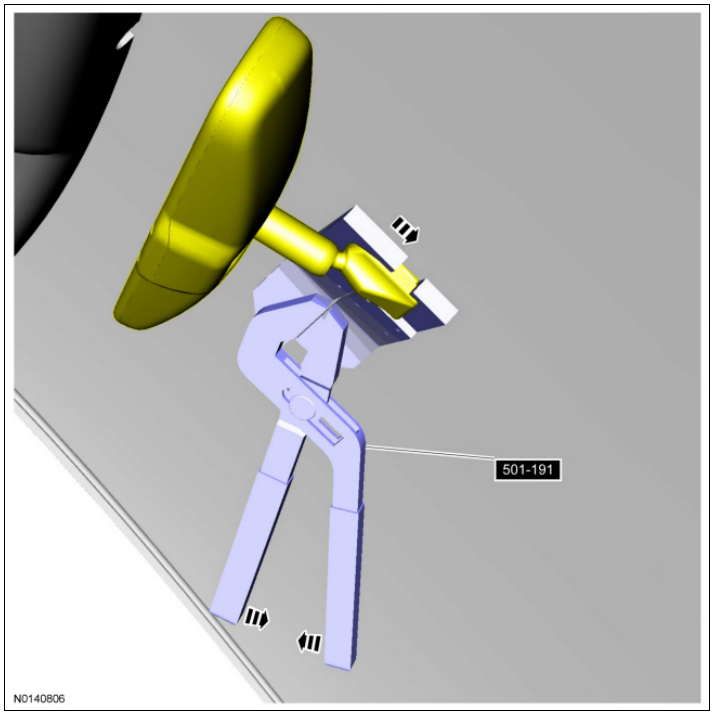
12. ***NOTICE:*** **To prevent damage to the mirror or base, rotate the mirror base with hands only do not use tools.**

    NOTICE: **To prevent damage to the mirror wiring, do not rotate the mirror head beyond 180 degrees.**



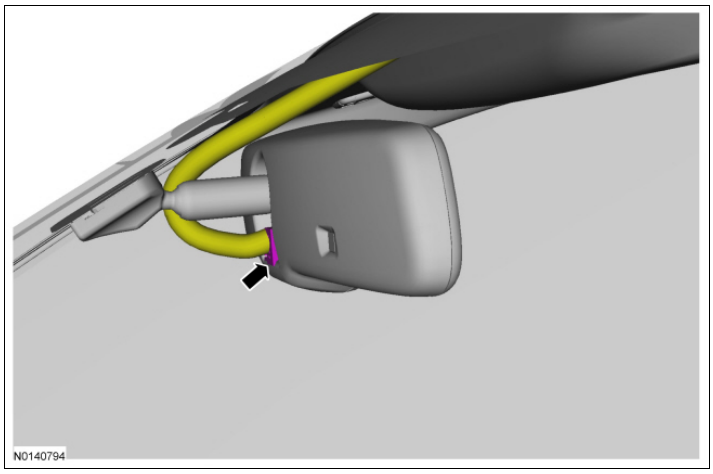
Installation

Mirror Type 1



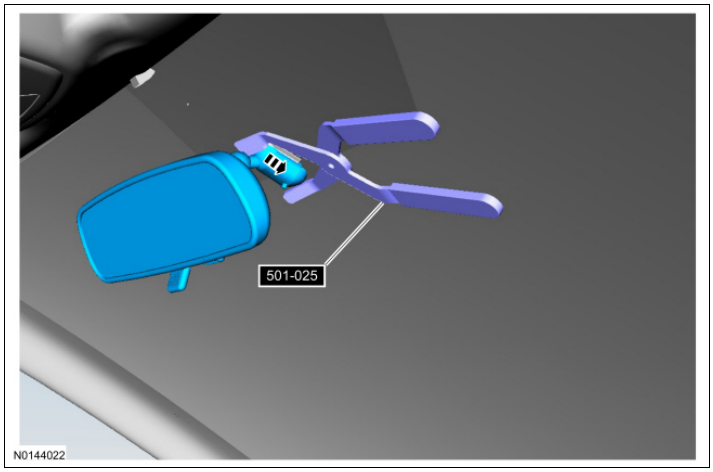
NOTE: Click here to view a video version of this procedure.

1. Slide the interior rear view mirror mount over the windshield bracket from the top.



2. **NOTE:** An audible click will be heard as the mirror fully seats.

tomsn048@gmail.com



3. If equipped.

4. If equipped with compass module, check the compass zone and calibration. Refer to General Procedures in Section 413-01 or Section 419-11.

Mirror Type 2

5.

6. If equipped with a compass module which requires calibration, check the compass zone adjustment and calibration. Refer to General Procedures in Section 413-01 or Section 419-11.

Mirror Type 3

7. To install, reverse the removal procedure.

Mirror Type 4

8. To install, reverse the removal procedure.
   - If a new mirror has been installed, download the IPM-A configuration information from the scan tool to the new IPM-A .
   - If a new mirror has been installed, perform camera alignment using a scan tool.

Safety belt buckle assembly-to-latch nut	75	55	-

[a] Refer to procedure in this section.
[b] Apply threadlock before installing.

Seats

Front Seats

The front seats can be equipped with the following serviceable items and systems:

- Manual seat tracks
- 6-way power seat tracks
- Heated seats
- Memory driver seat with easy entry/easy exit (if feature enabled) (Explorer/Mountaineer only)
- Manual lumbar
- Manual recline
- Power lumbar (driver seat only)
- Power recline (driver seat only)
- Seat side air bags
- Occupant Classification Sensor (OCS) system on passenger seat

Memory Seats

The power driver seat and power adjustable pedals are controlled by the Driver Seat Module (DSM) only when the vehicle is equipped with the programmable/recall memory option. This system allows automatic positioning of the driver power bucket seat, exterior power mirrors and adjustable pedals to 2 programmable positions. Memory positions can be stored at any time. A memory recall can be initiated only if the vehicle is in PARK or NEUTRAL and the ignition switch is not in START. A memory recall in progress will not be affected by moving the ignition switch to START or by moving the selector lever out of PARK or NEUTRAL. For information on programming memory positions or recalling a stored memory position, refer to Memory Position Programming in this section. For information on Remote Keyless Entry (RKE) transmitter programming, refer to Section 501-14 .

The DSM is located underneath the driver seat cushion. For information on installing a new DSM , refer to Section 419-10 . Programmable Module Installation (PMI) must be carried out when installing a new DSM . Refer to Section 418-01 .

This section only diagnoses concerns specific to the memory seat. To diagnose a memory adjustable pedal concern, refer to Section 206-00 .

Easy Entry/Easy Exit

The easy entry/easy exit feature can be enabled/disabled using a scan tool. When enabled, the feature becomes a user accessible item on the message center allowing the user to turn the feature on and off. Refer to Driver Controls in the Owner's Literature or Section 413-01 for information on the message center.

Heated Seats

This system allows the electrical heating of the front seats on passenger demand.

The serviceable components of the system are:

tomsn048@gmail.com

- the seat heating elements, located in the seat cushion and backrest.
- the heated seat control switch, located in the lower center of the instrument panel.

Manual Lumbar

The manual lumbar is adjusted by a knob mounted on the side of the seat cushion side shield.

Power Lumbar

The driver seat has an electro-mechanical lumbar adjuster. The lumbar adjustment switch is on the side of the seat cushion side shield and is part of the seat control switch.

Manual Recline

The manual recline can be adjusted by a handle mounted on the outboard side of the cushion side shield.

Power Recline

The driver seat has an electro-mechanical backrest adjuster. The backrest adjustment switch is located on the side of the seat cushion side shield and is part of the seat control switch.

Seat Side Air Bags

The driver and passenger seat side air bags are attached to the seat backrest frame. If a seat side air bag deployment has occurred or for more information, refer to Section 501-20B .

Occupant Classification Sensor (OCS) System

The OCS system is standard equipment on all front passenger seats. For information on diagnosing or servicing the OCS system, refer to Section 501-20B .

Second Row Seating

60/40 E-Z Entry Seat

The 60/40 E-Z entry seat can be equipped on Explorer and Mountaineer vehicles with third row seating.

The seat is equipped with the following serviceable items and systems:

- Backrest recline and forward fold down
- Front legs kneel for a level load floor
- Pivot forward to the E-Z entry position
- 60 percent seat integrated safety belt retractor
- Folding head restraints

60/40 Bench Seat

The 60/40 bench seat can be equipped on Explorer and Mountaineer vehicles with 5 passenger seating and on all Explorer Sport Tracs.

The seat is equipped with the following serviceable systems:

- Backrest forward fold down for a level load floor

- 60 percent seat integrated safety belt retractor

Bucket seats

The bucket seats can be equipped on Explorer and Mountaineer vehicles with third row seating.

The seat is equipped with the following serviceable systems:

- Backrest recline and forward fold down
- Pivot forward to the E-Z entry position

Third Row Seating

NOTE: The Smart Junction Box (SJB) may also be identified as the Generic Electronic Module (GEM).

Explorer and Mountaineer vehicles can be equipped with a 50/50 third row seat.

The seat can be equipped with the following serviceable items and systems:

- Manual forward folding backrest
- Power forward folding backrest
- Power fold seat control switches in the LH quarter trim panel
- Folding head restraints

tomsn048@gmail.com

Seats

Special Tool(s)

 ST2574-A	Flex Probe Kit 105-R025C or equivalent
 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Principles of Operation

Driver and Passenger Power Seats Without Memory

The 10-way power seat feature (driver seat only) moves the seat in 10 possible directions: the seat can be moved forward or backward and the front and back of the cushion can be moved up and down independently. The backrest of the seat can be moved forward and backward, and the lumbar in and out. All 10 positions are controlled by one switch. The power seat feature operates independent of the position of the ignition.

The 6-way power seat feature moves the seat in 6 possible directions: the seat can be moved forward or backward and the front and back of the cushion can be moved up and down independently. The power seat feature operates independent of the position of the ignition.

The power seat motors are hardwired to the seat control switch. The circuits are normally at ground through the seat control switch. An individual circuit is switched to voltage when a specific adjustment position is selected.

Power Driver Seat With Memory

NOTE: A memory recall can be initiated only if the vehicle is in PARK or NEUTRAL gear and the ignition switch is not in START. A memory recall in progress will not be affected by moving the ignition switch to START or by moving the gearshift lever out of PARK or NEUTRAL.

The driver power memory seat is controlled by the Driver Seat Module (DSM). The memory seat feature allows the driver to program a personalized seat position that can be recalled using the memory switch or a Remote Keyless Entry (RKE) transmitter. There are 2 memory settings possible. The adjustable pedal (if equipped) positions are also stored and recalled with the driver memory seat positions.

The driver seat control switch provides voltage to the DSM when activated. The NEUTRAL position of each driver seat control switch position is a ground state through the seat control switch contacts. A voltage input causes the DSM to power the appropriate motor until the input is removed. Ground is the normal state of the motor circuits through the DSM and is not switched to control the motors. The DSM internally switches the appropriate circuit from ground to voltage for operating the motors.

As the seat is adjusted, the DSM constantly monitors the motor position sensors to record the current seat position. The DSM will remove voltage from the motor upon termination of the seat control switch input or if the DSM does not see movement from the motor by monitoring the position sensor.

The DSM communicates DTC and other information using the Medium Speed Controller Area Network (MS-CAN) communication bus. It should be noted for diagnostics that because Controller Area Network (CAN) bus communication is more robust and reliable than other methods, it may be possible to have limited module communication with one of the CAN bus circuits disconnected or shorted to ground. Refer to Section 418-00 for information concerning MS-CAN bus communication.

Easy Entry/Easy Exit

The easy entry/easy exit feature moves the driver seat backwards about 50.8 mm (2 in) when the ignition key is removed from the ignition switch. The DSM receives a key out command over the MS-CAN communication network and powers the driver seat rearward. This function will not operate if the seat is less than the 50.8 mm (2 in) travel distance to the end of the track or the function has been disabled. The DSM will also cancel this operation if a valid input command is received from the driver seat control switch, memory SET switch or exterior mirror control switch.

The DSM will record the current driver seat positions before powering the seat for an easy exit operation. This recorded position will be used to return the driver seat to this position on the easy entry operation. During easy entry operation, the seat is returned to the position previous to the easy exit operation.

The easy entry/easy exit feature can be enabled/disabled using a scan tool. When enabled, the feature becomes a user accessible item on the message center allowing the user to turn the feature on and off. Refer to the Owner's Literature or Section 413-01 for information on the message center.

Heated Seats

The driver and passenger heated seats share a common ignition and battery feed to the heated seat control switch assembly. The ignition feed supplies voltage to the logic board and illumination of the heated seat switch assembly and the battery feed is used to provide voltage to the heater mats. The heated seat switch assembly uses a shared ground for the logic board and illumination.

When a heated seat switch is pressed with the ignition switch in RUN or START, a momentary ground is provided to the logic board of the heated seat switch assembly. The logic board then activates an internal relay in the heated seat switch assembly that provides voltage to a bi-metallic thermostat that is part of the seat cushion heater mat.

The driver seat cushion and backrest heater mats are wired in series as are the passenger seat cushion and backrest heater mats. The heated seat system is designed to maintain the temperature by the opening (no voltage to the heated seat mats) and closing (voltage supplied to the heated seat mats) of the bi-metallic thermostat.

The heated seat will remain ON until the heated seat switch is pressed or until ignition voltage is removed from the heated seat switch assembly.

tomsn048@gmail.com

Normal heat cycle may require several minutes to initially warm the seat. The seat should be occupied to correctly test for normal operation. Temperature measuring devices do not provide an accurate method for testing heated seat operation as surface temperatures are subject to human and environmental characteristics. Correct testing requires heater mat resistance measurements which have tight tolerances affecting the length of time for the heater mats to reach maximum operating temperature.

Second Row 60/40 E-Z Entry Seats

The 7-passenger second row E-Z entry seat backrest will:

- recline to 5 different positions.
  - To recline either the 60 percent or the 40 percent backrest, while sitting in the seat, turn the recliner handle and push back to the desired position. With the backrest adjusted, release the recliner handle and the backrest will stay where positioned. To return the backrest, turn the recliner handle and allow the backrest to come forward with the spring load of the recliners.
- fold down.
  - **NOTE:** Make sure that the head restraint is in the down position and no objects such as books, purses or briefcases are on the floor in front of the second row seats before folding the backrest down.

    NOTE: The backrest cannot be returned to the upright (vertical) position until the kneeling mechanism is returned to the standing (upright) position and the latch feet assembly is latched to the mounting plate strikers.

    To fold down either the 60 percent or the 40 percent seat backrest, lower the head restraint by pulling on the release strap. Turn the recliner handle or pull the third row occupant release strap and fold the backrest forward and down until it lays flat. To return the seat backrest to the upright (vertical) position, lift and pivot the top of the backrest toward the rear of the vehicle, rotating the backrest until you hear a click, locking it in the upright (vertical) position. Make sure the seat backrest is locked in position.

The 7-passenger, second row E-Z entry seats can be positioned in 2 functional positions. The E-Z entry seat will:

- kneel to create a level cargo area (load floor) after the backrest has been folded down.
  - **NOTE:** To kneel the seat, the backrest must be folded forward and all the way down. Remove anything between the backrest and cushion that may prevent the backrest from folding all the way down.

    The front legs of the seat will pivot forward and lower (kneel) the seat creating a level load floor with the rear cargo area of the vehicle. Fold the backrest forward and all the way down. Lift the kneeling mechanism release handle in the back of the backrest and moderately push the seat forward and down into the kneel position. To stand the seat back up from the load floor position, lift up with moderate force at the front of the seat cushion frame, pivot the seat up and toward the rear of the vehicle until the kneeling mechanism is locked in place. Make sure the kneeling mechanism is locked in position by pushing the seat forward and down. Lift and pivot the top of the backrest toward the rear of the vehicle, rotating the backrest until you hear a click, locking it in the upright (vertical) position. Make sure the seat backrest is locked in position.
- fold up out of the way (E-Z entry position), after the backrest has been folded down, to allow access to the third row seats through the second row doors.
  - **NOTE:** To release the latch feet from the mounting plate strikers and position the seat to the E-Z entry position, the backrest must be folded forward and all the way down. Remove

anything between the backrest and cushion that may prevent the backrest from folding all the way down.

NOTE: The recliner handle or third row occupant release strap must be released once the backrest is folded down then actuated a second time to release the seat from the mounting plate strikers.

Fold the backrest forward and down. Once the backrest is positioned down, release the recliner handle or third row occupant release strap. Turn the recliner handle or pull the third row occupant release strap a second time until the seat releases from the mounting plate strikers. Lift up on the rear of the seat, pivoting it forward, away from the third row seats and up to the E-Z entry position. To return the seat, push the rear of the seat down with moderate force to latch the seat to the mounting plate strikers. Make sure the seat is latched to the mounting plate strikers by lifting up on the rear of the seat. Lift and pivot the top of the backrest toward the rear of the vehicle, rotating the backrest until you hear a click, locking it in the upright (vertical) position. Make sure the seat backrest is locked in position.

Third Row Power-Fold Seat

NOTICE: **To prevent possible damage to the third row seat or the safety belts, make sure that the safety belts are not fastened when moving the seat to the load floor position.**

NOTICE: **Make sure that no objects such as books, purses or briefcases are on the floor in front of the third row seats or on the seat cushion before lowering the backrest(s) or the seat may not fold all the way down.**

NOTE: The Smart Junction Box (SJB) may also be identified as the Generic Electronic Module (GEM).

For the third row power-fold seat to operate, a shared ground is supplied by the SJB to both of the power-fold seat relays, enabling the seats to then be moved by pressing one of the third row power-fold seat control switches. The third row power-fold seat operates only when the vehicle is in PARK and the liftgate glass or liftgate door are open.

The third row power-fold seat relays will be provided ground on the coil side from the SJB for 30 minutes when the transmission selector is in PARK, and the liftgate, or liftgate glass is open. The ground will be disabled 30 minutes after turning the vehicle OFF. If the ground is disabled after 30 minutes, the ground can be enabled by opening any door, pressing the unlock key on the key fob, pressing any keyless keypad button or turning the ignition key.

The third row power-fold seat motors transfer movement to a drive screw and bracket assembly to raise and lower the seat backrest and cushion.

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical and electrical damage.

Visual Inspection Chart

tomsn048@gmail.com

Mechanical	Electrical
• Switch(es) • Seat tracks obstructed or damaged • Power lumbar assembly damaged • Power recline assembly damaged	• Driver power seat fuse: ♦ Battery Junction Box (BJB) fuse 14 (40A) • Passenger power seat fuse: ♦ BJB fuse 10 (30A) • Driver Seat Module (DSM) fuses (vehicles with memory seats only): ♦ BJB fuse 14 (30A) ♦ Smart Junction Box (SJB) fuse 1 (20A) • Third row power-fold seat fuses: ♦ BJB fuse 5 (30A) (left) ♦ BJB fuse 12 (30A) (right) • Heated seat fuses: ♦ BJB fuse 28 (20A) ♦ SJB fuse 18 (10A) • Wiring harness • Loose or corroded connections • Seat control switch(es) • Power seat motor(s) • Memory SET switch • DSM • Heated seat control switch(es) • Seat cushion heater • Seat back heater • Lumbar control switch • Power lumbar motor

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. If the concern is with the power seat (non-memory seat) or heated seat and the cause is not visually evident, verify the symptom and GO to Symptom Chart .

5. **NOTE:** Make sure to use the latest scan tool software release.

   If the concern is with the memory seat or the third row power-fold seat and the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

6. **NOTE:** The Vehicle Communication Module (VCM) indicator prove out confirms voltage and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM .
   - refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

7. If the scan tool does not communicate with the vehicle:
   - verify the ignition is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00 to diagnose no response from the PCM.

8. Carry out the network test.
    - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
    - If the network test passes, retrieve and record Continuous Memory Diagnostic Trouble Codes (CMDTCs).

9. Clear the CMDTCs and carry out the self-test diagnostics for the DSM or SJB .

10. If the DTCs retrieved are related to the concern, go to Driver Seat Module (DSM) DTC Chart or Smart Junction Box (SJB) DTC Chart. For all other DTCs, refer to Section 419-10 .

11. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

Symptom Chart

Pinpoint Tests

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.**

tomsn048@gmail.com

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test. Refer to Inspection and Verification in this section.

NOTE: During testing, wire colors may change as they pass through connectors.

Refer to Inspection and Verification, the Driver Seat Module (DSM) DTC Chart, Smart Junction Box (SJB) DTC Chart and the Symptom Chart for direction to the appropriate pinpoint test.

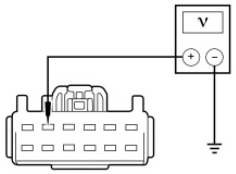
Pinpoint Test A: The Power Seat is Inoperative - Driver Seat With Power Recliner

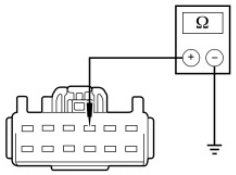
Refer to Wiring Diagrams Cell 120 , Power Seats for schematic and connector information.

Normal Operation

The driver seat control switch is supplied battery voltage on circuit SBB14 (BN/RD) and ground on circuit GD133 (BK). When pressed, the seat control switch supplies that voltage and ground to a power seat track motor or power recline motor to move the seat or backrest to the desired position. There are 3 power seat track motors that combine to move the seat cushion horizontally (forward/rearward) and vertically (front up/down and rear up/down). There is an additional motor in the power recline mechanism to move the seat backrest forward and rearward. If a new seat track motor needs to be installed, it is necessary to install an entire power seat track. The power recline motor is serviced separately.

This pinpoint test is intended to diagnose the following:





- Fuse
- Wiring, terminals or connectors
- Seat control switch

PINPOINT TEST A: THE POWER SEAT IS INOPERATIVE - DRIVER SEAT WITH POWER RECLINER

NOTE: The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
A1 CHECK CIRCUIT SBB14 (BN/RD) FOR VOLTAGE	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect: Driver Seat Safety Belt Buckle Pretensioner C3201. • Disconnect: Driver Seat Side Air Bag C3049. • Disconnect: Driver Seat Control Switch C352. • ⚠ **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected.**	**Yes** GO to A2 . **No** VERIFY Battery Junction Box (BJB) fuse 14 (40A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the Wiring Diagrams Manual to identify possible causes of the circuit short. TEST the system for normal operation. DISCONNECT the battery ground cable.

Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment. • Connect the battery ground cable. Refer to Section 414-01 . • Measure the voltage between driver seat control switch C352-5, circuit SBB14 (BN/RD), harness side and ground.  N0010816 • **Is the voltage greater than 10 volts?**	CONNECT driver safety belt buckle and pretensioner C3201. CONNECT driver seat side air bag module C3049. REPOWER the SRS . REFER to Section 501-20B .
A2 CHECK CIRCUIT GD133 (BK) FOR AN OPEN	
• Measure the resistance between driver seat control switch C352-3, circuit GD133 (BK), harness side and ground.  N0010815 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new driver seat control switch. REFER to Seat Control Switch in this section. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle and pretensioner C3201. CONNECT driver seat side air bag module C3049. REPOWER the SRS . REFER to Section 501-20B . **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle and pretensioner C3201. CONNECT driver seat side air bag module C3049. REPOWER the SRS . REFER to Section 501-20B .

Pinpoint Test B: The Power Seat is Inoperative - Driver Seat Without Power Recliner

PINPOINT TEST A: THE POWER SEAT IS INOPERATIVE - DRIVER SEAT WITH POWER RECLINER

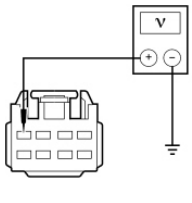
tomsn048@gmail.com

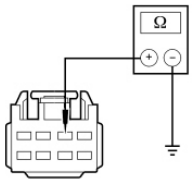
Refer to Wiring Diagrams Cell 120 , Power Seats for schematic and connector information.

Normal Operation

The driver seat control switch is supplied battery voltage on circuit SBB14 (BN/RD) and ground on circuit GD133 (BK). When pressed, the seat control switch supplies that voltage and ground to a power seat track motor to move the seat. When pressed in the opposite direction, the seat control switch reverses the polarity to that same power seat track motor, which moves the seat in the opposite direction. There are 3 power seat track motors that combine to move the seat cushion horizontally (forward/rearward) and vertically (front up/down and rear up/down). If a new seat track motor needs to be installed, it is necessary to install an entire power seat track.

This pinpoint test is intended to diagnose the following:





- Fuse
- Wiring, terminals or connectors
- Seat control switch

PINPOINT TEST B: THE POWER SEAT IS INOPERATIVE - DRIVER SEAT WITHOUT POWER RECLINER

NOTE: The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
B1 CHECK CIRCUIT SBB14 (BN/RD) FOR VOLTAGE	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect: Driver Seat Safety Belt Buckle Pretensioner C3201. • Disconnect: Driver Seat Side Air Bag C3049. • Disconnect: Driver Seat Control Switch C3016. • ⚠ **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Connect the battery ground cable. Refer to Section 414-01 . • Measure the voltage between driver seat control switch C3016-4, circuit SBB14 (BN/RD), harness side and ground.	**Yes** GO to B2 . **No** VERIFY Battery Junction Box (BJB) fuse 14 (40A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the Wiring Diagrams Manual to identify possible causes of the circuit short. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle and pretensioner C3201. CONNECT driver seat side air bag module C3049. REPOWER the SRS . REFER to Section 501-20B .

 N0010817 • **Is the voltage greater than 10 volts?**	
B2 CHECK CIRCUIT GD133 (BK) FOR AN OPEN	
• Measure the resistance between driver seat control switch C3016-2, circuit GD133 (BK), harness side and ground.  N0010818 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new driver seat control switch. REFER to Seat Control Switch in this section. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle and pretensioner C3201. CONNECT driver seat side air bag module C3049. REPOWER the SRS . REFER to Section 501-20B . **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle and pretensioner C3201. CONNECT driver seat side air bag module C3049. REPOWER the SRS . REFER to Section 501-20B .

Pinpoint Test C: The Power Seat is Inoperative - Passenger Seat

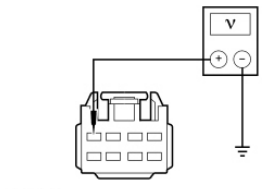
Refer to Wiring Diagrams Cell 120 , Power Seats for schematic and connector information.

Normal Operation

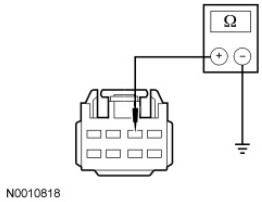
The passenger seat control switch is supplied battery voltage on circuit SBB10 (YE/RD) and ground on circuit GD151 (BK/GN). When pressed, the seat control switch supplies that voltage and ground to a power seat track motor to move the seat. When pressed in the opposite direction, the seat control switch reverses the polarity to that same power seat track motor, which moves the seat in the opposite direction. There are 3 power seat track motors that combine to move the seat cushion horizontally (forward/rearward) and vertically (front up/down and rear up/down). If a new seat track motor needs to be installed, it is necessary to install an

tomsn048@gmail.com

entire power seat track.



This pinpoint test is intended to diagnose the following:



- Fuse
- Wiring, terminals or connectors
- Seat control switch

PINPOINT TEST C: THE POWER SEAT IS INOPERATIVE - PASSENGER SEAT

NOTE: The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
C1 CHECK CIRCUIT SBB10 (YE/RD) FOR VOLTAGE	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect: Passenger Seat Safety Belt Buckle Pretensioner C3202. • Disconnect: Passenger Seat Side Air Bag C3050. • Disconnect: Passenger Seat Control Switch C355. • ⚠ **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Connect the battery ground cable. Refer to Section 414-01 . • Measure the voltage between passenger seat control switch C355-4, circuit SBB10 (YE/RD), harness side and ground.  N0010817 • **Is the voltage greater than 10 volts?**	**Yes** GO to C2 . **No** VERIFY Battery Junction Box (BJB) fuse 10 (30A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the Wiring Diagrams Manual to identify possible causes of the circuit short. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT passenger safety belt buckle and pretensioner C3202. CONNECT passenger seat side air bag module C3050. REPOWER the SRS . REFER to Section 501-20B .
C2 CHECK CIRCUIT GD151 (BK/GN) FOR AN OPEN	

• Measure the resistance between passenger seat control switch C355-2, circuit GD151 (BK/GN), harness side and ground.  N0010818 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new passenger seat control switch. REFER to Seat Control Switch in this section. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT passenger safety belt buckle and pretensioner C3202. CONNECT passenger seat side air bag module C3050. REPOWER the SRS . REFER to Section 501-20B . **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT passenger safety belt buckle and pretensioner C3202. CONNECT passenger seat side air bag module C3050. REPOWER the SRS . REFER to Section 501-20B .

Pinpoint Test D: The Power Seat Moves But is Loose

Normal Operation

The power seat movement should be smooth and the seat cushion should not rock during or after operation.

This pinpoint test is intended to diagnose the following:
- Loose fastening hardware
- Seat track component

PINPOINT TEST D: THE POWER SEAT MOVES BUT IS LOOSE

Test Step	Result / Action to Take
D1 CHECK THE FASTENING HARDWARE	
• Inspect for loose fastening hardware on the affected seat. • **Is the fastening hardware loose?**	**Yes** TIGHTEN all fastening hardware to specification. TEST the system for normal operation.

tomsn048@gmail.com

	No IDENTIFY the cause and REPAIR as necessary. TEST the system for normal operation.

Pinpoint Test E: The Power Seat Moves But is Noisy

Normal Operation

The power seat should move quietly during operation. Some noise is acceptable.

This pinpoint test is intended to diagnose the following:

- Misaligned seat track
- Seat track component
- Object obstructing seat movement

PINPOINT TEST E: THE POWER SEAT MOVES BUT IS NOISY

Test Step	Result / Action to Take
E1 CHECK SEAT TRACK ALIGNMENT	
• Check the alignment of the track to the floor and the track to the seat. • **Is the track out of alignment?**	**Yes** ALIGN the track to the seat and the floor. TEST the system for normal operation. **No** IDENTIFY the cause and REPAIR as necessary. TEST the system for normal operation.

Pinpoint Test F: The Power Seat Does Not Make Full Travel

Normal Operation

The power seat should travel fully horizontal (forward/rearward) and vertical (front up/down and rear up/down).

This pinpoint test is intended to diagnose the following:

- An obstruction
- Seat track components

PINPOINT TEST F: THE POWER SEAT DOES NOT MAKE FULL TRAVEL

NOTE: The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take

F1 CHECK FOR AN OBSTRUCTION IN THE SEAT TRACK	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Remove the affected seat. Refer to Seat - Front in this section. • **Are there any obstructions in the track?**	**Yes** REMOVE the obstruction(s) and GREASE the track(s). REPOWER the SRS . REFER to Section 501-20B . TEST the system for normal operation. **No** IDENTIFY the cause and REPAIR as necessary. REPOWER the SRS . REFER to Section 501-20B . TEST the system for normal operation.

Pinpoint Test G: The Power Seat Does Not Operate Correctly - Driver Seat With Power Recline

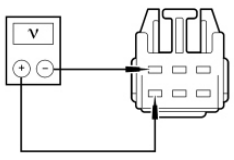
Refer to Wiring Diagrams Cell 120 , Power Seats for schematic and connector information.

Normal Operation

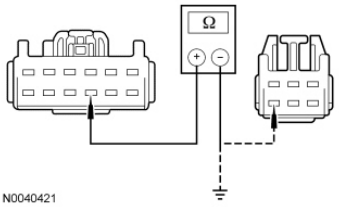
The driver seat control switch is supplied battery voltage on circuit SBB14 (BN/RD) and ground on circuit GD133 (BK). When pressed, the seat control switch supplies that voltage and ground to a power seat track motor or power recliner motor to move the seat or backrest. When pressed in the opposite direction, the seat control switch reverses the polarity to that same power seat track motor or power recliner motor, which moves the seat or backrest in the opposite direction. There are 3 power seat track motors that combine to move the seat cushion horizontally (forward/rearward) and vertically (front up/down and rear up/down). There is an additional motor in the power recliner mechanism to move the seat backrest forward and rearward. If a new seat track motor needs to be installed, it is necessary to install an entire power seat track. The power recline motor is serviced separately.

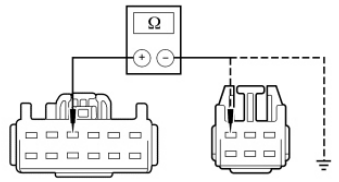
This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Seat control switch
- Seat track motor (seat track)
- Power recliner mechanism



PINPOINT TEST G: THE POWER SEAT DOES NOT OPERATE CORRECTLY - DRIVER SEAT WITH POWER RECLINE

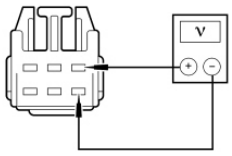


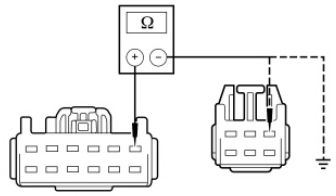


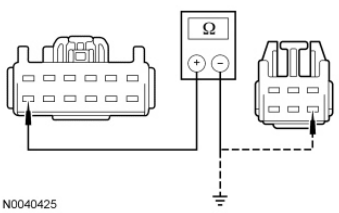
NOTE: The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take

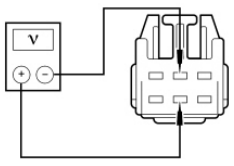




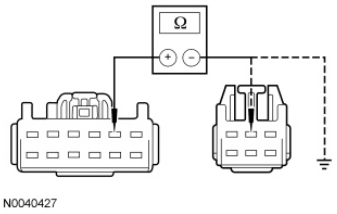


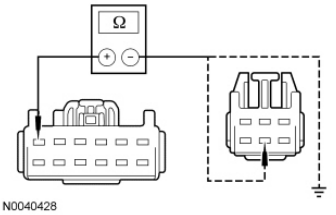
tomsn048@gmail.com

G1 CHECK THE HORIZONTAL DIRECTION MOTOR FOR CORRECT OPERATION	
• Operate the driver power seat forward and rearward. • **Will the seat move horizontally?**	**Yes** GO to G2 . **No** GO to G3 .
G2 CHECK THE RECLINER MOTOR FOR CORRECT OPERATION	
• Recline the driver backrest forward and rearward. • **Will the seat backrest recline forward and rearward?**	**Yes** GO to G6 . **No** GO to G13 .
G3 CHECK VOLTAGE TO THE DRIVER SEAT HORIZONTAL MOTOR	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect: Driver Seat Safety Belt Buckle Pretensioner C3201. • Disconnect: Driver Seat Side Air Bag C3049. • Disconnect: Driver Seat Motor C353. • ⚠ **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Connect the battery ground cable. Refer to Section 414-01 . • Measure the voltage between driver seat motor C353-6, circuit CPS28 (GN), harness side and C353-3, circuit CPS23 (GN/VT), harness side, while pushing the driver seat control switch forward and rearward.  N0040420 • **Is the voltage greater than -10 volts when the switch is pushed forward, greater than +10 volts when the switch is pushed rearward and 0 volt when the switch is in a rest position?**	**Yes** INSTALL a new driver seat track assembly. REFER to Seat Track in this section. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle and pretensioner C3201. CONNECT driver seat side air bag module C3049. REPOWER the SRS . REFER to Section 501-20B . **No** GO to G4 .
G4 CHECK CIRCUIT CPS28 (GN) FOR AN OPEN AND SHORT TO GROUND	



• Disconnect: Driver Seat Control Switch C352. • Measure the resistance between: ♦ driver seat control switch C352-9, circuit CPS28 (GN), harness side and driver seat motor C353-6, circuit CPS28 (GN), harness side. ♦ driver seat control switch C352-9, circuit CPS28 (GN), harness side and ground.  • **Is the resistance less than 5 ohms between the driver seat motor and the driver seat control switch; and greater than 10,000 ohms between the driver seat control switch and ground?**	**Yes** GO to G5 . **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle and pretensioner C3201. CONNECT driver seat side air bag module C3049. REPOWER the SRS . REFER to Section 501-20B .
G5 CHECK CIRCUIT CPS23 (GN/VT) FOR AN OPEN AND SHORT TO GROUND	
• Measure the resistance between: ♦ driver seat control switch C352-4, circuit CPS23 (GN/VT), harness side and driver seat motor C353-3, circuit CPS23 (GN/VT), harness side. ♦ driver seat control switch C352-4, circuit CPS23 (GN/VT), harness side and ground.  • **Is the resistance less than 5 ohms between the driver seat motor and the driver seat control switch; and greater than 10,000 ohms between the driver seat control switch and ground?**	**Yes** INSTALL a new driver seat control switch. REFER to Seat Control Switch in this section. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle and pretensioner C3201. CONNECT driver seat side air bag module C3049. REPOWER the SRS . REFER to Section 501-20B . **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle and pretensioner C3201. CONNECT driver seat side air bag module C3049.





tomsn048@gmail.com

	REPOWER the SRS . REFER to Section 501-20B .
G6 DETERMINE THE SEAT HEIGHT ADJUST FAILURE	
• Operate the seat front and rear height adjustments. • **Does the seat front and rear height adjust up and down?**	**Yes** If only the front height adjust motor operates, GO to G7 . If only the rear height adjust motor operates, GO to G10 . **No** INSTALL a new driver seat control switch. REFER to Seat Control Switch in this section. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle and pretensioner C3201. CONNECT driver seat side air bag module C3049. REPOWER the SRS . REFER to Section 501-20B .
G7 CHECK THE VOLTAGE TO THE DRIVER SEAT REAR HEIGHT MOTOR	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect: Driver Seat Safety Belt Buckle Pretensioner C3201. • Disconnect: Driver Seat Side Air Bag C3049. • Disconnect: Driver Seat Motor C353. • ⚠ **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Connect the battery ground cable. Refer to Section 414-01 . • Measure the voltage between driver seat motor C353-1, circuit CPS27 (BU/BN), harness side and C353-4, circuit CPS26 (YE/BU), harness side, while depressing the rear tilt switch up and down.	**Yes** INSTALL a new driver seat track assembly. REFER to Seat Track in this section. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle and pretensioner C3201. CONNECT driver seat side air bag module C3049. REPOWER the SRS . REFER to Section 501-20B . **No** GO to G8 .

 N0040423 • **Is the voltage greater than -10 volts when the rear tilt switch is pressed down, greater than +10 volts when the rear tilt switch is pressed up and 0 volt when the switch is in the rest position?**	
G8 CHECK CIRCUIT CPS27 (BU/BN) FOR AN OPEN AND SHORT TO GROUND	
• Disconnect: Driver Seat Control Switch C352. • Measure the resistance between: ♦ driver seat control switch C352-1, circuit CPS27 (BU/BN), harness side and driver seat motor C353-1, circuit CPS27 (BU/BN), harness side. ♦ driver seat control switch C352-1, circuit CPS27 (BU/BN), harness side and ground.  N0040424 • **Is the resistance less than 5 ohms between the driver seat motor and the driver seat control switch; and greater than 10,000 ohms between the driver seat control switch and ground?**	**Yes** GO to G9 . **No** REPAIR the circuit. Pinpoint Test H: The Power Seat Does Not Operate Correctly - Driver Seat Without Power Recline

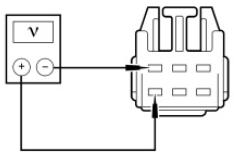
Refer to Wiring Diagrams Cell 120 , Power Seats for schematic and connector information.

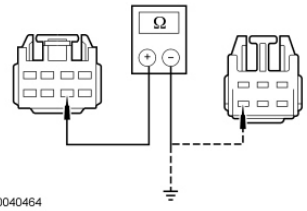
tomsn048@gmail.com

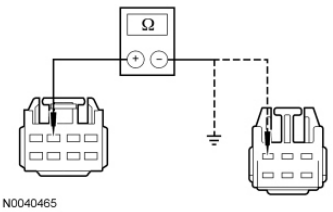
Normal Operation

The driver seat control switch is supplied battery voltage on circuit SBB14 (BN/RD) and ground on circuit GD133 (BK). When pressed, the seat control switch supplies that voltage and ground to a power seat track motor to move the seat. When pressed in the opposite direction, the seat control switch reverses the polarity to that same power seat track motor, which moves the seat in the opposite direction. There are 3 power seat track motors that combine to move the seat cushion horizontally (forward/rearward) and vertically (front up/down and rear up/down). If a new motor needs to be installed, it is necessary to install an entire power seat track.

This pinpoint test is intended to diagnose the following:



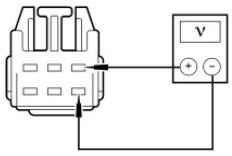


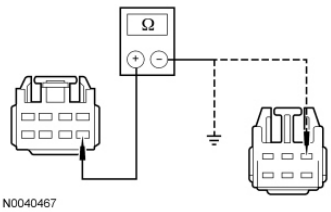


- Wiring, terminals or connectors
- Seat control switch
- Seat track motor (seat track)

PINPOINT TEST H: THE POWER SEAT DOES NOT OPERATE CORRECTLY - DRIVER SEAT WITHOUT POWER RECLINE

NOTE: The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is removed and the ignition switch is ON.

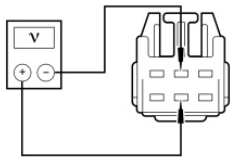


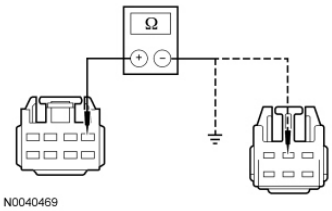


NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
H1 CHECK HORIZONTAL DIRECTION MOTOR FOR CORRECT OPERATION	
• Operate the driver power seat forward and rearward. • **Will the seat move horizontally?**	**Yes** GO to H5 . **No** GO to H2 .
H2 CHECK VOLTAGE TO THE DRIVER SEAT HORIZONTAL MOTOR	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect: Driver Seat Safety Belt Buckle Pretensioner C3201. • Disconnect: Driver Seat Side Air Bag C3049. • Disconnect: Driver Seat Motor C353. • ⚠ **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Connect the battery ground cable. Refer to Section 414-01 . • Measure the voltage between driver seat motor C353-6, circuit CPS28 (GN), harness side and C353-3, circuit CPS23 (GN/VT), harness side, while pushing the driver seat control switch forward and rearward.	**Yes** INSTALL a new driver seat track assembly. REFER to Seat Track in this section. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle and pretensioner C3201. CONNECT driver seat side air bag module C3049. REPOWER the SRS . REFER to Section 501-20B . **No**

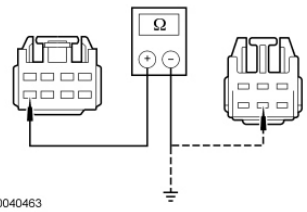
 N0040420 • **Is the voltage greater than -10 volts when the switch is pushed forward, greater than +10 volts when the switch is pushed rearward and 0 volt when the switch is in a rest position?**	GO to H3 .
H3 CHECK CIRCUIT CPS28 (GN) FOR AN OPEN AND SHORT TO GROUND	
• Disconnect: Driver Seat Control Switch C3016. • Measure the resistance between: ♦ driver seat control switch C3016-6, circuit CPS28 (GN), harness side and driver seat motor C353-6, circuit CPS28 (GN), harness side. ♦ driver seat control switch C3016-6, circuit CPS28 (GN), harness side and ground.  N0040464 • **Is the resistance less than 5 ohms between the driver seat motor and the driver seat control switch; and greater than 10,000 ohms between the driver seat control switch and ground?**	**Yes** GO to H4 . **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle and pretensioner C3201. CONNECT driver seat side air bag module C3049. REPOWER the SRS . REFER to Section 501-20B .
H4 CHECK CIRCUIT CPS23 (GN/VT) FOR AN OPEN AND SHORT TO GROUND	
• Measure the resistance between: ♦ driver seat control switch C3016-3, circuit CPS23 (GN/VT), harness side and driver seat motor C353-3, circuit CPS23 (GN/VT), harness side. ♦ driver seat control switch C3016-3, circuit CPS23 (GN/VT), harness side and ground.  N0040465	**Yes** INSTALL a new driver seat control switch. REFER to Seat Control Switch in this section. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle and pretensioner C3201. CONNECT driver seat side air bag module C3049.





tomsn048@gmail.com

• **Is the resistance less than 5 ohms between the driver seat motor and the driver seat control switch; and greater than 10,000 ohms between the driver seat control switch and ground?**	REPOWER the SRS . CONNECT driver seat side air bag module C3049. REPOWER the SRS . REFER to Section 501-20B .
H5 DETERMINE THE SEAT HEIGHT ADJUST FAILURE	
• Operate the seat front and rear height adjustments. • **Does the seat front and rear height adjust up and down?**	**Yes** If only the front height adjust motor operates, GO to H6 . If only the rear height adjust motor operates, GO to H9 . **No** INSTALL a new driver seat control switch. REFER to Seat Control Switch in this section. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle and pretensioner C3201. CONNECT driver seat side air bag module C3049. REPOWER the SRS . REFER to Section 501-20B .
H6 CHECK VOLTAGE TO THE DRIVER SEAT REAR HEIGHT MOTOR	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect: Driver Seat Safety Belt Buckle Pretensioner C3201.	**Yes** INSTALL a new driver seat track assembly. REFER to Seat Track in this section. TEST the system for normal operation. DISCONNECT the battery



• Disconnect: Driver Seat Side Air Bag C3049. • Disconnect: Driver Seat Motor C353. • **⚠ WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Connect the battery ground cable. Refer to Section 414-01 . • Measure the voltage between driver seat motor C353-1, circuit CPS27 (BU/BN), harness side and C353-4, circuit CPS26 (YE/BU), harness side, while depressing the rear tilt switch up and down.  N0040466 • **Is the voltage greater than -10 volts when the rear tilt switch is pressed down, greater than +10 volts when the rear tilt switch is pressed up and 0 volt when the switch is in the rest position?**	ground cable. CONNECT driver safety belt buckle and pretensioner C3201. CONNECT driver seat side air bag module C3049. REPOWER the SRS . REFER to Section 501-20B . **No** GO to H7 .
H7 CHECK CIRCUIT CPS27 (BU/BN) FOR AN OPEN AND SHORT TO GROUND	
• Disconnect: Driver Seat Control Switch C3016. • Measure the resistance between: ♦ driver seat control switch C3016-5, circuit CPS27 (BU/BN), harness side and driver seat motor C353-1, circuit CPS27 (BU/BN), harness side. ♦ driver seat control switch C3016-5, circuit CPS27 (BU/BN), harness side and ground.  N0040467 • **Is the resistance less than 5 ohms between the driver seat motor and the driver seat control switch; and greater than 10,000 ohms between the driver seat control switch and ground?**	**Yes** GO to H8 . **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle and pretensioner C3201. CONNECT driver seat side air bag module C3049. REPOWER the SRS . REFER to Section 501-20B .
H8 CHECK CIRCUIT CPS26 (YE/BU) FOR AN OPEN AND SHORT TO GROUND	

tomsn048@gmail.com

• Measure the resistance between: ♦ driver seat control switch C3016-7, circuit CPS26 (YE/BU), harness side and driver seat motor C353-4, circuit CPS26 (YE/BU), harness side. ♦ driver seat control switch C3016-7, circuit CPS26 (YE/BU), harness side and ground.  • **Is the resistance less than 5 ohms between the driver seat motor and the driver seat control switch; and greater than 10,000 ohms between the driver seat control switch and ground?**	**Yes** INSTALL a new driver seat control switch. REFER to Seat Control Switch in this section. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle and pretensioner C3201. CONNECT driver seat side air bag module C3049. REPOWER the SRS . REFER to Section 501-20B . **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle and pretensioner C3201. CONNECT driver seat side air bag module C3049. REPOWER the SRS . REFER to Section 501-20B .
H9 CHECK VOLTAGE TO THE DRIVER SEAT FRONT HEIGHT MOTOR	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect: Driver Seat Safety Belt Buckle Pretensioner C3201. • Disconnect: Driver Seat Side Air Bag C3049. • Disconnect: Driver Seat Motor C353. • ⚠ **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Connect the battery ground cable. Refer to Section 414-01 . • Measure the voltage between driver seat motor C353-2, circuit CPS25 (WH/VT), harness side and C353-5, circuit CPS24 (GY), while pushing the rear tilting switch up and	**Yes** INSTALL a new driver seat track assembly. REFER to Seat Track in this section. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle and pretensioner C3201. CONNECT driver seat side air bag module C3049. REPOWER the SRS . REFER to Section 501-20B .

down.  N0040426 • **Is the voltage greater than +10 volts when the front tilt switch is pressed down, greater than -10 volts when the front tilt switch is pressed up and 0 volt when the switch is in the rest position?**	**No** GO to H10 .
H10 CHECK CIRCUIT CPS25 (WH/VT) FOR AN OPEN AND SHORT TO GROUND	
• Disconnect: Driver Seat Control Switch C3016. • Measure the resistance between: ♦ driver seat control switch C3016-1, circuit CPS25 (WH/VT), harness side and driver seat motor C353-2, circuit CPS25 (WH/VT), harness side. ♦ driver seat control switch C3016-1, circuit CPS25 (WH/VT), harness side and ground.  N0040469 • **Is the resistance less than 5 ohms between the driver seat motor and the driver seat control switch; and greater than 10,000 ohms between the driver seat control switch and ground?**	**Yes** GO to H11 . **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle and pretensioner C3201. CONNECT driver seat side air bag module C3049. REPOWER the SRS . REFER to Section 501-20B .
H11 CHECK CIRCUIT CPS24 (GY) FOR AN OPEN AND SHORT TO GROUND	
• Measure the resistance between: ♦ driver seat control switch C3016-8, circuit CPS24 (GY), harness side, and driver seat motor C353-5, circuit CPS24 (GY), harness side. ♦ driver seat control switch C3016-8, circuit CPS24 (GY), harness side and ground.	**Yes** INSTALL a new driver seat control switch. REFER to Seat Control Switch in this section. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle and pretensioner C3201. CONNECT driver seat side air

tomsn048@gmail.com

 • **Is the resistance less than 5 ohms between the driver seat motor and the driver seat control switch; and greater than 10,000 ohms between the driver seat control switch and ground?**	bag module C3049. REPOWER the SRS . REFER to Section 501-20B . **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle and pretensioner C3201. CONNECT driver seat side air bag module C3049. REPOWER the SRS . REFER to Section 501-20B .

Pinpoint Test I: The Memory Seat is Inoperative/Does Not Operate Correctly - Does Not Operate Horizontally/Vertically/Recline

Refer to Wiring Diagrams Cell 123 , Memory Seats for schematic and connector information.

Refer to Wiring Diagrams Cell 149 , Component Testing for component testing.

Normal Operation

The driver seat control switch is supplied battery voltage on circuit SBP01 (RD) and ground on circuit GD133 (BK). When pressed, the seat control switch supplies the voltage and ground to the applicable Driver Seat Module (DSM) inputs. The DSM then supplies voltage and ground to the appropriate power seat track motor or power recline motor based on the inputs received from the seat control switch. When pressed in the opposite direction, the seat control switch reverses the polarity to the DSM inputs, and the DSM likewise reverses polarity of the appropriate power seat track motor or power recliner motor circuits causing the seat or backrest to move in the opposite direction. There are 3 power seat track motors that combine to move the seat horizontally (forward/rearward) and vertically (front up/down and rear up/down). The seat backrest power recliner mechanism uses a single motor to move the seat backrest forward and rearward.

Battery voltage is also supplied to DSM on circuits SBP01 (RD) and SBB14 (BN/RD). Ground is supplied to the DSM on circuits GD133 (BK) and GD143 (BK/VT).

Each motor, in the memory power seat track and power recliner mechanism contains a Hall-effect position sensor. The DSM supplies a signal feed circuit to each position sensor and a shared reference signal return circuit. Each position sensor sends a signal voltage back to the DSM used to monitor the position of the power seat and seat backrest. The DSM uses this information to return the seat to a stored pre-programmed position when pressing the memory SET switch or a remote entry transmitter. Refer to Principles of Operation in this section or the Owner's Literature for information on programming the DSM for storing memory seat positions.

The following pinpoint test diagnoses a memory seat that does not operate in one or more directions when using the seat control switch. If the memory seat moves in all directions using the seat control switch, GO to

Pinpoint Test J .

DTC Description	Fault Trigger Conditions
• B1342 - ECU is Faulted	If a programming error is detected, the DTC is set.
• B1663 - Seat Driver Front Up/Down Motor Stalled • B1664 - Seat Driver Rear Up/Down Motor Stalled • B1665 - Seat Driver Forward/Backward Motor Stalled	During the self-test, the DSM attempts to operate the appropriate seat track motor and uses the motor's position sensor to monitor movement. If no motor movement is sensed, the DTC is set. The DSM will retry motor operation on the next activation of the seat control switch. If no movement continues to be monitored after 250 milliseconds, the DSM disables the output.
• B1666 - Seat Driver Recline Motor Stalled	During the self-test, the DSM attempts to operate the recliner motor and uses the recliner motor position sensor to monitor movement. If no motor movement is sensed, the DTC is set. The DSM will retry motor operation on the next activation of the seat control switch. If no motor movement is still monitored after 250 milliseconds, the DSM disables the output.
• B1703 - Seat Driver Recline Forward Switch Circuit Short to Battery • B1707 - Seat Driver Recline Rearward Switch Circuit Short to Battery	If voltage is sensed on the switch input circuit during the DSM self-test, the DTC is set. If voltage is sensed on the input circuit for greater than 2 minutes the DTC is set as continuous. With the DTC set, any input signal on the circuit is ignored.
• B1711 - Seat Driver Front Up Switch Circuit Short to Battery • B1715 - Seat Driver Front Down Switch Circuit Short to Battery	If voltage is sensed on the switch input circuit during the DSM self-test, the DTC is set. If voltage is sensed on the input circuit for greater than 2 minutes the DTC is set as continuous. With the DTC set, any input signal on the circuit is ignored.
• B1719 - Seat Driver Forward Switch Circuit Short to Battery • B1723 - Seat Driver Rearward Switch Circuit Short to Battery	If voltage is sensed on the switch input circuit during the DSM self-test, the DTC is set. If voltage is sensed on the input circuit for greater than 2 minutes the DTC is set as continuous. With the DTC set, any input signal on the circuit is ignored.
	If voltage is sensed on the switch input circuit during the DSM self-test, the DTC is set. If voltage is sensed on the input circuit for greater than 2 minutes

tomsn048@gmail.com

• B1727 - Seat Driver Rear Up Switch Circuit Short to Battery • B1731 - Seat Driver Rear Down Switch Circuit Short to Battery	the DTC is set as continuous. With the DTC set, any input signal on the circuit is ignored.

This pinpoint test is intended to diagnose the following:

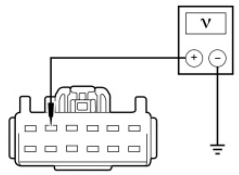
- Fuse
- Wiring, terminals or connectors
- Seat control switch
- Missing status information (Controller Area Network (CAN) communication bus message):
  - ♦ ignition switch status
  - ♦ gear selector position
- Power seat track
- Power recliner motor
- DSM

PINPOINT TEST I: THE MEMORY SEAT IS INOPERATIVE/DOES NOT OPERATE CORRECTLY - DOES NOT OPERATE HORIZONTALLY/VERTICALLY/RECLINE

NOTE: The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: Verify good battery condition before diagnosing the memory seat system. Poor battery condition may interfere with memory seat operation, even if vehicle starting is possible.



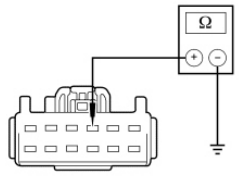
NOTE: Verify the PID(s) states agree with the ignition switch and transmission gear selector in all positions before proceeding with memory seat diagnosis.

Test Step	Result / Action to Take
I1 CHECK DSM TRANSMISSION GEAR SELECTED (TRANSGEAR) PID STATES	
• Connect the scan tool. • Enter the following diagnostic mode on the scan tool: DataLogger - DSM - PID: TRANSGEAR (PRNDL). • Operate the transmission gear selector in all positions while monitoring the following DSM PID TRANSGEAR states: ♦ Drive1 ♦ Drive2 ♦ Drive3 ♦ D6_PRK ♦ NTRL ♦ REV ♦ D6_PRK	**Yes** GO to I2 . **No** To diagnose a transmission gear selector (PRNDL) status concern, REFER to Section 307-01A or Section 307-01B .

• **Do the PID states agree with the selected positions?**	
I2 CHECK THE IGNITION SWITCH STATUS (IGN_SW) PID	
• Enter the following diagnostic mode on the scan tool: DataLogger - DSM - PID: IGN_SW. • Cycle the ignition switch in all positions while monitoring the following DSM IGN_SW PID states: ♦ Off ♦ Accessory ♦ Run ♦ Start • **Do the PID states agree with the selected positions?**	**Yes** GO to I3 . **No** To diagnose an ignition switch status concern, REFER to Section 211-05 .
I3 RETRIEVE THE DTCs	
• Using the switches, attempt to operate the memory seat and adjustable memory pedals in all directions through the full range of travel. • **NOTE:** During the self-test, each memory motor will be requested to move for one second. If a motor is near the end of travel, that position sensor feedback will not change as expected for one second resulting in a false DTC. • Place the memory seat and adjustable memory pedals in central travel positions. • Enter the following diagnostic mode on the scan tool: Self Test - DSM . • **Are any DSM DTCs retrieved?**	**Yes** If DTCs B1663, B1664, B1665 and B1666 are all retrieved, GO to I12 . If DTC B1663, GO to I22 . If DTC B1664, GO to I25 . If DTC B1665, GO to I28 . If DTC B1666, GO to I31 . If DTC B1703, GO to I5 . If DTC B1707, GO to I5 . If DTC B1711, GO to I5 . If DTC B1715, GO to I5 . If DTC B1719, GO to I5 . If DTC B1723, GO to I5 . If DTC B1727, GO to I5 . If DTC B1731, GO to I5 . If DTC B1342, INSTALL a new DSM and CARRY OUT Programmable Module Installation (PMI). REFER to Section 419-10 . REPEAT the self-test. CLEAR the DTCs. For any other DSM DTCs, REFER to the Driver Seat Module (DSM) DTC Chart.

tomsn048@gmail.com

	No GO to I4 .
I4 MONITOR THE DSM PIDs AND CHECK FOR CORRECT MEMORY SEAT SWITCH INPUTS	
• Enter the following diagnostic mode on the scan tool: DataLogger - DSM - PIDs. ♦ Driver Power Seat Front Up/Down Switch (SFNT_SW) ♦ Driver Power Seat Forward/Backward Switch (SFWD_SW) ♦ Driver Power Seat Recline Switch Status (SRCL_SW) ♦ Driver Power Seat Rear Up/Down Switch (SREARSW) • Operate the seat control switch in all positions while monitoring the DSM driver seat switch input status PIDs. • **Do the PID values agree with the switch positions?**	**Yes** GO to I11 . **No** VERIFY Smart Junction Box (SJB) fuse 1 (20A) is OK. If SJB fuse 1 (20A) fails while operating the seat control switch, DISCONNECT seat control switch C352 and GO to I9 . If SJB fuse 1 (20A) is OK, GO to I5 .
I5 CHECK THE SEAT CONTROL SWITCH	
• Ignition OFF. • Remove the seat control switch. Refer to Seat Control Switch in this section. • Check the seat control switch. Refer to Wiring Diagrams Cell 149 for component testing. • **Is the seat control switch OK?**	**Yes** GO to I6 . **No** INSTALL a new seat control switch. REFER to Seat Control Switch in this section. REPEAT the self-test. CLEAR the DTCs.
I6 CHECK CIRCUIT SBP01 (RD) FOR VOLTAGE TO THE SEAT CONTROL SWITCH	
• Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect: Driver Seat Safety Belt Buckle Pretensioner C3201. • Disconnect: Driver Seat Side Air Bag C3049. • ⚠ **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Connect the battery ground cable. Refer to Section 414-01 . • Measure the voltage between seat control switch C352-5, circuit SBP01 (RD), harness side and ground.	**Yes** GO to I7 . **No** VERIFY SJB fuse 1 (20A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the Wiring Diagrams Manual to identify possible causes of the circuit short. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle and pretensioner C3201. CONNECT driver seat side air bag module C3049. REPOWER the SRS . REFER to Section 501-20B .



N0010816

- **Is the voltage greater than 10 volts?**

I7 CHECK CIRCUIT GD133 (BK) FOR AN OPEN

- Measure the resistance between seat control switch C352-3, circuit GD133 (BK), harness side and ground.

N0010815

- **Is the resistance less than 5 ohms?**

Yes
GO to I8 .

No
REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable.

CONNECT driver safety belt buckle and pretensioner C3201.

CONNECT driver seat side air bag module C3049.

REPOWER the SRS . REFER to Section 501-20B .

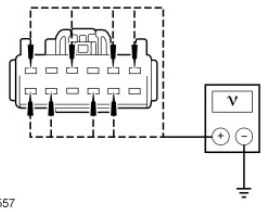
I8 CHECK SEAT CONTROL SWITCH TO DRIVER SEAT MODULE CIRCUITS FOR A SHORT TO VOLTAGE

- Disconnect: DSM C341b.
- Ignition ON.
- Measure for voltage between the following seat control switch C352 pins, harness side and ground.

Connector	Circuit
C352-9	CPS28 (GN)
C352-4	CPS23 (GN/VT)
C352-2	CPS25 (WH/VT)
C352-6	CPS24 (GY)
C352-11	CPS29 (WH/BN)
C352-8	CPS30 (VT/BN)
C352-12	CPS26 (YE/BU)
C352-1	CPS27 (BU/BN)

Yes
REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable.



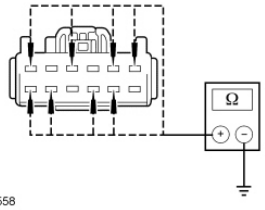
CONNECT driver safety belt buckle and pretensioner C3201.

CONNECT driver seat side air bag module C3049.

REPOWER the SRS . REFER to Section 501-20B .

No
GO to I9 .

tomsn048@gmail.com



- **Is voltage present on any circuits?**

I9 CHECK SEAT CONTROL SWITCH TO DSM CIRCUITS FOR A SHORT TO GROUND

- Ignition OFF.
- Measure the resistance between the following seat control switch C352 pins, harness side and ground.

Connector	Circuit
C352-9	CPS28 (GN)
C352-4	CPS23 (GN/VT)
C352-2	CPS25 (WH/VT)
C352-6	CPS24 (GY)
C352-11	CPS29 (WH/BN)
C352-8	CPS30 (VT/BN)
C352-12	CPS26 (YE/BU)
C352-1	CPS27 (BU/BN)

- **Are the resistances greater than 10,000 ohms?**

Yes
GO to I10 .

No
REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable.

CONNECT driver safety belt buckle and pretensioner C3201.

CONNECT driver seat side air bag module C3049.

REPOWER the SRS . REFER to Section 501-20B .

I10 CHECK SEAT CONTROL SWITCH TO DSM CIRCUITS FOR AN OPEN

- Measure the resistance between the following seat control switch C352 pins, harness side and DSM C341b pins, harness side.

Seat Control Switch Connector	Circuit	DSM Connector
C352-9	CPS28 (GN)	C341b-15

Yes
INSTALL a new DSM and CARRY OUT Programmable Module Installation (PMI). REFER to Section 419-10 . REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable.

CONNECT driver safety belt

C352-4	CPS23 (GN/VT)	C341b-3
C352-2	CPS25 (WH/VT)	C341b-14
C352-6	CPS24 (GY)	C341b-2
C352-11	CPS29 (WH/BN)	C341b-17
C352-8	CPS30 (VT/BN)	C341b-5
C352-12	CPS26 (YE/BU)	C341b-4
C352-1	CPS27 (BU/BN)	C341b-16

- **Are the resistances less than 5 ohms?**

buckle and pretensioner C3201.

CONNECT driver seat side air bag module C3049.

REPOWER the SRS . REFER to Section 501-20B .

No
REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable.

CONNECT driver safety belt buckle and pretensioner C3201.

CONNECT driver seat side air bag module C3049.

REPOWER the SRS . REFER to Section 501-20B .

I11 CHECK THE DSM FOR CORRECT OUTPUTS USING A SCAN TOOL AND DSM ACTIVE COMMANDS

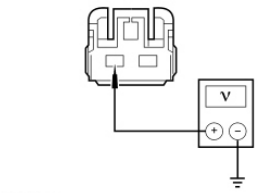
- Enter the following diagnostic mode on the scan tool: DataLogger - DSM - PIDs.
  - ♦ Front Motor Up (FRONT_UP)
  - ♦ Front Motor Down (FRONT_DWN)
  - ♦ Rear Motor Up (REAR_UP)
  - ♦ Rear Motor Down (REAR_DWN)
  - ♦ Horizontal Motor Forward (HORZ_FWD)
  - ♦ Horizontal Motor Backward (HORZ_BWD)
  - ♦ Recline Motor Forward (RECL_FWD)
  - ♦ Recline Motor Backward (RECL_BWD)
- Toggle the DSM active commands ON and OFF while monitoring the seat movement.
- **Does the driver seat operate correctly using the active commands?**

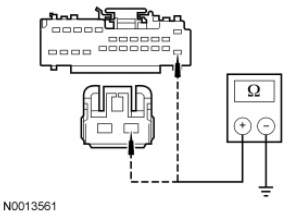
Yes
INSTALL a new DSM and CARRY OUT Programmable Module Installation (PMI). REFER to Section 419-10 . REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable.

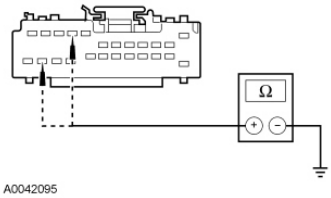
CONNECT driver safety belt buckle and pretensioner C3201.

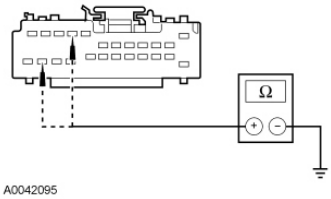
CONNECT driver seat side air bag module C3049.





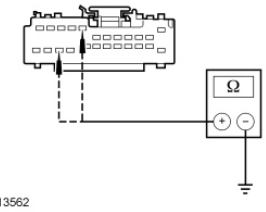
REPOWER the SRS . REFER to Section 501-20B .

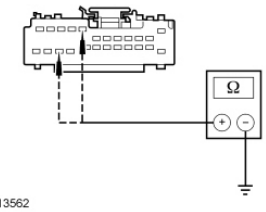




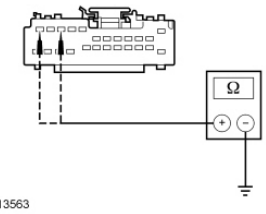
No
If no seat movement, GO to I12 .

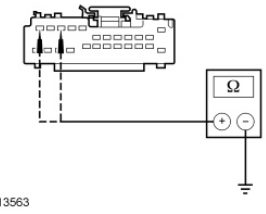
If no front vertical seat movement, GO to I22 .





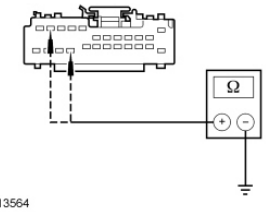
If no rear vertical seat

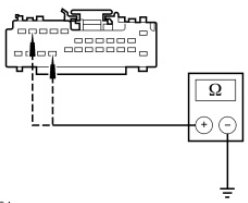




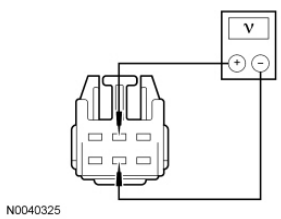
tomsn048@gmail.com

	movement, GO to I25 . If no horizontal seat movement, GO to I28 . If no recline seat movement, GO to I31 .
I12 CHECK DSM CIRCUIT SBB14 (BN/RD) FOR VOLTAGE	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect: Driver Seat Safety Belt Buckle Pretensioner C3201. • Disconnect: Driver Seat Side Air Bag C3049. • Disconnect: DSM C341a. • ⚠ **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Connect the battery ground cable. Refer to Section 414-01 . • Measure the voltage between DSM C341a-2, circuit SBB14 (BN/RD), harness side and ground.  N0013560 • **Is the voltage greater than 10 volts?**	**Yes** GO to I13 . **No** VERIFY Battery Junction Box (BJB) fuse 14 (30A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the Wiring Diagrams Manual to identify possible causes of the circuit short. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle and pretensioner C3201. CONNECT driver seat side air bag module C3049. REPOWER the SRS . REFER to Section 501-20B .
I13 CHECK CIRCUITS GD133 (BK) AND GD143 (BK/VT) FOR AN OPEN	
• Disconnect: DSM C341c. • Measure the resistance between: ♦ DSM C341a-1, circuit GD133 (BK), harness side and ground. ♦ DSM C341c-13, circuit GD143 (BK/VT), harness side and ground.  N0013561	**Yes** GO to I14 . **No** REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle and pretensioner C3201. CONNECT driver seat side air bag module C3049.





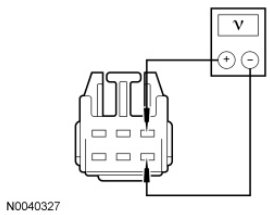
• **Is the resistance less than 5 ohms?**	REPOWER the SRS . REFER to Section 501-20B .
I14 CHECK CIRCUITS CPS03 (VT/GY) AND CPS02 (GY/YE) FOR A SHORT TO GROUND	
• Disconnect: DSM C341b. • Measure the resistance between: ♦ DSM C341b-9, circuit CPS03 (VT/GY), harness side and ground. ♦ DSM C341b-23, circuit CPS02 (GY/YE), harness side and ground.  A0042095 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to I16 . **No** GO to I15 .
I15 CHECK FRONT HEIGHT POWER SEAT MOTOR CIRCUITS CPS03 (VT/GY) AND CPS02 (GY/YE) FOR A SHORT TO GROUND	
• Disconnect: Power Seat Motor C353. • Measure the resistance between: ♦ DSM C341b-9, circuit CPS03 (VT/GY), harness side and ground. ♦ DSM C341b-23, circuit CPS02 (GY/YE), harness side and ground.  A0042095 • **Are the resistances greater than 10,000 ohms?**	**Yes** INSTALL a new driver seat track assembly. REFER to Seat Track in this section. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle and pretensioner C3201. CONNECT driver seat side air bag module C3049. REPOWER the SRS . REFER to Section 501-20B . **No** REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle and pretensioner C3201.



tomsn048@gmail.com

	CONNECT driver seat side air bag module C3049. REPOWER the SRS . REFER to Section 501-20B .
I16 CHECK CIRCUITS CPS05 (BU/WH) AND CPS04 (YE/OG) FOR A SHORT TO GROUND	
• Measure the resistance between: ♦ DSM C341b-8, circuit CPS05 (BU/WH), harness side and ground. ♦ DSM C341b-22, circuit CPS04 (YE/OG), harness side and ground.  N0013562 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to I18 . **No** GO to I17 .
I17 CHECK THE REAR HEIGHT POWER SEAT MOTOR CIRCUITS CPS05 (BU/WH) AND CPS04 (YE/OG) FOR A SHORT TO GROUND	
• Disconnect: Power Seat Motor C353. • Measure the resistance between: ♦ DSM C341b-8, circuit CPS05 (BU/WH), harness side and ground. ♦ DSM C341b-22, circuit CPS04 (YE/OG), harness side and ground.  N0013562 • **Are the resistances greater than 10,000 ohms?**	**Yes** INSTALL a new driver seat track assembly. REFER to Seat Track in this section. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle and pretensioner C3201. CONNECT driver seat side air bag module C3049. REPOWER the SRS . REFER to Section 501-20B . **No** REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle and pretensioner C3201.

	CONNECT driver seat side air bag module C3049. REPOWER the SRS . REFER to Section 501-20B .
I18 CHECK CIRCUITS CPS06 (GN/WH) AND CPS01 (GN/BU) FOR A SHORT TO GROUND	
• Measure the resistance between: ♦ DSM C341b-10, circuit CPS06 (GN/WH), harness side and ground. ♦ DSM C341b-12, circuit CPS01 (GN/BU), harness side and ground.  N0013563 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to I20 . **No** GO to I19 .
I19 CHECK THE HORIZONTAL POWER SEAT MOTOR CIRCUITS CPS06 (GN/WH) AND CPS01 (GN/BU) FOR A SHORT TO GROUND	
• Disconnect: Power Seat Motor C353. • Measure the resistance between: ♦ DSM C341b-10, circuit CPS06 (GN/WH), harness side and ground. ♦ DSM C341b-12, circuit CPS01 (GN/BU), harness side and ground.  N0013563 • **Are the resistances greater than 10,000 ohms?**	**Yes** INSTALL a new driver seat track assembly. REFER to Seat Track in this section. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle and pretensioner C3201. CONNECT driver seat side air bag module C3049. REPOWER the SRS . REFER to Section 501-20B . **No** REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt



tomsn048@gmail.com

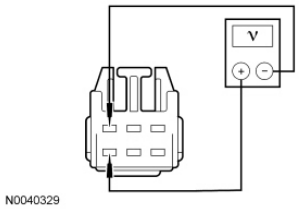
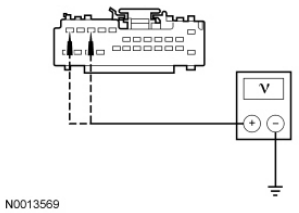
I20 CHECK CIRCUITS CPS07 (GY/BN) AND CPS08 (VT/OG) FOR A SHORT TO GROUND	
• Measure the resistance between: ♦ DSM C341b-11, circuit CPS07 (GY/BN), harness side and ground. ♦ DSM C341b-21, circuit CPS08 (VT/OG), harness side and ground.  N0013564 • **Are the resistances greater than 10,000 ohms?**	**Yes** INSTALL a new DSM and CARRY OUT Programmable Module Installation (PMI). REFER to Section 419-10 . REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle and pretensioner C3201. CONNECT driver seat side air bag module C3049. REPOWER the SRS . REFER to Section 501-20B . **No** GO to I21 .
I21 CHECK THE DRIVER POWER SEAT RECLINER MOTOR CIRCUITS CPS07 (GY/BN) AND CPS08 (VT/OG) FOR A SHORT TO GROUND	
• Disconnect: Driver Power Seat Recliner Motor C3187. • Measure the resistance between: ♦ DSM 341b-11, circuit CPS07 (GY/BN), harness side and ground. ♦ DSM C341b-21, circuit CPS08 (VT/OG), harness side and ground.  N0013564 • **Are the resistances greater than 10,000 ohms?**	**Yes** INSTALL a new driver seat recliner motor. REFER to Seat Recliner Motor in this section. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle and pretensioner C3201. CONNECT driver seat side air bag module C3049. REPOWER the SRS . REFER to Section 501-20B .

	No REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle and pretensioner C3201. CONNECT driver seat side air bag module C3049. REPOWER the SRS . REFER to Section 501-20B .
I22 CHECK THE FRONT HEIGHT POWER SEAT MOTOR FOR CORRECT OPERATION	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect: Driver Seat Safety Belt Buckle Pretensioner C3201. • Disconnect: Driver Seat Side Air Bag C3049. • Disconnect: Power Seat Motor C353. • ⚠ **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Connect the battery ground cable. Refer to Section 414-01 . • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger - DSM - PIDs. ♦ Front Motor Up (FRONT_UP) ♦ Front Motor Down (FRONT_DWN) • Measure the voltage between power seat motor C353-2, circuit CPS03 (VT/GY) and C353-5, circuit CPS02 (GY/YE), harness side while toggling DSM active commands front motor up and front motor down, ON and OFF.  N0040325 • **Is voltage present when the motor is commanded ON and no voltage present when commanded OFF?**	**Yes** INSTALL a new driver seat track assembly. REFER to Seat Track in this section. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle and pretensioner C3201. CONNECT driver seat side air bag module C3049. REPOWER the SRS . REFER to Section 501-20B . **No** GO to I23 .

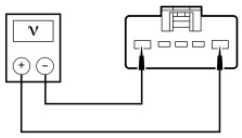


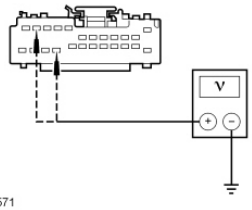


tomsn048@gmail.com

I23 CHECK CIRCUITS CPS03 (VT/GY) AND CPS02 (GY/YE) FOR A SHORT TO VOLTAGE	
• Disconnect: DSM C341b. • Measure the voltage between: ♦ DSM C341b-9, circuit CPS03 (VT/GY), harness side and ground. ♦ DSM C341b-23, circuit CPS02 (GY/YE), harness side and ground.  N0013565 • **Is voltage present on either circuit?**	**Yes** REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle and pretensioner C3201. CONNECT driver seat side air bag module C3049. REPOWER the SRS . REFER to Section 501-20B . **No** GO to I24 .
I24 CHECK CIRCUITS CPS03 (VT/GY) AND CPS02 (GY/YE) FOR AN OPEN	
• Ignition OFF. • Measure the resistance between: ♦ DSM C341b-9, circuit CPS03 (VT/GY), harness side and power seat motor C353-2, circuit CPS03 (VT/GY), harness side. ♦ DSM C341b-23, circuit CPS02 (GY/YE), harness side and power seat motor C353-5, circuit CPS02 (GY/YE), harness side.  N0092896 • **Are the resistances less than 5 ohms?**	**Yes** INSTALL a new DSM and CARRY OUT Programmable Module Installation (PMI). REFER to Section 419-10 . REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle and pretensioner C3201. CONNECT driver seat side air bag module C3049. REPOWER the SRS . REFER to Section 501-20B . **No** REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle and pretensioner C3201.

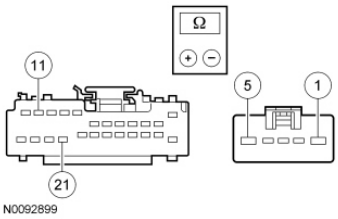
	CONNECT driver seat side air bag module C3049. REPOWER the SRS . REFER to Section 501-20B .
I25 CHECK THE REAR HEIGHT MOTOR FOR CORRECT OPERATION	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect: Driver Seat Safety Belt Buckle Pretensioner C3201. • Disconnect: Driver Seat Side Air Bag C3049. • Disconnect: Power Seat Motor C353. • ⚠ **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Connect the battery ground cable. Refer to Section 414-01 . • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger - DSM - PIDs. ♦ Rear Motor Up (REAR_UP) ♦ Rear Motor Down (REAR_DWN) • Measure the voltage between power seat motor C353-1, circuit CPS05 (BU/WH), harness side and C353-4, circuit CPS04 (YE/OG), harness side while toggling DSM active commands rear motor up and rear motor down, ON and OFF.  N0040327 • **Is voltage present when the motor is commanded ON and no voltage present when commanded OFF?**	**Yes** INSTALL a new driver seat track assembly. REFER to Seat Track in this section. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle and pretensioner C3201. CONNECT driver seat side air bag module C3049. REPOWER the SRS . REFER to Section 501-20B . **No** GO to I26 .
I26 CHECK CIRCUITS CPS05 (BU/WH) AND CPS04 (YE/OG) FOR A SHORT TO VOLTAGE	
• Disconnect: DSM C341b. • Measure the voltage between: ♦ DSM C341b-8, circuit CPS05 (BU/WH), harness side and ground. ♦ DSM C341b-22, circuit CPS04 (YE/OG), harness side and ground.	**Yes** REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt





tomsn048@gmail.com

 • **Is voltage present on either circuit?**	buckle and pretensioner C3201. CONNECT driver seat side air bag module C3049. REPOWER the SRS . REFER to Section 501-20B . **No** GO to I27 .
I27 CHECK CIRCUITS CPS05 (BU/WH) AND CPS04 (YE/OG) FOR AN OPEN	
• Ignition OFF. • Measure the resistance between: ♦ DSM C341b-8, circuit CPS05 (BU/WH), harness side and power seat motor C353-1, circuit CPS05 (BU/WH), harness side. ♦ DSM C341b-22, circuit CPS04 (YE/OG), harness side and rear height power seat motor C353-4, circuit CPS04 (YE/OG), harness side.  • **Are the resistances less than 5 ohms?**	**Yes** INSTALL a new DSM and CARRY OUT Programmable Module Installation (PMI). REFER to Section 419-10 . REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle and pretensioner C3201. CONNECT driver seat side air bag module C3049. REPOWER the SRS . REFER to Section 501-20B . **No** REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle and pretensioner C3201. CONNECT driver seat side air bag module C3049. REPOWER the SRS . REFER to Section 501-20B .
I28 CHECK THE HORIZONTAL MOTOR FOR CORRECT OPERATION	



• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect: Driver Seat Safety Belt Buckle Pretensioner C3201. • Disconnect: Driver Seat Side Air Bag C3049. • Disconnect: Power Seat Motor C353. • ⚠ **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Connect the battery ground cable. Refer to Section 414-01 . • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger - DSM - PIDs. ♦ Horizontal Motor Forward (HORZ_FWD) ♦ Horizontal Motor Backward (HORZ_BWD) • Measure the voltage between power seat motor C353-3, circuit CPS01 (GN/BU) and C353-6, circuit CPS06 (GN/WH), harness side while toggling DSM active commands horizontal motor forward and horizontal motor backward, ON and OFF.  N0040329 • **Is voltage present when the motor is commanded ON and no voltage present when commanded OFF?**	**Yes** INSTALL a new driver seat track assembly. REFER to Seat Track in this section. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle and pretensioner C3201. CONNECT driver seat side air bag module C3049. REPOWER the SRS . REFER to Section 501-20B . **No** GO to I29 .
I29 CHECK CIRCUITS CPS01 (GN/BU) AND CPS06 (GN/WH) FOR A SHORT TO VOLTAGE	
• Disconnect: DSM C341b. • Measure the voltage between: ♦ DSM C341b-10, circuit CPS06 (GN/WH), harness side and ground. ♦ DSM C341b-12, circuit CPS01 (GN/BU), harness side and ground.  N0013569 • **Is voltage present on either circuit?**	**Yes** REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle and pretensioner C3201. CONNECT driver seat side air bag module C3049. REPOWER the SRS . REFER to Section 501-20B .

tomsn048@gmail.com

	No GO to I30 .
I30 CHECK CIRCUITS CPS01 (GN/BU) AND CPS06 (GN/WH) FOR AN OPEN	
• Ignition OFF. • Measure the resistance between: ♦ DSM C341b-10, circuit CPS06 (GN/WH), harness side and horizontal power seat motor C353-6, circuit CPS06 (GN/WH), harness side. ♦ DSM C341b-12, circuit CPS01 (GN/BU), harness side and horizontal power seat motor C353-3, circuit CPS01 (GN/BU), harness side.  • **Are the resistances less than 5 ohms?**	**Yes** INSTALL a new DSM and CARRY OUT Programmable Module Installation (PMI). REFER to Section 419-10 . REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle and pretensioner C3201. CONNECT driver seat side air bag module C3049. REPOWER the SRS . REFER to Section 501-20B . **No** REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle and pretensioner C3201. CONNECT driver seat side air bag module C3049. REPOWER the SRS . REFER to Section 501-20B .
I31 CHECK THE DRIVER SEAT POWER RECLINER MOTOR FOR CORRECT OPERATION	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect: Driver Seat Safety Belt Buckle Pretensioner C3201. • Disconnect: Driver Seat Side Air Bag C3049. • Disconnect: Driver Seat Power Recliner Motor C3187. • ⚠ **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag**	**Yes** INSTALL a new driver seat recliner assembly. REFER to Seat Recliner Motor in this section. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt

module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment. • Connect the battery ground cable. Refer to Section 414-01 . • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger - DSM - PIDs. ♦ Recline Motor Forward (RECL_FWD) ♦ Recline Motor Backward (RECL_BWD) • Measure the voltage between driver seat power recliner motor C3187-1, circuit CPS07 (GY/BN) and C3187-5, circuit CPS08 (VT/OG), harness side while toggling DSM active commands recliner motor forward and recliner motor backward, ON and OFF.  N0040377 • **Is voltage present when the motor is commanded ON and no voltage present when commanded OFF?**	buckle and pretensioner C3201. CONNECT driver seat side air bag module C3049. REPOWER the SRS . REFER to Section 501-20B . **No** GO to I32 .
I32 CHECK CIRCUITS CPS07 (GY/BN) AND CPS08 (VT/OG) FOR A SHORT TO VOLTAGE	
• Disconnect: DSM C341b. • Measure the voltage between: ♦ DSM C341b-11, circuit CPS07 (GY/BN), harness side and ground. ♦ DSM C341b-21, circuit CPS08 (VT/OG), harness side and ground.  N0013571 • **Is voltage present on either circuit?**	**Yes** REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle and pretensioner C3201. CONNECT driver seat side air bag module C3049. REPOWER the SRS . REFER to Section 501-20B . **No** GO to I33 .
I33 CHECK CIRCUITS CPS07 (GY/BN) AND CPS08 (VT/OG) FOR AN OPEN	

tomsn048@gmail.com

• Ignition OFF. • Measure the resistance between: ♦ DSM C341b-11, circuit CPS07 (GY/BN), harness side and recliner power seat motor C3187-1, circuit CPS07 (GY/BN), harness side. ♦ DSM C341b-21, circuit CPS08 (VT/OG), harness side and recliner power seat motor C3187-5, circuit CPS08 (VT/OG), harness side.  N0092899 • **Are the resistances less than 5 ohms?**	**Yes** INSTALL a new DSM and CARRY OUT Programmable Module Installation (PMI). REFER to Section 419-10 . REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle and pretensioner C3201. CONNECT driver seat side air bag module C3049. REPOWER the SRS . REFER to Section 501-20B . **No** REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle and pretensioner C3201. CONNECT driver seat side air bag module C3049. REPOWER the SRS . REFER to Section 501-20B .

Pinpoint Test J: The Memory Seat Does Not Operate Correctly - Does Not Operate Using the Memory SET Switch

Refer to Wiring Diagrams Cell 123 , Memory Seats for schematic and connector information.

Normal Operation

The driver seat control switch is supplied battery voltage on circuit SBP01 (RD) and ground on circuit GD133 (BK). When pressed, the seat control switch supplies the voltage and ground to the applicable Driver Seat Module (DSM) inputs. The DSM then supplies voltage and ground to the appropriate power seat track motor or power recline motor based on the inputs received from the seat control switch. When pressed in the opposite direction, the seat control switch reverses the polarity to the DSM inputs, and the DSM likewise reverses polarity of the appropriate power seat track motor or power recliner motor circuits causing the seat or backrest to move in the opposite direction. There are 3 power seat track motors that combine to move the seat horizontally (forward/rearward) and vertically (front up/down and rear up/down). The seat backrest power recliner mechanism uses a single motor to move the seat backrest forward and rearward.

Battery voltage is also supplied to DSM on circuits SBP01 (RD) and SBB14 (BN/RD). Ground is supplied to the DSM on circuits GD133 (BK) and GD143 (BK/VT).

Each motor, in the memory power seat track and power recliner mechanism contains a Hall-effect position sensor. The DSM supplies a signal feed circuit to each position sensor and a shared reference signal return circuit. Each position sensor sends a signal voltage back to the DSM used to monitor the position of the power seat track and backrest. The DSM uses this information to return the seat to a stored pre-programmed position when pressing the memory SET switch or a remote entry transmitter. Refer to Principles of Operation in this section or the Owner's Literature for information on programming the DSM for storing memory seat positions.

The following pinpoint test diagnoses a memory seat that does not operate correctly using the memory SET switch. If the memory seat does not move in all directions using the seat control switch, GO to Pinpoint Test I
.

DTC Description	Fault Trigger Conditions
• B1342 - ECU is Faulted	If a programming error is detected, the DTC is set.
• B1530 - Memory SET Switch Circuit Short to Ground • B1534 - Memory 1 Switch Circuit Short to Ground • B1538 - Memory 2 Switch Circuit Short to Ground	If a short to ground is sensed on the switch input circuit during the DSM self-test, the DTC is set. If activity is sensed on the input circuit for greater than 2 minutes, the DTC is set as continuous. With the DTC set, any input signal on the circuit is ignored.
• B1663 - Seat Driver Front Up/Down Motor Stalled • B1664 - Seat Driver Rear Up/Down Motor Stalled • B1665 - Seat Driver Forward/Backward Motor Stalled	During the self-test, the DSM attempts to operate the seat track motors and uses the motor's position sensor to monitor movement. If no motor movement is sensed, a DTC is set. The DSM will retry motor operation on the next activation of the seat control switch. If no movement continues to be monitored after 250 milliseconds, the DSM disables the output.
• B1666 - Seat Driver Recline Motor Stalled	During the self-test, the DSM attempts to operate the recliner motor and uses the recliner motor position sensor to monitor movement. If no motor movement is sensed, the DTC is set. The DSM will retry motor operation on the next activation of the seat control switch. If no motor movement is still monitored after 250 milliseconds, the DSM disables the output.
• B1952 - Seat Rear Up/Down Position Feedback Circuit Short to Battery	If a short to voltage condition is present on the affected motor's position sensor (Hall effect) feedback circuit, the DTC is set. After a DTC is set, a memory recall is not possible but the seat control switch can operate the associated motor in one second increments.

tomsn048@gmail.com

• B1956 - Seat Front Up/Down Position Feedback Circuit Short to Battery • B1960 - Seat Recline Forward/Backward Position Feedback Circuit Short to Battery • B1964 - Seat Horizontal Forward/Rearward Position Feedback Circuit Short to Battery	
• B1953 - Seat Rear Up/Down Position Feedback Circuit Short to Ground • B1957 - Seat Front Up/Down Position Feedback Circuit Short to Ground • B1961 - Seat Recline Forward/Backward Position Feedback Circuit Short to Ground • B1965 - Seat Horizontal Forward/Rearward Position Feedback Circuit Short to Ground	If a short to ground condition is present on the affected motor's position sensor (Hall effect) feedback circuit, the DTC is set. After a DTC is set, a memory recall is not possible but the seat control switch can operate the associated motor in one second increments.
• B2084 - Memory SET Indicator Short to Ground	If a short to ground or open condition is present on the memory SET switch indicator output circuit, the DTC is set.

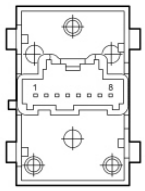
This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Memory SET switch
- Missing status information (Controller Area Network (CAN) communication bus message):
  - ♦ ignition switch status
  - ♦ gear selector position
- Remote entry transmitter
- Memory power seat track
- Recliner mechanism
- DSM

PINPOINT TEST J: THE MEMORY SEAT DOES NOT OPERATE CORRECTLY - DOES NOT OPERATE USING THE MEMORY SET SWITCH

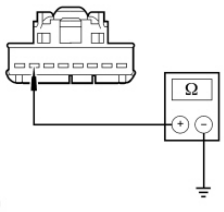
NOTE: The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.



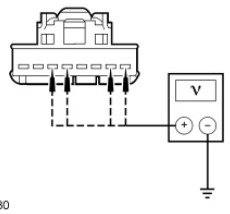
NOTE: Verify good battery condition before diagnosing the memory seat system. Poor battery condition may interfere with memory seat operation, even if vehicle starting is possible.

NOTE: Verify the PID(s) states agree with the ignition switch and transmission gear selector in all positions before proceeding with memory seat diagnosis.



Test Step	Result / Action to Take
J1 CHECK DSM TRANSMISSION GEAR SELECTED (TRANSGEAR) PID STATES	
• Connect the scan tool. • Enter the following diagnostic mode on the scan tool: DataLogger - DSM - PID: TRANSGEAR (PRNDL). • Operate the transmission gear selector in all positions while monitoring the following DSM PID TRANSGEAR states: ♦ Drive1 ♦ Drive2 ♦ Drive3 ♦ D6_PRK ♦ NTRL ♦ REV ♦ D6_PRK • **Do the PID states agree with the selected positions?**	**Yes** GO to J2 . **No** To diagnose a transmission gear selector (PRNDL) status concern, REFER to Section 307-01A or Section 307-01B .
J2 CHECK THE IGNITION SWITCH STATUS (IGN_SW) PID	
• Enter the following diagnostic mode on the scan tool: DataLogger - DSM - PID: IGN_SW PID. • Cycle the ignition switch in all positions while monitoring the following DSM IGN_SW PID states: ♦ Off ♦ Accessory ♦ Run ♦ Start • **Do the PID states agree with the selected positions?**	**Yes** GO to J3 . **No** To diagnose an ignition switch status concern, REFER to Section 211-05 .
J3 RETRIEVE THE DTCs	
• **NOTE:** During the self-test, each memory motor will be requested to move for one second. If a motor is near the end of travel, that position sensor feedback will not change as expected for one second resulting in a false DTC. • Place the memory seat and adjustable memory pedals in central travel positions. • Enter the following diagnostic mode on the scan tool: Self Test - DSM .	**Yes** If the memory SET indicator fails to illuminate during the self-test, GO to J7 . If DTC B2084, GO to J7 . If DTCs B1952, B1956, B1960 and B1964 are all retrieved, GO to J10 .

tomsn048@gmail.com



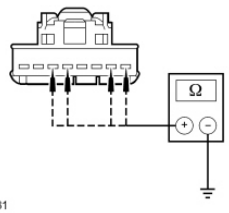
• **NOTE:** During the self-test, document when the memory SET indicator illuminates and turns off. • **Are any DTCs retrieved or does the memory SET indicator fail to illuminate during the self-test?**	If DTCs B1953, B1957, B1961 and B1965 are all retrieved, GO to J10 . If DTC B1530, GO to J5 . If DTC B1534, GO to J5 . If DTC B1538, GO to J5 . If DTC B1663, GO to J11 . If DTC B1664, GO to J14 . If DTC B1665, GO to J17 . If DTC B1666, GO to J20 . If DTC B1952, GO to J14 . If DTC B1953, GO to J14 . If DTC B1956, GO to J11 . If DTC B1957, GO to J11 . If DTC B1960, GO to J20 . If DTC B1961, GO to J20 . If DTC B1964, GO to J17 . If DTC B1965, GO to J17 . If DTC B1342, INSTALL a new DSM and CARRY OUT Programmable Module Installation (PMI). REFER to Section 419-10 . REPEAT the self-test. CLEAR the DTCs. For any other DSM DTCs, REFER to the Driver Seat Module (DSM) DTC Chart. **No** GO to J4 .
J4 MONITOR THE DSM PIDs AND CHECK THE DSM FOR CORRECT MEMORY SET SWITCH INPUTS	
• Enter the following diagnostic mode on the scan tool: DataLogger - DSM - PID: Memory Set/Recall Input Switch Status. ♦ Memory 1 recall switch status (MEM_1) ♦ Memory 2 recall switch status (MEM_2) ♦ Memory SET switch status (MEM_S)	**Yes** GO to J10 . **No** GO to J5 .

• Monitor the DSM memory SET switch, memory SET/recall 1 switch and memory SET/recall 2 switch PID while activating the memory SET switch, recall 1 and recall 2 buttons. • **Do the PID values agree with the switch button positions?**	
J5 CHECK THE MEMORY SET SWITCH	
• Ignition OFF. • Remove the memory SET switch. Refer to Memory Set Switch in this section. • Using the following table to check the memory SET switch, measure the resistance between the memory SET switch pins, component side, while pressing the indicated switch buttons and compare the results to the table. **Switch Button / Pins / Ohms** Memory Switch 1 / 7 and 2 / Less than 5 Memory Switch 2 / 7 and 6 / Less than 5 Memory SET Switch / 7 and 5 / Less than 5  A0074536 • **NOTE:** Refer to multimeter user's manual for testing diodes. • Using the diode testing meter function and the following table, connect the meter leads to the memory SET switch pins, component side. Measure the voltages and compare the results to the table, to check the switch indicator. **Positive Lead / Negative Lead / Volts** Pin 1 / Pin 7 / Greater than 0.3 Pin 7 / Pin 1 / OL • Carry out the Memory SET Switch Component Test. • **Is the memory SET switch OK?**	**Yes** GO to J6 . **No** INSTALL a new memory SET switch. REFER to Memory Set Switch in this section. REPEAT the self-test. CLEAR the DTCs.
J6 CHECK CIRCUIT GD145 (BK/BU) FOR AN OPEN	

tomsn048@gmail.com

• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect: Driver Seat Safety Belt Buckle Pretensioner C3201. • Disconnect: Driver Seat Side Air Bag C3049. • ⚠ **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Connect the battery ground cable. Refer to Section 414-01 . • Measure the resistance between memory SET switch C2094-7, circuit GD145 (BK/BU), harness side and ground.  N0040379 • **Is the resistance less than 5 ohms?**	**Yes** GO to J7 . **No** REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle and pretensioner C3201. CONNECT driver seat side air bag module C3049. REPOWER the SRS . REFER to Section 501-20B .
J7 CHECK CIRCUITS CPS55 (YE/GY), CPS15 (VT/WH), RPS14 (BN/YE) AND CPS16 (YE) FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect: Driver Seat Safety Belt Buckle Pretensioner C3201. • Disconnect: Driver Seat Side Air Bag C3049. • Disconnect: DSM C341c. • ⚠ **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Connect the battery ground cable. Refer to Section 414-01 . • Ignition ON. • Measure the voltage between the following memory SET switch C2094 pins, harness side and ground:	**Yes** REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle and pretensioner C3201. CONNECT driver seat side air bag module C3049. REPOWER the SRS . REFER to Section 501-20B . **No** GO to J8 .

Connector	Circuit
C2094-1	CPS55 (YE/GY)
C2094-2	CPS15 (VT/WH)
C2094-5	RPS14 (BN/YE)
C2094-6	CPS16 (YE)



N0040380

- **Is voltage present on any circuits?**

J8 CHECK CIRCUITS CPS55 (YE/GY), CPS15 (VT/WH), RPS14 (BN/YE) AND CPS16 (YE) FOR A SHORT TO GROUND

- Ignition OFF.
- Measure the resistance between the following memory SET switch C2094 pins, harness side and ground:

Connector	Circuit
C2094-1	CPS55 (YE/GY)
C2094-2	CPS15 (VT/WH)
C2094-5	RPS14 (BN/YE)
C2094-6	CPS16 (YE)

N0040381

- **Are the resistances greater than 10,000 ohms?**

Yes
GO to J9 .

No
REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable.

CONNECT driver safety belt buckle and pretensioner C3201.

CONNECT driver seat side air bag module C3049.

REPOWER the SRS . REFER to Section 501-20B .

J9 CHECK MEMORY SET SWITCH CIRCUITS FOR AN OPEN

tomsn048@gmail.com

<table>
<tr>

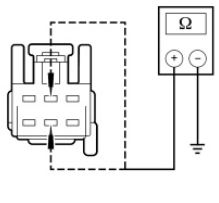
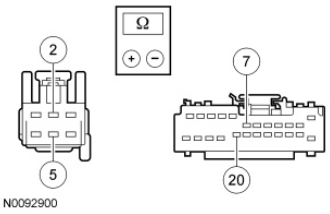
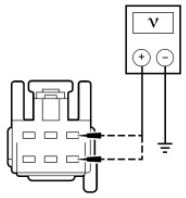
<tr><td>J10 MONITOR THE DSM PIDs</td><td></td></tr>
<tr>
<td>
• Enter the following diagnostic mode on the scan tool: DataLogger - DSM - PID: Driver Seat/Pedal Sensor Output Status.
♦ Driver Power Seat Front Up/Down Sense (SFNT_MT)
♦ Driver Power Seat Forward/Backward Sense (SFWD_MT)
♦ Driver Power Seat Recline Sense (SRCL_MT)
♦ Driver Power Seat Rear Up/Down Sense (SREARMT)
• Monitor the memory seat, and adjustable memory pedals sensor PIDs.
• Using the switches, operate the memory seat and adjustable memory pedals in all directions through the full range of travel while monitoring the PIDs.
• Does each PID indicate the sensor is operational throughout each associated motor's full range of travel?
</td>
<td>
Yes
INSTALL a new DSM and CARRY OUT Programmable Module Installation (PMI). REFER to Section 419-10 . REPEAT the self-test. CLEAR the DTCs.

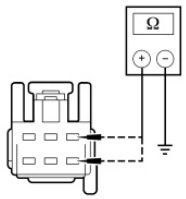
No
If front up/down position sensor PID indicates not present, GO to J11 .





If rear up/down position sensor PID indicates not present, GO to J14 .





If forward/rearward position sensor PID indicates not present, GO to J17 .

If recline position sensor PID indicates not present, GO to J20 .
</td>

REFER to Section 501-20B . **No** REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle and pretensioner C3201. CONNECT driver seat side air bag module C3049. REPOWER the SRS . REFER to Section 501-20B .

Pinpoint Test K: Easy Exit/Easy Entry is Inoperative/Does Not Operate Correctly

Normal Operation

The Driver Seat Module (DSM) receives a transmission park and key in/out command over the Medium Speed Controller Area Network (MS-CAN) communication network and powers the driver seat rearward about 51 mm (2 in).

tomsn048@gmail.com

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Easy exit/easy entry not enabled
- Missing status information (Controller Area Network (CAN) communication bus message):
  - ♦ ignition switch status
  - ♦ gear selector position
- Key-in-ignition warning switch
- Instrument Cluster (IC) module
- DSM

PINPOINT TEST K: EASY EXIT/EASY ENTRY IS INOPERATIVE/DOES NOT OPERATE CORRECTLY

NOTE: Verify good battery condition before diagnosing the memory seat system. Poor battery condition may interfere with memory seat operation, even if vehicle starting is possible.

NOTE: The transmission gear selector must be in PARK and the driver seat must be at least 51 mm (2 in) from its rear stopping point for the easy entry/easy exit feature to function.

NOTE: Make sure all memory seat DTC and symptom based faults are corrected before proceeding with easy entry/easy exit diagnosis. Verify the PID(s) states agree with the ignition switch and transmission gear selector in all positions before proceeding with easy entry/easy exit diagnosis.

Test Step	Result / Action to Take
K1 CHECK THE DRIVER POWER SEAT OPERATION	
• Ignition ON. • Check the message center to verify the easy entry/easy exit feature is enabled. ♦ The easy entry/easy exit feature can be enabled/disabled using a scan tool in module programming. When enabled, the feature becomes a user accessible item on the message center allowing the user to turn the feature on and off. Refer to the Owner's Literature or Section 413-01 for information on the message center. • Using the seat control switch, verify the driver power seat operates fully forward and rearward. • **NOTE:** During the self-test, each memory motor will be requested to move for one second. If a motor is near the end of travel, that position sensor feedback will not change as expected for one second resulting in a false DTC. • Place the memory seat and adjustable memory pedals in central travel positions. • Connect the scan tool. • Enter the following diagnostic mode on the scan tool: Self Test - DSM .	**Yes** REFER to the Driver Seat Module (DSM) DTC Chart. **No** If disabled, ENABLE the easy entry/easy exit feature with the message center. REFER to the Owner's Literature - Driver Controls for easy entry/easy exit feature enable/disable instructions. TEST the system for normal operation. If OK, INSTRUCT the customer on correct system operation. If easy entry/easy exit is enabled and the seat does not move horizontally from the seat control switch, GO to Pinpoint Test I . Otherwise, GO to K2 .

• **Are any DSM DTCs retrieved?**	
K2 CHECK DSM TRANSMISSION GEAR SELECTED (TRANSGEAR) PID STATES	
• Enter the following diagnostic mode on the scan tool: DataLogger - DSM - PID: TRANSGEAR (PRNDL). • Operate the transmission gear selector in all positions while monitoring the following DSM PID TRANSGEAR states: ♦ Drive1 ♦ Drive2 ♦ Drive3 ♦ D6_PRK ♦ NTRL ♦ REV ♦ D6_PRK • **Do the PID states agree with the selected positions?**	**Yes** GO to K3 . **No** To diagnose a transmission gear selector (PRNDL) status concern, REFER to Section 307-01A or Section 307-01B .
K3 CHECK THE IGNITION KEY IN/OUT (IGN_KEY) PID	
• Enter the following diagnostic mode on the scan tool: DataLogger - IC Module - PID: IGN_KEY PID. • Insert and remove the ignition key into the ignition lock cylinder while monitoring the following IC module PID IGN_SW states: ♦ In ♦ Out • Monitor the IC module PID IGN_SW with the key in and out of the ignition switch. • **Do the IC module PID states agree?**	**Yes** INSTALL a new DSM and CARRY OUT Programmable Module Installation (PMI). REFER to Section 419-10 . REPEAT the self-test. CLEAR the DTCs. **No** To diagnose the key-in-ignition warning switch fault, REFER to Section 413-01 .

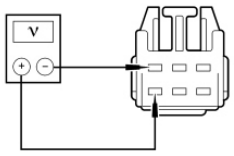
Pinpoint Test L: The Power Seat Does Not Operate Correctly - Passenger Seat

Refer to Wiring Diagrams Cell 120 , Power Seats for schematic and connector information.

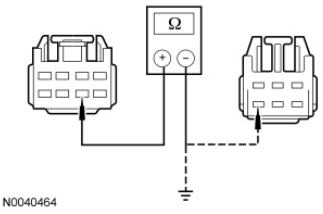
Normal Operation

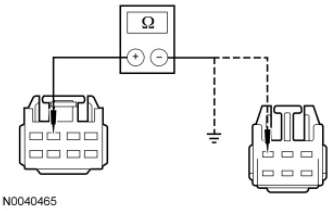
The passenger seat control switch is supplied battery voltage on circuit SBB10 (YE/RD) and ground on circuit GD151 (BK/GN). When pressed, the seat control switch supplies that voltage and ground to a power seat track motor to move the seat. When pressed in the opposite direction, the seat control switch reverses the polarity to that same power seat track motor, which moves the seat in the opposite direction. There are 3 power seat track motors that combine to move the seat cushion horizontally (forward/rearward) and vertically (front up/down and rear up/down). If a new motor needs to be installed, it is necessary to install an entire power seat track.

This pinpoint test is intended to diagnose the following:



- Wiring, terminals or connectors
- Seat control switch
- Seat track motor (seat track)

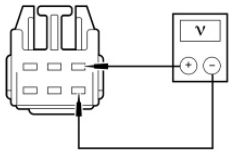


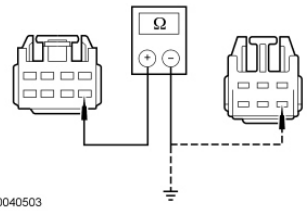


tomsn048@gmail.com

PINPOINT TEST L: THE POWER SEAT DOES NOT OPERATE CORRECTLY - PASSENGER SEAT

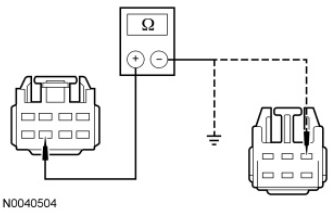
NOTE: The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is removed and the ignition switch is ON.

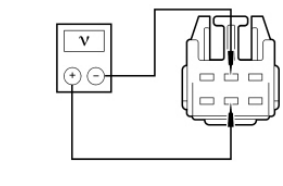




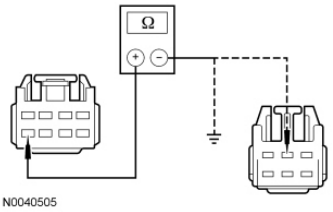
NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

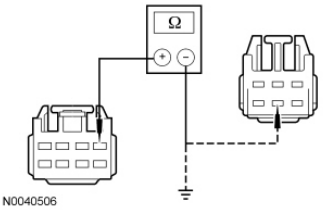
Test Step	Result / Action to Take
L1 CHECK HORIZONTAL DIRECTION MOTOR FOR CORRECT OPERATION	
• Operate the passenger power seat forward and rearward. • **Will the seat move horizontally?**	**Yes** GO to L5 . **No** GO to L2 .
L2 CHECK VOLTAGE TO THE PASSENGER SEAT HORIZONTAL MOTOR	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect: Passenger Seat Safety Belt Buckle Pretensioner C3202. • Disconnect: Passenger Seat Side Air Bag C3050. • Disconnect: Passenger Seat Motor C3015. • ⚠ **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Connect the battery ground cable. Refer to Section 414-01 . • Measure the voltage between passenger seat motor C3015-6, circuit CPS38 (GN/BU), harness side and C3015-3, circuit CPS33 (WH), harness side, while pushing the passenger seat control switch forward and rearward.  N0040420 • **Is the voltage greater than -10 volts when the switch is pushed forward, greater than +10 volts when the switch is pushed rearward and 0 volt when the switch is in a rest position?**	**Yes** INSTALL a new passenger seat track assembly. REFER to Seat Track in this section. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT the passenger safety belt buckle and pretensioner C3202. CONNECT the passenger seat side air bag module C3050. REPOWER the SRS . REFER to Section 501-20B . **No** GO to L3 .





L3 CHECK CIRCUIT CPS38 (GN/BU) FOR AN OPEN AND SHORT TO GROUND	
• Disconnect: Passenger Seat Control Switch C355. • Measure the resistance between: ♦ passenger seat control switch C355-6, circuit CPS38 (GN/BU), harness side and passenger seat motor C3015-6, circuit CPS38 (GN/BU), harness side. ♦ passenger seat control switch C355-6, circuit CPS38 (GN/BU), harness side and ground.  N0040464 • **Is the resistance less than 5 ohms between the passenger seat motor and the passenger seat control switch; and greater than 10,000 ohms between the passenger seat control switch and ground?**	**Yes** GO to L4 . **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT the passenger safety belt buckle and pretensioner C3202. CONNECT the passenger seat side air bag module C3050. REPOWER the SRS . REFER to Section 501-20B .
L4 CHECK CIRCUIT CPS33 (WH) FOR AN OPEN AND SHORT TO GROUND	
• Measure the resistance between: ♦ passenger seat control switch C355-3, circuit CPS33 (WH), harness side and passenger seat motor C3015-3, circuit CPS33 (WH), harness side. ♦ passenger seat control switch C355-3, circuit CPS33 (WH), harness side and ground.  N0040465 • **Is the resistance less than 5 ohms between the passenger seat motor and the passenger seat control switch; and greater than 10,000 ohms between the passenger seat control switch and ground?**	**Yes** INSTALL a new passenger seat control switch. REFER to Seat Control Switch in this section. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT the passenger safety belt buckle and pretensioner C3202. CONNECT the passenger seat side air bag module C3050. REPOWER the SRS . REFER to Section 501-20B . **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT passenger safety belt buckle and pretensioner C3202.





tomsn048@gmail.com

	CONNECT passenger seat side air bag module C3050. REPOWER the SRS . REFER to Section 501-20B .
L5 DETERMINE SEAT TILTING FAILURE	
• Determine seat tilting failure. • **Can the seat be tilted forward or backward?**	**Yes** If only forward tilting operates, GO to L6 . If only rear tilting operates, GO to L9 . **No** INSTALL a new passenger seat control switch. REFER to Seat Control Switch in this section. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT the passenger safety belt buckle and pretensioner C3202. CONNECT the passenger seat side air bag module C3050. REPOWER the SRS . REFER to Section 501-20B .
L6 CHECK VOLTAGE TO THE PASSENGER SEAT REAR HEIGHT MOTOR	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect: Passenger Seat Safety Belt Buckle Pretensioner C3202. • Disconnect: Passenger Seat Side Air Bag C3050. • Disconnect: Passenger Seat Motor C3015. • ⚠ **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Connect the battery ground cable. Refer to Section 414-01 . • Measure the voltage between passenger seat motor C3015-1, circuit CPS37 (WH/BU), harness side and C3015-4, circuit CPS36 (YE/GY), harness side, while depressing the rear tilt	**Yes** INSTALL a new passenger seat track assembly. REFER to Seat Track in this section. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT the passenger safety belt buckle and pretensioner C3202. CONNECT the passenger seat side air bag module C3050. REPOWER the SRS . REFER to Section 501-20B .

switch up and down.  N0040466 • **Is the voltage greater than -10 volts when the rear tilt switch is pressed down, greater than +10 volts when the rear tilt switch is pressed up and 0 volt when the switch is in the rest position?**	**No** GO to L7 .
L7 CHECK CIRCUIT CPS36 (YE/GY) FOR AN OPEN AND SHORT TO GROUND	
• Disconnect: Passenger Seat Control Switch C355. • Measure the resistance between: ♦ passenger seat control switch C355-5, circuit CPS36 (YE/GY), harness side and passenger seat motor C3015-4, circuit CPS36 (YE/GY), harness side. ♦ passenger seat control switch C355-5, circuit CPS36 (YE/GY), harness side and ground.  N0040503 • **Is the resistance less than 5 ohms between the passenger seat motor and the passenger seat control switch; and greater than 10,000 ohms between the passenger seat control switch and ground?**	**Yes** GO to L8 . **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT the passenger safety belt buckle and pretensioner C3202. CONNECT the passenger seat side air bag module C3050. REPOWER the SRS . REFER to Section 501-20B .
L8 CHECK CIRCUIT CPS37 (WH/BU) FOR AN OPEN AND SHORT TO GROUND	
• Measure the resistance between: ♦ passenger seat control switch C355-7, circuit CPS37 (WH/BU), harness side and passenger seat motor C3015-1, circuit CPS37 (WH/BU), harness side. ♦ passenger seat control switch C355-7, circuit CPS37 (WH/BU), harness side and ground.	**Yes** INSTALL a new passenger seat control switch. REFER to Seat Control Switch in this section. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT the passenger safety belt buckle and pretensioner C3202.

tomsn048@gmail.com

 N0040504 • **Is the resistance less than 5 ohms between the passenger seat motor and the passenger seat control switch; and greater than 10,000 ohms between the passenger seat control switch and ground?**	CONNECT the passenger seat side air bag module C3050. REPOWER the SRS . REFER to Section 501-20B . **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT the passenger safety belt buckle and pretensioner C3202. CONNECT the passenger seat side air bag module C3050. REPOWER the SRS . REFER to Section 501-20B .
L9 CHECK THE VOLTAGE TO THE PASSENGER SEAT FRONT HEIGHT MOTOR	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect: Passenger Seat Safety Belt Buckle Pretensioner C3202. • Disconnect: Passenger Seat Side Air Bag C3050. • Disconnect: Passenger Seat Motor C3015. • ⚠ **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Connect the battery ground cable. Refer to Section 414-01 . • Measure the voltage between passenger seat motor C3015-2, circuit CPS35 (VT/GN), harness side and C3015-5, circuit CPS34 (GY/BU), while pushing the rear tilting switch up and down.  N0040426	**Yes** INSTALL a new passenger seat track assembly. REFER to Seat Track in this section. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT the passenger safety belt buckle and pretensioner C3202. CONNECT the passenger seat side air bag module C3050. REPOWER the SRS . REFER to Section 501-20B . **No** GO to L10 .

• **Is the voltage greater than +10 volts when the front tilt switch is pressed down, greater than -10 volts when the front tilt switch is pressed up and 0 volt when the switch is in the rest position?**	
L10 CHECK CIRCUIT CPS35 (VT/GN) FOR AN OPEN AND SHORT TO GROUND	
• Disconnect: Passenger Seat Control Switch C355. • Measure the resistance between: ♦ passenger seat control switch C355-8, circuit CPS35 (VT/GN), harness side and passenger seat motor C3015-2, circuit CPS35 (VT/GN), harness side. ♦ passenger seat control switch C355-8, circuit CPS35 (VT/GN), harness side and ground.  N0040505 • **Is the resistance less than 5 ohms between the passenger seat motor and the passenger seat control switch; and greater than 10,000 ohms between the passenger seat control switch and ground?**	**Yes** GO to L11 . **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT the passenger safety belt buckle and pretensioner C3202. CONNECT the passenger seat side air bag module C3050. REPOWER the SRS . REFER to Section 501-20B .
L11 CHECK CIRCUIT CPS34 (GY/BU) FOR AN OPEN	
• Measure the resistance between: ♦ passenger seat control switch C355-1, circuit CPS34 (GY/BU), harness side, and passenger seat motor C3015-5, circuit CPS34 (GY/BU), harness side. ♦ passenger seat control switch C355-1, circuit CPS34 (GY/BU), harness side and ground.  N0040506 • **Is the resistance less than 5 ohms between the passenger seat motor and the passenger seat control switch; and greater than 10,000 ohms between the passenger seat control switch and ground?**	**Yes** INSTALL a new passenger seat control switch. REFER to Seat Control Switch in this section. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT the passenger safety belt buckle and pretensioner C3202. CONNECT the passenger seat side air bag module C3050. REPOWER the SRS . REFER to Section 501-20B . **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable.

tomsn048@gmail.com

	CONNECT the passenger safety belt buckle and pretensioner C3202. CONNECT the passenger seat side air bag module C3050. REPOWER the SRS . REFER to Section 501-20B .

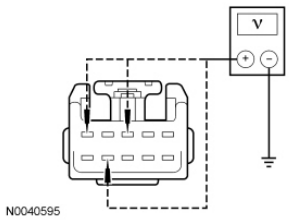
Pinpoint Test M: The Heated Seats are Inoperative

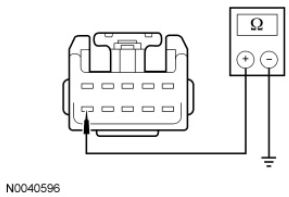
Refer to Wiring Diagrams Cell 119 , Climate Controlled Seats for schematic and connector information.

Normal Operation

The driver and passenger heated seats share a common ignition and battery feed to the heated seat control switch assembly. Ignition feed circuit CBP18 (GY/OG) supplies voltage to the logic board and illumination of the heated seat switch assembly and the battery feed circuit SBB28 (GN/RD) is used to provide voltage to the heater mats. The heated seat switch assembly uses shared ground GD145 (BK/BU) for the logic board and illumination.

When a heated seat switch is pressed with the ignition switch in RUN or START, a momentary ground is provided to the logic board of the heated seat switch assembly. The logic board then activates an internal relay in the heated seat switch assembly that provides voltage via circuit CHS02 (YE/BU) (driver seat) or CHS07 (GY/BU) (front passenger seat) to the bi-metallic thermostat that is part of the seat cushion heater mat.





The driver seat cushion and backrest heater mats are wired in series as are the passenger seat cushion and backrest heater mats. The heated seat system is designed to maintain the temperature by the opening (no voltage to the heated seat elements) and closing (voltage supplied to the heated seat elements) of the bi-metallic thermostat.

This pinpoint test is intended to diagnose the following:

- Fuse(s)
- Wiring, terminals or connectors
- Heated seat switch
- Heated seat relay
- Heated seat mat

PINPOINT TEST M: THE HEATED SEATS ARE INOPERATIVE

Test Step	Result / Action to Take
M1 CHECK HEATED SEAT SWITCH OPERATION	
• Ignition ON. • Press both heated seat switches to ON. • **Does one or both heated seat switch indicators illuminate?**	**Yes** If one or both indicators illuminate, GO to Pinpoint Test N . **No** GO to M2 .

M2 CHECK VOLTAGE TO HEATED SEAT SWITCH CIRCUITS	
• Ignition OFF. • Disconnect: Heated Seat Switch C2347. • Ignition ON. • Measure the voltage between the following heated seat switch C2347 pins, harness side and ground. **Connector / Circuit** C2347-9 — CBP18 (GY/OG) C2347-5 — SBB28 (GN/RD) C2347-3 — SBB28 (GN/RD)  N0040595 • **Are the voltages greater than 10 volts?**	**Yes** GO to M3 . **No** VERIFY Battery Junction Box (BJB) fuse 28 (20A) and Smart Junction Box (SJB) fuse 18 (10A) are OK. If OK, REPAIR circuit CBP18 (GY/OG) or SBB28 (GN/RD). If not OK, REFER to the Wiring Diagrams Manual to identify possible causes of the circuit short. TEST the system for normal operation.
M3 CHECK HEATED SEAT SWITCH GROUND CIRCUIT	
• Ignition OFF. • Measure the resistance between heated seat switch C2347-10, circuit GD145 (BK/BU), harness side and ground.  N0040596 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new heated seat switch. REFER to Heated Seat Switch in this section. **No** REPAIR circuit GD145 (BK/BU). TEST the system for normal operation.

Pinpoint Test N: The Heated Seat is Inoperative - Driver or Passenger

tomsn048@gmail.com

Refer to Wiring Diagrams Cell 119 , Climate Controlled Seats for schematic and connector information.

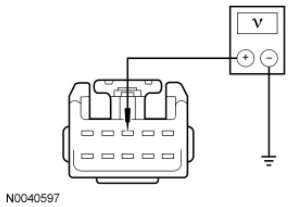
Normal Operation

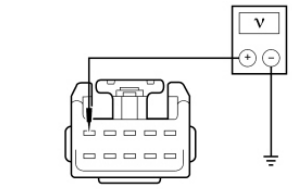
The driver and passenger heated seats share a common ignition and battery feed to the heated seat control switch assembly. Ignition feed circuit CBP18 (GY/OG) supplies voltage to the logic board and illumination of the heated seat switch assembly and the battery feed circuit SBB28 (GN/RD) is used to provide voltage to the heater mats. The heated seat switch assembly uses shared ground GD145 (BK/BU) for the logic board and illumination.

When a heated seat switch is pressed with the ignition switch in RUN or START, a momentary ground is provided to the logic board of the heated seat switch assembly. The logic board then activates an internal relay in the heated seat switch assembly that provides voltage via circuit CHS02 (YE/BU) (driver seat) or CHS07 (GY/BU) (front passenger seat) to the bi-metallic thermostat that is part of the seat cushion heater mat.

The driver seat cushion and backrest heater mats are wired in series as are the passenger seat cushion and backrest heater mats. The heated seat system is designed to maintain the temperature by the opening (no voltage to the heated seat elements) and closing (voltage supplied to the heated seat elements) of the bi-metallic thermostat.

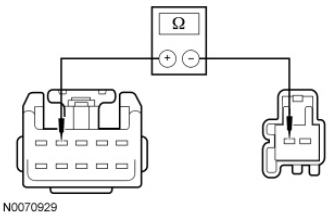
This pinpoint test is intended to diagnose the following:

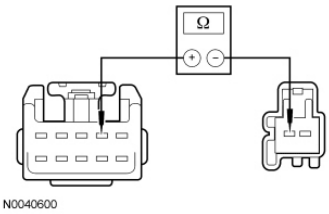


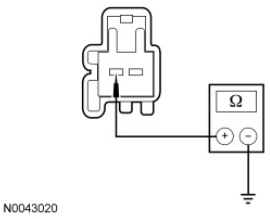


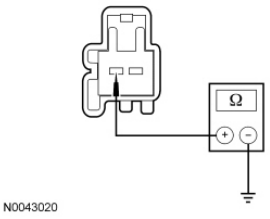
- Fuse(s)
- Wiring, terminals or connectors
- Heated seat switch
- Heated seat relay
- Heated seat mat

PINPOINT TEST N: THE HEATED SEAT IS INOPERATIVE - DRIVER OR PASSENGER

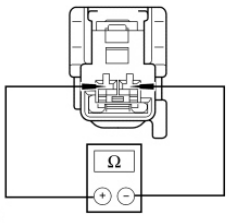


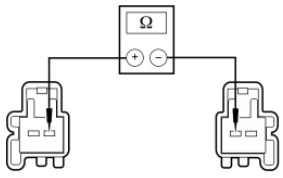






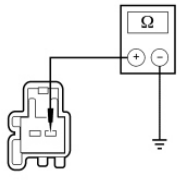
NOTE: The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is removed and the ignition switch is ON.

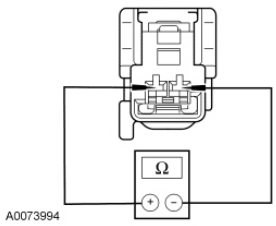




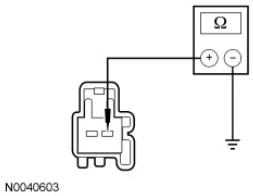
NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
N1 CHECK CIRCUIT SSB28 (GN/RD) FOR VOLTAGE	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • For heated seat diagnostics on the driver seat, carry out the following: ♦ disconnect: Driver Seat Safety Belt Buckle Pretensioner C3201. ♦ disconnect: Driver Seat Side Air Bag C3049. • For heated seat diagnostics on the passenger seat, carry out the following: ♦ disconnect: Passenger Seat Safety Belt Buckle Pretensioner C3202. ♦ disconnect: Passenger Seat Side Air Bag C3050.	**Yes** GO to N2 . **No** VERIFY Battery Junction Box (BJB) fuse 28 (20A) is OK. If OK, REPAIR circuit SBB28 (GN/RD). If not OK, REFER to the Wiring Diagrams Manual to identify possible causes of the circuit short. TEST the system for normal operation. DISCONNECT the battery ground cable.





• Disconnect: Heated Seat Switch C2347 . • ⚠ **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Connect the battery ground cable. Refer to Section 414-01 . • For driver seat, measure the voltage at heated seat switch C2347-3, circuit SBB28 (GN/RD), harness side and ground.  N0040597 • For passenger seat, measure the voltage at heated seat switch C2347-5, circuit SBB28 (GN/RD), harness side and ground.  N0040598 • **Is the voltage greater than 10 volts?**	CONNECT safety belt buckle and pretensioner C3201 (driver) or C3202 (passenger). CONNECT seat side air bag module C3049 (driver) or C3050 (passenger). REPOWER the SRS . REFER to Section 501-20B .
N2 CHECK CIRCUIT CHS02 (YE/BU) (DRIVER) OR CHS07 (GY/BU) (PASSENGER) FOR AN OPEN	
• Ignition OFF. • Disconnect: Heated Seat Cushion Element C364 (Driver) or C334 (Passenger). • For driver seat, measure the resistance between heated seat switch C2347-4, circuit CHS02 (YE/BU), harness side and driver heated seat cushion element C364-1, circuit CHS02 (YE/BU), harness side.	**Yes** GO to N3 . **No** REPAIR driver circuit CHS02 (YE/BU) or passenger circuit CHS07 (GY/BU). TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT safety belt buckle and pretensioner C3201 (driver) or C3202 (passenger). CONNECT seat side air bag module



tomsn048@gmail.com

 N0070929 • For passenger seat, measure the resistance between heated seat switch C2347-2, circuit CHS07 (GY/BU), harness side and passenger heated seat cushion element C334-1, circuit CHS07 (GY/BU), harness side.  N0040600 • **Is the resistance less than 5 ohms?**	C3049 (driver) or C3050 (passenger). REPOWER the SRS . REFER to Section 501-20B .
N3 CHECK CIRCUIT CHS02 (YE/BU) (DRIVER) OR CHS07 (GY/BU) (PASSENGER) FOR A SHORT TO GROUND	
• For driver seat, measure the resistance between heated seat cushion element C364-1, circuit CHS02 (YE/BU), harness side and ground.  N0043020 • For passenger seat, measure the resistance between heated seat cushion element C334-1, circuit CHS07 (GY/BU), harness side and ground.  N0043020 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to N4 . **No** REPAIR driver circuit CHS02 (YE/BU) or passenger circuit CHS07 (GY/BU). TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT safety belt buckle and pretensioner C3201 (driver) or C3202 (passenger). CONNECT seat side air bag module C3049 (driver) or C3050 (passenger). REPOWER the SRS . REFER to Section 501-20B .
N4 CHECK HEATED SEAT CUSHION ELEMENT FOR AN OPEN	

• Measure the resistance between driver heated seat cushion element C364-1 and C364-2, component side; or between passenger heated seat cushion element C334-1 and C334-2, component side.  A0073993 • **Is the resistance between 0.8 and 2.0 ohms?**	**Yes** GO to N5 . **No** INSTALL a new heated seat cushion element. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT safety belt buckle and pretensioner C3201 (driver) or C3202 (passenger). CONNECT seat side air bag module C3049 (driver) or C3050 (passenger). REPOWER the SRS . REFER to Section 501-20B .
N5 CHECK DRIVER HEATED SEAT CIRCUIT CHS01 (GY/VT) OR PASSENGER CIRCUIT CHS06 (BU/BN) FOR AN OPEN	
• Disconnect: Seat Back Heater C365 (Driver) or C335 (Passenger). • Measure the resistance between driver heated seat cushion element C364-2, circuit CHS01 (GY/VT), harness side and driver heated seat backrest element C365-1, circuit CHS01 (GY/VT), harness side; or between passenger heated seat cushion element C334-2, circuit CHS06 (BU/BN), harness side and passenger heated seat backrest element C335-1, circuit CHS06 (BU/BN), harness side.  N0040601 • **Is the resistance less than 5 ohms?**	**Yes** GO to N6 . **No** REPAIR driver circuit CHS01 (GY/VT) or passenger circuit CHS06 (BU/BN). TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT safety belt buckle and pretensioner C3201 (driver) or C3202 (passenger). CONNECT seat side air bag module C3049 (driver) or C3050 (passenger). REPOWER the SRS . REFER to Section 501-20B .
N6 CHECK DRIVER HEATED SEAT CIRCUIT CHS01 (GY/VT) OR PASSENGER CIRCUIT CHS06 (BU/BN) FOR A SHORT TO GROUND	

tomsn048@gmail.com

• Measure the resistance between driver heated seat cushion element C364-2, circuit CHS01 (GY/VT) or passenger heated seat cushion element C334-2, circuit CHS06 (BU/BN), harness side and ground.  N0040602 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to N7 . **No** REPAIR driver circuit CHS01 (GY/VT) or passenger circuit CHS06 (BU/BN). TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT safety belt buckle and pretensioner C3201 (driver) or C3202 (passenger). CONNECT seat side air bag module C3049 (driver) or C3050 (passenger). REPOWER the SRS . REFER to Section 501-20B .
N7 CHECK HEATED SEAT BACKREST ELEMENT FOR AN OPEN	
• Measure the resistance between driver heated seat backrest element C365-1 and C365-2, component side; or between passenger heated seat backrest element C335-1 and C335-2, component side.  A0073994 • **Is the resistance between 0.8 and 2.0 ohms?**	**Yes** GO to N8 . **No** INSTALL a new heated seat back element. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT safety belt buckle and pretensioner C3201 (driver) or C3202 (passenger). CONNECT seat side air bag module C3049 (driver) or C3050 (passenger). REPOWER the SRS . REFER to Section 501-20B .
N8 CHECK DRIVER CIRCUIT GD133 (BK) OR PASSENGER CIRCUIT GD151 (BK/GN) FOR AN OPEN	
• Measure the resistance between driver heated seat backrest element C365-2, circuit GD133 (BK) or passenger C335-2, circuit GD151 (BK/GN), harness side and ground.	**Yes** INSTALL a new heated seat switch. REFER to Heated Seat Switch in this section. TEST the system for normal operation. DISCONNECT the battery ground cable.

 • **Is the resistance less than 5 ohms?**	CONNECT safety belt buckle and pretensioner C3201 (driver) or C3202 (passenger). CONNECT seat side air bag module C3049 (driver) or C3050 (passenger). REPOWER the SRS . REFER to Section 501-20B . **No** REPAIR driver circuit GD133 (BK) or passenger circuit GD151 (BK/GN). TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT safety belt buckle and pretensioner C3201 (driver) or C3202 (passenger). CONNECT seat side air bag module C3049 (driver) or C3050 (passenger). REPOWER the SRS . REFER to Section 501-20B .

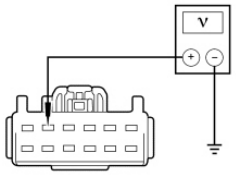
Pinpoint Test O: The Power Lumbar is Inoperative

Refer to Wiring Diagrams Cell 120 , Power Seats for schematic and connector information.

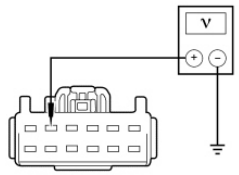
Refer to Wiring Diagrams Cell 123 , Memory Seats for schematic and connector information.

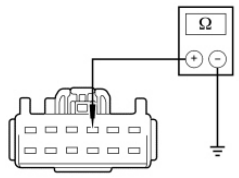
Normal Operation

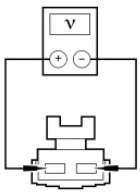
The seat control switch is supplied battery voltage on circuit SBB14 (BN/RD) (power seat) or SBP01 (RD) (memory seat) and ground on circuit GD133 (BK). When the knob of the seat control switch is pressed, voltage and ground are supplied to the power lumbar motor. When pressing the lumbar knob in the opposite direction, the lumbar control switch reverses the polarity to the power lumbar motor, which moves the lumbar mechanism in the opposite direction.



This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- Lumbar control switch
- Power lumbar motor assembly

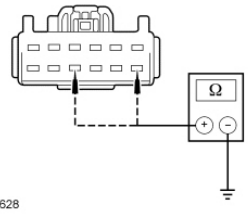


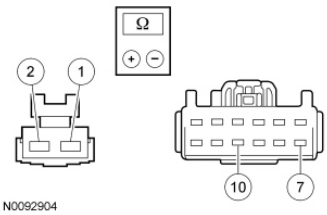




tomsn048@gmail.com

PINPOINT TEST O: THE POWER LUMBAR IS INOPERATIVE





NOTE: The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
O1 CHECK CIRCUIT SBB14 (BN/RD) (POWER SEAT) OR SBP01 (RD) (MEMORY SEAT) FOR AN OPEN	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect: Driver Seat Safety Belt Buckle Pretensioner C3201. • Disconnect: Driver Seat Side Air Bag C3049. • Disconnect: Seat Control Switch C352. • ⚠ **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Connect the battery ground cable. Refer to Section 414-01 . • For power seat, measure the voltage between seat control switch C352-5, circuit SBB14 (BN/RD), harness side and ground.  N0010816 • For memory seat, measure the voltage between seat control switch C352-5, circuit SBP01 (RD), harness side and ground.	**Yes** GO to O2 . **No** VERIFY Battery Junction Box (BJB) fuse 14 (40A) (power seat) or Smart Junction Box (SJB) fuse 1 (20A) (memory seat) is OK. If OK, REPAIR the circuit. If not OK, REFER to the Wiring Diagrams Manual to identify possible causes of the circuit short. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle and pretensioner C3201. CONNECT driver seat side air bag module C3049. REPOWER the SRS . REFER to Section 501-20B .

 N0010816 • **Is the voltage greater than 10 volts?**	
O2 CHECK CIRCUIT GD133 (BK) FOR AN OPEN	
• Measure the resistance between seat control switch C352-3, circuit GD133 (BK), harness side and ground.  N0010815 • **Is the resistance less than 5 ohms?**	**Yes** GO to O3 . **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle and pretensioner C3201. CONNECT driver seat side air bag module C3049. REPOWER the SRS . REFER to Section 501-20B .
O3 CHECK THE LUMBAR MOTOR	
• Connect: Seat Control Switch C352. • Disconnect: Power Lumbar Motor C366. • Measure the voltage between power lumbar motor C366-1, circuit CPS18 (BN/WH), harness side and power lumbar motor C366-2, circuit CPS19 (GY/VT), harness side.  N0040627 • Operate the seat control switch in both directions. • **Is the voltage greater than 10 volts in both directions?**	**Yes** INSTALL a new power lumbar assembly. REFER to Lumbar Assembly in this section. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle and pretensioner C3201. CONNECT driver seat side air bag module C3049. REPOWER the SRS . REFER to Section 501-20B . **No** GO to O4 .
O4 CHECK CIRCUITS CPS19 (GY/VT) AND CPS18 (BN/GN) FOR A SHORT TO GROUND	

tomsn048@gmail.com

• Disconnect: Seat Control Switch C352. • Measure the resistance between: ♦ seat control switch C352-7, circuit CPS19 (GY/VT), harness side and ground. ♦ seat control switch C352-10, circuit CPS18 (BN/GN), harness side and ground.  N0040628 • **Are the resistances greater than 10,000 ohms.**	**Yes** GO to O5 . **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle and pretensioner C3201. CONNECT driver seat side air bag module C3049. REPOWER the SRS . REFER to Section 501-20B .
O5 CHECK CIRCUITS CPS19 (GY/VT) AND CPS18 (BN/GN)/(BN/WH) FOR AN OPEN	
• Measure the resistance between: ♦ seat control switch C352-10, circuit CPS18 (BN/GN), harness side and power lumbar motor C366-1, circuit CPS18 (BN/WH), harness side. ♦ seat control switch C352-7, circuit CPS19 (GY/VT), harness side and power lumbar motor C366-2, circuit CPS19 (GY/VT), harness side.  N0092904 • **Are the resistances less than 5 ohms?**	**Yes** INSTALL a new seat control switch. REFER to Seat Control Switch in this section. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle and pretensioner C3201. CONNECT driver seat side air bag module C3049. REPOWER the SRS . REFER to Section 501-20B . **No** REPAIR the circuit. TEST the system for normal operation. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle and pretensioner C3201. CONNECT driver seat side air bag module C3049. REPOWER the SRS . REFER to Section 501-20B .

Pinpoint Test P: The Seat Backrest Will Not Fold Down/Fold Upright - Second Row 60 Percent or 40 Percent E-Z Entry Seat

Normal Operation

When the recliner handle is turned, it releases the outboard recliner. This also turns a gear drive in the outboard recliner, resulting in the recliner release shaft turning in the opposite direction of the recliner handle. When the recliner release shaft is turned, it releases the inboard recliner. This allows the backrest to fold down.

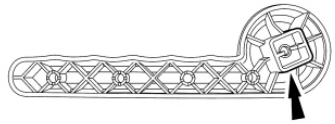
When the backrest is down, there are 2 safeties that prevent the backrest from being positioned upright (vertical) under 2 different conditions. The first condition is if the latch feet are not completely latched around the mounting plate strikers. When this happens, the cable attached to the latch feet assembly outboard latch foot holds the outboard recliner outer lock out lever back, engaging the safety, preventing the backrest from being positioned upright (vertical) and locking in position. The second condition is if the kneeling mechanism is not completely locked in the standing (upright) position. When this happens, the cable attached to the kneeling mechanism inboard leg lever holds the outboard recliner inner lock out lever back, engaging the safety, preventing the backrest from being positioned upright (vertical).

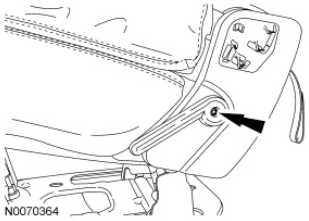
If the backrest is not folded forward and all the way down, the seat will not kneel or go up into the E-Z entry position. The backrest cannot be returned to the upright (vertical) position until the kneeling mechanism is returned to the standing (upright) position and the latch feet assembly is latched to the mounting plate strikers.

This pinpoint test is intended to diagnose the following:

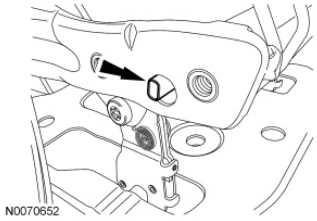
- Recliner handle or loose screw
- Inboard recliner
- Outboard recliner
- Cable assembly routing
- Cable assembly
- Kneeling mechanism release handle and cable
- Kneeling mechanism
- Latch feet assembly
- Recliner release shaft
- Cushion frame

PINPOINT TEST P: THE SEAT BACKREST WILL NOT FOLD DOWN/FOLD UPRIGHT - SECOND ROW 60 PERCENT OR 40 PERCENT E-Z ENTRY SEAT



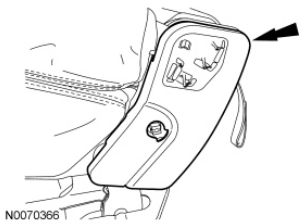


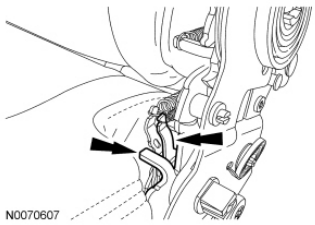
NOTE: Carry out this pinpoint test with the seat in vehicle and all fasteners tightened to specification.



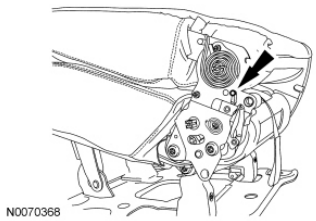
NOTE: The backrest cannot be returned to the upright (vertical) position until the kneeling mechanism is returned to the standing (upright) position and the latch feet assembly is latched to the mounting plate strikers.

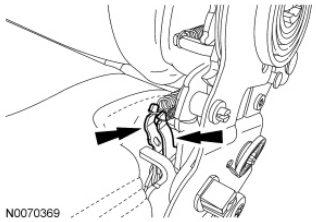
NOTE: 40 percent seat shown, 60 percent similar.

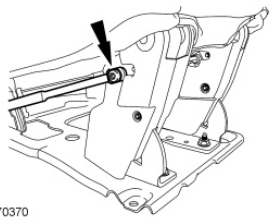




Test Step	Result / Action to Take
P1 CHECK THE RECLINER HANDLE	
NOTICE: **If the outboard recliner is binding, it may be the cause of recliner handle damage. After installing a new recliner handle, use care when checking backrest function as not to damage another recliner handle.**	**Yes** TIGHTEN the screw or INSTALL a new recliner handle. CHECK the seat for correct operation. If the backrest still does not function correctly, GO to P2 . **No** GO to P2 .

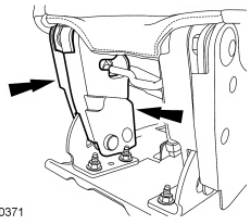


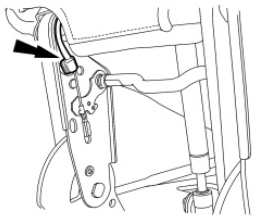


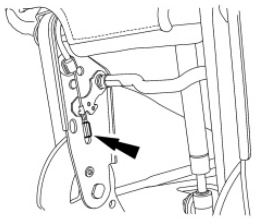


tomsn048@gmail.com

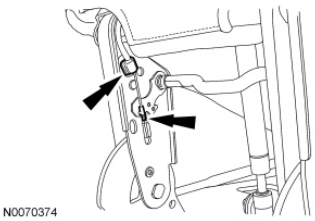
• Make sure the recliner handle square drive is not damaged.  N0070365 • Make sure the recliner handle screw is tight.  N0070364 • **Is the recliner handle screw loose or is the square drive damaged?**	
P2 CHECK BACKREST FUNCTION	
• Cycle the backrest. ♦ Lower the head restraint by pulling on the strap. ♦ Turn the recliner handle or pull the third row occupant release strap and fold the backrest forward and down until it lays flat. ♦ Return the seat backrest to the upright (vertical) position. Make sure the seat backrest is locked in position. • **Does the backrest fold forward and down and can it be returned to lock in the upright (vertical) position?**	**Yes** Repeat folding the backrest forward and down and returning it to lock in the upright (vertical) position a few times to verify repeatability. INSTRUCT the customer on correct function of the seat from the principles of operation or Owner's Literature. **No** If the backrest does not fold forward and down, GO to P3 . If the backrest does not fold upright (vertical) and lock in position, GO to P5 .
P3 CHECK THE OUTBOARD RECLINER	
• ***NOTICE:*** **Do not pull too hard on the recliner handle. If the outboard recliner is binding, it may cause damage to the recliner handle.** • Turn the recliner handle and attempt to release the backrest to fold forward and down. • **Did only the outboard recliner release and the backrest move forward on that side while the inboard recliner did not release?**	**Yes** GO to P4 . **No** INSTALL a new outboard recliner. REFER to Seat Recliner - Second Row, 40 Percent E-Z Entry or Seat Recliner - Outboard, Second Row, 60 Percent E-Z Entry in this section. CHECK the seat for correct operation.
P4 CHECK THE INBOARD RECLINER AND RECLINER RELEASE SHAFT	





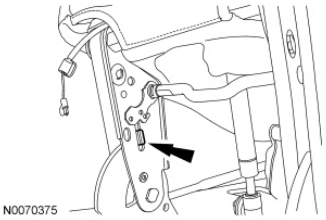


• **⚠ WARNING: Use care when the seat back frame is removed and when releasing the recliners from a backrest upright position. The recliners are spring-loaded, which may cause the recliner upper arms to fold with significant speed/force. Failure to follow this instruction may result in serious personal injury.** • Remove the outboard recliner. Refer to Seat Recliner - Second Row, 40 Percent E-Z Entry or Seat Recliner - Outboard, Second Row, 60 Percent E-Z Entry in this section. • **NOTE:** The recliner release shaft is splined to the inboard recliner. Before turning the recliner release shaft, make sure it is still attached to the inboard recliner stub. • Turn the recliner release shaft and release the inboard recliner. ♦ For 40 percent E-Z entry seat, turn the recliner release shaft counterclockwise. ♦ For 60 percent E-Z entry seat, turn the recliner release shaft clockwise.  N0070652 • **Did the inboard recliner release, folding the backrest forward and down?**	**Yes** The recliner release shaft should pass through the center of the cushion frame and not come in contact with anything other than the connection point at the inboard and outboard recliners. INSPECT the recliner release shaft for marks of being hit and binding. INSPECT the cushion frame opening where the recliner release shaft passes for anything that may come in contact with the recliner release shaft. INSPECT the cushion frame and inboard and outboard recliner attachment points. The recliners should meet flush, without any unwanted and obvious bends in their structures. MAKE SURE the recliner release shaft is not bent. Any bent parts can cause the recliner release shaft not to be centered in the cushion frame opening, resulting in binding of the recliner release shaft and inboard or outboard recliners. INSTALL new parts as necessary. CHECK the seat for correct operation. **No** INSTALL a new inboard recliner. REFER to Seat Recliner - Second Row, 40 Percent E-Z Entry or Seat Recliner - Inboard, Second Row, 60 Percent E-Z Entry in this section. CHECK the seat for correct operation.
P5 CHECK THE LATCH FEET ASSEMBLY AND KNEELING MECHANISM ARE LOCKED IN PLACE	
• **NOTE:** The backrest cannot be returned to the upright (vertical) position until the kneeling mechanism is returned to the standing (upright) position and the latch feet assembly is latched to the mounting plate strikers. • **NOTE:** Make sure the striker pockets in the floor do not have anything in them. • Make sure the latch feet are fully engaged around the mounting plate strikers. ♦ Turn the recliner release handle and unlatch the latch feet assembly from the mounting plate strikers. ♦ Lift and pivot the seat up to the E-Z entry position. ♦ Push the rear of the seat down with moderate force, latching the latch feet to	**Yes** REPEAT folding the backrest down and positioning the seat to the E-Z entry position and then back down, latching the latch feet assembly to the floor strikers. REPEAT kneeling the seat and then locking back in a standing (upright) position. ATTEMPT to latch the backrest in the upright (vertical) position. If the backrest latched in the upright (vertical) position again, INSTRUCT the customer that the latch feet assembly must be latched to the mounting plate strikers and the kneeling mechanism must be locked in



tomsn048@gmail.com

the mounting plate strikers. Make sure the seat is latched to the mounting plate strikers by lifting up on the rear of the seat. • Make sure the kneeling mechanism is locked in the standing (upright) position. ♦ Lift the kneeling mechanism release handle in the back of the backrest and moderately push the seat forward and down into the kneel position. ♦ Left with moderate force at the front of the seat cushion frame, pivot the seat up and toward the rear of the vehicle until the kneeling mechanism is locked in place. ♦ Make sure the kneeling mechanism is locked in position by pushing the seat forward and down. • Attempt to latch the backrest in the upright (vertical) position. • **Did the backrest latch in the upright (vertical) position?**	place in a standing (upright) position before the backrest will latch in the upright (vertical) position. **No** GO to P6 .
P6 CHECK THE OUTBOARD RECLINER OUTER LOCK OUT LEVER	
• Remove the screw and recliner handle. • Remove the outboard recliner outboard cover.  N0070366 • **NOTE:** The outboard recliner inner cover has been removed for clarity. • The outboard recliner outer lock out lever must be forward and close to the forward stop bar to position the backrest in the upright (vertical) position.  N0070607 • **Is the outboard recliner outer lock out lever in the forward position?**	**Yes** INSTALL a new outboard recliner. REFER to Seat Recliner - Outboard, Second Row, 60 Percent E-Z Entry or Seat Recliner - Second Row, 40 Percent E-Z Entry in this section. CHECK the seat for correct operation. **No** GO to P7 .
P7 CHECK THE OUTBOARD RECLINER INNER AND OUTER LOCK OUT LEVERS	

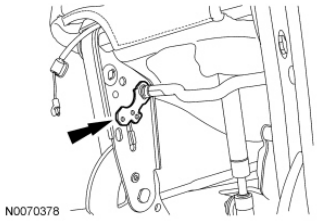


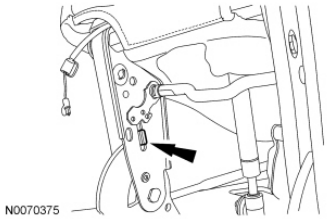
• Actuate the pin up and down at the side of the outboard recliner.  N0070368 • While actuating the pin up and down, monitor if the inner and outer lock out levers move in the outboard recliner.  N0070369 • **Did either or both lock out levers move?**	**Yes** If the inner lock out lever moved, GO to P8 . If the outer lock out lever moved, GO to P13 . If the inner and outer lock out levers both moved, INSTALL a new cable assembly from the outboard recliner to the outboard latch foot and inboard kneeling mechanism leg. CHECK the seat for correct operation. **No** INSTALL a new outboard recliner. REFER to Seat Recliner - Outboard, Second Row, 60 Percent E-Z Entry or Seat Recliner - Second Row, 40 Percent E-Z Entry in this section. CHECK the seat for correct operation.
P8 CHECK THE CABLE ASSEMBLY AT THE KNEELING MECHANISM INBOARD LEG TO THE OUTBOARD RECLINER	
• Remove the latch feet retracting link-to-kneeling mechanism bolt and separate the retracting link from the kneeling mechanism.  N0070370 • Release the cushion trim cover hook-and-loop strip at the front of the cushion to aide removal of the kneeling mechanism leg covers. • Remove the kneeling mechanism inboard leg inner and outer covers.	**Yes** ROUTE the cable assembly correctly or INSTALL a new cable assembly from the outboard recliner to the outboard latch foot and inboard kneeling mechanism leg. CHECK the seat for correct operation. **No** GO to P9 .

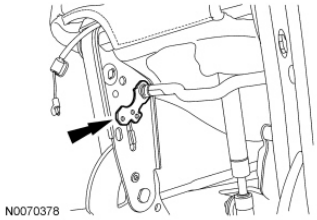
tomsn048@gmail.com

 N0070371 • Inspect the cable casing for pulling out of the anchor.  N0070372 • Inspect the cable assembly for any other obvious signs of kinking or damage. • Inspect the cable assembly for not being routed correctly. Refer to Seat Cushion - Second Row, 40 Percent E-Z Entry or Seat Cushion - Second Row, 60 Percent, E-Z Entry in this section. • **Is the cable assembly not routed correctly or is there casing and anchor damage?**	
P9 CHECK THE KNEELING MECHANISM IS LOCKED IN THE STANDING (UPRIGHT) POSITION	
• Using light finger pressure, try to move the sliding pin from side to side.  N0070373 • **Does the sliding pin move?**	**Yes** GO to P10 . **No** GO to P12 .
P10 CHECK THE KNEELING MECHANISM IS LOCKED IN THE STANDING (UPRIGHT) POSITION	
• Unlock the cable assembly anchor from the kneeling mechanism inboard leg and separate the cable end from the lever.	**Yes** GO to P11 . **No** INSTALL a new cable assembly from the outboard recliner to the outboard latch foot and inboard kneeling mechanism leg. CHECK the seat for correct operation.

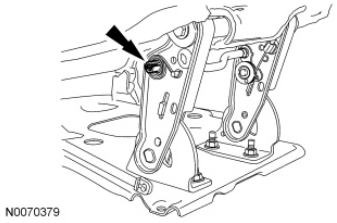
N0070374

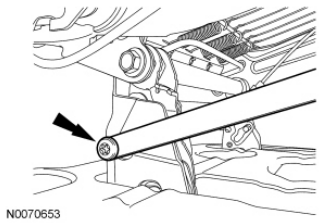


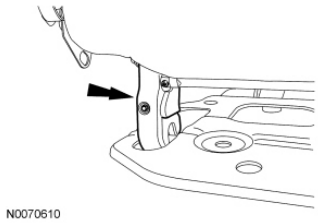




- Lift the kneeling mechanism release handle in the backrest and moderately push the seat forward and down into the kneel down load floor position. Lift with moderate force at the front of the seat cushion frame, pivot the seat up and toward the rear of the vehicle until the kneeling mechanism is locked in place. Make sure the kneeling mechanism is locked in position by pushing the seat forward and down.
- Using light finger pressure, try to move the sliding pin from side to side.

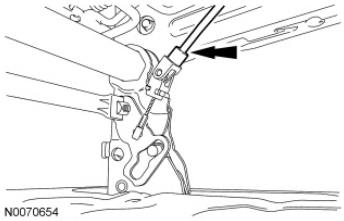






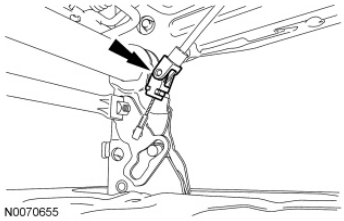
N0070375

- **Does the sliding pin move?**



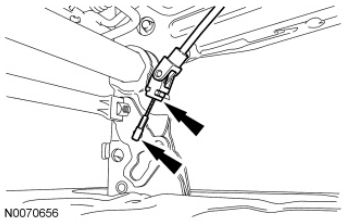
P11 CHECK THE RELEASE CABLE AT THE KNEELING MECHANISM	
• Remove the kneeling mechanism outboard leg inner and outer covers.  N0070376 • Unlock the release cable anchor from the kneeling mechanism outboard leg and separate the cable end from the pulley.  N0070377	**Yes** INSTALL a new kneeling mechanism. CHECK the seat for correct operation. **No** INSTALL a new kneeling mechanism release handle and cable. CHECK the seat for correct operation.

tomsn048@gmail.com

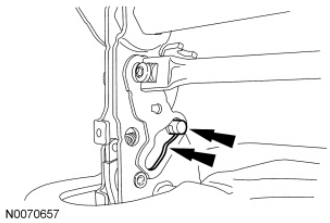


• *NOTICE:* **Do not put a wrench on the latch feet release bar to attempt to release the latches. Damage to the latch feet release bar or latch feet assembly may occur.** • Using the lever on the kneeling mechanism inboard leg, turn the lever and moderately push the seat forward and down into the kneel down load floor position. Lift up with moderate force at the front of the seat cushion frame, pivot the seat up and toward the rear of the vehicle until the kneeling mechanism is locked in place. Make sure the kneeling mechanism is locked in position by pushing the seat forward and down.  N0070378 • **NOTE:** Inboard leg sliding pin shown, outboard similar. • Using light finger pressure, try to move the inboard and outboard sliding pins from side to side.  N0070375 • **Do the sliding pins move?**	
P12 CHECK THE KNEELING MECHANISM INBOARD LEG LEVER FOR LOOSENESS	
• Turn the lever on the kneeling mechanism inboard leg back and forth.  N0070378 • While turning the lever on the kneeling mechanism inboard leg back and forth, monitor if the pivot	**Yes** INSTALL a new cable assembly from the outboard recliner to the outboard latch foot and inboard kneeling mechanism leg. CHECK the seat for correct operation. **No** INSTALL a new kneeling mechanism. CHECK the seat for correct operation.

moves at the same time without any delay in movement (movement must be synchronized and simultaneous). There must not be any play (wasted movement) from when the lever on the kneeling mechanism inboard leg is turned to when the pivot moves.  N0070379 • **When the lever on the kneeling mechanism inboard leg was actuated, did the pivot move at the same time and without any delay in movement?**	
P13 CHECK THE CABLE ASSEMBLY AT THE OUTBOARD LATCH FOOT	
• Remove the latch feet retracting link-to-latch feet assembly bolt and separate the latch feet retracting link from the inboard latch foot.  N0070653 • Remove the outboard latch foot cover.  N0070610 • Inspect the cable assembly at the outboard latch foot for the cable casing pulling out of the anchor (swivel).	**Yes** ROUTE the cable assembly correctly or INSTALL a new cable assembly from the outboard recliner to the outboard latch foot and inboard kneeling mechanism leg. CHECK the seat for correct operation. **No** GO to P14 .



tomsn048@gmail.com



- Inspect the cable assembly swivel at the outboard latch foot for not operating freely.

- Inspect the cable assembly for any other obvious signs of kinking or damage.
- Inspect the cable assembly for not being routed correctly. Refer to Seat Cushion - Second Row, 40 Percent E-Z Entry or Seat Cushion - Second Row, 60 Percent, E-Z Entry in this section.
- **Is the cable assembly not routed correctly or is there casing and anchor damage?**

P14 CHECK THE OUTBOARD LATCH FOOT RELEASE LEVER	
• Separate the cable assembly anchor (swivel) at the outboard latch foot. Turn the cable end to align to the key way and separate the cable end from the outboard latch foot release lever.  • The pin on the outboard latch foot should be two-thirds of the way up, to the right of the bump, in the release lever slot or higher.	**Yes** INSTALL a new cable assembly from the outboard recliner to the outboard latch foot and inboard kneeling mechanism leg. CHECK the seat for correct operation. **No** INSTALL a new latch feet assembly. CHECK the seat for correct operation.

 N0070657 • **Is the pin on the outboard latch foot two-thirds of the way up, to the right of the bump, in the release lever slot or higher?**	

Pinpoint Test Q: The Seat Will Not Release/Latch to the Floor Strikers - Second Row 60 Percent and 40 Percent E-Z Entry Seat

Normal Operation

When the recliner handle is turned, it releases the outboard recliner. This also turns a gear drive in the outboard recliner, resulting in the recliner release shaft turning in the opposite direction of the recliner handle. When the recliner release shaft is turned, it releases the inboard recliner. This allows the backrest to fold down.

When the backrest is down, there are 2 safeties that prevent the backrest from being positioned upright (vertical) under 2 different conditions. The first condition is if the latch feet are not completely latched around the mounting plate strikers. When this happens, the cable attached to the latch feet assembly outboard latch foot holds the outboard recliner outer lock out lever back, engaging the safety, preventing the backrest from being positioned upright (vertical) and locking in position. The second condition is if the kneeling mechanism is not completely locked in the standing (upright) position. When this happens, the cable attached to the kneeling mechanism inboard leg lever holds the outboard recliner inner lock out lever back, engaging the safety, preventing the backrest from being positioned upright (vertical).

If the backrest is not folded forward and all the way down, the seat will not kneel or go up into the E-Z entry position. The backrest cannot be returned to the upright (vertical) position until the kneeling mechanism is returned to the standing (upright) position and the latch feet assembly is latched to the mounting plate strikers.

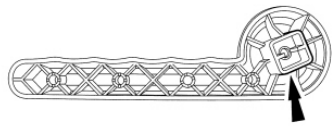
This pinpoint test is intended to diagnose the following:

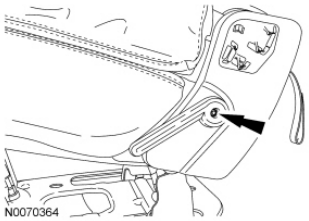
- Recliner handle or loose screw
- Outboard recliner
- Cable assembly
- Latch feet retracting link
- Latch feet assembly
- Mounting plate

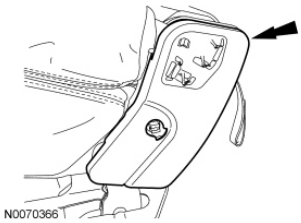
PINPOINT TEST Q: THE SEAT WILL NOT RELEASE/LATCH TO THE FLOOR STRIKERS - SECOND ROW 60 PERCENT AND 40 PERCENT E-Z ENTRY SEAT

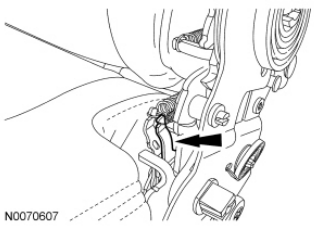
NOTE: Carry out this pinpoint test with the seat in vehicle and all fasteners tightened to specification.

