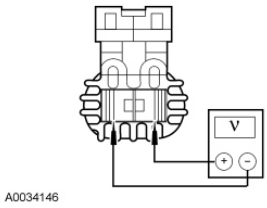
• Connect: HVAC Module - DATC C228B. • Connect: Blower Motor Speed Control C271. • Ignition ON. • Adjust the blower motor speed to HI. • Measure the voltage between ground and HVAC module - DATC C228B-4, circuit CH217 (BN), harness side by back-probing the HVAC module - DATC C228B.  A0033860 • **Is the voltage within 2 volts of battery voltage?**	**Yes** GO to S8 . **No** GO to S9 .
S8 CHECK THE HVAC MODULE BLOWER CONTROL OUTPUT	
• Adjust the blower motor speed to LO. • Measure the voltage between ground and HVAC module - DATC C228A-15, circuit CH218 (GN/VT), harness side by back-probing the HVAC module - DATC C228A.	**Yes** INSTALL a new blower motor speed control. REFER to Section 412-01 . TEST the system for normal operation. **No** GO to S9 .

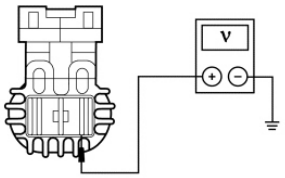
 • **Is the voltage greater than one volt?**	
S9 CHECK THE HVAC MODULE CONNECTION	
• Inspect the HVAC module connectors for: ♦ corrosion. ♦ pushed-out terminals. ♦ damaged terminals. • Connect and correctly seat all the HVAC module connectors. • Clear the DTCs. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new HVAC module. REFER to Section 412-01 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

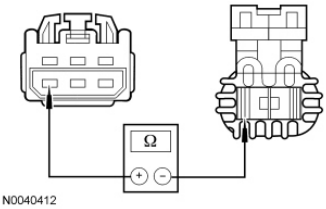
Pinpoint Test T: The Auxiliary Blower Motor is Inoperative

Refer to Wiring Diagrams Cell 52 , Auxilary Climate Control for schematic and connector information.

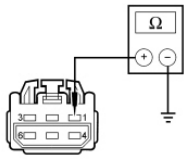
Normal Operation

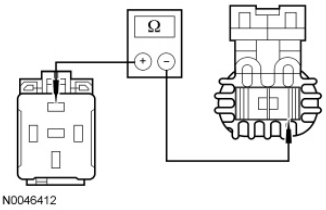


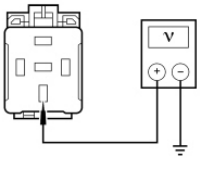




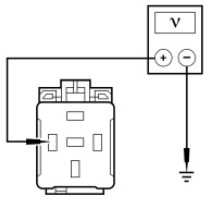
Under normal operation, the auxiliary blower motor relay coil receives a ground. The auxiliary blower motor relay coil receives voltage when the HVAC module - Dual Automatic Temperature Control (DATC) is ON or the function selector switch is in any position but OFF. Voltage is supplied to the auxiliary blower motor relay contacts. When the auxiliary blower motor relay coil is energized, voltage is delivered to the blower motor. Ground for the motor is provided from the blower motor resistor and blower motor switch. The blower motor resistor and blower motor switch are grounded.







This pinpoint test is intended to diagnose the following:



- Fuse
- Wiring, terminals or connectors
- Auxiliary blower motor
- Auxiliary blower motor relay
- Front auxiliary climate control assembly

PINPOINT TEST T: THE AUXILIARY BLOWER MOTOR IS INOPERATIVE

Test Step	Result / Action to Take
T1 CHECK FOR VOLTAGE AND GROUND TO THE AUXILIARY BLOWER MOTOR	

• Ignition OFF. • Disconnect: Auxiliary Blower Motor C3021. • Place the front auxiliary blower motor switch in its highest setting. • Ignition ON. • Measure the voltage between auxiliary blower motor C3021-1, circuit CHA02 (BN/GN), harness side and C3021-2, circuit CHA08 (GN/OG), harness side.  A0034146 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new auxiliary blower motor. REFER to Section 412-01 . TEST the system for normal operation. **No** GO to T2 .
T2 CHECK FOR VOLTAGE TO THE AUXILIARY BLOWER MOTOR	
• Measure the voltage between ground and auxiliary blower motor C3021-1, circuit CHA02 (BN/GN), harness side.  AM0416-A • **Is the voltage greater than 10 volts?**	**Yes** GO to T3 . **No** GO to T5 .
T3 CHECK CIRCUIT CHA08 (GN/OG) FOR AN OPEN	
• Ignition OFF. • Disconnect: Front Auxiliary Climate Control Assembly C951A. • Measure the resistance between auxiliary blower motor switch C951A-6, circuit CHA08 (GN/OG), harness side and auxiliary blower motor C3021-2, circuit CHA08 (GN/OG), harness side.  N0040412 • **Is the resistance less than 5 ohms?**	**Yes** GO to T4 . **No** REPAIR circuit CHA08 (GN/OG) for an open. TEST the system for normal operation.

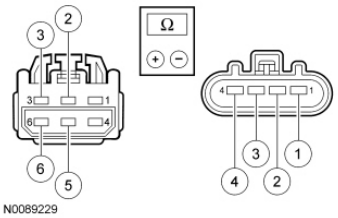
T4 CHECK CIRCUIT GD149 (BK/GY) FOR AN OPEN	
• Measure the resistance between ground and front auxiliary climate control assembly C951A-1, circuit GD149 (BK/GY), harness side.  A0034148 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new front auxiliary climate control assembly. REFER to Section 412-01 . TEST the system for normal operation. **No** REPAIR circuit GD149 (BK/GY) for an open. TEST the system for normal operation.
T5 CHECK CIRCUIT CHA02 (BN/GN) FOR AN OPEN	
• Ignition OFF. • Disconnect: Auxiliary Blower Motor Relay. • Measure the resistance between auxiliary blower motor relay socket pin 87, circuit CHA02 (BN/GN) and auxiliary blower motor C3021-1, circuit CHA02 (BN/GN), harness side.  N0046412 • **Is the resistance less than 5 ohms?**	**Yes** GO to T6 . **No** REPAIR circuit CHA02 (BN/GN) for an open. TEST the system for normal operation.
T6 CHECK CIRCUIT SBB18 (YE/RD) FOR AN OPEN	
• Measure the voltage between ground and auxiliary blower motor relay socket pin 30, circuit SBB18 (YE/RD).  N0046413 • **Is the voltage greater than 10 volts?**	**Yes** CARRY OUT the auxiliary blower motor relay component test. Refer to Wiring Diagrams Cell 149 for component testing. If the relay tests OK, GO to T7 . **No** VERIFY Battery Junction Box (BJB) fuse 18 (30A) is OK. If OK, REPAIR circuit SBB18 (YE/RD) for an open. TEST the system for normal operation.
T7 CHECK CIRCUIT CH123 (VT/GN) FOR AN OPEN	

• Ignition ON. • Press the DEFROST button on the HVAC module - DATC . • Measure the voltage between ground and auxiliary blower motor relay socket pin 85, circuit CH123 (VT/GN).  N0076723 • **Is the voltage greater than 10 volts?**	**Yes** REPAIR circuit GD140 (BK/GN) for an open. TEST the system for normal operation. **No** REPAIR circuit CH123 (VT/GN) for an open. TEST the system for normal operation.

Pinpoint Test U: The Auxiliary Blower Motor Does Not Operate Correctly Using the Front Auxiliary Blower Motor Switch

Refer to Wiring Diagrams Cell 52 , Auxilary Climate Control for schematic and connector information.

Normal Operation

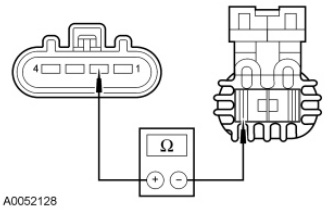


Under normal operation, the blower motor is provided a ground from the resistor. The resistor gets a ground from the front auxiliary blower switch, depending on selected speed.

This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- Auxiliary blower motor resistor
- Front auxiliary climate control assembly

PINPOINT TEST U: THE AUXILIARY BLOWER MOTOR DOES NOT OPERATE CORRECTLY USING THE FRONT AUXILIARY BLOWER MOTOR SWITCH

Test Step	Result / Action to Take
U1 CHECK THE AUXILIARY BLOWER MOTOR RESISTOR CIRCUITS FOR AN OPEN	
• Disconnect: Auxiliary Blower Motor Resistor C3022. • Disconnect: Front Auxiliary Climate Control Assembly C951A. • Measure the resistance between the front auxiliary climate control assembly, harness side and auxiliary blower motor resistor, harness side using the following chart. **Front Auxiliary Climate Control Assembly** / **Circuit** / **Auxiliary Blower Motor Resistor**	**Yes** GO to U2 . **No** REPAIR the affected circuit(s) for an open. TEST the system for normal operation.

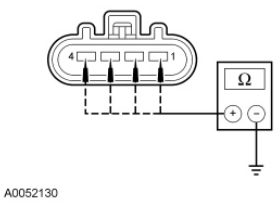


C951A-2	CHA06 (YE/VT)	C3022-4
C951A-3	CHA07 (BU/GY)	C3022-3
C951A-5	CHA16 (BU)	C3022-1
C951A-6	CHA08 (GN/OG)	C3022-2

- **Are the resistances less than 5 ohms?**

U2 CHECK CIRCUIT CHA08 (GN/OG) FOR AN OPEN

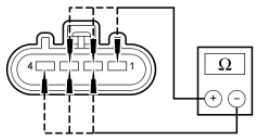
- Measure the resistance between auxiliary blower motor resistor C3022-2, circuit CHA08 (GN/OG), harness side and the auxiliary blower motor C3021-2, circuit CHA08 (GN/OG), harness side.



