These items, if not installed correctly, will affect the PCM or transmission function. Pay particular attention to add-on wiring splices in the PCM harness or transmission wiring harness, abnormal tire size or axle ratio changes.

- Leaks; refer to Leakage Inspection in this section.
- Correct selector lever linkage adjustments; refer to Section 307-05 .

Selector Lever Linkage Check

Check for a misadjustment in selector lever linkage by matching the detents in the selector lever with those in the transmission. If they match, the misadjustment is in the indicator. Do not adjust the selector lever linkage.

Hydraulic leakage at the manual control valve can cause delay in engagements and/or slipping while operating if the selector lever linkage is not correctly adjusted. Refer to Section 307-05 for selector lever linkage adjustment.

Check TSBs

Refer to all TSBs which pertain to the transmission concern and follow the procedure as described.

Carry Out On-Board Diagnostic (OBD) Key ON Engine OFF (KOEO), Key ON Engine Running (KOER)

After a road test, with the vehicle warm and before disconnecting any connectors, carry out the Self Test procedure. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the powertrain control system.

Diagnostics

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Diagnosing electronically controlled automatic transmissions is simplified using the following procedures. It is important to remember that there is a definite procedure to follow. Do not take shortcuts or assume that critical checks or adjustments have already been made. Follow the procedures as written to avoid missing critical components or steps. By following the diagnostic sequence, the technician will be able to diagnose and repair the concern the first time.

On-Board Diagnostics with Scan Tool

NOTE: For detailed instruction and other diagnostic methods using the scan tool, refer to the scan tool tester and the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

These self-tests should be used to diagnose the PCM and should be carried out in order.

- Self Test - Key ON Engine OFF (KOEO)
- Self Test - Continuous Memory
- Self Test - Key ON Engine Running (KOER)
- PCM Reset Mode
- Clearing DTCs
- On-Board Diagnostic (OBD) Drive Cycle

For further information on other diagnostic testing features, refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Diagnostic Parameters Identification (PID) Chart

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Using Output State Control and Accessing PIDs

To confirm that the output state control value was sent by the scan tool and the PCM has accepted the output state control substitution, a corresponding PID for each output state control parameter must be monitored. Additional PIDs should be monitored to help the technician adequately diagnose the transmission.

To confirm that the output state control substitution occurred, select the output state control value and monitor the corresponding PID value. If no ERROR MESSAGE was received and the value of the corresponding PID is the same as the value sent from output state control, then the output state control substitution was successful.

PID Name	Description	Units
APP	Accelerator Pedal Position (APP)	Percent
APP1	APP 1	Volts 0 to 5
APP2	APP 2	Volts 0 to 5
APP3	APP 3	Volts 0 to 5
BOO	Brake On/Off	On/Off
BPA	Brake pedal applied	On/Off
CPP/PNP	Clutch Pedal Position (CPP)/park neutral position	Neutral/Drive
DTC CMT	DTC Count	Number
ECT	Engine Coolant Temperature (ECT)	Temp/Voltage (0-5)
ETC_ACT	Electronic Throttle Control Actual	Angle (0-100 degrees)
ETC_DSD	Electronic Throttle Control (ETC) Desired	Angle (0-100 degrees)
GEAR#	Gear Commanded by module	1, 2, 3, 4 or 5
GEAR_MAX	Highest gear available for vehicle speed	1, 2, 3, 4 or 5
GEAR_RAT	Gear ratio	Ratio (0-5:1)
HRSH_SHFT#	Firm shift	On/Off
IAT	Intake Air Temperature (IAT)	Volts 0-5/Temp
ISS_SRC	Intermediate shaft speed	rpm 0-5,000
LOAD	Engine load	Percent 0-100
OSSFM	Output Shaft Speed (OSS) failure mode	Fault/No Fault

OSS_SRC	Unfiltered output speed failure mode	rpm 0-5,000
PCA	Pressure Control Solenoid A (PCA) (solenoid commanded pressure)	kPa/psi 0-3447/0-500
PCA AMP	PCA current	Current 0-1 amp
PCA_F	PCA fault	Fault/No Fault
PCB#	Pressure Control Solenoid B (PCB) (solenoid commanded pressure)	kPa/psi 0-3447/0-500
PCB AMP	PCB current	Current 0-1 amp
PCB_F	PCB fault	Fault/No Fault
PCC#	Pressure Control Solenoid C (PCC) (solenoid commanded pressure)	kPa/psi 0-3447/0-500
PCC AMP	PCC current	Current 0-1 amp
PCC_F	PCC fault	Fault/No Fault
PCFM	Pressure control failure mode	Fault/No Fault
RPM#	Engine revolutions per minute	rpm 0-5,000
SCCS	Speed control commanded switch	Volts 0-10/Mode
SHFT_TYPE	Shift type (selector lever range)	PRND321
SSA/SS1#	Shift Solenoid A (SSA) command	On/Off
SSA/SS1F	SSA fault	Fault/No Fault
SSB/SS2#	Shift Solenoid B (SSB) command	On/Off
SSB/SS2F	SSB fault	Fault/No Fault
SSC/SS3#	Shift Solenoid C (SSC) command	On/Off
SSC/SS3F	SSC fault	Fault/No Fault
SSD/SS4#	Shift Solenoid D (SSD) command	On/Off
SSD/SS4F	SSD fault	Fault/No Fault
TCC#	Torque Converter Clutch (TCC) modulated	Mode 0-100% On/Off
TCCFM	Torque convertor unlocking due to slipping	Fault/No Fault
TCC_F	TCC fault	Fault/No Fault
TCC_OT	Transmission over temperature	Fault/No Fault
TCC_RAT	Transmission slip ratio (engine speed compared with turbine shaft speed)	Ratio 0-5
TCIL	Transmission Control Indicator Lamp (TCIL)	On/Off
TCS	Transmission Control Switch (TCS) Overdrive (O/D) cancel/hold switch	On/Off
TCSLIP_ABSL	Absolute value of slip	rpm 0-2,000
TCCSLIPP ACT	Torque convertor slip actual	rpm (-100-4,000)
TC_SLIPDSD	Torque convertor slip desired	rpm 0-2,000
TFT	Transmission Fluid Temperature (TFT)	Volts 0-5/Temp
TFT_F	TFT status	Fault/No Fault
TORQUE	Net engine torque	Newton Meter -150/500
TP1	Throttle Position (TP) sensor 1	Volts 0-5
TP2	TP sensor 2	Volts 0-5
TR	Transmission Range (TR) switch	Mode PRN(D)321
TR1	TR 1	Open/Closed
TR2	TR 2	Open/Closed

TR3	TR 3	Open/Closed
TR_V	TR 3	Volts 0-5
TR4	TR 4	Open/Closed
TRAN_RAT	Transmission gear ratio	Ratio (0-6:1)
TRIP CNT	Number of On-Board Diagnostic (OBD) trips completed	Number
TR_F	TR status	Fault/No Fault
TSS	Turbine Shaft Speed (TSS)	rpm 0-5,000
TSSFM	TSS failure mode	Fault/No Fault
TSS_SRC	Unfiltered TSS	rpm 0-5,000
VPWR	Module supply voltage	Volts 10-16V
VSS	Vehicle Speed Sensor (VSS)	SPD 0-128 km/h 0-80 mph
VSS_FM	VSS signal status	Fault/No Fault

Transmission Drive Cycle Test

NOTE: Always drive the vehicle in a safe manner according to driving conditions and obey all traffic laws.

NOTE: The Transmission Drive Cycle Test must be followed exactly. Transmission failure must occur 4 times consecutively for shift error DTC to be set and 5 times consecutively for continuous Torque Converter Clutch (TCC) DTCs to set.

NOTE: When carrying out the Transmission Drive Cycle Test, use the Solenoid Operation Chart for proper solenoid operation. Refer to Pinpoint Tests - OSC Equipped Vehicle in this section.

After carrying out the Self Test, use the Transmission Drive Cycle Test for checking continuous codes.

1. Record and then clear Self Test codes.
2. Warm engine to normal operating temperature.
3. Make sure transmission fluid level is correct.
4. With the selector lever in (D) position, moderately accelerate from stop to 80 km/h (50 mph). This allows the transmission to shift into 5th gear. Hold speed and throttle open steady for a minimum of 15 seconds.
5. With transmission in 5th gear and maintaining steady speed and throttle opening, lightly apply and release the brake to operate the stop lamps. Then hold speed and throttle steady for a minimum of 5 seconds.
6. Brake to a stop and remain stopped for a minimum of 20 seconds.
7. Repeat Steps 4 through 6 at least 5 times.
8. Carry out Self Test and record continuous DTCs.

After On-Board Diagnostic (OBD)

NOTE: The vehicle wiring harness, PCM and non-transmission sensors may affect transmission operations. Repair these concerns first.

After the On-Board Diagnostic (OBD) procedures are completed, repair all DTCs.

Begin with non-transmission related DTCs, then repair any transmission related DTCs. Refer to the Diagnostic Trouble Code (DTC) Charts in this section for information on condition and symptoms. This chart will be helpful in referring to the correct manual(s) in diagnosing internal transmission concerns and external non-transmission inputs. The pinpoint tests are used in diagnosing transmission electrical concerns. Make sure that the vehicle wiring harness and the PCM are diagnosed as well. The Powertrain Control/Emissions Diagnosis (PC/ED) manual will aid in diagnosing non-transmission electronic components.

Before Pinpoint Tests

NOTE: Prior to entering pinpoint tests, check the PCM wiring harness and in-line connectors for correct connections, bent or broken terminals, corrosion, loose wires, correct routing, correct seals and their condition. Check the PCM, sensors and actuators for damage. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

NOTE: If a concern still exists after electrical diagnosis, refer to Diagnosis By Symptom in this section.

If DTCs appear while carrying out the OBD tests, refer to the Diagnostic Trouble Code (DTC) Charts in this section for the appropriate repair procedure. Prior to entering pinpoint tests, refer to any TSBs for transmission concerns.

Diagnostic Trouble Code (DTC) Charts

DTC Chart

**May also be generated by some other non-electric transmission hardware system.					
*Output circuit check, generated only by electrical symptoms.					
DTC	**Component**	**Description**	**Condition**	**Symptom**	**Action**
P0102, P0103, P1100, P1101	Mass Air Flow (MAF) sensor	MAF sensor concerns	MAF system inoperative which may cause a transmission concern.	High/low Electronic Pressure Control (EPC) pressure, incorrect shift schedule. Incorrect Torque Converter Clutch (TCC) engagement scheduling. Symptoms similar to a Throttle Position (TP) sensor failure.	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P0112	Intake Air Temperature (IAT) sensor	IAT sensor indicates 125°C (254°F) (grounded)	Voltage drop across IAT sensor exceeds scale set for temperature 125°C (254°F).	Incorrect EPC pressure. Either high or low which will result in harsh or soft shifts.	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P0113	IAT sensor	IAT sensor indicates -40°C (-40°F) (open circuit)	Voltage drop across IAT sensor exceeds scale set for temperature -40°C (-40°F).	Incorrect EPC pressure. Either high or low which will result in harsh or soft shifts.	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P0114	IAT sensor	IAT sensor out of On-Board Diagnostic (OBD) range	IAT sensor temperature higher or lower than expected during Key ON Engine OFF (KOEO) and Key ON Engine Running (KOER).	Rerun OBD test at normal operating temperature.	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P0117	Engine Coolant Temperature (ECT) sensor	ECT sensor indicates 125°C (254°F)	Voltage drop across ECT sensor exceeds scale set for temperature 125°C (254°F) (grounded).	TCC will always be OFF, resulting in reduced fuel economy.	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P0118	ECT	ECT sensor indicates -40°C (-40°F)	Voltage drop across ECT sensor exceeds scale set for temperature -40°C (-40°F) (open	TCC will always be OFF, resulting in reduced fuel economy.	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

			circuit).		
P0121, P0122, P0123, P1120, P1121, P1125, P1124	TP sensor	TP sensor concern	PCM has detected an error. This error may cause a transmission concern.	Harsh engagements, firm shift feel, abnormal shift schedule, TCC does not engage. TCC cycling.	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P0121- P0124, P0221- P0224, P2100- P2107, P2110- P2112, P2121- P2124, P2126- P2129, P2121- P2135, P2138- P2140	Accelerator Pedal Position (APP) sensor	APP sensor concern	PCM has detected an error. This error may cause a transmission concern.	Harsh engagements, firm shift feel, abnormal shift schedule, TCC does not engage. TCC cycling.	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P0300- P0308, P0320, P0340, P1351- P1364	Electronic Ignition (EI)	EI concerns	EI system is inoperative which may cause a transmission concern.	Harsh engagements and shifts, late Wide Open Throttle (WOT) shifts, no TCC engagement.	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P0500, P0503, U1039	ABS	Insufficient Vehicle Speed Sensor (VSS) input from ABS through the communication link	PCM detected a loss of VSS signal through the communication link from ABS.	No transmission symptom. Instrument Cluster (IC) speedometer may be affected.	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P0705	Transmission Range (TR) sensor	TR sensor circuit failure	TR circuits, indicating an invalid pattern in TR_D. Condition caused by a short to ground or an open in TR 4, TR	Harsh engagements or wrong gear commanded. Defaults to (D) or invalid position.	GO to Pinpoint Test C .

			3, TR 2 and or TR 1 circuits. This DTC cannot be set by an incorrectly adjusted TR sensor.		
P0708	TR sensor	TR sensor circuit TR 3 open	TR sensor circuit TR 3 reading 2.6V - 5.0V (open circuit). This DTC cannot be set by an incorrectly adjusted TR sensor.	Harsh engagements or wrong gear commanded. Defaults to (D) or invalid position.	GO to Pinpoint Test C .
P0711	Transmission Fluid Temperature (TFT) sensor	No change in TFT sensor	PCM has detected no TFT sensor change during operation.	DTC is set.	GO to Pinpoint Test B .
P0712	TFT	157°C (315°F) indicated TFT sensor circuit grounded	Voltage drop across TFT sensor exceeds scale set for temperature of 157°C (315°F).	DTC is set.	GO to Pinpoint Test B .
P0713	TFT	-40°C (-40°F) indicated TFT sensor circuit open	Voltage drop across TFT sensor exceeds scale set for temperature -40°C (-40°F).	DTC is set.	GO to Pinpoint Test B .
P0715	Turbine Shaft Speed (TSS) sensor	Insufficient input from TSS sensor	PCM detected a loss of TSS signal during operation.	-	GO to Pinpoint Test E .
P0717	TSS	Insufficient input from TSS sensor	PCM detected a loss of TSS signal during operation.	-	GO to Pinpoint Test E .
P0718	TSS	TSS sensor signal noisy	PCM has detected a noisy TSS sensor signal.	-	GO to Pinpoint Test E .
P0720	Output Shaft Speed (OSS)	Insufficient input from OSS sensor	PCM detected a loss of OSS sensor signal during operation.	Abnormal shift schedule, harsh shifts.	GO to Pinpoint Test E .
P0721	OSS	OSS sensor signal noisy	PCM has detected an erratic OSS sensor signal.	Abnormal shift schedule, harsh shifts.	GO to Pinpoint Test E .
P0722	OSS	Insufficient input from OSS sensor	PCM detected a loss of OSS sensor signal during operation.	Abnormal shift schedule, harsh shifts.	GO to Pinpoint Test E .
P0731**	Shift Solenoid A (SSA), Shift Solenoid B (SSB), Shift Solenoid C (SSC) or internal parts	1st gear ratio error	1st gear, not commanded.	Correct gear ratio not achieved for commanded gear. Shift errors may also be due to other transmission concerns (stuck	REFER to Diagnosis By Symptom in this section.

				valves, damaged friction material). Engine rpm could be higher or lower than expected.	
P0732**	SSA , SSB , SSC or internal parts	2nd gear ratio error	2nd gear not commanded.	Correct gear ratio not achieved for commanded gear. Shift errors may also be due to other transmission concerns (stuck valves, damaged friction material). Engine rpm could be higher or lower than expected.	REFER to Diagnosis By Symptom in this section.
P0733**	SSA , SSB , SSC or internal parts	3rd gear ratio error	3rd gear not commanded.	Correct gear ratio not achieved for commanded gear. Shift errors may also be due to other transmission concerns (stuck valves, damaged friction material). Engine rpm could be higher or lower than expected.	REFER to Diagnosis By Symptom in this section.
P0734**	SSA , SSB , SSC or internal parts	4th gear ratio error	4th gear not commanded.	Correct gear ratio not achieved for commanded gear. Shift errors may also be due to other transmission concerns (stuck valves, damaged friction material). Engine rpm could be higher or lower than expected.	REFER to Diagnosis By Symptom in this section.
P0735	SSA , SSB , SSC , Shift Solenoid D (SSD) or internal parts	5th gear ratio error	5th gear not commanded.	Correct gear ratio not achieved for commanded gear. Shift errors may also be due to other transmission concerns (stuck valves, damaged friction material). Engine rpm could be higher or lower than expected.	REFER to Diagnosis By Symptom in this section.

P0740*	TCC solenoid	TCC solenoid circuit failure during OBD test	TCC solenoid circuit fails to provide voltage drop across solenoid. Circuit open or shorted or PCM driver failure during OBD test.	Open or short to battery power: harsh shifts or engagements, engine rpm higher than expected. Short to ground: Engine will stall when in a Drive gear at idle, harsh shifts or engagements, engine rpm lower than expected.	GO to Pinpoint Test A .
P0741**	TCC solenoid	TCC solenoid circuit error or stuck OFF	The PCM picked up an excessive amount of TCC slippage during normal vehicle operation.	Stuck OFF: harsh shifts or engagements, no TCC operation. Engine rpm may be higher than expected.	GO to Pinpoint Test A . REFER to Diagnosis By Symptom in this section.
P0743*	TCC solenoid	TCC solenoid circuit failure during OBD test	TCC solenoid circuit fails to provide voltage drop across solenoid. Circuit open or shorted or PCM driver failure during OBD test.	Open or short to battery power: harsh shifts or engagements, engine rpm higher than expected. Short to ground: Engine will stall when in a Drive gear at idle, harsh shifts or engagements, engine rpm lower than expected.	GO to Pinpoint Test A .
P0745	Pressure Control Solenoid A (PCA)	PCA or circuit fault	PCA functional fault - low pressure.	Incorrect shift pattern indicating mechanical or hydraulic failure of the transmission.	REFER to Diagnosis By Symptom in this section.
P0748	PCA	PCA solenoid inoperative	Electrical failure of the solenoid detected.	Possible slip in gear and/or 3rd gear ratio.	GO to Pinpoint Test D .
P0750*	SSA	SSA circuit failure	SSA circuit failed to provide voltage drop across solenoid. Circuit open or shorted or PCM driver failure during OBD test.	Open or short to battery power: 1st gear ratio incorrect or no gear ratio errors, no 1st gear. Short to ground: no 4th or 5th gear.	GO to Pinpoint Test A .
P0753*	SSA	SSA circuit failure	SSA circuit failed to provide voltage drop across	Open or short to battery power: 1st gear ratio incorrect	GO to Pinpoint Test A .

			solenoid. Circuit open or shorted or PCM driver failure during OBD test.	or no gear ratio errors, no 1st gear. Short to ground: no 4th or 5th gear.	
P0755*	SSB	SSB circuit failure	SSB circuit failed to provide voltage drop across solenoid. Circuit open or shorted or PCM driver failure during OBD test.	Open or short to battery power: no 3rd gear. Short to ground: no 1st gear.	GO to Pinpoint Test A .
P0758*	SSB	SSB circuit failure	SSB circuit failed to provide voltage drop across solenoid. Circuit open or shorted or PCM driver failure during OBD test.	Open or short to battery power: no 3rd gear. Short to ground: no 1st gear.	GO to Pinpoint Test A .
P0760*	SSC	SSC circuit failure	SSC circuit failed to provide voltage drop across solenoid. Circuit open or shorted or PCM driver failure during OBD test.	Open or short to battery power: 2nd and 5th gear ratio incorrect. Short to ground: 1st gear ratio incorrect or no gear ratio errors.	GO to Pinpoint Test A .
P0763*	SSC	SSC circuit failure	SSC circuit failed to provide voltage drop across solenoid. Circuit open or shorted or PCM driver failure during OBD test.	Open or short to battery power: 2nd and 5th gear ratio incorrect. Short to ground: 1st gear ratio incorrect or no gear ratio errors.	GO to Pinpoint Test A .
P0765	SSD	SSD circuit failure	SSD circuit failed to provide voltage drop across solenoid. Circuit shorted to ground or PCM driver circuit failure during OBD test.	Short to ground: No engine braking. Open or short to voltage, engine braking in 1st auto only.	GO to Pinpoint Test A .
P0768	SSD	SSD circuit failure	SSD circuit failed to provide voltage drop across solenoid. Circuit shorted to ground or PCM driver circuit failure during OBD test.	Short to ground: No engine braking. Open or short to voltage, engine braking in 1st auto only.	GO to Pinpoint Test A .
P0775	Pressure Control Solenoid B (PCB)	PCB or circuit fault	PCB functional fault - low pressure.	Incorrect shift pattern indicating mechanical or hydraulic failure of the transmission.	REFER to Diagnosis By Symptom in this section.

P0778	PCB	PCB inoperative	Electrical failure of the solenoid detected.	No 2nd and 5th gear.	GO to Pinpoint Test D .
P0791	Intermediate shaft speed sensor	Insufficient input from the intermediate shaft speed sensor	PCM has detected a loss of the intermediate shaft speed sensor signal during operation.	Harsh shifts.	GO to Pinpoint Test E .
P0794	Intermediate shaft speed sensor	Intermediate shaft speed sensor signal noisy	PCM has detected an erratic intermediate shaft speed sensor signal.	Harsh shifts.	GO to Pinpoint Test E .
P0795	Pressure Control Solenoid C (PCC)	PCC or circuit fault	PCC functional fault - low pressure.	Incorrect shift pattern indicating mechanical or hydraulic failure of the transmission.	REFER to Diagnosis By Symptom in this section.
P0798	PCC	PCC inoperative	Electrical failure of the solenoid detected.	Incorrect gear ratio in 4th and 5th gear.	GO to Pinpoint Test D .
P0960	PCA	PCA circuit open	Voltage through PCA is checked. Error is noted if tolerance is exceeded.	Open circuit - causes maximum PCA pressure, harsh engagements and shifts.	GO to Pinpoint Test D .
P0962	PCA	PCA circuit failure, shorted to ground	Voltage through PCA is checked. An error will be noted if tolerance is exceeded.	Short circuit - causes minimum PCA pressure (minimum capacity) and limits engine torque (alternate firm). Slips in gear and no 3rd gear.	GO to Pinpoint Test D .
P0963	PCA	PCA short to power	Voltage through PCA is checked. An error will be noted if tolerance is exceeded.	Short to power - causes maximum PCA pressure, harsh engagements and shifts.	GO to Pinpoint Test D .
P0964	PCB	PCB circuit open	Voltage through PCB is checked. Error is noted if tolerance is exceeded.	Open circuit - causes maximum PCB pressure, harsh engagements and shifts.	GO to Pinpoint Test D .
P0966**	PCB	PCB circuit failure, shorted circuit to ground	Voltage through PCB is checked. An error will be noted if tolerance is exceeded.	Short circuit to ground no 2nd and 5th gear.	GO to Pinpoint Test D .
P0967	PCB	PCB short to battery voltage	Voltage through PCB is checked. An error will be noted if	Short to battery power: harsh shift and engagements.	GO to Pinpoint Test D .

			tolerance is exceeded.		
P0968**	Pressure Control Solenoid C (PCC)	PCC circuit open	Voltage through PCC is checked. Error is noted if tolerance is exceeded.	Open circuit - causes maximum PCC pressure, harsh engagements and shifts.	GO to Pinpoint Test D .
P0970**	PCC	PCC circuit failure, shorted circuit to ground	Voltage through PCC is checked. An error will be noted if tolerance is exceeded.	No 4th and 5th gear.	GO to Pinpoint Test D .
P0971	PCC	PCC short to power	Voltage through PCC is checked. An error will be noted if tolerance is exceeded.	Short to battery power: harsh shift and engagements.	GO to Pinpoint Test D .
P1116	ECT	ECT sensor out of OBD range	ECT sensor temperature higher or lower than expected during KOEO and KOER .	Rerun OBD test at normal operating temperature.	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P1124	TP	TP sensor voltage high/low for OBD test	TP sensor was not in the correct position for OBD test.	Rerun OBD test at appropriate TP per application.	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P1460	A/C	A/C clutch cycling pressure switch error	A/C or defrost ON condition may result from A/C clutch being ON during OBD test.	DTC set during OBD test- rerun with A/C OFF. Failed ON - EPC pressure slightly low with A/C OFF.	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P1501	VSS input	VSS input high during self-test	PCM had detected a VSS input signal during KOER - Self Test.	Cannot run KOER .	STOP vehicle. RERUN KOER - Self Test. If KOER cannot be carried out, REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P1572	Brake Pedal Position (BPP) switch	BPP switch circuit failed	Brake ON circuit failure during normal operation.	Failed ON or not connected - TCC will not engage at less than one-third throttle. Failed OFF or not connected - TCC will not disengage when brake is applied.	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P1636	SSx			-	

		SSx ISIG communication error	PCM has detected an error with the ISIG chip.		INSTALL a new PCM.
P1700	Transmission	Transmission undetermined failure	Internal component failure. Direct One-Way Clutch (OWC) failure.	Failure Mode Effect Management becomes active - engine rpm limited to 4,000 rpms. Failed a NEUTRAL condition in 1st, 3rd or 4th gear in automatic mode. Only 2nd and 5th gear available. Other DTCs that may set P1700: P0745, P1747, P1760, P1714, P1715, P0750, P0755.	If other solenoid DTCs are present, diagnose and repair them first. CLEAR the DTCs and drive vehicle. If P1700 returns, disassemble transmission and INSPECT the direct OWC . REPAIR as required. CLEAR the DTC. Drive vehicle and verify repair.
P1702	TR sensor	TR sensor signal intermittent, code P0705, P0708 are set	See P0705, P0708 conditions.	See P0705, P0708 symptoms.	GO to Pinpoint Test C .
P1703	BPP	Brake pedal not actuated during OBD KOER	Brake pedal not cycled during KOER .	Failed ON or not connected - TCC will not engage at less than one-third throttle. Failed OFF or not connected - TCC will not disengage when brake is applied.	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P1703	BPP	BPP switch circuit failed	Brake ON circuit failure during KOEO .	Failed ON or not connected - TCC will not engage at less than one-third throttle. Failed OFF or not connected - TCC will not disengage when brake is applied.	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P1704	TR sensor	TR sensor not in P or N positions during KOEO / KOER	TR sensor or selector lever cable incorrectly adjusted or TR circuit failure.	DTC is set.	GO to Pinpoint Test C .
P1705	TR sensor	TR sensor not in P or N during KOEO / KOER	KOEO / KOER not run in P or N or TR circuit failure.	DTC is set.	RERUN KOEO / KOER in P or N or GO to Pinpoint Test C .
P1711	TFT	TFT sensor out of OBD range	Transmission not at operating	DTC set - vehicle cold or overheated.	Warm or cool vehicle to normal

			temperature during OBD test.		operating temperature. GO to Pinpoint Test B .
P1714	SSA	SSA inoperative	Mechanical failure of the solenoid detected.	Stuck OFF: 1st gear ratio incorrect or no gear ratio errors, no 1st gear. Stuck ON: no 4th or 5th gear.	GO to Pinpoint Test F .
P1715	SSB	SSB inoperative	Mechanical failure of the solenoid detected.	Stuck OFF: 3rd gear ratio incorrect or no gear ratio errors, no 3rd gear. Stuck ON: 1st gear ratio incorrect or no gear ratio errors, no 1st gear.	GO to Pinpoint Test F .
P1716	SSC	SSC inoperative	Mechanical failure of the solenoid detected.	Stuck OFF: 2nd and 5th gear ratio incorrect. Stuck ON: 1st gear ratio incorrect or no gear ratio errors.	GO to Pinpoint Test F .
P1717	SSD	SSD inoperative	Mechanical failure of the solenoid detected.	Stuck ON: No engine braking. Open or short to voltage, engine braking in 1st auto only.	GO to Pinpoint Test F .
P1740**	TCC solenoid	TCC solenoid inoperative	TCC not commanded. Mechanical failure of the solenoid detected.	Stuck OFF: Harsh shifts or engagements, engine rpm higher than expected. Stuck ON: Vehicle stalls when in drive gear at idle, harsh shifts or engagements, engine rpm lower than expected.	GO to Pinpoint Test F .
P1780	Transmission Control Switch (TCS)	TCS not changing states	TCS not cycled during OBD test. TCS circuit or switch open or shorted.	No O/D cancel when switch is cycled.	RERUN OBD test and cycle switch. REFER to Section 307-05 .
P1783	TFT	Transmission overtemp condition indicated	TFT exceeded 127°C (270°F).	Increase in control pressure.	GO to Pinpoint Test B .

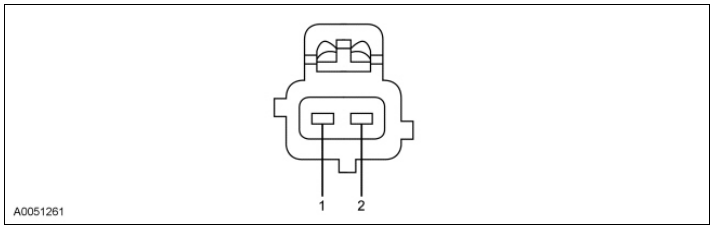
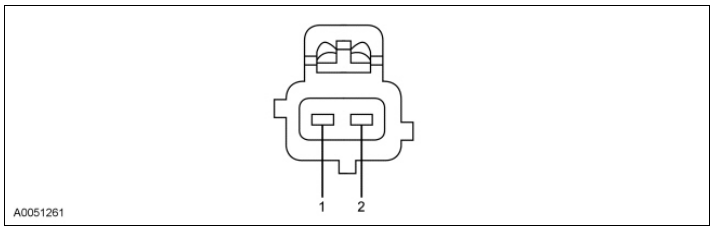
43	Shift Solenoid B (SSB)
44	Shift Solenoid C (SSC)
45	Shift Solenoid D (SSD)
46	Torque Converter Clutch (TCC) solenoid

Transmission Vehicle Harness - C168



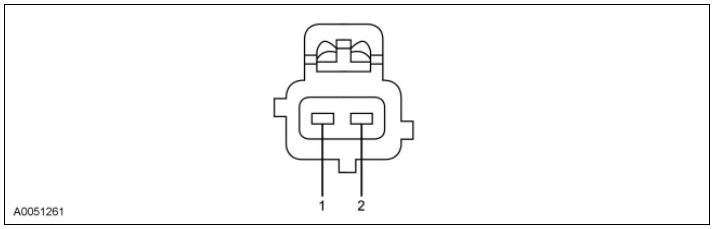
Pin Number	Circuit Description
1	Pressure Control Solenoid B (PCB)
2	Transmission Fluid Temperature (TFT) sensor input
3	Solenoid power
4	Pressure Control Solenoid C (PCC)
5	Shift Solenoid D (SSD)
6	Shift Solenoid C (SSC)
11	Pressure Control Solenoid A (PCA)
12	Signal return
14	Torque Converter Clutch (TCC) solenoid
15	Shift Solenoid B (SSB)
16	Shift Solenoid A (SSA)

Transmission Range (TR) Sensor - C167



Pin Number	Circuit Description
2	Signal return
3	Transmission Range (TR)3
4	TR 1
5	TR 2
6	TR 4
7	Ground
8	Neutral switch sense input
9	Not used
10	Starter solenoid control power
11	Not used
12	Starter relay

Turbine Shaft Speed (TSS) Sensor - C143



Pin Number	Circuit Description
1	Turbine Shaft Speed (TSS) sensor signal
2	Signal return

Output Shaft Speed (OSS) Sensor - C193

Pin Number	Circuit Description
1	Output Shaft Speed (OSS) sensor signal
2	Signal return

Intermediate Shaft Speed Sensor Harness - C164

Pin Number	Circuit Description
1	Intermediate shaft speed sensor signal
2	Signal return

Transmission Range (TR) Sensor Diagnosis Chart

Selector Position	PID: TR	PID: TR_V (volts)				
		TR4	TR3	TR2	TR1	TR3 (PCM pin 27 to sigrtn)
Park	P	Closed	Closed	Closed	Closed	0.0 volt
Reverse	R	Open	Open	Closed	Closed	1.3 - 1.8 volts
Neutral	N	Closed	Open	Open	Closed	1.3 - 1.8 volts
Overdrive	(D) [a]	Open	Open	Open	Open	1.3 - 1.8 volts
Manual 3	3	Open	Closed	Open	Closed	0.0 volt
Manual 2	2	Open	Closed	Closed	Open	0.0 volt
Manual 1	1	Closed	Closed	Open	Open	0.0 volt

[a] Will read "Drive" if (D) is canceled.

A. TR_V is the voltage at the PCM pin 27 (TR3 Circuit) to signal return.
B. "In Between" reading could be caused by a shift cable or TR sensor misaligned or a TR sensor circuit failure of TR 1, TR 2, TR 3 or TR .
C. TR_D: 1= Open TR switch, 0= Closed TR switch.
D. Readings: Taken from PCM signal pins for TR 1, TR , TR 3 or TR 4 to signal return.
    - **Voltages for TR1, TR2, TR4:**
    - 0 = 0.0 volt.
    - 1 = 9.0 - 14.0 volts.
    - **Voltage for TR3:(TR_V)**
    - 0 = 0.0 volt.
    - 1 = 1.3 - 1.8 volts.

Wiggle Test Information for Open/Shorts

- TR 4, TR 3, TR 2 and TR 1 are all closed in PARK. PARK is a good position to check for intermittent open circuits (with scan tool monitoring TR_V).
- TR 4, TR 3, TR 2 and TR 1 are all open in OVERDRIVE (D), so OVERDRIVE is a good position to check for shorts to ground. To determine the shorted components while observing TR_V, unplug the TR C167 and see if the short goes away. If the short is still present unplug the transmission C168 and see if the short goes away. If the short is still present, then the short is in the PCM or vehicle harness. Remove the suspect circuit(s) wire terminal from the PCM connector. If the short is still present, then the PCM has an internal failure, otherwise the failure is in the vehicle harness.

Pinpoint Tests - OSC Equipped Vehicle

Special Tool(s)

 ST1633-A	Alignment Gauge, TR Sensor 307-351 (T97L-70010-A)
 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software and appropriate hardware, or equivalent scan tool

Shift Solenoid Pre-Diagnosis

Any time an electrical connector or solenoid body is disconnected, inspect the connector for terminal condition, corrosion and contamination. Also inspect the connector seal for damage. Clean, repair or install new as necessary.

Use the following shift solenoid operation information when carrying out Pinpoint Test A.

Solenoid Operation Chart

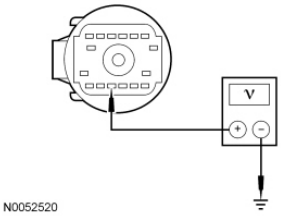
Pinpoint Tests

Refer to Wiring Diagrams Cell 29 , Transmission Controls - 5R55S for schematic and connector information.

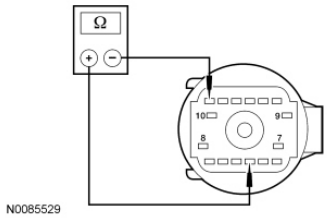
NOTE: Refer to all TSBs and On-Line Automotive Service Information System (OASIS) messages that pertain to the transmission concern and follow the procedure as described.

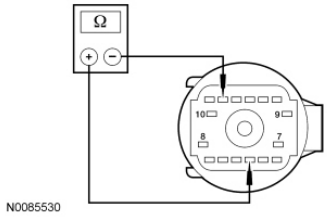


PINPOINT TEST A: SHIFT AND TCC SOLENOIDS

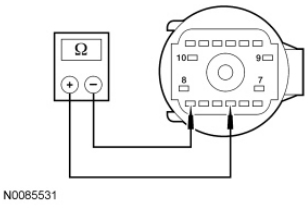
NOTE: Refer to Transmission Vehicle Harness Connector illustration within the Transmission Connector Layouts procedure in this section.

NOTE: Refer to the Transmission Internal Harness Connector illustration within the Transmission Connector Layouts procedure in this section.





NOTE: Read and record all DTCs.



Test Step	Result / Action to Take
A1 ELECTRONIC DIAGNOSTICS	
• Ignition OFF. • Select PARK. • Check to make sure the transmission vehicle harness connector C168 is fully seated and the terminals are fully engaged in the connector and are in good condition before proceeding. • Connect the scan tool. • Ignition ON. • **Was communication with the PCM established and can the PIDs be monitored?**	**Yes** GO to A2 . **No** REPEAT procedure to access the transmission PIDs. If the scan tool did not access the transmission PIDs, REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis of PCM.
A2 SOLENOID FUNCTIONAL CHECK	
• Select PIDs to be monitored. ♦ Shift Solenoid A (SSA) ♦ Shift Solenoid B (SSB) ♦ Shift Solenoid C (SSC) ♦ Shift Solenoid D (SSD) ♦ Torque Converter Clutch (TCC) • Select ON to turn suspect solenoid(s) ON. • Select OFF to turn solenoid(s) OFF. • Repeat steps for each solenoid. • **Does the suspect solenoid turn ON and OFF when commanded?**	**Yes** GO to A3 . **No** GO to A4 .
A3 TRANSMISSION DRIVE TEST	
• Select GEAR for shift solenoids. • Select TCC for torque converter clutch solenoid. • **Does the transmission upshift and downshift or torque converter engage/disengage when commanded?**	**Yes** CLEAR the DTCs. ROAD TEST to verify if concern is still present. If concern is still present, REFER to Diagnosis By Symptom in this section to diagnose shift or torque converter concern. **No** GO to A4 .
A4 CHECK FOR BATTERY VOLTAGE	

<table>
<tr>
<td>
• Ignition OFF.
• Disconnect: Transmission Vehicle Harness C168.
• Check to make sure the transmission vehicle harness C168 terminals are fully engaged in the connector and are in good condition before proceeding.
• Ignition ON.
• Measure the voltage between C168-3, circuit CBB38 (GY/BU), harness side and ground.

N0052520
• Is the voltage greater than 10 volts?
</td>
<td>
Yes
GO to A5 .

No
REPAIR circuit CBB38 (GY/BU). CLEAR the DTCs. TEST the system for normal operation.
</td>
</tr>
<tr>
<td>A5 ELECTRICAL SIGNAL CHECK</td>
<td></td>
</tr>
<tr>
<td>
• Measure the voltage between the transmission vehicle harness C168-3, circuit CBB38 (GY/BU) and C168 signal circuit, harness side.
• Using the scan tool, cycle the solenoids ON and OFF using the following chart.
<table>
<tr><th>Connector Terminal</th><th>Circuit</th><th>Connector Signal Terminal</th></tr>
<tr><td>C168-3</td><td>CET05 (BU/GN)</td><td>C168-16</td></tr>

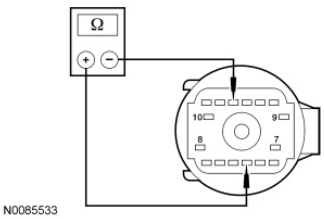
<tr>
<td>A6 CHECK VEHICLE HARNESS SIGNAL CIRCUITS FOR SHORT TO GROUND</td>
<td></td>
</tr>
</table>

• Disconnect: Transmission Vehicle Harness C175T. • Measure the resistance between transmission vehicle harness C168 harness side and ground using the following chart. **Connector Terminal / Circuit / Ground** C168-16 / CET05 (BU/GN) / Ground C168-15 / CET18 (GY/YE) / Ground C168-6 / CET07 (GY/OG) / Ground C168-5 / CET44 (BU/BN) / Ground C168-14 / CET19 (VT/GY) / Ground • **Is the resistance greater than 10,000 ohms?**	**Yes** REPLACE the PCM. REFER to Section 303-14 . **No** REPAIR the vehicle harness circuit for a short to ground. CLEAR the DTCs. TEST the system for normal operation.
A7 CHECK THE TRANSMISSION INTERNAL HARNESS/COMPONENT FOR AN OPEN	
• For SSA , measure the resistance between C168-3 and C168-16, component side.  N0085529 • For SSB , measure the resistance between C168-3 and C168-15, component side.  N0085530 • For SSC , measure the resistance between C168-3 and C168-6, component side.	**Yes** GO to A8 . **No** INSPECT the transmission internal harness for an open. If no open is found, REPLACE the faulty component. CLEAR the DTCs. TEST the system for normal operation.

N0085531



- For SSD , measure the resistance between C168-3 and C168-5, component side.

N0085532

- For TCC , measure the resistance between C168-3 and C168-14, component side.

Component	Resistance
SSA	16-45 ohms
SSB	16-45 ohms
SSC	16-45 ohms
SSD	16-45 ohms
TCC	9-16 ohms

N0085533

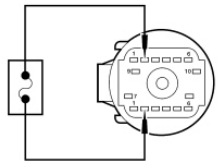
- **Is the resistance within specification?**

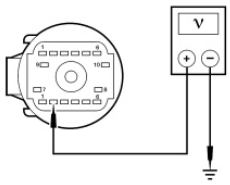
A8 CHECK THE TRANSMISSION INTERNAL HARNESS FOR A SHORT TO GROUND	
• Measure the resistance between the transmission internal harness C168, component side and ground using the following chart.	**Yes** REFER to Diagnosis By Symptom in this section for diagnosis of shift or torque converter concerns. **No** INSTALL a new transmission internal harness. CLEAR the DTCs. TEST the system for

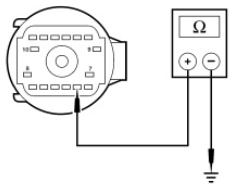
Connector Terminal	Component	Ground
C168-3	Power feed	Ground
C168-16	SSA	Ground
C168-15	SSB	Ground
C168-6	SSC	Ground
C168-5	SSD	Ground
C168-14	TCC	Ground

- **Is the resistance greater than 10,000 ohms?**

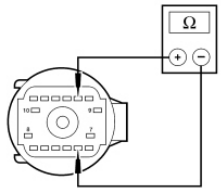
normal operation.







PINPOINT TEST B: TFT SENSOR



NOTE: Refer to Transmission Vehicle Harness Connector illustration within the Transmission Connector Layouts procedure in this section.

NOTE: Refer to the Transmission Internal Harness Connector illustration within the Transmission Connector Layouts procedure in this section.

NOTE: Read and record all DTCs.

Test Step	Result / Action to Take
B1 ELECTRONIC DIAGNOSTICS	
• Select PARK. • Ignition OFF. • Check to make sure the transmission vehicle harness C168 is fully seated, the terminals are fully engaged in the connector and are in good condition before proceeding. • Connect the scan tool. • Ignition ON. • Access the transmission PIDs. • **Is the scan tool able to access the transmission PIDs?**	**Yes** GO to B2 . **No** REPEAT procedure to access the transmission PIDs. If the scan tool did not access the transmission PIDs, REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis of PCM.
B2 ELECTRICAL SIGNAL CHECK	
• Ignition OFF. • Disconnect: Transmission Vehicle Harness C168. • Ignition ON. • Access the TFT PID. • **Does the scan tool display -40°C (-40°F)?**	**Yes** GO to B3 . **No** REPAIR the transmission vehicle harness circuit CET06 (GN/BN) for a short to ground. CLEAR the DTCs. TEST the system for normal operation.
B3 CHECK THE TRANSMISSION VEHICLE HARNESS SIGNAL CIRCUIT	
• Connect a fused jumper between C168-12, circuit RE406 (GY/VT) and C168-2, circuit CET06 (GN/BN), harness side.	**Yes** GO to B5 . **No** GO to B4 .

 N0085912 • **Does the scan tool display 145°C-151°C (293°F-302°F)?**	
B4 CHECK THE TFT INPUT CIRCUIT	
• Measure the voltage between C168-2, circuit CET06 (GN/BN), harness side and ground.  N0085913 • **Is the voltage between 4.8 and 5.1 volts?**	**Yes** GO to B5 . **No** INSPECT the transmission vehicle harness circuit CET06 (GN/BN) for an open. If an open circuit is not found, REPLACE the PCM. REFER to Section 303-14 . TEST the system for normal operation.
B5 CHECK THE RESISTANCE OF THE TRANSMISSION INTERNAL HARNESS	
• Measure the resistance between the transmission internal harness C168-2, component side and ground.  N0085914 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to B6 . **No** REPLACE the transmission internal harness. CLEAR the DTCs. TEST the system for normal operation.
B6 CHECK RESISTANCE OF THE TRANSMISSION INTERNAL HARNESS/ TFT SENSOR	
• Measure the resistance between the transmission internal harness C168-2 and C168-12, component side using the following chart.	**Yes** REFER to Diagnosis By Symptom in this section to diagnose an overheating concern. **No** INSPECT the transmission internal harness for an open. If no open is found, REPLACE the TFT sensor. CLEAR the DTCs. TEST the system for

TRANSMISSION FLUID TEMPERATURE (TFT) **°C** / **°F** / **Resistance (Ohms)** -40 to -20 / -40 to -4 / 967K-284K -19 to -1 / -3 to 31 / 284K-100K 0-20 / 32-68 / 100K-37K 21-40 / 69-104 / 37K-16K 41-70 / 105-158 / 16K-5K 71-90 / 159-194 / 5K-2.7K 91-110 / 195-230 / 2.7K-1.5K 111-130 / 231-266 / 1.5K-0.8K 131-150 / 267-302 / 0.8K-0.54K  N0085915 • **Is the resistance within specification?**	normal operation.

PINPOINT TEST C: TR SENSOR

NOTE: Refer to the Transmission Range (TR) Sensor Connector illustration within the Transmission Connector Layouts procedure in this section.

NOTE: Refer to Transmission Range (TR) Sensor Diagnosis Chart within the Transmission Connector Layouts procedure in this section.

NOTE: Read and record all DTCs.

Test Step	Result / Action to Take
C1 VERIFY DTCs	
• Select PARK. • Ignition OFF. • Check to make sure the transmission vehicle harness C167 is fully seated, the terminals are fully engaged in the connector and are in good condition before proceeding. • Connect the scan tool. • Ignition ON. • **NOTE:** DTCs P0705 and P0708 cannot be set by an incorrectly adjusted TR sensor. • Retrieve DTCs. • **Are only DTCs P0705 and P0708 present?**	**Yes** GO to C4 . **No** GO to C2 .

C2 VERIFY TR SENSOR ALIGNMENT	
• Select PARK. • Ignition OFF. • Check to make sure the TR sensor C167 is fully seated, the terminals are fully engaged in the connector and are in good condition before proceeding. • Apply the park brake. • Select NEUTRAL. • Disconnect the selector lever cable from the manual control lever. • Verify that the TR Sensor Alignment Gauge fits in the appropriate slots. • **Is the TR sensor correctly adjusted?**	**Yes** GO to C3 . **No** ADJUST the TR sensor. REFER to Transmission Range (TR) Sensor Adjustment in this section. PLACE selector lever in PARK. CLEAR the DTCs. TEST the system for normal operation. GO to C3 .
C3 VERIFY SELECTOR LEVER CABLE ADJUSTMENT	
• Place the manual control lever in the (D) position. • Re-connect the selector lever cable. • Verify that the selector lever cable is adjusted OK. Refer to Section 307-05 . • **Is the selector lever cable adjusted OK?**	**Yes** GO to C4 . **No** ADJUST the selector lever cable. REFER to Section 307-05 .
C4 CHECK ELECTRICAL SIGNAL OPERATION	
• Select PARK. • Disconnect: TR Sensor C167. • ***NOTICE:*** **Do not pry on connector. This will damage the connector and result in a transmission concern.** • Inspect C167 for damaged or pushed-out terminals, corrosion, loose wires and missing or damaged seals. • **Is there damage to the connector, terminals or harness?**	**Yes** REPAIR as necessary. CLEAR the DTCs. TEST the system for normal operation. **No** If diagnosing a DTC, GO to C5 . If diagnosing a starting concern, GO to C10 .
C5 CHECK ELECTRICAL SYSTEM OPERATION	
• Ignition OFF. • Connect: TR Sensor C167. • Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: TR PIDS: TR_D, TR_V. • Move the selector lever into each gear and stop. • Observe the PIDs, TR_D and TR_V while wiggling the harness, tapping on sensor or driving the vehicle. Use PIDs TR_D for DTCs P0705, P1704 and P1705. Use PIDs TR_V for DTC P0708. • Compare the PIDs to the Transmission Range (TR) Sensor Diagnosis Chart. • **Do the PIDs TR_D and TR_V match the Transmission Range (TR) Sensor Diagnosis Chart and does the TR_D PID remain steady when the harness is wiggled, the sensor is tapped ON or the**	**Yes** The problem is not in the TR sensor system. REFER to Diagnosis By Symptom for further diagnosis. **No** If TR_D changes when wiggling the harness, tapping on the sensor or driving the vehicle, the problem may be intermittent. GO to C6 .

vehicle driven?

C6 CHECK TR SENSOR OPERATION

- Ignition OFF.
- Disconnect: TR Sensor C167.
- ***NOTICE:*** **Do not pry on connector. This will damage the connector and result in a transmission concern.**
- Using the Transmission Range (TR) Sensor Diagnosis Chart, measure the resistance of the TR sensor with the selector lever in each range position using the following chart. Compare the measurements to the Transmission Range (TR) Sensor Diagnosis Chart.

TR Sensor

Terminal Number	Range Position	Terminal Number
2	TR 3	3
2	TR 1	4
2	TR 2	5
2	TR 4	6

- **Do the measurements match the Transmission Range (TR) Sensor Diagnosis Chart?**

Yes
Concern is not in the TR sensor, GO to C7 .

No
INSTALL a new TR sensor. CLEAR the DTCs. TEST the system for normal operation.

C7 CHECK TRANSMISSION VEHICLE HARNESS CIRCUITS FOR OPENS

- Ignition OFF.
- Disconnect: PCM C175T.
- Measure the resistance between TR C167 and PCM C175T, harness side using the following chart.

TR	Circuit	PCM
C167-3	VET29 (VT/WH)	C175T-27
C167-4	VET28 (GY/WH)	C175T-16
C167-5	VET30 (YE)	C167T-17
C167-6	VET31 (BU/OG)	C167T-28

- **Are the resistances less than 5 ohms?**

Yes
GO to C8 .

No
REPAIR the vehicle transmission harness circuit which is open. CLEAR the DTCs. TEST the system for normal operation

C8 CHECK TRANSMISSION VEHICLE HARNESS CIRCUITS FOR SHORT TO GROUND

<table>
<tr><td>

- Measure the resistance between the TR C167, harness side and ground using the following chart.

TR	Circuit	Ground
C167-3	VET29 (VT/WH)	Ground
C167-4	VET28 GY/VT)	Ground
C167-5	VET30 (YE)	Ground
C167-6	VET31 (BU/OG)	Ground

- **Are the resistances greater than 10,000 ohms?**

</td><td>

Yes
GO to C9 .

No
REPAIR the vehicle transmission harness circuit shorted to ground. CLEAR the DTCs. TEST the system for normal operation.

</td></tr>
<tr><td colspan="2">

C9 CHECK FOR SHORT BETWEEN TR AND PCM INPUT SIGNAL CIRCUITS

</td></tr>
<tr><td>

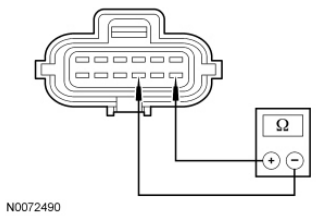
- Measure the resistance between the TR sensor C167 terminals, harness side using the following chart.

TR Sensor Pin	Circuit	TR Sensor Pins
2	RE406 (GY/VT)	3, 4, 5, 6
3	VET29 (VT/WH)	4, 5, 6
4	VET28 (GY/VT)	5, 6
5	VET30 (YE)	6

- **Are the resistances greater than 10,000 ohms?**

</td><td>

Yes
REPLACE the PCM. REFER to Section 303-14 . RECONNECT all components. CLEAR the DTCs. TEST the system for normal operation.



No
REPAIR circuits having less than 10,000 ohms between other TR /PCM input signal circuits that are shorted together. RECONNECT all components. CLEAR the DTCs. TEST the system for normal operation.

</td></tr>
<tr><td colspan="2">

C10 CHECK TR SENSOR OPERATION

</td></tr>
<tr><td>

- Disconnect: TR Sensor C167.
- ***NOTICE:*** **Do not pry on connector. This will damage the connector and result in a transmission concern.**
- Measure the resistance between TR sensor C167-10 and C167-12, component side, with the selector lever in PARK and then NEUTRAL.

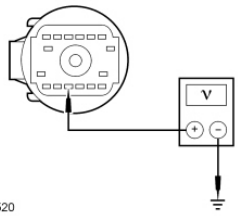
- **Are the resistances less than 5 ohms?**

</td><td>

Yes
Concern is not in the TR sensor. REFER to Section 303-06 .

No
INSTALL a new TR sensor. CLEAR the DTCs. TEST the system for normal operation.

</td></tr>
</table>



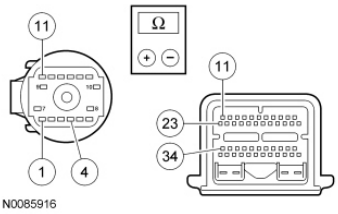
PINPOINT TEST D: PRESSURE CONTROL SOLENOIDS

NOTE: Refer to Transmission Vehicle Harness Connector illustration within the Transmission Connector Layouts procedure in this section.

NOTE: Refer to the Transmission Internal Harness Connector illustration within the Transmission Connector Layouts procedure in this section.

NOTE: Read and record all DTCs.

Test Step	Result / Action to Take
D1 ELECTRONIC DIAGNOSTICS	
• Select PARK. • Ignition OFF. • Check to make sure the transmission harness C168 is fully seated, the terminals are fully engaged in the connector and in good condition before proceeding. • Install the Transmission Fluid Pressure Gauges into the Line and Pressure Control Solenoid C (PCC) tap. • Connect the scan tool. • Ignition ON. • Access the transmission PIDs. • **Is the scan tool able to access the transmission PIDs?**	**Yes** GO to D2 . **No** REPEAT procedure to access the transmission PIDs. If the scan tool did not access the transmission PIDs, REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis of PCM or scan tool.
D2 SOLENOID FUNCTIONAL TEST	
• Monitor the Transmission Fluid Pressure Gauges. • **NOTE:** Make sure that the solenoids not being tested are off or at zero. • With the engine running, command the Pressure Control Solenoid A (PCA), Pressure Control Solenoid B (PCB) and PCC solenoids to change the pressure. • **For PCA and PCB : Does the pressure reading for PCA or PCB follow the commanded pressure (actual PCA and PCB pressures will be higher than the commanded pressure)? For PCC : Does the pressure reading match the commanded pressure?**	**Yes** REFER to Diagnosis By Symptom in this section for diagnosis of pressure concerns. TEST the system for normal operation. **No** GO to D3 .
D3 CHECK FOR BATTERY VOLTAGE	
• Ignition OFF. • Disconnect: Transmission Vehicle Harness C168. • Visually inspect the transmission vehicle harness C168 is fully seated, the terminals are fully engaged in the connector and are in good condition before proceeding. • Ignition ON. • Measure the voltage between C168-3, circuit CBB38 (GY/BU), harness side and ground.	**Yes** GO to D4 . **No** REPAIR circuit CBB38 (GY/BU). CLEAR the DTCs. TEST the system for normal operation.



- **Is the voltage greater than 10 volts?**

D4 CHECK CONTROL CIRCUITS FOR AN OPEN

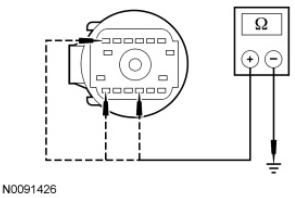
- Ignition OFF.
- Disconnect: PCM C175T.
- Measure the resistance between PCM C175T and transmission vehicle harness C168, harness side using the following chart.

PCM Connector	Circuit	Transmission Connector
C175T-11	VET27 (BN/YE)	C168-11
C175T-23	CET45 (YE/BU)	C168-1
C175T-34	CE418 (BU/OG)	C168-4

- **Is the resistance less than 5 ohms?**

Yes
GO to D5 .

No
CHECK the transmission vehicle harness circuit which has high resistance for an open. CLEAR the DTCs. TEST the system for normal operation.



D5 CHECK CONTROL CIRCUITS FOR A SHORT TO GROUND

- Measure the resistance between the transmission vehicle harness C168 and ground using the following chart.

Transmission Connector	Circuit	Ground
C168-11	VET27 (BN/YE)	Ground
C168-1	CET45 (YE/BU)	Ground
C168-4	CE418 (BU/OG)	Ground

Yes
GO to D6 .

No
REPAIR the vehicle transmission harness circuit shorted to ground. CLEAR the DTCs. TEST the system for normal operation.

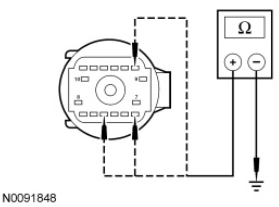
- **Is the resistance greater than 10,000 ohms?**

D6 CHECK SOLENOID RESISTANCE

- Measure the resistance between the transmission internal harness C168, component side power and C169, component side control using the following chart.

Transmission Connector	Component	Transmission Connector
C168-3	PCA	C168-11
C168-3	PCB	C168-1
C168-3	PCC	C168-4

- **Is the resistance within 3.3 ohms and 7.5 ohms?**



Yes
GO to D7 .

No
REPLACE the transmission internal harness for an open. If no open is found, REPLACE the appropriate solenoid. CLEAR the DTCs. TEST the system for normal operation.

D7 CHECK TRANSMISSION INTERNAL HARNESS/SOLENOID FOR SHORT TO GROUND

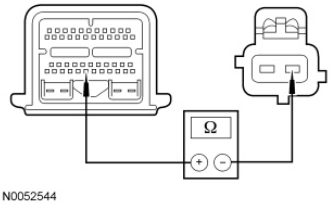
- Measure the resistance between the transmission vehicle harness C168, component side and ground using the following chart.

Transmission Connector	Component	Ground
C168-11	PCA	Ground
C168-1	PCB	Ground
C168-4	PCC	Ground

- **Is the resistance greater than 10,000 ohms?**

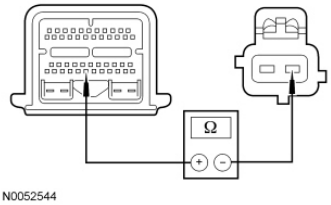
Yes
REPLACE the PCM. REFER to Section 303-14 . TEST the system for normal operation.

No
REPLACE the transmission internal harness for a short to ground. If no short to ground is found, REPLACE the appropriate solenoid. CLEAR the DTCs. TEST the system for normal operation.



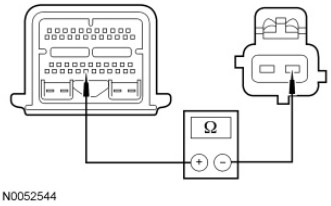
PINPOINT TEST E: TSS , INTERMEDIATE SHAFT SPEED AND OSS SENSORS

NOTE: Refer to the Turbine Shaft Speed (TSS), Intermediate Shaft Speed and Output Shaft Speed (OSS) Sensor Connector illustration within the Transmission Connector Layouts procedure in this section.

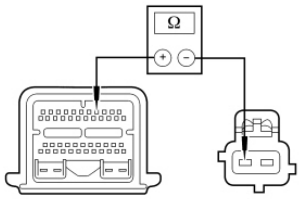


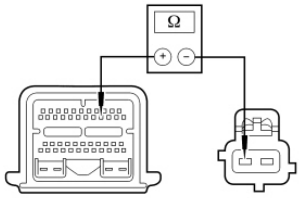
NOTE: Read and record all DTCs.

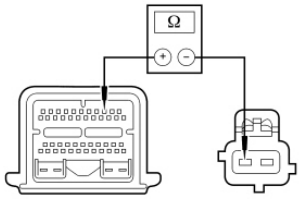
Test Step	Result / Action to Take
E1 ELECTRONIC DIAGNOSTICS	
• Select PARK. • Ignition OFF. • Check to make sure the transmission harness C168, C143, C164 and C193 are fully seated, the terminals are fully engaged in the connectors and are in good condition before proceeding. • Connect the scan tool. • Ignition ON. • Access the transmission PIDs. • **Is the scan tool able to access the transmission PIDs?**	**Yes** GO to E2 . **No** REPEAT procedure to access the transmission PIDs. If the scan tool did not access the transmission PIDs, REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis of PCM.
E2 DRIVE CYCLE TEST	
• While monitoring the appropriate sensor PID, drive the vehicle so that the transmission upshifts and downshifts through all gears. • **Does the TSS , intermediate shaft speed or OSS sensor PID increase and decrease with engine and vehicle speed?**	**Yes** GO to E3 . **No** If the TSS , intermediate shaft speed sensor or OSS speed PID does not increase and decrease with engine and vehicle speed, GO to E4 .
E3 DRIVE CYCLE TEST ERRATIC	
• While monitoring the appropriate sensor PID, drive the vehicle so that the transmission upshifts and downshifts through all gears. • **Is the TSS , intermediate shaft speed or OSS sensor PID signal erratic (drop to zero or near zero and return to normal operation)?**	**Yes** If the sensor signal is erratic, INSPECT for intermittent concern in the harness, sensor or connector. GO to E4 . **No** CLEAR the DTCs. TEST the system for normal operation.
E4 CHECK TRANSMISSION VEHICLE HARNESS FOR OPENS	
• Ignition OFF. • Disconnect: PCM C175T. • Inspect for damaged or pushed-out terminals, corrosion or loose wires. • Lower the rear of the transmission to gain access to the sensors. • Disconnect: TSS Sensor C143. • Disconnect: Intermediate Shaft Speed Sensor C164. • Disconnect: OSS Sensor C193. • For OSS , measure the resistance between PCM	**Yes** GO to E5 . **No** REPAIR circuits having more than 5 ohms. CLEAR the DTCs. TEST the system for normal operation.

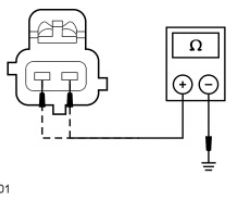


C175T-41, circuit RE406 (GY/VT), harness side and the OSS sensor C193-2, circuit RE406 (GY/VT), harness side.

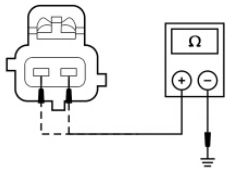




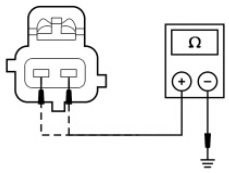




- For intermediate shaft speed, measure the resistance between PCM C175T-41, circuit RE406 (GY/VT), harness side and the intermediate shaft speed sensor C164-2, circuit RE406 (GY/VT), harness side.



- For TSS , measure the resistance between PCM C175T-41, circuit RE406 (GY/VT), harness side and the TSS sensor C143-2, circuit RE406 (GY/VT), harness side.

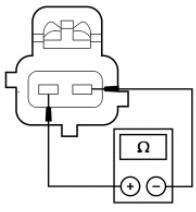


- For intermediate shaft speed, measure the resistance between PCM C175T-4, circuit VE739 (GY/YE), harness side and the intermediate shaft speed sensor C164-1, circuit VE739 (GY/YE), harness side.

 N0052545 • For TSS , measure the resistance between PCM C175T-15, circuit VET33 (WH/OG), harness side and the TSS sensor C143-1, circuit VET33 (WH/OG), harness side.  N0052546 • For OSS , measure the resistance between PCM C175T-3, circuit RET04 (YE/GN), harness side and the OSS sensor C193-1, circuit RET04 (YE/GN), harness side.  N0052547 • **Are the resistances less than 5 ohms?**	
E5 CHECK THE TRANSMISSION VEHICLE HARNESS FOR SHORT TO GROUND	
• For the OSS , measure the resistance between OSS sensor C193-1, harness side and ground and C193-2, harness side and ground.  A0005501 • For the intermediate shaft speed sensor, measure the resistance between intermediate shaft speed sensor C164-1, harness side and ground and C164-2, harness side and ground.	**Yes** GO to E6 . **No** REPAIR circuit(s) having more than 10,000 ohms. CLEAR the DTCs. TEST the system for normal operation.

A0005501

- For the TSS , measure the resistance between TSS C143-1, harness side and ground and C143-2, harness side and ground.

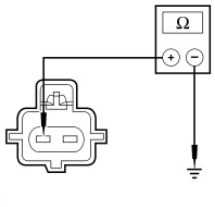


A0005501

- **Are the resistances greater than 10,000 ohms?**

E6 CHECK THE RESISTANCE OF THE TSS , INTERMEDIATE SHAFT SPEED SENSOR OR OSS SENSOR

- Disconnect the appropriate connector from the TSS C143, intermediate shaft speed sensor C164 or OSS sensor C193.
- Measure the resistance between terminal 1 and terminal 2 of the speed sensor using the following chart.



A0005211

- Record the value.

Resistance (ohms)	Temperature °C (°F)
266-390	-20° (4°)
325-485	21° (70°)
492-738	150° (302°)

Yes
GO to E7 .

No
INSTALL a new sensor. CLEAR the DTC. TEST the system for normal operation.

• **Is the resistance within specification?**	
E7 CHECK SENSORS FOR A SHORT TO GROUND	
• Measure the resistance between TSS C143-1 , OSS C193-1 or intermediate shaft speed sensor C164-1 component side of each sensor and ground.  N0085932 • **Is the resistance greater than 10,000 ohms?**	**Yes** REFER to Diagnosis By Symptom in this section for diagnosis of shift or torque converter concerns. **No** INSTALL a new sensor.

PINPOINT TEST F: SOLENOID MECHANICAL FAILURE

NOTE: Repair all other DTCs before repairing the following DTCs: P1714, P1715, P1716, P1717 and P1740.

Test Step	Result / Action to Take
F1 ELECTRONIC DIAGNOSIS	
• Select PARK. • Connect the scan tool. • Ignition ON. • Perform the Key ON Engine OFF (KOEO) Test. • If any of the following DTCs are present, P1714, P1715, P1716, P1717 and P1740, continue with this test. • **Are other DTCs present for the Transmission Fluid Temperature (TFT) or shift solenoids?**	**Yes** REPAIR the DTCs for TFT or shift solenoids first. CLEAR the DTCs and PERFORM the Transmission Drive Cycle Test. RERUN KOEO test. **No** INSTALL a new solenoid and/or body. REFER to Diagnostic Trouble Code (DTC) Charts in this section for code description. GO to F2 .
F2 TRANSMISSION DRIVE CYCLE TEST	
• Perform the Transmission Drive Cycle Test. Refer to Transmission Drive Cycle Test in this section. • **Does the transmission upshift and downshift OK?**	**Yes** GO to F3 . **No** REFER to Diagnosis By Symptom in this section to diagnose shift concerns.
F3 RETRIEVE DTCs	
• Select PARK. • Connect the scan tool. • Ignition ON. • Perform the KOEO test.	**Yes** INSTALL a new PCM. PERFORM the Transmission Drive Cycle Test. RERUN KOEO test. **No**

• **Are DTCs P1714, P1715, P1716, P1717 and P1740 still present?**	Testing complete. If a concern still exists, REFER to Diagnosis By Symptom in this section for concern diagnosis.

Special Testing Procedures

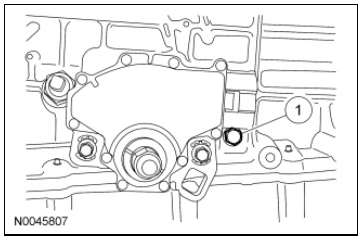
Special Tool(s)

 ST1565-A	Pressure Gauge, Transmission Fluid 307-004 (T57L-77820-A)
 ST2538-A	Transmission Air Test Plate and Gaskets 307-433-01, 307-433-02, 307-433-03
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

The special tests are designed to aid the technician in diagnosing the hydraulic and mechanical portion of the transmission.

Engine Idle Speed Check

Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the engine idle speed.



Pressure Test - PCA , PCB

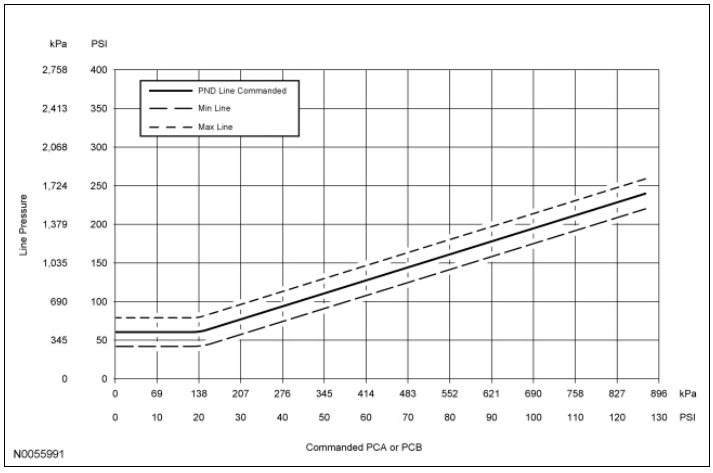
NOTICE: **Carry out Pressure Tests for Pressure Control Solenoid A (PCA), Pressure Control Solenoid B (PCB) and Pressure Control Solenoid C (PCC) prior to carrying out Stall Speed Test. If line pressure is low at stall, do not carry out the Stall Speed Test or further transmission damage will occur. Do not maintain Wide Open Throttle (WOT) in any gear range for more than 5 seconds.**

NOTE: Some sensor failures may cause high line pressure, failure mode effect management actions. Make sure that the electrical repairs and self-test have been performed or test results may be incorrect.

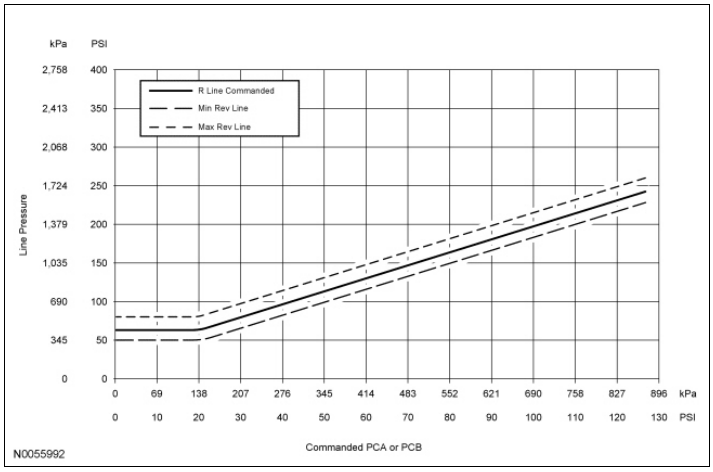
NOTE: The line pressure tap is used to verify output pressure from Pressure Control Solenoid A (PCA) or Pressure Control Solenoid B (PCB). Use pressure control PIDs and take note which solenoid, PCA or PCB , is commanded higher. Use the higher commanded pressure control solenoid value when referencing the Line Pressure Charts A and B. The second pressure tap is used to verify the output from the Pressure Control Solenoid C (PCC) solenoid.

This test verifies that the line pressure is within specifications.

Item	Part Number	Description
1	1390685-S430	Line pressure tap



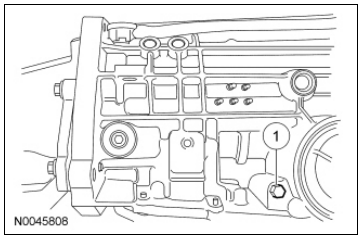
1. Connect the Transmission Fluid Pressure Gauge to the line pressure tap.



2. Connect the scan tool and monitor the PCA and PCB PIDs. Note which PID is commanded higher. Use the higher commanded pressure control solenoid value when referencing the Line Pressure Charts A and B.

3. Start the engine and check the line pressure reading from the Transmission Fluid Pressure Gauge. Refer to the Line Pressure Chart for the correct selector lever position.

4. If the line pressure is not within ranges given in Line Charts A and B, refer to Line Pressure Diagnosis Chart in this section for line pressure concern causes.



5. Go to the PCC Pressure Test in this section.

Pressure Test - PCC

This test verifies that PCC is functioning correctly within specifications.

Item	Part Number	Description
1	390685-S430	Pressure Control Solenoid C (PCC) tap

1. If not previously connected, install the scan tool.
2. Connect the Transmission Fluid Pressure Gauge to the PCC pressure tap.
3. Using the scan tool, monitor the PCC PID and note the commanded pressure.
4. Start the engine and check the PCC pressure. If the Transmission Fluid Pressure Gauge reading does not match within ± 15 psi of PID value displayed for PCC , GO to Pinpoint Test D to diagnose PCC operation. If PCC operation is OK, refer to Line Pressure Diagnosis Chart in this section for line pressure concern causes.
5. When pressure tests are completed, install the pressure tap plugs.
    - Tighten to 13 Nm (115 lb-in).

Line Pressure Diagnosis Chart

Test Results	Possible Source
High at Idle - All Ranges	• Wiring Harnesses • Pressure Control Solenoid C (PCC) Boost Valve • PCC Solenoid • Main Regulator Valve
Low at Idle - All Ranges	• Low Transmission Fluid Level • Transmission Fluid Filter/Seal • Main Control Valve Body • Cross Leaks • Gaskets • Pump • Separator Plate
Low - All Forward Ranges	• Forward Clutch • Main Control Valve Body • Overdrive Servo

	• Intermediate Servo
Low in PARK Only	• Main Control Valve Body
Low in REVERSE Only	• Separator Plate • Reverse Servo Piston, Cover Seal • Reverse Clutch • Overdrive (O/D) Servo • Intermediate Servo • Main Control Valve Body • Forward Clutch
Low in NEUTRAL Only	• Main Control Valve Body • O/D Servo • Intermediate Servo
Low in O/D Only	• Forward Clutch • O/D Servo • Intermediate Servo • Main Control Valve Body
Low in DRIVE Only (O/D Canceled)	• Forward Clutch • O/D Servo • Intermediate Servo • Main Control Valve Body
Low in 1st Position	• Forward Clutch • Main Control Valve Body
Low in 2nd Position	• Intermediate Servo • O/D Servo • Forward Clutch
Low in 3rd Position	• Intermediate Servo • O/D Servo • Forward Clutch

Stall Speed Test

This test checks operation of the following items:

- Torque Converter Clutch (TCC)
- Forward clutch
- Low One-Way Clutch (OWC) assembly
- Engine driveability concerns
- Overdrive (O/D) OWC assembly

⚠ WARNING: Block all wheels, set the parking brake and firmly apply the service brake to reduce the risk of vehicle movement during this procedure. Failure to follow these instructions may result in serious personal injury.

NOTICE: **Always perform the Line Pressure Test procedures prior to performing the Stall Speed Test. If line pressure is low at stall, do not perform the Stall Speed Test or further transmission damage will occur.**

NOTICE: **After testing each of the following ranges D, 3, 2, 1 and R, move the selector lever to NEUTRAL and run the engine at 1,000 rpm for about 15 seconds to allow the torque converter to cool before testing the next range. Failure to follow this instruction may result in transmission damage.**

NOTICE: **Do not maintain Wide Open Throttle (WOT) in any range for more than 5 seconds. Failure to follow this instruction may result in transmission damage.**

NOTICE: **If the engine rpm recorded by the scan tool exceeds maximum specified rpm, release the accelerator pedal immediately. Failure to follow this instruction may result in transmission damage. Clutch or band slippage is indicated.**

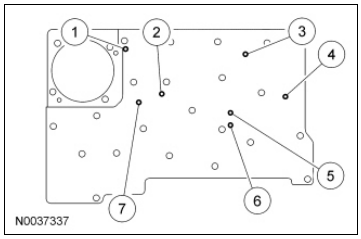
NOTE: The Stall Speed Test should be performed with the engine and transmission at normal operating temperatures.

NOTE: Prolonged use of this procedure may set DTC P0712 or P1783. After performing the Stall Speed Test, run the On-Board Diagnostic (OBD) Test and clear the DTCs.

1. Connect a scan tool to the vehicle.

2. Press the accelerator pedal, Wide Open Throttle (WOT) in each range. Record rpm reached in each range. Stall speeds should be as follows:

Stall Speed Chart



Vehicle	Engine	RPM
Explorer, Mountaineer, Explorer Sport Trac	4.0L	2,660-3,129

If the stall speeds were too high, refer to the following Stall Speed Diagnosis Chart. If the stall speeds were too low, first check the engine idle speed. If engine idle is OK, remove the transmission and replace the torque converter.

Stall Speed Diagnosis Chart

Selector Lever Position	Stall Speeds High	Stall Speeds Low
(D), D with O/D canceled and 1	Overdrive (O/D) One-Way Clutch (OWC), rear OWC	-
D with O/D canceled, 2 and 1	Forward clutch, O/D OWC	-
(D)	Forward clutch, O/D OWC	-
(D), D with O/D canceled, 2, 1 and R	General pressure concerns, forward clutch, O/D OWC	Converter OWC or engine driveability concerns
R Only	High/reverse, high clutch, low and reverse band/servo	-
2 Only	Intermediate band/servo	-
1 Only	Low/reverse band/servo	-

Air Pressure Tests

Item	Description
1	Reverse servo
2	Intermediate servo
3	Overdrive (O/D) servo
4	Coast clutch
5	Forward clutch
6	Direct clutch
7	Reverse servo modulator

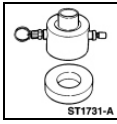
A no-drive or erratic shift condition may be due to inoperative bands and clutches. To diagnose these conditions a series of checks can be made by substituting air pressure for transmission fluid pressure to determine the location of the damaged or obstructed component.

Follow the procedure to determine the location of the inoperative clutch or band by substituting air pressure into the various test plate passages.

NOTE: Use only dry, regulated air pressure, 276 kPa (40 psi) maximum.

1. Remove the main control valve body. Refer to Main Control Valve Body in this section.
2. Install the Transmission Air Test Plate and Gasket. Tighten bolts to 10 Nm (89 lb-in).
3. **NOTE:** Do not apply air to the test plate vent hole.

   Apply air to the appropriate clutch or servo port (refer to plate layout diagram). Refer to the Air Pressure Test Diagnostic Chart for conditions, possible causes and actions.
4. After the testing is completed, remove the Transmission Air Test Plate and Gasket and proceed with any repairs that are needed.
5. After the repairs are completed, install the main control valve body. Refer to Main Control Valve Body in this section.



Air Pressure Test Diagnostic Chart

Condition	Possible Causes	Actions

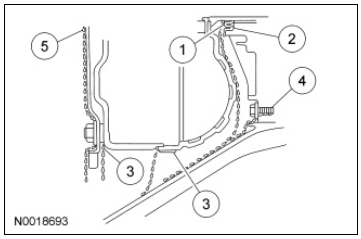
Dull Thud Heard or Movement Felt When Air is Applied and Released	Clutches, bands and fluid passages are OK.	Concerns may not be in the transmission. Check the PCM, wiring harness and non-transmission related components.
No Drive	Clutches and bands inoperative.	Disassemble the transmission, clean and inspect to locate area of concern.
Erratic Shifts	Clutches and bands inoperative due to incorrect pressures.	Disassemble the transmission, clean and inspect to locate area of concern.
No Dull Thud Heard	Clutches, bands and fluid passages may be damaged or obstructed.	Disassemble the transmission, clean and inspect to locate area of concern.
No Movement Felt	Clutches, bands and fluid passages may be damaged or obstructed.	Disassemble the transmission, clean and inspect to locate area of concern.
Hissing Sound Heard	Clutch seals or check ball may be damaged or leaking.	Disassemble the transmission, clean and inspect to locate area of concern.
Servos Do Not Operate	Seals and pistons may be damaged. Supply and release ports may be obstructed. Spring may be broken.	Disassemble the transmission, clean and inspect to locate area of concern.
Multiple Clutches are Applied	Fluid passages in center support or clutch cylinders may be obstructed.	Disassemble the transmission, clean and inspect to locate area of concern. Check fluid passages in the center support for obstructions.

Leakage Inspection

Special Tool(s)

 ST1731-A	Leak Tester, Torque Converter 307-421

Material



Item	Specification
Dye-Lite® ATF/Power Steering Fluid Leak Detection Dye 164-R3701 (Rotunda)	-

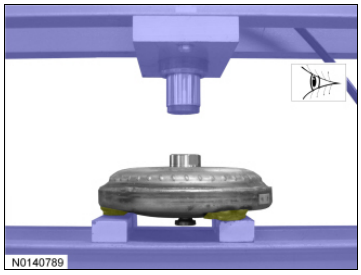
NOTE: When diagnosing transmission leaks, the source of the leak must be positively identified prior to repair. If the vehicle is driven extensively between adding the fluorescent additive and performing the leak test, the leaking oil can spread and make identifying the location of the leak difficult.

1. Clean off any transmission fluid from the top and bottom of the torque converter housing, the front of the case and rear face of the engine and oil pan. Clean the torque converter area by washing with a nonflammable solvent and blow dry with compressed air.

2. Add Dye-Lite® ATF Power Steering Fluid Leak Detection Dye to the transmission fluid. Use one 30 ml (1 fl. oz) of dye solution for every 3.8 L (4 qt) of transmission fluid.

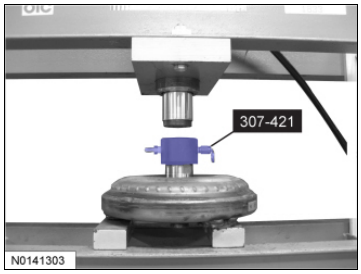
3. Start and run the engine until the transmission reaches its normal operating temperature. Raise the vehicle on a hoist and run the engine occasionally shifting to the DRIVE and REVERSE ranges to increase pressure within the transmission. Using a black light, observe the back of the cylinder block and top of the torque converter housing for evidence of fluid leakage. Run the engine until transmission fluid leakage is evident and the probable source of leakage can be determined.

4. If the source of the leak is obvious, repair as required. Leaks from the torque converter housing can originate from several locations. The paths which the fluid takes to reach the bottom of the torque converter housing are shown in the illustration. The 5 steps following correspond with the numbers in the illustration.
    1. Transmission fluid leaking by the converter hub seal lip will tend to move along the drive hub and onto the back of the torque converter. Except in the case of a total seal failure, transmission fluid leakage by the lip of the seal will be deposited on the inside of the torque converter housing only, near the outside diameter of the housing.



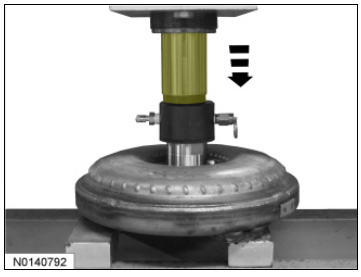
2. Transmission fluid leakage by the outside diameter of the converter impeller hub seal and the case will follow the same path that leaks by the ID of the converter hub seal follow.
3. Transmission fluid leakage from the converter cover weld or the converter-to-flexplate stud weld will appear at outside diameter of torque converter on the back face of the flexplate and in the converter housing only near the flexplate. If a converter-to-flexplate lug, lug weld or converter cover weld leak is suspected, remove the converter and pressure check.
4. Transmission fluid leakage from the bolts inside the converter housing will flow down the back of the torque converter housing. Leakage may be from loose or missing bolts.
5. Engine oil leaks from the rear main oil.

5. Remove the torque converter.

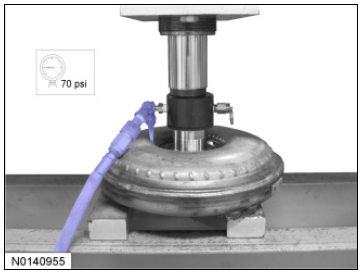


6. Using a black light, observe the torque converter housing. Inspect for evidence of dye from the pump bolts, pump seal, and torque converter hub seal. Repair as required.

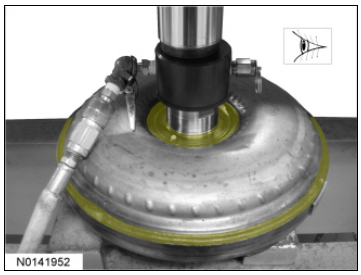
7. If the source of the leak is not evident, continue with this procedure to leak test the torque converter.



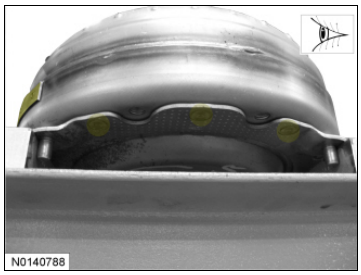
8. Install the torque converter in the arbor press. Support the torque converter on the mounting pads.



9. Install the Leak Tester, Torque Converter 307-421 into the torque converter hub.



10. Secure the press. Only apply enough force from the press to seal of the Leak Tester, Torque Converter 307-421 into the torque converter hub.



11. Connect a compressed air supply to the Leak Tester, Torque Converter 307-421.

12. With air pressure applied to the valve, inspect for leaks at the converter hub weld and seams. A soap bubble solution can be applied around those areas to aid in the diagnosis. If any leaks are present, install a new torque converter.

13. With air pressure applied to the valve, inspect for leaks at the stud or mounting pad and balance weight welds. A soap bubble solution can be applied around those areas to aid in the diagnosis. If any leaks are present, install a new torque converter.

14. After leaks are repaired, clean remaining transmission fluid dye from serviced areas.

Diagnosis By Symptom

The Diagnosis by Symptom Index gives the technician diagnostic information, direction and suggests possible components, using a symptom as a starting point.

Diagnosis by Symptom Index - Directions

1. Using the Symptom Index, select the Concern/Symptom that best describes the condition.

2. Refer to the routine indicated in the Diagnosis by Symptom Index.

3. Always begin diagnosis of a symptom with:
    1. preliminary inspections.
    2. verifications of condition.
    3. checking the transmission fluid levels.
    4. carrying out other test procedures as directed.

4. **NOTE:** Not all concerns and conditions with electrical components will set a DTC. Be aware that the components listed may still be the cause.

   NOTE: When the vehicle battery is disconnected or a new battery is installed, certain transmission operating parameters can be lost. The PCM must relearn these parameters. During this learning process, slightly firm shifts, delayed or early shifts may be experienced. This operation is considered normal and will not affect the function of the transmission. Normal operation will return once these parameters are stored by the PCM.

   Begin with the ROUTINE, if indicated. Follow the reference or action statements. Always carry out the On-Board Diagnostic (OBD) Tests as necessary. Never skip steps. Repair as necessary.

5. These components are listed in the removal sequence and by most probable cause. All components listed must be inspected to make sure of correct repair.

Diagnosis by Symptom Index

Diagnosis by Symptom Index

5R55S	Routines
Engagement Concerns	
• No Forward in (D) Only	201A
• No Forward Only (All Positions)	201B
• No Reverse Only	202
• Harsh Reverse Only	203

• Harsh Forward Only	204A
• Harsh Manual 1st Gear Only	204B
• Delayed/Soft Reverse Only	205
• Delayed/Soft Forward Only	206
• No Forward and No Reverse	207
• Harsh Forward and Harsh Reverse	208
• Delayed Forward and Delayed Reverse	209
Shift Concerns	
• Some/All Shifts Missing (Automatic Mode Only)	210
• Timing Concern	
- Early/Late (Some/All)	211
- Erratic/Hunting (Some/All)	212
• Feel Concerns	
- Soft/Slipping (Some/All)	213
- Harsh (Some/All)	214
• No 1st Gear in Drive, Engages in a Higher Gear	215
• No 1st Gear in Manual 1st	216
• No 2nd Gear In Manual 2 Position	217
• No 1-2 Shift	220
• No 2-3 Shift	221
• No 3-4 Shift	222
• No 4-3 Shift	223
• No 3-2 Shift	224

Torque Converter Operation Concerns	
• Does Not Apply	240
• Always Applied/Stalls Vehicle	241
• Cycling/Shudder/Chatter	242
Other Concerns	
• Selector Lever Efforts High	251
• External Leaks	252
• Noise/Vibration - Forward or Reverse	254
• Engine Will Not Crank	255
	256

• No Park Range	
• Transmission Overheating	257
• No Engine Braking in Manual 2nd Position	258
• No Engine Braking in Manual 1st Position	259
• Transmission Fluid Venting or Foaming	261
• Vehicle Movement with Selector Lever in "N"	262
• Slips/Chatters in Manual 1st Gear	263
• Slips/Chatters in Manual 2nd Gear	264
• No Engine Braking in Manual 3rd Position	280
• No Engine Braking in Manual 4th (D) Position	281
• Slips/Chatters in Manual 3rd Gear	282
• Engine Braking in All Gears	283
• No 2nd and 5th Gears (manual 2nd is OK)	284
• No 3rd, 4th and 5th Gears	285

Diagnostic Routines

Engagement Concern: No Forward in (D) Only

Possible Component	Reference/Action
201A - ROUTINE	
Powertrain Control System	
• PCM, vehicle wiring harnesses, Pressure Control Solenoid B (PCB)	• Carry out On-Board Diagnostic (OBD) Tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	• GO to Pinpoint Test D .
	• Repair as required. Clear the DTCs, road test and rerun OBD Test.

Main Control	
• Screw not tightened to specification	• Tighten to specification.
• Separator plate damaged	• Inspect for damage. If damaged, install a new separator plate.
• Contamination	• Disassemble and clean.
• Valves, springs damaged, misassembled, missing, stuck or bore damaged	• If damaged or parts are missing, install a new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Filter damaged or missing	• Inspect for damage. Repair as necessary.
Center Support	
• Screw not tightened to specification	• Tighten to specification.
• Seal rings or bearing damaged	• Inspect for damage. Repair as necessary.
• Outside diameter of case bore damaged	• Inspect for damage. Repair as necessary.
• Support damaged or leaking	• Inspect for damage. Repair as necessary.
Overdrive (O/D) Servo	
• Servo retaining screws damaged	• Inspect for damage. Repair as necessary.
• Seals (piston and cover) damaged	• Inspect for damage. Repair as necessary.
O/D Band	
• Band damaged	• Inspect for damage. Repair as necessary.
• Servo worn or damaged	• Inspect for damage. Repair as necessary.
• Not adjusted correctly	• Inspect for damage. Repair as necessary.
Case	
• Damaged	• Inspect for damage. Repair as necessary.

Engagement Concern: No Forward Only (All Positions)

Possible Component	Reference/Action
201B - ROUTINE	
Powertrain Control System	
• PCM, vehicle wiring harnesses, Pressure Control Solenoid B (PCB)	• Carry out On-Board Diagnostic (OBD) Tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	• GO to Pinpoint Test D .
	• Repair as required. Clear the DTCs, road test and rerun OBD Test.
Transmission Fluid	
• Incorrect level	• Check the transmission fluid level. Adjust transmission fluid to the correct level. Refer to Transmission Fluid Level Check in this section.
• Condition	• Carry out the Transmission Fluid Condition Check. Refer to Preliminary Inspection in this section.
Main Control	
• Screw not tightened to specification	• Tighten to specification.
• Separator plate damaged	• Inspect for damage. If damaged, install a new separator plate.
• Contamination	• Disassemble and clean.
• Valves, springs damaged, misassembled, missing, stuck or bore damaged	• If damaged or parts are missing, install a new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Transmission fluid filter damaged or missing	• Inspect for damage. Repair as necessary.
Forward Clutch Assembly	
• Seals, piston damaged	• Inspect for damage. Repair as necessary.

• Check ball damaged, missing, not seating, off location	• Inspect for mislocation, poor seating, damage. Install a new cylinder.
• Friction elements damaged or worn	• Inspect for damage. Repair as necessary.
• Return springs damaged	• Inspect for damage. Repair as necessary.
• Bronze seal ring on bearing damaged	• Inspect for damage. Repair as necessary.
Center Support	
• Screw not tightened to specification	• Tighten to specification.
• Seal rings or bearing damaged	• Inspect for damage. Repair as necessary.
• Outside diameter of case bore damaged	• Inspect for damage. Repair as necessary.
• Support damaged or leaking	• Inspect for damage. Repair as necessary.
Forward Planetary Assembly	
• Planetary damaged	• Inspect for damage. Repair as necessary.
Low One-Way Clutch (OWC)	
• Worn, damaged or assembled incorrectly	• Inspect for damage. Repair as necessary.
Case	
• Damaged	• Inspect for damage. Repair as necessary.

Engagement Concern: No Reverse Only

Possible Component	Reference/Action
202 - ROUTINE	
Powertrain Control System	
• PCM, vehicle wiring harnesses, Pressure Control Solenoid C (PCC), Shift Solenoid B	• Carry out On-Board Diagnostic (OBD) Tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.

(SSB)	
	• GO to Pinpoint Test A and GO to Pinpoint Test D .
	• Repair as required. Clear the DTCs, road test and rerun OBD Test.
Main Control	
• Screws not tightened to specification	• Tighten to specification.
• Separator plate damaged	• Inspect for damage. If damaged, install a new separator plate.
• Contamination	• Disassemble and clean.
• Valves, springs damaged, misassembled, missing, stuck or bore damage	• If damaged or parts are missing, install a new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Transmission fluid filter damaged or missing	• Inspect for damage. Repair as necessary.
Torque Converter	
• Internal component damage	• Remove transmission. Inspect for damage. Refer to Torque Converter Contamination Inspection in this section. If the torque converter fails to pass the checks or is damaged, install a new or remanufactured torque converter.
Direct Clutch Assembly	
• Seals, piston damaged	• Inspect or damage. Repair as necessary.
• Check ball damaged, missing, not seating, off location	• Inspect for mislocation, poor seating, damage. Install a new cylinder.
• Friction elements damaged or worn	• Inspect for damage. Repair as necessary.
• Return springs damaged	• Inspect for damage. Repair as necessary.
Reverse Servo	
• Servo retaining screws damaged	• Inspect for damage. Repair as necessary.
• Seals (piston and cover) damaged	• Inspect for damage. Repair as necessary.
Reverse Band	

• Band damaged	• Inspect for damage. Repair as necessary.
• Servo worn or damaged	• Inspect for damage. Repair as necessary.
Reverse Drum Assembly	
• One-Way Clutch (OWC) damaged	• Inspect for damage. Install a new drum assembly.
• Bearing damaged	• Inspect for damage. Install a new drum assembly.

Engagement Concern: Harsh Reverse Only

Possible Component	Reference/Action
203 - ROUTINE	
Powertrain Control System	
• PCM, vehicle wiring harnesses, Pressure Control Solenoid C (PCC)	• Carry out On-Board Diagnostic (OBD) Tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	• GO to Pinpoint Test D .
	• Repair as required. Clear the DTCs, road test and rerun OBD Test.
Incorrect Pressures	
• High pressure	• Carry out Line Pressure Test. Refer to Special Testing Procedures in this section.
Main Control	
• Screws not tightened to specification	• Tighten to specification.
• Separator plate damaged	• Inspect for damage. If damaged, install a new separator plate.
• Contamination	• Disassemble and clean.
• Valves, spring damaged, misassembled, missing, stuck or bore damaged	• If damaged or parts are missing, install a new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Transmission fluid filter damaged or missing	• Inspect for damage. Repair as necessary.

Direct Clutch Assembly	
• Seals, piston damaged	• Inspect for damage. Repair as necessary.
• Check ball damaged, missing not seating, off location	• Inspect for mislocation, poor seating, damage. Install a new cylinder.
• Friction elements damaged or worn	• Inspect for damage. Repair as necessary.
• Return springs damaged	• Inspect for damage. Repair as necessary.
Forward Clutch Assembly	
• Seals, piston damaged	• Inspect for damage. Repair as necessary.
• Check ball damaged, missing, not seating, off location	• Inspect for mislocation, poor seating, damage. Install a new cylinder.
• Friction elements damaged or worn	• Inspect for damage. Repair as necessary.
• Return springs damaged	• Inspect for damage. Repair as necessary.
• Bronze seal ring on bearing damaged	• Inspect for damage. Repair as necessary.
Reverse Servo	
• Servo retaining screws damaged	• Inspect for damage. Repair as necessary.
• Seals (piston and cover) damaged	• Inspect for damage. Repair as necessary.
Reverse Band	
• Band damaged	• Inspect for damage. Repair as necessary.
• Servo worn or damaged	• Inspect for damage. Repair as necessary.
Reverse Drum Assembly	
• One-Way Clutch (OWC) damaged	• Inspect for damage. Install a new drum assembly.
• Bearing damaged	• Inspect for damage. Install a new drum assembly.

Engagement Concern: Harsh Forward Only

Possible Component		Reference/Action
204A - ROUTINE		
Powertrain Control System		
	• PCM, vehicle wiring harnesses, Pressure Control Solenoid A (PCA), Pressure Control Solenoid C (PCC)	• Carry out On-Board Diagnostic (OBD) Tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
		• GO to Pinpoint Test D .
		• Repair as required. Clear the DTCs, road test and rerun OBD Test.
Incorrect Pressures		
	• High pressure	• Carry out Line Pressure Test. Refer to Special Testing Procedures in this section.
Main Control		
	• Screws not tightened to specification	• Tighten to specification.
	• Separator plate damaged	• Inspect for damage. If damaged, install a new separator plate.
	• Contamination	• Disassemble and clean.
	• Valves, springs damaged, misassembled, missing, stuck or bore damaged	• If damaged or parts are missing, install a new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
	• Transmission fluid filter damaged or missing	• Inspect for damage. Repair as necessary.
Center Support		
	• Screw not tightened to specification	• Tighten to specification.
	• Seal rings or bearing damaged	• Inspect for damage. Repair as necessary.
		• Inspect for damage. Repair as necessary.

	• Outside diameter of case bore damaged	
	• Support damaged or leaking	• Inspect for damage. Repair as necessary.
Forward Clutch Assembly		
	• Seals, piston damaged	• Inspect for damage. Repair as necessary.
	• Check ball damaged, missing, not seating, off location	• Inspect for mislocation, poor seating, damage. Install a new cylinder.
	• Friction elements damaged or worn	• Inspect for damage. Repair as necessary.
	• Return springs damaged	• Inspect for damage. Repair as necessary.
	• Bronze seal ring on bearing damaged	• Inspect for damage. Repair as necessary.

Engagement Concern: Harsh Manual 1st Gear Only

Possible Component	Reference/Action
204B - ROUTINE	
Powertrain Control System	
• PCM, vehicle wiring harnesses, Pressure Control Solenoid B (PCB), Turbine Shaft Speed (TSS) sensor	• Carry out On-Board Diagnostic (OBD) Tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	• GO to Pinpoint Test D and GO to Pinpoint Test E .
	• Repair as necessary. Clear the DTCs, road test and rerun OBD Test.

Engagement Concern: Delayed or Soft Reverse Only

Possible Component	Reference/Action
205 - ROUTINE	
Powertrain Control System	
• PCM, vehicle wiring harnesses, Pressure Control Solenoid C	• Carry out On-Board Diagnostic (OBD) Tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.

(PCC)	
	• GO to Pinpoint Test D .
	• Repair as required. Clear the DTCs, road test and rerun OBD Test.
Incorrect Pressures	
• Low pressure	• Carry out Line Pressure Test. Refer to Special Testing Procedures in this section.
Main Control	
• Screws not tightened to specification	• Tighten to specification.
• Separator plate damaged	• Inspect for damage. If damaged, install a new separator plate.
• Contamination	• Disassemble and clean.
• Valves, springs damaged, misassembled, missing, stuck or bore damaged	• If damaged or parts are missing, install a new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Transmission fluid filter damaged or missing	• Inspect for damage. Repair as necessary.
Direct Clutch Assembly	
• Seals, piston damaged	• Inspect for damage. Repair as necessary.
• Check ball damaged, missing not seating, off location	• Inspect for mislocation, poor seating, damage. Install a new cylinder.
• Friction elements damaged or worn	• Inspect for damage. Repair as necessary.
• Return springs damaged	• Inspect for damage. Repair as necessary.
Reverse Servo	
• Servo retaining screws damaged	• Inspect for damage. Repair as necessary.
• Seals (piston and cover) damaged	• Inspect for damage. Repair as necessary.
Reverse Band	

• Band damaged	• Inspect for damage. Repair as necessary.
• Servo worn or damaged	• Inspect for damage. Repair as necessary.

Engagement Concern: Delayed/Soft Forward Only

Possible Component	Reference/Action
206 - ROUTINE	
Powertrain Control System	
• PCM, vehicle wiring harnesses, Pressure Control Solenoid B (PCB)	• Carry out On-Board Diagnostic (OBD) Tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	• GO to Pinpoint Test D .
	• Repair as necessary. Clear the DTCs, road test and rerun OBD Test.
Incorrect Pressures	
• Low pressure	• Carry out Line Pressure Test. Refer to Special Testing Procedures in this section.
Main Control	
• Screws not tightened to specification	• Tighten to specification.
• Separator plate damaged	• Inspect for damage. If damaged, install a new separator plate.
• Contamination	• Disassemble and clean.
• Valves, spring damaged, misassembled, missing, stuck or bore damaged	• If damaged or parts are missing, install a new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Transmission fluid filter damaged or missing	• Inspect for damage. Repair as necessary.
Overdrive (O/D) Servo	
• Servo retaining screws damaged	• Inspect for damage. Repair as necessary.

• Seals (piston and cover) damaged	• Inspect for damage. Repair as necessary.
O/D Band	
• Band damaged	• Inspect for damage. Repair as necessary.
• Servo worn or damaged	• Inspect for damage. Repair as necessary.
• Not adjusted correctly	• Inspect for damage. Repair as necessary.
Center Support	
• Screw not tightened to specification	• Tighten to specification.
• Seal rings or bearing damaged	• Inspect for damage. Repair as necessary.
• Outside diameter of case bore damage	• Inspect for damage. Repair as necessary.
• Support damaged or leaking	• Inspect for damage. Repair as necessary.
Forward Clutch Assembly	
• Seals, piston damaged	• Inspect for damage. Repair as necessary.
• Check ball damaged, missing, not seating, off location	• Inspect for mislocation, poor seating, damage. Install a new cylinder.
• Friction element damaged or worn	• Inspect for damage. Repair as necessary.
• Return springs damaged	• Inspect for damage. Repair as necessary.
• Bronze seal ring on bearing damaged	• Inspect for damage. Repair as necessary.

Engagement Concern: No Forward and No Reverse

Possible Component	Reference/Action
207 - ROUTINE	
Powertrain Control System	

• PCM, vehicle wiring harnesses, Pressure Control Solenoid B (PCB)	• Carry out On-Board Diagnostic (OBD) Tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	• GO to Pinpoint Test D .
	• Repair as required. Clear the DTCs, road test and rerun OBD Test.
Transmission Fluid	
• Incorrect level	• Check the transmission fluid level. Adjust transmission fluid to the correct level. Refer to Transmission Fluid Level Check in this section.
• Condition	• Carry out Transmission Fluid Condition Check. Refer to Preliminary Inspection in this section.
Selector Lever Cable/Transmission Range (TR) Sensor	
• Selector lever cable system or TR sensor damaged, misaligned	• Inspect and repair as necessary. Refer to Transmission Range (TR) Sensor Adjustment in this section or Section 307-05 .
Main Control	
• Screws not tightened to specification	• Tighten screws to specification.
• Separator plate damaged	• Inspect for damage. If damaged, install a new separator plate.
• Contamination	• Disassemble and clean.
• Valve, springs damaged, misassembled, missing, stuck or bore damaged	• If damaged or parts are missing, install new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Transmission fluid filter damaged or missing	• Inspect for damage. Repair as necessary.
Torque Converter	
• Damaged flexplate or adapter plate	• Inspect for damage. Remove transmission.
• Damaged impeller hub • Damaged turbine hub	• Refer to Torque Converter Contamination Inspection in this section. If the torque converter fails to pass the checks or is damaged, install a new or remanufactured torque converter.

Input Shaft	
• Damaged	• Inspect for damage. Repair as necessary.
Pump Assembly	
• Screws not tightened to specification	• Tighten screws to specification.
• Gasket damaged	• Inspect for damage. If damaged, install a new gasket.
• Porosity, cross leaks, ball missing, plugged hole	• Inspect for damage. If damaged, repair as necessary.
• Pump gears cracked and/or seized	• Inspect for damage. Install a new pump.
• Flow control valves, springs or seals damaged, stuck or not assembled correctly	• Inspect for damage. Install a new seal or flow control valve.
Overdrive (O/D) Planetary Assembly	
• Planetary damaged	• Inspect for damage. Repair as necessary.
Center Shaft Assembly	
• Damaged. One-Way Clutch (OWC) damaged	• Inspect for damage. Repair as necessary.
Forward Clutch Assembly	
• Seals, piston damaged	• Inspect for damage. Repair as necessary.
• Check ball damaged, missing, not seating, off location	• Inspect for mislocation, poor seating, damage. Install a new cylinder.
• Friction elements damaged or worn	• Inspect for damage. Repair as necessary.
• Return springs damaged	• Inspect for damage. Repair as necessary.
• Bronze seal ring on bearing damaged	• Inspect for damage. Repair as necessary.
Forward Planetary Assembly	
• Planetary damaged	• Inspect for damage. Repair as necessary.

Reverse Planetary Assembly	
• Planetary damaged	• Inspect for damage. Repair as necessary.
Output Shaft	
• Damage	• Inspect for damage. Repair as necessary.
Direct OWC	
• Worn, damaged or assembled incorrectly	• Inspect for damage. Repair as necessary.

Engagement Concern: Harsh Forward and Harsh Reverse

Possible Component	Reference/Action
208 - ROUTINE	
Powertrain Control System	
• PCM, vehicle wiring harnesses, Transmission Range (TR) sensor, Transmission Fluid Temperature (TFT) sensor	• Carry out On-Board Diagnostic (OBD) Tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	• GO to Pinpoint Test B and GO to Pinpoint Test C .
	• Repair as necessary. Clear the DTCs, road test and rerun OBD Test.
Transmission Fluid	
• Incorrect level	• Check the transmission fluid level. Adjust transmission fluid to the correct level. Refer to Transmission Fluid Level Check in this section.
• Condition	• Carry out Transmission Fluid Condition Check. Refer to Preliminary Inspection in this section.
Incorrect Pressures	
• High pressure	• Carry out Line Pressure Test. Refer to Special Testing Procedures in this section.
Main Control	
• Screws not tightened to specification	• Tighten to specification.
• Separator plate damaged	• Inspect for damage. If damaged, install a new separator plate.

• Contamination	• Disassemble and clean.
• Valves, springs damaged, misassembled, missing, stuck or bore damaged	• If damaged or parts are missing, install new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Transmission fluid filter damaged or missing	• Inspect for damage. Repair as necessary.
Forward Clutch Assembly	
• Seals, piston damaged	• Inspect for damage. Repair as necessary.
• Check ball damaged, missing, not seating, off location	• Inspect for mislocation, poor seating, damage. Install a new cylinder.
• Friction elements damaged or worn	• Inspect for damage. Repair as necessary.
• Return springs damaged	• Inspect for damage. Repair as necessary.
• Bronze seal ring on bearing damaged	• Inspect for damage. Repair as necessary.

Engagement Concern: Delayed Forward and Delayed Reverse

Possible Component	Reference/Action
209 - ROUTINE	
Powertrain Control System	
• PCM, vehicle wiring harnesses, Transmission Fluid Temperature (TFT) sensor	• Carry out On-Board Diagnostic (OBD) Tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	• GO to Pinpoint Test B .
	• Repair as necessary. Clear the DTCs, road test and rerun OBD Test.
Transmission Fluid	
• Incorrect level	• Check the transmission fluid level. Adjust transmission fluid to the correct level. Refer to Transmission Fluid Level Check in this section.

• Condition	• Carry out Transmission Fluid Condition Check. Refer to Preliminary Inspection in this section.
Incorrect Pressures	
• High pressure	• Carry out Line Pressure Test. Refer to Special Testing Procedures in this section.
Main Control	
• Screws not tightened to specification	• Tighten to specification.
• Separator plate damaged	• Inspect for damage. If damaged, install a new separator plate.
• Contamination	• Disassemble and clean.
• Valves and springs damaged, misassembled, missing, stuck or bore damaged	• If damaged or parts are missing, install a new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Transmission fluid filter damaged or missing	• Inspect for damage. Repair as necessary.
Pump Assembly	
• Screws not tightened to specification	• Tighten screws to specification.
• Gasket damaged	• Inspect for damage. If damaged, install a new gasket.
• Porosity, cross leaks, ball missing, plugged hole	• Inspect for damage. If damaged, repair as necessary.
• Pump gears cracked and/or seized	• Inspect for damage. Install a new pump.
• Flow control valves, springs or seals damaged, stuck or not assembled correctly	• Inspect for damage. Install a new seal or flow control valve.

Shift Concern: Some/All Shifts Missing (Automatic Mode Only)

Possible Component	Reference/Action

210 - ROUTINE	
Powertrain Control System	
• PCM, vehicle wiring harnesses, Shift Solenoid A (SSA), Shift Solenoid B (SSB), Shift Solenoid C (SSC), Torque Converter Clutch (TCC) solenoid, Pressure Control Solenoid A (PCA), Pressure Control Solenoid B (PCB), Pressure Control Solenoid C (PCC), Output Shaft Speed (OSS) sensor, Transmission Range (TR) sensor, Intake Air Temperature (IAT) sensor, Vehicle Speed Sensor (VSS) input	• Carry out On-Board Diagnostic (OBD) Tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM, IAT and VSS .
	• GO to Pinpoint Test A , GO to Pinpoint Test C , GO to Pinpoint Test D and GO to Pinpoint Test E .
	• Repair as necessary. Clear the DTCs, road test and rerun OBD Test.
Some Shifts Missing Only	
	• If only some shifts are missing, determine which shift(s) is missing.
	• Refer to the following routine(s) for further No Shift concerns: ♦ No 1-2 Shift, Routine 220 ♦ No 2-3 Shift, Routine 221 ♦ No 3-4 Shift, Routine 222 ♦ No 4-5 Shift, Routine 270 ♦ No 5-4 Shift, Routine 271 ♦ No 4-3 Shift, Routine 223 ♦ No 3-2 Shift, Routine 224 ♦ No 2-1 Shift, Routine 225
Transmission Fluid	
• Incorrect level	• Check the transmission fluid level. Adjust transmission fluid to correct level, refer to Transmission Fluid Level Check in this section.
• Condition	• Carry out Transmission Fluid Condition Check. Refer to Preliminary Inspection in this section.
Selector Lever Cable/ TR Sensor	
• Selector Lever Cable system or TR sensor damaged, misaligned	• Inspect and repair as necessary. Refer to Section 307-05 .
Incorrect Pressures	

• High/low pressure	• Carry out Line Pressure Test. Refer to Special Testing Procedures in this section.
Main Control	
• Screws not tightened to specification	• Tighten to specification.
• Separator plate damaged	• Inspect for damage. If damaged, install a new separator plate.
• Contamination	• Disassemble and clean.
• Valve, springs damaged, misassembled, missing, stuck or bore damaged	• If damaged or parts are missing, install new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Transmission fluid filter damaged or missing	• Inspect for damage. Repair as necessary.
Pump Assembly	
• Screws not tightened to specification	• Tighten screws to specification.
• Gasket damaged	• Inspect for damage. If damaged, install a new gasket.
• Porosity, cross leaks, ball missing, plugged hole	• Inspect for damage. If damaged, repair as necessary.
• Pump gears cracked and/or seized	• Inspect for damage. Install a new pump.
• Flow control valves, springs or seals damaged, stuck or not assembled correctly	• Inspect for damage. Install a new seal or flow control valve.
Overdrive (O/D) Planetary Assembly	
• Planetary damaged	• Inspect for damage. Repair as necessary.
Center Support	
• Screw not tightened to specification	• Tighten to specification.
• Seal rings or bearing damaged	• Inspect for damage. Repair as necessary.
• Outside diameter of case bore damaged	• Inspect for damage. Repair as necessary.

• Support damaged or leaking	• Inspect for damage. Repair as necessary.
Direct Clutch Assembly	
• Seals, piston damaged	• Inspect for damage. Repair as necessary.
• Check ball damaged, missing, not seating, off location	• Inspect for mislocation, poor seating, damage. Install a new cylinder.
• Friction elements damaged or worn	• Inspect for damage. Repair as necessary.
• Return springs damaged	• Inspect for damage. Repair as necessary.

Shift Concern: Timing Concerns - Early/Late

Possible Component	Reference/Action
211 - ROUTINE	
Powertrain Control System	
• PCM, vehicle wiring harnesses, Output Shaft Speed (OSS) sensor, Intake Air Temperature (IAT) sensor	• Carry out On-Board Diagnostic (OBD) Tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM and IAT .
	• GO to Pinpoint Test E .
	• Repair as necessary. Clear the DTCs, road test and rerun OBD Test.
Some Shifts Early/Late Only	
	• If only some shifts are early/late, determine which shift(s) is missing.
	• Refer to the following routine(s) for further No Shift concerns: ♦ Soft/Slipping 1-2 Shift, Routine 226 ♦ Soft/Slipping 2-3 Shift, Routine 227 ♦ Soft/Slipping 3-4 Shift, Routine 228 ♦ Soft/Slipping 4-5 Shift, Routine 272 ♦ Soft/Slipping 5-4 Shift, Routine 273 ♦ Soft/Slipping 4-3 Shift, Routine 229 ♦ Soft/Slipping 3-2 Shift, Routine 230 ♦ Soft/Slipping 2-1 Shift, Routine 221
Transmission Fluid	

• Incorrect level	• Check the transmission fluid level. Adjust transmission fluid to the correct level. Refer to Transmission Fluid Level Check in this section.
• Condition	• Carry out Transmission Fluid Condition Check. Refer to Preliminary Inspection in this section.
Main Control	
• Screws not tightened to specification	• Tighten to specification.
• Separator plate damaged	• Inspect for damage. If damaged, install a new separator plate.
• Contamination	• Disassemble and clean.
• Valve, springs damaged, misassembled, missing, stuck or bore damaged	• If damaged or parts are missing, install new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Transmission fluid filter damaged or missing	• Inspect for damage. Repair as necessary.
Overdrive (O/D) Servo	
• Servo retaining screws damaged	• Inspect for damage. Repair as necessary.
• Seals (piston and cover) damaged	• Inspect for damage. Repair as necessary.
O/D Band	
• Band damaged	• Inspect for damage. Repair as necessary.
• Servo worn or damaged	• Inspect for damage. Repair as necessary.
• Not adjusted correctly	• Inspect for damage. Repair as necessary.

Shift Concern: Timing Concerns - Erratic/Hunting (Some/All)

Possible Component	Reference/Action
212 - ROUTINE	
Powertrain Control System	
• PCM, vehicle wiring harnesses, Output Shaft Speed (OSS) sensor, Intake Air Temperature (IAT)	• Carry out Overdrive (O/D) Tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM and IAT .

sensor	
	• GO to Pinpoint Test E .
	• Repair as necessary. Clear the DTCs, road test and rerun OBD Test.
Transmission Fluid	
• Incorrect level	• Check the transmission fluid level. Adjust transmission fluid to the correct level. Refer to Transmission Fluid Level Check in this section.
• Condition	• Carry out Transmission Fluid Condition Check. Refer to Preliminary Inspection in this section.
Main Control	
• Screws not tightened to specification	• Tighten to specification.
• Separator plate damaged	• Inspect for damage. If damaged, install a new separator plate.
• Contamination	• Disassemble and clean.
• Valve, springs damaged, misassembled, missing, stuck or bore damaged	• If damaged or parts are missing, install new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Transmission fluid filter damaged or missing	• Inspect for damage. Repair as necessary.
Overdrive (O/D) Servo	
• Servo retaining screws damaged	• Inspect for damage. Repair as necessary.
• Seals (piston and cover) damaged	• Inspect for damage. Repair as necessary.
Further Diagnosis	
• For further diagnosis for timing issues, refer to Reference/Actions	• Refer to the following routine(s) for specific diagnosis: ♦ No 1-2 Shift, Routine 220 ♦ No 2-3 Shift, Routine 221 ♦ No 3-4 Shift, Routine 222 ♦ No 4-5 Shift, Routine 270 ♦ No 5-4 Shift, Routine 271 ♦ No 4-3 Shift, Routine 223 ♦ No 3-2 Shift, Routine 224

		♦ No 2-1 Shift, Routine 225 ♦ Soft/Slip 1-2 Shift, Routine 226 ♦ Soft/Slip 2-3 Shift, Routine 227 ♦ Soft/Slip 3-4 Shift, Routine 228 ♦ Soft/Slip 4-5 Shift, Routine 272 ♦ Soft/Slip 5-4 Shift, Routine 273 ♦ Soft/Slip 4-3 Shift, Routine 229 ♦ Soft/Slip 3-2 Shift, Routine 230 ♦ Soft/Slip 2-1 Shift, Routine 231 ♦ Harsh 1-2 Shift, Routine 232 ♦ Harsh 2-3 Shift, Routine 233 ♦ Harsh 3-4 Shift, Routine 234 ♦ Harsh 4-5 Shift, Routine 274 ♦ Harsh 5-4 Shift, Routine 275 ♦ Harsh 4-3 Shift, Routine 235 ♦ Harsh 3-2 Shift, Routine 236 ♦ Harsh 2-1 Shift, Routine 237

Engagement Concern: Feel - Soft/Slipping (Some/All)

Possible Component		Reference/Action
213 - ROUTINE		
Powertrain Control System		
	• PCM, vehicle wiring harnesses, Shift Solenoid A (SSA), Shift Solenoid B (SSB), Shift Solenoid C (SSC), Shift Solenoid D (SSD), Pressure Control Solenoid A (PCA), Pressure Control Solenoid B (PCB), Pressure Control Solenoid C (PCC), intermediate shaft speed sensor, Transmission Fluid Temperature (TFT) sensor, Intake Air Temperature (IAT) sensor, Vehicle Speed Sensor (VSS) input	• Carry out On-Board Diagnostic (OBD) Tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM, IAT and VSS .
		• GO to Pinpoint Test A , GO to Pinpoint Test B , GO to Pinpoint Test D and GO to Pinpoint Test E .
		• Repair as necessary. Clear the DTCs, road test and rerun OBD Test.
Some Shifts Soft/Slipping Only		
		• If only some of the shifts are soft/slipping, determine which shift(s) is missing.

		• Refer to the following routine(s) for further Soft/Slipping concerns: ♦ Soft/Slipping 1-2 Shift, Routine 226 ♦ Soft/Slipping 2-3 Shift, Routine 227 ♦ Soft/Slipping 3-4 Shift, Routine 228 ♦ Soft/Slipping 4-5 Shift, Routine 272 ♦ Soft/Slipping 5-4 Shift, Routine 273 ♦ Soft/Slipping 4-3 Shift, Routine 229 ♦ Soft/Slipping 3-2 Shift, Routine 230 ♦ Soft/Slipping 2-1 Shift, Routine 231
Transmission Fluid		
	• Incorrect level	• Check the transmission fluid level. Adjust transmission fluid to the correct level. Refer to Transmission Fluid Level Check in this section.
	• Condition	• Carry out Transmission Fluid Condition Check. Refer to Preliminary Inspection in this section.
Incorrect Pressures		
	• High/low pressure	• Carry out Line Pressure Test. Refer to Special Testing Procedures in this section.
Main Control		
	• Screws not tightened to specification	• Tighten to specification.
	• Separator plate damaged	• Inspect for damage. If damaged, install a new separator plate.
	• Contamination	• Disassemble and clean.

	• Valves, springs damaged, misassembled, missing, stuck or bore damaged	• If damaged or parts are missing, install new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
	• Transmission fluid filter damaged or missing	• Inspect for damage. Repair as necessary.
Torque Converter		
	• Internal component damage	• Remove transmission. Inspect for damage. Refer to Torque Converter Contamination Inspection in this section. If the torque converter fails to pass the criteria or is damaged, install a new or remanufactured torque converter.
Pump Assembly		
	• Screws not tightened to specification	• Tighten screws to specification.
	• Gasket damaged	• Inspect for damage. If damaged, install a new gasket.
	• Porosity, cross leaks, ball missing, plugged hole	• Inspect for damage. If damaged, repair as necessary.
	• Pump gears cracked and/or seized	• Inspect for damage. Install a new pump.
	• Flow control valves, springs or seals damaged, stuck or not assembled correctly	• Inspect for damage. Install a new seal or flow control valve.
Coast Clutch Assembly		
	• Seals, piston damaged	• Inspect for damage. Repair as necessary.

	• Check ball damaged, missing, not seating, off location	• Inspect for mislocation, poor seating, damage. Install a new cylinder.
	• Friction elements damaged or worn	• Inspect for damage. Repair as necessary.
	• Return springs damaged	• Inspect for damage. Repair as necessary.
Center Support		
	• Screw not tightened to specification	• Tighten to specification.
	• Seal rings or bearings damaged	• Inspect for damage. Repair as necessary.
	• Outside diameter of case bore damage	• Inspect for damage. Repair as necessary.
	• Support damaged or leaking	• Inspect for damage. Repair as necessary.
Intermediate Servo		
	• Servo retaining screws damaged	• Inspect for damage. Repair as necessary.
	• Seals (piston and cover) damaged	• Inspect for damage. Repair as necessary.
Intermediate Band		
	• Band damaged	• Inspect for damage. Repair as necessary.
	• Servo worn or damaged	• Inspect for damage. Repair as necessary.
	• Not adjusted correctly	• Inspect for damage. Repair as necessary.
Direct Clutch Assembly		
	• Seals, piston damaged	• Inspect for damage. Repair as necessary.
	• Check ball damaged, missing, not seating, off location	• Inspect for mislocation, poor seating, damage. Install a new cylinder.
	• Friction elements damaged or worn	• Inspect for damage. Repair as necessary.

	• Return springs damaged	• Inspect for damage. Repair as necessary.
Forward Clutch Assembly		
	• Seals, piston damaged	• Inspect for damage. Repair as necessary.
	• Check ball damaged, missing, not seating, off location	• Inspect for mislocation, poor seating, damage. Install a new cylinder.
	• Friction elements damaged or worn	• Inspect for damage. Repair as necessary.
	• Return springs damaged	• Inspect for damage. Repair as necessary.
	• Bronze seal ring on bearing damaged	• Inspect for damage. Repair as necessary.
Reverse Servo		
	• Servo retaining screws damaged	• Inspect for damage. Repair as necessary.
	• Seals (piston and cover) damaged	• Inspect for damage. Repair as necessary.
Reverse Band		
	• Band damaged	• Inspect for damage. Repair as necessary.
	• Servo worn or damaged	• Inspect for damage. Repair as necessary.
	• Not adjusted correctly	• Inspect for damage. Repair as necessary.
Case		
	• Damaged	• Inspect for damage. Repair as necessary.

Shift Concern: Feel - Harsh (Some/All)

Possible Component	Reference/Action
214 - ROUTINE	
Powertrain Control System	

• PCM, vehicle wiring harnesses, Shift Solenoid A (SSA), Shift Solenoid B (SSB), Shift Solenoid C (SSC), Shift Solenoid D (SSD), Pressure Control Solenoid A (PCA), Pressure Control Solenoid B (PCB), Pressure Control Solenoid C (PCC), intermediate shaft speed sensor, Transmission Range (TR) sensor, Transmission Fluid Temperature (TFT) sensor, Intake Air Temperature (IAT) sensor, Vehicle Speed Sensor (VSS) input	• Carry out On-Board Diagnostic (OBD) Tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM, IAT and VSS .
	• GO to Pinpoint Test A , GO to Pinpoint Test B , GO to Pinpoint Test D and GO to Pinpoint Test E .
	• Repair as necessary. Clear the DTCs, road test and rerun OBD Test.
Some Shifts Harsh Only	
	• If only some of the shifts are harsh, determine which shift(s) is missing.
	• Refer to the following routine(s) for further No Shift concerns: ♦ Harsh 1-2 Shift, Routine 232 ♦ Harsh 2-3 Shift, Routine 233 ♦ Harsh 3-4 Shift, Routine 234 ♦ Harsh 4-5 Shift, Routine 274 ♦ Harsh 5-4 Shift, Routine 275 ♦ Harsh 4-3 Shift, Routine 235 ♦ Harsh 3-2 Shift, Routine 236 ♦ Harsh 2-1 Shift, Routine 237
Transmission Fluid	
• Incorrect level	• Check transmission fluid level. Adjust transmission fluid to the correct level. Refer to Transmission Fluid Level Check in this section.
• Condition	• Carry out Transmission Fluid Condition Check. Refer to Preliminary Inspection in this section.
Incorrect Pressures	
• High/low pressure	• Carry out Line Pressure Test. Refer to Special Testing Procedures in this section.
Main Control	

• Screws not tightened to specification	• Tighten to specification.
• Separator plate damaged	• Inspect for damage. If damaged, install a new separator plate.
• Contamination	• Disassemble and clean.
• Valves, springs damaged, misassembled, missing, stuck or bore damaged	• If damaged or parts are missing, install new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Transmission fluid filter damaged or missing	• Inspect for damage. Repair as necessary.
Input Shaft	
• Damaged	• Inspect for damage. Install new as necessary.
Overdrive (O/D) Servo	
• Servo retaining screws damaged	• Inspect for damage. Repair as necessary.
• Seals (piston and cover) damaged	• Inspect for damage. Repair as necessary.
O/D Band	
• Band damaged	• Inspect for damage. Repair as necessary.
• Servo worn or damaged	• Inspect for damage. Repair as necessary.
• Not adjusted correctly	• Inspect for damage. Repair as necessary.
Center Shaft Assembly	
• Center shaft assembly damaged	• Inspect for damage. Repair as necessary.
• One-Way Clutch (OWC) damaged	• Inspect for damage. Repair as necessary.
Center Support	
• Screw not tightened to specification	• Tighten to specification.
Intermediate Servo	

• Servo retaining screws damaged	• Inspect for damage. Repair as necessary.
• Seals (piston and cover) damaged	• Inspect for damage. Repair as necessary.
Intermediate Band	
• Band damaged	• Inspect for damage. Repair as necessary.
• Servo worn or damaged	• Inspect for damage. Repair as necessary.
• Not adjusted correctly	• Inspect for damage. Repair as necessary.
Forward Clutch Assembly	
• Seals, piston damaged	• Inspect for damage. Repair as necessary.
• Check ball damaged, missing, not seating, off location	• Inspect for mislocation, poor seating, damage. Install a new cylinder.
• Friction elements damaged or worn	• Inspect for damage. Repair as necessary.
• Return springs damaged	• Inspect for damage. Repair as necessary.
• Bronze seal ring on bearing damaged	• Inspect for damage. Repair as necessary.
Reverse Servo	
• Servo retaining screws damaged	• Inspect for damage. Repair as necessary.
• Seals (piston and cover) damaged	• Inspect for damage. Repair as necessary.
Reverse Band	
• Band damaged	• Inspect for damage. Repair as necessary.
• Servo worn or damaged	• Inspect for damage. Repair as necessary.
• Not adjusted correctly	• Inspect for damage. Repair as necessary.
Output Shaft	

• Damaged	• Inspect for damage. Install new as necessary.
Case	
• Damaged	• Inspect for damage. Repair as necessary.

Shift Concern: No 1st Gear in Drive, Engages in a Higher Gear

Possible Component	Reference/Action
215 - ROUTINE	
Powertrain Control System	
• PCM, vehicle wiring harnesses, Shift Solenoid A (SSA), Shift Solenoid B (SSB), Shift Solenoid C (SSC), Transmission Range (TR) sensor	• Carry out On-Board Diagnostic (OBD) Tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	• GO to Pinpoint Test A and GO to Pinpoint Test C .
	• Repair as necessary. Clear the DTCs, road test and rerun OBD Test.
Incorrect Pressures	
• High/low pressure	• Carry out Line Pressure Test. Refer to Special Testing Procedures in this section.
Main Control	
• Screws not tightened to specification	• Tighten to specification.
• Separator plate damaged	• Inspect for damage. If damaged, install a new separator plate.
• Contamination	• Disassemble and clean.
• Valves/springs damaged, misassembled, missing, stuck or bore damaged	• If damaged or parts are missing, install new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Transmission fluid filter damaged or missing	• Inspect for damage. Repair as necessary.
Overdrive (O/D) Servo	

• Servo retaining screws damaged	• Inspect for damage. Repair as necessary.
• Seals (piston and cover) damaged	• Inspect for damage. Repair as necessary.
Direct One-Way Clutch (OWC)	
• Worn, damaged or assembled incorrectly	• Inspect for damage. Repair as necessary.
Low OWC	
• Worn, damaged or assembled incorrectly	• Inspect for damage. Repair as necessary.

Engagement Concern: No 1st Gear in Manual 1 Position

Possible Component	Reference/Action
216 - ROUTINE	
Powertrain Control System	
• PCM, vehicle wiring harnesses, Shift Solenoid A (SSA), Shift Solenoid B (SSB), Pressure Control Solenoid B (PCB), Pressure Control Solenoid C (PCC)	• Carry out On-Board Diagnostic (OBD) Tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	• GO to Pinpoint Test A and GO to Pinpoint Test D .
	• Repair as necessary. Clear the DTCs, road test and rerun OBD Test.
Incorrect Pressures	
• High/low pressure	• Carry out Line Pressure Test. Refer to Special Testing Procedures in this section.
Main Control	
• Screws not tightened to specification	• Tighten to specification.
• Separator plate damaged	• Inspect for damage. If damaged, install a new separator plate.
• Contamination	• Disassemble and clean.
• Valves, springs damaged, misassembled, missing, stuck or bore damaged	• If damaged or parts are missing, install new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will

	remove the anodized finish and may result in further main control or transmission damage.
• Transmission fluid filter damaged or missing	• Inspect for damage. Repair as necessary.
Overdrive (O/D) Planetary Assembly	
• Planetary damaged	• Inspect for damage. Repair as necessary.
Direct One-Way Clutch (OWC)	
• Worn, damaged or assembled incorrectly	• Inspect for damage. Repair as necessary.
Low OWC	
• Worn, damaged or assembled incorrectly	• Inspect for damage. Repair as necessary.

Shift Concern: No 2nd Gear in Manual 2 Position

Possible Component	Reference/Action
217 - ROUTINE	
Powertrain Control System	
• PCM, vehicle wiring harnesses, Shift Solenoid A (SSA), Shift Solenoid B (SSB), Shift Solenoid C (SSC), Pressure Control Solenoid B (PCB)	• Carry out On-Board Diagnostic (OBD) Tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	• GO to Pinpoint Test A and GO to Pinpoint Test D .
	• Repair as necessary. Clear the DTCs, road test and rerun OBD Test.
Incorrect Pressures	
• High/low pressure	• Carry out Line Pressure Test. Refer to Special Testing Procedures in this section.
Main Control	
• Screws not tightened to specification.	• Tighten to specification.
• Separator plate damaged	• Inspect for damage. If damaged, install a new separator plate.
• Contamination	• Disassemble and clean.

• Valves, springs damaged, misassembled, missing, stuck or bore damaged	• If damaged or parts are missing, install a new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Transmission fluid filter damaged or missing	• Inspect for damage. Repair as necessary.
Overdrive (O/D) Servo	
• Servo retaining screws damaged	• Inspect for damage. Repair as necessary.
• Seals (piston and cover) damaged	• Inspect for damage. Repair as necessary.
• Not adjusted correctly	• Inspect for damage. Repair as necessary.
O/D Band	
• Band damaged	• Inspect for damage. Repair as necessary.
• Servo worn or damaged	• Inspect for damage. Repair as necessary.
• Not adjusted correctly	• Inspect for damage. Repair as necessary.
Direct One-Way Clutch (OWC)	
• Worn, damaged or assembled incorrectly	• Inspect for damage. Repair as necessary.
Low OWC	
• Worn, damaged or assembled incorrectly	• Inspect for damage. Repair as necessary.

Shift Concern: No 1-2 Shift

Possible Component	Reference/Action
220 - ROUTINE	
Powertrain Control System	
• PCM, vehicle wiring harnesses, Shift Solenoid C (SSC), Pressure Control Solenoid B (PCB), Output Shaft Speed (OSS) sensor, Transmission Range (TR) sensor, Vehicle Speed Sensor (VSS) input	• Carry out On-Board Diagnostic (OBD) Tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM and VSS .
	• GO to Pinpoint Test A , GO to Pinpoint Test C , GO to Pinpoint Test D and GO to Pinpoint Test E .

	• Repair as required. Clear the DTCs, road test and rerun OBD Test.
Transmission Fluid	
• Incorrect level	• Check transmission fluid level. Adjust transmission fluid to correct level. Refer to Transmission Fluid Level Check in this section.
Incorrect Pressures	
• High/low pressure	• Carry out Line Pressure Test. Refer to Special Testing Procedures in this section.
Main Control	
• Screws not tightened to specification	• Tighten to specification.
• Separator plate damaged	• Inspect for damage. If damaged, install a new separator plate.
• Contamination	• Disassemble and clean.
• Valve/springs damaged, misassembled, missing, stuck or bore damaged	• If damaged or parts are missing, install new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Transmission fluid filter damaged or missing	• Inspect for damage. Repair as necessary.
Overdrive (O/D) Servo	
• Servo retaining screws damaged	• Inspect for damage. Repair as necessary.
• Seals (piston and cover) damaged	• Inspect for damage. Repair as necessary.
• Servo bore	• Inspect for damage. Repair as necessary.
O/D Band	
• Band damaged	• Inspect for damage. Repair as necessary.
• Servo worn or damaged	• Inspect for damage. Repair as necessary.
• Not adjusted correctly	• Inspect for damage. Repair as necessary.
O/D Planetary Assembly	
• Planetary damaged	• Inspect for damage. Repair as necessary.

Shift Concern: No 2-3 Shift

Possible Component	Reference/Action
221 - ROUTINE	
Powertrain Control System	
• PCM, vehicle wiring harnesses, Shift Solenoid B (SSB), Torque Converter Clutch (TCC) solenoid, Pressure Control Solenoid A (PCA), Output Shaft Speed (OSS) sensor, Transmission Range (TR) sensor	• Carry out On-Board Diagnostic (OBD) Tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	• GO to Pinpoint Test A , GO to Pinpoint Test C , GO to Pinpoint Test D and GO to Pinpoint Test E .
	• Repair as required. Clear the DTCs, road test and rerun OBD Test.
Incorrect Pressures	
• High/low pressure	• Carry out Line Pressure Test. Refer to Special Testing Procedures in this section.
Main Control	
• Screws not tightened to specification	• Tighten to specification.
• Separator plate damaged	• Inspect for damage. If damaged, install a new separator plate.
• Contamination	• Disassemble and clean.
• Valve/springs damaged, misassembled, missing, stuck or bore damaged	• If damaged or parts are missing, install new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Transmission fluid filter damaged or missing	• Inspect for damage. Repair as necessary.
Forward Clutch Assembly	
• Seals, piston damaged	• Inspect for damage. Repair as necessary.
• Check ball, damaged, missing, not seating, off location	• Inspect for mislocation, poor seating, damage. Install a new cylinder.
• Friction elements damaged or worn	• Inspect for damage. Repair as necessary.
• Return springs damaged	• Inspect for damage. Repair as necessary.

• Bronze seal ring on bearing damaged	• Inspect for damage. Repair as necessary.
Intermediate Servo	
• Servo retaining screws damaged	• Inspect for damage. Repair as necessary.
• Seals (piston and cover) damaged	• Inspect for mislocation, poor seating, damage. Install a new cylinder.
• Servo bore	• Inspect for damage. Repair as necessary.
Intermediate Band	
• Band damaged	• Inspect for damage. Repair as necessary.
• Servo worn or damaged	• Inspect for damage. Repair as necessary.
• Not adjusted correctly	• Inspect for damage. Repair as necessary.

Shift Concern: No 3-4 Shift

Possible Component	Reference/Action
222 - ROUTINE	
Powertrain Control System	
• PCM, vehicle wiring harnesses, Shift Solenoid A (SSA), Pressure Control Solenoid C (PCC), Output Shaft Speed (OSS) sensor, Transmission Range (TR) sensor	• Carry out On-Board Diagnostic (OBD) Tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	• GO to Pinpoint Test A , GO to Pinpoint Test C , GO to Pinpoint Test D and GO to Pinpoint Test E .
	• Repair as required. Clear the DTCs, road test and rerun OBD Test.
Incorrect Pressures	
• High/low pressure	• Carry out Line Pressure Test. Refer to Special Testing Procedures in this section.
Main Control	
• Screws not tightened to specification	• Tighten to specification.
• Separator plate damaged	• Inspect for damage. If damaged, install a new separator plate.

• Contamination	• Disassemble and clean.
• Valve/springs damaged, misassembled, missing, stuck or bore damaged	• If damaged or parts are missing, install new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Transmission fluid filter damaged or missing	• Inspect for damage. Repair as necessary.
Center Support	
• Screws not tightened to specification	• Tighten to specification.
• Seal rings or bearing damaged	• Inspect for damage. Repair as necessary.
• Outside diameter of case bore damaged	• Inspect for damage. Repair as necessary.
• Support damaged or leaking	• Inspect for damage. Repair as necessary.
Direct Clutch Assembly	
• Seals, piston damaged	• Inspect for damage. Repair as necessary.
• Check ball damaged, missing, not seating, off location	• Inspect for mislocation, poor seating, damage. Install a new cylinder.
• Friction elements damaged or worn	• Inspect for damage. Repair as necessary.
• Return springs damaged	• Inspect for damage. Repair as necessary.
Forward Clutch Assembly	
• Seals, piston damaged	• Inspect for damage. Repair as necessary.
• Check ball damaged, missing, not seating, off location	• Inspect for mislocation, poor seating, damage. Install a new cylinder.
• Friction elements damaged or worn	• Inspect for damage. Repair as necessary.
• Return springs damaged	• Inspect for damage. Repair as necessary.
• Bronze seal ring on bearing damaged	• Inspect for damage. Repair as necessary.
Intermediate Servo	
• Servo retaining screws damaged	• Inspect for damage. Repair as necessary.
• Seals (piston and cover) damaged	

	• Inspect for mislocation, poor seating, damage. Install a new cylinder.

Shift Concern: No 4-3 Shift

Possible Component	Reference/Action
223 - ROUTINE	
Powertrain Control System	
• PCM, vehicle wiring harnesses, Shift Solenoid A (SSA), Shift Solenoid B (SSB), Pressure Control Solenoid A (PCA), Output Shaft Speed (OSS) sensor, Transmission Range (TR) sensor	• Carry out On-Board Diagnostic (OBD) Tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	• GO to Pinpoint Test A , GO to Pinpoint Test C , GO to Pinpoint Test D and GO to Pinpoint Test E .
	• Repair as required. Clear the DTCs, road test and rerun OBD Test.
Incorrect Pressures	
• High/low pressure	• Carry out Line Pressure Test. Refer to Special Testing Procedures in this section.
Main Control	
• Screws not tightened to specification	• Tighten to specification.
• Separator plate damaged	• Inspect for damage. If damaged, install a new separator plate.
• Contamination	• Disassemble and clean.
• Valves/springs damaged, misassembled, missing, stuck or bore damaged	• If damaged or parts are missing, install new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Transmission fluid filter damaged or missing	• Inspect for damage. Repair as necessary.
Intermediate Servo	
• Servo retaining screws damaged	• Inspect for damage. Repair as necessary.
• Seals (piston and cover) damaged	• Inspect for damage. Repair as necessary.

• Servo bore	• Inspect for damage. Repair as necessary.
Intermediate Band	
• Band damaged	• Inspect for damage. Repair as necessary.
• Servo worn or damaged	• Inspect for damage. Repair as necessary.
• Not adjusted correctly	• Inspect for damage. Repair as necessary.

Shift Concern: No 3-2 Shift

Possible Component	Reference/Action
224 - ROUTINE	
Powertrain Control System	
• PCM, vehicle wiring harnesses, Shift Solenoid C (SSC), Pressure Control Solenoid B (PCB), Output Shaft Speed (OSS) sensor, Transmission Range (TR) sensor	• Carry out On-Board Diagnostic (OBD) Tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	• GO to Pinpoint Test A , GO to Pinpoint Test C , GO to Pinpoint Test D and GO to Pinpoint Test E .
	• Repair as required. Clear the DTCs, road test and rerun OBD Test.
Incorrect Pressures	
• High/low pressure	• Carry out Line Pressure Test. Refer to Special Testing Procedures in this section.
Main Control	
• Screws not tightened to specification	• Tighten to specification.
• Separator plate damaged	• Inspect for damage. If damaged, install a new separator plate.
• Contamination	• Disassemble and clean.
• Valves/springs damaged, misassembled, missing, stuck or bore damaged	• If damaged or parts are missing, install new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
	• Inspect for damage. Repair as necessary.

• Transmission fluid filter damaged or missing	
Overdrive (O/D) Servo	
• Servo retaining screws damaged	• Inspect for damage. Repair as necessary.
• Seals (piston and cover) damaged	• Inspect for damage. Repair as necessary.
O/D Band	
• Band damaged	• Inspect for damage. Repair as necessary.
• Servo worn or damaged	• Inspect for damage. Repair as necessary.
• Not adjusted correctly	• Inspect for damage. Repair as necessary.
Forward Clutch Assembly	
• Seals, piston damaged	• Inspect for damage. Repair as necessary.
• Check ball damaged, missing, not seating, off location	• Inspect for mislocation, poor seating, damage. Install a new cylinder.
• Friction elements damaged or worn	• Inspect for damage. Repair as necessary.
• Return springs damaged	• Inspect for damage. Repair as necessary.
• Bronze seal ring on bearing damaged	• Inspect for damage. Repair as necessary.

Shift Concern: No 2-1 Shift

Possible Component	Reference/Action
225 - ROUTINE	
Powertrain Control System	
• PCM, vehicle wiring harnesses, Shift Solenoid C (SSC), Pressure Control Solenoid B (PCB), Output Shaft Speed (OSS) sensor, Transmission Range (TR) sensor	• Carry out On-Board Diagnostic (OBD) Tests. • Servo retaining screws damaged	• Inspect for damage. Repair as necessary.
• Seals (piston and cover) damaged	• Inspect for damage. Repair as necessary.
• Servo bore	• Inspect for damage. Repair as necessary.

O/D Band	
• Band damaged	• Inspect for damage. Repair as necessary.
• Servo worn or damaged	• Inspect for damage. Repair as necessary.
• Not adjusted correctly	• Inspect for damage. Repair as necessary.
Direct One-Way Clutch (OWC)	
• Worn, damaged or assembled incorrectly	• Inspect for damage. Repair as necessary.

Shift Concern: Feel - Soft/Slipping 2-1 Shift

Possible Component	Reference/Action
231 - ROUTINE	
Powertrain Control System	
• PCM, vehicle wiring harnesses, Shift Solenoid C (SSC), Pressure Control Solenoid B (PCB), Transmission Fluid Temperature (TFT) sensor	• Carry out On-Board Diagnostic (OBD) Tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	• GO to Pinpoint Test A , GO to Pinpoint Test B and GO to Pinpoint Test D .
	• Repair as required. Clear the DTCs, road test and rerun OBD Test.
Incorrect Pressures	
• High/low pressure	• Carry out Line Pressure Test. Refer to Special Testing Procedures in this section.
Main Control	
• Screws not tightened to specification	• Tighten to specification.
• Separator plate damaged	• Inspect for damage. If damaged, install a new separator plate.
• Contamination	• Disassemble and clean.
• Valves/springs damaged, misassembled, missing, stuck or bore damaged	• If damaged or parts are missing, install new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or

	transmission damage.
• Transmission fluid filter damaged or missing	• Inspect for damage. Repair as necessary.

Shift Concern: Harsh 1-2 Shift

Possible Component	Reference/Action
232 - ROUTINE	
Powertrain Control System	
• PCM, vehicle wiring harnesses, Shift Solenoid C (SSC), Pressure Control Solenoid B (PCB), Turbine Shaft Speed (TSS) sensor, Transmission Range (TR) sensor, Transmission Fluid Temperature (TFT) sensor	• Carry out On-Board Diagnostic (OBD) Tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	• GO to Pinpoint Test A , GO to Pinpoint Test B , GO to Pinpoint Test C , GO to Pinpoint Test D and GO to Pinpoint Test E .
	• Repair as required. Clear the DTCs, road test and rerun OBD Test.
Incorrect Pressures	
• High/low pressure	• Carry out Line Pressure Test. Refer to Special Testing Procedures in this section.
Main Control	
• Screws not tightened to specification	• Tighten to specification.
• Separator plate damaged	• Inspect for damage. If damaged, install a new separator plate.
• Contamination	• Disassemble and clean.
• Valve/springs damaged, misassembled, missing, stuck or bore damaged	• If damaged or parts are missing, install new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Transmission fluid filter damaged or missing	• Inspect for damage. Repair as necessary.
Overdrive (O/D) Servo	

• Servo retaining screws damaged	• Inspect for damage. Repair as necessary.
• Seals (piston and cover) damaged	• Inspect for damage. Repair as necessary.
O/D Band	
• Band damaged	• Inspect for damage. Repair as necessary.
• Servo worn or damaged	• Inspect for damage. Repair as necessary.
• Not adjusted correctly	• Inspect for damage. Repair as necessary.

Shift Concern: Harsh 2-3 Shift

Possible Component	Reference/Action
233 - ROUTINE	
Powertrain Control System	
• PCM, vehicle wiring harnesses, Shift Solenoid B (SSB), Pressure Control Solenoid A (PCA), Turbine Shaft Speed (TSS) sensor, intermediate shaft speed sensor, Transmission Range (TR) sensor, Transmission Fluid Temperature (TFT) sensor	• Carry out On-Board Diagnostic (OBD) Tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	• GO to Pinpoint Test A , GO to Pinpoint Test B , GO to Pinpoint Test C , GO to Pinpoint Test D and GO to Pinpoint Test E .
	• Repair as required. Clear the DTCs, road test and rerun OBD Test.
Incorrect Pressures	
• High/low pressure	• Carry out Line Pressure Test. Refer to Special Testing Procedures in this section.
Main Control	
• Screws not tightened to specification	• Tighten to specification.
• Separator plate damaged	• Inspect for damage. If damaged, install a new separator plate.
• Contamination	• Disassemble and clean.
• Valve/springs damaged, misassembled, missing, stuck or bore damaged	• If damaged or parts are missing, install new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or

	sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Transmission fluid filter damaged or missing	• Inspect for damage. Repair as necessary.
Overdrive (O/D) Servo	
• Servo retaining screws damaged	• Inspect for damage. Repair as necessary.
• Seals (piston and cover) damaged	• Inspect for damage. Repair as necessary.
O/D Band	
• Band damaged	• Inspect for damage. Repair as necessary.
• Servo worn or damaged	• Inspect for damage. Repair as necessary.
• Not adjusted correctly	• Inspect for damage. Repair as necessary.
Direct Clutch Assembly	
• Seals, piston damaged	• Inspect for damage. Repair as necessary.
• Check ball damaged, missing, not seating, off location	• Inspect for mislocation, poor seating, damage. Install a new cylinder.
• Friction elements damaged or worn	• Inspect for damage. Repair as necessary.
• Return springs damaged	• Inspect for damage. Repair as necessary.
Intermediate Servo	
• Servo retaining screws damaged	• Inspect for damage. Repair as necessary.
• Seals (piston and cover) damaged	• Inspect for damage. Repair as necessary.
Intermediate Band	
• Band damaged	• Inspect for damage. Repair as necessary.
• Servo worn or damaged	• Inspect for damage. Repair as necessary.
• Not adjusted correctly	• Inspect for damage. Repair as necessary.
Direct One-Way Clutch (OWC)	
• Worn, damaged or assembled incorrectly	• Inspect for damage. Repair as necessary.

Shift Concern: Harsh 3-4 Shift

Possible Component	Reference/Action
234 - ROUTINE	
Powertrain Control System	
• PCM, vehicle wiring harnesses, Shift Solenoid A (SSA), Pressure Control Solenoid C (PCC), Transmission Range (TR) sensor, Transmission Fluid Temperature (TFT) sensor	• Carry out On-Board Diagnostic (OBD) Tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	• GO to Pinpoint Test A , GO to Pinpoint Test B , GO to Pinpoint Test C and GO to Pinpoint Test D .
	• Repair as required. Clear the DTCs, road test and rerun OBD Test.
Incorrect Pressures	
• High/low pressure	• Carry out Line Pressure Test. Refer to Special Testing Procedures in this section.
Main Control	
• Screws not tightened to specification	• Tighten to specification.
• Separator plate damaged	• Inspect for damage. If damaged, install a new separator.
• Contamination	• Disassemble and clean.
• Valve/springs damaged, misassembled, missing, stuck or bore damaged	• If damaged or parts are missing, install new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Transmission fluid filter damaged or missing	• Inspect for damage. Repair as necessary.
Center Support	
• Screws not tightened to specification	• Tighten to specification.
• Seal rings or bearing damaged	• Inspect for damage. Repair as necessary.
• Outside diameter of case bore damaged	• Inspect for damage. Repair as necessary.
• Support damaged or leaking	• Inspect for damage. Repair as necessary.
Direct Clutch Assembly	
• Seals, piston damaged	• Inspect for damage. Repair as necessary.

• Check ball damaged, missing, not seating, off location	• Inspect for mislocation, poor seating, damage. Install a new cylinder.
• Friction elements damaged or worn	• Inspect for damage. Repair as necessary.
• Return springs damaged	• Inspect for damage. Repair as necessary.
Intermediate Servo	
• Seals (piston and cover) damaged	• Inspect for damage. Repair as necessary.

Shift Concern: Harsh 4-3 Shift

Possible Component	Reference/Action
235 - ROUTINE	
Powertrain Control System	
• PCM, vehicle wiring harnesses, Shift Solenoid A (SSA), Pressure Control Solenoid A (PCA), Transmission Range (TR) sensor, Transmission Fluid Temperature (TFT) sensor	• Carry out On-Board Diagnostic (OBD) Tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	• GO to Pinpoint Test A , GO to Pinpoint Test B , GO to Pinpoint Test C and GO to Pinpoint Test D .
	• Repair as required. Clear the DTCs, road test and rerun OBD Test.
Incorrect Pressures	
• High/low pressure	• Carry out Line Pressure Test. Refer to Special Testing Procedures in this section.
Main Control	
• Screws not tightened to specification	• Tighten to specification.
• Separator plate damaged	• Inspect for damage. If damaged, install a new separator plate.
• Contamination	• Disassemble and clean.
• Valves, springs damaged, misassembled, missing, stuck or bore damaged	• If damaged or parts are missing, install new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
	• Inspect for damage. Repair as necessary.

• Transmission fluid filter damaged or missing	
Direct Clutch Assembly	
• Seals, piston damaged	• Inspect for damage. Repair as necessary.
• Check ball damaged, missing, not seating, off location	• Inspect for mislocation, poor seating, damage. Install a new cylinder.
• Friction elements damaged or worn	• Inspect for damage. Repair as necessary.
• Return springs damaged	• Inspect for damage. Repair as necessary.
Intermediate Servo	
• Servo retaining screws damaged	• Inspect for damage. Repair as necessary.
• Seals (piston and cover) damaged	• Inspect for damage. Repair as necessary.
Intermediate Band	
• Band damaged	• Inspect for damage. Repair as necessary.
• Servo worn or damaged	• Inspect for damage. Repair as necessary.
• Not adjusted correctly	• Inspect for damage. Repair as necessary.

Shift Concern: Harsh 3-2 Shift

Possible Component	Reference/Action
236 - ROUTINE	
Powertrain Control System	
• PCM, vehicle wiring harnesses, Shift Solenoid C (SSC), Pressure Control Solenoid B (PCB), Turbine Shaft Speed (TSS) sensor, intermediate shaft speed sensor, Transmission Range (TR) sensor, Transmission Fluid Temperature (TFT) sensor	• Carry out On-Board Diagnostic (OBD) Tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	• GO to Pinpoint Test A , GO to Pinpoint Test B , GO to Pinpoint Test C , GO to Pinpoint Test D and GO to Pinpoint Test E .
	• Repair as required. Clear the DTCs, road test and rerun OBD Test.
Incorrect Pressures	

• High/low pressure	• Carry out Line Pressure Test. Refer to Special Testing Procedures in this section.
Main Control	
• Screws not tightened to specification	• Tighten to specification.
• Separator plate damaged	• Inspect for damage. If damaged, install a new separator plate.
• Contamination	• Disassemble and clean.
• Valve/springs damaged, misassembled, missing, stuck or bore damaged	• If damaged or parts are missing, install new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Transmission fluid filter damaged or missing	• Inspect for damage. Repair as necessary.
Overdrive (O/D) Servo	
• Servo retaining screws damaged	• Inspect for damage. Repair as necessary.
• Seals (piston and cover) damaged	• Inspect for damage. Repair as necessary.
O/D Band	
• Band damaged	• Inspect for damage. Repair as necessary.
• Servo worn or damaged	• Inspect for damage. Repair as necessary.
• Not adjusted correctly	• Inspect for damage. Repair as necessary.
Intermediate Servo	
• Servo retaining screws damaged	• Inspect for damage. Repair as necessary.
• Seals (piston and cover) damaged	• Inspect for damage. Repair as necessary.
Intermediate Band	
• Band damaged	• Inspect for damage. Repair as necessary.
• Servo worn or damaged	• Inspect for damage. Repair as necessary.
• Not adjusted correctly	• Inspect for damage. Repair as necessary.

Shift Concern: Harsh 2-1 Shift

Possible Component	Reference/Action
237 - ROUTINE	
Powertrain Control System	
• PCM, vehicle wiring harnesses, Shift Solenoid C (SSC), Pressure Control Solenoid B (PCB), Turbine Shaft Speed (TSS) sensor, Transmission Range (TR) sensor, Transmission Fluid Temperature (TFT) sensor	• Carry out On-Board Diagnostic (OBD) Tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	• GO to Pinpoint Test A , GO to Pinpoint Test B , GO to Pinpoint Test C , GO to Pinpoint Test D and GO to Pinpoint Test E .
	• Repair as required. Clear the DTCs, road test and rerun OBD Test.
Incorrect Pressures	
• High/low pressure	• Carry out Line Pressure Test. Refer to Special Testing Procedures in this section.
Main Control	
• Screws not tightened to specification	• Tighten to specification.
• Separator plate damaged	• Inspect for damage. If damaged, install a new separator plate.
• Contamination	• Disassemble and clean.
• Valve/springs damaged, misassembled, missing, stuck or bore damaged	• If damaged or parts are missing, install new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Transmission fluid filter damaged or missing	• Inspect for damage. Repair as necessary.
Overdrive (O/D) Servo	
• Servo retaining screws damaged	• Inspect for damage. Repair as necessary.
• Seals (piston and cover) damaged	• Inspect for damage. Repair as necessary.
O/D Band	
• Band damaged	• Inspect for damage. Repair as necessary.
• Servo worn or damaged	• Inspect for damage. Repair as necessary.

• Not adjusted correctly	• Inspect for damage. Repair as necessary.
Direct One-Way Clutch (OWC)	
• Worn, damaged or assembled incorrectly	• Inspect for damage. Repair as necessary.

Torque Converter Operation Concerns: Does Not Apply

Possible Component	Reference/Action
240 - ROUTINE	
Powertrain Control System	
• PCM, vehicle wiring harnesses, Torque Converter Clutch (TCC) solenoid, Transmission Fluid Temperature (TFT) sensor and Engine Coolant Temperature (ECT) sensor	• Carry out On-Board Diagnostic (OBD) Tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	• GO to Pinpoint Test A and GO to Pinpoint Test B .
	• Repair as necessary. Clear the DTCs, road test and rerun O/D Test.
Incorrect Pressures	
• High/low pressure	• Carry out Line Pressure Test. Refer to Special Testing Procedures in this section.
Main Control	
• Screws not tightened to specification	• Tighten to specification.
• Separator plate damaged	• Inspect for damage. If damaged, install a new separator plate.
• Contamination	• Disassemble and clean.
• Valve, springs damaged, misassembled, missing, stuck or bore damaged	• If damaged or parts are missing, install new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Transmission fluid filter damaged or missing	• Inspect for damage. Repair as necessary.
Pump Assembly	

• Screws not tightened to specification	• Tighten screws to specification.
• Gasket damaged	• Inspect for damage. If damaged, install a new gasket.
• Porosity, cross leaks, ball missing, plugged hole	• Inspect for damage. If damaged, repair as necessary.
• Pump gears cracked and/or seized	• Inspect for damage. Install a new pump.
• Flow control valves, springs or seals damaged, stuck or not assembled correctly	• Inspect for damage. Install a new seal or flow control valve.
Torque Converter Assembly	
• Torque converter internal failure preventing engagement, piston application	• Remove transmission. Inspect for damage. Refer to Torque Converter Contamination Inspection in this section. If the torque converter fails to pass the criteria or is damaged, install a new or remanufactured torque converter.

Torque Converter Operation Concern: Always Applied/Stalls Vehicle

Possible Component	Reference/Action
241 - ROUTINE	
Powertrain Control System	
• PCM, vehicle wiring harnesses, Torque Converter Clutch (TCC) solenoid	• Carry out On-Board Diagnostic (OBD) Tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	• GO to Pinpoint Test A .
	• Repair as necessary. Clear the DTCs, road test and rerun OBD Test.
Main Control	
• Screws not tightened to specification	• Tighten to specification.
• Separator plate damaged	• Inspect for damage. If damaged, install a new separator plate.
• Contamination	• Disassemble and clean.
• Valve, springs damaged,	• If damaged or parts are missing, install new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand

misassembled, missing, stuck or bore damaged	valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Transmission fluid filter damaged or missing	• Inspect for damage. Repair as necessary.
Torque Converter Assembly	
• Torque converter internal failure preventing engagement, piston release	• Remove transmission. Inspect for damage. Refer to Torque Converter Contamination Inspection in this section. If the torque converter fails to pass the criteria or is damaged, install a new or remanufactured torque converter.
Low One-Way Clutch (OWC)	
• Worn, damaged or assembled incorrectly	• Inspect for damage. Repair as necessary.

Torque Converter Operation Concern: Cycling/Shudder/Chatter

Possible Component	Reference/Action
242 - ROUTINE	
Powertrain Control System	
• PCM, vehicle wiring harnesses, Torque Converter Clutch (TCC) solenoid	• Carry out On-Board Diagnostic (OBD) Tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	• GO to Pinpoint Test A .
	• Repair as necessary. Clear the DTCs, road test and rerun OBD Test.
Transmission Fluid	
• Condition - contaminated, degraded	• Carry out Transmission Fluid Condition Check. Refer to Preliminary Inspection in this section. If contaminated, locate source of contamination. If burnt, inspect mechanical bands, clutches. Repair as necessary. Change transmission fluid. Carry out transmission fluid drain and refill procedure. Refer to Transmission Fluid Drain and Refill in this section. Carry out transmission fluid cooler cleaning procedure. Refer to Transmission Fluid Cooler Backflushing and Cleaning in this section.
Main Control	

• Screws not tightened to specification	• Tighten to specification.
• Separator plate damaged	• Inspect for damage. If damaged, install a new separator plate.
• Contamination	• Disassemble and clean.
• Valve, springs damaged, misassembled, missing, stuck or bore damaged	• If damaged or parts are missing, install new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Transmission fluid filter damaged or missing	• Inspect for damage. Repair as necessary.
Torque Converter Assembly	
• Torque converter internal leakage, clutch material damaged	• Remove transmission. Inspect for damage. Refer to Torque Converter Contamination Inspection in this section. If torque converter fails to pass the criteria or is damaged, install a new or remanufactured converter.

Other Concerns: Selector Lever Efforts High

Possible Component	Reference/Action
251 - ROUTINE	
Powertrain Control System	
• PCM, vehicle wiring harnesses, Transmission Range (TR) sensor	• Carry out On-Board Diagnostic (OBD) Tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	• GO to Pinpoint Test C .
	• Repair as required. Clear the DTCs, road test and rerun OBD Test.
Selector Lever Cable, TR sensor	
• Selector lever cable system or TR sensor damaged,	• Inspect and adjust the selector lever cable or adjust the TR sensor. Refer to Transmission Range (TR) Sensor

misaligned	Adjustment in this section or Section 307-05 .
Main Control	
• Screws not tightened to specification	• Tighten to specification.
• Separator plate damaged	• Inspect for damage. If damaged, install a new separator plate.
• Contamination	• Disassemble and clean.
• Valve/springs damaged, misassembled, missing, stuck or bore damaged	• If damaged or parts are missing, install new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Transmission fluid filter damaged or missing	• Inspect for damage. Repair as necessary.
Case	
• Manual control lever assembly damage, manual valve inner lever pin bent, manual valve inner lever damaged, spring rod damaged	• Inspect for damage. If damaged, install a new part.
• Manual valve lever shaft retaining pin damaged	• Inspect for damage. If damaged, repair as necessary.

Other Concerns: External Leaks

Possible Component	Reference/Action
252 - ROUTINE	
Powertrain Control System	
• Output Shaft Speed (OSS) sensor, intermediate shaft speed, Turbine Shaft Speed (TSS) sensor, Transmission Range (TR) sensor	• Inspect for transmission fluid leakage. If areas around the sensors show signs of transmission fluid leakage, install a new sensor O-ring seal. If area behind TR sensor shows signs of a leak, a new manual lever shaft seal may need to be installed.
Transmission Fluid	
• Incorrect level	• Check transmission fluid level. Adjust transmission fluid to correct level. Refer to Transmission Fluid Level Check in this section.

• Condition	• Carry out Transmission Fluid Condition Check. Refer to Preliminary Inspection in this section.
Case	
• Case vent damaged, output shaft flange damaged	• Inspect for damage. If damaged, repair as necessary.
Seals/Gaskets	
• Leakage at gaskets, seals, cooler lines, torque converter studs, venting	• Refer to Leakage Inspection in this section for potential leak locations.
	• Remove all traces of lubricant on exposed surfaces of the transmission. Check vent for free breathing. Operate the vehicle at normal temperatures and perform leak check test. Refer to Leakage Inspection in this section. Repair as necessary.
Vents	
• Transmission fluid leakage through the vent system into the bellhousing	• Incorrect transmission fluid level may cause the transmission fluid to vent. If not already carried out, verify and adjust the transmission fluid to the correct level. Refer to Transmission Fluid Level Check in this section.
	• Verify the transmission operating temperature by monitoring Transmission Fluid Temperature (TFT) with a scan tool while driving the vehicle for 32 km (20 mi). If the TFT exceeds 102°C (215°F) during the drive, refer to Routine No. 257 Transmission Overheating, Main Control, Thermostatic bypass valve.
	• Remove all traces of transmission fluid on exposed surfaces of the transmission.
	• Check the vent for damage and obstructions. Verify that the vent is operating correctly by applying air through the vent tubes. If the vent is damaged or obstructed, repair as necessary.

Other Concern: Noise/Vibration - Forward or Reverse

NOTE: NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to Section 100-04 . Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to Section 100-04 for the next likely system and continue diagnosis.

Possible Component	Reference/Action
254 - ROUTINE	
Powertrain Control System	

• PCM, vehicle wiring harnesses, Torque Converter Clutch (TCC) solenoid, Pressure Control Solenoid A (PCA), Pressure Control Solenoid B (PCB), Pressure Control Solenoid C (PCC)	• Carry out On-Board Diagnostic (OBD) Tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	• GO to Pinpoint Test A and GO to Pinpoint Test D .
	• Repair as required. Clear the DTCs, road test and rerun OBD Test.
Selector Lever Cable/Transmission Range (TR) Sensor	
• Selector lever cable or TR sensor damaged, misaligned	• Inspect and repair as necessary. Refer to Transmission Range (TR) Sensor Adjustment in this section or Section 307-05 for the selector lever cable adjustment.
Main Control	
• Screws not tightened to specification	• Tighten to specification.
• Separator plate damaged	• Inspect for damage. If damaged, install a new separator plate.
• Contamination	• Disassemble and clean.
• Valves/springs damaged, misassembled, missing, stuck or bore damaged, thermostatic bypass valve damaged	• If damaged or parts are missing, install new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Transmission fluid filter damaged or missing	• Inspect for damage. Repair as necessary.
Pump Assembly	
• Screws not tightened to specification	• Tighten screws to specification.
• Gasket damaged	• Inspect for damage. If damaged, install a new gasket.
• Porosity, cross leaks, ball missing, plugged hole	• Inspect for damage. If damaged, repair as necessary.
• Pump gears cracked and/or seized	• Inspect for damage. Install a new pump.
• Flow control valves, springs or seals damaged, stuck or not assembled correctly	• Inspect for damage. Install a new seal or flow control valve.

Low One-Way Clutch (OWC)	
• Worn, damaged or assembled incorrectly	• Inspect for damage. Repair as necessary.
Flexplate or Adapter Plate	
• Damaged	• Inspect for damage. Repair as necessary.
• Nuts not tightened to specification	• Tighten nuts to specification.
• Adapter plate not aligned correctly	• Remove transmission and, using a special service tool and procedure in this section, align adapter plate.
Torque Converter Assembly	
• Damaged	• Remove transmission. Inspect for damage. Refer to Torque Converter Contamination Inspection in this section. If the torque converter fails to pass the checks or is damaged, install a new or remanufactured torque converter.
Clutch Assemblies	
• Seals, piston damaged	• Inspect for damage. Repair as necessary.
• Check ball damaged, missing, not seating, off location	• Inspect for mislocation, poor seating, damage. Install a new cylinder.
• Friction elements damaged or worn	• Inspect for damage. Repair as necessary.
• Return springs damaged	• Inspect for damage. Repair as necessary.

Other Concern: Engine Will Not Crank

Possible Component	Reference/Action
255 - ROUTINE	
Powertrain Control System	
• PCM, vehicle wiring harnesses, Transmission Range (TR) sensor	• Carry out On-Board Diagnostic (OBD) Tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	• GO to Pinpoint Test C .
	• Repair as required. Clear the DTCs, road test and rerun OBD Test.
Selector Lever Cable/ TR Sensor	

• Selector lever cable or TR sensor damaged, misaligned	• Inspect and repair as necessary. Refer to Transmission Range (TR) Sensor Adjustment in this section or Section 307-05 .
Main Control/Park System/ TR Sensor Alignment	
• Detent spring, rooster comb, manual control lever and TR sensor are not correctly aligned together	• Inspect and repair as necessary. Refer to Transmission Range (TR) Sensor Adjustment in this section or Section 307-05 .
Pump Assembly	
• Screws not tightened to specification	• Tighten screws to specification.
• Gasket damaged	• Inspect for damage. If damaged, install a new gasket.
• Porosity, cross leaks, ball missing, plugged hole	• Inspect for damage. If damaged, repair as necessary.
• Pump gears cracked and/or seized	• Inspect for damage. Install a new pump.
• Flow control valves, springs or seals damaged, stuck or not assembled correctly	• Inspect for damage. Install a new seal or flow control valve.
Flexplate or Adapter Plate	
• Damaged	• Inspect for damage. Repair as necessary.

Other Concern: No Park Range

Possible Component	Reference/Action
256 - ROUTINE	
Selector Lever Cable/Transmission Range (TR) Sensor	
• Selector lever cable system or TR sensor damaged, misaligned	• Inspect and repair as necessary. Refer to Transmission Range (TR) Sensor Adjustment in this section or Section 307-05 .
Case	
• Manual control lever assembly damage, manual valve inner lever pin bent, manual valve inner lever damaged, spring rod damaged	• Inspect for damage. If damaged, repair as necessary.
• Manual valve lever shaft retaining pin damaged	• Inspect for damage. If damaged, repair as necessary.

Park System	
• Park gear, park pawl, park pawl return spring, park or guide plate, park actuating rod, park pawl shaft, manual lever, manual lever detent spring damaged or misassembled	• Inspect for damage. If damaged, repair as necessary.
• External linkages/brackets damaged	• Inspect for damage. If damaged, repair as necessary.

Other Concern: Transmission Overheating

Possible Component	Reference/Action
257 - ROUTINE	
Powertrain Control System	
• PCM, vehicle wiring harnesses, Torque Converter Clutch (TCC) solenoid, Pressure Control Solenoid A (PCA), Pressure Control Solenoid B (PCB), Pressure Control Solenoid C (PCC), Transmission Fluid Temperature (TFT) sensor	• Carry out On-Board Diagnostic (OBD) Tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	• GO to Pinpoint Test A , GO to Pinpoint Test B and GO to Pinpoint Test D .
	• Repair as required. Clear the DTCs, road test and rerun OBD Test.
Transmission Fluid	
• Incorrect level	• Check the transmission fluid level. Adjust transmission fluid to correct level. Refer to Transmission Fluid Level Check in this section.
Hydraulic/Mechanical	
• Thermostatic bypass valve is the main control valve body assembly	• Verify correct thermal valve function while monitoring TFT . Drive the vehicle for about 32 km (20 mi). If the temperature exceeds 102°C (215°F) during the drive, install a new main control valve body assembly.
Incorrect Pressures	
• High/low pressure	• Carry out Line Pressure Test. Refer to Special Testing Procedures in this section.
Main Control	

• Screws not tightened to specification	• Tighten to specification.
• Separator plate damaged	• Inspect for damage. If damaged, install a new separator plate.
• Contamination	• Disassemble and clean.
• Valves/springs damaged, misassembled, missing, stuck or bore damaged, thermostatic bypass valve damaged	• If damaged or parts are missing, install new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Thermostatic bypass valve damaged or malfunctioning	• If the verification procedure confirms the malfunction, install a new main control valve body assembly. If not malfunctioning, inspect for damage. If damaged, install a new main control valve body assembly.
• Transmission fluid filter damaged or missing	• Inspect for damage. Repair as necessary.
Pump Assembly	
• Screws not tightened to specification	• Tighten screws to specification.
• Gasket damaged	• Inspect for damage. If damaged, install a new gasket.
• Porosity, cross leaks, ball missing, plugged hole	• Inspect for damage. If damaged, repair as necessary.
• Pump gears cracked and/or seized	• Inspect for damage. Install a new pump.
• Flow control valves, springs or seals damaged, stuck or not assembled correctly	• Inspect for damage. Install a new seal or flow control valve.
Case	
• Case vent damaged	• Inspect for damage. If damaged, repair as necessary.
Torque Converter Assembly	
• Seized torque converter One-Way Clutch (OWC)	• Remove transmission. Inspect for damage. Refer to Torque Converter Contamination Inspection in this section. If torque converter fails to pass the criteria or is damaged, install a new or remanufactured converter.
• Excessive slip detected	
Other	

• Restriction in the transmission cooling system	• Refer to Section 307-02 for information and diagnosis of cooling issues.
• Excessive trailer tow load	• Refer to Owner's Literature for specifications on trailer towing.
• Engine driveability concerns	• Check engine. Refer to Section 303-00 .

Other Concerns: No Engine Braking in Manual 2nd Position

Possible Component	Reference/Action
258 - ROUTINE	
Powertrain Control System	
• PCM, vehicle wiring harnesses, Shift Solenoid A (SSA), Shift Solenoid C (SSC), Shift Solenoid D (SSD), Pressure Control Solenoid A (PCA)	• Carry out On-Board Diagnostic (OBD) Tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	• GO to Pinpoint Test A and GO to Pinpoint Test D .
	• Repair as required. Clear the DTCs, road test and rerun OBD Test.
Transmission Fluid	
• Incorrect level	• Check the transmission fluid level. Adjust transmission fluid to correct level. Refer to Transmission Fluid Level Check in this section.
Incorrect Pressures	
• High/low pressure	• Carry out Line Pressure Test. Refer to Special Testing Procedures in this section.
Overdrive (O/D) Servo	
• Servo retaining screws damaged	• Inspect for damage. Repair as necessary.
• Seals (piston and cover) damaged	• Inspect for damage. Repair as necessary.
O/D Band	
• Band damaged	• Inspect for damage. Repair as necessary.
• Servo worn or damaged	• Inspect for damage. Repair as necessary.
• Not adjusted correctly	• Inspect for damage. Repair as necessary.

Other Concern: No Engine Braking in Manual 1st Position

Possible Component	Reference/Action
259 - ROUTINE	
Powertrain Control System	
• PCM, vehicle wiring harnesses, Shift Solenoid A (SSA), Shift Solenoid C (SSC), Shift Solenoid D (SSD), Pressure Control Solenoid A (PCA), Pressure Control Solenoid B (PCB)	• Carry out On-Board Diagnostic (OBD) Tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	• GO to Pinpoint Test A and GO to Pinpoint Test D .
	• Repair as required. Clear the DTCs, road test and rerun OBD Test.
Transmission Fluid	
• Incorrect level	• Check the transmission fluid level. Adjust transmission fluid to the correct level, refer to Transmission Fluid Level Check in this section.
Incorrect Pressures	
• High/low pressure	• Carry out Line Pressure Test. Refer to Special Testing Procedures in this section.
Reverse Servo	
• Servo retaining screws damaged	• Inspect for damage. Repair as necessary.
• Seals (piston and cover) damaged	• Inspect for damage. Repair as necessary.
Reverse Band	
• Band damaged	• Inspect for damage. Repair as necessary.
• Servo worn or damaged	• Inspect for damage. Repair as necessary.

Other Concerns: Fluid Venting/Foaming

Possible Component	Reference/Action
261 - ROUTINE	
Transmission Fluid	
• Incorrect level	

	• Check the transmission fluid level. Adjust transmission fluid to correct level. Refer to Transmission Fluid Level Check in this section.
• Condition	• Carry out Transmission Fluid Condition Check. Refer to Preliminary Inspection in this section.
Pump Assembly	
• Screws not tightened to specification	• Tighten screws to specification.
• Gasket damaged	• Inspect for damage. If damaged, install a new gasket.
• Porosity, cross leaks, ball missing, plugged hole	• Inspect for damage. If damaged, repair as necessary.
Case	
• Case vent damaged	• Inspect for damage. If damaged, repair as necessary.
Other	
• Transmission overheating	• Refer to Routine 257 in this section.

Other Concern: Vehicle Movement with Gear Selector in N Position

Possible Component	Reference/Action
262 - ROUTINE	
Transmission Fluid	
• Incorrect level	• Check the transmission fluid level. Adjust transmission fluid to correct level. Refer to Transmission Fluid Level Check in this section.
Selector Lever Cable/Transmission Range (TR) sensor	
• Selector lever cable system or TR sensor damaged, misaligned	• Inspect and repair as necessary. Refer to Transmission Range (TR) Sensor Adjustment in this section or Section 307-05 .
Incorrect Pressures	
• High/low pressure	• Carry out Line Pressure Test. Refer to Special Testing Procedures in this section.
Main Control	
• Screws not tightened to specification	• Tighten to specification.

• Separator plate damaged	• Inspect for damage. If damaged, install a new separator plate.
• Contamination	• Disassemble and clean.
• Valve/springs damaged, misassembled, missing, stuck or bore damaged	• If damaged or parts are missing, install new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
Clutch Assemblies	
• Seals, piston damaged	• Inspect for damage. Repair as necessary.
• Check ball damaged, missing, not seating, off location	• Inspect for mislocation, poor seating, damage. Install a new cylinder.
• Friction elements damaged or worn	• Inspect for damage. Repair as necessary.
• Return springs damaged	• Inspect for damage. Repair as necessary.
Case	
• Manual control lever assembly damage, manual valve inner lever pin bent, manual valve inner lever damaged, spring rod damaged	• Inspect for damage. If damaged, repair as necessary.
• Manual valve lever shaft retaining pin damaged	• Inspect for damage. If damaged, repair as necessary.

Other Concern: Slips/Chatters in Manual 1st Position

Possible Component	Reference/Action
263 - ROUTINE	
Powertrain Control System	
• PCM, vehicle wiring harnesses, Pressure Control Solenoid A (PCA), Pressure Control Solenoid B (PCB)	• Carry out On-Board Diagnostic (OBD) Tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	• GO to Pinpoint Test D .

	• Repair as required. Clear the DTCs, road test and rerun OBD Test.
Transmission Fluid	
• Incorrect level	• Check the transmission fluid level. Adjust transmission fluid to the correct level. Refer to Transmission Fluid Level Check in this section.
• Condition	• Carry out Transmission Fluid Condition Check. Refer to Preliminary Inspection in this section.
Incorrect Pressures	
• High/low pressure	• Carry out Line Pressure Test. Refer to Special Testing Procedures in this section.
Main Control	
• Screws not tightened to specification	• Tighten to specification.
• Separator plate damaged	• Inspect for damage. If damaged, install a new separator plate.
• Contamination	• Disassemble and clean.
• Valve/springs damaged, misassembled, missing, stuck or bore damaged	• If damaged or parts are missing, install new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Transmission fluid filter damaged or missing	• Inspect for damage. Repair as necessary.
Pump Assembly	
• Screws not tightened to specification	• Tighten screws to specification.
• Gasket damaged	• Inspect for damage. If damaged, install a new gasket.
• Porosity, cross leaks, ball missing, plugged hole	• Inspect for damage. If damaged, repair as necessary.
• Pump gears cracked and/or seized	• Inspect for damage. Install a new pump.
• Flow control valves, springs or seals damaged, stuck or not assembled correctly	• Inspect for damage. Install a new seal or flow control valve.
Forward Clutch Assembly	
• Seals, piston damaged	• Inspect for damage. Repair as necessary.

• Check ball damaged, missing, not seating, off location	• Inspect for mislocation, poor seating, damage. Install a new cylinder.
• Friction elements damaged or worn	• Inspect for damage. Repair as necessary.
• Return springs damaged	• Inspect for damage. Repair as necessary.
• Bronze seal ring on bearing damaged	• Inspect for damage. Repair as necessary.
Reverse Servo	
• Servo retaining screws damaged	• Inspect for damage. Repair as necessary.
• Seals (piston and cover) damaged	• Inspect for damage. Repair as necessary.
Reverse Band	
• Band damaged	• Inspect for damage. Repair as necessary.
• Servo worn or damaged	• Inspect for damage. Repair as necessary.
Direct One-Way Clutch (OWC)	
• Worn, damaged or assembled incorrectly	• Inspect for damage. Repair as necessary.

Other Concern: Slips/Chatters in Manual 2nd Position

Possible Component	Reference/Action
264 - ROUTINE	
Powertrain Control System	
• PCM, vehicle wiring harnesses, Pressure Control Solenoid A (PCA), Pressure Control Solenoid B (PCB)	• Carry out On-Board Diagnostic (OBD) Tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	• GO to Pinpoint Test D .
	• Repair as required. Clear the DTCs, road test and rerun OBD Test.
Transmission Fluid	
• Incorrect level	• Check the transmission fluid level. Adjust transmission fluid to the correct level. Refer to Transmission Fluid

	Level Check in this section.
• Condition	• Carry out Transmission Fluid Condition Check. Refer to Preliminary Inspection in this section.
Incorrect Pressures	
• High/low pressure	• Carry out Line Pressure Test. Refer to Special Testing Procedures in this section.
Overdrive (O/D) Servo	
• Servo retaining screws damaged	• Inspect for damage. Repair as necessary.
• Seals (piston and cover) damaged	• Inspect for damage. Repair as necessary.
O/D Band	
• Band damaged	• Inspect for damage. Repair as necessary.
• Servo worn or damaged	• Inspect for damage. Repair as necessary.
• Not adjusted correctly	• Inspect for damage. Repair as necessary.
O/D Planetary Assembly	
• Planetary damaged	• Inspect for damage. Repair as necessary.
Forward Clutch Assembly	
• Seals, piston damaged	• Inspect for damage. Repair as necessary.
• Check ball damaged, missing, not seating, off location	• Inspect for mislocation, poor seating, damage. Install a new cylinder.
• Friction elements damaged or worn	• Inspect for damage. Repair as necessary.
• Return springs damaged	• Inspect for damage. Repair as necessary.
• Bronze seal ring on bearing damaged	• Inspect for damage. Repair as necessary.

Shift Concern: No 4-5 Shift

Possible Component	Reference/Action
270 - ROUTINE	
Powertrain Control System	
• PCM, vehicle wiring harnesses, Shift Solenoid C (SSC), Pressure	• Carry out On-Board Diagnostic (OBD) Tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED)

Control Solenoid B (PCB), Output Shaft Speed (OSS) sensor, Transmission Range (TR) sensor	manual for diagnosis and testing of the PCM.
• Transmission Control Switch (TCS)	• GO to Pinpoint Test A , GO to Pinpoint Test C , GO to Pinpoint Test D and GO to Pinpoint Test E .
	• Repair as required. Clear the DTCs, road test and rerun OBD Test.
	• For TCS diagnosis, refer to Section 307-05 .
Incorrect Pressures	
• High/low pressure	• Carry out Line Pressure Test. Refer to Special Testing Procedures in this section.
Main Control	
• Screws not tightened to specification	• Tighten to specification.
• Separator plate damaged	• Inspect for damage. If damaged, install a new separator plate.
• Contamination	• Disassemble and clean.
• Valve/springs damaged, misassembled, missing, stuck or bore damaged	• If damaged or parts are missing, install new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Transmission fluid filter damaged or missing	• Inspect for damage. Repair as necessary.
Overdrive (O/D) Servo	
• Servo retaining screws damaged	• Inspect for damage. Repair as necessary.
• Seals (piston and cover) damaged	• Inspect for damage. Repair as necessary.
• Servo bore	• Inspect for damage. Repair as necessary.
O/D Band	
• Band damaged	• Inspect for damage. Repair as necessary.
• Servo worn or damaged	• Inspect for damage. Repair as necessary.
• Not adjusted correctly	• Inspect for damage. Repair as necessary.

Shift Concern: No 5-4 Shift

Possible Component	Reference/Action
271 - ROUTINE	
Powertrain Control System	
• PCM, vehicle wiring harnesses, Shift Solenoid C (SSC), Pressure Control Solenoid C (PCC), Output Shaft Speed (OSS) sensor, Transmission Range (TR) sensor	• Carry out On-Board Diagnostic (OBD) Tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
• Transmission Control Switch (TCS)	• GO to Pinpoint Test A , GO to Pinpoint Test C , GO to Pinpoint Test D and GO to Pinpoint Test E .
	• Repair as required. Clear the DTCs, road test and rerun OBD Test.
	• For TCS diagnosis, refer to Section 307-05 .
Incorrect Pressures	
• High/low pressure	• Carry out Line Pressure Test. Refer to Special Testing Procedures in this section.
Main Control	
• Screws not tightened to specification	• Tighten to specification.
• Separator plate damaged	• Inspect for damage. If damaged, install a new separator plate.
• Contamination	• Disassemble and clean.
• Valves/springs damaged, misassembled, missing, stuck or bore damaged	• If damaged or parts are missing, install new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Transmission fluid filter damaged or missing	• Inspect for damage. Repair as necessary.
Overdrive (O/D) Servo	
• Servo retaining screws damaged	• Inspect for damage. Repair as necessary.
• Seals (piston and cover) damaged	• Inspect for damage. Repair as necessary.
O/D Band	
• Band damaged	• Inspect for damage. Repair as necessary.

• Servo worn or damaged	• Inspect for damage. Repair as necessary.
• Not adjusted correctly	• Inspect for damage. Repair as necessary.

Shift Concern: Soft/Slipping 4-5 Shift

Possible Component	Reference/Action
272 - ROUTINE	
Powertrain Control System	
• PCM, vehicle wiring harnesses, Shift Solenoid C (SSC), Pressure Control Solenoid B (PCB), Transmission Fluid Temperature (TFT) sensor	• Carry out On-Board Diagnostic (OBD) Tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	• GO to Pinpoint Test A , GO to Pinpoint Test B and GO to Pinpoint Test D .
	• Repair as required. Clear the DTCs, road test and rerun OBD Test.
Incorrect Pressures	
• High/low pressure	• Carry out Line Pressure Test. Refer to Special Testing Procedures in this section.
Main Control	
• Screws not tightened to specification	• Tighten to specification.
• Separator plate damaged	• Inspect for damage. If damaged, install a new separator plate.
• Contamination	• Disassemble and clean.
• Valves/springs damaged, misassembled, missing, stuck or bore damaged	• If damaged or parts are missing, install new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Transmission fluid filter damaged or missing	• Inspect for damage. Repair as necessary.
Overdrive (O/D) Servo	
• Servo retaining screws damaged	• Inspect for damage. Repair as necessary.

• Seals (piston and cover) damaged	• Inspect for damage. Repair as necessary.
• Servo bore	• Inspect for damage. Repair as necessary.
O/D Band	
• Band damaged	• Inspect for damage. Repair as necessary.
• Servo worn or damaged	• Inspect for damage. Repair as necessary.
• Not adjusted correctly	• Inspect for damage. Repair as necessary.

Shift Concern: Feel - Soft/Slipping 5-4 Shift

Possible Component	Reference/Action
273 - ROUTINE	
Powertrain Control System	
• PCM, vehicle wiring harnesses, Shift Solenoid C (SSC), Pressure Control Solenoid C (PCC), Transmission Fluid Temperature (TFT) sensor	• Carry out On-Board Diagnostic (OBD) Tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	• GO to Pinpoint Test A , GO to Pinpoint Test B and GO to Pinpoint Test D .
	• Repair as required. Clear the DTCs, road test and rerun OBD Test.
Incorrect Pressures	
• High/low pressure	• Carry out Line Pressure Test. Refer to Special Testing Procedures in this section.
Main Control	
• Screws not tightened to specification	• Tighten to specification.
• Separator plate damaged	• Inspect for damage. If damaged, install a new separator plate.
• Contamination	• Disassemble and clean.
• Valves/springs damaged, misassembled, missing, stuck or bore damaged	• If damaged or parts are missing, install new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or

	transmission damage.
• Transmission fluid filter damaged or missing	• Inspect for damage. Repair as necessary.
Direct Clutch Assembly	
• Seals, piston damaged	• Inspect for damage. Repair as necessary.
• Check ball damaged, missing, not seating, off location	• Inspect for mislocation, poor seating, damage. Install a new cylinder.
• Friction elements damaged or worn	• Inspect for damage. Repair as necessary.
• Return springs damaged	• Inspect for damage. Repair as necessary.
Direct One-Way Clutch (OWC)	
• Worn, damaged or assembled incorrectly	• Inspect for damage. Repair as necessary.

Shift Concerns: Harsh 4-5 Shift

Possible Component	Reference/Action
274 - ROUTINE	
Powertrain Control System	
• PCM, vehicle wiring harnesses, Shift Solenoid C (SSC), Pressure Control Solenoid B (PCB), Turbine Shaft Speed (TSS) sensor, Transmission Range (TR) sensor, Transmission Fluid Temperature (TFT) sensor	• Carry out On-Board Diagnostic (OBD) Tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	• GO to Pinpoint Test A , GO to Pinpoint Test B , GO to Pinpoint Test C , GO to Pinpoint Test D and GO to Pinpoint Test E .
	• Repair as required. Clear the DTCs, road test and rerun OBD Test.
Incorrect Pressures	
• High/low pressure	• Carry out Line Pressure Test. Refer to Special Testing Procedures in this section.
Main Control	
• Screws not tightened to specification	• Tighten to specification.

• Separator plate damaged	• Inspect for damage. If damaged, install a new separator.
• Contamination	• Disassemble and clean.
• Valve/springs damaged, misassembled, missing, stuck or bore damaged	• If damaged or parts are missing, install new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Transmission fluid filter damaged or missing	• Inspect for damage. Repair as necessary.
Overdrive (O/D) Servo	
• Servo retaining screws damaged	• Inspect for damage. Repair as necessary.
• Seal (piston and cover) damaged	• Inspect for damage. Repair as necessary.
O/D Band	
• Band damaged	• Inspect for damage. Repair as necessary.
• Servo worn or damaged	• Inspect for damage. Repair as necessary.
• Not adjusted correctly	• Inspect for damage. Repair as necessary.

Shift Concern: Harsh 5-4 Shift

Possible Component	Reference/Action
275 - ROUTINE	
Powertrain Control System	
• PCM, vehicle wiring harnesses, Shift Solenoid C (SSC), Pressure Control Solenoid C (PCC), Turbine Shaft Speed (TSS) sensor, Transmission Range (TR) sensor, Transmission Fluid Temperature (TFT) sensor	• Carry out On-Board Diagnostic (OBD) Tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	• GO to Pinpoint Test A , GO to Pinpoint Test B , GO to Pinpoint Test C , GO to Pinpoint Test D and GO to Pinpoint Test E .
	• Repair as required. Clear the DTCs, road test and rerun OBD Test.
Incorrect Pressures	

• High/low pressure	• Carry out Line Pressure Test. Refer to Special Testing Procedures in this section.
Main Control	
• Screws not tightened to specification	• Tighten to specification.
• Separator plate damaged	• Inspect for damage. If damaged, install a new separator plate.
• Contamination	• Disassemble and clean.
• Valve/springs damaged, misassembled, missing, stuck or bore damaged	• If damaged or parts are missing, install new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Transmission fluid filter damaged or missing	• Inspect for damage. Repair as necessary.
Overdrive (O/D) Servo	
• Servo retaining screws damaged	• Inspect for damage. Repair as necessary.
• Seals (piston and cover) damaged	• Inspect for damage. Repair as necessary.
O/D Band	
• Band damaged	• Inspect for damage. Repair as necessary.
• Servo worn or damaged	• Inspect for damage. Repair as necessary.
• Not adjusted correctly	• Inspect for damage. Repair as necessary.
Direct One-Way Clutch (OWC)	
• Worn, damaged or assembled incorrectly	• Inspect for damage. Repair as necessary.

Other Concern: No Engine Braking in Manual 3rd Position

Possible Component	Reference/Action
280 - ROUTINE	
Powertrain Control System	
• PCM, vehicle wiring harnesses, Shift Solenoid A (SSA), Shift Solenoid B (SSB), Shift Solenoid C (SSC), Pressure Control Solenoid A (PCA),	• Carry out On-Board Diagnostic (OBD) Tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.

Pressure Control Solenoid B (PCB)	
	• GO to Pinpoint Test A and GO to Pinpoint Test D .
	• Repair as required. Clear the DTCs, road test and rerun OBD Test.
Transmission Fluid	
• Incorrect level	• Check the transmission fluid level. Adjust transmission fluid to correct level. Refer to Transmission Fluid Level Check in this section.
Incorrect Pressures	
• High/low pressure	• Carry out Line Pressure Test. Refer to Special Testing Procedures in this section.
Main Control	
• Screws not tightened to specification	• Tighten to specification.
• Separator plate damaged	• Inspect for damage. If damaged, install a new separator plate.
• Contamination	• Disassemble and clean.
• Valve/springs damaged, misassembled, missing, stuck or bore damaged	• If damaged or parts are missing, install new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Transmission fluid filter damaged or missing	• Inspect for damage. Repair as necessary.
Coast Clutch Assembly	
• Seals, piston damaged	• Inspect for damage. Repair as necessary.
• Check ball damaged, missing, not seating, off location	• Inspect for mislocation, poor seating, damage. Install a new cylinder.
• Friction elements damaged or worn	• Inspect for damage. Repair as necessary.
• Return springs damaged	• Inspect for damage. Repair as necessary.
Center Support	
• Screw not tightened to specification	• Tighten to specification.
• Seals rings or bearing damaged	• Inspect for damage. Repair as necessary.
	• Inspect for damage. Repair as necessary.

• Outside diameter of case bore damaged	
• Support damaged or leaking	• Inspect for damage. Repair as necessary.
Intermediate Servo	
• Servo retaining screws damaged	• Inspect for damage. Repair as necessary.
• Seals (piston and cover) damaged	• Inspect for damage. Repair as necessary.
Intermediate Band	
• Band damaged	• Inspect for damage. Repair as necessary.
• Servo worn or damaged	• Inspect for damage. Repair as necessary.
• Not adjusted correctly	• Inspect for damage. Repair as necessary.

Other Concern: No Engine Braking in Manual 4th (D) Position

Possible Component	Reference/Action
281 - ROUTINE	
Powertrain Control System	
• PCM, vehicle wiring harnesses, Shift Solenoid D (SSD), Reverse Pressure (RP) switch, Pressure Control Solenoid B (PCB)	• Carry out On-Board Diagnostic (OBD) Tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	• GO to Pinpoint Test A and GO to Pinpoint Test D .
	• Repair as required. Clear the DTCs, road test and rerun OBD Test.
Transmission Fluid	
• Incorrect level	• Check the transmission fluid level. Adjust transmission fluid to correct level. Refer to Transmission Fluid Level Check in this section.
Main Control	
• Screws not tightened to specification	• Tighten to specification.
• Separator plate damaged	• Inspect for damage. If damaged, install a new separator plate.

• Contamination	• Disassemble and clean.
• Valve/springs damaged, misassembled, missing, stuck or bore damaged	• If damaged or parts are missing, install new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
• Transmission fluid filter damaged or missing	• Inspect for damage. Repair as necessary.
Coast Clutch Assembly	
• Seals, piston damaged	• Inspect for damage. Repair as necessary.
• Check ball damaged, missing, not seating, off location	• Inspect for mislocation, poor seating, damage. Install a new cylinder.
• Friction elements damaged or worn	• Inspect for damage. Repair as necessary.
• Return springs damaged	• Inspect for damage. Repair as necessary.

Other Concern: Slip/Chatters in Manual 3rd Position

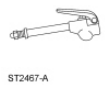
Possible Component	Reference/Action
282 - ROUTINE	
Powertrain Control System	
• PCM, vehicle wiring harnesses, Pressure Control Solenoid A (PCA), Pressure Control Solenoid B (PCB)	• Carry out On-Board Diagnostic (OBD) Tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	• GO to Pinpoint Test D .
	• Repair as required. Clear the DTCs, road test and rerun OBD Test.
Transmission Fluid	
• Incorrect level	• Check the transmission fluid level. Adjust transmission fluid to the correct level. Refer to Transmission Fluid Level Check in this section.
• Condition	• Carry out Transmission Fluid Condition Check. Refer to Preliminary Inspection in this section.
Incorrect Pressures	

• High/low pressure	• Carry out Line Pressure Test. Refer to Special Testing Procedures in this section.
Overdrive (O/D) Servo	
• Servo retaining screws damaged	• Inspect for damage. Repair as necessary.
• Seals (piston and cover) damaged	• Inspect for damage. Repair as necessary.
O/D Band	
• Band damaged	• Inspect for damage. Repair as necessary.
• Servo worn or damaged	• Inspect for damage. Repair as necessary.
• Not adjusted correctly	• Inspect for damage. Repair as necessary.
Intermediate Servo	
• Servo retaining screws damaged	• Inspect for damage. Repair as necessary.
• Seals (piston and cover) damaged	• Inspect for damage. Repair as necessary.
Intermediate Band	
• Band damaged	• Inspect for damage. Repair as necessary.
• Servo worn or damaged	• Inspect for damage. Repair as necessary.
• Not adjusted correctly	• Inspect for damage. Repair as necessary.
Forward Clutch Assembly	
• Seals, piston damaged	• Inspect for damage. Repair as necessary.
• Check ball damaged, missing, not seating, off location	• Inspect for mislocation, poor seating, damage. Install a new cylinder.
• Friction elements damaged or worn	• Inspect for damage. Repair as necessary.
• Return springs damaged	• Inspect for damage. Repair as necessary.
• Bronze seal ring on bearing damaged	• Inspect for damage. Repair as necessary.
Direct One-Way Clutch (OWC)	
• Worn, damaged or assembled incorrectly	• Inspect for damage. Repair as necessary.
Low OWC	
• Worn, damaged or assembled incorrectly	• Inspect for damage. Repair as necessary.

Other Concern: Engine Braking in ALL Gears

Possible Component	Reference/Action
283 - ROUTINE	
Powertrain Control System	
• PCM, vehicle wiring harnesses, Shift Solenoid D (SSD)	• Carry out On-Board Diagnostic (OBD) Tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	• GO to Pinpoint Test A .
	• Repair as required. Clear the DTCs, road test and rerun OBD Test.
Torque Converter Assembly	
• Torque converter internal failure preventing engagement, piston release	• Remove transmission. Inspect for damage. Refer to Torque Converter Contamination Inspection in this section. If the torque converter fails to pass the criteria or is damaged, install a new or remanufactured torque converter.

Other Concern: No 2nd and 5th Gears (Manual 2nd is OK)



Possible Component	Reference/Action
284 - ROUTINE	
Hydraulic/Mechanical	
	• Verify that Manual 2nd is present and functions correctly. If Manual 2nd is not operating correctly, go to Shift Concerns: Routine 210 - Some/All Shifts Missing (Automatic Mode) and continue diagnosis. If Manual 2nd is operating correctly, continue with this routine.
Powertrain Control System	
• PCM, vehicle wiring harnesses, Pressure Control Solenoid B (PCB), Pressure Control Solenoid C (PCC)	• Carry out On-Board Diagnostic (OBD) Tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	• GO to Pinpoint Test D .
	• Repair as required. Clear the DTCs, road test and rerun OBD Test.

Other Concern: No 3rd, 4th and 5th Gears

Possible Component	Reference/Action
285 - ROUTINE	
Powertrain Control System	
• PCM, vehicle wiring harnesses, Pressure Control Solenoid A (PCA), Pressure Control Solenoid B (PCB)	• Carry out On-Board Diagnostic (OBD) Tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	• GO to Pinpoint Test D .
	• Repair as required. Clear the DTCs, road test and rerun OBD Test.
Overdrive (O/D) Servo	
• Servo retaining screws damaged	• Inspect for damage. Repair as necessary.
• Seals (piston and cover) damaged	• Inspect for damage. Repair as necessary.
• Servo bore	• Inspect for damage. Repair as necessary.
O/D Band	
• Band damaged	• Inspect for damage. Repair as necessary.
• Servo worn or damaged	• Inspect for damage. Repair as necessary.
• Not adjusted correctly	• Inspect for damage. Repair as necessary.
O/D Planetary Assembly	
• Planetary damaged	• Inspect for damage. Repair as necessary.
Intermediate Servo	
• Servo retaining screws damaged	• Inspect for damage. Repair as necessary.
• Seals (piston and cover) damaged	• Inspect for damage. Repair as necessary.
Intermediate Band	
• Band damaged	• Inspect for damage. Repair as necessary.
• Servo worn or damaged	• Inspect for damage. Repair as necessary.
• Not adjusted correctly	• Inspect for damage. Repair as necessary.

Transmission Fluid Level Check

Special Tool(s)

 ST2467-A	Rubber Tip Air Nozzle 100-D009 (D93L-7000-A)
 ST2581-A	Transmission Fluid Fill Tool 307-437
 ST2715-A	Transporter Fluid Evacuator/Injector 307-D465
 ST1269-A	Vacuum Pump Kit 416-D002 (D95L-7559-A)
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Material

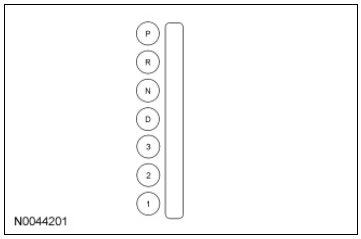
Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V

Transmission Fluid Fill Reference

NOTE: Left side of case shown.

Item	Part Number	Description
1	-	Transmission fluid level
2	7A010	Transmission fluid level tube
3	W704999-S309	

		Transmission fluid level and fill plug (small) (in-vehicle)
4	7A010	Transmission fluid drain plug (large)

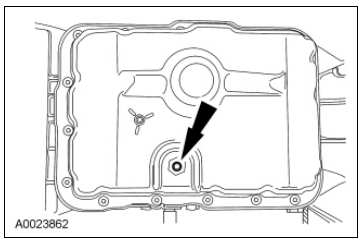


1. Using the scan tool, monitor the Transmission Fluid Temperature (TFT).

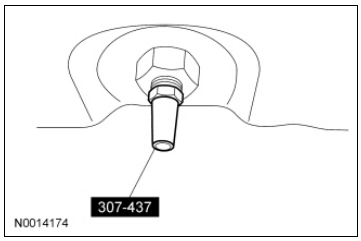
2. Start the engine.

3. **NOTE:** Engine idle speed is approximately 650 rpm.

   Run the engine until the TFT is between 27-49°C (80-120°F).



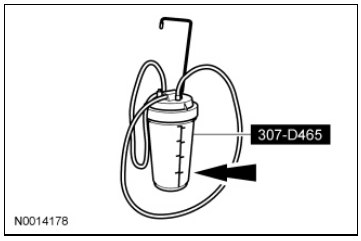
4. Move the selector lever slowly through each gear, stopping in each position and allowing the transmission to engage.



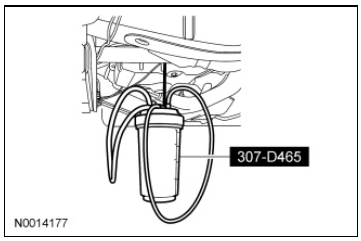
5. Place the selector lever in the PARK position.

6. With the engine running and the vehicle set as close to level as possible, position it on a hoist. For additional information, refer to Section 100-02 .

7. Hold the larger transmission fluid drain plug with a wrench and remove the small (center) transmission fluid level indicating plug.

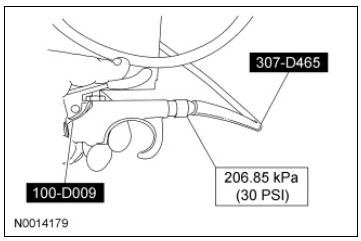


8. Install the Transmission Fluid Fill Tool into the pan.



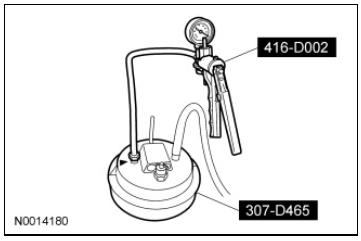
9. **NOTE:** Prior to filling the Transporter Fluid Evacuator/Injector with transmission fluid, make sure that the canister is clean.

   Fill the Transporter Fluid Evacuator/Injector with transmission fluid.

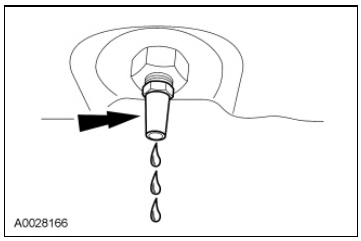


10. Hang the Transporter Fluid Evacuator/Injector under the vehicle. Position it upright and close to the transmission.

11. Connect the Transporter Fluid Evacuator/Injector.
    - Connect the open end of the fluid hose from the Transporter Fluid Evacuator/Injector to the Transmission Fluid Fill Tool at the bottom of the transmission fluid pan.

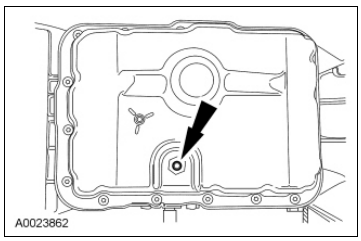


12. Apply a maximum of 206.85 kPa (30 psi) to the open end of the vacuum/pressure hose from the Rubber Tip Air Nozzle. Transmission fluid will immediately start flowing out of the Transporter Fluid Evacuator/Injector into the transmission fluid pan.



13. Add 0.5L (1 pt) of transmission fluid into the transmission fluid pan. Stop the process by releasing the air pressure and removing the Rubber Tip Air Nozzle from the end of the hose.

14. Inspect the transmission fluid level in the Transporter Fluid Evacuator/Injector. If the transmission fluid drains back into the canister, the transmission is full. If no transmission fluid drains back, more transmission fluid will need to be added. Repeat Steps 12 and 13.



15. Once the transmission is full, place a Vacuum Pump Kit on the open end of the vacuum/pressure hose on the Transporter Fluid Evacuator/Injector and apply vacuum to the system. This will pull out any extra transmission fluid trapped in the system and direct it into the container.

16. Allow the transmission fluid to drain. Make sure that the TFT is between 27-49°C (80-120°F). When the transmission fluid comes out as a thin stream or drip, the transmission fluid is at the correct level.

17. Reinstall the small (center) transmission fluid level indicating plug.
    - Tighten to 10 Nm (89 lb-in).

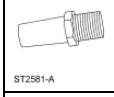
18. Check the operation of the transmission by moving the selector lever slowly through each gear, stopping in each position and allowing the transmission to engage.

Transmission Fluid Exchange

Special Tool(s)

 ST3088-A	Heavy-Duty Transmission and Power Steering Fluid X-Changer 078-00531 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Material



Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V

NOTICE: **Use transmission fluid specific for this transmission. Do not use any supplemental transmission fluid additives or cleaning agents. The use of these products can cause internal transmission components to fail, which will affect the operation of the transmission.**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Use the Heavy-Duty Transmission and Power Steering Fluid X-Changer to change the fluid.
3. Connect the Heavy-Duty Transmission and Power Steering Fluid X-Changer to the transmission fluid cooler tube after the transmission fluid cooler on the return tube. This will help remove any foreign material trapped in the transmission fluid coolers.
4. Perform the transmission fluid exchange using the Heavy-Duty Transmission and Power Steering Fluid X-Changer. Follow the manufacturer's instructions included with the machine.
5. Once the transmission fluid exchange is completed, disconnect the Heavy-Duty Transmission and Power Steering Fluid X-Changer. Reconnect any disconnected transmission fluid cooler tubes.
6. Using the scan tool with the engine running, check and make sure that the transmission is at normal operating temperature 66-77°C (150-170°F). Check and adjust the transmission fluid level and check for any leaks. If transmission fluid is needed, add transmission fluid in increments of 0.24L (0.5 pt) until the correct level is achieved.

Transmission Fluid Drain and Refill

Special Tool(s)

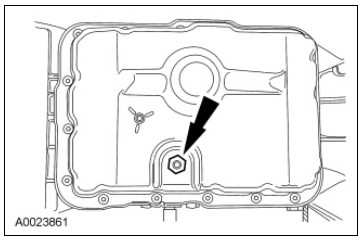
 ST2581-A	Adapter, Fluid Level and Fill Plug 307-437
 ST2715-A	Fluid Transporter/Evacuator/Injector 307-D465
 ST2467-A	Rubber Tip Air Nozzle 100-D009 (D93L-7000-A)
 ST1269-A	Vacuum Pump Kit 416-D002 (D95L-7559-A)
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V

Fluid Fill Reference

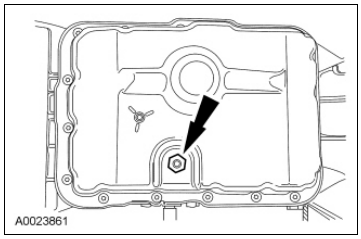
NOTE: Left side of case shown.



Item	Part Number	Description
1	-	Transmission fluid level
2	7A010	Transmission fluid level tube
3	W704999	

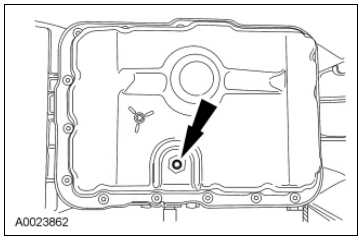
		Transmission fluid level and fill plug (small) (in-vehicle)
4	7A010	Transmission fluid drain plug (large)

Draining

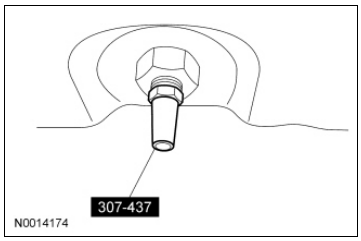


1. With the vehicle in PARK, position it on a hoist. Set the vehicle as close to level as possible. For additional information, refer to Section 100-02 .

2. Remove the transmission fluid drain plug (large plug) and allow the transmission fluid to drain.

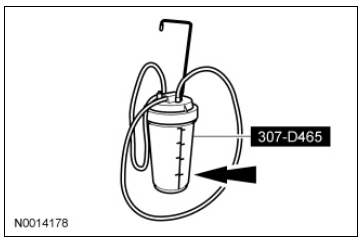


Refill

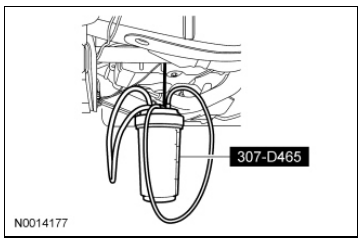


1. Install the transmission fluid drain plug.
   - Tighten to 26 Nm (19 lb-ft).

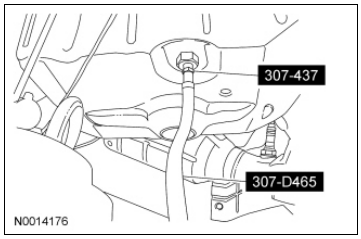
2. Hold the larger transmission fluid drain plug with a wrench and remove the small (center) transmission fluid level indicating plug.



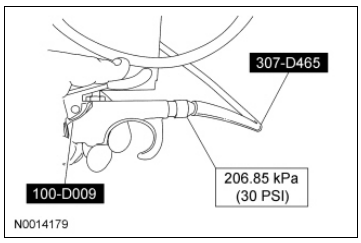
3. Install the Fluid Level and Fill Plug Adapter into the transmission fluid pan.



4. **NOTE:** Prior to filling the Fluid Transporter/Evacuator/Injector with transmission fluid, make sure that the canister is clean.



Fill the Fluid Transporter/Evacuator/Injector with transmission fluid.

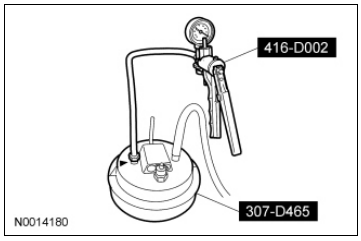


5. Hang the Fluid Transporter/Evacuator/Injector under the vehicle, upright and close to the transmission.

6. Connect the Fluid Transporter/Evacuator/Injector.
   - Connect the open end of the fluid hose from the Fluid Transporter/Evacuator/Injector to the Fluid Level and Fill Plug Adapter at the bottom of the transmission fluid pan.

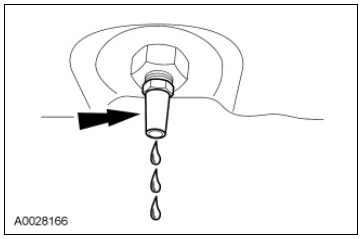
7. Apply a maximum of 206.85 kPa (30 psi) to the open end of the vacuum/pressure hose from the Rubber Tip Air Nozzle. Transmission fluid will immediately start flowing out of the Fluid Transporter/Evacuator/Injector into the transmission fluid pan.

8. Add 1.89L or 2.83L (2 qt or 3 qt) of transmission fluid into the transmission fluid pan. Stop the process by releasing the air pressure and removing the Rubber Tip Air Nozzle from the end of the hose.



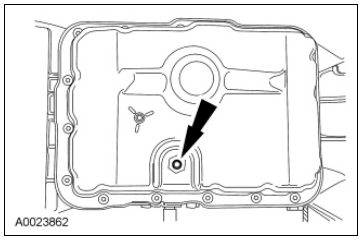
9. **NOTE:** Engine idle speed is approximately 650 rpm.

   Using the scan tool, start and run the engine until the Transmission Fluid Temperature (TFT) is between 27°C-49°C (80°F-120°F).



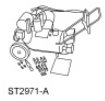
10. Inspect the transmission fluid level in the Fluid Transporter/Evacuator/Injector. If the fluid drains back into the canister, the transmission is full. If no transmission fluid drains back, more transmission

fluid will need to be added. Repeat Steps 9 and 10.



11. Once the transmission is full, place a hand Vacuum Pump Kit on the open end of the vacuum/pressure hose on the Fluid Transporter/Evacuator/Injector and apply vacuum to the system. This will pull out any extra fluid trapped in the system and direct it into the container.

12. Allow the transmission fluid to drain. When the transmission fluid comes out as a thin stream or drip, the transmission fluid is at the correct level.



13. Reinstall the small (center) transmission fluid level indicating plug.
    - Tighten to 10 Nm (89 lb-in).

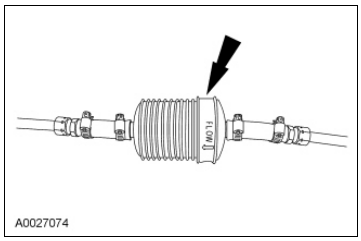
Transmission Fluid Cooler Backflushing and Cleaning

Special Tool(s)

 ST2971-A	Transmission Heated Cooler Line Flusher 222-00007, 222-00004 or equivalent

Material

Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC	MERCON® LV



NOTICE: **Use transmission fluid specified for this transmission. Do not use any supplemental transmission fluid additives or cleaning agents. The use of these products could cause internal transmission components to fail, which will affect the operation of the transmission.**

NOTE: Transmission fluid cooler backflushing and cleaning will be performed using the Transmission Heated Cooler Line Flusher or equivalent. Follow the manufacturer's instructions included with the machine. Test the equipment to make sure that a vigorous fluid flow is present before proceeding.

NOTE: If the Transmission Heated Cooler Line Flusher or equivalent is not available, install a new transmission fluid cooler and/or an auxiliary transmission fluid cooler.

NOTE: If the vehicle is equipped with an in-line transmission fluid filter, remove and discard the in-line filter.

1. Check and top off fluid level of the cooler line flusher with transmission fluid.
2. Allow the transmission fluid in the cooler line flusher 15-30 minutes to heat up to 60°C (140°F) before using.
3. If equipped, remove and discard the in-line transmission fluid filter.

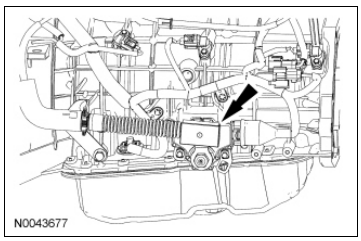
4. Install the line adapters into the transmission cooler tubes.
5. Attach the cooler line flusher red line to the transmission fluid cooler pressure tube quick disconnect fitting.

6. Attach the cooler line flusher blue line to the transmission fluid cooler return tube quick disconnect fitting.

7. Follow the equipment instructions to purge the transmission fluid cooler tubes and transmission fluid cooler prior to starting the flushing procedure.

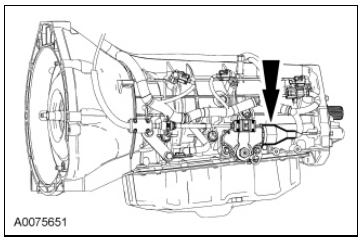
8. Allow the cooling system to backflush for 10-15 minutes, then flush the transmission fluid cooler in a normal flow direction for an additional 10-15 minutes.

Transmission Range (TR) Sensor Adjustment



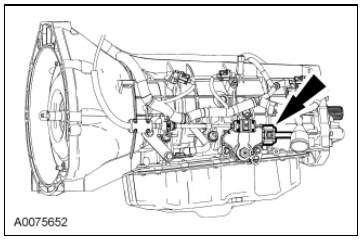
Special Tool(s)

 ST1633-A	Alignment Gauge, TR Sensor 307-351 (T97L-70010-A)



Adjust

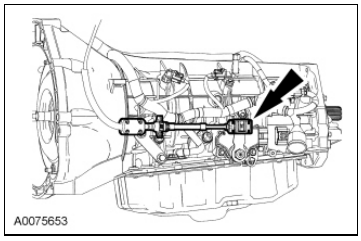
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .



2. Remove the selector lever cable shield by prying on the side of the shield closest to the boot, then sliding the shield away from the boot.

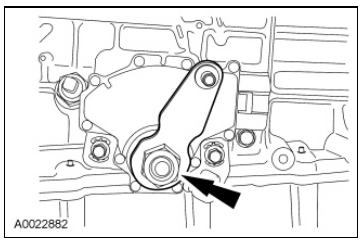
N0043677

3. Move the rubber boot back to gain access to the Transmission Range (TR) sensor connector.



A0075651

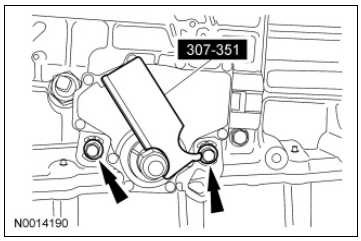
4. Disconnect the TR sensor connector.



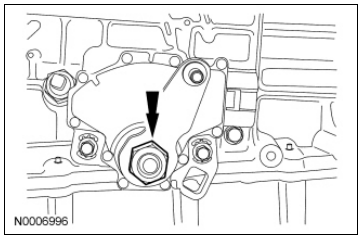
A0075652

5. ***NOTICE:*** **To prevent selector lever cable damage, do not apply force to the selector lever cable between the manual control lever and the selector lever cable bracket.**

   Remove the selector lever cable end from the manual control lever.

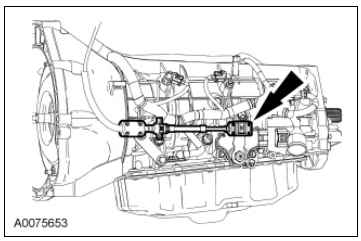


6. Remove the manual control lever nut and the manual control lever.

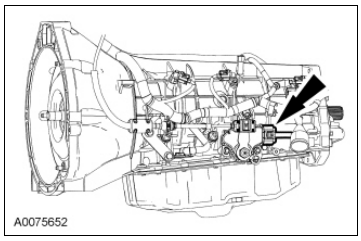


7. Loosen but do not remove the TR sensor screws.

8. Using the TR Sensor Alignment Gauge, align the TR sensor and tighten the screws in an alternating sequence.
    - Tighten to 8 Nm (71 lb-in).

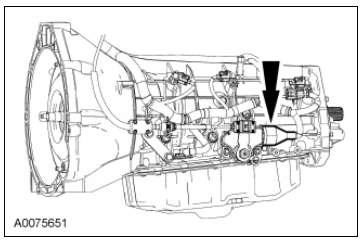


9. Install the manual control lever and manual control lever nut.
    - Tighten to 48 Nm (35 lb-ft).



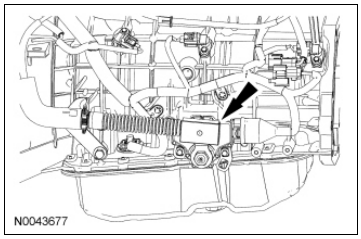
10. ***NOTICE:*** **To prevent selector lever cable damage, do not apply force to the selector lever cable between the manual control lever and the selector lever cable bracket.**

    NOTE: When installing the selector lever cable end, make sure that the selector lever cable end is correctly installed onto the manual control lever. Pull back on the selector lever cable to make sure that the selector cable end is correctly installed onto the manual control lever.



Install the selector lever cable end onto the manual control lever.

11. Connect the TR sensor connector.



12. Install the rubber boot over the TR connector.

13. **NOTE:** If the selector lever cable shield is loose on the selector lever cable, replace the selector lever cable shield.

    Install the selector lever cable shield.

14. Verify that the selector lever cable is adjusted correctly.

15. Verify that the vehicle will start in PARK and NEUTRAL and that the reverse lamps illuminate in REVERSE.

Torque Converter Contamination Inspection

Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V

1. A new or remanufactured torque converter must be installed if one or more of the following statements is true:
    - A torque converter malfunction has been determined based on complete diagnostic procedures.
    - The torque converter stud or studs, impeller hub or bushing are damaged.
    - The torque converter exhibits external discoloration (due to overheating).
    - There is evidence of transmission assembly or fluid contamination due to the following transmission or converter failure modes.
        - Major metallic failure
        - Multiple clutch plates or band failures
        - Sufficient component wear which results in metallic contamination
        - Water or antifreeze contamination

2. If none of the above conditions are present, continue with the following fluid inspection.

3. Pour a small amount of transmission fluid from the torque converter onto an absorbent white tissue or through a paper filter.

4. Examine the fluid for contaminants, color and smell. The fluid must be free of contaminants, red in color and not have a burnt smell.

5. ***NOTICE:*** **Do not use water-based cleaners or mineral spirits to clean or flush the torque converter or transmission damage will occur.**

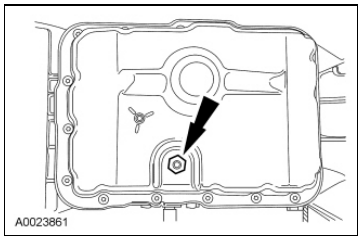
   If the fluid passed inspection:

    - drain the remaining fluid from the torque converter.
    - using only the recommended transmission fluid, add 1.9L (2 qt) of clean fluid into the converter and agitate by hand.
    - thoroughly drain the fluid.

Fluid Pan, Gasket and Filter

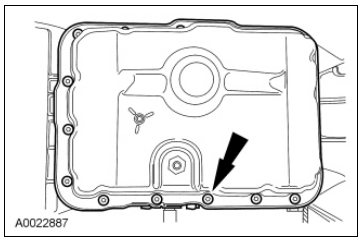
Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V



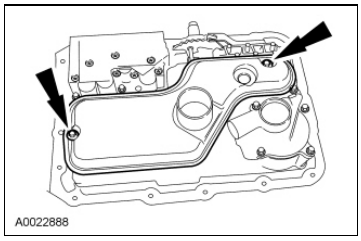
Item	Part Number	Description
1	7A010	Transmission fluid pan drain plug
2	W500213	Transmission fluid pan screw (16 required)
3	7A194	Transmission fluid pan
4	7L027	Transmission fluid pan magnet
5	7A191	Transmission fluid pan gasket
6	W500106	Transmission fluid filter screw (2 required)
7	7A098	Transmission fluid filter

Removal



1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the transmission fluid pan drain plug and drain the transmission fluid.

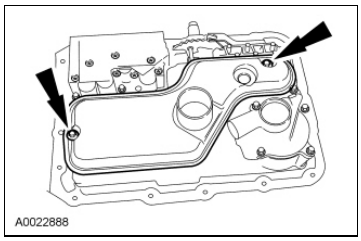


3. **NOTE:** The transmission fluid pan gasket is reusable, clean and inspect for damage. If not damaged, the transmission fluid gasket should be reused.

   Remove the 16 transmission fluid pan screws, transmission fluid pan and transmission fluid gasket.

4. Remove and discard the transmission fluid filter.

5. Clean and inspect the transmission fluid pan and magnet.



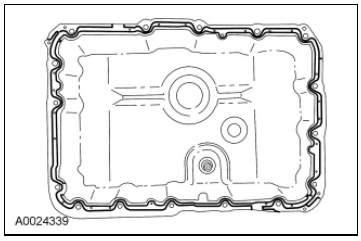
Installation

1. ***NOTICE:*** **Damage may occur to transmission fluid filter seals if they are not lubricated with transmission fluid.**

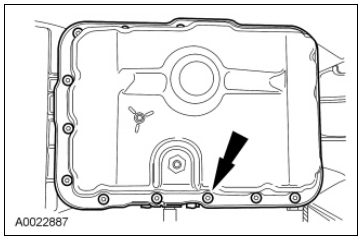
   NOTE: Make sure that the transmission fluid filter seals are correctly seated on the transmission fluid filter.

   Lubricate the transmission fluid filter seals and install the transmission fluid filter.

   - Tighten to 10 Nm (89 lb-in).

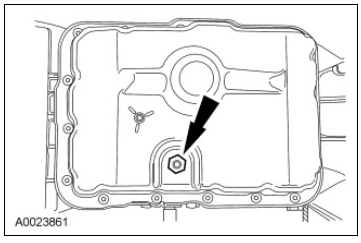


2. Install the transmission fluid pan magnet in the transmission fluid pan.



3. **NOTE:** The transmission fluid pan gasket is reusable, clean and inspect for damage. If not damaged, the transmission fluid pan gasket should be reused.

   Install the transmission fluid pan gasket on the transmission fluid pan.



4. Install the transmission fluid pan and transmission fluid pan gasket and loosely install the transmission fluid pan screws.

5. Tighten the transmission fluid pan screws in a crisscross sequence.
   - Tighten to 11 Nm (97 lb-in).

6. Install the transmission fluid pan drain plug.
   - Tighten to 26 Nm (19 lb-ft).

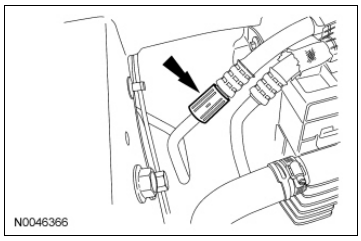
7. Fill the transmission. For additional information, refer to Transmission Fluid Drain and Refill in this section.

Transmission Filter - In Line

Special Tool(s)

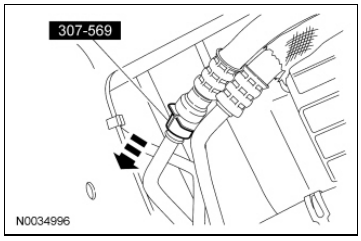
 ST2935A	Disconnect Tool, Transmission Cooler Line 307-569

Material



Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V

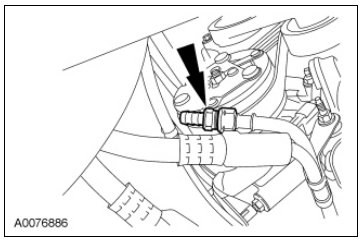
NOTE: Use the following guidelines for installing the transmission fluid in-line filter:



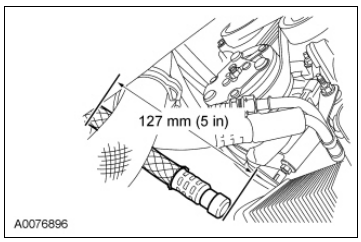
- If the transmission was overhauled and the vehicle was equipped with an in-line transmission fluid filter, install a new in-line transmission fluid filter.
- If the transmission was overhauled and the vehicle was not equipped with an in-line transmission fluid filter, install a new in-line transmission fluid filter kit.
- If the transmission is being installed for a non-internal repair, do not install an in-line transmission fluid filter or in-line transmission fluid filter kit.
- If installing a Ford-authorized remanufactured transmission, install a new in-line transmission fluid filter.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the transmission fluid cooler tube secondary latch from the transmission fluid cooler connector.



3. Using the Transmission Cooler Line Disconnect Tool, disconnect the transmission fluid cooler connector.

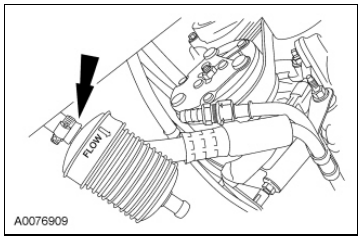


4. Remove the section of the transmission fluid cooler tube at the second flare.
    - Clean and de-burr the cut end of the transmission fluid cooler tube.

5. **NOTE:** Be sure the transmission fluid cooler tube is fully seated in the body of the fitting before final tightening of the ferrule nut.

   Install the tubing ferrule hose assembly connector onto the end of the transmission fluid cooler tube. Finger-tighten the ferrule nut, then tighten the nut an additional one and one-half turns to seat the ferrule in the connector.

6. Remove the section of the transmission fluid cooler hose as illustrated.



7. ***NOTICE:*** **The transmission fluid cooler filter has a bypass valve in it. The red arrow on the transmission fluid filter indicates the direction of transmission fluid flow through the filter. The transmission fluid filter must be installed in the transmission fluid cooler return tube with the red arrow on the transmission fluid filter pointing away from the transmission fluid cooler and toward the transmission (the transmission fluid return tube has transmission fluid coming out of the transmission fluid cooler going to the transmission). If the transmission fluid filter is not installed correctly, it will cause internal transmission damage.**

   NOTICE: **Do not install any transmission fluid cooler hoses or transmission fluid cooler tubes with a bend entering the transmission fluid filter greater than 60 degrees. Doing so can block transmission fluid flow and cause internal transmission damage.**

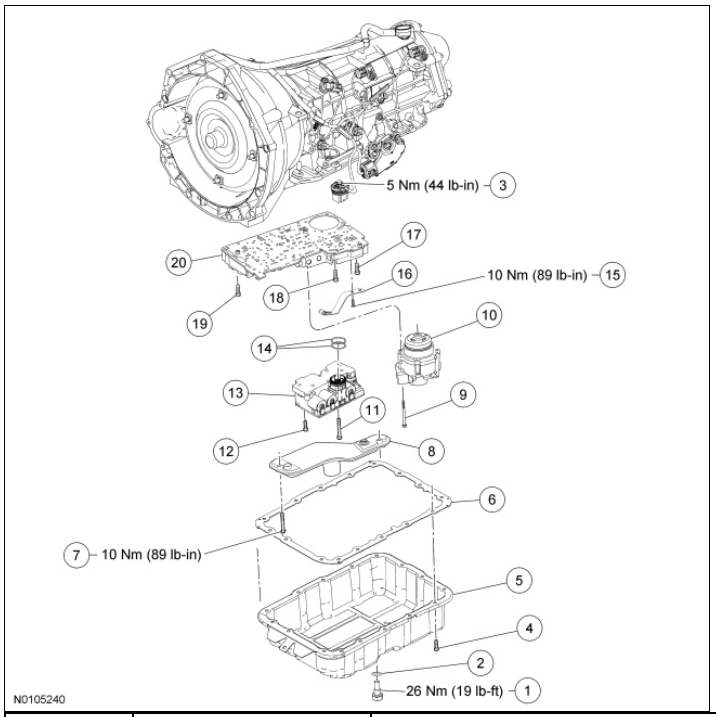
   Install the one end of the transmission fluid filter into the transmission fluid cooler hose with a clamp.

    - Tighten the transmission fluid cooler hose clamp.

8. Using a suitable length of hose, install the other end of the transmission fluid filter into the tubing ferrule hose assembly with 2 clamps.
    - Tighten the hose clamps.