NOTE: The backrest must function correctly before any further testing of the seat can be done.



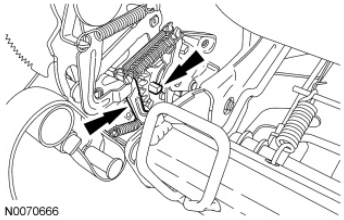


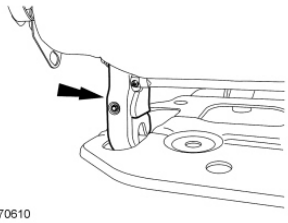


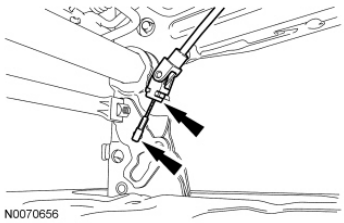


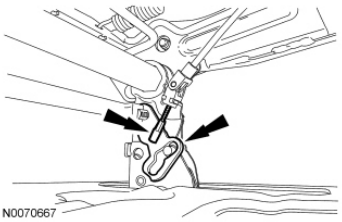
NOTE: To release the latch feet from the mounting plate strikers and position the seat to the E-Z entry position, the backrest must be folded forward and all the way down. Remove anything between the backrest and cushion that may prevent the backrest from folding all the way down. After folding the backrest forward

tomsn048@gmail.com

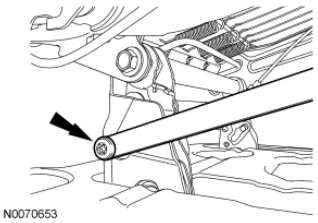


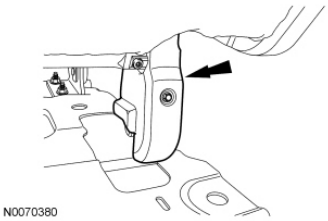


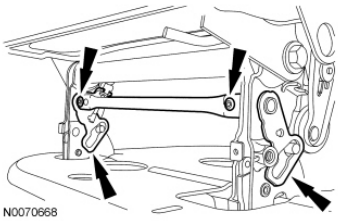




and down, release the recliner handle or third row strap, then turn the recliner handle or pull the third row strap a second time and lift up on the rear of the seat.







NOTE: 40 percent seat shown, 60 percent similar.

Test Step	Result / Action to Take
Q1 CHECK BACKREST FUNCTION	
• Cycle the backrest. ♦ Lower the head restraint by pulling on the strap. ♦ Turn the recliner handle or pull the third row occupant release strap and fold the backrest forward and down until it lays flat. ♦ Return the seat backrest to the upright (vertical) position. Make sure the seat backrest is locked in position. • **Does the backrest fold forward and down and can it be returned to lock in the upright (vertical) position?**	**Yes** If the backrest functions correctly, GO to Q2 . **No** If the backrest does not function correctly, GO to Pinpoint Test P .
Q2 CHECK THE LATCH FEET ASSEMBLY FUNCTION	
• **NOTE:** Remove anything between the backrest and cushion. If the backrest is not down all the way, the safety may not disengage. • Turn the recliner handle and fold the backrest forward and all the way down. • **NOTE:** After folding the backrest forward and down, the recliner handle has to be released and turned a second time before the latch feet assembly will release from the floor strikers. • Release the recliner handle and turn it a second time to release the latch feet from the floor strikers. • Push the rear of the seat down with moderate force to latch the seat to the mounting plate strikers. Make sure the seat is latched to the mounting plate strikers by lifting up on the rear of the seat. • If possible, repeat steps 2 and 3, making sure the function of the seat is repeatable. • **Will the latch feet release from the floor strikers and return to clasp around the mounting plate strikers?**	**Yes** EXPLAIN to the customer that the backrest must be all the way down and nothing can be between the cushion and backrest before the latch feet assembly will release from the mounting plate strikers and be able to return to clasp around the mounting plate strikers. **No** If the latch feet will not release from the floor strikers, GO to Q3 . If the latch feet will not clasp around the floor strikers, GO to Q8 .
Q3 CHECK THE RECLINER HANDLE	
NOTE: If the outboard recliner is binding, it may be the cause of recliner handle damaged. After installing a new recliner handle, use care when checking backrest function as not to damage another recliner handle. • Make sure the recliner handle square drive is not damaged.	**Yes** TIGHTEN the screw or INSTALL a new recliner handle. CHECK the seat for correct operation. If the latch feet still do not release from the floor strikers, GO to Q4 . **No** GO to Q4 .

 N0070365 • Make sure the recliner handle screw is tight.  N0070364 • **Is the recliner handle screw loose or is the square drive damaged?**	
Q4 CHECK THE OUTBOARD RECLINER OUTER LOCK OUT LEVER FUNCTION	
• Remove the outboard recliner inboard and outboard covers.  N0070366 • **NOTE:** Remove anything between the backrest and cushion that may prevent the backrest from folding all the way down. • Fold the backrest forward and all the way down. • ***NOTICE:*** **Do not pull too hard on the recliner handle. If the outboard recliner is binding, it may cause damage to the recliner handle.** • Turn the recliner handle back and forth and monitor the outboard recliner outer lock out lever.  N0070607 • **Does the outboard recliner outer lock out lever move while actuating the recliner handle back and forth?**	**Yes** GO to Q5 . **No** If the recliner handle moves and the outer lock out lever does not, INSTALL a new outboard recliner. REFER to Seat Recliner - Second Row, 40 Percent E-Z Entry or Seat Recliner - Outboard, Second Row, 60 Percent E-Z Entry in this section. CHECK the seat for correct operation. If the recliner handle does not move, GO to Q5 .
Q5 CHECK THE OUTBOARD RECLINER LEVER LOCATION	

tomsn048@gmail.com

• With the backrest folded forward and all the way down and the recliner handle released, the outboard recliner lever must be positioned away from the post.  N0070666 • **Is the outboard recliner lever in any other position?**	**Yes** INSTALL a new outboard recliner. REFER to Seat Recliner - Second Row, 40 Percent E-Z Entry or Seat Recliner - Outboard, Second Row, 60 Percent E-Z Entry in this section. CHECK the seat for normal operation. **No** GO to Q6 .
Q6 CHECK THE OUTBOARD LATCH FOOT RELEASE LEVER	
• Remove the outboard latch foot cover.  N0070610 • Make sure the cable assembly casing and anchor (swivel) are attached at the outboard latch foot.  N0070656 • Turn the recliner handle back and forth and monitor if the cable moves the outboard latch foot release lever at the same time without any delay in movement (movement must be synchronized and simultaneous). There must not be any play (wasted movement) from when the recliner handle is turned to when the cable moves the outboard latch foot release lever.  N0070667	**Yes** GO to Q7 . **No** INSTALL a new cable assembly. CHECK the seat for normal operation.

• **When the recliner handle was actuated, did the cable move the outboard latch foot release lever at the same time and without any delay in movement?**	
Q7 CHECK THE LATCH FEET ASSEMBLY AND CABLE ASSEMBLY	
• Remove the latch feet retracting link-to-latch feet assembly bolt and separate the latch feet retracting link from the inboard latch foot.  N0070653 • Remove the inboard latch foot cover.  N0070380 • Turn the recliner handle back and forth and monitor if the cable moves the latch feet assembly outboard latch foot release lever, latch feet release bar and inboard latch foot release lever at the same time (movement must be synchronized and simultaneous). There must not be any play (wasted movement) between any of these components. Make sure the latch feet release rod meets flush with the latch feet assembly pivots and the screws are tight. Make sure that the latch feet release rod is free to move and the latch feet assembly is not binding.  N0070668 • **When the recliner handle was actuated, did the cable move the outboard latch foot release lever, latch feet release bar and inboard latch foot release lever at the same time and without any delay in movement?**	**Yes** INSTALL a new cable assembly. CHECK the seat for normal operation. **No** INSTALL a new latch feet assembly. CHECK the seat for normal operation.
Q8 CHECK THE OUTBOARD RECLINER	

tomsn048@gmail.com

• Make sure the latch feet jaws are not in the closed position. If they are, turn the recliner handle to open the jaws. • Make sure the latch feet align to the floor strikers. • Make sure the recliner handle is not stuck in the up or release position. • **Is the recliner handle stuck in the up position?**	**Yes** INSTALL a new outboard recliner. REFER to Seat Recliner - Second Row, 40 Percent E-Z Entry or Seat Recliner - Outboard, Second Row, 60 Percent E-Z Entry in this section. CHECK the seat for normal operation. **No** INSTALL a new latch feet retracting link, latch feet assembly or mounting plate as necessary. CHECK the seat for normal operation.

Pinpoint Test R: The Seat Will Not Kneel/Stand - Second Row 60/40 E-Z Entry Seat

Normal Operation

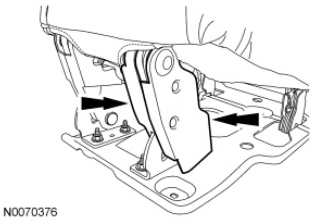
When the recliner handle is turned, it releases the outboard recliner. This also turns a gear drive in the outboard recliner, resulting in the recliner release shaft turning in the opposite direction of the recliner handle. When the recliner release shaft is turned, it releases the inboard recliner. This allows the backrest to fold down.

When the backrest is down, there are 2 safeties that prevent the backrest from being positioned upright (vertical) under 2 different conditions. The first condition is if the latch feet are not completely latched around the mounting plate strikers. When this happens, the cable attached to the latch feet assembly outboard latch foot holds the outboard recliner outer lock out lever back, engaging the safety, preventing the backrest from being positioned upright (vertical) and locking in position. The second condition is if the kneeling mechanism is not completely locked in the standing (upright) position. When this happens, the cable attached to the kneeling mechanism inboard leg lever holds the outboard recliner inner lock out lever back, engaging the safety, preventing the backrest from being positioned upright (vertical).

If the backrest is not folded forward and all the way down, the seat will not kneel or go up into the E-Z entry position. The backrest cannot be returned to the upright (vertical) position until the kneeling mechanism is returned to the standing (upright) position and the latch feet assembly is latched to the mounting plate strikers.

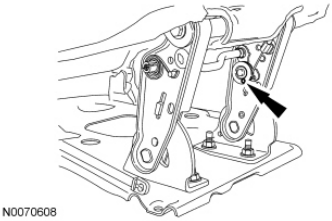
This pinpoint test is intended to diagnose the following:
- Kneeling mechanism release handle and cable
- Kneeling mechanism

PINPOINT TEST R: THE SEAT WILL NOT KNEEL/STAND - SECOND ROW 60/40 E-Z ENTRY SEAT



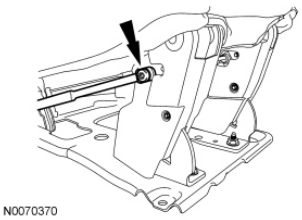
NOTE: Carry out this pinpoint test with the seat in vehicle and all fasteners tightened to specification.

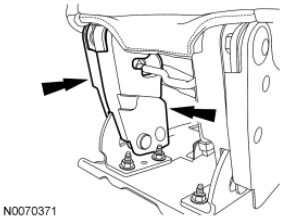
NOTE: The backrest must function correctly before any further testing of the seat can be done.



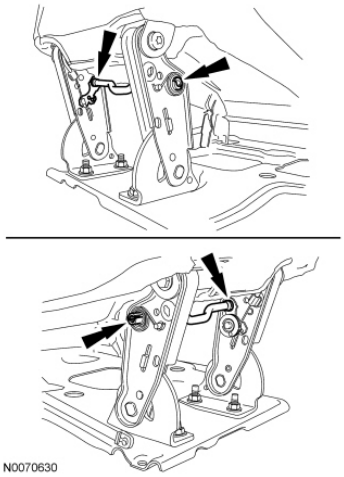
NOTE: To kneel the seat, the backrest must be folded forward and all the way down. Remove anything between the backrest and cushion.

Test Step	Result / Action to Take
R1 CHECK THE BACKREST FUNCTION	
• Cycle the backrest. ♦ Lower the head restraint by pulling on the strap. ♦ Turn the recliner handle or pull the third row occupant release strap and fold the backrest forward and down until it lays flat. ♦ Return the seat backrest to the upright (vertical) position. Make sure the seat backrest is locked in position. • **Does the backrest fold forward and down and can it be returned to lock in the upright (vertical) position?**	**Yes** If the backrest functions correctly, GO to R2 . **No** If the backrest does not function correctly, GO to Pinpoint Test P .
R2 CHECK THE KNEELING MECHANISM FUNCTION	
• **NOTE:** Remove anything between the backrest and cushion. If the backrest is not down all the way, the safety may not disengage to allow the kneeling mechanism to kneel when the release handle in the backrest is actuated. • Turn the recliner handle and fold the backrest forward and down. • Using moderate force, being careful not to break the handle, lift the kneeling mechanism release handle in the back of the backrest and moderately push the seat forward and down into the kneel position. • Lift from the bottom of the cushion frame with moderate force and pivot the seat up and toward the rear of the vehicle, rotating the seat rearward until an audible click is heard, locking the kneeling mechanism in a standing (upright) position. Make sure the kneeling mechanism is locked in position by pushing the seat forward and down. • If possible, repeat Steps 2 and 3, making sure the function of the seat is repeatable. • **Did the legs of the kneeling mechanism pivot down and kneel and return to lock in the standing (upright) position?**	**Yes** Explain to the customer that the backrest must be all the way down and nothing can be between the cushion and backrest before the kneeling mechanism will pivot down and kneel. **No** If the legs of the kneeling mechanism did not pivot down and kneel, GO to R3 . If the legs of the kneeling mechanism did not return to lock in the standing (upright) position, GO to R5 .
R3 CHECK CABLE END AND PULLEY CONNECTION LOCATION	
• Release the cushion trim cover hook-and-loop strip at the front of the cushion to aide removal of the kneeling mechanism leg covers. • Remove the kneeling mechanism outboard leg inner and outer cover.	**Yes** GO to R4 . **No** INSTALL a new kneeling mechanism release handle and cable. CHECK the seat for correct operation.



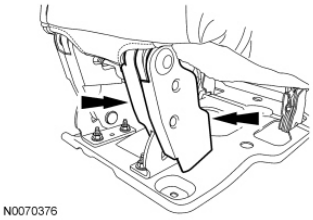


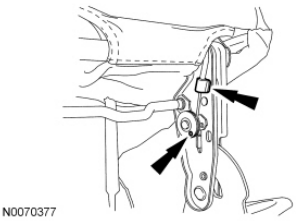
tomsn048@gmail.com



N0070376

- The cable end and pulley connection location must be at approximately the 5 o'clock position.





N0070608

- **Is the cable end and pulley connection point clocked at approximately the 5 o'clock position?**

R4 CHECK THE KNEELING MECHANISM	
- Remove the latch feet retracting link-to-kneeling mechanism bolt and separate the retracting link from the kneeling mechanism.  N0070370 - Remove the kneeling mechanism inboard leg inner and outer covers.  N0070371 - Using moderate force, being careful not to break the handle, lift the kneeling mechanism release handle and monitor that the pivots at the kneeling mechanism inboard and outboard legs are moving at the same time (movement must be synchronized and simultaneous). There must not be any play (wasted movement) from when the kneeling mechanism release handle is lifted to when the cable moves the pulley and lever on the kneeling mechanism outboard leg and transfers that movement through the cross rod to the lever on the kneeling mechanism inboard leg.	**Yes** INSTALL a new kneeling mechanism release handle and cable. CHECK the seat for normal operation. **No** INSTALL a new kneeling mechanism. CHECK the seat for normal operation.

- **When the kneeling mechanism release handle was actuated, did the cable move the pulley and lever on the kneeling mechanism outboard leg and transfer that movement through the cross rod to the lever on the kneeling mechanism inboard leg, making the pivots move at the same time and without any delay in movement?**

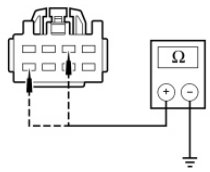
R5 CHECK CABLE END AND PULLEY CONNECTION LOCATION	
• Release the cushion trim cover hook-and-loop strip at the front of the cushion to aide removal of the kneeling mechanism leg covers. • Remove the kneeling mechanism outboard leg inner and outer cover.  • Unlock the cable casing from the kneeling mechanism outboard leg and separate the cable end from the pulley.  • Lift from the bottom of the cushion frame with moderate force and pivot the seat up and toward the rear of the vehicle, rotating the seat rearward until an audible click is heard, locking the kneeling mechanism in a standing (upright) position. Make sure the kneeling mechanism is locked in position by pushing the seat forward and down. • **Did the kneeling mechanism lock back in the standing (upright) position?**	**Yes** INSTALL a new kneeling mechanism release handle and cable. CHECK the seat for correct operation. **No** INSTALL a new kneeling mechanism. CHECK the seat for correct operation.

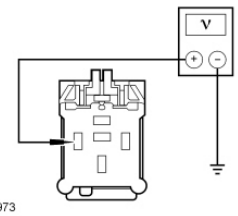
tomsn048@gmail.com

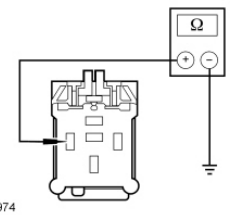
Pinpoint Test S: The Power Seats are Inoperative - Third Row Power-Fold Seat

Refer to Wiring Diagrams Cell 120 , Power Seats for schematic and connector information.

Normal Operation

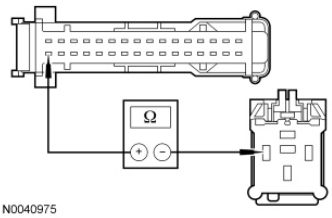






The third row power-fold seat relay is supplied battery voltage on circuits SBB12 (GN/RD) (right) and SBB05 (GY/RD) (left) and is hot at all times. The ground is supplied to each third row power-fold seat relay on the coil side through circuit CPS48 (BU) and controlled by the Smart Junction Box (SJB). The power-fold seat relays will be provided ground on the coil side from the SJB for 30 minutes when the transmission selector lever is in PARK, and the liftgate, or liftgate glass, is open. The ground will be disabled 30 minutes after turning the vehicle off. If the ground is disabled after 30 minutes, the ground can be enabled by opening any door, pressing the unlock key on the key fob, pressing any keyless keypad button or turning the ignition key.

- DTC B2794 Third Row Power Fold Circuit Failure - When SJB outputs to the left or right third row power-fold seat relay and short to voltage is present or when SJB output to the left or right third row power-fold seat relay is inactive and a short to ground is present, this DTC is set.



This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- SJB

PINPOINT TEST S: THE POWER SEATS ARE INOPERATIVE - THIRD ROW POWER-FOLD SEAT

Test Step	Result / Action to Take
S1 CHECK DTCs	
• Enter the following diagnostic mode on the scan tool: Self Test - GEM or SJB . • **Are any DTCs present?**	**Yes** If DTC B2794 is present, GO to S3 . For any other SJB DTCs, REFER to the Smart Junction Box (SJB) DTC Chart in this section. **No** GO to S2 .
S2 CHECK CIRCUIT GD149 (BK/GY) FOR AN OPEN	
• Ignition OFF. • Disconnect: Left Third Row Seat Control Switch C4179. • Measure the resistance between: ♦ left third row seat control switch C4179-2, circuit GD149 (BK/GY), harness side and ground. ♦ left third row seat switch C4179-8, circuit GD149 (BK/GY), harness side and ground.	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.

 A0050617 • **Are the resistances less than 5 ohms?**	
S3 CHECK CIRCUIT CPS48 (BU) FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: Left Third Row Seat Relay C4183. • Disconnect: Right Third Row Seat Relay C4184. • Disconnect: SJB C2280b. • Ignition ON. • Measure the voltage between left third row seat relay C4183-85, circuit CPS48 (BU), harness side and ground.  N0040973 • **Is any voltage present?**	**Yes** REPAIR the circuit. CLEAR the DTCs. TEST the system for normal operation. **No** GO to S4 .
S4 CHECK CIRCUIT CPS48 (BU) FOR A SHORT TO GROUND	
• Ignition OFF. • Measure the resistance between left third row seat relay C4183-85, circuit CPS48 (BU), harness side and ground.  N0040974 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to S5 . **No** REPAIR the circuit. TEST the system for normal operation.
S5 CHECK CIRCUIT CPS48 (BU) FOR AN OPEN	
• Measure the resistance between SJB C2280b-32, circuit CPS48 (BU), harness side and left third row seat relay C4183-85, circuit CPS48 (BU), harness side.	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** REPAIR the circuit. TEST the

tomsn048@gmail.com

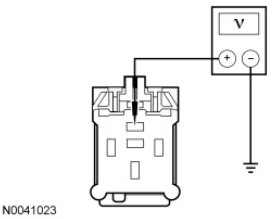
 • **Is the resistance less than 5 ohms?**	system for normal operation.

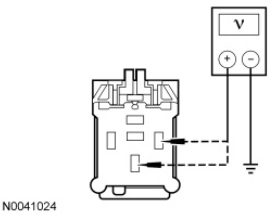
Pinpoint Test T: The Power Seat is Inoperative/Does Not Operate Correctly - Third Row Power-Fold Seat, Left

Refer to Wiring Diagrams Cell 120 , Power Seats for schematic and connector information.

Normal Operation

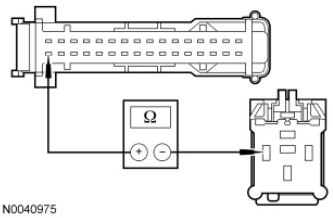
The left third row power-fold seat relay coil side is supplied battery voltage on circuit SBB05 (GY/RD) and is hot at all times. The ground is supplied to each third row power-fold seat relay on the coil side through circuit CPS48 (BU) and controlled by the Smart Junction Box (SJB). When the left third row power-fold seat control switch is pressed, voltage is supplied through the switch side of the left third row power-fold seat relay on circuit SBB05 (GY/RD) and supplied ground on circuit GD149 (BK/GY). When pressing the left third row power-fold seat control switch in the opposite direction, the left third row power-fold seat control switch reverses the polarity to the left third row power-fold seat motor, which moves the third row seat backrest in the opposite direction.

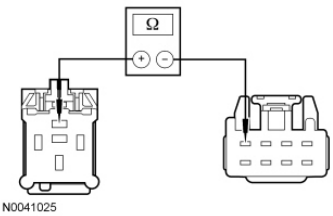


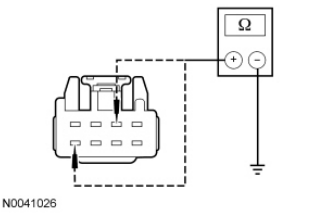


This pinpoint test is intended to diagnose the following:

- Fuse(s)
- Wiring, terminals or connectors
- Left third row power-fold seat control switch
- Left third row power-fold seat relay
- Left third row power-fold seat motor







PINPOINT TEST T: THE POWER SEAT IS INOPERATIVE/DOES NOT OPERATE CORRECTLY - THIRD ROW POWER-FOLD SEAT, LEFT

NOTE: The SJB may also be identified as the Generic Electronic Module (GEM).

Test Step	Result / Action to Take
T1 CHECK LH SEAT OPERATION	
• Turn the ignition on and place the transmission in NEUTRAL. • **Does the LH seat operate?**	**Yes** GO to T2 . **No** GO to T3 .
T2 CHECK CIRCUIT CPS53 (VT/BN) FOR A SHORT TO VOLTAGE	

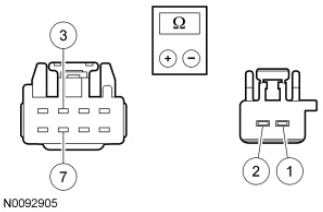
• Ignition OFF. • Disconnect: Left Third Row Seat Relay C4183. • Ignition ON. • Measure the voltage between left third row seat relay C4183-87, circuit CPS53 (VT/BN), harness side and ground.  N0041023 • **Is any voltage present?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** INSTALL a new left third row seat relay. TEST the system for normal operation.
T3 CHECK CIRCUIT SBB05 (GY/RD) FOR AN OPEN	
• Ignition OFF. • Disconnect: Left Third Row Seat Relay C4183. • Measure the voltage between: ♦ left third row seat relay C4183-30, circuit SBB05 (GY/RD), harness side and ground. ♦ left third row seat relay C4183-86, circuit SBB05 (GY/RD), harness side and ground.  N0041024 • **Are the voltages greater than 10 volts?**	**Yes** GO to T4 . **No** VERIFY Battery Junction Box (BJB) fuse 5 (30A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the Wiring Diagrams Manual to identify possible causes of the circuit short. TEST the system for normal operation.
T4 CHECK LEFT THIRD ROW SEAT RELAY	
• Carry out the component test on the left third row seat relay. Refer to Wiring Diagrams Cell 149 for component testing. • **Did the relay pass?**	**Yes** GO to T5 . **No** INSTALL a new left third row seat relay. TEST the system for normal operation.
T5 CHECK CIRCUIT CPS48 (BU) FOR AN OPEN	
• Disconnect: Right Third Row Seat Relay C4184. • Disconnect: SJB C2280b. • Measure the resistance between left third row seat relay C4183-85, circuit CPS48 (BU), harness side and SJB C2280b-32, circuit CPS48 (BU).	**Yes** GO to T6 . **No** REPAIR the circuit. TEST the system for normal operation.

tomsn048@gmail.com

 N0040975 • **Is the resistance less than 5 ohms?**	
T6 CHECK CIRCUIT CPS53 (VT/BN) FOR AN OPEN	
• Disconnect: Left Third Row Seat Control Switch C4179. • Measure the resistance between left third row seat relay C4183-87, circuit CPS53 (VT/BN), harness side and left third row seat switch C4179-4, circuit CPS53 (VT/BN), harness side.  N0041025 • **Is the resistance less than 5 ohms?**	**Yes** GO to T7 . **No** REPAIR the circuit. TEST the system for normal operation.
T7 CHECK CIRCUIT GD149 (BK/GY) FOR AN OPEN	
• Measure the resistance between: ♦ left third row power-fold seat control switch C4179-8, circuit GD149 (BK/GY), harness side and ground. ♦ left third row power-fold seat control switch C4179-2, circuit GD149 (BK/GY), harness side and ground.  N0041026 • **Are the resistances less than 5 ohms?**	**Yes** GO to T8 . **No** REPAIR the circuit. TEST the system for normal operation.
T8 CHECK LEFT THIRD ROW POWER-FOLD SEAT CONTROL SWITCH	

- Disconnect: Left Third Row Power-Fold Seat Control Switch C4179.
- Using the following table, check the left third row power-fold seat control switch. Measure the resistance between the left third row power-fold seat control switch pins, component side, while pressing the indicated switch buttons and compare the results to the table. The resistance measurement must fall within the tolerance given.

Seat Control Switch Button Position	Pins	Results
Up	2 and 3	Greater than 5 ohms
Rest	2 and 3	Less than 5 ohms
Fold	2 and 3	Less than 5 ohms
Up	3 and 4	Less than 5 ohms
Rest	3 and 4	Greater than 5 ohms
Fold	3 and 4	Greater than 5 ohms
Up	4 and 7	Greater than 5 ohms
Rest	4 and 7	Greater than 5 ohms
Fold	4 and 7	Less than 5 ohms
Up	7 and 8	Less than 5 ohms
Rest	7 and 8	Less than 5 ohms
Fold	7 and 8	Greater than 5 ohms



- Carry out the Third Row Power-Fold Seat Control Switch Component Test.
- **Did the switch pass?**

Yes
GO to T9 .

No
INSTALL a new switch. REFER to Seat Control Switch - Third Row in this section. TEST the system for normal operation.

T9 CHECK CIRCUITS CPS50 (BU/BN) AND CPS49 (BN/GN) FOR AN OPEN

tomsn048@gmail.com

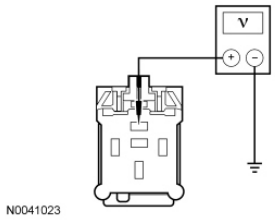
• Disconnect: Left Third Row Seat Motor C4181. • Measure the resistance between: ♦ left third row seat switch C4179-3, circuit CPS50 (BU/BN), harness side and left third row seat motor C4181-1, circuit CPS50 (BU/BN), harness side. ♦ left third row seat switch, C4179-7, circuit CPS49 (BN/GN), harness side and left third row seat motor C4181-2, circuit CPS49 (BN/GN), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new left third row power seat motor. REFER to Seat Control Switch - Third Row in this section. TEST the system for normal operation. **No** REPAIR the circuit(s). TEST the system for normal operation.

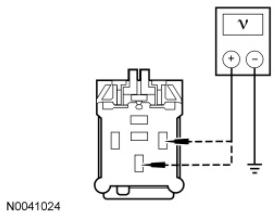
Pinpoint Test U: The Power Seat is Inoperative/Does Not Operate Correctly - Third Row Power-Fold Seat, Right

Refer to Wiring Diagrams Cell 120 , Power Seats for schematic and connector information.

Normal Operation

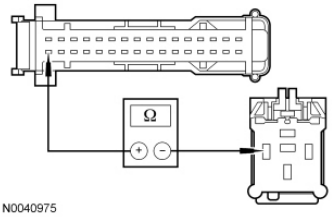
The right third row power-fold seat relay coil side is supplied battery voltage on circuit SBB12 (GN/RD) and is hot at all times. The ground is supplied to the right third row power-fold seat relay on the coil side through circuit CPS48 (BU) and controlled by the Smart Junction Box (SJB). When the right third row power-fold seat control switch is pressed, voltage is supplied through the switch side of the left third row power-fold seat relay on circuit SBB12 (GN/RD) and supplied ground on circuit GD149 (BK/GY). When pressing the right third row power-fold seat control switch in the opposite direction, the right third row power-fold seat control switch reverses the polarity to the right third row power-fold seat motor, which moves the third row seat backrest in the opposite direction.

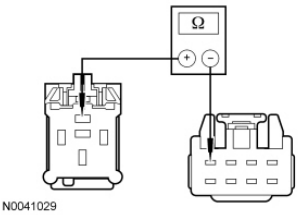


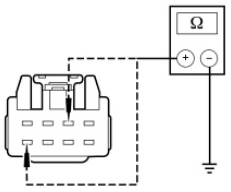


This pinpoint test is intended to diagnose the following:

- Fuse(s)
- Wiring, terminals or connectors
- Right third row power-fold seat control switch
- Right third row power-fold seat relay
- Right third row power-fold seat motor
- SJB







PINPOINT TEST U: THE POWER SEAT IS INOPERATIVE/DOES NOT OPERATE CORRECTLY - THIRD ROW POWER-FOLD SEAT, RIGHT

NOTE: The SJB may also be identified as the Generic Electronic Module (GEM).

Test Step	Result / Action to Take
U1 CHECK RH SEAT OPERATION	

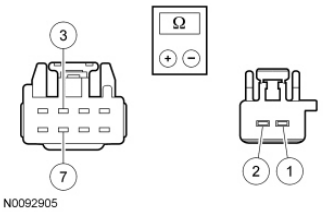
• Turn the ignition on and place the transmission in NEUTRAL. • **Does the RH seat operate?**	**Yes** GO to U2 . **No** GO to U3 .
U2 CHECK CIRCUIT CPS54 (WH/OG) FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: Right Third Row Seat Switch C4184. • Ignition ON. • Measure the voltage between right third row seat relay C4184-87, circuit CPS54 (WH/OG), harness side and ground.  N0041023 • **Is any voltage present?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** INSTALL a new right third row seat relay. TEST the system for normal operation.
U3 CHECK CIRCUIT SBB12 (GN/RD) FOR AN OPEN	
• Ignition OFF. • Disconnect: Right Third Row Seat Relay C4184. • Measure the voltage between: ♦ right third row seat relay C4184-30, circuit SBB12 (GN/RD), harness side and ground. ♦ right third row seat relay C4184-86, circuit SBB12 (GN/RD), harness side and ground.  N0041024 • **Are the voltages greater than 10 volts?**	**Yes** GO to U4 . **No** VERIFY Battery Junction Box (BJB) fuse 12 (30A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the Wiring Diagrams Manual to identify possible causes of the circuit short. TEST the system for normal operation.
U4 CHECK RIGHT THIRD ROW SEAT RELAY	
• Carry out component test on the right third row seat relay. Refer to Wiring Diagrams Cell 149 for component testing. • **Did the relay pass?**	**Yes** GO to U5 . **No** INSTALL a new right third row seat relay. TEST the system for normal operation.
U5 CHECK CIRCUIT CPS48 (BU) FOR AN OPEN	

tomsn048@gmail.com

• Disconnect: Left Third Row Seat Relay C4183. • Disconnect: SJB C2280b. • Measure the resistance between right third row seat relay C4184-85, circuit CPS48 (BU), harness side and SJB C2280b-32, circuit CPS48 (BU), harness side.  N0040975 • **Is the resistance less than 5 ohms?**	**Yes** GO to U6 . **No** REPAIR the circuit. TEST the system for normal operation.
U6 CHECK CIRCUIT CPS54 (WH/OG) FOR AN OPEN	
• Disconnect: Right Third Row Seat Control Switch C4180. • Measure the resistance between right third row power-fold seat relay C4184-87, circuit CPS54 (WH/OG), harness side and right third row power-fold seat control switch C4180-4, circuit CPS54 (WH/OG), harness side.  N0041029 • **Is the resistance less than 5 ohms?**	**Yes** GO to U7 . **No** REPAIR the circuit. TEST the system for normal operation.
U7 CHECK CIRCUIT GD149 (BK/GY) FOR AN OPEN	
• Measure the resistance between: ♦ right third row seat switch C4180-8, circuit GD149 (BK/GY), harness side and ground. ♦ right third row seat switch C4180-2, circuit GD149 (BK/GY), harness side and ground.  N0041030 • **Are the resistances less than 5 ohms?**	**Yes** GO to U8 . **No** REPAIR the circuit. TEST the system for normal operation.
U8 CHECK RIGHT THIRD ROW POWER-FOLD SEAT CONTROL SWITCH	

- Disconnect: Right Third Row Power-Fold Seat Control Switch C4180.
- Using the following table, check the right third row power-fold seat control switch. Measure the resistance between the right third row power-fold seat control switch pins, component side, while pressing the indicated switch buttons and compare the results to the table. The resistance measurement must fall within the tolerance given.

Seat Control Switch Button Position	Pins	Results
Up	2 and 3	Less than 5 ohms
Rest	2 and 3	Less than 5 ohms
Fold	2 and 3	Greater than 5 ohms
Up	3 and 4	Greater than 5 ohms
Rest	3 and 4	Greater than 5 ohms
Fold	3 and 4	Less than 5 ohms
Up	4 and 7	Less than 5 ohms
Rest	4 and 7	Greater than 5 ohms
Fold	4 and 7	Greater than 5 ohms
Up	7 and 8	Greater than 5 ohms
Rest	7 and 8	Less than 5 ohms
Fold	7 and 8	Less than 5 ohms



- Carry out the Third Row Power-Fold Seat Control Switch Component Test.
- **Did the switch pass?**

Yes
GO to U9 .

No
INSTALL a new switch. REFER to Seat Control Switch - Third Row in this section. TEST the system for normal operation.

U9 CHECK CIRCUITS CPS51 (VT/GY) AND CPS52 (YE/GN) FOR AN OPEN

tomsn048@gmail.com

• Disconnect: Right Third Row Seat Motor C4182. • Measure the resistance between: ♦ right third row seat switch C4180-3, circuit CPS52 (YE/GN), harness side and right third row seat motor C4182-1, circuit CPS52 (YE/GN) harness side. ♦ right third row seat switch, C4180-7, circuit CPS51 (VT/GY), harness side and right third row seat motor C4182-2, circuit CPS51 (VT/GY), harness side.  N0092905 • **Are the resistances less than 5 ohms?**	**Yes** INSTALL a new right third row power seat motor. REFER to Power-Fold Seat Motor - Third Row in this section. TEST the system for normal operation. **No** REPAIR the circuit(s). TEST the system for normal operation.

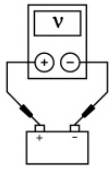
Pinpoint Test V: DTCs B1317 and B1318

Refer to Wiring Diagrams Cell 123 , Memory Seats for schematic and connector information.

Normal Operation - Driver Seat Module (DSM)

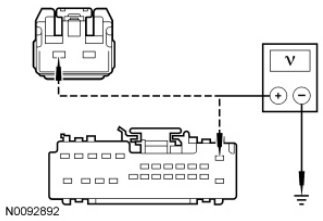
The Driver Seat Module (DSM) continuously monitors the input voltage for correct operation. If the DSM detects input voltage below 10 volts, it will store DTC B1318 in memory. If the DSM detects input voltage above 15 volts, it will store DTC B1317 in memory. If DTC B1317 or B1318 is set, the DSM disables the memory system outputs for the driver seat, memory mirrors, adjustable pedal and power adjustable steering column operation.

- DTC B1317 Battery Voltage High - If the DSM detects voltage above 15 volts, the DTC is set.
- DTC B1318 Battery Voltage Low - If the DSM detects voltage below 10 volts, the DTC is set.

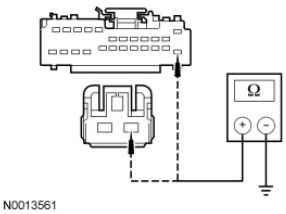


This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- DSM

PINPOINT TEST V: DTCs B1317 AND B1318



NOTE: DTC B1317, B1318 or B1676 can be set if the vehicle has been recently jump started, the battery has been recently charged or the battery has been discharged. The battery may become discharged due to excessive load(s) on the charging system from aftermarket accessories or if the battery has been left unattended with the accessories on.



NOTE: The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is removed and the ignition is ON.

NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
V1 RETRIEVE ALL CMDTCs IN ALL MODULES	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - ALL CMDTCs . • **Is DTC B1317, B1318 or B1676 present in one or more modules AND P0563, P0620, P0625, P0626 or P065B retrieved from the PCM?**	**Yes** REFER to Section 414-00 to diagnose the charging system. **No** GO to V2 .
V2 CHECK BATTERY CONDITION	
NOTE: DTC B1317, B1318 or B1676 can be set if the vehicle has been recently jump started, the battery has been recently charged or the battery has been discharged. The battery may become discharged due to excessive load(s) on the charging system from aftermarket accessories or if the battery has been left unattended with the accessories on. • Ignition OFF. • Carry out the Battery Condition Test. Refer to Section 414-01 . • **Did the battery pass the condition test?**	**Yes** If the battery passed the condition test but required a recharge, REFER to Section 414-00 to diagnose the charging system. CLEAR all Continuous Memory Diagnostic Trouble Codes (CMDTCs). TEST the system for normal operation. If the battery passed the condition test and did not require a recharge, GO to V3 . **No** INSTALL a new battery. CLEAR all CMDTCs . TEST the system for normal operation.
V3 CHECK CHARGING SYSTEM VOLTAGE	
NOTE: Do not allow the engine speed to increase above 2,000 rpm while performing this step or the generator may self excite and result in default charging system output voltage. If engine speed goes above 2,000 rpm, shut the vehicle OFF and restart the engine before performing this step. • Start the engine. • Measure voltage of the battery with and without a load on the charging system as follows: ♦ Turn off all accessories and run the engine at 1,500 rpm for a minimum of 2 minutes while measuring battery voltage. ♦ Turn on headlights and HVAC fan on high and run engine at 1,500 rpm for a minimum of 2 minutes while measuring battery voltage.  AJ0210-A	**Yes** GO to V4 . **No** REFER to Section 414-00 to diagnose the charging system. CLEAR all CMDTCs . TEST the system for normal operation.

tomsn048@gmail.com

• **Are the voltage measurements between 13 and 15.2 volts?**	
V4 CHECK VOLTAGE TO THE DSM	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B . • Disconnect: Driver Seat Side Air Bag C3049. • Disconnect: Driver Safety Belt Buckle Pretensioner C3201. • Disconnect: DSM C341a and C341c. • ⚠ **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Connect the battery ground cable. Refer to Section 414-01 . • Ignition ON. • Measure the voltage between: ♦ DSM C341a-2, circuit SBB14 (BN/RD), harness side and ground. ♦ DSM C341c-1, circuit SBP01 (RD), harness side and ground.  • **Are the voltage measurements greater than 10 volts?**	**Yes** GO to V5 . **No** VERIFY the Battery Junction Box (BJB) fuse 14 (30A) and Smart Junction Box (SJB) 1 (20A) are OK. If OK, REPAIR the circuit in question. If not OK, REFER to the Wiring Diagrams Manual to identify possible causes of the circuit short. CLEAR all CMDTCs . REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3201. CONNECT driver seat side air bag module C3049. REPOWER the SRS . REFER to Section 501-20B .
V5 CHECK THE DSM GROUND CIRCUITS FOR AN OPEN	
• Ignition OFF. • Measure the resistance between: ♦ DSM C341a-1, circuit GD133 (BK), harness side and ground. ♦ DSM C341c-13, circuit GD143 (BK/VT), harness side and ground.	**Yes** GO to V6 . **No** REPAIR the circuit. CLEAR all CMDTCs . REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3201. CONNECT driver seat side air bag module C3049.

 • Repeat this measurement while wiggling the harness. • **Are resistances less than 5 ohms?**	REPOWER the SRS . REFER to Section 501-20B .
V6 CHECK FOR CORRECT DSM OPERATION	
• Check the harness and component side connectors for the following: ♦ corrosion. ♦ damaged pins. ♦ pushed-out pins. • Connect: DSM C341a and C341c. • Make sure the DSM connectors are seated correctly. • Operate the memory seat and adjustable pedals to verify correct memory system operation. • Enter the following diagnostic mode on the scan tool: Self Test - DSM . • **Is DTC B1317 or B1318 still present?**	**Yes** INSTALL a new DSM . REFER to Section 419-10 . CLEAR all CMDTCs . REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3201. CONNECT driver seat side air bag module C3049. REPOWER the SRS . REFER to Section 501-20B . **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR all CMDTCs . REPEAT the self-test. DISCONNECT the battery ground cable. CONNECT driver safety belt buckle pretensioner C3201. CONNECT driver seat side air bag module C3049. REPOWER the SRS . REFER to Section 501-20B .

tomsn048@gmail.com

Memory Position Programming

Programming Memory Positions

NOTE: Memory positions can be stored at any time.

NOTE: Verify good battery condition before diagnosing the memory seat system. Poor battery condition may interfere with memory seat operation, even if vehicle starting is possible.

1. **NOTE:** To program the Remote Keyless Entry (RKE) transmitter, refer to Section 501-14 .

   To set memory position(s) move the memory driver seat, memory exterior mirrors (if equipped), memory adjustable pedals (if equipped) and memory tilt steering column (if equipped) to the preferred position using the appropriate switch(es).

2. **NOTE:** Once the memory SET switch button is pressed, there is a 5-second time limit to input a memory position. If a memory position input is not received within the time limit, the operation is aborted and the memory SET switch LED (if equipped) is turned OFF.

   NOTE: If one of the following other inputs is received during the time limit, the operation is aborted and the memory SET switch LED (if equipped) is turned OFF:

   - Driver seat control switch
   - Memory SET switch button
   - Adjustable pedal control switch (if equipped)
   - Exterior mirror control switch (if equipped)
   - Power tilt steering column switch (if equipped)

   Press the memory SET switch button, activating the memory SET switch LED (if equipped).

3. Within 5 seconds (before the LED goes out) (if equipped), press memory SET switch button 1 or 2.

4. Repeat Steps 1 through 3 to initiate another memory position setting.

Recalling a Stored Memory Position

NOTE: A memory recall can be initiated only if the vehicle is in PARK or NEUTRAL gear and the ignition switch is not in START. A memory recall in progress will not be affected by moving the ignition switch to START or by moving the gearshift lever out of PARK or NEUTRAL.

NOTE: Input from the driver seat control switch, memory SET switch, adjustable pedal control switch (if equipped), exterior mirror control switch (if equipped) or power tilt steering column switch (if equipped) during a memory recall will abort the memory recall.

1. The driver can recall the desired memory driver seat, memory exterior mirror (if equipped), memory adjustable pedal (if equipped) and memory tilt steering column (if equipped) positions by depressing either memory SET switch button 1 or 2. Depressing memory SET switch button 1 will initiate a recall of the positions stored for Memory 1. Depressing memory SET switch button 2 will initiate a recall of the positions stored for Memory 2.

Seat - Front

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Material

Item	Specification
Threadlock and Sealer TA-25	WSK-M2G351-A5

NOTE: Driver seat shown, passenger seat similar.

NOTE: The 4 seat track-to-floor bolts must be tightened in the sequence described in this procedure.

Item	Part Number	Description
1	62163	Seat track-to-floor bolt front cover
2	W711352	Seat track-to-floor front bolts
3	-	Seat

tomsn048@gmail.com

4	-	Electrical connectors (part of 14A005)
5	W711352	Seat track-to-floor rear bolts
6	-	Safety belt retractor belt anchor (part of 611B09)
7	-	Cushion side shield cover (part of 62187)
8	-	Safety belt retractor belt anchor bolt (part of 611B09)
9	600A58	Scrivets
10	61749	Seat track-to-floor bolt rear inboard cover
11	61749	Seat track-to-floor bolt rear outboard cover

Removal

⚠ WARNING: Never probe the electrical connectors on safety belt buckle/retractor pretensioners or adaptive load limiting retractors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners or adaptive load limiting retractors, which increases the risk of serious personal injury or death.

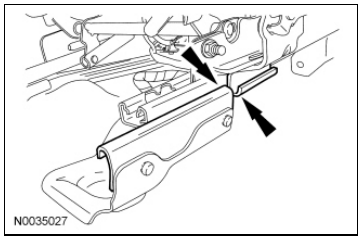
⚠ WARNING: Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

⚠ WARNING: Use care when handling the front passenger seat and track assembly. Dropping the assembly, placing excessive weight on or sitting on a front passenger seat that is not secured in the vehicle may result in damaged seat components. Failure to follow these instructions may result in incorrect operation of the occupant classification sensor (OCS) system and increases the risk of serious personal injury or death in a crash.

NOTE: The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

1. Pry out at the bottom, then slide up and remove the cushion side shield cover.



2. Remove the bolt and separate the safety belt anchor from the seat.

3. Remove the seat track-to-floor bolt front cover.
   - Pull up at the front to release the clips, then slide up and forward to remove.
     - ♦ The seat track must be back far enough for the rear of the cover to slide up and the locator tab to separate from the seat track.

4. **NOTE:** Driver seat track inboard rear mounting ear shown, passenger seat similar.

   Position the seat so that the seat track bracket does not engage the safety belt buckle and pretensioner bracket attached to the cushion frame.

   - If equipped with power seats, move the seat to its highest vertical position.

5. Depower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B .

6. Remove the 2 seat track-to-floor front bolts.

7. Remove the 2 seat track-to-floor bolt rear covers.

8. Remove the 2 seat track-to-floor rear bolts.

9. **⚠ WARNING: The occupant classification sensor (OCS) rails have a built-in strain gauge which may operate incorrectly if an OCS rail is dropped by itself, dropped after it is installed to the front passenger seat or dropped after it is installed to a front passenger seat track assembly. Use care when handling an OCS rail before or after it is installed to the front passenger seat or seat track assembly. Failure to follow these instructions may result in incorrect operation of the OCS system and increases the risk of serious personal injury or death in a crash.**

   Tip the seat, release the wire harness pin-type retainers, disconnect the electrical connectors and remove the seat.

Installation

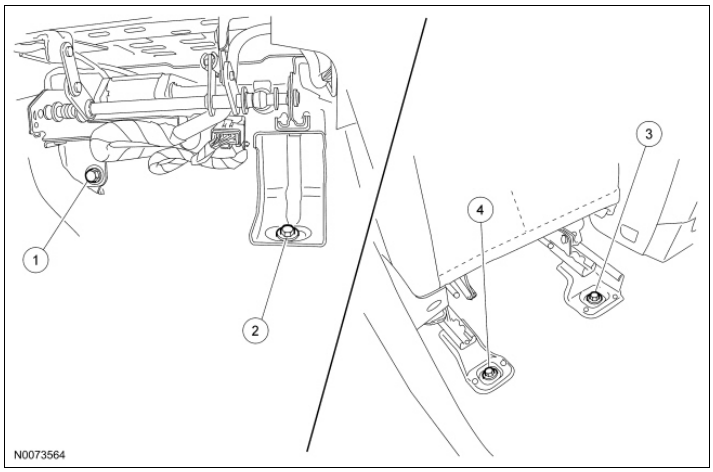
⚠ WARNING: Make sure the front passenger seat is correctly installed and fastened to the vehicle. Do not force the alignment to the floorpan mounting holes. If the seat does not align to the floorpan mounting holes, repair the seat or floorpan as needed. Failure to follow these instructions may result in incorrect operation of the occupant classification sensor (OCS) system and increase the risk of serious personal injury or death in a crash.

⚠ WARNING: After any crash, inspect the front passenger seat-to-floorpan mounting area for deformation and restore to its original condition, if deformed. Correct alignment of the occupant classification sensor (OCS) rails to the seat and floorpan is critical for correct OCS system operation. Incorrect operation of the OCS system increases the risk of serious personal injury or death in a crash.

All seats

1. Position the seat in the vehicle.

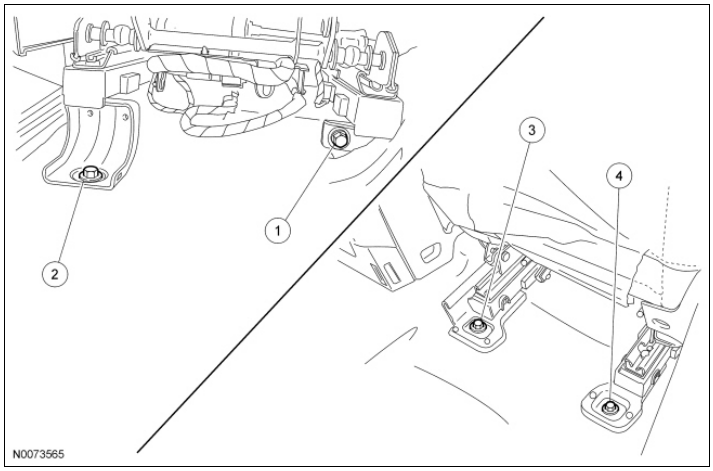
2. Tip the seat, connect the electrical connectors and install the wire harness pin-type retainers.
   - Always install a new pin-type retainer whenever the vehicle harness has been separated from the seat attachment point.



3. ***NOTICE:*** **Once the front inboard attachment bolt is hand-tightened to its angled bracket, make sure the 3 remaining holes in the track risers align to the floor mounting nuts without forcing them.**

   Start by hand all of the seat track-to-floor bolts, but do not tighten at this time.

Driver seat



tomsn048@gmail.com

4. Apply threadlock and start the 4 seat track-to-floor bolts by hand.
    - Tighten in the sequence shown to 40 Nm (30 lb-ft).

Passenger seat

5. Apply threadlock and start the 4 seat track-to-floor bolts by hand.
    - Tighten in the sequence shown to 40 Nm (30 lb-ft).

All seats

6. Install the seat track-to-floor bolt front cover and 2 rear covers.

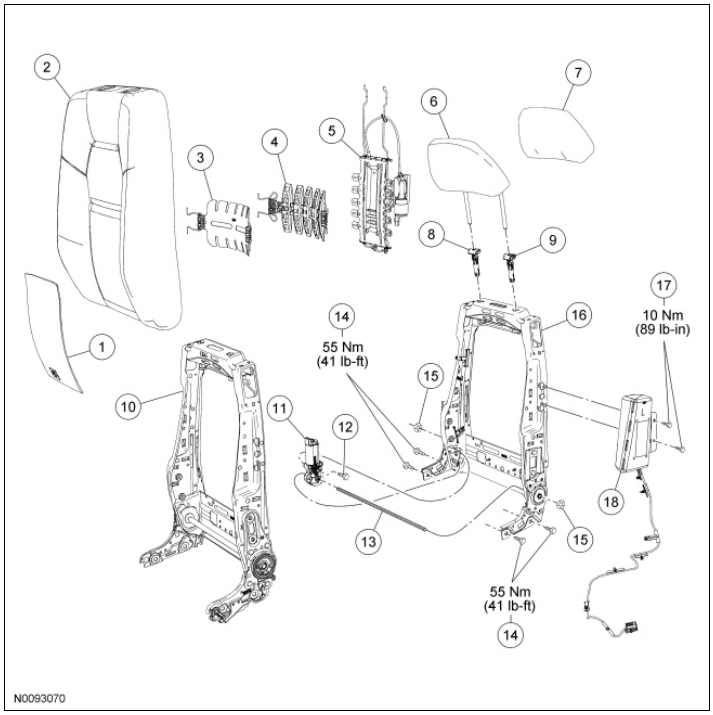
7. Repower the SRS . **If a passenger seat has been serviced, do not prove out the SRS at this time.** For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B .

8. If necessary, position the seat then align the safety belt retractor belt anchor to the seat and install the bolt.
    - Tighten to 40 Nm (30 lb-ft).

9. Install the cushion side shield cover.

10. Check the active restraint system of the seat.
    - Make sure the safety belts and buckles are accessible to the occupants after installation.

Passenger seat



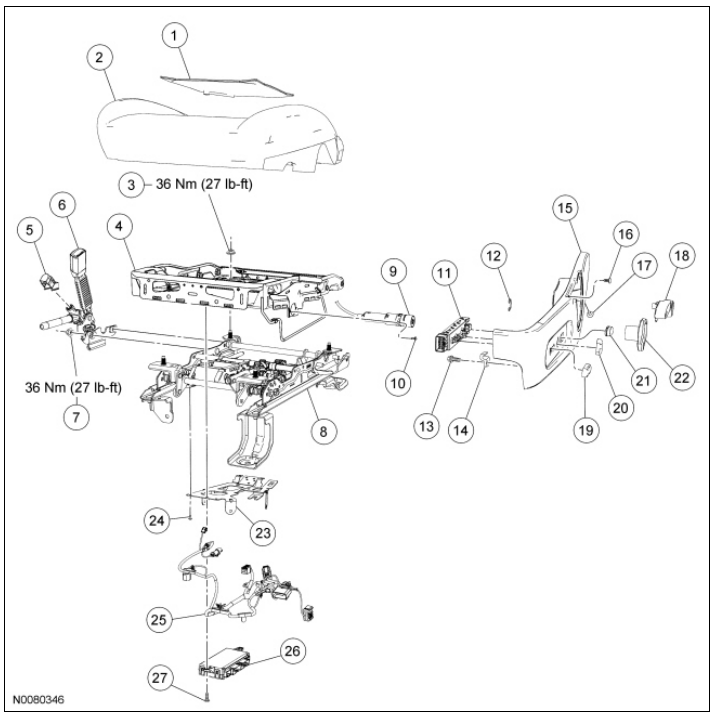
11. Carry out the Occupant Classification Sensor (OCS) System Zero Seat Weight Test and prove out the SRS . For additional information, refer to General Procedures portion of Section 501-20B .

tomsn048@gmail.com

Seat - Exploded View, Front

Front Seat Backrest

NOTE: Driver backrest shown, passenger backrest similar.



Item	Part Number	Description
1	14D696	Backrest heated seat mat (if equipped)
2	64417/ 64811	Backrest trim cover/ backrest foam pad
3	65500	Static lumbar (if equipped)
4	65500	Manual lumbar adjust assembly (if equipped)
5	65500	Power lumbar adjust assembly (if equipped)
6	611A08	Head restraint assembly
7	-	Head restraint cover
8	610A18	Inboard head restraint guide sleeve
9	610A16	Outboard head restraint guide sleeve
10	61018	Backrest frame (serviced with manual recliners) (if equipped)
11	14547	Power recline motor (if equipped)
12	-	Screw (if equipped) (part of 600A58)
13	62714	Recliner shaft (if equipped)
14	-	Recliner-to-cushion frame bolts (4 required) (part of 600A58)

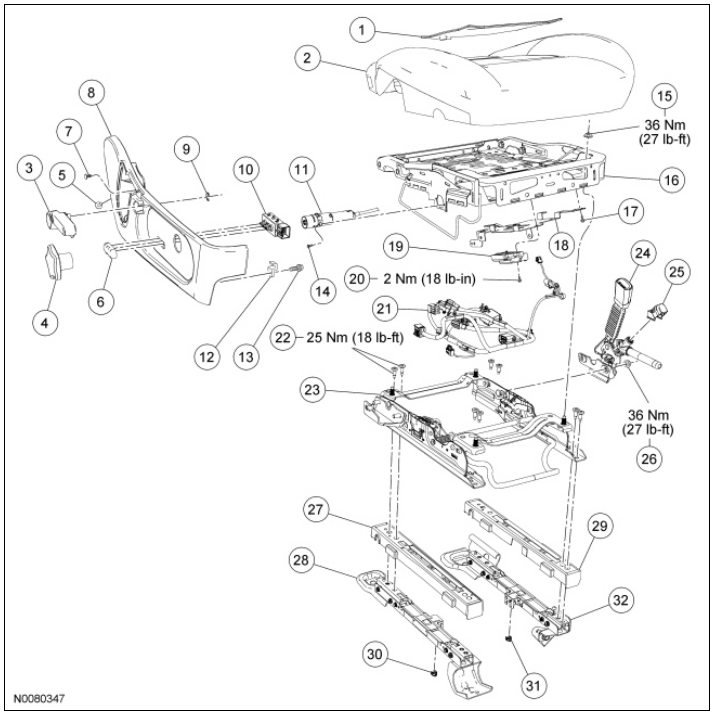
15	-	One-way push clips (2 required) (if equipped) (part of 14547)
16	61018	Backrest frame (serviced with power recliners) (if equipped)
17	-	Side air bag module bolts (2 required)
18	611D11	Side air bag module

Driver Seat Cushion

NOTE: Power seat track shown, manual seat track similar.

NOTE: The retention bracket and screw can be used to repair cushion side shields that will not retain to the cushion frame wire.

Item	Part Number	Description
1	-	Cushion heated seat mat (if equipped)
2	62901/ 632A23	Cushion trim cover/ cushion foam pad
3	-	Cushion frame-to-seat-track nut (4 required) (part of 600A58)
4	63100	Cushion frame
5	-	Safety belt buckle and pretensioner electrical connector cover
6	61203	Safety belt buckle and pretensioner
7	-	Safety belt buckle and pretensioner nut (2 required) (part of 61203)
8	61711	Power seat track



tomsn048@gmail.com

9	610C00	Manual lumbar control (if equipped)
10	-	Manual lumbar control screw (2 required) (if equipped) (part of 600A58)
11	14A701	Seat control switch (if equipped)
12	-	Manual recline handle clip (if equipped) (part of 610A76)
13	W506943	Retention bracket screw (if equipped)
14	62256	Retention bracket (if equipped)
15	62187	Cushion side shield
16	-	Scrivet (part of 600A58)
17	-	Pin-type retainer (part of 600A58)
18	62622	Manual recline handle (if equipped)
19	14C715	Seat control switch knob (if equipped)
20	14711	Power recline switch knob (if equipped)
21	14711	Power lumbar switch knob (if equipped)
22	617B70	Manual lumbar control knob (if equipped)
23	14A163	Bracket
24	-	Screw (4 required) (part of 600A58)
25	14C719	Driver seat wire harness
26	14C708	Driver Seat Module (DSM) (if equipped)
27	-	Screw (2 required) (if equipped) (part of 600A58)

Passenger Seat Cushion

NOTE: Manual seat track shown, power seat track similar.

NOTE: The retention bracket and screw can be used to repair cushion side shields that will not retain to the cushion frame wire.

Item	Part Number	Description
1	14D698	Cushion heated seat mat (if equipped)
2	62900/ 632A22	Cushion trim cover/ cushion foam pad
3	62622	Manual recline handle (if equipped)
4	617B70	Manual lumbar control knob (if equipped)
5	-	Pin-type retainer (part of 600A58)
6	14C715	Seat control switch knob (if equipped)
7	-	Scrivet (part of 600A58)
8	62186	Cushion side shield
9	-	Manual recline handle clip (part of 610A76) (if equipped)
10	14A701	Seat control switch (if equipped)
11	610C00	Manual lumbar control (if equipped)
12	62256	Retention bracket (if equipped)
13	W506943	Retention bracket screw (if equipped)
14	-	Manual lumbar control screw (2 required) (if equipped) (part of 600A58)
15	-	Cushion frame-to-seat-track nut (4 required) (part of 600A58)
16	63100	Cushion frame
17	-	Screw (4 required) (part of 600A58)
18	14A163	Bracket
19	14B422	Occupant Classification System Module (OCSM)
20	-	Screw, OCSM (2 required) (part of 600A58)
21	14A699	Passenger seat wire harness
22	-	

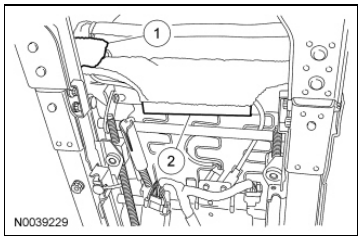
tomsn048@gmail.com

		Seat track-to-Occupant Classification Sensor (OCS) rail bolts (8 required) (part of 600A58)
23	61710	Manual seat track
24	61202	Safety belt buckle and pretensioner
25	-	Safety belt buckle and pretensioner electrical connector cover
26	-	Safety belt buckle and pretensioner nut (2 required) (part of 61203)
27	62126	Outboard OCS rail shield
28	61708	Outboard OCS rail
29	62127	Inboard OCS rail shield
30	-	Outboard OCS rail electrical connector (part of 14A699)
31	-	Inboard OCS rail electrical connector (part of 14A699)
32	61709	Inboard OCS rail

1. For additional information, refer to the procedures in this section.

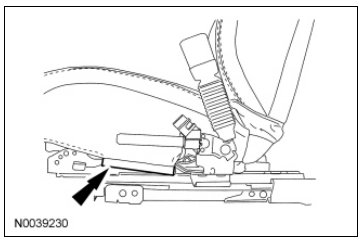
Seat Backrest - Front

Removal and Installation



NOTE: Driver shown, passenger similar.

All seats



1. Remove the front seat. For additional information, refer to Seat - Front in this section.

2. Remove the cushion side shield in the following sequence.
    1. Remove the clip and manual recline handle (if equipped).
    2. Pull and remove the manual lumbar control knob (if equipped).
        - Make sure the lumbar is completely relaxed before removing the handle.
    3. Remove the scrivet.
    4. Remove the retention bracket screw and the retention bracket (if equipped).
    5. Release the cushion side shield front clip.
    6. From under the cushion side shield, release the 3 hook retainers.
    7. Pull out on the cushion side shield at the back and release the pin-type retainer.
    8. Separate the cushion trim cover elastic strap from the cushion side shield.
        - With manual seat track, remove the cushion side shield.
    9. With power seat track, remove the seat control switch knob and separate the seat control switch from the cushion side shield.
        - Remove the cushion side shield.

3. Release the cushion trim cover rear J-clips.
    1. Release the cushion trim cover rear inboard J-clip from the inboard recliner.
    2. For a driver seat or passenger seat equipped with heat, release the cushion trim cover rear J-clips.

4. Release the cushion trim cover inboard J-clip.

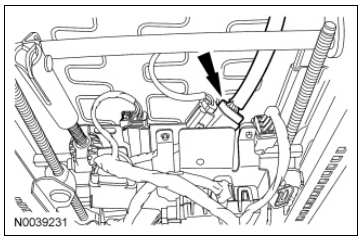
5. Remove the safety belt buckle and pretensioner electrical connector cover.

tomsn048@gmail.com

6. Remove the 2 safety belt buckle and pretensioner nuts.
    - To install, tighten to 36 Nm (27 lb-ft).

7. Disconnect the safety belt buckle and pretensioner electrical connector and safety belt buckle switch electrical connector.
    - Remove the safety belt buckle and pretensioner.

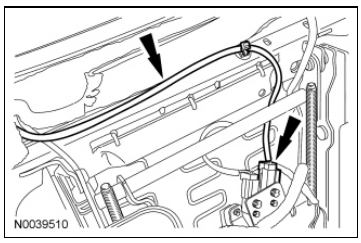
Seat with manual lumbar



8. Release the cushion trim cover front J-clip. Raise the cushion foam pad and release the lumbar cable pin-type retainer.

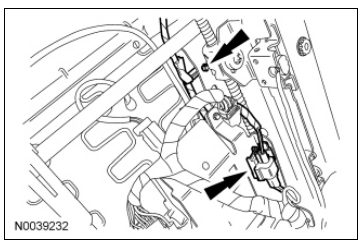
9. Remove the 2 screws and separate the manual lumbar control from the cushion frame.

10. Remove the cable from the manual lumbar control.



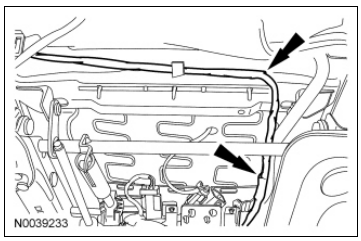
Driver seat with power recline

11. Disconnect the backrest power feed electrical connector and route out the wire harness.
    - Release any wire harness retainers.



Passenger seat with heat

12. Disconnect the backrest heated seat mat electrical connector and route out the wire harness.
    - Release any wire harness retainers.



All seats

13. Release the pin-type retainers, disconnect and route out the side air bag module electrical connector and wire harness.

14. **NOTE:** Driver shown, passenger similar.

Release the side air bag wire harness pin-type retainers across the back of the cushion frame.

15. Remove the 4 recliner-to-cushion frame bolts and remove the backrest assembly.
    - Route out the manual lumbar cable and any wire harnesses (if equipped).
    - To install, tighten to 55 Nm (41 lb-ft).

16. To install, reverse the removal procedure.

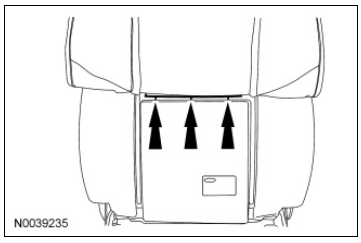
17. Install the front seat. **If a passenger seat has been serviced, do not prove out the SRS at this time.** For additional information, refer to Seat - Front in this section.

Passenger seat

18. Carry out the Occupant Classification Sensor (OCS) System Zero Seat Weight Test and prove out the SRS . For additional information, refer to General Procedures portion of Section 501-20B .

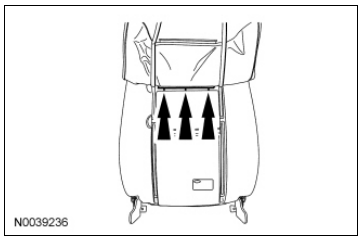
tomsn048@gmail.com

Seat Backrest Cover - Front



Removal and Installation

⚠ WARNING: Front seat backrest trim covers installed on seats equipped with seat side air bags cannot be repaired. A new trim cover must be installed. Cleaning is permissible. Failure to follow these instructions may result in the seat side air bag module deploying incorrectly and increase the risk of serious personal injury or death in a crash.



All seats

1. Remove the front seat. For additional information, refer to Seat - Front in this section.
2. Remove the front seat backrest. For additional information, refer to Seat Backrest - Front in this section.
3. Remove the 2 head restraint guide sleeves. For additional information, refer to Head Restraint Guide Sleeve in this section.
4. Remove the plastic rivets attaching the backrest trim cover to the inboard and outboard recliners.
5. ***NOTICE:*** **Use care when separating the seat back trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the backrest foam pad.**

   Release the backrest trim cover lower J-clip, hook-and-loop strips and invert the trim cover to the first row of hog rings.
6. Remove the first row of hog rings.

7. Release the hook-and-loop strips, invert the trim cover and remove the second row of hog rings.

8. Remove the backrest trim cover.
9. To install, reverse the removal procedure.

10. Install the front seat backrest. For additional information, refer to Seat Backrest - Front in this section.

11. Install the front seat. **If a passenger seat has been serviced, do not prove out the SRS at this time.** For additional information, refer to Seat - Front in this section.

Passenger seat

12. Carry out the Occupant Classification Sensor (OCS) System Zero Seat Weight Test and prove out the SRS . For additional information, refer to General Procedures portion of Section 501-20B .

tomsn048@gmail.com

Seat Cushion Cover - Front

Removal and Installation

All seats

1. Remove the front seat. For additional information, refer to Seat - Front in this section.

2. Remove the cushion side shield in the following sequence.
    1. Remove the clip and manual recline handle (if equipped).
    2. Pull and remove the manual lumbar control knob (if equipped).
    3. Remove the scrivet.
    4. Remove the retention bracket screw and the retention bracket (if equipped).
    5. Release the cushion side shield front clip.
    6. From under the cushion side shield, release the 3 hook retainers.
    7. Pull out on the cushion side shield at the back and release the pin-type retainer.
    8. Separate the cushion trim cover elastic strap from the cushion side shield.
        - With manual seat track, remove the cushion side shield.
    9. With power seat track, remove the seat control switch knob and separate the seat control switch from the cushion side shield.
        - Remove the cushion side shield.

3. Release all the cushion trim cover-to-cushion frame retainers.

4. ***NOTICE:*** **Use care when separating the cushion trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the cushion foam pad.**

   Release the hook-and-loop strips, remove the hog rings and remove the cushion trim cover from the cushion foam pad.

5. To install, reverse the removal procedure.

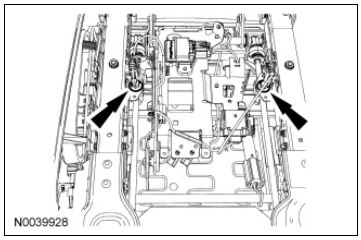
6. Install the front seat. **If a passenger seat has been serviced, do not prove out the SRS at this time.** For additional information, refer to Seat - Front in this section.

Passenger seat

7. Carry out the Occupant Classification Sensor (OCS) System Zero Seat Weight Test and prove out the SRS . For additional information, refer to General Procedures portion of Section 501-20B .

tomsn048@gmail.com

Seat Track



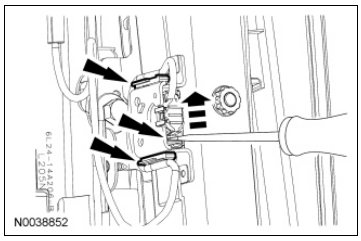
Removal and Installation

All seats

1. Remove the front seat. For additional information, refer to Seat - Front in this section.

Passenger seat with failed horizontal motor

2. To remove the Occupant Classification Sensor (OCS) rails, remove the 2 horizontal screw block bolts. This will allow the power seat tracks to move independently of each other for access to the 8 OCS rail bolts.



Passenger seat receiving a new seat track

3. Remove the inboard and outboard OCS rails. For additional information, refer to Occupant Classification Sensor (OCS) in the removal and installation portion of Section 501-20B .

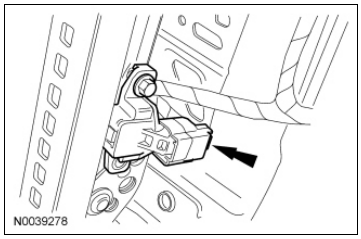
Passenger seat not receiving a new seat track

4. **NOTE:** Note the position and the routing of the OCS wiring, connector and wiring retainers for installation.

   Detach the 2 OCS wiring retainers at each OCS rail. Then using a suitable tool, release the tab and disconnect the RH and LH OCS rail electrical connectors.

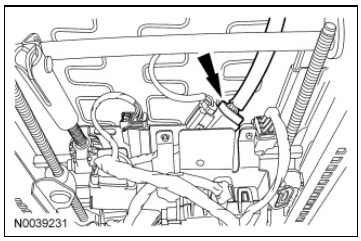
All seats

5. Remove the cushion side shield in the following sequence.
   1. Remove the clip and manual recline handle (if equipped).
   2. Pull and remove the manual lumbar control knob (if equipped).
   3. Remove the scrivet.
   4. Remove the retention bracket screw and the retention bracket (if equipped).



5. Release the cushion side shield front clip.
6. From under the cushion side shield, release the 3 hook retainers.
7. Pull out on the cushion side shield at the back and release the pin-type retainer.
8. Separate the cushion trim cover elastic strap from the cushion side shield.
    - ♦ With manual seat track, remove the cushion side shield.
9. With power seat track, remove the seat control switch knob and separate the seat control switch from the cushion side shield.
    - ♦ Remove the cushion side shield.

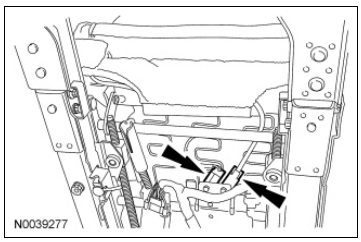
Power seat



6. Separate the seat control switch wire harness pin-type retainer from the cushion frame.

Driver seat

7. Disconnect the SRS seat position sensor.



8. Driver seat with 10-way power, disconnect the backrest power feed electrical connector and route out the wire harness.
    - Release any wire harness retainers.

Heated seat

9. **NOTE:** Passenger shown, driver similar.

   Disconnect the cushion and backrest heated seat mat electrical connectors.

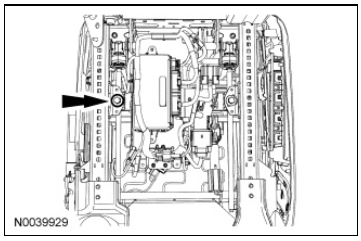
All seats

10. Release the pin-type retainers, disconnect and route out the side air bag module electrical connector and wire harness.

tomsn048@gmail.com

11. Remove the safety belt buckle and pretensioner electrical connector cover.

12. Disconnect the safety belt buckle and pretensioner electrical connector and safety belt buckle switch electrical connector.



13. Release all the cushion trim cover retainers.

14. Remove the seat cushion foam pad and cushion trim cover.

15. Remove the 4 cushion frame-to-seat track nuts and the seat track.
    - To install, tighten to 36 Nm (27 lb-ft).

Driver seat with failed horizontal motor

16. If necessary, remove the inboard horizontal screw block bolt. This will allow the inboard power seat track to move independently so the safety belt buckle and pretensioner can be removed.

All seats

17. To install, reverse the removal procedure.

18. Install the front seat. **If a passenger seat has been serviced, do not prove out the SRS at this time.** For additional information, refer to Seat - Front in this section.

Passenger seat

19. Carry out the Occupant Classification Sensor (OCS) System Zero Seat Weight Test and prove out the SRS . For additional information, refer to General Procedures portion of Section 501-20B .

tomsn048@gmail.com

Seat Recliner Motor

Removal

1. Remove the front seat. For additional information, refer to Seat - Front in this section.

2. Remove the front seat backrest. For additional information, refer to Seat Backrest - Front in this section.

3. Remove the plastic rivets attaching the backrest trim cover to the inboard and outboard recliners.

4. ***NOTICE:*** **Use care when separating the seat back trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the backrest foam pad.**

   Release the backrest trim cover lower J-clip, hook-and-loop strips and invert the trim cover to the first row of hog rings.

5. ***NOTICE:*** **Do not rotate the recliner shaft while not engaged to both recliners. Failure to do so will cause the inboard and outboard recliners to become out of synchronization.**

   Remove the one-way push clip on the side of the inboard power recliner. Slide the recliner shaft out from the outboard side of the seat enough to clear the inboard recliner and power recline motor.

6. Disconnect the electrical connector, remove the screw and the power recline motor.

Installation

All seats

1. ***NOTICE:*** **Do not rotate the recliner shaft while not engaged to both recliners. Failure to do so will cause the inboard and outboard recliners to become out of synchronization.**

   Install the recliner motor in the following sequence.

   1. Position the recliner shaft through the recliner motor and inboard recliner.
      - ♦ Slight turning of the recliner shaft may be necessary.
   2. Install a new one-way push clip onto the recliner shaft at the inboard power recliner.
   3. Turn the recliner motor so the recliner motor mounting hole lines up with the screw hole in the inboard power recliner.
   4. Install the recliner motor bolt.
   5. Connect the recliner motor electrical connector.

2. Roll the backrest trim cover down, attach the hook-and-loop strips and engage the backrest trim cover lower J-clip.

3. Position the backrest trim cover to the inboard and outboard recliners and install the plastic rivets.

4. Install the front seat backrest. For additional information, refer to Seat Backrest - Front in this section.

5. Install the front seat. **If a passenger seat has been serviced, do not prove out the SRS at this time.** For additional information, refer to Seat - Front in this section.

Passenger seat

6. Carry out the Occupant Classification Sensor (OCS) System Zero Seat Weight Test and prove out the SRS . For additional information, refer to General Procedures portion of Section 501-20B .

tomsn048@gmail.com

Lumbar Assembly

Removal and Installation

All seats

1. Remove the front seat. For additional information, refer to Seat - Front in this section.

2. Remove the front seat backrest. For additional information, refer to Seat Backrest - Front in this section.

3. Remove the plastic rivets attaching the backrest trim cover to the inboard and outboard recliners.

4. ***NOTICE:*** **Use care when separating the seat back trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the backrest foam pad.**

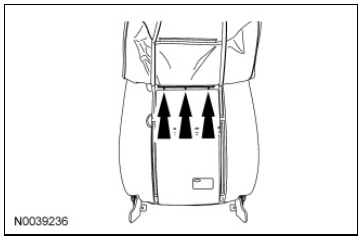
   Release the backrest trim cover lower J-clip, hook-and-loop strips and invert the trim cover to the first row of hog rings.

Seats with manual lumbar

5. **NOTE:** Illustration view from the back of seat.

   Release the 2 manual lumbar spring clips from the backrest frame and remove the manual lumbar.

   - Route out the lumbar cable from behind the recliner and from between the inboard side of the backrest foam pad and backrest frame.



Seats with power lumbar

6. Remove the first row of hog rings.

7. Release the hook-and-loop strips, invert the trim cover and remove the second row of hog rings.

8. Remove the power lumbar adjust assembly in the following sequence.
    1. Disconnect the power lumbar adjust assembly motor electrical connector.
    2. Release the 2 power lumbar adjust assembly lower pin-type retainers to the backrest frame.
    3. Slide the power lumbar adjust assembly rods out of the backrest frame at the top and remove the power lumbar adjust assembly.

All seats

9. To install, reverse the removal procedure.

10. Install the front seat backrest. For additional information, refer to Seat Backrest - Front in this section.

11. Install the front seat. **If a passenger seat has been serviced, do not prove out the SRS at this time.** For additional information, refer to Seat - Front in this section.

Passenger seat

12. Carry out the Occupant Classification Sensor (OCS) System Zero Seat Weight Test and prove out the SRS . For additional information, refer to General Procedures portion of Section 501-20B .

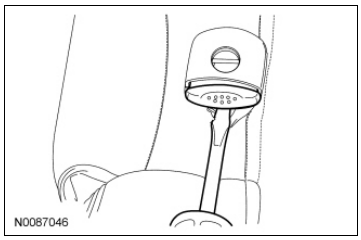
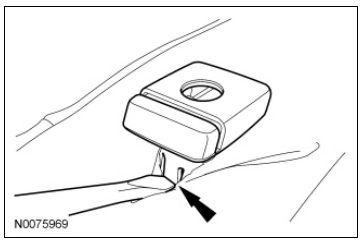
tomsn048@gmail.com

Head Restraint Guide Sleeve



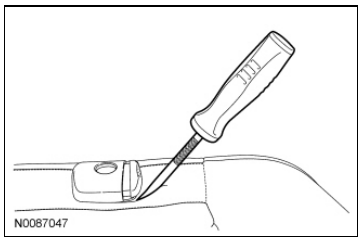
Removal

NOTE: Typical head restraint guide sleeve shown, others similar.



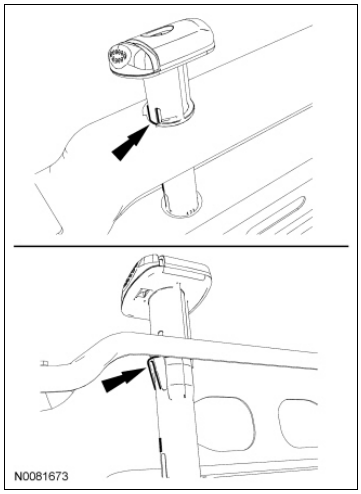
1. Push in on the 2 head restraint guide sleeve release buttons and remove the head restraint.

2. Obtain a flat-head screwdriver with a width of 4 mm (0.157 in) to 7 mm (0.275 in) and a thickness of approximately 1 mm (0.039 in).

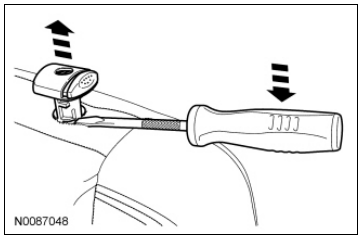


3. Align the screwdriver to the middle of the head restraint guide sleeve release button.

4. Position the screwdriver between the head restraint guide sleeve neck and backrest trim cover and foam pad.



5. Position the screwdriver at a 45-degree angle.



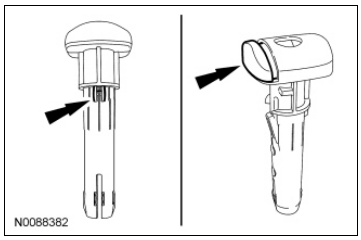
6. **NOTE:** For retainer clarity, backrest trim cover and foam pad are removed.

   Push the screwdriver in, bending the lock feature on the head restraint guide sleeve in.

7. While bending the lock feature in, push down on the screwdriver handle, prying the head restraint guide sleeve up and disengaging it from the backrest frame crossmember.

8. Remove the head restraint guide sleeve.
    - Discard the head restraint guide sleeve.

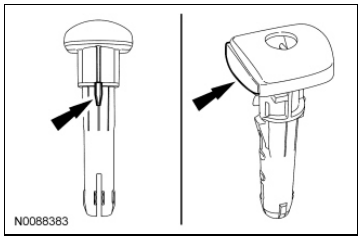
9. Repeat these steps for the head restraint guide sleeve on the opposite side.



Installation

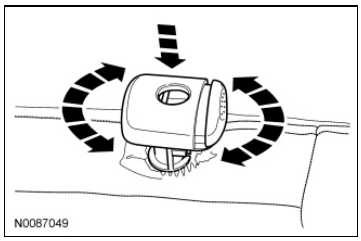
NOTICE: **Always install new head restraint guide sleeves. Difficult adjustment of the head restraint may occur. Failure to follow these instructions may result in component failure.**

NOTICE: **The head restraint guide sleeves are not interchangeable. Failure to install the correct head restraint guide sleeve at the correct position may result in component failure.**



1. Make sure the holes in the backrest foam pad and backrest trim cover are aligned to the holes in the backrest frame.

2. Install the head restraint guide sleeve with the large button and wide key on the LH side of the seat.



3. Install the head restraint guide sleeve with the small button and thin key on the RH side of the seat.

tomsn048@gmail.com

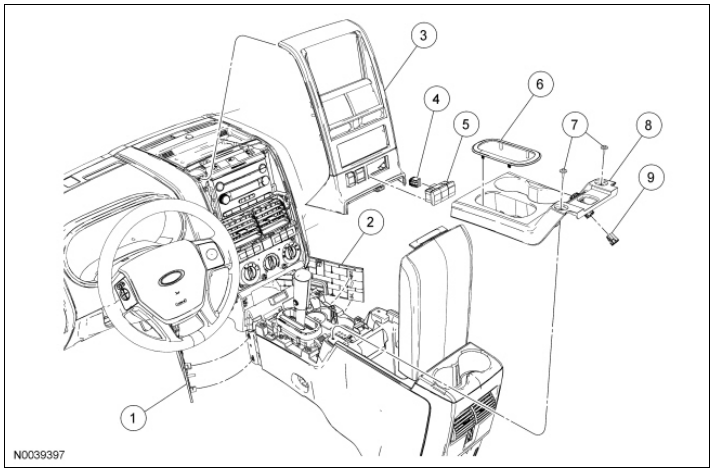
4. ***NOTICE:*** **Do not attempt to seat the head restraint guide sleeve by hand. This may result in excessive head restraint adjustment efforts and permanent damage to the head restraint guide sleeve.**

   To allow the head restraint guide sleeve to slide freely through the backrest foam pad and backrest trim cover, twist the head restraint guide sleeve while pushing it into the backrest frame hole as far as it will go with hand pressure.

5. ***NOTICE:*** **Striking effort should not result in any type of damage or distortion to the head restraint guide sleeve. If a head restraint guide sleeve is damaged, install a new one.**

   Using a non-marring mallet, strike the top of the head restraint guide sleeve with moderate force, seating it in the backrest frame.

   - Striking effort must be hard enough to snap the head restraint guide sleeve retainer in place in the backrest frame.



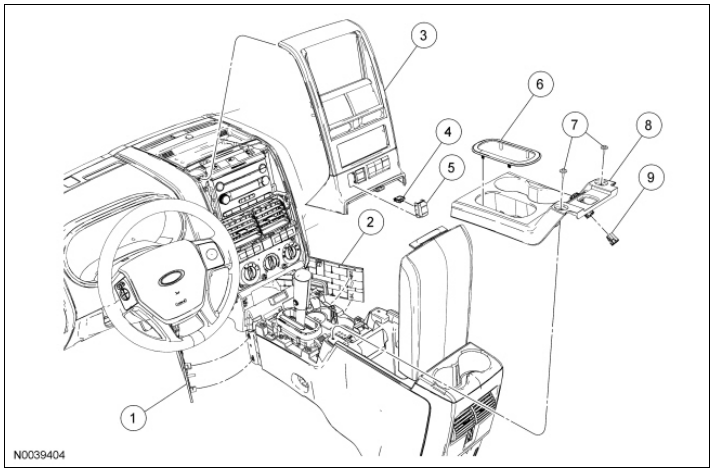
6. Inspect the head restraint guide sleeve.
   - Pull the head restraint guide sleeve out by hand, making sure it is locked in place. If the head restraint guide sleeve can be removed by hand, repeat the installation procedure. If the head restraint guide sleeve can be removed again after installing a second time, install a new head restraint guide sleeve.

7. Repeat these steps for the head restraint guide sleeve on the opposite side.

8. After installation of 2 new head restraint guide sleeves, install the head restraint in the following sequence.
   1. Position the head restraint rods to the head restraint guide sleeve holes.
   2. Push the head restraint down, guiding the rods into the head restraint guide sleeve holes.
   3. Make sure the head restraint adjusts without excessive effort and locks in place.

tomsn048@gmail.com

Heated Seat Switch



Item	Part Number	Description
1	04609	Instrument panel center lower LH finish panel
2	04608	Instrument panel center lower RH finish panel
3	044D70	Instrument panel center finish panel
4	-	Electrical connector (part of 14401)
5	13350	Heated seat/heated windshield switch pack
6	7E391	Console trim ring
7	W705796	Screws
8	04567	Console finish panel
9	-	Electrical connector (part of 14B079)

Removal and Installation

1. Position the gear selector to NEUTRAL.
2. Remove the console trim ring.
3. Open the center console door, remove the 2 screws and pull up on the console finish panel to release the retainers.
4. Disconnect the power point electrical connector and remove the console finish panel.
5. Pull out to release the retainers and separate the instrument panel center lower RH and LH finish panels.
6. Pull out to release the retainers and separate the instrument panel center finish panel.
7. Disconnect the electrical connector, release the 4 tabs and remove the heated seat/heated windshield switch pack.
8. To install, reverse the removal procedure.

tomsn048@gmail.com

Memory Set Switch

Item	Part Number	Description
1	04609	Instrument panel center lower LH finish panel
2	04608	Instrument panel center lower RH finish panel
3	044D70	Instrument panel center finish panel
4	-	Electrical connector (part of 14401)
5	044D82	Memory SET switch
6	7E391	Console trim ring
7	W705796	Screws
8	04567	Console finish panel
9	-	Electrical connector (part of 14B079)

Removal and Installation

1. Position the gear selector to NEUTRAL.
2. Remove the console trim ring.
3. Open the center console door, remove the 2 screws and pull up on the console finish panel to release the retainers.
4. Disconnect the power point electrical connector and remove the console finish panel.
5. Pull out to release the retainers and separate the instrument panel center lower RH and LH finish panels.
6. Pull out to release the retainers and separate the instrument panel center finish panel.
7. Disconnect the electrical connector, release the 4 tabs and remove the memory SET switch.
8. To install, reverse the removal procedure.

tomsn048@gmail.com

Seat Control Switch

Removal and Installation

All seats

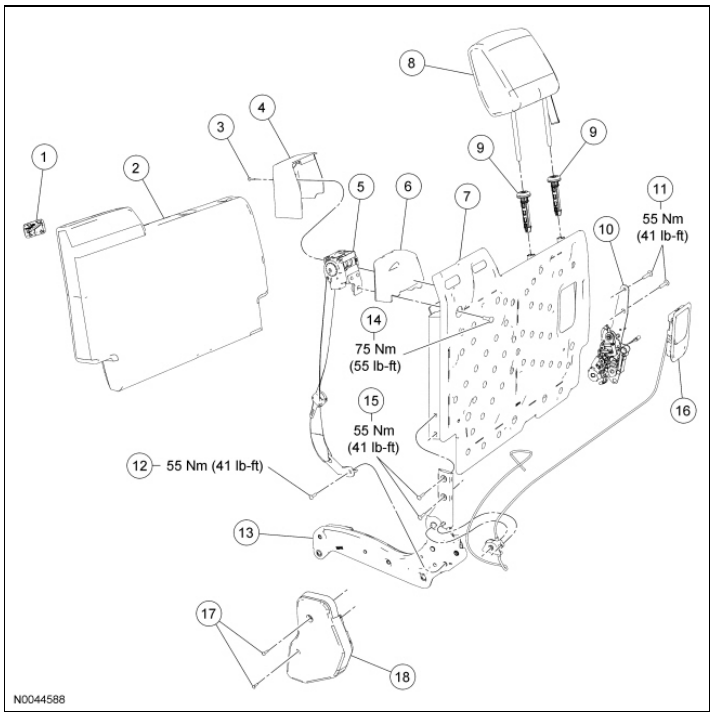
1. Remove the front seat. For additional information, refer to Seat - Front in this section.

2. Remove the cushion side shield in the following sequence.
    1. Remove the clip and manual recline handle (if equipped).
    2. Pull and remove the manual lumbar control knob (if equipped).
    3. Remove the scrivet.
    4. Remove the retention bracket screw and the retention bracket (if equipped).
    5. Release the cushion side shield front clip.
    6. From under the cushion side shield, release the 3 hook retainers.
    7. Pull out on the cushion side shield at the back and release the pin-type retainer.
    8. Separate the cushion trim cover elastic strap from the cushion side shield.
    9. Remove the seat control switch knob and separate the seat control switch from the cushion side shield.
        - Remove the cushion side shield.

3. Disconnect and remove the seat control switch.

4. To install, reverse the removal procedure.

5. Install the front seat. **If a passenger seat has been serviced, do not prove out the SRS at this time.** For additional information, refer to Seat - Front in this section.



Passenger seat

6. Carry out the Occupant Classification Sensor (OCS) System Zero Seat Weight Test and prove out the SRS . For additional information, refer to General Procedures portion of Section 501-20B .

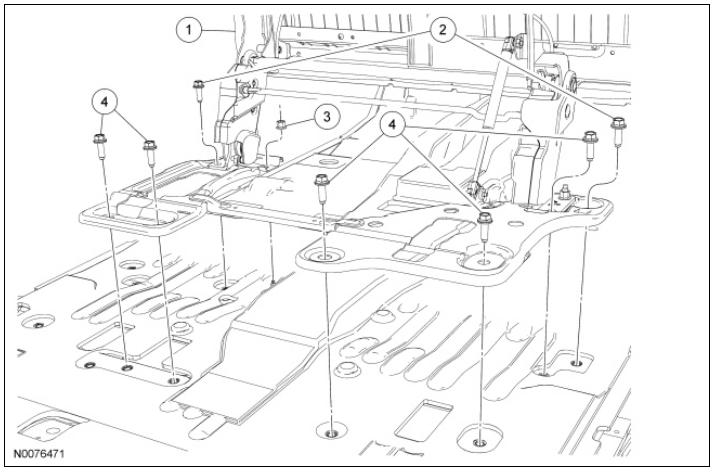
Seat - Second Row, 60/40, E-Z Entry

Material

Item	Specification
Threadlock and Sealer TA-25	WSK-M2G351-A5

40 Percent E-Z Entry

NOTE: When installing any seat-to-floor bolts or floor studs, apply threadlock.



Item	Part Number	Description
1	-	40 percent E-Z entry seat
2	W711175	Mounting plate-to-floor front bolts (M10) (2 required)
3	N620482	Mounting plate-to-floor nut
4	W711952	Mounting plate-to-floor rear bolts (M12) (2 required)

60 Percent E-Z Entry

NOTE: When installing any seat-to-floor bolts or floor studs, apply threadlock.

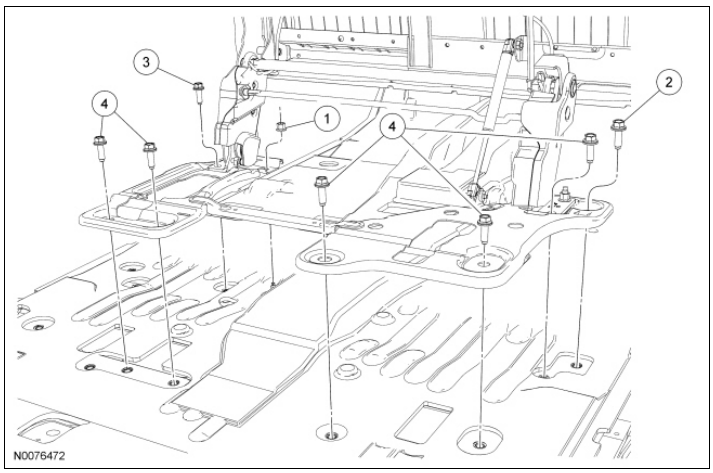
tomsn048@gmail.com

Item	Part Number	Description
1	-	60 percent E-Z entry seat
2	W711175	Mounting plate-to-floor front bolts (M10) (2 required)
3	N620482	Mounting plate-to-floor nut
4	W711952	Mounting plate-to-floor rear bolts (M12) (5 required)

Removal

1. Remove the affected seat retainers and the remove the 40 percent or 60 percent seat.

Installation



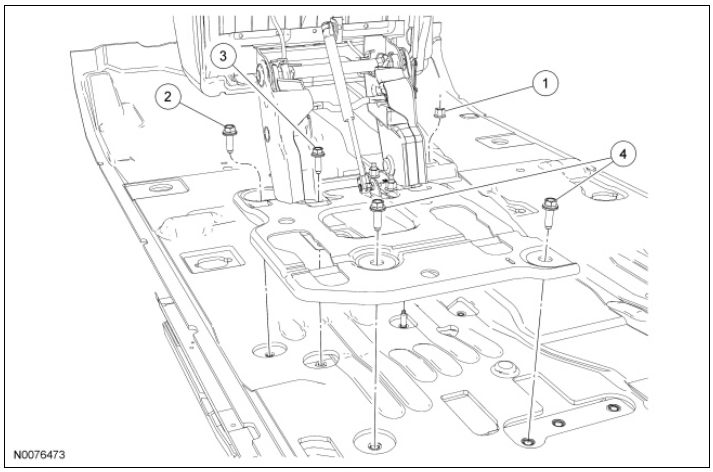
60 percent seat

1. Position the 60 percent seat into the vehicle.

2. **NOTE:** Before installation, make sure the safety belt webbing is not twisted and the safety belts and buckles are accessible to the occupants.

   Tighten the retainers in the following sequence.

   1. Tighten to 40 Nm (30 lb-ft).
   2. Apply threadlock and tighten to 40 Nm (30 lb-ft).
   3. Apply threadlock and tighten to 40 Nm (30 lb-ft).
   4. Apply threadlock and tighten the remaining 5 bolts in any sequence to 55 Nm (41 lb-ft).



40 percent seat

3. Position the 40 percent seat into the vehicle.

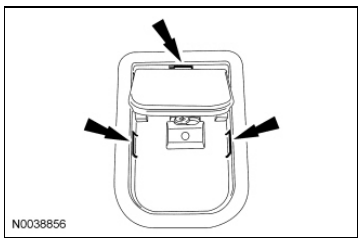
4. **NOTE:** Before installation, make sure the safety belt webbing is not twisted and the safety belts and buckles are accessible to the occupants.

   Tighten the retainers in the following sequence.

   1. Tighten to 40 Nm (30 lb-ft).
   2. Apply threadlock and tighten to 40 Nm (30 lb-ft).
   3. Apply threadlock and tighten to 40 Nm (30 lb-ft).
   4. Apply threadlock and tighten the remaining 2 bolts in any sequence to 55 Nm (41 lb-ft).

tomsn048@gmail.com

Seat Backrest - Second Row, 40 Percent E-Z Entry



Removal

1. Remove the second row, 40 percent E-Z entry seat from the vehicle. For additional information, refer to Seat - Second Row, 60/40, E-Z Entry in this section.

2. ***NOTICE:*** **Use care when separating the seat back trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the backrest foam pad.**

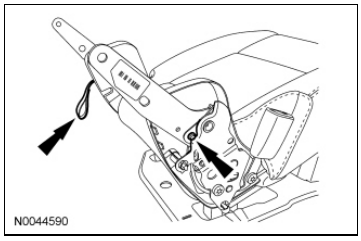
   Release the backrest trim cover lower J-clip, hook-and-loop strips and partially invert the backrest trim cover to expose the 2 inboard and 2 outboard recliner-to-backrest frame bolts.

3. Separate the kneeling mechanism release handle from the backrest frame.
   - Release the 3 kneeling mechanism release handle clips and separate from the backrest frame. Pull the kneeling mechanism release handle and cable back through the backrest frame.
     - Separating the kneeling mechanism release handle from the backrest frame can also be done by going between the backrest foam pad and backrest frame. Release the top and side clips and push out separating the kneeling mechanism release handle from the backrest frame.

4. Release the kneeling mechanism cable from the backrest frame.

5. Remove the 2 inboard and 2 outboard recliner-to-backrest frame bolts and remove the backrest assembly.

Installation



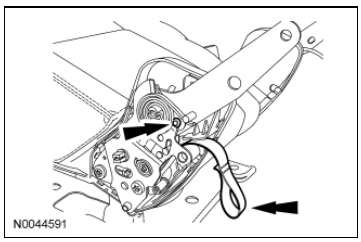
1. Remove 3 screws, recliner handle and outboard recliner outer cover.

2. Remove 2 screws and the inboard recliner outer cover.

3. ⚠ **WARNING: Use care when the seat back frame is removed and when releasing the recliners from a backrest upright position. The recliners are spring-loaded, which may cause the recliner upper arms to fold with significant speed/force. Failure to follow this instruction may result in serious personal injury.**

   Position the inboard recliner pin to the recliner stop.

   - The recliner pin must contact the inboard recliner outer plate (stop).



4. ⚠ **WARNING: Use care when the seat back frame is removed and when releasing the recliners from a backrest upright position. The recliners are spring-loaded, which may cause the recliner upper arms to fold with significant speed/force. Failure to follow this instruction may result in serious personal injury.**

   NOTE: If the latch feet are not locked around the strikers on the mounting plate, the recliners will not lock in position.

   NOTE: If the inboard recliner is not positioned to the recliner stop (or any upright position) when the outboard recliner is positioned to the recliner stop and the release strap is let go of, the recliners will not lock in place.

   Pull the release strap at the outboard recliner and position the outboard recliner pin to contact the recliner stop. Let go of the release strap and the inboard and outboard recliners will lock in place.

   - Each recliner pin must contact the recliner outer plate (stop).

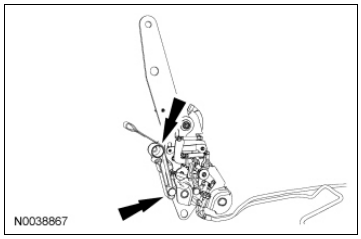
5. Position the backrest assembly to the inboard and outboard recliners and hand-start the 2 inboard and 2 outboard recliner-to-backrest frame bolts.

6. ***NOTICE:*** **The recliner-to-backrest frame bolts must be tightened in sequence or recliner latches that do not lock in place or binding may occur.**

   Install the recliner-to-backrest frame bolts in the following sequence:

   1. Install the inboard recliner-to-backrest frame upper bolt.
      - ♦ Tighten to 55 Nm (41 lb-ft).
   2. Install the inboard recliner-to-backrest frame lower bolt.
      - ♦ Tighten to 55 Nm (41 lb-ft).
   3. Install the outboard recliner-to-backrest frame upper bolt.
      - ♦ Tighten to 55 Nm (41 lb-ft).
   4. Install the outboard recliner-to-backrest frame lower bolt.
      - ♦ Tighten to 55 Nm (41 lb-ft).

7. Position the kneeling mechanism release handle and cable back through the backrest frame and backrest trim cover openings.
   - Attach the kneeling mechanism release cable to the backrest frame.



8. Roll the backrest trim cover down, attach the hook-and-loop strips and connect the backrest trim

tomsn048@gmail.com

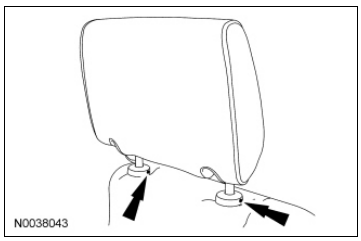
cover lower J-clip.

9. Position the kneeling mechanism release handle to the backrest opening and push in, engaging the clips.

10. Route the outboard recliner release strap before installing the outboard recliner outer cover.

11. Install the outboard recliner outer cover.
    - Position the outboard recliner outer cover.
    - Route the release strap through the cover.
    - Install the 2 screws.
    - Install the recliner handle.
    - Install the screw.

12. Position the inboard recliner outer cover and install the 2 screws.

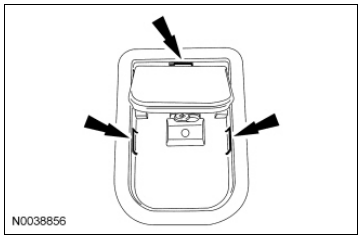


13. Install the second row, 40 percent E-Z entry seat into the vehicle. For additional information, refer to Seat - Second Row, 60/40, E-Z Entry in this section.

14. Cycle the backrest down and then back to the upright position. **Make sure the inboard and outboard recliners simultaneously and securely lock in the upright position.**

Seat Backrest Cover - Second Row, 40 Percent E-Z Entry

Removal and Installation



1. Using an appropriate tool, push in the hole of each head restraint guide while lifting up and remove the head restraint.

2. ***NOTICE:*** **Use care when separating the seat back trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the backrest foam pad.**

   Release the backrest trim cover lower J-clip, hook-and-loop strips and partially invert the trim cover.

3. Separate the kneeling mechanism release handle from the backrest frame.
   - Release the 3 kneeling mechanism release handle clips and separate from the backrest frame.
     - Separating the kneeling mechanism release handle from the backrest frame can also be done by going between the backrest foam pad and backrest frame. Release the top and side clips and push out, separating the kneeling mechanism release handle from the backrest frame.

4. ***NOTICE:*** **Use care when separating the seat back trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the backrest foam pad.**

   Release the hook-and-loop strips and invert the trim cover as high as it will go.

   - Pull the kneeling mechanism release handle and cable through the backrest trim cover opening.

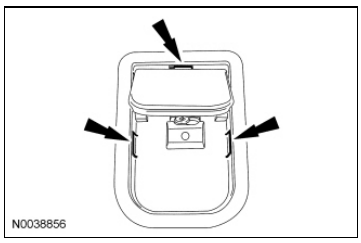
5. From between the backrest foam pad and the backrest frame, reach up, pinch the ends together and remove the head restraint guides.

6. Remove the backrest trim cover.

7. To install, reverse the removal procedure.

tomsn048@gmail.com

Seat Backrest - Second Row, 60 Percent, E-Z Entry



Removal

1. Remove the second row, 60 percent E-Z entry seat from the vehicle. For additional information, refer to Seat - Second Row, 60/40, E-Z Entry in this section.

2. ***NOTICE:*** **Use care when separating the seat back trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the backrest foam pad.**

   Release the backrest trim cover lower J-clip, hook-and-loop strips and partially invert the backrest trim cover to expose the 2 inboard and 2 outboard recliner-to-backrest frame bolts.

3. Separate the kneeling mechanism release handle from the backrest frame.
   - Release the 3 kneeling mechanism release handle clips and separate from the backrest frame. Pull the kneeling mechanism release handle and cable back through the backrest frame.
     - Separating the kneeling mechanism release handle from the backrest frame can also be done by going between the backrest foam pad and backrest frame. Release the top and side clips and push out separating the kneeling mechanism release handle from the backrest frame.

4. Release the kneeling mechanism cable from the backrest frame.

5. Remove 2 screws and the inboard recliner outer cover.

6. Remove the safety belt anchor bolt and separate the safety belt anchor from the inboard recliner.

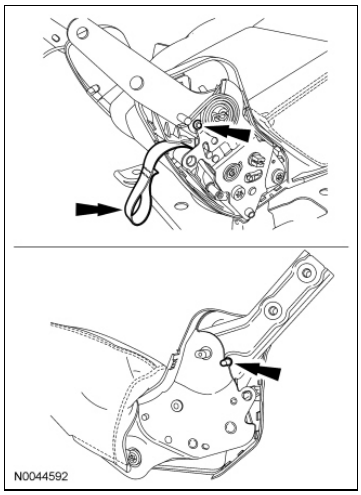
7. Remove the 2 inboard and 2 outboard recliner-to-backrest frame bolts and remove the backrest assembly.

Installation

1. Remove 3 screws, recliner handle and outboard recliner outer cover.

2. ⚠ **WARNING: Use care when the seat back frame is removed and when releasing the recliners from a backrest upright position. The recliners are spring-loaded, which may cause the recliner upper arms to fold with significant speed/force. Failure to follow this instruction may result in serious personal injury.**

   NOTE: An assistant will be necessary for this procedure.



tomsn048@gmail.com

NOTE: If the latch feet are not locked around the strikers on the mounting plate, the recliners will not lock in position.

NOTE: If both of the recliners are not locked in place simultaneously, the recliners will not lock in position.

Simultaneously pull the release strap at the outboard recliner and position the inboard and outboard recliner pins to the recliner stops. Let go of the release strap and the inboard and outboard recliners will lock in place.

- Each recliner pin must contact the recliner outer plate (stop).

3. Position the backrest assembly to the inboard and outboard recliners and hand-start the 2 inboard and 2 outboard recliner-to-backrest frame bolts.

4. ***NOTICE:*** **The recliner-to-backrest frame bolts must be tightened in sequence or recliner latches that do not lock in place or binding may occur.**

   Install the recliner-to-backrest frame bolts in the following sequence.

   1. Install the inboard recliner-to-backrest frame upper bolt.
      - Tighten to 55 Nm (41 lb-ft).
   2. Install the inboard recliner-to-backrest frame lower bolt.
      - Tighten to 55 Nm (41 lb-ft).
   3. Install the outboard recliner-to-backrest frame upper bolt.
      - Tighten to 55 Nm (41 lb-ft).
   4. Install the outboard recliner-to-backrest frame lower bolt.
      - Tighten to 55 Nm (41 lb-ft).

5. Position the kneeling mechanism release handle and cable back through the backrest frame and backrest trim cover openings.
   - Attach the kneeling mechanism release cable to the backrest frame.

6. Roll the backrest trim cover down, attach the hook-and-loop strips and connect the backrest trim cover lower J-clip.

7. Position the kneeling mechanism release handle to the backrest opening and push in, engaging the clips.

8. Route the outboard recliner release strap before installing the outboard recliner outer cover.

9. Position the outboard recliner outer cover, recliner handle and install the 3 screws.

10. **NOTE:** Before installation, make sure the safety belt webbing is not twisted and the safety belts and buckles are accessible to the occupants.

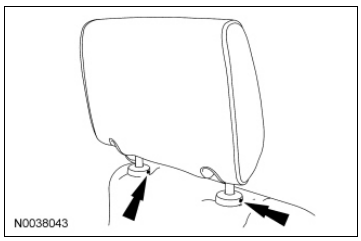
    Position the safety belt anchor to the inboard recliner and install the safety belt anchor bolt.

    - Tighten to 55 Nm (41 lb-ft).

11. Position the inboard recliner outer cover and install the 2 screws.
    - Make sure the kneeling mechanism release cable pivot is still positioned on the inboard recliner and the recliner pin is through the cable pivot before installing the inboard recliner outer cover.

12. Install the second row, 60 percent E-Z entry seat into the vehicle. For additional information, refer to Seat - Second Row, 60/40, E-Z Entry in this section.

13. Cycle the backrest down and then back to the upright position. **Make sure the inboard and outboard recliners simultaneously and securely lock in the upright position.**



---

tomsn048@gmail.com

Seat Backrest Cover - Second Row, 60 Percent, E-Z Entry

Removal

1. Using an appropriate tool, push in the hole of each head restraint guide while lifting up and remove the head restraint.

2. Remove 2 screws and the inboard recliner outer cover.

3. ***NOTICE:*** **Make sure the safety belt webbing is not twisted prior to installation. Failure to follow this instruction may result in incorrect operation of the safety belt retractor.**

   Remove the safety belt anchor bolt and separate safety belt anchor from the inboard recliner.

   - To install, tighten to 55 Nm (41 lb-ft).

4. Remove the safety belt bezel.

5. ***NOTICE:*** **Use care when separating the seat back trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the backrest foam pad.**

   Release the backrest trim cover lower J-clip, hook-and-loop strips and partially invert the backrest trim cover.

6. Separate the kneeling mechanism release handle from the backrest frame.
   - Release the 3 kneeling mechanism release handle clips and separate from the backrest frame.
     - Separating the kneeling mechanism release handle from the backrest frame can also be done by going between the backrest foam pad and backrest frame. Release the top and side clips and push out separating the kneeling mechanism release handle from the backrest frame.

7. Release the hook-and-loop strips and invert the trim cover as high as it will go.
   - Pull the kneeling mechanism release handle and cable through the backrest trim cover opening.

8. From between the backrest foam pad and the backrest frame, reach up, pinch the ends together and remove the 2 head restraint guides.

9. Route out the safety belt and remove the backrest trim cover.

10. **NOTE:** Before installation, make sure the safety belt webbing is not twisted and the safety belts and buckles are accessible to the occupants.

    To install, reverse the removal procedure.

tomsn048@gmail.com

Seat Cushion Cover - Second Row, 40 Percent E-Z Entry

Removal and Installation

1. Remove the 2 screws and the latch feet release bar.

2. Release all the cushion trim cover retainers and pin-type retainers.

3. ***NOTICE:*** **Use care when separating the cushion trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the cushion foam pad.**

   Release the hook-and-loop strips and remove the cushion trim cover from the cushion foam pad.

4. To install, reverse the removal procedure.
   - Make sure the lower anchor and tethers for children wires at the rear of the cushion frame are positioned through the cushion trim cover and accessible for use after installation.

Seat Cushion Cover - Second Row, 60 Percent, E-Z Entry

Removal

1. Remove the 2 screws and the latch feet release bar.
2. Release all the cushion trim cover retainers and pin-type retainers.
3. ***NOTICE:*** **Use care when separating the cushion trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the cushion foam pad.**

   Release the hook-and-loop strips and separate the cushion trim cover from the cushion foam pad.
4. **NOTE:** Before installation, make sure the safety belt webbing is not twisted and the safety belts and buckles are accessible to the occupants.

   To install, reverse the removal procedure.

   - Make sure the lower anchor and tethers for children wires at the rear of the cushion frame are positioned through the cushion trim cover and accessible for use after installation.

Seat Recliner - Second Row, 40 Percent E-Z Entry

Removal and Installation

⚠ WARNING: Use care when the seat back frame is removed and when releasing the recliners from a backrest upright position. The recliners are spring-loaded, which may cause the recliner upper arms to fold with significant speed/force. Failure to follow this instruction may result in serious personal injury.

NOTICE: **The recliner bolts must be tightened in sequence or recliner latches that do not lock in place or binding may occur.**

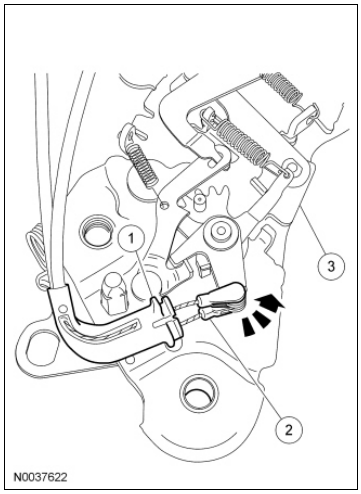
Inboard and/or outboard recliners

1. Remove the second row, 40 percent E-Z entry seat from the vehicle. For additional information, refer to Seat - Second Row, 60/40, E-Z Entry in this section.

2. Remove the second row, 40 percent E-Z entry seat backrest. For additional information, refer to Seat Backrest - Second Row, 40 Percent E-Z Entry in this section.

Outboard recliner

3. Remove 3 screws, recliner handle and outboard recliner outer cover.



4. Separate the outboard recliner.
   - Remove the 2 outboard recliner-to-cushion frame bolts.
   - **NOTE:** When pulling outboard recliner out, note keyed position of recliner release shaft as it may pull out of inboard recliner.

     Pull out to release the outboard recliner from the recliner release shaft.
   - Separate the outboard recliner.

5. Remove the outboard recliner inner cover.

6. Remove the outboard recliner.
   1. Rotate the cable casing out of the outboard recliner.
   2. **NOTE:** The cable ends are color coded/keyed to the levers.

      Rotate the cable ends out of the outboard recliner levers.
   3. Remove the outboard recliner.

Inboard recliner

7. Remove the 2 screws and inboard recliner outer cover.

8. Separate the inboard recliner.
   - Remove the 2 inboard recliner-to-cushion frame bolts and the safety belt buckle.
   - **NOTE:** When pulling the inboard recliner out, note keyed position of recliner release shaft as it may pull out of outboard recliner.

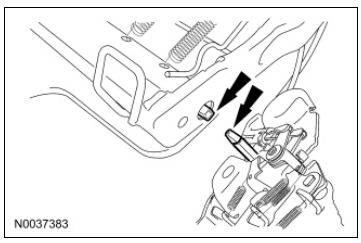
     Pull out to release the inboard recliner from the recliner release shaft.
   - Separate the inboard recliner.

9. Remove the inboard recliner inner cover.

10. Remove the screw and separate the kneeling mechanism release cable pivot at the inboard recliner.
    - Remove the inboard recliner.

Installation

Inboard and/or outboard recliners



1. If necessary, position the recliner release shaft onto the recliner release pivot stub of the recliner still attached to the seat.

Inboard recliner

2. Install the inboard recliner inner cover.

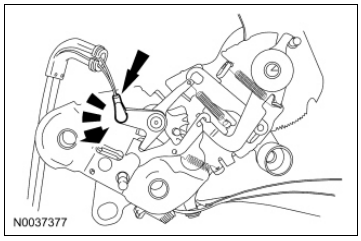
3. **NOTE:** The inboard recliner inner cover is removed for clarity.

   Position the inboard recliner release pivot stub into the recliner shaft.

tomsn048@gmail.com

4. Install the 2 inboard recliner-to-cushion frame bolts.
   - Tighten to 55 Nm (41 lb-ft).

5. Position the kneeling mechanism release cable pivot onto the inboard recliner and install the screw.
   - Make sure to put the recliner pin through the cable pivot.



Outboard recliner

6. **NOTE:** The cable ends are color coded/keyed to the levers.

   Position each keyed cable end to the outboard recliner lever and rotate into position.

   - Install the cable casing to the outboard recliner.

7. Install the outboard recliner inner cover.

8. **NOTE:** The outboard recliner inner cover is removed for clarity.

   Position the outboard recliner release pivot stub into the recliner shaft.

9. Install the 2 outboard recliner-to-cushion frame bolts.
   - Tighten to 55 Nm (41 lb-ft).

Inboard and/or outboard recliners

10. Install the second row, 40 percent E-Z entry seat backrest. For additional information, refer to Seat Backrest - Second Row, 40 Percent E-Z Entry in this section.

11. Install the second row, 40 percent E-Z entry seat into the vehicle. For additional information, refer to Seat - Second Row, 60/40, E-Z Entry in this section.

12. Cycle the backrest down and then back to the upright position. **Make sure the inboard and outboard recliners simultaneously and securely lock in the upright position.**

tomsn048@gmail.com

Seat Recliner - Inboard, Second Row, 60 Percent E-Z Entry

Removal

1. Remove the second row, 60 percent E-Z entry seat from the vehicle. For additional information, refer to Seat - Second Row, 60/40, E-Z Entry in this section.

2. Remove the second row, 60 percent E-Z entry seat backrest. For additional information, refer to Seat Backrest - Second Row, 60 Percent, E-Z Entry in this section.

3. Separate the kneeling mechanism release cable pivot at the inboard recliner.

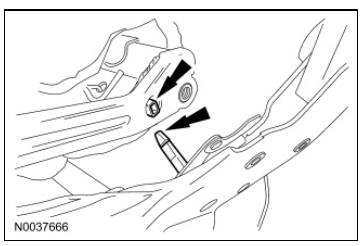
4. Release the cushion trim cover at the inboard side of the cushion frame. Pull the cushion trim cover back to expose 4 inboard recliner bolts.

5. Remove the inboard recliner.
   - Remove the 2 inboard recliner-to-cushion frame bolts.
   - Remove the inboard recliner-to-kneeling mechanism bolt.
   - Remove the inboard recliner-to-latch feet assembly bolt.
   - **NOTE:** When pulling inboard recliner out, note keyed position of recliner release shaft as it may pull out of outboard recliner.

     Pull out and remove the inboard recliner.

     ♦ Remove the inboard recliner inner cover.

Installation



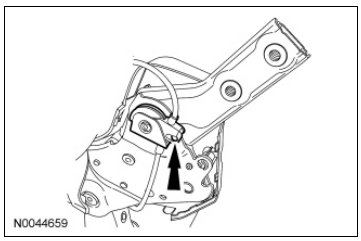
1. If necessary, position the recliner release shaft onto the outboard recliner release pivot stub.

2. Install the inboard recliner inner cover.

3. **NOTE:** The inboard recliner inner cover has been removed for clarity.

   Position the inboard recliner.

   - Position the inboard recliner release pivot stub into the recliner release shaft.
   - Align the inboard recliner to the cushion frame, latch feet assembly and kneeling mechanism.



4. Hand-start the 2 inboard recliner-to-cushion frame bolts, inboard recliner-to-latch feet assembly bolt and inboard recliner-to-kneeling mechanism bolt.

5. ***NOTICE:*** **The recliner bolts must be tightened in sequence or recliner latches that do not lock in place or binding may occur.**

   Install the inboard recliner bolts in the following sequence.

   1. Install the inboard recliner-to-latch feet assembly bolt.
      - Tighten to 55 Nm (41 lb-ft).
   2. Install the inboard recliner-to-kneeling mechanism bolt.
      - Tighten to 55 Nm (41 lb-ft).
   3. Install the inboard recliner-to-cushion frame rear bolt.
      - Tighten to 55 Nm (41 lb-ft).
   4. Install the inboard recliner-to-cushion frame front bolt.
      - Tighten to 55 Nm (41 lb-ft).

6. Position the kneeling mechanism release cable pivot at the inboard recliner.
   - Make sure the inboard recliner pin is through the cable pivot.

7. Attach the cushion trim cover retainers at the inboard side of the cushion frame.

8. Install the second row, 60 percent E-Z entry seat backrest. For additional information, refer to Seat Backrest - Second Row, 60 Percent, E-Z Entry in this section.

9. Install the second row, 60 percent E-Z entry seat into the vehicle. For additional information, refer to Seat - Second Row, 60/40, E-Z Entry in this section.

10. Cycle the backrest down and then back to the upright position. **Make sure the inboard and outboard recliners simultaneously and securely lock in the upright position.**

tomsn048@gmail.com

Seat Recliner - Outboard, Second Row, 60 Percent E-Z Entry

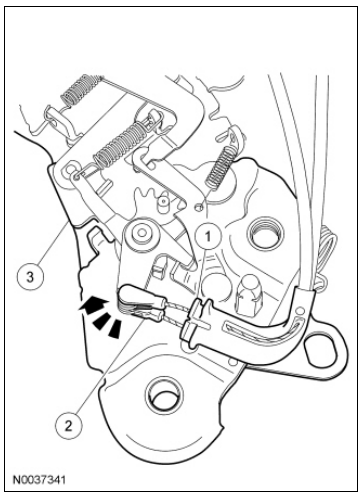
Removal

1. Remove the second row, 60 percent E-Z entry seat from the vehicle. For additional information, refer to Seat - Second Row, 60/40, E-Z Entry in this section.

2. Remove the second row, 60 percent E-Z entry seat backrest. For additional information, refer to Seat Backrest - Second Row, 60 Percent, E-Z Entry in this section.

3. Remove 3 screws, recliner handle and outboard recliner outer cover.

4. Remove the 2 outboard recliner-to-backrest frame bolts.



5. **NOTE:** When pulling outboard recliner out, note keyed position of recliner release shaft as it may pull out of inboard recliner.

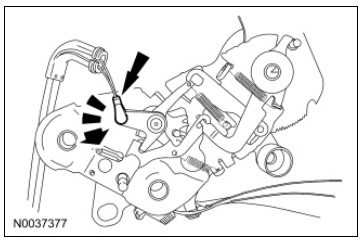
   Remove 2 outboard recliner-to-cushion frame bolts, pull out and separate the outboard recliner.

6. Remove the outboard recliner inner cover.

7. Remove the outboard recliner.
   1. Rotate the cable casing out of the outboard recliner.
   2. **NOTE:** The cable ends are color coded/keyed to the levers.

      Rotate the cable ends out of the outboard recliner levers.
   3. Remove the outboard recliner.

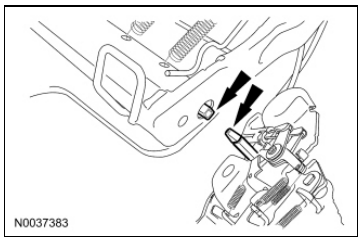
Installation



1. If necessary, position the recliner release shaft onto the inboard recliner release pivot stub.

2. **NOTE:** The cable ends are color coded/keyed to the levers.

tomsn048@gmail.com



Position each keyed cable end to the outboard recliner lever and rotate into position.

- Install the cable casing to the outboard recliner.

3. Install the outboard recliner inner cover.

4. Position the outboard recliner release pivot stub into the recliner shaft.

5. Install the 2 outboard recliner-to-cushion frame bolts.
   - Tighten to 55 Nm (41 lb-ft).

6. Install the second row, 60 percent E-Z entry seat backrest. For additional information, refer to Seat Backrest - Second Row, 60 Percent, E-Z Entry in this section.

7. Install the second row, 60 percent E-Z entry seat into the vehicle. For additional information, refer to Seat - Second Row, 60/40, E-Z Entry in this section.

8. Cycle the backrest down and then back to the upright position. **Make sure the inboard and outboard recliners simultaneously and securely lock in the upright position.**

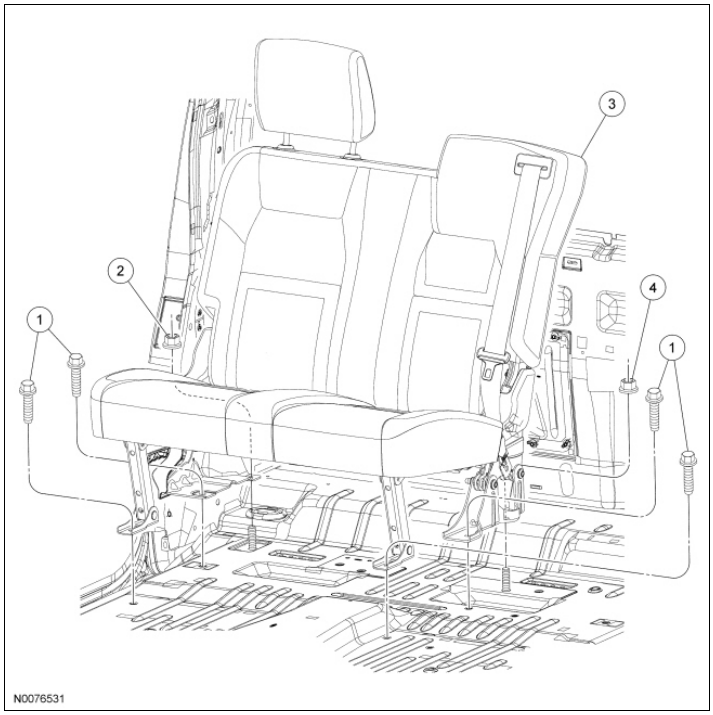
Seat - Second Row, Sport Trac

Material

Item	Specification
Threadlock and Sealer TA-25	WSK-M2G351-A5

40 Percent Seat



NOTE: When installing any seat-to-floor bolts or floor studs, apply threadlock.

Item	Part Number	Description
1	W711175	Seat-to-floor bolts (M10) (4 required)
2	N620482	Seat-to-floor nut
3	W711952	Seat-to-floor bolt (M12)
4	-	40 percent seat

60 Percent Seat

NOTE: When installing any seat-to-floor bolts or floor studs, apply threadlock.

Item	Part Number	Description
1	W711175	Seat-to-floor bolts (M10) (4 required)
2	N620482	Seat-to-floor nut (M10)
3	-	60 percent seat
4	N801995	Seat-to-floor nut (M12)

Removal

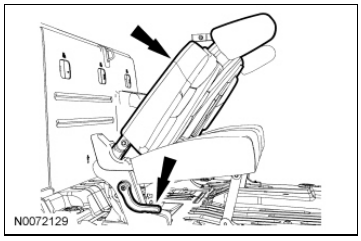
NOTE: When removing the 60 percent seat, the 40 percent seat must be removed first to gain access to the 60 percent seat-to-floor fasteners.

40 and 60 percent seats

1. Remove the 40 percent seat front seat-to-floor retainers.

2. With the 40 percent seat in the normal sitting position, lift the seat cushion up for access to the 40 percent seat rear retainers.

3. Remove the rear retainers and 40 percent seat from the vehicle.



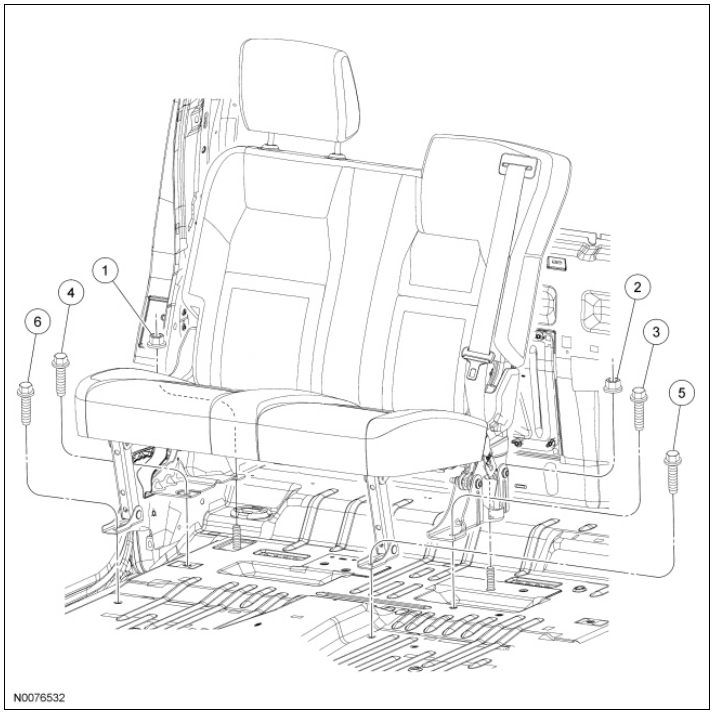
60 percent seat

4. Remove the 60 percent seat front seat-to-floor retainers.

5. With the 60 percent seat in the normal sitting position, lift the seat cushion up for access to the 60 percent seat rear retainers.
    - Pull the safety belt buckles through the 60 percent seat cushion opening.

6. Turn the release handle, releasing the outboard and upper latches and fold the backrest forward.
    - Remove the 60 percent seat from the vehicle.

tomsn048@gmail.com



Installation

60 percent seat

1. Position the 60 percent seat in the vehicle.

2. Tighten the retainers in the sequence shown.
    1. Tighten to 40 Nm (30 lb-ft).
    2. Tighten to 55 Nm (41 lb-ft).
    3. Apply threadlock and tighten to 40 Nm (30 lb-ft).
    4. Apply threadlock and tighten to 40 Nm (30 lb-ft).
    5. Apply threadlock and tighten to 40 Nm (30 lb-ft).
    6. Apply threadlock and tighten to 40 Nm (30 lb-ft).

3. **NOTE:** Make sure the safety belt webbing is not twisted and the safety belts and buckles are accessible to the occupants.

   Position the safety belt buckles through the 60 percent seat cushion opening.

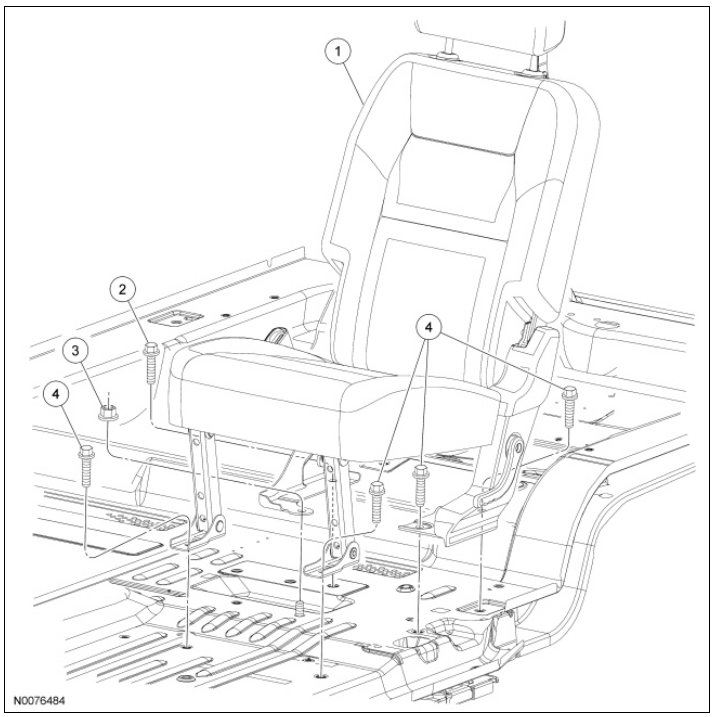
4. Position the backrest upright and make sure the outboard and upper latches lock the backrest in the upright position.

40 and 60 percent seats

5. Position the 40 percent seat in the vehicle.

6. Tighten the retainers in the sequence shown.
    1. Apply threadlock and tighten to 40 Nm (30 lb-ft).
    2. Apply threadlock and tighten to 55 Nm (41 lb-ft).
    3. Tighten to 40 Nm (30 lb-ft).
    4. Apply threadlock and tighten to 40 Nm (30 lb-ft).
    5. Apply threadlock and tighten to 40 Nm (30 lb-ft).
    6. Apply threadlock and tighten to 40 Nm (30 lb-ft).

tomsn048@gmail.com

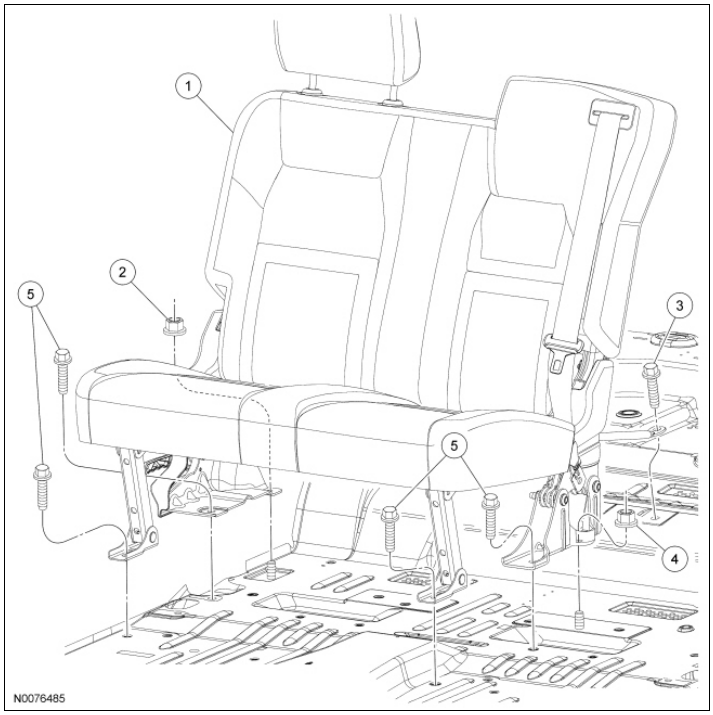


Seat - Second Row, Explorer, 60/40 Bench

Material

Item	Specification
Threadlock and Sealer TA-25	WSK-M2G351-A5

40 Percent Seat



NOTE: When installing any seat-to-floor bolts or floor studs, apply threadlock.

Item	Part Number	Description
1	-	40 percent seat
2	W711952	Seat-to-floor bolt (M12)

60 Percent Seat

NOTE: When installing any seat-to-floor bolts or floor studs, apply threadlock.

Item	Part Number	Description
1	-	60 percent seat
2	N620482	Seat-to-floor nut (M10)
3	W711952	Tether-to-floor bolt (M12) (late build)
4	N801995	Seat-to-floor nut (M12)
5	W711175	Seat-to-floor bolts (M10) (4 required)

Removal

NOTE: When removing the 60 percent seat, the 40 percent seat must be removed first to gain access to the 60 percent seat-to-floor fasteners.

40 and 60 percent seats

1. Remove the 40 percent seat front seat-to-floor bolts.

2. With the 40 percent seat in the normal sitting position, lift the seat cushion up for access to the 40 percent seat rear retainers.

3. Remove the rear retainers and 40 percent seat from the vehicle.

60 percent seat

4. Remove the tether-to-floor bolt (if equipped).

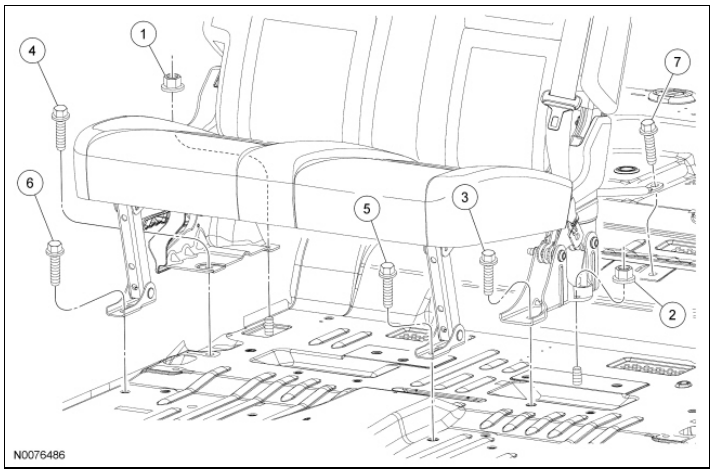
5. Remove the 60 percent seat front seat-to-floor bolts.

6. With the 60 percent seat in the normal sitting position, lift the seat cushion up for access to the 60 percent seat rear retainers.
    - Pull the safety belt buckles through the 60 percent seat cushion opening.

7. Remove the rear retainers and 60 percent seat from the vehicle.

tomsn048@gmail.com

Installation



60 percent seat

1. Position the 60 percent seat in the vehicle.
    - Position the safety belt buckles through the 60 percent seat cushion opening.

2. **NOTE:** Before installation, make sure the safety belt webbing is not twisted and the safety belts and buckles are accessible to the occupants.

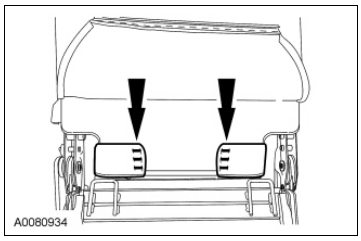
   Tighten the retainers in the sequence shown.

    1. Tighten to 40 Nm (30 lb-ft).
    2. Tighten to 55 Nm (41 lb-ft).
    3. Apply threadlock and tighten to 40 Nm (30 lb-ft).
    4. Apply threadlock and tighten to 40 Nm (30 lb-ft).
    5. Apply threadlock and tighten to 40 Nm (30 lb-ft).
    6. Apply threadlock and tighten to 40 Nm (30 lb-ft).
    7. Apply threadlock and tighten to 55 Nm (41 lb-ft).

40 and 60 percent seats

3. Position the 40 percent seat in the vehicle.

4. Tighten the retainers in the sequence shown.
    1. Apply threadlock and tighten to 40 Nm (30 lb-ft).
    2. Apply threadlock and tighten to 55 Nm (41 lb-ft).
    3. Tighten to 40 Nm (30 lb-ft).
    4. Apply threadlock and tighten to 40 Nm (30 lb-ft).
    5. Apply threadlock and tighten to 40 Nm (30 lb-ft).
    6. Apply threadlock and tighten to 40 Nm (30 lb-ft).



tomsn048@gmail.com

Seat Backrest - Second Row, 40 Percent, Bench

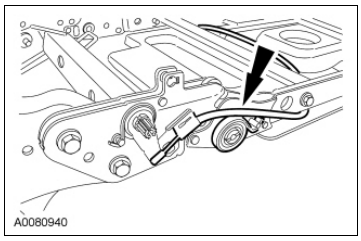
Removal

1. Release the seat backrest J-clip.

2. Remove all the staples holding the backrest trim cover to the backrest support panel.

3. Invert the seat backrest trim cover and foam pad to access the latch cover screws.

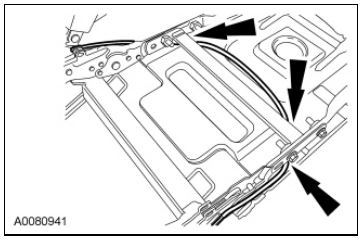
4. Remove the 4 screws and the 2 covers. Detach the seat backrest material attachment from both of the latch covers.



5. Remove the 2 backrest support panel lower screws and detach the latch cable. Position the cable out from between the backrest frame and backrest support panel.

6. Remove the 4 backrest pivot bolts.

7. Remove the 40 percent backrest.



Installation

1. Position the backrest to the latch. The cable is to be routed in front of the spring.

2. **NOTE:** When installing the backrest to the cushion, make sure the latch cover does not come in contact with the latch cable conduit or end fitting. The cable is to move freely after assembly.

   The cable is to pass between the backrest frame and the backrest support at the 2 points shown.

3. Install the 4 backrest pivot bolts.
   - Tighten to 40 Nm (30 lb-ft).

4. Install the 2 backrest support panel lower screws.

5. ***NOTICE:*** **When installing the backrest to the cushion, make sure the latch cover does not come in contact with the latch cable conduit or end fitting.**

   Position the 2 covers and install the 4 screws. Attach the material attachments to both of the latch covers.

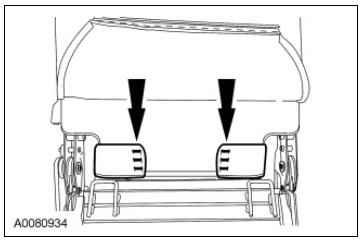
6. Roll the seat backrest trim cover and foam pad back down into position.

7. Position the trim cover and install staples in the backrest support panel.

8. Attach the seat backrest J-clip.

---

tomsn048@gmail.com



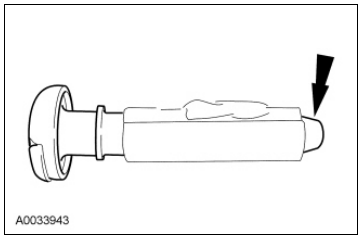
Seat Backrest Cover - Second Row, 40 Percent, Bench

Removal and Installation

1. Remove the head restraint.

2. Release the seat backrest J-clip.

3. Remove all the staples holding the backrest trim cover to the backrest support panel.



4. Invert the seat backrest trim cover and foam pad to access the head restraint sleeve.

5. **NOTE:** The inboard and outboard head restraint sleeves are not interchangeable.

   NOTE: The head restraint sleeves incorporate an alignment tab that must face forward when installed.

   Squeeze together the tip of the head restraint sleeve and pull the sleeve out of the frame tube.

6. ***NOTICE:*** **Use care when separating the seat backrest trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the backrest foam pad.**

   Separate the hook-and-loop fasteners. Remove the seat backrest trim cover.

7. To install, reverse the removal procedure.

tomsn048@gmail.com

Seat Backrest - Second Row, 60 Percent, Bench

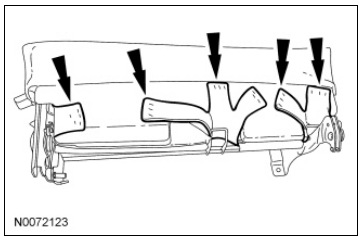
Removal

All vehicles

1. Remove the second row 60 percent seat of the 60/40 bench seat. For additional information, refer to Seat - Second Row, Sport Trac or Seat - Second Row, Explorer, 60/40 Bench in this section.

Sport Trac vehicles

2. Remove the safety belt guide cover in the following sequence.
    1. Pull out at the bottom and release the 2 safety belt guide cover retainers.
    2. Tip the bottom of the safety belt guide cover up to release the top retainer and remove the safety belt guide cover.



3. Remove the retainers and the upper latch cover.

All vehicles

4. Remove the safety belt anchor bolt.

5. Release the backrest trim cover lower J-clips.

6. Remove all the staples holding the backrest trim cover to the backrest support panel.

7. Position the backrest trim cover and foam pad to access the latch cover screws.

8. Remove the latch covers in the following sequence.
    1. Remove the 4 latch cover screws.
    2. Detach the backrest trim cover from the latch covers.
    3. Remove the latch covers.

Explorer and Mountaineer vehicles

9. Remove the 2 backrest support panel lower screws and detach the latch release cable from the backrest support panel.

Sport Trac vehicles

10. ***NOTICE:*** **Use care when separating the backrest trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the backrest foam pad.**

Separate the hook-and-loop fasteners and invert the backrest trim cover. Pull the backrest trim cover up over the top of the backrest frame to expose the backrest support panel screws and the upper latch bolts.

11. Remove the backrest support panel in the following sequence.
    1. Remove the backrest support panel screws.
    2. Slide the backrest support panel down and release it from the safety belt retractor cover.
    3. Release the latch release cable from the backrest support panel.
    4. Remove the backrest support panel.

12. Remove the screw and the inner latch cover.

13. Remove the 2 upper latch bolts.

14. Separate the latch release cable pin-type retainer from the backrest frame.

All vehicles

15. Remove the outboard upper pivot latch bolt.

16. Remove the 2 inboard and 2 outboard latch-to-backrest frame bolts.

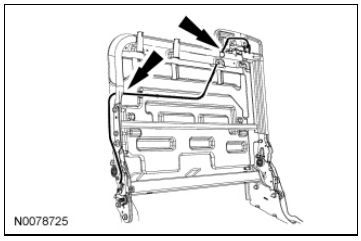
17. Remove the 60 percent backrest.
    - For Explorer and Mountaineer, position the latch release cable out from between the backrest frame and backrest support panel.

Installation

Sport Trac vehicles

1. Install the backrest frame to the inboard and outboard latches in the following sequence.
    1. Position the backrest frame to the inboard and outboard latches and hand-start the 2 inboard and 2 outboard latch-to-backrest frame bolts.
    2. Hand-start the outboard upper pivot latch bolt.
    3. Install the 2 inboard latch-to-backrest frame bolts.
        - Tighten to 40 Nm (30 lb-ft).
    4. Install the 2 outboard latch-to-backrest frame bolts.
        - Tighten to 40 Nm (30 lb-ft).
    5. Install the outboard upper pivot latch bolt.
        - Tighten to 40 Nm (30 lb-ft).

2. Position the upper latch and install the bolts.
    - Tighten to 25 Nm (18 lb-ft).



3. Position the inner latch cover and install the screw.

4. **NOTE:** The safety belt retractor has been removed for clarity.

   Position the backrest support panel to the backrest frame and route the latch release cable.

   - The latch release cable is to pass between the backrest frame and the backrest support at the 2 points shown.

tomsn048@gmail.com

5. **NOTE:** The cable is to move freely after assembly.

   Install the backrest support panel screws to the backrest frame.

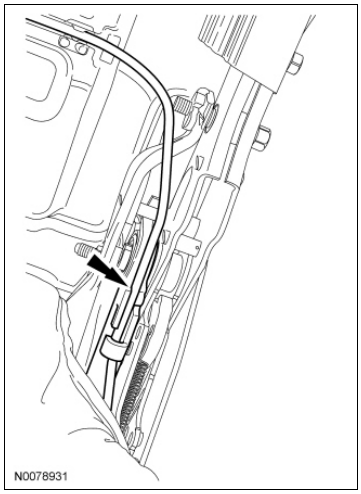
   - Attach the latch release cable to the backrest support panel.

Explorer and Mountaineer vehicles

6. **NOTE:** The cable is to move freely after assembly.

   Position the backrest to the inboard and outboard latches and route the cable between the backrest frame and support panel.

   - The cable is to pass between the backrest frame and the backrest support at the 2 points shown.



7. Install the backrest frame to the inboard and outboard latches in the following sequence.
   1. Position the backrest frame to the inboard and outboard latches and hand-start the 2 inboard and 2 outboard latch-to-backrest frame bolts.
   2. Hand-start the outboard upper pivot latch bolt.
   3. Install the 2 inboard latch-to-backrest frame bolts.
      - Tighten to 40 Nm (30 lb-ft).
   4. Install the 2 outboard latch-to-backrest frame bolts.
      - Tighten to 40 Nm (30 lb-ft).
   5. Install the outboard upper pivot latch bolt.
      - Tighten to 40 Nm (30 lb-ft).

8. **NOTE:** The cable is to move freely after assembly.

   Install the backrest support panel screws to the backrest frame.

   - Attach the latch release cable to the backrest support panel.

9. Route the latch release cable through the inboard latch holder.

All vehicles

10. Position the latch release cable in front of the spring.

11. Roll the backrest trim cover down.
    - For Sport Trac, route the safety belt through the backrest trim cover.
    - Attach the backrest trim cover to backrest foam pad hook-and-loop strips.

12. Attach the backrest trim cover to both of the latch covers. Position the 2 latch covers and install the 4 screws.

13. Position the trim cover and install staples in the backrest support panel.

14. Attach the backrest trim cover J-clip.

15. Position the safety belt anchor and install the bolt.
    - To install, tighten to 121 Nm (89 lb-ft).

Sport Trac vehicles

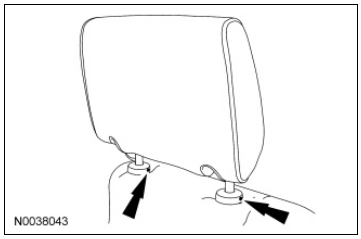
16. Position the upper latch cover and install the retainers.

17. Install the safety belt guide cover.

All vehicles

18. Install the second row 60 percent seat of the 60/40 bench seat. For additional information, refer to Seat - Second Row, Sport Trac or Seat - Second Row, Explorer, 60/40 Bench in this section.

tomsn048@gmail.com



Seat Backrest Cover - Second Row, 60 Percent, Bench

Removal and Installation

All vehicles

1. Remove the second row 60 percent seat of the 60/40 bench seat. For additional information, refer to Seat - Second Row, Sport Trac or Seat - Second Row, Explorer, 60/40 Bench in this section.

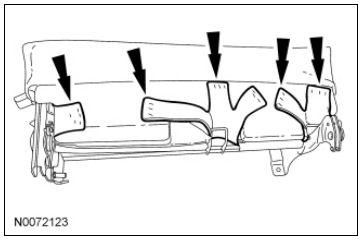
2. Using an appropriate tool, push in the hole of each head restraint guide while lifting up and remove the head restraint.

3. **NOTE:** Before installation, make sure the safety belt webbing is not twisted and the safety belts and buckles are accessible to the occupants.

   Remove the safety belt anchor bolt.

   - To install, tighten to 121 Nm (89 lb-ft).

4. Remove the safety belt guide cover in the following sequence.
   1. Pull out at the bottom and release the 2 safety belt guide cover retainers.
   2. Tip the bottom of the safety belt guide cover up to release the top retainer and remove the safety belt guide cover.



Sport Trac vehicles

5. Remove the retainers and the upper latch cover.

All vehicles

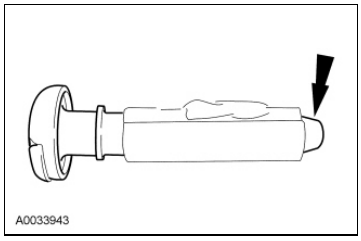
6. Release the backrest trim cover J-clip.

7. Remove all the staples in the backrest support panel.

tomsn048@gmail.com

8. Reposition the backrest trim cover and foam pad to access the latch cover screws.

9. Remove the latch covers in the following sequence.
    1. Remove the 4 latch cover screws.
    2. Detach the backrest trim cover from the latch covers.
    3. Remove the latch covers.



10. ***NOTICE:*** **Use care when separating the backrest trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the backrest foam pad.**

    Separate the hook-and-loop fasteners and invert the backrest trim cover.

11. **NOTE:** The inboard and outboard head restraint sleeves are not interchangeable.

    NOTE: The head restraint sleeves incorporate an alignment tab that must face forward when installed.

    Squeeze together the tip of the head restraint sleeve and pull the sleeve out of the frame tube.

12. Remove the backrest trim cover.
    - Feed the safety belt out through the opening in the backrest trim cover.

13. To install, reverse the removal procedure.

Seat Cushion Cover - Second Row, 40 Percent, Bench

Removal and Installation

1. Remove the second row 40 percent seat of the 60/40 bench seat. For additional information, refer to Seat - Second Row, Sport Trac or Seat - Second Row, Explorer, 60/40 Bench in this section.

2. ***NOTICE:*** **Use care when separating the cushion trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the cushion foam pad.**

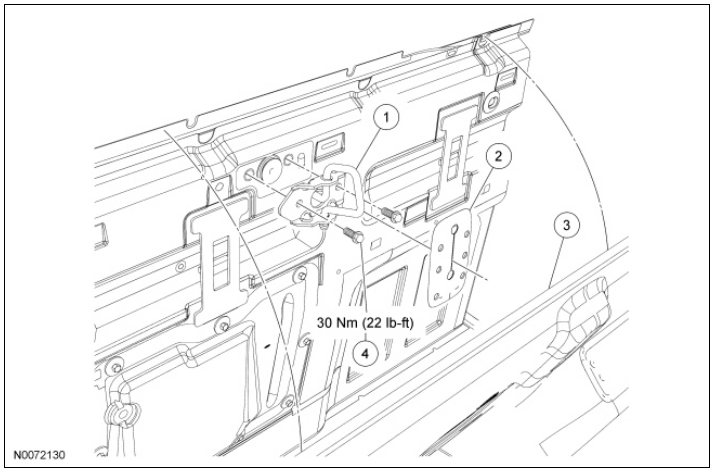
   Release the J-clips, separate the hook-and-loop fasteners, remove the hog rings and the cushion trim cover.

3. To install, reverse the removal procedure.

tomsn048@gmail.com

Seat Cushion Cover - Second Row, 60 Percent, Bench

Removal and Installation



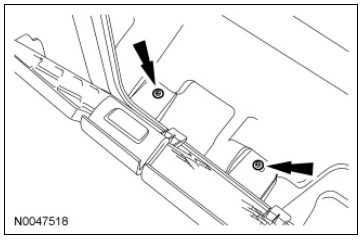
1. Remove the second row 60 percent seat of the 60/40 bench seat. For additional information, refer to Seat - Second Row, Sport Trac or Seat - Second Row, Explorer, 60/40 Bench in this section.

2. ***NOTICE:*** **Use care when separating the cushion trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the cushion foam pad.**

   Release the J-clips, separate the hook-and-loop fasteners, remove the hog rings and the cushion trim cover.

3. To install, reverse the removal procedure.

Seat Latch Striker - Second Row, Sport Trac, 60 Percent Bench



Item	Part Number	Description
1	62452	Seat latch striker
2	-	Seat latch striker cover
3	40374	Cab rear trim panel
4	W505264	Seat latch striker bolt (2 required)

Removal and Installation

1. Fold the rear 60 percent and 40 percent seat backrests forward.

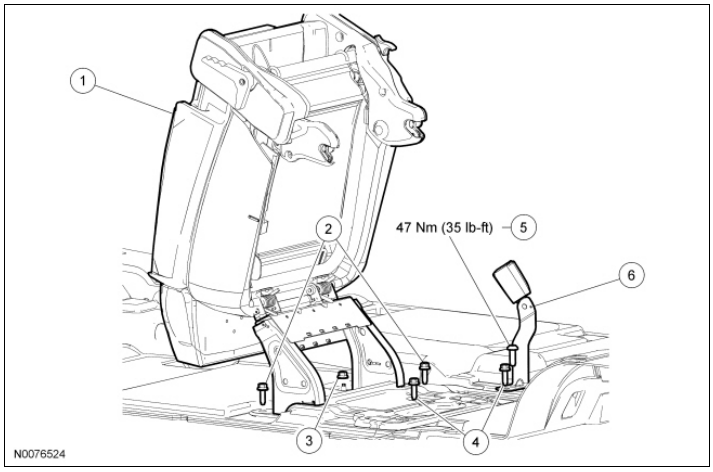
2. Remove the 2 screws from the storage compartment.

3. **NOTE:** When separating the cab rear trim panel, start in the upper left corner, moving clockwise and separate the panel from the retaining clips.

   Pull to release the clips and position the cab rear trim panel forward to access the seat latch striker.

4. Remove the 2 bolts and remove the striker.
   - To install, tighten to 30 Nm (22 lb-ft).

5. To install, reverse the removal procedure.



tomsn048@gmail.com

Seat - Second Row, Bucket

Material

Item	Specification
Threadlock and Sealer TA-25	WSK-M2G351-A5

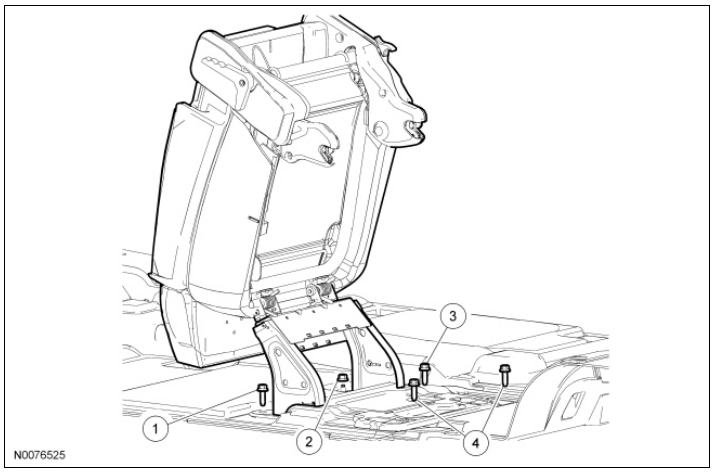
NOTE: When installing any seat-to-floor bolts or floor studs, apply threadlock.

Item	Part Number	Description
1	-	Bucket seat
2	W711175	Seat-to-floor bolts (M10) (2 required)
3	N620482	Seat-to-floor nut
4	W711952	Seat-to-floor bolts (M12) (2 required)
5	-	Safety belt buckle bolt (part of 60045)
6	60045	Safety belt buckle

Removal and Installation

NOTE: LH seat shown, RH seat similar.

1. Remove the front seat-to-floor nut and bolt.
2. Fold the affected bucket seat up to the E-Z entry position.
3. Pull up to release and remove the floor riser trim cover.
4. Remove the safety belt buckle bolt and the safety belt buckle.
5. Remove the 3 seat-to-floor bolts.



tomsn048@gmail.com

6. Remove the bucket seat.

Installation

1. Position the seat in the vehicle.

2. Tighten the retainers in the following sequence.
    1. Apply threadlock and tighten to 40 Nm (30 lb-ft).
    2. Tighten to 40 Nm (30 lb-ft).
    3. Apply threadlock and tighten to 40 Nm (30 lb-ft).
    4. Apply threadlock and tighten the remaining 2 bolts in any sequence to 55 Nm (41 lb-ft).

3. **NOTE:** Before installation, make sure the safety belt webbing is not twisted and the safety belts and buckles are accessible to the occupants.

   Position the safety belt buckle and install the bolt.

   - Apply threadlock and tighten to 47 Nm (35 lb-ft).

Seat Backrest - Second Row, Bucket

Removal and Installation

1. Release all of the seat backrest J-clips. Slightly raise the backrest trim cover.

2. Remove all of the staples in the backrest trim cover.

3. Pull the seat backrest material up and remove the 4 backrest bolts. Remove the backrest assembly.
   - To install, tighten to 23 Nm (17 lb-ft).

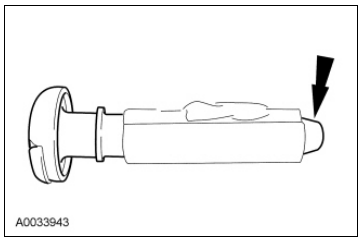
4. To install, reverse the removal procedure.

tomsn048@gmail.com

Seat Backrest Cover - Second Row, Bucket

Removal and Installation

1. Remove the head restraint.



2. ***NOTICE:*** **Use care when separating the backrest trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the backrest foam pad.**

   Release the backrest trim cover lower J-clip, separate the hook-and-loop fasteners, remove 2 rows of hog rings and invert the backrest trim cover as high as it will go.

3. **NOTE:** The inboard and outboard head restraint sleeves are not interchangeable.

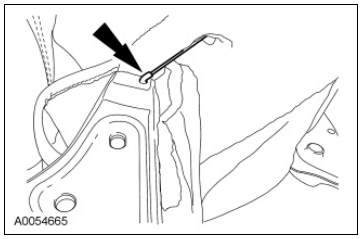
   NOTE: The head restraint sleeves incorporate an alignment tab that must face forward when installed.

   Squeeze together the tip of the head restraint sleeve and pull the sleeve out of the frame tube.

4. Remove the seat backrest trim cover.

5. To install, reverse the removal procedure.

tomsn048@gmail.com



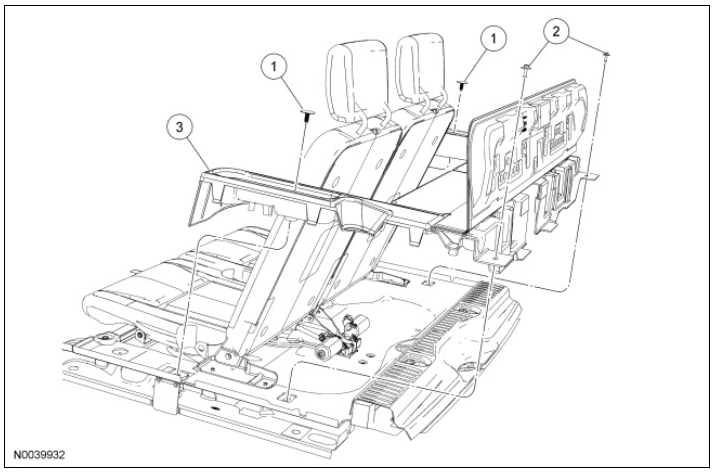
Seat Cushion Cover - Second Row, Bucket

Removal and Installation

1. ***NOTICE:*** **Use care when separating the cushion trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the cushion foam pad.**

   Release the cushion trim cover J-clips, separate the hook-and-loop fasteners and remove one row of hog rings.