- **Is the resistance less than 5 ohms?**

Yes
GO to U3 .

No
REPAIR circuit CHA08 (GN/OG) for an open. TEST the system for normal operation.



U3 CHECK THE AUXILIARY BLOWER MOTOR RESISTOR CIRCUITS FOR A SHORT TO GROUND

- Measure the resistance between ground and auxiliary blower motor resistor:
  - C3022-1, circuit CHA16 (BU), harness side.
  - C3022-2, circuit CHA08 (GN/OG), harness side.
  - C3022-3, circuit CHA07 (BU/GY), harness side.
  - C3022-4, circuit CHA06 (YE/VT), harness side.

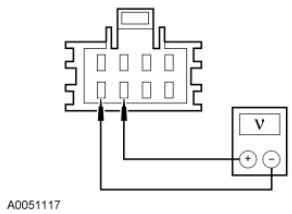
Yes
GO to U4 .

No
REPAIR the affected circuit(s) for a short to ground. TEST the system for normal operation.

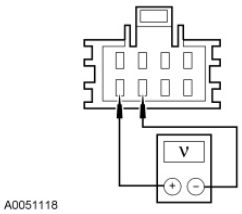
• **Are the resistances greater than 10,000 ohms?**	
U4 CHECK THE AUXILIARY BLOWER MOTOR RESISTOR CIRCUITS FOR A SHORT TOGETHER	
• Measure the resistance between auxiliary blower motor resistor: ♦ C3022-1, circuit CHA16 (BU), harness side and C3022-2, circuit CHA08 (GN/OG), harness side. ♦ C3022-1, circuit CHA16 (BU), harness side and C3022-3, circuit CHA07 (BU/GY), harness side. ♦ C3022-1, circuit CHA16 (BU), harness side and C3022-4, circuit CHA06 (YE/VT), harness side. ♦ C3022-2, circuit CHA08 (GN/OG), harness side and C3022-3, circuit CHA07 (BU/GY), harness side. ♦ C3022-2, circuit CHA08 (GN/OG), harness side and C3022-4, circuit CHA06 (YE/VT), harness side. ♦ C3022-3, circuit CHA07 (BU/GY), harness side and C3022-4, circuit CHA06 (YE/VT), harness side.  A0052131 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to U5 . **No** REPAIR the affected circuit(s) for shorts. TEST the system for normal operation.
U5 CHECK THE AUXILIARY BLOWER MOTOR RESISTOR	
• Carry out the Auxiliary Blower Motor Resistor component test in this section. • **Does the auxiliary blower motor resistor test good?**	**Yes** INSTALL a new front auxiliary climate control assembly. REFER to Section 412-01 . TEST the system for normal operation. **No** INSTALL a new blower motor resistor. REFER to Section 412-01 . TEST the system for normal operation.

Pinpoint Test V: The Auxiliary Panel/Floor Control is Inoperative Using the Front Auxiliary Climate Controls

Refer to Wiring Diagrams Cell 52 , Auxilary Climate Control for schematic and connector information.



Normal Operation



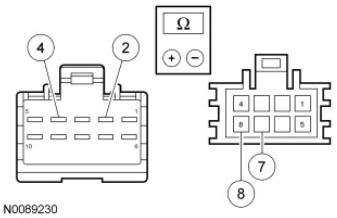
Under normal operation, the auxiliary mode door actuator motor is driven to the floor position by supplying voltage to the motor on circuit CHA11 (WH/OG) and ground to circuit CHA12 (GN/BU). The auxiliary mode door actuator motor is driven to the panel position by reversing the voltage and ground.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Front auxiliary climate control assembly
- Auxiliary mode door actuator motor
- Broken/binding auxiliary mode door

PINPOINT TEST V: THE AUXILIARY PANEL/FLOOR CONTROL IS INOPERATIVE USING THE FRONT AUXILIARY CLIMATE CONTROLS

Test Step	Result / Action to Take
V1 CHECK THE FLOOR MODE OUTPUT	
• Disconnect: Air Distribution Door Actuator C3004. • Ignition ON. • Place the front auxiliary blower motor switch in HI and set the front auxiliary climate control assembly to FLOOR. • Measure the voltage between air distribution door actuator C3004-8, circuit CHA11 (WH/OG), harness side and C3004-7, circuit CHA12 (GN/BU), harness side.  A0051117 • **Is the voltage greater than 10 volts?**	**Yes** GO to V2 . **No** GO to V3 .
V2 CHECK THE PANEL MODE OUTPUT	
• Set the front auxiliary climate control assembly to PANEL. • Measure the voltage between air distribution door actuator C3004-7, circuit CHA12 (GN/BU), harness side and C3004-8, circuit CHA11 (WH/OG), harness side.	**Yes** CHECK for a broken/binding auxiliary mode door. If OK, INSTALL a new air distribution door actuator. REFER to Section 412-01 . TEST the system for normal operation. **No** GO to V3 .



- **Is the voltage greater than 10 volts?**

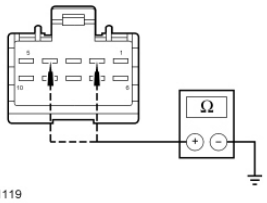
V3 CHECK THE AIR DISTRIBUTION DOOR CIRCUITS FOR AN OPEN

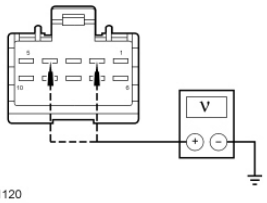
- Ignition OFF.
- Disconnect: Front Auxiliary Climate Control Assembly C951B.
- Measure the resistance between the front auxiliary climate control assembly, harness side and air distribution door actuator, harness side using the following chart.

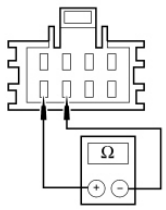
Front Auxiliary Climate Control Assembly	Circuit	Air Distribution Door Actuator
C951B-2	CHA11 (WH/OG)	C3004-7
C951B-4	CHA12 (GN/BU)	C3004-8

- **Are the resistances less than 5 ohms?**

Yes
GO to V4 .







No
REPAIR the affected circuit for an open. TEST the system for normal operation.

V4 CHECK CIRCUITS CHA11 (WH/OG) AND CHA12 (GN/BU) FOR A SHORT TO GROUND

- Measure the resistance between ground and front auxiliary climate control assembly:
  - C951B-2, circuit CHA11 (WH/OG), harness side.
  - C951B-4, circuit CHA12 (GN/BU), harness side.

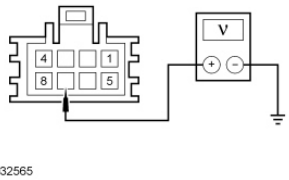
Yes
GO to V5 .

No
REPAIR the affected circuit for a short to ground. TEST the system for normal operation.

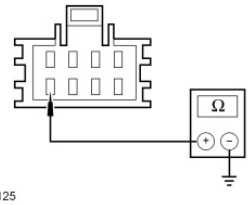
 A0051119 • **Are the resistances greater than 10,000 ohms?**	
V5 CHECK CIRCUITS CHA11 (WH/OG) AND CHA12 (GN/BU) FOR A SHORT TO VOLTAGE	
• Ignition ON. • Measure the voltage between ground and front auxiliary climate control assembly: ♦ C951B-2, circuit CHA11 (WH/OG), harness side. ♦ C951B-4, circuit CHA12 (GN/BU), harness side.  A0051120 • **Are any voltages present?**	**Yes** REPAIR the affected circuit for a short to voltage. TEST the system for normal operation. **No** GO to V6 .
V6 CHECK CIRCUITS CHA12 (GN/BU) AND CHA11 (WH/OG) FOR A SHORT TOGETHER	
• Ignition OFF. • Measure the resistance between front auxiliary climate control assembly C3004-8, circuit CHA12 (GN/BU), harness side and C3004-7, circuit CHA11 (WH/OG), harness side.  A0051121 • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new front auxiliary climate control assembly. REFER to Section 412-01 . TEST the system for normal operation. **No** REPAIR circuits CHA12 (GN/BU) and CHA11 (WH/OG) for a short together. TEST the system for normal operation.

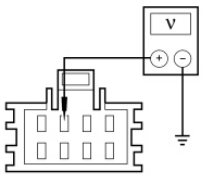
Pinpoint Test W: The Auxiliary Temperature Control is Inoperative Using the Front Auxiliary Climate Controls

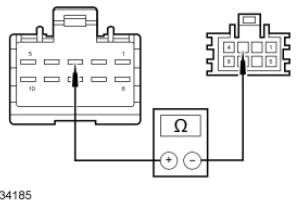
Refer to Wiring Diagrams Cell 52 , Auxilary Climate Control for schematic and connector information.



Normal Operation







Under normal operation, the auxiliary temperature blend door actuator is supplied voltage and ground. A signal voltage is received by the auxiliary temperature blend door actuator from the front auxiliary temperature control to command the auxiliary temperature blend door actuator position.