9. Clean a section of the transmission fluid pan, then install the sticker.

10. Fill the transmission with transmission fluid.
    - Verify for correct operation.
    - Check the filter for leaks.



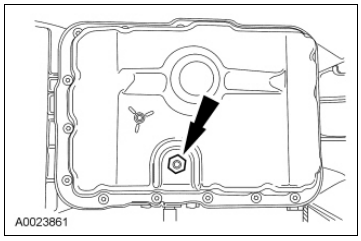
Main Control Valve Body

Special Tool(s)

 ST1639-A	Aligner, Valve Body (2 required) 307-334 (T95L-70010-C)

Material

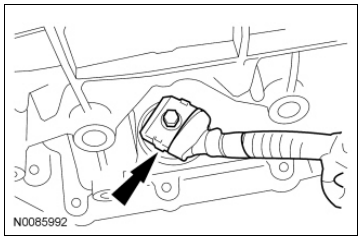
Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V



Item	Part Number	Description
1	7A010	Transmission fluid pan drain plug
2	6734	Transmission fluid pan drain plug gasket
3	-	Transmission vehicle harness connector screw
4	W500213	Transmission fluid pan screw (16 required)
5	7A194	Transmission fluid pan
6	7A191	Transmission fluid pan gasket
7	W705559	Transmission fluid filter screw (2 required)

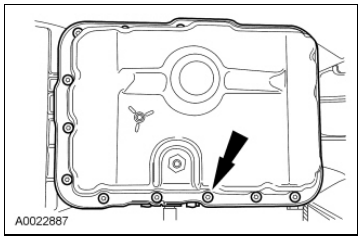
8	7A098	Transmission fluid filter
9	W702359	Reverse servo piston-to-case screw (4 required)
10	7B193	Reverse servo assembly
11	W703189	Transmission control solenoid body screw (7 required)
12	W702921	Transmission control solenoid body screw
13	7G391	Transmission control solenoid body
14	W705928	Solenoid body connector O-ring seals
15	W500100	Manual valve detent spring screw
16	7E332	Manual valve detent spring
17	W500102	Main control valve body screw (18 required)
18	W702791	Main control valve body screw
19	W706672	Main control valve body screw
20	7A100	Lower main control valve body assembly

Removal



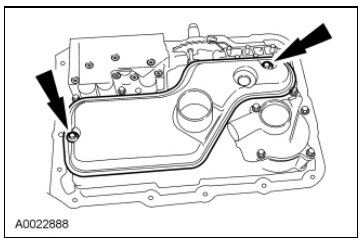
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the transmission fluid pan drain plug and drain the transmission fluid.



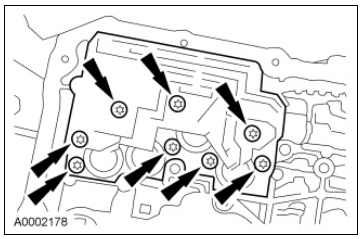
3. **NOTE:** Clean the area around the transmission vehicle harness connector to prevent contamination of the transmission control solenoid vehicle harness connector.

   Disconnect the transmission vehicle harness connector.

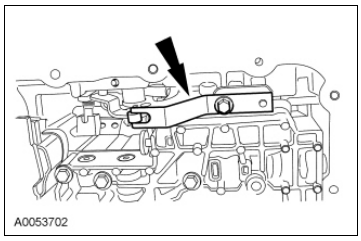


4. **NOTE:** The transmission fluid pan gasket is reusable. Clean and inspect for damage. If not damaged, the transmission fluid pan gasket should be reused.

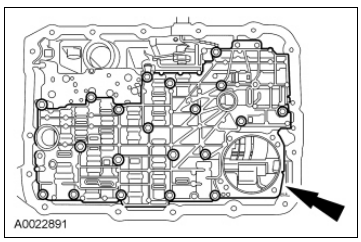
   Remove the 16 transmission fluid pan screws, transmission fluid pan and transmission fluid pan gasket.



5. Remove the transmission fluid filter.

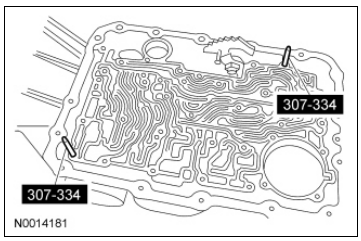


6. Remove the reverse servo assembly screws and the reverse servo assembly.

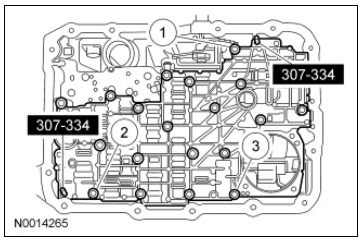


7. Remove the transmission control solenoid body screws and the transmission control solenoid body.

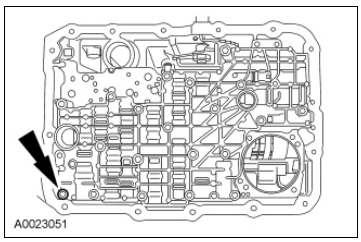
8. Remove the manual control valve detent spring.



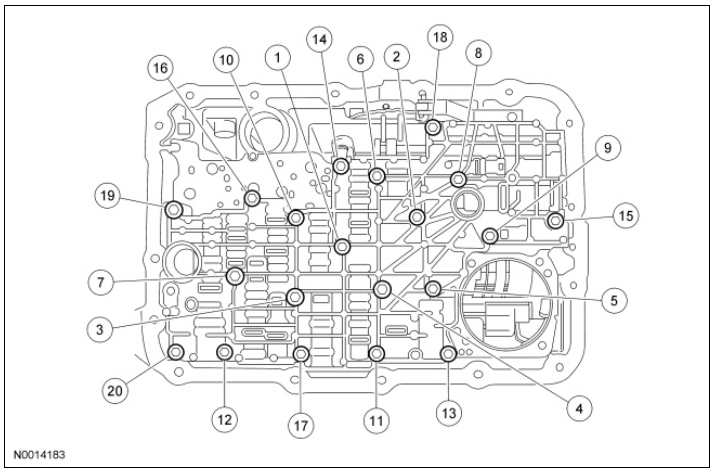
9. Remove the main control valve body screws and the main control valve body.



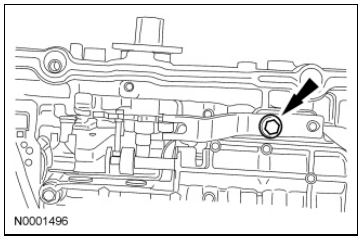
Installation



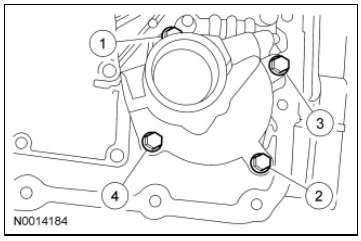
1. Install the Valve Body Aligners into the transmission case.



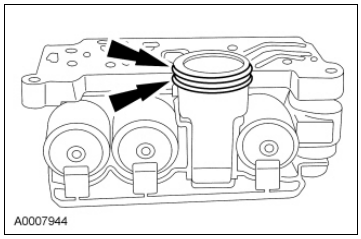
2. Using the Valve Body Aligners, install the main control valve body and loosely install the main control valve body-to-case screws.
    1. Install the short main control valve body-to-case screw.
    2. Install the main control valve body-to-case screw with the larger head.
    3. Install the remaining main control valve body-to-case screws.



3. Remove the Valve Body Aligners and loosely install the main control valve body screw.

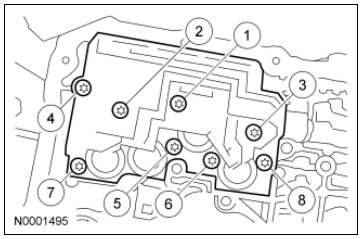


4. Tighten the main control valve body screws in the sequence shown.
    - Tighten to 10 Nm (89 lb-in).



5. Install the manual control valve detent spring screw.
    - Tighten to 10 Nm (89 lb-in).

6. Install the reverse servo assembly. Tighten the reverse servo assembly screws in 2 stages, in the sequence shown.
    - Stage 1: Tighten to 5 Nm (44 lb-in).
    - Stage 2: Tighten to 11 Nm (97 lb-in).

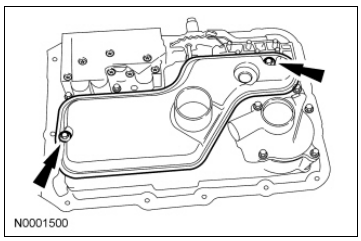


7. Install new O-ring seals on the transmission control solenoid body connector. Lubricate the O-ring seals with transmission fluid.

8. ***NOTICE:*** **Inspect the transmission case bore to make sure it is free of foreign material and not damaged. If damaged, a transmission leak may occur.**

    Install the transmission control solenoid body. Tighten the transmission control solenoid body screws in the sequence shown.

    - Tighten to 8 Nm (71 lb-in).

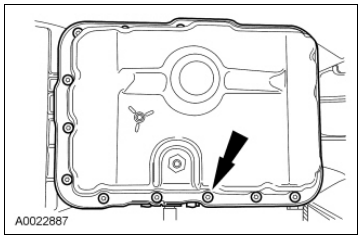


9. ***NOTICE:*** **Damage may occur to transmission fluid filter seals if they are not lubricated with transmission fluid.**

    NOTE: Make sure that the transmission fluid filter seals are correctly seated on the transmission fluid filter.

    Lubricate the transmission fluid filter seals and install the transmission fluid filter. Tighten the transmission fluid filter screws.

- Tighten to 10 Nm (89 lb-in).



10. **NOTE:** The transmission fluid pan gasket is reusable. Clean and inspect for damage. If not damaged, the transmission fluid pan gasket should be reused.

    Install the transmission fluid pan gasket on the transmission fluid pan.

11. Install the transmission fluid pan and transmission fluid pan gasket and loosely install the transmission fluid pan-to-case screws.

12. Tighten the transmission fluid pan-to-case screws in a crisscross sequence.
    - Tighten to 11 Nm (97 lb-in).

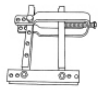
13. ***NOTICE:*** **Damage will occur to the transmission vehicle harness connector if the screw is tightened above specification.**

    NOTE: Always install new O-ring seals on the transmission control solenoid body connector.

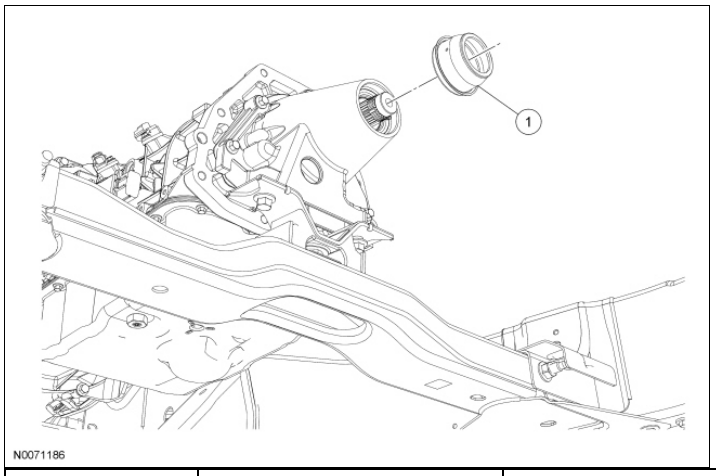
    NOTE: Clean the area around the transmission vehicle harness connector to prevent contamination of the transmission control solenoid body connector.

    NOTE: Use petroleum jelly to lubricate the O-ring seals to aid in the installation process.

Install and lubricate new O-ring seals on the transmission control solenoid body harness connector and connect the connector.



- Tighten to 5 Nm (44 lb-in).



14. Fill the transmission. For additional information, refer to Transmission Fluid Drain and Refill in this section.

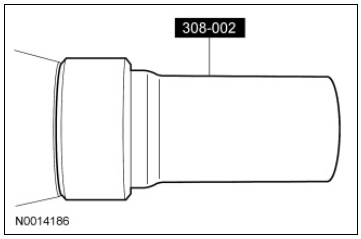
Extension Housing Seal - Rear Wheel Drive (RWD)

Special Tool(s)

 ST1188-A	Installer, Transmission Extension Housing Oil Seal 308-002 (T61L-7657-A)
 ST1758-A	Remover, Torque Converter Fluid Seal 307-309 (T94P-77001-BH)
 ST1185-A	Slide Hammer 100-001 (T50T-100-A)

Item	Part Number	Description
1	7052	Extension housing seal

Removal

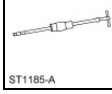


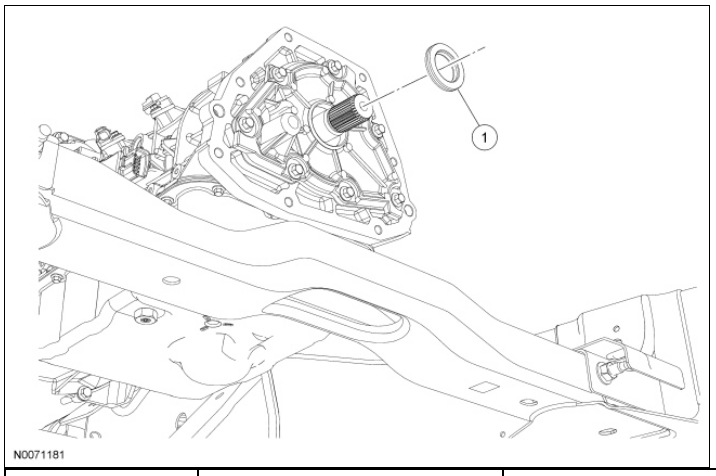
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the driveshaft. For additional information, refer to Section 205-01 .
3. Using the Torque Converter Fluid Seal Remover and Slide Hammer, remove the extension housing seal.

Installation

1. **NOTE:** Make sure the extension housing seal is correctly installed onto the Transmission Extension Housing Oil Seal Installer and the garter spring is in the correct position.

   Using the Transmission Extension Housing Oil Seal Installer, install the extension housing seal.





2. Install the driveshaft. For additional information, refer to Section 205-01 .

3. Carry out the transmission fluid level check. For additional information, refer to Transmission Fluid Level Check in this section.

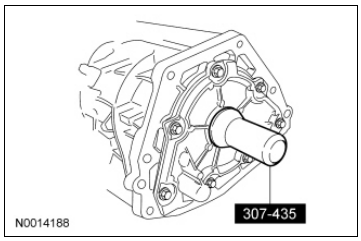
Extension Housing Seal - Four Wheel Drive (4WD)

Special Tool(s)

 ST3003-A	Installer, Extension Housing Seal 307-435
 ST2417-A	Remover, Input Shaft Oil Seal 308-375
 ST1185-A	Slide Hammer 100-001 (T50T-100-A)

Item	Part Number	Description
1	7052	Extension housing seal

Removal



1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the transfer case assembly. For additional information, refer to Section 308-07B .
3. Using the Input Shaft Oil Seal Remover and Slide Hammer, remove the extension housing seal.

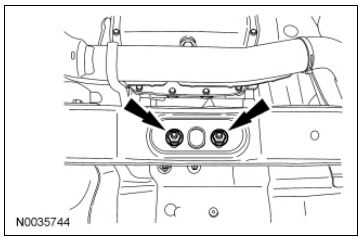
Installation

1. **NOTE:** Make sure the extension housing seal is correctly installed onto the Extension Housing Seal Installer and the garter spring is in the correct position.

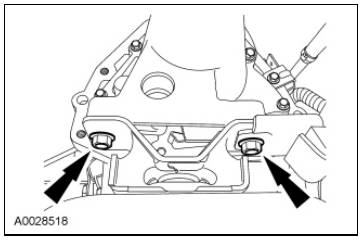
   Using the Extension Housing Seal Installer, install the extension housing seal.

2. Install the transfer case assembly. For additional information, refer to Section 308-07B .

3. Carry out the transmission fluid level check. For additional information, refer to Transmission Fluid Level Check in this section.

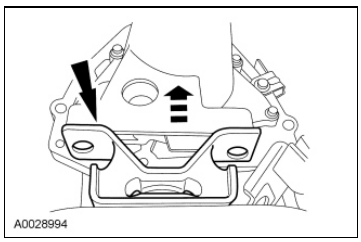


Extension Housing Gasket - Rear Wheel Drive (RWD)



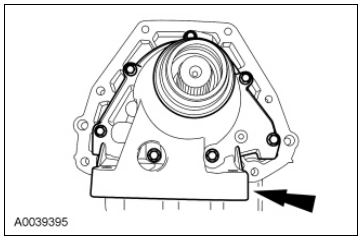
Item	Part Number	Description
1	W10660	Transmission support insulator-to-crossmember nuts
2	W708138	Transmission support insulator-to-extension housing screws
3	6D091	Transmission support insulator
4	W500311	Extension housing screw (7 required)
5	7A039	Extension housing
6	7086	Extension housing gasket

Removal

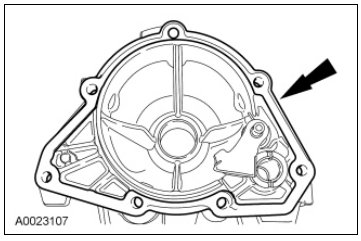


1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the driveshaft. For additional information, refer to Section 205-01 .
3. Support the transmission with a suitable jack.
4. Remove the transmission support insulator-to-crossmember nuts.

5. Remove the transmission support insulator-to-extension housing screws.

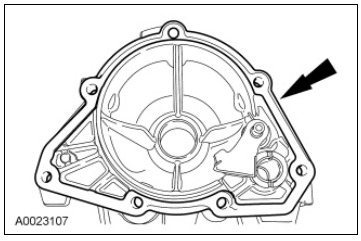


6. Raise the transmission and remove the transmission support insulator.



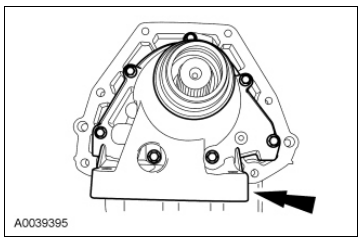
7. **NOTE:** The park pawl, park pawl return spring and park pawl shaft may fall out during removal of the extension housing.

   Remove the extension housing screws and the extension housing.

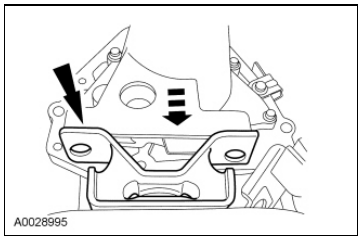


8. Remove and discard the extension housing gasket.

Installation

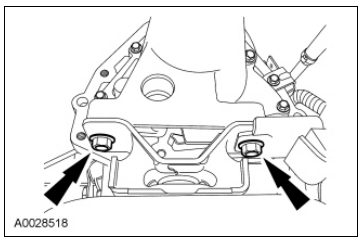


1. Clean the extension housing and install a new extension housing gasket. Verify that the park pawl is installed correctly.

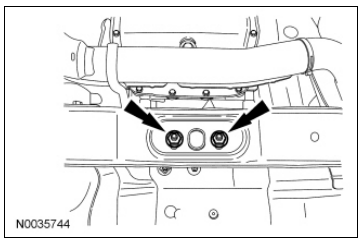


2. **NOTE:** Verify the park lever actuating rod is correctly seated into the case parking rod guide cup.

Install the extension housing and the extension housing screws.

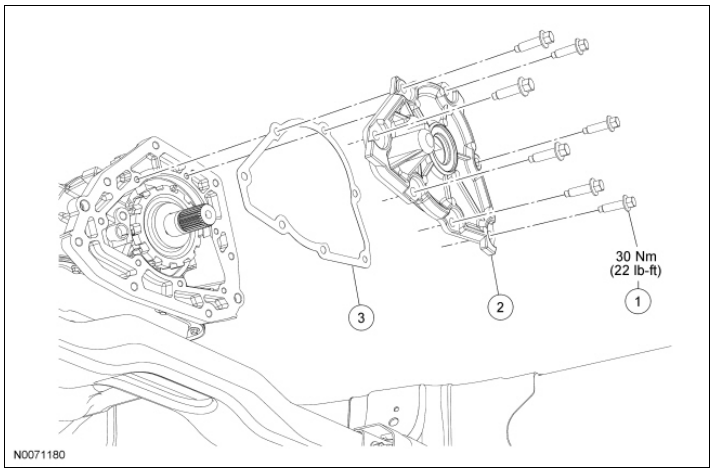


- Tighten to 30 Nm (22 lb-ft).



3. Install the transmission support insulator and lower the transmission onto the transmission support insulator.

4. Install the transmission support insulator-to-extension housing screws.
   - Tighten to 90 Nm (66 lb-ft).



5. Install the transmission support insulator-to-crossmember nuts.
   - Tighten to 90 Nm (66 lb-ft).

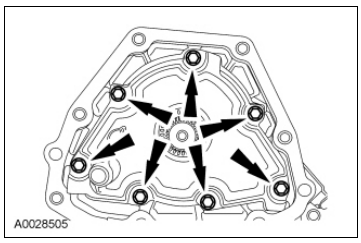
6. Install the driveshaft. For additional information, refer to Section 205-01 .

7. Carry out the transmission fluid level check. For additional information, refer to Transmission Fluid Level Check in this section.

Extension Housing Gasket - Four Wheel Drive (4WD)

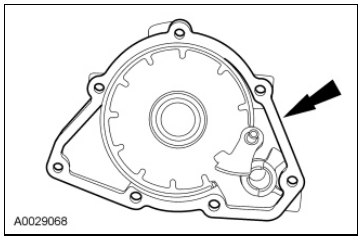
Item	Part Number	Description
1	W500224	Extension housing screw (7 required)
2	7A039	Extension housing
3	7086	Extension housing gasket

Removal



1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

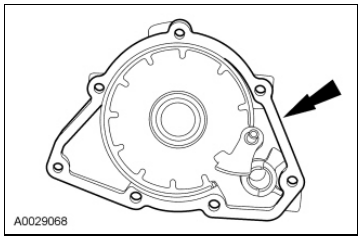
2. Support the transmission with a suitable jack.



3. Remove the transfer case. For additional information, refer to Section 308-07B .

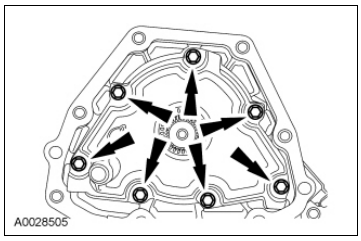
4. **NOTE:** The park pawl, park pawl return spring and park pawl shaft may fall out during removal of the extension housing.

   Remove the extension housing.



5. Remove and discard the extension housing gasket.

Installation



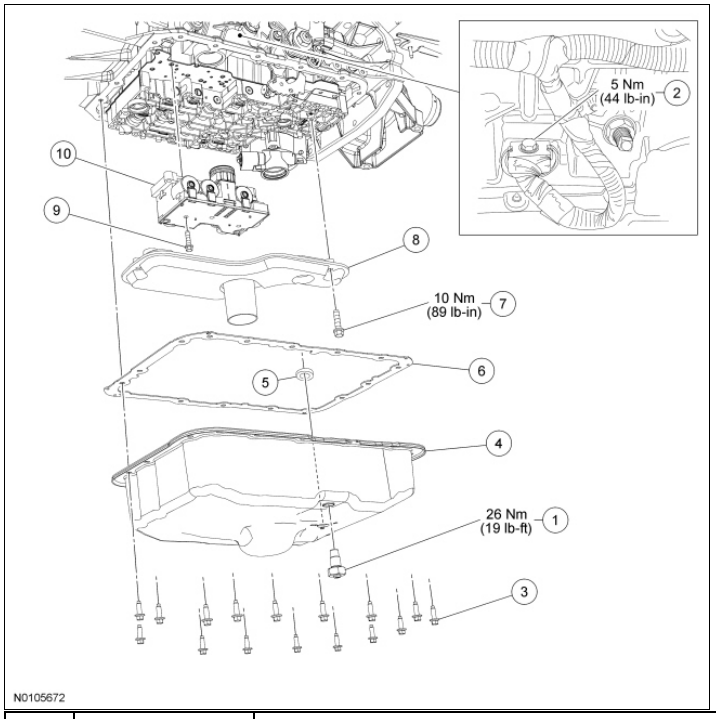
1. Clean the extension housing and install new extension housing gasket. Make sure that the park pawl is installed correctly.

2. **NOTE:** Verify the park lever actuating rod is correctly seated into the case park rod guide cup.

   Install the extension housing and the extension housing screws.

   - Tighten to 30 Nm (22 lb-ft).

3. Install the transfer case. For additional information, refer to Section 308-07B .



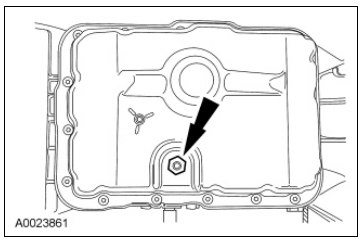
4. Remove the transmission support jack.

5. Carry out the transmission fluid level check. For additional information, refer to Transmission Fluid Level Check in this section.

Solenoid Body Assembly

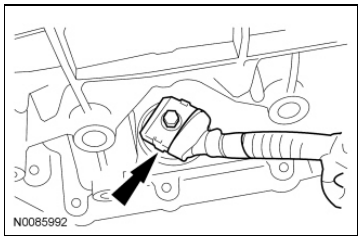
Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V



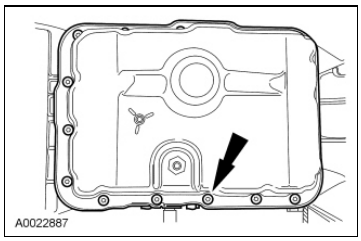
Item	Part Number	Description
1	7A010	Transmission fluid pan drain plug
2	-	Transmission vehicle harness connector screw
3	W500213	Transmission fluid pan-to-case screw (16 required)
4	7A194	Transmission fluid pan
5	7L027	Transmission fluid pan magnet
6	7A191	Transmission fluid pan gasket
7	W500106	Transmission fluid filter screw (2 required)
8	7A098	Transmission fluid filter
9	-	Transmission control solenoid body screw (8 required)
10	7G391	Transmission control solenoid body

Removal



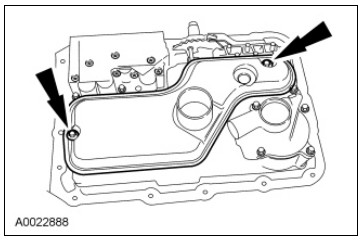
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the transmission fluid pan drain plug and drain the transmission fluid.



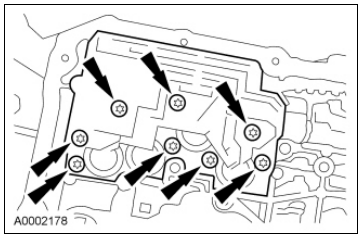
3. **NOTE:** Clean the area around the transmission vehicle harness connector to prevent contamination of the transmission control solenoid vehicle harness connector.

   Disconnect the transmission vehicle harness connector.

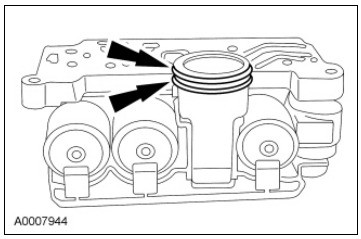


4. **NOTE:** The transmission fluid pan gasket is reusable, clean and inspect for damage. If not damaged, the transmission fluid pan gasket should be reused.

   Remove the 16 transmission fluid pan-to-case screws, transmission fluid pan and transmission fluid pan gasket.



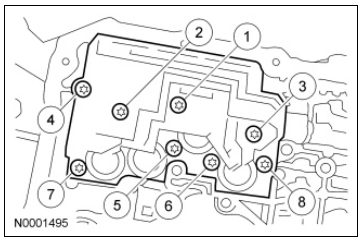
5. Remove the transmission fluid filter.



6. ***NOTICE:*** **Do not damage the solenoid body connector pins.**

   Remove the transmission control solenoid body screws and remove the transmission control solenoid body by pulling down on the transmission control solenoid body and pushing down on the transmission solenoid body connector from the other side of the case.

Installation

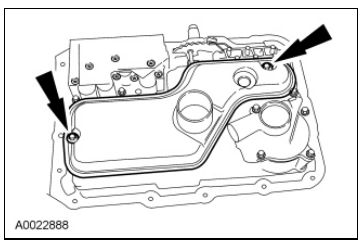


1. Install new O-ring seals on the transmission control solenoid body connector. Lubricate the O-ring seals with transmission fluid.

2. ***NOTICE:*** **Inspect the transmission case bore to make sure it is free of foreign material and not damaged. If damaged, a transmission leak may occur.**

   Install the transmission control solenoid body. Tighten the transmission control solenoid body screws in sequence shown.

   - Tighten to 8 Nm (71 lb-in).

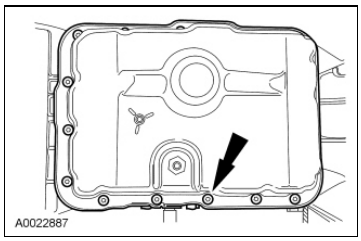


3. ***NOTICE:*** **Damage may occur to transmission fluid filter seals if they are not lubricated with transmission fluid.**

   NOTE: Make sure that the transmission fluid filter seals are correctly seated on the transmission fluid filter.

   Lubricate the transmission fluid seals and install the transmission fluid filter.

   - Tighten to 10 Nm (89 lb-in).



4. **NOTE:** The transmission fluid pan gasket is reusable, clean and inspect for damage. If not damaged,

the transmission fluid pan gasket should be reused.

Install the transmission fluid pan and transmission fluid pan gasket and loosely install the transmission fluid pan-to-case screws.

5. Tighten the transmission fluid pan-to-case screws in a crisscross sequence.
   - Tighten to 11 Nm (97 lb-in).

6. ***NOTICE:*** **Damage will occur to the transmission vehicle harness connector if the screw is tightened above specification.**

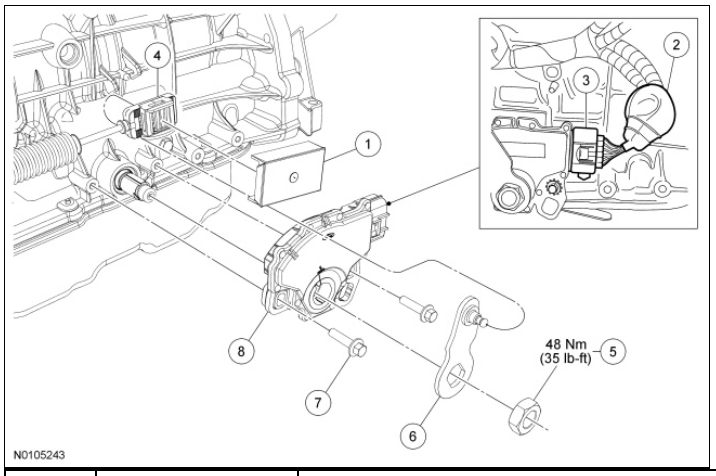
   NOTE: Always install new O-ring seals on transmission control solenoid body harness connector.

   NOTE: Clean the area around the transmission vehicle harness connector to prevent contamination of the transmission control solenoid body connector.

   NOTE: Use petroleum jelly to lubricate the O-ring seals to aid in the installation process.

   Install and lubricate new O-ring seals on the transmission control solenoid body harness connector and connect the connector.

   - Tighten to 5 Nm (44 lb-in).

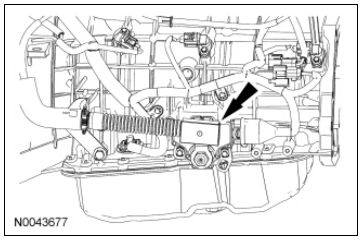


7. Fill the transmission. For additional information, refer to Transmission Fluid Level Check in this section.

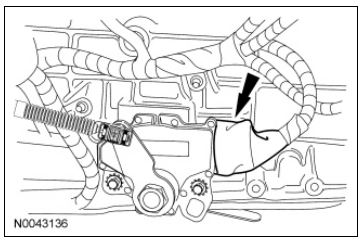
Digital Transmission Range (TR) Sensor

Special Tool(s)

 ST1633-A	Alignment Gauge, TR Sensor 307-351 (T97L-70010-A)

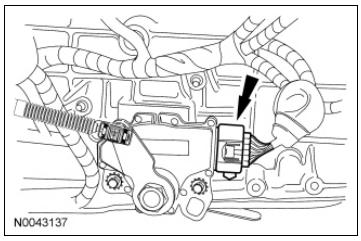


Item	Part Number	Description
1	-	Selector lever cable shield (part of 7E395)
2	-	Transmission Range (TR) sensor connector boot
3	-	TR sensor connector
4	7E395	Selector lever cable
5	W703001	Manual control lever nut
6	7A256	Manual control lever
7	W500106	TR sensor screw and washer (2 required)
8	7F293	TR sensor



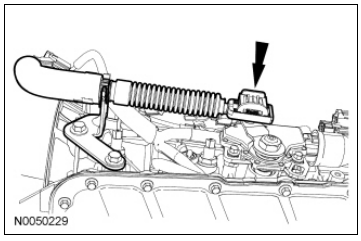
Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

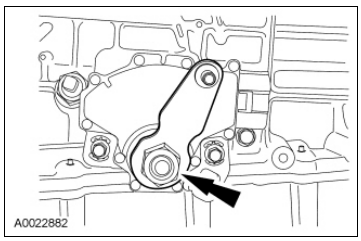


2. Remove the selector lever cable shield by prying on the side of the selector lever cable shield closest to the Transmission Range (TR) sensor connector boot, then sliding the selector lever cable shield away from the TR sensor connector boot.

3. Move the TR sensor connector boot back to gain access to the TR sensor connector.



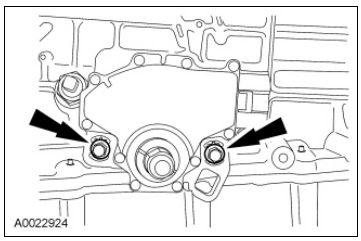
4. Disconnect the TR sensor connector.



5. ***NOTICE:*** **To prevent selector lever cable damage, do not apply force to the selector lever cable between the manual control lever and the selector lever cable bracket.**

   Remove the selector lever cable from the manual control lever.

6. Remove the manual control lever nut.

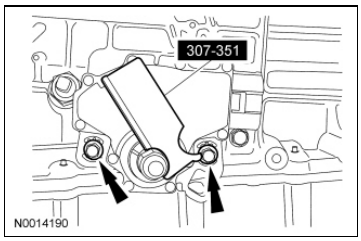


7. Remove the TR sensor.

Installation

1. ***NOTICE:*** **The Transmission Range (TR) sensor must fit flush against the boss on the case to prevent damage to the sensor.**

Install the TR sensor and loosely install the TR sensor screw and washer (2 required).

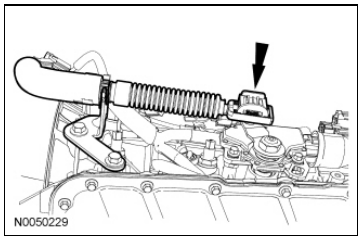


2. ***NOTICE:*** **Tightening one screw before tightening the other may cause the sensor to bind or become damaged.**

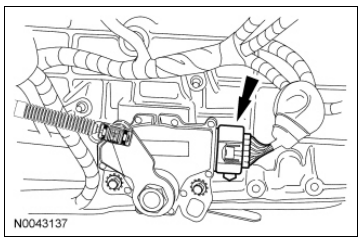
   NOTE: The manual control lever must be in the NEUTRAL position.

   Using the TR Sensor Alignment Gauge, align the TR sensor and tighten the screws in an alternating sequence.

   - Tighten to 8 Nm (71 lb-in).



3. Install the manual control lever and the manual control lever nut.
   - Tighten to 48 Nm (35 lb-ft).

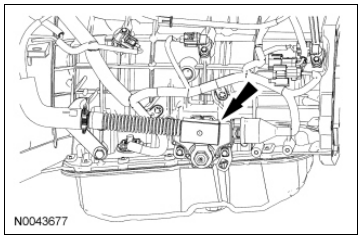


4. ***NOTICE:*** **To prevent selector lever cable damage, do not apply force to the selector lever cable between the manual control lever and the selector lever cable bracket.**

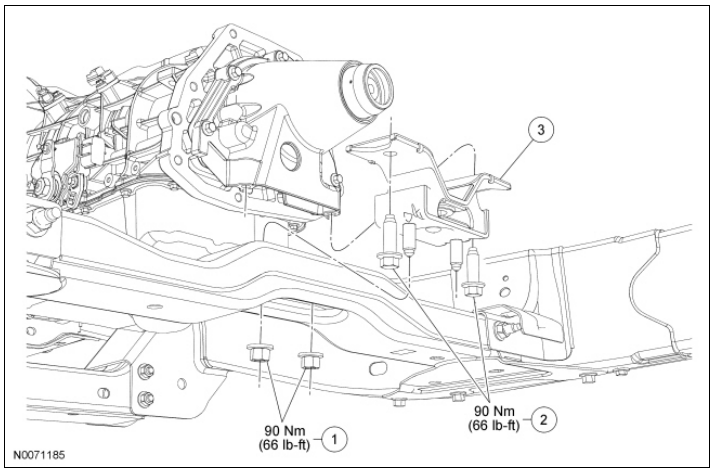
   NOTE: When installing the selector lever cable end, make sure that the selector lever cable end is correctly installed onto the manual control lever. Pull back on the selector lever cable to make sure that the selector cable end is correctly installed onto the manual control lever.

   Install the selector lever cable end onto the manual control lever.

5. Connect the TR sensor connector.



6. Move the TR sensor connector boot back over the TR sensor connector.

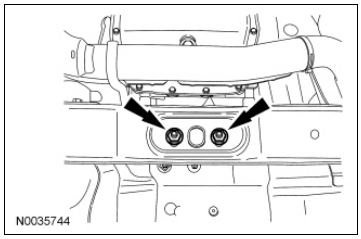


7. **NOTE:** If the selector lever cable shield is loose on the selector lever cable, install a new selector lever cable shield.

   Install the selector lever cable shield.

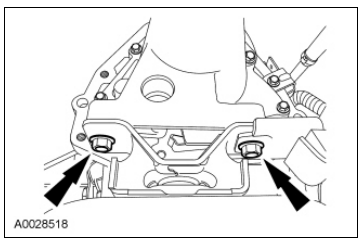
8. Verify that the selector lever cable is adjusted correctly. For additional information, refer to Section 307-05 .

Transmission Support Insulator - Rear Wheel Drive (RWD)



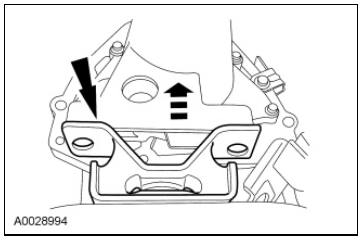
Item	Part Number	Description
1	W710660	Transmission support insulator-to-crossmember nuts
2	W708138	Transmission support insulator-to-extension housing screws
3	6D091	Transmission support insulator

Removal



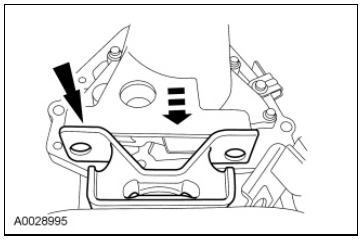
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Support the transmission with a transmission jack.

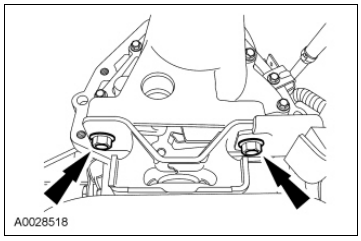


3. Remove the 2 transmission support insulator-to-crossmember nuts.

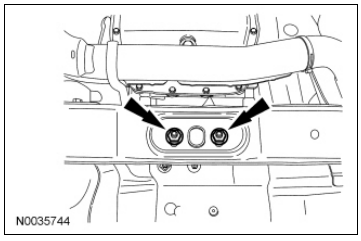
4. Remove the 2 transmission support insulator-to-extension housing screws.



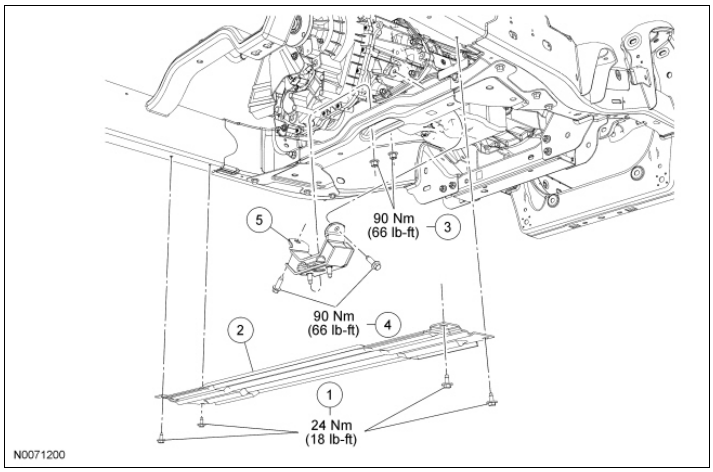
5. Raise the transmission and remove the transmission support insulator.



Installation

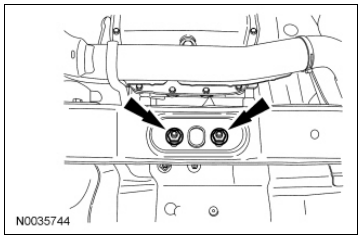


1. Install the transmission support insulator and lower the transmission onto the transmission support insulator.



2. Install the 2 transmission support insulator-to-extension housing screws.
   - Tighten to 90 Nm (66 lb-ft).

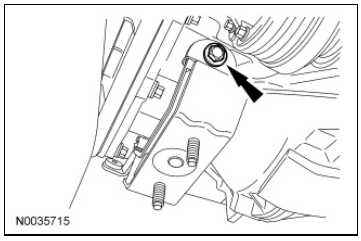
3. Install the 2 transmission support insulator-to-crossmember nuts.
   - Tighten to 90 Nm (66 lb-ft).



Transmission Support Insulator - Four Wheel Drive (4WD)

Item	Part Number	Description
1	W707079	Skid plate bolts
2	7E063	Skid plate
3	W710660	Transmission support insulator-to-crossmember nuts
4	W708138	Transmission support insulator-to-extension housing screws
5	6D091	Transmission support insulator

Removal

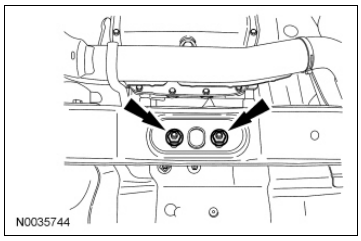


1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. If equipped, remove the skid plate bolts and the skid plate.
3. Support the transmission with a transmission jack.
4. Remove the 2 transmission support insulator-to-crossmember nuts.

5. **NOTE:** Crossmember and exhaust system removed for clarity.

   NOTE: LH shown, RH similar.

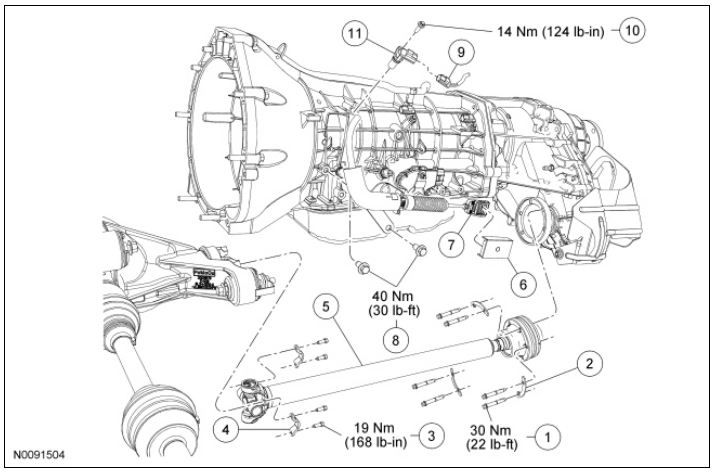
   Remove the 2 transmission support insulator-to-extension housing screws.



6. Raise the transmission and remove the transmission support insulator.

Installation

1. Install the transmission support insulator and the 2 transmission support insulator-to-extension housing screws.
    - Tighten to 90 Nm (66 lb-ft).

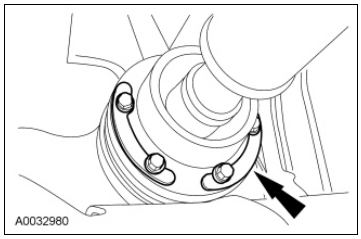


2. Lower the transmission and install the 2 transmission support insulator-to-crossmember nuts.
    - Tighten to 90 Nm (66 lb-ft).

3. If equipped, install the skid plate and skid plate bolts.
    - Tighten to 24 Nm (18 lb-ft).

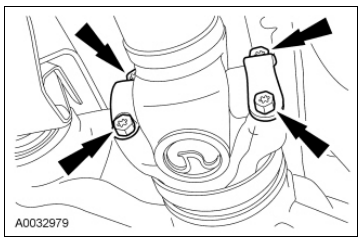
Turbine Shaft Speed (TSS) Sensor

Item	Part Number	Description
1	-	CV joint bolt (part of 4A376)
2	-	CV joint washer (part of 4A376)
3	389668	U-joint strap bolt
4	4639	U-joint strap
5	4A376	Front driveshaft
6	-	Selector lever cable cover (part of 7E395)
7	7E395	Selector lever cable
8	N605918	Selector lever cable bracket screws
9	-	Turbine Shaft Speed (TSS) sensor connector
10	W708389	TSS sensor screw
11	7H103	TSS sensor



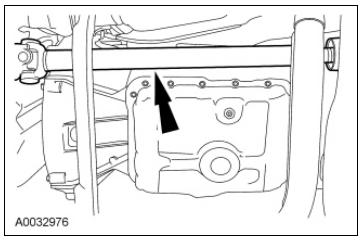
Removal

All vehicles



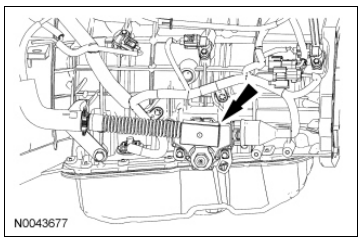
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to the Section 100-02 .

Four-Wheel Drive (4WD) vehicles

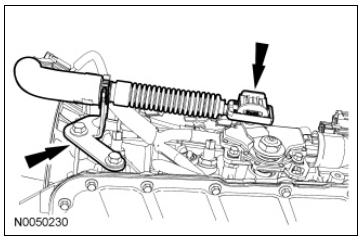


2. Disconnect the front driveshaft from the transfer case.

3. Disconnect the front driveshaft from the front differential.

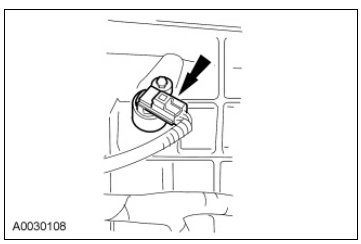


4. Remove the front driveshaft from the vehicle.



All vehicles

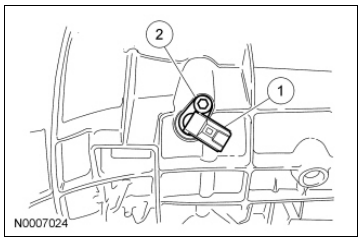
5. Remove the selector lever cable shield by prying on the side of the selector lever cable shield closest to the Transmission Range (TR) sensor connector boot, then sliding the selector lever cable shield away from the TR sensor connector boot.



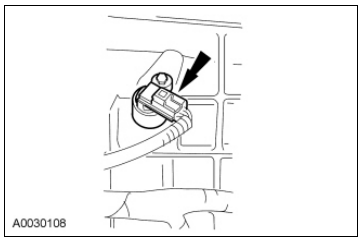
6. ***NOTICE:*** **To prevent selector lever cable damage, do not apply force to the selector lever cable between the manual control lever and the selector lever cable bracket.**

   Remove the selector lever cable and selector lever cable bracket.

7. Disconnect the Turbine Shaft Speed (TSS) sensor connector.



8. Remove the TSS sensor.
    1. Remove the TSS sensor screw.
    2. Remove the TSS sensor from the transmission.
    - Inspect the TSS sensor O-ring for damage. If damaged, install a new O-ring.

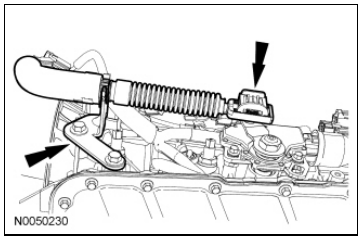


Installation

All vehicles

1. Inspect the TSS O-ring seal for damage. Install a new O-ring seal if damaged. Lubricate the O-ring seal with petroleum jelly to prevent damage to the O-ring seal.
    1. Install the TSS sensor into the transmission.
    2. Tighten the TSS sensor screw.
    - Tighten to 14 Nm (124 lb-in).

2. Connect the TSS sensor connector.

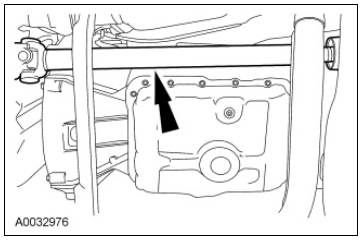


3. ***NOTICE:*** **To prevent selector lever cable damage, do not apply force to the selector lever cable between the manual control lever and the selector lever cable bracket.**

   NOTE: When installing the selector lever cable end, make sure that the selector lever cable end is correctly installed onto the manual control lever. Pull back on the selector lever cable to make sure that the selector cable end is correctly installed onto the manual control lever.

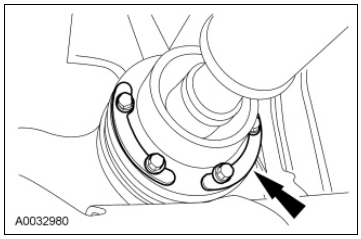
   Install the selector lever cable end onto the manual control lever, selector lever bracket and selector lever bracket screws.

   - Tighten to 40 Nm (30 lb-ft).

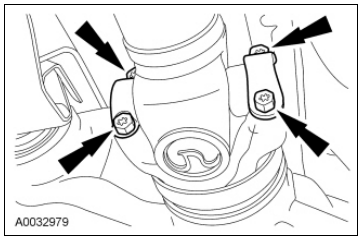


4. **NOTE:** If the selector lever cable shield is loose on the selector lever cable, install a new shield.

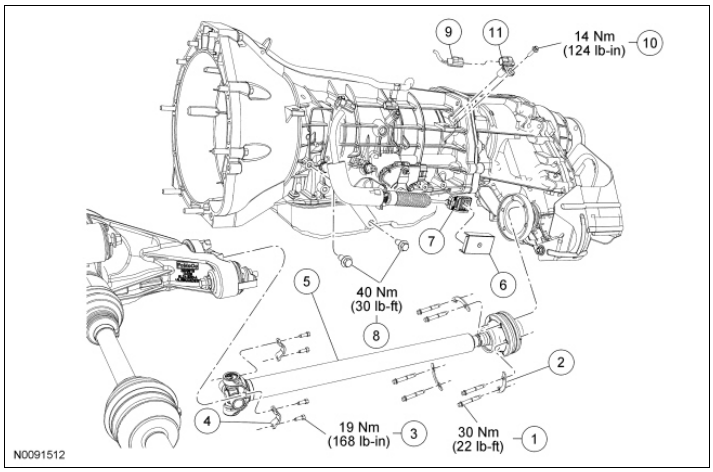
   Install the selector lever cable shield.



4WD vehicles



5. Install the front driveshaft in the vehicle.

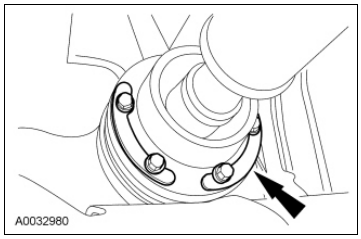


6. Connect the front driveshaft to the transfer case. Install the CV joint washers and CV joint bolts.
   - Tighten to 30 Nm (22 lb-ft).

7. Connect the front driveshaft to the front differential. Install the U-joint straps and U-joint strap bolts.
   - Tighten to 19 Nm (168 lb-in).

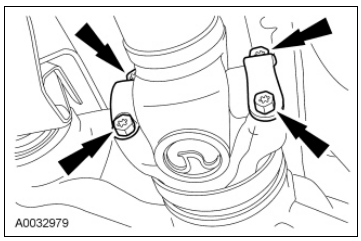
Output Shaft Speed (OSS) Sensor

Item	Part Number	Description
1	-	CV joint bolt (part of 4A376)
2	-	CV joint washer (part of 4A376)
3	389668	U-joint strap bolt
4	4639	U-joint strap
5	4A376	Front driveshaft
6	-	Selector lever cable cover (part of 7E395)
7	7E395	Selector lever cable
8	N605918	Selector lever cable bracket screws
9	-	Output Shaft Speed (OSS) sensor connector
10	W708389	OSS sensor screw
11	7H103	OSS sensor



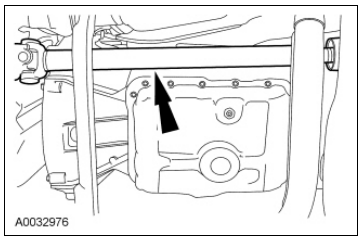
Removal

All vehicles



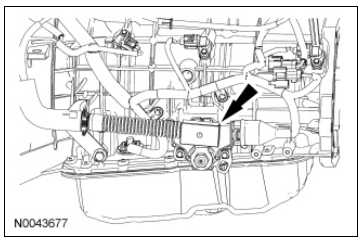
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to the Section 100-02 .

Four-Wheel Drive (4WD) vehicles

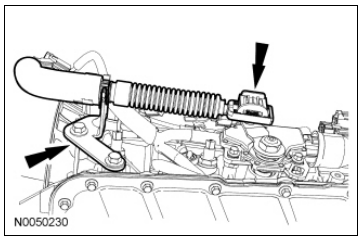


2. Disconnect the front driveshaft from the transfer case.

3. Disconnect the front driveshaft from the front differential.

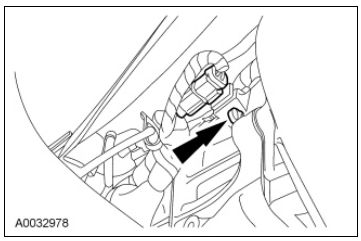


4. Remove the front driveshaft from the vehicle.



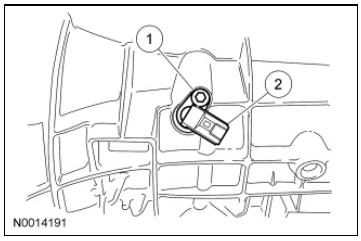
All vehicles

5. Remove the selector lever cable shield by prying on the side of the selector lever cable shield closest to the Transmission Range (TR) sensor connector boot, then sliding the selector lever cable shield away from the TR sensor connector boot.



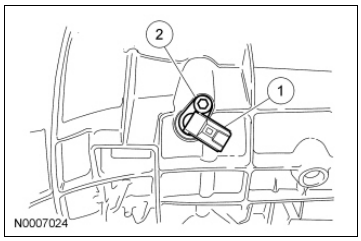
6. ***NOTICE:*** **To prevent selector lever cable damage, do not apply force to the selector lever cable between the manual control lever and the selector lever cable bracket.**

   Remove the selector lever cable and selector lever cable bracket.

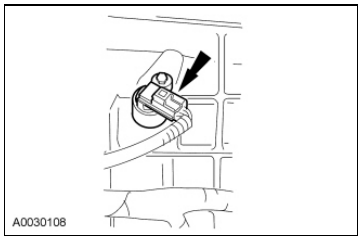


7. Disconnect the Heated Oxygen Sensor (HO2S) connector from the transmission case.

8. Disconnect the Output Shaft Speed (OSS) sensor connector.

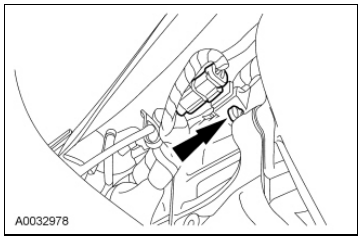


9. Remove the OSS sensor.
    1. Remove the OSS sensor screw.
    2. Remove the OSS sensor from the transmission.
    - Inspect the OSS sensor O-ring for damage. If damaged, install a new O-ring.



Installation

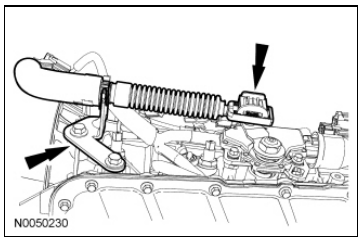
All vehicles



1. Inspect the OSS O-ring seal for damage. Install a new O-ring seal if damaged. Lubricate the O-ring seal with petroleum jelly to prevent damage to the O-ring seal.
    1. Install the OSS sensor into the transmission.
    2. Tighten the OSS sensor screw.
    - Tighten to 14 Nm (124 lb-in).

2. Connect the OSS sensor connector.

3. Connect the HO2S connector to the transmission case.

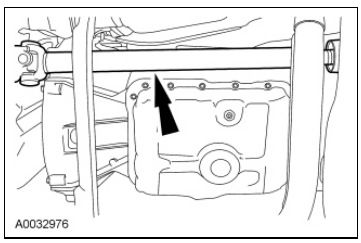


4. ***NOTICE:*** **To prevent selector lever cable damage, do not apply force to the selector lever cable between the manual control lever and the selector lever cable bracket.**

   NOTE: When installing the selector lever cable end, make sure that the selector lever cable end is correctly installed onto the manual control lever. Pull back on the selector lever cable to make sure that the selector cable end is correctly installed onto the manual control lever.

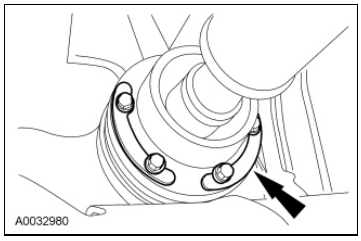
   Install the selector lever cable end onto the manual control lever, selector lever cable bracket and selector lever cable bracket screws.

   - Tighten to 40 Nm (30 lb-ft).

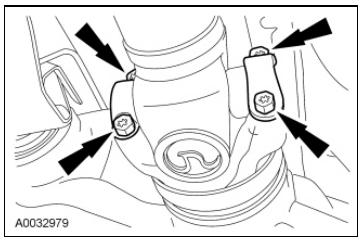


5. **NOTE:** If the selector lever cable shield is loose on the selector lever cable, install a new selector lever cable shield.

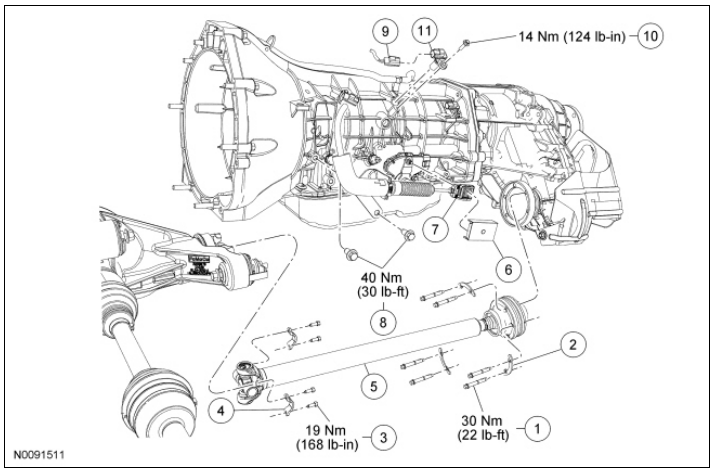
   Install the selector lever cable shield.



4WD vehicles



6. Install the front driveshaft in the vehicle.

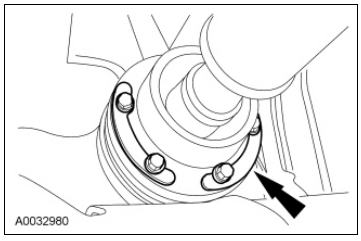


7. Connect the front driveshaft to the transfer case. Install the CV joint washers and CV joint bolts.
   - Tighten to 30 Nm (22 lb-ft).

8. Connect the front driveshaft to the front differential. Install the U-joint straps and U-joint strap bolts.
    - Tighten to 19 Nm (168 lb-in).

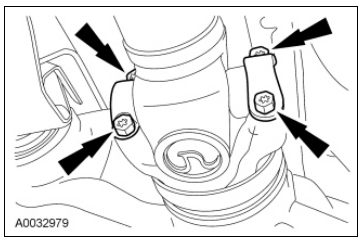
Intermediate Shaft Speed Sensor

Item	Part Number	Description
1	-	CV joint bolt (part of 4A376)
2	-	CV joint washer (part of 4A376)
3	389668	U-joint strap bolt
4	4639	U-joint strap
5	4A376	Front driveshaft
6	-	Selector lever cable cover (part of 7E395)
7	7E395	Selector lever cable
8	N605918	Selector lever cable bracket screws
9	-	Intermediate shaft speed sensor connector
10	W708389	Intermediate shaft speed sensor screw
11	7H103	Intermediate shaft speed sensor



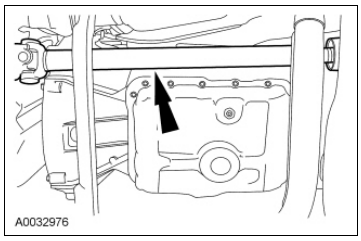
Removal

All vehicles



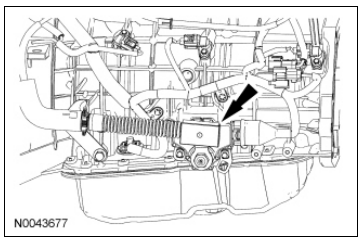
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to the Section 100-02 .

Four-Wheel Drive (4WD) vehicles

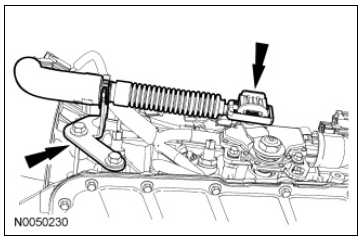


2. Disconnect the front driveshaft from the transfer case.

3. Disconnect the front driveshaft from the front differential.

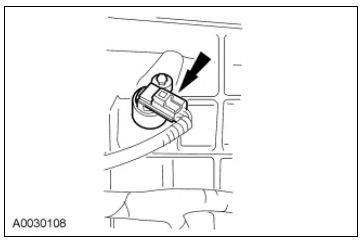


4. Remove the front driveshaft from the vehicle.



All vehicles

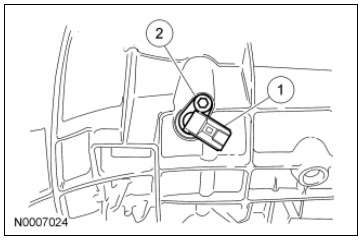
5. Remove the selector lever cable shield by prying on the side of the selector lever cable shield closest to the Transmission Range (TR) sensor connector boot, then sliding the selector lever cable shield away from the TR sensor connector boot.



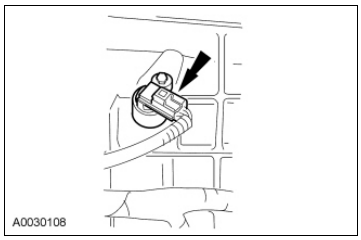
6. ***NOTICE:*** **To prevent selector lever cable damage, do not apply force to the selector lever cable between the manual control lever and the selector lever cable bracket.**

   Remove the selector lever cable and selector lever cable bracket.

7. Disconnect the intermediate shaft speed sensor connector.



8. Remove the intermediate shaft speed sensor.
    1. Remove the intermediate shaft speed sensor screw.
    2. Remove the intermediate shaft speed sensor from the transmission.
    - Inspect the intermediate shaft speed sensor O-ring for damage. If damaged, install a new O-ring.

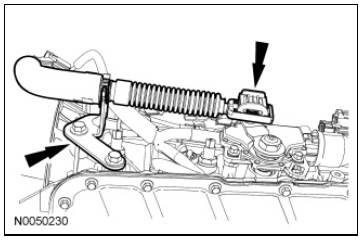


Installation

All vehicles

1. Inspect the O-ring seal for damage. Install a new O-ring seal if damaged. Lubricate the O-ring seal with petroleum jelly to prevent damage to the O-ring seal.
    1. Install the intermediate shaft speed sensor into the transmission.
    2. Tighten the intermediate shaft speed sensor screw.
    - Tighten to 14 Nm (124 lb-in).

2. Connect the intermediate shaft speed sensor connector.

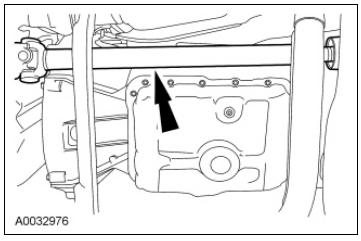


3. ***NOTICE:*** **To prevent selector lever cable damage, do not apply force to the selector lever cable between the manual control lever and the selector lever cable bracket.**

   NOTE: When installing the selector lever cable end, make sure that the selector lever cable end is correctly installed onto the manual control lever. Pull back on the selector lever cable to make sure that the selector cable end is correctly installed onto the manual control lever.

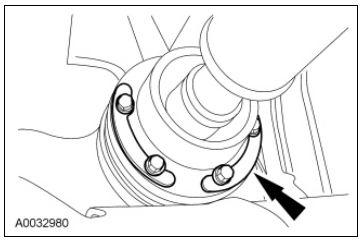
   Install the selector lever cable end onto the manual control lever, selector lever cable bracket and selector lever cable bracket screws.

   - Tighten to 40 Nm (30 lb-ft).

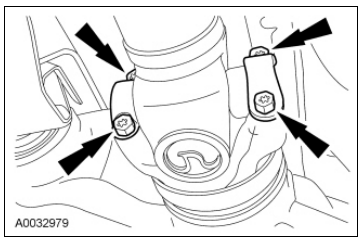


4. **NOTE:** If the selector lever cable shield is loose on the selector lever cable, install a new selector lever cable shield.

   Install the selector lever cable shield.



4WD vehicles



5. Install the front driveshaft in the vehicle.

6. Connect the front driveshaft to the transfer case. Install the CV joint washers and CV joint bolts.
   - Tighten to 30 Nm (22 lb-ft).

7. Connect the front driveshaft to the front differential. Install the U-joint straps and U-joint strap bolts.
   - Tighten to 19 Nm (168 lb-in).

Transmission - Rear Wheel Drive (RWD)

Special Tool(s)

 ST1636-A	Retainer, Torque Converter 307-346 (T97T-7902-A)

NOTE: Refer to the Transmission Cooler Flushing Job Aid on the FMCDealer website.

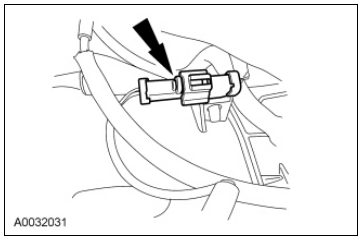
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. **NOTE:** When the battery has been disconnected and reconnected, some abnormal drive symptoms can occur while the vehicle relearns its adaptive strategy. Notify the customer that they can experience slightly different upshifts (either soft or firm) and that this is a temporary condition and will eventually return to normal operating condition.

   Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

3. Remove the coolant expansion tank bolts and position the tank aside.

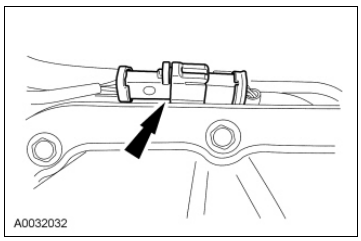
4. Remove the fan shroud bolts. Do not remove the fan shroud.



5. If transmission disassembly or installation of a new transmission is necessary, drain the transmission fluid.
   - Install the transmission fluid drain plug when finished.

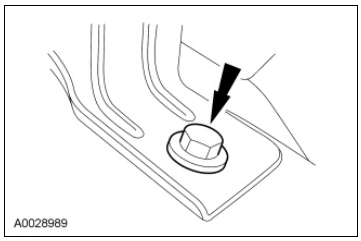
6. Remove the 2 RH heat shield bolts and position the RH heat shield aside.

A0043291



7. **NOTE:** LH side shown, RH side similar.

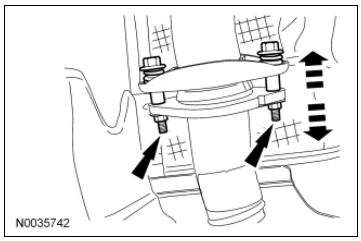
   Disconnect the 2 Heated Oxygen Sensor (HO2S) connectors.



A0032031

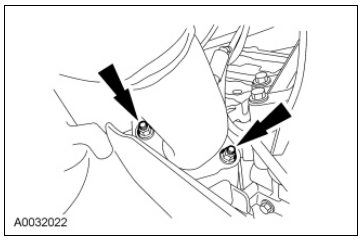
8. **NOTE:** LH side shown, RH side similar.

   Disconnect the 2 Catalyst Monitor Sensor (CMS) connectors.



9. Remove the LH exhaust heat shield bolt.

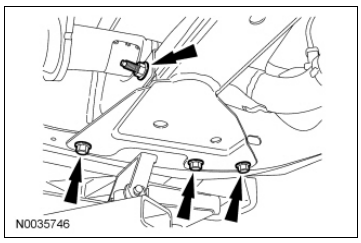
10. If equipped, remove the RH exhaust heat shield.



11. Remove the catalytic converter-to-muffler nuts and bolts. Separate the muffler from the converter.
    - Discard the gasket.
    - Discard the nuts.

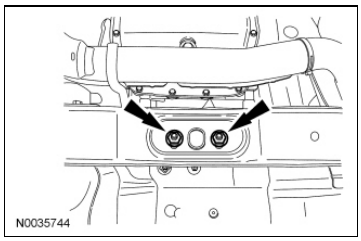
12. **NOTE:** RH shown, LH similar.

    Remove the 4 catalytic converter-to-manifold nuts.



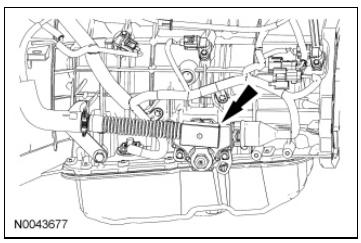
13. ⚠ **WARNING: Always secure transmission, transfer case, and axle assemblies to their service jack. Avoid obstructions while lowering and raising the jack. Improperly secured assemblies or contact with obstructions may cause the assembly to fall off the jack, which could result in serious personal injury.**

    Support the transmission with a suitable transmission jack.



14. Remove the 4 RH side crossmember bolts and the crossmember nut.

15. Remove the 4 LH side crossmember bolts and the crossmember nut.

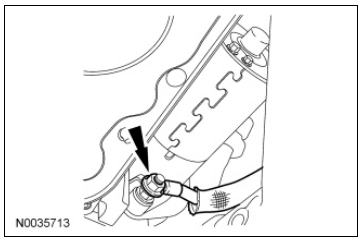


16. Remove the transmission support insulator-to-crossmember nuts and remove the crossmember.

17. **NOTE:** This step may require an assistant.

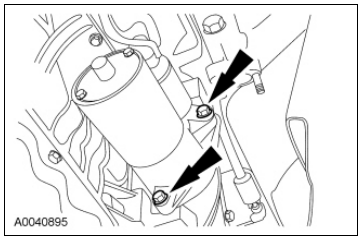
    Remove the 3-way catalytic converter system.

18. Remove the selector lever cable shield by prying on the side of the selector lever cable shield closest to the Transmission Range (TR) sensor connector boot, then sliding the selector lever cable shield away from the TR sensor connector boot.



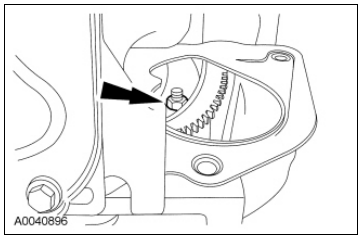
19. ***NOTICE:*** **To prevent selector lever cable damage, do not apply force to the selector lever cable between the manual control lever and the selector lever cable bracket.**

Remove the selector lever cable and selector lever cable bracket.

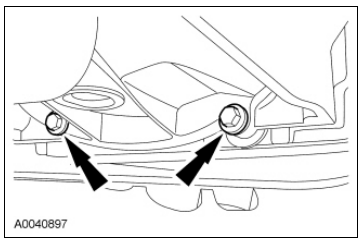


20. Remove the driveshaft. For additional information, refer to Section 205-01 .

21. Remove the ground cable nut and position the cable to the side.



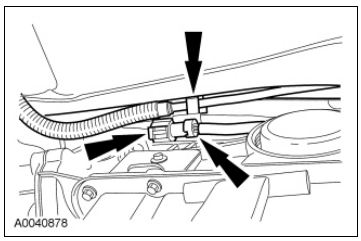
22. Remove the starter and position aside.



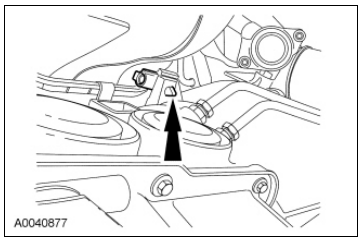
23. ***NOTICE:*** **Rotating the crankshaft pulley bolt counterclockwise could cause a reduction in clamp load on the crankshaft pulley and timing sprocket, which could cause severe engine damage.**

    NOTE: Make an identifying mark on the nut, stud and flexplate to allow for correct installation.

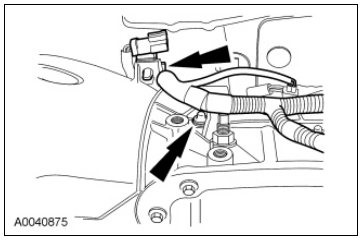
    Remove and discard the 4 torque converter-to-flexplate nuts.



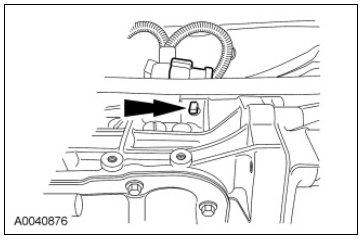
24. Remove the lower transmission-to-engine bolts.



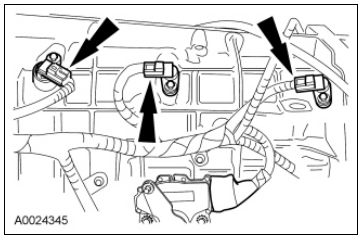
25. Lower the transmission to gain access to the sensor connectors and the transmission-to-engine bolts.



26. Remove the RH CMS connector and the fuel lines from the bracket.

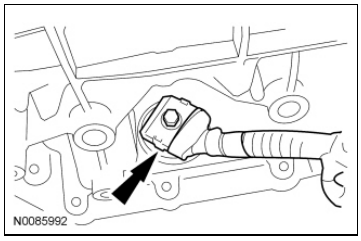


27. Remove the RH HO2S from the transmission.

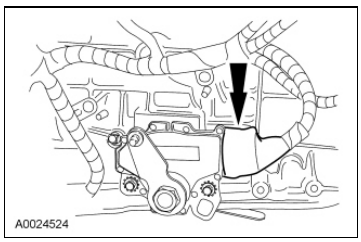


28. Remove the LH HO2S and the harness clip from the transmission.

29. Remove the LH CMS connector from the transmission.

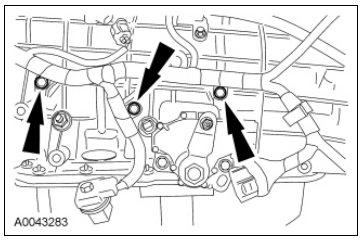


30. Disconnect the Turbine Shaft Speed (TSS) sensor, Output Shaft Speed (OSS) sensor and intermediate shaft speed sensor connectors.



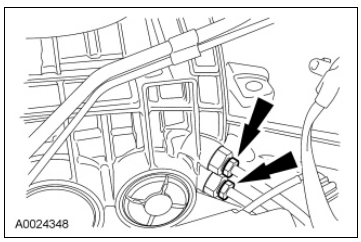
31. **NOTE:** Clean the area around the transmission vehicle harness connector to prevent contamination of the transmission control solenoid vehicle harness connector.

    Disconnect the transmission vehicle harness connector.

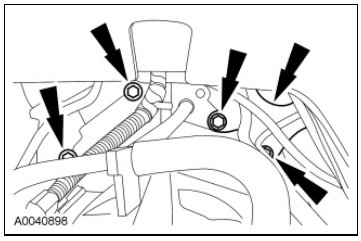


32. Move the TR sensor connector boot back to gain access to the TR sensor connector.

33. Disconnect the TR sensor connector.



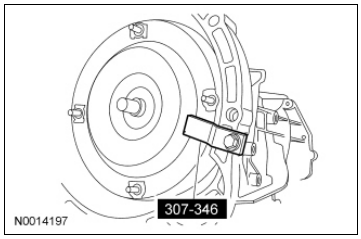
34. Remove the transmission vehicle harness retainers from the transmission.



35. ***NOTICE:*** **Do not damage the transmission fluid cooler tubes. Hold the transmission case fittings with a backup wrench.**

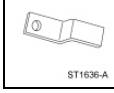
    Disconnect the 2 transmission fluid cooler tube nut-to-case fitting.

36. Remove the 6 transmission-to-engine bolts and position the fuel line bracket aside.



37. Move the transmission back enough to install the Torque Converter Retainer.

38. Lower the transmission from the vehicle.



39. Remove the Torque Converter Retainer.

40. If the transmission is being disassembled to install new parts, or if a new or remanufactured transmission is being installed, the transmission fluid cooler, the auxiliary transmission fluid cooler (if equipped) and the transmission fluid cooler tubes must be cleaned and backflushed to keep contaminants from entering the transmission. For additional information, refer to Transmission Fluid Cooler Backflushing and Cleaning in this section.

Transmission - Four Wheel Drive (4WD)

Special Tool(s)

 ST1636-A	Retainer, Torque Converter 307-346 (T97T-7902-A)

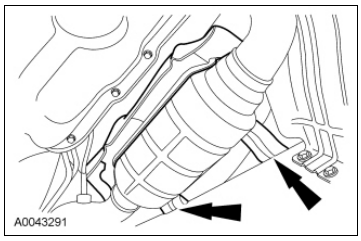
NOTE: Refer to the Transmission Cooler Flushing Job Aid on the FMCDealer website.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. **NOTE:** When the battery has been disconnected and reconnected, some abnormal drive symptoms can occur while the vehicle relearns its adaptive strategy. Notify the customer that they can experience slightly different upshifts either (soft or firm) and that this is a temporary condition and will eventually return to normal operating condition.

   Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

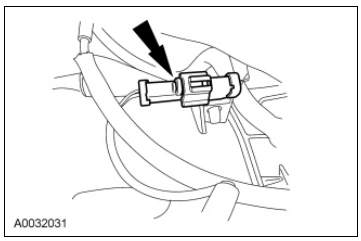
3. Remove the coolant expansion tank bolts and position the tank aside.



4. Remove the fan shroud bolts. Do not remove the fan shroud.

5. If transmission disassembly or installation of a new transmission is necessary, drain the transmission fluid.
   - Install the drain plug when finished.

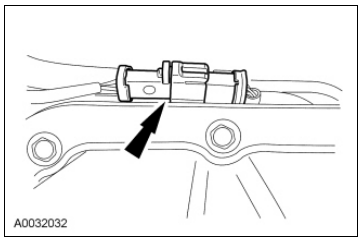
6. If equipped, remove the 4 skid plate bolts and the skid plate.



N0011032

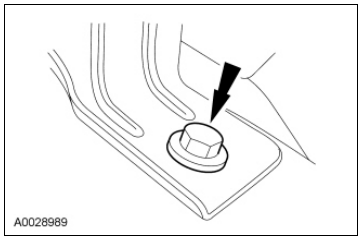
7. Remove the 2 RH heat shield bolts and position the RH heat shield aside.

A0043291



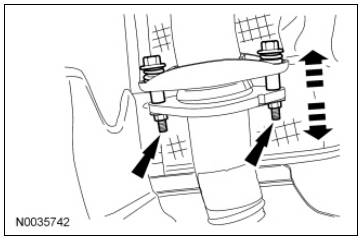
8. **NOTE:** LH side shown, RH side similar.

Disconnect the 2 Heated Oxygen Sensor (HO2S) connectors.



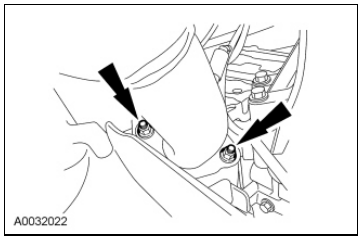
9. **NOTE:** LH side shown, RH side similar.

   Disconnect the 2 Catalyst Monitor Sensor (CMS) connectors.

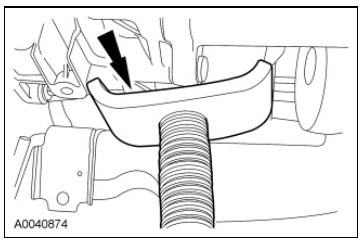


10. Remove the LH exhaust heat shield bolt.

11. If equipped, remove the RH exhaust heat shield.

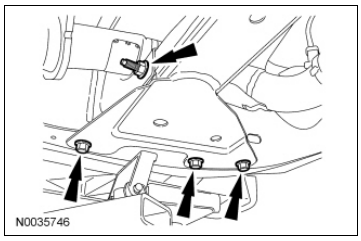


12. Remove the catalytic converter-to-muffler nuts and bolts. Separate the muffler from the converter.
    - Discard the gasket.
    - Discard the nuts.

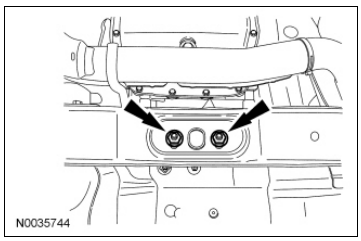


13. **NOTE:** RH side shown, LH similar.

    Remove the 4 catalytic converter-to-manifold nuts.



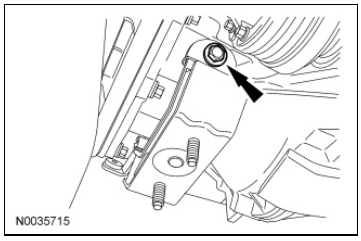
14. Install a suitable jackstand under the transfer case.



15. Remove the 4 RH side crossmember bolts and the crossmember nut.

16. Remove the 4 LH side crossmember bolts and the crossmember nut.

17. Remove the transmission support insulator-to-crossmember nuts and remove the crossmember.

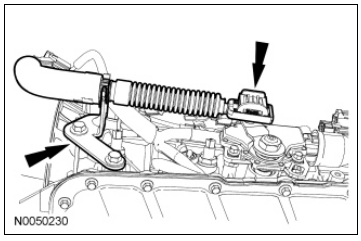


18. **NOTE:** This step may require an assistant.

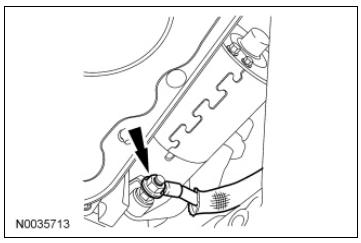
    Remove the 3-way catalytic converter system.

19. **NOTE:** LH side shown, RH similar.

    If required, remove the transmission support insulator.

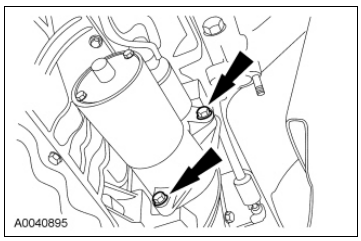


20. Remove the selector lever cable shield by prying on the side of the selector lever cable shield closest to the Transmission Range (TR) sensor connector boot, then sliding the selector lever cable shield away from the TR sensor connector boot.



21. ***NOTICE:*** **To prevent selector lever cable damage, do not apply force to the selector lever cable between the manual control lever and the selector lever cable bracket.**

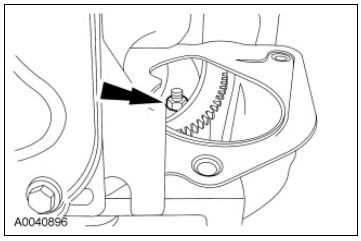
    Remove the selector lever cable and selector lever cable bracket.



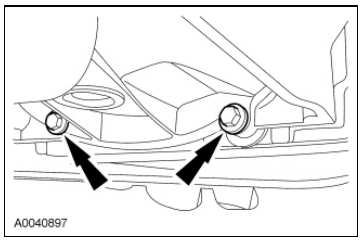
22. Remove the driveshafts. For additional information, refer to Section 205-01 .

23. Remove the ground cable nut and position the cable aside.

24. Remove the starter and position to the side.



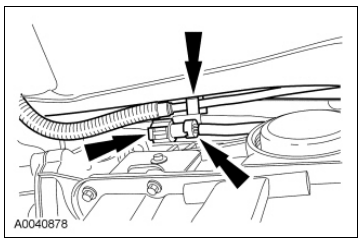
25. ***NOTICE:*** **Rotating the crankshaft pulley bolt counterclockwise could cause a reduction in clamp load on the crankshaft pulley and timing sprocket, which could cause severe engine**



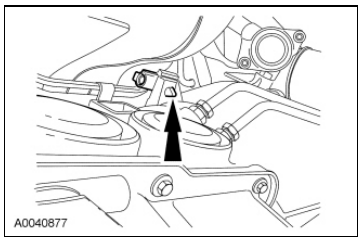
damage.

NOTE: Make an identifying mark on the nut, stud and flexplate to allow for correct installation.

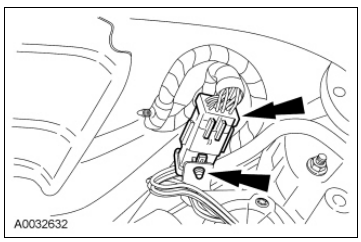
Remove and discard the 4 torque converter-to-flexplate nuts.



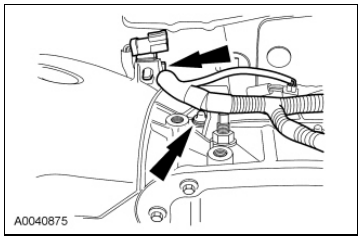
26. Remove the lower transmission-to-engine bolts.



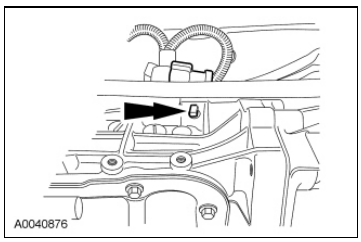
27. Lower the transmission to gain access to the sensor connectors and the transmission-to-engine bolts.



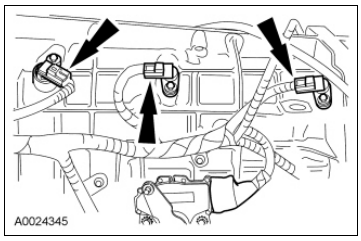
28. Remove the RH CMS connector and the fuel lines from the bracket.



29. Remove the RH HO2S from the transmission.

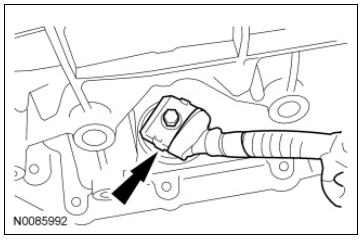


30. If equipped, disconnect the transfer case shift motor connector.

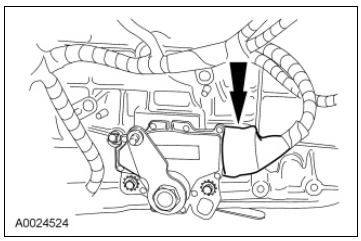


31. Remove the LH HO2S and the harness clip from the transmission.

32. Remove the LH CMS connector from the transmission.

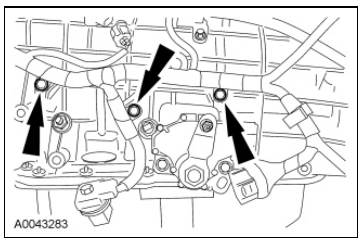


33. Disconnect the Turbine Shaft Speed (TSS) sensor, Output Shaft Speed (OSS) sensor and intermediate shaft speed sensor connectors.



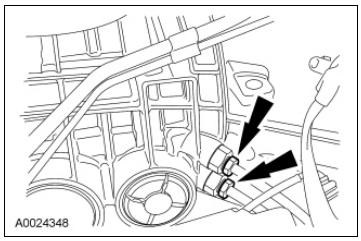
34. **NOTE:** Clean the area around the transmission vehicle harness connector to prevent contamination of the transmission control solenoid vehicle harness connector.

    Disconnect the transmission vehicle harness connector.



35. Move the TR sensor connector boot back to gain access to the TR sensor connector.

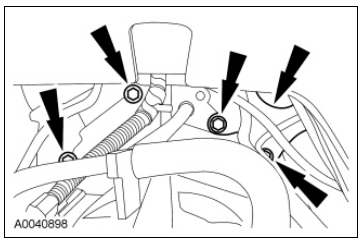
36. Disconnect the TR sensor connector.



37. Remove the transmission vehicle harness retainers from the transmission.

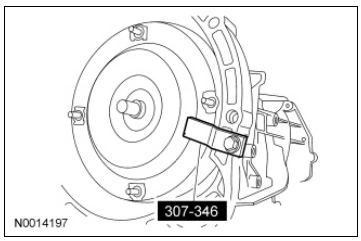
38. ***NOTICE:*** **Do not damage the transmission fluid cooler tubes. Hold the transmission case fittings with a backup wrench.**

    Disconnect the 2 transmission fluid cooler tube nut-to-case fitting.



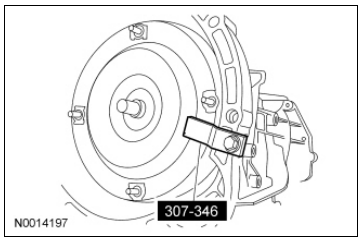
39. ⚠ **WARNING: Always secure transmission, transfer case, and axle assemblies to their service jack. Avoid obstructions while lowering and raising the jack. Improperly secured assemblies or contact with obstructions may cause the assembly to fall off the jack, which could result in serious personal injury.**

    Support the transmission with a transmission jack.



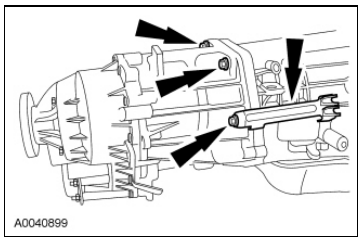
40. Remove the jackstand from under the transfer case.

41. Remove the 6 transmission-to-engine bolts and position the fuel line bracket aside.



42. Move the transmission back enough to install the Torque Converter Retainer.

43. Lower the transmission and transfer case (as an assembly) from the vehicle.



44. Remove the Torque Converter Retainer.

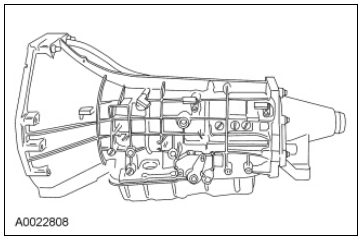
45. **NOTE:** If the transmission is being serviced, the transfer case will need to be removed.

    Remove the transfer case from the back of the transmission.

    - Remove the transfer case bolts and the bracket.
    - Disconnect the vent hose.

46. If the transmission is being disassembled to install new parts, or if a new or remanufactured transmission is being installed, the transmission fluid cooler, the auxiliary transmission fluid cooler (if equipped) and the transmission fluid cooler tubes must be cleaned and backflushed to keep contaminants from entering the transmission. For additional information, refer to Transmission Fluid Cooler Backflushing and Cleaning in this section.

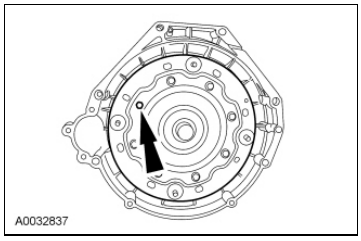
Transmission



Special Tool(s)

 ST2393-A	Compressor, Servo Cover 307-402
 ST1631-A	Handle, Torque Converter 307-091 (T81P-7902-C)
 ST1186-A	Holding Fixture, Transmission 307-003 (T57L-500-B)
 ST2417-A	Remover, Input Shaft Oil Seal 308-375
 ST1758-A	Remover, Torque Converter Fluid Seal 307-309 (T94P-77001-BH)
 ST2418-A	Remover, Transmission Fluid Pump 307-397
 ST1185-A	Slide Hammer 100-001 (T50T-100-A)

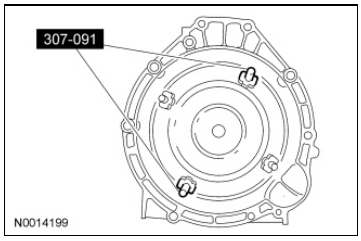
All vehicles



NOTE: Tag and identify all parts during disassembly.

1. Place the transmission on a workbench.

A0022808

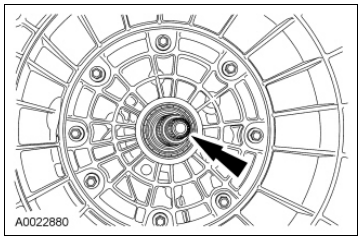


2. **NOTE:** If the adapter plate is removed, remove and discard the torque converter adapter plate-to-converter nuts.

   If vehicle is equipped, and installation of a new or remanufactured torque converter is necessary, remove and discard the torque converter adapter plate-to-converter nuts. Remove the adapter plate.

3. ⚠ **WARNING: Secure the torque converter in the transmission during removal or installation. The torque converter is heavy and may result in injury if it falls out of the transmission. Failure to follow this instruction may result in serious personal injury.**

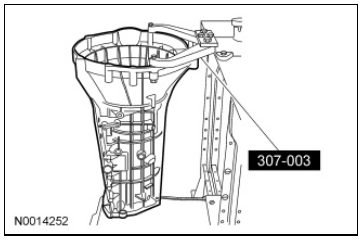
   If the adapter plate has been removed, use the Torque Converter Handle to remove the torque converter.



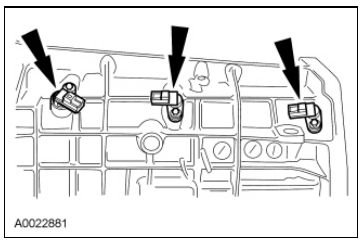
4. ⚠ **WARNING: Secure the torque converter in the transmission during removal or installation. The torque converter is heavy and may result in injury if it falls out of the transmission. Failure to follow this instruction may result in serious personal injury.**

   NOTE: If not installing a new torque converter, leave the adapter plate bolted to the torque converter.

   Using the Torque Converter Handle, remove the torque converter and adapter plate as an assembly.

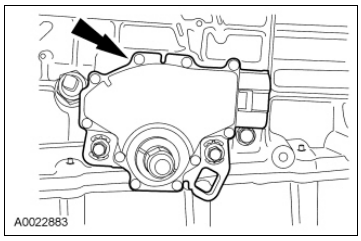


5. Remove the input shaft.



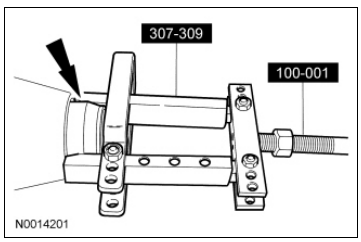
6. ⚠ **WARNING: Always verify that the lockpin on a bench-mounted holding fixture is correctly secured to help prevent unexpected component rotation. Failure to follow this instruction may result in serious personal injury.**

   Using the Transmission Holding Fixture, install the transmission into the bench with the torque converter housing facing up.

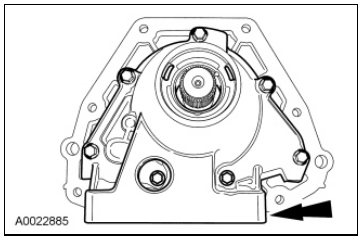


7. Remove the 3 speed sensors.

8. Remove the manual control lever nut and manual control lever.

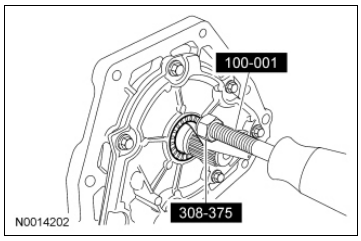


9. Remove the Transmission Range (TR) sensor.



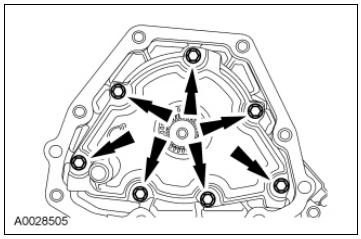
Rear Wheel Drive (RWD) applications

10. Using the Torque Converter Fluid Seal Remover and Slide Hammer, remove the extension housing seal.



11. ***NOTICE:*** **The park pawl, park pawl return spring and park pawl shaft may fall out during removal of the extension housing.**

    Remove the extension housing screws and extension housing.

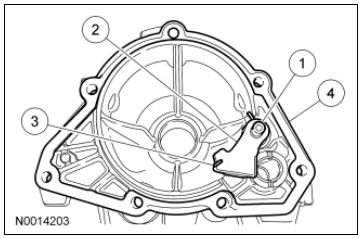


Four-Wheel Drive (4WD) applications

12. Using the Input Shaft Oil Seal Remover and Slide Hammer, remove the extension housing seal.

13. *NOTICE:* **The park pawl, park pawl return spring and park pawl shaft may fall out during removal of the extension housing.**

    Remove the extension housing screws and extension housing.

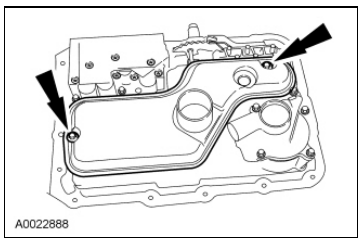


All applications

14. **NOTE:** Rear Wheel Drive (RWD) shown, Four-Wheel Drive (4WD) similar.

    Remove the park pawl assembly and discard the gasket.

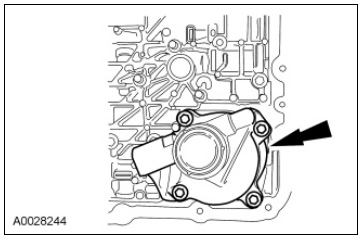
    1. Remove the park pawl shaft.
    2. Remove the park pawl.
    3. Remove the park pawl return spring.
    4. Remove and discard the gasket.



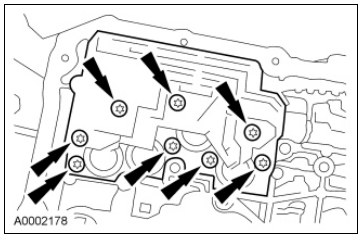
15. **NOTE:** The transmission fluid pan gasket is reusable. Clean and inspect the transmission fluid pan gasket for damage. If not damaged, the transmission fluid pan gasket should be reused.

    Remove the 16 transmission fluid pan-to-case screws, transmission fluid pan and gasket.

16. Remove the transmission fluid filter and seal assembly and discard.

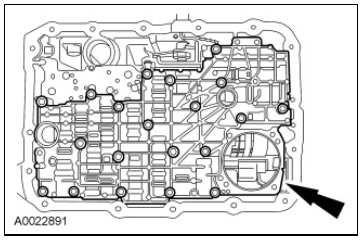


17. Remove the manual control valve detent spring.



18. ⚠ **WARNING: Follow the specified procedure when using the tool to remove the servo cover. The servo and servo cover are under high spring force and can separate forcefully, which may result in serious personal injury.**

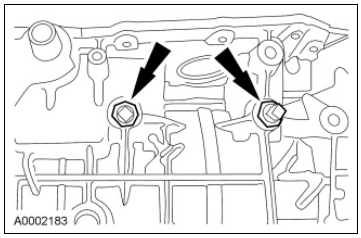
    Remove the reverse servo assembly.



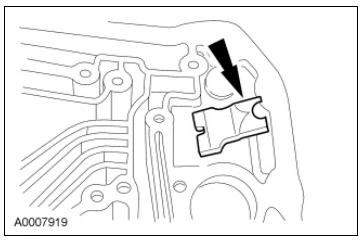
19. ***NOTICE:*** **Do not damage transmission control solenoid body connector pins.**

    Remove the transmission control solenoid body assembly by lifting on the body and pushing the transmission control solenoid body connector from the other side of the case.

20. Remove the main control valve body, separator plate and gasket.



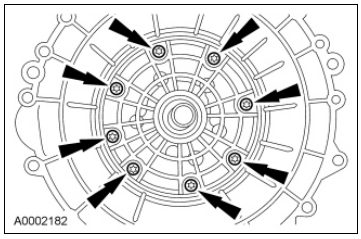
21. Using the Input Shaft Oil Seal Remover and Slide Hammer, remove the converter hub seal.



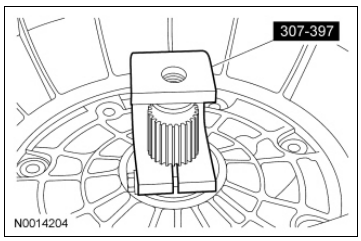
22. ***NOTICE:*** **Failure to loosen the Overdrive (O/D)/intermediate band adjustment screws prior to pump removal may cause damage to the pump and O/D band.**

    NOTE: Throw the locknuts away. The locknuts are not reusable for assembly.

    Remove and discard the locknuts, and loosen the Overdrive (O/D)/intermediate band adjustment screws.



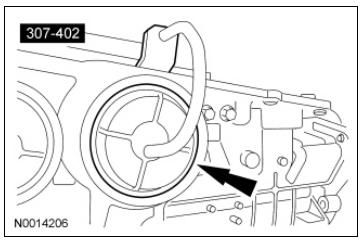
23. Remove and tag the O/D anchor strut for assembly.



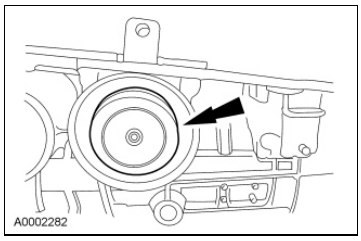
24. ***NOTICE:*** **The transmission fluid pump housing-to-case screws are not reusable for assembly. Discard the screws. If the screws are reused, the housing may become separated from the transmission.**

    Remove and discard the transmission fluid pump housing-to-case screws.

25. Install the Transmission Fluid Pump Remover.



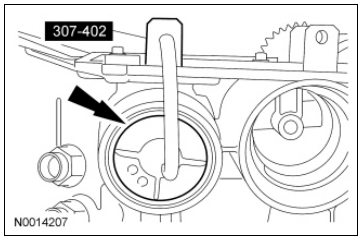
26. Using the Transmission Fluid Pump Remover and Slide Hammer, remove the pump.



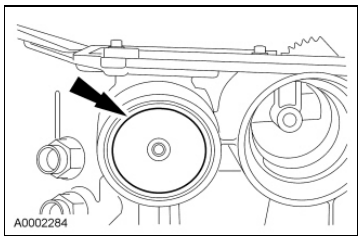
27. ⚠ **WARNING: Follow the specified procedure when using the tool to remove the servo cover. The servo and servo cover are under high spring force and can separate forcefully, which may result in serious personal injury.**

    Using the Servo Cover Compressor, remove the intermediate servo cover retaining ring and cover.

28. Remove the intermediate band servo piston and spring.

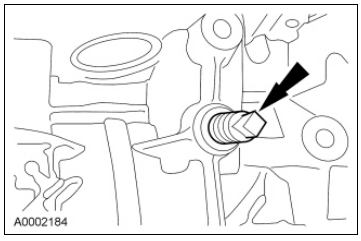


29. After removing the intermediate band servo piston and spring, inspect the transmission case servo bore for excessive wear. If excessive wear or damage to the transmission case is evident, repair the transmission case servo bore using the servo bore repair kit.



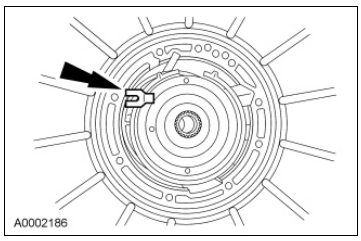
30. ⚠ **WARNING: Follow the specified procedure when using the tool to remove the servo cover. The servo and servo cover are under high spring force and can separate forcefully, which may result in serious personal injury.**

    Using the Servo Cover Compressor, remove the O/D servo cover retaining ring and cover.



31. Remove the front band servo piston and spring.

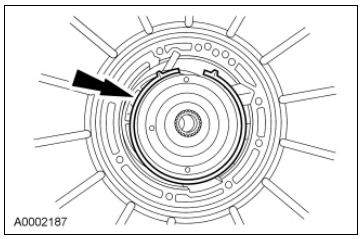
32. After removing the O/D band servo piston and spring, inspect the transmission case servo bore for excessive wear. If excessive wear or damage to the transmission case is evident, repair the transmission case servo bore using the servo bore repair kit.



33. Remove the screw.

34. **NOTE:** Tag and identify parts for reassembly.

    Compress the O/D band and remove the apply strut.

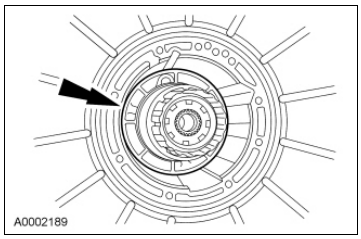


35. **NOTE:** Identify the anchor and apply ends of the O/D band.

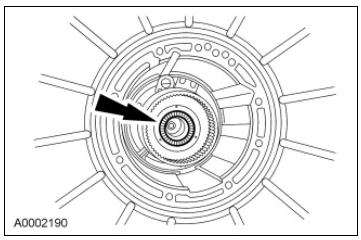
    NOTE: The new O/D band is dark in color. This is a normal condition of the band. Hairline cracks in the band are also considered normal. Do not install a new band based solely on the color.

    Remove and inspect the O/D band. Check the following conditions for installing a new band:

    - Inspect for glazing.
    - Inspect for missing friction material.
    - Inspect for material flaking.
    - Inspect for damage to the anchor pins.



36. Remove the O/D brake and coast clutch drum.

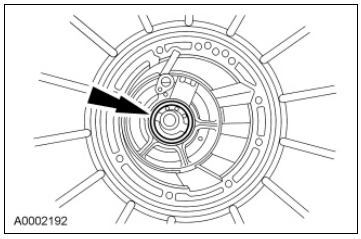


37. **NOTE:** Do not bend the trigger wheel.

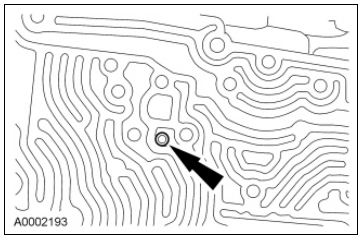
    NOTE: The No. 12 thrust bearing is in this assembly.

    Remove the planetary gear O/D carrier.

38. Remove the O/D planet thrust bearing (No. 2).

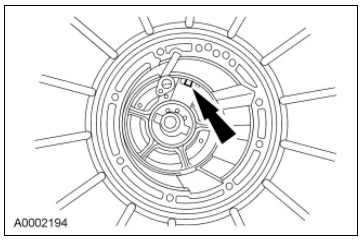


39. Remove the O/D ring gear, O/D One-Way Clutch (OWC) assembly and center shaft as an assembly.



40. **NOTE:** Tag and identify the center shaft thrust bearing (No. 3) for assembly.

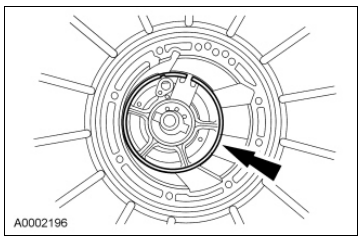
    Remove the No. 3 center shaft thrust bearing.



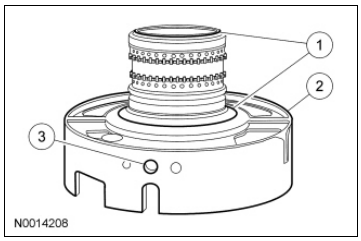
41. **NOTE:** The center support locknut may fall into the remaining assembly if not removed.

    Remove the screw.

42. Remove the locknut and cage.

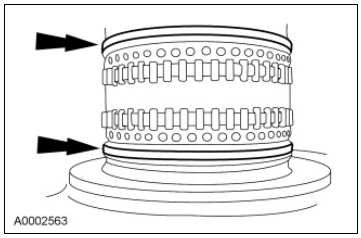


43. Remove the center support retaining ring.

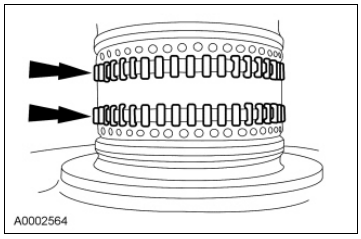


44. **NOTE:** The center support is repaired as an assembly. Any damage requires installing a new component.

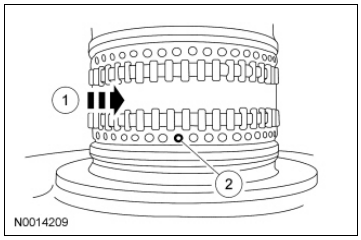
    NOTE: When removing the center support, pull evenly around the center support web.



Remove the center support.

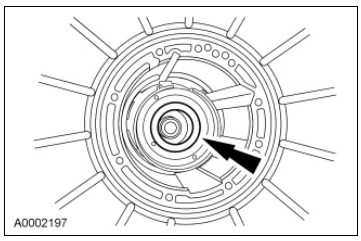


45. Inspect the center support assembly for wear or damage.
    1. Inspect the thrust surfaces for wear or damage.
    2. Inspect the center support sealing surface.
    3. Inspect the fluid passage for blockage or damage.

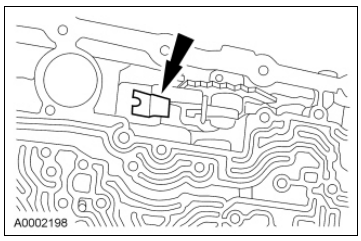


46. Inspect the seal rings for damage.

47. Inspect the bearing for missing rollers or damage.



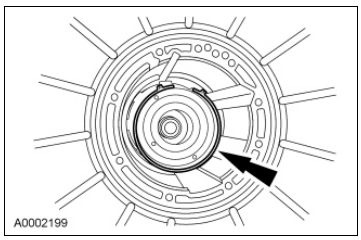
48. Inspect the direct clutch feed hole for blockage or damage.
    1. Rotate the center support bearing to locate the direct clutch feed hole.
    2. Inspect the direct clutch feed hole for blockage or damage.



49. **NOTE:** Tag and identify the No. 4 intermediate brake drum thrust bearing.

Remove the intermediate brake drum thrust bearing (No. 4).

50. Remove and tag the intermediate band anchor strut for assembly.



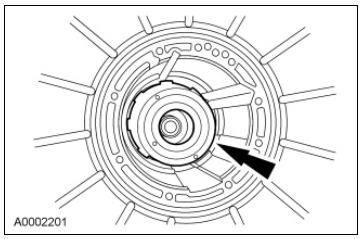
51. **NOTE:** Identify the anchor and apply ends of the intermediate band.

    NOTE: The new intermediate band is dark in color. This is a normal condition of the band. Hairline cracks in the band are also considered normal. Do not install a new band based solely on the color.

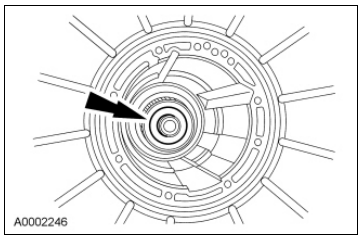
    Remove and inspect the intermediate band. Check the following conditions for installing a new band:

    - Inspect for glazing.
    - Inspect for missing friction material.
    - Inspect for material flaking.
    - Inspect for damage to the anchor pins.

52. Remove and tag the intermediate band apply strut for assembly.

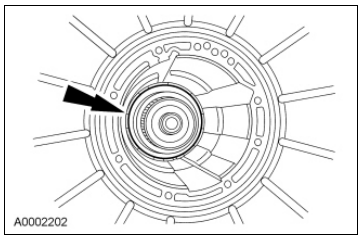


53. Remove the screw.

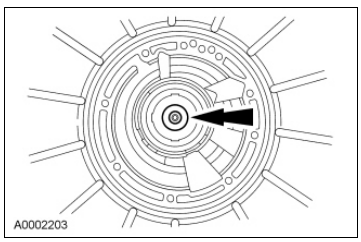


54. **NOTE:** The No. 5 forward clutch cylinder thrust bearing may come out with the intermediate brake and direct clutch drum.

    Remove the direct clutch drum.

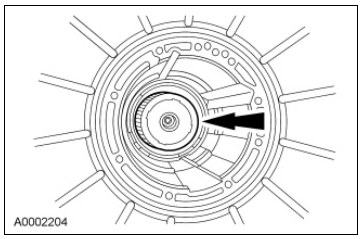


55. Remove the No. 5 forward clutch cylinder thrust bearing, tag and identify.



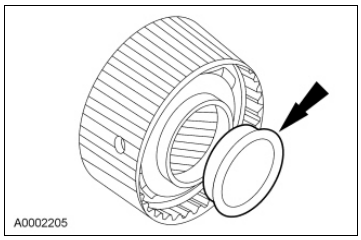
56. **NOTE:** The No. 6A thrust bearing may come out with the cylinder. Tag for reassembly.

    Remove the forward clutch cylinder.



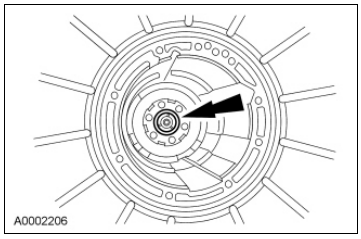
57. **NOTE:** The No. 6A forward ring gear hub thrust bearing may have come out with the forward clutch cylinder.

    Remove the No. 6A forward ring gear hub thrust bearing.

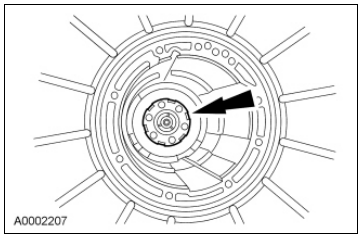


58. **NOTE:** The No. 7 forward planet thrust bearing may come out with the forward ring gear and hub assembly.

    Remove the forward ring gear and hub as an assembly.

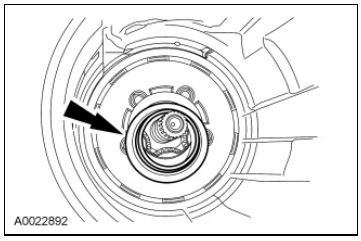


59. Remove the No. 6B forward clutch thrust washer from the forward ring gear hub.



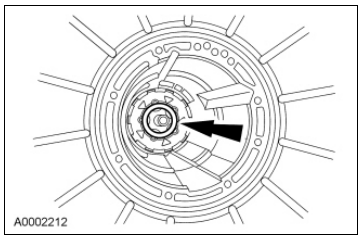
60. **NOTE:** The No. 7 forward planet thrust bearing may come out with the forward ring gear and hub assembly.

    Remove the No. 7 forward planet thrust bearing.

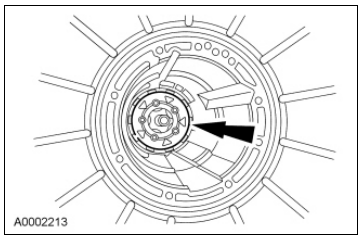


61. Remove the forward planetary assembly.

62. Remove the input shell and sun gear assembly.



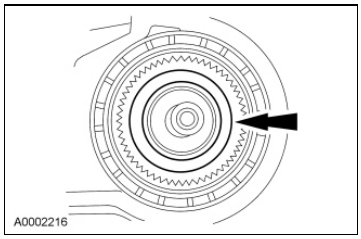
63. Remove the spacer.



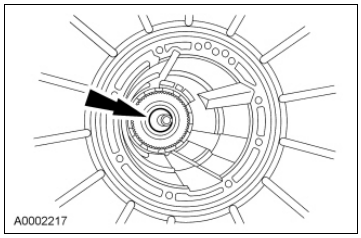
64. **NOTE:** Tag and identify the No. 8 low/reverse planetary carrier thrust bearing.

    Remove the thrust bearing.

65. Remove the retaining ring.



66. Remove low/reverse planetary assembly.

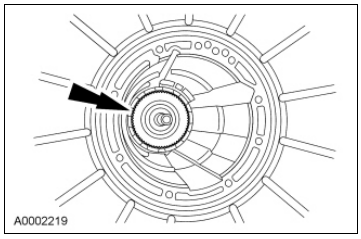


67. **NOTE:** Tag and identify the No. 9 low/reverse planetary carrier thrust bearing.

    Remove the thrust bearing.

68. **NOTE:** Use slots located around the outside of the sleeve.

    Using a small pick, remove the output shaft sleeve.

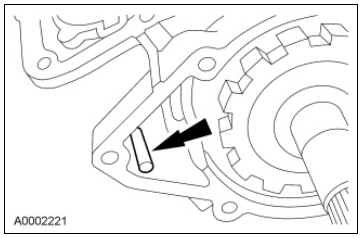


69. ⚠ **WARNING: Hold onto the output shaft so it does not fall out after removing the snap ring. Failure to follow this instruction may result in serious personal injury.**

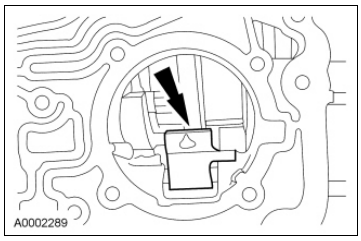
    NOTICE: **Discard the output shaft retaining ring. A new retaining ring must be used for assembly or damage to the transmission may occur.**

    While holding the output shaft, remove and discard the output shaft retaining ring.

70. Remove the output shaft ring gear and hub.



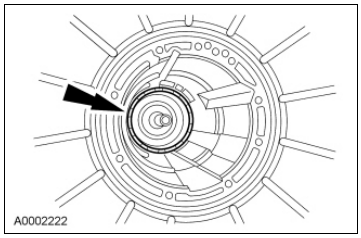
71. Remove the No. 10 low intermediate sun gear bearing.



72. ***NOTICE:*** **Do not pry on the outer edge of the case or damage to the gasket sealing surface may occur.**

    NOTE: It may be necessary to grind flat spots on the edges of the reverse band actuating lever shaft in order to remove it.

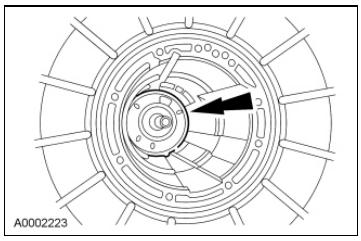
    Using a pair of vise grips, hold the flat spots on the reverse band actuating lever shaft, wiggle it back and forth and remove the reverse band actuating lever shaft.



73. Remove the reverse band actuating lever assembly.

74. **NOTE:** The inner race of the rear OWC is not removable. It is repaired in the case.

    Remove the low/reverse brake drum and OWC assembly by rotating it clockwise.

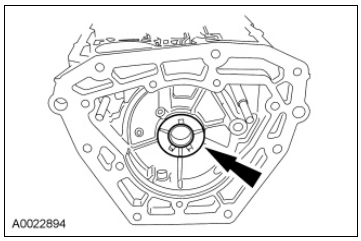


75. **NOTE:** The reverse OWC is part of the reverse brake drum assembly. Install a new reverse brake drum as an assembly only.

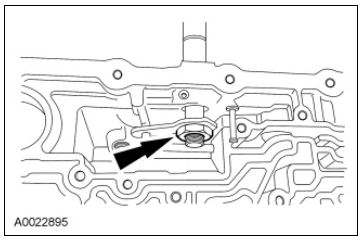
    Inspect the reverse brake drum assembly and install a new reverse brake drum assembly if damaged.

    1. Inspect the reverse brake drum sprags.
    2. Inspect the reverse brake drum rollers.
    3. Inspect the reverse brake drum.

76. Remove the reverse band.

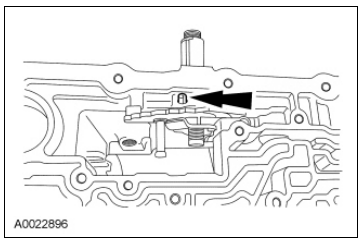


77. Remove the output shaft and park gear.



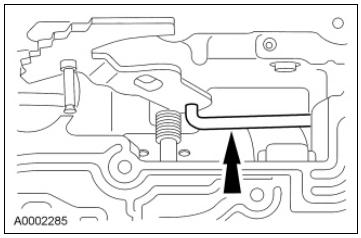
78. **NOTE:** Tag and identify the No. 11 output shaft thrust washer.

    Remove the output shaft thrust washer.

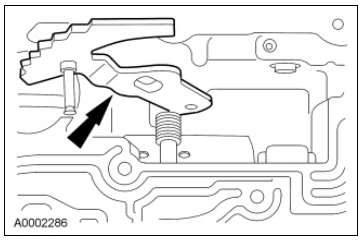


79. ***NOTICE:*** **To avoid damage, make sure the wrench does not strike the manual valve inner lever pin.**

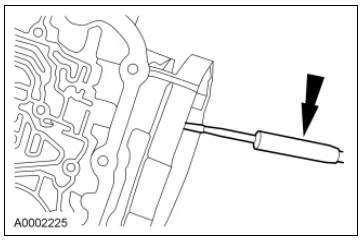
    Remove the nut.



80. Remove the manual control lever shaft retaining pin.

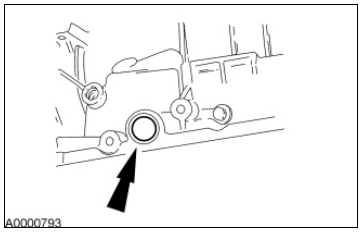


81. Remove the manual control lever shaft.



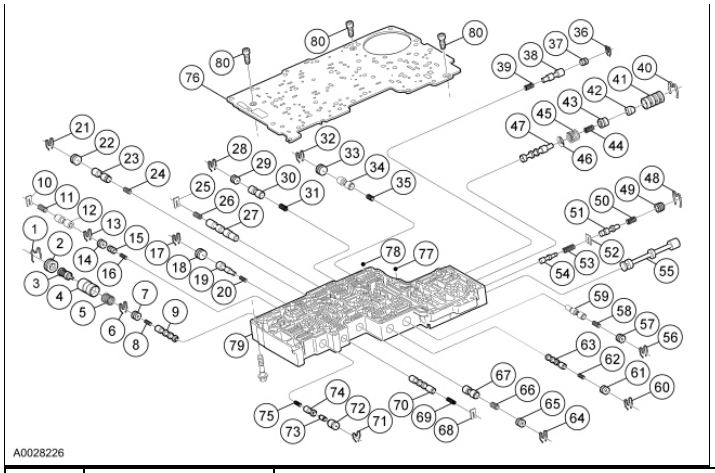
82. Disconnect the manual valve inner lever from the park lever actuating rod.

83. Remove the manual valve inner lever.



84. Remove the park lever actuating rod.

85. ***NOTICE:*** **Do not damage the bore.**



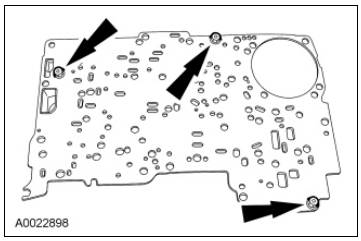
Remove the manual control lever seal.

Main Control Valve Body

Special Tool(s)

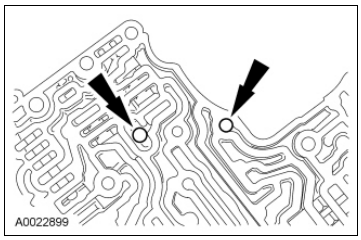
 ST1639-A	Aligner, Valve Body (2 required) 307-334 (T95L-70010-C)

Item	Part Number	Description
1	-	Clip - retainer
2	-	Plug - retainer
3	-	Valve assembly - thermo
4	-	Valve - fluid cooler bypass
5	-	Spring - fluid cooler bypass
6	-	Clip - retainer
7	-	Plug - retainer
8	-	Spring - converter clutch control valve
9	-	Valve - converter clutch control
10	-	Plate
11	-	Spring - coast clutch control
12	-	Valve - coast clutch control
13	-	Clip - retainer
14	-	Plug - retainer
15	-	Valve - converter clutch back pressure
16	-	Spring - converter clutch back pressure
17	-	Clip - retainer
18	-	Plug - retainer
19	-	Valve - VFS2 modulator
20	-	Spring - VFS2 modulator valve



21	-	Clip - retainer
22	-	Plug - retainer
23	-	Valve - intermediate servo release
24	-	Spring - intermediate servo release valve
25	-	Plate
26	-	Spring - high clutch control
27	-	Valve - high clutch control
28	-	Plug - retainer
29	-	Clip - retainer
30	-	Valve - reverse modulator
31	-	Spring - reverse modulator valve
32	-	Clip - retainer
33	-	Plug - retainer
34	-	Valve - reverse engagement
35	-	Spring - reverse engagement valve
36	-	Clip - retainer
37	-	Plug - retainer
38	-	Valve - VFS1 modulator
39	-	Spring -VFS1 modulator valve
40	-	Clip - retainer
41	-	Sleeve
42	-	Valve - booster
43	-	Valve - booster
44	-	Spring - inner
45	-	Spring - outer
46	-	Spring - retainer
47	-	Valve - main regulator
48	-	Clip - retainer
49	-	Plug - retainer
50	-	Spring - converter limit
51	-	Valve - converter limit
52	-	Plate
53	-	Spring - solenoid regulator valve
54	-	Valve - solenoid regulator
55	-	Valve - manual
56	-	Clip - retainer
57	-	Plug - retainer
58	-	Spring - rear servo control valve
59	-	Valve - rear servo control
60	-	Clip - retainer
61	-	Plug - retainer
62	-	Spring - RS ISA select valve
63	-	Valve - RS ISA select
64	-	Clip - retainer

65	-	Plug - retainer
66	-	Spring - forward engagement control valve
67	-	Valve - forward engagement control
68	-	Plate
69	-	Spring - Overdrive (O/D) servo control
70	-	Valve - O/D servo control
71	-	Retainer - clip
72	-	Sleeve - converter clutch modulator control
73	-	Valve - converter clutch modulator control
74	-	Valve - converter clutch modulator
75	-	Spring - converter clutch modulator control
76	7Z490	Plate assembly - main control valve body separator
77	7E195	Ball - lubrication check
78	7E195	Ball - shuttle valve
79	7A101	Body - control valve lower
80	W701099	Screws - separator plate



Disassembly

1. **NOTE:** The valve body separator plate has a bonded gasket. Do not reuse. Discard the plate.

   Remove and discard the valve body separator plate.

2. Remove the check balls.

3. **NOTE:** Refer to the disassembled view.

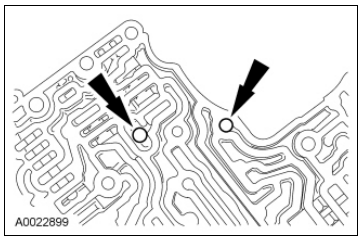
   Disassemble the main control valve body only if cleaning is required.

Assembly

1. ***NOTICE:*** **Do not lose parts when cleaning or repairing.**

   Thoroughly clean all parts in solvent and blow dry with moisture-free compressed air.

2. ***NOTICE:*** **Do not stone, file or sand the valves. This will remove the anodized finish and may**

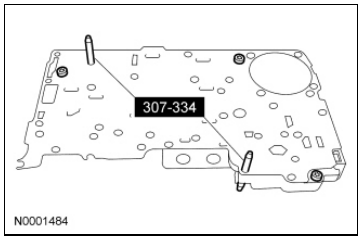


result in further main control or transmission damage.

After cleaning the main control valve body, carry out the following:

- Inspect all valve and plug bores for scoring or burrs.
- Check all fluid passages for obstructions.
- Inspect all valves and plugs for burrs.
- Inspect all mating surfaces for burrs or distortion.
- Inspect all springs for distortion.
- Check all valves and plugs for free movement in their respective bores.
    - ♦ Valves and plugs, when dry, must fall from their own weight into their respective bores.
- Roll the manual valve on a flat surface to check for a bent condition.

3. Assemble the main control valve body.



4. Install the main control valve body check balls.

5. **NOTE:** Use a new valve body separator plate for main control valve body installation.

   Using the Valve Body Aligners, install a new main control valve body separator plate.

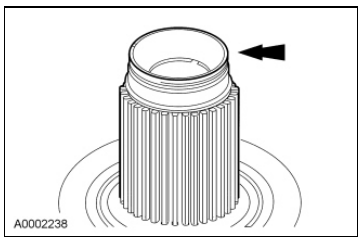
   - Tighten to 7 Nm (62 lb-in).

Fluid Pump

Special Tool(s)

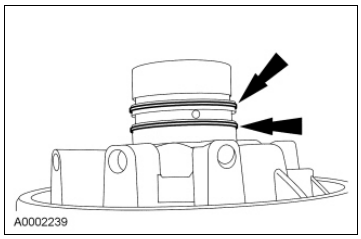
 ST2532-A	Alignment Gauge, Transmission Fluid Pump 307-431
 ST2533-A	Alignment Gauge, Transmission Fluid Pump 307-432
 ST2419-A	Alignment Pins, Transmission Fluid Pump 307-398
 ST1817-A	Alignment Set, Fluid Pump 307-S039 (T74P-77103-X)
 ST1833-A	Installer, Torque Converter Fluid Seal 307-349 (T97T-77000-A)
 ST1826-A	Sizer, Piston Seal 307-338 (T95L-70010-G)
 ST2684-A	Installer Tools, Transmission Fluid Pump Seal (Aligner) 307-451/1
 ST2686-A	Installer Tools, Transmission Fluid Pump Seal (Installer) 307-451/3
 ST2685-A	Installer Tools, Transmission Fluid Pump Seal (Sizer) 307-451/2

Material

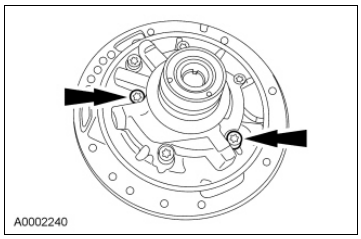


Item	Specification
Multi-Purpose Grease XG-4 and/or XL-5	ESB-M1C93-B

Disassembly

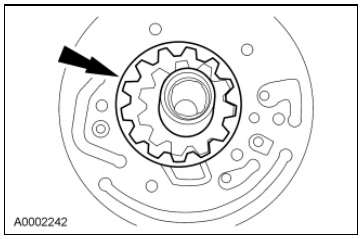


1. Remove the fluid pump gasket, fluid pump seal ring and the No. 1 thrust washer.
    1. Remove and discard the fluid pump gasket.
    2. Remove and discard the fluid pump seal ring (square cut).
    3. Remove and tag the No. 1 thrust washer.

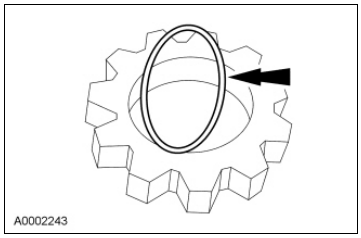


2. Remove the fluid pump support seal ring.

3. Remove the seal rings.



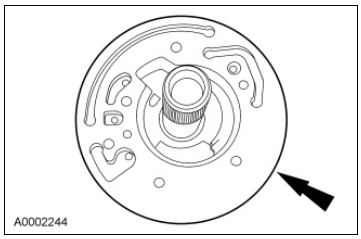
4. Remove the fluid pump housing.



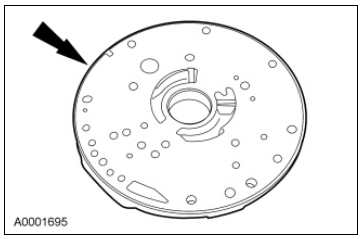
5. **NOTE:** A rough casting on the pump surface crescent is not a flaw.

   NOTE: The fluid pump gears are part of the pump assembly and are not repaired separately.

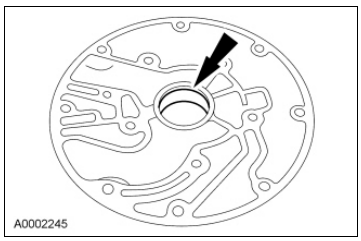
   Remove the fluid pump gears.



6. Remove the drive gear O-ring seal and discard. Inspect the fluid pump gears for cracks and scoring.



7. Remove and discard the valve.

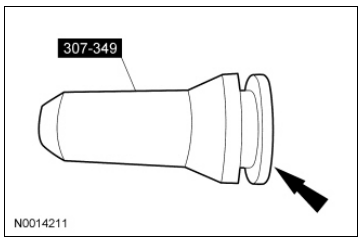


8. Inspect the Overdrive (O/D) pump.
   - Inspect the O/D pump support gear pockets for scoring and wear.
   - Clean and inspect the O/D and rear input shaft bushings.

9. Inspect the fluid pump adapter plate for scoring and wear.

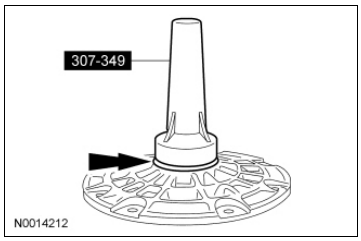
10. Inspect the fluid pump-to-converter housing bushing.

Assembly



1. **NOTE:** Minor burrs and scoring may be removed with crocus cloth. If damage is found, install a new assembly.

   Inspect the fluid pump components for the following:

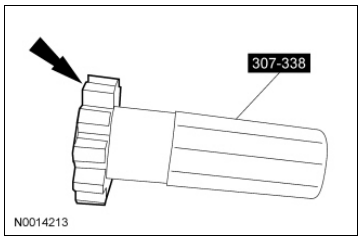


- Pump body and case for burrs
- Fluid passages for obstructions

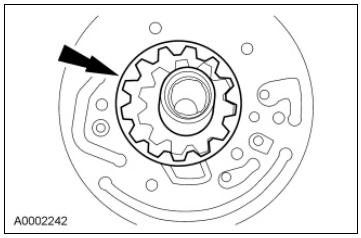
2. **NOTE:** Check and make sure that the garter spring in the seal has not popped off of the converter hub seal.

   Install a new seal onto the Torque Converter Fluid Seal Installer.

3. Using the Torque Converter Fluid Seal Installer, install the converter hub seal.

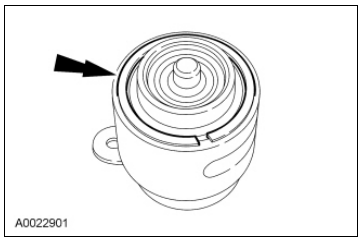


4. Install a new O-ring seal in fluid pump drive gear.



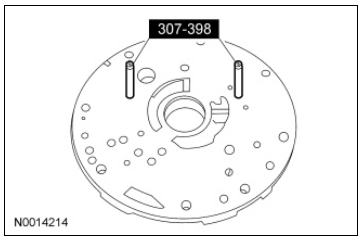
5. **NOTE:** Lubricate the Piston Seal Sizer with multi-purpose grease.

   Using the Piston Seal Sizer, seat the O-ring seal in the pump gear.



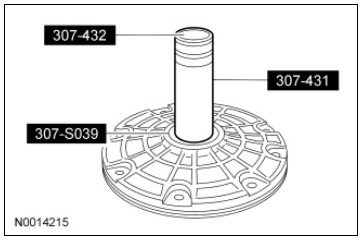
6. **NOTE:** The chamber on the inside edge of the small gear must be UP when in the pump housing gear pocket. The dimple on the larger gear must be DOWN when in the pump housing gear pocket.

   Install the pump gears into the fluid pump housing. Apply multi-purpose grease to the pump gear to prevent scoring at start up.

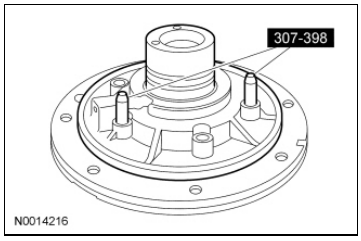


7. Install a new seal on the new valve.

8. Install a new valve with the tab facing down.

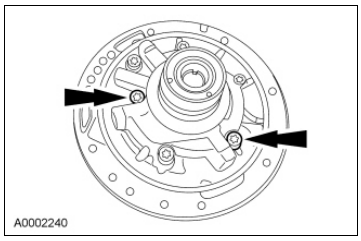


9. First install the fluid pump adapter plate and then the Transmission Fluid Pump Alignment Pins in their correct location.

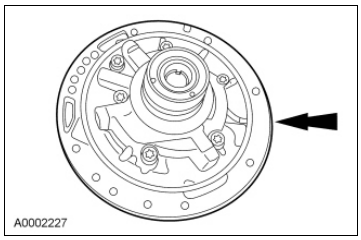


10. ***NOTICE:*** **The Fluid Pump Alignment Set and the Transmission Fluid Pump Alignment Gauge must be used to correctly align the pump with the adapter plate to reduce gear noise, bushing failure and leakage.**

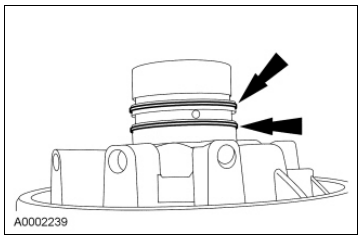
    Using the Fluid Pump Alignment Set and the Tranmission Fluid Pump Alignment Gauge, align the fluid pump to the adapter plate.



11. Using the Transmission Fluid Pump Alignment Pins, assemble the pump.

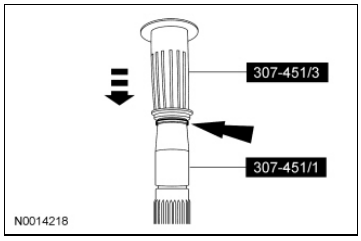


12. Loosely install the fluid pump housing screws in their correct location and remove the Transmission Fluid Pump Alignment Pins.



13. Install the 2 remaining screws and tighten all the transmission fluid pump housing-to-case screws in a star pattern.
    - Tighten to 22 Nm (16 lb-ft).

14. Install a new fluid pump seal ring.



15. Install 2 new seal rings.

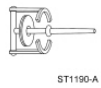
16. ***NOTICE:*** **Be careful not to overstretch the seal ring past the seal ring groove. Damage to the seal will occur.**

    Using the Transmission Fluid Pump Seal Installer Tools, install the fluid pump seal ring.

17. **NOTE:** Verify correct seal installation.

    NOTE: Make sure seal grooves are clean and free of burrs. Make sure that the seal is seated into the groove.

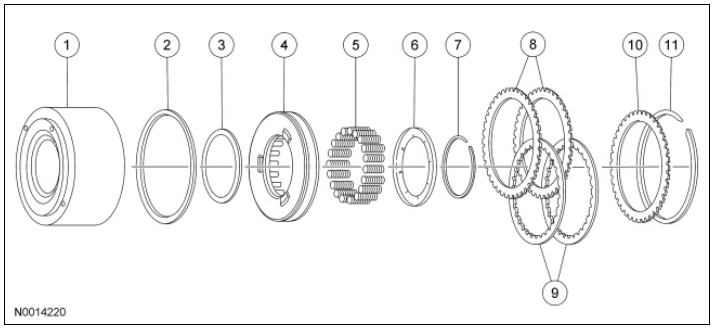
    Verify that the seal is installed correctly.



18. ***NOTICE:*** **Failure to correctly size the seal will cause damage to the seal when the torque converter is installed.**

    Using the Transmission Fluid Pump Seal Installer Tools, size the seal to the correct size. Leave the Transmission Fluid Pump Seal Installer Tools on the seal ring for 2 minutes to obtain the correct seal size.

Overdrive Brake and Coast Clutch Drum Assembly



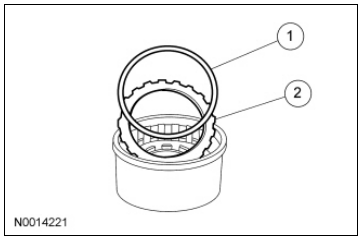
Special Tool(s)

 ST1190-A	Compressor, Clutch Spring 307-015 (T65L-77515-A)
 ST2431-A	Protector, Piston Seal 307-049 (T74P-77404-A)

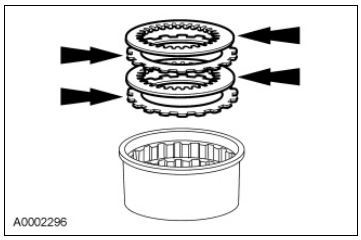
Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V

Overdrive (O/D) Brake and Coast Clutch Drum Assembly



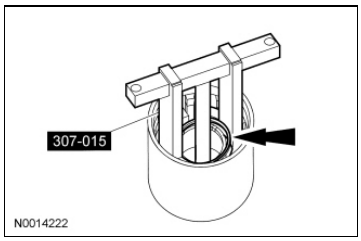
Item	Part Number	Description
1	7L669	Coast clutch drum
2	7A548	Overdrive (O/D) piston outer seal ring
3	7D404	O/D piston inner seal ring
4	7A262	O/D clutch piston
5	7A480	O/D piston spring (20 required)
6	7A527	Coast clutch piston spring retainer
7	E860125-S	Retaining ring
8	7B442	Coast clutch external plates - steel (2 required)
9	7B164	Coast clutch internal plates - friction (2 required)
10	7B066	Coast clutch pressure plate



11	E860126S/129S	Retaining ring (select fit)

Disassembly

1. Remove the coast clutch pressure plate.
    1. Remove the coast clutch retaining ring.
    2. Remove the coast clutch pressure plate.



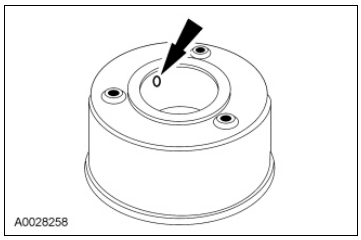
2. Remove the coast clutch disc pack.
    - Inspect for wear, install a new pack as necessary.

3. ⚠ **WARNING: While removing or installing the retaining ring, slowly release tool pressure on clutch piston springs. Failure to follow this instruction may cause the assembly to separate forcefully, resulting in serious personal injury.**

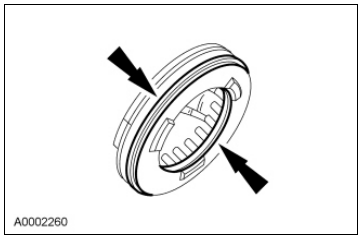
   NOTICE: **Do not fully compress the Clutch Spring Compressor or damage to the spring retainer may occur.**

   Using the Clutch Spring Compressor, remove the coast clutch piston retaining ring.

4. Relieve the coast clutch spring tension and remove the Clutch Spring Compressor.



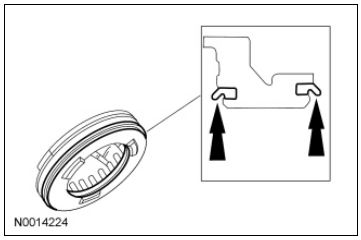
5. Remove the coast clutch piston springs.
    1. Remove the coast clutch piston retainer.
    2. Remove the clutch piston springs.



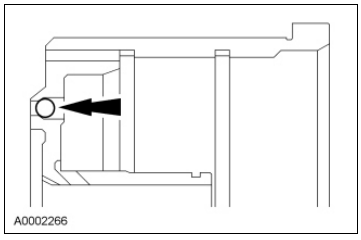
6. ⚠ **WARNING: When using compressed air, never let air pressure exceed 138 kPa (20 psi) and always wear safety glasses. Compressed air may cause foreign material or parts to become airborne. Failure to follow this instruction may result in serious personal injury.**

   Remove the coast clutch piston.

   - Apply air pressure to the hole in the drum to remove the coast clutch piston while blocking the other hole.



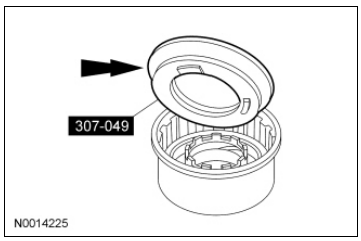
7. Remove and discard the coast clutch piston inner seal and the coast clutch piston outer seal.



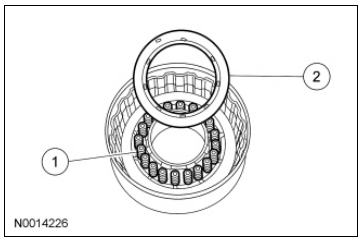
Assembly

1. ***NOTICE:*** **The lip seals must be positioned as shown. Care must be taken to prevent rollover of the lip seal.**

   Install the new coast clutch piston inner and outer seal.



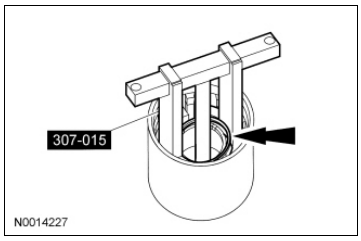
2. Verify the check ball is free to move.



3. ***NOTICE:*** **Care must be taken to prevent damage to the seals during installation.**

   Using the Piston Seal Protector, install the coast clutch piston.

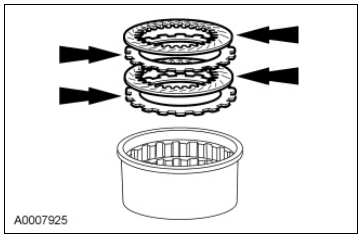
- Lubricate the seals with transmission fluid.



4. Install the coast clutch piston springs.
    1. Install the coast clutch piston springs.
    2. Install the coast clutch spring retainer.

5. ***NOTICE:*** **Do not fully compress the Clutch Spring Compressor or damage to the coast clutch piston spring retainer may occur.**

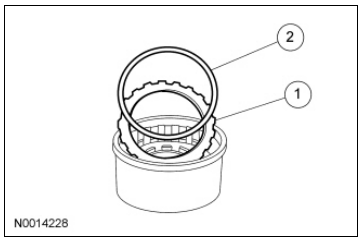
    Using the Clutch Spring Compressor, install the coast clutch piston spring retainer ring.



6. ***NOTICE:*** **Coast clutch friction plates are directional and must be installed with grooves clockwise (ID to OD). The word TOP should face up, otherwise transmission damage can occur.**

    NOTICE: **If new clutch plates are being used, they should be soaked in transmission fluid before assembly, otherwise transmission damage can occur.**

    When installing friction plates, the word TOP should face up. If reusing plates, grooves must be installed clockwise. Install the coast clutch disc pack.



7. Install the 2 steel clutch plates and 2 friction clutch plates in alternating order starting with a steel clutch plate.

8. **NOTE:** The retaining ring is select fit.

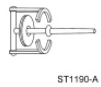
   Install the coast clutch pressure plate.

   1. Install the coast clutch pressure plate.
   2. Install the original coast clutch retaining ring.

9. ⚠ **WARNING: When using compressed air, never let air pressure exceed 138 kPa (20 psi) and always wear safety glasses. Compressed air may cause foreign material or parts to become airborne. Failure to follow this instruction may result in serious personal injury.**

   Air check the assembly.

   - Apply air pressure to the hole in the drum while blocking the other hole.



10. Check the coast clutch disc pack free play.
    1. Push down on the coast pressure plate.
    2. Check clearance between the coast clutch retaining ring and coast pressure plate. Clearance should be 1.3-2.0 mm (0.051-0.079 in). If clearance is not within the specification, install a correct coast clutch retaining ring that will provide the correct free play adjustment.

Part Number	Thickness		Diameter	
	mm	Inch	mm	Inch

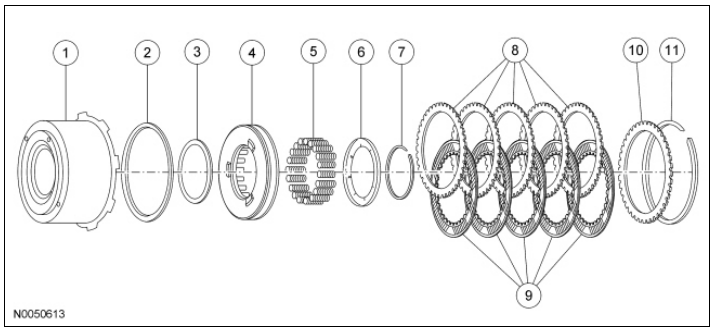
Direct Clutch Drum Assembly



Special Tool(s)

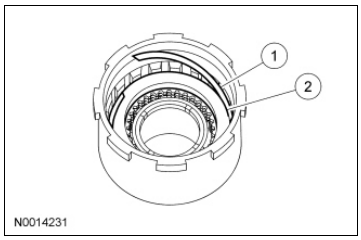
 ST1190-A	Compressor, Clutch Spring 307-015 (T65L-77515-A)
 ST2431-A	Protector, Piston Seal 307-049 (T74P-77404-A)
 ST1756-A	Sizer, Piston Seal 307-336 (T95L-70010-E)

Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V

Direct Clutch Drum Assembly

Item	Part Number	Description
1	7D044	Intermediate brake drum assembly
2	7A548	Direct piston outer seal ring
3	7D404	Direct piston inner seal ring
4	7A262	Direct clutch piston
5	7A480	Direct piston spring (20 required)
6	7A527	Direct clutch piston spring retainer
7	E860125-S	Retaining ring
8	7B442	Direct clutch external spline plates - steel



9	7B164	Direct clutch internal spline plates - friction
10	7B066	Direct clutch pressure plate
11	E860126S/129S	Retaining ring (select fit)

Disassembly

1. **NOTE:** The retaining ring is a select fit. See assembly procedure if installation of new ring or clutch pack is required.

   Remove the direct clutch retaining ring and the direct clutch pressure plate.

   1. Remove the direct clutch retaining ring.
   2. Remove the direct clutch pressure plate.

2. ***NOTICE:*** **Clutch plates are directional. Note the direction of the grooves for installation, otherwise transmission damage can occur.**

   Remove the direct clutch disc pack.

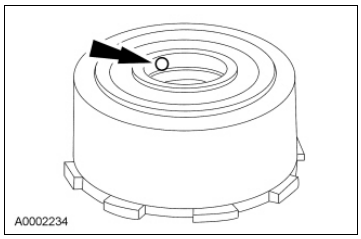
   - Inspect and install new friction plates if worn, damaged or overheated.
   - Measure and record the thickness of the steel plates for assembly.

3. ⚠ **WARNING: While removing or installing the retaining ring, slowly release tool pressure on clutch piston springs. Failure to follow this instruction may cause the assembly to separate forcefully, resulting in serious personal injury.**

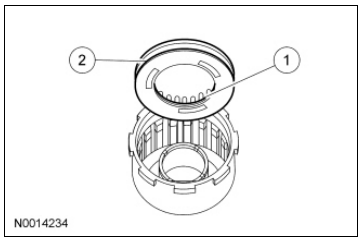
   NOTICE: **Do not fully compress the Clutch Spring Compressor or damage to the spring retainer may occur.**

   Using the Clutch Spring Compressor, remove the direct clutch piston retaining ring.

4. Relieve the direct clutch spring tension and remove the Clutch Spring Compressor.



5. Remove the direct clutch piston spring retainer and the direct clutch piston springs.
    1. Remove the direct clutch piston spring retainer.
    2. Remove the direct clutch piston springs.

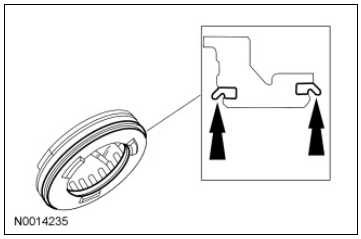


6. **⚠ WARNING: When using compressed air, never let air pressure exceed 138 kPa (20 psi) and always wear safety glasses. Compressed air may cause foreign material or parts to become airborne. Failure to follow this instruction may result in serious personal injury.**

    Using compressed air, remove the direct clutch piston from the direct clutch drum.

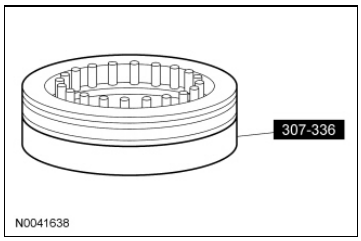
    - Apply air pressure to the hole in the drum while blocking the other hole.

7. Remove and discard the direct clutch piston inner and outer seal.
    1. Remove and discard the direct clutch piston inner seal.
    2. Remove and discard the direct clutch piston outer seal.
    - Clean the components as necessary.



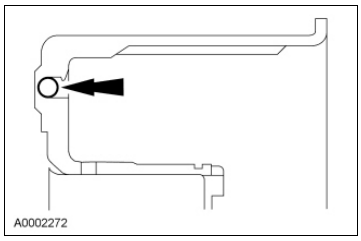
Assembly

1. ***NOTICE:*** **The lip seals must be positioned as shown. Care must be taken to prevent rollover of the lip seal.**



NOTE: Use new seals to help prevent seal failures.

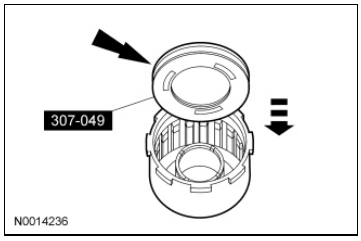
Install the new direct clutch piston inner seal and the direct clutch piston outer seal.



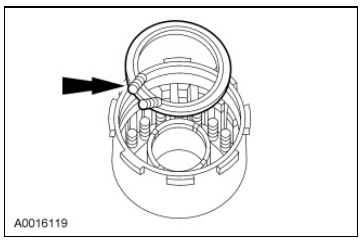
2. **NOTE:** Lubricate the direct clutch piston inner and outer seals with automatic transmission fluid.

   Install the direct clutch piston into the Piston Seal Sizer.

3. Inspect the clutch components for damage or wear. Install new components as necessary.
   - Inspect the drum surface for damage.
   - Inspect the clutch piston bore and piston.
   - Check the fluid passages for obstructions. All fluid passages must be clean and free of obstructions.
   - Inspect the clutch plates for damage.
   - Inspect the clutch springs.
   - Verify the check ball is free to move.



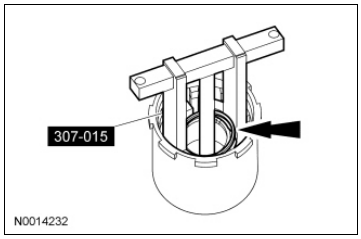
4. Carefully remove the direct clutch piston from the Piston Seal Sizer.



5. ***NOTICE:*** **Care must be taken to prevent damage to the seals during installation.**

   Using the Piston Seal Protector, install the direct clutch piston.

   - Lubricate the seals with transmission fluid before installing.

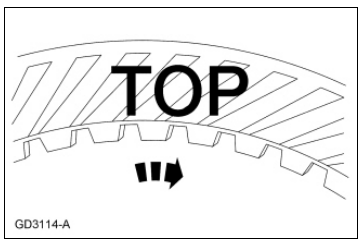


6. Install the direct clutch piston springs and the retainer.

7. ⚠ **WARNING: While removing or installing the retaining ring, slowly release tool pressure on clutch piston springs. Failure to follow this instruction may cause the assembly to separate forcefully, resulting in serious personal injury.**

   NOTICE: **Do not fully compress the Clutch Spring Compressor or damage to the spring retainer may occur.**

   Using the Clutch Spring Compressor, install the direct clutch piston retaining ring.

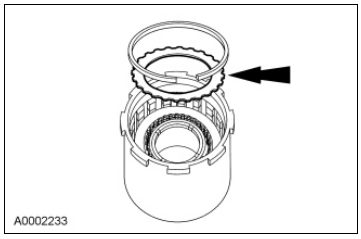


8. Relieve the direct clutch spring tension and remove the Clutch Spring Compressor.

9. ***NOTICE:*** **The direct clutch friction plates are directional and must be installed with grooves pointing clockwise (ID to OD) and the word TOP facing up, otherwise transmission damage can occur.**

   NOTICE: **If new plates are used, they should be soaked in transmission fluid before assembly, or damage to the plates may occur.**

   When installing friction plates, the word TOP should face up. If reusing plates, grooves must be installed clockwise. Install the direct clutch disc pack.

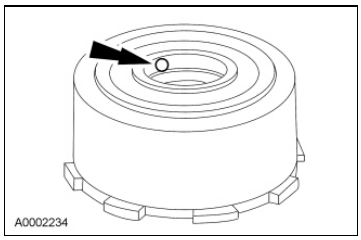


10. Install the steel clutch plates and friction clutch plates in alternating order starting with a steel clutch

plate.

11. **NOTE:** The retaining ring is a select fit.

    Install the direct clutch pressure plate using the original direct clutch retaining ring.



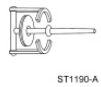
12. ⚠ **WARNING: When using compressed air, never let air pressure exceed 138 kPa (20 psi) and always wear safety glasses. Compressed air may cause foreign material or parts to become airborne. Failure to follow this instruction may result in serious personal injury.**

    NOTE: The direct clutch piston must apply with air pressure and release when air is removed.

    Air check the assembly.

    - Apply air pressure to the hole in the drum while blocking the other hole.

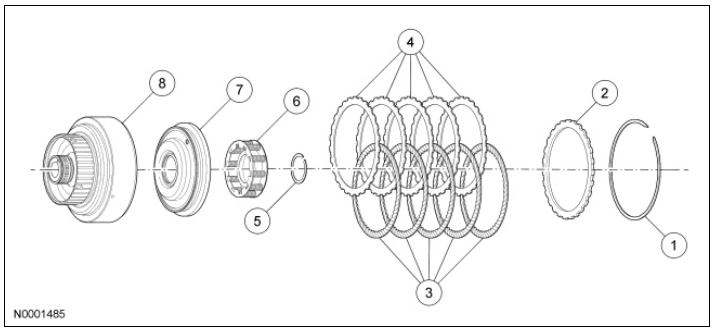
13. Check the direct clutch pack gap.
    1. Push down on the direct clutch pack.
    2. Using a feeler gauge, check the gap between the direct clutch retaining ring and the direct clutch pressure plate.
        - ♦ If the specifications do not match, use a select fit direct clutch retaining ring to match specifications and verify with a feeler gauge.



Direct Clutch

Part Number	Thickness		Diameter	
	mm	Inch	mm	Inch
E860126-S	1.37	0.053	130.1	5.122
E860127-S	1.73	0.068	130.1	5.122
E860128-S	2.08	0.081	130.1	5.122
E860129-S	2.44	0.096	130.1	5.122

Forward Clutch



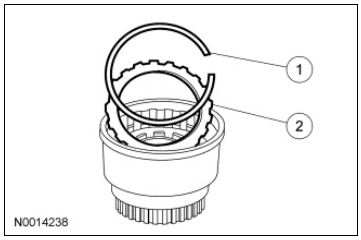
Special Tool(s)

 ST1190-A	Compressor, Clutch Spring 307-015 (T65L-77515-A)
 ST2534-A	Gauge, Forward Clutch Seal 307-434
 ST1813-A	Protector, Piston Seal 307-051 (T74P-77548-A)

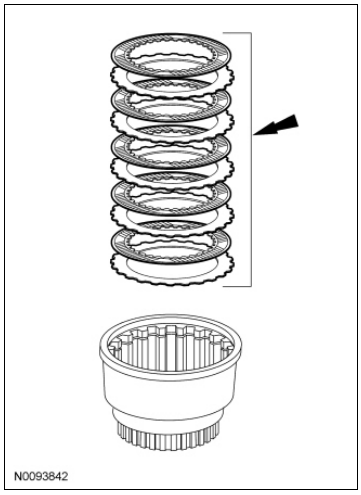
Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V

Forward Clutch Assembly



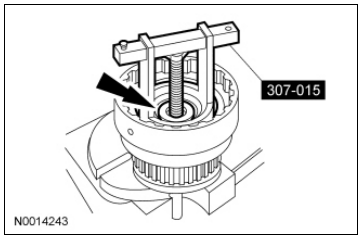
Item	Part Number	Description
1	7D483	Forward clutch retaining ring (select fit)
2	7B066	Forward clutch pressure plate
3	7B164	Forward clutch internal plates - friction (vehicle-dependent)
4	7B442	Forward clutch external plates - steel (vehicle-dependent)
5	E860109	Forward clutch retaining ring



6	7G229	Forward clutch spring assembly
7	7A262	Forward clutch piston
8	7A360	Forward clutch cylinder assembly

Disassembly

1. Remove the pressure plate.
    1. Remove the forward clutch retaining ring.
    2. Remove the pressure plate.



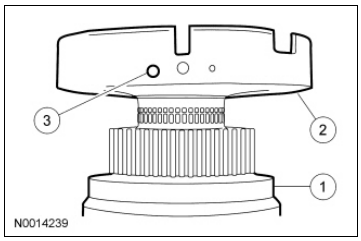
2. Remove the forward clutch disc pack.
    - Inspect the forward clutch plates for wear, damage or overheating.

3. ⚠ **WARNING: While removing or installing the retaining ring, slowly release tool pressure on clutch piston springs. Failure to follow this instruction may cause the assembly to separate forcefully, resulting in serious personal injury.**

   NOTICE: **Do not fully depress the Clutch Spring Compressor or damage to the spring retainer may occur.**

   Using the Clutch Spring Compressor, remove the forward clutch piston retaining ring.

4. Relieve the forward clutch spring tension and remove the Clutch Spring Compressor.

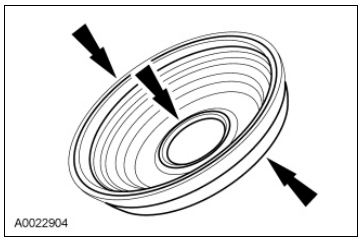


5. Remove the forward clutch piston spring assembly.

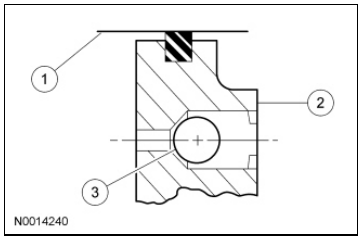
6. ⚠ **WARNING: When using compressed air, never let air pressure exceed 138 kPa (20 psi) and always wear safety glasses. Compressed air may cause foreign material or parts to become airborne. Failure to follow this instruction may result in serious personal injury.**

   Remove the forward clutch piston.

   1. Place the forward clutch cylinder with forward clutch piston facing down.
   2. Install the center support on the forward clutch cylinder.
   3. Apply air pressure to the left port of the center support.



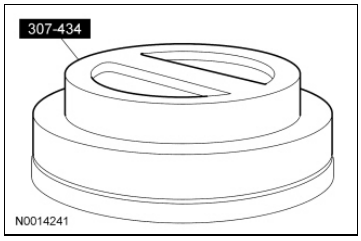
Assembly



1. Inspect the clutch components for damage or wear. Install new components as necessary.
   - Check the fluid passages for obstructions. All fluid passages must be clean and free of obstructions.
   - Inspect the clutch plates for damage.
   - Inspect the clutch springs.
   - Inspect the needle bearing and seal rings for damage.
   - Check clutch hub thrust surfaces for damage.
   - Check clutch plates for flatness and fit on the clutch hub serrations.

2. **NOTE:** If the seals on the forward clutch piston show any signs of damage, a new forward clutch piston will need to be installed.

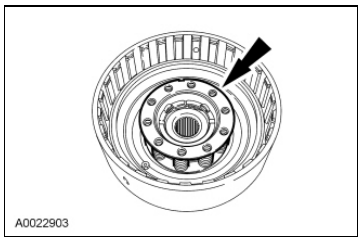
   Inspect the forward clutch piston and seals.



3. Inspect the forward clutch drum assembly.
   1. Inspect the forward clutch cylinder surfaces for scores or burrs.
   2. Inspect the forward clutch piston for scores or burrs.
   3. Verify the check ball is free to move in the piston.

4. **NOTE:** The Forward Clutch Seal Gauge must be installed on the forward clutch piston for a couple of minutes prior to installing it into the forward clutch cylinder.

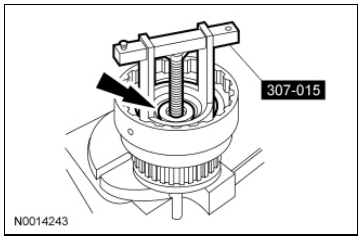
   Install the Forward Clutch Seal Gauge on the forward clutch piston.



5. ***NOTICE:*** **Care must be taken to prevent damage to the seals.**

   NOTE: Lubricate the forward clutch piston inner and outer seal with transmission fluid.

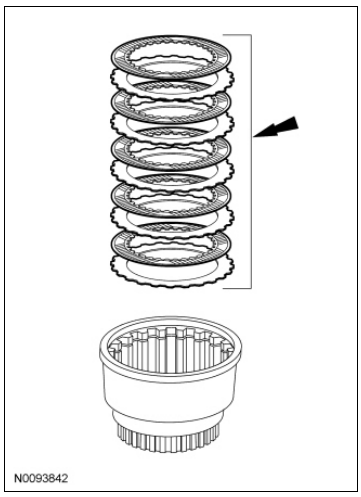
   Using the Piston Seal Protector, install the forward clutch piston assembly into the forward clutch cylinder.



6. Install the forward clutch piston spring assembly.

7. ***NOTICE:*** **Do not fully depress the Clutch Spring Compressor or damage to the spring retainer may occur.**

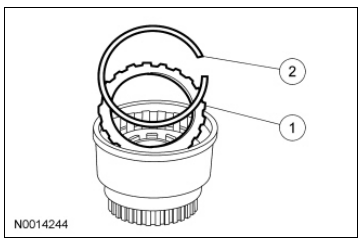
   Using the Clutch Spring Compressor, install the forward clutch piston spring retaining ring.



8. ***NOTICE:*** **The forward clutch friction plates are directional and must be installed with grooves pointing counterclockwise, otherwise transmission damage can occur.**

   NOTICE: **If new plates are used, they should be soaked in transmission fluid before assembly, or damage to the plates may occur.**

   If reusing plates, grooves must be installed counterclockwise. Install the forward clutch disc pack.



9. Install the steel clutch plates and friction clutch plates in alternating order starting with a steel clutch plate.

10. **NOTE:** The retaining ring is a select fit.

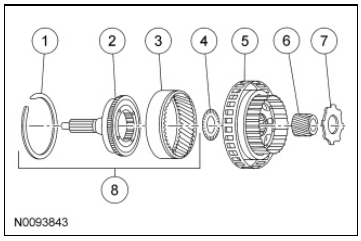
    Install the original selective retaining ring.

    1. Install the forward clutch pressure plate.
    2. Install the original selective retaining ring.

11. ⚠ **WARNING: When using compressed air, never let air pressure exceed 138 kPa (20 psi) and always wear safety glasses. Compressed air may cause foreign material or parts to become airborne. Failure to follow this instruction may result in serious personal injury.**

    Air check the forward clutch piston.

    1. Place the forward clutch cylinder with forward clutch piston facing down.
    2. Install the transmission center support on the forward clutch cylinder.
    3. Apply air pressure to the left port of the center support.

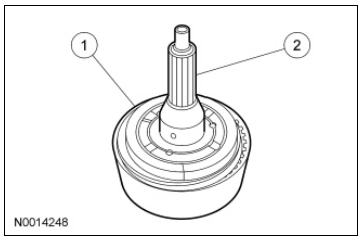


12. Check the forward clutch disc pack free play.
    1. Press down on the forward clutch disc pack.
    2. Using a feeler gauge, check the gap between the forward clutch retaining ring and the forward clutch pressure plate.

    • If the clearance is not within specifications, install the correct size retaining ring.

Part Number	Thickness		Diameter	
	mm	Inch	mm	Inch
XW4Z-7D483-AB	1.73	0.068	141.45	5.568
XW4Z-7D483-AC	2.08	0.081	141.45	5.568
XW4Z-7D483-AD	2.44	0.096	141.45	5.568

Overdrive Planetary and One-Way Clutch Assembly



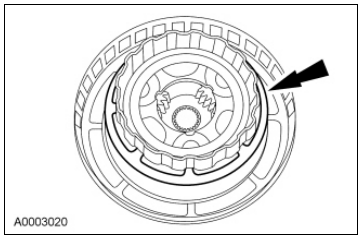
Item	Part Number	Description
1	W702037	Retaining ring
2	7A658	Center shaft
3	7A153	Overdrive (O/D) ring gear
4	7L495	No. 2 O/D planetary thrust bearing
5	7B446	O/D planetary gear carrier assembly
6	7D063	O/D sun gear
7	7660	Coast clutch adapter
8	7L678	O/D ring gear and center shaft assembly

Disassembly

1. **NOTE:** The Overdrive (O/D) One-Way Clutch (OWC) is serviced with the center shaft assembly.

   Remove the center shaft from the O/D ring gear.

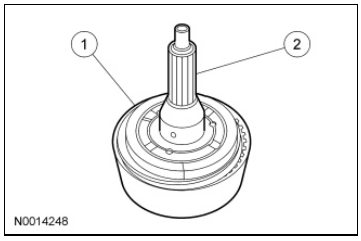
   1. Remove the O/D center shaft retaining ring.
   2. While rotating counterclockwise remove the center shaft from the ring gear.



2. ***NOTICE:*** **Do not remove the Overdrive (O/D) One-Way Clutch (OWC). Damage to the clutch may occur if it is removed.**

   Clean and inspect the O/D OWC and center shaft.

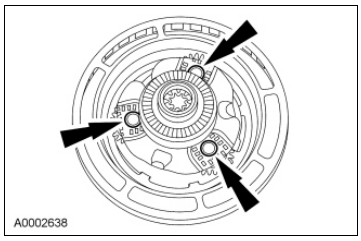
   - Inspect for cracks in the roller cage and wear on the roller clutch and the press fit of the OWC to the center shaft.



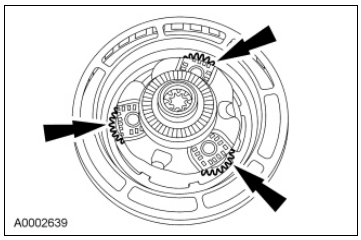
3. Inspect the OWC .
    - Temporarily insert the O/D planetary gear carrier assembly into the OWC rollers for verification of the OWC .
    - The planetary gear must rotate counterclockwise and hold when rotated clockwise.
    - Remove the planetary gear carrier assembly.

Assembly

1. Install the center shaft and OWC .
    1. Install the center shaft and OWC .
    2. Install the center shaft retaining ring.



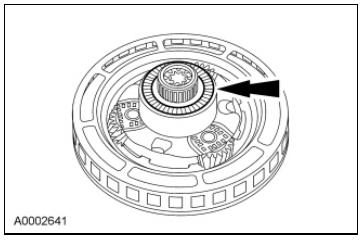
Overdrive Planetary Gears



Disassembly

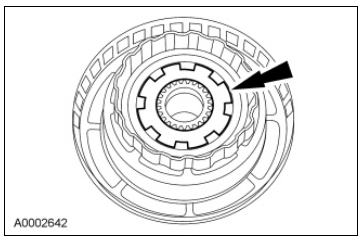
1. **NOTE:** Individual parts of the planetary carriers are not serviceable.

   Before installing a planetary assembly, the shaft retaining pins should be checked for adequate staking. Check the pins and shafts in the planetary assemblies for loose fit and/or complete disengagement. Install a new planetary assembly if necessary.

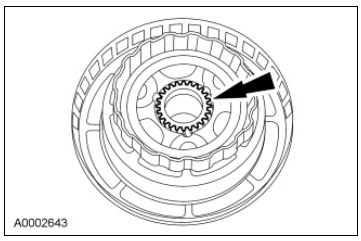


2. Inspect the pinion gears for damaged or excessively worn teeth and for free rotation.

3. Inspect the Overdrive (O/D) One-Way Clutch (OWC) inner race and the inner and outer races for scored or damaged surface areas where the rollers contact the races.

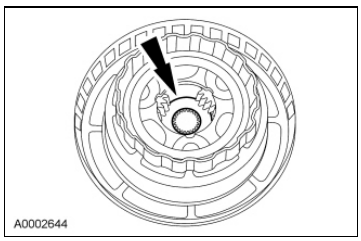


4. Remove and inspect the No. 2 O/D planetary thrust bearing on the nose of the O/D planetary gear carrier assembly.



5. **NOTE:** Inspect the sun gear for damaged or worn teeth.

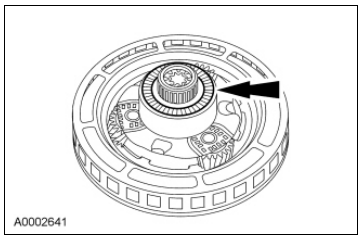
Remove the coast clutch-to- O/D carrier adapter.



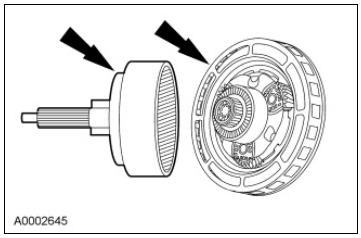
6. Remove and inspect the O/D sun gear.

7. ***NOTICE:*** **Do not attempt to remove the No. 12 bearing from behind the pinion gears or transmission damage can occur.**

   Inspect the No. 12 bearing for damage.



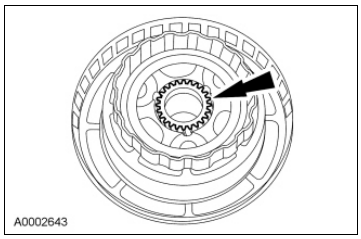
Assembly



1. **NOTE:** Thoroughly clean all parts and blow dry with moisture-free compressed air.

   NOTE: Use petroleum jelly to hold the No. 2 O/D planetary thrust bearing in place.

   Install the No. 2 O/D planetary thrust bearing.



2. Install the O/D planetary gear carrier into the center shaft and O/D .

3. **NOTE:** Make sure that the No. 12 bearing is in place in the O/D planetary prior to installing the O/D sun gear.

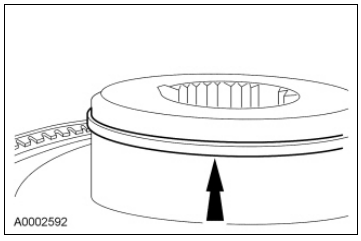
   Install the O/D sun gear with the recessed gear teeth facing toward the adapter.

4. **NOTE:** Adapter part number must not be visible after installation.

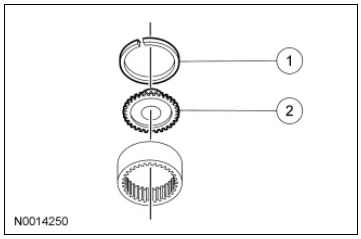
   NOTE: Inspect the sun gear for damaged or worn teeth.

   Install the coast clutch-to- O/D carrier adapter.

Output Shaft Ring Gear and Hub Shaft Assembly



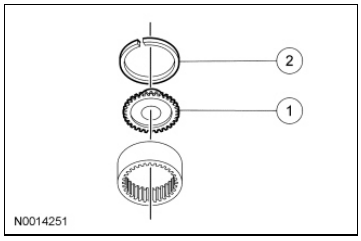
Disassembly



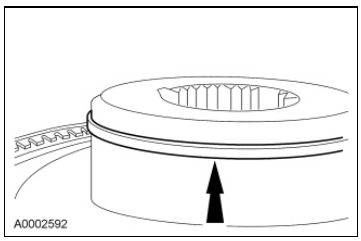
Item	Part Number	Description
1	7A153	Output shaft ring gear
2	7D164	Output shaft hub
3	7C122	Retaining ring
4	7D019	Output shaft hub seal
5	7D163	Output shaft ring gear and hub shaft assembly

1. Inspect the output shaft ring gear and hub shaft assembly for damage. If repair is necessary, use the following procedure.

2. Remove the seal.

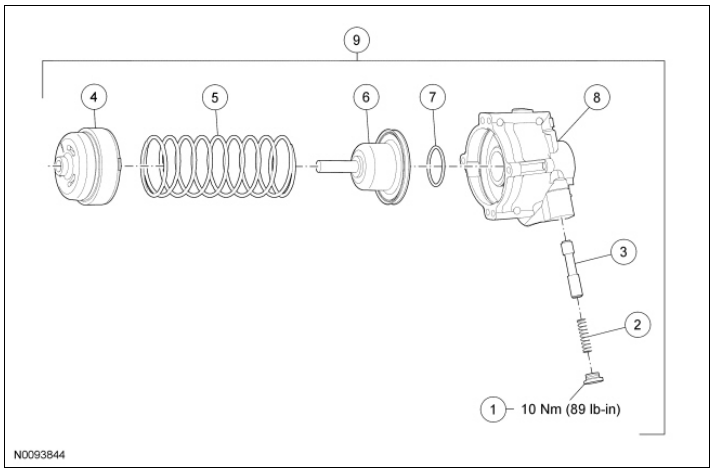


3. Remove the output shaft ring gear from the output shaft hub.
    1. Remove the retaining ring.
    2. Remove the output shaft ring gear.

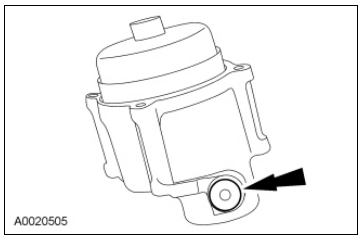


Assembly

1. Install the output shaft ring gear onto the output shaft hub.
    1. Install the output shaft ring gear.
    2. Install the retaining ring.

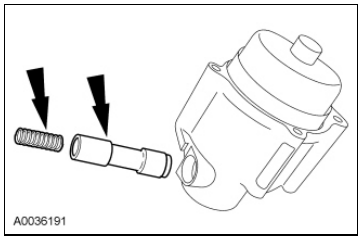


2. Install the seal.



Reverse Servo Assembly

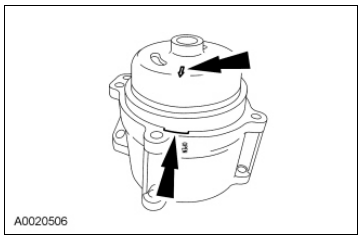
Disassembly



Item	Part Number	Description
1	7D321	Control valve spring retainer
2	7A270	Fluid pressure regulator valve spring
3	7D488	Reverse servo check valve
4	7D372	Reverse servo plate
5	7D466	Reverse servo accumulator spring
6	7D189	Reverse servo piston and seal
7	7423	Reverse servo piston O-ring
8	7D036	Reverse servo cover
9	7B193	Reverse servo assembly

1. Remove the control valve spring retainer.

2. Remove the reverse servo spring and check valve.

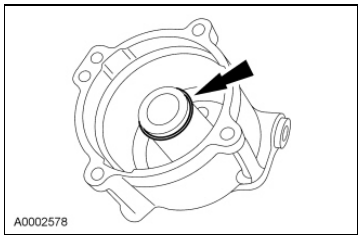


3. ⚠ **WARNING: Follow the specified procedure when using the tool to remove the servo cover. The servo and servo cover are under high spring force and can separate forcefully, which may result in serious personal injury.**

   NOTE: Tabs on servo plate mate with slots on cover every 120 degrees.

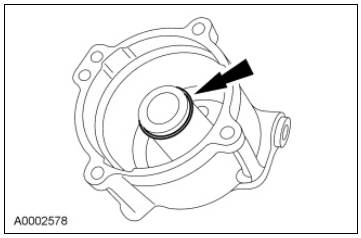
   Remove the reverse servo plate by turning in either direction to release.

   - Align the arrow on the servo plate with any slot on the cover.

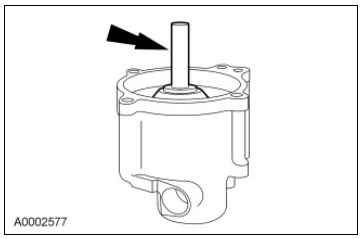


4. Remove the reverse servo spring.

5. Remove the reverse servo piston and seal assembly.
   - Inspect the seal for damage, install a new reverse servo piston if necessary.



6. Remove and discard the reverse servo piston seal.

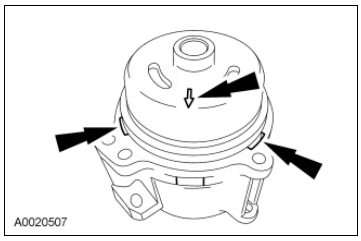


Assembly

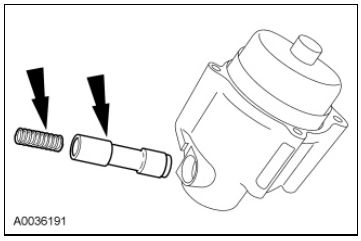
1. ***NOTICE:*** **Try not to roll the seal onto the housing when installing the seal, or damage to the seal may occur.**

   Lubricate and install a new reverse servo piston seal.

2. Lubricate and install the reverse servo piston and seal assembly.



3. Install the reverse servo spring.

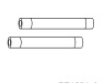


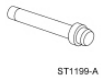
4. ⚠ **WARNING: Follow the specified procedure when using the tool to remove the servo cover. The servo and servo cover are under high spring force and can separate forcefully, which may result in serious personal injury.**

   NOTE: The arrow on the servo plate must be aligned evenly between any 2 slots on the cover.

   Install the reverse servo plate.

5. Install the reverse servo spring and check valve.





6. Install the control valve spring retainer.
    - Tighten to 10 Nm (89 lb-in).

Transmission

Special Tool(s)

 ST1792-A	Adjustment Set, Transmission Band 307-S022 (T71P-77370-A)
 ST2538-A	Air Test Plate and Gaskets, Transmission 307-433-01, 307-433-2, 307-433-3

Disassembled Views

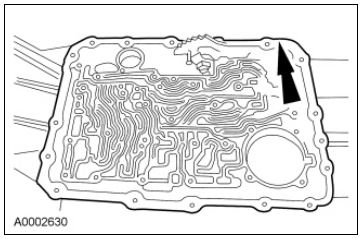
Disassembled Views

Disassembled Views

Item	Part Number	Description
1	379299	Torque converter-to-flexplate nut (attaches the converter assembly to the flexplate) (4 required)
2	7902	Torque converter assembly (4.0L)
3	7017	Input shaft
4	7A248	Front fluid pump seal assembly
5	7A248	Front fluid pump seal
6	W704892	M8 x 35 internal lobe screw and washer assembly (attaches pump to case) (8 required)
7	7G187	Fluid pump cover assembly
8	7B472	Fluid pump adapter plate
9	7A136	Fluid pump gasket
10	W701431	Fluid pump shaft-to-inner gear O-ring seal (also in pump assembly)
11	7L323	Stator support seal
12	7A108	Fluid pump support assembly
13	7H416	O-ring
14	7H411	Fluid pump control valve
15	7A103	Fluid pump assembly
16	W701429	M8 x 1 x 35 internal lobe screw (attaches pump support to pump assembly) (6 required)
17	7D025	Overdrive (O/D) brake drum seals
18	7D014	Fluid pump input thrust washer No. 1
19	7D029	Intermediate and O/D brake band anchor struts (2 required)
20	7D034	Intermediate and O/D brake bands (2 required)
21	7D029	Intermediate and O/D brake band apply struts (2 required)
22	7C492	O/D and intermediate band adjusting screws (2 required)
23	71000	O/D and intermediate locking nuts (2 required)
24	7L669	O/D brake band drum assembly
25	7A548	Direct and O/D piston outer seals
26	7D404	Direct and O/D piston inner seals
27	7A262	Direct and O/D clutch pistons
28	7A480	Direct and O/D clutch piston springs
29	7A527	Clutch piston spring retainers (2 required)
30	E860125	Retaining rings (retains 7D041 to drum) (2 required)
31	7B442	Coast clutch external splined plates (steel) (2 required)
32	7B164	Coast clutch internal splined friction plates (2 required)
33	7B066	Coast and direct clutch pressure plates (2 required)
34	E860126-S/129-S	Coast and direct clutch plates retaining rings (select fit) (2 required)
35	7660	Coast clutch-to- O/D carrier adapter

36	7D063	O/D sun gear
37	7B446	O/D planetary gear carrier (with trigger wheel)
38	7L495	O/D planet thrust bearing No. 2
39	7A153	O/D ring gear
40	7A089	Center shaft One-Way Clutch (OWC) assembly
41	7A658	O/D center shaft (part of 7L678)
42	W702037	Retaining ring (retains 7A658 to 7A153)
43	7L678	Hub and ring gear assembly (includes 7C109, 7A153, 7A658, W702037-S300)
44	7M153	Center shaft and forward clutch cylinder bearing assembly No. 3, No. 5, No. 8 and No. 9 (4 required)
45	W702465	Retaining ring
46	7A130	Center support assembly
47	E826160	Nut and cage assembly (attaches center support to case)
48	W705407	Bolt
49	7D014	Intermediate clutch drum bearing No. 4
50	7D044	Intermediate brake drum assembly
51	7B442	Direct clutch external splined steel plates (5 required)
52	7B164	Direct clutch internal splined friction plates (5 required)
53	7A360	Forward clutch cylinder
54	7A262	Forward clutch piston assembly
55	7G299	Forward clutch support and spring assembly
56	E860109	Forward clutch piston and spring retaining ring in forward clutch cylinder
57	7B442	Forward clutch external spline steel plates (5 required)
58	7B164	Forward clutch internal spline friction plates (5 required)
59	7B066	Forward clutch pressure plate
60	7D483	Retaining ring 141.45 x 1.37 internal (select fit)
61	7D234	Forward ring gear hub thrust bearing No. 6A
62	7D090	Forward clutch thrust washer No. 6B
63	7G375	Forward clutch hub retainer ring
64	7B067	Forward ring gear hub
65	7D392	Forward ring gear
66	7F374	Forward planet thrust bearing No. 7
67	7A398	Forward planetary
68	7A019	Shell and sun gear assembly
69	7C167	Low and reverse spacer gear
70	W702775	Reverse carrier drum snap ring
71	7D006	Reverse planet assembly
72	7B176	Output shaft sleeve
73	E860527	External retainer ring
74	7A153	Output shaft ring gear
75	7D164	Output shaft hub

76	7C122	Output shaft ring gear retaining ring
77	7D019	Output shaft hub seal
78	7H027	Low/intermediate sun gear bearing assembly
79	7C498	Reverse brake drum and clutch assembly - includes OWC
80	7D095	Low/reverse band assembly
81	7R205	Output shaft bearing (R15)
82	7B368	Output shaft thrust washer No. 11
83	7A233	Transmission park gear assembly
84	7060	Output shaft Rear Wheel Drive (RWD)
85	7A441	Park pawl
86	7D070	Park pawl return spring
87	7D071	Park pawl shaft
88	7086	Extension housing gasket
89	7A039	Extension housing RWD
90	W500311	M8 x 1.25 extension housing-to-case screw (7 required) RWD
91	7052	Extension housing seal RWD
92	7060	Output shaft assembly Four-Wheel Drive (4WD)
93	7A039	Extension housing 4WD
94	7052	Extension housing seal 4WD
95	W500224	Extension housing-to-case screw (7 required)
96	7D273	Transmission fluid tube connector assembly (2 required)
97	7H074	Ring O/D servo retainer
98	W703119	O/D servo cover seals (2 required)
99	7D027	O/D servo cover
100	7D021	O/D servo piston and rod
101	7D028	Intermediate and O/D servo piston springs (2 required)
102	W702777	Ring intermediate servo retainer
103	W702969	Intermediate servo cover seal
104	7D027	Intermediate servo cover
105	7D021	Intermediate servo piston and rod
106	7005	Case assembly
107	7H103	Output Shaft Speed (OSS), Turbine Shaft Speed (TSS) and intermediate shaft speed sensors
108	W702981	Speed sensor-to-case O-ring seals (3 required)
109	W708389	Speed sensor-to-case screws (M6 x 19) (3 required)
110	7034	Case vent RWD
111	7A179	Reverse brake drum lever
112	7D433	Reverse band actuating lever shaft
113	390318	Pipe plug
114	6026	Fluid fill plug
115	7B210	Manual control lever shaft retaining pin



116	7A232	Park pawl actuating rod
117	W703001	Manual control lever shaft outer and inner nut (2 required)

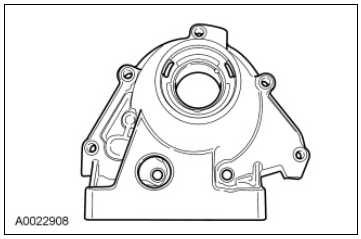
119	7B498	Manual control lever seal
120	7C493	Manual control lever shaft
121	7F293	Transmission Range (TR) sensor
122	W500015	TR sensor screw and washer (2 required)
123	7A256	Manual control lever
124	7B193	Reverse servo assembly
125	7D372	Reverse servo plate
126	7D466	Reverse servo accumulator spring
127	7D189	Reverse servo piston and seal
128	7423	Reverse servo piston O-ring seal
129	7D036	Reverse servo cover
130	W702359	Reverse servo piston-to-case screw (4 required)
131	7D321	Control valve spring retainer
132	7A270	Main fluid pressure spring regulator valve
133	7D488	Reverse servo check valve
134	W701099	Main control valve body separating plate screws
135	7Z490	Main control valve body separating plate (bonded)
136	7A101	Lower main control valve body
137	W500102	Main control valve body screw (18 required)
138	W702791	Main control valve body screw
139	7E332	Manual valve detent spring
140	W500100	Screw detent spring
141	W706672	Main control valve body screws
142	7A100	Main control valve body assembly
143	W705928	Solenoid body connector O-ring seals
144	7G391	Transmission control solenoid body
145	W702921	Transmission control solenoid body screw
146	W703189	Transmission control solenoid body screw (7 required)
147	7A098	Transmission fluid pan filter
148	7A191	Transmission fluid pan gasket
149	7L027	Transmission fluid pan magnet
150	W500106	Transmission fluid filter screw (2 required)
151	7A194	Transmission fluid pan
152	7A010	Transmission fluid pan drain plug
153	W500213	Transmission fluid pan screw (16 required)
154	W707919	Transmission fluid pan drain plug (short hex)
155	-	O/D and coast clutch assembly
156	-	Direct clutch assembly
157	-	Forward clutch assembly
158	-	O/D servo

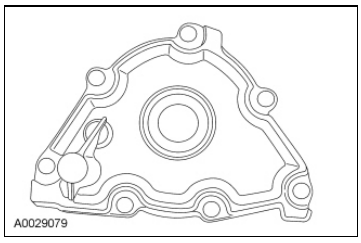
159	-	Intermediate servo

All vehicles



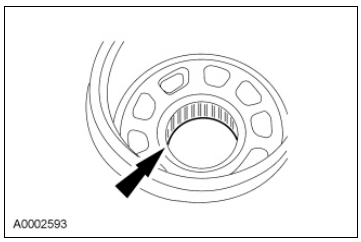
1. Thoroughly clean the transmission case and extension housing in solvent and blow dry with compressed air.

2. Inspect the transmission case for the following:
   - Stripped bolt hole threads
   - Gasket and mating surfaces for burrs or nicks
   - Obstructions to vent and fluid passages
   - Cracks or warping



Rear Wheel Drive (RWD) vehicles

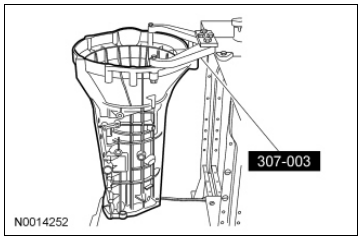
3. Inspect the extension housing for cracks, burrs or warping.



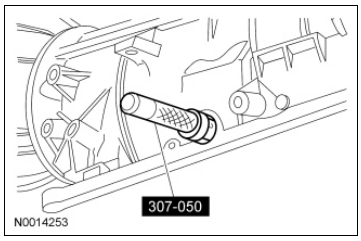
Four-Wheel Drive (4WD) vehicles

4. Inspect the extension housing for cracks, burrs or warping.

All vehicles



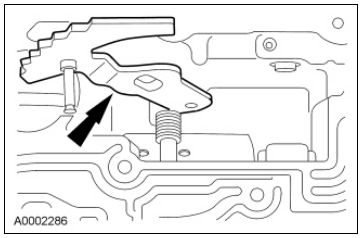
5. Inspect the case bearing for damage. If damage to the case bearing is indicated, install a new case.



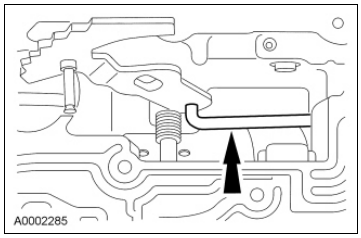
6. ⚠ **WARNING: Always verify that the lockpin on a bench-mounted holding fixture is correctly secured to help prevent unexpected component rotation. Failure to follow this instruction may result in serious personal injury.**

   NOTE: Inspect the intermediate and Overdrive (O/D) servo bores for excessive wear. Repair as required.

   Using the Transmission Holding Fixture, install the transmission onto the bench with the converter housing facing up.

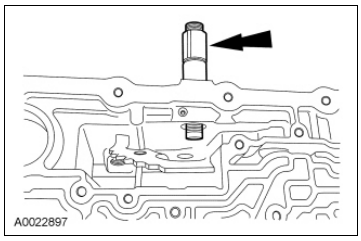


7. Using the Shift Shaft Fluid Seal Installer, install the manual control lever shaft seal and lubricate it with petroleum jelly.

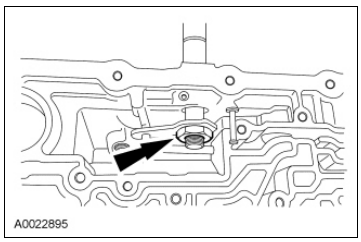


8. Install the park lever rod.

9. Install the manual valve inner lever.



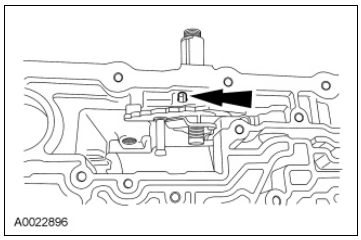
10. Assemble the manual valve inner lever and park lever actuating rod.



11. **NOTE:** Align the flats on the manual valve inner lever with the flats on the manual control lever shaft.

    Install the manual control lever shaft.

12. Install the manual valve inner lever onto the manual shaft and loosely install the inner nut.



13. ***NOTICE:*** **Use care not to damage the fluid pan rail surface when installing the retaining pin.**

    NOTE: Align the manual control lever shaft alignment groove with the manual control lever shaft spring pin bore in the transmission case.

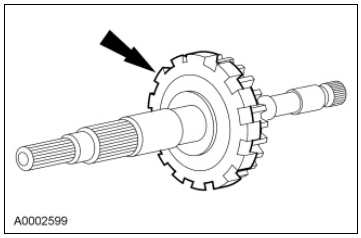
    Install the manual control lever shaft spring pin.

    - Tap the manual control lever shaft spring pin into the transmission case.

14. ***NOTICE:*** **To avoid damage, do not allow the wrench to strike the manual valve inner lever pin.**

    Tighten the inner nut.

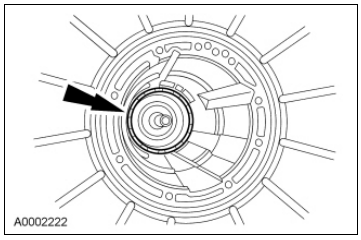
    - Tighten to 48 Nm (35 lb-ft).



15. ***NOTICE:*** **The tabs on the output shaft thrust washer (No. 11) point into the case. Make sure the thrust washer is correctly seated or damage may occur.**

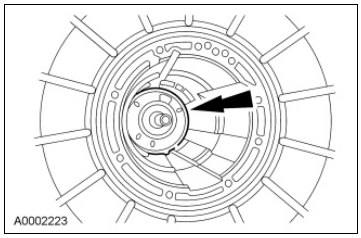
    Install the output shaft thrust washer (No. 11).

    - Coat the output shaft thrust washer with petroleum jelly.

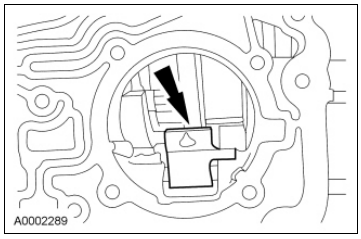


16. Install the park gear on the output shaft.

17. Install the output shaft and park gear.

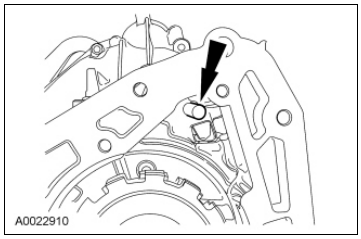


18. Install the low/reverse brake drum.
    - Rotate the low/reverse brake drum clockwise to install.



19. **NOTE:** Make sure band is resting on the 2 anchor pins in the case.

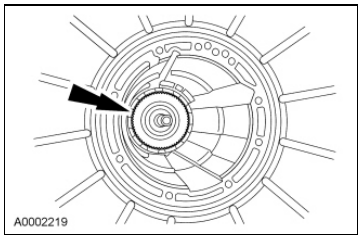
    Install the low/reverse band over the reverse drum.



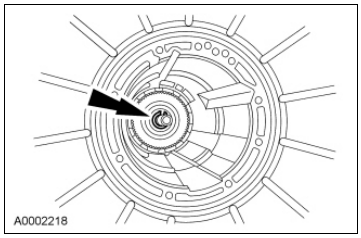
20. **NOTE:** The reverse band actuating lever must fit into the notches in the band.

    Install the reverse band actuating lever into the reverse band.

21. Install the reverse band actuating lever shaft into the case and into the reverse band actuating lever.

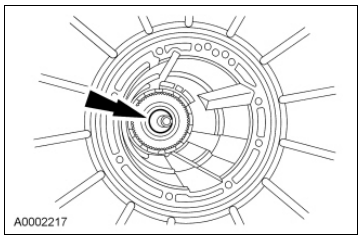


22. Install the No. 10 needle bearing into the case.



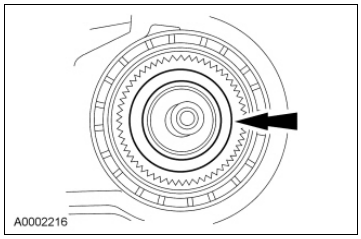
23. ***NOTICE:*** **Do not damage the seal against the case during assembly.**

    Install the output shaft ring gear, hub and seal.



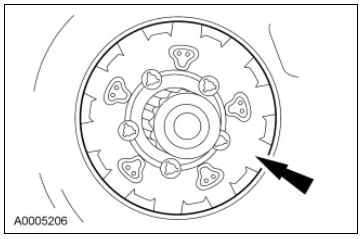
24. ***NOTICE:*** **Always install a new output shaft retaining ring, otherwise transmission damage can occur.**

    Install a new output shaft retaining ring.

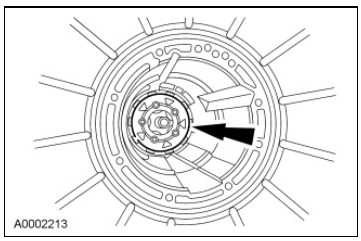


25. **NOTE:** Install the output shaft sleeve with the cone facing up. This sleeve will snap into place when correctly installed.

    Install the output shaft sleeve.

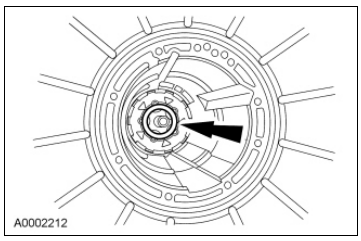


26. Install low/reverse planetary carrier needle bearing (No. 9) onto the output shaft ring gear and hub assembly.



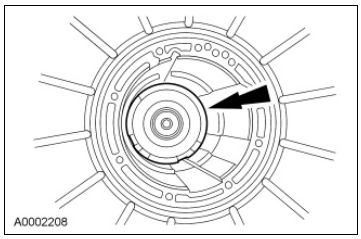
27. ***NOTICE:*** **Make sure the needle bearings stay in place or damage may occur.**

    Install the low/reverse planetary assembly.



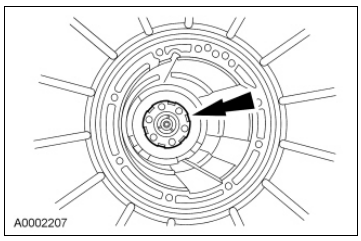
28. **NOTE:** The low/reverse brake drum must be pulled forward to install the low/reverse planet retaining ring.

    Install the retaining ring.

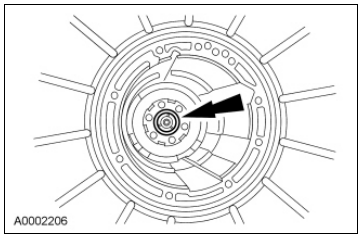


29. Install the No. 8 thrust bearing.

30. Install the spacer on the input shell, using petroleum jelly to hold it in place.

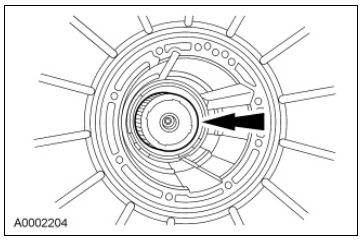


31. Install the input shell and sun gear assembly.

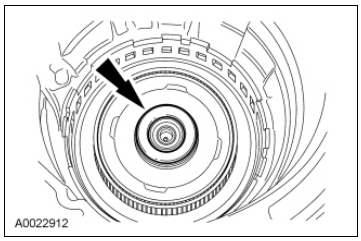


32. **NOTE:** The No. 13 bearing must be correctly seated in the forward planet assembly so the sun gear can be installed correctly.

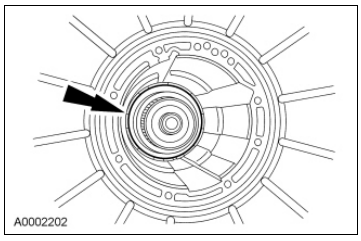
    Install the forward planetary assembly.



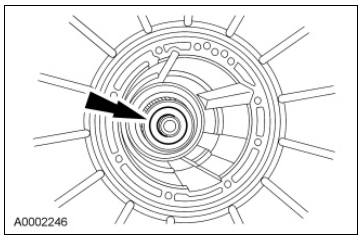
33. Install the No. 7 forward planet thrust bearing into the forward ring gear and hub assembly. Use petroleum jelly to hold the bearing in place.



34. Install the No. 6B forward clutch thrust washer onto the forward ring gear hub.

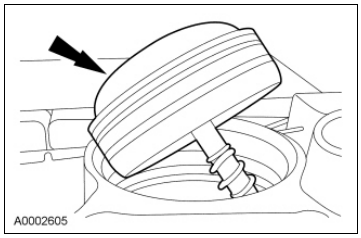


35. Install the forward ring gear and hub as an assembly.

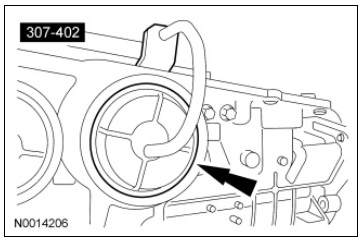


36. Install the No. 6A forward ring gear hub thrust bearing into the forward ring gear and hub.

37. Install the forward clutch cylinder.



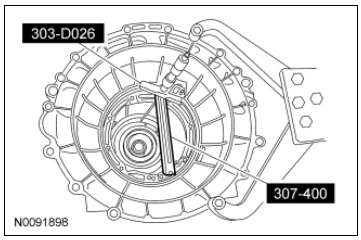
38. Install the No. 5 thrust bearing.



39. **NOTE:** Inspect the intermediate servo bore for excessive wear. Repair as required.

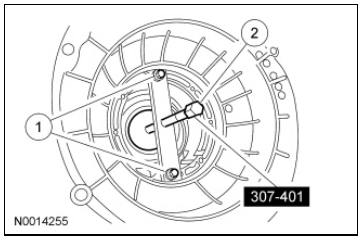
    Install the intermediate servo piston and spring.

    - Lubricate the servo bore with transmission fluid.



40. Using the Servo Cover Compressor, install the retaining ring.

41. Install the direct clutch drum.



42. Using a Depth Micrometer with an appropriate length extension, measure from the top of the Gauge Bar to the center support ledge in the case at 4 places 90 degrees apart.
    - Add the 4 measurements, divide by 4 and record as dimension A.

43. ***NOTICE:*** **The torque specifications are critical for this procedure. Failure to use the correct torque specifications may cause transmission damage.**

    Install the Cushion Spring Compressor.

    1. Install the Cushion Spring Compressor and the bolts using the 2 pump screw locations at approximately 6 and 12 o'clock positions.
        - ♦ Tighten to 15 Nm (133 lb-in).
    2. Tighten the center screw.
        - ♦ Tighten to 1.13 Nm (10 lb-in).

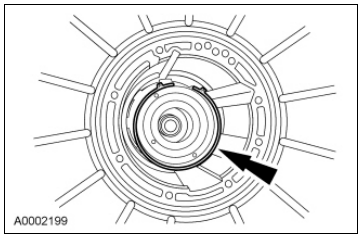
44. **NOTE:** Align the disc holes on the Cushion Spring Compressor with the slot in the Gauge Bar for correct measurement.

    Measure the distance with the Depth Micrometer from the top of the Gauge Bar to the drum bearing surface through the hole in the disc and record as dimension B. Repeat the measurement 180 degrees on the opposite side of the Gauge Bar and record as dimension C.

45. Add dimension B to C, divide by 2 and record as dimension D.

46. Subtract A from D and record as dimension E.

47. Select the bearing from the following chart, using dimension E.



Dimension E	Service Part Number (7D014)	Bearing Thickness	Identification (Notches)
1.69-1.87 mm (0.066-0.073 in)	XW4Z-CA	2.65-2.80 mm (0.104-0.11 in)	None
1.88-2.04 mm (0.074-0.08 in)	XW4X-DA	2.83-2.98 mm (0.111-0.117 in)	1
2.05-2.22 mm (0.08- 0.087 in)	XW4Z-EA	3.01-3.16 mm (0.118-0.124 in)	2
2.23-2.43 mm (0.087-0.095 in)	XW4Z-FA	3.21-3.36 mm (0.126-0.132 in)	3

48. **NOTE:** Make sure that the intermediate band apply strut is aligned with the band notch.

    NOTE: If the intermediate band is reused, it must be installed in the same position as it was when removed.

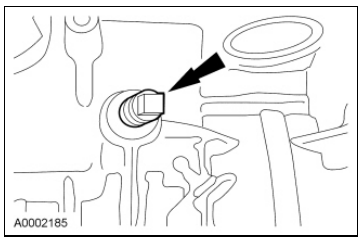
    NOTE: The new intermediate band is dark in color. This is a normal condition of the band. Hairline cracks in the band are also considered normal. Do not install a new band based solely on the color.

    Install the intermediate band.

49. ***NOTICE:*** **To avoid a fall out condition of the strut from the screw during assembly and function, the small U-shaped notch should be toward the band and the large U-shaped notch toward the main control side.**

    Install the intermediate band anchor strut.

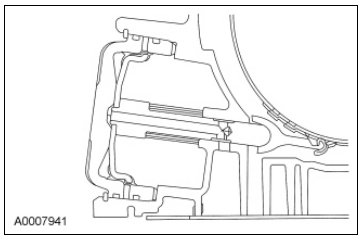
    1. Band/case side of anchor (small U notch).
    2. Main control side of anchor (large U notch).



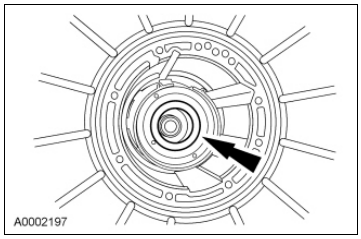
50. ***NOTICE:*** **If the strut is installed incorrectly, transmission damage will occur.**

    Make sure that the intermediate band anchor strut is installed in the correct orientation to the case and adjustment screw.

51. Loosely install the adjustment screw.

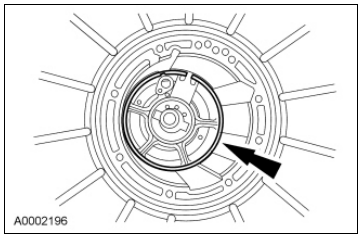


52. Install the intermediate band apply strut.

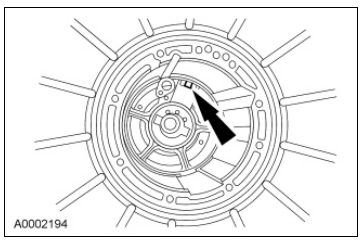


53. ***NOTICE:*** **If the strut is installed incorrectly, transmission damage will occur.**

    Make sure that the intermediate band apply strut is installed in the correct orientation to the case and piston rod.



54. Install the selected No. 4 thrust washer on the direct clutch drum.
    - Coat the thrust washer with petroleum jelly.

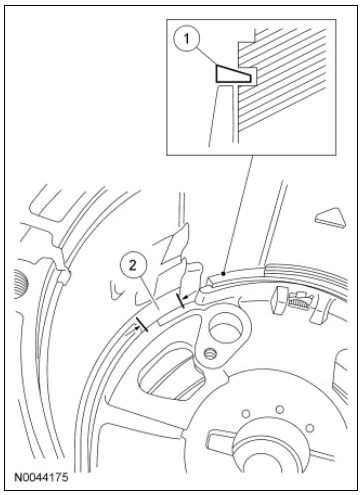


55. **NOTE:** Align the center support screw hole with correct case hole.

    Install the center support.

56. Install the center support locknut and cage.

57. Loosely install the center support screw.



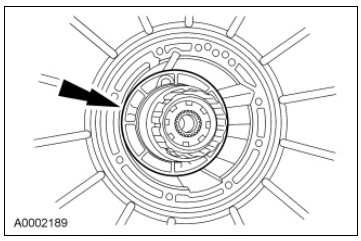
58. ***NOTICE:*** **Install the center support retaining ring with the tapered side facing up or damage may occur.**

    NOTICE: **Make sure the notch opening is not obstructed by the center support retaining ring or damage may occur.**

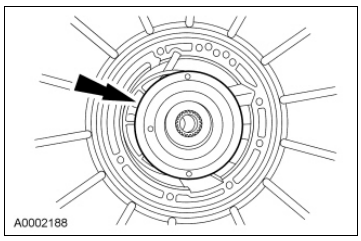
    Install the center support retaining ring.

    1. Make sure the center support retaining ring is installed with the tapered side facing up.
    2. Make sure the opening of the center support retaining ring is positioned correctly.

59. Install the center shaft thrust bearing (No. 3).

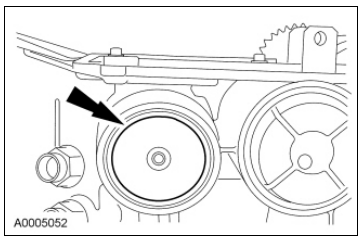


60. Install the O/D ring gear, O/D One-Way Clutch (OWC) and center shaft assembly.

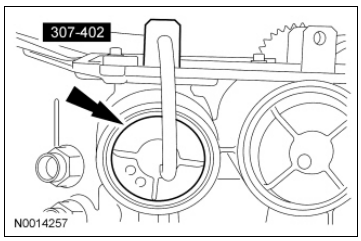


61. ***NOTICE:*** **Do not bend the trigger wheel. Make sure that the No. 2 thrust bearing is in this assembly.**

Install the planetary gear O/D carrier.



62. Install the O/D brake drum and coast clutch drum assembly.

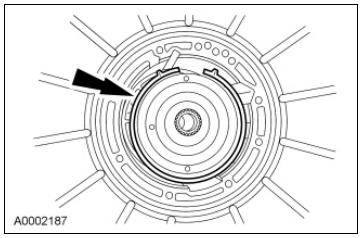


63. **NOTE:** Inspect the O/D servo bore for excessive wear. Repair as required.

Install the O/D band servo piston and spring.

- Lubricate the servo bore with transmission fluid.

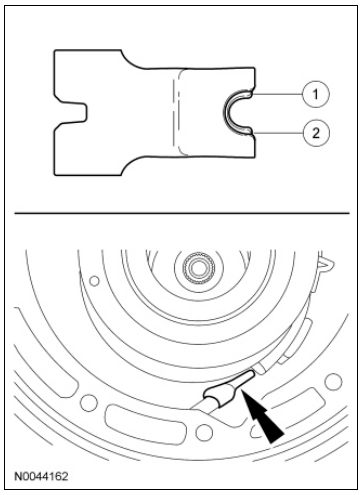
64. Using the Servo Cover Compressor, install the retaining ring.



65. **NOTE:** If the O/D band is reused, it must be installed in the same position as when removed.

NOTE: Make sure that the O/D band apply strut is aligned with the band notch.

NOTE: The new O/D band is dark in color. This is a normal condition of the band. Hairline cracks in the band are also considered normal. Do not install a new band based solely on the color.

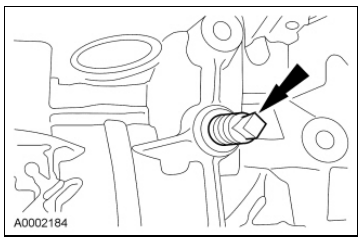


Install the O/D band.

66. ***NOTICE:*** **To avoid a fall out condition of the strut from the screw during assembly and function, the small U-shaped notch should be toward the band and the large U-shaped notch toward the main control side.**

    Install the O/D anchor strut.

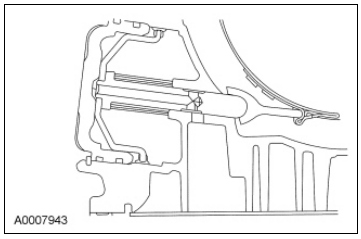
    1. Band/case side of anchor (small U notch).
    2. Main control side of anchor (large U notch).



67. ***NOTICE:*** **If the strut is installed incorrectly, transmission damage will occur.**

    Make sure that the O/D band anchor strut is installed in the correct orientation to the case and adjustment screw.

68. Loosely install the adjustment screw.



69. Install the O/D apply strut.

70. ***NOTICE:*** **If the strut is installed incorrectly, transmission damage will occur.**

    Make sure that the O/D band apply strut is installed in the correct orientation to the case and piston rod.

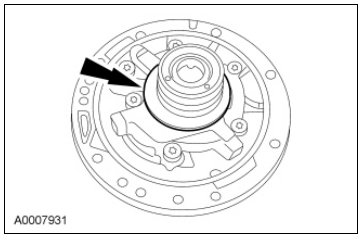
71. ***NOTICE:*** **The torque specifications are critical for this procedure. Failure to use the correct torque specifications may cause transmission damage.**

    Install the Cushion Spring Compressor.

    1. Install the Cushion Spring Compressor and the bolts using the 2 pump screw locations at approximately 6 and 12 o'clock positions.
        - Tighten to 15 Nm (133 lb-in).
    2. Tighten the center screw.
        - Tighten to 1.13 Nm (10 lb-in).

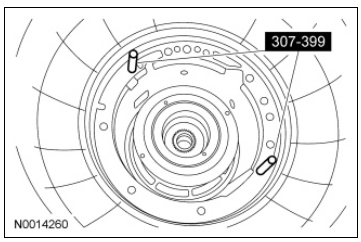
72. **NOTE:** Align the disc holes on Cushion Spring Compressor with the slot in the Gauge Bar for correct measurement.

    Measure the distance with the Depth Micrometer from the top of the Gauge Bar to the drum bearing surface through the hole in the disc and record as dimension A. Repeat the measurement 180 degrees on the opposite side of the Gauge Bar and record as dimension B.



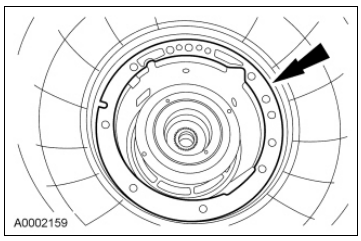
73. Add dimension A to B, divide by 2 and record as dimension C.

74. Subtract the thickness of the Gauge Bar 17.78 mm (0.70 in) from dimension C and record as dimension D.



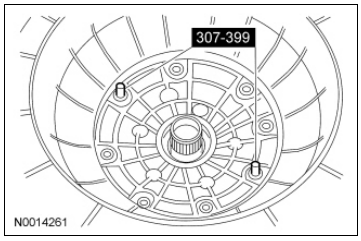
75. Select the No. 1 thrust bearing from the following chart using dimension D.

Dimension D	Service Part Number (7D014)	Bearing Thickness	Identification (Color/ID)
38.05-38.13 mm (1.498-1.501 in)	F7TZ-TA	1.55-1.6 mm (0.061-0.062 in)	White
38.14-38.28 mm (1.501-1.507 in)	F7TZ-MA	1.75-1.80 mm (0.068-0.07 in)	Green
38.29-38.42 mm (1.507-1.52 in)	F7TZ-NA	1.85-1.90 mm (0.072-0.074 in)	Red
38.43-38.61 mm (1.512-1.52 in)	F7TZ-RA	2.05-2.10 mm (0.08-0.082 in)	Black
38.63-38.74 mm (1.52-1.525 in)	F7TZ-SA	2.15-2.20 mm (0.084-0.086 in)	Yellow

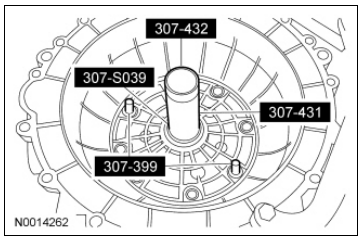


76. Install the selected No. 1 fluid pump input thrust washer.
    - Coat the fluid pump input thrust washer with petroleum jelly.

77. Install the Transmission Fluid Pump Alignment Pins into the transmission case.

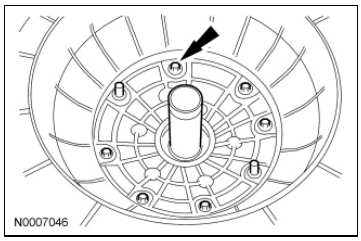


78. Install the fluid pump gasket.



79. ***NOTICE:*** **Make sure that the fluid pump inlet thrust washer (No. 1), selective thrust washer, fluid pump gasket and the fluid pump-to-case O-ring seal remain in the correct position throughout this step or damage may occur.**

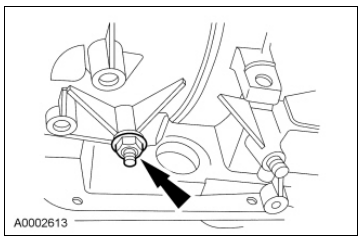
    Install the fluid pump.



80. ***NOTICE:*** **The Transmission Fluid Pump Alignment Pins, Fluid Pump Alignment Set and the Transmission Fluid Pump Alignment Gauge must be used to correctly align the pump with the adapter plate to reduce gear noise, bushing failure and leakage.**

    Using the Transmission Fluid Pump Alignment Pins, Fluid Pump Alignment Set and the Transmission Fluid Pump Alignment Gauge align the fluid pump to the adapter plate.

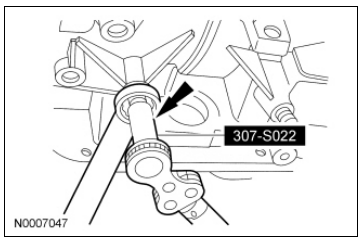
81. Install 6 transmission fluid pump housing-to-case screws. Tighten the screws in a star pattern.
    - Tighten to 22 Nm (16 lb-ft).



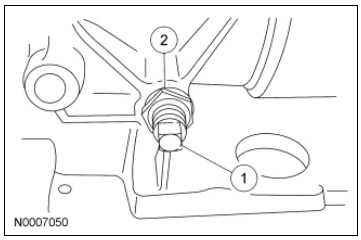
82. Remove Transmission Fluid Pump Alignment Pins and install the 2 remaining screws.
    - Tighten to 22 Nm (16 lb-ft).

83. ***NOTICE:*** **Do not allow the Overdrive (O/D) band adjustment screw to back out. Band strut may fall out of position.**

    NOTE: Install, but do not tighten, a new locknut on the band adjustment screw. Apply petroleum jelly to the locknut seal.



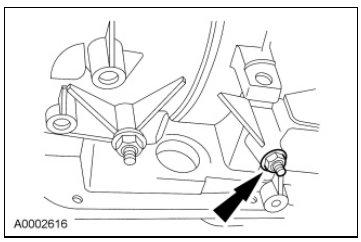
Install a new locknut on the band adjustment screw.



84. ***NOTICE:*** **The Overdrive (O/D) servo must be installed prior to band adjustment or damage may occur.**

    Using the Transmission Band Adjustment Set, tighten the O/D band adjustment screw.

    - Tighten to 13 Nm (115 lb-in).
    - Back the screw off exactly 2 turns and hold that position.

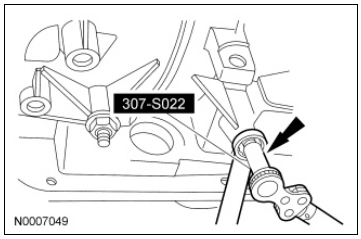


85. Tighten the O/D band locknut.
    1. Hold the O/D band adjustment screw stationary.
    2. Tighten the O/D band locknut.
    - Tighten to 54 Nm (40 lb-ft).

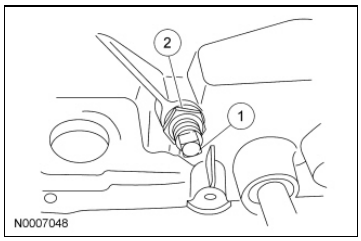
86. ***NOTICE:*** **Do not allow the intermediate band adjusting screw to back out. The band strut may fall out of position.**

    NOTE: Install, but do not tighten, a new locknut on the band adjustment screw. Apply petroleum jelly to the locknut seal.

    Install a new locknut on the band adjustment screw.

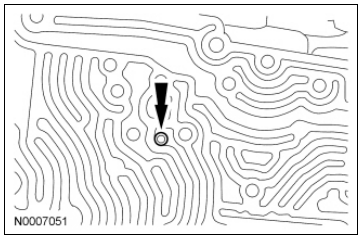


87. ***NOTICE:*** **The intermediate servo must be installed prior to band adjustment or damage may**

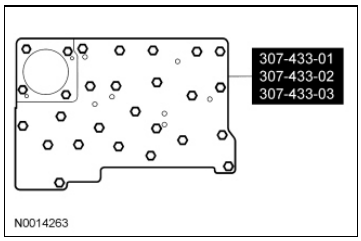


occur.

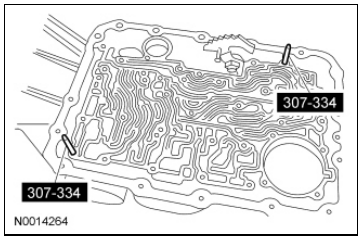
Using the Transmission Band Adjustment Set, tighten the intermediate band adjustment screw.



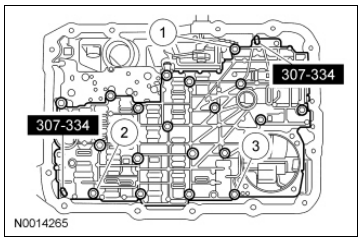
- Tighten to 13 Nm (115 lb-in).
- Back the screw off exactly 2 turns and hold that position.



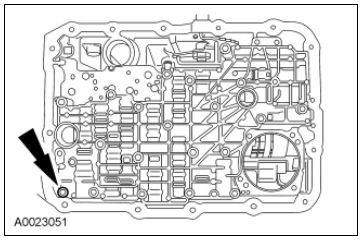
88. Tighten the intermediate band locknut.
    1. Hold the intermediate band adjustment screw stationary.
    2. Tighten the intermediate band locknut.
    - Tighten to 54 Nm (40 lb-ft).



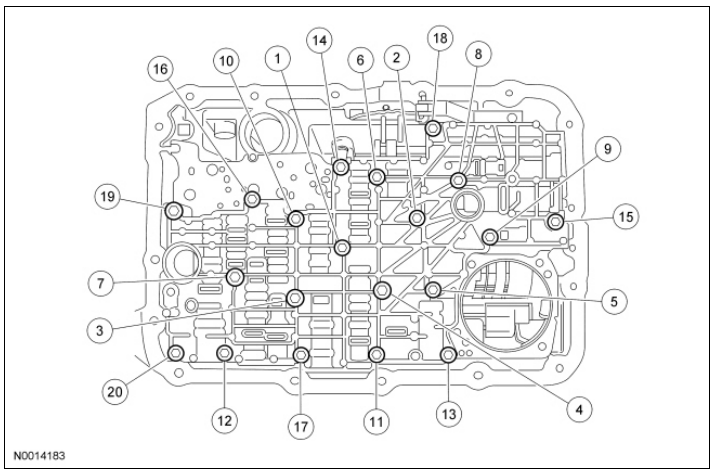
89. Tighten the center support screw.
    - Tighten to 11 Nm (97 lb-in).



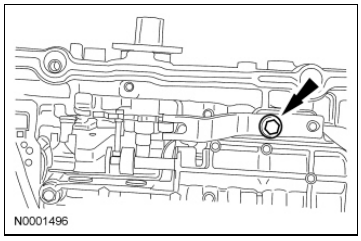
90. Using the Transmission Air Test Plate and Gaskets, carry out the air pressure test procedure. For additional information, refer to Special Testing Procedures in this section.



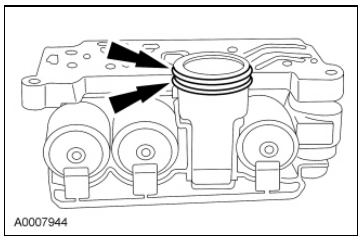
91. Install the Valve Body Aligners into the transmission case.



92. Using the Valve Body Aligners, install the main control valve body and loosely install the main control valve body screws.
    1. Install the short main control valve body screw.
    2. Install the screw with the larger head.
    3. Install the remaining main control valve body screws.

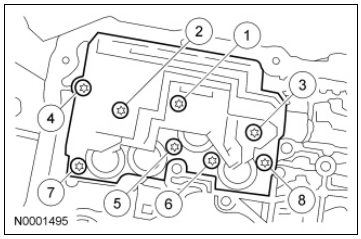


93. Remove the Valve Body Aligners and loosely install the main control valve body screw.

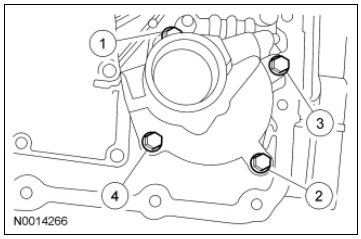


94. Tighten the main control valve body screws in the sequence shown.
    - Tighten to 10 Nm (89 lb-in).

95. With the manual lever in the NEUTRAL position, install the manual valve detent spring.
    - Tighten to 10 Nm (89 lb-in).



96. Install new O-ring seals on the transmission control solenoid body harness connector. Lubricate the O-ring seals with transmission fluid.

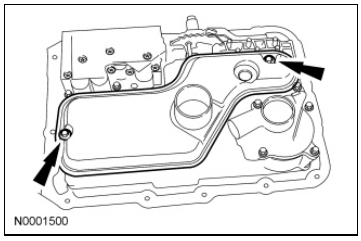


97. ***NOTICE:*** **Inspect the transmission case bore to make sure it is free of foreign material and not damaged. If damaged, transmission leak may occur.**

    Install the transmission control solenoid body. Tighten the transmission control solenoid body screws in the sequence shown.

    - Tighten to 8 Nm (71 lb-in).

98. Install the reverse servo. Tighten the bolts in the sequence shown in 2 stages.
    - Stage 1: Tighten bolts to 5 Nm (44 lb-in).
    - Stage 2: Tighten bolts to 11 Nm (97 lb-in).

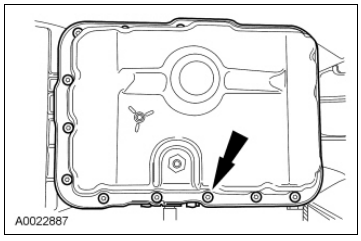


99. ***NOTICE:*** **Lubricate the transmission fluid filter seals with transmission fluid or they may be damaged.**

    NOTE: Make sure that the transmission fluid filter seals are correctly seated on the transmission fluid filter.

    Lubricate the transmission fluid filter seals and install the transmission fluid filter.

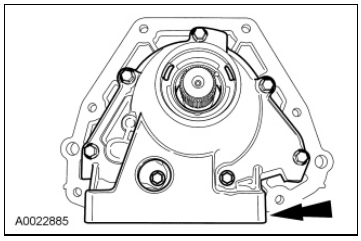
    - Tighten to 10 Nm (89 lb-in).



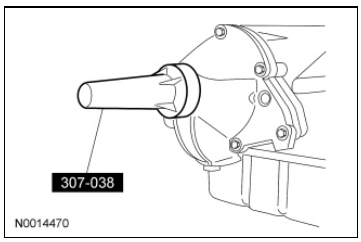
100. **NOTE:** The transmission fluid pan gasket is reusable. Clean and inspect for damage. If not damaged, the transmission fluid pan gasket should be reused.

    Install the transmission fluid pan and transmission fluid gasket and loosely install the transmission fluid pan screws.

101. Tighten the 16 transmission fluid pan screws in a crisscross sequence.
    - Tighten to 11 Nm (97 lb-in).

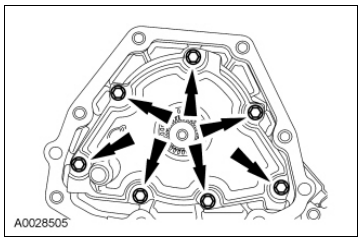


102. Install the park pawl assembly and gasket.
    1. Install the park pawl shaft.
    2. Install the park pawl return spring.
    3. Install the park pawl.
    4. Install a new gasket.