2. Release the cable from the seat riser and remove the cushion trim cover.

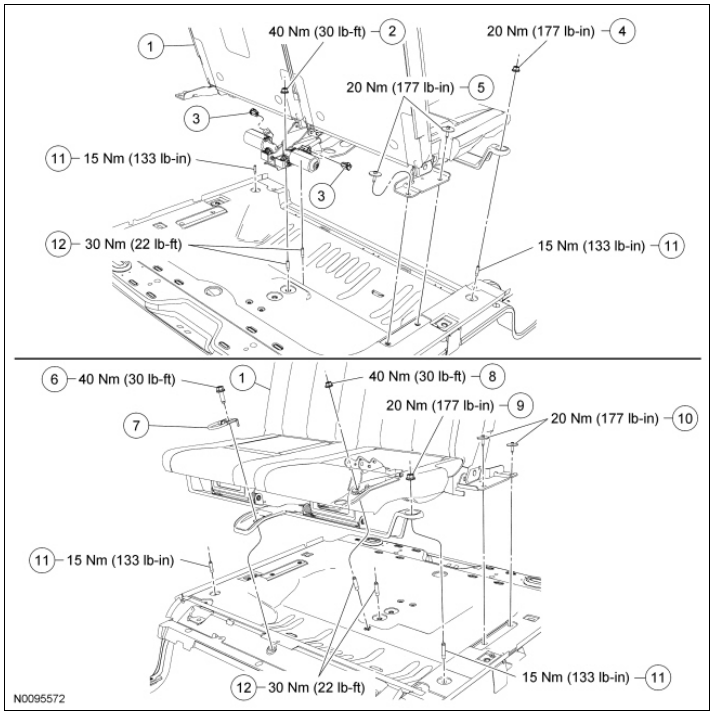


3. To install, reverse the removal procedure.

Seat - Third Row

Material

Item	Specification
Threadlock and Sealer TA-25	WSK-M2G351-A5



Cargo Management System

Item	Part Number	Description
1	W709343	Pin-type retainers (2 required)
2	W704734	Bolts (2 required)
3	310A67	Cargo management system

Third Row Seat

tomsn048@gmail.com

Item	Part Number	Description
1	-	Third row seat
2	W707654	Floor mounting bracket center rear nut
3	-	Power fold seat motor electrical connectors (part of 14B509)
4	W710869	Floor mounting bracket RH nut
5	W710851	Floor mounting bracket RH bolts (2 required)
6	-	Floor mounting bracket front bolt (part of 613D74)
7	613D74	Child safety seat tether anchor
8	W707654	Floor mounting bracket center front nut
9	W710869	Floor mounting bracket LH nut
10	W710851	Floor mounting bracket LH bolts (2 required)
11	W710867	Floor mounting bracket LH/RH studs (2 required)
12	W711375	Floor mounting bracket center studs (2 required)

Removal and Installation

All seats

1. Remove the 2 pin-type retainers.

2. Remove the 2 bolts and the cargo management system.

Power fold seats

3. Separate any power fold seat wire harness pin-type retainers and disconnect the power fold seat motor electrical connectors.

All seats

4. Remove the 2 LH and 2 RH floor mounting bracket bolts.
    - To install, apply threadlock and tighten to 20 Nm (177 lb-in).

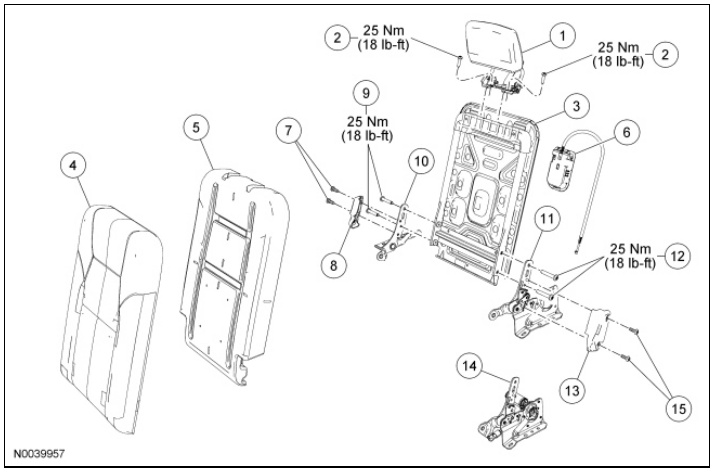
5. Remove the floor mounting bracket center front and rear nuts.
    - To install, tighten to 40 Nm (30 lb-ft).

6. Remove the floor mounting bracket front bolt and child safety seat tether anchor.
    - To install, apply threadlock and tighten to 40 Nm (30 lb-ft).

7. Remove the floor mounting bracket LH and RH nuts.
    - To install, tighten to 20 Nm (177 lb-in).

8. Remove the third row seat.

9. To install, reverse the removal procedure.
    - When installing any seat-to-floor bolts or studs, apply threadlock.



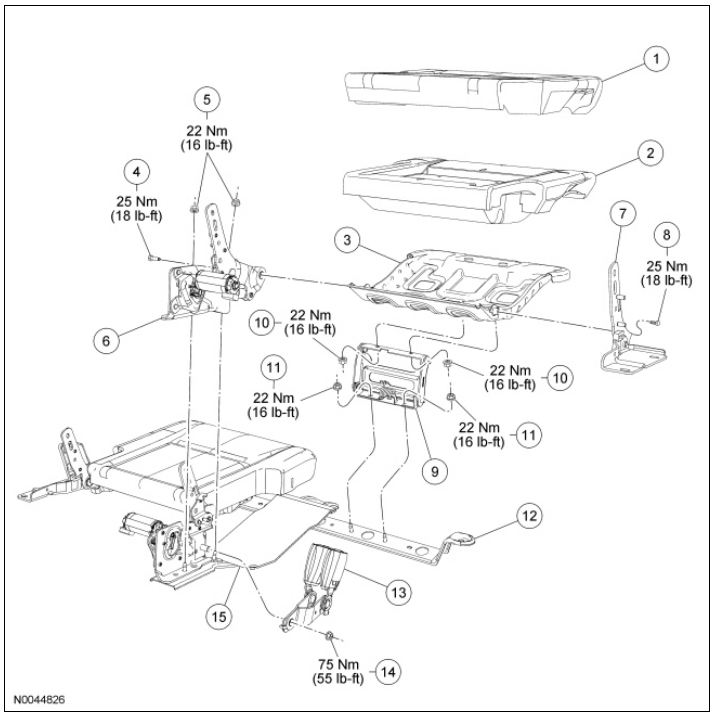
tomsn048@gmail.com

Seat - Exploded View, Third Row

Third Row Seat Backrest

NOTE: RH backrest shown, LH similar.

NOTE: Power latch shown, manual latch similar.



Item	Part Number	Description
1	611A08	Head restraint
2	-	Head restraint-to-backrest frame bolts (2 required) (part of 605C10)
3	613A38	Backrest frame
4	66600	Backrest trim cover
5	66800	Backrest foam pad
6	62418	Backrest release handle (if equipped)
7	-	Hinge cover screws (2 required) (part of 605C10)
8	61348	Hinge cover
9	-	Hinge-to-backrest frame bolts (2 required) (part of 605C10)
10	61382	Hinge
11	61382	Manual latch
12	-	Latch-to-backrest frame bolts (manual and power) (2 required) (part of 605C10)
13	61349	Latch cover
14	61382	Power latch
15	-	Latch cover screws (2 required) (part of 605C10)

Third Row Seat Cushion

NOTE: RH cushion shown, LH similar.

NOTE: Power latch shown, manual latch similar.

Item	Part Number	Description
1	63804	Cushion trim cover
2	63840	Cushion foam pad
3	63160	Cushion frame
4	-	Latch-to-cushion frame bolt (manual and power) (part of 605C10)
5	-	Latch-to-floor mounting bracket nuts (manual and power) (2 required) (part of 605C10)
6	61382	Power latch
7	61382	Hinge
8	-	Hinge-to-cushion frame bolt (part of 605C10)
9	613E52	Cushion pivot link assembly
10	-	Cushion pivot link assembly-to-cushion frame nuts (2 required) (part of 605C10)
11	-	Cushion pivot link assembly-to-floor mounting bracket nuts (2 required) (part of 605C10)
12	606A51	Floor mounting bracket
13	611B60	Safety belt buckle assembly
14	-	Safety belt buckle assembly-to-latch nut (power and manual)
15	617C42	Cover

1. For additional information, refer to the procedures in this section.

tomsn048@gmail.com

Seat Backrest - Third Row

Removal and Installation

All seats

1. Fold the backrest not being serviced down.

2. Remove 2 bolts and the hinge cover on the backrest being serviced.

3. Remove 2 bolts and the latch cover on the backrest being serviced.

4. Release the backrest trim cover lower J-clip on the backrest being serviced.

5. ***NOTICE:*** **Use care when separating the backrest trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the backrest foam pad.**

   Release the backrest trim cover side J-clips, hook-and-loop strips and invert the trim cover to expose the 2 hinge-to-backrest frame bolts and the 2 latch-to-backrest frame bolts on the backrest being serviced.

Manual fold seats

6. Separate the cable casing from the latch and remove the cable from the latch lever on the backrest being serviced.

All seats

7. Remove the 2 hinge-to-backrest frame bolts and the 2 latch-to-backrest frame bolts and remove the backrest.
   - To install, tighten to 25 Nm (18 lb-ft).

8. To install, reverse the removal procedure.

tomsn048@gmail.com

Seat Backrest Cover - Third Row

Removal and Installation

1. Fold the backrest not being serviced down.

2. Release the backrest trim cover J-clip at the top of the trim cover by the head restraint.
   - Pull the head restraint release strap through the backrest trim cover.

3. Remove the 2 head restraint-to-backrest frame bolts and remove the head restraint.
   - To install, tighten to 25 Nm (18 lb-ft).

4. Remove 2 bolts and the hinge cover.

5. Remove 2 bolts and the latch cover.

6. Release the backrest trim cover lower J-clip.

7. ***NOTICE:*** **Use care when separating the backrest trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the backrest foam pad.**

   Release the backrest trim cover side J-clips, hook-and-loop strips, invert and remove the backrest trim cover.

8. To install, reverse the removal procedure.

tomsn048@gmail.com

Seat Cushion - Third Row

Removal and Installation

1. Position the backrest to the upright position.

2. Remove the third row seat from the vehicle. For additional information, refer to Seat - Third Row in this section.

3. **NOTE:** The backrest must be up to access the bolts.

   Remove the latch-to-cushion frame bolt and the hinge-to-cushion frame bolt.

   - To install, tighten to 25 Nm (18 lb-ft).

4. From under the front of the cushion frame, release the cushion trim cover from the studs to access the 2 cushion pivot link assembly-to-cushion frame nuts.

5. Remove the 2 cushion pivot link assembly-to-cushion frame nuts. Remove the cushion assembly.
   - To install, tighten to 22 Nm (16 lb-ft).

6. To install, reverse the removal procedure.

Seat Cushion Cover - Third Row

Removal and Installation

1. Remove the third row seat from the vehicle. For additional information, refer to Seat - Third Row in this section.

2. Release the cushion trim cover retainers attached to the bottom of the cushion frame.

3. ***NOTICE:*** **Use care when separating the cushion trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the cushion foam pad.**

   Invert the cushion trim cover, release the hook-and-loop strips and separate the cushion trim cover from the cushion foam pad.

4. To install, reverse the removal procedure.

tomsn048@gmail.com

Power-Fold Seat Motor - Third Row

Removal and Installation

NOTE: The power-fold seat motor is serviced with the latch bracket.

LH or RH motors

1. Position the backrest with the working motor in the opposite position of the backrest with the motor that is not working.

2. Remove the third row seat from the vehicle. For additional information, refer to Seat - Third Row in this section.

3. From under the RH seat, remove the 2 cushion pivot link assembly-to-cushion frame nuts.
   - To install, tighten to 22 Nm (16 lb-ft).

4. Remove the 2 latch-to-floor mounting bracket nuts and separate the RH seat and power latch from the floor mounting bracket.
   - To install, tighten to 22 Nm (16 lb-ft).

Motor being serviced

5. Remove the latch-to-cushion frame bolt. If unable to position the seat to access the bolt, use a suitable tool to remove the bolt.
   - To install, tighten to 25 Nm (18 lb-ft).

6. Remove the 2 bolts and latch cover.

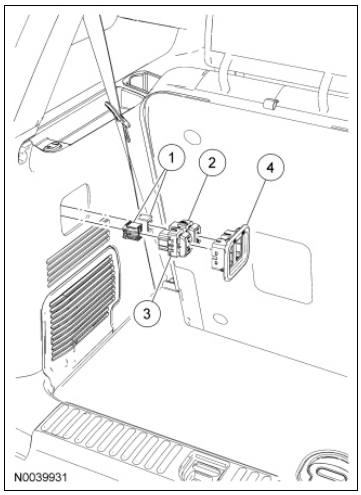
7. On the side with the motor being serviced, release the backrest trim cover lower J-clip, side retainer and invert the cover up to access to 2 latch-to-backrest frame bolts.

8. Remove the 2 latch-to-backrest frame bolts and remove the latch with motor.
   - To install, tighten to 25 Nm (18 lb-ft).

LH motor

9. Remove the safety belt buckle assembly-to-latch nut and remove the safety belt buckle assembly.
   - To install, tighten to 75 Nm (55 lb-ft).

LH or RH motors



10. To install, reverse the removal procedure.

tomsn048@gmail.com

Seat Control Switch - Third Row

Removal and Installation

NOTE: The third row seat control switches are located in the LH quarter trim panel.

Item	Part Number	Description
1	-	Third row seat control switch electrical connectors (part of 14A698)
2	14C715	Third row LH seat control switch
3	14C715	Third row RH seat control switch
4	14D721	Third row seat control switch bezel

1. Pull out on the third row seat control switch bezel and separate from the LH quarter trim panel.

2. Disconnect the third row seat control switch(es), release the retainers and remove the third row seat control switch(es).

3. To install, reverse the removal procedure.

tomsn048@gmail.com

Seat Latch - Third Row, Manual

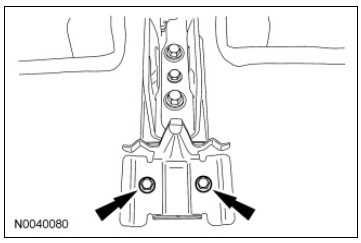
Removal and Installation

LH or RH latch

1. Position both of the third row seat backrests up.

2. Remove the RH latch-to-cushion frame bolt.
   - To install, tighten to 25 Nm (18 lb-ft).

LH latch



3. Remove the LH latch-to-cushion frame bolt.
   - To install, tighten to 25 Nm (18 lb-ft).

LH or RH latch

4. Position the third row seat LH backrest down.

5. Remove the vehicle jack.

6. Remove the 2 bolts and the vehicle jack mounting bracket.

7. Remove the 2 screws and the RH latch cover.

8. Separate the cable and casing from the RH latch.

9. ***NOTICE:*** **Use care when separating the backrest trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the backrest foam pad.**

   Release the RH seat backrest trim cover lower and inboard J-clips and roll the backrest trim cover up to access the 2 RH latch-to-backrest frame bolts.

10. Remove the 2 RH latch-to-backrest frame bolts.
    - To install, tighten to 25 Nm (18 lb-ft).

11. Remove the floor mounting bracket center front and rear nuts.
    - To install, tighten to 40 Nm (30 lb-ft).

12. Remove the 2 latch-to-floor mounting bracket nuts.
    - To install, tighten to 22 Nm (16 lb-ft).

13. Remove the RH latch.

LH latch

14. Position the third row seat LH backrest up and the RH backrest down.

15. Remove the 2 screws and the LH latch cover.

16. Separate the cable and casing from the LH latch.

17. ***NOTICE:*** **Use care when separating the backrest trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the backrest foam pad.**

    Release the LH seat backrest trim cover lower and inboard J-clips and roll the backrest trim cover up to access the 2 LH latch-to-backrest frame bolts.

18. Remove the 2 LH latch-to-backrest frame bolts.
    - To install, tighten to 25 Nm (18 lb-ft).

19. Remove the LH latch.

20. Remove the safety belt buckle assembly-to-latch nut and remove the safety belt buckle assembly.
    - To install, tighten to 75 Nm (55 lb-ft).

Both latches

21. To install, reverse the removal procedure.
    - The latch(es) must be in the backrest fold down position to install.

tomsn048@gmail.com

Seat Backrest - Front

Front Seat Backrest

NOTE: Driver backrest shown, passenger backrest similar.

Item	Part Number	Description
1	14D696	Backrest heated seat mat (if equipped)
2	64417/ 64811	Backrest trim cover/ backrest foam pad
3	65500	Static lumbar (if equipped)
4	65500	Manual lumbar adjust assembly (if equipped)
5	65500	Power lumbar adjust assembly (if equipped)
6	611A08	Head restraint assembly
7	-	Head restraint cover
8	610A18	Inboard head restraint guide sleeve
9	610A16	Outboard head restraint guide sleeve
10	61018	Backrest frame (serviced with manual recliners) (if equipped)
11	14547	Power recline motor (if equipped)
12	-	Screw (if equipped) (part of 600A58)
13	62714	Recliner shaft (if equipped)
14	-	Recliner-to-cushion frame bolts (4 required) (part of 600A58)

15	-	One-way push clips (2 required) (if equipped) (part of 14547)
16	61018	Backrest frame (serviced with power recliners) (if equipped)
17	-	Side air bag module bolts (2 required)
18	611D11	Side air bag module

Disassembly

⚠ WARNING: Always carry or place a live air bag module with the air bag and deployment door/trim cover/tear seam pointed away from the body. Do not set a live air bag module down with the deployment door/trim cover/tear seam face down. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

⚠ WARNING: Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

⚠ WARNING: If the seat side air bag cover has been damaged or separated from its mounting, or if the air bag material has been exposed, install a new seat side air bag module. Never try to repair the seat side air bag module. Failure to follow these instructions may result in the seat side air bag deploying incorrectly, which increases the risk of serious personal injury or death in a crash.

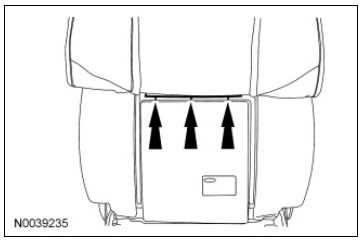
⚠ WARNING: Front seat backrest trim covers installed on seats equipped with seat side air bags cannot be repaired. A new trim cover must be installed. Cleaning is permissible. Failure to follow these instructions may result in the seat side air bag module deploying incorrectly and increase the risk of serious personal injury or death in a crash.

NOTE: If a side air bag deployment took place a new backrest foam pad, backrest trim cover and side air bag module must be installed. A new backrest frame should be installed if necessary.

NOTE: The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is removed and the ignition is ON.

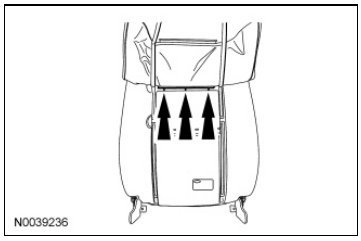
NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: The manual recliners and power recliners are serviced as part of the backrest frame.



All seats

1. Remove the front seat. For additional information, refer to Seat - Front in this section.
2. Remove the front seat backrest. For additional information, refer to Seat Backrest - Front in this section.
3. Remove the 2 head restraint guide sleeves. For additional information, refer to Head Restraint Guide Sleeve in this section.
4. Remove the plastic rivets attaching the backrest trim cover to the inboard and outboard recliners.
5. ***NOTICE:*** **Use care when separating the seat back trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the backrest foam pad.**



tomsn048@gmail.com

Release the backrest trim cover lower J-clip, hook-and-loop strips and invert the trim cover to the first row of hog rings.

6. Remove the first row of hog rings.

7. Release the hook-and-loop strips, invert the trim cover and remove the second row of hog rings.

8. Remove the backrest trim cover.

Heated seat

9. For power driver seat, disconnect the backrest heated seat mat electrical connector.
   - If necessary, remove the backrest heated seat mat from the backrest foam pad.

All seats

10. Separate the backrest foam pad from the backrest frame.

11. **NOTE:** Note the side air bag module wire harness routing for assembly.

    Release the side air bag module wire harness pin-type retainers, remove the bolts and the side air bag module with wire harness.

Seat with manual lumbar

12. Release the 2 manual lumbar spring clips from the backrest frame and remove the manual lumbar.

Seat with power lumbar

13. Remove the power lumbar adjust assembly in the following sequence.
    1. Disconnect the power lumbar adjust assembly motor electrical connector.
    2. Release the 2 power lumbar adjust assembly lower pin-type retainers to the backrest frame.
    3. Slide the power lumbar adjust assembly rods out of the backrest frame at the top and remove the power lumbar adjust assembly.

Seat with power recline

14. ***NOTICE:*** **Do not rotate the recliner shaft while not engaged to both recliners. Failure to do so will cause the inboard and outboard recliners to become out of synchronization.**

Remove a one-way push clip from the recliner shaft and remove the recliner shaft.

15. Disconnect the electrical connector, remove the screw and the power recline motor.

Assembly

Seat with power recline

1. ***NOTICE:*** **Do not rotate the recliner shaft while not engaged to both recliners. Failure to do so will cause the inboard and outboard recliners to become out of synchronization.**

   Install the recliner motor.

   - Position the recliner shaft through the inboard power recliner, power recline motor and outboard recliner.
     - ♦ Slight turning of the recliner shaft may be necessary.
   - Install a new one-way push clip at each end of the recliner shaft.
   - Turn the power recline motor so the mounting hole lines up with the bolt hole in the inboard power recliner.
   - Install the power recline motor bolt.
   - Connect the power recline motor electrical connector.

Seat with power lumbar

2. Install the power lumbar adjust assembly.
   - Slide the power lumbar adjust assembly rods into the backrest frame holes at the top.
   - Attach the 2 power lumbar adjust assembly lower pin-type retainers to the backrest frame.
   - Connect the power lumbar adjust assembly motor electrical connector.

Seat with manual lumbar

3. Attach the 2 manual lumbar spring clips to the backrest frame.

All seats

4. ⚠ **WARNING: Before installing the seat side air bag module/deployment chute assembly:**

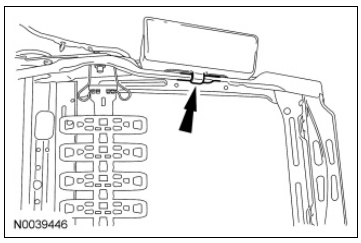
   - ♦ Inspect the side air bag module and mounting surfaces for any damage or foreign material.
   - ♦ Remove any foreign material from the mounting surfaces of the deployment chute, the seat backrest frame mounting bracket and the air bag module cavity in the seat backrest foam pad.
   - ♦ Install new parts if damaged.

   Failure to follow these instructions may result in the seat side air bag deploying incorrectly, which increases the risk of serious personal injury or death in a crash.

   ⚠ **WARNING: If the seat side air bag cover has been damaged or separated from its mounting, or if the air bag material has been exposed, install a new seat side air bag module. Never try to repair the seat side air bag module. Failure to follow these instructions may result in the seat side air bag deploying incorrectly, which increases the risk of serious personal injury or death in a crash.**

   ⚠ **WARNING: Inspect the seat side air bag module cavity in the seat backrest foam pad for any foreign material. If any foreign material is found, remove it. Failure to follow these instructions may result in the seat side air bag module deploying incorrectly and increases the risk of serious personal injury or death in a crash.**

tomsn048@gmail.com



NOTICE: **Make sure the side air bag module wiring harness is not pinched between the side air bag module and the mounting bracket. Failure to follow this instruction may result in wiring harness damage.**

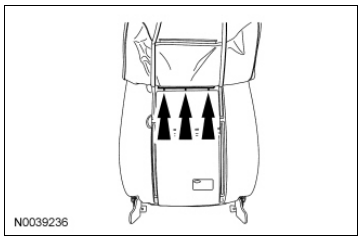
Align the holes of the side air bag module bracket to the U-nuts on the backrest frame.

- Install new U-nuts if installing a new side air bag module.

5. Slide the side air bag module onto the backrest frame so the bracket hook wraps around the backrest frame.

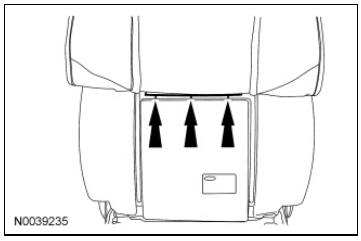
6. Install the side air bag module bolts, route the wire harness as noted during disassembly and install the side air bag module wire harness pin-type retainers.
   - Tighten to 10 Nm (89 lb-in).

Heated seat



7. If necessary, install the backrest heated seat mat.
   - For driver seats with power recline, connect the backrest heated seat mat electrical connector.

All seats



8. Position the backrest foam pad around the backrest frame.

9. Position the backrest trim cover to the backrest frame and foam pad.

10. Roll the backrest trim cover down, attach the hook-and-loop strips and install the second row of hog rings.

11. Roll the backrest trim cover down, attach the hook-and-loop strips and install the first row of hog rings.

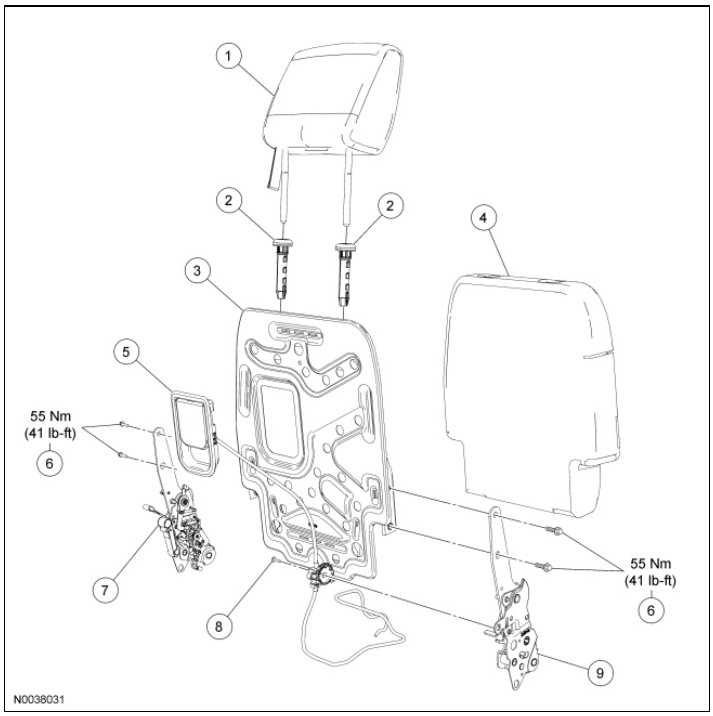
12. Roll the backrest trim cover down, attach the hook-and-loop strips and connect the backrest trim cover lower J-clip.

13. Position the backrest trim cover to the inboard and outboard recliners and install the plastic rivets.

14. Install the 2 head restraint guide sleeves. For additional information, refer to Head Restraint Guide Sleeve in this section.

15. Install the front seat backrest. For additional information, refer to Seat Backrest - Front in this section.

16. Install the front seat. **If a passenger seat has been serviced, do not prove out the SRS at this time.** For additional information, refer to Seat - Front in this section.



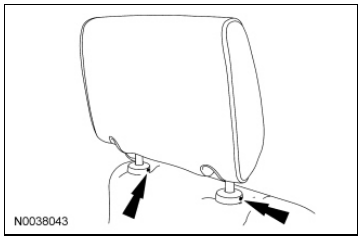
Passenger seat

17. Carry out the Occupant Classification Sensor (OCS) System Zero Seat Weight Test and prove out the SRS . For additional information, refer to General Procedures portion of Section 501-20B .

tomsn048@gmail.com

Seat Backrest - Second Row, 40 Percent E-Z Entry

Second Row, 40 Percent E-Z Entry Backrest



Item	Part Number	Description
1	611A09	Head restraint
2	610A16	Head restraint guides (2 required)
3	613A39	Backrest frame
4	66601/66801	Backrest trim cover/backrest foam pad
5	601L60	Kneeling mechanism release handle and cable
6	-	Recliner-to-backrest frame bolts (4 required) (part of 605C10)
7	61383	Outboard recliner
8	-	Screw (part of 605C10)
9	61383	Inboard recliner

Disassembly and Assembly

1. Remove the second row, 40 percent E-Z entry seat from the vehicle. For additional information, refer to Seat - Second Row, 60/40, E-Z Entry in this section.

2. Remove the second row, 40 percent E-Z entry seat backrest. For additional information, refer to Seat Backrest - Second Row, 40 Percent E-Z Entry in this section.

3. Using an appropriate tool, push in the hole of each head restraint guide while lifting up and remove the head restraint.

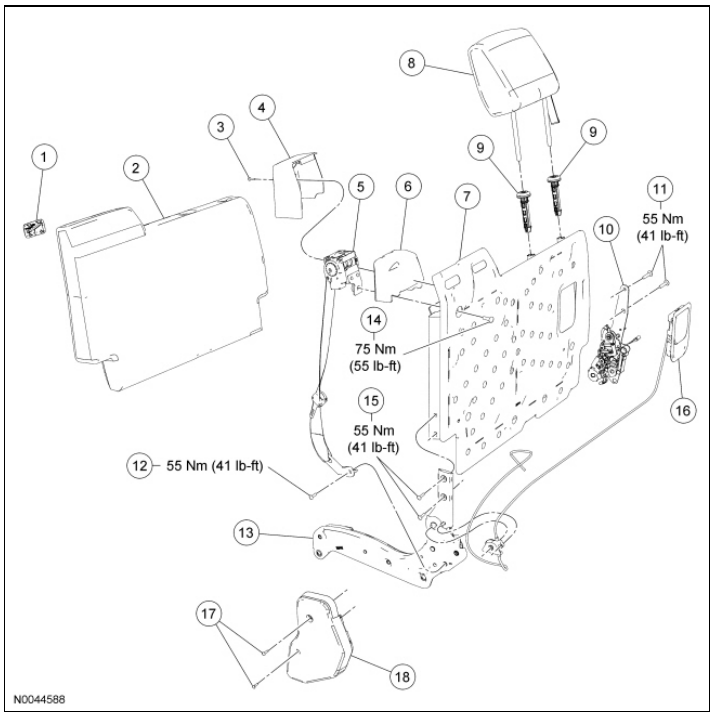
4. ***NOTICE:*** **Use care when separating the backrest trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the backrest foam pad.**

   Release the hook-and-loop strips, invert the trim cover as high as it will go.

5. From between the backrest foam pad and the backrest frame, reach up, pinch the ends together and remove the 2 head restraint guides.

6. Remove the backrest trim cover.

7. Separate the backrest foam pad from the backrest frame.



8. To assemble, reverse the disassembly procedure.

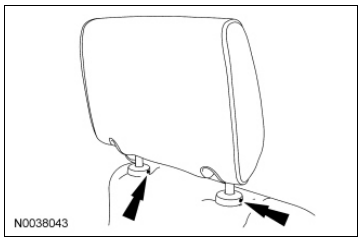
tomsn048@gmail.com

Seat Backrest - Second Row, 60 Percent, E-Z Entry

Second Row, 60 Percent E-Z Entry Backrest

Item	Part Number	Description
1	610D72	Safety belt bezel
2	66600/ 66800	Backrest trim cover/ backrest foam pad
3	-	Pin-type retainer (part of 605C10)
4	613C46	Safety belt retractor cover
5	611B64	Safety belt retractor
6	611D52	Safety belt retractor insulator
7	613A38	Backrest frame
8	611A08	Head restraint
9	610A16	Head restraint guides
10	61382	Outboard recliner
11	-	Outboard recliner-to-backrest frame bolts (part of 605C10)
12	-	Safety belt anchor bolt (part of 605C10)
13	61383	Inboard recliner
14	-	Safety belt retractor bolt (part of 605C10)
15	-	Inboard recliner-to-backrest frame bolts (part of 605C10)
16	601L60	Kneeling mechanism release handle and cable



17	-	Screws (part of 605C10)
18	61349	Inboard recliner outer cover

Disassembly

1. Remove the second row, 60 percent E-Z entry seat. For additional information, refer to Seat - Second Row, 60/40, E-Z Entry in this section.

2. Remove the second row, 60 percent E-Z entry seat backrest. For additional information, refer to Seat Backrest - Second Row, 60 Percent, E-Z Entry in this section.

3. Using an appropriate tool, push in the hole of each head restraint guide while lifting up and remove the head restraint.

4. Remove the safety belt bezel.

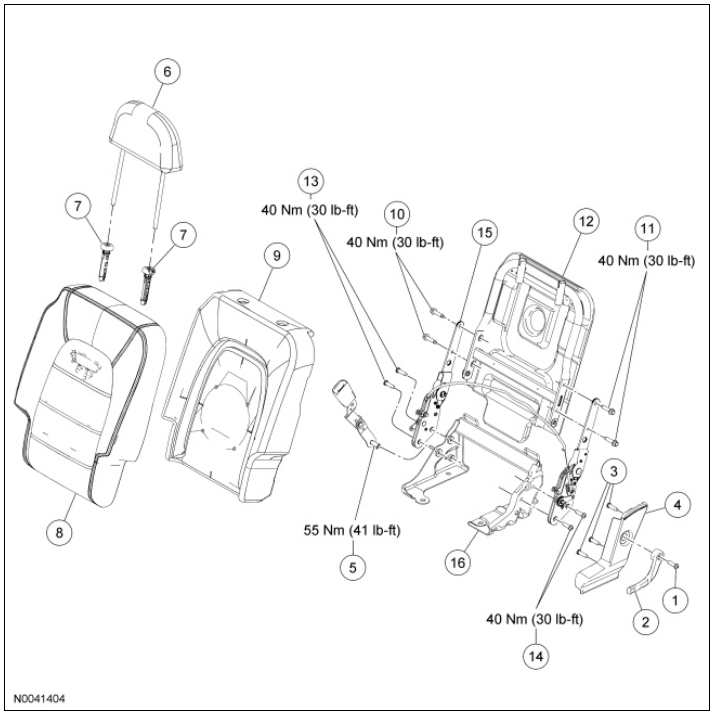
5. ***NOTICE:*** **Use care when separating the backrest trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the backrest foam pad.**

   Release the hook-and-loop strips and invert the trim cover as high as it will go.

6. From between the backrest foam pad and the backrest frame, reach up pinch the ends together and remove the 2 head restraint guides.

7. Route out the safety belt and remove the backrest trim cover.

8. Remove the backrest foam pad from the backrest frame.



9. Remove the safety belt retractor cover.
   - Remove the pin-type retainer.
   - Release the rear of the safety belt retractor cover from the backrest frame.
   - Route out the safety belt and remove the safety belt retractor cover.

10. Remove the bolt, safety belt retractor and insulator.
    - To install, tighten to 75 Nm (55 lb-ft).
    - If necessary, remove the safety belt retractor insulator.

11. To assemble, reverse the disassembly procedure.

tomsn048@gmail.com

Seat Backrest - Second Row, 40 Percent, Bench

Item	Part Number	Description
1	851334	Release handle screw
2	820015	Release handle
3	851334	Latch cover screws
4	820009	Outboard latch cover
5	611C73	Safety belt buckle and bolt
6	611A08	Head restraint
7	610A16	Head restraint sleeves
8	66601	Backrest trim cover
9	66801	Backrest foam pad
10	W505237	Upper latch bolts
11	W505237	Upper latch bolts
12	613A39	Backrest frame
13	W505237	Lower latch bolts
14	W505237	Lower latch bolts
15	61383	Latch assembly
16	600A87	Riser frame

Disassembly and Assembly

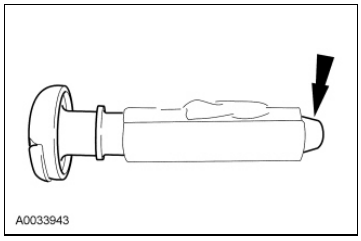
1. Remove the second row 60 percent seat of the 60/40 bench seat. For additional information, refer to Seat - Second Row, Sport Trac or Seat - Second Row, Explorer, 60/40 Bench in this section.

tomsn048@gmail.com

2. Remove the second row, 40 percent seat backrest. For additional information, refer to Seat Backrest - Second Row, 40 Percent, Bench in this section.

3. Remove the screw and the release handle.

4. Remove the 3 screws and the latch cover.



5. Remove the bolt and the safety belt buckle.
    - To install, tighten to 55 Nm (41 lb-ft).

6. Remove the head restraint.

7. **NOTE:** The inboard and outboard head restraint sleeves are not interchangeable.

   NOTE: The head restraint sleeves incorporate an alignment tab that must face forward when installed.

   Squeeze together the tip of the head restraint sleeve and pull the sleeve out of the frame tube.

8. ***NOTICE:*** **Use care when separating the backrest trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the backrest foam pad.**

   Separate the hook-and-loop fasteners. Remove the seat backrest trim cover.

9. Remove the backrest foam pad.

10. Remove the 2 outboard lower latch bolts.
    - To install, tighten to 40 Nm (30 lb-ft).

11. Remove the 2 inboard lower latch bolts.
    - To install, tighten to 40 Nm (30 lb-ft).

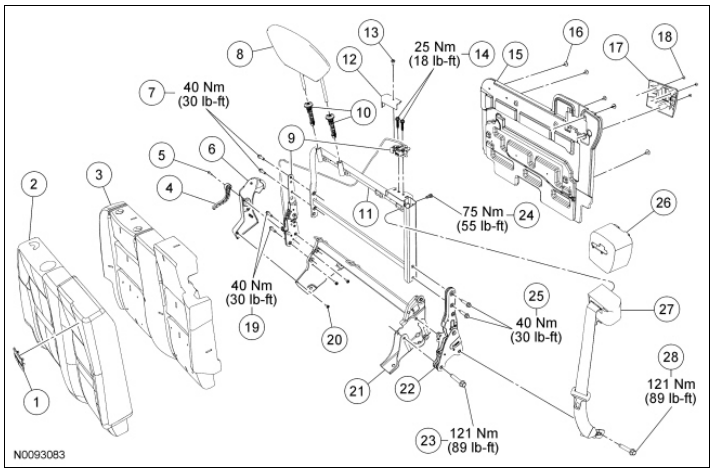
12. ***NOTICE:*** **Do not detach the latch cable from the seat latches. The latch assembly is synchronized; if disassembled, the latch assembly may not operate correctly.**

    Remove the latch assembly.

    - Do not separate or disassemble the latch assembly components.

13. To assemble, reverse the disassembly procedure.

tomsn048@gmail.com



Seat Backrest - Second Row, 60 Percent, Bench

Explorer/Mountaineer, 60 Percent Bench, Backrest

Item	Part Number	Description

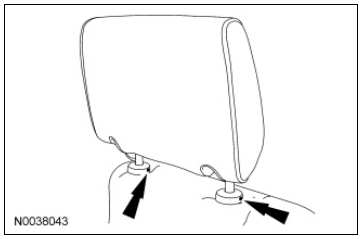
14	-	Upper latch-to-backrest frame bolts (part of 605C10)
15	-	Backrest support panel (part of 613A38)
16	-	Backrest support panel screw (part of 613A38)
17	638A74	Upper latch cover
18	-	Upper latch cover screw (part of 605C10)
19	W505237	Outboard latch-to-riser frame bolts
20	-	Latch cover screw (part of 605C10)
21	606A50	Riser frame
22	-	Inboard latch (inboard, outboard and cable) (part of 61382)
23	-	Inboard latch-to-riser frame front bolt (part of 605C10)
24	N807750	Safety belt retractor bolt

tomsn048@gmail.com

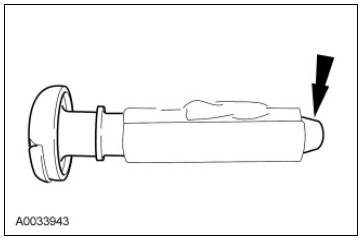


25	W505237	Inboard latch-to-backrest frame bolts
26	613C46	Safety belt retractor cover
27	611B64	Safety belt retractor
28	-	Safety belt anchor bolt (part of 605C10)

Disassembly and Assembly

1. Remove the second row 60 percent seat of the 60/40 bench seat. For additional information, refer to Seat - Second Row, Sport Trac or Seat - Second Row, Explorer, 60/40 Bench in this section.

2. Remove the second row, 60 percent seat backrest. For additional information, refer to Seat Backrest - Second Row, 60 Percent, Bench in this section.



3. Using an appropriate tool, push in the hole of each head restraint guide while lifting up and remove the head restraint.

4. **NOTE:** The inboard and outboard head restraint sleeves are not interchangeable.

   NOTE: The head restraint sleeves incorporate an alignment tab that must face forward when installed.

   Squeeze together the tip of the head restraint sleeve and pull the sleeve out of the frame tube.

5. For Explorer and Mountaineer, pull at the bottom and remove the safety belt guide cover.

6. ***NOTICE:*** **Use care when separating the backrest trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the backrest foam pad.**

   Separate the hook-and-loop fasteners, invert and remove the backrest trim cover.

   - Feed the safety belt out through the backrest trim cover.

7. Remove the backrest foam pad.

8. Remove the safety belt retractor cover.

9. Remove the bolt and the safety belt retractor.
   - To install, tighten to 75 Nm (55 lb-ft).

10. Remove the seat tether-to-riser frame nut and the seat tether (if equipped).
    - To install, tighten to 55 Nm (41 lb-ft).

11. Remove the screw and the release handle.

12. Remove the 3 screws and the outboard latch cover.

13. Remove the outboard latch-to-riser frame bolts.
    - To install, tighten to 40 Nm (30 lb-ft).
        - ♦ For Sport Trac, remove the outboard and upper latch assembly.

14. ***NOTICE:*** **For Explorer and Mountaineer, do not detach the latch cable from the seat latches. The latch assembly is synchronized; if disassembled, the latch assembly may not operate correctly.**

    Remove the inboard latch-to-riser frame front bolt. For Explorer and Mountaineer, remove the latch assembly. For Sport Trac, remove the inboard latch.

    - To install, tighten to 121 Nm (89 lb-ft).

15. To assemble, reverse the disassembly procedure.

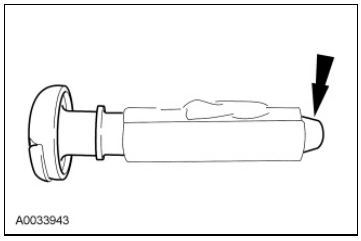
Seat Backrest - Second Row, Bucket

Item	Part Number	Description
1	611A08	Head restraint
2	610A16	Head restraint sleeves (2 required)
3	66601	Backrest trim cover
4	66801	Backrest foam pad
5	613A39	Backrest frame

Disassembly and Assembly

1. Remove the second row, 40 percent bucket seat backrest. For additional information, refer to Seat Backrest - Second Row, Bucket in this section.

2. Remove the head restraint.



3. ***NOTICE:*** **Use care when separating the backrest trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the backrest foam pad.**

   Separate the backrest trim cover hook-and-loop fasteners, remove 2 rows of hog rings and invert the backrest trim cover as high as it will go.

4. **NOTE:** The inboard and outboard head restraint sleeves are not interchangeable.

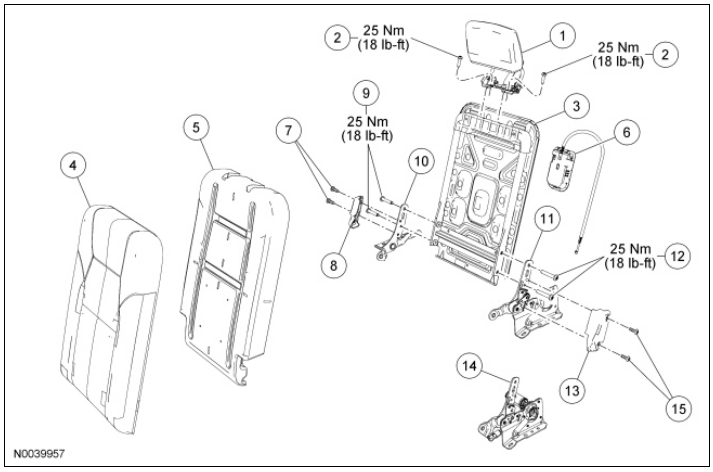
   NOTE: The head restraint sleeves incorporate an alignment tab that must face forward when installed.

   Squeeze together the tip of the head restraint sleeve and pull the sleeve out of the frame tube.

5. Remove the backrest trim cover.

6. Remove the backrest foam pad from the backrest frame.

7. To assemble, reverse the disassembly procedure.



---

tomsn048@gmail.com

Seat Backrest - Third Row

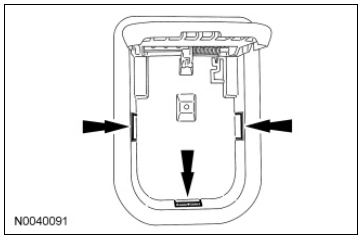
Third Row Seat Backrest

NOTE: RH backrest shown, LH similar.

Item	Part Number	Description
1	611A08	Head restraint
2	-	Head restraint-to-backrest frame bolts (2 required) (part of 605C10)
3	613A38	Backrest frame
4	66600	Backrest trim cover
5	66800	Backrest foam pad
6	62418	Backrest release handle (if equipped)
7	-	Hinge cover screws (2 required) (part of 605C10)
8	61348	Hinge cover
9	-	Hinge-to-backrest frame bolts (2 required) (part of 605C10)
10	61382	Hinge
11	61382	Manual latch
12	-	Latch-to-backrest frame bolts (manual and power) (2 required) (part of 605C10)
13	61349	Latch cover
14	61382	Power latch
15	-	Latch cover screws (2 required) (part of 605C10)

Disassembly and Assembly

All seats



1. Remove the seat backrest. For additional information, refer to Seat Backrest - Third Row in this section.

2. Release the backrest trim cover J-clip at the top of the trim cover by the head restraint.
   - Pull the head restraint release strap through the backrest trim cover.

3. Remove the 2 head restraint-to-backrest frame bolts and remove the head restraint.
   - To install, tighten to 25 Nm (18 lb-ft).

Manual fold seats

4. Release the 3 backrest release handle clips and separate from the backrest.

All seats

5. ***NOTICE:*** **Use care when separating the backrest trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the backrest foam pad.**

   Release the hook-and-loop strips, invert and remove the backrest trim cover.

   - If equipped, route the backrest release handle and cable through the backrest trim cover.

Manual fold seats

6. Route the backrest release cable out of the backrest frame and remove the backrest release handle and cable.

All seats

7. Separate the backrest foam pad from the backrest frame.

8. To assemble, reverse the disassembly procedure.

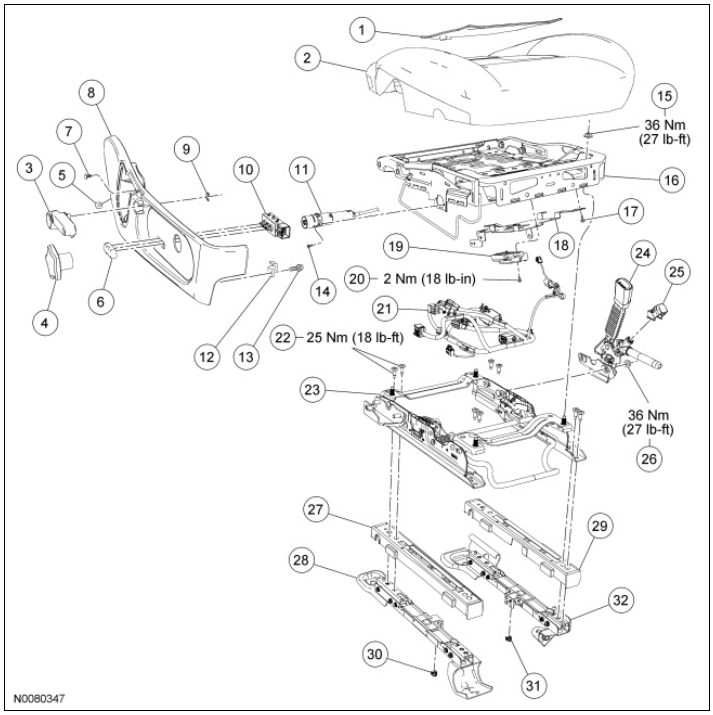
Seat Cushion - Front

Driver Seat Cushion

NOTE: Power seat track shown, manual seat track similar.

NOTE: The retention bracket and screw can be used to repair cushion side shields that will not retain to the cushion frame wire.

Item	Part Number	Description
1	-	Cushion heated seat mat (if equipped)
2	62901/ 632A23	Cushion trim cover/ cushion foam pad
3	-	Cushion frame-to-seat-track nut (4 required) (part of 600A58)
4	63100	Cushion frame
5	-	Safety belt buckle and pretensioner electrical connector cover
6	61203	Safety belt buckle and pretensioner
7	-	Safety belt buckle and pretensioner nut (2 required) (part of 61203)
8	61711	Power seat track
9	610C00	Manual lumbar control (if equipped)
10	-	Manual lumbar control screw (2 required) (if equipped) (part of 600A58)



tomsn048@gmail.com

11	14A701	Seat control switch (if equipped)
12	-	Manual recline handle clip (if equipped) (part of 610A76)
13	W506943	Retention bracket screw (if equipped)
14	62256	Retention bracket (if equipped)
15	62187	Cushion side shield
16	-	Scrivet (part of 600A58)
17	-	Pin-type retainer (part of 600A58)
18	62622	Manual recline handle (if equipped)
19	14C715	Seat control switch knob (if equipped)
20	14711	Power recline switch knob (if equipped)
21	14711	Power lumbar switch knob (if equipped)
22	617B70	Manual lumbar control knob (if equipped)
23	14A163	Bracket
24	-	Screw (4 required) (part of 600A58)
25	14C719	Driver seat wire harness
26	14C708	Driver Seat Module (DSM) (if equipped)
27	-	Screw (2 required) (if equipped) (part of 600A58)

Passenger Seat Cushion

NOTE: Manual seat track shown, power seat track similar.

NOTE: The retention bracket and screw can be used to repair cushion side shields that will not retain to the cushion frame wire.

Item		Description

	Part Number	
1	14D698	Cushion heated seat mat (if equipped)
2	62900/ 632A22	Cushion trim cover/ cushion foam pad
3	62622	Manual recline handle (if equipped)
4	617B70	Manual lumbar control knob (if equipped)
5	-	Pin-type retainer (part of 600A58)
6	14C715	Seat control switch knob (if equipped)
7	-	Scrivet (part of 600A58)
8	62186	Cushion side shield
9	-	Manual recline handle clip (part of 610A76) (if equipped)
10	14A701	Seat control switch (if equipped)
11	610C00	Manual lumbar control (if equipped)
12	62256	Retention bracket (if equipped)
13	W506943	Retention bracket screw (if equipped)
14	-	Manual lumbar control screw (2 required) (if equipped) (part of 600A58)
15	-	Cushion frame-to-seat-track nut (4 required) (part of 600A58)
16	63100	Cushion frame
17	14A163	Bracket
18	-	Screw (4 required) (part of 600A58)
19	14B422	Occupant Classification System Module (OCSM)
20	-	Screw, OCSM (2 required) (part of 600A58)
21	14A699	Passenger seat wire harness
22	-	Seat track-to- OCS rail bolts (8 required) (part of 600A58)
23	61710	Manual seat track
24	61202	Safety belt buckle and pretensioner
25	-	Safety belt buckle and pretensioner electrical connector cover
26	-	Safety belt buckle and pretensioner nut (2 required) (part of 61203)
27	62126	Outboard Occupant Classification Sensor (OCS) rail shield
28	61708	Outboard OCS rail
29	62127	Inboard OCS rail shield
30	-	Outboard OCS rail electrical connector (part of 14A699)
31	-	Inboard OCS rail electrical connector (part of 14A699)
32	61709	Inboard OCS rail

Disassembly and Assembly

All seats

tomsn048@gmail.com

1. Remove the front seat. For additional information, refer to Seat - Front in this section.

2. Remove the seat track. For additional information, refer to Seat Track in this section.

3. Remove the front seat backrest. For additional information, refer to Seat Backrest - Front in this section.

4. ***NOTICE:*** **Use care when separating the cushion trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the cushion foam pad.**

   Release the hook-and-loop strips, remove the hog rings and separate the cushion trim cover from the cushion foam pad.

Seat with heat

5. If necessary, remove the cushion heated seat mat and route out the wire harness through the cushion foam pad opening.

All seats

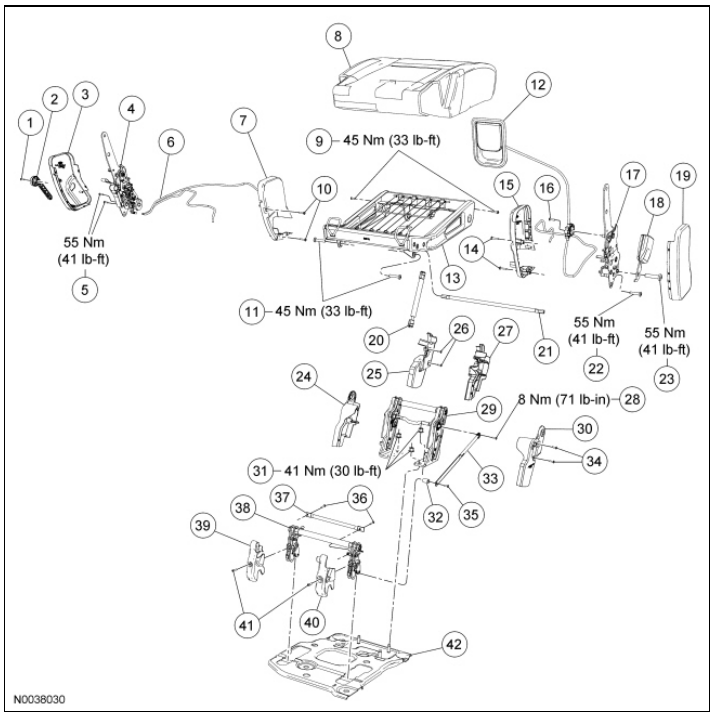
6. To assemble, reverse the disassembly procedure.

7. Install the front seat backrest. For additional information, refer to Seat Backrest - Front in this section.

8. Install the seat track. For additional information, refer to Seat Track in this section.

9. Install the front seat. **If a passenger seat has been serviced, do not prove out the SRS at this time.** For additional information, refer to Seat - Front in this section.

Passenger seat



10. Carry out the Occupant Classification Sensor (OCS) System Zero Seat Weight Test and prove out the SRS . For additional information, refer to General Procedures portion of Section 501-20B .

tomsn048@gmail.com

Seat Cushion - Second Row, 40 Percent E-Z Entry

Second Row, 40 Percent, E-Z Entry Cushion

Item	Part Number	Description
1	-	Screw (part of 605C10)
2	62419	Recliner handle
3	61349	Outboard recliner outer cover
4	61383	Outboard recliner
5	-	Outboard recliner-to-cushion frame bolts (part of 605C10)
6	601L60	Cable assembly
7	61349	Outboard recliner inner cover
8	63805/ 63841	Cushion trim cover/ cushion foam pad
9	-	Cushion frame-to-kneeling mechanism bolts (part of 605C10)
10	-	Screws (2 required) (part of 605C10)
11	-	Cushion frame-to-latch feet assembly bolts (part of 605C10)
12	601L60	Kneeling mechanism release handle and cable
13	63161	Cushion frame
14	-	Screws (part of 605C10)

15	61348	Inboard recliner inner cover
16	-	Screw (part of 605C10)
17	61383	Inboard recliner
18	611C73	Safety belt buckle
19	61348	Inboard recliner outer cover
20	624B75	Shock
21	61383	Recliner release shaft
22	-	Inboard recliner-to-cushion frame bolt (part of 605C10)
23	-	Inboard recliner and safety belt buckle-to-cushion frame bolt (part of 605C10)
24	61349	Kneeling mechanism outboard leg outer cover
25	61349	Kneeling mechanism outboard leg inner cover
26	-	Screws (part of 605C10)
27	81348	Kneeling mechanism inboard leg inner cover
28	-	Latch feet retracting link-to-kneeling mechanism bolt (part of 605C10)
29	61383	Kneeling mechanism
30	81348	Kneeling mechanism inboard leg outer cover
31	-	Kneeling mechanism-to-mounting plate nuts (2 required) (part of 605C10)
32	-	Spacer
33	61383	Latch feet retracting link
34	-	Screws (part of 605C10)
35	-	Latch feet retracting link-to-latch feet assembly bolt (part of 605C10)
36	-	Screws (part of 605C10)
37	-	Latch feet release bar
38	61383	Latch feet assembly
39	61349	Outboard latch foot cover
40	61348	Inboard latch foot cover
41	-	Screws (part of 605C10)
42	606A51	Mounting plate

Disassembly

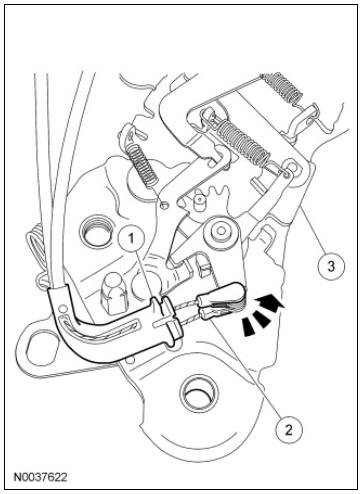
1. Remove the second row 40 percent E-Z entry seat from the vehicle. For additional information, refer to Seat - Second Row, 60/40, E-Z Entry in this section.

2. Lower the backrest and position the seat to the E-Z entry position.
   - The latch feet should be released from the mounting plate and the cushion and backrest must be pivoted up.

3. Using the kneeling mechanism release handle on the backrest, pull the handle and position the kneeling mechanism down in the fold flat load floor position.
   - The cushion and backrest of the seat will be in the E-Z entry position and the kneeling mechanism will be in the fold flat load floor position.

4. **NOTE:** The shock should be fully extended when removing.

tomsn048@gmail.com



Remove the shock from the seat assembly.

- Pry the retaining clip out and separate the shock at the mounting plate and cushion frame.

5. Remove the second row 40 percent E-Z entry seat backrest. For additional information, refer to Seat Backrest - Second Row, 40 Percent E-Z Entry in this section.
6. Remove 3 screws, recliner handle and outboard recliner outer cover.
7. Remove 2 screws and the inboard recliner outer cover.
8. Remove the 2 screws and the latch feet release bar.
9. Release all the cushion trim cover retainers and pin-type retainers.
10. Remove the cushion trim cover and cushion foam pad from the cushion frame.
11. ***NOTICE:*** **Use care when separating the cushion trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the cushion foam pad.**

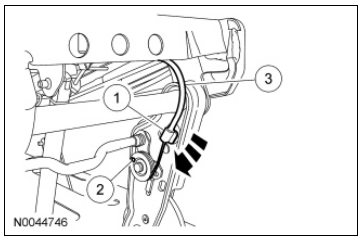
    Release the hook-and-loop strips and separate the cushion trim cover from the cushion foam pad.
12. Remove 2 outboard recliner-to-cushion frame bolts and separate the outboard recliner.
13. Remove the outboard recliner inner cover.
14. Remove the outboard recliner.
    1. Rotate the cable casing out of the outboard recliner.
    2. **NOTE:** The cable ends are color coded/keyed to the levers.

       Rotate the cable ends out of the outboard recliner levers.
    3. Remove the outboard recliner.

15. Remove the 2 screws, pull to separate and remove the kneeling mechanism inboard leg inner and outer covers.
16. Separate the cable to the kneeling mechanism inboard leg.
    1. Turn and separate the cable casing retainer at the inboard side of the kneeling mechanism inboard leg.
    2. Separate the cable from the kneeling mechanism inboard leg release lever.

♦ Remove any cable casing retainers.

17. Remove 2 bolts, the spacer and the latch feet retracting link.



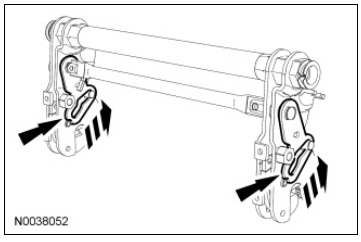
18. Remove the 2 screws and the 2 latch foot covers.

19. Separate the cable and casing from the outboard latch foot. Remove the cable assembly.

20. Remove the screw and separate the kneeling mechanism release cable pivot at the inboard recliner.

21. Remove the 2 screws, pull to separate and remove the kneeling mechanism outboard leg inner and outer covers.

22. Separate the cable to the kneeling mechanism outboard leg and cushion frame.
    1. Turn and separate the cable casing retainer at the inboard side of the outboard kneeling mechanism leg.
    2. Separate the cable from the outboard kneeling mechanism leg release lever.
    3. Separate any cable casing retainers to the cushion frame and remove the cable.



23. Remove the 2 inboard recliner-to-cushion frame bolts, the safety belt buckle and separate the inboard recliner with recliner release shaft.
    - If necessary, separate the recliner release shaft from the inboard recliner.

24. Remove the inboard recliner inner cover.

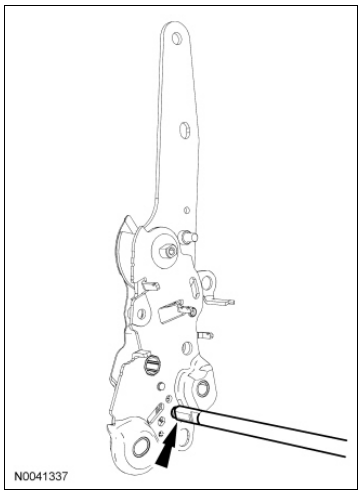
25. Remove the cushion frame.
    - Remove the 2 kneeling mechanism-to-cushion frame bolts.
    - Remove the 2 latch feet assembly-to-cushion frame bolt.
    - Remove the cushion frame.

26. Using the release lever, manually release the inboard and outboard latch feet and remove the latch feet assembly.

tomsn048@gmail.com

27. Remove the 2 nuts and remove the kneeling mechanism.

Assembly



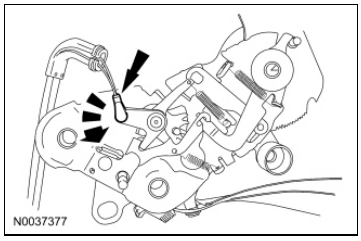
1. Position the kneeling mechanism to the mounting plate and install the nuts.
    - Tighten to 41 Nm (30 lb-ft).

2. **NOTE:** Latch feet will hang down lower than the mounting plate, potentially causing the latch feet to partially latch. Make sure the latch feet are completely latched.

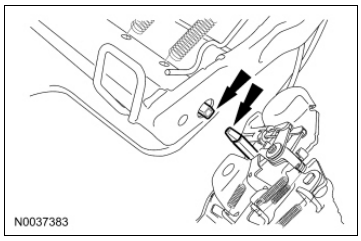
   Position the latching feet assembly to the mounting plate strikers and latch the feet in place.

3. Install the cushion frame.
    - Position the cushion frame to the latch feet assembly and kneeling mechanism.
    - Install the 2 latch feet assembly-to-cushion frame bolts.
        - ♦ Tighten to 45 Nm (33 lb-ft).
    - Install the 2 kneeling mechanism-to-cushion frame bolts.
        - ♦ Tighten to 45 Nm (33 lb-ft).

4. Position the recliner release shaft onto the inboard recliner release pivot stub.



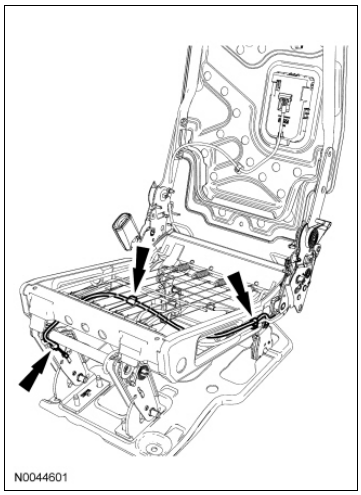
5. Position the inboard recliner and recliner release shaft to the cushion frame.
    - Position the inboard recliner to the cushion frame with the recliner release shaft through the cushion frame opening.
    - Position the safety belt buckle to the inboard recliner forward bolt hole and install the 2 inboard recliner-to-cushion frame bolts.
        - ♦ Tighten to 55 Nm (41 lb-ft).



6. **NOTE:** The cable ends are color coded/keyed to the levers.

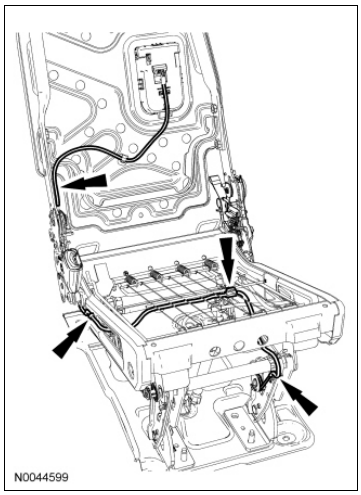
   Position each keyed cable end to the outboard recliner lever and rotate to the locked position.

    - Install the cable casing to the outboard recliner.



7. Position the outboard recliner release pivot stub into the recliner shaft and install the outboard recliner-to-cushion frame bolts.
    - Tighten to 55 Nm (41 lb-ft).

8. Route the outboard recliner short cable, attach the cable to the latch feet assembly outboard foot and attach the cable casing retainers.



9. Route the outboard recliner long cable, attach it to the kneeling mechanism inboard leg and attach all cable casing retainers.

tomsn048@gmail.com

10. Route the kneeling mechanism release cable, position the cable pivot at the inboard recliner and install the screw.

11. Install the cable to the kneeling mechanism outboard leg and cushion frame.
    - Attach the cable to the kneeling mechanism outboard leg release lever.
    - Position, turn and install the cable casing retainer at the inboard side of the kneeling mechanism outboard leg.
    - Attach any cable casing retainers.

12. Position the 2 latch foot covers and install the 2 screws.

13. Position the inner and outer covers around the kneeling mechanism outboard leg and install the 2 screws.

14. Position the inner and outer covers around the kneeling mechanism inboard leg and install the 2 screws.

15. Install the latch feet retracting link.
    - Position the spacer between the latch feet retracting link and inboard latch foot.
    - Install the bolt through the latch feet retracting link and spacer and into the inboard latch foot.
    - Install the latch feet retracting link bolt into the kneeling mechanism inboard leg.
        - Tighten to 8 Nm (71 lb-in).

16. Position the inboard and outboard recliner inner covers.

17. Align the cushion trim cover to the cushion foam pad and attach the hook-and-loop strips.

18. Position the cushion foam pad and trim cover to the cushion frame and attach the cushion trim cover retainers and pin-type retainers.
    - Make sure the lower anchor and tethers for children wires at the rear of the cushion frame are positioned through the cushion trim cover and accessible for use after installation.

19. Position the latch feet release bar and install the 2 screws.

20. Install the second row, 40 percent E-Z entry seat backrest. For additional information, refer to Seat Backrest - Second Row, 40 Percent E-Z Entry in this section.

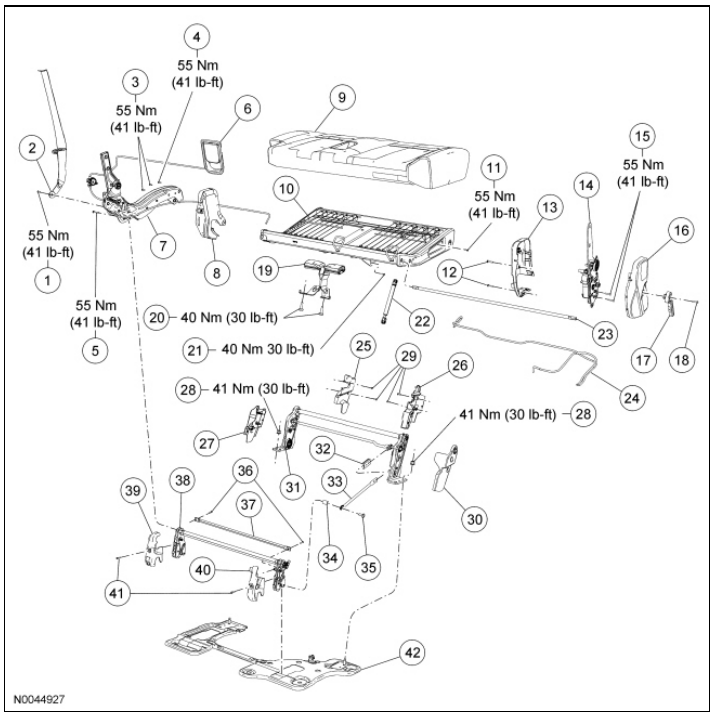
21. Lower the backrest and position the seat to the E-Z entry position.
    - The latch feet should be released from the mounting plate and the cushion and backrest must be pivoted up.

22. Using the kneeling mechanism release handle on the backrest, pull the handle and position the kneeling mechanism down in the fold flat load floor position.
    - The cushion and backrest of the seat will be in the E-Z entry position and the kneeling mechanism will be in the fold flat load floor position.

23. **NOTE:** The shock should be fully extended when installed.

    Position and install the shock onto the seat assembly.

24. Install the second row, 40 percent E-Z entry seat into the vehicle. For additional information, refer to Seat - Second Row, 60/40, E-Z Entry in this section.



25. Cycle the backrest down and then back to the upright position. **Make sure the inboard and outboard recliners simultaneously and securely lock in the upright position.**

40	61348	Outboard latch foot cover
41	-	Screws (part of 605C10)
42	606A50	Mounting plate

Disassembly

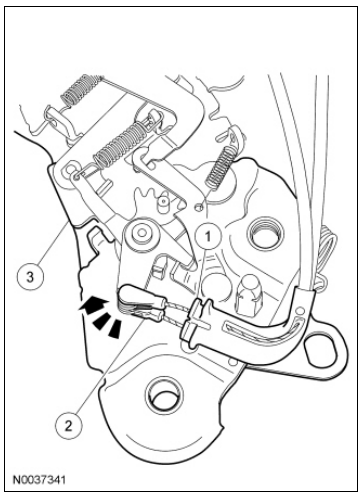
1. Remove the second row, 60 percent E-Z entry seat from the vehicle. For additional information, refer to Seat - Second Row, 60/40, E-Z Entry in this section.

2. Lower the backrest and position the seat to the E-Z entry position.
   - The latch feet should be released from the mounting plate and the cushion and backrest must be pivoted up.

3. Using the kneeling mechanism release handle on the backrest, pull the handle and position the kneeling mechanism down in the fold flat load floor position.
   - The cushion and backrest of the seat will be in the E-Z entry position and the kneeling mechanism will be in the fold flat load floor position.

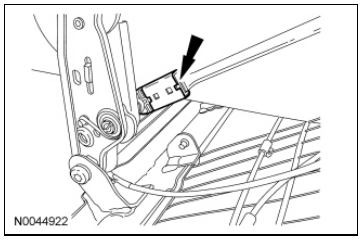
4. **NOTE:** The shock should be fully extended when removing.

   Remove the shock from the seat assembly.



tomsn048@gmail.com

- Pry the retaining clip out and separate the shock from the seat assembly at each end.

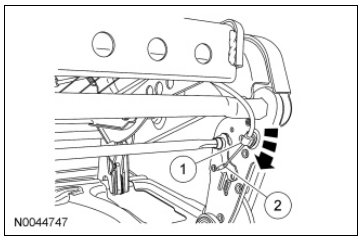


5. Remove the second row 60 percent E-Z entry seat backrest. For additional information, refer to Seat Backrest - Second Row, 60 Percent, E-Z Entry in this section.
6. Remove 3 screws, recliner handle and outboard recliner outer cover.
7. Remove the 2 screws and the latch feet release bar.
8. Release all the cushion trim cover retainers and pin-type retainers.
9. Remove the cushion trim cover and cushion foam pad from the cushion frame.
10. ***NOTICE:*** **Use care when separating the cushion trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the cushion foam pad.**

    Release the hook-and-loop strips and separate the cushion trim cover from the cushion foam pad.
11. Remove 2 outboard recliner-to-cushion frame bolts, pull out and separate the outboard recliner.
12. Remove the outboard recliner inner cover.
13. Remove the outboard recliner.
    1. Rotate the cable casing out of the outboard recliner.
    2. **NOTE:** The cable ends are color coded/keyed to the levers.

       Rotate the cable ends out of the outboard recliner levers.
    3. Remove the outboard recliner.

14. Remove the 2 screws, pull to separate and remove the kneeling mechanism inboard leg inner and outer covers.
15. Remove the 2 screws, pull to separate and remove the kneeling mechanism outboard leg inner and outer covers.
16. Remove the bolt and spacer and separate the latch feet retracting link from the latch feet assembly.
17. Release the tab and slide the latch feet retracting link retainer back.



18. Release the tab and remove the latch feet retracting link from the kneeling mechanism.

19. **NOTE:** Note the routing of the cable for installation.

    Separate the cable to the kneeling mechanism inboard leg and cushion frame.

    1. Turn and separate the cable casing retainer at the inboard side of the kneeling mechanism inboard leg.
    2. Separate the cable from the kneeling mechanism inboard leg release lever.
        - Remove the cable casing retainers from the cushion frame.

20. Remove the 2 screws and the 2 latch foot covers.

21. Separate the cable and casing from the outboard latch foot, cushion support springs and remove the cable assembly.

22. Through the opening in the cushion frame, remove the recliner release shaft.

23. **NOTE:** Note the routing of the cable for installation.

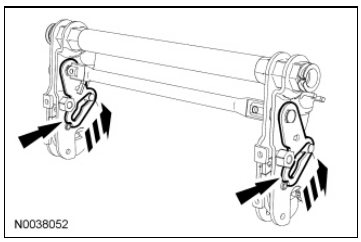
    Separate the kneeling mechanism cable pivot at the inboard recliner.

24. **NOTE:** Note the routing of the cable for installation.

    Remove the kneeling mechanism release handle with cable.

    1. Turn and separate the cable casing retainer at the inboard side of the outboard kneeling mechanism leg.
    2. Separate the cable from the outboard kneeling mechanism leg release lever.
    3. Separate any cable casing retainers to the cushion frame and remove the kneeling mechanism release handle with cable.

tomsn048@gmail.com



25. Remove the cushion frame.
    - Remove the cushion frame-to-kneeling mechanism bolt.
    - Remove the cushion frame-to-latch foot assembly bolt.
    - Remove the 2 inboard recliner-to-cushion frame bolts.
    - Remove the cushion frame.

26. Remove the 2 bolts and the safety belt buckles.

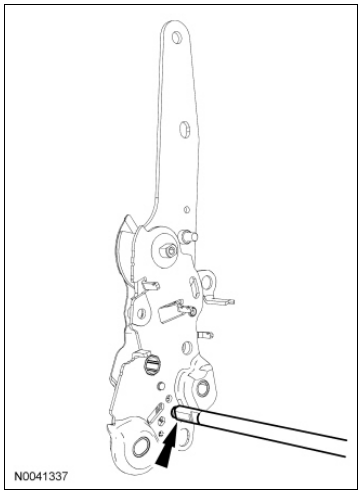
27. Remove the inboard recliner.
    - Remove the inboard recliner-to-kneeling mechanism bolt.
    - Remove the inboard recliner-to-latch feet assembly bolt.
    - Remove the inboard recliner.
        - ♦ Remove the inboard recliner inner cover.

28. Using the release levers, manually release the inboard and outboard latch feet and remove the latch feet assembly from the mounting plate.

29. Remove the 2 kneeling mechanism-to-mounting plate nuts and remove the kneeling mechanism.

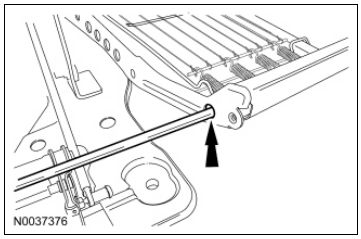
Assembly

1. Position the kneeling mechanism to the mounting plate and install the 2 kneeling mechanism-to-mounting plate nuts.
    - Tighten to 41 Nm (30 lb-ft).



2. **NOTE:** Latch feet will hang down lower than the mounting plate, potentially causing the latch feet to partially latch. Make sure the latch feet are completely latched.

   Position the latch feet assembly to the mounting plate strikers and latch the feet in place.



3. Install the inboard recliner inner cover.

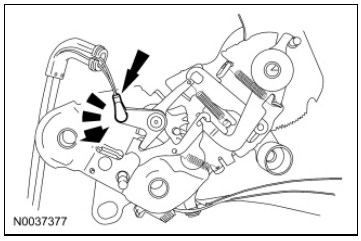
4. Position the inboard recliner.
    - Position the inboard recliner to the kneeling mechanism and latch feet assembly.
    - Hand-start the latch feet assembly-to-inboard recliner bolt.
    - Hand-start the kneeling mechanism-to-inboard recliner bolt.

5. Position the recliner release shaft onto the inboard recliner release pivot stub.

6. Position the cushion frame to the inboard recliner with the recliner release shaft through the cushion frame opening.

7. Hand-start the 2 inboard recliner-to-cushion frame bolts.

8. Hand-start the cushion frame-to-latch foot assembly bolt and the cushion frame-to-kneeling mechanism bolt.



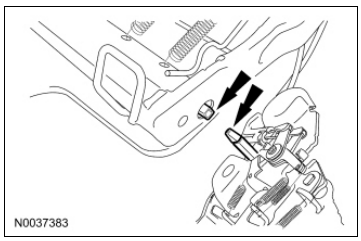
9. Install the bolts.
    - Install the inboard recliner-to-latch feet assembly bolt.
        - ♦ Tighten to 55 Nm (41 lb-ft).
    - Install the inboard recliner-to-kneeling mechanism bolt.
        - ♦ Tighten to 55 Nm (41 lb-ft).
    - Install the cushion frame-to-latch foot assembly bolt.
        - ♦ Tighten to 40 Nm (30 lb-ft).
    - Install the cushion frame-to-kneeling mechanism bolt.
        - ♦ Tighten to 55 Nm (41 lb-ft).
    - Install the inboard recliner-to-cushion frame rear bolt.
        - ♦ Tighten to 55 Nm (41 lb-ft).
    - Install the inboard recliner-to-cushion frame front bolt.
        - ♦ Tighten to 55 Nm (41 lb-ft).

10. **NOTE:** The cable ends are color coded/keyed to the levers.

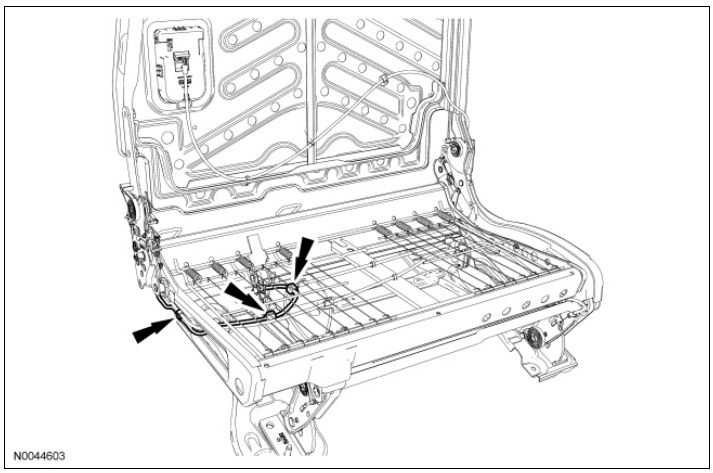
    Position each keyed cable end to the outboard recliner lever and rotate to the locked position.

    - Install the cable casing to the outboard recliner.

tomsn048@gmail.com



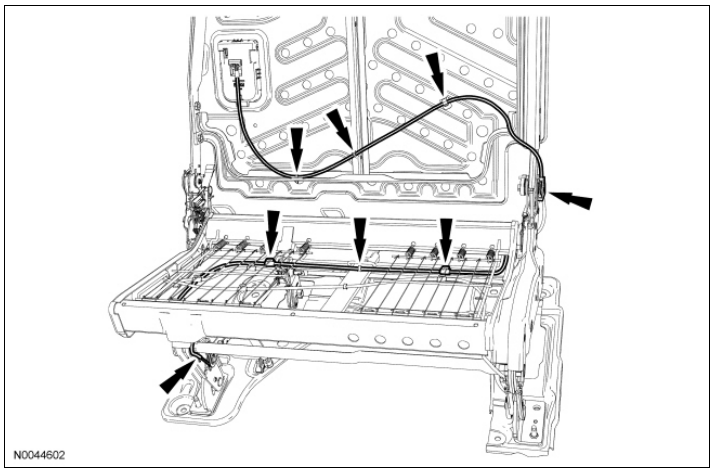
11. Install the outboard recliner inner cover.



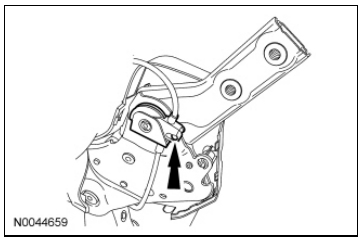
12. **NOTE:** The outboard recliner inner cover has been removed for clarity.

    Position the outboard recliner release pivot stub into the recliner shaft and install the 2 outboard recliner-to-cushion frame bolts.

    - Tighten to 55 Nm (41 lb-ft).



13. Install the outboard recliner short cable to the latch feet assembly outboard foot and attach all cable casing retainers.



14. Install the outboard recliner long cable to the kneeling mechanism inboard leg and attach all cable casing retainers.

15. Route the kneeling mechanism release cable, position the kneeling mechanism release cable pivot at the inboard recliner and attach all cable casing retainers.

16. Make sure the inboard recliner pin is through the cable pivot.

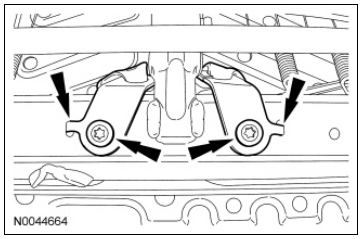
17. Install the kneeling mechanism release cable to the kneeling mechanism outboard leg.
    - Attach the cable to the kneeling mechanism outboard leg release lever.
    - Position, turn and install the cable casing retainer at the inboard side of the kneeling mechanism outboard leg.
    - Attach any cable casing retainers.

18. Position the inner and outer covers around the kneeling mechanism outboard leg and install the 2 screws.

19. Position the inner and outer covers around the kneeling mechanism inboard leg and install the 2 screws.

20. Position the 2 latch foot covers and install the 2 screws.

tomsn048@gmail.com



21. Position the latch feet retracting link retainer onto the latch feet retracting link shaft.

22. Position the latch feet retracting link into the kneeling mechanism coupler engaging the retainer.
    - The kneeling mechanism coupler is part of the kneeling mechanism.

23. Slide the latch feet retracting link retainer back to the kneeling mechanism coupler, engaging the retainer.

24. Position the spacer between the latch feet retracting link and outboard latch foot and install the bolt.

25. Align the safety belt buckle anti-rotation tabs to the cushion frame openings and install the 2 bolts.
    - Tighten to 40 Nm (30 lb-ft).

26. Align the cushion trim cover to the cushion foam pad and attach the hook-and-loop strips.

27. Position the cushion foam pad and trim cover to the cushion frame and attach the cushion trim cover retainers and pin-type retainers.
    - Pull the 2 safety belt buckles through the cushion trim cover and foam pad.
    - Make sure the lower anchor and tethers for children wires at the rear of the cushion frame are positioned through the cushion trim cover and accessible for use after installation.

28. Position the latch feet release bar and install the 2 screws.

29. Install the second row, 60 percent E-Z entry seat backrest. For additional information, refer to Seat Backrest - Second Row, 60 Percent, E-Z Entry in this section.

30. Lower the backrest and position the seat to the E-Z entry position.
    - The latch feet should be released from the mounting plate and the cushion and backrest must be pivoted up.

31. Using the kneeling mechanism release handle on the backrest, pull the handle and position the kneeling mechanism down in the fold flat load floor position.
    - The cushion and backrest of the seat will be in the E-Z entry position and the kneeling mechanism will be in the fold flat load floor position.

32. **NOTE:** The shock should be fully extended when installed.

    Position and install the shock onto the seat assembly.

33. Install the second row, 60 percent E-Z entry seat into the vehicle. For additional information, refer to Seat - Second Row, 60/40, E-Z Entry in this section.

34. Cycle the backrest down and then back to the upright position. **Make sure the inboard and outboard recliners simultaneously and securely lock in the upright position.**

Seat Cushion - Second Row, 40 Percent, Bench

Item	Part Number	Description
1	854182	Latch cover screws
2	820011	Latch cover
3	854182	Latch cover screws
4	851264	Latch cover
5	-	Rear seat 40 percent of 60/40 upper pivot latch bolt (part of 605C10)
6	-	Rear seat 40 percent of 60/40 upper pivot latch bolt (part of 605C10)
7	63805	Cushion trim cover
8	63841	Cushion foam pad
9	63844	Cushion pad support
10	631B79	Seat cushion frame

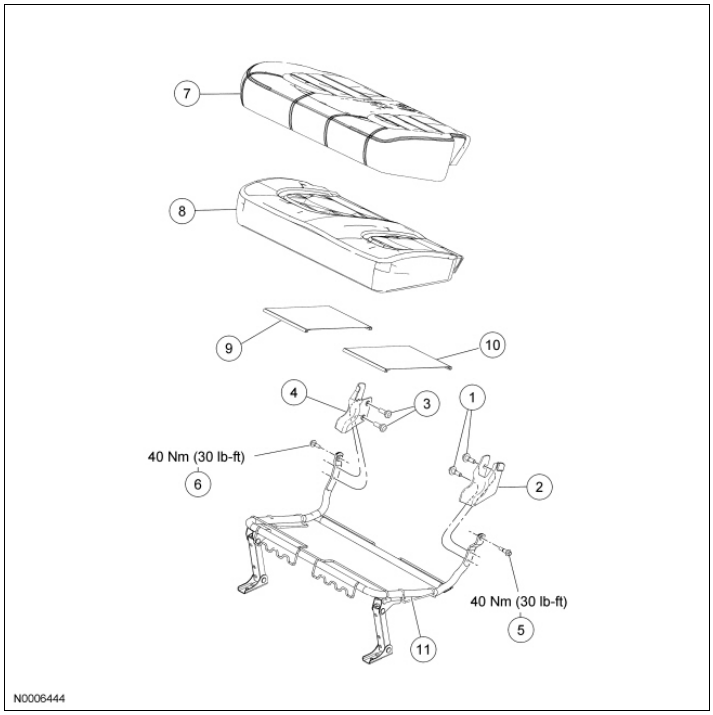
Disassembly and Assembly

1. Remove the second row 40 percent seat of the 60/40 bench seat. For additional information, refer to Seat - Second Row, Sport Trac or Seat - Second Row, Explorer, 60/40 Bench in this section.

2. Remove the second row, 40 percent bench seat backrest. For additional information, refer to Seat Backrest - Second Row, 40 Percent, Bench in this section.

3. ***NOTICE:*** **Use care when separating the cushion trim cover from the hook-and-loop strip, or the**

hook-and-loop strip can be torn from the seat cushion foam pad.



Release the J-clips, separate the hook-and-loop fasteners and remove the seat cushion trim cover.

4. Remove the cushion foam pad.
5. Remove the cushion pad supports.
6. To assemble, reverse the disassembly procedure.

18	61383	Latch pivot
19	7801L60	Riser attachment cable
20	61332	Torsion rod

21	63844	Cushion pad support
22	-	Front spring hinge bolts (part of 605C10)
23	605A76	Pivot springs
24	631B79	Seat cushion frame
25	600A87	Floor riser

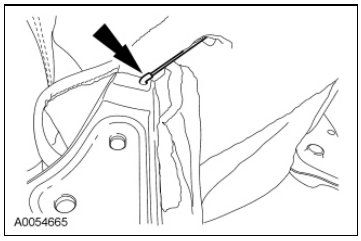
Disassembly and Assembly

NOTE: LH seat shown, RH similar.

1. Remove the second row bucket seat. For additional information, refer to Seat - Second Row, Bucket in this section.

2. Remove the second row bucket seat backrest. For additional information, refer to Seat Backrest - Second Row, Bucket in this section.

3. Remove the screw and the release handle.



4. Remove the 2 screws and the 2 LH latch covers.

5. Remove the 2 screws and the 2 RH latch covers.

6. ***NOTICE:*** **Use care when separating the cushion trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the seat cushion foam pad.**

   Release the cushion trim cover J-clips, separate the hook-and-loop fasteners and remove one row of hog rings.

7. Release the cable from the seat riser and remove the cushion trim cover.

8. Remove the seat cushion foam pad.

9. Remove the 2 lower latch cover screws and the 2 LH lower latch covers.

10. **NOTE:** The left and right latches with cables are one assembly and should not be separated.

    Remove the 4 latch bolts and the latch pivot.

    - To install, tighten to 40 Nm (30 lb-ft).

11. Remove the 2 latch nuts and separate the latch assembly.
    - To install, tighten to 40 Nm (30 lb-ft).

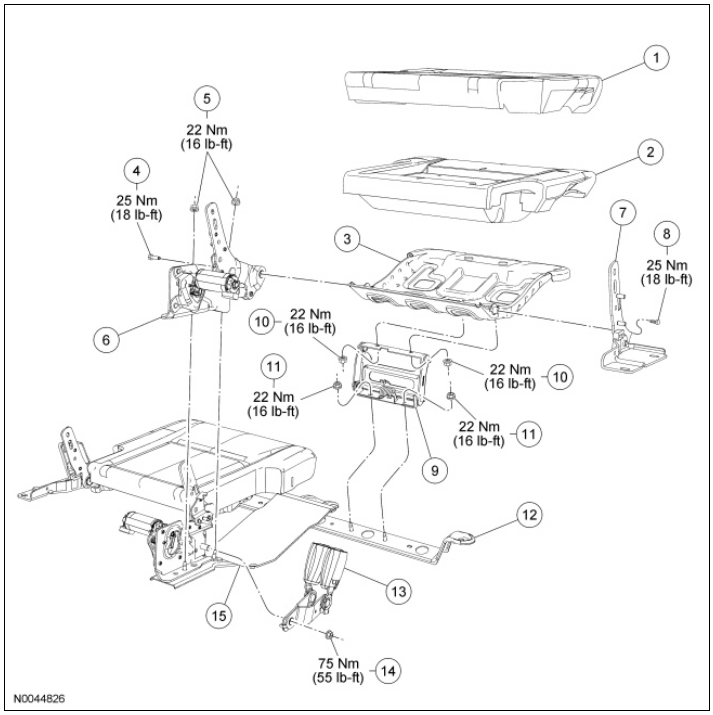
12. **NOTE:** On assembly, route the cable as shown.

    Remove the riser attachment cable and the latch assembly.

tomsn048@gmail.com

13. Remove the torsion rod and the cushion pad support.

14. Remove the front spring hinge bolts, springs and seat cushion frame assembly.
    - To install, tighten to 23 Nm (17 lb-ft).



15. To assemble, reverse the disassembly procedure.

Seat Cushion - Third Row

Third Row Seat Cushion

NOTE: RH cushion shown, LH similar.

NOTE: Power latch shown, manual latch similar.

Item	Part Number	Description
1	63804	Cushion trim cover
2	63840	Cushion foam pad
3	63160	Cushion frame
4	-	Latch-to-cushion frame bolt (manual and power) (part of 605C10)
5	-	Latch-to-floor mounting bracket nuts (manual and power) (2 required) (part of 605C10)
6	61382	Power latch
7	61382	Hinge
8	-	Hinge-to-cushion frame bolt (part of 605C10)
9	613E52	Cushion pivot link assembly
10	-	Cushion pivot link assembly-to-cushion frame nuts (2 required) (part of 605C10)
11	-	Cushion pivot link assembly-to-floor mounting bracket nuts (2 required) (part of 605C10)

tomsn048@gmail.com

12	606A51	Floor mounting bracket
13	611B60	Safety belt buckle assembly
14	-	Safety belt buckle assembly-to-latch nut (power and manual)
15	617C42	Cover

Disassembly and Assembly

1. Remove the third row seat from the vehicle. For additional information, refer to Seat - Third Row in this section.

2. Remove the third row cushion. For additional information, refer to Seat Cushion - Third Row in this section.

3. Release the cushion trim cover J-clips attached to the bottom of the cushion frame.

4. Remove the cushion foam pad and trim cover from the cushion frame.

5. ***NOTICE:*** **Use care when separating the backrest trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the backrest foam pad.**

   Invert the cushion trim cover, release the hook-and-loop strips and separate the cushion trim cover from the cushion foam pad.

6. To assemble, reverse the disassembly procedure.

Glass, Frames and Mechanisms

The glass, frames and mechanisms consist of the following:

- Accessory delay relay
- Exterior moulding
- Front door glass top run channel assembly
- Front door weather shield
- Front door window glass
- HVAC module
- Interior moulding
- Liftgate window glass
- Rear door glass top run channel assembly
- Rear door weather shield
- Rear door window glass
- Rear quarter window glass
- Rear window control switch
- Rear window defrost relay
- Rear window regulator assembly
- Rear window regulator motor
- Smart Junction Box (SJB)
- Window control switch
- Window regulator assembly
- Window regulator motor
- Windshield glass
- Windshield glass moulding assembly

Power Window Control

The window control switch:

- is located on each door trim panel.
- may be used to raise or lower all windows from the left front window control switch, or the individual side window from the corresponding individual door switch.
- can lock out passenger front and rear window control switches when the lock-out switch on the left front window control switch is turned on.
- can automatically raise or lower the driver door window when the window control switch is momentarily pushed or pulled into the second detent position and released.

Delayed accessory feature

The accessory delay relay, located in the SJB , provides power for the operation of the power windows and the power moon roof (if equipped). The accessory delay feature is active when the ignition switch is in the RUN or the ACC position, or when the ignition switch is changed from RUN or ACC to the OFF/LOCK position and the LF and RF doors are closed.

Rear window defrost

The HVAC module (if equipped) or manual climate control assembly controls the state of the rear window defrost relay. When the rear window defrost switch (integral to the HVAC module or manual climate control

tomsn048@gmail.com

assembly) is pressed, the HVAC module (if equipped) or manual climate control assembly will activate the rear window defrost relay. When the rear window defrost relay is active, both the rear window defrost grid and heated mirror elements will be energized.

Power Rear Window (if Equipped)

The power rear window is operated by the control switch located in the overhead console. When the rear window is in the fully CLOSED position, pressing and releasing the control switch will lower the rear window to the VENT position. Pressing and releasing the control switch again will lower the rear window to the fully OPEN position. When the rear window is in the fully OPEN or VENT position, pulling and releasing the control switch will return the rear window to the fully CLOSED position.

Glass, Frames and Mechanisms

Special Tool(s)

 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Principles of Operation

LH Front Power Window Operation

The LH front window motor contains integral electronics which must be initialized whenever a new window motor has been installed. Initialization is required to learn both the full UP and full DOWN positions and the profile of the glass as it travels through the glass channel. Once initialized, obstacle detection is enabled. When mechanical repairs have been carried out on either front window regulator or glass run, the LH front window motor must be de-initialized, and then initialized. The LH front window control switch sends 3 separate signals to the front window motor: up, down and auto. The front window control switch provides a 12-volt signal to the front window motor to request an up or down operation. When one-touch up or one-touch down is requested, the front window control switch provides a 12-volt signal on the up or down line and a ground signal on the auto line simultaneously. The up, down and auto feeds to the LH front window motor are all low current.

The LH front window motor operates with the ignition switch in the RUN or ACCESSORY positions, or when the accessory delay relay is active. The high current required to move the LH front window is supplied through a separate battery power circuit. For the motor to operate correctly, both power feeds and the ground feed must be intact at the window motor.

When the LH front window motor is operating in one-touch up or one-touch down mode, movement of the front window can be stopped by activating the switch in either direction. The front window control switch must be released before the window will move again.

Bounce-Back

The LH front window motor has a bounce-back feature. If an obstacle has been detected in the window opening as the window glass is moving upward, the window motor will automatically reverse direction and move the glass toward the bounce-back position (in both up and one-touch up modes). If an obstruction occurs between 4 mm (0.15 in) and 200 mm (7.87 in) of window opening, the bounce-back position will be 250 mm (9.84 in) of window opening. If an obstruction occurs at a position greater than 200 mm (7.87 in) of window opening, the bounce-back position will be 50 mm (1.96 in) below where the obstruction occurred.

tomsn048@gmail.com

Security Override

To override a bounce-back condition (to overcome the resistance of ice on the window or seals for example), within 2 seconds after the window reaches the bounce-back position, pull and hold the window control switch. The window will travel up with no bounce-back or pinch protection. If the window control switch is released before the window is fully closed, the window will stop. If the ignition switch is turned to OFF or START (without delayed accessory), the window motor will stop.

A new LH front window motor will not operate in one-touch up mode, and the bounce-back feature will be disabled prior to initialization. If the switch is actuated to the auto UP or auto DOWN position and released, window movement will stop when the up or down contact in the front window control switch is released. If the front window motor is removed from the window regulator drum housing, or if a new front window motor is installed, it must be initialized. Refer to Window Motor Initialization - Front in this section.

The LH front window motor will automatically adjust to system changes throughout its life: changes in seal drag and slight changes in the full OPEN position will occur and will be automatically compensated for. Once initialized, the front window motors will soft stall into the upper and lower positions contributing to extended durability of the system. If the front window does not seal completely in the full UP position (very small gaps/non bounce-back events only), the front window switch can be actuated to the UP position and the front window will be energized for a fraction of a second to fully seal and this new position will be learned.

Passenger Window Operation

Passenger windows may be raised or lowered using the LH front window control switch or the corresponding passenger window control switch. Passenger window control switches receive power when the accessory delay relay is active and the LH front window lock switch is in the UNLOCK position. When the LH front window lock switch is in the LOCK position, the passenger windows will only operate from the LH front window control switch.

Rear Window Defrost

The rear window defrost relay is located in the Smart Junction Box (SJB). The rear window defrost switch is integral to the HVAC module (if equipped) or the manual climate control assembly.

For vehicles equipped with a HVAC module, when the rear window defrost switch is pressed to the ON position, the HVAC module sends a message through the Controller Area Network (CAN) to the SJB . When the SJB receives the rear window defrost ON message, the SJB starts a 10-minute timing function, and grounds the rear window defrost relay coil control circuit, which is hardwired to the SJB . When the rear window defrost relay is active, both the rear window defrost grid and heated mirror elements will be energized.

For vehicles equipped with a manual climate control assembly, when the rear window defrost switch is pressed to the ON position, the manual climate control assembly sends a ground signal to the SJB . When the SJB receives the rear window defrost request, the SJB will activate the rear window defrost relay. When the rear window defrost relay is active, both the rear window defrost grid and heated mirror elements will be energized.

The HVAC module/manual climate control assembly/ SJB will deactivate the rear window defrost relay when one of the following conditions is met

- The rear window defrost switch is pressed when the feature is active
- Ignition switch state is changed from RUN to OFF/LOCK
- The 10 minute timing function is completed

Feature inputs

- Ignition switch RUN position (12V on both RUN and RUN/ACC inputs)

- Rear window defrost switch (momentary contact to ground when switch is pressed)

Feature outputs

- Rear window defrost relay control (grounded when activated, open circuit when deactivated)

Delayed Accessory Power

NOTE: The SJB may also be identified as the Generic Electronic Module (GEM).

The SJB controls power to the power windows and the roof opening panel (if equipped) with the accessory delay relay. Refer to the Wiring Diagrams manual for additional vehicle features powered by the accessory delay relay. The SJB activates the accessory delay relay whenever the ignition switch is in the RUN or the ACCESSORY position, or when the ignition switch is changed from RUN or ACCESSORY to the OFF/LOCK position and the LH and RH front doors are closed.

The SJB will deactivate the accessory delay feature when:

- the LF door is ajar and the ignition switch is in the OFF/LOCK or KEY-OUT position.
- the RF door is ajar and the ignition switch is in the OFF/LOCK or KEY-OUT position.
- ten minutes have elapsed since the ignition switch was changed from ACC or RUN to the OFF/LOCK position.

Feature inputs

- LF door ajar switch (open circuit with door closed, grounded with door ajar)
- RF door ajar switch (open circuit with door closed, grounded with door ajar)
- Ignition switch RUN position (battery potential on both the RUN and RUN/ACC inputs)
- Ignition switch ACC position (battery potential on the RUN/ACC input)
- Ignition switch OFF/LOCK position (absence of battery potential on the RUN, RUN/ACC and START inputs)

Feature outputs

- Accessory delay relay (control circuit grounded when activated, open circuit when deactivated)

Power Rear Window

NOTE: The power rear window motor does not communicate on the Controller Area Network (CAN).

The power rear window motor is an 8-pin motor with integral electronics. The power rear window control switch is located in the overhead console and provides a voltage signal to the motor to signal an open or close request. The integral electronics on the motor allow the power rear window to be moved to 3 positions: fully OPEN, fully CLOSED and VENT (approximately 50.8 mm [2 in] down from fully CLOSED).

When the power rear window is in the fully CLOSED position, pressing and releasing the control switch will lower the rear window to the VENT position. Pressing and releasing the control switch again will lower the rear window to the fully OPEN position. When the rear window is in the fully OPEN or VENT position, pulling and releasing the control switch will return the rear window to the fully CLOSED position.

The power rear window motor plastic pinion gear is mated to the drum housing of a single rail drum and cable window regulator. The motor is attached to the plastic drum housing by 3 screws. The motor uses internal Hall-effect sensor feedback coupled to the microprocessor to determine window position and operate the power rear window. If the microprocessor is not receiving the Hall-effect sensor pulses, the motor will run for approximately half a second, then enter error mode (window will become inoperative). The motor contains a thermal breaker to protect the motor windings from over-current/over-temperature operation. Continued successive operation of the motor will cause the thermal breaker to open, causing a loss of function until the

tomsn048@gmail.com

power rear window motor cools. If this occurs, when the motor cools it will be in position recovery mode. Simply press the control switch momentarily and the power rear window will stall in the full OPEN position. Full functionality will then be restored.

The power rear window motor operates only with the ignition switch in the RUN/ACC position, or when the accessory delay relay is active. The motor is supplied with battery power and draws a key-off load of approximately 0.5 mA. All of the high current required to move the window is supplied through the battery and motor ground inputs. The loss of both logic and motor ground will cause this system to become inoperative. For correct functionality, both power feeds and one ground feed must be intact at the power rear window motor.

If an open or close command is selected while the ignition switch is in the RUN/ACC position, and the ignition switch is turned to OFF or START without accessory delay relay power enabled, the window will move to the fully OPEN or VENT position and stop.

Bounce-Back

If an obstacle is detected in the power rear window opening as the window is closing, the window will automatically reverse direction and move toward the fully OPEN position. This is known as bounce-back.

Security Override

To override a bounce-back condition (to overcome the resistance of ice on the window or seals for example), within 2 seconds after the window reaches the bounce-back position, pull and hold the window control switch. The window will travel up with no bounce-back or pinch protection. If the ignition switch is turned to OFF or START without accessory delay power enabled, the window will reverse direction with bounce-back re-enabled.

If the high current power circuit is disconnected from the power rear window motor while the window is in motion, the motor will enter position recovery mode when power is restored. Position recovery mode allows upward movement of the window in 15 mm (0.6 in) increments. If the control switch is pulled, the window will move in a one-touch down mode until it stalls in the fully OPEN position. If no internal or external faults exist, the motor will automatically resume normal operation.

The power rear window motor will suspend normal operation if a power rear window control switch error exists. A control switch error is defined as open and close energized at the same time. The window will be inoperative if a control switch error is present.

If the motor is removed from the window regulator drum housing, or if a new motor is installed, the window must be initialized. A new motor will be inoperative until initialized. Refer to Window Motor Initialization - Rear in this section.

The power rear window will automatically adjust to system changes throughout its life. Changes in seal drag and slight changes in the fully CLOSED position will occur and are automatically compensated for. Once initialized, the motor will soft stall into the lower position contributing to the extended durability of the system.

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical and electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Window regulator assembly • Window motor • Window glass • Window control switch	• Battery Junction Box (BJB) fuse(s): ♦ 1 (50A) ♦ 10 (20A) ♦ 15 (40A) ♦ 37 (30A) • Smart Junction Box (SJB) circuit breaker 1 (25A) • SJB fuse 5 (5A) • Circuitry • Window control switch • Rear window defrost relay • Accessory delay relay

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM .
   - refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00 to diagnose no response from the SJB or HVAC module (if equipped).

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record Continuous Memory Diagnostic Trouble Codes (CMDTCs).

8. Clear the CMDTCs and carry out the self-test diagnostics for the SJB and HVAC module (if equipped).

9. If the DTCs retrieved are related to the concern, GO to Smart Junction Box (SJB) DTC Chart or HVAC Module DTC Chart. For all other DTCs, refer to Section 419-10 .

tomsn048@gmail.com

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

DTC Charts

Smart Junction Box (SJB) DTC Chart

DTC	Description	Action
B1302	Accessory Delay Relay Coil Circuit Failure	GO to Pinpoint Test I .
B1304	Accessory Delay Relay Coil Circuit Short To Battery	GO to Pinpoint Test J .
B1345	Heated Backlite Input Circuit Short To Ground	GO to Pinpoint Test H .
B1347	Heated Backlite Relay Circuit Failure	GO to Pinpoint Test G .
B1349	Heated Backlite Relay Short To Battery	CARRY OUT the rear window defrost relay component test. Refer to Wiring Diagrams Cell 149 for component testing. If the rear window defrost relay is OK, INSTALL a new SJB . REFER to Section 419-10 for removal and installation procedures. TEST the system for normal operation. If the rear window defrost relay is not OK, INSTALL a new rear window defrost relay. TEST the system for normal operation.
U0164	Lost Communication With HVAC Control Module	REFER to Section 418-00 to diagnose no response from the HVAC module.
All Other DTCs	-	REFER to the Master DTC Chart in Section 419-10 .

HVAC Module DTC Chart

DTC	Description	Action
B1342	ECU is Faulted	INSTALL a new HVAC module. REFER to Section 412-01 for removal and installation procedures.
All Other DTCs	-	REFER to the Master DTC Chart in Section 419-10 .

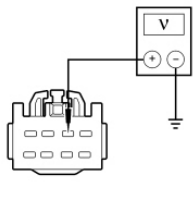
Pinpoint Tests

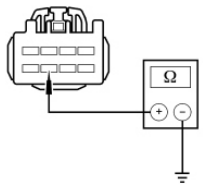
Pinpoint Test A: All Power Windows are Inoperative

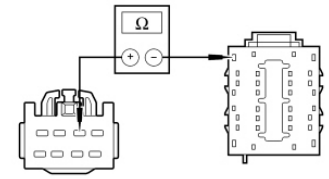
Refer to Wiring Diagrams Cell 100 , Power Windows for schematic and connector information.



Normal Operation

Under normal operation, the Smart Junction Box (SJB) grounds the accessory delay relay coil circuit to activate the relay. When the accessory delay relay is active, voltage is sent to the LH front window control switch through circuit CBP80 (YE/GN). The LH front window control switch is grounded through circuit GD133 (BK).





This pinpoint test is intended to diagnose the following:

- Circuit breaker
- Wiring, terminals or connectors
- Accessory delay relay
- SJB
- LH front window control switch

PINPOINT TEST A: ALL POWER WINDOWS ARE INOPERATIVE

Test Step	Result / Action to Take
A1 CHECK THE VOLTAGE TO THE LH FRONT WINDOW CONTROL SWITCH - CIRCUIT CBP80 (YE/GN)	
• Disconnect: LH Front Window Control Switch C504A. • Ignition ON. • Measure the voltage between LH front window control switch C504A-2, circuit CBP80 (YE/GN), harness side and ground.  N0037874 • **Is the voltage greater than 10 volts?**	**Yes** GO to A2 . **No** GO to A3 .
A2 CHECK THE GROUND TO THE DRIVER WINDOW CONTROL SWITCH - CIRCUIT GD133 (BK)	

tomsn048@gmail.com

• Ignition OFF. • Measure the resistance between LH front window control switch C504B-7, circuit GD133 (BK), harness side and ground.  N0037888 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new driver window control switch. REFER to Window Control Switch in this section. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
A3 CHECK CIRCUIT CBP80 (YE/GN) FOR AN OPEN	
• Disconnect: SJB C2280A. • Ignition OFF. • Measure the resistance between LH front window control switch C504A-2, circuit CBP80 (YE/GN), harness side and SJB C2280A-29, circuit CBP80 (YE/GN), harness side.  N0047263 • **Is the resistance less than 5 ohms?**	**Yes** VERIFY SJB circuit breaker 1 (25A) is OK. If OK, GO to Pinpoint Test I to diagnose the accessory delay relay circuit. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. REPAIR the circuit. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.

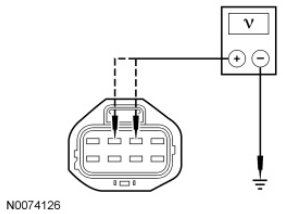
Pinpoint Test B: A Single Power Window is Inoperative - LH Front

Refer to Wiring Diagrams Cell 100 , Power Windows for schematic and connector information.

NOTE: A new LH front power window motor will not operate in one-touch up mode until initialized. Refer to Window Motor Initialization - Front in this section.

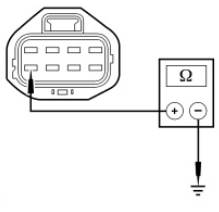
NOTE: The LH front power window motor must be de-initialized, then initialized whenever the LH front window motor is removed from the window regulator drum housing, a new window regulator is installed, a new window glass is installed, a new top run is installed or for any operation in which grease or lubricants are applied to the window regulator or glass run.

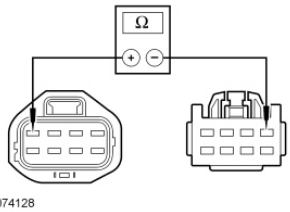
Normal Operation

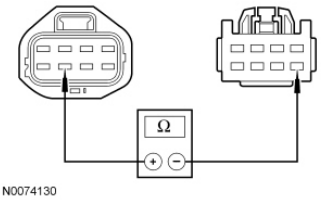


Under normal operation, the LH front power window motor microprocessor receives voltage from the accessory delay relay through circuit CBP05 (YE). The LH window motor receives battery voltage at all times through circuit SBB37 (GY/RD) and ground through circuit GD133 (BK). The LH front window control switch provides a voltage input to the power window motor microprocessor through circuit CPW11 (BU/GY)

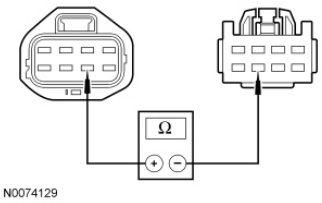
to operate the window upward, and voltage input through circuit CPW10 (YE/VT) to operate the driver window upward. When the LH front window control switch is operated to the second detent position (up/down) a ground signal is supplied to the LH front window motor through circuit CPW29 (VT/GY) to enter one-touch up/down mode.







This pinpoint test is intended to diagnose the following:



- Fuse(s)
- Wiring, terminals or connectors
- LH front window control switch
- LH front power window motor

PINPOINT TEST B: A SINGLE POWER WINDOW IS INOPERATIVE - LH FRONT

Test Step	Result / Action to Take
B1 CHECK THE POWER TO THE WINDOW MOTOR	
• Ignition OFF. • Disconnect: LH Front Window Motor C540. • Ignition ON. • Measure the voltage between LH front window motor C540-2, circuit CBP05 (YE), harness side and ground; and between LH front window motor C540-3, circuit SBB37 (GY/RD), harness side and ground.  • **Is the voltage greater than 10 volts for both measurements?**	**Yes** GO to B2 . **No** VERIFY Smart Junction Box (SJB) fuse 5 (5A) and Battery Junction Box (BJB) fuse 37 (30A) are OK. If OK, REPAIR the circuit in question. DE-INITIALIZE, then INITIALIZE the LH front window motor. REFER to Window Motor Initialization - Front in this section. TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. REPAIR the circuit. DE-INITIALIZE, then INITIALIZE the LH front window motor. REFER to Window Motor Initialization - Front in this section. TEST the system for normal operation.
B2 CHECK THE LH FRONT WINDOW MOTOR GROUND	
• Ignition OFF. • Measure the resistance between LH front window motor C540-8, circuit GD133 (BK), harness side and ground.	**Yes** GO to B3 . **No** REPAIR the circuit. DE-INITIALIZE, then INITIALIZE the LH front window motor. REFER to Window Motor Initialization - Front in this section. TEST the system for normal operation.

tomsn048@gmail.com

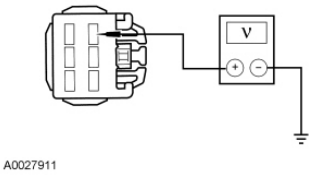
 N0074127 • **Is the resistance less than 5 ohms?**	
B3 CHECK CIRCUIT CPW10 (YE/VT) FOR AN OPEN	
• Disconnect: LH Front Window Control Switch C504A. • Measure the resistance between LH front window motor C540-4, circuit CPW10 (YE/VT), harness side and LH front window control switch C504A-1, circuit CPW10 (YE/VT), harness side.  N0074128 • **Is the resistance less than 5 ohms?**	**Yes** GO to B4 . **No** REPAIR the circuit. DE-INITIALIZE, then INITIALIZE the LH front window motor. REFER to Window Motor Initialization - Front in this section. TEST the system for normal operation.
B4 CHECK CIRCUIT CPW11 (BU/GY) FOR AN OPEN	
• Measure the resistance between LH front window motor C540-7, circuit CPW11 (BU/GY), harness side and LH front window control switch C504A-5, circuit CPW11 (BU/GY), harness side.  N0074130 • **Is the resistance less than 5 ohms?**	**Yes** GO to B5 . **No** REPAIR the circuit. DE-INITIALIZE, then INITIALIZE the LH front window motor. REFER to Window Motor Initialization - Front in this section. TEST the system for normal operation.
B5 CHECK CIRCUIT CPW29 (VT/GY) FOR AN OPEN	
• Measure the resistance between LH front window motor C540-6, circuit CPW29 (VT/GY), harness side and LH front window control switch C504A-7, circuit CPW29 (VT/GY), harness side.	**Yes** GO to B6 . **No** REPAIR the circuit. DE-INITIALIZE, then INITIALIZE the LH front window motor.

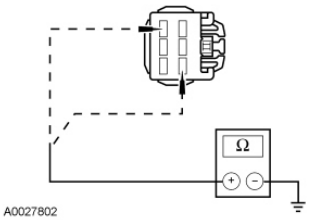
 • **Is the resistance less than 5 ohms?**	REFER to Window Motor Initialization - Front in this section. TEST the system for normal operation.
B6 CHECK THE LH FRONT WINDOW CONTROL SWITCH	
• Carry out the LH front window control switch component test. Refer to Wiring Diagrams Cell 149 for component testing. • **Did the window control switch pass the component test?**	**Yes** INSTALL a new LH front window motor. REFER to Window Regulator Motor - Front Door in this section. INITIALIZE the LH front window motor. REFER to Window Motor Initialization - Front in this section. TEST the system for normal operation. **No** INSTALL a new LH front window control switch. REFER to Window Control Switch in this section. DE-INITIALIZE, then INITIALIZE the LH front window motor. REFER to Window Motor Initialization - Front in this section. TEST the system for normal operation.

Pinpoint Test C: A Single Power Window is Inoperative - RH Front

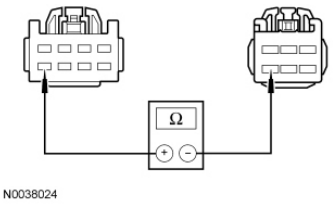
Refer to Wiring Diagrams Cell 100 , Power Windows for schematic and connector information.

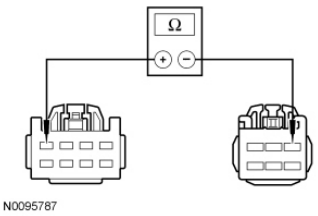
Normal Operation





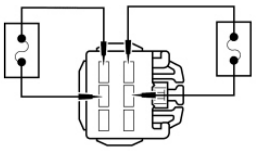
Under normal operation, the RH front window control switch receives voltage from the LH front window control switch through circuit CPW14 (VT/WH) when the LH front window lockout switch is in the UNLOCK position. The RH front window control switch provides voltage to the power window motor through circuit CPW19 (VT) and ground through circuit CPW20 (WH/OG) to operate the window downward; and voltage through circuit CPW20 (WH/OG) and ground through circuit CPW19 (VT) to operate the window upward.

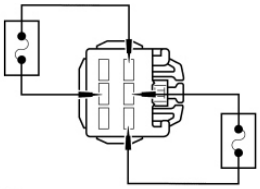


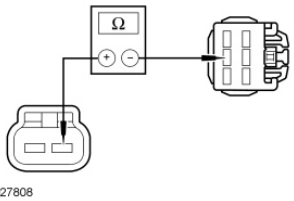


When operating the RH front window using the LH front window control switch, voltage is sent to the RH front window control switch through circuit CPW12 (GN/OG) and ground through circuit CPW13 (BN/YE) to operate the window downward; and voltage through circuit CPW13 (BN/YE) and ground through circuit CPW12 (GN/OG) to operate the window upward.

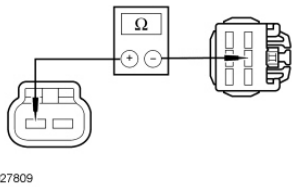
This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- LH front window control switch
- RH front window control switch
- RH front window motor







tomsn048@gmail.com



PINPOINT TEST C: A SINGLE POWER WINDOW IS INOPERATIVE - RH FRONT

Test Step	Result / Action to Take
C1 CHECK THE VOLTAGE TO THE RH FRONT WINDOW CONTROL SWITCH - CIRCUIT CPW14 (VT/WH)	
• Disconnect: RH Front Window Control Switch C604. • Ignition ON. • **NOTE:** Make sure the LH front window lock-out switch is in the UNLOCK position. • Measure the voltage between RH front window control switch C604-3, circuit CPW14 (VT/WH), harness side and ground.  A0027911 • **Is the voltage greater than 10 volts?**	**Yes** GO to C2 . **No** REPAIR the circuit. TEST system for normal operation.
C2 CHECK THE GROUNDS TO THE RH FRONT WINDOW CONTROL SWITCH - CIRCUITS CPW13 (BN/YE) AND CPW12 (GN/OG)	
• Ignition OFF. • Measure the resistance between RH front window control switch C604-6, circuit CPW13 (BN/YE), harness side and ground; and between RH front window control switch C604-1, circuit CPW12 (GN/OG), harness side and ground.  A0027802 • **Is the resistance less than 5 ohms?**	**Yes** GO to C4 . **No** GO to C3 .
C3 CHECK CIRCUITS CPW13 (BN/YE) AND CPW12 (GN/OG) FOR AN OPEN	

• Ignition OFF. • Disconnect: LH Front Window Control Switch C504A. • Measure the resistance between LH front window control switch C504A-8, circuit CPW13 (BN/YE), harness side and RH front window control switch C604-6, circuit CPW13 (BN/YE), harness side.  N0038024 • Measure the resistance between LH front window control switch C504A-4, circuit CPW12 (GN/OG), harness side and RH front window control switch C604-1, circuit CPW12 (GN/OG), harness side.  N0095787 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new LH front window control switch. REFER to Window Control Switch in this section. TEST the system for normal operation. **No** REPAIR circuit CPW13 (BN/YE) or CPW12 (GN/OG). TEST system for normal operation.
C4 CHECK THE RH FRONT WINDOW CONTROL SWITCH	
• Ignition ON. • **NOTE:** Make sure the LH front window lock-out switch is in the UNLOCK position. • Connect a fused jumper wire between RH front window control switch C604-6, circuit CPW13 (BN/YE), harness side and RH front window control switch C604-5, circuit CPW20 (WH/OG), harness side; and a second fused jumper wire between RH front window control switch C604-3, circuit CPW14 (VT/WH), harness side and RH front window control switch C604-2, circuit CPW19 (VT), harness side. The window should operate in the downward direction.	**Yes** If the RH front window did not operate with the RH front window control switch, INSTALL a new RH front window control switch. REFER to Window Control Switch in this section. TEST the system for normal operation. If the RH front power window did operate with the RH front window control switch, but not with the LH front window control switch, INSTALL a new LH front window control switch. REFER to Window Control Switch in this section. TEST the system for normal operation. **No** GO to C5 .

tomsn048@gmail.com

 N0058164 • Connect a fused jumper wire between RH front window control switch C604-1, circuit CPW12 (GN/OG), harness side and RH front window control switch C604-2, circuit CPW19 (VT), harness side; and a second fused jumper wire between RH front window control switch C604-3, circuit CPW14 (VT/WH), harness side and RH front window control switch C604-5, circuit CPW20 (WH/OG), harness side. The window should operate in the upward direction.  N0058163 • **Does the window operate correctly?**	
C5 CHECK CIRCUITS CPW20 (WH/OG) AND CPW19 (VT) FOR AN OPEN	
• Ignition OFF. • Disconnect: RH Front Window Motor C608. • Measure the resistance between RH front window control switch C604-5, circuit CPW20 (WH/OG), harness side and RH front window motor C608-1, circuit CPW20 (WH/OG), harness side.  A0027808 • Measure the resistance between RH front window control switch C604-2, circuit CPW19 (VT), harness side and RH front window motor C608-2, circuit CPW19 (VT), harness side.	**Yes** INSTALL a new RH front window motor. REFER to Window Regulator Motor - Front Door in this section. TEST the system for normal operation. **No** REPAIR circuit CPW20 (WH/OG) or CPW19 (VT). TEST the system for normal operation.

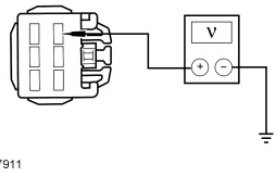
 • **Is the resistance less than 5 ohms for both measurements?**	

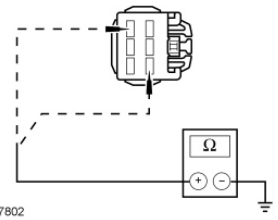
Pinpoint Test D: A Single Power Window is Inoperative - LH Rear

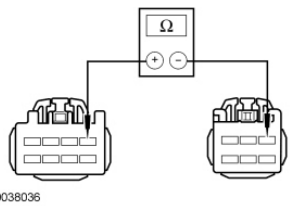
Refer to Wiring Diagrams Cell 100 , Power Windows for schematic and connector information.

Normal Operation

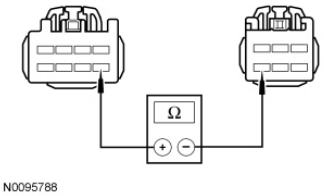
Under normal operation, the LH rear window control switch receives voltage from the LH front window control switch through circuit CPW14 (VT/WH) when the LH front window lockout switch is in the UNLOCK position. The LH rear window control switch provides voltage to the power window motor through circuit CPW21 (BN) and ground through circuit CPW22 (GN/VT) to operate the window downward; and voltage through circuit CPW22 (GN/VT) and ground through circuit CPW21 (BN) to operate the window upward.

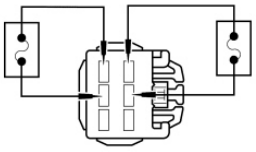


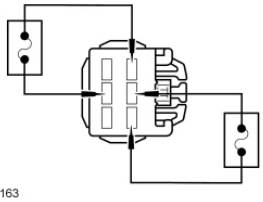




When operating the LH rear window using the LH front window control switch, voltage is sent to the LH rear window control switch through circuit CPW15 (YE) and ground through circuit CPW16 (BU/OG) to operate the LH rear window downward; and voltage through circuit CPW16 (BU/OG) and ground through circuit CPW15 (YE) to operate the window upward.

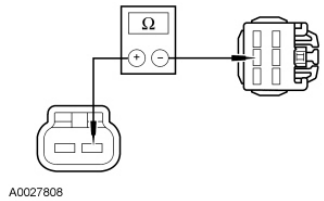


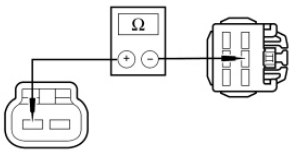




This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- LH front window control switch
- LH rear window control switch
- LH rear window motor

PINPOINT TEST D: A SINGLE POWER WINDOW IS INOPERATIVE - LH REAR





Test Step	Result / Action to Take
D1 CHECK THE VOLTAGE TO THE LH REAR WINDOW CONTROL SWITCH - CIRCUIT CPW14 (VT/WH)	
• Disconnect: LH Rear Window Control Switch C701. • Ignition ON. • **NOTE:** Make sure the LH front window lock-out switch is in the UNLOCK position. • Measure the voltage between LH rear window control switch C701-3, circuit CPW14 (VT/WH), harness side and ground.	**Yes** GO to D2 . **No** REPAIR the circuit. TEST system for normal operation.

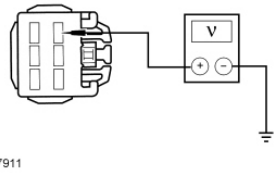
TEST the system for normal operation. **No** REPAIR circuit CPW21 (BN) or CPW22 (GN/VT). TEST the system for normal operation.

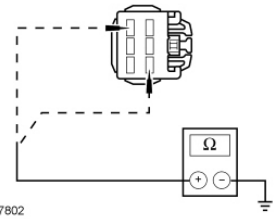
Pinpoint Test E: A Single Power Window is Inoperative - RH Rear

Refer to Wiring Diagrams Cell 100 , Power Windows for schematic and connector information.

Normal Operation

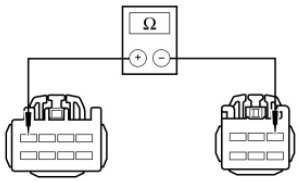
Under normal operation, the RH rear window control switch receives voltage from the LH front window control switch through circuit CPW14 (VT/WH) when the LH front window lockout switch is in the UNLOCK position. The RH rear window control switch provides voltage to the power window motor through circuit CPW23 (GY) and ground through circuit CPW24 (WH/VT) to operate the window downward; and voltage through circuit CPW24 (WH/VT) and ground through circuit CPW23 (GY) to operate the window upward.

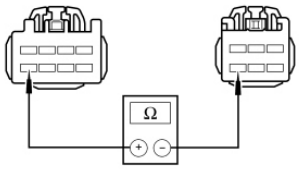


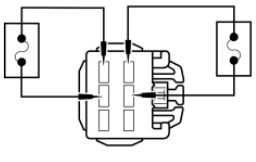


When operating the RH rear window using the LH front window control switch, voltage is sent to the RH rear window control switch through circuit CPW17 (BN/GN) and ground through circuit CPW18 (GY/VT) to operate the window downward; and voltage through circuit CPW18 (GY/VT) and ground through circuit CPW17 (BN/GN) to operate the window upward.

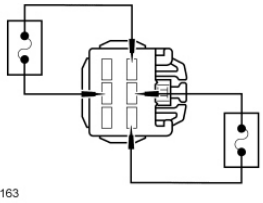
This pinpoint test is intended to diagnose the following:

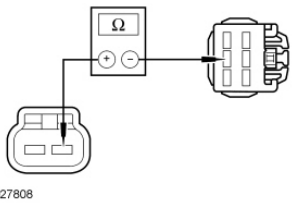


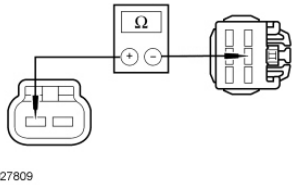




- Wiring, terminals or connectors
- LH front window control switch







- RH rear window control switch
- RH rear window motor

PINPOINT TEST E: SINGLE POWER WINDOW IS INOPERATIVE - RH REAR

Test Step	Result / Action to Take
E1 CHECK THE VOLTAGE TO THE RH REAR WINDOW CONTROL SWITCH - CIRCUIT CPW14 (VT/WH)	
• Disconnect: RH Rear Window Control Switch C801. • Ignition ON. • **NOTE:** Make sure the LH front window lock-out switch is in the UNLOCK position. • Measure the voltage between RH rear window control switch C801-3, circuit CPW14 (VT/WH), harness side and ground.  A0027911 • **Is the voltage greater than 10 volts?**	**Yes** GO to E2 . **No** REPAIR the circuit. TEST system for normal operation.

TEST the system for normal operation. **No** REPAIR circuit CPW17 (BN/GN) or CPW18 (GY/VT). TEST system for normal operation.
E4 CHECK THE RH REAR WINDOW CONTROL SWITCH	
• Disconnect: RH Rear Window Control Switch C801. • Ignition ON. • **NOTE:** Make sure the LH front window lock-out switch is in the UNLOCK position. • Connect a fused jumper wire between RH rear window control switch C801-6, circuit CPW18 (GY/VT), harness side and C801-5, circuit CPW24 (WH/VT), harness side; and a second fused jumper wire between C801-3, circuit CPW14 (VT/WH), harness side and C801-2, circuit CPW23 (GY), harness side. The window should operate in the downward direction.  N0058164	**Yes** If the RH rear window did not operate with the RH rear window control switch, INSTALL a new RH rear window control switch. REFER to Window Control Switch in this section. TEST the system for normal operation. If the RH rear power window did operate with the RH rear window control switch, but not with the LH front window control switch, INSTALL a new LH front window control switch. REFER to Window Control Switch in this section. TEST the system for normal operation. **No** GO to E5 .

• Connect a fused jumper wire between RH rear window control switch C801-1, circuit CPW17 (BN/GN), harness side and C801-2, circuit CPW23 (GY), harness side; and a second fused jumper wire between C801-3, circuit CPW14 (VT/WH), harness side and C801-5, circuit CPW24 (WH/VT), harness side. The window should operate in the upward direction.  N0058163 • **Does the window operate correctly?**	
E5 CHECK CIRCUITS CPW23 (GY) AND CPW24 (WH/VT) FOR AN OPEN	
• Ignition OFF. • Disconnect: RH Rear Window Motor C803. • Measure the resistance between RH rear window control switch C801-5, circuit CPW24 (WH/VT), harness side and RH rear window motor C803-1, circuit CPW24 (WH/VT), harness side.  A0027808 • Measure the resistance between RH rear window control switch C801-2, circuit CPW23 (GY), harness side and RH rear window motor C803-2, circuit CPW23 (GY), harness side.  A0027809 • **Is the resistance less than 5 ohms for both measurements?**	**Yes** INSTALL a new RH rear window motor. REFER to Window Regulator Motor - Rear Door in this section. TEST the system for normal operation. **No** REPAIR circuit CPW24 (WH/VT) or CPW23 (GY). TEST the system for normal operation.

tomsn048@gmail.com

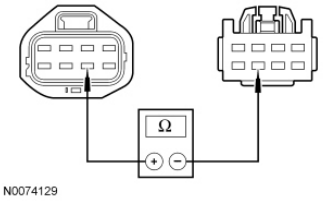
Pinpoint Test F: The One-Touch Up/Down Feature is Inoperative - LH Front

Refer to Wiring Diagrams Cell 100 , Power Windows for schematic and connector information.

NOTE: A new LH front power window motor will not operate in one-touch up mode until initialized. Refer to Window Motor Initialization - Front in this section.

NOTE: The LH front power window motor must be de-initialized, then initialized whenever the front window motor is removed from the window regulator drum housing, a new window regulator is installed, a new window glass is installed, a new top run is installed or for any operation in which grease or lubricants are applied to the window regulator or glass run.

Normal Operation



Under normal operation, the LH front power window motor microprocessor receives voltage from the accessory delay relay through circuit CBP05 (YE). The LH window motor receives battery voltage at all times through circuit SBB37 (GY/RD) and ground through circuit GD133 (BK). The LH front window control switch provides a voltage input to the power window motor microprocessor through circuit CPW11 (BU/GY) to operate the window upward, and voltage input through circuit CPW10 (YE/VT) to operate the driver window upward. When the LH front window control switch is operated to the second detent position (up/down) a ground signal is supplied to the LH front window motor through circuit CPW29 (VT/GY) to enter one-touch up/down mode.

This pinpoint test is intended to diagnose the following:

- LH front motor not initialized
- Wiring, terminals or connectors
- LH front window control switch
- LH front window motor

PINPOINT TEST F: THE ONE-TOUCH UP/DOWN FEATURE IS INOPERATIVE - LH FRONT

Test Step	Result / Action to Take
F1 DE-INITIALIZE, THEN INITIALIZE THE LH FRONT MOTOR	
• De-initialize the LH front window motor, then carry out the front window motor initialization procedure. Refer to Window Motor Initialization - Front in this section. • **Is the one-touch down feature operating correctly?**	**Yes** The system is operating normally at this time. The front window motor lost initialization. **No** GO to F2 .
F2 CHECK THE LH FRONT WINDOW CONTROL SWITCH	
• Ignition OFF. • Disconnect: LH Front Window Control Switch C504A and C504B. • Carry out the LH front window control switch component test. Refer to Wiring Diagrams Cell 149 for component testing.	**Yes** GO to F3 . **No** INSTALL a new LH front window control switch. REFER to Window Control Switch in this section. TEST the system for normal operation.

• **Did the LH front window control switch pass the component test?**	
F3 CHECK CIRCUIT CPW29 (VT/GY) FOR AN OPEN	
• Disconnect: LH Front Window Motor C540. • Measure the resistance between LH front window motor C540-6, circuit CPW29 (VT/GY), harness side and LH front window control switch C504A-7, circuit CPW29 (VT/GY), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new LH front window motor. REFER to Window Regulator Motor - Front Door in this section. TEST the system for normal operation. **No** REPAIR the circuit. DE-INITIALIZE, then INITIALIZE the LH front window motor. REFER to Window Motor Initialization - Front in this section. TEST the system for normal operation.

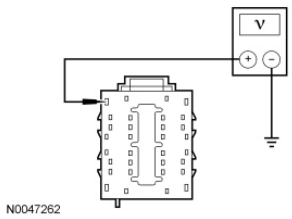
Pinpoint Test G: The Defrost System is Inoperative

Refer to Wiring Diagrams Cell 56 , Heated Window for schematic and connector information.

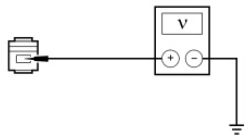
Normal Operation

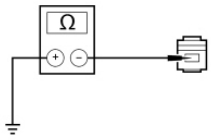
Under normal operation, the rear window defrost relay receives power from the Battery Junction Box (BJB) through circuit SBB15 (WH/RD).

For vehicles equipped with HVAC module, when the rear window defrost switch is depressed, a message is sent to the Smart Junction Box (SJB) through the Controller Area Network (CAN). When the SJB receives a rear window defrost ON message through the CAN , the SJB starts an internal 10 minute timer and grounds the rear window defrost relay coil, which activates the rear window defrost relay. When the rear window defrost relay is active, power is sent to the rear window defrost grid through circuit CRD06 (BN/YE). The rear window defrost grid is grounded to the chassis through circuit GD150 (BK/WH).



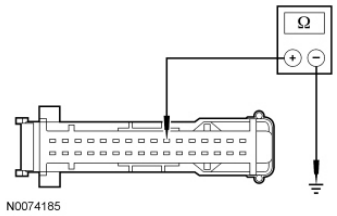
For vehicles equipped with manual climate control assembly, when the rear window defrost switch is depressed, a ground signal is sent to the SJB through circuit CRD09 (BU/GY). When the SJB receives ground through circuit CRD09 (BU/GY), the SJB starts an internal 10 minute timer and grounds the rear window defrost relay coil, which activates the rear window defrost relay. When the rear window defrost relay is active, power is sent to the rear window defrost grid through circuit CRD06 (BN/YE). The rear window defrost grid is grounded to the chassis through circuit GD150 (BK/WH).

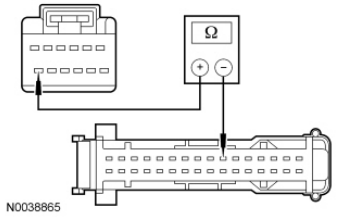




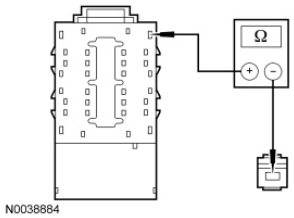
- DTC B1347 Heated Backlite Relay Circuit Failure - Open or short to ground in rear window defrost relay coil circuit.

This pinpoint test is intended to diagnose the following:
- Fuse
- Inoperative rear window defrost relay
- Wiring, terminals or connectors
- Inoperative SJB
- Inoperative HVAC module or manual climate control assembly





tomsn048@gmail.com



PINPOINT TEST G: THE DEFROST SYSTEM IS INOPERATIVE

Test Step	Result / Action to Take
G1 RETRIEVE THE DTCs	
• Carry out the SJB continuous and on-demand self tests. • **Are any DTCs present?**	**Yes** If DTC U0164 is present, REFER to Section 418-00 to diagnose no response from the HVAC module. If DTC B1347 is present, CARRY OUT the rear window defrost relay component test. Refer to Wiring Diagrams Cell 149 for component testing. If the rear window defrost relay is OK, GO to G2 . If the rear window defrost relay is not OK, INSTALL a new rear window defrost relay. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. For all other DTCs, REFER to the Smart Junction Box (SJB) DTC Chart. **No** If no DTCs are present, GO to G3 .
G2 CHECK CIRCUIT SBB15 (WH/RD) FOR VOLTAGE	
• Ignition OFF. • Disconnect: SJB C2280E. • Ignition ON. • Measure the voltage between SJB C2280E-29, circuit SBB15 (WH/RD), harness side and ground.  • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 for removal and installation procedures. TEST the system for normal operation. **No** VERIFY SJB fuse 15 (40A) is OK, If OK, REPAIR circuit SBB15 (WH/RD) for an open. CLEAR the DTCs. TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. REPAIR the circuit. CLEAR the DTCs. TEST the system for normal operation.
G3 CHECK THE REAR WINDOW DEFROST GRID VOLTAGE	

• Disconnect: Rear Window Defrost Grid C402A. • Start the engine. • Turn the rear window defrost ON. • Measure the voltage between rear window defrost grid C402A-1, circuit CRD06 (BN/YE), harness side and ground.  A0010207 • **Is the voltage greater than 10 volts?**	**Yes** GO to G4 . **No** GO to G5 .
G4 CHECK THE REAR WINDOW DEFROST GRID GROUND	
• Ignition OFF. • Disconnect: Rear Window Defrost Grid C402B. • Measure the resistance between rear window defrost grid C402B-1, circuit GD150 (BK/WH), harness side and ground.  A0010216 • **Is the resistance less than 5 ohms?**	**Yes** CARRY OUT the Grid Wire Component Test in this section. REPAIR the rear window defrost grid or INSTALL a new liftgate glass as necessary. REFER to Window Grid Wire Repair or Window Glass - Liftgate in this section. CLEAR the DTCs. TEST the system for normal operation. **No** REPAIR the circuit. CLEAR the DTCs. TEST the system for normal operation.
G5 CHECK THE REAR WINDOW DEFROST RELAY	
• Ignition OFF. • Disconnect: Rear Window Defrost Relay. • Carry out the rear window defrost relay component test. Refer to Wiring Diagrams Cell 149 for component testing. • **Did the rear window defrost relay pass the component test?**	**Yes** For vehicles equipped with HVAC module, GO to G7 . For vehicles equipped with manual climate control assembly, GO to G6 . **No** INSTALL a new rear window defrost relay. CLEAR the DTCs. TEST the system for normal operation.
G6 CHECK CIRCUIT CRD09 (BU/GY) INPUT TO SJB MODULE	

tomsn048@gmail.com

• Disconnect: SJB C2280D. • Ignition ON. • Monitor the resistance between SJB C2280D-7, circuit CRD09 (BU/GY), harness side and ground while activating and deactivating the rear window defrost switch.  N0074185 • **Is the resistance less than 30 ohms when the rear defrost switch is activated; and greater than 10,000 ohms when the rear window defrost switch is deactivated?**	**Yes** GO to G9 . **No** GO to G8 .
G7 CHECK THE REAR WINDOW DEFROST SWITCH PID CC_RDEF	
• Connect: Rear Window Defrost Relay. • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger - HVAC Module. • Monitor the HVAC module PID CC_RDEF while activating the rear window defrost ON and OFF. • **Does the PID agree with the rear window defrost switch status?**	**Yes** GO to G9 . **No** INSTALL a new HVAC module. REFER to Section 412-01 . CLEAR the DTCs. TEST the system for normal operation.
G8 CHECK CIRCUIT CRD09 (BU/GY) FOR AN OPEN	
• Ignition OFF. • Disconnect: C294C. • Measure the resistance between C294C-12, circuit CRD09 (BU/GY), harness side and SJB C2280D-7, circuit CRD09 (BU/GY), harness side.  N0038865 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new manual climate control assembly. CLEAR the DTCs. TEST the system for normal operation. **No** REPAIR the circuit. CLEAR the DTCs. TEST the system for normal operation.

G9 CHECK CIRCUIT CRD06 (BN/YE) FOR AN OPEN	
• Disconnect: SJB C2280A. • Measure the resistance between SJB C2280A-32, circuit CRD06 (BN/YE), harness side rear window defrost grid C402A, circuit CRD06 (BN/YE), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** GO to G10 . **No** REPAIR the circuit. CLEAR the DTCs. TEST the system for normal operation.
G10 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all SJB connectors. • Check for: ♦ corrosion. ♦ pushed-out pins. • Connect all SJB connectors and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 for removal and installation procedures. TEST the system for normal operation. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test H: The Defrost System Does Not Shut Off Automatically

Refer to Wiring Diagrams Cell 56 , Heated Window for schematic and connector information.

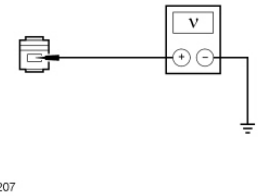
Normal Operation

Under normal operation, the rear window defrost relay receives power from the Battery Junction Box (BJB) through circuit SBB15 (WH/RD).

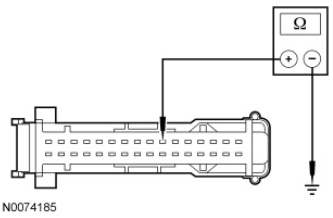
For vehicles equipped with HVAC module, when the rear window defrost switch is depressed, a message is sent to the Smart Junction Box (SJB) through the Controller Area Network (CAN). When the SJB receives a rear window defrost ON message through the CAN , the SJB starts an internal 10 minute timer and grounds the rear window defrost relay coil, which activates the rear window defrost relay. When the rear window defrost relay is active, power is sent to the rear window defrost grid through circuit CRD06 (BN/YE). The rear window defrost grid is grounded to the chassis through circuit GD150 (BK/WH).

For vehicles equipped with manual climate control assembly, when the rear window defrost switch is depressed, a ground signal is sent to the SJB through circuit CRD09 (BU/GY). When the SJB receives ground through circuit CRD09 (BU/GY), the SJB starts an internal 10 minute timer and grounds the rear window defrost relay coil, which activates the rear window defrost relay. When the rear window defrost relay is active,

tomsn048@gmail.com

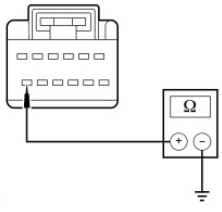


power is sent to the rear window defrost grid through circuit CRD06 (BN/YE). The rear window defrost grid is grounded to the chassis through circuit GD150 (BK/WH).



- DTC B1345 (Heated Backlite Input Circuit Short To Ground) - Short to ground detected on relay control circuit.

This pinpoint test is intended to diagnose the following:



- Inoperative rear window defrost relay
- Wiring, terminals or connectors
- Inoperative SJB
- Inoperative HVAC module or manual climate control assembly

PINPOINT TEST H: THE DEFROST SYSTEM DOES NOT SHUT OFF AUTOMATICALLY

Test Step	Result / Action to Take
H1 RETRIEVE THE DTCs	
• Carry out the SJB continuous and on-demand self tests. • **Are any DTCs present?**	**Yes** If DTC B1345 is present, GO to H3 . For all other DTCs, REFER to the Smart Junction Box (SJB) DTC Chart. **No** If no DTCs are present, GO to H2 .
H2 CHECK CIRCUIT CRD06 (BN/YE) FOR A SHORT TO VOLTAGE	
• Disconnect: Rear Window Defrost Relay. • Disconnect: Rear Window Defrost Grid C402A. • Start the engine. • Measure the voltage between rear window defrost grid C402A-1, circuit CRD06 (BN/YE), harness side and ground.  A0010207 • **Is any voltage present?**	**Yes** REPAIR the circuit. CLEAR the DTCs. TEST the system for normal operation. **No** GO to H3 .
H3 CHECK THE REAR WINDOW DEFROST RELAY	
• Ignition OFF. • Disconnect: Rear Window Defrost Relay. • Carry out the rear window defrost relay component test.	**Yes** For vehicles equipped with HVAC module, GO to H4 . For vehicles equipped with manual climate control assembly, GO to H5 .

Refer to Wiring Diagrams Cell 149 for component testing. • **Did the rear window defrost relay pass the component test?**	**No** INSTALL a new rear window defrost relay. CLEAR the DTCs. TEST the system for normal operation.
H4 CHECK THE REAR WINDOW DEFROST SWITCH PID CC_RDEF	
• Connect: Rear Window Defrost Relay. • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger - HVAC Module. • Monitor the HVAC module PID CC_RDEF while activating the rear window defrost switch ON and OFF. • **Does the PID agree with the rear window defrost switch status?**	**Yes** GO to H7 . **No** INSTALL a new HVAC module. REFER to Section 412-01 for removal and installation procedures. CLEAR the DTCs. TEST the system for normal operation.
H5 CHECK CIRCUIT CRD09 (BU/GY) INPUT TO SJB MODULE	
• Disconnect: SJB C2280D. • Ignition ON. • Monitor the resistance between SJB C2280D-7, circuit CRD09 (BU/GY), harness side and ground while activating and deactivating the rear window defrost switch.  N0074185 • **Is the resistance less than 30 ohms when the rear defrost switch is activated; and greater than 10,000 ohms when the rear window defrost switch is deactivated?**	**Yes** GO to H7 . **No** GO to H6 .
H6 CHECK CIRCUIT CRD09 (BU/GY) FOR A SHORT TO GROUND	
• Disconnect: Manual Climate Control Assembly C294C. • Measure the resistance between manual climate control assembly C294C-12, circuit CRD09 (BU/GY), harness side and ground.	**Yes** INSTALL a new manual climate control assembly. REFER to Section 412-01 for removal and installation procedures. CLEAR the DTCs. TEST the system for normal operation. **No** REPAIR the circuit. CLEAR the DTCs. TEST the system for normal operation.

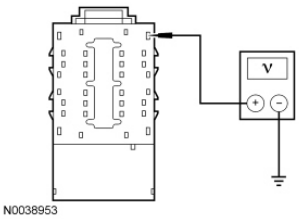
tomsn048@gmail.com

 • **Is the resistance greater than 10,000 ohms?**	
H7 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all SJB connectors. • Check for: ♦ corrosion. ♦ pushed-out pins. • Connect all SJB connectors and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 for removal and installation procedures. TEST the system for normal operation. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test I: The Delayed Accessory is Inoperative

Refer to Wiring Diagrams Cell 100 , Power Windows for schematic and connector information.

Normal Operation



The accessory delay relay is located in the Smart Junction Box (SJB), and the relay coil receives battery voltage through circuit SBB01 (RD) at all times. When the ignition key is turned to the ON position, the SJB activates the accessory delay relay by grounding the relay coil. When the accessory delay relay is active, voltage is provided to the LH front window control switch through circuit CBP80 (YE/GN). When the ignition key is turned to the OFF position, the SJB continues to ground the accessory delay relay coil for approximately 10 minutes, or until a door is opened.

- DTC B1302 (Accessory Delay Relay Coil Circuit Failure) - Open or short to ground in coil circuit.

This pinpoint test is intended to diagnose the following:
- Fuse
- Accessory delay relay
- Wiring, terminals or connectors
- SJB

PINPOINT TEST I: THE DELAYED ACCESSORY IS INOPERATIVE

Test Step	Result / Action to Take
I1 CHECK FOR CORRECT OPERATION OF THE DOOR AJAR SWITCHES	
• Open and close the LH and RH front doors. Verify the interior lights turn on when the doors are open,	**Yes** GO to I2 .

and off when the doors are closed. • **Do the interior lights operate correctly?**	**No** REFER to Section 417-02 to diagnose the interior lighting and door ajar switches.
I2 CHECK THE ACCESSORY DELAY RELAY	
• Ignition OFF. • Disconnect: Accessory Delay Relay. • Carry out the accessory delay relay component test. Refer to Wiring Diagrams Cell 149 for component testing. • **Did the accessory delay relay pass the component test?**	**Yes** GO to I3 . **No** INSTALL a new accessory delay relay. CLEAR the DTCs. TEST the system for normal operation.
I3 CHECK CIRCUIT SBB01 (RD) FOR VOLTAGE	
• Disconnect: SJB C2280E. • Measure the voltage between SJB C2280E-32, circuit SBB01 (RD), harness side and ground  • **Is the voltage greater than 10 volts?**	**Yes** GO to I4 . **No** VERIFY Battery Junction Box (BJB) fuse 1 (50A) is OK. If OK, REPAIR the circuit. CLEAR the DTCs. TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes or the circuit short. REPAIR the circuit. CLEAR the DTCs. TEST the system for normal operation.
I4 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all SJB connectors. • Check for: ♦ corrosion. ♦ pushed-out pins. • Connect all SJB connectors and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 for removal and installation procedures. TEST the system for normal operation. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

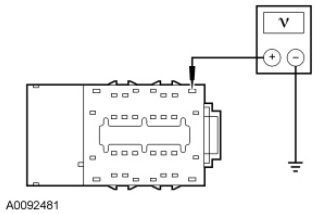
Pinpoint Test J: The Delayed Accessory Relay Does Not Turn Off

Refer to Wiring Diagrams Cell 100 , Power Windows for schematic and connector information.

Normal Operation

The accessory delay relay is located in the Smart Junction Box (SJB), and the relay coil receives battery voltage through circuit SBB01 (RD) at all times. When the ignition key is turned to the ON position, the SJB

tomsn048@gmail.com



activates the accessory delay relay by grounding the relay coil. When the accessory delay relay is active, voltage is provided to the LH front window control switch through circuit CBP80 (YE/GN). When the ignition key is turned to the OFF position, the SJB continues to ground the accessory delay relay coil for approximately 10 minutes, or until a door is opened.

- DTC B1304 (Accessory Delay Relay Coil Circuit Short To Battery) - Short to battery detected in the relay control circuit.

This pinpoint test is intended to diagnose the following:
- Accessory delay relay
- Wiring, terminals or connectors
- SJB

PINPOINT TEST J: THE DELAYED ACCESSORY RELAY DOES NOT TURN OFF

Test Step	Result / Action to Take
J1 CHECK FOR STUCK/STICKING ACCESSORY DELAY RELAY	
• Disconnect: Accessory Delay Relay. • Ignition ON. • Attempt to operate the power windows. • **Do the power windows still operate?**	**Yes** GO to J3 . **No** GO to J2 .
J2 CHECK THE ACCESSORY DELAY RELAY	
• Ignition OFF. • Carry out the accessory delay relay component test. Refer to Wiring Diagrams Cell 149 for component testing. • **Did the accessory delay relay pass the component test?**	**Yes** GO to J4 . **No** INSTALL a new accessory delay relay. CLEAR the DTCs. TEST the system for normal operation.
J3 CHECK CIRCUIT CBP80 (YE/GN) FOR A SHORT TO POWER	
• Disconnect: SJB C2280A. • Ignition ON. • Measure the voltage between SJB C2280A-29, circuit CBP80 (YE/GN), harness side and ground.	**Yes** REPAIR the circuit. CLEAR the DTCs. TEST the system for normal operation. **No** GO to J4 .

 • **Is any voltage present?**	
J4 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all SJB connectors. • Check for: ♦ corrosion. ♦ pushed-out pins. • Connect all SJB connectors and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 for removal and installation procedures. TEST the system for normal operation. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

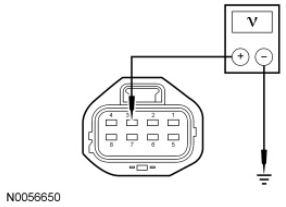
Pinpoint Test K: The Power Rear Window is Inoperative

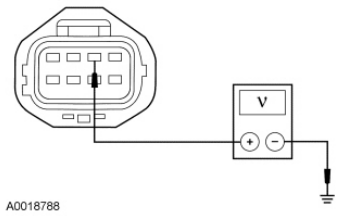
Refer to Wiring Diagrams Cell 100 , Power Windows for schematic and connector information.

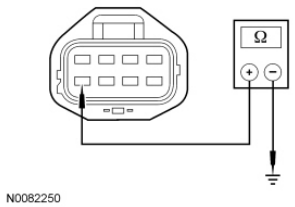
Normal Operation

Under normal operation, the power rear window motor receives voltage at all times through circuit SBB10 (YE/RD). When the accessory delay relay is active, voltage is sent to the power rear window motor microprocessor and rear window control switch (part of the overhead console switch assembly) through circuit CBP05 (YE). The power rear window motor is grounded through circuit GD148 (BK/YE). The power rear window motor receives a voltage input signal from the rear window control switch through circuit CPW58 (YE/OG) to operate the rear window downward; and through CPW59 (VT/BN) to operate the rear window upward. Ground is provided to the rear window control switch through circuit GD133 (BK).

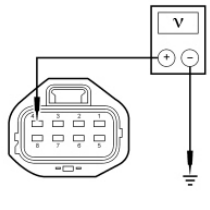
This pinpoint test is intended to diagnose the following:

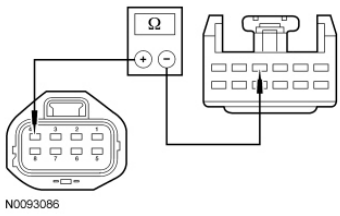






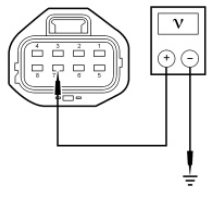
- Fuse(s)
- Wiring, terminals or connectors
- Power rear window control switch
- Power rear window motor
- Rear window regulator

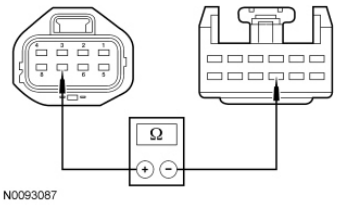


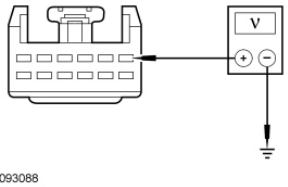


PINPOINT TEST K: THE POWER REAR WINDOW IS INOPERATIVE

NOTE: The initialization procedure must be carried out when repairs are carried out on any part of the power rear window system including when the power rear window motor is removed from the window regulator drum housing, a new power rear motor is installed, a new power rear window regulator is installed, a new power rear window glass module is installed and any operation in which grease or lubricants are applied to the power rear window system.







Test Step	Result / Action to Take

tomsn048@gmail.com

K1 CHECK CIRCUIT SBB10 (YE/RD) FOR VOLTAGE	
• Disconnect: Rear Window Motor C351. • Measure the voltage between power rear window motor C351-3, circuit SBB10 (YE/RD), harness side and ground.  N0056650 • **Is the voltage greater than 10 volts?**	**Yes** GO to K2 . **No** VERIFY Battery Junction Box (BJB) fuse 10 (20A) is OK. If OK, REPAIR the circuit. INITIALIZE the power rear window motor. REFER to Window Motor Initialization - Rear in this section. TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. REPAIR the circuit. INITIALIZE the power rear window motor. REFER to Window Motor Initialization - Rear in this section. TEST the system for normal operation.
K2 CHECK CIRCUIT CBP05 (YE) FOR VOLTAGE	
• Ignition ON. • Measure the voltage between power rear window regulator motor C351-2, circuit CBP05 (YE), harness side and ground.  A0018788 • **Is the voltage greater than 10 volts?**	**Yes** GO to K3 . **No** VERIFY Smart Junction Box (SJB) fuse 5 (5A) is OK. If OK, REPAIR the circuit. INITIALIZE the power rear window motor. REFER to Window Motor Initialization - Rear in this section. TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. REPAIR the circuit. INITIALIZE the power rear window motor. REFER to Window Motor Initialization - Rear in this section. TEST the system for normal operation.
K3 CHECK THE POWER REAR WINDOW MOTOR GROUND	
• Ignition OFF. • Measure the resistance between power rear window motor C351-8, circuit GD148 (BK/YE), harness side and ground.  N0082250	**Yes** GO to K4 . **No** REPAIR the circuit. INITIALIZE the power rear window motor. REFER to Window Motor Initialization - Rear in this section. TEST the system for normal operation.

• **Is the resistance less than 5 ohms?**	
K4 CHECK CIRCUIT CPW58 (YE/OG) FOR VOLTAGE	
• Ignition ON. • While pressing the power rear window control switch, measure the voltage between power rear window motor C351-4, circuit CPW58 (YE/OG), harness side and ground.  N0056645 • **Is the voltage greater than 10 volts?**	**Yes** GO to K6 . **No** GO to K5 .
K5 ISOLATE OPEN IN CIRCUIT CPW58 (YE/OG)	
• Ignition OFF. • Disconnect: Rear Window Control Switch C912. • Measure the resistance between power rear window motor C351-4, circuit CPW58 (YE/OG), harness side and power rear window control switch C912-4, circuit CPW58 (YE/OG), harness side.  N0093086 • **Is the resistance less than 5 ohms?**	**Yes** GO to K8 . **No** REPAIR the circuit. INITIALIZE the power rear window motor. REFER to Window Motor Initialization - Rear in this section. TEST the system for normal operation.
K6 CHECK CIRCUIT CPW59 (VT/BN) FOR VOLTAGE	
• While pulling the power rear window control switch, measure the voltage between power rear window motor C351-7, circuit CPW59 (VT/BN), harness side and ground.	**Yes** INSTALL a new power rear window motor. REFER to Window Regulator Motor - Rear in this section. INITIALIZE the power rear window motor. REFER to Window Motor Initialization - Rear in this section. TEST the system for normal operation. **No** GO to K7 .

tomsn048@gmail.com

 N0056647 • **Is the voltage greater than 10 volts?**	
K7 ISOLATE OPEN IN CIRCUIT CPW59 (VT/BN)	
• Ignition OFF. • Disconnect: Rear Window Control Switch C912. • Measure the resistance between power rear window motor C351-7, circuit CPW59 (VT/BN), harness side and power rear window control switch C912-9, circuit CPW59 (VT/BN), harness side.  N0093087 • **Is the resistance less than 5 ohms?**	**Yes** GO to K8 . **No** REPAIR the circuit. INITIALIZE the power rear window motor. REFER to Window Motor Initialization - Rear in this section. TEST the system for normal operation.
K8 CHECK CIRCUIT CBP05 (YE) FOR VOLTAGE AT THE REAR WINDOW CONTROL SWITCH	
• Ignition ON. • Measure the voltage between power rear window control switch C912-1, circuit CBP05 (YE), harness side and ground.  N0093088 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new power rear window control switch. INITIALIZE the power rear window motor. REFER to Window Motor Initialization - Rear in this section. TEST the system for normal operation. **No** REPAIR the circuit. INITIALIZE the power rear window motor. REFER to Window Motor Initialization - Rear in this section. TEST the system for normal operation.

Component Test

Grid Wire Test

1. Using a bright lamp in the vehicle, inspect the wire grid from the exterior. A broken grid wire will appear as a brown spot.

2. Run the engine at idle. Set the heated rear window switch to ON. The indicator light should come on.

3. Working in the vehicle with a voltmeter, contact the broad red-brown stripes of the rear glass window positive lead to battery side and the negative lead to ground side. The meter should read 10-13 volts. A lower voltage reading indicates a loose ground connection.

4. Contact a good ground point with the negative lead of the meter. The voltage reading should not change.

5. With the negative lead of the meter grounded, touch each grid line of the heated rear window glass at its midpoint with the positive lead. A reading of approximately 6 volts indicates the line is good. A reading of 0 volt indicates the line is broken between the midpoint and the B+ side of the grid line. A reading of 12 volts indicates the circuit is broken between the midpoint of the grid line and ground.