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Front auxiliary climate control assembly
- Auxiliary temperature blend door actuator
- Broken/binding auxiliary temperature blend door

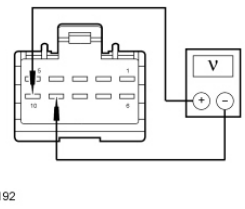
PINPOINT TEST W: THE AUXILIARY TEMPERATURE CONTROL IS INOPERATIVE USING THE FRONT AUXILIARY CLIMATE CONTROLS

Test Step	Result / Action to Take
W1 CHECK VOLTAGE TO BLEND DOOR ACTUATOR	
• Disconnect: Auxiliary Temperature Blend Door Actuator C3004. • Ignition ON. • Measure the voltage between ground and auxiliary temperature blend door actuator C3004-7, circuit CBP18 (GY/OG), harness side.  A0032565 • **Is the voltage greater than 10 volts?**	**Yes** GO to W2 . **No** VERIFY the Smart Junction Box (SJB) fuse 18 (10A) is OK. If OK, REPAIR circuit CBP18 (GY/OG) for an open. TEST the system for normal operation.
W2 CHECK THE BLEND DOOR ACTUATOR GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Measure the resistance between ground and auxiliary temperature blend door actuator C3004-8, circuit GD149 (BK/GY), harness side.	**Yes** GO to W3 . **No** REPAIR circuit GD149 (BK/GY) for an open. TEST the system for normal operation.

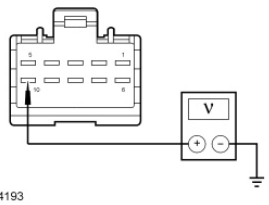
 A0051125 • **Is the resistance less than 5 ohms?**	
W3 CHECK THE TEMPERATURE BLEND DOOR ACTUATOR SIGNAL	
• Ignition ON. • Place the front auxiliary blower motor switch in HI. • Measure the voltage between ground and auxiliary temperature blend door actuator C3004-3, circuit VHA09 (VT/BN), harness side.  A0051126 • Rotate the temperature control switch to full COOL then to full WARM. • **Does the voltage vary from greater than 10 volts (full COOL) to less than 1 volt (full WARM)?**	**Yes** Check for a broken/binding auxiliary temperature blend door. If OK, INSTALL a new auxiliary temperature blend door actuator. REFER to Section 412-01 . TEST the system for normal operation. **No** GO to W4 .
W4 CHECK CIRCUIT VHA09 (VT/BN) FOR AN OPEN	
• Ignition OFF. • Disconnect: Front Auxiliary Climate Control Assembly C951B. • Measure the resistance between front auxiliary climate control assembly C951B-3, circuit VHA09 (VT/BN), harness side and auxiliary temperature blend door actuator C3004-3, circuit VHA09 (VT/BN), harness side.  A0034185 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new front auxiliary climate control assembly. REFER to Section 412-01 . TEST the system for normal operation. **No** REPAIR circuit VHA09 (VT/BN) for an open. TEST the system for normal operation.

Pinpoint Test X: The Auxiliary Temperature and Panel/Floor Controls are Inoperative Using the Front Auxiliary Climate Controls

Refer to Wiring Diagrams Cell 52 , Auxilary Climate Control for schematic and connector information.



Normal Operation



Under normal operation, the front auxiliary climate control assembly receives voltage and ground.

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Front auxiliary climate control assembly

PINPOINT TEST X: THE AUXILIARY TEMPERATURE AND PANEL/FLOOR CONTROLS ARE INOPERATIVE USING THE FRONT AUXILIARY CLIMATE CONTROLS

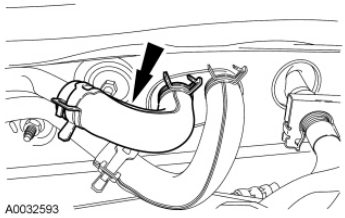
Test Step	Result / Action to Take
X1 CHECK FOR VOLTAGE TO THE FRONT AUXILIARY CLIMATE CONTROL ASSEMBLY	
• Ignition OFF. • Disconnect: Front Auxiliary Climate Control Assembly C951B. • Ignition ON. • Measure the voltage between front auxiliary climate control assembly C951B-10, circuit CBP18 (GY/OG), harness side and C951B-9, circuit GD149 (BK/GY), harness side.  A0034192 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new front auxiliary climate control assembly. REFER to Section 412-01 . TEST the system for normal operation. **No** GO to X2 .
X2 CHECK CIRCUIT CBP18 (GY/OG) FOR AN OPEN	
• Measure the voltage between ground and front auxiliary climate control assembly C951B-10, circuit CBP18 (GY/OG), harness side.	**Yes** REPAIR circuit GD149 (BK/GY) for an open. TEST the system for normal operation. **No** VERIFY Smart Junction Box (SJB) fuse 18 (10A) is OK. If OK, REPAIR circuit CBP18 (GY/OG) for an open. TEST the system for normal operation.

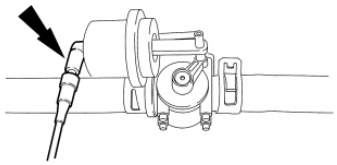
 • **Is the voltage greater than 10 volts?**	

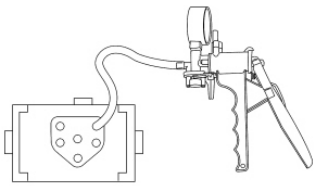
Pinpoint Test Y: Insufficient Air Conditioning (A/C) Cooling

Refer to Wiring Diagrams Cell 55 , Automatic Climate Control System for schematic and connector information.

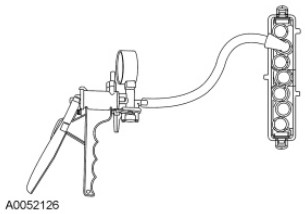
Normal Operation

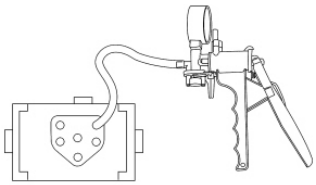


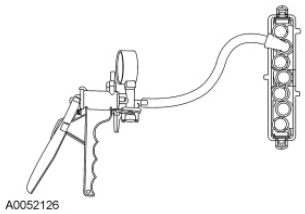




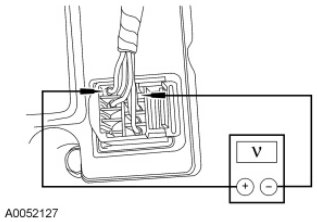
Under normal operation, the solenoid and manifold assembly receives a ground from the HVAC module - Dual Automatic Temperature Control (DATC). When the heater control valve vacuum solenoid is to be energized, the solenoid and manifold assembly receives voltage from the HVAC module - DATC .

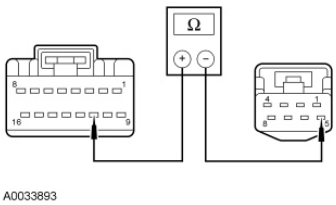






This pinpoint test is intended to diagnose the following:





- Wiring, terminals or connectors
- Solenoid and manifold assembly
- HVAC module - DATC
- Manual climate control assembly
- Heater control valve
- Stuck or bound linkage or door
- Leaking or plugged vacuum hose

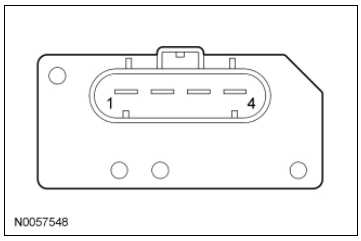
PINPOINT TEST Y: INSUFFICIENT AIR CONDITIONING (A/C) COOLING

Test Step	Result / Action to Take
Y1 CHECK FOR COOLANT FLOW TO THE HEATER CORE	
• Run the engine until it reaches normal operation temperature. • Press the PANEL, RECIRC and A/C buttons on the HVAC module - DATC or select MAX A/C on the function selector switch. Set the temperature control to full COOL. • Using a suitable temperature measuring device, check the heater core inlet hose to see if it is hot.	**Yes** GO to Y2 . **No** GO to Refrigerant System Tests in this section.

 A0032593 • **Is the heater core inlet hose hot?**	
Y2 CHECK FOR VACUUM AT THE HEATER CONTROL VALVE	
• Disconnect the heater control valve vacuum connector and check for vacuum.  A0035187 • **Is vacuum present at the heater control valve?**	**Yes** INSTALL a new heater control valve. REFER to Section 412-01 . TEST the system for normal operation. **No** GO to Y3 .
Y3 CHECK THE HEATER CONTROL VALVE VACUUM LINE FOR BLOCKAGE	
• Ignition OFF. • **NOTE:** Manual climate control systems only. • Disconnect the function selector switch vacuum connector. Connect the vacuum pump to the heater control valve vacuum line and attempt to pull a vacuum.  A0055376 • **NOTE:** DATC systems only. • Disconnect the solenoid and manifold assembly vacuum connector. Connect the vacuum pump to the heater control valve vacuum line and attempt to pull a vacuum.	**Yes** INSTALL a new vacuum harness. TEST the system for normal operation. **No** GO to Y4 .

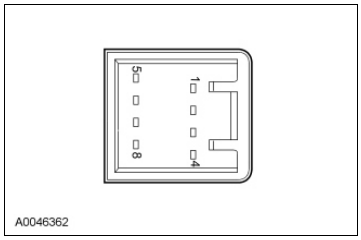
 A0052126 • **Can a vacuum be pulled on the heater control valve vacuum line?**	
Y4 CHECK THE HEATER CONTROL VALVE VACUUM LINE FOR LEAKS	
• Plug the heater control valve vacuum line at the heater control valve connection. • **NOTE:** Manual climate control systems only. • Leak test the heater control valve vacuum line, using the vacuum pump.  A0055376 • **NOTE:** DATC systems only. • Leak test the heater control valve vacuum line, using the vacuum pump.  A0052126 • **Does the heater control valve vacuum line leak?**	**Yes** INSTALL a new vacuum harness. TEST the system for normal operation. **No** GO to Y5 .
Y5 CHECK FOR INCORRECT VACUUM LINE PLACEMENT	
• Ignition OFF. • Inspect the heater control valve and A/C vacuum lines for correct placement. • **Is the vacuum line placement correct?**	**Yes** Manual climate control systems, INSTALL a new climate control assembly. REFER to Section 412-01 . TEST the system for normal operation. DATC systems, GO to Y6 . **No** CORRECT the vacuum line placement. TEST the system for normal operation.