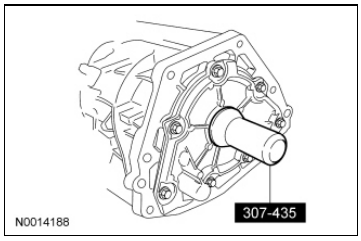


RWD vehicles

103. Install the extension housing and the extension housing screws.
    - Tighten to 30 Nm (22 lb-ft).

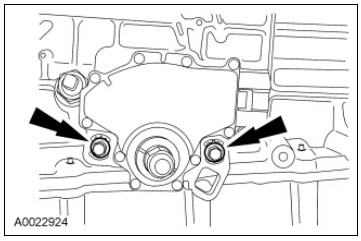


104. Using the Transmission Extension Housing Fluid Seal Installer, install the extension housing seal.



4WD vehicles

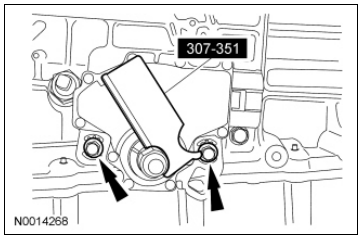
105. Install the extension housing and the extension housing screws.
    - Tighten to 30 Nm (22 lb-ft).



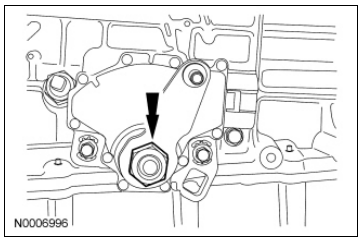
106. Using the Extension Housing Seal Installer, install the extension housing seal.

107. ***NOTICE:*** **The Transmission Range (TR) sensor must fit flush against the boss on the case to prevent damage to the sensor.**

    Install the Transmission Range (TR) sensor and loosely install the screws.



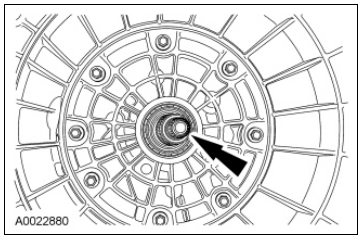
108. ***NOTICE:*** **Tightening one screw before tightening the other may cause the sensor to bind or become damaged.**



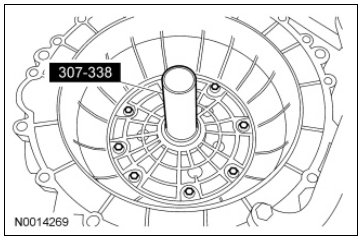
NOTE: The manual lever must be in the NEUTRAL position.

Using the TR Sensor Alignment Gauge, align the TR sensor and tighten the screws in an alternating sequence.

- Tighten to 8 Nm (71 lb-in).



109. Install the manual control lever and the manual lever shaft outer nut.
    - Tighten to 48 Nm (35 lb-ft).

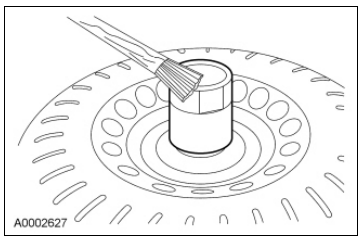


110. ***NOTICE:*** **The splines of the input shaft are not the same length on each end. Install the shaft with the shorter splines on the end into the fluid pump or damage may occur.**

    Install the input shaft.

111. Using the Piston Seal Sizer, make sure that the fluid pump gear seal ring is fully seated.

112. Remove the Piston Seal Sizer.

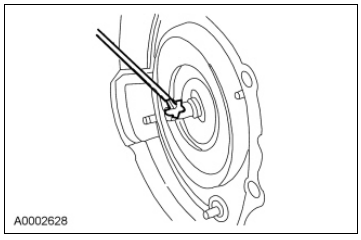


113. ***NOTICE:*** **Do not damage the fluid pump gear O-ring seal when installing the torque converter.**

    NOTICE: **Make sure the torque converter hub is fully engaged in the pump support and the gear rotates freely. Do not damage the hub seal.**

    NOTICE: **If the torque converter slides out, the hub seal may be damaged.**

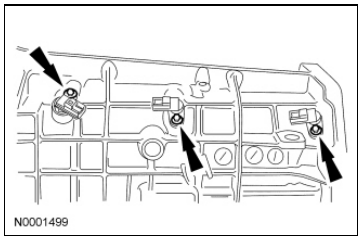
    Lubricate the converter hub with transmission fluid.



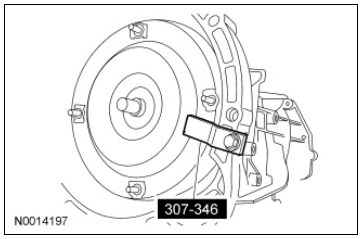
114. ⚠ **WARNING: Secure the torque converter in the transmission during removal or installation. The torque converter is heavy and may result in injury if it falls out of the transmission. Failure to follow this instruction may result in serious personal injury.**

    Using the Torque Converter Handles, install the torque converter by pushing and rotating.

115. Lubricate the torque converter pilot hub with multi-purpose grease.



116. Using one of the speed sensor holes, fill the transmission with 8.5L (9 qt) of transmission fluid.



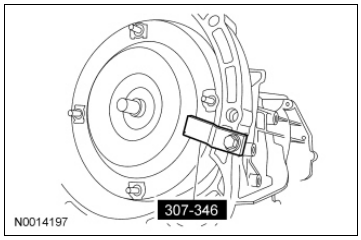
117. **NOTE:** Inspect the speed sensor O-ring seals for damage. Install new O-ring seals if damaged. Lubricate the O-ring seals with petroleum jelly to prevent damage to the O-ring seals.

    Install the speed sensors.

    - Tighten to 14 Nm (124 lb-in).

118. Install the Torque Converter Retainer.

Transmission - Rear Wheel Drive (RWD)



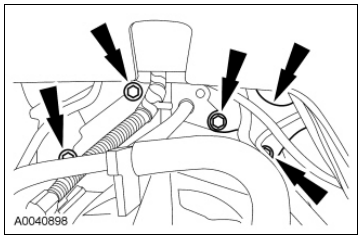
Special Tool(s)

 ST1636-A	Retainer, Torque Converter 307-346 (T97T-7902-A)

1. ⚠ **WARNING: Always secure transmission, transfer case, and axle assemblies to their service jack. Avoid obstructions while lowering and raising the jack. Improperly secured assemblies or contact with obstructions may cause the assembly to fall off the jack, which could result in serious personal injury.**

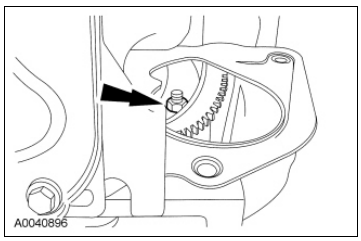
   NOTE: Rotate the torque converter so that the torque converter paint mark is in the 12 o'clock position.

   Install the Torque Converter Retainer if not done during assembly.

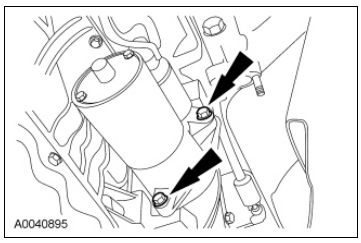


2. Raise and position the transmission to the back of the engine.

3. Remove the Torque Converter Retainer.



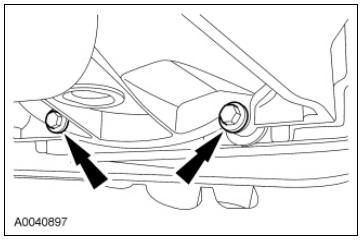
4. Position the fuel line bracket in place and install the 6 transmission-to-engine bolts.
   - Tighten to 48 Nm (35 lb-ft).



5. ***NOTICE:*** **Rotating the crankshaft pulley bolt counterclockwise could cause a reduction in clamp load on the crankshaft pulley and timing sprocket, which could cause severe engine damage.**

   Install 4 new torque converter-to-flexplate nuts.

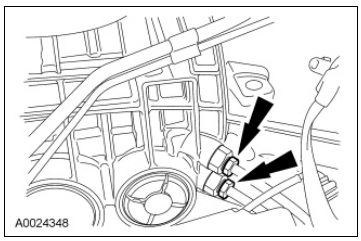
   - Tighten to 44 Nm (32 lb-ft).



6. Install the starter motor and starter motor bolts.
   - Tighten to 25 Nm (18 lb-ft).

7. Install the ground cable and ground cable nut.
   - Tighten to 13 Nm (115 lb-in).

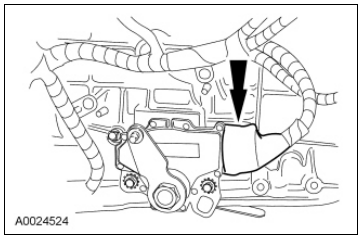
8. Install the lower transmission-to-engine bolts.
   - Tighten to 48 Nm (35 lb-ft).



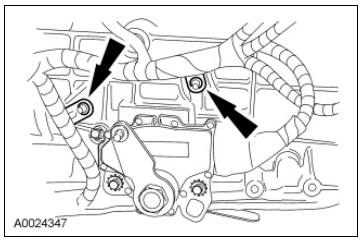
9. ***NOTICE:*** **Use care not to bend or force the transmission fluid cooler tubes, otherwise, damage to the transmission fluid cooler tubes and the transmission may result.**

   NOTE: Hold the transmission case fittings with a backup wrench.

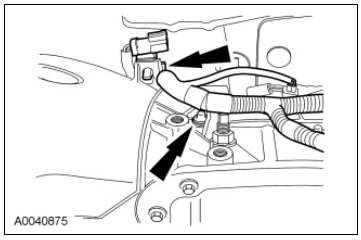
   Install the transmission fluid cooler tubes nut-to-case fitting.



- Tighten to 40 Nm (30 lb-ft).



10. Connect the Transmission Range (TR) sensor connector.



11. Move the TR sensor boot back over the TR sensor connector.

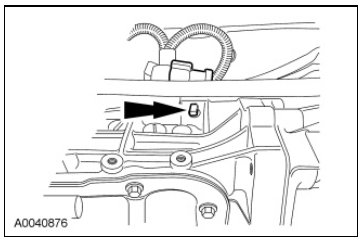
12. Position the wire harness and install the retainers.

13. Attach the LH Heated Oxygen Sensor (HO2S) to the transmission and install the wire harness retainer.

14. ***NOTICE:*** **Damage will occur to the transmission control solenoid body assembly if the screw is tightened above the specification.**

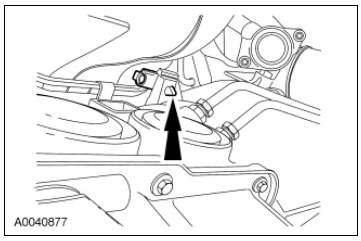
    NOTE: Always install new O-ring seals on the transmission solenoid body harness connector.

NOTE: Clean the area around the transmission vehicle harness connector to prevent contamination of the transmission solenoid body harness connector.

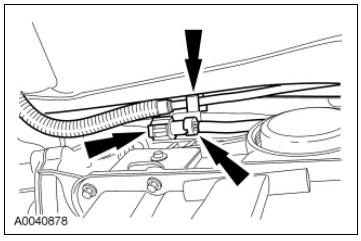


NOTE: Use petroleum jelly to lubricate the O-ring seals to aid in the installation process.

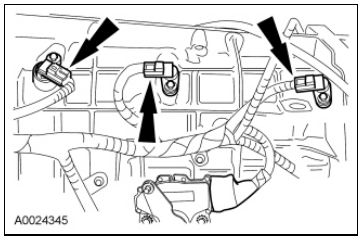
Install and lubricate new O-ring seals on the transmission solenoid body harness connector and connect the transmission vehicle harness connector.



- Tighten to 5 Nm (44 lb-in).



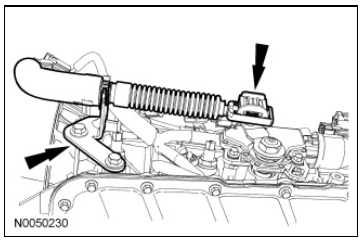
15. Attach the LH Catalyst Monitor Sensor (CMS) connector to the transmission.



16. Attach the RH HO2S to the transmission.

17. Attach the fuel lines and the RH CMS connector to the bracket.

18. Connect the Turbine Shaft Speed (TSS) sensor, Output Shaft Speed (OSS) sensor and intermediate shaft speed sensor connectors.

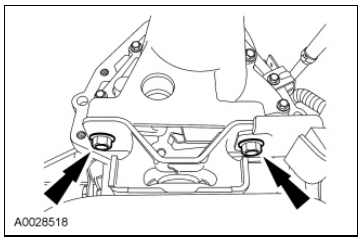


19. *NOTICE:* **To prevent selector lever cable damage, do not apply force to the selector lever cable between the manual control lever and the selector lever cable bracket.**

    NOTE: When installing the selector lever cable end, make sure that the selector lever cable end is correctly installed onto the manual control lever. Pull back on the selector lever cable end to make sure that the selector cable end is securely installed onto the manual control lever.

    Install the selector lever cable end onto the manual control lever, selector lever cable bracket and selector lever cable bracket screws.

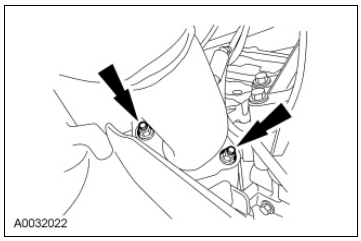
    - Tighten to 40 Nm (30 lb-ft).



20. **NOTE:** If the selector lever cable shield is loose on the selector lever cable, install a new selector lever cable shield.

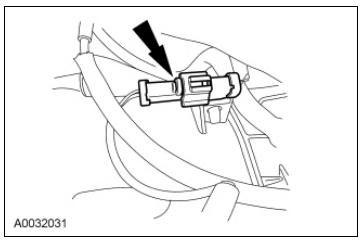
    Install the selector lever cable shield.

21. If removed, install the transmission support insulator and transmission support insulator-to-extension housing screws.
    - Tighten to 90 Nm (66 lb-ft).



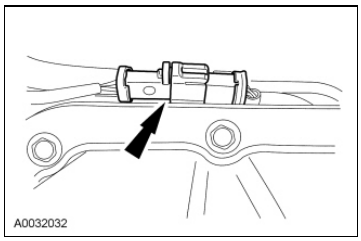
22. *NOTICE:* **Prior to Installation, Inspect the HO2S and the CMS wiring harness for damage.**

    NOTE: RH side shown, LH side similar.



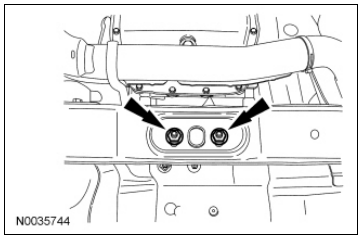
NOTE: This step may require an assistant.

Position the catalytic converter assembly and loosely install the 4 catalytic converter-to-manifold nuts.



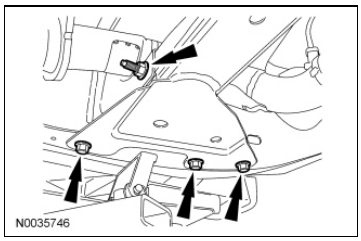
23. **NOTE:** LH side shown, RH side similar.

    Connect the 2 HO2S connectors.

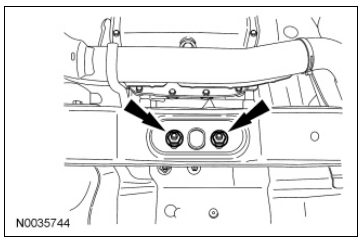


24. **NOTE:** LH side shown, RH side similar.

    Connect the 2 CMS sensor connectors.

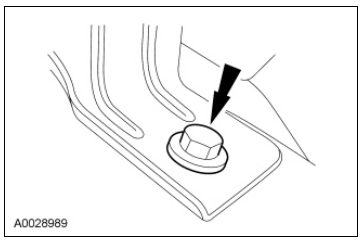


25. Position the crossmember in place and loosely install the 2 transmission support insulator-to-crossmember nuts to support the crossmember.

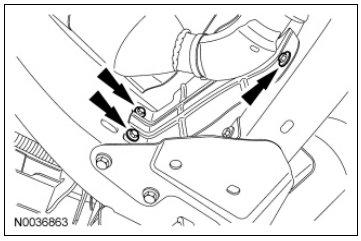


26. Install the 4 RH side crossmember bolts and the nut.
    - Tighten to 70 Nm (52 lb-ft).

27. Install the 4 LH side crossmember bolts and the nut.
    - Tighten to 70 Nm (52 lb-ft).

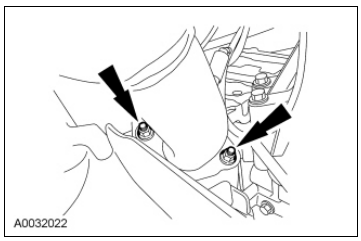


28. Tighten the transmission support insulator-to-crossmember nuts.
    - Tighten to 90 Nm (66 lb-ft).

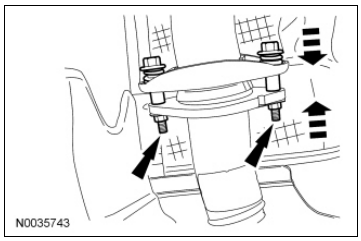


29. Remove the transmission jack from under the transmission.

30. Install the LH exhaust heat shield bolts.
    - Tighten to 20 Nm (177 lb-in).



31. If equipped, install the RH exhaust heat shield.
    - Tighten to 20 Nm (177 lb-in).



32. **NOTE:** RH shown, LH similar.

    Tighten the 4 catalytic converter-to-manifold nuts.

- Tighten to 40 Nm (30 lb-ft).

33. Using a new gasket, install the catalytic converter-to-muffler pipe and the heat shield. Install the catalytic converter-to-muffler pipe bolts, springs and flagnuts.
    - Tighten to 40 Nm (30 lb-ft).

34. Install the driveshaft. For additional information, refer to Section 205-01 .

35. Use the following guidelines for installing the in-line transmission fluid filter:
    - If the transmission was overhauled and the vehicle was equipped with an in-line transmission fluid filter, install a new in-line transmission fluid filter.
    - If the transmission was overhauled and the vehicle was not equipped with an in-line transmission fluid filter, install a new in-line transmission fluid filter kit.
    - If the transmission is being installed for a non-internal repair, do not install an in-line transmission filter or filter kit.
    - If installing a new or a Ford-authorized remanufactured transmission, install a new in-line transmission fluid filter.
        - Prior to lowering the vehicle, install a new in-line transmission filter or a filter kit. For additional information, refer to Transmission Filter - In Line in this section.

36. **NOTE:** When the battery has been disconnected and reconnected, some abnormal drive symptoms can occur while the vehicle relearns its adaptive strategy. The customer needs to be notified that they can experience slightly different upshifts (either soft or firm) and that this is a temporary condition and will eventually return to normal operating condition.

    Connect the battery ground cable. For additional information, refer to Section 414-01 .

37. Position the cooling fan shroud and install the bolts.
    - Tighten to 7 Nm (62 lb-in).

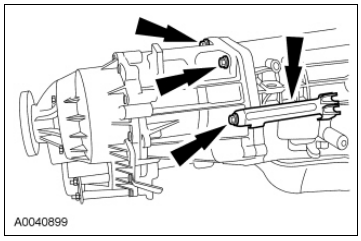
38. Position the coolant expansion tank and install the bolts.
    - Tighten to 7 Nm (62 lb-in).

39. Carry out the transmission fluid level check. For additional information, refer to Transmission Fluid Level Check in this section.

40. Verify that the selector lever cable is correctly adjusted. For additional information, refer to Section 307-05 .

41. Check the operation of the transmission and inspect for leaks.

Transmission - Four Wheel Drive (4WD)



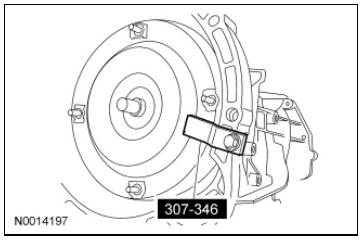
Special Tool(s)

 ST1636-A	Retainer, Torque Converter 307-346 (T97T-7902-A)

1. ⚠ **WARNING: Always secure transmission, transfer case, and axle assemblies to their service jack. Avoid obstructions while lowering and raising the jack. Improperly secured assemblies or contact with obstructions may cause the assembly to fall off the jack, which could result in serious personal injury.**

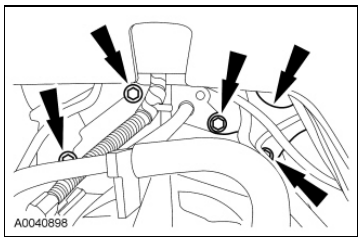
   If removed, install the transfer case to the back of the transmission. Install the transfer case bolts, bracket and connect the vent hose.

   - Tighten to 41 Nm (30 lb-ft).



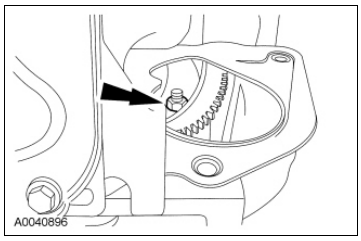
2. **NOTE:** Rotate the torque converter so that the torque converter paint mark is in the 12 o'clock position.

   Install the Torque Converter Retainer if not done during assembly.

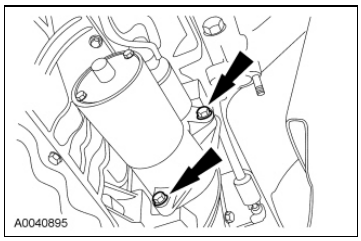


3. Raise and position the transmission and transfer case to the back of the engine.

4. Remove the Torque Converter Retainer.



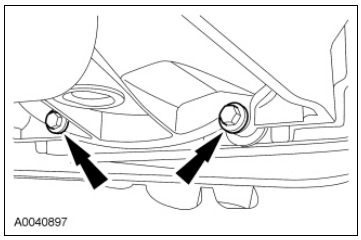
5. Position the fuel line bracket in place and install the 6 transmission-to-engine bolts.
   - Tighten to 48 Nm (35 lb-ft).



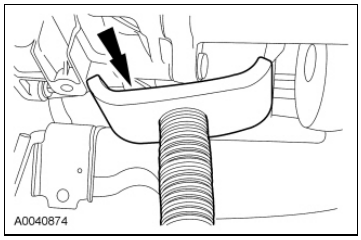
6. ***NOTICE:*** **Rotating the crankshaft pulley bolt counterclockwise could cause a reduction in clamp load on the crankshaft pulley and timing sprocket, which could cause severe engine damage.**

   Install 4 new torque converter-to-flexplate nuts.

   - Tighten to 44 Nm (32 lb-ft).



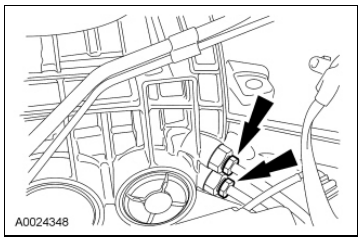
7. Install the starter motor and starter motor bolts.
   - Tighten to 25 Nm (18 lb-ft).



8. Install the ground cable and ground cable nut.
   - Tighten to 13 Nm (115 lb-in).

9. Install the lower transmission-to-engine bolts.
   - Tighten to 48 Nm (35 lb-ft).

10. Install a jackstand under the transfer case.



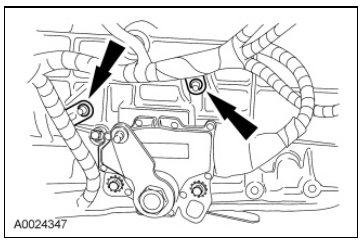
11. Remove the transmission jack from under the transmission.

12. ***NOTICE:*** **Use care not to bend or force the transmission fluid cooler tubes, otherwise damage to the transmission fluid cooler tubes and the transmission may result.**

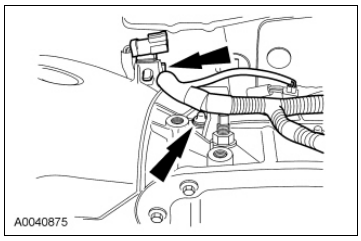
    NOTE: Hold the transmission case fittings with a backup wrench.

    Install the transmission fluid cooler tubes nut-to-case fitting.

    - Tighten to 40 Nm (30 lb-ft).



13. Connect the Transmission Range (TR) sensor connector.



14. Move the TR sensor boot back over the TR sensor connector.

15. Position the wire harness and install the retainers.

16. Attach the LH Heated Oxygen Sensor (HO2S) to the transmission and install the wire harness retainer.

17. ***NOTICE:*** **Damage will occur to the transmission control solenoid body assembly if the screw is tightened above the specification.**

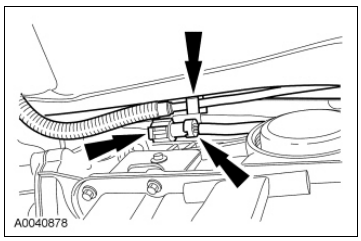
    NOTE: Always install new O-ring seals on the transmission vehicle harness connector.

    NOTE: Clean the area around transmission vehicle harness connector to prevent contamination of the transmission vehicle harness connector.

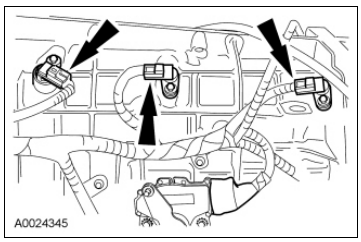
    NOTE: Use petroleum jelly to lubricate the O-ring seals to aid in the installation process.

    Install and lubricate new O-ring seals on the transmission vehicle harness connector and connect the transmission vehicle harness connector.

    - Tighten to 5 Nm (44 lb-in).



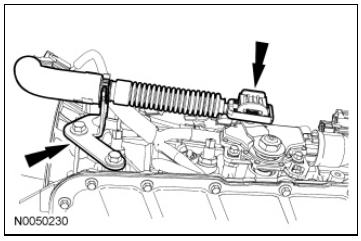
18. Attach the LH Catalyst Monitor Sensor (CMS) connector to the transmission.



19. Attach the RH HO2S to the transmission.

20. Attach the fuel lines and the RH CMS connector to the bracket.

21. Connect the Turbine Shaft Speed (TSS) sensor, Output Shaft Speed (OSS) sensor and intermediate shaft speed sensor connectors.



22. ***NOTICE:*** **To prevent selector lever cable damage, do not apply force to the selector lever cable between the manual control lever and the selector lever cable bracket.**

    NOTE: When installing the selector lever cable end, make sure that the selector lever cable end is correctly installed onto the manual control lever. Pull back on the selector lever cable end to make sure that the selector cable end is securely installed onto the manual control lever.

    Install the selector lever cable end onto the manual control lever, selector lever cable bracket and selector lever cable bracket screws.

    - Tighten to 40 Nm (30 lb-ft).

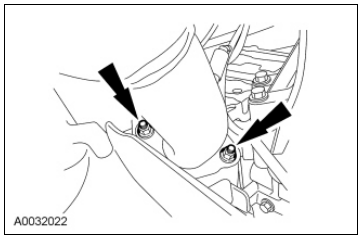
23. **NOTE:** If the selector lever cable shield is loose on the selector lever cable, install a new selector lever cable shield.

    Install the selector lever cable shield.

24. **NOTE:** LH side shown, RH similar.

    If removed, install the transmission support insulator and transmission support insulator screws.

    - Tighten to 90 Nm (66 lb-ft).

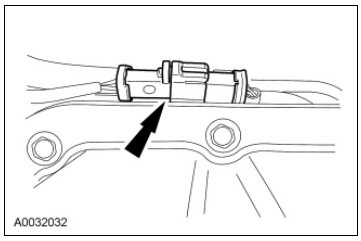


25. ***NOTICE:*** **Prior to Installation, Inspect the HO2S and the CMS wiring harness for damage.**

    NOTE: RH side shown, LH side similar.

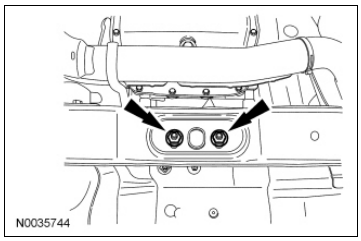
    NOTE: This step may require an assistant.

    Position the catalytic converter assembly and loosely install the 4 catalytic converter-to-manifold nuts.



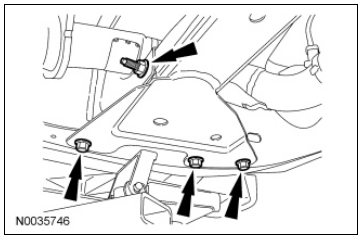
26. **NOTE:** LH side shown, RH side similar.

    Connect the 2 HO2S connectors.

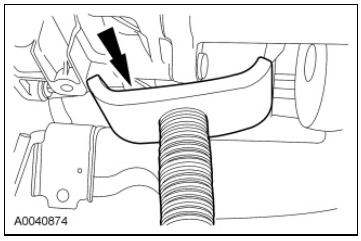


27. **NOTE:** LH side shown, RH side similar.

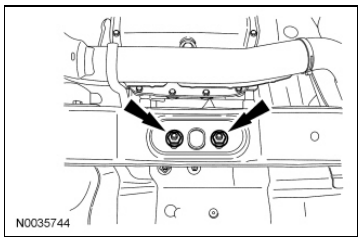
    Connect the 2 CMS sensor connectors.



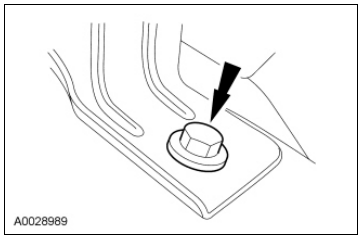
28. Position the crossmember in place and loosely install the 2 transmission support insulator-to-crossmember nuts to support the crossmember.



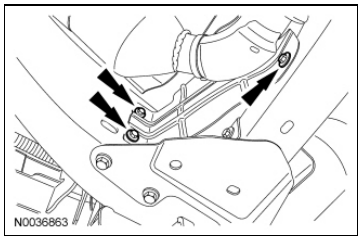
29. Install the 4 RH side crossmember bolts and the nut.
    - Tighten to 70 Nm (52 lb-ft).



30. Install the 4 LH side crossmember bolts and the nut.
    - Tighten to 70 Nm (52 lb-ft).

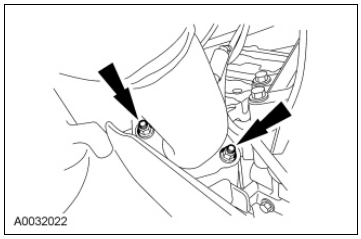


31. Remove the jackstand.



32. Tighten the transmission support insulator-to-crossmember nuts.
    - Tighten to 90 Nm (66 lb-ft).

33. Install the LH exhaust heat shield bolts.
    - Tighten to 20 Nm (177 lb-in).

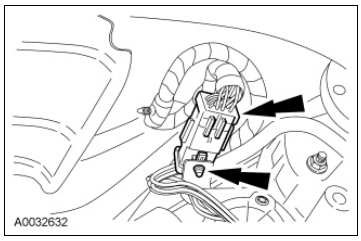


34. If equipped, install the RH exhaust heat shield.
    - Tighten to 20 Nm (177 lb-in).

35. **NOTE:** RH shown, LH similar.

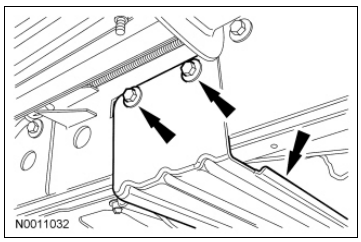
    Tighten the 4 catalytic converter-to-manifold nuts.

    - Tighten to 40 Nm (30 lb-ft).



36. Using a new gasket, install the catalytic converter-to-muffler pipe and the heat shield. Install the catalytic converter-to-muffler pipe bolts, springs and flagnuts.

- Tighten to 40 Nm (30 lb-ft).



37. If equipped, connect the 4WD shift motor connector.

38. Install the driveshafts. For additional information, refer to Section 205-01 .

39. Use the following guidelines for installing the in-line transmission fluid filter:
    - If the transmission was overhauled and the vehicle was equipped with an in-line transmission fluid filter, install a new in-line transmission fluid filter.
    - If the transmission was overhauled and the vehicle was not equipped with an in-line transmission fluid filter, install a new in-line transmission fluid filter kit.
    - If the transmission is being installed for a non-internal repair, do not install an in-line transmission filter or filter kit.
    - If installing a new or a Ford-authorized remanufactured transmission, install a new in-line transmission fluid filter.
        - Prior to lowering the vehicle, install a new in-line transmission filter or a filter kit. For additional information, refer to in this section.

40. If equipped, position the skid plate and install the 4 skid plate bolts.
    - Tighten to 24 Nm (18 lb-ft).

41. **NOTE:** When the battery has been disconnected and reconnected, some abnormal drive symptoms can occur while the vehicle relearns its adaptive strategy. The customer needs to be notified that they can experience slightly different upshifts (either soft or firm) and that this is a temporary condition and will eventually return to normal operating condition.

    Connect the battery ground cable. For additional information, refer to Section 414-01 .

42. Position the cooling fan shroud and install the bolts.
    - Tighten to 7 Nm (62 lb-in).

43. Position the coolant expansion tank and install the bolts.

- Tighten to 7 Nm (62 lb-in).

44. Carry out the fluid level check. For additional information, refer to Transmission Fluid Level Check in this section.

45. Verify that the selector lever cable is correctly adjusted. For additional information, refer to Section 307-05 .

46. Check the operation of the transmission and inspect for leaks.

Transmission Description

6R80 Transmission

This transmission has an internal thermal bypass valve contained within the case.

This transmission uses planetary gears with hydraulic electronic controls. The Transmission Control Module (TCM) and the main control valve body units form a composite element that is installed as a single unit inside the automatic transmission.

This transmission has the following features:

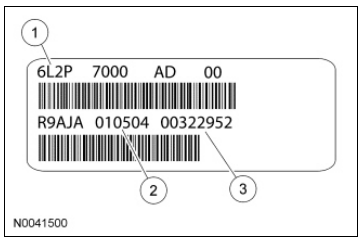
- Six forward speeds
- Torque converter with an integral converter clutch
- Electronic shift and pressure controls
- Single planetary gear set
- Double planetary gear set
- Two fixed multi-disc clutches
- Three multi-plate clutches

All hydraulic functions are directed by electronic solenoids to control the following:

- Engagement feel
- Shift feel
- Shift scheduling
- Modulated Torque Converter Clutch (TCC) applications

This transmission has a mechatronic unit which contains:

- Transmission Control Module (TCM)
- Turbine Shaft Speed (TSS) sensor
- Output Shaft Speed (OSS) sensor
- An internal P, R, N, D selector shaft position sensor
- Transmission Fluid Temperature (TFT) sensor



Engine power reaches the transmission by a torque converter with an integral clutch. The 6 forward gears and one reverse gear are obtained from 2 planetary gearsets.

This automatic transmission is a 6-speed electronically controlled transmission comprising the basic elements of a TCM , main control valve body unit, torque converter, 1 solenoid valve and 6 pressure regulators. Gear selection is achieved by the control of automatic transmission fluid flow to operate various internal clutches. The TCM operates the electrical components and provides for the control of gear selection shift pressure, which increases refinement and torque converter slip.

In the event of a system fault, the TCM also provides for Failure Mode Effect Management to maintain maximum functional operation of the transmission with a minimum reduction in driver, passenger or vehicle safety. In the event of a total loss of control or electrical power, the basic transmission functions P, R, N and D are retained. Also 3rd or 5th gear is retained by the hydraulic system. The gear retained is dependent upon the gear selected at the time of the failure.

Identification Tags

All vehicles come equipped with a Safety Compliance Certification Label. The location on the label marked TR is reserved for the transmission code. To determine the correct transmission for this vehicle, refer to the Owner's Literature, Transmission Code Designations. All transmissions are equipped with an identification tag located on the transmission case. For transmission part number, serial number and build date, refer to the transmission identification tag located on the transmission case.

Major Components

Major Components

This transmission has the following major components:

- Transmission case with integral torque converter housing and extension housing
- Torque converter
- Fluid pump
- Three drive clutches:
  - Forward clutch (A)
  - Direct clutch (B)
  - Overdrive (O/D) clutch (E)
- Two brake clutches:
  - Intermediate clutch (C)
  - Low/reverse clutch (D)
- Two planetary gearsets:
  - Front single planetary gearset (1 sun gear, 1 carrier, 1 ring gear)
  - Rear ravigenaux planetary gearset (2 sun gears, 1 carrier with 2 sets of pinion gears and 1 ring gear)
- Main control (mechatronic assembly):
  - Upper valve body
  - Lower valve body
  - Transmission Control Module (TCM)
  - Transmission Range (TR) sensor
  - Turbine Shaft Speed (TSS) sensor
  - Output Shaft Speed (OSS) sensor

NOTE: Friction and steel plate quantity will vary based on engine displacement. Refer to the Clutch Plate Quantity Chart in the Specifications portion of this section.

In addition to the torque converter, the other shift elements are:

- three rotating multi-plate clutches: forward (A), direct (B) and overdrive (E).
- two fixed multi-disc brakes: intermediate (C) and low/reverse (D).

All gear shifts from 1st to 6th or from 6th to 1st are power-on overlapping shifts. That is, during the shift, one of the clutches must continue to transmit the drive at lower main pressure until the other clutch is able to accept the input torque.

The shift elements, clutches or brakes are engaged hydraulically. The transmission fluid pressure builds up between the cylinder and the piston, pressing the clutches together.

The purpose of these shift elements is to carry out in-load shifts with no interruption to traction.

Multi-plate clutches; forward, direct and overdrive, supply power from the engine to the planetary geartrain. Multi-disc brakes, intermediate and low/reverse, press against the transmission housing in order to achieve a torque reaction effect.

Multi-Plate Clutch

Clutches; O/D (E), forward (A) and direct (B) are balanced in terms of dynamic pressure. That is, their pistons are exposed to the transmission fluid flow on both sides, in order to prevent pressure buildup in the clutch as speed increases. This equalization process is achieved by a baffle plate and pressure-free transmission fluid supply by a lubricating passage, through which the space between piston and baffle plate is filled with transmission fluid.

The advantages of this dynamic pressure equalization are:

- reliable clutch engagement and release in all speed ranges.
- improved shift refinement.

Shift Overlap Control

The electro-hydraulic shift action is obtained by means of various valves in the TCM and main control valve body, actuated by pressure regulators. They engage or disengage the relevant clutches or brakes at the correct moments.

Hydraulic Systems

Fluid Pump

The torque converter is supported in the fluid pump by a needle roller bearing. The fluid pump is driven directly from the engine by the torque converter shell and supplies transmission fluid to the transmission and the hydraulic control unit.

The fluid pump draws in transmission fluid through a transmission fluid filter and delivers it at high pressure to the main pressure valve in the main control valve body unit. The valve adjusts the pressure and returns excess transmission fluid to the transmission fluid pan.

Fluid Filter

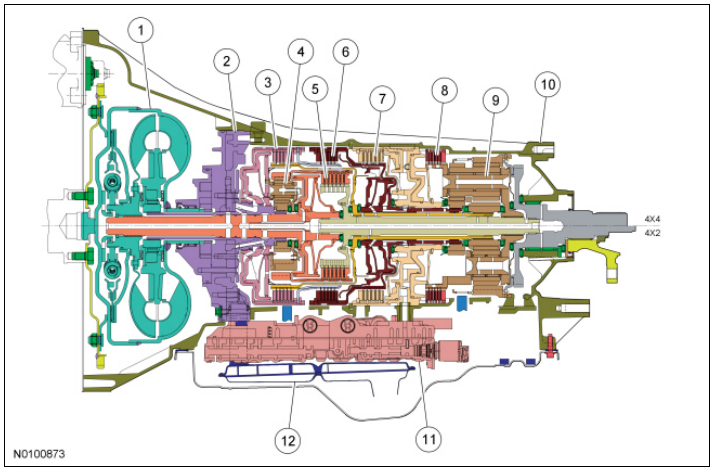
All transmission fluid that is picked up from the transmission fluid pan passes through the transmission fluid filter. The transmission fluid filter and its accompanying seal are part of the transmission fluid path from the pan to the transmission fluid pump.

Single Planetary Gearset

The single planetary gear O/D carrier is driven by the input shaft. The single planetary gear set consists of the following components:

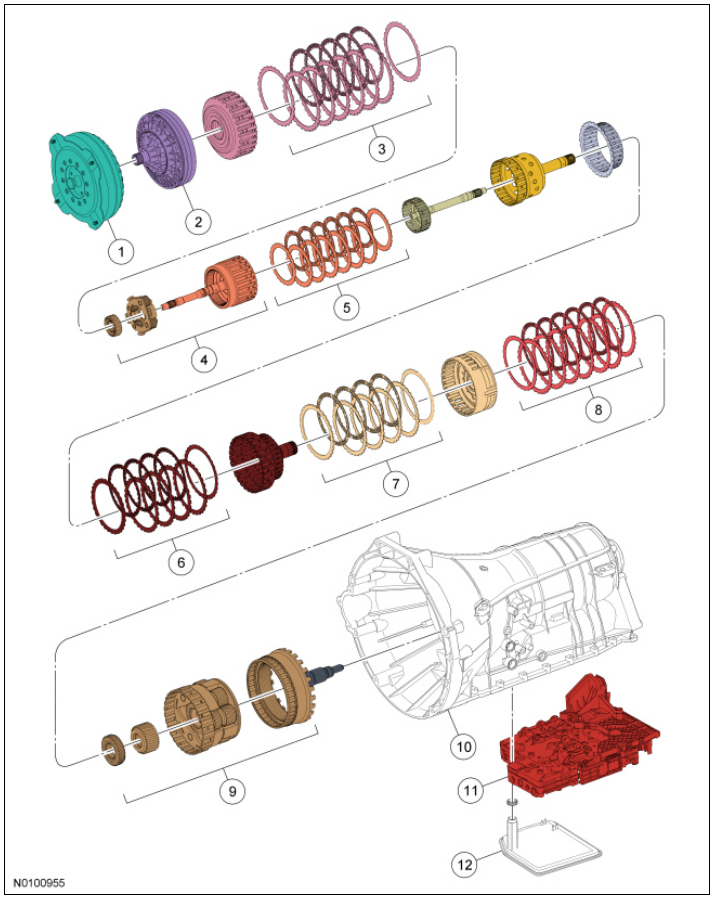
- One sun gear
- Four planetary gears meshing with the sun gear
- One planetary carrier
- One ring gear

Ravigenaux Planetary Gearset



The ravigenaux planetary gearset is splined to the output shaft and consists of the following components:

- Two sun gears of different sizes
- Three short planetary gear pinions meshing with the sun gears
- Three long planetary gear pinions meshing with the sun gears
- One planetary carrier
- One ring gear



Output Shaft

The output shaft provides torque to the driveshaft and rear axle assembly. It is driven by the ring gear of the planetary gearset.

Gear Ratios

Power is transmitted from the torque converter to the planetary gearsets through the input shaft. Clutches are used to hold and drive certain combinations of gearsets. This results in 6 forward ratios and one reverse ratio which are transmitted to the rear planetary ring gear (output shaft). The planetary gearsets of this transmission provide the following ratios:

- Reverse:
  - Front planetary gearset ratio of 1.52:1
  - Rear planetary gearset ratio of 2.24:1 (reverse direction)
  - Total ratio of 3.40:1 (reverse direction)
- 1st gear:
  - Front planetary gearset ratio of 1.52:1
  - Rear planetary gearset ratio of 2.74:1
  - Total ratio of 4.17:1
- 2nd gear:
  - Front planetary gearset ratio of 1.52:1
  - Rear planetary gearset ratio of 1.54:1
  - Total ratio of 2.34:1
- 3rd gear:
  - Front planetary gearset ratio of 1.52:1
  - Rear planetary gearset ratio of 1:1
  - Total ratio of 1.52:1
- 4th gear:
  - Front planetary gearset provides ratios of 1:1 and 1.52:1 to different rear planetary gearset members
  - Rear planetary gearset ratio of 1.14:1
  - Total ratio of 1.14:1
- 5th gear:
  - Front planetary gearset provides ratios of 1:1 and 1.52:1 to different rear planetary gearset members
  - Rear planetary gearset ratio of 0.87:1
  - Total ratio of 0.87:1
- 6th gear:
  - Front planetary gearset ratio of 1:1
  - Rear planetary gearset ratio of 0.69:1
  - Total ratio of 0.69:1

Range Selection

The transmission has 7 range positions: P, R, N, D, 3, 2 and 1.

Park

In the PARK position:

- there is no power flow through the transmission.
- the park pawl locks the output shaft to the case.
- the engine can be started.
- the ignition key can be removed.

Reverse

In the REVERSE position:

- the vehicle can be operated in a rearward direction, at a reduced gear ratio.
- backup lamps are illuminated.

Neutral

In the NEUTRAL position:

- there is no power flow through the transmission.
- the output shaft is not held and is free to turn.
- the engine can be started.

D Position

The D is the normal position for most forward driving.

The D position provides:

- automatic shifts 1-6 and 6-1.
- apply and release of the torque converter clutch.
- maximum fuel economy during normal operation.

Position 3 - 3rd Gear

This position provides:

- manual 3rd gear.

Position 2 - 2nd Gear

This position provides:

- manual 2nd gear.

Position 1 - 1st Gear

This position provides:

- first gear operation only.
- engine braking for descending steep grades.

Gear Availability

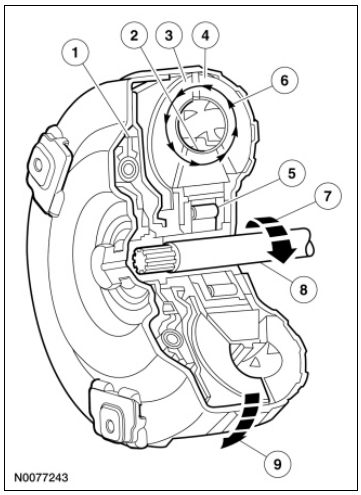
MANUAL LEVER POSITION	TRANSAXLE GEAR OPERATION	DESCRIPTION
P	Park	Forward or reverse gears not available. Final drive is held to the transmission case.
R	Reverse	Transmission allows reverse only.
N	Neutral	Forward or reverse gears not available. Final drive moves freely.
D	[1 ⇆ 2 ⇆ 3 ⇆ 4 ⇆ 5 ⇆ 6]	6 forward gears are available. Gears are dependent on vehicle speed and throttle position with coast braking.
D Tow/Haul	[1 ⇆ 2 ⇆ 3 ⇆ 4 ⇆ 5 ⇆ 6]	1st through 6th gears are available. The shift scheduling is altered for higher shift speeds for a given throttle position. Transmission provides engine braking.
3	[1 ⇆ 2 ⇆ 3 ← 4 ← 5 ← 6]	3rd gear hold. Downshift to 3rd gear when 3 position is selected above a calibrated speed.
2	[1 ⇆ 2 ← 3 ← 4 ← 5 ← 6]	2nd gear hold. Downshift to 2nd gear when 2 position is selected above a calibrated speed.
1	[1 ← 2 ← 3 ← 4 ← 5 ← 6]	1st gear hold with engine braking, the transmission downshifts to 1st gear when 1 is selected above a calibrated speed under minimum to moderate accelerator pedal position.

N0092155

Torque Converter

The torque converter is a 4-element unit containing a 3-plate clutch. The clutch can be controlled and engaged in any gear 2 to 6. Calibration parameters may be set to allow lockup in a higher gear only. The clutch is applied by removing fluid pressure from one side of the plate. The torque converter transmits and multiplies torque. The torque converter includes the following 4 elements:

- Impeller assembly
- Turbine assembly
- Reactor assembly
- Torque Converter Clutch (TCC)



Rotation of the torque converter housing and impeller set the transmission fluid in motion by driving the impeller blades and pump.

The turbine is driven by the transmission fluid from the impeller and transmits power to the input shaft.

The reactor redirects transmission fluid flow returned from the turbine to the impeller so that it rotates in the same direction as the impeller. This action assists in torque multiplication.

The reactor has a One-Way Clutch (OWC) to hold it stationary during torque multiplication and allows it to rotate at higher vehicle speeds.

Torque Converter Operation

Item	Description
1	Torque Converter Clutch (TCC)
2	Reactor
3	Turbine
4	Impeller and cover assembly
5	One-Way Clutch (OWC)
6	Fluid motion
7	Input shaft rotation

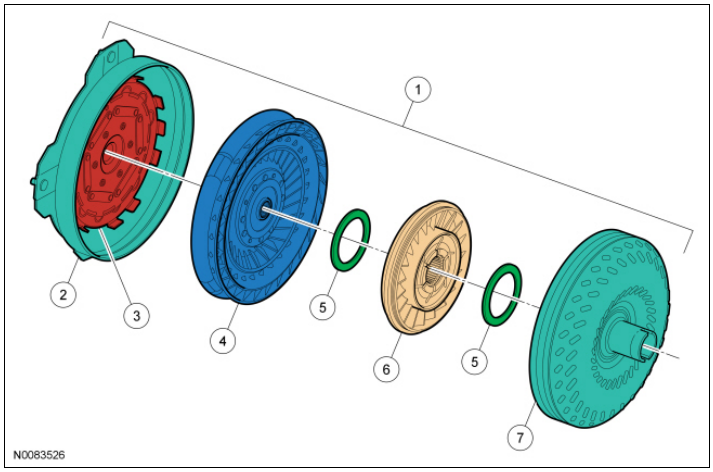
8	Input shaft
9	Engine rotation

Torque Converter Clutch (TCC)

The TCC has a cover assembly with a 3-plate clutch and a turbine and damper assembly that connects to the transmission input shaft.

The TCC connects the cover to the turbine when the TCC is applied.

During TCC release, transmission fluid flows through the torque converter in one direction to release the 3-plate clutch.



During TCC apply, transmission fluid flows through the torque converter in the opposite direction to apply the 3-plate clutch.

The TCC operates in 3 stages:

- Full release
- Controlled modulation
- Full apply

The Transmission Control Module (TCM) controls TCC operation using the TCC solenoid. TCC solenoid operation provides the modulation of hydraulic pressure to change the position of the bypass clutch control regulator valve. The valve changes the pressure and direction of transmission fluid flow in the torque converter. The TCC may be applied in forward gears, 2 to 6.

Shift Patterns

Downshifts

Under certain conditions, the transmission will downshift automatically to a lower gear range (without moving the range selector lever). There are 3 categories of automatic downshifts:

- Coastdown
- Torque demand
- Forced or kickdown shifts

Coastdown

The coastdown downshift occurs when the vehicle is coasting down to a stop.

Torque Demand

The torque demand downshift occurs (automatically) during part throttle acceleration when the demand for torque is greater than the engine can provide at that gear ratio.

Kickdown

For maximum acceleration, the driver can force a downshift by pressing the accelerator pedal to the floor. A forced downshift into a lower gear is possible below calibrated speeds. Specifications for downshift speeds are subject to variations due to tire size, engine and transmission calibration requirements.

Mechanical Components and Functions

Planetary Gearset

This transmission has 2 planetary gearsets (front and rear) to provide operation in reverse and 6 forward speeds.

The front planetary gearset is a single planetary gearset and has the following components:

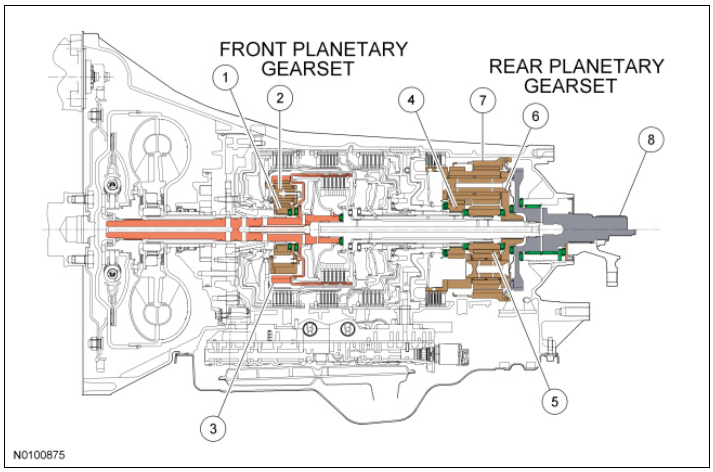
- Front planetary No. 1 sun gear
- Front planetary carrier
- Front planetary ring gear (part of the input shaft assembly)

The input shaft rotates the front ring gear as a driving member. The front sun gear is connected to the fluid pump and is held stationary. The front ring gear rotates the front planetary carrier assembly with a reduction ratio of 1.52:1

The front planetary carrier assembly is the only output member of the front planetary gearset in reverse, 1st gear, 2nd gear and 3rd gear. The front planetary gearset provides a 1.52:1 gear ratio to the rear planetary gearset.

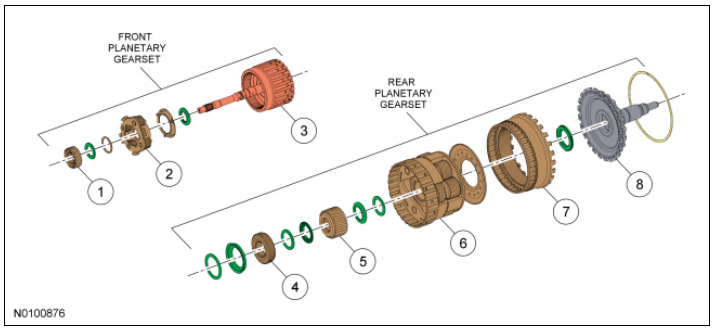
In 4th gear and 5th gear, both the front ring gear and front planetary carrier assembly are output members of the front planetary gearset. The front planetary gearset provides both a 1:1 and 1.52:1 gear ratio to different members of the rear planetary gearset.

In 6th gear, the front ring gear is the only output member of the front planetary gearset. The front planetary gearset provides a 1:1 gear ratio to the rear planetary gearset.



The rear planetary gearset is a ravigenaux planetary gearset and has the following components:

- Rear planetary No. 2 sun gear
- Rear planetary No. 3 sun gear
- Rear planetary carrier assembly (2 sets of pinion gears)
- Rear planetary ring gear assembly



Powerflow through the rear planetary gearset is as follows:

- In reverse, rear sun gear No. 2 is driven, the rear planetary carrier is held and the ring gear is the output (2.24:1 with reverse direction)
- In 1st gear, sun gear No. 3 is driven, the rear planetary carrier is held and the ring gear is the output (2.74:1)
- In 2nd gear, sun gear No. 3 is driven, sun gear No. 2 is held and the ring gear is the output (1.54:1)
- In 3rd gear, sun gear No. 3 and sun gear No. 2 are driven and the ring gear is the output (1:1)
- In 4th gear, sun gear No. 3 and the rear planetary carrier are driven and the ring gear is the output (1.14:1)
- In 5th gear, sun gear No. 2 and the rear planetary carrier are driven and the ring gear is the output (0.87:1)
- In 6th gear, the rear planetary carrier is driven, sun gear No. 2 is held and the ring gear is the output (0.69:1)

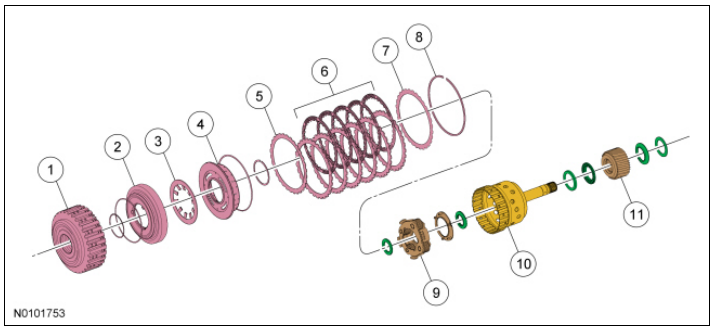
Forward Clutch (A)

NOTE: Friction and steel plate quantity will vary based on engine displacement. Refer to the Clutch Plate Quantity Chart in the Specifications portion of this section.



The forward clutch (A) connects the front planetary carrier to the rear No. 3 sun gear. This provides a reduction gear ratio of 1.52:1 from the input shaft to rear sun gear No. 3. The forward (A) is applied in 1st, 2nd, 3rd and 4th gears.

Regulated hydraulic pressure from the regulator valve in the valve body pushes the forward (A) clutch piston against the forward (A) clutch pack to apply the clutch. The front planetary carrier and the rear No. 3 sun gear are connected as a result of the clutch being applied.

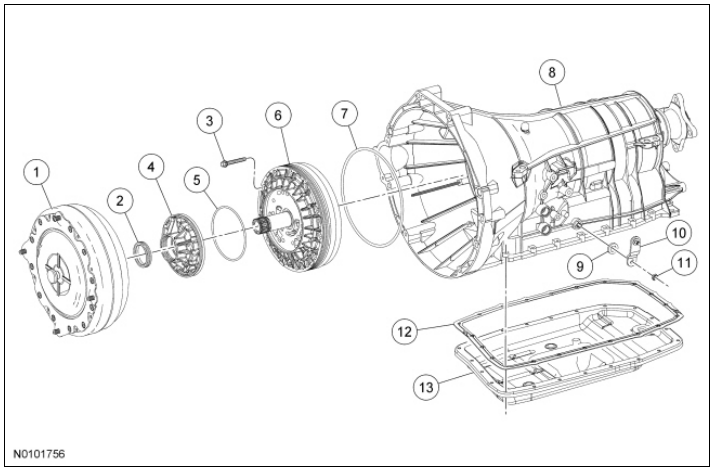
External Sealing

The pump assembly has a lip-type seal for the torque converter impeller hub. The pump assembly uses a large O-ring to seal the transmission case. The pump bolts also seal the pump to the transmission case.

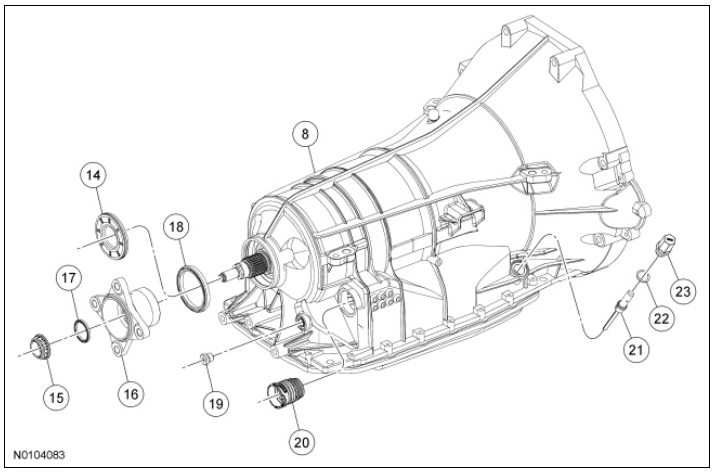
The manual control shaft has a lip seal for its bore in the transmission case.

The transmission fluid pan uses a reusable gasket.

The Four-Wheel Drive (4WD) applications use a lip-type seal that seals the transmission case to the output shaft flange.



The Rear Wheel Drive (RWD) applications use a lip-type seal that seals the transmission case to the output shaft flange.



The transmission case housing plug provides access to the park pawl shaft. The plug has a seal that is serviced as an assembly with the plug.

The bulkhead connector sleeve has a seal for the transmission case bore. The seal is serviced as an assembly with the bulkhead connector sleeve.

The plug for the fluid level indicator uses an O-ring seal.

Bushings, Bearings and Thrust Washer Locations

This transmission supports the rotating components of the transmission with bushings, bearings and thrust washers.

The pump assembly support thrust washer controls the amount of end play for components between the pump assembly and the center support (forward/Overdrive (O/D) clutch assembly, direct clutch cylinder).

The T8 thrust bearing outer race controls the amount of end play for components between the center support and the rear of the transmission case (rear planetary gearset assembly, output shaft assembly).

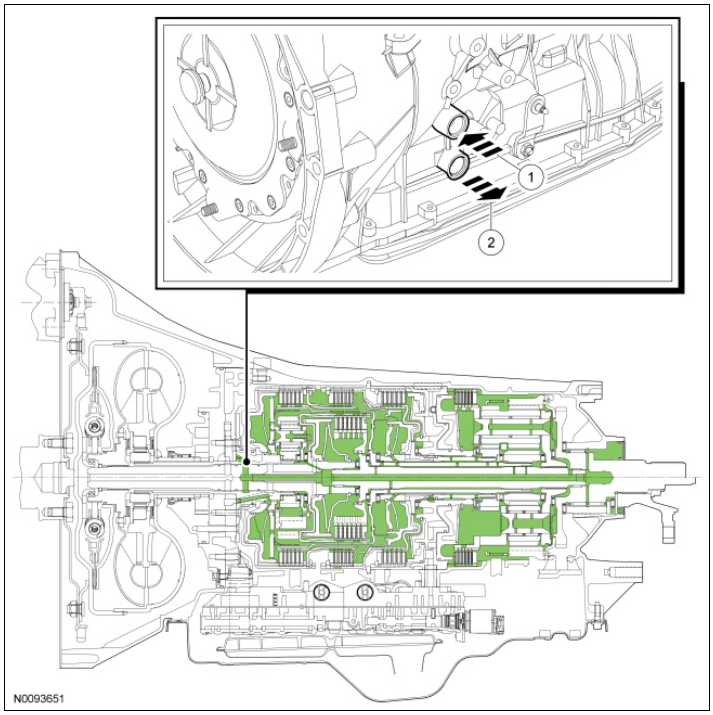
Lubrication

This transmission provides lubrication for rotating mechanical components through one main hydraulic circuit. The general flow of lubrication moves from the front of the transmission, through the input and intermediate shafts, to the rear of the transmission.



Transmission fluid from the pump assembly and the torque converter exit the transmission case to go to the transmission fluid cooler through the bottom transmission fluid cooler tube and returns to the transmission through the top transmission fluid cooler tube.

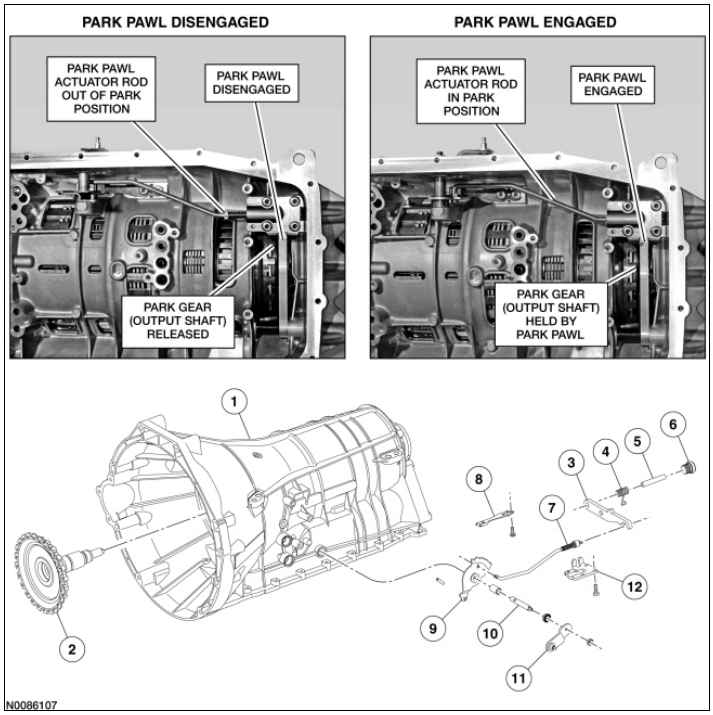
With lower transmission fluid temperatures, the thermal bypass valve in the transmission case will bypass the transmission fluid cooler tubes and redirect the fluid to the lubrication circuit. As transmission fluid temperature increases, the thermal bypass valve directs the fluid to the transmission fluid cooler.

Transmission fluid from the transmission fluid cooler or the thermal bypass valve enters the main lubrication circuit from the top transmission fluid cooler tube port.

Transmission fluid in the lubrication circuit flows to each of the balance pistons for the forward (A), direct (B) and Overdrive (O/D) (E) clutches. The balance pistons prevent unwanted clutch application when the clutch cylinder rotates at high speeds and hydraulic controls have released the clutch.

Lubrication Passages

Item	Description
1	Transmission fluid cooler return (inlet from the transmission fluid cooler)
2	Transmission fluid cooler pressure (outlet to the transmission fluid cooler)



Park

The park gear is part of the output shaft assembly. The park gear has lugs on its OD surface that the park pawl engages with to lock the output shaft.

The park lock prevents the vehicle wheels from rotating by allowing the output shaft to be held stationary by the transmission case through the park pawl. When the park pawl is engaged in the park gear, the output shaft is held stationary.

When the manual control lever is rotated to the PARK position, the park lock works as follows:

- The detent assembly (connected to the manual control shaft) rotates and pushes the park pawl actuator rod into the park pawl. The actuator rod is spring loaded.
- The actuator rod is guided into the park pawl by the park pawl abutment.
- When the park pawl actuator rod is pushed into the park pawl, the park pawl pivots into the park gear and engages with the lugs.
- The park pawl holds the output shaft to the transmission case.

Item	Part Number	Description

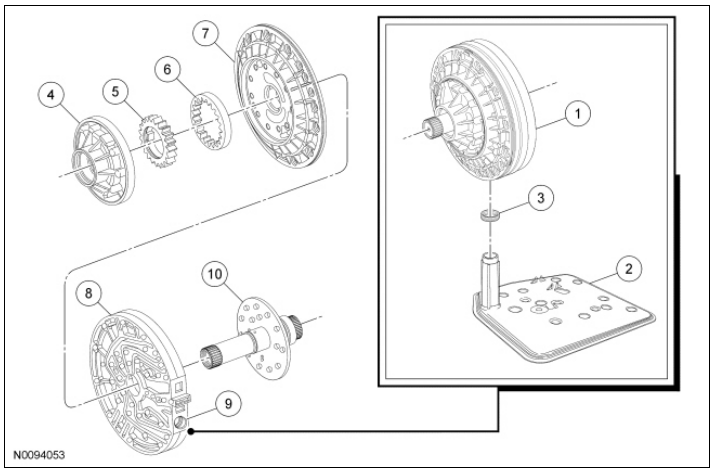
Hydraulic System

Pump Assembly and Transmission Fluid Filter

This transmission has a gear type pump that supplies transmission fluid pressure to the hydraulic system.



The inner (drive) gear is turned by the torque converter hub.

The transmission fluid pump has the following parts:

- Pump body, with inner (drive) and outer (driven) gears
- Centering plate
- Intermediate plate
- Stator shaft

The transmission fluid pump draws transmission fluid from the sump area, formed by the transmission fluid pan, through the transmission fluid filter, which is installed into the intermediate plate portion of the pump assembly and sealed by a rubber seal. A magnet attached to the transmission fluid pan collects any metallic material in the transmission fluid.

Pump Assembly and Transmission Fluid Filter Components

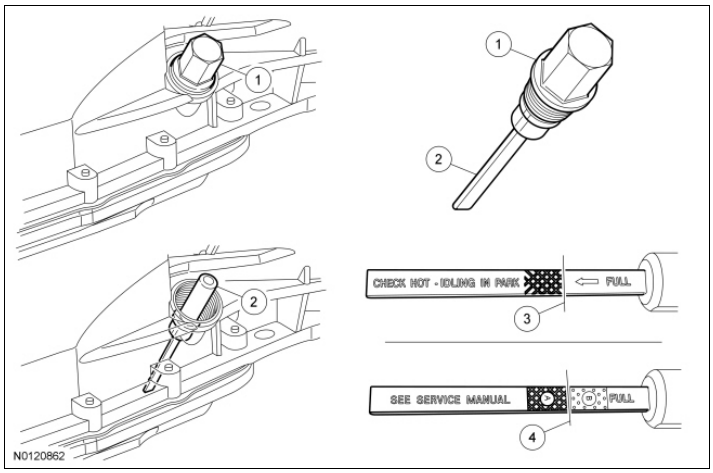
4	-	Transmission fluid pump body (part of 7A103)
5	-	Inner (drive) gear (part of 7A103)
6	-	Outer (driven) gear (part of 7A103)
7	-	Centering plate (part of 7A103)
8	-	Intermediate plate (part of 7A103)
9	-	Filter suction port

10	-	Stator shaft (part of 7A103)



Transmission Fluid Level Indicator

A removable dipstick-type fluid level indicator is located on the right front area of the transmission case. It is held in by an external fluid fill plug. The transmission fluid level indicator is removed with the transmission fluid fill plug. The transmission fluid level indicator is removed from the fill plug to check the transmission fluid level.

The transmission fluid level is correctly checked when the transmission is at normal operating temperature, 80ºC-85ºC (175ºF-185ºF), and the vehicle is on a level surface.

The transmission can have 2 types of transmission fluid level indicators, the original or the replacement. The original transmission fluid level indicator has a single crosshatch area for the fluid level. The replacement has 2 areas for the fluid level, a crosshatched (labeled A) area and a dotted (labeled B) area. Use the crosshatched area when checking the transmission fluid level. The correct transmission fluid level is at the upper level of the crosshatch marks on the transmission fluid level indicator.

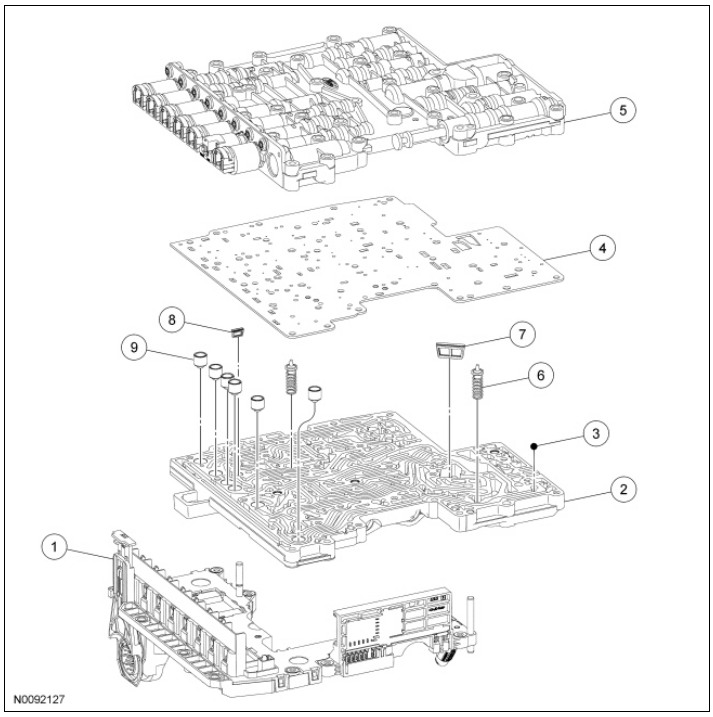
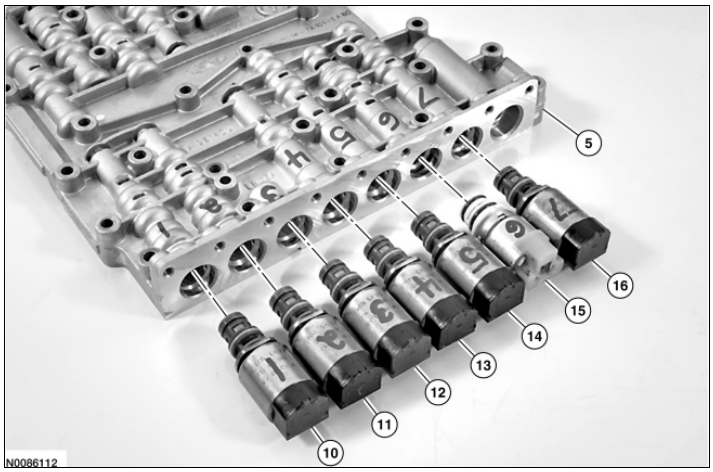
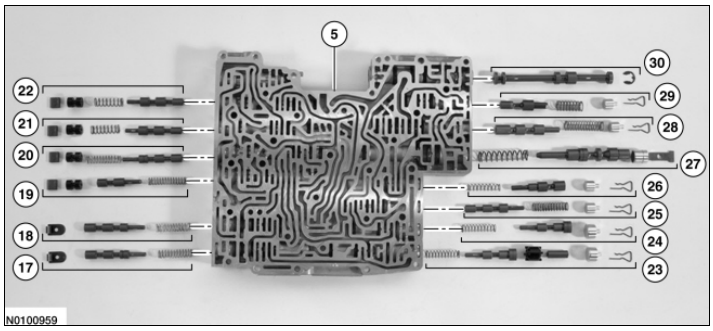
2	7A010	Transmission fluid level indicator
3	-	Original transmission fluid level indicator FULL line
4	-	Replacement transmission fluid level indicator FULL line



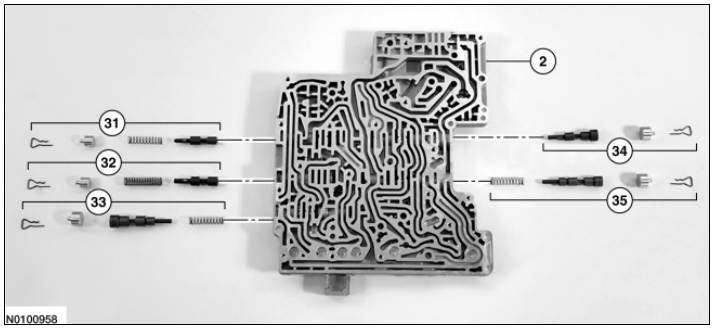
Main Control (Mechatronic) Assembly



The hydraulic system of this transmission includes the fluid pump, a main control, or mechatronic assembly and fluid passages in the transmission case and center support to apply the clutches.



The main control assembly has an upper valve body assembly, a separator plate and a lower valve body assembly. The lower valve body assembly has 7 solenoids to control the valves in the main control.



The Transmission Control Module (TCM) is part of the mechatronic assembly and is bolted to it. The Turbine Shaft Speed (TSS) sensor, Output Shaft Speed (OSS) sensor, Transmission Range (TR) sensor and the Transmission Fluid Temperature (TFT) sensor are all part of the TCM .

Mechatronic Assembly

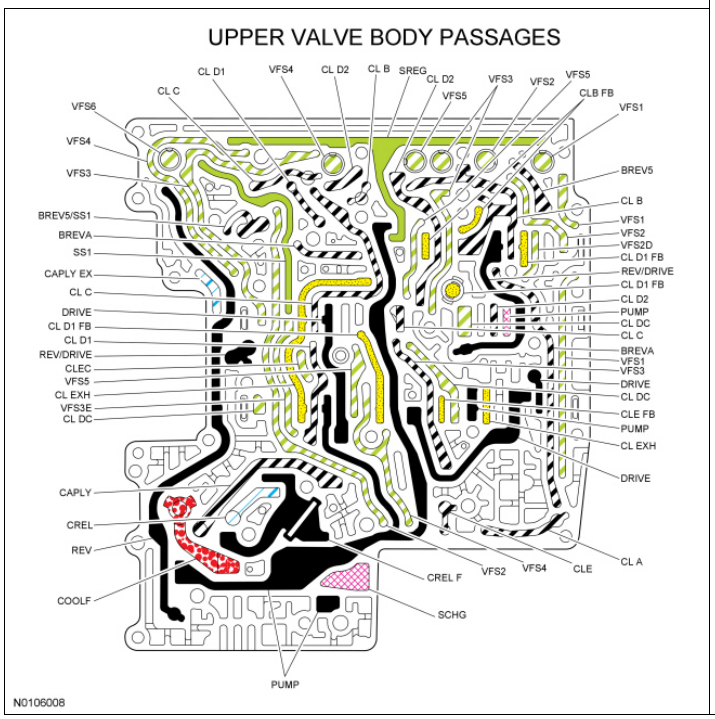
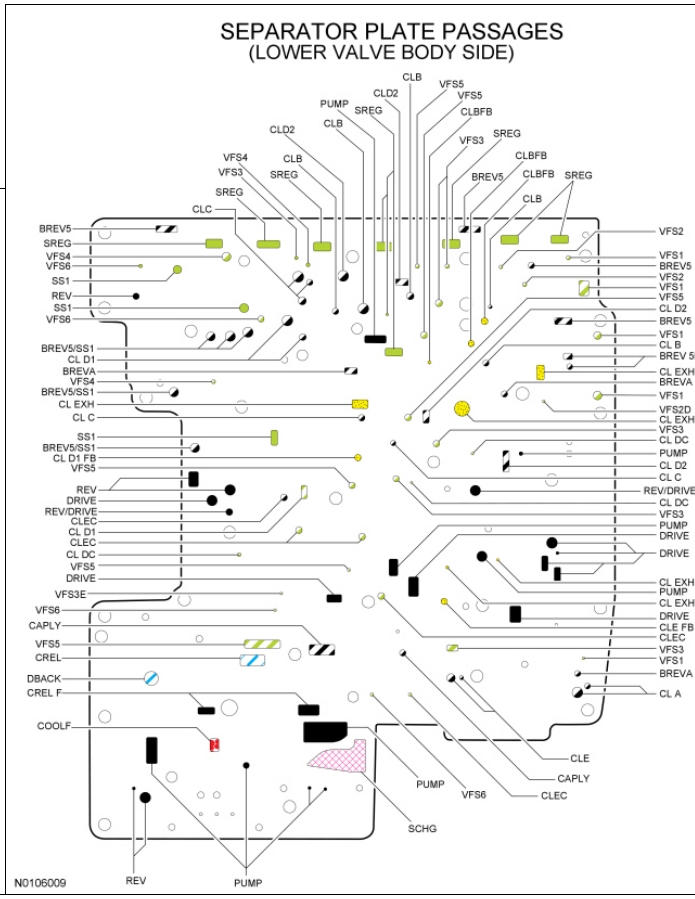
Hydraulic Circuits

Hydraulic Circuit Identification and Function

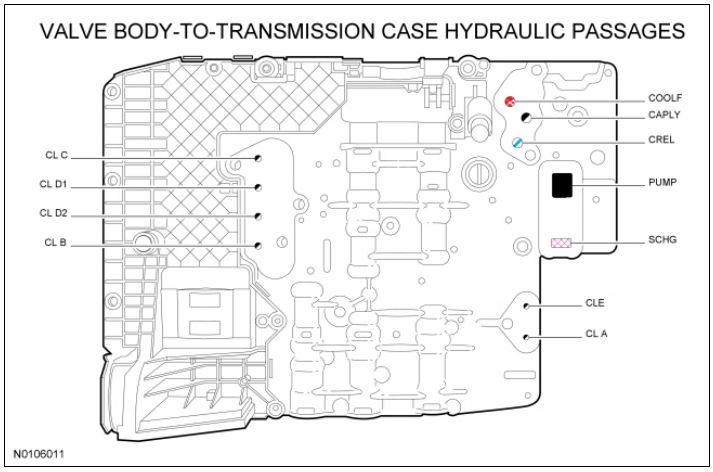


Hydraulic Circuit Identification Chart



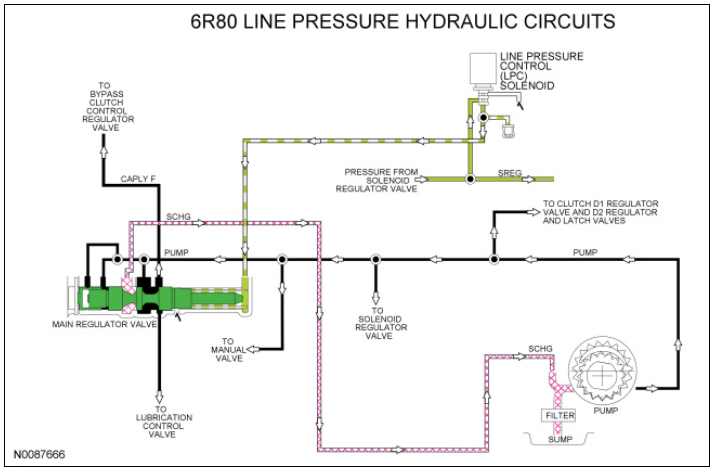
Circuit Name	Description
BREVA	BREV5 pressure from the drive enable valve to the clutch A regulator valve.
BREV5	BREV 5F pressure from the clutch A latch valve to the drive enable valve and the No. 2 shuttle ball.
BREV 5F	Regulated line pressure from the CL B circuit directed to the A clutch latch valve by the B clutch latch valve.
BREV5/SS1	BREV5 or SS1 pressure from the No. 2 shuttle ball to the solenoid multiplex valve.
CAPLY	Apply circuit to the torque converter, also the return circuit during Torque Converter Clutch (TCC) release.
CAPLY EX	TCC release pressure from the bypass clutch control regulator valve to the converter release regulator valve.
CAPLY F	Line pressure from the PUMP circuit directed to the bypass clutch control regulator valve by the main regulator valve.
CL A	Regulated line pressure from the clutch A regulator valve to the clutch A latch valve and the forward (A) clutch to apply the clutch.
CLA FB	Regulated line pressure from the clutch A latch valve that feeds back to the clutch A regulator valve.
CL B	Regulated line pressure from the clutch B regulator valve to the clutch B latch valve and the direct (B) clutch to apply the clutch.
CLB FB	Regulated line pressure from the clutch B latch valve that feeds back to the clutch B regulator valve.
CL C	Regulated line pressure from the clutch C regulator valve to the intermediate (C) clutch to apply the clutch.
CL D1	

	Regulated line pressure from the clutch D1 regulator valve to the clutch D1 latch valve and the low/reverse (D) clutch to apply the clutch.
CL D1 FB	Regulated line pressure from the clutch D1 latch valve that feeds back to the clutch D1 regulator valve.
CL D2	Regulated line pressure from the clutch D2 regulator valve to the low/reverse (D) clutch to apply the clutch.
CL DC	Regulated solenoid output pressure from Shift Solenoid D (SSD) directed by the solenoid multiplex valve to the D1 and D2 regulator and latch valves to apply the low/reverse (D) clutch.
CLE	Regulated line pressure from the clutch E regulator valve to the clutch E latch valve and the Overdrive (O/D) (E) clutch to apply the clutch.
CLEC	Regulated solenoid output pressure from the CLEC F circuit directed by the drive enable valve to the clutch E regulator and latch valves to apply the clutch.
CLEC F	Regulated solenoid output pressure from the VFS4 circuit directed to the drive enable valve by the solenoid multiplex valve to move the clutch E regulator and latch valves to apply the O/D (E) clutch.
CLE FB	Regulated line pressure from the clutch E latch valve that feeds back to the clutch E regulator valve.
CL EXH	Line pressure regulated to approximately 21 kPa (3 psi) by the D2 latch valve that supplies exhaust pressure to the A, B, C, D1 and E clutch when the clutches are released.
COOLF	Pressure from the lubrication control valve to the oil cooler or the thermal bypass valve that feeds the lubrication circuit.
CREL	Pressure supplied to the torque converter by the converter release regulator valve to release the TCC .
CREL F	Line pressure from the main regulator valve that supplies the converter release regulator valve and the lubrication control valve.
DBACK	CAPLY EX pressure directed to the drain back valve by the converter release regulator valve.
DRIVE	Line pressure directed by the manual valve to the A, C and E clutch regulator valves and the No. 1 shuttle ball.
LUBE	Transmission lubrication circuit supplied by the COOLF circuit after the fluid circulates the transmission fluid cooler or is returned by the cooler bypass valve.
PUMP	Line pressure supplied by the pump to the manual valve, solenoid pressure regulator valve, main regulator valve, clutch D1 regulator valve, clutch D2 regulator valve and clutch D2 latch valve.
REV	Line pressure from the manual valve to the No. 1 shuttle ball and the solenoid multiplex valve.
REV/DRIVE	REV or DRIVE pressure from the No. 1 shuttle ball to the clutch B regulator valve.
SCHG	Line pressure from the main regulator valve to the pump suction port.
SREG	Line pressure from the solenoid regulator valve that supplies pressure to the 7 solenoids (Shift Solenoid A (SSA), Shift Solenoid B (SSB), Shift Solenoid C (SSC), SSD , Shift Solenoid E (SSE), TCC solenoid and Line Pressure Control (LPC) solenoid).
SS1	Solenoid output pressure from SSE to the drive enable valve and to shuttle ball No. 2. to direct SSD output pressure to clutch E regulator and latch valves to apply the O/D (E) clutch.
VFS1	Solenoid output pressure from SSA to the A clutch regulator and latch valve to apply the forward (A) clutch.
VFS2	Solenoid output pressure from SSB to the B clutch regulator and latch valve to apply the direct (B) clutch and is also routed to the D1 latch valve.
VFS2D	SSB output pressure from the VFS2 circuit directed to the clutch B regulator valve by the D1 latch valve.



VFS3	Solenoid output pressure from SSC to the C clutch regulator valve to apply the intermediate (C) clutch and is also routed to the clutch E latch valve.
VFS3E	SSC output pressure from the VFS3 circuit directed to the clutch C regulator valve by the clutch E latch valve.
VFS4	Solenoid output pressure from SSD to the solenoid multiplex valve to apply either the D or E clutch.
VFS5	Solenoid output pressure from the LPC solenoid to the main regulator valve to control line pressure.
VFS6	Solenoid output pressure from the TCC solenoid to the bypass clutch control regulator valve and the converter release regulator valve to control the TCC .

Main Control Hydraulic Passage Identification

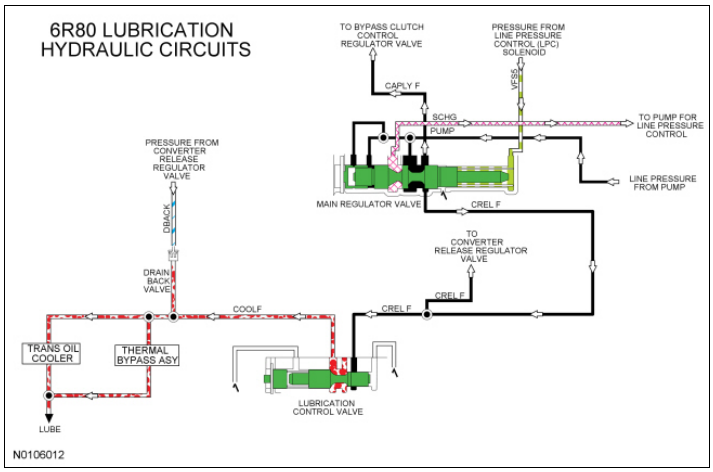


Line Pressure Hydraulic Circuits

The Transmission Control Module (TCM) controls line pressure with the Line Pressure Control (LPC) solenoid. Varying pressure from the LPC solenoid effects shift feel while allowing sufficient pressure for clutch application.

When the engine is running, the pump supplies pressure to the main regulator valve through the PUMP circuit. The position of the main regulator valve controls line pressure (in the PUMP circuit). Pressure from the LPC solenoid through the VFS5 circuit controls the position of the main regulator valve.

The main regulator valve varies pressure in the SCHG circuit. The higher the pressure in the SCHG circuit, the lower the line pressure (PUMP circuit) is. As SCHG pressure decreases, line pressure (PUMP circuit) increases.

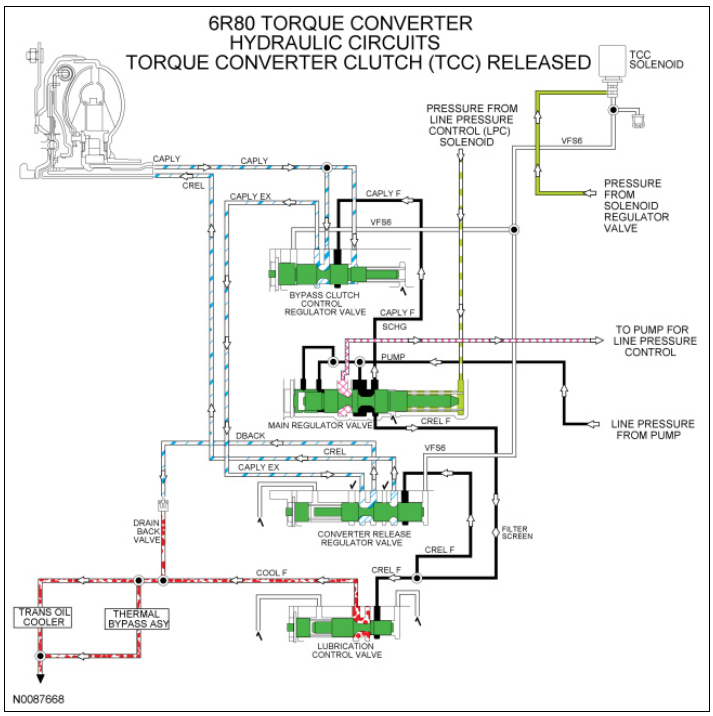


Lubrication Hydraulic Circuits

The main regulator valve supplies pressure to the lubrication control valve through the CREL F circuit. When the Torque Converter Clutch (TCC) is applied, the lubrication control valve supplies the transmission lubrication through the COOLF circuit to the LUBE circuit.

When the TCC is released, return fluid from the torque converter is supplied to the LUBE circuit through the CAPLY, CAPLY EX and DBACK circuits.

Pressure in the LUBE circuit either circulates through the thermal bypass valve when Transmission Fluid Temperature (TFT) is below operating temperature or through the transmission fluid cooler when the transmission fluid is at or above operating temperature. Return fluid from the thermal bypass valve or the transmission fluid cooler enters the input shaft through the pump assembly and flows through passages in the input shaft, intermediate shaft and output shaft to provide lubrication for the transmission.

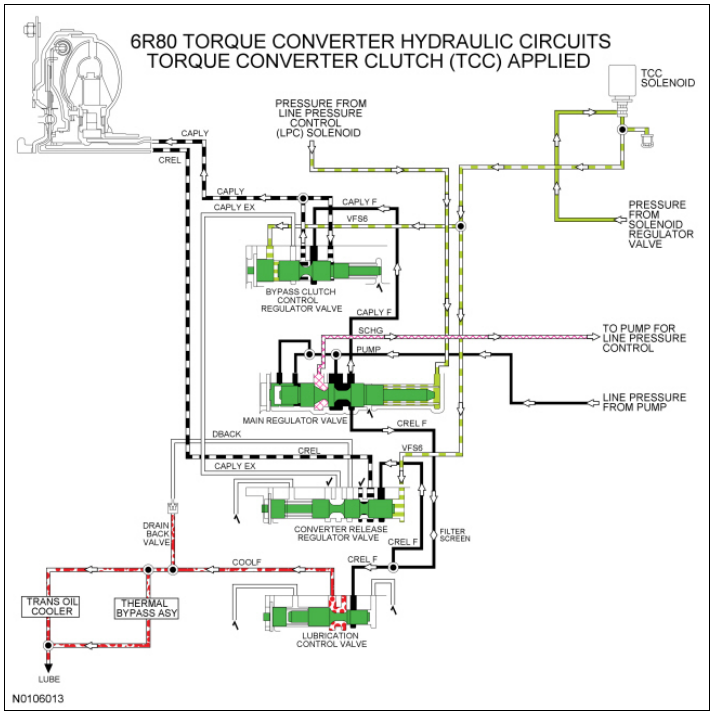


Torque Converter Hydraulic Circuits

When the TCC is released, line pressure is supplied to the converter release regulator valve from the lubrication control valve through the CREL F circuit. The converter release regulator valve supplies pressure to the torque converter through the CREL circuit to release the torque converter.

CREL pressure exits the torque converter through the CAPLY circuit and goes to the bypass clutch control regulator valve. The bypass clutch control regulator valve directs the fluid back to the converter release regulator valve through the CAPLY EX circuit. The converter release regulator valve directs the fluid to the

DBACK circuit where it supplies lubrication in the LUBE circuit.

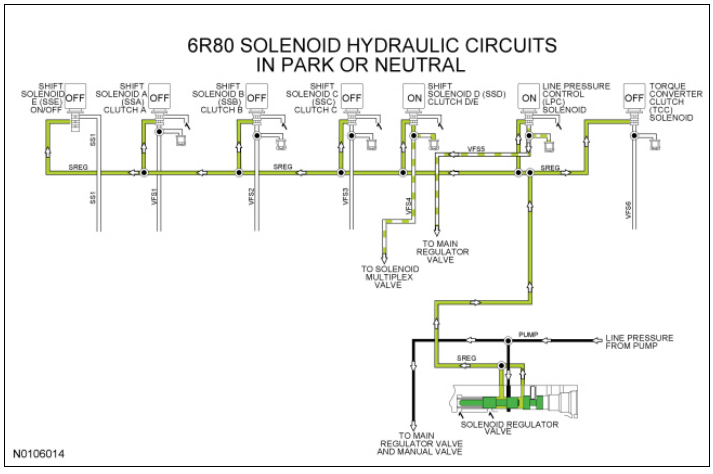


When the TCC is applied, the TCC solenoid applies hydraulic pressure to the bypass clutch control regulator valve and the converter release regulator valve through the VFS6 circuit to position the valves to apply the TCC .

Line pressure is supplied to the bypass clutch control regulator valve from the main regulator valve. The bypass clutch control regulator valve directs regulated line pressure to the TCC through the CAPLY circuit to apply the TCC .

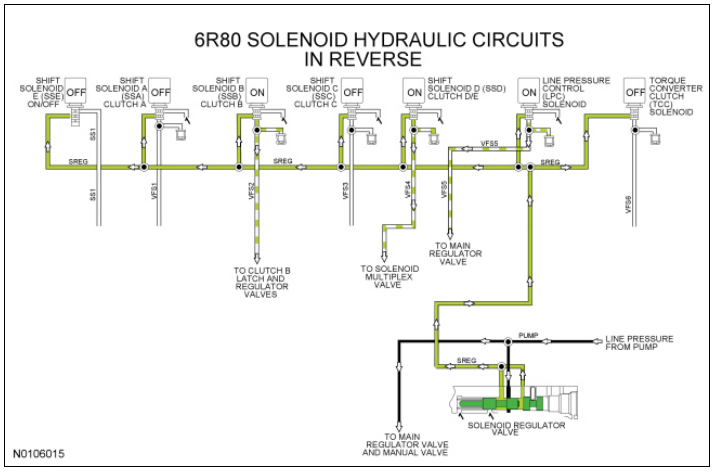
CAPLY pressure exits the torque converter through the CREL circuit and goes to the converter release regulator valve.

For torque converter description and function, refer to Torque Converter Contamination Inspection in this section.



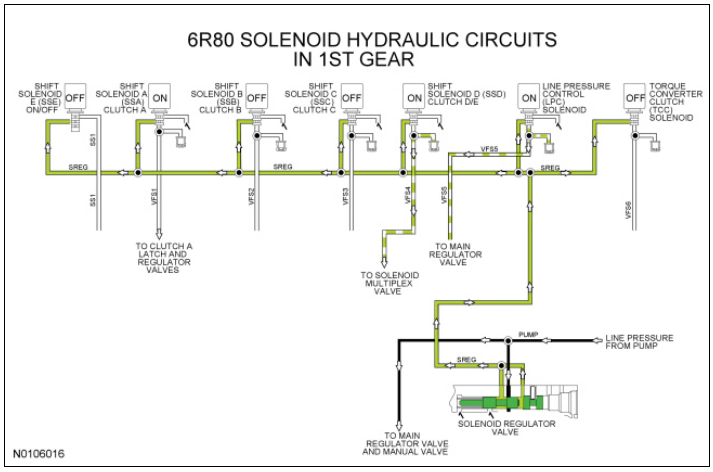
Solenoid Hydraulic Circuits

LINE pressure from the pump is directed to the individual shift, TCC and LPC solenoids by the solenoid regulator valve through the SREG circuit. The solenoids, controlled by the TCM , direct full or regulated SREG pressure to the valves that they control.

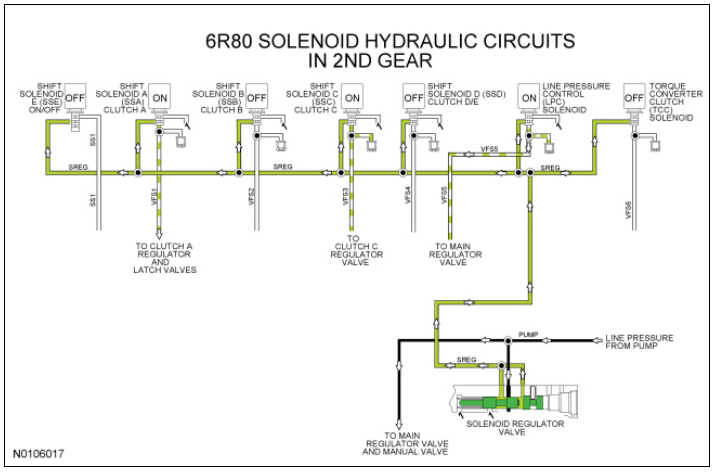


For electrical operation of the solenoids, refer to Transmission Electronic Control System in this section.

The LPC solenoid sends varying pressure to the main regulator valve to control line pressure.

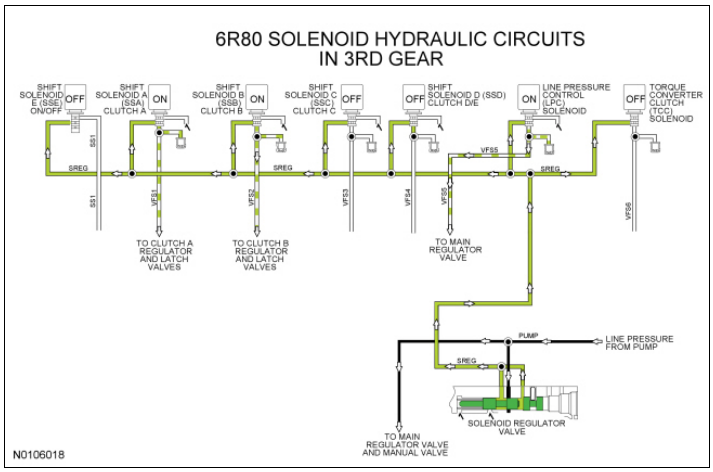


In the PARK and NEUTRAL position, the TCM supplies low amperage to Shift Solenoid D (SSD) to apply high-regulated pressure to the solenoid multiplex valve which directs the pressure to the D1 and D2 regulator and latch valves to apply the low/reverse clutch (D).

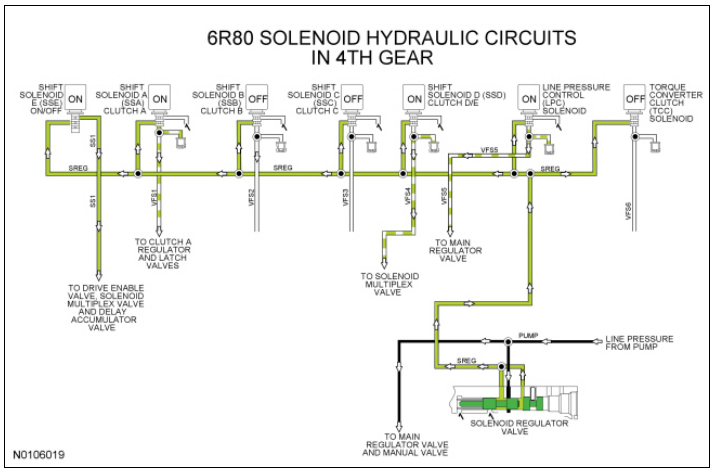


In the REVERSE position, the TCM supplies low amperage to Shift Solenoid B (SSB) to apply high-regulated pressure to the clutch B regulator and latch valves to apply the direct clutch (B). The TCM also supplies low amperage to SSD to apply high-regulated pressure to the solenoid multiplex valve which directs the pressure to the D1 and D2 regulator and latch valves to apply the low/reverse clutch (D).

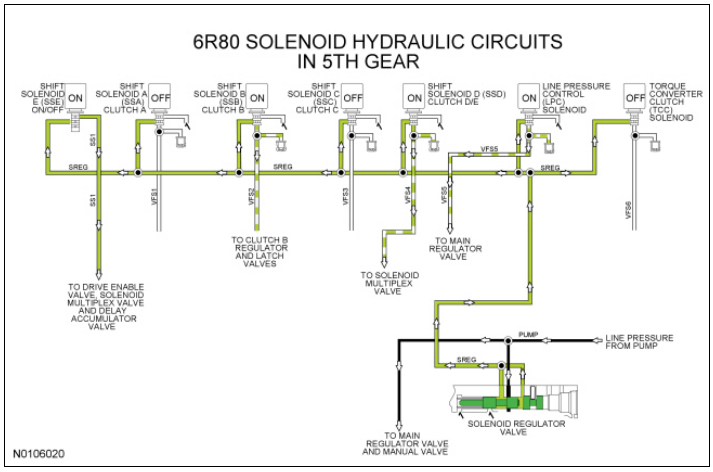
In 1st gear, the TCM supplies high amperage to Shift Solenoid A (SSA) to apply high-regulated pressure to the clutch A regulator and latch valves to apply the forward clutch (A). The TCM also supplies low amperage to SSD to apply high-regulated pressure to the solenoid multiplex valve which directs the pressure to the D1 and D2 regulator and latch valves to apply the low/reverse clutch (D).



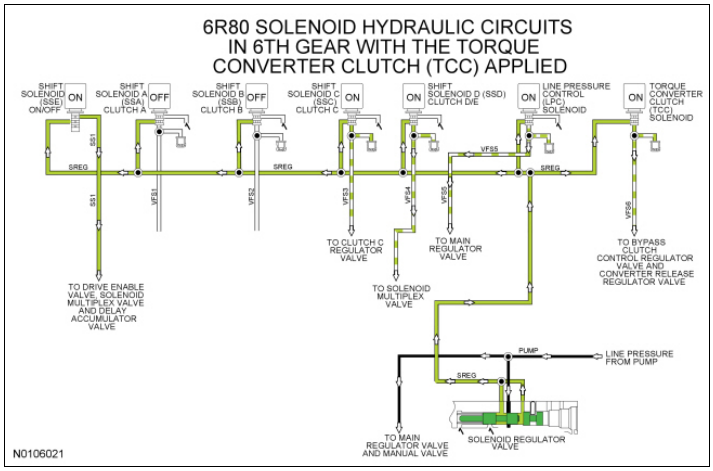
In 2nd gear, the TCM supplies high amperage to SSA to apply high-regulated pressure to the clutch A regulator and latch valves to apply the forward clutch (A). The TCM also supplies high amperage to Shift Solenoid C (SSC) to apply high-regulated pressure to the clutch C regulator valve to apply the intermediate clutch (C).



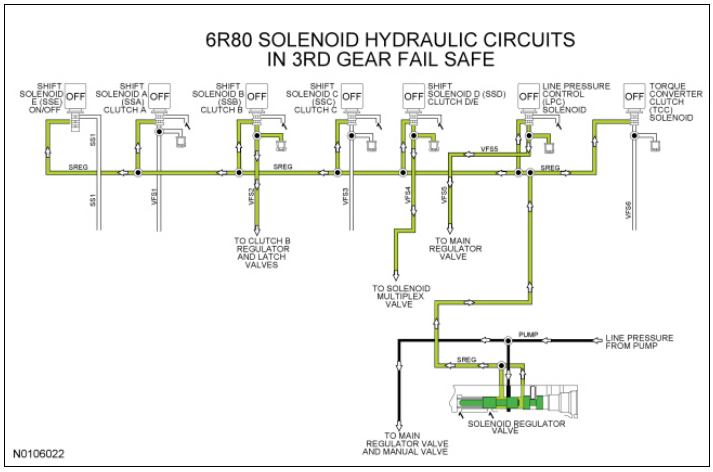
In 3rd gear, the TCM supplies high amperage to SSA to apply high-regulated pressure to the clutch A regulator and latch valves to apply the forward clutch (A). The TCM also supplies low amperage to Shift



Solenoid B (SSB) to apply high-regulated pressure to the clutch B regulator and latch valves to apply the direct clutch (B).



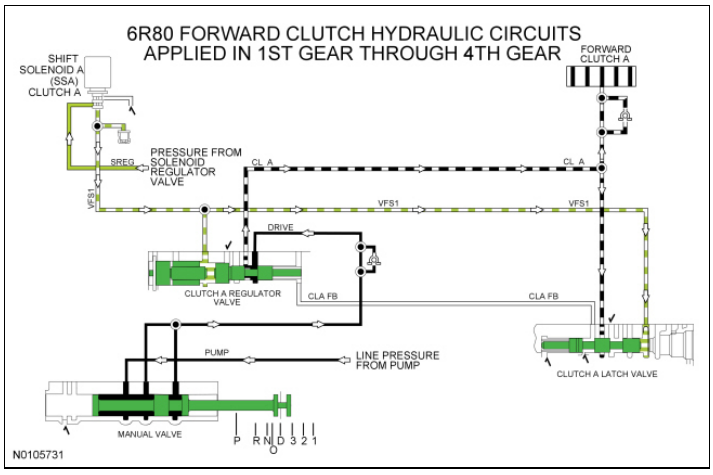
In 4th gear, the TCM supplies high amperage to SSA to apply high-regulated pressure to the clutch A regulator and latch valves to apply the forward clutch (A). The TCM also supplies low amperage to SSD to apply high-regulated pressure to the solenoid multiplex valve which directs the pressure to the clutch E regulator and latch valves to apply the Overdrive (O/D) clutch (E). The TCM turns on Shift Solenoid E (SSE) to apply pressure to the solenoid multiplex valve and the drive enable valve to direct SSD pressure to the clutch E regulator and latch valves.



In 5th gear, the TCM supplies low amperage to SSD to apply high-regulated pressure to the solenoid multiplex valve which directs the pressure to the clutch E regulator and latch valves to apply the O/D clutch (E). The TCM turns on SSE to apply pressure to the solenoid multiplex valve and the drive enable valve to direct SSD pressure to the clutch E regulator and latch valves. The TCM also supplies low amperage to SSB to apply high-regulated pressure to the clutch B regulator and latch valves to apply the direct clutch (B).

In 6th gear, the TCM supplies low amperage to SSD to apply high-regulated pressure to the solenoid multiplex valve which directs the pressure to the clutch E regulator and latch valves to apply the O/D clutch (E). The TCM turns on SSE to apply pressure to the solenoid multiplex valve and the drive enable valve to direct SSD pressure to the clutch E regulator and latch valves. The TCM also supplies high amperage to SSC to apply high-regulated pressure to the clutch C regulator valve to apply the intermediate clutch (C). To apply the TCC , the TCM supplies high amperage to the TCC solenoid to apply high-regulated pressure to the converter release regulator valve and the bypass clutch control regulator valve to apply the TCC .

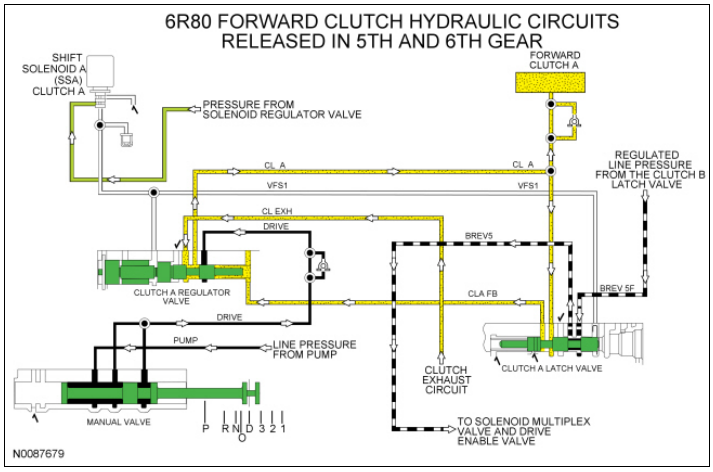
In 3rd gear fail safe, all solenoids are off. SSB , in the off position, applies high pressure to the clutch B regulator and latch valves to apply the direct clutch (B). The forward clutch (A) is hydraulically applied in 3rd gear fail safe. The LPC solenoid provides maximum solenoid pressure to the main regulator valve for maximum line pressure. Also, SSD is on which applies high pressure to the solenoid multiplex valve which is directed to the drive enable valve where it is blocked.



Forward Clutch (A) Hydraulic Circuits

To apply the forward clutch (A), the manual valve must be in the DRIVE, 3, 2 or 1 position to provide line pressure to the clutch A regulator valve through the DRIVE circuit.

For the forward clutch (A) to apply, SSA provides regulated solenoid pressure from the SREG circuit to the clutch A regulator and latch valves through the VFS1 circuit to position the valves to apply the forward clutch (A). As the forward clutch is applied, SSA increases pressure to the clutch A regulator and latch valves.

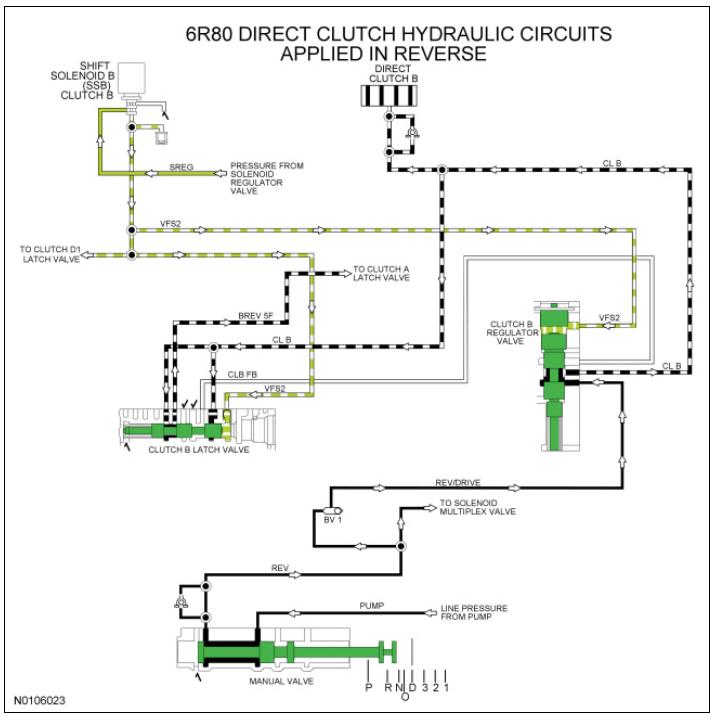


The clutch A regulator valve provides regulated line pressure to the CL A circuit to apply the forward clutch (A).

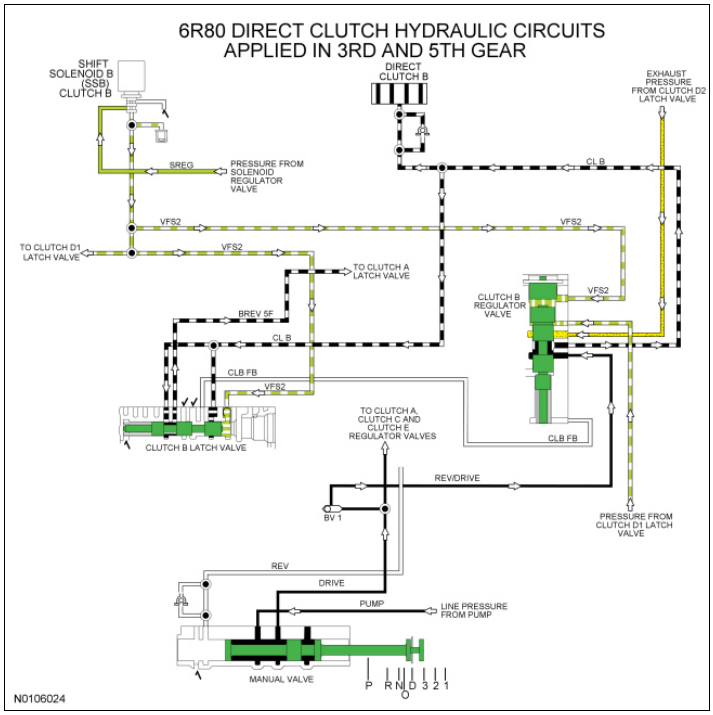
The forward clutch (A) is released when the manual valve is in the NEUTRAL, REVERSE or PARK position or the when the manual valve is in the DRIVE position with the transmission in 5th or 6th gear.

SSA lowers pressure to the clutch A regulator and latch valve to position the valves to lower the regulated line pressure in the CL A circuit to release the clutch.

When the forward clutch (A) is released, the clutch A regulator valve directs exhaust circuit pressure from the CL EXH circuit to the CL A circuit to fill the circuit and the forward clutch (A) with fluid at low pressure, approximately 21 kPa (3 psi).



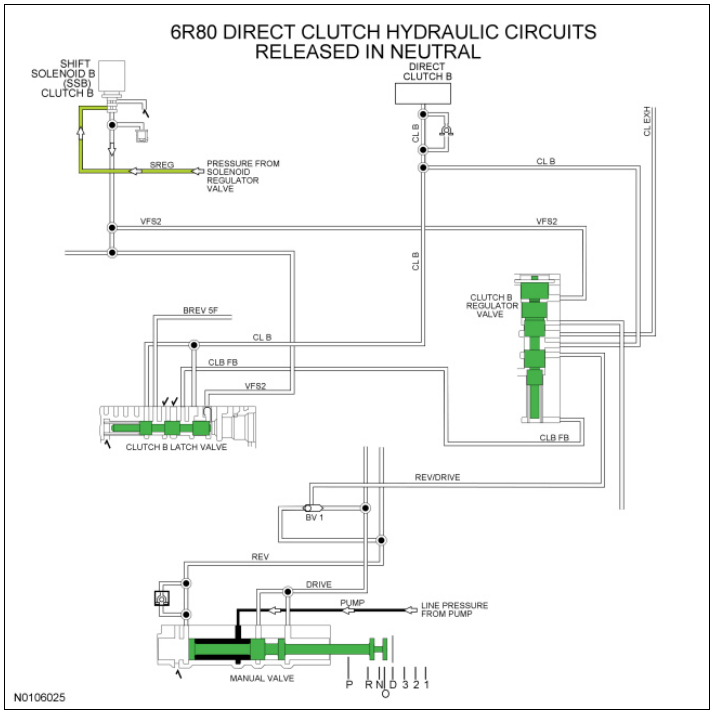
Direct Clutch (B) Hydraulic Circuits



To apply the direct clutch (B), the manual valve can be in the REVERSE, DRIVE, 3, 2 or 1 position to provide line pressure to the clutch B regulator valve through the REV/DRIVE circuit.

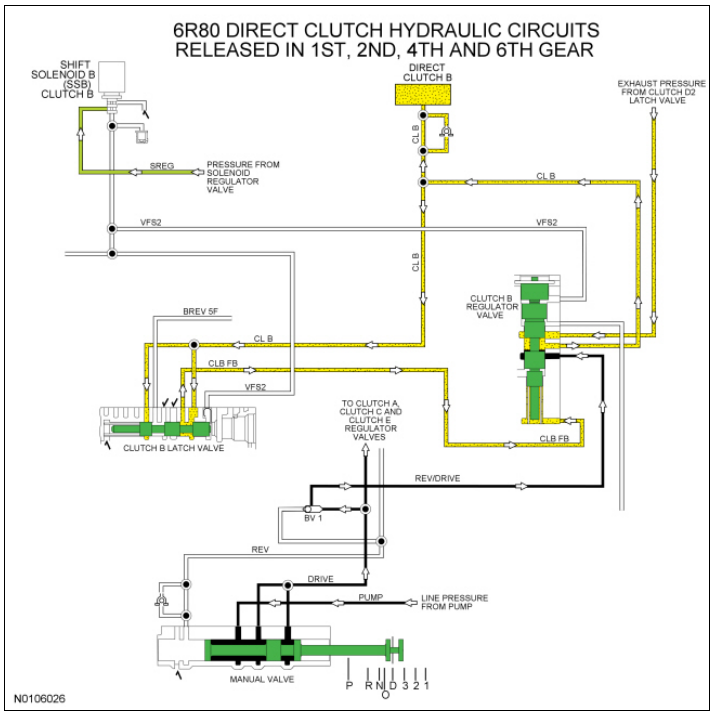
For the direct clutch (B) to apply in reverse, SSB provides regulated solenoid pressure from the SREG circuit to the clutch B regulator and latch valves through the VFS2 circuit to position the valves to apply the direct clutch (B). As the direct clutch is applied, SSB increases pressure to the clutch B regulator and latch valves.

The clutch B regulator valve provides regulated line pressure to the CL B circuit to apply the direct clutch (B).



When the direct clutch (B) is applied in 3rd and 5th gear, regulated solenoid pressure from the D1 latch valve is supplied to the clutch B regulator valve through the VFS2D circuit and opposes pressure from the VFS2 circuit for clutch B valve positioning.

The direct clutch (B) is released when the manual valve is in the PARK or NEUTRAL position or when the manual valve is in the DRIVE position with the transmission in 1st, 2nd, 4th or 6th gear.

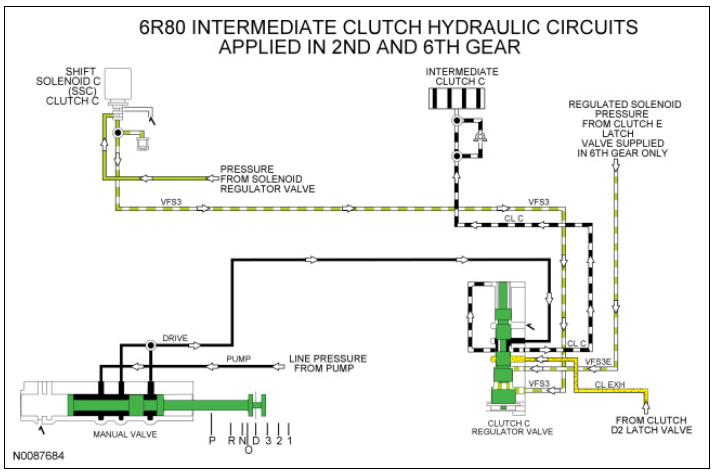


In NEUTRAL or PARK, the manual valve does not supply line pressure to the clutch B regulator valve. SSB lowers pressure to the clutch B regulator and latch valve to position the valves to lower the regulated line pressure in the CL B circuit to release the clutch.

In 1st, 2nd, 4th or 6th gear, the manual valve supplies line pressure to the clutch B regulator valve. SSB lowers pressure to the clutch B regulator and latch valve to position the valves to lower the regulated line pressure in the CL B circuit to release the clutch.

When the direct clutch (B) is released in 1st, 2nd, 4th or 6th gear, the clutch (B) regulator valve directs

exhaust circuit pressure from the CL EXH circuit to the CL B circuit to fill the circuit and the direct clutch (B) with fluid at low pressure, approximately 21 kPa (3 psi).

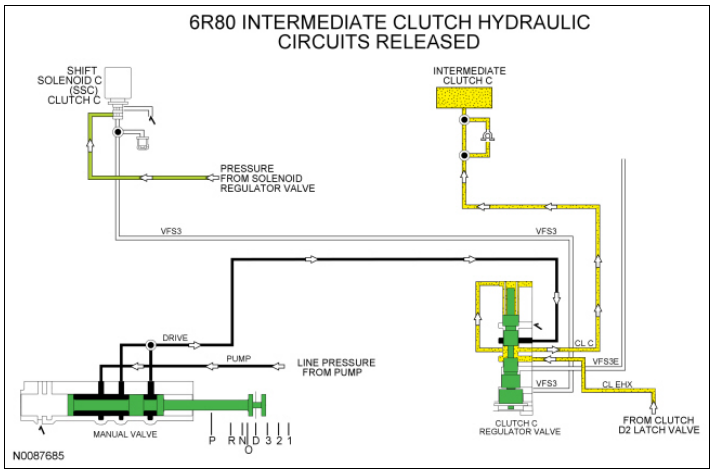


Intermediate Clutch (C) Hydraulic Circuits

To apply the intermediate clutch (C), the manual valve can be in the DRIVE, 3, 2 or 1 position to provide line pressure to the clutch C regulator valve through the DRIVE circuit.

SSC provides regulated solenoid pressure from the SREG circuit to the clutch C regulator valve through the VFS3 circuit to position the valve to apply the intermediate clutch (C). As the intermediate clutch (C) is applied, SSC increases pressure to the clutch C regulator valve.

The clutch C regulator valve provides regulated line pressure to the CL C circuit to apply the intermediate clutch (C).

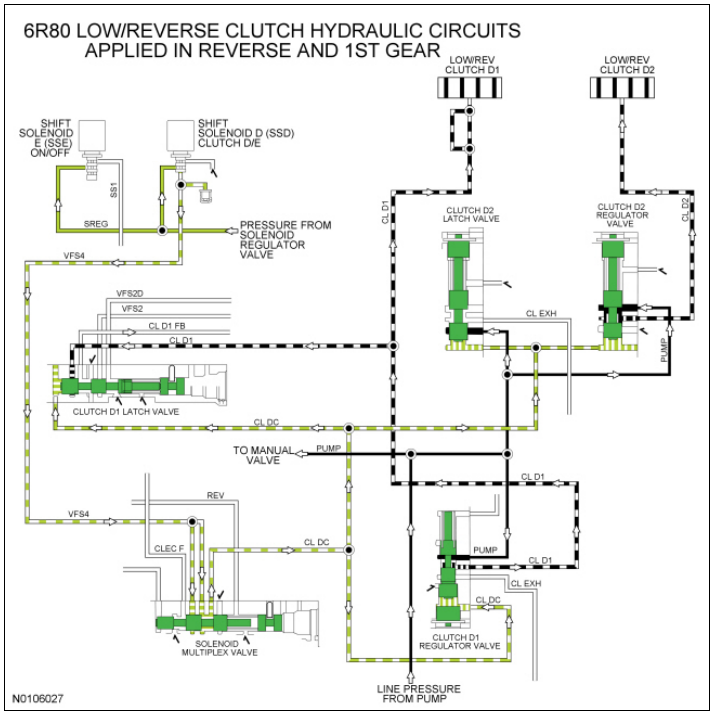


Regulated solenoid pressure from the clutch E latch valve is supplied to the clutch C regulator valve through the VFS3E circuit and opposes VFS3 pressure for clutch C regulator valve positioning in 6th gear only.

To release the intermediate clutch (C) when the manual valve is in the DRIVE, 3, 2 or 1 position SSC lowers pressure to the clutch C regulator valve to position the valve to lower the regulated line pressure in the CL C circuit to release the clutch.

When the intermediate clutch (C) is released, the clutch C regulator valve directs exhaust circuit pressure from the CL EXH circuit to the CL C circuit to fill the CL C circuit and the intermediate clutch (C) with fluid at low pressure, approximately 21 kPa (3 psi).

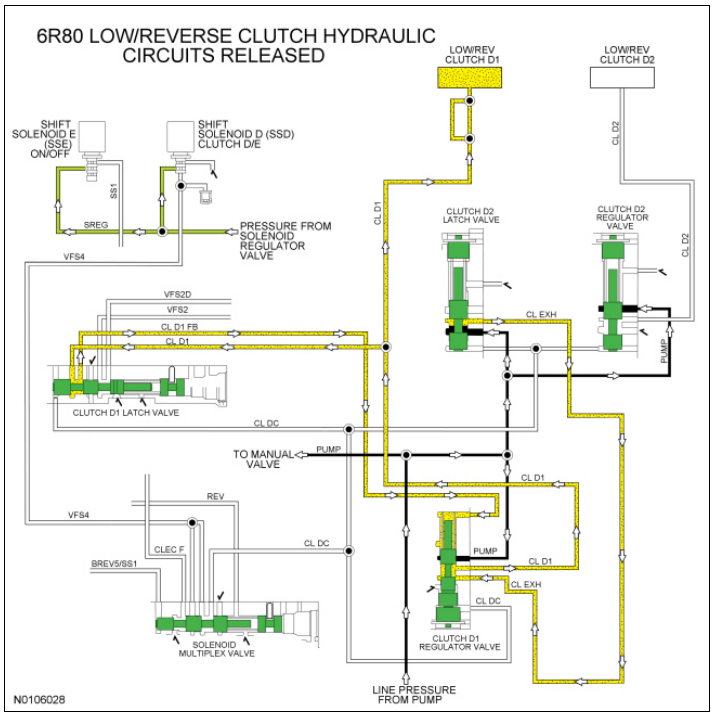
In PARK, REVERSE or NEUTRAL, the manual valve does not supply line pressure to the clutch C regulator valve.



Low/Reverse Clutch (D) Hydraulic Circuits

To apply the low/reverse clutch (D), the manual valve can be in any position. Line pressure is supplied to the D1 and D2 regulator and latch valves by the pump through the PUMP circuit.

SSD provides regulated solenoid pressure from the SREG circuit to the solenoid multiplex valve through the VFS4 circuit where it is directed to the D1 and D2 regulator and latch valves through the CL DC circuit to position the valves to apply the low/reverse clutch (D). As the low/reverse clutch (D) is applied, SSD increases pressure to the D1 and D2 clutch regulator and latch valves.

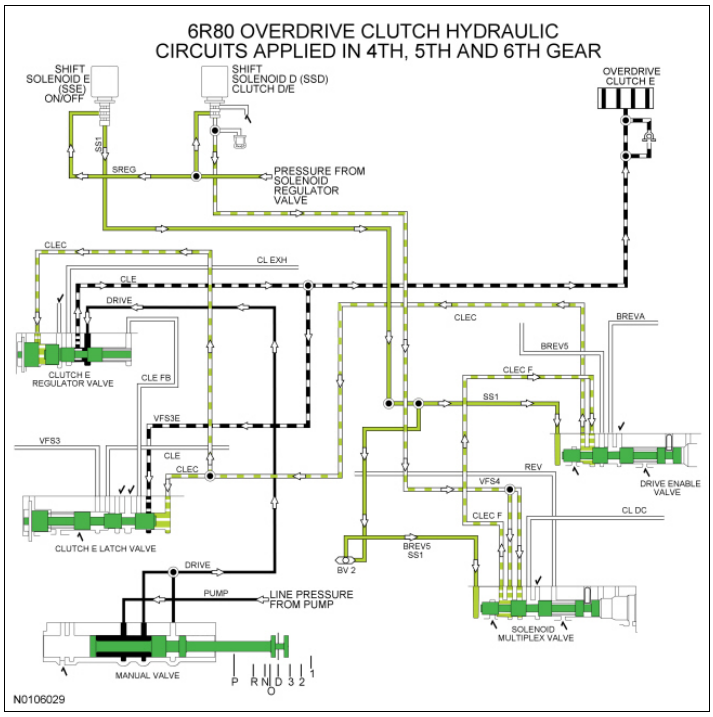


The clutch D1 and D2 regulator valves provide regulated line pressure from the PUMP circuit to the CL D1 and CL D2 circuits to apply the low/reverse clutch (D).

To release the low/reverse clutch (D), the manual valve can be in the DRIVE, 3 or 2 position. SSD lowers pressure to the VFS4 circuit which lowers pressure in the CL DC circuit to position the D1 and D2 regulator and latch valves to lower pressure in the CL D1 and CL D2 circuits and release the low/reverse clutch (D).

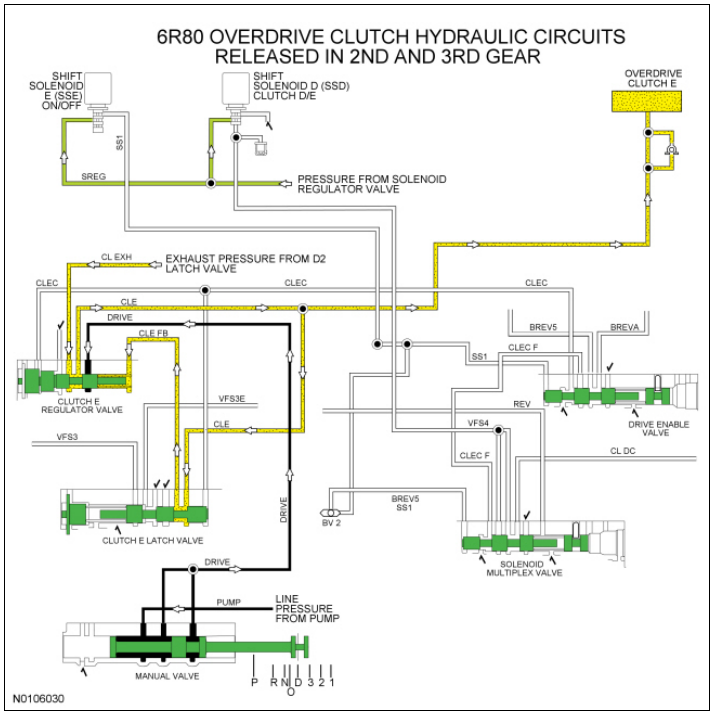
When the low/reverse clutch (D) is released, the clutch D2 latch valve directs line pressure regulated to approximately 21 kPa (3 psi) to the CL EXH circuit which fills the volume of the unused clutches and circuits.

When the low/reverse clutch (D) is released, the CL EXH circuit supplies the D1 regulator valve which fills the CL D1 circuit and the low/reverse (D) clutch.



Overdrive (O/D) Clutch (E) Hydraulic Circuits

To apply the O/D clutch (E), the manual valve must be in the DRIVE position. Line pressure is supplied to the clutch E regulator valve.



SSD provides regulated solenoid pressure from the SREG circuit to the solenoid multiplex valve through the VFS4 circuit. SSE supplies pressure to the solenoid multiplex valve and the drive enable valve to position the valves to direct pressure from the VFS4 circuit to the CLEC F and CLEC circuits to position the clutch E regulator and latch valves to apply the O/D clutch (E). As the O/D clutch (E) is applied, SSD increases pressure to the clutch E regulator and latch valve.

The clutch E regulator valve provides regulated line pressure from the DRIVE circuit to the CLE circuit to apply the O/D clutch (E).

To release the O/D clutch (E), the manual valve can be in any position. SSD lowers pressure to the VFS4 circuit which lowers pressure in the CLEC and CLEC F circuits and releases the O/D clutch (E). SSE blocks SREG pressure to the solenoid multiplex valve and the drive enable valve to allow SSD to control low/reverse clutch (D) operation.

When the O/D clutch (E) is released, the clutch E regulator valve directs exhaust circuit pressure from the CL EXH circuit to the CL E circuit to fill the circuit and the clutch with fluid at low pressure, approximately 21 kPa (3 psi).

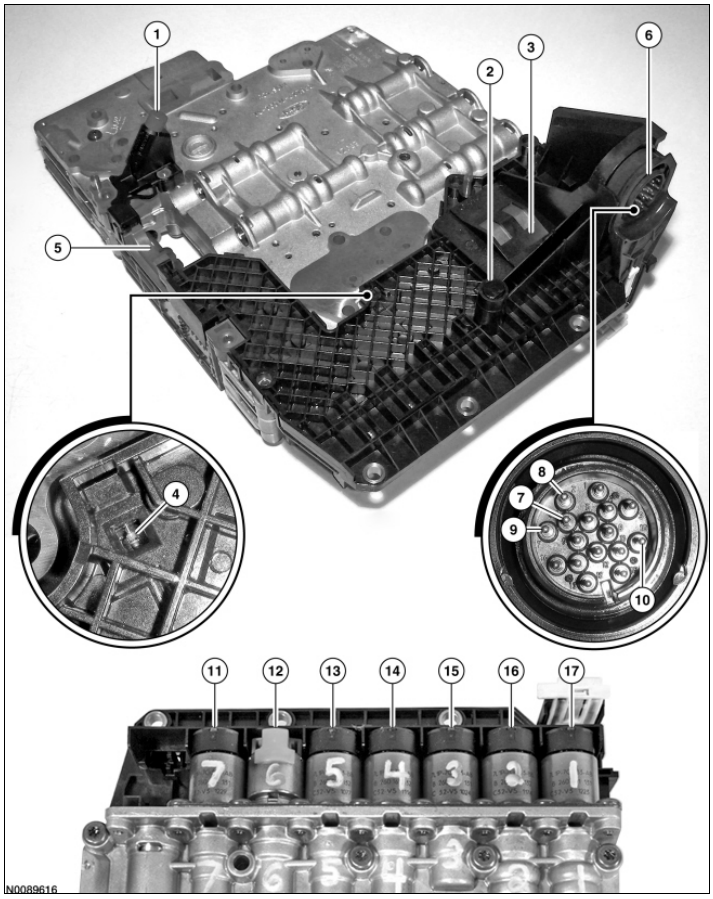
Transmission Electronic Control System

Transmission Control Module (TCM)

The Transmission Control Module (TCM) controls the functions of this transmission. The TCM is part of a molded plastic leadframe module that is bolted to the mechatronic assembly. The leadframe module also has the Turbine Shaft Speed (TSS) sensor, Output Shaft Speed (OSS) sensor, Transmission Range (TR) sensor and Transmission Fluid Temperature (TFT) sensor integrated into it.

The TCM responds to inputs from the sensors and from the vehicle Controller Area Network (CAN) signal. The TCM uses the inputs to control the line pressure, shift and TCC solenoids. The TCM also provides power and ground for the reverse lamp relay coil and provides a PARK/NEUTRAL start enable signal.



The TCM uses the following input from the vehicle CAN signal:

- Engine speed
- Engine torque
- Engine Coolant Temperature (ECT)
- Engine Oil Temperature (EOT)
- Throttle Position (TP)
- Accelerator Pedal Position (APP)
- Brake Pedal Position (BPP)
- ABS wheel speed
- Automatic Traction Control (ATC) status
- Four-Wheel Drive (4WD) status

The TCM also:

- monitors inputs and outputs for the presence of faults.
- stores DTCs related to detected faults.
- supplies output to the vehicle CAN for TR position, OSS , TSS , TFT , current gear and A/C inhibit.
- provides On-Board Diagnostic (OBD) information using the CAN signal to illuminate the Malfunction Indicator Lamp (MIL) or Transmission Control Indicator Lamp (TCIL).
- displays diagnostic information to a scan tool through the Data Link Connector (DLC).

Transmission Control Module (TCM)

Item	Part Number	Description
1	-	Turbine Shaft Speed (TSS) sensor
2	-	Output Shaft Speed (OSS) sensor

14	7G383	Line Pressure Control (LPC) solenoid
15	7G383	Shift Solenoid C (SSC) VFS
16	7G383	Shift Solenoid B (SSB) VFS
17	7G383	Shift Solenoid A (SSA) VFS

If the TCM detects a fault, it uses Failure Management and Effects Mode strategies to substitute a value or signal.

The TCM also uses Failure Management and Effects Mode strategies to compensate for detected solenoid or apply component faults that result in alternate shift patterns.

If the transmission loses complete electronic control, it will operate in a failsafe mode with:

- Maximum line pressure in all transmission ranges
- Functional PARK, REVERSE and NEUTRAL positions
- Operation in 3rd or 5th gear (depending on the failure conditions) when the selector lever is in the DRIVE, 3, 2 or 1 position
- TCC is released in all transmission ranges and gears

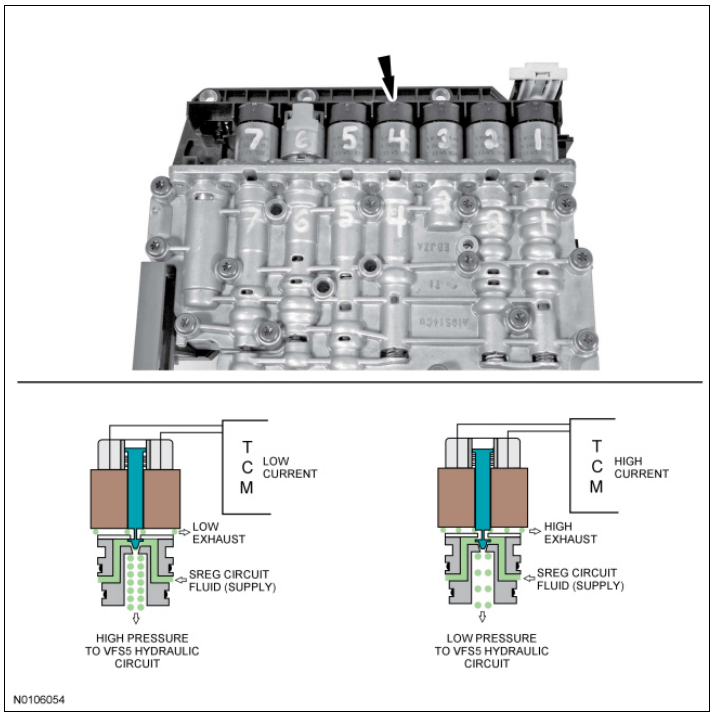
[a] Transmission control module (TCM) controlled

Line Pressure Control (LPC) Solenoid



The Line Pressure Control (LPC) solenoid is a Variable Force Solenoid (VFS) that varies hydraulic pressure by actuating a hydraulic valve.

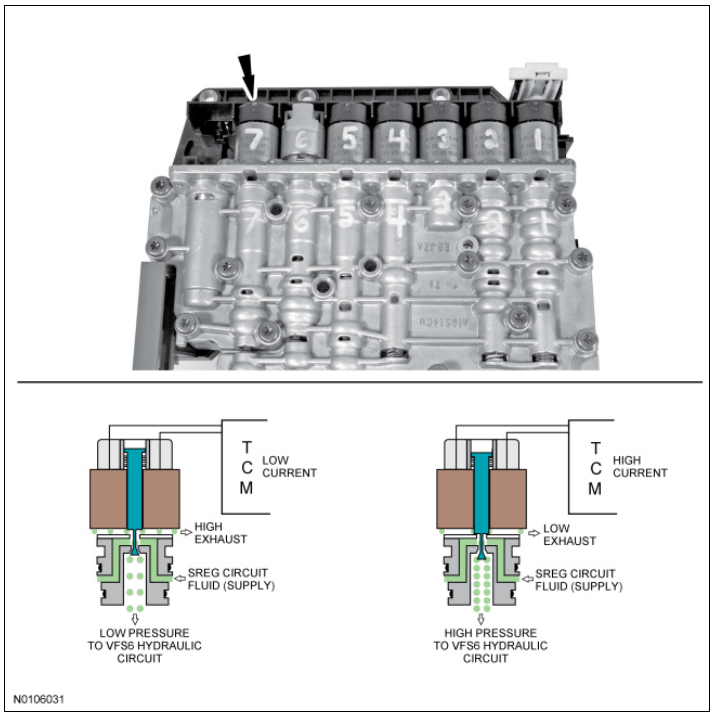
The TCM applies variable current to the LPC solenoid which varies pressure in the VFS5 hydraulic circuit to the Main Regulator Valve. Refer to Hydraulic Circuits in this section for information.

The LPC solenoid uses inversely proportional operation. As the current from the TCM decreases, the pressure from the solenoid increases. As the current from the TCM increases, the pressure from the solenoid decreases. The LPC solenoid is supplied hydraulic pressure from the SREG circuit.

With zero current, the LPC solenoid fully opens the hydraulic valve which applies the maximum amount of hydraulic pressure to the Main Regulator Valve through the VFS5 hydraulic circuit and applies maximum line pressure in the PUMP hydraulic circuit. With maximum current to the solenoid, the hydraulic valve fully closes the outlet port for minimum pressure to the VFS5 hydraulic circuit to lower the line pressure in the PUMP hydraulic circuit.

Line Pressure Control (LPC) Inversely Proportional Variable Force Solenoid (VFS)

Torque Converter Clutch (TCC) Solenoid



The TCC solenoid is a VFS that varies hydraulic pressure by actuating a hydraulic valve.

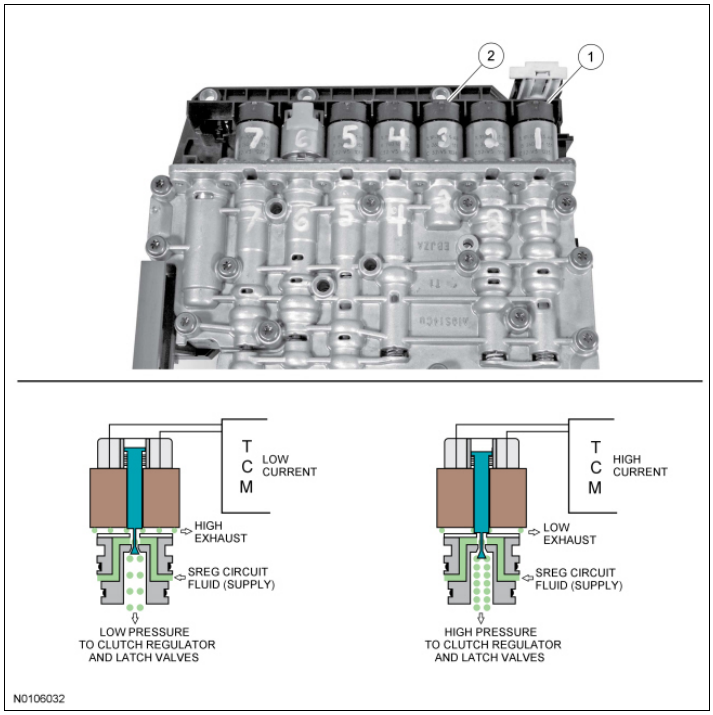
The TCM applies variable current to the TCC solenoid which varies pressure in the VFS6 hydraulic circuit to the Converter Release Regulator Valve and the Bypass Clutch Control Regulator Valve. Refer to Hydraulic Circuits in this section.

The TCC solenoid uses proportional operation. As the current from the TCM decreases, the pressure from the solenoid decreases. As the current from the TCM increases, the pressure from the solenoid increases. The TCC solenoid is supplied hydraulic pressure from the SREG circuit.

With zero current, the TCC solenoid fully closes the hydraulic valve which applies the minimum amount of hydraulic pressure to the Converter Release Regulator Valve and the Bypass Clutch Control Regulator Valve through the VFS6 hydraulic circuit and releases the TCC . With maximum current to the solenoid, the hydraulic valve fully opens the outlet port for maximum pressure to the VFS6 hydraulic circuit to apply the TCC .

Torque Converter Clutch (TCC) Proportional Variable Force Solenoid (VFS)

Shift Solenoid A (SSA), Shift Solenoid B (SSB), Shift Solenoid C (SSC) and Shift Solenoid D (SSD)



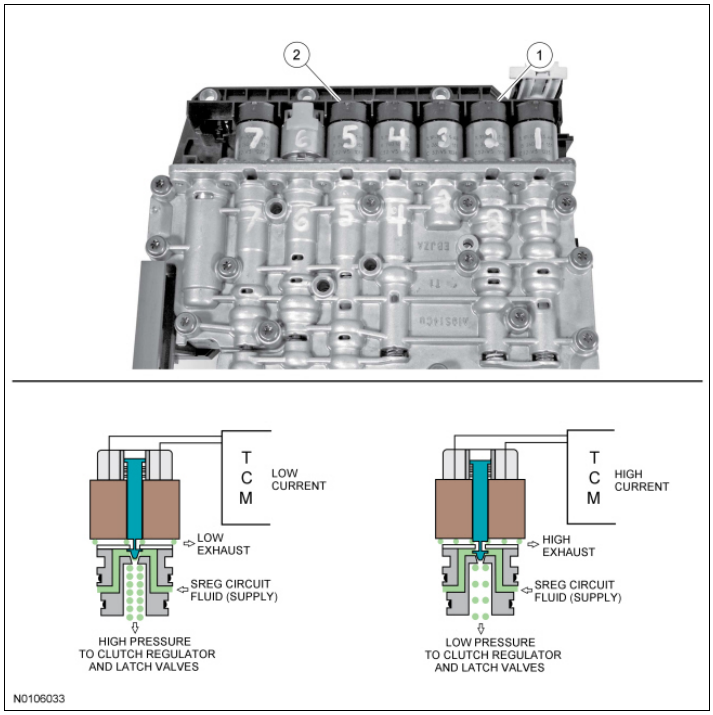
Shift solenoids A through D are variable force type solenoids that vary hydraulic pressure by actuating a hydraulic valve.

The TCM applies variable current to the shift solenoids which varies pressure in the hydraulic circuit to the regulator and latch valves of the clutch that it controls. Refer to Hydraulic Circuits in this section.

Shift Solenoid A (SSA) and Shift Solenoid C (SSC) use proportional operation. As the current from the TCM decreases, the pressure from the solenoid decreases. As the current from the TCM increases, the pressure from the solenoid increases. SSA and SSC are supplied hydraulic pressure from the SREG circuit.

With zero current, SSA and SSC fully close the hydraulic valves which applies zero amount of hydraulic pressure to the regulator and latch valves of the clutch that it controls and releases the clutch. With maximum current to the solenoids, the hydraulic valves fully open for maximum pressure to the regulator and latch valves to apply the clutch.

Shift Solenoid A (SSA) and Shift Solenoid C (SSC) Proportional Variable Force Type Solenoids

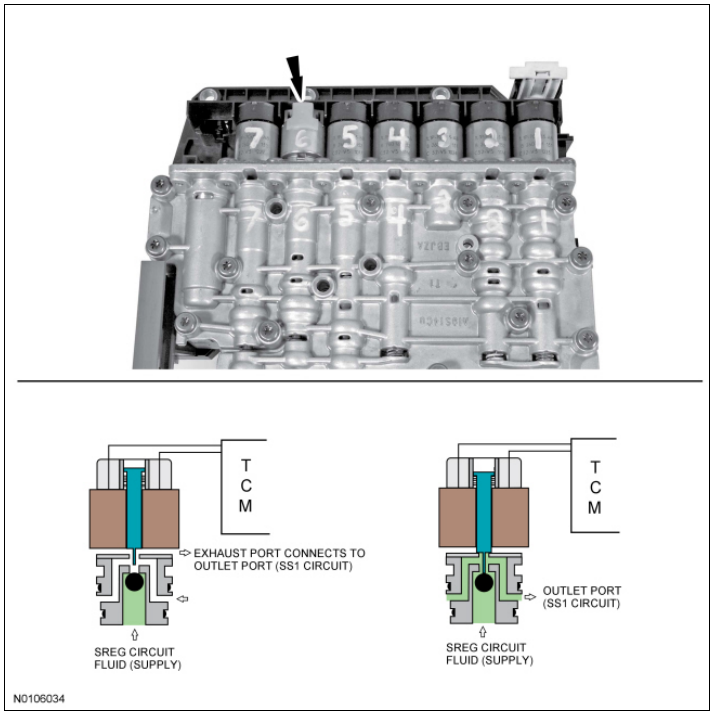


Item	Part Number	Description
1	7G383	Shift Solenoid A (SSA) Variable Force Solenoid (VFS)
2	7G383	Shift Solenoid C (SSC) VFS

Shift Solenoid B (SSB) and Shift Solenoid D (SSD) use inverse proportional operation. As the current from the TCM decreases, the pressure from the solenoid increases. As the current from the TCM increases, the pressure from the solenoid decreases. SSB and SSD are supplied hydraulic pressure from the SREG circuit.

With zero current, SSB and SSD fully open the hydraulic valves which applies maximum hydraulic pressure to the regulator and latch valves to apply the clutch that it controls. With maximum current to the solenoids, the hydraulic valve fully closes to apply zero amount of hydraulic pressure to the regulator and latch valves of the clutch that it controls and releases the clutch.

Shift Solenoid B (SSB) and Shift Solenoid D (SSD) Inverse Proportional Variable Force Type Solenoids



Item	Part Number	Description
1	7G383	Shift Solenoid B (SSB) Variable Force Solenoid (VFS)
2	7G383	Shift Solenoid D (SSD) VFS

Shift Solenoid E (SSE)

Shift Solenoid E (SSE) is an ON/OFF solenoid. When SSE is in the OFF position, SSD controls the regulator and latch valves to apply the low/reverse clutch. When SSE is in the ON position, SSD controls the regulator and latch valves to apply the Overdrive (O/D) (456) clutch. Refer to Hydraulic Circuits in this section.

SSE is supplied hydraulic pressure from the SREG circuit. When SSE is OFF, the solenoid supply is blocked and the outlet port (SS1 circuit) is connected to the exhaust port. When SSE is ON, the exhaust port is blocked and the solenoid supply is connected to the outlet port (SS1 circuit).

Shift Solenoid E (SSE) ON/OFF Solenoid

Turbine Shaft Speed (TSS) Sensor

The TSS sensor connects to the TCM through wiring inside the leadframe module assembly.

The TSS sensor is a Hall-effect type sensor that provides a signal to the TCM that changes in frequency as the rotating speed of the forward (1234) clutch cylinder varies.

The TCM compares the TSS sensor signal with the engine speed information to determine the amount of slip occurring in the torque converter.

The TCM also compares the TSS sensor signal with the OSS sensor signal to determine the gear ratio provided by the rear planetary gearset.

The TCM uses the TSS sensor signal as an input for its strategies for shifts and TCC operation. The TCM also uses the TSS sensor signal for transmission fault detection and diagnostics.

Refer to the component illustration at the beginning of this procedure for the location of the TSS sensor.

Output Shaft Speed (OSS) Sensor

The OSS sensor connects to the TCM through wiring inside the leadframe module assembly.

The OSS sensor is a Hall-effect type sensor that provides a signal to the TCM that changes in frequency as the rotating speed of the output shaft ring gear varies.

The TCM also compares the OSS sensor signal with the TSS sensor signal to determine the gear ratio provided by the rear planetary gearset.

The TCM uses the OSS sensor signal as an input for its strategies for shifts and TCC operation. The TCM also uses the OSS sensor signal for transmission fault detection and diagnostics.

Refer to the component illustration at the beginning of this procedure for the location of the OSS sensor.

Transmission Fluid Temperature (TFT) Sensor

The TFT sensor connects to the TCM through wiring inside the leadframe module assembly.

The TFT sensor is a temperature dependent resistor that is in contact with transmission fluid in the transmission sump area.

The TCM monitors the voltage across the TFT sensor, which changes as TFT varies.

The TCM uses the TFT sensor signal as an input for its strategy for shifting and TCC operation. The TCM also uses the TFT sensor signal for transmission fault detection and diagnostics.

Refer to the component illustration at the beginning of this procedure for the location of the TFT sensor.

Transmission Range (TR) Sensor

The TR sensor connects to the TCM through wiring inside the leadframe module assembly.

The TR sensor has a set of Hall-effect sensors that have a pattern of ON/OFF states which are dependant on the PARK, REVERSE, NEUTRAL, DRIVE, 3, 2 or 1 position of the manual valve.

The TR sensor also provides signals for the starting system and the reverse lights.

The TCM uses the TR sensor signal as an input for its strategy for shifting and TCC operation. The TCM also uses the TR sensor signal for transmission fault detection and diagnostics.

Refer to the component illustration at the beginning of this procedure for the location of the TR sensor.

Transmission Operation

Transmission Operation Overview

Torque Converter

This transmission uses a torque converter with the following elements:

- Impeller
- Turbine
- Reactor
- Torque Converter Clutch (TCC)

For component information, refer to Torque Converter Contamination Inspection in this section.

Planetary Gearsets

Operation of this transmission involves the use of 2 planetary gearsets that have the following components:

- Front (single planetary gearset)
  - One sun gear
  - One planetary carrier with 4 gears
  - One ring gear
- Rear (ravigenaux planetary gearset)
  - Two sun gears of different sizes
  - Three short planetary gear pinions meshing with the sun gears
  - Three long planetary gear pinions meshing with the sun gears
  - One planetary carrier
  - One ring gear

Apply Clutches

NOTE: Friction and steel plate quantity will vary based on engine displacement. Refer to the Clutch Plate Quantity Chart in the Specifications portion of this section.

This transmission uses the following clutches to operate the 2 planetary gearsets:

- Forward clutch (A)
- Direct clutch (B)
- Intermediate clutch (C)
- Low/reverse clutch (D)
- Overdrive clutch (E)

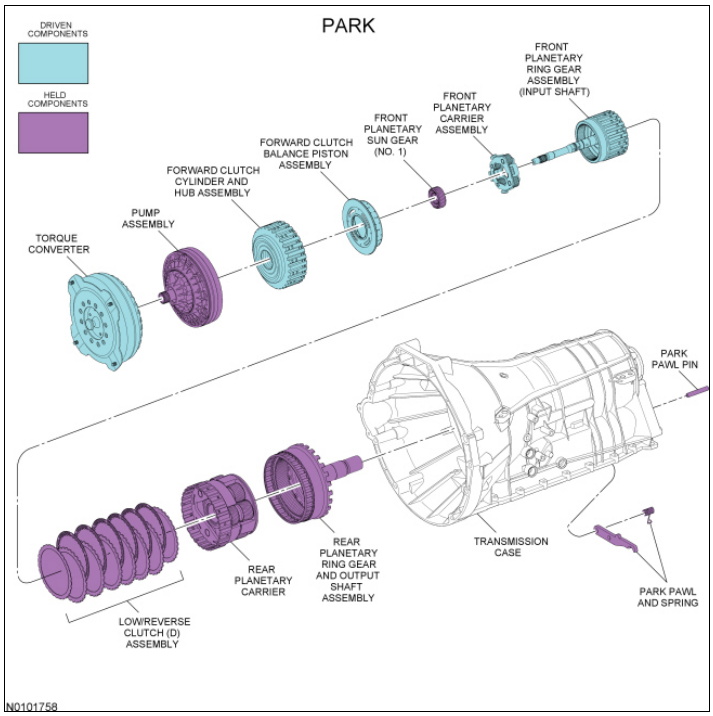
For information about planetary gearsets or the apply clutches, refer to Mechanical Components and Functions in this section.

Hydraulic System

The hydraulic operation of this transmission includes the following components:

- Main control (mechatronic) assembly with integrated Transmission Control Module (TCM)
- Pump assembly with filter
- Torque converter
- Apply components (clutches)

For component information, refer to Hydraulic System in this section.



Electronic Operation

The TCM controls the operation of this transmission with the following solenoids:

- Line Pressure Control (LPC) solenoid
- Shift Solenoid A (SSA) Variable Force Solenoid (VFS)
- Shift Solenoid B (SSB) VFS
- Shift Solenoid C (SSC) VFS
- Shift Solenoid D (SSD) VFS
- Shift Solenoid E (SSE) ON/OFF solenoid
- TCC solenoid VFS

For solenoid information, refer to Transmission Electronic Control System in this section.

Park Position Power Flow

Hydraulic Operation

Line pressure hydraulic circuits:

- The position of the main regulator valve controls line pressure. The position of the main regulator valve is dependent on the pressure applied to it by the LPC solenoid through the VFS5 circuit.
- The main regulator valve varies pressure in the PUMP circuit by controlling hydraulic flow from the SCHG circuit into the pump suction circuit.
- Line pressure is supplied to the:
  - ♦ manual valve.
  - ♦ lubrication control valve.
  - ♦ converter release regulator valve.
  - ♦ bypass clutch control regulator valve.
  - ♦ solenoid pressure regulator valve.
  - ♦ D1 and D2 latch and regulator valves.

Torque converter circuits:

- When the TCC is released, the converter release regulator valve applies pressure to the torque converter through the CREL circuit to release the TCC .
- CREL pressure exits the torque converter through the CAPLY circuit to the bypass clutch control regulator valve.
- The bypass clutch control regulator valve directs the pressure from the CAPLY circuit back to the converter release regulator valve through the CAPLY EX circuit.
- The converter release regulator valve directs the pressure from the CAPLY EX circuit to the drain back valve through the DBACK circuit.

Cooler and lubrication hydraulic circuits:

- The lubrication control valve directs line pressure to the transmission fluid cooler or the thermal bypass valve through the COOLF circuit.
- When the transmission fluid exits the transmission fluid cooler or thermal bypass valve, it provides lubrication to the transmission through the LUBE circuit. For information about transmission lubrication, refer to Mechanical Components and Functions in this section.

Solenoid hydraulic circuits:

- The solenoid pressure regulator valve supplies regulated line pressure to the shift, LPC and TCC solenoids through the SREG hydraulic circuit.
- The LPC solenoid applies varying pressure to the main regulator valve through the VFS5 hydraulic circuit. The LPC solenoid regulates line pressure by controlling the position of the main regulator valve.
- SSD supplies pressure to the solenoid multiplex valve through the VFS4 circuit.
- The position of the solenoid multiplex valve allows pressure from the VFS4 circuit to be directed to the D1 and D2 latch and regulator valves through the CL DC circuit to position the valves for low/reverse clutch (D) application.

Clutch hydraulic circuits:

- Line pressure is supplied by the pump to the D1 and D2 latch and regulator valves.
- Regulated line pressure from the D1 and D2 regulator valves is supplied to the low/reverse clutch (D) to apply the clutch.

For hydraulic circuit information, refer to Hydraulic Circuits in this section.

Reverse Position Power Flow

Hydraulic Operation

Line pressure hydraulic circuits:

- The position of the main regulator valve controls line pressure. The position of the main regulator valve is dependent on the pressure applied to it by the LPC solenoid through the VFS5 circuit.
- The main regulator valve varies pressure in the PUMP circuit by controlling hydraulic flow from the SCHG circuit into the pump suction circuit.
- Line pressure is supplied to the:
  - manual valve.
  - lubrication control valve.
  - converter release regulator valve.
  - bypass clutch control regulator valve.
  - solenoid pressure regulator valve.
  - D1 and D2 latch and regulator valves.
- In reverse, the manual valve directs line pressure to the No. 1 shuttle valve and the solenoid multiplex valve through the REV circuit.
- The No. 1 shuttle ball directs line pressure to the clutch B regulator valve.

Torque converter circuits:

- When the TCC is released, the converter release regulator valve applies pressure to the torque converter through the CREL circuit to release the TCC .
- CREL pressure exits the torque converter through the CAPLY circuit to the bypass clutch control regulator valve.
- The bypass clutch control regulator valve directs the pressure from the CAPLY circuit back to the converter release regulator valve through the CAPLY EX circuit.
- The converter release regulator valve directs the pressure from the CAPLY EX circuit to the drain back valve through the DBACK circuit.

Cooler and lubrication hydraulic circuits:

- The lubrication control valve directs line pressure to the transmission fluid cooler or the thermal bypass valve through the COOLF circuit.
- When the transmission fluid exits the transmission fluid cooler or thermal bypass valve, it provides lubrication to the transmission through the LUBE circuit. For information about transmission lubrication, refer to Mechanical Components and Functions in this section.

Solenoid hydraulic circuits:

- The solenoid pressure regulator valve supplies regulated line pressure to the shift, LPC and TCC solenoids through the SREG hydraulic circuit.
- The LPC solenoid applies varying pressure to the main regulator valve through the VFS5 hydraulic circuit. The LPC solenoid regulates line pressure by controlling the position of the main regulator valve.
- SSD supplies pressure to the solenoid multiplex valve through the VFS4 circuit.
- The position of the solenoid multiplex valve allows pressure from the VFS4 circuit to be directed to the D1 and D2 latch and regulator valves through the CLDC circuit to position the valves for low/reverse clutch (D) application.
- SSB supplies pressure to the clutch B regulator and latch valves to position the valves for direct clutch (B) application.

Clutch hydraulic circuits:

- Line pressure is supplied by the pump to the D1 and D2 latch and regulator valves.
- Regulated line pressure from the D1 and D2 regulator valves is supplied to the low/reverse clutch (D) to apply the clutch.
- Line pressure is supplied by the manual valve to the clutch B latch and regulator valves.
- Regulated line pressure from the clutch B regulator valve is supplied to the direct clutch (B) to apply the clutch.

For hydraulic circuit information, refer to Hydraulic Circuits in this section.

Neutral Position Power Flow

Hydraulic Operation

Line pressure hydraulic circuits:

- The position of the main regulator valve controls line pressure. The position of the main regulator valve is dependent on the pressure applied to it by the LPC solenoid through the VFS5 circuit.
- The main regulator valve varies pressure in the PUMP circuit by controlling hydraulic flow from the SCHG circuit into the pump suction circuit.
- Line pressure is supplied to the:
    - ♦ manual valve.
    - ♦ lubrication control valve.
    - ♦ converter release regulator valve.
    - ♦ bypass clutch control regulator valve.
    - ♦ solenoid pressure regulator valve.
    - ♦ D1 and D2 latch and regulator valves.

Torque converter circuits:

- When the TCC is released, the converter release regulator valve applies pressure to the torque converter through the CREL circuit to release the TCC .
- CREL pressure exits the torque converter through the CAPLY circuit to the bypass clutch control regulator valve.
- The bypass clutch control regulator valve directs the pressure from the CAPLY circuit back to the converter release regulator valve through the CAPLY EX circuit.
- The converter release regulator valve directs the pressure from the CAPLY EX circuit to the drain back valve through the DBACK circuit.

Cooler and lubrication hydraulic circuits:

- The lubrication control valve directs line pressure to the transmission fluid cooler or the thermal bypass valve through the COOLF circuit.
- When the transmission fluid exits the transmission fluid cooler or thermal bypass valve, it provides lubrication to the transmission through the LUBE circuit. For information about transmission lubrication, refer to Mechanical Components and Functions in this section.

Solenoid hydraulic circuits:

- The solenoid pressure regulator valve supplies regulated line pressure to the shift, LPC and TCC solenoids through the SREG hydraulic circuit.
- The LPC solenoid applies varying pressure to the main regulator valve through the VFS5 hydraulic circuit. The LPC solenoid regulates line pressure by controlling the position of the main regulator valve.
- SSD supplies pressure to the solenoid multiplex valve through the VFS4 circuit.
- The position of the solenoid multiplex valve allows pressure from the VFS4 circuit to be directed to the D1 and D2 latch and regulator valves through the CL DC circuit to position the valves for

low/reverse clutch (D) application.

Clutch hydraulic circuits:

- Line pressure is supplied by the pump to the D1 and D2 latch and regulator valves.
- Regulated line pressure from the D1 and D2 regulator valves is supplied to the low/reverse clutch (D) to apply the clutch.

For hydraulic circuit information, refer to Hydraulic Circuits in this section.

Power Flow

Hydraulic Operation

Line pressure hydraulic circuits:

- The position of the main regulator valve controls line pressure. The position of the main regulator valve is dependent on the pressure applied to it by the LPC solenoid through the VFS5 circuit.
- The main regulator valve varies pressure in the PUMP circuit by controlling hydraulic flow from the SCHG circuit into the pump suction circuit.
- Line pressure is supplied to the:
  - manual valve.
  - lubrication control valve.
  - converter release regulator valve.
  - bypass clutch control regulator valve.
  - solenoid pressure regulator valve.
  - D1 and D2 latch and regulator valves.
- In drive, the manual valve directs line pressure to the No. 1 shuttle valve and clutch A, C and E regulator valves.
- The No. 1 shuttle ball directs line pressure to the clutch B regulator valve.

Torque converter circuits:

- When the TCC is released, the converter release regulator valve applies pressure to the torque converter through the CREL circuit to release the TCC .
- CREL pressure exits the torque converter through the CAPLY circuit to the bypass clutch control regulator valve.
- The bypass clutch control regulator valve directs the pressure from the CAPLY circuit back to the converter release regulator valve through the CAPLY EX circuit.
- The converter release regulator valve directs the pressure from the CAPLY EX circuit to the drain back valve through the DBACK circuit.

Cooler and lubrication hydraulic circuits:

- The lubrication control valve directs line pressure to the transmission fluid cooler or the thermal bypass valve through the COOLF circuit.
- When the transmission fluid exits the transmission fluid cooler or thermal bypass valve, it provides lubrication to the transmission through the LUBE circuit. For information about transmission lubrication, refer to Mechanical Components and Functions in this section.

Solenoid hydraulic circuits:

- The solenoid pressure regulator valve supplies regulated line pressure to the shift, LPC and TCC solenoids through the SREG hydraulic circuit.
- The LPC solenoid applies varying pressure to the main regulator valve through the VFS5 hydraulic circuit. The LPC solenoid regulates line pressure by controlling the position of the main regulator valve.
- SSD supplies pressure to the solenoid multiplex valve through the VFS4 circuit.
- The position of the solenoid multiplex valve allows pressure from the VFS4 circuit to be directed to the D1 and D2 latch and regulator valves through the CLDC circuit to position the valves for low/reverse clutch (D) application.
- SSA supplies pressure to the clutch A regulator and latch valves to position the valves for forward clutch (A) application.

Clutch hydraulic circuits:

- Line pressure is supplied by the pump to the D1 and D2 latch and regulator valves.
- Regulated line pressure from the D1 and D2 regulator valves is supplied to the low/reverse clutch (D) to apply the clutch.
- Regulated line pressure from the clutch A regulator valve is supplied to the forward clutch (A) to apply the clutch.

For hydraulic circuit information, refer to Hydraulic Circuits in this section.

Power Flow

Hydraulic Operation

Line pressure hydraulic circuits:

- The position of the main regulator valve controls line pressure. The position of the main regulator valve is dependent on the pressure applied to it by the LPC solenoid through the VFS5 circuit.
- The main regulator valve varies pressure in the PUMP circuit by controlling hydraulic flow from the SCHG circuit into the pump suction circuit.
- Line pressure is supplied to the:
  - ♦ manual valve.
  - ♦ lubrication control valve.
  - ♦ converter release regulator valve.
  - ♦ bypass clutch control regulator valve.
  - ♦ solenoid pressure regulator valve.
  - ♦ D1 and D2 latch and regulator valves.
- In drive, the manual valve directs line pressure to the No. 1 shuttle valve and clutch A, C and E regulator valves.
- The No. 1 shuttle ball directs line pressure to the clutch B regulator valve.

Torque converter circuits:

- When the TCC is released, the converter release regulator valve applies pressure to the torque converter through the CREL circuit to release the TCC .
- CREL pressure exits the torque converter through the CAPLY circuit to the bypass clutch control regulator valve.
- The bypass clutch control regulator valve directs the pressure from the CAPLY circuit back to the converter release regulator valve through the CAPLY EX circuit.
- The converter release regulator valve directs the pressure from the CAPLY EX circuit to the drain back valve through the DBACK circuit.

Cooler and lubrication hydraulic circuits:

- The lubrication control valve directs line pressure to the transmission fluid cooler or the thermal bypass valve through the COOLF circuit.
- When the transmission fluid exits the transmission fluid cooler or thermal bypass valve, it provides lubrication to the transmission through the LUBE circuit. For information about transmission lubrication, refer to Mechanical Components and Functions in this section.

Solenoid hydraulic circuits:

- The solenoid pressure regulator valve supplies regulated line pressure to the shift, LPC and TCC solenoids through the SREG hydraulic circuit.
- The LPC solenoid applies varying pressure to the main regulator valve through the VFS5 hydraulic circuit. The LPC solenoid regulates line pressure by controlling the position of the main regulator valve.
- SSA supplies pressure to the clutch A regulator and latch valves to position the valves for forward clutch (A) application.
- SSB supplies pressure to the clutch B regulator valve to position the valve for direct clutch (B) application.

Clutch hydraulic circuits:

- Regulated line pressure from the clutch A regulator valve is supplied to the forward clutch (A) to apply the clutch.
- Regulated line pressure from the clutch B regulator valve is supplied to the direct clutch (B) to apply the clutch.

For hydraulic circuit information, refer to Hydraulic Circuits in this section.

Power Flow

Hydraulic Operation

Line pressure hydraulic circuits:

- The position of the main regulator valve controls line pressure. The position of the main regulator valve is dependent on the pressure applied to it by the LPC solenoid through the VFS5 circuit.
- The main regulator valve varies pressure in the PUMP circuit by controlling hydraulic flow from the SCHG circuit into the pump suction circuit.
- Line pressure is supplied to the:
  - ♦ manual valve.
  - ♦ lubrication control valve.
  - ♦ converter release regulator valve.
  - ♦ bypass clutch control regulator valve.
  - ♦ solenoid pressure regulator valve.
  - ♦ D1 and D2 latch and regulator valves.
- In drive, the manual valve directs line pressure to the No. 1 shuttle valve and clutch A, C and E regulator valves.
- The No. 1 shuttle ball directs line pressure to the clutch B regulator valve.

Torque converter circuits:

- When the TCC is released, the converter release regulator valve applies pressure to the torque converter through the CREL circuit to release the TCC .
- CREL pressure exits the torque converter through the CAPLY circuit to the bypass clutch control regulator valve.
- The bypass clutch control regulator valve directs the pressure from the CAPLY circuit back to the converter release regulator valve through the CAPLY EX circuit.
- The converter release regulator valve directs the pressure from the CAPLY EX circuit to the drain back valve through the DBACK circuit.

Cooler and lubrication hydraulic circuits:

- The lubrication control valve directs line pressure to the transmission fluid cooler or the thermal bypass valve through the COOLF circuit.
- When the transmission fluid exits the transmission fluid cooler or thermal bypass valve, it provides lubrication to the transmission through the LUBE circuit. For information about transmission lubrication, refer to Mechanical Components and Functions in this section.

Solenoid hydraulic circuits:

- The solenoid pressure regulator valve supplies regulated line pressure to the shift, LPC and TCC solenoids through the SREG hydraulic circuit.
- The LPC solenoid applies varying pressure to the main regulator valve through the VFS5 hydraulic circuit. The LPC solenoid regulates line pressure by controlling the position of the main regulator valve.

- SSA supplies pressure to the clutch A regulator and latch valves to position the valves for forward clutch (A) application.
- SSD supplies pressure to the solenoid multiplex valve through the VFS4 circuit.
- SSE supplies pressure to the solenoid multiplex valve and the drive enable valve through the SS1 circuit to move the valves.
- The position of the solenoid multiplex valve and the drive enable valve allows pressure from the VFS4 circuit to be directed to the clutch E latch and regulator valves through the CLEC circuit to position the valves for O/D clutch (E) application.

Clutch hydraulic circuits:

- Regulated line pressure from the clutch A regulator valve is supplied to the forward clutch (A) to apply the clutch.
- Regulated line pressure from the clutch E regulator valve is supplied to the O/D clutch (E) to apply the clutch.

For hydraulic circuit information, refer to Hydraulic Circuits in this section.

Power Flow

Hydraulic Operation

Line pressure hydraulic circuits:

- The position of the main regulator valve controls line pressure. The position of the main regulator valve is dependent on the pressure applied to it by the LPC solenoid through the VFS5 circuit.
- The main regulator valve varies pressure in the PUMP circuit by controlling hydraulic flow from the SCHG circuit into the pump suction circuit.
- Line pressure is supplied to the:
  - ♦ manual valve.
  - ♦ lubrication control valve.
  - ♦ converter release regulator valve.
  - ♦ bypass clutch control regulator valve.
  - ♦ solenoid pressure regulator valve.
  - ♦ D1 and D2 latch and regulator valves.
- In drive, the manual valve directs line pressure to the No. 1 shuttle valve and clutch A, C and E regulator valves.
- The No. 1 shuttle ball directs line pressure to the clutch B regulator valve.

Torque converter circuits:

- When the TCC is applied, the bypass clutch control regulator valve applies pressure to the torque converter through the CAPLY circuit to apply the TCC .
- CAPLY pressure exits the torque converter through the CREL circuit to the converter release regulator valve.

Cooler and lubrication hydraulic circuits:

- The lubrication control valve directs line pressure to the transmission fluid cooler or the thermal bypass valve through the COOLF circuit.
- When the transmission fluid exits the transmission fluid cooler or thermal bypass valve, it provides lubrication to the transmission through the LUBE circuit. For information about transmission lubrication, refer to Mechanical Components and Functions in this section.

Solenoid hydraulic circuits:

- The solenoid pressure regulator valve supplies regulated line pressure to the shift, LPC and TCC solenoids through the SREG hydraulic circuit.
- The LPC solenoid applies varying pressure to the main regulator valve through the VFS5 hydraulic circuit. The LPC solenoid regulates line pressure by controlling the position of the main regulator valve.
- The TCC solenoid supplies pressure to the converter release regulator valve and the bypass clutch control regulator valve to move the position of the valves for TCC application.
- SSC supplies pressure to the clutch C regulator valve to position the valve for intermediate clutch (C) application.

- SSD supplies pressure to the solenoid multiplex valve through the VFS4 circuit.
- SSE supplies pressure to the solenoid multiplex valve and the drive enable valve through the SS1 circuit to move the valves.
- The position of the solenoid multiplex valve and the drive enable valve allows pressure from the VFS4 circuit to be directed to the clutch E latch and regulator valves through the CLEC circuit to position the valves for O/D clutch (E) application.

Clutch hydraulic circuits:

- Regulated line pressure from the clutch C regulator valve is supplied to the intermediate clutch (C) to apply the clutch.
- Regulated line pressure from the clutch E regulator valve is supplied to the O/D clutch (E) to apply the clutch.

For hydraulic circuit information, refer to Hydraulic Circuits in this section.

- When the transmission fluid exits the transmission fluid cooler or thermal bypass valve, it provides lubrication to the transmission through the LUBE circuit. For information about transmission lubrication, refer to Mechanical Components and Functions in this section.

Solenoid hydraulic circuits:

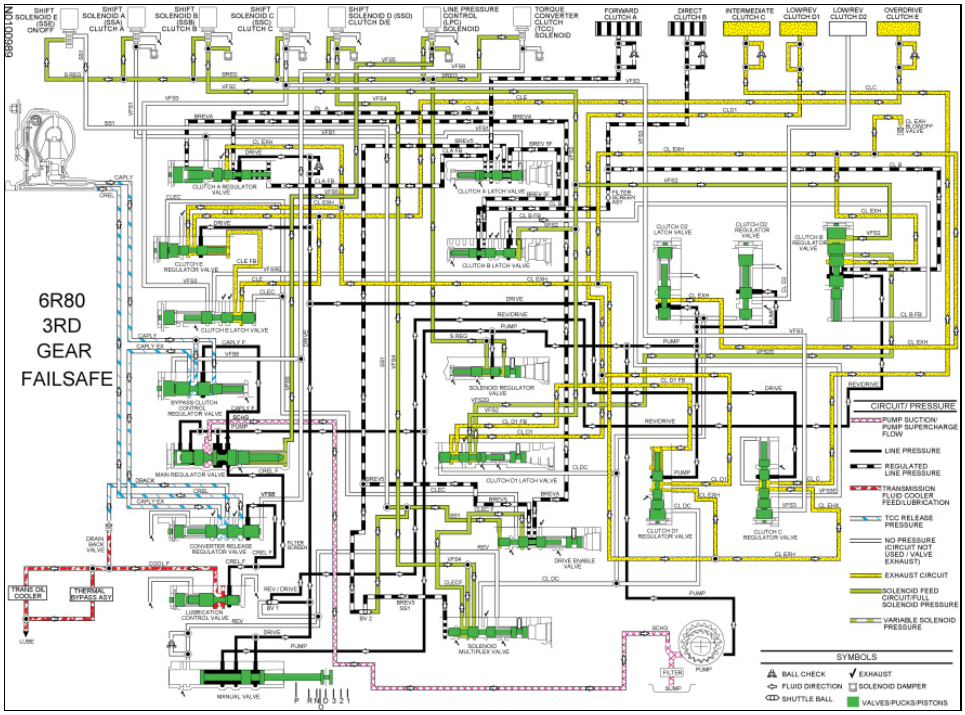
- The solenoid pressure regulator valve supplies line pressure to the shift, LPC and TCC solenoids through the SREG hydraulic circuit.
- The LPC solenoid applies full solenoid output pressure to the main regulator valve through the VFS5 hydraulic circuit. With full solenoid output pressure, the main regulator valve provides maximum line pressure during fail safe.
- SSB supplies maximum solenoid output pressure to the clutch B regulator valve to position the valve for direct clutch (B) application.

Clutch hydraulic circuits:

- Regulated line pressure from the clutch B regulator valve is supplied to the direct clutch (B) to, apply the clutch. Regulated line pressure from the clutch B regulator valve is also supplied to the clutch A latch valve from the clutch B latch valve through the BREV 5F circuit.
- The clutch A latch valve directs the regulated line pressure to the drive enable valve through the BREV5 circuit.
- The drive enable valve directs the BREV5 pressure to the BREVA circuit which supplies the clutch A regulator valve to position the valve to apply the forward clutch (A) with 81% of line pressure.

For hydraulic circuit information, refer to Hydraulic Circuits in this section.

Electrical Operation



Solenoid operation:

3rd Gear Fail Safe Solenoid Operation Chart

Gear	SSA (VFS) Proportional	SSB (VFS) Inversely Proportional	SSC (VFS) Proportional	SSD (VFS) Inversely Proportional	SSE (ON/OFF)	LPC (VFS) Inversely Proportional	TCC (VFS) Proportional
3rd Gear	-	-	-	-	-	-	-

For solenoid information, refer to Transmission Electronic Control System in this section.

Diagnostic Strategy

Troubleshooting an electronically controlled automatic transmission is simplified by using the proven method of diagnosis. One of the most important things to remember is that there is a definite procedure to follow.

NOTE: Do not take short cuts or assume that critical checks or adjustments have already been made.

Follow the procedures as written to avoid missing critical components or steps.

To correctly diagnose a concern, have the following publications available:

- Powertrain Control/Emissions Diagnosis (PC/ED) manual
- On-Line Automotive Service Information System (OASIS)
- TSBs
- Wiring Diagrams manual

These publications provide the information required when diagnosing transmission concerns.

Use the Diagnostic Flow Chart as a guide and follow the steps as indicated.

Preliminary Inspection

- Know and understand the customer concern.
- Verify the concern by operating the vehicle.
- Check the transmission fluid level and condition.
- Check for non-factory add-on items.
- Check selector lever cable for correct adjustment.
- Check TSBs regarding the concern.

Diagnostics

- Carry out On-Board Diagnostic (OBD) procedures, Key ON Engine OFF (KOEO) and Key ON Engine Running (KOER).
- Record all DTCs.
- Repair all non-transmission codes first.
- Repair all transmission codes second.
- Clear all continuous codes and attempt to repeat them.
- Repair all continuous codes.
- If only codes that have passed are obtained, refer to Diagnosis By Symptom in this section for additional information and diagnosis.

Follow the diagnostic sequence to diagnose and repair the concern the first time.

Diagnostic Flow Chart

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Prior to carrying out the flow test, the following items should be checked:

- Know and understand the customer concerns.
- Verify the concern by operating the vehicle.
- Check the transmission fluid level and condition.
- Check for non-factory-installed items and verify correct installation.
- Check the selector lever cable adjustments.
- Check TSBs for vehicle concerns.
- Carry out Self Test both Key ON Engine OFF (KOEO) and Key ON Engine Running (KOER).
- Record all DTCs.
- Verify the vehicles PCM and Transmission Control Module (TCM) is programmed to the latest calibration level.

Diagnostic Flow Chart		
1) Were any DTCs recorded?	Yes	• REPAIR all DTCs. FOLLOW the pinpoint tests. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual, then this workshop manual, GO to Step 2.
	No	• REFER to Diagnosis By Symptom in this section, GO to Step 5.
2) Are any continuous test memory codes present?	Yes	• CLEAR codes and CARRY OUT drive cycle test, GO to Step 3.
	No	• GO to Step 4.
3) Did the continuous test memory codes reappear?	Yes	• REPAIR all continuous test memory codes. FOLLOW the pinpoint tests. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual, then this workshop manual, GO to Step 4.
	No	• GO to Step 4.
4) Is the concern repaired?	Yes	• CARRY OUT the final self-test to verify that no DTCs are present. CLEAR the DTCs.
	No	

		• REFER to Diagnosis By Symptom in this section to diagnose and repair the concern, GO to Step 5.
5) Are there any electrical concerns?	Yes	• INSTALL the scan tool and CARRY OUT the output state control test, GO to Step 6.
	No	• REFER to the hydraulic and mechanical routine to DIAGNOSE and REPAIR the concern, GO to Step 7.
6) Was the transmission concern corrected when the scan tool was installed?	Yes	• REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual, intermittent fault diagnosis section and use the scan tool to diagnose cause of concern in the processor, vehicle harness of external inputs (sensors or switches).
	No	• REFER to the hydraulic and mechanical routine to DIAGNOSE and REPAIR the concern, GO to Step 7.
7) Is the concern repaired?	Yes	• CARRY OUT the final self-test and verify that no DTCs are present. CLEAR the DTCs.
	No	• Concern should have been repaired. RETURN to the Diagnostic Flow Chart and REVIEW other components that may have contributed to the concern. CHECK and DIAGNOSE those components.

Preliminary Inspection

The following items must be checked prior to beginning the diagnostic procedures:

Know and Understand the Concern

In order to correctly diagnose a concern, first understand the customer concern or condition. Customer contact may be required in order to begin to verify the concern. Understand the conditions, including when the concern occurs. For example:

- Hot or cold vehicle temperature
- Hot or cold ambient temperature
- Vehicle driving conditions
- Vehicle loaded/unloaded

After understanding when and how the concern occurs, proceed to Verification of Condition.

Verification of Condition

This section provides information that must be used in both determining the actual cause of customer concerns and carrying out the appropriate procedures.

The following procedures must be used when verifying customer concerns for the transmission.

Determine Customer Concern

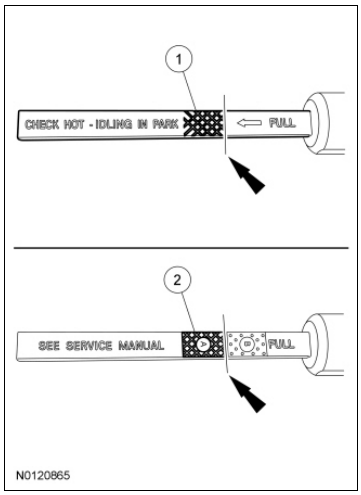
Determine customer concerns relative to vehicle use and dependent driving conditions, paying attention to the following items:

- Hot or cold vehicle operating temperature
- Hot or cold ambient temperature
- Type of terrain
- Vehicle loaded/unloaded
- City/highway driving
- Upshifting
- Downshifting
- Coasting
- Engagement
- Noise/vibration - check for engine rpm, vehicle speed, shift, gear, range or temperature dependencies.

Check Transmission Fluid Level and Condition

Transmission Fluid Level Check

NOTICE: **The vehicle should not be driven if the transmission fluid level is low as internal transmission failure could result.**



NOTICE: **The transmission fluid fill plug is located near the exhaust system. The exhaust will be extremely hot during this procedure.**

NOTE: If the vehicle has been operated for an extended period at high highway speeds, in city traffic, during hot weather or while pulling a trailer, the transmission fluid must cool down to obtain an accurate reading.

NOTE: If the transmission starts to slip, shifts slowly or shows signs of transmission fluid leaking, the transmission fluid level should be checked.

This transmission is equipped with an internal thermal bypass located in the case. This internal thermal bypass valve will shut off transmission fluid flowing to the transmission fluid cooler if the transmission fluid temperature falls below normal operating temperature. Refer to Transmission Fluid Level Check in this section.

The transmission can have 2 types of transmission fluid level indicators, the original or the replacement. The original transmission fluid level indicator has a single crosshatch area for the fluid level. The replacement has 2 areas for the fluid level, a crosshatched (labeled A) area and a dotted (labeled B) area. Use the crosshatched area when checking the transmission fluid level. The correct transmission fluid level is at the upper level of the crosshatch marks on the transmission fluid level indicator.

1	Original transmission fluid level indicator
2	Replacement transmission fluid level indicator

High Transmission Fluid Level

NOTICE: **A transmission fluid level that is too high can cause the transmission fluid to become aerated due to the churning action of the rotating internal parts. This will cause erratic control pressure, foaming, loss of transmission fluid from the vent tube and possible transmission failure.**

If an overfill reading is indicated, remove any excessive transmission fluid. Refer to Transmission Fluid Level Check in this section.

Low Transmission Fluid Level

Low transmission fluid level can result in poor transmission engagement, slipping or failure. This may also indicate a leak in one of the transmission seals or gaskets.

Adding Transmission Fluid

NOTICE: **The use of any type of transmission fluid other than specified can result in transmission failure.**

NOTICE: **The transmission fluid fill plug is located near the exhaust system. The exhaust will be extremely hot during this procedure.**

NOTICE: **The vehicle should not be driven if the transmission fluid level is low as internal failure could result.**

Add transmission fluid using the refill procedure. Refer to Transmission Fluid Drain and Refill in this section.

Transmission Fluid Condition Check

1. Check the transmission fluid level.
2. Remove the transmission fluid fill plug and transmission fluid level indicator allowing the transmission fluid to drip onto a facial tissue and examine the stain.
3. Observe the color and the odor.
4. If evidence of solid material is found, remove the transmission fluid pan for further inspection.
5. If the stain is a foamy pink color, this may indicate coolant in the transmission. Inspect the engine cooling system at this time.
6. If transmission fluid contamination or transmission failure is confirmed by the sediment in the bottom of the transmission fluid pan, disassemble and completely clean the transmission. This includes the torque converter and transmission fluid cooler tubes. Install a new auxiliary transmission fluid cooler.

Water in Transmission Fluid

To correctly repair an automatic transmission that had water or coolant introduced into the system, completely disassemble, clean and replace the following parts:

- All internal and external seals
- All friction material
- Torque converter
- All parts with bonded seals
- All solenoids
- All transmission fluid filters

Prior to installing the transmission, the transmission fluid cooler(s), transmission fluid cooler tubes and hoses need to be flushed and cleaned.

Shift Point Road Test

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

This test verifies the shift control system is operating correctly.

1. Bring engine and transmission up to normal operating temperature.
2. Operate vehicle with the selector lever in Overdrive (O/D) position.
3. Apply minimum throttle and observe speeds at which upshift occurs and the torque converter engages. Refer to the Shift Speeds chart in this section.
4. With the selector lever in O/D , move the selector lever into the manual 3 position. The transmission should downshift to 4th gear. Release the accelerator pedal; engine braking should occur.
5. Press the accelerator pedal to floor, Wide Open Throttle (WOT). Transmission should shift from 4th to 3rd, depending on vehicle speed. The torque converter should disengage and then reapply.
6. With the selector lever in the Overdrive (O/D) position and vehicle speed above 80 km/h (50 mph) and less than half throttle, move the selector lever from the O/D position to manual 2 position and release the accelerator pedal. The transmission should downshift into 2nd gear. With the transmission remaining in the manual 2 position, move the selector lever into the manual 1 position and release the accelerator pedal. The transmission should downshift into 1st gear at speeds below approximately 45-56 km/h (28-35 mph).
7. If the transmission fails to upshift/downshift or the torque converter does not apply and release, refer to Diagnosis By Symptom in this section.

Shift Speeds

NOTE: Shift speed ranges are approximate for all applications. For specific applications (engine, axle ratio, tire size and application), refer to the Automatic Transmission Specification booklet. Always drive the vehicle in a safe manner according to driving conditions and obey all traffic laws.

Throttle Position	Shift	Km/H	MPH
Light Throttle	1-2	13-21	8-13
Throttle Position (TP) Sensor	2-3	26-34	16-21
Voltage @ 1.25 Volts	3-4	35-43	22-27
	4-5	56-64	35-40
	5-6	71-79	44-49

Closed Throttle	6-5	56-64	35-40
	5-4	40-48	25-30
	4-3	13-21	8-13
	3-2	3-11	2-7
	2-1	2-6	1-4
Wide Open Throttle (WOT)	1-2	45-53	28-33
	2-3	87-95	54-59
	3-4	140-148	87-92

Road Test - Adaptive Drive Cycle

1. Connect the scan tool to the Data Link Connector (DLC).
2. **NOTE:** Disconnecting the battery will not clear the Keep Alive Memory (KAM).

   NOTE: Do not clear the PCM KAM .

   Using the scan tool, clear the Transmission Control Module (TCM) KAM and the adaptive table before conducting an adaptive drive cycle test.
3. Using the scan tool verify the transmission fluid is at normal operating temperature, between 80°C-82°C (176°F-180°F). If the transmission fluid is not at operating temperature, drive the vehicle approximately 5 km (3.1 mi) to reach operating temperature.
4. **NOTE:** The transmission fluid must be at operating temperature before proceeding to this step.

   Drive the vehicle to perform adaptive shift strategy learn on a level road surface.

   1. Accelerate from a stop with light throttle to 24 km/h (15 mph) and then release the accelerator pedal.
   2. Gently brake and bring the vehicle to a stop and hold the brake for 6 seconds.
   3. Repeat Substeps 1 and 2 an additional 5 times.
   4. Accelerate from a stop with light throttle so the 1-2, 2-3 and 3-4 shifts occur with engine speeds between 1,700-2,000 rpm.
   5. Continue accelerating until either the vehicle speed reaches 80 km/h (50 mph) or the 5-6 upshift is reached.
   6. Gently brake and bring the vehicle to a stop and hold the brake for 10 seconds.
   7. Repeat Substeps 4, 5 and 6 an additional 3 times.

Torque Converter Diagnosis

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Prior to torque converter installation, all diagnostic procedures must be followed. This is to prevent the unnecessary installation of good torque converters. Only after a complete diagnostic evaluation can the decision be made to install a new torque converter.

Begin with the normal diagnostic procedures as follows:

1. Preliminary inspection.

2. Know and understand the customer concern.

3. Verify the condition - carry out the Torque Converter Operation Test.

4. Perform diagnostic procedures.

- Perform On-Board Diagnostic (OBD) test. Refer to Diagnostics in this section.
  - ♦ Repair all non-transmission related DTCs first.
  - ♦ Repair all transmission-related DTCs.
  - ♦ Rerun OBD test to verify repair.
- Perform Stall Speed Test. Refer to Special Testing Procedures in this section.
- Perform Diagnostic Routines. Refer to Diagnosis By Symptom in this section.
  - ♦ Use the Diagnosis by Symptom to locate the appropriate routine that best describes the symptom(s). The routine will list all possible components that may cause or contribute to the symptom. Check each component listed; diagnose and repair as required before changing the torque converter.

Torque Converter Operation Test

The Torque Converter Operation Test verifies the Torque Converter Clutch (TCC) control system and the torque converter are operating correctly.

1. Perform a self-test with the scan tool. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. Check for DTCs.

2. Connect a scan tool to the vehicle.

3. Bring the engine to normal operating temperature by driving the vehicle at highway speeds with the selector lever in the Overdrive (O/D) position.

4. After normal operating temperature is reached, maintain a constant speed of about 56 km/h (35 mph) in 5th gear for 10 seconds.

5. Release the accelerator pedal and monitor the scan tool Throttle Position (TP) voltage to approximately 1.25 volts or 25% throttle.

6. Monitor the TCC and RPM TCM PIDs. The torque converter should release and engine rpms should increase before the 5-4 shift occurs.

NOTE: The following is a list of common vehicle concerns that have been misdiagnosed as torque converter shudder. For diagnosis of the following items, refer to the appropriate sections of the workshop manual and the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

- Spark plugs - check for cracks, high resistance or broken insulators
- Ignition coil-on-plug - misfire
- Fuel injector - filter may be plugged
- Fuel contamination - engine driveability concerns
- EGR valve - valve may let in too much exhaust gas and cause engine to run lean
- Vacuum leak - engine will not get correct air/fuel mixture
- Manifold Absolute Pressure (MAP) and Mass Air Flow (MAF) sensor - incorrect air/fuel mixture
- Heated Oxygen Sensor (HO2S) - too rich/lean air/fuel mixture
- Fuel pressure - may be too low
- Engine mounts - loose/damaged mounts can cause vibration concerns
- Axle joints - check for vibration

Visual Inspection

A visual inspection will identify modifications or additions to the vehicle operating system that may affect diagnosis. Inspect the vehicle for non-Ford factory add-on devices such as:

- Electronic add-on items:
  - A/C
  - generator (alternator)
  - engine turbo
  - cellular telephone
  - cruise control
  - CB radio
  - linear booster
  - backup alarm signal
  - computer
- Vehicle modification:

These items, if not installed correctly, will affect the PCM or transmission function. Pay particular attention to add-on wiring splices in the PCM harness or transmission wiring harness, abnormal tire size or axle ratio changes.

- Leaks; refer to Leakage Inspection in this section.
- Correct selector lever adjustments; refer to Section 307-05 .

Selector Lever Check

Check for a misadjustment in the selector lever by matching the detents in the Transmission Range (TR) selector lever with those of the manual control lever in the transmission.

Hydraulic leakage at the manual control valve can cause delay in engagements and/or slipping while operating if the linkage is not correctly adjusted. Refer to Section 307-05 for selector lever cable adjustment.

Check TSBs and On-Line Automotive Service Information System (OASIS)

Refer to all TSB and On-Line Automotive Service Information System (OASIS) messages that pertain to the transmission concern and follow the procedure as described.

Carry Out On-Board Diagnostic (OBD) Key ON Engine OFF (KOEO), Key ON Engine Running (KOER)

After a road test, with the vehicle warm and before disconnecting any connectors, perform a self-test using the scan tool. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Diagnostics

Special Tool(s)

 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Diagnosing an electronically controlled automatic transmission is simplified by using the following procedures. The most important things to remember is there is a definite procedure to follow. Do not take shortcuts or assume that critical checks or adjustments have already been made. Follow the procedures as written to avoid missing critical components or steps. By following the diagnostic sequence, the technician will be able to diagnose and repair the concern the first time.

On-Board Diagnostic (OBD) with Scan Tool

These self-tests should be used to diagnose the PCM and should be carried out in order.

NOTE: Make sure the latest software version is loaded on the scan tool.

1. If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

NOTE: The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC to the VCM .

2. If the scan tool does not communicate with the VCM :
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM .
   - refer to Section 418-00 , No power to the scan tool.

3. If the scan tool does not communicate with the vehicle:
   - verify the ignition is in the RUN position.
   - verify scan tool operation with a known good vehicle.
   - refer to Section 418-00 , The PCM does not respond to the scan tool.

4. Carry out the network test:
   - If the scan tool responds with no communication from one or more modules, refer to Section 418-00 , No High Speed Controller Area Network (CAN) communication, all modules are not responding.
   - If the network test passes, retrieve and record the continuous memory DTCs.

5. Clear the continuous DTCs and carry out the PCM self-test.

6. If DTCs retrieved are related to the concern, GO to the DTC Chart.

7. If no DTCs related to the concern are retrieved, REFER to Diagnosis By Symptom in this section.

Output State Control (OSC) Mode

On-Board Diagnostic (OBD)

Output state control allows the technician to take control of certain parameters to function the transmission.

Output state control allows the technician to shift the transmission when commanding a gear change.

Another example of the output state control features is, the technician can command the torque converter ON or OFF to check operation.

This transmission output state control has one mode of operation; DRIVE. This mode has a unique set of operating requirements that the technician must meet before allowed to operate the torque converter or select gears.

Diagnostic Parameters Identification (PID) Chart

The following is a list of output state control parameters and their corresponding PIDs:

Diagnostic PID Chart

PID Name	PID Description	Units
APP_R	Accelerator Pedal Position (APP) Relative	0% - 100%
AST	Time Since Start	Time
CLRDIST	Distance Since Diagnostic Trouble Codes Cleared	Miles
DRIVE	Gear Lever Position - Drive	Yes/No
DTC TCM	Continuous Codes	Number
ECT TCM	Engine Coolant Temperature (ECT) Transmission Control Module	Degrees
ENGLOAD	Engine Load	0% - 100%
GEAR	Gear Commanded by Module	1, 2, 3, 4, 5
GEAR_OSC#	Gear Commanded by Output State Control	1, 2, 3, 4, 5
GEAR_RAT_CMD	Gear Ratio Commanded	Ratio 0-5:1
GEAR_RAT_MES	Gear Ratio Measured	Ratio 0-5:1
MIL_DIS	The Distance Traveled Since the MIL was Activated	Miles
NEUTRAL	Gear Lever Position - Neutral	Yes/No
OSS	Output Shaft Speed (OSS)	rpm
OSS_SRC	Unfiltered OSS	rpm
PCA AMP	PCA Amp	Current
PVT	Pressure Vacuum Transducer	Pressure
PVT	Pressure Vacuum Transducer	Vacuum
REVERSE	Gear Lever Position - Reverse	Yes/No
RPM TCM	Engine Revolutions Per Minute	rpm
SHIFT_TYPE	Shifter Position	Mode
SSA_AMP	Shift Solenoid Pressure Control A (SSPCA)	Current
SSB_AMP	Shift Solenoid Pressure Control B (SSPCB)	Current
SSC_AMP	Shift Solenoid Pressure Control C (SSPCC)	Current
SSD_AMP	Shift Solenoid Pressure Control D (SSPCD)	Current
SSE	Shift Solenoid Pressure Control E (SSPCE)	0% - 100%
TCC AMP	Torque Converter Clutch (TCC) Solenoid Pressure Control	Current
TCC_OSC#	TCC Output State Control	Locked/Unlocked
TC_SLIPACT	Torque Converter Slip Actual	rpm
TC_SLIP_ABSL	Absolute Value of Torque Converter Slip	rpm
TFT	Transmission Fluid Temperature (TFT)	Temp
TORQUE	Net Engine Torque	Torque Nm

TP	Throttle Position (TP) Sensor	0% - 100%
TR	Transmission Range (TR) Sensor	Mode
TSS	Turbine Shaft Speed (TSS)	rpm
TSS_SRC	Unfiltered TSS Sensor	rpm
VPWR TCM	Module Supply Voltage	Voltage
VSS	Vehicle Speed Sensor (VSS)	mph 0-80
WARMUPS	Number of Warm-Ups Since DTCs Cleared	Number

Transmission Drive Cycle Test

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Material

Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC	MERCON® LV

NOTE: Always drive the vehicle in a safe manner according to driving conditions and obey all traffic laws.

NOTE: The Transmission Drive Cycle Test must be followed exactly. Malfunctions must occur 4 times consecutively for a shift error DTC to set, and 5 times consecutively for continuous Torque Converter Clutch (TCC) DTCs to set.

NOTE: Refer to the Solenoid Application Chart for solenoid operation while performing the Transmission Drive Cycle Test.

After performing the self-test, follow the transmission drive cycle test for checking codes.

1. Record then clear the DTCs.

2. Warm the engine to normal operating temperature.

3. Make sure the transmission fluid level is correct.

4. With the selector lever in Overdrive (O/D), moderately accelerate from stop to 80 km/h (50 mph) allowing the transmission to shift into 6th gear. Keep vehicle speed and throttle steady for a minimum of 15 seconds.

5. With the transmission in 6th gear and maintaining steady speed and throttle, lightly apply and release the brake pedal to operate the stop lamps. Then, hold vehicle speed and throttle steady for a minimum of 5 seconds.

6. Brake to a stop and remain stopped for a minimum of 20 seconds.

7. Repeat steps 4 through 6 at least 5 times.

8. Perform a self-test and record DTCs.
    - If DTCs are present, refer to the DTC Chart. Repair all non-transmission DTCs first as they can directly affect the operation of the transmission. Repeat the self-test and the road test to

verify the correction. Clear the DTCs. Perform the transmission drive cycle test and repeat the self-test after completing the repair.
- If the tests pass and a concern is present, refer to Diagnosis By Symptom in this section, OASIS messages and TSBs for concerns.

After On-Board Diagnostic (OBD)

NOTE: The vehicle wiring harness, PCM and non-transmission sensors may affect transmission operations. Repair these concerns first.

Repair all DTCs after the On-Board Diagnostic (OBD) test procedures are completed.

Begin with non-transmission related DTCs, then repair transmission related DTCs. Use the DTC Chart for information on condition and symptoms. This chart will be helpful in referring to the correct manual(s) and aids in diagnosing internal transmission concerns and external non-transmission inputs. The pinpoint tests are used in diagnosing transmission electrical concerns. Diagnosis the vehicle wiring harness and the PCM as well. The Powertrain Control/Emissions Diagnosis (PC/ED) manual aids in diagnosing non-transmission electronic components.

Diagnostic Trouble Code (DTC) Charts

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Using a scan tool to retrieve DTCs, begin with and repair all non-transmission related DTCs. Start with the U-DTC codes (communication link codes) then repair any transmission-related DTCs.

Limp-home mode is a default condition to protect the engine and transmission when a fault occurs. Limp-home mode depends on the actual gear the vehicle was in when the fault has occurred.

- For gears 1-3, the limp-home default will be 3rd gear.
- For gears 4-6, the limp-home default will be 5th gear.

The limp-home gear will be held until the vehicle is placed in R, P or the vehicle has been restarted. After these action(s) the vehicle will default to the limp-home mode of 3rd gear.

DTC Chart

DTC	Component	Description	Condition	Symptom	Action
P0218	Transmission Fluid Temperature (TFT)	TFT condition	Transmission Control Module (TCM) has detected a TFT that has exceeded a set temperature.	• Aggressive lockup schedule	PERFORM normal diagnostic for an overheating condition. REFER to Diagnosis By Symptom in this section.
P0562	Battery	System voltage low	TCM has detected a voltage level below minimum voltage to operate solenoids. Maintains current solenoid state.	• Malfunction Indicator Lamp (MIL) ON • Transmission Control Indicator Lamp (TCIL) ON • No adaptive	CONNECT the scan tool and monitor the VPWR TCM PID and verify module supply voltage to the TCM . REFER to Diagnostic Parameters Identification (PID) Chart in this section.

				strategy • No self learning strategy • Default to 3rd or 5th gear • Battery voltage below 9 volts	
P0563	Battery	System voltage high	TCM has detected a voltage level above maximum voltage.	• No adaptive strategy • No self learning strategy • MIL may turn ON • Default to 3rd or 5th gear • Battery voltage above 16 volts • Will turn on TCIL	CONNECT the scan tool and monitor the VPWR TCM PID and verify module supply voltage to the TCM . REFER to the Diagnostic Parameters Identification (PID) Chart and the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P0605	TCM	The TCM Read-Only Memory (ROM) has been corrupted	TCM has detected an internal software concern with ROM .	• MIL ON • TCIL ON • Default to 3rd or 5th gear	REPROGRAM the original mechatronic to the latest calibration. CLEAR the DTCs. TEST the system for normal operation. If DTCs return, INSTALL a new mechatronic assembly. After installing the new mechatronic assembly, it must be programmed with the latest calibration. PERFORM the Road Test - Adaptive Drive Cycle. REFER to Shift Point Road Test in this section.
P0613	TCM	TCM processor	TCM has detected an internal software issue.	• MIL ON • TCIL ON • Default to 3rd or 5th gear	INSTALL a new mechatronic assembly. After installing the new mechatronic assembly, it must be programmed with the latest calibration.
P0634	TCM	TCM module temperature	Internal temperature	• MIL ON	CONNECT the scan tool and monitor the TFT PID to

			within TCM too high. Possible restriction in cooling circuit.	• Default to 3rd or 5th gear	verify that a high temperature is present. INSPECT the transmission fluid cooler tubes for possible restrictions (kinked or bent cooler tube). VERIFY correct operation/orientation of the thermal bypass valve. INSTALL a new mechatronic unit. After installing the new mechatronic unit, it must be programmed with the latest calibration.
P0641	TCM	TCM module sensor voltage failed	Sensor reference voltage A circuit open, voltage too high or too low.	• MIL ON • TCIL ON • Default to 3rd or 5th gear • Low battery voltage under 9 volts. May also cause P0562	INSTALL a new mechatronic unit. After installing the new mechatronic unit, it must be programmed with the latest calibration.
P0657	TCM	Actuator supply voltage A circuit open	Power supply actuators open circuit.	• MIL ON • TCIL ON • Default to 3rd or 5th gear	INSTALL a new mechatronic unit. After installing the new mechatronic unit, it must be programmed with the latest calibration.
P0658	TCM	Actuator supply voltage A circuit low	Power supply actuators short circuit to ground.	• MIL ON • TCIL ON • Default to 3rd or 5th gear	REMOVE the mechatronic unit. INSPECT and clean the shift solenoid terminals at the leadframe for metallic contamination. REINSTALL the mechatronic unit. CONNECT the scan tool and CLEAR the DTCs. Road test the vehicle and check for DTCs. If the DTC returns, INSTALL a new mechatronic unit. After installing the new mechatronic unit, it must be programmed with the latest calibration.

P0659	TCM	Actuator supply voltage A circuit high	Actuator power supply short circuit to power before key ON.	• MIL ON • TCIL ON • Default to 3rd or 5th gear	REMOVE the mechatronic unit. INSPECT and clean the shift solenoid terminals at the leadframe for metallic contamination. REINSTALL the mechatronic unit. CONNECT the scan tool and CLEAR the DTCs. Road test the vehicle and check for DTCs. If the DTC returns, INSTALL a new mechatronic unit. After installing the new mechatronic unit, it must be programmed with the latest calibration.
P0667	TCM	PCM/ECM/ TCM internal temperature sensor range/performance	Substrate temperature sensor.	• MIL ON • TCIL ON • Default to 3rd or 5th gear	CONNECT the scan tool and monitor the appropriate PID to verify that an error is present. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, INSTALL a new mechatronic unit. After installing the new mechatronic unit, it must be programmed with the latest calibration.
P0701	Transmission control system	Transmission control system range/performance	TCM has detected a concern with the operational strategy.	• TCIL ON • One or more DTCs set causing transmission to default to a hydraulic limp-home mode • Default to 3rd or 5th gear	Multiple DTC failure with conflicting failure mode actions. If other DTCs are present, REPAIR them first. CONNECT the scan tool and monitor the appropriate PID to verify that an error is present. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR the DTCs. TEST the system for normal operation. REPROGRAM the TCM first. If the DTC returns, INSTALL a new mechatronic unit. After installing the new mechatronic unit, it must be programmed with the latest calibration.
P0705					

	Transmission Range (TR) sensor	TR sensor circuit error	TCM has detected a TR signal (P, R, N, D, 3, 2 or 1) is out of range.	• MIL ON • TCIL ON • Default to 3rd or 5th gear	CONNECT the scan tool and monitor the appropriate PID to validate that an error is present. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, INSTALL a new mechatronic unit. After installing the new mechatronic unit, it must be programmed with the latest calibration.
P0711	TFT sensor	TFT sensor circuit range/performance	TCM has detected no TFT change during operation.	• MIL ON • TCIL ON • Default to 3rd or 5th gear • No TCC	INSTALL a new mechatronic unit. After installing the new mechatronic unit, it must be programmed with the latest calibration.
P0712	TFT sensor	TFT sensor A circuit low	TCM has detected a voltage drop across the TFT sensor exceeds scale set for temperature (grounded circuit).	• MIL ON • TCIL ON • No TCC	INSTALL a new mechatronic unit. After installing the new mechatronic unit, it must be programmed with the latest calibration.
P0713	TFT sensor	TFT sensor A circuit high	TCM has detected a voltage drop across the TFT sensor; exceeds scale set for temperature.	• MIL ON • TCIL ON • No TCC	INSTALL a new mechatronic unit. After installing the new mechatronic unit, it must be programmed with the latest calibration.
P0714	TFT sensor	TFT sensor A circuit intermittent	TCM has detected no TFT intermittent operation.	• MIL ON • TCIL ON • No TCC	INSTALL a new mechatronic unit. After installing the new mechatronic unit, it must be programmed with the latest calibration.
P0715	Turbine Shaft Speed (TSS) sensor	TSS sensor A circuit	TSS has detected a short circuit to power.	• MIL ON • TCIL ON • No TCC engagement • Maximum line	INSTALL a new mechatronic unit. After installing the new mechatronic unit, it must be programmed with the latest calibration.

				pressure • No adaptive learning strategy • Default to 3rd gear	
P0716	TSS sensor	TSS sensor A circuit range/performance	TCM has detected a loss or noisy TSS signal during operation.	• MIL ON • TCIL ON • No TCC • Maximum line pressure • No adaptive learning strategy • Default to 3rd gear	CONNECT the scan tool and monitor the appropriate PID to verify that an error is present. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, INSTALL a new mechatronic unit. After installing the new mechatronic unit, it must be programmed with the latest calibration.
P0717	TSS sensor	No TSS sensor A circuit no signal	TCM has not detected a TSS signal. No TSS signal when Output Shaft Speed (OSS) signal is present.	• MIL ON • TCIL ON • No TCC • Maximum line pressure • No adaptive learning strategy • Default to 3rd gear	CONNECT the scan tool and monitor the appropriate PID to verify that an error is present. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, INSTALL a new mechatronic unit. After installing the new mechatronic unit, it must be programmed with the latest calibration.
P0720	OSS sensor	No OSS sensor circuit	TCM has detected an OSS short circuit to power.	MIL ON	INSTALL a new mechatronic unit. After installing the new mechatronic unit, it must be programmed with the latest calibration.
P0721	OSS sensor	OSS sensor circuit range/performance	TCM has detected a loss or noisy OSS signal during operation.	MIL ON	CONNECT the scan tool and monitor the appropriate PID to verify that an error is present. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR the DTCs. TEST the system for normal operation. If the

					DTC returns, INSTALL a new mechatronic unit. After installing the new mechatronic unit, it must be programmed with the latest calibration.
P0722	OSS sensor	No OSS sensor no signal	TCM has not detected a OSS signal. No OSS signal when OSS signal is present.	MIL ON	CONNECT the scan tool and monitor the appropriate PID to verify that an error is present. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, INSTALL a new mechatronic unit. After installing the new mechatronic unit, it must be programmed with the latest calibration.
P0723	OSS sensor	No OSS sensor circuit intermittent	TCM has detected an intermittent signal.	• MIL ON • TCIL ON • No TCC • Hold in gear currently selected • Maximum line pressure • No adaptive learning strategy	CONNECT the scan tool and monitor the appropriate PID to verify that an error is present. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, INSTALL a new mechatronic unit. After installing the new mechatronic unit, it must be programmed with the latest calibration.
P0729	Transmission	Gear 6 incorrect ratio	No 6th gear ratio detected by the TCM .	• MIL ON • TCIL ON • No 6th gear • No TCC • No adaptive learning strategy • Maximum line pressure • Default to 5th gear	FOLLOW preliminary diagnostics. CONNECT the scan tool and monitor the appropriate PID to verify that an error is present. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, see diagnostic Routine 272. REFER to Diagnosis By Symptom in this section.

P0731	Transmission	Gear 1 incorrect ratio	No 1st gear ratio detected by the TCM .	• MIL ON • TCIL ON • No 1st gear • No TCC • No adaptive learning strategy • Default to 3rd gear • Maximum line pressure	FOLLOW preliminary diagnostics. CONNECT the scan tool and monitor the appropriate PID to verify that an error is present. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, see diagnostic Routine 215. REFER to Diagnosis By Symptom in this section.
P0732	Transmission	Gear 2 incorrect ratio	No 2nd gear ratio detected by the TCM .	• MIL ON • TCIL ON • No TCC engagement • No adaptive learning strategy • Default to 3rd gear • Maximum line pressure	FOLLOW preliminary diagnostics. CONNECT the scan tool and monitor the appropriate PID to verify that an error is present. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, see diagnostic Routine 220, 224 and 217. REFER to Diagnosis By Symptom in this section.
P0733	Transmission	Gear 3 incorrect ratio	No 3rd gear ratio detected by the TCM .	• MIL ON • TCIL ON • No TCC • No adaptive learning strategy • Default to 4th gear • Maximum line pressure	FOLLOW preliminary diagnostics. CONNECT the scan tool and monitor the appropriate PID to verify that an error is present. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, see diagnostic Routine 221 or 223. REFER to Diagnosis By Symptom in this section.
P0734	Transmission	Gear 4 incorrect ratio	No 4th gear ratio detected by the TCM .	• MIL ON • TCIL ON • No TCC • No adaptive	FOLLOW preliminary diagnostics. CONNECT the scan tool and monitor the appropriate PID to verify that an error is present. REFER to Diagnostic Parameters Identification

				learning strategy • Default to 3rd gear • Maximum line pressure	(PID) Chart in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, see diagnostic Routine 222 or 271. REFER to Diagnosis By Symptom in this section.
P0735	Transmission	Gear 5 incorrect ratio	No 5th gear ratio detected by the TCM .	• MIL ON • TCIL ON • No TCC • No adaptive learning strategy • Default to 3rd gear • Maximum line pressure	FOLLOW preliminary diagnostics. CONNECT the scan tool and monitor the appropriate PID to verify that an error is present. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, see diagnostic Routine 270 or 273. REFER to Diagnosis By Symptom in this section.
P0736	Transmission	Reverse incorrect ratio	No reverse gear ratio detected by the TCM .	• MIL ON • No TCC • No adaptive learning strategy • Default to 4th gear • Maximum line pressure	FOLLOW preliminary diagnostics. CONNECT the scan tool and monitor the appropriate PID to verify that an error is present. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, see diagnostic Routine 202 or 205. REFER to Diagnosis By Symptom in this section.
P0740	TCC solenoid	TCC solenoid circuit open	TCC solenoid VFS 6 circuit fails. Circuit open.	• MIL ON • TCIL ON • No adaptive learning strategy • Default to 3rd or 5th gear • No TCC	CONNECT the scan tool and monitor the TCC PID to verify TCC electrical operation. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REMOVE the mechatronic unit. INSPECT and clean the shift solenoid terminals at the leadframe for metallic contamination. REINSTALL the mechatronic unit.

					CONNECT the scan tool and CLEAR the DTCs. Road test the vehicle and check for DTCs. If the DTC returns, INSTALL a new mechatronic unit. After installing the new mechatronic unit, it must be programmed with the latest calibration.
P0741	TCC	TCC solenoid circuit performance or stuck off	TCC solenoid VFS 6, clutch or circuit open.	• MIL ON • TCIL ON • No TCC	PERFORM normal diagnostics for TCC . FOLLOW diagnostic Routines 240, 241 and 242. REFER to Diagnosis By Symptom in this section.
P0742	TCC Solenoid	TCC solenoid circuit stuck on	The TCM has detected a TCC solenoid control circuit shorted to ground.	• MIL ON • TCC is disabled • Poor launch performance • Maximum line pressure • Default to 5th gear • DTC P0743 may be set	CONNECT the scan tool and monitor the TCC PID to verify TCC electrical operation. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REMOVE the mechatronic unit. INSPECT and clean the shift solenoid terminals at the leadframe for metallic contamination. REINSTALL the mechatronic unit. CONNECT the scan tool and CLEAR the DTCs. Road test the vehicle and check for DTCs. If the DTC returns, INSTALL a new mechatronic unit. After installing the new mechatronic unit, it must be programmed with the latest calibration.
P0743	TCC Solenoid	TCC solenoid circuit electrical	The TCM has detected a TCC solenoid circuit open, shorted to ground or an intermittent.	• TCIL ON • TCC is disabled • Maximum line pressure • Poor launch performance	CONNECT the scan tool and monitor the TCC PID to verify TCC electrical operation. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REMOVE the mechatronic unit. INSPECT and clean the shift solenoid

				• Default to 5th gear • DTCs P0740, P0742 or P0744 may be set	terminals at the leadframe for metallic contamination. REINSTALL the mechatronic unit. CONNECT the scan tool and CLEAR the DTCs. Road test the vehicle and check for DTCs. If the DTC returns, INSTALL a new mechatronic unit. After installing the new mechatronic unit, it must be programmed with the latest calibration.
P0744	TCC Solenoid	TCC solenoid circuit intermittent	The TCM has detected the TCC solenoid control circuit shorted to power.	• MIL ON • TCC is disabled • DTC P0743 may be set	CONNECT the scan tool and monitor the TCC PID to verify TCC electrical operation. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REMOVE the mechatronic unit. INSPECT and clean the shift solenoid terminals at the leadframe for metallic contamination. REINSTALL the mechatronic unit. CONNECT the scan tool and CLEAR the DTCs. Road test the vehicle and check for DTCs. If the DTC returns, INSTALL a new mechatronic unit. After installing the new mechatronic unit, it must be programmed with the latest calibration.
P0748	Pressure Control Solenoid A (PCA)	PCA electrical	The TCM will set this DTC along with one or more specific electrical DTCs.	• TCIL ON • Maximum line pressure • Default to 5th gear • DTCs P0960, P0962 or P0963 may be	CONNECT the scan tool and monitor the PCA PID to verify PCA electrical operation. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REMOVE the mechatronic unit. INSPECT and clean the shift solenoid terminals at the leadframe for metallic contamination.

				set	REINSTALL the mechatronic unit. CONNECT the scan tool and CLEAR the DTCs. Road test the vehicle and check for DTCs. If the DTC returns, INSTALL a new mechatronic unit. After installing the new mechatronic unit, it must be programmed with the latest calibration.
P0750	Shift Solenoid A (SSA)	SSA	The TCM has detected that the SSA circuit failed open or shorted to power.	• MIL ON • 5th and 6th gear only • Poor launch performance • DTC P0753 may be set	CONNECT the scan tool and monitor the SSA PID to verify SSA electrical operation. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REMOVE the mechatronic unit. INSPECT and clean the shift solenoid terminals at the leadframe for metallic contamination. REINSTALL the mechatronic unit. CONNECT the scan tool and CLEAR the DTCs. Road test the vehicle and check for DTCs. If the DTC returns, INSTALL a new mechatronic unit. After installing the new mechatronic unit, it must be programmed with the latest calibration.
P0751	SSA	SSA performance/stuck off	The TCM commanded SSA ON but detected a ratio error (mechanical failure).	• MIL ON • 5th or 6th gear only • Harsh reverse engagement • Neutral or flair condition on downshift • Poor launch performance	DTC P0751 is a non-electrical DTC. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REFER to Diagnosis By Symptom in this section.

				• DTC P2700 may be set	
P0752	SSA	SSA stuck on	The TCM commanded SSA OFF but detected a ratio error (mechanical failure).	• MIL ON • Disable 5th and 6th gear • Erratic shifts • Stuck in 4th gear • DTC P2700 may be set	DTC P0752 is a non-electrical DTC. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REFER to Diagnosis By Symptom in this section.
P0753	SSA	SSA electrical	The TCM will set this DTC along with one or more specific electrical DTCs.	• TCIL ON • 5th and 6th gear only • DTCs P0750, P0973 or P0974 may be set	CONNECT the scan tool and monitor the SSA PID to verify SSA electrical operation. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REMOVE the mechatronic unit. INSPECT and clean the shift solenoid terminals at the leadframe for metallic contamination. REINSTALL the mechatronic unit. CONNECT the scan tool and CLEAR the DTCs. Road test the vehicle and check for DTCs. If the DTC returns, INSTALL a new mechatronic unit. After installing the new mechatronic unit, it must be programmed with the latest calibration.
P0754	SSA	SSA intermittent	The TCM will set this DTC when an intermittent condition (open, short to power or ground) occurs three times for less than 5 seconds with each occurrence.	• MIL ON • Unexpected upshifts, downshifts, flairs or neutral conditions	CONNECT the scan tool and monitor the SSA PID to verify SSA electrical operation. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REMOVE the mechatronic unit. INSPECT

					and clean the shift solenoid terminals at the leadframe for metallic contamination. REINSTALL the mechatronic unit. CONNECT the scan tool and CLEAR the DTCs. Road test the vehicle and check for DTCs. If the DTC returns, INSTALL a new mechatronic unit. After installing the new mechatronic unit, it must be programmed with the latest calibration.
P0755	Shift Solenoid B (SSB)	SSB	The TCM has detected that the SSB circuit has failed open or shorted to power.	• MIL ON • 3rd and 5th gear only • Harsh 1-3 shift • DTC P0758 may be set	CONNECT the scan tool and monitor the SSB PID to verify SSB electrical operation. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REMOVE the mechatronic unit. INSPECT and clean the shift solenoid terminals at the leadframe for metallic contamination. REINSTALL the mechatronic unit. CONNECT the scan tool and CLEAR the DTCs. Road test the vehicle and check for DTCs. If the DTC returns, INSTALL a new mechatronic unit. After installing the new mechatronic unit, it must be programmed with the latest calibration.
P0756	SSB	SSB performance/stuck off	The TCM commanded SSB ON but detected a ratio error (mechanical failure).	• MIL ON • Disable 3rd and 5th gear • Neutral or flair condition • Transmission hangs in 2nd on acceleration	DTC P0756 is a non-electrical DTC. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REFER to Diagnosis By Symptom in this section.

				• DTC P2701 may be set	
P0757	SSB	SSB stuck on	The TCM commanded SSB OFF but detected a ratio error (mechanical failure).	• MIL ON • Disable 3rd and 5th gear • Neutral or flair condition • Erratic shifts • DTC P2701 may set	DTC P0757 is a non-electrical DTC. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REFER to Diagnosis By Symptom in this section.
P0758	SSB	SSB electrical	The TCM will set this DTC along with one or more specific electrical DTCs.	• TCIL ON • Default to 3rd or 5th gear depending on the DTC • Minimum or maximum line pressure depending on the DTC (failed voltage high or voltage low) • DTCs P0755, P0976 or P0977 may be set	CONNECT the scan tool and monitor the SSB PID to verify SSB electrical operation. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REMOVE the mechatronic unit. INSPECT and clean the shift solenoid terminals at the leadframe for metallic contamination. REINSTALL the mechatronic unit. CONNECT the scan tool and CLEAR the DTCs. Road test the vehicle and check for DTCs. If the DTC returns, INSTALL a new mechatronic unit. After installing the new mechatronic unit, it must be programmed with the latest calibration.
P0759	SSB	SSB intermittent	The TCM will set this DTC when an intermittent condition (open, short to power or ground) occurs three times for less than 5	• MIL ON • Unexpected upshifts, downshifts, flairs or neutral conditions	CONNECT the scan tool and monitor the SSB PID to verify SSB electrical operation. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR the DTCs. TEST the system for normal operation. If the

			seconds with each occurrence.		DTC returns, REMOVE the mechatronic unit. INSPECT and clean the shift solenoid terminals at the leadframe for metallic contamination. REINSTALL the mechatronic unit. CONNECT the scan tool and CLEAR the DTCs. Road test the vehicle and check for DTCs. If the DTC returns, INSTALL a new mechatronic unit. After installing the new mechatronic unit, it must be programmed with the latest calibration.
P0760	Shift Solenoid C (SSC)	SSC	The TCM detected that he SSC circuit failed open.	• MIL ON • Disable 2nd and 6th gear • Erratic or harsh 1-3 shift • DTC P0763 may be set	CONNECT the scan tool and monitor the SSC PID to verify SSC electrical operation. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REMOVE the mechatronic unit. INSPECT and clean the shift solenoid terminals at the leadframe for metallic contamination. REINSTALL the mechatronic unit. CONNECT the scan tool and CLEAR the DTCs. Road test the vehicle and check for DTCs. If the DTC returns, INSTALL a new mechatronic unit. After installing the new mechatronic unit, it must be programmed with the latest calibration.
P0761	SSC	SSC performance/stuck off	The TCM commanded SSC ON but detected a ratio error (mechanical failure).	• MIL ON • Disable 2nd and 6th gear • Neutral or flair condition • DTC P2702 may be	DTC P0761 is a non-electrical DTC. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REFER to Diagnosis By Symptom in this section.

				set	
P0762	SSC	SSC stuck on	The TCM commanded SSC OFF but detected a ratio error (mechanical failure).	• MIL ON • 2nd and 6th gear only • Harsh reverse engagement • Erratic shift or stuck in 6th • DTC P2702 may be set	DTC P0762 is a non-electrical DTC. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REFER to Diagnosis By Symptom in this section.
P0763	SSC	SSC electrical	The TCM will set this DTC along with one or more specific electrical DTCs.	• TCIL ON • Default to 2nd and 6th gear or 1st and 3rd depending on the DTC • Minimum or maximum line pressure depending on the DTC (failed voltage high or voltage low) • DTCs P0760, P0979 or P0980 may be set	CONNECT the scan tool and monitor the SSC PID to verify SSC electrical operation. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REMOVE the mechatronic unit. INSPECT and clean the shift solenoid terminals at the leadframe for metallic contamination. REINSTALL the mechatronic unit. CONNECT the scan tool and CLEAR the DTCs. Road test the vehicle and check for DTCs. If the DTC returns, INSTALL a new mechatronic unit. After installing the new mechatronic unit, it must be programmed with the latest calibration.
P0764	SSC	SSC intermittent	The TCM will set this DTC when an intermittent condition (open, short to power or	• MIL ON • Unexpected upshifts, downshifts, flairs or	CONNECT the scan tool and monitor the SSC PID to verify SSC electrical operation. REFER to Diagnostic Parameters Identification (PID) Chart in

			ground) occurs three times for less than 5 seconds with each occurrence.	neutral conditions	this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REMOVE the mechatronic unit. INSPECT and clean the shift solenoid terminals at the leadframe for metallic contamination. REINSTALL the mechatronic unit. CONNECT the scan tool and CLEAR the DTCs. Road test the vehicle and check for DTCs. If the DTC returns, INSTALL a new mechatronic unit. After installing the new mechatronic unit, it must be programmed with the latest calibration.
P0765	Shift Solenoid D (SSD)	SSD	The TCM detected that the SSD circuit failed open.	• MIL ON • TCIL ON • Disable 1st gear • DTC P0768 may be set	CONNECT the scan tool and monitor the SSD PID to verify SSD electrical operation. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REMOVE the mechatronic unit. INSPECT and clean the shift solenoid terminals at the leadframe for metallic contamination. REINSTALL the mechatronic unit. CONNECT the scan tool and CLEAR the DTCs. Road test the vehicle and check for DTCs. If the DTC returns, INSTALL a new mechatronic unit. After installing the new mechatronic unit, it must be programmed with the latest calibration.
P0766	SSD	SSD performance/stuck off	The TCM commanded SSD ON but detected a ratio error (mechanical failure).	• MIL ON • 2nd and 3rd gear only • Delayed or no reverse	DTC P0766 is a non-electrical DTC. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REFER to Diagnosis By Symptom in this section.

				engagement • DTC P2703 and/or DTC P2704 may be set	
P0767	SSD	SSD stuck on	The TCM commanded SSD OFF but detected a ratio error (mechanical failure).	• MIL ON • 4th gear only • DTC P2704 may be set	DTC P0767 is a non-electrical DTC. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REFER to Diagnosis By Symptom in this section.
P0768	SSD	SSD electrical	The TCM will set this DTC along with one or more specific electrical DTCs.	• TCIL ON • Disable 1st gear or 3rd gear only depending on the DTC • Minimum or maximum line pressure depending on the DTC (failed voltage high or voltage low) • DTCs P0765, P0982 or P0983 may be set	CONNECT the scan tool and monitor the SSD PID to verify SSD electrical operation. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REMOVE the mechatronic unit. INSPECT and clean the shift solenoid terminals at the leadframe for metallic contamination. REINSTALL the mechatronic unit. CONNECT the scan tool and CLEAR the DTCs. Road test the vehicle and check for DTCs. If the DTC returns, INSTALL a new mechatronic unit. After installing the new mechatronic unit, it must be programmed with the latest calibration.
P0769	SSD	SSD intermittent	The TCM will set this DTC when an intermittent condition (open, short to power or ground) occurs three times for less than 5	• MIL ON • Unexpected upshifts, downshifts, flairs or neutral conditions	CONNECT the scan tool and monitor the SSD PID to verify SSD electrical operation. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR the DTCs. TEST the system for normal operation. If the

			seconds with each occurrence.		DTC returns, REMOVE the mechatronic unit. INSPECT and clean the shift solenoid terminals at the leadframe for metallic contamination. REINSTALL the mechatronic unit. CONNECT the scan tool and CLEAR the DTCs. Road test the vehicle and check for DTCs. If the DTC returns, INSTALL a new mechatronic unit. After installing the new mechatronic unit, it must be programmed with the latest calibration.
P0770	Shift Solenoid E (SSE)	SSE	SSE circuit or solenoid failure.	• MIL ON • TCIL ON • Default to 3rd or 5th gear	CONNECT the scan tool and monitor the SSE PID to verify SSE electrical operation. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REMOVE the mechatronic unit. INSPECT and clean the shift solenoid terminals at the leadframe for metallic contamination. MEASURE the resistance of SSE . If the value is not between 9.5 to 10.5 ohms, INSTALL a new SSE , REFER to Mechatronic Assembly in this section. If the value is between 9.5 to 10.5 ohms, REINSTALL the mechatronic unit. CONNECT the scan tool and CLEAR the DTCs. Road test the vehicle and check for DTCs. If the DTC returns, INSTALL a new mechatronic unit. After installing the new mechatronic unit, it must be programmed with the latest calibration.
P0771	SSE	SSE performance/stuck off	The TCM commanded SSE ON but detected a ratio error	• MIL ON • 1st, 2nd and 3rd	DTC P0771 is a non-electrical DTC. CLEAR the DTCs. TEST the system for normal operation. If the

			(mechanical failure).	gear only • Erratic shifting, flairs or neutral condition • DTC P0984 may be set	DTC returns, REFER to Diagnosis By Symptom in this section.
P0772	SSE	SSE stuck on	The TCM commanded SSE OFF but detected a ratio error (mechanical failure).	• MIL ON • Disable 1st, 2nd and 3rd gear • 4th gear launch • DTC P0984 may be set	DTC P0772 is a non-electrical DTC. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REFER to Diagnosis By Symptom in this section.
P0773	SSE	SSE electrical	The TCM will set this DTC along with one or more specific electrical DTCs.	• MIL ON • TCIL ON • Default to 3rd or 5th gear • DTC P0770 may be set	CONNECT the scan tool and monitor the SSE PID to verify SSE electrical operation. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REMOVE the mechatronic unit. INSPECT and clean the shift solenoid terminals at the leadframe for metallic contamination. MEASURE the resistance of SSE . If the value is not between 9.5 to 10.5 ohms, INSTALL a new SSE , REFER to Mechatronic Assembly in this section. If the value is between 9.5 to 10.5 ohms, REINSTALL the mechatronic unit. CONNECT the scan tool and CLEAR the DTCs. Road test the vehicle and check for DTCs. If the DTC returns, INSTALL a new mechatronic unit. After installing the new mechatronic unit, it must be programmed with the latest

					calibration.
P0774	SSE	SSE intermittent	The TCM will set this DTC when an intermittent condition (open, short to power or ground) occurs three times for less than 5 seconds with each occurrence.	• TCIL ON • Hangs In 1st gear • Default to 3rd or 5th gear • DTC P0770 may be set	CONNECT the scan tool and monitor the SSE PID to verify SSE electrical operation. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REMOVE the mechatronic unit. INSPECT and clean the shift solenoid terminals at the leadframe for metallic contamination. MEASURE the resistance of SSE . If the value is not between 9.5 to 10.5 ohms, INSTALL a new SSE , REFER to Mechatronic Assembly in this section. If the value is between 9.5 to 10.5 ohms, REINSTALL the mechatronic unit. CONNECT the scan tool and CLEAR the DTCs. Road test the vehicle and check for DTCs. If the DTC returns, INSTALL a new mechatronic unit. After installing the new mechatronic unit, it must be programmed with the latest calibration.
P07A8	Friction Element D	Friction element D performance/stuck off	The Low/Reverse clutch failed off, ratio error (mechanical failure)	• Disable 1st gear • Delayed or no reverse engagement	DTC P07A8 is a non-electrical DTC. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REFER to Diagnosis By Symptom in this section.
P07A9	Friction Element D	Friction element D stuck on	The Low/Reverse clutch failed on, ratio error (mechanical failure)	• 1st gear only • High engine rpm	DTC P07A9 is a non-electrical DTC. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REFER to Diagnosis By Symptom in this section.
P07AA	Friction Element E	Friction element E performance/stuck off	Clutch 4, 5, 6 failed off, ratio error (mechanical failure)	• Disable 4th, 5th and 6th gear	DTC P07AA is a non-electrical DTC. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REFER to

				• Erratic shifts, neutral conditions, flair or high engine rpm	Diagnosis By Symptom in this section.
P0781	Transmission	1-2 or 2-1 shift error	Incorrect ratio calculated during shift 1-2 or 2-1.	• Incorrect gear selection depending on failure or mode and manual lever position. Shift errors may also be due to other internal transmission concerns (stuck valves, damaged friction material) • MIL ON • TCIL ON • No TCC • No adaptive learning strategy • Hold in 3rd, 2nd or 4th gear	CONNECT the scan tool and monitor the appropriate PID to verify that an error is present. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, see diagnostic Routine 220 or 225. REFER to Diagnosis By Symptom in this section.
P0782	Transmission	2-3 or 3-2 shift error	Incorrect ratio calculated during shift 2-3.	• Incorrect gear selection depending on failure or mode and manual lever	CONNECT the scan tool and monitor the appropriate PID to verify that an error is present. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, see diagnostic

				position. Shift errors may also be due to other internal transmission concerns (stuck valves, damaged friction material) • MIL ON • TCIL ON • No TCC • No adaptive learning strategy • Hold in 4th, 3rd or 2nd gear	Routine 221 or 224. REFER to Diagnosis By Symptom in this section.
P0783	Transmission	3-4 or 4-3 shift error	Incorrect ratio calculated during shift 3-4 or 4-3.	• Incorrect gear selection depending on failure or mode and manual lever position. Shift errors may also be due to other internal transmission concerns (stuck valves, damaged friction material) • MIL ON • TCIL ON • No TCC	CONNECT the scan tool and monitor the appropriate PID to verify that an error is present. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, see diagnostic Routine 222 or 223. REFER to Diagnosis By Symptom in this section.