6. Pinpointing the exact position of the break can be accomplished (if the voltmeter reads 0 volt when the midpoint of the grid line is touched with the positive lead of the voltmeter) by moving the positive lead of the voltmeter toward the B+ side of the grid line and touching the grid line until the voltmeter reads 12 volts. If the voltmeter reads 12 volts when the midpoint of the grid line is touched with the positive lead of the voltmeter, simply move the positive lead of the voltmeter toward the ground connection of the grid line and touch the grid line until the voltmeter reads 0 volt.

Glass Reseal - Windshield

Material

Item	Specification
Dow Urethane Adhesive BetasealTM Express	-
Sika Urethane Adhesive Sika Tack ASAP	-
Motorcraft® Ultra-Clear Spray Glass Cleaner ZC-23	ESR-M14P5-A

1. Remove the RH and LH side A-pillar trim panel. For additional information, refer to Section 501-05 .
2. Remove the sun visors, retainers and, if equipped, the overhead console. For additional information, refer to Section 501-12 .
3. If equipped, remove the roof opening panel trim.
4. Remove the interior mirror. For additional information, refer to Section 501-09 .
5. Lower the front portion of the headliner.
6. Remove the cowl panel grille. For additional information, refer to Section 501-02 .
7. Clean the edge formed by the existing urethane adhesive and the glass on the inside at the top, sides and outside on the bottom of the windshield with glass cleaner.
8. Cut the urethane adhesive applicator tip to specification.

9. **NOTE:** Use either a high-ratio electric or battery-operated caulk gun that will apply the urethane adhesive with less effort and a continuous bead.

   NOTE: Make sure that all gaps in the urethane adhesive are smoothed into one continuous bead.

   Apply a bead of urethane adhesive over the top of the existing urethane adhesive.

   - Apply the urethane adhesive to the top and sides of the windshield glass from the interior of the vehicle.

- Apply the urethane adhesive to the bottom of the windshield glass from the exterior of the vehicle.

10. **NOTE:** The urethane adhesive must cure for a minimum of one hour before testing for air or water leaks.

    After the urethane adhesive has cured, check the windshield seal for air or water leaks through the urethane adhesive bead and add urethane adhesive as necessary.

11. Install the cowl panel grille. For additional information, refer to Section 501-05 .

12. Raise the front portion of the headliner.

13. Install the interior mirror. For additional information, refer to Section 501-09 .

14. Install the sun visors, retainers and, if equipped, the overhead console. For additional information, refer to Section 501-12 .

15. If equipped, install the roof opening panel trim.

16. Install the RH and LH side A-pillar trim panels. For additional information, refer to Section 501-05 .

17. Clean the exterior and interior of the windshield glass with glass cleaner.

---

tomsn048@gmail.com

Window Motor Initialization - Front

NOTE: Initialization is required to learn both the full UP and full DOWN positions and the profile of the glass as it travels through the glass channel. Once initialized, obstacle detection is enabled.

NOTE: The front window motor must be de-initialized, then initialized whenever the LH front window motor is removed from the window regulator drum housing, a new window regulator is installed, a new window glass is installed, a new top run is installed or for any operation in which grease or lubricants are applied to the window regulator or glass run.

NOTE: A new (original factory setting) or de-initialized LH front window motor will not operate in one-touch up or one-touch down mode until initialized. If a new LH front window motor has been installed, proceed to the initialization procedure.

NOTE: If diagnosing a LH front window switch problem, perform the window initialization procedure before replacing the window switch.

NOTE: All LH front window components (window glass, window regulator, window motor, seals and glass top run) must be installed and tightened to specification before carrying out the initialization procedure.

NOTE: Excessive bounce-back (window reverses direction with no obstructions present) may indicate that a de-initialization procedure may need to be performed.

De-initialization procedure

NOTE: The LH front window motor must be reset to its original factory settings first, then perform the following de-initialization procedure.

1. Hold the LH front door open.
2. **NOTE:** Steps 2 and 3 must be performed within 8 seconds.

   Cycle the ignition key from OFF and back to ON 5 times.
3. **NOTE:** The glass will stop moving after a short distance during this step.

   Press the LH front window control switch to the one-touch DOWN position (second detent) and release.
4. Verify that the LH front window does not operate in one-touch up or one-touch down modes. If the window still performs one-touch up/down operations, carefully repeat this procedure.

Initialization procedure

⚠ WARNING: Keep objects and body parts clear of the glass panel when carrying out the initialization procedure. During the initialization procedure, the glass panel closes with high force and cannot detect objects in its path. Failure to follow this instruction may result in serious personal injury.

NOTE: The LH front window must be in the full OPEN position for this procedure to operate correctly.

NOTE: If the initialization procedure is only partially completed, the LH front window motor will remain de-initialized and will not operate in one-touch up or one-touch down mode.

5. Hold the LH front door open.

6. Cycle the ignition key from OFF and back to ON 5 times.

7. Press and hold the LH front window control switch until the window glass stalls for one second at the bottom of its travel and release the switch.

8. **NOTE:** If this operation is interrupted at any time before the window glass stalls into the glass top run, repeat Steps 6 through 8.

   Pull and hold the LH front window control switch until the window glass stalls for one second into the glass top run and release the switch.

9. Test the LH front window for correct operation by carrying out the one-touch-up and one-touch-down features.

---

tomsn048@gmail.com

Window Motor Initialization - Rear

⚠ WARNING: Keep objects and body parts clear of the glass panel when carrying out the initialization procedure. During the initialization procedure, the glass panel closes with high force and cannot detect objects in its path. Failure to follow this instruction may result in serious personal injury.

NOTE: The rear window motor is in error mode when shipped and will be inoperative until initialized.

NOTE: This procedure must be carried out when repairs are performed on any part of the power rear window system including when: the power rear window motor is removed from the window regulator drum housing, a new power rear motor is installed, a new power rear window regulator is installed, a new power rear window glass module is installed, and any operation in which grease or lubricants are applied to the power rear window system.

NOTE: All power rear window components (window glass module, window regulator, window motor and glass runs) must be installed and tightened to specification before carrying out this procedure.

1. Open the driver door. The door must remain open through the entire procedure.

2. Insert the key into the ignition and cycle to the RUN position 5 times, ending in the RUN position.

3. **NOTE:** When performing this step, movement of the rear window may not be seen, but the rear window motor will be active.

   Depress and hold the power rear window control switch in the down position for 3 seconds and then release.

4. **NOTE:** If the rear window does not operate when performing this step, repeat steps 1,2 and 3.

   Depress and hold the power rear window control switch in the down position for 3 seconds after the rear window stalls in the full down position.

5. Depress and hold the power rear window control switch in the up position for 3 seconds after the rear window stalls in the full up position.

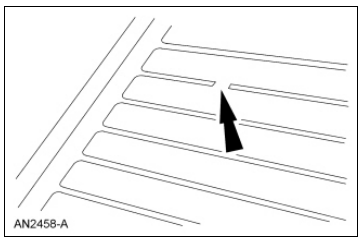
6. Verify correct operation of the power rear window by moving the window to the VENT, fully OPEN and fully CLOSED positions. If the window does not operate correctly, carefully repeat this procedure.

tomsn048@gmail.com

Window Grid Wire Repair

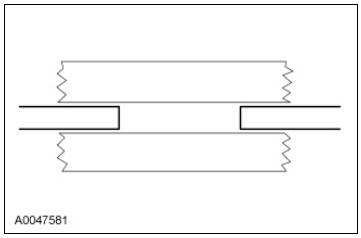
General Equipment

Polypropylene Film Fine Line Tape (Commercially available)



Material

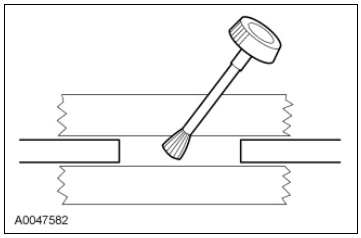
Item	Specification
Motorcraft® Lacquer Touch-Up Paint (match color to exterior grid wire) PMP-19500-XXXXX	ESR-M2P100-C
Rear Window Defroster Repair PM-11 (US); CPM-11 (Canada)	-
Motorcraft® Ultra-Clear Spray Glass Cleaner ZC-23	ESR-M14P5-A



NOTE: The grid line material is not embedded into the glass, but is baked to the glass surface and consequently can be scraped off. An undamaged grid line will have small ridges that project above the surface of the glass and can easily be felt when running a fingernail across them. Grid lines that have been "razor bladed" will feel smooth when a fingernail is dragged across the affected area. Inoperative lines may appear to the eye to be undamaged due to residue remaining on the glass and will require diagnosis with a voltmeter or 12V test lamp. For additional information, refer to Diagnosis and Testing in this section.

1. Bring the vehicle up to a room temperature of at least 16°C (60°F) or above.
2. ***NOTICE:*** **Do not use scrapers, sharp instruments or abrasive window cleaners on the interior surface of the rear window glass as this may cause damage to the grid lines.**

   Clean the entire grid line repair area with glass cleaner and 0000 steel wool to remove all dirt, wax, grease, oil or other foreign material.
3. Mark the location of the grid break on the exterior of the rear window glass.



4. Using a polypropylene film fine line tape, mask the area directly above and below the grid break extending the tape 26 mm (1.02 in) beyond the concern area in both directions. The break area should be at the center of the mask.

5. **NOTE:** If the brown layer is not broken or missing, apply only the silver grid repair compound to the break. If both the brown and silver layers of the grid are broken or missing, apply a coating of the lacquer touch up paint across the break in the grid line prior to applying the rear window defroster repair compound. Do not overlap the silver grid line with the paint. Several applications may be necessary to achieve a color match.

   NOTE: Allow at least 5 minutes of drying time between applications for the touch up paint or the silver repair coating. Applying fewer coats or not allowing adequate drying time between coats will produce repaired resistance that is greater than OEM resistance, resulting in poor defrost performance and excessive localized heating.

   Apply the repair coating to the grid break area in several smooth, continuous strokes. Extend the silver repair coating at least 6.35 mm (0.25 in) on both sides of the break area.
   Apply a minimum of 6 applications of the grid repair compound.

6. **NOTE:** The repair coating air-dries in approximately one minute and can be energized after 5 minutes. Optimum adhesion occurs after approximately 24 hours.

   Allow the repair area to dry completely and remove the mask.

7. ***NOTICE:*** **Be careful not to damage the grid line with the razor blade. If this occurs, additional repair may be necessary.**

   Remove any excess repair compound above or below the grid line with a razor blade.

8. **NOTE:** The interior side of the grid lines are not painted, but due to the silver tarnishing will tend to change the grid to a gold or brown color. The repair area will be bright silver and will also tarnish over time to match the rest of the grid.

   Test the system for normal operation.

tomsn048@gmail.com

Lead Terminal Repair

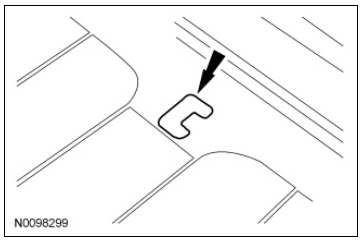
General Equipment

Defroster Connector 7L2Z-14421-A

Material

Item	Specification
Motorcraft® Ultra-Clear Spray Glass Cleaner ZC-23	ESR-M14P5-A

1. Bring the vehicle up to room temperature of at least 16°C (60°F) or above.



2. **NOTE:** The new terminal will cover the original terminal location, but it must be placed so that the terminal conductive areas will be placed on a good conductive base.

   Clean the bus bar in the area to be repaired with steel wool (000 to 0000 grade), and then with glass cleaner to remove all dirt, wax, grease, oil or other foreign material.

3. ***NOTICE:*** **Do not use any type of flame torch or flame-heated soldering gun for this procedure. Use of these tools provide inadequate heat generation at the tip and the exhaust heat can cause damage to plastic trim parts in the area. Use only an electric soldering gun with 100 watts or more of power. Before using the soldering gun, be sure to melt a small amount of rosin core solder to the tip. The solder will assist in achieving better heat transfer from the soldering gun tip to the new terminal.**

   NOTE: Depending on the original terminal location, and whether the terminal is covered by pillar trim, will determine where to locate the new terminal. Some grid line bus bars may only allow the placement of the terminal above or below the original tab location due to space limitations. For most vehicle applications, the replacement tab location will cover the original tab location, but still allow the replacement tab to attach to the bus bar on good conductive material.

   Place the replacement terminal over the original tab location, making sure the conductive areas of the terminal will be on a good conductive area. Do not place the terminal tab foot on the original location, which does not have conductive material.

4. Hold the terminal in place with an item such as a regular lead pencil at a 90 degree angle from the terminal. (Holding at other than a 90 degree angle may allow the terminal to slip when the solder

tomsn048@gmail.com

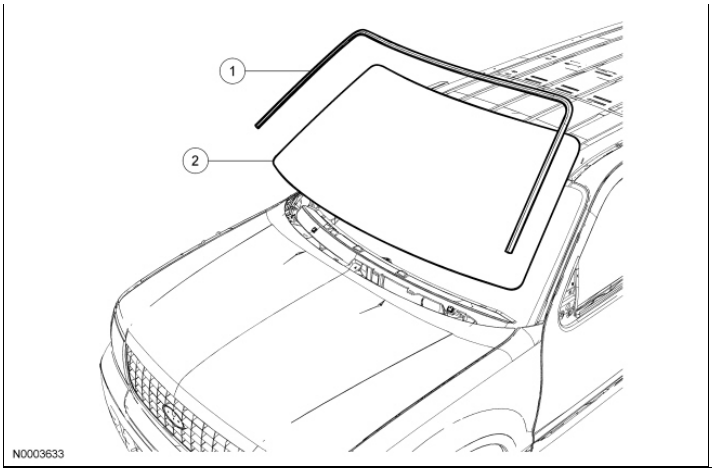
liquefies.)

5. **NOTE:** The new terminal has pre-applied solder and flux. When the proper temperature is achieved, the solder will liquefy.

   Place the soldering gun tip on the base of the terminal near the pre-applied solder areas of the tab. Energize the soldering gun and watch for the pre-applied area of the terminal to liquefy. The solder should liquefy in approximately 40-45 seconds after heating. As soon as the solder completely changes on either side of the terminal, de-energize the soldering gun and continue to hold the terminal in place with the soldering gun and pencil for an additional 30 seconds.

6. Remove the soldering gun and pencil from the terminal. The terminal should be allowed to cool for another 2 minutes before the wiring lead is attached to the terminal.

7. Attach the electrical lead connection to this terminal, turn on the heated rear window and verify the operation.



Windshield Glass

Special Tool(s)

 ST1320-A	Deluxe Windshield Removal Tool 164-R2450 or equivalent
 ST2085-A	The Pumper 164-R2459 or equivalent

Material

Item	Specification
Dow Urethane Adhesive BetasealTM Express	-
Dow Urethane One Step Glass Primer BetaprimeTM 5500 / 5500A / 5500SA	-
Sika Urethane Adhesive Sika Tack ASAP	-
Sika Urethane Metal and Glass Primer Sika 206 G+P	-
Motorcraft® Ultra-Clear Spray Glass Cleaner ZC-23	ESR-M14P5-A

Item	Part Number	Description
1	03682	Windshield glass moulding
2	03100	Windshield glass

Removal

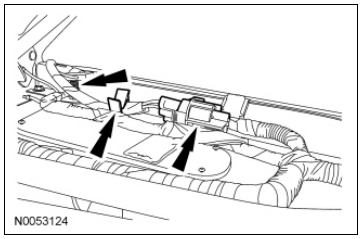
tomsn048@gmail.com

1. Remove the RH and LH side A-pillar trim panels. For additional information, refer to Section 501-05 .

2. Remove the sun visors and retainers and, if equipped, the overhead console. For additional information, refer to Section 501-12 .

3. If equipped, remove the roof opening panel trim.

4. Remove the interior mirror. For additional information, refer to Section 501-09 .



5. Lower the front portion of the headliner.

6. Remove the cowl panel grille. For additional information, refer to Section 501-02 .

7. **NOTE:** LH shown, RH similar.

   If equipped, disconnect the heated windshield electrical connectors.

   - Disconnect the connector.
   - Remove the connector from the retainer.
   - Remove the connector from the stud.

8. **NOTE:** LH shown, RH similar.

   Lower the setting blocks.

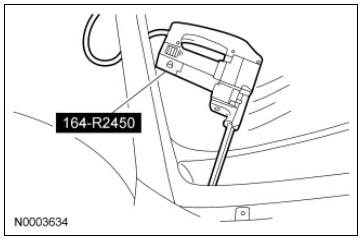
   - Use a flat screwdriver to release the setting block and lower.

9. Before cutting the urethane adhesive, remove dirt and other foreign material from the windshield pinch weld area.
   - Use a clean shop towel or oil-free compressed air.

10. **⚠ WARNING: Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.**

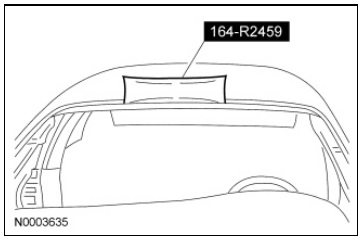
    ⚠ WARNING: Wear protective gloves when handling components or parts that have pointed or sharp edges. Failure to follow this instruction may result in serious personal injury.

    NOTICE: **To avoid rust formation, use extreme care not to scratch the paint or primer or**



otherwise damage the pinch weld during glass removal.

NOTE: Insert the blade into the Deluxe Windshield Removal Tool so that the flat side is against the glass. This will leave the entire urethane adhesive bead on the pinch weld and allow a dry fit of the replacement windshield glass.



NOTE: Lubricate the urethane adhesive with water to aid the Deluxe Windshield Removal Tool when cutting the urethane adhesive.

NOTE: Support the windshield glass to prevent the glass from dropping while cutting the urethane adhesive.

Using the Deluxe Windshield Removal Tool, cut the urethane adhesive from the windshield glass starting at the upper center of the windshield glass and working toward the bottom corners.

11. Using The Pumper, distance the windshield from the body.

12. Using the Deluxe Windshield Removal Tool, cut the remaining urethane adhesive.

13. **NOTE:** Removing the windshield glass requires more than one technician.

    NOTE: If reinstalling the windshield glass, tape the windshield at the windshield stops to aid in alignment of the glass during installation.

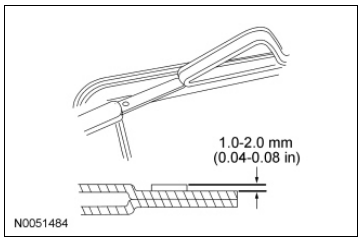
    Carefully remove the windshield glass from the vehicle and place on a stable work surface.

Installation

1. **NOTE:** Raise the setting block until flush with top. Lock the blocks into place after windshield is installed.

   Raise the setting blocks.

tomsn048@gmail.com



2. Dry-fit the new windshield glass on the existing urethane adhesive bead on the pinch weld.
    - Position the windshield glass on the pinch weld.
    - Center the windshield glass in the opening.
    - Make alignment marks with tape or non-staining grease pencil (preferably at the windshield glass setting blocks) on the windshield glass and the body.

3. After the dry-fit alignment, remove the glass assembly from the windshield opening and place on a stable work surface with the interior side of the glass facing upward.

4. ⚠ **WARNING: Repair any corrosion found on the pinch weld. The pinch weld is a structural component of the vehicle. Corrosion left unrepaired may reduce the structural integrity of the vehicle. Failure to follow this instruction may result in serious injury to vehicle occupant(s).**

   NOTE: Avoid scratching the pinch weld. Repair all minor scratches or exposed metal on the pinch weld following manufacturer's instructions. Use the same brand pinchweld primer, glass primer and urethane adhesive.

   Using an appropriate tool, trim the urethane adhesive leaving a 1 mm to 2 mm (0.04 in to 0.08 in) base of original equipment urethane adhesive on the pinch weld.

5. Using a clean shop towel, brush or oil-free compressed air, clean the pinch weld area around the existing urethane adhesive. Remove any foreign material or water that may have entered during windshield removal.

6. If installing the original windshield glass, remove the excess urethane adhesive from the glass leaving a thin layer to bond with the new urethane adhesive bead.

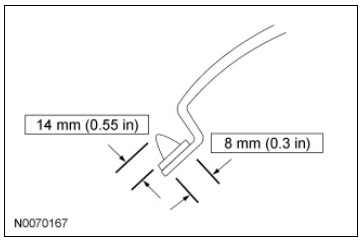
7. **NOTE:** Inspect the flat foil connectors at the bottom of the new windshield for damage prior to installation. Do not install a windshield with damaged flat foil connectors.

   Clean the inside of the new windshield glass with glass cleaner.

    - Make sure to thoroughly clean the surface of the blackened border area where the urethane adhesive will be applied.

8. **NOTE:** Be sure to use the same brand and cure-rate products for the urethane adhesive and glass primer. Do not mix different brands of urethane adhesive and glass primer. Refer to the Material Chart in this procedure.

   If installing a new windshield glass, apply glass primer according to manufacturer's instructions. Allow at least 6 minutes to dry.



9. Cut the urethane adhesive applicator tip to specification.

10. **NOTE:** Use either a high-ratio, electric or battery-operated caulk gun that will apply the urethane adhesive with less effort and continuous bead.

    NOTE: The windshield glass must be positioned within 10 minutes of applying the urethane adhesive.

    Apply a uniform bead of urethane adhesive on top of the existing trimmed urethane adhesive bead on the pinch weld, starting and ending at the bottom of the windshield near the center, making sure there are no gaps in the bead.

11. ⚠ **WARNING: Do not drive vehicle until the urethane adhesive seal has cured. Follow urethane adhesive manufacturer's curing directions. Inadequate or incorrect curing of the urethane adhesive seal will adversely affect glass retention. Failure to follow these instructions may result in serious injury to vehicle occupant(s).**

    NOTICE: **Before positioning the windshield glass, open vehicle windows to prevent the air pressure of closing doors from affecting the urethane adhesive bond.**

    Using the alignment marks made previously, position the windshield glass on the pinch weld.

12. **NOTE:** The urethane adhesive must cure for a minimum of one hour before testing for air and water leaks.

    After the urethane adhesive has cured, check for water leaks and add urethane adhesive where needed.

13. **NOTE:** Follow the same routing for the electrical connector that was used during removal.

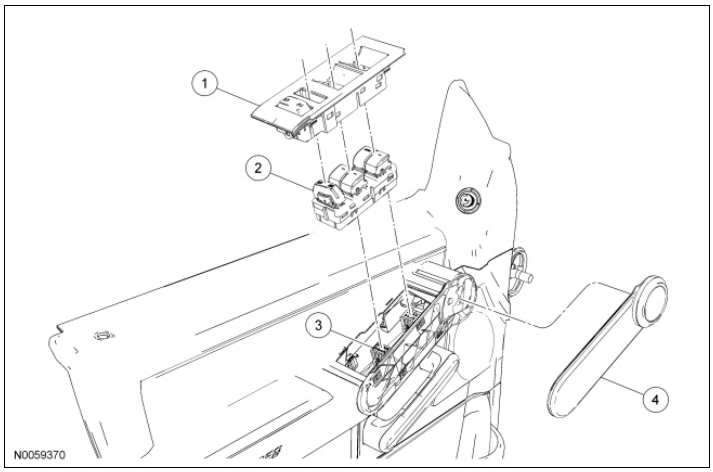
    If equipped, connect the heated windshield electrical connectors.

14. Install the cowl panel grille. For additional information, refer to Section 501-02 .

15. Raise the front portion of the headliner.

16. Install the interior mirror. For additional information, refer to Section 501-09 .

17. Install the sun visors, retainers and, if equipped, the overhead console. For additional information, refer to Section 501-12 .



18. If equipped, install the roof opening panel trim.

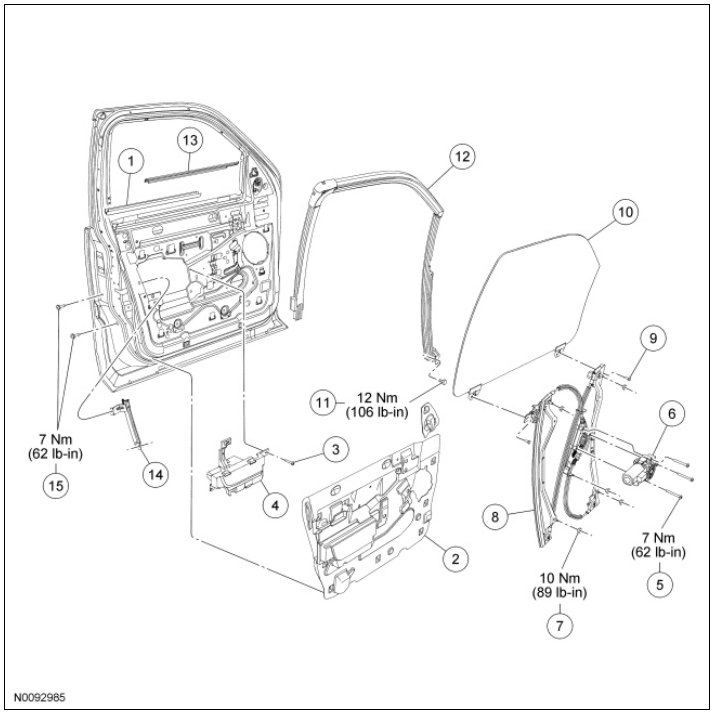
tomsn048@gmail.com

19. Install the RH and LH side A-pillar trim panels. For additional information, refer to Section 501-05 .

20. Clean the exterior and interior of the windshield glass with glass cleaner.

Window Control Switch

Item	Part Number	Description
1	14A464B	Window control switch bezel
2	14529	Window control switch
3	14524 RH/ 14525 LH	Window control switch electrical connectors
4	14A563 RH/ 14A564 LH	Interior door handle cover



Removal and Installation

1. Remove the interior door handle cover.
2. Lift the window control switch bezel upward to release the clips.
3. Disconnect the window control switch electrical connectors from the window control switch.
4. Disconnect the window control switch from the window control switch bezel to remove.
5. To install, reverse the removal procedure.

tomsn048@gmail.com

Glass, Frames and Mechanisms - Exploded View, Front Door

NOTE: LH shown, RH similar.

Item	Part Number	Description
1	7821434 RH/ 7821435 LH	Interior moulding
2	78237A04 RH/ 78237A05 LH	Front door weather shield
3	-	Door trim panel reinforcement screw
4	7840380	Door trim panel reinforcement
5	-	Window regulator motor bolt (3 required)
6	7823394 RH/ 7823395 LH	Window regulator motor
7	W705817	Window regulator assembly nut (5 required)
8	7823200 RH/ 7823201 LH	Window regulator assembly (includes motor)
9	W707874	Front door window glass-to-regulator assembly rivet (2 required)
10	7821410 RH/ 7821411 LH	Front door window glass
11	W503923	Front door glass top run channel assembly bolt
12	7821596 RH/ 7821597 LH	Front door run channel assembly
13	7821452 RH/ 7821453 LH	Exterior moulding

tomsn048@gmail.com

14	78222A00 RH/ 78222A01 LH	Front door glass run retainer
15	W710236	Front door glass run screws (2 required)

1. For additional information, refer to the procedures in this section.

Door Glass Top Run - Front

Removal and Installation

NOTE: For LH front only, the front window motor must be initialized whenever the front window motor is removed from the window regulator drum housing, a new window regulator is installed, a new top run is installed or for any operation in which grease or lubricants are applied to the window regulator or glass run.

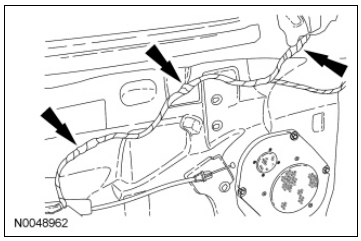
1. Remove the front door window glass. For additional information, refer to Window Glass - Front Door in this section.

2. Remove the exterior moulding.

3. Remove the front door glass top run channel assembly bolt.
   - To install, tighten to 12 Nm (106 lb-in).

4. Remove the front door glass top run channel assembly through the top opening of the front door.

5. To install, reverse the removal procedure.
   - For LH front window only, initialize the LH front window motor. For additional information, refer to Window Motor Initialization - Front in this section.



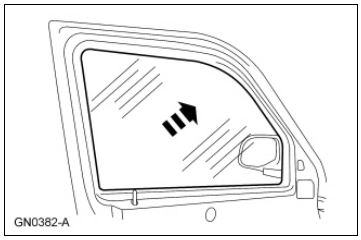
tomsn048@gmail.com

Window Glass - Front Door

Removal and Installation

NOTE: For LH front only, the front window motor must be initialized whenever the front window motor is removed from the window regulator drum housing, a new window regulator is installed, a new top run is installed or for any operation in which grease or lubricants are applied to the window regulator or glass run.

1. Remove the front door trim panel. For additional information, refer to Section 501-05 .
2. Remove the front door speaker. For additional information, refer to Section 415-00 .
3. Remove the interior moulding.
4. Remove the exterior mirror front door weather shield.
5. Disconnect the exterior mirror electrical connector.
6. Release the 3 door wiring harness pin-type retainers.



7. Remove the front door weather shield.
8. ***NOTICE:*** **Make sure the holes in the glass bracket do not become enlarged during the rivet removal process. Damage to the window regulator will occur if the holes become enlarged. The new rivets may become loose, resulting in a clicking noise concern.**

   NOTE: Use a 4.5 mm (0.1772 in) drill bit to drill out the glass-to-regulator rivets.

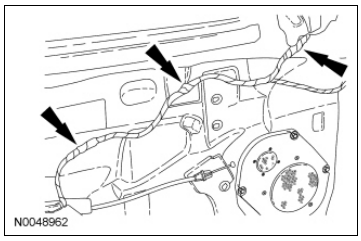
   Remove the 2 front door window glass-to-regulator rivets.

   - Position the front door window glass as necessary to access the front door window glass-to-regulator rivets.

9. Remove the front window glass.
   - Pull the glass out through the top inboard side of the door.

10. To install, reverse the removal procedure.
    - For LH front window only, initialize the LH front window motor. For additional information, refer to Window Motor Initialization - Front in this section.

---



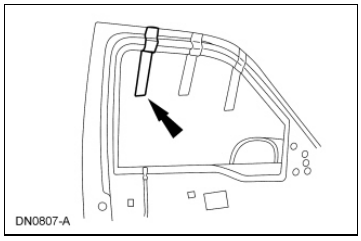
tomsn048@gmail.com

Window Regulator - Front Door

Removal and Installation

NOTE: For LH front only, the front window motor must be initialized whenever the front window motor is removed from the window regulator drum housing, a new window regulator is installed, a new top run is installed or for any operation in which grease or lubricants are applied to the window regulator or glass run.

1. Remove the front door trim panel. For additional information, refer to Section 501-05 .
2. Remove the front door speaker. For additional information, refer to Section 415-00 .
3. Remove the exterior mirror front door weather shield.
4. Disconnect the exterior mirror electrical connector.
5. Release the 3 door wiring harness pin-type retainers.



6. Remove the front door weather shield.
7. Remove the door trim panel reinforcement screw.
8. Remove the door trim panel reinforcement.
9. ***NOTICE:*** **Make sure the holes in the glass bracket do not become enlarged during the rivet removal process. Damage to the window regulator will occur if the holes become enlarged. The new rivets may become loose, resulting in a clicking noise concern.**

   NOTE: Use a 4.5 mm (0.1772 in) drill bit to drill out the glass-to-regulator rivets.

   Remove the 2 front door window glass-to-regulator rivets.

   - Position the front door window glass as necessary to access the front door window glass-to-regulator rivets.

10. Secure the front door glass in the full UP position with tape.

11. Disconnect the window regulator motor electrical connector.

12. Remove the 5 window regulator assembly nuts.
    - To install, tighten to 10 Nm (89 lb-in).

13. Remove the window regulator assembly.

14. To install, reverse the removal procedure.
    - For LH front window only, initialize the LH front window motor. For additional information, refer to Window Motor Initialization - Front in this section.

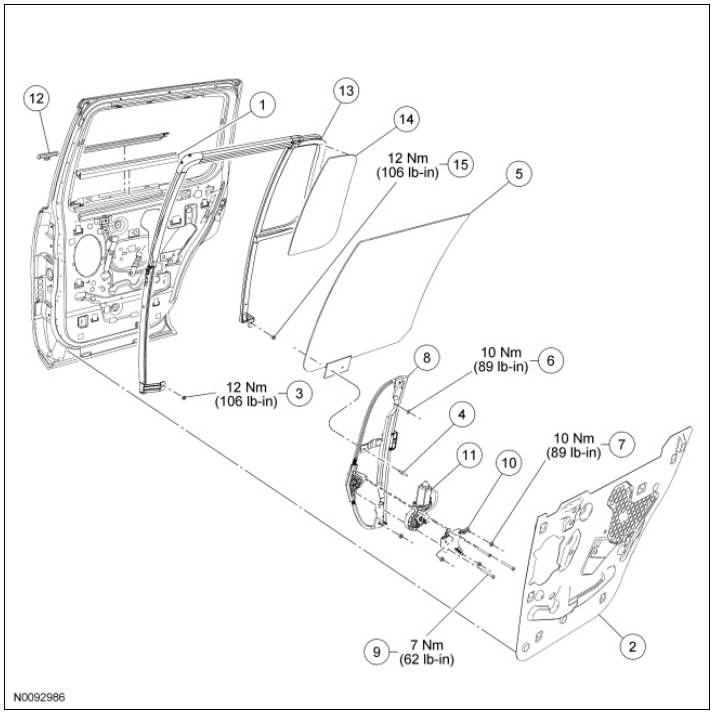
tomsn048@gmail.com

Window Regulator Motor - Front Door

Removal and Installation

NOTE: For LH front only, the front window motor must be initialized whenever the front window motor is removed from the window regulator drum housing, a new window regulator is installed, a new top run is installed or for any operation in which grease or lubricants are applied to the window regulator or glass run.

1. Remove the front door window regulator. For additional information, refer to Window Regulator - Front Door in this section.



2. Remove the 3 front door window regulator motor bolts.
   - To install, tighten to 7 Nm (62 lb-in).

3. Remove the front door window regulator motor.

4. To install, reverse the removal procedure.
   - For LH front window only, initialize the LH front window motor. For additional information, refer to Window Motor Initialization - Front in this section.

Glass, Frames and Mechanisms - Exploded View, Rear Door

NOTE: Explorer shown, Explorer Sport Trac similar.

Item	Part Number	Description
1	7825860 RH/ 7825861 LH	Interior moulding
2	7827458 RH/ 7827459 LH	Rear door weather shield
3	W705817	Door below channel assembly nut
4	W705426	Rear door window glass-to-regulator assembly rivet
5	7826224 RH/ 7826225 LH	Rear door window glass
6	W705817	Window regulator nut (2 required)

1. For additional information, refer to the procedures in this section.

Window Glass - Fixed, Rear Door

Removal and Installation

1. Remove the rear door window glass. For additional information, refer to Window Glass - Rear Door in this section.
2. Remove the exterior moulding.
3. Remove the rear door glass top run channel assembly. For additional information, refer to Door Glass Top Run - Rear in this section.
4. To install, reverse the removal procedure.

tomsn048@gmail.com

Door Glass Top Run - Rear

Removal and Installation

1. Remove the rear door window glass. For additional information, refer to Window Glass - Rear Door in this section.

2. Remove the exterior moulding.

3. Remove the rear door glass top run assembly bolt.
   - To install, tighten to 12 Nm (106 lb-in).

4. Remove the rear door glass top run channel assembly.
   - Remove the rear door glass top run channel assembly through the top opening of the rear door.

5. To install, reverse the removal procedure.

Window Glass - Rear Door

Removal and Installation

1. Remove the rear door trim panel. For additional information, refer to Section 501-05 .

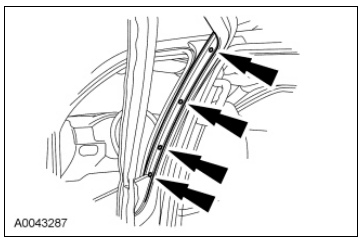
2. Remove the rear door speaker. For additional information, refer to Section 415-00 .

3. Remove the interior moulding.

4. Remove the rear door weather shield.

5. Remove the rear door glass top run channel assembly bolt.
   - To install, tighten to 12 Nm (106 lb-in).

6. Remove the rear door below belt channel assembly nut.
   - To install, tighten to 12 Nm (106 lb-in).



7. ***NOTICE:*** **Make sure the hole in the glass bracket does not become enlarged during the rivet removal process. Damage to the window regulator will occur if the hole becomes enlarged. The new rivet may become loose, resulting in a clicking noise concern.**

   NOTE: Use a 4.5 mm (0.1772 in) drill bit to drill out the glass-to-regulator rivets.

   Remove the rear door window glass-to-regulator rivet.

   - Position the rear door window glass as necessary to access the rear door window glass-to-regulator rivet.

8. Remove the applique on the rear door.
   - Remove the screws.

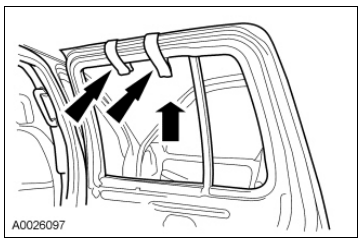
9. Remove the rear door window glass.
   - Pull the glass out through the top inboard side of the door.

tomsn048@gmail.com

10. To install, reverse the removal procedure.

Window Regulator - Rear Door

Removal and Installation



1. Remove the rear door trim panel. For additional information, refer to Section 501-05 .
2. Remove the rear door speaker. For additional information, refer to Section 415-00 .
3. Remove the interior moulding.
4. Remove the rear door weather shield.
5. ***NOTICE:*** **Make sure the hole in the glass bracket does not become enlarged during the rivet removal process. Damage to the window regulator will occur if the hole becomes enlarged. The new rivet may become loose, resulting in a clicking noise concern.**

   NOTE: Use a 4.5 mm (0.1772 in) drill bit to drill out the glass-to-regulator rivets.

   Remove the rear door window glass-to-regulator rivet.

   - Position the rear door window glass as necessary to access the rear door window glass-to-regulator rivet.

6. Secure the rear door window glass in the full UP position with tape.

7. Disconnect the window regulator motor electrical connector.
8. Remove the 2 rear window regulator mounting nuts.
   - To install, tighten to 10 Nm (89 lb-in).
9. Remove the 3 window regulator motor bracket nuts.
   - To install, tighten to 10 Nm (89 lb-in).
10. Remove the window regulator assembly.
11. To install, reverse the removal procedure.

tomsn048@gmail.com

Window Regulator Motor - Rear Door

Removal and Installation

1. Remove the interior moulding.

2. Remove the rear door trim panel and weather shield. For additional information, refer to Section 501-05 .

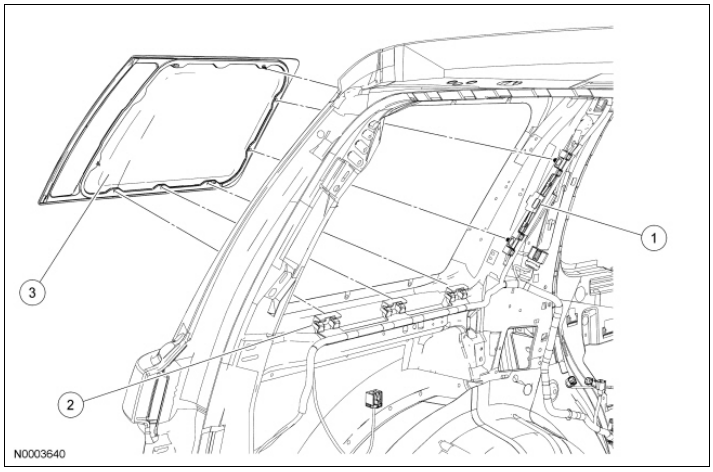
3. Remove the 3 window regulator motor bolts.
   - To install, tighten to 7 Nm (62 lb-in).

4. Remove the window regulator motor.

5. To install, reverse the removal procedure.

tomsn048@gmail.com

Window Glass - Rear Quarter



Special Tool(s)

 ST1320-A	Deluxe Windshield Removal Tool 164-R2450 or equivalent

Material

Item	Specification
Dow Urethane Adhesive BetasealTM Express	-
Dow Urethane One Step Glass Primer BetaprimeTM 5500 / 5500A / 5500SA	-
Sika Urethane Adhesive Sika Tack ASAP	-
Sika Urethane Metal and Glass Primer Sika 206 G+P	-
Motorcraft® Ultra-Clear Spray Glass Cleaner ZC-23	ESR-M14P5-A

NOTE: LH shown, RH similar.

Item	Part Number	Description
1	-	Wiring harness bracket
2	-	Wiring harness bracket

3	29710	Rear quarter window glass

Removal

1. Remove the rear quarter trim panel. For additional information, refer to Section 501-05 .

2. Remove the wiring harness brackets.

3. Before cutting the urethane adhesive, remove dirt and other foreign material from the windshield pinch weld area.
   - Use a clean shop towel or oil-free compressed air.

4. **⚠ WARNING: Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.**

   ⚠ WARNING: Wear protective gloves when handling components or parts that have pointed or sharp edges. Failure to follow this instruction may result in serious personal injury.

   NOTICE: **To avoid rust formation, use extreme care not to scratch the paint or primer or otherwise damage the pinch weld during glass removal.**

   NOTE: Insert the blade into the Deluxe Windshield Removal Tool so that the flat side is against the glass. This will leave the entire urethane adhesive bead on the pinch weld and allow a dry fit of the replacement glass.

   NOTE: Lubricate the urethane adhesive with water to aid the Deluxe Windshield Removal Tool when cutting the urethane adhesive.

   NOTE: Locating tabs need to be cut through in order to remove the rear quarter window glass. The new rear quarter window glass will be equipped with new locating tabs.

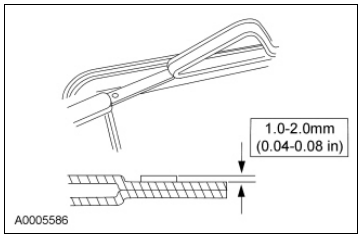
   NOTE: Support the glass to prevent the glass from dropping while cutting the urethane adhesive.

   Using the Deluxe Windshield Removal Tool, cut the urethane adhesive from the quarter window glass starting at the upper center of the quarter window glass and working toward the bottom corners.

5. Using the Deluxe Windshield Removal Tool, cut the remaining urethane adhesive and carefully remove the quarter glass from the vehicle and place on a stable work surface.

Installation

1. Dry fit the rear quarter window glass in the window opening.
   - Position the quarter window glass on the pinch weld.
   - Center the quarter glass in the opening for best fit.
   - Make alignment marks with tape or non-staining grease pencil on the quarter window glass and the body.



2. After the dry-fit alignment, remove the glass from the opening and place on a stable work surface with the interior side of the glass facing upward.

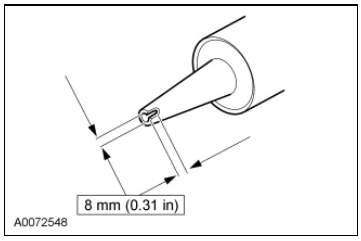
3. **⚠ WARNING: Repair any corrosion found on the pinch weld. The pinch weld is a structural component of the vehicle. Corrosion left unrepaired may reduce the structural integrity of the vehicle. Failure to follow this instruction may result in serious injury to vehicle occupant(s).**

tomsn048@gmail.com

NOTE: Avoid scratching the pinch weld. Repair all minor scratches or exposed metal on the pinch weld following manufacturer's instructions. Use the same brand pinch weld primer, glass primer and urethane adhesive.

Using an appropriate tool, trim the urethane adhesive leaving a 1 mm to 2 mm (0.04 in to 0.08 in) base of original equipment urethane adhesive on the pinch weld.

4. Using a clean shop towel, brush or oil-free compressed air, clean the pinch weld area around the existing urethane adhesive. Remove any foreign material or water that may have entered during glass removal.



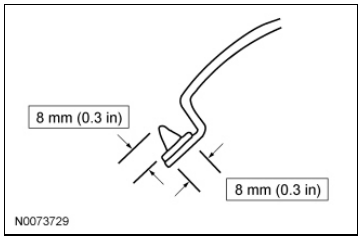
5. If reinstalling the original quarter window glass, remove the excess urethane adhesive from the glass leaving a thin layer to bond with the new urethane adhesive bead.

6. Clean the inside of the new quarter window glass with glass cleaner.
    - Make sure to thoroughly clean the surface of the blackened border area where the urethane adhesive will be applied.

7. **NOTE:** Be sure to use the same brand and cure-rate products for the urethane adhesive and glass primer. Do not mix different brands of urethane adhesive and glass primer. Refer to the Material Chart in this procedure.

   If installing a new rear quarter window glass, apply glass primer according to manufacturer's instructions. Allow at least 6 minutes to dry.

8. Cut the urethane adhesive applicator tip to specification.



9. **NOTE:** Use either a high-ratio, electric or battery-operated caulk gun that will apply the urethane adhesive with less effort and continuous bead.

   NOTE: The rear quarter glass must be positioned within 10 minutes of applying the urethane adhesive.

   Use caution when applying urethane adhesive. Apply to the outside edges of the locating tabs on the glass surface. Start at the bottom and work around to the sides of the rear quarter window glass.

    - Make sure there are no gaps in the urethane bead.

10. ⚠ **WARNING: Do not drive vehicle until the urethane adhesive seal has cured. Follow urethane adhesive manufacturer's curing directions. Inadequate or incorrect curing of the urethane adhesive seal will adversely affect glass retention. Failure to follow these instructions may result in serious injury to vehicle occupant(s).**

    NOTICE: **Before positioning the quarter window glass, open vehicle windows to prevent the air pressure of closing doors from affecting the urethane adhesive bond.**

    Using the alignment marks made previously, position the quarter window glass on the pinch weld.

11. **NOTE:** The urethane adhesive must cure for a minimum of one hour before testing for air and water leaks.

    After the urethane adhesive has cured, check for water leaks and add urethane adhesive where needed.

12. Install the wiring harness brackets.

13. Install the rear quarter trim panel. For additional information, refer to Section 501-05 .

14. Clean the exterior and interior of the quarter window glass with glass cleaner.

tomsn048@gmail.com

Window Glass - Rear, Fixed

Material

Item	Specification
Foam Core Butyl E69Z-19562-A	WSB-M3G143-B1

Item	Part Number	Description
1	N621901	Rear window glass mounting nut (15 required)
2	3542006	Rear window glass

Removal

NOTE: If the rear window glass is being removed to repair a dust/water leak, remove and reinstall the existing rear window glass.

1. Remove the cab rear panel. For additional information, refer to Section 501-05 .
2. Remove the 15 rear window glass mounting nuts.
3. ***NOTICE:*** **Use only a plastic windshield setting tool to slide under the seal to separate the foam core butyl from the glass. Once the glass starts to separate from the body, constant hand pressure will break the seal and the glass can be removed. Failure to use a plastic windshield setting tool can damage the body or the glass frame.**

   Remove the rear window glass.

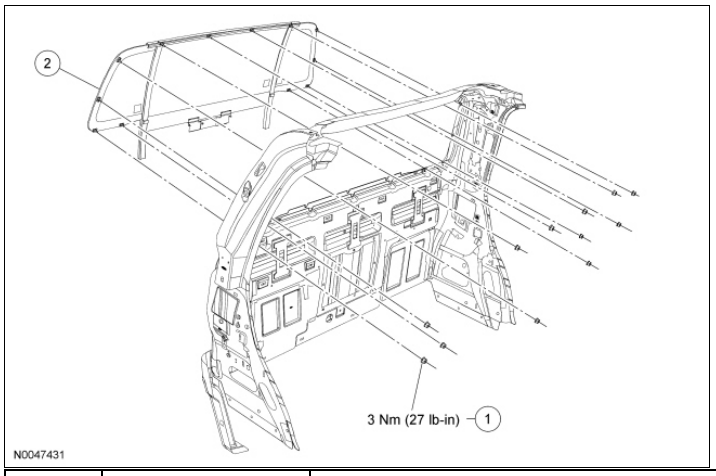
Installation

1. **NOTE:** Remove as much as possible of the foam core butyl from the body and rear window glass prior to installation.

   Install the rear window glass.

- Apply foam core butyl to the window. Overlap the foam core butyl by 25 mm (0.984 in) at the bottom middle of the rear window glass.
- Carefully install the rear window glass into the body opening.

2. Install the 15 rear window glass mounting nuts.
   - Tighten to 3 Nm (27 lb-in).
   - Test the rear window glass for water leaks.



3. Install the cab rear panel. For additional information, refer to Section 501-05 .

tomsn048@gmail.com

Window Glass - Rear, Power

Material

Item	Specification
Foam Core Butyl E69Z-19562-A	WSB-M3G143-B1

Item	Part Number	Description
1	N621901	Rear window glass mounting nut (12 required)
2	78422A12	Rear window glass

Removal

NOTE: The power rear window motor must be initialized when repairs are performed on any part of the power rear window system including when: the power rear window motor is removed from the window regulator drum housing, a new power rear motor is installed, a new power rear window regulator is installed, a new power rear window glass module is installed, and any operation in which grease or lubricants are applied to the power rear window system.

NOTE: If the rear window glass is being removed to repair a dust/water leak, remove and reinstall the existing rear window glass.

1. Remove the rear window glass regulator. For additional information, refer to Window Regulator - Rear in this section.

2. Remove both C-pillar upper trim panels. For additional information, refer to Section 501-05 .

3. Remove the 12 rear window glass mounting nuts.

4. ***NOTICE:*** **Use only a plastic windshield setting tool to slide under the seal to separate the foam core butyl from the glass. Once the glass starts to separate from the body, constant hand pressure will break the seal and the glass can be removed. Failure to use a plastic windshield setting tool can damage the body or the glass frame.**

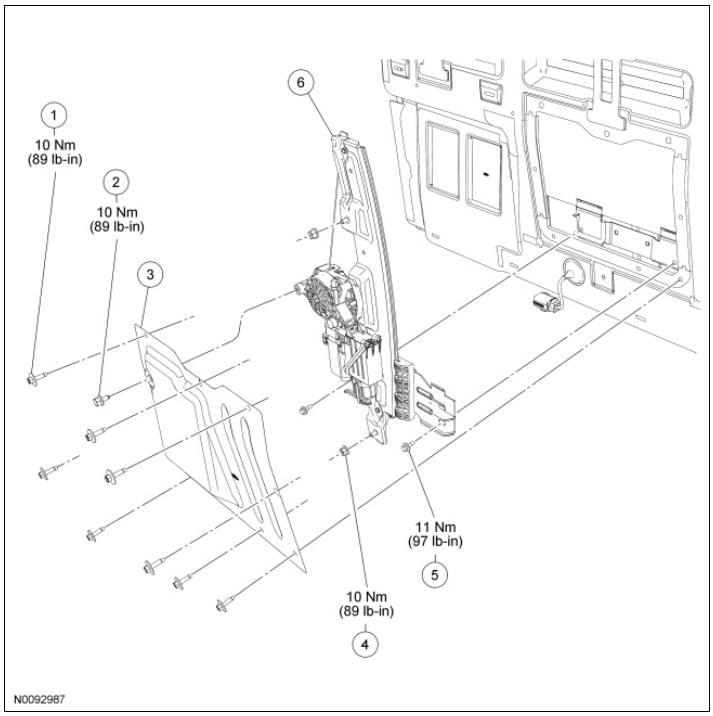
Remove the rear window glass.

Installation

1. **NOTE:** Remove as much as possible of the foam core butyl from the body and rear window glass prior to installation.

   Install the rear window glass.

   - Apply foam core butyl to the window. Overlap the foam core butyl by 25 mm (0.984 in) at the bottom middle of the rear window glass.
   - Carefully install the rear window glass into the body opening.



2. Install the 12 rear window glass mounting nuts.
   - Tighten to 3 Nm (27 lb-in).
   - Test the rear window glass for water leaks.

3. Install both C-pillar upper trim panels. For additional information, refer to Section 501-05 .

4. Install the rear window glass regulator. For additional information, refer to Window Regulator - Rear in this section.
   - Initialize the power rear window motor. For additional information, refer to Window Motor Initialization - Rear in this section.

tomsn048@gmail.com

Window Regulator - Rear

Item	Part Number	Description
1	W704734	Window regulator cover bolt (8 required)
2	N800510	Window regulator cover-to-motor bolt
3	78403E82	Window regulator cover
4	W705817	Window regulator mounting nut (2 required)
5	N800510	Window regulator-to-window bolt (2 required)
6	784400	Window regulator assembly

Removal and Installation

NOTE: The power rear window motor must be initialized when repairs are performed on any part of the power rear window system including when: the power rear window motor is removed from the window regulator drum housing, a new power rear motor is installed, a new power rear window regulator is installed, a new power rear window glass module is installed, and any operation in which grease or lubricants are applied to the power rear window system.

1. Remove the cab rear panel. For additional information, refer to Section 501-05 .

2. Position the insulator aside.

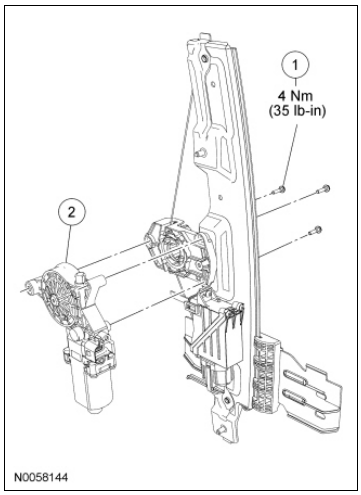
3. Remove the 8 window regulator cover bolts.
   - To install, tighten to 10 Nm (89 lb-in).

4. Remove the window regulator cover-to-motor bolt.
   - To install, tighten to 10 Nm (89 lb-in).

5. Remove the window regulator cover.

6. Remove the 2 window regulator mounting nuts.
   - To install, tighten to 10 Nm (89 lb-in).

7. Remove the 2 window regulator-to-window bolts.
   - To install, tighten to 11 Nm (97 lb-in).



8. Disconnect the electrical connector.

9. Remove the window regulator.

10. To install, reverse the removal procedure.
    - Initialize the power rear window motor. For additional information, refer to Window Motor Initialization - Rear in this section.

tomsn048@gmail.com

Window Regulator Motor - Rear

Item	Part Number	Description
1	-	Window regulator motor bolt (3 required) (part of 7844000)
2	14553	Window regulator motor

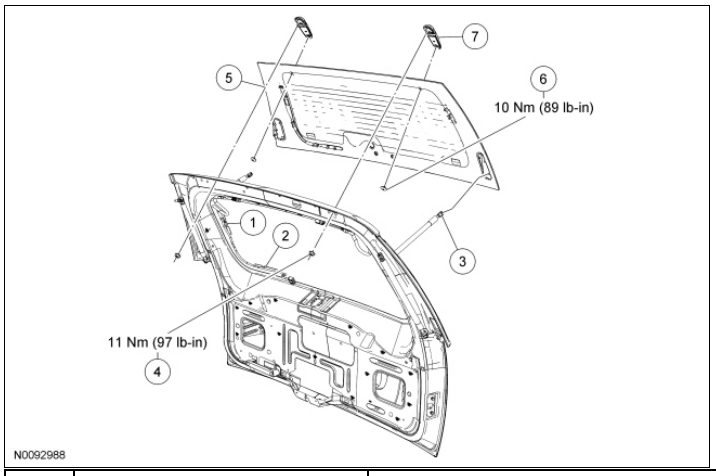
Removal and Installation

NOTE: The power rear window motor must be initialized when repairs are performed on any part of the power rear window system including when: the power rear window motor is removed from the window regulator drum housing, a new power rear motor is installed, a new power rear window regulator is installed, a new power rear window glass module is installed, and any operation in which grease or lubricants are applied to the power rear window system.

1. Remove the rear window glass regulator. For additional information, refer to Window Regulator - Rear in this section.

2. Remove the 3 window regulator motor bolts.
   - To install, tighten to 4 Nm (35 lb-in).

3. Remove the window regulator motor.



4. To install, reverse the removal procedure.
   - Initialize the power rear window motor. For additional information, refer to Window Motor Initialization - Rear in this section.

tomsn048@gmail.com

Window Glass - Liftgate

Material

Item	Specification
Threadlock 262 TA-26	WSK-M2G351-A6

Item	Part Number	Description
1	17A413 RH/ 18C673 LH	Heated rear window grid electrical wire
2	-	Rear window glass electrical connector
3	7842105 RH/ 7842104 LH	Liftgate window glass strut
4	N621926	Liftgate window glass hinge-to-body retaining nut (2 required)
5	7842004	Liftgate window glass
6	-	Liftgate hinge-to-glass screw (2 required)
7	78420A68 RH / 78420A69 LH	Liftgate hinge

Removal and Installation

1. If installing a new liftgate window glass, remove the rear window wiper motor. For additional information, refer to Section 501-16 .

2. Position the liftgate trim panel aside to access the liftgate window glass electrical connectors and the 2 liftgate window glass hinge-to-glass screws.

3. Disconnect the liftgate window glass electrical connectors.

4. **NOTE:** Open and support the liftgate window glass before removing the liftgate window glass struts.

   Remove the liftgate window glass struts.

- To avoid breaking the liftgate window glass, disconnect the liftgate window glass struts from the liftgate window glass before disconnecting the liftgate window glass struts from the rear liftgate.

5. Remove the 2 liftgate hinge-to-glass screws.
   - Apply threadlock into the liftgate window glass hinge-to-glass bolt hole, making sure that the threadlock is on the threads.
   - To install, tighten to 10 Nm (89 lb-in).

6. With the help of an assistant, remove the liftgate window glass.

7. To install, reverse the removal procedure.

Instrument Panel - Exploded View

NOTE: Explorer/Explorer Sport Trac shown, Mountaineer similar.

Item	Part Number	Description
1	04480 RH/ 04481 LH	Instrument panel side finish panel (2 required)
2	W706246	Instrument panel bolts (6 required)
3	W707628	Steering column opening trim panel screw (2 required)
4	04459	Steering column opening trim panel
5	-	Steering column cover screws (2 required)
6	3530	Lower steering column cover
7	04302	Instrument panel center finish panel
8	044F58	Instrument panel upper cowl bolt cover (2 required)
9	044D70	Instrument cluster finish panel
10	W705314	Instrument cluster finish panel screw (2 required)
11	3530	Upper steering column cover
12	04320	Instrument panel

1. For additional information, refer to the procedures in this section.

tomsn048@gmail.com

Instrument Panel Finish Panel - Center

Removal and Installation

1. Remove the selector lever trim ring.

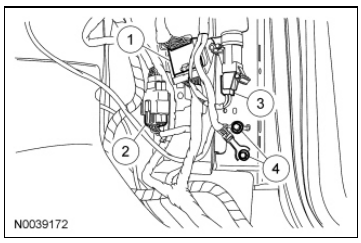
2. Remove the front floor console finish panel.
   - Disconnect the power point electrical connector.

3. Remove the instrument panel center finish panel.
   - Disconnect the electrical connectors.

4. To install, reverse the removal procedure.

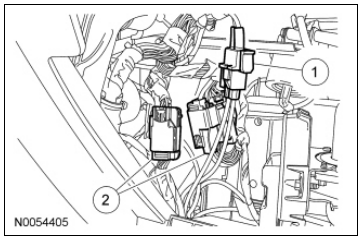
tomsn048@gmail.com

Instrument Cluster Finish Panel



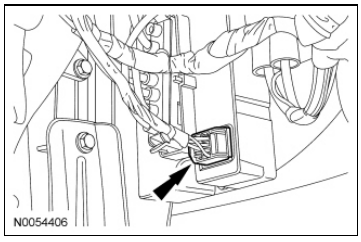
Removal and Installation

1. Remove the 2 steering column opening trim panel screws.
2. Remove the steering column opening trim panel.
3. Remove the 2 steering column cover screws.
4. Remove the 2 instrument cluster finish panel screws.
5. Remove the instrument cluster finish panel.
6. To install, reverse the removal procedure.



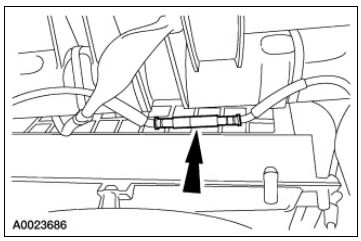
Instrument Panel

Removal and Installation

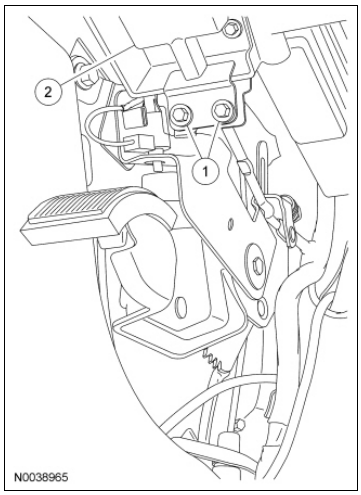


1. Remove the A-pillar and LH cowl side trim panels. For additional information, refer to Section 501-05 .
2. Remove the transmission selector lever. For additional information, refer to Section 307-05 .
3. Remove the steering wheel. For additional information, refer to Section 211-04 .
4. Remove the instrument panel side finish panels.
5. Remove the instrument panel center finish panel.
6. Remove the RH cowl side panel and disconnect the instrument panel connectors behind it in this order.
    1. Disconnect the bulkead electrical connector and detach it from the cowl.
    2. Disconnect the electrical connector.
    3. Disconnect the inertia switch electrical connector.
    4. Disconnect the 2 ground strap bolts.

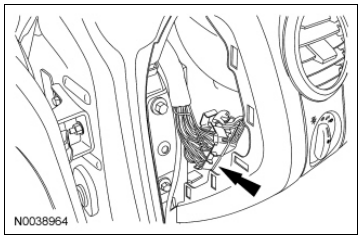
7. Lower the glove compartment and disconnect the instrument panel harness connectors.
    1. Disconnect the vacuum harness connector.
    2. Disconnect the instrument panel harness electrical connectors.



8. Disconnect the automatic temperature control solenoid and manifold electrical connector.

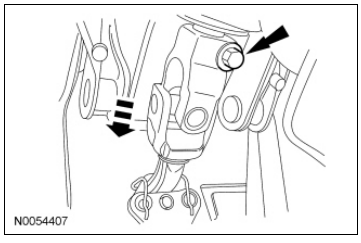


tomsn048@gmail.com



9. Disconnect the antenna lead-in cable.

10. Remove the parking brake release handle.
    1. Remove the 2 screws.
    2. Remove the release handle.

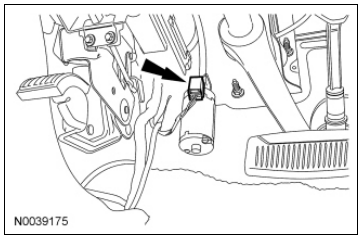


11. Disconnect the LH side instrument panel bulkhead electrical connector.

12. **NOTE:** Install a new steering column shaft-to-steering column bolt.

    Remove and discard the steering column shaft-to-steering column bolt.

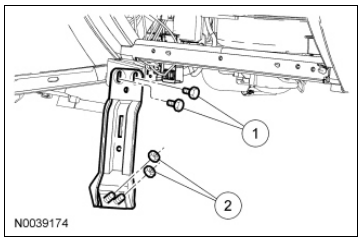
    - To install, tighten to 30 Nm (22 lb-ft).



13. Separate the steering column shaft from the steering column.

14. From atop the accelerator pedal, disconnect the RH adjustable pedal electrical connector (if equipped).

15. From the LH side of the brake pedal, disconnect the adjustable pedal motor electrical connector (if equipped).

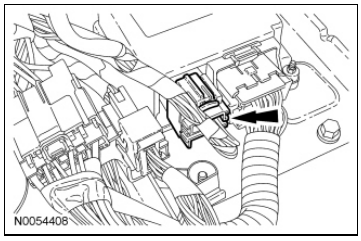


16. **NOTE:** RH side shown, LH side similar.

    Remove the RH and LH instrument panel center braces.

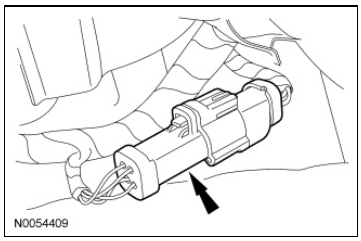
    1. Remove the 4 instrument panel brace bolts.
    2. Remove the 4 instrument panel brace nuts.

    • To install, tighten to 9 Nm (80 lb-in).



17. Remove the 2 instrument panel bolts.
    • Remove the covers and remove the bolts.
        ♦ To install, tighten to 30 Nm (22 lb-ft).

18. Remove the driver front seat. For additional information, refer to Section 501-10 .

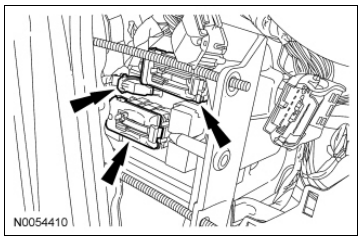


19. Position the carpet away from the Restraints Control Module (RCM).

20. Disconnect the small RCM electrical connector.

tomsn048@gmail.com

21. Disconnect the stability control sensor cluster jumper harness electrical connector and detach the instrument panel harness from the floorpan.



22. Loosen the RH instrument panel bolts one half of the bolt length, but do not completely remove the bolts.
    - To install, tighten to 30 Nm (22 lb-ft).

23. **NOTE:** The instrument panel may be supported by installing long bolts or threaded rods with the same diameter and thread pitch (in place of the LH instrument panel bolts), to support the instrument panel while allowing it to be moved away from the dash panel.

    Remove the 2 LH instrument panel bolts and correctly support the instrument panel.

    - To install, tighten to 30 Nm (22 lb-ft).

24. Position the LH side of the instrument panel rearward and disconnect the Smart Junction Box (SJB) electrical connectors.

25. Position the instrument panel back to the original position and remove the LH instrument panel supports (if necessary).

26. ***NOTICE:*** **To avoid damage to the instrument panel, an assistant is required to support the panel before carrying out this step.**

    NOTICE: **Before removing the instrument panel, make sure all electrical connector wiring is free and not caught up on other components or damage to the wire harness may occur.**

    Remove the RH instrument panel bolts and remove the instrument panel.

27. To install, reverse the removal procedure.
    - Make sure to align the trim panel retaining clips to the adjacent retaining clip holes.

tomsn048@gmail.com

Console - Front, Floor

Item	Part Number	Description
1	W705549	Front floor console rear bolt (2 required)
2	06024	Front floor console stowage door
3	7E391	Selector lever bezel
4	W705796	Front floor console finish panel screw (2 required)
5	045A76	Front floor console finish panel
6	-	Front floor console-to-instrument panel screw (2 required)
7	31172	Front floor console pushpin retainer (2 required)
8	04608	Front floor console extension trim panel
9	W706391	Front floor console middle bolt (2 required)
10	045A36	Front floor console

Removal and Installation

1. Move the front seats to the full rearward position.

2. Remove the LH and RH front floor console rear bolts.

3. Position the front seats to the full rearward position.

4. Remove the selector lever bezel.

5. Open and lift the front floor console stowage door upward.

6. Remove the 2 front floor console finish panel screws.

7. Remove the front floor console finish panel.
   - Disconnect the electrical connector.

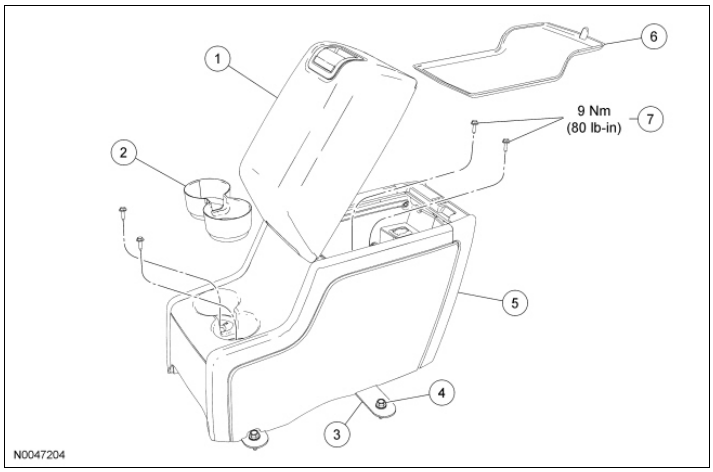
8. Disconnect the front floor console electrical connectors.

9. Remove the 2 front floor console-to-instrument panel screws.

10. Remove the LH and RH front floor console pushpin retainers.

11. Remove the LH and RH front floor console extension trim panels.

12. Remove the LH and RH front floor console middle bolts.



13. Remove the front floor console.
    - Pull the front floor console toward the rear of the vehicle.

14. To install, reverse the removal procedures.
    - Make sure to align the trim panel retaining clips to the adjacent retaining clip holes.

tomsn048@gmail.com

Console - Rear, Floor

Item	Part Number	Description
1	78045C80	Rear console arm rest (part of 78045)
2	78046B94	Cup holder insert
3	78672A44	Rear floor console bracket
4	W706636	Rear floor console bracket bolt (4 required)
5	7867442	Rear console assembly
6	78047A03	Storage compartment insert
7	W705549	Rear floor console bolts (4 required)

Removal and Installation

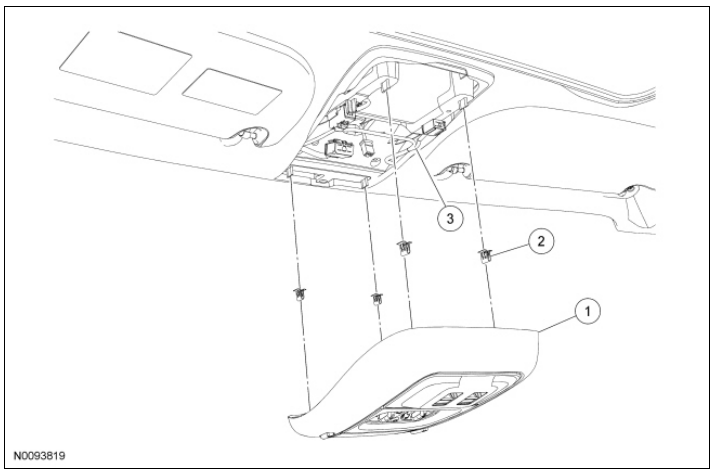
NOTE: The rear floor console bracket does not need to be removed to remove the console.

1. Open the armrest and remove the storage compartment insert.

2. Remove the 4 rear floor console bolts.
   - To install, tighten to 9 Nm (80 lb-in).

3. ***NOTICE:*** **To prevent damage to the 2 plastic guide pegs located on the bottom of the console, pull the console straight up when removing.**

   Disconnect the electrical connector and remove the rear floor console.



4. ***NOTICE:*** **To prevent damage to the 2 plastic guide pegs located on the bottom of the console, install the console straight down until the pegs are correctly seated in the holes.**

   To install, reverse the removal procedure.

Console - Overhead

Overhead Console With Roof Opening Panel

Item	Part Number	Description
1	519A70	Overhead console
2	-	Overhead console retaining clip (4 required) (part of 519A70)
3	14334	Overhead console wiring harness

Overhead Console Without Roof Opening Panel

Item	Part Number	Description
1	519A70	Overhead console
2	-	Overhead console electrical connector (part of 14334)
3	-	Overhead console screw

Removal and Installation

Vehicles with roof opening panel

1. Pull the overhead console downward to release the retaining clips.

Vehicles without roof opening panel

2. Open the overhead console garage door opener storage compartment.

3. Remove the overhead console screw.

All vehicles

4. Remove the overhead console.

5. Disconnect the electrical connectors.

6. To install, reverse the removal procedure.
    - On vehicles with a roof opening panel, make sure to align the overhead console retaining clips to the adjacent retaining clip holes.

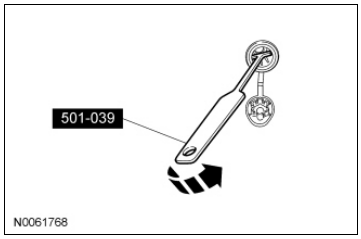
Power Point

Special Tool(s)

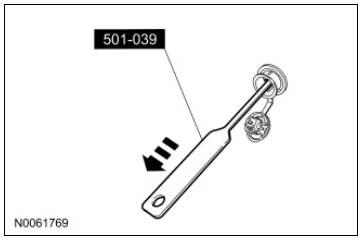
 ST3024-A	Remover, Power Point Socket 501-039 or equivalent

Removal



NOTE: Power point cover may differ depending on location.

1. Open the power point cover.



2. Install the Power Point Socket Remover in one of the power point socket slots.

3. Position the Power Point Socket Remover so that it engages in the adjacent slot.

4. Using the Power Point Socket Remover, pull the power point socket out of the retainer.

5. Disconnect the electrical connector.

Installation

1. Connect the electrical connector.

2. Slide the power point socket into the retainer.

tomsn048@gmail.com

Handles, Locks, Latches and Entry Systems

NOTE: The Smart Junction Box (SJB) is also known as the generic electronic module GEM.

Hood Latch

The hood latch system contains a latch fastened to the body and a hood latch striker attached to the hood. The latch is controlled by the hood latch release handle and cable.

Front Door

The front door entry system contains a latch that is fastened to the inside of the door frame and is controlled by the exterior and interior door handles. The latch contains the door ajar switch and door lock actuator. The front doors are locked/unlocked by the Remote Keyless Entry (RKE) transmitter, the keyless entry keypad, the door lock control switches or the driver door lock cylinder.

Rear Door

The rear door entry system contains a latch that is fastened to the inside of the door frame and is controlled by the exterior and interior door handles. The latch contains the door ajar switch and door lock actuator. The rear doors can be locked/unlocked by the RKE transmitter, the keyless entry keypad, or the door lock control switches. The rear doors have a child safety lock feature, which is a manual lock on the inside of the rear door frame. When the child safety feature is on, the rear doors cannot be opened from the interior door handle.

Liftgate

The liftgate system contains a latch located on the bottom of the inside frame of the liftgate, which is controlled by the exterior liftgate release handle. The liftgate window latch is mounted on the upper center portion of the liftgate frame and includes the ajar switch and the latch actuator. The liftgate window latch is actuated by the release switch mounted on the license plate housing, the RKE transmitter, or the keyless entry keypad. The liftgate window glass release switch operates only when all the doors are unlocked.

Tailgate

The tailgate release handle is integrated with a lock cylinder. The 2 latches are actuated by 2 actuating rods that are controlled by the release handle and remote control.

Power Lock/Unlock

The Smart Junction Box (SJB) controls the power locking/unlocking feature of all of the vehicle doors, including the liftgate. The determination to lock or unlock the vehicle is based off the input received from the door lock control switch(es), the keyless entry keypad or the Remote Keyless Entry (RKE) transmitter (if the vehicle speed is less than 5 km/h [3 mph]). Power locking and unlocking of the doors function independently of the key position, vehicle speed or transmission position. The SJB activates internal relays to supply power for the door lock actuators.

The liftgate window glass is released, using the keyless entry keypad or the RKE transmitter, and does not operate if the vehicle speed is greater than 5 km/h (3 mph).

Autolock

The autolock feature locks all the doors when all the doors, including the liftgate, are closed, after the brake pedal is pressed, and the vehicle speed exceeds 20 km/h (12 mph). This feature also relocks the doors (if any doors were open) after the brake pedal is pressed, once the SJB receives door closed inputs from all door ajar switches and vehicle speed exceeds 20 km/h (12 mph). The autolock feature can be enabled/disabled, refer to Autolock and Auto-Unlock Programming in this section for programming information. The autolock feature also uses inputs from the key position, the stoplamp switch and vehicle speed through the Controller Area Network (CAN) from the ABS module.

Auto-Unlock

The auto-unlocking feature unlocks all the doors when all of the following conditions are met:

- All the doors are closed
- The key is in the run position and the vehicle was in motion at a speed greater than 20 km/h (12 mph) for a minimum of 2 seconds since the last key start. The vehicle then comes to a stop and the key is turned to the OFF or ACC position
- The driver door is opened within 10 minutes of the key being turned to the OFF or ACC position

The doors do not auto-unlock if:

- The doors are locked using the door lock control switches
- The doors are locked with the keyless entry keypad or the RKE transmitter within 10 minutes of turning the key to the OFF or ACC position
- 10 minutes elapse and the driver door is not opened

The auto-unlock feature can be enabled/disabled independently of autolock. Refer to Autolock and Auto-Unlock Programming in this section for programming information.

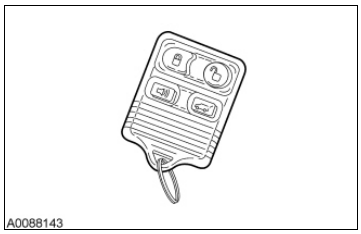
Smart Unlock

The smart unlock feature prevents all the doors from being locked with the key in the ignition lock cylinder. When the SJB receives a lock command from a front door lock control switch, and the key is in the ignition lock cylinder with one of the front doors open, the SJB commands all the doors to unlock.

Unlock Inhibit Feature

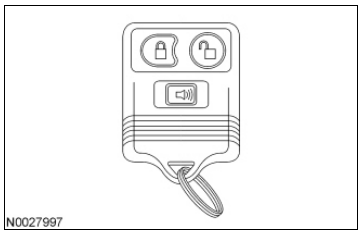
NOTE: The unlock inhibit feature is configured off from the factory.

The unlock inhibit feature prevents the doors from being unlocked from the door lock control switches after certain conditions have been met. This feature is designed to prevent vehicle theft.



The conditions for the unlock inhibit feature are:

- The key is out of the ignition
- All doors are closed
- The vehicle has been locked using the Remote Keyless Entry (RKE) transmitter, keyless entry keypad (if equipped), or the door lock control switch (while the front door was open then subsequently closed)
- 20 seconds have elapsed once all doors are closed and locked



Remote Keyless Entry (RKE) Transmitter

tomsn048@gmail.com

Explorer, Mountaineer

Explorer Sport Trac

The RKE transmitter initiates the following electronic system functions:

- Unlocks the driver door (with stepped unlock enabled)
- Unlocks all doors
- Locks all doors
- Releases the liftgate window glass (Explorer only)
- Activates/deactivates the panic alarm
- Commands the interior lamps on (when unlocking) and off (when locking)
- Sounds the horn once when LOCK is pressed twice within 3 seconds, and the doors are closed
- Sounds the horn twice when LOCK is pressed twice within 3 seconds, and any door is open

The RKE transmitter has a normal operating range of 10 m (33 ft).

The RKE transmitters can be programmed using a scan tool or by using the remote keyless entry transmitter programming procedure. Refer to Remote Keyless Entry (RKE) Transmitter Programming in this section for programming information.

Remote Keyless Entry (RKE) Transmitter Lock/Unlock Control - Lock

The RKE transmitter feature requests that all the doors be locked when the lock button is pressed. On any press of the lock button with all doors closed, the SJB provides 1 flash of the parking lamps. If any door is ajar, no flash occurs. As soon as the last door is closed, the SJB provides the flash of the parking lamps. If 2 presses of the lock button are received within 3 seconds the horn chirps once, and the parking lamps flash twice to indicate that all the doors are closed and locked. If any door is ajar when the second lock request is received within 3 seconds of the first, the RKE transmitter feature requests the SJB chirp the horn twice without flashing the parking lamps to indicate it locked all the doors, but 1 or more doors are ajar. When the key is in the ON or START position, the parking lamp flashes and horn chirp confirmations do not occur.

Remote Keyless Entry (RKE) Transmitter Lock/Unlock Control - Unlock

The RKE transmitter feature provides lock/unlock functions independently of key position or transmission position. The RKE feature will not unlock the doors if the vehicle speed is greater than 20 km/h (12 mph). The RKE transmitter feature provides a stepped (if enabled) process for unlocking the doors. Upon receipt of the first request for unlocking the doors, the RKE control feature requests the SJB to unlock the driver door only. If another unlock request is received within 3 seconds of the first, the RKE transmitter feature requests the

SJB to unlock all the doors. This feature can be changed to global unlock, so that all the doors unlock on the first press of the unlock button. Refer to Stepped Unlock Programming in this section for programming information.

Remote Keyless Entry (RKE) Liftgate Glass Release (Explorer, Mountaineer)

The RKE transmitter feature provides liftgate release function independently of key position. The vehicle speed must be less than 5 km/h (3 mph) for this function to work.

Remote Keyless Entry (RKE) Transmitter Memory Seat

The RKE transmitter feature provides memory seat/adjustable pedals easy entry feature. When the unlock button is pressed, the driver seat and adjustable pedals move to the desired memory position (the seat and pedal position corresponds to the transmitter being used). This feature can be enabled/disabled. For additional information, refer to Remote Memory Activation and Remote Memory Deactivation in this section.

Panic Alarm

The panic alarm feature provides audible and visual alarms which are evident from the exterior of the vehicle. The panic alarm feature requests that the parking lamps are flashed and the horn sounds until deactivation. The flashing of the outputs occurs simultaneously. Activation of the panic alarm is accomplished by pressing the panic button on an RKE transmitter whenever the key is in the OFF or ACC position. At all other times this feature is disabled. Deactivation of an active PANIC alarm is accomplished by any of the following actions:

- A second press of the RKE transmitter panic button
- The key is switched out of the OFF or ACC position
- A period of 2 minutes and 45 seconds has elapsed since the initial activation

Keyless Entry Keypad

The keypad, located on the exterior of the driver door, provides a method for customers to access their vehicle without a key or RKE transmitter. The keypad feature:

- Locks all doors
- Unlocks the driver door
- Unlocks all doors
- Programs/erases the customer key code
- Enables/disables auto-unlocking
- Enables/disables autolocking
- Releases the liftgate window glass

The keypad feature operates independently of key position status, vehicle speed, or transmission position. When a keypad button is pressed, the keypad buttons illuminate to provide better visibility. If the lock all doors command is entered or 5 seconds have elapsed since the last button press, the illumination is turned off.

Each vehicle equipped with a keypad is programmed with a 5-digit entry code. This code is provided to the customer through a wallet card in the Owner's Literature. In addition, this code is available through a scan tool and is also printed on the SJB label. When entering codes, each digit must be entered within 5 seconds of the previous button press.

Locking the Doors with the Keyless Entry Keypad System

It is not necessary to enter the factory set or personal code prior to locking all doors. To lock all doors, press

tomsn048@gmail.com

the 7/8 and 9/0 controls at the same time.

Unlocking the Doors with the Keyless Entry Keypad System

To unlock the driver door, enter either the factory set code or a personal code; each digit must be pressed within 5 seconds of the prior digit. The interior lamps illuminate.

To unlock all doors, enter either the factory set code or a personal code (driver door unlocks) and press the 3/4 control within 5 seconds.

To open the liftgate window glass, enter the factory set code or a personal code (driver door unlocks) and press the 5/6 control within 5 seconds.

Anti-Scan Feature

To provide added security, the keypad is disabled for 1 minute after 35 button presses without a valid entry code being entered. The keypad illumination flashes during this 1-minute mode with all functionality disabled except for 7/8 and 9/0 still being allowed to lock the vehicle.

Anti-Scan is turned off after 1 minute of keypad inactivity.

Material

Item	Specification
Multi-Purpose Grease XG-4 and/or XL-5	ESB-M1C93-B
Penetrating and Lock Lubricant (US); Penetrating Fluid (Canada) XL-1 (US); CXC-51-A (Canada)	-

Principles of Operation

NOTE: The Smart Junction Box (SJB) is also known as the Generic Electronic Module (GEM).

Power Locks

The SJB monitors the door lock control switches. When the SJB receives an unlock/lock command from either door lock control switch, the SJB energizes a relay (internal to the SJB) to supply the correct power and grounds for the door lock actuators.

Liftgate Glass Release

The SJB monitors the liftgate glass release switch. The doors must be unlocked electronically in order for the SJB to release the liftgate glass latch. When this condition is met and the SJB receives a request from the liftgate glass release switch, the SJB provides power to the latch release motor.

Keyless Entry Keypad

The SJB monitors the keyless entry keypad input. When the correct codes are entered into the SJB, the SJB carries out functions associated with the code entered. Based on input from the keypad, the SJB:

- Locks all doors
- Unlocks the driver door

tomsn048@gmail.com

- Unlocks all doors
- Enters programming mode
- Enables/disables the autolock feature
- Enables/disables the auto-unlock feature
- Releases the liftgate glass latch

Remote Keyless Entry (RKE)

The SJB receives input from programmed RKE transmitters. Based on input from the RKE transmitter, the SJB:

- Locks all doors
- Unlocks the driver door (with stepped unlock enabled)
- Unlocks all doors
- Releases the liftgate glass latch
- Activates/deactivates the panic alarm
- Turns the interior lamps on (when unlocking) and off (when locking), provided the defeat switch on the dimmer switch is not active
- Sounds the horn once when LOCK is pressed twice within 3 seconds, and the doors are closed
- Sounds the horn twice when LOCK is pressed twice within 3 seconds, and any door is open/ajar

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Door/liftgate handles • Latches	• Smart Junction Box (SJB) fuse 6 (20A) • Door lock control switches • Wiring, terminals or connectors • Remote Keyless Entry (RKE) transmitter • Keyless entry keypad • SJB

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

If the scan tool does not communicate with the VCM:

- Check the VCM connection to the vehicle.
- Check the scan tool connection to the VCM.
- Refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the SJB.

9. If the DTCs retrieved are related to the concern, go to DTC Charts. For all other DTCs, refer to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

DTC Charts

Smart Junction Box (SJB) DTC Chart

NOTE: Do not replace the SJB for DTCs B2276 or B2425.

DTC	Description	Action
B1300	Power Door Lock Circuit Failure	GO to Pinpoint Test F .
B1396	Power Door Lock Circuit Short to Battery	INSTALL a new SJB. REFER to Section 419-10 .
B1397	Power Door Unlock Circuit Short to Battery	INSTALL a new SJB. REFER to Section 419-10 .
B1982	Driver's Door Unlock Relay Coil Circuit Failure	GO to Pinpoint Test F .
B1983	Driver's Door Unlock Relay Coil Circuit Short to Battery	INSTALL a new SJB. REFER to Section 419-10 .
B2250	All Door's - Unlock All Relay Coil Circuit Failure	GO to Pinpoint Test F .
B2276	Less Than 2 Transmitters Programmed	PROGRAM the Remote Keyless Entry (RKE) transmitter(s). REFER to Remote Keyless Entry (RKE) Transmitter Programming in this section.
B2425	Remote Keyless Entry Out of Synchronization	GO to Pinpoint Test J .
B2574	Drivers Door LOCK Switch Short to Ground	GO to Pinpoint Test E .
B2575	Drivers Door UNLOCK Switch Short to Ground	GO to Pinpoint Test E .

tomsn048@gmail.com

B2667	Liftglass Release Switch Circuit Failure	GO to Pinpoint Test G .
B2670	Liftglass Release Relay Coil Short to Vbatt	INSTALL a new SJB. REFER to Section 419-10 .
B2671	Liftglass Release Relay Coil Circuit Failure	GO to Pinpoint Test F .
B2695	Keypad_A Switch Circuit Failure	GO to Pinpoint Test H .
B2696	Keypad_B Switch Circuit Failure	GO to Pinpoint Test H .
B2697	Keypad_C Switch Circuit Failure	GO to Pinpoint Test H .

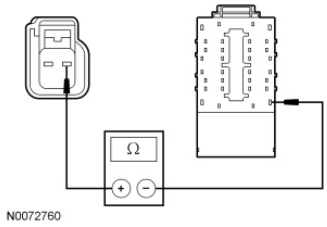
Pinpoint Tests

Pinpoint Test A: All Door Locks Are Inoperative

Refer to Wiring Diagrams Cell 110 , Power Door Locks for schematic and connector information.

Normal Operation

The SJB fuse 6 (20A) provides voltage for the power lock/unlock system. Ground for the power lock/unlock system is internal to the SJB. The SJB contains internal relays that are energized depending on input received.



When the SJB receives a lock request from the door lock control switch, the SJB provides voltage to the door lock actuators through circuit CPL11 (GY/BN). Ground for the LH front door actuator is provided through circuit CPL51 (BU/GN) and ground for the remaining door lock actuators is provided through circuit CPL52 (VT/GY). When the SJB receives an unlock request, voltage and ground are reversed on the previously listed circuits.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- SJB

PINPOINT TEST A: ALL DOOR LOCKS ARE INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
A1 VERIFY THE OPERATION OF BOTH DOOR LOCK CONTROL SWITCHES	
• Press the lock and unlock button of both door lock control switches while observing the door lock operation. • **Are the door locks inoperative from both switches?**	**Yes** GO to A2 . **No** GO to Pinpoint Test D .
A2 RETRIEVE THE RECORDED SJB DTCs FROM THE CONTINUOUS AND ON-DEMAND SELF-TESTS	
• Check for recorded SJB DTCs from the continuous and on-demand self-tests. • **Are DTCs B1300, B1982, B2250, B2574, B2575 or B2671 recorded?**	**Yes** For DTCs B2574 and B2575, GO to Pinpoint Test E . For DTCs B1300, B1982, B2250, and B2671, GO to Pinpoint Test F . **No** GO to A3 .
A3 CHECK CIRCUIT CPL11 (GY/BN) FOR AN OPEN	
• Ignition OFF. • Disconnect: SJB C2280a . • Disconnect: LH Front Door Lock Actuator C525 . • Measure the resistance between the LH front door lock actuator C525-1, circuit CPL11 (GY/BN), harness side and the SJB C2280a-4, circuit CPL11 (GY/BN), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** GO to A4 . **No** REPAIR the circuit. TEST the system for normal operation.
A4 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly.	**Yes** INSTALL a new SJB. REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been

tomsn048@gmail.com

• Operate the system and verify the concern is still present. • **Is the concern still present?**	caused by a loose or corroded connector.

Pinpoint Test B: A Single/More Than One Door Lock Is Inoperative

Refer to Wiring Diagrams Cell 110 , Power Door Locks for schematic and connector information.

Normal Operation

When the SJB receives a lock request from the door lock control switch, the SJB provides voltage to the door lock actuators through circuit CPL11 (GY/BN). Ground for the LH front door actuator is provided through circuit CPL51 (BU/GN) and ground for the remaining door lock actuators is provided through circuit CPL52 (VT/GY). When the SJB receives an unlock request, voltage and ground are reversed on the previously listed circuits.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Door lock actuator
- Liftgate lock actuator
- SJB

PINPOINT TEST B: A SINGLE/MORE THAN ONE DOOR LOCK IS INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
B1 RETRIEVE THE RECORDED SJB DTCs FROM THE CONTINUOUS AND ON-DEMAND SELF-TESTS	
• Check for recorded SJB DTCs from the continuous and the on-demand self-test. • **Are DTCs B1300, B1982, B2250 or B2671 recorded?**	**Yes** GO to Pinpoint Test F . **No** GO to B2 .
B2 CHECK THE DOOR LATCH FOR BINDING	
• Lock and unlock the inoperative door lock using the door lock rod. • **Does the door lock and unlock?**	**Yes** GO to B4 . **No** GO to B3 .
B3 CHECK THE LOCK ROD FOR BINDING	
• Operate the door lock rod manually while observing the door lock rod for any binding or if the rod is bent. • **Is the door lock rod bent or binding?**	**Yes** REPAIR as necessary. TEST the system for normal operation. **No** INSTALL a new door latch. REFER to Front Door Latch , Rear Door Latch or Liftgate Latch

	in this section. TEST the system for normal operation.
B4 CHECK CIRCUIT CPL11 (GY/BN) FOR AN OPEN	
• Ignition OFF. • Disconnect: Inoperative Door Lock Actuator . • **NOTE:** The SJB only supplies voltage to the actuator momentarily. It is important to monitor the meter while pressing the door lock control switch. • While pressing the door lock control switch in the LOCK position, measure the voltage between the inoperative door lock actuator, harness side and ground as follows: • **Is the voltage momentarily greater than 10 volts?**	**Yes** GO to B5 . **No** REPAIR the circuit. TEST the system for normal operation.

Inoperative Door Lock Actuator	Connector-Pin	Circuit
LH front	C525-1	CPL11 (GY/BN)
RH front	C603-1	CPL11 (GY/BN)
LH rear	C704-1	CPL11 (GY/BN)
RH rear	C804-1	CPL11 (GY/BN)
Liftgate	C457-1	CPL11 (GY/BN)

B5 CHECK CIRCUIT CPL52 (VT/GY) OR CIRCUIT CPL51 (BU/GN) FOR VOLTAGE	
• **NOTE:** The SJB only supplies voltage to the actuator momentarily. It is important to monitor the meter while pressing the door lock control switch. • While pressing the door lock control switch in the UNLOCK position, measure the voltage between the inoperative door lock actuator, harness side and ground as follows:	**Yes** INSTALL a new door lock actuator. REFER to Front Door Lock Actuator , Rear Door Lock Actuator , or Liftgate Latch Actuator in this section. TEST the system for normal operation. **No** GO to B6 .

Inoperative Door Lock Actuator	Connector-Pin	Circuit
LH front	C525-2	CPL51 (BU/GN)
RH front	C603-2	CPL52 (VT/GY)
LH rear	C704-2	CPL52 (VT/GY)

tomsn048@gmail.com

RH rear	C804-2	CPL52 (VT/GY)
Liftgate	C457-2	CPL52 (VT/GY)

- **Is the voltage momentarily greater than 10 volts?**

B6 CHECK CIRCUIT CPL51 (BU/GN) OR CIRCUIT CPL52 (VT/GY) FOR AN OPEN	
• Disconnect: SJB C2280a . • Measure the resistance between the inoperative door lock actuator, harness side and the SJB, harness side as follows:	**Yes** GO to B7 . **No** REPAIR the circuit. TEST the system for normal operation.

Inoperative Door Lock Actuator Connector-Pin	SJB Connector-Pin	Circuit
LH front C525-2	C2280a-17	CPL51 (BU/GN)
RH front C603-2	C2280a-1	CPL52 (VT/GY)
LH rear C704-2	C2280a-1	CPL52 (VT/GY)
RH rear C804-2	C2280a-1	CPL52 (VT/GY)
Liftgate C457-2	C2280a-1	CPL52 (VT/GY)

- **Is the resistance less than 5 ohms?**

B7 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB. REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test C: The Door Locks Operate Only One Way

Refer to Wiring Diagrams Cell 110 , Power Door Locks for schematic and connector information.

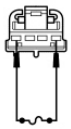
Normal Operation

The SJB sends voltage signals to the door lock control switches through circuits CPL42 (GY/YE) and CPL43 (VT/GY) for the lock and unlock requests. When the lock or unlock switch is pressed, the voltage signal is

routed to ground.

The SJB contains internal relays that are energized depending on input received. When the SJB receives a lock or unlock request from the door lock control switch, the SJB energizes the appropriate relay(s) to lock or unlock the doors.

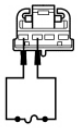
This pinpoint test is intended to diagnose the following:



- Wiring, terminals or connectors
- SJB

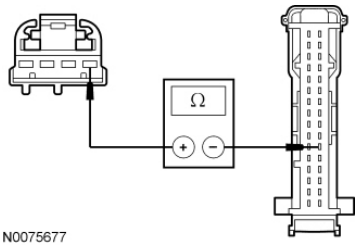
PINPOINT TEST C: THE DOOR LOCKS OPERATE ONLY ONE WAY

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

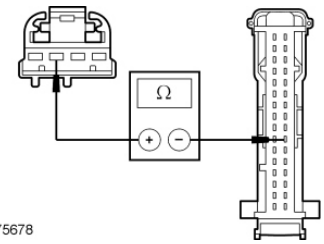


Test Step	Result / Action to Take
C1 CHECK THE RECORDED SJB DTCs FROM THE SELF-TEST	
• Check the recorded results from the SJB self-test. • **Is DTC B2574 or B2575 present?**	**Yes** GO to Pinpoint Test E . **No** GO to C2 .
C2 VERIFY THE OPERATION OF BOTH DOOR LOCK CONTROL SWITCHES	
• Ignition OFF. • Press the lock and unlock button of both door lock control switches while observing the door lock operation. • **Do the door locks operate only one way from both switches?**	**Yes** GO to C4 . **No** GO to C3 .
C3 CHECK CIRCUIT CPL42 (GY/YE) (LOCK INPUT) OR CIRCUIT CPL43 (VT/GY) (UNLOCK INPUT) FOR AN OPEN (SINGLE SWITCH INOPERATIVE)	
• Disconnect: Suspect Door Lock Control Switch . • Unlock the doors from the working door lock control switch. • Connect a fused jumper wire between the LH door lock control switch C505-1, circuit CPL42 (GY/YE), harness side and the LH door lock control switch C505-4, circuit GD133 (BK), harness side; or between the RH door lock control switch C605-1, circuit CPL42 (GY/YE), harness side and the RH door lock control switch C605-4, circuit GD151 (BK/GN), harness side.	**Yes** REMOVE the jumper wire. INSTALL a new door lock control switch. REFER to Door Lock Control Switch in this section. TEST the system for normal operation. **No** REMOVE the jumper wire. REPAIR the input circuit in question. TEST the system for normal operation.

tomsn048@gmail.com



N0058784



- Remove the jumper wire.
- Connect a fused jumper wire between the LH door lock control switch C505-3, circuit CPL43 (VT/GY), harness side and the LH door lock control switch C505-4, circuit GD133 (BK), harness side; or between the RH door lock control switch C605-3, circuit CPL43 (VT/GY), harness side and the RH door lock control switch C605-4, circuit GD151 (BK/GN), harness side.

N0058803

- **Do the doors lock and unlock with the jumper wire?**

C4 CHECK CIRCUIT CPL42 (GY/YE) (LOCK INPUT) OR CIRCUIT CPL43 (VT/GY) (UNLOCK INPUT) FOR AN OPEN (BOTH SWITCHES INOPERATIVE)	
• Disconnect: LH Door Lock Control Switch C505 . • Disconnect: SJB C2280b . • If the doors do not lock, measure the resistance between the LH door lock control switch C505-1, circuit CPL42 (GY/YE), harness side and the SJB C2280b-27, circuit CPL42 (GY/YE), harness side.  N0075677 • If the doors do not unlock, measure the resistance between the LH door lock control switch C505-3, circuit CPL43 (VT/GY), harness side and the SJB C2280b-26, circuit CPL43 (VT/GY), harness side.	**Yes** GO to C5 . **No** REPAIR the circuit in question. TEST the system for normal operation.

 • **Is the resistance less than 5 ohms?**	
C5 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB. REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test D: All Door Locks Are Inoperative From One Switch

Refer to Wiring Diagrams Cell 110 , Power Door Locks for schematic and connector information.

Normal Operation

The SJB sends voltage signals to the door lock control switches through circuits CPL42 (GY/YE) and CPL43 (VT/GY) for the lock and unlock requests. When the lock or unlock switch is pressed, the voltage signal is routed to ground. Ground for the LH door lock control switch is provided through circuit GD133 (BK). Ground for the RH door lock control switch is provided through circuit GD151 (BK/GN).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Door lock control switch

PINPOINT TEST D: ALL DOOR LOCKS ARE INOPERATIVE FROM ONE SWITCH

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
D1 CHECK THE SUSPECT DOOR LOCK CONTROL SWITCH FOR CORRECT OPERATION	
• Disconnect: Inoperative Door Lock Control Switch . • Carry out the door lock control switch component test.	**Yes** REPAIR circuit GD133 (BK) or circuit GD151 (BK/GN) for an open. TEST the system for normal operation.

tomsn048@gmail.com

Refer to Wiring Diagrams Cell 149 for component testing. • **Is the door lock control switch OK?**	**No** INSTALL a new door lock control switch. REFER to Door Lock Control Switch in this section. TEST the system for normal operation.

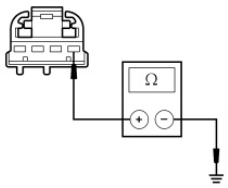
Pinpoint Test E: DTC B2574 or B2575

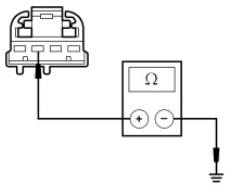
Refer to Wiring Diagrams Cell 110 , Power Door Locks for schematic and connector information.

Normal Operation

The SJB sends voltage signals to the door lock control switches through circuits CPL42 (GY/YE) and CPL43 (VT/GY) for the lock and unlock requests. When the lock or unlock switch is pressed, the voltage signal is routed to ground. Ground for the LH door lock control switch is provided through circuit GD133 (BK). Ground for the RH door lock control switch is provided through circuit GD151 (BK/GN).

- DTC B2574 (Drivers Door LOCK Switch Short to Ground) - an on-demand DTC that sets when the SJB detects a short to ground from the lock request input circuit CPL42 (GY/YE).
- DTC B2575 (Drivers Door UNLOCK Switch Short to Ground) - an on-demand DTC that sets when the SJB detects a short to ground from the unlock request input circuit CPL43 (VT/GY).





This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Door lock control switch
- SJB

PINPOINT TEST E: DTC B2574 OR B2575

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
E1 CHECK THE RECORDED SJB DTCs FROM THE SELF-TEST	
• Check the recorded results from the SJB self-test. • **Is DTC B2574 or B2575 present?**	**Yes** GO to E2 . **No** GO to Symptom Chart .
E2 CHECK THE LH DOOR LOCK CONTROL SWITCH	
• Disconnect: LH Door Lock Control Switch C505 . • Clear the DTCs and repeat the SJB self-test. • **Is DTC B2574 or B2575 present?**	**Yes** LEAVE the switch disconnected. GO to E3 . **No** INSTALL a new LH door lock control switch. REFER to Door Lock Control Switch in this section. TEST the system for normal operation.

E3 CHECK THE RH DOOR LOCK CONTROL SWITCH	
• Disconnect: RH Door Lock Control Switch C605 . • Clear the DTCs and repeat the SJB self-test. • **Is DTC B2574 or B2575 present?**	**Yes** LEAVE the switch disconnected. GO to E4 . **No** INSTALL a new RH door lock control switch. REFER to Door Lock Control Switch in this section. TEST the system for normal operation.
E4 CHECK THE LOCK INPUT CIRCUIT OR THE UNLOCK INPUT CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: SJB C2280b . • For DTC B2574, measure the resistance between the LH door lock control switch C505-1, circuit CPL42 (GY/YE), harness side and ground.  N0101970 • For DTC B2575, measure the resistance between the LH door lock control switch C505-3, circuit CPL43 (VT/GY), harness side and ground.  N0101971 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to E5 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.
E5 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present.	**Yes** INSTALL a new SJB. REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

tomsn048@gmail.com

• **Is the concern still present?**	

Pinpoint Test F: DTC B1300, B1982, B2250, or B2671

Refer to Wiring Diagrams Cell 110 , Power Door Locks for schematic and connector information.

Normal Operation

The SJB contains the all lock, all unlock, driver unlock, and the liftgate glass release relays. They are all non-servicable relays. All 4 relays receive voltage through SJB fuse 6 (20A) and have an internal SJB ground. Based on input from the door lock control switches, keypad, or Remote Keyless Entry (RKE) the SJB grounds the coil side of the relays, which in turn energizes the relay, and sends voltage to the appropriate output.

If the SJB fuse 6 (20A) has failed or is removed, all 4 DTCs will be present.

DTC Description	Fault Trigger Conditions
• B1300 - Power Door Lock Circuit Failure	A continuous and on-demand DTC that sets when the SJB detects a short to ground or open on the all lock relay coil circuit.
• B1982 - Driver's Door Unlock Relay Coil Circuit Failure	A continuous and on-demand DTC that sets when the SJB detects a short to ground or open on the driver door unlock relay coil circuit.
• B2250 - All Door's - Unlock All Relay Coil Circuit Failure	A continuous and on-demand DTC that sets when the SJB detects a short to ground or open on the all unlock relay coil circuit.
• B2671 - Liftglass Release Relay Coil Circuit Failure	A continuous and on-demand DTC that sets when the SJB detects a short to ground or open on the liftgate glass release relay coil circuit.

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- All lock actuators
- Liftgate glass actuator
- SJB

PINPOINT TEST F: DTC B1300, B1982, B2250, OR B2671

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take

F1 RETRIEVE THE RECORDED SJB DTCs FROM THE SELF-TEST	
• Check for recorded SJB DTCs from the self-test. • **Are all 4 DTCs B1300, B1982, B2250, and B2671 recorded?**	**Yes** VERIFY the SJB fuse 6 (20A) is OK. If it has failed, GO to F2 . If it is OK, INSTALL a new SJB. REFER to Section 419-10 . TEST the system for normal operation. **No** INSTALL a new SJB. REFER to Section 419-10 . TEST the system for normal operation.
F2 CHECK CIRCUIT CPL59 (BN/BU) FOR A SHORT TO GROUND	
• INSTALL a new SJB fuse 6 (20A). • Operate the liftgate glass actuator by pressing the liftgate glass release switch. • **Is the SJB fuse 6 (20A) OK?**	**Yes** GO to F4 . **No** GO to F3 .
F3 CHECK THE LIFTGATE GLASS ACTUATOR FOR A SHORT	
• Disconnect: Liftgate Glass Actuator C4040 . • INSTALL a new SJB fuse 6 (20A). • Operate the liftgate glass actuator by pressing the liftgate glass release switch. • **Is the SJB fuse 6 (20A) OK?**	**Yes** INSTALL a new liftgate glass actuator. REFER to Liftgate Window Latch Actuator in this section. TEST the system for normal operation. **No** REPAIR circuit CPL59 (BN/BU) for a short to ground. TEST the system for normal operation.
F4 CHECK CIRCUIT CPL11 (GY/BN) FOR A SHORT TO GROUND	
• INSTALL a new SJB fuse 6 (20A). • Operate the door lock actuators by pressing LOCK on the door lock control switch. • **Is the SJB fuse 6 (20A) OK?**	**Yes** REPAIR circuit CPL51 (BU/GN) or CPL52 (VT/GY) for a short to ground. TEST the system for normal operation. **No** REPAIR circuit CPL11 (GY/BN) for a short to ground. TEST the system for normal operation.

Pinpoint Test G: The Liftgate Glass Latch Release Is Inoperative/Does Not Operate Correctly

Refer to Wiring Diagrams Cell 117 , Remote Keyless Entry and Alarm for schematic and connector information.

tomsn048@gmail.com

Normal Operation

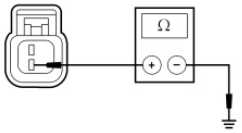
The SJB does not release the liftgate glass unless the doors have been unlocked electronically or the request is initiated from a Remote Keyless Entry (RKE) transmitter.

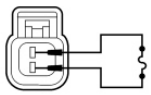
The SJB sends a voltage signal to the liftgate glass release switch through circuit CPL45 (BN). When the switch is pressed, the signal is routed to ground through circuit GD143 (BK/VT). When the SJB detects a request from the liftgate glass release switch, the SJB provides voltage to the liftgate glass latch release actuator through circuit CPL59 (BN/BU). Ground for the liftgate glass latch is provided through circuit GD149 (BK/GY).

The liftgate glass release switch circuit CPL45 (BN) changes to CPL45 (GN), and the ground circuit GD143 (BK/VT) changes to GD143 (GN) in the 13412 wiring harness.

- DTC B2667 (Liftglass Release Switch Circuit Failure) - an on-demand DTC that sets when the SJB detects a short to ground on the liftgate glass release switch input circuit.

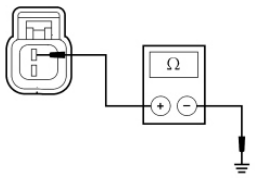
This pinpoint test is intended to diagnose the following:

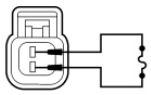


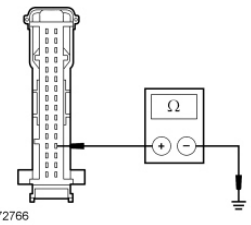


- Wiring, terminals or connectors
- Liftgate glass release switch
- Liftgate glass actuator
- SJB

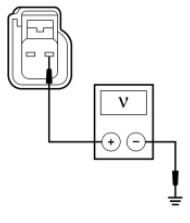
PINPOINT TEST G: THE LIFTGATE GLASS LATCH RELEASE IS INOPERATIVE/DOES NOT OPERATE CORRECTLY

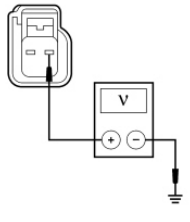


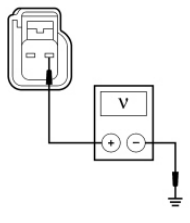




NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

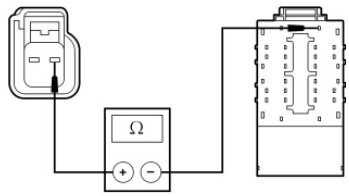


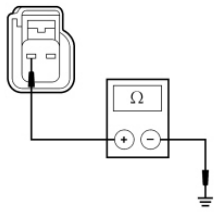




NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
G1 CHECK THE DOOR LOCK OPERATION	
• Lock and unlock the doors using a door lock control switch. • **Do the door locks operate correctly?**	**Yes** GO to G2 . **No** GO to Symptom Chart .
G2 CHECK THE RECORDED SJB DTCs FROM THE SELF-TEST	
• Check the recorded results from the SJB self-test. • **Is DTC B2667 present?**	**Yes** GO to G3 . **No** GO to G5 .
G3 CHECK THE LIFTGATE GLASS RELEASE SWITCH (SHORT TO GROUND)	
• Disconnect: Liftgate Glass Release Switch C4039 .	**Yes** GO to G4 .





• Clear the DTC and carry out the SJB self-test. • **Is DTC B2667 still present?**	**No** INSTALL a new liftgate glass release switch.
G4 CHECK THE LIFTGATE GLASS RELEASE SWITCH INPUT CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: SJB C2280b . • Measure the resistance between the liftgate glass release switch C4039-2, circuit CPL45 (GN), harness side and ground.  N0058822 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to G14 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
G5 CHECK THE LIFTGATE GLASS RELEASE SWITCH	
• Disconnect: Liftgate Glass Release Switch C4039 . • Unlock the doors with the door lock control switch. • Connect a fused jumper wire between the liftgate glass release switch C4039-2, circuit CPL45 (GN), harness side and the liftgate glass release switch C4039-1, circuit GD143 (GN), harness side.  N0072765 • **Does the liftgate glass latch release?**	**Yes** INSTALL a new liftgate glass release switch. TEST the system for normal operation. **No** LEAVE the jumper wire connected. GO to G6 .
G6 CHECK FOR SJB DTCs FROM THE SELF-TEST	
• Ignition ON. • With the jumper wire still connected, carry out the SJB self-test. • **Is DTC B2667 retrieved?**	**Yes** REMOVE the jumper wire. GO to G9 . **No** REMOVE the jumper wire. GO to G7 .
G7 CHECK THE GROUND CIRCUIT TO THE SWITCH FOR AN OPEN	

tomsn048@gmail.com

• Ignition OFF. • Disconnect: Negative Battery Cable . • Measure the resistance between the liftgate glass release switch C4039-1, circuit GD143 (GN), harness side and ground.  N0026505 • **Is the resistance less than 5 ohms?**	**Yes** GO to G8 . **No** REPAIR the circuit. TEST the system for normal operation.
G8 CHECK THE LIFTGATE GLASS RELEASE SWITCH INPUT CIRCUIT FOR AN OPEN	
• Connect a fused jumper wire between the liftgate glass release switch C4039-2, circuit CPL45 (GN), harness side and the liftgate glass release switch C4039-1, circuit GD143 (GN), harness side.  N0072765 • Disconnect: SJB C2280b . • Measure the resistance between the SJB C2280b-29, circuit CPL45 (BN), harness side and ground.  N0072766 • **Is the resistance less than 5 ohms?**	**Yes** GO to G14 . **No** REPAIR circuit CPL45 (BN) for an open. TEST the system for normal operation.
G9 CHECK FOR A SHORT TO VOLTAGE TO THE LIFTGATE GLASS LATCH	
• Disconnect: Liftgate Glass Latch C4040 . • Measure the voltage between the liftgate glass latch C4040-1, circuit CPL59 (BN/BU), harness side and ground.	**Yes** GO to G10 . **No** GO to G11 .

 N0072767 • **Is any voltage present?**	
G10 CHECK CIRCUIT CPL59 (BN/BU) FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: SJB C2280a . • Ignition ON. • Measure the voltage between the liftgate glass latch C4040-1, circuit CPL59 (BN/BU), harness side and ground.  N0072767 • **Is any voltage present?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to G14 .
G11 CHECK FOR VOLTAGE TO THE LIFTGATE GLASS LATCH	
• Ignition OFF. • Connect: Liftgate Glass Release Switch C4039 . • Unlock the doors with the door lock control switch. • **NOTE:** The SJB only supplies voltage to the liftgate glass latch momentarily. It is important to monitor the meter while pressing the liftgate glass release switch. • While pressing the liftgate glass release switch, measure the voltage between the liftgate glass latch C4040-1, circuit CPL59 (BN/BU), harness side and ground.  N0072767 • **Is the voltage momentarily greater than 10 volts?**	**Yes** GO to G13 . **No** GO to G12 .
G12 CHECK CIRCUIT CPL59 (BN/BU) FOR AN OPEN	

tomsn048@gmail.com

• Disconnect: SJB C2280a . • Measure the resistance between the liftgate glass latch C4040-1, circuit CPL59 (BN/BU), harness side and the SJB C2280a-31, circuit CPL59 (BN/BU), harness side.  N0072768 • **Is the resistance less than 5 ohms?**	**Yes** GO to G14 . **No** REPAIR the circuit. TEST the system for normal operation.
G13 CHECK THE GROUND CIRCUIT TO THE LATCH FOR AN OPEN	
• Disconnect: Negative Battery Cable . • Measure the resistance between the liftgate glass latch C4040-2, circuit GD149 (BK/GY), harness side and ground.  N0026508 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new liftgate window latch. REFER to Liftgate Window Latch in this section. TEST the system for normal operation. **No** REPAIR circuit GD149 (BK/GY) for an open. TEST the system for normal operation.
G14 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB. REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test H: The Doors Do Not Lock/Unlock Using The Keyless Entry Keypad

Refer to Wiring Diagrams Cell 117 , Remote Keyless Entry and Alarm for schematic and connector information.

Normal Operation

The SJB monitors for a ground signal on the 12-volt reference circuits CPK29 (GY/BU), CPK30 (VT/GN), and CPK31 (YE/GN) for the keyless entry keypad. When an individual keypad button is pressed, an

individual or a combination of the reference circuits are connected to ground. The SJB then determines which button was pressed based on which circuit(s) has a ground signal. Circuit RPK27 (BU) is the ground for the keypad buttons and is internally grounded in the SJB. Once the SJB determines that the 5-digit personal entry code, or the factory set 5-digit entry code has been entered on the keypad, the SJB then energizes the driver door unlock relay to unlock the driver door.

To unlock all the doors and liftgate, the 3/4 button must be pressed within 5 seconds of the 5-digit code being entered.

To lock all the doors and liftgate, the 5-digit code does not need to be entered. Press the 7/8 and 9/0 buttons at the same time.

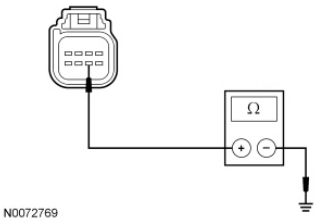
The keyless entry keypad has an anti-scan feature to help prevent theft. If a valid 5-digit code is not entered within 7 attempts (35 consecutive button presses), the keyless entry keypad will go into anti-scan mode. In anti-scan mode, the keypad illumination will flash and all input will be ignored except for pressing the 7/8 and 9/0 buttons, which will lock all doors.

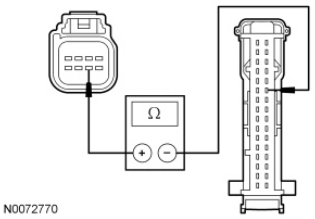
- DTC B2695 (Keypad_A Switch Circuit Failure) - an on-demand DTC that sets when the SJB detects a short to ground on a keypad input circuit.
- DTC B2696 (Keypad_B Switch Circuit Failure) - an on-demand DTC that sets when the SJB detects a short to ground on a keypad input circuit.
- DTC B2697 (Keypad_C Switch Circuit Failure) - an on-demand DTC that sets when the SJB detects a short to ground on a keypad input circuit.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Keyless entry keypad
- SJB

PINPOINT TEST H: THE DOORS DO NOT LOCK/UNLOCK USING THE KEYLESS ENTRY KEYPAD





NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
H1 CHECK THE SJB KEYCODE PID	
• Enter the following diagnostic mode on the scan tool: SJB DataLogger . • Observe the KEYCODE PID. Read and record the 5-digit factory set entry code. • Enter the 5-digit factory set entry code on the keyless entry keypad. • **Do the doors unlock?**	**Yes** The system is operating as designed. INFORM the customer of the correct system operation. **No** GO to H2 .
H2 RETRIEVE THE RECORDED SJB DTCs FROM THE SELF-TEST	
	Yes

tomsn048@gmail.com

• Check for recorded SJB DTCs from the self-test. • **Is DTC B2695, B2696, or B2697 recorded?**	GO to H3 . **No** GO to H6 .
H3 REPEAT THE SJB SELF-TEST	
• Disconnect: Keyless Entry Keypad C500 . • Clear the DTCs, then repeat the SJB self-test. • **Is DTC B2695, B2696, or B2697 recorded?**	**Yes** GO to H4 . **No** INSTALL a new keyless entry keypad. REFER to Keyless Entry Keypad in this section. CLEAR the DTCs. REPEAT the self-test.
H4 CHECK CIRCUITS CPK29 (GY/BU), CPK30 (VT/GN) AND CPK31 (YE/GN) FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: SJB C2280b . • Measure the resistance between the keypad, harness side and ground as follows: **Keypad Connector-Pin** / **Circuit** C500-1 — CPK29 (GY/BU) C500-3 — CPK30 (VT/GN) C500-7 — CPK31 (YE/GN) • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to H5 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.
H5 CHECK CIRCUITS CPK29 (GY/BU), CPK30 (VT/GN) AND CPK31 (YE/GN) FOR A SHORT TO CIRCUIT RPK27 (BU)	
• Measure the resistance between the keypad, harness side and ground as follows: **Keypad Connector-Pin** / **Circuits** / **Keypad Connector-Pin** C500-6 — RPK27 (BU) and CPK29 (GY/BU) — C500-1 C500-6 — RPK27 (BU) and CPK30 (VT/GN) — C500-3 C500-6 — RPK27 (BU) and CPK31 (YE/GN) — C500-7 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to H12 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.
H6 CHECK THE SJB KEY_PAD PID	

• Enter the following diagnostic mode on the scan tool: SJB DataLogger . • Press each keyless entry keypad button while observing the KEY_PAD PID. • **Does the PID display the correct values?**	**Yes** GO to H12 . **No** GO to H7 .
H7 CHECK FOR GROUND ON CIRCUIT RPK27 (BU)	
• Disconnect: Negative Battery Cable . • Disconnect: Keyless Entry Keypad C500 . • Measure the resistance between the keyless entry keypad C500-6, circuit RPK27 (BU), harness side and ground.  N0072769 • **Is the resistance less than 5 ohms?**	**Yes** GO to H9 . **No** GO to H8 .
H8 CHECK CIRCUIT RPK27 (BU) FOR AN OPEN	
• Disconnect: SJB C2280b . • Measure the resistance between the keyless entry keypad C500-6, circuit RPK27 (BU), harness side and the SJB C2280b-22, circuit RPK27 (BU), harness side.  N0072770 • **Is the resistance less than 5 ohms?**	**Yes** GO to H12 . **No** REPAIR the circuit. TEST the system for normal operation.
H9 CHECK THE KEYLESS ENTRY KEYPAD	
• Connect: Negative Battery Cable . • Ignition ON. • Connect a fused jumper wire between the keyless entry keypad harness side, while monitoring the SJB PID (KEY_PAD) as follows:	**Yes** INSTALL a new keyless entry keypad. REFER to Keyless Entry Keypad in this section. **No** GO to H10 .

Keyless Entry Keypad Connector-Pin/ Circuit	Keyless Entry Keypad Connector-Pin/ Circuit	SJB PID (KEY_PAD) Value

tomsn048@gmail.com

C500-1 CPK29 (GY/BU)	C500-6 RPK27 (BU)	1/2
C500-3 CPK30 (VT/GN)	C500-6 RPK27 (BU)	7/8
C500-7 CPK31 (YE/GN)	C500-6 RPK27 (BU)	9/0

- **Does the PID display the correct values?**

H10 CHECK CIRCUITS CPK29 (GY/BU), CPK30 (VT/GN), AND CPK31 (YE/GN) FOR AN OPEN

- Ignition OFF.
- Disconnect: SJB C2280b .
- Measure the resistance between the SJB, harness side and the keyless entry keypad, harness side as follows:

SJB Connector-Pin	Circuit	Keyless Entry Keypad Connector-Pin
C2280b-23	CPK29 (GY/BU)	C500-1
C2280b-24	CPK30 (VT/GN)	C500-3
C2280b-25	CPK31 (YE/GN)	C500-7
C2280b-22	RPK27 (BU)	C500-6

- **Are the resistances less than 5 ohms?**

Yes
GO to H11 .

No
REPAIR the circuit in question. TEST the system for normal operation.

H11 CHECK CIRCUITS CPK29 (GY/BU), CPK30 (VT/GN) AND CPK31 (YE/GN) FOR A SHORT TO EACH OTHER

- Measure the resistance between the keypad, harness side as follows:

Keypad Connector-Pin	Circuits	Keypad Connector-Pin
C500-1	CPK29 (GY/BU) and CPK30 (VT/GN)	C500-3
C500-1	CPK29 (GY/BU) and CPK31 (YE/GN)	C500-7

Yes
GO to H12 .

No
REPAIR the circuit in question. TEST the system for normal operation.

C500-3	CPK30 (VT/GN) and CPK31 (YE/GN)	C500-7	

- **Are the resistances greater than 10,000 ohms?**

Test Step	Result / Action to Take
H12 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB. REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test I: The Keyless Entry Keypad Illumination Is Inoperative/Does Not Operate Correctly

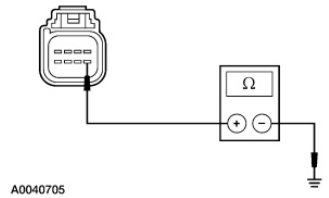
Refer to Wiring Diagrams Cell 117 , Remote Keyless Entry and Alarm for schematic and connector information.

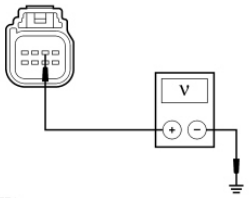
Normal Operation

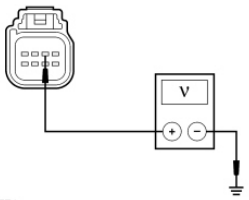
When the SJB detects a keyless entry keypad button is pressed, the SJB provides voltage to the keyless entry keypad through circuit CPK28 (GN/BK). Ground for the keyless entry keypad is provided through circuit GD133 (BK).

This pinpoint test is intended to diagnose the following:

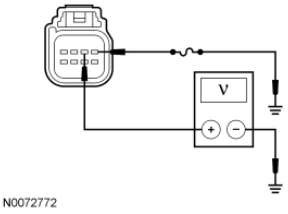
- Wiring, terminals or connectors
- Keyless entry keypad
- SJB

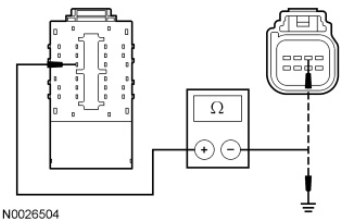






PINPOINT TEST I: THE KEYLESS ENTRY KEYPAD ILLUMINATION IS INOPERATIVE/DOES NOT OPERATE CORRECTLY





NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
I1 CHECK THE SJB KEYPAD SWITCH PIDs	
• Enter the following diagnostic mode on the scan tool: SJB DataLogger . • Observe the SJB PID (KEY_PAD) while pressing each keyless entry keypad button.	**Yes** GO to I2 . **No** GO to Pinpoint Test H .

tomsn048@gmail.com

• **Do the PID values agree with the keypad button positions?**	
I2 CHECK CIRCUIT GD133 (BK) FOR AN OPEN	
• Ignition OFF. • Disconnect: Negative Battery Cable . • Disconnect: Keyless Entry Keypad C500 . • Measure the resistance between the keyless entry keypad C500-5, circuit GD133 (BK), harness side and ground.  A0040705 • **Is the resistance less than 5 ohms?**	**Yes** GO to I3 . **No** REPAIR the circuit. TEST the system for normal operation.
I3 CHECK FOR CONSTANT VOLTAGE	
• Connect: Negative Battery Cable . • Ignition ON. • Measure the voltage between the keyless entry keypad C500-2, circuit CPK28 (GN/BK), harness side and ground.  N0072771 • **Is any voltage present?**	**Yes** GO to I4 . **No** GO to I5 .
I4 CHECK CIRCUIT CPK28 (GN/BK) FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: SJB C2280a . • Ignition ON. • Measure the voltage between the keyless entry keypad C500-2, circuit CPK28 (GN/BK), harness side and ground.  N0072771	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to I7 .

• **Is any voltage present?**	
I5 CHECK FOR SJB OUTPUT	
• Ignition OFF. • Measure the voltage between the keyless entry keypad C500-2, circuit CPK28 (GN/BK), harness side and ground while connecting a fused (5A) jumper wire between the keyless entry keypad C500-1, circuit CPK29 (GY/BU), harness side and ground.  N0072772 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new keyless entry keypad. REFER to Keyless Entry Keypad in this section. TEST the system for normal operation. **No** GO to I6 .
I6 CHECK CIRCUIT CPK28 (GN) FOR AN OPEN OR A SHORT TO GROUND	
• Disconnect: SJB C2280a . • Measure the resistance between the SJB C2280a-18, circuit CPK28 (WH/GN), harness side and the keyless entry keypad C500-2, circuit CPK28 (GN/BK), harness side; and between the SJB C2280a-18, circuit CPK28 (WH/GN), harness side and ground.  N0026504 • **Is the resistance less than 5 ohms between the SJB and the keyless entry keypad; and greater than 10,000 between the SJB and ground?**	**Yes** GO to I7 . **No** REPAIR the circuit. TEST the system for normal operation.
I7 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB. REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

tomsn048@gmail.com

Pinpoint Test J: The Remote Keyless Entry (RKE) Transmitter Is Inoperative

Normal Operation

Remote locking and unlocking of the doors is accomplished by the SJB receiving a command message from the RKE transmitter. The SJB energizes the appropriate relays to lock or unlock the doors. The RKE transmitters and SJB also utilize a rolling code to prevent the code from being "captured" by a code grabber. The system advances the counter in the RKE transmitter and SJB every time an RKE transmitter button is pressed.

- DTC B2425 (Remote Keyless Entry Out of Synchronization) - a continuous DTC that sets when the SJB detects the rolling counter received from an RKE transmitter is 1,024 times greater than the rolling counter stored in the module.

This pinpoint test is intended to diagnose the following:

- RKE transmitter
- RKE transmitter battery
- RKE transmitter button pressed a substantial amount of times while outside the range of the vehicle
- RKE transmitter programming
- SJB

PINPOINT TEST J: THE RKE TRANSMITTER IS INOPERATIVE

NOTE: All RKE transmitters must be present to begin diagnosis of the RKE system.

NOTE: Aftermarket or dealer-installed systems may adversely affect the RKE system operation. These systems should be disconnected before diagnosing any RKE concerns.

Test Step	Result / Action to Take
J1 CHECK FOR THE CORRECT RKE TRANSMITTERS	
• **NOTE:** Make sure the RKE transmitters are ones provided with the OEM system and not from an aftermarket system, or a dealer-installed system that may have been installed on the vehicle. • Check that the correct RKE transmitters are used with the vehicle. • **Are all the correct RKE transmitters present?**	**Yes** GO to J2 . **No** The system cannot be tested without the correct RKE transmitters. INFORM the customer that all the correct RKE transmitters must be present to proceed with diagnosis of the system.
J2 CHECK IF THE RKE TRANSMITTER IS OUT OF SYNCHRONIZATION WITH THE SJB	
• Check the recorded results from the SJB self-test. • **Is continuous DTC B2425 present?**	**Yes** GO to J3 . **No** GO to J7 .
J3 RESYNCHRONIZE THE INOPERATIVE RKE	

TRANSMITTER	
• Ignition OFF. • Press any button on the inoperative RKE transmitter 4 times consecutively within 30 seconds. • **Does the RKE transmitter operate correctly now?**	**Yes** The transmitter is now synchronized. CLEAR the DTCs. REPEAT the self-test. **No** GO to J4 .
J4 CHECK FOR A SECOND RKE TRANSMITTER	
• Check for another RKE transmitter that operates with the vehicle. • **Is there another RKE transmitter that operates with the vehicle?**	**Yes** GO to J5 . **No** GO to J6 .
J5 RESYNCHRONIZE THE INOPERATIVE RKE TRANSMITTER USING THE SECOND RKE TRANSMITTER	
• Press any button on the operational RKE transmitter. • Within 30 seconds, press a button on the inoperative RKE transmitter. • Check the inoperative RKE transmitter for correct operation. • **Does the inoperative RKE transmitter operate now?**	**Yes** The RKE transmitter is now synchronized. CLEAR the DTCs. REPEAT the self-test. **No** GO to J6 .
J6 PROGRAM THE INOPERATIVE RKE TRANSMITTER OR ALL THE RKE TRANSMITTERS	
• Program the inoperative RKE transmitter individually using a scan tool or program all RKE transmitters using the manual key cycle method. Refer to Remote Keyless Entry (RKE) Transmitter Programming in this section. • **Does the inoperative RKE transmitter(s) operate now?**	**Yes** The transmitter(s) is now synchronized. INFORM the customer that any RKE transmitters not present need to be programmed. CLEAR the DTCs. REPEAT the self-test. **No** GO to J7 .
J7 MAKE SURE THE RKE TRANSMITTER SIGNAL IS BEING RECEIVED	
• Enter the following diagnostic mode on the scan tool: Remote Keyless Entry . • **NOTE:** The remote keyless entry test is accessed through the scan tool by selecting Toolbox, Body, Security. • Monitor the RKE Transmitter Identification Code (TIC) and the last command received through the scan tool menus. • Verify the RKE transmitter signal is being received. Press a button on the RKE transmitter while observing the scan tool. • **Does the TIC and RKE command show up on the scan tool screen when a button is pressed?**	**Yes** GO to J8 . **No** GO to J9 .

tomsn048@gmail.com

J8 CHECK IF THE RKE TRANSMITTERS ARE PROGRAMMED	
• Enter the following diagnostic mode on the scan tool: Remote Keyless Entry . • Monitor the RKE transmitter TIC through the scan tool menus. • Verify the RKE transmitters are programmed to the vehicle. • **Does the TIC displayed under the RKE transmitter match any of the TICs stored in memory?**	**Yes** GO to J11 . **No** PROGRAM the inoperative RKE transmitter individually using a scan tool or program all RKE transmitters using the manual key cycle method. REFER to Remote Keyless Entry (RKE) Transmitter Programming in this section. TEST the system for normal operation.
J9 CHECK THE RKE TRANSMITTER BATTERY	
• Using a thin coin, open the RKE transmitter. • Do not clean off any grease from the battery terminals on the back surface of the circuit board. • Verify the correct battery is used (CR2032). • Remove the RKE transmitter battery and measure the voltage. • **Is the voltage greater than 2.5 volts?**	**Yes** GO to J10 . **No** INSTALL a new battery. DO NOT reprogram the RKE transmitters (weak or dead batteries do not erase TICs from memory). TEST the system for normal operation.
J10 CHECK FOR NORMAL OPERATION WITH A KNOWN GOOD RKE TRANSMITTER	
• Enter the following diagnostic mode on the scan tool: Remote Keyless Entry . • Monitor the RKE transmitter TIC through the scan tool menus. • Using the customer's second RKE transmitter or a known good RKE transmitter that is correct for the vehicle (and programmed to the vehicle), verify the RKE transmitter signal is being received. • **Does the TIC show up on the scan tool when a button is pressed on the RKE transmitter?**	**Yes** PROGRAM the inoperative RKE transmitter individually using a scan tool or program all RKE transmitters using the manual key cycle method. REFER to Remote Keyless Entry (RKE) Transmitter Programming in this section. TEST the system for normal operation. **No** GO to J11 .
J11 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB. REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test K: An Individual Button/Feature Is Inoperative From The Remote Keyless Entry (RKE) Transmitter

Normal Operation

When any Remote Keyless Entry (RKE) transmitter button is pressed, the SJB receives and processes the command to provide the appropriate output.

NOTE: The panic feature will only operate when the key is in the OFF position.

This pinpoint test is intended to diagnose the following:

- All door locks
- Horn system
- Liftgate glass latch
- Parking lamps
- RKE transmitter

PINPOINT TEST K: AN INDIVIDUAL BUTTON/FEATURE IS INOPERATIVE FROM THE RKE TRANSMITTER

Test Step	Result / Action to Take
K1 VERIFY THE DOOR LOCK OPERATION	
• Press the lock and unlock button from the driver door lock control switch while observing the door lock operation. • **Do the door locks operate correctly?**	**Yes** GO to K2 . **No** GO to Symptom Chart .
K2 VERIFY THE HORN OPERATION	
• Enter the following diagnostic mode on the scan tool: SJB DataLogger . • Select the SJB PID (HORNRLY) and active command the horn on. • **Does the horn sound when commanded on?**	**Yes** GO to K3 . **No** REFER to Section 413-06 .
K3 VERIFY THE PARKING LAMP OPERATION	
• Place the headlamp switch in the PARKLAMP position. • **Do the parking lamps operate correctly?**	**Yes** For Explorer/Mountaineer, GO to K4 . For Sport Trac, REPLACE the inoperative RKE transmitter. PROGRAM the inoperative RKE transmitter individually using a scan tool or program all RKE transmitters using the manual key cycle method. REFER to Remote Keyless Entry (RKE) Transmitter Programming in this section. TEST the system for normal operation. **No** REFER to Section 417-01 .

tomsn048@gmail.com

K4 VERIFY THE LIFTGATE GLASS LATCH OPERATION	
• **NOTE:** The liftgate must be unlocked before verifying the liftgate glass release operation. • Press the liftgate glass release button on the liftgate. • **Does the liftgate glass release?**	**Yes** REPLACE the inoperative RKE transmitter. PROGRAM the inoperative RKE transmitter individually using a scan tool or program all RKE transmitters using the manual key cycle method. REFER to Remote Keyless Entry (RKE) Transmitter Programming in this section. TEST the system for normal operation. **No** GO to Pinpoint Test G .

Pinpoint Test L: The Remote Keyless Entry (RKE) Transmitter Has Poor Range Performance

Normal Operation

The Remote Keyless Entry (RKE) transmitter has a normal operating range of 10 m (33 ft). The SJB has an internal antenna to receive the RKE transmitter signal. When the SJB receives a command from a programmed RKE transmitter, the SJB processes the command to provide the appropriate output.

This pinpoint test is intended to diagnose the following:

- Environmental interference
- RKE transmitter
- RKE transmitter battery
- SJB

PINPOINT TEST L: THE RKE TRANSMITTER HAS POOR RANGE PERFORMANCE

NOTE: All RKE transmitters must be present to begin diagnosis of the RKE system.

NOTE: Aftermarket or dealer-installed systems may adversely affect the RKE system operation. These systems must be disconnected before diagnosing any RKE concerns.

Test Step	Result / Action to Take
L1 CHECK FOR THE CORRECT RKE TRANSMITTERS	
• **NOTE:** Make sure the RKE transmitters are ones provided with the OEM system and not from an aftermarket system, or a dealer-installed system, that may have been installed on the vehicle. • Check that the correct RKE transmitters are used with the vehicle. • **Are all the correct RKE transmitters present?**	**Yes** GO to L2 . **No** The system cannot be tested without the correct RKE transmitters. INFORM the customer that all the correct RKE transmitters must be present to proceed with diagnosis of the system.
L2 CHECK ALL RKE TRANSMITTERS FOR POOR RANGE PERFORMANCE	

• **NOTE:** The 10 m (33 ft) measurement of range is not the standard but is a guideline that clearly indicates a vehicle is experiencing normal range performance. • Check all RKE transmitters for poor range performance (less than 10 m [33 ft]). • **Do all RKE transmitters experience poor range performance?**	**Yes** GO to L4 . **No** GO to L3 .
L3 CHECK THE RKE TRANSMITTER BATTERY	
• Using a thin coin, open the RKE transmitter. • Do not clean off any grease from the battery terminals on the back surface of the circuit board. • Verify the correct battery is used (CR2032). • Remove the RKE transmitter battery and measure the voltage. • **Is the voltage greater than 2.5 volts?**	**Yes** REPLACE the inoperative RKE transmitter. PROGRAM the inoperative RKE transmitter individually using a scan tool or program all RKE transmitters using the manual key cycle method. REFER to Remote Keyless Entry (RKE) Transmitter Programming in this section. TEST the system for normal operation. **No** INSTALL a new battery (make sure the battery is seated correctly). DO NOT reprogram the RKE transmitters (weak or dead batteries do not erase Transmitter Identification Codes (TICs) from memory). TEST the system for normal operation.
L4 CHECK THE LOCATION OF THE VEHICLE AND THE APPROACH ANGLES AROUND THE VEHICLE	
• Make sure the poor performance is consistent in nature and is not from one approaching angle. • RKE transmitter range performance may be degraded in certain locations. For example, if the vehicle is within 0.5 miles (0.8 km) of high-power devices or radio/TV towers, the operating distance of the transmitters may be reduced. • **Is the poor range performance consistent around the vehicle?**	**Yes** GO to L5 . **No** The system is operating correctly at this time. The range may have been affected by environmental interference.
L5 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly.	**Yes** INSTALL a new SJB. REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

tomsn048@gmail.com

• Operate the system and verify the concern is still present. • **Is the concern still present?**	

Pinpoint Test M: The Autolock Does Not Operate Correctly

Normal Operation

When autolock is enabled the SJB requires the following inputs:

- Transmission Range (TR) sensor
- Door ajar switches (all doors closed)
- Ignition switch position
- Vehicle speed

The vehicle speed and TR sensor inputs are received through the Controller Area Network (CAN). Once the SJB receives all 4 inputs, the doors automatically lock.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Door ajar switches
- Ignition switch
- Vehicle speed signal
- SJB

PINPOINT TEST M: THE AUTOLOCK DOES NOT OPERATE CORRECTLY

Test Step	Result / Action to Take
M1 VERIFY THE AUTOLOCK FEATURE IS ENABLED	
• Verify the autolock feature is enabled. Refer to Autolock and Auto-Unlock Programming in this section. • **Is the autolock feature enabled?**	**Yes** GO to M2 . **No** PROGRAM the autolock feature. REFER to Autolock and Auto-Unlock Programming in this section.
M2 CHECK THE COURTESY LAMP OPERATION	
• Open and close each door, liftgate and liftgate window glass while checking the courtesy lamp operation. • **Do the courtesy lamps operate correctly?**	**Yes** GO to M3 . **No** REFER to Section 417-02 .
M3 CHECK THE SJB PIDs	
• Ignition ON.	**Yes** GO to M4 .

• Enter the following diagnostic mode on the scan tool: SJB DataLogger . • Monitor the SJB transmission gear selected PID (TRANSGEAR). • Monitor the SJB ignition switch status PID (GEM-IGN). • Monitor the SJB vehicle speed PID (VSS_GEM). • **Are the correct values received?**	**No** To diagnose an incorrect vehicle speed PID, REFER to Section 206-09 . To diagnose an incorrect transmission gear selected PID, REFER to Section 307-01A or Section 307-01B . To diagnose an incorrect ignition switch status PID, REFER to Section 211-05 .
M4 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB. REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test N: The Smart Unlock Does Not Operate Correctly

Normal Operation

The smart unlock feature is controlled by the SJB. The SJB unlocks all doors after 1 second if the key is in the ignition and either front door is open when the vehicle is locked with a door lock control switch.

The doors can still be locked by using the manual door lock rod, a Remote Keyless Entry (RKE) transmitter, or the keyless entry keypad.

This pinpoint test is intended to diagnose the following:

- Key-in-ignition switch
- LH front door ajar switch
- SJB

PINPOINT TEST N: THE SMART UNLOCK DOES NOT OPERATE CORRECTLY

Test Step	Result / Action to Take
N1 CHECK THE KEY-IN-IGNITION WARNING CHIME	
• Insert the key in the ignition lock cylinder. • Open the driver door. • **Does the key-in-ignition warning chime work correctly?**	**Yes** GO to N2 . **No** REFER to Section 413-01 .

tomsn048@gmail.com

N2 CHECK THE COURTESY LAMP OPERATION	
• Open and close each door, liftgate and liftgate window glass while checking the courtesy lamp operation. • **Do the courtesy lamps operate correctly?**	**Yes** GO to N3 . **No** REFER to Section 417-02 .
N3 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB. REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test O: The Auto-Unlock Does Not Operate Correctly

Normal Operation

The SJB energizes the unlock relay based on input from the ajar switches and the vehicle speed signal. The SJB unlocks the doors when the following conditions are met:

- The vehicle speed has exceeded 20 km/h (12 mph), for a minimum of 2 seconds, then dropped to 0 km/h (0 mph) (vehicle stopped).
- The key is turned to the OFF or ACC position.
- The LH front door is opened within 10 minutes of the key being turned to the OFF or ACC position.

The auto-unlock feature is cancelled if the doors are locked with the door lock control switch or the Remote Keyless Entry (RKE) transmitter within the 10 minute active window or if the 10 minute active window expires.

This pinpoint test is intended to diagnose the following:

- Door ajar switches
- Vehicle speed signal
- SJB

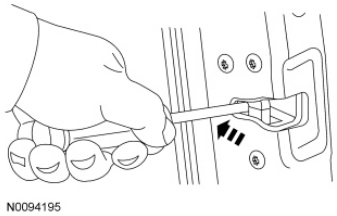
PINPOINT TEST O: THE AUTO-UNLOCK DOES NOT OPERATE CORRECTLY

Test Step	Result / Action to Take
O1 CHECK IF THE AUTO-UNLOCK IS ENABLED	
• Verify the auto-unlock feature is enabled. Refer to Autolock and Auto-Unlock	**Yes** GO to O2 .

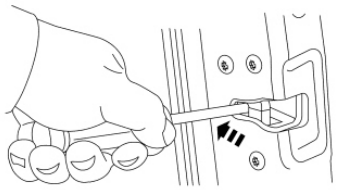
Programming in this section. • **Is the auto-unlock enabled?**	**No** Enable the auto-unlock. REFER to Autolock and Auto-Unlock Programming in this section. TEST the system for normal operation.
O2 CHECK THE COURTESY LAMP OPERATION	
• Open and close each door while observing the courtesy lamp operation. • **Do the courtesy lamps operate correctly?**	**Yes** GO to O3 . **No** REFER to Section 417-02 .
O3 CHECK THE SJB IGNITION STATUS PID	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: SJB DataLogger . • Monitor the SJB PID (GEM_IGN). • **Does the ignition status PID indicate RUN?**	**Yes** GO to O4 . **No** REFER to Section 211-05 .
O4 CHECK THE VEHICLE SPEED OPERATION	
• Check the operation of the speedometer. • **Does the speedometer operate correctly?**	**Yes** GO to O5 . **No** REFER to Section 413-01 .
O5 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB. REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test P: Hard To Open/Close Door From Either Door Handle

Normal Operation



The door latch can be actuated from the interior or exterior door handle. When actuated, the door latch releases and allows the door to open. If the door latch or the door hinges have insufficient lubrication or if the striker or door are misaligned, it causes extra force to be used when opening or closing the door.



This pinpoint test is intended to diagnose the following:

tomsn048@gmail.com

- Door alignment
- Door hinges
- Striker adjustment
- Door latch

PINPOINT TEST P: HARD TO OPEN/CLOSE DOOR FROM EITHER DOOR HANDLE

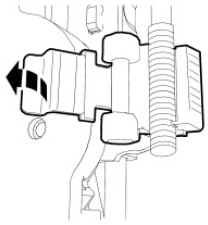
Test Step	Result / Action to Take
P1 CHECK THE LATCH OPERATION FROM BOTH DOOR HANDLES	
• Open and close the door using both the interior and exterior door handles. • **Does the door open normally from one of the door handles?**	**Yes** If the door is difficult/does not open from the exterior door handle, GO to Pinpoint Test Q . If the door is difficult/does not open from the interior door handle, GO to Pinpoint Test R . **No** If the door does not operate correctly from both door handles, GO to P2 .
P2 CHECK THE LATCH OPERATION	
• Open the door. • Using a screwdriver, fully close the latch (two clicks).  N0094195 • Verify that the latch releases easily while pulling on the interior/exterior door handle. • **Does the latch release easily?**	**Yes** GO to P4 . **No** GO to P3 .
P3 CHECK THE LATCH OPERATION AFTER LUBRICATION	
• Lubricate the door latch. REFER to Latch Lubrication in this section. • Using a screwdriver, fully close the latch (two clicks).	**Yes** The concern was caused by an insufficiently lubricated door latch. **No** INSTALL a new door latch. REFER to Front Door Latch or Rear Door Latch in this section. TEST the system for normal operation.

 N0094195 • Verify that the latch releases easily while pulling on the interior/exterior door handle. • **Does the latch release easily?**	
P4 CHECK THE STRIKER ADJUSTMENT	
• Check the adjustment of the striker. REFER to Section 501-03 . • **Is the striker adjusted correctly?**	**Yes** GO to P5 . **No** ADJUST the striker as necessary. TEST the system for normal operation.
P5 CHECK THE DOOR ALIGNMENT	
• Check the alignment of the door. REFER to Section 501-03 . • **Is the door aligned correctly?**	**Yes** LUBRICATE the door hinges. TEST the system for normal operation. **No** ADJUST the door as necessary. TEST the system for normal operation.

Pinpoint Test Q: A Door Is Difficult/Does Not Open From The Exterior Door Handle

Normal Operation

The exterior door handle is connected to the door latch with an actuating rod. When the exterior door handle is pulled it causes the actuating rod to push down on the latch lever. The actuating rod can be adjusted for proper exterior door handle operation. When the latch lever is moved, the door latch releases, allowing the door to open.



This pinpoint test is intended to diagnose the following:

- Broken or binding linkage
- Exterior door handle to latch rod adjustment
- Exterior door handle
- Door latch

PINPOINT TEST Q: A DOOR IS DIFFICULT/DOES NOT OPEN FROM THE EXTERIOR DOOR HANDLE

Test Step	Result / Action to Take
Q1 CHECK THE LATCH OPERATION FROM BOTH DOOR HANDLES	
	Yes

tomsn048@gmail.com

• Open and close the door using both the interior and exterior door handles. • **Does the door open normally from one of the door handles?**	If the door is difficult/does not open from only the exterior door handle, GO to Q2 . **No** If the door does not operate correctly from both door handles, GO to Pinpoint Test P .
Q2 CHECK THE EXTERIOR DOOR HANDLE	
• Remove the door trim panel. Refer to Section 501-05 . • Open the clip and disconnect the exterior door handle actuating rod.  N0088081 • Pull and release the exterior door handle. • **Does the exterior door handle operate correctly?**	**Yes** GO to Q3 . **No** INSTALL a new exterior door handle. REFER to Exterior Front Door Handle or Exterior Rear Door Handle in this section. TEST the system for normal operation.
Q3 CHECK THE EXTERIOR DOOR HANDLE AND LINKAGE OPERATION	
• Operate the exterior door handle while observing the linkage. • **Are any of the exterior door handle components or linkages binding or broken?**	**Yes** REPAIR as necessary. TEST the system for normal operation. **No** GO to Q4 .
Q4 CARRY OUT THE EXTERIOR DOOR HANDLE ADJUSTMENT	
• Carry out the exterior door handle to latch rod adjustment. Refer to Door Handle to Latch Rod Adjustment in this section. • **Does the exterior door handle operate correctly?**	**Yes** The concern was caused by an improperly adjusted exterior door handle. **No** INSTALL a new door latch. REFER to Front Door Latch or Rear Door Latch in this section. TEST the system for normal operation.

Pinpoint Test R: A Door Is Difficult/Does Not Open From The Interior Door Handle

Normal Operation

The interior door handle is connected to the door latch by an actuating cable. When the interior door handle is pulled it causes the cable to pull on the latch lever. When the latch lever is moved, the door latch releases, allowing the door to open.

This pinpoint test is intended to diagnose the following:

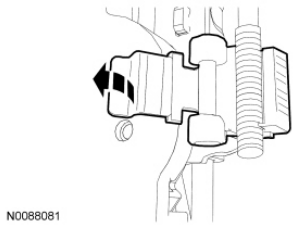
- Broken or binding cable/linkage
- Door latch

PINPOINT TEST R: A DOOR IS DIFFICULT/DOES NOT OPEN FROM THE INTERIOR DOOR HANDLE

Test Step	Result / Action to Take
R1 CHECK THE LATCH OPERATION FROM BOTH DOOR HANDLES	
• Open and close the door using both the interior and exterior door handles. • **Does the door open normally from one of the door handles?**	**Yes** If the door is difficult/does not open from only the interior door handle, GO to R2 . **No** If the door does not operate correctly from both door handles, GO to Pinpoint Test P .
R2 CHECK THE INTERIOR DOOR HANDLE AND CABLE/LINKAGE OPERATION	
• Remove the door trim panel. Refer to Section 501-05 . • Install the interior door handle back onto the release cable. • Operate the interior door handle while observing the cable/linkage. • **Are any of the interior door handle components or cable/linkages binding or broken?**	**Yes** REPAIR as necessary. TEST the system for normal operation. **No** INSTALL a new door latch. REFER to Front Door Latch or Rear Door Latch in this section. TEST the system for normal operation.

Pinpoint Test S: Exterior Door Release Handle Sticks

Normal Operation



The exterior door handle is connected to the door latch with an actuating rod. When the exterior door handle is pulled it causes the actuating rod to push down on the latch lever. The actuating rod can be adjusted for proper exterior door handle operation. When the latch lever is moved, the door latch releases, allowing the door to open. The handle has a return spring to make sure the handle returns to a closed position.

This pinpoint test is intended to diagnose the following:

- Binding linkage
- Broken handle return spring
- Exterior door handle adjustment
- Door latch

tomsn048@gmail.com

PINPOINT TEST S: EXTERIOR DOOR RELEASE HANDLE STICKS

Test Step	Result / Action to Take
S1 CHECK FOR A BROKEN RETURN SPRING	
• Remove the door trim panel. Refer to Section 501-05 . • Open the clip and disconnect the exterior door handle actuating rod.  N0088081 • Pull and release the exterior door handle. • **Does the exterior door handle return to a closed position once released?**	**Yes** GO to S2 . **No** INSTALL a new exterior door handle. REFER to Exterior Front Door Handle or Exterior Rear Door Handle in this section. TEST the system for normal operation.
S2 CARRY OUT THE EXTERIOR DOOR HANDLE ADJUSTMENT	
• Carry out the exterior door handle to latch rod adjustment. Refer to Door Handle to Latch Rod Adjustment in this section. • **Does the exterior door handle operate correctly?**	**Yes** The concern was caused by an improperly adjusted exterior door handle. **No** GO to S3 .
S3 CHECK THE EXTERIOR DOOR HANDLE AND LINKAGE OPERATION	
• Operate the exterior door handle while observing the linkage. • **Are any of the exterior door handle components or linkages binding?**	**Yes** REPAIR as necessary. TEST the system for normal operation. **No** INSTALL a new door latch. REFER to Front Door Latch or Rear Door Latch in this section. TEST the system for normal operation.

Pinpoint Test T: Interior Door Release Handle Sticks

Normal Operation

The interior door handle is connected to the door latch by an actuating cable. When the interior door handle is pulled it causes the cable to pull on the latch lever. When the latch lever is moved, the door latch releases, allowing the door to open. The handle has a return spring to make sure the handle returns to a closed position.

This pinpoint test is intended to diagnose the following:

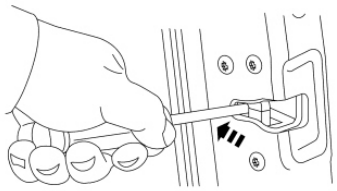
- Binding cable

- Broken handle return spring
- Door latch

PINPOINT TEST T: INTERIOR DOOR RELEASE HANDLE STICKS

Test Step	Result / Action to Take
T1 CHECK FOR A BROKEN RETURN SPRING	
• Remove the interior door handle. Refer to Interior Door Handle - Front or Interior Door Handle - Rear in this section. • Pull and release the interior door handle. • **Does the interior door handle return to a closed position once released?**	**Yes** GO to T2 . **No** INSTALL a new interior door handle. REFER to Interior Door Handle - Front or Interior Door Handle - Rear in this section. TEST the system for normal operation.
T2 CHECK THE INTERIOR DOOR HANDLE CABLE OPERATION	
• Remove the door latch release cable. • Observe the door latch release cable for any damage or binding. • **Is the door latch release cable OK?**	**Yes** INSTALL a new door latch. REFER to Front Door Latch or Rear Door Latch in this section. TEST the system for normal operation. **No** REPAIR as necessary. TEST the system for normal operation.

Pinpoint Test U: Squeak/Rattle/Chucking Noise From Door



This pinpoint test is intended to diagnose the following:

- Door alignment
- Striker adjustment
- Door latch

PINPOINT TEST U: SQUEAK/RATTLE/CHUCKING NOISE FROM DOOR

Test Step	Result / Action to Take
U1 CHECK FOR ANY LOOSE COMPONENTS	
• Remove the door trim panel. REFER to Section 501-05 . • Inspect inside the door for any loose components.	**Yes** REPAIR as necessary. TEST the system for normal operation. **No** GO to U2 .

tomsn048@gmail.com

• **Are there any loose components inside the door?**	
U2 CHECK THE STRIKER ADJUSTMENT	
• Check the adjustment of the striker. REFER to Section 501-03 . • **Is the striker adjusted correctly?**	**Yes** GO to U3 . **No** ADJUST the striker as necessary. TEST the system for normal operation.
U3 CHECK THE DOOR ALIGNMENT	
• Check the alignment of the door. REFER to Section 501-03 . • **Is the door aligned correctly?**	**Yes** GO to U4 . **No** ADJUST the door as necessary. TEST the system for normal operation.
U4 CHECK THE LATCH OPERATION AFTER LUBRICATION	
• Lubricate the door latch. REFER to Latch Lubrication in this section. • Using a screwdriver, fully close the latch (two clicks).  N0094195 • Operate the door latch and listen for the noise. • **Is the original noise still present after the latch is lubricated?**	**Yes** INSTALL a new door latch. REFER to Front Door Latch or Rear Door Latch in this section. TEST the system for normal operation. **No** The concern was caused by an insufficiently lubricated door latch.

Pinpoint Test V: Manual Door Lock Cylinder Inoperative

Normal Operation

The door lock cylinder is connected to the door latch via a lock rod and can be used to manually lock/unlock a door.

This pinpoint test is intended to diagnose the following:

- Bent or binding lock rod and lever
- Door lock cylinder
- Door latch

PINPOINT TEST V: MANUAL DOOR LOCK CYLINDER INOPERATIVE

Test Step	Result / Action to Take
V1 CHECK THE LOCK CYLINDER OPERATION AFTER LUBRICATION	
• Spray a lock lubricant such as Motorcraft XL-1 into the lock cylinder opening for a couple seconds. • Operate the door lock cylinder with the key. • **Does the door lock and unlock using the door lock cylinder?**	**Yes** The concern was caused by an insufficiently lubricated lock cylinder. Spray a multi-purpose grease such as Motorcraft XL-5 into the lock cylinder for a couple seconds to provide long term lubrication. **No** GO to V2 .
V2 CHECK THE DOOR LOCK CYLINDER	
• Remove the door lock cylinder. Refer to Door Lock Cylinder in this section. • Operate the door lock cylinder with the key. • **Does the door lock cylinder rotate freely to both lock and unlock positions?**	**Yes** GO to V3 . **No** INSTALL a new door lock cylinder. REFER to Door Lock Cylinder in this section. TEST the system for normal operation.
V3 CHECK THE DOOR LOCK CYLINDER LINKAGE	
• Operate the door lock cylinder while observing the linkage. • **Is the door lock cylinder rod and lever bent or binding?**	**Yes** REPAIR as necessary. TEST the system for normal operation. **No** INSTALL a new door latch. REFER to Front Door Latch in this section. TEST the system for normal operation.

Pinpoint Test W: Unable To Remove The Key From The Ignition Lock Cylinder

Refer to Wiring Diagrams Cell 37 , Shift Interlock for schematic and connector information.

Normal Operation

The ignition switch contains a key removal inhibit solenoid. The solenoid prevents the ignition lock cylinder to be turned to lock and the key removed any time the transmission selector lever is in any position except park. The inhibit solenoid receives voltage at all times from the Smart Junction Box (SJB) fuse 8 (15A) on circuit SBP08 (VT/RD). When the transmission selector lever is in any gear except park, the selector switch closes and connects circuit GD138 (BK/WH) to circuit CDC41 (WH/BN), which supplies ground to the solenoid.

This pinpoint test is intended to diagnose the following:

tomsn048@gmail.com

- Wiring, terminals or connectors
- Transmission selector lever
- Binding steering column components
- Ignition lock cylinder
- Ignition switch

PINPOINT TEST W: UNABLE TO REMOVE THE KEY FROM THE IGNITION LOCK CYLINDER

Test Step	Result / Action to Take
W1 CHECK FOR AN ENERGIZED KEY REMOVAL INHIBIT SOLENOID	
• Remove the SJB fuse 8 (15A). • Attempt to turn the ignition key to the run position and then back to the lock position and remove the key. • **Does the ignition lock cylinder turn to the lock position and can the key be removed?**	**Yes** REFER to Section 211-05 to continue diagnosis of the key removal inhibit solenoid system. **No** GO to W2 .
W2 CHECK THE IGNITION LOCK CYLINDER FOR BINDING	
• Remove the ignition lock cylinder. REFER to Ignition Lock Cylinder - Functional in this section. • Rotate the ignition lock cylinder through all positions using the key. • **Does the ignition lock cylinder freely rotate through all positions and can the key be removed from the lock cylinder?**	**Yes** REFER to Section 211-05 to continue diagnosis of the steering column for any binding steering column components or ignition switch. **No** INSTALL a new ignition lock cylinder. REFER to Ignition Lock Cylinder - Functional in this section. TEST the system for normal operation.

tomsn048@gmail.com

Remote Keyless Entry (RKE) Transmitter Programming

NOTE: All Remote Keyless Entry (RKE) transmitters must be programmed at the same time.

NOTE: Programming of the RKE transmitters can be accomplished using a scan tool or by carrying out the following steps.

1. The vehicle must be electronically unlocked before entering program mode using the RKE transmitter, keyless entry keypad (if equipped) or door lock control switch while the driver door is open.

2. Turn the key from OFF to RUN 8 times within 10 seconds, with the eighth turn ending in RUN. If the module successfully enters the program mode, it locks and then unlocks all doors.

3. Within 20 seconds, press any button on an RKE transmitter, and the doors lock and then unlock to confirm that the RKE transmitter is programmed. Repeat this step for each RKE transmitter.

4. If the door locks do not respond for any RKE transmitter, wait several seconds and press the button again. If the door locks still fail to respond, refer to Handles, Locks, Latches and Entry Systems in this section. Make sure that no more than the maximum number of 6 RKE transmitters are attempted to be programmed.

5. Exiting the programming mode is accomplished if one of the following occurs:
   - The key transitions to the OFF position.
   - Twenty seconds have passed since entering programming mode or since the last RKE transmitter was programmed.
   - The maximum number of 6 RKE transmitters have been programmed.