Y6 CHECK THE SOLENOID AND MANIFOLD ASSEMBLY CIRCUIT VOLTAGE	
• Connect the vacuum harness connector to the solenoid and manifold assembly. • Ignition ON. • Press the PANEL, RECIRC and A/C buttons on the HVAC module - DATC . • **NOTE:** The following measurement must be taken by back-probing the solenoid and manifold assembly C2093. • Measure the voltage between solenoid and manifold assembly C2093-1, circuit RH226 (WH/VT), harness side and C2093-6, circuit CH224 (BU/OG), harness side.  A0052127 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new solenoid and manifold assembly. TEST the system for normal operation. **No** GO to Y7 .
Y7 CHECK THE SOLENOID AND MANIFOLD ASSEMBLY CIRCUIT CH224 (BU/OG) FOR AN OPEN	
• Ignition OFF. • Disconnect: HVAC Module - DATC C228B. • Disconnect: Solenoid and Manifold Assembly C2093. • Measure the resistance between HVAC module - DATC C228B-14, circuit CH224 (BU/OG), harness side and solenoid and manifold assembly C2093-6, circuit CH224 (BU/OG), harness side.  A0033893 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new HVAC module - DATC . REFER to Section 412-01 . TEST the system for normal operation. **No** REPAIR circuit CH224 (BU/OG) for an open. TEST the system for normal operation.



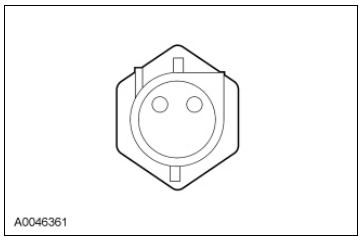
Component Tests

Blower Motor Resistor



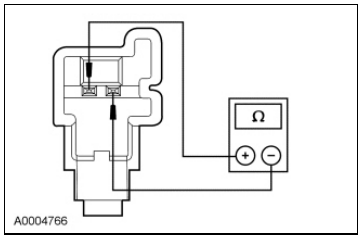
Blower Motor Resistor Pins	Resistance
1 and 4	1.5-2.1 ohms
1 and 3	0.4-0.8 ohm
1 and 2	0.15-0.3 ohm

Auxiliary Blower Motor Resistor



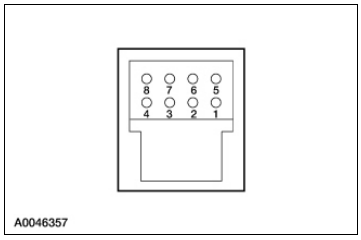
Blower Motor Resistor Pins	Resistance
1 and 4	2.3-2.9 ohms
1 and 3	0.8-1.1 ohms
1 and 2	0.2-0.4 ohm

Solenoid and Manifold Assembly



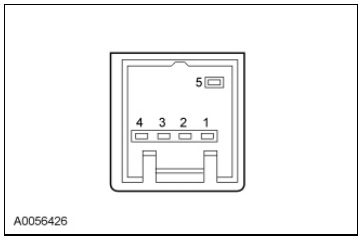
Solenoid and Manifold Assembly Pins	Resistance
1 and 2	44-54 ohms
1 and 3	44-54 ohms
1 and 4	44-54 ohms
1 and 5	44-54 ohms
1 and 6	44-54 ohms

Ambient Temperature Sensor



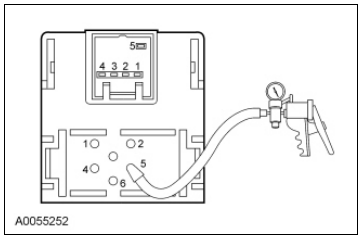
Ambient Temperature	Resistance
10-20°C (50-68°F)	37,000-58,000 ohms
20-30°C (68-86°F)	24,000-37,000 ohms
30-40°C (86-104°F)	16,000-24,000 ohms

In-Vehicle Temperature Sensor



Temperature	Resistance
10-20°C (50-68°F)	37,000-58,000 ohms
20-30°C (68-86°F)	24,000-37,000 ohms
30-40°C (86-104°F)	16,000-24,000 ohms

(Dual Automatic Temperature Control (DATC) systems) Temperature Blend Door Actuator



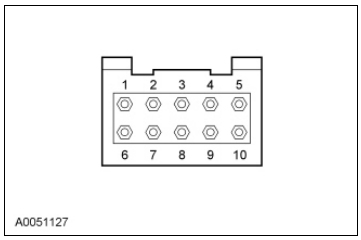
Resistance Between Pins	Resistance Range (approx.)
1 and 5	250-5,500 ohms
1 and 6	250-5,500 ohms

Function Selector Switch

Function Selection	Continuity Between Electrical Pins
MAX A/C	1, 2, 3 and 4
PANEL	1, 2 and 4
PANEL/FLOOR	1, 2 and 4
OFF	None
FLOOR	1, 2 and 4
FLOOR/DEFROST	1, 2 and 5
DEFROST	1, 2 and 5

Function Selector Vacuum Switch

Connect a vacuum pump to the function selector switch vacuum supply port and try to pull a vacuum in each function selector switch positions. Follow the chart below, to determine which positions should and should not hold vacuum. If the vacuum pump can pull and hold a vacuum when the chart indicates no vacuum (NV), the switch is plugged. If the vacuum pump does not pull and hold a vacuum when the chart indicates vacuum (V), the switch leaks.

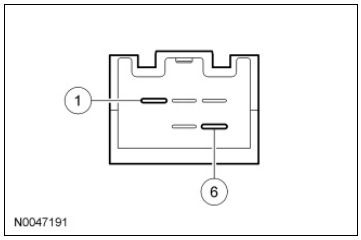


Vacuum Application Chart

Function Selector Switch Position						
MAX A/C	**PANEL**	**FLOOR/ PANEL**	**OFF**	**FLOOR**	**FLOOR/ DEF**	**DEF**
NV	V	V	NV	V	V	V
V	V	NV	V	NV	NV	V
NV	NV	NV	V	V	V	V
V	V	V	NV	NV	V	V

V = Vacuum

NV= No Vacuum



Front Auxiliary Climate Control Assembly

Airflow Mode	Continuity Between Pins
FLOOR	4 and 9, 2 and 10
PANEL	4 and 10, 2 and 9

Resistance Between Pins	Resistance Range (approx.)
3 and 9	50 ohms (WARM)-3,000 ohms (COOL)
3 and 10	50 ohms (COOL)-3,000 ohms (WARM)

Front Auxiliary Blower Motor Switch

Blower Switch Selection	Continuity Between Electrical Pins
Off	None
Low	1 and 2
Med-Low	1 and 3
Med-High	1 and 5
High	1 and 6

Heater Core

1. **NOTE:** If a heater core leak is suspected, the heater core must be tested by carrying out the plugged heater core component test before the heater core pressure test. Carry out a system inspection by checking the heater system thoroughly as follows:

   Inspect for evidence of coolant leakage at the heater water hose to heater core attachments. A coolant leak in the heater water hose could follow the heater core tube to the heater core and appear as a leak

in the heater core.

2. **NOTE:** Spring-type clamps are installed as original equipment. Installation and overtightening of non-specification clamps can cause leakage at the heater water hose connection and damage the heater core.

   Check the integrity of the heater water hose clamps.

Heater Core - Plugged

1. Check to see that the engine coolant is at the correct level.

2. Start the engine and turn on the heater.

3. When the engine coolant reaches operating temperature, using a suitable temperature measuring device, check the heater core inlet and outlet hose to see if they are hot.

If the inlet hose is not hot:

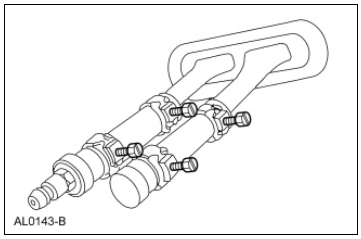
- the heater control valve may be stuck closed.
- the thermostat is not working correctly.

If the outlet hose is not hot:

- the heater core may have an air pocket.
- the heater core may be restricted or plugged.

Heater Core - Pressure Test

Use the Pressure Test Kit to perform the pressure test.



1. **NOTE:** Due to space limitations, a bench test may be necessary for pressure testing.

   Clamp off the heater hoses.

2. Disconnect the heater water hoses from the heater core.

3. Install a short piece of heater hose, approximately 101 mm (4 in) long on each heater core tube.

4. Fill the heater core and heater water hoses with water and install Plug BT-7422-B and Adapter BT-7422-A from the Pressure Test Kit in the heater water hose ends. Secure the heater water hoses, plug and adapter with hose clamps.

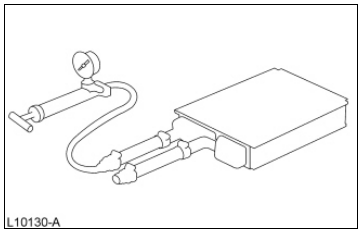
5. Attach the pump and gauge assembly from the Pressure Test Kit to the adapter.

6. Close the bleed valve at the base of the gauge. Pump 138 kPa (20 psi) of air pressure into the heater core.

7. Observe the pressure gauge for a minimum of 3 minutes.

8. If the pressure drops, check the heater water hose connections to the core tubes for leaks. If the heater water hoses do not leak, remove the heater core from the vehicle and perform the bench test.

Heater Core - Bench Test



1. Remove the heater core from the vehicle. Refer to Section 412-01 .

2. Drain all of the coolant from the heater core.

3. Connect the 101 mm (4 in) test heater water hoses with plug and adapter to the core tubes. Then connect the radiator/heater core pressure tester from the Pressure Test Kit to the adapter.