				• No adaptive learning strategy • Default to 3rd or 4th gear	
P0784	Transmission	4-5 or 5-4 shift error	Incorrect ratio calculated during shift 4-5 or 5-4.	• Incorrect gear selection depending on failure or mode and manual lever position. Shift errors may also be due to other internal transmission concerns (stuck valves, damaged friction material) • MIL ON • TCIL ON • No TCC • No adaptive learning strategy • Default to 4th or 5th gear	CONNECT the scan tool and monitor the appropriate PID to verify that an error is present. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, see diagnostic Routine 270 or 271. REFER to Diagnosis By Symptom in this section.
P0829	Transmission	5-6 or 6-5 shift error	Incorrect ratio calculated during shift 5-6 or 6-5.	• Incorrect gear selection depending on failure or mode and manual lever position. Shift	CONNECT the scan tool and monitor the appropriate PID to verify that an error is present. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, see diagnostic Routine 272 or 273. REFER to Diagnosis By Symptom

				errors may also be due to other internal transmission concerns (stuck valves, damaged friction material) • MIL ON • TCIL ON • No TCC • Default to 2nd or 3rd gear	in this section.
P0960	Pressure Control Solenoid A (PCA)	PCA control circuit open	PCA circuit failed during operation.	• MIL ON • TCIL ON • No adaptive strategy • Maximum line pressure	CONNECT the scan tool and monitor the PCA PID to verify PCA electrical operation. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REMOVE the mechatronic unit. INSPECT and clean the solenoid terminals at the leadframe for metallic contamination. REINSTALL the mechatronic unit. CONNECT the scan tool and CLEAR the DTCs. Road test the vehicle and check for DTCs. If the DTC returns, INSTALL a new mechatronic unit. After installing the new mechatronic unit, it must be programmed with the latest calibration.
P0962	PCA	PCA control circuit low	Voltage through PCA was not detected when the solenoid was commanded on.	• MIL ON • TCIL ON • Default to 3rd or 5th gear	CONNECT the scan tool and monitor the PCA PID to verify PCA electrical operation. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR the DTCs. TEST the system for normal operation. If the

					DTC returns, REMOVE the mechatronic unit. INSPECT and clean the solenoid terminals at the leadframe for metallic contamination. REINSTALL the mechatronic unit. CONNECT the scan tool and CLEAR the DTCs. Road test the vehicle and check for DTCs. If the DTC returns, INSTALL a new mechatronic unit. After installing the new mechatronic unit, it must be programmed with the latest calibration.
P0963	PCA	PCA circuit high	Voltage through PCA was not detected when the solenoid was commanded on.	• MIL ON • TCIL ON • Maximum line pressure • No adaptive strategy	CONNECT the scan tool and monitor the PCA PID to verify PCA electrical operation. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REMOVE the mechatronic unit. INSPECT and clean the solenoid terminals at the leadframe for metallic contamination. REINSTALL the mechatronic unit. CONNECT the scan tool and CLEAR the DTCs. Road test the vehicle and check for DTCs. If the DTC returns, INSTALL a new mechatronic unit. After installing the new mechatronic unit, it must be programmed with the latest calibration.
P0972	Shift Solenoid A (SSA)	SSA control circuit range/performance	SSA control circuit or solenoid failure.	• MIL ON • TCIL ON • Default to 3rd or 5th gear	CONNECT the scan tool and monitor the SSA PID to verify SSA electrical operation. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REMOVE the mechatronic unit. INSPECT

					and clean the shift solenoid terminals at the leadframe for metallic contamination. REINSTALL the mechatronic unit. CONNECT the scan tool and CLEAR the DTCs. Road test the vehicle and check for DTCs. If the DTC returns, INSTALL a new mechatronic unit. After installing the new mechatronic unit, it must be programmed with the latest calibration.
P0973	SSA	SSA control circuit low	Voltage through SSA was not detected when the solenoid was commanded off. Short to ground detected.	• MIL ON • TCIL ON • Default to 3rd or 5th gear	CONNECT the scan tool and monitor the SSA PID to verify SSA electrical operation. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REMOVE the mechatronic unit. INSPECT and clean the shift solenoid terminals at the leadframe for metallic contamination. REINSTALL the mechatronic unit. CONNECT the scan tool and CLEAR the DTCs. Road test the vehicle and check for DTCs. If the DTC returns, INSTALL a new mechatronic unit. After installing the new mechatronic unit, it must be programmed with the latest calibration.
P0974	SSA	SSA control circuit high	Voltage through SSA was not detected when the solenoid was commanded on. Open or short to power detected.	• MIL ON • TCIL ON • Default to 3rd or 5th gear	CONNECT the scan tool and monitor the SSA PID to verify SSA electrical operation. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REMOVE the mechatronic unit. INSPECT and clean the shift solenoid terminals at the leadframe

					for metallic contamination. REINSTALL the mechatronic unit. CONNECT the scan tool and CLEAR the DTCs. Road test the vehicle and check for DTCs. If the DTC returns, INSTALL a new mechatronic unit. After installing the new mechatronic unit, it must be programmed with the latest calibration.
P0975	Shift Solenoid B (SSB)	SSB control circuit range/performance	SSB control circuit or solenoid failure.	• MIL ON • TCIL ON • Default to 3rd or 5th gear	CONNECT the scan tool and monitor the SSB PID to verify SSB electrical operation. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REMOVE the mechatronic unit. INSPECT and clean the shift solenoid terminals at the leadframe for metallic contamination. REINSTALL the mechatronic unit. CONNECT the scan tool and CLEAR the DTCs. Road test the vehicle and check for DTCs. If the DTC returns, INSTALL a new mechatronic unit. After installing the new mechatronic unit, it must be programmed with the latest calibration.
P0976	SSB	SSB circuit low	Voltage through SSB was not detected when the solenoid was commanded off. Short to ground detected.	• MIL ON • TCIL ON • Default to 3rd or 5th gear	CONNECT the scan tool and monitor the SSB PID to verify SSB electrical operation. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REMOVE the mechatronic unit. INSPECT and clean the shift solenoid terminals at the leadframe for metallic contamination. REINSTALL the

					mechatronic unit. CONNECT the scan tool and CLEAR the DTCs. Road test the vehicle and check for DTCs. If the DTC returns, INSTALL a new mechatronic unit. After installing the new mechatronic unit, it must be programmed with the latest calibration.
P0977	SSB	SSB circuit high	Voltage through SSB was not detected when the solenoid was commanded on. Open or short to power detected.	• MIL ON • TCIL ON • Default to 3rd or 5th gear	CONNECT the scan tool and monitor the SSB PID to verify SSB electrical operation. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REMOVE the mechatronic unit. INSPECT and clean the shift solenoid terminals at the leadframe for metallic contamination. REINSTALL the mechatronic unit. CONNECT the scan tool and CLEAR the DTCs. Road test the vehicle and check for DTCs. If the DTC returns, INSTALL a new mechatronic unit. After installing the new mechatronic unit, it must be programmed with the latest calibration.
P0978	Shift Solenoid C (SSC)	SSC control circuit range/performance	SSC control circuit or solenoid failure.	• MIL ON • TCIL ON • Default to 3rd or 5th gear	CONNECT the scan tool and monitor the SSC PID to verify SSC electrical operation. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REMOVE the mechatronic unit. INSPECT and clean the shift solenoid terminals at the leadframe for metallic contamination. REINSTALL the mechatronic unit. CONNECT the scan tool

					and CLEAR the DTCs. Road test the vehicle and check for DTCs. If the DTC returns, INSTALL a new mechatronic unit. After installing the new mechatronic unit, it must be programmed with the latest calibration.
P0979	SSC	SSC control circuit low	Voltage through SSC was not detected when the solenoid was commanded off. Short to ground detected.	• MIL ON • TCIL ON • Default to 3rd or 5th gear	CONNECT the scan tool and monitor the SSC PID to verify SSC electrical operation. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REMOVE the mechatronic unit. INSPECT and clean the shift solenoid terminals at the leadframe for metallic contamination. REINSTALL the mechatronic unit. CONNECT the scan tool and CLEAR the DTCs. Road test the vehicle and check for DTCs. If the DTC returns, INSTALL a new mechatronic unit. After installing the new mechatronic unit, it must be programmed with the latest calibration.
P0980	SSC	SSC control circuit high	Voltage through SSC was not detected when the solenoid was commanded on. Open or short to power detected.	• MIL ON • TCIL ON • Default to 3rd or 5th gear	CONNECT the scan tool and monitor the SSC PID to verify SSC electrical operation. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REMOVE the mechatronic unit. INSPECT and clean the shift solenoid terminals at the leadframe for metallic contamination. REINSTALL the mechatronic unit. CONNECT the scan tool and CLEAR the DTCs. Road test the vehicle and

					check for DTCs. If the DTC returns, INSTALL a new mechatronic unit. After installing the new mechatronic unit, it must be programmed with the latest calibration.
P0981	Shift Solenoid D (SSD)	SSD control circuit range/performance	SSD control circuit or solenoid failure.	• MIL ON • TCIL ON • Default to 3rd or 5th gear	CONNECT the scan tool and monitor the SSD PID to verify SSD electrical operation. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REMOVE the mechatronic unit. INSPECT and clean the shift solenoid terminals at the leadframe for metallic contamination. REINSTALL the mechatronic unit. CONNECT the scan tool and CLEAR the DTCs. Road test the vehicle and check for DTCs. If the DTC returns, INSTALL a new mechatronic unit. After installing the new mechatronic unit, it must be programmed with the latest calibration.
P0982	SSD	SSD control circuit low	Voltage through SSD was not detected when the solenoid was commanded off. Short to ground detected.	• MIL ON • TCIL ON • Default to 3rd or 5th gear	CONNECT the scan tool and monitor the SSD PID to verify SSD electrical operation. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REMOVE the mechatronic unit. INSPECT and clean the shift solenoid terminals at the leadframe for metallic contamination. REINSTALL the mechatronic unit. CONNECT the scan tool and CLEAR the DTCs. Road test the vehicle and check for DTCs. If the DTC returns, INSTALL a new

					mechatronic unit. After installing the new mechatronic unit, it must be programmed with the latest calibration.
P0983	SSD	SSD control circuit high	Voltage through SSD was not detected when the solenoid was commanded on. Open or short to power detected.	• MIL ON • TCIL ON • Default to 3rd or 5th gear	CONNECT the scan tool and monitor the SSD PID to verify SSD electrical operation. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REMOVE the mechatronic unit. INSPECT and clean the shift solenoid terminals at the leadframe for metallic contamination. REINSTALL the mechatronic unit. CONNECT the scan tool and CLEAR the DTCs. Road test the vehicle and check for DTCs. If the DTC returns, INSTALL a new mechatronic unit. After installing the new mechatronic unit, it must be programmed with the latest calibration.
P0985	SSE	SSE control circuit low	Voltage through SSE was not detected when the solenoid was commanded off. Short to ground detected.	• MIL ON • TCIL ON • Default to 3rd or 5th gear	CONNECT the scan tool and monitor the SSE PID to verify SSE electrical operation. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REMOVE the mechatronic unit. INSPECT and clean the shift solenoid terminals at the leadframe for metallic contamination. MEASURE the resistance of SSE . If the value is not between 9.5 to 10.5 ohms, INSTALL a new SSE , REFER to Mechatronic Assembly in this section. If the value is between 9.5 to 10.5 ohms, REINSTALL the mechatronic unit.

					CONNECT the scan tool and CLEAR the DTCs. Road test the vehicle and check for DTCs. If the DTC returns, INSTALL a new mechatronic unit. After installing the new mechatronic unit, it must be programmed with the latest calibration.
P0986	SSE	SSE control circuit high	Voltage through SSE was not detected when the solenoid was commanded on. Open or short to power detected.	• MIL ON • TCIL ON • Default to 3rd or 5th gear	CONNECT the scan tool and monitor the SSE PID to verify SSE electrical operation. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REMOVE the mechatronic unit. INSPECT and clean the shift solenoid terminals at the leadframe for metallic contamination. MEASURE the resistance of SSE . If the value is not between 9.5 to 10.5 ohms, INSTALL a new SSE , REFER to Mechatronic Assembly in this section. If the value is between 9.5 to 10.5 ohms, REINSTALL the mechatronic unit. CONNECT the scan tool and CLEAR the DTCs. Road test the vehicle and check for DTCs. If the DTC returns, INSTALL a new mechatronic unit. After installing the new mechatronic unit, it must be programmed with the latest calibration.
P1705	TR sensor	TR circuit not indicating park/neutral during self-test	TR circuit not indicating park/neutral during Key ON Engine OFF (KOEO) or Key ON Engine Running (KOER) self-test.	-	VERIFY the selector lever is in PARK or NEUTRAL. CLEAR the DTC. RERUN the KOEO and/or KOER self-test. TEST the system for normal operation.
P1707	Transmission				

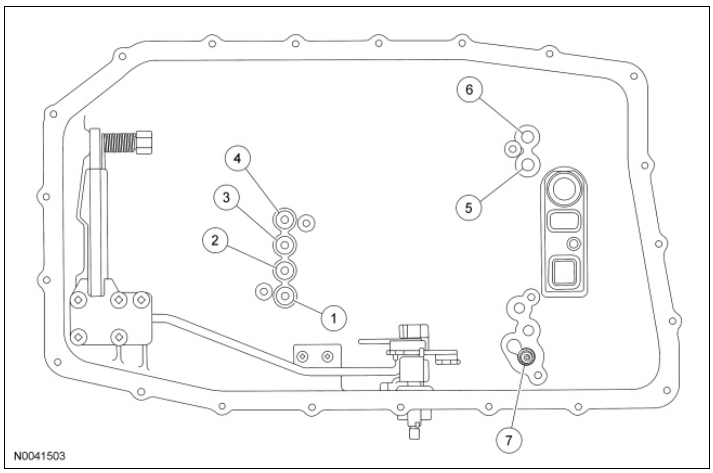
		Park/Neutral (P/N) switch circuit failure	Circuit or sensor failure high. Circuit or sensor failure low.	• Engine will not crank in P or N or engine will crank in all gears • TCIL ON	CONNECT the scan tool and monitor the appropriate PID to verify that an error is present. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR the DTCs. TEST the system for normal operation. CHECK the shift linkage. If the DTC returns, INSTALL a new mechatronic unit. After installing the new mechatronic unit, it must be programmed with the latest calibration.
P1910	Reverse lamp circuit	Reverse lamp control circuit open	Control circuit or sensor failure.	• Park lock or interlock switched OFF • Reverse lamps may be on at all times • Reverse may not come on	CONNECT the scan tool and monitor the appropriate PID to verify that an error is present. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR the DTCs. TEST system for normal operation. If DTC returns, REFER to Section 417-01 .
P1911	Reverse lamp circuit	Reverse lamp control circuit shorted to ground. Circuit low	Circuit or sensor failure.	-	CONNECT the scan tool and monitor the appropriate PID to verify that an error is present. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR the DTCs. TEST system for normal operation. If DTC returns, REFER to Section 417-01 .
P1912	Reverse lamp circuit	Reverse lamp control circuit shorted to power. Circuit high	Circuit or sensor failure.	• Park lock or interlock switched OFF	CONNECT the scan tool and monitor the appropriate PID to verify that an error is present. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR the DTCs. TEST system for normal operation. If DTC returns, REFER to Section 417-01 .
P2763	TCC				

		TCC pressure control solenoid control circuit high.	Voltage through TCC was not detected when the solenoid was commanded on. Short to power detected.	• MIL ON • TCIL ON • No TCC • No adaptive learning strategy • Default to 3rd or 5th gear	CONNECT the scan tool and monitor the TCC PID to verify TCC electrical operation. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REMOVE the mechatronic unit. INSPECT and clean the solenoid terminals at the leadframe for metallic contamination. REINSTALL the mechatronic unit. CONNECT the scan tool and CLEAR the DTCs. Road test the vehicle and check for DTCs. If the DTC returns, INSTALL a new mechatronic unit. After installing the new mechatronic unit, it must be programmed with the latest calibration.
P2764	TCC	TCC pressure control solenoid control circuit low.	TCC was not detected when the solenoid was commanded on. Short to ground detected.	• MIL ON • TCIL ON • No TCC • No adaptive learn strategy	CONNECT the scan tool and monitor the TCC PID to verify TCC electrical operation. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REMOVE the mechatronic unit. INSPECT and clean the solenoid terminals at the leadframe for metallic contamination. REINSTALL the mechatronic unit. CONNECT the scan tool and CLEAR the DTCs. Road test the vehicle and check for DTCs. If the DTC returns, INSTALL a new mechatronic unit. After installing the new mechatronic unit, it must be programmed with the latest calibration.
P062F	TCM	Internal control module EEPROM	Internal TCM with Electrically	• MIL ON	CLEAR the DTCs. TEST the system for normal

		error	Erasable Programmable Read-Only Memory (EEPROM) error.	• Mechanical limp-home mode	operation. If the DTC returns, install a new mechatronic unit. After installing the new mechatronic unit, it must be programmed with the latest calibration.
U0073	Controller Area Network (CAN)	Control module communication bus off	CAN communication bus off, short circuit CAN high to CAN low.	• TCIL ON • No TCC • No adaptive learn strategy • Default to 3rd gear • Maximum line pressure	REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual.
U0100	CAN	Lost communication with ECM/PCM A	CAN link error detected by TCM , between TCM and PCM.	• TCIL ON • No TCC • No adaptive learn strategy • Default to 3rd gear • Maximum line pressure	REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual.
U0155	CAN	Lost communication with Instrument Cluster (IC) control module	CAN link error detected by the TCM and IC .	• No communication with the IC	REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Transmission Connector Layouts

Transmission Vehicle Harness - C1575



Item	Description
1	NOT USED

11	NOT USED
12	NOT USED
13	Ground
14	Battery voltage
15	NOT USED
16	Ground

Special Testing Procedures

The special tests are designed to aid the technician in diagnosing the hydraulic and mechanical portions of the transmission.

Air Pressure Test

Item	Description
1	Intermediate clutch (C) port
2	Low/reverse clutch (D1) port
3	Not used
4	Direct clutch (B) port
5	Overdrive clutch (E) port
6	Forward clutch (A) port
7	Thermal bypass valve

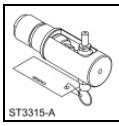
A no-drive condition can exist with correct transmission fluid pressure because of inoperative clutches. Refer to the Clutch Application Chart to determine the appropriate elements. A clutch concern can be located through a series of checks by substituting air pressure for fluid pressure to determine the location of the concern.

Example: When the selector lever is in a forward gear range, a no-drive condition may be caused by an inoperative clutch.

1. Drain the transmission fluid. Remove the transmission fluid pan.

2. Remove the transmission fluid filter, seal assembly and mechatronic unit.

3. Locate the inoperative clutches by applying air pressure into the appropriate clutch port.



4. Apply air pressure to the appropriate clutch port. A dull thud may be heard or movement felt when a clutch piston is applied. If the clutch seals or check ball are leaking, a hissing sound may be heard.

5. If the clutches fail to operate during the air check:
    - the piston seals are not seated, damaged or installed incorrectly.
    - plugged feed holes for clutch apply in the case and/or clutch cylinder.
    - damaged piston and/or clutch cylinder.

6. Service as required and recheck.

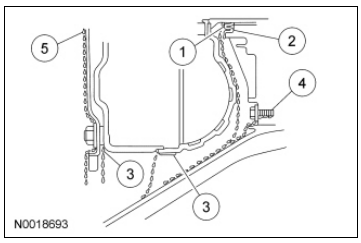
Leakage Inspection

Special Tool(s)

 ST3315-A	Leak Tester, Torque Converter 307-691

Material

Item	Specification
Dye-Lite® ATF/Power Steering Fluid Leak Detection Dye 164-R3701 (Rotunda)	-



Leak Check Test

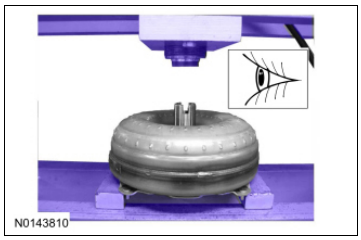
NOTE: When diagnosing transmission leaks, the source of the leak must be positively identified prior to repair. If the vehicle is driven extensively between adding the fluorescent additive and performing the leak test, the leaking oil can spread and make identifying the location of the leak difficult.

1. Clean off any transmission fluid from the top and bottom of the torque converter housing, the front of the case and rear face of the engine and oil pan. Clean the torque converter area by washing with a nonflammable solvent and blow dry with compressed air.

2. Add Dye-Lite® ATF Power Steering Fluid Leak Detection Dye to the transmission fluid. Use one 30 ml (1 fl. oz) of dye solution for every 3.8 L (4 qt) of transmission fluid.

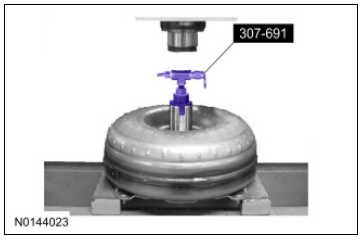
3. Start and run the engine until the transmission reaches its normal operating temperature. Raise the vehicle on a hoist and run the engine occasionally shifting to the DRIVE and REVERSE ranges to increase pressure within the transmission. Using a black light, observe the back of the cylinder block and top of the torque converter housing for evidence of fluid leakage. Run the engine until transmission fluid leakage is evident and the probable source of leakage can be determined.

4. If the source of the leak is obvious, repair as required. Leaks from the torque converter housing can originate from several locations. The paths which the fluid takes to reach the bottom of the torque converter housing are shown in the illustration. The 5 steps following correspond with the numbers in the illustration.
    1. Transmission fluid leaking by the converter hub seal lip will tend to move along the drive hub and onto the back of the torque converter. Except in the case of a total seal failure,



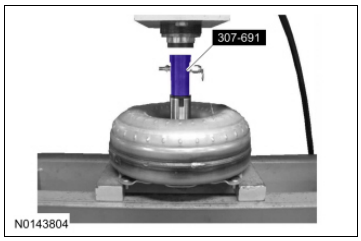
transmission fluid leakage by the lip of the seal will be deposited on the inside of the torque converter housing only, near the outside diameter of the housing.
2. Transmission fluid leakage by the outside diameter of the converter impeller hub seal and the case will follow the same path that leaks by the ID of the converter hub seal follow.
3. Transmission fluid leakage from the converter cover weld or the converter-to-flexplate stud weld will appear at outside diameter of torque converter on the back face of the flexplate and in the converter housing only near the flexplate. If a converter-to-flexplate lug, lug weld or converter cover weld leak is suspected, remove the converter and pressure check.
4. Transmission fluid leakage from the bolts inside the converter housing will flow down the back of the torque converter housing. Leakage may be from loose or missing bolts.
5. Engine oil leaks from the rear main oil.

5. Remove the torque converter.

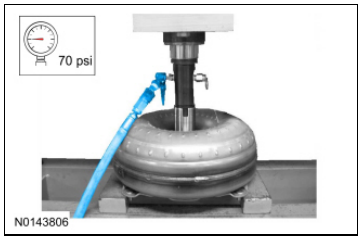


6. Using a black light, observe the torque converter housing. Inspect for evidence of dye from the pump bolts, pump seal, and torque converter hub seal. Repair as required.

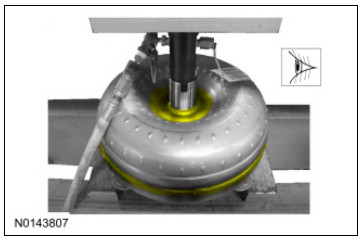
7. If the source of the leak is not evident, continue with this procedure to leak test the torque converter.



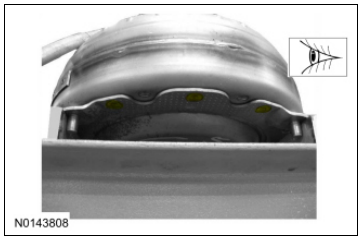
8. Install the torque converter in the arbor press. Support the torque converter on the mounting pads.



9. Install the Leak Tester, Torque Converter 307-691 into the torque converter hub. Tighten to 25 Nm.



10. Secure the press. Only apply enough force from the press to seal the Leak Tester, Torque Converter 307-691 into the torque converter hub.



11. Connect a compressed air supply to the Leak Tester, Torque Converter 307-691.

12. With air pressure applied to valve, inspect for leaks at the converter hub weld and seams. A soap bubble solution can be applied around those areas to aid in the diagnosis. If any leaks are present, install a new torque converter.

13. With air pressure applied to valve, inspect for leaks at the stud or mounting pad and balance weight welds. A soap bubble solution can be applied around those areas to aid in the diagnosis. If any leaks are present, install a new torque converter.

14. After leaks are repaired, clean the remaining transmission fluid dye from serviced areas.

Transmission Fluid Cooler

NOTICE: **When a transmission has been disassembled to install new parts, the transmission fluid cooler and/or auxiliary cooler should be replaced and the transmission fluid cooler tubes must be cleaned and backflushed to keep contaminants from entering the transmission, causing internal damage.**

NOTE: Cleaning and backflushing the transmission fluid cooling tubes, along with following all the normal cleaning and inspection procedures during disassembly and reassembly, will keep contaminants from entering the transmission, causing a repeat repair.

When internal wear or damage has occurred in the transmission, metal particles, clutch plate material or band material may have been carried into the torque converter and transmission fluid cooler. These contaminants are a major cause of recurring transmission failure and must be removed from the transmission cooling system before the transmission is put back into use. Install a new transmission fluid cooler and/or auxiliary cooler and backflush the transmission fluid cooler tubes.

Diagnosis By Symptom

The Diagnosis By Symptom gives the technician diagnostic information and direction, and suggests possible components using a symptom as a starting point. All routines start out with any potential electrical components that can cause or contribute to the symptom described. The routines then list all possible hydraulic or mechanical components that can cause or contribute the symptom described.

Diagnosis by Symptom Chart Directions

1. Using the Diagnosis by Symptom, select the condition that best describes the condition.

2. Refer to the Routine indicated in the Diagnosis by Symptom Index.

3. Always begin diagnosis of a symptom with:
    1. preliminary inspections.
    2. verifications of condition.
    3. checking the fluid levels.
    4. perform other test procedures as directed.

4. **NOTE:** Not all concerns and conditions with electrical components will set a DTC. Be aware that components listed may still be the cause. Verify correct function of these components prior to proceeding to the Hydraulic/Mechanical Routine listed.

   NOTE: When the battery is disconnected or a new battery is installed, certain transmission operating parameters can be lost. The Transmission Control Module (TCM) must relearn these parameters. During this learning process, slightly firm shifts, delayed or early shifts may occur. This operation is considered normal and will not affect the function of the transmission. Normal operation will return once these parameters are stored in the TCM .

   Begin with the ROUTINES, if indicated. Follow the reference or action required statements. Always perform the On-Board Diagnostic (OBD) tests as required. Never skip steps. Repair as required. If the concern is still present after electrical diagnosis, proceed to the Hydraulic/Mechanical Routine listed.

5. The list contains only possible hydraulic or mechanical components that may cause or contribute to the concern. These components are listed in the removal sequence and by most probable cause. All components listed must be inspected to make sure that repairs are complete.

Diagnosis by Symptom Index

Title	Routines
Engagement Concerns	
No Forward In Drive	201
No Reverse	202
Harsh Reverse	203
Harsh Forward	204

Delayed/Soft Reverse	205
Delayed/Soft Forward	206
No Forward and No Reverse	207
Harsh Forward and Harsh Reverse	208
Delayed Forward and Delayed Reverse	209
Shift Concerns	
Some/All Shifts Missing	210
Timing - Early/Late	211
Timing - Erratic/Hunting	212
Feel Concerns	
Soft/Slipping (some or all)	213
Harsh (some or all)	214
No 1st Gear, Engages in Higher Gear	215
No Manual 1st Gear	216
No Manual 2nd Gear	217
No Manual 3rd Gear	218
No 1-2 Shift	220
No 2-3 Shift	221
No 3-4 Shift	222
No 4-5 Shift	270

Engagement Concerns: No Forward in Drive

Possible Component	Reference/Action

201 - ROUTINE	
Transmission Fluid	
• Incorrect level	• CHECK the transmission fluid level. ADJUST transmission fluid to correct level. REFER to Transmission Fluid Level Check in this section.
Selector Lever Linkage	
• Selector lever linkage - damage or incorrectly adjusted	• INSPECT and REPAIR as required. VERIFY selector lever cable adjustment. REFER to Section 307-05 . ADJUST selector lever cable as necessary.
Mechatronics	
• Electronic component - failure	• REMOVE the mechatronic unit. INSPECT and CLEAN the shift solenoid terminals on the mechatronic leadframe for metallic contamination. INSTALL the mechatronic unit. REFER to Mechatronic Assembly in this section. CONNECT the scan tool and CLEAR the DTCs. ROAD TEST the vehicle and check for DTCs. If the DTC returns, install a new mechatronic unit. REFER to Mechatronic Assembly in this section. After installing the new mechatronic unit, it must be programmed with the latest calibration.
• Defective Shift Solenoid A (SSA)	• INSPECT and CLEAN the SSA terminals on the mechatronic leadframe for metallic contamination. REFER to Mechatronic Assembly in this section. CONNECT the scan tool and CLEAR the DTCs. ROAD TEST the vehicle and check for DTCs. If the DTC returns, install a new mechatronic unit. REFER to Mechatronic Assembly in this section. After installing the new mechatronic unit, it must be programmed with the latest calibration.
• Defective manual valve	• Inspect manual valve linkage.
• Defective clutch A regulator valve	• INSPECT mechatronic assembly for stuck valves or contamination. REFER to Mechatronic Assembly in this section.
Clutch Plates	
• Forward clutch (A) friction and steel plate - failure	• INSPECT the forward clutch assembly for damage. REPAIR as required. REFER to Forward Clutch Assembly in this section.

• Direct clutch (B) friction and steel plate - failure	• INSPECT the direct clutch assembly for damage. REPAIR as required. REFER to Direct Clutch Assembly in this section.
• Low/reverse clutch (D) friction and steel plate - failure	• INSPECT the low/reverse clutch assembly for damage. REPAIR as required. REFER to Low/Reverse Clutch Assembly in this section.
Pump	
• Pump gear - failure	• INSTALL a new pump assembly. REFER to Pump Assembly in this section.

Engagement Concerns: No Reverse

Possible Component	Reference/Action
202 - ROUTINE	
Transmission Fluid	
• Incorrect level	• CHECK the transmission fluid level. ADJUST transmission fluid to correct level. REFER to Transmission Fluid Level Check in this section.
Selector Lever Linkage	
• Selector lever linkage - damage or incorrectly adjusted	• INSPECT and REPAIR as required. VERIFY selector lever cable adjustment. REFER to Section 307-05 . ADJUST selector lever cable as necessary.
Mechatronics	
• Electronic component - failure	• REMOVE the mechatronic unit. INSPECT and CLEAN the shift solenoid terminals on the mechatronic leadframe for metallic contamination. INSTALL the mechatronic unit. REFER to Mechatronic Assembly in this section. CONNECT the scan tool and clear the DTCs. ROAD TEST the vehicle and check for DTCs. If the DTC returns, install a new mechatronic unit. REFER to Mechatronic Assembly in this section. After installing the new mechatronic unit, it must be programmed with the latest calibration.
• Defective Shift	• INSPECT and CLEAN the SSB terminals on the mechatronic leadframe for metallic contamination. REFER to Mechatronic Assembly in this section.

Solenoid B (SSB)	CONNECT the scan tool and clear the DTCs. ROAD TEST the vehicle and check for DTCs. If the DTC returns, install a new mechatronic unit. REFER to Mechatronic Assembly in this section. After installing the new mechatronic unit, it must be programmed with the latest calibration.
• Defective direct clutch (B) or low/reverse clutch (D) regulator valve	• INSPECT mechatronic assembly for stuck valves or contamination. REFER to Mechatronic Assembly in this section.
Clutch Plates	
• Direct clutch (B) friction and steel plate - failure	• INSPECT the direct clutch assembly for damage. REPAIR as required. REFER to Direct Clutch Assembly in this section.
Pump	
• Pump gear - failure	• INSTALL a new pump assembly. REFER to Pump Assembly in this section.

Engagement Concerns: Harsh Reverse

Possible Component		Reference/Action
203 - ROUTINE		
Transmission Fluid		
	• Incorrect level	• CHECK the transmission fluid level. ADJUST transmission fluid to correct level. REFER to Transmission Fluid Level Check in this section.
Mechatronics		
	• Electronic component - failure	• REMOVE the mechatronic unit. INSPECT and CLEAN the shift solenoid terminals on the mechatronic leadframe for metallic contamination. INSTALL the mechatronic unit. REFER to Mechatronic Assembly in this section. CONNECT the scan tool and clear the DTCs. ROAD TEST the vehicle and check for DTCs. If the DTC returns, install a new mechatronic unit. REFER to Mechatronic Assembly in this section. After installing the new mechatronic unit, it must be programmed with the latest calibration.
	• Defective Shift Solenoid B (SSB)	• INSPECT and CLEAN the SSB terminals on the mechatronic leadframe for metallic contamination. REFER to Mechatronic

		Assembly in this section. CONNECT the scan tool and clear the DTCs. ROAD TEST the vehicle and check for DTCs. If the DTC returns, install a new mechatronic unit. REFER to Mechatronic Assembly in this section. After installing the new mechatronic unit, it must be programmed with the latest calibration.
	• Defective clutch B regulator valve	• INSPECT mechatronic assembly for stuck valves or contamination. REFER to Mechatronic Assembly in this section.
	• Transmission Control Module (TCM) mechatronic unit - failed	• INSTALL a new mechatronic assembly. REFER to Mechatronic Assembly in this section.
Driveline		
	• Engine driveline looseness in the driveshaft, U-joints or the engine mounts	• INSPECT and REPAIR as required.

Engagement Concerns: Harsh Forward

Possible Component	Reference/Action
204 - ROUTINE	
Transmission Fluid	
• Incorrect level	• CHECK the transmission fluid level. ADJUST transmission fluid to correct level. REFER to Transmission Fluid Level Check in this section.
Mechatronics	
• Electronic component - failure	• REMOVE the mechatronic unit. INSPECT and CLEAN the shift solenoid terminals on the mechatronic leadframe for metallic contamination. INSTALL the mechatronic unit. REFER to Mechatronic Assembly in this section. CONNECT the scan tool and clear the DTCs. ROAD TEST the vehicle and check for DTCs. If the DTC returns, install a new mechatronic unit. REFER to Mechatronic Assembly in this section. After installing the new mechatronic unit, it must be programmed with the latest calibration.
• Defective Shift Solenoid A (SSA)	• INSPECT and CLEAN the SSA terminals on the mechatronic leadframe for metallic contamination. REFER to Mechatronic Assembly in this section. CONNECT the scan tool and clear the DTCs. ROAD TEST the vehicle and check for DTCs. If the DTC returns, install a new mechatronic unit. REFER to Mechatronic Assembly in this section. After installing the new mechatronic unit, it must be programmed with the latest calibration.

• Defective clutch A regulator valve	• INSPECT mechatronic assembly for stuck valves or contamination. REFER to Mechatronic Assembly in this section.
• Defective clutch A latch valve	• INSPECT mechatronic assembly for stuck valves or contamination. REFER to Mechatronic Assembly in this section.
• TCM mechatronic unit - failed	• INSTALL a new mechatronic assembly. REFER to Mechatronic Assembly in this section.
Driveline	
• Engine driveline looseness in the driveshaft, U-joints or the engine mounts	• INSPECT and REPAIR as required.

Engagement Concerns: Delayed/Soft Reverse

Possible Component	Reference/Action
205 - ROUTINE	
Transmission Fluid	
• Incorrect level	• CHECK the transmission fluid level. ADJUST transmission fluid to correct level. REFER to Transmission Fluid Level Check in this section.
• Transmission fluid filter and seal assembly - plugged, damaged	• INSTALL a new transmission fluid filter assembly. REFER to Fluid Pan, Gasket and Filter in this section.
Mechatronics	
• Electronic component - failure	• REMOVE the mechatronic unit. INSPECT and CLEAN the shift solenoid terminals on the mechatronic leadframe for metallic contamination. INSTALL the mechatronic unit. REFER to Mechatronic Assembly in this section. CONNECT the scan tool and clear the DTCs. ROAD TEST the vehicle and check for DTCs. If the DTC returns, install a new mechatronic unit. REFER to Mechatronic Assembly in this section. After installing the new mechatronic unit, it must be programmed with the latest calibration.

• Defective Shift Solenoid B (SSB)	• INSPECT and CLEAN the SSB terminals on the mechatronic leadframe for metallic contamination. REFER to Mechatronic Assembly in this section. CONNECT the scan tool and clear the DTCs. ROAD TEST the vehicle and check for DTCs. If the DTC returns, install a new mechatronic unit. REFER to Mechatronic Assembly in this section. After installing the new mechatronic unit, it must be programmed with the latest calibration.
• Defective clutch B regulator valve	• INSPECT mechatronic assembly for stuck valves or contamination. REFER to Mechatronic Assembly in this section.
• Transmission Control Module (TCM) mechatronic unit - failed	• INSTALL a new mechatronic assembly. REFER to Mechatronic Assembly in this section.

Engagement Concerns: Delayed/Soft Forward

Possible Component	Reference/Action
206 - ROUTINE	
Transmission Fluid	
• Incorrect level	• CHECK the transmission fluid level. ADJUST transmission fluid to correct level. REFER to Transmission Fluid Level Check in this section.
• Transmission fluid filter and seal assembly - plugged, damaged	• INSTALL a new transmission fluid filter assembly. REFER to Fluid Pan, Gasket and Filter in this section.
Mechatronics	
• Electronic component - failure	• REMOVE the mechatronic unit. INSPECT and CLEAN the shift solenoid terminals on the mechatronic leadframe for metallic contamination. INSTALL the mechatronic unit. REFER to Mechatronic Assembly in this section. CONNECT the scan tool and clear the DTCs. ROAD TEST the vehicle and check for DTCs. If the DTC returns, install a new mechatronic unit. REFER to Mechatronic Assembly in this section. After installing the new mechatronic unit, it must be programmed with the latest calibration.
• Defective Shift Solenoid A (SSA)	• INSPECT and CLEAN the SSA terminals on the mechatronic leadframe for metallic contamination. REFER to Mechatronic Assembly in this section. CONNECT the scan tool and clear the DTCs. ROAD TEST the vehicle and check for DTCs. If the DTC returns, install a new mechatronic unit. REFER to Mechatronic Assembly in this section. After installing the new mechatronic

	unit, it must be programmed with the latest calibration.
• Defective clutch A latch valve	• INSPECT mechatronic assembly for stuck valves or contamination. REFER to Mechatronic Assembly in this section.
• Transmission Control Module (TCM) mechatronic unit - failed	• INSTALL a new mechatronic assembly. REFER to Mechatronic Assembly in this section.

Engagement Concerns: No Forward and No Reverse

Possible Component	Reference/Action
207 - ROUTINE	
Transmission Fluid	
• Incorrect level	• CHECK the transmission fluid level. ADJUST transmission fluid to correct level. REFER to Transmission Fluid Level Check in this section.
Selector Lever Linkage (Internal/External)	
• Damaged, out of aadjustment	• INSPECT for damage, repair as required.
Transmission Filter and Seal Assembly	
• Not seated, damaged or plugged • Pump adapter Seal	• INSPECT for position, damage and restriction. INSTALL a new filter and seal assembly. . • INSPECT for crack or damage. INSTALL new as required.
Mechatronics	
• Manual Valve • Mounting bolt torque • Solenoid Pressure Regulator Valve	• INSPECT for damage. Replace as required. • INSPECT for loose mechatronic assembly to transmission bolts. Tighten to specification. • INSPECT for valve stuck in spring compressed position or broken spring. CLEAN or REPLACE mechatronic assembly as required. REFER to Mechatronic Assembly .

Pump Assembly	
• Gear	• INSPECT for damage. REPLACE as required.
• Sun gear hub/splines	• INSPECT for damage. REPLACE as required.
Other Possible Components	
• Turbine shaft	• INSPECT for damage. REPAIR as required.
• Front planetary gear set	• INSPECT for damage. REPAIR as required.
• Forward clutch drum	• INSPECT for damage. REPAIR as required.
• Output shaft/ring gear	• INSPECT for damage. REPAIR as required.

Engagement Concerns: Harsh Forward and Harsh Reverse

Possible Component	Reference/Action
208 - ROUTINE	
Transmission Fluid	
• Incorrect level	• CHECK the transmission fluid level. ADJUST transmission fluid to correct level. REFER to Transmission Fluid Level Check in this section.
• Transmission fluid filter and seal assembly - plugged, damaged	• INSTALL a new transmission fluid filter assembly. REFER to Fluid Pan, Gasket and Filter in this section.
Powertrain Control System	
• PCM electrical inputs/outputs, Transmission Control Module (TCM), external vehicle wiring harnesses, solenoids, Transmission Range (TR) sensor, Shift Solenoid A (SSA), Pressure Control Solenoid A (PCA)	• PERFORM On-Board Diagnostic (OBD) tests. REPAIR as required. CLEAR the DTCs. ROAD TEST and PERFORM the OBD test again.
• Multiple shift missing (more than one gear)	• If some shifts are missing, determine which shifts do not occur. REFER to clutch and solenoid application charts in this section. MONITOR appropriate PIDs as listed in diagnostics.

	REFER to Routine 210.
Mechatronics	
• Electronic component - failure	• REMOVE the mechatronic unit. INSPECT and CLEAN the shift solenoid terminals on the mechatronic leadframe for metallic contamination. INSTALL the mechatronic unit. REFER to Mechatronic Assembly in this section. CONNECT the scan tool and clear the DTCs. ROAD TEST the vehicle and check for DTCs. If the DTC returns, install a new mechatronic unit. REFER to Mechatronic Assembly in this section. After installing the new mechatronic unit, it must be programmed with the latest calibration.

Engagement Concerns: Delayed Forward and Delayed Reverse

Possible Component	Reference/Action
209 - ROUTINE	
Transmission Fluid	
• Incorrect level	• CHECK the transmission fluid level. ADJUST transmission fluid to correct level. REFER to Transmission Fluid Level Check in this section.
• Transmission fluid filter and seal assembly - plugged, damaged	• INSTALL a new transmission fluid filter assembly. REFER to Fluid Pan, Gasket and Filter in this section.
Mechatronics	
• Mechatronic unit - failed	• INSTALL a new mechatronic assembly. REFER to Mechatronic Assembly in this section.

Shift Concerns: Some/All Shifts Missing

Possible Component	Reference/Action
210 - ROUTINE	
Transmission Fluid	
• Incorrect level	• CHECK the transmission fluid level. ADJUST transmission fluid to correct level. REFER to Transmission Fluid Level Check in this section.
• Transmission fluid filter and seal assembly - plugged, damaged	• INSTALL a new transmission fluid filter assembly. REFER to Fluid Pan, Gasket and Filter in this section.

Selector Lever Linkage Damaged or Incorrectly Adjusted	
• Selector lever cable	• INSPECT and REPAIR as required. VERIFY selector lever cable adjustment. REFER to Section 307-05 . ADJUST selector lever cable as necessary.
Forward Clutch (A) Assembly (No Shifts)	
• Seals, piston - damaged	• INSPECT and REPAIR as required.
• Friction elements - damaged or worn	• INSPECT and REPAIR as required.
• Return springs - damaged	• INSPECT and REPAIR as required.
Powertrain Control System	
• PCM electrical inputs/outputs, Transmission Control Module (TCM), vehicle wiring harnesses, solenoids, Transmission Range (TR) sensor, Shift Solenoid A (SSA), Pressure Control Solenoid A (PCA)	• PERFORM On-Board Diagnostic (OBD) tests. REPAIR as required. CLEAR the DTCs. ROAD TEST and PERFORM the OBD test again.
• Multiple shift missing (more than one gear)	• If some shifts are missing, determine which shifts do not occur. REFER to the Clutch and Solenoid Application Charts in this section. MONITOR appropriate PIDs as listed in diagnostics.

Shift Concerns: Timing - Early/Late

Possible Component	Reference/Action
211 - ROUTINE	
Powertrain Control System	
• PCM electrical inputs/outputs, Transmission Control Module (TCM), vehicle wiring harnesses	• PERFORM On-Board Diagnostic (OBD) tests. REPAIR as required. CLEAR the DTCs. ROAD TEST and PERFORM the OBD test again.
• Engine driveability concerns	• REFER to Section 303-00 .
Mechatronics	
• Bolts not tightened to specification	• TIGHTEN to specification.
• Mechatronic unit contaminated, solenoid(s) damaged, stuck or bore damaged. Manual valve	• INSPECT for damage. If damaged, INSTALL a new mechatronic assembly. REFER to Mechatronic Assembly in this section.

damaged, stuck or bore damaged	
Incorrect Pressures	
• Application pressures are incorrect	• Incorrect application pressures may be due to non-transmission components, mechatronic assembly or internal transmission damage. REPAIR all non-transmission components then continue with this routine.
Other	
• Tire size change, axle ratio change	• VERIFY the vehicle has the original equipment. REFER to the Vehicle Certification (VC) label. Changes in tire size and axle ratio will affect shift timing.

Shift Concerns: Timing - Erratic/Hunting

Possible Component		Reference/Action
212 - ROUTINE		
Transmission Fluid		
	• Incorrect level	• CHECK the transmission fluid level. ADJUST transmission fluid to correct level. REFER to Transmission Fluid Level Check in this section.
	• Condition	• CARRY OUT Transmission Fluid Condition Check. REFER to Preliminary Inspection in this section.
	• Transmission fluid over temperature condition	• REFER to Transmission Overheating, Routine 257.
Powertrain Control System		
	• PCM electrical inputs/outputs, Transmission Control Module (TCM), vehicle wiring harnesses	• PERFORM On-Board Diagnostic (OBD) tests. REPAIR as required. CLEAR the DTCs. ROAD TEST and PERFORM the OBD test again.
Torque Converter Concerns		
	• Torque Converter Clutch (TCC)	• REFER to Torque Converter Operation Concerns: Cycling/Chatter.

Feel Concerns: Soft/Slipping (some or all)

Possible Component	Reference/Action
213 - ROUTINE	
Transmission Fluid	
• Incorrect level	• CHECK the transmission fluid level. ADJUST transmission fluid to correct level. REFER to Transmission Fluid Level Check in this section.
• Transmission fluid filter and seal assembly - plugged, damaged	• INSTALL a new transmission fluid filter assembly. REFER to Fluid Pan, Gasket and Filter in this section.
Powertrain Control System	
• PCM electrical inputs/outputs, Transmission Control Module (TCM), vehicle wiring harnesses	• PERFORM On-Board Diagnostic (OBD) tests. REPAIR as required. CLEAR the DTCs. ROAD TEST and PERFORM the OBD test again.
Transmission Fluid Temperature (TFT) Sensor Damaged	
• Mechatronic assembly	• REMOVE the mechatronic unit. INSPECT and CLEAN the TFT terminals on the mechatronic leadframe for metallic contamination. INSTALL the mechatronic unit. REFER to Mechatronic Assembly in this section. CONNECT the scan tool and clear the DTCs. ROAD TEST the vehicle and check for DTCs. If the DTC returns, install a new mechatronic unit. REFER to Mechatronic Assembly in this section. After installing the new mechatronic unit, it must be programmed with the latest calibration.
• Bolts not tightened to specification	• TIGHTEN to specification.
• Mechatronic unit contaminated, solenoid(s) damaged, stuck or bore damaged. Manual valve damaged, stick or bore damaged	• INSPECT for damage. If damaged, install a new mechatronic assembly. REFER to Mechatronic Assembly in this section.

Feel Concerns: Harsh (some or all)

Possible Component	Reference/Action

214 - ROUTINE	
Transmission Fluid	
• Incorrect level	• CHECK the transmission fluid level. ADJUST transmission fluid to correct level. REFER to Transmission Fluid Level Check in this section.
• Transmission fluid filter and seal assembly - plugged, damaged	• INSTALL a new transmission fluid filter assembly. REFER to Fluid Pan, Gasket and Filter in this section.
Powertrain Control System	
• PCM electrical inputs/outputs, Transmission Control Module (TCM), vehicle wiring harnesses	• PERFORM On-Board Diagnostic (OBD) tests. REPAIR as required. CLEAR the DTCs. REPROGRAM the mechatronic assembly with the latest calibration. CARRY OUT Shift Point Road Test - Adaptive Drive Cycle, REFER to Shift Point Road Test in this section. ROAD TEST and PERFORM the OBD test.
Mechatronics	
• Bolts not tightened to specification	• TIGHTEN bolts to specification.
• Mechatronic assembly contaminated, solenoid(s) damaged, solenoids stuck or bore damaged	• INSPECT for damage. If damaged install a new mechatronic assembly. REFER to Mechatronic Assembly in this section.
• Manual valve damaged, stuck or bore damaged	• INSPECT for damage. If damaged install a new mechatronic assembly. REFER to Mechatronic Assembly in this section.

Feel Concerns: No 1st Gear, Engages in Higher Gear

Possible Component	Reference/Action
215 - ROUTINE	
Powertrain Control System	
• PCM electrical inputs/outputs, Transmission Control Module (TCM), vehicle wiring harnesses	• PERFORM On-Board Diagnostic (OBD) tests. REPAIR as required. CLEAR the DTCs. ROAD TEST and PERFORM the OBD test.
Incorrect Gear	
• Mechatronic failure	• DETERMINE which gear the transmission is in. REFER to the Clutch and Solenoid Application Charts in this section.

Feel Concerns: No Manual 1st Gear

Possible Component	Reference/Action
216 - ROUTINE	
Transmission Fluid	
• Incorrect level	• CHECK the transmission fluid level. ADJUST transmission fluid to correct level. REFER to Transmission Fluid Level Check in this section.
• Transmission fluid filter and seal assembly - plugged, damaged	• INSTALL a new transmission fluid filter assembly. REFER to Fluid Pan, Gasket and Filter in this section.
Selector Lever Linkage	
• Selector lever cable system - damaged, misaligned	• INSPECT and REPAIR as necessary.
Mechatronics	
• Electronic component - failure	• REMOVE the mechatronic unit. INSPECT and CLEAN the shift solenoid terminals on the mechatronic leadframe for metallic contamination. INSTALL the mechatronic unit. REFER to Mechatronic Assembly in this section. CONNECT the scan tool and clear the DTCs. ROAD TEST the vehicle and check for DTCs. If the DTC returns, install a new mechatronic unit. REFER to Mechatronic Assembly in this section. After installing the new mechatronic unit, it must be programmed with the latest calibration.
• Defective Shift Solenoid A (SSA)	• INSPECT and CLEAN the SSA terminals on the mechatronic leadframe for metallic contamination. REFER to Mechatronic Assembly in this section. CONNECT the scan tool and clear the DTCs. ROAD TEST the vehicle and check for DTCs. If the DTC returns, install a new mechatronic unit. REFER to Mechatronic Assembly in this section. After installing the new mechatronic unit, it must be programmed with the latest calibration.
Powertrain Control System	
• PCM electrical inputs/outputs, Transmission Control Module (TCM), vehicle wiring harnesses	• PERFORM On-Board Diagnostic (OBD) tests. REPAIR as required. CLEAR the DTCs. ROAD TEST and PERFORM the OBD test.

Clutch Plates	
• Forward clutch (A) friction and steel plate - failure	• INSPECT the forward clutch assembly for damage. REPAIR as required. REFER to Forward Clutch Assembly in this section.
• Low/reverse clutch (D) friction and steel plate - failure	• INSPECT the low/reverse clutch assembly for damage. REPAIR as required. REFER to Low/Reverse Clutch Assembly in this section.
Pump	
• Pump gear - failure	• INSTALL a new pump assembly. REFER to Pump Assembly in this section.

Feel Concerns: No Manual 2nd Gear

Possible Component	Reference/Action
217 - ROUTINE	
Transmission Fluid	
• Incorrect level	• CHECK the transmission fluid level. ADJUST transmission fluid to correct level. REFER to Transmission Fluid Level Check in this section.
• Transmission fluid filter and seal assembly - plugged, damaged	• INSTALL a new transmission fluid filter assembly. REFER to Fluid Pan, Gasket and Filter in this section.
Selector Lever Linkage	
• Selector lever cable system - damaged, misaligned	• INSPECT and REPAIR as necessary.
Mechatronics	
• Electronic component - failure	• REMOVE the mechatronic unit. INSPECT and CLEAN the shift solenoid terminals on the mechatronic leadframe for metallic contamination. INSTALL the mechatronic unit. REFER to Mechatronic Assembly in this section. CONNECT the scan tool and clear the DTCs. ROAD TEST the vehicle and check for DTCs. If the DTC returns, install a new mechatronic unit. REFER to Mechatronic Assembly in this section. After installing the new mechatronic unit, it must be programmed with the latest calibration.

• Defective Shift Solenoid A (SSA)	• INSPECT and CLEAN the SSA terminals on the mechatronic leadframe for metallic contamination. REFER to Mechatronic Assembly in this section. CONNECT the scan tool and clear the DTCs. ROAD TEST the vehicle and check for DTCs. If the DTC returns, install a new mechatronic unit. REFER to Mechatronic Assembly in this section. After installing the new mechatronic unit, it must be programmed with the latest calibration.
Powertrain Control System	
• PCM electrical inputs/outputs, Transmission Control Module (TCM), vehicle wiring harnesses	• PERFORM On-Board Diagnostic (OBD) tests. REPAIR as required. CLEAR the DTCs. ROAD TEST and PERFORM the OBD test.
Clutch Plates	
• Forward clutch (A) friction and steel plate - failure	• INSPECT the forward clutch assembly for damage. REPAIR as required. REFER to Forward Clutch Assembly in this section.
• Low/reverse clutch (D) friction and steel plate - failure	• INSPECT the low/reverse clutch assembly for damage. REPAIR as required. REFER to Low/Reverse Clutch Assembly in this section.
Pump	
• Pump gear - failure	• INSTALL a new pump assembly. REFER to Pump Assembly in this section.

Feel Concerns: No Manual 3rd Gear

Possible Component	Reference/Action
218 - ROUTINE	
Selector Lever Linkage	
• Selector lever cable system - damaged, misaligned	• INSPECT and REPAIR as necessary.
Mechatronics	
• Electronic component - failure	• REMOVE the mechatronic unit. INSPECT and CLEAN the shift solenoid terminals on the mechatronic leadframe for metallic contamination. INSTALL the mechatronic unit. REFER to Mechatronic Assembly in this section. CONNECT the scan tool and clear the DTCs.

	ROAD TEST the vehicle and check for DTCs. If the DTC returns, install a new mechatronic unit. REFER to Mechatronic Assembly in this section. After installing the new mechatronic unit, it must be programmed with the latest calibration.
• Defective Shift Solenoid B (SSB)	• INSPECT and CLEAN the SSB terminals on the mechatronic leadframe for metallic contamination. REFER to Mechatronic Assembly in this section. CONNECT the scan tool and clear the DTCs. ROAD TEST the vehicle and check for DTCs. If the DTC returns, install a new mechatronic unit. REFER to Mechatronic Assembly in this section. After installing the new mechatronic unit, it must be programmed with the latest calibration.
Powertrain Control System	
• PCM electrical inputs/outputs, Transmission Control Module (TCM), vehicle wiring harnesses	• PERFORM On-Board Diagnostic (OBD) tests. REPAIR as required. CLEAR the DTCs. ROAD TEST and PERFORM the OBD test.
Clutch Plates	
• Forward clutch (A) friction and steel plate - failure	• INSPECT the forward clutch assembly for damage. REPAIR as required. REFER to Forward Clutch Assembly in this section.
• Direct clutch (B) friction and steel plate - failure	• INSPECT the direct clutch assembly for damage. REPAIR as required. REFER to Direct Clutch Assembly in this section.
• Low/reverse clutch (D) friction and steel plate - failure.	• INSPECT the low/reverse clutch assembly for damage. REPAIR as required. REFER to Low/Reverse Clutch Assembly in this section.
Pump	
• Pump gear - failure	• INSTALL a new pump assembly. REFER to Pump Assembly in this section.

Feel Concerns: No 1-2 Shift

Possible Component	Reference/Action
220 - ROUTINE	
Transmission Fluid	

• Incorrect level	• CHECK the transmission fluid level. ADJUST transmission fluid to correct level. REFER to Transmission Fluid Level Check in this section.
• Transmission fluid filter and seal assembly - plugged, damaged	• INSTALL a new transmission fluid filter assembly. REFER to Fluid Pan, Gasket and Filter in this section.
Mechatronics	
• Electronic component - failure	• REMOVE the mechatronic unit. INSPECT and CLEAN the shift solenoid terminals on the mechatronic leadframe for metallic contamination. INSTALL the mechatronic unit. REFER to Mechatronic Assembly in this section. CONNECT the scan tool and clear the DTCs. ROAD TEST the vehicle and check for DTCs. If the DTC returns, install a new mechatronic unit. REFER to Mechatronic Assembly in this section. After installing the new mechatronic unit, it must be programmed with the latest calibration.
• Defective Shift Solenoid C (SSC)	• INSPECT and CLEAN the SSC terminals on the mechatronic leadframe for metallic contamination. REFER to Mechatronic Assembly in this section. CONNECT the scan tool and clear the DTCs. ROAD TEST the vehicle and check for DTCs. If the DTC returns, install a new mechatronic unit. REFER to Mechatronic Assembly in this section. After installing the new mechatronic unit, it must be programmed with the latest calibration.
• Defective Shift Solenoid D (SSD)	• INSPECT and CLEAN the SSD terminals on the mechatronic leadframe for metallic contamination. REFER to Mechatronic Assembly in this section. CONNECT the scan tool and clear the DTCs. ROAD TEST the vehicle and check for DTCs. If the DTC returns, install a new mechatronic unit. REFER to Mechatronic Assembly in this section. After installing the new mechatronic unit, it must be programmed with the latest calibration.
• Defective clutch B regulator valve	• INSPECT mechatronic assembly for stuck valves or contamination. REFER to Mechatronic Assembly in this section.
• Defective clutch B latch valve	• INSPECT mechatronic assembly for stuck valves or contamination. REFER to Mechatronic Assembly in this section.
• Defective clutch C regulator valve	• INSPECT mechatronic assembly for stuck valves or contamination. REFER to Mechatronic Assembly in this section.
• Mechatronic unit - failed	• INSTALL a new mechatronic assembly. REFER to Mechatronic Assembly in this section.
Clutch Plates	

• Intermediate clutch (C) friction and steel plate - failure	• INSPECT the intermediate clutch assembly for damage. REPAIR as required. REFER to Intermediate Clutch Assembly in this section.
• Low/reverse clutch (D) friction and steel plate - failure	• INSPECT the low/reverse clutch assembly for damage. REPAIR as required. REFER to Low/Reverse Clutch Assembly in this section.

Feel Concerns: No 2-3 Shift

Possible Component	Reference/Action
221 - ROUTINE	
Transmission Fluid	
• Incorrect level	• CHECK the transmission fluid level. ADJUST transmission fluid to correct level. REFER to Transmission Fluid Level Check in this section.
• Transmission fluid filter and seal assembly - plugged, damaged	• INSTALL a new transmission fluid filter assembly. REFER to Fluid Pan, Gasket and Filter in this section.
Mechatronics	
• Electronic component - failure	• REMOVE the mechatronic unit. INSPECT and CLEAN the shift solenoid terminals on the mechatronic leadframe for metallic contamination. INSTALL the mechatronic unit. REFER to Mechatronic Assembly in this section. CONNECT the scan tool and clear the DTCs. ROAD TEST the vehicle and check for DTCs. If the DTC returns, install a new mechatronic unit. REFER to Mechatronic Assembly in this section. After installing the new mechatronic unit, it must be programmed with the latest calibration.
• Defective Shift Solenoid B (SSB)	• INSPECT and CLEAN the SSB terminals on the mechatronic leadframe for metallic contamination. REFER to Mechatronic Assembly in this section. CONNECT the scan tool and clear the DTCs. ROAD TEST the vehicle and check for DTCs. If the DTC returns, install a new mechatronic unit. REFER to Mechatronic Assembly in this section. After installing the new mechatronic unit, it must be programmed with the latest calibration.
• Defective Shift Solenoid C (SSC)	• INSPECT and CLEAN the SSC terminals on the mechatronic leadframe for metallic contamination. REFER to Mechatronic Assembly in this section. CONNECT the scan tool and clear the DTCs. ROAD TEST the vehicle and check for DTCs. If the DTC returns, install a new mechatronic unit. REFER to Mechatronic Assembly in this section. After installing the new mechatronic

	unit, it must be programmed with the latest calibration.
• Defective clutch B regulator valve	• INSPECT mechatronic assembly for stuck valves or contamination. REFER to Mechatronic Assembly in this section.
• Defective clutch B latch valve	• INSPECT mechatronic assembly for stuck valves or contamination. REFER to Mechatronic Assembly in this section.
• Defective clutch C regulator valve	• INSPECT mechatronic assembly for stuck valves or contamination. REFER to Mechatronic Assembly in this section.
• Mechatronic unit - failed	• INSTALL a new mechatronic assembly. REFER to Mechatronic Assembly in this section.
Clutch Plates	
• Direct clutch (B) friction and steel plate - failure	• INSPECT the direct clutch assembly for damage. REPAIR as required. REFER to Direct Clutch Assembly in this section.
• Intermediate clutch (C) friction and steel plate - failure	• INSPECT the intermediate clutch assembly for damage. REPAIR as required. REFER to Intermediate Clutch Assembly in this section.

Feel Concerns: No 3-4 Shift

Possible Component	Reference/Action
222 - ROUTINE	
Mechatronics	
• Electronic component - failure	• REMOVE the mechatronic unit. INSPECT and CLEAN the shift solenoid terminals on the mechatronic leadframe for metallic contamination. INSTALL the mechatronic unit. REFER to Mechatronic Assembly in this section. CONNECT the scan tool and clear the DTCs. ROAD TEST the vehicle and check for DTCs. If the DTC returns, install a new mechatronic unit. REFER to Mechatronic Assembly in this section. After installing the new mechatronic unit, it must be programmed with the latest calibration.

• Defective Shift Solenoid B (SSB)	• INSPECT and CLEAN the SSB terminals on the mechatronic leadframe for metallic contamination. REFER to Mechatronic Assembly in this section. CONNECT the scan tool and clear the DTCs. ROAD TEST the vehicle and check for DTCs. If the DTC returns, install a new mechatronic unit. REFER to Mechatronic Assembly in this section. After installing the new mechatronic unit, it must be programmed with the latest calibration.
• Defective Shift Solenoid D (SSD)	• INSPECT and CLEAN the SSD terminals on the mechatronic leadframe for metallic contamination. REFER to Mechatronic Assembly in this section. CONNECT the scan tool and clear the DTCs. ROAD TEST the vehicle and check for DTCs. If the DTC returns, install a new mechatronic unit. REFER to Mechatronic Assembly in this section. After installing the new mechatronic unit, it must be programmed with the latest calibration.
• Defective Shift Solenoid E (SSE)	• INSPECT and CLEAN the SSE terminals on the mechatronic leadframe for metallic contamination. REFER to Mechatronic Assembly in this section. CONNECT the scan tool and clear the DTCs. ROAD TEST the vehicle and check for DTCs. If the DTC returns, install a new mechatronic unit. REFER to Mechatronic Assembly in this section. After installing the new mechatronic unit, it must be programmed with the latest calibration.
• Defective clutch B regulator valve	• INSPECT mechatronic assembly for stuck valves or contamination. REFER to Mechatronic Assembly in this section.
• Defective clutch B latch valve	• INSPECT mechatronic assembly for stuck valves or contamination. REFER to Mechatronic Assembly in this section.
• Defective clutch E regulator valve	• INSPECT mechatronic assembly for stuck valves or contamination. REFER to Mechatronic Assembly in this section.
• Defective solenoid multiplex valve	• INSPECT mechatronic assembly for stuck valves or contamination. REFER to Mechatronic Assembly in this section.
• Mechatronic unit - failed	• INSTALL a new mechatronic assembly. REFER to Mechatronic Assembly in this section.
Clutch Plates	
• Direct clutch (B) friction and steel plate - failure	• INSPECT the direct clutch assembly for damage. REPAIR as required. REFER to Direct Clutch Assembly in this section.

• Overdrive clutch (E) friction and steel plate - failure	• Inspect the overdrive clutch assembly for damage. Repair as required. Refer to Overdrive Clutch Assembly in this section.

Feel Concerns: No 4-3 Shift

Possible Component	Reference/Action
223 - ROUTINE	
Mechatronics	
• Electronic component - failure	• REMOVE the mechatronic unit. INSPECT and CLEAN the shift solenoid terminals on the mechatronic leadframe for metallic contamination. INSTALL the mechatronic unit. REFER to Mechatronic Assembly in this section. CONNECT the scan tool and clear the DTCs. ROAD TEST the vehicle and check for DTCs. If the DTC returns, install a new mechatronic unit. REFER to Mechatronic Assembly in this section. After installing the new mechatronic unit, it must be programmed with the latest calibration.
• Defective Shift Solenoid B (SSB)	• INSPECT and CLEAN the SSB terminals on the mechatronic leadframe for metallic contamination. REFER to Mechatronic Assembly in this section. CONNECT the scan tool and clear the DTCs. ROAD TEST the vehicle and check for DTCs. If the DTC returns, install a new mechatronic unit. REFER to Mechatronic Assembly in this section. After installing the new mechatronic unit, it must be programmed with the latest calibration.
• Defective Shift Solenoid D (SSD)	• INSPECT and CLEAN the SSD terminals on the mechatronic leadframe for metallic contamination. REFER to Mechatronic Assembly in this section. CONNECT the scan tool and clear the DTCs. ROAD TEST the vehicle and check for DTCs. If the DTC returns, install a new mechatronic unit. REFER to Mechatronic Assembly in this section. After installing the new mechatronic unit, it must be programmed with the latest calibration.
• Defective clutch E regulator valve	• INSPECT mechatronic assembly for stuck valves or contamination. REFER to Mechatronic Assembly in this section.
• Defective clutch E latch valve	• INSPECT mechatronic assembly for stuck valves or contamination. REFER to Mechatronic Assembly in this section.
• Defective clutch B regulator	• INSPECT mechatronic assembly for stuck valves or contamination. REFER to Mechatronic Assembly in this section.

valve	
• Solenoid multiplex valve	• INSPECT mechatronic assembly for stuck valves or contamination. REFER to Mechatronic Assembly in this section.
• Drive enable valve	• INSPECT mechatronic assembly for stuck valves or contamination. REFER to Mechatronic Assembly in this section.
• Mechatronic unit - failed	• INSTALL a new mechatronic assembly. REFER to Mechatronic Assembly in this section.
Clutch Plates	
• Direct clutch (B) friction and steel plate - failure	• INSPECT the direct clutch assembly for damage. REPAIR as required. REFER to Direct Clutch Assembly in this section.
• Overdrive clutch (E) friction and steel plate - failure	• INSPECT the overdrive clutch assembly for damage. REPAIR as required. REFER to Overdrive Clutch Assembly in this section.

Feel Concerns: No 3-2 Shift

Possible Component	Reference/Action
224 - ROUTINE

• Low/reverse clutch (D) friction and steel plate - failure	• INSPECT the low/reverse clutch assembly for damage. REPAIR as required. REFER to Low/Reverse Clutch Assembly in this section.

Torque Converter Operation Concerns: No Apply

Possible Component	Reference/Action
240 - ROUTINE	
Transmission Fluid	

• Condition	• CARRY OUT the Transmission Fluid Condition Check. REFER to Preliminary Inspection in this section.
Mechatronics	
• Defective Torque Converter Clutch (TCC) solenoid	• INSPECT and CLEAN the TCC solenoid terminals on the mechatronic leadframe for metallic contamination. REFER to Mechatronic Assembly in this section. CONNECT the scan tool and clear the DTCs. ROAD TEST the vehicle and check for DTCs. If the DTC returns, install a new mechatronic unit. REFER to Mechatronic Assembly in this section. After installing the new mechatronic unit, it must be programmed with the latest calibration.
• Defective torque converter apply regulator valve	• INSPECT mechatronic assembly for stuck valves or contamination. REFER to Mechatronic Assembly in this section.
• Defective torque converter release regulator valve	• INSPECT mechatronic assembly for stuck valves or contamination. REFER to Mechatronic Assembly in this section.
• Mechatronic assembly bolts - not tightened to specification	• TIGHTEN to specification.
• Mechatronic unit contaminated, solenoid(s) damaged, stuck or bore damaged. Manual valve damaged, stuck or bore damaged	• INSPECT for damage. If damaged, install a new mechatronic assembly. REFER to Mechatronic Assembly in this section.
PCM	
• Powertrain control system electrical inputs/outputs, Transmission Control Module (TCM), vehicle wiring harnesses, TCC solenoid, Transmission Fluid Temperature (TFT) sensor	• PERFORM On-Board Diagnostic (OBD) tests. REPAIR as required. CLEAR the DTCs. ROAD TEST and PERFORM the OBD test.
Torque Converter	
• Torque converter components	• REMOVE the transmission. INSPECT for damage. INSTALL a new or remanufactured torque converter. REFER to Transmission - Four Wheel Drive (4WD) or Transmission - Rear Wheel Drive (RWD) in this section.

Torque Converter Operation Concerns: Cycling/Chatter

Possible Component	Reference/Action
241 - ROUTINE	
Transmission Fluid	
• Condition	• CARRY OUT the Transmission Fluid Condition Check. REFER to Preliminary Inspection in this section.
Mechatronics	
• Defective Torque Converter Clutch (TCC) solenoid	• INSPECT and CLEAN the TCC solenoid terminals on the mechatronic leadframe for metallic contamination. REFER to Mechatronic Assembly in this section. CONNECT the scan tool and clear the DTCs. ROAD TEST the vehicle and check for DTCs. If the DTC returns, install a new mechatronic unit. REFER to Mechatronic Assembly in this section. After installing the new mechatronic unit, it must be programmed with the latest calibration.
• Defective torque converter apply regulator valve	• INSPECT mechatronic assembly for stuck valves or contamination. REFER to Mechatronic Assembly in this section.
• Mechatronic assembly bolts - not tightened to specification	• TIGHTEN to specification.
• Mechatronic unit contaminated, solenoid(s) damaged, stuck or bore damaged. Manual valve damaged, stuck or bore damaged	• INSPECT for damage. If damaged, install a new mechatronic assembly. REFER to Mechatronic Assembly in this section.
PCM	
• Powertrain control system electrical inputs/outputs, Transmission Control Module (TCM), vehicle wiring harnesses, TCC solenoid, Transmission Fluid Temperature (TFT) sensor	• PERFORM On-Board Diagnostic (OBD) tests. REPAIR as required. CLEAR the DTCs. ROAD TEST and PERFORM the OBD test.
Torque Converter	
• Torque converter components	• REMOVE the transmission. INSPECT for damage. INSTALL a new or remanufactured torque converter. REFER to Transmission - Four Wheel Drive (4WD) or Transmission - Rear Wheel Drive (RWD) in this section.

Torque Converter Operation Concerns: Always Applied/Stalls Vehicle

Possible Component	Reference/Action
242 - ROUTINE	
Transmission Fluid	
• Condition	• CARRY OUT the Transmission Fluid Condition Check. REFER to Preliminary Inspection in this section.
Mechatronics	
• Defective Torque Converter Clutch (TCC) solenoid	• INSPECT and CLEAN the TCC solenoid terminals on the mechatronic leadframe for metallic contamination. REFER to Mechatronic Assembly in this section. CONNECT the scan tool and clear the DTCs. ROAD TEST the vehicle and check for DTCs. If the DTC returns, install a new mechatronic unit. REFER to Mechatronic Assembly in this section. After installing the new mechatronic unit, it must be programmed with the latest calibration.
• Mechatronic assembly bolts - not tightened to specification	• TIGHTEN to specification.
• Mechatronic unit contaminated, solenoid(s) damaged, stuck or bore damaged. Manual valve damaged, stuck or bore damaged	• INSPECT for damage. If damaged, install a new mechatronic assembly. REFER to Mechatronic Assembly in this section.
PCM	
• Powertrain control system electrical inputs/outputs, Transmission Control Module (TCM), vehicle wiring harnesses, TCC solenoid, Transmission Fluid Temperature (TFT) sensor	• PERFORM On-Board Diagnostic (OBD) tests. REPAIR as required. CLEAR the DTCs. ROAD TEST and PERFORM the OBD test.
Torque Converter	
• Torque converter components	• REMOVE the transmission. INSPECT for damage. Install a new or remanufactured torque converter. REFER to Transmission - Four Wheel Drive (4WD) or Transmission - Rear Wheel Drive (RWD) in this section.

Other Concerns: External Leaks

Possible Component	Reference/Action
252 - ROUTINE	
Transmission Fluid	
• Incorrect level	• CHECK the transmission fluid level. ADJUST transmission fluid to correct level. REFER to Transmission Fluid Level Check in this section.
• Transmission case vent - damaged, case porosity	• INSPECT and REPAIR as necessary.
• Leakage at gaskets, seals, bulkhead connector	• REFER to Leakage Inspection , Fluid Leakage in Torque Converter Area and Transmission Leak Check Test Procedures in this section for potential leak locations. REMOVE all traces of lubricant on exposed surface of the transmission. REPAIR as necessary.
Transmission Fluid Cooler Tubes	
• Transmission fluid cooler tube fittings	• LOCATE leak source. REPAIR as required. REFER to Section 307-02 .
• Transmission fluid cooler tube O-rings, transmission fluid cooler tubes	• LOCATE leak source. REPAIR as required. REFER to Section 307-02 .
Torque Converter	
• Torque converter studs	• INSTALL a new torque converter.
• Torque converter hub seal	• INSTALL a new torque converter hub seal.
• Torque converter weld	• INSTALL a new torque converter.
Transmission Case	
• Case - leaking	• INSTALL a new transmission case. REFER to Transmission in this section.
• Transmission electrical connector	• INSTALL a new transmission electrical connector O-ring.
• Transmission fluid fill plug	• INSTALL a new transmission fluid fill plug.
• Output shaft seal	• INSTALL a new seal. REFER to Output Shaft Seal in this section.

• Manual control valve lever seal	• INSTALL a new seal.
• Transmission fluid pan seal (gasket)	• INSTALL a new seal.
Fluid Pump	
• Fluid pump O-ring	• INSTALL a new O-ring. REFER to Pump Assembly in this section.
• Fluid pump seal ring	• INSTALL a new seal ring. REFER to Pump Assembly in this section.

Noise/Vibration in Forward or Reverse

NOTE: NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to Section 100-04 . Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to Section 100-04 for the next likely system and continue diagnosis.

Possible Component	Reference/Action
254 - ROUTINE	
Transmission Fluid	
• Incorrect level (low) pump cavitation	• CHECK the transmission fluid level. ADJUST transmission fluid to correct level. REFER to Transmission Fluid Level Check in this section.
Transmission Fluid Cooler Tubes	
• Transmission fluid cooler tubes grounding out	• ADJUST or reposition cooler tubes.
Torque Converter	
• Check the torque converter components/balance weight	• LOCATE source of disturbance. REPAIR as required.
Engine Driveline	
• Engine drive accessories	• REFER to Section 303-00 .

Engine Will Not Crank

Possible Component	Reference/Action
255 - ROUTINE	
Selector Lever Cable System	

• Selector lever cable system - damaged, misaligned	• INSPECT and REPAIR as necessary. REFER to Section 307-05 .
Powertrain Control System	
• Electrical inputs/outputs, Transmission Control Module (TCM), vehicle wiring harnesses, engine starting system, Transmission Range (TR) sensor	• PERFORM On-Board Diagnostic (OBD) tests. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of engine components. CHECK PIDs for TR park and neutral positions. REPAIR as required. CLEAR the DTCs. ROAD TEST and PERFORM the OBD test.
Torque Converter	
• Flexplate - damaged	• INSPECT and REPAIR as necessary.
Vehicle Starter	
• Starter system concerns	• INSPECT and REPAIR as necessary. REFER to Section 303-06 .
TR Sensor Assembly	
• TR assembly - damaged	• INSPECT and REPAIR as necessary.
Fluid Pump Assembly	
• Internal parts seized	• INSPECT and REPAIR as necessary.

No Park (P) Range

Possible Component	Reference/Action
256 - ROUTINE	
Selector Lever Cable	
• Selector lever cable system - damaged, misaligned	• INSPECT and REPAIR as necessary.
• Manual control lever assembly damaged, manual valve inner lever pin bent, manual valve inner lever damaged, spring rod damaged, park pawl pin loose or damaged, park rod actuating plate loose, damaged or missing	• INSPECT and REPAIR as necessary.
• Transmission case assembly	• INSPECT and REPAIR as necessary.
• Park gear, park pawl, park pawl return spring, part or guide, park actuating rod, park pawl shaft, manual lever	• INSPECT and REPAIR as necessary.
• External linkages/brackets - damaged	• INSPECT and REPAIR as necessary.
Transmission Range (TR) Assembly Damaged	

• Manual lever detent spring	
• TR assembly	• INSTALL a new mechatronic assembly. REFER to Mechatronic Assembly in this section.

Transmission Overheating

Possible Component	Reference/Action
257 - ROUTINE	
Transmission Fluid	
• Incorrect level	• CHECK transmission fluid level. ADJUST transmission fluid to correct level. REFER to Transmission Fluid Level Check in this section.
• Condition	• CARRY OUT the Transmission Fluid Condition Check. REFER to Preliminary Inspection in this section.
Powertrain Control System	
• Electrical inputs/outputs, Transmission Control Module (TCM), vehicle wiring harnesses, Torque Converter Clutch (TCC) solenoid	• PERFORM On-Board Diagnostic (OBD) tests. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of engine components. CHECK PIDs for Transmission Range (TR) park and neutral positions. REPAIR as required. CLEAR the DTCs. ROAD TEST and PERFORM the OBD test.
Torque Converter Not Engaging	
• Torque converter	• INSTALL a new torque converter.
Case Vent Damaged	
• Transmission case assembly	• INSPECT and REPAIR as necessary.
Other	
• Restriction in transmission cooling system	• CHECK transmission cooling system efficiency. REFER to Section 307-02 for automatic transmission cooling system diagnostic procedures.
• Excessive trailer tow load	• REFER to the Owner's Literature for specifications on trailer towing.
• Vehicle heat shield - missing or damaged	• INSPECT and REPAIR as necessary.
	• INSPECT and REPAIR as necessary.

• Vehicle airflow is restricted	
• Thermal bypass valve - missing or damaged	• INSPECT for damage. If damaged, repair as necessary. REFER to Mechatronic Assembly .

Fluid Venting/Foaming

Possible Component	Reference/Action
261 - ROUTINE	
Transmission Fluid	
• Incorrect level	• CHECK the transmission fluid level. ADJUST transmission fluid to correct level. REFER to Transmission Fluid Level Check in this section.
Case Vent Damaged	
• Transmission case assembly	• INSPECT and REPAIR as necessary.

Shift Concerns: No 4-5 Shift

Possible Component	Reference/Action
270 - ROUTINE	
Mechatronics	
• Electronic component - failure	• Remove the mechatronic unit. Inspect and clean the shift solenoid terminals on the mechatronic leadframe for metallic contamination. Install the mechatronic unit. Refer to Mechatronic Assembly in this section. Connect the scan tool and clear the DTCs. Road test the vehicle and check for DTCs. If the DTC returns, install a new mechatronic unit. Refer to Mechatronic Assembly in this section. After installing the new mechatronic unit, it must be programmed with the latest calibration.
• Defective Shift Solenoid A (SSA)	• Inspect and clean the SSA terminals on the mechatronic leadframe for metallic contamination. Refer to Mechatronic Assembly in this section. Connect the scan tool and clear the DTCs. Road test the vehicle and check for DTCs. If the DTC returns, install a new mechatronic unit. Refer to Mechatronic Assembly in this section. After installing the new mechatronic unit, it must be programmed with the latest calibration.
• Defective Shift Solenoid	• Inspect and clean the SSB terminals on the mechatronic leadframe for metallic contamination. Refer to Mechatronic Assembly in this section. Connect the scan tool and clear the DTCs. Road test the vehicle and check for DTCs. If the DTC

B (SSB)	returns, install a new mechatronic unit. Refer to Mechatronic Assembly in this section. After installing the new mechatronic unit, it must be programmed with the latest calibration.
• Defective clutch A regulator valve	• Inspect mechatronic assembly for stuck valves or contamination. Refer to Mechatronic Assembly in this section.
• Defective clutch A latch valve	• Inspect mechatronic assembly for stuck valves or contamination. Refer to Mechatronic Assembly in this section.
• Defective clutch B regulator valve	• Inspect mechatronic assembly for stuck valves or contamination. Refer to Mechatronic Assembly in this section.
• Mechatronic unit - failed	• Install a new mechatronic assembly. Refer to Mechatronic Assembly in this section.
Clutch Plates	
• Forward clutch (A) friction and steel plate - failure	• Inspect the forward clutch assembly for damage. Repair as required. Refer to Forward Clutch Assembly in this section.
• Direct clutch (B) friction and steel plate - failure	• Inspect the direct clutch assembly for damage. Repair as required. Refer to Direct Clutch Assembly in this section.

Feel Concerns: No 5-4 Shift

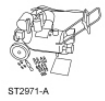
Possible Component	Reference/Action
271 - ROUTINE	
Mechatronics	
• Electronic component - failure	• REMOVE the mechatronic unit. INSPECT and CLEAN the shift solenoid terminals on the mechatronic leadframe for metallic contamination. INSTALL the mechatronic unit. REFER to Mechatronic Assembly in this section. CONNECT the scan tool and clear the DTCs. ROAD TEST the vehicle and check for DTCs. If

		the DTC returns, install a new mechatronic unit. REFER to Mechatronic Assembly in this section. After installing the new mechatronic unit, it must be programmed with the latest calibration.
	• Defective Shift Solenoid B (SSB)	• INSPECT and CLEAN the SSB terminals on the mechatronic leadframe for metallic contamination. REFER to Mechatronic Assembly in this section. CONNECT the scan tool and clear the DTCs. ROAD TEST the vehicle and check for DTCs. If the DTC returns, install a new mechatronic unit. REFER to Mechatronic Assembly in this section. After installing the new mechatronic unit, it must be programmed with the latest calibration.
	• Defective clutch B regulator valve	• INSPECT mechatronic assembly for stuck valves or contamination. REFER to Mechatronic Assembly in this section.
	• Defective clutch B latch valve	• INSPECT mechatronic assembly for stuck valves or contamination. REFER to Mechatronic Assembly in this section.
	• Defective clutch A regulator valve	• INSPECT mechatronic assembly for stuck valves or contamination. REFER to Mechatronic Assembly in this section.
	• Mechatronic unit - failed	• INSTALL a new mechatronic assembly. REFER to Mechatronic Assembly in this section.
Clutch Plates		
	• Direct clutch (B) friction and steel plate - failure	• INSPECT the direct clutch assembly for damage. REPAIR as required. REFER to Direct Clutch Assembly in this section.
	• Forward clutch (A) friction and steel plate - failure	• INSPECT the forward clutch assembly for damage. REPAIR as required. REFER to Forward Clutch Assembly in this section.

Feel Concerns: No 5-6 Shift

Possible Component	Reference/Action
272 - ROUTINE	
Mechatronics	
• Electronic component - failure	• REMOVE the mechatronic unit. INSPECT and CLEAN the shift solenoid terminals on the mechatronic leadframe for metallic contamination. INSTALL the mechatronic unit. REFER to Mechatronic Assembly in this section.

	CONNECT the scan tool and clear the DTCs. ROAD TEST the vehicle and check for DTCs. If the DTC returns, install a new mechatronic unit. REFER to Mechatronic Assembly in this section. After installing the new mechatronic unit, it must be programmed with the latest calibration.
• Defective Shift Solenoid B (SSB)	• INSPECT and CLEAN the SSB terminals on the mechatronic leadframe for metallic contamination. REFER to Mechatronic Assembly in this section. CONNECT the scan tool and clear the DTCs. ROAD TEST the vehicle and check for DTCs. If the DTC returns, install a new mechatronic unit. REFER to Mechatronic Assembly in this section. After installing the new mechatronic unit, it must be programmed with the latest calibration.
• Defective Shift Solenoid C (SSC)	• INSPECT and CLEAN the SSC terminals on the mechatronic leadframe for metallic contamination. REFER to Mechatronic Assembly in this section. CONNECT the scan tool and clear the DTCs. ROAD TEST the vehicle and check for DTCs. If the DTC returns, install a new mechatronic unit. REFER to Mechatronic Assembly in this section. After installing the new mechatronic unit, it must be programmed with the latest calibration.
• Defective clutch B regulator valve	• INSPECT mechatronic assembly for stuck valves or contamination. REFER to Mechatronic Assembly in this section.
• Defective clutch B latch valve	• INSPECT mechatronic assembly for stuck valves or contamination. REFER to Mechatronic Assembly in this section.
• Defective clutch C regulator valve	• INSPECT mechatronic assembly for stuck valves or contamination. REFER to Mechatronic Assembly in this section.
• Mechatronic unit - failed	• INSTALL a new mechatronic assembly. REFER to Mechatronic Assembly in this section.
Clutch Plates	
• Direct clutch (B) friction and steel plate - failure	• INSPECT the direct clutch assembly for damage. REPAIR as required. REFER to Direct Clutch Assembly in this section.
• Intermediate clutch (C) friction and steel plate - failure	• INSPECT the intermediate clutch assembly for damage. REPAIR as required. REFER to Intermediate Clutch Assembly in this section.



Feel Concerns: No 6-5 Shift

Possible Component	Reference/Action
273 - ROUTINE	
Mechatronics	
• Electronic component - failure	• REMOVE the mechatronic unit. INSPECT and CLEAN the shift solenoid terminals on the mechatronic leadframe for metallic contamination. INSTALL the mechatronic unit. REFER to Mechatronic Assembly in this section. CONNECT the scan tool and clear the DTCs. ROAD TEST the vehicle and check for DTCs. If the DTC returns, install a new mechatronic unit. REFER to Mechatronic Assembly in this section. After installing the new mechatronic unit, it must be programmed with the latest calibration.
• Defective Shift Solenoid C (SSC)	• INSPECT and CLEAN the SSC terminals on the mechatronic leadframe for metallic contamination. REFER to Mechatronic Assembly in this section. CONNECT the scan tool and clear the DTCs. ROAD TEST the vehicle and check for DTCs. If the DTC returns, install a new mechatronic unit. REFER to Mechatronic Assembly in this section. After installing the new mechatronic unit, it must be programmed with the latest calibration.
• Defective clutch B regulator valve	• INSPECT mechatronic assembly for stuck valves or contamination. REFER to Mechatronic Assembly in this section.
• Defective clutch B latch valve	• INSPECT mechatronic assembly for stuck valves or contamination. REFER to Mechatronic Assembly in this section.
• Defective clutch C regulator valve	• INSPECT mechatronic assembly for stuck valves or contamination. REFER to Mechatronic Assembly in this section.
• Mechatronic unit - failed	• INSTALL a new mechatronic assembly. REFER to Mechatronic Assembly in this section.
Clutch Plates	
• Direct clutch (B) friction and steel plate - failure	• INSPECT the direct clutch assembly for damage. REPAIR as required. REFER to Direct Clutch Assembly in this section.

	• Intermediate clutch (C) friction and steel plate - failure	• INSPECT the intermediate clutch assembly for damage. REPAIR as required. REFER to Intermediate Clutch Assembly in this section.

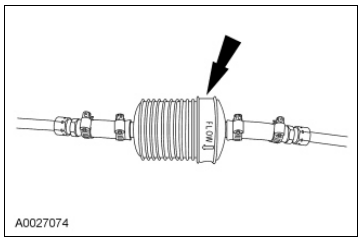
Transmission Fluid Cooler Backflushing and Cleaning

Special Tool(s)

 ST2971-A	Transmission Heated Cooler Line Flusher 222-00007, 222-00004 or equivalent

Material

Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC	MERCON® LV



NOTICE: **Use transmission fluid specified for this transmission. Do not use any supplemental transmission fluid additives or cleaning agents. The use of these products could cause internal transmission components to fail; this will affect the operation of the transmission.**

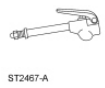
NOTE: Transmission fluid cooler backflushing and cleaning will be performed using the Transmission Heated Cooler Line Flusher or equivalent. Follow the manufacturer's instructions included with the machine. Test the equipment to make sure that a vigorous fluid flow is present before proceeding.

NOTE: If the Transmission Heated Cooler Line Flusher or equivalent is not available, install a new transmission fluid cooler and/or an auxiliary transmission fluid cooler will be required.

NOTE: If the vehicle is equipped with an in-line transmission fluid filter, remove and discard the in-line filter.

1. Check and top off the fluid level of the cooler line flusher with transmission fluid.
2. Allow the transmission fluid in the cooler line flusher 15-30 minutes to heat up to 60°C (140°F) before using.
3. If equipped, remove and discard the in-line transmission fluid filter.

4. Install the line adapters into the transmission fluid cooler tubes.
5. Attach the cooler line flusher red line to the transmission fluid cooler pressure tube quick connect fitting.



6. Attach the cooler line flusher blue line to the transmission fluid cooler return tube quick connect fitting.

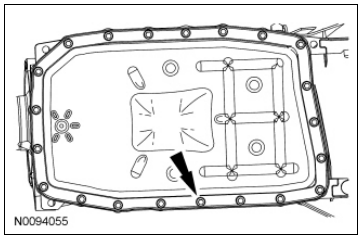
7. Follow the equipment instructions to purge the transmission fluid cooler tubes and cooler prior to starting the flushing procedure.

8. Allow the transmission fluid cooling system to backflush for 10-15 minutes, then flush the transmission fluid cooler in a normal flow direction for an additional 10-15 minutes.

Transmission Fluid Drain and Refill

Special Tool(s)

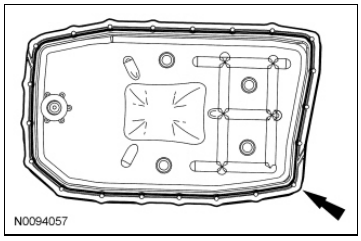
 ST2467-A	Rubber Tip Air Nozzle 100-D009 (D93L-7000-A)
 ST2933-A	Transmission Fluid Fill Tube 307-570
 ST2715-A	Transporter Fluid Evacuator/Injector 307-D465 or equivalent
 ST1269-A	Vacuum Pump Kit 416-D002 (D95L-7559-A) or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool



Material

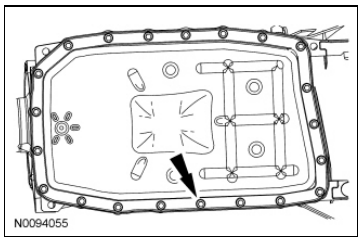
Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC	MERCON® LV

Drain



1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the transmission fluid pan and allow the transmission fluid to drain.



N0094055

3. **NOTE:** The transmission fluid pan gasket can be reused if not damaged.

   Install a new transmission fluid pan gasket, if required.

4. Install the transmission fluid pan and tighten the bolts in a crisscross pattern.
    - Tighten to 12 Nm (106 lb-in).

Refill

NOTICE: **This procedure contains the air purge steps required to purge air from the transmission fluid cooling system. This procedure is NOT intended for use with the Transmission Fluid Level Check.**

NOTICE: **The vehicle should not be driven if the transmission fluid level is low as internal failure could result.**

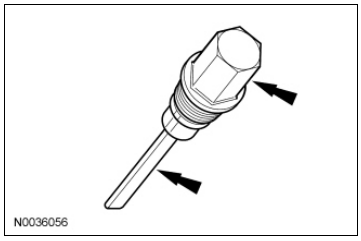
NOTICE: **The transmission fluid fill plug is located near the exhaust system. The exhaust will be extremely hot during this procedure.**

NOTICE: **The use of any other transmission fluid than specified can result in the transmission failing to operate in a normal manner or transmission failure.**

NOTE: If the transmission starts to slip, shifts slowly or shows signs of transmission fluid leaking, the transmission fluid level should be checked.

NOTE: Here is an overview of the Transmission Fluid Drain and Refill procedure.

- Adding 3.3L (3.5 qt) of transmission fluid to the transmission is an initial fill enabling the engine to be started.
- The cold level range shown in the procedure allows the vehicle to be driven.
- The vehicle should be driven to allow the Transmission Fluid Temperature (TFT) to reach 85ºC-88ºC (185ºF-190ºF) in order to purge the air from the transmission fluid cooling system.
- Fill the transmission fluid to the fill range on the transmission fluid level indicator at the normal operating range 80ºC-85ºC (176ºF-185ºF).



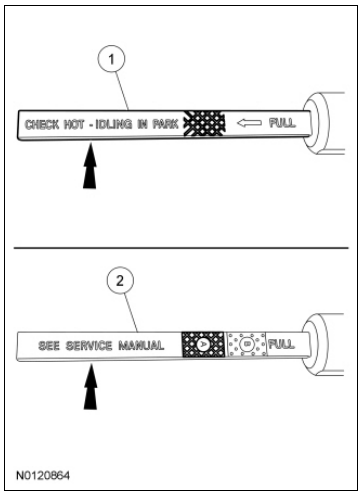
1. **NOTE:** The transmission will need 3.3L (3.5 qt) of transmission fluid added to the transmission as an initial fill if:

    - a new mechatronic assembly has been installed.
    - the transmission fluid pan or transmission fluid filter have been removed.

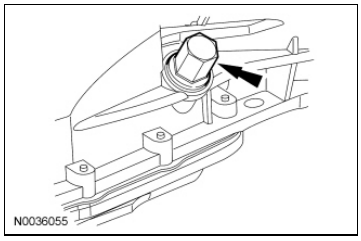
    NOTE: The transmission will need 11.35L (12 qt) of transmission fluid added to the transmission as an initial fill if the transmission has been overhauled.

Using the Transmission Fluid Fill Tube, add the transmission fluid to the transmission through the transmission fluid fill hole. For additional information, refer to Adding Additional Transmission Fluid in this procedure.

2. Separate the transmission fluid level indicator from the transmission fluid fill plug.



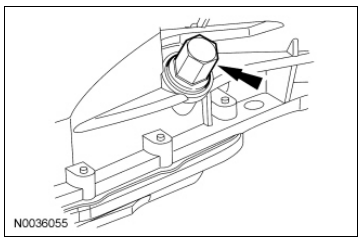
3. Wipe the transmission fluid level indicator clean. Reinstall the transmission fluid level indicator only back into the transmission fluid fill plug hole to check the transmission fluid level. Repeat this until a consistent reading is established.



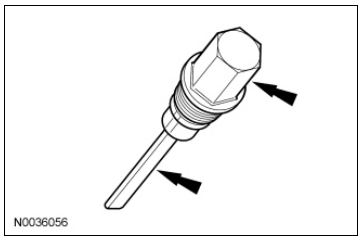
4. **NOTE:** The transmission can have 2 types of transmission fluid level indicators, the original or the replacement. The original transmission fluid level indicator has a single crosshatch area for the fluid level. The replacement has 2 areas for the fluid level, a crosshatched (labeled A) area and a dotted (labeled B) area.

   Add transmission fluid to the cold level location as shown in the illustration.

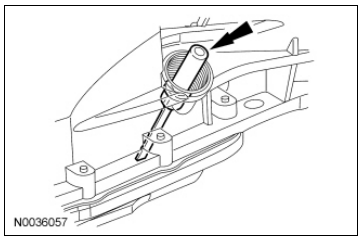
   1. Original transmission fluid level indicator
   2. Replacement transmission fluid level indicator



5. Install the transmission fluid fill plug.
   - Tighten to 35 Nm (26 lb-ft).

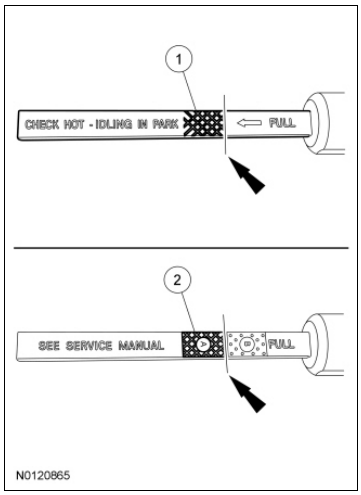


6. While driving the vehicle, use the scan tool to verify that the TFT has reached a temperature of 88°C (190°F). This will circulate the transmission fluid through the torque converter and the transmission fluid cooling system, eliminating any trapped air in the transmission fluid cooling system.
    - With the engine idling (600-750 rpm) in PARK, verify that the TFT is between 80ºC-85ºC (176ºF-185ºF).



7. Remove the transmission fluid fill plug transmission fluid level indicator assembly located on the passenger side front portion of the transmission case.

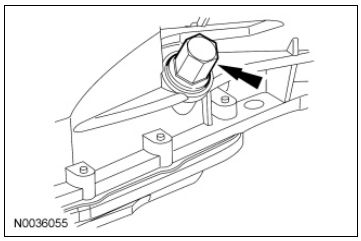
8. Separate the transmission fluid level indicator from the transmission fluid fill plug.



9. Wipe the transmission fluid level indicator clean. Reinstall the transmission fluid level indicator only back into the transmission fluid fill plug hole to check the transmission fluid level. Repeat this until a consistent reading is established.

10. **NOTE:** The transmission can have 2 types of transmission fluid level indicators, the original or the replacement. The original transmission fluid level indicator has a single crosshatch area for the fluid level. The replacement has 2 areas for the fluid level, a crosshatched (labeled A) area and a dotted (labeled B) area. Use the crosshatched area when checking the transmission fluid level. The correct transmission fluid level is at the upper level of the crosshatch marks on the transmission fluid level indicator.

    Using the scan tool verify that the TFT is between 80ºC-85ºC (176ºF-185ºF). The transmission fluid level must be at the upper level of the crosshatch mark.

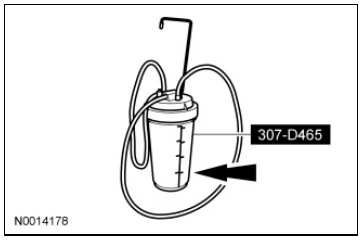


1. Original transmission fluid level indicator
2. Replacement transmission fluid level indicator

11. **NOTE:** If the transmission fluid is not at the correct level, follow the steps for Adding Additional Transmission Fluid or Removing Transmission Fluid in this procedure.

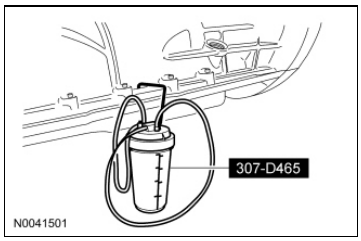
    Install the transmission fluid fill plug.

    - Tighten to 35 Nm (26 lb-ft).

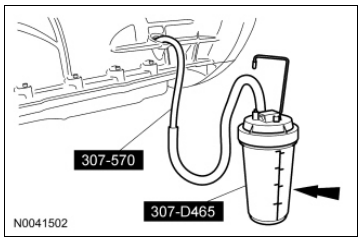


Adding Additional Transmission Fluid

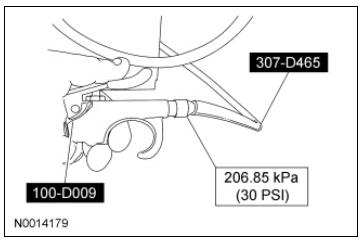
NOTE: To get an accurate transmission fluid level reading the engine should be idling (600-750 rpm) in PARK.



1. Install the Transmission Fluid Fill Tube into the transmission fluid fill hole.

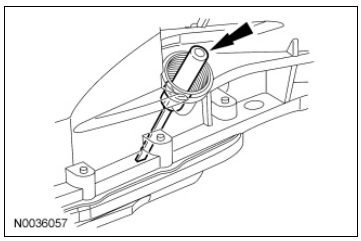


2. Fill the Transporter Fluid Evacuator/Injector with approximately 0.47L (1 pt) of transmission fluid.

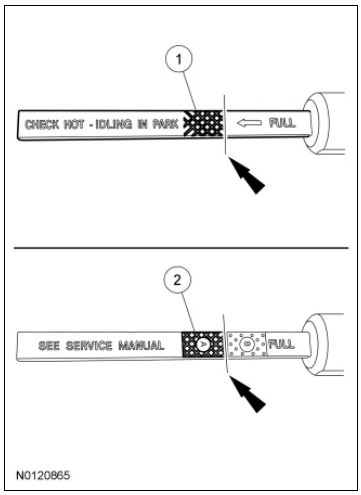


3. Hang the Transporter Fluid Evacuator/Injector under the vehicle, upright and close to the transmission.

4. Connect the Transporter Fluid Evacuator/Injector and Transmission Fluid Fill Tube.
   - Connect the open end of the fluid hose from the Transporter Fluid Evacuator/Injector onto the Transmission Fluid Fill Tube from the transmission case.

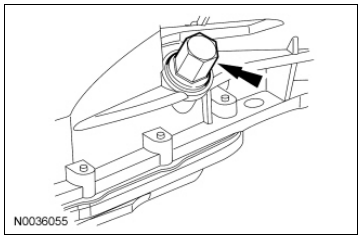


5. Use a Rubber Tip Air Nozzle to apply a maximum of 206.85 kPa (30 psi) to the open end of the vacuum/pressure hose from the Transporter Fluid Evacuator/Injector. Transmission fluid will immediately start flowing out of the Transporter Fluid Evacuator/Injector into the transmission.



6. **NOTE:** Do not overfill the transmission. The transmission fluid level must be at the upper level of the crosshatch mark.

   Reinstall the transmission fluid level indicator only back into the transmission fluid fill plug hole to check the transmission fluid level. Repeat this until a consistent reading is established.



7. Using the scan tool, verify that the TFT is between 80ºC-85ºC (176ºF-185ºF). The transmission fluid level must be at the upper level of the crosshatch mark.
    1. Original transmission fluid level indicator
    2. Replacement transmission fluid level indicator

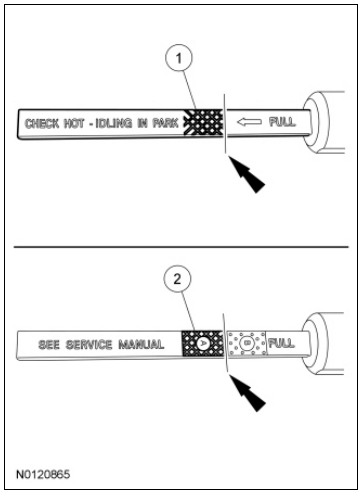
8. **NOTE:** If the transmission fluid is over full, follow the steps for Removing Transmission Fluid in this procedure.

   Install the transmission fluid fill plug.

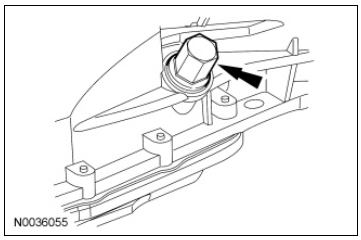
   - Tighten to 35 Nm (26 lb-ft).

Removing Transmission Fluid

NOTE: To get an accurate transmission fluid level reading the engine should be idling (600-750 rpm) in PARK.



1. If the transmission is overfilled, transmission fluid must be removed to the correct level. Use the Transporter Fluid Evacuator/Injector and the Vacuum Pump Kit to extract any excessive transmission fluid.



2. Using the scan tool, verify that the TFT is between 80ºC-85ºC (176ºF-185ºF). The transmission fluid level must be at the upper level of the crosshatch mark. Reinstall the transmission fluid level indicator only back into the transmission fluid fill plug hole to check the transmission fluid level. Repeat this

until a consistent reading is established.

1. Original transmission fluid level indicator
2. Replacement transmission fluid level indicator

3. Install the transmission fluid fill plug.
   - Tighten to 35 Nm (26 lb-ft).

Transmission Fluid Exchange

Special Tool(s)

 ST3088-A	Heavy-Duty Transmission and Power Steering Fluid X-Changer 078-00531 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Material

Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC	MERCON® LV

NOTICE: **Use transmission fluid specific for this transmission. Do not use any supplemental transmission fluid additives or cleaning agents. The use of these products can cause internal transmission components to fail, which will affect the operation of the transmission.**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Use the Heavy-Duty Transmission and Power Steering Fluid X-Changer to change the fluid.
3. Connect the Heavy-Duty Transmission and Power Steering Fluid X-Changer to the transmission fluid cooler tube after the transmission fluid cooler on the return tube. This will help remove any foreign material trapped in the transmission fluid coolers.
4. Perform the transmission fluid exchange using the Heavy-Duty Transmission and Power Steering Fluid X-Changer. Follow the manufacturer's instructions included with the machine.
5. Once the transmission fluid exchange is completed, disconnect the Heavy-Duty Transmission and Power Steering Fluid X-Changer. Reconnect any disconnected transmission fluid cooler tubes.
6. Using the scan tool with the engine running, check and make sure that the transmission is at normal operating temperature 66-77°C (150-170°F). Check and adjust the transmission fluid level and check for any leaks. If transmission fluid is needed, add transmission fluid in increments of 0.24L (0.5 pt) until the correct level is achieved.

Transmission Fluid Level Check

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Material

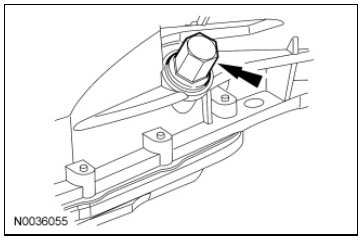
Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC	MERCON® LV

NOTICE: **The vehicle should not be driven if the transmission fluid level is low as internal failure could result.**

NOTICE: **The transmission fluid fill plug is located near the exhaust system. The exhaust will be extremely hot during this procedure.**

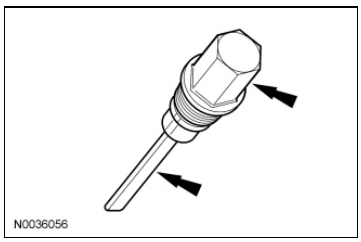
NOTE: If the vehicle has been operated for an extended period at high highway speeds, in city traffic, during hot weather or while pulling a trailer, the transmission fluid must cool down to obtain an accurate reading.

NOTE: If the transmission starts to slip, shifts slowly or shows signs of transmission fluid leaking, the transmission fluid level should be checked.



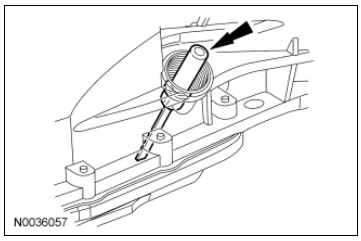
NOTE: Do not overfill the transmission. The transmission fluid level must be at the upper level of the crosshatch mark.

NOTE: If the installation of a new transmission fluid cooler or transmission fluid cooler tubes has been carried out, the vehicle must be driven to get the transmission fluid to a temperature of 88ºC (190ºF) in order to purge the air from the transmission fluid cooling system.



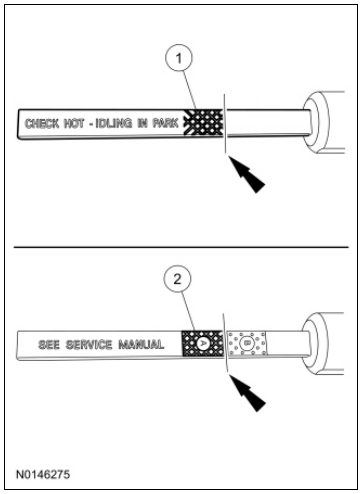
1. With the engine running, place the transmission selector lever in each gear position and hold approximately 5 seconds. Place the transmission selector lever in PARK.

2. With the engine idling (600-750 rpm) in PARK, position it on a hoist. For additional information, refer to Section 100-02 .



3. Remove the transmission fluid fill plug transmission fluid level indicator assembly, located on the passenger side front portion of the transmission case.

4. Separate the transmission fluid level indicator from the transmission fluid fill plug.



5. Wipe the transmission fluid level indicator clean. Reinstall the transmission fluid level indicator only back into the transmission fluid fill plug hole to check the transmission fluid level.

6. **NOTE:** The transmission can have 2 types of transmission fluid level indicators, the original or the replacement. The original transmission fluid level indicator has a single crosshatch area for the fluid level. The replacement has 2 areas for the fluid level, a crosshatched (labeled A) area and a dotted (labeled B) area. Use the crosshatched area when checking the transmission fluid level. The correct transmission fluid level is at the upper level of the crosshatch marks on the transmission fluid level indicator.

   Using the scan tool, verify that the Transmission Fluid Temperature (TFT) is between 80ºC-85ºC (176ºF-185ºF). Do not overfill the transmission. The transmission fluid level must be at the upper level of the crosshatch mark.

   1. Original transmission fluid level indicator
   2. Replacement transmission fluid level indicator

7. **NOTE:** If the transmission fluid is not at the correct level, follow the steps for Adding Additional Transmission Fluid or Removing Transmission Fluid. For additional information, refer to Transmission Fluid Drain and Refill in this section.

   Install the transmission fluid fill plug.

   - Tighten to 35 Nm (26 lb-ft).

Torque Converter Contamination Inspection

Material

Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC	MERCON® LV

1. A new or remanufactured torque converter must be installed if one or more of the following statements is true:
    - A torque converter malfunction has been determined based on complete diagnostic procedures.
    - The torque converter stud or studs, impeller hub or bushing are damaged.
    - The torque converter exhibits external discoloration (due to overheating).
    - There is evidence of transmission assembly or fluid contamination due to the following transmission or converter failure modes.
        - Major metallic failure
        - Multiple clutch plates or band failures
        - Sufficient component wear which results in metallic contamination
        - Water or antifreeze contamination

2. If none of the above conditions are present, continue with the following fluid inspection.

3. Pour a small amount of transmission fluid from the torque converter onto an absorbent white tissue or through a paper filter.

4. Examine the fluid for contaminants, color and smell. The fluid must be free of contaminants, red in color and not have a burnt smell.

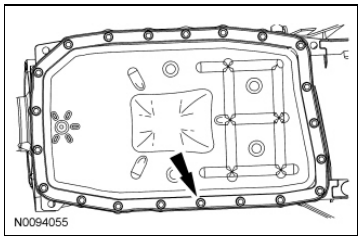
5. ***NOTICE:*** **Do not use water-based cleaners or mineral spirits to clean or flush the torque converter or transmission damage will occur.**

   If the fluid passed inspection:

    - drain the remaining fluid from the torque converter.
    - using only the recommended transmission fluid, add 1.9L (2 qt) of clean fluid into the converter and agitate by hand.
    - thoroughly drain the fluid.

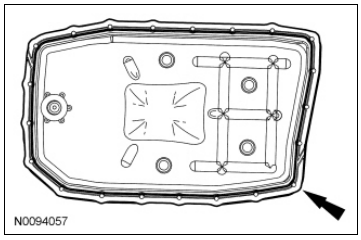
Fluid Pan, Gasket and Filter

Material



Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC	MERCON® LV

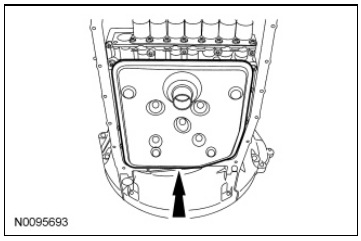
Removal



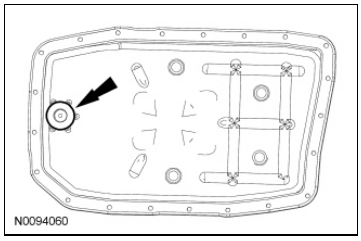
NOTICE: **The use of any transmission fluid other than specified can result in the transmission failing to operate in a normal manner or transmission failure.**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the transmission fluid pan and allow the transmission fluid to drain.

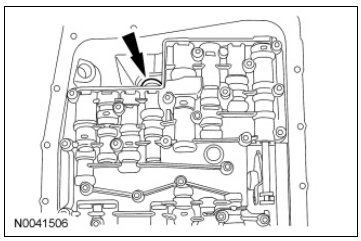


3. Remove the transmission fluid pan gasket.

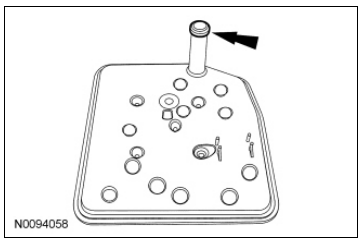


4. **NOTE:** The transmission fluid filter may be reused if no excessive contamination is indicated.

   Remove and discard the transmission fluid filter.



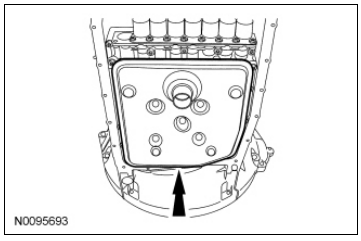
5. Clean and inspect the transmission fluid pan and magnet.



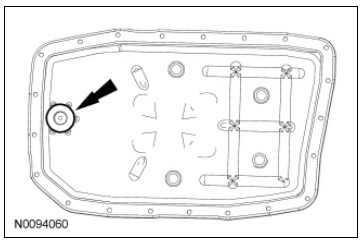
Installation

NOTE: If the transmission is being repaired for a contamination-related failure, install a new transmission fluid filter and seal assembly. The transmission fluid filter may be reused if no excessive contamination is indicated.

1. Inspect the transmission case for the transmission fluid filter seal. If the seal is in the case, carefully remove the seal without scratching the case.

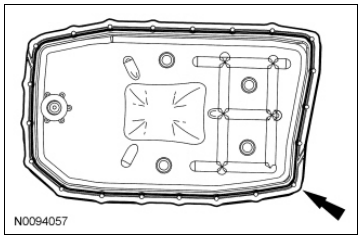


2. Make sure that the seal is on the transmission fluid filter and lubricate the seal with automatic transmission fluid.

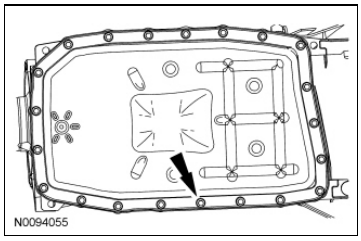


3. **NOTE:** The transmission fluid filter may be reused if no excessive contamination is indicated.

   If required, install a new transmission fluid filter.



4. Position the magnet in the transmission fluid pan.



5. **NOTE:** The transmission fluid pan gasket can be reused if not damaged.

   Install a new transmission fluid pan gasket if required.

6. Install the transmission fluid pan and tighten the bolts in a crisscross pattern.
   - Tighten to 12 Nm (106 lb-in).

7. Using the Adding Additional Transmission Fluid procedure, fill and check the transmission fluid. For additional information, refer to Transmission Fluid Drain and Refill in this section.

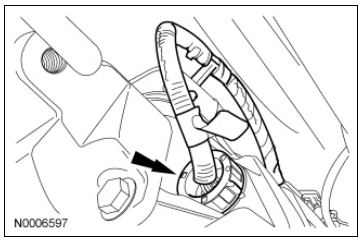
Mechatronic Assembly

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

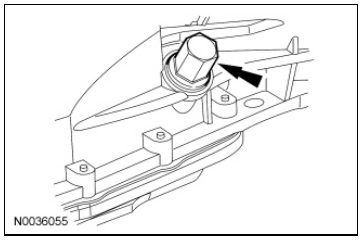
Removal

Mechatronic assembly



NOTICE: **The only serviceable solenoid in the mechatronic assembly is Shift Solenoid E (SSE). If the mechatronic assembly is being removed due to a faulty SSE , follow the specific steps in this procedure to install a new SSE . If the mechatronic assembly is being removed due to a faulty solenoid other than SSE , a new mechatronic assembly must be installed.**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

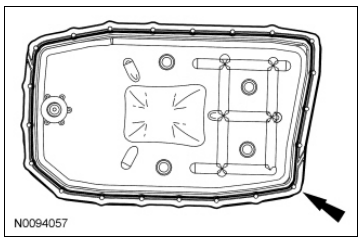


2. Retrieve the module configuration from the PCM. Carry out the module configuration retrieval steps of the Programmable Module Installation (PMI) procedure. For additional information, refer to Section 418-01 .

3. ***NOTICE:*** **Do not pull on the wire harness to disconnect the connector or damage to the connector will occur.**

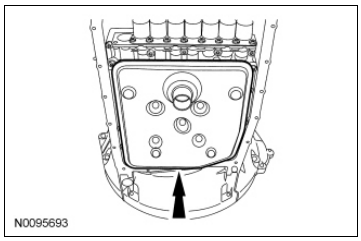
   Disconnect the transmission vehicle harness connector by twisting the outer shell and pulling back on the connector.

N0006597

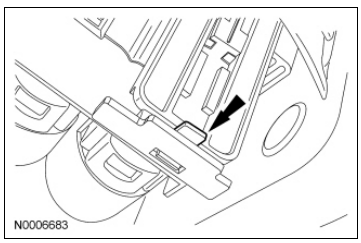


4. Remove the transmission fluid fill plug transmission fluid level indicator assembly located on the passenger side front portion of the transmission case. Removal of the transmission fluid fill plug will relieve any vacuum that might have built up in the transmission. This will aid in allowing the transmission fluid pan to be easily removed when the bolts are removed.

5. Remove the transmission fluid pan and allow the transmission fluid to drain.

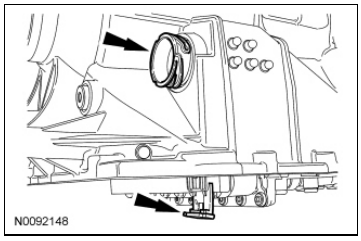


6. Remove the transmission fluid pan gasket.

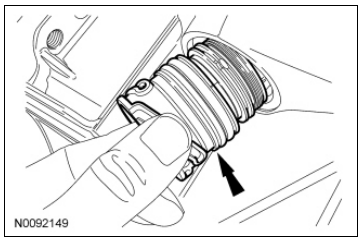


7. **NOTE:** The transmission fluid filter may be reused if no excessive contamination is indicated.

   Remove and discard the transmission fluid filter.

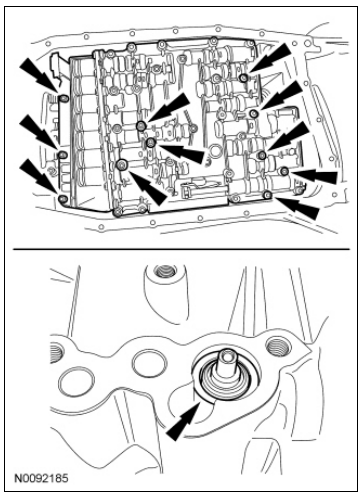


8. Pull the release tab and pull down on the transmission bulkhead electrical connector retainer.



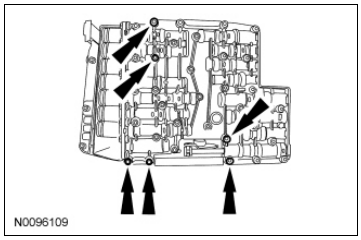
9. ***NOTICE:*** **Do not touch the electrical connector pins or the exposed solenoid tabs on the transmission bulkhead electrical connector. Electrostatic discharge may occur and may cause damage to the mechatronic unit.**

   With the release tab down, pull the outer shell of the transmission bulkhead electrical connector out of the mechatronic assembly.



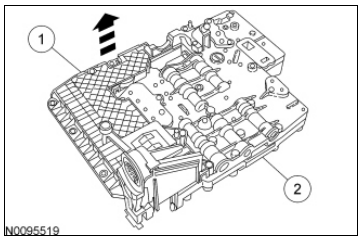
10. ***NOTICE:*** **Do not touch the electrical connector pins or the exposed solenoid tabs on the transmission bulkhead electrical connector. Electrostatic discharge may occur and may cause damage to the mechatronic unit.**

    Pull the transmission bulkhead electrical connector out of the transmission case.



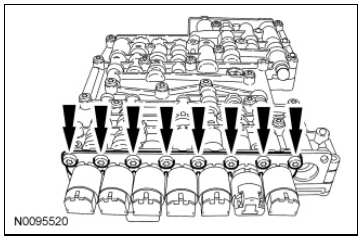
11. ***NOTICE:*** **During removal of the mechatronic assembly, the thermal bypass valve will fall out of the transmission case. Damage to the valve will occur if the valve falls out.**

    Remove the 11 bolts from the mechatronic assembly and remove the mechatronic assembly and the bypass valve.

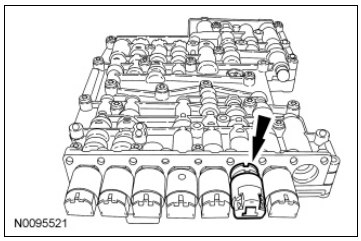


SSE

12. Remove the 6 long bolts from the TCM unit.

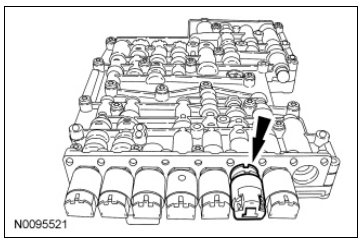


13. Carefully separate the TCM from the mechatronic assembly.

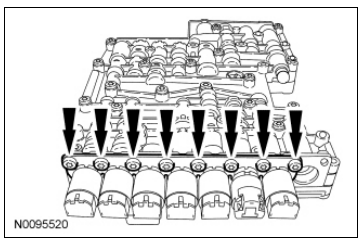


1. TCM
2. Mechatronic assembly

14. Remove the 8 solenoid bracket bolts and the solenoid bracket.



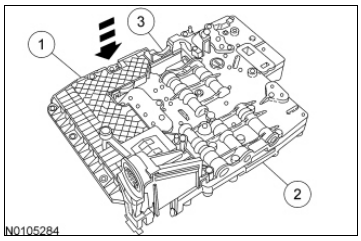
15. Remove SSE .



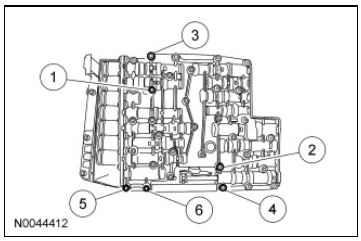
Installation

SSE

1. Install SSE .



2. Position the solenoid bracket in place and install the 8 bolts.
   - Tighten to 6 Nm (53 lb-in).

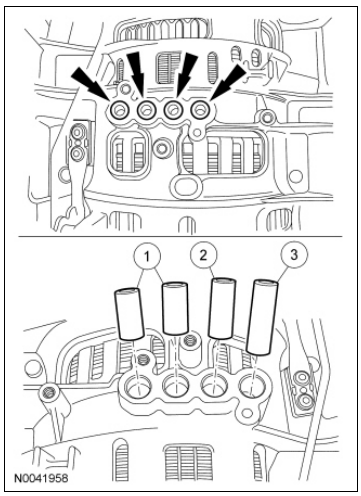


3. **NOTE:** The Transmission Range (TR) sensor pin must be aligned with the manual control valve during installation.

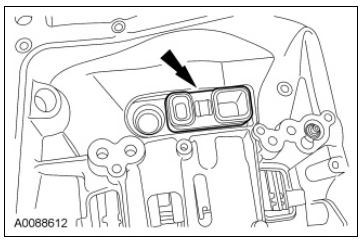
   Position the TCM on the mechatronic assembly.

   1. TCM
   2. Mechatronic assembly
   3. TR sensor pin

4. Install the 6 long bolts into the TCM unit. Tighten the bolts in the sequence shown.
   - Tighten to 6 Nm (53 lb-in).



Mechatronic assembly

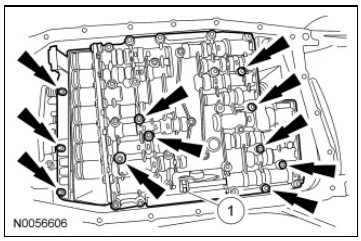


5. **NOTE:** Before installing the mechatronic assembly into the transmission case, verify the presence and correct orientation of the thermal bypass valve, pump adapter seal and center support seals. Also note that one or more of the center support seals may have remained in the mechatronic assembly during removal and should be installed into the transmission case at this time.

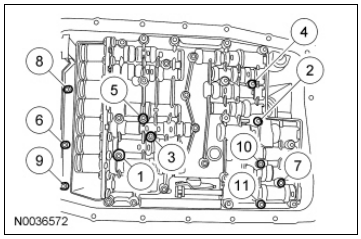
   Verify the 4 rubber feed tubes for the center support are in place.

   1. Black feed tubes
   2. Green feed tube
   3. Blue feed tube

6. Verify the rubber adapter is in place.



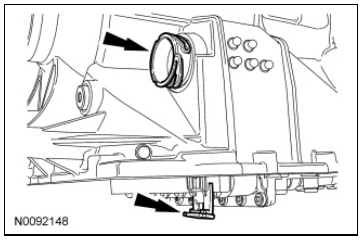
7. Coat the thermal bypass valve with petroleum jelly to hold it in place and install the thermal bypass valve in the transmission case.



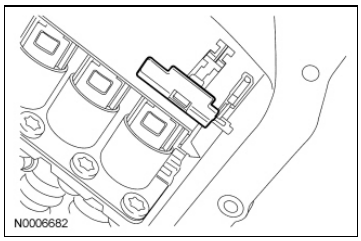
8. ***NOTICE:*** **Do not touch the electrical connector pins or the exposed solenoid tabs on the transmission vehicle harness connector. Electrostatic discharge may occur and may cause damage to the mechatronic unit.**

   Position the mechatronic assembly in place and loosely install the 11 bolts.

   1. Align the manual valve and control lever linkage.

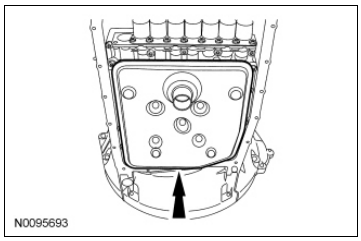


9. Tighten the mechatronic bolts in the sequence shown.
   - Tighten to 8 Nm (71 lb-in).

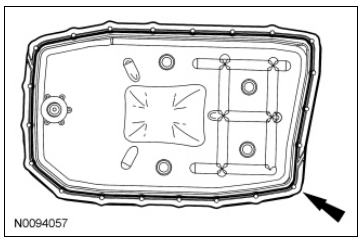


10. ***NOTICE:*** **Do not touch the electrical connector pins or the exposed solenoid tabs on the transmission bulkhead electrical connector. Electrostatic discharge may occur and may cause damage to the mechatronic unit.**

    With the release tab down and unlocked, push the outer shell of the transmission bulkhead electrical connector into the transmission. Make sure that the transmission bulkhead electrical connector is fully seated into the mechatronic assembly.

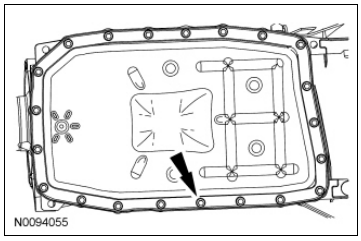


11. Press up on the tab and lock the outer shell of the transmission bulkhead electrical connector in place. Make sure that the locking tab is securely locked.



12. **NOTE:** The transmission fluid filter may be reused if no excessive contamination is indicated.

    If required, install a new transmission fluid filter.

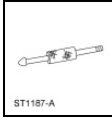


13. **NOTE:** The transmission fluid pan gasket can be reused if not damaged.

    Install a new transmission fluid pan gasket, if required.

14. Install the transmission fluid pan and tighten the transmission fluid pan bolts in a crisscross pattern.
    - Tighten to 12 Nm (106 lb-in).

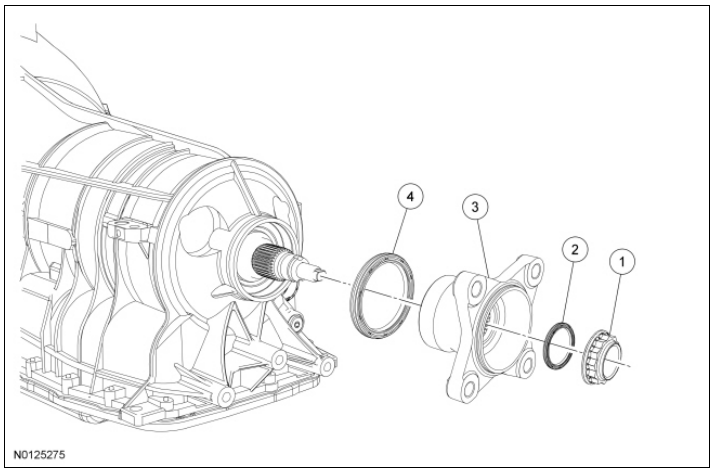
15. Connect the transmission vehicle harness connector by pushing it in and twisting the outer shell to lock it in place.



16. Make sure the transmission fluid is at the correct level, follow the steps for Adding Additional Transmission Fluid or Removing Transmission Fluid. For additional information, refer to Transmission Fluid Drain and Refill in this section.

17. Restore the module configuration. Carry out the module configuration restore steps of the PMI procedure for the PCM. For additional information, refer to Section 418-01 .

Output Shaft Seal



Special Tool(s)

 ST3059-A	Installer, Rear Seal 4X4 307-637
 ST3060-A	Rear Seal Installer 4X2 307-638
 ST2381-A	Remover, Input Shaft Oil Seal 308-375
 ST1187-A	Slide Hammer 100-001 (T50T-100-A)

Material

Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC	MERCON® LV

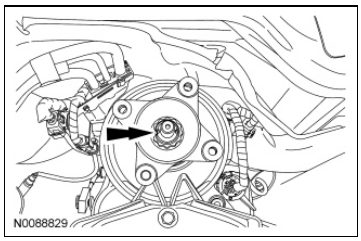
NOTE: Rear Wheel Drive (RWD) shown, Four-Wheel Drive (4WD) similar.

Item	Part Number	Description
1	7045	Output shaft flange nut
2	7052	Extension housing flange seal
3	7089	Output shaft flange

4	7052	Output shaft seal

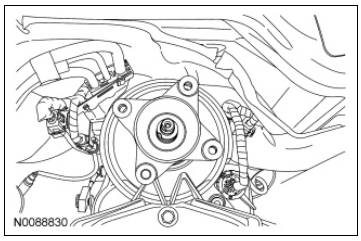
Removal

All vehicles



1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

Rear Wheel Drive (RWD) vehicles

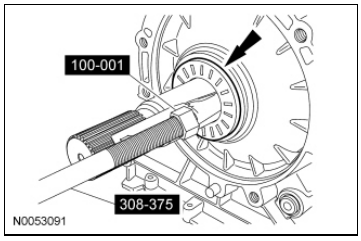


2. Remove the rear driveshaft. For additional information, refer to Section 205-01 .

3. **NOTE:** The output shaft flange nut has been staked to prevent it from coming loose. Prior to removing the nut, remove the stake to prevent damage to the output shaft.

   Remove and discard the output shaft flange nut.

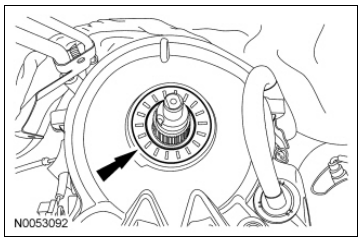
4. Remove the extension housing flange seal and the output shaft flange.



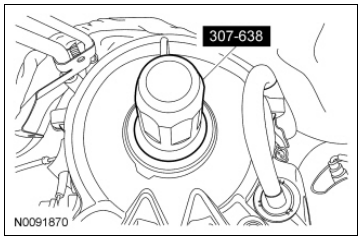
5. Using the Input Shaft Oil Seal Remover and Slide Hammer, remove the output shaft seal.

Four-Wheel Drive (4WD) vehicles

6. Remove the transfer case. For additional information, refer to Section 308-07B .

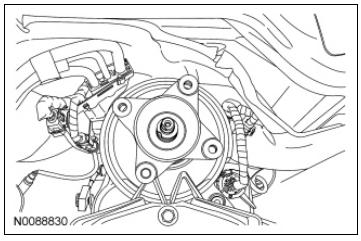


7. Using the Input Shaft Oil Seal Remover and Slide Hammer, remove the output shaft seal.

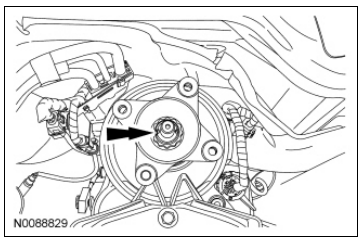


Installation

RWD vehicles

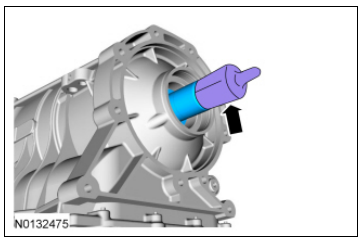


1. Position a new output shaft seal.

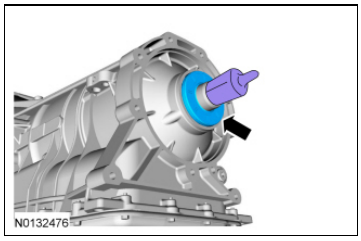


2. Using the Rear Seal 4X2 Installer, install the output shaft seal.

3. Install the output shaft flange.

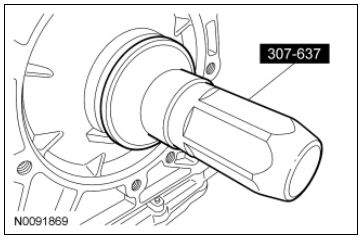


4. Install the extension housing flange seal and a new output shaft flange nut.
   - Tighten to 80 Nm (59 lb-ft).
   - After installing the new output shaft flange nut, it must be staked at the slots to prevent it from coming loose.



5. Install the rear driveshaft. For additional information, refer to Section 205-01 .

4WD vehicles



6. Install the seal protector provided with the new output shaft seal on the output shaft.

7. Slide the output shaft seal over the output shaft seal protector onto the output shaft. Remove the output shaft seal protector.

8. Using the Rear Seal 4X4 Installer, install a new output shaft seal.

9. Install the transfer case. For additional information, refer to Section 308-07B .

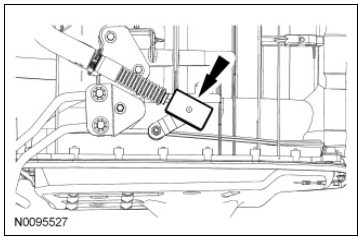
All vehicles

10. Fill and check the transmission fluid. For additional information, refer to Transmission Fluid Level Check in this section.

Manual Control Lever Shaft and Seal

Special Tool(s)

 ST2690-A	Installer, Shift Shaft Fluid Seal 307-559

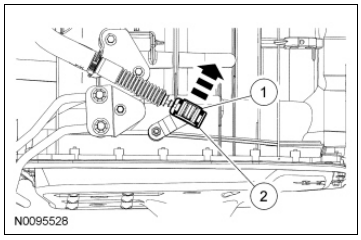


Material

Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC	MERCON® LV

Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .



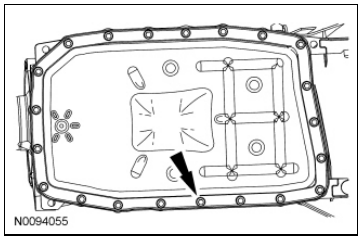
2. Remove the selector lever cable heat shield.

N0095527

3. ***NOTICE:*** **To prevent selector lever cable damage, do not apply force to the selector lever cable between the manual control lever and the selector lever cable bracket.**

   Move the locking tab up and disconnect the transmission selector lever cable end from the manual control lever.

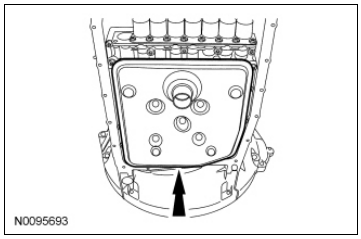
   1. Locking tab
   2. Selector lever cable end



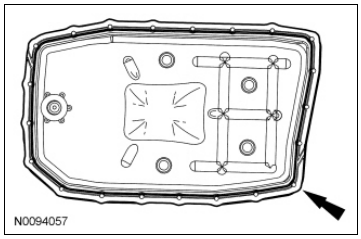
N0095528

4. Remove the transmission fluid fill plug transmission fluid level indicator assembly located on the passenger side front portion of the transmission case. Removal of the transmission fluid fill plug will

relieve any vacuum that might have built up in the transmission. This will aid in allowing the transmission fluid pan to be easily removed when the bolts are removed.

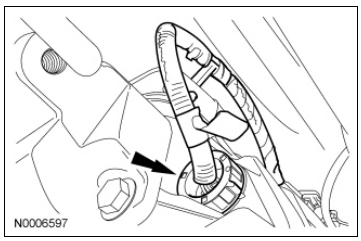


5. Remove the transmission fluid pan and allow the transmission fluid to drain.

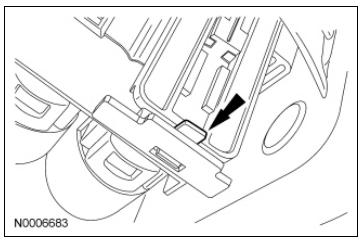


6. **NOTE:** The transmission fluid filter may be reused if no excessive contamination is indicated.

   Remove and discard the transmission fluid filter.

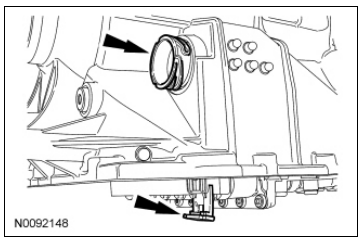


7. Remove the transmission fluid pan gasket.

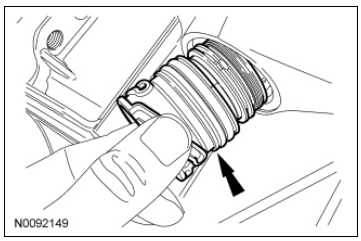


8. ***NOTICE:*** **Do not pull on the wire harness to disconnect the connector or damage to the connector will occur.**

   Disconnect the transmission vehicle harness connector by twisting the outer shell and pulling back on the connector.

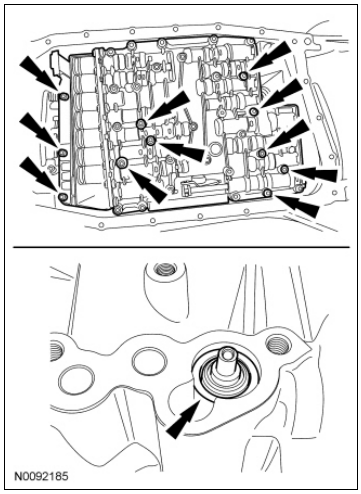


9. Pull the release tab and pull down on the transmission bulkhead electrical connector retainer.



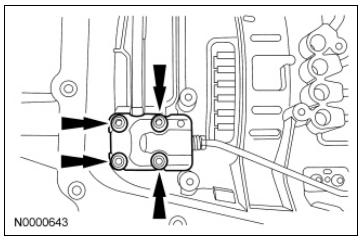
10. ***NOTICE:*** **Do not touch the electrical connector pins or the exposed solenoid tabs on the transmission bulkhead electrical connector. Electrostatic discharge may occur and may cause damage to the mechatronic unit.**

    With the release tab down, pull the outer shell of the transmission bulkhead electrical connector out of the mechatronic assembly.



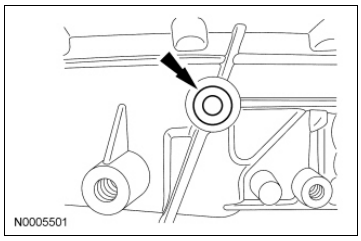
11. ***NOTICE:*** **Do not touch the electrical connector pins or the exposed solenoid tabs on the mechatronic unit. Electrostatic discharge may occur and may cause damage to the mechatronic unit.**

    Pull the transmission bulkhead electrical connector out of the transmission.



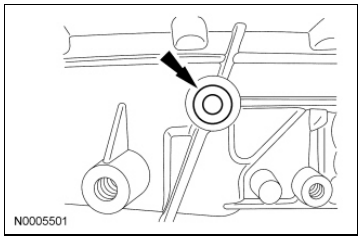
12. ***NOTICE:*** **During removal of the mechatronic assembly, the thermal bypass valve will fall out of the transmission case. Damage to the valve will occur if the valve falls out.**

    Remove the 11 bolts from the mechatronic assembly and remove the mechatronic assembly and the bypass valve.

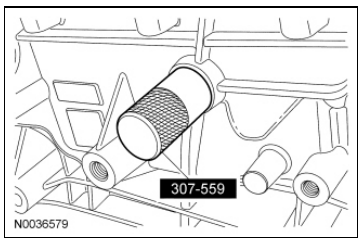


13. Remove the park rod actuating plate.

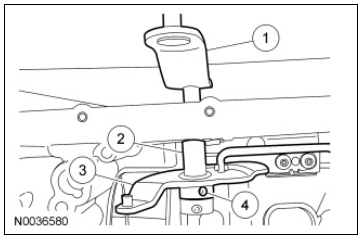
14. Remove the manual control lever.
    1. Remove the roll pin.
    2. Slide the manual control lever shaft out of the case.
    3. Hold the spacer to keep it from falling out of the case.
    4. Remove the manual valve inner lever and the park rod as an assembly.



15. Remove and discard the manual control lever seal.

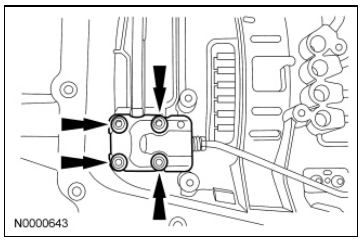


Installation



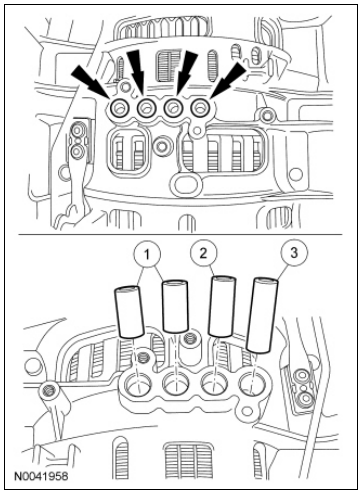
1. Position a new manual control lever seal in place.

2. Using the Shift Shaft Fluid Seal Installer, install a new manual control lever shaft seal.

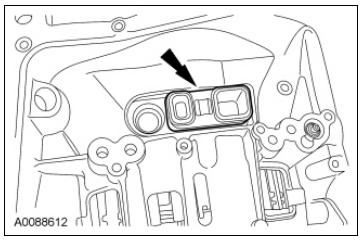


3. Install the manual lever in the case.
    1. Slide the manual lever in the case.
    2. Position the spacer in place while sliding the manual lever into the spacer.
    3. Position the manual valve inner lever while sliding the manual lever and lining up the roll pin hole.
    4. Install the roll pin.

4. Position the park rod in place. Push down on the park pawl and position the park rod in place.



5. While holding the park rod down, install the park rod actuating plate.
    - Tighten to 12 Nm (106 lb-in).

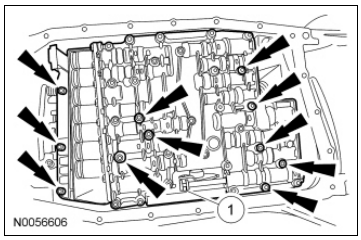


6. **NOTE:** Before installing the mechatronic assembly into the transmission case, verify presence and correct orientation of the thermal bypass valve, pump adapter seal and center support seals. Also note that one or more of the center support seals may have remained in the mechatronic assembly during removal and should be installed into the transmission case at this time.

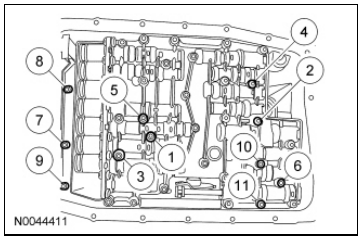
    Verify the 4 rubber feed tubes for the center support are in place.

    1. Black feed tubes
    2. Green feed tube
    3. Blue feed tube

7. Verify the rubber adapter is in place.



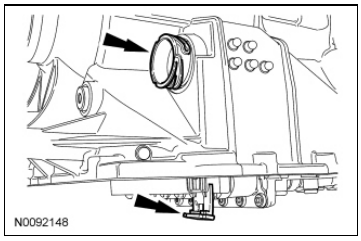
8. Coat the thermal bypass valve with petroleum jelly to hold it in place and install the thermal bypass valve in the transmission case.



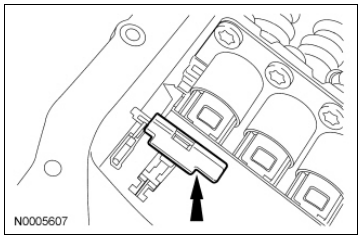
9. ***NOTICE:*** **Do not touch the electrical connector pins or the exposed solenoid tabs on the mechatronic unit. Electrostatic discharge may occur and may cause damage to the mechatronic unit.**

   Position the mechatronic assembly in place and loosely install the 11 bolts.

   1. Align the manual valve and control lever linkage.

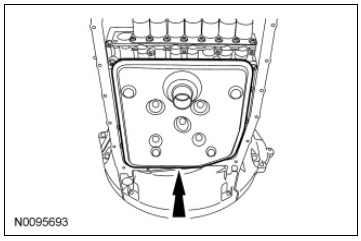


10. Tighten the mechatronic bolts in the sequence shown.
    - Tighten to 8 Nm (71 lb-in).

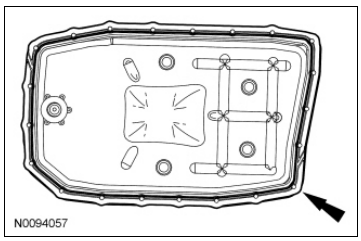


11. *NOTICE:* **Do not touch the electrical connector pins. Electrostatic discharge may occur and will cause damage to the mechatronic unit.**

    With the release tab down and unlocked, push the outer shell of the transmission bulkhead electrical connector into the transmission. Make sure that the transmission bulkhead electrical connector is fully seated into the mechatronic assembly.

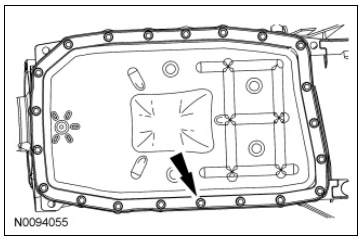


12. Press up on the tab and lock the outer shell of the transmission bulkhead electrical connector in place.



13. **NOTE:** The transmission fluid filter may be reused if no excessive contamination is indicated.

    If required, install a new transmission fluid filter.

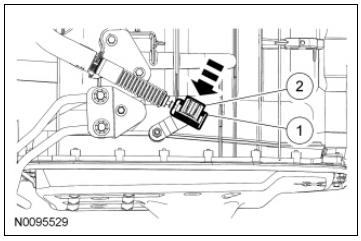


14. **NOTE:** The transmission fluid pan gasket can be reused if not damaged.

    Install a new transmission fluid pan gasket, if necessary.

15. Install the transmission fluid pan and tighten the transmission fluid pan bolts in a crisscross pattern.
    - Tighten to 12 Nm (106 lb-in).

16. Connect the transmission vehicle harness connector by pushing it in and twisting the outer shell to lock it in place.



17. ***NOTICE:*** **To prevent selector lever cable damage, do not apply force to the selector lever cable between the manual control lever and the selector lever cable bracket.**

    NOTE: When installing the selector lever cable end, make sure that the selector lever cable end is correctly installed onto the manual control lever. Pull back on the selector lever cable end to make sure that the selector lever cable end is securely installed onto the manual control level.

    With the manual lever in NEUTRAL, connect the selector lever cable onto the manual control lever and move the locking tab down.

    1. Selector lever cable end
    2. Locking tab
        - ♦ Listen for the audible click.
        - ♦ Pull back on the selector lever cable to make sure that it is correctly installed.

18. Install the selector lever cable heat shield.

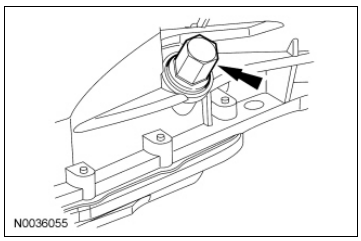
19. Using the transmission fluid refill procedure, fill and check the transmission fluid. For additional information, refer to Transmission Fluid Drain and Refill in this section.

Transmission - Four Wheel Drive (4WD)

Special Tool(s)

 ST1636-A	Retainer, Torque Converter 307-346 (T97T-7902-A)

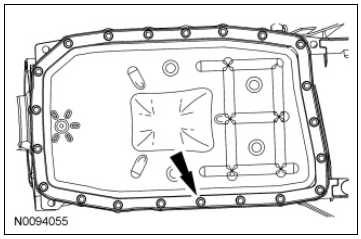
Removal



NOTE: Refer to the Transmission Cooler Flushing Job Aid on the FMCDealer website.

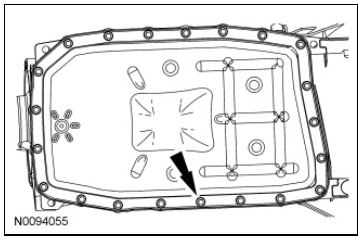
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Retrieve the module configuration from the PCM. Carry out the module configuration retrieval steps of the Programmable Module Installation (PMI) procedure. For additional information, refer to Section 418-01 .



3. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

4. Remove the transmission fluid fill plug transmission fluid level indicator assembly located on the passenger side front portion of the transmission case. Removal of the transmission fluid fill plug will relieve any vacuum that might have built up in the transmission. This will allow the transmission fluid pan to be easily removed when the bolts are removed.



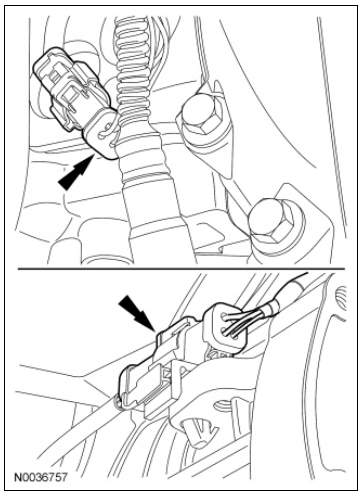
N0036055

5. **NOTE:** If transmission disassembly or installation of a new transmission is necessary, drain the transmission fluid.

   Remove the transmission fluid pan and allow the transmission fluid to drain.

N0094055

6. Install the transmission fluid pan and tighten the bolts in a crisscross pattern.
   - Tighten to 12 Nm (106 lb-in).

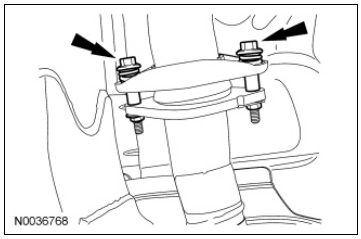


7. Remove the transfer case. For additional information, refer to Section 308-07B .
8. **NOTE:** Make sure the transmission jack makes contact on the outer ribs of the transmission fluid pan.

   NOTE: Make sure the transmission is securely fastened to the transmission jack.

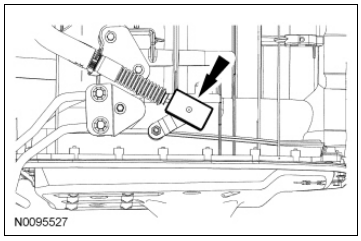
   Position a suitable high-lift transmission jack under the transmission and remove the jackstand.
9. Remove the transmission support crossmember. For additional information, refer to Section 502-02 .
10. **NOTE:** LH shown, RH similar.

    Disconnect the RH and LH Heated Oxygen Sensor (HO2S) and the Catalyst Monitor Sensor (CMS) connectors.



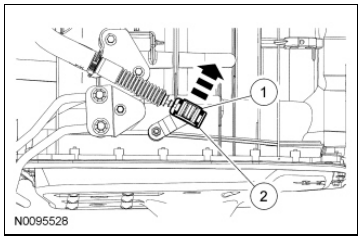
11. **NOTE:** LH shown, RH similar.

    Remove and discard the RH and LH exhaust flange nuts.

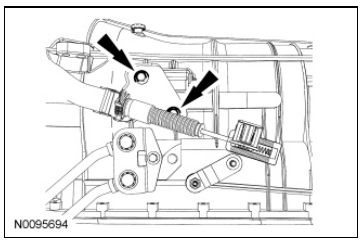


12. Remove the dual catalytic converter Y-pipe bolts, discard the nuts and remove the dual catalytic converter Y-pipe.

13. Remove the fuel line bracket bolt from the bracket. Position the bracket and lines aside.



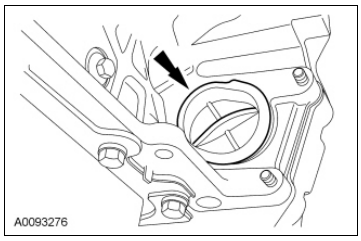
14. Remove the selector lever cable heat shield.



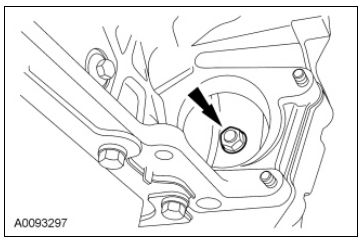
15. ***NOTICE:*** **To prevent selector lever cable damage, do not apply force to the selector lever cable between the manual control lever and the selector lever cable bracket.**

    Move the locking tab up and disconnect the selector lever cable end from the manual control lever.

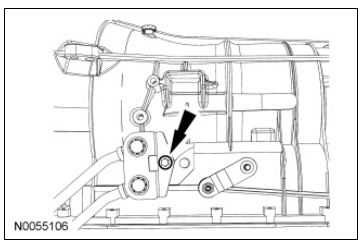
    1. Locking tab
    2. Selector lever cable end



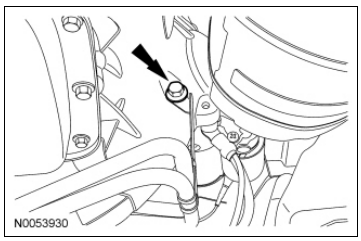
16. Remove the selector lever bracket bolts and remove the selector lever bracket.



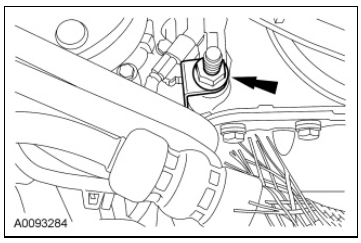
17. Remove the flexplate inspection cover bolts and the flexplate inspection cover.



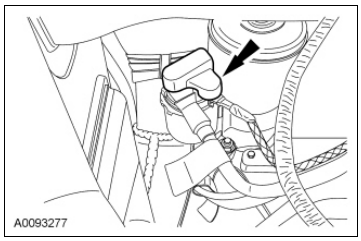
18. Remove the rubber torque converter nut access plug.



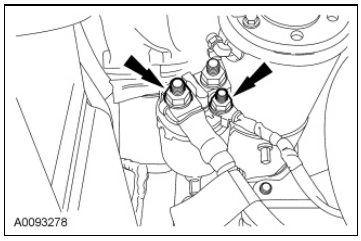
19. Remove and discard the 4 flexplate-to-torque converter nuts.



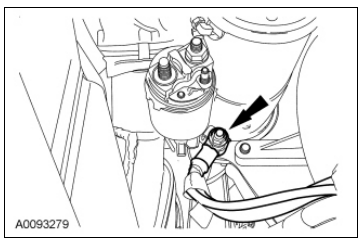
20. Remove the transmission fluid cooler tube bracket bolt.



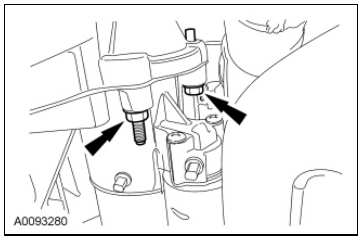
21. Remove the transmission-to-engine bolt.



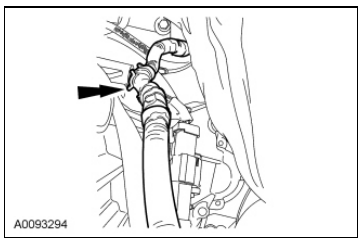
22. Remove the transmission fluid cooler tube bracket nut and position the transmission fluid cooler tube bracket and tubes aside.



23. Remove the plastic starter motor electrical connector cap.

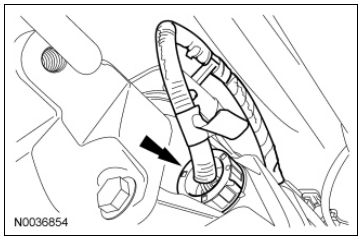


24. Remove the starter motor electrical connectors.



25. Remove the ground wire from the stud.

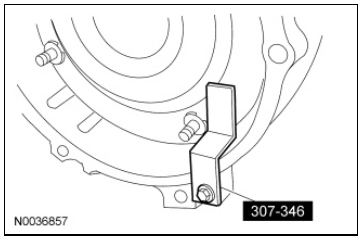
26. Remove the 3 starter motor bolts and the starter motor.



27. Disconnect the transmission vehicle harness from the top of the transmission.

28. ***NOTICE:*** **Do not pull on the transmission vehicle harness to disconnect the connector or damage to the connector will occur.**

    Disconnect the transmission vehicle harness connector by twisting the outer shell and pulling back on the connector.



29. **NOTE:** The top 2 transmission-to-engine bolts need to be removed prior to removing the remaining bolts.

    NOTE: The top left bolt secures the fuel line bracket to the transmission case.

    Remove the 6 remaining transmission-to-engine bolts.

30. Slide the transmission back enough to install the Torque Converter Retainer.

31. Remove the transmission from the vehicle.

32. If the transmission is being disassembled to install new parts, or if a new or remanufactured transmission is being installed, the transmission fluid cooler, the auxiliary transmission fluid cooler (if equipped) and the transmission fluid cooler tubes must be cleaned and backflushed to keep contaminants from entering the transmission. For additional information, refer to Transmission Fluid Cooler Backflushing and Cleaning in this section.

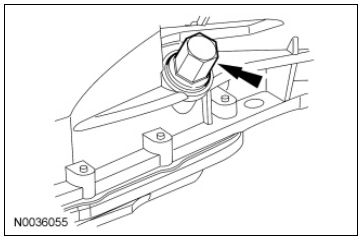
Transmission - Rear Wheel Drive (RWD)

Special Tool(s)

 ST1636-A	Retainer, Torque Converter 307-346 (T97T-7902-A)

Removal

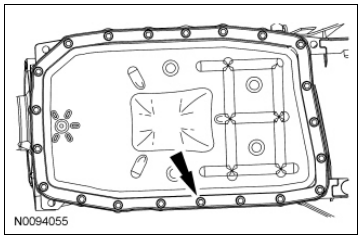
NOTE: Refer to the Transmission Cooler Flushing Job Aid on the FMCDealer website.



1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Retrieve the module configuration from the PCM. Carry out the module configuration retrieval steps of the Programmable Module Installation (PMI) procedure. For additional information, refer to Section 418-01 .

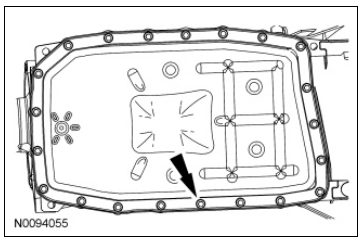
3. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .



4. Remove the driveshaft. For additional information, refer to Section 205-01 .

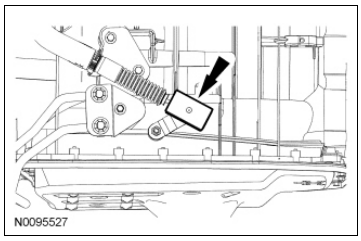
5. Remove the transmission fluid fill plug transmission fluid level indicator assembly located on the passenger side front portion of the transmission case. Removal of the transmission fluid fill plug will relieve any vacuum that might have built up in the transmission. This will allow the transmission fluid pan to be easily removed when the bolts are removed.

N0036055



6. **NOTE:** If transmission disassembly or installation of a new transmission is necessary, drain the transmission fluid.

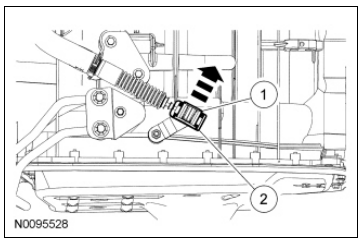
   Remove the transmission fluid pan and allow the fluid to drain.



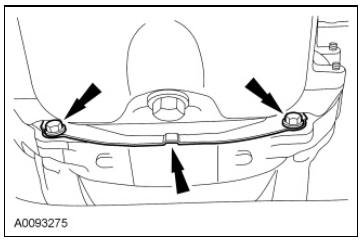
N0094055

7. Install the transmission fluid pan and tighten the bolts in a crisscross pattern.

- Tighten to 12 Nm (106 lb-in).



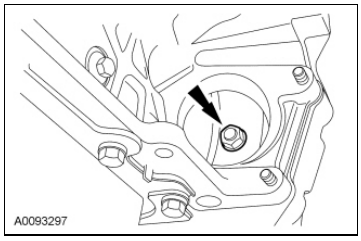
8. Remove the selector lever cable heat shield.



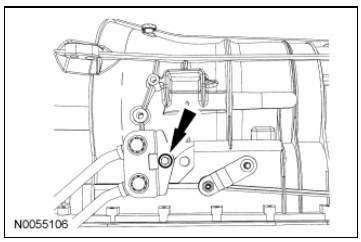
9. ***NOTICE:*** **To prevent selector lever cable damage, do not apply force to the selector lever cable between the manual control lever and the selector lever cable bracket.**

   Move the locking tab up and disconnect the selector lever cable end from the manual control lever.

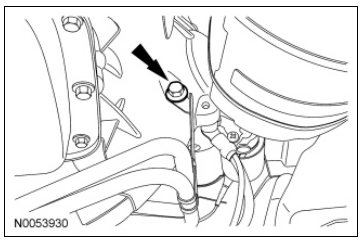
   1. Locking tab
   2. Selector lever cable end



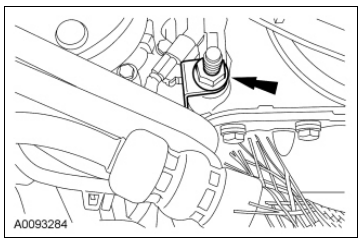
10. Remove the flexplate inspection cover bolts and the inspection cover.



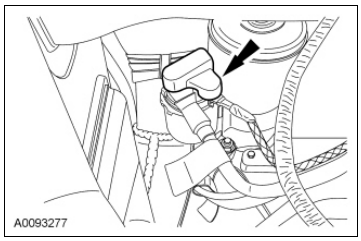
11. Remove the rubber torque converter nut access plug.



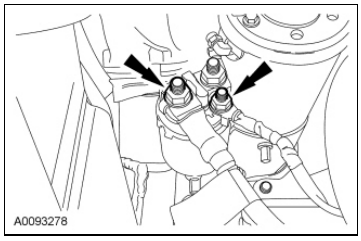
12. Remove and discard the 4 flexplate-to-torque converter nuts.



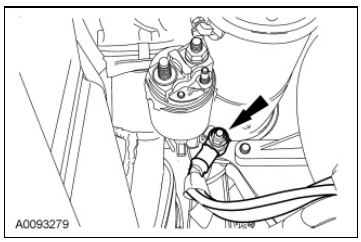
13. Remove the transmission fluid cooler tube bracket bolt.



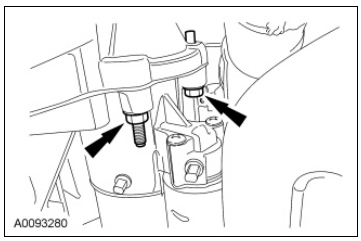
14. Remove the transmission-to-engine bolt.



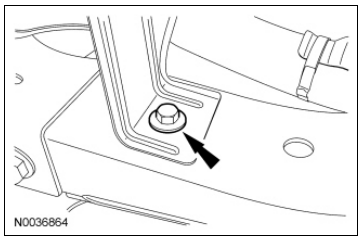
15. Remove the transmission fluid cooler tube bracket nut and position the transmission fluid cooler tube bracket and tubes aside.



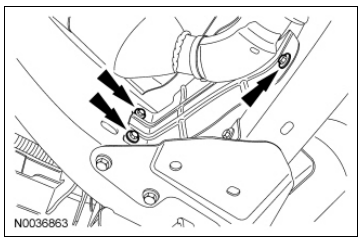
16. Remove the plastic starter motor electrical connector cap.



17. Remove the starter motor electrical connectors.

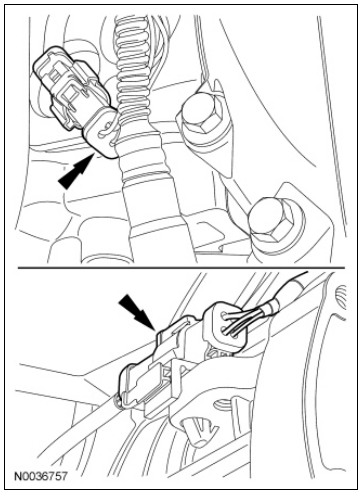


18. Remove the ground wire from the stud.

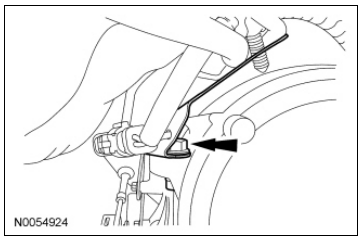


19. Remove the starter motor bolts and the starter motor.

20. Remove the LH exhaust heat shield bolt.



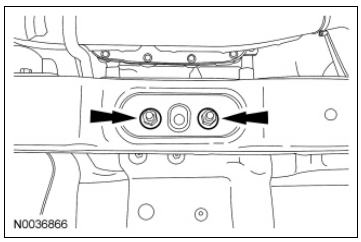
21. Remove the RH exhaust heat shield bolts and heat shield.



22. **NOTE:** LH shown, RH similar.

    Disconnect the RH and LH Heated Oxygen Sensor (HO2S) and the Catalyst Monitor Sensor (CMS) connectors.

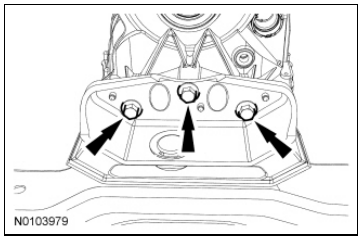
23. Remove the fuel line bracket bolt and position the fuel line bracket and fuel lines aside.



24. **NOTE:** Make sure the transmission jack makes contact on the outer ribs of the fluid pan.

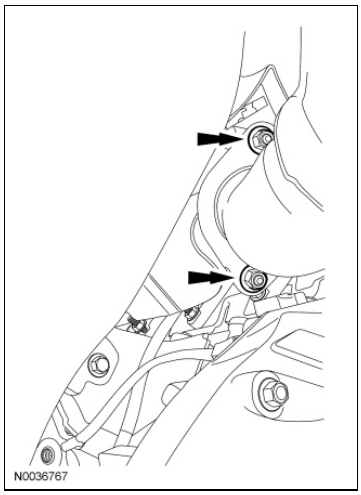
    NOTE: Make sure the transmission is securely fastened to the transmission jack.

    Position a suitable high-lift transmission jack under the transmission.

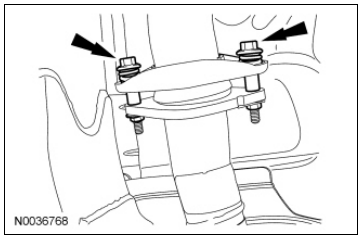


25. Remove the 2 transmission insulator and retainer nuts.

26. Remove the 8 transmission crossmember bolts.



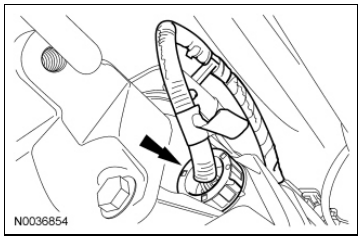
27. Remove the 3 transmission insulator and retainer bolts and remove the transmission insulator and retainer.



28. **NOTE:** LH shown, RH similar.

    Remove and discard the RH and LH exhaust flange nuts.

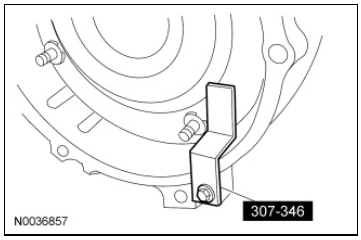
29. Remove the 2 dual catalytic converter Y-pipe bolts, discard the nuts and remove the dual catalytic converter Y-pipe.



30. Disconnect the wire harness from the top of the transmission.

31. ***NOTICE:*** **Do not pull on the transmission vehicle harness to disconnect the connector or damage to the connector will occur.**

    Disconnect the transmission vehicle harness connector by twisting the outer shell and pulling back on the connector.

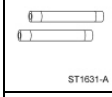


32. **NOTE:** The top 2 transmission-to-engine bolts need to be removed prior to removing the remaining bolts.

    NOTE: The top left bolt secures the fuel line bracket to the transmission case.

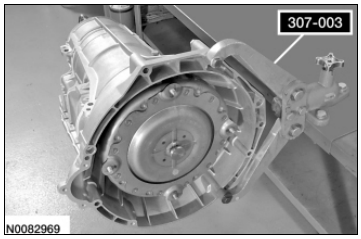
    Remove the 6 remaining transmission-to-engine bolts.

33. Slide the transmission back far enough to install the Torque Converter Retainer.



34. Remove the transmission from the vehicle.

35. If the transmission is being disassembled to install new parts, or if a new or remanufactured transmission is being installed, the transmission fluid cooler, the auxiliary transmission fluid cooler (if equipped) and the transmission fluid cooler tubes must be cleaned and backflushed to keep contaminants from entering the transmission. For additional information, refer to Transmission Fluid Cooler Backflushing and Cleaning in this section.

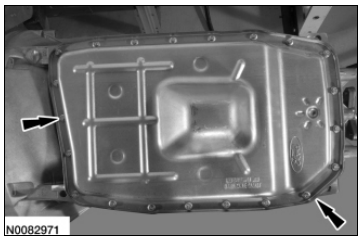


Transmission

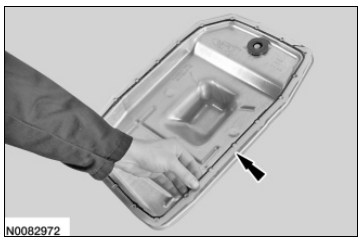
Special Tool(s)

 ST1631-A	Handle, Torque Converter 307-091 (T81P-7902-C)
 ST1186-A	Holding Fixture, Transmission 307-003 (T57L-500-B)
 ST1433-B	Installer, Front Wheel Hub Oil Seal 205-256
 ST2381-A	Remover, Input Shaft Oil Seal 308-375
 ST2932-A	Remover, Needle Bearing 307-562 (includes 307-562/1 and 307-562/2)
 ST1282-A	Remover, Pilot Bearing 308-001 (T58L-101-B)
 ST2891-A	Remover, Transmission Fluid Pump 307-553
 ST1104-B	Retaining Ring Pliers 307-343 (T95P-77001-AHR)
 ST1185-A	Slide Hammer 100-001 (T50T-100-A)

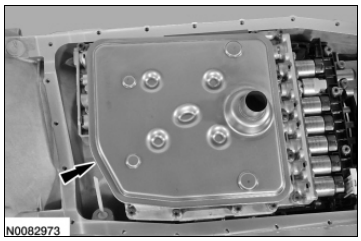
All vehicles



1. Install Transmission Holding Fixture 307-003 on the torque converter housing and install the transmission on a bench.



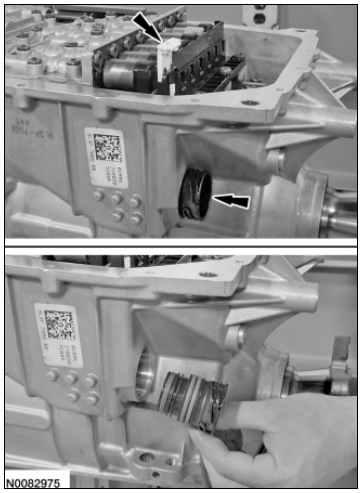
2. Using the Torque Converter Handle 307-091, remove the torque converter.



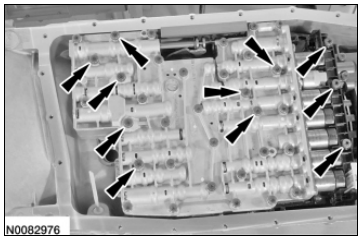
3. Remove the transmission fluid pan bolts and the pan.

4. Remove the transmission fluid pan gasket.

5. Remove and discard the transmission fluid filter.

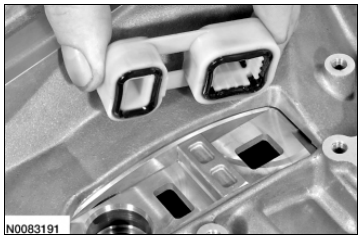


6. Press the release tab and lift up on the bulkhead connector retainer to release the bulkhead connector shell.



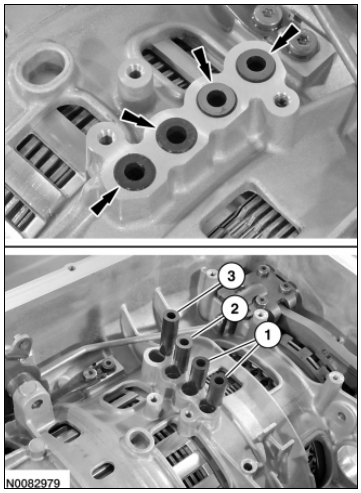
7. ***NOTICE:*** **Do not touch the electrical connector pins or the exposed solenoid tabs on the Transmission Control Module (TCM). Electrostatic discharge may occur and may cause damage to the mechatronic unit.**

   With the transmission bulkhead connector retainer up, pull the outer shell of the bulkhead connector out of the transmission.

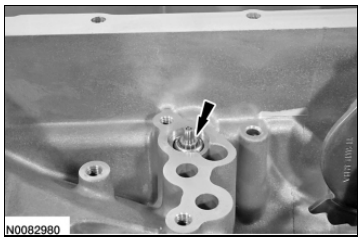


8. Remove the 11 bolts from the mechatronic assembly.

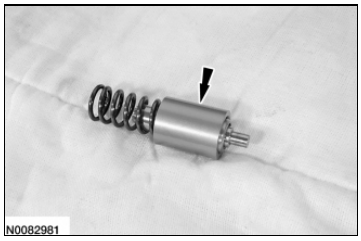
9. Remove the mechatronic assembly.



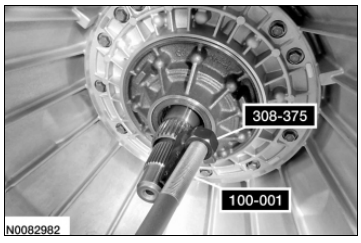
10. Remove the rubber adapter and the fluid filter seal.



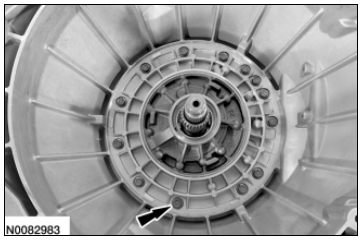
11. Remove and discard the 4 rubber feed tubes for the center support. Note the size and location while removing for correct installation.
    1. Black feed tubes
    2. Green feed tube



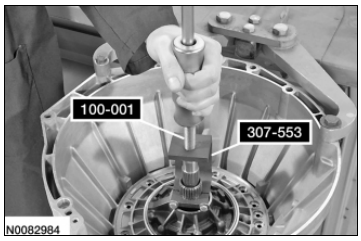
3. Blue feed tube



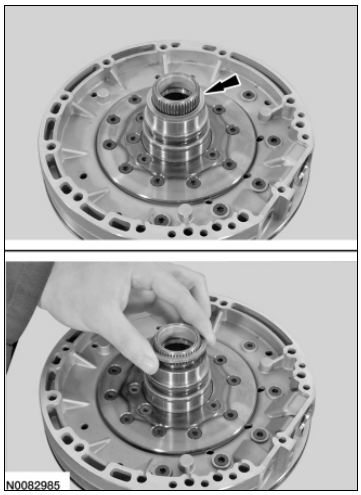
12. Remove the thermal bypass valve from the case.



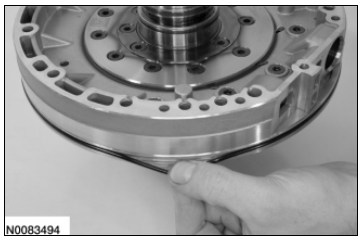
13. Inspect the thermal bypass valve for damage, install a new valve if damage is indicated.



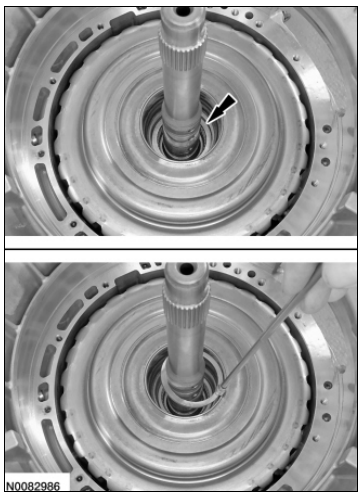
14. Using the Input Shaft Oil Seal Remover 308-375 and Slide Hammer 100-001, remove and discard the front pump seal.



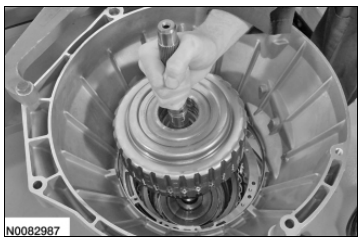
15. Remove and discard the 13 front pump bolts.



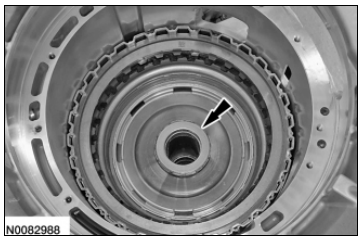
16. Using the Transmission Fluid Pump Remover 307-553 and Slide Hammer 100-001, remove the front pump support.



17. Inspect the back of the front pump to check if the selective shim is on the pump. If the selective shim is on the pump, remove it from the pump.

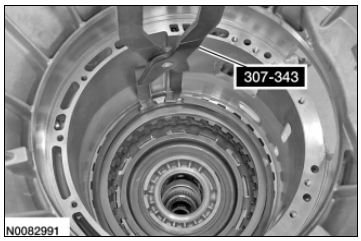


18. Remove and discard the front pump O-ring seal from the pump assembly.

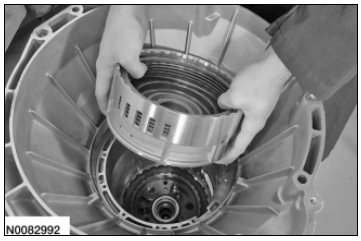


19. If the selective shim is not on the pump, using a magnet, remove it from the forward/overdrive clutch assembly.

20. Remove the forward (clutch A)/overdrive (clutch E) clutch assembly.



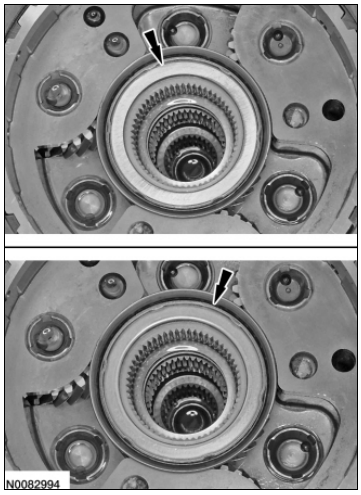
21. Remove the caged T5 roller bearing.



22. Remove the direct clutch assembly.

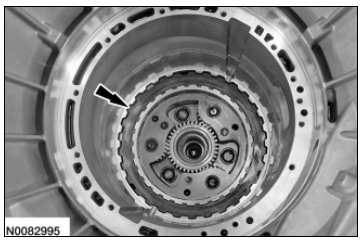
23. Using the Retaining Ring Pliers 307-343, remove the center support snap ring.

24. Remove the center support and T6 bearing.



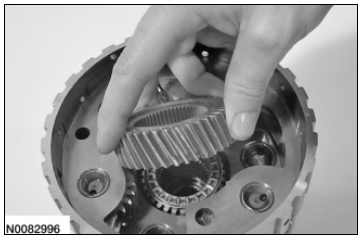
25. **NOTE:** If the thrust bearing stuck to the back of the center support during removal, remove the thrust bearing from the center support.

    Remove the selective shim from the center support.



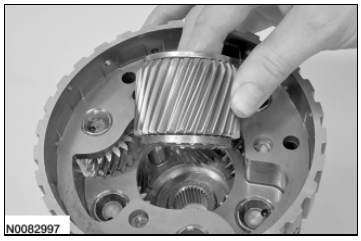
26. **NOTE:** If the selective shim stuck to the T7 thrust bearing during removal of the center support, remove the shim from the thrust bearing.

    If the selective shim is stuck to the T7 thrust bearing, remove the shim and remove the thrust bearing.

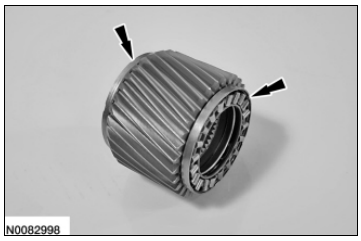


27. **NOTE:** When removing the planet carrier and the low/reverse clutch pack, some of the clutch plates may stay in the case. Remove any clutch plates from the transmission that were not removed with the carrier and keep the clutch plates together.

    Remove the planet carrier and the low/reverse clutch pack as an assembly.



28. Remove the low/reverse sun gear.



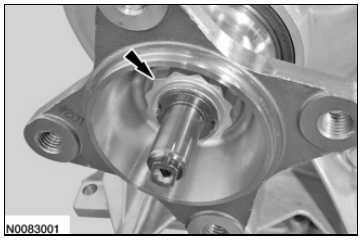
29. **NOTE:** When removing the sun gear, take note that the taper edge is facing up toward the torque converter housing.

    Remove the sun gear from the planet assembly.

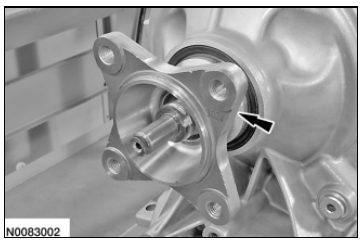
30. **NOTE:** Remove the bearings with the sun gear.

    Remove the top T8 and the bottom T9 roller bearings from the sun gear.

31. Remove the T9 roller bearing race in the bottom of the carrier.



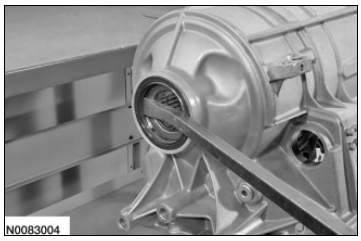
32. If the T10 thrust bearing is attached to the rear planetary carrier, remove it from the carrier. If it stayed in the transmission case when the rear planetary carrier was removed, remove it from the transmission case.



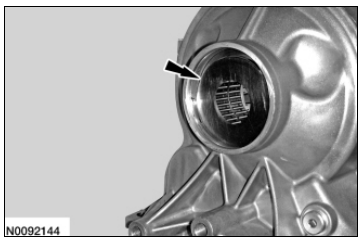
Rear Wheel Drive (RWD) vehicles

33. ***NOTICE:*** **The output shaft flange nut has been staked to prevent it from coming loose. Prior to removing the nut, remove the stake to prevent damage to the output shaft.**

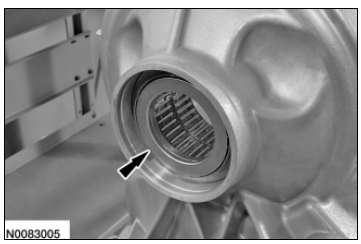
    Remove and discard the output shaft flange nut.



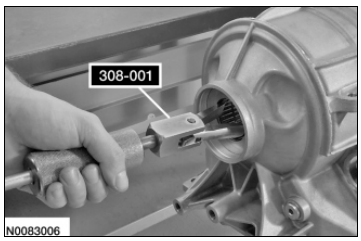
34. Remove the extension housing flange seal and the output shaft flange.



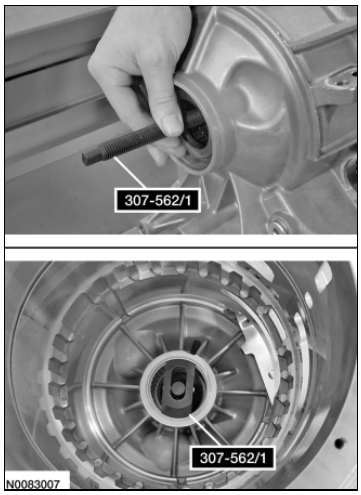
35. Remove the planet carrier hub, output shaft assembly and T11 bearing.



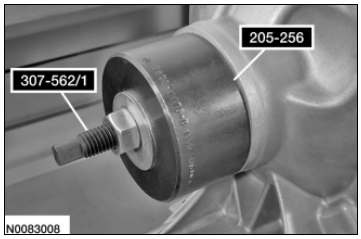
36. Using a suitable tool, remove the output shaft seal.



37. Remove the slip plane washer.

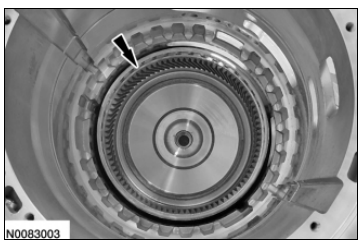


38. Remove the thrust bearing.

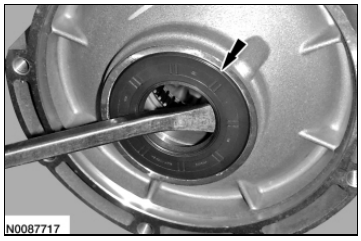


39. Using the Pilot Bearing Remover 308-001, remove the thrust bearing spacer.

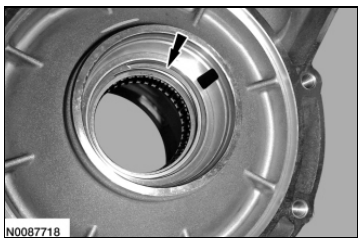
40. Install the Needle Bearing Remover 307-562/1 on the bearing.



41. Install the Front Wheel Hub Oil Seal Installer 205-256 on the Needle Bearing Remover 307-562/1 and remove the bearing.

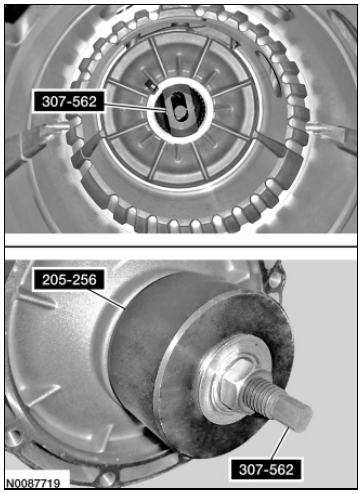


Four-Wheel Drive (4WD) vehicles

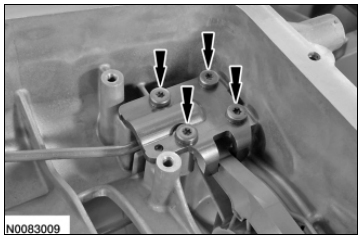


42. Remove the planet carrier hub, output shaft assembly and T11 bearing.

43. Remove and discard the output shaft seal.

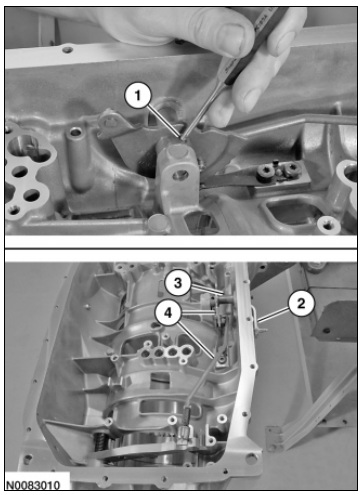


44. Remove the snap ring from the case.



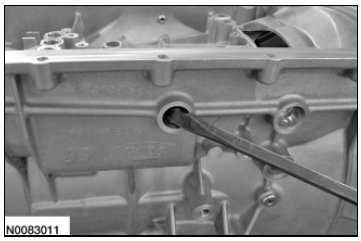
45. ***NOTICE:*** **Use care when installing the Needle Bearing Remover 307-562. Look inside the transmission case to make sure that the Needle Bearing Remover 307-562 contacts the bearing only and not the lip of the case, or damage to the case will occur.**

    Using the Needle Bearing Remover 307-562 and the Front Wheel Hub Oil Seal Installer 205-256, remove the bearing assembly.

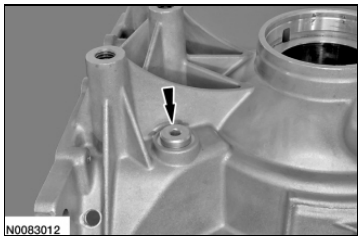


All vehicles

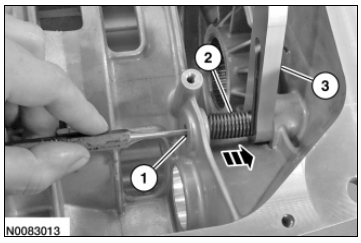
46. Remove the park rod actuating plate.



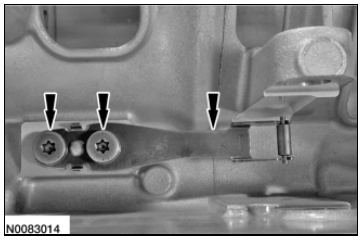
47. Remove the manual control lever detent plate and park pawl actuator rod.
    1. Remove the roll pin.
    2. Slide the manual control lever shaft out of the case.
    3. Hold the manual control lever spacer to keep it from falling into the case.



4. Remove the manual control lever detent plate and park pawl actuator rod as an assembly.



48. Using a suitable tool, remove and discard the manual control lever seal.



49. Remove the bolt from the back of the case to gain access to the park pawl pin.

50. From the inside of the case, push the park pawl pin out toward the back side of the case while holding the spring and the park pawl. Remove the park pawl pin then remove the park pawl and spring.
    1. Park pawl pin
    2. Park pawl spring
    3. Park pawl

51. Remove the 2 bolts and the park detent spring.

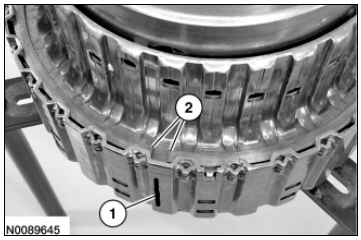
N0083014

Forward/Overdrive Clutch Assembly - Disassembly

Special Tool(s)

 ST2692-A	End Play Gauge, Clutch 307-555

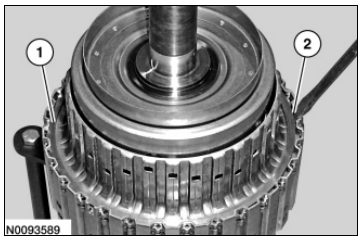
Material



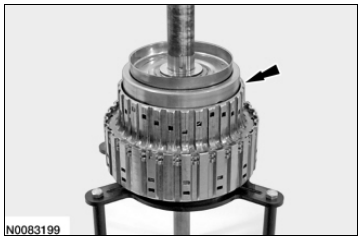
Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC	MERCON® LV

Disassembly

1. Position the forward/overdrive clutch assembly in the Clutch End Play Gauge 307-555.



2. Index-mark the direct clutch outer shell snap ring gap location to the side of the forward clutch hub using a suitable paint marker.
    1. Index mark
    2. Snap ring gap

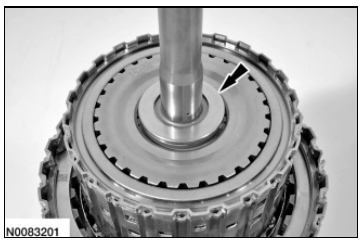


3. ***NOTICE:*** **Compress the snap ring out of the groove 180 degrees from the snap ring gap or damage to the forward clutch hub can occur.**

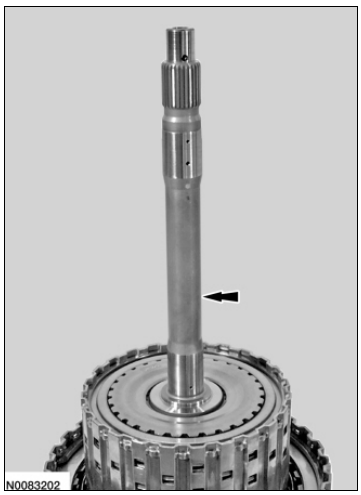
   Using a suitable tool, remove and discard the direct clutch outer shell retaining ring by compressing the snap ring 180 degrees from the snap ring gap.

   1. Snap ring gap
   2. 180 degrees from the snap ring gap

4. Remove and discard the direct clutch hub.

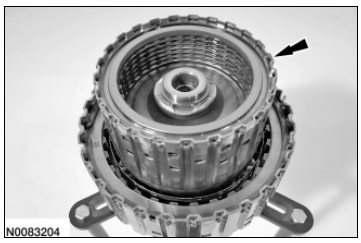


5. Remove the forward clutch hub and sun shaft assembly.



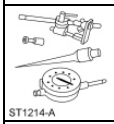
6. **NOTE:** The bearing may stick in the forward clutch drum.

   Remove the intermediate shaft bearing.



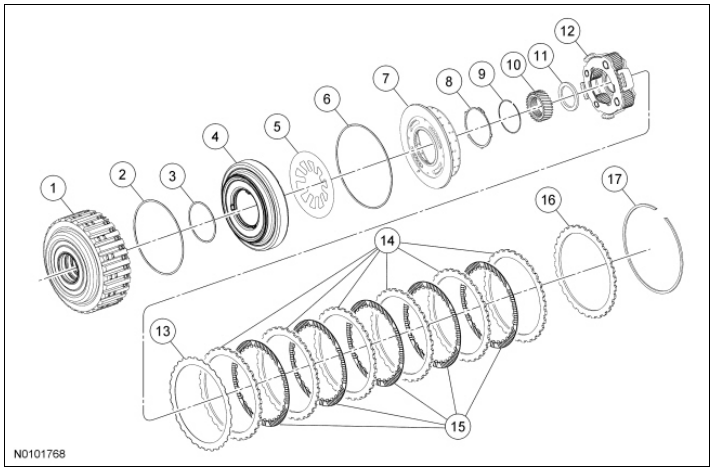
7. Remove the intermediate shaft assembly.

8. If the T3 thrust bearing stuck to the intermediate shaft assembly, remove it from the intermediate shaft assembly. If the T3 thrust bearing is on the overdrive clutch, remove it from the overdrive clutch assembly.



9. Remove the overdrive clutch pack from the forward clutch pack.

Forward Clutch Assembly



Special Tool(s)

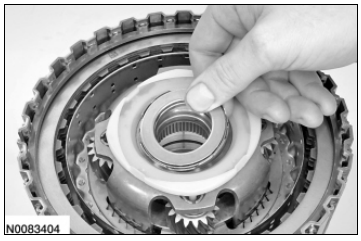
 ST2681-A	Compressor, Clutch Spring 307-525
 ST1214-A	Dial Indicator Gauge with Holding Fixture 100-002 (TOOL-4201-C) or equivalent
 ST2892-A	End Play Gauge, Clutch 307-555

Material

Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC	MERCON® LV

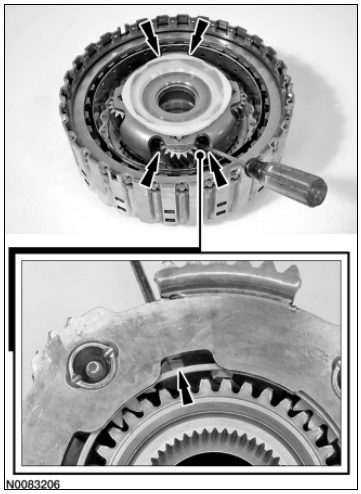
Forward Clutch Assembly (A Clutch)

Item	Part Number	Description
1	7A360	Forward clutch drum
2	7A548	Forward clutch piston outer O-ring seal
3	7A548	Forward clutch piston inner O-ring seal
4	7A262	Forward clutch piston



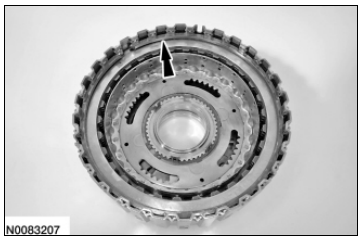
5	7A480	Forward clutch piston return spring
6	7A548	Forward clutch balance dam O-ring seal
7	7H360	Forward clutch balance dam
8	7H365	Forward clutch balance dam retaining ring
9	7H579	Sun gear retaining ring
10	7D063	Sun gear
11	7H375	Bearing (T1)
12	7A398	Planetary gear
13	7E085	Forward clutch cushion spring
14	7E314	Forward clutch external splined steel plates (quantity model dependent)
15	7B164	Forward clutch internal splined friction plates (quantity model dependent)
16	7B066	Forward clutch pressure plate
17	7D483	Forward clutch plate retaining ring

Disassembly



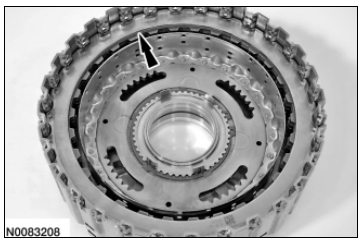
NOTE: Clutch plate quantity is model dependant based on engine displacement:

- 4.6L engine (Explorer, Mountaineer, Sport Trac, F-150)
  - ♦ Four friction plates
  - ♦ Five steel plates
- 5.4L engine (Expedition, Navigator, F-150)
  - ♦ Five friction plates
  - ♦ Six steel plates

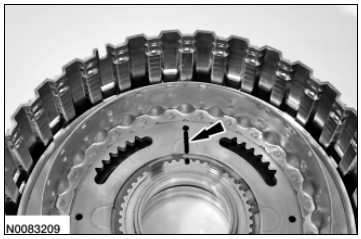


1. If the T2 thrust bearing is on the forward clutch assembly, remove it from the forward clutch assembly.

2. Remove the front planetary carrier and sun gear from the forward clutch assembly.
   - With a small screwdriver or a suitable pick inserted into the front planetary assembly, push on the retaining ring in 4 places while lifting up on the front planetary assembly.



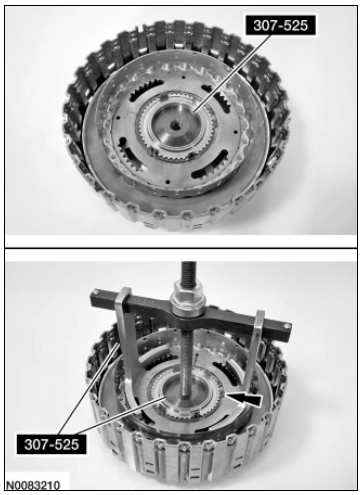
3. Remove the forward clutch pack snap ring.



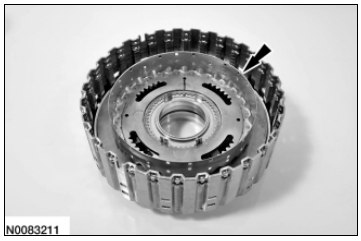
4. **NOTE:** Inspect the forward clutch drum and the friction and steel plates for damage. Install new components as necessary.

   Remove and inspect the forward clutch steel and friction plates.

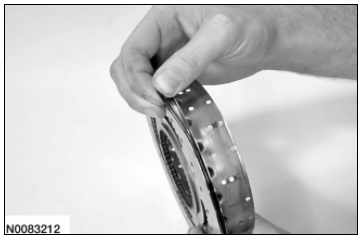
   - If the plates are damaged, install a new forward clutch assembly.
   - If no damage is indicated, the forward clutch may be reassembled.



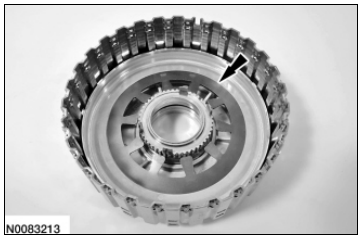
5. For correct alignment during assembly, make an identifying mark on the balance dam and the center part of the housing.



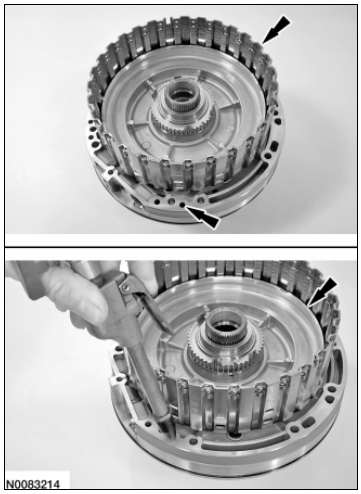
6. **NOTE:** The bottom of the Clutch Spring Compressor 307-525 will need to be installed from the back side of the forward clutch assembly.



Using the Clutch Spring Compressor 307-525, slightly collapse the balance dam to gain access to the retaining ring and remove the retaining ring.

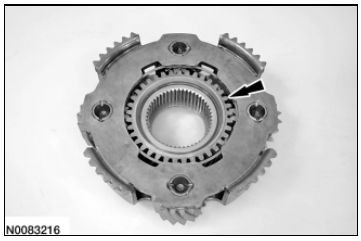


7. Remove the balance dam.



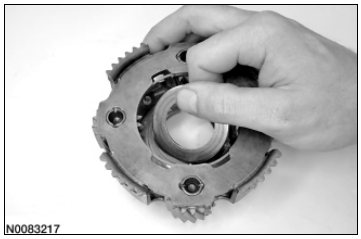
8. Remove and discard the O-ring seal from the balance dam.

9. Remove the forward clutch return spring.

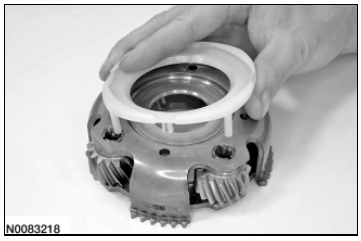


10. Install the forward clutch on the front pump to remove the forward clutch piston. Apply a small amount of shop air to remove the piston.

11. Remove and discard the inner and outer piston O-ring seals.



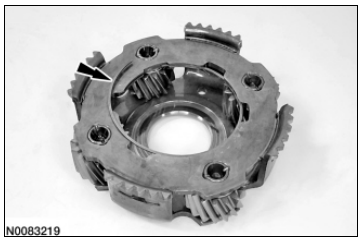
12. Remove the sun gear from the planet assembly.



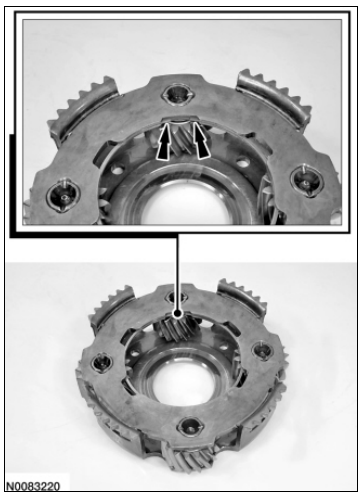
13. **NOTE:** The T1 thrust bearing may have stuck to the sun gear when it was removed.

    Remove the T1 bearing from the planetary carrier.

14. Remove the transmission fluid collector plate from the front planetary carrier.



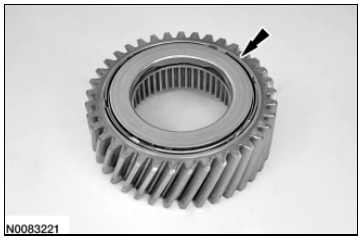
15. Clean and inspect the components of the forward clutch assembly for damage and install new components as necessary.



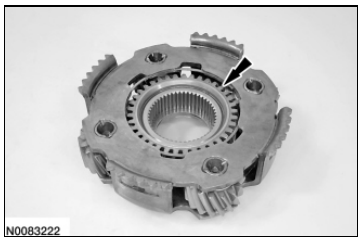
Assembly

1. **NOTE:** If a new planetary assembly is being installed, the new planetary assembly may not come with the snap ring installed.

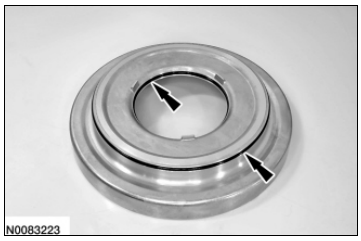
   Install the planetary assembly snap ring, if necessary.



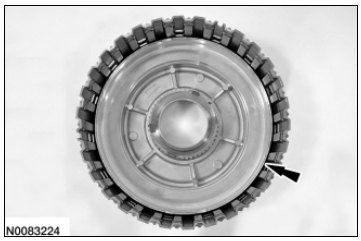
2. Make sure the planetary snap ring is oriented as shown.



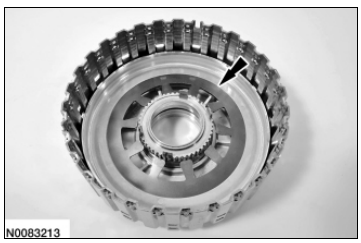
3. Install the transmission fluid collector plate on the front planetary carrier.



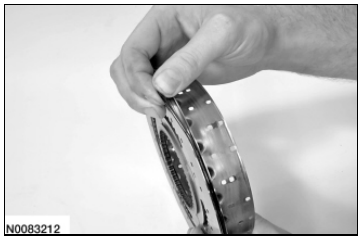
4. Install the T1 bearing onto the sun gear.



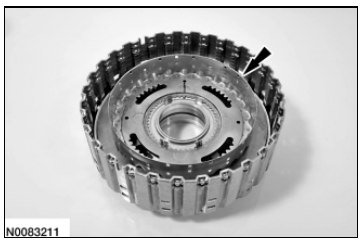
5. Install the sun gear into the planet assembly with the T1 bearing facing down and the recessed part of the gear up.



6. Install new O-ring seals onto the forward clutch piston.

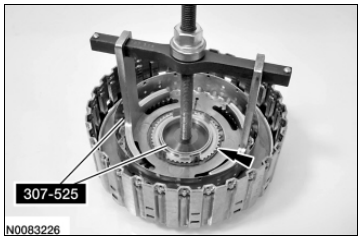


7. Lightly coat the O-ring seals with clean transmission fluid and install the forward clutch piston into the forward clutch drum.

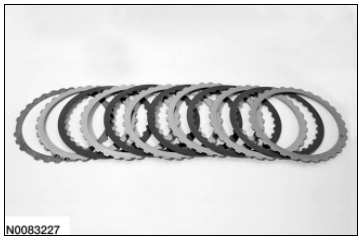


8. Install the forward clutch return spring.

9. Install a new O-ring seal onto the forward clutch balance dam. Lightly coat the O-ring seal with clean transmission fluid.

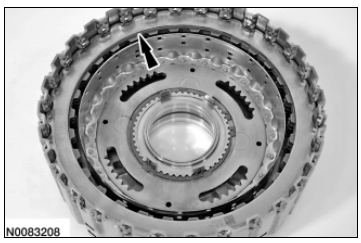


10. Align the marks made during disassembly and install the balance dam into the forward clutch drum.



11. **NOTE:** Prior to releasing the Clutch Spring Compressor 307-525, make sure that the snap ring is fully seated.

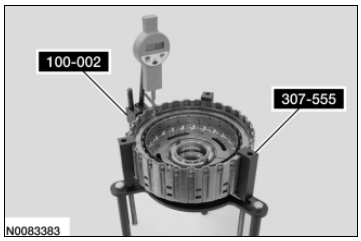
    Using the Clutch Spring Compressor 307-525, slightly collapse the balance dam to install the retaining ring. Install the retaining ring.



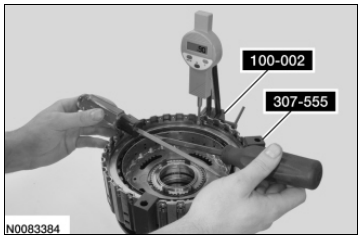
12. **NOTE:** Friction and steel plate quantity will vary based on engine displacement. For additional information, refer to the Clutch Plate Quantity Chart in the Specifications portion of this section.

    Soak the new forward clutch plates in clean transmission fluid.

13. Install the new forward clutch plates, starting with the wave spring then a steel plate and alternating between friction and steel plates and install the pressure plate.



14. Install the forward clutch plate snap ring.

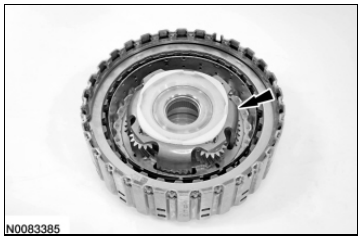


15. **NOTE:** All forward clutch plates, friction and steel are of a wave-type design.

    Install the forward clutch assembly into the Clutch End Play Gauge 307-555 and install the Dial Indicator Gauge with Holding Fixture 100-002 and position the plunger so it fits into the opening of the snap ring.

16. With the Dial Indicator Gauge set at zero, lift up on the steel pressure plate so it is against the select fit snap ring. Record this reading as reading A.

17. Rotate the forward clutch assembly 180 degrees from the opening of the snap ring, take a second reading and record this reading as reading B.



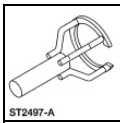
Description	Reading
Reading A	
Reading B	
Add reading A to reading B for a total end clearance	
Divide the total reading by 2 for an average end clearance	

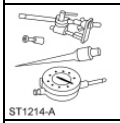
18. **NOTE:** If the final measurement is not within specification, install a new snap ring until the correct specification is achieved.

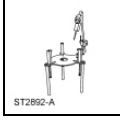
    - 5.4L engine - 0.71-1.10 mm (0.028-0.043 in).
    - 4.6L engine - 0.71-1.10 mm (0.028-0.043 in).

    If the free pack end clearance between the bottom of the snap ring and the top of the pressure plate is high, remeasure using a thicker select fit snap ring. If the free pack end clearance between the bottom of the snap ring and the top of the pressure plate is low, remeasure using a thinner select fit snap ring.

19. Install the sun gear and planetary gearset into the forward clutch drum. Make sure it snaps and locks in place.

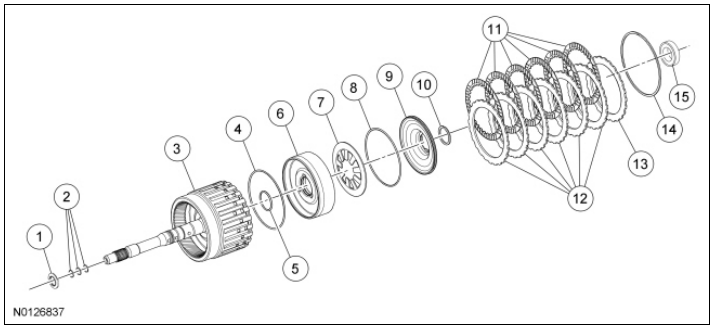






20. Install the T2 thrust bearing.

Overdrive Clutch Assembly



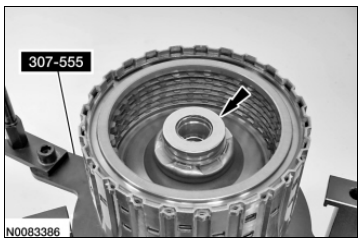
Special Tool(s)

 ST2497-A	Compressor, Spring Washer 307-209
 ST1214-A	Dial Indicator Gauge with Holding Fixture 100-002 (TOOL-4201-C) or equivalent
 ST2892-A	End Play Gauge, Clutch 307-555

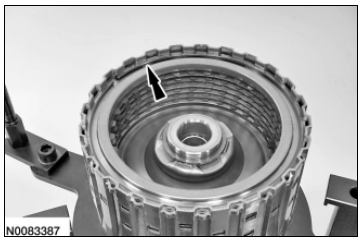
Material

Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC	MERCON® LV

Overdrive (O/D) Clutch Assembly

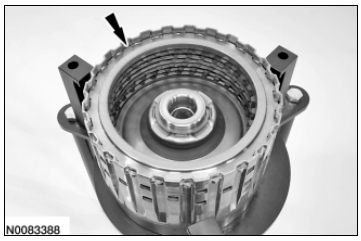


Item	Part Number	Description
1	7L495	Bearing (T2)
2	7G091	Turbine shaft seals (4.6L-2 required, 5.4L and 6.2L-3 required)
3	7F207	Input shaft
4	7A548	Overdrive (O/D) clutch piston outer seal
5	7A548	O/D clutch piston inner seal
6	7A262	O/D clutch piston
7	7B070	O/D clutch piston spring



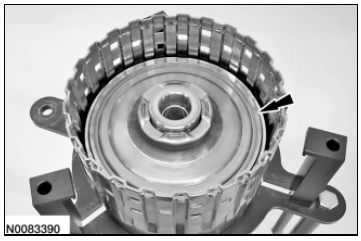
8	7A548	O/D balance piston outer seal
9	7H360	O/D balance piston
10	7C122	O/D balance piston snap ring
11	7B164	O/D clutch internal splined clutch plates (friction)
12	7B442	O/D clutch external splined clutch plates (steel)
13	7B066	O/D pressure plate
14	7D483	O/D clutch retaining ring
15	7C096	Bearing T3

Disassembly

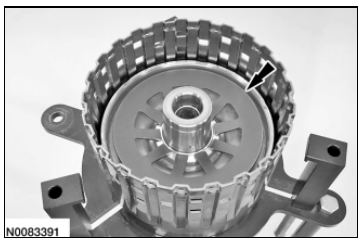


1. Position the Overdrive (O/D) clutch assembly in the Clutch End Play Gauge 307-555 and remove the T3 thrust bearing.

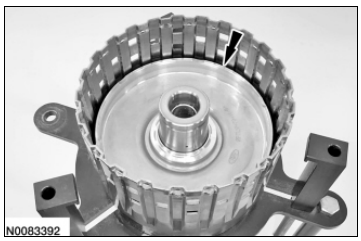
2. Remove the O/D clutch pack snap ring.



3. Remove the O/D clutch pack.

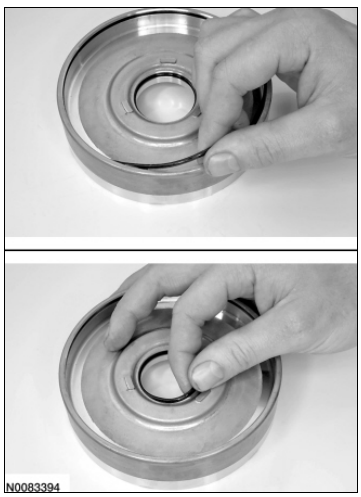


4. Using the Spring Washer Compressor 307-209 and a press, remove and discard the O/D clutch balance piston retaining ring.



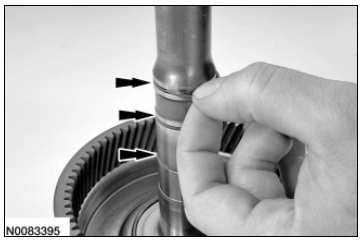
5. Remove the O/D clutch balance piston.

6. Remove the O/D clutch return spring.



7. Remove the O/D clutch apply piston.

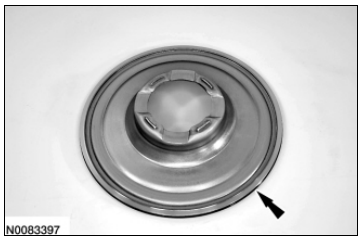
8. Remove and discard the outer O-ring seal on the O/D clutch balance piston.



9. Remove and discard both the inner (one large and one small) O-ring seals on the O/D clutch apply piston.

10. **NOTE:** 5.4L/6.2L shown, 4.6L similar. Vehicles equipped with a 5.4L or 6.2L engine will have 3 scarf cut seals and vehicles equipped with a 4.6L engine will have 2 scarf cut seals.

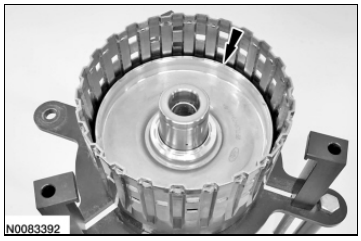
    Remove and discard the scarf cut seals.



Assembly

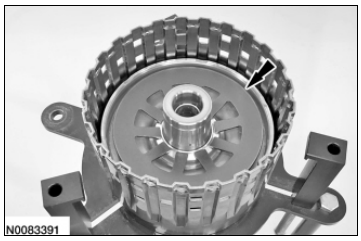
1. **NOTE:** 5.4L/6.2L shown, 4.6L similar. Vehicles equipped with a 5.4L or 6.2L engine will have 3 scarf cut seals and vehicles equipped with a 4.6L engine will have 2 scarf cut seals.

   Install new scarf cut seals and the roller bearing.

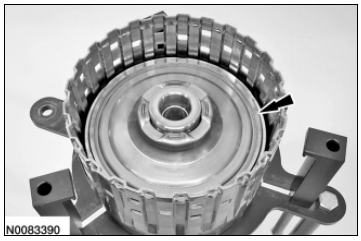


2. Install a new outer O-ring seal on the O/D clutch balance piston.

3. Install 2 new inner O-ring seals on the O/D clutch apply piston.

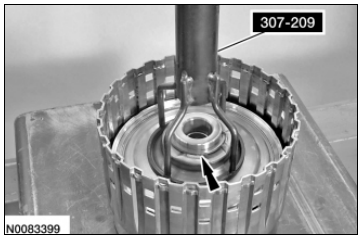


4. Lubricate all the O-ring seals with clean transmission fluid. Install the O/D clutch apply piston into the drum with the O-ring seals and the 3 pads facing down toward the drum.



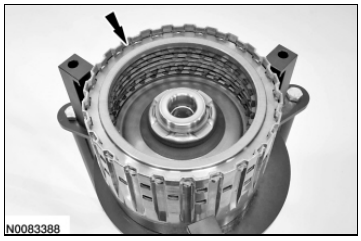
5. **NOTE:** The fingers on the return spring are facing down toward the piston.

   Install the O/D clutch return spring.

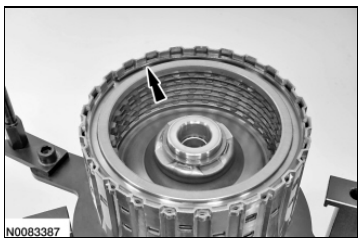


6. **NOTE:** The cone shape of the balance piston must face up when installed correctly.

   Lubricate all the O-ring seals with clean transmission fluid. Install the O/D clutch balance piston.

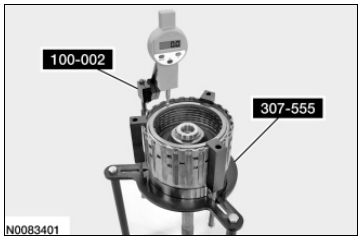


7. Using the Spring Washer Compressor 307-209, install a new O/D clutch balance piston retaining ring.



8. Soak the new O/D clutch plates in clean transmission fluid.

9. Install the new O/D clutch plates, starting with a steel plate and alternating between friction and steel plates, and ending with the pressure plate on the top.



10. Install the O/D clutch pack snap ring.

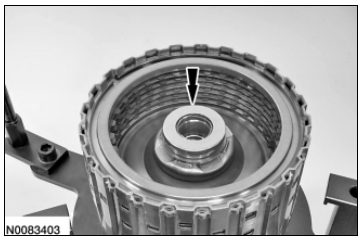
11. **NOTE:** All O/D clutch plates, friction and steel are of a wave-type design.

    Install the O/D clutch assembly into the Clutch End Play Gauge 307-555 and install the Dial Indicator Gauge with Holding Fixture 100-002 and position the plunger so it fits into the opening of the snap ring.

12. With the Dial Indicator Gauge set at zero, lift up on the steel pressure plate so it is against the select fit snap ring. Record this reading as reading A.

13. Rotate the O/D clutch assembly 180 degrees from the opening of the snap ring, take a second reading and record this reading as reading B.

Description	Reading
Reading A	
Reading B	
Add reading A to reading B for a total end clearance	
Divide the total reading by 2 for an average end clearance	



14. **NOTE:** If the final measurement is not within specification, install a new snap ring until the correct specification is achieved.

- 0.5-0.9 mm (0.019-0.035 in).

If the free pack end clearance between the bottom of the snap ring and the top of the pressure plate is high, remeasure using a thicker select fit snap ring. If the free pack end clearance between the bottom of the snap ring and the top of the pressure plate is low, remeasure using a thinner select fit snap ring.

15. **NOTE:** Inspect and install new thrust bearings as required.

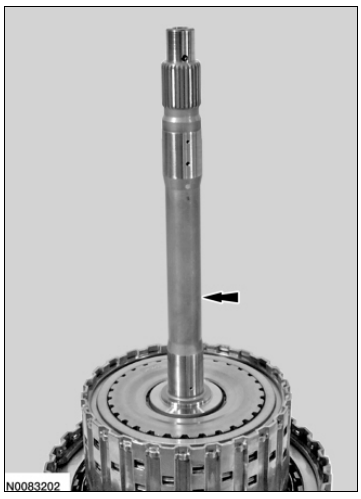
    Install the T3 thrust bearing.

Forward/Overdrive Clutch Assembly - Assembly

Special Tool(s)

 ST2692-A	End Play Gauge, Clutch 307-555

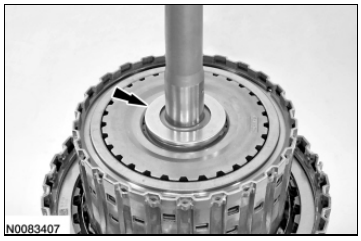
Material



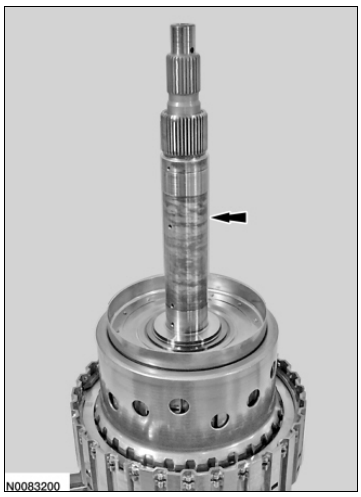
Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC	MERCON® LV

Assembly

1. Position the forward clutch assembly in the Clutch End Play Gauge 307-555 and install the overdrive clutch pack onto the forward clutch and planetary gear set.



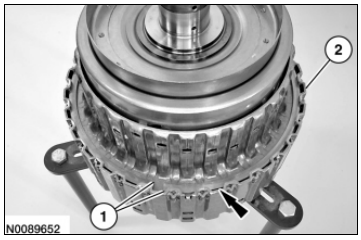
2. Install the intermediate shaft assembly.



3. **NOTE:** Inspect and install new thrust bearings as required.

   Install the T4 intermediate shaft bearing.

4. Install the forward clutch hub and sun shaft assembly.



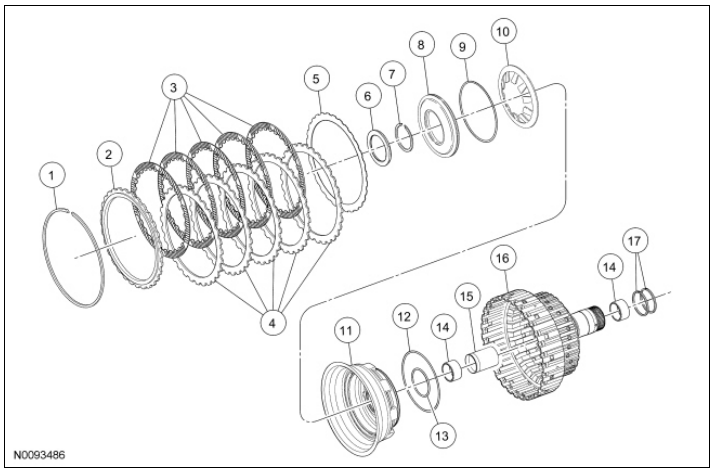
5. Install a new the direct clutch hub.

6. ***NOTICE:*** **Do not install the snap ring on the forward clutch hub with the snap ring gap in the same position as the original snap ring or damage to the transmission can occur.**

   Install a new direct clutch outer shell retaining ring with the snap ring gap positioned approximately 120 degrees from the index mark made on the forward clutch hub during disassembly.

   1. New snap ring gap
   2. Index mark from original snap ring gap

Direct Clutch Assembly



Special Tool(s)

 ST1190-A	Compressor, Clutch Spring 307-015 (T65L-77515-A)
 ST2893-A	Compressor, Clutch Spring 307-552

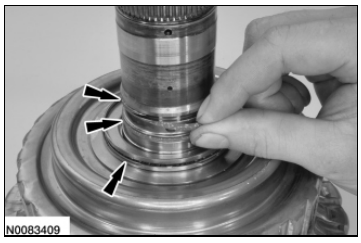
 ST2892-A	End Play Gauge, Clutch 307-555

Material

Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC	MERCON® LV

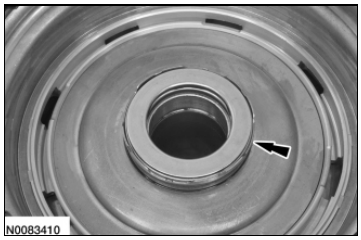
Direct Clutch Assembly

Item	Part Number	Description
1	7D483	Direct clutch pressure plate retaining ring
2	7B066	Direct clutch pressure plate (quantity model dependant)



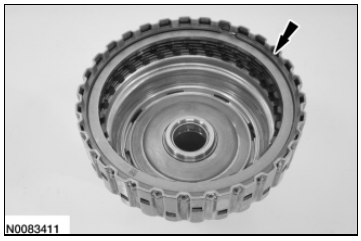
3	7B164	Direct clutch internal splined friction plates (quantity model dependant)
4	7B442	Direct clutch external splined steel plates
5	-	Direct clutch cushion plate (wave spring)
6	7C096	Bearing (T5)
7	7A577	Piston retaining ring
8	7A262	Direct clutch balance piston
9	7A548	Direct clutch balance piston seal
10	7B488	Return spring
11	7A262	Direct clutch apply piston
12	7A548	Direct clutch apply piston outer seal
13	7C099	Direct clutch apply piston inner seal
14	-	Direct clutch bushing hubs (part of 7F283) (2 required)
15	-	Gear shaft tube sleeve (part of 7F283)
16	7F283	Direct clutch cylinder
17	7D020	Seal shell cylinders

Disassembly

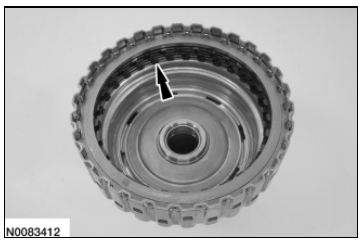


NOTE: Clutch plate quantity is model dependant based on engine displacement:

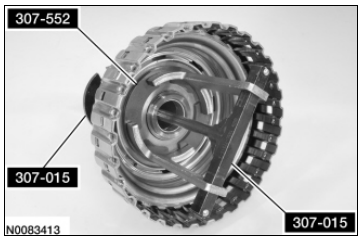
- 4.6L engine (Explorer, Mountaineer, Sport Trac, F-150)
  - Four friction plates
  - Five steel plates
- 5.4L engine (Expedition, Navigator, F-150)
  - Five friction plates
  - Six steel plates



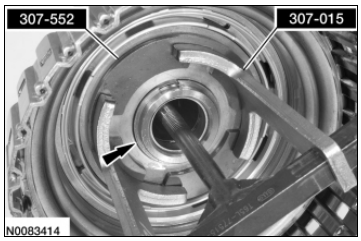
1. Remove and discard the 2 scarf cut seals and the roller bearing.