Remote Memory Activation

1. Position the driver seat and adjustable pedals to the desired position.

2. Press the set button on the lower center of the instrument panel.

3. Within 5 seconds press one control on the Remote Keyless Entry (RKE) transmitter and then the 1 or 2 button on the lower center of the instrument panel to associate the RKE transmitter to the driver 1 or the driver 2 position. This stores the configuration for driver 1 or driver 2.

4. If a second memory setting is desired, repeat the procedure with the second RKE transmitter.

tomsn048@gmail.com

Remote Memory Deactivation

1. Press the set button on the lower center of the instrument panel.

2. Within 5 seconds press one control on the Remote Keyless Entry (RKE) transmitter and then the set button on the lower center of the instrument panel to associate the RKE transmitter to the driver 1 or the driver 2 position.

3. If a second memory setting is desired to be deactivated, repeat the procedure with the second RKE transmitter.

Keyless Entry Keypad Code Programming

NOTE: A maximum of 3 personal entry codes can be programmed into the vehicle. The personal entry codes can be associated with up to two memory seat/adjustable pedal settings.

1. Enter the permanent factory keyless entry keypad code.
2. Press the 1/2 button within 5 seconds to activate the programming mode. Holding the 1/2 button for more than 2 seconds after activation erases all the stored customer codes. The existing codes do not need to be erased to program a new code.
3. Within 5 seconds, enter the new 5-digit keyless entry keypad code.
4. Press the 1/2, 3/4, or 5/6 to indicate which of the 3 personal entry code positions is to be programmed.
5. The door locks lock and unlock to confirm the new code is programmed.
6. To program an additional personal entry code, repeat Steps 2 through 4.

tomsn048@gmail.com

Stepped Unlock Programming

1. With the ignition switch in the OFF position, press the LOCK and UNLOCK buttons on the Remote Keyless Entry (RKE) transmitter simultaneously for 4 seconds.
    - The parking lamps will flash twice to indicate the mode change.

2. Repeat Step 1 to enable/disable the stepped unlocking feature.

Autolock and Auto-Unlock Programming

Autolock Programming Using the Keyless Entry Keypad

1. Close all doors and windows.
2. Confirm that the ignition key is OFF.
3. Enter the 5-digit permanent entry code into the keyless entry keypad.
4. Within 5 seconds of entering the code, press and hold the 3/4 button on the keyless entry keypad.
5. Within 5 seconds of Step 3, and while holding the 3/4 button, press the 7/8 button on the keyless entry keypad and release it.
6. **NOTE:** If the autolock is disabled, the horn chirps once. If the autolock feature is enabled, the horn chirps once shortly and then sounds a second time with a longer sound of the horn once the above sequence is completed.

   Within 5 seconds of Step 3, release the 3/4 button on the keyless entry keypad.

Autolock Programming Using the Ignition Lock Cylinder

1. Close all doors and windows.
2. Confirm that the ignition key is OFF.
3. **NOTE:** Steps 5 through 9 must be carried out within 30 seconds.

   Turn the ignition key from OFF to RUN.
4. Press the door lock control switch UNLOCK button 3 times.
5. Turn the ignition key from RUN to OFF.
6. Press the door lock control switch UNLOCK button 3 times.
7. Turn the ignition key from OFF to RUN.
8. Verify the horn chirps. This indicates the enable/disable mode and now is ready to accept program changes.
9. Press the door lock control switch UNLOCK button then the LOCK button 1 time to command the module to toggle the autolock/relock feature.
10. Verify that the horn chirps. There should be 1 chirp indicating that autolock/relock feature has been disabled. If 1 chirp is heard, followed by a longer sound of the horn, the autolock/relock feature has just been enabled.
11. Turn the key to the OFF position or wait 2 minutes to exit the enable/disable mode.

tomsn048@gmail.com

12. Verify that the horn chirps once to indicate that a feature has been changed and that autolock/relock has been toggled.

Auto-Unlock Programming Using the Keyless Entry Keypad

1. Close all doors and windows.
2. Confirm that the ignition key is OFF.
3. Enter the 5-digit permanent entry code into the keyless entry keypad.
4. Within 5 seconds of entering the code, press and hold the 3/4 button on the keyless entry keypad.
5. Within 5 seconds of Step 3, and while holding the 3/4 button, press the 7/8 button twice on the keyless entry keypad and release it.
6. **NOTE:** If the auto-unlock is disabled, the horn chirps once. If the auto-unlock feature is enabled, the horn chirps twice.

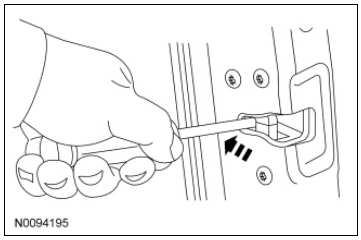
   Within 5 seconds of Step 3, release the 3/4 button on the keyless entry keypad.

Auto-Unlock Programming Using the Ignition Lock Cylinder

1. Close all doors and windows.
2. Confirm that the ignition key is OFF.
3. **NOTE:** Steps 5 through 9 must be carried out within 30 seconds.

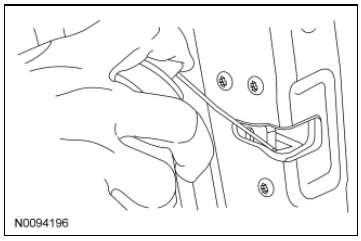
   Turn the ignition key from OFF to RUN.
4. Press the door lock control switch UNLOCK button 3 times.
5. Turn the ignition key from RUN to OFF.
6. Press the door lock control switch UNLOCK button 3 times.
7. Turn the ignition key from OFF to RUN.
8. Verify the horn chirps. This indicates the enable/disable mode and now is ready to accept program changes.
9. Press the door lock control switch LOCK button then the UNLOCK button 1 time to command the module to toggle the auto-unlock feature.
10. Verify that the horn chirps. There should be 1 chirp indicating that auto-unlock feature has been disabled. If 1 chirp is heard, followed by a longer sound of the horn, the auto-unlock feature has just been enabled.
11. Turn the key to the OFF position or wait 2 minutes to exit the enable/disable mode.
12. Verify that the horn chirps once to indicate that a feature has been changed and that auto-unlock has been toggled.

tomsn048@gmail.com



Latch Lubrication

Material



Item	Specification
Multi-Purpose Grease XG-4 and/or XL-5	ESB-M1C93-B

1. Open the door.

2. Using a screwdriver, fully close the latch (2 clicks).

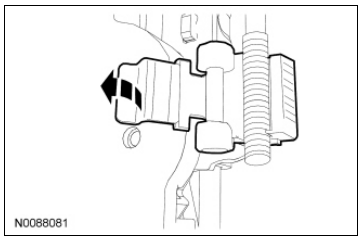
3. Spray the multi-purpose grease into the opening on the door latch for approximately 5 seconds.

4. Open the latch using either the interior or exterior door handle.

5. Open and close the door several times to circulate the lubricant inside the latch.

6. Wipe off any excess grease.

tomsn048@gmail.com



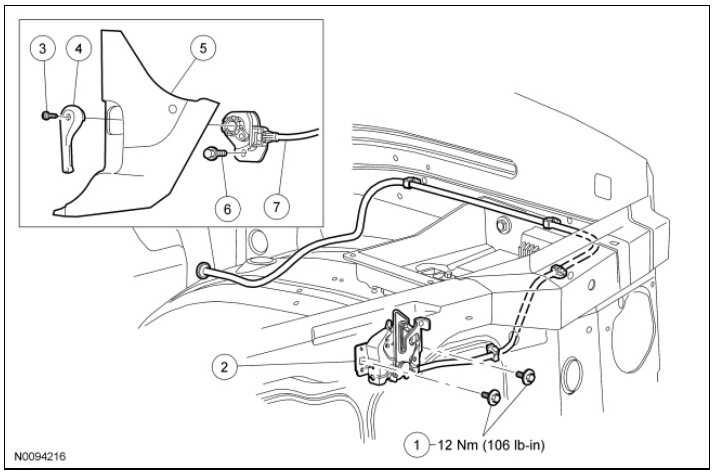
Door Handle to Latch Rod Adjustment

NOTE: If the vehicle is equipped with an adjustable door latch actuating rod, perform this procedure.

NOTE: An incorrectly adjusted exterior door handle can cause a loose handle, rattle noise, door hard to open from the outside door handle, or the outside door handle to not sit flush in the closed position.

NOTE: Prior to carrying out the adjustment procedure, the door latch, exterior door handle, and linkages must be installed on the door.

1. Raise the door glass to the full-up position.
2. Remove the door trim panel. For additional information, refer to Section 501-05 .
3. Position the water shield aside.
4. Open the clip and disconnect the exterior door handle actuating rod.



5. Position the actuating rod and latch actuating lever in a neutral position.
6. **NOTE:** Do not push up or pull down on the actuating rod or latch actuating lever.

   Reinstall the exterior door handle actuating rod back into the clip.
7. Close the clip and test the system to make sure that the exterior door handle is operating correctly.
8. Reseal the water shield.
9. Install the door trim panel. For additional information, refer to Section 501-05 .

tomsn048@gmail.com

Hood Latch and Components - Exploded View

Item	Part Number	Description
1	N808727	Hood latch bolts (2 required)
2	16700	Hood latch
3	-	Hood latch release handle screw
4	16916	Hood latch release handle
5	7802344	A-pillar lower trim panel
6	N805375	Hood latch release cable assembly screw
7	16916	Hood latch release cable assembly

1. For additional information, refer to the procedures in this section.

Hood Latch

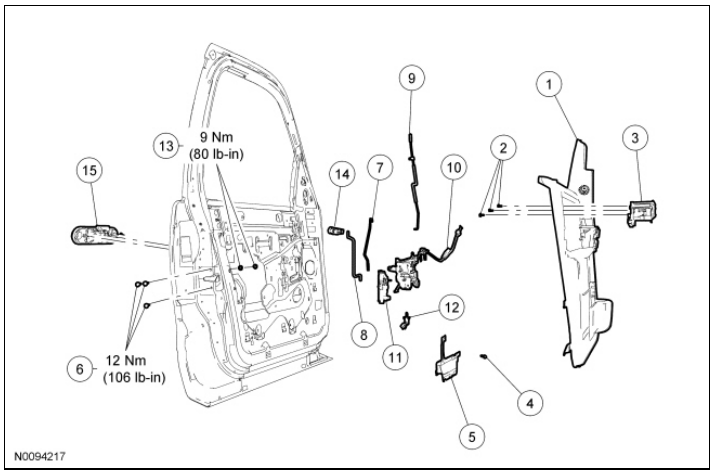
Removal and Installation

NOTE: Mark the position of the hood latch prior to removing the hood latch bolts to aid positioning during installation.

1. Remove the 2 hood latch bolts.
   - To install, tighten to 12 Nm (106 lb-in).

2. Disconnect the hood latch release cable from the hood latch and remove the latch.

3. To install, reverse the removal procedure.
   - Check the latch adjustment to make sure the latch was installed and aligned correctly.



tomsn048@gmail.com

Hood Latch Release Handle

Removal and Installation

1. Remove the hood latch. For additional information, refer to Hood Latch in this section.
2. Remove the screw and the hood latch release handle.
3. Remove the pin-type retainer and the LH A-pillar lower trim panel.
4. Remove the hood latch release cable assembly screw.
5. Release the hood latch release cable from the 4 cable locators and remove the cable.
6. To install, reverse the removal procedure.

Front Door Handles, Locks and Latches - Exploded View

Item	Part Number	Description
1	7823942/ 7823943	Interior front door trim panel (RH/LH)
2	-	Interior front door handle screws (3 required)
3	78224A52/ 78224A53	Interior front door handle (RH/LH)
4	-	Energy absorbing foam pad screw
5	7840380	Energy absorbing foam pad
6	N811471	Front door latch screws (3 required)
7	7822152/ 7822153	Exterior front door handle actuating rod (RH/LH)
8	7822135	Front door lock cylinder actuating lock rod
9	7821852/ 7821853	Front door push button rod (RH/LH)
10	7821812/ 7821813	Front door latch (RH/LH)
11	78218A42/ 78218A43	Front door lock actuator (RH/LH)
12	-	Front door ajar switch
13	-	Exterior front door handle nuts (2 required)
14	7821991	Door lock cylinder
15	7822404/ 7822405	Exterior front door handle (RH/LH)

1. For additional information, refer to the procedures in this section.

tomsn048@gmail.com

Front Door Latch

Removal and Installation

1. Remove the front door trim panel. For additional information, refer to Section 501-05 .
2. Position the water shield aside.
3. **NOTE:** Slide the foam insulating block forward to release the 2 clips.

   Remove the screw and the energy absorbing foam pad.
4. Release the interior door handle actuating cable locator from the door frame.
5. Disconnect the front door latch harness electrical connector and release the harness locator from the door frame.
6. Open the clip and disconnect the exterior front door handle actuating rod.
7. Release the front door push button rod from the door frame retainer.
8. If equipped, disconnect the front door lock cylinder actuating rod from the lock cylinder.
9. Remove the 3 screws and the front door latch.
   - To install, tighten to 12 Nm (106 lb-in).
10. To install, reverse the removal procedure.

tomsn048@gmail.com

Door Ajar Switch - Front Door

Removal and Installation

1. Remove the front door latch. For additional information, refer to Front Door Latch in this section.
2. Disconnect the front door ajar switch electrical connector.
3. Release the locking tab and rotate the front door ajar switch counterclockwise and remove the switch from the front door latch.
4. To install, reverse the removal procedure.

Front Door Lock Actuator

Removal and Installation

1. Remove the front door latch. For additional information, refer to Front Door Latch in this section.
2. Disconnect the front door ajar switch and the front door lock actuator electrical connectors.
3. Release the locking tab and remove the front door lock actuator.
4. To install, reverse the removal procedure.

tomsn048@gmail.com

Door Lock Cylinder

Removal and Installation

NOTE: When any new lock cylinder is installed, the driver door and ignition lock cylinders should be installed as a set. This eliminates carrying an extra key which fits only 1 lock. If a new key is used, the new key code number is stamped on a metal tag attached to the key.

NOTE: Individual lock cylinders are repaired by discarding the inoperative cylinder and building a new lock cylinder using the appropriate lock repair package. The lock repair package includes a detailed instruction sheet to build the new lock cylinder to the current key code of the vehicle.

1. Remove the front door trim panel. For additional information, refer to Section 501-05 .

2. Position the water shield aside.

3. Release the front door push button rod from the door frame retainer.

4. Remove the exterior front door handle nut (rear).
   - To install, tighten to 9 Nm (80 lb-in).

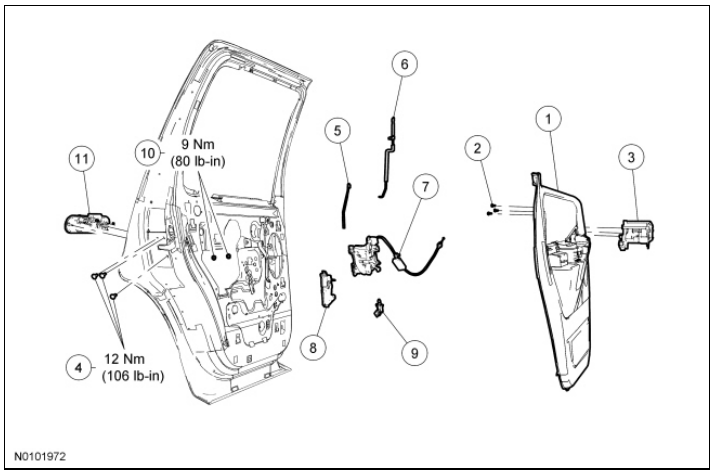
5. Remove the door lock cylinder.
   - Disconnect the front door lock cylinder actuating rod.

6. To install, reverse the removal procedure.

Interior Door Handle - Front

Removal and Installation

1. Remove the front door trim panel. For additional information, refer to Section 501-05 .
2. Remove the 3 screws and the interior front door handle.
3. To install, reverse the removal procedure.



tomsn048@gmail.com

Exterior Front Door Handle

Removal and Installation

1. Remove the front door trim panel. For additional information, refer to Section 501-05 .
2. Position the water shield aside.
3. Remove the screw and the energy absorbing foam pad.
4. If equipped, disconnect the door lock cylinder actuating rod.
5. Open the clip and disconnect the exterior front door handle actuating rod.
6. Remove the 2 exterior front door handle nuts.
   - To install, tighten to 9 Nm (80 lb-in).
7. Remove the exterior front door handle.
8. To install, reverse the removal procedure.

Rear Door Handles, Locks and Latches - Exploded View

Item	Part Number	Description
1	7827406/ 7827407	Interior rear door trim panel (RH/LH)
2	-	Interior rear door handle screws (3 required)
3	78266B40/ 78266B41	Interior rear door handle (RH/LH)
4	N811471	Rear door latch screws (3 required)
5	7826596/ 7826597	Exterior rear door handle actuating rod (RH/LH)
6	7826460/ 7826461	Rear door push button rod (RH/LH)
7	7826412/ 7826413	Rear door latch (RH/LH)
8	78218A42/ 78218A43	Rear door lock actuator (RH/LH)
9	-	Rear door ajar switch
10	-	Exterior rear door handle nuts (2 required)
11	7826604/ 7826605	Exterior rear door handle (RH/LH)

1. For additional information, refer to the procedures in this section.

tomsn048@gmail.com

Rear Door Latch

Removal and Installation

1. Remove the rear door trim panel. For additional information, refer to Section 501-05 .
2. Position the water shield aside.
3. Release the interior door handle actuating cable locator from the door frame.
4. Open the clip and disconnect the exterior handle actuating rod.
5. Disconnect the rear door ajar switch and rear door lock actuator electrical connectors.
6. Remove the 3 rear door latch screws.
   - To install, tighten to 12 Nm (106 lb-in).
7. Release the rear door push button rod from the door frame retainer.
8. To install, reverse the removal procedure.

tomsn048@gmail.com

Door Ajar Switch - Rear Door

Removal and Installation

1. Remove the rear door latch. For additional information, refer to Rear Door Latch in this section.
2. Release the locking tab, rotate the rear door ajar switch counterclockwise and remove the switch from the rear door latch.
3. To install, reverse the removal procedure.

Rear Door Lock Actuator

Removal and Installation

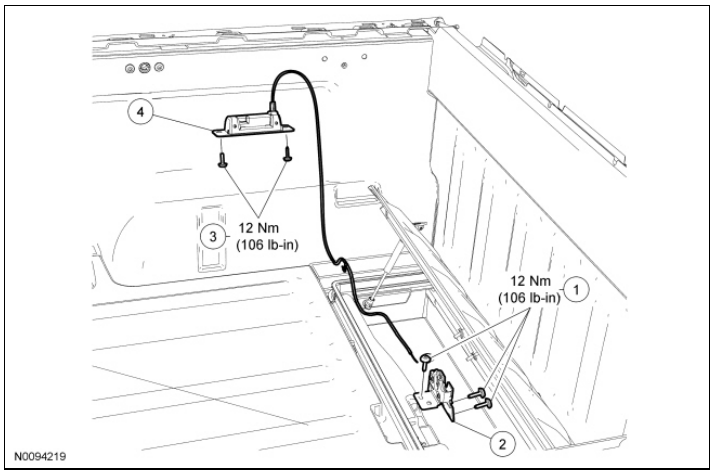
1. Remove the rear door latch. For additional information, refer to Rear Door Latch in this section.
2. Release the locking tab and remove the rear door lock actuator.
3. To install, reverse the removal procedure.

tomsn048@gmail.com

Interior Door Handle - Rear

Removal and Installation

1. Remove the rear door trim panel. For additional information, refer to Section 501-05 .
2. Remove the 3 interior rear door handle screws and the interior rear door handle.
3. To install, reverse the removal procedure.



Exterior Rear Door Handle

Removal and Installation

1. Remove the rear door trim panel. For additional information, refer to Section 501-05 .
2. Position the water shield aside.
3. Open the clip and disconnect the exterior rear door handle actuating rod.
4. Remove the 2 nuts and the exterior rear door handle.
   - To install, tighten to 9 Nm (80 lb-in).
5. To install, reverse the removal procedure.

tomsn048@gmail.com

Pickup Bed Storage Compartment - Exploded View

Item	Part Number	Description
1	W706322	Pickup bed storage compartment latch bolts (3 required)
2	99286B48	Pickup bed storage compartment latch
3	W706322	Pickup bed storage compartment release handle bolts (2 required)
4	99286E08	Pickup bed storage compartment release handle and cable

1. For additional information, refer to the procedures in this section.

Pickup Bed Storage Compartment Latch

Removal and Installation

1. Remove the 3 pickup bed storage compartment latch bolts.
   - To install, tighten to 12 Nm (106 lb-in).

2. ***NOTICE:*** **Do not allow the pickup bed storage compartment lid to close until the latch has been connected to the cable. If the lid is closed prior to attaching the cable to the latch, releasing the latch is extremely difficult.**

   Disconnect the pickup bed storage compartment release cable from the pickup bed storage compartment latch.

3. Remove the pickup bed storage compartment latch.

4. To install, reverse the removal procedures.

tomsn048@gmail.com

Pickup Bed Storage Compartment Release Handle

Removal and Installation

1. Remove the 2 pickup bed storage compartment release handle bolts.
   - To install, tighten to 12 Nm (106 lb-in).

2. ***NOTICE:*** **Do not allow the pickup bed storage compartment lid to close until the latch has been connected to the cable. If the lid is closed prior to attaching the cable to the latch, releasing the latch is extremely difficult.**

   Remove the pickup bed storage compartment latch. For additional information, refer to Pickup Bed Storage Compartment Latch in this section.

3. **NOTE:** Note the routing of the pickup bed storage compartment release cable.

   Release the routing clips and remove the pickup bed storage compartment release handle and cable as an assembly.

4. To install, reverse the removal procedures.

Liftgate Handle, Lock and Latch - Exploded View

Item	Part Number	Description
1	7843329	Liftgate handle actuating rod
2	W705830	Liftgate latch screws (3 required)
3	7843150	Liftgate latch
4	25218A42	Liftgate latch actuator
5	14018	Liftgate ajar switch
6	-	Liftgate window latch screws (4 required)
7	7840860	Liftgate window latch
8	13713	Liftgate window ajar switch
9	-	Liftgate release handle screws (2 required)
10	7843400	Liftgate release handle

1. For additional information, refer to the procedures in this section.

tomsn048@gmail.com

Liftgate Latch

Removal and Installation

1. Remove the liftgate trim panel. For additional information, refer to Section 501-05 .
2. Position the water shield aside.
3. Disconnect the liftgate release handle actuating rod.
4. Disconnect the liftgate latch actuator and the liftgate ajar switch electrical connectors.
5. Remove the 3 liftgate latch screws and remove the latch.
   - To install, tighten to 12 Nm (106 lb-in).
6. To install, reverse the removal procedure.

tomsn048@gmail.com

Liftgate Latch Actuator

Removal and Installation

1. Remove the liftgate latch. For additional information, refer to Liftgate Latch in this section.
2. Release the locking tab and remove the liftgate latch actuator.
3. To install, reverse the removal procedure.

Door Ajar Switch - Liftgate

Removal and Installation

1. Remove the liftgate latch. For additional information, refer to Liftgate Latch in this section.
2. Release the locking tab, rotate the liftgate ajar switch counterclockwise and remove the ajar switch form the liftgate latch.
3. To install, reverse the removal procedure.

tomsn048@gmail.com

Liftgate Window Latch

Removal and Installation

1. Remove the liftgate trim panel. For additional information, refer to Section 501-05 .
2. Position the water shield aside.
3. Disconnect the liftgate window actuator and liftgate window ajar switch electrical connectors.
4. Remove the 4 screws and the liftgate window latch.
    - To install, tighten to 12 Nm (106 lb-in).
5. To install, reverse the removal procedure.

Liftgate Window Latch Actuator

Removal and Installation

1. Remove the liftgate window latch. For additional information, refer to Liftgate Window Latch in this section.
2. Remove the 3 screws and the liftgate window latch actuator.
3. To install, reverse the removal procedure.

tomsn048@gmail.com

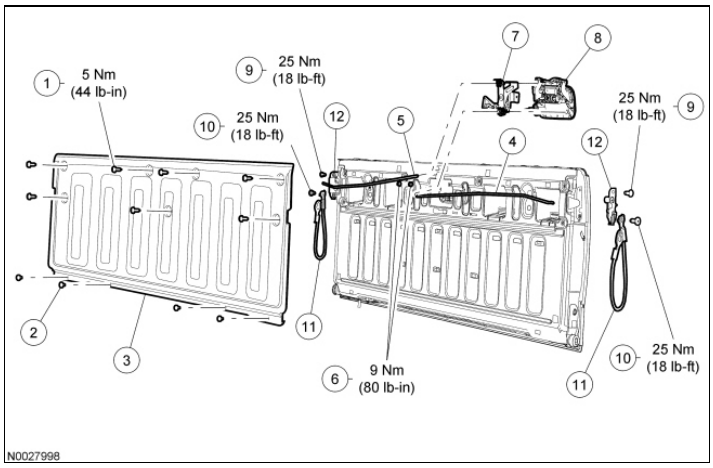
Door Ajar Switch - Liftgate Glass

Removal and Installation

1. Remove the liftgate window latch. For additional information, refer to Liftgate Window Latch in this section.

2. Rotate the liftgate window ajar switch counterclockwise and remove the ajar switch from the liftgate window latch.

3. To install, reverse the removal procedure.



Liftgate Release Handle

Removal and Installation

1. Remove the liftgate trim panel. For additional information, refer to Section 501-05 .
2. Position the water shield aside.
3. Disconnect the liftgate release handle actuating rod.
4. Remove the 2 liftgate release handle screws.
5. Remove the liftgate release handle.
6. To install, reverse the removal procedure.

tomsn048@gmail.com

Tailgate Handle, Lock and Latches - Exploded View

Item	Part Number	Description
1	W711876	Tailgate access panel bolts (7 required)
2	388577	Pin-type retainers (4 required)
3	40602	Tailgate access panel
4	83431A78	LH tailgate latch actuating rod

8	9943400	Tailgate release handle
9	N806910	Tailgate latch bolt (upper)
10	NB11361	Tailgate latch bolt (lower)
11	5443052/ 5443053	Tailgate latch cable (RH/LH)
12	9943150	RH and LH tailgate latch

1. For additional information, refer to the procedures in this section.

tomsn048@gmail.com

Tailgate Latch

Removal and Installation

1. Open and support the tailgate.

2. Remove the 7 bolts, the 4 pin-type retainers and the tailgate access panel.
   - To install, tighten to 5 Nm (44 lb-in).

3. Open the clip and release the tailgate latch actuating rod from the tailgate remote control.

4. Release the tailgate latch actuating rod locator from the tailgate.

5. Remove the 2 bolts and the tailgate latch.
   - To install, tighten to 25 Nm (18 lb-ft).

6. Remove the tailgate latch actuating rod.

7. To install, reverse the removal procedure.

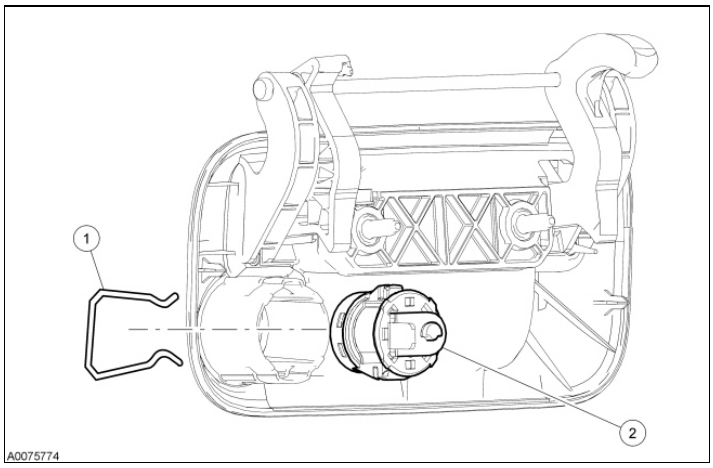
Tailgate Latch Remote Control

Removal and Installation

1. Open and support the tailgate.

2. Remove the 7 bolts, the 4 pin-type retainers and the tailgate access panel.
   - To install, tighten to 5 Nm (44 lb-in).

3. Open the 2 clips and release the 2 tailgate latch actuating rods from the tailgate remote control.



4. Release the 2 tailgate latch actuating rod locators from the tailgate.

5. Remove the 2 nuts and the tailgate remote control.
   - To install, tighten to 9 Nm (80 lb-in).

6. To install, reverse the removal procedure.

tomsn048@gmail.com

Tailgate Lock Cylinder

Item	Part Number	Description
1	1522023	Retaining clip
2	1521990	Tailgate lock cylinder

Removal and Installation

NOTE: When a new lock cylinder is installed, the tailgate lock cylinder, door lock cylinders and the ignition lock cylinder should be installed as a set. This eliminates carrying an extra key which fits only one lock. If a new key is to be used, the new key code is attached to a tag.

NOTE: The individual door lock cylinders are repaired by discarding the inoperative lock cylinder and building a new lock cylinder using the appropriate lock repair package. The lock repair package includes a detailed instruction sheet to build a new lock cylinder to the current key code of the vehicle.

1. Remove the tailgate release handle. For additional information, refer to Tailgate Release Handle in this section.

2. Remove the retaining clip and the tailgate lock cylinder.

3. To install, reverse the removal procedure.

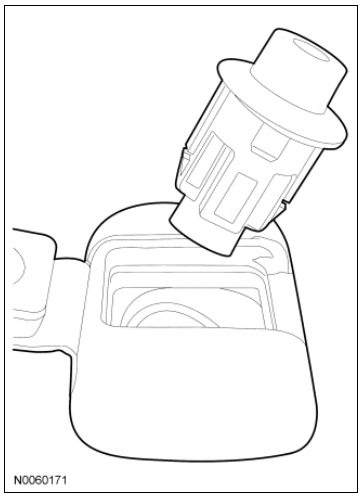
tomsn048@gmail.com

Tailgate Release Handle

Removal and Installation

1. Remove the tailgate latch remote control. For additional information, refer to Tailgate Latch Remote Control in this section.

2. Remove the tailgate release handle.



3. To install, reverse the removal procedure.

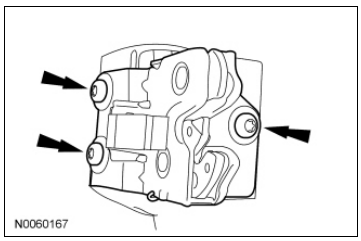
Tonneau Cover Lock Cylinder

Removal and Installation

1. Remove the tonneau cover latch release cable. For additional information, refer to Tonneau Cover Latch Release Cable in this section.

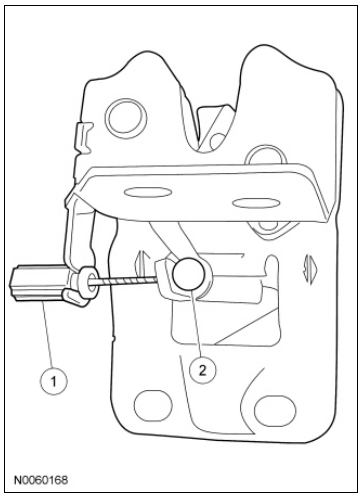
2. Remove the tonneau cover lock cylinder.

3. To install, reverse the removal procedure.



tomsn048@gmail.com

Tonneau Cover Latch



Removal and Installation

NOTE: Rear tonneau cover latch shown, front tonneau cover latch similar.

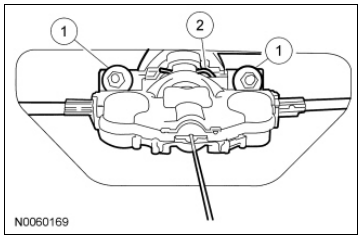
1. Remove the tonneau cover latch bolts.

2. Disconnect the tonneau cover cable.
    1. Disconnect the tonneau cover cable conduit.
    2. Disconnect the tonneau cover cable end.

3. Remove the tonneau cover latch.

4. To install, reverse the removal procedure.

tomsn048@gmail.com

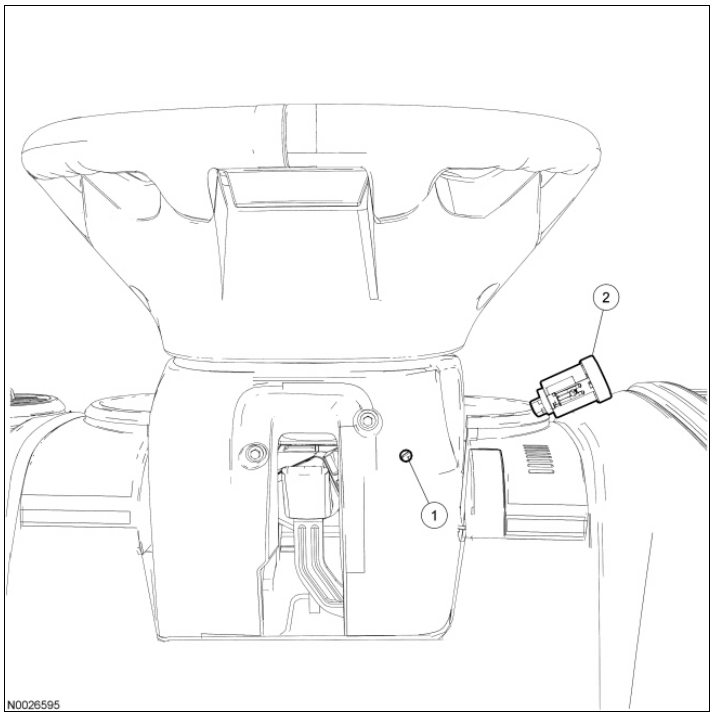


Tonneau Cover Latch Release Cable

Removal and Installation

NOTE: Rear tonneau cover latch release cable shown, front tonneau cover latch release cable similar.

1. Remove the tonneau cover latches. For additional information, refer to Tonneau Cover Latch in this section.



2. Disconnect the tonneau cover latch release cable.
    1. Remove the tonneau cover latch release cable bolts.
    2. Disconnect the tonneau cover latch release cable locking clip.

3. Remove the tonneau cover latch release cable.

4. To install, reverse the removal procedure.

Ignition Lock Cylinder - Functional

Item	Part Number	Description
1	-	Ignition switch locking pin access hole
2	11582	Ignition lock cylinder

Removal

NOTE: Individual lock cylinders are repaired by discarding the inoperative cylinder and building a new lock cylinder using the appropriate lock repair package. The lock repair package includes a detailed instruction sheet to build the new lock cylinder to the current key code of the vehicle.

1. Insert the ignition key and position the ignition lock cylinder to the ACC position.

2. Using a suitable tool, depress the ignition lock cylinder release pin through the access hole while pulling the ignition lock cylinder outward.

Installation

1. Make sure the ignition lock cylinder is in the ACC position.

2. Insert the ignition lock cylinder into the ignition lock cylinder access hole located on the steering column.
   - Make sure to align the locking pin with the locking pin access hole.

3. Rotate the ignition key through all lock cylinder positions to check for correct operation.

tomsn048@gmail.com

Ignition Lock Cylinder - Non Functional

Removal

1. Remove the Passive Anti-Theft System (PATS) transceiver. For additional information, refer to Section 419-01 .

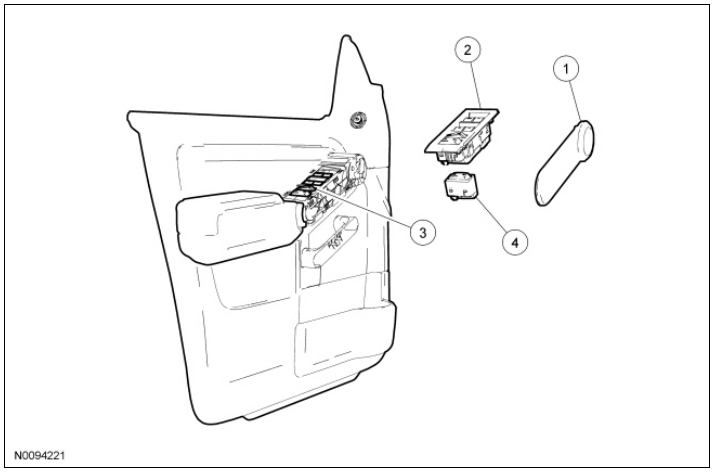
2. Remove the ignition lock cylinder.
   - Use a 1/8-inch diameter drill bit to drill out the lock cylinder retaining pin.
   - Use a 3/8-inch diameter drill bit to drill down the middle of the ignition lock key slot until the ignition lock cylinder breaks loose.
   - Remove and discard the ignition lock cylinder and drill shavings from the steering column.

3. Remove the bearing retainer.

4. Remove the steering column lock housing bearing and steering column lock gear.

Installation

1. Thoroughly clean all drill shavings from the steering column and inspect it for damage.



2. Install a new ignition lock cylinder.
   - Verify the ignition lock cylinder operation.

3. Program the new PATS keys. For additional information, refer to Key Programming Using Diagnostic Equipment in Section 419-01 .

tomsn048@gmail.com

Door Lock Control Switch

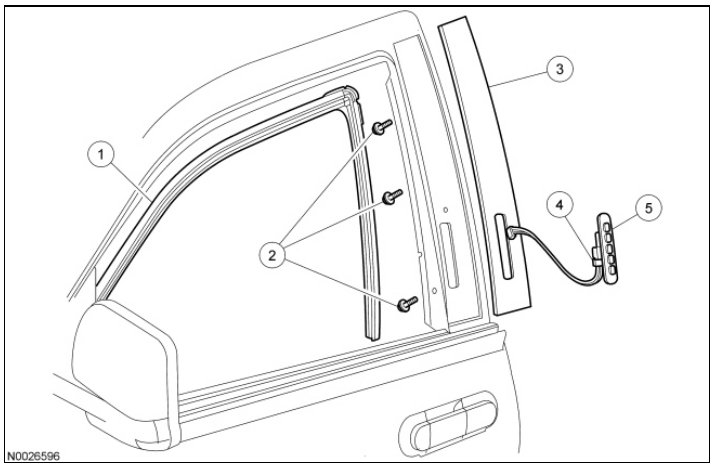
NOTE: The LH side is shown, the RH side is similar.

Item	Part Number	Description
1	14A563/ 14A564	Interior door handle cover (RH/LH)
2	78224A34	Door lock control switch bezel (RH/LH)
3	14524/14525	Door lock control switch electrical connectors (RH/LH)
4	14028	Door lock control switch

Removal and Installation

1. Remove the interior door handle cover.

2. Remove the front door switch bezel.
   - Release the 4 retaining tabs.



3. Disconnect the door lock control switch and window control switch electrical connectors.

4. Remove the door lock control switch.
   - Release the 4 retaining tabs.

5. To install, reverse the removal procedure.

tomsn048@gmail.com

Keyless Entry Keypad

Item	Part Number	Description
1	7821547	Door glass top run
2	-	Door pillar trim panel screws (3 required) (part of 14K138)
3	7820555	Door pillar trim panel
4	-	Keyless entry keypad electrical connector (part of 14K138)
5	14A626	Keyless entry keypad

Removal and Installation

1. Position the front window glass to the full down position.
2. Position the door glass top run aside to access the door pillar trim panel screws.
3. Remove the 3 door pillar trim panel screws and the door pillar trim panel.
4. Disconnect the electrical connector and remove the keyless entry keypad from the door pillar trim panel.
5. To install, reverse the removal procedure.

Wipers and Washers

The wipers and washers system consists of the following components:

- Windshield wiper blades
- Windshield wiper pivot arms
- Windshield wiper motor assembly
- Windshield wiper motor
- Windshield washer pump
- Windshield washer reservoir
- Rear window wiper blade
- Rear window wiper pivot arm
- Rear window wiper motor assembly

The wiper system is activated by the multifunction switch. The multifunction switch provides input to the front wiper motor module to activate wash, low, high and intermittent modes. On Explorer, the multifunction switch also provides input to the rear wiper module to activate wash, INT 1 and INT 2 modes. The relays are all integral to the wiper motor module assemblies and are not serviceable separately.

On Explorer, the front and rear washer system share the same washer reservoir and washer pump. The front and rear wiper motor module integral electronics control the direction of the washer pump to direct washer fluid to the windshield or rear window.

On Explorer Sport Trac, the washer system consists of the washer reservoir and pump. When the multifunction switch is placed into the wash mode, the windshield wiper motor integral electronics activate the washer pump to direct washer fluid to the windshield.

When the wiper control is set on any intermittent setting except INT 1, the speed dependent wipers will automatically adjust with the vehicle speed. This feature decreases the time between wipes when the vehicle speed increases.

NOTE: The Smart Junction Box (SJB) may also be identified as the Generic Electronic Module (GEM).

If equipped with automatic headlamps, the SJB will illuminate the exterior lamps within 10 seconds, when the front wipers are activated and the headlamp control switch is in the AUTOLAMP position. When the wipers are turned off, the exterior lamps will remain on for 30 seconds before turning off.

tomsn048@gmail.com

Wipers and Washers

Special Tool(s)

 ST1138-A	Flex Probe Kit 105-R025D or equivalent
 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
 ST3094-A	Test Light SGT27000 or equivalent 250-350 mA incandescent bulb test lamp SGT27000

Principles of Operation

If equipped with automatic headlamps, the Smart Junction Box (SJB) will illuminate the exterior lamps, including the parking lamps, when the front wipers are on for more than 10 seconds and the headlamp control is in the AUTOLAMP position. When the wipers are turned off, the exterior lamps will remain on for 30 seconds before turning off.

High-Speed Windshield Wipers

When the multifunction switch is set to the HIGH-speed position, it supplies ground to the high/low-speed relay coil and the run/park relay coil, which causes the windshield wiper motor to operate at high speed. During HIGH-speed operation only, both the high/low-speed relay coil ground and the run/park relay coil ground are controlled directly by the multifunction switch. This differs from LOW-speed or INTERMITTENT operation when the run/park relay coil is controlled by the microprocessor. When the switch is placed in the OFF position, the motor continues to operate until the motor returns to the PARK position and the internal Hall-effect sensor senses the motor magnet. The output to the run/park relay deactivates the relay and disconnects the voltage to the motor.

Since the high/low relay coil and the run/park relay coil are both controlled by a hard-wired circuit to the multifunction switch, the windshield wipers will still operate in high-speed mode if the internal windshield wiper module fails, but will not automatically park when the multifunction switch is turned to the OFF position.

Low-Speed Windshield Wipers

When the multifunction switch is set to the LOW-speed position, it supplies ground to the internal windshield wiper motor module low-speed input and the windshield wiper motor operates at low speed. During LOW-speed operation, the internal run/park relay is activated by the microprocessor and supplies 12 volts to the low-speed brush of the windshield wiper motor. The run/park relay coil ground is controlled by the

internal windshield wiper motor module based on inputs received from the multifunction switch. When the switch is placed in the OFF position, the motor continues to operate until the motor returns to the PARK position and the internal Hall-effect sensor senses the motor magnet. The output to the run/park relay deactivates the relay and disconnects the voltage to the motor.

Since the run/park relay is controlled by the internal windshield wiper motor microprocessor, the wipers will only operate in high-speed mode if the internal windshield wiper motor module fails, and will not automatically park when the multifunction switch is turned to the OFF position. This is due to the run/park and high/low relay coils being directly hard-wired to the switch in high speed. The diode prevents current flow through the high/low relay coil so the relay remains in the normally closed LOW-speed position.

Intermittent Speed Windshield Wipers

When the multifunction switch is set to the INTERMITTENT position(s), it supplies ground to the windshield wiper motor module inputs and the windshield wiper motor operates in intermittent mode. During INTERMITTENT operation, the windshield wiper motor activates the run/park relay coil which sends voltage through the high/low relay. The high/low relay remains deactivated, supplying the voltage to the low-speed brush of the windshield wiper motor. The windshield motor continues to operate until the internal Hall-effect sensor senses the magnet (PARK position) and deactivates the run/park relay, which disconnects voltage from the wiper motor. The windshield wipers remain parked until the windshield wiper motor module completes a time-out and then repeats the intermittent windshield wiper cycle.

Wiper Activated Headlamps (If Equipped with Autolamp System)

If equipped with automatic headlamps, the SJB will illuminate the exterior lamps within 10 seconds, when the wipers are on and the headlamp control switch is in the AUTOLAMP position. When the wipers are turned off, the exterior lamps will remain on for 30 seconds before turning off.

Speed Dependent Windshield Wipers

The speed-dependent feature increases the frequency of wiping to compensate for the extra moisture that accumulates on the windshield as the vehicle speed increases, when the multifunction switch is in any intermittent setting except the INT 1 position. The windshield wiper module receives Vehicle Speed Sensor (VSS) information directly from the PCM. As vehicle speed increases, the speed-dependent feature gradually shortens the delay between wipes.

The speed-dependent feature is easiest to verify in the INT 2 position. With the vehicle at a standstill and the multifunction switch in the INT 2 position, the wipers should operate once every 10 seconds. As vehicle speed increases, the delay between wipes will gradually shorten. For example, by the time the vehicle reaches 100 km/h (62 mph), the wipers should operate every 5 seconds. Speed dependent operation is similar in INT 3, INT 4 and INT 5 modes.

Intermittent Rear Window Wiper System

When the multifunction switch is set to the rear INTERMITTENT position(s), it supplies ground to the rear window wiper motor module input and the wiper operates in intermittent mode. During INTERMITTENT operation, the rear wiper motor momentarily activates the rear window wiper relay (internal), which sends voltage to the motor. Once the rear window wiper motor is activated, the internal run/park switch connects voltage to the motor, keeping it operating. When the rear window wiper motor returns to the PARK position, the run/park switch disconnects voltage internally from the wiper motor input, reconnecting it to the rear window wiper motor module output. The rear window wiper remains parked until the rear window wiper motor module completes a time-out and then repeats the cycle.

Washer System - Explorer Sport Trac

tomsn048@gmail.com

When windshield WASH is selected on the multifunction switch, the windshield wiper motor module activates its integral washer relay which sends voltage to the washer pump to direct fluid to the windshield.

Washer System - Explorer

The front and rear washer system share the same washer reservoir and washer pump. The front and rear wiper motor modules each contain an integral washer relay that supplies a ground path for the washer pump whenever they are inactive. When windshield WASH is selected on the multifunction switch, the windshield wiper motor module activates its integral washer relay, which sends voltage to the washer pump to direct fluid to the windshield. When rear WASH is selected on the multifunction switch, the rear wiper motor module activates its integral washer relay to send voltage to the washer pump to direct fluid to the rear window.

Software Safe Mode

The windshield wiper motor defaults to software safe mode when the run/park sensor does not sense the Hall-effect magnet inside the wiper motor. This can be caused by an obstruction of the windshield wipers, a binding linkage or loss of the Hall sensor signal. The motor continues to operate in a high/low-speed condition, and when turned off, the wipers immediately park on the windshield. If necessary, the wipers can be turned ON and OFF until they return to the PARK position.

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Windshield washer hoses • Wiper linkage • Multifunction switch	• Battery Junction Box (BJB) fuses: ♦ 20 (30A) ♦ 30 (25A) • Smart Junction Box (SJB) fuses: ♦ 10 (5A) ♦ 12 (5A) • Circuitry • Windshield wiper motor • Rear wiper motor

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** The Smart Junction Box (SJB) may also be identified as the Generic Electronic Module (GEM).

   NOTE: The windshield wiper motor does not communicate on the network. The windshield wiper motor provides wiper on/off status directly to the SJB .

   NOTE: Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM .
   - refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the VCM .

6. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00 to diagnose no response from the SJB .

tomsn048@gmail.com

7. Carry out the network test.
    - If the scan tool responds with no communication from one or more modules, refer to Section 418-00 .
    - If the network test passes, retrieve and record the continuous memory DTCs.
8. Clear the continuous DTCs and carry out the self-test diagnostics for the SJB and PCM.
9. If the DTCs retrieved are related to the concern, go to the Smart Junction Box (SJB) DTC Chart or the Powertrain Control/Emissions Diagnosis (PC/ED) manual for PCM related DTCs. For all other DTCs, refer to Section 419-10 .
10. If no DTCs related to the concern are retrieved, GO to Symptom Chart - Wipers and Washers .

DTC Charts

Smart Junction Box (SJB) DTC Chart

DTC	Description	Action
B2008	Wipers On Signal Circuit Short to Ground	GO to Pinpoint Test J .

For a complete list of SJB DTCs, refer to Section 419-10 .

Symptom Chart - Wipers and Washers

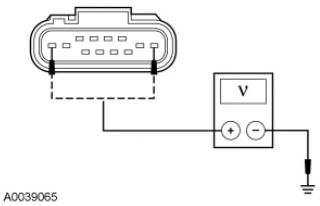
Symptom Chart - Wipers and Washers

Pinpoint Tests

Pinpoint Test A: The Wipers are Inoperative - Windshield

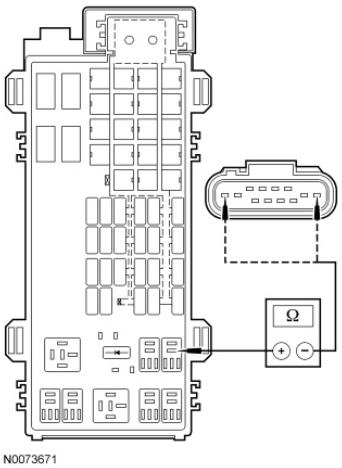
Refer to Wiring Diagrams Cell 81 , Wipers and Washers for schematic and connector information.

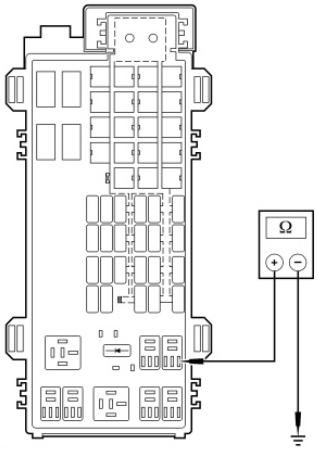
Normal Operation



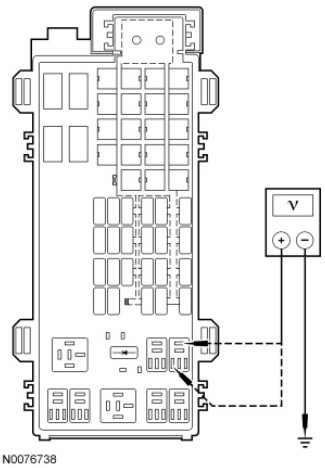
Under normal operation, the windshield wiper relay receives power at all times through circuit SBB20 (GN/RD). When the key is in the RUN or ACC position, the windshield wiper relay receives power from the Smart Junction Box (SJB) through circuit CBP10 (YE/OG). The windshield wiper relay is grounded at all times through circuit GD120 (BK/GN). When the windshield wiper relay is activated, the front windshield wiper motor receives power through circuit CRW03 (VT/WH). The front windshield wiper motor is grounded through circuits GD108 (BK/VT) and GD120 (BK/GN). The multifunction switch is grounded through circuit GD145 (BK/BU). The front windshield wiper motor receives open and ground inputs from the multifunction switch through circuits CRW17 (GN/VT), CRW18 (VT/WH), CRW19 (BU/OG) and CRW08 (VT/OG) to activate the wipers to the appropriate modes.

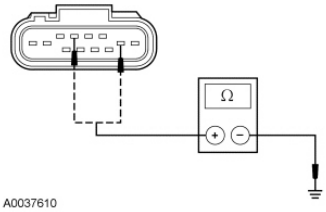
This pinpoint test is intended to diagnose the following:





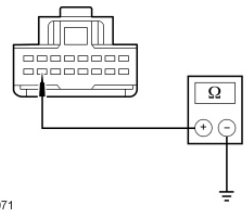
- Fuse(s)
- Windshield wiper relay





- Wiring, terminals or connectors
- Multifunction switch
- Windshield wiper motor

PINPOINT TEST A: THE WIPERS ARE INOPERATIVE - WINDSHIELD



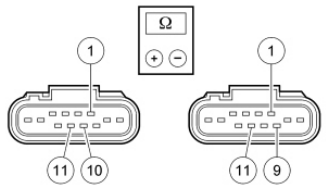
Test Step	Result / Action to Take
A1 CHECK CIRCUIT CRW03 (VT/WH) FOR VOLTAGE	
• Ignition OFF. • Disconnect: Windshield Wiper Motor C125. • Ignition ON. • Measure the voltage between windshield wiper motor C125-5, circuit CRW03 (VT/WH), harness side and ground; and between windshield wiper motor C125-8, circuit CRW03 (VT/WH), harness side and ground.  A0039065 • **Are the voltages greater than 10 volts?**	**Yes** GO to A5 . **No** GO to A2 .
A2 CHECK CIRCUIT CRW03 (VT/WH) FOR AN OPEN	
• Ignition OFF. • Disconnect: Windshield Wiper Relay. • Measure the resistance between windshield wiper motor C125-5, circuit CRW03 (VT/WH), harness side and windshield wiper relay pin 5, circuit CRW03 (VT/WH), harness side; and between windshield wiper motor C125-8, circuit CRW03 (VT/WH), harness side and windshield wiper relay pin 5, circuit CRW03 (VT/WH), harness side.	**Yes** GO to A3 . **No** REPAIR the circuit. TEST the system for normal operation.

tomsn048@gmail.com

 N0073671 • **Are the resistances less than 5 ohms?**	
A3 CHECK CIRCUIT GD120 (BK/GN) FOR AN OPEN	
• Measure the resistance between windshield wiper relay pin 2, circuit GD120 (BK/GN), harness side and ground.  N0076737 • **Is the resistance less than 5 ohms?**	**Yes** GO to A4 . **No** REPAIR the circuit. TEST the system for normal operation.
A4 CHECK CIRCUITS SBB20 (GN/RD) AND CBP10 (YE/OG) FOR VOLTAGE	
• Ignition ON. • Measure the voltage between windshield wiper relay pin 1, circuit CBP10 (YE/OG), harness side and ground; and between windshield wiper relay pin 3, circuit SBB20 (GN/RD), harness side and ground.	**Yes** INSTALL a new windshield wiper relay. TEST the system for normal operation. **No** VERIFY Battery Junction Box (BJB) fuse 20 (30A) and SJB fuse 10 (5A) are OK. If OK, REPAIR the circuit(s) in question. If not OK, REFER to the Wiring Diagrams Manual to identify the possible cause of the circuit short. TEST the system for normal operation.

 • **Are the voltages greater than 10 volts?**	
A5 CHECK CIRCUITS GD120 (BK/GN) AND GD108 (BK/VT) FOR AN OPEN	
• Ignition OFF. • Measure the resistance between windshield wiper motor C125-6, circuit GD120 (BK/GN), harness side and ground; and between windshield wiper motor C125-3, circuit GD108 (BK/VT), harness side and ground.  • **Are the resistances less than 5 ohms?**	**Yes** GO to A6 . **No** REPAIR the circuit(s) in question. TEST the system for normal operation.
A6 CHECK THE MULTIFUNCTION SWITCH	
• Disconnect: Multifunction Switch C202. • Carry out the Multifunction Switch Component Test. Refer to Wiring Diagrams Cell 149 for component testing. • **Did the multifunction switch pass the component test?**	**Yes** GO to A7 . **No** INSTALL a new multifunction switch. REFER to Section 211-05 .
A7 CHECK CIRCUIT GD145 (BK/BU) FOR AN OPEN	
• Measure the resistance between multifunction switch C202-15, circuit GD145 (BK/BU), harness side and ground.	**Yes** GO to A8 . **No** REPAIR the circuit. TEST the system for normal operation.

tomsn048@gmail.com



N0037071

- **Is the resistance less than 5 ohms?**

A8 CHECK FOR SHORTS IN THE WINDSHIELD WIPER MOTOR HARNESS

- Measure the resistance at windshield wiper motor C125, harness side, between the circuits shown in the following chart.

Windshield Wiper Motor	Circuits	Windshield Wiper Motor
C125-10	CRW19 (BU/OG)/CRW08 (VT/OG)	C125-1
C125-10	CRW19 (BU/OG)/CRW17 (GN/VT)	C125-9
C125-10	CRW19 (BU/OG)/CRW18 (VT/WH)	C125-11
C125-11	CRW18 (VT/WH)/CRW08 (VT/OG)	C125-1
C125-11	CRW18 (VT/WH)/CRW17 (GN/VT)	C125-9
C125-1	CRW08 (VT/OG)/CRW17 (GN/VT)	C125-9

N0091498

- **Is the resistance greater than 10,000 ohms for all measurements?**

Yes
GO to A9 .

No
REPAIR the circuit. TEST the system for normal operation.

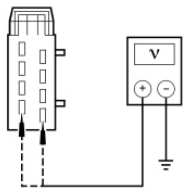
A9 CHECK FOR CORRECT WINDSHIELD WIPER MOTOR OPERATION

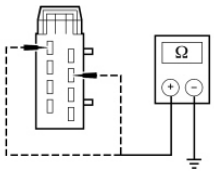
• Disconnect all windshield wiper motor connectors. • Check for: ♦ corrosion. ♦ pushed-out pins. • Connect all the windshield wiper motor connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new windshield wiper motor. REFER to Wiper Motor - Windshield in this section. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

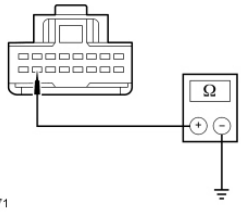
Pinpoint Test B: The Wipers are Inoperative - Rear Window

Refer to Wiring Diagrams Cell 81 , Wipers and Washers for schematic and connector information.

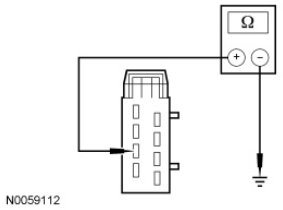
Normal Operation

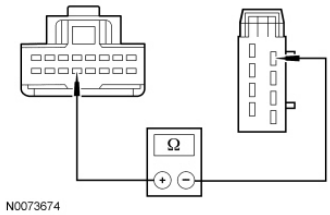






Under normal operation, the rear window wiper motor receives power through circuit SBB30 (BN/RD) and circuit CBP12 (GN/WH). The rear window wiper motor is grounded through circuit GD150 (BK/WH). The rear window wiper motor receives open and ground inputs from the multifunction switch through circuits CRW20 (GY/YE) and CRW21 (YE/VT) to activate the wiper to the appropriate speeds. The rear window wiper motor monitors the liftgate glass ajar switch through circuit CPL58 (GY/OG). When the liftgate glass is closed, this circuit is grounded. If ground is not detected on this circuit by the rear window wiper motor, rear window wiper operation is disabled.





This pinpoint test is intended to diagnose the following:
- Fuse(s)
- Wiring, terminals or connectors
- Rear window wiper motor
- Multifunction switch

PINPOINT TEST B: THE WIPERS ARE INOPERATIVE - REAR WINDOW

Test Step	Result / Action to Take
B1 CHECK CIRCUITS CBP12 (GN/WH) AND SBB30 (BN/RD) FOR VOLTAGE	
• Ignition OFF. • Disconnect: Rear Window Wiper Motor C4323. • Ignition ON. • Measure the voltage between rear window wiper motor C4323-7, circuit CBP12 (GN/WH), harness side and ground; and between rear window wiper motor C4323-8, circuit SBB30 (BN/RD), harness side and ground.	**Yes** GO to B2 . **No** VERIFY Battery Junction Box (BJB) fuse 30 (25A) and Smart Junction Box (SJB) fuse 12 (5A) are OK. If OK, REPAIR the circuit(s) in question. If not OK, REFER to the Wiring Diagrams Manual to identify the possible cause of the circuit short. TEST the system for normal operation.

tomsn048@gmail.com

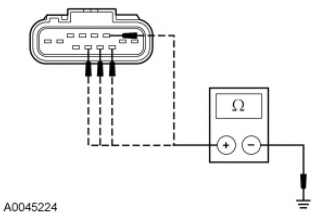
 N0037073 • **Are the voltages greater than 10 volts?**	
B2 CHECK CIRCUIT GD150 (BK/WH) FOR AN OPEN	
• Ignition OFF. • Measure the resistance between rear window wiper C4323-2, circuit GD150 (BK/WH), harness side and ground; and between rear window wiper C4323-3, circuit GD150 (BK/WH), harness side and ground.  N0037074 • **Is the resistance less than 5 ohms?**	**Yes** GO to B3 . **No** REPAIR the circuit(s) in question. TEST the system for normal operation.
B3 CHECK THE MULTIFUNCTION SWITCH	
• Ignition OFF. • Disconnect: Multifunction Switch C202. • Carry out the Multifunction Switch Component Test. Refer to Wiring Diagrams Cell 149 for component testing. • **Did the multifunction switch pass the component test?**	**Yes** GO to B4 . **No** INSTALL a new multifunction switch. REFER to Section 211-05 .
B4 CHECK CIRCUIT GD145 (BK/BU) FOR AN OPEN	
• Measure the resistance between multifunction switch C202-15, circuit GD145 (BK/BU), harness side and ground.  N0037071 • **Is the resistance less than 5 ohms?**	**Yes** GO to B5 . **No** REPAIR the circuit. TEST the system for normal operation.

B5 CHECK CIRCUIT CPL58 (GY/OG) FOR AN OPEN	
• The liftgate must be closed. • Measure the resistance between rear wiper motor C4323-6, circuit CPL58 (GY/OG) harness side and ground.  N0059112 • **Is the resistance less than 5 ohms?**	**Yes** GO to B6 . **No** REPAIR the circuit. TEST the system for normal operation.
B6 CHECK CIRCUIT CRW21 (YE/VT) FOR AN OPEN	
• Measure the resistance between multifunction switch C202-13, circuit CRW21 (YE/VT), harness side and rear window wiper C4323-1, circuit CRW21 (YE/VT), harness side.  N0073674 • **Is the resistance less than 5 ohms?**	**Yes** GO to B7 . **No** REPAIR the circuit. TEST the system for normal operation.
B7 CHECK FOR CORRECT WIPER MOTOR OPERATION	
• Disconnect all wiper motor connectors. • Check for: ♦ liftgate glass open. ♦ corrosion. ♦ pushed-out pins. • Connect all wiper motor connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new rear window wiper motor. REFER to Wiper Motor - Rear Window in this section. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

Pinpoint Test C: The Wipers Stay On Continuously - Windshield

Refer to Wiring Diagrams Cell 81 , Wipers and Washers for schematic and connector information.

tomsn048@gmail.com



Normal Operation

Under normal operation, the windshield wiper motor receives open and ground inputs from the multifunction switch through circuits CRW17 (GN/VT), CRW18 (VT/WH), CRW19 (BU/OG) and CRW08 (VT/OG) to activate the wipers to the appropriate modes.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Windshield wiper motor
- Multifunction switch

PINPOINT TEST C: THE WIPERS STAY ON CONTINUOUSLY - WINDSHIELD

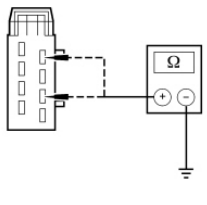
Test Step	Result / Action to Take
C1 CHECK THE MULTIFUNCTION SWITCH	
• Ignition OFF. • Disconnect: Multifunction Switch C202. • Carry out the Multifunction Switch Component Test. Refer to Wiring Diagrams Cell 149 for component testing. • **Did the multifunction switch pass the component test?**	**Yes** GO to C2 . **No** INSTALL a new multifunction switch. REFER to Section 211-05 .
C2 CHECK CIRCUITS CRW19 (BU/OG), CRW18 (VT/WH), CRW08 (VT/OG) AND CRW17 (GN/VT) FOR A SHORT TO GROUND	
• Disconnect: Windshield Wiper Motor C125. • Measure the resistance between ground and windshield wiper motor: ♦ C125-1, circuit CRW08 (VT/OG), harness side. ♦ C125-9, circuit CRW17 (GN/VT), harness side. ♦ C125-10, circuit CRW19 (BU/OG), harness side. ♦ C125-11, circuit CRW18 (VT/WH), harness side.  • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to C3 . **No** REPAIR the circuit(s) in question. TEST the system for normal operation.
C3 CHECK FOR CORRECT WIPER MOTOR OPERATION	

• Disconnect all wiper motor connectors. • Check for: ♦ corrosion. ♦ pushed-out pins. • Connect all wiper motor connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new windshield wiper motor. REFER to Wiper Motor - Windshield in this section. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

Pinpoint Test D: The Wipers Stay On Continuously - Rear Window

Refer to Wiring Diagrams Cell 81 , Wipers and Washers for schematic and connector information.

Normal Operation



Under normal operation, the rear window wiper motor receives open and ground inputs from the multifunction switch through circuits CRW20 (GY/YE) and CRW21 (YE/VT) to activate the wiper to the appropriate modes. The multifunction switch supplies a ground input to the rear wiper motor on CRW21 (YE/VT) when INT 1 is selected. The multifunction switch supplies ground to the rear wiper motor on CRW21 (YE/VT) and CRW20 (GY/YE) when INT 2 is selected.

This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- Rear window wiper motor
- Multifunction switch

PINPOINT TEST D: THE WIPERS STAY ON CONTINUOUSLY - REAR WINDOW

Test Step	Result / Action to Take
D1 CHECK THE MULTIFUNCTION SWITCH	
• Ignition OFF. • Disconnect: Multifunction Switch C202. • Carry out the Multifunction Switch Component Test. Refer to Wiring Diagrams Cell 149 for component testing. • **Did the multifunction switch pass the component test?**	**Yes** GO to D2 . **No** INSTALL a new multifunction switch. REFER to Section 211-05 .
D2 CHECK CIRCUITS CRW20 (GY/YE) AND CRW21 (YE/VT) FOR A SHORT TO GROUND	
• Disconnect: Rear Window Wiper Motor C4323. • Measure the resistance between rear window wiper motor C4323-5, circuit CRW20 (GY/YE), harness side and ground; and between rear window wiper motor C4323-1, circuit CRW21 (YE/VT), harness side and ground.	**Yes** GO to D3 . **No** REPAIR the circuit(s) in question. TEST the system for normal operation.

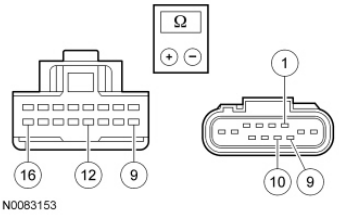
tomsn048@gmail.com

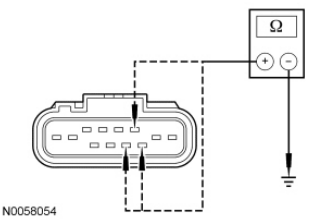
 • **Are the resistances greater than 10,000 ohms?**	
D3 CHECK FOR CORRECT WIPER MOTOR OPERATION	
• Disconnect all wiper motor connectors. • Check for: ♦ corrosion. ♦ pushed-out pins. • Connect all wiper motor connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new rear window wiper motor. REFER to Wiper Motor - Rear Window in this section. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

Pinpoint Test E: The High/Low Wiper Speeds Do Not Operate Correctly - Windshield

Refer to Wiring Diagrams Cell 81 , Wipers and Washers for schematic and connector information.

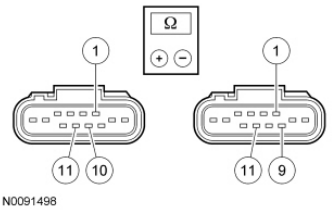
Normal Operation





Under normal operation, the windshield wiper motor receives open and ground inputs from the multifunction switch through circuits CRW17 (GN/VT), CRW18 (VT/WH), CRW19 (BU/OG) and CRW08 (VT/OG) to activate the wipers to the appropriate modes.

This pinpoint test is intended to diagnose the following:



- Wiring, terminals or connectors
- Windshield wiper motor
- Multifunction switch

PINPOINT TEST E: THE HIGH/LOW WIPER SPEEDS DO NOT OPERATE CORRECTLY - WINDSHIELD

Test Step	Result / Action to Take
E1 CHECK THE MULTIFUNCTION SWITCH	
• Ignition OFF. • Disconnect: Multifunction Switch C202. • Carry out the Multifunction Switch Component Test. Refer to Wiring Diagrams Cell 149 for component testing. • **Did the multifunction switch pass the component test?**	**Yes** GO to E2 . **No** INSTALL a new multifunction switch. REFER to Section 211-05 . TEST the system for normal operation.

E2 CHECK CIRCUITS CRW19 (BU/OG), CRW08 (VT/OG) AND CRW17 (GN/VT) FOR AN OPEN	
• Disconnect: Windshield Wiper Motor C125. • Measure the resistance between multifunction switch C202, harness side and windshield wiper motor C125, harness side using the following chart: **Multifunction Switch** / **Circuit** / **Windshield Wiper Motor** C202-9 / CRW08 (VT/OG) / C125-1 C202-12 / CRW17 (GN/VT) / C125-9 C202-16 / CRW19 (BU/OG) / C125-10  N0083153 • **Is the resistance less than 5 ohms?**	**Yes** GO to E3 . **No** REPAIR the circuit(s) in question. TEST the system for normal operation.
E3 CHECK CIRCUITS CRW19 (BU/OG), CRW08 (VT/OG) AND CRW17 (GN/VT) FOR A SHORT TO GROUND	
• Measure the resistance between ground and windshield wiper motor: ♦ C125-1, circuit CRW08 (VT/OG), harness side. ♦ C125-9, circuit CRW17 (GN/VT), harness side. ♦ C125-10, circuit CRW19 (BU/OG), harness side.  N0058054 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to E4 . **No** REPAIR the circuit(s) in question. TEST the system for normal operation.

tomsn048@gmail.com

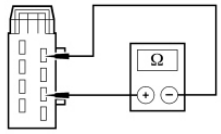
E4 CHECK FOR SHORTS IN THE WINDSHIELD WIPER MOTOR HARNESS	
• Measure the resistance at windshield wiper motor C125, harness side, between the circuits shown in the following chart: **Windshield Wiper Motor** / **Circuits** / **Windshield Wiper Motor** C125-10 / CRW19 (BU/OG)/CRW08 (VT/OG) / C125-1 C125-10 / CRW19 (BU/OG)/CRW17 (GN/VT) / C125-9 C125-10 / CRW19 (BU/OG)/CRW18 (VT/WH) / C125-11 C125-11 / CRW18 (VT/WH)/CRW08 (VT/OG) / C125-1 C125-11 / CRW18 (VT/WH)/CRW17 (GN/VT) / C125-9 C125-1 / CRW08 (VT/OG)/CRW17 (GN/VT) / C125-9  N0091498 • **Is the resistance greater than 10,000 ohms for all measurements?**	**Yes** GO to E5 . **No** REPAIR the circuit. TEST the system for normal operation.
E5 CHECK FOR CORRECT WIPER MOTOR OPERATION	
• Disconnect all wiper motor connectors. • Check for: ♦ corrosion. ♦ pushed-out pins. • Connect all wiper motor connectors and make sure they seat correctly.	**Yes** INSTALL a new windshield wiper motor. REFER to Wiper Motor - Windshield in this section. **No** The system is operating correctly at this time. Concern may have been caused by a

• Operate the system and verify the concern is still present. • **Is the concern still present?**	loose or corroded connector. TEST the system for normal operation.

Pinpoint Test F: The Intermittent Wiper Speed Does Not Operate Correctly - Rear Window

Refer to Wiring Diagrams Cell 81 , Wipers and Washers for schematic and connector information.

Normal Operation



Under normal operation, the rear window wiper motor receives open and ground inputs from the multifunction switch through circuits CRW20 (GY/YE) and CRW21 (YE/VT) to activate the wiper to the appropriate modes. The multifunction switch supplies a ground input to the rear wiper motor on CRW21 (YE/VT) when INT 1 is selected. The multifunction switch supplies ground to the rear wiper motor on CRW21 (YE/VT) and CRW20 (GY/YE) when INT 2 is selected.

This pinpoint test is intended to diagnose the following:
- Rear window wiper motor
- Multifunction switch

PINPOINT TEST F: THE INTERMITTENT WIPER SPEED DOES NOT OPERATE CORRECTLY - REAR WINDOW

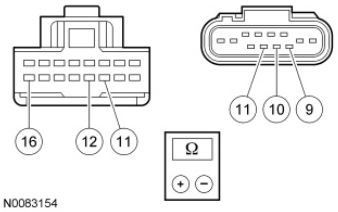
Test Step	Result / Action to Take
F1 VERIFY REAR WASHER PUMP OPERATION	
• Ignition ON. • Activate the rear washer pump. • **Does the rear washer pump activate?**	**Yes** GO to F2 . **No** GO to Pinpoint Test H .
F2 CHECK THE MULTIFUNCTION SWITCH	
• Ignition OFF. • Disconnect: Multifunction Switch C202. • Carry out the Multifunction Switch Component Test. Refer to Wiring Diagrams Cell 149 for component testing. • **Did the multifunction switch pass the component test?**	**Yes** GO to F3 . **No** INSTALL a new multifunction switch. REFER to Section 211-05 .
F3 CHECK FOR A SHORT BETWEEN CIRCUITS CRW20 (GY/YE) AND CRW21 (YE/VT)	
• Measure the resistance between rear window wiper C4323-5, circuit CRW20 (GY/YE), harness side and rear window wiper C4323-1, circuit CRW21 (YE/VT), harness side.	**Yes** GO to F4 . **No** REPAIR the circuit. TEST the system for normal operation.

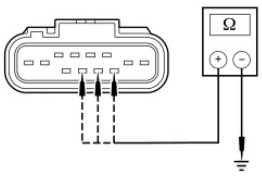
tomsn048@gmail.com

 N0073675 • **Is the resistance greater than 10,000 ohms?**	
F4 CHECK FOR CORRECT WIPER MOTOR OPERATION	
• Disconnect all wiper motor connectors. • Check for: ♦ corrosion. ♦ pushed-out pins. • Connect all wiper motor connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new rear window wiper motor. REFER to Wiper Motor - Rear Window in this section. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

Pinpoint Test G: The Intermittent Wiper Speed Does Not Operate Correctly - Windshield

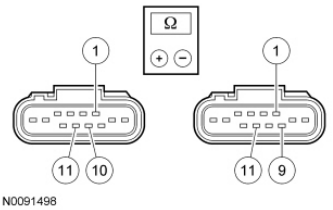
Refer to Wiring Diagrams Cell 81 , Wipers and Washers for schematic and connector information.





Normal Operation

Under normal operation, the windshield wiper motor receives open and ground inputs from the multifunction switch through circuits CRW17 (GN/VT), CRW18 (VT/WH), CRW19 (BU/OG) and CRW08 (VT/OG) to activate the wipers to the appropriate speeds.



This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- Windshield wiper motor
- Multifunction switch

PINPOINT TEST G: THE INTERMITTENT WIPER SPEED DOES NOT OPERATE CORRECTLY - WINDSHIELD

Test Step	Result / Action to Take
G1 CHECK THE MULTIFUNCTION SWITCH	
• Ignition OFF. • Disconnect: Multifunction Switch C202. • Carry out the Multifunction Switch Component Test. Refer to Wiring Diagrams Cell 149 for component testing. • **Did the multifunction switch pass the component test?**	**Yes** GO to G2 . **No** INSTALL a new multifunction switch. REFER to Section 211-05 . TEST the system for normal operation.
G2 CHECK CIRCUITS CRW19 (BU/OG), CRW18 (VT/WH) AND CRW17 (GN/VT) FOR AN OPEN	

• Disconnect: Windshield Wiper Motor C125. • Measure the resistance between multifunction switch C202, harness side and windshield wiper motor C125, harness side using the following chart: **Multifunction Switch** / **Circuit** / **Windshield Wiper Motor** C202-11 / CRW18 (VT/WH) / C125-11 C202-12 / CRW17 (GN/VT) / C125-9 C202-16 / CRW19 (BU/OG) / C125-10  N0083154 • **Is the resistance less than 5 ohms?**	**Yes** GO to G3 . **No** REPAIR the circuit(s) in question. TEST the system for normal operation.
G3 CHECK CIRCUITS CRW19 (BU/OG), CRW18 (VT/WH) AND CRW17 (GN/VT) FOR A SHORT TO GROUND	
• Measure the resistance between ground and windshield wiper motor: ♦ C125-9, circuit CRW17 (GN/VT), harness side. ♦ C125-10, circuit CRW19 (BU/OG), harness side. ♦ C125-11, circuit CRW18 (VT/WH), harness side.  N0058187 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to G4 . **No** REPAIR the circuit(s) in question. TEST the system for normal operation.
G4 CHECK FOR SHORTS IN THE WINDSHIELD WIPER MOTOR HARNESS	

tomsn048@gmail.com

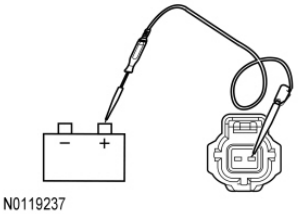
• Measure the resistance at windshield wiper motor C125 between the circuits shown in the following chart. **Windshield Wiper Motor** / **Circuits** / **Windshield Wiper Motor** C125-10 / CRW19 (BU/OG)/CRW08 (VT/OG) / C125-1 C125-10 / CRW19 (BU/OG)/CRW17 (GN/VT) / C125-9 C125-10 / CRW19 (BU/OG)/CRW18 (VT/WH) / C125-11 C125-11 / CRW18 (VT/WH)/CRW08 (VT/OG) / C125-1 C125-11 / CRW18 (VT/WH)/CRW17 (GN/VT) / C125-9 C125-1 / CRW08 (VT/OG)/CRW17 (GN/VT) / C125-9  N0091498 • **Is the resistance greater than 10,000 ohms for all measurements?**	**Yes** GO to G5 . **No** REPAIR the circuit. TEST the system for normal operation.
G5 CHECK FOR CORRECT WIPER MOTOR OPERATION	
• Disconnect all wiper motor connectors. • Check for: ♦ corrosion. ♦ pushed-out pins. • Connect all wiper motor connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new windshield wiper motor. REFER to Wiper Motor - Windshield in this section. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

Pinpoint Test H: The Washer Pump is Inoperative - Explorer

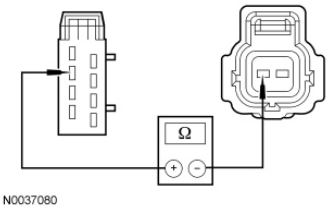
Refer to Wiring Diagrams Cell 81 , Wipers and Washers for schematic and connector information.

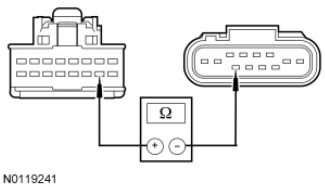
Normal Operation

The front and rear washer systems share the same washer pump motor. The washer pump motor is controlled by two relays; one relay is integral to the front windshield wiper motor and the other relay is integral to the rear wiper motor. Each relay output is connected to one of the washer pump motor's two inputs and when the washer pump motor is not in use, the relay outputs are both in a state of ground. When the rear window WASH function has been selected, the rear wiper motor's integral relay supplies power to one of the washer pump motor inputs causing it to rotate and deliver washer solvent to the rear window. When the front windshield WASH function has been selected, the front windshield wiper motor's integral relay supplies power to the other washer pump motor input causing it to rotate in the opposite direction and deliver washer solvent to the front windshield. The multifunction switch is connected directly to the front windshield wiper motor and also the rear wiper motor.



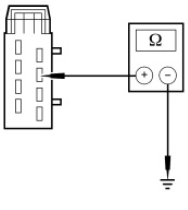
This pinpoint test is intended to diagnose the following:

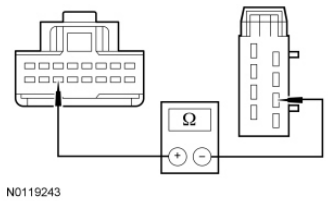




- Wiring, terminals or connectors
- Multifunction switch
- Washer pump motor
- Windshield wiper motor
- Rear window wiper motor

PINPOINT TEST H: THE WASHER PUMP IS INOPERATIVE - EXPLORER





Test Step	Result / Action to Take
H1 CHECK THE OPERATION OF THE FRONT AND REAR WIPERS	
• Ignition ON. • Operate the front and rear wipers in all modes. • **Do the front and/or rear wipers operate in all modes other than front and/or rear wash?**	**Yes** GO to H2 . **No** If the front and/or rear wipers are inoperative or display any other faults (other than front or rear wash), GO to Symptom Chart - Wipers and Washers .
H2 CHECK THE OPERATION OF THE FRONT AND REAR WASH FUNCTIONS	
• Operate the front and rear wash function. • **Is the front and rear wash function inoperative?**	**Yes** If the front and rear wash function is inoperative, GO to H3 . **No** If the front wash is inoperative, GO to H7 . If the rear wash is inoperative, GO to H10 .

tomsn048@gmail.com

H3 CHECK THE WASHER PUMP MOTOR BY USING A TEST LIGHT	
NOTICE: **The following step uses a test light to simulate normal circuit loads. Use only the test light recommended in the Special Tools table at the beginning of this section. To avoid connector terminal damage, use the Flex Probe Kit for the test light probe connection to the vehicle. Do not use the test light probe directly on any connector.** • Disconnect: Washer Pump Motor C1397. • Connect a test light between the washer pump motor C1397-1, circuit CRW12 (GY/WH), harness side and the washer pump motor C1397-2, circuit CRW14 (BU/WH), harness side.  N0119238 • Operate the front and rear wash function. • **Does the test light illuminate?**	**Yes** INSTALL A new washer pump motor. TEST the system for normal operation. **No** GO to H4 .
H4 CHECK CIRCUIT CRW14 FOR GROUND	
NOTICE: **The following step uses a test light to simulate normal circuit loads. Use only the test light recommended in the Special Tools table at the beginning of this section. To avoid connector terminal damage, use the Flex Probe Kit for the test light probe connection to the vehicle. Do not use the test light probe directly on any connector.** • Connect a test light between the washer pump motor C1397-2, circuit CRW14 (BU/WH), harness side and the battery positive post.  N0119237 • **Does the test light illuminate?**	**Yes** GO to H5 . **No** GO to H6 .
H5 CHECK THE REAR WASHER SWITCH CIRCUIT FOR AN OPEN	

• Disconnect: Rear Wiper Motor C4323. • Measure the resistance between the rear wiper motor C4323-4, circuit CRW12 (GY/OG), harness side and the washer pump C1397-1, circuit CRW12 (GY/OG), harness side.  N0037080 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new rear wiper motor. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
H6 CHECK THE FRONT WASHER CONTROL CIRCUIT FOR AN OPEN	
• Disconnect: Windshield Wiper Motor C125. • Measure the resistance between the windshield wiper motor C125-7, circuit CRW14 (BU/WH), harness side and the washer pump C1397-2, CRW14 (BU/WH), harness side. • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new windshield wiper motor. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
H7 CHECK THE MULTIFUNCTION SWITCH	
• Ignition OFF. • Disconnect: Multifunction Switch C202. • Carry out the Multifunction Switch Component Test. Refer to Wiring Diagrams Cell 149 for component testing. • **Did the multifunction switch pass the component test?**	**Yes** GO to H8 . **No** INSTALL a new multifunction switch. REFER to Section 211-05 . TEST the system for normal operation.
H8 CHECK THE FRONT WASHER SWITCH CIRCUIT FOR AN OPEN	
• Disconnect: Windshield Wiper Motor C125. • Measure the resistance between the multifunction switch C202-10, circuit CRW07 (GY/BN), harness side and the windshield wiper motor C125-12, circuit CRW07 (GY/BN), harness side.  N0119241 • **Is the resistance less than 5 ohms?**	**Yes** GO to H9 . **No** REPAIR the circuit. TEST the system for normal operation.

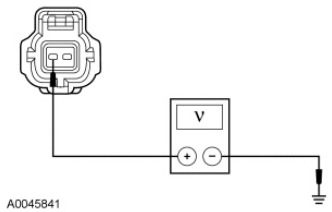
tomsn048@gmail.com

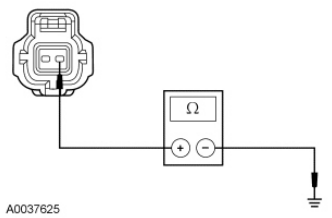
H9 CHECK THE REAR WASHER GROUND CIRCUIT FOR AN OPEN	
• Disconnect: Rear Wiper Motor C4323. • Measure the resistance between the rear wiper motor C4323-3, circuit GD150 (BK/WH), harness side and ground.  N0059129 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new windshield wiper motor. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
H10 CHECK THE MULTIFUNCTION SWITCH	
• Ignition OFF. • Disconnect: Multifunction Switch C202. • Carry out the Multifunction Switch Component Test. Refer to Wiring Diagrams Cell 149 for component testing. • **Did the multifunction switch pass the component test?**	**Yes** GO to H11 . **No** INSTALL a new multifunction switch. REFER to Section 211-05 . TEST the system for normal operation.
H11 CHECK THE REAR WASHER SWITCH CIRCUIT FOR AN OPEN	
• Disconnect: Rear Wiper Motor C4323. • Measure the resistance between the multifunction switch C202-14, circuit CRW20 (GY/YE), harness side and the rear wiper motor C4323-5, circuit CRW20 (GY/YE), harness side.  N0119243 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new rear wiper motor. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.

Pinpoint Test I: The Washer Pump is Inoperative - Explorer Sport Trac

Refer to Wiring Diagrams Cell 81 , Wipers and Washers for schematic and connector information.

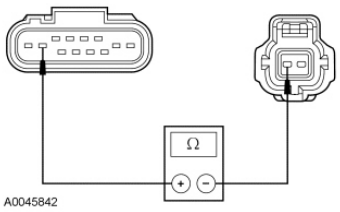
Normal Operation

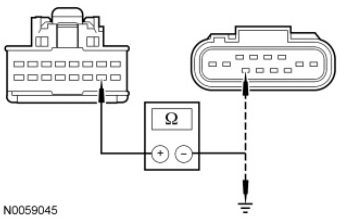




During normal operation, the washer pump motor is powered through an internal relay in the wiper motor using circuit CRW14 (BU/WH). The multifunction switch provides input to the windshield wiper motor

through circuit CRW07 (GY/BN) to activate the washer. The washer pump motor is grounded at all times through circuit GD120 (BK/GN).





This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Washer pump motor
- Multifunction switch

PINPOINT TEST I: THE WASHER PUMP IS INOPERATIVE - EXPLORER SPORT TRAC

Test Step	Result / Action to Take
I1 CHECK THE WASHER PUMP MOTOR FOR VOLTAGE	
• Ignition OFF. • Disconnect: Washer Pump Motor C137. • Ignition ON. • Measure the voltage between washer pump motor C137-1, circuit CRW14 (BU/WH) harness side and ground while depressing the multifunction switch to the WASH position.  A0045841 • **Is the voltage greater than 10 volts?**	**Yes** GO to I2 . **No** GO to I3 .
I2 CHECK CIRCUIT GD120 (BK/GN) FOR GROUND	
• Ignition OFF. • Measure the resistance between washer pump motor C137-2, circuit GD120 (BK/GN), harness side and ground.  A0037625 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new washer pump. REFER to Washer Pump in this section. **No** REPAIR the circuit. TEST the system for normal operation.
I3 CHECK CIRCUIT CRW14 (BU/WH) FOR AN OPEN	

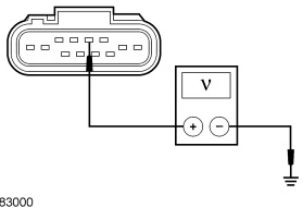
tomsn048@gmail.com

• Ignition OFF. • Disconnect: Windshield Wiper Motor C125. • Measure the resistance between windshield wiper motor C125-7, circuit CRW14 (BU/WH), harness side and washer pump motor C137-1, circuit CRW14 (BU/WH), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** GO to I4 . **No** REPAIR the circuit. TEST the system for normal operation.
I4 CHECK THE MULTIFUNCTION SWITCH	
• Ignition OFF. • Disconnect: Multifunction Switch C202. • Carry out the Multifunction Switch Component Test. Refer to Wiring Diagrams Cell 149 for component testing. • **Did the multifunction switch pass the component test?**	**Yes** GO to I5 . **No** INSTALL a new multifunction switch. REFER to Section 211-05 .
I5 CHECK CIRCUIT CRW07 (GY/BN) FOR AN OPEN OR SHORT TO GROUND	
• Measure the resistance between windshield wiper motor C125-12, circuit CRW07 (GY/BN), harness side and multifunction switch C202-10, circuit CRW07 (GY/BN), harness side; and between multifunction switch C202-10, circuit CRW07 (GY/BN), harness side and ground.  • **Is the resistance less than 5 ohms between multifunction switch and wiper motor; and greater than 10,000 ohms between multifunction switch and ground?**	**Yes** GO to I6 . **No** REPAIR the circuit. TEST the system for normal operation.
I6 CHECK FOR CORRECT WIPER MOTOR OPERATION	
• Disconnect all wiper motor connectors. • Check for: ♦ corrosion. ♦ pushed-out pins. • Connect all wiper motor connectors and make sure they seat correctly.	**Yes** INSTALL a new windshield wiper motor. REFER to Wiper Motor - Windshield in this section. **No** The system is operating correctly at

• Operate the system and verify the concern is still present. • **Is the concern still present?**	this time. Concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

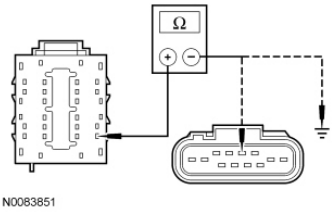
Pinpoint Test J: The Headlamps Do Not Illuminate When the Wipers are On

Refer to Wiring Diagrams Cell 81 , Front Wipers and Washers for schematic and connector information.



Normal Operation

If equipped with automatic headlamps, the Smart Junction Box (SJB) will illuminate the exterior lamps within 10 seconds when the front wipers are on and the headlamp control switch is in the AUTOLAMP position. The SJB monitors the front wiper motor on circuit CRW22 (WH/BU).



- DTC B2008 Wipers On Signal Circuit Short to Ground - Short to ground on wiper motor on input circuit.

This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- Windshield wiper motor
- SJB

PINPOINT TEST J: THE HEADLAMPS DO NOT ILLUMINATE WHEN THE WIPERS ARE ON

Test Step	Result / Action to Take
J1 CHECK CIRCUIT CRW22 (WH/BU) FOR VOLTAGE	
• Disconnect: Windshield Wiper Motor C125. • Ignition ON. • Measure the voltage between windshield wiper motor C125-2 circuit CRW22 (WH/BU), harness side and ground.  A0083000 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new windshield wiper motor. REFER to Wiper Motor - Windshield in this section. TEST the system for normal operation. **No** GO to J2 .
J2 CHECK CIRCUIT CRW22 (WH/BU) FOR AN OPEN OR SHORT TO GROUND	
• Ignition OFF. • Disconnect: SJB C2280E. • Measure the resistance between SJB C2280E-8 circuit CRW22 (WH/BU), harness side and windshield wiper motor C125-2 circuit CRW22 (WH/BU); then between SJB C2280E-8 circuit	**Yes** GO to J3 . **No** REPAIR the circuit. TEST the system for normal operation.

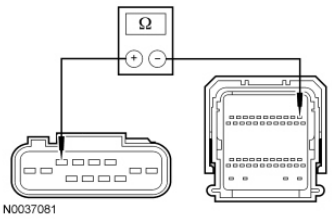
tomsn048@gmail.com

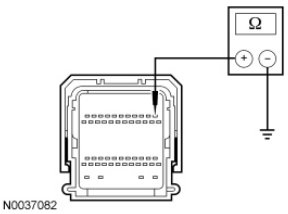
CRW22 (WH/BU), harness side and ground.  N0083851 • **Is the resistance less than 5 ohms between the SJB and windshield wiper motor and greater than 10,000 ohms between the SJB and ground?**	
J3 CHECK FOR CORRECT MODULE OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion. ♦ pushed-out pins. • Connect all the SJB connectors and make sure they are seated correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . CLEAR the DTCs. REPEAT the SJB self-test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test K: The Speed Dependent Interval Mode Does Not Operate Correctly

Refer to Wiring Diagrams Cell 81 , Wipers and Washers for schematic and connector information.

Normal Operation





Under normal operation, the windshield wiper motor receives vehicle speed information from the PCM through circuit VMC05 (VT/OG). The speed dependent wipers function in all INT modes except INT 1.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Windshield wiper motor
- PCM

PINPOINT TEST K: THE SPEED DEPENDENT INTERVAL MODE DOES NOT OPERATE CORRECTLY

Test Step	Result / Action to Take
K1 REVIEW THE DTCs	
• Review the DTCs from the PCM self-test. • **Are any Vehicle Speed Sensor (VSS) related DTCs present?**	**Yes** REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual to diagnose the fault.

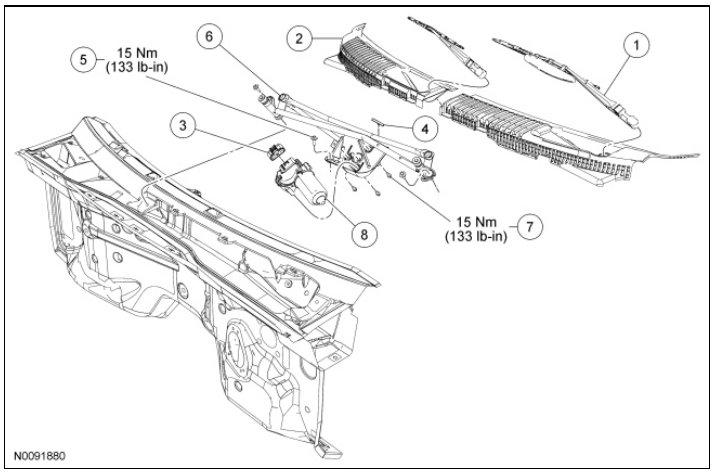
	No GO to K2 .
K2 CHECK CIRCUIT VMC05 (VT/OG) FOR AN OPEN	
• Disconnect: PCM C175b. • Disconnect: Windshield Wiper Motor C125. • Measure the resistance between PCM C175b-1, circuit VMC05 (VT/OG), harness side and windshield wiper motor C125-4, circuit VMC05 (VT/OG), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** GO to K3 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
K3 CHECK CIRCUIT VMC05 (VT/OG) FOR A SHORT TO GROUND	
• Measure the resistance between PCM C175b-1, circuit VMC05 (VT/OG), harness side and ground.  • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to K4 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
K4 CHECK FOR CORRECT WIPER MOTOR OPERATION	
• Disconnect all wiper motor connectors. • Check for: ♦ corrosion. ♦ pushed-out pins. • Connect all wiper motor connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new windshield wiper motor. REFER to Wiper Motor - Windshield in this section. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

tomsn048@gmail.com

Wiper Blade and Pivot Arm Adjustment - Windshield

1. Cycle and park the windshield wipers.

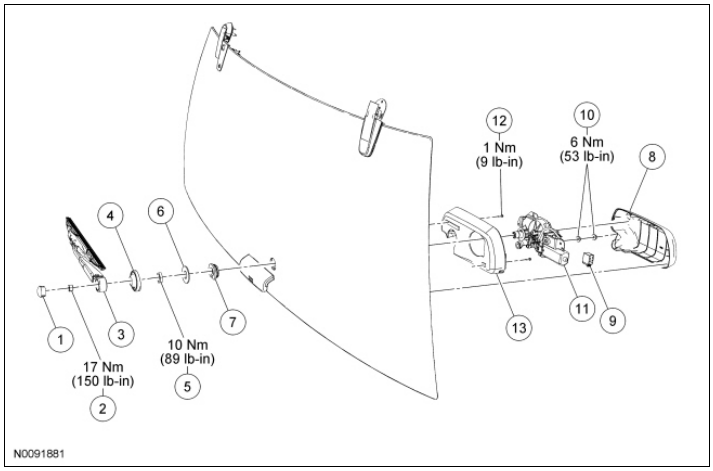
2. Verify that the RH and LH wiper blades are located at the specified position.



3. **NOTE:** Make sure there is no mechanical binding in the linkage preventing the wiper arms from returning to the fully parked position.

   If the distance is not within specification, remove the windshield wiper pivot arm and reposition to specification.

tomsn048@gmail.com



Wiper and Washer System - Exploded View

1. For additional information, refer to the procedures in this section.

Wiper Pivot Arm - Front

1. Remove the wiper pivot arm.
    1. Pull up on the pivot arm.
    2. Pull out on the retaining tab and remove the pivot arm.

2. **NOTE:** The windshield wiper motor must be cycled to make sure that it is in the park position. If necessary, adjust the wiper pivot arms. For additional information, refer to Wiper Blade and Pivot Arm Adjustment - Windshield in this section.

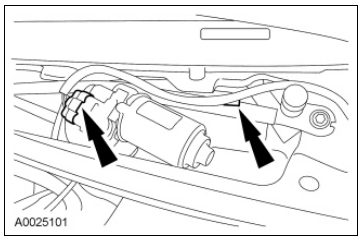
   To install, reverse the removal procedure.

tomsn048@gmail.com

Wiper Motor - Windshield

Removal and Installation

NOTE: A new wiper motor assembly comes with the linkage arm installed.



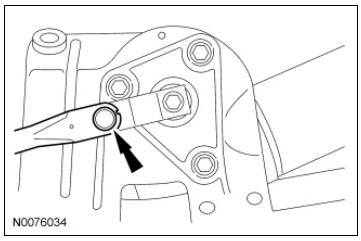
1. Remove the front wiper pivot arms. For additional information, refer to Wiper Pivot Arm - Front in this section.

2. ***NOTICE:*** **To avoid breaking the retaining clips on the cowl panel, do not pull up on the rear of the cowl panel.**

   Pry up on the front of the cowl panels to release it from the retaining clips.

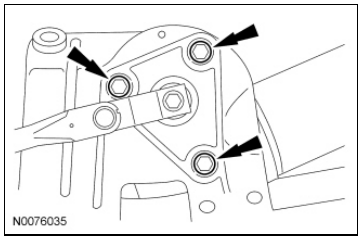
3. Remove the cowl panel grilles.

4. Disconnect the windshield wiper motor electrical connector.
   - Unclip the wiring harness from the wiper arm.
   - Position the wiring harness aside.



5. Remove the 3 windshield wiper assembly mounting bolts.
   - To install, tighten to 15 Nm (133 lb-in).

6. Remove the windshield wiper assembly and position on a workbench.



7. ***NOTICE:*** **Do not remove the wiper motor linkage arm from the wiper motor assembly. If the arm is removed, the wiper arms may not park in the correct location.**

   Separate the wiper motor linkage arm from the wiper mounting arm and pivot shaft assembly.

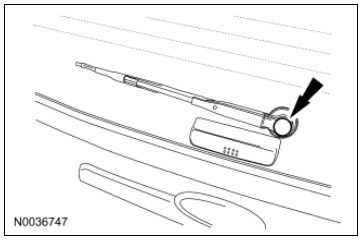
   - Use a suitable tool at the location shown to separate the wiper linkage arm from the wiper mounting arm and pivot shaft assembly.

8. Remove the 3 windshield wiper motor mounting bolts.
   - To install, tighten to 15 Nm (133 lb-in).

9. Remove the windshield wiper motor.

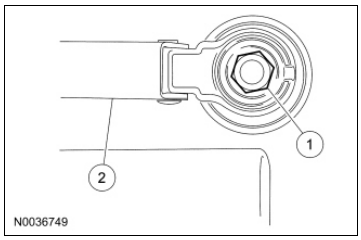
10. **NOTE:** The windshield wiper motor must be cycled to make sure it is in the park position before installing the wiper pivot arms.

    To install, reverse the removal procedure.



---

tomsn048@gmail.com

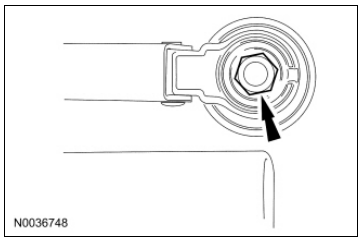


Wiper Pivot Arm - Rear

Removal

1. Remove the wiper pivot arm cover.

2. Remove the wiper pivot arm.
    1. Remove the pivot arm nut.
    2. Remove the wiper pivot arm.



Installation

1. **NOTE:** Before installation, be sure that the rear window wiper motor is in the park position.

   Turn the wiper switch ON and OFF to allow the rear window wiper motor to cycle and stop in the park position.

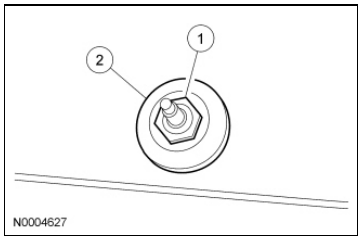
2. Position the wiper pivot arm.

3. Install the pivot arm nut.
    - Tighten to 17 Nm (150 lb-in).

4. Install the wiper pivot arm cover.

5. Operate the rear window wiper for one cycle to be sure that the pivot arm is in the correct position when the rear window wiper motor is in the park position.
   If the pivot arm is not in the correct position, remove the pivot arm and repeat Steps 1 through 4.

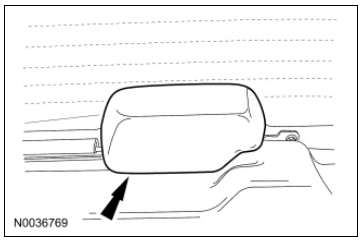
---



tomsn048@gmail.com

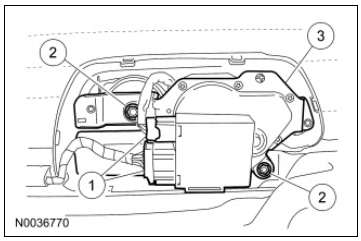
Wiper Motor - Rear Window

Removal and Installation



1. Remove the rear wiper pivot arm. For additional information, refer to Wiper Pivot Arm - Rear in this section.

2. Remove the rear window wiper motor grommet.
    1. Remove the pivot shaft nut.
        - To install, tighten to 10 Nm (89 lb-in).
    2. Remove the grommet.



3. Open the liftgate window.

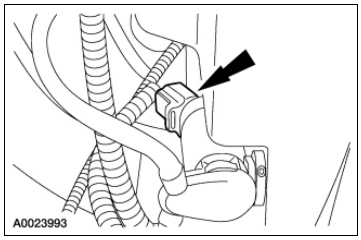
4. Remove the wiper motor cover trim panel.

5. Remove the rear window wiper motor.
    1. Disconnect the electrical connectors.
    2. Remove the 2 rear window wiper motor nuts.
        - To install, tighten to 6 Nm (53 lb-in).
    3. Remove the rear window wiper motor.

6. To install, reverse the removal procedure.

tomsn048@gmail.com

Washer Pump



Material

Item	Specification
Motorcraft® Premium Quality Windshield Washer Fluid (Canada) CXC-37-(A, B, D, and F) (Canada)	-
Motorcraft® Premium Windshield Washer Concentrate (US) ZC-32-A or B (US)	WSB-M8B16-A2

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Disconnect the windshield washer pump electrical connector.

3. ⚠ **WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.**

   NOTE: To prevent spilling windshield washer fluid, drain the windshield washer reservoir before washer pump removal.

   Disconnect the windshield washer reservoir hoses.

4. **NOTE:** When servicing the windshield washer pump, be careful not to damage the windshield washer pump seal.

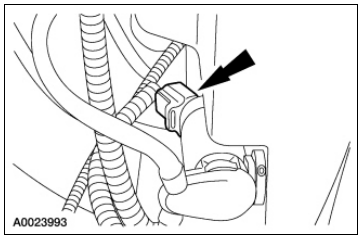
   Remove the windshield washer pump.

5. ***NOTICE:*** **Do not operate the windshield washer pump before filling the windshield washer reservoir. Failure to do so could result in premature pump failure.**

   To install, reverse the removal procedure.

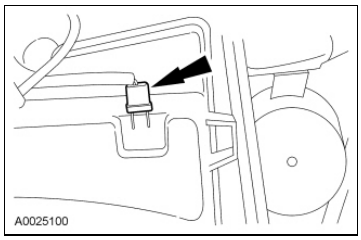
   - Fill the windshield washer reservoir with windshield washer fluid.

tomsn048@gmail.com



Washer Reservoir

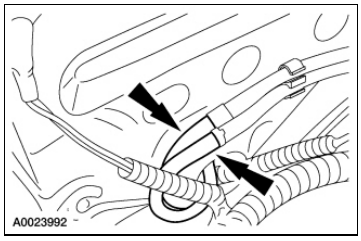
Material



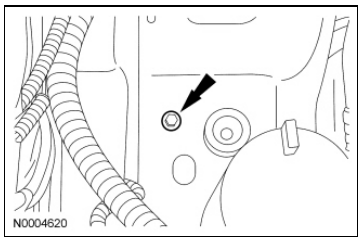
Item	Specification
Motorcraft® Premium Quality Windshield Washer Fluid (Canada) CXC-37-(A, B, D, and F) (Canada)	-
Motorcraft® Premium Windshield Washer Concentrate (US) ZC-32-A or B (US)	WSB-M8B16-A2

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the Air Cleaner (ACL) assembly. For additional information, refer to Section 303-12 .
3. Remove the RH front fender splash shield. For additional information, refer to Section 501-02 .
4. Disconnect the windshield washer pump electrical connector.

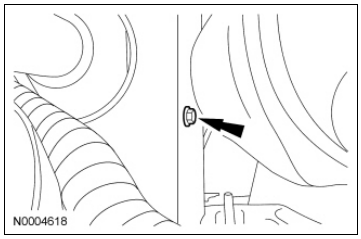


5. Disconnect the windshield washer solvent level electrical connector.

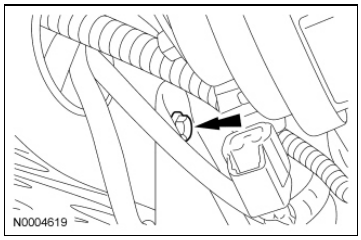


⚠ WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

NOTE: If necessary, drain the windshield washer reservoir after removal.



6. Disconnect the windshield washer reservoir hoses.



7. Remove the top bolt.
    - To install, tighten to 5 Nm (44 lb-in).

8. Remove the side bolt.
    - To install, tighten to 5 Nm (44 lb-in).

9. Remove the bolt.
    - To install, tighten to 5 Nm (44 lb-in).

10. Remove the windshield washer pump reservoir.

11. ***NOTICE:*** **When servicing the windshield washer pump, be careful not to damage the windshield washer pump seal.**

    Transfer components as necessary.

12. ***NOTICE:*** **Do not operate the washer pump prior to filling the windshield washer reservoir. Failure to follow these instructions may result in premature pump failure.**

    To install, reverse the removal procedure.

General Specifications

Item	Specification
Roof Opening Panel Alignment	
Roof opening panel glass clearance: roof to the front of the roof opening panel	-3 to 1 mm (-0.12 to 0.04 in) flush front to rear
Roof opening panel glass clearance: rear of the roof opening panel to the roof	3 to -1 mm (0.12 to -0.04 in) flush front to rear

Torque Specifications

Description	Nm	lb-in
Air deflector screws	1	9
Roof opening panel frame bolts	6	53
Roof opening panel glass screws	4	35
Roof opening panel motor mounting screws	3	27

tomsn048@gmail.com

Roof Opening Panel

The roof opening panel consists of the following:

- Air deflector
- Roof opening panel drain hose
- Roof opening panel frame
- Roof opening panel glass
- Roof opening panel glass seal
- Roof opening panel motor and module assembly
- Roof opening panel shield (sun shade)
- Roof opening panel shield guide feet
- Roof opening panel switch
- Roof opening panel trough
- Roof opening panel trough guides
- Skid plates
- Trim lace

Roof Opening Panel Operation

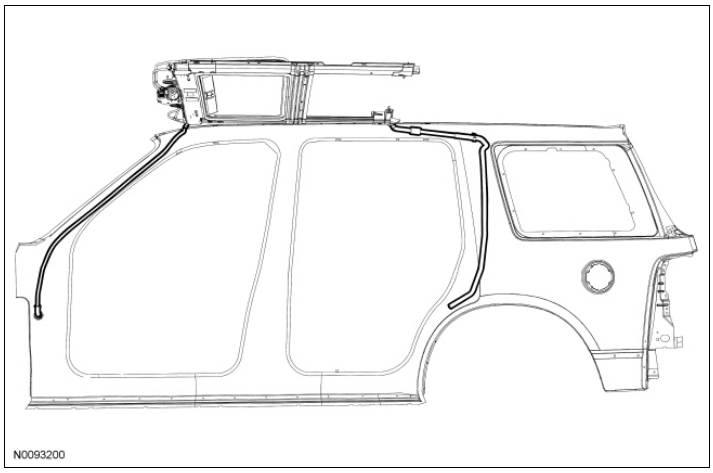
The roof opening panel assembly uses an integrated motor and module to operate the roof opening panel. The roof opening panel is an electronically operated glass panel that has one-touch open, one-touch close and one-touch vent features.

To vent the roof opening panel, the roof opening panel must first be in the CLOSED position. Press and release the TILT control switch. The roof opening panel will move to the VENT position automatically. To close the roof opening panel from the VENT position, pull and hold the TILT control switch until the glass panel stops moving.

To open the roof opening panel, press and release the SLIDE control switch. The roof opening panel will open automatically. The roof opening panel movement can be stopped at any time by pressing the switch again.

To close the roof opening panel, pull and release the SLIDE or TILT control switch. The roof opening panel will close automatically. The roof opening panel movement can be stopped at any time by pressing the switch again.

Bounce-Back



The roof opening panel has a bounce-back feature. If an obstacle has been detected in the roof opening panel as the sliding glass is closing, the roof opening panel will automatically open and stop at a predetermined position.

Security Override

To override a bounce-back condition (to overcome the resistance of ice on the roof opening panel seal for example), within 2 seconds of a bounce-back event, pull and hold the SLIDE or TILT control switch. The closing force will begin to increase each time the roof opening panel is closed for the first 3 closing cycles (bounce-back will still be enabled).

Roof Opening Panel

Special Tool(s)

 ST1137-A	73III Automotive Meter 105-R0057 or equivalent

Principles of Operation

Roof Opening Panel

The roof opening panel assembly uses an integrated motor and module to operate the roof opening panel. The roof opening panel motor and module are installed new as an assembly. The roof opening panel is an electronically operated glass panel that can be opened, closed or vented by the roof opening panel switch.

The roof opening panel motor must be initialized when repairs are carried out on any part of the roof opening panel system, including: whenever the roof opening panel motor has been removed from the roof opening panel system, the roof opening panel glass has been removed from the roof opening panel system, the roof opening panel assembly has been removed from the vehicle, a new roof opening panel motor has been installed, a new roof opening panel glass has been installed or a new roof opening panel assembly has been installed.

Inspection and Verification

1. Verify the customer concern by operating the system.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Roof opening panel • Roof opening panel shield • Roof panel frame • Opening shield guide feet	• Smart Junction Box (SJB) fuse(s): ♦ 1 (20A) ♦ 5 (5A) • Circuitry • Accessory delay relay • Roof opening panel control switch • Roof opening panel motor

tomsn048@gmail.com

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. If the concern is not visually evident, determine the symptom. GO to Symptom Chart - Roof Opening Panel or GO to Symptom Chart - NVH .

Symptom Chart - Roof Opening Panel

Symptom Chart - Roof Opening Panel

Symptom Chart - NVH

Symptom Chart- NVH
NOTE: NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to Section 100-04 . Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to Section 100-04 for the next likely system and continue diagnosis.

ConditionPossible SourcesAction

- The roof opening panel has excessive wind noise

- Glass panel not fully closed
- Incorrect alignment
- Roof opening panel seals damaged

- GO to Pinpoint Test A .

- The roof opening panel rattles

- Roof opening panel
- Roof opening panel rail or guide
- Roof opening panel lifter assemblies
- Loose roof opening panel fasteners
- Roof opening panel shield
- DVD entertainment system

- GO to Pinpoint Test C .

- The roof opening panel is noisy during operation

- Roof opening panel
- Roof opening panel rail or guide
- Roof opening panel lifter assemblies
- Roof opening panel alignment
- Roof opening panel motor

- GO to Pinpoint Test D .

Pinpoint Tests

Pinpoint Test A: The Roof Opening Panel Has Excessive Wind Noise

Normal Operation

When the roof opening panel glass is completely closed, it is flush with the roof panel.

This pinpoint test is intended to diagnose the following:

- Incorrect roof opening panel alignment
- Poorly fitting roof opening panel seal/weatherstrip
- Incorrect installation of the roof opening panel and motor/module
- Incorrect curvature of the air deflector

PINPOINT TEST A: THE ROOF OPENING PANEL HAS EXCESSIVE WIND NOISE

Test Step	Result / Action to Take
A1 VERIFY THE ROOF OPENING PANEL NOISE	
• Road test the vehicle with the roof opening panel in the CLOSED and OPEN positions. • **Is the wind noise present only in the OPEN position?**	**Yes** GO to A4 . **No** GO to A2 .
A2 CHECK THE ROOF OPENING PANEL WEATHERSTRIP	
NOTE: Make sure the weatherstrip is secured to the glass, not cut, cracked, pinched, loose or obstructed in CLOSED, VENT and OPEN positions. • Check the roof opening panel weatherstrip. • **Is the roof opening panel weatherstrip OK?**	**Yes** GO to A3 . **No** INSTALL a new roof opening panel weatherstrip. REFER to Roof Opening Panel - Exploded View in this section. TEST the system for normal operation.
A3 CHECK THE ROOF OPENING PANEL ALIGNMENT	
• Check the roof opening panel alignment. • **Is the alignment OK?**	**Yes** REFER to Section 501-00 to diagnose other possible sources of the excessive wind noise. **No** ALIGN the roof opening panel. REFER to Roof Opening Panel Alignment in this section. TEST the system for normal operation.

tomsn048@gmail.com

A4 CHECK THE AIR DEFLECTOR	
• Make sure the air deflector is securely attached and check for damaged or unsecured springs. • **Is the air deflector OK?**	**Yes** PARTIALLY close the roof opening panel until the noise is eliminated. If the noise is eliminated, INFORM the customer that changing glass location will eliminate the wind noise. If the wind noise is not eliminated, INSTALL a new air deflector. TEST the system for normal operation. **No** INSTALL new air deflector assembly. REFER to Air Deflector in this section. TEST the system for normal operation.

Pinpoint Test B: The Roof Opening Panel Leaks

Normal Operation

When the roof opening panel glass is completely closed, it is flush with the roof panel.

This pinpoint test is intended to diagnose the following:
- Incorrect roof opening panel alignment
- Damaged, clogged or obstructed roof opening panel drain hoses
- Damaged roof opening panel seal/weatherstrip
- Incorrect position of the roof opening panel glass

PINPOINT TEST B: THE ROOF OPENING PANEL LEAKS

Test Step	Result / Action to Take
B1 VERIFY CUSTOMER OPERATION OF ROOF OPENING PANEL WHEN PARKED	
• Make sure customer is parking with the roof opening panel correctly in the CLOSED position. • **Is the customer parking with the roof opening panel in the CLOSED position?**	**Yes** GO to B2 . **No** INSTRUCT the customer to refer to the Owner's Literature for correct operation of the roof opening panel.
B2 CHECK THE ALIGNMENT OF THE ROOF OPENING PANEL	
• Make sure the roof opening panel glass is centered and flush with roof line. • **Is the roof opening panel alignment correctly?**	**Yes** GO to B3 . **No** ALIGN the roof opening panel. REFER to Roof Opening Panel Alignment in this section. TEST the system for normal operation.
B3 CHECK THE WEATHERSTRIP CONDITION	
	Yes GO to B4 .

• **NOTE:** The seal has a bonded joint located on the passenger side or rear edge. This is not a defect. • Make sure the roof opening panel seal is not cracked, torn or loose. • Check the roof opening panel seal. • **Is the roof opening panel seal in good condition and free from damage?**	**No** INSTALL a new roof opening panel seal. TEST the system for normal operation.
B4 CHECK THE WATER TROUGH CONDITION	
• Check the water trough and guides for damage and/or correct attachment and function. • **Is the water trough OK?**	**Yes** GO to B5 . **No** REPAIR the water trough or replace as necessary. TEST the system for normal operation.
B5 CHECK THE DRAIN HOSES	
NOTE: Drain hoses can be viewed with a flashlight by removing the headliner lace around the inside opening and gently pulling down on the headliner. (On some vehicles, the trim lace has been replaced by Velcro® style attachments.) • Make sure the drain hoses are all connected and not cracked, slit, pinched or obstructed. • **Are all the drain hoses present and attached correctly?**	**Yes** GO to B6 . **No** REPAIR or INSTALL a new drain hose(s). TEST the system for normal operation.
B6 CHECK THE DRAIN HOSES FOR CORRECT FLOW	
NOTE: Drain hoses must flow downhill and can not be pinched or restricted by headliner or any other trim components. • With the panel open, slowly pour water into the water trough area and make sure that the same amount of water exits the vehicle at the bottom of the A- and C-pillars. • Check the drain hoses for obstructions by blowing compressed air through the drain spouts in the water trough area, then retest with water. • **Are the drain hoses operating correctly?**	**Yes** INSPECT other areas of the vehicle that may cause water to enter the roof area such as the windshield or luggage rack, if equipped. If no problem is found, GO to B7 . **No** LOWER the headliner and INSPECT drain hoses for correct routing. REPAIR or INSTALL a new drain hose(s). TEST the system for normal operation.
B7 CHECK THE CONDITION OF THE ROOF OPENING PANEL FRAME	
• Check the roof opening panel frame for damage that may cause the roof opening panel seal to seat incorrectly. • **Is the roof opening panel frame OK?**	**Yes** INSTALL a new roof opening panel. REFER to Roof Opening Panel in this section. TEST the system for normal operation. **No** REPAIR roof opening panel frame as necessary. TEST the system for normal operation.

tomsn048@gmail.com

Pinpoint Test C: The Roof Opening Panel Rattles

Normal Operation

When the roof opening panel glass is completely closed, it is flush with the roof panel. All components should be secured correctly.

This pinpoint test is intended to diagnose the following:

- Roof opening panel
- Roof opening panel air deflector assembly
- Roof opening panel water trough
- Roof opening panel lifter assemblies
- Headliner
- Roof opening panel motor/module pad
- Roof opening panel frame
- Loose fasteners
- DVD entertainment system

PINPOINT TEST C: THE ROOF OPENING PANEL RATTLES

Test Step	Result / Action to Take
C1 CHECK THE ROOF OPENING PANEL WEATHERSTRIP	
• **NOTE:** Make sure the weatherstrip is secured to the glass, not cut, cracked, pinched, loose or obstructed in CLOSED, VENT and OPEN positions. • Check the roof opening panel weatherstrip. • **Is the roof opening panel weatherstrip OK?**	**Yes** GO to C2 . **No** INSTALL a new roof opening panel weatherstrip. REFER to Roof Opening Panel - Exploded View in this section. TEST the system for normal operation.
C2 CHECK THE ROOF OPENING PANEL TIGHTNESS	
• Manually push the roof opening glass panel up and fore/aft. • **Is the roof opening panel glass loose?**	**Yes** ALIGN the roof opening panel. REFER to Roof Opening Panel Alignment in this section. TEST the system for normal operation. **No** GO to C3 .
C3 CHECK THE ROOF OPENING PANEL TRACKS	
• Open the roof opening panel. • Check the roof opening panel tracks for obstructions and damage.	**Yes** GO to C4 . **No** REMOVE all the roof opening panel track obstructions

• **Are the roof opening panel tracks OK?**	and REPAIR the roof opening panel tracks. If the roof opening panel tracks cannot be repaired, INSTALL a new roof opening panel frame. REFER to Roof Opening Panel Frame in this section. TEST the system for normal operation.
C4 CHECK THE ROOF OPENING PANEL WATER TROUGH AND TROUGH GUIDES	
• Check the roof opening panel water trough and trough guides for any loose obstructions. • **Are the roof opening panel water trough and trough guides installed securely and free from obstructions?**	**Yes** GO to C5 . **No** REMOVE all obstructions from the roof opening panel water trough guides and install securely. INSTALL a new roof opening panel frame if the water trough guides are damaged. REFER to Roof Opening Panel - Exploded View and Roof Opening Panel Frame in this section. TEST the system for normal operation.
C5 CHECK THE ROOF OPENING PANEL SHIELD (SUNSHADE)	
• Check the roof opening panel shield for correct installation. • **Is the roof opening panel shield installed correctly?**	**Yes** GO to C6 . **No** INSTALL the roof opening panel shield correctly. REFER to Roof Opening Panel Shield . TEST the system for normal operation.
C6 CHECK THE ROOF OPENING PANEL AIR DEFLECTOR ASSEMBLY	
• Check the roof opening panel air deflector assembly for obstructions and damage. • **Is the roof opening panel air deflector assembly OK?**	**Yes** GO to C7 . **No** REMOVE all obstructions and REPAIR or INSTALL a new roof opening panel air deflector assembly. REFER to Air Deflector in this section. TEST the system for normal operation.
C7 CHECK THE ROOF OPENING PANEL GLASS	
• Verify the roof opening panel glass is free from obstructions and damage, and is securely fastened. • **Is the roof opening panel glass OK?**	**Yes** GO to C8 . **No** REPAIR or INSTALL a new roof opening panel glass. REFER to Roof Opening Panel Glass in this section. TEST the system for normal operation.
C8 CHECK THE ROOF OPENING PANEL LIFTER ASSEMBLIES	
• Verify the roof opening panel lifter assemblies are free from obstructions and damage.	**Yes** GO to C9 . **No**

tomsn048@gmail.com

• **Are the roof opening panel lifter assemblies OK?**	REMOVE all obstructions from the roof opening panel lifter assemblies and REPAIR any damage. If the roof opening panel lifter assemblies cannot be repaired, INSTALL a new roof opening panel frame. REFER to Roof Opening Panel - Exploded View and Roof Opening Panel Frame in this section. TEST the system for normal operation.
C9 CHECK ROOF OPENING PANEL FRAME INSTALLATION	
• Check all roof opening fasteners for correct torque and verify correct installation of the roof opening panel frame. Refer to Roof Opening Panel - Exploded View and Roof Opening Panel Frame in this section. • **Is the roof opening panel correctly installed and tightened to specification?**	**Yes** GO to C10 . **No** TIGHTEN the loose fasteners or REINSTALL the roof opening panel frame. REFER to Roof Opening Panel - Exploded View and Roof Opening Panel Frame in this section. TEST the system for normal operation.
C10 CHECK THE ROOF OPENING PANEL FRAME FOR RATTLES	
• Check the roof opening panel frame assembly for any loose parts or for any condition that will cause rattles. • **Is there a condition that will cause rattles?**	**Yes** INSTALL a suitable sound damper material to correct the condition. If the rattle still persists, INSTALL a new roof opening panel frame. REFER to Roof Opening Panel - Exploded View and Roof Opening Panel Frame in this section. TEST the system for normal operation. **No** If equipped with a DVD entertainment system, GO to C11 . INSTALL a new roof opening panel frame. REFER to Roof Opening Panel - Exploded View and Roof Opening Panel Frame in this section. TEST the system for normal operation.
C11 CHECK THE DVD ENTERTAINMENT SYSTEM FOR RATTLES	
• Check all DVD entertainment system fasteners for correct torque and verify correct installation. Refer to Section 415-00 . • **Is the DVD entertainment system correctly installed and tightened to specification?**	**Yes** INSTALL a new roof opening panel frame. REFER to Roof Opening Panel - Exploded View and Roof Opening Panel Frame in this section. TEST the system for normal operation. **No** TIGHTEN the loose fasteners or REINSTALL the DVD entertainment system. REFER to Section 415-00 . TEST the system for normal operation.

Pinpoint Test D: The Roof Opening Panel is Noisy During Operation

Normal Operation

The roof opening panel operates smoothly while opening and closing.

This pinpoint test is intended to diagnose the following:

- Obstructed or damaged roof opening panel
- Obstructed or damaged roof opening panel lifter assemblies
- Incorrect roof opening panel alignment
- Noisy roof opening panel motor/module assembly

PINPOINT TEST D: THE ROOF OPENING PANEL IS NOISY DURING OPERATION

Test Step	Result / Action to Take
D1 CHECK THE ROOF OPENING PANEL FOR OBSTRUCTIONS OR DAMAGE	
• Check the roof opening panel for any obstructions and damage. • **Are there any obstructions and/or damage?**	**Yes** REMOVE all obstructions. REPAIR any damage. If the damage cannot be repaired, INSTALL a new roof opening panel frame. REFER to Roof Opening Panel Frame in this section. TEST the system for normal operation. **No** GO to D2 .
D2 CHECK THE ROOF OPENING PANEL OPERATION	
• Check the roof opening panel during operation. • **Is the roof opening panel loose or incorrectly adjusted?**	**Yes** ALIGN the roof opening panel. REFER to Roof Opening Panel Alignment in this section. TEST the system for normal operation. **No** GO to D3 .
D3 CHECK THE ROOF OPENING PANEL TRACKS	
• Open the roof. • Check the roof opening panel tracks for obstructions and damage. • **Are the roof opening panel tracks OK?**	**Yes** GO to D4 . **No** REMOVE all obstructions and REPAIR any damage. If the roof opening panel tracks cannot be repaired, INSTALL a new roof opening panel frame. REFER to Roof Opening Panel Frame in this section. TEST the system for normal operation.
D4 CHECK THE ROOF OPENING PANEL SHIELD	
• Check the roof opening panel shield for correct movement. • **Is the roof opening panel shield moving correctly?**	**Yes** GO to D5 . **No** REMOVE and REINSTALL the roof opening panel shield. REFER to Roof Opening Panel Shield in this section. TEST the

tomsn048@gmail.com

	system for normal operation.
D5 CHECK THE ROOF OPENING PANEL LIFTER ASSEMBLIES	
• Check the roof opening panel lifter assemblies for obstructions and damage. • **Are the roof opening panel lifter assemblies OK?**	**Yes** GO to D6 . **No** REMOVE all obstructions and REPAIR any damage. If the roof opening panel lifter assemblies cannot be repaired, INSTALL a new roof opening panel frame. REFER to Roof Opening Panel - Exploded View and Roof Opening Panel Frame in this section. TEST the system for normal operation.
D6 CHECK THE ROOF OPENING PANEL MOTOR/MODULE	
• Remove the roof opening panel motor/module and leave the electrical connector connected. • Operate the roof opening panel to the full OPEN and CLOSED positions. • **Does the motor/module make excessive noise?**	**Yes** INSTALL a new roof opening panel motor/module. REFER to Roof Opening Panel - Exploded View and Roof Opening Panel Motor in this section. TEST the system for normal operation. **No** REINSTALL the roof opening panel motor/module. TEST the system for normal operation. If the roof opening panel is still noisy, INSTALL a new roof opening panel frame. REFER to Roof Opening Panel - Exploded View and Roof Opening Panel Frame in this section. If the roof opening panel is no longer noisy, the system is operating correctly. The concern may have been caused by an incorrectly installed roof opening panel motor.

Pinpoint Test E: The Roof Opening Panel Does Not Open or Close

Refer to Wiring Diagrams Cell 101 , Roof Opening Panel for schematic and connector information.

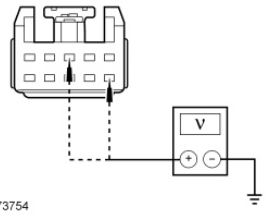
The roof opening panel motor must be initialized when repairs are carried out on any part of the roof opening panel system, including: whenever the roof opening panel motor has been removed from the roof opening panel system, the roof opening panel glass has been removed from the roof opening panel system, the roof opening panel assembly has been removed from the vehicle, a new roof opening panel motor has been installed, a new roof opening panel glass has been installed or a new roof opening panel assembly has been installed. Refer to Roof Opening Panel Motor Initialization in this section.

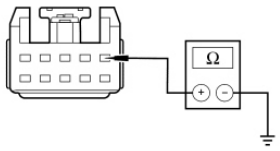
Normal Operation

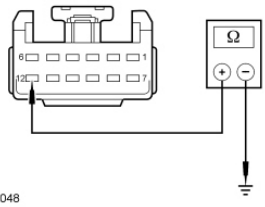
The roof opening panel uses an integrated motor and module to operate the roof opening panel. A new roof opening panel motor/module is installed as an assembly.

The roof opening panel motor/module receives voltage from the accessory delay relay through circuit CBP05 (YE) when the key is in the ACC or RUN position and voltage at all times through circuit SBP01 (RD). Ground is supplied to the roof opening panel motor/module and the roof opening panel control switch through circuit GD133 (BK). When the roof opening panel SLIDE or TILT switch is pulled, a ground signal is sent to the roof opening panel motor/module through circuit CPR40 (YE/OG), which causes the roof opening panel

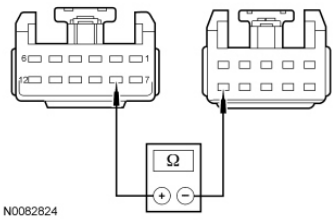
to close. When the roof opening panel SLIDE switch is pressed, a ground signal is sent to the roof opening panel motor/module through circuit CPR31 (VT/BN), which causes the roof opening panel to open.





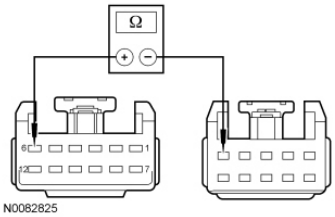


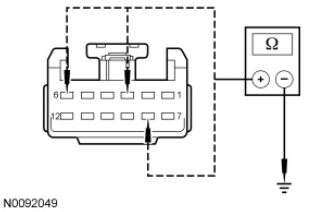
This pinpoint test is intended to diagnose the following:



- Fuse(s)
- Wiring, terminals or connectors
- Inoperative roof opening panel switch
- Inoperative roof opening panel motor/module assembly
- Roof opening panel motor not initialized

PINPOINT TEST E: THE ROOF OPENING PANEL DOES NOT OPEN OR CLOSE





Test Step	Result / Action to Take
E1 CHECK THE POWER WINDOWS	
• Ignition ON. • Verify the power windows operate. • **Do the power windows operate?**	**Yes** GO to E2 . **No** REFER to Section 501-11 to diagnose the accessory delay relay circuit.
E2 CHECK THE MOTOR/MODULE FOR INITIALIZATION	
• Attempt to carry out the roof opening panel motor initialization procedure. Refer to Roof Opening Panel Motor Initialization in this section. • **Is the concern still present, or does the roof opening panel motor fail to initialize?**	**Yes** GO to E3 . **No** The system is operating normally at this time. The roof opening panel motor was not initialized.
E3 CHECK THE ROOF OPENING PANEL SWITCH	
• Ignition OFF. • Disconnect: Roof Opening Panel Switch C912. • Carry out the roof opening panel switch component test. Refer to Wiring Diagrams Cell 149 for component testing. • **Is the roof opening panel switch OK?**	**Yes** GO to E4 . **No** INSTALL a new roof opening panel switch. TEST the system for normal operation.
E4 CHECK VOLTAGE TO THE ROOF OPENING PANEL MOTOR/MODULE	
• Ignition OFF. • Disconnect: Roof Opening Panel Motor/Module C921. • Ignition ON. • Measure the voltage between roof opening panel motor/module C921-3, circuit CBP05 (YE), harness side and roof opening panel motor/module C921-6, circuit SBP01 (RD), harness side and ground.	**Yes** GO to E5 . **No** VERIFY Smart Junction Box (SJB) fuse 1 (20A) and circuit fuse 5 (5A) are OK. If OK, REPAIR the circuit. If not OK, REFER to the Wiring

tomsn048@gmail.com

 A0073754 • **Is the voltage greater than 10 volts for both measurements?**	Diagrams Manual to identify the possible causes of the circuit short. TEST the system for normal operation.
E5 CHECK THE ROOF OPENING PANEL MOTOR/MODULE GROUND	
• Ignition OFF. • Measure the resistance between roof opening panel motor/module C921-1, circuit GD133 (BK), harness side and ground.  A0073757 • **Is the resistance less than 5 ohms?**	**Yes** GO to E6 . **No** REPAIR the circuit. TEST the system for normal operation.
E6 CHECK THE ROOF OPENING PANEL CONTROL SWITCH GROUND	
• Measure the resistance between roof opening panel switch C912-12, circuit GD133 (BK), harness side and ground.  N0092048 • **Is the resistance less than 5 ohms?**	**Yes** GO to E7 . **No** REPAIR the circuit. TEST the system for normal operation.
E7 CHECK CIRCUIT CPR40 (YE/OG) FOR AN OPEN	
• Measure the resistance between roof opening panel switch C912-8, circuit CPR40 (YE/OG), harness side and roof opening panel motor/module C921-10, circuit CPR40 (YE/OG), harness side.	**Yes** GO to E8 . **No** REPAIR the circuit. TEST the system for normal operation.

- **Is the resistance less than 5 ohms?**

E8 CHECK CIRCUIT CPR31 (VT/BN) FOR AN OPEN	
• Measure the resistance between roof opening panel switch C912-6, circuit CPR31 (VT/BN), harness side and roof opening panel motor/module C921-5, circuit CPR31 (VT/BN), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** GO to E9 . **No** REPAIR the circuit. TEST the system for normal operation.
E9 CHECK CIRCUITS CPR31 (VT/BN), CPR40 (YE/OG) AND CPR38 (WH/BU) FOR A SHORT TO GROUND	
• Measure the resistance between roof opening panel switch C912, harness side and ground using the following chart: **Roof Opening Panel Switch** / **Circuit** C912-6 — CPR31 (VT/BN) C912-3 — CPR38 (WH/BU) C912-8 — CPR40 (YE/OG)  • **Is the resistance greater than 10,000 ohms for all measurements?**	**Yes** GO to E10 . **No** REPAIR the circuit(s). TEST the system for normal operation.

tomsn048@gmail.com

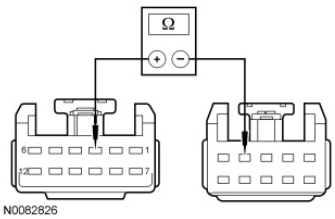
E10 CHECK THE ROOF OPENING PANEL MOTOR/MODULE FOR CORRECT OPERATION	
• Disconnect all roof opening panel motor/module connectors. • Check for: ♦ corrosion. ♦ bent pins. ♦ pushed-out pins. • Connect all roof opening panel motor/module connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new roof opening panel motor/module. REFER to Roof Opening Panel Motor in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

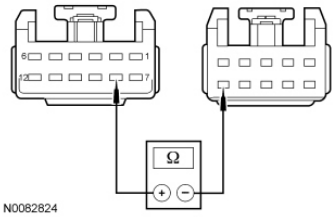
Pinpoint Test F: The Roof Opening Panel Does Not Open or Close in VENT Position

Refer to Wiring Diagrams Cell 101 , Roof Opening Panel for schematic and connector information.

The roof opening panel motor must be initialized when repairs are carried out on any part of the roof opening panel system, including: whenever the roof opening panel motor has been removed from the roof opening panel system, the roof opening panel glass has been removed from the roof opening panel system, the roof opening panel assembly has been removed from the vehicle, a new roof opening panel motor has been installed, a new roof opening panel glass has been installed or a new roof opening panel assembly has been installed. Refer to Roof Opening Panel Motor Initialization in this section.

Normal Operation





The roof opening panel uses a integrated motor and module to operate the roof opening panel. A new roof opening panel motor/module is installed as an assembly.

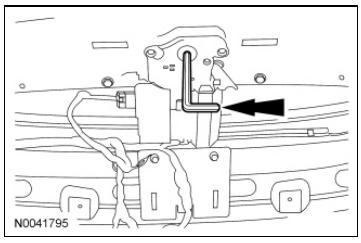
The roof opening panel motor/module receives voltage from the accessory delay relay through circuit CBP05 (YE) when the key is in the ACC or RUN position and voltage at all times through circuit SBP01 (RD). Ground is supplied to the roof opening panel motor/module and the roof opening panel control switch through circuit GD133 (BK). When the roof opening panel TILT switch is pressed, a ground signal is sent to the roof opening panel motor/module through circuit CPR38 (WH/BU), which causes the roof opening panel to open to the VENT position. When the roof opening panel SLIDE or TILT switch is pulled, a ground signal is sent to the roof opening panel motor/module through circuit CPR40 (YE/OG), which causes the roof opening panel to close.

This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- Roof opening panel switch
- Roof opening panel motor/module assembly

PINPOINT TEST F: THE ROOF OPENING PANEL DOES NOT OPEN OR CLOSE IN VENT POSITION

Test Step	Result / Action to Take
F1 CHECK THE MOTOR/MODULE FOR INITIALIZATION	
	Yes GO to F2 .

• Attempt to carry out the roof opening panel motor initialization procedure. Refer to Roof Opening Panel Motor Initialization in this section. • **Is the concern still present, or does the roof opening panel motor fail to initialize?**	**No** The system is operating normally at this time. The roof opening panel motor was not initialized.
F2 CHECK THE ROOF OPENING PANEL SWITCH	
• Ignition OFF. • Disconnect: Roof Opening Panel Switch C912. • Carry out the roof opening panel switch component test. Refer to Wiring Diagrams Cell 149 for component testing. • **Is the roof opening panel switch OK?**	**Yes** GO to F3 . **No** INSTALL a new roof opening panel switch. TEST the system for normal operation.
F3 CHECK CIRCUIT CPR38 (WH/BU) FOR AN OPEN	
• Measure the resistance between roof opening panel switch C912-3, circuit CPR38 (WH/BU), harness side and roof opening panel motor/module C921-4, circuit CPR38 (WH/BU), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** GO to F4 . **No** REPAIR the circuit. TEST the system for normal operation.
F4 CHECK CIRCUIT CPR40 (YE/OG) FOR AN OPEN	
• Measure the resistance between roof opening panel switch C912-8, circuit CPR40 (YE/OG), harness side and roof opening panel motor/module C921-10, circuit CPR40 (YE/OG), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** GO to F5 . **No** REPAIR the circuit. TEST the system for normal operation.
F5 CHECK THE ROOF OPENING PANEL MOTOR/MODULE FOR CORRECT OPERATION	
• Disconnect all roof opening panel motor/module connectors. • Check for: ♦ corrosion.	**Yes** INSTALL a new roof opening panel motor/module. REFER to Roof Opening Panel Motor in this



tomsn048@gmail.com

♦ bent pins. ♦ pushed-out pins. • Connect all roof opening panel motor/module connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	section. TEST the system for normal operation. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

Roof Opening Panel Manual Operation

1. Remove the overhead console. For additional information, refer to Section 501-12 .

2. Insert an Allen wrench into the center of the manual drive hole of the roof opening panel motor. Rotate the Allen wrench counterclockwise until the roof opening panel is closed.

tomsn048@gmail.com

Roof Opening Panel Motor Initialization

⚠ WARNING: Keep objects and body parts clear of the glass panel when carrying out the initialization procedure. During the initialization procedure, the glass panel closes with high force and cannot detect objects in its path. Failure to follow this instruction may result in serious personal injury.

NOTE: A new roof opening panel motor will only vent and must be initialized.

NOTE: The roof opening panel motor must be initialized when repairs are carried out on any part of the roof opening panel system, including: whenever the roof opening panel motor has been removed from the roof opening panel system, the roof opening panel glass has been removed from the roof opening panel system, the roof opening panel assembly has been removed from the vehicle, a new roof opening panel motor has been installed, a new roof opening panel glass has been installed or a new roof opening panel assembly has been installed.

1. Turn the ignition to the RUN position. For a new roof opening panel motor, skip to Step 3.

2. **For an existing roof opening panel motor,** pull and hold the SLIDE switch until the roof opening panel glass moves to the full VENT position. Release the SLIDE switch.

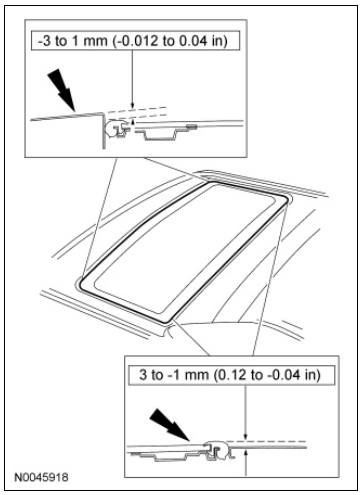
3. **For a new roof opening panel motor,** pull and hold the SLIDE switch until the roof opening panel glass moves past full VENT and suddenly back to full VENT.
   For an existing motor, pull and hold the SLIDE switch (for approximately 10 seconds) until the roof opening panel glass moves past full VENT and suddenly back to full VENT.

4. Quickly release the SLIDE switch and re-pull and hold the SLIDE switch while the roof opening panel glass moves to full OPEN and back to CLOSED (movement will start approximately 3 seconds after the switch is pulled).

5. Release the SLIDE switch and verify successful initialization by carrying out one-touch open, one-touch close and one-touch vent operations.

tomsn048@gmail.com

Roof Opening Panel Alignment



NOTE: The roof opening panel motor must be initialized when repairs are carried out on any part of the roof opening panel system, including: whenever the roof opening panel motor has been removed from the roof panel system, the roof opening panel glass has been removed from the roof opening panel system, the roof opening panel assembly has been removed from the vehicle, a new roof opening panel motor has been installed, a new roof opening panel glass has been installed or a new roof opening panel assembly has been installed. For additional information, refer to Roof Opening Panel Motor Initialization in this section.

1. Position the roof opening panel in the CLOSED position.

2. Loosen the 4 roof opening panel glass screws.

3. **NOTE:** Make sure the roof opening panel is centered in the roof opening.

   Adjust the roof opening panel glass height to specification.

4. Maintain horizontal and vertical roof opening panel position while adjusting and tighten the 4 roof opening panel glass screws to 4 Nm (35 lb-in).

tomsn048@gmail.com

Roof Opening Panel - Exploded View

Item	Part Number	Description
1	78502F90	Roof opening panel glass screw (4 required)
2	78500A18	Roof opening panel glass
3	78502C46	Skid plate (2 required)
4	15C682	Roof opening panel motor screw (3 required)
5	78515B689	Roof opening panel motor
6	7851884	Glass seal
7	7854022	Trough assembly
8	78500A64	Trough guide shoe assembly (2 required)
9	78502F92	Air deflector screw (4 required)
10	78500A26	Air deflector assembly
11	78519A02	Roof opening panel shield
12	7850152	Roof opening panel shield spring-loaded guide feet (4 required)
13	7852124	Headliner trim piece
14	W505179-S424	Roof opening panel frame bolt (10 required)
15	78502C52	Roof opening panel front drain hose (2 required)
16	78502C53	Roof opening panel rear drain hose (2 required)
17	7851070	Roof opening panel frame

1. For additional information, refer to the procedures in this section.

tomsn048@gmail.com

Roof Opening Panel Glass

Removal and Installation

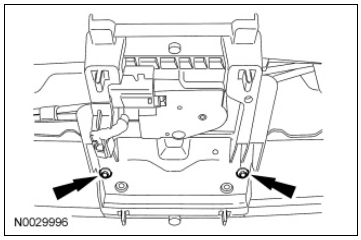
NOTE: The roof opening panel motor must be initialized when repairs are carried out on any part of the roof opening panel system, including: whenever the roof opening panel motor has been removed from the roof opening panel system, the roof opening panel glass has been removed from the roof opening panel system, the roof opening panel assembly has been removed from the vehicle, a new roof opening panel motor has been installed, a new roof opening panel glass has been installed or a new roof opening panel assembly has been installed. For additional information, refer to Roof Opening Panel Motor Initialization in this section.

1. Position the roof opening panel to the VENT position.

2. Remove the 4 roof opening panel glass screws.
   - To install, tighten to 4 Nm (35 lb-in).

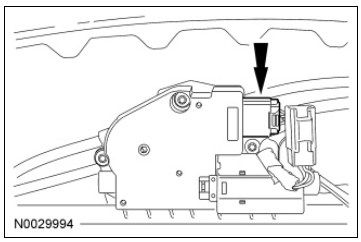
3. From the outside of the vehicle, remove the roof opening panel glass assembly.

4. To install, reverse the removal procedure.
   - If installing a new roof opening panel glass seal, use care around the corners to make sure of a correct seal to the roof opening panel glass.
   - Align the roof opening panel. For additional information, refer to Roof Opening Panel Alignment in this section.
   - Initialize the roof opening panel motor. For additional information, refer to Roof Opening Panel Motor Initialization in this section.



Roof Opening Panel Frame

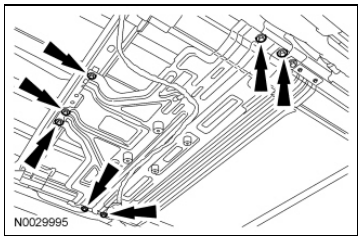
Removal and Installation



NOTE: The roof opening panel motor must be initialized when repairs are carried out on any part of the roof opening panel system, including: whenever the roof opening panel motor has been removed from the roof opening panel system, the roof opening panel glass has been removed from the roof opening panel system, the roof opening panel assembly has been removed from the vehicle, a new roof opening panel motor has been installed, a new roof opening panel glass has been installed or a new roof opening panel assembly has been installed. For additional information, refer to Roof Opening Panel Motor Initialization in this section.

1. Remove the headliner. For additional information, refer to Section 501-05 .

2. Remove the 2 retaining screws and the upper console bracket.



3. Disconnect the roof opening panel motor electrical connector.

4. Disconnect the 4 roof opening panel drain hoses from the corners of the roof opening panel frame.

5. Remove the entertainment center support bracket (if equipped).
   - Remove the 7 bolts.
   - Remove the support bracket.

NOTICE: **To avoid damage to the roof opening panel frame, be sure to support the roof opening panel frame when removing the frame bolts.**

6. Remove the 10 roof opening panel frame bolts.

tomsn048@gmail.com

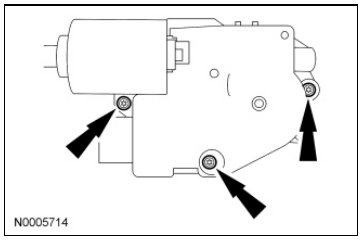
- To install, tighten to 6 Nm (53 lb-in).

7. Remove the roof opening panel frame.

8. To install, reverse the removal procedure.
   - Align the roof opening panel. For additional information, refer to Roof Opening Panel Alignment in this section.
   - Initialize the roof opening panel motor. For additional information, refer to Roof Opening Panel Motor Initialization in this section.

Roof Opening Panel Motor

Removal and Installation



NOTICE: **The roof opening panel motor contains ceramic magnets that may fail at any time if cracked. Any roof opening panel motor that has been dropped onto a hard surface during removal or installation should be replaced with a new motor.**

NOTE: The roof opening panel motor must be initialized when repairs are carried out on any part of the roof opening panel system, including: whenever the roof opening panel motor has been removed from the roof opening panel system, the roof opening panel glass has been removed from the roof opening panel system, the roof opening panel assembly has been removed from the vehicle, a new roof opening panel motor has been installed, a new roof opening panel glass has been installed or a new roof opening panel assembly has been installed. For additional information, refer to Roof Opening Panel Motor Initialization in this section.

1. Remove the overhead console. For additional information, refer to Section 501-12 .

2. Disconnect the roof opening panel electrical connectors.

3. Remove the 3 roof opening panel motor screws.
   - To install, tighten to 3 Nm (27 lb-in).

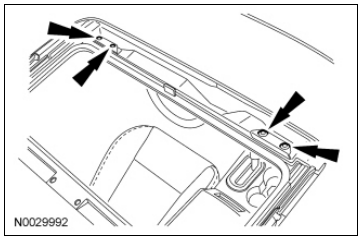
4. **NOTE:** When installing the roof opening panel motor, it may be necessary to turn the roof opening panel motor slightly to engage the drive splines.

   NOTE: Anytime a roof opening panel motor is removed, the cables/mechanisms can experience free-play movement. It is important that the cables/mechanisms do not move. They are timed to be parallel with each other.

   Remove the roof opening panel motor.

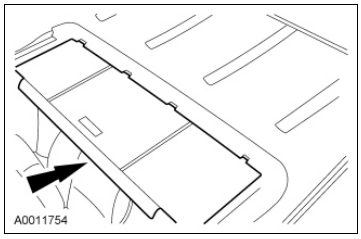
5. To install, reverse the removal procedure.
   - Initialize the roof opening panel motor. For additional information, refer to Roof Opening Panel Motor Initialization in this section.

tomsn048@gmail.com



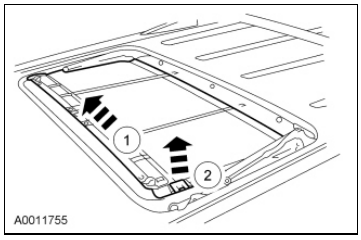
Roof Opening Panel Shield

Removal and Installation



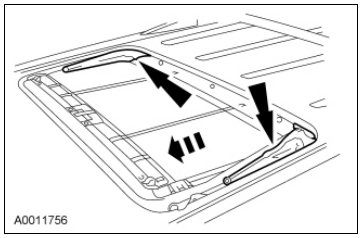
1. Remove the roof opening panel glass. For additional information, refer to Roof Opening Panel Glass in this section.

2. Remove the trough.
   - Pull the trough assembly arms outward to release the trough assembly guide arm pins from the roof opening panel frame to remove.



3. Remove the air deflector.
   - Remove the 4 screws.
     - ♦ To install, tighten to 1 Nm (9 lb-in).
   - Remove the air deflector.

4. Slide the roof opening panel shield forward halfway.



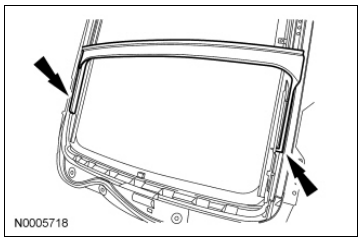
5. Disengage the roof opening panel shield guide feet.
   1. Push the roof opening panel shield toward one side of the vehicle.
   2. Lift the front portion of the roof opening panel shield upward to disengage the guide feet.

6. Slide the roof opening panel shield forward and release the rear guide feet.

tomsn048@gmail.com

7. **NOTE:** The roof opening panel shield guide feet can be serviced separately from the roof opening panel shield.

   If necessary, new roof opening panel shield guide feet may be installed at this time.



8. To install, reverse the removal procedure.
   - Align the roof opening panel. For additional information, refer to Roof Opening Panel Alignment in this section.
   - Initialize the roof opening panel motor. For additional information, refer to Roof Opening Panel Motor Initialization in this section.

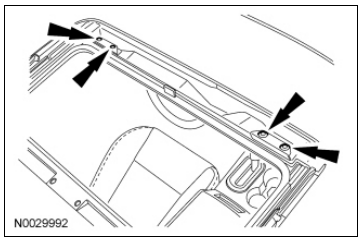
Trough Assembly

Removal and Installation

1. Remove the roof opening panel glass. For additional information, refer to Roof Opening Panel Glass in this section.

2. Remove the trough assembly.
   - Pull the trough assembly arms outward to release the trough assembly guide arm pins from the roof opening panel frame to remove.

3. To install, reverse the removal procedure.
   - Align the roof opening panel. For additional information, refer to Roof Opening Panel Alignment in this section.
   - Initialize the roof opening panel motor. For additional information, refer to Roof Opening Panel Motor Initialization in this section.



tomsn048@gmail.com

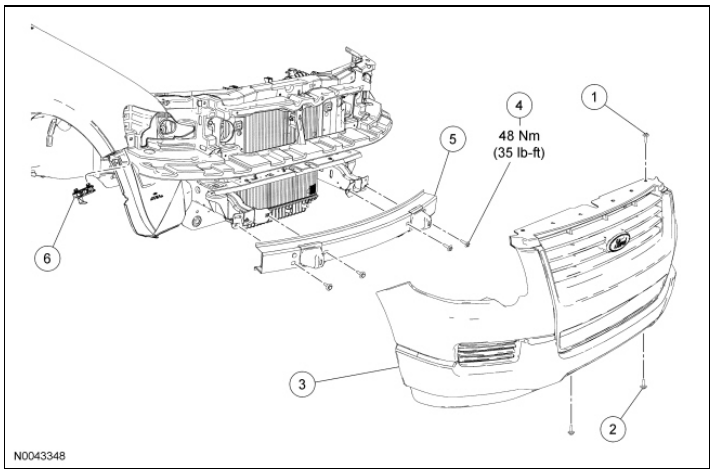
Air Deflector

Removal and Installation

1. Move the roof opening panel to full OPEN position.

2. Remove the air deflector.
   - Remove the 4 screws.
     - ♦ To install, tighten to 1 Nm (9 lb-in).
   - Remove the air deflector from the roof opening panel frame.

3. To install, reverse the removal procedure.
   - Initialize the roof opening panel motor. For additional information, refer to Roof Opening Panel Motor Initialization in this section.



Torque Specifications

Description	Nm	lb-ft	lb-in
Front bumper mounting bolts	48	35	-
Rear bumper cover bracket bolts - Explorer	11	-	97
Rear bumper cover bracket bolts - Explorer Sport Trac	6	-	53

tomsn048@gmail.com

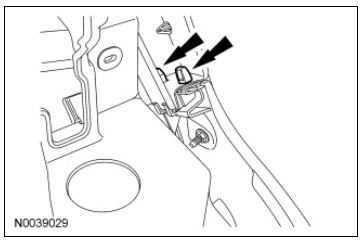
Bumper Cover - Front

Removal and Installation

Explorer/Explorer Sport Trac

1. Remove the headlamp assemblies. For additional information, refer to Section 417-01 .

All vehicles



2. Disconnect the fog lamp electrical connectors, if equipped.
3. Disconnect the side turn signal lamp electrical connectors, if equipped.
4. Remove the front fender inner splash shield screws.
5. Remove the front fender inner splash shield pin-type retainers.
6. Remove the front fender inner splash shields.
7. Remove the 2 bolts from the bottom of the bumper cover.

Explorer/Explorer Sport Trac

8. Remove the 6 grille-to-grille opening panel scrivets.

NOTE: The fender clips are removed with the front fender. Use a flat-blade screwdriver to release the locking tabs from the front bumper cover.

9. Release the bumper cover-to-fender clips.

Mountaineer

10. Remove the bumper cover upper screws.
11. Rotate the bottom of the front bumper cover upward.
12. Apply downward pressure to the top of the front bumper cover to release the 3 locking tabs.

All vehicles

13. Remove the front bumper cover.

14. To install, reverse the removal procedure.

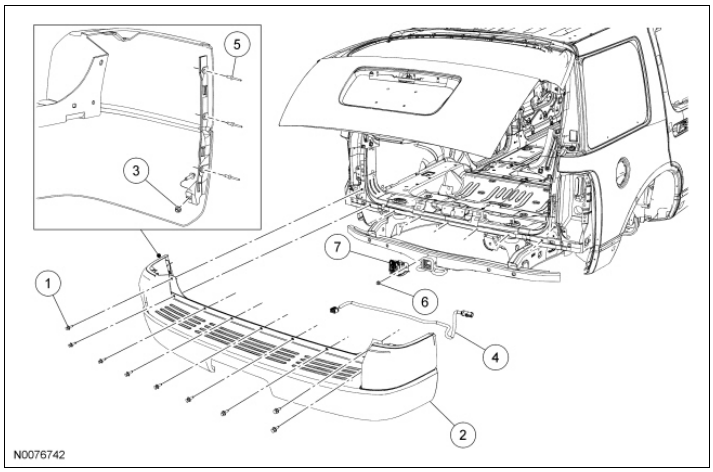
---

tomsn048@gmail.com

Bumper - Front

Removal and Installation

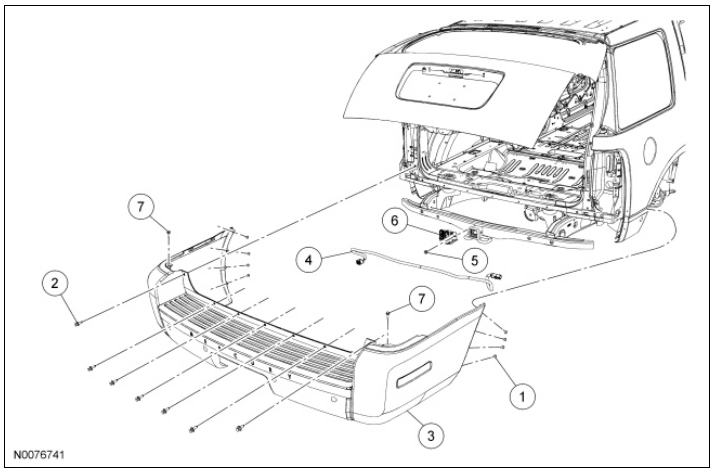
1. Remove the front bumper cover. For additional information, refer to Bumper Cover - Front in this section.



2. Remove the 4 front bumper bolts.
   - To install, tighten to 48 Nm (35 lb-ft).

3. Remove the front bumper.

4. To install, reverse the removal procedure.



Bumper - Exploded View, Rear

Explorer

Item	Part Number	Description

1. For additional information, refer to the procedures in this section.

tomsn048@gmail.com

Bumper Cover - Rear, Explorer

Removal and Installation

1. Remove the tail lamp assemblies.

2. Remove the 2 rear bumper cover bracket bolts.
   - To install, tighten to 11 Nm (97 lb-in).

3. Remove the 9 bumper cover pin-type retainers.

4. Disconnect the rear parking aid sensor electrical connector, if equipped.

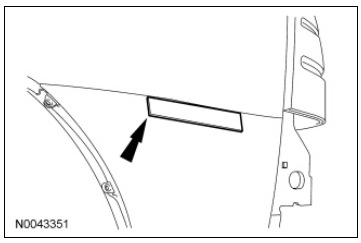
5. ***NOTICE:*** **To avoid damaging the rear bumper cover, do not twist the cover when removing.**

   Remove the bumper cover.

   - Lift the outer corners upward and pull the bumper cover straight up and out.

6. Transfer components as necessary.

7. To install, reverse the removal procedure.



Bumper Cover - Rear, Mountaineer

Removal and Installation

1. Remove the taillamp assemblies.
2. Remove the 2 rear bumper bracket bolts.
3. Remove the bumper cover pin-type retainers.
4. Disconnect the rear parking aid sensor electrical connector, if equipped.
5. Remove the side marker lamp electrical connector, if equipped.
6. Remove the 8 bumper cover-to-splash shield pin-type retainers.
7. **NOTE:** The rear bumper cover has a bracket located at the upper edge of the moulding that attaches to the sheet metal.

   Remove the rear bumper cover.

   - Lift the front corner of the rear bumper cover straight up and pull away.
   - Repeat on the opposite side.

8. Transfer components as necessary.
9. To install, reverse the removal procedure.

tomsn048@gmail.com

Bumper Cover - Rear, Sport Trac

1. Remove the 6 rear bumper cover screws.
   - To install, tighten to 6 Nm (53 lb-in).
2. Remove the 6 rear bumper cover splash shield screws (3 each side).
3. Disconnect the license plate electrical connector.
4. ***NOTICE:*** **To avoid damaging the rear bumper cover, do not twist the cover when removing.**

   Remove the bumper cover.

   - Pull the outer corners outward and pull the bumper cover rearward to disengage the cover from the retaining clips.
5. Transfer the components as necessary.
6. To install, reverse the removal procedure.

tomsn048@gmail.com

Material

Item	Specification	Fill Capacity
Clear Silicone Rubber TA-32	ESB-M4G92-A	-

Torque Specifications

Description	Nm	lb-ft
60 percent bench safety belt anchor bolt (early production with Torx head)	76	56
60 percent bench safety belt anchor bolt (late production with hex head)	121	89

Third row D-ring bolt	40	30
Third row safety belt buckle nut	75	55

tomsn048@gmail.com

Safety Belt System

⚠ WARNING: After any crash, all of the following safety belt assemblies and attaching hardware must be inspected by an authorized dealer to verify correct function:

- Retractors
- Buckles
- Belt tension sensor (BTS) (if equipped)
- Front safety belt buckle support assemblies (slide bar) (if equipped)
- Safety belt shoulder belt height adjusters (if equipped)
- Child safety seat tether bracket assemblies
- Automatic locking retractor (ALR) feature for child safety seats (passenger seating positions only)

If any safety belt assembly is damaged, does not operate correctly or does not pass all of the Functional Tests in the Diagnosis and Testing portion of this section, a new safety belt assembly must be installed. If any safety belt assembly attaching areas are damaged or distorted, the sheet metal must be restored to its original structural integrity and new safety belt assembly and attaching hardware must be installed. Failure to install new safety belt assemblies and attaching hardware may increase the risk of serious personal injury or death in a crash.