4. Apply 138 kPa (20 psi) of air pressure to the heater core. Submerge the heater core in water.

5. If a leak is observed, replace the heater core.

A/C Evaporator/Condenser Core - On Vehicle Leak Test

1. Recover the refrigerant. Refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

2. Disconnect the suspect A/C evaporator core or A/C condenser core from the A/C system. Refer to Section 412-01 .

3. Clean the spring lock couplings. Refer to Spring Lock Coupling in this section.

4. Connect the appropriate test fittings from the A/C Flush Adapter Kit to the evaporator or condenser tube connections.

5. **NOTE:** The automatic shut-off valves on some gauge set hoses do not open when connected to the test fittings. If available, use hoses without shut-off valves. If hoses with shut-off valves are used, make sure the valve opens when attached to the test fittings or install an adapter which will activate the valve. The test is not valid if the shut-off valve does not open.

   Connect the red and blue hoses from the R-134a Manifold Gauge Set to the test fittings on the A/C evaporator core or A/C condenser core. Connect the yellow hose to a known good vacuum pump.

6. Open both gauge set valves and start the vacuum pump. Allow the vacuum pump to operate for a minimum of 45 minutes after the low-pressure gauge of the gauge set indicates 101 kPa (30 in-Hg). The 45 minute evacuation is necessary to remove any refrigerant from oil left in the A/C evaporator

core or A/C condenser core. If the refrigerant is not completely removed from the oil, outgassing will degrade the vacuum and appear as a refrigerant leak.

7. If the low-pressure gauge reading will not drop to 101 kPa (30 in-Hg) when the valves on the gauge and manifold set are open and the vacuum pump is operating, close the gauge set valves and observe the low-pressure gauge. If the pressure rises rapidly to zero, a large leak is indicated. Recheck the test fitting connections and gauge set connections before replacing the A/C evaporator core or A/C condenser core.

8. After evacuating for 45 minutes, close the gauge set valves and stop the vacuum pump. Observe the low-pressure gauge; it should remain at the 101 kPa (30 in-Hg) mark.
    - If the low-pressure gauge reading rises 34 kPa (10 in-Hg) or more of vacuum from the 101 kPa (30 in-Hg) position in 10 minutes, a leak is indicated.
    - If a very small leak is suspected, wait 30 minutes and observe the vacuum gauge.
    - If a small amount of vacuum is lost, operate the vacuum pump with gauge valves open for an additional 30 minutes to remove any remaining refrigerant from the oil in the A/C evaporator core or A/C condenser core. Then recheck for loss of vacuum.
    - If a very small leak is suspected, allow the system to set overnight with vacuum applied and check for vacuum loss.

9. If the A/C evaporator core or A/C condenser core does leak, as verified by the above procedure, install a new A/C evaporator core or A/C condenser core. Refer to Section 412-01 .

A/C Compressor - External Leak Test

1. Install the appropriate adapter from the A/C Flush Adapter Kit on the rear head of the A/C compressor, using the existing peanut fitting nuts.

2. Connect the high and low pressure lines of a manifold gauge set or a refrigerant recovery/recycling station to the corresponding fittings on the adapter.

3. Attach the center hose of the manifold gauge set to a refrigerant container standing in an upright position.

4. Open the low pressure gauge valve, the high pressure gauge valve and the valve on the refrigerant container to allow the refrigerant vapor to flow into the A/C compressor.

5. Using the Refrigerant Leak Detector, check the entire A/C compressor for leaks.

6. If an external leak is found, install a new A/C compressor. Refer to Section 412-01 .

7. When the leak test is complete, recover the refrigerant from the compressor.

Spring Lock Coupling

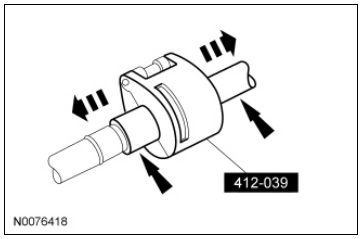
Special Tool(s)

 ST2352-A	Remover, Refrigerant Coupling Spring 412-039 (T84L-19623-B)

Material

Item	Specification
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B

Disconnect



NOTE: If a leak has been found at a spring lock coupling, inspect the O-ring sealing surfaces on the male and female sides of the fitting for damage or scratches. Replace the affected component if damage is identified. If no damage is present, thoroughly clean both sides of the fitting using a suitable non-abrasive cloth, lubricate with PAG oil and install new O-ring seals. Due to subtle differences in O-ring sizes, it is critical for leak prevention that the correct O-ring seal be identified. Refer to the Ford Catalog AdvantageTM or equivalent for the specific vehicle and application. When repairs are complete, leak test the spring lock coupling to verify the repair.

1. Remove the spring lock coupling clip, if equipped.

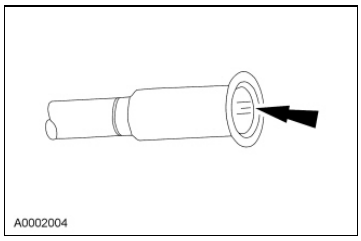
2. ***NOTICE:*** **Do not use metal tools to remove the O-ring seals. They may cause axial scratches across the O-ring seal grooves, resulting in refrigerant leaks.**

   Push the Refrigerant Coupling Spring Remover into the cage opening to release the female fitting from the spring lock coupling spring and pull the fitting apart.

   - Remove the O-ring seals using a non-metallic tool.

3. ***NOTICE:*** **Do not use a screwdriver or similar tool to remove the Air Conditioning (A/C) tube lock coupling spring; this may cause axial scratches across the O-ring seal grooves resulting in refrigerant leaks.**

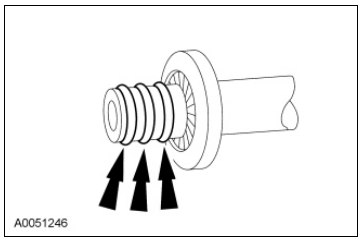
   Remove the spring lock coupling spring with a small hooked wire.



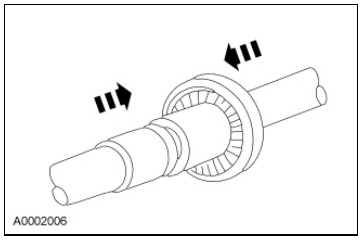
Connect

NOTICE: **It is imperative that the sealing surface of the spring lock coupling and O-ring seal be clean and completely free from debris. To prevent contamination, only new PAG oil should be used as an O-ring seal lubricant. Contamination from used PAG oil, residual PAG oil from inside the refrigerant system or a failure to thoroughly clean the fitting sealing surface will interrupt the O-ring seal-to-fitting sealing surface and cause refrigerant system leaks.**

1. Install the spring lock coupling spring.

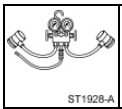


2. Lubricate the inside of the coupling with PAG oil.



3. ***NOTICE:*** **Use only the new O-ring seals. The use of any O-ring seals other than those specified in the Ford Catalog AdvantageTM or equivalent may result in intermittent leakage during vehicle operation.**

   Install the O-ring seals.



4. Connect the spring lock coupling fittings with a twisting motion until the spring lock coupling spring snaps over the flared end of the female fitting.

5. Install the spring lock coupling clip.

Refrigerant System Tests

Special Tool(s)

 ST1928-A	R-134a Manifold Gauge Set 023-00047 or equivalent
 ST3079A	R-134a Refrigerant Management Machine (SAE J-2788 Compliant) 023-00181 or equivalent
 ST3081-A	R-134a Refrigerant Management Machine (SAE J-2788 Compliant) 199-00067 or equivalent
 ST3080-A	R-134a Refrigerant Management Machine (SAE J-2788 Compliant) 265-00012 or equivalent

Procedure 1 - Ambient Temperature At or Below 38°C (100°F)

NOTE: The system performance can be evaluated and diagnosed by analysis of the compressor suction and discharge pressures. The following procedure is used to determine if the system is operating at normal pressures.

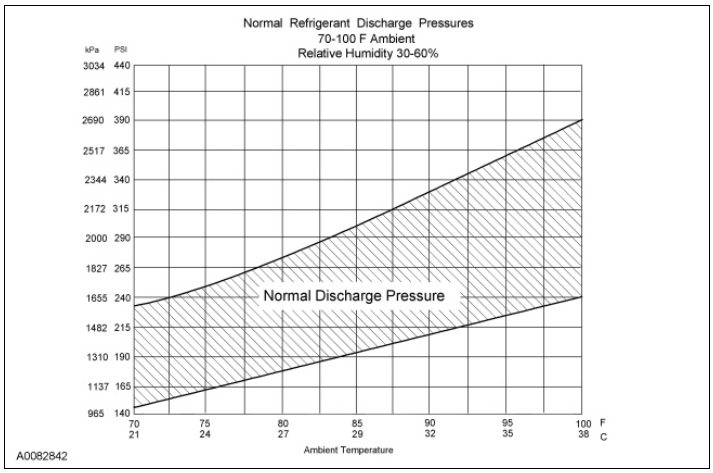
NOTE: The procedure varies depending on the ambient (shop) temperature. If the ambient temperature is 38°C (100°F) or lower, follow Procedure 1. If the ambient temperature is over 38°C (100°F), follow Procedure 2.

NOTE: If the A/C compressor cycles at any time during this test, refer to the diagnostic table.

1. Drive the vehicle or run the engine until it reaches normal operating temperature.

2. Connect a R-134 Manifold Gauge Set or R134a Refrigerant Management Machine with high-pressure and low-pressure gauges to the refrigerant system.