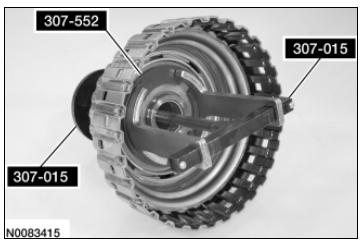
2. Remove the T5 thrust bearing.



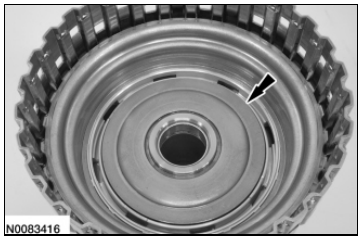
3. Remove the direct clutch snap ring.



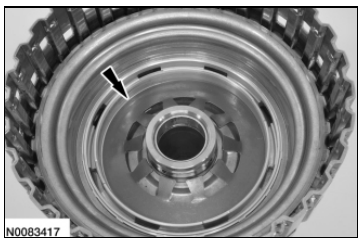
4. Remove the direct clutch steel and friction plates.



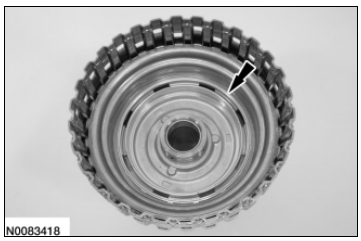
5. Install the Clutch Spring Compressor 307-552 and the Clutch Spring Compressor 307-015 onto the direct clutch assembly.



6. Using the Clutch Spring Compressor 307-552 and Clutch Spring Compressor 307-015, compress the direct clutch return spring and remove the direct clutch return spring retainer.

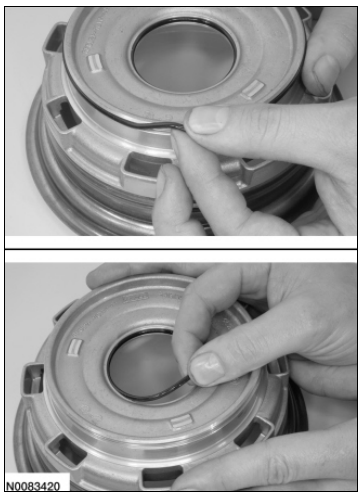


7. Remove the Clutch Spring Compressor 307-552 and the Clutch Spring Compressor 307-015.



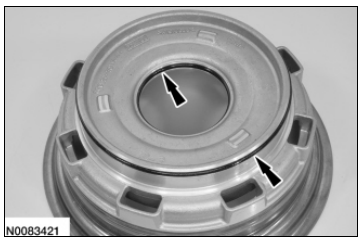
8. Remove the balance piston.

9. Remove the direct clutch return spring.



10. Remove the direct clutch piston.

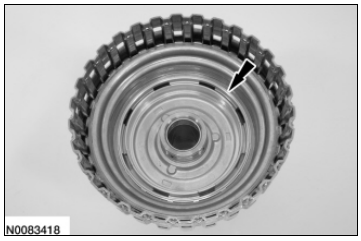
11. Remove and discard the outer O-ring seal from the balance piston.



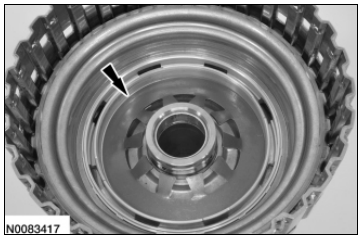
12. Remove and discard the outer and inner O-ring seals from the apply piston.

13. Inspect the components of the direct clutch for damage. If damage is indicated, install new components as necessary.

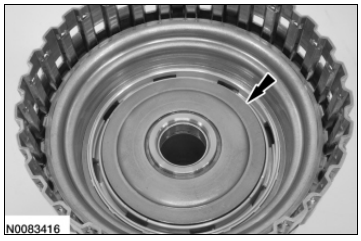
Assembly



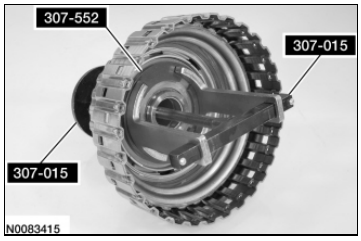
1. Install a new inner and outer O-ring seal on the apply piston.



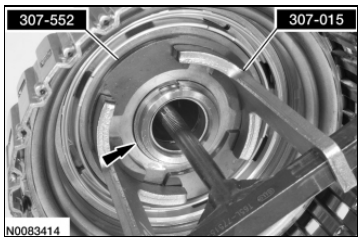
2. Install a new outer O-ring seal on the balance piston.



3. Lightly coat the O-ring seals in clean transmission fluid and install the direct clutch piston.

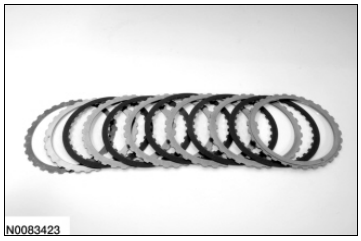


4. Install the direct clutch return spring.

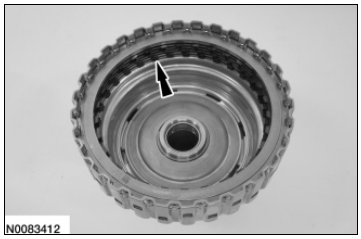


5. Install the balance piston.

6. Install the Clutch Spring Compressor 307-552 and the Clutch Spring Compressor 307-015 onto the direct clutch assembly.



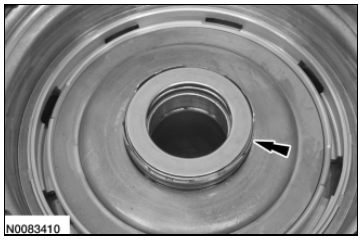
7. Using the Clutch Spring Compressor 307-552 and the Clutch Spring Compressor 307-015, compress the direct clutch return spring and install the direct clutch return spring retainer.



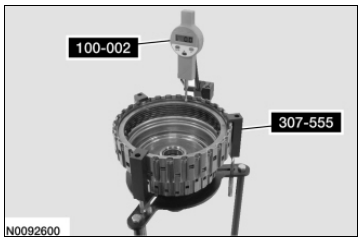
8. **NOTE:** Friction and steel plate quantity will vary based on engine displacement. For additional information, refer to the Clutch Plate Quantity Chart in the Specifications portion of this section.

   Soak the new direct clutch in clean transmission fluid.

9. Install the new direct clutch plates, starting with the wave spring then a steel plate and alternating between steel and friction plates, and ending with the pressure plate on the top.

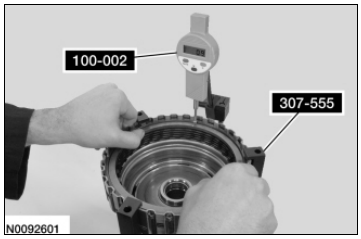


10. Install the direct clutch snap ring.



11. **NOTE:** Inspect and install a new thrust bearing as required.

    Install the T5 thrust bearing.

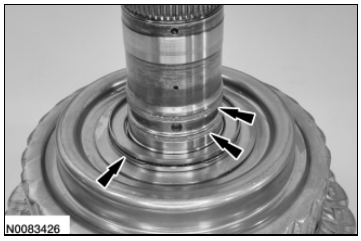


12. **NOTE:** All direct clutch plates, friction and steel are of a wave-type design.

    Install the direct clutch assembly into the Clutch End Play Gauge 307-555 and install the Dial Indicator Gauge with Holding Fixture 100-002 and position the plunger so it fits into the opening of the snap ring.

13. With the Dial Indicator Gauge set at zero, lift up on the steel pressure plate so it is against the select fit snap ring. Record this reading as reading A.

14. Rotate the direct clutch assembly 180 degrees from the opening of the snap ring, take a second reading and record this reading as reading B.



Description	Reading
Reading A	
Reading B	
Add reading A to reading B for a total end clearance	
Divide the total reading by 2 for an average end clearance	

15. **NOTE:** If the final measurement is not within specification, install a new snap ring until the correct specification is achieved.

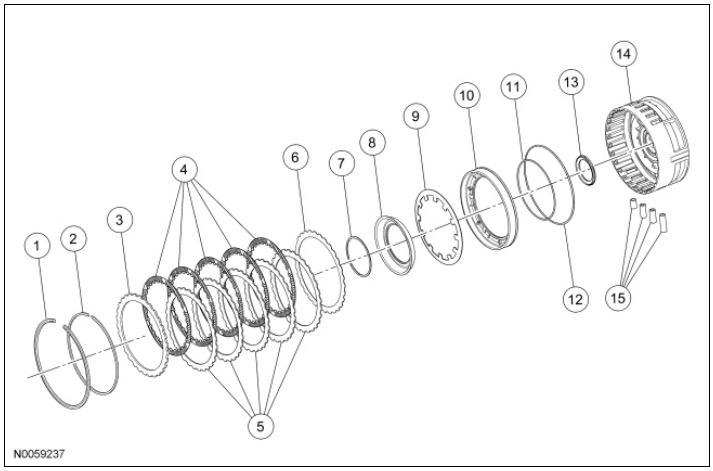
    - 5.4L engine - 0.5-1.3 mm (0.019-0.051 in).
    - 4.6L engine - 0.5-1.3 mm (0.019-0.051 in).

    If the free pack end clearance between the bottom of the snap ring and the top of the pressure plate is high, remeasure using a thicker select fit snap ring. If the free pack end clearance between the bottom of the snap ring and the top of the pressure plate is low, remeasure using a thinner select fit snap ring.

16. Install 2 new scarf cut seals and the roller bearing.

N0083426

Intermediate Clutch Assembly



Special Tool(s)

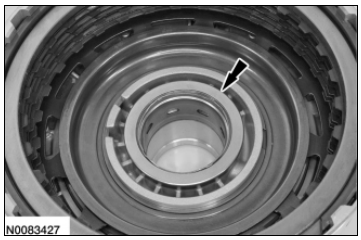
 ST2681-A	Compressor, Clutch Spring 307-525
 ST1214-A	Dial Indicator Gauge with Holding Fixture 100-002 (TOOL-4201-C) or equivalent
 ST2892-A	End Play Gauge, Clutch 307-555

Material

Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC	MERCON® LV

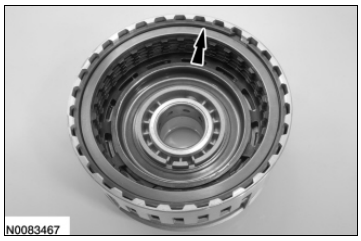
Intermediate Clutch Assembly

Item	Part Number	Description
1	7D483	Center support retaining ring
2	7D483	Intermediate clutch pack retaining ring
3	7B066	Intermediate clutch pressure plate
4	7B164	Intermediate clutch internal splined friction plates (quantity model dependent)



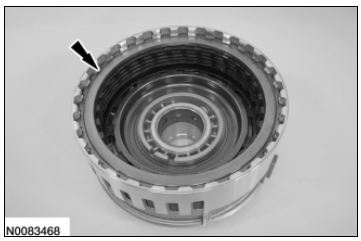
5	7B442	Intermediate clutch external splined steel plates (quantity model dependent)
6	7E085	Intermediate clutch cushion spring
7	7A577	Intermediate clutch snap ring
8	7B043	Intermediate clutch return spring retaining ring
9	7A480	Intermediate clutch piston return spring
10	7E005	Intermediate clutch piston
11	7F225	Intermediate clutch piston inner seal
12	7F224	Intermediate clutch piston outer seal
13	7F373	Bearing (T6)
14	-	Intermediate/low/reverse clutch center support
15	7G199	Center support seals (2 - 7G199, 1 - 7G087, 1 - 7G484)

Disassembly

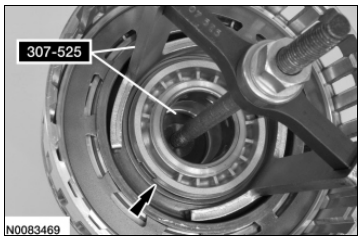


NOTE: Clutch plate quantity is model dependant based on engine displacement:

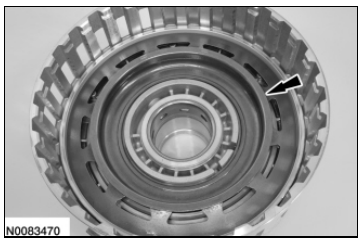
- 4.6L engine (Explorer, Mountaineer, Sport Trac, F-150)
  - ♦ Four friction plates
  - ♦ Four steel plates
- 5.4L engine (Expedition, Navigator, F-150)
  - ♦ Five friction plates
  - ♦ Five steel plates



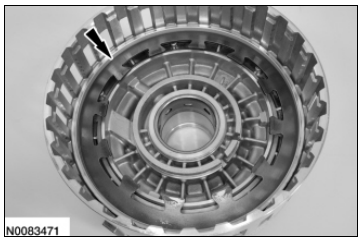
1. Remove the T6 thrust bearing.



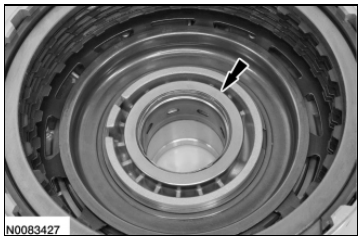
2. Remove the intermediate clutch plate snap ring.



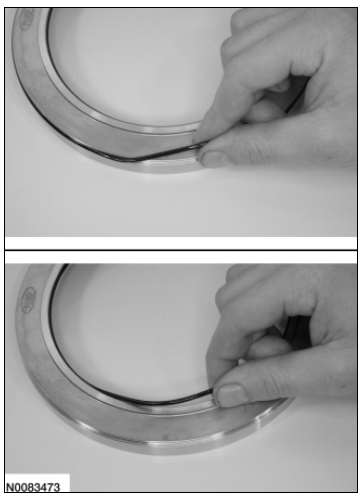
3. Remove the intermediate clutch plates.



4. Using the Clutch Spring Compressor 307-525, remove and discard the intermediate clutch return spring retainer.

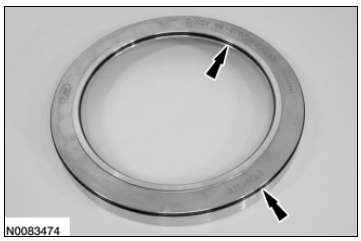


5. Remove the intermediate clutch return spring top plate.

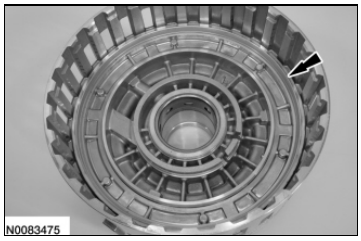


6. Remove the intermediate clutch return spring.

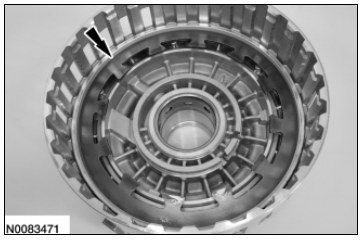
7. Applying a slight amount of air to the port, remove the intermediate clutch piston.



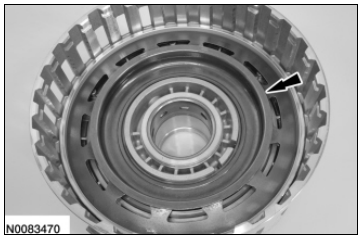
8. Remove and discard the inner and outer intermediate clutch piston O-ring seals.



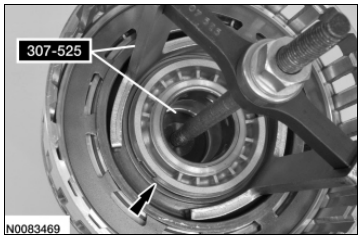
Assembly



1. Install new inner and outer intermediate clutch piston O-ring seals.

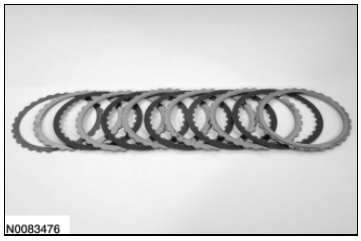


2. Lightly coat the O-ring seals in clean automatic transmission fluid and install the intermediate clutch piston.

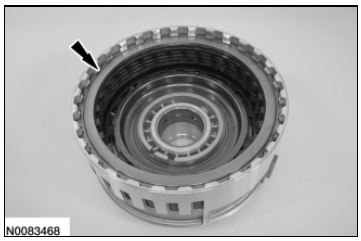


3. Install the intermediate clutch return spring.

4. Install the intermediate clutch return spring top plate.



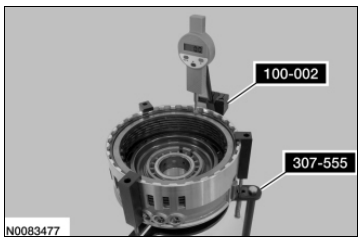
5. Using the Clutch Spring Compressor 307-525, install a new intermediate clutch return spring retainer.



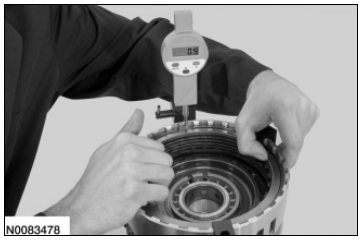
6. **NOTE:** Friction and steel plate quantity will vary based on engine displacement. For additional information, refer to the Clutch Plate Quantity Chart in the Specifications portion of this section.

   Soak the new intermediate clutch plates in clean automatic transmission fluid.

7. Install the new intermediate clutch plates, starting with the wave spring then a steel plate and alternating between friction and steel plates, and ending with the pressure plate.



8. Install the intermediate clutch plate snap ring.

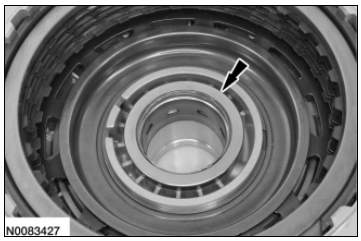


9. **NOTE:** All intermediate clutch plates, friction and steel are of a wave-type design.

   Install the intermediate clutch assembly into the Clutch End Play Gauge 307-555 and install the Dial Indicator Gauge with Holding Fixture 100-002 and position the plunger so it fits into the opening of the snap ring.

10. With the Dial Indicator Gauge set at zero, lift up on the steel pressure plate so it is against the select fit snap ring. Record this reading as reading A.

11. Rotate the intermediate clutch assembly 180 degrees from the opening of the snap ring, take a second reading and record this reading as reading B.



Description	Reading
Reading A	
Reading B	
Add reading A to reading B for a total end clearance	
Divide the total reading by 2 for an average end clearance	

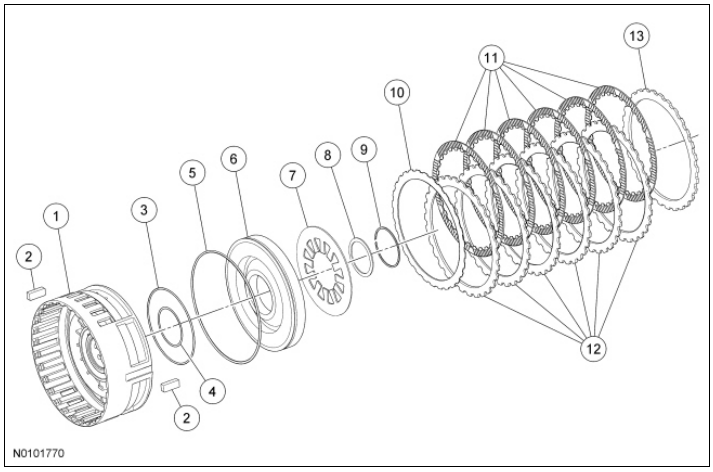
12. **NOTE:** If the final measurement is not within specification, install a new snap ring until the correct specification is achieved.

    - 5.4L engine - 0.7-1.1 mm (0.027-0.043 in).
    - 4.6L engine - 0.7-1.1 mm (0.027-0.043 in).

    If the free pack end clearance between the bottom of the snap ring and the top of the pressure plate is high, remeasure using a thicker select fit snap ring. If the free pack end clearance between the bottom of the snap ring and the top of the pressure plate is low, remeasure using a thinner select fit snap ring.

13. Install the T6 thrust bearing.

Low/Reverse Clutch Assembly



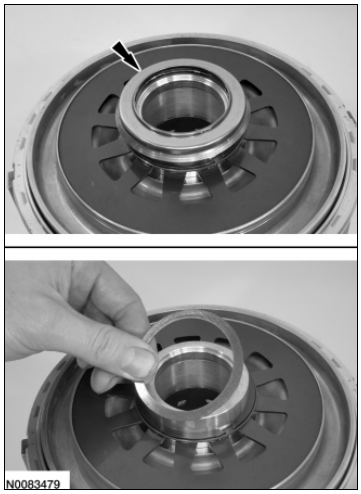
Special Tool(s)

 ST2681-A	Compressor, Clutch Spring 307-525
 ST1274-A	Depth Micrometer 303-D075 (D92P-4201-A) or equivalent
 ST1214-A	Dial Indicator Gauge with Holding Fixture 100-002 (TOOL-4201-C) or equivalent
 ST2892-A	End Play Gauge, Clutch 307-555
 ST2896-A	Gauge, D-Clutch Measurement 307-554

Material

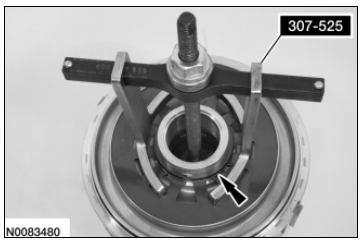
Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC	MERCON® LV

Low/Reverse Clutch Assembly



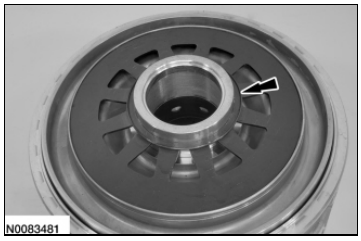
Item		Description

	Part Number	
1	-	Intermediate/low/reverse clutch center support
2	7B220	Center support keys (2 required)
3	7F225	Low/reverse clutch piston center seal
4	7D404	Low/reverse clutch cylinder inner seal
5	7D403	Low/reverse clutch cylinder outer seal
6	7A262	Low/reverse clutch piston
7	7B070	Low/reverse clutch return spring
8	-	Washer
9	7D483	Low/reverse clutch return spring retainer
10	7E085	Low/reverse clutch cushion spring
11	7B164	Low/reverse clutch internal splined friction plates (internal to case)
12	7B442	Low/reverse clutch external splined steel plates (internal to case)
13	7B066	Low/reverse clutch pressure plate (internal to case) (select fit)

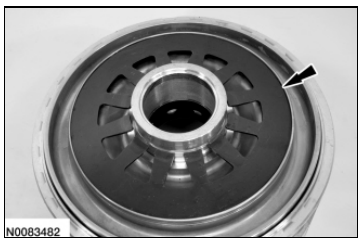


Disassembly

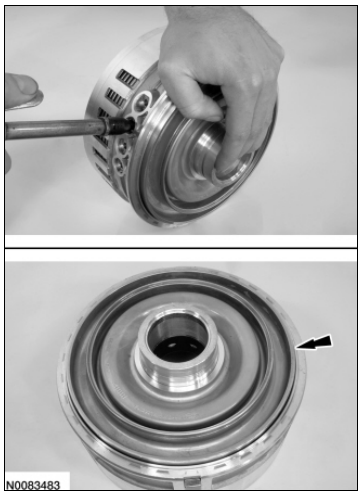
NOTE: The low/reverse clutch plates are installed in the case during the Assembly procedure.



1. Remove the T7 thrust bearing and the shim from the center support.

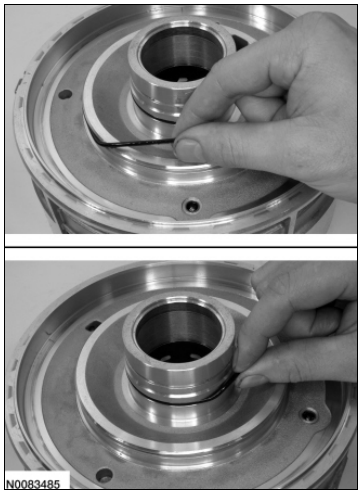


2. Using the Clutch Spring Compressor 307-525, remove and discard the low/reverse clutch return spring retainer.



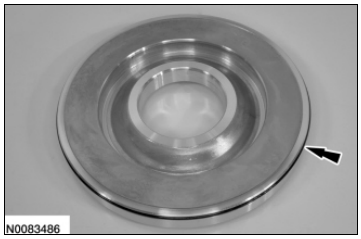
3. Remove and discard the low/reverse clutch return spring washer.

4. Remove the low/reverse clutch return spring.

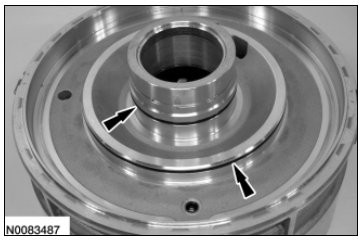


5. Apply a slight amount of air to the port, remove the low/reverse clutch piston from the low/reverse clutch drum.

6. Remove and discard the low/reverse outer piston O-ring seals.

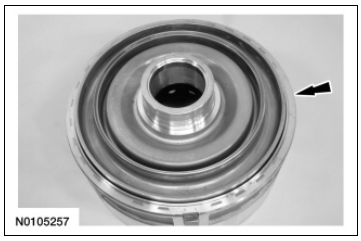


7. Remove and discard the low/reverse drum O-ring seals.

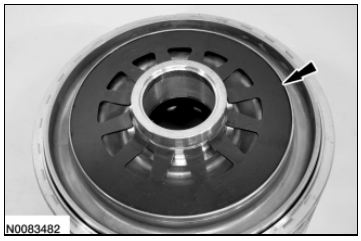


Assembly

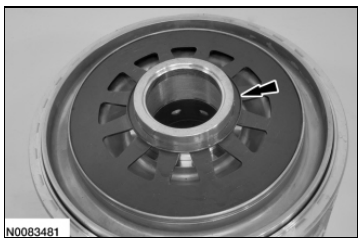
Low/reverse piston



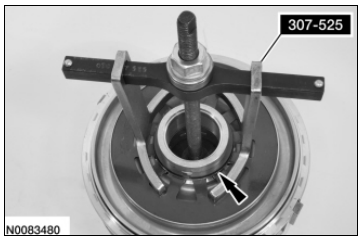
1. Install new low/reverse outer piston O-ring seals.



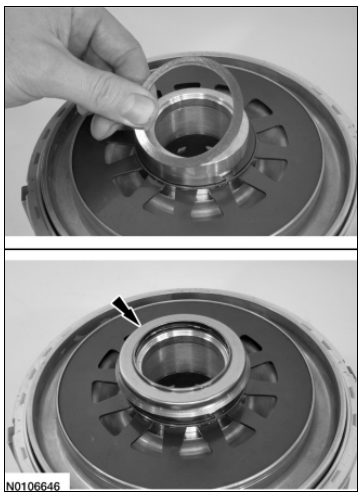
2. Install new low/reverse drum O-ring seals.



3. Lubricate the O-ring seal with clean automatic transmission fluid and install the low/reverse piston.

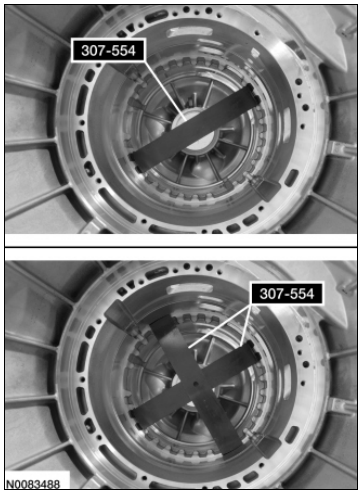


4. Install the low/reverse clutch return spring.



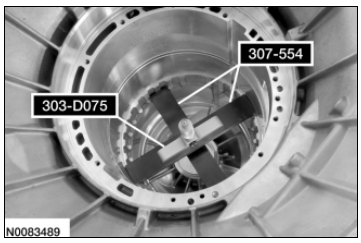
5. Install a new low/reverse clutch return spring washer.

6. Using the Clutch Spring Compressor 307-525, compress the low/reverse clutch return spring and install the retaining ring.



7. Install the shim and the T7 thrust bearing on the center support.

Low/reverse clutch stackup

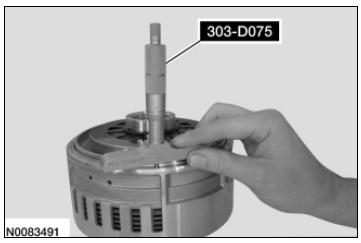


8. **NOTE:** All intermediate clutch plates, friction and steel are of a wave-type design.

   Install the D-Clutch Measurement Gauge 307-554 into the case.

9. With the D-Clutch Measurement Gauge 307-554 positioned in the case, use the Depth Micrometer 303-D075 to measure the case stop depth.

Description	Reading
Measure the distance from the top of the upper gauge bar to the top of the lower gauge bar. Record this reading as the case measurement. Record as reading A.	



10. Measure the clutch pack height.

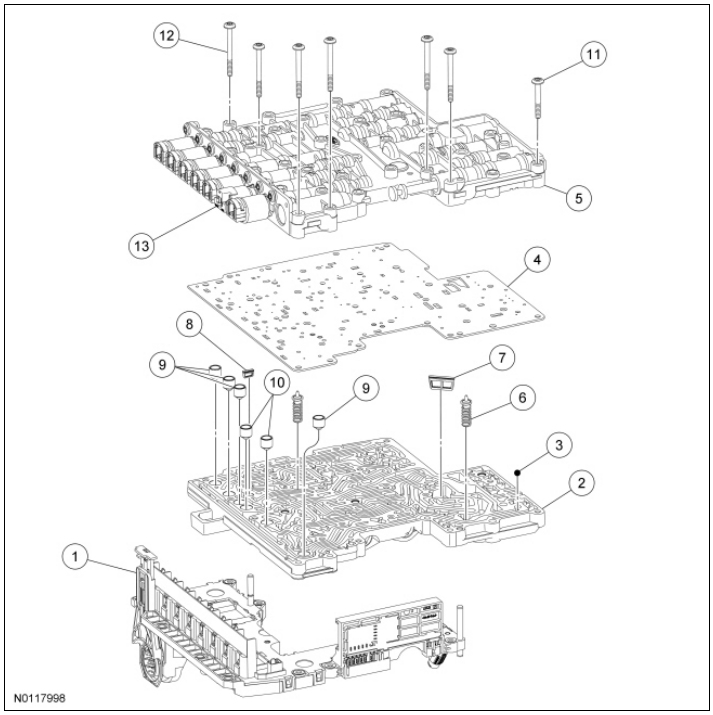
Description	Reading
Place the low/reverse clutch pack on the Clutch End Play Gauge 307-555 with the wave spring down and the pressure plate on top. Using the Dial Indicator Gauge with Holding Fixture 100-002, place the plunger on the pressure plate. Slide the clutch to the side so the plunger of the Dial Indicator is touching the gauge plate of the Clutch End Play Gauge 307-555. Zero out the Dial Indicator Gauge.	
Carefully lift the plunger enough to slide the clutch pack under the plunger to take a reading. Record this reading. Rotate the clutch pack 180 degrees and take a second reading. Add the first and second readings together and divide the total by 2. Record this reading as B.	

11. Using the Depth Micrometer 303-D075, measure the piston to center support shoulder height.

Description	Reading
Measure the piston to center support shoulder height. Record this measurement. Rotate the center support 180 degrees and record this measurement. Add the first and the second measurements, then divide by 2. Record this as reading C.	

12. Calculate the end clearance.

Description	Reading
Subtract B and C from A to determine end clearance	
Total C measurement	
End clearance specification	1.0-1.6 mm (0.039-0.062 in)

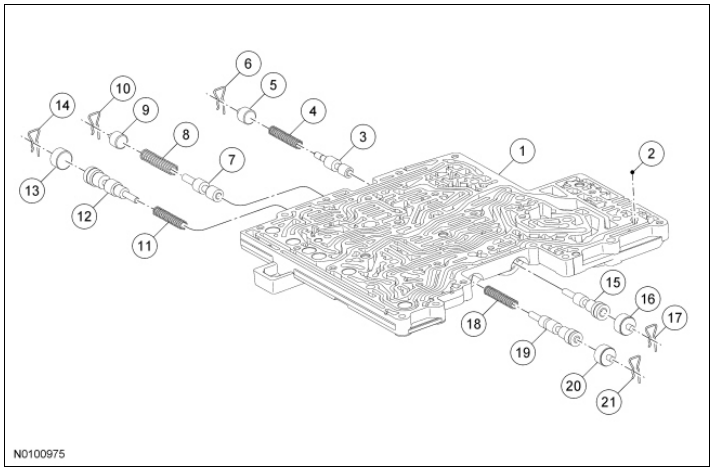


Compare the end clearance to the specification. If the end clearance is out of specification, select the next thinner or thicker plate as required and repeat Steps 10, 11 and 12.

Mechatronic Assembly

Material

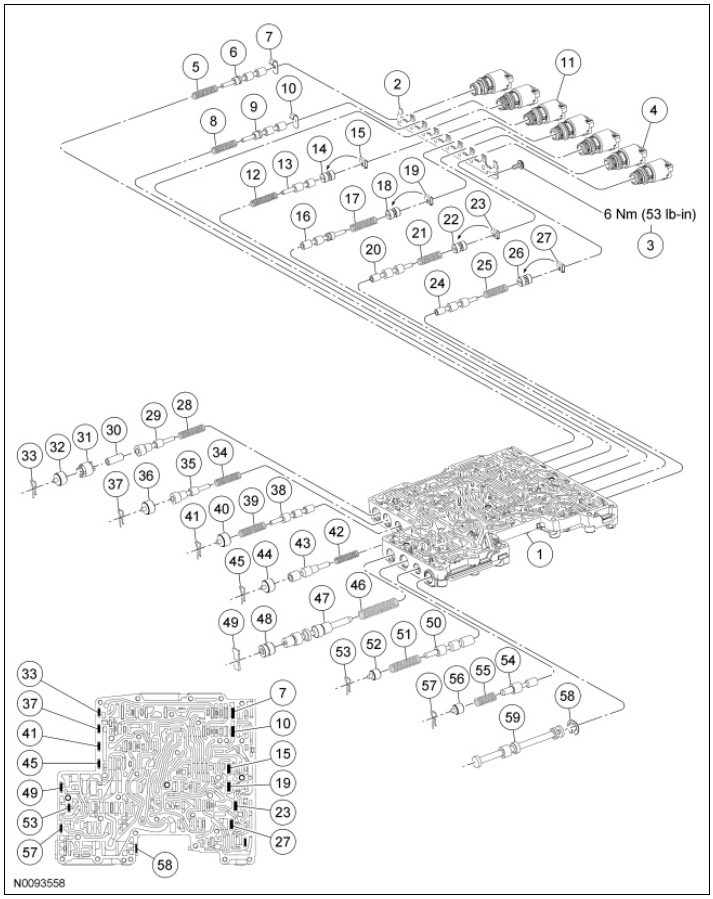
Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC	MERCON® LV



Mechatronic

Item	Part Number	Description
1	7A100	Transmission Control Module (TCM)
2	-	Transmission control valve body (upper)
3	7E195	Transmission control valve check ball (8 required)
4	7Z490	Transmission control valve body separator plate (model dependent)
5	-	Transmission control valve body (lower)
6	-	Transmission control valve assembly
7	7H187	Transmission control filter assembly
8	7B155	Transmission fluid filter

9	7J191	Transmission solenoid damper valve assembly (early build vehicles only)
10	7J191	Transmission solenoid damper valve assembly (all vehicles)
11	W707886	Mechatronic assembly bolt - connects upper and lower half together (19 required)
12	W707884	Mechatronic assembly bolt - connects TCM to transmission control valve assembly (6 required)
13	-	Transmission shift control solenoids

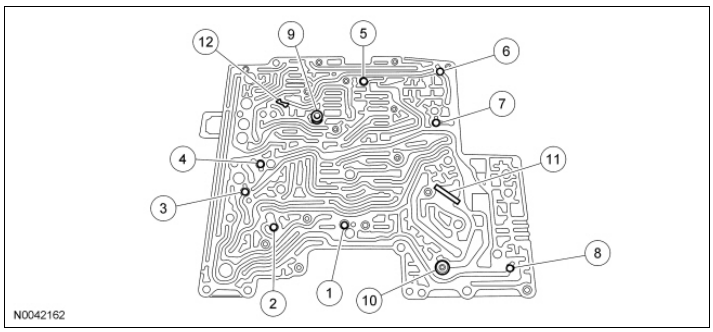


Mechatronic Upper Half

Item	Part Number	Description
1	7A092	Transmission control valve assembly (ditch plate) (upper half)
2	7E195	Transmission control valve check ball (8 required)
3	-	Transmission clutch D2 latch valve
4	-	Transmission clutch valve spring
5	-	Transmission clutch valve spring plug
6	7G007	Transmission clutch valve spring plug retainer clip
7	-	Transmission clutch D2 regulator valve
8	-	Transmission clutch valve spring
9	-	Transmission clutch valve spring plug
10	7G007	Transmission clutch valve spring plug retainer clip
11	-	Transmission clutch valve spring
12	-	Transmission clutch B regulator valve
13	-	Transmission clutch valve spring plug
14	7G007	Transmission clutch valve spring plug retainer clip
15	-	Transmission clutch valve
16	-	Transmission clutch valve spring plug
17	7G007	Transmission clutch valve spring plug retainer clip
18	-	Transmission clutch valve spring

19	-	Transmission clutch valve
20	-	Transmission clutch valve spring plug
21	7G007	Transmission clutch valve spring plug retainer clip

Mechatronic Lower Half



Item	Part Number	Description
1	-	Transmission control valve assembly (lower half)
2	-	Transmission shift control solenoid hold-down bracket
3	-	Transmission shift control solenoid hold-down bracket bolt M5 x 0.80 x 12
4	7G484	Transmission shift control solenoid
5	-	Transmission clutch valve spring
6	-	Transmission clutch A latch valve
7	-	Transmission spring retainer plate
8	-	Transmission clutch valve spring
9	-	Transmission clutch B latch valve
10	7F194	Transmission spring retainer plate
11	7G383	Electronic Pressure Control (EPC) solenoid
12	-	Transmission solenoid regulator valve spring
13	-	Transmission solenoid pressure regulator valve

14	-	Transmission solenoid plug
15	7G007	Transmission valve plug retainer
16	-	Transmission clutch D1 latch valve
17	-	Transmission clutch valve spring
18	-	Transmission solenoid plug
19	7G007	Transmission valve plug retainer
20	-	Transmission drive enable valve
21	-	Transmission solenoid valve spring
22	-	Transmission solenoid plug
23	7G007	Transmission valve plug retainer
24	-	Transmission solenoid multiplex valve
25	-	Transmission solenoid valve spring
26	-	Transmission solenoid plug
27	7G007	Transmission valve plug retainer
28	-	Transmission clutch valve spring
29	-	Transmission clutch A pressure regulator valve
30	-	Transmission clutch regulator valve sleeve
31	-	Transmission valve return plug
32	-	Transmission valve return plug
33	7G077	Transmission valve plug return clip
34	-	Transmission clutch valve spring
35	-	Transmission clutch E pressure regulator valve
36	-	Transmission valve return plug
37	7G007	Transmission valve plug return clip
38	-	Transmission clutch E latch valve
39	-	Transmission clutch control valve spring
40	-	Transmission valve return plug
41	7G007	Transmission valve plug return clip
42	-	Transmission bypass clutch control valve spring
43	-	Transmission bypass clutch control valve
44	-	Transmission valve return plug
45	7G007	Transmission valve plug return clip
46	-	Transmission manual oil pressure regulator valve spring
47	-	Transmission main oil pressure regulator valve
48	-	Transmission manual oil pressure regulator valve sleeve
49	7G007	Transmission valve plug return clip
50	-	Transmission converter regulator valve
51	-	Transmission converter regulator valve spring
52	-	Transmission valve return plug
53	7G007	Transmission valve plug return clip
54	-	Transmission lube control valve
55	-	Transmission lube control valve spring

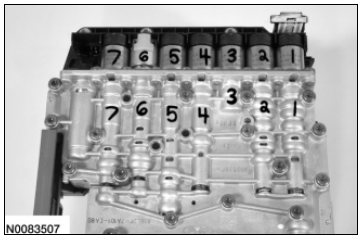
56	-	Transmission valve return plug
57	7G007	Transmission valve plug return clip
58	W527007-S	Retaining ring
59	-	Transmission control manual valve

Check Ball Location

Item	Description
1	Reverse/drive control check ball
2	Shift solenoid control check ball
3	Intermediate clutch exhaust control check ball
4	Direct clutch exhaust control check ball
5	Low/reverse clutch exhaust control check ball
6	Forward clutch exhaust control check ball
7	Overdrive (O/D) clutch exhaust control check ball
8	Reverse exhaust control check ball
9	Clutch exhaust valve
10	Converter drain back valve
11	Large screen
12	Small screen

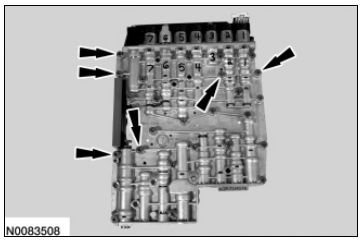
Disassembly

NOTICE: **Do not touch the electrical connector pins or the exposed solenoid tabs on the Transmission Control Module (TCM). An electrostatic discharge may occur and may cause damage to the TCM /mechatronic assembly.**



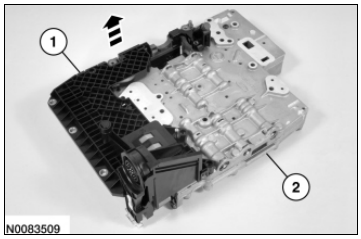
NOTE: Make an identifying mark on each solenoid and the corresponding bore for correct assembly.

NOTE: Solenoids may visually appear the same but their designs/functions are different. Caution must be taken not to assemble the mechatronic assembly incorrectly. Incorrect solenoid installation will result in poor transmission shift quality.

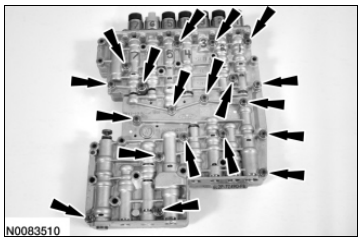


NOTE: Note where the 8 check balls, 6 (early build) or 2 (late build) solenoid dampers, 2 internal valves and springs and 2 internal filters are located for reassembly.

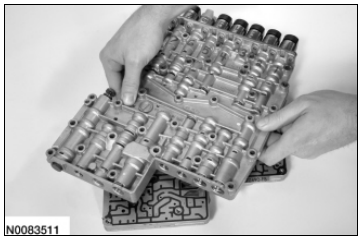
Mechatronic assembly upper half



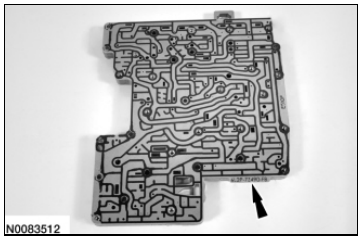
1. Make an identifying mark on each solenoid and the corresponding bore for correct assembly.



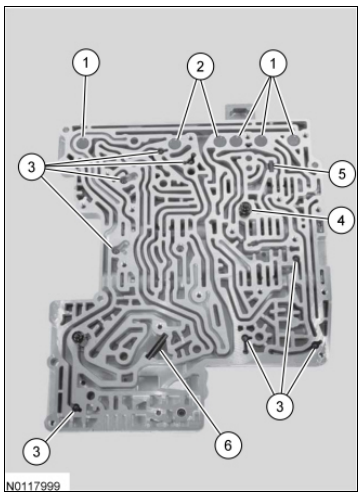
2. Remove the 6 long bolts from the Transmission Control Module (TCM) unit.



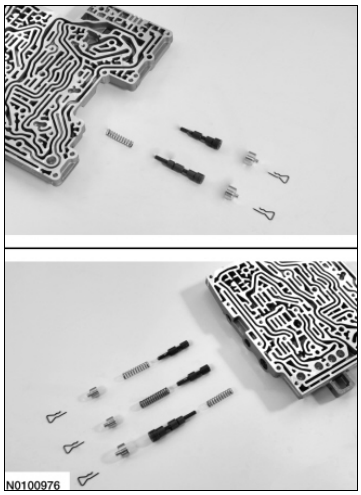
3. Carefully separate the TCM from the mechatronic assembly.
    1. TCM
    2. Mechatronic assembly



4. Remove 19 short bolts from the mechatronic assembly.



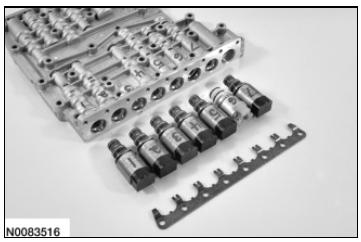
5. Separate the lower half of the mechatronic assembly from the upper half of the mechatronic assembly.



6. Remove and discard the separator plate.

7. Remove the solenoid dampers, check balls, converter drain back valve and filter screens from the mechatronic assembly. Note the location for assembly. Refer to the preceding exploded views.
    1. Solenoid dampers (early build vehicles only)
    2. Solenoid dampers
    3. Check balls
    4. Converter drain back valve
    5. Small screen
    6. Big screen

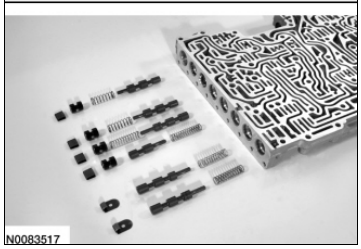
8. Remove the clips, caps, valves and springs from each bore of the mechatronic assembly. Note the location and order for assembly. Refer to the preceding exploded views.



9. Using clean mineral spirits, clean the upper half of the mechatronic assembly.

Mechatronic assembly lower half

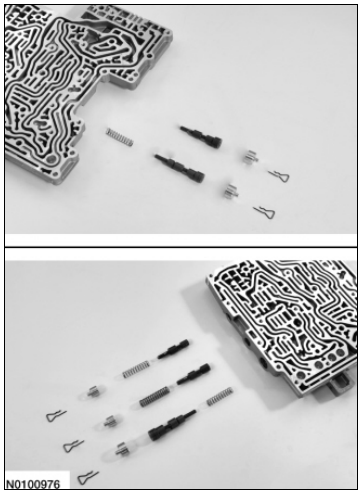
10. Remove the 8 solenoid bracket bolts and the solenoid bracket.



11. Remove the solenoids.

12. Remove the clips, caps, valves and springs from each bore of the mechatronic assembly. Note the location and order for assembly. Refer to the preceding exploded views.

13. Using clean mineral spirits, clean the lower half of the mechatronic assembly.



Assembly

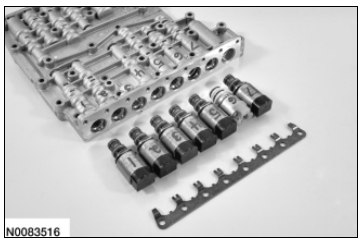
NOTICE: **Do not touch the electrical connector pins or the exposed solenoid tabs on the Transmission Control Module (TCM). An electrostatic discharge may occur and may cause damage to the TCM /mechatronic assembly.**

Mechatronic assembly upper half

1. **NOTE:** Many components and surfaces in the mechatronic valve body are precision machined. Careful handling during disassembly, cleaning, inspection and assembly will prevent unnecessary damage to machined surfaces.

   Install the clips, caps, valves and spring into each bore. Refer to the preceding exploded views.

Mechatronic assembly lower half



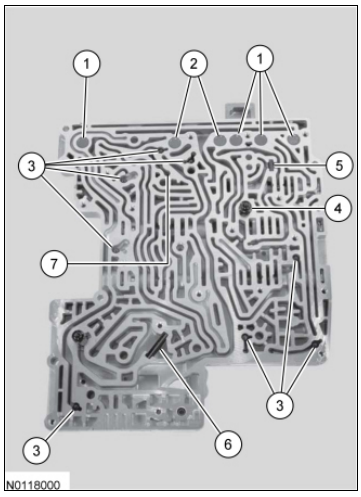
2. **NOTE:** Many components and surfaces in the mechatronic valve body are precision machined. Careful handling during disassembly, cleaning, inspection and assembly will prevent unnecessary damage to machined surfaces.

   Install the clips, caps, valves and spring into each bore.

3. **NOTE:** Lubricate the O-ring seals of the solenoids with clean automatic transmission fluid when installing them into the valve body.

   Install the solenoids into their correct bores as indicated during disassembly.

4. Install the solenoid bracket and the 8 bolts.
   - Tighten to 6 Nm (53 lb-in).



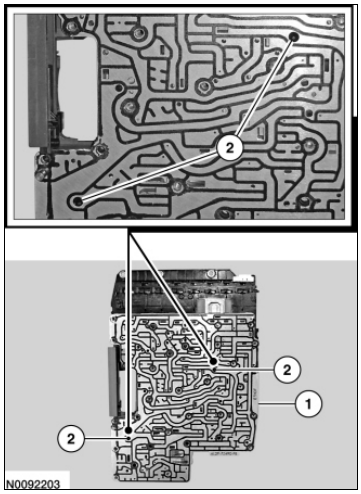
5. ***NOTICE:*** **Early build vehicles will have 6 solenoid valve dampers and late build vehicles will have 2. Failure to install the dampers in the correct ports can result in harsh, soft or erratic shifts or damage to the transmission.**

   NOTICE: **Towards the back of the upper valve body there is a hydraulic passage that is shaped as though it receives a check ball. This passage does not require a check ball. Be sure not to mistake this hydraulic passage for a passage that does require a check ball or damage to the transmission can occur.**

   Install the solenoid dampers, check balls, converter drain back valve and filter screens.

   1. Solenoid dampers (early build vehicles only)
   2. Solenoid dampers
   3. Check balls
   4. Converter drain back valve
   5. Small screen
   6. Big screen
   7. Empty hydraulic passage (no check ball)

6. Align the guide pins on the TCM with the holes in the upper valve body and install the valve body on the TCM .
   1. TCM
   2. Upper valve body
   3. Guide pins

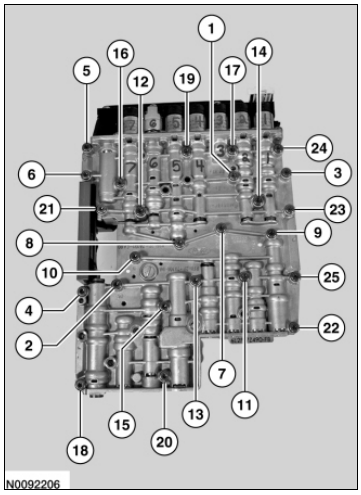


7. ***NOTICE:*** **The separator plates are different between the early and late build mechatronic assemblies to accommodate the different number of dampers. Failure to install the correct separator plate can result in harsh, soft or erratic shifts or damage to the transmission.**

   NOTICE: **If the drain back valves are not installed correctly in the separator plate, damage to the transmission can occur.**

   Position the separator plate on the upper valve body.
   Check the 2 drain back valves to be sure they are correctly positioned in the separator plate when the separator plate is pressed flush against the upper valve body.

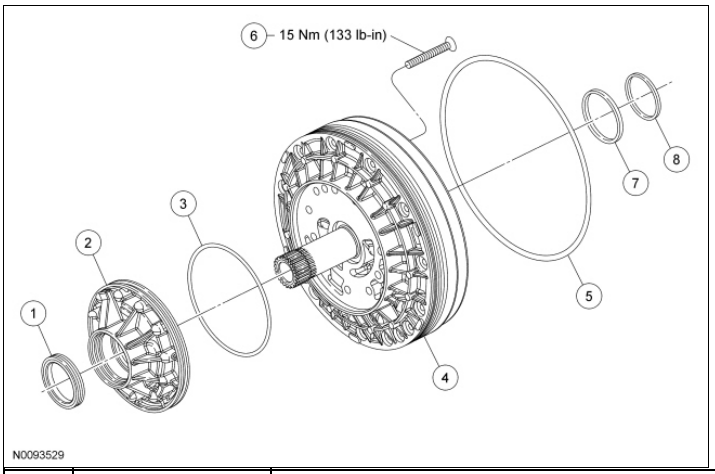
   1. Separator plate
   2. Drain back valves



8. Position the lower valve body on the 2 TCM alignment studs, align the manual valve with the Transmission Range (TR) sensor on the TCM and install the lower valve body.
   1. Lower valve body
   2. Manual valve
   3. TR sensor

9. Install the 6 (long) TCM -to-valve body bolts hand-tight.

10. Install the 19 (short) mechatronic assembly lower-to-upper valve body bolts.
    - Tighten the bolts in the sequence shown.
    - Tighten bolts 1 through 6 in the tightening sequence to 7 Nm (62 lb-in).
    - Tighten bolts 7 through 25 in the tightening sequence to 6 Nm (53 lb-in).

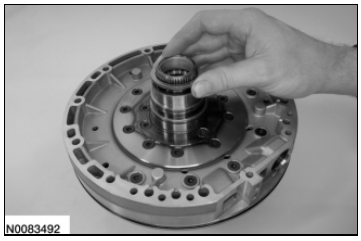


Pump Assembly

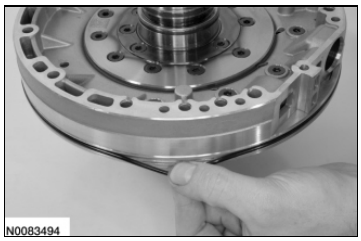
Special Tool(s)

 ST2687-A	Installer, Fluid Pump Seal 307-556

Material

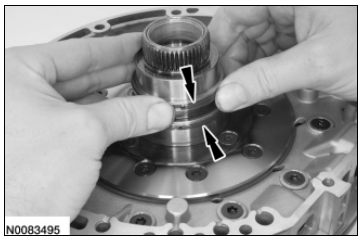


Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC	MERCON® LV

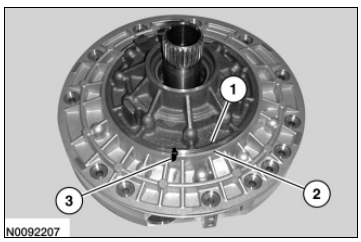


Item	Part Number	Description
1	7A248	Front pump oil seal
2	-	Pump body (part of 7A103)
3	7A248C	Pump body seal
4	7A103	Pump plate assembly
5	7A248A	Pump plate assembly seal
6	W707871-S300	Pump plate assembly-to-front pump body bolt (11 required)
7	7D019	Clutch support fluid seal
8	7L323	Front pump support seal

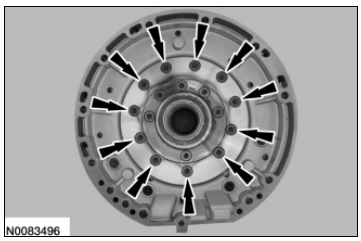
Disassembly



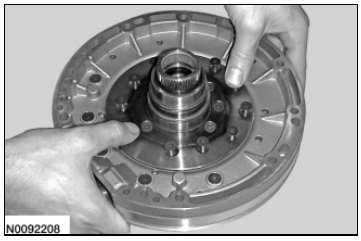
1. Remove the front pump washer.



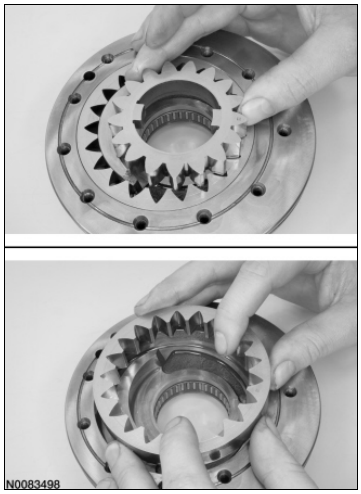
2. If the O-ring seal was not removed during disassembly, remove and discard the front pump O-ring seal from the pump assembly.



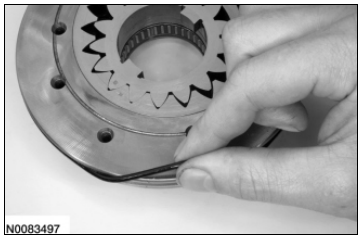
3. Remove and discard the front pump seal rings from the stator support.



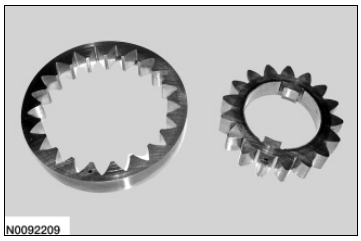
4. Index-mark the pump body to the pump plate assembly.
    1. Pump body
    2. Pump plate assembly
    3. Index mark



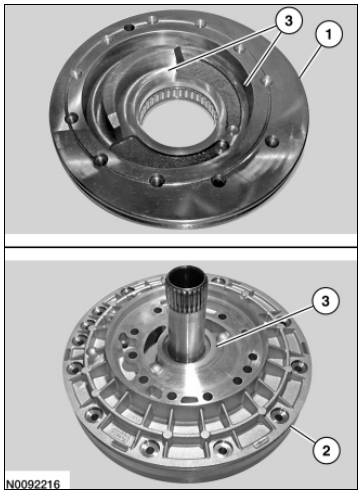
5. Remove the 11 pump plate assembly-to-pump body bolts.



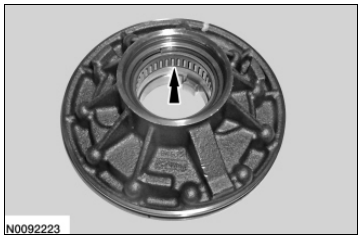
6. Push down on the loose pump plate assembly-to-pump body bolts to remove the pump body from the pump plate assembly and remove the 11 bolts.



7. Remove the fluid pump gears.

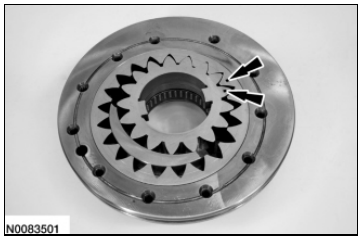


8. Remove and discard the pump body outer seal.

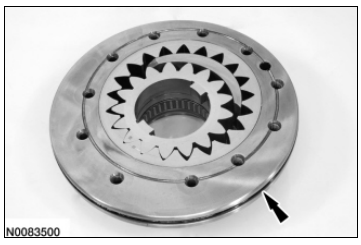


9. Inspect the inner and the outer pump gears for damage.
    - Clean all pump components in solvent.
    - Dry the parts with compressed air.
    - Inspect the pump gears, faces, gear teeth and mating surfaces for damage or scoring.
    - Install a new pump as necessary.

10. Inspect the pump body and pump plate thrust surfaces for damage or scoring.
    1. Pump body
    2. Pump plate assembly
    3. Pump gear thrust surfaces



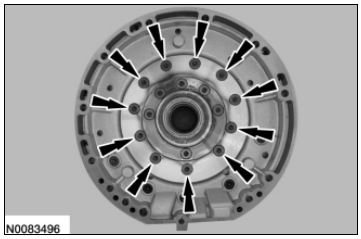
11. Inspect the torque converter hub bearing for damage or scoring. Make sure that the bearing rotates smoothly.



Assembly

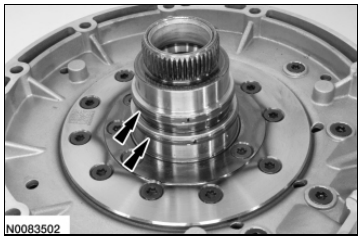
1. **NOTE:** Prior to installation, lightly lubricate the pump gears with clean automatic transmission fluid.

   Install the pump gears with the dot facing the pump plate assembly.

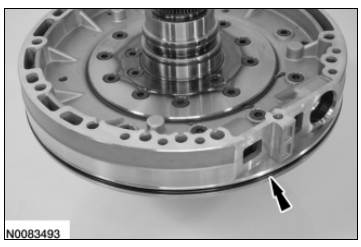


2. Install a new pump body outer seal.

3. Align the marks made during disassembly to correctly assemble the pump. Press the pump body into the pump plate assembly. Visually inspect the pump body-to-pump plate assembly bolt holes to be sure that the pump body and pump plate are correctly aligned.
   1. Pump body
   2. Pump plate assembly
   3. Pump gear thrust surfaces



4. Install the pump plate assembly-to-front pump body bolts.
    - Tighten to 15 Nm (133 lb-in).

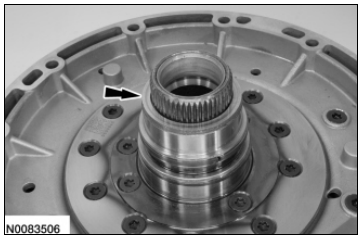


5. ***NOTICE:*** **Make sure that the seal ends of each seal ring are hooked together or fluid leakage can occur.**

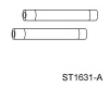
   Install the 2 front pump seal rings onto the stator support. Make sure the seals are fully seated in the stator support seal grooves and the seal ends are oriented 180 degrees apart.

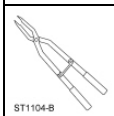
6. Install the pump outer diameter front pump O-ring seal.

7. Install a new front pump seal on the Fluid Pump Seal Installer 307-556.



8. Using the Fluid Pump Seal Installer 307-556, install the front pump seal.





9. **NOTE:** Lightly lubricate the thrust washer with petroleum jelly to hold it in place during assembly.

   Install the pump thrust washer.

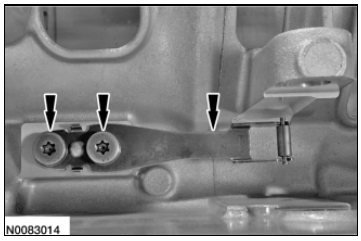
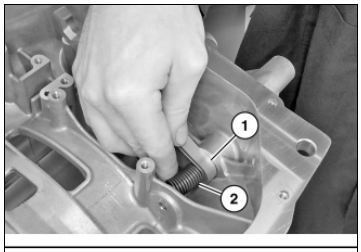
153	7A115	Manual valve detent lever assembly
154	7G100	Manual valve detent lever retaining pin
155	7H322	Thermal bypass valve
156	7F401	Front pump adapter seal
157	7A100	Main control assembly
158	-	Main control valve body assembly (part of 7A100)
159	7Z490	Main control valve body separator plate
160	-	Lower main control valve body (part of 7A100)
161	-	Transmission Control Module (TCM) (part of 7A100)
162	7G276	Bulkhead connector sleeve
163	-	Transmission fluid filter seal (part of 7A098)

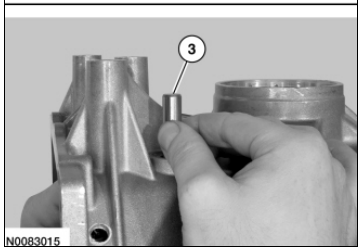


164	7A098	Transmission fluid filter
165	-	Transmission fluid pan magnet
166	7A191	Transmission fluid pan gasket
167	7A194	Transmission fluid pan
168	W500214-S437	Transmission fluid pan bolt

NOTE: Clutch plate quantity is model dependant based on engine displacement:

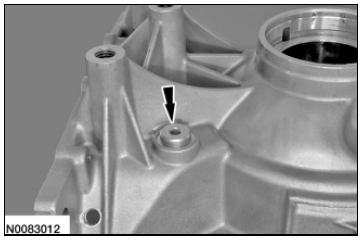


- 4.6L engine (Explorer, Mountaineer, Sport Trac, F-150)
  - ♦ Four friction plates
  - ♦ Five steel plates
- 5.4L engine (Expedition, Navigator, F-150)
  - ♦ Five friction plates
  - ♦ Six steel plates

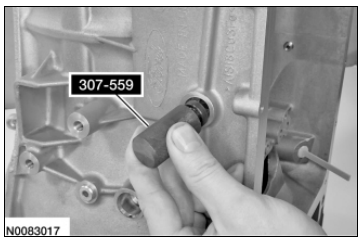


All vehicles

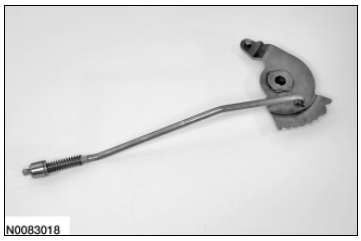
1. Install the detent spring and the 2 bolts.
   - Tighten to 12 Nm (106 lb-in).



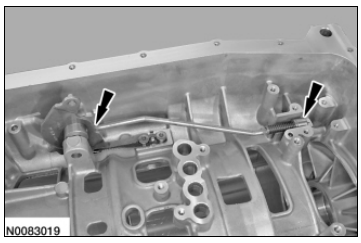
2. Position the park pawl and spring into the case and install the park pawl pin.
   1. Park pawl
   2. Park pawl spring
   3. Park pawl pin



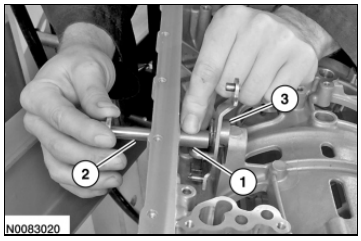
3. Install the park pawl pin bolt.
   - Tighten to 23 Nm (17 lb-ft).



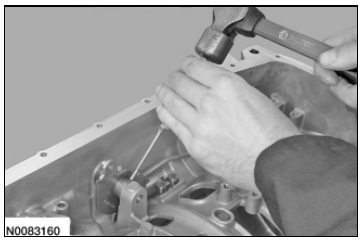
4. Install a new manual control lever shaft seal on the Shifter Fluid Seal Installer 307-559.



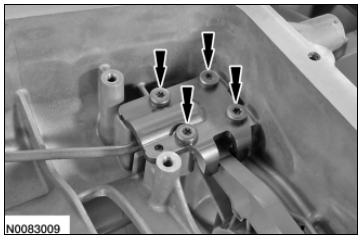
5. Using the Shifter Fluid Seal Installer 307-559, install the manual control lever shaft seal.



6. Assemble the manual valve detent lever assembly and park pawl actuator rod.

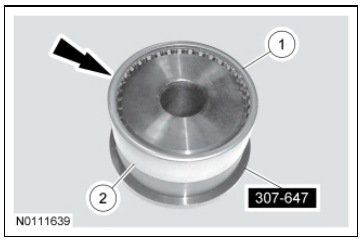


7. Position the detent lever and park pawl actuator rod in the transmission case.

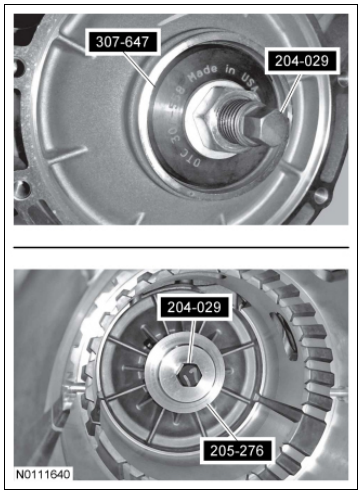


8. Position the manual control lever spacer in place and slide the manual control lever shaft in the case and into the manual lever detent plate.
    1. Manual control lever spacer
    2. Manual control lever shaft
    3. Manual control lever detent plate

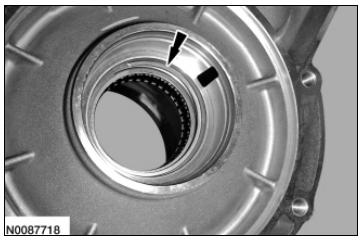
9. Align the roll pin hole in the manual control lever detent plate with the roll pin hole in the manual control lever shaft and install a new roll pin using a suitable tool.



10. Install the park rod actuating plate and the 4 bolts.
    - Tighten to 12 Nm (106 lb-in).

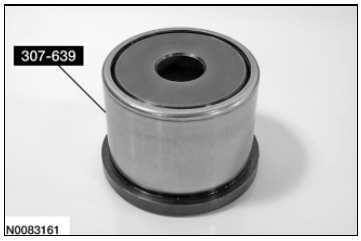


Four-Wheel Drive (4WD) vehicles

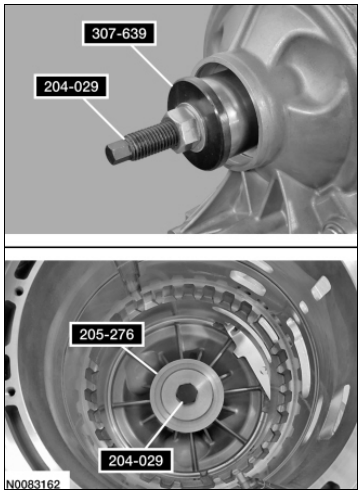


11. If removed, position a new bearing on Needle Bearing Installer 307-647. Install the bearing with the flat bearing surface facing down and the rounded bearing surface facing up so that when installed, the flat surface is on the snap ring side and the rounded surface is on the transmission case side.
    1. Rounded bearing surface facing up
    2. Flat bearing surface facing down

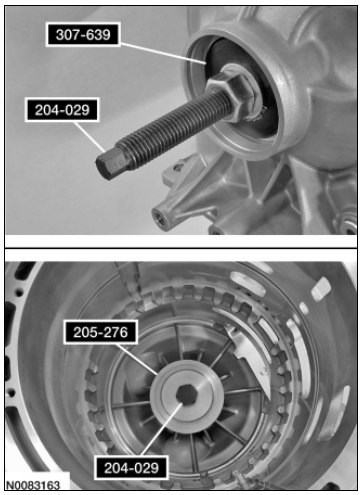
12. Using the Needle Bearing Installer 307-647, the Drawbar 204-029 and the Front Wheel Hub Oil Seal Installer 205-276, install the bearing in the transmission case.



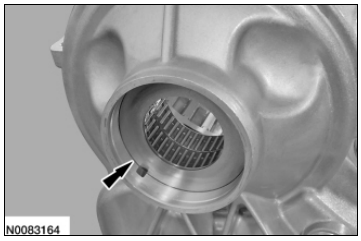
13. Install the snap ring.



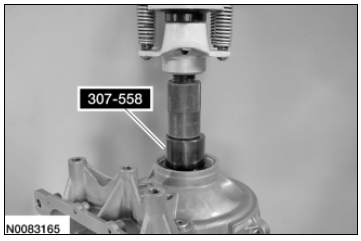
Rear Wheel Drive (RWD) vehicles



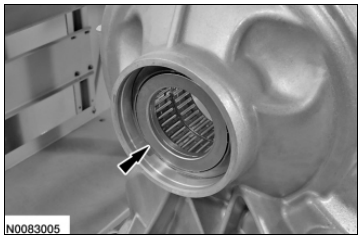
14. Install the bearing on the Rear Bearing Remover/Installer 307-639.



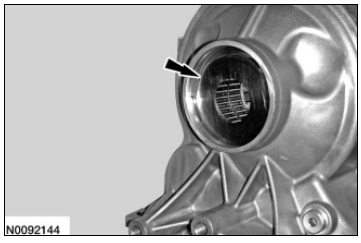
15. Assemble the Front Wheel Hub Oil Seal Installer 205-276 and the Rear Bearing Remover/Installer 307-639 on the Drawbar 204-029 and install the bearing in the transmission case.



16. Remove the Front Wheel Hub Oil Seal Installer 205-276, the Rear Bearing Remover/Installer 307-639 and the Drawbar 204-029.

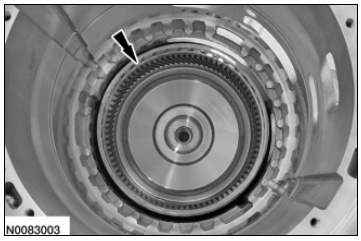


17. Position the thrust bearing spacer in place.



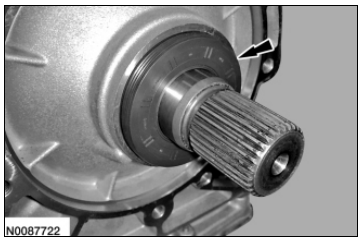
18. Using the Needle Bearing Installer 307-558 and a press, press the thrust bearing spacer in place.

19. Install the T12 thrust bearing.



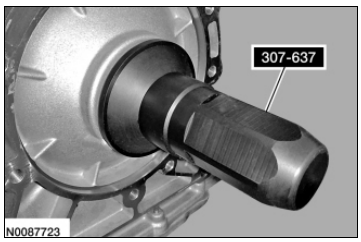
20. Install the slip plane washer.

All vehicles



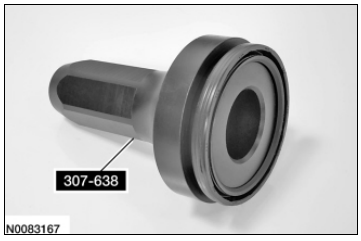
21. Place the transmission in the vertical position.

22. Install the T11 bearing, planet carrier hub and output shaft assembly.

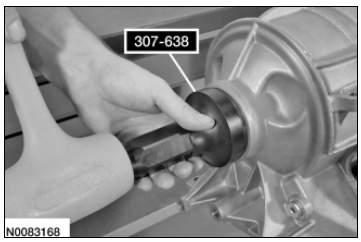


4WD vehicles

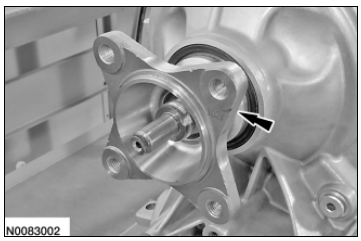
23. Position a new output shaft seal in place.



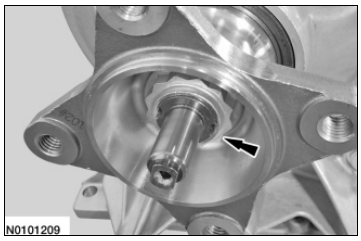
24. Using the Rear Seal 4X4 Installer 307-637, install the output shaft seal.



RWD vehicles

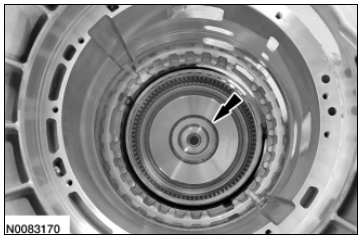


25. Position a new output shaft seal on the Rear Seal Installer 4X2 307-638.



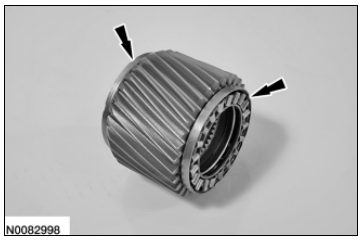
26. Using the Rear Seal Installer 4X2 307-638, install the output shaft seal.

27. Install the output shaft flange and the extension housing flange seal.



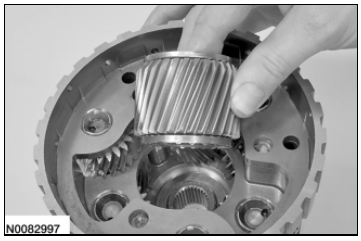
28. Loosely install a new output shaft flange nut.

All vehicles



29. Install the T10 bearing and silver shim (caged bearing) on the planet carrier hub and output shaft assembly.

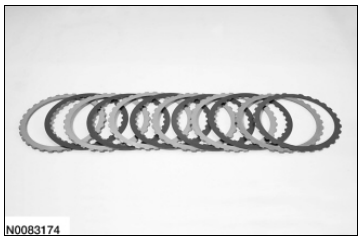
30. Install the T9 roller bearing race in the bottom of the carrier.



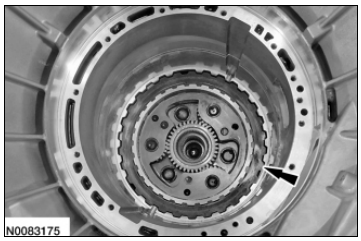
31. Install the top T8 and the bottom T9 roller bearings onto the sun gear.

32. **NOTE:** When installing the sun gear, make sure that the taper edge is facing up toward the torque converter housing.

    Install the sun gear into the planet assembly.

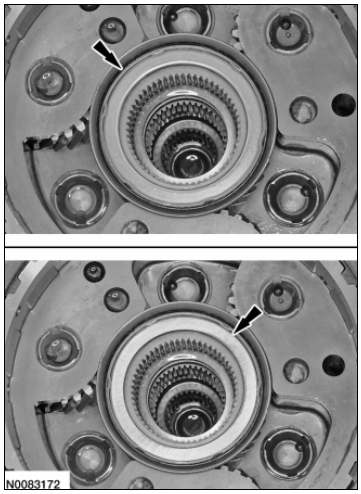


33. Install the low/reverse sun gear and race in the planet carrier.

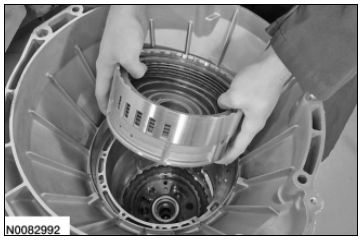


34. Install the planet carrier.

35. Soak the new low/reverse clutch plates in clean automatic transmission fluid.

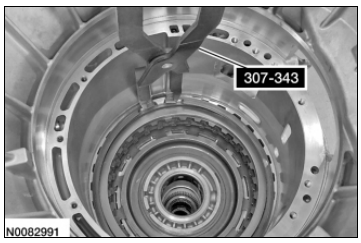


36. Install the low/reverse clutch plates, starting with the pressure plate and alternating between the friction and steel plates and ending with the wave spring plate on the top.



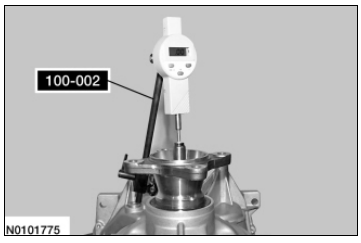
37. **NOTE:** Inspect and install a new thrust bearing as required.

    Install the low/reverse thrust bearing T7 and the select fit thrust gear shim.



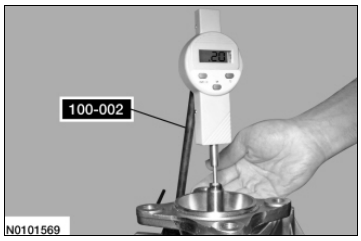
38. **NOTE:** Make sure that when installing the center support the feed holes on the center support are lined up with the feed holes in the case.

    Install the center support into the case.



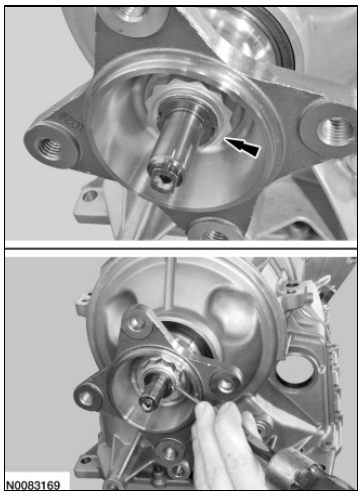
39. **NOTE:** Rotate the case to a horizontal position.

    Using the Retaining Ring Pliers 307-343, install the center support snap ring. Using a suitable tool, be sure the snap ring is fully seated.



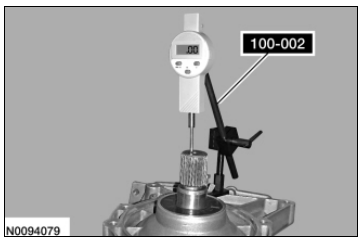
RWD vehicles

40. Install the Dial Indicator Gauge with Holding Fixture 100-002 on the transmission case and position the plunger on the output shaft flange.

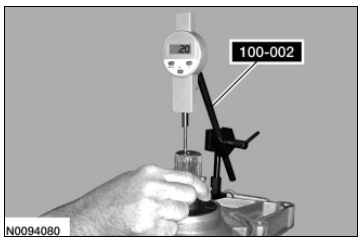


41. Using the Dial Indicator Gauge with Holding Fixture 100-002, lift up on the output shaft flange and record the reading. The reading should be within 0.15-0.35 mm (0.005-0.013 in).

- If the reading is not within the specification, install a different (either thinner or thicker) select fit thrust gear shim.

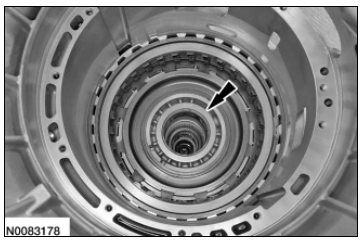


42. Tighten the output shaft flange nut.
    - Tighten to 80 Nm (59 lb-ft).
    - After installing the new output shaft flange nut, stake the slots to prevent it from coming loose.

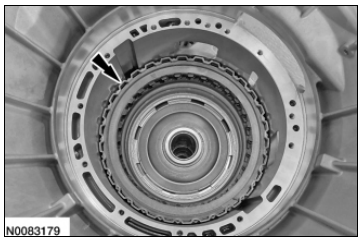


4WD vehicles

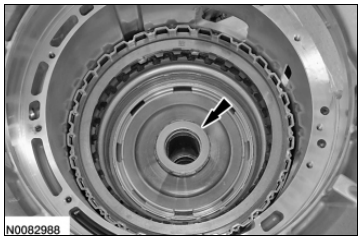
43. Install the Dial Indicator Gauge with Holding Fixture 100-002 on the transmission case and position the plunger on the output shaft.



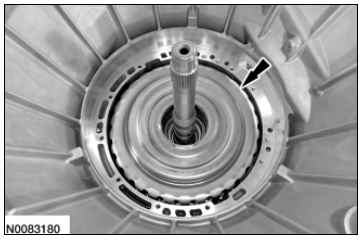
44. Using the Dial Indicator Gauge with Holding Fixture 100-002, lift up on the output shaft and record the reading. The reading should be within 0.15-0.35 mm (0.005-0.013 in).
    - If the reading is not within the specification, install a different (either thinner or thicker) select fit thrust gear shim.



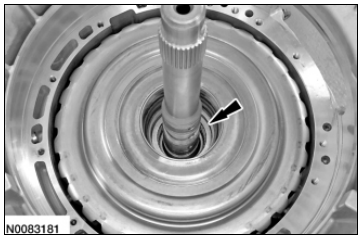
All vehicles



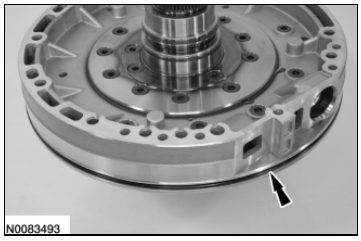
45. Install the T6 thrust bearing.



46. Install the direct clutch drum.



47. Install the T5 bearing on the direct clutch assembly.

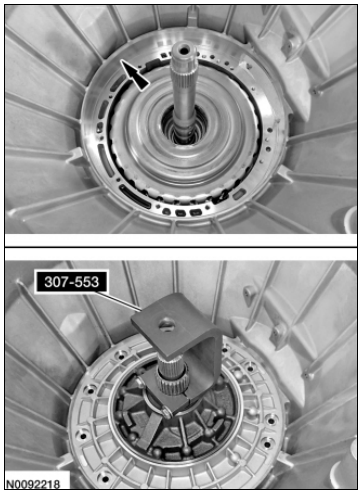


48. Install the forward and overdrive clutch assembly.

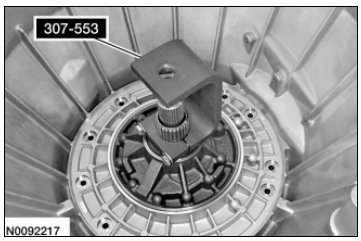
49. Install the selective pump washer.

50. If the front pump assembly was not disassembled and assembled, install a new front pump outer diameter O-ring seal and lubricate it with petroleum jelly.

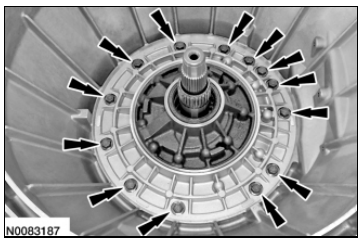
51. Install a new front pump seal on the Fluid Pump Seal Installer 307-556.



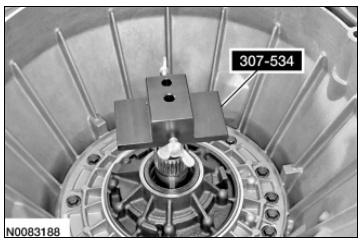
52. Using the Fluid Pump Seal Installer 307-556, install the front pump seal.



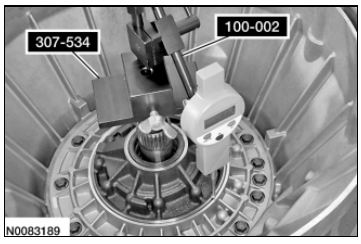
53. Install the Transmission Fluid Pump Remover 307-553 on the front pump.



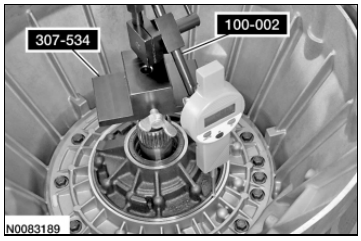
54. Lubricate the transmission case pump bore with petroleum jelly. Using the Transmission Fluid Pump Remover 307-553, position the pump assembly in the case and rotate the pump to insert the pump splines into the front planetary sun gear. Rotate the pump to align the pump-to-case bolts and push the pump into the case.



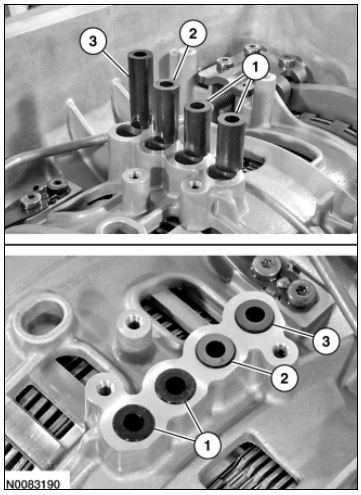
55. Remove the Transmission Fluid Pump Remover 307-553.



56. Install new front pump bolts with new washers. Tighten the bolts in a crisscross pattern.
    - Tighten to 10 Nm (89 lb-in).

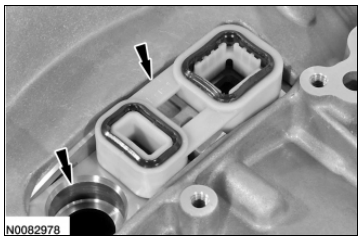


57. Install the Transmission End Play Gauge 307-534 on the input shaft to measure the end play.
    - Tighten the wing nut.

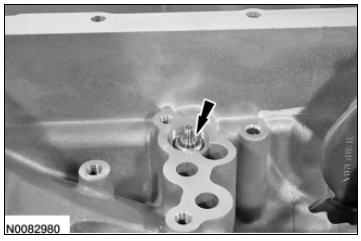


58. Install the Dial Indicator Gauge with Holding Fixture 100-002 on the Transmission End Play Gauge 307-534.
    - Push down on the Transmission End Play Gauge 307-534 and zero out the Dial Indicator Gauge.
    - Lift up on the Transmission End Play Gauge 307-534 and record the measurement on the Dial Indicator Gauge. The measurement should be between 0.2-0.4 mm (0.008-0.015 in). If the measurement is not within specification, install a new selective front pump washer.
    - Measure the original washer, install a thinner or a thicker washer to achieve the correct measurement.

59. Remove the Dial Indicator Gauge with Holding Fixture 100-002 and the Transmission End Play Gauge 307-534.



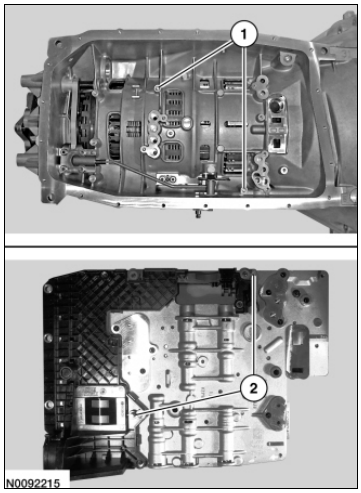
60. Install the 4 rubber feed tubes for the center support.
    1. Black feed tubes
    2. Green feed tube
    3. Blue feed tube



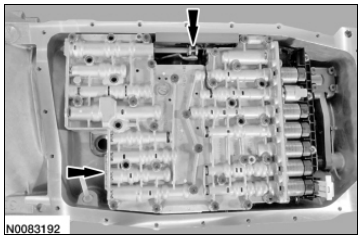
61. **NOTE:** Make sure that the fluid filter seal has been removed. If it has not, use a suitable pick and remove the seal.

    NOTE: Add 0.118L (4 oz) of clean transmission fluid to prime the pump.

    Install the rubber adapter and prime the fluid pump.



62. Install the thermal bypass valve into the case.



63. Align the mechatronic assembly guide pins in the alignment holes in the transmission case and position the mechatronic assembly in place.
    1. Alignment holes

2. Guide pins

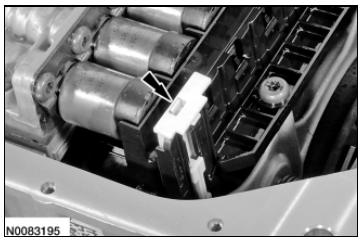
64. **NOTE:** The mechatronic assembly will not lay flush on the case, this is a normal condition with the rubber feed tubes, the bolts will pull the mechatronic assembly down.

    Slightly lift the mechatronic assembly and align the manual valve in the manual valve linkage and position the mechatronic assembly in place.

65. ***NOTICE:*** **Do not touch the electrical connector pins or the exposed solenoid tabs on the Transmission Control Module (TCM). Electrostatic discharge may occur and may cause damage to the mechatronic unit.**

    Install the mechatronic assembly bolts and tighten the bolts in the sequence shown.

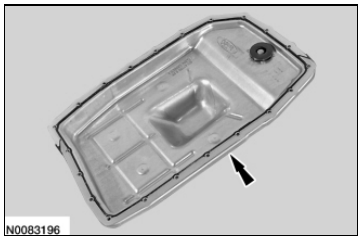
    - Tighten to 8 Nm (71 lb-in).



66. ***NOTICE:*** **Do not touch the electrical connector pins or the exposed solenoid tabs on the Transmission Control Module (TCM). Electrostatic discharge may occur and may cause damage to the mechatronic unit.**

    With the release tab up and unlocked, push the outer shell of the bulkhead electrical connector into the transmission. Make sure that the bulkhead connector is fully seated into the TCM .

67. Press down on the tab and lock the outer shell of the bulkhead electrical connector in place. Make sure that the locking tab is securely locked.



68. Install a new transmission fluid filter.

69. **NOTE:** The fluid pan gasket can be reused if not damaged.

    Install a new transmission fluid pan gasket if required.

70. Install the fluid pan and tighten the bolts in a crisscross pattern.
    - Tighten to 12 Nm (106 lb-in).

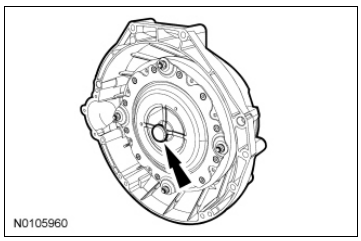
71. Using the Torque Converter Handle 307-091, install the torque converter. Remove the Torque Converter Handle 307-091.

307-091
N0083197

Transmission - Four Wheel Drive (4WD)

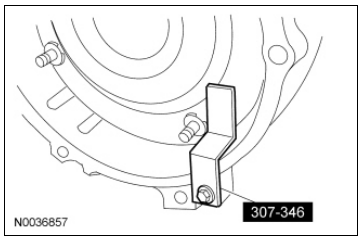
Special Tool(s)

 ST1636-A	Retainer, Torque Converter 307-346 (T97T-7902-A)



Material

Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC	MERCON® LV
Multi-Purpose Grease Motorcraft® XL-5 (aerosol) and/or CRC® SL3151	ESB-M1C93-B

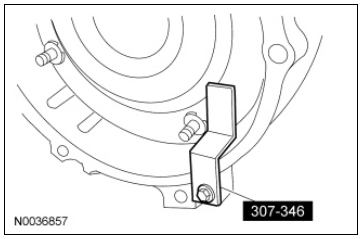


Installation

NOTICE: **Prior to installation of the transmission, the torque converter pilot hub must be lubricated with multi-purpose grease or damage to the torque converter or the engine crankshaft can occur.**

1. Lubricate the torque converter pilot hub with multi-purpose grease.

2. Install the Torque Converter Retainer.



3. ***NOTICE:*** **The converter housing is piloted into position by dowels in the rear of the engine block. The torque converter must rest squarely against the flexplate. This indicates that the converter pilot is not binding in the engine crankshaft.**

   NOTE: Make sure the transmission jack makes contact on the outer ribs of the transmission fluid pan.

NOTE: Make sure the transmission is securely fastened to the transmission jack.

Position and secure the transmission on the high-lift transmission jack. Raise and position the transmission into the vehicle.

4. Remove the Torque Converter Retainer.

5. **NOTE:** Make sure the torque converter is fully seated in the transmission before aligning the transmission to the engine.

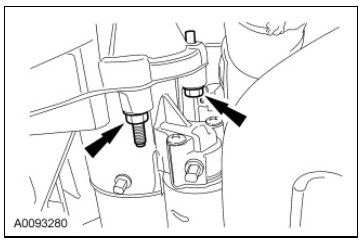
   With the transmission in a horizontal position, move it toward the engine. Align the orange balancing marks between the torque converter studs and the flexplate bolt holes.

6. **NOTE:** Install the transmission-to-engine bolts in their correct locations.

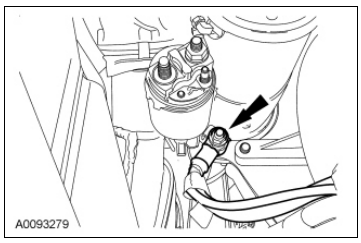
   NOTE: The top 2 transmission-to-engine bolts need to be installed prior to installing the rest of the bolts.

   Install 6 of the remaining 7 transmission-to-engine bolts.

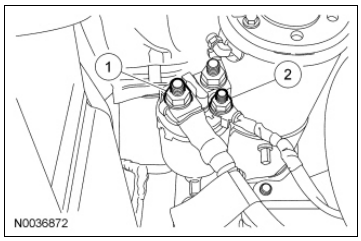
   - Tighten to 48 Nm (35 lb-ft).



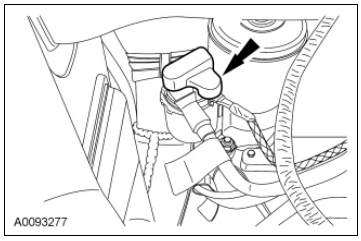
7. Connect the transmission vehicle harness connector by pushing it in and twisting the outer shell to lock it in place.



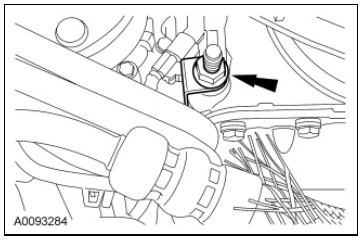
8. Attach the transmission vehicle harness to the top of the transmission.



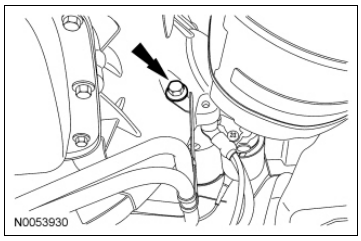
9. Install the starter motor and the 3 starter motor bolts.
   - Tighten to 26 Nm (19 lb-ft).



10. Install the ground wire on the stud and install the ground wire nut.
    - Tighten to 23 Nm (17 lb-ft).

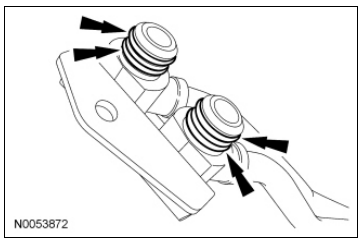


11. Install the starter motor electrical connectors.
    1. Tighten to 12 Nm (106 lb-in).
    2. Tighten to 6 Nm (53 lb-in).

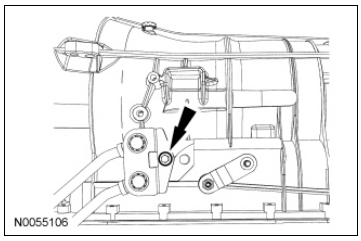


12. Install the plastic starter motor electrical connector cap.

13. Position the transmission fluid cooler tubes in place and install the transmission fluid cooler tube bracket front stud bolt nut.
    - Tighten to 27 Nm (20 lb-ft).



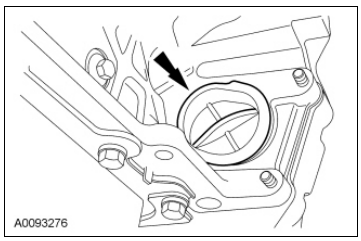
14. Align the transmission fluid cooler tube bracket and install the remaining transmission-to-engine bolts.
    - Tighten to 48 Nm (35 lb-ft).



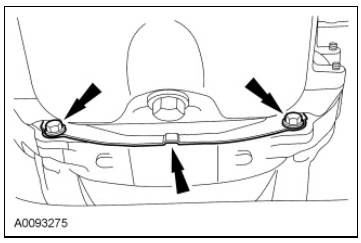
15. **NOTE:** Inspect the case and make sure the old transmission fluid cooler tube O-rings are not stuck in the case.

    NOTE: Install new transmission fluid cooler tube O-rings on the ends of the transmission fluid cooler tubes prior to installing.

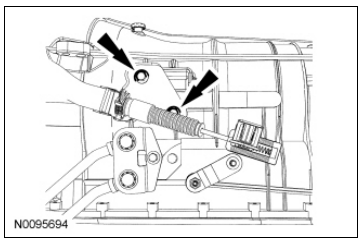
    Install new transmission fluid cooler tube O-rings on the transmission fluid cooler tubes.



16. Install the transmission fluid cooler tube bracket bolt.
    - Tighten to 23 Nm (17 lb-ft).



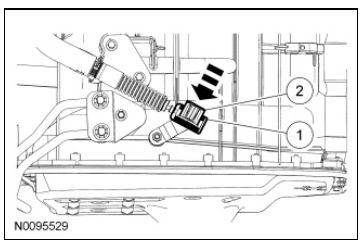
17. Install 4 new flexplate-to-torque converter nuts.
    - Tighten to 35 Nm (26 lb-ft).



18. Install the rubber access plug.

19. Install the flexplate inspection cover and the flexplate inspection cover bolts.
    - Tighten to 35 Nm (26 lb-ft).

20. Install the selector lever cable bracket and selector lever cable bracket bolts.
    - Tighten to 48 Nm (35 lb-ft).



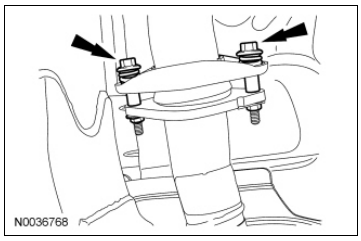
21. ***NOTICE:*** **To prevent selector lever cable damage, do not apply force to the selector lever cable between the manual control lever and the selector lever cable bracket.**

    NOTE: When installing the selector lever cable end, make sure that the selector lever cable end is correctly installed onto the manual control lever. Pull back on the selector lever cable end to make sure the selector lever cable end is securely installed onto the manual control lever.

    With the manual lever in NEUTRAL, connect the selector lever cable onto the manual lever and move the locking tab down.

    1. Selector lever cable end
    2. Locking tab
    - Listen for the audible click.
    - Pull back on the selector lever cable to make sure that it is securely installed.

22. Install selector lever cable heat shield.



23. Install the fuel line bracket and the rear fuel line bracket bolt.
    - Tighten to 25 Nm (18 lb-ft).

24. ***NOTICE:*** **Prior to installation, inspect theHeated Oxygen Sensor (HO2S) and theCatalyst Monitor Sensor (CMS) wiring harness for damage.**

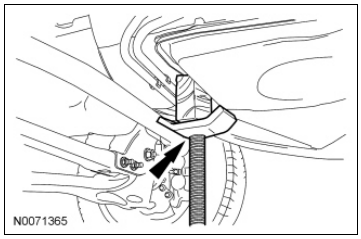
    Position the dual catalytic converter Y-pipe in place and install the dual catalytic converter Y-pipe bolts and new nuts.

    - Tighten to 40 Nm (30 lb-ft).

25. **NOTE:** LH shown, RH similar.

    Install new LH and RH exhaust flange nuts.

    - Tighten to 40 Nm (30 lb-ft).



26. **NOTE:** LH shown, RH similar.

    Connect the RH and LH HO2S connectors and the CMS connectors.

27. Install the transmission support crossmember. For additional information, refer to Section 502-02 .

28. Position a jackstand under the transmission, and remove the transmission jack.

29. Install the transfer case. For additional information, refer to Section 308-07B .

30. Connect the battery ground cable. For additional information, refer to Section 414-01 .

31. Verify that the selector lever cable is correctly adjusted. For additional information, refer to Section 307-05 .

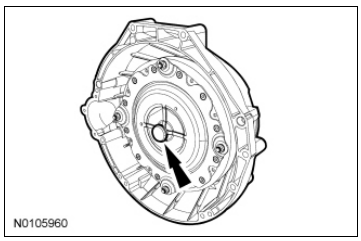
32. Restore the module configuration. Carry out the module configuration restore steps of the Programmable Module Installation (PMI) procedure for the PCM. For additional information, refer to Section 418-01 .

33. Fill the transmission with clean transmission fluid. For additional information, refer to Transmission Fluid Drain and Refill in this section.

Transmission - Rear Wheel Drive (RWD)

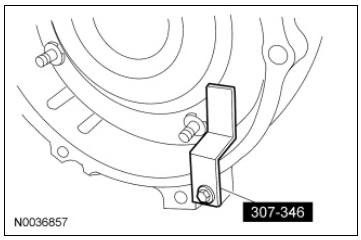
Special Tool(s)

 ST1636-A	Retainer, Torque Converter 307-346 (T97T-7902-A)



Material

Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC	MERCON® LV
Multi-Purpose Grease Motorcraft® XL-5 (aerosol) and/or CRC® SL3151	ESB-M1C93-B

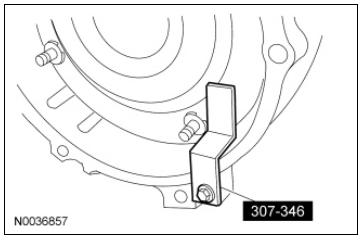


Installation

NOTICE: **Prior to installation of the transmission, the torque converter pilot hub must be lubricated with multi-purpose grease or damage to the torque converter or the engine crankshaft can occur.**

1. Lubricate the torque converter pilot hub with multi-purpose grease.

2. Install the Torque Converter Retainer.



3. ***NOTICE:*** **The converter housing is piloted into position by dowels in the rear of the engine block. The torque converter must rest squarely against the flexplate. This indicates that the converter pilot is not binding in the engine crankshaft.**

   NOTE: Make sure the transmission jack makes contact on the outer ribs of the transmission fluid pan.

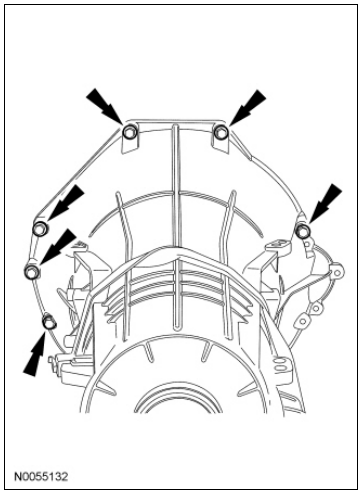
NOTE: Make sure the transmission is securely fastened to the transmission jack.

Position and secure the transmission on the high-lift transmission jack. Raise and position the transmission into the vehicle.

4. Remove the Torque Converter Retainer.

5. **NOTE:** Make sure the torque converter is fully seated in the transmission before aligning the transmission to the engine.

   With the transmission in a horizontal position, move it toward the engine. Align the orange balancing marks between the torque converter studs and the flexplate bolt holes.



6. **NOTE:** Install the transmission case bolts in their correct locations noted during removal.

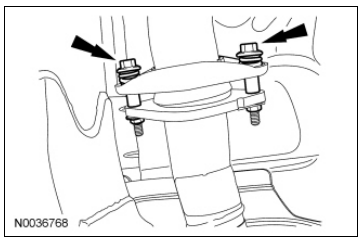
   NOTE: The top 2 transmission case bolts need to be installed prior to installing the remaining bolts.

   NOTE: The top left bolt is inserted through the fuel line bracket first, then through the transmission case.

   Install 6 of the remaining 7 transmission-to-engine bolts.

   - Tighten to 48 Nm (35 lb-ft).

7. Connect the transmission vehicle harness connector by pushing it in and twisting the outer shell to lock it in place.



8. Attach the transmission vehicle harness to the top of the transmission.

9. ***NOTICE:*** **Prior to installation, inspect theHeated Oxygen Sensor (HO2S) and theCatalyst Monitor Sensor (CMS) wiring harness for damage.**

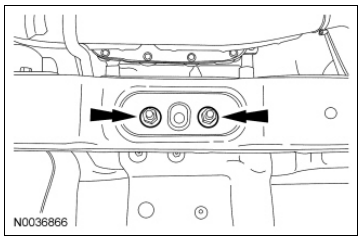
   Position the dual catalytic converter Y-pipe in place and install the 2 dual catalytic converter Y-pipe bolts and new nuts.

   - Tighten to 40 Nm (30 lb-ft).

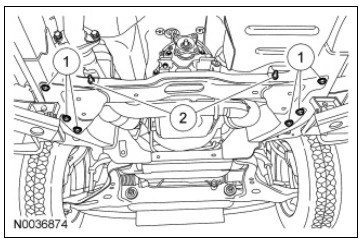
10. **NOTE:** LH shown, RH similar.

    Install new LH and RH exhaust flange nuts.

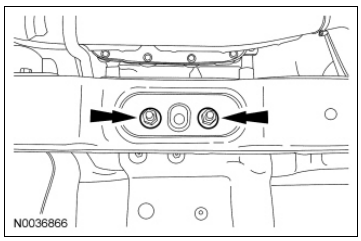
    - Tighten to 40 Nm (30 lb-ft).



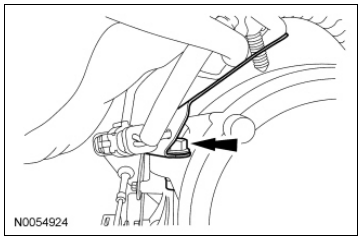
11. Install the transmission insulator and retainer and the 3 transmission insulator and retainer bolts.



- Tighten to 90 Nm (66 lb-ft).

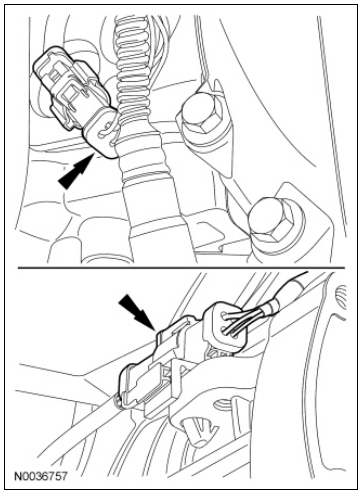


12. Position the crossmember in place and loosely install the transmission insulator and retainer nuts.

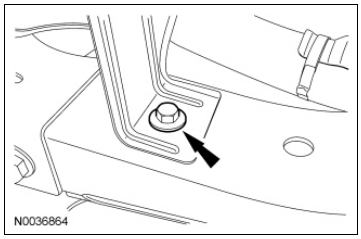


13. Install the 8 transmission crossmember bolts and nuts.
    1. Tighten bolts to 80 Nm (59 lb-ft).
    2. Tighten nuts to 143 Nm (105 lb-ft).

14. Tighten the transmission insulator and retainer crossmember nuts.
    - Tighten to 90 Nm (66 lb-ft).

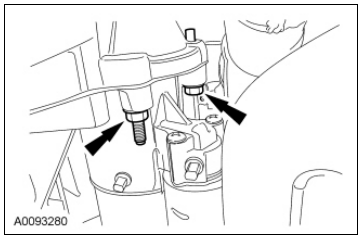


15. Install the fuel line bracket and rear fuel line bracket bolt.
    - Tighten to 25 Nm (18 lb-ft).

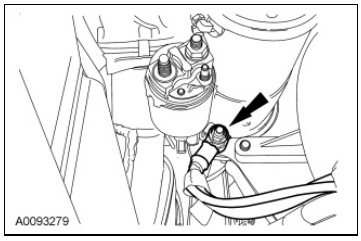


16. **NOTE:** LH shown, RH similar.

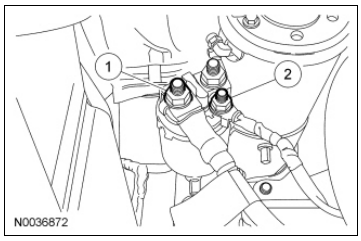
    Connect the RH and LH HO2S connectors and the CMS connectors.



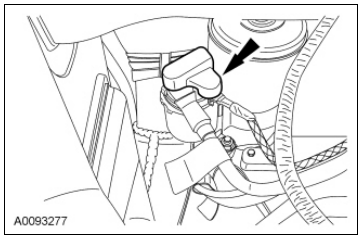
17. Install the LH exhaust heat shield bolt.
    - Tighten to 15 Nm (133 lb-in).



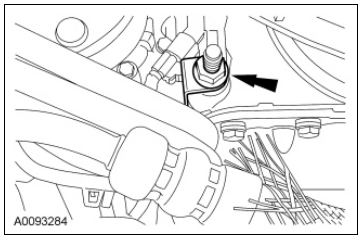
18. If equipped, install the RH exhaust heat shield.
    - Tighten to 15 Nm (133 lb-in).



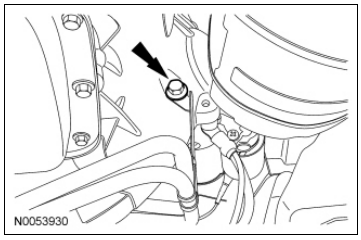
19. Position the starter motor in place and install the 3 starter motor bolts.
    - Tighten to 26 Nm (19 lb-ft).



20. Install the ground wire on the stud and install the ground wire nut.
    - Tighten to 23 Nm (17 lb-ft).

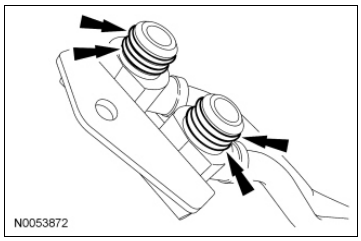


21. Install the starter motor electrical connectors.
    1. Tighten to 12 Nm (106 lb-in).
    2. Tighten to 6 Nm (53 lb-in).

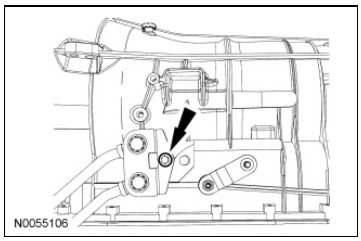


22. Install the plastic starter motor electrical connector cap.

23. Position the transmission fluid cooler tubes in place and install the transmission fluid cooler tube bracket nut.
    - Tighten to 27 Nm (20 lb-ft).

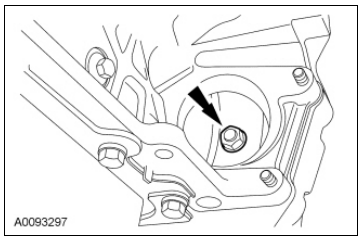


24. Align the transmission fluid cooler tube bracket and install the remaining transmission-to-engine bolt.
    - Tighten to 48 Nm (35 lb-ft).

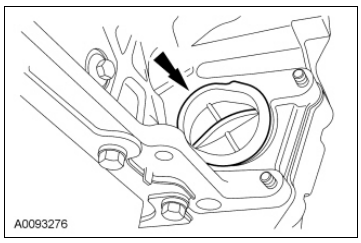


25. **NOTE:** Inspect the case and make sure the old transmission fluid cooler tube O-rings are not stuck in the case.

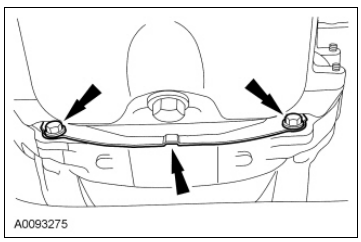
NOTE: Install new transmission fluid cooler tube O-rings on the ends of the transmission fluid cooler tubes prior to installing.



Install new transmission fluid cooler tube O-rings on the transmission fluid cooler tubes.

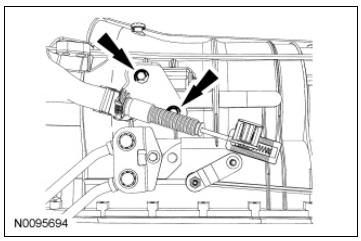


26. Install the transmission fluid cooler tubes and the transmission fluid cooler tube bracket bolt.
    - Tighten to 23 Nm (17 lb-ft).



27. Install 4 new flexplate-to-torque converter nuts.
    - Tighten to 35 Nm (26 lb-ft).

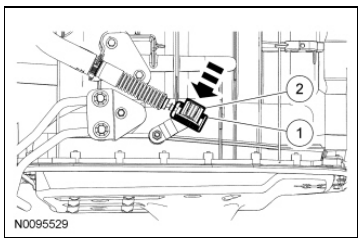
28. Install the rubber access plug.



29. Install the flexplate inspection cover and the flexplate inspection cover bolts.
    - Tighten to 35 Nm (26 lb-ft).

30. Install the selector lever cable bracket and selector lever cable bracket bolts.

- Tighten to 48 Nm (35 lb-ft).



31. ***NOTICE:*** **To prevent selector lever cable damage, do not apply force to the selector lever cable between the manual control lever and the selector lever cable bracket.**

    NOTE: When installing the selector lever cable end, make sure that the selector lever cable end is correctly installed onto the manual control lever. Pull back on the selector lever cable end to make sure the selector lever cable end is securely installed onto the manual control lever.

    With the manual lever in NEUTRAL, connect the selector lever cable onto the manual lever and move the locking tab down.

    1. Selector lever cable end
    2. Locking tab
    - Listen for the audible click.
    - Pull back on the selector lever cable to make sure that it is securely installed.

32. Install the selector lever cable heat shield.

33. Install the driveshaft. For additional information, refer to Section 205-01 .

34. Connect the battery ground cable. For additional information, refer to Section 414-01 .

35. Verify that the selector lever cable is correctly adjusted. For additional information, refer to Section 307-05 .

36. Restore the module configuration. Carry out the module configuration restore steps of the Programmable Module Installation (PMI) procedure for the PCM. For additional information, refer to Section 418-01 .

37. Fill the transmission with clean transmission fluid. For additional information, refer to Transmission Fluid Drain and Refill in this section.

Material

Item	Specification	Fill Capacity
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V	11.7L (12.7 qt) [a]
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLV	MERCON® LV	11.45L (12.10 qt) [b]
Threadlock and Sealer TA-25	WSK-M2G351-A5	-

[a] 5R55S Transmission
[b] 6R80 Transmission

General Specifications

Item	Specification
Transmission Fluid	
NOTICE: The use of any transmission fluids other than specified may result in transmission damage or failure. • Normal maintenance: ♦ Transmission fluid change not necessary, filled for life. • Severe duty maintenance: ♦ 5R55S change	

	the transmission fluid at 48,000 km (30,000 mi) intervals. ♦ 6R80 change the transmission fluid at 240,000 km (150,000 mi) intervals.
Transmission Fluid Capacity	
NOTE: Approximate dry capacity, includes transmission fluid cooler and transmission fluid cooler tubes. Transmission fluid level procedures in this section should be used to determine actual transmission fluid requirements and transmission fluid specification. DO NOT OVERFILL. If it is necessary to add or change transmission fluid, use only transmission fluid that is recommended.	

Torque Specifications

Description	Nm	lb-ft	lb-in

Transmission fluid cooler bolts	7	-	62
Transmission fluid cooler tube bracket assembly-to-case bolt (6R80)	25	18	-
Transmission fluid cooler tube bracket-to-engine nut (5R55S)	25	18	-
Transmission fluid cooler tube bracket-to-engine nut (6R680)	12	-	106
Transmission fluid cooler tube case fitting (5R55S)	56	41	-
Transmission fluid cooler tube nut-to-case fitting (5R55S)	40	30	-
U-joint strap bolts	19	-	168

Transmission Cooling

Vehicles equipped with automatic transmissions have an auxiliary transmission fluid cooler which is mounted in front of the radiator and the A/C condenser. In operation, transmission fluid travels from the transmission to the auxiliary transmission fluid cooler then back to the transmission. The auxiliary transmission fluid cooler transfers heat from the transmission fluid to the outside air.

Transmission Cooling

Inspection and Verification

NOTICE: **When a transmission has been disassembled to install new parts or a new or remanufactured transmission has been installed, the transmission fluid cooler and/or auxiliary transmission fluid cooler and the transmission fluid cooler tubes must be cleaned and backflushed to keep contaminants from entering the transmission, causing internal damage.**

NOTE: Backflushing and cleaning the transmission fluid cooler tubes, along with following all the normal cleaning and inspection procedures during disassembly and assembly, will keep contaminants from entering the transmission, eliminating a repeat repair. For additional information, refer to Section 307-01A for 5R55S or Section 307-01B for 6R80, Transmission Fluid Cooler Backflushing and Cleaning.

When internal wear or damage has occurred in the transmission, metal particles, clutch plate material or band material may have been carried into the torque converter and transmission fluid cooler. These contaminants are a major cause of recurring transmission failure and must be removed from the transmission fluid cooling system before the transmission is put back into use. Install a new transmission fluid cooler and/or auxiliary transmission fluid cooler and backflush the transmission fluid cooler tubes.

When transmission fluid leakage is found in the transmission fluid cooler, install a new transmission fluid cooler.

If the fault is not visually evident, GO to Symptom Chart - Transmission Cooling or GO to Symptom Chart - NVH .

Symptom Chart - Transmission Cooling

Symptom Chart - Transmission Cooling

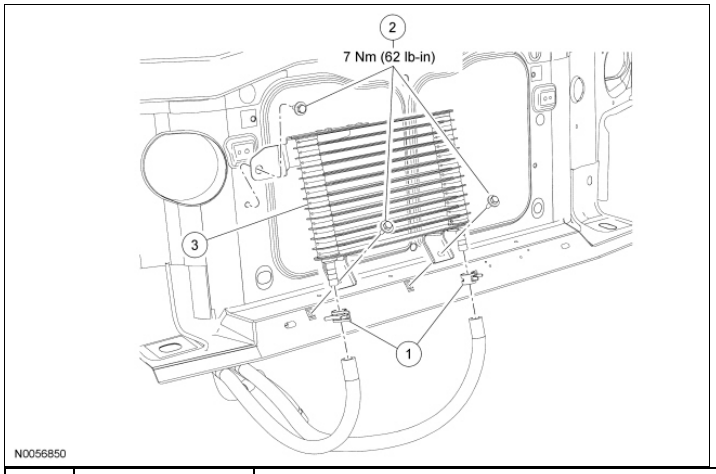
Symptom Chart - NVH

Symptom Chart - NVH
NOTE: NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to Section 100-04 . Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to Section 100-04 for the next likely system and continue diagnosis.

ConditionPossible SourcesAction

- Vibration - a high frequency (20-80 Hz) that is felt through the seat or selector lever. Changes with engine speed

- Transmission fluid cooler tubes grounded out
- CHECK the transmission fluid cooler tubes. REPAIR as necessary.



Transmission Fluid Cooler Flow Test - 5R55S

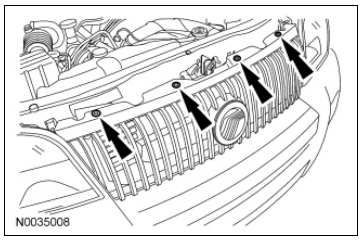
1. Refer to the Transmission Fluid Cooler Flow Test in Section 307-01A .

Auxiliary Transmission Fluid Cooler

Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLV	MERCON® LV

Item	Part Number	Description
1	-	Transmission fluid cooler hose constant tension clamps
2	-	Transmission fluid cooler bolts
3	7A095	Transmission fluid cooler



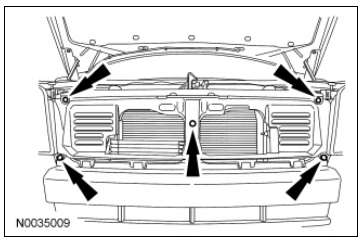
Removal

NOTE: The 5R55S uses MERCON® V Automatic Transmission Fluid.

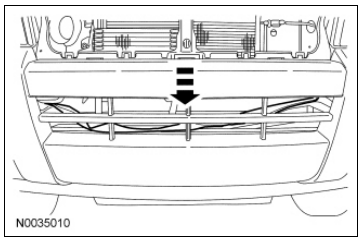
The 6R80 uses Motorcraft MERCON® LV Automatic Transmission Fluid.

Mountaineer

1. Remove the grille fasteners and the grille. For additional information, refer to Section 501-08 .

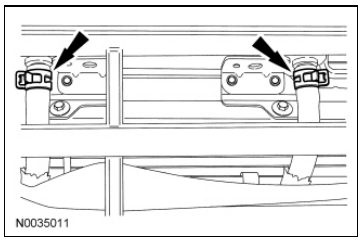


Explorer

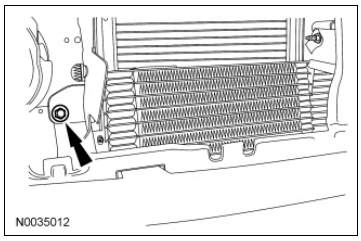


2. Remove the front bumper cover. For additional information, refer to Section 501-19 .

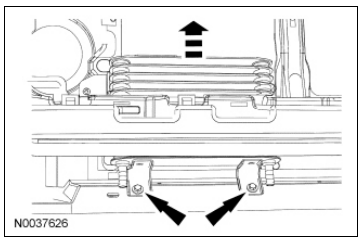
All vehicles



3. Remove the 5 bolts and remove the inner grille air deflector.

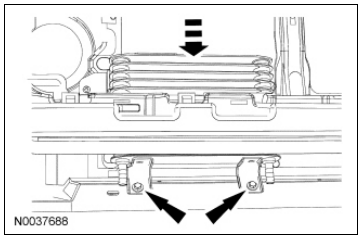


4. Push the lower air deflector down past the transmission fluid cooler.

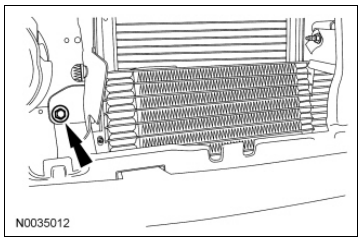


5. Disconnect the transmission fluid cooler hoses.
   - Remove and discard the transmission fluid cooler hoses and the clamps.

6. Remove the upper transmission fluid cooler bolt.



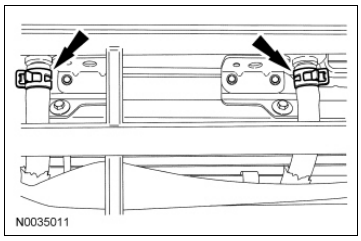
7. Remove the lower transmission fluid cooler bolts and the transmission fluid cooler.



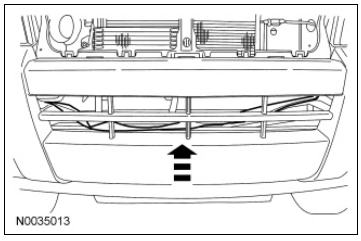
Installation

All vehicles

1. Install the transmission fluid cooler and the lower transmission fluid cooler bolts.
   - Tighten to 7 Nm (62 lb-in).



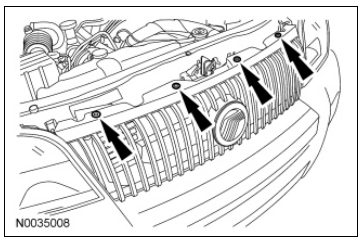
2. Install the upper transmission fluid cooler bolt.
   - Tighten to 7 Nm (62 lb-in).



3. **NOTE:** Clean the transmission cooler tube stems with degreaser prior to installing the hoses.

   Using new hoses and clamps, install the new transmission fluid cooler hoses.

4. Push the lower air deflector back into place.

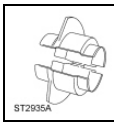


5. Install the inner grille air deflector.

Mountaineer

6. Install the grille and the fasteners. For additional information, refer to Section 501-08 .

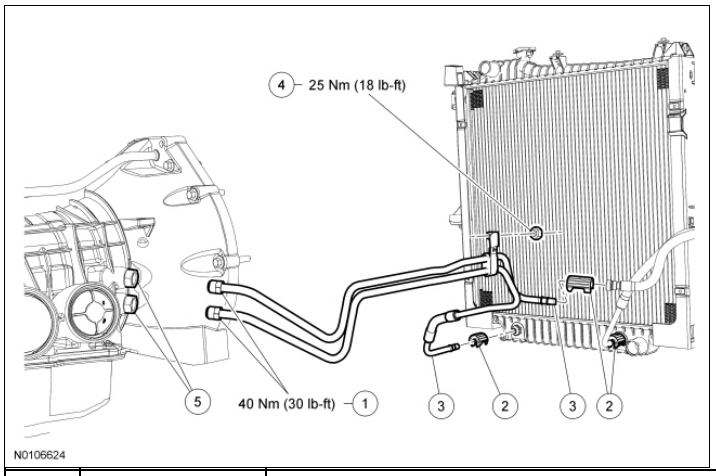
Explorer



7. Install the bumper cover. For additional information, refer to Section 501-19 .

All vehicles

8. Fill the transmission fluid to the correct level using clean transmission fluid and inspect the leaks. For additional information, refer to Section 307-01A for 5R55S or Section 307-01B for 6R80.



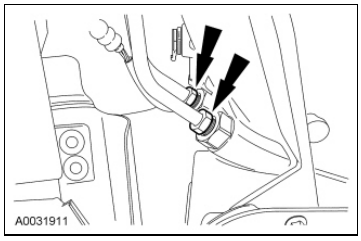
Transmission Fluid Cooler Tubes - 5R55S

Special Tool(s)

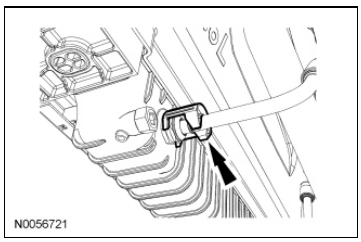
 ST2935A	Disconnect Tool, Transmission Cooler Line 307-569

Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V

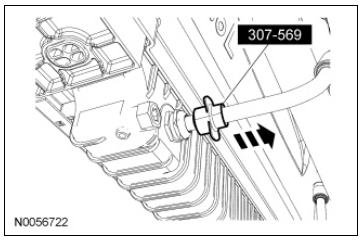


Item	Part Number	Description
1	-	Transmission fluid cooler tube nut-to-case fitting
2	7Z465	Transmission fluid cooler tube secondary latches
3	7R081	Transmission fluid cooler tubes
4	-	Transmission fluid cooler tube bracket-to-engine nut
5	7D273	Transmission fluid cooler tube nut-to-case fittings

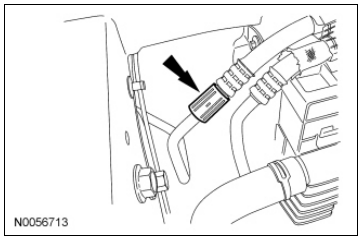


Removal

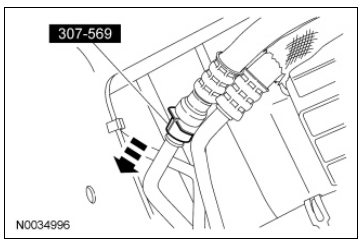
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .



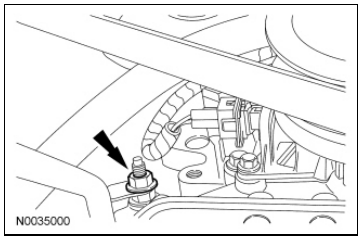
2. Using a backup wrench to hold the case fitting securely, disconnect the transmission fluid cooler tube nut-to-case fittings.



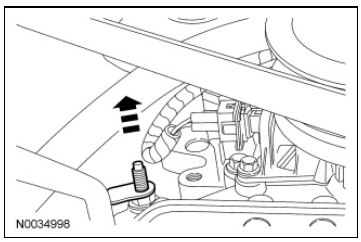
3. Remove the transmission fluid cooler tube secondary latch from the transmission fluid cooler tube.



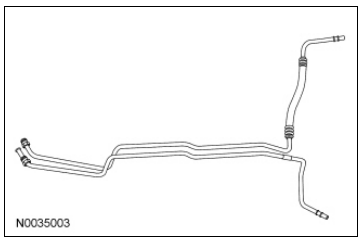
4. Using the Transmission Cooler Line Disconnect Tool, disconnect the quick connect coupler and remove the transmission fluid cooler tube from the radiator.



5. Remove the transmission fluid cooler tube secondary latch from the transmission fluid cooler tube.

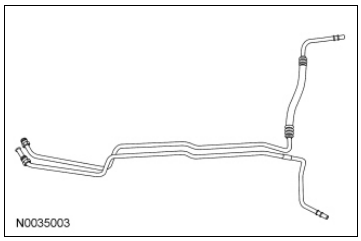


6. Using the Transmission Cooler Line Disconnect Tool, disconnect the quick connect coupler and separate the transmission fluid cooler tube from the transmission fluid cooler hose.

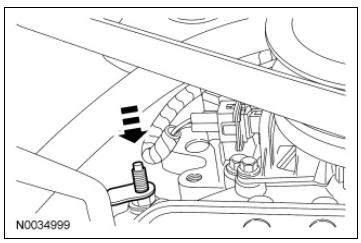


7. Remove the transmission fluid cooler tube bracket-to-engine nut.

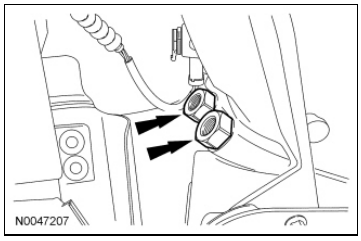
8. Remove the transmission fluid cooler tube bracket from the stud.



9. Remove the transmission fluid cooler tubes from the vehicle.

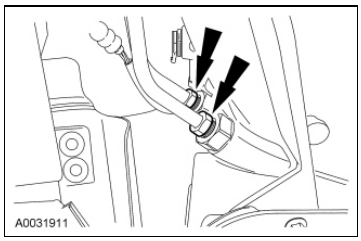


Installation

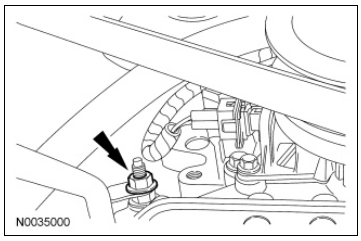


1. Install the transmission fluid cooler tubes into the vehicle.

2. Install the transmission fluid cooler tube bracket onto the stud.



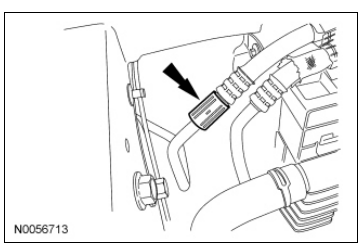
3. Verify the transmission fluid cooler tube case fitting torque.
    - Tighten to 56 Nm (41 lb-ft).



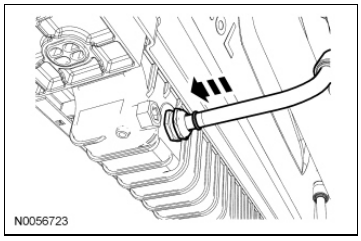
4. ***NOTICE:*** **To prevent cross threading, all transmission fluid cooler tube nuts must be hand-started before being tightened to specification.**

   Using a backup wrench to hold the case fittings securely, install the transmission fluid cooler tube nut-to-case fittings.

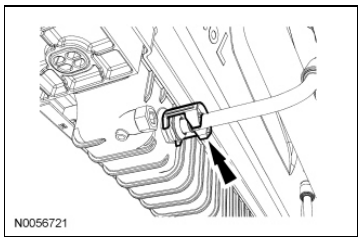
   - Tighten to 40 Nm (30 lb-ft).



5. Install the transmission fluid cooler tube bracket-to-engine nut.
   - Tighten to 25 Nm (18 lb-ft).

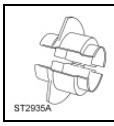


6. Connect the transmission fluid cooler tube to the transmission fluid cooler hose.



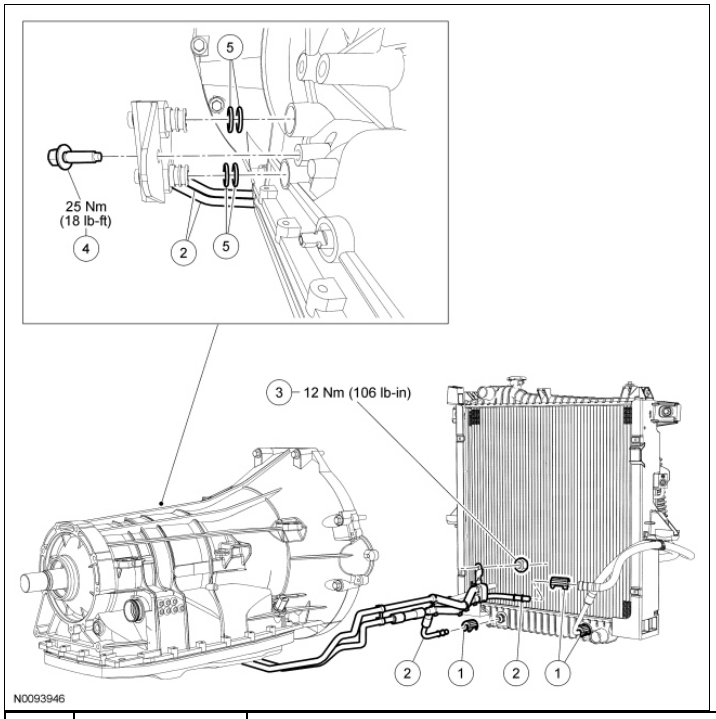
7. Install the transmission fluid cooler tube secondary latch to the transmission fluid cooler tube at the transmission fluid cooler hose.

8. Install the transmission fluid cooler tube to the radiator.



9. Install the transmission fluid cooler tube secondary latch to the transmission fluid cooler tube at the radiator.

10. Fill the transmission to the correct fluid level using clean transmission fluid and inspect for leaks. For additional information, refer to Transmission Fluid Level Check in Section 307-01A .



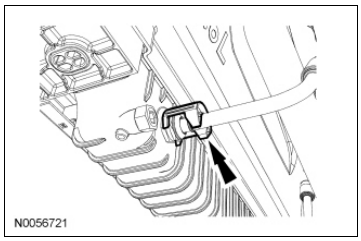
Transmission Fluid Cooler Tubes - 6R80

Special Tool(s)

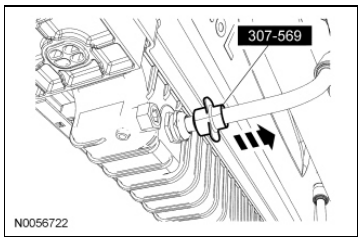
 ST2935A	Disconnect Tool, Transmission Cooler Line 307-569

Material

Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLV	MERCON® LV
Threadlock and Sealer TA-25	WSK-M2G351-A5

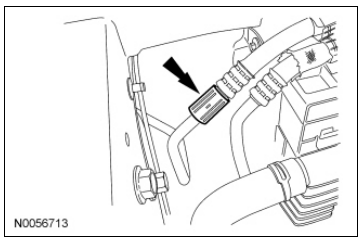


Item	Part Number	Description
1	7Z465	Transmission fluid cooler tube secondary latches
2	7R081	Transmission fluid cooler tubes
3	-	Transmission fluid cooler tube bracket-to-engine nut
4	-	Transmission fluid cooler tube bracket assembly-to-case bolt
5	7J227	Transmission fluid cooler tube O-rings (4 required)

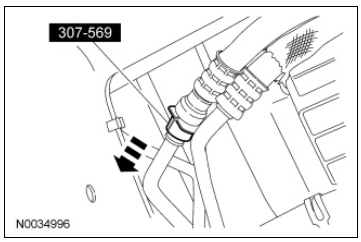


Removal

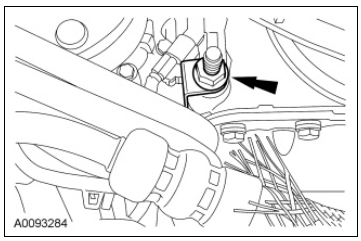
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .



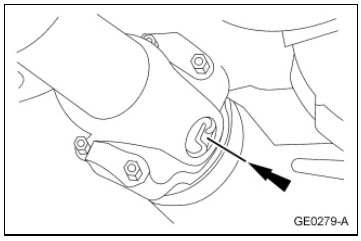
2. Remove the transmission fluid cooler tube secondary latch from the transmission fluid cooler tube.



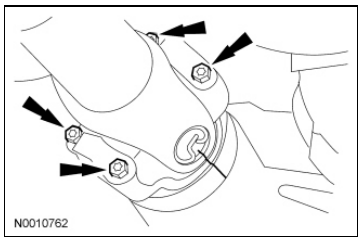
3. Using the Transmission Cooler Line Disconnect Tool, disconnect the quick connect coupler and remove the transmission fluid cooler tube from the radiator.



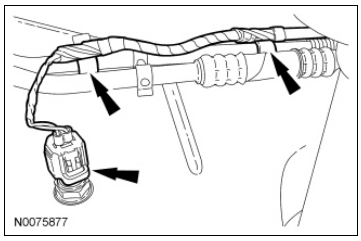
4. Remove the transmission fluid cooler tube secondary latch from the transmission fluid cooler tube.



5. Using the Transmission Cooler Line Disconnect Tool, disconnect the quick connect coupler and separate the transmission fluid cooler tube from the transmission fluid cooler hose.

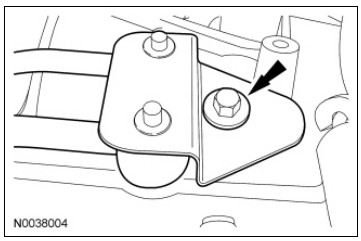


6. Remove the transmission fluid cooler tube bracket-to-engine nut.

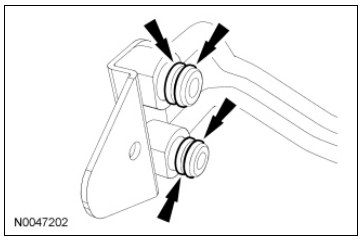


7. If equipped, index-mark the front driveshaft to maintain driveshaft balance.

8. If equipped, remove the 4 U-joint strap bolts and remove the U-joint straps.
   - Discard the bolts.



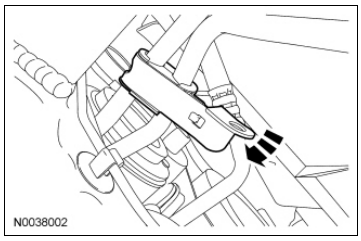
9. Disconnect the engine oil low level sensor electrical connector and harness clips.



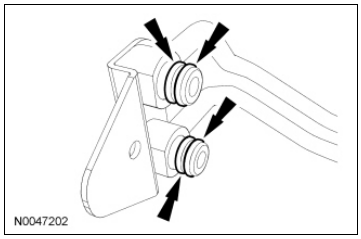
10. **NOTE:** The transmission fluid cooler tube O-rings may remain in the transmission case. Carefully remove them from the case.

    Remove the transmission fluid cooler tube bracket assembly-to-case bolt and remove the transmission fluid cooler tubes from the transmission.

11. Remove and discard the 4 O-rings from the transmission fluid cooler tube ends.

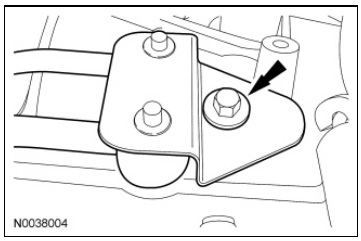


12. Remove the transmission fluid cooler tubes from the vehicle.

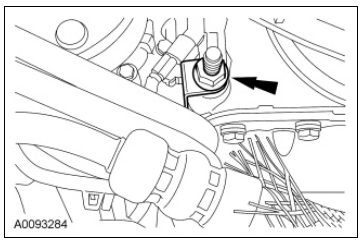


Installation

1. Position the transmission fluid cooler tubes in the vehicle.



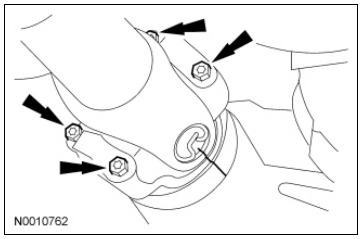
2. Install 4 new O-rings on the transmission fluid cooler tube ends.



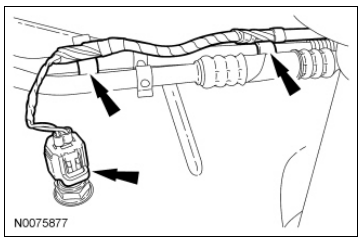
3. **NOTE:** Inspect the transmission case to make sure that the old O-rings are not stuck in the transmission case.

   Position the transmission fluid cooler tubes into the transmission, then install the transmission fluid cooler tube bracket assembly-to-case bolt.

   - Tighten to 25 Nm (18 lb-ft).



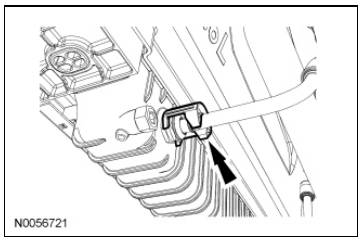
4. Position the transmission fluid cooler tube bracket on the stud and install the transmission fluid cooler tube bracket-to-engine nut.
   - Tighten to 12 Nm (106 lb-in).



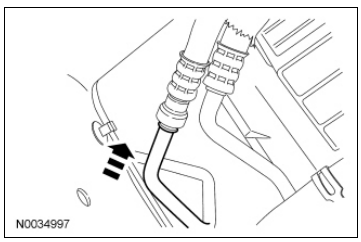
5. **NOTE:** Install new U-joint strap bolts. If new U-joint strap bolts are not available, coat the threads of the original U-joint strap bolts with threadlock and sealer.

   If removed, install the U-joint straps and 4 new U-joint strap bolts.

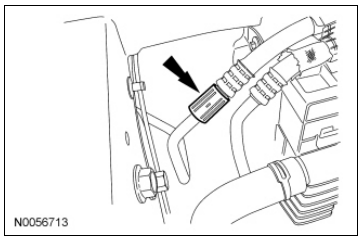
   - Tighten to 19 Nm (168 lb-in).



6. Connect the engine oil low level sensor electrical connector and harness clips.

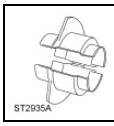


7. Install the transmission fluid cooler tube to the radiator.



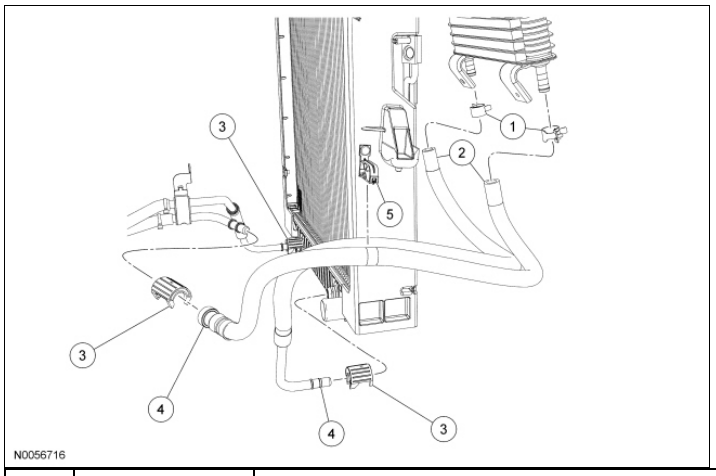
8. Install the transmission fluid cooler tube secondary latch to the transmission fluid cooler tube at the radiator.

9. Connect the transmission fluid cooler tube to the transmission fluid cooler hose.



10. Install the transmission fluid cooler tube secondary latch to the transmission fluid cooler tube at the transmission fluid cooler hose.

11. Fill the transmission to the correct fluid level using clean transmission fluid and inspect for leaks. For additional information, refer to Transmission Fluid Level Check in Section 307-01B .



Transmission Fluid Cooler Hoses

Special Tool(s)

 ST2935A	Disconnect Tool, Transmission Cooler Line 307-569

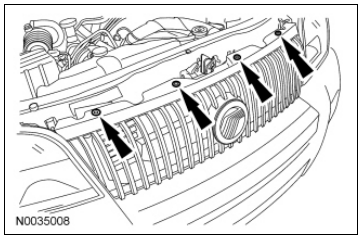
Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLV	MERCON® LV

Item	Part Number	Description
1	-	Transmission fluid cooler constant tension hose clamps
2	7B028	Transmission fluid cooler hoses
3	7Z465	Transmission fluid cooler tube secondary latches
4	7890	Transmission fluid cooler hoses
5	7N291	Transmission fluid cooler hose retainer

Removal

NOTE: The 5R55S uses MERCON® V Automatic Transmission Fluid.



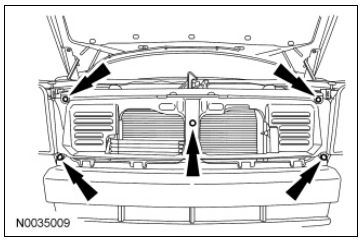
The 6R80 uses Motorcraft MERCON® LV Automatic Transmission Fluid.

All vehicles

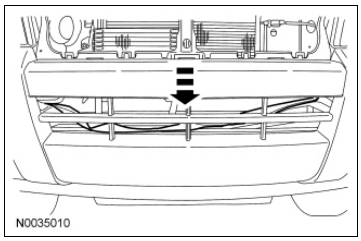
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

Mountaineer

2. Remove the grille fasteners and the grille. For additional information, refer to Section 501-08 .

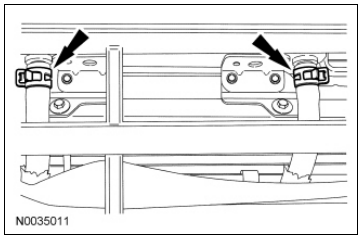


Explorer

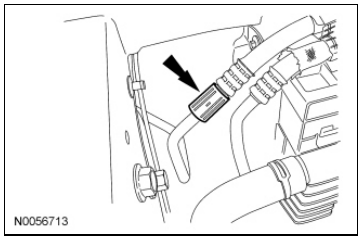


3. Remove the bumper cover. For additional information, refer to Section 501-19 .

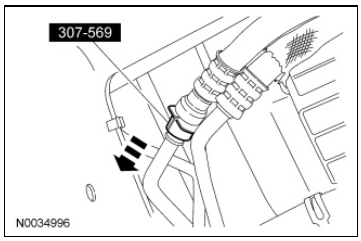
All vehicles



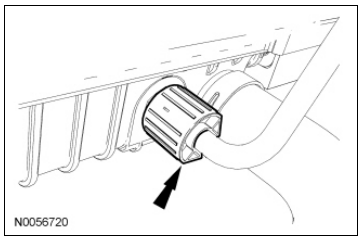
4. Remove the inner grille air deflector.



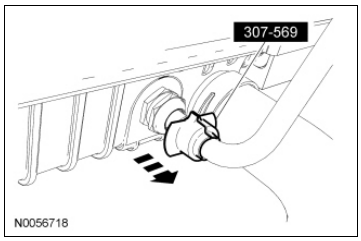
5. Push the lower air deflector down past the transmission fluid cooler.



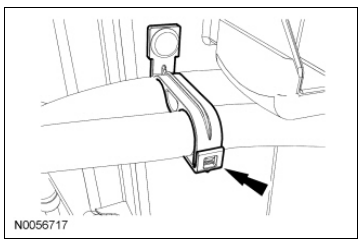
6. Disconnect the transmission fluid cooler hoses.
   - Remove and discard the transmission fluid cooler hoses and the clamps.



7. Remove the transmission fluid cooler tube secondary latch from the transmission fluid cooler tube.

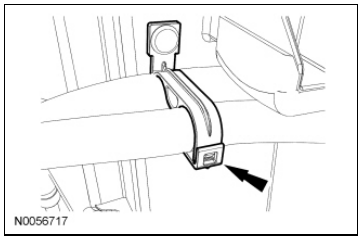


8. Using the Transmission Cooler Line Disconnect Tool, disconnect the quick connect coupler and separate the transmission fluid cooler tube from the transmission cooler hose.

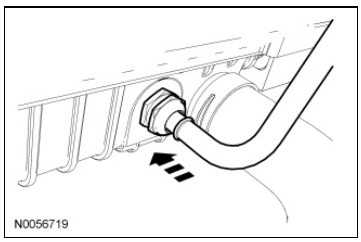


9. Remove the transmission fluid cooler tube secondary latch from the transmission fluid cooler hose.

10. Using the Transmission Cooler Line Disconnect Tool, disconnect the quick connect coupler and remove the transmission fluid cooler hose from the radiator.

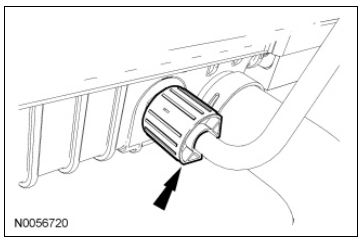


11. Remove the hoses from the retainer.

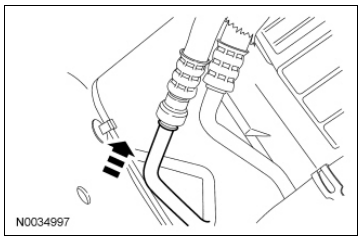


Installation

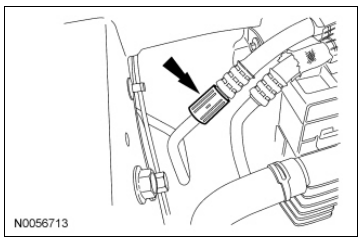
All vehicles



1. Install the hoses into the retainer.

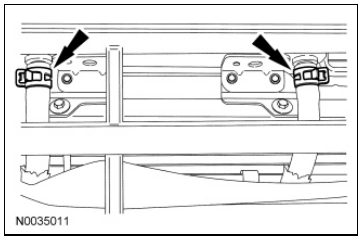


2. Install the transmission fluid cooler hose to the radiator.

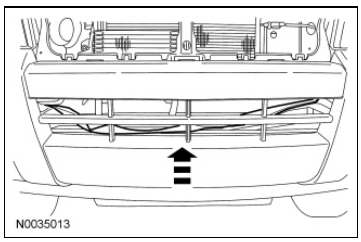


3. Install the transmission fluid cooler tube secondary latch.

4. Install the transmission fluid cooler hose to the transmission fluid cooler tube.



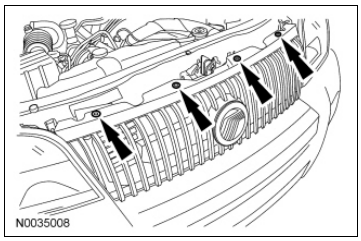
5. Install the transmission fluid cooler tube secondary latch.



6. **NOTE:** Clean the transmission fluid cooler tube stems with degreaser prior to installing the hoses.

   Using new hoses and clamps, install the new transmission fluid cooler hoses.

7. Push the lower air deflector back into place.



8. Install the inner grille air deflector.

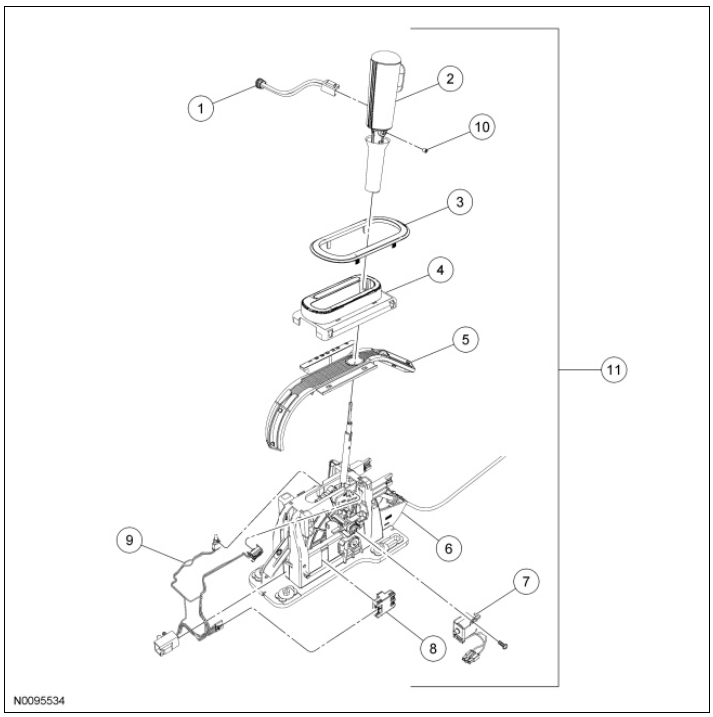
Mountaineer

9. Install the grille and the fasteners. For additional information, refer to Section 501-08 .

Explorer

10. Install the bumper cover. For additional information, refer to Section 501-19 .

All vehicles



11. Fill the transmission fluid to the correct level using clean transmission fluid and inspect for leaks. For additional information, refer to Section 307-01A for 5R55S or Section 307-01B for 6R80.

Torque Specifications

Description	Nm	lb-ft	lb-in
Selector lever cable bracket screws (5R555)	40	30	-
Selector lever cable bracket screws (6R80)	27	20	-
Selector lever housing nuts	9	-	80
Selector lever knob set screw	3	-	27

External Controls

Transmission Selector Lever - 5R555, 6R80

Item	Part Number	Description
1	7G550	Transmission Control Switch (TCS)
2	7213	Transmission selector lever knob
3	061A16	Transmission selector lever bezel ring
4	7D443	Transmission selector lever housing bezel
5	7C444	Transmission selector lever housing slider
6	7210	Transmission selector lever assembly
7	7E096	Brake Shift Interlock Actuator (BSIA)
8	7J437	BSIA module
9	15A808	Transmission selector lever harness
10	-	Transmission selector lever knob set screw
11	7210	Transmission selector lever assembly

The selector lever cable transfers the transmission operating mode from the selector lever to the transmission. The indicated position of the selector lever is transferred to the transmission through the selector lever linkage, then to the selector lever cable and bracket and down to the manual control lever on the transmission.

Brake Shift Interlock System

The brake shift interlock system prevents moving the selector lever from the PARK position until the brake pedal is applied. The brake shift interlock system consists of a Brake Shift Interlock Actuator (BSIA) mounted on the selector lever. When the ignition switch is in the RUN position and the selector lever is in PARK, the

BSIA is energized when the brake pedal is applied. This will allow the selector lever to be moved from the PARK position.

If the selector lever will not move out of the PARK position with the key in the ON position and the brake pedal applied, it will need to be unlocked manually. For additional information, refer to Brake Shift Interlock Override in this section.

Transmission Control Switch (TCS)

The Transmission Control Switch (TCS) is a momentary contact switch located on the selector lever knob. Pushing the TCS will either disengage or engage the overdrive function of the transmission. If OVERDRIVE is disengaged, the message O/D OFF will illuminate on the Instrument Cluster (IC).

External Controls

Special Tool(s)

 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent

Brake Shift Interlock System

The brake shift interlock system prevents moving the selector lever from the PARK position until the brake pedal is applied. The brake shift interlock system consists of a Brake Shift Interlock Actuator (BSIA) mounted on the selector lever. When the ignition switch is in the RUN position and the selector lever is in PARK, the BSIA is energized when the brake pedal is applied. This will allow the selector lever to be moved from the PARK position.

Transmission Control Switch (TCS)

The Transmission Control Switch (TCS) is a momentary contact switch located on the selector lever knob. Pushing the TCS will either disengage or engage the overdrive function of the transmission. If OVERDRIVE is disengaged, the message O/D OFF will illuminate on the Instrument Cluster (IC).

Inspection and Verification

1. Verify the customer concern by operating the transmission external control.
2. Visually inspect for obvious signs of mechanical or electrical damage; refer to the following chart:

Visual Inspection Chart

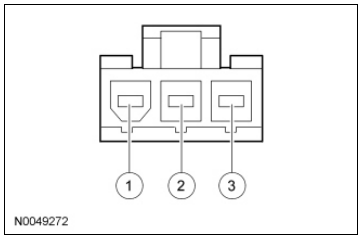
Mechanical	Electrical
• Damaged Brake Shift Interlock Actuator (BSIA) • Damaged Transmission Control Switch (TCS)	• Failed fuse(s): ♦ 20 (10A) ♦ 22 (15A) • Damaged wiring harness • Loose or corroded connections • Failed Transmission Control Indicator Lamp (TCIL)

3. If the fault is not visually evident, determine the symptom. GO to Symptom Chart - Exterior Controls or GO to Symptom Chart - NVH .

Symptom Chart - External Controls

Symptom Chart - External Controls

Symptom Chart - NVH



Symptom Chart - NVH
NOTE: NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to Section 100-04 . Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to Section 100-04 for the next likely system and continue diagnosis.

ConditionPossible SourcesAction

- Vibration - a high frequency (20-80 Hz) that is felt through the seat or selector lever. Changes with engine speed
- Selector lever cable incorrectly routed, grounded out or loose
- CHECK the selector lever cable. REPAIR as necessary. REFER to Selector Lever Cable in this section.
- Rattle, noise, buzz or other noise
- Selector lever loose
- TIGHTEN the selector lever bolt.
- Noisy selector lever
- INSTALL a new selector lever. REFER to Selector Lever in this section.

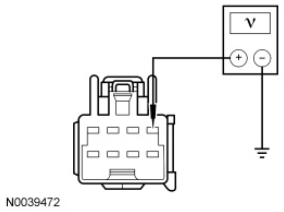
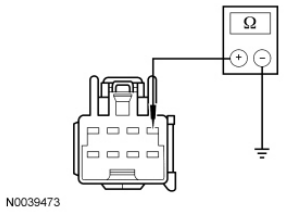
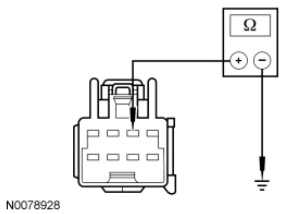
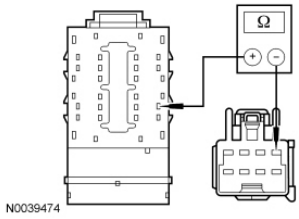
Pinpoint Tests

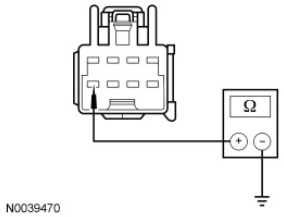


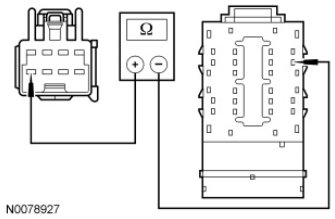




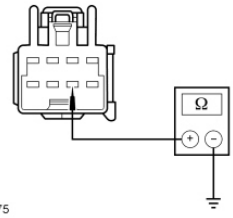
Refer to Wiring Diagrams Cell 29 , Transmission Controls - 5R55S for schematic and connector information.

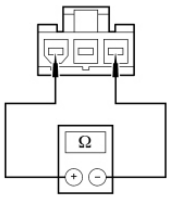






Refer to Wiring Diagrams Cell 30 , Transmission Controls - 6R80 for schematic and connector information.





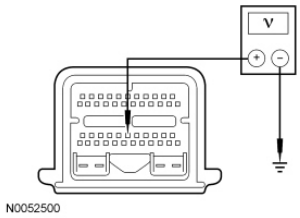
Refer to Wiring Diagrams Cell 37 , Shift Interlock for schematic and connector information.

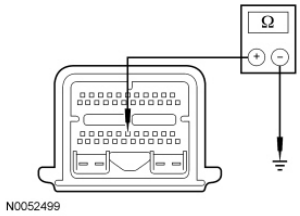
PINPOINT TEST A: BRAKE SHIFT INTERLOCK SYSTEM DOES NOT RELEASE/LOCK CORRECTLY

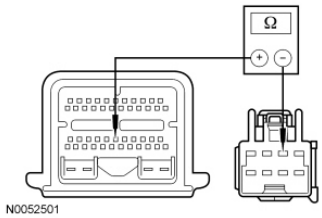
Test Step	Result / Action to Take
A1 TEST THE BRAKE LIGHTS	
• Apply the brake pedal and view the high mounted stoplamp. • **Did the high mounted stoplamp illuminate?**	**Yes** GO to A2 . **No** REFER to Section 417-01 .
A2 TEST FOR VOLTAGE	

• Disconnect: Brake Shift Interlock C2008. • Ignition ON. • Measure the voltage between brake shift interlock C2008-1, circuit CBP20 (YE/VT), harness side and ground.  N0039472 • **Is the voltage greater than 10 volts?**	**Yes** GO to A7 . **No** GO to A3 .
A3 TEST FUSE 20 (10A)	
• Ignition OFF. • Check fuse: 20 (10A). • **Is the resistance less than 5 ohms?**	**Yes** GO to A6 . **No** GO to A4 .
A4 TEST THE CIRCUIT FOR A SHORT TO GROUND	
• Measure the resistance between the brake shift interlock C2008-1, circuit CBP20 (YE/VT), harness side and ground.  N0039473 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to A5 . **No** REPAIR circuit CBP20 (YE/VT) for short to ground. TEST the system for normal operation.
A5 TEST THE CIRCUIT FOR A SHORT TO GROUND	
• Disconnect: PCM C175B. • Measure the resistance between the brake shift interlock C2008-2, circuit CET34 (BN/GN), harness side and ground.  N0078928	**Yes** GO to A10 . **No** REPAIR circuit CET34 (BN/GN) for a short to ground. TEST the system for normal operation.

• **Is the resistance greater than 10,000 ohms?**	
A6 TEST THE CIRCUIT FOR AN OPEN	
• Disconnect: Smart Junction Box (SJB) C2280C. • Measure the resistance between the SJB C2280C-12 and the brake shift interlock C2008-1, circuit CBP20 (YE/VT), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** GO to A10 . **No** REPAIR circuit CBP20 (YE/VT) for an open. TEST the system for normal operation.
A7 TEST THE CIRCUIT FOR A SHORT TO GROUND	
• Disconnect: Smart Junction Box (SJB) C2280C. • Disconnect: Trailer Brake Control (TBC) Module . • Measure the resistance between the brake shift interlock C2008-8, circuit CCB08 (VT/WH), harness side and ground.  • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to A8 . **No** REPAIR circuit CCB08 (VT/WH) for short to ground. TEST the system for normal operation.
A8 TEST THE CIRCUIT FOR AN OPEN	
• Measure the resistance between the brake shift interlock C2008-8, circuit CCB08 (VT/WH) and the SJB C2280C-24, circuit CCB08 (VT/WH).  • **Is the resistance less than 5 ohms?**	**Yes** GO to A9 . **No** REPAIR circuit CCB08 (VT/WH) for an open. TEST the system for normal operation.
A9 CHECK THE CIRCUIT FOR AN OPEN	







• Measure the resistance between the brake shift interlock C2008-6, circuit GD138 (BK/WH), harness side and ground.  N0039475 • **Is the resistance less than 5 ohms?**	**Yes** GO to A10 . **No** REPAIR circuit GD138 (BK/WH) for an open. TEST the system for normal operation.
A10 CHECK THE CIRCUITS FOR AN OPEN	
• Disconnect: Brake Shift Interlock Actuator (BSIA) Module Connector. • Measure the resistance between the brake shift interlock C2008, component side, and the BSIA module connector using the following table: **Brake Shift Interlock** / **Circuit** / **BSIA Module** C2008-1 / CBP20 (YE/VT) / Connector pin 6 C2008-2 / CET34 (BN/GN) / Connector pin 7 C2008-6 / GD138 (BK/WH) / Connector pin 2 C2008-8 / CCB08 (VT/WH) / Connector pin 5 • **Are all the measurements less than 5 ohms?**	**Yes** GO to A11 . **No** REPAIR circuit for open. TEST the system for normal operation.
A11 CHECK THE BSIA	
• Disconnect: BSIA . • Measure the resistance between pin 1 and pin 3 of the BSIA .  N0049273 • **Is the resistance between 20 and 30 ohms?**	**Yes** INSTALL a new BSIA module. TEST the system for normal operation. **No** INSTALL a new BSIA . TEST the system for normal operation.

PINPOINT TEST B: SELECTOR LEVER IS OUT OF CORRECT GEAR RELATIONSHIP

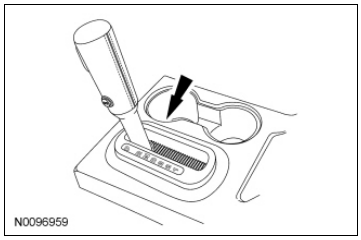
Test Step	Result / Action to Take
B1 CHECK THE SELECTOR LEVER LINKAGE	
• Ignition ON. • Apply the brake pedal. • Gain access to the selector lever linkage. • Actuate the selector lever in all ranges. • Observe all linkages during operation. • **Is the linkage damaged?**	**Yes** INSTALL a new selector lever. TEST the system for normal operation. **No** GO to B2 .
B2 CHECK THE SELECTOR LEVER CABLE	
• Check the selector lever cable and bracket installation and tightness. • **Is the selector lever cable correctly installed and adjusted?**	**Yes** VERIFY the selector lever cable adjustment. REFER to Selector Lever Cable Adjustment - 6R80 or Selector Lever Cable Adjustment - 5R55S in this section. ADJUST the selector lever cable if necessary. VERIFY the Transmission Range (TR) sensor for correct adjustment. REFER to Section 307-01A . ADJUST the TR sensor if necessary. GO to B3 . **No** REPAIR as necessary. TEST the system for normal operation.
B3 CHECK THE SELECTOR LEVER LINKAGE/CABLE FOR CORRECT GEAR RELATIONSHIP	
• Apply the brake pedal. • Actuate the selector lever in all ranges. • **Does the indicator match the gear selection?**	**Yes** System OK. TEST the system for normal operation. **No** REFER to Selector Lever Cable Adjustment - 6R80 or Selector Lever Cable Adjustment - 5R55S in this section. TEST the system for normal operation.

PINPOINT TEST C: TCS IS NOT OPERATING CORRECTLY

Test Step	Result / Action to Take
C1 CHECK THE TCS CIRCUIT FOR VOLTAGE	
• Disconnect: PCM C175B. • Inspect for damaged or pushed-out terminals, corrosion or loose wires. Repair as necessary. • Ignition ON. • Measure the voltage between PCM C175B-29, circuit CET34 (BN/GN) and ground while cycling the Transmission Control Switch (TCS) several times.	**Yes** INSTALL a new PCM. TEST the system for normal operation. **No** GO to C2 .

 N0052500 • **Does the voltage cycle?**	
C2 CHECK THE CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: Brake Shift Interlock C2008. • Inspect for damaged, pushed-out terminals or loose wires. Repair as necessary. • Measure the resistance between PCM C175B-29, circuit CET34 (BN/GN) and ground.  N0052499 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to C3 . **No** REPAIR circuit CET34 (BN/GN) for a short to ground. TEST the system for normal operation.
C3 CHECK THE CIRCUIT FOR AN OPEN	
• Measure the resistance between PCM C175B-29, circuit CET34 (BN/GN) and the brake shift interlock C2008-2, harness side.  N0052501 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new TCS . RECONNECT all components. TEST the system for normal operation. **No** REPAIR open in circuit CET34 (BN/GN). RECONNECT all components. TEST the system for normal operation.

Brake Shift Interlock Override



NOTE: If it is necessary to use the Brake Shift Interlock Actuator (BSIA) override procedure to move the selector lever out of the PARK position, it is possible that a fuse has blown and the brake lights are not operational. Before driving the vehicle, verify that the brake lights are working.

This vehicle is equipped with a BSIA feature that prevents the selector lever from being moved out of the PARK position when the ignition is in the ON position until the brake pedal is applied.

If the selector lever cannot be moved out of the PARK position when the ignition is in the ON position and the brake pedal is applied:

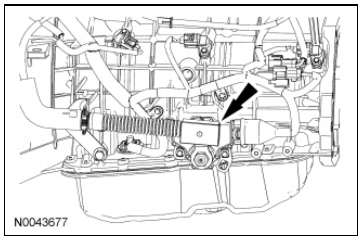
1. Apply the park brake and remove the ignition key.

2. Remove the cup holder and locate the access cap and remove.

3. Using a suitable tool, press the brake shift interlock override mechanism on the selector lever assembly, apply the brake pedal, press the button on the selector lever knob and move the selector lever into NEUTRAL.

4. Insert the ignition key into the ignition and start the vehicle.

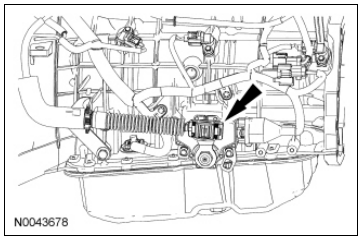
5. To install, reverse the procedure.



Selector Lever Cable Adjustment - 5R55S

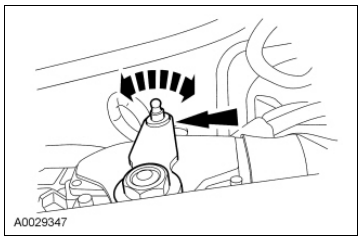
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Place the selector lever in the PARK position.



3. Move the selector lever 3 detents. This should be the (D) position.

4. Remove the selector lever cable shield by prying on the side of the selector lever cable shield closest to the boot, then sliding the selector lever cable shield away from the boot.

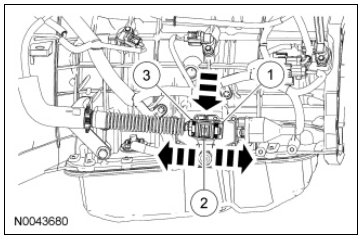


5. ***NOTICE:*** **To prevent selector lever cable damage, do not apply force to the selector lever cable between the manual control lever and the selector lever cable bracket.**

   Disconnect the selector lever cable end from the manual control lever.

6. Rotate the manual control lever clockwise until the travel stops. Then rotate the manual control lever counterclockwise 3 detents. This should be the (D) position.

7. With the selector lever cable end disconnected, unlock the tab on the selector lever cable end by sliding it up.



8. ***NOTICE:*** **To prevent selector lever cable damage, do not apply force to the selector lever cable between the manual control lever and the selector lever cable bracket.**

   NOTE: When installing the selector lever cable end, make sure that the selector lever cable end is correctly installed onto the manual control lever. Pull back on the selector lever cable end to make sure that the selector lever cable end is correctly installed onto the manual control lever.

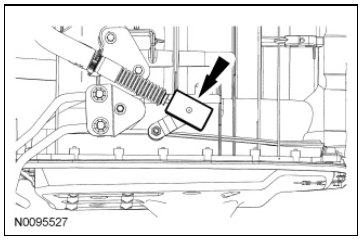
   Carry out the following adjustments on the selector lever cable end and install the selector lever cable end onto the manual control lever:

   1. Make sure that the selector lever cable end slides forward and backward.
   2. Connect the selector lever cable end onto the manual control lever.
   3. Lock the selector lever cable end into place by pressing the lock tab down.

9. **NOTE:** If the selector lever cable shield is loose on the selector lever cable, install a new selector lever cable shield.

   Install and secure the selector lever cable shield.

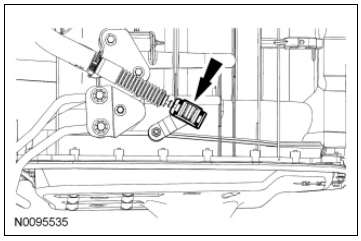
10. Verify that the engine will start in PARK and NEUTRAL. Verify that the reverse lamps will illuminate in the REVERSE position. If not, check the adjustment of the Transmission Range (TR) sensor. For additional information on the TR sensor adjustment, refer to Section 307-01A .



Selector Lever Cable Adjustment - 6R80

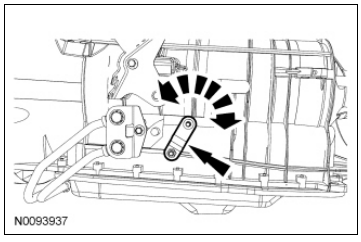
1. With the vehicle in NEUTRAL, position the vehicle on a hoist. For additional information, refer to Section 100-02 .

2. Place the selector lever in the PARK position.



3. Move the selector lever 3 detents. This should be the (D) position.

4. Remove the selector lever cable shield by prying on the side of the selector lever cable shield closest to the boot, then sliding the shield away from the boot.

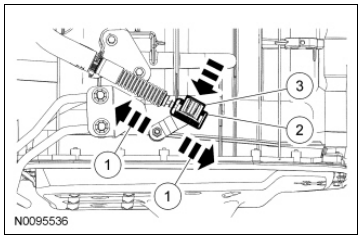


5. ***NOTICE:*** **To prevent selector lever cable damage, do not apply force to the selector lever cable between the manual control lever and the selector lever cable bracket.**

   Disconnect the selector lever cable from the manual control lever.

6. Rotate the manual control lever clockwise until the travel stops. Then rotate the manual control lever counterclockwise 3 detents. This should be the (D) position.

7. With the selector lever cable end disconnected, unlock the tab on the selector lever cable end by sliding it up.

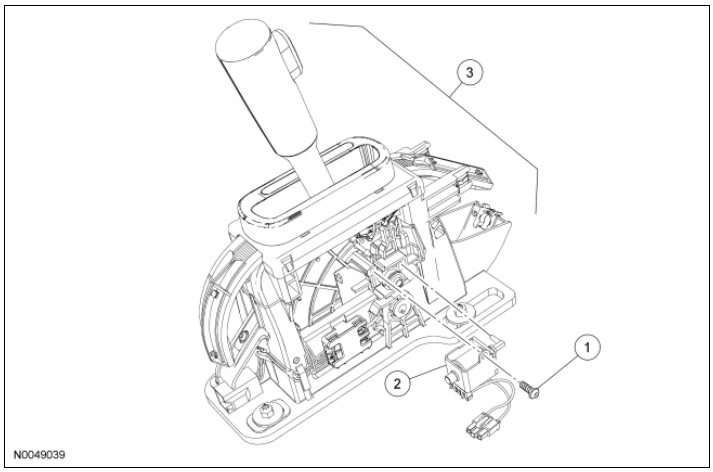


8. ***NOTICE:*** **To prevent selector lever cable damage, do not apply force to the selector lever cable between the manual control lever and the selector lever cable bracket.**

   NOTE: When installing the selector lever cable end, make sure that the selector lever cable end is correctly installed onto the manual control lever. Pull back on the selector lever cable end to make sure that the selector lever cable end is correctly installed onto the manual control lever.

   Carry out the following adjustments on the selector lever cable end and install the selector lever cable end onto the manual control lever:

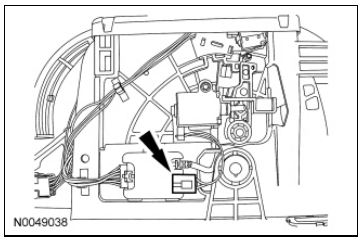
   1. Make sure that the selector lever cable end slides forward and backward.
   2. Connect the selector lever cable end onto the manual control lever.
   3. Lock the selector lever cable end into place by pressing the lock tab down.



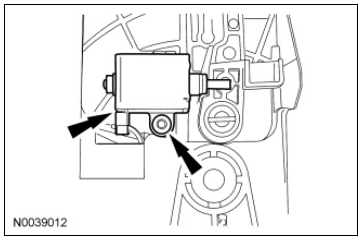
9. **NOTE:** If the selector lever cable shield is loose on the selector lever cable, install a new selector lever cable shield.

   Install and secure the selector lever cable shield.

Brake Shift Interlock Actuator



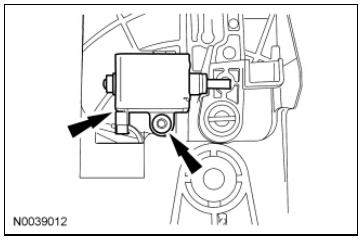
Item	Part Number	Description
1	-	Brake Shift Interlock Actuator (BSIA) screw (part of 7210)
2	7E096	BSIA
3	7210	Selector lever



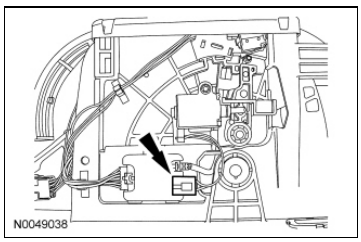
Removal

1. Remove the front floor console. For additional information, refer to Section 501-12 .

2. Disconnect the Brake Shift Interlock Actuator (BSIA) electrical connector.

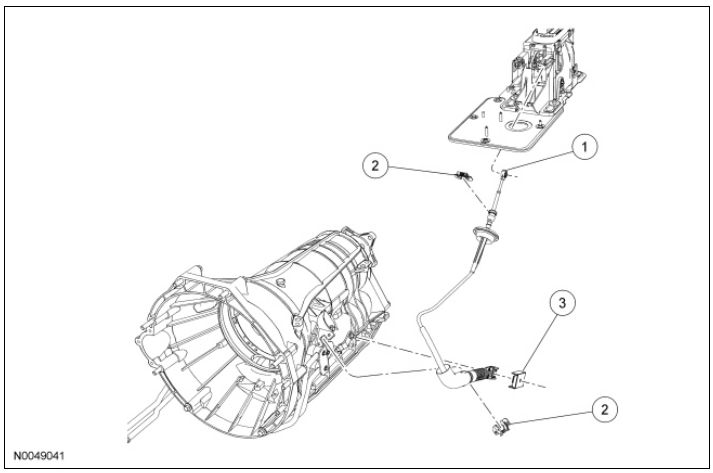


3. Remove the screw and the BSIA .



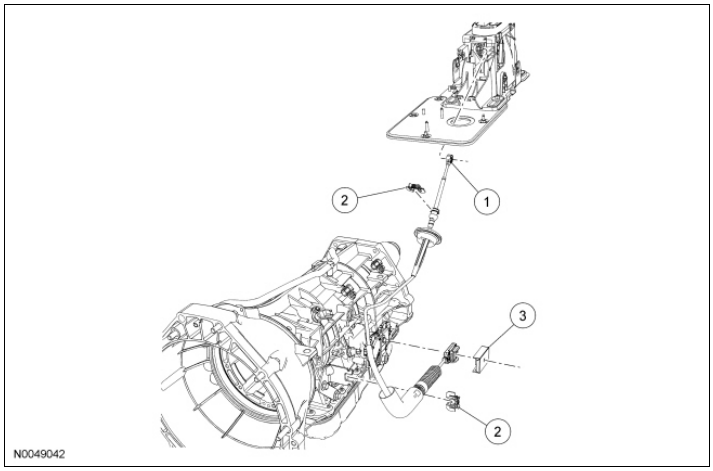
Installation

1. Install the BSIA and the screw.



2. Connect the BSIA electrical connector.

3. Install the front floor console. For additional information, refer to Section 501-12 .

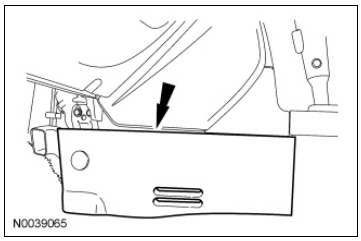


Selector Lever Cable

Vehicles Equipped With a 6R80 Transmission

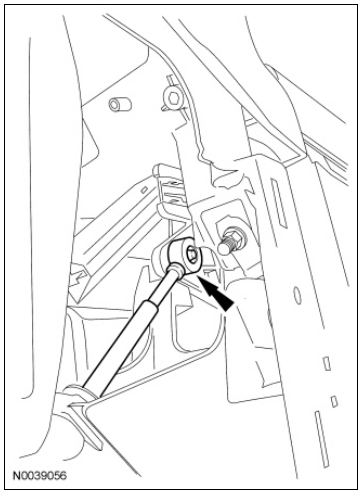
Item	Part Number	Description
1	7E395	Selector lever cable
2	7H181	Selector lever-to-cable clips
3	7A434	Selector lever cable shield

Vehicles Equipped With a 5R55S Transmission



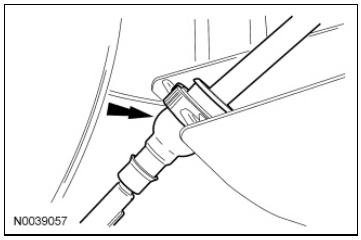
Item	Part Number	Description
1	7E395	Selector lever cable
2	7H181	Selector lever-to-cable clips
3	7A434	Selector lever cable shield

Removal

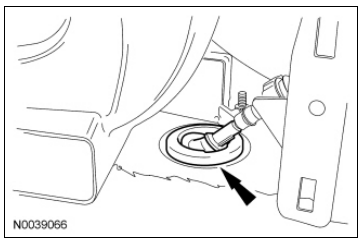


All vehicles

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

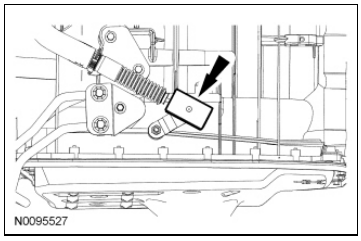


2. Remove the front floor console left side panel.



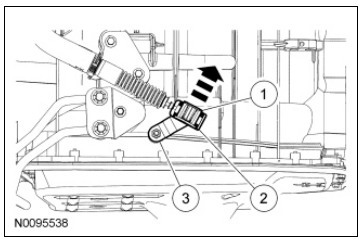
3. With the selector lever in PARK, remove the selector lever cable from the selector lever.

4. Remove the selector lever cable from the selector lever housing.

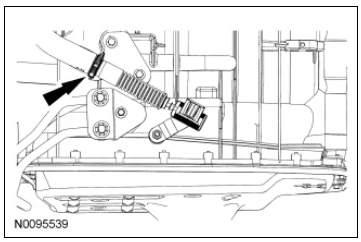


5. Pull the selector lever cable and grommet through the floorpan.

Vehicles equipped with a 6R80 transmission



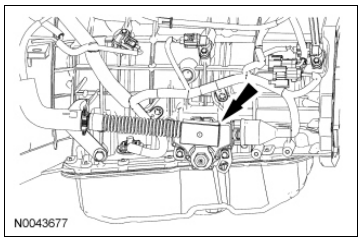
6. Remove the selector lever cable shield by prying on the selector lever shield closest to the boot, then sliding the shield away from the boot.



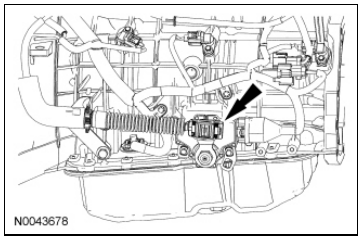
7. ***NOTICE:*** **To prevent selector lever cable damage, do not apply force to the selector lever cable between the manual control lever and the selector lever cable bracket.**

   Unlock the lock tab and disconnect the selector lever cable end from the manual control lever.

   1. Lock tab.
   2. Selector lever cable end.
   3. Manual control lever.

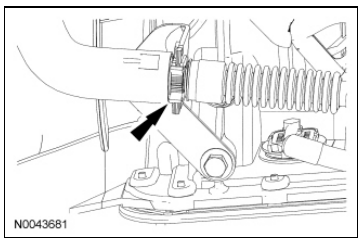


8. Disconnect the selector lever cable from the selector lever cable bracket and remove the selector lever cable.



Vehicles equipped with a 5R55S transmission

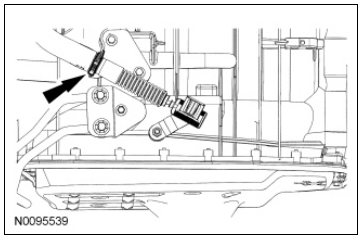
9. Remove the selector lever cable shield by prying on the side of the selector lever cable shield closest to the boot, then sliding the shield away from the boot.



10. ***NOTICE:*** **To prevent selector lever cable damage, do not apply force to the selector lever cable between the manual control lever and the selector lever cable bracket.**

    Unlock the lock tab and disconnect the selector lever cable end from the manual control lever.

11. Disconnect the selector lever cable from the bracket and remove the selector lever cable.



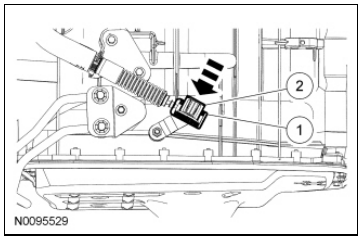
Installation

Vehicles equipped with a 6R80 transmission

1. ***NOTICE:*** **To prevent selector lever cable damage, do not apply force to the selector lever cable between the manual control lever and the selector lever cable bracket.**

   NOTE: When installing the selector lever cable end, make sure that the selector lever cable end is correctly installed onto the manual control lever. Pull back on the selector lever cable end to make sure that the selector lever cable end is correctly installed onto the manual control lever.

   Install the selector lever cable into the selector lever cable bracket.



2. ***NOTICE:*** **To prevent selector lever cable damage, do not apply force to the selector lever cable between the manual control lever and the selector lever cable bracket.**

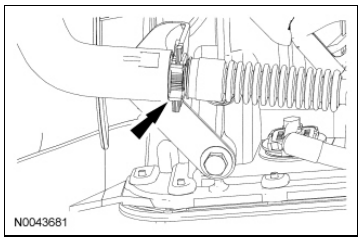
   NOTE: When installing the selector lever cable end, make sure that the selector lever cable end is correctly installed onto the manual control lever. Pull back on the selector lever cable end to make sure that the selector lever cable end is correctly installed onto the manual control lever.

   Install the selector lever cable end onto the manual control lever and lock the tab.

   1. Selector lever cable end.
   2. Lock tab.

3. **NOTE:** If the selector lever cable shield is loose on the selector lever cable, install a new selector lever cable shield.

   Install and secure the selector lever cable shield.

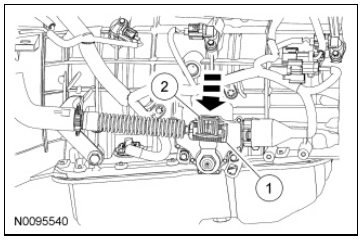


Vehicles equipped with a 5R55S transmission

4. ***NOTICE:*** **To prevent selector lever cable damage, do not apply force to the selector lever cable between the manual control lever and the selector lever cable bracket.**

   NOTE: When installing the selector lever cable end, make sure that the selector lever cable end is correctly installed onto the manual control lever. Pull back on the selector lever cable end to make sure that the selector lever cable end is correctly installed onto the manual control lever.

   Install the selector lever cable into the selector lever cable bracket.

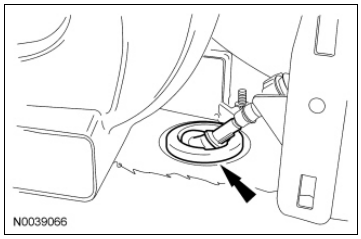


5. ***NOTICE:*** **To prevent selector lever cable damage, do not apply force to the selector lever cable between the manual control lever and the selector lever cable bracket.**

   NOTE: When installing the selector lever cable end, make sure that the selector lever cable end is correctly installed onto the manual control lever. Pull back on the selector lever cable end to make sure that the selector lever cable end is correctly installed onto the manual control lever.

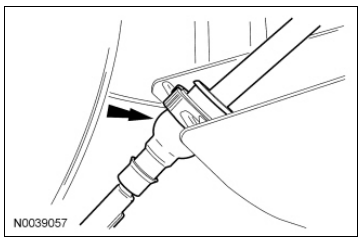
   Install the selector lever cable end onto the manual control lever and lock the tab.

   1. Selector lever cable end.
   2. Lock tab.

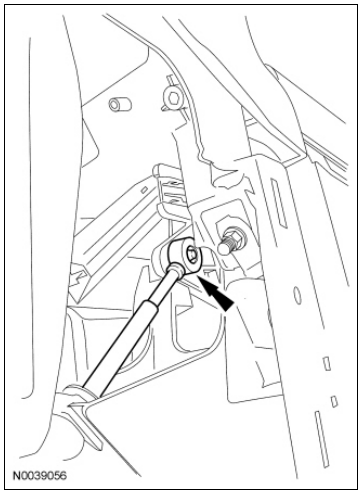


6. **NOTE:** If the selector lever cable shield is loose on the selector lever cable, install a new selector lever cable shield.

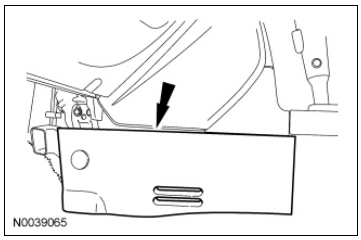
   Install and secure the selector lever cable shield.



All vehicles

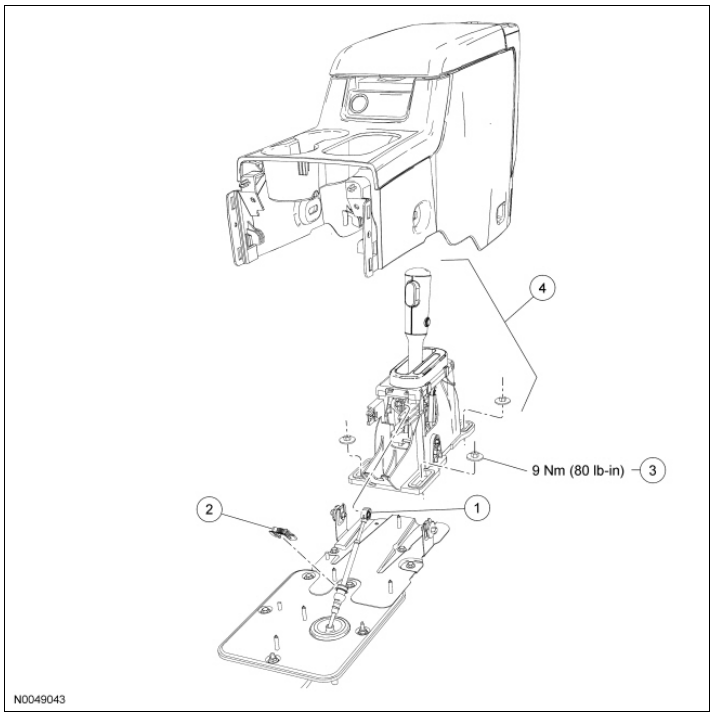


7. Push the selector lever cable and grommet through the floorpan.



8. Install the selector lever cable onto the selector lever housing.

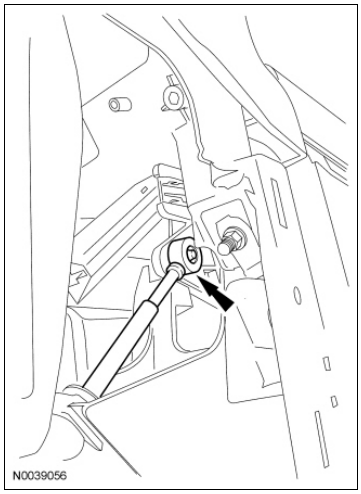
9. Install the selector lever cable onto the selector lever.



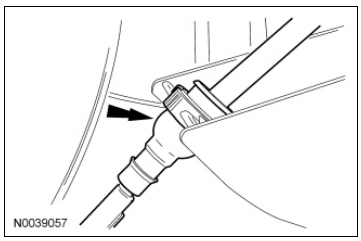
10. Install the front floor console left side panel.

11. Verify the engine will start in PARK and NEUTRAL and the reversing lamps illuminate in REVERSE. If not, readjust the selector lever cable. For additional information, refer to Selector Lever Cable Adjustment - 5R55S or Selector Lever Cable Adjustment - 6R80 in this section.

Selector Lever

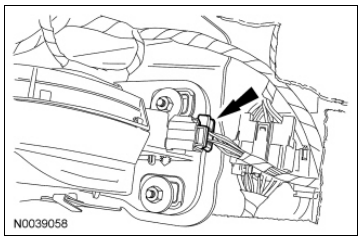


Item	Part Number	Description
1	7E395	Selector lever cable
2	7H181	Selector lever-to-cable clip
3	W710618	Selector lever housing nut
4	7210	Selector lever assembly

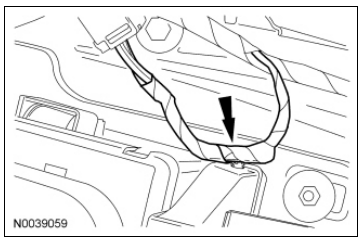


Removal

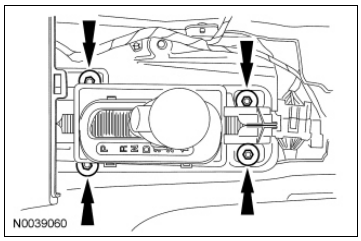
1. Remove the front floor console. For additional information, refer to Section 501-12 .



2. Disconnect the selector lever cable from the selector lever.

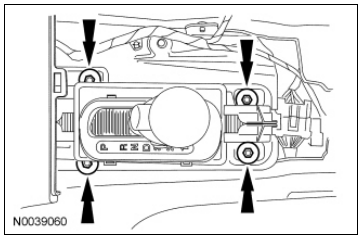


3. Disconnect the selector lever cable from the selector lever housing.

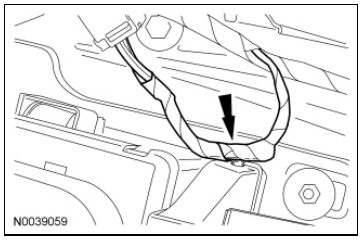


4. Disconnect the selector lever housing electrical connector.

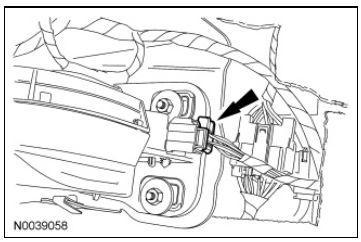
5. Disconnect the wiring harness from the selector lever housing.



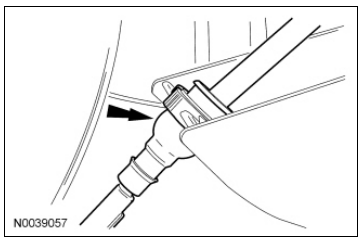
6. Remove the 4 nuts and remove the selector lever housing from the vehicle.



Installation

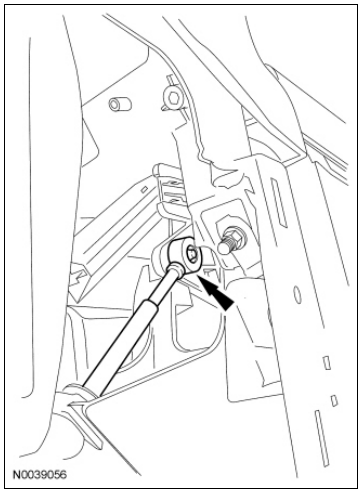


1. Install the selector lever housing.
   - Tighten to 9 Nm (80 lb-in).

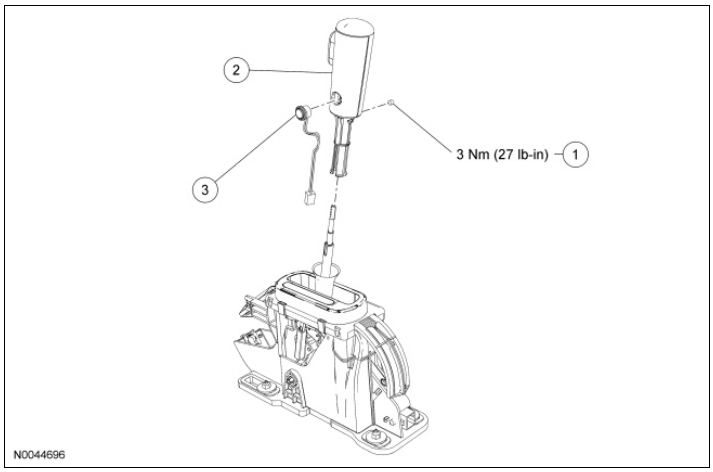


2. Connect the wiring harness to the selector lever housing.

3. Connect the selector lever housing electrical connector.



4. Install the selector lever cable onto the selector lever housing.



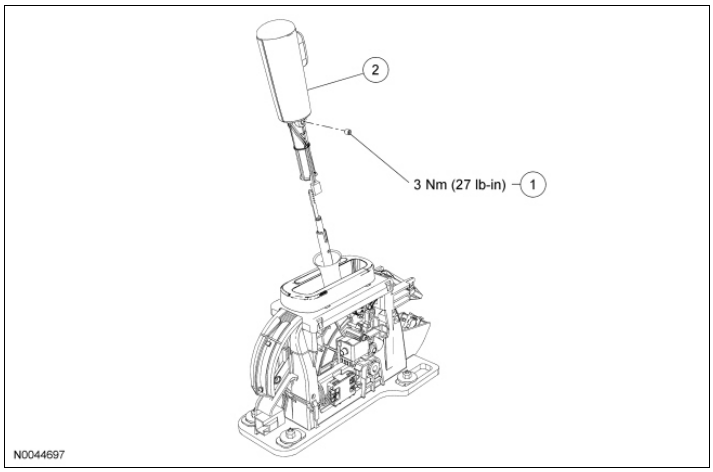
5. **NOTE:** When installing the selector lever cable end, make sure that the selector lever cable end is correctly installed onto the selector housing. Pull back on the selector lever cable end to make sure that the selector lever cable end is correctly installed onto the selector lever housing.

   Install the selector lever cable end onto the selector lever housing.

6. Install the front floor console. For additional information, refer to Section 501-12 .

Transmission Control (TC) Switch

Item	Part Number	Description
1	-	Selector lever knob set screw
2	7213	Selector lever knob
3	7G550	Transmission Control Switch (TCS)

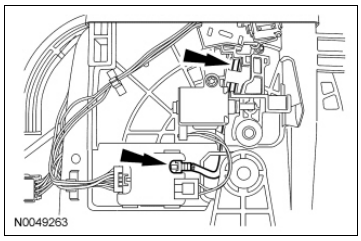


Removal

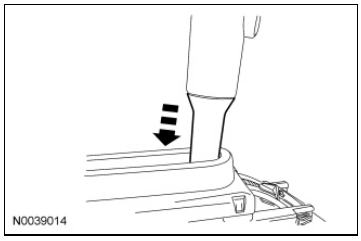
1. Remove the selector lever knob. For additional information, refer to Selector Lever Knob in this section.
2. Remove the Transmission Control Switch (TCS) from the knob.

Installation

1. Install the TCS into the selector lever knob.
2. Install the selector lever knob. For additional information, refer to Selector Lever Knob in this section.

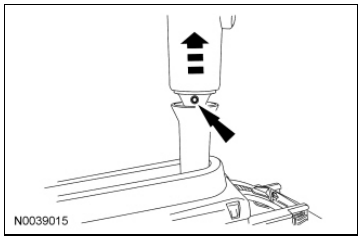


Selector Lever Knob



Item	Part Number	Description
1	-	Selector lever knob set screw
2	7213	Selector lever knob

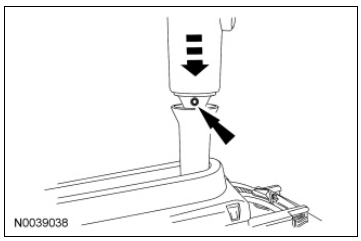
Removal



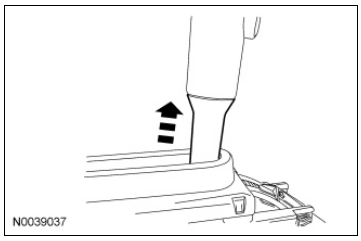
1. Remove the front floor console. For additional information, refer to Section 501-12 .
2. Disconnect the Transmission Control Switch (TCS) electrical connector and feed the wire through the selector lever housing.

3. Slide the selector lever knob lower trim cover downward.

4. Remove the set screw and remove the selector lever knob while routing the TCS harness out of the selector lever housing.



Installation

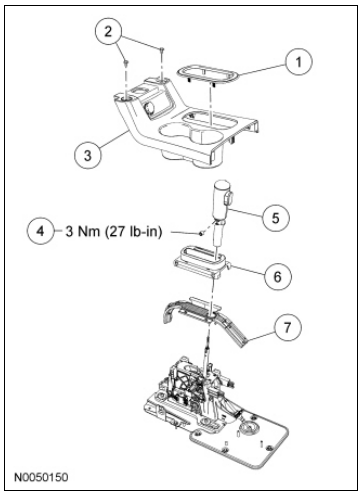


1. ***NOTICE:*** **Do not overtighten the set screw or damage to the selector lever knob may occur.**

   Install the selector lever knob and set screw while routing the TCS harness through the selector lever housing.

   - Tighten to 3 Nm (27 lb-in).

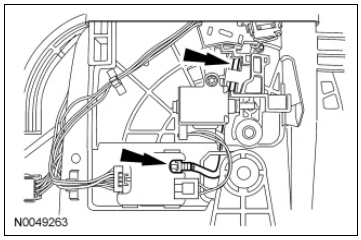
2. Slide the selector lever knob lower trim cover upward.



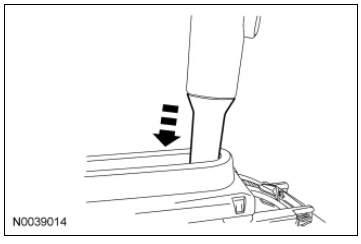
3. Feed the wire through the selector lever housing and connect the TCS electrical connector.

4. Install the front floor console. For additional information, refer to Section 501-12 .

Selector Lever Bezel

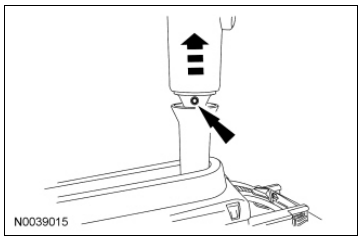


Item	Part Number	Description
1	061A16	Selector lever bezel ring
2	W705796	Front floor console center finish panel screws
3	78045B44	Front floor console center finish panel
4	-	Selector lever knob set screw
5	7213	Selector lever knob
6	7D443	Selector lever bezel
7	7C444	Selector lever housing slider

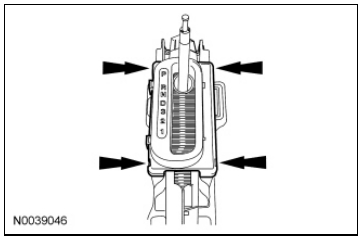


Removal

1. Remove the front floor console. For additional information, refer to Section 501-12 .

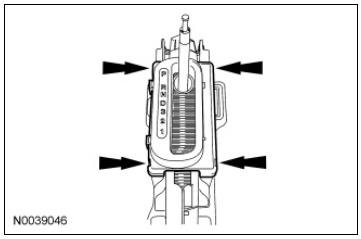


2. Disconnect the Transmission Control Switch (TCS) electrical connector and feed the wire through the selector lever housing.



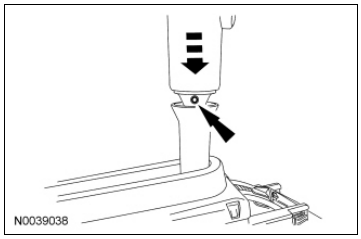
3. Slide the selector lever knob lower trim cover downward.

4. Remove the set screw and remove the selector lever knob while routing the TCS harness out of the selector lever housing.

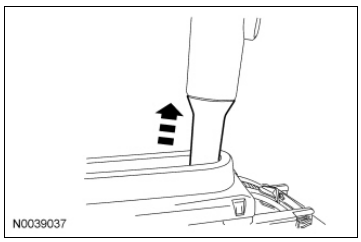


5. Remove the selector lever bezel from the selector lever housing.

Installation



1. Install the selector lever bezel onto the selector lever housing.



2. ***NOTICE:*** **Do not overtighten the set screw or damage to the selector lever knob may occur.**

   Install the selector lever knob and set screw while routing the TCS harness through the selector lever housing.

   - Tighten to 3 Nm (27 lb-in).

3. Slide the selector lever lower trim cover upward.

4. Feed the wire through the selector lever housing and connect the TCS electrical connector.

5. Install the front floor console. For additional information, refer to Section 501-12 .

Material

Item	Specification	Fill Capacity
Multi-Purpose Grease XG-4 and/or XL-5	ESB-M1C93-B	-
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4	-

Torque Specifications

Description	Nm	lb-in
Transfer case shift motor bolts	10	89
Transfer case shift motor heat shield bolts	16	142

Four Wheel Drive (4WD) Systems

There are 3 types of Four-Wheel Drive (4WD) operating systems:

- All-Wheel Drive (AWD)
- 1-speed torque-on-demand
- 2-speed torque-on-demand

All-Wheel Drive (AWD)

The AWD system utilizes the following components:

- Transfer case
- Differential (internal to the transfer case)

1-Speed Torque-On-Demand

The 1-speed torque-on-demand system utilizes the following components:

- Transfer case
- Electromagnetic clutch (internal to the transfer case)
- 4X4 control module
- Message center, used to select between AUTO and LOCKED modes.

2-Speed Torque-On-Demand

The automatic 4WD system is a 2-speed torque-on-demand design that utilizes the following components:

- Transfer case
- Electromagnetic clutch (internal to the transfer case)
- 4X4 control module
- Mode Select Switch (MSS), used to select between 4X4 AUTO, 4X4 HIGH and 4X4 LOW modes
- Transfer case shift motor
- Encoder assembly (part of the transfer case shift motor)
- Shift motor sense plate (part of the encoder assembly)

Four Wheel Drive (4WD) Systems - All Wheel Drive (AWD)

Principles of Operation

The automatic, All-Wheel Drive (AWD) transfer case has no external controls. A 2-piece aluminum case houses the assembly. The unit is chain-driven. A differential provides torque to the front and rear transfer case outputs. The differential transmits torque at the ratio of 40% to the front output and 60% to the rear output.

Torque flows through the input shaft to the front planetary gear assembly and then outward to the ring gear and upper output shaft. Torque also flows through the front planetary gear assembly to the overdrive sun gear outward to the upper drive sprocket. The torque flow continues from the upper drive sprocket through the drive chain to the lower drive sprocket and then to the front output shaft. The differential provides the connection between the ring gear and the overdrive sun gear.

Inspection and Verification - All-Wheel Drive (AWD)

1. **NOTE:** Driving habits as well as road and weather conditions should be noted.

   Road test the vehicle to verify the concern, noting the road speed, engine speed and speed range where the vehicle problem is evident.

2. Raise the vehicle on the hoist and position suitable safety floor stands under the vehicle. Refer to Section 100-02 .

3. Run the vehicle at the road speed where the concern exists. Verify the concern:
   - Engine
   - Transmission
   - Front/rear driveline components
   - Front/rear drive axles
   - Front/rear brake systems
   - Front/rear wheels or tires
   - Transfer case

4. Refer to the appropriate Owner's Literature for operating data. Verify the concern as driveline or torsional windup before repairing the transfer case.

5. Check the tires and vehicle load if the problem is clearly driveline windup and not broken parts.

6. If the concern is not visually evident, GO to Symptom Chart - All Wheel Drive (AWD) or GO to Symptom Chart - NVH .

Symptom Chart - All-Wheel Drive (AWD)

Symptom Chart - All-Wheel Drive (AWD)

Symptom Chart - NVH

Symptom Chart - NVH

NOTE: NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to Section 100-04 . Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to Section 100-04 for the next likely system and continue diagnosis.

Condition	Possible Sources	Action
• Transfer case whine - noise at all ranges	• Incorrect fluid level or fluid quality	• CHECK that the transfer case is filled to the correct level and with the specified fluid. REFER to Section 308-07B .
	• Worn oil pump	• DISASSEMBLE the transfer case. CHECK the oil pump for wear or damage. REPAIR as necessary. REFER to Section 308-07B .
	• Under-inflated or oversized tires	• CONFIRM that the tires and wheels are correct for the vehicle. CHECK that the tire inflation pressures are correct.
• Transfer case growl/rumble - noise at all ranges	• Damaged or worn bearings or planetary gear	• DISASSEMBLE the transfer case. CHECK the bearings or planetary gear for wear or damage. REPAIR as necessary. REFER to Section 308-07B .
• Transfer case scraping/grating - noise at all ranges	• Excessively stretched drive chain hitting the case	• DISASSEMBLE the transfer case. CHECK the drive chain for wear or damage. REPAIR as necessary. REFER to Section 308-07B .
• Transfer case howl/hum - noise at all ranges or 4X4 only	• Worn or damaged sun (input) gear, clutch pack (intermediate) gear or output shaft gear	• DISASSEMBLE the transfer case. CHECK the gears for wear or damage. REPAIR as necessary. REFER to Section 308-07B .

Four Wheel Drive (4WD) Systems - 1-Speed Torque-On-Demand

Special Tool(s)

 ST2574-A	Flex Probe Kit 105-R025D or equivalent
 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Principles of Operation

The 1-speed torque-on-demand transfer case modes are controlled through the 4X4 control module.

The modes are:

- All-Wheel Drive (AWD) AUTO - torque is supplied to the front and rear driveshafts as needed to maintain traction. AWD AUTO mode can be changed to AWD LOCKED mode by pressing the message center SETUP button; the message AUTO will be selected, press RESET within 4 seconds, then the message LOCKED will be selected and the 4X4 indicator will be illuminated.
- AWD LOCKED - torque is supplied to the front and rear driveshafts constantly and the 4X4 indicator will stay illuminated in the Instrument Cluster (IC). This mode is not recommended for use on dry pavement or hard surfaces. AWD LOCKED mode can be changed to AWD AUTO mode by pressing the message center SETUP button; the message LOCKED will be selected, press RESET within 4 seconds, the message AUTO will be selected and the 4X4 indicator will turn off.

If the transfer case begins to overheat, the system will default to the AUTOLOCK mode. The 4X4 indicator will illuminate in the IC . This condition may clear without any action being taken by the driver. The 4X4 indicator will turn off when the system cools down.

When a problem is detected in the AWD system, the powertrain Malfunction Indicator Lamp (MIL) (wrench indicator) in the IC will illuminate.

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Axle shafts and CV joints • Driveshaft and U-joints • Fluid leaks • Matching tire sizes	• Battery Junction Box (BJB) fuses: ♦ 23 (20A) ♦ 26 (20A) • Smart Junction Box (SJB) fuse 18 (10A) • 4X4 control module • Wiring harness • Connector(s) • Circuitry

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM .
   - refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record the Continuous Memory Diagnostic Trouble Codes (CMDTCs).

8. **NOTE:** Before carrying out the self-test, make sure that:

   - the ignition is in RUN.
   - all doors are closed.
   - the brake pedal is not pressed.
   - the transmission is not in NEUTRAL.

   Clear the CMDTCs and carry out the self-test diagnostics for the 4X4 control module.

9. If the DTCs retrieved are related to the concern, go to the 4X4 Control Module DTC Chart in this section. For all other DTCs, refer to Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart - Four Wheel Drive (4WD) or GO to Symptom Chart - NVH .

4X4 Control Module DTC Chart

DTC	Description	Action
B1317	Battery Voltage High	GO to Pinpoint Test A .
B1318	Battery Voltage Low	GO to Pinpoint Test A .
B1342	ECU is Faulted	CLEAR the DTCs. REPEAT the 4X4 control module self-test. If DTC B1342 is retrieved, INSTALL a new 4X4 control module. REFER to 4X4 Control Module in this section. CLEAR the DTCs. REPEAT the self-test.
B1555	Ignition Run/Start Circuit Failure	GO to Pinpoint Test B .
P1824	4-Wheel Drive Clutch Relay Circuit Failure	GO to Pinpoint Test C .
P1825	4-Wheel Drive Clutch Relay Open Circuit	GO to Pinpoint Test C .
P1826	4-Wheel Drive Low Clutch Relay Circuit to Battery	GO to Pinpoint Test C .
P1827	4-Wheel Drive Low Clutch Relay Circuit to Ground	GO to Pinpoint Test C .
U1900	CAN Communication BUS Fault - Receive Error	**NOTE:** Do not install a new 4X4 control module as part of repair for 4X4 control module DTC U1900 fault. The 4X4 control module is not the source of the fault when DTC U1900 is present. CARRY OUT the network test to identify the module the 4X4 control module lost communication with. REFER to Section 418-00 to diagnose the module communication.
U2023	Fault Received From External Node	REFER to Section 206-09 to diagnose the wheel speed sensor fault.
U2050	No Application Present	REFER to Section 418-01 .

Symptom Chart - Four-Wheel Drive (4WD)

Symptom Chart - Four-Wheel Drive (4WD)

Symptom Chart - NVH

Symptom Chart - NVH

NOTE: NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to Section 100-04 . Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for

the symptom, refer back to Section 100-04 for the next likely system and continue diagnosis.

Condition	Possible Sources	Action
• Transfer case whine - noise at all ranges	• Incorrect fluid level or fluid quality	• CHECK that the transfer case is filled to the correct level and with the specified fluid. REFER to Section 308-07B .
	• Worn oil pump	• DISASSEMBLE the transfer case. CHECK the oil pump for wear or damage. REPAIR as necessary. REFER to Section 308-07B .
	• Under-inflated or oversized tires	• CONFIRM that the tires and wheels are correct for the vehicle. CHECK that the tire inflation pressures are correct.
• Transfer case growl/rumble - noise at all ranges	• Damaged or worn bearings or planetary gear	• DISASSEMBLE the transfer case. CHECK the bearings or planetary gear for wear or damage. REPAIR as necessary. REFER to Section 308-07B .
• Transfer case scraping/grating - noise at all ranges	• Excessively stretched drive chain hitting the case	• DISASSEMBLE the transfer case. CHECK the drive chain for wear or damage. REPAIR as necessary. REFER to Section 308-07B .
• Transfer case howl/hum - noise at all ranges or 4X4 only	• Worn or damaged sun (input) gear, clutch pack (intermediate) gear or output shaft gear	• DISASSEMBLE the transfer case. CHECK the gears for wear or damage. REPAIR as necessary. REFER to Section 308-07B .

Pinpoint Tests

Pinpoint Test A: DTC B1317/B1318

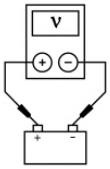
Refer to Wiring Diagrams Cell 34 , Four-Wheel Drive System for schematic and connector information.

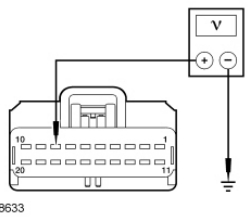
Normal Operation

If the 4X4 control module observes an overpower or underpower voltage condition, DTCs are set and the 4X4 control module may not allow Four-Wheel Drive (4WD) operation.

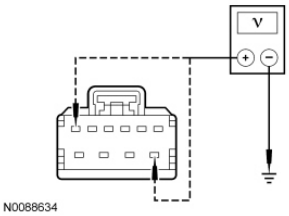
- DTC B1317 (Battery Voltage High) - When the 4X4 control module detects battery voltage greater than 16 volts for at least 10 seconds, this DTC is set.
- DTC B1318 (Battery Voltage Low) - When the 4X4 control module detects battery voltage less than 9 volts for at least 10 seconds, with the engine running at 1,500 rpm or greater, this DTC is set.

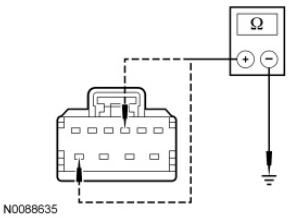
This pinpoint test is intended to diagnose the following:





- Fuses
- Wiring, terminals or connectors
- 4X4 control module





PINPOINT TEST A: DTC B1317/B1318

NOTE: DTC B1317 or B1318 can be set if the vehicle has been recently jump started, the battery has been recently charged or the battery has been discharged. The battery may become discharged due to excessive load(s) on the charging system from aftermarket accessories or if the battery has been left unattended with the accessories on.

NOTE: Carry out a thorough inspection and verification before proceeding with the pinpoint test. Refer to Inspection and Verification in this section.

Test Step	Result / Action to Take
A1 RETRIEVE ALL CMDTCs IN ALL MODULES	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - All CMDTCs . • **Is B1317 or B1318 present in one or more modules AND P0563, P0620, P0625, P0626 or P065B present in the PCM?**	**Yes** REFER to Section 414-00 for diagnosis of the battery and charging system. **No** GO to A2 .
A2 CHECK BATTERY CONDITION	
• Ignition OFF. • Refer to Section 414-01 and carry out the Battery - Condition Test in the Diagnosis and Testing portion of this section. • **Does the battery pass the condition test?**	**Yes** If the battery passed the condition test but required a recharge, REFER to Section 414-00 to diagnose the charging system. CLEAR all Continuous Memory Diagnostic Trouble Codes (CMDTCs). TEST the system for normal operation. If the battery passed the condition test and did not require a recharge, GO to A3 . **No** INSTALL a new battery. REFER to Section 414-01 . CLEAR all CMDTCs . TEST the system for normal operation.
A3 CHECK THE CHARGING SYSTEM	

VOLTAGE	
NOTE: Do not allow the engine rpm to increase above 2,000 rpm while performing this step or the generator may self excite and result in default charging system output voltage. If engine rpm has gone above 2,000 rpm, shut the vehicle OFF and restart the engine before performing this step. • Start the engine. • Measure the voltage of the battery: ♦ For DTC B1317, turn off all accessories and run the engine at 1,500 rpm for a minimum of 2 minutes. ♦ For DTC B1318, turn on headlights and HVAC fan on high and run engine at 1,500 rpm for a minimum of 2 minutes.  AJ0210-A • **Is the battery voltage between 13-15.2 volts?**	**Yes** For DTC B1318, GO to A4 . For DTC B1317, INSTALL a new 4X4 control module. REFER to 4X4 Control Module in this section. CLEAR all CMDTCs . REPEAT the self-test. **No** REFER to Section 414-00 to diagnose the charging system. CLEAR all CMDTCs . TEST the system for normal operation.
A4 CHECK POWER TO 4X4 CONTROL MODULE	
• Ignition OFF. • Disconnect: 4X4 Control Module C281A and C281B. • Ignition ON. • Measure the voltage between 4X4 control module C281A-8, circuit CBP18 (GY/OG), harness side and ground.  N0088633 • Measure the voltage between 4X4 control module C281B-6, circuit SBB23 (WH/RD), harness side and ground; and between 4X4 control module C281B-7, circuit SBB26 (YE/RD), harness side and ground.	**Yes** GO to A5 . **No** VERIFY the Smart Junction Box (SJB) fuse18 (10A) and Battery Junction Box (BJB) fuse(s) 23 (20A) and 26 (20A) are OK, REPAIR the circuit in question. If SJB and BJB fuse(s) are not OK, REFER to the Wiring Diagrams manual to identify possible causes of the circuit short. CLEAR all CMDTCs . REPEAT the self-test.

 • **Is the voltage greater than 10 volts?**	
A5 CHECK GROUND CIRCUITS TO 4X4 CONTROL MODULE FOR AN OPEN	
• Ignition OFF. • Measure the resistance between 4X4 control module C281B-3, circuit GD145 (BK/BU), harness side and ground; and between 4X4 control module C281B-10, circuit GD138 (BK/WH) harness side and ground. ♦ Repeat this measurement while wiggling the harness.  • **Is the resistance less than 5 ohms?**	**Yes** GO to A6 . **No** REPAIR the circuit. CLEAR all CMDTCs . REPEAT the self-test.
A6 CHECK FOR CORRECT 4X4 CONTROL MODULE OPERATION	
• Ignition OFF. • Check the harness and component side connectors for: ♦ corrosion. ♦ pushed-out/bent pins. • Connect the 4X4 control module and make sure it seats correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new 4X4 control module. REFER to 4X4 Control Module in this section. CLEAR all CMDTCs . REPEAT the self-test. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR all CMDTCs . REPEAT the self-test.

Pinpoint Test B: DTC B1555

Refer to Wiring Diagrams Cell 34 , Four-Wheel Drive System for schematic and connector information.

Normal Operation

The 4X4 control module receives ignition switch position status from the hard-wired run/start input to 4X4 control module pin 8 and the ignition switch position status message is communicated by the Instrument Cluster (IC) over the High Speed Controller Area Network (HS-CAN). The ignition switch position status message originates from the Smart Junction Box (SJB) which communicates the ignition switch position

status over the Medium Speed Controller Area Network (MS-CAN) to the IC which acts as a gateway module, transferring the ignition switch status message from MS-CAN to HS-CAN . For information regarding network messaging, refer to Section 418-00 .

- DTC B1555 (Ignition Run/Start Circuit Failure) - If the ignition switch is not in RUN for the self-test, this code will set.

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Ignition switch and/or circuitry
- HS-CAN

PINPOINT TEST B: DTC B1555

Test Step	Result / Action to Take
B1 CARRY OUT NETWORK TEST	
• Ignition ON. • Connect the scan tool. • Carry out a network test. • **Did the network test pass?**	**Yes** GO to B2 . **No** REFER to Section 418-00 to diagnose the network concern.
B2 CHECK 4X4 INDICATOR PROVE-OUT	
• Carry out the 4X4 control module self-test. • **Are any 4X4 control module DTCs present?**	**Yes** For DTC B1555, GO to B3 . For all other DTCs, REFER to the 4X4 Control Module DTC Chart in this section. **No** The system is functioning correctly.
B3 CHECK THE 4X4 CONTROL MODULE IGNITION SWITCH STATUS PIDs	
• Enter the following diagnostic mode on the scan tool: DataLogger - 4X4 Control Module. • Monitor the following ignition switch PIDs: ♦ Ignition Switch - Off/Unlock Position (IGN_O/U) ♦ ACC Position (IGN_A) ♦ Start Position 3 (IGN_S) ♦ Ignition Switch - Run/Start Position (IGN_R/S) ♦ Ignition Switch - Run Position (IGN_R)	**Yes** The system is functioning correctly. **No** If the IGN_R/S PID did not match, CHECK SJB fuse 18 (10A). If the fuse is OK, REPAIR circuit CBP18 (GY/OG). CLEAR the DTCs. REPEAT the self-test. If the IGN_O/U, IGN_A, IGN_S or IGN_R PIDs did not match, REFER to Section 211-05 to diagnose the ignition switch concern.

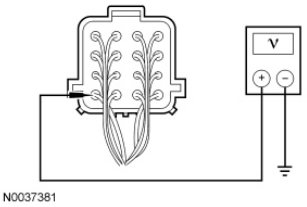
• **Do the ignition switch PIDs match the ignition switch positions?**	

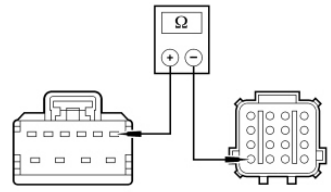
Pinpoint Test C: The Vehicle Does Not Shift Between All-Wheel Drive (AWD) AUTO and AWD LOCKED Correctly

Refer to Wiring Diagrams Cell 34 , Four-Wheel Drive System for schematic and connector information.

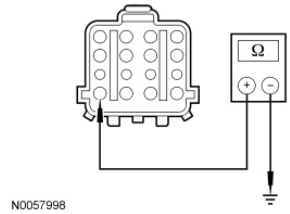
Normal Operation

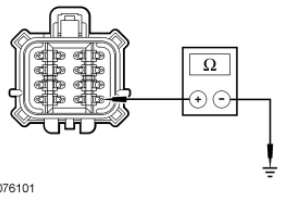
With the key in the ON position, the 4X4 control module receives the operator's choice of All-Wheel Drive (AWD) selection from the message center. The 4X4 control module then controls the electric clutch. If the transfer case is not responding to the operator's intentions, systematically check all inputs and outputs to the 4X4 control module.



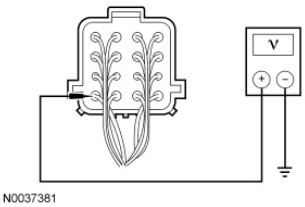


DTC Description	Fault Trigger Condition
• P1824 - 4-Wheel Drive Clutch Relay Circuit Failure	Short to ground on clutch output line sensed by 4X4 control module C281B pin 1 or overtemperature condition on clutch coil circuit detected.
• P1825 - 4-Wheel Drive Clutch Relay Open Circuit	Open circuit on clutch output line sensed by 4X4 control module C281B pin 1.
• P1826 - 4-Wheel Drive Low Clutch Relay Circuit to Battery	Short to battery on clutch output line sensed by 4X4 control module C281B pin 1.
• P1827 - 4-Wheel Drive Low Clutch Relay Circuit to Ground	Short to ground on clutch output line sensed by 4X4 control module C281B pin 1.

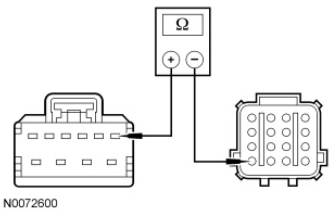


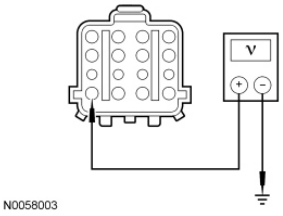


This pinpoint test is intended to diagnose the following:



- 4X4 indicator
- Transfer case
- 4X4 control module
- Wiring, terminals or connectors
- Transfer case clutch
- Ignition switch and/or circuitry
- High Speed Controller Area Network (HS-CAN)
- Instrument Cluster (IC)





PINPOINT TEST C: THE VEHICLE DOES NOT SHIFT BETWEEN ALL-WHEEL DRIVE (AWD) AUTO AND AWD LOCKED CORRECTLY

Test Step	Result / Action to Take
C1 CHECK 4X4 INDICATOR PROVE-OUT	
• Ignition OFF. • Start the vehicle while observing the 4X4 indicator prove-out. • **Did the 4X4 indicator prove out?**	**Yes** GO to C2 . **No** CHECK the IC for faults. REFER to Section 413-01 . TEST the system for normal operation.
C2 CHECK THE POWERTRAIN MIL	
• Start the engine. • Observe the powertrain Malfunction Indicator Lamp (MIL). • **Does the powertrain MIL illuminate?**	**Yes** GO to C3 . **No** GO to C4 .
C3 CARRY OUT THE SELF-TEST	
• Enter the following diagnostic mode on the scan tool: Self Test - 4X4 Control Module. • Using the scan tool, carry out the Network Test. • **Did the 4X4 control module self-test complete and yield any DTCs?**	**Yes** GO to C4 . **No** If no communication, REFER to Section 418-00 to diagnose no communication with the 4X4 control module. CHECK the IC for faults. REFER to Section 413-01 . TEST the system for normal operation.
C4 CHECK FOR 4X4 INDICATOR ILLUMINATION	
• Select AWD LOCKED. • **Does the 4X4 indicator illuminate?**	**Yes** GO to C5 . **No** GO to C21 .
C5 CHECK FOR WIND-UP IN AWD LOCKED MODE	
• Drive the vehicle on a dry, hard surface in turns while applying the throttle. • **Is wind-up present in turns?**	**Yes** GO to C13 . **No** GO to C6 .
C6 CHECK THE 4WD CLUTCH PWM STATUS (4WDCPWMST) PID	
• Enter the following diagnostic mode on the scan tool: DataLogger - 4X4 Control Module. • Monitor the 4WDCPWMST PID at Wide Open Throttle (WOT), with the transfer case in AWD LOCKED mode, Key ON Engine OFF (KOEO).	**Yes** GO to C7 . **No** GO to C11 .