After any crash that results in deployment of the driver and/or front outboard passenger safety belt pretensioners, new driver and/or front outboard passenger safety belt systems (including retractors, buckles and height adjusters) must be installed. Failure to install new safety belt systems increases the risk of serious personal injury or death in a crash.

When replacing any active occupant restraint components, use only the replacement parts specified in the Ford Customer Service Division Master Parts and Accessories Catalog.

The active restraint system serviceable components consist of the following:

- Front row safety belt buckles and pretensioners
- Front row adaptive load limiting retractors
- Second row outboard safety belt retractors
- Second row 60 percent bench or E-Z entry seat center safety belt retractor
- Second row 60 percent bench seat dual safety belt buckle assembly (Explorer/Mountaineer with 5-passenger seating and Explorer Sport Trac)
- Second row 60 percent E-Z entry seat dual safety belt buckle assembly (Explorer/Mountaineer with 7-passenger seating)
- Second row 40 percent bench seat safety belt buckle assembly (Explorer/Mountaineer with 5-passenger seating and Explorer Sport Trac)
- Second row 40 percent E-Z entry seat safety belt buckle assembly (Explorer/Mountaineer with 7-passenger seating)
- Second row bucket seat safety belt buckle assembly (Explorer/Mountaineer with 6-passenger seating)
- Second row child safety seat tether anchors
- Second row lower anchors and tethers for children
- Third row safety belt retractors
- Third row dual safety belt buckle assembly
- Third row child safety seat tether anchors

Safety Belt Retractors

- Adaptive load limiting retractor (front only)
- Dual locking mode
    - ♦ Emergency Locking Retractor (ELR)
    - ♦ Automatic Locking Retractor (ALR) (all except driver seat)

Adaptive load limiting

Adaptive load limiting safety belt retractors are pyrotechnic devices integrated with the driver and front passenger safety belt retractor assemblies. Adaptive load limiting safety belt retractors work in conjunction with the safety belt buckle pretensioners to control the tension of the driver and front passenger safety belts. The Restraints Control Module (RCM) monitors the readiness of the adaptive load limiting safety belt retractor. The RCM uses this information and all other information provided by the restraints system to determine what action is to be taken.

For adaptive load limiting safety belt retractor diagnostic information, refer to Diagnosis and Testing in Section 501-20B .

Automatic Locking Retractor (ALR)

The ALR mode is used when locking a child seat in an outboard seating position. The ALR mode is automatically activated when the safety belt webbing is fully extracted from the retractor and then allowed to retract. As the safety belt webbing is retracted back onto the spool, an audible clicking sound is made indicating the safety belt retractor is in ALR mode and the safety belt webbing will not pull back out of the safety belt retractor. To disengage the ALR mode, allow the safety belt webbing to fully retract back onto the spool. The ALR mode is disengaged when the webbing is free to extract and retract back into the retractor. For testing, refer to the appropriate Functional Test procedure Diagnosis and Testing in Safety Belt System in this section.

Emergency Locking Retractor (ELR)

The ELR is a vehicle-sensitive feature designed to activate and lock the safety belt webbing during hard braking, hard cornering or in an impact of approximately 24 km/h (15 mph). The ELR feature helps to reduce the forward movement of the driver and passengers. For testing, refer to the appropriate Functional Test procedure Diagnosis and Testing in Safety Belt System in this section.

Safety Belt Buckles

Safety belt buckle and pretensioner

The safety belt buckle and pretensioners are located on the inboard side of the seat track and is for front seat occupants.

The safety belt buckle and pretensioner is a pyrotechnic device that removes excess webbing from the safety belt system when deployed. When the pretensioner deploys, the buckle moves downward, removing excess webbing from the lap and shoulder safety belts.

If the vehicle is involved in a crash that results in pretensioner deployment, a new safety belt buckle pretensioner must be installed.

For safety belt buckle pretensioner diagnosis and disposal information, refer to Diagnosis and Testing or General Procedures in Section 501-20B .

tomsn048@gmail.com

Second and third row safety belt buckles

The second and third row safety belt buckles are attached to the seat cushion frames or floor and can be serviced separately.

Child Safety Seat Restraints

Lower anchors and tethers for children and child safety seat tether anchors are provided. Check all attachment points after a collision.

Lower Anchors and Tethers for Children

This system will be referred to as lower anchors. The lower anchor system is a standardized and uniform attachment system for installing child safety seats in passenger vehicles. Lower anchor-equipped child safety seats have 2 lower attachments that connect to the vehicle portion of the system.

The vehicle portion of the system consists of 2 attachment points (6-mm wires) welded to the seat cushion frame. The attachment points protrude from between where the backrest and cushion of the seat meet, only at the second row outboard seating positions.

If a child safety seat was in use during a collision, inspect the vehicle portion of the system for damage. If any of the attachment points (6-mm wires) are damaged, install a new seat cushion frame.

Child Safety Seat Tether Anchors

Child safety seat tether anchors are attachment points located in the back panel of the sheet metal (Sport Trac) or bolted into the floor (Explorer/Mountaineer).

If a child safety seat was in use during a collision, inspect the vehicle portion of the system for damage. If any of the attachment points are damaged, install new ones.

Explorer, Mountaineer and Sport Trac Front Row

Child safety seat tether anchors are not available in the front row for any of the vehicles.

Explorer, Mountaineer - 5 and 6 Passenger, Second Row

The 2 second row outboard child safety seat tether anchors are located directly behind the seat, attached to the floor pan protruding from the carpet. For 5 passenger center seat, either tether anchor located near the back hatch door can be used.

Explorer, Mountaineer - 7 passenger, Second Row

The 3 second row child safety seat tether anchors are located directly behind the seat, attached to the floor pan protruding from the carpet.

Sport Trac - Second Row

Child safety seat tether anchors are located at all 3 seating positions. They are part of the back panel sheet metal.

The 2 third row child safety seat tether anchors are located directly behind the seat near the back hatch door.

Safety Belt Warning System

The safety belt warning system is a reminder to fasten the driver safety belt. Refer to Diagnosis and Testing, Safety Belt System in this section.

Belt-Minder®

The Belt-Minder® feature is a supplemental warning to the safety belt warning function. This feature provides additional reminders to the driver that the driver safety belt is unbuckled. Refer to Diagnosis and Testing, Safety Belt System in this section.

---

tomsn048@gmail.com

Safety Belt System

Principles of Operation

⚠ WARNING: After any crash, all of the following safety belt assemblies and attaching hardware must be inspected by an authorized dealer to verify correct function:

- Retractors
- Buckles
- Belt tension sensor (BTS) (if equipped)
- Front safety belt buckle support assemblies (slide bar) (if equipped)
- Safety belt shoulder belt height adjusters (if equipped)
- Child safety seat tether bracket assemblies
- Automatic locking retractor (ALR) feature for child safety seats (passenger seating positions only)

If any safety belt assembly is damaged, does not operate correctly or does not pass all of the Functional Tests in the Diagnosis and Testing portion of this section, a new safety belt assembly must be installed. If any safety belt assembly attaching areas are damaged or distorted, the sheet metal must be restored to its original structural integrity and new safety belt assembly and attaching hardware must be installed. Failure to install new safety belt assemblies and attaching hardware may increase the risk of serious personal injury or death in a crash.

After any crash that results in deployment of the driver and/or front outboard passenger safety belt pretensioners, new driver and/or front outboard passenger safety belt systems (including retractors, buckles and height adjusters) must be installed. Failure to install new safety belt systems increases the risk of serious personal injury or death in a crash.

Safety Belt Warning System

The conditions of operation for the driver and/or passenger safety belt warning indicator and chime operate as follows:

- If the driver and/or passenger safety belt is not buckled with the ignition ON, then the safety belt warning indicator illuminates for 1 to 2 minutes and the warning chime sounds for 4 to 8 seconds
- If the driver and/or passenger safety belt is buckled while the warning indicator is illuminated and the warning chime is sounding, then the indicator and chime will turn off
- If the driver and/or passenger safety belt is buckled before the ignition is in the ON position, the safety belt warning indicator and chime will remain off

Belt-Minder®

The Belt-Minder® feature is a supplemental warning to the safety belt warning function. This feature provides an additional reminder that the driver and/or front passenger safety belt is unbuckled by intermittently sounding a chime and illuminating the safety belt warning indicator in the Instrument Cluster (IC) module.

Either the driver or front passenger safety belt systems may activate the Belt-Minder®. If the Belt-Minder® warnings have expired (warnings for approximately 5 minutes) for one occupant (driver or front passenger),

the other occupant can still activate the Belt-Minder® feature.

The passenger Belt-Minder® feature is activated only when the Occupant Classification Sensor (OCS) system detects a passenger in the right front seat and the passenger weight exceeds a programmed limit. For information on the OCS system, refer to Diagnosis and Testing in Section 501-20B .

To activate or deactivate the Belt-Minder® feature, refer to General Procedures in Section 413-01 or the Owner's Literature.

If...	Then...
the driver and/or passenger safety belt is buckled before the ignition is in the ON position or less than 1-2 minutes have elapsed since the ignition has been turned ON...	the Belt-Minder® feature will not activate.
the driver and/or front passenger safety belt is not buckled before the vehicle has reached at least 5 km/h (3 mph) and 1-2 minutes have elapsed since the ignition has been turned ON...	the Belt-Minder® feature is activated - the safety belt warning indicator illuminates and the warning chime sounds for 6 seconds every 30 seconds, repeating for approximately 5 minutes or until the safety belt(s) is buckled.
the driver or front passenger safety belt becomes unbuckled for approximately one minute while the vehicle is traveling at least 5 km/h (3 mph) and more than 1-2 minutes have elapsed since the ignition has been ON...	the Belt-Minder® feature is activated - the safety belt warning indicator illuminates and the warning chime sounds for 6 seconds every 30 seconds, repeating for approximately 5 minutes or until the safety belt(s) is buckled.

Inspection and Verification

1. Verify the customer concern by operating the active restraint system to duplicate the condition.

2. Inspect to determine if any of the following mechanical or electrical concerns apply:

Visual Inspection Chart

Mechanical	Electrical
• Safety belt webbing integrity (torn, frayed, cut or stretched) • Safety belt buckle and tongue assembly • Safety belt retractor	• Bare, broken or disconnected wire • Connector not tightly engaged • Safety belt warning indicator burned out or broken

3. If the inspection reveals an obvious concern(s) that can be readily identified, service as required. With the exception of removing a twist from the safety belt webbing, do not attempt to repair a component of the safety belt system; new components must be installed.

4. If the concern remains after the inspection, determine the symptom. GO to Symptom Chart .

tomsn048@gmail.com

5. To check the active restraint system for correct operation, carry out the appropriate Functional Test(s).

Symptom Chart

Symptom Chart

Component Test

⚠ WARNING: After any crash, all of the following safety belt assemblies and attaching hardware must be inspected by an authorized dealer to verify correct function:

- Retractors
- Buckles
- Belt tension sensor (BTS) (if equipped)
- Front safety belt buckle support assemblies (slide bar) (if equipped)
- Safety belt shoulder belt height adjusters (if equipped)
- Child safety seat tether bracket assemblies
- Automatic locking retractor (ALR) feature for child safety seats (passenger seating positions only)

If any safety belt assembly is damaged, does not operate correctly or does not pass all of the Functional Tests in the Diagnosis and Testing portion of this section, a new safety belt assembly must be installed. If any safety belt assembly attaching areas are damaged or distorted, the sheet metal must be restored to its original structural integrity and new safety belt assembly and attaching hardware must be installed. Failure to install new safety belt assemblies and attaching hardware may increase the risk of serious personal injury or death in a crash.

After any crash that results in deployment of the driver and/or front outboard passenger safety belt pretensioners, new driver and/or front outboard passenger safety belt systems (including retractors, buckles and height adjusters) must be installed. Failure to install new safety belt systems increases the risk of serious personal injury or death in a crash.

Carry out the appropriate Functional Test(s) as determined in Inspection and Verification.

Functional Test - Safety Belt Buckle and Tongue

The safety belt buckle and tongue assembly must operate freely during the latching and unlatching function. Fasten the safety belt by inserting the tongue (male portion) into the buckle (female portion).

1. Verify the following during the latching sequence:
   - Tongue insertion is not hindered by excessive effort.
   - A click is heard when the safety belt buckle latches the tongue.

2. Verify the system integrity by forcefully pulling on the safety belt webbing.

3. Unlatch the safety belt by fully depressing the safety belt buckle release button and allowing the safety belt to release and retract.

4. Verify the following during the unlatching process:
   - Push-button depression does not require excessive effort.
   - The tongue can be removed easily from the buckle.

5. Repeat the above steps 3 times.

6. If the functional test reveals a concern(s), install a new safety belt buckle or safety belt retractor as required.

Functional Test - Safety Belt Retractor

The safety belt retractor must be freely operational for extraction and retraction of the safety belt webbing between full extension and in-vehicle stowed positions.

1. Extract and retract the safety belt between the full extension and stowed positions.

2. Verify the safety belt retractor operates without excessive effort or binding.

3. Install a new safety belt retractor if any concern is found or the complaint has been verified.

Functional Test - Safety Belt Retractor, Automatic Locking Retractor (ALR) Mode

1. Position the seat backrest fully upright (if adjustable).

2. Position the safety belt shoulder height adjuster (if equipped) in the full down or up position.

3. Fasten the safety belt.

4. Pull out the safety belt webbing until the Automatic Locking Retractor (ALR) feature is activated.

5. Allow the safety belt webbing to retract until it stops.

6. Pull on the safety belt webbing to check that the safety belt retractor has remained in the ALR mode. If the safety belt retractor is not locked, install a new safety belt retractor.

7. Unfasten the safety belt and allow the safety belt webbing to retract to its stowed position.

8. Pull out and retract the safety belt webbing to verify the safety belt retractor has converted automatically out of ALR mode. If the safety belt retractor remains locked in the ALR mode, install a new safety belt retractor.

Functional Test - Safety Belt Retractor, Road Test Inspection

⚠ WARNING: The driver and passenger must be prepared to brace themselves in the event the safety belt retractor does not lock. Failure to follow this instruction may result in serious personal injury.

NOTE: Make sure there is no excessive slack in the safety belt webbing across the torso during testing.

NOTE: Do not jerk on the safety belt webbing when carrying out this test.

1. Test the safety belts in the following sequence:
    1. Fasten the safety belts and proceed to a safe area.
    2. Attain a speed of 24 km/h (15 mph).
    3. **⚠ WARNING: Apply maximum brake force only on dry concrete or equivalent hard surface, NEVER on wet pavement or gravel. Failure to follow this instruction may**

tomsn048@gmail.com

result in serious personal injury.

Grasp the shoulder harness, lean forward and apply the brakes, making a maximum braking application without a skid.

4. The safety belts should lock up with minimum webbing extension.
5. If there is a lockup of all safety belt retractors being tested, the safety belt retractors are functioning correctly. If any safety belt retractor fails to lock up, install a new safety belt retractor(s).

Safety Belt Cleaning

1. ⚠ **WARNING: Do not bleach or re-dye the safety belt webbing, as the webbing may weaken. Failure to follow this instruction may increase the risk of serious personal injury or death in a crash.**

   Clean the safety belt webbing only with a mild soap solution recommended for cleaning upholstery or carpets. Follow the instructions provided with the soap.

tomsn048@gmail.com

Safety Belt Maintenance

⚠ WARNING: After any crash, all of the following safety belt assemblies and attaching hardware must be inspected by an authorized dealer to verify correct function:

- Retractors
- Buckles
- Belt tension sensor (BTS) (if equipped)
- Front safety belt buckle support assemblies (slide bar) (if equipped)
- Safety belt shoulder belt height adjusters (if equipped)
- Child safety seat tether bracket assemblies
- Automatic locking retractor (ALR) feature for child safety seats (passenger seating positions only)

If any safety belt assembly is damaged, does not operate correctly or does not pass all of the Functional Tests in the Diagnosis and Testing portion of this section, a new safety belt assembly must be installed. If any safety belt assembly attaching areas are damaged or distorted, the sheet metal must be restored to its original structural integrity and new safety belt assembly and attaching hardware must be installed. Failure to install new safety belt assemblies and attaching hardware may increase the risk of serious personal injury or death in a crash.

After any crash that results in deployment of the driver and/or front outboard passenger safety belt pretensioners, new driver and/or front outboard passenger safety belt systems (including retractors, buckles and height adjusters) must be installed. Failure to install new safety belt systems increases the risk of serious personal injury or death in a crash.

1. The safety belt assemblies should be periodically inspected to make sure that they have not become damaged and that they remain in correct operating condition, particularly if they have been subjected to severe stress.

2. Before installing the new safety belt assembly, the safety belt retaining areas must be inspected for damage and distortion. If the retaining points are damaged and distorted, the sheet metal must be reworked back to its original shape and structural integrity.

3. Install the new safety belt(s) using the appropriate instructions. Carry out the appropriate Functional Test Procedure. For additional information, refer to the appropriate Functional Test procedure in Safety Belt System in this section.

tomsn048@gmail.com

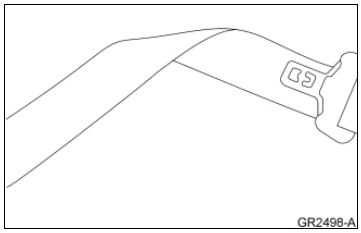
Safety Belt Procedure After a Collision

⚠ WARNING: After any crash, all of the following safety belt assemblies and attaching hardware must be inspected by an authorized dealer to verify correct function:

- Retractors
- Buckles
- Belt tension sensor (BTS) (if equipped)
- Front safety belt buckle support assemblies (slide bar) (if equipped)
- Safety belt shoulder belt height adjusters (if equipped)
- Child safety seat tether bracket assemblies
- Automatic locking retractor (ALR) feature for child safety seats (passenger seating positions only)

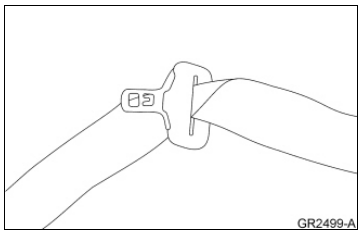
If any safety belt assembly is damaged, does not operate correctly or does not pass all of the Functional Tests in the Diagnosis and Testing portion of this section, a new safety belt assembly must be installed. If any safety belt assembly attaching areas are damaged or distorted, the sheet metal must be restored to its original structural integrity and new safety belt assembly and attaching hardware must be installed. Failure to install new safety belt assemblies and attaching hardware may increase the risk of serious personal injury or death in a crash.

After any crash that results in deployment of the driver and/or front outboard passenger safety belt pretensioners, new driver and/or front outboard passenger safety belt systems (including retractors, buckles and height adjusters) must be installed. Failure to install new safety belt systems increases the risk of serious personal injury or death in a crash.



1. Before installing a new safety belt assembly, the safety belt attaching areas must be inspected for damage and distortion. If the attaching points are damaged and distorted, the sheet metal must be worked back to its original shape and structural integrity.

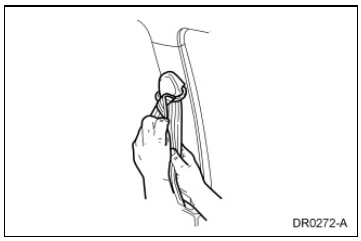
2. Install the new safety belt(s). For additional information, refer to the appropriate procedure in this section. Carry out all applicable Functional Tests for the component(s). For additional information, refer to the appropriate Functional Test procedure in Safety Belt System in this section.



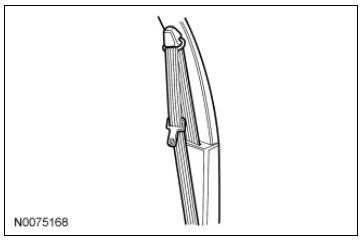
tomsn048@gmail.com

Safety Belt Tongue Rotated on Belt

1. Fold the safety belt as indicated.



2. Pull the safety belt tongue over the fold in the safety belt.



Safety Belt Twisted at the Safety Belt Guide

NOTE: These procedures apply to both wire-formed and stamped D-ring designs.

1. Grasp the safety belt webbing at the D-ring and fold the twisted portion of the belt webbing over itself.

2. Feed the folded portion of the safety belt webbing through the safety belt guide (D-ring) to remove the twist from the belt webbing.

Child Safety Seat Tether Anchor - Second Row

Material

Item	Specification
Clear Silicone Rubber TA-32	ESB-M4G92-A

Item	Part Number	Description
1	-	Tether anchor bolt
2	-	Tether anchor
3	-	Tether anchor bolt
4	-	Tether anchor
5	-	Tether anchor bolt (part of 613D76A)
6	613D76A	Tether anchor

Removal and Installation

⚠ WARNING: After any crash, all of the following safety belt assemblies and attaching hardware must be inspected by an authorized dealer to verify correct function:

- Retractors
- Buckles
- Belt tension sensor (BTS) (if equipped)
- Front safety belt buckle support assemblies (slide bar) (if equipped)
- Safety belt shoulder belt height adjusters (if equipped)
- Child safety seat tether bracket assemblies
- Automatic locking retractor (ALR) feature for child safety seats (passenger seating positions only)

If any safety belt assembly is damaged, does not operate correctly or does not pass all of the Functional Tests in the Diagnosis and Testing portion of this section, a new safety belt assembly must be installed. If any safety belt assembly attaching areas are damaged or distorted, the sheet metal must be restored to its original structural integrity and new safety belt assembly and attaching hardware must be installed. Failure to install new safety belt assemblies and attaching hardware may increase the risk of serious personal injury or death in

a crash.

After any crash that results in deployment of the driver and/or front outboard passenger safety belt pretensioners, new driver and/or front outboard passenger safety belt systems (including retractors, buckles and height adjusters) must be installed. Failure to install new safety belt systems increases the risk of serious personal injury or death in a crash.

NOTE: Second row bucket seats shown, others similar.

NOTE: Carpet removed for clarity.

1. Remove the bolt(s) and tether anchor(s).
    - To install, apply clear silicone rubber and tighten to 40 Nm (30 lb-ft).

2. To install, reverse the removal procedure.

Child Safety Seat Tether Anchor - Third Row

Material

Item	Specification
Clear Silicone Rubber TA-32	ESB-M4G92-A

Item	Part Number	Description
1	-	Tether anchor bolt
2	613F10B	Tether anchor
3	613F10B	Tether anchor
4	-	Tether anchor bolt
5	42624	Liftgate scuff plate trim panel

Removal and Installation

⚠ WARNING: After any crash, all of the following safety belt assemblies and attaching hardware must be inspected by an authorized dealer to verify correct function:

- Retractors
- Buckles
- Belt tension sensor (BTS) (if equipped)
- Front safety belt buckle support assemblies (slide bar) (if equipped)
- Safety belt shoulder belt height adjusters (if equipped)
- Child safety seat tether bracket assemblies
- Automatic locking retractor (ALR) feature for child safety seats (passenger seating positions only)

If any safety belt assembly is damaged, does not operate correctly or does not pass all of the Functional Tests in the Diagnosis and Testing portion of this section, a new safety belt assembly must be installed. If any safety belt assembly attaching areas are damaged or distorted, the sheet metal must be restored to its original structural integrity and new safety belt assembly and attaching hardware must be installed. Failure to install new safety belt assemblies and attaching hardware may increase the risk of serious personal injury or death in a crash.

After any crash that results in deployment of the driver and/or front outboard passenger safety belt pretensioners, new driver and/or front outboard passenger safety belt systems (including retractors, buckles and height adjusters) must be installed. Failure to install new safety belt systems increases the risk of serious personal injury or death in a crash.

1. Remove the liftgate scuff plate trim panel. For additional information, refer to Section 501-05 .

2. Remove the tether anchor bolt(s) and tether anchor(s).
    - To install, apply clear silicone rubber and tighten to 40 Nm (30 lb-ft).

3. To install, reverse the removal procedure.

Safety Belt Buckle - Second Row, Bucket

Material

Item	Specification
Clear Silicone Rubber TA-32	ESB-M4G92-A

Item	Part Number	Description
1	60026	Seat assembly
2	N807750	Safety belt buckle bolt
3	60044	Safety belt buckle

Removal and Installation

⚠ WARNING: After any crash, all of the following safety belt assemblies and attaching hardware must be inspected by an authorized dealer to verify correct function:

- Retractors
- Buckles
- Belt tension sensor (BTS) (if equipped)
- Front safety belt buckle support assemblies (slide bar) (if equipped)
- Safety belt shoulder belt height adjusters (if equipped)
- Child safety seat tether bracket assemblies
- Automatic locking retractor (ALR) feature for child safety seats (passenger seating positions only)

If any safety belt assembly is damaged, does not operate correctly or does not pass all of the Functional Tests in the Diagnosis and Testing portion of this section, a new safety belt assembly must be installed. If any safety belt assembly attaching areas are damaged or distorted, the sheet metal must be restored to its original structural integrity and new safety belt assembly and attaching hardware must be installed. Failure to install new safety belt assemblies and attaching hardware may increase the risk of serious personal injury or death in a crash.

After any crash that results in deployment of the driver and/or front outboard passenger safety belt

pretensioners, new driver and/or front outboard passenger safety belt systems (including retractors, buckles and height adjusters) must be installed. Failure to install new safety belt systems increases the risk of serious personal injury or death in a crash.

1. Tilt the second row seat forward.

2. Remove the seat base cover.

3. Remove the bolt and safety belt buckle.
   - To install, apply clear silicone rubber and tighten to 47 Nm (35 lb-ft).

4. **NOTE:** Before installation, make sure the safety belt webbing is not twisted and the safety belts and buckles are accessible to the occupants.

   To install, reverse the removal procedure.

5. Check the active restraint system for correct operation. For additional information, refer to the appropriate Functional Test procedure in Safety Belt System in this section.

Safety Belt Buckle - Second Row, Center and RH, 60/40, Bench

Item	Part Number	Description
1	611C72C	Dual safety belt buckle
2	N807750	Safety belt buckle bolts (2 required)

Removal and Installation

⚠ WARNING: After any crash, all of the following safety belt assemblies and attaching hardware must be inspected by an authorized dealer to verify correct function:

- Retractors
- Buckles
- Belt tension sensor (BTS) (if equipped)
- Front safety belt buckle support assemblies (slide bar) (if equipped)
- Safety belt shoulder belt height adjusters (if equipped)
- Child safety seat tether bracket assemblies
- Automatic locking retractor (ALR) feature for child safety seats (passenger seating positions only)

If any safety belt assembly is damaged, does not operate correctly or does not pass all of the Functional Tests in the Diagnosis and Testing portion of this section, a new safety belt assembly must be installed. If any safety belt assembly attaching areas are damaged or distorted, the sheet metal must be restored to its original structural integrity and new safety belt assembly and attaching hardware must be installed. Failure to install new safety belt assemblies and attaching hardware may increase the risk of serious personal injury or death in a crash.

After any crash that results in deployment of the driver and/or front outboard passenger safety belt pretensioners, new driver and/or front outboard passenger safety belt systems (including retractors, buckles and height adjusters) must be installed. Failure to install new safety belt systems increases the risk of serious personal injury or death in a crash.

NOTE: Seat cushion removed for clarity.

1. Remove the 2 bolts and dual safety belt buckle.
   - To install, tighten to 40 Nm (30 lb-ft).

2. **NOTE:** Before installation, make sure the safety belt webbing is not twisted and the safety belts and buckles are accessible to the occupants.

   To install, reverse the removal procedure.

3. Check the active restraint system for correct operation. For additional information, refer to the appropriate Functional Test procedure in Safety Belt System in this section.

Safety Belt Buckle - Second Row, LH, 60/40, Bench

Item	Part Number	Description
1	W708473	Safety belt buckle bolt
2	-	Safety belt buckle

Removal and Installation

⚠ WARNING: After any crash, all of the following safety belt assemblies and attaching hardware must be inspected by an authorized dealer to verify correct function:

- Retractors
- Buckles
- Belt tension sensor (BTS) (if equipped)
- Front safety belt buckle support assemblies (slide bar) (if equipped)
- Safety belt shoulder belt height adjusters (if equipped)
- Child safety seat tether bracket assemblies
- Automatic locking retractor (ALR) feature for child safety seats (passenger seating positions only)

If any safety belt assembly is damaged, does not operate correctly or does not pass all of the Functional Tests in the Diagnosis and Testing portion of this section, a new safety belt assembly must be installed. If any safety belt assembly attaching areas are damaged or distorted, the sheet metal must be restored to its original structural integrity and new safety belt assembly and attaching hardware must be installed. Failure to install new safety belt assemblies and attaching hardware may increase the risk of serious personal injury or death in a crash.

After any crash that results in deployment of the driver and/or front outboard passenger safety belt pretensioners, new driver and/or front outboard passenger safety belt systems (including retractors, buckles and height adjusters) must be installed. Failure to install new safety belt systems increases the risk of serious personal injury or death in a crash.

1. Remove the 40 percent seat. For additional information, refer to Seat - Second Row, Sport Trac or Seat - Second Row, Explorer, 60/40 Bench in Section 501-10 .

2. Remove the bolt and safety belt buckle.
   - To install, tighten to 55 Nm (41 lb-ft).

3. **NOTE:** Before installation, make sure the safety belt webbing is not twisted and the safety belts and buckles are accessible to the occupants.

   To install, reverse the removal procedure.

4. Check the active restraint system for correct operation. For additional information, refer to the appropriate Functional Test procedure in Safety Belt System in this section.

Item	Part Number	Description
1	-	Inboard side shield screws (2 required)
2	61348	Side shield
3	W702441	Safety belt buckle bolt
4	60044 LH/ 60045 RH	Safety belt buckle

Removal and Installation

⚠ WARNING: After any crash, all of the following safety belt assemblies and attaching hardware must be inspected by an authorized dealer to verify correct function:

- Retractors
- Buckles
- Belt tension sensor (BTS) (if equipped)
- Front safety belt buckle support assemblies (slide bar) (if equipped)
- Safety belt shoulder belt height adjusters (if equipped)
- Child safety seat tether bracket assemblies
- Automatic locking retractor (ALR) feature for child safety seats (passenger seating positions only)

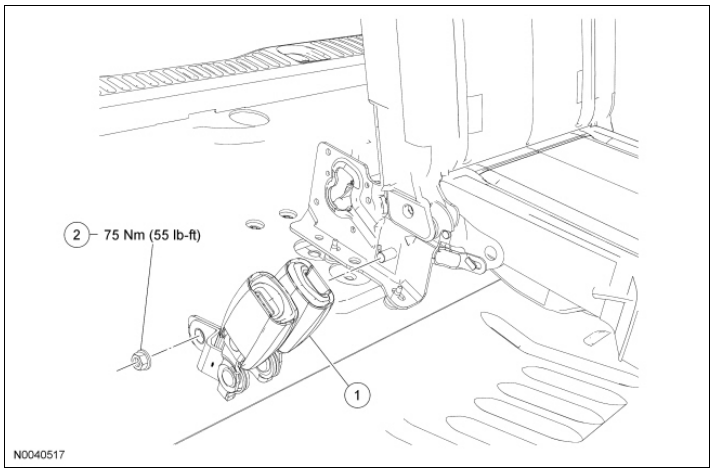
If any safety belt assembly is damaged, does not operate correctly or does not pass all of the Functional Tests in the Diagnosis and Testing portion of this section, a new safety belt assembly must be installed. If any safety belt assembly attaching areas are damaged or distorted, the sheet metal must be restored to its original structural integrity and new safety belt assembly and attaching hardware must be installed. Failure to install new safety belt assemblies and attaching hardware may increase the risk of serious personal injury or death in a crash.

After any crash that results in deployment of the driver and/or front outboard passenger safety belt pretensioners, new driver and/or front outboard passenger safety belt systems (including retractors, buckles and height adjusters) must be installed. Failure to install new safety belt systems increases the risk of serious personal injury or death in a crash.

1. Tilt the seat forward.

2. Remove the 2 screws and inboard side shield.

3. Remove the bolt and safety belt buckle.
    - To install, tighten to 55 Nm (41 lb-ft).



4. **NOTE:** Before installation, make sure the safety belt webbing is not twisted and the safety belts and buckles are accessible to the occupants.

   To install, reverse the removal procedure.

5. Check the active restraint system for correct operation. For additional information, refer to the appropriate Functional Test procedure in Safety Belt System in this section.

tomsn048@gmail.com

Safety Belt Buckle - Third Row

Item	Part Number	Description
1	613048	Dual safety belt buckle
2	-	Safety belt buckle nut

Removal and Installation

⚠ WARNING: After any crash, all of the following safety belt assemblies and attaching hardware must be inspected by an authorized dealer to verify correct function:

- Retractors
- Buckles
- Belt tension sensor (BTS) (if equipped)
- Front safety belt buckle support assemblies (slide bar) (if equipped)
- Safety belt shoulder belt height adjusters (if equipped)
- Child safety seat tether bracket assemblies
- Automatic locking retractor (ALR) feature for child safety seats (passenger seating positions only)

If any safety belt assembly is damaged, does not operate correctly or does not pass all of the Functional Tests in the Diagnosis and Testing portion of this section, a new safety belt assembly must be installed. If any safety belt assembly attaching areas are damaged or distorted, the sheet metal must be restored to its original structural integrity and new safety belt assembly and attaching hardware must be installed. Failure to install new safety belt assemblies and attaching hardware may increase the risk of serious personal injury or death in a crash.

After any crash that results in deployment of the driver and/or front outboard passenger safety belt pretensioners, new driver and/or front outboard passenger safety belt systems (including retractors, buckles and height adjusters) must be installed. Failure to install new safety belt systems increases the risk of serious personal injury or death in a crash.

NOTE: Power seat shown, manual seat similar.

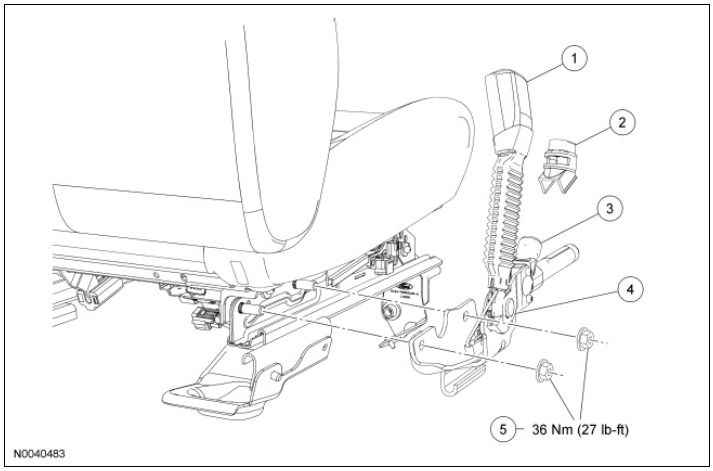
1. Remove the RH third row seat. For additional information, refer to Seat - Third Row Section 501-10 .

2. Remove the nut and dual safety belt buckle assembly.

- To install, tighten to 75 Nm (55 lb-ft).

3. **NOTE:** Before installation, make sure the safety belt webbing is not twisted and the safety belts and buckles are accessible to the occupants.

   To install, reverse the removal procedure.



4. Check the active restraint system for correct operation. For additional information, refer to the appropriate Functional Test procedure in Safety Belt System in this section.

tomsn048@gmail.com

Safety Belt Buckle and Pretensioner

NOTE: LH shown, RH similar.

Item	Part Number	Description
1	61202 RH/ 61203 LH	Safety belt buckle pretensioner
2	-	Safety belt buckle pretensioner electrical connector cover
3	-	Safety belt buckle pretensioner electrical connector
4	-	Safety belt buckle switch electrical connector
5	-	Safety belt buckle pretensioner nuts (2 required)

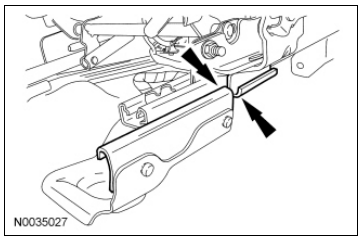
Removal and Installation

⚠ WARNING: Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.

⚠ WARNING: After any crash, all of the following safety belt assemblies and attaching hardware must be inspected by an authorized dealer to verify correct function:

- Retractors
- Buckles
- Belt tension sensor (BTS) (if equipped)
- Front safety belt buckle support assemblies (slide bar) (if equipped)
- Safety belt shoulder belt height adjusters (if equipped)
- Child safety seat tether bracket assemblies
- Automatic locking retractor (ALR) feature for child safety seats (passenger seating positions only)

If any safety belt assembly is damaged, does not operate correctly or does not pass all of the Functional Tests in the Diagnosis and Testing portion of this section, a new safety belt assembly must be installed. If any safety belt assembly attaching areas are damaged or distorted, the sheet metal must be restored to its original structural integrity and new safety belt assembly and attaching hardware must be installed. Failure to install new safety belt assemblies and attaching hardware may increase the risk of serious personal injury or death in



a crash.

After any crash that results in deployment of the driver and/or front outboard passenger safety belt pretensioners, new driver and/or front outboard passenger safety belt systems (including retractors, buckles and height adjusters) must be installed. Failure to install new safety belt systems increases the risk of serious personal injury or death in a crash.

NOTE: The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is removed and the ignition is ON.

NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

1. Position the seat so it does not engage the safety belt buckle and pretensioner bracket and allows access to all 4 seat mounting fasteners.
    - If equipped with power seats, position the passenger seat track downward to access the safety belt retractor anchor bolt.

2. Remove the seat and depower the SRS . For additional information, refer to Seat - Front in Section 501-10 .

3. Remove the safety belt buckle pretensioner electrical connector cover.

4. Disconnect the safety belt buckle electrical connectors.

5. Remove the 2 nuts and safety belt buckle pretensioner.
    - To install, tighten to 36 Nm (27 lb-ft).

6. **NOTE:** Before installation, make sure the safety belt webbing is not twisted and the safety belts and buckles are accessible to the occupants.

   To install, reverse the removal procedure.

7. Install the seat and repower the SRS . **If the passenger seat has been serviced, do not prove out the SRS at this time.** For additional information, refer to Front Seat in Section 501-10 .

8. Check the active restraint system for correct operation. For additional information, refer to the appropriate Functional Test procedure in Safety Belt System in this section.

tomsn048@gmail.com

Safety Belt Retractor - Front

Item	Part Number	Description
1	-	D-ring cover

6	-	Adaptive load limiting electrical connector
7	W700883	Safety belt retractor bolt

Removal and Installation

⚠ WARNING: After any crash, all of the following safety belt assemblies and attaching hardware must be inspected by an authorized dealer to verify correct function:

- Retractors
- Buckles
- Belt tension sensor (BTS) (if equipped)
- Front safety belt buckle support assemblies (slide bar) (if equipped)
- Safety belt shoulder belt height adjusters (if equipped)
- Child safety seat tether bracket assemblies
- Automatic locking retractor (ALR) feature for child safety seats (passenger seating positions only)

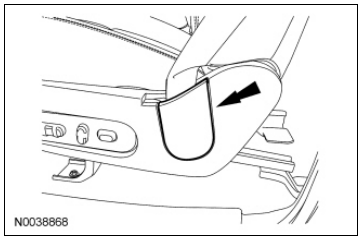
If any safety belt assembly is damaged, does not operate correctly or does not pass all of the Functional Tests in the Diagnosis and Testing portion of this section, a new safety belt assembly must be installed. If any safety belt assembly attaching areas are damaged or distorted, the sheet metal must be restored to its original structural integrity and new safety belt assembly and attaching hardware must be installed. Failure to install

tomsn048@gmail.com

new safety belt assemblies and attaching hardware may increase the risk of serious personal injury or death in a crash.

After any crash that results in deployment of the driver and/or front outboard passenger safety belt pretensioners, new driver and/or front outboard passenger safety belt systems (including retractors, buckles and height adjusters) must be installed. Failure to install new safety belt systems increases the risk of serious personal injury or death in a crash.

NOTE: The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is removed and the ignition is ON.



NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: LH shown, RH similar.

1. If equipped with power seats, position the passenger seat track downward to access the safety belt retractor anchor bolt.

2. Depower the Supplemental Restraint System (SRS). For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B .

3. Remove the safety belt anchor cover.

4. Remove the bolt and safety belt anchor.
   - To install, tighten to 40 Nm (30 lb-ft).

5. **NOTE:** If the D-ring cover is damaged or does not remain attached, install a new D-ring cover.

   Remove the D-ring cover.

6. Remove the bolt and D-ring.
   - To install, tighten to 48 Nm (35 lb-ft).

7. Remove the lower B-pillar trim panel. For additional information, refer to B-Pillar Lower Trim Panel in Section 501-05 .

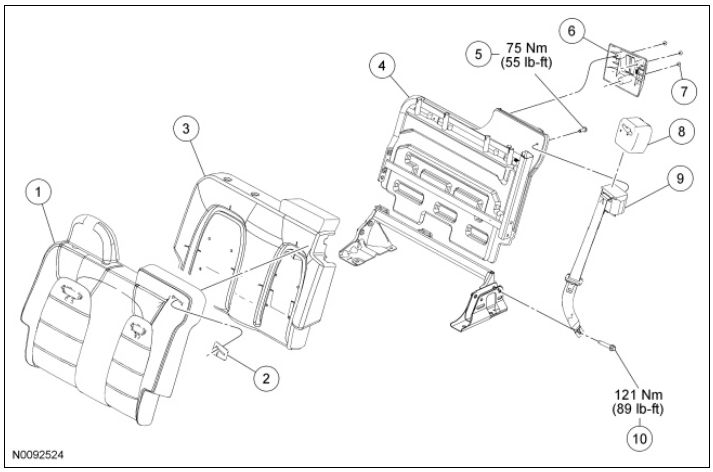
8. Remove the secondary safety belt guide.

9. Disconnect the electrical connector.

10. Remove the bolt and safety belt retractor.
    - To install, tighten to 40 Nm (30 lb-ft).

11. **NOTE:** Before installation, make sure the safety belt webbing is not twisted and the safety belts and buckles are accessible to the occupants.

To install, reverse the removal procedure.



12. Repower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of Section 501-20B .

13. Check the active restraint system for correct operation. For additional information, refer to the appropriate Functional Test procedure in Safety Belt System in this section.

Safety Belt Retractor - Second Row, Center, 60/40, Bench

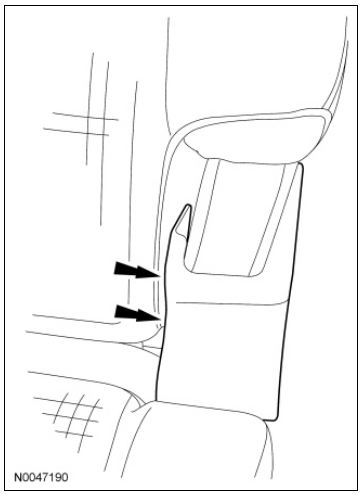
Item	Part Number	Description
1	66601	Backrest trim cover
2	610D72	Safety belt guide cover
3	66800	Backrest foam pad
4	613A38	Backrest frame
5	N807750	Safety belt retractor bolt
6	638A74	Upper latch cover (Sport Trac only)
7	-	Upper latch cover screw (3 required) (part of 605C10)
8	613C46	Safety belt retractor cover
9	611B64	Safety belt retractor
10	-	Safety belt anchor bolt (part of 611B64)

Removal and Installation

⚠ WARNING: After any crash, all of the following safety belt assemblies and attaching hardware must be inspected by an authorized dealer to verify correct function:

- Retractors
- Buckles
- Belt tension sensor (BTS) (if equipped)
- Front safety belt buckle support assemblies (slide bar) (if equipped)
- Safety belt shoulder belt height adjusters (if equipped)
- Child safety seat tether bracket assemblies
- Automatic locking retractor (ALR) feature for child safety seats (passenger seating positions only)

If any safety belt assembly is damaged, does not operate correctly or does not pass all of the Functional Tests in the Diagnosis and Testing portion of this section, a new safety belt assembly must be installed. If any safety belt assembly attaching areas are damaged or distorted, the sheet metal must be restored to its original structural integrity and new safety belt assembly and attaching hardware must be installed. Failure to install new safety belt assemblies and attaching hardware may increase the risk of serious personal injury or death in a crash.



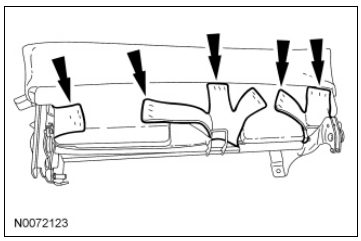
After any crash that results in deployment of the driver and/or front outboard passenger safety belt pretensioners, new driver and/or front outboard passenger safety belt systems (including retractors, buckles and height adjusters) must be installed. Failure to install new safety belt systems increases the risk of serious personal injury or death in a crash.

1. Remove the second row, 40 percent seat. For additional information, refer to Section 501-10 .

2. Remove the bolt and safety belt anchor.
   - To install tighten to 121 Nm (89 lb-ft).

3. **NOTE:** LH shown, RH similar.

   Remove the 4 screws and position aside the latch covers.



4. Remove the safety belt guide cover.

5. If equipped, remove the 3 screws and the upper latch cover.

6. Release the J-clip at the bottom of the seat backrest.

7. Remove all the staples in the backrest support panel.

8. ***NOTICE:*** **Use care when separating the seat upholstery from the hook-and-loop strip, or the hook-and-loop strip can be torn from the seat backrest foam pad.**

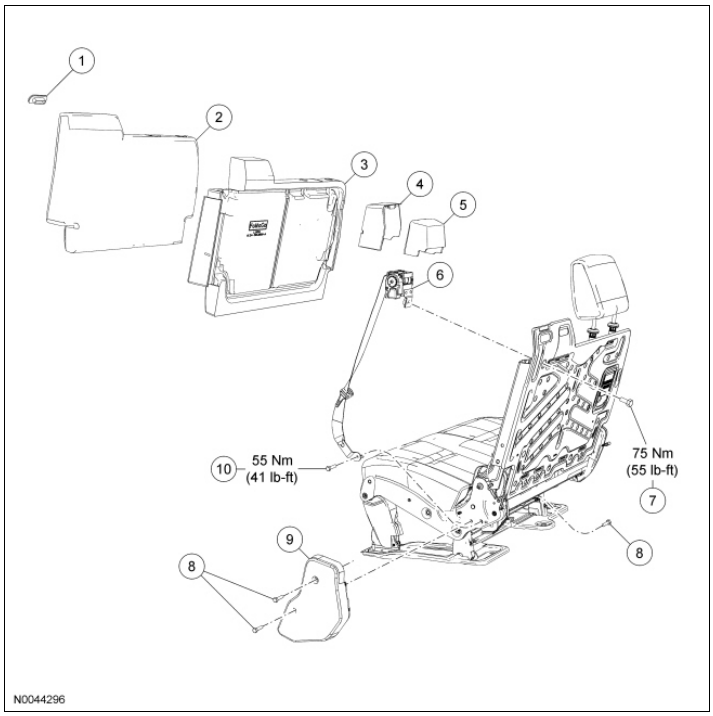
   Separate the hook-and-loop fasteners. Invert the seat backrest trim cover and position aside.

9. Position aside the backrest foam pad.

10. Remove the safety belt retractor cover.

11. Remove the bolt and safety belt retractor.

tomsn048@gmail.com



- To install, tighten to 75 Nm (55 lb-ft).

12. **NOTE:** Before installation, make sure the safety belt webbing is not twisted and the safety belts and buckles are accessible to the occupants.

    To install, reverse the removal procedure.

13. Check the active restraint system for correct operation. For additional information, refer to Safety Belt System in this section.

Safety Belt Retractor - Second Row, Center, 60/40, E-Z Entry

Item	Part Number	Description
1	610D72	Safety belt bezel
2	66600	Seat backrest trim cover
3	66800	Seat backrest foam pad
4	613D46	Safety belt retractor cover
5	611D52	Safety belt retractor insulator
6	611B64	Safety belt retractor
7	-	Safety belt retractor bolt
8	-	Latch cover screws (3 required)
9	61349	Recliner latch cover
10	-	Safety belt retractor anchor bolt

Removal and Installation

⚠ WARNING: After any crash, all of the following safety belt assemblies and attaching hardware must be inspected by an authorized dealer to verify correct function:

- Retractors
- Buckles
- Belt tension sensor (BTS) (if equipped)
- Front safety belt buckle support assemblies (slide bar) (if equipped)
- Safety belt shoulder belt height adjusters (if equipped)
- Child safety seat tether bracket assemblies
- Automatic locking retractor (ALR) feature for child safety seats (passenger seating positions only)

tomsn048@gmail.com

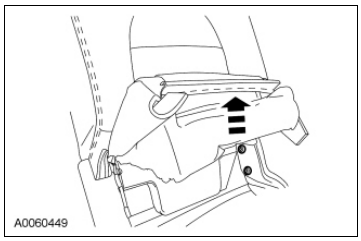
If any safety belt assembly is damaged, does not operate correctly or does not pass all of the Functional Tests in the Diagnosis and Testing portion of this section, a new safety belt assembly must be installed. If any safety belt assembly attaching areas are damaged or distorted, the sheet metal must be restored to its original structural integrity and new safety belt assembly and attaching hardware must be installed. Failure to install new safety belt assemblies and attaching hardware may increase the risk of serious personal injury or death in a crash.

After any crash that results in deployment of the driver and/or front outboard passenger safety belt pretensioners, new driver and/or front outboard passenger safety belt systems (including retractors, buckles and height adjusters) must be installed. Failure to install new safety belt systems increases the risk of serious personal injury or death in a crash.

NOTE: Seat is removed and exploded for clarity.

1. Fold the seat and tilt to the E-Z entry position.

2. Remove the 3 screws and inboard recliner outer cover side shield.



3. Remove the bolt and safety belt anchor.
   - To install, tighten to 55 Nm (41 lb-ft).

4. Release the backrest trim cover retainers.

5. Remove the safety belt bezel.

6. ***NOTICE:*** **Use care when separating the seat back trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the backrest foam pad.**

   Invert the backrest trim cover.

7. Release the hook-and-loop strips.

8. Remove the pin-type retainer and safety belt retractor cover and insulator.

9. Remove the bolt and safety belt retractor.
   - To install, tighten to 75 Nm (55 lb-ft).

10. **NOTE:** Before installation, make sure the safety belt webbing is not twisted and the safety belts and buckles are accessible to the occupants.

    To install, reverse the removal procedure.

11. Check the active restraint system for correct operation. For additional information, refer to the appropriate Functional Test procedure in Safety Belt System in this section.

Safety Belt Shoulder Height Adjuster

Item	Part Number	Description
1	602B82	Safety belt shoulder height adjuster
2	-	Safety belt shoulder height adjuster bolt (part of 602B82)
3	-	D-ring cover
4	611B08 RH/ 611B09 LH	Safety belt retractor
5	W710896	D-ring bolt (part of 611B08 RH/ 611B09 LH)

⚠ WARNING: After any crash, all of the following safety belt assemblies and attaching hardware must be inspected by an authorized dealer to verify correct function:

- Retractors
- Buckles
- Belt tension sensor (BTS) (if equipped)
- Front safety belt buckle support assemblies (slide bar) (if equipped)
- Safety belt shoulder belt height adjusters (if equipped)
- Child safety seat tether bracket assemblies
- Automatic locking retractor (ALR) feature for child safety seats (passenger seating positions only)

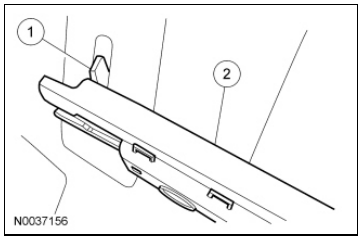
If any safety belt assembly is damaged, does not operate correctly or does not pass all of the Functional Tests in the Diagnosis and Testing portion of this section, a new safety belt assembly must be installed. If any safety belt assembly attaching areas are damaged or distorted, the sheet metal must be restored to its original structural integrity and new safety belt assembly and attaching hardware must be installed. Failure to install new safety belt assemblies and attaching hardware may increase the risk of serious personal injury or death in a crash.

After any crash that results in deployment of the driver and/or front outboard passenger safety belt pretensioners, new driver and/or front outboard passenger safety belt systems (including retractors, buckles and height adjusters) must be installed. Failure to install new safety belt systems increases the risk of serious personal injury or death in a crash.

1. **NOTE:** Inspect the D-ring cover for damage. If the cover is damage or does not remain attached,

install a new D-ring cover.

Remove the D-ring cover.



2. Remove the bolt and D-ring.
   - To install, tighten to 48 Nm (35 lb-ft).

3. Remove the upper B-pillar trim panel. For additional information, refer to B-Pillar Upper Trim Panel in Section 501-05 .

4. Lower the shoulder safety belt shoulder height adjuster to the most downward position.

5. Remove the bolt.
   - To install, tighten to 40 Nm (30 lb-ft).

6. Remove the safety belt shoulder height adjuster.
   1. Rotate the safety belt shoulder height adjuster downward to release the lower tab.
   2. Remove the safety belt shoulder height adjuster.

7. **NOTE:** Before installation, make sure the safety belt webbing is not twisted and the safety belts and buckles are accessible to the occupants.

   To install, reverse the removal procedure.

8. Check the active restraint system for correct operation. For additional information, refer to the appropriate Functional Test procedure in Safety Belt System in this section.

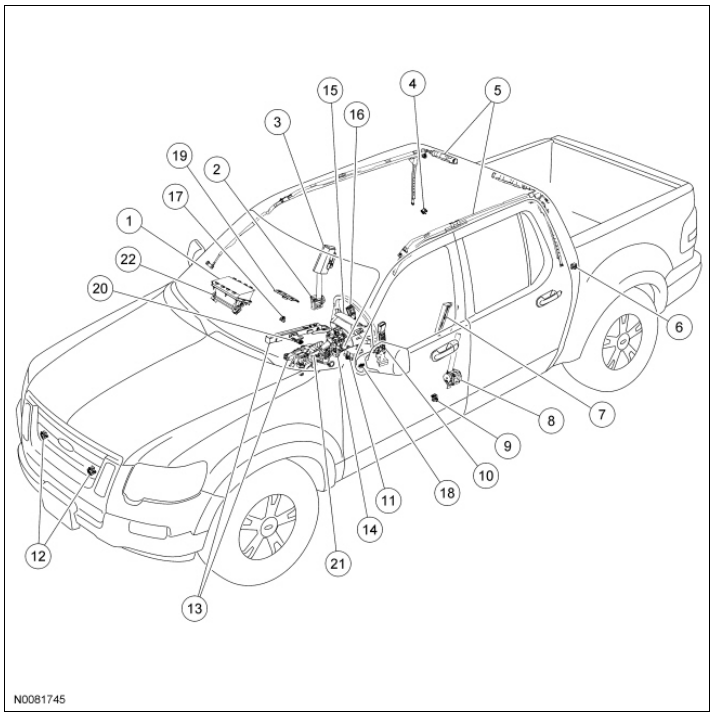
Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS)

The Supplemental Restraint System (SRS) is designed to provide increased collision protection for front seat and second row outboard occupants in addition to that provided by the 3-point safety belt system. Safety belt use is necessary to obtain the best occupant protection and to receive the full advantage of the SRS .

The serviceable air bag and safety belt pretensioner SRS components are shown in the following illustrations.



Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) Components - Explorer/Mountaineer

Item	Part Number	Description
1	044A74	Passenger air bag module assembly
2	04338	Passenger air bag cover
3	14B345	Passenger first row side impact sensor (pressure sensor, located in passenger front door)
4	14B422	Occupant Classification System Module (OCSM)

Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS)

Special Tool(s)

 ST2574-A	Flex Probe Kit 300-NUD105-R025DE or equivalent
 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Principles of Operation

A Supplemental Restraint System (SRS) consists of the following:

- Dual stage driver and passenger air bag module
- Safety belt buckle pretensioners
- Adaptive load limiting retractors
- Safety canopies
- Impact sensors (driver\center front crash sensor, passenger front crash sensor first and second row driver and passenger side impact sensors)
- Clockspring
- An air bag warning indicator (located in the Instrument Cluster (IC))
- Restraints Control Module (RCM)
- Occupant Classification System (OCS) system
- Passenger Air Bag Deactivation (PAD) indicator

In addition to dual stage deployment (advanced restraint system) driver and front passenger air bag modules, this vehicle is equipped with a passenger air bag adaptive tether as well as driver and passenger air bag canister vents.

The RCM includes a backup power supply. This feature provides sufficient backup power to deploy the SRS components in the event that the ignition circuit is lost or damaged during impact. The backup power supply will deplete its stored energy approximately one minute after power and/or ground has been removed from the RCM . The RCM performs an internal, external circuitry and component "self-test" during each startup. If a SRS fault exists, the RCM sends a message to IC module to illuminate the air bag warning indicator. In addition to the self-test at start up, the RCM continuously monitors all of its external and internal circuitry for faults.

In a frontal collision, the impact sensors located in the front of the vehicle detect the sudden deceleration and send an electrical signal to the RCM . The RCM uses the information from the impact sensors and the Occupant Classification System Module (OCSM) in the deployment determination. If the RCM determines that SRS deployment is required, the RCM sends voltage and current to the squib(s) causing the solid

tomsn048@gmail.com

chemical propellant to undergo a rapid chemical reaction. This controlled reaction produces harmless nitrogen gas that fills the air bag(s)/safety canopies and/or activates the safety belt pretensioners/adaptive load limiting retractor(s) to control the tension of the safety belt(s).

The RCM communicates through the Data Link Connector (DLC) the current and historical DTCs on the High Speed Controller Area Network (HS-CAN). The RCM also communicates over the HS-CAN to the IC module, OCSM and PCM.

Adaptive Load Limiting Safety Belt Retractor

This vehicle is equipped with driver and front passenger adaptive load limiting retractors. Adaptive load limiting retractors are pyrotechnic devices integrated to the driver and front passenger safety belt retractor assemblies. Adaptive load limiting retractors work in conjunction with the safety belt buckle pretensioners and control the tension of the driver and front passenger seat belts in the event of a deployable collision. The RCM monitors the readiness of the adaptive load limiting retractors. The RCM uses this information and all other information provided by the restraints system to determine what action is to be taken.

Air Bag Module Second Stage Deployment Check

Because the driver and passenger front air bags each have 2 deployment stages, it is possible that Stage 1 has deployed and Stage 2 has not.

If a front air bag module has deployed, it is **mandatory** that the front air bag module be remotely deployed using the appropriate air bag disposal procedure.

- For information on driver air bag module and/or passenger air bag module remote deployment, refer to Pyrotechnic Device Disposal in this section.

Air Bag Warning Indicator

The air bag warning indicator:

- is located in the IC module.
- and circuitry prove out is a function of the IC module. The IC module will prove out the air bag warning indicator by lighting the air bag warning indicator for 6 seconds and then turn off.
- will flash and/or illuminate based on the message the IC module receives from the RCM .
- will illuminate if the IC module does not receive a message from the RCM .

Clockspring

The clockspring:

- is mounted on the steering column, behind the steering wheel.
- allows for continuous electrical connections between the driver air bag module and the RCM when the steering wheel is turned.

Driver Air Bag Module

The driver air bag module:

- contains dual stage deployment (advanced restraint system).
- is equipped with canister vent.

In addition to dual stage deployment (advanced restraint system) driver air bag module, this vehicle is equipped with a driver air bag canister vent. Canister venting is a deployable device integrated to the driver air bag module. Canister venting controls the inflation rate of the driver air bag and the escape rate of gases from the vent.

Deployable Steering Column

This vehicle is equipped with a deployable steering column. The deployable steering column includes a deployable device that, once deployed, reduces the amount of force necessary to collapse the steering column during a crash event. The deployable device is activated by the RCM depending on when the module detects a crash event force exceeding a programmed limit and the position of the driver seat. After deployment, a new steering column **must** be installed.

High Speed Controller Area Network (HS-CAN)

This vehicle utilizes a communication system called a HS-CAN . The HS-CAN consists of a twisted pair of wires connected to the following:

- ABS module
- Accessory Protocol Interface Module (APIM)
- IC module
- OCS system
- PCM
- Transmission Control Module (TCM)
- RCM
- Four-Wheel Drive (4WD) module
- DLC

The HS-CAN circuits use a bias voltage of approximately 2.5 volts, one is a positive 2.5 volts while the other is a negative 2.5 volts. The HS-CAN also uses 2 terminating resistors, one contained within the PCM, the other in the IC module. The terminating resistors are not serviced separately. The terminating resistors have a value of 120 ohms each, for a total normal operating system total of 60 ohms. The HS-CAN may operate with only one terminating resistor and may communicate some messages to some of the control modules with only one circuit functioning. Refer to Section 418-00 .

Impact Sensors

⚠ WARNING: If a vehicle has been in a crash, inspect the restraints control module (RCM) and the impact sensor (if equipped) mounting areas for deformation. If damaged, restore the mounting areas to the original production configuration. A new RCM and sensors must be installed whether or not the air bags have deployed. Failure to follow these instructions may result in serious personal injury or death in a crash.

For these vehicles, the SRS uses 6 satellite sensors in addition to the RCM . The RCM is mounted to the center tunnel beneath the console. All vehicles will have 2 front impact severity sensors (driver/center front crash sensor and passenger front crash sensor) located in the front-center area of the vehicle, behind the grille mounted on the lower radiator support. The first row impact sensors (pressure sensors) are located in each of the front doors behind the trim panel. The second row impact sensors are located on each C-pillar. Mounting

tomsn048@gmail.com

orientation and torque is critical for correct operation of all impact and rollover sensors.

Deployment Loop

The deployment loop is made up of the RCM , deployable device (each containing a squib), air bag(s), safety belt pretensioners (safety canopies/side air curtains, deployable steering columns, load limiting retractor, adaptive tether, adaptive vent, if equipped) and associated circuits.

Loops/Squibs

All deployable devices contain an initiating device called a squib. The squib is part of the deployment loop. Air bag/safety canopies modules can contain more than one squib, some vehicles may have up to 4 squibs in one air bag module. Squibs are often referred to as loops during the diagnostic process.

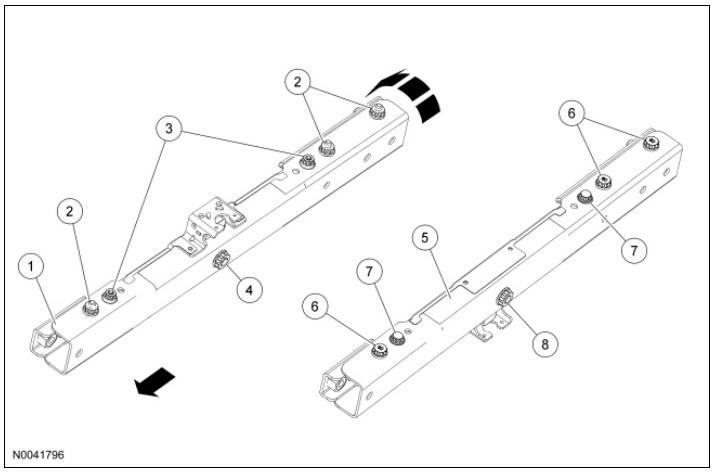
Occupant Classification System (OCS) System

The OCS system is found only on the front passenger seat. The front passenger OCS system is comprised of 2 OCS rails (weight sensors) that are mounted to each side of the seat track and an OCSM which is mounted to the electrical bracket underneath the seat cushion pan. The components that make up the OCS system are serviced separately. The weight of any occupant or object on the front passenger seat is electronically communicated to the OCSM .

The OCS system is also used for operation of the passenger Belt-Minder®. For information on the passenger Belt-Minder® feature, refer to Section 501-20A . To deactivate or reactivate the passenger Belt-Minder® feature, refer to Section 413-01 or the Owner's Literature.

When the front passenger seat is removed for service, the Zero Seat Weight Test must be carried out after the installation of the front passenger seat. When a new OCS system component is installed, the System Reset must be carried out after the installation of the front passenger seat. The Zero Seat Weight Test and/or System Reset must be carried out only as instructed in the Workshop Manual. For information on the Zero Seat Weight Test and/or System Reset, refer to Occupant Classification Sensor (OCS) System Zero Seat Weight Test or Occupant Classification Sensor (OCS) System Reset in this section.

Occupant Classification System Module (OCSM)



Based on programmed limits, the OCSM will inform the RCM , via a HS-CAN , the weight of any occupant or object on the front passenger seat. The RCM uses this information in determining if the passenger air bag module or passenger seat side air bag module is to be deployed in the event of a deployable collision.

The OCSM monitors the OCS system for faults and communicates on-demand and continuous DTCs via the DLC with the use of a scan tool.

Occupant Classification System (OCS) Rails (Weight Sensors)

⚠ WARNING: Do not disassemble the occupant classification system (OCS) sensor rail or tighten or loosen any of the nuts and bolts installed to the OCS rail body. Only the 8 bolts that attach the 2 OCS sensor rails to the seat track may be removed and installed. Failure to follow these instructions may result in incorrect operation of the OCS and increase the risk of serious personal injury or death in a crash.

NOTE: The illustration below is indicating the fasteners of the OCS rails (weight sensors) that **must not** be tightened or loosened. The OCS rails are installed individually as an assembly and require no adjustment.

Item	Description
1	Occupant Classification System (OCS) rail, outboard side
2	Stopper nut(s) and bolt(s), outboard side
3	Sensor pivot nut(s) and bolt(s), outboard side
4	Sensor nut (under assembly), outboard side
5	OCS rail, inboard side
6	Stopper nut(s) and bolt(s), inboard side
7	Sensor pivot nut(s) and bolt(s), inboard side
8	Sensor nut (under assembly), inboard side

Passenger Air Bag Deactivation (PAD) Indicator

The PAD indicator is a visual indicator used to inform the front seat occupants of the passenger air bag deactivation state. The PAD indicator is a stand-alone lamp installed into the vehicle instrument panel in a position visible to each front seat occupant.

The RCM controls the state of the PAD indicator through a direct hardwire connection, based on information provided by the OCS system. The PAD indicator is lit to indicate the passenger air bag module is disabled. An exception to this is when the front passenger seat is determined to be empty and the passenger safety belt buckle is unbuckled indicating a deactivated passenger air bag module is not necessary. In all other cases, the PAD indicator is unlit when the passenger air bag module is enabled.

When the ignition is in the ON position, the PAD indicator prove-out period is initiated by the RCM . The RCM briefly activates the PAD indicator to prove-out the indicator function and verify correct operation.

For information on the OCS system, refer to Occupant Classification Sensor System in this section.

The following table indicates the passenger air bag status and the PAD indicator status based the size of the front outboard passenger occupant.

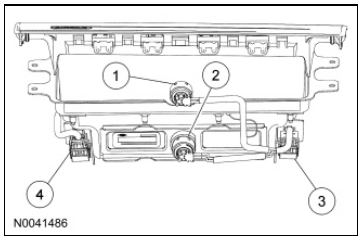
tomsn048@gmail.com

Passenger Air Bag Deactivation (PAD) Indicator Status

Occu- pant Size	Passenger Safety Belt Buckle Status	Pass. Air Bag Status	PAD Ind. Status
None	Unbuckled	Disabled	Unlit
None	Buckled	Disabled	Lit
Infant or Small Child	Buckled/ Unbuckled	Disabled	Lit
Adult Sized	Buckled/ Unbuckled	Enabled	Unlit

Passenger Air Bag Module

The passenger air bag module:



- contains dual stage deployment (advanced restraint system).
- is equipped with canister vent.
- is equipped with adaptive tether.
- is mounted in the passenger side of the instrument panel.

In addition to the dual stage deployment (advanced restraint system) front passenger air bag module, this vehicle is equipped with a passenger air bag adaptive tether, as well as a passenger air bag canister vent. Canister venting is a deployable device integrated to the passenger air bag module. Canister venting controls the inflation rate of the passenger air bag and the escape rate of gases from the vent.

Adaptive tether is a deployable device integrated to the passenger air bag module. Adaptive tether restricts the rearward movement of the passenger air bag.

Passenger Air Bag Module

NOTE: Illustration shown as if looking through the glove compartment opening, rotated slightly for clarity.

Item	Description
1	Passenger air bag adaptive tether
2	Passenger air bag canister vent
3	Adaptive tether and canister vent 4-way connector
4	Passenger air bag squib 1 and squib 2 4-way connector

Restraints Control Module (RCM)

⚠ WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the Safety Canopy® and cause serious personal injury or death.

⚠ WARNING: If a vehicle has been in a crash, inspect the restraints control module (RCM) and the impact sensor (if equipped) mounting areas for deformation. If damaged, restore the mounting areas to the original production configuration. A new RCM and sensors must be installed whether or not the air bags have deployed. Failure to follow these instructions may result in serious personal injury or death in a crash.

NOTICE: **Prior to the installation of a new Restraints Control Module (RCM), it is necessary to upload module configuration information to the scan tool. This information needs to be downloaded into the new RCM once installed. Refer to Section 418-01 .**

NOTE: This vehicle may be equipped with the SYNC® V2 feature which contains the 911 assist option. Refer to the Owner's Literature.

NOTE: Carrying out Programmable Module Installation (PMI) will not enable the 911 assist option that is disabled. The RCM and Accessory Protocol Interface Module (APIM) must be configured correctly to fully support 911 assist functionality.

The RCM carries out the following functions:

- deploys the air bag(s) in the event of a deployable crash.
- activates the safety belt buckle pretensioner(s) and safety belt adaptive load limiting retractor(s) to control tension on the safety belt.
- monitors the SRS for faults.
- requests the illumination of the air bag indicator if a fault is detected.
- communicates the on-demand or continuous DTCs through the DLC .

The RCM monitors the SRS for possible faults. If a fault is detected while the ignition switch is in the ON position, the RCM will request illumination of the air bag indicator located in the IC .

When the ignition is cycled (turned OFF and then ON), the IC module will prove out the air bag indicator by lighting the indicator for 6 seconds and then off. If a SRS fault exists, the air bag indicator will illuminate and remain illuminated for the rest of the ignition cycle. The RCM will also communicate the on-demand (current) and continuous (historical) DTCs through the DLC to the scan tool. If the RCM requests illumination of the air bag indicator and the air bag indicator does not function, the IC module will automatically activate an audible chime. The chime is a series of 5 sets of 5 tone bursts. If the chime is heard, the SRS and the air bag indicator require repair.

The RCM includes a backup power supply. This feature provides sufficient backup power to deploy the air bags in the event that the ignition circuit is lost or damaged during impact. The backup power supply will deplete its stored energy approximately one minute after the battery ground cable is disconnected.

Safety Belt Buckle Pretensioners

The safety belt buckles are equipped with pretensioners. The safety belt buckle pretensioners remove excess slack from the safety belt webbing. The pretensioners are activated by the RCM when the module detects a crash event force exceeding a programmed limit.

Safety Belt Buckle Switches

The front safety belt buckles are equipped with safety belt buckle switches. The safety belt buckles are comprised of integrated circuits called Hall-effect switches. The safety belt buckle switches indicate to the RCM whether the safety belts are buckled or unbuckled.

tomsn048@gmail.com

The RCM supplies current to the safety belt buckle switch. Current flows through the switch, buckled or unbuckled, to ground. The RCM will sense the difference in this current draw, 6 mA (unbuckled) or 15 mA (buckled), and use this information in determining the deployment rate of the dual-stage driver and passenger air bag modules. If the RCM detects current out of this range, it will set a DTC.

The RCM uses this information in determining the deployment rate of the dual-stage driver and passenger air bag modules. The RCM also communicates the driver safety belt buckle switch status to the IC module, which monitors the information to control the safety belt warning indicator. For information on the safety belt warning indicator, refer to Section 413-01 .

Safety Canopy® Module

⚠ WARNING: Anytime the Safety Canopy® or side air curtain module has deployed, a new headliner and new A-, B-, C- and D-pillar upper trim panels and attaching hardware must be installed. Remove any other damaged components and hardware and install new components and hardware as needed. Failure to follow these instructions may result in the Safety Canopy® or side air curtain module deploying incorrectly and increases the risk of serious personal injury or death in a crash.

The Safety Canopy® module:

- is installed as an assembly.
- is mounted above the headliner.
- attaches from the A-pillar frame to the D-pillar frame on Explorer/Mountaineer and from the A-pillar frame to the C-pillar frame on Explorer Sport Trac.

Seat Side Air Bag Module

NOTE: When servicing a seat equipped with a seat side air bag module, refer to Section 501-10 .

A seat side air bag module provides protection of the thorax area (between the neck and abdomen) of the body, working in conjunction with the head protection provided by a Safety Canopy® module.

The seat side air bag module:

- will deploy upon receiving a flow of current from the RCM initiated by the side impact sensor(s) and internal RCM circuitry.
- is installed as an assembly.
- is mounted in the driver/passenger seat back.
- is used in conjunction with a Safety Canopy® module.

Seat Track Position Sensor

The seat track position sensor is a Hall-effect sensor located on the driver seat track. The seat track position sensor informs the RCM of the driver seat position. The RCM uses this information in determining the deployment rate of the dual-stage driver air bag module.

Secondary Air Bag Warning (Chime)

The secondary air bag warning chime, is an audible chime generated by the IC module. If the IC module has detected a fault with the air bag warning indicator, a DTC will be stored in the memory of the IC module.

Upon receiving the message from the RCM that a SRS fault has been detected, the IC module will sound the secondary air bag warning chime in a pattern of 5 sets of 5 beeps.

Diagnostic Instructions

The symptom chart can be used to help locate SRS concerns if no DTCs are retrieved and the listed symptoms are observed. Whether or not the listed symptoms are observed, always carry out the following:

1. Retrieve all DTCs stored in the RCM memory and OCSM memory. Refer to Retrieve/Clear Continuous DTCs in this section.

2. Run the on-demand Self Test to determine what DTCs are currently being sensed by the RCM and OCSM .

3. If on-demand DTCs are different than CMDTCs , always repair the on-demand DTCs first.

A DTC can indicate several concerns. The DTCs are to assist in system diagnosis and are not to be considered definitive. Always refer to the pinpoint test corresponding to the DTC to determine where the concern lies and to repair the concern correctly.

Self Test/On-Demand

The on-demand Self Test option is used to verify that no electrical concerns exist with the SRS . Upon entering the self-test, the RCM / OCSM will make an electrical check of each electrical component in the system. If a concern is detected, a DTC is displayed on the scan tool with a brief description of the DTC. The self-test should always be run after any repair to verify that the repair was successful.

Self Test/Continuous Memory and Clear DTCs

During vehicle operation, the RCM and OCSM will detect and store both intermittent and hard failure DTCs in non-volatile memory. The DTC strategy employed by the RCM incorporates a time-out scheme for determining when a concern exists in the system. This requires a concern to exist for up to one minute in the system before the RCM will detect it. For the RCM to determine that a concern no longer exists, the concern must be absent for up to one minute. The actual detection time-outs vary with each DTC. DTCs can be retrieved with a scan tool using the Self Test option. All DTCs stored in the RCM and OCSM will be displayed on the scan tool along with a brief description of the DTC. If no DTCs are present, the scan tool will display a SYSTEM PASSED message. This option can also be used to clear DTCs from the RCM and OCSM memory, as long as the concern no longer exists.

Once 75 hours of operation have been recorded by the RCM since the concern was last detected, all RCM CMDTCs will be automatically removed from memory.

Once 128 ignition cycles have been recorded by the OCSM since the concern was last detected, all OCSM continuous memory DTCs will be automatically removed from memory.

DataLogger PID/Data

The DataLogger PID/Data option allows the scan tool operator to read the state of several PIDs to aid in diagnosing the system. PIDs are real time measurements of parameters, such as voltages and resistances, calculated by the RCM sent to the scan tool for display. Many of the PIDs supported by the modules are

tomsn048@gmail.com

calculated periodically and are, therefore, not true real time readings.

To retrieve PIDs, follow these steps:

1. Connect the scan tool to the DLC .
2. Turn the ignition to the ON position.
3. Follow the manufacturer's instructions for the scan tool being used.
4. Select DataLogger.
5. Select RCM or OCSM .

Active Commands

Instrument Cluster (IC) module

These commands allow the technician to verify the operation of IC module components and subsystems.

Occupant Classification System (OCS) System Reset

The Occupant Classification System (OCS) System Reset active command sets the zero set point or rezeros the OCS system. Refer to Occupant Classification Sensor (OCS) System Reset in this section.

Lamp Fault Codes (LFCs)

This vehicle supports LFCs **only** when the RCM is in plant mode. A new RCM installed in a vehicle will be in plant mode until:

- Programmable Module Installation (PMI) has been carried out.
- the RCM sees a fault-free SRS (no DTCs present).

If a LFC is present after completing PMI , a fault is present in the SRS and on-demand DTCs must be retrieved and diagnosed.

Diagnosing Customer Concerns With On-Demand DTCs

NOTE: Most SRS diagnostic procedures will require depowering and repowering of the SRS . Depowering and repowering requires disconnecting of the battery and removal of the RCM fuse. This reduces the risk of accidental deployment of SRS components while diagnostic procedures are being carried out.

If the air bag warning indicator is reported ON by the customer when the vehicle comes in for service, connect the scan tool and follow the Diagnostic Instruction procedures in this section to identify the concern.

Once the DTC is known, read the Normal Operation of the pinpoint test for the DTC involved.

Using the scan tool with the use of PIDs and active command(s) may be of assistance in diagnosing the concern.

- Follow the depowering procedure as directed in this section.

- Determine the location of components involved in creating the DTC.
- Carry out a thorough visual inspection of:
    - components.
    - connectors.
    - splices and wiring harnesses.
    - insulation on conductors.

Diagnosing Customer Concerns With Continuous Memory DTCs

If an air bag warning indicator ON is reported by the customer but is not present when the vehicle comes in for service, follow the Diagnostic Instruction procedures in this section to identify the intermittent DTC.

Once the DTC is known, read the Normal Operation section of the pinpoint test for the DTC involved.

- Follow the depowering procedure as directed in this section.
- Determine the location of components involved in creating the DTC.
- Carry out a thorough visual inspection of:
    - components.
    - connectors.
    - splices and wiring harnesses.
    - insulation on conductors.

Refer to the Normal Operations section of the pinpoint test for the DTC involved, which lists the common concerns that relate to the DTC. Concerns are listed according to priority.

Bit-Mapped DTCs

Many of the continuous memory and on-demand DTCs that can be present in the RCM provide general fault information and require accessing the associated bit-mapped PIDs (fault PIDs) to identify the specific concern. DTCs that use fault PIDs are conceptually different from conventional DTCs.

Conventional DTCs identify a specific concern for a given component and point to a particular diagnostic path. In the diagnostic path, PIDs are sometimes used to determine the root cause.

DTCs that use fault PIDs do not identify the specific concern. The DTC identifies the component(s) or type of components in which the concern exists. The next level, fault PIDs, identifies the specific device and fault condition. Fault PIDs are available for both on-demand (active) and continuous memory (historic) DTCs. Those associated PIDs are an extension of the information provided by the DTC and are identified by the same DTC number. Using both DTC and the fault PID is necessary to define the specific fault present (in the same manner as normal DTCs do).

A scan tool must be used to view DTCs and their fault PIDs. Once a scan tool has retrieved a DTC, use the scan tool to view the fault PIDs. Viewing the fault PIDs must be carried out to identify the specific concern that is present. When the viewing of fault PIDs has been carried out, the scan tool can display the PIDs associated with that DTC, including the status or state that exists (on-demand DTC) or existed (Continuous Memory Diagnostic Trouble Code (CMDTC)). Refer to the manufacturer's instructions for the scan tool being used on how to view fault PIDs.

Prove Out Procedure

Turn the ignition switch from the off to the on position and monitor the air bag indicator with all SRS

tomsn048@gmail.com

components connected. The air bag indicator will light continuously for approximately 6 seconds and then turn off. If an SRS fault is present, the air bag indicator will:

- fail to light.
- remain lit continuously.
- flash at a 5Hz rate RCM not configured).

The air bag indicator may not illuminate until approximately 30 seconds after the ignition switch has been turned from the OFF to the ON position. This is the time required for the RCM to complete the testing of the SRS . If the air bag indicator is inoperative and an SRS fault exists, a chime will sound in a pattern of 5 sets of 5 beeps. If this occurs, the air bag indicator will need to be repaired before diagnosis can continue.

Air Bag Reconnect Checklist

The checklist below should be completed following diagnosis or repair of any air bag system concern:

- All in-seat harness connectors connected?
- All OCS system components connected?
- All air bag modules connected?
- Safety Canopy® modules connected?
- Safety belt pretensioner connectors connected?
- Safety belt load limiter connectors connected?
- All sensors (front, side impact sensors and seat track position sensor) connected?
- PAD indicator connected?
- RCM connected?
- RCM fuse installed?
- Battery connected?

Glossary

Secondary Air Bag Warning

The secondary air bag warning is an audible fault format that consists of 5 sets of 5 tone bursts, with each set of 5 tone bursts separated by a 5-second quiet period. One tone burst cycle will consist of 1-second ON and 1-second OFF. This series of 5 activations is repeated every 30 minutes.

Disconnect the Component

Disconnect the component means to disconnect the component vehicle harness connector, not to remove the component. Do not reconnect a disconnected component unless instructed to do so.

Deactivate the Supplemental Restraint System (SRS)

Deactivate the SRS means to carry out a deactivation procedure for the SRS . Refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.

Depower the SRS

Depower the SRS means to disconnect the battery and remove the RCM fuse. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.

Install a New Component

Install a new component means to remove the existing component and install a new authorized part obtained from Ford Customer Service Division.

Prove Out the SRS

Prove out the SRS means to turn the ignition switch from the OFF to the ON position, and to monitor the air bag indicator with the SRS components connected. Refer to Prove Out Procedure in this section.

Reactivate the SRS

Reactivate the SRS means to carry out the reactivation procedure for the SRS . Refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.

Reconnect the System

Reconnect the system means to reconnect all SRS components. Refer to Air Bag System Reconnect Checklist in this section.

Repower the SRS

Repower the SRS means to turn the ignition ON, install the RCM fuse and connect the battery ground cable. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.

Inspection and Verification

1. Verify the customer concern.

2. Inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Damaged Restraints Control Module (RCM) or loose mounting • Damaged Occupant Classification System Module (OCSM) or loose mounting • Occupant Classification System (OCS) rail is damaged, has contamination or has an obstruction • Damaged front impact severity sensor(s) or loose mounting • Damaged side impact sensor(s) or loose mounting • Damaged or disconnected Passenger Air Bag Deactivation (PAD) indicator	• Open Smart Junction Box (SJB) fuse 17 (10A) • Damaged wiring harness • Loose, damaged or corroded connectors • Circuitry open/shorted • Damaged shorting bars

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the DLC .

tomsn048@gmail.com

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM .
   - refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - verify the ignition is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record CMDTCs .

8. Clear the continuous DTCs and carry out the self-test diagnostics for the RCM and OCSM .

9. If the DTCs retrieved are related to the concern, go to the DTC Charts. For all other DTCs, refer to Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

DTC Charts

The DTCs can be retrieved from the RCM and the OCSM with a scan tool via the DLC .

Restraints Control Module (RCM) DTC Chart

DTC [a]	Description	Action To Take
Continuous lamp	The Air Bag Indicator is Illuminated Continuously	GO to Pinpoint Test A .
B1085	Restraint System - Seatbelt Load Limiter Status	GO to Pinpoint Test B .
B1118	Passenger Front Crash Sensor Mount/Communication Fault (RH front impact severity sensor)	GO to Pinpoint Test C .
B1135	Passenger Front Crash Sensor Internal Fault (RH front impact severity sensor)	INSTALL a new passenger front crash sensor. REFER to Front Impact Severity Sensor in this section.

B1231	Event Threshold Exceeded	INSTALL a new Restraints Control Module (RCM) and impact sensors. REFER to Inspection and Repair After a Supplemental Restraint System (SRS) Deployment in this section.
B1317	Battery Voltage High	GO to Pinpoint Test AB .
B1318	Battery Voltage Low	GO to Pinpoint Test AB .
B1342	ECU is Faulted	INSTALL a new RCM . REFER to Restraints Control Module (RCM) in this section.
B1884	PAD Warning Lamp Circuit Failure	GO to Pinpoint Test D .
B1890	PAD Warning Lamp Circuit Short to Battery	GO to Pinpoint Test E .
B2290	Occupant Classification System Fault	**NOTE:** If no on-demand or continuous DTC is present in the Occupant Classification System Module (OCSM) and DTC B2290 is only present in the RCM as a continuous memory DTC, CLEAR all RCM DTCs, PROVE OUT the SRS and CONFIRM the battery and charging system are OK. The OCSM reported a fault message to the RCM . CARRY OUT on-demand self test of the OCSM and REFER to the OCSM DTC Chart for any OCSM DTCs present. If no OCSM DTCs are present, the DTC may have been set due to a momentary low voltage condition. REFER to Section 414-00 to CONFIRM the battery and charging system are OK as a momentary low voltage condition may have resulted in the OCSM reporting a fault message to the RCM and setting RCM DTC B2290.
B2292	Restraint System - Seatbelt Pretensioner Fault	GO to Pinpoint Test G .
B2293	Restraint System - Air Bag Fault	GO to Pinpoint Test H .
B2294	Restraint System - Curtain Fault	GO to Pinpoint Test I .
B2295	Restraint System - Side Air Bag Fault	GO to Pinpoint Test J .
B2296	Restraint System - Impact Sensor Fault	GO to Pinpoint Test K .
B2434	Drivers Seat Belt Buckle Switch Circuit Short to Ground	GO to Pinpoint Test L .
B2435	Drivers Seat Belt Buckle Switch Resistance Out of Range	GO to Pinpoint Test M .
B2438	Passengers Seat Belt Buckle Switch Short to Ground	GO to Pinpoint Test N .
B2439	Passengers Seat Belt Buckle Switch Resistance Out of Range	GO to Pinpoint Test O .
B2477	Module Configuration Failure	**NOTE:** When installing a new RCM , always make sure the correct RCM is being installed. If an incorrect RCM is installed, DTCs will result.

tomsn048@gmail.com

		CARRY OUT Programmable Module Installation (PMI). REFER to Section 418-01 .
B2607	Harness/Configuration Mismatch	**NOTE:** When installing a new RCM , always make sure the correct RCM is being installed. If an incorrect RCM is installed, DTCs will result. CARRY OUT Programmable Module Installation (PMI). REFER to Section 418-01 .
B2691	Seat Belt Buckle Switch Circuit Fault, Front Driver's Side	GO to Pinpoint Test P .
B2692	Front Passenger's Seat Belt Buckle Switch Circuit Fault	GO to Pinpoint Test Q .
B2792	Cross Link Between Firing Loops	GO to Pinpoint Test R .
B2984	Deployable Steering Column Circuit Open	GO to Pinpoint Test S .
B2985	Deployable Steering Column Circuit Short to Battery	GO to Pinpoint Test T .
B2986	Deployable Steering Column Circuit Short to Ground	GO to Pinpoint Test U .
B2987	Deployable Steering Column Circuit Resistance Low on Squib	GO to Pinpoint Test S .
C1414	Incorrect Module Design Level	GO to Pinpoint Test AC .
C1946	Front Driver's Seat Track Position Switch Circuit Open	GO to Pinpoint Test X .
C1947	Front Driver's Seat Track Position Switch Circuit Short to Ground	GO to Pinpoint Test Y .
C1948	Front Driver's Seat Track Position Switch Circuit Resistance Out of Range	GO to Pinpoint Test Z .
C1981	Front Driver's Seat Track Position Switch Circuit Fault	GO to Pinpoint Test AA .
U0300	Internal Control Module Software Incompatibility	**NOTE:** When installing a new RCM , always make sure the correct RCM is being installed. If an incorrect RCM is installed, DTCs will result. CARRY OUT Programmable Module Installation (PMI). REFER to Section 418-01 .
U1900	CAN Communication Bus Fault - Receive Error	**NOTE:** DTC U1900 will set in a module that is reporting a communication fault from another module on the data bus. The module that reports the fault is not the problem module. Do not install a new RCM as part of repair for a RCM DTC U1900 fault.

		VIEW and RECORD IC_MSG_ RCM , PCM_MSG_ RCM and OCS _MSG_ RCM fault PIDs to determine the module with the concern. REFER to Section 418-00 to diagnose the High Speed Controller Area Network (HS-CAN)/module concern.
U2050	No Application Present	**NOTE:** When installing a new RCM , always make sure the correct RCM is being installed. If an incorrect RCM is installed, DTCs will result. INSTALL a new RCM . REFER to Restraints Control Module (RCM) in this section.
U2051	One or More Calibration Files Missing/Corrupt	**NOTE:** When installing a new RCM , always make sure the correct RCM is being installed. If an incorrect RCM is installed, DTCs will result. CARRY OUT Programmable Module Installation (PMI). REFER to Section 418-01 .

Occupant Classification System Module (OCSM) DTC Chart

DTC [a]	Description	Action To Take
B229A	Occupant Classification System Contamination	**NOTE:** If no on-demand or continuous DTC is present in the RCM and DTC B229A is only present in the OCSM continuous, CLEAR all OCSM DTCs and PROVE OUT the SRS . GO to Pinpoint Test V .
B229B	Occupant Classification System Obstruction	**NOTE:** If no on-demand or continuous DTC is present in the RCM and DTC B229B is only present in the OCSM continuous, CLEAR all OCSM DTCs and PROVE OUT the SRS . GO to Pinpoint Test W .
B1231	Event Threshold Exceeded (Crash Data Memory Full)	INSTALL new OCS rails and CLEAR all OCSM and RCM DTCs. REFER to Occupant Classification Sensor and Inspection and Repair After a Supplemental Restraint System (SRS) Deployment in this section.
B1317	Battery Voltage High	GO to Pinpoint Test AB .
B1318	Battery Voltage Low	GO to Pinpoint Test AB .
B1342	ECU is Faulted	CARRY OUT Occupant Classification System (OCS) system reset. REFER to Occupant Classification Sensor (OCS) System Reset in this section. DO NOT carry out the Zero Seat Weight Test at this time. CLEAR the DTCs and REPEAT the self-test. If the DTC is no longer present, CARRY OUT the Zero Weight Test to complete the repair. REFER to Occupant Classification Sensor (OCS) System Zero Seat Weight Test in this section. If the DTC is still present, INSTALL a new OCSM . REFER to Occupant Classification System Module (OCSM) in this section.
B2290	Occupant Classification System Fault	**NOTE:** If no on-demand or continuous DTCs are present in the OCSM and DTC B2290 is only present in the RCM , REFER to

tomsn048@gmail.com

		DTC B2290 in the RCM DTC chart above. GO to Pinpoint Test F .
B2477	Module Configuration Failure	INSTALL a new OCSM . REFER to Occupant Classification System Module (OCSM) in this section.
C1941	Zero Seat Weight Test Failure	Can only be reported when carrying out Occupant Classification System (OCS) system Zero Seat Weight Test. REFER to Occupant Classification Sensor (OCS) System Zero Seat Weight Test in this section.
U1900	CAN Communication Bus Fault - Receive Error	**NOTE:** DTC U1900 will set in a module that is reporting a communication fault from another module on the data bus. The module that reports the fault is not the problem module. Do not install a new OCSM as part of repair for a OCS DTC U1900 fault. VIEW and RECORD RCM _MSG_ OCS fault PIDs to determine the module with the concern. REFER to Section 418-00 to diagnose the HS-CAN /module concern.
U2050	No Application Present	**NOTE:** If no on-demand or continuous DTC is present in the RCM and DTC U2050 is only present in the OCSM continuous, CLEAR all OCSM DTCs and PROVE OUT the SRS . INSTALL a new OCSM . REFER to Occupant Classification System Module (OCSM) in this section.
U2051	One or More Calibration Files Missing/Corrupt	INSTALL a new OCSM . REFER to Occupant Classification System Module (OCSM) in this section.

Symptom Chart

Symptom Chart

Pinpoint Tests

Pinpoint Test A: The Air Bag Indicator is Illuminated Continuously

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

Normal Operation

During normal operation, the Instrument Cluster (IC) module will illuminate the air bag indicator continuously for 6 seconds after the ignition is placed to the RUN or ON position. If the Supplemental Restraint System (SRS) is fault free, the air bag warning indicator will turn off and remain off. If a fault is detected in the SRS , the air bag warning indicator will illuminate and remain illuminated for the rest of the ignition cycle. The Restraints Control Module (RCM) will communicate to the IC module via the High Speed Controller Area Network (HS-CAN). The IC module will illuminate the air bag indicator based on messaging from the RCM or if there is no communication between the RCM and IC module.

This pinpoint test is intended to diagnose the following:

- IC module

- RCM

PINPOINT TEST A: THE AIR BAG INDICATOR IS ILLUMINATED CONTINUOUSLY

⚠ WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the Safety Canopy® and cause serious personal injury or death.

⚠ WARNING: Always tighten the fasteners of the restraints control module (RCM) and impact sensor (if equipped) to the specified torque. Failure to do so may result in incorrect restraint system operation, which increases the risk of personal injury or death in a crash.

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: SRS components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
A1 RETRIEVE RCM DTCs	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • **Were any DTCs retrieved during self-test?**	**Yes** If on-demand or Continuous Memory Diagnostic Trouble Codes (CMDTCs) were retrieved, GO to the DTC Charts in this section for diagnostic direction. Do not clear any DTCs until all DTCs have been resolved. **No** If the RCM **does** communicate with the scan tool, REFER to Section 413-01 to diagnose the IC module concern. If the RCM **does not** communicate with the scan tool, REFER to Section 418-00 to diagnose the no communication concern. Do not clear any DTCs until all DTCs have been resolved.

Pinpoint Test B: DTC B1085

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

Normal Operation

The Restraints Control Module (RCM) continuously monitors the adaptive load limiting retractors circuits for an acceptable resistance range, unacceptable voltage and shorts to ground. The RCM will set and store

tomsn048@gmail.com

on-demand DTC B1085 in memory if any of these conditions are detected. If the RCM detects a fault, it will send a message to the Instrument Cluster (IC) module to illuminate the air bag warning indicator.

As the RCM continuously monitors adaptive load limiting retractor circuits for resistance, it expects a normal resistance between 1.31 and 4.29 ohms.

If a loop resistance is between 0.9 and 1.31 ohms or between 4.29 and 5 ohms, there exists a strong potential for an intermittent fault, a DTC may or may not set. The RCM will also set an on-demand DTC if the loop resistance is less than 0.9 ohm or greater than 5 ohms.

NOTE: When monitoring fault and/or resistance PIDs with the scan tool, it may take up to 2 seconds for the scan tool display to update.

Fault PIDs [a]	Description	Fault Trigger Condition
1085_24_OD and 1085_24_CM	Seatbelt Load Limiter Front Passenger Circuit Resist Low on Squib	When the Restraints Control Module (RCM) measures resistance less than 0.9 ohm between the passenger safety belt load limiting retractor circuits, a fault will be indicated.
1085_25_OD and 1085_25_CM	Seatbelt Load Limiter Front Passenger Open	When the RCM measures resistance greater than 5 ohms between the passenger safety belt load limiting retractor circuits, a fault will be indicated.
1085_26_OD and 1085_26_CM	Seatbelt Load Limiter Front Passenger Short to Battery	When the RCM senses a short to voltage on either of the passenger safety belt load limiting retractor circuits, a fault will be indicated.
1085_27_OD and 1085_27_CM	Seatbelt Load Limiter Front Passenger Short to Ground	When the RCM senses a short to ground on either of the passenger safety belt load limiting retractor circuits, a fault will be indicated.
1085_28_OD and 1085_28_CM	Seatbelt Load Limiter Driver Circuit Resist Low on Squib	When the RCM measures resistance less than 0.9 ohm between the driver safety belt load limiting retractor circuits, a fault will be indicated.
1085_29_OD and 1085_29_CM	Seatbelt Load Limiter Driver Open	When the RCM measures resistance greater than 5 ohms between the driver safety belt load limiting retractor circuits, a fault will be indicated.
1085_30_OD and 1085_30_CM	Seatbelt Load Limiter Driver Short to Battery	When the RCM senses a short to voltage on either of the driver safety belt load limiting retractor circuits, a fault will be indicated.
1085_31_OD and 1085_31_CM	Seatbelt Load Limiter Driver Short to Ground	When the RCM senses a short to ground on either of the driver safety belt load limiting retractor circuits, a fault will be indicated.

[a] Fault PIDs that end in OD indicate an on-demand status and are associated with on-demand DTC B1085. Fault PIDs that end in CM indicate continuous memory status and are associated with continuous DTC B1085.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Adaptive load limiting retractor
- RCM

PINPOINT TEST B: DTC B1085

⚠ WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the Safety Canopy® and cause serious personal injury or death.

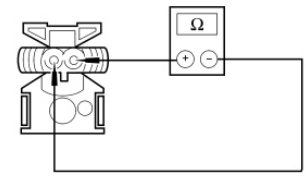
⚠ WARNING: Never disassemble or tamper with safety belt buckle/retractor pretensioners, adaptive load limiting retractors, safety belt inflators, or probe the electrical connectors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners, adaptive load limiting retractors, or safety belt inflators, which increases the risk of serious personal injury or death.

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.**

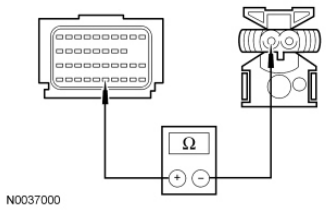
Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

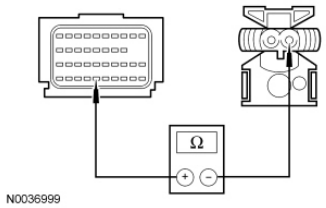
NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: SRS components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .



Test Step	Result / Action to Take
B1 RETRIEVE RCM DTCs	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record All 1085 Fault PIDs . ♦ Refer to PID list in Normal Operation to view 1085 fault PIDs. • **Do any RCM on-demand 1085 fault PIDs indicate a fault?**	**Yes** The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Using the fault PIDs recorded, GO to the appropriate pinpoint test step. For 1085_28_OD (Seatbelt Load Limiter Driver Circuit Resist Low on Squib), GO to B2 . For 1085_29_OD (Seatbelt Load Limiter Driver Open), GO to B2 . For 1085_31_OD (Seatbelt Load Limiter Driver Short to Ground), GO to B8 . For 1085_30_OD (Seatbelt Load Limiter Driver Short to Battery), GO to B10 . For 1085_24_OD (Seatbelt Load Limiter Front Passenger Circuit Resist Low on Squib), GO to B11 . For 1085_25_OD (Seatbelt Load Limiter Front Passenger Open), GO to B11 . For 1085_27_OD (Seatbelt Load Limiter Front Passenger Short to Ground), GO to B17 .

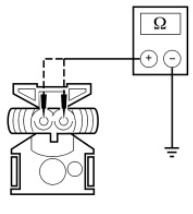


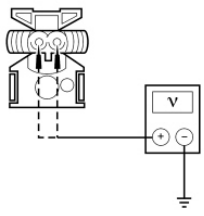


tomsn048@gmail.com

	For 1085_26_OD (Seatbelt Load Limiter Front Passenger Short to Battery), GO to B19 . **No** This is an intermittent fault when present as a CMDTC only. The fault condition is not present at this time. Using the fault PIDs recorded, GO to the appropriate pinpoint test step. For 1085_28_CM (Seatbelt Load Limiter Driver Circuit Resist Low on Squib), 1085_24_CM (Seatbelt Load Limiter Front Passenger Circuit Resist Low on Squib), 1085_29_CM (Seatbelt Load Limiter Driver Open) and 1085_25_CM (Seatbelt Load Limiter Front Passenger Open), GO to B22 . For 1085_31_CM (Seatbelt Load Limiter Driver Short to Ground) and 1085_27_CM (Seatbelt Load Limiter Front Passenger Short to Ground), GO to B24 . For 1085_30_CM (Seatbelt Load Limiter Driver Short to Battery) and 1085_26_CM (Seatbelt Load Limiter Front Passenger Short to Battery), GO to B25 .
B2 CHECK THE DRIVER ADAPTIVE LOAD LIMITING RETRACTOR RESISTANCE PID (D_LOAD)	
• Enter the following diagnostic mode on the scan tool: DataLogger - RCM - PID . • Enter the following diagnostic mode on the scan tool: D_LOAD (Seatbelt Load Limiter Resistance, Driver Side) Resistance PID . • **Does the resistance PID value read between 1.31 and 4.29 ohms?**	**Yes** GO to B21 . **No** GO to B3 .
B3 CHECK THE DRIVER ADAPTIVE LOAD LIMITING RETRACTOR RESISTANCE PID (D_LOAD) WHILE CARRYING OUT A HARNESS TEST	
• Continue monitoring the D_LOAD (Seatbelt Load Limiter Resistance, Driver Side) resistance PID while carrying out a harness test of the driver adaptive load limiting retractor circuits and accessible connectors (including any inline connectors), by wiggling connectors and flexing the wire harness.	**Yes** DEPOWER the SRS and REPAIR the connector, terminals or wire harness as needed. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information.

• **Does the resistance PID value read between 1.31 and 4.29 ohms while carrying out a harness test?**	GO to B26 . **No** If the driver adaptive load limiting retractor resistance PID is less than 1.31 ohms, GO to B4 . If the driver adaptive load limiting retractor resistance PID is greater than 4.29 ohms, GO to B6 .
B4 CHECK THE DRIVER ADAPTIVE LOAD LIMITING RETRACTOR FAULT PIDs (1085_28_OD) AND (1085_29_OD) FOR A CHANGE IN FAULT STATUS	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Driver Adaptive Load Limiting Retractor C323 . • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record The Following Fault PIDs . ♦ 1085_28_OD (Seatbelt Load Limiter Driver Circuit Resist Low on Squib) ♦ 1085_29_OD (Seatbelt Load Limiter Driver Open) • **DIAGNOSTIC TIP:** When viewing DTC B1085 on-demand fault PIDs with the driver adaptive load limiting retractor disconnected, an open circuit fault would normally be retrieved. • **Did the driver adaptive load limiting retractor on-demand fault PIDs change from indicating a low resistance to an open circuit fault?**	**Yes** GO to B20 . **No** GO to B5 .
B5 CHECK FOR A SHORT BETWEEN DRIVER ADAPTIVE LOAD LIMITING RETRACTOR CIRCUITS	

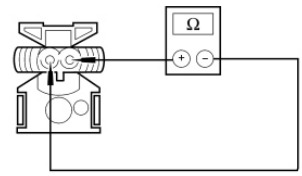




tomsn048@gmail.com

• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310a and C310b . • Measure resistance between driver adaptive load limiting retractor C323-1, circuit CR146 (GY/VT), harness side and C323-2, circuit RR146 (BU/BN), harness side.  A0030495 • **Is resistance greater than 10,000 ohms?**	**Yes** GO to B21 . **No** REPAIR circuits CR146 (GY/VT) and RR146 (BU/BN). GO to B26 .
B6 CHECK THE DRIVER ADAPTIVE LOAD LIMITING RETRACTOR FAULT PIDs (1085_28_OD) AND (1085_29_OD) FOR A CHANGE IN FAULT STATUS	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Driver Adaptive Load Limiting Retractor C323 . • Connect a fused jumper wire between driver adaptive load limiting retractor C323-1, circuit CR146 (GY/VT), harness side and C323-2, circuit RR146 (BU/BN), harness side. • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record The Following Fault PIDs .	**Yes** GO to B20 . **No** GO to B7 .

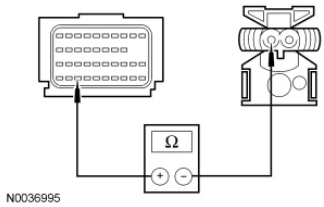
♦ 1085_28_OD (Seatbelt Load Limiter Driver Circuit Resist Low on Squib) ♦ 1085_29_OD (Seatbelt Load Limiter Driver Open) • **DIAGNOSTIC TIP:** When viewing DTC B1085 on-demand fault PIDs with the driver safety belt load limiting retractor circuits shorted together, a low resistance fault would normally be retrieved. • **Did the driver adaptive load limiting retractor on-demand fault PIDs change from indicating an open circuit to a low resistance fault?**	
B7 CHECK DRIVER ADAPTIVE LOAD LIMITING RETRACTOR CIRCUITS FOR AN OPEN	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the jumper wire between driver adaptive load limiting retractor C323. • Disconnect: RCM C310a and C310b . • Measure resistance between RCM C310b-35, circuit CR146 (GY/VT), harness side and driver adaptive load limiting retractor C323-1, circuit CR146 (GY/VT), harness side.  • Measure resistance between RCM C310b-36, circuit RR146 (BU/BN), harness side and driver adaptive load limiting retractor C323-2, circuit RR146 (BU/BN), harness side.  • **Are resistances less than 0.5 ohm?**	**Yes** GO to B8 . **No** REPAIR circuit CR146 (GY/VT) or RR146 (BU/BN). GO to B26 .
B8 CHECK THE DRIVER ADAPTIVE LOAD LIMITING RETRACTOR FAULT PIDs	

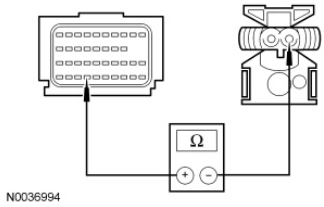


tomsn048@gmail.com

(1085_31_OD) AND (1085_29_OD) FOR A CHANGE IN FAULT STATUS	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Driver Adaptive Load Limiting Retractor C323 . • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record The Following Fault PIDs . ♦ 1085_31_OD (Seatbelt Load Limiter Driver Short to Ground) ♦ 1085_29_OD (Seatbelt Load Limiter Driver Open) • **DIAGNOSTIC TIP:** When viewing DTC B1085 on-demand fault PIDs with the driver adaptive load limiting retractor disconnected, an open circuit fault would normally be retrieved. • **Did the driver adaptive load limiting retractor on-demand fault PIDs change from indicating a short to ground to an open circuit fault?**	**Yes** GO to B20 . **No** GO to B9 .
B9 CHECK DRIVER ADAPTIVE LOAD LIMITING RETRACTOR CIRCUITS FOR A SHORT TO GROUND	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310a and C310b . • Measure resistance between driver adaptive load limiting retractor: ♦ C323-1, circuit CR146 (GY/VT), harness side and ground. ♦ C323-2, circuit RR146 (BN/BU), harness side and ground.	**Yes** GO to B21 . **No** REPAIR circuit CR146 (GY/VT) or RR146 (BN/BU). GO to B26 .

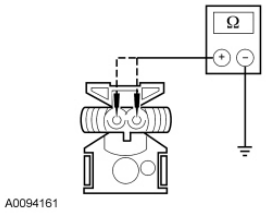
 • **Are resistances greater than 10,000 ohms?**	
B10 CHECK DRIVER ADAPTIVE LOAD LIMITING RETRACTOR CIRCUITS FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Driver Adaptive Load Limiting Retractor C323 . • Disconnect: RCM C310a and C310b . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Measure voltage between driver adaptive load limiting retractor: ♦ C323-1, circuit CR146 (GY/VT), harness side and ground. ♦ C323-2, circuit RR146 (BU/BN), harness side and ground.  • **Is voltage present on either circuit?**	**Yes** REPAIR circuit CR146 (GY/VT) or RR146 (BU/BN). GO to B26 . **No** GO to B21 .
B11 CHECK THE PASSENGER ADAPTIVE LOAD LIMITING RETRACTOR RESISTANCE PID (P_LOAD)	
• Enter the following diagnostic mode on the scan tool: DataLogger - RCM - PID . • Enter the following diagnostic mode on the scan tool: P_LOAD (Seatbelt Load Limiter Resistance, Passenger Side) Resistance PID . • **Does the resistance PID value read between 1.31 and 4.29 ohms?**	**Yes** GO to B21 . **No** GO to B12 .



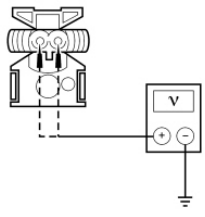


tomsn048@gmail.com

B12 CHECK THE PASSENGER ADAPTIVE LOAD LIMITING RETRACTOR RESISTANCE PID (P_LOAD) WHILE CARRYING OUT A HARNESS TEST	
• Continue monitoring the P_LOAD (Seatbelt Load Limiter Resistance, Passenger Side) resistance PID while carrying out a harness test of the passenger adaptive load limiting retractor circuits and accessible connectors (including any inline connectors), by wiggling connectors and flexing the wire harness. • **Does the resistance PID value read between 1.31 and 4.29 ohms while carrying out the harness test?**	**Yes** DEPOWER the SRS and REPAIR the connector, terminals or wire harness as needed. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to B26 . **No** If the passenger adaptive load limiting retractor resistance PID is less than 1.31 ohms, GO to B13 . If the passenger adaptive load limiting retractor resistance PID is greater than 4.29 ohms, GO to B15 .
B13 CHECK THE PASSENGER ADAPTIVE LOAD LIMITING RETRACTOR FAULT PIDs (1085_25_OD) AND (1085_24_OD) FOR A CHANGE IN FAULT STATUS	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Adaptive Load Limiting Retractor C303 . • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record The Following Fault PIDs . ♦ 1085_24_OD (Seatbelt Load Limiter Front Passenger Circuit Resist Low on Squib)	**Yes** GO to B20 . **No** GO to B14 .



♦ 1085_25_OD (Seatbelt Load Limiter Front Passenger Open) • **DIAGNOSTIC TIP:** When viewing DTC B1085 on-demand fault PIDs with the passenger adaptive load limiting retractor disconnected, an open circuit fault would normally be retrieved. • **Did the passenger adaptive load limiting retractor on-demand fault PIDs change from indicating a low resistance to an open circuit fault?**	
B14 CHECK FOR A SHORT BETWEEN PASSENGER ADAPTIVE LOAD LIMITING RETRACTOR CIRCUITS	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310a and C310b . • Measure resistance between passenger adaptive load limiting retractor C303-1, circuit CR147 (GN/OG), harness side and C303-2, circuit RR147 (YE/VT), harness side.  A0030495 • **Is resistance greater than 10,000 ohms?**	**Yes** GO to B21 . **No** REPAIR circuits CR147 (GN/OG) and RR147 (YE/VT). GO to B26 .
B15 CHECK THE PASSENGER ADAPTIVE LOAD LIMITING RETRACTOR FAULT PIDs (1085_25_OD) AND (1085_24_OD) FOR A CHANGE IN FAULT STATUS	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Adaptive Load Limiting Retractor C303 .	**Yes** GO to B20 . **No** GO to B16 .



tomsn048@gmail.com

• Connect a fused jumper wire between passenger adaptive load limiting retractor C303-1, circuit CR147 (GN/OG), harness side and C303-2, circuit RR147 (YE/VT), harness side. • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record The Following Fault PIDs . ♦ 1085_24_OD (Seatbelt Load Limiter Front Passenger Circuit Resist Low on Squib) ♦ 1085_25_OD (Seatbelt Load Limiter Front Passenger Open) • **DIAGNOSTIC TIP:** When viewing DTC B1085 on-demand fault PIDs with the passenger adaptive load limiting retractor circuits shorted together, a low resistance fault would normally be retrieved. • **Did the passenger adaptive load limiting retractor on-demand fault PIDs change from indicating an open circuit to a low resistance fault?**	
B16 CHECK PASSENGER ADAPTIVE LOAD LIMITING RETRACTOR CIRCUITS FOR AN OPEN	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the jumper wire from passenger adaptive load limiting retractor C303. • Disconnect: RCM C310a and C310b . • Measure resistance between RCM C310b-38, circuit CR147 (GN/OG), harness side and passenger adaptive load limiting retractor C303-1, circuit CR147 (GN/OG), harness side.	**Yes** GO to B21 . **No** REPAIR circuit RR147 (YE/VT) or RR147 (YE/VT). GO to B26 .

 N0036995 • Measure resistance between RCM C310b-37, circuit RR147 (YE/VT), harness side and passenger adaptive load limiting retractor C303-2, circuit RR147 (YE/VT), harness side.  N0036994 • **Are resistances less than 0.5 ohm?**	
B17 CHECK THE PASSENGER ADAPTIVE LOAD LIMITING RETRACTOR FAULT PIDs (1085_27_OD) AND (1085_25_OD) FOR A CHANGE IN FAULT STATUS	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Adaptive Load Limiting Retractor C303 . • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record The Following Fault PIDs . ♦ 1085_27_OD (Seatbelt Load Limiter Front Passenger Short to Ground) ♦ 1085_25_OD (Seatbelt Load Limiter Front Passenger Open)	**Yes** GO to B20 . **No** GO to B18 .

tomsn048@gmail.com

• **DIAGNOSTIC TIP:** When viewing DTC B1085 on-demand fault PIDs with the passenger adaptive load limiting retractor disconnected, an open circuit fault would normally be retrieved. • **Did the passenger adaptive load limiting retractor on-demand fault PIDs change from indicating a short to ground to an open circuit fault?**	
B18 CHECK PASSENGER ADAPTIVE LOAD LIMITING RETRACTOR CIRCUITS FOR A SHORT TO GROUND	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310a and C310b . • Measure resistance between passenger adaptive load limiting retractor: ♦ C303-2, circuit RR147 (YE/VT), harness side and ground. ♦ C303-1, circuit CR147 (GN/OG), harness side and ground.  A0094161 • **Are resistances greater than 10,000 ohms?**	**Yes** GO to B21 . **No** REPAIR circuit RR147 (YE/VT) or CR147 (GN/OG). GO to B26 .
B19 CHECK PASSENGER ADAPTIVE LOAD LIMITING RETRACTOR CIRCUITS FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Adaptive Load Limiting Retractor C303 . • Disconnect: RCM C310a and C310b . • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Measure voltage between passenger adaptive load limiting retractor: ♦ C303-2, circuit RR147 (YE/VT), harness side and ground.	**Yes** REPAIR circuit RR147 (YE/VT) or CR147 (GN/OG). GO to B26 . **No** GO to B21 .

♦ C303-1, circuit CR147 (GN/OG), harness side and ground.  • **Is voltage present on either circuit?**	
B20 CONFIRM THE ADAPTIVE LOAD LIMITING RETRACTOR FAULT	
NOTE: Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, DTCs will be recorded. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Connect: Affected Adaptive Load Limiting Retractor C323 (Driver) C303 (Passenger) . • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record All 1085 Fault PIDs . ♦ Refer to PID list in Normal Operation to view 1085 fault PIDs. • **Does the original RCM on-demand 1085 fault PID indicate a fault?**	**Yes** INSTALL a new driver or passenger adaptive load limiting retractor. REFER to Section 501-20A . GO to B26 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. Using the fault PIDs recorded, GO to the appropriate pinpoint test step and CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. For 1085_28_CM (Seatbelt Load Limiter Driver Circuit Resist Low on Squib), 1085_24_CM (Seatbelt Load Limiter Front Passenger Circuit Resist Low on Squib), 1085_29_CM (Seatbelt Load Limiter Driver Open) and 1085_25_CM (Seatbelt Load Limiter Front Passenger Open), GO to B22 . For 1085_31_CM (Seatbelt Load Limiter Driver Short to Ground) and 1085_27_CM (Seatbelt Load Limiter Front Passenger Short to Ground), GO to B24 . For 1085_30_CM (Seatbelt Load Limiter Driver Short to Battery) and 1085_26_CM (Seatbelt Load Limiter Front Passenger Short to Battery), GO to B25 .
B21 CONFIRM THE RCM FAULT	
NOTE: Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, DTCs will be recorded. • Ignition OFF.	**Yes** INSTALL a new RCM . REFER to Restraints Control Module (RCM) in this section. GO to B26 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. Using the

tomsn048@gmail.com

• Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Connect: All Restraint System Components (if previously disconnected) . • Connect: RCM C310a and C310b (if previously disconnected) . • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record All 1085 Fault PIDs . ♦ Refer to PID list in Normal Operation to view 1085 fault PIDs. • **Does the original RCM on-demand 1085 fault PID indicate a fault?**	fault PIDs recorded, GO to the appropriate pinpoint test step and CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. For 1085_28_CM (Seatbelt Load Limiter Driver Circuit Resist Low on Squib), 1085_24_CM (Seatbelt Load Limiter Front Passenger Circuit Resist Low on Squib), 1085_29_CM (Seatbelt Load Limiter Driver Open) and 1085_25_CM (Seatbelt Load Limiter Front Passenger Open), GO to B22 . For 1085_31_CM (Seatbelt Load Limiter Driver Short to Ground) and 1085_27_CM (Seatbelt Load Limiter Front Passenger Short to Ground), GO to B24 . For 1085_30_CM (Seatbelt Load Limiter Driver Short to Battery) and 1085_26_CM (Seatbelt Load Limiter Front Passenger Short to Battery), GO to B25 .
B22 CHECK ADAPTIVE LOAD LIMITING RETRACTOR PRETENSIONER RESISTANCE PIDs FOR AN INTERMITTENT LOW RESISTANCE OR OPEN	
• If the fault was reported for the driver adaptive load limiting retractor, monitor the D_LOAD (Seatbelt Load Limiter Resistance, Driver Side) resistance PID. • If the fault was reported for the passenger adaptive load limiting retractor, monitor the P_LOAD (Seatbelt Load Limiter Resistance, Passenger Side) pretensioner resistance PID. • **NOTE:** A resistance PID that reads between 0.9 and 1.31 ohms or between 4.29 and 5 ohms may or may not set an on-demand DTC yet indicates a strong potential of an intermittent fault condition. Make sure to thoroughly check wire harness(es), connectors and terminals as they are the likely source of the fault condition. • Attempt to recreate the fault by wiggling the connectors (including any inline connectors) and flexing the wire harness. • **Does any adaptive load limiting retractor resistance PID indicate less than 1.31 ohms or greater than 4.29 ohms?**	**Yes** DEPOWER the SRS and REPAIR as necessary. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to B26 . **No** GO to B23 .
B23 CHECK THE HARNESS AND CONNECTORS	

• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect the affected adaptive load limiting retractor C323 (driver) or C303 (passenger): ♦ inspect connector(s) (including any inline connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals. ♦ inspect wire harness for any damage, pinched, cut or pierced wires. • **Were any concerns found?**	**Yes** REPAIR as necessary. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to B26 . **No** The fault is not present and cannot be recreated at this time. CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition frequently. ACTIVATE other systems in the same wire harness. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. GO to B26 .
B24 CHECK ADAPTIVE LOAD LIMITING RETRACTOR FAULT PIDs FOR AN INTERMITTENT SHORT TO GROUND	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - PID . • If the fault was reported for the driver adaptive load limiting retractor, monitor the 1085_31_OD (Seatbelt Load Limiter Driver Short to Ground) on-demand fault PID on the scan tool. • If the fault was reported for the passenger adaptive load limiting retractor, monitor the 1085_27_OD (Seatbelt Load Limiter Front Passenger Short to Ground) on-demand fault PID on the scan tool. • **DIAGNOSTIC TIP:** When monitoring fault PIDs with the scan tool, it may take up to 2 seconds for the scan tool display to update. • Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness. • **Does any adaptive load limiting retractor on-demand fault PID indicate a fault is present?**	**Yes** DEPOWER the SRS and REPAIR as necessary. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to B26 . **No** The fault is not present and cannot be recreated at this time. CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition frequently. ACTIVATE other systems in the same wire harness. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. GO to B26 .
B25 CHECK ADAPTIVE LOAD LIMITING RETRACTOR FAULT PIDs FOR AN INTERMITTENT SHORT TO VOLTAGE	

tomsn048@gmail.com

• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect the side air bag module electrical connector C3049 (driver) or C3050 (passenger) on the side with the affected pretensioner. • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • If the fault was reported for the driver adaptive load limiting retractor , monitor the 1085_30_OD (Seatbelt Load Limiter Driver Short to Battery) on-demand fault PID. • If the fault was reported for the passenger adaptive load limiting retractor, monitor the 1085_26_OD (Seatbelt Load Limiter Front Passenger Short to Battery) on-demand fault PID. • **DIAGNOSTIC TIP:** When monitoring fault PIDs with the scan tool, it may take up to 2 seconds for the scan tool display to update. • Attempt to recreate the fault by wiggling the connectors (including any inline connectors) and flexing the wire harness. • **Does the adaptive load limiting retractor short to battery on-demand fault PID indicate a fault is present?**	**Yes** DEPOWER the SRS and REPAIR as necessary. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to B26 . **No** The fault is not present and cannot be recreated at this time. CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition frequently. ACTIVATE other systems in the same wire harness. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. GO to B26 .
B26 CHECK FOR ADDITIONAL SRS DTCs	
• Ignition OFF. • ⚠ **WARNING: Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.** • Reconnect all SRS components (if previously disconnected). • If previously directed to depower the SRS , repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - Restraints . • **Are any RCM and/or OCSM DTCs indicating a fault?**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the DTC Charts in this section for pinpoint test direction. **No** CLEAR all RCM and OCSM CMDTCs . PROVE OUT the SRS . Repair is complete. RETURN the vehicle to the customer.

Pinpoint Test C: DTC B1118

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

Normal Operation

The Restraints Control Module (RCM) checks the passenger front crash sensor for faults. If the RCM detects a fault on any of the passenger front crash sensor circuits, it will store DTC B1118 in memory and send a message to the Instrument Cluster (IC) module to illuminate the air bag warning indicator.

- DTC B1118 (Passenger Front Crash Sensor Mount/Communication Fault) - When the RCM is unable to communicate with the passenger front crash sensor, a fault will be indicated.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Impact severity sensor
- Incorrect sensor mounting
- RCM

PINPOINT TEST C: DTC B1118

⚠ WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the Safety Canopy® and cause serious personal injury or death.

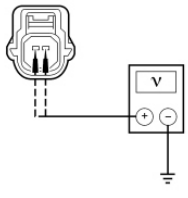
⚠ WARNING: Always tighten the fasteners of the restraints control module (RCM) and impact sensor (if equipped) to the specified torque. Failure to do so may result in incorrect restraint system operation, which increases the risk of personal injury or death in a crash.

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: SRS components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

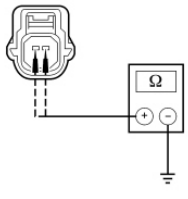


Test Step	Result / Action to Take
C1 RETRIEVE RCM DTCs	
• Enter the following diagnostic mode on the scan tool: Self Test - RCM . • **Was DTC B1118 retrieved on-demand during self-test?**	**Yes** The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to C2 . **No** This is an intermittent fault when present as a

tomsn048@gmail.com

	CMDTC only. The fault condition is not present at this time. GO to C12 .
C2 INSPECT THE PASSENGER FRONT CRASH SENSOR MOUNTING AND MOUNTING SURFACE	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Inspect the passenger front crash sensor mounting and make sure that the retaining bolt is fully seated and tightened correctly. • Remove the passenger front crash sensor. Refer to Front Impact Severity Sensor in this section. • Inspect the passenger front crash sensor and mounting surface for damage, corrosion or dirt. • **Was a significant amount of corrosion or dirt found, the passenger front crash sensor attached to the mounting surface incorrectly or was the passenger front crash sensor bolt not fully seated and tightened correctly?**	**Yes** CLEAN and TIGHTEN bolt or REPAIR the mounting surface as necessary. REINSTALL the passenger front crash sensor. GO to C13 . **No** GO to C3 .
C3 INSTALL THE PASSENGER FRONT CRASH SENSOR AND CARRY OUT THE SELF TEST	
• Clean the passenger front crash sensor mounting bolt and mounting surface as necessary. • Install the passenger front crash sensor. Refer to Front Impact Severity Sensor in this section. • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • **Was DTC B1118 retrieved on-demand during self-test?**	**Yes** GO to C4 . **No** Fault corrected. GO to C13 .
C4 CHECK THE PASSENGER FRONT CRASH SENSOR GROUND CIRCUIT FOR HIGH RESISTANCE	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Front Crash Sensor C1466 .	**Yes** GO to C6 . **No** GO to C5 .

• Measure resistance between passenger front crash sensor C1466-2, circuit RR130 (GN/BU), harness side and the passenger front crash sensor case ground. • **Is resistance less than 10 ohms?**	
C5 CLEAN THE PASSENGER FRONT CRASH SENSOR MOUNTING SURFACE AND CARRY OUT THE SELF TEST	
• Remove the passenger front crash sensor. Refer to Front Impact Severity Sensor in this section. • Clean and repair the mounting surface as necessary. • Clean the passenger front crash sensor mounting bolt. • Install the passenger front crash sensor. Refer to Front Impact Severity Sensor in this section. • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • **Was DTC B1118 retrieved on-demand during self-test?**	**Yes** GO to C6 . **No** Fault corrected. GO to C13 .
C6 CHECK PASSENGER FRONT CRASH SENSOR CIRCUITS FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Front Crash Sensor C1466 . • Disconnect: RCM C310a and C310b . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Measure voltage between passenger front crash sensor: ♦ C1466-1, circuit VR214 (WH/BU), harness side and ground. ♦ C1466-2, circuit RR130 (GN/BU), harness side and ground.	**Yes** REPAIR circuit VR214 (WH/BU) or RR130 (GN/BU). GO to C13 . **No** GO to C7 .



tomsn048@gmail.com

- **Is voltage present on either circuit?**

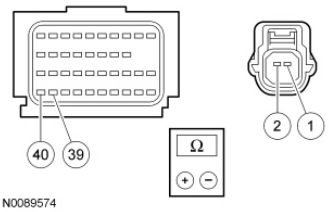
C7 CHECK PASSENGER FRONT CRASH SENSOR CIRCUITS FOR A SHORT TO GROUND

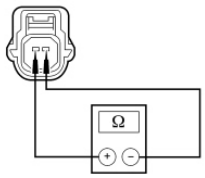
- Ignition OFF.
- Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
- Measure resistance between passenger front crash sensor:
  - C1466-1, circuit VR214 (WH/BU), harness side and ground.
  - C1466-2, circuit RR130 (GN/BU), harness side and ground.

- **Are resistances greater than 10,000 ohms?**

Yes
GO to C8 .

No
REPAIR circuit VR214 (WH/BU) or RR130 (GN/BU). GO to C13 .





C8 CHECK PASSENGER FRONT CRASH SENSOR CIRCUITS FOR AN OPEN

- Measure resistance between RCM C310b, harness side and passenger front crash sensor C1466, harness side using the following chart.

RCM	Circuit	Passenger Front Crash Sensor
C310b-39	VR214 (WH/BU)	C1466-1
C310b-40	RR130 (GN/BU)	C1466-2

Yes
GO to C9 .

No
REPAIR circuit VR214 (WH/BU) or RR130 (GN/BU). GO to C13 .

 N0089574 • **Is resistance less than 0.5 ohm?**	
C9 CHECK FOR A SHORT BETWEEN PASSENGER FRONT CRASH SENSOR CIRCUITS	
• Measure resistance between passenger front crash sensor C1466-1, circuit VR214 (WH/BU), harness side and C1466-2, circuit RR130 (GN/BU), harness side.  N0036987 • **Is resistance greater than 10,000 ohms?**	**Yes** GO to C10 . **No** REPAIR circuits VR214 (WH/BU) and RR130 (GN/BU). GO to C13 .
C10 CHECK THE PASSENGER FRONT CRASH SENSOR	
• Connect: RCM C310a and C310b . • Install a known good passenger front crash sensor. • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • **Was on-demand DTC B1118 retrieved on-demand during self-test?**	**Yes** GO to C11 . **No** Fault corrected. GO to C13 .
C11 CONFIRM THE RCM FAULT	
NOTE: Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, DTCs will be recorded. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.	**Yes** INSTALL a new RCM . REFER to Restraints Control Module (RCM) in this section. GO to C13 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. ATTEMPT to recreate the hard

tomsn048@gmail.com

• Install the original passenger front crash sensor. • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • **Was DTC B1118 retrieved on-demand during self-test?**	fault by flexing the wire harness and cycling the ignition frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. GO to C13 .
C12 CHECK FOR AN INTERMITTENT FAULT	
• Enter the following diagnostic mode on the scan tool: Self Test - RCM . • **Was on-demand DTC B1118 retrieved on-demand during self-test?**	**Yes** The fault condition is now present. The fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to C2 . **No** INSPECT the impact sensor mounting surface for damage, corrosion or dirt. INSPECT the wiring, terminals and connectors for damage, corrosion or dirt. CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition frequently. ACTIVATE other systems in the same wire harness. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. GO to C13 .
C13 CHECK FOR ADDITIONAL SRS DTCs	
• Ignition OFF. • ⚠ **WARNING: Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.** • Reconnect all SRS components (if previously disconnected). • If previously directed to depower the SRS , repower the SRS . **Do not** prove out the SRS at this time. GO to the DTC Charts in this section for pinpoint test direction. **No** CLEAR all RCM and OCSM CMDTCs . PROVE OUT the SRS . Repair is complete. RETURN the vehicle to the customer.

Pinpoint Test D: DTC B1884

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

Normal Operation

When the ignition is in the ON position, the Passenger Air Bag Deactivation (PAD) indicator prove-out period is initiated by the Restraints Control Module (RCM). The RCM briefly activates the PAD indicator to verify to the occupants correct functional operation of the PAD indicator. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.

If the RCM detects an open or short to ground on the PAD indicator circuit, it will store DTC B1884 in memory and send a message to the Instrument Cluster (IC) module to illuminate the air bag warning indicator.

- DTC B1884 (PAD Warning Lamp Circuit Failure) - If the RCM detects an open circuit or short to ground on the PAD indicator circuit, it will set this DTC.

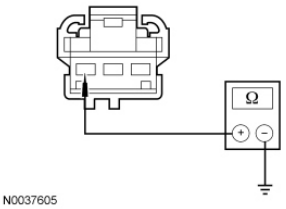
This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- Passenger Air Bag Deactivation (PAD) indicator
- RCM

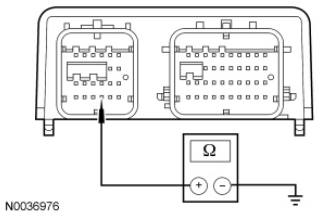
PINPOINT TEST D: DTC B1884

⚠ WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the Safety Canopy® and cause serious personal injury or death.

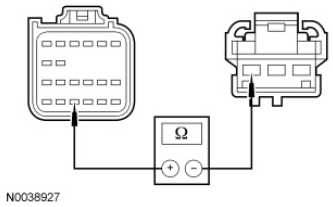
⚠ WARNING: Always tighten the fasteners of the restraints control module (RCM) and impact sensor (if equipped) to the specified torque. Failure to do so may result in incorrect restraint system operation, which increases the risk of personal injury or death in a crash.

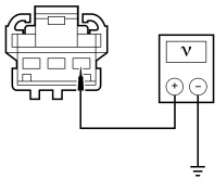
NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.**





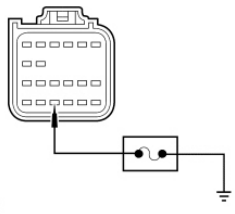
Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.





NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: SRS components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .



Test Step	Result / Action to Take
D1 RETRIEVE RCM DTCs	
• Enter the following diagnostic mode on the scan tool: Self Test - RCM .	**Yes** If the PAD indicator **does** illuminate, GO to D2 . If the PAD indicator **does not** illuminate, GO to D4 .

tomsn048@gmail.com

• **Was DTC B1884 retrieved on-demand during self-test?**	**No** This is an intermittent fault when present as a CMDTC only. The fault condition is not present at this time. GO to D8 .
D2 CHECK CIRCUIT CR116 (GN/WH) FOR SHORT TO GROUND	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: PAD Indicator C2286 . • Measure resistance between PAD indicator C2286-3, circuit CR116 (GN/WH), harness side and ground.  N0037605 • **Is resistance greater than 10,000 ohms?**	**Yes** GO to D7 . **No** GO to D3 .
D3 CHECK THE RCM FOR LOW RESISTANCE	
• Disconnect: RCM C310a and C310b . • Measure resistance between RCM C310a pin 22, component side and ground.  N0036976 • **Is resistance greater than 10,000 ohms?**	**Yes** REPAIR circuit CR116 (GN/WH). GO to D9 . **No** GO to D7 .
D4 CHECK PAD INDICATOR CIRCUIT FOR AN OPEN	

• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310a and C310b . • Disconnect: PAD Indicator C2286 . • Measure resistance between PAD indicator C2286-3, circuit CR116 (GN/WH), harness side and RCM C310a-22, circuit CR116 (GN/WH), harness side.  N0038927 • **Is resistance less than 0.5 ohm?**	**Yes** GO to D5 . **No** REPAIR circuit CR116 (GN/WH). GO to D9 .
D5 CHECK PAD IGNITION CIRCUIT FOR VOLTAGE	
• Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Measure voltage between PAD indicator C2286-1, circuit CBP17 (BN/GN), harness side and ground.  N0005022 • **Is voltage greater than 10 volts?**	**Yes** GO to D6 . **No** REPAIR circuit CBP17 (BN/GN). GO to D9 .
D6 CHECK THE PAD INDICATOR	
• Ignition OFF. • Deactivate the SRS . Refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.	**Yes** GO to D7 . **No** INSTALL a new PAD indicator. REFER to Passenger Air Bag Deactivation (PAD) Indicator in this section. GO to

tomsn048@gmail.com

• Connect: PAD Indicator C2286 . • Ignition ON. • Connect a fused jumper wire between RCM C310a-22, circuit CR116 (GN/WH), harness side and ground.  N0036974 • **Does the PAD indicator illuminate?**	D9 .
D7 CONFIRM THE RCM FAULT	
NOTE: Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, DTCs will be recorded. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Connect: PAD Indicator C2286 (if disconnected in prior step) . • Connect: RCM C310a and C310b (if disconnected in prior step) . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • **Was on-demand DTC B1884 retrieved on-demand during self-test?**	**Yes** INSTALL a new RCM . REFER to Restraints Control Module (RCM) in this section. GO to D9 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. GO to D9 .
D8 CHECK FOR AN INTERMITTENT FAULT	
• Enter the following diagnostic mode on the scan tool: Self Test - RCM . • **Was DTC B1884 retrieved on-demand during self-test?**	**Yes** The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to D2 . **No**

	The fault is not present and cannot be recreated at this time. CHECK for causes of intermittent open or short to ground on circuit CR116 (GN/WH). ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition frequently. ACTIVATE other systems in the same wire harness. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. GO to D9 .
D9 CHECK FOR ADDITIONAL SRS DTCs	
• Ignition OFF. • ⚠ **WARNING: Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.** • Reconnect all SRS components (if previously disconnected). • If previously directed to depower the SRS , repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • If previously directed to deactivate the SRS , reactivate the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - Restraints . • **Are any RCM and/or OCSM DTCs indicating a fault?**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the DTC Charts in this section for pinpoint test direction. **No** CLEAR all RCM and OCSM CMDTCs . PROVE OUT the SRS . Repair is complete. RETURN the vehicle to the customer.

Pinpoint Test E: DTC B1890

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

Normal Operation

When the ignition is in the ON position, the Passenger Air Bag Deactivation (PAD) indicator prove-out period is initiated by the Restraints Control Module (RCM). The RCM briefly activates the PAD indicator to verify to the occupants correct functional operation of the PAD indicator. Refer to Air Bag and Safety Belt

tomsn048@gmail.com

Pretensioner Supplemental Restraint System (SRS) in this section.

During the PAD prove-out period, if the RCM detects a short to battery on the PAD indicator circuit, it will store DTC B1890 in memory and send a message to the Instrument Cluster (IC) module to illuminate the air bag warning indicator.

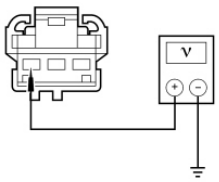
- DTC B1890 (PAD Warning Lamp Circuit Short to Battery) - If the RCM detects a short to battery on the PAD indicator circuit, it will set this DTC.

This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- PAD indicator
- RCM

PINPOINT TEST E: DTC B1890

⚠ WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the Safety Canopy® and cause serious personal injury or death.

⚠ WARNING: Always tighten the fasteners of the restraints control module (RCM) and impact sensor (if equipped) to the specified torque. Failure to do so may result in incorrect restraint system operation, which increases the risk of personal injury or death in a crash.



NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: SRS components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

Test Step	Result / Action to Take
E1 RETRIEVE RCM DTCs	
• Enter the following diagnostic mode on the scan tool: Self Test - RCM . • **Was DTC B1890 retrieved on-demand during self-test?**	**Yes** GO to E2 . **No** This is an intermittent fault when present as a CMDTC only. The fault condition is not present at this time. GO to E4 .
E2 CHECK PAD INDICATOR CIRCUIT FOR A SHORT TO VOLTAGE	

• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: PAD Indicator C2286 . • Disconnect: RCM C310a and C310b . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Measure voltage between PAD indicator C2286-3, circuit CR116 (GN/WH), harness side and ground.  N0005019 • **Is any voltage present?**	**Yes** REPAIR circuit CR116 (GN/WH). GO to E5 . **No** GO to E3 .
E3 CHECK THE RCM	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Connect: RCM C310a and C310b . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • **NOTE:** DTC B1884 should be retrieved when carrying out the on-demand self test due to an open on circuit CR116 (GN/WH). DTC B1890 should not be retrieved at this time. • **Was DTC B1890 retrieved on-demand during self-test?**	**Yes** INSTALL a new RCM . REFER to Restraints Control Module (RCM) in this section. GO to E5 . **No** INSTALL a new PAD indicator. GO to E5 .
E4 CHECK FOR AN INTERMITTENT FAULT	
• Enter the following diagnostic mode on the scan tool: Self Test - RCM . • **Was on-demand DTC B1890 retrieved on-demand during self-test?**	**Yes** The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to E2 .

tomsn048@gmail.com

	No The fault is not present and cannot be recreated at this time. CHECK for causes of intermittent short to battery on circuit CR116 (GN/WH). ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition frequently. ACTIVATE other systems in the same wire harness. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. GO to E5 .
E5 CHECK FOR ADDITIONAL SRS DTCs	
• Ignition OFF. • ⚠ **WARNING: Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.** • Reconnect all SRS components (if previously disconnected). • If previously directed to depower the SRS , repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - Restraints . • **Are any RCM and/or OCSM DTCs indicating a fault?**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the DTC Charts in this section for pinpoint test direction. **No** CLEAR all RCM and OCSM CMDTCs . PROVE OUT the SRS . Repair is complete. RETURN the vehicle to the customer.

Pinpoint Test F: DTC B2290

NOTE: DTC B2290 reported by the Restraints Control Module (RCM) is informational only and indicates the presence of a fault in the Occupant Classification System Module (OCSM). Refer to the DTC Charts when DTC B2290 is reported by the RCM for diagnostic instructions.

NOTE: The following pinpoint test must only be used to diagnose DTC B2290 when reported by the OCSM .

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

Normal Operation

The Occupant Classification System (OCS) system is used to classify the front passenger seat occupant in the event of a deployable impact. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.

The OCSM monitors the 2 OCS rails (weight sensors) and circuity for faults. If the OCSM detects a fault with the sensor(s) or circuitry, it will store DTC B2290 in memory and send a message to the RCM which sends a message to the Instrument Cluster (IC) module to illuminate the air bag indicator.

Fault PIDs [a]	Description	Fault Trigger Condition
2290_8_OD and 2290_8_CM	Passenger Seat Occupant Classification System (OCS) Sensor No.2 Circuit Short to Battery	When the Occupant Classification System Module (OCSM) senses a short to voltage on either one of sensor 2 circuits, a fault will be indicated.
2290_9_OD and 2290_9_CM	Passenger Seat OCS Sensor No.2 Circuit Short to Ground	When the OCSM senses a short to ground on either one of sensor 1 circuits, a fault will be indicated.
2290_10_OD and 2290_10_CM	Passenger Seat OCS Sensor No.2 Comm. Fault / Open	When the OCSM is unable to communicate with sensor 2 or senses an open circuit, a fault will be indicated.
2290_11_OD and 2290_11_CM	Passenger Seat OCS Sensor No.2 Internal Fault	When the OCSM senses a internal failure with sensor 2, a fault will be indicated.
2290_12_OD and 2290_12_CM	Passenger Seat OCS Sensor No.1 Circuit Short to Battery	When the OCSM senses a short to voltage on either one of sensor 2 circuits, a fault will be indicated.
2290_13_OD and 2290_13_CM	Passenger Seat OCS Sensor No.1 Circuit Short to Ground	When the OCSM senses a short to ground on either one of sensor 2 circuits, a fault will be indicated.
2290_14_OD and 2290_14_CM	Passenger Seat OCS Sensor No.1 Comm. Fault/Open	When the OCSM is unable to communicate with sensor 1 or senses an open circuit, a fault will be indicated.
2290_15_OD and 2290_15_CM	Passenger Seat OCS Sensor No.1 Internal Fault	When the OCSM is unable to communicate with sensor 1 or senses an open circuit, a fault will be indicated.

[a] Fault PIDs that end in OD indicate an on-demand status and are associated with on-demand DTC B2290. Fault PIDs that end in CM indicate continuous memory status and are associated with continuous DTC B2290.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- OCS system component

PINPOINT TEST F: DTC B2290

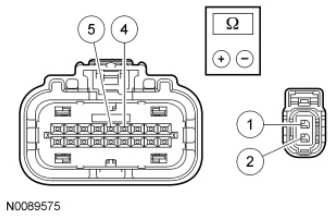
⚠ WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the Safety Canopy® and cause serious personal injury or death.

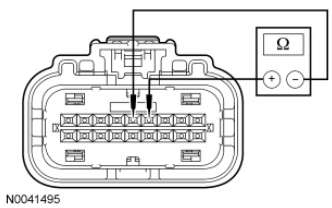
⚠ WARNING: Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

⚠ WARNING: Never disassemble or tamper with safety belt buckle/retractor pretensioners, adaptive load limiting retractors, safety belt inflators, or probe the electrical connectors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners, adaptive load

tomsn048@gmail.com

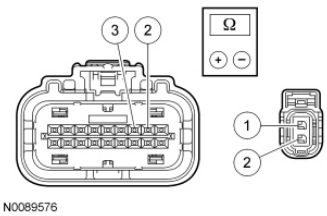
limiting retractors, or safety belt inflators, which increases the risk of serious personal injury or death.



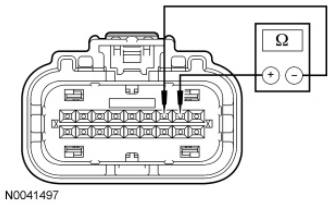


NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.



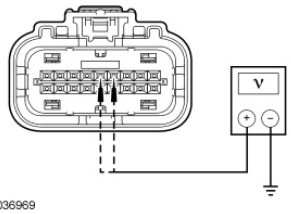
NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

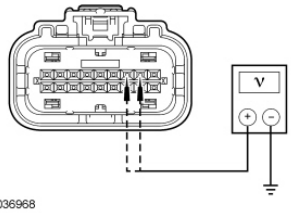


NOTE: SRS components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

Test Step	Result / Action to Take
F1 RETRIEVE OCSM DTCs	
• Enter the following diagnostic mode on the scan tool: Self Test - OCSM . • Enter the following diagnostic mode on the scan tool: DataLogger - OCSM - View and Record All 2290 Fault PIDs . ♦ Refer to PID list in Normal Operation to view 2290 fault PIDs. • **Do any OCSM on-demand 2290 fault PIDs indicate a fault?**	**Yes** The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to F2 . **No** This is an intermittent fault when present as a CMDTC only. The fault condition is not present at this time. GO to F14 .
F2 CHECK THE SEAT WIRING AND CONNECTORS	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Carry out a thorough visual inspection of the OCS system wiring, terminals and connectors and the related seat wiring harness and body wiring harness terminals and connectors. • **Were any problems noted?**	**Yes** REPAIR the seat connectors and wiring as needed. GO to F15 . **No** Using the fault PIDs recorded in Step F1, GO to the appropriate pinpoint test step. For 2290_15_OD (Passenger Seat OCS Sensor No.1 Internal Fault) (inboard) or 2290_11_OD (Passenger Seat OCS Sensor No.2 Internal Fault) (outboard), INSTALL a new OCS rail. REFER to Occupant Classification Sensor in this section. For 2290_14_OD (Passenger Seat OCS Sensor No.1 Comm. Fault/Open) (inboard), GO to F3 . For 2290_10_OD (Passenger Seat OCS Sensor No.2 Comm. Fault / Open) (outboard), GO to F6 . For 2290_13_OD (Passenger Seat OCS Sensor No.1 Circuit Short to Ground) (inboard), GO to F9 . For 2290_9_OD (Passenger Seat OCS Sensor No.2

	Circuit Short to Ground) (outboard), GO to F10 . For 2290_12_OD (Passenger Seat OCS Sensor No.1 Circuit Short to Battery) (inboard), GO to F11 . For 2290_8_OD (Passenger Seat OCS Sensor No.2 Circuit Short to Battery) (outboard), GO to F12 .
F3 CHECK OCS RAIL 1 CIRCUITS FOR AN OPEN	
• Disconnect: OCSM C3159 . • Disconnect: OCS Rail 1 C3291 . • Measure resistance between OCSM C3285, harness side and OCS rail 1, harness side using the following chart. **OCSM / Circuit / OCS Rail 1** C3159-4 / VR211 (WH/BN) / C3291-2 C3159-5 / RR140 (GN/OG) / C3291-1  N0089575 • **Are resistances less than 0.5 ohm?**	**Yes** GO to F4 . **No** REPAIR circuit VR211 (WH/BN) or RR140 (GN/OG). GO to F15 .
F4 CHECK FOR A SHORT BETWEEN OCS RAIL 1 CIRCUITS	
• Measure resistance between OCSM C3159-4, circuit VR211 (WH/BN), harness side and OCSM C3159-5, circuit RR140 (GN/OG), harness side.  N0041495 • **Is resistance greater than 10,000 ohms?**	**Yes** GO to F5 . **No** REPAIR circuits VR211 (WH/BN) and RR140 (GN/OG). GO to F15 .
F5 CHECK THE OCSM	





tomsn048@gmail.com

• Install a known good OCS rail. Refer to Occupant Classification Sensor in this section. • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Carry out the OCS System Reset procedure. Refer to Occupant Classification Sensor (OCS) System Reset in this section. • Ignition OFF. • **NOTE:** The ignition switch must be cycled after Zero Seat Weight Test and/or the System Reset procedure. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - OCSM . • Enter the following diagnostic mode on the scan tool: DataLogger - OCSM - View and Record All 2290 Fault PIDs . ♦ Refer to PID list in Normal Operation to view 2290 fault PIDs. • **Do any OCSM on-demand 2290 fault PIDs indicate a fault?**	**Yes** INSTALL a new OCSM . REFER to Occupant Classification System Module (OCSM) in this section. GO to F15 . **No** Fault corrected. GO to F15 .
F6 CHECK OCS RAIL 2 CIRCUITS FOR AN OPEN	
• Disconnect: OCSM C3159 . • Disconnect: OCS Rail 2 C3292 . • Measure resistance between OCSM C3285, harness side and OCS rail 2 C3292, harness side using the following chart. **OCSM / Circuit / OCS Rail 2** C3159-2 / VR212 (YE/GN) / C3292-2 C3159-3 / RR141 (VT/BN) / C3292-1  N0089576 • **Are resistances less than 0.5 ohm?**	**Yes** GO to F7 . **No** REPAIR circuit VR212 (YE/GN) or RR141 (VT/BN). GO to F15 .

F7 CHECK FOR A SHORT BETWEEN OCS RAIL 2 CIRCUITS	
• Measure resistance between OCSM C3159-2, circuit VR212 (YE/GN), harness side and OCSM C3159-3, circuit RR141 (VT/BN), harness side.  • **Is resistance greater than 10,000 ohms?**	**Yes** GO to F8 . **No** REPAIR circuits VR212 (YE/GN) and RR141 (VT/BN). GO to F15 .
F8 CHECK THE OCSM	
• Install a known good OCS rail. Refer to Occupant Classification Sensor in this section. • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Carry out the OCS System Reset procedure. Refer to Occupant Classification Sensor (OCS) System Reset in this section. • Ignition OFF. • **NOTE:** The ignition switch must be cycled after Zero Seat Weight Test and/or the System Reset procedure. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - OCSM . • Enter the following diagnostic mode on the scan tool: DataLogger - OCSM - View and Record All 2290 Fault PIDs . ♦ Refer to PID list in Normal Operation to view 2290 fault PIDs. • **Do any OCSM on-demand 2290 fault PIDs indicate a fault?**	**Yes** INSTALL a new OCSM . REFER to Occupant Classification System Module (OCSM) in this section. GO to F15 . **No** Fault corrected. GO to F15 .
F9 CHECK OCS RAIL 1 CIRCUITS FOR A SHORT TO GROUND	

tomsn048@gmail.com

• Disconnect: OCSM C3159 . • Measure resistance between: ♦ OCSM C3159-4, circuit VR211 (WH/BN), harness side and ground. ♦ OCSM C3159-5, circuit RR140 (GN/OG), harness side and ground.  • **Are resistances greater than 10,000 ohms?**	**Yes** GO to F13 . **No** REPAIR circuit VR211 (WH/BN) or RR140 (GN/OG). GO to F15 .
F10 CHECK OCS RAIL 2 CIRCUITS FOR A SHORT TO GROUND	
• Disconnect: OCSM C3159 . • Measure resistance between: ♦ OCSM C3159-2, circuit VR212 (YE/GN), harness side and ground. ♦ OCSM C3159-3, circuit RR141 (VT/BN), harness side and ground.  • **Are resistances greater than 10,000 ohms?**	**Yes** GO to F13 . **No** REPAIR circuit VR212 (YE/GN) or RR141 (VT/BN). GO to F15 .
F11 CHECK OCS RAIL 1 CIRCUITS FOR A SHORT TO VOLTAGE	
• Disconnect: Passenger Seat Side Air Bag Module C3050 . • Disconnect: Passenger Safety Belt Buckle Pretensioner C3202 . • Disconnect: OCSM C3159 . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON.	**Yes** REPAIR circuit VR211 (WH/BN) or RR140 (GN/OG). GO to F15 . **No** GO to F13 .

• Measure voltage between OCSM : ♦ C3159-4, circuit VR211 (WH/BN), harness side and ground. ♦ C3159-5, circuit RR140 (GN/OG), harness side and ground.  N0036969 • **Is voltage present on either circuit?**	
F12 CHECK OCS RAIL 2 CIRCUITS FOR A SHORT TO VOLTAGE	
• Disconnect: Passenger Seat Side Air Bag Module C3050 . • Disconnect: Passenger Safety Belt Buckle Pretensioner C3202 . • Disconnect: OCSM C3159 . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Measure voltage between OCSM : ♦ C3159-2, circuit VR212 (YE/GN), harness side and ground. ♦ C3159-3, circuit RR141 (VT/BN), harness side and ground.  N0036968 • **Is voltage present on either circuit?**	**Yes** REPAIR circuit VR212 (YE/GN) or RR141 (VT/BN). GO to F15 . **No** GO to F13 .
F13 CHECK THE OCS SYSTEM	
NOTE: Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, DTCs will be	**Yes** INSTALL a new OCSM . REFER to Occupant Classification System Module (OCSM) in this section. GO to F15 . **No**

tomsn048@gmail.com

recorded. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Install a new OCS rail. Refer to Occupant Classification Sensor in this section. • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Carry out the OCS System Reset procedure. Refer to Occupant Classification Sensor (OCS) System Reset in this section. • Ignition OFF. • **NOTE:** The ignition switch must be cycled after Zero Seat Weight Test and/or the System Reset procedure. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - OCSM . • Enter the following diagnostic mode on the scan tool: DataLogger - OCSM - View and Record All 2290 Fault PIDs . ♦ Refer to PID list in Normal Operation to view 2290 fault PIDs. • **Do any OCSM on-demand 2290 fault PIDs indicate a fault?**	Fault corrected. GO to F15 .
F14 CHECK FOR AN INTERMITTENT FAULT	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Seat Side Air Bag Module C3050 . • Disconnect: Passenger Safety Belt Buckle Pretensioner C3202 . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the scan tool: Self Test - OCSM . • Enter the following diagnostic mode on the scan tool: DataLogger - OCSM - View and Record All 2290 Fault PIDs .	**Yes** The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. CHECK for causes of the intermittent fault at or near the affected SRS component connector. REPAIR any intermittent concerns found. If an intermittent concern **was** found and repaired, GO to F15 . If an intermittent concern **was not** found and repaired, USE the fault PIDs recorded and GO to the appropriate pinpoint test step. For 2290_15_OD (Passenger Seat OCS Sensor No.1 Internal Fault) (inboard) or 2290_11_OD (Passenger Seat OCS Sensor No.2 Internal Fault) (outboard), INSTALL a new OCS rail. REFER to Occupant

♦ Refer to PID list in Normal Operation to view 2290 fault PIDs. • **Do any OCSM on-demand 2290 fault PIDs indicate a fault?**	Classification Sensor in this section. For 2290_14_OD (Passenger Seat OCS Sensor No.1 Comm. Fault/Open) (inboard), GO to F3 . For 2290_10_OD (Passenger Seat OCS Sensor No.2 Comm. Fault / Open) (outboard), GO to F6 . For 2290_13_OD (Passenger Seat OCS Sensor No.1 Circuit Short to Ground) (inboard), GO to F9 . For 2290_9_OD (Passenger Seat OCS Sensor No.2 Circuit Short to Ground) (outboard), GO to F10 . For 2290_12_OD (Passenger Seat OCS Sensor No.1 Circuit Short to Battery) (inboard), GO to F11 . For 2290_8_OD (Passenger Seat OCS Sensor No.2 Circuit Short to Battery) (outboard), GO to F12 . **No** The fault is not present and cannot be recreated at this time. CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition frequently. ACTIVATE other systems in the same wire harness. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. GO to F15 .
F15 CHECK FOR ADDITIONAL SRS DTCs	
• Ignition OFF. • ⚠ **WARNING: Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.** • Reconnect all SRS components (if previously disconnected). • If previously directed to depower the SRS , repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - Restraints . • **Are any RCM and/or OCSM DTCs indicating a fault?**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the DTC Charts in this section for pinpoint test direction. **No** CLEAR all RCM and OCSM CMDTCs . PROVE OUT the SRS . Repair is complete. RETURN the vehicle to the customer.

tomsn048@gmail.com

Pinpoint Test G: DTC B2292

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

Normal Operation

The Restraints Control Module (RCM) continuously monitors the safety belt buckle pretensioner circuits for an acceptable resistance range, unacceptable voltage and shorts to ground. The RCM will set on-demand and store DTC B2292 in memory if any of these conditions are detected. If the RCM detects a fault, it will send a message to the Instrument Cluster (IC) module to illuminate the air bag warning indicator.

As the RCM continuously monitors safety belt buckle pretensioner circuits for resistance, it expects a normal resistance between 1.31 and 4.29 ohms.

If a loop resistance is between 0.9 and 1.31 or between 4.29 and 5 ohms, there exists a strong potential for an intermittent fault, a DTC may or may not set. The RCM will also set an on-demand DTC if the loop resistance is less than 0.9 ohm or greater than 5 ohms.

NOTE: When monitoring fault and/or resistance PIDs with the scan tool, it may take up to 2 seconds for the scan tool display to update.

Fault PIDs [a]	Description	Fault Trigger Condition
2292_24_OD and 2292_24_CM	Pretensioner Circuit Short to Ground, Front Passenger Side	When the Restraints Control Module (RCM) senses a short to ground on either of the passenger pretensioner circuits, a fault will be indicated.
2292_25_OD and 2292_25_CM	Pretensioner Circuit Short to Battery, Front Passenger Side	When the RCM senses a short to voltage on either of the passenger pretensioner circuits, a fault will be indicated.
2292_26_OD and 2292_26_CM	Pretensioner Circuit Open, Front Passenger Side	When the RCM measures resistance greater than 5 ohms between the passenger pretensioner circuits, a fault will be indicated.
2292_27_OD and 2292_27_CM	Pretensioner Circuit Resistance Low, Front Passenger Side	When the RCM measures resistance less than 0.9 ohm between the passenger pretensioner circuits, a fault will be indicated.
2292_28_OD and 2292_28_CM	Pretensioner Circuit Short to Ground, Front Driver Side	When the RCM senses a short to ground on either of the driver pretensioner circuits, a fault will be indicated.
2292_29_OD and 2292_29_CM	Pretensioner Circuit Short to Battery, Front Driver Side	When the RCM senses a short to voltage on either of the driver pretensioner circuits, a fault will be indicated.
2292_30_OD and 2292_30_CM	Pretensioner Circuit Open, Front Driver Side	When the RCM measures resistance greater than 5 ohms between the driver pretensioner circuits, a fault will be indicated.
2292_31_OD and 2292_31_CM	Pretensioner Circuit Resistance Low, Front Driver Side	When the RCM measures resistance less than 0.9 ohm between the driver pretensioner circuits, a fault will be indicated.

[a] Fault PIDs that end in OD indicate an on-demand status and are associated with on-demand DTC B2292. Fault PIDs that end in CM indicate continuous memory status and are associated with continuous memory DTC B2292.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Safety belt buckle pretensioner
- RCM

PINPOINT TEST G: DTC B2292

⚠ WARNING: Never disassemble or tamper with safety belt buckle/retractor pretensioners, adaptive load limiting retractors, safety belt inflators, or probe the electrical connectors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners, adaptive load limiting retractors, or safety belt inflators, which increases the risk of serious personal injury or death.

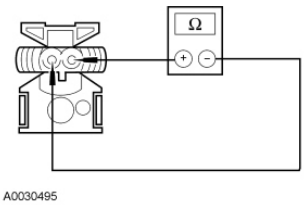
⚠ WARNING: Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

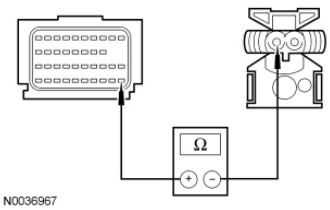
Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Supplemental Restraint System (SRS) components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

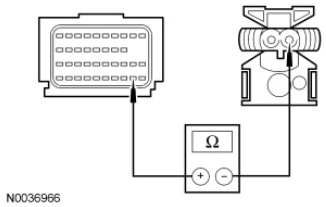


Test Step	Result / Action to Take
G1 RETRIEVE RCM DTCs	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record All 2292 Fault PIDs . ♦ Refer to PID list in Normal Operation to view 2292 fault PIDs. • **Do any RCM on-demand 2292 fault PIDs indicate a fault?**	**Yes** The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Using the fault PIDs recorded, GO to the appropriate pinpoint test step. For 2292_31_OD (Pretensioner Circuit Resistance Low, Front Driver Side), GO to G2 . For 2292_30_OD (Pretensioner Circuit Open, Front Driver Side), GO to G2 . For 2292_28_OD (Pretensioner Circuit Short to Ground, Front Driver Side), GO to G8 . For 2292_29_OD (Pretensioner Circuit Short to Battery, Front Driver Side), GO to G10 . For 2292_27_OD (Pretensioner Circuit Resistance Low, Front Passenger Side), GO to G11 .