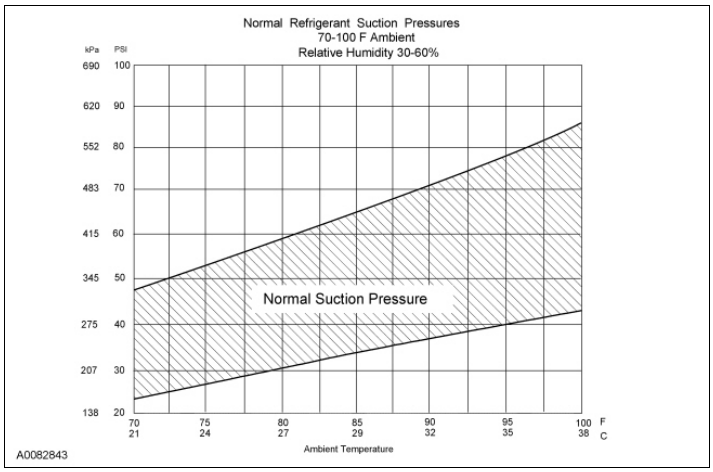
3. Set the climate controls.
   - If equipped with manual climate control, set the A/C controls for normal A/C-PANEL mode, full COOL temperature, FRESH air, HI Blower. If the vehicle has a fresh air/recirc button, set it to FRESH. If the vehicle has an A/C switch or compressor on switch, set it to A/C ON.
   - If equipped with Dual Automatic Temperature Control (DATC), set temperature to 15°C (60°F) (lowest possible temp setting) with the dual function disabled (if equipped). Manually set blower on HIGH. If the vehicle has a fresh air/recirc button, set it to FRESH. If the vehicle has an A/C switch or compressor on switch, set it to A/C ON.
   - If the vehicle is equipped with auxiliary climate control, set the auxiliary controls to full COOL in the PANEL mode at HI blower speed.



4. Open all vehicle windows and leave the hood open for the test. Open the rear hatch and/or rear doors (if equipped).

5. Confirm the compressor clutch is engaged and the engine cooling fan(s) are operating or engaged. Allow the vehicle to idle until the suction (low-side) and discharge (high-side) pressures are stable or fluctuate in a range that repeats.

6. Record the ambient (shop) temperature.



7. Record the discharge pressure. If the pressure is fluctuating, record the average value.

8. Determine if the discharge pressure falls within the normal operating limits using the Normal Refrigerant Discharge Pressures chart.

9. Record the suction pressure. If the pressure is fluctuating, record the average value.

10. Determine if the suction pressure falls between normal operating limits using the Normal Refrigerant Suction Pressures chart.

11. Proceed to the diagnostic table.

Procedure 2 - Ambient Temperature Above 38°C (100°F)

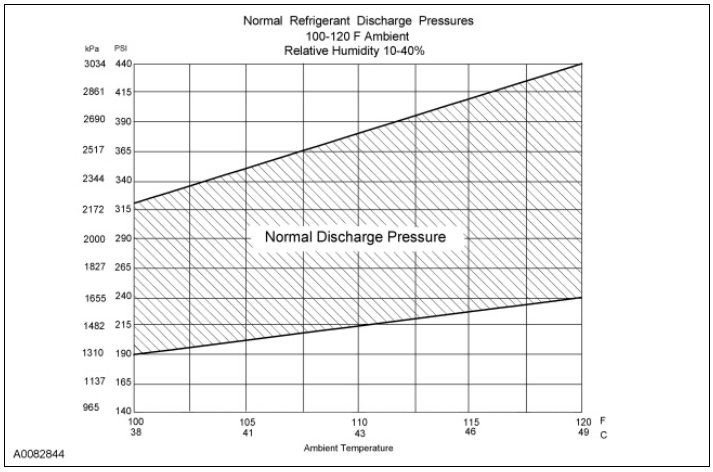
NOTE: The system performance can be evaluated and diagnosed by analysis of the compressor suction and discharge pressures. The following procedure is used to determine if the system is operating at normal pressures.

NOTE: The procedure varies depending on the ambient (shop) temperature. If the ambient temperature is 38°C (100°F) or lower, follow Procedure 1. If the ambient temperature is over 38°C (100°F), follow Procedure 2.

1. Drive the vehicle or run the engine until it reaches normal operating temperature.

2. Connect a R-134a Manifold Gauge Set or R-134a Refrigerant Management Machine with high-pressure and low-pressure gauges to the refrigerant system.

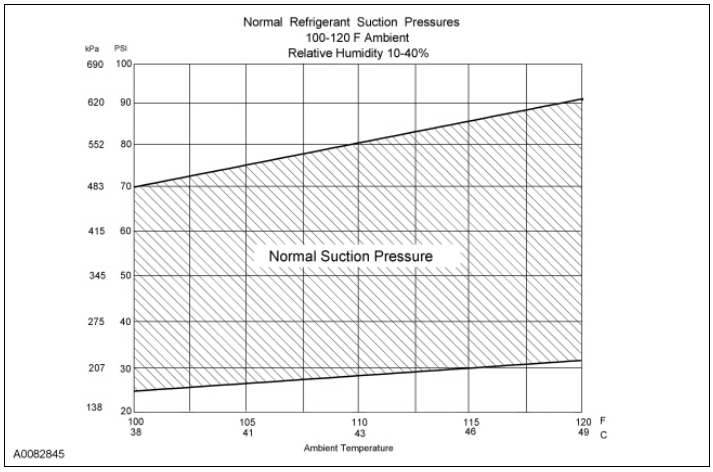
3. Set the climate controls.
   - If equipped with manual climate control, set the A/C controls for normal A/C-PANEL mode, full COOL temperature, FRESH air, MED-LO blower. If the vehicle has a fresh air/recirc button, set it to FRESH. If the vehicle has an A/C switch or compressor on switch, set it to A/C ON.
   - If equipped with ATC, set temperature to 15°C (60°F) (lowest possible temp setting). Manually set blower to MED-LO (3 to 4 bars). If the vehicle has a fresh air/recirc button, set it to FRESH. If the vehicle has an A/C switch or compressor on switch, set it to A/C ON.
   - If the vehicle is equipped with auxiliary climate control, set the auxiliary controls to full COOL in the PANEL mode at MED-LO blower speed.



4. Open all vehicle windows and leave the hood open for the test. Open the rear hatch and/or rear doors (if equipped).

5. Confirm the compressor clutch is engaged and the engine cooling fan(s) are operating or engaged. Allow the vehicle to idle until the suction (low-side) and discharge (high-side) pressures are stable or fluctuate in a range that repeats.

6. Record the ambient (shop) temperature.



7. Record the discharge pressure. If the pressure is fluctuating, record the average value.

8. Determine if the discharge pressure falls within the normal operating limits using the Normal Refrigerant Discharge Pressures chart.

9. Record the suction pressure. If the pressure is fluctuating, record the average value.

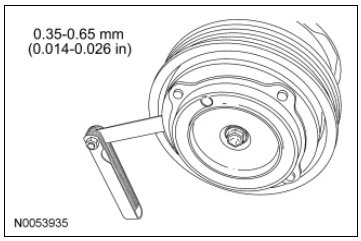
10. Determine if the suction pressure falls between normal operating limits using the Normal Refrigerant Suction Pressures chart.

11. Refer to the chart below.

Diagnostic Table

1. **NOTE:** The following table is used to guide diagnosis of the refrigerant system if operating pressures are outside normal limits.

   Proceed to the Diagnostic Table.



High (Discharge) Pressure	Low (Suction) Pressure	Component - Causes
High or clutch cycling	High	Condenser - inadequate airflow.
High	Normal to high	Engine - overheating.
Normal to high	Normal	Refrigerant overcharge - air in refrigerant.
Normal to low	High	Fixed orifice tube - missing O-rings leaking/missing.
Normal to low	Normal to high	A/C suction line - partially restricted or plugged. [a]
Normal to low	Low or clutch cycling	Low refrigerant charge, A/C suction line - partially restricted or plugged A/C cycling switch - sticking closed. [b]
Erratic operation or compressor not running		A/C cycling switch - poor connection at A/C clutch connector or clutch cycling switch connector. A/C electrical circuit erratic - see A/C Electrical Circuit Wiring Diagram.
Normal to low	High	Compressor - low performance.
Additional Possible Cause Components Associated With Inadequate Compressor Operation		
• Compressor drive belt - loose • Compressor clutch - slipping • Clutch coil open - shorted, or loose mounting • Control assembly switch - dirty contacts or sticking open • Clutch wiring circuit - high resistance, open or blown fuse • Compressor operation interrupted by engine computer		
Additional Possible Cause Components Associated With a Damaged Compressor		
• Incorrect clutch air-gap • Suction accumulator - refrigerant oil bleed hose plugged		

• Refrigerant leaks

[a] Low pressure reading will be normal to high if pressure is taken at accumulator and if restriction is downstream of service access valve.
[b] Low pressure reading will be low if pressure is taken near the compressor and restriction is upstream of service access valve.

Air Conditioning (A/C) Clutch Air Gap Adjustment

1. Check the A/C clutch air gap at 3 equally spaced places between the clutch plate and the A/C clutch pulley.

2. Remove the clutch plate. Add or remove spacers between the clutch plate hub and the compressor shaft until the clearance is within specification.

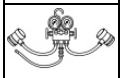
Electronic Leak Detection

Special Tool(s)

 ST3072-A	Heated Pentode Halogen Leak Detector 023-00178 or equivalent

NOTE: Good ventilation is necessary in the area where electronic A/C leak testing is to be carried out. If the surrounding air is contaminated with refrigerant gas, the Heated Pentode Halogen Leak Detector will indicate this gas all the time. Odors from other chemicals such as antifreeze, diesel fuel, disc brake cleaner or other cleaning solvents can cause the same problem. Using a fan to ventilate the area to be tested before proceeding with the leak detection procedure is helpful in removing small traces of contamination from the air, but the fan should be turned off during actual testing.