• **Does the 4WDCPWMST PID indicate 98% clutch at WOT ?**	
C7 CHECK VOLTAGE ON THE CLUTCH POWER CIRCUIT CCF03 (GY/BN) USING THE PWM OUTPUT CONTROL COMMAND #1 (CLCH_SOL) ACTIVE COMMAND	
• Use the CLCH_SOL active command to energize the transfer case clutch to 100%. • Measure the voltage by carefully back-probing transfer case C350-16, circuit CCF03 (GY/BN), component side and ground.  N0037381 • **Is the voltage greater than 8.5 volts?**	**Yes** END the CLCH_SOL active command. GO to C10 . **No** END the CLCH_SOL active command. GO to C8 .
C8 CHECK CIRCUIT CCF03 (GY/BN) FOR AN OPEN	
• Ignition OFF. • Disconnect: Transfer Case C350. • Disconnect: 4X4 Control Module C281B. • Measure the resistance between 4X4 control module C281B-1, circuit CCF03 (GY/BN), harness side and transfer case C350-16, circuit CCF03 (GY/BN), harness side.  N0072600 • **Is the resistance less than 5 ohms?**	**Yes** GO to C9 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
C9 CHECK CIRCUIT CCF03 (GY/BN) FOR A SHORT TO GROUND	
• Measure the resistance between transfer case C350-16, circuit CCF03 (GY/BN), harness side and ground.	**Yes** GO to C10 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

 N0057998 • **Is the resistance greater than 10,000 ohms?**	
C10 CHECK THE TRANSFER CASE CLUTCH COIL	
• Measure the resistance between transfer case C350 pin 16, circuit CCF03 (GY/BN), component side and ground.  N0076101 • **Is the resistance between 2-4 ohms?**	**Yes** The system is functioning correctly. **No** REPAIR the transfer case. REFER to Section 308-07B . CLEAR the DTCs. REPEAT the self-test.
C11 CHECK THE TP STATUS (TPI) PID	
• Enter the following diagnostic mode on the scan tool: DataLogger - 4X4 Control Module. • **NOTE:** The TPI PID is Accelerator Pedal Position (APP) as communicated by the PCM via HS-CAN . • Slowly move the accelerator pedal from closed throttle to WOT and observe the TPI PID, KOEO . • **Does the TPI PID vary between 0 at closed throttle and 255 at WOT ?**	**Yes** GO to C12 . **No** CHECK the APP sensor and/or PCM. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. CLEAR the DTCs. REPEAT the self-test.
C12 CHECK THE ABS MODULE WHEEL SPEED SENSOR PIDs	
• Enter the following diagnostic mode on the scan tool: DataLogger - ABS Module. • While driving the vehicle at 30 km/h (18 mph), monitor the following wheel speed sensor PIDs: ♦ Left Front Wheel Speed Sensor (LF_WSPD) ♦ Left Rear Wheel Speed Sensor (LR_WSPD) ♦ Right Front Wheel Speed Sensor (RF_WSPD) ♦ Right Rear Wheel Speed Sensor (RR_WSPD) • Compare the speedometer reading to the wheel speed sensor PIDs. • **Do the wheel speed sensor PIDs and speedometer speeds match within 1.5 km/h (1 mph)?**	**Yes** GO to C7 . **No** CHECK the ABS for faults. REFER to Section 206-09 . CLEAR the DTCs. REPEAT the self-test.
C13 CHECK THE 4X4 INDICATOR IN AWD AUTO MODE	
• Select AWD AUTO. • **Does the 4X4 indicator turn off?**	**Yes** GO to C14 .

	No GO to Pinpoint Test D .
C14 CHECK FOR WIND-UP IN 4X4 AUTO MODE	
• Drive the vehicle on a dry, hard surface in turns while applying the throttle. • **Is wind-up present in turns?**	**Yes** GO to C15 . **No** The AWD drive system is operating correctly.
C15 CHECK THE 4WD CLUTCH PWM STATUS (4WDCPWMST) PID	
• Enter the following diagnostic mode on the scan tool: DataLogger - 4X4 Control Module. • Monitor the 4WDCPWMST PID at closed throttle, KOEO . • **Does the 4WDCPWMST PID indicate approximately 2 to 4% clutch application at closed throttle?**	**Yes** GO to C16 . **No** GO to C19 .
C16 CHECK VOLTAGE ON THE CLUTCH POWER CIRCUIT CCF03 (GY/BN) USING THE PWM OUTPUT CONTROL COMMAND #1 (CLCH_SOL) ACTIVE COMMAND	
• Use the CLCH_SOL active command to energize the transfer case clutch to 4%. • Measure the voltage by carefully back-probing transfer case C350-16, circuit CCF03 (GY/BN), component side and ground.  N0037381 • **Is the voltage approximately 0.2-0.4 volt?**	**Yes** END the active command. CHECK the transfer case. REFER to Section 308-07B . CLEAR the DTCs. REPEAT the self-test. **No** END the active command. GO to C17 .
C17 CHECK CIRCUIT CCF03 (GY/BN) FOR AN OPEN	
• Ignition OFF. • Disconnect: Transfer Case C350. • Disconnect: 4X4 Control Module C281B. • Measure the resistance between 4X4 control module C281B-1, circuit CCF03 (GY/BN), harness side and transfer case C350-16, circuit CCF03 (GY/BN), harness side.	**Yes** GO to C18 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

 N0072600 • **Is the resistance less than 5 ohms?**	
C18 CHECK CIRCUIT CCF03 (GY/BN) FOR A SHORT TO BATTERY	
• Ignition ON. • Measure the voltage between transfer case C350-16, circuit CCF03 (GY/BN), harness side and ground.  N0058003 • **Is any voltage present?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** INSTALL a new 4X4 control module. REFER to 4X4 Control Module in this section. CLEAR the DTCs. REPEAT the self-test.
C19 CHECK THE TP STATUS (TPI) PID	
• Enter the following diagnostic mode on the scan tool: DataLogger - 4X4 Control Module. • **NOTE:** The TPI PID is APP as communicated by the PCM via HS-CAN . • Slowly move the accelerator pedal from closed throttle to WOT and observe the TPI PID, KOEO . • **Does the throttle output PID vary between 0 at closed throttle and 255 at WOT ?**	**Yes** GO to C20 . **No** CHECK the APP sensor and/or PCM for faults. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. CLEAR the DTCs. REPEAT the self-test.
C20 CHECK THE ABS MODULE WHEEL SPEED SENSOR PIDs	
• Enter the following diagnostic mode on the scan tool: DataLogger - ABS Module. • While driving the vehicle at 30 km/h (18 mph), monitor the following wheel speed sensor PIDs: ♦ Left Front Wheel Speed Sensor (LF_WSPD) ♦ Left Rear Wheel Speed Sensor (LR_WSPD) ♦ Right Front Wheel Speed Sensor (RF_WSPD) ♦ Right Rear Wheel Speed Sensor (RR_WSPD) • Compare the speedometer reading to the wheel speed sensor PIDs. • **Do the wheel speed sensor PIDs and speedometer speeds match within 1.5 km/h (1 mph)?**	**Yes** GO to C16 . **No** CHECK the ABS for faults. REFER to Section 206-09 . CLEAR the DTCs. REPEAT the self-test.
C21 CHECK THE IGNITION SWITCH STATUS PIDs	
	Yes GO to C22 .

• Enter the following diagnostic mode on the scan tool: DataLogger - 4X4 Control Module. • Monitor the following ignition switch PIDs: ♦ Ignition Switch - Off/Unlock Position (IGN_O/U) ♦ ACC Position (IGN_A) ♦ Start Position 3 (IGN_S) ♦ Ignition Switch - Run/Start Position (IGN_R/S) ♦ Ignition Switch - Run Position (IGN_R) • **Do the ignition switch PIDs match the ignition switch positions?**	**No** If the IGN_R/S PID did not match, CHECK Smart Junction Box (SJB) fuse 18 (10A). If the fuse is OK, REPAIR circuit CBP18 (GY/OG). CLEAR the DTCs. REPEAT the self-test. If the IGN_O/U, IGN_A, IGN_S or IGN_R PIDs did not match, REFER to Section 211-05 to diagnose the ignition switch concern.
C22 CHECK THE 4WD CLUTCH PWM STATUS (4WDCPWMST) PID WITH AWD LOCKED MODE SELECTED	
• Enter the following diagnostic mode on the scan tool: DataLogger - 4X4 Control Module. • Monitor the 4WDCPWMST PID. • **Does the 4WDCPWMST PID value equal 10%?**	**Yes** CHECK the IC . REFER to Section 413-01 . CLEAR the DTCs. REPEAT the self-test. **No** INSTALL a new 4X4 control module. REFER to 4X4 Control Module in this section. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test D: The 4X4 Indicator Does Not Operate Correctly/Does Not Operate

Refer to Wiring Diagrams Cell 34 , Four-Wheel Drive System for schematic and connector information.

Normal Operation

The Four-Wheel Drive (4WD) system status is transmitted to the Instrument Cluster (IC) from the 4X4 control module through the High Speed Controller Area Network (HS-CAN) to the powertrain Malfunction Indicator Lamp (MIL). A steady indicator displays if the vehicle is in All-Wheel Drive (AWD) LOCKED mode, according to the driver selection. A 4WD system fault condition will illuminate the powertrain MIL . The powertrain MIL includes other general powertrain system failures. For information about HS-CAN , refer to Section 418-00 .

This pinpoint test is intended to diagnose the following:

- IC
- 4WD system fault
- HS-CAN circuits
- 4X4 control module

PINPOINT TEST D: THE 4X4 INDICATOR DOES NOT OPERATE CORRECTLY/DOES NOT OPERATE

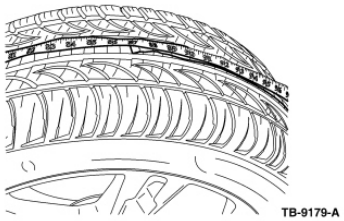
Test Step	Result / Action to Take
D1 CHECK THE 4X4 INDICATOR PROVE-OUT	

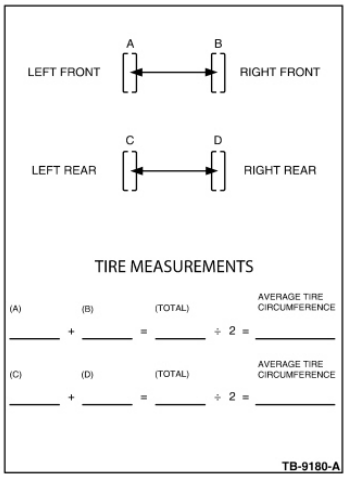
• Ignition ON. • Observe the 4X4 indicator in the IC . • **Does the 4X4 indicator prove out correctly?**	**Yes** GO to D2 . **No** CHECK the IC . REFER to Section 413-01 . TEST the system for normal operation.
D2 CHECK THE IGNITION SWITCH STATUS PID	
• Connect the scan tool. • Enter the following diagnostic mode on the scan tool: DataLogger - 4X4 Control Module. • Monitor the following ignition switch PIDs: ♦ Ignition Switch - Off/Unlock Position (IGN_O/U) ♦ ACC Position (IGN_A) ♦ Start Position 3 (IGN_S) ♦ Ignition Switch - Run/Start Position (IGN_R/S) ♦ Ignition Switch - Run Position (IGN_R) • **Do the ignition switch PIDs match the ignition switch positions?**	**Yes** GO to D3 . **No** If the IGN_R/S PID did not match, CHECK Smart Junction Box (SJB) fuse 18 (10A). If the fuse is OK, REPAIR circuit CBP18 (GY/OG). CLEAR the DTCs. REPEAT the self-test. If the IGN_O/U, IGN_A, IGN_S or IGN_R PIDs did not match, REFER to Section 211-05 to diagnose the ignition switch concern.
D3 CHECK FOR DTCs	
• Carry out the 4X4 control module self-test. • **Are DTCs present?**	**Yes** REFER to the 4X4 Control Module DTC Chart in this section for diagnosis. **No** GO to D4 .
D4 CHECK FOR INCORRECT 4X4 INDICATOR ILLUMINATION	
• Select AWD AUTO. • Observe the IC . • **Does the 4X4 indicator illuminate?**	**Yes** GO to D5 . **No** GO to D6 .
D5 CHECK THE 4WD CLUTCH PWM STATUS (4WDCPWMST) PID	
• Enter the following diagnostic mode on the scan tool: DataLogger - 4X4 Control Module. • Monitor the 4WDCPWMST PID.	**Yes** CHECK the IC . REFER to Section 413-01 . TEST the system for normal operation. **No** GO to Pinpoint Test C .

• **Does the 4WDCPWMST PID read approximately 2% at closed throttle?**	
D6 CHECK THE 4X4 INDICATOR	
• Select AWD LOCKED. • Observe the IC . • **Does the 4X4 indicator illuminate?**	**Yes** CHECK the AWD system. GO to Pinpoint Test G . **No** GO to Pinpoint Test C .

Pinpoint Test E: Straightline Driveline Wind-Up

Normal Operation





In order for the All-Wheel Drive (AWD) system to function correctly, tires and wheels must be the same size, be in good condition and the front and rear axle ratios must match.

This pinpoint test is intended to diagnose the following:
- Unmatched tire sizes
- Unequal amounts of tire wear
- Unequal tire inflation pressures
- Unmatched front and rear axle ratios

PINPOINT TEST E: STRAIGHTLINE DRIVELINE WIND-UP

NOTE: AWD LOCKED is not intended for driving on hard/dry surfaces.

Test Step	Result / Action to Take
E1 VERIFY THE CONCERN	
• Drive the vehicle and shift from AWD AUTO to AWD LOCKED. There should be minimal wind-up in 4H mode during straightline maneuvers, (wind-up in turns is normal; AWD LOCKED is not intended for driving on hard/dry surfaces). • **Is excessive wind-up present?**	**Yes** GO to E2 . **No** RETURN the vehicle to the customer. ADVISE about correct AWD system operation and normal vehicle behavior.
E2 ISOLATE TRANSFER CASE	
• Disconnect all wiring going to the transfer case and road test. • **Is excessive wind-up present?**	**Yes** CARRY OUT the AWD Functional Test. GO to Pinpoint Test F . **No** CONNECT the transfer case wiring and GO to E3 .
E3 CHECK FOR MATCHING WHEEL AND TIRE SIZES	
• Check the wheel and tire sizes. • **Do the 4 wheel and tire sizes match?**	**Yes** GO to E4 .

	No ADVISE the customer that AWD systems require 4 matched, correctly inflated, correctly maintained tires to operate correctly.
E4 CHECK TIRE INFLATION PRESSURE	
• Check the inflation pressure in each tire. Refer to Vehicle Certification (VC) label. • **Are the tire inflation pressures correct?**	**Yes** GO to E5 . **No** ADJUST the tire pressure as necessary. TEST the vehicle for normal operation. ADVISE the customer that AWD systems require 4 matched, correctly inflated, correctly maintained tires to operate correctly.
E5 CHECK THE TIRE CIRCUMFERENCE	
• Using a tailor's tape or flexible measuring tape, measure the circumference of all 4 tires and record the measurements.  TB-9179-A • Calculate the average of the circumference of the 2 front tires and 2 rear tires.  TB-9180-A • **Is the difference between the 2 averages or the side to side measurements greater than 13 mm (0.5 in)?**	**Yes** REPLACE the smallest circumference tire(s) and REMEASURE tire averages. REFER to Section 204-04 for additional information. **No** GO to E6 .
E6 CHECK THE FRONT AND REAR AXLE RATIOS	

• Check that front and rear axle ratios match. Refer to Section 205-00 . • **Do the front and rear axle ratios match?**	**Yes** RETURN the vehicle to the customer and ADVISE about correct AWD usage and normal vehicle behavior. **No** CHECK the vehicle identification label. INSTALL the correct axle(s). REFER to Section 205-02 and Section 205-03 .

Pinpoint Test F: All-Wheel Drive (AWD) System Functional Test

Refer to Wiring Diagrams Cell 34 , Four-Wheel Drive System for schematic and connector information.

Normal Operation

When the vehicle is operating in All-Wheel Drive (AWD) LOCKED mode, the front and rear driveshafts rotate at the same speed. The amount of traction the vehicle can achieve depends on the amount of traction each tire can establish with the road surface. In order for the AWD system to operate correctly, each wheel/tire assembly must have matching sizes, and the front and rear axle ratios must match.

This pinpoint test is intended to diagnose the following:
- 4X4 indicator
- 4X4 control module
- Transfer case and related components
- Wheel/tire assemblies

PINPOINT TEST F: AWD SYSTEM FUNCTIONAL TEST

NOTE: AWD LOCKED mode is not intended for driving on hard/dry surfaces.

Test Step	Result / Action to Take
F1 CHECK THE AWD LOCKED INDICATOR PROVE-OUT	
• Ignition ON. • **Does the 4X4 indicator illuminate at prove out?**	**Yes** GO to F2 . **No** CHECK the Instrument Cluster (IC). REFER to Section 413-01 . TEST the system for normal operation.
F2 CHECK THE AWD AUTO OPERATION	
• Select AWD AUTO. • **Is the 4X4 indicator off?**	**Yes** GO to F5 . **No** GO to F3 .
F3 CHECK FOR DTCs	
• Connect the scan tool.	**Yes** REFER to the 4X4 Control Module DTC

• Carry out the 4X4 control module self-test. • **Are DTCs present?**	Chart in this section for diagnosis. **No** GO to F4 .
F4 CHECK FOR WIND-UP IN AWD AUTO	
• Drive the vehicle on a dry, hard surface in turns. • **Is wind-up present in turns?**	**Yes** GO to Pinpoint Test C . **No** GO to Pinpoint Test D .
F5 CHECK THE 4WD CLUTCH PWM STATUS (4WDCPWMST) PID	
• Connect the scan tool. • Enter the following diagnostic mode on the scan tool: DataLogger - 4X4 Control Module. • Monitor the 4WDCPWMST PID. • **Does the 4WDCPWMST PID indicate approximately 2-4% clutch application at closed throttle?**	**Yes** GO to F6 . **No** GO to Pinpoint Test C .
F6 CHECK THE ABS MODULE WHEEL SPEED SENSOR PIDs	
• Enter the following diagnostic mode on the scan tool: DataLogger - ABS Module. • While driving the vehicle at 30 km/h (18 mph), monitor the following wheel speed sensor PIDs: ♦ Left Front Wheel Speed Sensor (LF_WSPD) ♦ Left Rear Wheel Speed Sensor (LR_WSPD) ♦ Right Front Wheel Speed Sensor (RF_WSPD) ♦ Right Rear Wheel Speed Sensor (RR_WSPD) • Compare the speedometer reading to the wheel speed sensor PIDs. • **Do the wheel speed sensor PIDs and speedometer speeds match within 1.5 km/h (1 mph)?**	**Yes** GO to F7 . **No** VERIFY that the 4 road wheels are the same size and have similar tread depth. CHECK the ABS for faults. REFER to Section 206-09 . TEST the system for normal operation.
F7 CHECK THE TP STATUS (TPI) PID	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger - 4X4 Control Module. • **NOTE:** The TPI PID is Accelerator Pedal Position (APP) as communicated by the PCM via High Speed Controller Area Network (HS-CAN). • Slowly move throttle from closed throttle to Wide Open Throttle (WOT) and observe the TPI PID, Key ON Engine OFF (KOEO).	**Yes** GO to F8 . **No** CHECK the APP sensor and/or PCM. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. TEST the system for normal operation.

• **Does the TPI PID value vary between 0 at closed throttle and 255 at WOT ?**	
F8 CHECK FOR WIND-UP IN TURNS ON THE THROTTLE	
• Drive the vehicle on a dry, hard surface, executing turns while applying the throttle. • **Is wind-up present?**	**Yes** CHECK the transfer case. REFER to Section 308-07B . TEST the system for normal operation. **No** GO to F9 .
F9 CHECK THE AWD LOCKED OPERATION	
• Select AWD LOCKED. • **Does the 4X4 indicator illuminate correctly?**	**Yes** GO to F10 . **No** GO to F11 .
F10 CHECK FOR AWD LOCKED WIND-UP	
• Drive the vehicle on a dry, hard surface in turns. • **Is wind-up present in turns?**	**Yes** GO to F13 . **No** GO to Pinpoint Test C .
F11 CHECK FOR DTCs	
• Carry out the 4X4 control module self-test. • **Are DTCs present?**	**Yes** REFER to the 4X4 Control Module DTC Chart in this section for diagnosis. **No** GO to F12 .
F12 CHECK FOR WIND-UP IN AWD LOCKED WHILE APPLYING THE THROTTLE	
• Drive the vehicle on a dry, hard surface in turns while applying the throttle. • **Is wind-up present in turns?**	**Yes** GO to Pinpoint Test D . **No** GO to Pinpoint Test C .
F13 CHECK THE AWD AUTO OPERATION	
• Select AWD AUTO. • **Does the 4X4 indicator turn off?**	**Yes** The AWD system is operating correctly. **No** GO to F14 .
F14 CHECK FOR DTCs	
• Carry out the 4X4 control module self-test. • **Are DTCs retrieved?**	**Yes** REFER to the 4X4 Control Module DTC Chart in this section. **No** GO to F15 .
F15 CHECK FOR WIND-UP IN AWD AUTO	

• Drive the vehicle on a dry, hard surface in turns. • **Is wind-up present in turns?**	**Yes** GO to Pinpoint Test D . **No** GO to Pinpoint Test C .

Pinpoint Test G: The Vehicle Binds in Turns/Resists Turning/Pulsates/Shudders in a Straight Line

Refer to Wiring Diagrams Cell 34 , Four-Wheel Drive System for schematic and connector information.

Normal Operation

When the vehicle is operating in All-Wheel Drive (AWD) LOCKED mode, the front and rear driveshafts rotate at the same speed. The amount of traction the vehicle can achieve depends on the amount of traction each tire can establish with the road surface. In order for the AWD system to operate correctly, each wheel/tire assembly must have matching sizes and the front and rear axle ratios must match.

This pinpoint test is intended to diagnose the following:

- Unmatched tire sizes
- Unequal amounts of tire wear
- Unequal tire inflation pressures
- Unmatched front and rear axle ratios

PINPOINT TEST G: THE VEHICLE BINDS IN TURNS/RESISTS TURNING/PULSATES/SHUDDERS IN A STRAIGHT LINE

NOTE: All-Wheel Drive (AWD) LOCKED mode is not intended for driving on hard/dry surfaces.

Test Step	Result / Action to Take
G1 VERIFY THE CONCERN	
• Test drive the vehicle on a straight stretch of road in AWD AUTO mode. • Drive the vehicle through turns and parking lot maneuvers. • **Does the vehicle bind, pulsate or shudder?**	**Yes** If the problem occurs in AWD AUTO mode, GO to G2 ; in AWD LOCKED mode, binding is a normal condition. **No** GO to Pinpoint Test F .
G2 CHECK THE 4X4 INDICATOR	
• Review the test drive notes. • **Did the 4X4 indicator or the powertrain Malfunction Indicator Lamp (MIL) illuminate?**	**Yes** If the powertrain MIL is illuminated, GO to G4 . If the 4X4 indicator stayed illuminated, GO to G3 . **No** GO to G5 .
G3 VERIFY THE FAULT	
• Review the test drive notes. • **Was AWD LOCKED selected when the indicators were**	**Yes** The system is functioning correctly. **No**

illuminated?	The fault may have been caused by an intermittent, uncommanded or autolock shift. GO to Pinpoint Test F .
G4 CHECK FOR DTCs	
• Connect the scan tool. • Carry out the 4X4 control module self-test. • **Are DTCs retrieved?**	**Yes** REFER to the 4X4 Control Module DTC Chart in this section for diagnosis. **No** GO to G5 .
G5 VERIFY THE CONCERN	
• Ignition OFF. • Disconnect: Transfer Case C350. • Test drive the vehicle on a straight stretch of road and in turns, and shift the transfer case through each mode. Record any fault conditions. • **Is the concern present?**	**Yes** **Vehicles with limited slip rear differential:** The condition may be normal and no repair action is necessary. CHECK the rear axle to verify. REFER to Section 205-02 . TEST the system for normal operation. **Vehicles without limited slip rear differential:** INSPECT the driveline components for damage or wear. REFER to Inspection and Verification in this section. TEST the system for normal operation. **No** GO to G6 .
G6 CHECK THE 4WD CLUTCH PWM STATUS (4WDCPWMST) PID	
• Ignition OFF. • Connect: Transfer Case C350. • Ignition ON. • Clear the 4X4 control module DTCs. • Enter the following diagnostic mode on the scan tool: DataLogger - 4X4 Control Module. • Monitor the 4WDCPWMST PID at closed throttle, Key ON Engine OFF (KOEO). • **Is the 4WDCPWMST PID greater than 10%?**	**Yes** GO to G7 . **No** CHECK the transfer case. REFER to Section 308-07B . TEST the system for normal operation.
G7 CHECK THE ABS MODULE WHEEL SPEED SENSOR PIDs	
• Enter the following diagnostic mode on the scan tool: DataLogger - ABS Module. • While driving the vehicle at 30 km/h (18 mph), monitor the following wheel speed sensor PIDs: ♦ Left Front Wheel Speed Sensor (LF_WSPD) ♦ Left Rear Wheel Speed Sensor (LR_WSPD)	**Yes** GO to G8 . **No** VERIFY that the 4 road wheels are the same size and have similar tread depth. CHECK the ABS for faults. REFER to Section 206-09 . TEST the system for normal operation.

♦ Right Front Wheel Speed Sensor (RF_WSPD) ♦ Right Rear Wheel Speed Sensor (RR_WSPD) • Compare the speedometer reading to the wheel speed sensor PIDs. • **Do the wheel speed sensor PIDs and speedometer speeds match within 1.5 km/h (1 mph)?**	
G8 CHECK THE TP STATUS (TPI) PID	
• Enter the following diagnostic mode on the scan tool: DataLogger - 4X4 Control Module. • **NOTE:** The TPI PID is Accelerator Pedal Position (APP) as communicated by the PCM via High Speed Controller Area Network (HS-CAN). • Slowly move throttle from closed throttle to Wide Open Throttle (WOT) and observe the TPI PID, KOEO . • **Does the TPI PID value vary between 0 at closed throttle and 255 at WOT ?**	**Yes** GO to G9 . **No** CHECK the APP sensor and/or PCM for faults. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. TEST the system for normal operation.
G9 CHECK THE TRANSFER CASE FRONT DRIVESHAFT OUTPUT	
• With the vehicle in the NEUTRAL, position it on a hoist. Refer to Section 100-02 . • Rotate the front driveshaft by hand. • **Does the front driveshaft rotate freely (does it require less than 45 Nm (33 lb-ft) to rotate)?**	**Yes** GO to Pinpoint Test C . **No** CHECK the transfer case. REFER to Section 308-07B . TEST the system for normal operation.

Four Wheel Drive (4WD) Systems - 2-Speed Torque-On-Demand

Special Tool(s)

 ST2574-A	Flex Probe Kit 105-R025D or equivalent
 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Principles of Operation

The vehicle is equipped with an automatic electronic-shift system that allows the operator to choose between 3 different Four-Wheel Drive (4WD) modes. The operator can switch between 4X4 AUTO and 4X4 HIGH at any speed. To engage or disengage 4X4 LOW modes, the vehicle speed must be less than 3 km/h (2 mph) and the transmission must be in NEUTRAL.

Wheel slip is sensed by monitoring the average front and rear wheel speeds. Based on steering wheel angle, Accelerator Pedal Position (APP) and wheel slip, a Pulse-Width Modulation (PWM) signal is transmitted to the transfer case as torque is required.

The 4X4 control module will provide the ABS with current clutch duty cycle and whether or not ABS may command the clutch duty cycle.

The brake subsystem sends the following information signals to the 4WD system:

- Occurrences of brake events and failures. Refer to Section 206-09 .
- Steering wheel angle status. Refer to Section 206-09 .
- Wheel speeds. Refer to Section 206-09 .

A concern with any of the above listed brake system signals will affect operation of the 4WD system.

The APP output signal is provided to the 4X4 control module from the PCM. This signal is used by the 4X4 control module in controlling the transfer case clutch. The transfer case shift motor sense plate, an integral part of the assembly, informs the 4X4 control module of the transfer case position.

The electric shift motor is mounted externally to the transfer case. It drives a rotary cam which moves the range fork within the transfer case between the HIGH range (4X4 AUTO and 4X4 HIGH modes) and low range (4X4 LOW) positions.

The 4X4 control module varies the torque sent to the front driveline by controlling the transfer case clutch. At rest and under cruising conditions, the 4X4 control module activates the transfer case clutch a minimum duty

cycle (percentage of time the clutch is turned on), which allows for the slight difference between the front and rear driveshafts which normally occurs when negotiating a corner on dry pavement. Under any of the following conditions, the 4X4 control module will increase the duty cycle in order to prevent or control slip.

- Slip is detected
- Transfer case shift motor contact plate position inputs A, B, C, D

Feature inputs:

- Mode Select Switch (MSS)
- Steering wheel angle
- Transmission range indicator (transmitted from the Transmission Control Module (TCM))
- Wheel speed (transmitted from the ABS module)
- APP information (transmitted from the PCM)

Feature outputs:

- PWM signal to transfer case clutch
- 4WD message center indicators
- Transfer case shift motor outputs

Shifts between 4X4 AUTO mode and 4X4 HIGH modes can be made at any speed. Listed below are the inputs and outputs needed by the 4X4 control module to execute a change between any of these modes.

Feature inputs:

- APP information (transmitted from the PCM)
- MSS
- Transfer case shift motor encoder contact plate position inputs A, B, C, D
- Wheel speed (transmitted from ABS module)

Feature outputs:

- Transfer case shift motor outputs
- 4WD message center indicators
- PWM signal to transfer case clutch

When shifting into or out of 4X4 LOW mode, the 4X4 control module requires that the vehicle speed is less than 3 km/h (2 mph) and the transmission is in NEUTRAL.

Feature inputs:

- APP information (transmitted from the PCM)
- MSS
- Transfer case shift motor encoder contact plate position inputs A, B, C, D
- Wheel speed signal (transmitted from ABS module)

Feature outputs:

- Transfer case shift motor outputs
- 4WD message center indicators
- PWM signal to transfer case clutch

Neutral Tow

The neutral tow feature is a program embedded in the 4X4 control module, which must be activated by a dealer technician. The neutral tow feature disengages the wheels from the powertrain by shifting the transfer case to the NEUTRAL position. This allows the vehicle to be towed with all 4 wheels on the ground. To activate the neutral tow feature, the dealer technician must access the 4X4 control module through the scan tool and data link connector. Once communication is achieved, the technician can request the neutral tow feature be enabled. The technician must also install the neutral tow indicator lamp (and neutral position sensor for vehicles equipped with 4.6L), in order for the feature to be activated.

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Axle shafts and CV joints • Driveshaft and U-joints • Fluid leaks • Matching tire sizes • Transfer case shift motor	• Battery Junction Box (BJB) fuses: ♦ 23 (20A) ♦ 26 (20A) • Smart Junction Box (SJB) fuse 18 (10A) • 4X4 control module • Wiring harness • Encoder contact plate • Connector(s) • Circuitry • Mode Select Switch (MSS)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** TheVehicle Communication Module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM .
   - refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.

- verify the scan tool operation with a known good vehicle.
- refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record Continuous Memory Diagnostic Trouble Codes (CMDTCs).

8. **NOTE:** Before carrying out the self-test, make sure that:

   - the ignition is in RUN.
   - all doors are closed.
   - the brake pedal is not pressed.
   - the transmission is not in NEUTRAL.

   Clear the CMDTCs and carry out the self-test diagnostics for the 4X4 control module.

9. If the DTCs retrieved are related to the concern, go to the 4X4 Control Module DTC Chart in this section. For all other DTCs, refer to Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart - Four Wheel Drive (4WD) or GO to Symptom Chart - NVH .

4X4 Control Module DTC Chart

DTC	Description	Action
B1317	Battery Voltage High	GO to Pinpoint Test H .
B1318	Battery Voltage Low	GO to Pinpoint Test H .
B1319	Driver Door Ajar Circuit Failure	GO to Pinpoint Test O .
B1322	Driver Door Ajar Circuit Short to Ground	GO to Pinpoint Test O .
B1342	ECU is Faulted	CLEAR the DTCs. REPEAT the 4X4 control module self-test. If DTC B1342 is retrieved, INSTALL a new 4X4 control module. REFER to 4X4 Control Module in this section. CLEAR the DTCs. REPEAT the self-test.
B1555	Ignition Run/Start Circuit Failure	GO to Pinpoint Test I .
C1729	Transfer Case Unable to Transition Between 4H and 4L	GO to Pinpoint Test K .
C1970	4X4 Low Mode Switch LED Short to Battery	GO to Pinpoint Test K .
C1971	4X4 Low Mode Switch LED Circuit Failure	GO to Pinpoint Test K .
P1707	Transfer Case Neutral or Park/Neutral Indication Circuit	GO to Pinpoint Test O .
P1812	4-Wheel Drive Mode Select Circuit Failure	GO to Pinpoint Test K .
P1815		GO to Pinpoint Test K .

	4-Wheel Drive Mode Select Short Circuit to Ground	
P1816	Transmission Neutral Safety Switch Circuit Failure	GO to Pinpoint Test O .
P1819	Transmission Neutral Safety Switch Short Circuit to Ground	GO to Pinpoint Test O .
P1824	4-Wheel Drive Clutch Relay Circuit Failure	GO to Pinpoint Test J .
P1825	4-Wheel Drive Clutch Relay Open Circuit	GO to Pinpoint Test J .
P1826	4-Wheel Drive Low Clutch Relay Short Circuit to Battery	GO to Pinpoint Test J .
P1827	4-Wheel Drive Low Clutch Relay Short Circuit to Ground	GO to Pinpoint Test J .
P1849	Transfer Case Contact Plate 'A' Short Circuit to Ground	GO to Pinpoint Test K .
P1853	Transfer Case Contact Plate 'B' Short Circuit to Ground	GO to Pinpoint Test K .
P1857	Transfer Case Contact Plate 'C' Short Circuit to Ground	GO to Pinpoint Test K .
P1861	Transfer Case Contact Plate 'D' Short Circuit to Ground	GO to Pinpoint Test K .
P1867	Transfer Case Contact Plate General Circuit Failure	GO to Pinpoint Test K .
P1891	Transfer Case Contact Plate Ground Return Open Circuit	GO to Pinpoint Test K .
U1900	CAN Communication BUS Fault - Receive Error	**NOTE:** Do not install a new 4X4 control module as part of repair for 4X4 control module DTC U1900 fault. The 4X4 control module is not the source of the fault when DTC U1900 is present CARRY OUT the network test to identify the module communication was lost with. REFER to Section 418-00 to diagnose the module communication.
U2023	Fault Received From External Node	REFER to Section 206-09 to diagnose the wheel speed sensor fault.
U2050	No Application Present	REFER to Section 418-01 .

Smart Junction Box (SJB) DTC Chart

DTC	Description	Source	Action
B1895	Driver's/Passenger's Door Ajar Output Circuit Failure	Smart Junction Box (SJB)	GO to Pinpoint Test O .
B1896	Driver's/Passenger's Door Ajar Output Circuit Short to Battery	SJB	GO to Pinpoint Test O .
All Other DTCs	-	SJB	REFER to Section 419-10 .

Symptom Chart - Four-Wheel Drive (4WD)

Symptom Chart - Four-Wheel Drive (4WD)

Symptom Chart - NVH

Symptom Chart - NVH

NOTE: NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to Section 100-04 . Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to Section 100-04 for the next likely system and continue diagnosis.

ConditionPossible SourcesAction

- Transfer case whine - noise at all ranges
- Incorrect fluid level or fluid quality
- CHECK that the transfer case is filled to the correct level and with the specified fluid. REFER to Section 308-07B .
- Worn oil pump
- DISASSEMBLE the transfer case. CHECK the oil pump for wear or damage. REPAIR as necessary. REFER to Section 308-07B .
- Under-inflated or oversized tires
- CONFIRM that the tires and wheels are correct for the vehicle. CHECK that the tire inflation pressures are correct.
- Transfer case growl/rumble - noise at all ranges
- Damaged or worn bearings or planetary gear
- DISASSEMBLE the transfer case. CHECK the bearings or planetary gear for wear or damage. REPAIR as necessary. REFER to Section 308-07B .
- Transfer case scraping/grating - noise at all ranges

- Excessively stretched drive chain hitting the case
- DISASSEMBLE the transfer case. CHECK the drive chain for wear or damage. REPAIR as necessary. REFER to Section 308-07B .
- Transfer case howl/hum - noise at all ranges or 4X4 only
- Worn or damaged sun (input) gear, clutch pack (intermediate) gear or output shaft gear
- DISASSEMBLE the transfer case. CHECK the gears for wear or damage. REPAIR as necessary. REFER to Section 308-07B .

Pinpoint Tests

Pinpoint Test H: DTC B1317/B1318

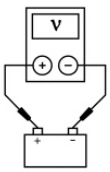
Refer to Wiring Diagrams Cell 34 , Four-Wheel Drive System for schematic and connector information.

Normal Operation

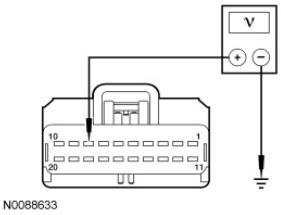
If the 4X4 control module observes an overpower or underpower voltage condition, DTCs are set and the 4X4 control module may not allow Four-Wheel Drive (4WD) operation.

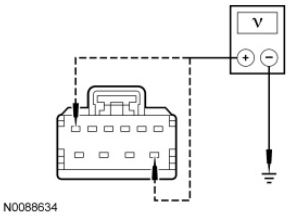
- DTC B1317 (Battery Voltage High) - When the 4X4 control module detects battery voltage greater than 16 volts for at least 10 seconds, this DTC is set.
- DTC B1318 (Battery Voltage Low) - When the 4X4 control module detects battery voltage less than 9 volts for at least 10 seconds, with the engine running at 1,500 rpm or greater, this DTC is set.

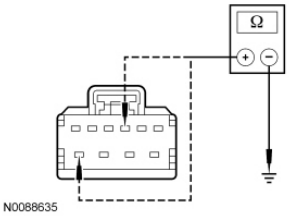
This pinpoint test is intended to diagnose the following:



- Fuses
- Wiring, terminals or connectors
- 4X4 control module







PINPOINT TEST H: DTC B1317/B1318

NOTE: DTC B1317 or B1318 can be set if the vehicle has been recently jump started, the battery has been recently charged or the battery has been discharged. The battery may become discharged due to excessive load(s) on the charging system from aftermarket accessories or if the battery has been left unattended with the accessories on.

NOTE: Carry out a thorough inspection and verification before proceeding with the pinpoint test. Refer to Inspection and Verification in this section.

Test Step	Result / Action to Take
H1 RETRIEVE ALL CMDTCs IN ALL MODULES	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - All CMDTCs .	**Yes** REFER to Section 414-00 for diagnosis of the battery and charging system.

• **Is B1317 or B1318 present in one or more modules AND P0563, P0620, P0625, P0626 or P065B present in the PCM?**	**No** GO to H2 .
H2 CHECK BATTERY CONDITION	
• Ignition OFF. • Refer to Section 414-01 and carry out the Battery - Condition Test. • **Does the battery pass the condition test?**	**Yes** If the battery passed the condition test but required a recharge, REFER to Section 414-00 to diagnose the charging system. CLEAR all Continuous Memory Diagnostic Trouble Codes (CMDTCs). TEST the system for normal operation. If the battery passed the condition test and did not require a recharge, GO to H3 . **No** INSTALL a new battery. REFER to Section 414-01 . CLEAR all CMDTCs . TEST the system for normal operation.
H3 CHECK THE CHARGING SYSTEM VOLTAGE	
NOTE: Do not allow the engine rpm to increase above 2,000 rpm while performing this step or the generator may self excite and result in default charging system output voltage. If engine rpm has gone above 2,000 rpm, shut the vehicle OFF and restart the engine before performing this step. • Start the engine. • Measure the voltage of the battery: ♦ For DTC B1317, turn off all accessories and run the engine at 1,500 rpm for a minimum of 2 minutes. ♦ For DTC B1318, turn on headlights and HVAC fan on high and run engine at 1,500 rpm for a minimum of 2 minutes.  AJ0210-A • **Is the battery voltage between 13-15.2 volts?**	**Yes** For DTC B1318, GO to H4 . For DTC B1317, INSTALL a new 4X4 control module. REFER to 4X4 Control Module in this section. CLEAR all CMDTCs . REPEAT the self-test. **No** REFER to Section 414-00 to diagnose the charging system. CLEAR all CMDTCs . TEST the system for normal operation.
H4 CHECK POWER TO 4X4 CONTROL MODULE	

• Ignition OFF. • Disconnect: 4X4 Control Module C281A and C281B. • Ignition ON. • Measure the voltage between 4X4 control module C281A-8, circuit CBP18 (GY/OG), harness side and ground.  N0088633 • Measure the voltage between 4X4 control module C281B-6, circuit SBB23 (WH/RD), harness side and ground; and between 4X4 control module C281B-7, circuit SBB26 (YE/RD), harness side and ground.  N0088634 • **Is the voltage greater than 10 volts?**	**Yes** GO to H5 . **No** VERIFY Smart Junction Box (SJB) fuse 18 (10A) and Battery Junction Box (BJB) fuse(s) 23 (20A) and 26 (20A) are OK, REPAIR the circuit in question. If SJB and BJB fuse(s) are not OK, REFER to the Wiring Diagrams manual to identify possible causes of the circuit short. CLEAR all CMDTCs . REPEAT the self-test.
H5 CHECK GROUND CIRCUITS TO 4X4 CONTROL MODULE FOR AN OPEN	
• Ignition OFF. • Measure the resistance between 4X4 control module C281B-3, circuit GD145 (BK/BU), harness side and ground; and between 4X4 control module C281B-10, circuit GD138 (BK/WH), harness side and ground. ♦ Repeat this measurement while wiggling the harness.  N0088635 • **Is the resistance less than 5 ohms?**	**Yes** GO to H6 . **No** REPAIR the circuit. CLEAR all CMDTCs . REPEAT the self-test.

H6 CHECK FOR CORRECT 4X4 CONTROL MODULE OPERATION	
• Ignition OFF. • Check the harness and component side connectors for: ♦ corrosion. ♦ pushed-out/bent pins. • Connect the 4X4 control module and make sure it seats correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new 4X4 control module. REFER to 4X4 Control Module in this section. CLEAR all CMDTCs . REPEAT the self-test. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR all CMDTCs . REPEAT the self-test.

Pinpoint Test I: DTC B1555

Refer to Wiring Diagrams Cell 34 , Four-Wheel Drive System for schematic and connector information.

Normal Operation

The 4X4 control module receives ignition switch position status from the hard-wired run/start input to 4X4 control module pin 8 and the ignition switch position status message communicated by the Instrument Cluster (IC) over the High Speed Controller Area Network (HS-CAN). The ignition switch position status message originates from the Smart Junction Box (SJB) which communicates the ignition switch position status over the Medium Speed Controller Area Network (MS-CAN) to the IC which acts as a gateway module, transferring the ignition switch status message from MS-CAN to HS-CAN . For information regarding network messaging, refer to Section 418-00 .

- DTC B1555 (Ignition Run/Start Circuit Failure) - If the ignition switch is not in RUN for the self test, this code will set.

This pinpoint test is intended to diagnose the following:
- Fuse
- Wiring, terminals or connectors
- Ignition switch and/or circuitry
- HS-CAN

PINPOINT TEST I: DTC B1555

Test Step	Result / Action to Take
I1 CARRY OUT NETWORK TEST	
• Ignition ON. • Connect the scan tool. • Carry out a network test. • **Did the network test pass?**	**Yes** GO to I2 . **No** REFER to Section 418-00 to diagnose the network concern.
I2 CHECK 4X4 INDICATOR PROVE-OUT	
	Yes For DTC B1555, GO to I3 . For all other DTCs, REFER to the

• Carry out the 4X4 control module self-test. • **Are any 4X4 control module DTCs present?**	4X4 Control Module DTC Chart in this section. **No** The system is functioning correctly.
I3 CHECK THE 4X4 CONTROL MODULE IGNITION SWITCH STATUS PIDs	
• Enter the following diagnostic mode on the scan tool: DataLogger - 4X4 Control Module. • Monitor the following ignition switch PIDs: ♦ Ignition Switch - Off/Unlock Position (IGN_O/U) ♦ ACC Position (IGN_A) ♦ Start Position 3 (IGN_S) ♦ Ignition Switch - Run/Start Position (IGN_R/S) ♦ Ignition Switch - Run Position (IGN_R) • **Do the ignition switch PIDs match the ignition switch positions?**	**Yes** The system is functioning correctly. **No** If the IGN_R/S PID did not match, CHECK SJB fuse 18 (10A). If the fuse is OK, REPAIR circuit CBP18 (GY/OG). CLEAR the DTCs. REPEAT the self-test. If the IGN_O/U, IGN_A, IGN_S or IGN_R PIDs did not match, REFER to Section 211-05 to diagnose the ignition switch concern.

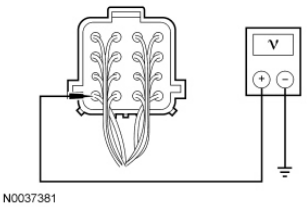
Pinpoint Test J: The Vehicle Does Not Shift Between 4X4 AUTO and 4X4 HIGH Correctly

Refer to Wiring Diagrams Cell 34 , Four-Wheel Drive (4WD) System for schematic and connector information.

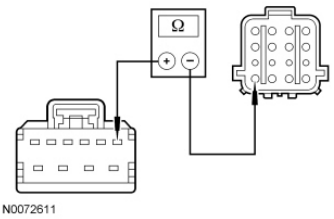
Normal Operation

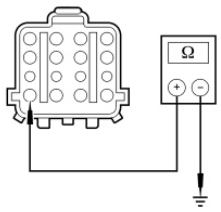
With the key in the ON position, the 4X4 control module receives the operator's choice of Four-Wheel Drive (4WD) selection from the Mode Select Switch (MSS). The 4X4 control module then controls the electric clutch and transfer case shift motor. If the transfer case is not responding to the operator's intentions, systematically check all inputs and outputs to the 4X4 control module.

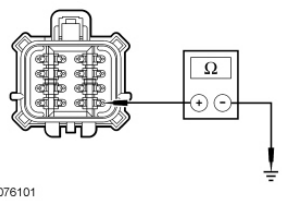
DTC Description	Fault Trigger Conditions
• DTC P1824 - 4-Wheel Drive Clutch Relay Circuit Failure	Hard short to ground on clutch output line sensed by 4X4 control module C281B pin 1 or overtemperature condition on clutch coil circuit detected.
• DTC P1825 - 4-Wheel Drive Clutch Relay Open Circuit	Open circuit on clutch output line sensed by 4X4 control module C281B pin 1.



• DTC P1826 - 4-Wheel Drive Low Clutch Circuit to Battery	Short to battery on clutch output line sensed by 4X4 control module C281B pin 1.
• DTC P1827 - 4-Wheel Drive Low Clutch Circuit to Ground	Soft short to ground on clutch output line sensed by 4X4 control module C281B pin 1.

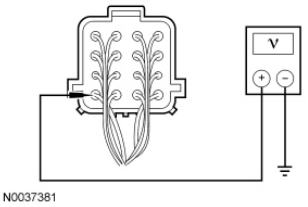


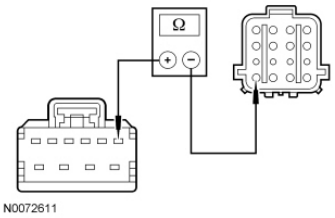




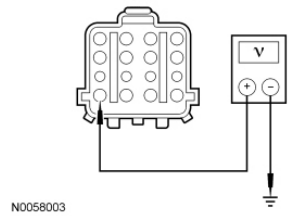
This pinpoint test is intended to diagnose the following:

- 4X4 indicators
- Transfer case
- 4X4 control module
- Wiring, terminals or connectors
- Transfer case clutch
- Ignition switch and/or circuitry
- High Speed Controller Area Network (HS-CAN)
- Instrument Cluster (IC)



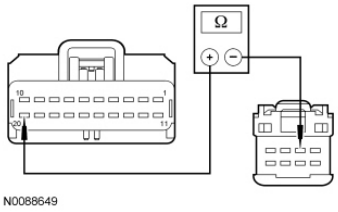


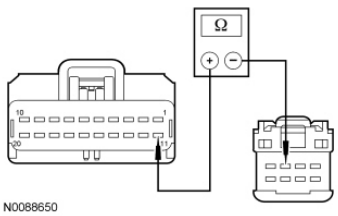
PINPOINT TEST J: THE VEHICLE DOES NOT SHIFT BETWEEN 4X4 AUTO AND 4X4 HIGH CORRECTLY

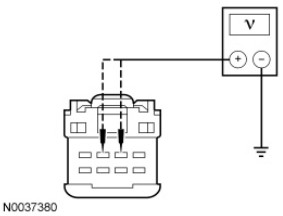


Test Step	Result / Action to Take
J1 CHECK THE 4X4 INDICATORS PROVE-OUT	
• Ignition OFF. • Start the vehicle while observing the 4X4 indicators prove out. • **Did the indicators prove out?**	**Yes** GO to J2 . **No** CHECK the IC . REFER to Section 413-01 . TEST the system for normal operation.
J2 CHECK THE POWERTRAIN MIL	
• Start the engine. • Observe the powertrain Malfunction Indicator Lamp (MIL). • **Does the powertrain MIL illuminate?**	**Yes** GO to J3 . **No** GO to J4 .
J3 CARRY OUT THE 4X4 CONTROL MODULE SELF-TEST	
• Connect the scan tool. • Carry out the 4X4 control module self-test. • **Did the self-test complete?**	**Yes** GO to J4 . **No** REFER to Section 418-00 to diagnose no communication with the 4X4 control module. TEST the system for normal operation.
J4 REVIEW THE SELF-TEST	
• Review the self-test results. • **Were on-demand DTCs retrieved?**	**Yes** GO to J5 . **No** CHECK the IC . REFER to Section 413-01 .

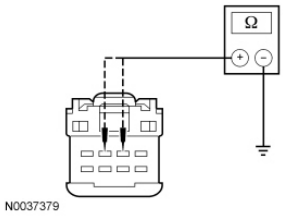
	TEST the system for normal operation.
J5 CHECK FOR 4X4 INDICATOR ILLUMINATION	
• Select 4X4 HIGH. • **Does the 4X4 indicator illuminate?**	**Yes** GO to J6 . **No** GO to J22 .
J6 CHECK FOR WIND-UP IN 4X4 HIGH	
• Drive the vehicle on a dry, hard surface in turns while applying the throttle. • **Is wind-up present in turns?**	**Yes** GO to J14 . **No** GO to J7 .
J7 CHECK THE 4WD CLUTCH PWM STATUS (4WDCPWMST) PID	
• Enter the following diagnostic mode on the scan tool: DataLogger - 4X4 Control Module. • Monitor the 4WDCPWMST PID at Wide Open Throttle (WOT), with the transfer case in 4X4 HIGH, Key ON Engine OFF (KOEO). • **Does the 4WDCPWMST PID indicate 98% clutch at WOT ?**	**Yes** GO to J8 . **No** GO to J12 .
J8 CHECK VOLTAGE ON THE CLUTCH POWER CIRCUIT CCF03 (GY/BN) USING THE PWM OUTPUT CONTROL COMMAND #1 (CLCH_SOL) ACTIVE COMMAND	
• Use the scan tool CLCH_SOL active command to energize the transfer case clutch to 100%. • Measure the voltage by carefully back-probing transfer case C350-16, circuit CCF03 (GY/BN), component side and ground.  N0037381 • **Is the voltage greater than 8.5 volts?**	**Yes** END the CLCH_SOL active command. GO to J11 . **No** END the CLCH_SOL active command. GO to J9 .
J9 CHECK CIRCUIT CCF03 (GY/BN) FOR AN OPEN	







• Ignition OFF. • Disconnect: Transfer Case C350. • Disconnect: 4X4 Control Module C281B. • Measure the resistance between 4X4 control module C281B-1, circuit CCF03 (GY/BN), harness side and transfer case C350-16, circuit CCF03 (GY/BN), harness side.  N0072611 • **Is the resistance less than 5 ohms?**	**Yes** GO to J10 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
J10 CHECK CIRCUIT CCF03 (GY/BN) FOR A SHORT TO GROUND	
• Measure the resistance between transfer case C350-16, circuit CCF03 (GY/BN), harness side and ground.  N0057992 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to J11 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
J11 CHECK THE TRANSFER CASE CLUTCH COIL	
• Measure the resistance between transfer case C350 pin 16, circuit CCF03 (GY/BN), component side and ground.  N0076101 • **Is the resistance between 2-4 ohms?**	**Yes** The system is functioning correctly. **No** REPAIR the transfer case. REFER to Section 308-07B . CLEAR the DTCs. REPEAT the self-test.
J12 CHECK THE TP STATUS (TPI) PID	



• Enter the following diagnostic mode on the scan tool: DataLogger - 4X4 Control Module. • **NOTE:** The TPI PID is Accelerator Pedal Position (APP) as communicated by the PCM via HS-CAN . • Slowly move the accelerator pedal from closed throttle to WOT and observe the TPI PID, KOEO . • **Does the TPI PID vary between 0 at closed throttle and 255 at WOT ?**	**Yes** GO to J13 . **No** CHECK the APP sensor and/or PCM. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. CLEAR the DTCs. REPEAT the self-test.
J13 CHECK THE ABS MODULE WHEEL SPEED SENSOR PIDs	
• Enter the following diagnostic mode on the scan tool: DataLogger - ABS Module. • While driving the vehicle at 30 km/h (18 mph), monitor the following wheel speed sensor PIDs: ♦ Left Front Wheel Speed Sensor (LF_WSPD) ♦ Left Rear Wheel Speed Sensor (LR_WSPD) ♦ Right Front Wheel Speed Sensor (RF_WSPD) ♦ Right Rear Wheel Speed Sensor (RR_WSPD) • Compare the speedometer reading to the wheel speed sensor PIDs. • **Do the wheel speed sensor PIDs and speedometer speeds match within 1.5 km/h (1 mph)?**	**Yes** GO to J8 . **No** CHECK the ABS for faults. REFER to Section 206-09 . CLEAR the DTCs. REPEAT the self-test.
J14 CHECK THE 4X4 INDICATOR IN 4X4 AUTO	
• Select 4X4 AUTO. • **Does the 4X4 indicator turn off?**	**Yes** GO to J15 . **No** GO to Pinpoint Test L .
J15 CHECK FOR WIND-UP IN 4X4 AUTO	
• Drive the vehicle on a dry, hard surface in turns while applying the throttle. • **Is wind-up present in turns?**	**Yes** GO to J16 . **No** The 4WD drive system is operating correctly.
J16 CHECK THE 4WD CLUTCH PWM STATUS (4WDCPWMST) PID	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger - 4X4 Control Module. • Monitor the 4WDCPWMST PID at closed throttle, KOEO . • **Does the 4WDCPWMST PID indicate 2-4% clutch application at closed throttle?**	**Yes** GO to J17 . **No** GO to J20 .

J17 CHECK VOLTAGE ON THE CLUTCH POWER CIRCUIT CCF03 (GY/BN) USING THE PWM OUTPUT CONTROL COMMAND #1 (CLCH_SOL) ACTIVE COMMAND	
• Use the scan tool CLCH_SOL active command to energize the transfer case clutch to 4%. • Measure the voltage by carefully back-probing transfer case C350-16, circuit CCF03 (GY/BN), component side and ground.  N0037381 • **Is the voltage approximately 0.2-0.4 volt?**	**Yes** END the CLCH_SOL active command. CHECK the transfer case. REFER to Section 308-07B . CLEAR the DTCs. REPEAT the self-test. **No** END the CLCH_SOL active command. GO to J18 .
J18 CHECK CIRCUIT CCF03 (GY/BN) FOR AN OPEN	
• Ignition OFF. • Disconnect: Transfer Case C350. • Disconnect: 4X4 Control Module C281A. • Measure the resistance between 4X4 control module C281B-1, circuit CCF03 (GY/BN), harness side and transfer case C350-16, circuit CCF03 (GY/BN), harness side.  N0072611 • **Is the resistance less than 5 ohms?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** GO to J19 .
J19 CHECK CIRCUIT CCF03 (GY/BN) FOR A SHORT TO BATTERY	
• Ignition ON. • Measure the voltage between transfer case C350-16, circuit CCF03 (GY/BN), harness side and ground.	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** INSTALL a new 4X4 control module. REFER to 4X4 Control Module in this section. CLEAR the DTCs. REPEAT the self-test.

 N0058003 • **Is any voltage present?**	
J20 CHECK THE TP STATUS (TPI) PID	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger - 4X4 Control Module. • **NOTE:** The TPI PID is APP as communicated by the PCM via HS-CAN . • Slowly move the accelerator pedal from closed throttle to WOT and observe the TPI PID, KOEO . • **Does the TPI PID vary between 0 at closed throttle and 255 at WOT ?**	**Yes** GO to J21 . **No** CHECK the APP sensor and/or PCM for faults. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. CLEAR the DTCs. REPEAT the self-test.
J21 CHECK THE ABS MODULE WHEEL SPEED SENSOR PIDs	
• Enter the following diagnostic mode on the scan tool: DataLogger - ABS Module. • While driving the vehicle at 30 km/h (18 mph), monitor the following wheel speed sensor PIDs: ♦ Left Front Wheel Speed Sensor (LF_WSPD) ♦ Left Rear Wheel Speed Sensor (LR_WSPD) ♦ Right Front Wheel Speed Sensor (RF_WSPD) ♦ Right Rear Wheel Speed Sensor (RR_WSPD) • Compare the speedometer reading to the wheel speed sensor PIDs. • **Do the wheel speed sensor PIDs and speedometer speeds match within 1.5 km/h (1 mph)?**	**Yes** GO to J17 . **No** CHECK the ABS for faults. REFER to Section 206-09 . CLEAR the DTCs. REPEAT the self-test.
J22 CHECK THE IGNITION SWITCH STATUS PIDs	
• Enter the following diagnostic mode on the scan tool: DataLogger - 4X4 Control Module. • Monitor the following ignition switch PIDs: ♦ Ignition Switch - Off/Unlock Position (IGN_O/U) ♦ ACC Position (IGN_A) ♦ Start Position 3 (IGN_S) ♦ Ignition Switch - Run/Start Position (IGN_R/S) ♦ Ignition Switch - Run Position (IGN_R)	**Yes** GO to J23 . **No** If the IGN_R/S PID did not match, CHECK Smart Junction Box (SJB) fuse 18 (10A). If the fuse is OK, REPAIR circuit CBP18 (GY/OG). CLEAR the DTCs. REPEAT the self-test. If the IGN_O/U, IGN_A, IGN_S or IGN_R

• **Do the ignition switch PIDs match the ignition switch positions?**	PIDs did not match, REFER to Section 211-05 to diagnose the ignition switch concern.
J23 CHECK THE 4WD SWITCH STATUS (4WDINP_SW) PID IN 4X4 HIGH	
• Enter the following diagnostic mode on the scan tool: DataLogger - 4X4 Control Module. • Monitor the 4WDINP_SW PID while switching to 4X4 HIGH. • **Does the 4WDINP_SW PID indicate 4W Auto/Hi?**	**Yes** GO to J24 . **No** GO to J25 .
J24 CHECK THE 4WD CLUTCH PWM STATUS (4WDCPWMST) PID WITH THE MSS IN 4X4 HIGH	
• Monitor the 4WDCPWMST PID while switching to 4X4 HIGH. • **Does the 4WDCPWMST PID read 2-10% at closed throttle?**	**Yes** CHECK the IC . REFER to Section 413-01 . CLEAR the DTCs. REPEAT the self-test. **No** GO to J6 .
J25 CHECK THE MSS	
• Ignition OFF. • Disconnect: MSS C284. • **NOTE:** The MSS is a momentary switch, the button must be pressed and held when measuring resistance of the MSS . • Measure the resistance between MSS C284 pin 2 and pin 3, component side while pressing and holding each switch position button. Refer to the following chart: **MSS Position** / **Resistance (± 1%)** 4X4 AUTO — 39 ohms 4X4 HIGH — 237 ohms 4X4 LOW — 536 ohms  N0038956 • **Are the resistances within the specified values?**	**Yes** GO to J26 . **No** INSTALL a new MSS . REFER to Mode Select Switch (MSS) in this section. CLEAR the DTCs. REPEAT the self-test.

J26 CHECK MSS CIRCUITS RCF13 (WH/BN) AND CCF13 (WH/BU) FOR AN OPEN	
• Disconnect: 4X4 Control Module C281A. • Measure the resistance between 4X4 control module C281A-20, circuit RCF13 (WH/BN), harness side and MSS C284-2, circuit RCF13 (WH/BN), harness side.  • Measure the resistance between 4X4 control module C281A-11, circuit CCF13 (WH/BU), harness side and MSS C284-3, circuit CCF13 (WH/BU), harness side.  • **Are the resistances less than 5 ohms?**	**Yes** GO to J27 . **No** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test.
J27 CHECK MSS CIRCUITS RCF13 (WH/BN) AND CCF13 (WH/BU) FOR A SHORT TO VOLTAGE	
• Ignition ON. • Measure the voltage between MSS C284-2, circuit RCF13 (WH/BN), harness side and ground; and between MSS C284-3, circuit CCF13 (WH/BU), harness side and ground.  • **Is any voltage present?**	**Yes** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. **No** GO to J28 .
J28 CHECK MSS CIRCUITS RCF13 (WH/BN) AND CCF13 (WH/BU) FOR A SHORT TO	

GROUND	
• Ignition OFF. • Measure the resistance between MSS C284-2, circuit RCF13 (WH/BN), harness side and ground; and between MSS C284-3, circuit CCF13 (WH/BU), harness side and ground.  • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new 4X4 control module. REFER to 4X4 Control Module in this section. CLEAR the DTCs. REPEAT the self-test. **No** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test K: The Vehicle Does Not Shift Between 4X4 AUTO and 4X4 LOW Correctly

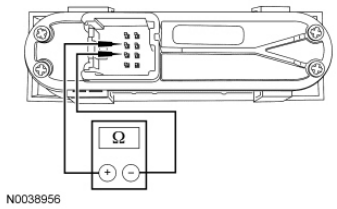
Refer to Wiring Diagrams Cell 34 , Four-Wheel Drive (4WD) System for schematic and connector information.

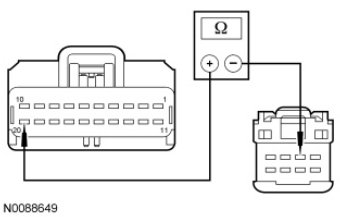
Normal Operation

With the key in the ON position, the 4X4 control module receives the operator's choice of Four-Wheel Drive (4WD) selection from the Mode Select Switch (MSS). The 4X4 control module then controls the electric clutch and transfer case shift motor. If the transfer case is not responding to the operator's intentions, systematically check all inputs and outputs to the 4X4 control module.

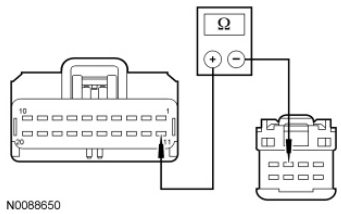
DTC Description	Fault Trigger Conditions
• DTC C1729 - Transfer Case Unable to Transition Between 4H and 4L	Failure to reach designated motor position within allotted time after multiple retries.
• DTC C1970 - 4X4 Low Mode Switch LED Short to Battery	4L (4X4 LOW) LED short to battery sensed by 4X4 control module C281A pin 18.
• DTC C1971 - 4X4 Low Mode Switch LED Circuit Failure	4L (4X4 LOW) LED short to ground sensed by 4X4 control module C281A pin 18.
• DTC P1812 - 4-Wheel Drive Mode Select Circuit Failure	Open circuit or short to battery sensed by the 4X4 control module C281A pin 11 or proper mode not selected for self-test.
• DTC P1815 - 4-Wheel Drive Mode Select Short Circuit to Ground	Short to ground sensed by 4X4 control module C281A pin 11.

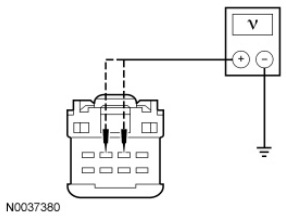
• DTC P1849 - Transfer Case Contact Plate 'A' Short Circuit to Ground	Motor encoder POS1 short to ground sensed at 4X4 control module C281A pin 1, checked when new 4WD mode is selected.
• DTC P1853 - Transfer Case Contact Plate 'B' Short Circuit to Ground	Motor encoder POS2 short to ground sensed at 4X4 control module C281A pin 2, checked when new 4WD mode is selected.
• DTC P1857 - Transfer Case Contact Plate 'C' Short Circuit to Ground	Motor encoder POS3 short to ground sensed at 4X4 control module C281A pin 3, checked when new 4WD mode is selected.
• DTC P1861 - Transfer Case Contact Plate 'D' Short Circuit to Ground	Motor encoder POS4 short to ground sensed at 4X4 control module C281A pin 4, checked when new 4WD mode is selected.
• DTC P1867 - Transfer Case Contact Plate General Circuit Failure	General motor encoder fault, invalid motor position detected when new 4WD mode is selected or during a motor movement.
• DTC P1891 - Transfer Case Contact Plate Ground Return Open Circuit	Open circuit on motor encoder position return line sensed at 4X4 control module C281A pin 16.

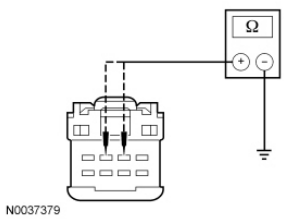




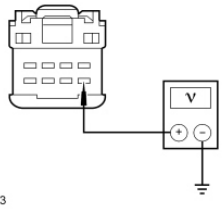
This pinpoint test is intended to diagnose the following:

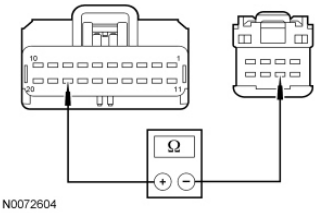


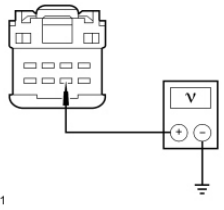




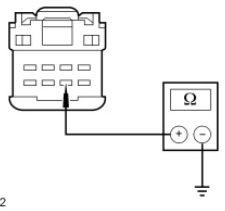
- Wiring, terminals or connectors
- Fuses
- 4X4 LOW indicator
- 4X4 LOW LED
- MSS
- Transfer case
- Transfer case shift motor
- 4X4 control module
- ABS module
- High Speed Controller Area Network (HS-CAN)







PINPOINT TEST K: THE VEHICLE DOES NOT SHIFT BETWEEN 4X4 AUTO AND 4X4 LOW CORRECTLY



Test Step	Result / Action to Take
K1 CHECK FOR DTCs	
• Ignition ON. • Connect the scan tool. • Carry out the self-test. • **Are DTCs retrieved?**	**Yes** If C1729, GO to K27 . If C1970, GO to K15 . If C1971, GO to K16 . If P1812, GO to K9 . If P1815, GO to K12 . If P1849, P1853, P1857 or P1861, GO to K26 . If P1867 or P1891, GO to K24 . **No**

	GO to K2 .
K2 MONITOR THE 4X4 LOW LED SWITCH	
• Select 4X4 LOW: ♦ press the brake pedal. ♦ vehicle at rest. ♦ transmission in NEUTRAL. • Monitor the 4X4 LOW LED. • **Does the 4X4 LOW LED blink then stay illuminated?**	**Yes** GO to K3 . **No** GO to K4 .
K3 VERIFY THE 4X4 LOW LED STATE	
• Monitor the 4X4 LOW LED. • **Does the 4X4 LOW LED continue blinking?**	**Yes** GO to K4 . **No** GO to K8 .
K4 VERIFY THE 4X4 LOW LED STATE	
• Monitor the 4X4 LOW LED. • **Does the 4X4 LOW LED illuminate constantly?**	**Yes** GO to K5 . **No** GO to K17 .
K5 MONITOR THE 4X4 LOW INDICATOR (CLUSTER)	
• Monitor the 4X4 LOW Instrument Cluster (IC) indicator. • **Is the 4X4 LOW IC indicator illuminated?**	**Yes** GO to K6 . **No** CHECK the IC . REFER to Section 413-01 . TEST the system for normal operation.
K6 CHECK FOR WIND-UP IN TURNS ON THROTTLE	
• Drive the vehicle on a dry, hard surface, executing turns while applying the throttle. • **Is wind-up present?**	**Yes** GO to K7 . **No** GO to K18 .
K7 CHECK FOR GEAR REDUCTION	
• While driving the vehicle, monitor the engine rpm and vehicle speed. • **Does the engine rpm and vehicle speed indicate that the vehicle is in 4X4 LOW (high rpm at low vehicle speed)?**	**Yes** The system is functioning correctly. **No** GO to K22 .
K8 CHECK THE IGNITION SWITCH STATUS PIDs	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger - 4X4 Control Module. • Monitor the following ignition switch PIDs: ♦ Ignition Switch - Off/Unlock Position (IGN_O/U) ♦ ACC Position (IGN_A) ♦ Start Position 3 (IGN_S) ♦ Ignition Switch - Run/Start Position (IGN_R/S)	**Yes** GO to K9 . **No** If the IGN_R/S PID did not match, CHECK Smart Junction Box (SJB) fuse 18 (10A). If the fuse is OK, REPAIR circuit CBP18 (GY/OG). CLEAR the DTCs. REPEAT the

♦ Ignition Switch - Run Position (IGN_R) • **Do the ignition switch PIDs match the ignition switch positions?**	self-test. If the IGN_O/U, IGN_A, IGN_S or IGN_R PIDs did not match, REFER to Section 211-05 to diagnose the ignition switch concern.
K9 CHECK THE MSS	
• Ignition OFF. • Disconnect: MSS C284. • **NOTE:** The MSS is a momentary switch, the button must be pressed and held when measuring resistance of the MSS . • Measure the resistance between MSS C284 pin 2 and pin 3, component side while pressing and holding each switch position button. Refer to the following chart: **MSS Position** / **Resistance (± 1%)** 4X4 AUTO — 39 ohms 4X4 HIGH — 237 ohms 4X4 LOW — 536 ohms  • **Are the resistances within the specified values?**	**Yes** GO to K10 . **No** INSTALL a new MSS . REFER to Mode Select Switch (MSS) in this section. CLEAR the DTCs. REPEAT the self-test.
K10 CHECK MSS CIRCUITS RCF13 (WH/BN) AND CCF13 (WH/BU) FOR AN OPEN	
• Disconnect: 4X4 Control Module C281A. • Measure the resistance between 4X4 control module C281A-20, circuit RCF13 (WH/BN), harness side and MSS C284-2, circuit RCF13 (WH/BN), harness side.  	**Yes** GO to K11 . **No** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test.

• Measure the resistance between 4X4 control module C281A-11, circuit CCF13 (WH/BU), harness side and MSS C284-3, circuit CCF13 (WH/BU), harness side.  • **Are the resistances less than 5 ohms?**	
K11 CHECK MSS CIRCUITS RCF13 (WH/BN) AND CCF13 (WH/BU) FOR A SHORT TO VOLTAGE	
• Ignition ON. • Measure the voltage between MSS C284-2, circuit RCF13 (WH/BN), harness side and ground; and between MSS C284-3, circuit CCF13 (WH/BU), harness side and ground.  • **Is any voltage present?**	**Yes** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test. **No** GO to K12 .
K12 CHECK MSS CIRCUITS RCF13 (WH/BN) AND CCF13 (WH/BU) FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: MSS C284. • Measure the resistance between MSS C284-2, circuit RCF13 (WH/BN), harness side and ground; and between MSS C284-3, circuit CCF13 (WH/BU), harness side and ground.  • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to K13 . **No** REPAIR the circuit(s). CLEAR the DTCs. REPEAT the self-test.
K13 CHECK MSS LED CIRCUIT CBP18 (GY/OG) FOR VOLTAGE	

• Ignition ON. • Measure the voltage between MSS C284-5, circuit CBP18 (GY/OG), harness side and ground.  N0037393 • **Is the voltage greater than 8 volts?**	**Yes** GO to K14 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
K14 CHECK MSS LED CIRCUIT CCF06 (BU/GN) FOR AN OPEN	
• Ignition OFF. • Disconnect: 4X4 Control Module C281A. • Measure the resistance between 4X4 control module C281A-18, circuit CCF06 (BU/GN), harness side and MSS C284-6, circuit CCF06 (BU/GN), harness side.  N0072604 • **Is the resistance less than 5 ohms?**	**Yes** GO to K15 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
K15 CHECK MSS LED CIRCUIT CCF06 (BU/GN) FOR A SHORT TO VOLTAGE	
• Ignition ON. • Measure the voltage between MSS C284-6, circuit CCF06 (BU/GN), harness side and ground.  N0037391 • **Is any voltage present?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** GO to K16 .
K16 CHECK MSS LED CIRCUIT CCF06 (BU/GN) FOR A SHORT TO GROUND	

• Ignition OFF. • Measure the resistance between MSS C284-6, circuit CCF06 (BU/GN), harness side and ground.  N0037392 • **Is the resistance greater than 10,000 ohms?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** INSTALL a new MSS . REFER to Mode Select Switch (MSS) in this section. CLEAR the DTCs. REPEAT the self-test.
K17 CHECK THE NEUTRAL SAFETY SWITCH (NTRL_SW) AND WHEEL SPEED PIDs DURING 4X4 LOW SHIFT	
• Enter the following diagnostic mode on the scan tool: DataLogger - 4X4 Control Module. • A. Monitor the 4X4 control module NTRL_SW PID while shifting the transmission to NEUTRAL. • Enter the following diagnostic mode on the scan tool: DataLogger - ABS Module. • B. Monitor the following ABS wheel speed PIDs: ♦ Left Front Wheel Speed Sensor (LF_WSPD) ♦ Left Rear Wheel Speed Sensor (LR_WSPD) ♦ Right Front Wheel Speed Sensor (RF_WSPD) ♦ Right Rear Wheel Speed Sensor (RR_WSPD) • **A. Does the 4X4 control module NTRL_SW PID indicate NEUTRAL when the transmission is shifted to NEUTRAL?** **B. Does any ABS wheel speed PID indicate 0 km/h (0 mph)?**	**Yes** If all 5 PIDs are accurate, GO to K24 . **No** **A.** REFER to Section 307-01A or Section 307-01B for further diagnosis of the Transmission Range (TR) sensor and the HS-CAN . CLEAR the DTCs. REPEAT the self-test. **B.** REFER to Section 206-09 for further diagnosis of the ABS and the HS-CAN . CLEAR the DTCs. REPEAT the self-test.
K18 CHECK THE 4WD CLUTCH PWM STATUS (4WDCPWMST) PID	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger - 4X4 Control Module. • Monitor the 4WDCPWMST PID at Wide Open Throttle (WOT), with the transfer case in 4X4 LOW, Key ON Engine OFF (KOEO). • **Does the 4WDCPWMST PID indicate 98% clutch application at WOT ?**	**Yes** GO to K19 . **No** GO to K21 .
K19 CHECK FOR VOLTAGE ON THE CLUTCH POWER CIRCUIT CCF03 (GY/BN) USING THE PWM OUTPUT CONTROL COMMAND #1 (CLCH_SOL) ACTIVE COMMAND	

• Use the CLCH_SOL active command to cycle the transfer case clutch to 98%. • Measure the voltage by carefully back-probing transfer case C350-16, circuit CCF03 (GY/BN), component side and ground.  N0037381 • **Is the voltage greater than 9 volts?**	**Yes** END the CLCH_SOL active command. CHECK the transfer case. REFER to Section 308-07B . CLEAR the DTCs. REPEAT the self-test. **No** END the CLCH_SOL active command. GO to K20 .
K20 CHECK CIRCUIT CCF03 (GY/BN) FOR AN OPEN	
• Ignition OFF. • Disconnect: Transfer Case C350. • Disconnect: 4X4 Control Module C281B. • Measure the resistance between 4X4 control module C281B-1, circuit CCF03 (GY/BN), harness side and transfer case C350-16, circuit CCF03 (GY/BN), harness side.  N0072600 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new 4X4 control module. REFER to 4X4 Control Module in this section. CLEAR the DTCs. REPEAT the self-test. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
K21 CHECK THE TP STATUS (TPI) PID	
• Enter the following diagnostic mode on the scan tool: DataLogger - 4X4 Control Module. • **NOTE:** The TPI PID is Accelerator Pedal Position (APP) as communicated by the PCM via HS-CAN . • Slowly move throttle from closed throttle to WOT and observe the TPI PID, KOEO . • **Does the TPI PID value vary between 0 at closed throttle and 255 at WOT ?**	**Yes** INSTALL a new 4X4 control module. REFER to 4X4 Control Module in this section. CLEAR the DTCs. REPEAT the self-test. **No** CHECK the APP sensor and/or the PCM. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. CLEAR the DTCs. REPEAT the self-test.
K22 CHECK THE CONTACT PLATE ENCODER PIDs IN 4X4 LOW	

- Enter the following diagnostic mode on the scan tool: DataLogger - 4X4 Control Module.
- Using the active command contact plate power (PLATE_PWR) to energize the transfer case motor contact plate position return circuit.
- **NOTE:** Plate PIDs are momentarily monitored when switching positions.
- With the MSS in 4X4 LOW, monitor the Transfer Case Contact Plate Switch A (PLATE_A), B (PLATE_B), C (PLATE_C) and D (PLATE_D) PIDs. Refer to the following chart:

Contact Plate Position PID	MSS 4WD AUTO/4X4 HIGH	MSS 4X4 LOW
PLATE_A	CLOSED	OPEN
PLATE_B	OPEN	CLOSED
PLATE_C	CLOSED	OPEN
PLATE_D	CLOSED	CLOSED

- **Do the contact plate position PIDs indicate that the transfer case shift motor is in 4X4 LOW?**

Yes
GO to K23 .

No
GO to K24 .

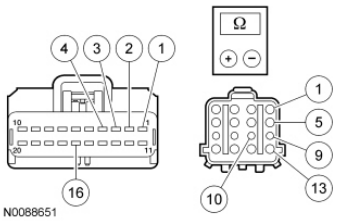
K23 CHECK THE TRANSFER CASE SHIFT MOTOR

- Remove the transfer case shift motor from the transfer case.
- Rotate the shift cam through all positions.
- **Does the transfer case shift cam rotate with difficulty (is the force required to rotate the cam greater than 45 Nm [33 lb-ft])?**

Yes
REPAIR the transfer case. REFER to Section 308-07B . CLEAR the DTCs. REPEAT the self-test.

No
INSTALL a new transfer case shift motor. REFER to Transfer Case Shift Motor in this section. CLEAR the DTCs. REPEAT the self-test.

K24 CHECK CIRCUITS RCF09 (BN/WH), CCF17 (WH/OG), CCF16 (VT/GN), CCF15 (BN/YE) AND CCF14 (GN/OG) FOR AN OPEN



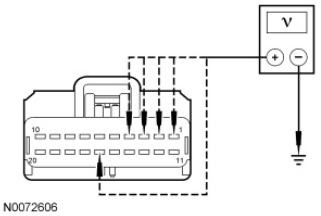
- Ignition OFF.
- Disconnect: Transfer Case C350.
- Disconnect: 4X4 Control Module C281A.
- Measure the resistance of the following circuits between 4X4 control module C281A, harness side and transfer case C350, harness side:

Circuit	C281A	C350
C281A-16	RCF09 (BN/WH)	C350-10

Yes
GO to K25 .

No
REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

C281A-4	CCF17 (WH/OG)	C350-13
C281A-3	CCF16 (VT/GN)	C350-9
C281A-2	CCF15 (BN/YE)	C350-1
C281A-1	CCF14 (GN/OG)	C350-5

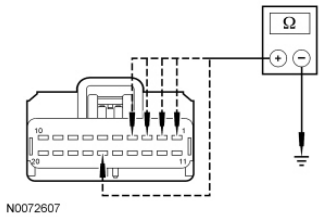


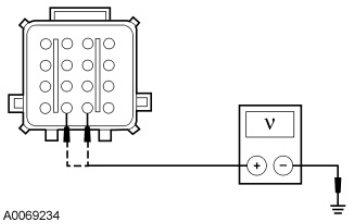
- **Are the resistances less than 5 ohms?**

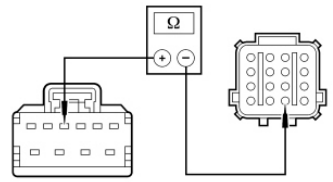
K25 CHECK CIRCUITS RCF09 (BN/WH), CCF17 (WH/OG), CCF16 (VT/GN), CCF15 (BN/YE) AND CCF14 (GN/OG) FOR A SHORT TO VOLTAGE

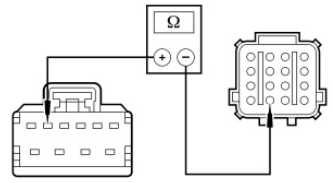
- Ignition ON.
- Measure the voltage between the following circuits at the 4X4 control module C281A, harness side and ground:

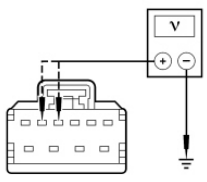
Circuit	C281A
RCF09 (BN/WH)	16
CCF17 (WH/OG)	4
CCF16 (VT/GN)	3
CCF15 (BN/YE)	2
CCF14 (GN/OG)	1



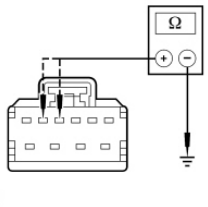








- **Is any voltage present?**



Yes
REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

No
GO to K26 .

K26 CHECK CIRCUITS RCF09 (BN/WH), CCF17 (WH/OG), CCF16 (VT/GN), CCF15 (BN/YE) AND CCF14 (GN/OG) FOR A SHORT TO GROUND

• Ignition OFF. • Disconnect: 4X4 Control Module C281A. • Measure the resistance between the following circuits at 4X4 control module C281A, harness side and ground: **Circuit** / **C281A** RCF09 (BN/WH) / 16 CCF17 (WH/OG) / 4 CCF16 (VT/GN) / 3 CCF15 (BN/YE) / 2 CCF14 (GN/OG) / 1  N0072607 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to K27 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
K27 CHECK CIRCUITS CCF08 (GY/OG) AND CCF07 (BN/GN) FOR POWER DURING ACTIVE COMMANDS	
• Ignition OFF. • Connect: 4X4 Control Module C281A. • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger - 4X4 Control Module. • Command the Clockwise Relay Control (CW_RELAY) active command ON and OFF and measure the voltage between transfer case C350-15, circuit CCF07 (BN/GN), harness side and ground. Command the Counterclockwise Relay Control (CCW_RELAY) active command ON and OFF and measure the voltage between transfer case C350-14, circuit CCF08 (GY/OG), harness side and ground.  A0069234 • **Are the voltages 10 volts or greater while the corresponding active commands are on?**	**Yes** INSTALL a new transfer case shift motor. CLEAR the DTCs. REPEAT the self-test. **No** GO to K28 .

K28 CHECK CIRCUITS CCF08 (GY/OG) AND CCF07 (BN/GN) FOR AN OPEN	
• Ignition OFF. • Disconnect: 4X4 Control Module C281B. • Measure the resistance between transfer case C350-14, circuit CCF08 (GY/OG), harness side and 4X4 control module C281B-4, circuit CCF08 (GY/OG), harness side.  N0088652 • Measure the resistance between transfer case C350-15, circuit CCF07 (BN/GN), harness side and 4X4 control module C281B-5, circuit CCF07 (BN/GN), harness side.  N0088653 • **Are the resistances less than 5 ohms?**	**Yes** GO to K29 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. GO to Pinpoint Test P .
K29 CHECK CIRCUITS CCF08 (GY/OG) AND CCF07 (BN/GN) FOR A SHORT TO VOLTAGE	
• Ignition ON. • Measure the voltage between 4X4 control module C281B-4, circuit CCF08 (GY/OG), harness side and ground; and between 4X4 control module C281B-5, circuit CCF07 (BN/GN), harness side and ground.  N0072609 • **Is any voltage present?**	**Yes** GO to K30 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. GO to Pinpoint Test P .
K30 CHECK CIRCUITS CCF08 (GY/OG) AND CCF07 (BN/GN) FOR A SHORT TO GROUND	

• Ignition OFF. • Measure the resistance between 4X4 control module C281B-5, circuit CCF07 (BN/GN), harness side and ground; and between 4X4 control module C281B-4, circuit CCF08 (GY/OG).  N0072610 • **Are the resistances greater than 10,000 ohms?**	**Yes** INSTALL a new 4X4 control module. REFER to 4X4 Control Module in this section. CLEAR the DTCs. REPEAT the self-test. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. GO to Pinpoint Test P .

Pinpoint Test L: The 4X4 Indicators Do Not Operate Correctly/Do Not Operate

Refer to Wiring Diagrams Cell 34 , Four-Wheel Drive (4WD) System for schematic and connector information.

Normal Operation

The 4X4 HIGH indicator status is transmitted to the IC from the 4X4 control module through the High Speed Controller Area Network (HS-CAN). A steady indicator displays whether the vehicle is in 4X4 LOW or 4X4 HIGH, according to the driver selection. A Four-Wheel Drive (4WD) system fault will cause the powertrain Malfunction Indicator Lamp (MIL) to illuminate when a 4WD system fault condition has been detected. This light also indicates other general powertrain failures.

This pinpoint test is intended to diagnose the following:

- Instrument Cluster (IC)
- 4WD system fault
- HS-CAN circuits
- 4X4 control module

PINPOINT TEST L: THE 4X4 INDICATORS DO NOT OPERATE CORRECTLY/DO NOT OPERATE

Test Step	Result / Action to Take
L1 CHECK THE 4X4 INDICATOR PROVE-OUT	
• Ignition ON. • Observe the 4X4 LOW and 4X4 indicators in the IC . • **Do the 4X4 LOW and 4X4 indicators prove out correctly?**	**Yes** GO to L2 . **No** CHECK the IC . REFER to Section 413-01 . TEST the system for normal operation.
L2 CHECK FOR DTCs	
• Connect the scan tool. • Carry out the 4X4 control module self-test.	**Yes** REFER to the 4X4 Control Module DTC Chart in this

• **Are DTCs present?**	section for diagnosis. **No** GO to L3 .
L3 CHECK FOR INCORRECT 4X4 INDICATOR ILLUMINATION	
• Select 4X4 AUTO with transmission in NEUTRAL, vehicle at rest and engine running. • Observe the IC . • **Do any 4X4 IC indicators illuminate?**	**Yes** GO to L4 . **No** GO to L6 .
L4 CHECK THE CONTACT PLATE ENCODER PIDs	
• Enter the following diagnostic mode on the scan tool: PID/DATA Monitor and Record. • Using the active command contact plate power (PLATE_PWR) to energize the transfer case motor contact plate position return circuit. • **NOTE:** Plate PIDs are momentarily monitored when switching positions. • Monitor the 4X4 control module Transfer Case Contact Plate Switch A (PLATE_A), B (PLATE_B), C (PLATE_C) and D (PLATE_D) PIDs. Refer to the following chart: • **Does the contact plate position PID indicate that the transfer case shift motor is in 4X4 AUTO?**	**Yes** GO to L5 . **No** GO to Pinpoint Test K .
L5 CHECK THE 4WD CLUTCH PWM STATUS (4WDCPWMST) PID	
• Enter the following diagnostic mode on the scan tool: DataLogger - 4X4 Control Module. • Monitor the 4WDCPWMST PID. • **Does the 4WDCPWMST PID read 2% at closed throttle?**	**Yes** CHECK the IC . REFER to Section 413-01 . TEST the system for normal operation. **No** GO to Pinpoint Test J .
L6 CHECK THE 4X4 INDICATOR	
• Select 4X4 HIGH. • Observe the IC . • **Does the 4X4 indicator illuminate?**	**Yes** GO to L7 . **No** GO to Pinpoint Test J .

Contact Plate Position PID	MSS 4X4 AUTO/4X4 HIGH	MSS 4X4 LOW
PLATE_A	CLOSED	OPEN
PLATE_B	OPEN	CLOSED
PLATE_C	CLOSED	OPEN
PLATE_D	CLOSED	CLOSED

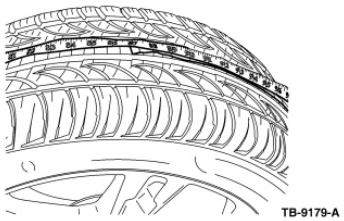
L7 CHECK THE 4X4 INDICATORS	
• Observe the IC . • **Are other 4X4 indicators illuminated?**	**Yes** CHECK the IC . REFER Section 413-01 . TEST the system for normal operation. **No** GO to L8 .
L8 CHECK THE 4X4 LOW INDICATOR	
• Select 4X4 LOW: ♦ vehicle stationary. ♦ shift the transmission to NEUTRAL. ♦ select 4X4 LOW. ♦ wait for the 4X4 LOW indicator to illuminate in the IC indicating that the shift is complete. • **Does the 4X4 LOW indicator illuminate?**	**Yes** GO to L10 . **No** GO to L9 .
L9 CHECK THE 4X4 INDICATORS	
• Observe the IC . • **Are other 4X4 indicators illuminated?**	**Yes** CHECK the IC . REFER to Section 413-01 . TEST the system for normal operation. **No** The indicators are working correctly. GO to Pinpoint Test P .
L10 CHECK THE 4WD CLUTCH PWM STATUS (4WDCPWMST) AND TRANSFER CASE CONTACT PLATE SWITCH PIDs	
• Enter the following diagnostic mode on the scan tool: DataLogger - 4X4 Control Module. • Using the active command PLATE_PWR to energize the transfer case motor contact plate position return circuit. • **NOTE:** The MSS is a momentary switch, the button must be pressed and held. • Monitor the 4X4 control module Transfer Case Contact Plate Switch A (PLATE_A), B (PLATE_B), C (PLATE_C) and D (PLATE_D) PIDs. Refer to the following chart:	**Yes** CHECK the IC . REFER to Section 413-01 . TEST the system for normal operation. **No** CHECK the 4WD system. GO to Pinpoint Test K .

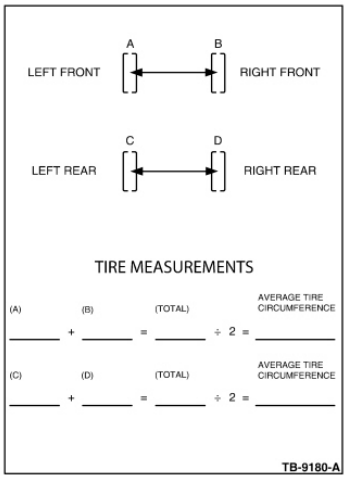
Contact Plate PID	MSS 4X4 AUTO/4X4 HIGH	MSS 4X4 LOW
PLATE_A	CLOSED	OPEN
PLATE_B	OPEN	CLOSED
PLATE_C	CLOSED	OPEN
PLATE_D	CLOSED	CLOSED

• Monitor the 4WDCPWMST PID. • **Do the contact plate position PIDs indicate the transfer case shift motor is in 4X4 LOW mode and does the 4WDCPWMST PID read 10% at closed throttle?**	

Pinpoint Test M: Straightline Driveline Wind-Up

Normal Operation





In order for the Four-Wheel Drive (4WD) system to function correctly, tires and wheels must be the same size, be in good condition and the front and rear axle ratios must match.

This pinpoint test is intended to diagnose the following:
- Unmatched tire sizes
- Unequal amounts of tire wear
- Unequal tire inflation pressures
- Unmatched front and rear axle ratios

PINPOINT TEST M: STRAIGHTLINE DRIVELINE WIND-UP

NOTE: 4X4 HIGH/LOW is not intended for driving on hard/dry surfaces.

Test Step	Result / Action to Take
M1 VERIFY THE CONCERN	
• Drive the vehicle and shift from 4X4 AUTO to 4X4 HIGH. There should be minimal wind-up in 4H mode during straightline maneuvers, (wind-up in turns is normal; 4X4 HIGH/LOW is not intended for driving on hard/dry surfaces). • **Is excessive wind-up present?**	**Yes** GO to M2 . **No** RETURN the vehicle to the customer. ADVISE about correct 4WD system operation and normal vehicle behavior.
M2 ISOLATE TRANSFER CASE	
• Disconnect all wiring going to the transfer case and road test. • **Is excessive wind-up present?**	**Yes** CARRY OUT the 4WD Functional Test. GO to Pinpoint Test P . **No** CONNECT the transfer case wiring and GO to M3 .
M3 CHECK FOR MATCHING WHEEL AND TIRE SIZES	
• Check the wheel and tire sizes. • **Do the 4 wheel and tire sizes match?**	**Yes** GO to M4 . **No** ADVISE the customer that 4WD systems require 4 matched, correctly inflated, correctly maintained tires to operate correctly.
M4 CHECK TIRE INFLATION PRESSURE	

• Check the inflation pressure in each tire. Refer to Vehicle Certification (VC) label. • **Are the tire inflation pressures correct?**	**Yes** GO to M5 . **No** ADJUST the tire pressure as necessary. TEST the vehicle for normal operation. ADVISE the customer that 4WD systems require 4 matched, correctly inflated, correctly maintained tires to operate correctly.
M5 CHECK THE TIRE CIRCUMFERENCE	
• Using a tailor's tape or flexible measuring tape, measure the circumference of all 4 tires and record the measurements.  TB-9179-A • Calculate the average of the circumference of the 2 front tires and 2 rear tires.  TB-9180-A • **Is the difference between the 2 averages or the side to side measurements greater than 13 mm (0.5 in)?**	**Yes** REPLACE the smallest circumference tire(s) and REMEASURE tire averages. REFER to Section 204-04 for additional information. **No** GO to M6 .
M6 CHECK THE FRONT AND REAR AXLE RATIOS	
• Check that front and rear axle ratios match. Refer to Section 205-00 . • **Do the front and rear axle ratios match?**	**Yes** RETURN the vehicle to the customer and ADVISE about correct 4WD usage and normal vehicle behavior.

	No CHECK the vehicle identification label. INSTALL the correct axle(s). REFER to Section 205-02 and Section 205-03 .

Pinpoint Test N: The Vehicle Binds in Turns/Resists Turning/Pulsates/Shudders in a Straight Line

Normal Operation

When the vehicle is operating in 4X4 AUTO, all 4 wheels receive the same amount of torque and rotate at the same speed. The amount of traction the vehicle can achieve depends on the amount of traction each tire can establish with the road surface. In order for the Four-Wheel Drive (4WD) system to function correctly, each tire must be in good condition and the front and rear axle ratios must match.

This pinpoint test is intended to diagnose the following:

- Unmatched tire sizes
- Unequal amounts of tire wear
- Unequal tire inflation pressures
- Unmatched front and rear axle ratios

PINPOINT TEST N: THE VEHICLE BINDS IN TURNS/RESISTS TURNING/PULSATES/SHUDDERS IN A STRAIGHT LINE

NOTE: 4X4 HIGH/4X4 LOW is not intended for driving on hard/dry surfaces.

Test Step	Result / Action to Take
N1 VERIFY THE CONCERN	
• Test drive the vehicle on a straight stretch of road in 4X4 AUTO mode. • Drive the vehicle through turns and parking lot maneuvers. • **Does the vehicle bind, pulsate or shudder?**	**Yes** If the problem occurs in 4X4 AUTO mode, GO to N2 ; in 4X4 HIGH mode or 4X4 LOW mode, binding is a normal condition. **No** GO to Pinpoint Test P .
N2 CHECK THE INDICATORS	
• Review the test drive notes. • **Did any of the Instrument Cluster (IC) 4X4 indicators or the powertrain Malfunction Indicator Lamp (MIL) illuminate?**	**Yes** If the 4X4 or 4X4 LOW indicators stayed illuminated, GO to N3 . If the powertrain MIL stayed illuminated, GO to N4 . **No** GO to N5 .
N3 VERIFY THE FAULT	
• Review the test drive notes. • **Was 4X4 HIGH or 4X4 LOW selected when the indicators were illuminated?**	**Yes** The system is functioning correctly. **No** The fault may have been caused by an intermittent, uncommanded or autolock shift. TEST the system for

	normal operation. GO to Pinpoint Test P .
N4 CHECK FOR DTCs	
• Connect the scan tool. • Carry out the 4X4 control module self-test. • **Are DTCs retrieved?**	**Yes** REFER to the 4X4 Control Module DTC Chart in this section for diagnosis. **No** GO to N5 .
N5 VERIFY THE CONCERN	
• Ignition OFF. • Disconnect: Transfer Case C350. • Test drive the vehicle on a straight stretch of road and in turns, and shift the transfer case through each mode. Record any fault conditions. • **Is the concern present?**	**Yes** **Vehicles with limited slip rear differential:** The condition may be normal and no repair action is necessary. CHECK the rear axle to verify. REFER to Section 205-02 . TEST the system for normal operation. **Vehicles without limited slip rear differential:** INSPECT the driveline components for damage or wear. REFER to Inspection and Verification. TEST the system for normal operation. **No** GO to N6 .
N6 CHECK THE 4WD CLUTCH PWM STATUS (4WDCPWMST) PID	
• Ignition OFF. • Connect: Transfer Case C350. • Ignition ON. • Clear the 4X4 control module DTCs. • Enter the following diagnostic mode on the scan tool: DataLogger - 4X4 Control Module. • Monitor the 4WDCPWMST PID at closed throttle, Key ON Engine OFF (KOEO). • **Is the 4WDCPWMST PID greater than 10%?**	**Yes** GO to N7 . **No** CHECK the transfer case. REFER to Section 308-07B . TEST the system for normal operation.
N7 CHECK THE ABS MODULE WHEEL SPEED SENSOR PIDs	
• Enter the following diagnostic mode on the scan tool: DataLogger - ABS Module. • While driving the vehicle at 30 km/h (18 mph), monitor the following wheel speed sensor PIDs: ♦ Left Front Wheel Speed Sensor (LF_WSPD) ♦ Left Rear Wheel Speed Sensor (LR_WSPD)	**Yes** GO to N8 . **No** VERIFY that the 4 road wheels are the same size and have similar tread depth. CHECK the ABS for faults. REFER to Section 206-09 . TEST the system for normal operation.

♦ Right Front Wheel Speed Sensor (RF_WSPD) ♦ Right Rear Wheel Speed Sensor (RR_WSPD) • Compare the speedometer reading to the wheel speed sensor PIDs. • **Do the wheel speed sensor PIDs and speedometer speeds match within 1.5 km/h (1 mph)?**	
N8 CHECK THE TP STATUS (TPI) PID	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger - 4X4 Control Module. • **NOTE:** The TPI PID is Accelerator Pedal Position (APP) as communicated by the PCM via High Speed Controller Area Network (HS-CAN). • Slowly move accelerator pedal from closed throttle to Wide Open Throttle (WOT) and observe the TPI PID, KOEO . • **Does the TPI PID value vary between 0 at closed throttle and 255 at WOT ?**	**Yes** GO to N9 . **No** CHECK the APP sensor and/or PCM for faults. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. TEST the system for normal operation.
N9 CHECK THE TRANSFER CASE FRONT DRIVESHAFT OUTPUT	
• With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 . • Rotate the front driveshaft by hand. • **Does the front driveshaft rotate freely (does it require less than 45 Nm [33 lb-ft] to rotate)?**	**Yes** INSTALL a new 4X4 control module. REFER to 4X4 Control Module in this section. TEST the system for normal operation. **No** CHECK the transfer case. REFER to Section 308-07B . TEST the system for normal operation.

Pinpoint Test O: Neutral Tow Functional Test

Normal Operation

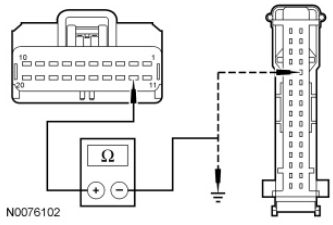
Neutral tow is a dealer-installed option that allows the vehicle to be towed with the 4 road wheels without damaging the transmission. Neutral tow operates by disengaging the transmission from the rear differential.

4X4 Control Module

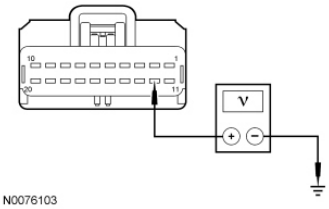
DTC Description	Fault Trigger Conditions

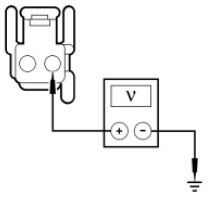
• B1319 - Driver Door Ajar Circuit Failure	Open circuit or short to battery sensed by 4X4 control module C281A pin 12. DTC sets only if neutral tow feature is enabled.
• B1322 - Driver Door Ajar Circuit Short To Ground	Short to ground sensed by 4X4 control module C281A pin 12. DTC sets only if neutral tow feature is enabled.
• P1707 - Transfer Case Neutral or Park/Neutral Indication Circuit	30 ignition cycles of inactivity - open circuit, short to battery or short to ground sensed by 4X4 control module C281A pin 19. DTC sets only if neutral tow feature is enabled.
• P1816 - Transmission Neutral Safety Switch Circuit Failure	30 ignition cycles of inactivity - open circuit or short to battery sensed by 4X4 control module C281A pin 13. DTC sets only if neutral tow feature is enabled.
• P1819 - Transmission Neutral Safety Switch Short Circuit to Ground	30 ignition cycles of inactivity - short to ground sensed by 4X4 control module C281A pin 13 or vehicle in neutral during self-test. DTC sets only if neutral tow feature is enabled.

Smart Junction Box (SJB)

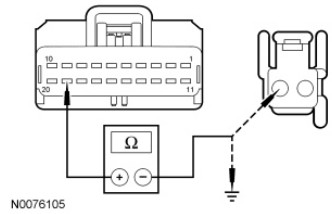


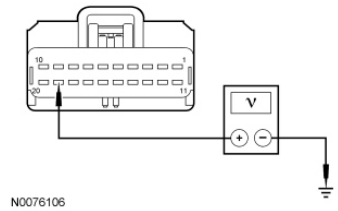
DTC Description	Fault Trigger Conditions
• B1895 - Driver's/Passenger's Door Ajar Output Circuit Failure	Open circuit or short to ground sensed by Smart Junction Box (SJB) C2280D pin 21. DTC sets only if neutral tow feature is enabled.
• B1896 - Driver's/Passenger's Door Ajar Output Circuit Short to Battery	Short to battery sensed by SJB C2280D pin 21. DTC sets only if neutral tow feature is enabled.



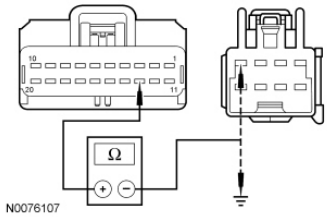


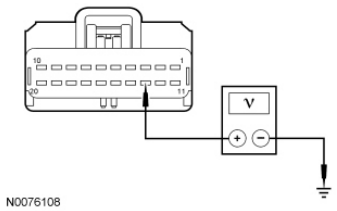
This pinpoint test is intended to diagnose the following:





- Neutral tow indicator
- High Speed Controller Area Network (HS-CAN)
- Vehicle Security Module (VSM)
- Digital Transmission Range (TR) sensor (4.0L)
- Neutral shifter position sensor (4.6L)
- Brake ON/OFF switch
- Door ajar switch
- Ignition switch/circuitry





PINPOINT TEST O: NEUTRAL TOW FUNCTIONAL TEST

Test Step	Result / Action to Take
O1 CARRY OUT 4X4 CONTROL MODULE SELF-TEST	
• Connect the scan tool. • Ignition ON.	**Yes** For DTC B1319 or B1322, GO to O3 .

• Carry out the 4X4 control module self-test. • **Are DTCs present?**	For DTC P1707, GO to O7 . For DTC P1816 or P1819, GO to O11 . For all other DTCs, REFER to 4X4 Control Module DTC Chart in this section. **No** GO to O2 .
O2 CARRY OUT SJB SELF-TEST	
• Carry out the SJB self-test. • **Are DTCs present?**	**Yes** For DTC B1895 or B1896, GO to O3 . For all other SJB DTCs, REFER to Section 419-10 . **No** GO to O14 .
O3 CHECK THE SJB DRIVER DOOR AJAR SWITCH STATUS (D_DR_SW) PID	
• Enter the following diagnostic mode on the scan tool: DataLogger - SJB . • Monitor the D_DR_SW PID with the driver door closed and ajar. • **Does the D_DR_SW PID status match the driver door position?**	**Yes** GO to O4 . **No** REFER to Section 417-02 to diagnose the driver door ajar switch (courtesy lamps do not operate or stay on continuously). CLEAR the DTCs. REPEAT the self-test.
O4 CHECK CIRCUIT CPL01 (VT/GN) FOR AN OPEN OR SHORT TO GROUND	
• Ignition OFF. • Disconnect: 4X4 Control Module C281A. • Disconnect: SJB C2280D. • Measure the resistance between 4X4 control module C281A-12, circuit CPL01 (VT/GN), harness side and SJB C2280D-21, circuit CPL01 (VT/GN), harness side; and between 4X4 control module C281A-12, circuit CPL01 (VT/GN), harness side and ground.  • **Is the resistance less than 5 ohms between the 4X4 control module and the SJB and greater than 10,000 ohms between the 4X4 control**	**Yes** GO to O5 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

module and ground?	
O5 CHECK CIRCUIT CPL01 (VT/GN) FOR A SHORT TO BATTERY	
• Ignition ON. • Measure the voltage between 4X4 control module C281A-12, circuit CPL01 (VT/GN), harness side and ground.  • **Is any voltage present?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to O6 .
O6 CHECK THE 4X4 CONTROL MODULE DRIVER DOOR AJAR SWITCH STATUS (D_DR_SW) PID	
• Ignition OFF. • Connect: 4X4 Control Module C281A. • Connect: SJB C2280D. • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger - 4X4 Control Module. • Monitor the D_DR_SW PID with the driver door closed and ajar. • **Does the D_DR_SW PID status match the driver door position?**	**Yes** System is functioning correctly. **No** INSTALL a new 4X4 control module. REFER to 4X4 Control Module in this section. CLEAR the DTCs. REPEAT the self-test.
O7 CHECK CIRCUIT SBB26 (YE/RD) FOR VOLTAGE	
• Ignition OFF. • Disconnect: Neutral Tow Indicator C2260. • Measure the voltage between neutral tow indicator C2260-1, circuit SBB26 (YE/RD), harness side and ground.  • **Is the voltage greater than 10 volts?**	**Yes** GO to O8 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
O8 CHECK CIRCUIT CCF21 (VT/WH) FOR AN OPEN OR SHORT TO GROUND	

• Disconnect: 4X4 Control Module C281A. • Measure the resistance between 4X4 control module C281A-19, circuit CCF21 (VT/WH), harness side and neutral tow indicator C2260-2, circuit CCF21 (VT/WH), harness side; and between 4X4 control module C281A-19, circuit CCF21 (VT/WH), harness side and ground.  N0076105 • **Is the resistance less than 5 ohms between the 4X4 control module and the neutral tow indicator and greater than 10,000 ohms between the 4X4 control module and ground?**	**Yes** GO to O9 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
O9 CHECK CIRCUIT CFF21 (VT/WH) FOR A SHORT TO BATTERY	
• Ignition ON. • Measure the voltage between 4X4 control module C281A-19, circuit CCF21 (VT/WH), harness side and ground.  N0076106 • **Is any voltage present?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** GO to O10 .
O10 CHECK THE NEUTRAL TOW INDICATOR USING THE NEUTRAL TOW LIGHT (TOW_LAMP) COMMAND	
• Ignition OFF. • Connect: Neutral Tow Indicator C2260. • Connect: 4X4 Control Module C281A. • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger - 4X4 Control Module. • Using the TOW_LAMP active command, command the neutral tow indicator on. • **Does the neutral tow indicator illuminate?**	**Yes** INSTALL a new 4X4 control module. REFER to 4X4 Control Module in this section. **No** INSTALL a new neutral tow indicator. CLEAR the DTCs. REPEAT the self-test.
O11 CHECK CIRCUIT CCF20 (GY/VT) FOR AN OPEN OR SHORT TO GROUND	

• Ignition OFF. • Disconnect: 4X4 Control Module C281A. • Disconnect: Brake Shift Interlock C2008. • Measure the resistance between 4X4 control module C281A-13, circuit CCF20 (GY/VT), harness side and brake shift interlock C2008-4, circuit CCF20 (GY/VT), harness side; and between 4X4 control module C281A-13, circuit CCF20 (GY/VT), harness side and ground.  • **Is the resistance less than 5 ohms between the 4X4 control module and the brake shift interlock and greater than 10,000 ohms between the 4X4 control module and ground?**	**Yes** GO to O12 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
O12 CHECK CIRCUIT CCF20 (GY/VT) FOR A SHORT TO BATTERY	
• Ignition ON. • Measure the voltage between 4X4 control module C281A-13, circuit CCF20 (GY/VT), harness side and ground.  • **Is any voltage present?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** GO to O13 .
O13 CHECK THE NEUTRAL SAFETY SWITCH (NTRL_SW) PID	
• Ignition OFF. • Connect: 4X4 Control Module C281A. • Connect: Brake Shift Interlock C2008. • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger - 4X4 Control Module. • Monitor the 4X4 control module NTRL_SW PID while shifting the transmission through gear ranges.	**Yes** System is functioning correctly. **No** INSTALL a new 4X4 control module. REFER to 4X4 Control Module in this section. CLEAR the DTCs. REPEAT the self-test.

• **Does the NTRL_SW PID indicate NEUTRAL when the transmission is shifted to NEUTRAL?**	
O14 CHECK NEUTRAL TOW INDICATOR PROVE-OUT	
• Ignition ON. • Ignition OFF. • **Does the neutral tow indicator prove out?**	**Yes** GO to O15 . **No** GO to O20 .
O15 CHECK NEUTRAL TOW ACTIVATION	
• Activate neutral tow: ♦ transmission in NEUTRAL. ♦ key in OFF position. ♦ press the 4X4 AUTO switch and hold it for 5 seconds. • **Does neutral tow activate?**	**Yes** GO to O16 . **No** GO to O22 .
O16 CHECK FOR NEUTRAL TOW INDICATOR TIME-OUT	
• Close the driver door. • Monitor the neutral tow indicator. • **Does the indicator turn off after 20 seconds?**	**Yes** GO to O17 . **No** CHECK the module configuration. REFER to Section 418-01 . TEST the system for normal operation.
O17 CHECK NEUTRAL TOW INDICATION	
• Open the driver door. • Monitor the neutral tow indicator. • **Does the neutral tow indicator illuminate?**	**Yes** GO to O18 . **No** CHECK the module configuration. REFER to Section 418-01 . TEST the system for normal operation.
O18 CHECK NEUTRAL TOW DEACTIVATION BY IGNITION SWITCH	
• Ignition ON. • **Does neutral tow deactivate?**	**Yes** GO to O19 . **No** GO to O22 .
O19 CHECK NEUTRAL TOW REACTIVATION	
• Reactivate neutral tow: ♦ transmission in NEUTRAL. ♦ key in OFF position. ♦ press the 4X4 AUTO switch and hold it for 5 seconds. • Deactivate neutral tow by shifting the transmission out of NEUTRAL.	**Yes** The neutral tow system is operating correctly. **No** GO to O23 .

• **Does neutral tow reactivate then deactivate?**	
O20 CHECK NEUTRAL TOW SYSTEM INSTALLATION	
• Verify that the neutral tow system components are installed correctly. • **Are the neutral tow system components installed correctly?**	**Yes** GO to O21 . **No** INSTALL the neutral tow system components as necessary, then REPEAT the Neutral Tow Functional Test. TEST the system for normal operation.
O21 CHECK THE NEUTRAL TOW INDICATOR OPERATION	
• Connect the scan tool. • Follow the scan tool directions to activate neutral tow system. • Monitor the neutral tow indicator. • Key ON Engine OFF (KOEO). • **Does the neutral tow indicator prove out correctly?**	**Yes** GO to O15 . **No** CHECK and REPAIR neutral tow system wiring as necessary, then REPEAT the Neutral Tow Functional Test. TEST the system for normal operation.
O22 CHECK THE TRANSFER CASE SHIFT MOTOR OPERATION BY ACTIVATING 4X4 LOW	
• Ignition ON. • Select 4X4 LOW: ♦ vehicle stationary. ♦ shift the transmission to NEUTRAL. ♦ select 4X4 LOW. ♦ wait for the 4X4 LOW indicator to illuminate in the Instrument Cluster (IC) indicating that the shift is complete. • **Does the 4X4 LOW indicator illuminate?**	**Yes** GO to O23 . **No** GO to Pinpoint Test K .
O23 CHECK THE NEUTRAL SAFETY SWITCH (NTRL_SW) AND IGNITION STATE PIDs	
• Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger - 4X4 Control Module. • A. Monitor the 4X4 control module NTRL_SW PID while shifting the transmission through gear ranges. • B. Monitor the following ignition switch PIDs: ♦ Ignition Switch - Off/Unlock Position (IGN_O/U) ♦ ACC Position (IGN_A) ♦ Start Position 3 (IGN_S) ♦ Ignition Switch - Run/Start Position (IGN_R/S) ♦ Ignition Switch - Run Position (IGN_R)	**Yes** If all 6 PIDs are accurate, INSTALL a new 4X4 control module, then REPEAT the Neutral Tow Functional Test. TEST the system for normal operation. **No** **A.** REFER to Section 307-01A or Section 307-01B for further diagnosis of the neutral safety switch. TEST the system for normal operation. **B.** If the IGN_R/S PID did not match, CHECK SJB fuse 18 (10A). If the fuse is OK, REPAIR circuit CBP18 (GY/OG). CLEAR the DTCs. REPEAT the self-test. If the IGN_O/U,

• **A. Does the NTRL_SW PID indicate NEUTRAL when the transmission is shifted to NEUTRAL?** **B. Do the ignition switch PIDs match the ignition switch positions?**	IGN_A, IGN_S or IGN_R PIDs did not match, REFER to Section 211-05 to diagnose the ignition switch concern.

Pinpoint P: Four-Wheel Drive (4WD) System Functional Test

Refer to Wiring Diagrams Cell 34 , Four-Wheel Drive (4WD) System for schematic and connector information.

Normal Operation

When the vehicle is operating in 4X4 HIGH or 4X4 LOW (4H/4L), all 4 wheels rotate at the same speed. The amount of traction the vehicle can achieve depends on the amount of traction each tire can establish with the road surface. In order for the Four-Wheel Drive (4WD) system to operate correctly, each wheel/tire assembly must have matching sizes and the front and rear axle ratios must match.

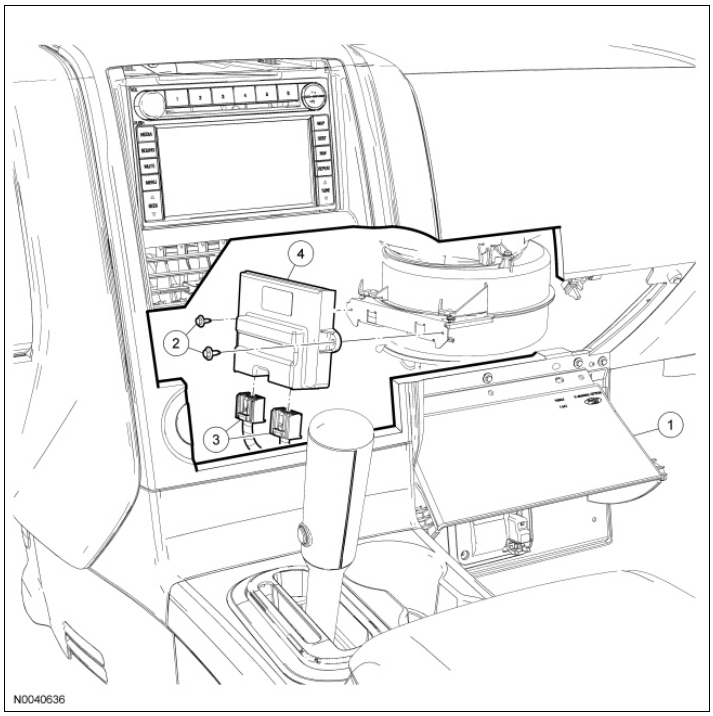
This pinpoint test is intended to diagnose the following:
- 4X4 indicators
- 4X4 control module
- Transfer case and related components
- Wheel/tire assemblies

PINPOINT TEST P: 4WD SYSTEM FUNCTIONAL TEST

NOTE: 4X4 HIGH/4X4 LOW are not intended for driving on hard/dry surfaces.

Test Step	Result / Action to Take
P1 CHECK 4X4 INDICATOR PROVE-OUT	
• Ignition ON. • **Do the 4X4 indicators illuminate at prove out?**	**Yes** GO to P2 . **No** CHECK the Instrument Cluster (IC). REFER to Section 413-01 . TEST the system for normal operation.
P2 CHECK 4X4 AUTO OPERATION	
• If in 4X4 LOW, switch the Mode Select Switch (MSS) to 4X4 AUTO. • **Are the 4X4 indicators off?**	**Yes** GO to P5 . **No** GO to P3 .
P3 CHECK FOR DTCs	
• Connect the scan tool. • Carry out the 4X4 control module self-test. • **Are DTCs present?**	**Yes** REFER to the 4X4 Control Module DTC Chart in this section for diagnosis. **No**

	GO to P4 .
P4 CHECK FOR WIND-UP IN 4X4 AUTO	
• Drive the vehicle on a dry, hard surface in turns. • **Is wind-up present in turns?**	**Yes** GO to Pinpoint Test J . **No** GO to Pinpoint Test K .
P5 CHECK THE 4WD CLUTCH PWM STATUS (4WDCPWMST) PID	
• Enter the following diagnostic mode on the scan tool: DataLogger - 4X4 Control Module. • Monitor the 4WDCPWMST PID. • **Does the 4WDCPWMST PID indicate 2-4% clutch application at closed throttle?**	**Yes** GO to P7 . **No** GO to P6 .
P6 CHECK THE TRANSFER CASE CONTACT PLATE SWITCH PIDs	
• Enter the following diagnostic mode on the scan tool: DataLogger - 4X4 Control Module. • Using the active command PLATE_PWR to energize the transfer case motor contact plate position return circuit. • **NOTE:** Plate PIDs are momentarily monitored when switching positions. • Monitor the 4X4 control module Transfer Case Contact Plate Switch A (PLATE_A), B (PLATE_B), C (PLATE_C) and D (PLATE_D) PIDs. Refer to the following chart: • **Does the contact plate position PIDs indicate that the transfer case shift motor is in 4X4 AUTO?**	**Yes** GO to Pinpoint Test J . **No** GO to Pinpoint Test K .
P7 CHECK FRONT SHAFT SPEED (FR_OUTSHA) AND REAR SHAFT SPEED (R_OUTSHA) PIDs	
• Enter the following diagnostic mode on the scan tool: DataLogger - 4X4 Control Module.	**Yes** GO to P8 . **No**



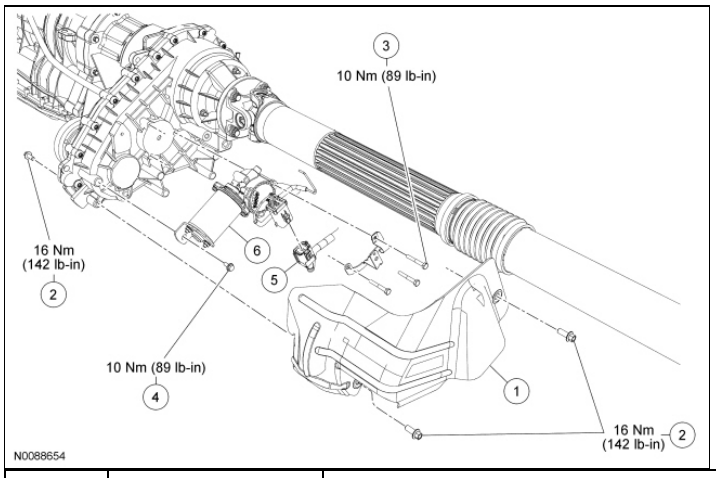
Contact Plate Position PID	MSS 4X4 AUTO/4X4 HIGH	MSS 4X4 LOW
PLATE_A	CLOSED	OPEN
PLATE_B	OPEN	CLOSED
PLATE_C	CLOSED	OPEN
PLATE_D	CLOSED	CLOSED

• Monitor the FR_OUTSHA AND R_OUTSHA PIDs. • Drive the vehicle at 30 km/h (18 mph). • Record and compare the FR_OUTSHA AND R_OUTSHA PIDs. • **Do the FR_OUTSHA and R_OUTSHA PID values match within 1.5 km/h (1 mph)?**	CHECK the ABS. REFER to Section 206-09 and VERIFY that the 4 road tire sizes match. TEST the system for normal operation.
P8 CHECK THE TP STATUS (TPI) PID	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger - 4X4 Control Module. • **NOTE:** The TPI PID is APP as communicated by the PCM via High Speed Controller Area Network (HS-CAN). • Slowly move throttle from closed throttle to Wide Open Throttle (WOT) and observe the 4X4 control module TPI PID, Key ON Engine OFF (KOEO). • **Does the TPI PID value vary between 0 at closed throttle and 255 at WOT ?**	**Yes** GO to P9 . **No** CHECK the APP accelerator pedal position sensor and/or PCM. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. TEST the system for normal operation.
P9 CHECK FOR WIND-UP IN TURNS ON THROTTLE	
• Drive the vehicle on a dry, hard surface, executing turns while applying the throttle. • **Is wind-up present?**	**Yes** CHECK the transfer case. REFER to Section 308-07B . TEST the system for normal operation. **No** GO to P10 .
P10 CHECK 4X4 HIGH OPERATION	
• Select 4X4 HIGH. • **Does the 4X4 indicator illuminate correctly?**	**Yes** GO to P11 . **No** GO to P12 .
P11 CHECK FOR 4X4 HIGH WIND-UP	
• Drive the vehicle on a dry, hard surface in turns. • **Is wind-up present in turns?**	**Yes** GO to P14 . **No** GO to Pinpoint Test J .
P12 CHECK FOR DTCs	
• Connect the scan tool. • Carry out the 4X4 control module self-test. • **Are DTCs present?**	**Yes** REFER to the 4X4 Control Module DTC Chart in this section for diagnosis. **No** GO to P13 .
P13 CHECK FOR WIND-UP IN 4X4 HIGH ON THROTTLE	

• Drive the vehicle on a dry, hard surface in turns while applying the throttle. • **Is wind-up present in turns?**	**Yes** GO to Pinpoint Test K . **No** GO to Pinpoint Test J .
P14 CHECK THE 4X4 LOW OPERATION	
• Select 4X4 LOW: ♦ vehicle stationary. ♦ shift the transmission to NEUTRAL. ♦ select 4X4 LOW. ♦ wait for the 4X4 LOW indicator to illuminate in the IC indicating that the shift is complete. • **Does the 4X4 LOW indicator illuminate?**	**Yes** GO to P15 . **No** GO to P16 .
P15 CHECK FOR WIND-UP IN 4X4 LOW	
• Drive the vehicle on a dry, hard surface in turns while applying the throttle. • **Is wind-up present in turns?**	**Yes** GO to P19 . **No** GO to P17 .
P16 CHECK FOR DTCs	
• Connect the scan tool. • Carry out the 4X4 control module self-test. • **Are DTCs present?**	**Yes** REFER to the 4X4 Control Module DTC Chart in this section for diagnosis. **No** GO to P18 .
P17 CHECK FOR DTCs	
• Connect the scan tool. • Carry out the 4X4 control module self-test. • **Are DTCs present?**	**Yes** REFER to the 4X4 Control Module DTC Chart in this section for diagnosis. **No** GO to Pinpoint Test J .
P18 CHECK FOR WIND-UP IN 4X4 LOW	
• Drive the vehicle on a dry, hard surface in turns while applying the throttle. • **Is wind-up present in turns?**	**Yes** GO to Pinpoint Test K . **No** GO to Pinpoint Test J .
P19 CHECK 4X4 AUTO OPERATION	
• Switch the MSS to 4X4 AUTO. • **Do the 4X4 indicators turn off?**	**Yes** The 4WD system is operating correctly. **No** GO to P20 .
P20 CHECK FOR DTCs	
• Connect the scan tool. • Carry out the 4X4 control module self-test.	**Yes** REFER the 4X4 Control Module DTC Chart in this section.

• **Are DTCs retrieved?**	**No** GO to P21 .
P21 CHECK FOR WIND-UP IN 4X4 AUTO	
• Drive the vehicle on a dry, hard surface in turns. • **Is wind-up present in turns?**	**Yes** GO to Pinpoint Test L . **No** GO to Pinpoint Test K .

4X4 Control Module



Item	Part Number	Description
1	-	Glove compartment
2	W705314	Screws
3	-	Connectors
4	7E453	4X4 control module

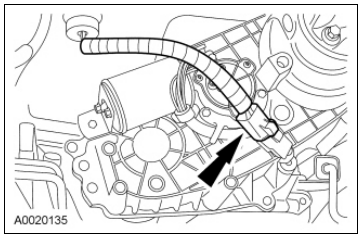
1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
2. Open the glove compartment, press in on sides and lower it to gain access.
3. Remove the 2 screws.
4. Disconnect the electrical connectors.
5. Remove the 4X4 control module.
6. To install, reverse the removal procedure.

Transfer Case Shift Motor

Material

Item	Specification
Multi-Purpose Grease XG-4 and/or XL-5	ESB-M1C93-B
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4

Item	Part Number	Description
1	7C277	Heat shield
2	7A443	Heat shield bolts (3 required)
3	N800670-S	Transfer case shift motor bolt (3 required)
4	N802503-S	Transfer case shift motor bolt
5	-	Transfer case shift motor electrical connector
6	7G360	Transfer case shift motor



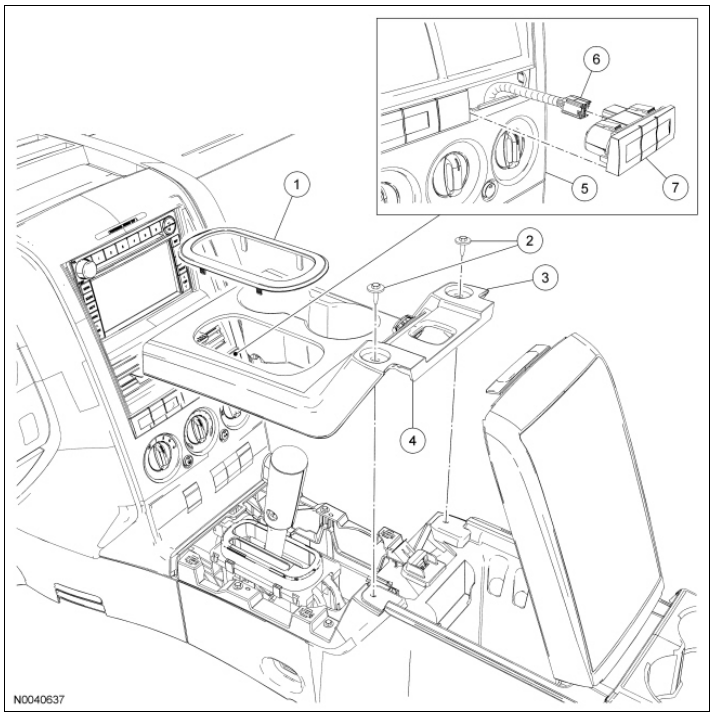
Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. With the ignition ON, press the 4X4 HIGH button on the Mode Select Switch (MSS).

3. Remove the 3 heat shield bolts and the heat shield.
   - To install, tighten to 16 Nm (142 lb-in).

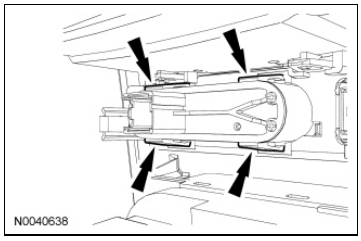
4. Disconnect the transfer case shift motor electrical connector.



5. Using an electrical connector pin extractor tool, remove the coil wire pin from the electrical connector.

6. Remove the 4 transfer case shift motor mounting bolts and the transfer case shift motor.
    - To install, tighten to 10 Nm (89 lb-in).

7. To install, reverse the removal procedure.
    - Apply a coat of multi-purpose grease to the transfer case shift motor bolts.
    - Apply a thin coat of silicone sealant to the shift motor mating surface.



Mode Select Switch (MSS)

Item	Part Number	Description
1	-	Bezel
2	W705314	Screws
3	-	Floor console center finish panel
4	14401	Auxiliary power point electrical connector
5	980327	Instrument panel center finish panel
6	14401	Mode Select Switch (MSS) electrical connector
7	7Z155	MSS

Removal and Installation

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
2. Remove the bezel.
3. With the center console cover open, remove the floor console center finish panel screws.
4. Raise the floor console center finish panel and disconnect the auxiliary power point electrical connector.
5. Remove the floor console center finish panel.
6. Disconnect the electrical connector(s).
7. Disengage the locking tangs and remove the Mode Select Switch (MSS) from the instrument panel center finish panel.

8. To install, reverse the removal procedure.

Material

Item	Specification	Fill Capacity

Transfer case shift motor bolts	10	-	89
Transfer case-to-transmission bolts	20	-	177
Transmission insulator nuts	98	72	-
Transmission insulator-to-transfer case bolts	90	66	-

[a] Refer to the procedure for specifications.

Transfer Case

The Four-Wheel Drive (4WD) system consists of the following:

- Transfer case
- Front driveshaft
- Rear driveshaft
- 4X4 control module

All-Wheel Drive (AWD) Transfer Case

Torque from the transmission is transferred to the input shaft through the planetary gear assembly and out the rear output shaft. Torque also flows through the planetary gear assembly to the drive gear outward to the driven gear. The torque flow continues from the upper drive sprocket through the drive chain to the lower drive sprocket to the front output shaft. The open differential provides 60% of available torque to the rear and 40% to the front, between the rear output shaft drive gear and the front output shaft driven gear.

1-Speed Torque-On-Demand Transfer Case

The transfer case transfers power from the transmission to the rear axle and front axle when the electromechanical clutch is activated.

The electromechanical clutch assembly drives the drive sprocket after the 4X4 control module activates the clutch coil. The drive sprocket turns the drive chain that rotates the front output shaft and the front driveshaft.

2-Speed Torque-On-Demand Transfer Case

4X4 AUTO Mode

Torque from the transmission is transferred to the input shaft which drives the rear output shaft that drives the rear axle assembly. The electromechanical clutch assembly drives the drive sprocket after the 4X4 control module activates the clutch coil. The drive sprocket turns the drive chain that rotates the front output shaft and the front driveshaft.

4X4 HIGH Mode

The operation is the same as in AUTO Mode, except that the 4X4 control module constantly activates the electromechanical clutch assembly.

4X4 LOW Mode

The HIGH-LOW shift occurs when the reduction shift fork moves the high-low collar to lock the planetary gearset to the output shaft. Then, torque transmitted through the sun gear from the input shaft turns the front planetary gearset assembly. The front planetary gearset assembly is engaged and provides transfer case speed reduction.

Transfer Case

Refer to Section 308-07A .

Transfer Case Draining and Filling

Material

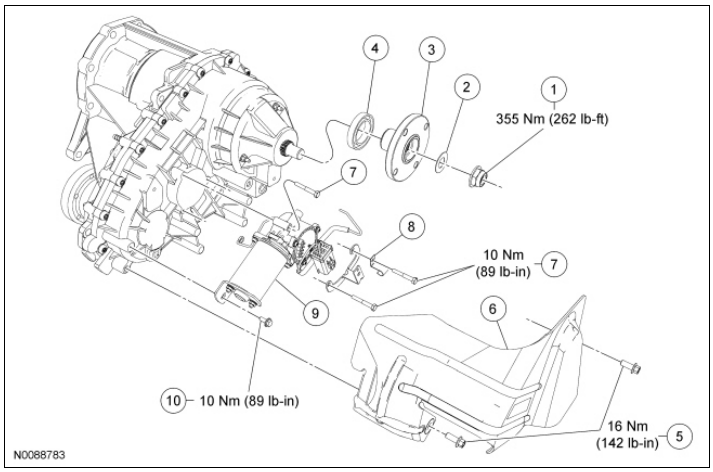
Item	Specification
Motorcraft® Transfer Case Fluid XL-12	ESP-M2C166-H

1. ***NOTICE:*** **Transfer case failure can result if the correct fill procedures are not followed.**

   NOTE: Position a suitable drain pan under the transfer case.

   Remove the drain plug and drain the fluid.

2. Clean and install the drain plug.
   - Tighten to 20 Nm (177 lb-in).

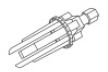


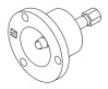
3. ***NOTICE:*** **Incorrect fluid fill can result in transfer case failure.**

   NOTE: Fill the transfer case with the vehicle on a level surface. Make sure the fluid is level with the filler opening for the correct fluid level.

   Clean the area around the fill plug. Remove the fill plug. Using a suitable oil suction gun, fill the transfer case to the correct level with the specified fluid.

Transfer Case - Exploded View





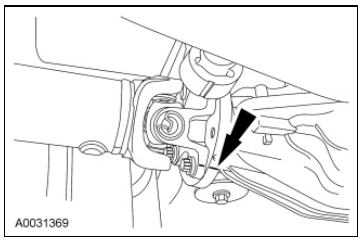
Item	Part Number	Description
1	7045	Rear output shaft flange nut
2	7B368	Rear output shaft flange washer
3	7B214	Rear output shaft flange
4	7B215	Rear output shaft oil seal
5	7A443	Heat shield bolts (3 required)
6	7C277	Heat shield
7	N800670	Shift motor bolts (3 required)
8	7K470	J-clip
9	7G360	Transfer case shift motor
10	N802503	Transfer case shift motor bolt

1. For additional information, refer to the procedures in this section.

Transfer Case Rear Output Shaft Seal

Special Tool(s)

 ST1257-A	Holding Fixture, Drive Pinion Flange 205-126 (T78P-4851-A)
 ST2305-A	Installer, Input Shaft Oil Seal 308-186 (T90T-7172-B)
 ST1213-A	Remover, Bushing 307-001 (TOOL-1175-AC) or equivalent
 ST2415-A	Remover, Output Shaft Flange 307-523 or equivalent
 ST1351-A	Slide Hammer 100-001 (T50T-100-A)

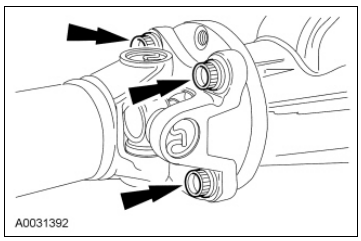


Material

Item	Specification
Motorcraft® Transfer Case Fluid XL-12	ESP-M2C166-H
Threadlock and Sealer TA-25	WSK-M2G351-A5

Removal and Installation

1. With the transmission in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .



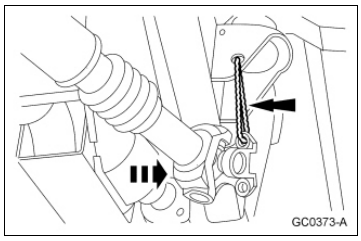
2. Index-mark the rear output flange and the driveshaft yoke.

A0031369

3. **NOTE:** If new driveshaft yoke bolts are not available, coat the threads of the original bolts with threadlock and sealer.

   Remove the 4 driveshaft yoke bolts.

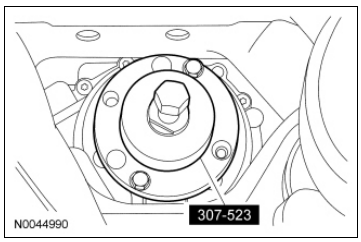
- To install, tighten to 112 Nm (83 lb-ft) evenly in a cross pattern.



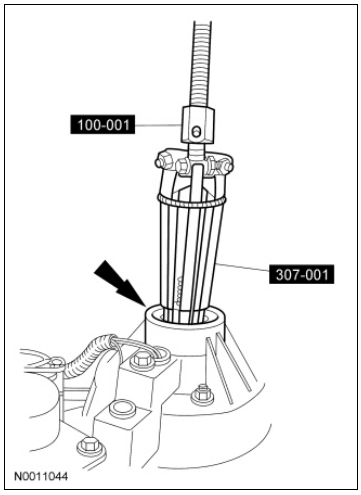
4. ***NOTICE:*** **The driveshaft flange fits tightly on the rear axle pinion flange pilot. Never hammer on the driveshaft or any of its components to disconnect the driveshaft flange from the pinion flange. Pry only in the area shown, with a suitable tool, to disconnect the driveshaft flange from the pinion flange or damage to the components can occur.**

   Using a suitable tool as shown, disconnect the driveshaft flange from the rear axle pinion flange.

5. Position the driveshaft aside and support with mechanic's wire.

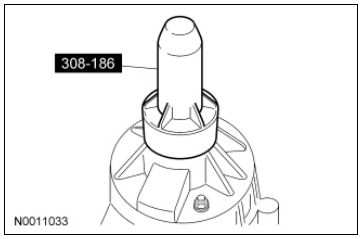


6. Using the Drive Pinion Flange Holding Fixture to hold the output flange, remove the nut.
   - To install, tighten to 355 Nm (262 lb-ft).



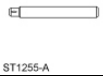
7. Remove the output shaft yoke washer.

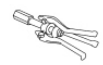
8. Using the Output Shaft Flange Remover, remove the rear output shaft flange.



9. Remove and discard the rear output shaft flange oil seal.

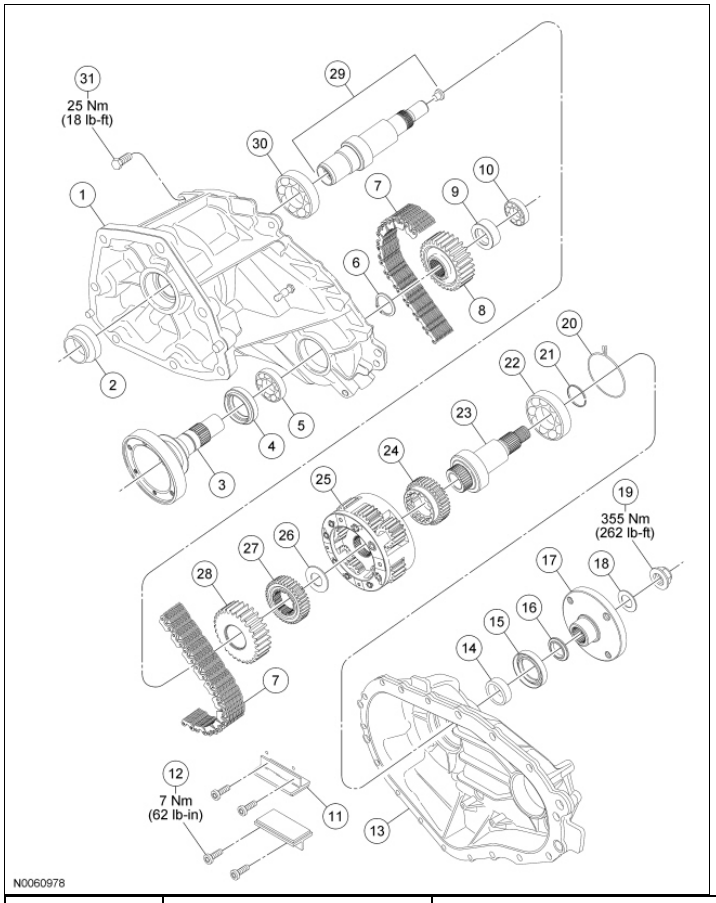
10. Using the Bushing Remover with the Slide Hammer, remove the rear output shaft oil seal.





11. Using the Input Shaft Oil Seal Installer, install a new rear output shaft oil seal.

12. To install, reverse the removal procedure.
    - Always install a new rear output shaft flange oil seal.



Transfer Case - All-Wheel Drive (AWD)

Special Tool(s)

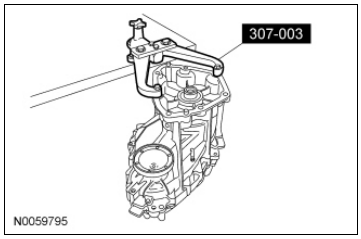
20	7917	Snap ring
21	7R141	Snap ring
22	7025	Bearing

23	7061	Upper output shaft
24	-	Sun gear
25	-	Planetary gear
26	-	Thrust washer
27	-	Sun gear
28	-	Upper drive sprocket
29	7017	Input shaft assembly
30	7025	Input shaft bearing
31	7A443	Transfer case bolt (17 required)



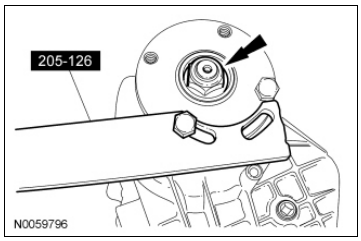
Disassembly

1. **NOTE:** Discard all seals after removing them.

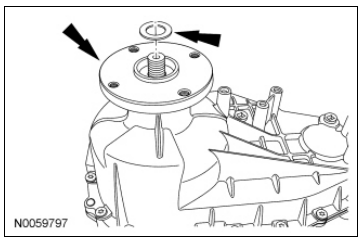
   Remove the transfer case from the vehicle. For additional information, refer to Transfer Case in this section.

2. ⚠ **WARNING: Always verify that the lockpin on the bench-mounted holding fixture is correctly secured to help prevent unexpected component rotation. Failure to follow this instruction may result in serious personal injury.**

   Using the Transmission Holding Fixture, secure the transfer case to a bench.

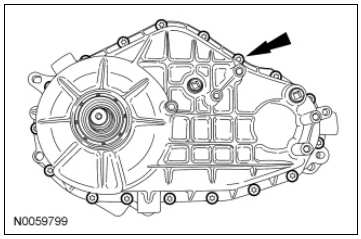


3. If not done previously, remove the drain plug and drain the fluid.
   - Install the drain plug when finished draining.
   - Tighten to 20 Nm (177 lb-in).



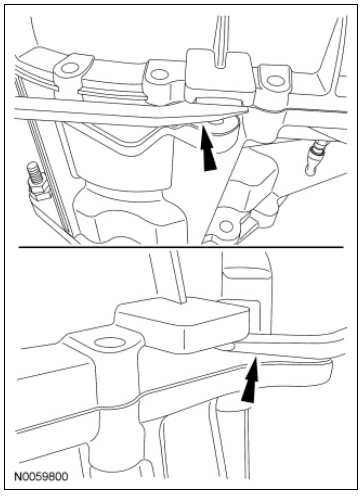
4. **NOTE:** Index-mark the rear output flange and the upper output shaft.

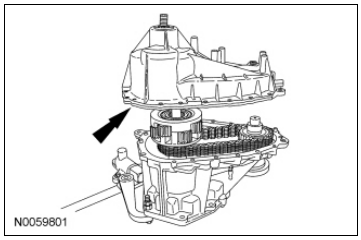
   Using the Drive Pinion Flange Holding Fixture to hold the output flange, remove the output flange nut.



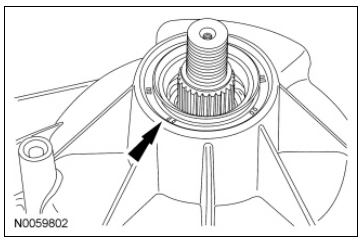
5. Remove the output flange and the output shaft yoke washer.

6. Remove the oil seal.



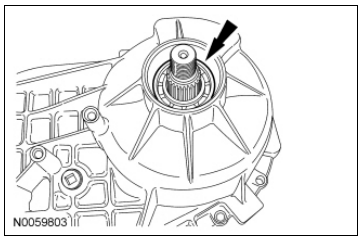


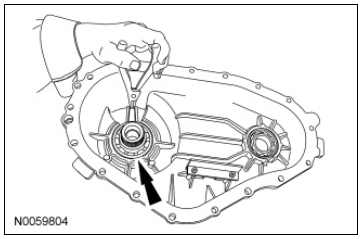
7. Remove the 17 transfer case bolts.



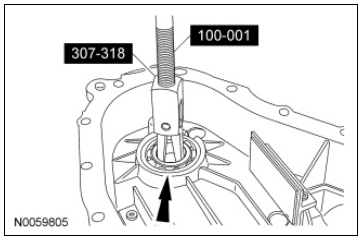
8. ***NOTICE:*** **Pry only at the transfer case pry bosses. Prying other than at the pry bosses may cause damage to the components.**

   Using a pry bar, separate the rear case from the front case.

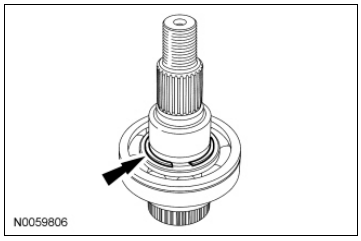




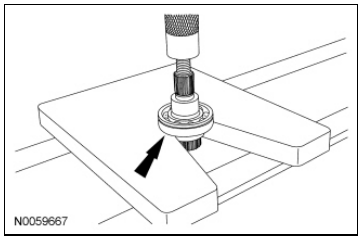
9. Remove the oil seal.



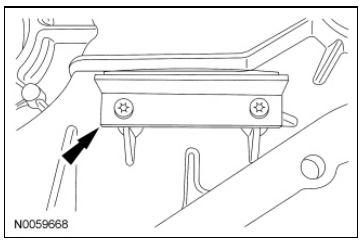
10. Remove the bearing.



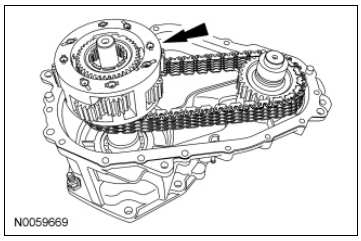
11. Expand the snap ring, then remove the output shaft and bearing.



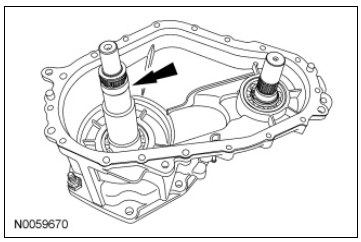
12. Using the Slide Hammer and Stator Bearing Remover, remove the bearing.



13. Remove the snap ring and discard.

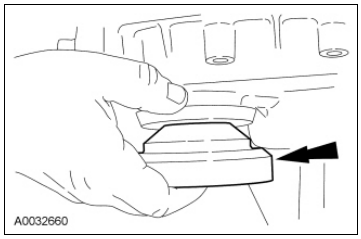


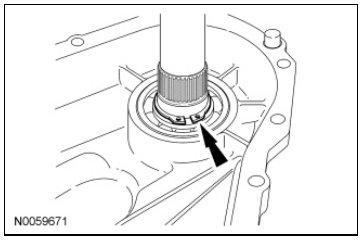
14. Using a suitable press, remove the bearing.



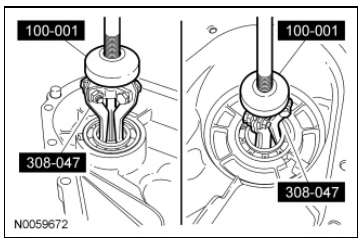
15. Remove the 4 Torx screws and the damper snubber.

16. Remove the sun gears, the thrust washer, the planetary, the upper drive sprocket, the drive chain, the lower drive sprocket and the sprocket spacer as an assembly.



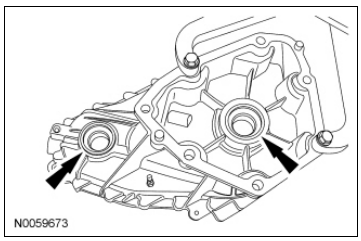


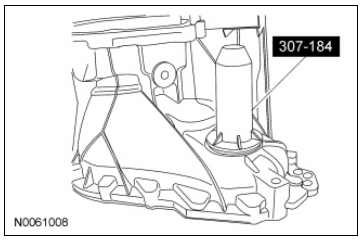
17. Remove the input shaft.



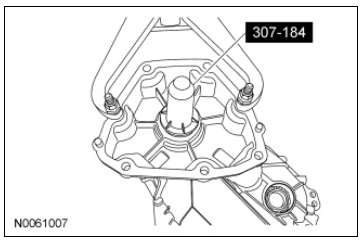
18. Remove the input shaft bearing.

19. Holding the front output shaft, remove the snap ring and discard, then remove the front output shaft.

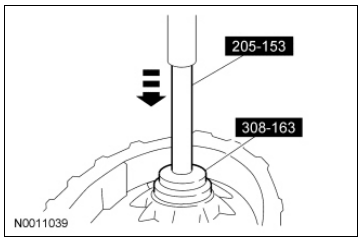




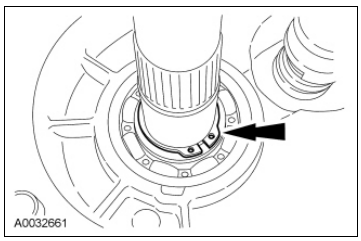
20. Using the Slide Hammer and Bearing Cup Remover, remove the bearings.



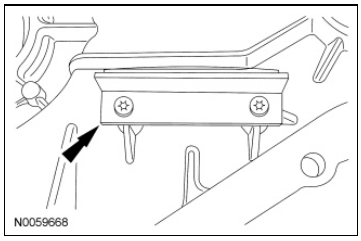
21. Remove the seals.



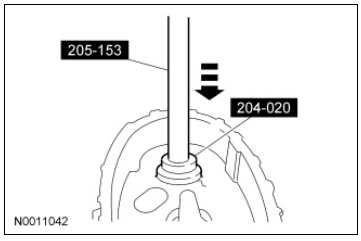
Assembly



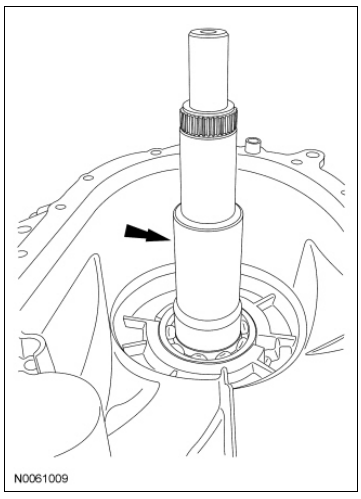
1. Using the Front Pump Fluid Seal Installer, install the seals in the front transfer case.



2. Using the Differential Bearing Cup Installer and Handle with Adapter, install the bearing.

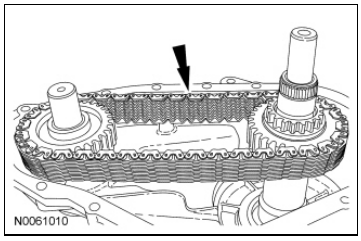


3. Install the front output shaft.
    - Install the front output shaft.
    - Install a new snap ring.

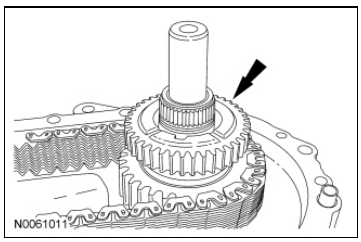


4. Position the damper snubber and install the 4 Torx screws.
    - Tighten to 7 Nm (62 lb-in).

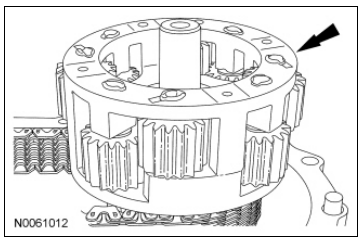
5. Using the Wheel Hub Bearing Cup Installer and Handle with Adapter, install the bearing.



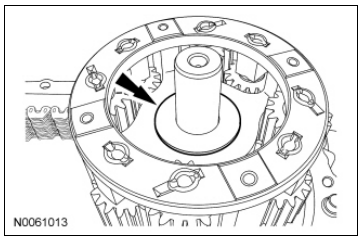
6. Install the input shaft.



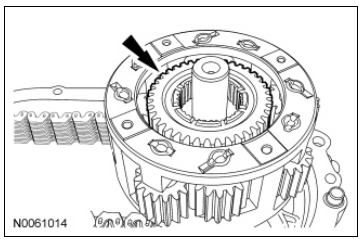
7. Assemble the upper drive sprocket, lower drive sprocket and the drive chain.



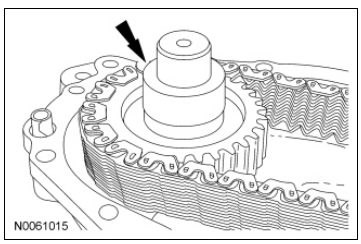
8. Install the upper and lower drive sprockets and the drive chain as an assembly.



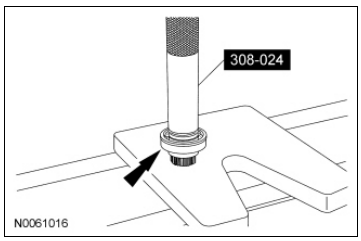
9. Install the lower sun gear.



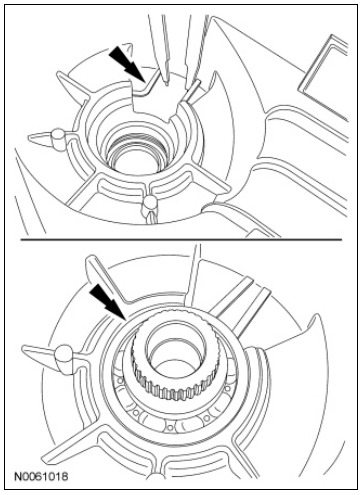
10. Install the front planetary gear assembly.



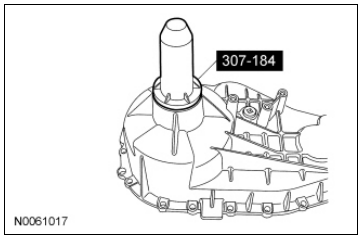
11. Install the thrust washer.



12. Install the upper sun gear.



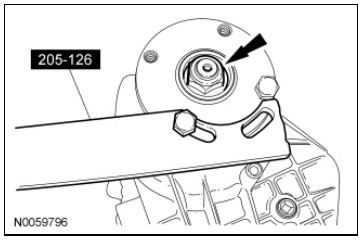
13. Install the spacer.



14. Using the Bearing Tube Remover/Installer, install the bearing.

15. Install the output shaft and bearing in the rear case half.
    - Expand the snap ring. Install the output shaft.

16. Using the Front Pump Fluid Seal Installer, install the yoke-to-flange seal.



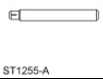
17. ***NOTICE:*** **Applying excess silicone rubber can damage the internal components.**

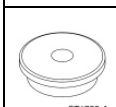
    Apply a 3 mm (0.125 in) bead of silicone rubber on the rear case mating surface.

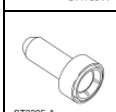
18. Assemble the front and rear case halves.

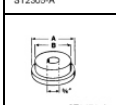
19. Install the 17 transfer case bolts.
    - Tighten to 25 Nm (18 lb-ft) evenly in a star pattern.

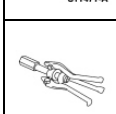
20. Using the Drive Pinion Flange Holding Fixture to hold the output flange, install the nut.
    - Tighten to 355 Nm (262 lb-ft).

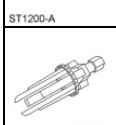


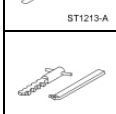


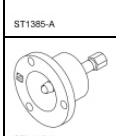


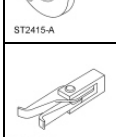


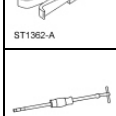












21. Install the transfer case in the vehicle. For additional information, refer to Transfer Case in this section.

22. Fill the transfer case. For additional information, refer to Transfer Case Draining and Filling in this section.

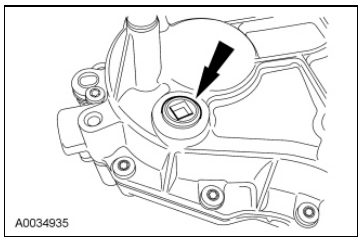
47	7061	Output shaft and flange (front) (4.0L)
48	7B215	Input seals
49	7005	Transfer case cover (4.6L)
50	7061	Output shaft and flange (4.6L)

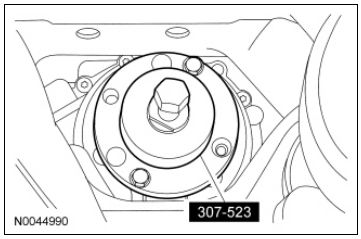


Disassembly

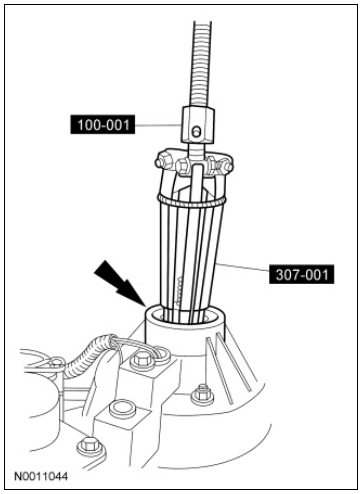
1. Remove the transfer case. For additional information, refer to Transfer Case in this section.
2. ⚠ **WARNING: Always verify that the lockpin on the bench-mounted holding fixture is correctly secured to help prevent unexpected component rotation. Failure to follow this instruction may result in serious personal injury.**

   Using the Transmission Holding Fixture, secure the transfer case to the bench.

3. If not previously done, remove the drain plug and drain the fluid.
    - When finished draining, install the drain plug and tighten to 20 Nm (177 lb-in).

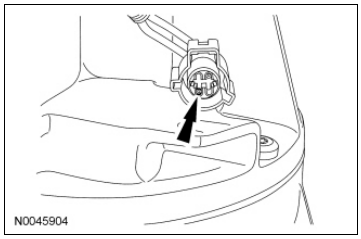


4. Using the Drive Pinion Flange Holding Fixture to hold the rear output flange, remove the rear output shaft flange nut.

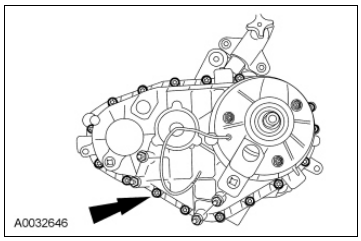


5. Remove the output shaft yoke washer.

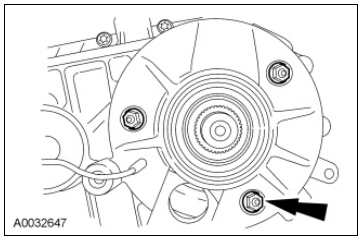
6. Using the Output Shaft Flange Remover, remove the rear output shaft flange.



7. Remove and discard the output flange oil seal.

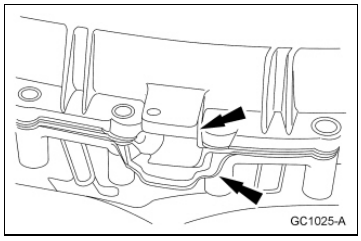


8. Using the Bushing Remover with the Slide Hammer, remove and discard the yoke-to-flange seal.

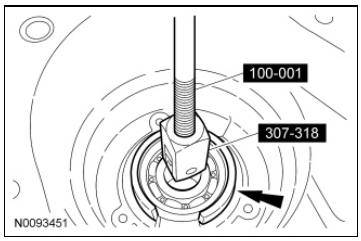


9. Remove the connector interlock from the electrical connector. Using an electrical connector pin extractor tool, remove the coil wire pin.

10. Remove the 17 transfer case bolts.

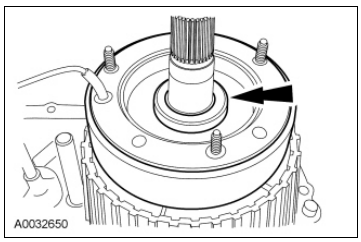


11. Remove the 3 clutch coil assembly nuts.

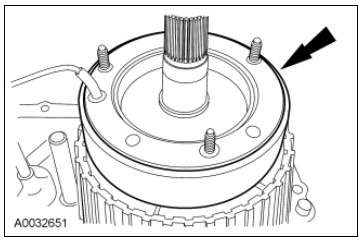


12. ***NOTICE:*** **Pry only at the transfer case pry bosses. Prying other than at the pry bosses may cause damage to the components.**

    Separate the transfer case halves at the transfer case pry bosses.

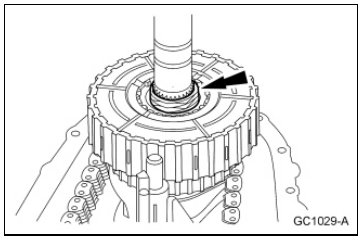


13. Remove the snap ring, then using the Slide Hammer and the Stator Bearing Remover, remove the rear output shaft support bearing.

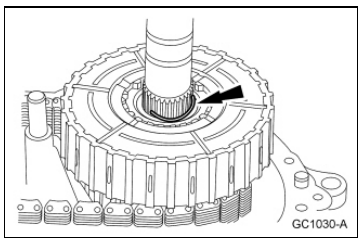


14. Using the Slide Hammer and the Stator Bearing Remover, remove the front output shaft rear bearing.

15. Remove the thrust bearing.

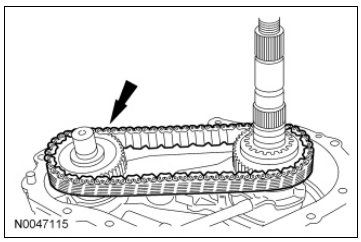


16. Remove the cam and coil housing assembly.

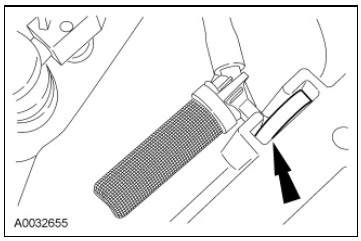


17. Remove the apply cam and 3 steel balls.

18. Remove the wave spring.

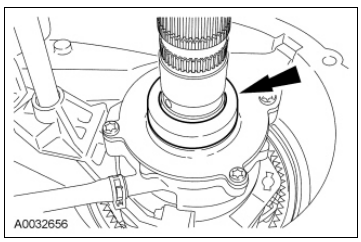


19. Remove the snap ring.

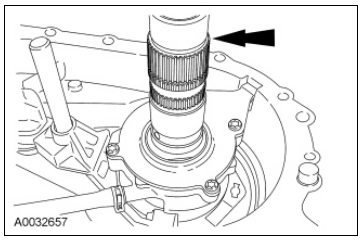


20. ***NOTICE:*** **When removing or installing the clutch pack assembly, do not separate the clutch pack assembly. Keep tension on the clutch pack upon removal. Set the clutch pack assembly on the bench in the same position as it was located in the transfer case. The thrust washer in the lower clutch pack uses tabs to hold it in place. If the thrust washer is not in place, a transfer case clearance problem can occur.**

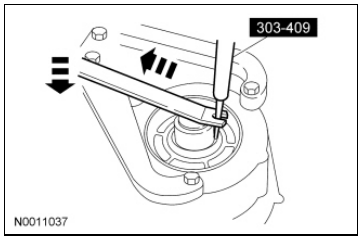
    Remove the clutch pack assembly.



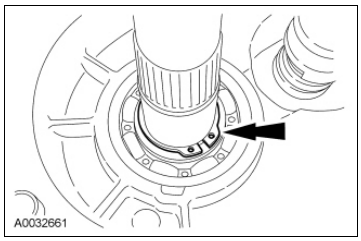
21. Remove the drive chain and the 2 sprockets as an assembly.



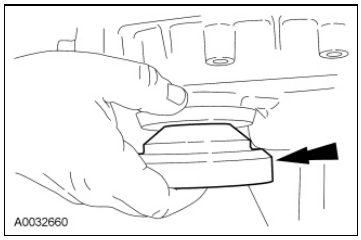
22. Remove and clean the oil pan magnet.



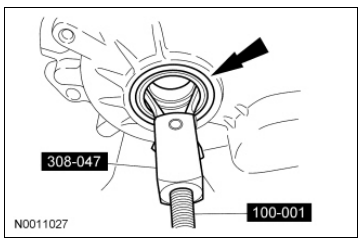
23. Remove the thrust washer.



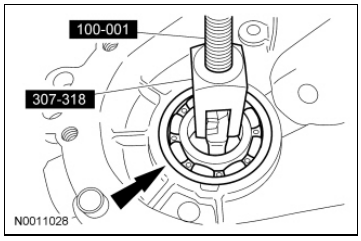
24. Remove the pump assembly and the rear output shaft as an assembly. Do not disassemble the pump assembly.



25. Using the Oil Seal Remover, remove the oil seal.

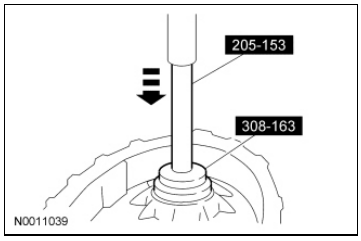


26. While holding the front output shaft and flange, remove the snap ring.

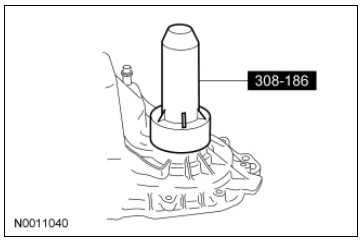


27. Remove the front output shaft and flange.

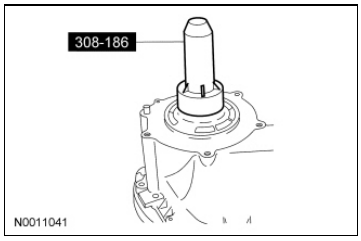
28. Using the Bearing Cup Remover with the Slide Hammer, remove the oil seal.



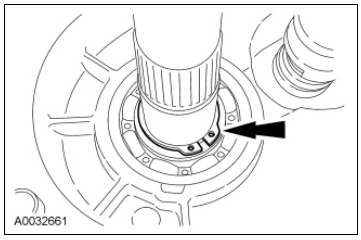
29. Using the Stator Bearing Remover with the Slide Hammer, remove the front output shaft support bearing.



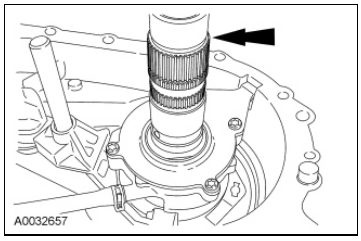
Assembly



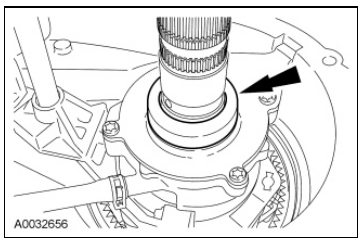
1. Using the Differential Bearing Cup Installer with the Adapter, press the front output shaft support bearing into the case.



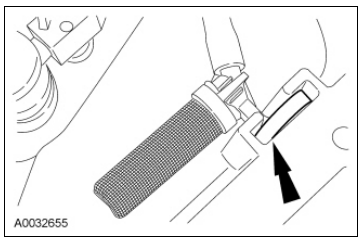
2. Using the Input Shaft Oil Seal Installer, install the oil seal.



3. Using the Input Shaft Oil Seal Installer, install the oil seal.



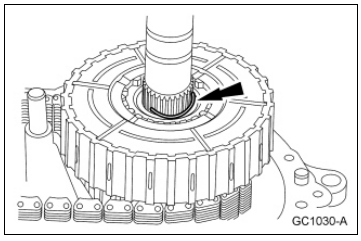
4. Install the front output shaft and flange and snap ring.



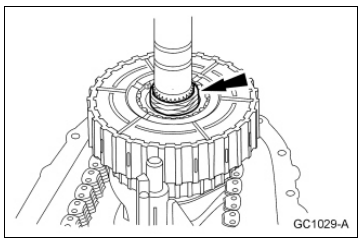
5. Install the pump assembly and the rear output shaft as an assembly.

6. Install the thrust washer.

7. Install the oil pan magnet.



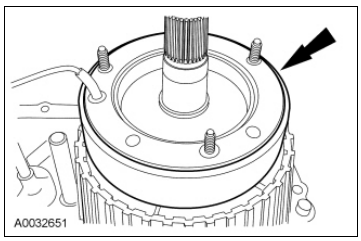
8. Install the drive chain and the 2 sprockets as an assembly.



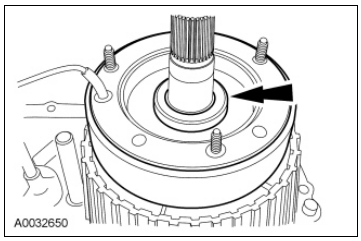
9. ***NOTICE:*** **When removing or installing the clutch pack assembly, do not separate the clutch pack assembly. Keep tension on the clutch pack upon removal. Set the clutch pack assembly on the bench in the same position as it was located in the transfer case. The thrust washer in the lower clutch pack uses tabs to hold it in place. If the thrust washer is not in place, a transfer case clearance problem can occur.**

   Install the clutch pack assembly.

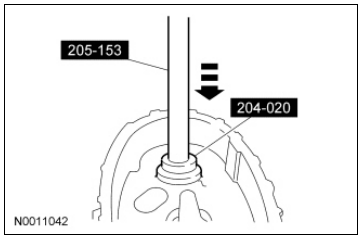
10. Install a new snap ring.



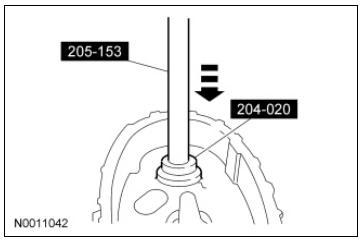
11. Install the wave spring.



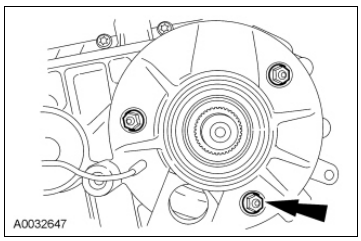
12. Install the apply cam and 3 steel balls.



13. Install the cam and coil housing assembly.

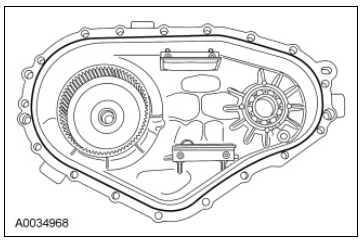


14. Install the thrust bearing.

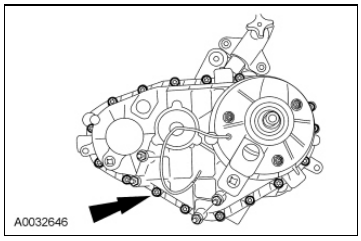


15. Using the Wheel Hub Bearing Cup Installer with the Adapter, install the front output shaft rear bearing into the case.

16. Using the Wheel Hub Bearing Cup Installer with the Adapter, install the rear output shaft rear bearing into the case.

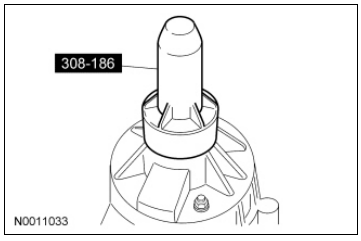


17. Position and support the clutch coil assembly, then install the 3 nuts.
    - Tighten to 10 Nm (89 lb-in).



18. ***NOTICE:*** **Applying excess gasket sealant can damage the internal components.**

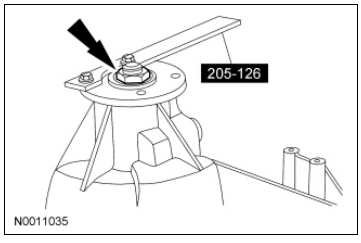
Apply a 3 mm (0.11 in) bead of gasket sealant on the rear case mating surface.



19. Assemble the front and rear case halves.

20. Install the 17 transfer case bolts.
    - Tighten the bolts evenly in a cross pattern to 25 Nm (18 lb-ft).

21. Using the Input Shaft Oil Seal Installer, install the yoke-to-flange oil seal.



22. Install a new output flange oil seal.

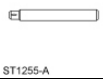
23. **NOTE:** Align the index marks made during disassembly.

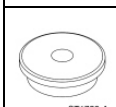
    Install the output flange.

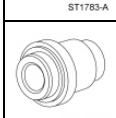
24. Install the output shaft yoke washer.

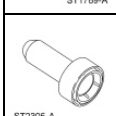
25. Using the Drive Pinion Flange Holding Fixture to hold the output flange, install the nut.
    - Tighten to 355 Nm (262 lb-ft).

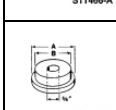
26. Seat the coil wire pin into the electrical connector and install the connector interlock.

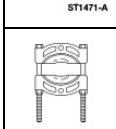


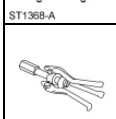


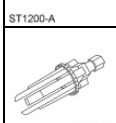


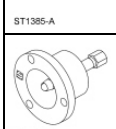












27. Install the transfer case in the vehicle. For additional information, refer to Transfer Case in this section.

28. Fill the transfer case. For additional information, refer to Transfer Case Draining and Filling in this section.

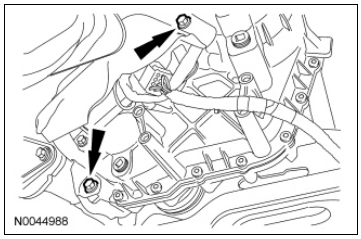
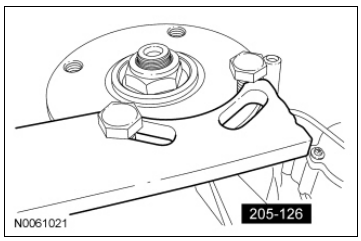
Disassembly



1. Remove the transfer case. For additional information, refer to Transfer Case in this section.

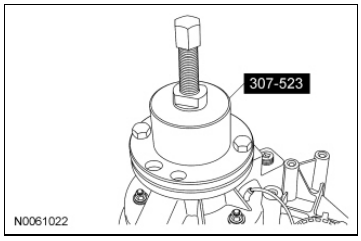
2. ⚠ **WARNING: Always verify that the lockpin on the bench-mounted holding fixture is correctly secured to help prevent unexpected component rotation. Failure to follow this instruction may result in serious personal injury.**

   Using the Transmission Holding Fixture, secure the transfer case to the bench.

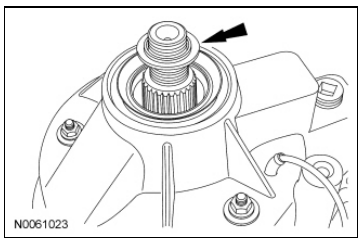


3. Remove the 3 heat shield bolts, then remove the heat shield.

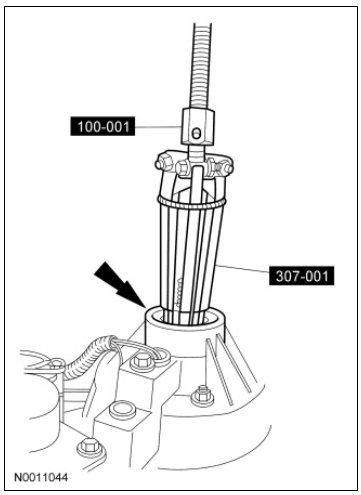
4. If not previously done, remove the drain plug and drain the fluid.
   - When finished draining, install the drain plug and tighten to 20 Nm (177 lb-in).



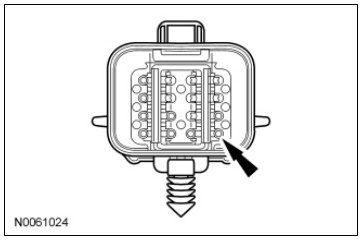
5. Using the Drive Pinion Flange Holding Fixture to hold the output flange, remove the rear output shaft flange nut.



6. Remove the output shaft yoke washer.

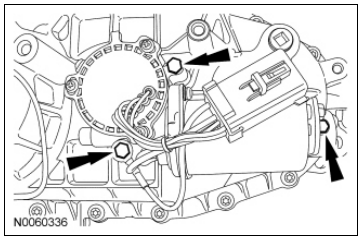


7. Using the Output Shaft Flange Remover, remove the output flange.

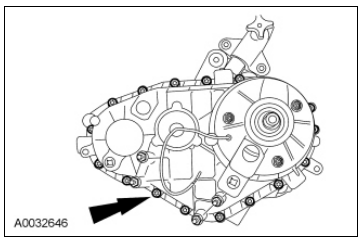


8. Remove and discard the output flange oil seal.

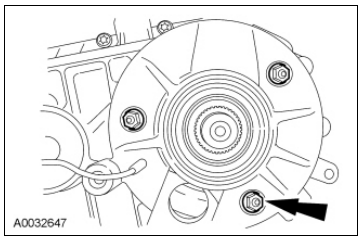
9. Using the Bushing Remover with the Slide Hammer, remove and discard the yoke-to-flange seal.



10. Remove the connector interlock. Using an electrical connector pin extractor tool, remove the coil wire pin from the electrical connector.

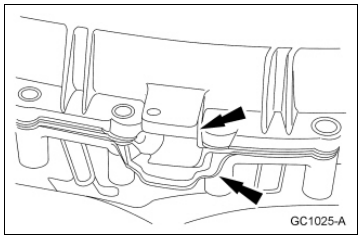


11. Remove the 4 transfer case shift motor bolts.

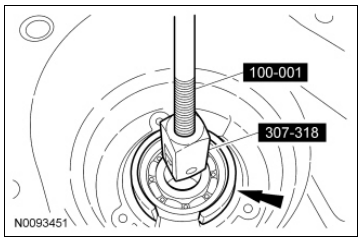


12. Remove the transfer case shift motor.

13. Remove the 17 transfer case bolts.

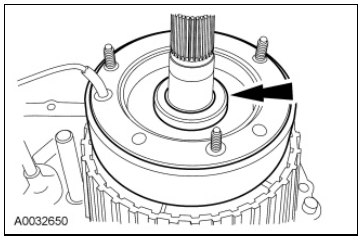


14. Remove the 3 clutch coil assembly nuts.

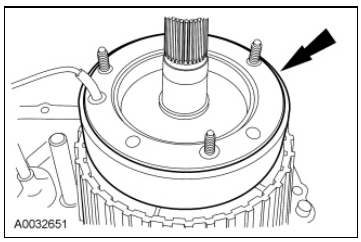


15. ***NOTICE:*** **Pry only at the transfer case pry bosses. Prying other than at the pry bosses may cause damage to the components.**

    Separate the transfer case halves at the transfer case pry bosses.

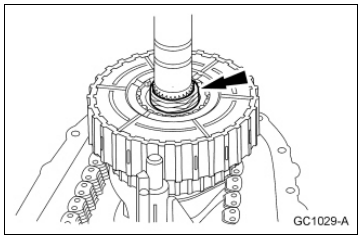


16. Remove the snap ring, then using the Slide Hammer and the Stator Bearing Remover, remove the rear output shaft support bearing.

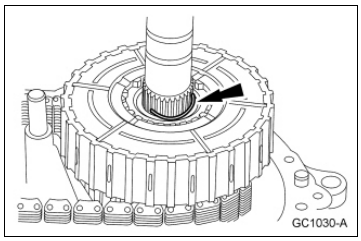


17. Using the Slide Hammer and the Stator Bearing Remover, remove the front output shaft rear bearing.

18. Remove the thrust bearing.

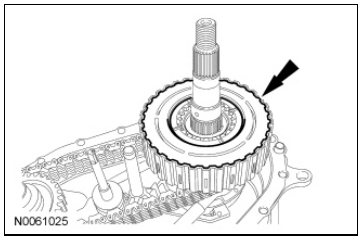


19. Remove the cam and coil housing assembly.

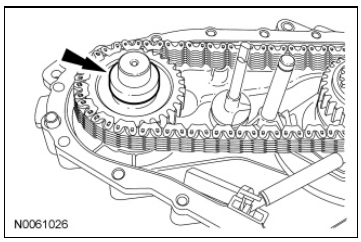


20. Remove the apply cam and 3 steel balls.

21. Remove the wave spring.



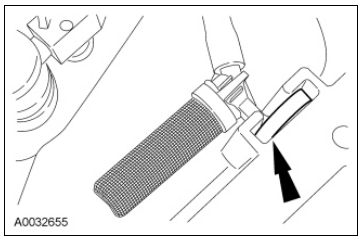
22. Remove the snap ring.



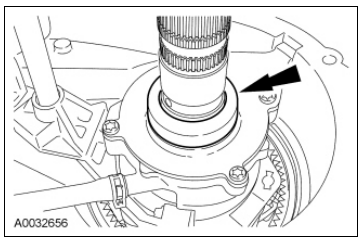
23. ***NOTICE:*** **When removing the clutch pack assembly, do not separate the clutch pack assembly. Keep tension on the clutch pack during removal. Set the clutch pack assembly on the bench in the same position as located in the transfer case. The thrust washer in the lower clutch pack uses tabs to hold it in place. If the thrust washer is not in place, a transfer case clearance problem will occur.**

    NOTICE: **If the clutch pack is disassembled, a new clutch pack must be installed. Failure to install a new clutch pack can result in component failure.**

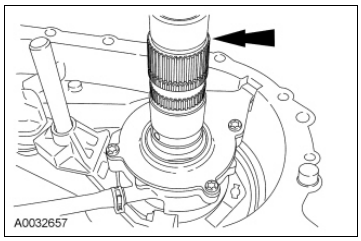
    Remove the clutch pack assembly.



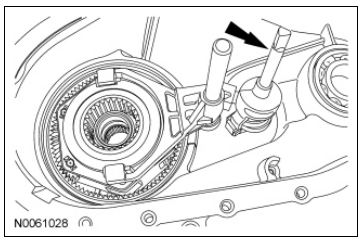
24. Remove the driven sprocket thrust washer.



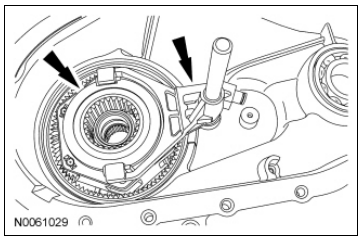
25. Remove the drive chain and the 2 sprockets as an assembly.



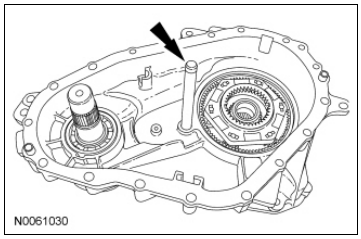
26. Remove and clean the oil pan magnet.



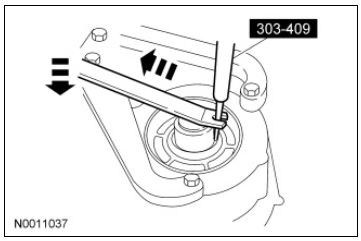
27. Remove the thrust washer.



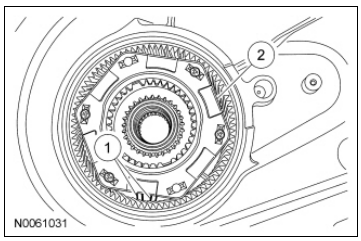
28. Remove the pump assembly and the rear output shaft as an assembly.



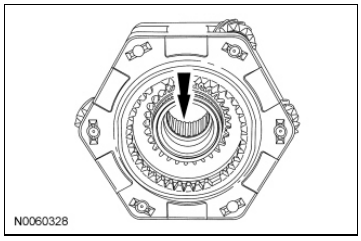
29. Remove the electric shift cam assembly. Do not disassemble the electric shift cam assembly.



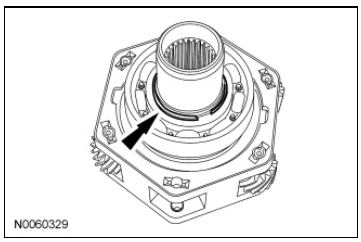
30. Remove the reduction shift fork and the high-low collar as an assembly.



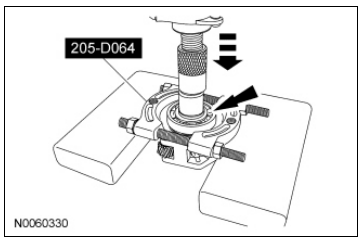
31. Remove the shift rail.



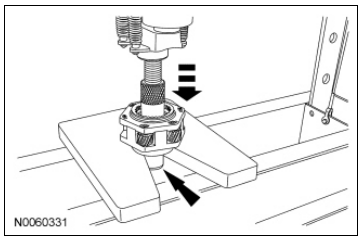
32. Using the Oil Seal Remover, remove and discard the oil seal.



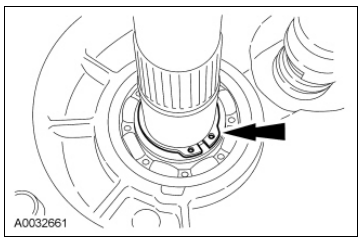
33. Remove the front planetary gear set assembly.
    1. Expand the snap ring.
    2. Remove the front planetary gear set assembly.



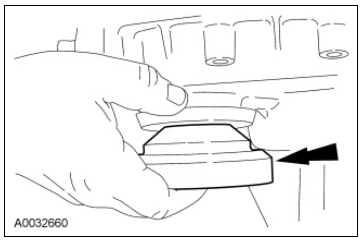
34. Using a drift and hammer, remove the output shaft bushing and bearing, if necessary.



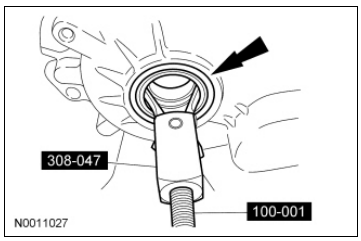
35. If the planetary gear carrier support bearing removal is necessary, remove the snap ring.



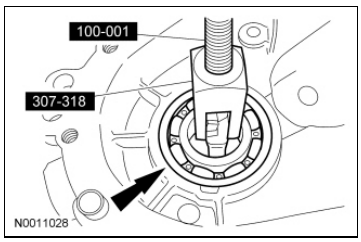
36. Using a suitable press and the Bearing Puller, remove the planetary gear carrier support bearing.



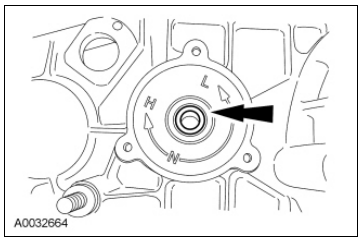
37. Remove the planetary input shaft.



38. While holding the front output shaft and flange, remove the snap ring.

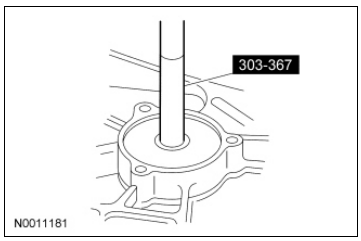


39. Remove the front output shaft and flange.

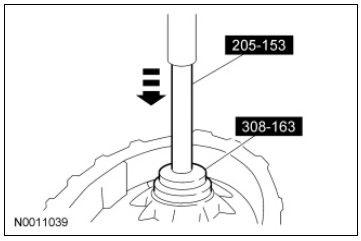


40. Using the Bearing Cup Remover with the Slide Hammer, remove and discard the oil seal.

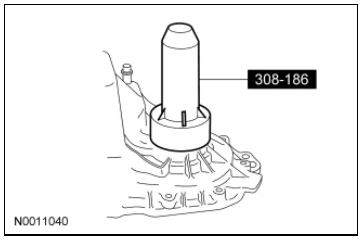
41. Using the Stator Bearing Remover with the Slide Hammer, remove the front output shaft support bearing.



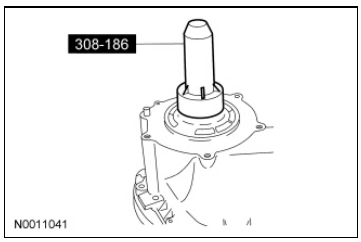
42. Remove and discard the shifter shaft seal.



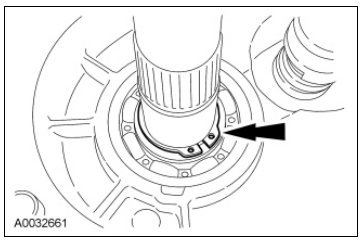
Assembly



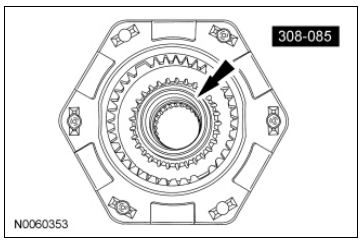
1. Using the Valve Stem Oil Seal Installer, carefully install the shifter shaft seal.



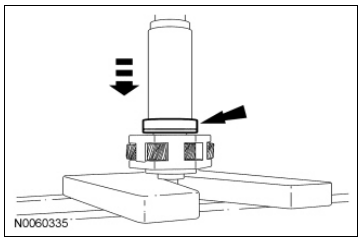
2. Using the Differential Bearing Cup Installer with the Adapter, press the front output shaft support bearing into the case.



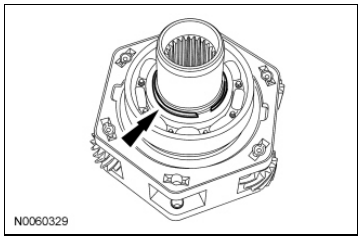
3. Using the Input Shaft Oil Seal Installer, install a new oil seal.



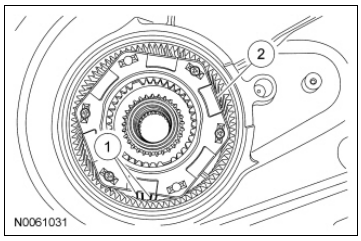
4. Using the Input Shaft Oil Seal Installer, install a new oil seal.



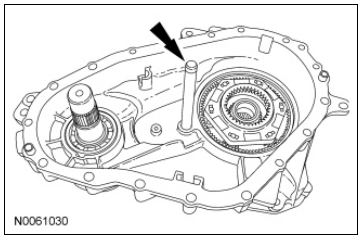
5. Install the front output shaft and flange and snap ring.



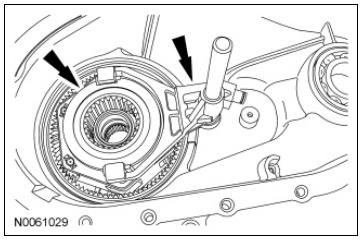
6. Using a suitable press and the Input Shaft Bearing Installer, install the bushing and the bearing, if removed.



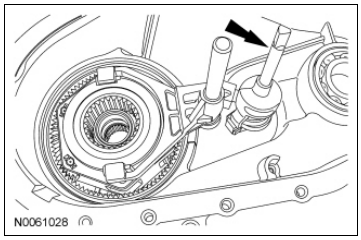
7. Using a suitable press, install the planetary gear carrier support bearing, if removed.



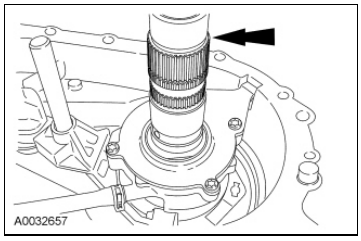
8. Install a new snap ring.



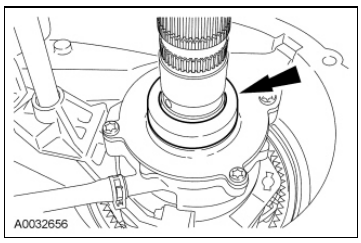
9. Install the front planetary gear set assembly.
    1. Expand the snap ring.
    2. Position the front planetary gear set assembly and release the snap ring.



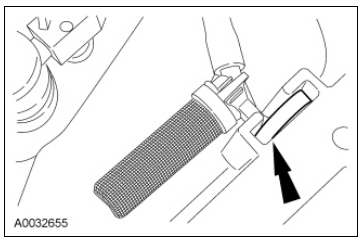
10. Install the shift rail.



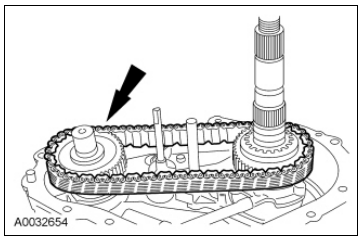
11. Install the reduction shift fork and the high-low collar as an assembly.



12. Install the electric shift cam assembly.

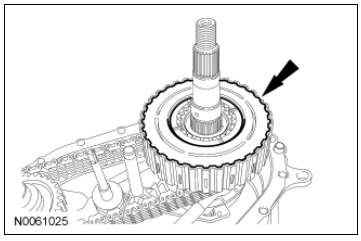


13. Install the pump assembly and the rear output shaft as an assembly.

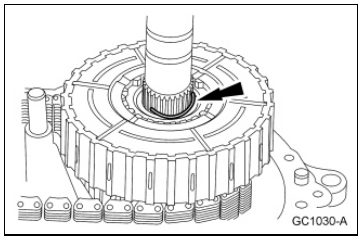


14. Install the thrust washer.

15. Install the oil pan magnet.



16. Install the drive chain and the 2 sprockets as an assembly.

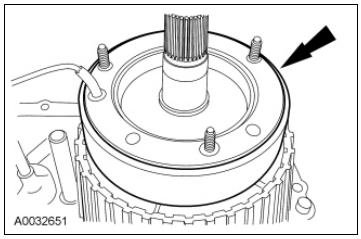


17. ***NOTICE:*** **When installing the clutch assembly, do not separate the clutch pack assembly. The thrust washer in the lower clutch pack uses tabs to hold it in place. If the thrust washer is not in place, a transfer case clearance problem will occur.**

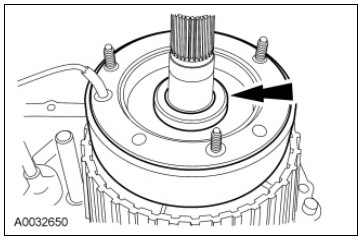
    NOTICE: **If the clutch pack is disassembled, a new clutch pack must be installed. Failure to install a new clutch pack can result in component failure.**

    Install the clutch pack assembly.

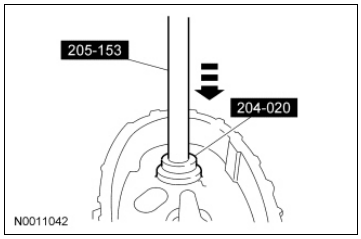
18. Install a new snap ring.



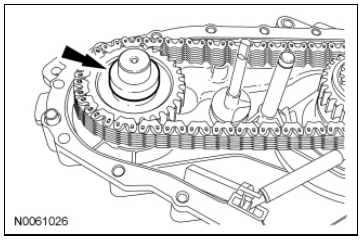
19. Install the wave spring.



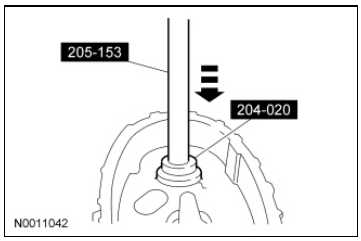
20. Install the apply cam and 3 steel balls.



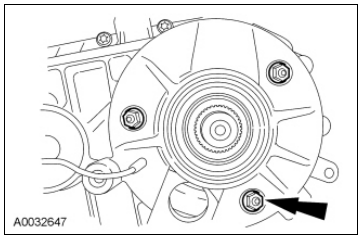
21. Install the cam and coil housing assembly.



22. Install the thrust bearing.

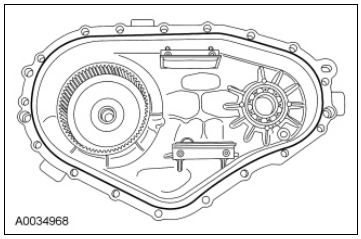


23. Using the Wheel Hub Bearing Cup Installer with the Adapter, install the front output shaft rear bearing into the case.

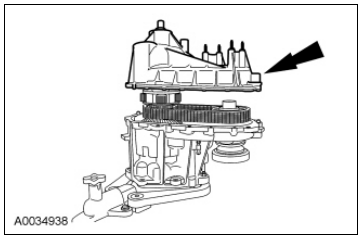


24. Install the driven sprocket thrust washer.

25. Using the Wheel Hub Bearing Cup Installer with the Adapter, install the rear output shaft rear bearing into the case.

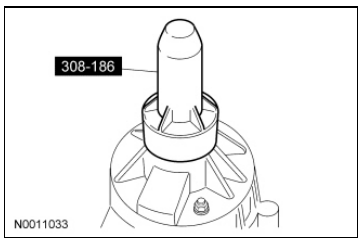


26. Position and support the clutch coil assembly, then install the 3 nuts.
    - Tighten to 10 Nm (89 lb-in).



27. ***NOTICE:*** **Applying excess silicone rubber can damage the internal components.**

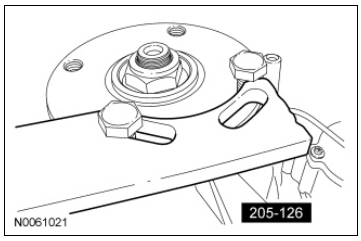
    Apply a 3 mm (0.11 in) bead of silicone rubber on the rear case mating surface.



28. Assemble the front and rear case halves.

29. Install the 17 transfer case bolts.
    - Tighten the bolts evenly in a star pattern to 25 Nm (18 lb-ft).

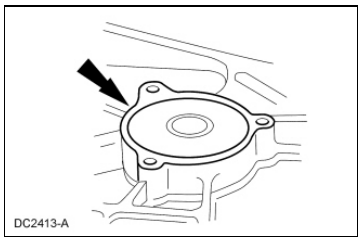
30. Using the Input Shaft Oil Seal Installer, install a new yoke-to-flange oil seal.



31. Install a new output flange oil seal.

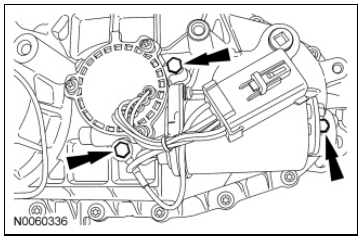
32. **NOTE:** Align the index marks made during disassembly.

    Install the output flange.



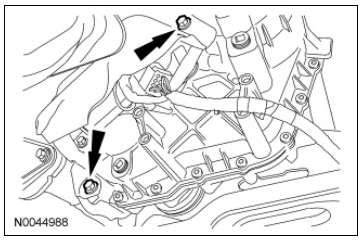
33. Install the output shaft yoke washer.

34. Using the Drive Pinion Flange Holding Fixture to hold the output flange. Install the rear output shaft flange nut.
    - Tighten to 355 Nm (262 lb-ft).



35. **NOTE:** Make sure the motor mounting surfaces are clean.

    Apply a 3 mm (0.11 in) bead of sealant to the motor mounting surface on the case.



36. Position the transfer case shift motor and install the 4 bolts.
    - Tighten to 10 Nm (89 lb-in).

37. Seat the coil wire pin into the electrical connector. Install the connector interlock.

38. Position the heat shield and install the 3 heat shield bolts.
    - Tighten to 16 Nm (142 lb-in).

39. Install the transfer case in the vehicle. For additional information, refer to Transfer Case in this section.

40. Fill the transfer case. For additional information, refer to Transfer Case Draining and Filling in this section.

12	-	Skid plate bolt (4 required)

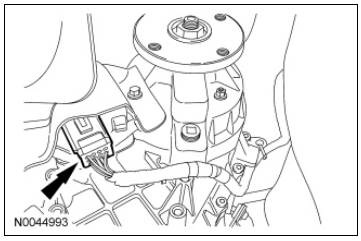
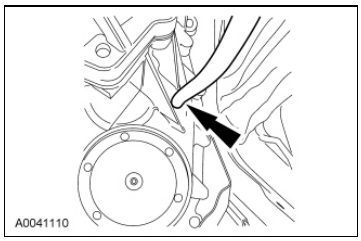
Removal

1. Remove the rear driveshaft. For additional information, refer to Section 205-01 .

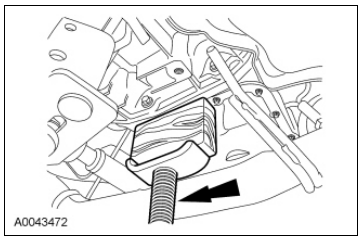


2. Remove the front driveshaft. For additional information, refer to Section 205-01 .

3. Remove the 4 bolts and the skid plate, if equipped.

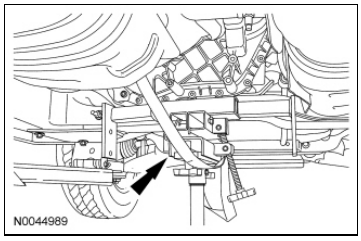


4. Drain the fluid if the transfer case is to be disassembled. For additional information, refer to Transfer Case Draining and Filling in this section.



5. Disconnect the shift motor electrical connector.

6. Disconnect the vent hose from the transfer case.

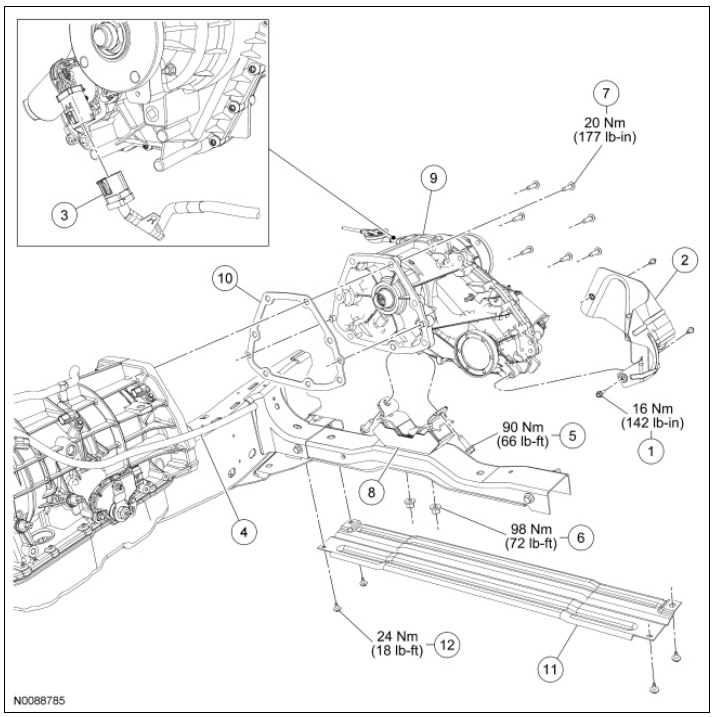


7. Position a suitable jack under the transmission.

8. Remove and discard the 7 transfer case-to-transmission bolts.

9. Using the Transmission Jack, position it to the transfer case. Securely strap the transfer case to the Transmission Jack.

10. Move the transfer case rearward. Remove the transmission insulator, then move the transfer case forward. Using the jack, tip the rear end of the transfer case downward, remove the transfer case from vehicle.



11. Remove the transfer case-to-transmission gasket and clean the mating surfaces of the transfer case and the transmission with metal surface prep.

9	7A195	Transfer case
10	7086	Transfer case-to-transmission gasket
11	-	Skid plate
12	-	Skid plate bolt (4 required)

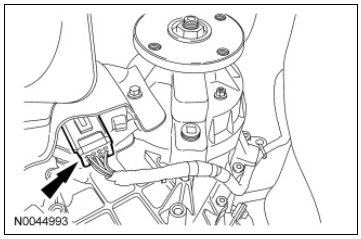
Installation

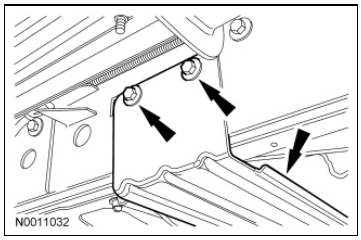
1. Install a new transfer case-to-transmission gasket onto the transfer case.
2. **NOTE: Always install new aluminum bolts. Do not reuse the old bolts.**

   Position the transfer case and install 7 new aluminum transfer case-to-transmission bolts.

   - Tighten to 20 Nm (177 lb-in).



3. Remove the Transmission Jack from the transfer case.



4. Connect the vent hose to the transfer case.

5. Connect the shift motor electrical connector.

6. Position the skid plate and install the 4 bolts, if equipped.
   - Tighten to 24 Nm (18 lb-ft).

7. Install the front driveshaft. For additional information, refer to Section 205-01 .

8. Install the rear driveshaft. For additional information, refer to Section 205-01 .

9. Fill the transfer case. For additional information, refer to Transfer Case Draining and Filling in this section.

Torque Specifications

Description	Nm	lb-ft	lb-in
Exhaust Y-pipe - dual catalytic converter heat shield clamp screws	7	-	62
Exhaust Y-pipe - dual catalytic converter-to-exhaust manifold nuts [a]	-	-	-
Muffler-to-catalytic converter bolts	40	30	-
Service exhaust coupler	47	35	-
Torca® clamp	48	35	-

[a] Refer to procedure in this section.

Exhaust System

The exhaust system consists of the following components:

- Exhaust Y-pipe dual catalytic converter
- Muffler
- Tail pipe

Exhaust System

The exhaust system provides an exit for exhaust gases and reduces engine noise by passing exhaust gases through the catalytic converter and a muffler assembly. Rubber exhaust hanger isolators attach the exhaust system to the mounting hooks.

Catalytic Converter

The catalytic converter plays a major role in the emission control system. The catalytic converter operates as a gas reactor. Its catalytic function is to speed the heat-producing chemical reaction of components in the exhaust gases in order to reduce air pollutants. The catalyst material inside the catalytic converter consists of a ceramic substrate.

The catalytic converter is designed to provide a long life. No maintenance is necessary for the catalytic converter.

Sound Insulators and Shields

Sound insulators and shields attached to the underbody protect the vehicle from exhaust system heat and should be inspected at regular intervals to make sure they are not dented or out of position. If a sound insulator and shield is damaged or shows evidence of deterioration, a new sound insulator and shield should be installed. The sound insulators and shields for the exhaust Y-pipe dual catalytic converter, muffler and tail pipe are installed separately.

Precautions

NOTICE: **Do not use leaded fuel in a vehicle equipped with a catalytic converter. In a vehicle that is continually misfueled, the lead in the fuel will be deposited in the catalytic converter and completely blanket the catalyst. Lead reacts with platinum to "poison" the catalyst. Continuous use of leaded fuel can destroy the catalyst and render the catalytic converter useless.**

NOTICE: **The addition of lead to the catalytic converter can also solidify the catalyst, causing excessive back pressure in the exhaust system and possibly causing engine damage.**

NOTICE: **Extremely high temperatures (1,100°C [2,012°F] or above) due to misfiring or over-rich fuel/air mixture will cause the ceramic substrate to sinter or burn, destroying the catalytic converter. Do not continue to operate the vehicle if the engine is misfiring, there is a power loss or other unusual**

operating conditions, such as engine overheating and backfiring.

NOTICE: **Do not use oil or grease-based lubricants on the isolators. These lubricants may cause deterioration of the rubber. This can lead to separation of the isolator from the exhaust hanger bracket during vehicle operation.**

NOTE: Exhaust fasteners are of a prevailing torque design. Use only new fasteners with the same part number as the original. Torque values must be used as specified during reassembly to make sure of correct retention of exhaust components.

NOTE: Always install new gasket and nuts whenever an exhaust joint containing these is loosened.

Make sure to follow these precautions when carrying out the procedures in this section.

Exhaust System

Principles of Operation

The exhaust system provides an exit for exhaust gases and reduces engine noise by passing exhaust gases through the catalytic converters and a muffler assembly. The catalytic converters also play a major role in reducing air pollutants.

Inspection and Verification

1. Verify the concern by running the engine (with the vehicle on the ground) or road testing the vehicle to duplicate the condition.
2. Visually inspect the components of the exhaust system and related controls that may affect exhaust gas quality or loss of power.
3. Visually inspect for obvious signs of mechanical damage. Refer to the following chart.

Visual Inspection Chart

Mechanical
• Exhaust pipe pinched or crushed • Damaged muffler • Broken or damaged exhaust hanger brackets • Damaged catalytic converter • Cracked exhaust manifold • Dirty engine air cleaner • Loose or damaged heat shields (4.6L only)

4. Verify that the exhaust system is installed correctly, with clamps correctly located and tightened to specification.
5. If the fault is not visually evident, determine the symptom. GO to Symptom Chart - Exhaust System or GO to Symptom Chart - NVH .

Symptom Chart - Exhaust System

Symptom Chart - Exhaust System

Symptom Chart - NVH

Symptom Chart - NVH
NOTE: NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to Section 100-04 . Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to Section 100-04 for the next likely system and continue diagnosis.

ConditionPossible SourcesAction

- Rattle, squeaks or buzz type noise - from the bottom of vehicle

- Loose or damaged heat shield (4.6L only)

- INSPECT the exhaust system for loose or missing heat shields or foreign material trapped between the heat shields and the exhaust system components. If any heat shields are loose, INSTALL either worm gear clamp FOTZ-5A231-A or W705949-S300 and tighten to 7 Nm (62 lb-in). If the heat shields are missing, INSTALL new heat shields or exhaust system components as necessary. If a rattle, noise or buzz condition persists, INSTALL a new heat shield or component as necessary. TEST the system for normal operation after the repair.

- Loose or damaged exhaust isolators

- CHECK that the exhaust isolators are correctly installed. INSPECT the exhaust isolators for wear or damage. INSTALL new isolators as necessary. TEST the system for normal operation after the repair.

- Damaged exhaust isolator hanger bracket

- INSPECT the exhaust system components for damage or broken hangers. INSTALL new components as necessary. CHECK for loose or damaged exhaust hanger brackets or fasteners. TIGHTEN bolts to specification or INSTALL new components as necessary. TEST the system for normal operation after the repair.

- Catalytic converter
- Muffler

- MOVE the exhaust system to simulate the bouncing action of the vehicle, checking for exhaust-to-body contact while moving the exhaust system. Using a rubber mallet, lightly TAP on the exhaust components one at a time to duplicate the noise concern. DETERMINE if there are any loose or broken baffles or element. REPAIR or INSTALL new components as necessary. TEST the system for normal operation after the repair.

- Exhaust grounded to chassis

- INSPECT for signs of exhaust components-to-body contact. If necessary, CARRY OUT the Exhaust System Alignment in this section.

- Drone or clunk type noise - from bottom of vehicle

- Loose or damaged exhaust isolators

- INSPECT exhaust isolators for wear or damage. INSTALL new isolators as necessary. TEST the system for normal operation after the repair.

- Exhaust grounded to chassis

- INSPECT for signs of exhaust components-to-body contact. If necessary, CARRY OUT the Exhaust System Alignment in this section.

- Whistles, boom, hum or ticking type noise - noise tends to change as engine warms. Noises are often accompanied by exhaust fumes

- Exhaust system leak

- INSPECT the entire exhaust system for leaks. CHECK for punctures, loose or damaged clamps/fasteners, gaskets, sensors or broken welds. EXAMINE the chassis for grayish-white or black exhaust soot, which would indicate exhaust leakage at that point. To magnify a small leak, have an assistant hold a shop towel over the tail pipe outlet, while listening for a leak. REPAIR or INSTALL new components as necessary. TEST the system for normal operation after the repair.

- Catalytic converter
- Muffler

- MOVE the exhaust system to simulate the bouncing action of the vehicle, checking for exhaust-to-body contact while moving the exhaust system. Using a rubber mallet, lightly TAP on the exhaust components one at a time to duplicate the noise concern. DETERMINE if there are any loose or broken baffles or element. REPAIR or INSTALL new components as necessary. TEST the system for normal operation after the repair.

- Exhaust muffler/resonator drain hole enlarged due to corrosion

- **NOTE:** Check with vehicle on the ground, not on a hoist.

  CONFIRM drain holes are noise source. INSTALL new components as necessary. TEST the system for normal operation after the repair.

- Thermal expansion of exhaust versus heat shields (4.6L only)

- This is a normal condition.

- Hissing or rushing noise - high frequency sound. Vehicle performance is unaffected

- Exhaust system. Exhaust flow through pipes

- MOVE the exhaust system to simulate the bouncing action of the vehicle, checking for exhaust-to-body contact while moving the exhaust system. Using a rubber mallet, lightly TAP on the exhaust components one at a time to duplicate the noise concern. DETERMINE if there are any loose or broken baffles or element. CHECK for missing or leaking Torca® clamps. REPAIR or INSTALL new components as necessary. TEST the system for normal operation after the repair.

- Pinging noise - occurs when exhaust system is hot, engine turned off

- Catalytic converter/exhaust system
- Thermal expansion of exhaust system

- Cool down pinging is the exhaust system expanding and contracting during heating and cooling. This is a normal condition.
- Vibration - occurs at idle and at low speeds. Also accompanied by clunk or buzz type noise
- Loose or damaged exhaust isolators
- INSPECT the exhaust isolators for wear or damage. INSTALL new isolators as necessary. TEST the system for normal operation after the repair.
- Loose or damaged exhaust isolator hanger brackets
- INSPECT the exhaust isolator hanger brackets for wear or damage. INSTALL or REPAIR as necessary. TEST the system for normal operation after the repair.
- Exhaust system grounded to chassis
- CARRY OUT the Exhaust System Alignment in this section.
- Engine drumming noise - normally accompanied by vibration
- Damaged or misaligned exhaust system
- INSPECT the exhaust system for loose or damaged fasteners, Torca® clamps or isolators. CARRY OUT the Exhaust System Alignment in this section. TEST the system for normal operation after the repair.
- Sputter type noise - noise worse when cold, lessens or disappears when the vehicle is at operating temperature
- Damaged or worn exhaust system
- INSPECT the exhaust system for leaks or damage. REPAIR as necessary. TEST the system for normal operation after the repair.
- Thumping noise - from the bottom of the vehicle, worse at acceleration
- Misaglined exhaust system
- CHECK the exhaust system-to-chassis clearance. CHECK the exhaust system isolators for damage. REPAIR as necessary. TEST the system for normal operation after the repair.
- Engine vibration - is felt with increases and decreases in engine rpm
- Strain on exhaust system isolators
- CARRY OUT the Exhaust System Alignment in this section. REPAIR as necessary. TEST the system for normal operation after the repair.
- Drumming noise - occurs inside the vehicle during idle or high idle, hot or cold. Very low-frequency drumming is very rpm dependent
- Exhaust system vibration excites the body resonances inducing interior noise.

- GO to Pinpoint Test A .

Pinpoint Test

Pinpoint Test A: Drumming Noise

This pinpoint test is intended to diagnose the following:

- Exhaust system

PINPOINT TEST A: DRUMMING NOISE

Test Step	Result / Action to Take
A1 CHECK THE EXHAUST SYSTEM	
• Start the engine. • Increase the engine rpm until the noise is the loudest. Note the engine rpm. • Ignition OFF. • Add approximately 9 kg (20 lb) of weight to the exhaust system. First place the weight at the tail pipe and test, then at the front pipe. • Start the engine. • Increase the engine rpm and listen for the drumming noise. Note the engine rpm if the noise occurs. • Ignition OFF. • Determine the amount of vibration that occurs with the drumming noise. • **Is the noise/vibration reduced or eliminated, or does the noise/vibration occur at a different rpm?**	**Yes** REFER to Exhaust System Alignment in this section. TEST the system for normal operation. **No** CONDUCT a diagnosis on other suspect systems. REFER to Section 100-04 .

Exhaust System Alignment

All vehicles

NOTICE: **Do not use oil or grease-based lubricants on the isolators. These lubricants may cause deterioration of the rubber. This can lead to separation of the isolator from the exhaust hanger bracket during vehicle operation. Use only water-based lubricants on the isolators.**

NOTE: Exhaust fasteners are of a prevailing torque design. Use only new fasteners with the same part number as the original. Torque values must be used as specified during reassembly to make sure of correct retention of exhaust components.

NOTE: Always install new gasket and nuts whenever an exhaust joint is loosened.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Loosen all fasteners joining the exhaust system components.

3. **NOTE:** Do not fully torque the exhaust Y-pipe dual catalytic converter-to-exhaust manifold joint.

   Position the exhaust Y-pipe dual catalytic converter to the exhaust manifold and loosely tighten all nuts to stiffen the joint enough to maintain position.

   - Tighten to 8 Nm (71 lb-in) and then add additional torque if needed to stiffen the joint.

4. **NOTE:** Make sure that the tab on the muffler assembly is seated inside the notch on the tail pipe before tightening the Torca® clamp.

   Tighten the muffler assembly-to-tail pipe Torca® clamp.

   - Tighten to 48 Nm (35 lb-ft).

5. Confirm that the exhaust isolators are at zero load.

4.0L Explorer Sport Trac

6. **NOTE:** The production muffler assembly is a one-piece design. The service muffler assembly is serviced with 2 pieces.

   NOTE: If the muffler has not been removed from the vehicle, this muffler inlet pipe joint will not be present.

NOTE: If installing a service muffler kit, the coupling will be welded into position on the muffler inlet pipe.

NOTE: The factory muffler inlet pipe will not have an alignment nub.

If equipped, and not welded to the muffler inlet pipe, make sure that the service exhaust coupler is against the alignment nub and is positioned approximately at the 2 o'clock position facing the muffler. If the muffler inlet pipe does not have an alignment nub, center the exhaust coupler over the muffler inlet pipe joint and position it at approximately the 2 o'clock position facing the muffler.

- Tighten to 47 Nm (35 lb-ft).

4.6L Explorer Sport Trac

7. **NOTE:** The production muffler assembly is a one-piece design. The service muffler assembly is serviced with 2 pieces.

   NOTE: If the muffler has not been removed from the vehicle, this muffler inlet pipe joint will not be present.

   NOTE: If installing a service muffler kit, the coupling will be welded into position on the muffler inlet pipe.

   NOTE: The factory muffler inlet pipe will not have an alignment nub.

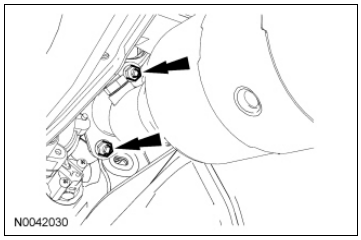
   If equipped, and not welded to the muffler inlet pipe, make sure that the service exhaust coupler is against the alignment nub and is positioned approximately at the 2 o'clock position facing the muffler. If the muffler inlet pipe does not have an alignment nub, center the exhaust coupler over the muffler inlet pipe joint and position it at approximately the 2 o'clock position facing the muffler.

   - Tighten to 47 Nm (35 lb-ft).

Explorer Sport Trac

8. Confirm that the exhaust isolators are at zero load.

All vehicles



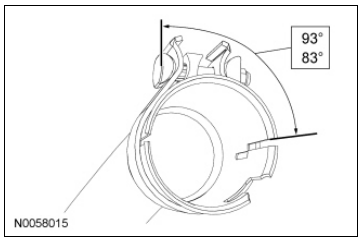
9. Tighten the exhaust Y-pipe dual catalytic converter-to-muffler assembly bolts.

- Tighten to 40 Nm (30 lb-ft).

10. Confirm that the exhaust isolators are at zero load.
11. **NOTE:** RH shown, LH similar.

    Tighten the exhaust Y-pipe dual catalytic converter-to-exhaust manifold nuts.

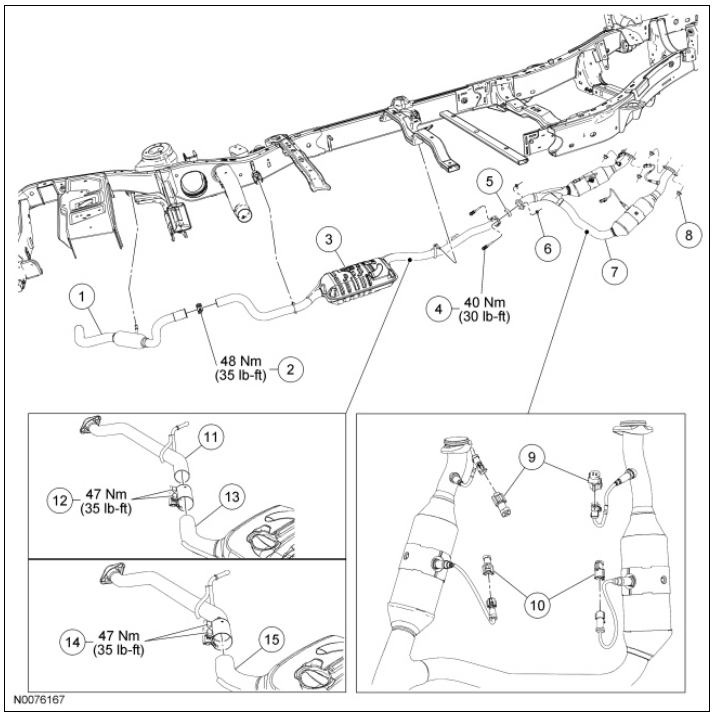
    - Tighten to 40 Nm (30 lb-ft).



12. Confirm that the exhaust isolators are at zero load.
13. Start the engine and check the exhaust system for leaks.

Torca® Clamp

1. Remove the nut from the Torca® clamp.
2. Grind the spot weld from the Torca® clamp and remove the clamp.
3. Clean the uneven surface area and, using an abrasive pad, clean the Torca® clamp surface area of any rust on the pipe.
4. Position a new Torca® clamp 3-4 mm (0.12-0.16 in) from the button slot.



5. Rotate the Torca® clamp until it is 83 to 93 degrees from slot in the side of pipe.

Exhaust Y-Pipe - Dual Catalytic Converter

Removal

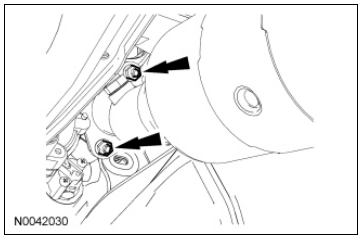
NOTICE: **Do not use oil or grease-based lubricants on the isolators. These lubricants may cause deterioration of the rubber. This can lead to separation of the isolator from the exhaust hanger bracket during vehicle operation. Use only water-based lubricants on the isolators.**

NOTE: Exhaust fasteners are of a prevailing torque design. Use only new fasteners with the same part number as the original. Torque values must be used as specified during reassembly to make sure of correct retention of exhaust components.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Using a suitable jack, support the exhaust system.

3. Disconnect the Heated Oxygen Sensor (HO2S) and the Catalyst Monitor Sensor (CMS) electrical connectors.



4. Remove the 2 exhaust Y-pipe dual catalytic converter-to-muffler assembly bolts, 2 nuts and gasket.
   - Discard the exhaust Y-pipe dual catalytic converter-to-muffler assembly nuts and gasket.

5. Remove the transmission support crossmember. For additional information, refer to Section 502-02 .

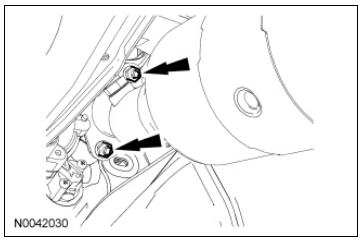
6. **NOTE:** RH side shown, LH similar.

   Remove the exhaust Y-pipe dual catalytic converter-to-exhaust manifold nuts.

   - Discard the exhaust Y-pipe dual catalytic converter-to-exhaust manifold nuts.

7. Remove the exhaust Y-pipe dual catalytic converter.

Installation



1. **NOTE:** RH side shown, LH similar.

   NOTE: Install new exhaust Y-pipe dual catalytic converter-to-exhaust manifold nuts.

   NOTE: Do not fully tighten the exhaust Y-pipe dual catalytic converter-to-exhaust manifold joint.

Position the exhaust Y-pipe dual catalytic converter to the exhaust manifold and loosely tighten all 4 new nuts to stiffen the joint enough to maintain position.

- Tighten to 8 Nm (71 lb-in) and then add additional torque if needed to stiffen the joint.

2. **NOTE:** Install new exhaust Y-pipe dual catalytic converter-to-muffler assembly gasket and nuts.

   Install the exhaust Y-pipe-dual catalytic converter-to-muffler assembly new gasket, 2 bolts and 2 new nuts.

   - Tighten to 40 Nm (30 lb-ft).

3. **NOTE:** RH shown, LH similar.

   Tighten the 4 new exhaust Y-pipe dual catalytic converter-to-exhaust manifold nuts.

   - Tighten to 40 Nm (30 lb-ft).

4. Install the transmission support crossmember. For additional information, refer to Section 502-02 .

5. Connect the HO2S and CMS electrical connectors.

6. Check to see if the exhaust system isolators are at zero load. If the exhaust system isolators are not at zero load, then carry out the exhaust system alignment procedure. For additional information, refer the Exhaust System Alignment in this section.

Muffler

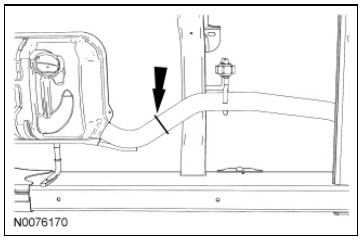
Removal

All vehicles

NOTICE: **Do not use oil or grease-based lubricants on the isolators. These lubricants may cause deterioration of the rubber. This can lead to separation of the isolator from the exhaust hanger bracket during vehicle operation. Use only water-based lubricants on the isolators.**

NOTE: Exhaust fasteners are of a prevailing torque design. Use only new fasteners with the same part number as the original. Torque values must be used as specified during reassembly to make sure of correct retention of exhaust components.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .



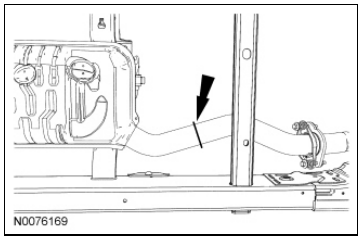
2. Using a suitable jack, support the exhaust system.

4.0L Explorer Sport Trac

3. **NOTE:** The production muffler assembly is a one-piece design. The service muffler assembly is serviced with 2 pieces.

   NOTE: In order to remove the muffler assembly, the muffler inlet pipe must be cut.

   Using a suitable exhaust cutter, cut the muffler inlet pipe between the first bend coming out of the muffler and the next bend in line. If a service exhaust coupler is present at this point, loosen the service exhaust coupler nuts and separate the muffler inlet pipe.



4.6L Explorer Sport Trac

4. **NOTE:** The production muffler assembly is a one-piece design. The service muffler assembly is serviced with 2 pieces.

   NOTE: In order to remove the muffler assembly, the muffler inlet pipe must be cut.

   Using a suitable exhaust cutter, cut the muffler inlet pipe between the first bend coming out of the muffler and the next bend in line. If a service exhaust coupler is present at this point, loosen the service exhaust coupler nuts and separate the muffler inlet pipe.

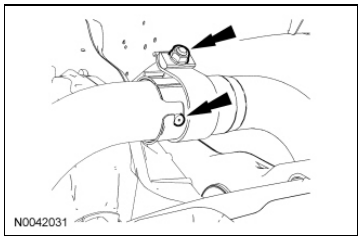
All vehicles

5. Loosen the muffler assembly-to-tail pipe Torca® clamp.

6. Remove the 2 exhaust Y-pipe dual catalytic converter-to-muffler assembly bolts, 2 nuts and gasket.
   - Discard the exhaust Y-pipe dual catalytic converter-to-muffler assembly nuts and gasket.

7. Disconnect the rubber isolators and remove the muffler assembly.

Installation



All vehicles

1. Position the muffler assembly and connect the rubber isolators.

2. **NOTE:** Using an abrasive pad, clean the muffler assembly-to-tail pipe surface area of any rust.

   Position the muffler assembly-to-tail pipe and make sure the tab on the muffler assembly is seated inside the notch on the tail pipe and then tighten the Torca® clamp.

   - Tighten to 48 Nm (35 lb-ft).

4.0L Explorer Sport Trac

3. **NOTE:** Using an abrasive pad, clean the muffler inlet pipe service coupler surface area of any rust.

   NOTE: If installing a service muffler kit, the coupling will be welded into position on the muffler inlet pipe.

   NOTE: The factory muffler inlet pipe will not have an alignment nub.

   If reusing the factory muffler assembly, position the 2 halves of the muffler inlet pipe into the service exhaust coupler and center the service exhaust coupler onto the cut joint on the muffler inlet pipe. If installing a new service muffler kit, install the muffler inlet pipe coming out of the muffler into the service exhaust coupler.

4. **NOTE:** If installing a service muffler kit, the coupling will be welded into position on the muffler inlet pipe.

NOTE: The factory muffler inlet pipe will not have an alignment nub.

If not welded to the muffler inlet pipe, make sure that the service exhaust coupler is against the alignment nub and is positioned approximately at the 2 o'clock position facing the muffler. If the muffler inlet pipe does not have an alignment nub, center the exhaust coupler over the muffler inlet pipe joint and position it at approximately the 2 o'clock position facing the muffler.

- Tighten to 47 Nm (35 lb-ft).

4.6L Explorer Sport Trac

5. **NOTE:** Using an abrasive pad, clean the muffler inlet pipe service coupler surface area of any rust.

   NOTE: If installing a service muffler kit, the coupling will be welded into position on the muffler inlet pipe.

   NOTE: The factory muffler inlet pipe will not have an alignment nub.

   If reusing the factory muffler assembly, position the 2 halves of the muffler inlet pipe into the service exhaust coupler and center the service exhaust coupler onto the cut joint on the muffler inlet pipe. If installing a new service muffler kit, install the muffler inlet pipe coming out of the muffler into the service exhaust coupler.

6. **NOTE:** If installing a service muffler kit, the coupling will be welded into position on the muffler inlet pipe.

   NOTE: The factory muffler inlet pipe will not have an alignment nub.

   If not welded to the muffler inlet pipe, make sure that the service exhaust coupler is against the alignment nub and is positioned approximately at the 2 o'clock position facing the muffler. If the muffler inlet pipe does not have an alignment nub, center the exhaust coupler over the muffler inlet pipe joint and position it at approximately the 2 o'clock position facing the muffler.

   - Tighten to 47 Nm (35 lb-ft).

All Vehicles

7. **NOTE:** Install new exhaust Y-pipe dual catalytic converter-to-muffler assembly gasket and nuts.

Install the exhaust Y-pipe-dual catalytic converter-to-muffler assembly new gasket, 2 bolts and 2 new nuts.

- Tighten to 40 Nm (30 lb-ft).