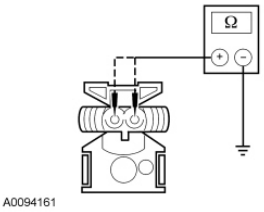


tomsn048@gmail.com

	For 2292_26_OD (Pretensioner Circuit Open, Front Passenger Side), GO to G11 . For 2292_24_OD (Pretensioner Circuit Short to Ground, Front Passenger Side), GO to G17 . For 2292_25_OD (Pretensioner Circuit Short to Battery, Front Passenger Side), GO to G19 . **No** This is an intermittent fault when present as a CMDTC only. The fault condition is not present at this time. Using the fault PIDs recorded, GO to the appropriate pinpoint test step. For 2292_31_CM (Pretensioner Circuit Resistance Low, Front Driver Side), 2292_27_CM (Pretensioner Circuit Resistance Low, Front Passenger Side), 2292_30_CM (Pretensioner Circuit Open, Front Driver Side) and 2292_26_CM (Pretensioner Circuit Open, Front Passenger Side), GO to G22 . For 2292_28_CM (Pretensioner Circuit Short to Ground, Front Driver Side) and 2292_24_CM (Pretensioner Circuit Short to Ground, Front Passenger Side), GO to G24 . For 2292_29_CM (Pretensioner Circuit Short to Battery, Front Driver Side) and 2292_25_CM (Pretensioner Circuit Short to Battery, Front Passenger Side), GO to G25 .
G2 CHECK THE DRIVER SAFETY BELT PRETENSIONER RESISTANCE PID (DR_PTENS)	
• Enter the following diagnostic mode on the scan tool: DataLogger - RCM - PID . • Enter the following diagnostic mode on the scan tool: DR_PTENS (Pretensioner Circuit Resistance, Driver side) Resistance PID . • **Does the resistance PID value read between 1.31 and 4.29 ohms?**	**Yes** GO to G23 . **No** GO to G3 .
G3 CHECK THE DRIVER SAFETY BELT BUCKLE PRETENSIONER RESISTANCE PID (DR_PTENS) WHILE CARRYING OUT A HARNESS TEST	
• Continue monitoring the DR_PTENS (Pretensioner Circuit Resistance, Driver	**Yes** DEPOWER the SRS and REPAIR the connector, terminals or wire harness as needed.

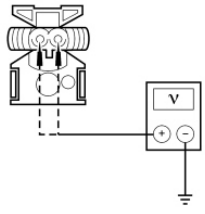


side) resistance PID while carrying out a harness test of the driver safety belt buckle pretensioner circuits and accessible connectors (including any inline connectors), by wiggling connectors and flexing the wire harness. • **Does the resistance PID value read between 1.31 and 4.29 ohms while carrying out a harness test?**	Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to G26 . **No** If the driver safety belt buckle pretensioner resistance PID is less than 1.31 ohms, GO to G4 . If the driver safety belt buckle pretensioner resistance PID is greater than 4.29 ohms, GO to G6 .
G4 CHECK DRIVER SAFETY BELT BUCKLE PRETENSIONER FAULT PIDs (2292_31_OD) AND (2292_30_OD) FOR A CHANGE IN FAULT STATUS	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Driver Safety Belt Buckle Pretensioner C3201 . • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record The Following Fault PIDs . ♦ 2292_30_OD (Pretensioner Circuit Open, Front Driver Side) ♦ 2292_31_OD (Pretensioner Circuit Resistance Low, Front Driver Side) • **DIAGNOSTIC TIP:** When viewing DTC B2292 on-demand fault PIDs with the driver pretensioner disconnected, an open circuit fault would normally be retrieved. • **Did the driver safety belt buckle pretensioner on-demand fault PIDs change from indicating a low resistance to an open circuit fault?**	**Yes** GO to G22 . **No** GO to G5 .

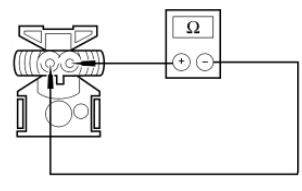


tomsn048@gmail.com

G5 CHECK FOR A SHORT BETWEEN DRIVER SAFETY BELT BUCKLE PRETENSIONER CIRCUITS	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310a and C310b . • Measure resistance between driver safety belt buckle pretensioner C3201-1, circuit CR120 (BU/OG), harness side and C3201-2, circuit RR120 (BN/GN)/(GN/RD), harness side.  A0030495 • **Is resistance greater than 10,000 ohms?**	**Yes** GO to G23 . **No** REPAIR circuits CR120 (BU/OG) and RR120 (BN/GN)/(GN/RD). GO to G26 .
G6 CHECK THE DRIVER SAFETY BELT BUCKLE PRETENSIONER FAULT PIDs (2292_30_OD) AND (2292_31_OD) FOR A CHANGE IN FAULT STATUS	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Driver Safety Belt Buckle Pretensioner C3201 . • Connect a fused jumper wire between driver safety belt pretensioner C3201-1, circuit CR120 (BU/OG), harness side and C3201-2, circuit RR120 (BN/GN)/(GN/RD), harness side. • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON.	**Yes** GO to G22 . **No** GO to G7 .



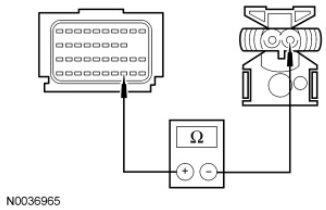
• Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record The Following Fault PIDs . ♦ 2292_30_OD (Pretensioner Circuit Open, Front Driver Side) ♦ 2292_31_OD (Pretensioner Circuit Resistance Low, Front Driver Side) • **DIAGNOSTIC TIP:** When viewing DTC B2292 on-demand fault PIDs with the driver pretensioner circuits shorted together, a low resistance fault would normally be retrieved. • **Did the driver safety belt buckle pretensioner on-demand fault PIDs change from indicating an open circuit to a low resistance fault?**	
G7 CHECK DRIVER SAFETY BELT PRETENSIONER CIRCUITS FOR AN OPEN	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the jumper wire from the driver safety belt buckle pretensioner C3201. • Disconnect: RCM C310a and C310b . • Measure resistance between RCM C310b-31, circuit CR120 (BU/OG), harness side and driver safety belt buckle pretensioner C3201-1, circuit CR120 (BU/OG), harness side.  • Measure resistance between RCM C310b-32, circuit RR120 (BN/GN), harness side and driver safety belt buckle pretensioner C3201-2, circuit RR120 (BN/GN)/(GN/RD), harness side.	**Yes** 21GO to G8 . **No** REPAIR circuit CR120 (BU/OG) or RR120 (BN/GN)/(GN/RD). GO to G26 .

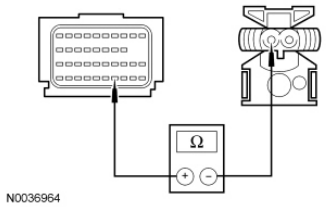


tomsn048@gmail.com

 • **Is resistance less than 0.5 ohm?**	
G8 CHECK THE DRIVER SAFETY BELT BUCKLE PRETENSIONER FAULT PIDs (2292_28_OD) AND (2292_30_OD) FOR A CHANGE IN FAULT STATUS	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Driver Safety Belt Buckle Pretensioner C3201 . • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record The Following Fault PIDs . ♦ 2292_28_OD (Pretensioner Circuit Short to Ground, Front Driver Side) ♦ 2292_30_OD (Pretensioner Circuit Open, Front Driver Side) • **DIAGNOSTIC TIP:** When viewing DTC B2292 on-demand fault PIDs with the driver pretensioner disconnected, an open circuit fault would normally be retrieved. • **Did the driver safety belt buckle pretensioner on-demand fault PIDs change from indicating a short to ground to an open circuit fault?**	**Yes** GO to G22 . **No** GO to G9 .
G9 CHECK DRIVER SAFETY BELT PRETENSIONER CIRCUITS FOR A SHORT TO GROUND	

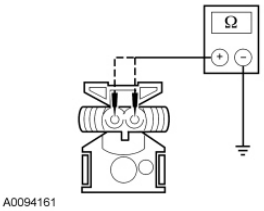
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310a and C310b . • Measure resistance between driver safety belt buckle pretensioner: ♦ C3201-1, circuit CR120 (BU/OG), harness side and ground. ♦ C3201-2, circuit RR120 (BN/GN)/(GN/RD), harness side and ground.  A0094161 • **Are resistances greater than 10,000 ohms?**	**Yes** GO to G23 . **No** REPAIR circuit CR120 (BU/OG) or RR120 (BN/GN)/(GN/RD). GO to G26 .
G10 CHECK DRIVER SAFETY BELT PRETENSIONER CIRCUITS FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Driver Side Air Bag Module C3049 . • Disconnect: Driver Safety Belt Buckle Pretensioner C3201 . • Disconnect: RCM C310a and C310b . • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Measure voltage between driver safety belt buckle pretensioner: ♦ C3201-1, circuit CR120 (BU/OG), harness side and ground. ♦ C3201-2, circuit RR120 (BN/GN)/(GN/RD), harness side and ground.	**Yes** REPAIR circuit CR120 (BU/OG) or RR120 (BN/GN)/(GN/RD). GO to G26 . **No** GO to G23 .



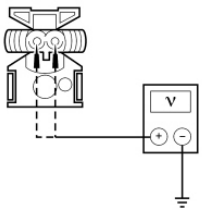


tomsn048@gmail.com

 • **Is voltage present on either circuit?**	
G11 CHECK THE PASSENGER SAFETY BELT PRETENSIONER RESISTANCE PID (PS_PTENS)	
• Enter the following diagnostic mode on the scan tool: DataLogger - RCM - PID . • Enter the following diagnostic mode on the scan tool: PS_PTENS (Passenger Retractor Circuit Resistance) Resistance PID . • **Does the resistance PID value read between 1.31 and 4.29 ohms?**	**Yes** GO to G23 . **No** GO to G12 .
G12 CHECK THE PASSENGER SAFETY BELT BUCKLE PRETENSIONER RESISTANCE PID (PS_PTENS) WHILE CARRYING OUT A HARNESS TEST	
• Continue monitoring the PS_PTENS (Passenger Retractor Circuit Resistance) resistance PID while carrying out a harness test of the passenger safety belt buckle pretensioner circuits and accessible connectors (including any inline connectors), by wiggling connectors and flexing the wire harness. • **Does the resistance PID value read between 1.31 and 4.29 ohms while carrying out the harness test?**	**Yes** DEPOWER the SRS and REPAIR the connector, terminals or wire harness as needed. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to G26 . **No** If the passenger safety belt buckle pretensioner resistance PID is less than 1.31 ohms, GO to G13 . If the passenger safety belt buckle pretensioner resistance PID is greater than 4.29 ohms, GO to G15 .
G13 CHECK THE PASSENGER SAFETY BELT BUCKLE PRETENSIONER FAULT PIDs (2292_26_OD) AND (2292_27_OD) FOR A CHANGE IN FAULT STATUS	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF.	**Yes** GO to G22 . **No** GO to G14 .



• Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Safety Belt Buckle Pretensioner C3202 . • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record The Following Fault PIDs . ♦ 2292_26_OD (Pretensioner Circuit Open, Front Passenger Side) ♦ 2292_27_OD (Pretensioner Circuit Resistance Low, Front Passenger Side) • **DIAGNOSTIC TIP:** When viewing DTC B2292 on-demand fault PIDs with the passenger pretensioner disconnected, an open circuit fault would normally be retrieved. • **Did the passenger safety belt buckle pretensioner on-demand fault PIDs change from indicating a low resistance to an open circuit fault?**	
G14 CHECK FOR A SHORT BETWEEN THE PASSENGER SAFETY BELT BUCKLE PRETENSIONER CIRCUITS	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310a and C310b . • Measure resistance between passenger safety belt buckle pretensioner C3202-1, circuit CR122 (WH/OG), harness side and C3202-2, circuit RR122 (BN or TN), harness side.  A0030495 • **Is resistance greater than 10,000 ohms?**	**Yes** GO to G23 . **No** REPAIR circuits CR122 (WH/OG) and RR122 (BN or TN). GO to G26 .



tomsn048@gmail.com

G15 CHECK THE PASSENGER SAFETY BELT PRETENSIONER FAULT PIDs (2292_26_OD) AND (2292_27_OD) FOR A CHANGE IN FAULT STATUS	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Safety Belt Buckle Pretensioner C3202 . • Connect a fused jumper wire between passenger safety belt pretensioner C3202-1, circuit CR122 (WH/OG), harness side and C3202-2, circuit RR122 (BN or TN), harness side. • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record The Following Fault PIDs . ♦ 2292_26_OD (Pretensioner Circuit Open, Front Passenger Side) ♦ 2292_27_OD (Pretensioner Circuit Resistance Low, Front Passenger Side) • **DIAGNOSTIC TIP:** When viewing DTC B2292 on-demand fault PIDs with the passenger pretensioner circuits shorted together, a low resistance fault would normally be retrieved. • **Did the passenger safety belt buckle pretensioner on-demand fault PIDs change from indicating an open circuit to a low resistance fault?**	**Yes** GO to G22 . **No** GO to G16 .
G16 CHECK PASSENGER SAFETY BELT PRETENSIONER CIRCUITS FOR AN OPEN	

• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the jumper wire from passenger safety belt buckle pretensioner C3202. • Disconnect: RCM C310a and C310b . • Measure resistance between RCM C310b-33, circuit RR122 (BN or TN), harness side and passenger safety belt buckle pretensioner C3202-2, circuit RR122 (BN or TN), harness side.  • Measure resistance between RCM C310b-34, circuit CR122 (WH/OG), harness side and passenger safety belt buckle pretensioner C3202-1, circuit CR122 (WH/OG), harness side.  • **Are resistances less than 0.5 ohm?**	**Yes** GO to G21 . **No** REPAIR circuit RR122 (BN or TN) or CR122 (WH/OG). GO to G26 .
G17 CHECK THE PASSENGER SAFETY BELT BUCKLE PRETENSIONER FAULT PIDs (2292_24_OD) AND (2292_26_OD) FOR A CHANGE IN FAULT STATUS	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.	**Yes** GO to G20 . **No** GO to G18 .

tomsn048@gmail.com

• Disconnect: Passenger Safety Belt Buckle Pretensioner C3202 . • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record The Following Fault PIDs . ♦ 2292_24_OD (Pretensioner Circuit Short to Ground, Front Passenger Side) ♦ 2292_26_OD (Pretensioner Circuit Open, Front Passenger Side) • **DIAGNOSTIC TIP:** When viewing DTC B2292 on-demand fault PIDs with the passenger pretensioner disconnected, an open circuit fault would normally be retrieved. • **Did the passenger safety belt buckle pretensioner on-demand fault PIDs change from indicating a short to ground to an open circuit fault?**	
G18 CHECK PASSENGER SAFETY BELT BUCKLE PRETENSIONER CIRCUITS FOR A SHORT TO GROUND	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310a and C310b . • Measure resistance between passenger safety belt buckle pretensioner: ♦ C3202-2, circuit RR122 (BN or TN), harness side and ground. ♦ C3202-1, circuit CR122 (WH/OG), harness side and ground.  • **Are resistances greater than 10,000 ohms?**	**Yes** GO to G21 . **No** REPAIR circuit RR122 (BN or TN) or CR122 (WH/OG). GO to G26 .
G19 CHECK PASSENGER SAFETY BELT BUCKLE PRETENSIONER CIRCUITS FOR A	

SHORT TO VOLTAGE	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Side Air Bag Module C3050 . • Disconnect: Passenger Safety Belt Buckle Pretensioner C3202 . • Disconnect: RCM C310a and C310b . • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Measure voltage between passenger safety belt buckle pretensioner: ♦ C3202-2, circuit RR122 (BN or TN), harness side and ground. ♦ C3202-1, circuit CR122 (WH/OG), harness side and ground.  N0037005 • **Is voltage present on either circuit?**	**Yes** REPAIR circuit RR122 (BN or TN) or CR122 (WH/OG). GO to G26 . **No** GO to G21 .
G20 CONFIRM THE SAFETY BELT BUCKLE PRETENSIONER FAULT	
NOTE: Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, DTCs will be recorded. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Connect: Affected Safety Belt Buckle Pretensioner C3201 (Driver) C3202 (Passenger) . • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON.	**Yes** INSTALL a new driver or passenger safety belt buckle pretensioner. REFER to Section 501-20A . GO to G26 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. Using the fault PIDs recorded, GO to the appropriate pinpoint test step and CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. For 2292_31_CM (Pretensioner Circuit Resistance Low, Front Driver Side), 2292_27_CM (Pretensioner Circuit Resistance Low, Front Passenger Side), 2292_30_CM (Pretensioner Circuit Open, Front Driver Side) and 2292_26_CM (Pretensioner Circuit Open, Front Passenger Side),

tomsn048@gmail.com

• Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record All 2292 Fault PIDs . ♦ Refer to PID list in Normal Operation to view 2292 fault PIDs. • **Does the original RCM on-demand 2292 fault PID indicate a fault?**	GO to G22 . For 2292_28_CM (Pretensioner Circuit Short to Ground, Front Driver Side) and 2292_24_CM (Pretensioner Circuit Short to Ground, Front Passenger Side), GO to G24 . For 2292_29_CM (Pretensioner Circuit Short to Battery, Front Driver Side) and 2292_25_CM (Pretensioner Circuit Short to Battery, Front Passenger Side), GO to G25 .
G21 CONFIRM THE RCM FAULT	
NOTE: Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, DTCs will be recorded. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Connect: All Restraint System Components (if previously disconnected) . • Connect: RCM C310a and C310b (if previously disconnected) . • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record All 2292 Fault PIDs . ♦ Refer to PID list in Normal Operation to view 2292 fault PIDs. • **Does the original RCM on-demand 2292 fault PID indicate a fault?**	**Yes** INSTALL a new RCM . REFER to Restraints Control Module (RCM) . GO to G26 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. Using the fault PIDs recorded, GO to the appropriate pinpoint test step and CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. For 2292_31_CM (Pretensioner Circuit Resistance Low, Front Driver Side), 2292_27_CM (Pretensioner Circuit Resistance Low, Front Passenger Side), 2292_30_CM (Pretensioner Circuit Open, Front Driver Side) and 2292_26_CM (Pretensioner Circuit Open, Front Passenger Side), GO to G22 . For 2292_28_CM (Pretensioner Circuit Short to Ground, Front Driver Side) and 2292_24_CM (Pretensioner Circuit Short to Ground, Front Passenger Side), GO to G24 . For 2292_29_CM (Pretensioner Circuit Short to Battery, Front Driver Side) and 2292_25_CM (Pretensioner Circuit Short to Battery, Front Passenger Side), GO to G25 .
G22 CHECK SAFETY BELT BUCKLE PRETENSIONER RESISTANCE PIDs FOR AN INTERMITTENT LOW RESISTANCE OR OPEN	
• If the fault was reported for the driver safety belt buckle pretensioner, monitor the DR_PTENS (Driver Pretensioner Circuit Resistance) resistance PID. • If the fault was reported for the passenger safety belt buckle pretensioner, monitor the	**Yes** DEPOWER the SRS and REPAIR as necessary. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information.

PS_PTENS (Passenger Pretensioner Circuit Resistance) resistance PID. • **NOTE:** A resistance PID that reads between 0.9 and 1.31 ohms or between 4.29 and 5 ohms may or may not set an on-demand DTC yet indicates a strong potential of an intermittent fault condition. Make sure to thoroughly check wire harness(es), connectors and terminals as they are the likely source of the fault condition. • Attempt to recreate the fault by wiggling the connectors (including any inline connectors) and flexing the wire harness. • **Does any safety belt buckle pretensioner resistance PID indicate less than 1.31 ohms or greater than 4.29 ohms?**	GO to G26 . **No** GO to G23 .
G23 CHECK THE HARNESS AND CONNECTORS	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect the affected safety belt buckle pretensioner C3201 (driver) or C3202 (passenger): ♦ inspect connector(s) (including any inline connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals. ♦ inspect wire harness for any damage, pinched, cut or pierced wires. • **Were any concerns found?**	**Yes** REPAIR as necessary. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to G26 . **No** The fault is not present and cannot be recreated at this time. CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. GO to G26 .
G24 CHECK SAFETY BELT BUCKLE PRETENSIONER FAULT PIDs FOR AN INTERMITTENT SHORT TO GROUND	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - PID . • If the fault was reported for the driver safety belt buckle pretensioner, monitor the 2292_28_OD (Pretensioner Circuit Short to Ground, Front Driver Side) on-demand fault PID on the scan tool. • If the fault was reported for the passenger safety belt buckle pretensioner, monitor the 2292_24_OD (Pretensioner Circuit Short to	**Yes** DEPOWER the SRS and REPAIR as necessary. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to G26 . **No** The fault is not present and cannot be recreated at this time. CHECK for causes of the intermittent

tomsn048@gmail.com

Ground, Front Passenger Side) on-demand fault PID on the scan tool. • **DIAGNOSTIC TIP:** When monitoring fault PIDs with the scan tool, it may take up to 2 seconds for the scan tool display to update. • Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness. • **Does any safety belt buckle pretensioner on-demand fault PID indicate a fault is present?**	fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. GO to G26 .
G25 CHECK SAFETY BELT PRETENSIONER FAULT PIDs FOR AN INTERMITTENT SHORT TO VOLTAGE	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect the side air bag module electrical connector C3049 (driver) or C3050 (passenger) on the side with the affected pretensioner. • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • If the fault was reported for the driver safety belt buckle pretensioner, monitor the 2292_29_OD (Pretensioner Circuit Short to Battery, Front Driver Side) on-demand fault PID. • If the fault was reported for the passenger safety belt buckle pretensioner, monitor the 2292_25_OD (Pretensioner Circuit Short to Battery, Front Passenger Side) on-demand fault PID. • **DIAGNOSTIC TIP:** When monitoring fault PIDs with the scan tool, it may take up to 2 seconds for the scan tool display to update. • Attempt to recreate the fault by wiggling the connectors (including any inline connectors) and flexing the wire harness. • **Does the safety belt buckle pretensioner short to battery on-demand fault PID indicate a fault is present?**	**Yes** DEPOWER the SRS and REPAIR as necessary. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to G26 . **No** The fault is not present and cannot be recreated at this time. CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. GO to G26 .
G26 CHECK FOR ADDITIONAL SRS DTCs	
• Ignition OFF.	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the DTC Charts in this section for

• **⚠ WARNING: Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.** • Reconnect all SRS components (if previously disconnected). • If previously directed to depower the SRS , repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - Restraints . • **Are any RCM and/or OCSM DTCs indicating a fault?**	pinpoint test direction. **No** CLEAR all RCM and OCSM CMDTCs . PROVE OUT the SRS . Repair is complete. RETURN the vehicle to the customer.

Pinpoint Test H: DTC B2293

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

Normal Operation

The Restraints Control Module (RCM) continuously monitors all front air bag module circuits (loop) for an acceptable resistance range, unacceptable voltage and shorts to ground. The RCM will set on-demand and store DTC B2293 in memory if any of these conditions are detected. If the RCM detects a fault on any of the front air bag circuits, it will store DTC B2293 in memory and send a message to the Instrument Cluster (IC) module to illuminate the air bag warning indicator.

As the RCM continuously monitors all front air bag module circuits for resistance, it expects a normal loop resistance between 1.31 to 4.29 ohms.

If any loop (loop 1, loop 2, canister vent and/or adaptive tether) resistance for the driver and/or passenger air bag is between 0.9 and 1.31 or between 4.29 and 5 ohms, there exists a strong potential for an intermittent fault, a DTC may or may not set. The RCM will also set an on-demand DTC if the loop resistance is less than 0.9 ohm or greater than 5 ohms.

Fault PIDs [a]	Description	Fault Trigger Condition
2293_0_OD and 2293_0_CM	Air bag Passenger Front Adaptive Tether Circuit Resist. Low on Squib	When the Restraints Control Module (RCM) measures resistance less than 0.9 ohm between the passenger adaptive tether loop circuits, a fault will be indicated.
2293_1_OD and 2293_1_CM	Air bag Passenger Front Adaptive Tether Open	When the RCM measures resistance greater than 5 ohms between the passenger adaptive tether loop circuits, a fault will be indicated.
2293_2_OD and 2293_2_CM	Air bag Passenger Front Adaptive Tether Short to Battery	When the RCM senses a short to voltage on either of the passenger adaptive tether loop circuits, a fault will be indicated.

tomsn048@gmail.com

2293_3_OD and 2293_3_CM	Air bag Passenger Front Adaptive Tether Short to Ground	When the RCM senses a short to ground on either of the passenger adaptive tether loop circuits, a fault will be indicated.
2293_8_OD and 2293_8_CM	Air bag Passenger Front Can Vent Circuit Resist. Low on Squib	When the RCM measures resistance less than 0.9 ohm between the passenger air bag can vent loop circuits, a fault will be indicated.
2293_9_OD and 2293_9_CM	Air bag Passenger Front Can Vent Open	When the RCM measures resistance greater than 5 ohms between on the passenger air bag can vent loop circuits, a fault will be indicated.
2293_10_OD and 2293_10_CM	Air bag Passenger Front Can Vent Short to Battery	When the RCM senses a short to voltage on either of the passenger air bag can vent loop circuits, a fault will be indicated.
2293_11_OD and 2293_11_CM	Air bag Passenger Front Can Vent Short to Ground	When the RCM senses a short to ground on either of the passenger air bag can vent loop circuits, a fault will be indicated.
2293_12_OD and 2293_12_CM	Air bag Driver Front Can Vent Circuit Resist. Low on Squib	When the RCM measures resistance less than 0.9 ohm between the driver air bag can vent loop circuits, a fault will be indicated.
2293_13_OD and 2293_13_CM	Air bag Driver Front Can Vent Open	When the RCM measures resistance greater than 5 ohms between the driver air bag can vent loop circuits, a fault will be indicated.
2293_14_OD and 2293_14_CM	Air bag Driver Front Can Vent Short to Battery	When the RCM senses a short to voltage on either of the driver air bag can vent loop circuits, a fault will be indicated.
2293_15_OD and 2293_15_CM	Air bag Driver Front Can Vent Short to Ground	When the RCM senses a short to ground on either of the driver air bag can vent loop circuits, a fault will be indicated.
2293_16_OD and 2293_16_CM	Air Bag Inflator Circuit Resistance Low - Loop No. 2, Front Passenger Side	When the RCM measures resistance less than 0.9 ohm between the passenger air bag loop circuits, a fault will be indicated.
2293_17_OD and 2293_17_CM	Air Bag Circuit Open - Loop No. 2, Front Passenger Side	When the RCM measures resistance greater than 5 ohms between the passenger air bag loop circuits, a fault will be indicated.
2293_18_OD and 2293_18_CM	Air Bag Circuit Short to Battery - Loop No. 2, Front Passenger Side	When the RCM senses a short to voltage on either of the passenger air bag loop circuits, a fault will be indicated.
2293_19_OD and 2293_19_CM	Air Bag Circuit Short to Ground - Loop No. 2, Front Passenger Side	When the RCM senses a short to ground on either of the passenger air bag loop circuits, a fault will be indicated.
2293_20_OD and 2293_20_CM	Air Bag Inflator Circuit Resistance Low - Loop No. 2, Front Driver Side	When the RCM measures resistance less than 0.9 ohm between the driver air bag loop circuits, a fault will be indicated.
2293_21_OD and 2293_21_CM	Air Bag Circuit Open - Loop No. 2, Front Driver Side	When the RCM measures resistance greater than 5 ohms between the driver air bag loop circuits, a fault will be indicated.
2293_22_OD and 2293_22_CM	Air Bag Circuit Short to Battery - Loop No. 2, Front Driver Side	When the RCM senses a short to voltage on either of the driver air bag loop circuits, a fault will be indicated.
2293_23_OD and 2293_23_CM	Air Bag Circuit Short to Ground - Loop No. 2, Front	When the RCM senses a short to ground on either of the driver air bag loop circuits, a fault will be indicated.

	Driver Side	
2293_24_OD and 2293_24_CM	Air Bag Inflator Circuit Resistance Low - Loop No. 1, Front Passenger Side	When the RCM measures resistance less than 0.9 ohm between the passenger air bag loop circuits, a fault will be indicated.
2293_25_OD and 2293_25_CM	Air Bag Circuit Open - Loop No. 1, Front Passenger Side	When the RCM measures resistance greater than 5 ohms between the passenger air bag loop circuits, a fault will be indicated.
2293_26_OD and 2293_26_CM	Air Bag Circuit Short to Battery - Loop No. 1, Front Passenger Side	When the RCM senses a short to voltage on either of the passenger air bag loop circuits, a fault will be indicated.
2293_27_OD and 2293_27_CM	Air Bag Circuit Short to Ground - Loop No. 1, Front Passenger Side	When the RCM senses a short to ground on either of the passenger air bag loop circuits, a fault will be indicated.
2293_28_OD and 2293_28_CM	Air Bag Inflator Circuit Resistance Low - Loop No. 1, Front Driver Side	When the RCM measures resistance less than 0.9 ohm between the driver air bag loop circuits, a fault will be indicated.
2293_29_OD and 2293_29_CM	Air Bag Circuit Open - Loop No. 1, Front Driver Side	When the RCM measures resistance greater than 5 ohms between the driver air bag loop circuits, a fault will be indicated.
2293_30_OD and 2293_30_CM	Air Bag Circuit Short to Battery - Loop No. 1, Front Driver Side	When the RCM senses a short to voltage on either of the driver air bag loop circuits, a fault will be indicated.
2293_31_OD and 2293_31_CM	Air Bag Circuit Short to Ground - Loop No. 1, Front Driver Side	When the RCM senses a short to ground on either of the driver air bag loop circuits, a fault will be indicated.

[a] Fault PIDs that end in OD indicate an on-demand status and are associated with on-demand DTC B2293. Fault PIDs that end in CM indicate continuous memory status and are associated with continuous DTC B2293.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Clockspring
- Air bag module
- RCM

PINPOINT TEST H: DTC B2293

⚠ WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the Safety Canopy® and cause serious personal injury or death.

⚠ WARNING: Always tighten the fasteners of the restraints control module (RCM) and impact sensor (if equipped) to the specified torque. Failure to do so may result in incorrect restraint system operation, which increases the risk of personal injury or death in a crash.

⚠ WARNING: Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

tomsn048@gmail.com

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: SRS components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

Test Step	Result / Action to Take
H1 RETRIEVE RCM DTCs	
• Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record All 2293 Fault PIDs . ♦ Refer to PID list in Normal Operation to view 2293 fault PIDs. • **Do any RCM on-demand 2293 fault PIDs indicate a fault?**	**Yes** The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Using the fault PIDs recorded, GO to the appropriate pinpoint test step. For 2293_28_OD (Air Bag Inflator Circuit Resistance Low - Loop No. 1, Front Driver Side), GO to H2 . For 2293_29_OD (Air Bag Circuit Open - Loop No. 1, Front Driver Side), GO to H2 . For 2293_31_OD (Air Bag Circuit Short to Ground - Loop No. 1, Front Driver Side), GO to H10 . For 2293_30_OD (Air Bag Circuit Short to Battery - Loop No. 1, Front Driver Side), GO to H13 . For 2293_20_OD (Air Bag Inflator Circuit Resistance Low - Loop No. 2, Front Driver Side), GO to H15 . For 2293_21_OD (Air Bag Circuit Open - Loop No. 2, Front Driver Side), GO to H15 . For 2293_23_OD (Air Bag Circuit Short to Ground - Loop No. 2, Front Driver Side), GO to H23 . For 2293_22_OD (Air Bag Circuit Short to Battery - Loop No. 2, Front

Driver Side), GO to H26 .

For 2293_13_OD (Air bag Driver Front Can Vent Open), GO to H28 .

For 2293_12_OD (Air bag Driver Front Can Vent Circuit Resist. Low on Squib), GO to H28 .

For 2293_15_OD (Air bag Driver Front Can Vent Short to Ground), GO to H36 .

For 2293_14_OD (Air bag Driver Front Can Vent Short to Battery), GO to H39 . For 2293_24_OD (Air Bag Inflator Circuit Resistance Low - Loop No. 1, Front Passenger Side), GO to H41 .

For 2293_25_OD (Air Bag Circuit Open - Loop No. 1, Front Passenger Side), GO to H41 .

For 2293_27_OD (Air Bag Circuit Short to Ground - Loop No. 1, Front Passenger Side), GO to H47 .

For 2293_26_OD (Air Bag Circuit Short to Battery - Loop No. 1, Front Passenger Side), GO to H49 .

For 2293_16_OD (Air Bag Inflator Circuit Resistance Low - Loop No. 2, Front Passenger Side), GO to H50 .

For 2293_17_OD (Air Bag Circuit Open - Loop No. 2, Front Passenger Side), GO to H50 .

For 2293_19_OD (Air Bag Circuit Short to Ground - Loop No. 2, Front Passenger Side), GO to H56 .

For 2293_18_OD (Air Bag Circuit Short to Battery - Loop No. 2, Front Passenger Side), GO to H58 .

For 2293_1_OD (Air bag Passenger Front Adaptive Tether Open), GO to H59 .

For 2293_0_OD (Air bag Passenger Front Adaptive Tether Circuit Resist. Low on Squib), GO to H59 .

tomsn048@gmail.com

For 2293_3_OD (Air bag Passenger Front Adaptive Tether Short to Ground), GO to H65 .

For 2293_2_OD (Air bag Passenger Front Adaptive Tether Short to Battery), GO to H67 .

For 2293_9_OD (Air bag Passenger Front Can Vent Open), GO to H68 .

For 2293_8_OD (Air bag Passenger Front Can Vent Circuit Resist. Low on Squib), GO to H68 .

For 2293_11_OD (Air bag Passenger Front Can Vent Short to Ground), GO to H74 .

For 2293_10_OD (Air bag Passenger Front Can Vent Short to Battery), GO to H76 .

No
This is an intermittent fault when present as a CMDTC only. The fault condition is not present at this time.

Using the fault PIDs recorded, GO to the appropriate pinpoint test step.

For 2293_28_CM (Air Bag Inflator Circuit Resistance Low - Loop No. 1, Front Driver Side), GO to H81 .

For 2293_29_CM (Air Bag Circuit Open - Loop No. 1, Front Driver Side), GO to H81 .

For 2293_31_CM (Air Bag Circuit Short to Ground - Loop No. 1, Front Driver Side), GO to H83 .

For 2293_30_CM (Air Bag Circuit Short to Battery - Loop No. 1, Front Driver Side), GO to H85 .

For 2293_20_CM (Air Bag Inflator Circuit Resistance Low - Loop No. 2, Front Driver Side), GO to H81 .

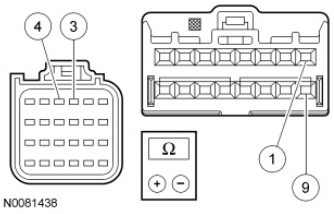
For 2293_21_CM (Air Bag Circuit Open - Loop No. 2, Front Driver Side),

	GO to H81 . For 2293_23_CM (Air Bag Circuit Short to Ground - Loop No. 2, Front Driver Side), GO to H83 . For 2293_22_CM (Air Bag Circuit Short to Battery - Loop No. 2, Front Driver Side), GO to H85 . For 2293_13_CM (Air bag Driver Front Can Vent Open), GO to H81 . For 2293_12_CM (Air bag Driver Front Can Vent Circuit Resist. Low on Squib), GO to H81 . For 2293_15_CM (Air bag Driver Front Can Vent Short to Ground), GO to H83 . For 2293_14_CM (Air bag Driver Front Can Vent Short to Battery), GO to H85 . For 2293_24_CM (Air Bag Inflator Circuit Resistance Low - Loop No. 1, Front Passenger Side), GO to H82 . For 2293_25_CM (Air Bag Circuit Open - Loop No. 1, Front Passenger Side), GO to H82 . For 2293_27_CM (Air Bag Circuit Short to Ground - Loop No. 1, Front Passenger Side), GO to H84 . For 2293_26_CM (Air Bag Circuit Short to Battery - Loop No. 1, Front Passenger Side), GO to H86 . For 2293_16_CM (Air Bag Inflator Circuit Resistance Low - Loop No. 2, Front Passenger Side), GO to H82 . For 2293_17_CM (Air Bag Circuit Open - Loop No. 2, Front Passenger Side), GO to H82 . For 2293_19_CM (Air Bag Circuit Short to Ground - Loop No. 2, Front Passenger Side), GO to H84 . For 2293_18_CM (Air Bag Circuit Short to Battery - Loop No. 2, Front

tomsn048@gmail.com

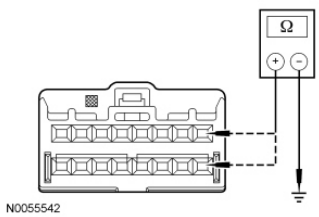
	Passenger Side), GO to H86 . For 2293_1_CM (Air bag Passenger Front Adaptive Tether Open), GO to H82 . For 2293_0_CM (Air bag Passenger Front Adaptive Tether Circuit Resist. Low on Squib), GO to H82 . For 2293_3_OD (Air bag Passenger Front Adaptive Tether Short to Ground), GO to H84 . For 2293_2_CM (Air bag Passenger Front Adaptive Tether Short to Battery), GO to H86 . For 2293_9_CM (Air bag Passenger Front Can Vent Open), GO to H82 . For 2293_8_CM (Air bag Passenger Front Can Vent Circuit Resist. Low on Squib), GO to H82 . For 2293_11_CM (Air bag Passenger Front Can Vent Short to Ground), GO to H84 . For 2293_10_CM (Air bag Passenger Front Can Vent Short to Battery), GO to H86 .
H2 CHECK DRIVER AIR BAG MODULE LOOP 1 RESISTANCE PID (D_ABAGR)	
• Enter the following diagnostic mode on the scan tool: DataLogger - RCM - PID . • Enter the following diagnostic mode on the scan tool: D_ABAGR (Driver Air Bag) Resistance PID . • **Does the resistance PID value read between 1.31 and 4.29 ohms?**	**Yes** GO to H80 . **No** GO to H3 .
H3 CHECK DRIVER AIR BAG MODULE LOOP 1 RESISTANCE PID (D_ABAGR) WHILE CARRYING OUT A HARNESS TEST	
• **NOTE:** Do not remove the driver air bag module from its mounted position at this time. • With the driver air bag in its mounted position, continue monitoring the D_ABAGR (Driver Air Bag) resistance PID while carrying out a harness test of the driver air bag circuits and accessible connectors (including any inline connectors) by wiggling and flexing the wire harness, connectors, tilting and rotating the steering	**Yes** DEPOWER the SRS and REPAIR the connector, terminals or wire harness or INSTALL a new clockspring as needed. REFER to Clockspring in this section. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for

wheel frequently. • **Does the resistance PID value read between 1.31 and 4.29 ohms while carrying out the harness test?**	schematic and connector information. GO to H88 . **No** If the driver air bag module loop 1 resistance PID is less than 1.31 ohms, GO to H4 . If the driver air bag module loop 1 resistance PID is greater than 4.29 ohms, GO to H7 .
H4 CHECK THE DRIVER AIR BAG MODULE LOOP 1 FAULT PIDs (2293_28_OD) AND (2293_29_OD) FOR A CHANGE IN FAULT STATUS	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the driver air bag module. Refer to Driver Air Bag Module in this section. • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record The Following Fault PIDs . ♦ 2293_28_OD (Air Bag Inflator Circuit Resistance Low - Loop No. 1, Front Driver Side) ♦ 2293_29_OD (Air Bag Circuit Open - Loop No. 1, Front Driver Side) • **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the driver air bag module disconnected, open circuit faults would normally be retrieved for loop 1, loop 2 and canister vent. • **Did the driver air bag module loop 1 on-demand fault PIDs change from indicating a low resistance to an open circuit fault?**	**Yes** GO to H77 . **No** GO to H5 .
H5 CHECK THE DRIVER AIR BAG MODULE LOOP 1 FAULT PIDs (2293_28_OD) AND (2293_29_OD) FOR A CHANGE IN FAULT STATUS (DRIVER AIR BAG REMOVED)	



tomsn048@gmail.com

NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Clockspring C218a . • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record The Following Fault PIDs . ♦ 2293_28_OD (Air Bag Inflator Circuit Resistance Low - Loop No. 1, Front Driver Side) ♦ 2293_29_OD (Air Bag Circuit Open - Loop No. 1, Front Driver Side) • **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the driver air bag module/clockspring disconnected, open circuit faults would normally be retrieved for loop 1, loop 2 and canister vent. • **Did the driver air bag module loop 1 on-demand fault PIDs change from indicating a low resistance to an open circuit fault?**	**Yes** GO to H79 . **No** GO to H6 .
H6 CHECK THE RCM FOR LOW RESISTANCE	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310a and C310b . • Measure resistance between RCM C310a pin 3 and C310a pin 4, component side.  • **Is resistance greater than 10,000 ohms?**	**Yes** REPAIR circuits CR101 (VT/BN) and RR101 (YE/GN). GO to H88 . **No** GO to H80 .



H7 CHECK THE DRIVER AIR BAG MODULE LOOP 1 FAULT PIDs (2293_29_OD) AND (2293_28_OD) FOR A CHANGE IN FAULT STATUS	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the driver air bag module. Refer to Driver Air Bag Module in this section. • Connect a fused jumper wire between driver air bag module loop 1 C216a-1, harness side and C216a-2, harness side. • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record The Following Fault PIDs . ♦ 2293_28_OD (Air Bag Inflator Circuit Resistance Low - Loop No. 1, Front Driver Side) ♦ 2293_29_OD (Air Bag Circuit Open - Loop No. 1, Front Driver Side) • **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the driver air bag module loop 1 circuits shorted together, a low resistance fault would normally be retrieved for loop 1. Loop 2 and canister vent will show an open circuit fault. • **Did the driver air bag module loop 1 on-demand fault PIDs change from indicating a open circuit to a low resistance fault?**	**Yes** GO to H77 . **No** GO to H8 .
H8 CHECK THE DRIVER AIR BAG MODULE LOOP 1 FAULT PIDs (2293_29_OD) AND (2293_28_OD) FOR A CHANGE IN FAULT STATUS (CLOCKSPRING DISCONNECTED)	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF.	**Yes** GO to H79 . **No** GO to H9 .

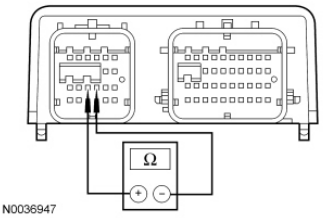
tomsn048@gmail.com

• Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the jumper wire from driver air bag module loop 1 C216a. • Disconnect: Clockspring C218a . • Connect a fused jumper wire between clockspring C218a-1, circuit CR101 (VT/BN), harness side and clockspring C218a-9, circuit RR101 (YE/GN), harness side. • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record The Following Fault PIDs . ♦ 2293_28_OD (Air Bag Inflator Circuit Resistance Low - Loop No. 1, Front Driver Side) ♦ 2293_29_OD (Air Bag Circuit Open - Loop No. 1, Front Driver Side) • **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the driver air bag module loop 1 circuits shorted together, a low resistance fault would normally be retrieved for loop 1. Loop 2 and canister vent will show an open circuit fault. • **Did the driver air bag module loop 1 on-demand fault PIDs change from indicating a open circuit to a low resistance fault?**	
H9 CHECK THE DRIVER AIR BAG MODULE LOOP 1 CIRCUITS FOR AN OPEN BETWEEN THE CLOCKSPRING AND RCM	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the jumper wire from the clockspring C218a. • Disconnect: RCM C310a and C310b . • Measure resistance between RCM C310a, harness side and clockspring C218a, harness side using the following chart. **RCM** / **Circuit** / **Clockspring** C310a-4 / CR101 (VT/BN) / C218a-1 C310a-3 / RR101 (YE/GN) / C218a-9	**Yes** GO to H80 . **No** REPAIR circuit CR101 (VT/BN) or RR101 (YE/GN). GO to H88 .

 • **Are resistances less than 0.5 ohm?**	
H10 CHECK THE DRIVER AIR BAG MODULE LOOP 1 FAULT PIDs (2293_31_OD) AND (2293_29_OD) FOR A CHANGE IN FAULT STATUS	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the driver air bag module. Refer to Driver Air Bag Module in this section. • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record The Following Fault PIDs . ♦ 2293_29_OD (Air Bag Circuit Open - Loop No. 1, Front Driver Side) ♦ 2293_31_OD (Air Bag Circuit Short to Ground - Loop No. 1, Front Driver Side) • **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the driver air bag module disconnected, open circuit faults would normally be retrieved for loop 1, loop 2 and canister vent. • **Did the driver air bag module loop 1 on-demand fault PIDs change from indicating a short to ground to an open circuit fault?**	**Yes** GO to H77 . **No** GO to H11 .
H11 CHECK THE DRIVER AIR BAG MODULE LOOP 1 FAULT PIDs (2293_31_OD) AND (2293_29_OD) FOR A CHANGE IN FAULT STATUS (CLOCKSPRING DISCONNECTED)	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different	**Yes** GO to H79 .

tomsn048@gmail.com

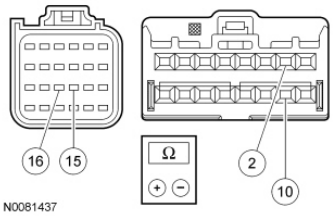
fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Clockspring C218a . • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record The Following Fault PIDs . ♦ 2293_29_OD (Air Bag Circuit Open - Loop No. 1, Front Driver Side) ♦ 2293_31_OD (Air Bag Circuit Short to Ground - Loop No. 1, Front Driver Side) • **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the clockspring disconnected, open circuit faults would normally be retrieved for loop 1, loop 2 and canister vent. • **Did the driver air bag module loop 1 on-demand fault PIDs change from indicating a short to ground to an open circuit fault?**	**No** GO to H12 .
H12 CHECK DRIVER AIR BAG MODULE LOOP 1 CIRCUITS FOR A SHORT TO GROUND	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310a and C310b . • Measure resistance between clockspring: ♦ C218a-1, circuit CR101 (VT/BN), harness side and ground. ♦ C218a-9, circuit RR101 (YE/GN), harness side and ground.  N0055542 • **Are resistances greater than 10,000 ohms?**	**Yes** GO to H80 . **No** Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar. REPAIR circuit CR101 (VT/BN) or RR101 (YE/GN). GO to H88 .
H13 CHECK THE DRIVER AIR BAG MODULE LOOP 1 FAULT PIDs (2293_30_OD) AND (2293_29_OD) FOR A	



CHANGE IN FAULT STATUS (CLOCKSPRING DISCONNECTED)	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the driver air bag module. Refer to Driver Air Bag Module in this section. • Disconnect: Clockspring C218a . • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record The Following Fault PIDs . ♦ 2293_29_OD (Air Bag Circuit Open - Loop No. 1, Front Driver Side) ♦ 2293_30_OD (Air Bag Circuit Short to Battery - Loop No. 1, Front Driver Side) • **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the driver air bag module/clockspring disconnected, open circuit faults would normally be retrieved for loop 1, loop 2 and canister vent. • **Did the driver air bag module loop 1 on-demand fault PIDs change from indicating a short to battery to an open circuit fault?**	**Yes** GO to H79 . **No** GO to H14 .
H14 CHECK DRIVER AIR BAG MODULE LOOP 1 CIRCUITS FOR A SHORT TO VOLTAGE (CLOCKSPRING DISCONNECTED)	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310a and C310b . • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Measure voltage between clockspring: ♦ C218a-1, circuit CR101 (VT/BN), harness side and ground.	**Yes** Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar. REPAIR circuit CR101 (VT/BN) or RR101 (YE/GN). GO to H88 . **No** GO to H80 .

tomsn048@gmail.com

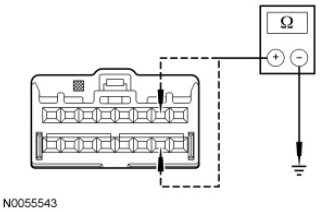
♦ C218a-9, circuit RR101 (YE/GN), harness side and ground.  • **Is voltage present on either circuit?**	
H15 CHECK THE DRIVER AIR BAG MODULE LOOP 2 RESISTANCE PID (D_ABAGR2)	
• Enter the following diagnostic mode on the scan tool: DataLogger - RCM - PID . • Enter the following diagnostic mode on the scan tool: D_ABAGR2 (Driver Air Bag #2 Resistance) Resistance PID . • **Does the resistance PID value read between 1.31 and 4.29 ohms?**	**Yes** GO to H80 . **No** GO to H16 .
H16 CHECK THE DRIVER AIR BAG MODULE LOOP 2 RESISTANCE PID (D_ABAGR2) WHILE CARRYING OUT A HARNESS TEST	
• **NOTE:** Do not remove the driver air bag module from its mounted position at this time. • With the driver air bag in its mounted position, continue monitoring the D_ABAGR2 (Driver Air Bag #2 Resistance) resistance PID while carrying out a harness test of the driver air bag circuits and accessible connectors (including any inline connectors), by wiggling and flexing the wire harness, connectors, tilting and rotating the steering wheel frequently. • **Does the resistance PID value read between 1.31 and 4.29 ohms while carrying out the harness test?**	**Yes** DEPOWER the SRS and REPAIR the connector, terminals or wire harness or INSTALL a new clockspring as needed. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to H88 . **No** If the driver air bag module loop 2 resistance PID is less than 1.31 ohms, GO to H17 . If the driver air bag module loop 2 resistance PID is greater than 4.29 ohms, GO to H20 .
H17 CHECK THE DRIVER AIR BAG MODULE LOOP 2 FAULT PIDs (2293_20_OD) AND (2293_21_OD) FOR A CHANGE IN FAULT STATUS	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not	**Yes** GO to H77 . **No** GO to H18 .



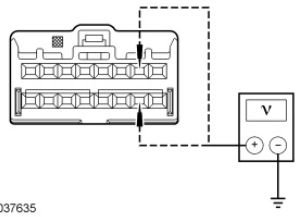
the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the driver air bag module. Refer to Driver Air Bag Module in this section. • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record The Following Fault PIDs . ♦ 2293_20_OD (Air Bag Inflator Circuit Resistance Low - Loop No. 2, Front Driver Side) ♦ 2293_21_OD (Air Bag Circuit Open - Loop No. 2, Front Driver Side) • **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the driver air bag module disconnected, open circuit faults would normally be retrieved for loop 1, loop 2 and canister vent. • **Did the driver air bag module loop 2 on-demand fault PIDs change from indicating a low resistance to an open circuit fault?**	
H18 CHECK THE DRIVER AIR BAG MODULE LOOP 2 FAULT PIDs (2293_20_OD) AND (2293_21_OD) FOR A CHANGE IN FAULT STATUS (CLOCKSPRING DISCONNECTED)	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Disconnect: Clockspring C218a . • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record The Following Fault PIDs . ♦ 2293_20_OD (Air Bag Inflator Circuit Resistance Low - Loop No. 2, Front Driver Side) ♦ 2293_21_OD (Air Bag Circuit Open - Loop No. 2, Front Driver Side)	**Yes** GO to H79 . **No** GO to H19 .

tomsn048@gmail.com

• **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the driver air bag module/clockspring disconnected, open circuit faults would normally be retrieved for loop 1, loop 2 and canister vent. • **Did the driver air bag module loop 2 on-demand fault PIDs change from indicating a low resistance to an open circuit fault?**	
H19 CHECK THE RCM FOR LOW RESISTANCE	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310a and C310b . • Measure resistance between RCM C310a pin 15 and C310a pin 16, component side.  • **Is resistance greater than 10,000 ohms?**	**Yes** REPAIR circuits CR102 (BU) and RR102 (WH). GO to H88 . **No** GO to H80 .
H20 CHECK THE DRIVER AIR BAG MODULE LOOP 2 FAULT PIDs (2293_21_OD) AND (2293_20_OD) FOR A CHANGE IN FAULT STATUS	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the driver air bag module. Refer to Driver Air Bag Module in this section. • Connect a fused jumper wire between driver air bag module loop 2 C216b-1, harness side and C216b-2, harness side. • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM .	**Yes** GO to H77 . **No** GO to H21 .



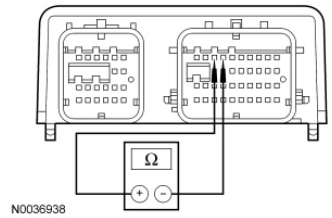
• Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record The Following Fault PIDs . ♦ 2293_20_OD (Air Bag Inflator Circuit Resistance Low - Loop No. 2, Front Driver Side) ♦ 2293_21_OD (Air Bag Circuit Open - Loop No. 2, Front Driver Side) • **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the driver air bag module loop 2 circuits shorted together, a low resistance fault would normally be retrieved for loop 2. Loop 1 and canister vent will show an open circuit fault. • **Did the driver air bag module loop 2 on-demand fault PIDs change from indicating an open circuit to a low resistance fault?**	
H21 CHECK THE DRIVER AIR BAG MODULE LOOP 2 FAULT PIDs (2293_21_OD) AND (2293_20_OD) FOR A CHANGE IN FAULT STATUS (CLOCKSPRING DISCONNECTED)	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Remove the jumper wire from driver air bag module loop 2 C216b. • Disconnect: Clockspring C218a . • Connect a fused jumper wire between clockspring C218a-2, circuit CR102 (BU), harness side and clockspring C218a-10, circuit RR102 (WH), harness side. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record The Following Fault PIDs . ♦ 2293_20_OD (Air Bag Inflator Circuit Resistance Low - Loop No. 2, Front Driver Side) ♦ 2293_21_OD (Air Bag Circuit Open - Loop No. 2, Front Driver Side) • **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the driver air bag module loop 2 circuits shorted together, a low resistance fault would normally be retrieved for loop 2. Loop 1 and canister vent will show an open circuit fault. • **Did the driver air bag module loop 2 on-demand fault PIDs change from indicating an open circuit to a low resistance fault?**	**Yes** GO to H79 . **No** GO to H22 .



tomsn048@gmail.com

H22 CHECK THE DRIVER AIR BAG MODULE LOOP 2 CIRCUITS FOR AN OPEN BETWEEN THE CLOCKSPRING AND RCM	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the jumper wire from the clockspring C218a. • Disconnect: RCM C310a and C310b . • Measure resistance between RCM C310a, harness side and clockspring C218a, harness side using the following chart. **RCM** / **Circuit** / **Clockspring** C310a-16 / CR102 (BU) / C218a-2 C310a-15 / RR102 (WH) / C218a-10  • **Are resistances less than 0.5 ohm?**	**Yes** GO to H80 . **No** REPAIR circuit CR102 (BU) or RR102 (WH). GO to H88 .
H23 CHECK THE DRIVER AIR BAG MODULE LOOP 2 FAULT PIDs (2293_23_OD) AND (2293_21_OD) FOR A CHANGE IN FAULT STATUS	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the driver air bag module. Refer to Driver Air Bag Module in this section. • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM .	**Yes** GO to H77 . **No** GO to H24 .

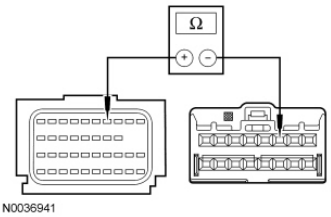
• Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record The Following Fault PIDs . ♦ 2293_21_OD (Air Bag Circuit Open - Loop No. 2, Front Driver Side) ♦ 2293_23_OD (Air Bag Circuit Short to Ground - Loop No. 2, Front Driver Side) • **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the driver air bag module disconnected, open circuit faults would normally be retrieved for loop 1, loop 2 and canister vent. • **Did the driver air bag module loop 2 on-demand fault PIDs change from indicating a short to ground to an open circuit fault?**	
H24 CHECK THE DRIVER AIR BAG MODULE LOOP 2 FAULT PIDs (2293_23_OD) AND (2293_21_OD) FOR A CHANGE IN FAULT STATUS (CLOCKSPRING DISCONNECTED)	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Disconnect: Clockspring C218a . • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record The Following Fault PIDs . ♦ 2293_21_OD (Air Bag Circuit Open - Loop No. 2, Front Driver Side) ♦ 2293_23_OD (Air Bag Circuit Short to Ground - Loop No. 2, Front Driver Side) • **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the driver air bag module disconnected, open circuit faults would normally be retrieved for loop 1 and loop 2. • **Did the driver air bag module loop 2 on-demand fault PIDs change from indicating a short to ground to an open circuit fault?**	**Yes** GO to H79 . **No** GO to H25 .
H25 CHECK DRIVER AIR BAG MODULE LOOP 2 CIRCUITS FOR A SHORT TO GROUND (CLOCKSPRING DISCONNECTED)	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310a and C310b .	**Yes** GO to H80 . **No** Due to the shorting bar feature in the RCM electrical connector, the fault can



tomsn048@gmail.com

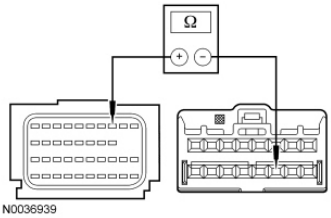
• Measure resistance between clockspring: ♦ C218a-2, circuit CR102 (BU), harness side and ground. ♦ C218a-10, circuit RR102 (WH), harness side and ground.  N0055543 • **Are resistances greater than 10,000 ohms?**	exist in either circuit. Do not remove or defeat the shorting bar. REPAIR circuit CR102 (BU) or RR102 (WH). GO to H88 .
H26 CHECK THE DRIVER AIR BAG MODULE LOOP 2 FAULT PIDs (2293_22_OD) AND (2293_21_OD) FOR A CHANGE IN FAULT STATUS (CLOCKSPRING DISCONNECTED)	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the driver air bag module. Refer to Driver Air Bag Module in this section. • Disconnect: Clockspring C218a . • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record The Following Fault PIDs . ♦ 2293_21_OD (Air Bag Circuit Open - Loop No. 2, Front Driver Side) ♦ 2293_22_OD (Air Bag Circuit Short to Battery - Loop No. 2, Front Driver Side) • **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the driver air bag module/clockspring disconnected, open circuit faults would normally be retrieved for loop 1 and loop 2. • **Did the driver air bag module loop 2 on-demand fault PIDs change from indicating a short to battery to an open circuit fault?**	**Yes** GO to H79 . **No** GO to H27 .

H27 CHECK DRIVER AIR BAG MODULE LOOP 2 CIRCUITS FOR A SHORT TO VOLTAGE (CLOCKSPRING DISCONNECTED)	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310a and C310b . • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Measure voltage between clockspring: ♦ C218a-2, circuit CR102 (BU), harness side and ground. ♦ C218a-10, circuit RR102 (WH), harness side and ground.  • **Is voltage present on either circuit?**	**Yes** Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar. REPAIR circuit CR102 (BU) or RR102 (WH). GO to H88 . **No** GO to H80 .
H28 CHECK THE DRIVER AIR BAG MODULE CANISTER VENT RESISTANCE PID (D_VENT)	
• Enter the following diagnostic mode on the scan tool: DataLogger - RCM - PID . • Enter the following diagnostic mode on the scan tool: D_VENT (Airbag Canister Vent Resistance, Driver Side) Resistance PID . • **Does the resistance PID value read between 1.31 and 4.29 ohms?**	**Yes** GO to H80 . **No** GO to H29 .
H29 CHECK THE DRIVER AIR BAG MODULE CANISTER VENT RESISTANCE PID (D_VENT) WHILE CARRYING OUT A HARNESS TEST	
• **NOTE:** Do not remove the driver air bag module from its mounted position at this time. • With the driver air bag in its mounted position, continue monitoring the D_VENT (Airbag Canister Vent Resistance, Driver Side) resistance PID while carrying out a harness test of the driver air bag circuits and accessible connectors (including any inline connectors) by wiggling and flexing the wire harness, connectors, tilting and rotating the steering wheel frequently. • **Does the resistance PID value read between 1.31 and 4.29 ohms while carrying out the harness test?**	**Yes** DEPOWER the SRS and REPAIR the connector, terminals or wire harness or INSTALL a new clockspring as needed. REFER to Clockspring in this section. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to H88 .

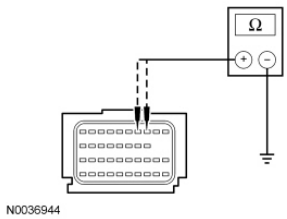


tomsn048@gmail.com

	No If the driver air bag module canister vent resistance PID is less than 1.31 ohms, GO to H30 . If the driver air bag module canister vent resistance PID is greater than 4.29 ohms, GO to H33 .
H30 CHECK THE DRIVER AIR BAG MODULE CANISTER VENT FAULT PIDs (2293_12_OD) AND (2293_13_OD) FOR A CHANGE IN FAULT STATUS	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the driver air bag module. Refer to Driver Air Bag Module in this section. • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record The Following Fault PIDs . ♦ 2293_12_OD (Air bag Driver Front Can Vent Circuit Resist. Low on Squib) ♦ 2293_13_OD (Air bag Driver Front Can Vent Open) • **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the driver air bag module disconnected, open circuit faults would normally be retrieved for loop 1, loop 2 and canister vent. • **Did the driver air bag module canister vent on-demand fault PIDs change from indicating a low resistance to an open circuit fault?**	**Yes** GO to H77 . **No** GO to H31 .
H31 CHECK THE DRIVER AIR BAG MODULE CANISTER VENT FAULT PIDs (2293_12_OD) AND (2293_13_OD) FOR A CHANGE IN FAULT STATUS (DRIVER AIR BAG REMOVED)	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not	**Yes** GO to H79 . **No** GO to H32 .



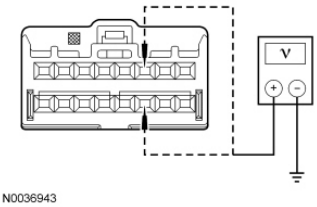
the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Clockspring C218a . • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record The Following Fault PIDs . ♦ 2293_12_OD (Air bag Driver Front Can Vent Circuit Resist. Low on Squib) ♦ 2293_13_OD (Air bag Driver Front Can Vent Open) • **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the driver air bag module disconnected, open circuit faults would normally be retrieved for loop 1, loop 2 and canister vent. • **Did the driver air bag module canister vent on-demand fault PIDs change from indicating a low resistance to an open circuit fault?**	
H32 CHECK THE RCM FOR LOW RESISTANCE	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310a and C310b . • Measure resistance between RCM C310b pin 3 and C310b pin 4, component side.  • **Is resistance greater than 10,000 ohms?**	**Yes** REPAIR circuits CR143 (VT) and RR143 (BU/GN). GO to H88 . **No** GO to H80 .
H33 CHECK THE DRIVER AIR BAG MODULE CANISTER VENT FAULT PIDs (2293_12_OD) AND (2293_13_OD) FOR A CHANGE IN FAULT STATUS	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this	**Yes** GO to H77 . **No**



tomsn048@gmail.com

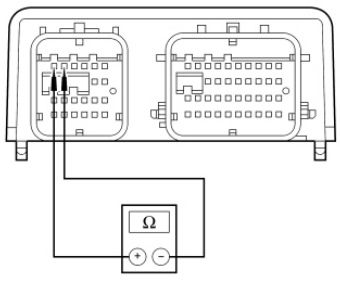
indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the driver air bag module. Refer to Driver Air Bag Module in this section. • Connect a fused jumper wire between driver air bag module C216c-1, harness side and C216c-2, harness side. • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record The Following Fault PIDs . ♦ 2293_12_OD (Air bag Driver Front Can Vent Circuit Resist. Low on Squib) ♦ 2293_13_OD (Air bag Driver Front Can Vent Open) • **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the driver air bag module canister vent circuits shorted together, a low resistance fault would normally be retrieved. Loop 1 and loop 2 will show an open circuit fault. • **Did the driver air bag module canister vent on-demand fault PIDs change from indicating a open circuit to a low resistance fault?**	GO to H34 .
H34 CHECK THE DRIVER AIR BAG MODULE CANISTER VENT FAULT PIDs (2293_12_OD) AND (2293_13_OD) FOR A CHANGE IN FAULT STATUS (CLOCKSPRING DISCONNECTED)	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the jumper wire from driver air bag module C216c. • Disconnect: Clockspring C218a . • Connect a fused jumper wire between clockspring C218a-3, circuit CR143 (VT), harness side and clockspring C218a-11, circuit RR143 (BU/GN), harness	**Yes** GO to H79 . **No** GO to H35 .

side. • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record The Following Fault PIDs . ♦ 2293_12_OD (Air bag Driver Front Can Vent Circuit Resist. Low on Squib) ♦ 2293_13_OD (Air bag Driver Front Can Vent Open) • **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the driver air bag module canister vent circuits shorted together, a low resistance fault would normally be retrieved. Loop 1 and loop 2 will show an open circuit fault. • **Did the driver air bag module canister vent on-demand fault PIDs change from indicating a open circuit to a low resistance fault?**	
H35 CHECK THE DRIVER AIR BAG MODULE CANISTER VENT CIRCUITS FOR AN OPEN BETWEEN THE CLOCKSPRING AND RCM	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the jumper wire from the clockspring C218a. • Disconnect: RCM C310a and C310b . • Measure resistance between RCM C310b-4, circuit CR143 (VT), harness side and clockspring C218a-3, circuit CR143 (VT), harness side.  N0036941 • Measure resistance between RCM C310b-3, circuit RR143 (BU/GN), harness side and clockspring C218a-11, circuit RR143 (BU/GN), harness side.	**Yes** GO to H80 . **No** REPAIR circuit CR143 (VT) or RR143 (BU/GN). GO to H88 .



tomsn048@gmail.com

 • **Are resistances less than 0.5 ohm?**	
H36 CHECK THE DRIVER AIR BAG MODULE CANISTER VENT FAULT PIDs (2293_15_OD) AND (2293_13_OD) FOR A CHANGE IN FAULT STATUS	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the driver air bag module. Refer to Driver Air Bag Module in this section. • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record The Following Fault PIDs . ♦ 2293_13_OD (Air bag Driver Front Can Vent Open) ♦ 2293_15_OD (Air bag Driver Front Can Vent Short to Ground) • **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the driver air bag module disconnected, open circuit faults would normally be retrieved for loop 1, loop 2 and canister vent. • **Did the driver air bag module canister vent on-demand fault PIDs change from indicating a short to ground to an open circuit fault?**	**Yes** GO to H77 . **No** GO to H37 .
H37 CHECK THE DRIVER AIR BAG MODULE CANISTER VENT FAULT PIDs (2293_15_OD) AND (2293_13_OD) FOR A CHANGE IN FAULT STATUS (CLOCKSPRING DISCONNECTED)	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.	**Yes** GO to H79 . **No** GO to H38 .

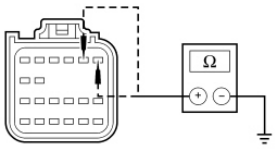


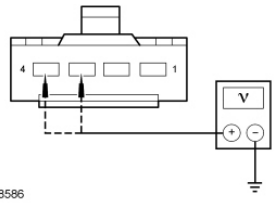
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Clockspring C218a . • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record The Following Fault PIDs . ♦ 2293_13_OD (Air bag Driver Front Can Vent Open) ♦ 2293_15_OD (Air bag Driver Front Can Vent Short to Ground) • **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the driver air bag module disconnected, open circuit faults would normally be retrieved for loop 1, loop 2 and canister vent. • **Did the driver air bag module canister vent on-demand fault PIDs change from indicating a short to ground to an open circuit fault?**	
H38 CHECK DRIVER AIR BAG MODULE CANISTER VENT CIRCUITS FOR A SHORT TO GROUND (CLOCKSPRING DISCONNECTED)	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310a and C310b . • Measure resistance between RCM : ♦ C310b-4, circuit CR143 (VT), harness side and ground. ♦ C310b-3, circuit RR143 (BU/GN), harness side and ground.  • **Are resistances greater than 10,000 ohms?**	**Yes** GO to H80 . **No** Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar. REPAIR circuit CR143 (VT) or RR143 (BU/GN). GO to H88 .
H39 CHECK THE DRIVER AIR BAG MODULE CANISTER VENT FAULT PIDs (2293_14_OD) AND (2293_13_OD) FOR A CHANGE IN FAULT STATUS (CLOCKSPRING DISCONNECTED)	

tomsn048@gmail.com

NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the driver air bag module. Refer to Driver Air Bag Module in this section. • Disconnect: Clockspring C218a . • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record The Following Fault PIDs . ♦ 2293_13_OD (Air bag Driver Front Can Vent Open) ♦ 2293_14_OD (Air bag Driver Front Can Vent Short to Battery) • **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the driver air bag module/clockspring disconnected, open circuit faults would normally be retrieved for loop 1, loop 2 and canister vent. • **Did the driver air bag module canister vent on-demand fault PIDs change from indicating a short to battery to an open circuit fault?**	**Yes** GO to H79 . **No** GO to H40 .
H40 CHECK DRIVER AIR BAG MODULE CANISTER VENT CIRCUITS FOR A SHORT TO VOLTAGE (CLOCKSPRING DISCONNECTED)	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310a and C310b . • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Measure voltage between clockspring: ♦ C218a-3, circuit CR143 (VT), harness side and ground. ♦ C218a-11, circuit RR143 (BU/GN), harness side and ground.	**Yes** Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar. REPAIR circuit CR143 (VT) or RR143 (BU/GN). GO to H88 . **No** GO to H80 .

 N0036943 • **Is voltage present on either circuit?**	
H41 CHECK THE PASSENGER AIR BAG MODULE LOOP 1 RESISTANCE PID (P_ABAGR)	
• Enter the following diagnostic mode on the scan tool: DataLogger - RCM - PID . • Enter the following diagnostic mode on the scan tool: P_ABAGR (Passenger Air Bag) Resistance PID . • **Does the resistance PID value read between 1.31 and 4.29 ohms?**	**Yes** GO to H80 . **No** GO to H42 .
H42 CHECK THE PASSENGER AIR BAG MODULE LOOP 1 RESISTANCE PID (P_ABAGR) WHILE CARRYING OUT A HARNESS TEST	
• **NOTE:** Do not remove the passenger air bag module from its mounted position at this time. • With the passenger air bag in its mounted position, continue monitoring the P_ABAGR (Passenger Air Bag) resistance PID while carrying out a harness test of the passenger air bag module circuits and accessible connectors (including any inline connectors), by wiggling connectors and flexing the wire harness. • **Does the resistance PID value read between 1.31 and 4.29 ohms while carrying out the harness test?**	**Yes** DEPOWER the SRS and REPAIR the connector, terminals or wire harness as needed. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to H88 . **No** If the passenger air bag module loop 1 resistance PID is less than 1.31 ohms, GO to H43 . If the passenger air bag module loop 1 resistance PID is greater than 4.29 ohms, GO to H45 .
H43 CHECK THE PASSENGER AIR BAG MODULE LOOP 1 FAULT PIDs (2293_24_OD) AND (2293_25_OD) FOR A CHANGE IN FAULT STATUS	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.	**Yes** GO to H78 . **No** GO to H44 .

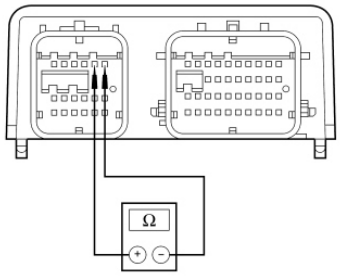




tomsn048@gmail.com

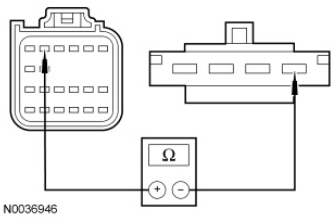
• Disconnect: Passenger Air Bag Module C256 . • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record The Following Fault PIDs . ♦ 2293_24_OD (Air Bag Inflator Circuit Resistance Low - Loop No. 1, Front Passenger Side) ♦ 2293_25_OD (Air Bag Circuit Open - Loop No. 1, Front Passenger Side) • **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the passenger air bag module disconnected, open circuit faults would normally be retrieved for loop 1 and loop 2. • **Did the passenger air bag module loop 1 on-demand fault PIDs change from indicating a low resistance to an open circuit fault?**	
H44 CHECK THE RCM FOR LOW RESISTANCE	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310a and C310b . • Measure resistance between RCM C310a pin 1 and C310a pin 2, component side.  A0041266 • **Is resistance greater than 10,000 ohms?**	**Yes** REPAIR circuits CR103 (GY/BU) and RR103 (VT/GN). GO to H88 . **No** GO to H80 .
H45 CHECK THE PASSENGER AIR BAG MODULE LOOP 1 FAULT PIDs (2293_25_OD) AND (2293_24_OD) FOR A CHANGE IN FAULT STATUS	
	Yes GO to H78 .

NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Air Bag Module C256 . • Connect a fused jumper wire between passenger air bag module C256-3, circuit CR103 (GY/BU), harness side and C256-4, circuit RR103 (VT/GN), harness side. • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record The Following Fault PIDs . ♦ 2293_24_OD (Air Bag Inflator Circuit Resistance Low - Loop No. 1, Front Passenger Side) ♦ 2293_25_OD (Air Bag Circuit Open - Loop No. 1, Front Passenger Side) • **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the passenger air bag module loop 1 circuits shorted together, a low resistance fault would normally be retrieved for loop 1. Loop 2 will show an open circuit fault due to the passenger air bag being disconnected. • **Did the passenger air bag module loop 1 on-demand fault PIDs change from indicating an open circuit to a low resistance fault?**	**No** GO to H46 .
H46 CHECK THE PASSENGER AIR BAG MODULE LOOP 1 CIRCUITS FOR AN OPEN	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the jumper wire from passenger air bag module C256. • Disconnect: RCM C310a and C310b . • Measure resistance between RCM C310a-1, circuit CR103 (GY/BU), harness side and passenger air bag module C256-3, circuit CR103 (GY/BU), harness side.	**Yes** GO to H80 . **No** REPAIR circuit CR103 (GY/BU) or RR103 (VT/GN). GO to H88 .

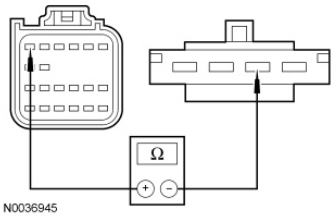


tomsn048@gmail.com

 • Measure resistance between RCM C310a-2, circuit RR103 (VT/GN), harness side and passenger air bag module C256-4, circuit RR103 (VT/GN), harness side.  • **Are resistances less than 0.5 ohm?**	
H47 CHECK THE PASSENGER AIR BAG MODULE LOOP 1 FAULT PIDs (2293_27_OD) AND (2293_25_OD) FOR A CHANGE IN FAULT STATUS	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Air Bag Module C256 . • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record The Following Fault PIDs . ♦ 2293_25_OD (Air Bag Circuit Open - Loop No. 1, Front Passenger Side) ♦ 2293_27_OD (Air Bag Circuit Short to Ground - Loop No. 1, Front Passenger Side) • **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the passenger air bag module disconnected, open circuit faults would normally be retrieved for loop 1 and loop 2. • **Did the passenger air bag module loop 1 on-demand fault PIDs change from indicating a short to ground**	**Yes** GO to H78 . **No** GO to H48 .

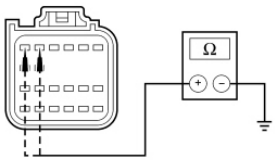


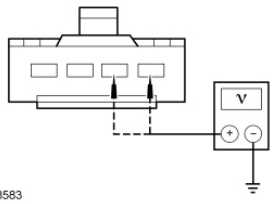
to an open circuit fault?	
H48 CHECK PASSENGER AIR BAG MODULE LOOP 1 CIRCUITS FOR A SHORT TO GROUND	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310a and C310b . • Measure resistance between RCM : ♦ C310a-1, circuit CR103 (GY/BU), harness side and ground. ♦ C310a-2, circuit RR103 (VT/GN), harness side and ground.  A0041212 • **Are resistances greater than 10,000 ohms?**	**Yes** GO to H80 . **No** Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar. REPAIR circuit CR103 (GY/BU) or RR103 (VT/GN). GO to H88 .
H49 CHECK PASSENGER AIR BAG MODULE LOOP 1 CIRCUITS FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Air Bag Module C256 . • Disconnect: RCM C310a and C310b . • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Measure voltage between passenger air bag module: ♦ C256-3, circuit CR103 (GY/BU), harness side and ground. ♦ C256-4, circuit RR103 (VT/GN), harness side and ground.  A0088586 • **Is voltage present on either circuit?**	**Yes** Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar. REPAIR circuit CR103 (GY/BU) or RR103 (VT/GN). GO to H88 . **No** GO to H80 .
H50 CHECK PASSENGER AIR BAG MODULE LOOP 2 RESISTANCE PID (P_ABAGR2)	



tomsn048@gmail.com

• Enter the following diagnostic mode on the scan tool: DataLogger - RCM - PID . • Enter the following diagnostic mode on the scan tool: P_ABAGR2 (Passenger Side Air Bag #2 Resistance) Resistance PID . • **Does the resistance PID value read between 1.31 and 4.29 ohms?**	**Yes** GO to H80 . **No** GO to H51 .
H51 CHECK PASSENGER AIR BAG MODULE LOOP 2 RESISTANCE PID (P_ABAGR2) WHILE CARRYING OUT A HARNESS TEST	
• **NOTE:** Do not remove the passenger air bag module from its mounted position at this time. • With the passenger air bag in its mounted position, continue monitoring the P_ABAGR2 (Passenger Side Air Bag #2 Resistance) resistance PID while carrying out a harness test of the passenger air bag module circuits and accessible connectors (including any inline connectors), by wiggling connectors and flexing the wire harness. • **Does the resistance PID value read between 1.31 and 4.29 ohms while carrying out the harness test?**	**Yes** DEPOWER the SRS and REPAIR the connector, terminals or wire harness as needed. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to H88 . **No** If the passenger air bag module loop 2 resistance PID is less than 1.31 ohms, GO to H52 . If the passenger air bag module loop 2 resistance PID is greater than 4.29 ohms, GO to H54 .
H52 CHECK PASSENGER AIR BAG MODULE LOOP 2 FAULT PIDs (2293_16_OD) AND (2293_17_OD) FOR A CHANGE IN FAULT STATUS	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Air Bag Module C256 . • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record The Following Fault PIDs .	**Yes** GO to H78 . **No** GO to H53 .



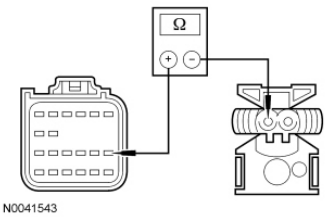


♦ 2293_16_OD (Air Bag Inflator Circuit Resistance Low - Loop No. 2, Front Passenger Side) ♦ 2293_17_OD (Air Bag Circuit Open - Loop No. 2, Front Passenger Side) • **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the passenger air bag module disconnected, open circuit faults would normally be retrieved for loop 1 and loop 2. • **Did the passenger air bag module loop 2 on-demand fault PIDs change from indicating a low resistance to an open circuit fault?**	
H53 CHECK THE RCM FOR LOW RESISTANCE	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310a and C310b . • Measure resistance between RCM C310a pin 5 and C310a pin 6, component side.  A0041276 • **Is resistance greater than 10,000 ohms?**	**Yes** REPAIR circuits CR104 (YE/GY) and RR104 (WH/BU). GO to H88 . **No** GO to H80 .
H54 CHECK PASSENGER AIR BAG MODULE LOOP 2 FAULT PIDs (2293_17_OD) AND (2293_16_OD) FOR A CHANGE IN FAULT STATUS	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Air Bag Module C256 .	**Yes** GO to H78 . **No** GO to H55 .

tomsn048@gmail.com

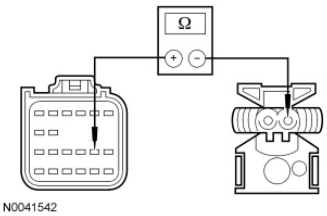
• Connect a fused jumper wire between passenger air bag module C256-1, circuit CR104 (YE/GY), harness side and C256-2, circuit RR104 (WH/BU), harness side. • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record The Following Fault PIDs . ♦ 2293_16_OD (Air Bag Inflator Circuit Resistance Low - Loop No. 2, Front Passenger Side) ♦ 2293_17_OD (Air Bag Circuit Open - Loop No. 2, Front Passenger Side) • **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the passenger air bag module loop 2 circuits shorted together, a low resistance fault would normally be retrieved for loop 2. Loop 1 will show an open circuit fault due to the passenger air bag module being disconnected. • **Did the passenger air bag module loop 2 on-demand fault PIDs change from indicating an open circuit to a low resistance fault?**	
H55 CHECK PASSENGER AIR BAG MODULE LOOP 2 CIRCUITS FOR AN OPEN	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the jumper wire from passenger air bag module C256. • Disconnect: RCM C310a and C310b . • Measure resistance between RCM C310a-5, circuit CR104 (YE/GY), harness side and passenger air bag module C256-1, circuit CR104 (YE/GY), harness side.  • Measure resistance between RCM C310a-6, circuit RR104 (WH/BU), harness side and passenger air bag module C256-2, circuit RR104 (WH/BU), harness side.	**Yes** GO to H80 . **No** REPAIR circuit CR104 (YE/GY) or RR104 (WH/BU). GO to H88 .

 • **Are resistances less than 0.5 ohm?**	
H56 CHECK PASSENGER AIR BAG MODULE LOOP 2 FAULT PIDs (2293_19_OD) AND (2293_17_OD) FOR A CHANGE IN FAULT STATUS	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Air Bag Module C256 . • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record The Following Fault PIDs . ♦ 2293_17_OD (Air Bag Circuit Open - Loop No. 2, Front Passenger Side) ♦ 2293_19_OD (Air Bag Circuit Short to Ground - Loop No. 2, Front Passenger Side) • **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the passenger air bag module disconnected, open circuit faults would normally be retrieved for loop 1 and loop 2. • **Did the passenger air bag module loop 2 on-demand fault PIDs change from indicating a short to ground to an open circuit fault?**	**Yes** GO to H78 . **No** GO to H57 .
H57 CHECK PASSENGER AIR BAG MODULE LOOP 2 CIRCUITS FOR A SHORT TO GROUND	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310a and C310b . • Measure resistance between RCM :	**Yes** GO to H80 . **No** Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or

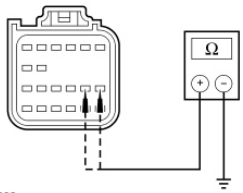


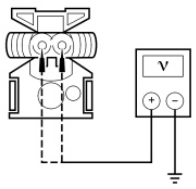
tomsn048@gmail.com

♦ C310a-5, circuit CR104 (YE/GY), harness side and ground. ♦ C310a-6, circuit RR104 (WH/BU), harness side and ground.  A0041272 • **Are resistances greater than 10,000 ohms?**	defeat the shorting bar. REPAIR circuit CR104 (YE/GY) or RR104 (WH/BU). GO to H88 .
H58 CHECK PASSENGER AIR BAG MODULE LOOP 2 CIRCUITS FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Air Bag Module C256 . • Disconnect: RCM C310a and C310b . • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Measure voltage between passenger air bag module: ♦ C256-1, circuit CR104 (YE/GY), harness side and ground. ♦ C256-2, circuit RR104 (WH/BU), harness side and ground.  A0088583 • **Is voltage present on either circuit?**	**Yes** Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar. REPAIR circuit CR104 (YE/GY) or RR104 (WH/BU). GO to H88 . **No** GO to H80 .
H59 CHECK THE PASSENGER AIR BAG MODULE ADAPTIVE TETHER RESISTANCE PID (P_TETHER)	
• Enter the following diagnostic mode on the scan tool: DataLogger - RCM - PID . • Enter the following diagnostic mode on the scan tool: P_TETHER (Passenger Side Adaptive Tether Resistance) Resistance PID . • **Does the resistance PID value read between 1.31 and 4.29 ohms?**	**Yes** GO to H80 . **No** GO to H60 .
H60 CHECK THE PASSENGER AIR BAG MODULE ADAPTIVE TETHER RESISTANCE PID (P_TETHER)	



WHILE CARRYING OUT A HARNESS TEST	
• **NOTE:** Do not remove the passenger air bag module from its mounted position at this time. • With the passenger air bag in its mounted position, continue monitoring the P_TETHER (Passenger Side Adaptive Tether Resistance) resistance PID while carrying out a harness test of the passenger air bag module circuits and accessible connectors (including any inline connectors), by wiggling connectors and flexing the wire harness. • **Does the resistance PID value read between 1.31 and 4.29 ohms while carrying out the harness test?**	**Yes** DEPOWER the SRS and REPAIR the connector, terminals or wire harness as needed. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to H88 . **No** If the passenger air bag module loop 1 resistance PID is less than 1.31 ohms, GO to H61 . If the passenger air bag module loop 1 resistance PID is greater than 4.29 ohms, GO to H63 .
H61 CHECK THE PASSENGER AIR BAG MODULE ADAPTIVE TETHER FAULT PIDs (2293_0_OD) AND (2293_1_OD) FOR A CHANGE IN FAULT STATUS	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • **NOTE:** Refer to Passenger Air Bag Module under Principles of Operation in this section for connector identification. • Disconnect: Passenger Air Bag Module Adaptive Tether 2-Pin Electrical Connector . • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record The Following Fault PIDs . ♦ 2293_0_OD (Air bag Passenger Front Adaptive Tether Circuit Resist. Low on Squib) ♦ 2293_1_OD (Air bag Passenger Front Adaptive Tether Open) • **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the passenger air bag	**Yes** GO to H78 . **No** GO to H62 .

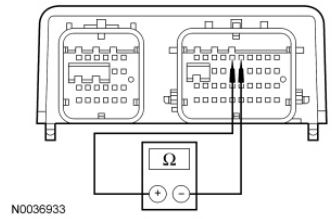




tomsn048@gmail.com

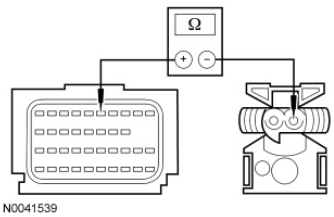
module adaptive tether disconnected, open circuit faults would normally be retrieved. • **Did the passenger air bag module adaptive tether on-demand fault PIDs change from indicating a low resistance to an open circuit fault?**	
H62 CHECK THE RCM FOR LOW RESISTANCE	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310a and C310b . • Measure resistance between RCM C310a pin 13 and C310a pin 14, component side.  A0041281 • **Is resistance greater than 10,000 ohms?**	**Yes** REPAIR circuits CR145 (WH/OG) and RR145 (GY/YE). GO to H88 . **No** GO to H80 .
H63 CHECK THE PASSENGER AIR BAG MODULE ADAPTIVE TETHER FAULT PIDs (2293_0_OD) AND (2293_1_OD) FOR A CHANGE IN FAULT STATUS	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • **NOTE:** Refer to Passenger Air Bag Module under Principles of Operation in this section for connector identification. • Disconnect: Passenger Air Bag Module Adaptive Tether 2-Pin Electrical Connector . • Connect a fused jumper wire between passenger air bag module adaptive tether 2-pin electrical connector, circuit CR145 (WH/OG), harness side and circuit	**Yes** GO to H78 . **No** GO to H64 .

RR145 (GY/YE), harness side. • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record The Following Fault PIDs . ♦ 2293_0_OD (Air bag Passenger Front Adaptive Tether Circuit Resist. Low on Squib) ♦ 2293_1_OD (Air bag Passenger Front Adaptive Tether Open) • **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the passenger air bag module adaptive tether circuits shorted together, a low resistance fault would normally be retrieved. • **Did the passenger air bag module adaptive tether on-demand fault PIDs change from indicating an open circuit to a low resistance fault?**	
H64 CHECK THE PASSENGER AIR BAG MODULE ADAPTIVE TETHER CIRCUITS FOR AN OPEN	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the jumper wire from passenger air bag module adaptive tether 2-pin electrical connector. • Disconnect: RCM C310a and C310b . • Measure resistance between RCM C310a-13, circuit CR145 (WH/OG), harness side and passenger air bag module adaptive tether 2-pin electrical connector, circuit CR145 (WH/OG), harness side.  • Measure resistance between RCM C310a-14, circuit RR145 (GY/YE), harness side and passenger air bag module adaptive tether 2-pin electrical connector, circuit RR145 (GY/YE), harness side.	**Yes** GO to H80 . **No** REPAIR circuit CR145 (WH/OG) or RR145 (GY/YE). GO to H88 .

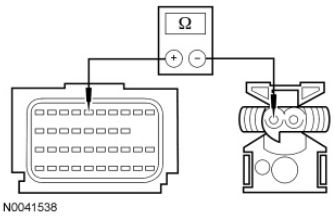


tomsn048@gmail.com

 • **Are resistances less than 0.5 ohm?**	
H65 CHECK THE PASSENGER AIR BAG MODULE ADAPTIVE TETHER FAULT PIDs (2293_3_OD) AND (2293_1_OD) FOR A CHANGE IN FAULT STATUS	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • **NOTE:** Refer to Passenger Air Bag Module under Principles of Operation in this section for connector identification. • Disconnect: Passenger Air Bag Module Adaptive Tether 2-Pin Electrical Connector. • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record The Following Fault PIDs . ♦ 2293_1_OD (Air bag Passenger Front Adaptive Tether Open) ♦ 2293_3_OD (Air bag Passenger Front Adaptive Tether Short to Ground) • **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the passenger air bag module adaptive tether electrical connector disconnected, an open circuit fault would normally be retrieved. • **Did the passenger air bag module adaptive tether on-demand fault PIDs change from indicating a short to ground to an open circuit fault?**	**Yes** GO to H78 . **No** GO to H66 .
H66 CHECK PASSENGER AIR BAG MODULE ADAPTIVE TETHER CIRCUITS FOR A SHORT TO GROUND	

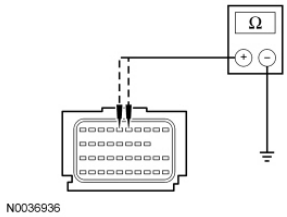


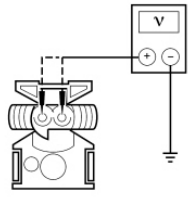
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310a and C310b . • Measure resistance between RCM : ♦ C310a-13, circuit CR145 (WH/OG), harness side and ground. ♦ C310a-14, circuit RR145 (GY/YE), harness side and ground.  N0036932 • **Are resistances greater than 10,000 ohms?**	**Yes** GO to H80 . **No** Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar. REPAIR circuit CR145 (WH/OG) or RR103 RR145 (GY/YE). GO to H88 .
H67 CHECK PASSENGER AIR BAG MODULE ADAPTIVE TETHER CIRCUITS FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • **NOTE:** Refer to Passenger Air Bag Module under Principles of Operation in this section for connector identification. • Disconnect: Passenger Air Bag Module Adaptive Tether 2-Pin Electrical Connector . • Disconnect: RCM C310a and C310b . • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Measure voltage between: ♦ passenger air bag module adaptive tether 2-pin electrical connector, circuit CR145 (WH/OG), harness side and ground. ♦ passenger air bag module adaptive tether 2-pin electrical connector, circuit RR145 (GY/YE), harness side and ground.  N0041541 • **Is voltage present on either circuit?**	**Yes** Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar. REPAIR circuit CR145 (WH/OG) or RR145 (GY/YE). GO to H88 . **No** GO to H80 .



tomsn048@gmail.com

H68 CHECK PASSENGER AIR BAG MODULE CANISTER VENT RESISTANCE PID (P_VENT)	
• Enter the following diagnostic mode on the scan tool: DataLogger - RCM - PID . • Enter the following diagnostic mode on the scan tool: P_VENT (Airbag Canister Vent Resistance, Passenger Side) Resistance PID . • **Does the resistance PID value read between 1.31 and 4.29 ohms?**	**Yes** GO to H80 . **No** GO to H69 .
H69 CHECK PASSENGER AIR BAG MODULE CANISTER VENT RESISTANCE PID (P_VENT) WHILE CARRYING OUT A HARNESS TEST	
• **NOTE:** Do not remove the passenger air bag module from its mounted position at this time. • With the passenger air bag in its mounted position, continue monitoring the P_VENT (Airbag Canister Vent Resistance, Passenger Side) resistance PID while carrying out a harness test of the passenger air bag module circuits and accessible connectors (including any inline connectors), by wiggling connectors and flexing the wire harness. • **Does the resistance PID value read between 1.31 and 4.29 ohms while carrying out the harness test?**	**Yes** DEPOWER the SRS and REPAIR the connector, terminals or wire harness as needed. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to H88 . **No** If the passenger air bag module canister vent resistance PID is less than 1.31 ohms, GO to H70 . If the passenger air bag module canister vent resistance PID is greater than 4.29 ohms, GO to H72 .
H70 CHECK PASSENGER AIR BAG MODULE CANISTER VENT FAULT PIDs (2293_8_OD) AND (2293_9_OD) FOR A CHANGE IN FAULT STATUS	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • **NOTE:** Refer to Passenger Air Bag Module under Principles of Operation in this section for connector identification. • Disconnect: Passenger Air Bag Module Canister Vent 2-Pin Electrical Connector . • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS)	**Yes** GO to H78 . **No** GO to H71 .





Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record The Following Fault PIDs . ♦ 2293_8_OD (Air bag Passenger Front Can Vent Circuit Resist. Low on Squib) ♦ 2293_9_OD (Air bag Passenger Front Can Vent Open) • **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the passenger air bag module canister vent disconnected, an open circuit fault would normally be retrieved. • **Did the passenger air bag module canister vent on-demand fault PIDs change from indicating a low resistance to an open circuit fault?**	
H71 CHECK THE RCM FOR LOW RESISTANCE	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310a and C310b . • Measure resistance between RCM C310b pin 5 and C310b pin 6, component side.  • **Is resistance greater than 10,000 ohms?**	**Yes** REPAIR circuits CR144 (GY/OG) and RR144 (VT/GN). GO to H88 . **No** GO to H80 .
H72 CHECK PASSENGER AIR BAG MODULE CANISTER VENT FAULT PIDs (2293_9_OD) AND (2293_8_OD) FOR A CHANGE IN FAULT STATUS	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • **NOTE:** Refer to Passenger Air Bag Module under Principles of Operation in this section for connector	**Yes** GO to H78 . **No** GO to H73 .

tomsn048@gmail.com

identification. • Disconnect: Passenger Air Bag Module Canister Vent 2-Pin Electrical Connector . • Connect a fused jumper wire between passenger air bag module canister vent 2-pin electrical connector circuit CR144 (GY/OG), harness side, and circuit RR144 (VT/GN), harness side. • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record The Following Fault PIDs . ♦ 2293_8_OD (Air bag Passenger Front Can Vent Circuit Resist. Low on Squib) ♦ 2293_9_OD (Air bag Passenger Front Can Vent Open) • **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the passenger air bag module canister vent circuits shorted together, a low resistance fault would normally be retrieved. • **Did the passenger air bag module canister vent on-demand fault PIDs change from indicating an open circuit to a low resistance fault?**	
H73 CHECK PASSENGER AIR BAG MODULE CANISTER VENT CIRCUITS FOR AN OPEN	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the jumper wire from passenger air bag module canister vent 2-pin electrical connector. • Disconnect: RCM C310a and C310b . • Measure resistance between RCM C310b-5, circuit CR144 (GY/OG), harness side and passenger air bag module canister vent 2-pin electrical connector, circuit CR144 (GY/OG), harness side.  • Measure resistance between RCM C310b-6, circuit RR144 (VT/GN), harness side and passenger air bag module canister vent 2-pin electrical connector, circuit	**Yes** GO to H80 . **No** REPAIR circuit CR144 (GY/OG) or RR144 (VT/GN). H81 CHECK DRIVER AIR BAG MODULE CIRCUIT RESISTANCE PIDs FOR AN INTERMITTENT LOW RESISTANCE OR OPEN	
• Ignition ON. • If the fault was reported for the driver air bag module loop 1 and/or loop 2, monitor the following PIDs: ♦ D_ABAGR (Driver Air Bag) resistance PID. ♦ D_ABAGR2 (Driver Air Bag #2 Resistance) resistance PID.	**Yes** DEPOWER the SRS and REPAIR as necessary. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information.

• If the fault was reported for the driver air bag module canister vent, monitor the following PIDs: ♦ D_VENT (Airbag Canister Vent Resistance, Driver Side) resistance PID. • **NOTE:** A resistance PID that reads between 0.9 and 1.31 ohms or between 4.29 and 5 ohms may or may not set an on-demand DTC yet indicates a strong potential of an intermittent fault condition. Make sure to thoroughly check wire harness(es), connectors and terminals as they are the likely source of the fault condition. • **NOTE:** Do not remove the driver air bag module from its mounted position at this time. • With the driver air bag in its mounted position, attempt to recreate the fault by wiggling connectors (including any inline connectors), and flexing the wire harness, tilting and rotating the steering wheel frequently. • **Does any driver air bag resistance PID indicate less than 1.31 ohms or greater than 4.29 ohms?**	GO to H88 . **No** GO to H87 .
H82 CHECK PASSENGER AIR BAG MODULE CIRCUIT RESISTANCE PIDs FOR AN INTERMITTENT LOW RESISTANCE OR OPEN	
• Ignition ON. • If the fault was reported for the passenger air bag module loop 1 and/or loop 2, monitor the following PIDs: ♦ P_ABAGR (Passenger Air Bag) resistance PID. ♦ P_ABAGR2 (Passenger Side Air Bag #2 Resistance) resistance PID. • If the fault was reported for the passenger air bag module adaptive tether and/or canister vent, monitor the following PIDs: ♦ P_TETHER (Passenger Side Adaptive Tether Resistance) resistance PID. ♦ P_VENT (Airbag Canister Vent Resistance, Passenger Side) resistance PID. • **NOTE:** A resistance PID that reads between 0.9 and 1.31 ohms or between 4.29 and 5 ohms may or may not set an on-demand DTC yet indicates a strong potential of an intermittent fault condition. Make sure to thoroughly check wire harness(es), connectors and terminals as they are the likely source of the fault condition. • **NOTE:** Do not remove the passenger air bag module from its mounted position at this time. • With the passenger air bag in its mounted position, attempt to recreate the fault by wiggling connectors (including any inline connectors), and flexing the wire harness. • **Does any passenger air bag resistance PID indicate less than 1.31 ohms or greater than 4.29 ohms?**	**Yes** DEPOWER the SRS and REPAIR as necessary. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to H88 . **No** GO to H87 .
H83 CHECK DRIVER AIR BAG MODULE FAULT PIDs FOR AN INTERMITTENT SHORT TO GROUND	

tomsn048@gmail.com

• Ignition ON. • Monitor the following fault PIDs: ♦ 2293_23_OD (Air Bag Circuit Short to Ground - Loop No. 2, Front Driver Side) on-demand fault PIDs. ♦ 2293_31_OD (Air Bag Circuit Short to Ground - Loop No. 1, Front Driver Side) on-demand fault PIDs. ♦ 2293_15_OD (Air bag Driver Front Can Vent Short to Ground) on-demand fault PIDs. • **DIAGNOSTIC TIP:** When monitoring fault PIDs with the scan tool, it may take up to 2 seconds for the scan tool display to update. • **NOTE:** Do not remove the driver air bag module from its mounted position at this time. • With the driver air bag in its mounted position, attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness, tilting and rotating the steering wheel frequently. • **Does any RCM on-demand 2293 fault PID indicate a fault is present?**	**Yes** DEPOWER the SRS and REPAIR as necessary. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to H88 . **No** GO to H87 .
H84 CHECK PASSENGER AIR BAG MODULE FAULT PIDs FOR AN INTERMITTENT SHORT TO GROUND	
• Ignition ON. • Monitor the following fault PIDs: ♦ 2293_27_OD (Air Bag Circuit Short to Ground - Loop No. 1, Front Passenger Side) on-demand fault PIDs. ♦ 2293_19_OD (Air Bag Circuit Short to Ground - Loop No. 2, Front Passenger Side) on-demand fault PIDs. ♦ 2293_11_OD (Air bag Passenger Front Can Vent Short to Ground) on-demand fault PIDs. ♦ 2293_3_OD (Air bag Passenger Front Adaptive Tether Short to Ground) on-demand fault PIDs. • **DIAGNOSTIC TIP:** When monitoring fault PIDs with the scan tool, it may take up to 2 seconds for the scan tool display to update. • **NOTE:** Do not remove the passenger air bag module from its mounted position at this time. • With the passenger air bag in its mounted position, attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness. • **Does any RCM on-demand 2293 fault PID indicate a fault is present?**	**Yes** DEPOWER the SRS and REPAIR as necessary. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to H88 . **No** GO to H87 .
H85 CHECK DRIVER AIR BAG MODULE FAULT PIDs FOR AN INTERMITTENT SHORT TO BATTERY	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this	**Yes** DEPOWER the SRS and REPAIR as necessary.

section. • Remove the driver air bag module. Refer to Driver Air Bag Module in this section. • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Monitor the following fault PIDs: ♦ 2293_30_OD (Air Bag Circuit Short to Battery - Loop No. 1, Front Driver Side) on-demand fault PIDs. ♦ 2293_22_OD (Air Bag Circuit Short to Battery - Loop No. 2, Front Driver Side) on-demand fault PIDs. ♦ 2293_14_OD (Air bag Driver Front Can Vent Short to Battery) on-demand fault PIDs. • **DIAGNOSTIC TIP:** When monitoring fault PIDs with the scan tool, it may take up to 2 seconds for the scan tool display to update. • Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness, tilting and rotating the steering wheel frequently. • **Does any RCM on-demand 2293 fault PID indicate a fault is present?**	Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to H88 . **No** GO to H87 .
H86 CHECK PASSENGER AIR BAG MODULE FAULT PIDs FOR AN INTERMITTENT SHORT TO BATTERY	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Air Bag Module C256 and C2351 . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Monitor the following fault PIDs: ♦ 2293_26_OD (Air Bag Circuit Short to Battery - Loop No. 1, Front Passenger Side) on-demand fault PIDs. ♦ 2293_18_OD (Air Bag Circuit Short to Battery - Loop No. 2, Front Passenger Side) on-demand fault PIDs. ♦ 2293_10_OD (Air bag Passenger Front Can Vent Short to Battery) on-demand fault PIDs. ♦ 2293_2_OD (Air bag Passenger Front Adaptive Tether Short to Battery) on-demand fault PIDs. • **DIAGNOSTIC TIP:** When monitoring fault PIDs with the scan tool, it may take up to 2 seconds for the scan tool display to update. • **NOTE:** Do not remove the passenger air bag module from its mounted position at this time.	**Yes** DEPOWER the SRS and REPAIR as necessary. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to H88 . **No** GO to H87 .

tomsn048@gmail.com

• With the passenger air bag in its mounted position, attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness. • **Does any RCM on-demand 2293 fault PID indicate a fault is present?**	
H87 CHECK THE HARNESS AND CONNECTORS	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • If the fault was reported for the driver air bag: ♦ remove the driver air bag module. Refer to Driver Air Bag Module in this section. ♦ inspect connector(s) (including any inline connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals. ♦ inspect wire harness for any damage, pinched, cut or pierced wires. • If the fault was reported for the passenger air bag: ♦ disconnect the passenger air bag module C256 and C2351. ♦ inspect connector(s) (including any inline connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals. ♦ inspect wire harness for any damage, pinched, cut or pierced wires. • **Were any concerns found?**	**Yes** REPAIR as necessary. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to H88 . **No** The fault is not present and cannot be recreated at this time. CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness, cycling the ignition frequently and rotating the steering wheel (driver air bag module fault). **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. GO to H88 .
H88 CHECK FOR ADDITIONAL SRS DTCs	
• Ignition OFF. • ⚠ **WARNING: Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.** • Reconnect all SRS components (if previously disconnected). • If previously directed to depower the SRS , repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - Restraints . • **Are any RCM and/or OCSM DTCs indicating a fault?**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the DTC Charts in this section for pinpoint test direction. **No** CLEAR all RCM and OCSM CMDTCs . PROVE OUT the SRS . Repair is complete. RETURN the vehicle to the customer.

Pinpoint Test I: DTC B2294

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

Normal Operation

The Restraints Control Module (RCM) continuously monitors the driver and passenger Safety Canopy® module circuits (loop) for an acceptable resistance range, unacceptable voltage and shorts to ground. The RCM will set on-demand and store DTC B2294 in memory if any of these conditions are detected. If the RCM detects a fault, it will send a message to the Instrument Cluster (IC) module to illuminate the air bag warning indicator.

As the RCM continuously monitors Safety Canopy® module circuits for resistance, it expects a normal resistance between 1.31 to 4.29 ohms.

If a loop resistance is between 0.9 and 1.31 or between 4.29 and 5 ohms, there exists a strong potential for an intermittent fault, a DTC may or may not set. The RCM will also set an on-demand DTC if the loop resistance is less than 0.9 ohm or greater than 5 ohms.

NOTE: When monitoring fault and/or resistance PIDs with the scan tool, it may take up to 2 seconds for the scan tool display to update.

Fault PIDs [a]	Description	Fault Trigger Condition
2294_24_OD and 2294_24_CM	A - B or A - C Pillar Curtain Circuit Resistance Low, Passenger Side	When the Restraints Control Module (RCM) measures resistance less than 0.9 ohm between the passenger safety canopy circuits, a fault will be indicated.
2294_25_OD and 2294_25_CM	A - B or A - C Pillar Curtain Circuit Open, Passenger Side	When the RCM measures resistance greater than 5 ohms between the passenger safety canopy circuits, a fault will be indicated.
2294_26_OD and 2294_26_CM	A - B or A - C Pillar Curtain Circuit Short to Ground, Passenger Side	When the RCM senses a short to ground on either of the passenger safety canopy circuits, a fault will be indicated.
2294_27_OD and 2294_27_CM	A - B or A - C Pillar Curtain Circuit Short to Battery, Passenger Side	When the RCM senses a short to voltage on either of the passenger safety canopy circuits, a fault will be indicated.
2294_28_OD and 2294_28_CM	A - B or A - C Pillar Curtain Circuit Resistance Low, Driver Side	When the RCM measures resistance less than 0.9 ohm between the driver safety canopy circuits, a fault will be indicated.
2294_29_OD and 2294_29_CM	A - B or A - C Pillar Curtain Circuit Open, Driver Side	When the RCM measures resistance greater than 5 ohms between the driver safety canopy circuits, a fault will be indicated.
2294_30_OD and 2294_30_CM	A - B or A - C Pillar Curtain Circuit Short to Ground, Driver Side	When the RCM senses a short to ground on either of the driver safety canopy circuits, a fault will be indicated.
2294_31_OD and 2294_31_CM	A - B or A - C Pillar Curtain Circuit Short to Battery, Driver Side	When the RCM senses a short to voltage on either of the driver safety canopy circuits, a fault will be indicated.

[a] Fault PIDs that end in OD indicate an on-demand status and are associated with on-demand DTC B2294. Fault PIDs that end in CM indicate continuous memory status and are associated with continuous DTC

tomsn048@gmail.com

B2294.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Safety Canopy® module
- RCM

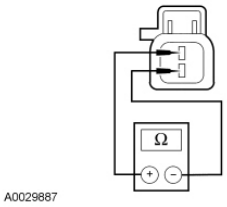
PINPOINT TEST I: DTC B2294

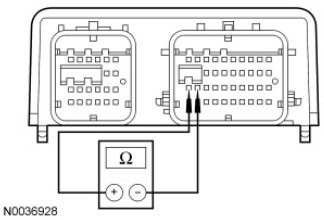
⚠ WARNING: Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Supplemental Restraint System (SRS) components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

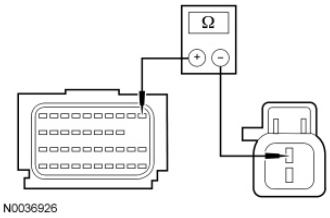


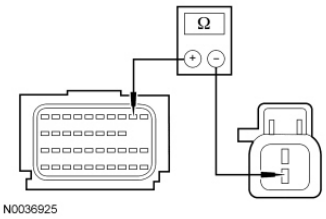


NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
I1 RETRIEVE RCM DTCs	
• Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record All 2294 Fault PIDs . ♦ Refer to PID list in Normal Operation to view 2294 fault PIDs. • **Do any RCM on-demand 2294 fault PIDs indicate a fault?**	**Yes** The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Using the fault PIDs recorded, GO to the appropriate pinpoint test step. For 2294_28_OD (A - B or A - C Pillar Curtain Circuit Resistance Low, Driver Side), GO to I2 . For 2294_29_OD (A - B or A - C Pillar Curtain Circuit Open, Driver Side), GO to I2 . For 2294_30_OD (A - B or A - C Pillar Curtain Circuit Short to Ground, Driver Side), GO to I9 . For 2294_31_OD (A - B or A - C Pillar Curtain Circuit Short to Battery, Driver Side), GO to I11 . For 2294_24_OD (A - B or A - C Pillar Curtain Circuit Resistance

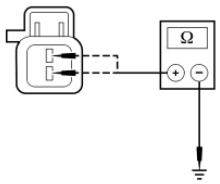
	Low, Passenger Side), GO to I12 . For 2294_25_OD (A - B or A - C Pillar Curtain Circuit Open, Passenger Side), GO to I12 . For 2294_26_OD (A - B or A - C Pillar Curtain Circuit Short to Ground, Passenger Side), GO to I19 . For 2294_27_OD (A - B or A - C Pillar Curtain Circuit Short to Battery, Passenger Side), GO to I21 . **No** This is an intermittent fault when present as a CMDTC only. The fault condition is not present at this time. Using the fault PIDs recorded, GO to the appropriate pinpoint test step. For (2294_28_CM (A - B or A - C Pillar Curtain Circuit Resistance Low, Driver Side), 2294_29_CM (A - B or A - C Pillar Curtain Circuit Open, Driver Side), 2294_24_CM (A - B or A - C Pillar Curtain Circuit Resistance Low, Passenger Side) or 2294_25_CM (A - B or A - C Pillar Curtain Circuit Open, Passenger Side), GO to I24 . For 2294_30_CM (A - B or A - C Pillar Curtain Circuit Short to Ground, Driver Side) or 2294_26_CM (A - B or A - C Pillar Curtain Circuit Short to Ground, Passenger Side), GO to I26 . For 2294_31_CM (A - B or A - C Pillar Curtain Circuit Short to Battery, Driver Side) or 2294_27_CM (A - B or A - C Pillar Curtain Circuit Short to Battery, Passenger Side), GO to I27 .
I2 CHECK THE DRIVER SAFETY CANOPY® MODULE RESISTANCE PID (DCURTL1)	
• Enter the following diagnostic mode on the scan tool: DataLogger - RCM - PID . • Enter the following diagnostic mode on the scan tool: DCURTL1 (Curtain Airbag Driver Loop No.1 Resistance) Resistance PID . • **Does the resistance PID value read between 1.31 and 4.29 ohms?**	**Yes** GO to I23 . **No** GO to I3 .
I3 CHECK THE DRIVER SAFETY CANOPY® MODULE RESISTANCE PID (DCURTL1) WHILE	



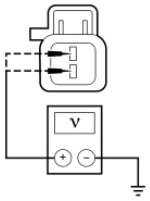


tomsn048@gmail.com

CARRYING OUT A HARNESS TEST	
• Continue monitoring the DCURTL1 (Curtain Airbag Driver Loop No.1 Resistance) Resistance PID while carrying out a harness test of the driver safety canopy circuits and accessible connectors (including any inline connectors) by wiggling connectors and flexing the wire harness. • **Does the resistance PID value read between 1.31 and 4.29 ohms while carrying out the harness test?**	**Yes** DEPOWER the SRS and REPAIR the connector, terminals or wire harness as needed. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to I28 . **No** If the driver safety canopy resistance PID is less than 1.31 ohm, GO to I4 . If the driver safety canopy resistance PID is greater than 4.29 ohms, GO to I7 .
I4 CHECK THE DRIVER SAFETY CANOPY® MODULE FAULT PIDs (2294_28_OD) AND (2294_29_OD) FOR A CHANGE IN FAULT STATUS	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Driver Safety Canopy C3213 (Explorer/Mountaineer)/C9006 (Explorer Sport Trac) . • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record The Following Fault PIDs . ♦ 2294_28_OD (A - B or A - C Pillar Curtain Circuit Resistance Low, Driver Side) ♦ 2294_29_OD (A - B or A - C Pillar Curtain Circuit Open, Driver Side) • **DIAGNOSTIC TIP:** When viewing DTC B2294 on-demand fault PIDs with the driver safety canopy disconnected, an open circuit fault would normally be retrieved.	**Yes** GO to I22 . **No** GO to I5 .



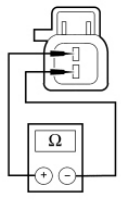
• **Did the driver safety canopy on-demand fault PIDs change from indicating a low resistance to an open circuit fault?**	
I5 CHECK FOR A SHORT BETWEEN DRIVER SAFETY CANOPY CIRCUITS	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Measure resistance between driver safety canopy C3213-1 (Explorer/Mountaineer)/C9006-1 (Explorer Sport Trac), circuit CR109 (BN/BU), harness side and C3213-2 (Explorer/Mountaineer)/C9006-2 (Explorer Sport Trac), circuit RR109 (BU/GN), harness side.  • **Is resistance greater than 10,000 ohms?**	**Yes** GO to I23 . **No** GO to I6 .
I6 CHECK THE RCM FOR LOW RESISTANCE	
• Disconnect: RCM C310a and C310b . • Measure resistance between RCM C310b pin 21, component side, and C310b pin 22, component side.  • **Is resistance greater than 10,000 ohms?**	**Yes** REPAIR circuits CR109 (BN/BU) and RR109 (BU/GN). GO to I28 . **No** GO to I23 .
I7 CHECK THE DRIVER SAFETY CANOPY® MODULE FAULT PIDs (2294_29_OD) AND (2294_28_OD) FOR A CHANGE IN FAULT STATUS	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.	**Yes** GO to I22 . **No** GO to I8 .

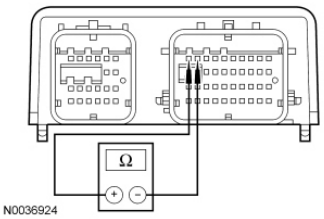


tomsn048@gmail.com

• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Driver Safety Canopy C3213 (Explorer/Mountaineer)/C9006 (Explorer Sport Trac) . • Connect a fused jumper wire between driver safety canopy C3213-1 (Explorer/Mountaineer)/C9006-1 (Explorer Sport Trac), circuit CR109 (BN/BU), harness side and C3213-2 (Explorer/Mountaineer)/C9006-2 (Explorer Sport Trac), circuit RR109 (BU/GN), harness side. • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record The Following Fault PIDs . ♦ 2294_28_OD (A - B or A - C Pillar Curtain Circuit Resistance Low, Driver Side) ♦ 2294_29_OD (A - B or A - C Pillar Curtain Circuit Open, Driver Side) • **DIAGNOSTIC TIP:** When viewing DTC B2294 on-demand fault PIDs with the driver safety canopy circuits shorted together, a low resistance fault would normally be retrieved. • **Did the driver safety canopy on-demand fault PIDs change from indicating an open circuit to a low resistance fault?**	
I8 CHECK DRIVER SAFETY CANOPY® MODULE CIRCUITS FOR AN OPEN	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the fused jumper wire from the driver safety canopy C3213 (Explorer/Mountaineer)/C9006 (Explorer Sport Trac). • Disconnect: RCM C310a and C310b . • Measure resistance between RCM C310b-21, circuit CR109 (BN/BU), harness side and driver safety canopy C3213-1 (Explorer/Mountaineer)/C9006-1 (Explorer Sport Trac), circuit CR109 (BN/BU), harness side.	**Yes** GO to I23 . **No** REPAIR circuit CR109 (BN/BU) or RR109 (BU/GN). GO to I28 .

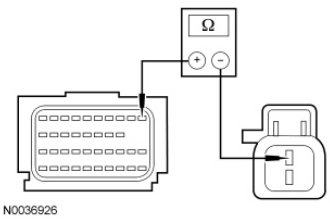
 N0036926 • Measure resistance between RCM C310b-22, circuit RR109 (BU/GN), harness side and driver safety canopy C3213-2 (Explorer/Mountaineer)/C9006-2 (Explorer Sport Trac), circuit RR109 (BU/GN), harness side.  N0036925 • **Are resistances less than 0.5 ohm?**	
I9 CHECK THE DRIVER SAFETY CANOPY® MODULE FAULT PIDs (2294_30_OD) AND (2294_29_OD) FOR A CHANGE IN FAULT STATUS	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Driver Safety Canopy C3213 (Explorer/Mountaineer)/C9006 (Explorer Sport Trac) . • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record The Following Fault PIDs . ♦ 2294_29_OD (A - B or A - C Pillar Curtain Circuit Open, Driver Side)	**Yes** GO to I22 . **No** GO to I10 .



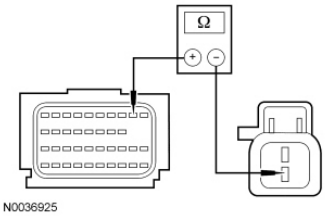


tomsn048@gmail.com

♦ 2294_30_OD (A - B or A - C Pillar Curtain Circuit Short to Ground, Driver Side) • **DIAGNOSTIC TIP:** When viewing DTC B2294 on-demand fault PIDs with the driver safety canopy disconnected, an open circuit fault would normally be retrieved. • **Did the driver safety canopy on-demand fault PIDs change from indicating a short to ground to an open circuit fault?**	
I10 CHECK DRIVER SAFETY CANOPY® MODULE CIRCUITS FOR A SHORT TO GROUND	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310a and C310b . • Measure resistance between driver safety canopy: ♦ C3213-1 (Explorer/Mountaineer)/C9006-1 (Explorer Sport Trac), circuit CR109 (BN/BU), harness side and ground. ♦ C3213-2 (Explorer/Mountaineer)/C9006-2 (Explorer Sport Trac), circuit RR109 (BU/GN), harness side and ground.  N0081823 • **Are resistances greater than 10,000 ohms?**	**Yes** GO to I23 . **No** Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar. REPAIR circuit CR109 (BN/BU) or RR109 (BU/GN). GO to I28 .
I11 CHECK DRIVER SAFETY CANOPY® MODULE CIRCUITS FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Driver Safety Canopy C3213 (Explorer/Mountaineer)/C9006 (Explorer Sport Trac) . • Disconnect: RCM C310a and C310b . • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON.	**Yes** Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar. REPAIR circuit CR109 (BN/BU) or RR109 (BU/GN). GO to I28 . **No** GO to I23 .



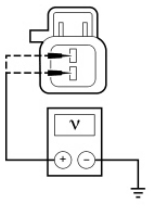
• Measure voltage between driver safety canopy: ♦ C3213-1 (Explorer/Mountaineer)/C9006-1 (Explorer Sport Trac), circuit CR109 (BN/BU), harness side and ground. ♦ C3213-2 (Explorer/Mountaineer)/C9006-2 (Explorer Sport Trac), circuit RR109 (BU/GN), harness side and ground.  N0005052 • **Is voltage present on either circuit?**	
I12 CHECK THE PASSENGER SAFETY CANOPY® MODULE RESISTANCE PID (PCURTL1)	
• Enter the following diagnostic mode on the scan tool: DataLogger - RCM - PID . • Enter the following diagnostic mode on the scan tool: PCURTL1 (Curtain Airbag Passenger Loop No.1 Resistance) Resistance PID . • **Does the resistance PID value read between 1.31 and 4.29 ohms?**	**Yes** GO to I23 . **No** GO to I13 .
I13 CHECK THE PASSENGER SAFETY CANOPY® MODULE RESISTANCE PID (PCURTL1) WHILE CARRYING OUT A HARNESS TEST	
• Continue monitoring the PCURTL1 (Curtain Airbag Passenger Loop No.1 Resistance) resistance PID while carrying out a harness test of the passenger safety canopy circuits and accessible connectors (including any inline connectors), by wiggling connectors and flexing the wire harness. • **Does the resistance PID value read between 1.31 and 4.29 ohms while carrying out the harness test?**	**Yes** DEPOWER the SRS and REPAIR the connector, terminals or wire harness as needed. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to I28 . **No** If the passenger safety canopy resistance PID is less than 1.31 ohm, GO to I14 . If the passenger safety canopy resistance PID is greater than 4.29 ohms, GO to I17 .
I14 CHECK THE PASSENGER SAFETY CANOPY® MODULE FAULT PIDs (2294_24_OD) AND (2294_25_OD) FOR A CHANGE IN FAULT	



tomsn048@gmail.com

STATUS	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Safety Canopy C3214 (Explorer/Mountaineer)/C9007 (Explorer Sport Trac) . • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record The Following Fault PIDs . ♦ 2294_24_OD (A - B or A - C Pillar Curtain Circuit Resistance Low, Passenger Side) ♦ 2294_25_OD (A - B or A - C Pillar Curtain Circuit Open, Passenger Side) • **DIAGNOSTIC TIP:** When viewing DTC B2294 on-demand fault PIDs with the passenger safety canopy disconnected, an open circuit fault would normally be retrieved. • **Did the passenger safety canopy on-demand fault PIDs change from indicating a low resistance to an open circuit fault?**	**Yes** GO to I22 . **No** GO to I15 .
I15 CHECK FOR A SHORT BETWEEN PASSENGER SAFETY CANOPY CIRCUITS	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Measure resistance between passenger Safety Canopy® module: C3214-1 (Explorer/Mountaineer)/C9007-1 (Explorer Sport Trac), circuit CR111 (BN/WH), harness side and C3214-2 (Explorer/Mountaineer)/ C9007-2 (Explorer Sport Trac), circuit RR111 (YE/VT), harness side.	**Yes** GO to I23 . **No** GO to I16 .

 A0029887 • **Is resistance greater than 10,000 ohms?**	
I16 CHECK THE RCM FOR LOW RESISTANCE	
• Disconnect: RCM C310a and C310b . • Measure resistance between RCM C310b pin 1, component side, and C310b pin 2, component side.  N0036924 • **Is resistance greater than 10,000 ohms?**	**Yes** REPAIR circuits CR111 (BN/WH) and RR111 (YE/VT). GO to I28 . **No** GO to I23 .
I17 CHECK THE PASSENGER SAFETY CANOPY® MODULE FAULT PIDs (2294_24_OD) AND (2294_24_OD) FOR A CHANGE IN FAULT STATUS	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Safety Canopy C3214 (Explorer/Mountaineer)/C9007 (Explorer Sport Trac) . • Connect a fused jumper wire between passenger safety canopy C3214-1 (Explorer/Mountaineer)/C9007-1 (Explorer Sport Trac), circuit CR111 (BN/WH), harness side and C3214-2 (Explorer/Mountaineer)/ C9007-2 (Explorer Sport Trac), circuit RR111 (YE/VT), harness side. • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.	**Yes** GO to I22 . **No** GO to I18 .



tomsn048@gmail.com

• Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record The Following Fault PIDs . ♦ 2294_24_OD (A - B or A - C Pillar Curtain Circuit Resistance Low, Passenger Side) ♦ 2294_25_OD (A - B or A - C Pillar Curtain Circuit Open, Passenger Side) • **DIAGNOSTIC TIP:** When viewing DTC B2294 on-demand fault PIDs with the passenger safety canopy circuits shorted together, a low resistance fault would normally be retrieved. • **Did the passenger safety canopy on-demand fault PIDs change from indicating an open circuit to a low resistance fault?**	
I18 CHECK PASSENGER SAFETY CANOPY® MODULE CIRCUITS FOR AN OPEN	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the jumper wire from the passenger safety canopy C3214 (Explorer/Mountaineer)/C9007 (Explorer Sport Trac). • Disconnect: RCM C310a and C310b . • Measure resistance between RCM C310b-1, circuit CR111 (BN/WH), harness side and passenger Safety Canopy® module C3214-1 (Explorer/Mountaineer)/C9007-1 (Explorer Sport Trac), circuit CR111 (BN/WH), harness side.  • Measure resistance between RCM C310b-2, circuit RR111 (YE/VT), harness side and passenger Safety Canopy® module C3214-2 (Explorer/Mountaineer)/C9007-2 (Explorer Sport Trac), circuit RR111 (YE/VT), harness side.	**Yes** GO to I23 . **No** REPAIR circuit CR111 (BN/WH) or RR111 (YE/VT). GO to I28 .

 • **Are resistances less than 0.5 ohm?**	
I19 CHECK THE PASSENGER SAFETY CANOPY® MODULE FAULT PIDs (2294_26_OD) AND (2294_25_OD) FOR A CHANGE IN FAULT STATUS	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Safety Canopy C3214 (Explorer/Mountaineer)/C9007 (Explorer Sport Trac) . • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record The Following Fault PIDs . ♦ 2294_25_OD (A - B or A - C Pillar Curtain Circuit Open, Passenger Side) ♦ 2294_26_OD (A - B or A - C Pillar Curtain Circuit Short to Ground, Passenger Side) • **DIAGNOSTIC TIP:** When viewing DTC B2294 on-demand fault PIDs with the passenger safety canopy disconnected, an open circuit fault would normally be retrieved. • **Did the passenger safety canopy on-demand fault PIDs change from indicating a short to ground to an open circuit fault?**	**Yes** GO to I22 . **No** GO to I20 .
I20 CHECK PASSENGER SAFETY CANOPY® MODULE CIRCUITS FOR A SHORT TO GROUND	

tomsn048@gmail.com

• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310a and C310b . • Measure resistance between passenger safety canopy: ♦ C3214-1 (Explorer/Mountaineer)/C9007-1 (Explorer Sport Trac), circuit CR111 (BN/WH), harness side and ground. ♦ C3214-2 (Explorer/Mountaineer)/C9007-2 (Explorer Sport Trac), circuit RR111 (YE/VT), harness side and ground.  N0081823 • **Are resistances greater than 10,000 ohms?**	**Yes** GO to I23 . **No** Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar. REPAIR circuit CR111 (BN/WH) or RR111 (YE/VT). GO to I28 .
I21 CHECK PASSENGER SAFETY CANOPY® MODULE CIRCUITS FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Safety Canopy C3214 (Explorer/Mountaineer)/C9007 (Explorer Sport Trac) . • Disconnect: RCM C310a and C310b . • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Measure voltage between passenger safety canopy: ♦ C3214-1 (Explorer/Mountaineer)/C9007-1 (Explorer Sport Trac), circuit CR111 (BN/WH), harness side and ground. ♦ C3214-2 (Explorer/Mountaineer)/C9007-2 (Explorer Sport Trac), circuit RR111 (YE/VT), harness side and ground.	**Yes** Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar. REPAIR circuit CR111 (BN/WH) or RR111 (YE/VT). GO to I28 . **No** GO to I23 .

 N0005052 • **Is voltage present on either circuit?**	
I22 CONFIRM THE SAFETY CANOPY® MODULE FAULT	
NOTE: Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, DTCs will be recorded. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Connect: Affected Safety Canopy C3213 (Explorer/Mountaineer)/C9006 (Explorer Sport Trac) (Driver) or C3214 (Explorer/Mountaineer)/C9007 (Explorer Sport Trac) (Passenger) . • Connect: RCM C310a and C310b . • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record All 2294 Fault PIDs . ♦ Refer to PID list in Normal Operation to view 2294 fault PIDs. • **Does the original RCM on-demand 2294 fault PID indicate a fault?**	**Yes** INSTALL a new driver or passenger safety canopy. REFER to Safety Canopy Module - Explorer, Mountaineer or Safety Canopy Module - Explorer Sport Trac in this section. GO to I28 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. Using the fault PIDs recorded, GO to the appropriate pinpoint test step and CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. For (2294_28_CM (A - B or A - C Pillar Curtain Circuit Resistance Low, Driver Side), 2294_29_CM (A - B or A - C Pillar Curtain Circuit Open, Driver Side), 2294_24_CM (A - B or A - C Pillar Curtain Circuit Resistance Low, Passenger Side) or 2294_25_CM (A - B or A - C Pillar Curtain Circuit Open, Passenger Side), GO to I24 . For 2294_30_CM (A - B or A - C Pillar Curtain Circuit Short to Ground, Driver Side) or 2294_26_CM (A - B or A - C Pillar Curtain Circuit Short to Ground, Passenger Side), GO to I26 . For 2294_31_CM (A - B or A - C Pillar Curtain Circuit Short to Battery, Driver Side) or 2294_27_CM (A - B or A - C Pillar Curtain Circuit Short to Battery, Passenger Side), GO to I27 .
I23 CONFIRM THE RCM FAULT	
NOTE: Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, DTCs will be recorded.	**Yes** INSTALL a new RCM . REFER to Restraints Control Module (RCM) in this section. GO to I28 . **No**

tomsn048@gmail.com

• Ignition OFF. • If previously directed to disconnect any SRS component(s): ♦ depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. ♦ connect all previously disconnected restraint system component(s), including RCM C310a and C310b. ♦ repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record All 2294 Fault PIDs . ♦ Refer to PID list in Normal Operation to view 2294 fault PIDs. • **Does the original RCM on-demand 2294 fault PID indicate a fault?**	In the process of diagnosing the fault, the fault condition has become intermittent. Using the fault PIDs recorded, GO to the appropriate pinpoint test step and CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. For (2294_28_CM (A - B or A - C Pillar Curtain Circuit Resistance Low, Driver Side), 2294_29_CM (A - B or A - C Pillar Curtain Circuit Open, Driver Side), 2294_24_CM (A - B or A - C Pillar Curtain Circuit Resistance Low, Passenger Side) or 2294_25_CM (A - B or A - C Pillar Curtain Circuit Open, Passenger Side), GO to I24 . For 2294_30_CM (A - B or A - C Pillar Curtain Circuit Short to Ground, Driver Side) or 2294_26_CM (A - B or A - C Pillar Curtain Circuit Short to Ground, Passenger Side), GO to I26 . For 2294_31_CM (A - B or A - C Pillar Curtain Circuit Short to Battery, Driver Side) or 2294_27_CM (A - B or A - C Pillar Curtain Circuit Short to Battery, Passenger Side), GO to I27 .
I24 CHECK SAFETY CANOPY® MODULE CIRCUIT RESISTANCE PIDs FOR AN INTERMITTENT LOW RESISTANCE OR OPEN	
• If the fault was reported for the driver safety canopy, monitor the DCURTL1 (Curtain Airbag Driver Loop No.1 Resistance) resistance PID. • If the fault was reported for the passenger safety canopy, monitor the PCURTL1 (Curtain Airbag Passenger Loop No.1 Resistance) resistance PID. • **NOTE:** A resistance PID that reads between 0.9 and 1.31 ohms or between 4.29 and 5 ohms may or may not set an on-demand DTC yet indicates a strong potential of an intermittent fault condition. Make sure to thoroughly check wire harness(es), connectors and terminals as they are the likely source of the fault condition. • Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness. • **Does any safety canopy resistance PID indicate less than 1.31 ohms or greater than 4.29 ohms?**	**Yes** DEPOWER the SRS and REPAIR as necessary. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to I28 . **No** GO to I25 .
I25 CHECK THE HARNESS AND CONNECTORS	

• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect the affected Safety Canopy® module C3213 (Explorer/Mountaineer)/C9006 (Explorer Sport Trac) (Driver) or C3214 (Explorer/Mountaineer)/C9007 (Explorer Sport Trac) (Passenger): ♦ inspect connector(s) (including any inline connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals. ♦ inspect wire harness for any damage, pinched, cut or pierced wires. • **Were any concerns found?**	**Yes** REPAIR as necessary. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to I28 . **No** The fault is not present and cannot be recreated at this time. CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness, cycling the ignition frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. GO to I28 .
I26 CHECK THE AFFECTED SAFETY CANOPY® MODULE FAULT PIDs FOR AN INTERMITTENT SHORT TO GROUND	
• Enter the following diagnostic mode on the scan tool: DataLogger - RCM - PID . • If the fault was reported for the driver safety canopy, monitor the 2294_30_OD (A - B or A - C Pillar Curtain Circuit Short to Ground, Driver Side) fault PID. • If the fault was reported for the passenger safety canopy, monitor the 2294_26_OD (A - B or A - C Pillar Curtain Circuit Short to Ground, Passenger Side) fault PID. • **DIAGNOSTIC TIP:** When monitoring fault PIDs with the scan tool, it may take up to a 2-second delay for the scan tool display to update. • Attempt to recreate the fault by wiggling connectors (including any inline connectors), and flexing the wire harness. • **Does any safety canopy on-demand fault PID indicate a fault is present?**	**Yes** DEPOWER the SRS and REPAIR as necessary. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to I28 . **No** The fault is not present and cannot be recreated at this time. CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness, cycling the ignition frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. GO to I28 .
I27 CHECK THE AFFECTED SAFETY CANOPY® MODULE FAULT PIDs FOR AN INTERMITTENT SHORT TO VOLTAGE	
• Ignition OFF.	**Yes** DEPOWER the SRS and REPAIR as

tomsn048@gmail.com

• Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • If the fault was reported for the driver safety canopy, disconnect the driver Safety Canopy® module C3213 (Explorer/Mountaineer)/C9006 (Explorer Sport Trac). • If the fault was reported for the passenger safety canopy, disconnect the passenger Safety Canopy® module C3214 (Explorer/Mountaineer)/C9007 (Explorer Sport Trac). • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • **DIAGNOSTIC TIP:** When monitoring fault PIDs with the scan tool, it may take up to a 2-second delay for the scan tool display to update. • Monitor the 2294_31_OD (A - B or A - C Pillar Curtain Circuit Short to Battery, Driver Side) or 2294_27_OD (A - B or A - C Pillar Curtain Circuit Short to Battery, Passenger Side) fault PIDs. • Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness. • **Does any safety canopy on-demand fault PID indicate a fault is present?**	necessary. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to I28 . **No** The fault is not present and cannot be recreated at this time. CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness, cycling the ignition frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. GO to I28 .
I28 CHECK FOR ADDITIONAL SRS DTCs	
• Ignition OFF. • ⚠ **WARNING: Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.** • Reconnect all SRS components (if previously disconnected). • If previously directed to depower the SRS , repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - Restraints . • **Are any RCM and/or OCSM DTCs indicating a fault?**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the DTC Charts in this section for pinpoint test direction. **No** CLEAR all RCM and OCSM DTCs. PROVE OUT the SRS . Repair is complete. RETURN the vehicle to the customer.

Pinpoint Test J: DTC B2295

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

Normal Operation

A side air bag module provides protection of the thorax area (between the neck and abdomen) of the body, working in conjunction with the head protection provided by a Safety Canopy® module. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.

The Restraints Control Module (RCM) continuously monitors the driver and passenger side air bag module circuits (loop) for an acceptable resistance range, unacceptable voltage and shorts to ground. The RCM will set on-demand and store DTC B2295 in memory if any of these conditions are detected. If the RCM detects a fault, it will send a message to the Instrument Cluster (IC) module to illuminate the air bag warning indicator.

As the RCM continuously monitors side air bag module circuits for resistance, it expects a normal resistance between 1.31 to 4.29 ohms.

If a loop resistance is between 0.9 and 1.31 or between 4.29 and 5 ohms, there exists a strong potential for an intermittent fault, a DTC may or may not set. The RCM will also set an on-demand DTC if the loop resistance is less than 0.9 ohm or greater than 5 ohms.

NOTE: When monitoring fault and/or resistance PIDs with the scan tool, it may take up to 2 seconds for the scan tool display to update.

Fault PIDs [a]	Description	Fault Trigger Condition
2295_24_OD and 2295_24_CM	Side Air Bag Circuit Resistance Low, Front Passenger Side	When the Restraints Control Module (RCM) measures resistance less than 0.9 ohm between the passenger side air bag module circuits, a fault will be indicated.
2295_25_OD and 2295_25_CM	Side Air Bag Circuit Open, Front Passenger Side	When the RCM measures resistance greater than 5 ohms between the passenger side air bag module circuits, a fault will be indicated.
2295_26_OD and 2295_26_CM	Side Air Bag Circuit Short to Ground, Front Passenger Side	When the RCM senses a short to ground on either of the passenger side air bag module circuits, a fault will be indicated.
2295_27_OD and 2295_27_CM	Side Air Bag Circuit Short to Battery, Front Passenger Side	When the RCM senses a short to voltage on either of the passenger side air bag module circuits, a fault will be indicated.
2295_28_OD and 2295_28_CM	Side Air Bag Circuit Resistance Low, Front Driver Side	When the RCM measures resistance less than 0.9 ohm between the driver side air bag module circuits, a fault will be indicated.
2295_29_OD and 2295_29_CM	Side Air Bag Circuit Open, Front Driver Side	When the RCM measures resistance greater than 5 ohms between the driver side air bag module circuits, a fault will be indicated.
2295_30_OD and 2295_30_CM	Side Air Bag Circuit Short to Ground, Front Driver Side	When the RCM senses a short to ground on either of the driver side air bag module circuits, a fault will be indicated.
2295_31_OD and 2295_31_CM	Side Air Bag Circuit Short to Battery, Front Driver Side	When the RCM senses a short to voltage on either of the driver side air bag module circuits, a fault will be indicated.

[a] Fault PIDs that end in OD indicate an on-demand status and are associated with on-demand DTC B2295. Fault PIDs that end in CM indicate continuous memory status and are associated with continuous DTC B2295.

tomsn048@gmail.com

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Side air bag module
- RCM

PINPOINT TEST J: DTC B2295

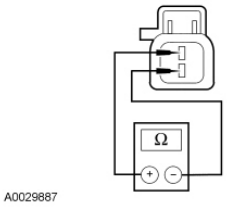
⚠ WARNING: Never disassemble or tamper with safety belt buckle/retractor pretensioners, adaptive load limiting retractors, safety belt inflators, or probe the electrical connectors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners, adaptive load limiting retractors, or safety belt inflators, which increases the risk of serious personal injury or death.

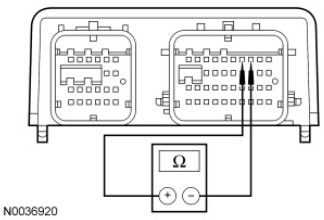
⚠ WARNING: Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Supplemental Restraint System (SRS) components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .





NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
J1 RETRIEVE RCM DTCs	
• Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record All 2295 Fault PIDs . ♦ Refer to PID list in Normal Operation to view 2295 fault PIDs. • **Do any RCM on-demand 2295 fault PIDs indicate a fault?**	**Yes** The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Using the fault PIDs recorded, GO to the appropriate pinpoint test step. For 2295_28_OD (Side Air Bag Circuit Resistance Low, Front Driver Side), GO to J2 . For (2295_29_OD (Side Air Bag Circuit Open, Front Driver Side), GO to J2 . For 2295_30_OD (Side Air Bag Circuit Short to Ground, Front Driver Side), GO to J9 . For 2295_31_OD (Side Air Bag Circuit Short to Battery, Front Driver Side), GO to J11 . For 2295_24_OD (Side Air Bag Circuit Resistance Low, Front Passenger Side), GO to J12 .

	For 2295_25_OD (Side Air Bag Circuit Open, Front Passenger Side), GO to J12 . For 2295_26_OD (Side Air Bag Circuit Short to Ground, Front Passenger Side), GO to J19 . For (2295_27_OD (Side Air Bag Circuit Short to Battery, Front Passenger Side), GO to J21 . **No** This is an intermittent fault when present as a CMDTC only. The fault condition is not present at this time. Using the fault PIDs recorded, GO to the appropriate pinpoint test step. For 2295_28_CM (Side Air Bag Circuit Resistance Low, Front Driver Side), 2295_29_CM (Side Air Bag Circuit Open, Front Driver Side), 2295_24_CM (Side Air Bag Circuit Resistance Low, Front Passenger Side) or 2295_25_CM (Side Air Bag Circuit Open, Front Passenger Side), GO to J24 . For (2295_30_CM (Side Air Bag Circuit Short to Ground, Front Driver Side) or 2295_26_CM (Side Air Bag Circuit Short to Ground, Front Passenger Side), GO to J26 . For 2295_31_CM (Side Air Bag Circuit Short to Battery, Front Driver Side) or 2295_27_CM (Side Air Bag Circuit Short to Battery, Front Passenger Side), GO to J27 .
J2 CHECK THE DRIVER SIDE AIR BAG MODULE RESISTANCE PID (DS_AB)	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - PID . • Enter the following diagnostic mode on the scan tool: DS_AB (Driver Side Impact Air Bag Resistance) Resistance PID . • **Does the resistance PID value read between 1.31 and 4.29 ohms?**	**Yes** GO to J23 . **No** GO to J3 .
J3 CHECK THE DRIVER SIDE AIR BAG RESISTANCE PID (DS_AB) WHILE CARRYING OUT A HARNESS TEST	
• Continue monitoring the DS_AB (Driver Side Impact Air Bag Resistance) resistance PID while carrying out a harness test of the driver side air	**Yes** DEPOWER the SRS and REPAIR the connector, terminals or wire harness as needed.

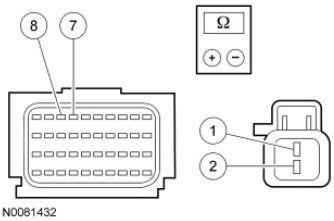
tomsn048@gmail.com

bag circuits and accessible connectors (including any inline connectors) by wiggling connectors and flexing the wire harness. • **Does the resistance PID value read between 1.31 and 4.29 ohms while carrying out the harness test?**	Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to J28 . **No** If the driver side air bag resistance PID is less than 1.31 ohms, GO to J4 . If the driver safety canopy resistance PID is greater than 4.29 ohms, GO to J7 .
J4 CHECK THE DRIVER SIDE AIR BAG MODULE FAULT PIDs (2295_28_OD) AND (2295_29_OD) FOR A CHANGE IN FAULT STATUS	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Driver Side Air Bag Module C3049 . • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record The Following Fault PIDs . ♦ 2295_28_OD (Side Air Bag Circuit Resistance Low, Front Driver Side) ♦ 2295_29_OD (Side Air Bag Circuit Open, Front Driver Side) • **DIAGNOSTIC TIP:** When viewing DTC B2295 on-demand fault PIDs with the driver side air bag disconnected, an open circuit fault would normally be retrieved. • **Did the driver side air bag on-demand fault PIDs change from indicating a low resistance to an open circuit fault?**	**Yes** GO to J22 . **No** GO to J5 .
J5 CHECK FOR A SHORT BETWEEN DRIVER SEAT SIDE AIR BAG CIRCUITS	

• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Measure resistance between driver side air bag C3049-2, circuit CR105 (GN/BU), harness side and C3049-1, circuit RR105 (GY/YE), harness side.  A0029887 • **Is resistance greater than 10,000 ohms?**	**Yes** GO to J22 . **No** GO to J6 .
J6 CHECK THE RCM FOR LOW RESISTANCE	
• Disconnect: RCM C310a and C310b . • Measure resistance between RCM C310b pin 7, component side, and C310b pin 8, component side.  N0036920 • **Is resistance greater than 10,000 ohms?**	**Yes** REPAIR circuits CR105 (GN/BU) and RR105 (GY/YE). GO to J25 . **No** GO to J23 .
J7 CHECK THE DRIVER SIDE AIR BAG MODULE FAULT PIDs (2295_29_OD) AND (2295_28_OD) FOR A CHANGE IN FAULT STATUS	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Driver Side Air Bag Module C3049 .	**Yes** GO to J22 . **No** GO to J8 .

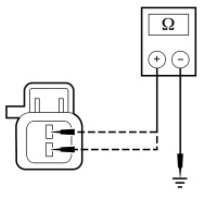
tomsn048@gmail.com

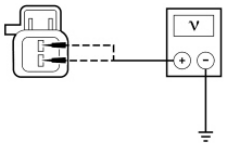
- Connect a fused jumper wire between driver side air bag C3049-2, circuit CR105 (GN/BU), harness side and C3049-1, circuit RR105 (GY/YE), harness side.
- Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
- Ignition ON.
- Enter the following diagnostic mode on the scan tool: Self Test - RCM .
- Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record The Following Fault PIDs .
  - 2295_28_OD (Side Air Bag Circuit Resistance Low, Front Driver Side)
  - 2295_29_OD (Side Air Bag Circuit Open, Front Driver Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2295 on-demand fault PIDs with the driver side air bag module circuits shorted together, a low resistance fault would normally be retrieved.
- **Did the driver side air bag on-demand fault PIDs change from indicating an open circuit to a low resistance fault?**



J8 CHECK DRIVER SIDE AIR BAG MODULE CIRCUITS FOR AN OPEN

- Ignition OFF.
- Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.
- Remove the jumper wire from the driver side air bag C3049.
- Disconnect: RCM C310a and C310b .
- Measure resistance between RCM C310b, harness side and driver seat side air bag C3049, harness side using the following chart.





RCM	Circuit	Driver Seat Side Air Bag Module
C310b-8	CR105 (GN/BU)	C3049-1
C310b-7	RR105 (GY/YE)	C3049-2

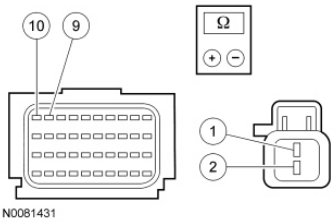
Yes
GO to J23 .

No
REPAIR circuit CR105 (GN/BU) or RR105 (GY/YE). GO to J28 .

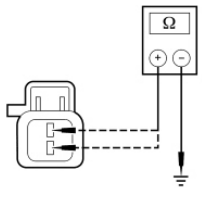
 • **Are resistances less than 0.5 ohm?**	
J9 CHECK THE DRIVER SIDE AIR BAG MODULE FAULT PIDs (2295_30_OD) AND (2295_28_OD) FOR A CHANGE IN FAULT STATUS	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Driver Side Air Bag Module C3049 . • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record The Following Fault PIDs . ♦ 2295_29_OD (Side Air Bag Circuit Open, Front Driver Side) ♦ 2295_30_OD (Side Air Bag Circuit Short to Ground, Front Driver Side) • **DIAGNOSTIC TIP:** When viewing DTC B2295 on-demand fault PIDs with the driver side air bag module disconnected, an open circuit fault would normally be retrieved. • **Did the driver side air bag on-demand fault PIDs change from indicating a short to ground to an open circuit fault?**	**Yes** GO to J22 . **No** GO to J10 .
J10 CHECK DRIVER SIDE AIR BAG MODULE CIRCUITS FOR A SHORT TO GROUND	

tomsn048@gmail.com

• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310a and C310b . • Measure resistance between driver side air bag: ♦ C3049-1, circuit CR105 (GN/BU), harness side and ground. ♦ C3049-2, circuit RR105 (GY/YE), harness side and ground.  N0062801 • **Is resistance greater than 10,000 ohms?**	**Yes** GO to J23 . **No** Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar. REPAIR circuit CR105 (GN/BU) or RR105 (GY/YE). GO to J28 .
J11 CHECK DRIVER SIDE AIR BAG MODULE CIRCUITS FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Driver Side Air Bag Module C3049 . • Disconnect: RCM C310a and C310b . • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Measure voltage between driver side air bag: ♦ C3049-1, circuit CR105 (GN/BU), harness side and ground. ♦ C3049-2, circuit RR105 (GY/YE), harness side and ground.  N0059342 • **Is voltage present on either circuit?**	**Yes** Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar. REPAIR circuit CR105 (GN/BU) or RR105 (GY/YE). GO to J28 . **No** GO to J23 .
J12 CHECK THE PASSENGER SIDE AIR BAG MODULE RESISTANCE PID (PS_AB)	
• Ignition ON.	**Yes** GO to J23 .

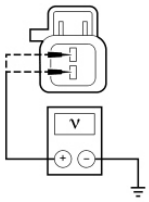


• Enter the following diagnostic mode on the scan tool: DataLogger - RCM - PID . • Enter the following diagnostic mode on the scan tool: PS_AB (Passenger Side Impact Air Bag Resistance) Resistance PID . • **Does the resistance PID value read between 1.31 and 4.29 ohms?**	**No** GO to J13 .
J13 CHECK THE PASSENGER SIDE AIR BAG RESISTANCE PID (PS_AB) WHILE CARRYING OUT A HARNESS TEST	
• Continue monitoring the PS_AB (Passenger Side Impact Air Bag Resistance) resistance PID while carrying out a harness test of the passenger side air bag circuits and accessible connectors (including any inline connectors), by wiggling connectors and flexing the wire harness. • **Does the resistance PID value read between 1.31 and 4.29 ohms while carrying out the harness test?**	**Yes** DEPOWER the SRS and REPAIR the connector, terminals or wire harness as needed. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to J28 . **No** If the passenger side air bag resistance PID is less than 1.31 ohms, GO to J14 . If the passenger side air bag resistance PID is greater than 4.29 ohms, GO to J17 .
J14 CHECK THE PASSENGER SIDE AIR BAG MODULE FAULT PIDs (2295_24_OD) AND (2295_25_OD) FOR A CHANGE IN FAULT STATUS	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Side Air Bag Module C3050 . • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM .	**Yes** GO to J22 . **No** GO to J15 .



tomsn048@gmail.com

• Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record The Following Fault PIDs . ♦ 2295_24_OD (Side Air Bag Circuit Resistance Low, Front Passenger Side) ♦ 2295_25_OD (Side Air Bag Circuit Open, Front Passenger Side) • **DIAGNOSTIC TIP:** When viewing DTC B2295 on-demand fault PIDs with the passenger side air bag module disconnected, an open circuit fault would normally be retrieved. • **Did the passenger side air bag on-demand fault PIDs change from indicating a low resistance to an open circuit fault?**	
J15 CHECK FOR A SHORT BETWEEN PASSENGER SEAT SIDE AIR BAG CIRCUITS	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Measure resistance between passenger side air bag C3050-1, circuit CR106 (GN/BU), harness side and C3050-2, circuit RR106 (GN/YE), harness side.  • **Is resistance greater than 10,000 ohms?**	**Yes** GO to J23 . **No** GO to J16 .
J16 CHECK THE RCM FOR LOW RESISTANCE	
• Disconnect: RCM C310a and C310b . • Measure resistance between RCM C310b pin 9, component side, and C310b pin 10, component side.  • **Is resistance greater than 10,000 ohms?**	**Yes** REPAIR circuits CR106 (GN/BU) and RR106 (GN/YE). GO to J28 . **No** GO to J23 .



J17 CHECK THE PASSENGER SIDE AIR BAG MODULE FAULT PIDs (2295_25_OD) AND (2295_24_OD) FOR A CHANGE IN FAULT STATUS	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Side Air Bag Module C3050 . • Connect a fused jumper wire between passenger side air bag C3050-1, circuit CR106 (GN/BU), harness side and C3050-2, circuit RR106 (GN/YE), harness side. • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record The Following Fault PIDs . ♦ 2295_24_OD (Side Air Bag Circuit Resistance Low, Front Passenger Side) ♦ 2295_25_OD (Side Air Bag Circuit Open, Front Passenger Side) • **DIAGNOSTIC TIP:** When viewing DTC B2295 on-demand fault PIDs with the passenger side air bag circuits shorted together, a low resistance fault would normally be retrieved. • **Did the passenger side air bag on-demand fault PIDs change from indicating an open circuit to a low resistance fault?**	**Yes** GO to J22 . **No** GO to J18 .
J18 CHECK PASSENGER SIDE AIR BAG MODULE CIRCUITS FOR AN OPEN	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the jumper wire from the passenger side air bag C3050. • Disconnect: RCM C310a and C310b .	**Yes** GO to J23 . **No** REPAIR circuit CR106 (GN/BU) or RR106 (GN/YE). GO to J28 .

tomsn048@gmail.com

• Measure resistance between RCM C310b, harness side and passenger seat side air bag module C3050, harness side using the following chart. **RCM** / **Circuit** / **Passenger Seat Side Air Bag Module** C310b-9 / CR106 (VT/GY) / C3050-1 C310b-10 / RR106 (YE/OG) / C3050-2  N0081431 • **Are resistances less than 0.5 ohm?**	
J19 CHECK THE PASSENGER SIDE AIR BAG MODULE FAULT PIDs (2295_26_OD) AND (2295_25_OD) FOR A CHANGE IN FAULT STATUS	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Side Air Bag Module C3050 . • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record The Following Fault PIDs .	**Yes** GO to J22 . **No** GO to J20 .

♦ 2295_25_OD (Side Air Bag Circuit Open, Front Passenger Side) ♦ 2295_26_OD (Side Air Bag Circuit Short to Ground, Front Passenger Side) • **DIAGNOSTIC TIP:** When viewing DTC B2295 on-demand fault PIDs with the passenger side air bag module disconnected, an open circuit fault would normally be retrieved. • **Did the passenger side air bag on-demand fault PIDs change from indicating a short to ground to an open circuit fault?**	
J20 CHECK PASSENGER SIDE AIR BAG MODULE CIRCUITS FOR A SHORT TO GROUND	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310a and C310b . • Measure resistance between passenger side air bag: ♦ C314-2, circuit CR106 (VT/GY), harness side and ground. ♦ C314-1, circuit RR106 (YE/OG), harness side and ground.  • **Is resistance greater than 10,000 ohms?**	**Yes** GO to J23 . **No** Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar. REPAIR circuit CR106 (VT/GY) or RR106 (YE/OG). GO to J28 .
J21 CHECK PASSENGER SIDE AIR BAG MODULE CIRCUITS FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Side Air Bag Module C3050 . • Disconnect: RCM C310a and C310b . • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Measure voltage between passenger side air bag:	**Yes** Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar. REPAIR circuit CR106 (VT/GY) or RR106 (YE/OG). GO to J28 . **No** GO to J23 .

tomsn048@gmail.com

♦ C314-2, circuit CR106 (VT/GY), harness side and ground. ♦ C314-1, circuit RR106 (YE/OG), harness side and ground.  N0005052 • **Is voltage present on either circuit?**	
J22 CONFIRM THE SIDE AIR BAG MODULE FAULT	
NOTE: Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, DTCs will be recorded. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Connect: Affected Side Air Bag C3049 (Driver) C3050 (Passenger) . • Connect: RCM C310a and C310b . • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record All 2295 Fault PIDs . ♦ Refer to PID list in Normal Operation to view 2295 fault PIDs. • **Does the original RCM on-demand 2295 fault PID indicate a fault?**	**Yes** REMOVE and INSPECT the seat side air bag module jumper harness, connector terminals, C3049 (Driver) C3050 (Passenger) for damage. REFER to Side Air Bag Module in this section. If a concern is found, REPAIR or INSTALL a new seat jumper harness. GO to J28 . If a concern was not found, INSTALL a new driver or passenger side air bag module. GO to J28 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. Using the fault PIDs recorded, GO to the appropriate pinpoint test step and CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. For 2295_28_CM (Side Air Bag Circuit Resistance Low, Front Driver Side), 2295_29_CM (Side Air Bag Circuit Open, Front Driver Side), 2295_24_CM (Side Air Bag Circuit Resistance Low, Front Passenger Side) or 2295_25_CM (Side Air Bag Circuit Open, Front Passenger Side), GO to J24 . For (2295_30_CM (Side Air Bag Circuit Short to Ground, Front Driver Side) or 2295_26_CM (Side Air Bag Circuit Short to Ground, Front Passenger Side), GO to J26 . For 2295_31_CM (Side Air Bag Circuit Short to Battery, Front Driver Side) or 2295_27_CM

	(Side Air Bag Circuit Short to Battery, Front Passenger Side), GO to J27 .
J23 CONFIRM THE RCM FAULT	
NOTE: Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, DTCs will be recorded. • Ignition OFF. • If previously directed to disconnect any SRS component(s): ♦ depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. ♦ connect all previously disconnected restraint system component(s), including RCM C310a and C310b. ♦ repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record All 2295 Fault PIDs . ♦ Refer to PID list in Normal Operation to view 2295 fault PIDs. • **Does the original RCM on-demand 2295 fault PID indicate a fault?**	**Yes** INSTALL a new RCM . REFER to Restraints Control Module (RCM) in this section. GO to J28 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. Using the fault PIDs recorded, GO to the appropriate pinpoint test step and CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. For 2295_28_CM (Side Air Bag Circuit Resistance Low, Front Driver Side), 2295_29_CM (Side Air Bag Circuit Open, Front Driver Side), 2295_24_CM (Side Air Bag Circuit Resistance Low, Front Passenger Side) or 2295_25_CM (Side Air Bag Circuit Open, Front Passenger Side), GO to J24 . For (2295_30_CM (Side Air Bag Circuit Short to Ground, Front Driver Side) or 2295_26_CM (Side Air Bag Circuit Short to Ground, Front Passenger Side), GO to J26 . For 2295_31_CM (Side Air Bag Circuit Short to Battery, Front Driver Side) or 2295_27_CM (Side Air Bag Circuit Short to Battery, Front Passenger Side), GO to J27 .
J24 CHECK SIDE AIR BAG MODULE CIRCUIT RESISTANCE PIDs FOR AN INTERMITTENT LOW RESISTANCE OR OPEN	
• If the fault was reported for the driver side air bag module, monitor the DS_AB (Driver Side Impact Air Bag Resistance) resistance PID. • If the fault was reported for the passenger side air bag, monitor the PS_AB (Passenger Side Impact Air Bag Resistance) resistance PID. • **NOTE:** A resistance PID that reads between 0.9 and 1.31 ohms or between 4.29 and 5 ohms may or may not set an on-demand DTC yet indicates a strong potential of an intermittent fault condition. Make sure to thoroughly check wire harness(es), connectors and terminals as they are the likely source of the fault condition.	**Yes** DEPOWER the SRS and REPAIR as necessary. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to J28 . **No** GO to J25 .

tomsn048@gmail.com

• Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness. • **Does any side air bag on-demand fault PID indicate a fault is present or is the side air bag resistance PID less than 1.31 ohms or greater than 4.29 ohms?**	
J25 CHECK THE HARNESS AND CONNECTORS	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect the affected side air bag module C3049 (driver) C3050 (passenger): ♦ inspect connector(s) (including any inline connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals. ♦ inspect wire harness for any damage, pinched, cut or pierced wires. • **Were any concerns found?**	**Yes** REPAIR as necessary. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to J28 . **No** The fault is not present and cannot be recreated at this time. CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness, cycling the ignition frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. GO to J28 .
J26 CHECK SIDE AIR BAG MODULE FAULT PIDs FOR AN INTERMITTENT SHORT TO GROUND	
• If the fault was reported for the driver side air bag module, monitor the 2295_30_OD (Side Air Bag Circuit Short to Ground, Front Driver Side) fault PID on the scan tool. • If the fault was reported for the passenger side air bag, monitor the 2295_26_OD (Side Air Bag Circuit Short to Ground, Front Passenger Side) fault PID on the scan tool. • **DIAGNOSTIC TIP:** When monitoring fault PIDs with the scan tool, it may take up to a 2-second delay for the scan tool display to update. • Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness. • **Does any side air bag on-demand fault PID indicate a fault is present?**	**Yes** DEPOWER the SRS and REPAIR as necessary. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to J28 . **No** The fault is not present and cannot be recreated at this time. CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness, cycling the ignition frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do**

	so in the pinpoint test. REPAIR any intermittent wiring, terminal or connector concerns found. GO to J28 .
J27 CHECK SIDE AIR BAG MODULE FAULT PIDs FOR AN INTERMITTENT SHORT TO VOLTAGE	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect the affected side air bag module C3049 (driver) C3050 (passenger). • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • **DIAGNOSTIC TIP:** When monitoring fault PIDs with the scan tool, it may take up to a 2-second delay for the scan tool display to update. • Monitor the 2295_31_OD (Side Air Bag Circuit Short to Battery, Front Driver Side) or 2295_27_OD (Side Air Bag Circuit Short to Battery, Front Passenger Side) on-demand fault PIDs on the scan tool. • Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness. • **Does any side air bag on-demand fault PID indicate a fault is present?**	**Yes** DEPOWER the SRS and REPAIR as necessary. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to J28 . **No** The fault is not present and cannot be recreated at this time. CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness, cycling the ignition frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. GO to J28 .
J28 CHECK FOR ADDITIONAL SRS DTCs	
• Ignition OFF. • ⚠ **WARNING: Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.** • Reconnect all SRS components (if previously disconnected). • If previously directed to depower the SRS , repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - Restraints . • **Are any RCM and/or OCSM DTCs indicating a fault?**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the DTC Charts in this section for pinpoint test direction. **No** CLEAR all RCM and OCSM DTCs. PROVE OUT the SRS . Repair is complete. RETURN the vehicle to the customer.

tomsn048@gmail.com

Pinpoint Test K: DTC B2296

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

Normal Operation

The Restraints Control Module (RCM) checks all of the impact sensor circuits for faults. If the RCM detects one of the following faults on any of the impact sensor circuits, it will store DTC B2296 in memory and send a message to the Instrument Cluster (IC) module to illuminate the air bag warning indicator.