NOTE: R-134a is heavier than air, and will tend to move downward from the source of the leak if present. It is possible that a leak may not be detected if the leak detector tip is held above the leaking fitting, line or component. Always be sure to thoroughly leak test below the fitting, line or component for the presence of R-134a as well as leak testing above and around.



1. **NOTE:** The system pressure should be between 413-551 kPa (60-80 psi) at 24°C (75°F) with the engine off.

   Leak test the refrigerant system using the Heated Pentode Halogen Leak Detector. Follow the instructions included with the Heated Pentode Halogen Leak Detector for handling and operation techniques.

Fluorescent Dye Leak Detection

Special Tool(s)

 ST3073-A	Cordless/Rechargeable True UV LED Light ES 023-00182 or equivalent
 ST3057-A	R-134a Loop/Add On Injector Kit-Set 219-00069 or equivalent
 ST1928-A	R-134a Manifold Gauge Set 300-R0B40134AE or equivalent
 ST3079A	R-134a Refrigerant Management Machine (SAE J-2788 Compliant) 300-R0B34788-PROE or equivalent
 ST3081-A	R-134a Refrigerant Management Machine (SAE J-2788 Compliant) 199-00067 or equivalent
 ST3080-A	R-134a Refrigerant Management Machine (SAE J-2788 Compliant) 265-00012 or equivalent

Material

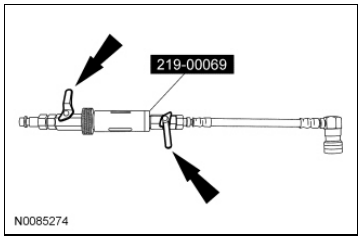
Item	Specification
Stay-Brite® R-134a Leak Detection Dye 164-R6060 (Rotunda)	-

Fluorescent Dye Injection Using a R-134a Refrigerant Management Machine and Dye Injector - Vehicles Requiring R-134a Addition

NOTE: This method of fluorescent dye injection requires the addition of R-134a from a R-134a Refrigerant Management Machine or R-134a Manifold Gauge Set hooked to an external tank to charge the dye into the refrigerant system. If adding fluorescent dye to a refrigerant system that is already fully charged, the R-134a Loop/Add On Injector Kit-Set method should be used.

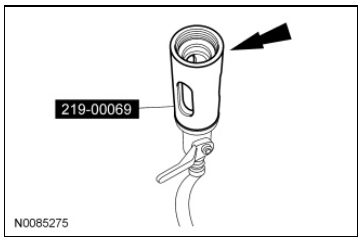
NOTE: Fluorescent refrigerant system dye is added to the refrigerant system at the factory to assist in refrigerant system leak diagnosis using a Rotunda-approved UV blacklight. It is not necessary to add additional dye to the refrigerant system before diagnosing leaks, even if a significant amount of refrigerant has been removed from the system. Replacement suction accumulators and receiver/driers are shipped with a fluorescent dye "wafer" included in the desiccant bag which will dissolve after approximately 30 minutes of continued A/C operation. It is not necessary to add dye after flushing or filtering the refrigerant system because a new suction accumulator or receiver/drier is installed as part of the flushing or filtering procedure. Additional refrigerant system dye should only be added if more than 50% of the refrigerant system lubricant

capacity has been lost due to a fitting separation, hose rupture or other damage.



NOTE: Before using the R-134a Loop/Add On Injector Kit-Set for the first time, refer to the manufacturer's instructions on evacuation of any non-condensable gases from the hoses.

NOTE: Only connect the dye/lubricant injector from the R-134a Loop/Add On Injector Kit-Set when fluorescent dye is to be injected. The dye/lubricant injector has a one-way check valve that will prevent refrigerant system recovery and evacuation.



1. **NOTE:** If no R-134a pressure is present in the refrigerant system, the system should be evacuated before carrying out the injection procedure. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

   Connect a R-134a Refrigerant Management Machine or a R-134a Manifold Gauge Set to the refrigerant system service port valves.

2. Verify that the valves on the dye/lubricant injector from the R-134a Loop/Add On Injector Kit-Set are closed.

3. Fill the R-134a fluorescent dye injector reservoir with 7 ml (0.25 oz) of fluorescent dye.

4. Install the dye/lubricant injector between the low-pressure service gauge port valve and the R-134a Refrigerant Management Machine or R-134a Manifold Gauge Set.

5. **NOTE:** Following fluorescent dye injection, the refrigerant system should be fully charged to make sure of correct movement of the dye.

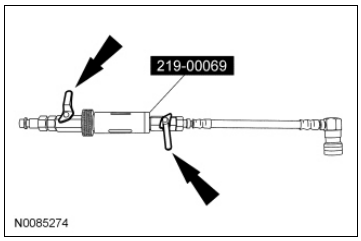
   Open all valves and inject the fluorescent dye into the refrigerant system by charging the refrigerant system with the required amount of R-134a.

6. When fluorescent dye injection is complete, close all valves.

7. Recover the refrigerant from the dye/lubricant injector.

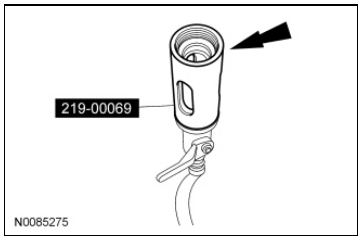
8. Remove the dye/lubricant injector from the low-pressure service gauge port valve and the R-134a Refrigerant Management Machine or R-134a Manifold Gauge Set.

Fluorescent Dye Injection Using a R-134a Loop/Add On Injector Kit-Set - Vehicles Not Requiring



R-134a Addition

NOTE: Fluorescent refrigerant system dye is added to the refrigerant system at the factory to assist in refrigerant system leak diagnosis using a Rotunda-approved UV blacklight. It is not necessary to add additional dye to the refrigerant system before diagnosing leaks, even if a significant amount of refrigerant has been removed from the system. Replacement suction accumulators and receiver/driers are shipped with a fluorescent dye "wafer" included in the desiccant bag which will dissolve after approximately 30 minutes of continued A/C operation. It is not necessary to add dye after flushing or filtering the refrigerant system because a new suction accumulator or receiver/drier is installed as part of the flushing or filtering procedure. Additional refrigerant system dye should only be added if more than 50% of the refrigerant system lubricant capacity has been lost due to a fitting separation, hose rupture or other damage.

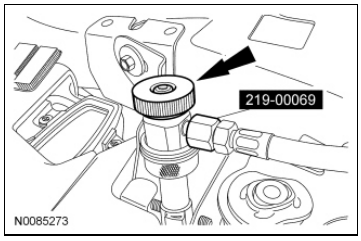


NOTE: Before using the R-134a Loop/Add On Injector Kit-Set for the first time, refer to the equipment manufacturer's instructions on evacuation of non-condensable gases from the hoses.

NOTE: Refrigerant system pressure should be between 413-551 kPa (60-80 psi) at 24°C (75°F) with the engine off and cool.

1. Verify that the valves on the R-134a Loop/Add On Injector Kit-Set are closed.

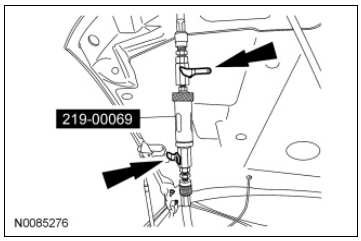
2. Fill the R-134a Loop/Add On Injector Kit-Set reservoir with 7 ml (0.25 oz) of fluorescent dye.



3. Install the R-134a Loop/Add On Injector Kit-Set between the high-pressure and low-pressure service gauge port valves.

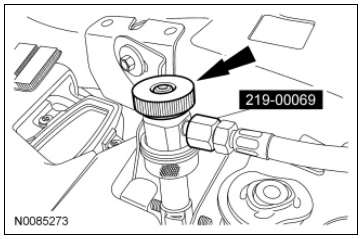
4. ***NOTICE:*** **Make sure all tools and hoses are clear of the engine cooling fan and drive belt before starting the engine. Failure to keep tools and hoses clear from the engine cooling fan and drive belt will result in damage to the tools and/or vehicle.**

   With the A/C off, start the engine. Allow engine speed to stabilize below 1,000 rpm.



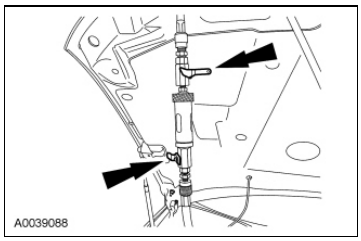
5. Set the A/C to the ON position.

6. Open the high-pressure service valve.



7. **NOTE:** To prevent pressure spike/liquid slug, crack the R-134a Loop/Add On Injector Kit-Set valves and slowly open to inject the fluorescent dye into the refrigerant system.

   Open the R-134a Loop/Add On Injector Kit-Set valves and inject the fluorescent dye into the refrigerant system.



8. Close the high-pressure service valve to allow the pressure inside the R-134a Loop/Add On Injector Kit-Set to equalize with the suction side of the refrigerant system.

9. **NOTE:** Close the valves on the R-134a Loop/Add On Injector Kit-Set while the A/C compressor is operating.

   Close the valves on the R-134a Loop/Add On Injector Kit-Set.

10. **NOTE:** Leave all valves on the R-134a Loop/Add On Injector Kit-Set closed when not in use.

    Disconnect the high-pressure and low-pressure service valves and remove the R-134a Loop/Add On Injector Kit-Set from the vehicle.