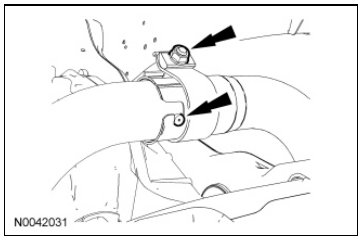
8. Check to see if the exhaust system isolators are at zero load. If the exhaust system isolators are not at zero load, then carry out the exhaust system alignment procedure. For additional information, refer the Exhaust System Alignment in this section.

Tailpipe

Removal

NOTICE: **Do not use oil or grease-based lubricants on the isolators. These lubricants may cause deterioration of the rubber. This can lead to separation of the isolator from the exhaust hanger bracket during vehicle operation. Use only water-based lubricants on the isolators.**

NOTE: Exhaust fasteners are of a prevailing torque design. Use only new fasteners with the same part number as the original. Torque values must be used as specified during reassembly to make sure of correct retention of exhaust components.



1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Loosen the muffler assembly-to-tail pipe Torca® clamp.
3. Disconnect the rubber isolator and remove the tail pipe.

Installation

1. Position the tail pipe and connect the rubber isolator.
2. **NOTE:** Using an abrasive pad, clean the muffler assembly-to-tail pipe surface area of any rust.

   Position the muffler assembly-to-tail pipe and make sure the tab on the muffler assembly is seated inside the notch on the tail pipe and then tighten the Torca® clamp.

   - Tighten to 48 Nm (35 lb-ft).

3. Check to see if the exhaust system isolators are at zero load. If the exhaust system isolators are not at zero load, then carry out the exhaust system alignment procedure. For additional information, refer the Exhaust System Alignment in this section.

Fuel tank filler pipe clamp	3	27

Fuel System

The fuel system consists of the following componenets:

- Fuel and vapor tubes
- Fuel filter (located on the front of the fuel tank)
- Fuel Pump (FP) (located in the fuel tank)
- Fuel tank filler pipe assembly
- Fuel tank
- Fuel rail
- Fuel injectors
- Inertia Fuel Shutoff (IFS) switch (located behind the front passenger side interior kick panel)

The vehicle is equipped with electronic multi-port fuel injection that is supplied by an electronic returnless fuel system. The PCM receives pressure information from a fuel pressure sensor mounted on the fuel rail. The PCM is able to maintain constant fuel pressure by varying the FP output. This is accomplished by increasing or decreasing voltage supplied to the FP . The returnless fuel system offers improved economy, lower fuel temperatures and decreased fuel vapor in the fuel tank.

For exploded view information of the fuel system, refer to Fuel Tank and Filler Pipe - Exploded View or Fuel Lines and Fuel Filter - Exploded View in Section 310-01 .

Fuel System

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Principles of Operation

NOTE: The following procedure diagnoses a slow-to-fill concern only. For all other concerns, refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

The fuel tank filler pipe assembly is used to refuel the vehicle. The fuel tank inlet check valve prevents spitback of fuel during and after refueling. The fuel tank stores the fuel. The fuel tank contains a Fuel Pump (FP) module. The FP module consists of a fuel level sender and a FP . The fuel level sender sends a signal to the fuel gauge informing the driver of how much fuel is in the fuel tank. The FP provides fuel to the fuel tubes which supply the fuel rail.

During refueling, the fuel tank vents to the atmosphere through the vent and filler pipes, on vehicles without On-Board Refueling Vapor Recovery (ORVR) systems. In vehicles equipped with ORVR , the fuel tank and filler pipe are designed so that when the vehicle is being refueled, fuel vapors in the fuel tank travel to the Evaporative Emission (EVAP) canister, which absorbs the fuel vapors and vents the pressure from the fuel tank during refueling.

Inspection and Verification

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

NOTE: Do not use incandescent lights when inspecting the fuel system. Use only flourescent or LED lighting.

1. Verify the customer concern by refueling the vehicle and observe the fuel fill rate.

2. Inspect to determine if any of the following mechanical concerns apply.

Visual Inspection Chart

Mechanical
• Bent, kinked or damaged fuel tank filler pipe • Bent, kinked or damaged fuel tank filler pipe vent tube (if equipped) • Incorrect routing of the fuel tank filler pipe • Incorrect routing of the fuel tank filler pipe vent tube (if equipped) • Incorrect position of fuel tank filler pipe clamps • Incorrect position of fuel tank filler pipe vent tube clamps (if equipped) • Fuel tank mounted vapor tubes bent or damaged • Evaporative Emission (EVAP) system tubes or hoses bent or damaged • Accident damage to the fuel tank • Accident damage to the vehicle affecting the fuel tank filler pipe-to-body connection • Unauthorized modifications and/or alterations to the vehicle • EVAP system fresh air hose plugged (dirt, spider webbing)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM .
   - refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .

- If the network test passes, retrieve and record Continuous Memory Diagnostic Trouble Codes (CMDTCs).

8. Clear the continuous DTCs and carry out the self-test diagnostics for the EVAP system using the scan tool.

9. If the DTCs retrieved are related to the concern, go to Evaporative Emission (EVAP) System DTC Chart. For PCM-related DTCs, refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. For all other DTCs, refer to Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

DTC Chart

Evaporative Emission (EVAP) System DTC Chart

Symptom Chart

Symptom Chart

Pinpoint Test

Pinpoint Test A: Slow to Fill

Normal Operation

Under normal operation, fuel should flow at a steady rate through the fuel tank filler pipe into the fuel tank. As fuel enters the fuel tank, air is vented through the filler pipe or the On-Board Refueling Vapor Recovery (ORVR) system.

This pinpoint test is intended to diagnose the following:

- Fuel tank filler pipe vent tube, if equipped
- Fuel tank filler pipe
- Evaporative Emission (EVAP) system
- Fuel tank inlet check valve (part of the fuel tank)
- Fuel level vent valve, if equipped

PINPOINT TEST A: SLOW TO FILL

Test Step	Result / Action to Take
A1 CARRY OUT INSPECTION AND VERIFICATION	
• Carry out Inspection and Verification. • **Was the cause of the concern found?**	**Yes** REPAIR or INSTALL new components to correct the concern. **No** GO to A2 .
A2 CHECK THE SYSTEM FOR ANY EVAP DTCs	
• Connect the scan tool. • Check the system for any of the following EVAP DTCs: P0446, P0451, P0452, P0453, P0454, P1450, P1451 and P260F. • **Are any of these DTCs present?**	**Yes** REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual to diagnosis the EVAP system. **No** GO to A3 .
A3 MONITOR THE FTP WHILE FILLING THE FUEL TANK	
• Monitor the Fuel Tank Pressure (FTP) reference value while filling the fuel tank. Refer to the Reference Values in the Powertrain Control/Emissions Diagnosis (PC/ED) manual. • **Is FTP within specification?**	**Yes** GO to A5 . **No** GO to A4 .
A4 MONITOR THE FTP WHILE FILLING THE FUEL TANK WITH THE EVAP SYSTEM DISCONNECTED	
• Disconnect the fuel tank-to- EVAP canister quick connect coupling at the EVAP canister. • Monitor the FTP reference value while filling the fuel tank. Refer to Powertrain Control/Emissions Diagnosis (PC/ED) manual. • **Is FTP within specification?**	**Yes** INSPECT the EVAP system for blockage or restrictions. REPAIR the blockage or restriction. If the blockage or restriction cannot be repaired, INSTALL new EVAP system components. **No** GO to A5 .
A5 CHECK THE FUEL TANK FILLER PIPE ASSEMBLY FOR BLOCKAGE OR RESTRICTION	
• Remove the fuel tank filler pipe assembly. Refer to Section 310-01 . • Inspect the fuel tank filler pipe and fuel tank filler pipe vent tube (if equipped) for a blockage or restriction.	**Yes** If possible, REPAIR the blockage or restriction. If the blockage or restriction cannot be repaired, INSTALL a new fuel tank filler pipe or fuel tank filler pipe vent tube. **No**

• **Is the fuel tank filler pipe or fuel tank filler pipe vent tube (if equipped) blocked or restricted?**	GO to A6 .
A6 CHECK THE FUEL TANK INLET CHECK VALVE	
• Inspect the fuel tank inlet check valve for restriction or sticking. • **Is the fuel tank inlet check valve restricted or sticking?**	**Yes** If possible, REPAIR the restrictions. If the restriction cannot be repaired, INSTALL a new fuel tank. REFER to Section 310-01 . **No** GO to A7 .
A7 CHECK TO MAKE SURE THAT THE FUEL LEVEL VENT VALVE IS FUNCTIONING CORRECTLY	
• **NOTE:** The fuel level vent valve, if equipped, is part of the FP module. • Remove the FP module. Refer to Section 310-01 . • Inspect the fuel level vent valve for foreign material at the bottom drain hole. • Invert the FP . Watch for a movement and a click noise. • **Was a movement/click noise witnessed?**	**Yes** Fuel level vent valve is OK. RETEST the system for normal operation. **No** INSTALL a new FP module. REFER to Section 310-01 .

Fuel System Pressure Release

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

1. **NOTE:** The front passenger door frame scuff plate is retained only by internal metal clips.

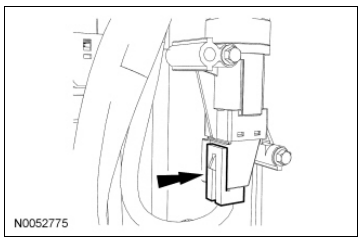
   Remove the front passenger door frame scuff plate.

2. **NOTE:** The front passenger door side interior kick panel is retained only by internal metal clips.

   NOTE: It may be necessary to reposition the lower end of the door jam weatherstripping to remove the front passenger door side interior kick panel.

   Remove the front passenger side interior kick panel.

3. Disconnect the Inertia Fuel Shutoff (IFS) switch electrical connector.



4. Start the engine and allow it to idle until it stalls.

5. After the engine stalls, crank the engine for approximately 5 seconds to make sure the fuel rail pressure has been released.

6. Turn the ignition switch to the OFF position.

7. When the fuel system service is complete, reconnect the IFS switch electrical connector.

8. **NOTE:** It may take more than one key cycle to pressurize the fuel system.

Cycle the ignition key and wait 3 seconds to pressurize the fuel system. Check for leaks before starting the engine.

9. Start the vehicle and check the fuel system for leaks.
10. Install the front passenger side interior kick panel.
11. Install the front passenger door frame scuff plate.

Fuel System Pressure Test

Special Tool(s)

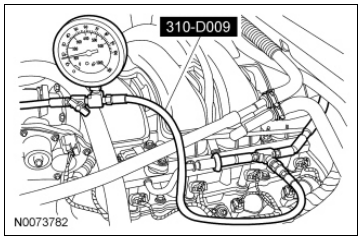
 ST3038-A	Fuel Pressure Test Kit 310-D009 (D95L-7211-A) or equivalent

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

⚠ WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.



1. Release the fuel system pressure. For additional information, refer to Fuel System Pressure Release in this section.

2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

3. Disconnect the fuel supply tube-to-fuel rail spring lock coupling. For additional information, refer to Spring Lock Couplings in this section.

4. **NOTE:** 4.6L shown, 4.0L similar.

   Install the Fuel Pressure Test Kit in line between the fuel supply tube and fuel rail.

5. **NOTE:** The Inertia Fuel Shutoff (IFS) switch electrical connector was disconnected during fuel system pressure release.

Connect the IFS switch electrical connector.

6. Connect the battery ground cable. For additional information, refer to Section 414-01 .

7. **NOTE:** It may take more than one key cycle to pressurize the fuel system.

   Cycle the ignition key and wait 3 seconds to pressurize the fuel system. Check for leaks before starting the engine.

8. Test the fuel system pressure to make sure it is within the specified range. For additional information, refer to Specifications in this section.

9. **NOTE:** 4.6L shown, 4.0L similar.

   NOTE: Open the drain valve slowly to relieve the fuel system pressure. This may drain fuel from the system. Place the fuel in a suitable container.

   Upon completion of the fuel system pressure test, open the drain valve on the Fuel Pressure Test Kit and relieve the fuel system pressure.

Fuel Tank Draining

Special Tool(s)

 ST1114-A	30 Gallon Hand-Operated Fuel Tanker 034-00002 or equivalent
 ST2134-A	Fuel Tank Drain Hose 310-F013

All vehicles

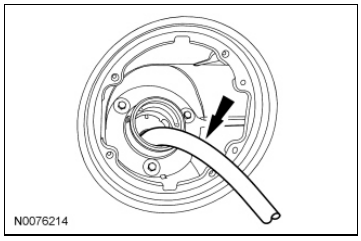
⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Remove the fuel filler cap slowly. The fuel system may be under pressure. If the fuel filler cap is venting vapor or if you hear a hissing sound, wait until it stops before completely removing the fuel filler cap. Otherwise, fuel may spray out. Failure to follow these instructions may result in serious personal injury.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .



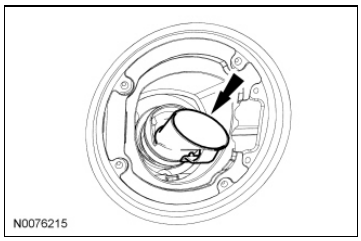
2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

Explorer Sport Trac

3. Release the fuel tank filler cap and position aside.

4. **NOTE:** Fuel tank filler pipe cap and fuel door removed from art for clarity.

   Insert a suitable fuel drain tube into the fuel tank filler pipe until it stops.



Explorer/Mountaineer

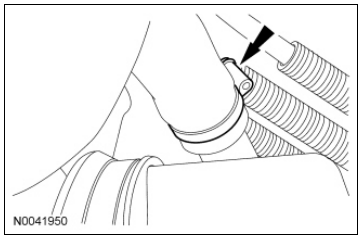
5. **NOTE:** Fuel door removed from art for clarity.

   NOTE: The use of the supplemental refueling adapter is necessary to open the fuel tank filler pipe.

   Insert the supplemental refueling adapter into the fuel tank filler pipe.

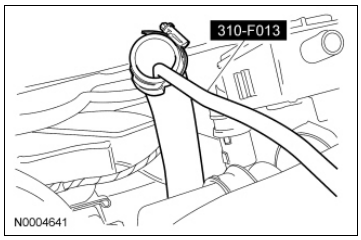
6. **NOTE:** Fuel door removed from art for clarity.

   Insert a suitable fuel drain tube through the supplemental refueling adapter and into the fuel tank filler pipe until it stops.



All vehicles

7. Attach the 30 Gallon Hand-Operated Fuel Tanker to the fuel drain tube and remove as much fuel as possible from the fuel tank filler pipe.



8. **NOTE:** There may be some residual fuel in the fuel tank filler pipe hose. Drain fuel into a suitable container.

   Loosen the clamp and disconnect the fuel tank filler pipe.

   - To install, tighten to 3 Nm (27 lb-in).

9. Using the Fuel Tank Drain Hose and the 30 Gallon Hand-Operated Fuel Tanker, siphon the fuel from the fuel tank.

Quick Connect Coupling

Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A
Motorcraft® SAE 5W-30 Premium Synthetic Blend Motor Oil XO-5W30-QSP (US); Motorcraft® SAE 5W-30 Super Premium Motor Oil CXO-5W30-LSP12 (Canada); or equivalent	WSS-M2C929-A

Disconnect - Type I

⚠ WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

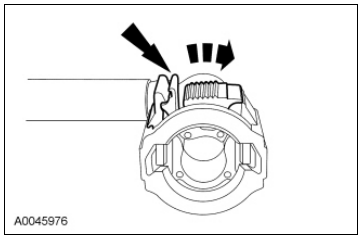
⚠ WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.

NOTICE: **Fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is essential that absolute cleanliness is observed when working with these components or component damage may occur. Always install plugs to any open orifices or tubes.**

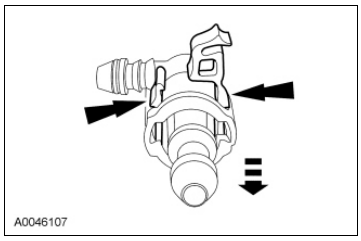
NOTICE: **When reusing liquid or vapor tube connectors, make sure to use compressed air to remove any foreign material from the connector retaining clip area before separating from the tube or damage**

to the tube or connector retaining clip may occur. Apply clean engine oil to the end of the tube before inserting the tube into the connector.



NOTE: During the repair or replacement of fuel-related components, all fuel liquid and fuel vapor openings must be capped, taped or otherwise appropriately protected to prevent the ingress of dirt or other contamination. All caps, tape and other protective materials must be removed prior to installation.

1. If servicing a liquid fuel tube, release the fuel system pressure. For additional information, refer to Fuel System Pressure Release in this section.



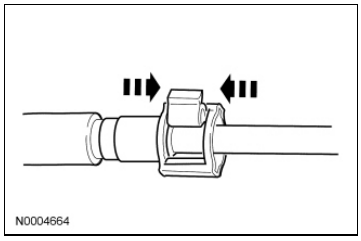
2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

3. ***NOTICE:*** **Do not use any tools. The use of tools may cause a deformity in the clip components which may cause fuel leaks.**

   Unclip the locking tab.

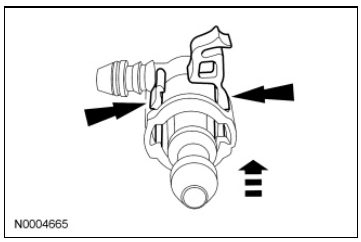
4. Depress the tabs and press the clip downward.

5. Separate the quick connect coupling.



Connect - Type I

1. Inspect the quick connect coupling and the tube for damage. Remove any dirt or obstructions.



2. **NOTE:** Make sure the fuel tube clicks into place when installing the tube. To make sure that the fuel tube is fully seated, pull on the tube.

   NOTE: Lubricate the quick connect coupling with clean engine oil.

   Connect the quick connect coupling.

3. Push the clip up into the quick connect coupling. Pull on the tube to make sure it is seated correctly.

4. Clip the locking tab in place.

5. Connect the battery ground cable. For additional information, refer to Section 414-01 .

Disconnect - Type II

⚠ WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

⚠ WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

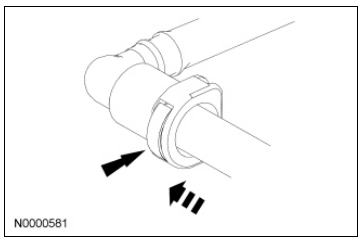
⚠ WARNING: When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.

***NOTICE:* Fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is essential that absolute cleanliness is observed when working with these components or component**

damage may occur. Always install plugs to any open orifices or tubes.

NOTICE: **When reusing liquid or vapor tube connectors, make sure to use compressed air to remove any foreign material from the connector retaining clip area before separating from the tube or damage to the tube or connector retaining clip may occur. Apply clean engine oil to the end of the tube before inserting the tube into the connector.**

NOTE: During the repair or replacement of fuel-related components, all fuel liquid and fuel vapor openings must be capped, taped or otherwise appropriately protected to prevent the ingress of dirt or other contamination. All caps, tape and other protective materials must be removed prior to installation.



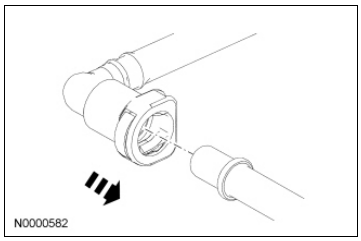
1. If servicing a liquid fuel tube, release the fuel system pressure. For additional information, refer to Fuel System Pressure Release in this section.

2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

3. ***NOTICE:*** **Do not use any tools. The use of tools may cause a deformity in the clip components which may cause fuel leaks.**

   Disconnect the fuel tube quick connect coupling.

   - Press the fuel tube quick connect coupling button and pull the fuel tube to disconnect.



Connect - Type II

1. Inspect the quick connect coupling and the tube for damage. Remove any dirt or obstructions.

2. **NOTE:** Make sure the fuel tube clicks into place when installing the tube. To make sure that the fuel tube is fully seated, pull on the tube.

   NOTE: Apply clean engine oil to O-ring seals.

   Install the quick connect coupling onto the tube until it is fully seated.

3. Connect the battery ground cable. For additional information, refer to Section 414-01 .

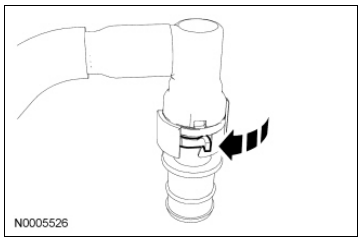
Disconnect - Type III

⚠ **WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working**

on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

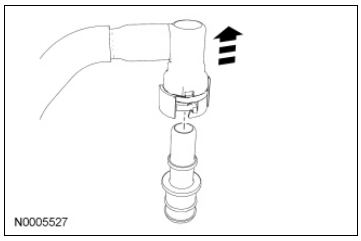
⚠ WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.



NOTICE: **Fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is essential that absolute cleanliness is observed when working with these components or component damage may occur. Always install plugs to any open orifices or tubes.**

NOTICE: **When reusing liquid or vapor tube connectors, make sure to use compressed air to remove any foreign material from the connector retaining clip area before separating from the tube or damage to the tube or connector retaining clip may occur. Apply clean engine oil to the end of the tube before inserting the tube into the connector.**

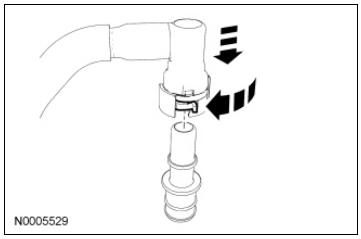


NOTE: During the repair or replacement of fuel-related components, all fuel liquid and fuel vapor openings must be capped, taped or otherwise appropriately protected to prevent the ingress of dirt or other contamination. All caps, tape and other protective materials must be removed prior to installation.

1. ***NOTICE:*** **Do not use any tools. The use of tools may cause a deformity in the clip components which may cause fuel leaks.**

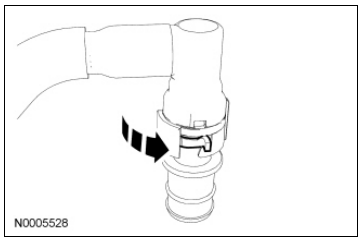
   Release the locking tab on the quick connect coupling.

2. Separate the quick connect coupling from the fitting.



Connect - Type III

1. Inspect the quick connect coupling and the tube for damage. Remove any dirt or obstructions.



2. **NOTE:** Make sure the fuel tube clicks into place when installing the tube. To make sure that the fuel tube is fully seated, pull on the tube.

NOTE: Apply clean engine oil to O-ring seals.

Release the locking tab and install the quick connect coupling onto the fitting.

3. Position the locking tab into the latched position.

Disconnect - Type IV

⚠ WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

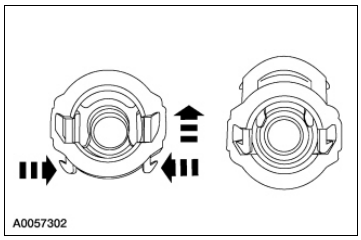
⚠ WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

⚠ WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.

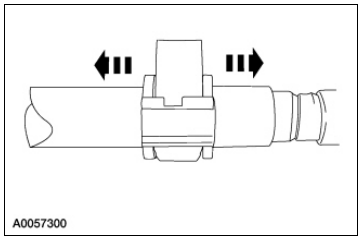
NOTICE: **Fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is essential that absolute cleanliness is observed when working with these components or component damage may occur. Always install plugs to any open orifices or tubes.**

NOTICE: **When reusing liquid or vapor tube connectors, make sure to use compressed air to remove any foreign material from the connector retaining clip area before separating from the tube or damage to the tube or connector retaining clip may occur. Apply clean engine oil to the end of the tube before inserting the tube into the connector.**



NOTE: During the repair or replacement of fuel-related components, all fuel liquid and fuel vapor openings must be capped, taped or otherwise appropriately protected to prevent the ingress of dirt or other contamination. All caps, tape and other protective materials must be removed prior to installation.

1. If servicing a liquid fuel tube, release the fuel system pressure. For additional information, refer to Fuel System Pressure Release in this section.

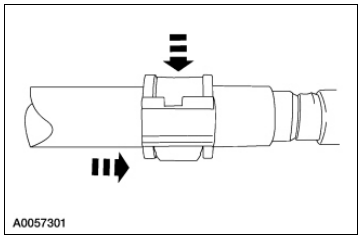


2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

3. ***NOTICE:*** **Do not use any tools. The use of tools may cause a deformity in the clip components which may cause fuel leaks.**

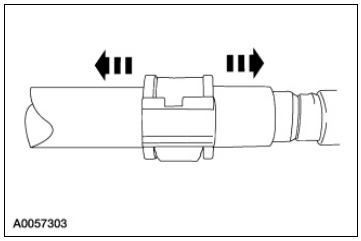
   Compress the clip legs and push the clip into the quick connect coupling.

4. Separate the quick connect coupling from the tube.



Connect - Type IV

1. Inspect the quick connect coupling and the tube for damage. Remove any dirt or obstructions.



2. **NOTE:** Make sure the fuel tube clicks into place when installing the tube. To make sure that the fuel tube is fully seated, pull on the tube.

   NOTE: Apply clean engine oil to O-ring seals.

   Fully insert the male tube end in the quick connect coupling and push the clip downward to lock the fuel tubes together.

3. Pull on the connection to make sure it is fully engaged.

4. Connect the battery ground cable. For additional information, refer to Section 414-01 .

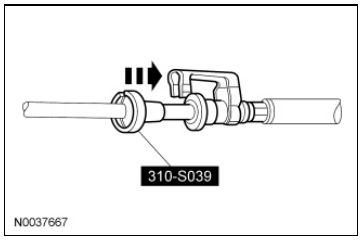
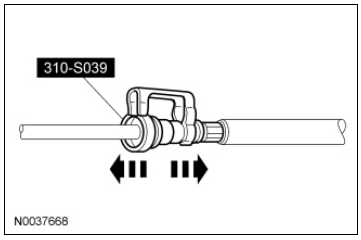
NOTICE: **When reusing liquid or vapor tube connectors, make sure to use compressed air to remove any foreign material from the connector retaining clip area before separating from the tube or damage to the tube or connector retaining clip may occur. Apply clean engine oil to the end of the tube before inserting the tube into the connector.**



1. Release the fuel system pressure. For additional information, refer to Fuel System Pressure Release in this section.

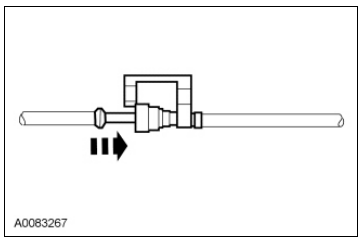
2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .



3. Disconnect the safety clip from the fuel tube.

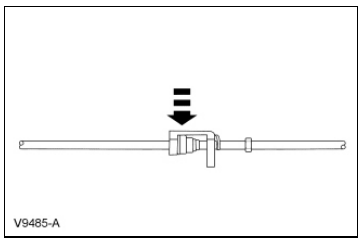
4. Install the Spring Lock Coupling Disconnect Tool and press it into the spring lock coupling.

5. Separate the spring lock coupling.



Connect - Type I

1. Inspect and clean both spring lock coupling ends.



2. **NOTE:** Make sure the fuel tube clicks into place when installing the tube. To make sure that the fuel tube is fully seated, pull on the tube.

   NOTE: Lubricate the spring lock coupling with clean engine oil.

Align the fuel tube spring lock coupling and push together until a click is heard.

3. Pull on the spring lock coupling to make sure it is fully seated. Install the fuel tube safety clip on the male end.

4. Connect the battery ground cable. For additional information, refer to Section 414-01 .

Disconnect - Type II

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

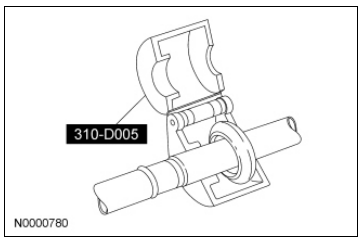
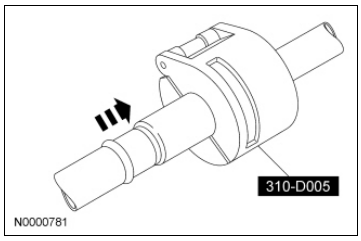
NOTICE: **When reusing liquid or vapor tube connectors, make sure to use compressed air to remove any foreign material from the connector retaining clip area before separating from the tube or damage to the tube or connector retaining clip may occur. Apply clean engine oil to the end of the tube before inserting the tube into the connector.**

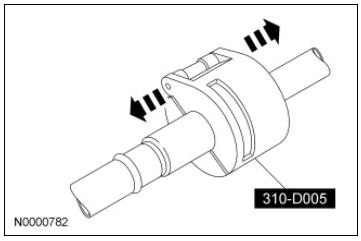


1. Release the fuel system pressure. For additional information, refer to Fuel System Pressure Release in this section.

2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

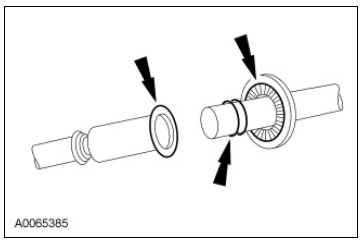


3. Remove the fuel tube safety clip.



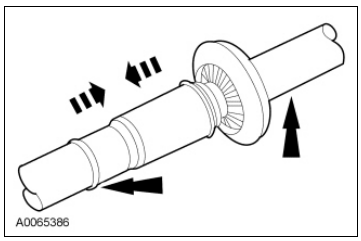
4. Install the Spring Lock Coupling Disconnect Tool.

5. Close and push the Spring Lock Coupling Disconnect Tool into the open side of the cage.

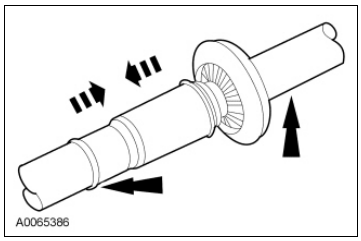


6. Separate the spring lock coupling.

Connect - Type II



1. Inspect and clean both spring lock coupling ends. Install new O-ring seals and garter springs if necessary.



2. **NOTE:** Make sure the fuel tube clicks into place when installing the tube. To make sure that the fuel tube is fully seated, pull on the tube.

   NOTE: Apply clean engine oil to O-ring seals.

   Fit the male end into the female end and push until the garter spring snaps over the flared end of the female end.

3. Make sure the spring lock coupling is engaged by pulling on the tube.

4. Install the fuel tube safety clip.

5. Connect the battery ground cable. For additional information, refer to Section 414-01 .

Torque Specifications

Description	Nm	lb-ft	lb-in
Dust separator bracket bolt	9	-	80
Fuel filter heat shield bolts	20	-	177
Fuel filter shield nuts	6	-	53

Transfer case skid plate bolts	40	30	-

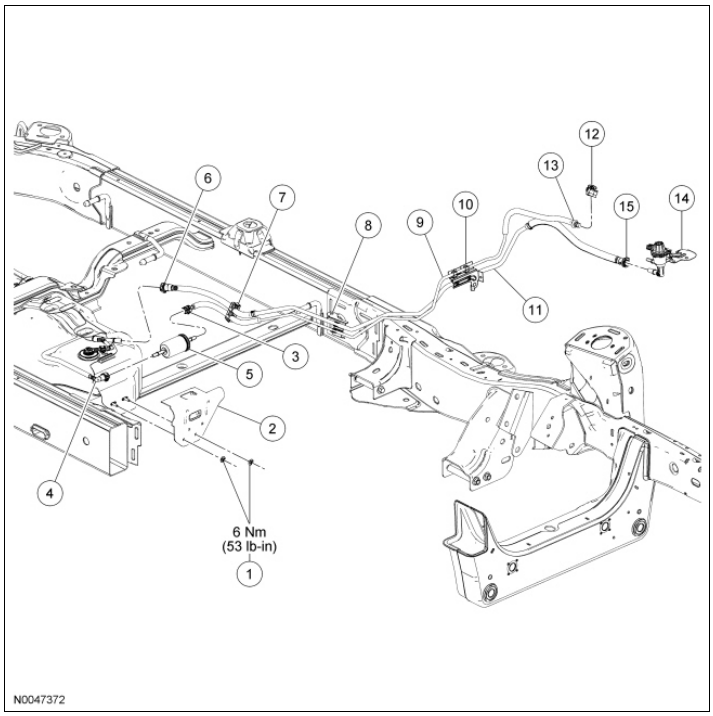
Fuel Tank and Lines

The fuel system consists of the following components:

- Fuel tank
- Fuel tank filler pipe which contains a restrictor plate to permit only unleaded fuel to be pumped into the fuel tank
- Electronic returnless fuel system
- One-fourth-turn-type fuel tank filler cap on Explorer Sport Trac
- Easy Fuel ™ capless fuel tank filler pipe on Explorer/Mountaineer
- Fuel filter providing filtration to protect the fuel injectors (located on the front of the fuel tank)
- Fuel tubes
- Vapor tubes
- Fuel Pump (FP) assembly containing:
    - ♦ the electric FP which provides pressurized fuel to the engine.
    - ♦ a serviceable fuel level sender.
    - ♦ an inlet filter.
    - ♦ a check valve which maintains system pressure after the FP is shut off.

The FP is controlled by the PCM which energizes the FP relay. Electrical power to the FP is provided through the Inertia Fuel Shutoff (IFS) switch.

Fuel Tank and Lines



Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Fuel Filter

Removal and Installation

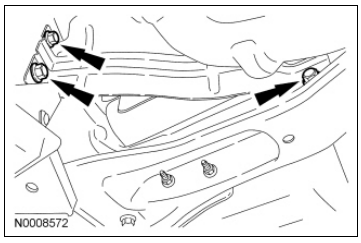
All vehicles

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

⚠ WARNING: When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.

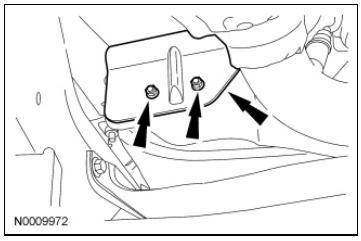
NOTE: During the repair or replacement of fuel-related components, all liquid and vapor fuel openings must be capped, taped or otherwise appropriately protected to prevent the ingress of dirt or other contamination. All caps, tape and other protective materials must be removed prior to installation.



1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Release the fuel system pressure. For additional information, refer to Section 310-00 .

3. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .



Explorer/Mountaineer

4. Remove the 3 bolts and the fuel filter heat shield.
   - To install, tighten to 20 Nm (177 lb-in).

All vehicles

5. Remove the 2 nuts and the fuel filter shield.
   - To install, tighten to 6 Nm (53 lb-in).

6. Disconnect the fuel supply tubes quick connect couplings. For additional information, refer to Section 310-00 .

7. Remove the fuel filter.

8. To install, reverse the removal procedure.

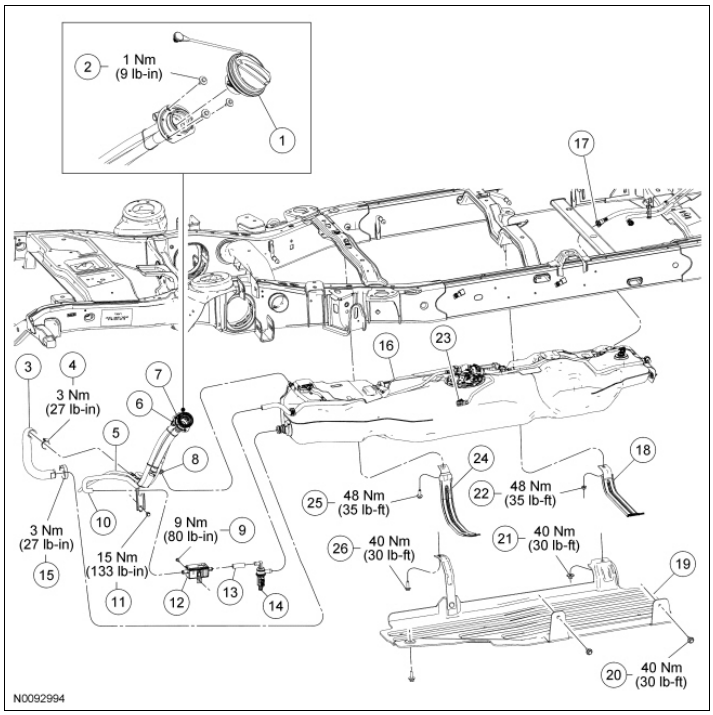
Fuel Lines

Removal and Installation

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

⚠ WARNING: When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.



NOTE: During the repair or replacement of fuel-related components, all liquid and vapor fuel openings must be capped, taped or otherwise appropriately protected to prevent the ingress of dirt or other contamination. All caps, tape and other protective materials must be removed prior to installation.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Release the fuel system pressure. For additional information, refer to Section 310-00 .
3. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
4. Disconnect the spring lock coupling at the engine and the vapor tube quick connect coupling at the purge valve. For additional information, refer to Section 310-00 .
5. Disconnect the quick connect coupling at the fuel filter and the vapor tube quick connect coupling at the fuel tank. For additional information, refer to Section 310-00 .
6. Remove the transmission. For additional information, refer to Section 307-01A or Section 307-01B .
7. Remove the fuel lines from the vehicle.
8. To install, reverse the removal procedure.

Fuel Tank and Filler Pipe - Exploded View

Explorer Sport Trac

Fuel Tank Filler Pipe

Removal and Installation

All vehicles

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Remove the fuel filler cap slowly. The fuel system may be under pressure. If the fuel filler cap is venting vapor or if you hear a hissing sound, wait until it stops before completely removing the fuel filler cap. Otherwise, fuel may spray out. Failure to follow these instructions may result in serious personal injury.

NOTE: During the repair or replacement of fuel-related components, all liquid and vapor fuel openings must be capped, taped or otherwise appropriately protected to prevent the ingress of dirt or other contamination. All caps, tape and other protective materials must be removed prior to installation.

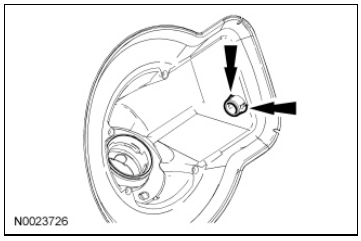
1. Drain the fuel tank. For additional information, refer to Section 310-00 .

2. **NOTE:** The fuel tank filler pipe hose between the fuel tank filler pipe and the fuel tank is serviceable separately. The fuel tank filler pipe does not have to be removed from the vehicle to service the fuel tank filler pipe hose.

   If necessary, loosen the fuel tank filler pipe hose clamp at the fuel tank and disconnect the hose and remove from the vehicle.

   - To install, tighten to 3 Nm (27 lb-in).

Explorer Sport Trac



3. Open the fuel tank filler cap.

Explorer/Mountaineer

4. Remove the fuel tank filler pipe upper retainer. For additional information, refer to Section 501-08 .

5. **NOTE:** Body panel and fuel door removed from art for clarity.

   Depress the 2 tabs on the fresh air vent tube in the fuel filler door pocket and disconnect the fresh air vent tube from the inner fenderwell.

All vehicles

6. Remove the 3 bolts.
    - To install, tighten to 1 Nm (9 lb-in).

7. Disconnect the fuel filler pipe vapor tube-to-Fuel Tank Pressure (FTP) sensor and vapor tube assembly quick connect coupling. For additional information, refer to Section 310-00 .

8. Disconnect the rear axle vent hose.

9. Disconnect the dust separator hose.

10. Remove the 2 bolts and the fuel tank filler pipe assembly.
    - To install, tighten to 15 Nm (133 lb-in).

11. To install, reverse the removal procedure.

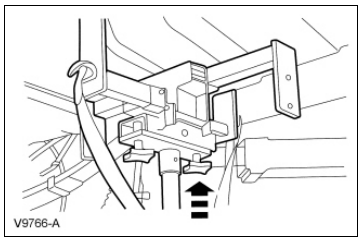
Fuel Tank Support Straps

Removal and Installation

All vehicles

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .



2. If equipped, remove the 4 bolts, the nut and the fuel tank skid plate.
   - To install, tighten to 40 Nm (30 lb-ft).

Explorer/Mountaineer

3. Remove the driveshaft. For additional information, refer to Section 205-01 .

All vehicles

4. Using a suitable jack, support the fuel tank.

5. Remove the bolt and the fuel tank rear support strap.
   - To install, tighten to 48 Nm (35 lb-ft).

6. Remove the nut and the fuel tank front support strap.
   - To install, tighten to 48 Nm (35 lb-ft).

7. To install, reverse the removal procedure.

Fuel Tank

Removal and Installation

All vehicles

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

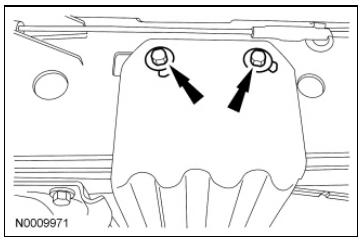
⚠ WARNING: When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.

NOTE: During the repair or replacement of fuel-related components, all liquid and vapor fuel openings must be capped, taped or otherwise appropriately protected to prevent the ingress of dirt or other contamination. All caps, tape and other protective materials must be removed prior to installation.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Release the fuel system pressure. For additional information, refer to Section 310-00 .

3. Disconnect the battery negative cable. For additional information, refer to Section 414-01 .



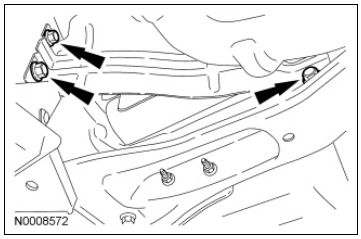
Explorer/Mountaineer

4. Remove the driveshaft. For additional information, refer to Section 205-01 .

All vehicles

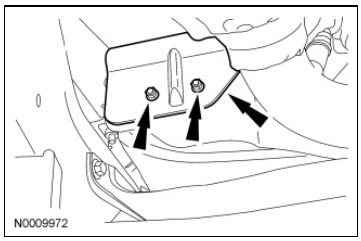
5. Drain the fuel tank. For additional information, refer to Section 310-00 .

6. If equipped, remove the 4 bolts and the transfer case skid plate.
   - To install, tighten to 40 Nm (30 lb-ft).



7. Disconnect the filler pipe vapor tube-to-Fuel Tank Pressure (FTP) sensor and vapor tube assembly quick connect coupling. For additional information, refer to Section 310-00 .

8. Disconnect the fuel vapor hose from the Evaporative Emission (EVAP) canister vent valve.

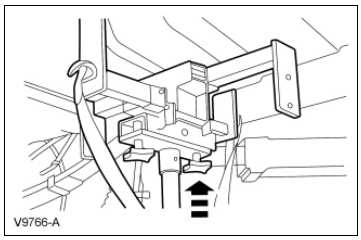


Explorer/Mountaineer

9. Remove the 3 bolts and the fuel filter heat shield.
    - To install, tighten to 20 Nm (177 lb-in).

All vehicles

10. Remove the 2 nuts and the fuel filter shield.
    - To install, tighten to 6 Nm (53 lb-in).



11. Disconnect the fuel filter outlet quick connect coupling. For additional information, refer to Section 310-00 .

12. Disconnect the FTP and tube assembly-to-vapor tube quick connect coupling. For additional information, refer to Section 310-00 .

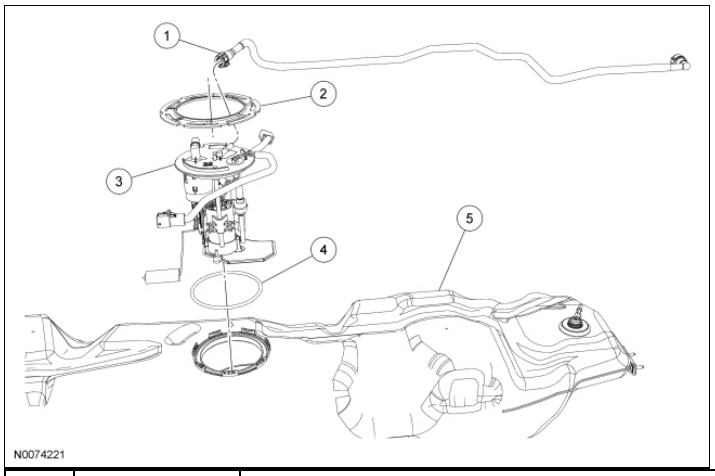
13. If equipped, remove the 4 bolts, 1 nut and the fuel tank skid plate.
    - To install, tighten to 40 Nm (30 lb-ft).

14. Using a suitable jack, support the fuel tank.

15. Remove the bolt and the fuel tank rear support strap.
    - To install, tighten to 48 Nm (35 lb-ft).

16. Remove the nut and the fuel tank front support strap.
    - To install, tighten to 48 Nm (35 lb-ft).

17. Lower the fuel tank far enough to access the Fuel Pump (FP) electrical connector and disconnect the connector.



18. Remove the fuel tank from the vehicle.
19. **NOTE:** Make sure the fuel and vapor tubes are correctly routed prior to installing the fuel tank.

    To install, reverse the removal procedure.

Fuel Pump

Special Tool(s)

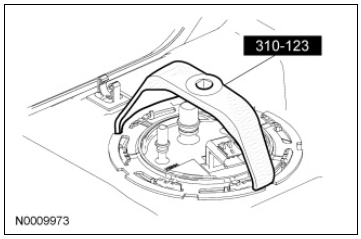
 ST2803-A	Wrench, Fuel Tank Sender Unit 310-123 (SR-015312)

Item	Part Number	Description
1	-	Fuel supply tube-to-fuel pump quick connect coupling (part of 9J280)
2	9C385	Fuel Pump (FP) locking ring
3	9H307	FP module
4	9417	FP O-ring seal
5	9002	Fuel tank

Removal

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.



NOTE: During the repair or replacement of fuel-related components, all liquid and vapor fuel openings must be capped, taped or otherwise appropriately protected to prevent the ingress of dirt or other contamination. All caps, tape and other protective materials must be removed prior to installation.

1. Remove the Fuel Tank Pressure (FTP) sensor and vapor tube assembly. For additional information, refer to Section 303-13 .

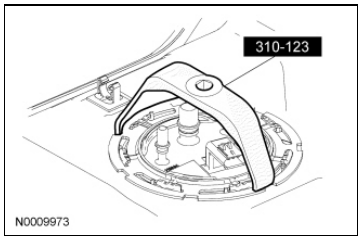
2. Disconnect the fuel supply tube-to-Fuel Pump (FP) quick connect coupling. For additional information, refer to Section 310-00 .

3. Remove the fuel supply tube.

4. Using the Fuel Tank Sender Unit Wrench, remove the FP locking ring.

5. **NOTE:** The FP module must be handled carefully to avoid damage to the float arm and filter.

   Remove the FP module and the O-ring seal. Discard the O-ring seal.



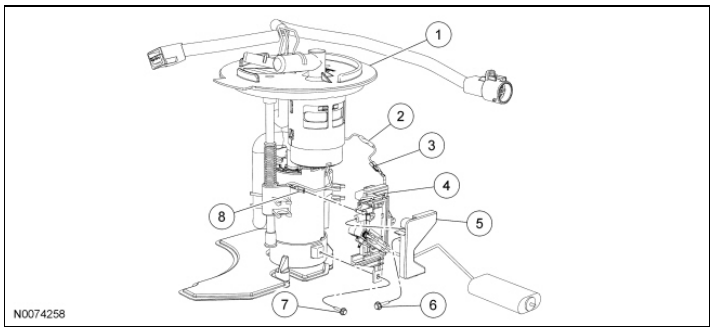
Installation

1. **NOTE:** The FP module must be handled carefully to avoid damage to the float arm and filter.

   Install a new O-ring seal and the FP module.

2. **NOTE:** The FP module locking ring is a cam-type lock. Turn the locking ring until it stops and is locked in place.

   Using the Fuel Tank Sender Unit Wrench, install the FP module locking ring.

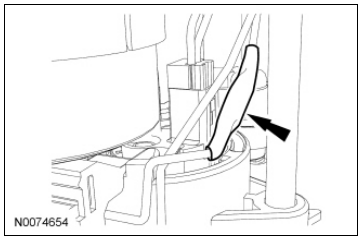


3. Install the fuel supply tube.

4. Connect the fuel supply tube-to- FP quick connect coupling. For additional information, refer to Section 310-00 .

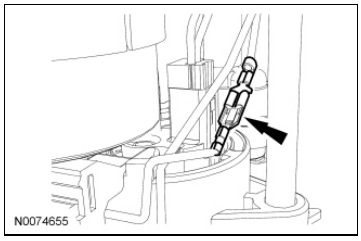
5. Install the FTP sensor and vapor tube assembly. For additional information, refer to Section 303-13 .

Fuel Level Sender



Item	Part Number	Description
1	9H307	Fuel Pump (FP)
2	-	Heat shrink tube
3	-	Fuel level sender wire electrical connector (part of 9A299)
4	-	Fuel level sender (part of 9A299)
5	-	Fuel level sender cover (part of 9A299)
6	-	Fuel level sender cover screw (part of 9A299)
7	-	Fuel level sender screw (part of 9A299)
8	-	Fuel level sender ground wire electrical connector (part of 9H307)

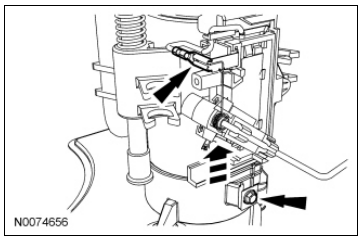
Removal



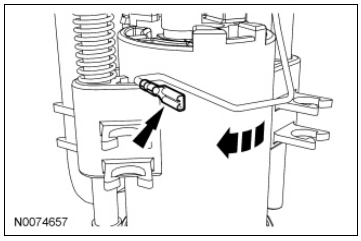
⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

1. Remove the Fuel Pump (FP). For additional information, refer to Fuel Pump in this section.
2. Remove the screw and the fuel level sender cover.
3. **NOTE:** Note the routing of the fuel level sender wire for installation.

   Remove the heat shrink tube covering the fuel level sender wire electrical connector.

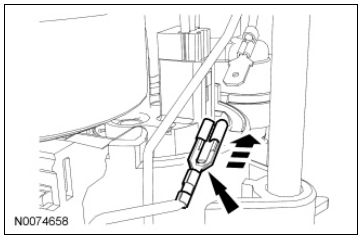


4. Disconnect the fuel level sender wire electrical connector.



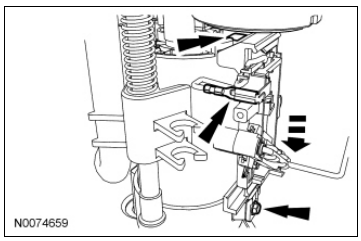
5. **NOTE:** Note the routing of the fuel level sender ground wire for installation.

   Disconnect the ground wire and remove the screw and lift up to remove the fuel level sender.

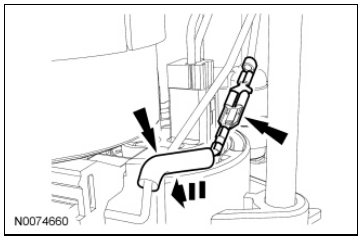


Installation

1. Route the fuel level sender ground wire along the FP body.

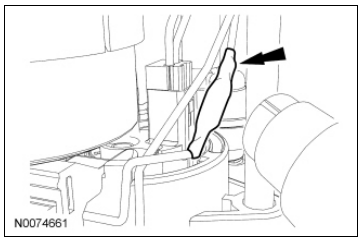


2. Route the fuel level sender wire through the center of the FP .



3. **NOTE:** Both fuel gauge sending wires must be routed behind the metal sending unit plate.

   Hook the fuel level sender on the FP and install and tighten the screw. Connect the fuel level sender unit ground wire.



4. Slide the heat shrink tube onto the wire harness and connect the fuel level sender wire electrical connector.

5. ⚠ **WARNING: Do not use an open flame to shrink the heat shrink tube. Use a heat gun only. Fuel residue may be ignited if an open flame is used. Failure to follow this instruction may result in serious personal injury.**

   Using a heat gun, shrink the heat shrink tube.

6. Install the fuel level sender cover and screw and tighten the screw.

7. Install the FP . For additional information, refer to Fuel Pump in this section.

Inertia Fuel Shutoff (IFS) Switch

Item	Part Number	Description
1	9341	Inertia Fuel Shutoff (IFS) switch
2	W504148	Bolts (2 required)
3	-	IFS switch electrical connector

Removal and Installation

1. **NOTE:** The front passenger door frame scuff plate is retained only by internal metal clips.

   Remove the front passenger door frame scuff plate.

2. **NOTE:** The front passenger door side interior kick panel is retained only by internal metal clips.

   NOTE: It may be necessary to reposition the lower end of the door jam weather stripping to remove the front passenger door side interior kick panel.

   Remove the front passenger side interior kick panel.

3. Disconnect the Inertia Fuel Shutoff (IFS) switch electrical connector.

4. Remove the 2 bolts and the IFS switch.
   - To install, tighten to 2 Nm (18 lb-in).

5. To install, reverse the removal procedure.

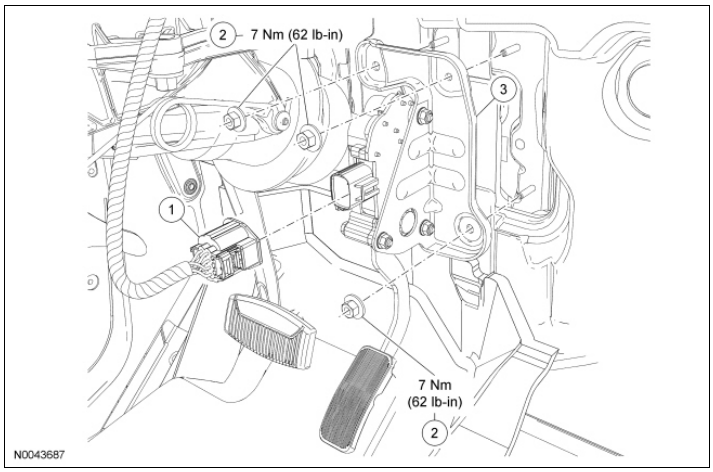
Torque Specifications

Description	Nm	lb-in
Accelerator pedal mounting nuts	7	62

Acceleration Control

The acceleration control consists of one of the following:

- A fixed accelerator pedal and position sensor assembly
- An adjustable accelerator pedal and position sensor assembly



The throttle is controlled by an Accelerator Pedal Position (APP) sensor on the accelerator pedal assembly. The APP sensor sends a signal to the PCM in response to throttle pedal movements initiated by the driver. The PCM sends a signal to the electronic throttle control which increases and decreases throttle position.

Some vehicles are equipped with adjustable pedals. This allows both the accelerator and brake pedals to be adjusted simultaneously forward or rearward. A rocker switch on the instrument panel provides adjustment on the pedal assembly when it is activated. On vehicles with the memory seat option, the pedal position can be controlled by the memory selection, as well as the rocker switch. The components in the acceleration control system are not adjustable and new components must be installed if damaged or worn.

Acceleration Control

Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Accelerator Pedal - Fixed

Item	Part Number	Description
1	-	Accelerator pedal electrical connector (part of 14401)
2	90907	Accelerator pedal assembly nuts (3 required)
3	9F836	Accelerator pedal assembly

Removal and Installation

1. Disconnect the accelerator pedal electrical connector.

2. Remove the 3 nuts and the accelerator pedal assembly.
   - To install, tighten to 7 Nm (62 lb-in).

3. To install, reverse the removal procedure.

Accelerator Pedal - Adjustable

Removal and Installation

1. The adjustable accelerator pedal and adjustable brake pedal must be serviced as a unit. For additional information, refer to Section 206-06 .

SECTION 310-03: Speed Control

DESCRIPTION AND OPERATION

2009 Explorer/Mountaineer/Explorer Sport Trac Workshop Manual

Procedure revision date: 02/27/2009

Speed Control

The vehicle speed control system consists of the following components:

- Speed control switch
- Speed control deactivator switch (integral to the stoplamp switch)
- Stoplamp switch
- Speed control indicator
- PCM
- Electronically controlled throttle
- Clockspring

The speed control system is controlled by the PCM. The speed control system is designed to maintain a selected vehicle speed between 40 km/h (25 mph) and the maximum limited vehicle speed. The speed control system is controlled by the steering wheel mounted switches (ON, OFF, SET+, SET-, and RES) and the brake pedal. The steering wheel mounted switches are hardwired to the PCM.

Speed Control

Special Tool(s)

 ST1137-A	73III Automotive Meter 105-R0057 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
 ST2574-A	Flex Probe Kit 105-R025C or equivalent

Principles of Operation

The speed control system is controlled by the PCM. The speed control system is designed to maintain a selected vehicle speed between 40 km/h (25 mph) and the maximum limited vehicle speed. The speed control system is controlled by the steering wheel mounted switches (ON, OFF, SET+, SET-, and RES), the stoplamp switch and the speed control deactivator switch (integral to the stoplamp switch). The steering wheel mounted switches are hardwired to the PCM through the clockspring.

The speed control functions include:

- turning on the speed control system
- setting and maintaining the desired vehicle speed
- accelerating the vehicle speed
- decelerating the vehicle speed
- turning off the vehicle speed control system
- canceling the speed control

Pressing and releasing the ON switch turns the speed control system on. Pressing and releasing the SET +/- switch while the vehicle is traveling at the desired speed activates the speed control system.

Tapping the SET+ or the SET- switch while in the set mode increases or decreases the maintained vehicle speed by 1.6 km/h (1 mph) per tap, respectively. If either switch is pressed and held, the vehicle speed continues to accelerate (SET+) or decelerate (SET-) until the switch is released.

Pressing and releasing the OFF switch, or switching the ignition switch to the OFF position, turns the speed control system off. Applying the brake pedal puts the speed control system into the standby mode. Pressing the RES switch when the speed control system is in the standby mode causes the vehicle to accelerate to the last set speed. The RES switch does not function if the OFF switch is pressed or if the current vehicle speed is below the minimum operational speed.

Whenever the speed control system is engaged and active, a speed control icon on the Instrument Cluster (IC) is illuminated.

The clockspring provides the electrical interface between the steering column wiring and the speed control switch in the steering wheel.

When the brake pedal is applied, an electrical signal from the stoplamp switch is sent to the PCM to deactivate the speed control system. The speed control deactivator switch (integral to the stoplamp switch) is provided as an additional safety feature. Under increased brake pedal effort, the speed control deactivator switch opens and removes the voltage signal from the PCM input circuit, deactivating the speed control system.

The ABS module monitors brake pressure and also receives an electrical signal from the stoplamp switch. A fault in the ABS module can disable the speed control system.

The clockspring provides the electrical interface between the steering column wiring and the speed control switches in the steering wheel.

The inputs to the PCM for the speed control system are the:

- Output Shaft Speed (OSS) sensor
- Digital Transmission Range (TR) sensor
- Speed control switch
- Stoplamp switch
- Speed control deactivator switch (integral to the stoplamp switch)
- Accelerator pedal position sensor

The outputs from the PCM for the speed control system are the:

- Speed control indicator lamp
- Throttle command

The speed control system throttle position is completely controlled by the PCM through the electronically controlled throttle body. Speed control electronics are contained entirely within the PCM.

When the speed control system is active, the PCM corrects for deviations in the actual vehicle speed by proportionally moving the throttle plate. The PCM modulates the throttle to minimize error between actual and desired vehicle speed.

The PCM strategy uses the throttle control for smooth accelerations.

The PCM sends a serial message over the High Speed Controller Area Network (HS-CAN) to the IC to command the speed control telltale to be turned on or off.

In the event of an off command or a deactivation request from any source, the system carries out a hard deactivation and immediately returns the throttle to the idle position.

The speed control system provides self-diagnostics. The speed control system will disable operation and set a PCM DTC if it detects certain faults. The IC does not indicate speed control faults with a telltale or message center message. Fault codes are logged by the PCM.

Additionally, the following conditions will cause the speed control system to deactivate:

- The transmission gear selector is in a position other than D or OD.
- The speed control set speed is over-ridden with the accelerator pedal for longer than 5 minutes.
- Vehicle speed loss from set speed of greater than 16 km/h (10 mph) occurs.
- The vehicle speed falls below the minimum allowable limit (40 km/h [25 mph]).
- A speed control switch is pressed or stuck longer than 2 minutes.

- ABS system fault

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Throttle body	• Battery Junction Box (BJB) fuse 42 (15A) • Wiring, terminals or connectors • Speed control switch • Stoplamp switch • PCM

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM .
   - Refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the PCM.

9. If the DTCs retrieved are related to the concern, go to DTC Charts. For all other DTCs, refer to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

DTC Charts

PCM DTC Chart

DTC	Description	Action
P0579	Cruise Control Multi-Function Input A Circuit Range/Performance	GO to Pinpoint Test C .
P0581	Cruise Control Multi-Function Input A Circuit High	GO to Pinpoint Test C .
P1572	Brake Pedal Switch Circuit	GO to Pinpoint Test B .
P1703	Brake Switch Out of Self Test Range	GO to Pinpoint Test B .
All other DTCs	-	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Symptom Chart

Symptom Chart

Pinpoint Tests

Pinpoint Test A: The Speed Control Is Inoperative

Refer to Wiring Diagrams Cell 31 , Speed Control for schematic and connector information.

Normal Operation

The PCM sends a signal through circuit VES10 (WH) to the speed control switch, which passes through the clockspring. The return signal is sent to the PCM through circuit RES08 (GN/BN) and the clockspring. When the brake pedal is applied, the stoplamp switch sends a voltage signal to the PCM on circuit CCB08 (VT/WH) to deactivate the speed control if engaged.

The speed control deactivator switch, which is integral to the stoplamp switch, interrupts circuit CES09 (VT/OG) removing the voltage signal to the PCM when the brake pedal is applied. This is a redundant signal to the PCM.

The ABS module monitors brake pressure and also receives a voltage signal on circuit CCB08 (VT/WH) from the stoplamp switch . A fault in the ABS module can disable the speed control system.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- PCM not configured for speed control
- Stoplamp switch
- Speed control deactivator switch (integral to the stoplamp switch)
- Speed control switch

- Digital Transmission Range (TR) sensor
- Vehicle speed signal
- PCM
- ABS module

PINPOINT TEST A: THE SPEED CONTROL IS INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
A1 VERIFY PCM CONFIGURATION	
• Enter the following diagnostic mode on the scan tool: Programmable Parameters. • Verify that the speed control is enabled in the PCM. • **Is the speed control enabled?**	**Yes** GO to A2 . **No** ENABLE the speed control in the PCM using the scan tool programmable parameters menu. TEST the system for normal operation.
A2 CHECK FOR ABS DTCs	
• Review the recorded DTCs from the ABS self-test. • **Are any DTCs recorded?**	**Yes** REFER to the Section 206-09 . REPAIR all ABS module DTCs and RETEST the speed control. **No** GO to A3 .
A3 CHECK FOR PCM DTCs	
• Review the recorded DTCs from the PCM self-test. • **Are any non-speed control DTCs recorded?**	**Yes** REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. REPAIR all PCM DTCs and RETEST the speed control. **No** GO to A4 .
A4 CHECK THE VEHICLE SPEED	
• Check for correct operation of the speedometer. • **Does the speedometer operate correctly?**	**Yes** GO to A5 . **No** REFER to Section 413-01 to continue diagnosis of the speedometer.
A5 CHECK THE STOPLAMP SWITCH (BOO AND BPA) PID	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: PCM DataLogger. • Monitor the PCM PIDs BOO (brake pedal top travel) and BPA (brake pedal bottom travel) while applying and	**Yes** GO to A6 . **No** GO to Pinpoint Test B .

releasing the brake pedal as follows: **Brake Pedal Position** / **BOO PID** / **BPA PID** Released / Off / Off Applied lightly / On / Off Applied firmly / On / On • **Do the PID values agree with the brake pedal positions?**	
A6 MONITOR THE PCM (TR) PID	
• Apply the parking brake. • Enter the following diagnostic mode on the scan tool: PCM DataLogger. • Monitor the PCM PID (TR) . • Select DRIVE. • **Does the PID value agree with the transmission range selector lever position?**	**Yes** GO to A7 . **No** REFER to Section 307-01A or Section 307-01B to diagnose the digital TR sensor.
A7 CHECK THE SPEED CONTROL SWITCH	
• Enter the following diagnostic mode on the scan tool: PCM DataLogger. • Press each speed control switch while monitoring the speed control switch PID (SCCS). **Speed Control Switch** / **SCCS PID Value** - / NONE Pressed RES / RESUME OFF / Off ON / On SET + / SET/+ SET - / SET/- • **Does the PID value agree with the switch position?**	**Yes** GO to A8 . **No** If only one switch does not display the correct PID value, INSTALL a new speed control switch. REFER to Speed Control Switch in this section. TEST the system for normal operation. Otherwise, GO to Pinpoint Test C .
A8 CHECK FOR CORRECT PCM OPERATION	
• Disconnect all the PCM connectors.	**Yes** INSTALL a new PCM. REFER to Section 303-14 .

• Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the PCM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test B: DTC P1572 or DTC P1703

Refer to Wiring Diagrams Cell 31 , Speed Control for schematic and connector information.

Normal Operation

When the brake pedal is applied, the stoplamp switch sends a voltage signal to the PCM on circuit CCB08 (VT/WH) to deactivate the speed control if engaged.

The speed control deactivator switch, which is integral to the stoplamp switch, interrupts circuit CES09 (VT/OG) by removing the voltage signal to the PCM when the brake pedal is applied. This is a redundant signal to the PCM.

- DTC P1572 (Brake Pedal Switch Circuit) - sets when the PCM does not sense the proper sequence of the brake pedal input signal from both the stoplamp and deactivator switches when the brake pedal is pressed and released.
- DTC P1703 (Brake Switch Out of Self-Test Range) - sets when there is an open or short in the deactivator switch circuits or when there is an open or short in the stoplamp circuits.

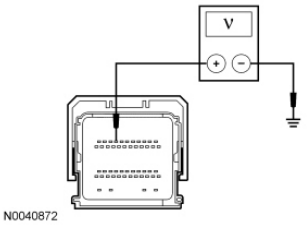
This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Speed control deactivator switch (integral to the stoplamp switch)
- Stoplamp switch
- PCM

PINPOINT TEST B: DTC P1572 OR DTC P1703

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
B1 CHECK THE OPERATION OF THE STOPLAMPS	
• Ignition ON. • Operate the stoplamps. • **Do the stoplamps and high mount stoplamp operate correctly?**	**Yes** GO to B2 . **No** REFER to Section 417-01 .
B2 CHECK THE STOPLAMP SWITCH (BOO1 AND BOO2) PID	

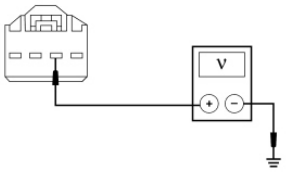


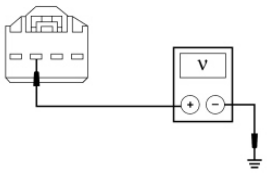
<table>
<tr><td>
• Enter the following diagnostic mode on the scan tool: PCM DataLogger.
• Monitor the PCM PIDs BOO (brake pedal top travel) and BPA (brake pedal bottom travel) while applying and releasing the brake pedal as follows:

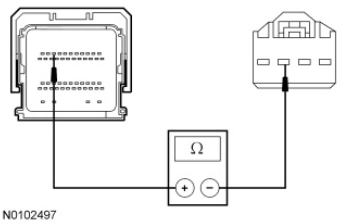
<table>
<tr><th>Brake Pedal Position</th><th>BOO PID</th><th>BPA PID</th></tr>
<tr><td>Released</td><td>Off</td><td>Off</td></tr>
<tr><td>Applied lightly</td><td>On</td><td>Off</td></tr>
<tr><td>Applied firmly</td><td>On</td><td>On</td></tr>
</table>

• Do the PID values agree with the brake pedal positions?
</td><td>
Yes
GO to B7 .

No
For an incorrect BOO PID value, GO to B3 .







For an incorrect BPA PID value, GO to B4 .
</td></tr>
<tr><td colspan="2">B3 CHECK THE STOPLAMP SWITCH CIRCUIT FOR VOLTAGE</td></tr>
<tr><td>
• Ignition OFF.
• Disconnect: PCM C175b.
• Ignition ON.
• While applying the brake pedal, measure the voltage between the PCM C175b-8, circuit CCB08 (VT/WH), harness side and ground.

• Is the voltage greater than 10 volts with the brake pedal applied?
</td><td>
Yes
GO to B7 .

No
REPAIR the circuit for an open. CLEAR the DTCs. REPEAT the self-test.
</td></tr>
<tr><td colspan="2">B4 CHECK THE SPEED CONTROL DEACTIVATOR SWITCH CIRCUIT FOR AN OPEN</td></tr>
<tr><td>
• Ignition OFF.
• Disconnect: Stoplamp Switch C278.
• Ignition ON.
• Measure the voltage between the stoplamp switch C278-2, circuit CBB42 (GN), harness side and ground.
</td><td>
Yes
GO to B5 .

No
REPAIR the circuit for an open. CLEAR the DTCs. TEST the system for normal operation.
</td></tr>
</table>

 N0038829 • **Is the voltage greater than 10 volts?**	
B5 CHECK THE SPEED CONTROL DEACTIVATOR SWITCH SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: PCM C175b. • Ignition ON. • Measure the voltage between the stoplamp switch C278-3, circuit CES09 (VT/OG), harness side and ground.  N0038830 • **Is any voltage present?**	**Yes** REPAIR the circuit. CLEAR the DTCs. TEST the system for normal operation. **No** GO to B6 .
B6 CHECK THE SPEED CONTROL DEACTIVATOR SWITCH SIGNAL CIRCUIT FOR AN OPEN	
• Ignition OFF. • Measure the resistance between the PCM C175b-9, circuit CES09 (VT/OG), harness side and the stoplamp switch C278-3, circuit CES09 (VT/OG), harness side.  N0102497 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new stoplamp switch. REFER to Section 417-01 . TEST the system for normal operation. **No** REPAIR the circuit. CLEAR the DTCs. TEST the system for normal operation.
B7 CHECK FOR CORRECT PCM OPERATION	
• Connect: All Disconnected Connectors. • Disconnect all the PCM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins	**Yes** INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may

• Connect all the PCM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	have been caused by a loose or corroded connector.

Pinpoint Test C: The Speed Control Switches Do Not Operate Correctly

Refer to Wiring Diagrams Cell 31 , Speed Control for schematic and connector information.

Normal Operation

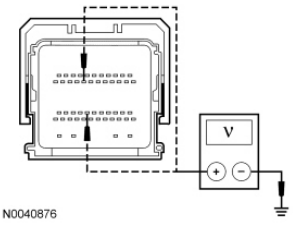
The PCM sends a signal through circuit VES10 (WH) to the speed control switch, which passes through the clockspring. The return signal is sent to the PCM through circuit RES08 (GN/BN) and the clockspring.

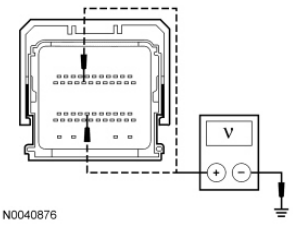
- DTC P0579 (Cruise Control Multi-Function Input A Circuit Range/Performance) - sets when a speed control switch is stuck, or when the speed control switch circuits are shorted to voltage or ground.
- DTC P0581 (Cruise Control Multi-Function Circuit High) - sets when a speed control switch is stuck, or when the speed control switch circuits are shorted to voltage or ground.

This pinpoint test is intended to diagnose the following:

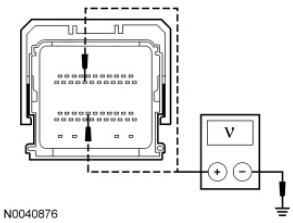
- Wiring, terminals or connectors
- Clockspring
- Speed control switch
- PCM

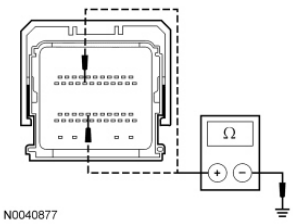
PINPOINT TEST C: THE SPEED CONTROL SWITCHES DO NOT OPERATE CORRECTLY



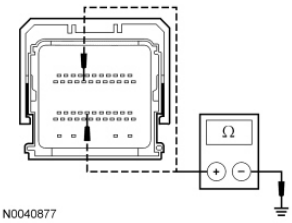


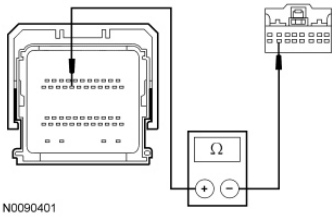
NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

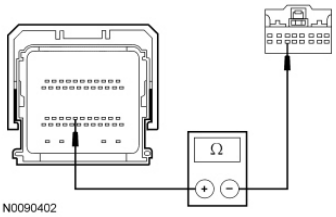




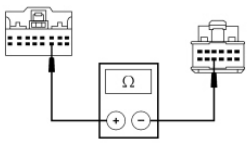
<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>
<tr><td>C1 CHECK THE SPEED CONTROL SWITCH</td><td></td></tr>
<tr><td>• Enter the following diagnostic mode on the scan tool: PCM DataLogger.
• Press each speed control switch while monitoring the speed control switch PID (SCCS).

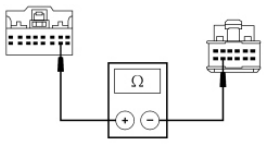






<table><tr><th>Speed Control Switch</th><th>SCCS PID Value</th></tr><tr><td>-</td><td>NONE Pressed</td></tr><tr><td>RES</td><td>RESUME</td></tr><tr><td>OFF</td><td>Off</td></tr><tr><td>ON</td><td>On</td></tr><tr><td>SET +</td><td>SET/+</td></tr><tr><td>SET -</td><td>SET/-</td></tr></table></td><td>Yes
GO to C10 .

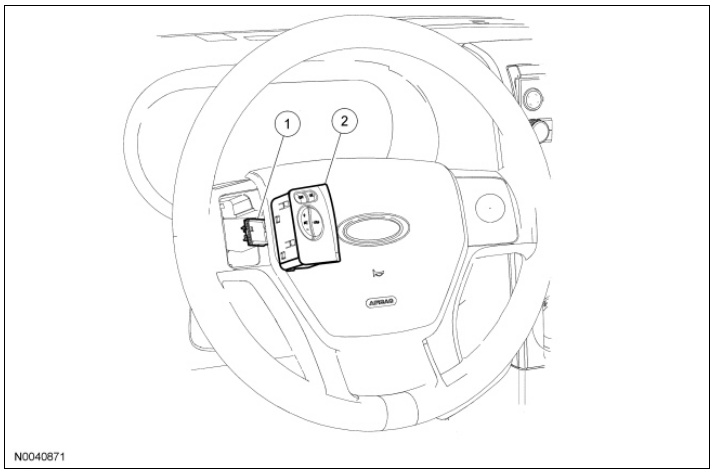




No
If only one switch does not display the correct PID value, INSTALL a new speed control switch. REFER to Speed Control Switch in this section. TEST the system for normal operation.

Otherwise, GO to C2 .</td></tr>
</table>

• **Does the PID value agree with the switch position?**	
C2 CHECK THE SPEED CONTROL SWITCH CIRCUITRY FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: PCM C175b. • Ignition ON. • Turn the parking lamps on. • Measure the voltage between the PCM C175b-19, circuit VES10 (WH), harness side and ground; and between the PCM C175b-30, circuit RES08 (GN/BN), harness side and ground.  • **Is any voltage present?**	**Yes** TURN the parking lamps off. GO to C3 . **No** TURN the parking lamps off. GO to C5 .
C3 CHECK THE SPEED CONTROL SWITCH CIRCUITRY FOR A SHORT TO VOLTAGE WITH THE CLOCKSPRING DISCONNECTED	
• Ignition OFF. • Disconnect: Clockspring C218a. • Ignition ON. • Turn the parking lamps on. • Measure the voltage between the PCM C175b-19, circuit VES10 (WH), harness side and ground; and between the PCM C175b-30, circuit RES08 (GN/BN), harness side and ground.  • **Is any voltage present?**	**Yes** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test. **No** TURN the parking lamps off. GO to C4 .
C4 CHECK THE CLOCKSPRING FOR A SHORT TO VOLTAGE	



• Ignition OFF. • Connect: Clockspring C218a. • ⚠ **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Remove the driver air bag module. Refer to Section 501-20B . • Disconnect: Upper Clockspring C218b. • Connect the battery. • Ignition ON. • Turn the parking lamps on. • Measure the voltage between the PCM C175b-19, circuit VES10 (WH), harness side and ground; and between the PCM C175b-30, circuit RES08 (GN/BN), harness side and ground.  • **Is any voltage present?**	**Yes** INSTALL a new clockspring. REFER to Section 501-20B . DISCONNECT the battery. INSTALL the driver air bag module. REFER to Section 501-20B . CLEAR the DTCs. REPEAT the self-test. **No** GO to C10 .
C5 CHECK THE SPEED CONTROL SWITCH CIRCUITRY FOR A SHORT TO GROUND	
• Remove the driver air bag module. Refer to Section 501-20B . • Disconnect: Upper Clockspring C218b. • Ignition OFF. • Measure the resistance between the PCM C175b-19, circuit VES10 (WH), harness side and ground; and between the PCM C175b-30, circuit RES08 (GN/BN), harness side and ground.  • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to C7 . **No** GO to C6 .
C6 CHECK THE CLOCKSPRING FOR A SHORT TO GROUND	

• Disconnect: Clockspring C218a. • Measure the resistance between the PCM C175b-19, circuit VES10 (WH), harness side and ground; and between the PCM C175b-30, circuit RES08 (GN/BN), harness side and ground.  N0040877 • **Are the resistances greater than 10,000 ohms?**	**Yes** INSTALL a new clockspring. REFER to Section 501-20B . INSTALL the driver air bag module. REFER to Section 501-20B . CLEAR the DTCs. REPEAT the self-test. **No** REPAIR the circuit in question. INSTALL the driver air bag module. REFER to Section 501-20B . CLEAR the DTCs. REPEAT the self-test.
C7 CHECK THE SPEED CONTROL SWITCH CIRCUITRY FOR AN OPEN	
• Disconnect: Clockspring C218a. • Measure the resistance between the PCM C175b-19, circuit VES10 (WH), harness side and the clockspring C218a-15, circuit VES10 (WH), harness side.  N0090401 • Measure the resistance between the PCM C175b-30, circuit RES08 (GN/BN), harness side and the clockspring C218a-14, circuit RES08 (GN/BN), harness side.  N0090402 • **Are the resistances less than 5 ohms?**	**Yes** GO to C9 . **No** GO to C8 .
C8 CHECK THE CLOCKSPRING	
• Measure the resistance between the clockspring C218a pin 14, component side and the clockspring C218b pin 9, component side.	**Yes** GO to C9 . **No** INSTALL a new clockspring. INSTALL the driver air bag module. REFER to Section

 N0090098 • Measure the resistance between the clockspring C218a pin 15, component side and the clockspring C218b pin 8, component side.  N0090099 • **Are the resistances less than 5 ohms?**	501-20B . CLEAR the DTCs. REPEAT the self-test.
C9 CHECK THE STEERING WHEEL SWITCH HARNESS	
• Check the steering wheel switch harness for an open, short to ground or short to voltage. • **Are any of these conditions present?**	**Yes** REPAIR the steering wheel switch harness. INSTALL the driver air bag module. REFER to Section 501-20B . CLEAR the DTCs. REPEAT the self-test. **No** INSTALL a new speed control switch. REFER to Speed Control Switch in this section. INSTALL the driver air bag module. REFER to Section 501-20B . CLEAR the DTCs. REPEAT the self-test.
C10 CHECK FOR CORRECT PCM OPERATION	
• Connect: All Disconnected Connectors. • Disconnect all the PCM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the PCM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PCM. REFER to Section 303-14 . INSTALL the driver air bag module. REFER to Section 501-20B . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. INSTALL the driver air bag module. REFER to Section 501-20B . CLEAR the DTCs. REPEAT the self-test.

Speed Control Switch

NOTE: Explorer shown, Mountaineer similar.

Item	Part Number	Description
1	-	Speed control switch electrical connector (part of 3600)
2	9E740	Speed control switch

Removal and Installation

NOTE: It is not necessary to remove the driver air bag module during this procedure.

NOTE: Be careful not to allow the speed control switch electrical connector to fall back into the steering wheel.

1. Remove the speed control switch by pulling the switch toward the rear of the vehicle.
   - Disconnect the electrical connector.

2. To install, reverse the removal procedure.

Brake Flexible Hose (REMOVAL AND INSTALLATION, Rear Disc Brake)

Brake Master Cylinder (REMOVAL AND INSTALLATION, Hydraulic Brake Actuation)

Brake Pads (REMOVAL AND INSTALLATION, Front Disc Brake)

Brake Pads (REMOVAL AND INSTALLATION, Rear Disc Brake)

Brake Pedal and Bracket (REMOVAL AND INSTALLATION, Hydraulic Brake Actuation)

Brake Pedal Motor (REMOVAL AND INSTALLATION, Hydraulic Brake Actuation)

Brake Shift Interlock Actuator (REMOVAL AND INSTALLATION, Automatic Transaxle/Transmission External Controls)

Brake Shift Interlock Override (GENERAL PROCEDURES, Automatic Transaxle/Transmission External Controls)

Brake System (DESCRIPTION AND OPERATION, Brake System - General Information)

Brake System Bleeding (GENERAL PROCEDURES, Brake System - General Information)

Brake System Inspection (GENERAL PROCEDURES, Brake System - General Information)

Brake System - General Information (Section Table of Contents)

Brake System - General Information (SPECIFICATIONS)

Bumper Cover - Front (REMOVAL AND INSTALLATION, Bumpers)

Bumper Cover - Rear, Explorer (REMOVAL AND INSTALLATION, Bumpers)

Bumper Cover - Rear, Mountaineer (REMOVAL AND INSTALLATION, Bumpers)

Bumper Cover - Rear, Sport Trac (REMOVAL AND INSTALLATION, Bumpers)

Bumper - Exploded View, Front (REMOVAL AND INSTALLATION, Bumpers)

Bumper - Exploded View, Rear (REMOVAL AND INSTALLATION, Bumpers)

Bumper - Front (REMOVAL AND INSTALLATION, Bumpers)

Bumpers (Section Table of Contents)

Bumpers (SPECIFICATIONS)

C

C-Pillar Lower Trim Panel - Explorer Sport Trac (REMOVAL AND INSTALLATION, Interior Trim and Ornamentation)

C-Pillar Trim Panel - Explorer, Mountaineer (REMOVAL AND INSTALLATION, Interior Trim and Ornamentation)

C-Pillar Upper Trim Panel - Explorer Sport Trac (REMOVAL AND INSTALLATION, Interior Trim and Ornamentation)

Cab Rear Trim Panel (REMOVAL AND INSTALLATION, Interior Trim and Ornamentation)

Camber Adjustment - Rear (GENERAL PROCEDURES, Suspension System - General Information)

Camber and Caster Adjustment - Front (GENERAL PROCEDURES, Suspension System - General Information)

Camshaft Bearing Journal Diameter (GENERAL PROCEDURES, Engine System - General Information)

Camshaft Drive Cassette - LH (IN-VEHICLE REPAIR, Engine - 4.0L SOHC)

Camshaft End Play - OHC Engines (GENERAL PROCEDURES, Engine System - General Information)

Camshaft Journal to Bearing Clearance - OHC Engines (GENERAL PROCEDURES, Engine System - General Information)

Camshaft Lobe Lift (GENERAL PROCEDURES, Engine System - General Information)

Camshaft Phaser and Sprocket Inspection (GENERAL PROCEDURES, Engine System - General Information)

Camshaft Phaser and Sprocket - LH (IN-VEHICLE REPAIR, Engine - 4.6L (3V))

Camshaft Phaser and Sprocket - RH (IN-VEHICLE REPAIR, Engine - 4.6L (3V))

Camshaft Position (CMP) Sensor - 4.0L SOHC (REMOVAL AND INSTALLATION, Electronic Engine Controls)

Camshaft Position (CMP) Sensor - 4.6L (3V) (REMOVAL AND INSTALLATION, Electronic Engine Controls)

Camshaft Roller Follower (IN-VEHICLE REPAIR, Engine - 4.0L SOHC)

Camshaft Roller Follower (IN-VEHICLE REPAIR, Engine - 4.6L (3V))

Camshaft Runout (GENERAL PROCEDURES, Engine System - General Information)

Camshaft Surface Inspection (GENERAL PROCEDURES, Engine System - General Information)

Camshaft Timing (GENERAL PROCEDURES, Engine - 4.0L SOHC)

Camshaft - LH (IN-VEHICLE REPAIR, Engine - 4.6L (3V))

Camshaft - RH (IN-VEHICLE REPAIR, Engine - 4.6L (3V))

Camshafts (IN-VEHICLE REPAIR, Engine - 4.0L SOHC)

Cargo Lamp (REMOVAL AND INSTALLATION, Interior Lighting)

Catalyst Monitor Sensor (REMOVAL AND INSTALLATION, Electronic Engine Controls)

Charge Motion Control Valve (CMCV) - 4.6L (3V) (REMOVAL AND INSTALLATION, Electronic Engine Controls)

Charging System (DESCRIPTION AND OPERATION)

Charging System (Section Table of Contents)

Charging System (SPECIFICATIONS)

Child Safety Seat Tether Anchor - Second Row (REMOVAL AND INSTALLATION, Safety Belt System)

Child Safety Seat Tether Anchor - Third Row (REMOVAL AND INSTALLATION, Safety Belt System)

Climate Control (Section Table of Contents)

Climate Control (SPECIFICATIONS)

Climate Control Assembly (REMOVAL AND INSTALLATION, Climate Control)

Climate Control System (DESCRIPTION AND OPERATION, Climate Control System - General Information and Diagnostics)

Climate Control System (DIAGNOSIS AND TESTING, Climate Control System - General Information and Diagnostics)

Climate Control System - General Information and Diagnostics (Section Table of Contents)

Climate Control System - General Information and Diagnostics (SPECIFICATIONS)

Clockspring (REMOVAL AND INSTALLATION, Supplemental Restraint System)

Clutch and Clutch Field Coil (REMOVAL AND INSTALLATION, Climate Control)

Communications Network (DESCRIPTION AND OPERATION, Module Communications Network)

Communications Network (DIAGNOSIS AND TESTING, Module Communications Network)

Compass Calibration (GENERAL PROCEDURES, Instrumentation, Message Center, and Warning Chimes)

Compass Zone Adjustment (GENERAL PROCEDURES, Instrumentation, Message Center, and Warning Chimes)

Component Bleeding (GENERAL PROCEDURES, Brake System - General Information)

Component Test (DIAGNOSIS AND TESTING, Battery, Mounting and Cables)

Component Tests (DIAGNOSIS AND TESTING, Brake System - General Information)

Compressor to Condenser Discharge Line - 4.0L SOHC (REMOVAL AND INSTALLATION, Climate Control)

Compressor to Condenser Discharge Line - 4.6L (REMOVAL AND INSTALLATION, Climate Control)

Condenser Core (REMOVAL AND INSTALLATION, Climate Control)

Condenser to Evaporator Line (REMOVAL AND INSTALLATION, Climate Control)

Connecting Rod Bearing Journal Taper and Out-of-Round (GENERAL PROCEDURES, Engine System - General Information)

Connecting Rod Bearing Journal-to-Bearing Clearance (GENERAL PROCEDURES, Engine System - General Information)

Connecting Rod Bend (GENERAL PROCEDURES, Engine System - General Information)

Connecting Rod Bushing Diameter (GENERAL PROCEDURES, Engine System - General Information)

Connecting Rod Cleaning (GENERAL PROCEDURES, Engine System - General Information)

Connecting Rod Large End Bore (GENERAL PROCEDURES, Engine System - General Information)

Connecting Rod to Crankshaft Side Clearance (GENERAL PROCEDURES, Engine System - General Information)

Connecting Rod Twist (GENERAL PROCEDURES, Engine System - General Information)

Console - Front, Floor (REMOVAL AND INSTALLATION, Instrument Panel and Console)

Console - Overhead (REMOVAL AND INSTALLATION, Instrument Panel and Console)

Console - Rear, Floor (REMOVAL AND INSTALLATION, Instrument Panel and Console)

Control Components (DESCRIPTION AND OPERATION, Climate Control)

Coolant Crossover Manifold Assembly (REMOVAL AND INSTALLATION, Engine Cooling)

Coolant Expansion Tank (REMOVAL AND INSTALLATION, Engine Cooling)

Coolant Pump - 4.0L SOHC (REMOVAL AND INSTALLATION, Engine Cooling)

Coolant Pump - 4.6L (3V) (REMOVAL AND INSTALLATION, Engine Cooling)

Cooling Fan (REMOVAL AND INSTALLATION, Engine Cooling)

Cooling Fan Shroud (REMOVAL AND INSTALLATION, Engine Cooling)

Cooling System Draining, Filling and Bleeding (GENERAL PROCEDURES, Engine Cooling)

Cooling System Flushing (GENERAL PROCEDURES, Engine Cooling)

Core Plug Replacement (GENERAL PROCEDURES, Engine System - General Information)

Cowl Panel Grille (REMOVAL AND INSTALLATION, Front End Body Panels)

Cowl Side Trim Panel (REMOVAL AND INSTALLATION, Interior Trim and Ornamentation)

Crankshaft End Play (GENERAL PROCEDURES, Engine System - General Information)

Crankshaft Front Seal (IN-VEHICLE REPAIR, Engine - 4.0L SOHC)

Crankshaft Front Seal (IN-VEHICLE REPAIR, Engine - 4.6L (3V))

Crankshaft Main Bearing Journal Diameter (GENERAL PROCEDURES, Engine System - General Information)

Crankshaft Main Bearing Journal Taper and Out-of-Round (GENERAL PROCEDURES, Engine System - General Information)

Crankshaft Main Bearing Journal-to-Bearing Clearance (GENERAL PROCEDURES, Engine System - General Information)

Crankshaft Position (CKP) Sensor - 4.0L SOHC (REMOVAL AND INSTALLATION, Electronic Engine Controls)

Crankshaft Position (CKP) Sensor - 4.6L (3V) (REMOVAL AND INSTALLATION, Electronic Engine Controls)

Crankshaft Pulley (IN-VEHICLE REPAIR, Engine - 4.0L SOHC)

Crankshaft Pulley (IN-VEHICLE REPAIR, Engine - 4.6L (3V))

Crankshaft Rear Seal (IN-VEHICLE REPAIR, Engine - 4.0L SOHC)

Crankshaft Rear Seal (IN-VEHICLE REPAIR, Engine - 4.6L (3V))

Crankshaft Rear Seal with Retainer Plate (IN-VEHICLE REPAIR, Engine - 4.6L (3V))

Crossmember - 1B (REMOVAL AND INSTALLATION, Full Frame and Body Mounting)

Cylinder Block Cradle (IN-VEHICLE REPAIR, Engine - 4.0L SOHC)

Cylinder Block Distortion (GENERAL PROCEDURES, Engine System - General Information)

Cylinder Bore Cleaning (GENERAL PROCEDURES, Engine System - General Information)

Cylinder Bore Out-of-Round (GENERAL PROCEDURES, Engine System - General Information)

Cylinder Bore Taper (GENERAL PROCEDURES, Engine System - General Information)

Cylinder Head (DISASSEMBLY AND ASSEMBLY OF SUBASSEMBLIES, Engine - 4.0L SOHC)

Cylinder Head (DISASSEMBLY AND ASSEMBLY OF SUBASSEMBLIES, Engine - 4.6L (3V))

Cylinder Head (IN-VEHICLE REPAIR, Engine - 4.0L SOHC)

Cylinder Head (INSTALLATION, Engine - 4.6L (3V))

Cylinder Head (REMOVAL, Engine - 4.6L (3V))

Cylinder Head Distortion (GENERAL PROCEDURES, Engine System - General Information)

Cylinder Head Temperature (CHT) Sensor - 4.6L (3V) (REMOVAL AND INSTALLATION, Electronic Engine Controls)

D

D-Pillar Trim Panel (REMOVAL AND INSTALLATION, Interior Trim and Ornamentation)

Daytime Running Lamps (DRL) (DIAGNOSIS AND TESTING, Exterior Lighting)

Diagnosis By Symptom (DIAGNOSIS AND TESTING, Automatic Transaxle/Transmission - 5R55S)

Diagnosis By Symptom (DIAGNOSIS AND TESTING, Automatic Transaxle/Transmission - 6R80)

Diagnostic Flow Chart (DIAGNOSIS AND TESTING, Automatic Transaxle/Transmission - 6R80)

Diagnostic Methods (DESCRIPTION AND OPERATION, Service Information)

Diagnostic Parameters Identification (PID) Chart (DIAGNOSIS AND TESTING, Automatic Transaxle/Transmission - 5R55S)

Diagnostic Parameters Identification (PID) Chart (DIAGNOSIS AND TESTING, Automatic Transaxle/Transmission - 6R80)

Diagnostic Strategy (DIAGNOSIS AND TESTING, Automatic Transaxle/Transmission - 6R80)

Diagnostic Trouble Code (DTC) Chart (DIAGNOSIS AND TESTING, Charging System)

Diagnostic Trouble Code (DTC) Chart (DIAGNOSIS AND TESTING, Exterior Lighting)

Diagnostic Trouble Code (DTC) Chart (DIAGNOSIS AND TESTING, Multifunction Electronic Modules)

Diagnostic Trouble Code (DTC) Charts (DIAGNOSIS AND TESTING, Automatic Transaxle/Transmission - 5R55S)

Diagnostic Trouble Code (DTC) Charts (DIAGNOSIS AND TESTING, Automatic Transaxle/Transmission - 6R80)

Diagnostic Trouble Code (DTC) Charts (DIAGNOSIS AND TESTING, Hydraulic Brake Actuation)

Diagnostics (DIAGNOSIS AND TESTING, Automatic Transaxle/Transmission - 5R55S)

Diagnostics (DIAGNOSIS AND TESTING, Automatic Transaxle/Transmission - 6R80)

Differential Bearings (REMOVAL AND INSTALLATION, Front Drive Axle/Differential - Dana 30)

Differential Bearings (REMOVAL AND INSTALLATION, Rear Drive Axle/Differential - Ford 8.8-Inch Ring Gear)

Differential Carrier (REMOVAL AND INSTALLATION, Front Drive Axle/Differential - Dana 30)

Differential Case (DISASSEMBLY AND ASSEMBLY, Front Drive Axle/Differential - Dana 30)

Differential Case and Ring Gear (DISASSEMBLY AND ASSEMBLY, Rear Drive Axle/Differential - Ford 8.8-Inch Ring Gear)

Differential Draining and Filling (GENERAL PROCEDURES, Rear Drive Axle/Differential - Ford 8.8-Inch Ring Gear)

Differential Ring And Pinion (REMOVAL AND INSTALLATION, Front Drive Axle/Differential - Dana 30)

Differential Ring And Pinion (REMOVAL AND INSTALLATION, Rear Drive Axle/Differential - Ford 8.8-Inch Ring Gear)

Digital Transmission Range (TR) Sensor (IN-VEHICLE REPAIR, Automatic Transaxle/Transmission - 5R55S)

Direct Clutch Assembly (DISASSEMBLY AND ASSEMBLY OF SUBASSEMBLIES, Automatic Transaxle/Transmission - 6R80)

Direct Clutch Drum Assembly (DISASSEMBLY AND ASSEMBLY OF SUBASSEMBLIES, Automatic Transaxle/Transmission - 5R55S)

Door (REMOVAL AND INSTALLATION, Body Closures)

Door Ajar Switch - Front Door (REMOVAL AND INSTALLATION, Handles, Locks, Latches and Entry Systems)

Door Ajar Switch - Liftgate (REMOVAL AND INSTALLATION, Handles, Locks, Latches and Entry Systems)

Door Ajar Switch - Liftgate Glass (REMOVAL AND INSTALLATION, Handles, Locks, Latches and Entry Systems)

Door Ajar Switch - Rear Door (REMOVAL AND INSTALLATION, Handles, Locks, Latches and Entry Systems)

Door Alignment (GENERAL PROCEDURES, Body Closures)

Door Glass Top Run - Front (REMOVAL AND INSTALLATION, Glass, Frames and Mechanisms)

Door Glass Top Run - Rear (REMOVAL AND INSTALLATION, Glass, Frames and Mechanisms)

Door Handle to Latch Rod Adjustment (GENERAL PROCEDURES, Handles, Locks, Latches and Entry

Systems)

Door Lock Control Switch (REMOVAL AND INSTALLATION, Handles, Locks, Latches and Entry Systems)

Door Lock Cylinder (REMOVAL AND INSTALLATION, Handles, Locks, Latches and Entry Systems)

Door Moulding - Explorer (REMOVAL AND INSTALLATION, Exterior Trim and Ornamentation)

Door Moulding - Mountaineer (REMOVAL AND INSTALLATION, Exterior Trim and Ornamentation)

Door Trim Panel - Front (REMOVAL AND INSTALLATION, Interior Trim and Ornamentation)

Door Trim Panel - Rear (REMOVAL AND INSTALLATION, Interior Trim and Ornamentation)

Drive Pinion Flange and Drive Pinion Seal (IN-VEHICLE REPAIR, Rear Drive Axle/Differential - Ford 8.8-Inch Ring Gear)

Drive Pinion Flange and Seal (IN-VEHICLE REPAIR, Front Drive Axle/Differential - Dana 30)

Driveline Angle Measurement (GENERAL PROCEDURES, Driveline System - General Information)

Driveline System (DESCRIPTION AND OPERATION, Driveline System - General Information)

Driveline System (DIAGNOSIS AND TESTING, Driveline System - General Information)

Driveline System - General Information (Section Table of Contents)

Driveline System - General Information (SPECIFICATIONS)

Driver Air Bag Module (REMOVAL AND INSTALLATION, Supplemental Restraint System)

Driver Seat Module (DSM) (DIAGNOSIS AND TESTING, Multifunction Electronic Modules)

Driver Seat Module (DSM) (REMOVAL AND INSTALLATION, Multifunction Electronic Modules)

Driveshaft (DESCRIPTION AND OPERATION)

Driveshaft (DIAGNOSIS AND TESTING)

Driveshaft (Section Table of Contents)

Driveshaft (SPECIFICATIONS)

Driveshaft Center Bearing (DISASSEMBLY AND ASSEMBLY, Driveshaft)

Driveshaft Runout and Balancing (GENERAL PROCEDURES, Driveline System - General Information)

Driveshaft Slip Yoke Boot (REMOVAL AND INSTALLATION, Driveshaft)

Driveshaft Universal Joint - Snap Ring Type (DISASSEMBLY AND ASSEMBLY, Driveshaft)

Driveshaft Universal Joint - Stake Type (DISASSEMBLY AND ASSEMBLY, Driveshaft)

Driveshaft - Front (REMOVAL AND INSTALLATION, Driveshaft)

Driveshaft - Rear, One-Piece, 4.0L SOHC (REMOVAL AND INSTALLATION, Driveshaft)

Driveshaft - Rear, One-Piece, 4.6L (3V) (REMOVAL AND INSTALLATION, Driveshaft)

Driveshaft - Rear, Two-Piece, Four Wheel Drive (4WD) (REMOVAL AND INSTALLATION, Driveshaft)

Driveshaft - Rear, Two-Piece, Rear Wheel Drive (RWD) (REMOVAL AND INSTALLATION, Driveshaft)

Dust Separator (REMOVAL AND INSTALLATION, Evaporative Emissions)

E

Electronic Engine Controls (DESCRIPTION AND OPERATION)

Electronic Engine Controls (DIAGNOSIS AND TESTING)

Electronic Engine Controls (Section Table of Contents)

Electronic Engine Controls (SPECIFICATIONS)

Electronic Leak Detection (GENERAL PROCEDURES, Climate Control System - General Information and Diagnostics)

Elevation System Check (GENERAL PROCEDURES, Parking Aid)

Engine (ASSEMBLY, Engine - 4.0L SOHC)

Engine (ASSEMBLY, Engine - 4.6L (3V))

Engine (DESCRIPTION AND OPERATION, Engine System - General Information)

Engine (DESCRIPTION AND OPERATION, Engine - 4.0L SOHC)

Engine (DESCRIPTION AND OPERATION, Engine - 4.6L (3V))

Engine (DIAGNOSIS AND TESTING, Engine System - General Information)

Engine (DIAGNOSIS AND TESTING, Engine - 4.0L SOHC)

Engine (DIAGNOSIS AND TESTING, Engine - 4.6L (3V))

Engine (DISASSEMBLY, Engine - 4.0L SOHC)

Engine (DISASSEMBLY, Engine - 4.6L (3V))

Engine (INSTALLATION, Engine - 4.0L SOHC)

Engine (INSTALLATION, Engine - 4.6L (3V))

Engine (REMOVAL, Engine - 4.0L SOHC)

Engine (REMOVAL, Engine - 4.6L (3V))

Engine Coolant Temperature (ECT) Sensor - 4.0L SOHC (REMOVAL AND INSTALLATION, Electronic Engine Controls)

Engine Cooling (DESCRIPTION AND OPERATION)

Engine Cooling (DIAGNOSIS AND TESTING)

Engine Cooling (Section Table of Contents)

Engine Cooling (SPECIFICATIONS)

Engine Emission Control (DESCRIPTION AND OPERATION)

Engine Emission Control (DIAGNOSIS AND TESTING)

Engine Emission Control (Section Table of Contents)

Engine Emission Control (SPECIFICATIONS)

Engine Front Cover (IN-VEHICLE REPAIR, Engine - 4.0L SOHC)

Engine Front Cover (IN-VEHICLE REPAIR, Engine - 4.6L (3V))

Engine Ignition (DESCRIPTION AND OPERATION, Engine Ignition - 4.0L SOHC)

Engine Ignition (DESCRIPTION AND OPERATION, Engine Ignition - 4.6L (3V))

Engine Ignition (DIAGNOSIS AND TESTING, Engine Ignition - 4.0L SOHC)

Engine Ignition (DIAGNOSIS AND TESTING, Engine Ignition - 4.6L (3V))

Engine Ignition Components - Exploded View (REMOVAL AND INSTALLATION, Engine Ignition - 4.0L SOHC)

Engine Ignition Components - Exploded View (REMOVAL AND INSTALLATION, Engine Ignition - 4.6L (3V))

Engine Ignition - 4.0L SOHC (Section Table of Contents)

Engine Ignition - 4.0L SOHC (SPECIFICATIONS)

Engine Ignition - 4.6L (3V) (Section Table of Contents)

Engine Ignition - 4.6L (3V) (SPECIFICATIONS)

Engine Lubrication Components - Exploded View (IN-VEHICLE REPAIR, Engine - 4.0L SOHC)

Engine Lubrication Components - Exploded View (IN-VEHICLE REPAIR, Engine - 4.6L (3V))

Engine Support Insulators (IN-VEHICLE REPAIR, Engine - 4.0L SOHC)

Engine Support Insulators (IN-VEHICLE REPAIR, Engine - 4.6L (3V))

Engine System - General Information (Section Table of Contents)

Engine System - General Information (SPECIFICATIONS)

Engine - 4.0L SOHC (Section Table of Contents)

Engine - 4.0L SOHC (SPECIFICATIONS)

Engine - 4.6L (3V) (Section Table of Contents)

Engine - 4.6L (3V) (SPECIFICATIONS)

Evaporative Emission Canister (REMOVAL AND INSTALLATION, Evaporative Emissions)

Evaporative Emission Canister Purge Valve (REMOVAL AND INSTALLATION, Evaporative Emissions)

Evaporative Emission System Leak Test (GENERAL PROCEDURES, Evaporative Emissions)

Evaporative Emissions (DESCRIPTION AND OPERATION)

Evaporative Emissions (DIAGNOSIS AND TESTING)

Evaporative Emissions (Section Table of Contents)

Evaporative Emissions (SPECIFICATIONS)

Evaporator Core (REMOVAL AND INSTALLATION, Climate Control)

Evaporator Core Orifice (REMOVAL AND INSTALLATION, Climate Control)

Exhaust Gas Recirculation (EGR) System Components - Exploded View, 4.0L SOHC (REMOVAL AND INSTALLATION, Engine Emission Control)

Exhaust Gas Recirculation (EGR) System Module Tube - 4.0L SOHC (REMOVAL AND INSTALLATION, Engine Emission Control)

Exhaust Gas Recirculation (EGR) System Module - 4.0L SOHC (REMOVAL AND INSTALLATION, Engine Emission Control)

Exhaust Manifold Cleaning and Inspection (GENERAL PROCEDURES, Engine System - General Information)

Exhaust Manifold - LH (IN-VEHICLE REPAIR, Engine - 4.0L SOHC)

Exhaust Manifold - LH (IN-VEHICLE REPAIR, Engine - 4.6L (3V))

Exhaust Manifold - RH (IN-VEHICLE REPAIR, Engine - 4.0L SOHC)

Exhaust Manifold - RH (IN-VEHICLE REPAIR, Engine - 4.6L (3V))

Exhaust System (DESCRIPTION AND OPERATION)

Exhaust System (DIAGNOSIS AND TESTING)

Exhaust System (Section Table of Contents)

Exhaust System (SPECIFICATIONS)

Exhaust System Alignment (GENERAL PROCEDURES, Exhaust System)

Exhaust System - Exploded View (REMOVAL AND INSTALLATION, Exhaust System)

Exhaust Y-Pipe - Dual Catalytic Converter (REMOVAL AND INSTALLATION, Exhaust System)

Extension Housing Gasket - Four Wheel Drive (4WD) (IN-VEHICLE REPAIR, Automatic Transaxle/Transmission - 5R55S)

Extension Housing Gasket - Rear Wheel Drive (RWD) (IN-VEHICLE REPAIR, Automatic Transaxle/Transmission - 5R55S)

Extension Housing Seal - Four Wheel Drive (4WD) (IN-VEHICLE REPAIR, Automatic Transaxle/Transmission - 5R55S)

Extension Housing Seal - Rear Wheel Drive (RWD) (IN-VEHICLE REPAIR, Automatic Transaxle/Transmission - 5R55S)

Exterior Front Door Handle (REMOVAL AND INSTALLATION, Handles, Locks, Latches and Entry Systems)

Exterior Lighting (DESCRIPTION AND OPERATION)

Exterior Lighting (Section Table of Contents)

Exterior Mirror (REMOVAL AND INSTALLATION, Rear View Mirrors)

Exterior Mirror Control Switch (REMOVAL AND INSTALLATION, Rear View Mirrors)

Exterior Mirror Cover (REMOVAL AND INSTALLATION, Rear View Mirrors)

Exterior Mirror Damper Spring Alignment (GENERAL PROCEDURES, Rear View Mirrors)

Exterior Mirror Glass (REMOVAL AND INSTALLATION, Rear View Mirrors)

Exterior Mirror Motor (REMOVAL AND INSTALLATION, Rear View Mirrors)

Exterior Mirrors - Exploded View (REMOVAL AND INSTALLATION, Rear View Mirrors)

Exterior Rear Door Handle (REMOVAL AND INSTALLATION, Handles, Locks, Latches and Entry Systems)

Exterior Trim (DESCRIPTION AND OPERATION, Exterior Trim and Ornamentation)

Exterior Trim and Ornamentation (Section Table of Contents)

Exterior Trim and Ornamentation (SPECIFICATIONS)

Exterior Trim - Exploded View (REMOVAL AND INSTALLATION, Exterior Trim and Ornamentation)

External Controls (DESCRIPTION AND OPERATION, Automatic Transaxle/Transmission External Controls)

External Controls (DIAGNOSIS AND TESTING, Automatic Transaxle/Transmission External Controls)

F

Fender (REMOVAL AND INSTALLATION, Front End Body Panels)

Fender Moulding - Front (REMOVAL AND INSTALLATION, Exterior Trim and Ornamentation)

Fender Moulding - Rear (REMOVAL AND INSTALLATION, Exterior Trim and Ornamentation)

Fender Splash Shield (REMOVAL AND INSTALLATION, Front End Body Panels)

Fender Vent (REMOVAL AND INSTALLATION, Exterior Trim and Ornamentation)

Flexplate (IN-VEHICLE REPAIR, Engine - 4.0L SOHC)

Flexplate (IN-VEHICLE REPAIR, Engine - 4.6L (3V))

Flexplate Inspection (GENERAL PROCEDURES, Engine System - General Information)

Flexplate or Flywheel and Crankshaft Rear Seal - Exploded View (IN-VEHICLE REPAIR, Engine - 4.6L (3V))

Fluid Pan, Gasket and Filter (IN-VEHICLE REPAIR, Automatic Transaxle/Transmission - 5R55S)

Fluid Pan, Gasket and Filter (IN-VEHICLE REPAIR, Automatic Transaxle/Transmission - 6R80)

Fluid Pump (DISASSEMBLY AND ASSEMBLY OF SUBASSEMBLIES, Automatic Transaxle/Transmission - 5R55S)

Fluorescent Dye Leak Detection (GENERAL PROCEDURES, Climate Control System - General Information and Diagnostics)

Fog Lamp (REMOVAL AND INSTALLATION, Exterior Lighting)

Fog Lamp Bulb (REMOVAL AND INSTALLATION, Exterior Lighting)

Fog Lamps (DIAGNOSIS AND TESTING, Exterior Lighting)

Forward Clutch (DISASSEMBLY AND ASSEMBLY OF SUBASSEMBLIES, Automatic Transaxle/Transmission - 5R55S)

Forward Clutch Assembly (DISASSEMBLY AND ASSEMBLY OF SUBASSEMBLIES, Automatic Transaxle/Transmission - 6R80)

Forward/Overdrive Clutch Assembly - Assembly (DISASSEMBLY AND ASSEMBLY OF SUBASSEMBLIES, Automatic Transaxle/Transmission - 6R80)

Forward/Overdrive Clutch Assembly - Disassembly (DISASSEMBLY AND ASSEMBLY OF SUBASSEMBLIES, Automatic Transaxle/Transmission - 6R80)

Four Wheel Drive (4WD) Systems (DESCRIPTION AND OPERATION)

Four Wheel Drive (4WD) Systems (Section Table of Contents)

Four Wheel Drive (4WD) Systems (SPECIFICATIONS)

Four Wheel Drive (4WD) Systems - 1-Speed Torque-On-Demand (DIAGNOSIS AND TESTING, Four Wheel Drive (4WD) Systems)

Four Wheel Drive (4WD) Systems - 2-Speed Torque-On-Demand (DIAGNOSIS AND TESTING, Four Wheel Drive (4WD) Systems)

Four Wheel Drive (4WD) Systems - All Wheel Drive (AWD) (DIAGNOSIS AND TESTING, Four Wheel Drive (4WD) Systems)

Frame and Body Mounting (DESCRIPTION AND OPERATION, Full Frame and Body Mounting)

Frame Drilling (GENERAL PROCEDURES, Full Frame and Body Mounting)

Frame Members (REMOVAL AND INSTALLATION, Body Repairs)

Front Disc Brake (DESCRIPTION AND OPERATION)

Front Disc Brake (DIAGNOSIS AND TESTING)

Front Disc Brake (Section Table of Contents)

Front Disc Brake (SPECIFICATIONS)

Front Door Handles, Locks and Latches - Exploded View (REMOVAL AND INSTALLATION, Handles, Locks, Latches and Entry Systems)

Front Door Latch (REMOVAL AND INSTALLATION, Handles, Locks, Latches and Entry Systems)

Front Door Lock Actuator (REMOVAL AND INSTALLATION, Handles, Locks, Latches and Entry Systems)

Front Drive Axle (DIAGNOSIS AND TESTING, Front Drive Axle/Differential - Dana 30)

Front Drive Axle and Differential (DESCRIPTION AND OPERATION, Front Drive Axle/Differential - Dana 30)

Front Drive Axle/Differential - Dana 30 (Section Table of Contents)

Front Drive Axle/Differential - Dana 30 (SPECIFICATIONS)

Front Drive Halfshafts (DESCRIPTION AND OPERATION)

Front Drive Halfshafts (DIAGNOSIS AND TESTING)

Front Drive Halfshafts (Section Table of Contents)

Front Drive Halfshafts (SPECIFICATIONS)

Front End Accessory Drive (FEAD) - Exploded View, 4.0L SOHC (REMOVAL AND INSTALLATION, Accessory Drive)

Front End Accessory Drive (FEAD) - Exploded View, 4.6L (3V) (REMOVAL AND INSTALLATION, Accessory Drive)

Front End Body Panels (Section Table of Contents)

Front End Body Panels (SPECIFICATIONS)

Front End Body Panels - Exploded View (REMOVAL AND INSTALLATION, Front End Body Panels)

Front Fog Lamp Adjustment (GENERAL PROCEDURES, Exterior Lighting)

Front Impact Severity Sensor (REMOVAL AND INSTALLATION, Supplemental Restraint System)

Front Suspension (DESCRIPTION AND OPERATION, Front Suspension - Four Wheel Drive (4WD))

Front Suspension (DESCRIPTION AND OPERATION, Front Suspension - Rear Wheel Drive (RWD))

Front Suspension (DIAGNOSIS AND TESTING, Front Suspension - Four Wheel Drive (4WD))

Front Suspension (DIAGNOSIS AND TESTING, Front Suspension - Rear Wheel Drive (RWD))

Front Suspension - Four Wheel Drive (4WD) (Section Table of Contents)

Front Suspension - Four Wheel Drive (4WD) (SPECIFICATIONS)

Front Suspension - Rear Wheel Drive (RWD) (Section Table of Contents)

Front Suspension - Rear Wheel Drive (RWD) (SPECIFICATIONS)

Fuel Charging and Controls (DESCRIPTION AND OPERATION, Fuel Charging and Controls - 4.0L SOHC)

Fuel Charging and Controls (DESCRIPTION AND OPERATION, Fuel Charging and Controls - 4.6L (3V))

Fuel Charging and Controls (DIAGNOSIS AND TESTING, Fuel Charging and Controls - 4.0L SOHC)

Fuel Charging and Controls (DIAGNOSIS AND TESTING, Fuel Charging and Controls - 4.6L (3V))

Fuel Charging and Controls - 4.0L SOHC (Section Table of Contents)

Fuel Charging and Controls - 4.0L SOHC (SPECIFICATIONS)

Fuel Charging and Controls - 4.6L (3V) (Section Table of Contents)

Fuel Charging and Controls - 4.6L (3V) (SPECIFICATIONS)

Fuel Filler Door Cup Bezel (REMOVAL AND INSTALLATION, Exterior Trim and Ornamentation)

Fuel Filter (REMOVAL AND INSTALLATION, Fuel Tank and Lines)

Fuel Injectors (REMOVAL AND INSTALLATION, Fuel Charging and Controls - 4.0L SOHC)

Fuel Injectors (REMOVAL AND INSTALLATION, Fuel Charging and Controls - 4.6L (3V))

Fuel Level Sender (REMOVAL AND INSTALLATION, Fuel Tank and Lines)

Fuel Lines (REMOVAL AND INSTALLATION, Fuel Tank and Lines)

Fuel Lines and Fuel Filter - Exploded View (REMOVAL AND INSTALLATION, Fuel Tank and Lines)

Fuel Pump (REMOVAL AND INSTALLATION, Fuel Tank and Lines)

Fuel Pump Driver Module (FPDM) - Explorer Sport Trac (REMOVAL AND INSTALLATION, Fuel Charging and Controls - 4.0L SOHC)

Fuel Pump Driver Module (FPDM) - Explorer Sport Trac (REMOVAL AND INSTALLATION, Fuel Charging and Controls - 4.6L (3V))

Fuel Pump Driver Module (FPDM) - Explorer, Mountaineer (REMOVAL AND INSTALLATION, Fuel Charging and Controls - 4.0L SOHC)

Fuel Pump Driver Module (FPDM) - Explorer, Mountaineer (REMOVAL AND INSTALLATION, Fuel Charging and Controls - 4.6L (3V))

Fuel Rail (REMOVAL AND INSTALLATION, Fuel Charging and Controls - 4.0L SOHC)

Fuel Rail (REMOVAL AND INSTALLATION, Fuel Charging and Controls - 4.6L (3V))

Fuel Rail and Fuel Injector - Exploded View (REMOVAL AND INSTALLATION, Fuel Charging and Controls - 4.0L SOHC)

Fuel Rail and Fuel Injector - Exploded View (REMOVAL AND INSTALLATION, Fuel Charging and Controls - 4.6L (3V))

Fuel Rail Pressure and Temperature Sensor - 4.0L SOHC (REMOVAL AND INSTALLATION, Electronic Engine Controls)

Fuel Rail Pressure and Temperature Sensor - 4.6L (3V) (REMOVAL AND INSTALLATION, Electronic Engine Controls)

Fuel Rail Supply Tube (REMOVAL AND INSTALLATION, Fuel Charging and Controls - 4.0L SOHC)

Fuel System (DESCRIPTION AND OPERATION, Fuel System - General Information)

Fuel System (DIAGNOSIS AND TESTING, Fuel System - General Information)

Fuel System Pressure Release (GENERAL PROCEDURES, Fuel System - General Information)

Fuel System Pressure Test (GENERAL PROCEDURES, Fuel System - General Information)

Fuel System - General Information (Section Table of Contents)

Fuel System - General Information (SPECIFICATIONS)

Fuel Tank (REMOVAL AND INSTALLATION, Fuel Tank and Lines)

Fuel Tank and Filler Pipe - Exploded View (REMOVAL AND INSTALLATION, Fuel Tank and Lines)

Fuel Tank and Lines (DESCRIPTION AND OPERATION)

Fuel Tank and Lines (DIAGNOSIS AND TESTING)

Fuel Tank and Lines (Section Table of Contents)

Fuel Tank and Lines (SPECIFICATIONS)

Fuel Tank Draining (GENERAL PROCEDURES, Fuel System - General Information)

Fuel Tank Filler Pipe (REMOVAL AND INSTALLATION, Fuel Tank and Lines)

Fuel Tank Pressure Sensor (REMOVAL AND INSTALLATION, Evaporative Emissions)

Fuel Tank Support Straps (REMOVAL AND INSTALLATION, Fuel Tank and Lines)

Fuel Vapor Vent Valve (REMOVAL AND INSTALLATION, Evaporative Emissions)

Full Frame and Body Mounting (Section Table of Contents)

Full Frame and Body Mounting (SPECIFICATIONS)

G

Gear Ratios (DESCRIPTION AND OPERATION, Automatic Transaxle/Transmission - 6R80)

Geartrain (DESCRIPTION AND OPERATION, Automatic Transaxle/Transmission - 5R55S)

Generator - 4.0L SOHC (REMOVAL AND INSTALLATION, Charging System)

Generator - 4.6L (2V) (REMOVAL AND INSTALLATION, Charging System)

Glass Reseal - Windshield (GENERAL PROCEDURES, Glass, Frames and Mechanisms)

Glass, Frames and Mechanisms (DESCRIPTION AND OPERATION)

Glass, Frames and Mechanisms (DIAGNOSIS AND TESTING)

Glass, Frames and Mechanisms (Section Table of Contents)

Glass, Frames and Mechanisms (SPECIFICATIONS)

Glass, Frames and Mechanisms - Exploded View, Front Door (REMOVAL AND INSTALLATION, Glass, Frames and Mechanisms)

Glass, Frames and Mechanisms - Exploded View, Rear Door (REMOVAL AND INSTALLATION, Glass, Frames and Mechanisms)

H

Halfshaft (DISASSEMBLY AND ASSEMBLY, Front Drive Halfshafts)

Halfshaft (REMOVAL AND INSTALLATION, Front Drive Halfshafts)

Halfshaft (REMOVAL AND INSTALLATION, Rear Drive Halfshafts)

Halfshaft Joint (DISASSEMBLY AND ASSEMBLY, Rear Drive Halfshafts)

Handles, Locks, Latches and Entry Systems (DESCRIPTION AND OPERATION)

Handles, Locks, Latches and Entry Systems (DIAGNOSIS AND TESTING)

Handles, Locks, Latches and Entry Systems (Section Table of Contents)

Handles, Locks, Latches and Entry Systems (SPECIFICATIONS)

Head Restraint Guide Sleeve (REMOVAL AND INSTALLATION, Seating)

Headlamp Adjustment (GENERAL PROCEDURES, Exterior Lighting)

Headlamp Assembly (REMOVAL AND INSTALLATION, Exterior Lighting)

Headlamp Bulb (REMOVAL AND INSTALLATION, Exterior Lighting)

Headlamp Switch (REMOVAL AND INSTALLATION, Exterior Lighting)

Headlamps (DIAGNOSIS AND TESTING, Exterior Lighting)

Headliner (REMOVAL AND INSTALLATION, Interior Trim and Ornamentation)

Heated Oxygen Sensor (HO2S) (REMOVAL AND INSTALLATION, Electronic Engine Controls)

Heated Oxygen Sensor (HO2S) and Catalyst Monitor Sensor - Exploded View, 4.0L SOHC (REMOVAL AND INSTALLATION, Electronic Engine Controls)

Heated Oxygen Sensor (HO2S) and Catalyst Monitor Sensor - Exploded View, 4.6L (3V) (REMOVAL AND INSTALLATION, Electronic Engine Controls)

Heated Seat Switch (REMOVAL AND INSTALLATION, Seating)

Heater Control Valve (REMOVAL AND INSTALLATION, Climate Control)

Heater Core (REMOVAL AND INSTALLATION, Climate Control)

Heater Core And Evaporator Core Housing (REMOVAL AND INSTALLATION, Climate Control)

Heating and Ventilation (DESCRIPTION AND OPERATION, Climate Control)

Heating Ventilation Air Conditioning (HVAC) Module (REMOVAL AND INSTALLATION, Climate Control)

Hood Latch (REMOVAL AND INSTALLATION, Handles, Locks, Latches and Entry Systems)

Hood Latch and Components - Exploded View (REMOVAL AND INSTALLATION, Handles, Locks, Latches and Entry Systems)

Hood Latch Release Handle (REMOVAL AND INSTALLATION, Handles, Locks, Latches and Entry Systems)

Horn (DESCRIPTION AND OPERATION)

Horn (DIAGNOSIS AND TESTING)

Horn (REMOVAL AND INSTALLATION)

Horn (Section Table of Contents)

Horn (SPECIFICATIONS)

Hydraulic Brake Actuation (DESCRIPTION AND OPERATION)

Hydraulic Brake Actuation (Section Table of Contents)

Hydraulic Brake Actuation (SPECIFICATIONS)

Hydraulic Circuits (DESCRIPTION AND OPERATION, Automatic Transaxle/Transmission - 6R80)

Hydraulic Control Unit (HCU) (REMOVAL AND INSTALLATION, Anti-Lock Brake System (ABS) and Stability Control)

Hydraulic Lash Adjuster (IN-VEHICLE REPAIR, Engine - 4.0L SOHC)

Hydraulic Lash Adjuster (IN-VEHICLE REPAIR, Engine - 4.6L (3V))

Hydraulic Lash Adjuster Inspection (GENERAL PROCEDURES, Engine System - General Information)

Hydraulic System (DESCRIPTION AND OPERATION, Automatic Transaxle/Transmission - 5R55S)

Hydraulic System (DESCRIPTION AND OPERATION, Automatic Transaxle/Transmission - 6R80)

Hydraulic Timing Chain Tensioner - LH (IN-VEHICLE REPAIR, Engine - 4.0L SOHC)

Hydraulic Timing Chain Tensioner - RH (IN-VEHICLE REPAIR, Engine - 4.0L SOHC)

I

Identification Codes (DESCRIPTION AND OPERATION)

Identification Codes (Section Table of Contents)

Identification Tags (DESCRIPTION AND OPERATION, Automatic Transaxle/Transmission - 5R55S)

Identification Tags (DESCRIPTION AND OPERATION, Automatic Transaxle/Transmission - 6R80)

Ignition Coil (REMOVAL AND INSTALLATION, Engine Ignition - 4.0L SOHC)

Ignition Coil-On-Plug (REMOVAL AND INSTALLATION, Engine Ignition - 4.6L (3V))

Ignition Lock Cylinder - Functional (REMOVAL AND INSTALLATION, Handles, Locks, Latches and Entry Systems)

Ignition Lock Cylinder - Non Functional (REMOVAL AND INSTALLATION, Handles, Locks, Latches and Entry Systems)

Ignition Switch (REMOVAL AND INSTALLATION, Steering Column Switches)

In-Vehicle Temperature Sensor (REMOVAL AND INSTALLATION, Climate Control)

Inertia Fuel Shutoff (IFS) Switch (REMOVAL AND INSTALLATION, Fuel Tank and Lines)

Information and Entertainment System (DESCRIPTION AND OPERATION, Information and Entertainment Systems)

Information and Entertainment System (DIAGNOSIS AND TESTING, Information and Entertainment Systems)

Information and Entertainment Systems (Section Table of Contents)

Information and Entertainment Systems (SPECIFICATIONS)

Information And Message Center (DESCRIPTION AND OPERATION, Instrumentation, Message Center, and Warning Chimes)

Inner Body Reinforcing Panels (REMOVAL AND INSTALLATION, Body Repairs)

Inner Tie Rod (REMOVAL AND INSTALLATION, Power Steering)

Inspection and Repair After a Supplemental Restraint System (SRS) Deployment (GENERAL PROCEDURES, Supplemental Restraint System)

Inspection And Verification (DIAGNOSIS AND TESTING, Battery, Mounting and Cables)

Inspection And Verification (DIAGNOSIS AND TESTING, Brake System - General Information)

Inspection And Verification (DIAGNOSIS AND TESTING, Charging System)

Inspection And Verification (DIAGNOSIS AND TESTING, Hydraulic Brake Actuation)

Instrument Cluster (IC) (DESCRIPTION AND OPERATION, Instrumentation, Message Center, and Warning Chimes)

Instrument Cluster (IC) (REMOVAL AND INSTALLATION, Instrumentation, Message Center, and Warning Chimes)

Instrument Cluster (IC) Lens (REMOVAL AND INSTALLATION, Instrumentation, Message Center, and Warning Chimes)

Instrument Cluster and Panel Illumination (DESCRIPTION AND OPERATION)

Instrument Cluster and Panel Illumination (DIAGNOSIS AND TESTING)

Instrument Cluster and Panel Illumination (Section Table of Contents)

Instrument Cluster Bulb (REMOVAL AND INSTALLATION, Instrument Cluster and Panel Illumination)

Instrument Cluster Finish Panel (REMOVAL AND INSTALLATION, Instrument Panel and Console)

Instrument Panel (REMOVAL AND INSTALLATION, Instrument Panel and Console)

Instrument Panel and Console (Section Table of Contents)

Instrument Panel and Console (SPECIFICATIONS)

Instrument Panel Dimmer Switch (REMOVAL AND INSTALLATION, Instrument Cluster and Panel Illumination)

Instrument Panel Finish Panel - Center (REMOVAL AND INSTALLATION, Instrument Panel and Console)

Instrument Panel - Exploded View (REMOVAL AND INSTALLATION, Instrument Panel and Console)

Instrumentation, Message Center and Warning Chimes (DIAGNOSIS AND TESTING, Instrumentation, Message Center, and Warning Chimes)

Instrumentation, Message Center, and Warning Chimes (Section Table of Contents)

Insulation (DESCRIPTION AND OPERATION, Body System - General Information)

Intake Air Distribution and Filtering (DESCRIPTION AND OPERATION)

Intake Air Distribution and Filtering (DIAGNOSIS AND TESTING)

Intake Air Distribution and Filtering (Section Table of Contents)

Intake Air Distribution and Filtering (SPECIFICATIONS)

Intake Air System Components - Exploded View (REMOVAL AND INSTALLATION, Intake Air Distribution and Filtering)

Intake Manifold (IN-VEHICLE REPAIR, Engine - 4.0L SOHC)

Intake Manifold (IN-VEHICLE REPAIR, Engine - 4.6L (3V))

Interior Door Handle - Front (REMOVAL AND INSTALLATION, Handles, Locks, Latches and Entry Systems)

Interior Door Handle - Rear (REMOVAL AND INSTALLATION, Handles, Locks, Latches and Entry Systems)

Interior Lamp - Front (REMOVAL AND INSTALLATION, Interior Lighting)

Interior Lamp - Rear (REMOVAL AND INSTALLATION, Interior Lighting)

Interior Lighting (DESCRIPTION AND OPERATION)

Interior Lighting (DIAGNOSIS AND TESTING)

Interior Lighting (Section Table of Contents)

Interior Rear View Mirror (REMOVAL AND INSTALLATION, Rear View Mirrors)

Interior Trim and Ornamentation (Section Table of Contents)

Interior Trim and Ornamentation (SPECIFICATIONS)

Interior Trim - Exploded View (REMOVAL AND INSTALLATION, Interior Trim and Ornamentation)

Intermediate Clutch Assembly (DISASSEMBLY AND ASSEMBLY OF SUBASSEMBLIES, Automatic Transaxle/Transmission - 6R80)

Intermediate Shaft Speed Sensor (IN-VEHICLE REPAIR, Automatic Transaxle/Transmission - 5R55S)

J

Jacking and Lifting (DESCRIPTION AND OPERATION)

Jacking and Lifting (Section Table of Contents)

K

Key Programming Switch State Control (GENERAL PROCEDURES, Anti-Theft - Passive Anti-Theft System (PATS))

Key Programming Using Diagnostic Equipment (GENERAL PROCEDURES, Anti-Theft - Passive Anti-Theft System (PATS))

Key Programming Using Two Programmed Keys (GENERAL PROCEDURES, Anti-Theft - Passive Anti-Theft System (PATS))

Keyless Entry Keypad (REMOVAL AND INSTALLATION, Handles, Locks, Latches and Entry Systems)

Keyless Entry Keypad Code Programming (GENERAL PROCEDURES, Handles, Locks, Latches and Entry Systems)

Knock Sensor (KS) - 4.0L SOHC (REMOVAL AND INSTALLATION, Electronic Engine Controls)

Knock Sensor (KS) - 4.6L (3V) (REMOVAL AND INSTALLATION, Electronic Engine Controls)

L

Latch Lubrication (GENERAL PROCEDURES, Handles, Locks, Latches and Entry Systems)

Lead Terminal Repair (GENERAL PROCEDURES, Glass, Frames and Mechanisms)

Leakage Inspection (DIAGNOSIS AND TESTING, Automatic Transaxle/Transmission - 5R55S)

Leakage Inspection (DIAGNOSIS AND TESTING, Automatic Transaxle/Transmission - 6R80)

Liftgate (REMOVAL AND INSTALLATION, Body Closures)

Liftgate Alignment (GENERAL PROCEDURES, Body Closures)

Liftgate Handle, Lock and Latch - Exploded View (REMOVAL AND INSTALLATION, Handles, Locks, Latches and Entry Systems)

Liftgate Latch (REMOVAL AND INSTALLATION, Handles, Locks, Latches and Entry Systems)

Liftgate Latch Actuator (REMOVAL AND INSTALLATION, Handles, Locks, Latches and Entry Systems)

Liftgate Release Handle (REMOVAL AND INSTALLATION, Handles, Locks, Latches and Entry Systems)

Liftgate Trim Panel (REMOVAL AND INSTALLATION, Interior Trim and Ornamentation)

Liftgate Window Latch (REMOVAL AND INSTALLATION, Handles, Locks, Latches and Entry Systems)

Liftgate Window Latch Actuator (REMOVAL AND INSTALLATION, Handles, Locks, Latches and Entry Systems)

Light Sensor (REMOVAL AND INSTALLATION, Exterior Lighting)

Low/Reverse Clutch Assembly (DISASSEMBLY AND ASSEMBLY OF SUBASSEMBLIES, Automatic Transaxle/Transmission - 6R80)

Lower Arm (REMOVAL AND INSTALLATION, Front Suspension - Four Wheel Drive (4WD))

Lower Arm (REMOVAL AND INSTALLATION, Front Suspension - Rear Wheel Drive (RWD))

Lower Arm (REMOVAL AND INSTALLATION, Rear Suspension)

Lower End Components - Exploded View, Crankshaft Pulley and Crankshaft Front Seal (IN-VEHICLE REPAIR, Engine - 4.6L (3V))

Lumbar Assembly (REMOVAL AND INSTALLATION, Seating)

M

Main Control Valve Body (DISASSEMBLY AND ASSEMBLY OF SUBASSEMBLIES, Automatic Transaxle/Transmission - 5R55S)

Main Control Valve Body (IN-VEHICLE REPAIR, Automatic Transaxle/Transmission - 5R55S)

Maintenance Schedule (Section Table of Contents)

Maintenance Schedules - Gasoline Engines (DESCRIPTION AND OPERATION, Maintenance Schedule)

Major Components (DESCRIPTION AND OPERATION, Automatic Transaxle/Transmission - 6R80)

Manual Control Lever Shaft and Seal (IN-VEHICLE REPAIR, Automatic Transaxle/Transmission - 6R80)

Mass Air Flow (MAF) Sensor - 4.0L SOHC (REMOVAL AND INSTALLATION, Electronic Engine Controls)

Mass Air Flow (MAF) Sensor - 4.6L (3V) (REMOVAL AND INSTALLATION, Electronic Engine Controls)

Mechanical Components and Functions (DESCRIPTION AND OPERATION, Automatic Transaxle/Transmission - 6R80)

Mechatronic Assembly (DISASSEMBLY AND ASSEMBLY OF SUBASSEMBLIES, Automatic Transaxle/Transmission - 6R80)

Mechatronic Assembly (IN-VEHICLE REPAIR, Automatic Transaxle/Transmission - 6R80)

Memory Position Programming (GENERAL PROCEDURES, Seating)

Memory Set Switch (REMOVAL AND INSTALLATION, Seating)

Message Center Configuration (GENERAL PROCEDURES, Instrumentation, Message Center, and Warning Chimes)

Message Center Switch (REMOVAL AND INSTALLATION, Instrumentation, Message Center, and Warning Chimes)

Mode Select Switch (MSS) (REMOVAL AND INSTALLATION, Four Wheel Drive (4WD) Systems)

Module Communications Network (Section Table of Contents)

Module Configuration (DIAGNOSIS AND TESTING)

Module Configuration (Section Table of Contents)

Module Controlled Functions (DESCRIPTION AND OPERATION, Multifunction Electronic Modules)

Muffler (REMOVAL AND INSTALLATION, Exhaust System)

Multifunction Electronic Modules (Section Table of Contents)

Multifunction Electronic Modules (SPECIFICATIONS)

N

Noise, Vibration and Harshness (Section Table of Contents)

Noise, Vibration and Harshness (NVH) (DESCRIPTION AND OPERATION, Noise, Vibration and Harshness)

Noise, Vibration and Harshness (NVH) (DIAGNOSIS AND TESTING, Noise, Vibration and Harshness)

O

Occupant Classification Sensor (REMOVAL AND INSTALLATION, Supplemental Restraint System)

Occupant Classification Sensor (OCS) System Reset (GENERAL PROCEDURES, Supplemental Restraint System)

Occupant Classification Sensor (OCS) System Zero Seat Weight Test (GENERAL PROCEDURES, Supplemental Restraint System)

Occupant Classification System Module (OCSM) (REMOVAL AND INSTALLATION, Supplemental Restraint System)

Oil Cooler (IN-VEHICLE REPAIR, Engine - 4.0L SOHC)

Oil Filter Adapter (IN-VEHICLE REPAIR, Engine - 4.0L SOHC)

Oil Filter Adapter (IN-VEHICLE REPAIR, Engine - 4.6L (3V))

Oil Level Indicator and Tube (IN-VEHICLE REPAIR, Engine - 4.6L (3V))

Oil Pan (IN-VEHICLE REPAIR, Engine - 4.0L SOHC)

Oil Pan (IN-VEHICLE REPAIR, Engine - 4.6L (3V))

Oil Pump (IN-VEHICLE REPAIR, Engine - 4.0L SOHC)

Oil Pump (IN-VEHICLE REPAIR, Engine - 4.6L (3V))

Oil Pump Screen and Pickup Tube (IN-VEHICLE REPAIR, Engine - 4.0L SOHC)

Oil Pump Screen and Pickup Tube (IN-VEHICLE REPAIR, Engine - 4.6L (3V))

Output Shaft Ring Gear and Hub Shaft Assembly (DISASSEMBLY AND ASSEMBLY OF SUBASSEMBLIES, Automatic Transaxle/Transmission - 5R55S)

Output Shaft Seal (IN-VEHICLE REPAIR, Automatic Transaxle/Transmission - 6R80)

Output Shaft Speed (OSS) Sensor (IN-VEHICLE REPAIR, Automatic Transaxle/Transmission - 5R55S)

Output State Control (OSC) Mode (DIAGNOSIS AND TESTING, Automatic Transaxle/Transmission - 6R80)

Overdrive Brake and Coast Clutch Drum Assembly (DISASSEMBLY AND ASSEMBLY OF SUBASSEMBLIES, Automatic Transaxle/Transmission - 5R55S)

Overdrive Clutch Assembly (DISASSEMBLY AND ASSEMBLY OF SUBASSEMBLIES, Automatic Transaxle/Transmission - 6R80)

Overdrive Planetary and One-Way Clutch Assembly (DISASSEMBLY AND ASSEMBLY OF SUBASSEMBLIES, Automatic Transaxle/Transmission - 5R55S)

Overdrive Planetary Gears (DISASSEMBLY AND ASSEMBLY OF SUBASSEMBLIES, Automatic Transaxle/Transmission - 5R55S)

P

Parking Aid (DESCRIPTION AND OPERATION)

Parking Aid (Section Table of Contents)

Parking Aid (SPECIFICATIONS)

Parking Aid Module (PAM) - Explorer (REMOVAL AND INSTALLATION, Parking Aid)

Parking Aid Module (PAM) - Explorer Sport Trac (REMOVAL AND INSTALLATION, Parking Aid)

Parking Aid Module (PAM) - Mountaineer (REMOVAL AND INSTALLATION, Parking Aid)

Parking Aid Sensor - Mountaineer, Explorer Sport Trac (REMOVAL AND INSTALLATION, Parking Aid)

Parking Aid Speaker (REMOVAL AND INSTALLATION, Parking Aid)

Parking Aid - Explorer (DIAGNOSIS AND TESTING, Parking Aid)

Parking Aid - Mountaineer, Explorer Sport Trac (DIAGNOSIS AND TESTING, Parking Aid)

Parking Brake (DESCRIPTION AND OPERATION, Parking Brake and Actuation)

Parking Brake (DIAGNOSIS AND TESTING, Parking Brake and Actuation)

Parking Brake and Actuation (Section Table of Contents)

Parking Brake and Actuation (SPECIFICATIONS)

Parking Brake Cable Tension Release (GENERAL PROCEDURES, Parking Brake and Actuation)

Parking Brake Cable - Front (REMOVAL AND INSTALLATION, Parking Brake and Actuation)

Parking Brake Cable - Intermediate (REMOVAL AND INSTALLATION, Parking Brake and Actuation)

Parking Brake Cable - Rear, LH (REMOVAL AND INSTALLATION, Parking Brake and Actuation)

Parking Brake Cable - Rear, RH (REMOVAL AND INSTALLATION, Parking Brake and Actuation)

Parking Brake Control (REMOVAL AND INSTALLATION, Parking Brake and Actuation)

Parking Brake Shoe Adjustment (GENERAL PROCEDURES, Parking Brake and Actuation)

Parking Brake Shoes (REMOVAL AND INSTALLATION, Parking Brake and Actuation)

Parking Lamp Bulb - Front (REMOVAL AND INSTALLATION, Exterior Lighting)

Parking, Rear and License Plate Lamps (DIAGNOSIS AND TESTING, Exterior Lighting)

Passenger Air Bag Deactivation (PAD) Indicator (REMOVAL AND INSTALLATION, Supplemental Restraint System)

Passenger Air Bag Module (REMOVAL AND INSTALLATION, Supplemental Restraint System)

Passive Anti-Theft System (PATS) Parameter Reset (GENERAL PROCEDURES, Anti-Theft - Passive Anti-Theft System (PATS))

Passive Anti-Theft System (PATS) Transceiver (REMOVAL AND INSTALLATION, Anti-Theft - Passive Anti-Theft System (PATS))

Pickup Bed (DESCRIPTION AND OPERATION, Pickup Bed and Platform Body)

Pickup Bed (REMOVAL AND INSTALLATION, Pickup Bed and Platform Body)

Pickup Bed Alignment (GENERAL PROCEDURES, Pickup Bed and Platform Body)

Pickup Bed and Platform Body (Section Table of Contents)

Pickup Bed and Platform Body (SPECIFICATIONS)

Pickup Bed Body Side (REMOVAL AND INSTALLATION, Pickup Bed and Platform Body)

Pickup Bed Power Point (REMOVAL AND INSTALLATION, Pickup Bed and Platform Body)

Pickup Bed Reinforcement (REMOVAL AND INSTALLATION, Pickup Bed and Platform Body)

Pickup Bed Storage Compartment Hinge - Front Compartment (REMOVAL AND INSTALLATION, Pickup Bed and Platform Body)

Pickup Bed Storage Compartment Hinge - Side Compartment (REMOVAL AND INSTALLATION, Pickup Bed and Platform Body)

Pickup Bed Storage Compartment Latch (REMOVAL AND INSTALLATION, Handles, Locks, Latches and Entry Systems)

Pickup Bed Storage Compartment Lid - Front Compartment (REMOVAL AND INSTALLATION, Pickup Bed and Platform Body)

Pickup Bed Storage Compartment Lid - Side Compartment (REMOVAL AND INSTALLATION, Pickup Bed and Platform Body)

Pickup Bed Storage Compartment Release Handle (REMOVAL AND INSTALLATION, Handles, Locks, Latches and Entry Systems)

Pickup Bed Storage Compartment Seal - Front Compartment (REMOVAL AND INSTALLATION, Pickup Bed and Platform Body)

Pickup Bed Storage Compartment Seal - Side Compartment (REMOVAL AND INSTALLATION, Pickup Bed and Platform Body)

Pickup Bed Storage Compartment - Exploded View (REMOVAL AND INSTALLATION, Handles, Locks, Latches and Entry Systems)

Pickup Bed Storage Compartment - Exploded View (REMOVAL AND INSTALLATION, Pickup Bed and Platform Body)

Pickup Bed Wheel House (REMOVAL AND INSTALLATION, Pickup Bed and Platform Body)

Pinpoint Test (DIAGNOSIS AND TESTING, Battery, Mounting and Cables)

Pinpoint Test (DIAGNOSIS AND TESTING, Charging System)

Pinpoint Tests (DIAGNOSIS AND TESTING, Brake System - General Information)

Pinpoint Tests (DIAGNOSIS AND TESTING, Hydraulic Brake Actuation)

Pinpoint Tests - OSC Equipped Vehicle (DIAGNOSIS AND TESTING, Automatic Transaxle/Transmission - 5R55S)

Piston (DISASSEMBLY AND ASSEMBLY OF SUBASSEMBLIES, Engine - 4.0L SOHC)

Piston (DISASSEMBLY AND ASSEMBLY OF SUBASSEMBLIES, Engine - 4.6L (3V))

Piston Diameter (GENERAL PROCEDURES, Engine System - General Information)

Piston Inspection (GENERAL PROCEDURES, Engine System - General Information)

Piston Pin Bore Diameter (GENERAL PROCEDURES, Engine System - General Information)

Piston Pin Diameter (GENERAL PROCEDURES, Engine System - General Information)

Piston Ring End Gap (GENERAL PROCEDURES, Engine System - General Information)

Piston Ring-to-Groove Clearance (GENERAL PROCEDURES, Engine System - General Information)

Piston Selection (GENERAL PROCEDURES, Engine System - General Information)

Piston To Cylinder Bore Clearance (GENERAL PROCEDURES, Engine System - General Information)

Plastic Components (DESCRIPTION AND OPERATION, Body Repairs)

Plastics Identification (GENERAL PROCEDURES, Body Repairs)

Plastics Refinishing (GENERAL PROCEDURES, Body Repairs)

Plastics Repair (GENERAL PROCEDURES, Body Repairs)

Plenum Chamber (REMOVAL AND INSTALLATION, Climate Control)

Positive Crankcase Ventilation (PCV) Valve - 4.0L SOHC (REMOVAL AND INSTALLATION, Engine Emission Control)

Power Brake Actuation (Section Table of Contents)

Power Brake Actuation (SPECIFICATIONS)

Power Brake System (DIAGNOSIS AND TESTING, Power Brake Actuation)

Power Point (REMOVAL AND INSTALLATION, Instrument Panel and Console)

Power Running Board (PRB) (DIAGNOSIS AND TESTING, Exterior Trim and Ornamentation)

Power Running Board (PRB) (REMOVAL AND INSTALLATION, Exterior Trim and Ornamentation)

Power Running Board (PRB) Bracket (REMOVAL AND INSTALLATION, Exterior Trim and Ornamentation)

Power Running Board (PRB) Gap Hider (REMOVAL AND INSTALLATION, Exterior Trim and Ornamentation)

Power Running Board (PRB) Module (REMOVAL AND INSTALLATION, Exterior Trim and Ornamentation)

Power Running Board (PRB) Step (REMOVAL AND INSTALLATION, Exterior Trim and Ornamentation)

Power Steering (DESCRIPTION AND OPERATION)

Power Steering (DIAGNOSIS AND TESTING)

Power Steering (Section Table of Contents)

Power Steering (SPECIFICATIONS)

Power Steering Fluid Cooler (REMOVAL AND INSTALLATION, Power Steering)

Power Steering Fluid Reservoir (REMOVAL AND INSTALLATION, Power Steering)

Power Steering Pump Pulley - 4.0L (REMOVAL AND INSTALLATION, Power Steering)

Power Steering Pump Pulley - 4.6L (REMOVAL AND INSTALLATION, Power Steering)

Power Steering Pump to Steering Gear Pressure Line (REMOVAL AND INSTALLATION, Power Steering)

Power Steering Pump - 4.0L (REMOVAL AND INSTALLATION, Power Steering)

Power Steering Pump - 4.6L (REMOVAL AND INSTALLATION, Power Steering)

Power Steering System Filling (GENERAL PROCEDURES, Steering System)

Power Steering System Flushing (GENERAL PROCEDURES, Steering System)

Power Steering System Purging (GENERAL PROCEDURES, Steering System)

Power-Fold Seat Motor - Third Row (REMOVAL AND INSTALLATION, Seating)

Powertrain Control Module (PCM) (REMOVAL AND INSTALLATION, Electronic Engine Controls)

Powertrain/Drivetrain Mount Neutralizing (GENERAL PROCEDURES, Engine System - General Information)

Preliminary Inspection (DIAGNOSIS AND TESTING, Automatic Transaxle/Transmission - 5R55S)

Preliminary Inspection (DIAGNOSIS AND TESTING, Automatic Transaxle/Transmission - 6R80)

Principles of Operation (DIAGNOSIS AND TESTING, Battery, Mounting and Cables)

Principles of Operation (DIAGNOSIS AND TESTING, Brake System - General Information)

Principles of Operation (DIAGNOSIS AND TESTING, Charging System)

Principles of Operation (DIAGNOSIS AND TESTING, Hydraulic Brake Actuation)

Programmable Module Installation (PMI) (GENERAL PROCEDURES, Module Configuration)

Puddle Lamp (REMOVAL AND INSTALLATION, Exterior Lighting)

Pump Assembly (DISASSEMBLY AND ASSEMBLY OF SUBASSEMBLIES, Automatic Transaxle/Transmission - 6R80)

Pyrotechnic Device Disposal (GENERAL PROCEDURES, Supplemental Restraint System)

Q

Quarter Panel Moulding (REMOVAL AND INSTALLATION, Exterior Trim and Ornamentation)

Quarter Trim Panel (REMOVAL AND INSTALLATION, Interior Trim and Ornamentation)

Quick Connect Coupling (GENERAL PROCEDURES, Fuel System - General Information)

R

Radiator (REMOVAL AND INSTALLATION, Engine Cooling)

Radiator and Cooling Fan - Exploded View (REMOVAL AND INSTALLATION, Engine Cooling)

Radiator Grille Opening Panel (REMOVAL AND INSTALLATION, Front End Body Panels)

Radiator Grille - Explorer, Explorer Sport Trac (REMOVAL AND INSTALLATION, Exterior Trim and Ornamentation)

Radiator Grille - Mountaineer (REMOVAL AND INSTALLATION, Exterior Trim and Ornamentation)

Range Selection (DESCRIPTION AND OPERATION, Automatic Transaxle/Transmission - 5R55S)

Range Selection (DESCRIPTION AND OPERATION, Automatic Transaxle/Transmission - 6R80)

Rear Axle Housing Support Insulator (REMOVAL AND INSTALLATION, Rear Drive Axle/Differential - Ford 8.8-Inch Ring Gear)

Rear Disc Brake (DESCRIPTION AND OPERATION)

Rear Disc Brake (DIAGNOSIS AND TESTING)

Rear Disc Brake (Section Table of Contents)

Rear Disc Brake (SPECIFICATIONS)

Rear Door Handles, Locks and Latches - Exploded View (REMOVAL AND INSTALLATION, Handles, Locks, Latches and Entry Systems)

Rear Door Latch (REMOVAL AND INSTALLATION, Handles, Locks, Latches and Entry Systems)

Rear Door Lock Actuator (REMOVAL AND INSTALLATION, Handles, Locks, Latches and Entry Systems)

Rear Drive Axle and Differential (DESCRIPTION AND OPERATION, Rear Drive Axle/Differential - Ford 8.8-Inch Ring Gear)

Rear Drive Axle and Differential (DIAGNOSIS AND TESTING, Rear Drive Axle/Differential - Ford 8.8-Inch Ring Gear)

Rear Drive Axle/Differential - Ford 8.8-Inch Ring Gear (Section Table of Contents)

Rear Drive Axle/Differential - Ford 8.8-Inch Ring Gear (SPECIFICATIONS)

Rear Drive Halfshafts (DESCRIPTION AND OPERATION)

Rear Drive Halfshafts (DIAGNOSIS AND TESTING)

Rear Drive Halfshafts (Section Table of Contents)

Rear Drive Halfshafts (SPECIFICATIONS)

Rear Entertainment Module (RETM) (REMOVAL AND INSTALLATION, Information and Entertainment Systems)

Rear Suspension (DESCRIPTION AND OPERATION)

Rear Suspension (DIAGNOSIS AND TESTING)

Rear Suspension (Section Table of Contents)

Rear Suspension (SPECIFICATIONS)

Rear View Mirrors (DESCRIPTION AND OPERATION)

Rear View Mirrors (Section Table of Contents)

Rear View Mirrors (SPECIFICATIONS)

Rear View Mirrors - Exterior (DIAGNOSIS AND TESTING, Rear View Mirrors)

Rear View Mirrors - Interior (DIAGNOSIS AND TESTING, Rear View Mirrors)

Refinishing - Environmental Damage (GENERAL PROCEDURES, Body Repairs)

Refinishing - Manufacturing Damage (GENERAL PROCEDURES, Body Repairs)

Refrigerant Identification Testing (GENERAL PROCEDURES, Climate Control System - General Information and Diagnostics)

Refrigerant Oil Adding (GENERAL PROCEDURES, Climate Control System - General Information and Diagnostics)

Refrigerant System Filtering Following Air Conditioning (A/C) Compressor Installation (GENERAL PROCEDURES, Climate Control System - General Information and Diagnostics)

Refrigerant System Tests (GENERAL PROCEDURES, Climate Control System - General Information and Diagnostics)

Remote Convenience (Section Table of Contents)

Remote Keyless Entry (RKE) Transmitter Programming (GENERAL PROCEDURES, Handles, Locks, Latches and Entry Systems)

Remote Memory Activation (GENERAL PROCEDURES, Handles, Locks, Latches and Entry Systems)

Remote Memory Deactivation (GENERAL PROCEDURES, Handles, Locks, Latches and Entry Systems)

Restoring Corrosion Protection Following Repair (GENERAL PROCEDURES, Body Repairs)

Restraints Control Module (RCM) (REMOVAL AND INSTALLATION, Supplemental Restraint System)

Reverse Servo Assembly (DISASSEMBLY AND ASSEMBLY OF SUBASSEMBLIES, Automatic Transaxle/Transmission - 5R55S)

Reversing Lamps (DIAGNOSIS AND TESTING, Exterior Lighting)

Ride Height Measurement (GENERAL PROCEDURES, Suspension System - General Information)

Rivet Nut Replacement (GENERAL PROCEDURES, Supplemental Restraint System)

Road Testing Vehicle (DIAGNOSIS AND TESTING, Automatic Transaxle/Transmission - 5R55S)

Roller Follower Inspection (GENERAL PROCEDURES, Engine System - General Information)

Roof Opening Panel (DESCRIPTION AND OPERATION)

Roof Opening Panel (DIAGNOSIS AND TESTING)

Roof Opening Panel (Section Table of Contents)

Roof Opening Panel (SPECIFICATIONS)

Roof Opening Panel Alignment (GENERAL PROCEDURES, Roof Opening Panel)

Roof Opening Panel Frame (REMOVAL AND INSTALLATION, Roof Opening Panel)

Roof Opening Panel Glass (REMOVAL AND INSTALLATION, Roof Opening Panel)

Roof Opening Panel Manual Operation (GENERAL PROCEDURES, Roof Opening Panel)

Roof Opening Panel Motor (REMOVAL AND INSTALLATION, Roof Opening Panel)

Roof Opening Panel Motor Initialization (GENERAL PROCEDURES, Roof Opening Panel)

Roof Opening Panel Shield (REMOVAL AND INSTALLATION, Roof Opening Panel)

Roof Opening Panel - Exploded View (REMOVAL AND INSTALLATION, Roof Opening Panel)

Running Board (REMOVAL AND INSTALLATION, Exterior Trim and Ornamentation)

S

Safety Belt Buckle and Pretensioner (REMOVAL AND INSTALLATION, Safety Belt System)

Safety Belt Buckle - Second Row, Bucket (REMOVAL AND INSTALLATION, Safety Belt System)

Safety Belt Buckle - Second Row, Center and RH, 60/40, Bench (REMOVAL AND INSTALLATION, Safety Belt System)

Safety Belt Buckle - Second Row, Center and RH, 60/40, E-Z Entry (REMOVAL AND INSTALLATION, Safety Belt System)

Safety Belt Buckle - Second Row, LH, 60/40, Bench (REMOVAL AND INSTALLATION, Safety Belt System)

Safety Belt Buckle - Second Row, LH, 60/40, E-Z Entry (REMOVAL AND INSTALLATION, Safety Belt System)

Safety Belt Buckle - Third Row (REMOVAL AND INSTALLATION, Safety Belt System)

Safety Belt Cleaning (GENERAL PROCEDURES, Safety Belt System)

Safety Belt Maintenance (GENERAL PROCEDURES, Safety Belt System)

Safety Belt Procedure After a Collision (GENERAL PROCEDURES, Safety Belt System)

Safety Belt Retractor - Front (REMOVAL AND INSTALLATION, Safety Belt System)

Safety Belt Retractor - Second Row, Center, 60/40, Bench (REMOVAL AND INSTALLATION, Safety Belt System)

Safety Belt Retractor - Second Row, Center, 60/40, E-Z Entry (REMOVAL AND INSTALLATION, Safety Belt System)

Safety Belt Retractor - Second Row, Outboard (REMOVAL AND INSTALLATION, Safety Belt System)

Safety Belt Retractor - Third Row (REMOVAL AND INSTALLATION, Safety Belt System)

Safety Belt Shoulder Height Adjuster (REMOVAL AND INSTALLATION, Safety Belt System)

Safety Belt System (DESCRIPTION AND OPERATION)

Safety Belt System (DIAGNOSIS AND TESTING)

Safety Belt System (Section Table of Contents)

Safety Belt System (SPECIFICATIONS)

Safety Belt Tongue Rotated on Belt (GENERAL PROCEDURES, Safety Belt System)

Safety Belt Twisted at the Safety Belt Guide (GENERAL PROCEDURES, Safety Belt System)

Safety Canopy Module - Explorer Sport Trac (REMOVAL AND INSTALLATION, Supplemental Restraint System)

Safety Canopy Module - Explorer, Mountaineer (REMOVAL AND INSTALLATION, Supplemental Restraint System)

Safety Warnings (DESCRIPTION AND OPERATION, Service Information)

Satellite Digital Audio Receiver System (SDARS) Module (REMOVAL AND INSTALLATION, Information and Entertainment Systems)

Sealers (DESCRIPTION AND OPERATION, Body Repairs)

Seat Backrest Cover - Front (REMOVAL AND INSTALLATION, Seating)

Seat Backrest Cover - Second Row, 40 Percent E-Z Entry (REMOVAL AND INSTALLATION, Seating)

Seat Backrest Cover - Second Row, 40 Percent, Bench (REMOVAL AND INSTALLATION, Seating)

Seat Backrest Cover - Second Row, 60 Percent, Bench (REMOVAL AND INSTALLATION, Seating)

Seat Backrest Cover - Second Row, 60 Percent, E-Z Entry (REMOVAL AND INSTALLATION, Seating)

Seat Backrest Cover - Second Row, Bucket (REMOVAL AND INSTALLATION, Seating)

Seat Backrest Cover - Third Row (REMOVAL AND INSTALLATION, Seating)

Wipers and Washers (SPECIFICATIONS)

Material

Item	Specification	Fill Capacity
Dye-Lite® ATF/Power Steering Fluid Leak Detection Dye 164-R3701 (Rotunda)	-	-
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V	1.2L (1.3 qt)

General Specifications

Item	Specification
Power Steering Gear	
Tie-rod articulation torque	1-3 Nm
Turning effort	4.5 kg (10 lb)
Turns lock-to-lock	3.70
Power Steering Pump	
Flow rate @ 74°-80°C (165°-175°F), engine speed set at 1,500 rpm and power steering analyzer set at 345 kPa (50 psi)	11.4-13.2L/min (2.5-2.9 gpm)
Flow rate-minimum @ 74°-80°C (165°-175°F), power steering analyzer set at 5,102 kPa (750 psi) and engine speed set at idle	4.35L/min (1.15 gpm)
Maximum pressure @ 74°-80°C (165°-175°F) and engine speed set at 2,100 rpm	1,172 kPa (170 psi)
Relief pressure	1,400-1,530 @ 500 rpm
Power Steering Purge Vacuum	
Air purge vacuum	68-85 kPa (20-25 in-Hg)

Steering System

The power steering system consists of the following components:

- Power steering pump
- Power steering fluid reservoir
- Steering gear
- Power steering lines
- Steering column
- Steering column shaft
- Power steering cooler (if equipped)

The power steering system transfers driver inputs at the steering wheel to the front wheels of the vehicle. The steering column, hydraulic system and linkages that transfer these driver inputs make up the steering system. Gearing and hydraulic assist are used to significantly reduce steering efforts.

For information on the power steering fluid reservoir, power steering pump, power steering lines and steering gear, refer to Section 211-02 .

For information on the steering wheel, steering column and steering column shaft, refer to Section 211-04 .

Steering System

Material

Item	Specification
Dye-Lite® ATF/Power Steering Fluid Leak Detection Dye 164-R3701 (Rotunda)	-
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V

Principles of Operation

Power Steering

The power steering system uses a vane-type pump to move the fluid from the reservoir to the steering gear and through the rest of the steering hydraulic system. The power steering pump is mounted to the engine and driven by the engine accessory drive belt. Power steering fluid flows into the pump from the reservoir. The power steering fluid is trapped between the pump vanes and moved to the high-pressure side of the pump, creating a flow of fluid. The restriction of this flow by the steering gear creates the pressure that provides the steering assist. A combined pressure relief/flow valve is built into the pump to control the maximum pressure and flow provided to the steering system. This action prevents damage to the system and provides the correct level of assist during all engine speeds. While under pressure, the power steering fluid flows through the high-pressure power steering line to the steering gear. The fluid exits the gear and flows through the return line, cooler and finally to the reservoir. The reservoir slows the fluid, allows air to escape and filters the fluid

before returning it to the pump.

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical damage.

Visual Inspection Chart

Mechanical
• Fluid level • Tire pressure • Tires • Drive belt • Drive belt tensioner (if equipped) • Steering column alignment • Tie-rod ends • Suspension components • Steering column shaft U-joints • Steering column shaft bolts • Power steering reservoir screen or filter • Pressure lines, fittings or O-rings • Power steering return hoses and clamps • Steering gear • Power steering pump • Power steering fluid cooler (if equipped) • Power Steering Pressure (PSP) switch

3. Inspect the power steering fluid for the following conditions:
    - Aeration or foam: Purge the power steering system. Refer to Power Steering System Purging in this section.
    - Overheating or contamination: Flush the power steering system. Refer to Power Steering System Flushing in this section.

4. **NOTE:** It may be necessary to add power steering fluid to achieve the correct level.

   Check the fluid level and clean the power steering components.
   With the ignition OFF:

    - check the power steering fluid level and add fluid as necessary.
    - wipe off any visible signs of fluid or residue build up.
    - ***NOTICE:*** **Do not hold the steering wheel at the stops for an extended amount of time. Damage to the power steering pump may occur.**

Start the engine and turn the steering wheel from stop-to-stop several times.

5. Visually inspect the power steering hydraulic line/hose connections for damage or leaks.

- If a leak is detected at a threaded fitting or clamp plate joint, tighten to specification. If the leak is still evident, visually inspect the O-rings or Teflon® seals. Install new O-rings or Teflon® seals as necessary. Refer to Section 211-02 .
- If a leak is detected at a constant tension spring clamp, verify that the hose is not damaged and fully installed on the hose fitting. Make sure that the constant tension spring clamp is positioned 2 mm (0.078 in) from the end of the hose. If the leak remains, install a new constant tension spring clamp.
- If a leak is detected at a screw clamp joint, verify that the hose is not damaged and fully installed on the hose fitting and the clamp is positioned 2 mm (0.078 in) from the end of the hose before tightening the screw clamp. If the leak remains, install a new screw clamp. Refer to Section 211-02 .
- If a leak is detected at the Power Steering Pressure (PSP) switch, install a new switch as necessary.

6. Visually inspect the power steering components for leaks.

- If a leak is detected in the pressure or return line, install a new line. Refer to Section 211-02 .
- If a leak is detected in the power steering pump, install a new power steering pump. Refer to Section 211-02 .
- **NOTE:** On vehicles with rack-and-pinion steering gear, it may be necessary to remove the bellows boot clamp from the steering gear bellows boot to inspect for internal steering gear leaks.

  If a leak is detected in the steering gear, repair or install a new steering gear. Refer to Section 211-02 .
- If a leak is detected in the power steering reservoir, install a new reservoir. Refer to Section 211-02 .

7. For information on power steering leak detection, refer to Component Tests in this section.

8. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding.

9. If the cause is not visually evident, verify the symptom and GO to Symptom Chart - Steering System or GO to Symptom Chart - NVH .

Steering System Symptom Definitions

Drift/Pull

Pull is described as a tugging sensation felt by the hands on the steering wheel that must be overcome to keep the vehicle going straight.

Drift describes what a vehicle with this condition does with the hands off the steering wheel.

- A vehicle-related drift/pull on a flat road can cause a consistent deviation from the straight-ahead path and require constant steering input in the opposite direction to counteract the effect.
- Drift/pull can be induced by conditions external to the vehicle, such as wind or road camber.

Excessive Steering Wheel Play

Excessive steering wheel play is a condition in which there is too much steering wheel movement before the wheels move. A small amount of steering wheel free play is considered normal.

Lack of Assist or Inconsistent Assist

Lack of assist or inconsistent assist is experienced when the steering wheel effort is higher than normal. Hard steering can remain constant through the full turn or occur near the end of a turn. It is important to know the difference between hard steering/lack of assist and poor returnability/sticky steering.

Hard steering or lack of assist can result from either hydraulic or mechanical conditions. It is extremely important to know if this concern occurs during driving or during high-effort parking maneuvers.

Poor Returnability/Sticky Steering

Poor returnability and sticky steering is used to describe the poor return of the steering wheel to center after a turn or steering correction is completed.

Wander

Wander is the tendency of the vehicle to require frequent, random left and right steering wheel corrections to maintain a straight path down a level road.

Symptom Chart - Steering System

Symptom Chart - Steering System

Symptom Chart - NVH

Symptom Chart - NVH
NOTE: NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to Section 100-04 . Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to Section 100-04 for the next likely system and continue diagnosis.

ConditionPossible SourcesAction

- Steering system cold start noise
- Blockage in the power steering fluid reservoir caused by power steering fluid contamination
- **NOTE:** Some noise during an extremely cold start (-12.2°C [-10°F]) is normal and should improve as the steering system warms up (usually within 60 seconds).
- **NOTE:** It may be necessary to remove the power steering fluid reservoir to flush contamination trapped in the reservoir screen.

  CHECK the power steering fluid reservoir for contamination. FLUSH the power steering system as necessary. REFER to Power Steering System Flushing in this section.
- Air in the steering hydraulic system (aerated fluid)
- CHECK for leaks in the system. REFER to Power Steering Leak Test Component Test in this section. PURGE the air from the system. REFER to Power Steering System Purging in this section.

- Steering grunt or shudder - occurs when turning into or out of a turn at low speeds (temperature sensitive)

- Air in the steering hydraulic system (aerated fluid)

- CHECK for leaks in the system. REFER to Power Steering Leak Test Component Test. PURGE the air from the system. REFER to Power Steering System Purging in this section.

- Steering gear or power steering hoses

- GO to Steering Gear Grunt/Shudder Component Test in this section.

- Steering system clonk - hydraulic knocking sound

- Air in the steering hydraulic system (aerated fluid)

- **NOTE:** Some amount of clonk noise is considered acceptable. If in doubt of the acceptability, compare to another vehicle.

  CHECK for leaks in the system. REFER to Power Steering Leak Test Component Test in this section. PURGE the air from the system. REFER to Power Steering System Purging in this section.

- Power steering pump moan - loud humming noise occurs when the steering wheel is rotated to the stop position. Produces a 120-600 Hz frequency that changes with rpm

- Low fluid and/or air in the steering hydraulic system (aerated fluid)

- CHECK for leaks in the system. REFER to Power Steering Fluid Leak Test Component Test. PURGE the air from the system. REFER to Power Steering System Purging in this section. If a pump moan still exists, INSTALL a new power steering pump. REFER to Section 211-02 .

- Power steering fluid reservoir or screen is blocked or damaged

- **NOTE:** It may be necessary to remove the power steering fluid reservoir to flush contamination trapped in the reservoir screen.

  CHECK the power steering fluid reservoir for contamination. FLUSH the power steering system as necessary. REFER to Power Steering System Flushing in this section.

- Power steering line/hose grounded to chassis

- INSPECT the power steering lines/hoses. REPAIR as necessary.

- Power steering pump bolts loose

- TIGHTEN bolts to specification. REPAIR or INSTALL new brackets as necessary. REFER to Section 211-02 .

- Steering gear isolators

- INSPECT the isolators for wear or damage. REPAIR as necessary.

- Steering gear clunk - occurs only while cornering over a bump (can be temperature sensitive)

- Steering gear
- INSPECT the steering gear for loose mounting bolts. TIGHTEN to specification as necessary. REFER to Section 211-02 .
- Feedback (rattle, chuckle or knocking noise in the steering gear) - roughness is felt in the steering wheel when the vehicle is driven over rough surfaces
- Steering column shaft/U-joints damaged or worn
- INSTALL a new steering column shaft. REFER to Section 211-04 .
- Loose, damaged or worn tie-rod ends
- INSPECT and INSTALL new tie-rod ends as necessary. GO to Steering Linkage Component Test in this section.
- Steering gear insulators or mounting bolts loose or damaged
- TIGHTEN the bolts to specification or INSTALL new bolts as necessary. REFER to Section 211-02 .
- Steering column shaft bolts are loose
- TIGHTEN the bolts to specification. REFER to Section 211-04 .
- Steering column damaged or worn
- REPAIR or INSTALL a new steering column as necessary. REFER to Section 211-04 .
- Power steering hiss or whistle
- Steering column shaft-to-steering gear is binding or misaligned
- REPAIR or INSTALL a new steering column shaft as necessary. REFER to Section 211-04 .
- Grounded or loose steering column boot at the dash panel
- REPAIR as necessary.
- Damaged or worn steering gear input shaft and valve
- REPAIR or INSTALL a new steering gear as necessary. REFER to Section 211-02 .
- Restricted power steering lines/hoses
- INSTALL new power steering lines/hoses as necessary. REFER to Section 211-02 .
- Steering column rattle
- Loose bolts or attaching brackets
- TIGHTEN the bolts to specification.
- Loose, worn or insufficiently lubricated column bearings

- LUBRICATE bearings or INSTALL new steering column bearings or steering column as necessary. REFER to Section 211-04 .

- Steering shaft insulators damaged or worn

- INSTALL new insulators. REFER to Section 211-04 .

- Steering column shaft compressed or extended

- INSPECT the rubber spider coupling for damage. INSTALL a new steering column shaft. REFER to Section 211-04 .

- Steering gear squeak

- Incorrect power steering fluid in system

- If incorrect power steering fluid is suspected, FLUSH the power steering system. REFER to Power Steering System Flushing in this section. If noise persists after system flush, INSTALL a new steering gear. REFER to Section 211-02 .

- Steering gear rotary seal

- **NOTE:** VERIFY that the steering gear is the source of the noise. It may be necessary to replicate the customer operating conditions (fluid temperature, turning rate of steering wheel) to get the squeak to reoccur.

  INSTALL a new steering gear as necessary. REFER to Section 211-02 .

- Stone shield (if equipped)

- MAKE SURE that the stone shield is correctly installed and that it is not making contact with the steering shaft. REPOSITION stone shield or INSTALL a new stone shield as necessary.

- Steering column squeak, clicks or grinds

- Loose or misaligned steering column shrouds

- TIGHTEN or ALIGN the steering column shrouds.

- Steering wheel rubbing against steering column shrouds

- REPOSITION the steering column shrouds.

- Upper or lower steering column bearing

- INSTALL a new steering column or steering column bearings as necessary.

- Power steering pump noisy

- Power steering pump

- INSTALL a new power steering pump as necessary. REFER to Section 211-02 .

- Power steering pump noise (steering wheel turned fully to stop/lock)

- Power steering fluid flow into the bypass valve of the pump valve housing, with fluid temperature below 54°C (130°F)
- Acceptable condition.
- Power steering pump whine noise
- Aerated fluid
- CHECK for a leak in the system. REFER to Power Steering Fluid Leak Test Component Test in this section. PURGE the air from the system. REFER to Power Steering System Purging in this section.
- Damaged power steering pump
- INSTALL a new power steering pump as necessary. REFER to Section 211-02 .
- High speed shake or shimmy - occurs at high speeds
- Worn or damaged steering linkage components
- GO to Steering Linkage Component Test in this section.

Pinpoint Tests

Pinpoint Test A: Steering Has Lack of Assist or Inconsistent Assist

NOTE: Hard steering or lack of assist is experienced when the steering wheel effort is higher than normal. Hard steering can remain constant through the full turn, occur near the end of a turn or differ right to left.

This pinpoint test is intended to diagnose the following:
- Power steering fluid contamination
- Steering gear
- Power steering pump
- Power steering hoses

PINPOINT TEST A: STEERING HAS LACK OF ASSIST OR INCONSISTENT ASSIST

Test Step	Result / Action to Take
A1 CHECK FOR POWER STEERING FLUID CONTAMINATION	
• Check the power steering fluid for contamination. • **Is the power steering fluid contaminated?**	**Yes** FLUSH the power steering system. REFER to Power Steering System Flushing in this section. CHECK the system for normal operation. If assist concern still exists, GO to A2 . **No** GO to A2 .

A2 CHECK THE STEERING ASSIST WITH THE ENGINE RPM RAISED	
• *NOTICE:* **Do not hold the steering wheel at the stops for an extended amount of time. Damage to the power steering pump may occur.** • Set the engine at 2,100 rpm and turn the steering wheel fully to the left and right. • **Is steering assist fully restored to normal with the engine rpm raised?**	**Yes** INSTALL a new power steering pump. REFER to Section 211-02 . **No** GO to A3 .
A3 CHECK FOR A CHANGE OF ASSIST ON LEFT AND RIGHT TURNS	
• With the engine at idle, turn the steering wheel fully to the left and to the right. • **Does the steering assist change when turning from right to left?**	**Yes** INSTALL a new steering gear. REFER to Section 211-02 . **No** GO to A4 .
A4 CHECK THE STEERING LINES AND HOSES FOR RESTRICTIONS	
• Inspect the steering lines and hoses for damage, kinks or restrictions. • **Are the steering lines or hoses damaged, kinked or restricted?**	**Yes** INSTALL new lines or hoses as necessary. **No** GO to A5 .
A5 MONITOR THE ENGINE RPM CHANGES	
NOTICE: **Do not hold the steering wheel at the stops for an extended amount of time. Damage to the power steering pump may occur.** **NOTE:** Make sure that the vehicle is on a flat dry surface, all accessories are in the OFF position and that the steering system is at normal operating temperature. • Connect the scan tool. • Start the engine. • With the engine at idle, raise the power steering fluid temperature to 74-80°C (165-176°F) by rotating the steering wheel fully to the left and right several times. • Enter the following diagnostic mode on the scan tool: DataLogger - PCM. • Monitor the Engine Revolutions Per Minute (RPM) PID while turning the steering wheel quickly to the left stop position and then to the right stop position. • Note the engine rpm during the turns. • **Does the engine rpm change (even temporarily) more than 30 rpm when turning the steering wheel?**	**Yes** INSTALL a new steering gear. REFER to Section 211-02 . **No** INSTALL a new power steering pump. REFER to Section 211-02 .

Pinpoint Test B: Excessive Steering Wheel Play

This pinpoint test is intended to diagnose the following:

- Steering linkage
- Steering column shaft U-joints
- Steering gear

PINPOINT TEST B: EXCESSIVE STEERING WHEEL PLAY

Test Step	Result / Action to Take
B1 CHECK THE STEERING LINKAGE	
• Carry out the Steering Linkage Component Test in this section. • **Is the steering linkage OK?**	**Yes** GO to B2 . **No** INSTALL new steering linkage components as necessary. Refer to the appropriate section in Group 211 for the procedure.
B2 CHECK THE STEERING COLUMN SHAFT	
• Inspect the steering column shaft U-joints and fasteners for looseness. • **Are the U-joints and fasteners OK?**	**Yes** INSTALL a new steering gear as necessary. REFER to Section 211-02 . **No** TIGHTEN the steering column shaft fasteners or INSTALL a new steering column shaft. REFER to Section 211-04 .

Pinpoint Test C: Steering System Drift/Pull/Wander

This pinpoint test is intended to diagnose the following:

- Steering gear
- Steering column shaft
- Steering column shaft U-joints
- Steering gear mounts

PINPOINT TEST C: STEERING SYSTEM DRIFT/PULL/WANDER

Test Step	Result / Action to Take
C1 CHECK THE STEERING COLUMN SHAFT	
NOTE: Be sure to keep the clockspring centered when disconnecting the intermediate shaft. Refer to the appropriate section in Group 501 for the procedure. • Check the steering column and shaft for grounding. • Disconnect the steering column shaft at the steering column.	**Yes** GO to C2 . **No** INSTALL a new steering column shaft as necessary. REFER to Section 211-04 .

• Inspect the steering column shaft U-joints for looseness or wear. • **Are the steering column shaft U-joints OK?**	
C2 CHECK THE STEERING GEAR MOUNTING	
• Check the steering gear mounts for looseness or wear. • **Are the steering gear mounts OK?**	**Yes** GO to C3 . **No** INSTALL a new steering gear as necessary. REFER to Section 211-02 .
C3 CHECK THE STEERING GEAR	
• Carry out the Steering Gear Valve Component Test in this section. • **Is the steering gear valve OK?**	**Yes** REFER to Section 204-00 to diagnose suspension system drift/pull/wander. **No** REPAIR or INSTALL a new steering gear as necessary. REFER to Section 211-02 .

Component Tests

Power Steering Fluid Leak Test

NOTE: This test should only be carried out if a leak in the system has not been detected during a thorough visual inspection. Refer to Inspection and Verification in this section.

1. Remove the power steering pump reservoir cap and check the power steering fluid level. If necessary, add the specified power steering fluid.

2. Tightly install the Power Steering Evacuation Cap onto the reservoir and connect the Vacuum Pump Kit to the Evacuation Cap.

3. Using the Vacuum Pump Kit, apply 68-85 kPa (20-25 in-Hg) of vacuum to the power steering system.

4. Observe the vacuum gauge for 30 seconds. If the vacuum gauge reading drops more than 3 kPa (0.88 in-Hg), a leak is present.

5. Remove the Vacuum Pump Kit.

6. Start the engine and insert the Dial Thermometer into the Evacuation Cap.

7. ***NOTICE:*** **Do not hold the steering wheel at the stops for an extended amount of time. Damage to the power steering pump may occur.**

   With the engine at idle, raise the power steering fluid temperature to 74-80°C (165-176°F) by rotating the steering wheel fully to the left and right several times.

8. Stop the engine and visually inspect the system for leaks.
   - If a leak is evident, repair as necessary.
   - If a leak is not evident, add the specified UV fluorescent tracer dye to the power steering fluid. Use 14.78 ml (1/2 oz) of dye solution for every 1.89L (2 qt) of power steering fluid.

9. Start the engine.

10. ***NOTICE:*** **Do not hold the steering wheel at the stops for an extended amount of time. Damage to the power steering pump may occur.**

    With the engine at idle, raise the power steering fluid temperature to 74-80°C (165-176°F) by rotating the steering wheel fully to the left and right several times.

11. Stop the engine and inspect the system for traces of UV dye using the 100W/12 Volt DC UV Lamp. Repair as necessary.

Steering Gear Valve Test

1. With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 .
   - Raise the vehicle until the front wheels are off the ground.

2. **NOTE:** Do not hold the steering wheel while carrying out this step.

   Start the engine.

   - If the steering wheel rotates in either direction (with no hand input), install a new steering gear. Refer to Section 211-02 .

Steering Gear Grunt/Shudder Test

1. Place a Dial Thermometer in the power steering fluid reservoir.

2. With the engine cold, start the engine and set engine idle speed to 1,200 rpm.

3. ***NOTICE:*** **Do not hold the steering wheel against the stops for an extended amount of time. Damage to the power steering pump may occur.**

   Rotate the steering wheel to the RH stop, then turn the steering wheel 90 degrees back from that position. Slowly turn the steering wheel back and forth approximately one-twelfth of a full turn.

4. Turn the steering wheel another 90 degrees. Slowly turn the steering wheel back and forth approximately one-twelfth of a full turn.

5. Repeat the test with the power steering fluid at different temperatures until the temperature reaches 74-80°C (165-176°F).

6. If a light grunt is heard or a low (50-200 Hz) shudder is present, this is a normal steering system condition.

7. If a loud grunt is heard or a strong shudder is felt, purge the power steering system. Refer to Power Steering System Purging in this section. If a loud grunt or strong shudder still exists, check the power steering lines/hoses for restrictions or damage and repair as necessary. Refer to Section 211-02 . If the lines/hoses are OK, install a new steering gear. Refer to Section 211-02 .

Steering Linkage Test

1. With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 .

2. Using hand force only, check the inner and outer tie rods for vertical and lateral movement in the tie-rod ball studs/sockets.
    - If there is any lateral or vertical movement in the tie-rod ball studs/sockets (inner or outer), a new tie rod must be installed. Refer to the appropriate section in Group 211 for the procedure.

Power Steering System Flushing

Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V

NOTICE: **Do not mix fluid types. Any mixture or any unapproved fluid may lead to seal deterioration and leaks. A leak may ultimately cause loss of fluid, which may result in a loss of power steering assist.**

1. Remove the power steering fluid reservoir cap.
2. Using a suitable suction device, remove the power steering fluid from the reservoir.
3. Release the clamp and disconnect the return hose from the reservoir.
   - Remove the clamp from the hose and allow the remaining fluid to drain out of the reservoir.
4. Plug the power steering fluid reservoir inlet port.
5. Attach an extension hose to the return hose.
6. **NOTE:** Do not reuse the power steering fluid that has been flushed from the power steering system.

   Place the open end of the extension hose into a suitable container.
7. If equipped with Hydro-Boost®, apply the brake pedal 4 times.
8. **NOTE:** Do not overfill the reservoir.

   Fill the reservoir as needed with the specified fluid.
9. ***NOTICE:*** **Do not allow the power steering pump to run completely dry of power steering fluid. Damage to the power steering pump may occur.**

   Start the engine while simultaneously turning the steering wheel to lock and then immediately turn the ignition switch to the OFF position.
10. **NOTE:** Avoid turning the steering wheel without the engine running as this may cause air to be pulled into the steering gear.

    NOTE: Do not overfill the reservoir.

    Fill the reservoir as needed with the specified fluid.
11. Repeat Steps 8 and 9, turning the steering wheel in the opposite direction each time, until the fluid exiting the power steering fluid return hose is clean and clear of foreign material.

12. Remove the extension hose from the return hose.

13. Remove the plug from the fluid reservoir inlet port.

14. Install the clamp and connect the power steering return hose to the reservoir.

15. **NOTE:** It is necessary to correctly fill the power steering system to remove any trapped air and completely fill the power steering system components.

    If, after correctly filling the power steering system, there is power steering noise accompanied by evidence of aerated fluid and there are no fluid leaks, it may be necessary to purge the power steering system. For additional information, refer to Power Steering System Purging in this section.

    Fill the power steering system. For additional information, refer to Power Steering System Filling in this section.

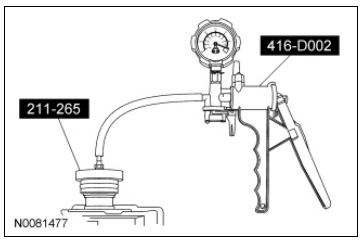
Power Steering System Purging

Special Tool(s)

 ST2670-A	Evacuation Cap, Power Steering 211-265
 ST1176-A	Vacuum Pump Kit 416-D002 (D95L-7559-A) or equivalent

Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V



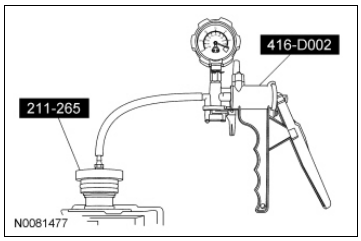
NOTICE: **If the air is not purged from the power steering system correctly, premature power steering pump failure may result. The condition may occur on pre-delivery vehicles with evidence of aerated fluid or on vehicles that have had steering component repairs.**

1. **NOTE:** A whine heard from the power steering pump can be caused by air in the system. The power steering purge procedure must be carried out prior to any component repair for which power steering noise complaints are accompanied by evidence of aerated fluid.

   Remove the power steering reservoir cap. Check the fluid.

2. Raise the front wheels off the floor. Refer to the appropriate section in Group 100 for the procedure.

3. Tightly insert the Power Steering Evacuation Cap into the reservoir and connect the Vacuum Pump Kit.



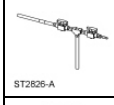
4. Start the engine.

5. Using the Vacuum Pump Kit, apply vacuum and maintain the maximum vacuum of 68-85 kPa (20-25 in-Hg).
   - If the Vacuum Pump Kit does not maintain vacuum, check the power steering system for leaks before proceeding. For additional information, refer to Power Steering Fluid Leak Test in this section.

6. If equipped with Hydro-Boost®, apply the brake pedal 4 times.
7. ***NOTICE:*** **Do not hold the steering wheel against the stops for an extended amount of time. Damage to the power steering pump may occur.**

   Cycle the steering wheel fully from stop-to-stop 10 times.
8. Stop the engine.
9. Release the vacuum and remove the Vacuum Pump Kit and the Power Steering Evacuation Cap.
10. **NOTE:** Do not overfill the reservoir.

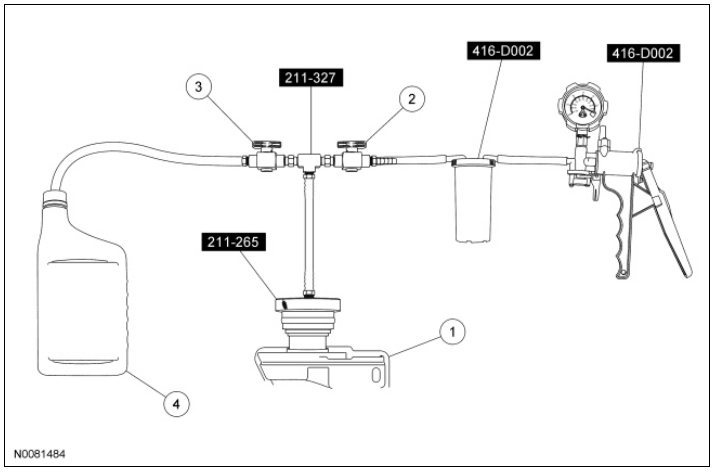
    Fill the reservoir as needed with the specified fluid.
11. Start the engine.
12. Install the Power Steering Evacuation Cap and the Vacuum Pump Kit. Apply and maintain the maximum vacuum of 68-85 kPa (20-25 in-Hg).



13. ***NOTICE:*** **Do not hold the steering wheel against the stops for an extended amount of time. Damage to the power steering pump may occur.**

    Cycle the steering wheel fully from stop-to-stop 10 times.
14. Stop the engine, release the vacuum and remove the Vacuum Pump Kit and the Power Steering Evacuation Cap.
15. **NOTE:** Do not overfill the reservoir.

    Fill the reservoir as needed with the specified fluid and install the reservoir cap.
16. Visually inspect the power steering system for leaks.



Power Steering System Filling

Special Tool(s)

 ST2670-A	Evacuation Cap, Power Steering 211-265
 ST2826-A	Fill Adapter Manifold, Power Steering 211-327
 ST1176-A	Vacuum Pump Kit 416-D002 (D95L-7559-A) or equivalent

Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V

Item	Description
1	Power steering fluid reservoir
2	Control valve (vacuum side)
3	Control valve (fluid container side)
4	Fluid container

1. ***NOTICE:*** **If the air is not purged from the power steering system correctly, premature power steering pump failure may result. The condition can occur on pre-delivery vehicles with evidence of aerated fluid or on vehicles that have had steering component repairs.**

Remove the power steering fluid reservoir cap.

2. Install the Power Steering Evacuation Cap, Power Steering Fill Adapter Manifold and Vacuum Pump Kit as shown in the illustration.

3. **NOTE:** The Power Steering Fill Adapter Manifold control valves are in the OPEN position when the points of the handles face the center of the Power Steering Fill Adapter Manifold.

   Close the Power Steering Fill Adapter Manifold control valve (fluid side).

4. Open the Power Steering Fill Adapter Manifold control valve (vacuum side).

5. Using the Vacuum Pump Kit, apply 68-85 kPa (20-25 in-Hg) of vacuum to the power steering system.

6. Observe the Vacuum Pump Kit gauge for 30 seconds.

7. If the Vacuum Pump Kit gauge reading drops more than 3 kPa (0.88 in-Hg), correct any leaks in the power steering system or the Power Steering Evacuation Cap, Power Steering Fill Adapter Manifold and Vacuum Pump Kit before proceeding.

8. **NOTE:** The Vacuum Pump Kit gauge reading will drop slightly during this step.

   Slowly open the Power Steering Fill Adapter Manifold control valve (fluid side) until power steering fluid completely fills the hose and then close the control valve.

9. Using the Vacuum Pump Kit, apply 68-85 kPa (20-25 in-Hg) of vacuum to the power steering system.

10. Close the Power Steering Fill Adapter Manifold control valve (vacuum side).

11. Slowly open the Power Steering Fill Adapter Manifold control valve (fluid side).

12. Once power steering fluid enters the fluid reservoir and reaches the minimum fluid level indicator line on the reservoir, close the Power Steering Fill Adapter Manifold control valve (fluid side).

13. Remove the Power Steering Evacuation Cap, Power Steering Fill Adapter Manifold and Vacuum Pump Kit.

14. Install the reservoir cap.

15. ***NOTICE:*** **Do not hold the steering wheel against the stops for an extended amount of time. Damage to the power steering pump may occur.**

    NOTE: There will be a slight drop in the power steering fluid level in the reservoir when the engine is started.

    Start the engine and turn the steering wheel from stop-to-stop.

16. Turn the ignition switch to the OFF position.

17. **NOTE:** Do not overfill the reservoir.

    Remove the reservoir cap and fill the reservoir with the specified fluid.

18. Install the reservoir cap.

SECTION 211-02: Power Steering

2009 Explorer/Mountaineer/Explorer Sport Trac Workshop Manual

DESCRIPTION AND OPERATION

Procedure revision date: 08/13/2008

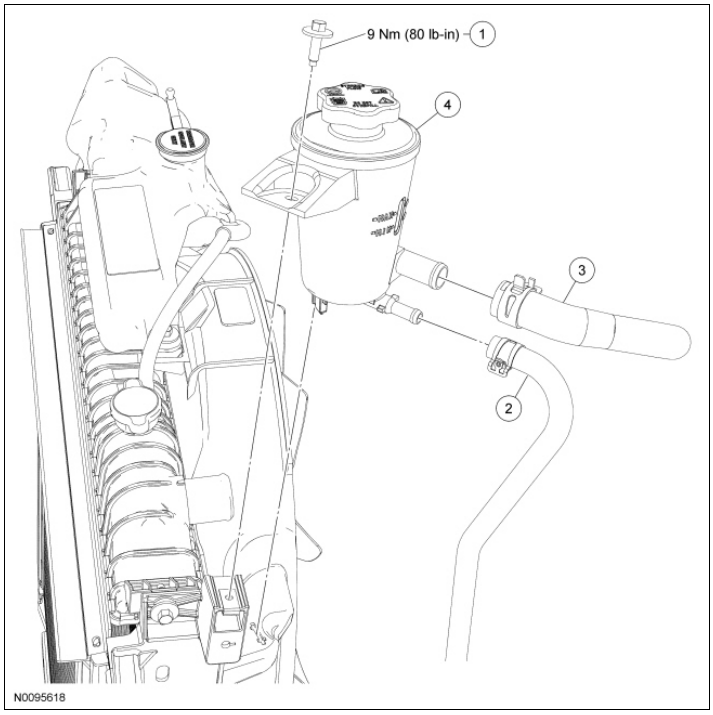
Power Steering

The power steering system consists of the following components:

- Power steering pump
- Power steering fluid reservoir
- Power steering pressure and return lines/hoses
- Power steering fluid cooler
- Power steering gear
- Inner tie rod
- Steering gear turn tubes

The power steering system uses a vane-type pump to move the fluid from the reservoir to the steering gear and through the rest of the steering hydraulic system. The power steering pump is mounted to the engine and driven by the engine accessory drive belt. Power steering fluid flows into the pump from the reservoir. The power steering fluid is then trapped between the pump vanes and moved to the high-pressure side of the pump creating a flow of fluid. The restriction of this flow by the steering gear creates the pressure that provides the steering assist. A combined pressure relief/flow valve is built into the pump to control the maximum pressure and flow provided to the steering system. This action prevents damage to the system and provides the correct level of assist during all engine speeds. While under pressure, the power steering fluid flows through the high-pressure power steering line to the steering gear. The fluid exits the gear and flows through the return line, cooler and finally to the reservoir. The reservoir slows the fluid, allows air to escape and filters the fluid before returning it to the pump.

Power Steering



Refer to Section 211-00 .

Power Steering Fluid Reservoir

Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V

NOTE: 4.0L engine shown, 4.6L engine similar.

Item	Part Number	Description
1	W503924	Power steering fluid reservoir bolt
2	3D746	Power steering fluid cooler
3	3691	Power steering pump supply hose
4	3R700	Power steering fluid reservoir

Removal and Installation

NOTICE: **While repairing the power steering system, care should be taken to prevent the entry of foreign material or failure of the power steering components may result.**

1. Using a suitable suction device, remove the power steering fluid from the reservoir.

2. Remove the power steering fluid reservoir bolt.
    - To install, tighten to 9 Nm (80 lb-in).

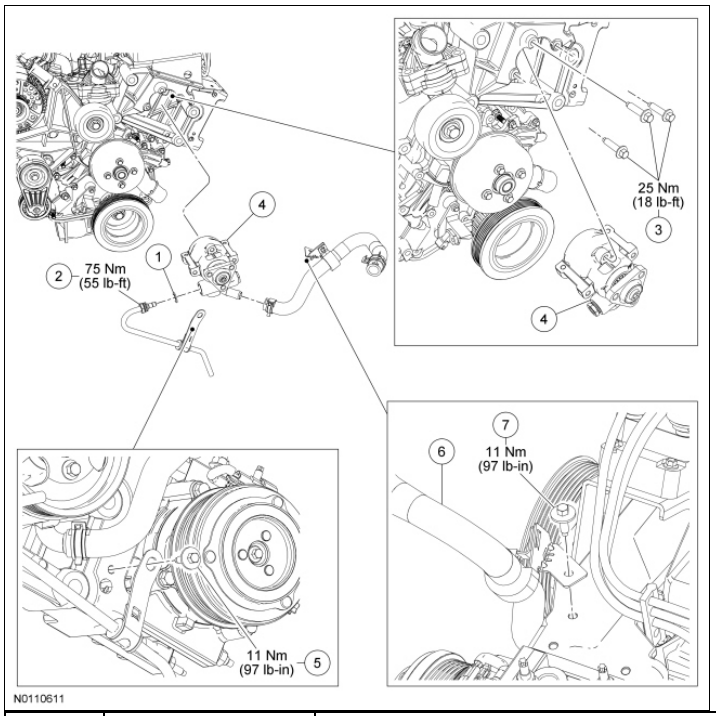
3. Release the power steering pump supply hose clamp and disconnect the hose.

4. Release the power steering fluid cooler hose clamp and disconnect the hose.

5. Remove the power steering fluid reservoir.

6. To install, reverse the removal procedure.

7. Fill the power steering system. For additional information, refer to Section 211-00 .



Power Steering Pump - 4.0L

Special Tool(s)

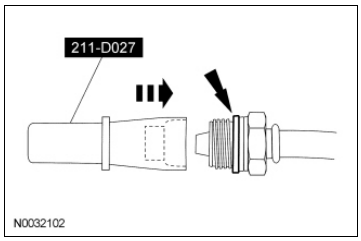
 ST1444-A	Installer Set, Teflon® Seal 211-D027 (D90P-3517-A) or equivalent

Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V

Item	Part Number	Description
1	388898	Teflon® seal
2	-	Pressure line-to-pump fitting (part of 3A719)
3	W700839	Power steering pump bolts (3 required)
4	3A674	Power steering pump
5	W503924	Pressure line bracket-to-engine bolt
6	3691	Power steering pump supply hose
7	W503924	Power steering pump supply hose bracket bolt

Removal



NOTICE: **While repairing the power steering system, care should be taken to prevent the entry of foreign material or failure of the power steering components may result.**

1. Using a suitable suction device, remove the power steering fluid from the reservoir.
2. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
3. Remove the power steering pump pulley. For additional information, refer to Power Steering Pump Pulley - 4.0L in this section.
4. Remove the pressure line bracket-to-engine bolt.
5. Remove the power steering pump supply hose bracket bolt.
6. Release the power steering pump supply hose clamp and disconnect the hose.
7. Disconnect the pressure line-to-pump fitting.
    - Remove and discard the Teflon® seal.
8. Remove the 3 bolts and the power steering pump.

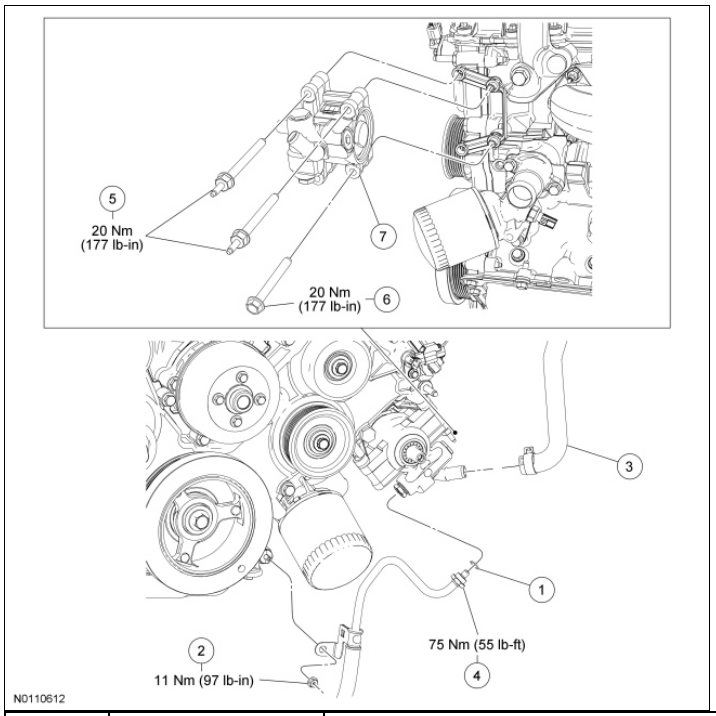
Installation

1. **NOTE:** A new Teflon® seal must be installed.

   Using the Teflon® Seal Installer Set, install a new Teflon® seal to the pressure line fitting.

2. Position the power steering pump and install the 3 bolts.
    - Tighten to 25 Nm (18 lb-ft).
3. Connect the pressure line-to-pump fitting.
    - Tighten to 75 Nm (55 lb-ft).
4. Connect the power steering pump supply hose.
5. Install the power steering pump supply hose bracket bolt.
    - Tighten to 11 Nm (97 lb-in).
6. Install the pressure line bracket-to-engine bolt.
    - Tighten to 11 Nm (97 lb-in).
7. Install the power steering pump pulley. For additional information, refer to Power Steering Pump Pulley - 4.0L in this section.

8. Fill the power steering system. For additional information, refer to Section 211-00 .



Power Steering Pump - 4.6L

Special Tool(s)

 ST1444-A	Installer Set, Teflon® Seal 211-D027 (D90P-3517-A) or equivalent

Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V

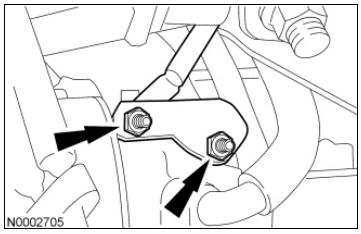
Item	Part Number	Description
1	388898	Teflon® seal
2	N805320	Pressure line bracket-to-engine nut
3	3691	Power steering pump supply hose
4	-	Pressure line-to-pump fitting (part of 3A719)
5	W707225	Power steering pump bolts (2 required)
6	W706447	Power steering pump bolt
7	3A696	Power steering pump

Removal and Installation

NOTICE: **While repairing the power steering system, care should be taken to prevent the entry of foreign material or failure of the power steering components may result.**

1. Using a suitable suction device, remove the power steering fluid from the reservoir.

2. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .



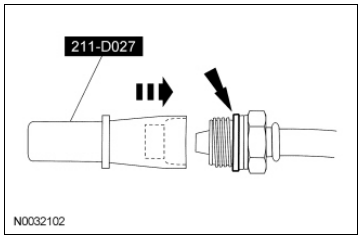
3. Remove the power steering pump pulley. For additional information, refer to Power Steering Pump Pulley - 4.6L in this section.

4. Remove the pressure line bracket-to-engine nut.

5. Compress the clamp and disconnect the power steering pump supply hose.

6. Disconnect the pressure line-to-pump fitting.
   - Remove and discard the Teflon® seal.

7. Remove the 2 engine wiring bracket nuts and position the wiring harness and ground cable aside.



8. Remove the 3 bolts and the power steering pump.

Installation

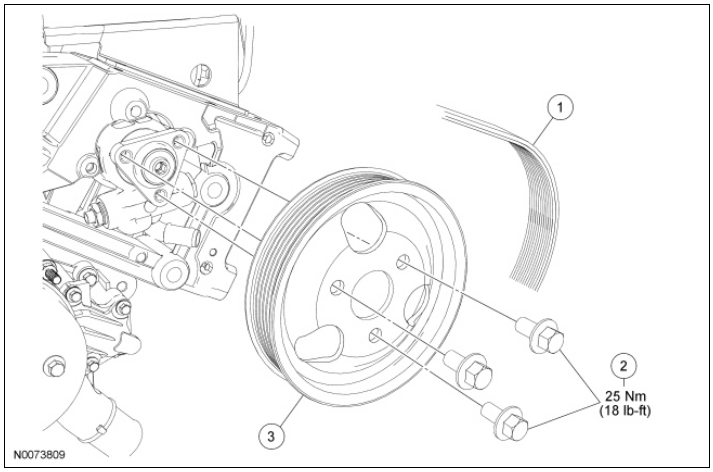
1. **NOTE:** A new Teflon® seal must be installed.

   Using the Teflon® Seal Installer Set, install a new Teflon® seal on the pressure line-to-pump fitting.

2. Position the power steering pump and install the 3 bolts.
   - To install, tighten to 20 Nm (177 lb-in).

3. Position the ground cable and engine wiring bracket. Install the 2 nuts.
   - Tighten to 20 Nm (177 lb-in).

4. Connect the pressure line-to-pump fitting.
   - Tighten to 75 Nm (55 lb-ft).

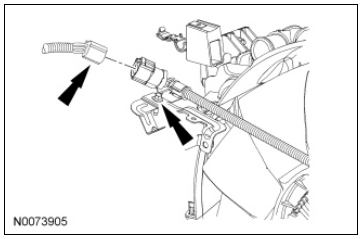


5. Connect the power steering pump supply hose.

6. Install the pressure line bracket-to-engine nut.
    - Tighten to 11 Nm (97 lb-in).

7. Install the power steering pump pulley. For additional information, refer to Power Steering Pump Pulley - 4.6L in this section.

8. Fill the power steering system. For additional information, refer to Section 211-00 .



Power Steering Pump Pulley - 4.0L

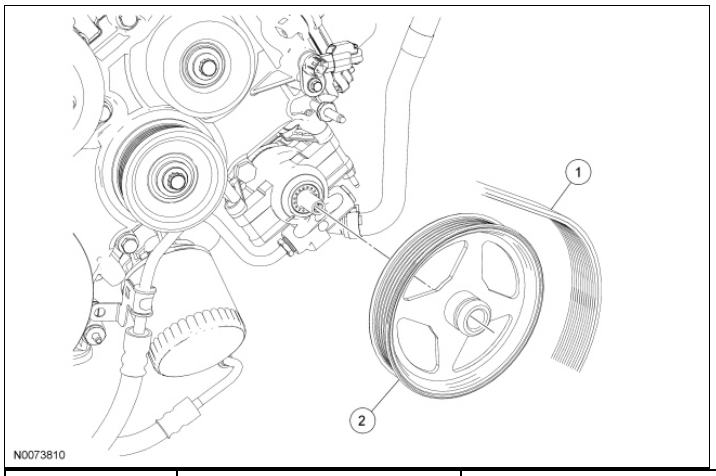
Item	Part Number	Description
1	8620	Accessory drive belt
2	N605784	Power steering pump pulley bolts (3 required)
3	3A733	Power steering pump pulley

Removal and Installation

1. Disconnect the fan clutch electrical connector, remove the fan clutch wiring harness bracket bolt and position the harness aside.
    - To install, tighten to 7 Nm (62 lb-in).

2. Loosen the 3 power steering pump pulley bolts.

3. Rotate the tensioner and remove the engine accessory drive belt from the power steering pump pulley.



4. Remove the 3 bolts and the power steering pump pulley.
    - To install, tighten to 25 Nm (18 lb-ft).

5. To install, reverse the removal procedure.

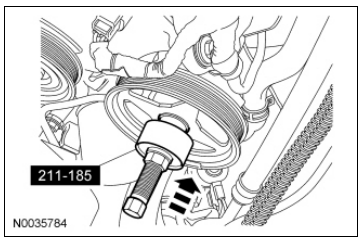
Power Steering Pump Pulley - 4.6L

Special Tool(s)

 ST1586-A	Installer, Power Steering Pump Pulley 211-185 (T91P-3A733-A)
 ST1290-A	Remover, Power Steering Pump Pulley 211-016 (T69L-10300-B)

Item	Part Number	Description
1	8620	Accessory drive belt
2	3A733	Power steering pump pulley

Removal



1. Remove the engine air cleaner outlet pipe. For additional information, refer to Section 303-12 .
2. Rotate the tensioner and remove the engine accessory drive belt from the power steering pump pulley.
3. Using the Power Steering Pump Pulley Remover, remove the pulley.

Installation

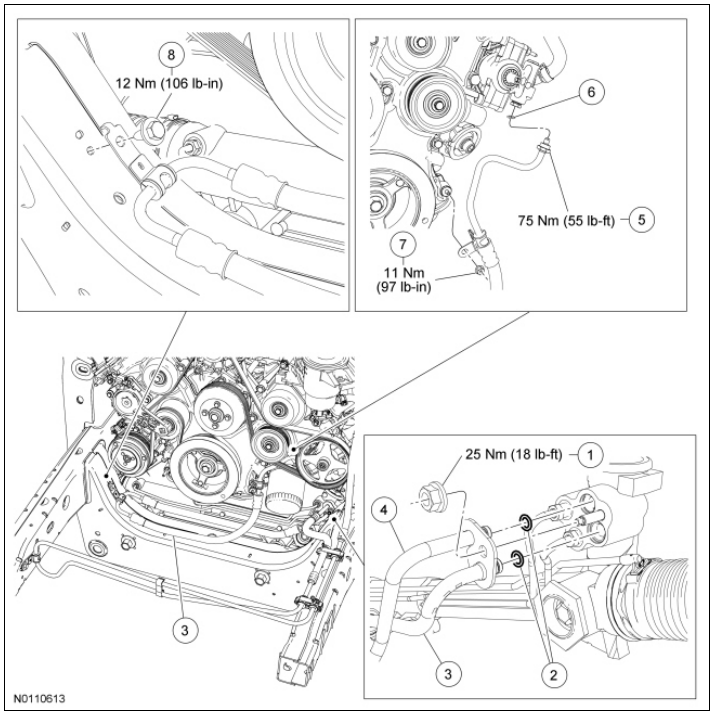
1. ***NOTICE:*** **Do not install a power steering pump pulley that has been removed and installed twice or pulley failure and/or pump damage may occur. Inspect the pulley for paint marks in the web area near the hub. If there are 2 paint marks, discard the pulley and install a new one. If there is 1 paint mark or no paint marks, use a paint pencil to mark the web area of the pulley near the hub.**

   Using the Power Steering Pump Pulley Installer, install the pulley.

2. Rotate the tensioner and install the engine accessory drive belt on the power steering pump pulley. For additional information on accessory drive belt routing, refer to Section 303-05 .

3. Install the engine air cleaner outlet pipe. For additional information, refer to Section 303-12 .

Power Steering Pump to Steering Gear Pressure Line



Special Tool(s)

 ST1444-A	Installer Set, Teflon® Seal 211-D027 (D90P-3517-A) or equivalent

Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V

NOTE: 4.6L engine shown, 4.0L engine similar.

Item	Part Number	Description
1	W520413-S	Steering line clamp plate nut
2	N803257	O-ring seals (2 required)
3	3A719	Pressure line
4	3D746	Power steering fluid cooler

5	-	Pressure line-to-pump fitting (part of 3A719)
6	388898	Teflon® seal
7	N805320/ W503924	Pressure line bracket-to-engine nut/bolt (4.6L engine/4.0L engine)
8	W710617	Pressure line bracket-to-crossmember bolt

Removal

NOTICE: **While repairing the power steering system, care should be taken to prevent the entry of foreign material or failure of the power steering components may result.**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the power steering pump pulley. For additional information, refer to Power Steering Pump Pulley - 4.0L or Power Steering Pump Pulley - 4.6L in this section.

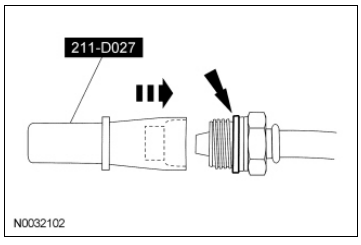
3. Remove the steering line clamp plate nut.

4. Rotate the steering line clamp plate and disconnect the power steering fluid cooler from the steering gear.
   - Discard the O-ring seal.

5. Disconnect the pressure line from the steering gear.
   - Discard the O-ring seal.

6. Remove the pressure line bracket-to-engine nut (4.6L) or bolt (4.0L).

7. Remove the pressure line bracket-to-crossmember bolt.



8. Disconnect the pressure line-to-pump fitting.
   - Remove and discard the Teflon® seal.

9. Remove the pressure line.

Installation

1. **NOTE:** A new Teflon® seal must be installed.

   Using the Teflon® Seal Installer Set, install a new Teflon® seal on the pressure line fitting.

2. Position the pressure line and connect the pressure line-to-pump fitting.
   - Tighten to 75 Nm (55 lb-ft).

3. Install the pressure line bracket-to-engine nut (4.6L) or bolt (4.0L).
   - Tighten to 11 Nm (97 lb-in).

4. **NOTE:** New O-rings must be installed whenever the pressure line and fluid cooler are disconnected from the steering gear.

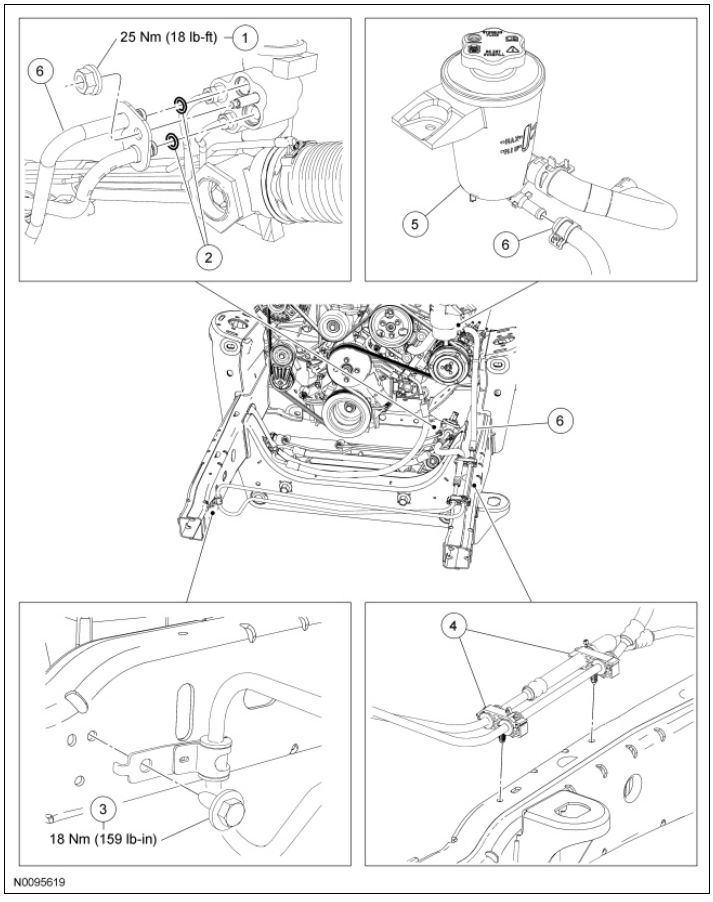
   Install a new O-ring seal and position the pressure line to the steering gear.

5. Install the pressure line bracket-to-crossmember bolt.
   - Tighten to 12 Nm (106 lb-in).

6. Install a new O-ring seal and position the power steering fluid cooler to the steering gear. Rotate the steering line clamp plate into position.

7. Install the steering line clamp plate nut.
   - Tighten to 25 Nm (18 lb-ft).

8. Install the power steering pump pulley. For additional information, refer to Power Steering Pump Pulley - 4.0L or Power Steering Pump Pulley - 4.6L in this section.



9. Fill the power steering system. For additional information, refer to Section 211-00 .

Power Steering Fluid Cooler

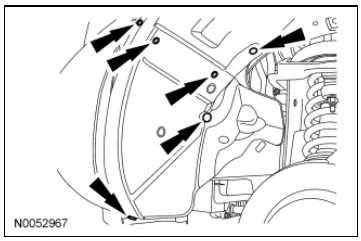
Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V

NOTE: 4.0L engine shown, 4.6L engine similar.

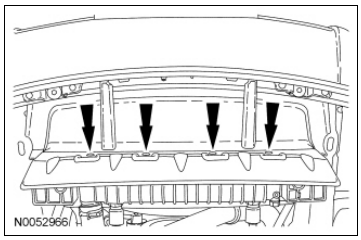
Item	Part Number	Description
1	W520143	Steering line clamp plate nut
2	N803257	O-ring seals (2 required)
3	W710617	Power steering fluid cooler hose bracket bolt
4	-	Power steering fluid cooler hose braces (2 required)
5	3R700	Power steering fluid reservoir

6	3D746	Power steering fluid cooler



Removal and Installation

NOTICE: **While repairing the power steering system, care should be taken to prevent the entry of foreign material or failure of the power steering components may result.**



1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Release the power steering fluid cooler clamp and disconnect the fluid cooler from the fluid reservoir.

3. Remove the LH front splash shield screws, pin-type retainers and the splash shield.

4. Remove the lower radiator air deflector pushpins and the air deflector.

5. Remove the 2 power steering fluid cooler hose braces.

6. Remove the power steering fluid cooler hose bracket bolt.
   - To install, tighten to 18 Nm (159 lb-in).

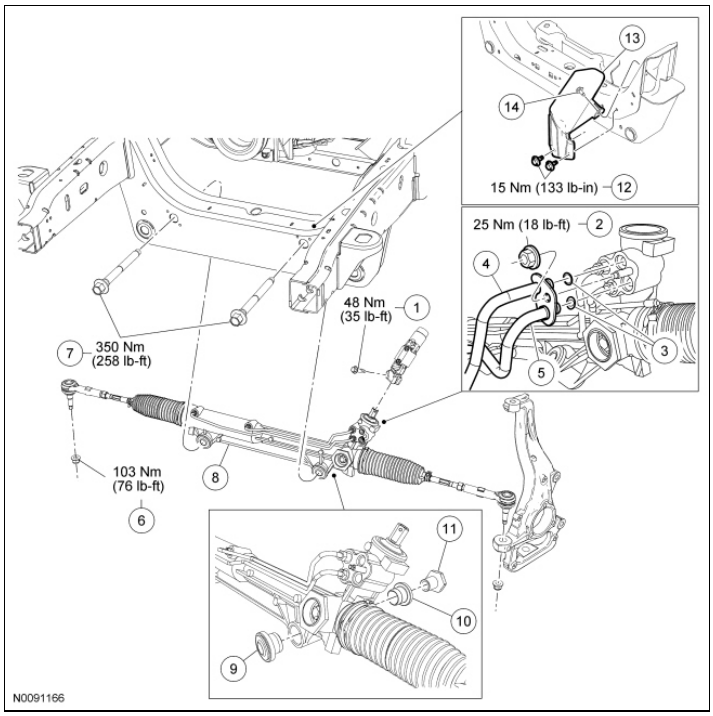
7. Remove the steering line clamp plate nut.
   - To install, tighten to 25 Nm (18 lb-ft).

8. Rotate the steering line clamp plate and disconnect the power steering fluid cooler from the steering gear.
   - Discard the O-ring seal.

9. Remove the power steering fluid cooler.

10. **NOTE:** New O-ring seals must be installed whenever the power steering pressure and fluid cooler line is disconnected from the steering gear.

    To install, reverse the removal procedure.

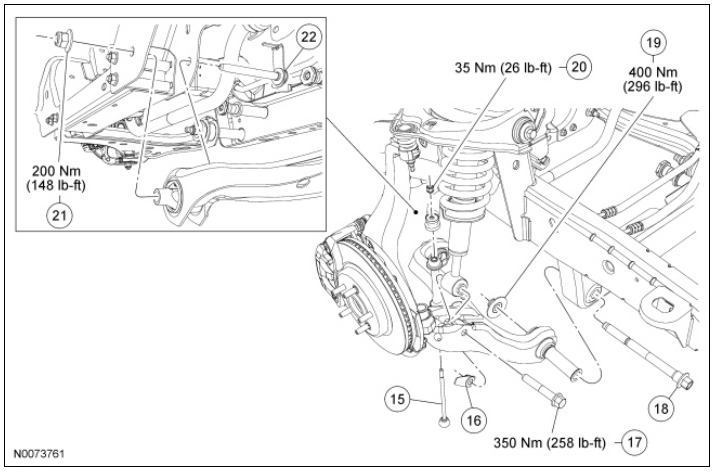


11. Fill the power steering system. For additional information, refer to Section 211-00 .

Steering Gear

Special Tool(s)

 ST1494-A	C-Frame and Screw 211-023 (T74P-3044-A1)



Steering Gear (View 1 of 2)

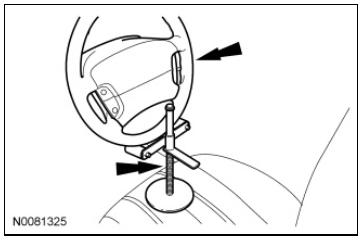
Item	Part Number	Description
1	W710570	Lower steering column shaft-to-steering gear bolt
2	W520413	Steering line clamp plate nut
3	N803257	O-ring seals (2 required)
4	3F780	Power steering fluid cooler
5	3A719	Power steering pressure line
6	W520215	Tie-rod end nut (2 required)
7	W710466	Steering gear-to-crossmember bolts (2 required)
8	3504	Steering gear
9	3C716A	Forward steering gear bushing (2 required)
10	3C716B	Rearward steering gear bushing (2 required)
11	W710283	Steering gear-to-crossmember nut (2 required)

12	W707079	Oil shield-to-crossmember bolts (2 required)
13	6N634	Oil shield
14	W709571	Oil shield pin-type retainer

Steering Gear (View 2 of 2)

Item	Part Number	Description
15	5495	Stabilizer bar link bolt
16	W710747	Shock absorber lower flagnut
17	W710775	Shock absorber lower bolt
18	W711505	Lower arm forward bolt
19	W710796	Lower arm forward nut
20	5C491	Stabilizer bar link nut
21	W707254	Lower arm rearward nut
22	W711533	Lower arm rearward flag bolt

Removal and Installation



All vehicles

NOTICE: **While repairing the power steering system, care should be taken to prevent the entry of foreign material or failure of the power steering components may result.**

1. ***NOTICE:*** **Do not allow the steering column to rotate while the steering column shaft is disconnected or damage to the clockspring may result. If there is evidence that the lower shaft has rotated, the clockspring must be removed and recentered. For additional information, refer to Section 501-20B .**

   NOTE: Use a steering wheel holding device (such as Hunter® 28-75-1 or equivalent).

   Using a suitable holding device, hold the steering wheel in the straight-ahead position.

2. Remove the front tires and wheels. For additional information, refer to Section 204-04 .

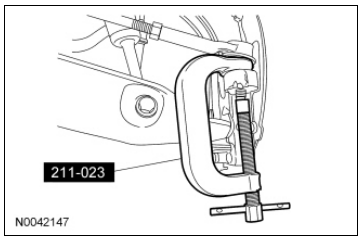
3. If equipped, remove the 2 bolts, pin-type retainer and the oil shield.
   - To install, tighten to 15 Nm (133 lb-in).

4. Remove and discard the lower steering column shaft-to-steering gear bolt.
   - To install, tighten the new bolt to 48 Nm (35 lb-ft).

5. Disconnect the lower steering column shaft from the steering gear.

6. Remove the steering line clamp plate nut.
   - To install, tighten to 25 Nm (18 lb-ft).

7. Rotate the steering line clamp plate and disconnect the power steering pressure line and fluid cooler.



8. **NOTE:** New O-rings must be installed whenever the power steering line and fluid cooler are disconnected from the steering gear.

   Remove and discard the 2 O-rings.

9. Remove and discard the 2 tie-rod end nuts.
   - To install, tighten the new nuts to 103 Nm (76 lb-ft).

10. ***NOTICE:*** **Use care when installing the C-Frame and Screw or damage to the tie-rod end boot may occur.**

    Using the C-Frame and Screw, separate the 2 tie-rod ends from the wheel knuckle.

11. Remove the 2 steering gear-to-crossmember nuts and bolts.
    - To install, tighten to 350 Nm (258 lb-ft).

Four-Wheel Drive (4WD) vehicles

NOTE: On Four-Wheel Drive (4WD) vehicles, the following steps (LH lower arm only) must be carried out to provide clearance to remove the steering gear.

12. Remove the shock absorber lower bolt and flagnut.
    - Discard the flagnut.
    - To install, tighten to 350 Nm (258 lb-ft).

13. *NOTICE:* **Do not tighten the LH lower arm nuts and bolts until the installation procedure is complete and the weight of the vehicle is resting on the wheel and tire assemblies or incorrect clamp load or bushing damage may occur.**

    NOTE: It is not necessary to disconnect the LH lower ball joint.

    Remove and discard the lower arm forward bolt and nut and the lower arm rearward flag bolt and nut.

    - To install the new lower arm forward bolt and nut, tighten to 400 Nm (296 lb-ft).
    - To install the new lower arm rearward flag bolt and nut, tighten to 200 Nm (148 lb-ft).

14. Remove the stabilizer bar link nut and the link.
    - Discard the stabilizer bar link nut.
    - To install, tighten the new nut to 35 Nm (26 lb-ft).

All vehicles

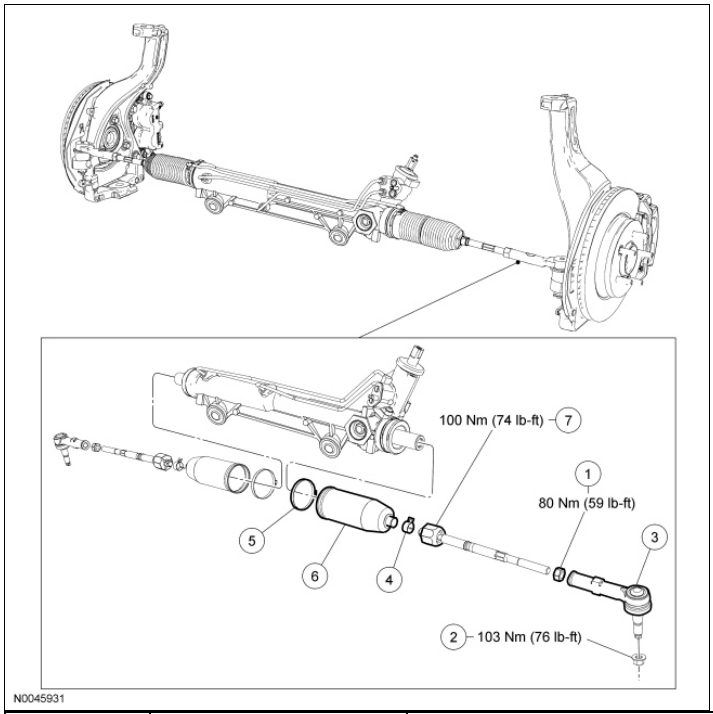
15. Remove the steering gear from the LH side of the vehicle.

16. If a new steering gear is being installed, remove the 4 steering gear bushings and the 2 nuts.

17. *NOTICE:* **On Four-Wheel Drive (4WD) vehicles, do not tighten the LH lower arm nuts and bolts until the installation procedure is complete and the weight of the vehicle is resting on the wheel and tire assemblies or incorrect clamp load bushing damage may occur.**

    To install, reverse the removal procedure.

    - Install 2 new O-ring seals and new flag nuts.
    - Fill the power steering system. For additional information, refer to Section 211-00 .
    - Check and, if necessary, set the front toe. For additional information, refer to Section 204-00 .



Inner Tie Rod

Special Tool(s)

 ST1525-A	Boot Clamp Pliers 205-D067 (D87P-1098-A) or equivalent
 ST1494-A	C-Frame and Screw 211-023 (T74P-3044-A1)

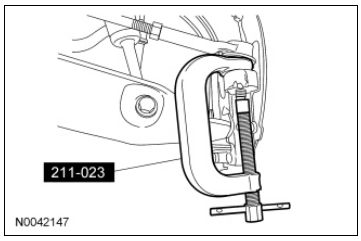
Material

Item	Specification
Premium Long-Life Grease XG-1-C or XG-1-K (US); CXG-1-C (Canada)	ESA-M1C75-B

Item	Part Number	Description
1	-	Tie-rod end jam nut (part of 3290)
2	W520215	Tie-rod end nut
3	3290	Tie-rod end
4	3C560	Outer bellows boot clamp
5	3C650	Inner bellows boot clamp

6	3K661	Steering gear bellows boot
7	3280	Inner tie rod

Removal



NOTICE: **The boots and clamps are designed to provide an airtight seal and protect the internal components of the steering gear. If the seal is not airtight the vacuum generated during turning will draw water and contamination into the gear causing damage. Zip ties do not produce an airtight seal and must not be used.**

NOTICE: **The inner ball joint grease is not compatible with water and foreign material trapped in the grease will degrade the life of the joint.**

NOTICE: **If present, the orientation of the vent tube must be noted so the boots and vent tubes can be installed in the correct location. Incorrect venting may lead to internal component damage.**

1. Remove the front tire and wheel. For additional information, refer to Section 204-04 .
2. Loosen the tie-rod end jam nut.
3. Remove and discard the tie-rod end nut.
4. ***NOTICE:*** **Use care when installing the C-Frame and Screw or damage to the tie-rod end boot may occur.**

   Using the C-Frame and Screw, separate the tie-rod end from the wheel knuckle.

5. **NOTE:** Count the number of turns required to remove the tie-rod end for reference during installation.

   Remove the tie-rod end.
6. Remove the tie-rod end jam nut.
7. **NOTE:** A new outer bellows boot clamp must be installed.

   Using the Boot Clamp Pliers, remove and discard the outer bellows boot clamp.
8. **NOTE:** A new inner bellows boot clamp must be installed.

   Using the Boot Clamp Pliers, remove and discard the inner bellows boot clamp.
9. Remove the steering gear bellows boot.
10. ***NOTICE:*** **Place the steering gear at the center position. Use an appropriate-sized crowfoot wrench on the flat of the rack gear to resist rotation and to prevent damage during removal and installation of the inner tie rod.**

NOTE: If repairing the RH side, it will be necessary to pull back the LH inner tie-rod boot to hold the steering gear.

NOTE: An assistant may be needed for removal of the RH inner tie rod.

While holding the steering gear rack, use an appropriate-sized crowfoot wrench to remove the inner tie rod.

11. *NOTICE:* **Thoroughly remove any abrasive material. This material is extremely harmful to the steering gear.**

    Thoroughly clean and inspect all the parts to be reused. Install new parts as necessary.

Installation

1. *NOTICE:* **Place the steering gear at the center position. Use an appropriate-sized crowfoot wrench on the flat of the rack gear to resist rotation and to prevent damage during the installation of the inner tie rod.**

   NOTE: An assistant may be needed for installation of the RH inner tie rod.

   Using an appropriate-sized crowfoot wrench, install the inner tie rod.

   - Tighten to 100 Nm (74 lb-ft).

2. **NOTE:** Apply steering gear grease to the steering gear bellows boot groove in the inner tie rod.

   NOTE: Make sure the steering gear bellows boot is positioned correctly over the steering gear housing bead and the groove in the inner tie rod.

   NOTE: Make sure the steering gear bellows boot is not twisted and the vent tube (if equipped) is securely inserted into the vent nipple of the steering gear bellows boot.

   Install the steering gear bellows boot.

3. Using the Boot Clamp Pliers, install a new inner bellows boot clamp.

4. **NOTE:** Make sure the end of the steering gear bellows is positioned between the 2 grooves on the inner tie rod or an internal leak can result.

   Install a new outer bellows boot clamp.

5. Thread the tie-rod end jam nut onto the inner tie rod.

6. **NOTE:** Install the tie-rod end the same number of turns as recorded during the removal.

   Install the tie-rod end to the inner tie rod.

7. Tighten the tie-rod end jam nut.
   - Tighten to 80 Nm (59 lb-ft).

8. Position the tie-rod end to the wheel knuckle and install a new tie-rod end nut.
   - Tighten to 103 Nm (76 lb-ft).

9. Check and, if necessary, align the front end. For additional information, refer to Section 204-00 .

Torque Specifications

Upper steering column shaft dash seal bolts	12	-	106

SECTION 211-04: Steering Column

2009 Explorer/Mountaineer/Explorer Sport Trac Workshop Manual

DESCRIPTION AND OPERATION

Procedure revision date: 08/13/2008

Steering Column

The steering column system consists of the following components:

- Steering wheel
- Steering column
- Upper and lower steering column shafts
- Steering column switches
- Ignition lock cylinder

The steering column is the mechanical linkage between the steering wheel and the steering gear. It contains various switches and is able to tilt to suit driver preference. The steering wheel is mounted to a shaft which passes through the center of the steering column to the upper steering shaft. The upper steering shaft then connects to the lower steering shaft, which is connected to the steering gear. The upper and lower connections utilize U-joint type knuckles. The steering shaft is centered by roller ball bearings within the steering column. The tilt function of the steering column is controlled by a mechanical lever on the underside of the steering column, which uses a cam to lock and unlock the steering column. When the tilt column lever is unlocked, the steering column can then be adjusted to various positions. The steering column switches (multifunction and ignition) are mounted to the steering column. These switches are covered by the upper and lower steering column shrouds.

NOTE: If the deployable steering column electrical connector becomes damaged or the deployable steering column has deployed, a new overlay wiring harness must be installed. Make sure to follow the installation instructions that are included in the service kit.