NOTE: Do not probe any impact sensor. The impact sensor is an electronic device and cannot be tested using a multi-meter.

Fault PIDs [a]	Description	Fault Trigger Condition
2296_18_OD and 2296_18_CM	Driver/Center Front Crash Sensor Internal Fault (LH front impact severity sensor)	When the Restraints Control Module (RCM) senses a internal failure with the driver/center front impact sensor, a fault will be indicated.
2296_19_OD and 2296_19_CM	Driver/Center Front Crash Sensor Mount/Communication Fault (LH front impact severity sensor)	When the RCM is unable to communicate with the driver/center front impact sensor, a fault will be indicated.
2296_24_OD and 2296_24_CM	Side Crash Sensor 2 Internal Fault, Passenger side (second row passenger side impact sensor)	When the RCM senses a internal failure with the passenger side second row impact sensor, a fault will be indicated.
2296_25_OD and 2296_25_CM	Side Crash Sensor Mount or Communication Fault, Row No. 2 Passenger Side (second row passenger side impact sensor)	When the RCM is unable to communicate with the passenger side second row impact sensor, a fault will be indicated.
2296_26_OD and 2296_26_CM	Side Crash Sensor 2 Internal Fault, Driver side (second row driver side impact sensor)	When the RCM senses a internal failure with the driver side second row impact sensor, a fault will be indicated.
2296_27_OD and 2296_27_CM	Side Crash Sensor Mount or Communication Fault, Row No. 2 Driver Side (second row driver side impact sensor)	When the RCM is unable to communicate with the driver side second row impact sensor, a fault will be indicated.
2296_28_OD and 2296_28_CM	Side Crash Sensor Internal Fault, Front Passenger Side (first row passenger side impact sensor)	When the RCM senses a internal failure with the passenger side first row impact sensor, a fault will be indicated.
2296_29_OD and 2296_29_CM	Side Crash Sensor Mount or Communication Fault, Front Passenger Side	When the RCM is unable to communicate with the passenger side first row impact sensor, a fault will be indicated.

	(first row passenger side impact sensor)	
2296_30_OD and 2296_30_CM	Side Crash Sensor Internal Fault, Front Driver Side (first row driver side impact sensor)	When the RCM senses a internal failure with the driver/center front impact sensor, a fault will be indicated.
2296_31_OD and 2296_31_CM	Side Crash Sensor Mount or Communication Fault, Front Driver Side (first row driver side impact sensor)	When the RCM is unable to communicate with the driver side first row impact sensor, a fault will be indicated.

[a] Fault PIDs that end in OD indicate an on-demand status and are associated with on-demand DTC B2296. Fault PIDs that end in CM indicate continuous memory status and are associated with continuous DTC B2296.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Impact sensor
- Incorrect sensor mounting
- RCM

PINPOINT TEST K: DTC B2296

⚠ WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the Safety Canopy® and cause serious personal injury or death.

⚠ WARNING: Always tighten the fasteners of the restraints control module (RCM) and impact sensor (if equipped) to the specified torque. Failure to do so may result in incorrect restraint system operation, which increases the risk of personal injury or death in a crash.

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.**

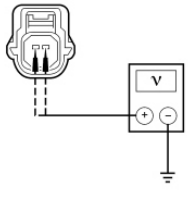
Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

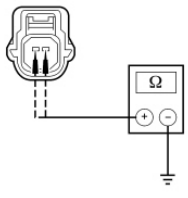
NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: SRS components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

NOTE: Do not probe any impact sensor. The impact sensor is an electronic device and cannot be tested using a multi-meter.

Test Step	Result / Action to Take
K1 RETRIEVE RCM DTCs	
	Yes The fault condition is still present. This fault





tomsn048@gmail.com

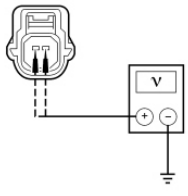
• Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record All 2296 Fault PIDs . ♦ Refer to PID list in Normal Operation to view 2296 fault PIDs. • **Do any RCM on-demand 2296 fault PIDs indicate a fault?**	cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Using the fault PIDs recorded, GO to the appropriate pinpoint test step. For 2296_31_OD (Side Crash Sensor Mount or Communication Fault, Front Driver Side), GO to K2 . For 2296_30_OD (Side Crash Sensor Internal Fault, Front Driver Side), INSTALL a new first row driver side impact sensor. REFER to Side Impact Sensor - Front Door in this section. GO to K54 . For 2296_29_OD (Side Crash Sensor Mount or Communication Fault, Front Passenger Side), GO to K12 . For 2296_28_OD (Side Crash Sensor Internal Fault, Front Passenger Side), INSTALL a new first row passenger side impact sensor. REFER to Side Impact Sensor - Front Door in this section. GO to K54 . For 2296_27_OD (Side Crash Sensor Mount or Communication Fault, Row No. 2 Driver Side), GO to K22 . For 2296_26_OD (Side Crash Sensor 2 Internal Fault, Driver side), INSTALL a new second row driver side impact sensor. REFER to Side Impact Sensor - C-Pillar, Explorer Sport Trac in this section. GO to K54 . For 2296_25_OD (Side Crash Sensor Mount or Communication Fault, Row No. 2 Passenger Side), GO to K32 . For 2296_24_OD (Side Crash Sensor 2 Internal Fault, Passenger side), INSTALL a new second row passenger side impact sensor. REFER to Side Impact Sensor - C-Pillar, Explorer Sport Trac in this section. GO to K54 . For 2296_19_OD (Driver/Center Front Crash Sensor Mount/Communication Fault), GO to K42 . For 2296_18_OD (Driver/Center Front Crash Sensor Internal Fault), INSTALL a new front impact severity sensor. REFER to Front Impact

	Severity Sensor in this section. GO to K54 . **No** This is an intermittent fault when present as a CMDTC only. The fault condition is not present at this time. GO to K53 .
K2 INSPECT THE FIRST ROW DRIVER SIDE IMPACT SENSOR MOUNTING AND MOUNTING SURFACE	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Access the first row driver side impact sensor located in the driver front door. Refer to Side Impact Sensor - Front Door in this section. • Inspect the first row driver side impact sensor for: ♦ loose electrical connector. ♦ improper mounting. ♦ loose sensor mounting bolt. ♦ damaged U-nut. • Remove the first row driver side impact sensor. • Inspect the first row driver side impact sensor, electrical connector and mounting surface for damage, corrosion or dirt. • **Was a significant amount of corrosion or dirt found, the first row driver side impact sensor attached to the mounting surface incorrectly or was the impact sensor bolt not fully seated and tightened correctly?**	**Yes** CLEAN and TIGHTEN the bolt or REPAIR the mounting surface as necessary. REINSTALL the first row driver side impact sensor. GO to K54 . **No** GO to K3 .
K3 INSTALL THE FIRST ROW DRIVER SIDE IMPACT SENSOR AND CARRY OUT THE SELF TEST	
• Clean and repair the mounting surface as necessary. • Clean the first row driver side impact sensor mounting bolt. • Install the first row driver side impact sensor. • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record All 2296 Fault PIDs . ♦ Refer to PID list in Normal Operation to view 2296 fault PIDs.	**Yes** GO to K4 . **No** Fault corrected. GO to K54 .

tomsn048@gmail.com

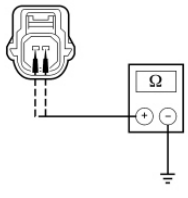
• **Do any RCM on-demand 2296 fault PIDs for the first row driver side impact sensor indicate a fault?**	
K4 CHECK THE FIRST ROW DRIVER SIDE IMPACT SENSOR GROUND CIRCUIT FOR HIGH RESISTANCE	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: First Row Driver Side Impact Sensor C567a . • Measure resistance between first row driver side impact sensor C567a-2, circuit RR131 (VT/GY), harness side and the first row driver side impact sensor case ground. • **Is resistance less than 10 ohms?**	**Yes** GO to K6 . **No** GO to K5 .
K5 CLEAN THE FIRST ROW DRIVER SIDE IMPACT SENSOR MOUNTING SURFACE AND CARRY OUT THE ON-DEMAND SELF TEST	
• Remove the first row driver side impact sensor. • Clean and repair the mounting surface as necessary. • Clean the first row driver side impact sensor mounting bolt. • Install the first row driver side impact sensor. • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record All 2296 Fault PIDs . ♦ Refer to PID list in Normal Operation to view 2296 fault PIDs. • **Do any RCM on-demand 2296 fault PIDs for the first row driver side impact sensor indicate a fault?**	**Yes** GO to K6 . **No** Fault corrected. GO to K54 .
K6 CHECK FIRST ROW DRIVER SIDE IMPACT SENSOR CIRCUITS FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: First Row Driver Side Impact Sensor C567a .	**Yes** REPAIR circuit VR217 (GY/YE) or RR131 (VT/GY). GO to K54 . **No** GO to K7 .

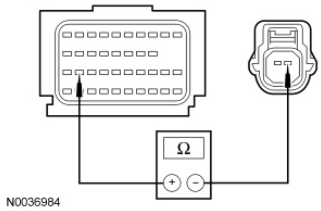
• Disconnect: RCM C310a and C310b . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Measure voltage between first row driver side impact sensor: ♦ C567a-2, circuit RR131 (VT/GY), harness side and ground. ♦ C567a-1, circuit VR217 (GY/YE), harness side and ground.  N0036990 • **Is voltage present on either circuit?**	
K7 CHECK FIRST ROW DRIVER SIDE IMPACT SENSOR CIRCUITS FOR A SHORT TO GROUND	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Measure resistance between first row driver side impact sensor: ♦ C567a-2, circuit RR131 (VT/GY), harness side and ground. ♦ C567a-1, circuit VR217 (GY/YE), harness side and ground.  N0036989 • **Are resistances greater than 10,000 ohms?**	**Yes** GO to K8 . **No** REPAIR short to ground in circuit VR217 (GY/YE) or RR131 (VT/GY). GO to K54 .
K8 CHECK FIRST ROW DRIVER SIDE IMPACT SENSOR CIRCUITS FOR AN OPEN	
• Measure resistance between RCM C310b-28, circuit VR217 (GY/YE), harness side and first row driver side impact sensor C567a-1, circuit VR217 (GY/YE), harness side.	**Yes** GO to K9 . **No** REPAIR circuit VR217 (GY/YE). GO to K54 .

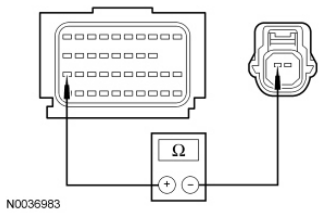


tomsn048@gmail.com

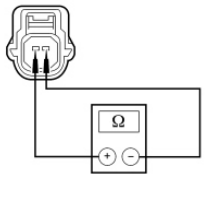
 N0036986 • **Are resistances less than 0.5 ohm?**	
K9 CHECK FIRST ROW DRIVER SIDE IMPACT SENSOR CIRCUIT FOR AN OPEN	
• Measure resistance between RCM C310b-27, circuit RR131 (VT/GY), harness side and first row driver side impact sensor C567a-2, circuit RR131 (VT/GY), harness side.  N0036985 • **Is resistance less than 0.5 ohm?**	**Yes** GO to K10 . **No** REPAIR circuit RR131 (VT/GY). GO to K54 .
K10 CHECK FOR A SHORT BETWEEN FIRST ROW DRIVER SIDE IMPACT SENSOR CIRCUITS	
• Measure resistance between first row driver side impact sensor C567a-1, circuit VR217 (GY/YE), harness side and C567a-2, circuit RR131 (VT/GY), harness side.  N0036987 • **Is resistance greater than 10,000 ohms?**	**Yes** GO to K11 . **No** REPAIR circuits VR217 (GY/YE) and RR131 (VT/GY). GO to K54 .
K11 CHECK THE FIRST ROW DRIVER SIDE IMPACT SENSOR	
• Connect: RCM C310a and C310b . • Install a known good first row driver side impact sensor.	**Yes** GO to K52 . **No** Fault corrected. GO to K54 .







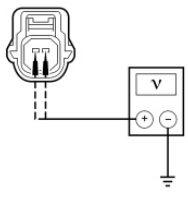
• Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record All 2296 Fault PIDs . ♦ Refer to PID list in Normal Operation to view 2296 fault PIDs. • **Do any RCM on-demand 2296 fault PIDs for the first row driver side impact sensor indicate a fault?**	
K12 INSPECT THE FIRST ROW PASSENGER SIDE IMPACT SENSOR MOUNTING AND MOUNTING SURFACE	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Access the first row passenger side impact sensor located in the front door. Refer to Side Impact Sensor - Front Door in this section. • Inspect the first row passenger side impact sensor for: ♦ loose electrical connector. ♦ improper mounting. ♦ loose sensor mounting bolt. ♦ damaged U-nut. • Remove the first row passenger side impact sensor. • Inspect the first row passenger side impact sensor, electrical connector and mounting surface for damage, corrosion or dirt. • **Was a significant amount of corrosion or dirt found, the first row passenger side impact sensor attached to the mounting surface incorrectly or was the impact sensor bolt not fully seated and tightened correctly?**	**Yes** CLEAN and TIGHTEN the bolt or REPAIR the mounting surface as necessary. REINSTALL the first row passenger side impact sensor. GO to K54 . **No** GO to K13 .
K13 INSTALL THE FIRST ROW PASSENGER SIDE IMPACT SENSOR AND CARRY OUT THE SELF TEST	
• Clean and repair the mounting surface as necessary. • Clean the first row passenger side impact sensor mounting bolt. • Install the first row passenger side impact sensor.	**Yes** GO to K14 . **No** Fault corrected. GO to K54 .



tomsn048@gmail.com

• Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record All 2296 Fault PIDs . ♦ Refer to PID list in Normal Operation to view 2296 fault PIDs. • **Do any RCM on-demand 2296 fault PIDs for the first row passenger side impact sensor indicating a fault?**	
K14 CHECK THE FIRST ROW PASSENGER SIDE IMPACT SENSOR GROUND CIRCUIT FOR HIGH RESISTANCE	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: First Row Passenger Side Impact Sensor C644a . • Measure resistance between the first row passenger side impact sensor C644a-2, circuit RR132 (BU/WH), harness side and the first row passenger side impact sensor case ground. • **Is resistance less than 10 ohms?**	**Yes** GO to K16 . **No** GO to K15 .
K15 CLEAN THE FIRST ROW PASSENGER SIDE IMPACT SENSOR MOUNTING SURFACE AND CARRY OUT THE SELF TEST	
• Remove the first row passenger side impact sensor. • Clean and repair the mounting surface as necessary. • Clean the first row passenger side impact sensor mounting bolt. • Install the first row passenger side impact sensor. • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record All 2296 Fault PIDs . ♦ Refer to PID list in Normal Operation to view 2296 fault PIDs.	**Yes** GO to K16 . **No** Fault corrected. GO to K54 .

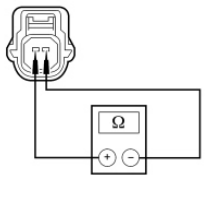
• **Do any RCM on-demand 2296 fault PIDs for the first row passenger side impact sensor indicating a fault?**	
K16 CHECK FIRST ROW PASSENGER SIDE IMPACT SENSOR CIRCUITS FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: First Row Passenger Side Impact Sensor C644a . • Disconnect: RCM C310a and C310b . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Measure voltage between first row passenger side impact sensor: ♦ C644a-1, circuit VR218 (YE/OG), harness side and ground. ♦ C644a-2, circuit RR132 (BU/WH), harness side and ground.  N0036990 • **Is voltage present on either circuit?**	**Yes** REPAIR circuit VR218 (YE/OG) or RR132 (BU/WH). GO to K54 . **No** GO to K17 .
K17 CHECK FIRST ROW PASSENGER SIDE IMPACT SENSOR CIRCUITS FOR A SHORT TO GROUND	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Measure resistance between first row passenger side impact sensor: ♦ C644a-1, circuit VR218 (YE/OG), harness side and ground. ♦ C644a-2, circuit RR132 (BU/WH), harness side and ground.	**Yes** GO to K18 . **No** REPAIR circuit VR218 (YE/OG) or RR132 (BU/WH). GO to K54 .



tomsn048@gmail.com

 • **Are resistances greater than 10,000 ohms?**	
K18 CHECK FIRST ROW PASSENGER SIDE IMPACT SENSOR CIRCUIT FOR AN OPEN	
• Measure resistance between RCM C310b-29, circuit VR218 (YE/OG), harness side and first row passenger side impact sensor C644a-1, circuit VR218 (YE/OG), harness side.  • **Are resistances less than 0.5 ohm?**	**Yes** GO to K19 . **No** REPAIR circuit VR218 (YE/OG). GO to K54 .
K19 CHECK FIRST ROW PASSENGER SIDE IMPACT SENSOR CIRCUIT FOR AN OPEN	
• Measure resistance between RCM C310b-30, circuit RR132 (BU/WH), harness side and first row passenger side impact sensor C644a-2, circuit RR132 (BU/WH), harness side.  • **Is resistance less than 0.5 ohm?**	**Yes** GO to K20 . **No** REPAIR circuit RR132 (BU/WH). GO to K54 .
K20 CHECK FOR A SHORT BETWEEN FIRST ROW PASSENGER SIDE IMPACT SENSOR CIRCUITS	
• Measure resistance between first row passenger side impact sensor C644a-1, circuit VR218 (YE/OG), harness side and C644a-2, circuit RR132 (BU/WH), harness side.	**Yes** GO to K21 . **No** REPAIR circuits VR218 (YE/OG) and RR132 (BU/WH). GO to K54 .

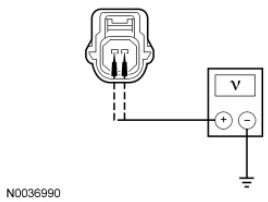
 N0036987 • **Is resistance greater than 10,000 ohms?**	
K21 CHECK THE FIRST ROW PASSENGER SIDE IMPACT SENSOR	
• Connect: RCM C310a and C310b . • Install a known good first row passenger side impact sensor. • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record All 2296 Fault PIDs . ♦ Refer to PID list in Normal Operation to view 2296 fault PIDs. • **Do any RCM on-demand 2296 fault PIDs for the first row passenger side impact sensor indicating a fault?**	**Yes** GO to K52 . **No** Fault corrected. GO to K54 .
K22 INSPECT THE SECOND ROW DRIVER SIDE IMPACT SENSOR MOUNTING AND MOUNTING SURFACE	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Inspect the second row driver side impact sensor mounting and make sure that the retaining bolts are fully seated and tightened correctly. • Remove the second row driver side impact sensor. • Inspect the second row driver side impact sensor and mounting surface for damage, corrosion or dirt. • **Was a significant amount of corrosion or dirt found, the second row driver side impact sensor attached to the mounting surface incorrectly or were the impact sensor bolts not fully seated and tightened correctly?**	**Yes** CLEAN and TIGHTEN the bolts or REPAIR the mounting surface as necessary. REINSTALL the second row driver side impact sensor. GO to K54 . **No** GO to K23 .



tomsn048@gmail.com

K23 INSTALL THE SECOND ROW DRIVER SIDE IMPACT SENSOR AND CARRY OUT THE SELF TEST	
• Clean and repair the mounting surface as necessary. • Clean the second row driver side impact sensor mounting bolt. • Install the second row driver side impact sensor. • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record All 2296 Fault PIDs . ♦ Refer to PID list in Normal Operation to view 2296 fault PIDs. • **Do any RCM on-demand 2296 fault PIDs for the second row driver side impact sensor indicating a fault?**	**Yes** GO to K24 . **No** Fault corrected. GO to K54 .
K24 CHECK THE SECOND ROW DRIVER SIDE IMPACT SENSOR GROUND CIRCUIT FOR HIGH RESISTANCE	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Second Row Driver Side Impact Sensor C3248 . • Measure resistance between second row driver side impact sensor C3248-2, circuit RR135 (GN/BN), harness side and the second row driver side impact sensor case ground. • **Is resistance less than 10 ohms?**	**Yes** GO to K26 . **No** GO to K25 .
K25 CLEAN THE SECOND ROW DRIVER SIDE IMPACT SENSOR MOUNTING SURFACE AND CARRY OUT THE SELF TEST	
• Remove the second row driver side impact sensor. • Clean and repair the mounting surface as necessary. • Clean the second row driver side impact sensor mounting bolts. • Install the second row driver side impact sensor. • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint	**Yes** GO to K26 . **No** Fault corrected. GO to K54 .

System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record All 2296 Fault PIDs . ♦ Refer to PID list in Normal Operation to view 2296 fault PIDs. • **Do any RCM on-demand 2296 fault PIDs for the second row driver side impact sensor indicating a fault?**	
K26 CHECK SECOND ROW DRIVER SIDE IMPACT SENSOR CIRCUITS FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Second Row Driver Side Impact Sensor C3248 . • Disconnect: RCM C310a and C310b . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Measure voltage between second row driver side impact sensor: ♦ C3248-1, circuit VR221 (BU/GN), harness side and ground. ♦ C3248-2, circuit RR135 (GN/BN), harness side and ground.  N0036990 • **Is voltage present on either circuit?**	**Yes** REPAIR circuit VR221 (BU/GN) or RR135 (GN/BN). GO to K54 . **No** GO to K27 .
K27 CHECK SECOND ROW DRIVER SIDE IMPACT SENSOR CIRCUITS FOR A SHORT TO GROUND	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Measure resistance between second row driver side impact sensor:	**Yes** GO to K28 . **No** REPAIR circuit VR221 (BU/GN) or RR135 (GN/BN). GO to K54 .



tomsn048@gmail.com

♦ C3248-1, circuit VR221 (BU/GN), harness side and ground. ♦ C3248-2, circuit RR135 (GN/BN), harness side and ground.  • **Are resistances greater than 10,000 ohms?**	
K28 CHECK SECOND ROW DRIVER SIDE IMPACT SENSOR CIRCUITS FOR AN OPEN	
• Measure resistance between RCM C310b-14, circuit VR221 (BU/GN), harness side and second row driver side impact sensor C3248-1, circuit VR221 (BU/GN), harness side.  • **Are resistances less than 0.5 ohm?**	**Yes** GO to K29 . **No** REPAIR circuit VR221 (BU/GN). GO to K54 .
K29 CHECK SECOND ROW DRIVER SIDE IMPACT SENSOR CIRCUIT FOR AN OPEN

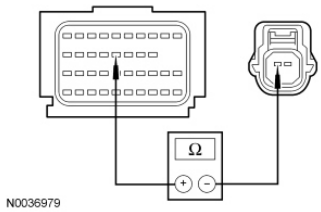
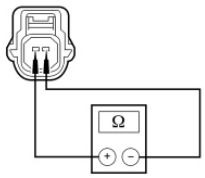
REINSTALL the second row passenger side impact sensor. GO to K54 . **No** GO to K33 .





tomsn048@gmail.com

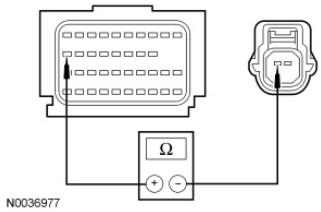
impact sensor attached to the mounting surface incorrectly or were the impact sensor bolt not fully seated and tightened correctly?	
K33 INSTALL THE SECOND ROW PASSENGER SIDE IMPACT SENSOR AND CARRY OUT THE SELF TEST	
• Clean and repair the mounting surface as necessary. • Clean the second row passenger side impact sensor mounting bolt. • Install the second row passenger side impact sensor. • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record All 2296 Fault PIDs . ♦ Refer to PID list in Normal Operation to view 2296 fault PIDs. • **Do any RCM on-demand 2296 fault PIDs for the second row passenger side impact sensor indicating a fault?**	**Yes** GO to K34 . **No** Fault corrected. GO to K54 .
K34 CHECK THE SECOND ROW PASSENGER SIDE IMPACT SENSOR GROUND CIRCUIT FOR HIGH RESISTANCE	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Second Row Passenger Side Impact Sensor C3249 . • Measure resistance between second row passenger side impact sensor C3249-2, circuit RR136 (BN/WH), harness side and the second row passenger side impact sensor case ground. • **Is resistance less than 10 ohms?**	**Yes** GO to K36 . **No** GO to K35 .
K35 CLEAN THE SECOND ROW PASSENGER SIDE IMPACT SENSOR MOUNTING SURFACE AND CARRY OUT THE SELF TEST	
• Remove the second row passenger side impact sensor. • Clean and repair the mounting surface as necessary. • Clean the second row passenger side impact sensor mounting bolts.	**Yes** GO to K36 . **No** Fault corrected. GO to K54 .

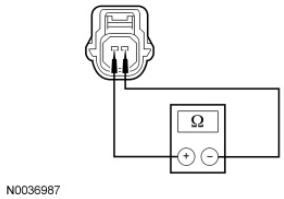
• Install the second row passenger side impact sensor. • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record All 2296 Fault PIDs . ♦ Refer to PID list in Normal Operation to view 2296 fault PIDs. • **Do any RCM on-demand 2296 fault PIDs for the second row passenger side impact sensor indicating a fault?**	
K36 CHECK SECOND ROW PASSENGER SIDE IMPACT SENSOR CIRCUITS FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Second Row Passenger Side Impact Sensor C3249 . • Disconnect: RCM C310a and C310b . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Measure voltage between second row passenger side impact sensor: ♦ C3249-1, circuit VR222 (GY/OG), harness side and ground. ♦ C3249-2, circuit RR136 (BN/WH), harness side and ground.  • **Is voltage present on either circuit?**	**Yes** REPAIR circuits VR222 (GY/OG) or RR136 (BN/WH). GO to K54 . **No** GO to K37 .
K37 CHECK SECOND ROW PASSENGER SIDE IMPACT SENSOR CIRCUITS FOR A SHORT TO GROUND	

tomsn048@gmail.com

• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Measure resistance between second row passenger side impact sensor: ♦ C3249-1, circuit VR222 (GY/OG), harness side and ground. ♦ C3249-2, circuit RR136 (BN/WH), harness side and ground.  • **Are resistances greater than 10,000 ohms?**	**Yes** GO to K38 . **No** REPAIR circuits VR222 (GY/OG) or RR136 (BN/WH). GO to K54 .
K38 CHECK SECOND ROW PASSENGER SIDE IMPACT SENSOR CIRCUITS FOR AN OPEN	
• Measure resistance between RCM C310b-15, circuit VR222 (GY/OG), harness side and second row passenger side impact sensor C3249-1, circuit VR222 (GY/OG), harness side.  • **Are resistances less than 0.5 ohm?**	**Yes** GO to K39 . **No** REPAIR circuit VR222 (GY/OG). GO to K54 .
K39 CHECK SECOND ROW PASSENGER SIDE IMPACT SENSOR CIRCUIT FOR AN OPEN	
• Measure resistance between RCM C310b-16, circuit RR136 (BN/WH), harness side and second row passenger side impact sensor C3249-2, circuit RR136 (BN/WH), harness side.	**Yes** GO to K40 . **No** REPAIR circuit RR136 (BN/WH). GO to K54 .

 N0036979 • **Is resistance less than 0.5 ohm?**	
K40 CHECK FOR A SHORT BETWEEN SECOND ROW PASSENGER SIDE IMPACT SENSOR CIRCUITS	
• Measure resistance between second row passenger side impact sensor C3249-1, circuit VR222 (GY/OG), harness side and C3249-2, circuit RR136 (BN/WH), harness side.  N0036987 • **Is resistance greater than 10,000 ohms?**	**Yes** GO to K41 . **No** REPAIR circuits VR222 (GY/OG) and RR136 (BN/WH). GO to K54 .
K41 CHECK THE SECOND ROW PASSENGER SIDE IMPACT SENSOR	
• Connect: RCM C310a and C310b . • Install a known good second row passenger side impact sensor. • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record All 2296 Fault PIDs . ♦ Refer to PID list in Normal Operation to view 2296 fault PIDs. • **Do any RCM on-demand 2296 fault PIDs for the second row passenger side impact sensor indicating a fault?**	**Yes** GO to K52 . **No** Fault corrected. GO to K54 .
K42 INSPECT THE DRIVER\CENTER FRONT CRASH SENSOR MOUNTING AND MOUNTING SURFACE	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and	**Yes** CLEAN and TIGHTEN bolt or REPAIR the mounting surface as necessary. REINSTALL the driver\center front crash sensor. GO to K54 .





tomsn048@gmail.com

Repowering in this section. • Inspect the driver\center crash sensor mounting and make sure that the retaining bolt is fully seated and tightened correctly. • Remove the driver\center front crash sensor. Refer to Front Impact Severity Sensor . • Inspect the driver\center front crash sensor and mounting surface for damage, corrosion or dirt. • **Was a significant amount of corrosion or dirt found, the driver\center front crash sensor attached to the mounting surface incorrectly or was the driver\center front crash sensor bolt not fully seated and tightened correctly?**	**No** GO to K43 .
K43 INSTALL THE DRIVER\CENTER FRONT CRASH SENSOR AND CARRY OUT THE SELF TEST	
• Clean and repair the mounting surface as necessary. • Clean the driver\center front crash sensor mounting bolt. • Install the driver\center front crash sensor. Refer to Front Impact Severity Sensor . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record All 2296 Fault PIDs . ♦ Refer to PID list in Normal Operation to view 2296 fault PIDs. • **Do any RCM on-demand 2296 fault PIDs for the driver\center front crash sensor indicating a fault?**	**Yes** GO to K44 . **No** Fault corrected. GO to K54 .
K44 CHECK THE DRIVER\CENTER FRONT CRASH SENSOR GROUND CIRCUIT FOR HIGH RESISTANCE	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Driver\Center Front Crash Sensor C1465 . • Measure resistance between driver\center front crash sensor C1465-2, circuit RR129 (YE/GY), harness side and the driver\center front crash sensor case ground.	**Yes** GO to K46 . **No** GO to K45 .

• **Is resistance less than 10 ohms?**	
K45 CLEAN THE DRIVER\CENTER FRONT CRASH SENSOR MOUNTING SURFACE AND CARRY OUT THE SELF TEST	
• Remove the driver\center front crash sensor. Refer to Front Impact Severity Sensor . • Clean and repair the mounting surface as necessary. • Clean the driver\center front crash sensor mounting bolt. • Install the driver\center front crash sensor. Refer to Front Impact Severity Sensor . • Repower the SRS . **Do not** prove out the SRS in this section at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record All 2296 Fault PIDs . ♦ Refer to PID list in Normal Operation to view 2296 fault PIDs. • **Do any RCM on-demand 2296 fault PIDs for the driver\center front crash sensor indicating a fault?**	**Yes** GO to K46 . **No** Fault corrected. K46 CHECK DRIVER\CENTER FRONT CRASH SENSOR CIRCUITS FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Driver\Center Front Crash Sensor C1465 . • Disconnect: RCM C310a and C310b . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Measure voltage between driver\center front crash sensor: ♦ C1465-1, circuit VR213 (VT/GN), harness side and ground. ♦ C1465-2, circuit RR129 (YE/GY), harness side and ground.	**Yes** REPAIR circuit VR213 (VT/GN) or RR129 (YE/GY). GO to K54 . **No** GO to K47 .

tomsn048@gmail.com

 • **Is voltage present on either circuit?**	
K47 CHECK DRIVER\CENTER FRONT CRASH SENSOR CIRCUITS FOR A SHORT TO GROUND	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Measure resistance between driver\center front crash sensor: ♦ C1465-1, circuit VR213 (VT/GN), harness side and ground. ♦ C1465-2, circuit RR129 (YE/GY), harness side and ground.  • **Are resistances greater than 10,000 ohms?**	**Yes** GO to K48 . **No** REPAIR circuit VR213 (VT/GN) or RR129 (YE/GY). GO to K54 .
K48 CHECK DRIVER\CENTER FRONT CRASH SENSOR CIRCUIT FOR AN OPEN	
• Measure resistance between RCM C310b-19, circuit VR213 (VT/GN), harness side and LH front impact severity sensor C1465-1, circuit VR213 (VT/GN), harness side.  • **Is resistance less than 0.5 ohm?**	**Yes** GO to K49 . **No** REPAIR circuit VR213 (VT/GN). GO to K54 .
K49 CHECK DRIVER\CENTER FRONT CRASH SENSOR FOR AN OPEN	

• Measure resistance between RCM C310b-20, circuit RR129 (YE/GY), harness side and LH front impact severity sensor C1465-2, circuit RR129 (YE/GY), harness side.  N0036977 • **Is resistance less than 0.5 ohm?**	**Yes** GO to K50 . **No** REPAIR circuit RR129 (YE/GY). GO to K54 .
K50 CHECK FOR A SHORT BETWEEN DRIVER\CENTER FRONT CRASH SENSOR CIRCUITS	
• Measure resistance between LH front impact severity sensor C1465-1, circuit VR213 (VT/GN), harness side and C1465-2, circuit RR129 (YE/GY), harness side.  N0036987 • **Is resistance greater than 10,000 ohms?**	**Yes** GO to K51 . **No** REPAIR circuits VR213 (VT/GN) and RR129 (YE/GY). GO to K54 .
K51 CHECK THE DRIVER\CENTER FRONT CRASH SENSOR	
• Connect: RCM C310a and C310b . • Install a known good LH front impact severity sensor. • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record All 2296 Fault PIDs . ♦ Refer to PID list in Normal Operation to view 2296 fault PIDs. • **Do any RCM on-demand 2296 fault PIDs for the driver\center front crash sensor indicating a fault?**	**Yes** GO to K52 . **No** Fault corrected. GO to K54 .

tomsn048@gmail.com

K52 CONFIRM THE RCM FAULT	
NOTE: Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, DTCs will be recorded. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Install the original sensor. • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record All 2296 Fault PIDs . ♦ Refer to PID list in Normal Operation to view 2296 fault PIDs. • **Does the original RCM on-demand 2296 fault PID indicate a fault?**	**Yes** INSTALL a new RCM . REFER to Restraints Control Module (RCM) in this section. GO to K54 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. GO to K54 .
K53 CHECK FOR AN INTERMITTENT FAULT	
• Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record All 2296 Fault PIDs . ♦ Refer to PID list in Normal Operation to view 2296 fault PIDs. • **Do any RCM on-demand 2296 fault PIDs indicate a fault?**	**Yes** The fault condition is now present. The fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Using the fault PIDs recorded, GO to the appropriate pinpoint test step. For 2296_31_OD (Side Crash Sensor Mount or Communication Fault, Front Driver Side), GO to K2 . For 2296_30_OD (Side Crash Sensor Internal Fault, Front Driver Side), INSTALL a new first row driver side impact sensor. REFER to Side Impact Sensor - Front Door in this section. GO to K54 . For 2296_29_OD (Side Crash Sensor Mount or Communication Fault, Front Passenger Side), GO to K12 . For 2296_28_OD (Side Crash Sensor Internal Fault, Front Passenger Side), INSTALL a new first row passenger side impact sensor. REFER to Side Impact Sensor - Front Door in this

	section. GO to K54 . For 2296_27_OD (Side Crash Sensor Mount or Communication Fault, Row No. 2 Driver Side), GO to K22 . For 2296_26_OD (Side Crash Sensor 2 Internal Fault, Driver side), INSTALL a new second row driver side impact sensor. REFER to Side Impact Sensor - C-Pillar, Explorer Sport Trac in this section. GO to K54 . For 2296_25_OD (Side Crash Sensor Mount or Communication Fault, Row No. 2 Passenger Side), GO to K32 . For 2296_24_OD (Side Crash Sensor 2 Internal Fault, Passenger side), INSTALL a new second row passenger side impact sensor. REFER to Side Impact Sensor - C-Pillar, Explorer Sport Trac in this section. GO to K54 . For 2296_19_OD (Driver/Center Front Crash Sensor Mount/Communication Fault), GO to K42 . For 2296_18_OD (Driver/Center Front Crash Sensor Internal Fault), INSTALL a new front impact severity sensor. REFER to Front Impact Severity Sensor in this section. GO to K54 . **No** INSPECT the affected impact sensor and mounting surface for damage, corrosion or dirt. INSPECT the wiring, terminals and connectors for damage, corrosion or dirt. CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition frequently. ACTIVATE other systems in the same wire harness. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. GO to K54 .
K54 CHECK FOR ADDITIONAL SRS DTCs	
• Ignition OFF. • ⚠ **WARNING: Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the DTC Charts in this section for pinpoint test direction. **No** CLEAR all RCM and OCSM DTCs. PROVE OUT the SRS . Repair is complete. RETURN

tomsn048@gmail.com

• Reconnect all SRS components (if previously disconnected). • If previously directed to depower the SRS , repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - Restraints . • **Are any RCM and/or OCSM DTCs indicating a fault?**	the vehicle to the customer.

Pinpoint Test L: DTC B2434

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

Normal Operation

As part of the Supplemental Restraint System (SRS), the driver and passenger safety belt buckles are equipped with safety belt buckle switches. The safety belt buckles are comprised of integrated circuits called Hall-effect switches. The safety belt buckle switches indicate to the Restraints Control Module (RCM) whether the safety belt buckles are buckled or unbuckled.

The RCM supplies current to the safety belt buckle switch. Current flows through the switch, buckled or unbuckled, to ground. The RCM will sense the difference in this current draw, 6 mA (unbuckled) or 15 mA (buckled), and use this information in determining the deployment rate of the dual-stage driver and passenger air bag modules. If the RCM detects current out of this range, it will store DTC B2434 in memory and send a message to the Instrument Cluster (IC) module to illuminate the air bag warning indicator.

- DTC B2434 (Drivers Seat Belt Buckle Switch Circuit Short to Ground) - If the RCM detects a short to ground on the driver safety belt buckle circuit, it will set this DTC.

This pinpoint test is intended to diagnose the following:

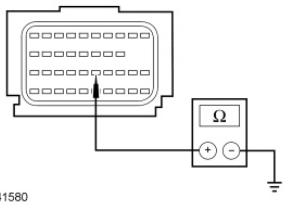
- Wiring, terminals or connectors
- Driver safety belt buckle switch
- RCM

PINPOINT TEST L: DTC B2434

⚠ WARNING: Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

⚠ WARNING: Never disassemble or tamper with safety belt buckle/retractor pretensioners, adaptive load limiting retractors, safety belt inflators, or probe the electrical connectors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners, adaptive load limiting retractors, or safety belt inflators, which increases the risk of serious personal injury or death.

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**



Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: SRS components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
L1 RETRIEVE RCM DTCs	
• Enter the following diagnostic mode on the scan tool: Self Test - RCM . • **Was DTC B2434 retrieved on-demand during self-test?**	**Yes** The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to L2 . **No** This is an intermittent fault when present as a CMDTC only. The fault condition is not present at this time. GO to L5 .
L2 CHECK DRIVER SAFETY BELT BUCKLE SWITCH FOR A SHORT TO GROUND	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Driver Safety Belt Buckle Switch C3065 . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • **DIAGNOSTIC TIP:** When viewing on-demand DTCs with the driver safety belt buckle switch disconnected, an open circuit fault would normally be retrieved. • **Did the driver safety belt buckle switch on-demand DTC change from indicating B2434 to B2691?**	**Yes** INSTALL a new driver safety belt buckle assembly. REFER to Section 501-20A . GO to L6 . **No** GO to L3 .
L3 CHECK THE DRIVER SAFETY BELT BUCKLE SWITCH CIRCUIT FOR A SHORT TO GROUND	

tomsn048@gmail.com

• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310a and C310b . • Measure resistance between RCM C310b-25, circuit CR201 (GN/BU), harness side and ground.  A0041580 • **Is resistance greater than 10,000 ohms?**	**Yes** GO to L4 . **No** REPAIR circuit CR201 (BU/OG)/(GN/BU). GO to L6 .
L4 CONFIRM THE RCM FAULT	
NOTE: Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, DTCs will be recorded. • Connect: Driver Safety Belt Buckle Switch C3065 . • Connect: RCM C310a and C310b . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • **Was DTC B2434 retrieved on-demand during self-test?**	**Yes** INSTALL a new RCM . REFER to Restraints Control Module (RCM) in this section. GO to L6 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. GO to L6 .
L5 CHECK FOR AN INTERMITTENT FAULT	
• Enter the following diagnostic mode on the scan tool: Self Test - RCM . • **Was DTC B2434 retrieved on-demand during self-test?**	**Yes** The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to L2 . **No** The fault is not present and cannot be recreated at this time. CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition frequently. **Do not install any new SRS**

	components at this time. SRS components should only be installed when directed to do so in the pinpoint test. REPAIR any intermittent wiring, terminal or connector concerns found. GO to L6 .
L6 CHECK FOR ADDITIONAL SRS DTCs	
• Ignition OFF. • ⚠ **WARNING: Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.** • Reconnect all SRS components (if previously disconnected). • If previously directed to depower the SRS , repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - Restraints . • **Are any RCM and/or OCSM DTCs indicating a fault?**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the DTC Charts in this section for pinpoint test direction. **No** CLEAR all RCM and OCSM DTCs. PROVE OUT the SRS . Repair is complete. RETURN the vehicle to the customer.

Pinpoint Test M: DTC B2435

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

Normal Operation

As part of the Supplemental Restraint System (SRS), the driver and passenger safety belt buckles are equipped with safety belt buckle switches. The safety belt buckles are comprised of integrated circuits called Hall-effect switches. The safety belt buckle switches indicate to the Restraints Control Module (RCM) whether the safety belt buckles are buckled or unbuckled.

The RCM supplies current to the safety belt buckle switch. Current flows through the switch, buckled or unbuckled, to ground. The RCM will sense the difference in this current draw, 6 mA (unbuckled) or 15 mA (buckled), and use this information in determining the deployment rate of the dual-stage driver and passenger air bag modules. If the RCM detects current out of this range, it will store DTC B2435 in memory and send a message to the Instrument Cluster (IC) module to illuminate the air bag warning indicator.

- DTC B2435 (Drivers Seat Belt Buckle Switch Resistance Out of Range) - If the RCM detects a current out of range between buckled and unbuckled on the driver safety belt buckle switch, it will set this DTC.

This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- Driver safety belt buckle and pretensioner assembly
- RCM

tomsn048@gmail.com

PINPOINT TEST M: DTC B2435

⚠ WARNING: Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

⚠ WARNING: Never disassemble or tamper with safety belt buckle/retractor pretensioners, adaptive load limiting retractors, safety belt inflators, or probe the electrical connectors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners, adaptive load limiting retractors, or safety belt inflators, which increases the risk of serious personal injury or death.

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: SRS components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
M1 RETRIEVE RCM DTCs	
• Enter the following diagnostic mode on the scan tool: Self Test - RCM . • **Was DTC B2435 retrieved on-demand during self-test?**	**Yes** The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to M2 . **No** This is an intermittent fault when present as a CMDTC only. The fault condition is not present at this time. GO to M4 .
M2 CHECK THE DRIVER SAFETY BELT BUCKLE SWITCH	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Driver Safety Belt Buckle Switch C3065 .	**Yes** INSTALL a new driver safety belt buckle assembly. REFER to Section 501-20A . GO to M5 . **No** GO to M3 .

• Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • **DIAGNOSTIC TIP:** When viewing on-demand DTCs with the driver safety belt buckle switch disconnected, an open circuit fault would normally be retrieved. • **Did the driver safety belt buckle switch on-demand DTC change from indicating B2435 to B2691?**	
M3 CONFIRM THE RCM FAULT	
NOTE: Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. M4 CHECK FOR AN INTERMITTENT FAULT	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect the driver safety belt buckle switch C3065: ♦ inspect connector(s) (including any inline connectors) for corrosion, loose or spread	**Yes** The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to M2 . **No** The fault is not present and cannot be recreated at this time. CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and

tomsn048@gmail.com

terminals and loose or frayed wire connections at terminals. ♦ inspect wire harness for any damage, pinched, cut or pierced wires. ♦ repair any concerns found. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. • Connect: All Previously Disconnected Component(s)/Connector(s) . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • **Was DTC B2435 retrieved on-demand during self-test?**	cycling the ignition frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. GO to M5 .
M5 CHECK FOR ADDITIONAL SRS DTCs	
• Ignition OFF. • ⚠ **WARNING: Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.** • Reconnect all SRS components (if previously disconnected). • If previously directed to depower the SRS , repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - Restraints . • **Are any RCM and/or OCSM DTCs indicating a fault?**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the DTC Charts in this section for pinpoint test direction. **No** CLEAR all RCM and OCSM DTCs. PROVE OUT the SRS . Repair is complete. RETURN the vehicle to the customer.

Pinpoint Test N: DTC B2438

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

Normal Operation

As part of the Supplemental Restraint System (SRS), the driver and passenger safety belt buckles are equipped with safety belt buckle switches. The safety belt buckles are comprised of integrated circuits called Hall-effect switches. The safety belt buckle switches indicate to the Restraints Control Module (RCM) whether the safety belt buckles are buckled or unbuckled.

The RCM supplies current to the safety belt buckle switch. Current flows through the switch, buckled or unbuckled, to ground. The RCM will sense the difference in this current draw, 6 mA (unbuckled) or 15 mA (buckled), and use this information in determining the deployment rate of the dual-stage driver and passenger air bag modules. If the RCM detects current out of this range, it will store DTC B2438 in memory and send a message to the Instrument Cluster (IC) module to illuminate the air bag warning indicator.

NOTE: When monitoring fault and/or resistance PIDs with the scan tool, it may take up to 2 seconds for the scan tool display to update.

- DTC B2438 (Passenger's Seat Belt Buckle Switch Circuit Short to Ground) - If the RCM detects a short to ground on the passenger safety belt buckle circuit, it will set this DTC.

This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- Passenger safety belt buckle switch
- RCM

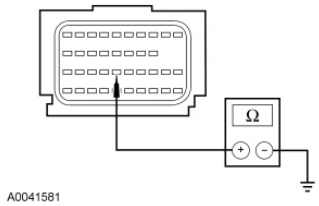
PINPOINT TEST N: DTC B2438

⚠ WARNING: Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

⚠ WARNING: Never disassemble or tamper with safety belt buckle/retractor pretensioners, adaptive load limiting retractors, safety belt inflators, or probe the electrical connectors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners, adaptive load limiting retractors, or safety belt inflators, which increases the risk of serious personal injury or death.

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.



NOTE: SRS components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
N1 RETRIEVE RCM DTCs	
• Enter the following diagnostic mode on the scan tool: Self Test - RCM .	**Yes** The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to N2 .

tomsn048@gmail.com

• **Was DTC B2438 retrieved on-demand during self-test?**	**No** This is an intermittent fault when present as a CMDTC only. The fault condition is not present at this time. GO to N5 .
N2 CHECK PASSENGER SAFETY BELT BUCKLE SWITCH FOR A SHORT TO GROUND	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Safety Belt Buckle Switch C3066 . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • **DIAGNOSTIC TIP:** When viewing on-demand DTCs with the passenger safety belt buckle switch disconnected, an open circuit fault would normally be retrieved. • **Did the passenger safety belt buckle switch on-demand DTC change from indicating B2438 to B2692?**	**Yes** INSTALL a new passenger safety belt buckle assembly. REFER to Section 501-20A . GO to N6 . **No** GO to N3 .
N3 CHECK THE SAFETY BELT BUCKLE SWITCH CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310a and C310b . • Measure resistance between RCM C310b-26, circuit CR203 (GY/VT), harness side and ground.	**Yes** GO to N4 . **No** REPAIR circuit CR203 (GY/VT). GO to N6 .

 • **Is resistance greater than 10,000 ohms?**	
N4 CONFIRM THE RCM FAULT	
NOTE: Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, DTCs will be recorded. • Connect: Passenger Safety Belt Buckle Switch C3066 . • Connect: RCM C310a and C310b . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • **Was DTC B2438 retrieved on-demand during self-test?**	**Yes** INSTALL a new RCM . REFER to Restraints Control Module (RCM) in this section. GO to N6 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. **Do not install any new SRS components at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - Restraints . • **Are any RCM and/or OCSM DTCs indicating a fault?**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the DTC Charts in this section for pinpoint test direction. **No** CLEAR all RCM and OCSM DTCs. PROVE OUT the SRS . Repair is complete. RETURN the vehicle to the customer.

Pinpoint Test O: DTC B2439

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

Normal Operation

As part of the Supplemental Restraint System (SRS), the driver and passenger safety belt buckles are equipped with safety belt buckle switches. The safety belt buckles are comprised of integrated circuits called Hall-effect switches. The safety belt buckle switches indicate to the Restraints Control Module (RCM) whether the safety belt buckles are buckled or unbuckled.

The RCM supplies current to the safety belt buckle switch. Current flows through the switch, buckled or unbuckled, to ground. The RCM will sense the difference in this current draw, 6 mA (unbuckled) or 15 mA (buckled), and use this information in determining the deployment rate of the dual-stage driver and passenger air bag modules. If the RCM detects current out of this range, it will store DTC B2439 in memory and send a message to the Instrument Cluster (IC) module to illuminate the air bag warning indicator.

NOTE: When monitoring fault and/or resistance PIDs with the scan tool, it may take up to 2 seconds for the scan tool display to update.

- DTC B2439 (Passengers Seat Belt Buckle Switch Resistance Out of Range) - If the RCM detects a current out of range between buckled and unbuckled on the passenger safety belt buckle switch, it will set this DTC.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Passenger safety belt buckle switch
- RCM

PINPOINT TEST O: DTC B2439

⚠ WARNING: Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

⚠ WARNING: Never disassemble or tamper with safety belt buckle/retractor pretensioners, adaptive load limiting retractors, safety belt inflators, or probe the electrical connectors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners, adaptive load limiting retractors, or safety belt inflators, which increases the risk of serious personal injury or death.

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: SRS components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
O1 RETRIEVE RCM DTCs	
• Enter the following diagnostic mode on the scan tool: Self Test - RCM . • **Was DTC B2439 retrieved on-demand during self-test?**	**Yes** The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to O2 . **No** This is an intermittent fault when present as a CMDTC only. The fault condition is not present at this time. GO to O4 .
O2 CHECK THE PASSENGER SAFETY BELT BUCKLE SWITCH	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Safety Belt Buckle Switch C3066 . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and	**Yes** INSTALL a new passenger safety belt buckle assembly. REFER to Section 501-20A . GO to O5 . **No** GO to O3 .

tomsn048@gmail.com

Repowering in this section. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • **DIAGNOSTIC TIP:** When viewing on-demand DTCs with the passenger safety belt buckle switch disconnected, an open circuit fault would normally be retrieved. • **Did the passenger safety belt buckle switch on-demand DTC change from indicating B2439 to B2692?**	
O3 CONFIRM THE RCM FAULT	
NOTE: Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, DTCs will be recorded. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Connect: Passenger Safety Belt Buckle Switch C3066 . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • **Was DTC B2439 retrieved on-demand during self-test?**	**Yes** INSTALL a new RCM . REFER to Restraints Control Module (RCM) in this section. GO to O5 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. GO to O4 .
O4 CHECK FOR AN INTERMITTENT FAULT	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect the passenger safety belt buckle switch C3066: ♦ inspect connector(s) (including any inline connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals. ♦ inspect wire harness for any damage, pinched, cut or pierced wires. ♦ repair any concerns found.	**Yes** The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to O2 . **No** The fault is not present and cannot be recreated at this time. CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. GO to O5 .

Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. • Connect: All Previously Disconnected Component(s)/Connector(s) . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • **Was DTC B2439 retrieved on-demand during self-test?**	
O5 CHECK FOR ADDITIONAL SRS DTCs	
• Ignition OFF. • ⚠ **WARNING: Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.** • Reconnect all SRS components (if previously disconnected). • If previously directed to depower the SRS , repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - Restraints . • **Are any RCM and/or OCSM DTCs indicating a fault?**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the DTC Charts in this section for pinpoint test direction. **No** CLEAR all RCM and OCSM DTCs. PROVE OUT the SRS . Repair is complete. RETURN the vehicle to the customer.

Pinpoint Test P: DTC B2691

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

Normal Operation

As part of the Supplemental Restraint System (SRS), the driver and passenger safety belt buckles are equipped with safety belt buckle switches. The safety belt buckles are comprised of integrated circuits called Hall-effect switches. The safety belt buckle switches indicate to the Restraints Control Module (RCM) whether the safety belt buckles are buckled or unbuckled.

The RCM supplies current to the safety belt buckle switch. Current flows through the switch, buckled or unbuckled, to ground. The RCM will sense the difference in this current draw, 6 mA (unbuckled) or 15 mA (buckled), and use this information in determining the deployment rate of the dual-stage driver and passenger air bag modules.

tomsn048@gmail.com

If the RCM detects an open circuit or short to voltage fault, it will store DTC B2691 in memory and send a message to the Instrument Cluster (IC) module to illuminate the air bag warning indicator.

NOTE: When monitoring fault and/or resistance PIDs with the scan tool, it may take up to 2 seconds for the scan tool display to update.

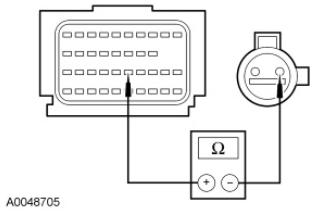
- DTC B2691 (Seat Belt Buckle Switch Circuit Fault, Front Driver's Side) - If the RCM detects an open or short to voltage on the driver safety belt buckle switch circuit, it will set this DTC.

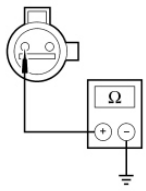
This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- Driver safety belt buckle switch
- RCM

PINPOINT TEST P: DTC B2691

⚠ WARNING: Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

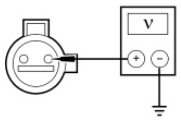
⚠ WARNING: Never disassemble or tamper with safety belt buckle/retractor pretensioners, adaptive load limiting retractors, safety belt inflators, or probe the electrical connectors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners, adaptive load limiting retractors, or safety belt inflators, which increases the risk of serious personal injury or death.





NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.



NOTE: SRS components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
P1 RETRIEVE RCM DTCs	
• Enter the following diagnostic mode on the scan tool: Self Test - RCM . • **Was DTC B2691 retrieved on-demand during self-test?**	**Yes** The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to P2 . **No** This is an intermittent fault when present as a CMDTC only. The fault condition is not present at this time. GO to P7 .
P2 CHECK DRIVER SAFETY BELT BUCKLE SWITCH CIRCUIT FOR AN OPEN	

• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310a and C310b . • Disconnect: Driver Safety Belt Buckle Switch C3065 . • Measure resistance between RCM C310b-25, circuit CR201 (GN/BU), harness side and driver safety belt buckle switch C3065-1, circuit CR201 (BU/OG), harness side.  A0048705 • **Is resistance less than 0.5 ohm?**	**Yes** GO to P3 . **No** REPAIR circuit CR201 (BU/OG)/(GN/BU). GO to P8 .
P3 CHECK DRIVER SAFETY BELT BUCKLE SWITCH GROUND CIRCUIT FOR AN OPEN	
• Measure resistance between driver safety belt buckle switch C3065-2, circuit GD145 (BK/BU), harness side and ground.  A0048711 • **Is resistance less than 5 ohms?**	**Yes** GO to P4 . **No** REPAIR circuit GD145 (BK/BU). GO to P8 .
P4 CHECK DRIVER SAFETY BELT BUCKLE SWITCH CIRCUIT FOR A SHORT TO VOLTAGE	
• Disconnect: Driver Seat Side Air Bag Module C3049 . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.	**Yes** REPAIR circuit CR201 (BU/OG)/(GN/BU). GO to P8 . **No** GO to P5 .

tomsn048@gmail.com

• Ignition ON. • Measure voltage between driver safety belt buckle switch C3065-1, circuit CR201 (BU/OG), harness side and ground.  A0048712 • **Is any voltage present?**	
P5 CHECK THE DRIVER SAFETY BELT BUCKLE SWITCH DTCs FOR A CHANGE IN FAULT STATUS	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Connect: RCM C310a and C310b . • Connect a fused jumper wire between driver safety belt buckle switch C3065-1, circuit CR201 (BU/OG)/(GN/BU), harness side and C3065-2, circuit GD145 (BK/BU), harness side. • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • **DIAGNOSTIC TIP:** When viewing on-demand DTCs with the driver safety belt buckle switch circuits shorted together, a short to ground fault would normally be retrieved. • **Did the driver safety belt buckle switch on-demand DTC change**	**Yes** INSTALL a new driver safety belt buckle assembly. REFER to Section 501-20A . GO to P8 . **No** GO to P6 .

from indicating B2691 to B2434?	
P6 CONFIRM THE RCM FAULT	
NOTE: Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, DTCs will be recorded. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the fused jumper wire from driver safety belt buckle switch C3065. • Connect: Driver Safety Belt Buckle Switch C3065 . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • **Was DTC B2691 retrieved on-demand during self-test?**	**Yes** INSTALL a new RCM . REFER to Restraints Control Module (RCM) in this section. GO to P8 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. GO to P7 .
P7 CHECK FOR AN INTERMITTENT FAULT	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Driver Seat Side Air Bag Module C3049 . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • **Was DTC B2691 retrieved on-demand during self-test?**	**Yes** The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to P2 . **No** The fault is not present and cannot be recreated at this time. CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness, cycling the ignition frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. GO to P8 .
P8 CHECK FOR ADDITIONAL SRS DTCs	
• Ignition OFF.	**Yes** Do not clear any DTCs until all DTCs have been

tomsn048@gmail.com

• **⚠ WARNING: Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.** • Reconnect all SRS components (if previously disconnected). • If previously directed to depower the SRS , repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - Restraints . • **Are any RCM and/or OCSM DTCs indicating a fault?**	resolved. GO to the DTC Charts in this section for pinpoint test direction. **No** CLEAR all RCM and OCSM DTCs. PROVE OUT the SRS . Repair is complete. RETURN the vehicle to the customer.

Pinpoint Test Q: DTC B2692

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

Normal Operation

As part of the Supplemental Restraint System (SRS), the driver and passenger safety belt buckles are equipped with safety belt buckle switches. The safety belt buckles are comprised of integrated circuits called Hall-effect switches. The safety belt buckle switches indicate to the Restraints Control Module (RCM) whether the safety belt buckles are buckled or unbuckled.

The RCM supplies current to the safety belt buckle switch. Current flows through the switch, buckled or unbuckled, to ground. The RCM will sense the difference in this current draw, 6 mA (unbuckled) or 15 mA (buckled), and use this information in determining the deployment rate of the dual-stage driver and passenger air bag modules.

If the RCM detects an open circuit or short to voltage fault, it will store DTC B2692 in memory and send a message to the Instrument Cluster (IC) module to illuminate the air bag warning indicator.

NOTE: When monitoring fault and/or resistance PIDs with the scan tool, it may take up to 2 seconds for the scan tool display to update.

- DTC B2692 (Front Passenger's Safety Belt Buckle Switch Circuit Fault) - If the RCM detects an open or short to voltage on the passenger safety belt buckle switch circuit, it will set this DTC.

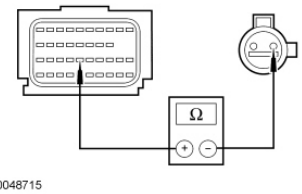
This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- Passenger safety belt buckle switch
- RCM

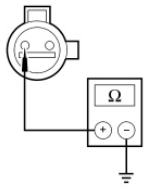
PINPOINT TEST Q: DTC B2692

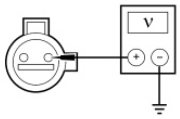
⚠ WARNING: Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

⚠ WARNING: Never disassemble or tamper with safety belt buckle/retractor pretensioners, adaptive load limiting retractors, safety belt inflators, or probe the electrical connectors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners, adaptive load limiting retractors, or safety belt inflators, which increases the risk of serious personal injury or death.

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**







Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: SRS components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
Q1 RETRIEVE RCM DTCs	
• Enter the following diagnostic mode on the scan tool: Self Test - RCM . • **Was DTC B2692 retrieved on-demand during self-test?**	**Yes** The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to Q2 . **No** This is an intermittent fault when present as a CMDTC only. The fault condition is not present at this time. GO to Q7 .
Q2 CHECK PASSENGER SAFETY BELT BUCKLE SWITCH CIRCUIT FOR AN OPEN	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310a and C310b . • Disconnect: Passenger Safety Belt Buckle Switch C3066 . • Measure resistance between RCM C310b-26, circuit CR203 (GY/VT), harness side and the passenger safety belt buckle switch C3066-1, circuit CR203 (GY/VT), harness side.	**Yes** GO to Q3 . **No** REPAIR circuit CR203 (GY/VT). GO to Q8 .

tomsn048@gmail.com

 A0048715 • **Is resistance less than 0.5 ohm?**	
Q3 CHECK PASSENGER SAFETY BELT BUCKLE SWITCH GROUND CIRCUIT FOR AN OPEN	
• Measure resistance between passenger safety belt buckle switch C3066-2, circuit GD145 (BK/BU), harness side and ground.  A0048711 • **Is resistance less than 5 ohms?**	**Yes** GO to Q4 . **No** REPAIR circuit GD145 (BK/BU). GO to Q8 .
Q4 CHECK PASSENGER SAFETY BELT BUCKLE SWITCH CIRCUIT FOR A SHORT TO VOLTAGE	
• Disconnect: Passenger Seat Side Air Bag Module C3050 . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Measure voltage between passenger safety belt buckle switch C3066-1, circuit CR203 (GY/VT), harness side and ground.  A0048712 • **Is any voltage present?**	**Yes** REPAIR circuit CR203 (GY/VT). GO to Q8 . **No** GO to Q5 .

Q5 CHECK THE SAFETY BELT BUCKLE SWITCH DTCs FOR A CHANGE IN FAULT STATUS	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Connect: RCM C310a and C310b . • Connect a fused jumper wire between passenger safety belt buckle switch C3066-1, circuit CR203 (GY/VT), harness side and C3066-2, circuit GD145 (BK/BU), harness side. • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • **DIAGNOSTIC TIP:** When viewing on-demand DTCs with the passenger safety belt buckle switch circuits shorted together, a short to ground fault would normally be retrieved. • **Did the passenger safety belt buckle switch on-demand DTC change from indicating B2692 to B2438?**	**Yes** INSTALL a new passenger safety belt buckle assembly. REFER to Section 501-20A . GO to Q8 . **No** GO to Q6 .
Q6 CONFIRM THE RCM FAULT	
NOTE: Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, DTCs will be recorded. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the fused jumper wire from passenger safety belt buckle switch	**Yes** INSTALL a new RCM . REFER to Restraints Control Module (RCM) in this section. GO to Q8 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. GO to Q7 .

tomsn048@gmail.com

C3066. • Connect: Passenger Safety Belt Buckle Switch C3066 . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • **Was DTC B2692 retrieved on-demand during self-test?**	
Q7 CHECK FOR AN INTERMITTENT FAULT	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Passenger Seat Side Air Bag Module C3050 . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • **Was DTC B2692 retrieved on-demand during self-test?**	**Yes** The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to Q2 . **No** The fault is not present and cannot be recreated at this time. CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness, cycling the ignition frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. GO to Q8 .
Q8 CHECK FOR ADDITIONAL SRS DTCs	
• Ignition OFF. • ⚠ **WARNING: Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.** • Reconnect all SRS components (if previously disconnected). • If previously directed to depower the SRS , repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - Restraints .	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the DTC Charts in this section for pinpoint test direction. **No** CLEAR all RCM and OCSM DTCs. PROVE OUT the SRS . Repair is complete. RETURN the vehicle to the customer.

• **Are any RCM and/or OCSM DTCs indicating a fault?**	

Pinpoint Test R: DTC B2792

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

Normal Operation

The Restraints Control Module (RCM) monitors all the deployable devices for a cross link between the circuits of another deployable device. If the RCM detects a short between the circuits of the deployable devices, it will store DTC B2792 in memory and send a message to the Instrument Cluster (IC) module to illuminate the air bag warning indicator.

Fault PIDs [a]	Description	Fault Trigger Condition
2792_8_OD and 2792_8_CM	A-B or A-C pillar Curtain, Passenger Side	When the Restraints Control Module (RCM) detects a short between the circuits of 2 deployable devices, a fault will be indicated.
2792_9_OD and 2792_9_CM	A-B or A-C pillar Curtain, Driver Side	When the RCM detects a short between the circuits of 2 deployable devices, a fault will be indicated.
2792_12_OD and 2792_12_CM	Side Airbag Passenger	When the RCM detects a short between the circuits of 2 deployable devices, a fault will be indicated.
2792_13_OD and 2792_13_CM	Side Airbag Driver	When the RCM detects a short between the circuits of 2 deployable devices, a fault will be indicated.
2792_14_OD and 2792_14_CM	Airbag Adaptive Tether Front Passenger	When the RCM detects a short between the circuits of 2 deployable devices, a fault will be indicated.
2792_16_OD and 2792_16_CM	Deployable Steering Column	When the RCM detects a short between the circuits of 2 deployable devices, a fault will be indicated.
2792_17_OD and 2792_17_CM	Driver Seatbelt Load Limiter	When the RCM detects a short between the circuits of 2 deployable devices, a fault will be indicated.
2792_18_OD and 2792_18_CM	Passenger Seatbelt Load Limiter	When the RCM detects a short between the circuits of 2 deployable devices, a fault will be indicated.
2792_19_OD and 2792_19_CM	Passenger Airbag Front CAN Vent	When the RCM detects a short between the circuits of 2 deployable devices, a fault will be indicated.
2792_20_OD and 2792_20_CM	Driver Airbag Front CAN Vent	When the RCM detects a short between the circuits of 2 deployable devices, a fault will be indicated.
2792_26_OD and 2792_26_CM	Pretensioner Passenger	When the RCM detects a short between the circuits of 2 deployable devices, a fault will be indicated.
2792_27_OD and 2792_27_CM	Pretensioner Driver	When the RCM detects a short between the circuits of 2 deployable devices, a fault will be indicated.
2792_28_OD and 2792_28_CM	Airbag Passenger Front Loop #2	When the RCM detects a short between the circuits of 2 deployable devices, a fault will be indicated.
2792_29_OD and 2792_29_CM	Airbag Passenger Front Loop #1	When the RCM detects a short between the circuits of 2 deployable devices, a fault will be indicated.
2792_30_OD and 2792_30_CM	Airbag Driver Front Loop #2	When the RCM detects a short between the circuits of 2 deployable devices, a fault will be indicated.

tomsn048@gmail.com

2792_31_OD and 2792_31_CM	Airbag Driver Front Loop #1	When the RCM detects a short between the circuits of 2 deployable devices, a fault will be indicated.

[a] Fault PIDs that end in OD indicate an on-demand status and are associated with on-demand DTC B2792. Fault PIDs that end in CM indicate continuous memory status and are associated with continuous DTC B2792.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- RCM

PINPOINT TEST R: DTC B2792

⚠ WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the Safety Canopy® and cause serious personal injury or death.

⚠ WARNING: Always tighten the fasteners of the restraints control module (RCM) and impact sensor (if equipped) to the specified torque. Failure to do so may result in incorrect restraint system operation, which increases the risk of personal injury or death in a crash.

⚠ WARNING: Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

⚠ WARNING: Never disassemble or tamper with safety belt buckle/retractor pretensioners, adaptive load limiting retractors, safety belt inflators, or probe the electrical connectors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners, adaptive load limiting retractors, or safety belt inflators, which increases the risk of serious personal injury or death.

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: SRS components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

Test Step	Result / Action to Take
R1 RETRIEVE RCM DTCs	
• Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record All 2792 Fault PIDs . ♦ Refer to PID list in Normal Operation to view 2792 fault PIDs.	**Yes** The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to R2 . **No** This is an intermittent fault when present as a

• **Do any RCM on-demand 2792 fault PIDs indicate a fault?**	CMDTC only. The fault condition is not present at this time. GO to R4 .
R2 CHECK DEPLOYABLE CIRCUITS FOR A CROSS LINK FAULT	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310a and C310b . • Disconnect **ALL of the affected** deployable devices as indicated by the fault PIDs in Step R1. • Using the fault PIDs recorded and the following table, measure the resistance between the circuits of the affected deployable devices.	**Yes** GO to R3 . **No** REPAIR the affected circuits. GO to R5 .

Deployable Devices

Fault PID (loop/deployable device)	Connector - Pin	Circuit
2792_31_OD (Airbag Driver Front Loop #1)	• C310a-3 • C310a-4	• RR101 (YE/GN) • CR101 (VT/BN)

- **Are resistances greater than 10,000 ohms between the affected circuits?**

R3 CONFIRM THE RCM FAULT	
NOTE: Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, DTCs will be recorded. • Connect: RCM C310a and C310b .	**Yes** INSTALL a new RCM . REFER to Restraints Control Module (RCM) in this section. GO to R5 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and

• Connect: All Previously Disconnected SRS Components . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record All 2792 Fault PIDs . ♦ Refer to PID list in Normal Operation to view 2792 fault PIDs. • **Does the original RCM on-demand 2792 fault PID indicate a fault?**	terminals of electrical connectors that were disconnected. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. GO to R5 .
R4 CHECK FOR AN INTERMITTENT FAULT	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • If a cross link fault for driver air bag loop 1, loop 2 or canister vent is present continuous, remove the driver air bag module. Refer to Driver Air Bag Module in this section. • If a cross link fault for passenger air bag module loop 1 or loop 2 is present continuous, disconnect the passenger air bag module C256. • If a cross link fault for passenger air bag module canister vent is present continuous, disconnect the passenger air bag module canister vent electrical connector. • If a cross link fault for passenger air bag module adaptive tether is present continuous, disconnect the passenger air bag module adaptive tether electrical connector. • If a cross link fault for driver seat side air bag is present continuous, disconnect the driver seat side air bag module C3049. • If a cross link fault for passenger seat side air bag is present continuous, disconnect the passenger seat side air bag module C3050. • If a cross link fault for driver Safety Canopy® module is present continuous, disconnect the driver Safety Canopy® module C3213 (Explorer/Mountaineer)/C9006 (Explorer Sport Trac). • If a cross link fault for passenger Safety Canopy® module is present continuous,	**Yes** The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to R2 . **No** The fault is not present and cannot be recreated at this time. CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness, cycling the ignition frequently and rotating the steering wheel (driver air bag module fault). **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. GO to R5 .

tomsn048@gmail.com

disconnect the passenger Safety Canopy® module C3214 (Explorer/Mountaineer)/C9007 (Explorer Sport Trac). • If a cross link fault for driver safety belt buckle pretensioner is present continuous, disconnect the driver safety belt buckle pretensioner C3201. • If a cross link fault for passenger safety belt buckle pretensioner is present continuous, disconnect the passenger safety belt buckle pretensioner C3202. • If a cross link fault for deployable steering column is present continuous, disconnect the deployable steering column C2318. • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: DataLogger - RCM - View and Record All 2792 Fault PIDs . ♦ Refer to PID list in Normal Operation to view 2792 fault PIDs. • **Do any RCM on-demand 2792 fault PIDs indicate a fault?**	
R5 CHECK FOR ADDITIONAL SRS DTCs	
• Ignition OFF. • ⚠ **WARNING: Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.** • Reconnect all SRS components (if previously disconnected). • If previously directed to depower the SRS , repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - Restraints . • **Are any RCM and/or OCSM DTCs indicating a fault?**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the DTC Charts in this section for pinpoint test direction. **No** CLEAR all RCM and OCSM DTCs. PROVE OUT the SRS . Repair is complete. RETURN the vehicle to the customer.

Pinpoint Test S: DTC B2984/B2987

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

Normal Operation

As part of the Supplemental Restraint System (SRS), this vehicle is equipped a deployable steering column. The Restraints Control Module (RCM) will deploy (collapse) the steering column during a frontal collision when seat position information and other parameters reach predetermined limits. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.

The RCM continuously monitors the deployable steering column circuits (loop) for an acceptable resistance range, unacceptable voltage and shorts to ground. The RCM will set on-demand and store a DTC (B2984, B2985, B2986 or B2987) in memory if any of these conditions are detected. If the RCM detects a fault, it will send a message to the Instrument Cluster (IC) module to illuminate the air bag warning indicator.

As the RCM continuously monitors deployable steering column circuits for resistance, it expects a normal resistance between 1.31 to 4.29 ohms.

If a loop resistance is between 0.9 and 1.31 or between 4.29 and 5 ohms, there exists a strong potential for an intermittent fault, a DTC may or may not set. The RCM will also set an on-demand DTC B2984 or B2987 respectfully if the loop resistance is less than 0.9 ohm or greater than 5 ohms.

- DTC B2984 (Deployable Steering Column Circuit Open) - If the RCM detects an open on the deployable steering column circuits, it will set this DTC.
- DTC B2987 (Deployable Steering Column Circuit Resistance Low on Squib) - If the RCM detects loop resistance less than 0.9 ohm on the deployable steering column circuits, it will set this DTC.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Deployable steering column
- RCM

PINPOINT TEST S: DTC B2984/B2987

⚠ WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the Safety Canopy® and cause serious personal injury or death.

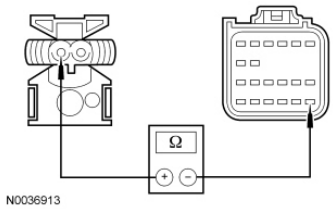
⚠ WARNING: Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

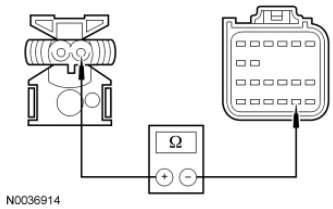
NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

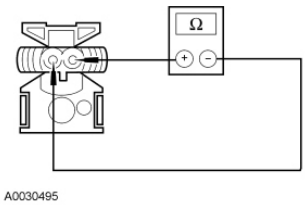
NOTE: SRS components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

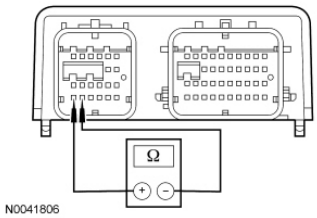
NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.





NOTE: When monitoring fault and/or resistance PIDs with the scan tool, it may take up to 2 seconds for the scan tool display to update.





tomsn048@gmail.com

Test Step	Result / Action to Take
S1 RETRIEVE RCM DTCs	
• Enter the following diagnostic mode on the scan tool: Self Test - RCM . • **Was DTC B2984 or B2987 retrieved on-demand during self-test?**	**Yes** The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to S2 . **No** This is an intermittent fault when present as a CMDTC only. The fault condition is not present at this time. GO to S10 .
S2 CHECK THE DEPLOYABLE STEERING COLUMN	
• Enter the following diagnostic mode on the scan tool: DataLogger - RCM - PID . • Enter the following diagnostic mode on the scan tool: COL_RES (Deployable Column Resistance) Resistance PID . • **Does the resistance PID value read between 1.31 and 4.29 ohms?**	**Yes** GO to S9 . **No** GO to S3 .
S3 CHECK THE COL_RES (DEPLOYABLE COLUMN RESISTANCE) RESISTANCE PID WHILE CARRYING OUT A HARNESS TEST	
NOTE: A resistance PID that reads between 0.9 and 1.31 ohms or between 4.29 and 5 ohms may or may not set an on-demand DTC yet indicates a strong potential of an intermittent fault condition. Make sure to thoroughly check wire harness(es), connectors and terminals as they are the likely source of the fault condition. • Continue monitoring the COL_RES (Deployable Column Resistance) resistance PID while carrying out a harness test of the deployable column circuits and accessible connectors (including any inline connectors), by wiggling connectors and flexing the wire harness. • **Does the resistance PID value read between 1.31 and 4.29 ohms while carrying out the harness test?**	**Yes** DEPOWER the SRS and REPAIR the connector, terminals or wire harness as needed. Refer to Wiring Diagrams Cell 5 , Connector Repair Procedures for schematic and connector information. GO to S11 . **No** If the deployable column resistance PID is less than 1.31 ohms, GO to S7 . If the deployable column resistance PID is greater than 4.29 ohms, GO to S4 .
S4 CHECK THE DEPLOYABLE COLUMN DTCs FOR A CHANGE IN FAULT STATUS	
	Yes INSTALL a new steering column assembly. REFER

NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Deployable Steering Column C2318 . • Connect a fused jumper wire between deployable steering column C2318 pin-1, harness side and pin-2, harness side. • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • **DIAGNOSTIC TIP:** When viewing on-demand DTCs with the deployable steering column circuits shorted together, a low resistance fault (B2987) would normally be retrieved. • **Did the RCM on-demand fault change from B2984 to B2987?**	to Section 211-04 . GO to S11 . **No** GO to S5 .
S5 CHECK DEPLOYABLE STEERING COLUMN CIRCUITS FOR AN OPEN	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310a and C310b . • Remove the fused jumper wire from deployable steering column C2318. • Measure resistance between RCM C310a-19, circuit CR139 (VT/WH), harness side and deployable steering column C2318-1, circuit CR139 (VT/WH), harness side.	**Yes** GO to S6 . **No** REPAIR circuit CR139 (VT/WH) or RR139 (YE). GO to S11 .

tomsn048@gmail.com

 N0036913 • Measure resistance between RCM C310a-20, circuit RR139 (YE), harness side and deployable steering column C2318-2, circuit RR139 (YE), harness side.  N0036914 • **Are resistances less than 0.5 ohm?**	
S6 CHECK CIRCUIT RR139 (YE) FOR AN OPEN	
• Measure resistance between RCM C310a-20, circuit RR139 (YE), harness side and deployable steering column C2318-2, circuit RR139 (YE), harness side. • **Is resistance less than 0.5 ohm?**	**Yes** GO to S9 . **No** REPAIR circuit RR139 (YE). GO to S11 .
S7 CHECK FOR A SHORT BETWEEN DEPLOYABLE STEERING COLUMN CIRCUITS	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Deployable Steering Column C2318 . • Measure resistance between the deployable steering column C2318-2, circuit RR139 (YE), harness side and C2318-1, circuit CR139 (VT/WH), harness side.	**Yes** INSTALL a new steering column assembly. REFER to Section 211-04 . GO to S11 . **No** GO to S8 .

 A0030495 • **Is resistance greater than 10,000 ohms?**	
S8 CHECK THE RCM FOR LOW RESISTANCE	
• Disconnect: RCM C310a and C310b . • Measure resistance between RCM C310a pin 19, component side and C310a pin 20, component side.  N0041806 • **Is resistance greater than 10,000 ohms?**	**Yes** REPAIR circuits CR139 (VT/WH) and RR139 (YE). GO to S11 . **No** GO to S9 .
S9 CONFIRM THE RCM FAULT	
NOTE: Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, DTCs will be recorded. • Connect: Deployable Steering Column C2318 . • Connect: RCM C310a and C310b (if previously disconnected) . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • **Was DTC B2984 or B2987 retrieved on-demand during self-test?**	**Yes** INSTALL a new RCM . REFER to Restraints Control Module (RCM) . GO to S11 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. GO to S11 .
S10 CHECK FOR AN INTERMITTENT FAULT	
• Enter the following diagnostic mode on the scan tool: Self Test - RCM . • **Was DTC B2984 or B2987 retrieved on-demand during self-test?**	**Yes** The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to S3 .

tomsn048@gmail.com

	No CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. GO to S11 .
S11 CHECK FOR ADDITIONAL SRS DTCs	
• Ignition OFF. • ⚠ **WARNING: Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.** • Reconnect all SRS components (if previously disconnected). • If previously directed to depower the SRS , repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - Restraints . • **Are any RCM and/or OCSM DTCs indicating a fault?**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the DTC Charts in this section for pinpoint test direction. **No** CLEAR all RCM and OCSM CMDTCs . PROVE OUT the SRS . Repair is complete. RETURN the vehicle to the customer.

Pinpoint Test T: DTC B2985

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

Normal Operation

As part of the Supplemental Restraint System (SRS), this vehicle is equipped a deployable steering column. The Restraints Control Module (RCM) will deploy (collapse) the steering column during a frontal collision when seat position information and other parameters reach predetermined limits. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.

The RCM continuously monitors the deployable steering column circuits (loop) for an acceptable resistance range, unacceptable voltage and shorts to ground. The RCM will set on-demand and store a DTC (B2984, B2985, B2986 or B2987) in memory if any of these conditions are detected. If the RCM detects a fault, it will send a message to the Instrument Cluster (IC) module to illuminate the air bag warning indicator.

As the RCM continuously monitors deployable steering column circuits for resistance, it expects a normal resistance between 1.31 to 4.29 ohms.

If a loop resistance is between 0.9 and 1.31 or between 4.29 and 5 ohms, there exists a strong potential for an intermittent fault, a DTC may or may not set. The RCM will also set an on-demand DTC B2984 or B2987

respectfully if the loop resistance is less than 0.9 ohm or greater than 5 ohms.

- DTC B2985 (Deployable Steering Column Circuit Short to Battery) - If the RCM detects a short to voltage on the deployable steering column circuits, it will set this DTC.

This pinpoint test is intended to diagnose the following:

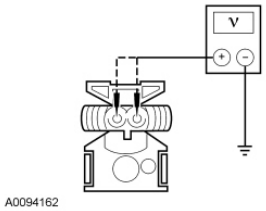
- Wiring, terminals or connectors
- Deployable steering column
- RCM

PINPOINT TEST T: DTC B2985

⚠ WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the Safety Canopy® and cause serious personal injury or death.

⚠ WARNING: Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**



Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: SRS components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
T1 RETRIEVE RCM DTCs	
• Enter the following diagnostic mode on the scan tool: Self Test - RCM . • **Was DTC B2985 retrieved on-demand during self-test?**	**Yes** The fault condition is still present. This fault cannot be cleared until it is corrected and DTC is no longer retrieved during the on-demand self test. GO to T2 . **No** This is an intermittent fault when present as a CMDTC only. The fault condition is not present at this time. GO to T4 .
T2 CHECK DEPLOYABLE STEERING COLUMN CIRCUITS FOR A SHORT TO VOLTAGE	

tomsn048@gmail.com

• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Deployable Steering Column C2318 . • Disconnect: RCM C310a and C310b . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Measure voltage between deployable steering column: ♦ C2318-1, circuit CR139 (VT/WH), harness side and ground. ♦ C2318-2, circuit RR139 (YE), harness side and ground. Pinpoint Test U: DTC B2986

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

Normal Operation

As part of the Supplemental Restraint System (SRS), this vehicle is equipped a deployable steering column. The Restraints Control Module (RCM) will deploy (collapse) the steering column during a frontal collision when seat position information and other parameters reach predetermined limits. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.

The RCM continuously monitors the deployable steering column circuits (loop) for an acceptable resistance range, unacceptable voltage and shorts to ground. The RCM will set on-demand and store a DTC (B2984, B2985, B2986 or B2987) in memory if any of these conditions are detected. If the RCM detects a fault, it will send a message to the Instrument Cluster (IC) module to illuminate the air bag warning indicator.

tomsn048@gmail.com

As the RCM continuously monitors deployable steering column circuits for resistance, it expects a normal resistance between 1.31 to 4.29 ohms.

If a loop resistance is between 0.9 and 1.31 ohms or between 4.29 and 5 ohms, there exists a strong potential for an intermittent fault, a DTC may or may not set. The RCM will also set an on-demand DTC B2984 or B2987 respectfully if the loop resistance is less than 0.9 ohm or greater than 5 ohms.

- DTC B2986 (Deployable Steering Column Circuit Short to Ground) - If the RCM detects a short to ground on the deployable steering column circuits, it will set this DTC.

This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- Deployable steering column
- RCM

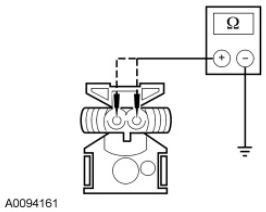
PINPOINT TEST U: DTC B2986

⚠ WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the Safety Canopy® and cause serious personal injury or death.

⚠ WARNING: Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.



NOTE: SRS components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
U1 RETRIEVE RCM DTCs	
• Enter the following diagnostic mode on the scan tool: Self Test - RCM . • **Was DTC B2986 retrieved on-demand during self-test?**	**Yes** The fault condition is still present. This fault cannot be cleared until it is corrected and DTC is no longer retrieved during the on-demand self test. GO to U2 . **No** This is an intermittent fault when present as a CMDTC only. The fault condition is not present at this time. GO to U5 .
U2 CHECK THE DEPLOYABLE STEERING COLUMN DTCs FOR A CHANGE IN FAULT STATUS	

NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Deployable Steering Column C2318 . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • **DIAGNOSTIC TIP:** When viewing on-demand DTCs with the deployable column disconnected, a open circuit fault would normally be retrieved. • **Did the deployable column on-demand DTC change from indicating B2986 to B2984?**	**Yes** INSTALL a new steering column assembly. REFER to Section 211-04 . GO to U6 . **No** GO to U3 .
U3 CHECK DEPLOYABLE STEERING COLUMN CIRCUITS FOR A SHORT TO GROUND	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310a and C310b . • Measure resistance between deployable steering column: ♦ C2318-1, circuit CR139 (VT/WH), harness side and ground. ♦ C2318-2, circuit RR139 (YE), harness side and ground.	**Yes** GO to U4 . **No** REPAIR circuit CR139 (VT/WH) or RR139 (YE). GO to U6 .

tomsn048@gmail.com

 • **Are resistances greater than 10,000 ohms?**	
U4 CONFIRM THE RCM FAULT	
NOTE: Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, DTCs will be recorded. • Connect: Deployable Steering Column C2318 . • Connect: RCM C310a and C310b . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • **Was DTC B2986 retrieved on-demand during self-test?**	**Yes** INSTALL a new RCM . REFER to Restraints Control Module (RCM) . GO to U6 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. GO to U6 .
U5 CHECK FOR AN INTERMITTENT FAULT	
• Enter the following diagnostic mode on the scan tool: Self Test - RCM . • **Was DTC B2986 retrieved on-demand during self-test?**	**Yes** The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to U2 . **No** CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. GO to U6 .
U6 CHECK FOR ADDITIONAL SRS DTCs	
• Ignition OFF. • ⚠ **WARNING: Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the DTC Charts in this section for pinpoint test direction. **No**

may result in serious personal injury or death in the event of an accidental deployment. • Reconnect all SRS components (if previously disconnected). • If previously directed to depower the SRS , repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - Restraints . • **Are any RCM and/or OCSM DTCs indicating a fault?**	CLEAR all RCM and OCSM CMDTCs . PROVE OUT the SRS . Repair is complete. RETURN the vehicle to the customer.

Pinpoint Test V: DTC B229A

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

Normal Operation

The Occupant Classification System (OCS) system is used to classify the front passenger seat occupant in the event of a deployable impact. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.

The Occupant Classification System Module (OCSM) monitors the 2 OCS rails (weight sensors) and circuity for faults. If the OCSM detects an object within the OCS rails, it will store DTC B229A in memory and send a message to the Restraints Control Module (RCM) which sends a message to the Instrument Cluster (IC) module to illuminate the air bag warning indicator.

- DTC B229A (Occupant Classification System Contamination) - If the OCSM detects foreign object(s)/substance in one or both OCS rails (weight sensors), it will set this DTC.

This pinpoint test is intended to diagnose the following:
- A foreign object within an OCS rail
- OCS system component

PINPOINT TEST V: DTC B229A

⚠ WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the Safety Canopy® and cause serious personal injury or death.

⚠ WARNING: Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

tomsn048@gmail.com

⚠ WARNING: Never disassemble or tamper with safety belt buckle/retractor pretensioners, adaptive load limiting retractors, safety belt inflators, or probe the electrical connectors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners, adaptive load limiting retractors, or safety belt inflators, which increases the risk of serious personal injury or death.

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: SRS components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

Test Step	Result / Action to Take
V1 RETRIEVE OCSM DTCs	
• Enter the following diagnostic mode on the scan tool: Self Test - OCSM . • **Was DTC B229A retrieved on-demand during self-test?**	**Yes** The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to V2 . **No** This is an intermittent fault when present as a CMDTC only. The fault condition is not present at this time. GO to V5 .
V2 INSPECT THE OCS RAIL	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the passenger seat. Refer to Section 501-10 . • Remove and inspect the affected OCS rail for the presence of any foreign objects. Refer to Occupant Classification Sensor in this section. • **Were any problems noted?**	**Yes** REPAIR as necessary. GO to V6 . **No** GO to V3 .
V3 INSTALL A NEW OCS RAIL	
• Install a new OCS rail. Refer to Occupant Classification Sensor in this section. • Install the passenger seat. Refer to Section 501-10 . • Repower the SRS . **Do not** prove out the SRS at this	**Yes** GO to V4 . **No** Fault corrected. GO to V6 .

time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the scan tool: Self Test - OCSM . • **Was DTC B229A retrieved on-demand during self-test?**	
V4 CONFIRM OCSM FAULT	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the passenger seat. Refer to Section 501-10 . • Install the original OCS rail. Refer to Occupant Classification Sensor in this section. • Install the passenger seat. Refer to Section 501-10 . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the scan tool: Self Test - OCSM . • **Was DTC B229A retrieved on-demand during self-test?**	**Yes** INSTALL a new OCSM . REFER to Occupant Classification System Module (OCSM) in this section. GO to V6 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. GO to V6 .
V5 CHECK FOR AN INTERMITTENT FAULT	
• Enter the following diagnostic mode on the scan tool: Self Test - OCSM . • **Was DTC B229A retrieved on-demand during self-test?**	**Yes** The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to V2 . **No** CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by moving/positioning the passenger seat. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. GO to V6 .

tomsn048@gmail.com

V6 CHECK FOR ADDITIONAL SRS DTCs	
• Ignition OFF. • ⚠ **WARNING: Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.** • Reconnect all SRS components (if previously disconnected). • If previously directed to depower the SRS , repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - Restraints . • **Are any RCM and/or OCSM DTCs indicating a fault?**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the DTC Charts in this section for pinpoint test direction. **No** CLEAR all RCM and OCSM DTCs. PROVE OUT the SRS . Repair is complete. RETURN the vehicle to the customer.

Pinpoint Test W: DTC B229B

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

Normal Operation

The Occupant Classification System (OCS) system is used to classify the front passenger seat occupant in the event of a deployable impact. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.

The Occupant Classification System Module (OCSM) monitors the 2 OCS rails (weight sensors) and circuity for faults. If the OCSM detects an obstruction of both OCS rails, it will store DTC B229B in memory and send a message to the Restraints Control Module (RCM) which sends a message to the Instrument Cluster (IC) module to illuminate the air bag warning indicator.

- DTC B229B (Occupant Classification System Obstruction) - If the OCSM detects a negative force on one or both OCS rails (weight sensors), it will set this DTC.

This pinpoint test is intended to diagnose the following:
- A foreign object placed under or contacting the passenger seat
- OCS system component(s)

PINPOINT TEST W: DTC B229B

⚠ WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the Safety Canopy® and cause serious personal injury or death.

⚠ WARNING: Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

⚠ WARNING: Never disassemble or tamper with safety belt buckle/retractor pretensioners, adaptive load limiting retractors, safety belt inflators, or probe the electrical connectors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners, adaptive load limiting retractors, or safety belt inflators, which increases the risk of serious personal injury or death.

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: SRS components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

Test Step	Result / Action to Take
W1 RETRIEVE OCSM DTCs	
• Enter the following diagnostic mode on the scan tool: Self Test - OCSM . • **Was DTC B229B retrieved on-demand during self-test?**	**Yes** The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to W2 . **No** This is an intermittent fault when present as a CMDTC only. The fault condition is not present at this time. GO to W5 .
W2 INSPECT THE OCCUPANT CLASSIFICATION SENSOR	
• Ignition OFF. • Position the seat and inspect under the seat for the presence of any foreign objects contacting the under side of the seat. • **Were any problems noted?**	**Yes** REPAIR as necessary. GO to W6 . **No** GO to W3 .
W3 CHECK THE OCCUPANT CLASSIFICATION SENSOR	

tomsn048@gmail.com

• Ignition ON. • Carry out the Zero Seat Weight Test procedure. **Do not carry out System Reset at this time.** Refer to Occupant Classification Sensor (OCS) System Zero Seat Weight Test in this section. • **Was DTC C1941 retrieved during the Zero Seat Weight Test?**	**Yes** INSTALL 2 new OCS rails. REFER to Occupant Classification Sensor in this section. GO to W6 . **No** GO to W4 .
W4 CONFIRM OCSM FAULT	
• Enter the following diagnostic mode on the scan tool: Self Test - OCSM . • **Was DTC B229B retrieved on-demand during self-test?**	**Yes** INSTALL a new OCSM . REFER to Occupant Classification System Module (OCSM) in this section. GO to W6 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. GO to W6 .
W5 CHECK FOR AN INTERMITTENT FAULT	
• Enter the following diagnostic mode on the scan tool: Self Test - OCSM . • **Was DTC B229B retrieved on-demand during self-test?**	**Yes** The fault condition is now present. GO to the DTC Charts in this section for pinpoint test direction. **No** CLEAR all RCM and OCSM DTCs. PROVE OUT the SRS . Repair is complete. RETURN the vehicle to the customer.

of an accidental deployment. • Reconnect all SRS components (if previously disconnected). • If previously directed to depower the SRS , repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - Restraints . • **Are any RCM and/or OCSM DTCs indicating a fault?**	

Pinpoint Test X: DTC C1946

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

Normal Operation

As part of the Supplemental Restraint System (SRS), the driver seat is equipped with a seat track position sensor. The seat track position sensor is comprised of integrated circuits called Hall-effect switch. The seat track position sensor indicates to the Restraints Control Module (RCM) the position of the driver seat, forward or rearward.

The RCM supplies current to the seat track position sensor. Current flows through the switch, both in the forward or rearward seat position, to ground. The RCM will sense the difference in this current draw, 6 mA (forward) or 15 mA (rearward), and use this information in determining the deployment rate of the dual-stage driver air bag module. If the RCM detects current out of range, it will store C1946 in memory and send a message to the Instrument Cluster (IC) module to illuminate the air bag warning indicator.

NOTE: When monitoring fault and/or resistance PIDs with the scan tool, it may take up to 2 seconds for the scan tool display to update.

- DTC C1946 (Front Driver's Seat Track Position Switch Circuit Open) - If the RCM detects a open on the driver seat track position sensor circuit, it will set this DTC.

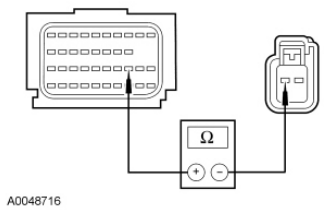
This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- Driver seat track position sensor
- RCM

PINPOINT TEST X: DTC C1946

⚠ WARNING: Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

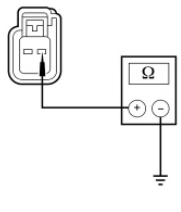
tomsn048@gmail.com

⚠ WARNING: Never disassemble or tamper with safety belt buckle/retractor pretensioners, adaptive load limiting retractors, safety belt inflators, or probe the electrical connectors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners, adaptive load limiting retractors, or safety belt inflators, which increases the risk of serious personal injury or death.



NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.



NOTE: SRS components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
X1 RETRIEVE RCM DTCs	
• Enter the following diagnostic mode on the scan tool: Self Test - RCM . • **Was DTC C1946 retrieved on-demand during self-test?**	**Yes** The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to X2 . **No** This is an intermittent fault when present as a CMDTC only. The fault condition is not present at this time. GO to X6 .
X2 CHECK DRIVER SEAT TRACK POSITION SENSOR CIRCUIT DTCs FOR A CHANGE IN FAULT STATUS	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Seat Track Position Sensor C356 . • Connect a fused jumper wire between driver seat track position sensor C356-2, circuit VR215 (YE/VT), harness side and C356-1, circuit GD145 (BK/BU), harness side. • Repower the SRS . **Do not** prove out the system at this time. Refer to	**Yes** INSTALL a new seat track position sensor. REFER to Seat Position Sensor in this section. GO to X7 . **No** GO to X3 .

Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • **DIAGNOSTIC TIP:** When viewing on-demand DTCs with the driver seat track position sensor circuits shorted together, a short to ground fault would normally be retrieved. • **Did the driver seat track position switch on-demand DTC change from indicating C1946 to C1947?**	
X3 CHECK DRIVER SEAT TRACK POSITION SENSOR CIRCUIT FOR AN OPEN	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310a and C310b . • Remover the jumper wire from the driver seat track position sensor C356. • Measure resistance between RCM C310b-23, circuit VR215 (YE/VT), harness side and driver seat track position sensor C356-2, circuit VR215 (YE/VT), harness side.  A0048716 • **Is resistance less than 0.5 ohm?**	**Yes** GO to X4 . **No** REPAIR circuit VR215 (YE/VT). GO to X7 .
X4 CHECK DRIVER SEAT TRACK POSITION SENSOR GROUND CIRCUIT FOR AN OPEN	
• Measure resistance between driver seat track position sensor C356-1, circuit GD145 (BK/BU) and ground.	**Yes** GO to X5 . **No** REPAIR GD145 (BK/BU). GO to X7 .

tomsn048@gmail.com

 • **Is resistance less than 5 ohms?**	
X5 CONFIRM THE RCM FAULT	
NOTE: Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, DTCs will be recorded. • Connect: Driver Seat Track Position Sensor C356 . • Connect: RCM C310a and C310b . • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • **Was DTC C1946 retrieved on-demand during self-test?**	**Yes** INSTALL a new RCM . REFER to Restraints Control Module (RCM) in this section. GO to X7 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. GO to X7 .
X6 CHECK FOR AN INTERMITTENT FAULT	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Driver Side Air Bag Module C3049 . • Repower the SRS . **Do not** prove out the system at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • **Was DTC C1946 retrieved on-demand during self-test?**	**Yes** The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to X2 . **No** The fault is not present and cannot be recreated at this time. CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. GO to X7 .
X7 CHECK FOR ADDITIONAL SRS DTCs	

• Ignition OFF. • ⚠ **WARNING: Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.** • Reconnect all SRS components (if previously disconnected). • If previously directed to depower the SRS , repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - Restraints . • **Are any RCM and/or OCSM DTCs indicating a fault?**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the DTC Charts in this section for pinpoint test direction. **No** CLEAR all RCM and OCSM DTCs. PROVE OUT the SRS . Repair is complete. RETURN the vehicle to the customer.

Pinpoint Test Y: DTC C1947

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

Normal Operation

As part of the Supplemental Restraint System (SRS), the driver seat is equipped with a seat track position sensor. The seat track position sensor is comprised of integrated circuits called Hall-effect switch. The seat track position sensor indicates to the Restraints Control Module (RCM) the position of the driver seat, forward or rearward.

The RCM supplies current to the seat track position sensor. Current flows through the switch, both in the forward or rearward seat position, to ground. The RCM will sense the difference in this current draw, 6 mA (forward) or 15 mA (rearward), and use this information in determining the deployment rate of the dual-stage driver air bag module. If the RCM detects current out of range, it will set a DTC.

If the RCM detects a short to ground, it will store DTC C1947 in memory and send a message to the Instrument Cluster (IC) module to illuminate the air bag warning indicator.

- DTC C1947 (Front Driver's Seat Track Position Switch Circuit Short to Ground) - If the RCM detects a short to ground on the driver seat track position sensor circuit, it will set this DTC.

This pinpoint test is intended to diagnose the following:

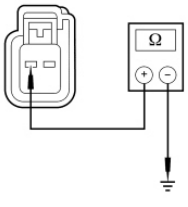
- Wiring, terminals or connectors
- Driver seat track position sensor
- RCM

tomsn048@gmail.com

PINPOINT TEST Y: DTC C1947

⚠ WARNING: Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

⚠ WARNING: Never disassemble or tamper with safety belt buckle/retractor pretensioners, adaptive load limiting retractors, safety belt inflators, or probe the electrical connectors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners, adaptive load limiting retractors, or safety belt inflators, which increases the risk of serious personal injury or death.



NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: SRS components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
Y1 RETRIEVE RCM DTCs	
• Enter the following diagnostic mode on the scan tool: Self Test - RCM . • **Was DTC C1947 retrieved on-demand during self-test?**	**Yes** The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to Y2 . **No** This is an intermittent fault when present as a CMDTC only. The fault condition is not present at this time. GO to Y5 .
Y2 CHECK DRIVER SEAT TRACK POSITION SENSOR DTCs FOR A CHANGE IN FAULT STATUS	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Seat Track Position Sensor C356 . • Repower the SRS . **Do not** prove out	**Yes** INSTALL a new driver seat track position sensor. REFER to Seat Position Sensor in this section. GO to Y6 . **No** GO to Y3 .

the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • **DIAGNOSTIC TIP:** When viewing on-demand DTCs with the driver seat track position sensor disconnected, an open circuit fault would normally be retrieved. • **Did the driver seat track position switch on-demand DTC change from indicating C1947 to C1981?**	
Y3 CHECK THE DRIVER SEAT TRACK POSITION SENSOR CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310a and C310b . • Measure resistance between driver seat track position sensor C356-2, circuit VR215 (YE/VT) and ground.  N0056815 • **Is resistance greater than 10,000 ohms?**	**Yes** GO to Y4 . **No** REPAIR circuit VR215 (YE/VT). GO to Y6 .
Y4 CONFIRM THE RCM FAULT	
NOTE: Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, DTCs will be recorded. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.	**Yes** INSTALL a new RCM . REFER to Restraints Control Module (RCM) in this section. GO to Y6 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. GO to Y5 .

tomsn048@gmail.com

• Connect: Seat Track Position Sensor C356 . • Connect: RCM C310a and C310b . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • **Was DTC C1947 retrieved on-demand during self-test?**	
Y5 CHECK FOR AN INTERMITTENT FAULT	
• Enter the following diagnostic mode on the scan tool: Self Test - RCM . • **Was DTC C1947 retrieved on-demand during self-test?**	**Yes** The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to Y2 . **No** The fault is not present and cannot be recreated at this time. CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. GO to Y6 .
Y6 CHECK FOR ADDITIONAL SRS DTCs	
• Ignition OFF. • ⚠ **WARNING: Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.** • Reconnect all SRS components (if previously disconnected). • If previously directed to depower the SRS , repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - Restraints .	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the DTC Charts in this section for pinpoint test direction. **No** CLEAR all RCM and OCSM DTCs. PROVE OUT the SRS . Repair is complete. RETURN the vehicle to the customer.

• **Are any RCM and/or OCSM DTCs indicating a fault?**	

Pinpoint Test Z: DTC C1948

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

NOTE: Due to the seat track position sensor being a Hall-effect type sensor, this pinpoint test will be diagnosing a current out of range fault instead of the current DTC definition for a resistance out of range fault.

Normal Operation

As part of the Supplemental Restraint System (SRS), the driver seat is equipped with a seat track position sensor. The seat track position sensor is comprised of integrated circuits called Hall-effect switch. The seat track position sensor indicate to the Restraints Control Module (RCM) the position of the driver seat, forward or rearward.

The RCM supplies current to the seat track position sensor. Current flows through the switch, both in the forward or rearward seat position, to ground. The RCM will sense the difference in this current draw, 6 mA (forward) or 15 mA (rearward), and use this information in determining the deployment rate of the dual-stage driver air bag module. If the RCM detects current out of range, it will set a DTC.

If the RCM detects a current out of range condition, it will store DTC C1948 in memory and send a message to the Instrument Cluster (IC) module to illuminate the air bag warning indicator.

NOTE: When monitoring fault and/or resistance PIDs with the scan tool, it may take up to 2 seconds for the scan tool display to update.

- DTC C1948 (Front Driver's Seat Track Position Switch Circuit Resistance out of Range) - If the RCM detects a current out of range between forward and rearward on the driver seat track position switch, it will set this DTC.

This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- Driver seat track position sensor
- RCM

PINPOINT TEST Z: DTC C1948

⚠ **WARNING: Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

⚠ **WARNING: Never disassemble or tamper with safety belt buckle/retractor pretensioners, adaptive load limiting retractors, safety belt inflators, or probe the electrical connectors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners, adaptive load limiting retractors, or safety belt inflators, which increases the risk of serious personal injury or death.**

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and

tomsn048@gmail.com

verification before proceeding with the pinpoint test.

NOTE: SRS components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
Z1 RETRIEVE RCM DTCs	
• Enter the following diagnostic mode on the scan tool: Self Test - RCM . • **Was DTC C1948 retrieved on-demand during self-test?**	**Yes** The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to Z2 . **No** This is an intermittent fault when present as a CMDTC only. The fault condition is not present at this time. GO to Z4 .
Z2 CHECK THE DRIVER SEAT TRACK POSITION SENSOR DTCs FOR A CHANGE IN FAULT STATUS	
NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: Driver Seat Track Position Sensor C356 . • Connect a fused jumper wire between driver seat track position sensor C356-2, circuit VR215 (YE/VT), harness side and C356-1, circuit GD145 (BK/BU), harness side. • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • **DIAGNOSTIC TIP:** When viewing on-demand DTCs with the driver seat track position sensor circuits shorted together, a short to ground fault would	**Yes** INSTALL a new driver seat track position sensor. REFER to Seat Position Sensor in this section. GO to Z5 . **No** GO to Z3 .

normally be retrieved. • **Did the driver seat track position sensor on-demand DTC change from indicating C1948 to C1947?**	
Z3 CONFIRM THE RCM FAULT	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Remove the fused jumper wire from the driver seat track position sensor. • Connect: Driver Seat Track Position Sensor C356 . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • **Was DTC C1948 retrieved on-demand during self-test?**	**Yes** INSTALL a new RCM . REFER to Restraints Control Module (RCM) in this section. GO to Z5 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. GO to Z5 .
Z4 CHECK FOR AN INTERMITTENT FAULT	
• Enter the following diagnostic mode on the scan tool: Self Test - RCM . • **Was DTC C1948 retrieved on-demand during self-test?**	**Yes** The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to Z2 . **No** The fault is not present and cannot be recreated at this time. CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. GO to Z5 .
Z5 CHECK FOR ADDITIONAL SRS DTCs	
• Ignition OFF. • ⚠ **WARNING: Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the DTC Charts in this section for pinpoint test direction. **No** CLEAR all RCM and OCSM DTCs. PROVE OUT the SRS . Repair is complete. RETURN the vehicle to the customer.

tomsn048@gmail.com

• Reconnect all SRS components (if previously disconnected). • If previously directed to depower the SRS , repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - Restraints . • **Are any RCM and/or OCSM DTCs indicating a fault?**	

Pinpoint Test AA: DTC C1981

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

Normal Operation

As part of the Supplemental Restraint System (SRS), the driver seat is equipped with a seat track position sensor. The seat track position sensor is comprised of integrated circuits called Hall-effect switch. The seat track position sensor indicate to the Restraints Control Module (RCM) the position of the driver seat, forward or rearward.

The RCM supplies current to the seat track position sensor. Current flows through the switch, both in the forward or rearward seat position, to ground. The RCM will sense the difference in this current draw, 6 mA (forward) or 15 mA (rearward), and use this information in determining the deployment rate of the dual-stage driver air bag module. If the RCM detects current out of range, it will set a DTC.

If the RCM detects an open circuit or a short to battery on the driver seat track position sensor, it will store DTC C1981 in memory and send a message to the Instrument Cluster (IC) module to illuminate the air bag warning indicator.

NOTE: When monitoring fault and/or resistance PIDs with the scan tool, it may take up to 2 seconds for the scan tool display to update.

- DTC C1981 (Front Driver's Seat Track Position Switch Circuit Fault) - If the RCM detects a short to voltage on the driver seat track position sensor circuit, it will set this DTC.

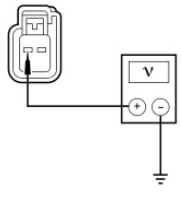
This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- RCM

PINPOINT TEST AA: DTC C1981

⚠ WARNING: Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

⚠ WARNING: Never disassemble or tamper with safety belt buckle/retractor pretensioners, adaptive load limiting retractors, safety belt inflators, or probe the electrical connectors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners, adaptive load limiting retractors, or safety belt inflators, which increases the risk of serious personal injury or death.

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**



Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: SRS components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
AA1 RETRIEVE RCM DTCs	
• Enter the following diagnostic mode on the scan tool: Self Test - RCM . • **Was DTC C1981 retrieved on-demand during self-test?**	**Yes** The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to AA2 . **No** This is an intermittent fault when present as a CMDTC only. The fault condition is not present at this time. GO to AA4 .
AA2 CHECK DRIVER SEAT TRACK POSITION SENSOR CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect: RCM C310a and C310b . • Disconnect: Driver Seat Track Position Sensor C356 . • Disconnect: Driver Seat Side Air Bag Module C3049 . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Measure voltage between driver seat track position sensor C356-2, circuit VR215 (YE/VT), harness side and ground.	**Yes** REPAIR circuit VR215 (YE/VT). GO to AA5 . **No** GO to AA3 .

tomsn048@gmail.com

 • **Is any voltage present?**	
AA3 CONFIRM THE RCM FAULT	
NOTE: Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, DTCs will be recorded. • Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Connect: RCM C310a and C310b . • Connect: Driver Seat Track Position Sensor C356 . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • **Was DTC C1981 retrieved on-demand during self-test?**	**Yes** INSTALL a new RCM . REFER to Restraints Control Module (RCM) in this section. GO to AA5 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. GO to AA4 .
AA4 CHECK FOR AN INTERMITTENT FAULT	
• Enter the following diagnostic mode on the scan tool: Self Test - RCM . • **Was DTC C1981 retrieved on-demand during self-test?**	**Yes** The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to AA2 . **No** The fault is not present and cannot be recreated at this time. CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or

	connector concerns found. GO to AA5 .
AA5 CHECK FOR ADDITIONAL SRS DTCs	
• Ignition OFF. • ⚠ **WARNING: Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.** • Reconnect all SRS components (if previously disconnected). • If previously directed to depower the SRS , repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - Restraints . • **Are any RCM and/or OCSM DTCs indicating a fault?**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the DTC Charts in this section for pinpoint test direction. **No** CLEAR all RCM and OCSM DTCs. PROVE OUT the SRS . Repair is complete. RETURN the vehicle to the customer.

Pinpoint Test AB: DTC B1317/B1318

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

NOTE: DTCs B1317, B1318 and B1676 can be set if the vehicle has been recently jump started, the battery has been recently charged or the battery has been discharged. The battery may become discharged due to excessive load(s) on the charging system from aftermarket accessories or if the battery has been left unattended with the accessories on.

Normal Operation - Restraints Control Module (RCM)

The Restraints Control Module (RCM) continuously monitors the input voltage for correct operation. If the RCM detects input voltage below 9.5 volts, it will store DTC B1318 in memory. If the RCM detects input voltage of 20 volts, it will store DTC B1317 in memory. If the RCM sets DTC B1317 or B1318, it will send a message to the Instrument Cluster (IC) module to illuminate the air bag warning indicator.

Normal Operation - Occupant Classification System Module (OCSM)

The Occupant Classification System Module (OCSM) continuously monitors the input voltage for correct operation. If the OCSM detects input voltage below 8 volts, it will store DTC B1318 in memory. If the OCSM detects input voltage above 17.2 volts, it will store DTC B1317 in memory. If the OCSM sets DTC B1317 or B1318, it will send a fault message to the RCM . The RCM will then send a message to the IC module to illuminate the air bag warning indicator.

tomsn048@gmail.com

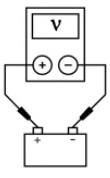
DTC Description	Fault Trigger Condition
• B1317 - Battery Voltage High	If the Restraints Control Module (RCM) detects voltage above 16 volts with a Supplemental Restraint System (SRS) fault or above 20 volts without a SRS fault, it will set this DTC.
• B1317 - Battery Voltage High	If the Occupant Classification System Module (OCSM) detects voltage above 17.2 volts, it will set this DTC.
• B1318 - Battery Voltage Low	If the RCM detects voltage below 9.5 volts with a SRS fault, it will set this DTC.
• B1318 - Battery Voltage Low	If the OCSM detects voltage below 8 volts, it will set this DTC.

This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- RCM
- OCSM

PINPOINT TEST AB: DTC B1317/B1318

⚠ WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the Safety Canopy® and cause serious personal injury or death.

⚠ WARNING: Always tighten the fasteners of the restraints control module (RCM) and impact sensor (if equipped) to the specified torque. Failure to do so may result in incorrect restraint system operation, which increases the risk of personal injury or death in a crash.



NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: SRS components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take

AB1 RETRIEVE ALL CMDTCs IN ALL MODULES	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - ALL CMDTCs . • **Is DTC B1317, B1318 or B1676 present in one or more modules AND P0563, P0620, P0625, P0626 or P065B retrieved from the PCM?**	**Yes** REFER to Section 414-00 to diagnose the charging system. **No** GO to AB2 .
AB2 TEST BATTERY CONDITION	
NOTE: DTCs B1317, B1318 and B1676 can be set if the vehicle has been recently jump started, the battery has been recently charged or the battery has been discharged. The battery may become discharged due to excessive load(s) on the charging system from aftermarket accessories or if the battery has been left unattended with the accessories on. • Ignition OFF. • Carry out the battery condition test. Refer to Section 414-01 . • **Did the battery pass the condition test?**	**Yes** If the battery passed the condition test but required a recharge, REFER to Section 414-00 to diagnose the charging system. CLEAR all CMDTCs . TEST the system for normal operation. If the battery passed the condition test and did not require a recharge, GO to AB3 . **No** INSTALL a new battery. CLEAR all Continuous Memory Diagnostic Trouble Codes (CMDTCs). TEST the SRS for normal operation.
AB3 CHECK CHARGING SYSTEM VOLTAGE	
NOTE: Do not allow the engine speed to increase above 2,000 rpm while performing this step or the generator may self excite and result in default charging system output voltage. If engine speed goes above 2,000 rpm, shut the vehicle OFF and restart the engine before performing this step. • Measure voltage of the battery: ♦ For DTC B1317, turn off all accessories and run the engine at 1,500 rpm for a minimum of 2 minutes while measuring battery voltage. ♦ For DTC B1318, turn on headlights and HVAC fan on high and run engine at 1,500 rpm for a minimum of 2 minutes while measuring battery voltage.  AJ0210-A • **Is voltage between 13 and 15.2 volts?**	**Yes** For DTC B1318, GO to AB4 . For DTC B1317, GO to AB6 . **No** REFER to Section 414-00 to diagnose the charging system. CLEAR all CMDTCs . TEST the SRS for normal operation.

tomsn048@gmail.com

AB4 CHECK FOR OPEN IGNITION CIRCUIT TO THE MODULE	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect the module with the concern: ♦ For the RCM , disconnect C310a and C310b. ♦ For the OCSM , disconnect C3159. • Measure resistance of the ignition circuit: ♦ For the RCM , measure resistance between RCM C310a-24, circuit CBP17 (BN/GN), harness side and Smart Junction Box (SJB) fuse 17. ♦ For the OCSM , measure resistance between OCSM C3159-1, circuit CBP17 (BN/GN), harness side and SJB fuse 17. • **Is resistance less than 1 ohm?**	**Yes** GO to AB5 . **No** REPAIR the circuit as necessary. CLEAR all CMDTCs . TEST the SRS for normal operation.
AB5 CHECK FOR OPEN GROUND TO THE MODULE	
• Measure resistance of the ground circuit: ♦ For the RCM , measure resistance between the RCM case and a good ground. ♦ For the OCSM , measure the resistance between OCSM C3159-14, circuit GD145 (BK/BU), harness side and ground. • **Is resistance less than 5 ohms?**	**Yes** GO to AB6 . **No** For the RCM , MAKE SURE there is no corrosion between the RCM case and mounting. MAKE SURE the fasteners are clean and tightened to specification with no corrosion. REPAIR as necessary. For the OCSM , REPAIR circuit GD145 (BK/BU)) as necessary. CLEAR all CMDTCs . TEST the SRS for normal operation.
AB6 CHECK FOR MODULE OPERATION	
• Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Disconnect the module with the concern: ♦ For the RCM , disconnect C310a and C310b. ♦ For the OCSM , disconnect C3159. • Check for the following: ♦ corrosion. ♦ damaged pins. ♦ pushed-out pins. • Connect the RCM C310a and C310b or OCSM C3159 and make sure the connector seats correctly. • Repower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.	**Yes** INSTALL a new module. REFER to Restraints Control Module (RCM) or Occupant Classification System Module (OCSM) in this section. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR

• Operate the system and verify the concern is still present. • **Is concern still present?**	all CMDTCs . TEST the SRS for normal operation.

Pinpoint Test AC: DTC C1414 - Incorrect Module Design Level (Incorrect Vehicle Application)

Refer to Wiring Diagrams Cell 13 , Power Distribution/SJB for schematic and connector information.

Normal Operation

When the ignition is turned ON, the Restraints Control Module (RCM) compares information with the Occupant Classification System Module (OCSM). If the RCM and OCSM information do not match, DTC C1414 will be set.

This pinpoint test is intended to diagnose the following:
- OCSM
- RCM

PINPOINT TEST AC: DTC C1414 - INCORRECT MODULE DESIGN LEVEL (INCORRECT VEHICLE APPLICATION)

⚠ **WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the Safety Canopy® and cause serious personal injury or death.**

NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

NOTE: Supplemental Restraint System (SRS) components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: Always make sure the correct SRS component is being installed. Parts released for other vehicles may not be compatible even if they appear physically similar. Check the part number listed in the Ford Catalog AdvantageTM or equivalent to make sure the correct component is being installed. If an incorrect SRS component is installed, DTCs may set.

Test Step	Result / Action to Take
AC1 RETRIEVE RCM DTCs	
• Ignition ON. • Connect the scan tool. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • **Was DTC C1414 retrieved on-demand during the self-test?**	**Yes** GO to AC2 . **No** The fault is not present at this time. GO to AC4 .
AC2 CHECK THE OCSM PART NUMBER	
• Enter the following diagnostic mode on the scan tool:	**Yes** GO to AC3 .

tomsn048@gmail.com

Log Viewer. • Retrieve and record the OCSM part number from Log Viewer. • Check the OCSM part number against the part number listed in the Ford Catalog AdvantageTM or equivalent. • **Does the OCSM part number match the listed part number?**	**No** INSTALL the correct OCSM . REFER to Occupant Classification System Module (OCSM) in this section. GO to AC4 .
AC3 CHECK THE RCM PART NUMBER	
• Retrieve and record the RCM part number from Log Viewer. • Check the RCM part number against the part number listed in the Ford Catalog AdvantageTM or equivalent. • **Does the RCM part number match the listed part number?**	**Yes** CONFIGURE the RCM using as-built data. REFER to Section 418-01 . GO to AC4 . **No** INSTALL the correct RCM . REFER to Restraints Control Module (RCM) in this section. GO to AC4 .
AC4 CHECK FOR ADDITIONAL SRS DTCs	
• Ignition OFF. • ⚠ **WARNING: Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.** • Reconnect all SRS components (if previously disconnected). • If previously directed to depower the SRS , repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - Restraints. • **NOTE:** When selecting Restraints from the Self Test menu, DTCs will be retrieved from the RCM and OCSM . • **Are any RCM and/or OCSM DTCs retrieved on-demand during self-test?**	**Yes** Do not clear any DTCs until all DTCs have been resolved. REFER to DTC Charts in this section for pinpoint test direction. **No** CLEAR all RCM and OCSM CMDTCs . PROVE OUT the SRS . Repair is complete. RETURN the vehicle to the customer.

tomsn048@gmail.com

Supplemental Restraint System (SRS) Depowering and Repowering

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Depowering Procedure

⚠ WARNING: Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.

⚠ WARNING: Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

⚠ WARNING: Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the Safety Canopy® and cause serious personal injury or death.

⚠ WARNING: To reduce the risk of accidental deployment, do not use any memory saver devices. Failure to follow this instruction may result in serious personal injury or death.

NOTE: The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is removed and the ignition is ON.

NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

1. Turn all vehicle accessories OFF.
2. Turn the ignition switch to OFF.
3. At the Smart Junction Box (SJB), located below the LH side of the instrument panel, remove the cover and the RCM fuse 17 (10A) from the SJB . For additional information, refer to the Wiring Diagram manual.
4. Turn the ignition ON and visually monitor the air bag warning indicator for at least 30 seconds. The air bag warning indicator will remain lit continuously (no flashing) if the correct RCM fuse has been removed. If the air bag warning indicator does not remain lit continuously, remove the correct RCM fuse before proceeding.
5. Turn the ignition to OFF.

6. ⚠ **WARNING: Always deplete the backup power supply before repairing or installing any new front or side air bag supplemental restraint system (SRS) component and before servicing, removing, installing, adjusting or striking components near the front or side impact sensors or the restraints control module (RCM). Nearby components include doors, instrument panel, console, door latches, strikers, seats and hood latches.**

   Refer to the Description and Operation portion of Section 501-20B for location of the RCM and impact sensor(s).

   To deplete the backup power supply energy, disconnect the battery ground cable and wait at least 1 minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

   Failure to follow these instructions may result in serious personal injury or death in the event of an accidental deployment.

   Disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 .

Repowering Procedure

1. Turn the ignition switch from OFF to ON.

2. Install RCM fuse 17 (10A) to the SJB and close the cover.

3. ⚠ **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

   Connect the battery ground cable.

4. Prove out the SRS as follows:
   Turn the ignition switch from ON to OFF. Wait 10 seconds, then turn the ignition switch back to ON and visually monitor the air bag warning indicator with the air bag modules installed. The air bag warning indicator will light continuously for approximately 6 seconds and then turn off. If an SRS fault is present, the air bag warning indicator will:
   - fail to light.
   - remain lit continuously.
   - flash at a 5 Hz rate (RCM not configured).

   The air bag warning indicator might not light until approximately 30 seconds after the ignition switch has been turned from the OFF to the ON position. This is the time required for the RCM to complete the testing of the SRS . If the air bag warning indicator is inoperative and an SRS fault exists, a chime will sound in a pattern of 5 sets of 5 beeps. If this occurs, the air bag warning indicator and any SRS fault discovered must be diagnosed and repaired.
   Clear all continuous DTCs from the RCM and Occupant Classification System Module (OCSM) using a scan tool.

---

tomsn048@gmail.com

Supplemental Restraint System (SRS) Deactivation and Reactivation

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Deactivation

⚠ WARNING: Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.

⚠ WARNING: Always carry or place a live air bag module with the air bag and deployment door/trim cover/tear seam pointed away from the body. Do not set a live air bag module down with the deployment door/trim cover/tear seam face down. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

⚠ WARNING: Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

⚠ WARNING: Never disassemble or tamper with safety belt buckle/retractor pretensioners, adaptive load limiting retractors, safety belt inflators, or probe the electrical connectors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners, adaptive load limiting retractors, or safety belt inflators, which increases the risk of serious personal injury or death.

⚠ WARNING: To reduce the risk of accidental deployment, do not use any memory saver devices. Failure to follow this instruction may result in serious personal injury or death.

NOTE: The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is removed and the ignition is ON.

NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

All vehicles

1. Turn all vehicle accessories OFF.
2. Turn the ignition switch OFF.
3. At the Smart Junction Box (SJB), located below the LH side of the instrument panel, remove the cover and RCM fuse 17 (10A) from the SJB . For additional information, refer to the Wiring Diagram manual.

tomsn048@gmail.com

4. Turn the ignition switch ON and visually monitor the air bag warning indicator for at least 30 seconds. The air bag warning indicator will remain lit continuously (no flashing) if the correct RCM fuse has been removed. If the air bag warning indicator does not remain lit continuously, remove the correct RCM fuse before proceeding.

5. Turn the ignition OFF.

6. ⚠ **WARNING: Always deplete the backup power supply before repairing or installing any new front or side air bag supplemental restraint system (SRS) component and before servicing, removing, installing, adjusting or striking components near the front or side impact sensors or the restraints control module (RCM). Nearby components include doors, instrument panel, console, door latches, strikers, seats and hood latches.**

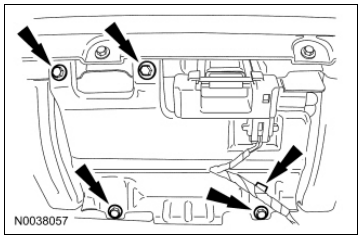
   Refer to the Description and Operation portion of Section 501-20B for location of the RCM and impact sensor(s).

   To deplete the backup power supply energy, disconnect the battery ground cable and wait at least 1 minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

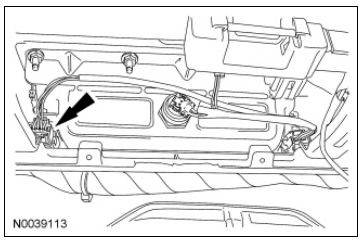
   Failure to follow these instructions may result in serious personal injury or death in the event of an accidental deployment.

   Disconnect the battery ground cable and wait at least one minute. For additional information, refer to Section 414-01 .

7. Remove the 2 driver air bag module bolts (1 shown).

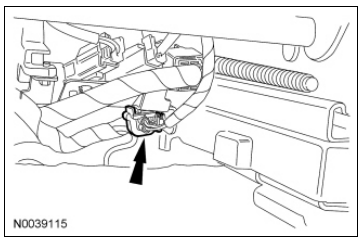


8. Disconnect the 3 driver air bag module electrical connectors and remove the driver air bag module.



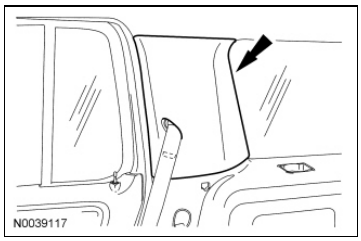
9. Open and lower the glove compartment door.

10. Detach the wiring retainer, remove the 4 bolts and passenger air bag module heat shield.

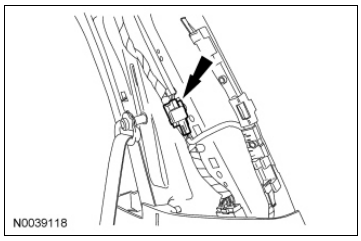


11. **NOTE:** The canister vent and adaptive tether do not require deactivation.

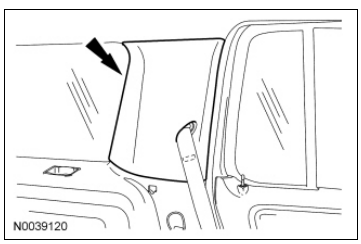
    Disconnect the LH side passenger air bag module electrical connector.



12. Under the rear of the passenger seat, detach the passenger seat side air bag module electrical connector from the seat track bracket. Disengage the passenger seat side air bag module electrical connector locking clip, release the tab and disconnect the passenger seat side air bag module electrical connector.

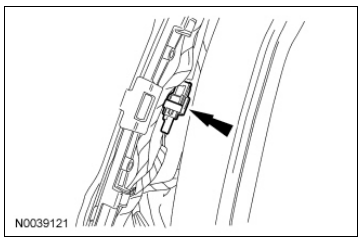


Explorer and Mountaineer vehicles



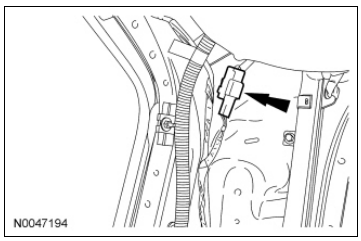
13. Release and position aside the passenger side C-pillar trim panel.

14. Disconnect the passenger side Safety Canopy® module electrical connector.

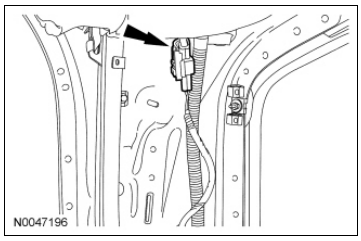


15. Release and position aside the driver side C-pillar trim panel.

tomsn048@gmail.com



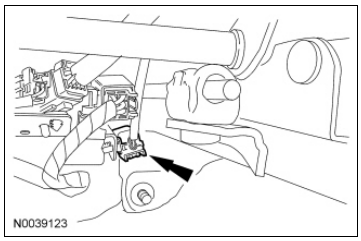
16. Disconnect the driver side Safety Canopy® module electrical connector.



Explorer Sport Trac vehicles

17. Remove the driver and passenger side upper C-pillar trim panels. For additional information, refer to Section 501-05 .

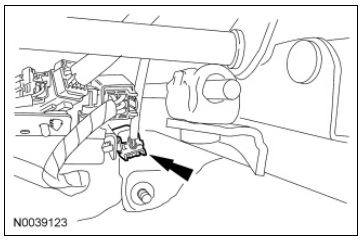
18. Disconnect the passenger side Safety Canopy® module electrical connector.



19. Disconnect the driver side Safety Canopy® module electrical connector.

All vehicles

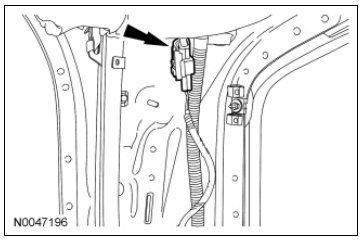
20. Under driver seat, the rear of the slide and disengage the driver seat side air bag module electrical connector locking clip, release the tab and disconnect the driver seat side air bag module electrical connector.



21. Install the RCM fuse 17 (10A) to the SJB .

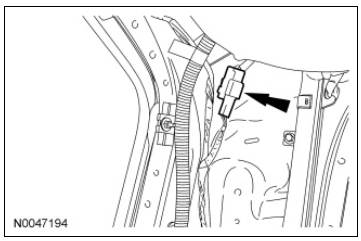
22. Connect the battery ground cable. For additional information, refer to Section 414-01 .

Reactivation



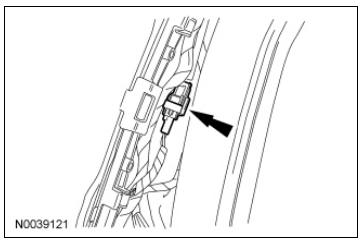
All vehicles

1. Remove the RCM fuse 17 (10A) from the SJB .
2. Disconnect the battery ground cable and wait at least one minute.
3. Connect the driver seat side air bag module electrical connector and engage the seat side air bag electrical connector locking clip.



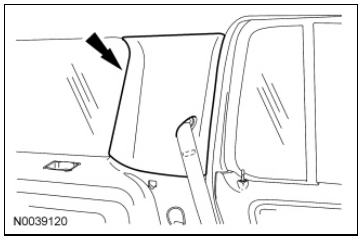
Explorer Sport Trac vehicles

4. Connect the driver side Safety Canopy® module electrical connector.



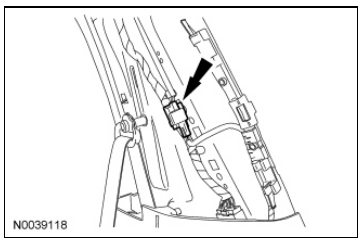
5. Connect the passenger side Safety Canopy® module electrical connector.

6. Install the driver and passenger upper C-pillar trim panels. For additional information, refer to Section 501-05 .

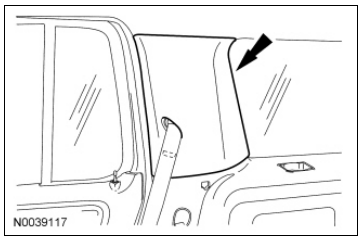


Explorer and Mountaineer vehicles

7. Connect the driver side Safety Canopy® module electrical connector.

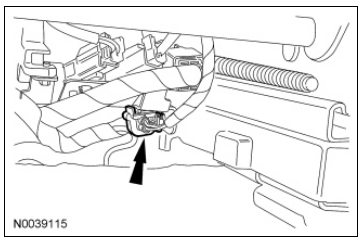


8. Install the driver side C-pillar trim panel.
    - Verify the safety belt retractor operates without excessive effort or binding.

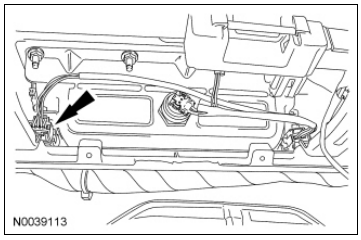


tomsn048@gmail.com

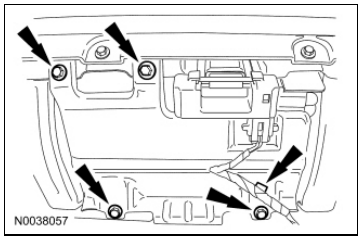
9. Connect the passenger side Safety Canopy® module electrical connector.



10. Install the passenger side C-pillar trim panel.
    - Verify the safety belt retractor operates without excessive effort or binding.

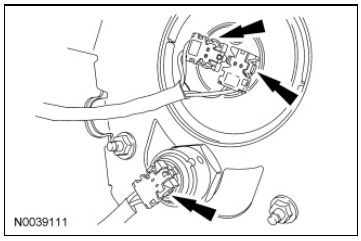


All vehicles

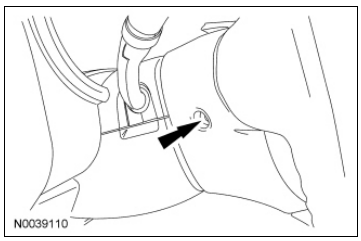


11. Connect the passenger seat side air bag module electrical connector and engage the seat side air bag electrical connector locking clip. Attach the passenger seat side air bag module electrical connector to the seat track bracket.

12. Connect the LH side passenger air bag module electrical connector.



13. Install the passenger air bag module heat shield and 4 bolts. Attach the wiring retainer.



14. ***NOTICE:*** **The driver air bag module electrical connectors are unique and cannot be reversed when connected to the driver air bag module. Match the electrical connector key to the keyway in the driver air bag module. Do not force the electrical connectors into the driver air bag module. Damage to the connector or component may occur.**

    Connect the driver air bag module electrical connectors as noted in removal.

15. Install the 2 driver air bag module bolts (1 shown).
    - Tighten to 7 Nm (62 lb-in).

16. Turn the ignition switch from OFF to ON.

17. Install RCM fuse 17 (10A) to the SJB and install the cover.

18. ⚠ **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

    Connect the battery ground cable.

19. Prove out the SRS as follows:
    Turn the ignition switch from ON to OFF. Wait 10 seconds, then turn the ignition switch back to ON and visually monitor the air bag warning indicator with the air bag modules installed. The air bag warning indicator will light continuously for approximately 6 seconds and then turn off. If an SRS fault is present, the air bag warning indicator will:
    - fail to light.
    - remain lit continuously.
    - flash at a 5 Hz rate (RCM not configured).

    The air bag warning indicator might not light until approximately 30 seconds after the ignition switch has been turned from the OFF to the ON position. This is the time required for the RCM to complete the testing of the SRS . If the air bag warning indicator is inoperative and an SRS fault exists, a chime will sound in a pattern of 5 sets of 5 beeps. If this occurs, the air bag warning indicator and any SRS

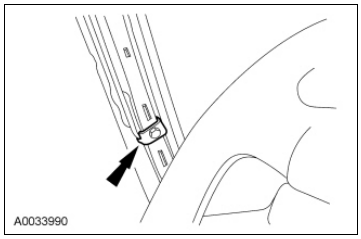
tomsn048@gmail.com

fault discovered must be diagnosed and repaired.
Clear all continuous DTCs from the RCM and Occupant Classification System Module (OCSM) using a scan tool.

Rivet Nut Replacement

⚠ WARNING: Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.

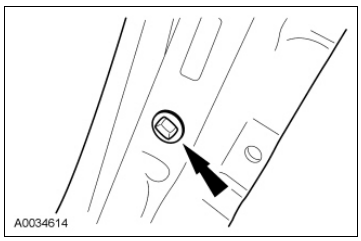
NOTICE: **If the Safety Canopy®/side air curtain module has deployed, the tether cord rivet nut must be inspected and replaced if damaged before installing a new Safety Canopy®.**



NOTE: A typical rivet nut replacement is shown that is similar for all vehicles.

NOTE: LH shown, RH similar.

1. Depower the Supplemental Restraint System (SRS). For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in this section.



2. Remove the necessary trim panel(s). For additional information, refer to Section 501-05 .

3. Remove the bolt and bracket for the tether cord (if present).

4. If needed, position and secure the Safety Canopy®/side air curtain tether cord and bracket assembly aside.

5. Using the appropriate service tool, sand the rivet nut shoulder until the shoulder surface is removed.

6. Punch the remaining portion of the rivet nut through the rivet nut hole.

7. **NOTE:** Use only Ford Motor Company factory-authorized replacement parts for rivet nut repair procedure.

   Obtain the correct square shank rivet nut for the vehicle application from the Ford Catalog AdvantageTM or equivalent and insert it into the rivet nut hole.

8. Using a suitable rivet nut installing tool, install the rivet nut. For additional information, refer to the tool manufacturer's operating instructions.

tomsn048@gmail.com

9. If present, position the tether cord. Install the bolt. See the appropriate component removal and installation procedure or Specifications for the correct torque specification.

10. **NOTE:** The tether cord must be positioned correctly in place before installing the A-pillar trim panel.

    Install the necessary trim panel(s). For additional information, refer to Section 501-05 .

Inspection and Repair After a Supplemental Restraint System (SRS) Deployment

⚠ **WARNING: Remove restraint system diagnostic tools from the vehicle prior to road testing. If tools are not removed, the supplemental restraint system (SRS) device may not deploy in a crash. Failure to follow this instruction may result in serious personal injury or death in a crash and possibly violate vehicle safety standards.**

NOTE: After diagnosing or repairing a Supplemental Restraint System (SRS), the restraint system diagnostic tools (if required) must be removed before operating the vehicle over the road.

NOTE: Deployable devices (such as air bag modules, pretensioners) may deploy alone or in various combinations depending on the impact event.

NOTE: Always refer to the appropriate workshop manual procedures prior to carrying out vehicle repairs affecting the SRS and safety belt system.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

All vehicles

1. **NOTE:** Refer to the correct removal and installation procedure for all SRS components being installed.

   When any deployable device or combination of devices have deployed and/or the Restraints Control Module (RCM) has DTC B1231/B1193:00 (Event Threshold Exceeded) in memory, the repair of the vehicle SRS is to include the removal of all deployed devices and the installation of new deployable devices, the removal and installation of new impact sensors and the removal and installation of a new RCM . DTCs must be cleared from all required modules after repairs are carried out.

Vehicles with Occupant Classification System (OCS) system

2. **NOTE:** After installation of new Occupant Classification System (OCS) components, carry out the Occupant Classification System (OCS) System Reset procedure as instructed in the workshop manual. Refer to the appropriate workshop manual for OCS system removal and installation procedure.

   When a vehicle has been involved in a collision and the Occupant Classification System Module (OCSM) has DTC B1231/B1193:00 stored in memory, the repair of the OCS system is to include the following procedures for the specified system:

   - For rail-type OCS system, inspect the passenger side floorpan for damage and repair as necessary. Install new OCS system rails. Do not install a new OCSM unless DTC B1231 cannot be cleared.
   - For weight sensor bolt-type OCS system, inspect the passenger side floorpan for damage and repair as necessary. Install a new seat track with OCS system weight sensor bolts. DTC must be cleared from the OCSM before carrying out Occupant Classification System (OCS) System Reset. Do not install a new OCSM unless DTC B1231/B1193:00 cannot be cleared.
   - For bladder-type OCS system, inspect for damage and repair as necessary. If installation of an OCS system component is required, an OCS system service kit must be installed.

All vehicles

tomsn048@gmail.com

3. When any damage to the impact sensor mounting points or mounting hardware has occurred, repair or install new mounting points and mounting hardware as needed.

4. When the driver air bag module has deployed, a new clockspring must be installed.

5. New driver and/or front passenger safety belt systems (including retractors, buckles and height adjusters) must be installed if the vehicle is involved in a collision that results in deployment of the driver and/or front passenger safety belt pretensioners. For additional information, refer to Section 501-20A .

6. Inspect the entire vehicle for damage, including the following components:
    - Steering column (deployable column if equipped)
    - Instrument panel knee bolsters and mounting points
    - Instrument panel braces and brackets
    - Instrument panel and mounting points
    - Seats and seat mounting points
    - Safety belts, safety belt buckles and safety belt retractors. For additional information, refer to Section 501-20A .
    - SRS wiring, wiring harnesses and connectors

7. After carrying out the review and inspection of the entire vehicle for damage, repair or install new components as needed.

Occupant Classification Sensor (OCS) System Reset

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

System Reset

⚠ WARNING: Make sure the front passenger seat is correctly installed and fastened to the vehicle. Do not force the alignment to the floorpan mounting holes. If the seat does not align to the floorpan mounting holes, repair the seat or floorpan as needed. Failure to follow these instructions may result in incorrect operation of the occupant classification system (OCS) and increase the risk of serious personal injury or death in a crash.

NOTE: The System Reset active command should only be carried out as directed by the workshop manual.

NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

1. **⚠ WARNING: The following precautions must be taken before carrying out the following procedure on the front passenger seat:**

    - Park the vehicle on level ground.
    - Make sure the occupant classification system (OCS) is stabilized at a temperature in the range of 5°C to 48°C (41°F to 118°F) and is not exposed to temperatures outside that range.
    - Make sure the front passenger seat is empty and dry.
    - Make sure the front passenger seat repair is complete and all attached components (head restraint, seat side shield) are correctly installed.
    - Make sure the front passenger seat occupant classification system (OCS) sensor rail shields are correctly installed.
    - Make sure nothing is placed in the map pockets (if equipped) of the front passenger seat.
    - Make sure nothing is underneath the front passenger seat.
    - Make sure the under-seat body wiring harness and seat wiring harness are not twisted or pinched between the electrical bracket and the No. 2 crossmember, or are not twisted or pinched between the electrical bracket and the floor.
    - Make sure no non-factory installed items (seat covers, DVD screens) are on or contacting the front passenger seat. If any non-factory items were installed to the seat, remove the item(s) and communicate to the customer that any alteration/modification to the front passenger seat may affect performance of the OCS. Refer to the Owner's Literature.
    - Make sure the seat is correctly installed in the vehicle.

    Failure to follow these instructions may result in incorrect operation of the OCS and increases the risk of serious personal injury or death in a crash.Make sure the front passenger seat is empty, there is nothing underneath the seat, remove any items from the seat that were not factory installed, and make sure that the seat is correctly installed in the vehicle.

tomsn048@gmail.com

2. Position the front passenger seat.
    - Position the seat in the middle of seat track travel.
    - Position the seat backrest in the most forward position.
    - Position the seat height to its lowest position (power seat only).

3. ⚠ **WARNING: Remove binding or resistance between all components of the front passenger seat as directed in the following procedure. Failure to follow this instruction may result in incorrect operation of the occupant classification system (OCS) and increases the risk of serious personal injury or death in a crash.**

   Remove hysteresis from the front passenger seat by firmly hitting the back of the seat head restraint 3 times.

4. ⚠ **WARNING: Make sure nothing is placed on the front passenger seat during the following procedure. Do not press, touch or lay anything on the front passenger seat until the following procedure has been completed. Failure to follow these instructions may result in incorrect operation of the occupant classification system (OCS) and increase the risk of serious personal injury or death in a crash.**

   NOTE: Make sure a minimum 8-second time period has passed after cycling the ignition ON before carrying out the System Reset active command.

   Turn the ignition ON, wait 8 seconds and carry out the System Reset active command using the scan tool.

5. **NOTE:** The ignition must be cycled after carrying out the System Reset active command.

   Cycle the ignition from ON to OFF.

6. ⚠ **WARNING: Make sure nothing is placed on the front passenger seat during the following procedure. Do not press, touch or lay anything on the front passenger seat until the following procedure has been completed. Failure to follow these instructions may result in incorrect operation of the occupant classification system (OCS) and increase the risk of serious personal injury or death in a crash.**

   NOTE: Make sure a minimum 8-second time period has passed after cycling the ignition ON before carrying out the Zero Seat Weight Test.

   Turn the ignition switch ON, wait 8 seconds and carry out the Zero Seat Weight Test using the scan tool.

    1. If the scan tool responds with system passed, the repair is complete. GO to Step 7.
    2. If the system did not pass (DTC C1941 Zero Seat Weight Test Failure reported), carry out the following steps.
        - ♦ Cycle the ignition OFF then ON, wait 8 seconds and carry out the System Reset active command using the scan tool.
        - ♦ Cycle the ignition OFF then ON and wait 8 seconds.
        - ♦ Carry out the Zero Seat Weight Test using the scan tool.
            - ♦ If the system passed, the repair is complete.
            - ♦ If the system did not pass (DTC C1941 Zero Seat Weight Test Failure reported), install 2 new Occupant Classification System (OCS) rails and carry out the System Reset procedure. For additional information, refer to Occupant Classification Sensor and Occupant Classification Sensor (OCS) System Reset in this section.

7. Prove out the SRS as follows:
   Turn the ignition from ON to OFF. Wait 10 seconds, then turn the ignition back to ON and visually monitor the air bag warning indicator with the air bag modules installed. The air bag warning indicator will light continuously for approximately 6 seconds and then turn off. If an air bag SRS fault is present, the air bag warning indicator will:
   - fail to light.
   - remain lit continuously.
   - flash at a 5 Hz rate (Restraints Control Module (RCM) not configured).
   The air bag warning indicator might not light until approximately 30 seconds after the ignition has been turned from the OFF to the ON position. This is the time required for the RCM to complete the testing of the SRS . If the air bag warning indicator is inoperative and a SRS fault exists, a chime will sound in a pattern of 5 sets of 5 beeps. If this occurs, the air bag warning indicator and any SRS fault discovered must be diagnosed and repaired.
   Clear all continuous DTCs from the RCM and Occupant Classification System Module (OCSM).

---

tomsn048@gmail.com

Occupant Classification Sensor (OCS) System Zero Seat Weight Test

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Zero Seat Weight Test

⚠ WARNING: Make sure nothing is placed on the front passenger seat during the following procedure. Do not press, touch or lay anything on the front passenger seat until the following procedure has been completed. Failure to follow these instructions may result in incorrect operation of the occupant classification system (OCS) and increase the risk of serious personal injury or death in a crash.

NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

1. **⚠ WARNING: The following precautions must be taken before carrying out the following procedure on the front passenger seat:**

    - Park the vehicle on level ground.
    - Make sure the occupant classification system (OCS) is stabilized at a temperature in the range of 5°C to 48°C (41°F to 118°F) and is not exposed to temperatures outside that range.
    - Make sure the front passenger seat is empty and dry.
    - Make sure the front passenger seat repair is complete and all attached components (head restraint, seat side shield) are correctly installed.
    - Make sure the front passenger seat occupant classification system (OCS) sensor rail shields are correctly installed.
    - Make sure nothing is placed in the map pockets (if equipped) of the front passenger seat.
    - Make sure nothing is underneath the front passenger seat.
    - Make sure the under-seat body wiring harness and seat wiring harness are not twisted or pinched between the electrical bracket and the No. 2 crossmember, or are not twisted or pinched between the electrical bracket and the floor.
    - Make sure no non-factory installed items (seat covers, DVD screens) are on or contacting the front passenger seat. If any non-factory items were installed to the seat, remove the item(s) and communicate to the customer that any alteration/modification to the front passenger seat may affect performance of the OCS. Refer to the Owner's Literature.
    - Make sure the seat is correctly installed in the vehicle.

   Failure to follow these instructions may result in incorrect operation of the OCS and increases the risk of serious personal injury or death in a crash.Make sure the front passenger seat is empty, there is nothing underneath the seat, remove any items from the seat that were not factory installed, and make sure that the seat is correctly installed in the vehicle.

2. Position the front passenger seat.
    - Position the seat in the middle of seat track travel.

- Position the seat backrest in the most forward position.
- Position the seat height to its lowest position (power seat only).

3. ⚠ **WARNING: Remove binding or resistance between all components of the front passenger seat as directed in the following procedure. Failure to follow this instruction may result in incorrect operation of the occupant classification system (OCS) and increases the risk of serious personal injury or death in a crash.**

   Remove hysteresis from the front passenger seat by firmly hitting the back of the seat head restraint 3 times.

4. **NOTE:** Make sure a minimum 8-second time period has passed after cycling the ignition ON before carrying out the Zero Seat Weight Test.

   NOTE: If the scan tool responds with system passed, do not carry out the System Reset active command.

   Cycle the ignition ON, wait 8 seconds and carry out the Zero Seat Weight Test using the scan tool.

   - If the system passed, the repair is complete. GO to Step 7.
   - If the system did not pass (DTC C1941 Zero Seat Weight Test Failure reported), repeat Steps 1 through 4. If the system did not pass the second Zero Seat Weight Test, proceed to the next step.

5. **NOTE:** Make sure a minimum 8-second time period has passed after cycling the ignition ON before carrying out the Zero Seat Weight Test.

   Cycle the ignition OFF then ON, wait 8 seconds and carry out the System Reset active command using the scan tool.

6. Cycle the ignition switch OFF then ON, wait 8 seconds and carry out the Zero Seat Weight Test using the scan tool.
   - If the system passed, the repair is complete. Proceed to Step 7.
   - If the system did not pass (DTC C1941 Zero Seat Weight Test Failure reported), install 2 new OCS rails and carry out the System Reset procedure. For additional information, refer to Occupant Classification Sensor and Occupant Classification Sensor (OCS) System Reset in this section.

7. Prove out the SRS as follows:
   Turn the ignition switch from ON to OFF. Wait 10 seconds, then turn the ignition switch back to ON and visually monitor the air bag warning indicator with the air bag modules installed. The air bag warning indicator will light continuously for approximately 6 seconds and then turn off. If an air bag SRS fault is present, the air bag warning indicator will:
   - fail to light.
   - remain lit continuously.
   - flash at a 5 Hz rate (Restraints Control Module (RCM) not configured).

   The air bag warning indicator might not light until approximately 30 seconds after the ignition has been turned from the OFF to the ON position. This is the time required for the RCM to complete the testing of the SRS . If the air bag warning indicator is inoperative and a SRS fault exists, a chime will sound in a pattern of 5 sets of 5 beeps. If this occurs, the air bag warning indicator and any SRS fault discovered must be diagnosed and repaired.
   Clear all continuous DTCs from the RCM and Occupant Classification System Module (OCSM).

tomsn048@gmail.com

Pyrotechnic Device Disposal

Disposal of Deployable Devices and Pyrotechnic Devices That are Undeployed/Inoperative

NOTE: All inoperative air bag modules and safety belt pretensioners have been placed on the Mandatory Return List. All discolored or damaged air bag modules must be treated the same as any inoperative live air bag being returned.

1. Depower the Supplemental Restraint System (SRS). For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

2. Remove the undeployed/inoperative device. For additional information, refer to the appropriate procedure in this section or Section 501-20A .

3. **NOTE:** When installing a new air bag module, a prepaid return postcard is provided with the replacement air bag module. The serial number for the new part and the Vehicle Identification Number (VIN) must be recorded and sent to Ford Motor Company.

   If installing a new air bag module, record the necessary information and return the inoperative air bag module to Ford Motor Company.

Disposal of Deployable Devices and Pyrotechnic Devices That Are Deployed

1. Depower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

2. Remove the deployed device. For additional information, refer to the appropriate procedure in this section or Section 501-20A .

3. **NOTE:** If a dual stage driver or passenger air bag module has deployed due to a crash event, the air bag module requires manual deployment to make sure both stages have deployed before scrapping the vehicle or disposing of the air bag module. To determine if a vehicle is equipped with dual stage driver or passenger air bag modules, refer to the Description and Operation portion of this section.

   Dispose of the deployed device in the same manner as any other part to be scrapped.

Disposal of Deployable Devices and Pyrotechnic Devices That Require Manual Deployment

1. Safety and environmental concerns require consideration and treatment of restraints system deployable and pyrotechnic devices when disposing of vehicles, deployable devices or pyrotechnic devices. Deploying deployable and pyrotechnic devices before scrapping a vehicle or the device eliminates the potential for hazardous exposures or reactions during processing. If special handling procedures are followed, deployable and pyrotechnic devices can be deployed safely and recycled with the vehicle, shipped separately to a recycling facility or disposed of safely.

tomsn048@gmail.com

NOTE: To determine the deployable devices a vehicle is equipped with, refer to the Description and Operation portion of this section.

A vehicle equipped with any of the following deployable devices requires manual deployment of the devices before scrapping the vehicle or component. For additional information, refer to the appropriate portion of this procedure.

- Driver air bag module
- Passenger air bag module
- Seat side air bag modules
- Safety Canopy® modules
- Side air curtain modules

2. **NOTE:** To determine the pyrotechnic devices a vehicle is equipped with, refer to the Description and Operation portion of this section.

   A vehicle equipped with any of the following pyrotechnic devices requires manual deployment of the devices before scrapping the vehicle or component. For additional information, refer to the appropriate portion of this procedure.

   - Safety belt buckle pretensioners
   - Safety belt retractor pretensioners
   - Adaptive load-limiting retractors
   - Deployable steering column

3. **NOTE:** To determine if a vehicle is equipped with dual stage driver or passenger air bag modules, refer to the Description and Operation portion of this section.

   If a dual stage driver or passenger air bag module has deployed due to a crash event, the air bag module requires manual deployment to make sure both stages have deployed before scrapping the vehicle or disposing of the air bag module. For additional information, refer to Driver Air Bag Module, Passenger Air Bag Module and Seat Side Air Bag Modules - Remote Deployment in this procedure.

Driver Air Bag Module, Passenger Air Bag Module and Seat Side Air Bag Modules - Remote Deployment

⚠ WARNING: Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

⚠ WARNING: Always carry or place a live air bag module with the air bag and deployment door/trim cover/tear seam pointed away from the body. Do not set a live air bag module down with the deployment door/trim cover/tear seam face down. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

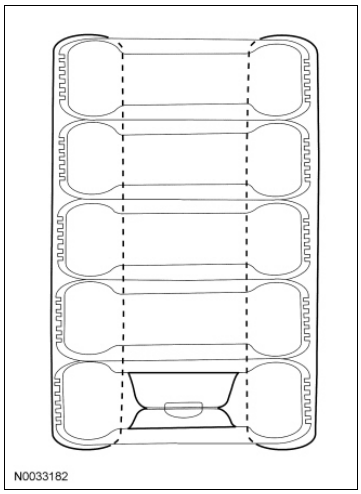
⚠ WARNING: Always carry or place a live Safety Canopy®, or side air curtain module, with the module and tear seam pointed away from your body. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.

⚠ WARNING: Deploy all supplemental restraint system (SRS) devices (air bags, pretensioners, load limiters, etc.) outdoors with all personnel at least 9.14 meters (30 feet) away to make sure of personal safety. Due to the loud report which occurs when an SRS device is deployed, hearing protection is

required. Failure to follow these instructions may result in serious personal injury.

NOTE: For air bag modules with multiple loops, all the loops on the air bag module must be deployed.

NOTE: Some driver and passenger front air bags have 2 deployment stages. After a collision it is possible that Stage 1 has deployed and Stage 2 has not.



If a front air bag module has deployed, it is **mandatory** that the front air bag module be remotely deployed using the appropriate air bag disposal procedure.

NOTE: A typical air bag disposal is shown that is similar for all vehicles.

All driver, passenger and seat side air bag modules

1. Make a container to house the air bag module for deployment.
   - **NOTE:** The tires must be of sufficient size to accommodate the air bag module.

     Obtain a tire and wheel assembly and an additional 4 tires (without wheels) of the same size.
   - With the tire and wheel assembly on the bottom, stack the tires.
   - Securely tie all of the tires together.

2. Depower the SRS . For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of this section.

3. Remove the air bag module. For additional information, refer to the appropriate procedure in this section.

4. **NOTE:** If the air bag module does not have a hard-wired pigtail, it will be necessary to cut the wires and connector(s) from the vehicle wire harness and reconnect to the air bag module.

   Cut each of the air bag module wires near the electrical connector that connects to the vehicle wire harness.

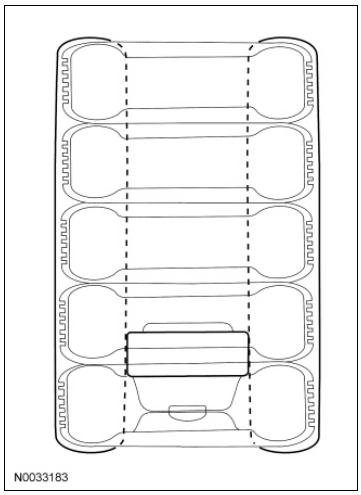
5. Remove any sheathing (if present) and strip the insulation from the ends of the cut wires.

6. **NOTE:** Typical driver air bag module with 2 loops shown, other air bag modules with multiple loops similar.

   For air bag modules with multiple loops, twist together a wire from each loop then repeat for the remaining wires from each loop.

tomsn048@gmail.com

7. Make a jumper harness to deploy the air bag module.
    - Obtain 2 wires (20 gauge minimum) at least 9.14 m (30 ft) long and strip both ends of each wire.
    - At one end of the jumper harness, connect the wires together.

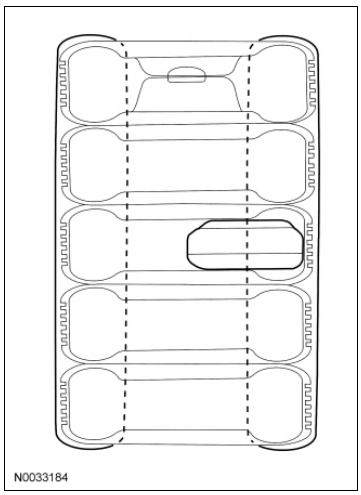


8. Using the end of the jumper harness where the wires are not connected together, attach each wire of the jumper harness to each wire of the air bag module or to the twisted-together wires if multiple loops. Use tape or other insulating material to make sure that the leads do not make contact with each other.

Driver air bag modules

9. **NOTE:** Make sure to maintain the connections to the air bag module.

    With the stack of tires upright and the wheel on the bottom, carefully place the driver air bag module, with the trim cover facing up, on the wheel.



Passenger and seat side air bag modules

10. **NOTE:** Make sure to maintain the connections to the air bag module.

    Tip the stack of tires on its side and place the air bag module inside the center tire, making sure that there are 2 tires beneath the tire containing the air bag module and 2 tires (including the tire and wheel assembly) above the tire containing the air bag module.

11. Place the tire stack upright, with the wheel on top.

All driver, passenger and seat side air bag modules

12. Remain at least 9.14 m (30 ft) away from the air bag module.

13. From the end of the jumper harness that is not connected to the air bag module, disconnect the 2 wires of the jumper harness from each other.

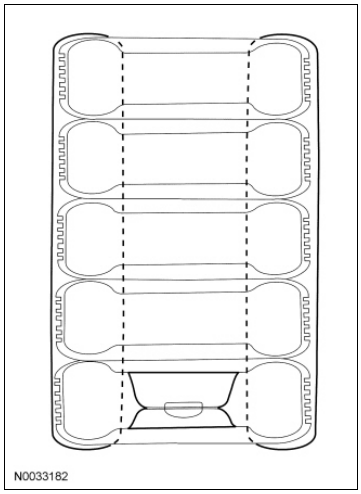
14. Deploy the air bag module by touching the ends of the 2 wires of the jumper harness to the terminals of a 12-volt battery.

15. To allow for cooling, wait at least 10 minutes before approaching the deployed air bag module.

16. Dispose of the deployed air bag module in the same manner as any other part to be scrapped.

Safety Belt Buckle Pretensioners, Safety Belt Retractor Pretensioners and Adaptive Load Limiting Safety Belt Retractors - Remote Deployment

⚠ WARNING: Never disassemble or tamper with safety belt buckle/retractor pretensioners, adaptive load limiting retractors, safety belt inflators, or probe the electrical connectors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners, adaptive load limiting retractors, or safety belt inflators, which increases the risk of serious personal injury or death.



⚠ WARNING: Deploy all supplemental restraint system (SRS) devices (air bags, pretensioners, load limiters, etc.) outdoors with all personnel at least 9.14 meters (30 feet) away to make sure of personal safety. Due to the loud report which occurs when an SRS device is deployed, hearing protection is required. Failure to follow these instructions may result in serious personal injury.

NOTE: A typical safety belt buckle and retractor disposal is shown that is similar for all vehicles.

1. Make a container to house the safety belt buckle or retractor for deployment.
   - **NOTE:** The tires must be of sufficient size to accommodate the safety belt buckle or retractor.