This vehicle is equipped with a deployable steering column. The deployable steering column includes a deployable device that, once deployed, reduces the amount of force necessary to collapse the steering column during a crash event. The deployable device is activated by the Restraints Control Module (RCM) depending on when the module detects a crash event force exceeding a programmed limit and the position of the driver seat. **After deployment, a new steering column must be installed.** Refer to Steering Column in this section.

Steering Column

Refer to Section 211-00 .

Steering Wheel Wrap Bonding

Material

Item	Specification
Instant Gel Adhesive TA-19	WSK-M2G402-A4

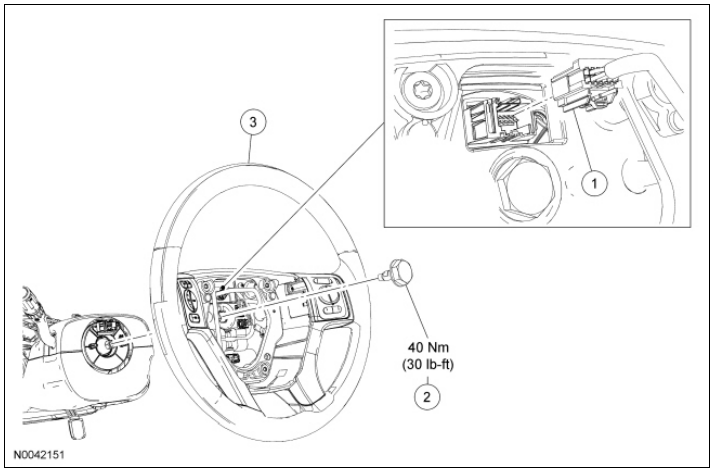
1. **NOTE:** If re-adhering leather to the front side of the steering wheel only, it will not be necessary to remove the steering wheel. Steering wheel removal is necessary only when repairing loose leather on the backside of the steering wheel.

   If necessary remove the steering wheel. For additional information, refer to Steering Wheel in this section.

2. Position the loose leather out of the way.

3. Apply the specificed adhesive evenly over the wheel spoke.

4. Position the loose leather back into the original position.



5. **NOTE:** The adhesive should be completely set after 5 minutes. Do not pull on the repair area.

   Smooth the leather and tuck in for neat appearance.

   - Apply pressure (for at least 30 seconds) until the leather is bonded to the wheel spoke.

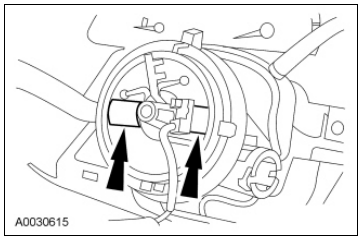
6. If removed, Install the steering wheel. For additional information, refer to Steering Wheel in this section.

Steering Wheel

Item	Part Number	Description
1	-	Steering wheel switches electrical connector (part of 9C888)
2	W705985	Steering wheel bolt
3	3600	Steering wheel

Removal and Installation

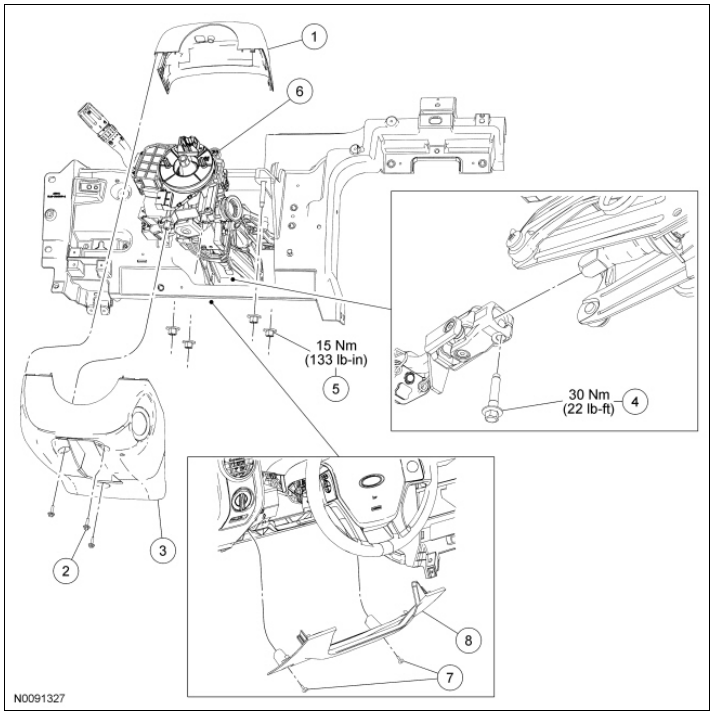
1. Place the steering wheel in the straight-ahead position and turn the ignition switch to the OFF position.



2. Remove the driver air bag module. For additional information, refer to Section 501-20B .

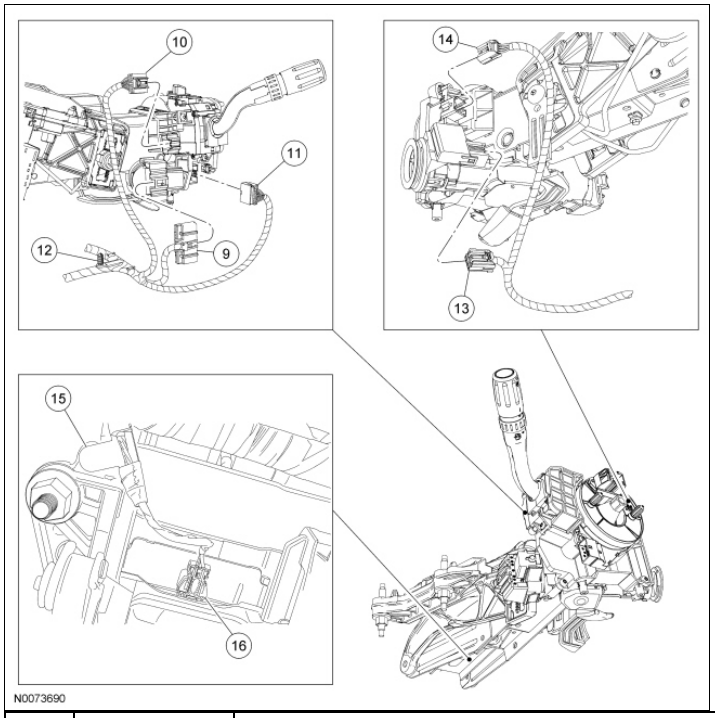
3. Disconnect the steering wheel switches electrical connector.

4. Remove the steering wheel bolt and the steering wheel.
   - Discard the bolt.
   - To install, tighten the new bolt to 40 Nm (30 lb-ft).



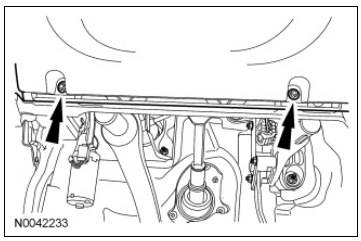
5. ***NOTICE:*** **Do not allow the clockspring to turn from its removal position or damage to the clockspring may occur.**

   Tape the clockspring center rotor to the outer housing to keep it from rotating.



6. To install, reverse the removal procedure.

Steering Column



Item	Part Number	Description
1	3F914	Upper steering column shroud
2	W707658	Lower steering column shroud screw (3 required)
3	3F914	Lower steering column shroud
4	N808684	Upper steering column shaft-to-steering column bolt
5	N806423	Steering column support bracket nut (4 required)
6	3C529	Steering column
7	W705314	Steering column opening cover screws (3 required)
8	04459	Steering column opening cover

Item	Part Number	Description
9	-	Ignition switch electrical connector (part of 14401)
10	-	Multifunction switch electrical connector (part of 14401)
11	-	Clockspring electrical connector (part of 14401)
12	-	Wiring harness retainer (part of 14401)
13	-	Passive Anti-Theft System (PATS) electrical connector (part of 14401)
14	-	Steering angle sensor electrical connector (part of 14401)
15	-	Wiring harness retainer (part of 14401)
16	-	Steering column adaptive load safety device electrical connector (part of 14401)

Removal and Installation

1. Remove the steering wheel. For additional information, refer to Steering Wheel in this section.
2. Remove the 2 bolts and the steering column opening cover.

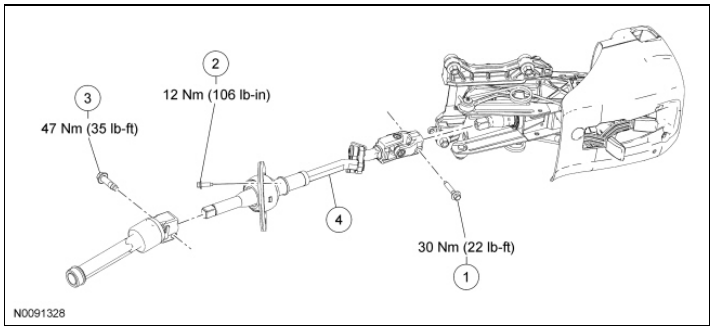
3. Disconnect the multifunction switch, ignition switch and clockspring electrical connectors.
4. Disconnect the steering angle sensor electrical connector.
5. Disconnect the Passive Anti-Theft System (PATS) electrical connector.

6. Detach the wiring harness retainer and position the wiring harness aside.

7. ***NOTICE:*** **The steering column is equipped with a safety device located at the bottom side of the column support. Make sure that the electrical connector and wiring retainer are disconnected prior to removing the column support-to-instrument panel nuts or damage to the safety device or wiring may occur.**

   Using a suitable tool, squeeze the connector at the sides and disconnect the steering column adaptive load safety device electrical connector.

   - Detach the wiring retainer.



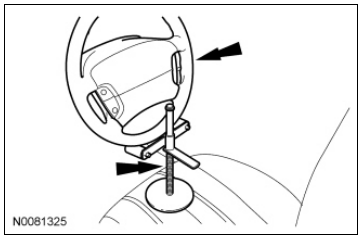
8. Remove and discard the upper steering column shaft-to-steering column bolt.
   - To install, tighten the new bolt to 30 Nm (22 lb-ft).

9. Remove and discard the 4 steering column support bracket nuts and the steering column.
   - To install, tighten the new nuts to 15 Nm (133 lb-in).

10. Remove the steering column.

11. To install, reverse the removal procedure.

Steering Column Shaft - Upper



Item	Part Number	Description
1	N808684	Upper steering column shaft-to-steering column bolt
2	W611624	Upper steering column shaft dash seal bolt (3 required)
3	W710570	Lower steering column shaft-to-upper steering column shaft bolt
4	3E751	Upper steering column shaft

Removal and Installation

1. ***NOTICE:*** **Do not allow the steering column to rotate while the steering column shaft is disconnected or damage to the clockspring may result. If there is evidence that the shaft has rotated, the clockspring must be removed and recentered. For additional information, refer to Section 501-20B .**

   NOTE: Use a steering wheel holding device (such as Hunter® 28-75-1 or equivalent).

   Using a suitable holding device, hold the steering wheel in the straight-ahead position.

2. ⚠ **WARNING: Install a new steering column shaft bolt. Reuse could result in bolt failure and loss of vehicle control. Failure to follow this instruction may result in serious injury to vehicle occupant(s).**

   Remove and discard the upper steering column shaft-to-steering column bolt.

   - To install, tighten the new bolt to 30 Nm (22 lb-ft).

3. Remove the 3 upper steering column shaft dash seal bolts.

- To install, tighten to 12 Nm (106 lb-in).

4. ⚠ **WARNING: Install a new steering column shaft bolt. Reuse could result in bolt failure and loss of vehicle control. Failure to follow this instruction may result in serious injury to vehicle occupant(s).**

   Remove and discard the lower steering column shaft-to-upper steering column shaft bolt.

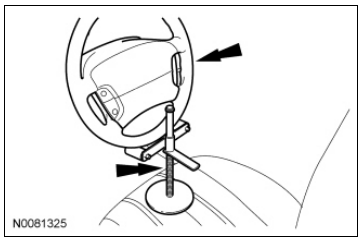
   - To install, tighten the new bolt to 47 Nm (35 lb-ft).

5. Remove the upper steering column shaft.

6. To install, reverse the removal procedure.

Steering Column Shaft - Lower

Item	Part Number	Description
1	3C662	Lower steering column shaft
2	W710570	Lower steering column shaft-to-upper steering column shaft bolt
3	W710570	Lower steering column shaft-to-steering gear bolt



Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. ***NOTICE:*** **Do not allow the steering column shaft to rotate while the steering column shaft is disconnected or damage to the clockspring can result. If there is evidence that the shaft has rotated, the clockspring must be removed and recentered. For additional information, refer to Section 501-20B .**

   NOTE: Use a steering wheel holding device (such as Hunter® 28-75-1 or equivalent).

   Using a suitable holding device, hold the steering wheel in the straight-ahead position.

3. ⚠ **WARNING: Install a new steering column shaft bolt. Reuse could result in bolt failure and loss of vehicle control. Failure to follow this instruction may result in serious injury to vehicle occupant(s).**

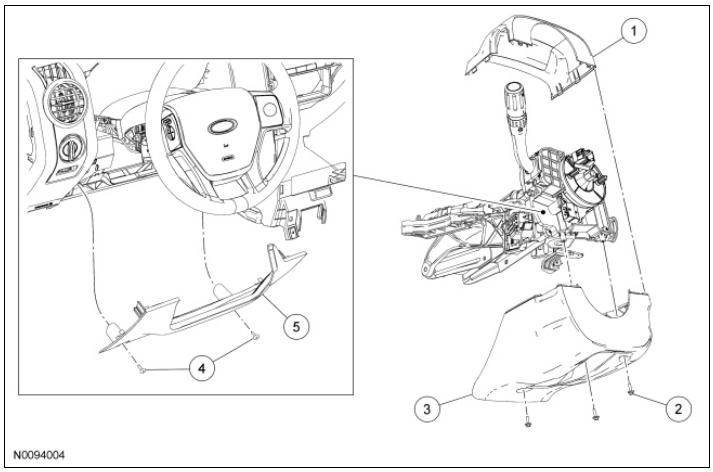
   Remove and discard the lower steering column shaft-to-upper steering column shaft bolt.

   - To install, tighten the new bolt to 47 Nm (35 lb-ft).

4. ⚠ **WARNING: Install a new steering column shaft bolt. Reuse could result in bolt failure and loss of vehicle control. Failure to follow this instruction may result in serious injury to vehicle occupant(s).**

   Remove and discard the lower steering column shaft-to-steering gear bolt.

   - To install, tighten the new bolt to 47 Nm (35 lb-ft).

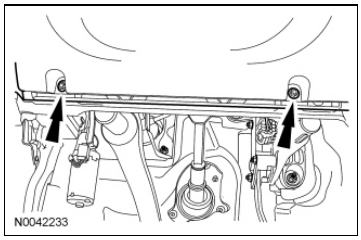


5. Remove the lower steering column shaft.

6. Inspect the lower steering column shaft for boot damage or separation from the shaft tube.
   - If damage or separation of the lower steering column shaft is evident, install a new lower steering column shaft.

7. To install, reverse the removal procedure.

Steering Column Shroud



NOTE: Steering wheel is removed for clarity.

Item	Part Number	Description
1	3530	Upper steering column shroud
2	W705314	Lower steering column shroud screw (3 required)
3	3530	Lower steering column shroud
4	W705314	Steering column opening cover screws (2 required)
5	04459	Steering column opening cover

Removal and Installation

1. Remove the 2 screws and the steering column opening cover.

2. Remove the 3 screws and the upper and lower steering column shrouds.

3. To install, reverse the removal procedure.

Torque Specifications

Description	Nm	lb-in
Multifunction switch screws	3	27

Steering Column Switches

The steering column switches consist of the following:

- Multifunction switch
- Ignition switch

The steering column switches receive driver inputs and send signals to various components. The multifunction switch controls the windshield wipers, hazard flasher, turn signal, headlamp low/high beam and headlamp dimmer/flash-to-pass. The ignition switch is used in conjunction with the lock cylinder key to start the vehicle. When the lock cylinder key is switched to different positions, it moves linkages which enable the ignition switch to send battery voltage to various components.

Steering Column Switches

Special Tool(s)

 ST1137-A	73III Automotive Meter 105-R0057 or equivalent
 ST2574-A	Flex Probe Kit 105-R0258 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Principles of Operation

NOTE: The Smart Junction Box (SJB) is also identified as the Generic Electronic Module (GEM).

Ignition Switch

The ignition switch is controlled by the ignition lock cylinder with a key. When the ignition lock cylinder is turned using the key, a mechanical connection positions the ignition switch to the selected position and allows the ignition switch to send voltage to specific components.

Multifunction Switch

The multifunction switch (high beam/low beam, flash-to-pass, turn signal and windshield wiper) controls the various components electrically. The headlamp switch sends constant voltage to the headlamps when placed in the ON position, while the flash-to-pass is a momentary switch used to send voltage to the headlamp high beams only. The headlamp high beam/low beam switch sends voltage to the low or high beam headlamps while the headlamps are on. The turn signal switch portion of the multifunction switch operates the left and right turn signals. The windshield wiper switch function uses a ground signal to activate the various wiper modes and the wiper/washer.

Key Release Interlock Actuator

The key release interlock actuator (also known as the key removal inhibit solenoid) is an electronically controlled solenoid that prevents the ignition key from being removed from the ignition cylinder unless the transmission selector lever is in the PARK position. The actuator is part of the ignition switch.

When the transmission selector lever is placed in a position other than PARK, the park detection switch (internal to the transmission selector lever) closes and the key release interlock engages. This prevents the ignition key from being removed from the ignition cylinder.

When the transmission selector lever is placed in the PARK position, the park detection switch opens and the key release interlock disengages, allowing the ignition key to be removed from the ignition cylinder.

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Multifunction switch • Ignition key • Ignition switch • Ignition key turning effort	• Smart Junction Box (SJB) fuse 8 (15A) • Wiring, terminals or connectors • Instrument cluster • Passive Anti-Theft System (PATS) module • Wiring harness

NOTE: For multifunction switch concerns, refer to one of the following sections:

- Exterior Lighting, Section 417-01 .
- Wipers and Washers, Section 501-16 .

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM .
   - refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the instrument cluster.
9. If the DTCs retrieved are related to the concern, go to Smart Junction Box (SJB) DTC Chart. For all other DTCs, refer to Section 419-10 .
10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

Smart Junction Box (SJB) DTC Chart

DTC	Description	Source	Action
B1359	Ignition RUN/ACC Circuit Failure	Smart Junction Box (SJB)	GO to Pinpoint Test B .
B1363	Ignition START Circuit Failure	SJB	GO to Pinpoint Test D .
B1555	Ignition RUN/START Circuit Failure	SJB	GO to Pinpoint Test C .

Symptom Chart

Symptom Chart

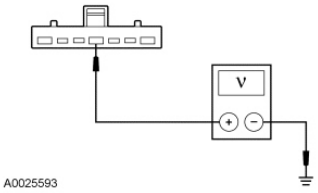
Pinpoint Test

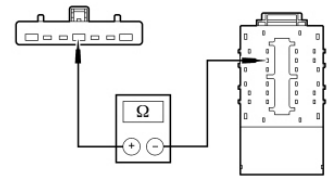
Pinpoint Test A: No Power in All Ignition Switch Positions

Refer to Wiring Diagrams Cell 13 , Power Distribution/SJB for schematic and connector information.

Normal Operation

The ignition switch receives fused battery voltage from Smart Junction Box (SJB) fuse 8 (15A) through circuit SBP08 (VT/RD). The ignition switch has 4 possible states:





- OFF
- RUN/ACC
- RUN/START
- START

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Ignition switch

PINPOINT TEST A: NO POWER IN ALL IGNITION SWITCH POSITIONS

NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

Test Step	Result / Action to Take
A1 CHECK FOR VOLTAGE TO THE IGNITION SWITCH	
• Disconnect: Ignition Switch C250. • Measure the voltage between ignition switch C250-4, circuit SBP08 (VT/RD), harness side and ground.  A0025593 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new ignition switch. REFER to Ignition Switch in this section. TEST the system for normal operation. **No** VERIFY that SJB fuse 8 (15A) is OK. If OK, GO to A2 . If not OK, REFER to the Wiring Diagrams Manual to identify the possible cause of the circuit short. TEST the system for normal operation.
A2 CHECK CIRCUIT SBP08 (VT/RD) FOR AN OPEN	
• Disconnect: SJB C2280c. • Measure resistance between ignition switch C250-4, circuit SBP08 (VT/RD), harness side and SJB C2280c-22, circuit SBP08 (VT/RD), harness side.  N0042597 • **Is the resistance less than 5 ohms?**	**Yes** REPAIR or INSTALL a new SJB as necessary. TEST the system for normal operation. **No** REPAIR circuit SBP08 (VT/RD). TEST the system for normal operation.

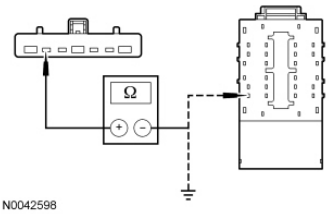
Pinpoint Test B: No Power in ACC/RUN

Refer to Wiring Diagrams Cell 13 , Power Distribution/SJB for schematic and connector information.

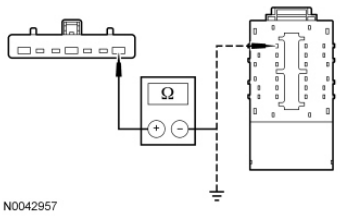
Normal Operation

When placed in ACC, the ignition switch provides voltage to the Smart Junction Box (SJB) on circuit CDC33 (VT/GN). When placed in RUN, the ignition switch provides voltage to the SJB and the instrument cluster on circuit CDC34 (WH/OG).

- DTC B1359 Ignition RUN/ACC Circuit Failure - If the SJB detects an open circuit, a short to voltage or a short to ground on the RUN/ACC circuit, DTC B1359 will be set.



This pinpoint test is intended to diagnose the following:



- Wiring, terminals or connectors

- Ignition switch
- SJB

PINPOINT TEST B: NO POWER IN ACC/RUN

NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

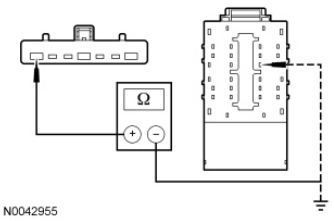
Test Step	Result / Action to Take
B1 RETRIEVE DTCs	
• Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: SJB Self Test. • Record DTCs. • **Is DTC B1359 or B1555 present?**	**Yes** If only DTC B1359 is present, GO to B2 . If only DTC B1555 is present, GO to B3 . If both DTCs are present, GO to B4 . **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.
B2 CHECK CIRCUIT CDC33 (VT/GN) FOR AN OPEN OR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: SJB C2280c. • Disconnect: Ignition Switch C250. • Measure resistance between: ♦ ignition switch C250-6, circuit CDC33 (VT/GN), harness side and SJB C2280c-5, circuit CDC33 (VT/GN), harness side. ♦ ignition switch C250-6, circuit CDC33 (VT/GN), harness side and ground.  • **Are the resistances less than 5 ohms between the components and greater than 10,000 ohms to ground?**	**Yes** GO to B4 . **No** REPAIR circuit CDC33 (VT/GN). CLEAR the DTCs. REPEAT the self-test.
B3 CHECK CIRCUIT CDC34 (WH/OG) FOR AN OPEN OR A SHORT TO GROUND	

• Ignition OFF. • Disconnect: SJB C2280c. • Disconnect: Ignition Switch C250. • Measure resistance between: ♦ ignition switch C250-1, circuit CDC34 (WH/OG), harness side and SJB C2280c-26, circuit CDC34 (WH/OG), harness side. ♦ ignition switch C250-1, circuit CDC34 (WH/OG), harness side and ground.  • **Are the resistances less than 5 ohms between the ignition switch and the SJB , and greater than 10,000 ohms between the ignition switch and ground?**	**Yes** GO to B4 . **No** REPAIR circuit CDC34 (WH/OG). CLEAR the DTCs. REPEAT the self-test.
B4 CHECK THE IGNITION SWITCH	
• Carry out the Ignition Switch Component Test. Refer to Wiring Diagrams Cell 149 for component testing. • **Is the ignition switch OK?**	**Yes** GO to B5 . **No** INSTALL a new ignition switch. REFER to Ignition Switch in this section. CLEAR the DTCs. REPEAT the self-test.
B5 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion. ♦ pushed-out pins. ♦ spread terminals. • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

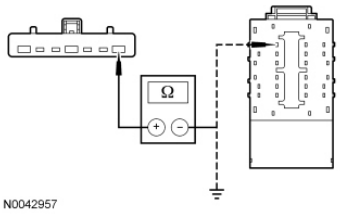
Pinpoint Test C: DTC B1555

Refer to Wiring Diagrams Cell 13 , Power Distribution/SJB for schematic and connector information.

Normal Operation



When placed in RUN, the ignition switch provides voltage to the Smart Junction Box (SJB) and the instrument cluster on circuit CDC34 (WH/OG). When placed in START, the ignition switch provides voltage to the SJB on circuit CDC35 (BU/WH).



- DTC B1555 Ignition RUN/START Circuit Failure - If the SJB detects an open circuit, a short to voltage or a short to ground on the RUN/START circuit, DTC B1555 will be set.

This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- Ignition switch
- SJB

PINPOINT TEST C: DTC B1555

NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

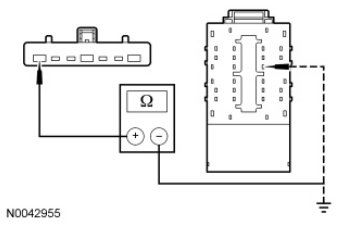
Test Step	Result / Action to Take
C1 RETRIEVE DTCs	
• Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: SJB Self Test. • Record DTCs. • **Is DTC B1363 or B1555 present?**	**Yes** If only DTC B1363 is present, GO to C2 . If only DTC B1555 is present, GO to C3 . If both DTCs are present, GO to C4 . **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.
C2 CHECK CIRCUIT CDC35 (BU/WH) FOR AN OPEN OR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: SJB C2280c. • Disconnect: Ignition Switch C250. • Measure the resistance between: ♦ ignition switch C250-7, circuit CDC35 (BU/WH), harness side and SJB C2280c-19, circuit CDC35 (BU/WH), harness side. ♦ ignition switch C250-7, circuit CDC35 (BU/WH), harness side and ground.  • **Are the resistances less than 5 ohms between the components and greater than 10,000 ohms to ground?**	**Yes** GO to C4 . **No** REPAIR circuit CDC35 (BU/WH). CLEAR the DTCs. REPEAT the self-test.

C3 CHECK CIRCUIT CDC34 (WH/OG) FOR AN OPEN OR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: SJB C2280c. • Disconnect: Ignition Switch C250. • Measure resistance between: ♦ ignition switch C250-1, circuit CDC34 (WH/OG), harness side and SJB C2280c-26, circuit CDC34 (WH/OG), harness side. ♦ ignition switch C250-1, circuit CDC34 (WH/OG), harness side and ground.  • **Are the resistances less than 5 ohms between the components and greater than 10,000 ohms to ground?**	**Yes** GO to C4 . **No** REPAIR circuit CDC34 (WH/OG). CLEAR the DTCs. REPEAT the self-test.
C4 CHECK THE IGNITION SWITCH	
• Carry out the Ignition Switch Component Test. Refer to Wiring Diagrams Cell 149 for component testing. • **Is the ignition switch OK?**	**Yes** GO to C5 . **No** INSTALL a new ignition switch. REFER to Ignition Switch in this section. CLEAR the DTCs. REPEAT the self-test.
C5 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion. ♦ pushed-out pins. ♦ spread terminals. • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test D: DTC B1363

Refer to Wiring Diagrams Cell 13 , Power Distribution/SJB for schematic and connector information.

Normal Operation



When placed in START, the ignition switch provides voltage to the Smart Junction Box (SJB) on circuit CDC35 (BU/WH).

- DTC B1363 Ignition START Circuit Failure - If the SJB detects an open circuit, a short to voltage or a short to ground on the START circuit, DTC B1363 will be set.

This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- Ignition switch
- SJB

PINPOINT TEST D: B1363

NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

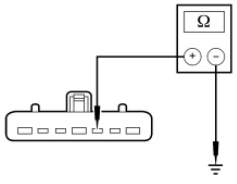
Test Step	Result / Action to Take
D1 RETRIEVE THE SJB DTCs	
• Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: SJB Self Test. • Record DTCs. • **Is DTC B1363 present?**	**Yes** GO to D2 . **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.
D2 CHECK CIRCUIT CDC35 (BU/WH) FOR AN OPEN OR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: SJB C2280c. • Disconnect: Ignition Switch C250. • Measure resistance between: ♦ ignition switch C250-7, circuit CDC35 (BU/WH), harness side and SJB C2280c-19, circuit CDC35 (BU/WH), harness side. ♦ ignition switch C250-7, circuit CDC35 (BU/WH), harness side and ground.  	**Yes** GO to D3 . **No** REPAIR circuit CDC35 (BU/WH). CLEAR the DTCs. REPEAT the self-test.

• **Is the resistance less than 5 ohms between the components, and greater than 10,000 ohms to ground?**	
D3 CHECK THE IGNITION SWITCH	
• Carry out the Ignition Switch Component Test. Refer to Wiring Diagrams Cell 149 for component testing. • **Is the ignition switch OK?**	**Yes** GO to D4 . **No** INSTALL a new ignition switch. REFER to Ignition Switch in this section. CLEAR the DTCs. REPEAT the self-test.
D4 CHECK FOR CORRECT SJB OPERATION	
• Inspect the SJB connectors. • Check for: ♦ corrosion. ♦ pushed-out pins. ♦ spread terminals. • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test E: The Ignition Key Cannot Be Removed from the Ignition Lock Cylinder

Refer to Wiring Diagrams Cell 13 , Power Distribution/SJB for schematic and connector information.

Normal Operation



When the transmission selector lever is placed in a position other than PARK, the key release interlock actuator (part of the ignition switch assembly) prevents the key from being removed from the ignition lock cylinder. The key release interlock actuator receives fused battery voltage from Smart Junction Box (SJB) fuse 8 (15A) along circuit SBP08 (VT/RD). Ground for the solenoid is provided along circuit CDC41 (WH/BN), through the park detection switch (internal to the transmission selector lever) and then along circuit GD138 (BK/WH). When the transmission selector lever is placed in a position other than PARK, the park detection switch applies ground to circuit CDC41 (WH/BN). This prevents the key from being removed from the ignition lock cylinder.

This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- Ignition switch
- Transmission selector lever

PINPOINT TEST E: THE IGNITION KEY CANNOT BE REMOVED FROM THE IGNITION LOCK CYLINDER

NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

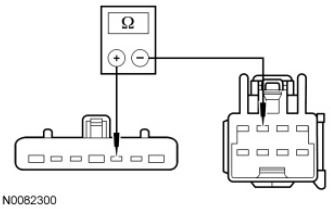
Test Step	Result / Action to Take

E1 CHECK THE TRANSMISSION SELECTOR LEVER	
• Ignition ON. • Apply the brake pedal. • Move the transmission selector lever from PARK, through all ranges and back to PARK. • **Can the transmission selector lever be moved freely into and out of the PARK position?**	**Yes** GO to E2 . **No** REFER to Section 307-05 to diagnose the automatic transmission external controls.
E2 CHECK THE IGNITION SWITCH	
• Carry out the Ignition Switch Mechanical Check. • **Is the ignition switch and ignition lock cylinder OK?**	**Yes** GO to E3 . **No** INSTALL a new ignition switch or ignition lock cylinder as necessary. For new ignition switch, REFER to Ignition Switch in this section. For new ignition lock cylinder, REFER to Section 501-14 .
E3 CHECK THE PARK DETECTION SWITCH	
• Place the transmission selector lever in the PARK position. • Ignition OFF. • Disconnect: Transmission Selector Lever C2008. • **Can the ignition key be removed from the ignition lock cylinder?**	**Yes** INSTALL a new transmission selector lever. REFER to Section 307-05 . TEST the system for normal operation. **No** GO to E4 .
E4 CHECK CIRCUIT CDC41 (WH/BN) FOR A SHORT TO GROUND	
• Disconnect: Ignition Switch C250. • Measure the resistance between ignition switch C250-3, circuit CDC41 (WH/BN), harness side and ground.  N0065439 • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new ignition switch. REFER to Ignition Switch in this section. TEST the system for normal operation. **No** REPAIR circuit CDC41 (WH/BN). TEST the system for normal operation.

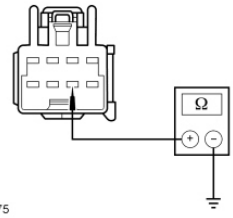
Pinpoint Test F: The Ignition Key Can Be Removed from the Ignition Lock Cylinder Regardless of Transmission Selector Lever Position

Refer to Wiring Diagrams Cell 13 , Power Distribution/SJB for schematic and connector information.

Normal Operation



When the transmission selector lever is placed in a position other than PARK, the key release interlock actuator (part of the ignition switch assembly) prevents the key from being removed from the ignition lock cylinder. The key release interlock actuator receives fused battery voltage from Smart Junction Box (SJB) fuse 8 (15A) along circuit SBP08 (VT/RD). Ground for the solenoid is provided along circuit CDC41 (WH/BN), through the park detection switch (internal to the transmission selector lever) and then along circuit GD138 (BK/WH). When the transmission selector lever is placed in a position other than PARK the park detection switch applies ground to circuit CDC41 (WH/BN). This prevents the key from being removed from the ignition lock cylinder.



This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Ignition switch
- Transmission selector lever

PINPOINT TEST F: THE IGNITION KEY CAN BE REMOVED FROM THE IGNITION LOCK CYLINDER REGARDLESS OF TRANSMISSION SELECTOR LEVER POSITION

NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

Test Step	Result / Action to Take
F1 CHECK CIRCUIT CDC41 (WH/BN) FOR AN OPEN	
• Ignition OFF. • Disconnect: Transmission Selector Lever C2008. • Disconnect: Ignition Switch C250. • Measure the resistance between ignition switch C250-3 circuit CDC41 (WH/BN), harness side and transmission selector lever C2008-3, circuit CDC41 (WH/BN), harness side.  N0082300 • **Is the resistance less than 5 ohms?**	**Yes** GO to F2 . **No** REPAIR circuit CDC41 (WH/BN). TEST the system for normal operation.
F2 CHECK CIRCUIT 1205 (BK) FOR AN OPEN	
• Measure the resistance between transmission selector lever C2008-6, circuit GD138 (BK/WH), harness side and ground.	**Yes** GO to F3 . **No** REPAIR circuit CDC138 (BK/WH). TEST the system for normal operation.

 • **Is the resistance less than 5 ohms?**	
F3 CHECK THE PARK DETECTION SWITCH	
• Connect: Ignition Switch C250. • Ignition ON. • Apply the parking brake and place the transmission selector lever in the NEUTRAL position. • Connect a fused jumper wire between transmission selector lever C2008-3, circuit CDC41 (WH/BN), harness side and transmission selector lever C2008-6, circuit GD138 (BK/WH) harness side. • **Can the ignition key be removed from the lock cylinder?**	**Yes** INSTALL a new ignition switch. REFER to Ignition Switch in this section. TEST the system for normal operation. **No** INSTALL a new transmission selector lever. REFER to Section 307-05 . TEST the system for normal operation.

Component Tests

Ignition Switch - Mechanical

The following conditions can cause difficulty in operating the ignition switch and lock cylinder:

- Burrs on the lock cylinder key
- Insufficient lube on the lock cylinder
- Binding lock cylinder
- Burrs or foreign material around the rack-and-pinion actuator in the lock cylinder housing
- Insufficient lube on the actuator (do not apply lubricant to the inside of the ignition switch)
- Binding ignition switch

Carry out the following test to determine if the ignition switch and lock cylinder are operating correctly.

1. If the ignition key can be removed, inspect the ignition key for any burrs, damage or incorrect cut. Have a new ignition key made as necessary. If the ignition key cannot be removed, continue with Step 2.

2. Turn the key to the ACC position and then the RUN position.
   - If the ignition key turns to the ACC and RUN position, continue with Step 3.
   - If the ignition key will not turn to the ACC and RUN position, continue with Step 4.

3. **NOTE:** The ignition switch and lock cylinder should return from the START position back to the RUN position without assistance.

   Turn the ignition key to the START position and release the key.

   - If the ignition switch and lock cylinder return from the START position back to the RUN position without assistance, the ignition switch is operating correctly at this time.

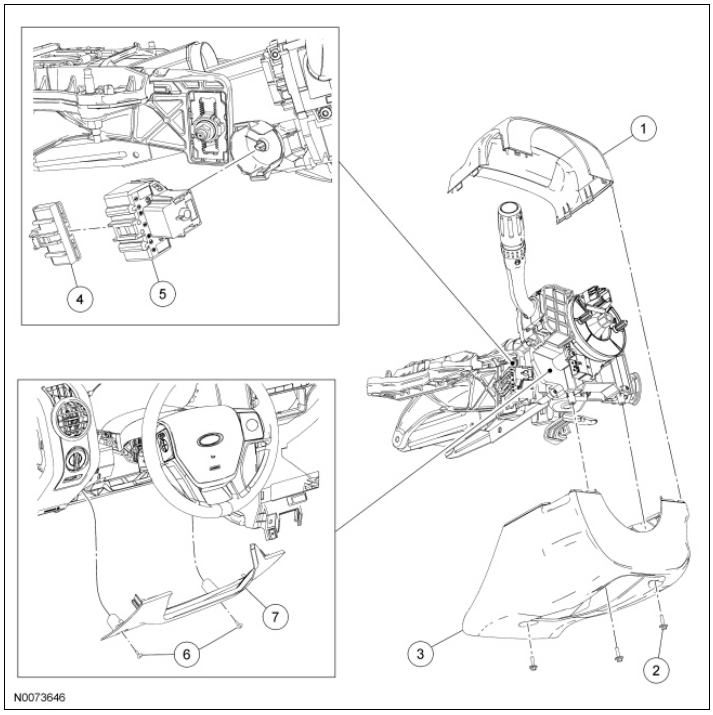
- If the ignition switch and lock cylinder do not return from the START position back to the RUN position without assistance, continue with Step 4.

4. Remove the ignition lock cylinder. Refer to Section 501-14 .

5. Rotate the ignition lock cylinder through all of the switch positions.
   - If the lock cylinder operates correctly, continue with Step 6.
   - If the lock cylinder does not operate correctly, install a new ignition lock cylinder. Refer to Section 501-14 .

6. Check for binding or sticking ignition switch actuating rod, burrs around the rack-and-pinion actuator in the ignition lock cylinder housing or insufficient lubrication.
   - If there is sufficient lubrication and there are no burrs, binding or sticking conditions; install a new ignition switch. Refer to Ignition Switch in this section.
   - If there is insufficient lubrication, burrs, binding or sticking conditions; repair or lubricate as necessary.

Ignition Switch - Electrical



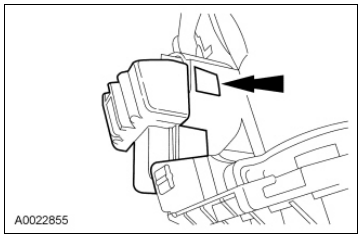
Refer to Wiring Diagrams Cell 149 for component testing.

Multifunction Switch - Electrical

Refer to Wiring Diagrams Cell 149 for component testing.

Ignition Switch

NOTE: Steering wheel removed for clarity.

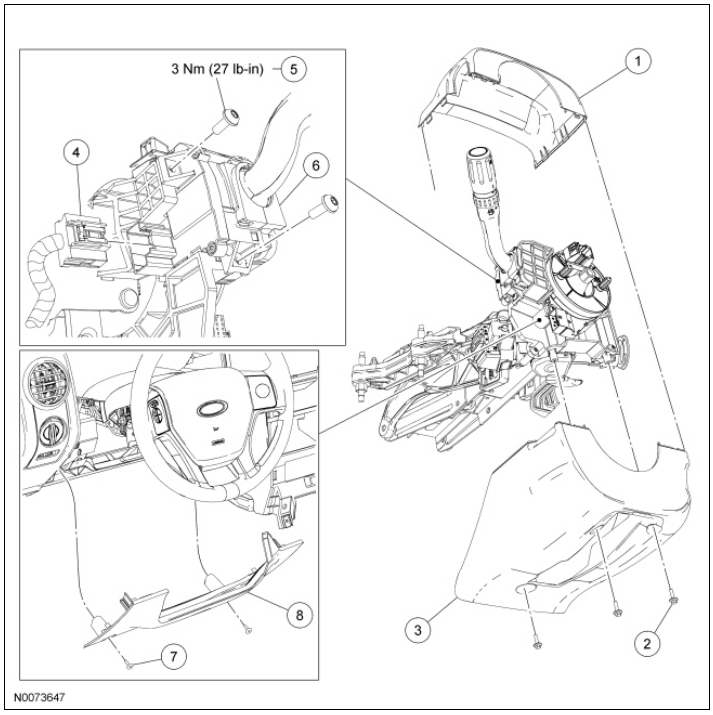


Item	Part Number	Description
1	3530	Upper steering column shroud
2	W705314	Lower steering column shroud screw (3 required)
3	3530	Lower steering column shroud
4	-	Ignition switch electrical connector (part of 14401)
5	W706952	Ignition switch
6	W705314	Steering column opening cover screws (2 required)
7	04459	Steering column opening cover

Removal and Installation

NOTICE: **Do not remove the ignition lock cylinder and the ignition switch at the same time or damage to the column may result.**

1. Depower the Supplemental Restraint System (SRS). For additional information, refer to Section 501-20B .
2. Remove the 2 screws and the steering column opening cover.
3. Remove the 3 screws and the upper and lower steering column shrouds.
4. Disconnect the ignition switch electrical connector.
5. Push the 2 locking tabs inward and remove the ignition switch.



6. To install, reverse the removal procedure.

7. Repower the SRS . For additional information, refer to Section 501-20B .

Steering Column Multifunction Switch

NOTE: Steering wheel removed for clarity.

Item	Part Number	Description
1	3530	Upper steering column shroud
2	W705314	Lower steering column shroud screw (3 required)
3	3530	Lower steering column shroud
4	-	Multifunction switch electrical connector (part of 14401)
5	W706952	Multifunction switch screw (2 required)
6	3K359	Multifunction switch
7	W705314	Steering column opening cover screw (2 required)
8	04459	Steering column opening cover

Removal and Installation

NOTICE: **Do not remove the ignition lock cylinder and the ignition switch at the same time or damage to the column may result.**

1. Remove the 2 screws and the steering column opening cover.

2. Remove the 3 screws and the upper and lower steering column shrouds.

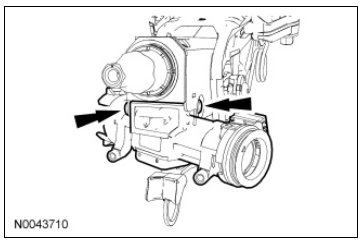
3. Disconnect the multifunction switch electrical connector.

4. Remove the 2 multifunction switch screws and the multifunction switch.
    - To install, tighten to 3 Nm (27 lb-in).

5. To install, reverse the removal procedure.

Steering Column Lock Module

Removal and Installation



NOTICE: **Do not remove the ignition lock cylinder and the ignition switch at the same time or damage to the column may result.**

1. Remove the ignition switch. For additional information, refer to Ignition Switch in this section.

2. Remove the clockspring. For additional information, refer to Section 501-20B .

3. **NOTE:** Clean all metal shavings and foreign material after cutting slots in the steering column lock module bolts.

   Cut slots into the heads of the 2 steering column lock module bolts.

4. Remove the 2 steering column lock module bolts.
   - Discard the bolts.

5. Remove the steering column lock module clamp.

6. Remove the steering column lock module.

7. To install, reverse the removal procedure.
   - Align the ribs on the steering column lock module with the window of the steering column tube.
   - Align the locating pin with the slot on the locating bracket of the steering column.
   - Tighten the 2 new bolts until the heads of the bolts shear off.

Material

Item	Specification	Fill Capacity
A/C Cooling Coil Coating YN-29	-	-
A/C System Flushing Solvent YN-23	-	-
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B	266 ml (9 fl oz) (vehicles without auxiliary systems)
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B	473 ml (16 fl oz) (vehicles with auxiliary systems)
R-134a Refrigerant YN-19 (US); CYN-16-P or CYN-16-R (Canada)	WSH-M17B19-A	0.77 kg (27 oz) (1.7 lb) (vehicles without auxiliary systems)
R-134a Refrigerant YN-19 (US); CYN-16-P or CYN-16-R (Canada)	WSH-M17B19-A	1.25 kg (44 oz) (2.75 lb) (vehicles with auxiliary systems)

General Specifications

Item	Specification
A/C Compressor Magnetic Clutch	
Air gap clearance	0.35-0.65 mm (0.014-0.026 in)
A/C Compressor With Auxiliary A/C	
Rotation	Clockwise
Type	Halla FS20 piston
A/C Compressor Without Auxiliary A/C	
Rotation	Clockwise
Type	Halla FS18 piston
A/C Cycling Switch [a]	
Closed status	290 kPa (42 psi)
Open status	145-159 kPa (21-23 psi)

A/C Pressure Relief Valve [a]	
Open pressure	3,792-4,137 kPa (550-600 psi)
Evaporator Core Orifice With Auxiliary A/C	
Color	Black
Evaporator Core Orifice Without Auxiliary A/C	
Color	Red
Refrigerant System Dye	
R-134a Leak Detection Dye 164-R6060 or 164-R6081	-

[a] Manifold gauge set pressures may vary slightly depending on the distance between the service gauge port valve and the A/C pressure relief valve, the A/C cycling switch and the pressure cutoff switch location.

Climate Control System

⚠ WARNING: Take the following precautions when repairing an air conditioning system containing R-134a:

- Always wear safety goggles.
- Avoid contact with liquid refrigerant R-134a. R-134a vaporizes at approximately -25°C (-13°F) under atmospheric pressure and will freeze skin tissue.
- Never allow refrigerant R-134a gas to escape in quantity in an occupied space. It will displace the oxygen needed to support life.
- Never use a torch in an atmosphere containing R-134a gas. R-134a is non-toxic at all normal conditions, but it decomposes when exposed to high temperatures such as a torch flame. During decomposition it releases irritating and toxic gasses (as described in the MSDS sheet from the manufacturer). Decomposition products are hydrofluoric acid, carbon dioxide and water.

Failure to follow these instructions may result in serious personal injury.

NOTICE: **To avoid damaging the vehicle or Air Conditioning (A/C) components, the following precautions must be observed.**

- The A/C refrigerant of all vehicles must be identified and analyzed prior to refrigerant charging. Failure to do so can contaminate the shop bulk refrigerant and other vehicles.
- Do not add R-12 refrigerant to an A/C system that requires the use of R-134a refrigerant. These 2 types of refrigerant must never be mixed. Doing so can damage the A/C system.
- Charge the A/C system with the engine running only at the low-pressure side to prevent refrigerant slugging from damaging the A/C compressor.
- Use only R-134a refrigerant. Due to environmental concerns, when the A/C system is drained, the refrigerant must be collected using refrigerant recovery/recycling equipment. Federal, State/Provincial and/or local laws REQUIRE that R-134a be recovered into appropriate recovery equipment and the process be conducted by qualified technicians who have been certified by an approved organization, such as ASE or Mobile Air Conditioning Society (MACS). Use of a recovery machine dedicated to R-134a is necessary to reduce the possibility of oil and refrigerant incompatibility concerns. Refer to the instructions provided by the equipment manufacturer when removing refrigerant from or charging the A/C system.
- Refrigerant R-134a must not be mixed with air for leak testing or used with air for any other purpose above atmospheric pressure. R-134a is combustible when mixed with high concentrations of air and higher pressures.
- A number of manufacturers are producing refrigerant products that are described as direct substitutes for Refrigerant R-134a. The use of any unauthorized substitute refrigerant can severely damage the A/C components. If repair is required, use only new or recycled Refrigerant R-134a.

NOTICE: **To avoid contamination of the Air Conditioning (A/C) system:**

- Never open or loosen a connection before recovering the refrigerant.
- When loosening a connection, if any residual pressure is evident, allow it to leak out before opening the fitting.
- Evacuate a system that has been opened to install a new component or one that has discharged through leakage before charging.
- Seal open fittings with a cap or plug immediately after disconnecting a component from the system.
- Clean the outside of the fittings thoroughly before disconnecting a component from the system.

- Do not remove the sealing caps from a new component until ready to install.
- Refrigerant oil will absorb moisture from the atmosphere if left uncapped. Do not open an oil container until ready to use and install the cap immediately after using. Store the oil in a clean, moisture-free container.
- Install a new O-ring seal before connecting an open fitting. Coat the fitting and O-ring seal with mineral oil before connecting.
- When installing a refrigerant line, avoid sharp bends. Position the line away from the exhaust or any sharp edges that can chafe the line.
- Tighten threaded fittings only to specifications. The steel and aluminum fittings used in the refrigerant system will not tolerate overtightening.
- When disconnecting a fitting, use a wrench on both halves of the fitting to prevent twisting of the refrigerant lines or tubes.
- Do not open a refrigerant system or uncap a new component unless it is as close as possible to room temperature. This will prevent condensation from forming inside a component that is cooler than the surrounding air.

The manual climate control system heats or cools the vehicle depending on the function selector switch position and the temperature selected.

- The function selector switch position determines heating or cooling, air distribution and enables blower motor operation.
- The temperature control setting determines the air temperature.
- The blower motor switch varies the blower motor speed.

The Dual Automatic Temperature Control (DATC) system maintains the selected vehicle interior temperature by heating and/or cooling the air.

- During A/C operation the system also reduces the relative humidity of the air.
- The driver may override the automatic mode of operation.
- The driver side and passenger side temperature settings can be individually controlled.

The system components are the following:

- A/C compressor
- A/C compressor clutch assembly
- A/C condenser core
- A/C evaporator core
- Suction accumulator
- Connecting refrigerant lines
- A/C evaporator core orifice
- A/C cycling switch
- A/C pressure transducer
- Heater core and evaporator core housing
- HVAC module - DATC
- Manual climate control assembly
- Blower switch (manual system)
- Temperature blend door actuator(s)
- Blower motor resistor or speed control module
- Blower motor
- Ambient temperature sensor
- In-vehicle temperature sensor
- Solar radiation sensor
- Auxiliary connecting refrigerant lines
- Auxiliary heater core and evaporator core housing

- Auxiliary A/C evaporator core
- Auxiliary climate control assembly
- Auxiliary blower motor
- Auxiliary blower motor resistor

Climate Control System Operation

Manual Climate Control System

The manual climate control system operation is determined by the settings on the climate control assembly. The climate control assembly includes a serviceable function selector switch and blower motor switch. The temperature control switch, A/C request switch and rear window defrost switch are integral to the climate control assembly and are serviced as an assembly.

The blower motor switch:

- sets the front blower motor speed.
- directs the blower motor path to ground through the blower motor resistor to allow blower motor operation in LO, MED-LO and MED-HI.
- actuates the high speed blower motor relay, giving the blower motor a direct path to ground which allows the blower motor to operate in HI.

The temperature control switch:

- is a potentiometer that outputs a variable voltage to the temperature blend door actuator to set the position of the temperature blend door.
- initiates closing of the heater control valve. When set to full COOL, a lever on the temperature blend door pivot shaft depresses the pintle of the heater control valve vacuum switch. The heater control valve vacuum switch then applies vacuum to the heater control valve, closing off engine coolant flow to the heater core.
- is serviced only with the climate control assembly.

The function selector switch setting:

- determines where the system airflow is directed.
- enables blower motor operation.
- enables auxiliary blower motor operation, if equipped, by supplying voltage to the auxiliary blower motor relay.
- commands A/C compressor operation in MAX A/C, FLOOR/DEFROST and DEFROST.

The A/C request switch:

- can command the A/C compressor on when the function selector switch is in PANEL, FLOOR/PANEL and FLOOR when the A/C request switch is pressed.
- is inoperative in MAX A/C, OFF, FLOOR/DEFROST and DEFROST.
- indicator illuminates when the function selector switch is in MAX A/C and cannot be toggled.
- indicator does not illuminate in OFF and cannot be toggled.
- indicator does not illuminate in FLOOR/DEFROST and DEFROST and cannot be toggled. The A/C compressor will not operate if the outside air temperature is below -1°C (30°F). The A/C compressor will resume operation when the outside air temperature rises above 2°C (35°F).
- is serviced only with the climate control assembly.

Dual Automatic Temperature Control (DATC) System

The DATC system maintains the selected vehicle interior temperature by heating and/or cooling the air.

- During A/C operation the system also reduces the relative humidity of the air.
- The driver may override the automatic mode of operation.
- The temperature control setting determines the desired air temperature.
- The blower motor control override buttons vary the blower motor speed.
- The driver side and passenger side temperature settings can be individually controlled.

The DATC system operation is determined by the settings on the HVAC module - DATC . The DATC system automatically maintains a selected temperature for vehicle interior comfort, including capabilities to maintain separate temperature settings for the driver and front passenger. The electronic temperature control capabilities are achieved by splitting the air distribution system internally and utilizing 2 individually operated temperature blend doors. The DATC system is composed of the HVAC module - DATC , solenoid and manifold assembly, blower motor speed control, 4 vacuum control motors, 2 temperature blend door actuators, in-car temperature sensor, ambient air temperature sensor and solar radiation sensor to control the various functions.

When the HVAC module - DATC is set to AUTO:

- the air distribution direction, heater control valve operation and blower motor speed are automatically controlled based on the temperature(s) selected.

The HVAC module - DATC manual override settings:

- allow the air distribution direction to be manually selected.
- allow the blower motor speed to be manually selected.
- allow RECIRCULATION mode to be manually selected except in FLOOR/DEFROST and DEFROST. The A/C request can be cancelled by pressing the A/C request switch, turning the indicator off.
- allow A/C compressor operation to be manually selected except in FLOOR/DEFROST and DEFROST.

The HVAC module - DATC also includes:

- an EXT button to monitor ambient (outside) air temperature. By pressing the EXT button the ambient temperature will be displayed on the HVAC module - DATC display until the EXT button is pressed again.
- a F°/C° temperature conversion button to toggle the temperature being displayed from Fahrenheit and Celsius.
- a rear window defrost button (Explorer only). Refer to Section 501-11 .

Dual temperature control can be enabled in AUTO or in all manual override settings. When the HVAC module - DATC is set to DUAL:

- the DATC system enables varying temperatures to be selected by the driver and the front passenger. Dual temperature control is indicated by the presence of 2 temperature settings on the HVAC module - DATC display. To return to single temperature control press the DUAL button, turning the DUAL button indicator off and the front passenger temperature display off.
- the air distribution direction and the blower motor speed cannot be varied between the driver and front passenger. Only the temperature settings can be varied.
- the system will favor the driver temperature setting if the driver and front passenger temperature set

points vary greatly.

External Temperature Display

The external temperature is displayed when the EXT button is pressed. While the actual external temperature can vary continuously, the value that is displayed will update at a specific rate depending on whether or not the engine is "hot" and whether or not the vehicle is moving.

When the external temperature is rising, the display will update slowly.

Updates (when the actual external temperature is higher than currently displayed value) will be limited to 0.6°C (1°F) every 20 seconds while the vehicle is moving at greater than 40 km/h (25 mph) for more than 90 seconds OR 0.6°C (1°F) every 20 minutes if the vehicle is not moving at this speed. This is to prevent the heat from the engine compartment from affecting the accuracy of the display.

When the external temperature is dropping, the display will update quickly.

Updates (when the actual external temperature is lower than currently displayed value) will only be limited to 0.6°C (1°F) every 2 seconds (regardless of vehicle speed). Consequently the display will essentially follow the drop experienced by the external temperature thermistor.

Auxiliary Climate Control System

NOTE: Auxiliary climate control system not available on Sport Trac model.

An auxiliary climate control system is available as optional equipment. The auxiliary climate control system operation is determined by the settings on the front auxiliary climate control assembly. The auxiliary climate control assemblies include a blower motor switch, temperature control switch and air distribution mode switch, none of which can be individually serviced.

On vehicles with manual climate control the auxiliary blower motor operation is enabled when the function selector switch is in any position except OFF. The auxiliary system air can be cooled below ambient temperature only when A/C compressor operation has been requested by the settings of the climate control assembly of the base (front) system. The auxiliary system air can be heated at any time, the heater control valve does not affect the auxiliary climate control system operation.

On vehicles with DATC the auxiliary blower motor is operational regardless of the DATC system setting. The auxiliary system air can be cooled below ambient temperature only when A/C compressor operation has been requested by the settings of the HVAC module - DATC . The auxiliary system air can be heated at any time, the heater control valve operation does not affect the auxiliary climate control system.

The front auxiliary climate control assembly:

- blower motor switch controls the auxiliary blower motor speed. The blower motor speed can be set to OFF, MED-LO, MED-HI or HI.
- air distribution mode switch toggles airflow between the overhead vents and the floor vent by outputting signals to the auxiliary airflow mode door actuator which positions the auxiliary airflow mode door in all blower motor switch positions. Back-lit icons on the front climate control display indicate the source of the auxiliary system airflow.
- temperature control switch is a potentiometer that outputs a variable voltage to the auxiliary temperature blend door actuator to set the position of the auxiliary temperature blend door in all blower motor switch positions. The temperature of the auxiliary system air may be affected by the manual climate control assembly or HVAC module - DATC settings (as equipped). When A/C

compressor operation has not been initiated (A/C compressor commanded on) by the manual climate control assembly or the HVAC module - DATC (as equipped), the auxiliary climate control system cannot cool the air below that of the ambient temperature.

System Airflow Description - Manual Climate Control

MAX A/C

When MAX A/C is selected:

- the air inlet door vacuum control motor is at full vacuum, closing off outside air and admitting only recirculated air.
- the panel door vacuum control motor is at full vacuum and the defrost door and floor door vacuum control motors are at no vacuum, directing airflow to the instrument panel A/C registers. A small amount of airflow from the floor duct, defroster duct and side window demisters will be present.
- the heater control valve is at full vacuum when the temperature selection is in the full COOL position, preventing the flow of hot coolant to the heater core. Otherwise, blended air temperature is available.
- air will be drawn from the recirculated air inlet by the blower motor. When the temperature selection is in the full COOL position, the airflow will be diverted past the heater core and then into the passenger compartment through the instrument panel A/C registers.
- the A/C request switch will be illuminated and will be disabled.
- The A/C compressor will not operate if the outside air temperature is below -1°C (30°F). The A/C compressor will resume operation when the outside air temperature rises above 2°C (35°F).
- the blower motor is ON.
- the auxiliary blower motor is enabled, if equipped.

PANEL

When PANEL is selected:

- the air inlet door vacuum control motor is at no vacuum, admitting only outside air into the passenger compartment.
- the panel door vacuum control motor is at full vacuum and the defrost door and floor door vacuum control motors are at no vacuum, directing airflow to the instrument panel A/C registers. A small amount of airflow from the floor duct, defroster duct and side window demisters will be present.
- the heater control valve is at full vacuum when the temperature selection is in the full COOL position, preventing the flow of hot coolant to the heater core. Otherwise, blended air temperature is available.
- the A/C request switch will be enabled. The A/C compressor can operate and the indicator will be illuminated if the A/C request switch is selected and if the outside air temperature is not below -1°C (30°F). If the outside air temperature has gone below -1°C (30°F), A/C compressor operation will resume when the outside air temperature rises above 2°C (35°F).
- the blower motor is ON.
- the auxiliary blower motor is enabled, if equipped.

PANEL/FLOOR

When PANEL/FLOOR is selected:

- the air inlet door vacuum control motor is at no vacuum, admitting only outside air into the passenger compartment.
- the panel door and floor door vacuum control motors are at full vacuum and the defrost door vacuum control motor is at no vacuum, directing airflow to the floor duct and the instrument panel A/C registers. A small amount of airflow from the defroster duct and side window demisters will be

present.
- the heater control valve is at full vacuum when the temperature selection is in the full COOL position, preventing the flow of hot coolant to the heater core. Otherwise, blended air temperature is available.
- the A/C request switch will be enabled. The A/C compressor can operate and the indicator will be illuminated if the A/C request switch is selected and if the outside air temperature is not below -1°C (30°F). If the outside air temperature has gone below -1°C (30°F), A/C compressor operation will resume when the outside air temperature rises above 2°C (35°F).
- the blower motor is ON.
- the auxiliary blower motor is enabled, if equipped.

OFF

When OFF is selected:

- the air inlet door vacuum control motor is at full vacuum, closing off outside air from entering the passenger compartment.
- the defrost door vacuum control motor is at full vacuum and the panel door and floor door vacuum control motors are at no vacuum, closing off airflow to the passenger compartment outlets.
- the heater control valve is at full vacuum when the temperature selection is in the full COOL position, preventing the flow of hot coolant to the heater core.
- the A/C request switch is disabled.
- the blower motor is OFF.
- the auxiliary blower motor is disabled, if equipped.

FLOOR

When FLOOR is selected:

- the air inlet door vacuum control motor is at no vacuum, admitting only outside air into the passenger compartment.
- the floor door and defrost door vacuum control motors are at full vacuum and the panel door vacuum control motors are at no vacuum, directing airflow to the floor duct and the defroster duct. A small amount of airflow from the instrument panel A/C registers, defroster duct and side window demisters will be present.
- the heater control valve is at full vacuum when the temperature selection is in the full COOL position, preventing the flow of hot coolant to the heater core. Otherwise, blended air temperature is available.
- the A/C request switch will be enabled. The A/C compressor can operate and the indicator will be illuminated if the A/C request switch is selected and if the outside air temperature is not below -1°C (30°F). If the outside air temperature has gone below -1°C (30°F), A/C compressor operation will resume when the outside air temperature rises above 2°C (35°F).
- the blower motor is ON.
- the auxiliary blower motor is enabled, if equipped.

FLOOR/DEFROST

When FLOOR/DEFROST is selected:

- the air inlet door vacuum control motor is at no vacuum, admitting only outside air into the passenger compartment.
- the floor door vacuum control motor is at full vacuum and the defrost door and panel door vacuum control motors are at no vacuum, directing airflow to the floor duct, the defroster duct and the side window demisters. A small amount of airflow from the instrument panel A/C registers will be present.
- the heater control valve is at full vacuum when the temperature selection is in the full COOL position, preventing the flow of hot coolant to the heater core. Otherwise, blended air temperature is available.

- the A/C request switch will not illuminate and will be disabled. To reduce fogging, the A/C compressor will operate automatically if the outside air temperature is not below -1°C (30°F). If the outside air temperature has gone below -1°C (30°F), A/C compressor operation will resume when the outside air temperature rises above 2°C (35°F).
- the blower motor is ON.
- the auxiliary blower motor is enabled, if equipped.

DEFROST

When DEFROST is selected:

- the air inlet door vacuum control motor is at no vacuum, admitting only outside air into the passenger compartment.
- the floor door, panel door and defrost door vacuum control motors are at no vacuum, directing airflow to the defroster duct and the side window demisters. A small amount of airflow from the instrument panel A/C registers and floor duct will be present.
- the heater control valve is at full vacuum when the temperature selection is in the full COOL position, preventing the flow of hot coolant to the heater core. Otherwise, blended air temperature is available.
- the A/C request switch will not illuminate and will be disabled. To reduce fogging, the A/C compressor will operate automatically if the outside air temperature is not below -1°C (30°F). If the outside air temperature has gone below -1°C (30°F), A/C compressor operation will resume when the outside air temperature rises above 2°C (35°F).
- the blower motor is ON.
- the auxiliary blower motor is enabled, if equipped.

System Airflow Description - Dual Automatic Temperature Control (DATC) System

AUTO

When AUTO is selected:

- the temperature control setting(s) is/are manually set to the desired setting(s).
- the air inlet door vacuum control motor is controlled by the HVAC module - DATC , based on the temperature settings.
- the mode door vacuum control motors are controlled by the HVAC module - DATC , based on the temperature settings.
- the heater control valve is by the HVAC module - DATC based on the temperature settings.
- the A/C request is controlled by the HVAC module - DATC based on the temperature settings. The A/C compressor will not operate if the outside air temperature is below -1°C (30°F). The A/C compressor will resume operation when the outside air temperature rises above 2°C (35°F).
- the A/C request switch or the RECIRC button, if pressed, will transfer the system to manual operation.
- the blower motor is ON. The blower motor speed is automatically controlled by the HVAC module - DATC based on the temperature settings, but can be manually overridden.

OFF

When OFF is selected:

- the air inlet door vacuum control motor is at full vacuum, closing off outside air to the passenger compartment.
- the defrost door vacuum control motor is at full vacuum and the floor door and panel door vacuum control motors are at no vacuum, closing off airflow to the passenger compartment outlets.

- the heater control valve is at full vacuum, preventing the flow of hot coolant to the heater core.
- the blower motor is OFF.

PANEL

When PANEL is selected:

- the RECIRC button is enabled. If the RECIRC button is pressed (indicator ON) the air inlet door vacuum control motor is at full vacuum, closing off outside air to the passenger compartment. If the RECIRC button is not selected (indicator OFF), the air inlet door vacuum control motor will be at no vacuum, admitting only outside air into the passenger compartment.
- the defrost door and panel door vacuum control motors are at full vacuum and the floor door vacuum control motor is at no vacuum, directing airflow to the instrument panel A/C registers. A small amount of airflow from the floor duct, defroster duct and side window demisters will be present.
- the heater control valve is controlled by the HVAC module - DATC based on the temperature settings.
- temperature control can be adjusted by directing the airflow through and around the heater core. Only when A/C compressor operation has been selected by pressing the A/C request switch (indicator ON) can the airflow temperature be cooled below that of the ambient (outside) air temperature.
- the A/C request switch is enabled. When the A/C request switch is pressed (indicator ON), the A/C compressor can operate if the outside air temperature is not below -1°C (30°F). If the outside air temperature has gone below -1°C (30°F), A/C compressor operation will resume when the outside air temperature rises above 2°C (35°F).
- the blower motor is ON.

PANEL/FLOOR

When PANEL/FLOOR is selected:

- the RECIRC button is enabled. If the RECIRC button is pressed (indicator ON), the air inlet door vacuum control motor is at full vacuum, closing off outside air to the passenger compartment. If the RECIRC button is not selected (indicator OFF) the air inlet door vacuum control motor will be at no vacuum, admitting only outside air into the passenger compartment.
- the defrost door, panel door and floor door vacuum control motors are at full vacuum, directing airflow to the instrument panel A/C registers and to the floor duct. A small amount of airflow from the defroster duct and side window demisters will be present.
- the heater control valve is controlled by the HVAC module - DATC based on the temperature settings.
- temperature control can be adjusted by directing the airflow through and around the heater core. Only when A/C compressor operation has been selected by pressing the A/C request switch (indicator ON) can the airflow temperature be cooled below that of the ambient (outside) air temperature.
- the A/C request switch is enabled. When the A/C request switch is pressed (indicator ON), the A/C compressor can operate if the outside air temperature is not below -1°C (30°F). If the outside air temperature has gone below -1°C (30°F), A/C compressor operation will resume when the outside air temperature rises above 2°C (35°F).
- the blower motor is ON.

FLOOR

When FLOOR is selected:

- the RECIRC button is enabled. If the RECIRC button is pressed (indicator ON), the air inlet door vacuum control motor is at full vacuum, closing off outside air to the passenger compartment. A RECIRC door time-out strategy will be used to prevent fogging and the RECIRC function will

automatically be turned off after approximately 4 minutes. If the RECIRC button is not selected (indicator OFF), the air inlet door vacuum control motor will be at no vacuum, admitting only outside air into the passenger compartment.
- the defrost door and floor door vacuum control motors are at full vacuum and the panel door vacuum control motor is at no vacuum, directing airflow to the floor duct. A small amount of airflow from the instrument panel A/C registers, defroster duct and side window demisters will be present.
- the heater control valve is controlled by the HVAC module - DATC based on the temperature settings.
- temperature control can be adjusted by directing the airflow through and around the heater core. Only when A/C compressor operation has been selected by pressing the A/C request switch (indicator ON) can the airflow temperature be cooled below that of the ambient (outside) air temperature.
- the A/C request switch is enabled. When the A/C request switch is pressed (indicator ON), the A/C compressor can operate if the outside air temperature is not below -1°C (30°F). If the outside air temperature has gone below -1°C (30°F), A/C compressor operation will resume when the outside air temperature rises above 2°C (35°F).
- the blower motor is ON.

FLOOR/DEFROST

When FLOOR/DEFROST is selected:

- the RECIRC button is disabled. The air inlet door vacuum control motor is at no vacuum, admitting only outside air into the passenger compartment.
- the floor door vacuum control motor is at full vacuum and the defrost door and panel door vacuum control motors are at no vacuum, directing airflow to the floor duct, defroster duct and side window demisters. A small amount of airflow from the instrument panel A/C registers will be present.
- the heater control valve is controlled by the HVAC module - DATC based on the temperature settings.
- temperature control can be adjusted by directing the airflow through and around the heater core.
- the A/C request switch will be disabled and will not illuminate. The A/C compressor will operate automatically if the outside air temperature is not below -1°C (30°F). If the outside air temperature has gone below -1°C (30°F), A/C compressor operation will resume when the outside air temperature rises above 2°C (35°F).
- the blower motor is ON.

DEFROST

When DEFROST is selected:

- the RECIRC button is disabled. The air inlet door vacuum control motor is at no vacuum, admitting only outside air into the passenger compartment.
- the floor door, defrost door and panel door vacuum control motors are at no vacuum, directing airflow to the defroster duct and side window demisters. A small amount of airflow from the instrument panel A/C registers and the floor duct will be present.
- the heater control valve is controlled by the HVAC module - DATC based on the temperature settings.
- temperature control can be adjusted by directing the airflow through and around the heater core.
- the A/C request switch will be disabled and will not illuminate. The A/C compressor will operate automatically if the outside air temperature is not below -1°C (30°F). If the outside air temperature has gone below -1°C (30°F), A/C compressor operation will resume when the outside air temperature rises above 2°C (35°F).
- the blower motor is ON.

Principles of Operation

Compressor Anti-Slugging Strategy (CASS)

Liquid refrigerant may accumulate in the A/C compressor under certain conditions. To alleviate damage to the A/C compressor, Compressor Anti-Slugging Strategy (CASS) is utilized.

CASS is initiated only under specific conditions:

- The ignition is off for more than 8 hours
- The ambient temperature is above -4°C (25°F)
- Battery voltage is above 8.5 volts during engine cranking

When these conditions are present, the PCM will activate the A/C control relay prior to cranking of the engine. The A/C control relay engages the A/C compressor for approximately 4-15 A/C compressor

revolutions or a maximum of 2 seconds (depending upon vehicle application), allowing the liquid refrigerant to be pushed from the A/C compressor. CASS is initiated by the PCM regardless of the climate system settings.

The Refrigerant Cycle

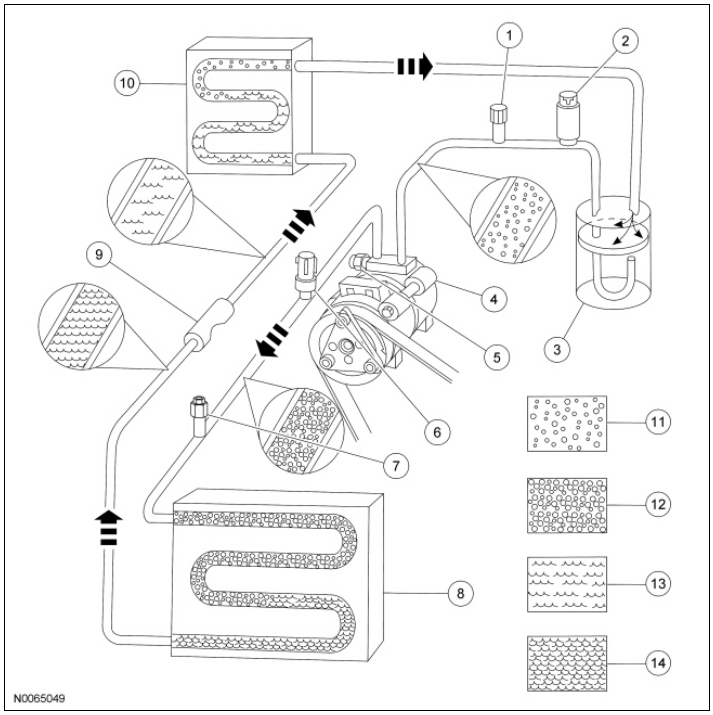
During stabilized conditions (A/C system shutdown), the refrigerant is in a vaporized state and pressures are equal throughout the system. When the A/C compressor is in operation, it increases pressure on the refrigerant vapor, raising its temperature. The high-pressure and high-temperature vapor is then released into the top of the condenser core.

The condenser core, being close to ambient temperature, causes the refrigerant vapor to condense into a liquid when heat is removed from the refrigerant by ambient air passing over the fins and tubing. The liquid refrigerant, still at high pressure, exits from the bottom of the condenser core and enters the inlet side of the evaporator core orifice.

The evaporator core orifice is the restriction in the refrigerant system that creates the low pressure drop in the evaporator core and separates the high- and low-pressure sides of the A/C system. As the liquid refrigerant leaves this restriction, its pressure and boiling point are reduced.

The liquid refrigerant is now at its lowest pressure and temperature. As it passes through the evaporator core, it absorbs heat from the passenger compartment airflow passing over the plate/fin sections of the evaporator core. This addition of heat causes the refrigerant to boil (convert to gas). The now cooler passenger compartment air can no longer support the same humidity level of the warmer air and this excess moisture condenses on the exterior of the evaporator coils and fins and drains outside the vehicle.

The suction accumulator is designed to remove moisture from the refrigerant and to prevent any liquid refrigerant that may not have been vaporized in the evaporator core from reaching the A/C compressor. The A/C compressor is designed to pump refrigerant vapor only, as liquid refrigerant will not compress and can damage the A/C compressor.

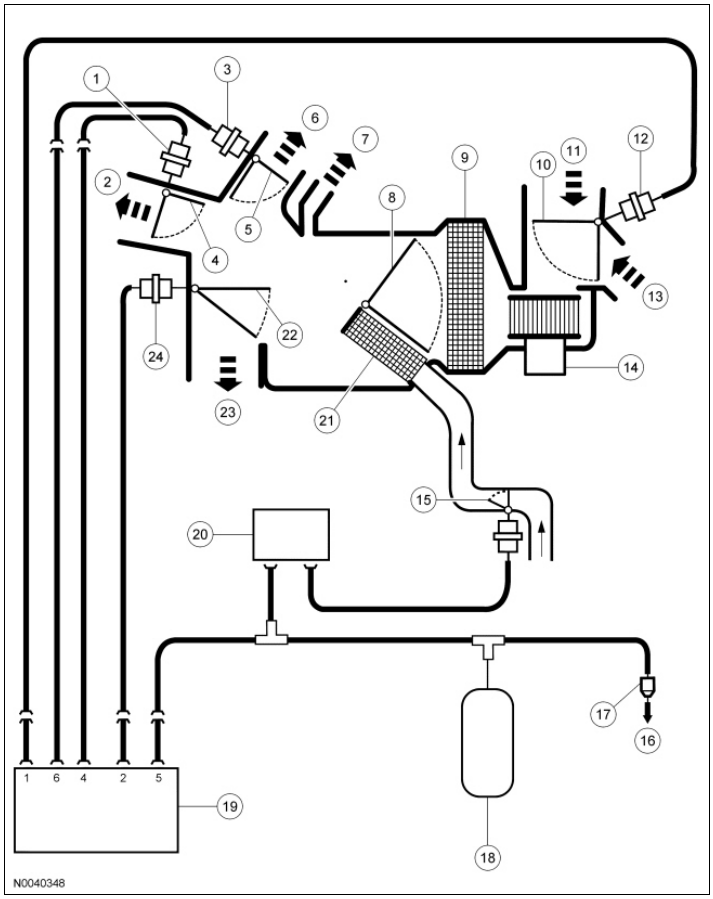


The refrigerant cycle is now repeated with the A/C compressor again increasing the pressure and temperature of the refrigerant.

The A/C cycling switch interrupts compressor operation before the external temperature of the evaporator core gets low enough to cause the condensed water vapor (excess humidity) to turn to ice. It does this by monitoring low side line pressure. It is known that a refrigerant pressure of approximately 210 kPa (30 psi) will yield an operating temperature of 0°C (32°F). The A/C cycling switch controls system operation in an effort to maintain this temperature.

The high side line pressure is also monitored so that A/C compressor operation can be interrupted if system pressure becomes too high.

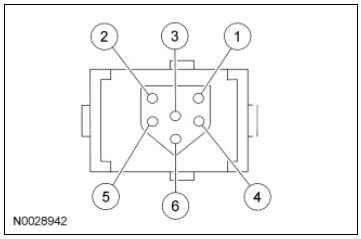
The A/C pressure relief valve will open and vent refrigerant to relieve unusually high system pressure.



Clutch Cycling Orifice Tube Type Refrigerant System

Item	Description
1	A/C charge valve port (low side)
2	A/C cycling switch
3	Suction accumulator
4	A/C compressor
5	A/C compressor pressure relief valve
6	A/C pressure transducer
7	A/C charge valve port (high side)
8	Condenser core
9	Evaporator core orifice tube
10	Evaporator core
11	Low-pressure vapor
12	High-pressure vapor
13	Low-pressure liquid
14	High-pressure liquid

Vacuum System



Vacuum Schematic - Manual Climate Control System

Item	Part Number	Description
1	18A318	Vacuum control motor - panel door
2	-	Panel airflow
3	18A318	Vacuum control motor - defrost door
4	-	Panel door (full vacuum position)
5	-	Defrost door (full vacuum position)
6	-	Defrost airflow
7	-	Side window demister airflow
8	-	Temperature blend door (full heat position)

[a] The dual automatic temperature control (DATC) system may be manually set to enable or disable the recirculation of cabin air by pressing the RECIRCULATION manual override button in all manual override modes except OFF, DEFROST and FLOOR/DEFROST.
[b] The automatic temperature control solenoid and manifold will supply vacuum and close the heater control valve depending on the HVAC module - DATC settings and ambient conditions in any setting except OFF.

Inspection and Verification

1. Verify the customer concern by operating the climate control system to duplicate the condition.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Loose, missing or damaged A/C compressor drive belt • A/C compressor inoperative • Loose, misrouted or damaged vacuum lines • Broken or leaking vacuum control motor [a] • Discharged A/C system • Broken or leaking refrigerant lines [a]	• Smart Junction Box (SJB) fuse(s): ♦ 18 (10A) ♦ 20 (10A) ♦ 28 (10A) • Battery Junction Box (BJB) fuse(s): ♦ 16 (40A) ♦ 18 (30A) ♦ 35 (10A) ♦ 40 (15A) • Blower motor • Loose or disconnected A/C clutch connector • Circuitry open/shorted • Disconnected, loose fitting or incorrectly installed electrical connectors and pins

[a] A leak in the vacuum control circuit may occur during acceleration (slow leak), may exist at all times (large leak) and may exist only when specific functions are selected (indicating a leak in that portion of the circuit). The vacuum hoses used in the passenger compartment control circuit are constructed from PVC plastic material. The vacuum hoses used in the engine compartment are constructed of Hytrel®. Because of the materials used, never pinch the vacuum hoses off during diagnosis to locate a leak. A golf tee can be used as a plug when it is necessary to plug one end of the vacuum hose for leak test purposes.

3. As pinpoint tests and measurements are being carried out, be sure to inspect for any disconnected, loose-fitting or incorrectly installed component, module and in-line electrical connectors and pins.
4. If the inspection reveals obvious concerns that can be readily identified, repair as necessary.

5. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

6. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM .
   - refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the VCM .

7. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00 to diagnose no response from the PCM or HVAC module - Dual Automatic Temperature Control (DATC).

8. Carry out the network test.
   - If the scan tool responds with no communication from one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record the Continuous Memory Diagnostic Trouble Codes (CMDTCs).

9. Carry out the self-test diagnostics from the PCM or HVAC module - DATC .

10. **NOTE:** Some PCM DTCs may inhibit A/C operation. If any PCM DTCs are retrieved, diagnose those first. Refer to the PCM DTC Chart.

    If any of the DATC DTCs retrieved are related to the concern, go to the HVAC Module - Dual Automatic Temperature Control (DATC) DTC Chart. If the PCM DTCs retrieved are related to the concern, go to the PCM DTC Chart. For all other DTCs, refer to Section 419-10 .

11. If no DTCs related to the concern are retrieved, go to the GO to Symptom Chart - Climate Control Systems or GO to Symptom Chart - NVH .

DTC Charts

Symptom Chart - Climate Control Systems

Symptom Chart - Climate Control Systems

Symptom Chart - NVH

Symptom Chart - NVH

NOTE: NVH symptoms will be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to Section 100-04 . Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for

the symptom, refer back to Section 100-04 for the next likely system and continue diagnosis.

ConditionPossible SourcesAction

- Noisy A/C compressor
- A/C compressor clutch air gap out of specification
- CHECK and ADJUST the A/C compressor clutch gap if necessary. REFER to Air Conditioning (A/C) Clutch Air Gap Adjustment in this section. TEST the system for normal operation.
- If the A/C compressor clutch gap is OK, INSTALL an A/C compressor clutch. REFER to Section 412-01 . TEST the system for normal operation.
- A/C compressor pulley bearing worn
- INSPECT the A/C compressor pulley bearing for roughness. If bearing roughness is found, INSTALL an A/C compressor pulley. REFER to Section 412-01 . TEST the system for normal operation.

Pinpoint Tests

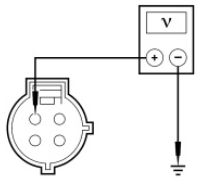
Pinpoint Test A: DTC P0532 or P0533

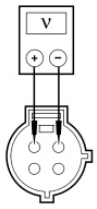
Refer to Wiring Diagrams Cell 23 for schematic and connector information.

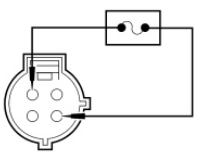
Refer to Wiring Diagrams Cell 24 for schematic and connector information.

Normal Operation

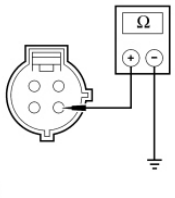
Under normal operation, the A/C pressure transducer receives a ground from the PCM. A 5-volt reference voltage is supplied to the A/C pressure transducer from the PCM. The A/C pressure transducer then sends a voltage to the PCM to indicate the A/C pressure.

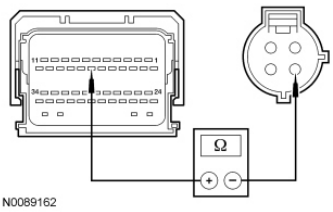




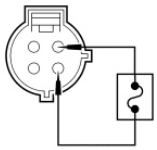


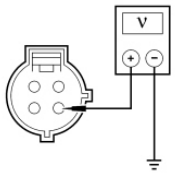
- DTC P0532 (A/C Pressure Refrigerant Sensor A Circuit Low) - The A/C pressure transducer inputs a voltage to the PCM. If the voltage is below the calibrated level, this DTC sets.
- DTC P0533 (A/C Pressure Refrigerant Sensor A Circuit High) - The A/C pressure transducer inputs a voltage to the PCM. If the voltage is above the calibrated level, this DTC sets.

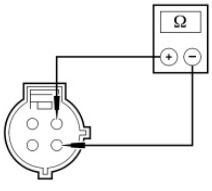




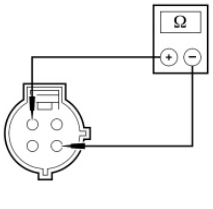
This pinpoint test is intended to diagnose the following:







- Wiring, terminals or connectors
- A/C pressure transducer
- PCM



PINPOINT TEST A: DTC P0532 OR P0533

Test Step	Result / Action to Take
A1 CHECK THE PCM OUTPUT VOLTAGE	

• Ignition OFF. • Disconnect: A/C Pressure Transducer C1078. • Ignition ON. • Measure the voltage between ground and A/C pressure transducer C1078-2, circuit LE423 (GN/VT), harness side.  N0082573 • **Is the voltage between 4.7 and 5.1 volts?**	**Yes** GO to A2 . **No** If the voltage is less than 4.7 volts, REPAIR circuit LE423 (GN/VT) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. If the voltage is greater than 5.1 volts, REPAIR circuit LE423 (GN/VT) for a short to voltage. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
A2 CHECK THE PCM SENSOR GROUND	
• Measure the voltage between A/C pressure transducer C1078-1, circuit RE407 (YE/VT), harness side and A/C pressure transducer C1078-2, circuit LE423 (GN/VT), harness side.  A0047632 • **Is the voltage between 4.7 and 5.1 volts?**	**Yes** If diagnosing **DTC P0532** , GO to A3 . If diagnosing **DTC P0533** , GO to A6 . **No** REPAIR circuit RE407 (YE/VT) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
A3 CHECK THE A/C PRESSURE TRANSDUCER HIGH	
• Enter the following diagnostic mode on the scan tool: A/C Pressure (ACP_PRESS) PCM PID. • While observing the ACP_PRESS PCM PID, connect a fused jumper between A/C pressure transducer C1078-3, circuit VH433 (VT/OG), harness side and A/C pressure transducer C1078-2, circuit LE423 (GN/VT), harness side.  N0082574	**Yes** INSTALL a new A/C pressure transducer. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to A4 .

• **Does the ACP_PRESS PCM PID voltage read greater than 4 volts?**	
A4 CHECK CIRCUIT VH433 (VT/OG) FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: PCM C175B. • Measure the resistance between ground and A/C pressure transducer C1078-3, circuit VH433 (VT/OG), harness side.  A0047688 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to A5 . **No** REPAIR circuit VH433 (VT/OG) for a short to ground. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
A5 CHECK CIRCUIT VH433 (VT/OG) FOR AN OPEN	
• Measure the resistance between A/C pressure transducer C1078-3, circuit VH433 (VT/OG), harness side and PCM C175B-18, circuit VH433 (VT/OG), harness side.  N0089162 • **Is the resistance less than 5 ohms?**	**Yes** GO to A8 . **No** REPAIR circuit VH433 (VT/OG) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
A6 CHECK THE A/C PRESSURE TRANSDUCER LOW	
• Enter the following diagnostic mode on the scan tool: A/C Pressure (ACP_PRESS) PCM PID. • While observing the ACP_PRESS PCM PID, connect a fused jumper between A/C pressure transducer C1078-3, circuit VH433 (VT/OG), harness side and A/C pressure transducer C1078-1, circuit RE407 (YE/VT), harness side.	**Yes** INSTALL a new A/C pressure transducer. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to A7 .

 A0008127 • **Does the ACP_PRESS PCM PID voltage read less than 4.9 volts?**	
A7 CHECK CIRCUIT VH433 (VT/OG) FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: PCM C175B. • Ignition ON. • Measure the voltage between ground and A/C pressure transducer C1078-3, circuit VH433 (VT/OG), harness side.  A0047689 • **Is any voltage present?**	**Yes** REPAIR circuit VH433 (VT/OG) for a short to voltage. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to A8 .
A8 CHECK CIRCUIT VH433 (VT/OG) FOR A SHORT TO CIRCUIT LE423 (GN/VT) OR RE407 (YE/VT)	
• Ignition OFF. • **NOTE: For DTC P0532 only.** • Measure the resistance between A/C pressure transducer C1078-3, circuit VH433 (VT/OG), harness side and A/C pressure transducer C1078-1, circuit RE407 (YE/VT), harness side.  N0082575 • **NOTE: For DTC P0533 only.** • Measure the resistance between A/C pressure transducer C1078-3, circuit VH433 (VT/OG), harness side and A/C pressure transducer C1078-2, circuit LE423 (GN/VT), harness side.	**Yes** GO to A9 . **No** REPAIR circuit VH433 (VT/OG) for a short to circuit LE423 (GN/VT) or RE407 (YE/VT). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

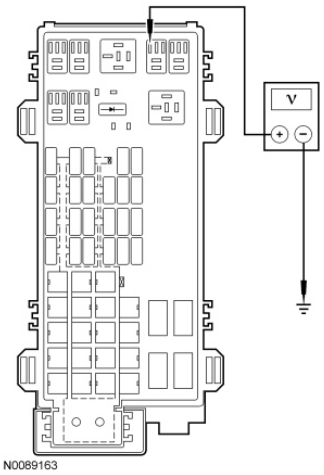
 N0082576 • **Is the resistance greater than 10,000 ohms?**	
A9 CHECK THE PCM CONNECTION	
• Clear the DTCs. • Disconnect all the PCM connectors. • Check for: ♦ corrosion. ♦ pushed-out pins. ♦ incorrectly seated connector. • Connect and correctly seat all the PCM connectors. • Operate the system. • **Does the concern return?**	**Yes** INSTALL a new PCM. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

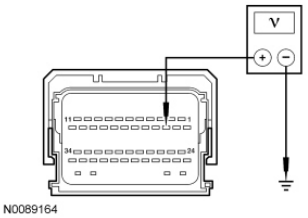
Pinpoint Test B: DTC P0645

Refer to Wiring Diagrams Cell 54 , Manual Climate Control System for schematic and connector information.

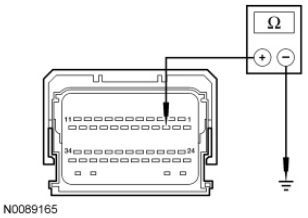
Refer to Wiring Diagrams Cell 55 , Automatic Climate Control System for schematic and connector information.

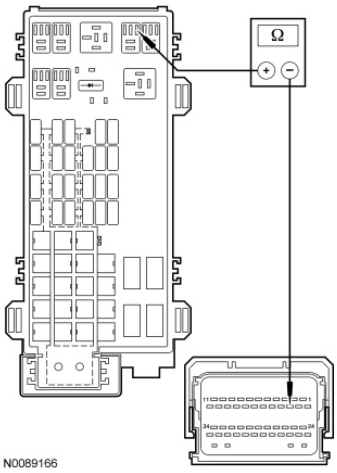
Normal Operation





Under normal operation, voltage is provided to the A/C clutch relay coil. When A/C is requested and A/C line pressures allow, a ground is provided to the A/C clutch relay coil from the PCM, energizing the A/C clutch relay.





- DTC P0645 (A/C Clutch Relay Control Circuit) - The DTC sets when the PCM grounds the relay circuit, excessive current draw is detected on the relay circuit or, with the relay circuit not grounded by the PCM, voltage is not detected on the relay circuit the PCM expects to detect voltage coming through the relay coil to the relay circuit.

This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- A/C clutch relay
- PCM

PINPOINT TEST B: DTC P0645

Test Step	Result / Action to Take
B1 CHECK THE VOLTAGE TO THE A/C CLUTCH RELAY	

• Ignition OFF. • Disconnect: A/C Clutch Relay. • Ignition ON. • Measure the voltage between ground and the A/C clutch relay socket pin 2, circuit CBB40 (YE/GN).  N0089163 • **Is the voltage greater than 10 volts?**	**Yes** CARRY OUT the A/C clutch relay component test. Refer to Wiring Diagrams Cell 149 for component testing. If the relay tests OK, GO to B2 . **No** REPAIR circuit CBB40 (YE/GN) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
B2 CHECK CIRCUIT CH302 (WH/BN) FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: PCM C175B. • Ignition ON. • Measure the voltage between ground and PCM C175B-14, circuit CH302 (WH/BN), harness side.  N0089164 • **Is any voltage present?**	**Yes** REPAIR circuit CH302 (WH/BN) for a short to voltage. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to B3 .
B3 CHECK CIRCUIT CH302 (WH/BN) FOR A SHORT TO GROUND	
• Ignition OFF. • Measure the resistance between ground and PCM C175B-14, circuit CH302 (WH/BN), harness side.	**Yes** GO to B4 . **No** REPAIR circuit CH302 (WH/BN) for a short to ground. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

 N0089165 • **Is the resistance greater than 10,000 ohms?**	
B4 CHECK CIRCUIT CH302 (WH/BN) FOR AN OPEN	
• Measure the resistance between A/C clutch relay socket, circuit CH302 (WH/BN) and PCM C175B-14, circuit CH302 (WH/BN), harness side.  N0089166 • **Is the resistance less than 5 ohms?**	**Yes** GO to B5 . **No** REPAIR circuit 321 (GY/WH) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
B5 CHECK THE PCM CONNECTION	
• Clear the DTCs. • Disconnect all the PCM connectors. • Check for: ♦ corrosion. ♦ pushed-out pins. ♦ incorrectly seated connector. • Connect and correctly seat all the PCM connectors. • Operate the system. • **Does the concern return?**	**Yes** INSTALL a new PCM. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

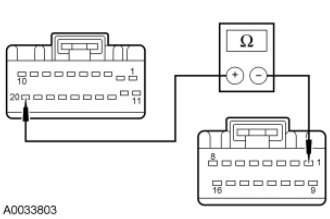
Pinpoint Test C: DTC B2266 or B2267

Refer to Wiring Diagrams Cell 55 , Automatic Climate Control System for schematic and connector information.

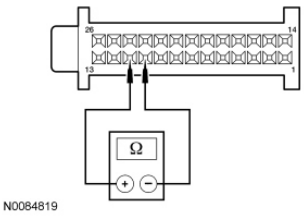
Normal Operation

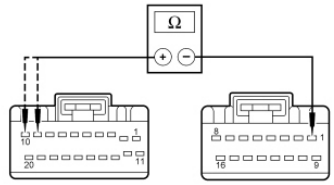
Under normal operation, to rotate the temperature blend door actuator, the HVAC module supplies voltage and ground to the temperature blend door actuators through the door actuator motor circuits. To reverse the temperature blend door actuator rotation, the HVAC module reverses the voltage and ground circuits.

The temperature blend door actuator feedback resistors are supplied a ground from the HVAC module and a 5-volt reference voltage on the temperature blend door actuator reference circuits. The HVAC module reads the voltage on the temperature blend door actuator feedback circuits to determine the temperature blend door actuator position by the position of the actuator feedback resistor wiper arm.

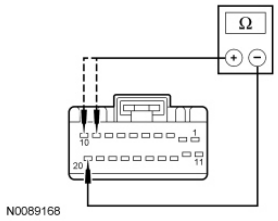


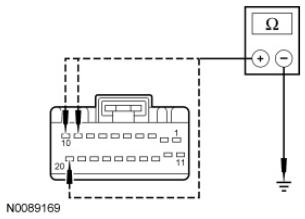
During an actuator calibration cycle, the HVAC module drives the temperature blend door until the door reaches both internal stops in the HVAC case. If the temperature blend door is temporarily obstructed or binding during a calibration cycle, the HVAC module may interpret this as the actual end of travel for the door. When this condition occurs and the HVAC module commands the actuator to its end of travel, the airflow temperature may not be as warm or cold as expected.



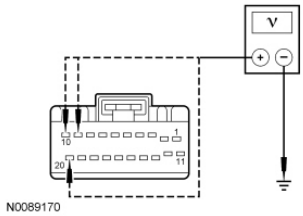


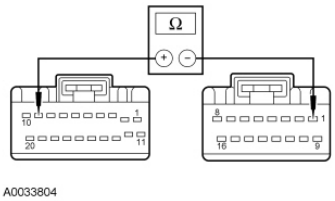
- DTC B2266 (Left Side Blend Door Circuit Failure) - The module senses no change in actuator feedback voltage when the actuator motor has been energized.
- DTC B2267 (Right Side Blend Door Circuit Failure) - The module senses no change in actuator feedback voltage when the actuator motor has been energized.



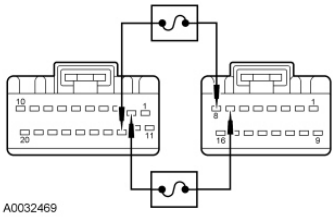


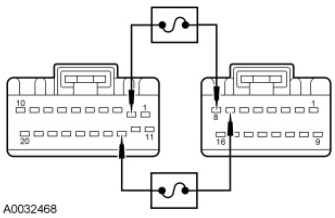
This pinpoint test is intended to diagnose the following:



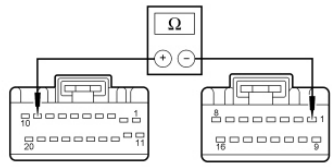


- Wiring, terminals or connectors
- Blend door actuator
- HVAC module - Dual Automatic Temperature Control (DATC)
- Stuck or bound linkage or door





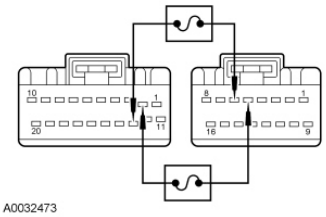
PINPOINT TEST C: DTC B2266 OR B2267



Test Step	Result / Action to Take
C1 CHECK THE FEEDBACK POTENTIOMETER TOTAL RESISTANCE	
• Disconnect: HVAC Module - DATC C228A. • Disconnect: HVAC Module - DATC C228B. • Measure the resistance between HVAC module - DATC C228A-20, circuit LH111 (BN/WH), harness side and HVAC module - DATC C228B-1, circuit RH111 (GY/BU), harness side.  A0033803 • **Is the resistance greater than 500 ohms?**	**Yes** GO to C3 . **No** GO to C2 .
C2 CHECK CIRCUITS RH111 (GY/BU) AND LH111 (BN/WH) FOR A SHORT TOGETHER	

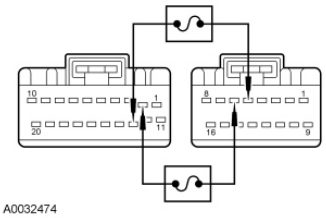
NOTE: Access to the connector in the following step is difficult. Before performing this step, visually inspect the actuator and its harness for obvious damage. If no damage is evident, proceed with the test. • Disconnect: RH blend door actuator C2092. • Measure the resistance between HVAC module - DATC C228A-11, circuit LH111 (BN/WH), harness side and HVAC module - DATC C228A-10, circuit RH111 (GY/BU), harness side.  N0084819 • **Is the resistance greater than 500 ohms?**	**Yes** INSTALL a new RH actuator. REFER to Section 412-01 . TEST the system for normal operation. **No** CARRY OUT the Temperature Blend Door Actuator component test on the LH blend door actuator in this section. If a new actuator is installed, CONNECT the actuator electrical connector before the HVAC module connector(s). This will allow the new actuator to be calibrated when the HVAC module is reconnected. If the actuator tests OK, REPAIR circuits LH111 (BN/WH) and RH111 (GY/BU) for a short together. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
C3 CHECK THE POTENTIOMETER LOW- AND HIGH-SIDE RESISTANCE	
• Measure the **low-side** resistance between HVAC module - DATC C228B-1, circuit RH111 (GY/BU), harness side and the following: ♦ **For DTC B2266** , HVAC module - DATC C228A-9, circuit VH440 (BU/BN), harness side. ♦ **For DTC B2267** , HVAC module - DATC C228A-10, circuit VH441 (WH/BN), harness side.  N0089167 • Measure the **high-side** resistance between HVAC module - DATC C228A-20, circuit LH111 (BN/WH), harness side and the following:	**Yes** GO to C4 . **No** CARRY OUT the Temperature Blend Door Actuator component test in this section. If a new actuator is installed, CONNECT the actuator electrical connector before the HVAC module connector(s). This will allow the new actuator to be calibrated when the HVAC module is reconnected. If the actuator tests OK and: If the **low-side** resistance only is greater than 5,500 ohms, REPAIR circuit RH111 (GY/BU) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. If the **low-side** resistance only is less than 250 ohms, REPAIR circuit VH440 (BU/BN) or VH411 (VT/GN) for a short to circuit RH111 (GY/BU). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. If the **high-side** resistance only is greater than 5,500 ohms, REPAIR circuit LH111 (BN/WH) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

♦ **For DTC B2266** , HVAC module - DATC C228A-9, circuit VH440 (BU/BN), harness side. ♦ **For DTC B2267** , HVAC module - DATC C228A-10, circuit VH441 (WH/BN), harness side.  N0089168 • **Is the resistance between 250 and 5,500 ohms?**	If the **high-side** resistance only is less than 250 ohms, REPAIR circuits circuit VH440 (BU/BN) or VH411 (VT/GN) for a short to circuit LH111 (BN/WH). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. If both the **high-side and low-side** resistance is greater than 5,500 ohms, REPAIR circuit VH440 (BU/BN) or VH411 (VT/GN) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
C4 CHECK CIRCUIT LH111 (BN/WH), VH440 (BU/BN) OR CIRCUIT VH441 (WH/BN) FOR A SHORT TO GROUND	
• Measure the resistance between ground and the following: ♦ HVAC module - DATC C228A-20, circuit LH111 (BN/WH), harness side. ♦ **For DTC B2266** , HVAC module - DATC C228A-9, circuit VH440 (BU/BN), harness side. ♦ **For DTC B2267** , HVAC module - DATC C228A-10, circuit VH441 (WH/BN), harness side.  N0089169 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to C5 . **No** REPAIR circuit LH111 (BN/WH), VH441 (WH/BN) or VH440 (BU/BN) for a short to ground. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
C5 CHECK CIRCUIT LH111 (BN/WH), VH440 (BU/BN) OR CIRCUIT VH441 (WH/BN) FOR A SHORT TO VOLTAGE	



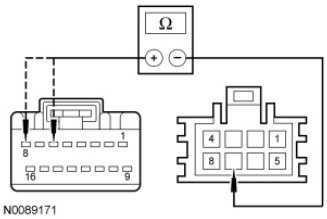
• Ignition ON. • Measure the voltage between ground and the following: ♦ HVAC module - DATC C228A-20, circuit LH111 (BN/WH), harness side. ♦ **For DTC B2266** , HVAC module - DATC C228A-9, circuit VH440 (BU/BN), harness side. ♦ **For DTC B2267** , HVAC module - DATC C228A-10, circuit VH441 (WH/BN), harness side.  N0089170 • **Are any voltages present?**	**Yes** REPAIR circuit RH111 (GY/BU), VH441 (WH/BN) or VH440 (BU/BN) for a short to voltage. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** **For DTC B2266** , GO to C6 . **For DTC B2267** , GO to C7 .
C6 CHECK THE BLEND DOOR ACTUATOR OPERATION	
NOTE: If a jumper fuse opens while carrying out this test step, repair the circuit(s) for a short. • With the fused jumper connections made as directed below, measure the resistance between HVAC module - DATC C228B-1, circuit RH111 (GY/BU), harness side and HVAC module - DATC C228A-9, circuit VH440 (BU/BN), harness side.  A0033804 • Connect fused jumper wires between: ♦ HVAC module - DATC C228B-8, circuit CH239 (BU/WH), harness side and HVAC module - DATC C228A-13, circuit SBP28 (GN/RD), harness side.	**Yes** INSPECT for broken door and linkage. REPAIR as necessary. If no condition is found, GO to C9 . **No** GO to C8 .

♦ HVAC module - DATC C228B-7, circuit CH237 (VT/GY), harness side and HVAC module - DATC C228A-2, circuit GD145 (BK/BU), harness side.  A0032469 • Remove the fused jumpers. • Connect fused jumper wires between: ♦ HVAC module - DATC C228B-7, circuit CH237 (VT/GY), harness side and HVAC module - DATC C228A-13, circuit SBP28 (GN/RD), harness side. ♦ HVAC module - DATC C228B-8, circuit CH239 (BU/WH), harness side and HVAC module - DATC C228A-2, circuit GD145 (BK/BU), harness side.  A0032468 • **Does the resistance increase and decrease when the jumpers are connected?**	
C7 CHECK THE BLEND DOOR ACTUATOR OPERATION	
NOTE: If a jumper fuse opens while carrying out this test step, repair the circuit(s) for a short. • With the fused jumper connections made as directed below, measure the resistance between HVAC module - DATC C228B-1, circuit RH111 (GY/BU), harness side and HVAC module - DATC C228A-10, circuit VH441 (WH/BN), harness side.	**Yes** INSPECT for broken door and linkage. REPAIR as necessary. If no condition is found, GO to C9 . **No** GO to C8 .

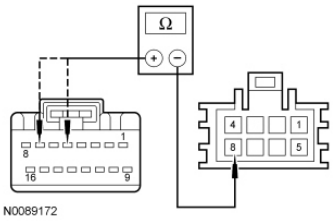


A0033804

- Connect fused jumper wires between:
  - HVAC module - DATC C228B-6, circuit CH213 (BN/GN), harness side and HVAC module - DATC C228A-13, circuit SBP28 (GN/RD), harness side.
  - HVAC module - DATC C228B-5, circuit CH211 (YE), harness side and HVAC module - DATC C228A-2, circuit GD145 (BK/BU), harness side.



A0032473



- Remove the fused jumpers.
- Connect fused jumper wires between:
  - HVAC module - DATC C228B-5, circuit CH211 (YE), harness side and HVAC module - DATC C228A-13, circuit SBP28 (GN/RD), harness side.
  - HVAC module - DATC C228B-6, circuit CH213 (BN/GN), harness side and HVAC module - DATC C228A-2, circuit GD145 (BK/BU), harness side.

A0032474

- **Does the resistance increase and decrease when the jumpers are**

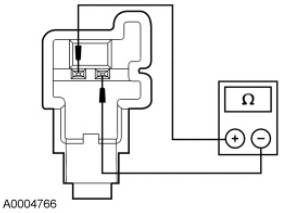
connected?	
C8 CHECK THE ACTUATOR MOTOR DRIVE CIRCUITS FOR AN OPEN	
NOTE: Access to the connector in the following step is difficult. Before performing this step, visually inspect the actuator and its harness for obvious damage. If no damage is visually evident, proceed with the test. • Disconnect: **For DTC B2266** , LH Blend Door Actuator C2091. • Disconnect: **For DTC B2267** , RH Blend Door Actuator C2092. • Measure the resistance between: ♦ **For DTC B2266** , HVAC module - DATC C228B-8, circuit CH239 (BU/WH), harness side and temperature blend door actuator C2091-7, circuit CH239 (BU/WH), harness side. ♦ **For DTC B2267** , HVAC module - DATC C228B-6, circuit CH213 (BN/GN), harness side and temperature blend door actuator C2092-7, circuit CH213 (BN/GN), harness side.  N0089171 • Measure the resistance between: ♦ **For DTC B2266** , HVAC module - DATC C228B-7, circuit CH237 (VT/GY), harness side and temperature blend door actuator C2091-8, circuit CH237 (VT/GY), harness side. ♦ **For DTC B2267** , HVAC module - DATC C228B-5, circuit CH211 (YE), harness side and temperature blend door actuator C2092-8, circuit CH211 (YE), harness side.	**Yes** INSPECT for binding or broken linkage. REPAIR as necessary. If no condition is found, INSTALL a new door actuator. If a new actuator is installed, CONNECT the actuator electrical connector before the HVAC module connector(s). This will allow the new actuator to be calibrated when the HVAC module is reconnected. TEST the system for normal operation. **No** REPAIR the circuit(s) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

 • **Are the resistances less than 5 ohms?**	
C9 CHECK THE ACTUATOR CONNECTION	
• Disconnect: **For DTC B2266** , LH Temperature Blend Door Actuator C2091. • Disconnect: **For DTC B2267** , RH Temperature Blend Door Actuator C2092. • Check for: ♦ corrosion. ♦ pushed-out terminals. ♦ damaged terminals. • Connect and correctly seat the actuator connector. • Clear the DTCs. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** CARRY OUT the Temperature Blend Door Actuator component test in this section. If a new actuator is installed, CONNECT the actuator electrical connector before the HVAC module connector(s). This will allow the new actuator to be calibrated when the HVAC module is reconnected. If the actuator tests OK, GO to C10 . **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. TEST the system for normal operation.
C10 MODULE ACTUATOR POSITION CALIBRATION	
NOTE: The purpose of the module actuator position calibration is to allow the HVAC module to reinitialize and calibrate the actuator stop points. To carry out the calibration, follow the steps below. • Ignition OFF. • Disconnect and inspect the HVAC module connectors for: ♦ corrosion. ♦ pushed-out terminals. ♦ damaged terminals. • Connect and correctly seat all the HVAC module connectors. • Ignition ON. • Clear the DTCs. • Select any position except OFF. • **NOTE:** The HVAC module will now initialize and calibrate the actuators. Calibration of the actuators will take approximately 30 seconds.	**Yes** INSTALL a new HVAC module. REFER to Section 412-01 . TEST the system for normal operation. **No** The system is now operating correctly at this time. The concern may have been caused by a foreign object in the HVAC case or temporary binding that restricted actuator door travel. CHECK any actuator external linkage. If condition recurs, INSPECT actuator linkage and door for binding and CHECK HVAC case for foreign objects.

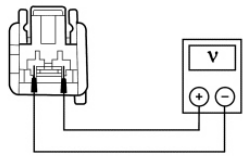
• Operate the system. • Enter the following diagnostic mode on the scan tool: Self-Test - HVAC Module. • **Do the DTCs return?**	

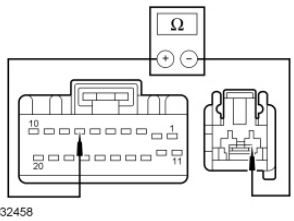
Pinpoint Test D: DTC B1251 or B1253

Refer to Wiring Diagrams Cell 55 , Automatic Climate Control System for schematic and connector information.

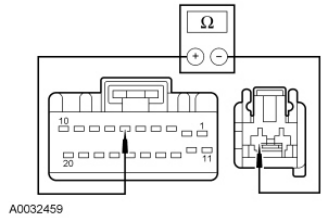


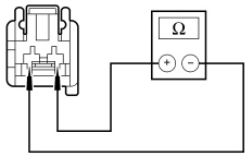
Normal Operation

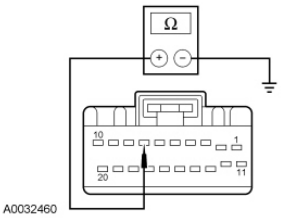




Under normal operation, the in-vehicle air temperature sensor receives a ground from the HVAC module. The sensor varies its resistance with the temperature. As the temperature rises, the resistance falls. As the temperature falls the resistance rises. The HVAC module measures this resistance to determine the temperature at the sensor.







- DTC B1251 (Air Temperature Internal Sensor Circuit Open) - The module senses no voltage drop on the sensor reference voltage circuit, indicating an open circuit.
- DTC B1253 (Air Temperature Internal Sensor Circuit Short to Ground) - The module senses excessive voltage drop on the sensor reference voltage circuit, indicating a short directly to ground.

This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- In-vehicle air temperature sensor
- HVAC module - Dual Automatic Temperature Control (DATC)

PINPOINT TEST D: DTC B1251 OR B1253

Test Step	Result / Action to Take
D1 CHECK THE SENSOR RESISTANCE	
• Ignition OFF. • Disconnect: In-Vehicle Temperature Sensor C233. • Measure the resistance between the in-vehicle temperature sensor terminals.  A0004766 • **Is the resistance within the specified values for these temperature ranges: 10-20°C (50-68°F), 37,000-58,000 ohms; 20-30°C (68-86°F),**	**Yes** GO to D2 . **No** GO to D7 .

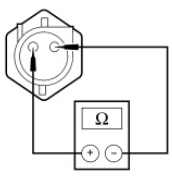
24,000-37,000 ohms; 30-40°C (86-104°F), 16,000-24,000 ohms?	
D2 CHECK THE HVAC MODULE SENSOR OUTPUT VOLTAGE	
• Ignition ON. • Press the AUTOMATIC button. • Measure the voltage between in-vehicle temperature sensor C233-1, circuit VH414 (GN/BU), harness side and C233-2, circuit RH104 (BU/BN), harness side.  A0001977 • **Is the voltage between 4.7 and 5.1 volts?**	**Yes** INSTALL a new in-vehicle temperature sensor. TEST the vehicle for normal operation. If code returns, INSTALL a new HVAC module - DATC . REFER to Section 412-01 . TEST the system for normal operation. **No** **For DTC B1251** , GO to D3 . **For DTC B1253** , GO to D5 .
D3 CHECK CIRCUIT VH414 (GN/BU) FOR AN OPEN	
• Ignition OFF. • Disconnect: HVAC Module - DATC C228A. • Measure the resistance between HVAC module - DATC C228A-7, circuit VH414 (GN/BU), harness side and in-vehicle temperature sensor C233-1, circuit VH414 (GN/BU), harness side.  A0032458 • **Is the resistance less than 5 ohms?**	**Yes** GO to D4 . **No** REPAIR circuit VH414 (GN/BU) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
D4 CHECK CIRCUIT RH104 (BU/BN) FOR AN OPEN	
• Measure the resistance between HVAC module - DATC C228A-6, circuit RH104 (BU/BN), harness side and in-vehicle temperature sensor C233-2, circuit RH104 (BU/BN), harness side.	**Yes** GO to D7 . **No** REPAIR circuit RH104 (BU/BN) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

 A0032459 • **Is the resistance less than 5 ohms?**	
D5 CHECK CIRCUITS VH414 (GN/BU) AND RH104 (BU/BN) FOR A SHORT TOGETHER	
• Ignition OFF. • Disconnect: HVAC Module - DATC C228A. • Disconnect: HVAC Module - DATC C228B. • Measure the resistance between in-vehicle temperature sensor C233-1, circuit VH414 (GN/BU), harness side and C233-2, circuit RH104 (BU/BN), harness side.  A0052122 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to D6 . **No** REPAIR circuits VH414 (GN/BU) and RH104 (BU/BN) for a short together. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
D6 CHECK CIRCUIT VH414 (GN/BU) FOR A SHORT TO GROUND	
• Measure the resistance between ground and HVAC module - DATC C228A-7, circuit VH414 (GN/BU), harness side.  A0032460 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to D7 . **No** REPAIR circuit VH414 (GN/BU) for a short to ground. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
D7 CHECK THE HVAC MODULE CONNECTION	
• Disconnect and inspect the HVAC module connectors for: ♦ corrosion. ♦ pushed-out terminals. ♦ damaged terminals.	**Yes** INSTALL a new HVAC module. REFER to Section 412-01 . TEST the system for normal operation. **No** The system is operating correctly at this time.

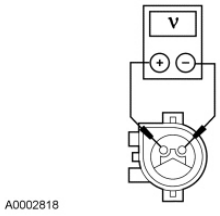
• Connect and correctly seat all the HVAC module connectors. • Clear the DTCs. • Operate the system. • Enter the following diagnostic mode on the scan tool: Self-Test - HVAC Module. • **Do the DTCs return?**	The concern may have been caused by a loose or corroded connector.

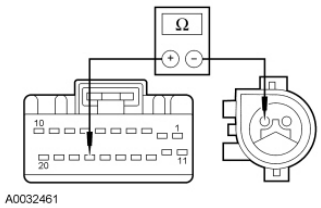
Pinpoint Test E: DTC B1255 or B1257

Refer to Wiring Diagrams Cell 55 , Automatic Climate Control System for schematic and connector information.

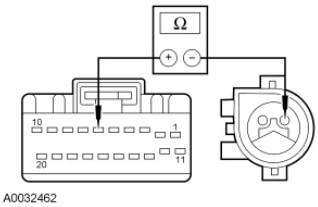


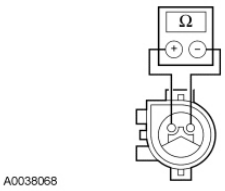
Normal Operation

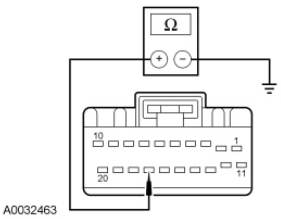




Under normal operation, the ambient air temperature sensor receives a ground from the HVAC module. The sensor varies its resistance with the temperature. As the temperature rises, the resistance falls. As the temperature falls, the resistance rises. The HVAC module measures this resistance to determine the temperature at the sensor.







- DTC B1255 (Air Temperature External Sensor Circuit Open) - The module senses no voltage drop on the sensor reference voltage circuit, indicating an open circuit.
- DTC B1257 (Air Temperature External Sensor Circuit Short to Ground) - The module senses excessive voltage drop on the sensor reference voltage circuit, indicating a short directly to ground.

This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- Ambient air temperature sensor
- HVAC module - Dual Automatic Temperature Control (DATC)

PINPOINT TEST E: DTC B1255 OR B1257

Test Step	Result / Action to Take
E1 CHECK THE AMBIENT TEMPERATURE SENSOR RESISTANCE	
• Ignition OFF. • Disconnect: Ambient Temperature Sensor C132. • Measure the resistance between the ambient temperature sensor terminals.  A0013640 • **Is the resistance within the specified values for**	**Yes** GO to E2 . **No** INSTALL a new ambient air temperature sensor. REFER to Section 412-01 . CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

these temperature ranges: 10-20°C (50-68°F), 37,000-58,000 ohms; 20-30°C (68-86°F), 24,000-37,000 ohms; 30-40°C (86-104°F), 16,000-24,000 ohms?	
E2 CHECK THE HVAC MODULE OUTPUT VOLTAGE	
• Ignition ON. • Press the AUTOMATIC button. • Measure the voltage between ambient temperature sensor C132-1, circuit VH407 (YE/GN), harness side and C132-2, circuit RMC32 (GN/BU), harness side.  A0002818 • **Is the voltage between 4.7 and 5.1 volts?**	**Yes** INSTALL a new ambient temperature sensor. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. If code returns, GO to E7 . **No** **For DTC B1255** , GO to E3 . **For DTC B1257** , GO to E5 .
E3 CHECK CIRCUIT VH407 (YE/GN) FOR AN OPEN	
• Ignition OFF. • Disconnect: HVAC Module - DATC C228A. • Measure the resistance between HVAC module - DATC C228A-17, circuit VH407 (YE/GN), harness side and ambient temperature sensor C132-1, circuit VH407 (YE/GN), harness side.  A0032461 • **Is the resistance less than 5 ohms?**	**Yes** GO to E4 . **No** REPAIR circuit VH407 (YE/GN) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
E4 CHECK CIRCUIT RH104 (BU/BN)/RMC32 (GN/BU) FOR AN OPEN	
• Measure the resistance between HVAC module - DATC C228A-6, circuit RH104 (BU/BN), harness side and ambient temperature sensor C132-2, circuit RMC32 (GN/BU), harness side.	**Yes** GO to E7 . **No** REPAIR circuit RH104 (BU/BN)/RMC32 (GN/BU) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

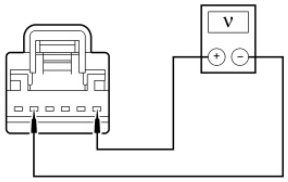
 A0032462 • **Is the resistance less than 5 ohms?**	
E5 CHECK CIRCUITS VH407 (YE/GN) AND RH104 (BU/BN)/RMC32 (GN/BU) FOR A SHORT TOGETHER	
• Ignition OFF. • Disconnect: HVAC Module - DATC C228A. • Disconnect: HVAC Module - DATC C228B. • Measure the resistance between ambient temperature sensor C132-1, circuit VH407 (YE/GN), harness side and C132-2, circuit RMC32 (GN/BU), harness side.  A0038068 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to E6 . **No** REPAIR circuits VH407 (YE/GN) and RH104 (BU/BN)/RMC32 (GN/BU) for a short together. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
E6 CHECK CIRCUIT VH407 (YE/GN) FOR A SHORT TO GROUND	
• Ignition OFF. • Measure the resistance between ground and HVAC module - DATC C228A-17, circuit VH407 (YE/GN), harness side.  A0032463 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to E7 . **No** REPAIR circuit VH407 (YE/GN) for a short to ground. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
E7 CHECK THE HVAC MODULE CONNECTION	
• Disconnect and inspect the HVAC module connectors for: ♦ corrosion. ♦ pushed-out terminals.	**Yes** INSTALL a new HVAC module. REFER to Section 412-01 . TEST the system for normal operation.

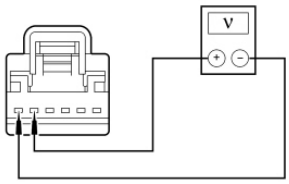
♦ damaged terminals. • Connect and correctly seat all the HVAC module connectors. • Clear the DTCs. • Operate the system. • Enter the following diagnostic mode on the scan tool: Self-Test - HVAC Module. • **Do the DTCs return?**	**No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

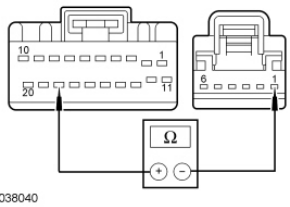
Pinpoint Test F: DTC B1259 or B1261

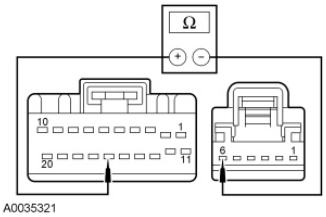
Refer to Wiring Diagrams Cell 55 , Automatic Climate Control System for schematic and connector information.

Normal Operation

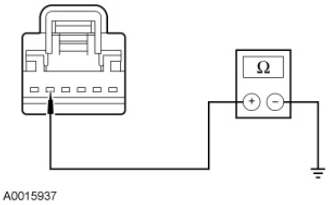


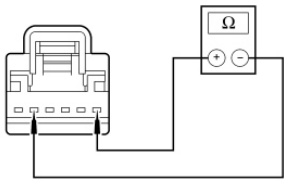


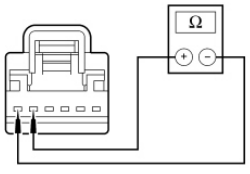




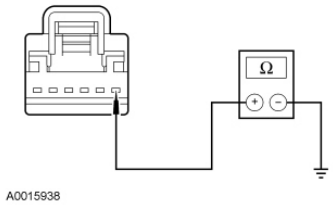
Under normal operation, the sunload sensor receives a ground from the HVAC module. As the light applied to the sensor changes, the PCM detects the change through the RH and LH feedback circuits.

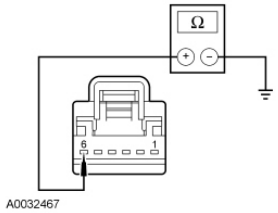






- DTC B1259 (Solar Radiation Sensor Circuit Open) - The module senses no voltage drop on the sensor reference voltage circuit, indicating an open circuit.
- DTC B1261 (Solar Radiation Sensor Circuit Short To Ground) - The module senses excessive voltage drop on the sensor reference voltage circuit, indicating a short directly to ground.





This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- Solar radiation sensor
- HVAC module - Dual Automatic Temperature Control (DATC)

PINPOINT TEST F: DTC B1259 OR B1261

Test Step	Result / Action to Take
F1 CHECK THE HVAC MODULE OUTPUT VOLTAGE	
• Ignition OFF. • Disconnect: Solar Radiation Sensor C286. • Ignition ON. • Press the AUTOMATIC button. • Measure the voltage between solar radiation sensor C286-1, circuit VH417 (YE/OG), harness side and C286-5, circuit GD145 (BK/BU), harness side.	**Yes** INSTALL a new solar radiation sensor. CLEAR the DTCs. REPEAT the self-test. If the code returns, GO to F6 . **No** **For DTC B1259** , GO to F2 . **For DTC B1261** , GO to F4 .

 A0015935 • Measure the voltage between solar radiation sensor C286-5, circuit GD145 (BK/BU), harness side and C286-6, circuit VH416 (VT/GY), harness side.  A0038234 • **Are the voltages between 4.7 and 5.1 volts?**	
F2 CHECK CIRCUITS VH416 (VT/GY) AND VH417 (YE/OG) FOR AN OPEN	
• Ignition OFF. • Disconnect: HVAC Module - DATC C228A. • Measure the resistance between HVAC module - DATC C228A-18, circuit VH417 (YE/OG), harness side and solar radiation sensor C286-1, circuit VH417 (YE/OG), harness side.  A0038040 • Measure the resistance between HVAC module - DATC C228A-16, circuit VH416 (VT/GY), harness side and solar radiation sensor C286-6, circuit VH416 (VT/GY), harness side.  A0035321 • **Are the resistances less than 5 ohms?**	**Yes** GO to F3 . **No** REPAIR circuit VH416 (VT/GY) or VH417 (YE/OG) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

F3 CHECK CIRCUIT GD145 (BK/BU) FOR AN OPEN	
• Measure the resistance between ground and solar radiation sensor C286-5, circuit GD145 (BK/BU), harness side.  A0015937 • **Is the resistance less than 5 ohms?**	**Yes** GO to F6 . **No** REPAIR circuit GD145 (BK/BU) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
F4 CHECK CIRCUITS VH416 (VT/GY) AND VH417 (YE/OG) FOR A SHORT TO CIRCUIT GD145 (BK/BU)	
• Ignition OFF. • Disconnect: HVAC Module - DATC C228A. • Measure the resistance between solar radiation sensor C286-1, circuit VH417 (YE/OG), harness side and circuit C286-5, GD145 (BK/BU), harness side.  A0047078 • Measure the resistance between solar radiation sensor C286-6, circuit VH416 (VT/GY), harness side and circuit C286-5, GD145 (BK/BU), harness side.  A0047079 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to F5 . **No** REPAIR circuit VH416 (VT/GY) or VH417 (YE/OG) for a short to circuit GD145 (BK/BU). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
F5 CHECK CIRCUITS VH416 (VT/GY) AND VH417 (YE/OG) FOR A SHORT TO GROUND	

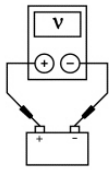
• Measure the resistance between ground and solar radiation sensor C286-1, circuit VH417 (YE/OG), harness side.  A0015938 • Measure the resistance between ground and solar radiation sensor C286-6, circuit VH416 (VT/GY), harness side.  A0032467 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to F6 . **No** REPAIR circuit VH416 (VT/GY) or VH417 (YE/OG) for a short to ground. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
F6 CHECK THE HVAC MODULE CONNECTION	
• Disconnect and inspect the HVAC module connectors for: ♦ corrosion. ♦ pushed-out terminals. ♦ damaged terminals. • Connect and correctly seat all the HVAC module connectors. • Clear the DTCs. • Operate the system. • Enter the following diagnostic mode on the scan tool: Self-Test - HVAC Module. • **Do the DTCs return?**	**Yes** INSTALL a new HVAC module. REFER to Section 412-01 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

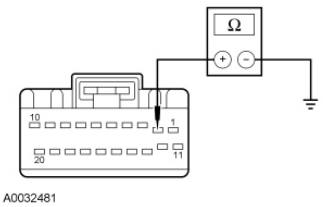
Pinpoint Test G: DTC B1676

Refer to Wiring Diagrams Cell 55 , Automatic Climate Control System for schematic and connector information.

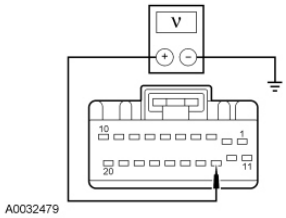
Normal Operation

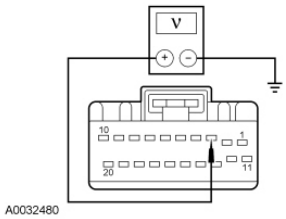
Under normal operation, the HVAC module - Dual Automatic Temperature Control (DATC) receives a ground through circuit GD145 (BK/BU). The HVAC module - DATC is supplied constant battery voltage through circuit SBP28 (GN/RD) and ignition switched voltage through circuit CBP20 (YE/VT).





- DTC B1676 (Battery Pack Voltage Out Of Range) - The module senses when battery voltage is less than 9 volts or greater than 16 volts.





This pinpoint test is intended to diagnose the following:

- Fuse(s)
- Wiring, terminals or connectors
- HVAC module - DATC

PINPOINT TEST G: DTC B1676

Test Step	Result / Action to Take
G1 RETRIEVE ALL CMDTCs IN ALL MODULES	
• Enter the following diagnostic mode on the scan tool: Self Test - All CMDTCs . • **Is DTC B1317, B1318 or B1676 present in more than one module AND DTC P0563, P0620, P0625, P0626 or P065B present in the PCM?**	**Yes** REFER to Section 414-00 for diagnosis of the battery and charging system. CLEAR all Continuous Memory Diagnostic Trouble Codes (CMDTCs). TEST the system for normal operation. **No** GO to G2 .
G2 CHECK BATTERY CONDITION	
• Refer to Section 414-01 and carry out the Battery - Condition Test. • **Does the battery pass the condition test?**	**Yes** If the battery passed the condition test but required a recharge, REFER to Section 414-00 to diagnose the charging system. CLEAR all CMDTCs . TEST the system for normal operation. If the battery passed the condition test and did not require a recharge, GO to G3 . **No** INSTALL a new battery. CLEAR all CMDTCs . TEST the system for normal operation.
G3 CHECK CHARGING SYSTEM VOLTAGE	
NOTE: Do not allow the engine speed to increase above 2,000 rpm while performing this step or the generator may self excite and result in default charging system output voltage. If engine speed goes above 2,000 rpm, shut the vehicle OFF and restart the engine before performing this step. • Measure the voltage of the battery with and without a load on the charging system as follows: ♦ Turn off all accessories and run the engine at 1,500 rpm for a minimum of 2 minutes while measuring battery voltage. ♦ Turn on headlights and HVAC fan on high and run engine at 1,500 rpm for a minimum of 2	**Yes** GO to G4 . **No** REFER to Section 414-00 to diagnose the charging system. CLEAR all CMDTCs . TEST the system for normal operation.

minutes while measuring battery voltage.  AJ0210-A • **Are the voltages between 13 and 15.2 volts?**	
G4 CHECK FOR VOLTAGE MONITORING THE MODULE SUPPLY VOLTAGE (VBAT_CC) HVAC PID	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: VBAT_CC HVAC PID. • Monitor the battery voltage VBAT_CC HVAC PID. • **Is the battery voltage less than 9 or greater than 15.5 volts?**	**Yes** If voltage is less than 9 volts, GO to G5 . If voltage is greater than 15.5 volts, INSTALL a new HVAC module. REFER to Section 412-01 . CLEAR all CMDTCs . REPEAT the self-test. **No** GO to G8 .
G5 CHECK CIRCUIT GD145 (BK/BU) FOR AN OPEN	
• Ignition OFF. • Measure the resistance between ground and HVAC module - DATC C228A-2, circuit GD145 (BK/BU), harness side.  A0032481 • **Is the resistance less than 5 ohms?**	**Yes** GO to G6 . **No** REPAIR circuit GD145 (BK/BU) for an open. TEST the system for normal operation.
G6 CHECK CIRCUIT SBP28 (GN/RD) FOR AN OPEN	
• Ignition OFF. • Disconnect: HVAC Module - DATC C228A. • Measure the voltage between ground and HVAC module - DATC C228A-13, circuit SBP28 (GN/RD), harness side.	**Yes** GO to G7 . **No** VERIFY Smart Junction Box (SJB) fuse 28 (10A) is OK. If OK, REPAIR circuit SBP28 (GN/RD) for an open. TEST the system for normal operation.

 A0032479 • **Is the voltage greater than 10 volts?**	
G7 CHECK CIRCUIT CBP20 (YE/VT) FOR AN OPEN	
• Ignition ON. • Measure the voltage between ground and HVAC module - DATC C228A-3, circuit CBP20 (YE/VT), harness side.  A0032480 • **Is the voltage greater than 10 volts?**	**Yes** GO to G8 . **No** If DTC B1676 is present in multiple modules, refer to Section 414-00 . If DTC B1676 is present only in the HVAC module - Electronic Manual Temperature Control (EMTC) or HVAC module - DATC , VERIFY SJB fuse 20 (10A) is OK. If OK, REPAIR circuit SBP28 (GN/RD) for an open. TEST the system for normal operation.
G8 CHECK THE HVAC MODULE CONNECTION	
• Disconnect and inspect the HVAC module connectors for: ♦ corrosion. ♦ pushed-out terminals. ♦ damaged terminals. • Connect and correctly seat all the HVAC module connectors. • Clear the DTCs. • Operate the system. • Enter the following diagnostic mode on the scan tool: Self-Test - HVAC Module. • **Do the DTCs return?**	**Yes** INSTALL a new HVAC module. REFER to Section 412-01 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test H: Unable to Duplicate the Customer Concern and No DTCs Present

Normal Operation

The purpose of this pinpoint test is to test the functions of the HVAC system and to identify the correct pinpoint test symptom.

This pinpoint test is intended to diagnose the following:
- Incorrect functioning of the HVAC system

PINPOINT TEST H: UNABLE TO DUPLICATE THE CUSTOMER CONCERN AND NO DTCs PRESENT

NOTE: Before carrying out the following test, diagnose any HVAC, PCM or Instrument Cluster (IC) DTCs.

Test Step	Result / Action to Take
H1 CHECK THE BLOWER MOTOR OPERATION	
• Ignition ON. • Select PANEL mode. • Observe blower motor operation and select each blower motor speed. • **Does the blower motor operate in all selections and change speed in each?**	**Yes** GO to H2 . **No** (Manual climate control systems) If the blower motor does not operate in any setting, GO to Pinpoint Test P . (Dual Automatic Temperature Control (DATC) systems) If the blower motor does not operate in any setting, GO to Pinpoint Test R . (Manual climate control systems) If the blower motor does not properly change speeds or shut OFF, GO to Pinpoint Test Q . (DATC systems) If the blower motor does not properly change speeds or shut OFF, GO to Pinpoint Test S .
H2 CHECK AIRFLOW OPERATION	
• Select the highest blower motor setting. • **NOTE:** Refer to Description and Operation in this section for proper airflow descriptions. • While observing the airflow, select each of the airflow positions (PANEL, PANEL/FLOOR, FLOOR, FLOOR/DEFROST, DEFROST). • **Is the airflow directed to the proper outlets?**	**Yes** GO to H3 . **No** (Manual climate control systems) GO to Pinpoint Test I . (DATC systems) GO to Pinpoint Test J .
H3 VERIFY TEMPERATURE CONTROL OPERATION	
• Start the vehicle and allow it to reach normal operating temperature. • With the A/C OFF, select PANEL mode. • Change the temperature setting from the coldest to the warmest and back to the coldest. • **Does the temperature change between very warm to cool?**	**Yes** GO to H4 . **No** If the temperature does not get very warm, GO to Pinpoint Test K . (Manual climate control systems) If the temperature does not change at all, GO to Pinpoint Test O . (DATC systems) If the temperature does not change at all, GO to Pinpoint Test C .

H4 VERIFY THE A/C CLUTCH DOES NOT ENGAGE WITH A/C OFF	
• With the A/C OFF, select PANEL mode. • Select the coldest temperature setting. • **Is the outlet temperature close to ambient temperature?**	**Yes** GO to H5 . **No** (Manual climate control systems) If the temperature is warmer than ambient temperature, GO to Pinpoint Test O and diagnose for inoperative blend door. (DATC systems) If the temperature is warmer than ambient temperature, GO to Pinpoint Test C and diagnose for inoperative blend door. If the outlet temperature is significantly colder than ambient temperature and the A/C compressor clutch cycles normally, GO to Pinpoint Test N . If the outlet temperature is significantly colder than ambient temperature and the A/C compressor clutch is engaged and does not cycle, GO to Pinpoint Test M .
H5 VERIFY A/C CLUTCH ENGAGEMENT IN THE A/C MODE	
• Make sure the ambient air temperature is above 2°C (35°F). • Select PANEL mode. • Press the A/C button (indicator ON). • **Does the A/C clutch engage when the PANEL and A/C button (indicator ON) is pressed?**	**Yes** GO to H6 . **No** GO to Pinpoint Test L .
H6 CHECK THE RECIRC OPERATION	
• Press the RECIRC button (indicator OFF). • Select PANEL mode. • Select the highest blower motor setting. • Observe airflow noise. • Press the RECIRC button (indicator ON). • **Does the airflow noise increase when the RECIRC mode is selected (indicator ON)?**	**Yes** GO to H7 . **No** (Manual climate control systems) GO to Pinpoint Test I . (DATC systems) GO to Pinpoint Test J .
H7 CHECK THE AUXILIARY BLOWER MOTOR OPERATION	
• Using the front and rear auxiliary blower motor controls, observe blower motor operation and select each auxiliary blower motor speed.	**Yes** GO to H8 . **No**

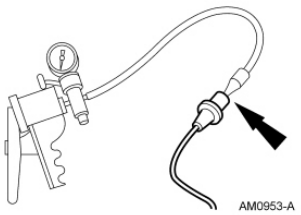
• **Does the auxiliary blower motor operate in all selections and change speed in each?**	If the auxiliary blower motor does not operate in any setting, GO to Pinpoint Test T . If the auxiliary blower motor does not properly change speeds or shut OFF, GO to Pinpoint Test U .
H8 VERIFY AUXILIARY TEMPERATURE/MODE OPERATION	
• Select the highest auxiliary blower motor setting. • Using the front and rear auxiliary controls, change the temperature/mode setting from the coldest to the warmest/floor and back to the coldest/overhead. • **Does the temperature change between very warm to cool and auxiliary airflow to the floor when warm is selected and headliner when cool is selected?**	**Yes** The system is operating normally. **No** If the auxiliary temperature control is inoperative/does not operate correctly, GO to Pinpoint Test W . If the auxiliary panel/floor control is inoperative/does not operate correctly from the front/rear auxiliary controls, GO to Pinpoint Test V .

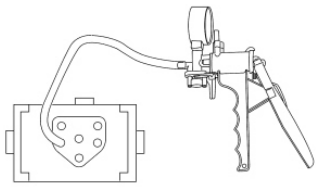
Pinpoint Test I: Incorrect/Erratic Direction of Airflow From Outlets - Manual Climate Control

Normal Operation

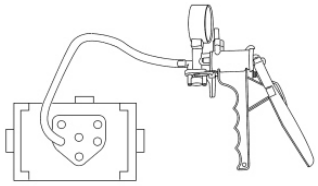
Under normal operation, the function selector switch is provided vacuum from the engine. When a position is selected, vacuum is applied to the desired vacuum control motor that is connected to the mode door to be controlled.

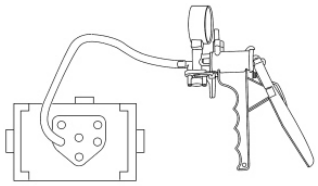
A leak or blockage of the vacuum source line to the HVAC system will result in the following default conditions:



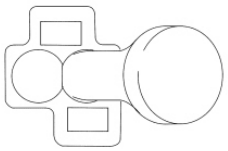


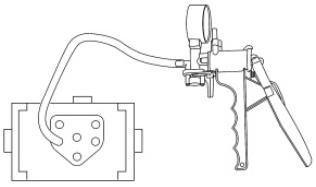
- Airflow will be from the defrost outlets only.
- The air inlet door will remain in the fresh air position only.
- The coolant control valve will allow coolant flow to the heater core at all times.

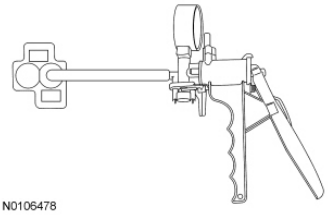




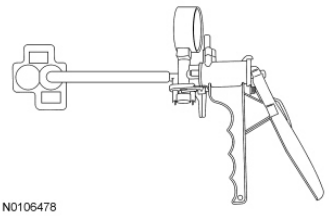
This pinpoint test is intended to diagnose the following:
- Function selector switch
- Heater control valve
- Vacuum control motor
- Stuck or bound linkage or door
- Leaking or plugged vacuum hose







PINPOINT TEST I: INCORRECT/ERRATIC DIRECTION OF AIRFLOW FROM OUTLETS - MANUAL CLIMATE CONTROL



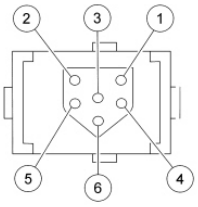
Test Step	Result / Action to Take
I1 CHECK THE SYSTEM AIRFLOW	
• Start the engine.	**Yes** GO to I2 .

• Set the blower motor speed to maximum. • Check for proper airflow in each function selector switch position at engine idle and under acceleration. • Road test the vehicle and recheck the airflow during the road test. • **Is the airflow correct in each function selector switch position?**	**No** If the airflow is from only the defrost outlet in all settings, GO to I3 . CARRY OUT the Function Selector Vacuum Switch component test. If the switch leaks or is blocked, INSTALL a new climate control assembly. TEST the system for normal operation. If the switch tests OK and: If there is no airflow from the panel outlets in PANEL mode, GO to I11 and diagnose the panel door vacuum control motor. If there is no airflow from the floor outlets in FLOOR mode, GO to I11 and diagnose the floor door vacuum control motor. If there is no airflow from the defrost outlets in DEFROST mode, GO to I11 and diagnose the defroster door vacuum control motor. If there is some airflow from the defrost outlets in PANEL and FLOOR modes, GO to I11 and diagnose the defroster door vacuum control motor. If there is some airflow from the panel outlets in DEFROST and FLOOR modes, GO to I11 and diagnose the panel door vacuum control motor. If there is some airflow from the floor outlets in DEFROST and PANEL modes, GO to I11 and diagnose the floor door vacuum control motor.
I2 CHECK THE AIR INLET DOOR OPERATION	
• Select PANEL mode. • Select the highest blower motor setting. • Observe airflow noise. • Select MAX A/C mode. • **During the road test, does the airflow noise increase when the MAX A/C mode is selected?**	**Yes** The system is operating normally. **No** CARRY OUT the Function Selector Vacuum Switch component test. If the switch leaks or is blocked, INSTALL a new climate control assembly. If the switch tests OK, GO to I11 and diagnose the air inlet door vacuum control motor.
I3 CHECK THE VACUUM CHECK VALVE	

• Ignition OFF. • Disconnect: Vacuum Check Valve. • **NOTE:** The vacuum check valve is located in the passenger side, rear area of the engine compartment, near the heater control valve. • Connect the vacuum pump to the each port on the vacuum check valve and attempt to pull a vacuum. • **Can a vacuum be pulled on only one side of the vacuum check valve and not the other?**	**Yes** GO to I4 . **No** INSTALL a new vacuum check valve. TEST the system for normal operation.
I4 CHECK FOR VACUUM AT THE CHECK VALVE	
• Connect the vacuum pump to the vacuum source line to the check valve from the engine intake manifold.  AM0953-A • Start the engine. • Check for manifold vacuum. • **Is manifold vacuum present at the check valve vacuum source line?**	**Yes** GO to I5 . **No** REPAIR or INSTALL a new check valve vacuum source line harness. TEST the system for normal operation.
I5 CHECK THE FUNCTION SELECTOR SWITCH VACUUM SOURCE LINE FOR BLOCKAGE	
• Ignition OFF. • Disconnect: Function Selector Switch Vacuum Connector. • With the vacuum check valve disconnected, connect the vacuum pump to the function selector switch vacuum source line (black) and attempt to pull a vacuum. (Pulling a vacuum here would indicate a restricted or blocked vacuum source line.)  A0033878 • **Does air flow freely through the vacuum source line (no vacuum)?**	**Yes** GO to I6 . **No** REPAIR or INSTALL a new function selector switch vacuum source line. TEST the system for normal operation.
I6 CHECK THE FUNCTION SELECTOR SWITCH VACUUM SOURCE LINE FOR LEAKS	

• Connect: Vacuum Check Valve. • Apply 51 kPa (15 in-Hg) of vacuum to the selector switch vacuum source line (black) using the vacuum pump.  A0033878 • **Does the function selector switch vacuum source line hold the vacuum?**	**Yes** INSTALL a new climate control assembly. TEST the system for normal operation. **No** GO to I7 .
I7 CHECK THE VACUUM RESERVOIR FOR LEAKS	
• Disconnect the vacuum reservoir line at the vacuum reservoir. • Plug the vacuum reservoir line at the vacuum reservoir connection. • Apply 51 kPa (15 in-Hg) of vacuum to the selector switch vacuum source line (black) using the vacuum pump.  A0033878 • **Does the function selector switch vacuum source line hold the vacuum?**	**Yes** INSTALL a new vacuum reservoir. REFER to Section 412-01 . TEST the system for normal operation. **No** GO to I8 .
I8 CHECK THE HEATER CONTROL VALVE VACUUM SWITCH CIRCUIT	
• Disconnect: Heater Control Valve Vacuum Switch. • **NOTE:** The heater control valve vacuum switch is located on the RH side of the heater core and evaporator core housing, attached to the temperature blend door shaft. The control valve vacuum switch is accessible through the glove compartment opening. • Using a golf tee or equivalent, plug the vacuum source line (black) port of the heater control valve vacuum switch vacuum harness.	**Yes** GO to I9 . **No** REPAIR the vacuum line to the heater control valve vacuum switch or INSTALL a new vacuum source line harness. TEST the system for normal operation.

 A0033879 • Apply 51 kPa (15 in-Hg) of vacuum to the selector switch vacuum source line (black) using the vacuum pump.  A0033878 • **Does the function selector switch vacuum source line hold the vacuum?**	
I9 CHECK THE HEATER CONTROL VALVE VACUUM SWITCH	
• Apply 51 kPa (15 in-Hg) of vacuum to the heater control valve switch vacuum motor line (gray) using the vacuum pump.  N0106478 • **Does the heater control valve switch vacuum motor line hold the vacuum?**	**Yes** INSTALL a new heater control valve vacuum switch. TEST the system for normal operation. **No** GO to I10 .
I10 CHECK THE HEATER CONTROL VALVE VACUUM MOTOR CIRCUIT	
• Disconnect the vacuum line from the heater control valve and plug the vacuum line (gray) at the heater control valve. • Apply 51 kPa (15 in-Hg) of vacuum to the heater control valve vacuum motor line (gray) using the vacuum pump.	**Yes** INSTALL a new heater control valve. REFER to Section 412-01 . TEST the system for normal operation. **No** REPAIR or INSTALL a new heater control valve vacuum line. TEST the system for normal operation.



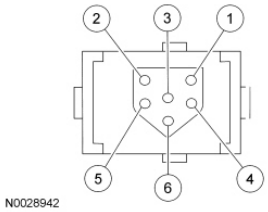
N0106478

- **Does the heater control valve vacuum motor line hold the vacuum?**

I11 CHECK THE VACUUM CONTROL MOTOR LINE FOR LEAKS

- Ignition OFF.
- Disconnect: Function Selector Switch Vacuum Connector.
- Disconnect: Vacuum Control Motor (noted in Step I1).
- Plug the vacuum control motor line at the vacuum control motor connection.
- Apply 51 kPa (15 in-Hg) of vacuum to the appropriate vacuum control motor line (noted in Step I1) at the function selector switch vacuum connector using the vacuum pump. using the following chart:

Function Selector Switch Vacuum Connector Port Number	Vacuum Control Motor Vacuum Line Color	Vacuum Control Motor
1	White	Air inlet door
2	Blue	Floor door
4	Red	Panel door
6	Yellow	Defrost door



N0028942

- **Does the vacuum control motor line hold the vacuum?**

Yes
GO to I12 .

No
REPAIR or INSTALL a new vacuum harness. TEST the system for normal operation.

I12 CHECK THE VACUUM CONTROL MOTOR LINE FOR BLOCKAGE

<table>
<tr>
<td>
• Remove the plug from the vacuum control motor line.
• Connect the vacuum pump to the appropriate vacuum control motor line (noted in Step I1) at the function selector switch vacuum connector using the following chart and attempt to pull a vacuum.

GO to I13 .

No
INSTALL a new vacuum harness. TEST the system for normal operation.</td>
</tr>
<tr>
<td>I13 CHECK THE MODE DOOR LINKAGE AND MOVEMENT</td>
<td></td>
</tr>
<tr>
<td>
• Inspect the mode door linkage and verify correct movement of the mode door.
• Is the mode door or mode door linkage broken, binding or otherwise obstructed?
</td>
<td>Yes
REPAIR the mode door or mode door linkage as necessary. TEST the system for normal operation.

No
INSTALL a new vacuum control motor. TEST the system for normal operation.</td>
</tr>
</table>

Pinpoint Test J: Incorrect/Erratic Direction of Airflow From Outlets - DATC

Refer to Wiring Diagrams Cell 55 , Automatic Climate Control System for schematic and connector information.

Normal Operation

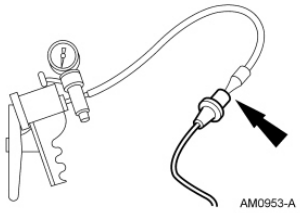
Under normal operation, the solenoid and manifold assembly receives a ground from the HVAC module - Dual Automatic Temperature Control (DATC). Depending on which solenoid is to be energized, the solenoid and manifold assembly receives voltage from the HVAC module - DATC through circuits:

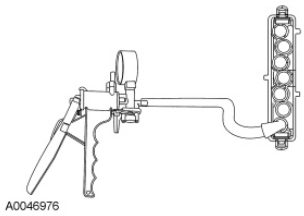
- CH220 (GN/BN) for the air inlet door vacuum control motor.
- CH221 (GY/VT) for the defrost door vacuum control motor.
- CH222 (WH/VT) for the floor door vacuum control motor.
- CH223 (YE/BU) for the panel door vacuum control motor.
- CH224 (BU/OG) for the heater control valve.

Engine vacuum is supplied to the solenoid and manifold assembly. When one of the solenoids is energized, vacuum is applied to the control motor or valve and the desired door or valve is either opened or closed.

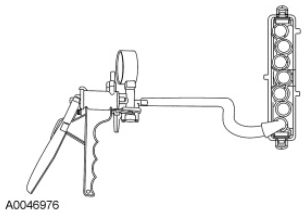
A leak or blockage of the vacuum source line to the HVAC system will result in the following default conditions:

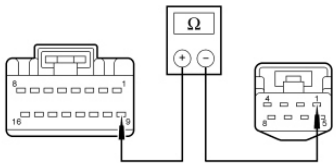
- Airflow will be from the defrost outlets only.
- The air inlet door will remain in the fresh air position only.
- The coolant control valve will allow coolant flow to the heater core at all times.

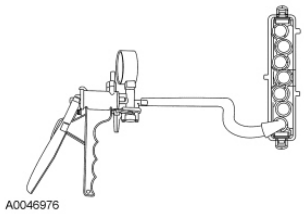




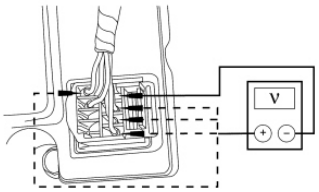
This pinpoint test is intended to diagnose the following:







- Wiring, terminals or connectors
- Solenoid and manifold assembly
- HVAC module - DATC
- Heater control valve
- Vacuum control motor
- Stuck or bound linkage or door
- Leaking or plugged vacuum hose



PINPOINT TEST J: INCORRECT/ERRATIC DIRECTION OF AIRFLOW FROM OUTLETS - DATC

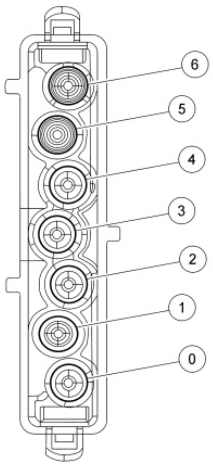
Test Step	Result / Action to Take
J1 CHECK THE AIRFLOW IN EACH SETTING	
• Start the engine. • Set the blower motor speed to maximum. • Check the airflow in each manual override setting on the HVAC module - DATC during engine idle and under acceleration. • Road test the vehicle and recheck the airflow during the road test. • **Is the airflow correct in each manual override setting?**	**Yes** GO to J2 . **No** If the airflow is from only the defrost outlet in all settings, GO to J3 . CARRY OUT the Solenoid and Manifold Assembly component test. If the solenoid and manifold assembly tests OK and: If there is no airflow from the panel outlets in PANEL mode, GO to J9 and diagnose the panel door vacuum control motor.

	If there is no airflow from the floor outlets in FLOOR mode, GO to J9 and diagnose the floor door vacuum control motor. If there is no airflow from the defrost outlets in DEFROST mode, GO to J9 and diagnose the defroster door vacuum control motor. If there is some airflow from the defrost outlets in PANEL and FLOOR modes, GO to J9 and diagnose the defroster door vacuum control motor. If there is some airflow from the panel outlets in DEFROST and FLOOR modes, GO to J9 and diagnose the panel door vacuum control motor. If there is some airflow from the floor outlets in DEFROST and PANEL modes, GO to J9 and diagnose the floor door vacuum control motor. For all other symptoms, GO to J15 .
J2 CHECK THE AIR INLET DOOR OPERATION	
• Press the RECIRC button (indicator OFF). • Select PANEL mode. • Select the highest blower motor setting. • Observe airflow noise. • Press the RECIRC button (indicator ON). • **During the road test, does the airflow noise increase when the RECIRC mode is selected (indicator ON)?**	**Yes** The system is operating normally. **No** CARRY OUT the Solenoid and Manifold Assembly component test. If the solenoid and manifold assembly tests OK, GO to J9 and diagnose the air inlet door vacuum control motor.
J3 CHECK THE VACUUM CHECK VALVE	
• Ignition OFF. • Disconnect: Vacuum Check Valve. • **NOTE:** The vacuum check valve is located in the passenger side, rear area of the engine compartment, near the heater control valve. • Connect the vacuum pump to the each port on the vacuum check valve and attempt to pull a vacuum.	**Yes** GO to J4 . **No** INSTALL a new vacuum check valve. TEST the system for normal operation.

• **Can a vacuum be pulled on only one side of the vacuum check valve and not the other?**	
J4 CHECK FOR VACUUM AT THE CHECK VALVE	
• Connect the vacuum pump to the vacuum source line to the check valve from the engine intake manifold.  AM0953-A • Start the engine. • Check for manifold vacuum. • **Is manifold vacuum present at the check valve vacuum source line?**	**Yes** GO to J5 . **No** REPAIR or INSTALL a new check valve vacuum source line harness. TEST the system for normal operation.
J5 CHECK THE SOLENOID AND MANIFOLD ASSEMBLY VACUUM SOURCE LINE FOR BLOCKAGE	
• Ignition OFF. • Disconnect: Solenoid and Manifold Assembly Vacuum Connector. • With the vacuum check valve disconnected, connect the vacuum pump to the solenoid and manifold assembly vacuum source line (black) and attempt to pull a vacuum. (Pulling a vacuum here would indicate a restricted or blocked vacuum source line.)  A0046976 • **Does air flow freely through the vacuum source line (no vacuum)?**	**Yes** GO to J6 . **No** REPAIR or INSTALL a new solenoid and manifold assembly vacuum source line. TEST the system for normal operation.
J6 CHECK THE SOLENOID AND MANIFOLD ASSEMBLY VACUUM SOURCE LINE FOR LEAKS	
• Connect: A/C Vacuum Check Valve. • Apply 51 kPa (15 in-Hg) of vacuum to the solenoid and manifold assembly vacuum source line (black) using the vacuum pump.	**Yes** GO to J7 . **No** GO to J8 .

 A0046976 • **Does the solenoid and manifold assembly vacuum source line hold the vacuum?**	
J7 CHECK CIRCUIT RH226 (WH/VT) FOR AN OPEN	
• Ignition OFF. • Disconnect: HVAC Module - DATC C228B. • Disconnect: Solenoid and Manifold Assembly C2093. • Measure the resistance between HVAC module - DATC C228B-9, circuit RH226 (WH/VT), harness side and solenoid and manifold assembly C2093-1, circuit RH226 (WH/VT), harness side.  A0033889 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new solenoid and manifold assembly. TEST the system for normal operation. If the condition returns, GO to J18 . **No** REPAIR circuit RH226 (WH/VT) for an open. TEST the system for normal operation.
J8 CHECK THE VACUUM RESERVOIR FOR LEAKS	
• Disconnect the vacuum reservoir line at the vacuum reservoir. • Plug the vacuum reservoir line at the vacuum reservoir connection. • Apply 51 kPa (15 in-Hg) of vacuum to the solenoid and manifold assembly vacuum source line (black) using the vacuum pump.  A0046976 • **Does the solenoid and manifold assembly vacuum source line hold the vacuum?**	**Yes** INSTALL a new vacuum reservoir. REFER to Section 412-01 . TEST the system for normal operation. **No** REPAIR or INSTALL a new solenoid and manifold assembly vacuum source line. TEST the system for normal operation.
J9 CHECK THE SOLENOID AND MANIFOLD ASSEMBLY	

• Press the PANEL/FLOOR button then the RECIRCULATION button on the HVAC module - DATC . • **NOTE:** The following measurements must be taken by back-probing the solenoid and manifold assembly C2093. • Measure the voltage between solenoid and manifold assembly C2093-1, circuit RH226 (WH/VT), harness side and solenoid and manifold assembly: ♦ C2093-2, circuit CH220 (GN/BN), harness side. ♦ C2093-3, circuit CH221 (GY/VT), harness side. ♦ C2093-4, circuit CH222 (WH/VT), harness side. ♦ C2093-5, circuit CH223 (YE/BU), harness side.  A0033888 • **Are all the voltages greater than 10 volts?**	**Yes** INSTALL a new solenoid and manifold assembly. TEST the system for normal operation. **No** GO to J10 .
J10 CHECK THE SOLENOID AND MANIFOLD ASSEMBLY CIRCUITS FOR AN OPEN	
• Ignition OFF. • Disconnect: HVAC Module - DATC C228B. • Disconnect: Solenoid and Manifold Assembly C2093. • Measure the resistance between the HVAC module - DATC connector, harness side and solenoid and manifold assembly, harness side using the following chart.	**Yes** GO to J11 . **No** REPAIR the affected circuit for an open. TEST the system for normal operation.



HVAC Module Connector	Circuit	Solenoid and Manifold Assembly Connector
C228B-3	CH220 (GN/BN)	C2093-2
C228B-2	CH221 (GY/VT)	C2093-3
C228B-10	CH222 (WH/VT)	C2093-4
C228B-11	CH223 (YE/BU)	C2093-5

N0089173

• **Are the resistances less than 5 ohms?**	
J11 CHECK THE VACUUM CONTROL MOTOR LINE FOR LEAKS	
• Ignition OFF. • Disconnect: Solenoid and Manifold Assembly Vacuum Connector. • Disconnect: Vacuum Control Motor (noted in Step J1). • Plug the vacuum control motor line at the vacuum control motor connection. • Apply 51 kPa (15 in-Hg) of vacuum to the appropriate vacuum control motor line (noted in Step J1) at the solenoid and manifold assembly vacuum connector using the vacuum pump. using the following chart:	**Yes** GO to J12 . **No** REPAIR or INSTALL a new vacuum harness. TEST the system for normal operation.

Solenoid and Manifold Assembly Vacuum Connector Port Number	Vacuum Control Motor Vacuum Line Color	Vacuum Control Motor
1	White	Air inlet door
2	Yellow	Defrost door
3	Blue	Floor door
4	Red	Panel door

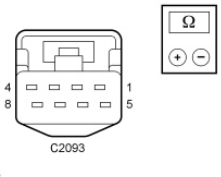
GO to J14 .</td>
</tr>
<tr><td>J14 CHECK THE VACUUM CONTROL MOTOR FOR LEAKS AND CORRECT OPERATION</td><td></td></tr>
</table>

• Connect the vacuum pump to the appropriate vacuum control motor and pull a vacuum.  AL0136-A • **Does the vacuum control motor operate and hold vacuum?**	**Yes** GO to J18 . **No** INSTALL a new vacuum control motor. TEST the system for normal operation.
J15 CHECK THE SOLENOID AND MANIFOLD ASSEMBLY CIRCUITS FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: HVAC Module - DATC C228B. • Disconnect: Solenoid and Manifold Assembly C2093. • Measure the resistance between ground and solenoid and manifold assembly: ♦ C2093-2, circuit CH220 (GN/BN), harness side. ♦ C2093-3, circuit CH221 (GY/VT), harness side. ♦ C2093-4, circuit CH222 (WH/VT), harness side. ♦ C2093-5, circuit CH223 (YE/BU), harness side.  A0040177 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to J16 . **No** REPAIR the affected circuit for a short to ground. TEST the system for normal operation.
J16 CHECK THE SOLENOID AND MANIFOLD ASSEMBLY CIRCUITS FOR A SHORT TO CIRCUIT RH226 (WH/VT)	
• Measure the resistance between solenoid and manifold assembly C2093-1, circuit RH226 (WH/VT), harness side and solenoid and manifold assembly: ♦ C2093-2, circuit CH220 (GN/BN), harness side. ♦ C2093-3, circuit CH221 (GY/VT), harness side. ♦ C2093-4, circuit CH222 (WH/VT), harness side. ♦ C2093-5, circuit CH223 (YE/BU), harness side.	**Yes** GO to J17 . **No** REPAIR the affected circuit for a short to circuit RH226 (WH/VT). TEST the system for normal operation.



- **Are the resistances greater than 10,000 ohms?**

J17 CHECK THE SOLENOID AND MANIFOLD ASSEMBLY CIRCUITS FOR A SHORT TOGETHER

- Measure the resistance between the solenoid and manifold assembly connector C2093, harness side using the following chart.

Solenoid and Manifold Assembly Connector	Circuit	Solenoid and Manifold Assembly Connector	Circuit
C2093-2	CH220 (GN/BN)	C2093-3	CH221 (GY/VT)
C2093-2	CH220 (GN/BN)	C2093-4	CH222 (WH/VT)
C2093-2	CH220 (GN/BN)	C2093-5	CH223 (YE/BU)
C2093-3	CH221 (GY/VT)	C2093-4	CH222 (WH/VT)
C2093-3	CH221 (GY/VT)	C2093-5	CH223 (YE/BU)
C2093-4	CH222 (WH/VT)	C2093-5	CH223 (YE/BU)

- **Are the resistances greater than 10,000 ohms?**

Yes
GO to J18 .

No
REPAIR the affected circuits for a short together. TEST the system for normal operation.

J18 CHECK THE HVAC MODULE CONNECTION

- Inspect the HVAC module connectors for:
  - ♦ corrosion.
  - ♦ pushed-out terminals.
  - ♦ damaged terminals.
- Connect and correctly seat all the HVAC module connectors.

Yes
INSTALL a new HVAC module. REFER to Section 412-01 . TEST the system for normal operation.

No
The system is operating correctly

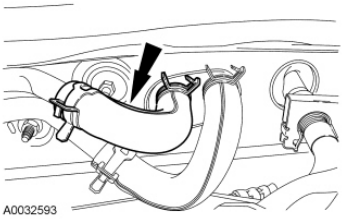
• Clear the DTCs. • Operate the system and verify the concern is still present. • **Is the concern still present?**	at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

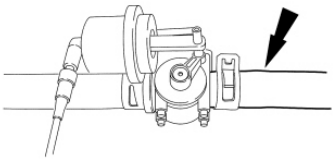
Pinpoint Test K: Insufficient, Erratic or No Heat

Refer to Wiring Diagrams Cell 55 , Automatic Climate Control System for schematic and connector information.

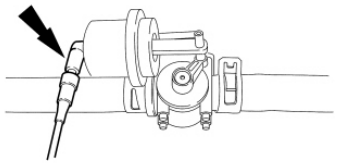
Normal Operation

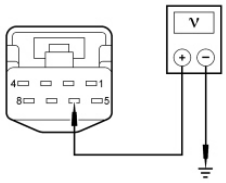
Under normal operation, for Dual Automatic Temperature Control (DATC) systems, the solenoid and manifold assembly receives a ground from the HVAC module - DATC . When the heater control valve vacuum solenoid is to be energized, the solenoid and manifold assembly receives voltage from the HVAC module - DATC .



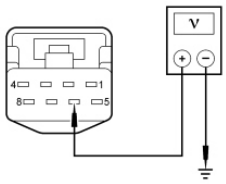


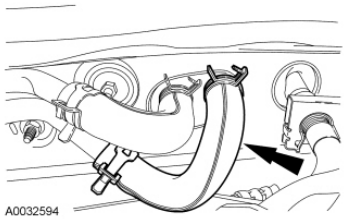
Under normal operation, for manual climate control systems, the function selector switch receives engine vacuum. When OFF or MAX A/C is selected, vacuum is applied to the recirculation vacuum control motor. When the temperature is in the full COOL position, the heater control valve vacuum switch applies vacuum to the heater control valve.





This pinpoint test is intended to diagnose the following:





- Wiring, terminals or connectors
- Solenoid and manifold assembly (DATC systems only)
- HVAC module - DATC
- Function selector switch (manual climate control systems only)
- Heater control valve
- Heater control valve vacuum switch (if equipped)
- Stuck or bound linkage or door
- Leaking or plugged vacuum hose
- Temperature blend door actuator

PINPOINT TEST K: INSUFFICIENT, ERRATIC OR NO HEAT

Test Step	Result / Action to Take
K1 CHECK FOR PROPER ENGINE COOLANT LEVEL	
• Ignition OFF. • Check the engine coolant level when hot and cold. • **Is the engine coolant at the correct level (hot/cold) as indicated on the engine coolant recovery reservoir?**	**Yes** GO to K3 . **No** GO to K2 .
K2 CHECK THE ENGINE COOLING SYSTEM FOR LEAKS	
• Pressure test the cooling system for leaks. Refer to Section 303-03 . • **Does the engine cooling system leak?**	**Yes** REPAIR the engine coolant leak. TEST the system for normal operation.

	No FILL and BLEED the cooling system. REFER to Section 303-03 . After filling and bleeding the cooling system, GO to K3 .
K3 CHECK FOR COOLANT FLOW TO THE HEATER CORE	
• Run the engine until it reaches normal operation temperature. Select the FLOOR position on the control assembly. Set the temperature control to full warm and the blower to the lowest setting. • Using a suitable temperature measuring device, check the heater core inlet hose to see if it is hot.  A0032593 • **Is the heater core inlet hose hot?**	**Yes** GO to K9 . **No** GO to K4 .
K4 CHECK FOR COOLANT FLOW TO THE HEATER CONTROL VALVE	
• Using a suitable temperature measuring device, measure the heater control valve inlet hose to see if it is hot.  A0035188 • **Is the heater control valve inlet hose hot?**	**Yes** GO to K5 . **No** REFER to Section 303-03 .
K5 CHECK FOR VACUUM AT THE HEATER CONTROL VALVE	
• Disconnect the heater control valve vacuum connector and check for vacuum.	**Yes** GO to K6 . **No** INSTALL a new heater control valve. REFER to Section 412-01 . TEST the system for normal operation.

 A0035187 • **Is vacuum present at the heater control valve?**	
K6 CHECK FOR INCORRECT VACUUM LINE PLACEMENT	
• Ignition OFF. • Inspect the heater control valve and A/C vacuum lines for correct placement. • **Is the vacuum line placement correct?**	**Yes** For manual climate control systems, INSTALL a new heater control valve vacuum switch. For DATC systems, GO to K7 . **No** CORRECT the vacuum line placement. TEST the system for normal operation.
K7 CHECK THE CIRCUIT FOR VOLTAGE	
• Ignition OFF. • Disconnect: Solenoid and Manifold Assembly C2093. • Ignition ON. • Measure the voltage between ground and solenoid and manifold assembly C2093-6, circuit CH224 (BU/OG), harness side.  N0105581 • **Is any voltage present?**	**Yes** GO to K8 . **No** INSTALL a new solenoid and manifold assembly. TEST the system for normal operation.
K8 CHECK THE CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: HVAC Module - DATC C228A. • Ignition ON. • Measure the voltage between ground and solenoid and manifold assembly C2093-6, circuit CH224 (BU/OG), harness side.	**Yes** REPAIR circuit CH224 (BU/OG) for a short to voltage. TEST the system for normal operation. **No** INSTALL a new HVAC module - DATC . TEST the system for normal operation.

 N0105581 • **Is any voltage present?**	
K9 CHECK FOR A PLUGGED OR RESTRICTED HEATER CORE	
• Using a suitable temperature measuring device, measure the heater core outlet hose temperature.  A0032594 • **Is the heater core outlet hose temperature similar to the inlet hose temperature (within approximately 6-17°C [10-30°F])?**	**Yes** For manual climate control systems, GO to Pinpoint Test O . For DATC systems, GO to Pinpoint Test C . **No** INSTALL a new heater core. REFER to Section 412-01 . TEST the system for normal operation.

Pinpoint Test L: The Air Conditioning (A/C) is Inoperative

Refer to Wiring Diagrams Cell 54 , Manual Climate Control System for schematic and connector information.

Refer to Wiring Diagrams Cell 55 , Automatic Climate Control System for schematic and connector information.

Normal Operation

Under normal operation, for Dual Automatic Temperature Control (DATC) systems, when A/C is requested, the HVAC module - DATC sends an A/C request message over the Medium Speed Controller Area Network (MS-CAN) bus to the Instrument Cluster (IC), then from the IC through the High Speed Controller Area Network (HS-CAN) bus to the PCM.

Under normal operation, for manual climate control systems, when A/C is requested, a voltage is supplied to the PCM on the A/C request PCM input.

The PCM also receives a ground from the A/C cycling switch when pressures are sufficient to close the switch. Ground is provided to the A/C cycling switch.

Voltage is provided to the A/C clutch relay switch. When the PCM energizes the relay, voltage is supplied to the A/C clutch from the relay. Ground is supplied for the A/C clutch.

When an A/C request is received by the PCM, the A/C compressor clutch will only be engaged through the A/C clutch relay if all of the following conditions are met:

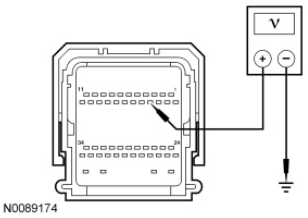
- The PCM does not detect excessively high refrigerant pressure from the A/C pressure transducer.

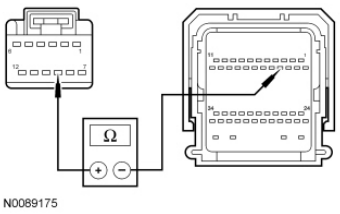
- The PCM does not detect excessively high engine coolant temperature.
- The PCM does not detect an ambient air temperature below -1°C (30°F).
- The PCM has not detected a Wide Open Throttle (WOT) condition.
- The PCM does not detect excessively low refrigerant pressure from the A/C cycling switch.

The A/C cycling switch is used for A/C compressor cycling. The A/C cycling switch is used by the PCM to turn off the A/C compressor when the refrigerant pressure is low enough to make the evaporator temperatures cold enough to freeze the condensation. The A/C pressure transducer is used to turn off the A/C compressor when the refrigerant pressure is to high. Excessively high refrigerant pressure can damage the A/C compressor.

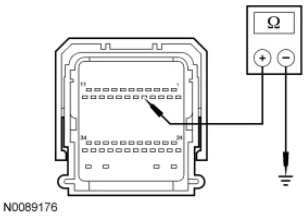
This pinpoint test is intended to diagnose the following:

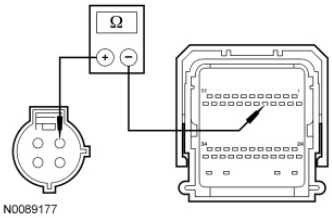
- Fuse(s)
- Wiring, terminals or connectors
- PCM
- HVAC module - DATC
- Function selector switch (manual climate control systems)
- A/C cycling switch
- A/C compressor clutch field coil
- A/C control relay
- A/C clutch air gap

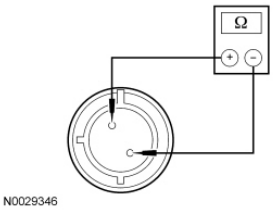




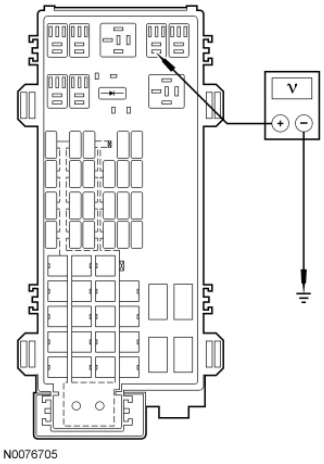
PINPOINT TEST L: THE AIR CONDITIONING (A/C) IS INOPERATIVE

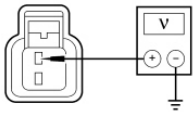




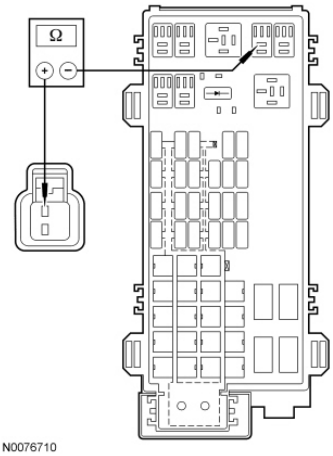


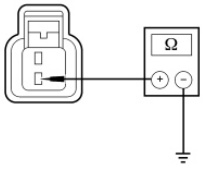
NOTE: Before carrying out the following test, diagnose any HVAC, PCM or IC DTCs.



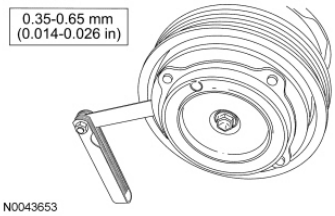


NOTE: Before carrying out the following test, check that the A/C system pressure is above 290 kPa (42 psi). If the pressure is below 290 kPa (42 psi), refer to Fluorescent Dye Leak Detection in this section.





NOTE: The ambient temperature, as indicated by the DATC display, must be over 6°C (43°F). If the ambient temperature display is inaccurate, GO to Symptom Chart - Climate Control Systems .



Test Step	Result / Action to Take
L1 CHECK THE AIR CONDITIONING COMPRESSOR CYCLING SWITCH (ACCS) PCM PID WITH THE A/C ON	
• Enter the following diagnostic mode on the scan tool: ACCS PCM PID. • Place the function selector switch in the MAX A/C position or press the PANEL and A/C manual override buttons on the HVAC module - DATC . • **Does the ACCS PCM PID read ON?**	**Yes** GO to L5 . **No** For manual climate control systems, GO to L2 . For DATC systems, GO to L4 .
L2 CHECK PCM FOR A/C SIGNAL VOLTAGE	
• Ignition OFF. • Disconnect: PCM C175B. • Ignition ON. • Measure the voltage between ground and PCM C175B-15, circuit CH443 (GN/OG), harness side.	**Yes** GO to L16 . **No** GO to L3 .

 • **Is the voltage greater than 10 volts?**	
L3 CHECK CIRCUIT CH443 (GN/OG) FOR AN OPEN	
• Ignition OFF. • Disconnect: Function Selector Switch C294C. • Measure the resistance between climate control assembly C294C-9, circuit CH443 (GN/OG), harness side and PCM C175B-15, circuit CH443 (GN/OG), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new function selector switch. REFER to Section 412-01 . TEST the system for normal operation. **No** REPAIR circuit CH443 (GN/OG) for an open. TEST the system for normal operation.
L4 CHECK THE AIR CONDITIONING SWITCH STATUS (AC_SEL_SW) HVAC PID WITH THE A/C ON	
• Enter the following diagnostic mode on the scan tool: AC_SEL_SW HVAC PID. • Press the PANEL and press and hold the A/C manual override buttons on the HVAC module - DATC . • **Does the AC_SEL_SW HVAC PID read A/C?**	**Yes** GO to L16 . **No** GO to L15 .
L5 CHECK THE AIR CONDITIONING COMPRESSOR DIAGNOSTIC SWITCH (ACDS1) PCM PID WITH THE A/C ON	
• Enter the following diagnostic mode on the scan tool: ACDS1 PCM PID. • Place the function selector switch in the MAX A/C position or press the PANEL and A/C manual override buttons on the HVAC module - DATC . • **Does the ACDS1 PCM PID read ENABLE?**	**Yes** GO to L9 . **No** GO to L6 .
L6 CHECK THE A/C CYCLING SWITCH INPUT	

• Ignition OFF. • Disconnect: PCM C175B. • Measure the resistance between ground and PCM C175B-16, circuit CH423 (YE), harness side.  N0089176 • **Is the resistance less than 5 ohms?**	**Yes** GO to L16 . **No** GO to L7 .
L7 CHECK CIRCUIT CH423 (YE) FOR AN OPEN	
• Disconnect: A/C Cycling Switch C130. • Measure the resistance between A/C cycling switch C130-1, circuit CH423 (YE), harness side and PCM C175B-16, circuit CH423 (YE), harness side.  N0089177 • **Is the resistance less than 5 ohms?**	**Yes** GO to L8 . **No** REPAIR circuit CH423 (YE) for an open. TEST the system for normal operation.
L8 CHECK THE A/C CYCLING SWITCH	
• Ignition OFF. • Measure the resistance between the A/C cycling switch terminals.  N0029346 • **Is the resistance less than 5 ohms?**	**Yes** REPAIR circuit GD113 (BK/YE) for an open. TEST the system for normal operation. **No** INSTALL a new A/C cycling switch. TEST the system for normal operation.
L9 CHECK THE AIR CONDITIONING CLUTCH (WAC/ACCR) PCM PID WITH THE A/C ON	
• Enter the following diagnostic mode on the scan tool: WAC/ACCR PCM PID.	**Yes** GO to L10 . **No**

• Place the function selector switch in the MAX A/C position or press the PANEL and A/C manual override buttons on the HVAC module - DATC . • **With the engine running, does the WAC/ACCR PCM PID read ON?**	GO to L16 .
L10 CHECK CIRCUIT SBB35 (BU/RD) FOR VOLTAGE	
• Ignition OFF. • Disconnect: A/C Control Relay. • Ignition ON. • Measure the voltage between ground and A/C control relay socket pin 3, circuit SBB35 (BU/RD).  N0076705 • **Is the voltage greater than 10 volts?**	**Yes** GO to L11 . **No** VERIFY the Battery Junction Box (BJB) fuse 35 (10A) is OK. If OK, REPAIR circuit SBB35 (BU/RD) for an open. TEST the system for normal operation.
L11 CHECK THE VOLTAGE AT THE A/C COMPRESSOR CLUTCH FIELD COIL	
• Ignition OFF. • Connect: A/C Control Relay. • Disconnect: A/C Compressor Clutch Field Coil C1110. • Ignition ON. • With the engine running, measure the voltage between ground and A/C compressor clutch field coil C1110-1, circuit CH401 (VT/WH) (4.0L) or CH401 (GY/WH) (4.6L), harness side.  A0048576 • **Is the voltage greater than 10 volts?**	**Yes** GO to L13 . **No** GO to L12 .

L12 CHECK CIRCUIT CH401 (VT/WH) OR CIRCUIT CH401 (GY/WH) FOR AN OPEN	
• Ignition OFF. • Connect: A/C Control Relay. • Measure the resistance between A/C control relay socket pin 5, circuit CH401 (VT/WH) (4.0L) or CH401 (GY/WH) (4.6L) and A/C compressor clutch field coil C1110-1, circuit CH401 (VT/WH) (4.0L) or CH401 (GY/WH) (4.6L), harness side.  N0076710 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new A/C control relay. TEST the system for normal operation. **No** REPAIR circuit CH401 (VT/WH) (4.0L) or CH401 (GY/WH) (4.6L) for an open. TEST the system for normal operation.
L13 CHECK THE GROUND AT THE A/C COMPRESSOR CLUTCH FIELD COIL	
• Ignition OFF. • Measure the resistance between ground and A/C compressor clutch field coil C1110-2, circuit GD120 (BK/GN) (4.0L) or GD120 (BK) (4.6L), harness side.  N0003086 • **Is the resistance less than 5 ohms?**	**Yes** GO to L14 . **No** REPAIR circuit GD120 (BK/GN) (4.0L) or GD120 (BK) (4.6L) for an open. TEST the system for normal operation.
L14 CHECK THE A/C COMPRESSOR CLUTCH AIR GAP	

• Measure the A/C compressor clutch air gap at 3 equally spaced locations between the clutch hub and the A/C compressor clutch pulley.  N0043653 • **Is the A/C compressor clutch air gap average greater than 0.65 mm (0.026 in)?**	**Yes** ADJUST the A/C compressor clutch field coil. REFER to Air Conditioning (A/C) Clutch Air Gap Adjustment in this section. TEST the system for normal operation. **No** INSTALL a new A/C compressor clutch field coil. REFER to Section 412-01 . TEST the system for normal operation.
L15 CHECK THE HVAC MODULE CONNECTION	
• Inspect the HVAC module connectors for: ♦ corrosion. ♦ pushed-out terminals. ♦ damaged terminals. • Connect and correctly seat all the HVAC module connectors. • Clear the DTCs. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new HVAC module. REFER to Section 412-01 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
L16 CHECK THE PCM CONNECTION	
• Disconnect all the PCM connectors. • Inspect the module connectors for: ♦ corrosion. ♦ pushed-out terminals. ♦ damaged terminals. • Connect and correctly seat all the PCM connectors. • Clear the DTCs. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PCM. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test M: The Air Conditioning (A/C) is Always On - A/C Compressor Does Not Cycle

Refer to Wiring Diagrams Cell 54 , Manual Climate Control System for schematic and connector information.

Refer to Wiring Diagrams Cell 55 , Automatic Climate Control System for schematic and connector information.

Normal Operation

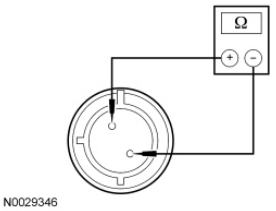
Under normal operation, for Dual Automatic Temperature Control (DATC) systems, when A/C is requested, the HVAC module - DATC sends an A/C request message over the Medium Speed Controller Area Network (MS-CAN) bus to the Instrument Cluster (IC), then from the IC through the High Speed Controller Area Network (HS-CAN) bus to the PCM.

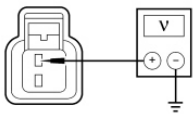
Under normal operation, for manual climate control systems, when A/C is requested, a voltage is supplied to the PCM on the A/C request PCM input.

The PCM also receives a ground from the A/C cycling switch when pressures are sufficient to close the switch. Ground is provided to the A/C cycling switch.

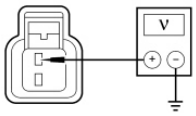
Voltage is provided to the A/C clutch relay switch. When the PCM energizes the relay, voltage is supplied to the A/C clutch from the relay. Ground is supplied for the A/C clutch.

The A/C cycling switch is used for A/C compressor cycling. The A/C cycling switch is used by the PCM to turn off the A/C compressor when the refrigerant pressure is low enough to make the evaporator temperatures cold enough to freeze the condensation. The A/C pressure transducer is used to turn off the A/C compressor when the refrigerant pressure is to high. Excessively high refrigerant pressure can damage the A/C compressor.





This pinpoint test is intended to diagnose the following:



- Wiring, terminals or connectors
- PCM
- A/C compressor clutch field coil
- A/C control relay
- A/C clutch air gap

PINPOINT TEST M: THE AIR CONDITIONING (A/C) IS ALWAYS ON - A/C COMPRESSOR DOES NOT CYCLE

NOTE: Before carrying out the following test, diagnose any HVAC, PCM or IC DTCs.

Test Step	Result / Action to Take
M1 CHECK THE AIR CONDITIONING CLUTCH (WAC/ACCR) PCM PID WITH THE A/C ON	
• Ignition ON. • Place the function selector switch to the OFF position. • Enter the following diagnostic mode on the scan tool: WAC/ACCR PCM PID. • **Does the WAC/ACCR PCM PID read OFF?**	**Yes** GO to M2 . **No** GO to M6 .
M2 CHECK THE AIR CONDITIONING COMPRESSOR DIAGNOSTIC SWITCH (ACDS1) PCM PID	
• Ignition OFF. • Disconnect: A/C Cycling Switch C130. • Ignition ON. • Enter the following diagnostic mode on the scan tool: ACDS1 PCM PID. • Observe the ACDS1 PCM PID. • **Does the ACDS1 PCM PID read DISABLE?**	**Yes** GO to M3 . **No** REPAIR circuit CH423 (YE) for a short to ground. TEST the system for normal operation.
M3 CHECK THE A/C CYCLING SWITCH	

• Ignition OFF. • Remove the A/C cycling switch from the vehicle. • Measure the resistance between the A/C cycling switch terminals.  N0029346 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to M4 . **No** INSTALL a new A/C cycling switch. TEST the system for normal operation.
M4 CHECK FOR VOLTAGE TO THE A/C COMPRESSOR CLUTCH FIELD COIL	
• Ignition OFF. • Disconnect: A/C Compressor Clutch Field Coil C1110. • Ignition ON. • With the engine running, measure the voltage between ground and A/C compressor clutch field coil C1110-1, circuit CH401 (VT/WH) (4.0L) or CH401 (GY/WH) (4.6L), harness side.  A0048576 • **Is any voltage present?**	**Yes** GO to M5 . **No** ADJUST the A/C compressor clutch air gap. REFER to Air Conditioning (A/C) Clutch Air Gap Adjustment in this section. TEST the system for normal operation.
M5 CHECK THE A/C CONTROL RELAY	
• Ignition OFF. • Disconnect: A/C Control Relay. • Ignition ON. • With the engine running, measure the voltage between ground and A/C compressor clutch field coil C1110-1, circuit CH401 (VT/WH) (4.0L) or CH401 (GY/WH) (4.6L), harness side.	**Yes** REPAIR circuit CH401 (VT/WH) for a short to voltage. TEST the system for normal operation. **No** INSTALL a new A/C control relay. TEST the A/C clutch diode. INSTALL a new diode, if necessary. TEST the system for normal operation.

 A0048576 • **Is any voltage present?**	
M6 CHECK THE PCM CONNECTION	
• Clear the DTCs. • Disconnect all the PCM connectors. • Check for: ♦ corrosion. ♦ pushed-out pins. ♦ incorrectly seated connector. • Connect and correctly seat all the PCM connectors. • Operate the system. • **Does the concern return?**	**Yes** INSTALL a new PCM. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

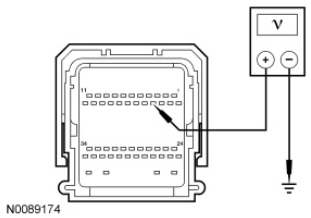
Pinpoint Test N: The Air Conditioning (A/C) is Always On - A/C Mode Always Commanded ON

Refer to Wiring Diagrams Cell 54 , Manual Climate Control System for schematic and connector information.

Refer to Wiring Diagrams Cell 55 , Automatic Climate Control System for schematic and connector information.

Normal Operation

Under normal operation, for Dual Automatic Temperature Control (DATC) systems, when A/C is requested, the HVAC module - DATC sends an A/C request message over the Medium Speed Controller Area Network (MS-CAN) bus to the Instrument Cluster (IC), then from the IC through the High Speed Controller Area Network (HS-CAN) bus to the PCM.



Under normal operation, for manual climate control systems, when A/C is requested, a voltage is supplied to the PCM on the A/C request PCM input.

This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- PCM
- HVAC module - DATC
- Function selector switch (manual climate control systems)

PINPOINT TEST N: THE AIR CONDITIONING (A/C) IS ALWAYS ON - A/C MODE ALWAYS COMMANDED ON

NOTE: Before carrying out the following test, diagnose any HVAC, PCM or IC DTCs.

Test Step	Result / Action to Take
N1 CHECK THE AIR CONDITIONING COMPRESSOR CYCLING SWITCH (ACCS) PCM PID WITH THE A/C OFF	

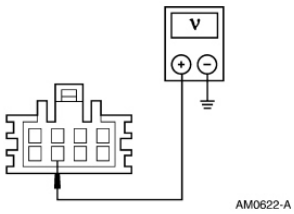
• Enter the following diagnostic mode on the scan tool: ACCS PCM PID. • Place the function selector switch to the OFF position or press the OFF manual override button on the HVAC module - DATC . • **Does the ACCS PCM PID read OFF?**	**Yes** GO to N6 . **No** GO to N4 . For manual climate control systems, GO to N2 .
N2 CHECK CIRCUIT CH443 (GN/OG) FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: Climate Control Assembly C294B and C294C. • Disconnect: PCM C175B. • Ignition ON. • Measure the voltage between ground and PCM 175b-15, circuit CH443 (GN/OG), harness side.  • **Is any voltage present?**	**Yes** REPAIR circuit CH443 (GN/OG) for a short to voltage. TEST the system for normal operation. **No** GO to N3 .
N3 CHECK THE FUNCTION SELECTOR SWITCH	
• Ignition OFF. • Carry out the Function Selector Switch component test in this section. • **Does the function selector switch test good?**	**Yes** GO to N5 . **No** INSTALL a new function selector switch. REFER to Section 412-01 . TEST the system for normal operation.
N4 CHECK THE AIR CONDITIONING SWITCH STATUS (AC_SEL_SW) HVAC PID WITH THE A/C OFF	
• Enter the following diagnostic mode on the scan tool: AC_SEL_SW HVAC PID. • Select PANEL mode on the HVAC module and make sure the A/C button and indicator are OFF. • **Does the AC_SEL_SW HVAC PID read Not Pressed?**	**Yes** GO to N6 . **No** GO to N5 .
N5 CHECK THE HVAC MODULE CONNECTION	
• Inspect the HVAC module connectors for:	**Yes** INSTALL a new HVAC module. REFER to Section

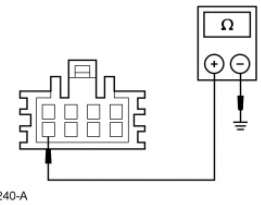
♦ corrosion. ♦ pushed-out terminals. ♦ damaged terminals. • Connect and correctly seat all the HVAC module connectors. • Clear the DTCs. • Operate the system and verify the concern is still present. • **Is the concern still present?**	412-01 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
N6 CHECK THE PCM CONNECTION	
• Disconnect all the PCM connectors. • Inspect the module connectors for: ♦ corrosion. ♦ pushed-out terminals. ♦ damaged terminals. • Connect and correctly seat all the PCM connectors. • Clear the DTCs. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PCM. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

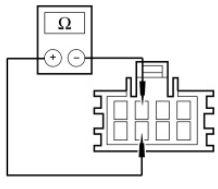
Pinpoint Test O: The Temperature Control is Inoperative/Does Not Operate Correctly - Manual Climate Control

Refer to Wiring Diagrams Cell 54 , Manual Climate Control System for schematic and connector information.

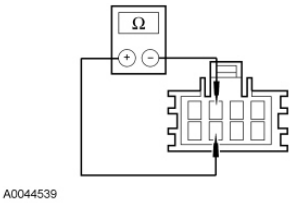
Normal Operation

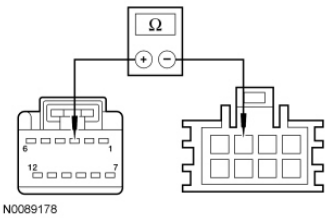


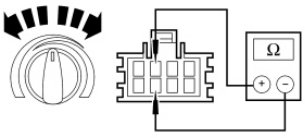




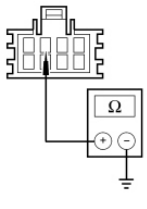
Under normal operation, the temperature blend door actuator receives voltage and ground. As the temperature selection changes it varies the voltage to the temperature blend door actuator from the temperature selector.







This pinpoint test is intended to diagnose the following:



- Fuse
- Wiring, terminals or connectors
- Temperature control switch
- Temperature blend door actuator
- Stuck or bound linkage or door

PINPOINT TEST O: THE TEMPERATURE CONTROL IS INOPERATIVE/DOES NOT OPERATE CORRECTLY - MANUAL CLIMATE CONTROL

Test Step	Result / Action to Take
O1 CHECK THE VOLTAGE TO THE BLEND DOOR ACTUATOR	

• Ignition OFF. • Disconnect: Temperature Blend Door Actuator C2091. • Ignition ON. • Measure the voltage between ground and temperature blend door actuator C2091-7, circuit CBP20 (YE/VT), harness side.  AM0622-A • **Is the voltage greater than 10 volts?**	**Yes** GO to O2 . **No** VERIFY Battery Junction Box (BJB) fuse 20 (10A) is OK. If OK, REPAIR circuit CBP20 (YE/VT) for an open. TEST the system for normal operation.
O2 CHECK CIRCUIT GD140 (BK/GN) FOR AN OPEN	
• Ignition OFF. • Measure the resistance between ground and temperature blend door actuator C2091-8, circuit GD140 (BK/GN), harness side.  AM2240-A • **Is the resistance less than 5 ohms?**	**Yes** GO to O3 . **No** REPAIR circuit GD140 (BK/GN) for an open. TEST the system for normal operation.
O3 CHECK THE TEMPERATURE CONTROL POTENTIOMETER TOTAL RESISTANCE	
• Ignition OFF. • Measure the resistance between temperature blend door actuator C2091-7, circuit CBP20 (YE/VT), harness side and C2091-3, circuit VH439 (GY/VT), harness side.  A0044539 • **Is the resistance between 30 and 1,600 ohms?**	**Yes** GO to O6 . **No** If the resistance is less than 30 ohms, GO to O4 . If the resistance is greater than 1,600 ohms, GO to O5 .
O4 CHECK CIRCUITS CBP20 (YE/VT) AND VH439 (GY/VT) FOR A SHORT TOGETHER	

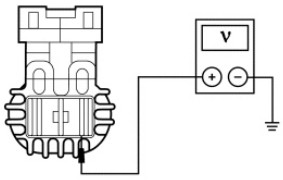
• Disconnect: Climate Control Assembly C294C. • Measure the resistance between temperature blend door actuator C2091-7, circuit CBP20 (YE/VT), harness side and C2091-3, circuit VH439 (GY/VT), harness side.  A0044539 • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new climate control assembly. REFER to Section 412-01 . TEST the system for normal operation. **No** REPAIR circuits CBP20 (YE/VT) and VH439 (GY/VT) for a short together. TEST the system for normal operation.
O5 CHECK VH439 (GY/VT) FOR AN OPEN	
• Disconnect: Climate Control Assembly C294C. • Measure the resistance between blend door actuator control connector C2091-3, circuit VH439 (GY/VT), harness side and climate control assembly C294C-3, circuit VH439 (GY/VT), harness side.  N0089178 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new climate control assembly. REFER to Section 412-01 . TEST the system for normal operation. **No** REPAIR circuit VH439 (GY/VT) for an open. TEST the system for normal operation.
O6 CHECK THE TEMPERATURE CONTROL POTENTIOMETER OPERATION	
• Measure the resistance between temperature blend door actuator C2091-7, circuit CBP20 (YE/VT), harness side and C2091-3, circuit CH439 (GY/VT), harness side while rotating the temperature control potentiometer from full WARM to full COOL.  A0044541 • **Does the resistance vary between 30 and 1,600 ohms?**	**Yes** GO to O7 . **No** INSTALL a new climate control assembly. REFER to Section 412-01 . TEST the system for normal operation.
O7 CHECK CIRCUIT VH439 (GY/VT) FOR A SHORT TO GROUND	

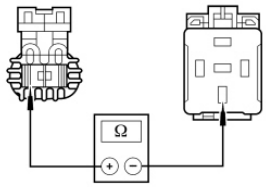
• Disconnect: Climate Control Assembly C294C. • Measure the resistance between ground and blend door actuator C2091-3, circuit VH439 (GY/VT), harness side.  A0044542 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to O8 . **No** REPAIR circuit VH439 (GY/VT) for a short to ground. TEST the system for normal operation.
O8 CHECK FOR A BINDING, STUCK OR BROKEN BLEND DOOR	
• Ignition OFF. • Remove the actuator. Refer to Section 412-01 . • Inspect for a binding, stuck or broken blend door or linkage. • **Is there a binding, stuck or broken blend door or linkage condition?**	**Yes** REPAIR the blend door/linkage. TEST the system for normal operation. **No** INSTALL a new temperature blend door actuator. REFER to Section 412-01 . TEST the system for normal operation.

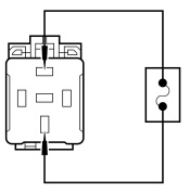
Pinpoint Test P: The Blower Motor is Inoperative - Manual Climate Control

Refer to Wiring Diagrams Cell 54 , Manual Climate Control System for schematic and connector information.

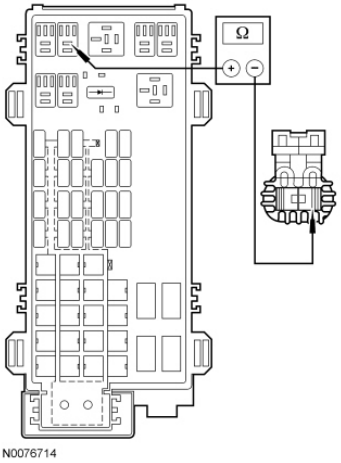
Normal Operation

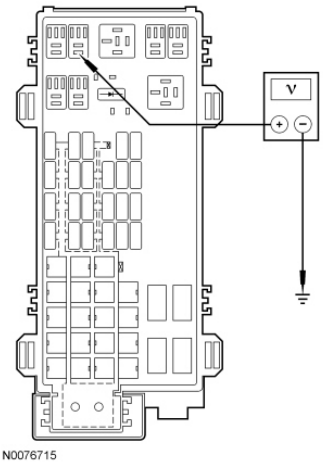




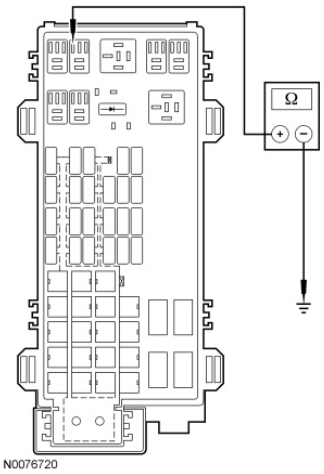


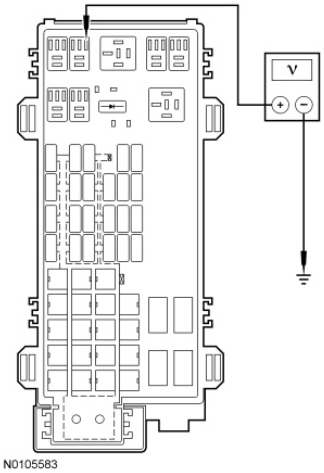
Under normal operation, the blower motor relay coil receives a ground. The coil receives voltage from the function selector switch when any position but OFF is selected. Voltage is supplied to the relay contacts. When the relay coil is energized, voltage is delivered to the blower motor and the high-speed blower motor relay. Ground is provided from the high-speed blower motor relay to the blower motor. Voltage is supplied for the function selector switch.



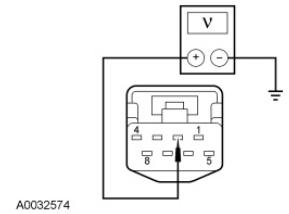


This pinpoint test is intended to diagnose the following:





- Fuse(s)
- Wiring, terminals or connectors
- Blower motor
- High-speed blower motor relay
- Blower motor relay



PINPOINT TEST P: THE BLOWER MOTOR IS INOPERATIVE - MANUAL CLIMATE CONTROL

Test Step	Result / Action to Take
P1 CHECK FOR VOLTAGE TO THE BLOWER MOTOR	

• Disconnect: Blower Motor C288. • Ignition ON. • Place the function selector switch in the FLOOR position. • Measure the voltage between ground and blower motor C288-1, circuit CH402 (YE/GN), harness side.  AM0416-A • **Is the voltage greater than 10 volts?**	**Yes** GO to P2 . **No** GO to P4 .
P2 CHECK CIRCUIT VH301 (YE/BU) FOR AN OPEN	
• Ignition OFF. • Disconnect: High-Speed Blower Motor Relay. • Measure the resistance between blower motor C288-2, circuit VH301 (YE/BU), harness side and high-speed blower motor relay socket pin 30, circuit VH301 (YE/BU).  N0105644 • **Is the resistance less than 5 ohms?**	**Yes** GO to P3 . **No** REPAIR circuit VH301 (YE/BU) for an open. TEST the system for normal operation.
P3 CHECK THE BLOWER MOTOR	
• Connect: Blower Motor C288. • Ignition ON. • Connect a fused jumper lead between high-speed blower motor relay socket pin 87, circuit GD140 (BK/GN) and pin 30, circuit VH301 (YE/BU).  N0105582 • **Does the blower motor operate?**	**Yes** INSTALL a new high-speed blower motor relay. TEST the system for normal operation. **No** INSTALL a new blower motor. REFER to Section 412-01 . TEST the system for normal operation.
P4 CHECK CIRCUIT CH402 (YE/GN) FOR AN OPEN	

• Ignition OFF. • Disconnect: Blower Motor Relay. • Measure the resistance between blower motor relay socket pin 5, circuit CH402 (YE/GN) and blower motor C288-1, circuit CH402 (YE/GN), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** GO to P5 . **No** REPAIR circuit CH402 (YE/GN) for an open. TEST the system for normal operation.
P5 CHECK FOR VOLTAGE TO THE BLOWER MOTOR RELAY, SWITCH SIDE	
• Measure the voltage between ground and blower motor relay socket pin 3, circuit SBB16 (VT/RD).  • **Is the voltage greater than 10 volts?**	**Yes** GO to P6 . **No** VERIFY Battery Junction Box (BJB) fuse 16 (40A) is OK. If OK, REPAIR circuit SBB16 (VT/RD) for an open. TEST the system for normal operation.
P6 CHECK CIRCUIT GD120 (BK/GN) FOR AN OPEN	

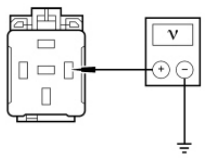
• Measure the resistance between ground and blower motor relay socket pin 2, circuit GD120 (BK/GN).  • **Is the resistance less than 5 ohms?**	**Yes** GO to P7 . **No** REPAIR circuit GD120 (BK/GN) for an open. TEST the system for normal operation.
P7 CHECK FOR VOLTAGE TO THE BLOWER MOTOR RELAY, COIL SIDE	
• Ignition ON. • Measure the voltage between ground and blower motor relay socket pin 1, circuit CH123 (VT/GN).  • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new blower motor relay. TEST the system for normal operation. **No** GO to P8 .
P8 CHECK CIRCUIT CBP20 (YE/VT) FOR AN OPEN	
• Ignition OFF. • Disconnect: Function Selector Switch C294B. • Ignition ON. • Measure the voltage between ground and function selector switch C294B-2, circuit CBP20 (YE/VT), harness side.	**Yes** GO to P9 . **No** VERIFY the Smart Junction Box (SJB) fuse 20 (10A) is OK. If OK, REPAIR circuit CBP20 (YE/VT) for an open. TEST the system for normal operation.

 • **Is the voltage greater than 10 volts?**	
P9 CHECK THE FUNCTION SELECTOR SWITCH	
• Ignition OFF. • Carry out the Function Selector Switch component test in this section. • **Does the function selector switch test good?**	**Yes** REPAIR circuit CH123 (VT/GN) for an open. TEST the system for normal operation. **No** INSTALL a new function selector switch. REFER to Section 412-01 . TEST the system for normal operation.

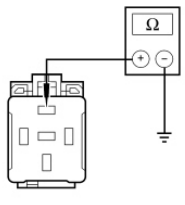
Pinpoint Test Q: The Blower Motor Does Not Operate Correctly - Manual Climate Control

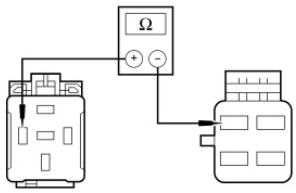
Refer to Wiring Diagrams Cell 54 , Manual Climate Control System for schematic and connector information.

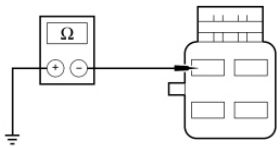
Normal Operation



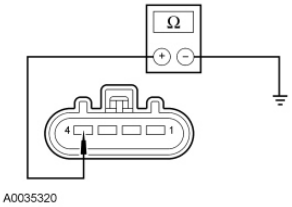
Under normal operation, when the high-speed blower relay is not energized, the blower motor is provided a ground from the resistor. The resistor is provided ground in the lowest blower setting. In MED-LO and MED-HI, the resistor gets a ground from the blower motor switch, depending on selected speed. The blower motor switch is grounded.

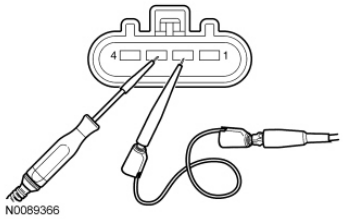


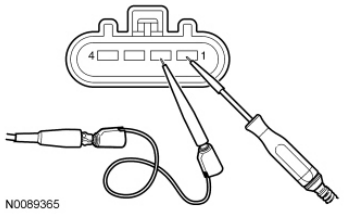




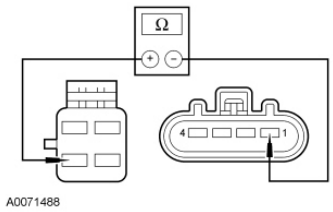
The high-speed blower motor relay coil receives voltage from the blower motor relay. The coil receives ground from the function selector switch when the highest blower speed is selected. Ground for high blower speed is provided to the high-speed blower relay when the relay is energized. The high-speed blower motor relay provides the blower motor ground.

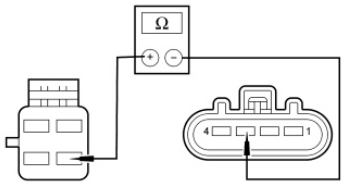


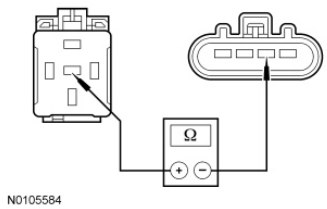




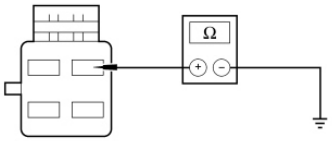
This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- Blower motor resistor
- Blower motor switch
- High-speed blower motor relay

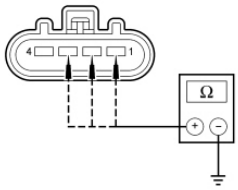






PINPOINT TEST Q: THE BLOWER MOTOR DOES NOT OPERATE CORRECTLY - MANUAL CLIMATE CONTROL





Test Step	Result / Action to Take
Q1 CHECK THE BLOWER MOTOR OPERATION	
• Ignition ON. • Turn the function selector switch to the FLOOR position. • Select all blower speed positions. • **Does the blower motor operate in any position?**	**Yes** If the blower motor does not operate in HI setting only, GO to Q2 .

	If the blower motor does not operate in LO setting only, GO to Q6 . If the blower motor does not operate in MED-LO or MED-HI setting only, GO to Q7 . If the blower motor operates in HI setting only, GO to Q9 . If the blower motor operates in LO setting only, GO to Q10 . For all other symptoms, GO to Q11 . **No** GO to Pinpoint Test P .
Q2 CHECK CIRCUIT CH402 (YE/GN) FOR AN OPEN	
• Ignition OFF. • Disconnect: High-Speed Blower Motor Relay. • Ignition ON. • Place the function selector switch in FLOOR and the blower motor switch in HI. • Measure the voltage between ground and high-speed blower motor relay pin 86, circuit CH402 (YE/GN).  N0046415 • **Is the voltage greater than 10 volts?**	**Yes** GO to Q3 . **No** REPAIR circuit CH402 (YE/GN) for an open. TEST the system for normal operation.
Q3 CHECK THE HIGH-SPEED BLOWER MOTOR RELAY CIRCUIT GD140 (BK/GN) FOR AN OPEN	
• Ignition OFF. • Measure the resistance between ground and high-speed blower motor relay socket pin 87, circuit GD140 (BK/GN).	**Yes** GO to Q4 . **No** REPAIR circuit GD140 (BK/GN) for an open. TEST the system for normal operation.

 N0047168 • **Is the resistance less than 5 ohms?**	
Q4 CHECK CIRCUIT CH430 (VT/OG) FOR AN OPEN	
• Disconnect: Blower Motor Switch C294A. • Measure the resistance between high-speed blower motor relay socket pin 85, circuit CH430 (VT/OG) and the blower motor switch C294A-2, circuit CH430 (VT/OG), harness side.  N0047169 • **Is the resistance less than 5 ohms?**	**Yes** GO to Q5 . **No** REPAIR circuit CH430 (VT/OG) for an open. TEST the system for normal operation.
Q5 CHECK CIRCUIT CH430 (VT/OG) FOR A SHORT TO GROUND	
• Disconnect: Blower Motor Switch C294A. • Measure the resistance between ground and blower motor switch C294A-2, circuit CH430 (VT/OG), harness side.  A0013882 • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new blower motor switch. TEST the system for normal operation. **No** REPAIR circuit CH430 (VT/OG) for a short to ground. TEST the system for normal operation.
Q6 CHECK BLOWER MOTOR RESISTOR GROUND CIRCUIT GD140 (BK/GN) FOR AN OPEN	
• Ignition OFF. • Disconnect: Blower Motor Resistor C293. • Measure the resistance between ground and blower motor resistor C293-4, circuit GD140 (BK/GN), harness side.	**Yes** INSTALL a new blower motor resistor. REFER to Section 412-01 . TEST the system for normal operation. **No** REPAIR circuit GD140 (BK/GN) for an open. TEST the system for normal

TEST the system for normal operation. **No** REPAIR circuit CH430 (VT/OG) for an open. TEST the system for normal operation.
Q10 CHECK THE BLOWER MOTOR SWITCH GROUND FOR AN OPEN	

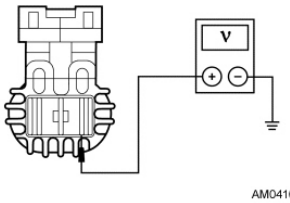
• Ignition OFF. • Disconnect: Blower Motor Switch C294A. • Measure the resistance between ground and blower motor switch C294A-1, circuit GD138 (BK/WH), harness side.  A0020414 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new blower motor switch. REFER to Section 412-01 . TEST the system for normal operation. **No** REPAIR circuit GD138 (BK/WH) for an open. TEST the system for normal operation.
Q11 CHECK CIRCUITS CH446 (BU/BN), CH429 (GY/BN) AND CH428 (GN/WH) FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: Blower Motor Switch C294A. • Disconnect: Blower Motor C288. • Disconnect: Blower Motor Resistor C293. • Disconnect: High-Speed Blower Motor Relay. • Place the blower switch in the lowest setting. • Measure the resistance between ground and blower motor resistor: ♦ C293-1, circuit CH429 (GY/BN), harness side. ♦ C293-2, circuit CH446 (BU/BN), harness side. ♦ C293-3, circuit CH428 (GN/WH), harness side.  A0051664 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to Q12 . **No** REPAIR the affected circuit for a short to ground. TEST the system for normal operation.
Q12 CHECK THE BLOWER MOTOR CIRCUITS FOR SHORTS TOGETHER	
• Measure the resistance between blower motor resistor: ♦ C293-1, circuit CH429 (GY/BN), harness side and C293-2, circuit CH446 (BU/BN), harness side. ♦ C293-1, circuit CH429 (GY/BN), harness side and C293-3, circuit CH428 (GN/WH), harness side. ♦ C293-2, circuit CH446 (BU/BN), harness side and C293-3, circuit CH428 (GN/WH), harness side.	**Yes** INSTALL a new blower motor switch. REFER to Section 412-01 . TEST the system for normal operation. **No** REPAIR the affected circuits for shorts. TEST the system for normal operation.

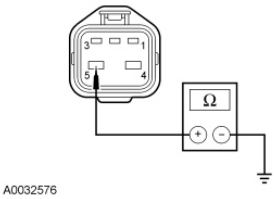
 • **Are the resistances greater than 10,000 ohms?**	

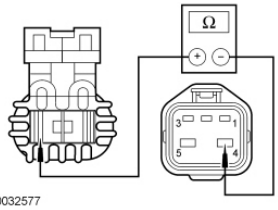
Pinpoint Test R: The Blower Motor is Inoperative - DATC System

Refer to Wiring Diagrams Cell 55 , Automatic Climate Control System for schematic and connector information.

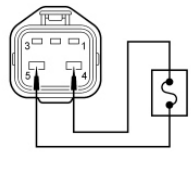
Normal Operation

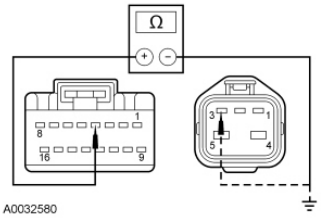


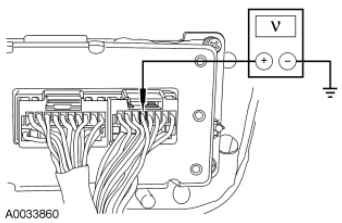




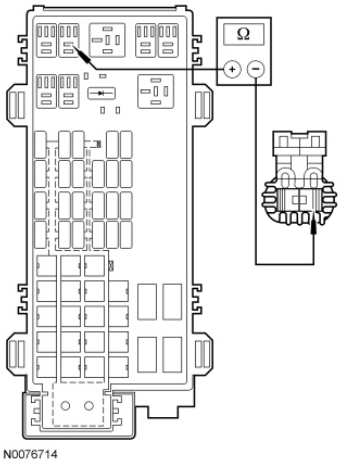
Under normal operation, the blower motor relay coil receives a ground. The coil receives voltage from the HVAC module - Dual Automatic Temperature Control (DATC) when the HVAC module - DATC is ON. Voltage is supplied to the relay contacts. When the relay coil is energized, voltage is delivered to the blower motor. Ground for the motor is provided from the blower control module. Ground is provided to the blower control module.

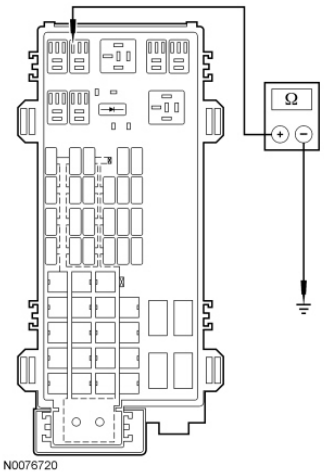




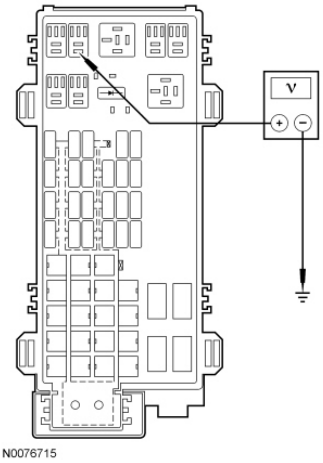


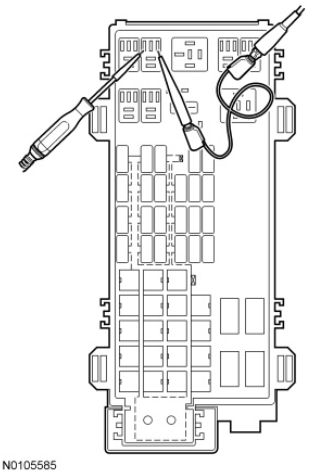
This pinpoint test is intended to diagnose the following:



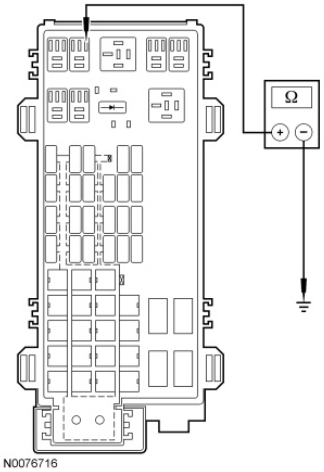


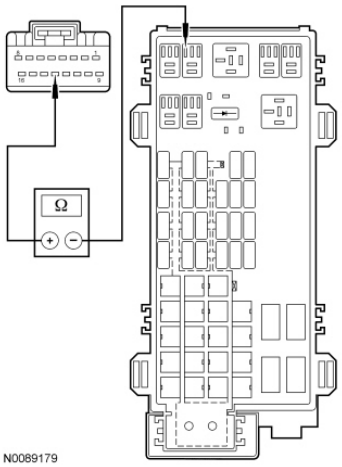
- Fuse(s)
- Wiring, terminals or connectors
- Blower motor control module
- HVAC module - DATC
- Blower motor relay
- Blower motor





PINPOINT TEST R: THE BLOWER MOTOR IS INOPERATIVE - DATC SYSTEM





Test Step	Result / Action to Take
R1 VERIFY THE BLOWER MOTOR OPERATION	
• Ignition ON. • Press the PANEL button on the HVAC module - DATC . Adjust the blower motor setting to LO and then to HI. • **Is the blower motor inoperative in all settings?**	**Yes** GO to R2 . **No** GO to Pinpoint Test S .
R2 CHECK FOR VOLTAGE TO THE BLOWER MOTOR	
• Ignition OFF. • Disconnect: Blower Motor C288. • Ignition ON. • Measure the voltage between ground and blower motor C288-1, circuit CH402 (YE/GN), harness side.	**Yes** GO to R3 . **No** GO to R8 .

 AM0416-A • **Is the voltage greater than 10 volts?**	
R3 CHECK CIRCUIT GD140 (BK/GN) FOR AN OPEN	
• Ignition OFF. • Disconnect: Blower Motor Speed Control C271. • Measure the resistance between ground and blower motor speed control C271-5, circuit GD140 (BK/GN), harness side.  A0032576 • **Is the resistance less than 5 ohms?**	**Yes** GO to R4 . **No** REPAIR circuit GD140 (BK/GN) for an open. TEST the system for normal operation.
R4 CHECK CIRCUIT VH301 (YE/BU) FOR AN OPEN	
• Measure the resistance between blower motor C288-2, circuit VH301 (YE/BU), harness side and blower motor speed control C271-4, circuit VH301 (YE/BU), harness side.  A0032577 • **Is the resistance less than 5 ohms?**	**Yes** GO to R5 . **No** REPAIR circuit VH301 (YE/BU) for an open. TEST the system for normal operation.
R5 CHECK THE BLOWER MOTOR	
• Connect: Blower Motor C288. • Connect a fused jumper lead between blower motor speed control C271-4, circuit VH301 (YE/BU), harness side and C271-5, circuit GD140 (BK/GN), harness side.	**Yes** GO to R6 . **No** INSTALL a new blower motor. REFER to Section 412-01 . TEST the system for normal operation.

 A0032579 • Ignition ON. • **Does the blower motor operate?**	
R6 CHECK CIRCUIT CH217 (BN) FOR AN OPEN OR SHORT TO GROUND	
• Ignition OFF. • Remove the fused jumper lead from blower motor speed control C271. • Disconnect: HVAC Module - DATC C228B. • Measure the resistance between: ♦ HVAC module - DATC C228B-4, circuit CH217 (BN), harness side and blower motor speed control C271-3, circuit CH217 (BN), harness side. ♦ ground and HVAC module - DATC C228B-4, circuit CH217 (BN), harness side.  A0032580 • **Is the resistance less than 5 ohms between the HVAC module - DATC and the blower motor speed control and greater than 10,000 ohms between the HVAC module - DATC and ground?**	**Yes** GO to R7 . **No** REPAIR circuit CH217 (BN) for an open or a short to ground. TEST the system for normal operation.
R7 CHECK THE HVAC MODULE OUTPUT	
• Connect: HVAC Module - DATC C228B. • Connect: Blower Motor Speed Control C271. • Ignition ON. • Adjust the blower motor speed to HI. • Measure the voltage between ground and HVAC module - DATC C228B-4, circuit CH217 (BN), harness side by back-probing the HVAC module - DATC C228B.  A0033860 • **Is the voltage within 2 volts of battery voltage?**	**Yes** INSTALL a new blower motor speed control. REFER to Section 412-01 . TEST the system for normal operation. **No** GO to R14 .

R8 CHECK CIRCUIT CH402 (YE/GN) FOR AN OPEN	
• Ignition OFF. • Disconnect: Blower Motor Relay. • Measure the resistance between blower motor relay socket pin 5, circuit CH402 (YE/GN) and blower motor C288-1, circuit CH402 (YE/GN), harness side.  N0076714 • **Is the resistance less than 5 ohms?**	**Yes** GO to R9 . **No** REPAIR circuit CH402 (YE/GN) for an open. TEST the system for normal operation.
R9 CHECK CIRCUIT GD120 (BK/GN) FOR AN OPEN	
• Measure the resistance between ground and blower motor relay socket pin 2, circuit GD120 (BK/GN).  N0076720 • **Is the resistance less than 5 ohms?**	**Yes** GO to R10 . **No** REPAIR circuit GD120 (BK/GN) for an open. TEST the system for normal operation.
R10 CHECK CIRCUIT SBB16 (VT/RD) FOR VOLTAGE	

• Measure the voltage between ground and blower motor relay socket pin 3, circuit SBB16 (VT/RD).  N0076715 • **Is the voltage greater than 10 volts?**	**Yes** GO to R11 . **No** VERIFY Battery Junction Box (BJB) fuse 16 (40A) is OK. If OK, REPAIR circuit SBB16 (VT/RD) for an open. TEST the system for normal operation.
R11 CHECK THE HVAC MODULE OUTPUT	
NOTICE: **The following step uses a test light to simulate normal circuit loads. Use only the test light recommended in the Special Tools table at the beginning of this section. To avoid connector terminal damage, use the Flex Probe Kit for the test light probe connection to the vehicle. Do not use the test light probe directly on any connector.** • Ignition ON. • Connect a 12-volt test light between blower motor relay socket pin 2, circuit GD120 (BK/GN) and socket pin 1, circuit CH123 (VT/GN).  N0105585 • **Does the test light illuminate?**	**Yes** INSTALL a new blower motor relay. TEST the system for normal operation. **No** GO to R12 .
R12 CHECK CIRCUIT CH123 (VT/GN) FOR SHORT TO GROUND	

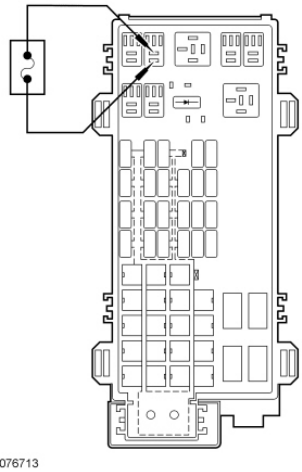
• Ignition OFF. • Disconnect: HVAC Module - DATC C228B. • Measure the resistance between ground and blower motor relay socket pin 1, circuit CH123 (VT/GN).  • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to R13 . **No** REPAIR circuit CH123 (VT/GN) for a short to ground. TEST the system for normal operation.
R13 CHECK CIRCUIT CH123 (VT/GN) FOR AN OPEN	
• Measure the resistance between HVAC module - DATC C228B-13, circuit CH123 (VT/GN), harness side and blower motor relay socket pin 2, circuit CH123 (VT/GN).  • **Is the resistance less than 5 ohms?**	**Yes** GO to R14 . **No** REPAIR circuit CH123 (VT/GN) for an open. TEST the system for normal operation.
R14 CHECK THE HVAC MODULE CONNECTION	
• Inspect the HVAC module connectors for: ♦ corrosion. ♦ pushed-out terminals. ♦ damaged terminals. • Connect and correctly seat all the HVAC module connectors. • Clear the DTCs. • Operate the system and verify the concern is still present.	**Yes** INSTALL a new HVAC module. REFER to Section 412-01 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may

• **Is the concern still present?**	have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test S: The Blower Motor Does Not Operate Correctly - DATC System

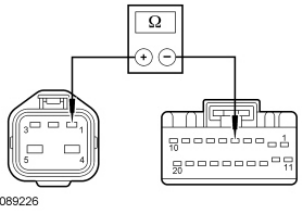
Refer to Wiring Diagrams Cell 55 , Automatic Climate Control System for schematic and connector information.

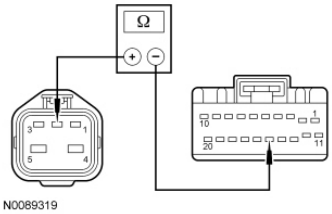
Normal Operation



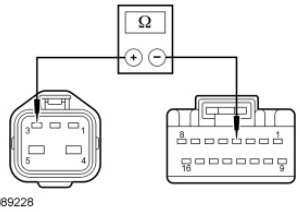
Under normal operation, the blower motor control module receives a 1-2 volt signal from the HVAC module - Dual Automatic Temperature Control (DATC) to determine the desired blower motor speed. The HVAC module - DATC receives a feedback voltage from the blower motor control module to determine actual blower motor speed. When the highest blower motor setting is selected, the HVAC module - DATC sends 12 volts to the blower control module.

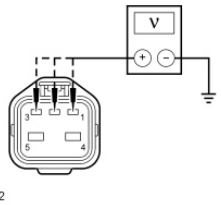
This pinpoint test is intended to diagnose the following:

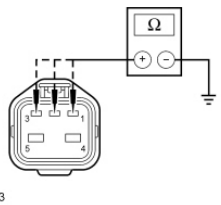




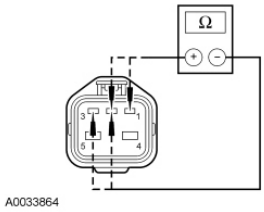
- Wiring, terminals or connectors
- Blower motor control module
- HVAC module - DATC

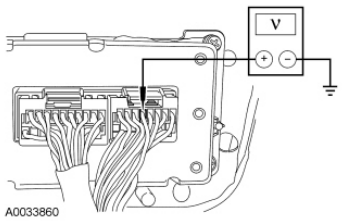




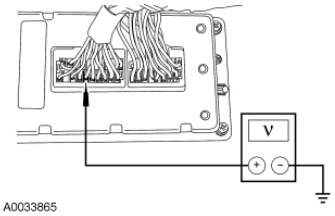


PINPOINT TEST S: THE BLOWER MOTOR DOES NOT OPERATE CORRECTLY - DATC SYSTEM





Test Step	Result / Action to Take
S1 CHECK CIRCUIT VH301 (YE/BU) FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: Blower Motor Speed Control C271. • Ignition ON. • Press the PANEL button on the HVAC module - DATC . Adjust the blower motor setting to LO and then to HI. • **Does the blower motor operate?**	**Yes** REPAIR circuit VH301 (YE/BU) for a short to ground. TEST the system for normal operation. **No** GO to S2 .
S2 CHECK THE BLOWER MOTOR SPEED CONTROL	
• Ignition OFF. • Connect: Blower Motor Speed Control C271. • Disconnect: HVAC Module - DATC C228A. • Disconnect: HVAC Module - DATC C228B. • Disconnect: Blower Motor Relay. • Connect a fused jumper lead between blower motor relay socket pin 3, circuit SBB16 (VT/RD) and pin 5, circuit CH402 (YE/GN).	**Yes** INSTALL a new blower motor speed control module. REFER to Section 412-01 . TEST the system for normal operation. **No** GO to S3 .



N0076713

- **Does the blower motor operate?**

S3 CHECK THE BLOWER MOTOR SPEED CONTROL CIRCUITS FOR AN OPEN	
• Ignition OFF. • Connect: Blower Motor Relay. • Disconnect: Blower Motor Speed Control C271. • Measure the resistance between blower motor speed control C271-1, circuit VH219 (GY), harness side and HVAC module - DATC C228A-5, circuit VH219 (GY), harness side.  N0089226 • Measure the resistance between blower motor speed control C271-2, circuit CH218 (GN/VT), harness side and HVAC module - DATC C228A-15, circuit CH218 (GN/VT), harness side.  N0089319 • Measure the resistance between blower motor speed control C271-3, circuit CH217 (BN), harness side and HVAC module - DATC C228B-4, circuit CH217 (BN), harness side.	**Yes** GO to S4 . **No** REPAIR the affected circuit for an open. TEST the system for normal operation.

 N0089228 • **Are the resistances less than 5 ohms?**	
S4 CHECK THE BLOWER MOTOR SPEED CONTROL CIRCUITS FOR A SHORT TO VOLTAGE	
• Ignition ON. • Measure the voltage between ground and blower motor speed control: ♦ C271-1, circuit VH219 (GY), harness side. ♦ C271-2, circuit CH218 (GN/VT), harness side. ♦ C271-3, circuit CH217 (BN), harness side.  A0033862 • **Are any voltages present?**	**Yes** REPAIR the affected circuit for a short to voltage. TEST the system for normal operation. **No** GO to S5 .
S5 CHECK THE BLOWER MOTOR SPEED CONTROL CIRCUITS FOR A SHORT TO GROUND	
• Ignition OFF. • Measure the resistance between ground and blower motor speed control: ♦ C271-1, circuit VH219 (GY), harness side. ♦ C271-2, circuit CH218 (GN/VT), harness side. ♦ C271-3, circuit CH217 (BN), harness side.  A0033863 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to S6 . **No** REPAIR the affected circuit for a short to ground. TEST the system for normal operation.
S6 CHECK THE BLOWER MOTOR SPEED CONTROL CIRCUITS FOR SHORTS TOGETHER	

• Measure the resistance between blower motor speed control: ♦ C271-1, circuit VH219 (GY), harness side and C271-2, circuit CH218 (GN/VT), harness side. ♦ C271-1, circuit VH219 (GY), harness side and C271-3, circuit CH217 (BN), harness side. ♦ C271-2, circuit CH218 (GN/VT), harness side and C271-3, circuit CH217 (BN), harness side.  A0033864 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to S7 . **No** REPAIR the affected circuits for shorts. TEST the system for normal operation.
S7 CHECK THE HVAC MODULE HIGH BLOWER OUTPUT