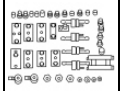
Fluorescent Dye Detection

NOTE: Ford Motor Company vehicles are produced with R-134a fluorescent dye installed in the refrigerant system from the factory. The location of leaks can be pinpointed by the bright yellow-green glow of the

fluorescent dye under a UV lamp. Since more than one leak can exist, make sure to inspect each component, line and fitting in the refrigerant system for a leak.

NOTE: Use of dye-enhancing glasses or goggles greatly improves the detection of the dye under the UV lamp.

NOTE: Not all UV lamps will fluoresce the dye used in Ford vehicles. All Rotunda UV lamps are optimized to fluoresce the dye.



1. Check for leaks using a Rotunda-approved UV lamp and dye enhancing glasses.
    - Inspect all components, lines and fittings of the refrigerant system.

2. After the leak(s) is repaired, remove any traces of fluorescent dye with a general purpose oil solvent.

3. Verify the repair by running the vehicle for a short period of time and rechecking the area of the leak with a Rotunda-approved UV lamp.

Air Conditioning (A/C) System Flushing

Special Tool(s)

 ST2985-A	A/C Flush Adapter Kit 219-00074 or equivalent
 ST2469-A	A/C Flush and Purge Fitting Kit 219-00024 (part of 219-00023) or equivalent
 ST2466-A	A/C Flush and Purge Machine 219-00022 (part of 219-00023) or equivalent

Material

Item	Specification
A/C System Flushing Solvent YN-23	-
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B

NOTICE: **An Air Conditioning (A/C) refrigerant analyzer must be used before the recovery of any vehicle's A/C refrigerant. Failure to do so puts the shop's bulk refrigerant at risk of contamination. If the vehicle's A/C refrigerant is contaminated, refer the customer to the service facility that carried out the last A/C service. If the customer wishes to pay the additional cost, use the A/C recovery equipment that is designated for recovering contaminated A/C refrigerant. All contaminated A/C refrigerant must be disposed of as hazardous waste. For all equipment, follow the equipment manufacturer procedures and instructions.**

NOTICE: **Suction accumulator or receiver/drier, Thermostatic Expansion Valve (TXV) and/or evaporator core orifice, and hoses with mufflers, should be removed when flushing the Air Conditioning (A/C) system. Internal plumbing of these devices makes it impossible to correctly remove any residual-flushing agent. These components are typically discarded after A/C system contamination. Hoses without mufflers can normally be reused unless they are clogged with foreign material.**

NOTICE: **Only the listed A/C Flush and Purge Machine, A/C Flush and Purge Fitting Kit, A/C Flush Adapter Kit and A/C System Flushing Solvent are approved for use on Ford vehicles. No other flushing device or solvent is approved for flushing heat exchangers (Air Conditioning [A/C] condenser, A/C evaporator). Use of any other flusher or solvent may cause damage to the A/C system and the flushing unit.**

1. Recover the refrigerant. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

2. Disconnect the refrigerant lines from the heat exchanger(s) to be flushed.

3. Using the correct adapters from the A/C Flush Adapter Kit or A/C Flush and Purge Fitting Kit, connect the A/C Flush and Purge Machine to the heat exchanger to be flushed. Do not flush through the evaporator core orifice (if equipped), Thermostatic Expansion Valve (TXV) (if equipped) or hoses with mufflers. Internal plumbing and material make-up of these components make it impossible to correctly remove foreign material or residual flushing solvent.

4. **NOTE:** Use 3.785L (1 gal) of A/C System Flushing Solvent to flush the heat exchanger for a minimum of 15 minutes. The flush solvent may be used for one or both heat exchangers in the A/C system. However, the flush solvent is intended for one vehicle only. The filter used on the flushing unit is also intended for use on one vehicle only.

   Flush the heat exchanger for a minimum of 15 minutes.

5. Apply 621-862 kPa (90-125 psi) pressurized air to the component for a minimum of 30 minutes. The 30-minute purge time is required to force and evaporate all residual solvent from the A/C system component. Failure to successfully remove all residual solvent within the component can result in system damage when reconnected and operated. Dispose of the used flush solvent and filter in accordance with local, state and federal regulations.

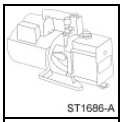
6. **NOTE:** A/C system filtering as described in this section is optional if system flushing is carried out. However, the filter kit use is recommended after flushing if the A/C system contamination is extensive.

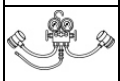
   Install a new A/C evaporator core orifice (if equipped) and/or TXV (if equipped) in any vehicle being serviced for an internal A/C compressor or desiccant failure.

7. Install new refrigerant hoses with mufflers if clogged with foreign material.

8. Install a new suction accumulator (if equipped), receiver/drier (if equipped) or receiver/drier cartridge (if equipped) in any vehicle being serviced for an internal A/C compressor or desiccant failure.

9. Reconnect the heat exchanger being serviced.





10. If a new A/C compressor is not to be installed, lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to Refrigerant Oil Adding in this section.

11. If a new A/C compressor is not to be installed, evacuate, leak test and charge the A/C system. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

12. If a new A/C compressor is to be installed, refer to the A/C Compressor removal and installation procedure in Section 412-01 .

Refrigerant System Recovery

NOTICE: **An Air Conditioning (A/C) refrigerant analyzer must be used before the recovery of any vehicle's A/C refrigerant. Failure to do so puts the shop's bulk refrigerant at risk of contamination. If the vehicle's A/C refrigerant is contaminated, refer the customer to the service facility that carried out the last A/C service. If the customer wishes to pay the additional cost, use the A/C recovery equipment that is designated for recovering contaminated A/C refrigerant. All contaminated A/C refrigerant must be disposed of as hazardous waste. For all equipment, follow the equipment manufacturer procedures and instructions.**

NOTE: Ford Motor Company recommends the use of R-134a refrigerant management equipment that meets the requirements of the SAE J2788 standard.

1. Prior to recovering, the purity of the refrigerant must be verified. For additional information, refer to Refrigerant Identification Testing in this section.

2. Connect a R-134a Refrigerant Management Machine to the low- and high-pressure service gauge port valves following the operating instructions provided by the equipment manufacturer.

3. Recover the refrigerant from the system following the operating instructions provided by the equipment manufacturer. Note the amount of oil removed during the refrigerant recovery (if any). Add that same amount back into the system once repairs are complete.

4. Once the R-134a Refrigerant Management Machine has recovered the refrigerant, switch OFF the power supply.

5. Allow the system to set for about 2 minutes, and observe the system vacuum reading. If the vacuum is not lost, disconnect the recovery equipment.

6. If the system does lose vacuum, repeat Steps 3 through 5 until the vacuum level remains stable for 2 minutes.

7. Carry out the required repairs.

Refrigerant System Evacuation Using a R-134a Refrigerant Management Machine

1. Connect a R-134a Refrigerant Management Machine to the low- and high-pressure service gauge port valves following the operating instructions provided by the equipment manufacturer.

2. Evacuate the system until the low-pressure gauge reads at least 99.4 kPa (29.5 in-Hg) of vacuum and as close to 101.1 kPa (30 in-Hg) as possible. Continue to operate the Vacuum Pump for a minimum of 45 minutes.

3. Turn OFF the Vacuum Pump. Observe the low-pressure gauge for 5 minutes to make sure that the system vacuum is held.

Refrigerant System Evacuation Using a R-134a Manifold Gauge Set and Vacuum Pump

NOTE: Leaks in refrigerant system service equipment, hoses or gauges can cause a leak in vacuum that may be misinterpreted as a problem with the vehicle's refrigerant system. It is necessary to leak-test all refrigerant system service equipment, hoses and gauges on a weekly basis to verify that no leaks are present.

1. Connect the R-134a Manifold Gauge Set to the low-side and high-side service gauge port valves.

2. Connect the center (yellow) hose from the R-134a Manifold Gauge Set to the suction port on the Vacuum Pump.

3. Open all valves on the R-134a Manifold Gauge Set and both service gauge port valves.

4. Turn on the Vacuum Pump and evacuate the system until the low-pressure gauge reads at least 99.4 kPa (29.5 in-Hg) of vacuum and as close to 101.1 kPa (30 in-Hg) as possible. Continue to operate the Vacuum Pump for a minimum of 45 minutes.

5. Close the high-side and low-side valves on the R-134a Manifold Gauge Set (not the service gauge port valves) and turn OFF the Vacuum Pump.

6. Observe the low-pressure gauge for 5 minutes to make sure that the system vacuum is held. If vacuum is not held for 5 minutes, leak test the system, repair the leak and evacuate the system again.

Refrigerant System Charging Using a R-134a Refrigerant Management Machine

1. Lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to Refrigerant Oil Adding in this section.

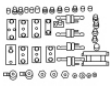
2. Connect a R-134a Refrigerant Management Machine to the low-side and high-side service gauge port valves following the operating instructions provided by the equipment manufacturer.

3. Set the refrigerant charge amount, and charge the refrigerant system following the instructions provided by the equipment manufacturer.

Refrigerant System Charging Using a R-134a Manifold Gauge Set and Automatic Refrigerant Charging Meter

NOTE: Ford Motor Company recommends use of a R-134a Refrigerant Management Machine to carry out charging of the refrigerant system. If a R-134a Refrigerant Management Machine is not available, refrigerant system charging may be accomplished using a separate Automatic Refrigerant Charging Meter and R-134a Manifold Gauge Set.

1. Lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to Refrigerant Oil Adding in this section.



2. Assemble the R-134a Manifold Gauge Set, Automatic Refrigerant Charging Meter and R-134a supply tank following the Automatic Refrigerant Charging Meter operating instructions.

3. Charge the refrigerant system following the Automatic Refrigerant Charging Meter operating instructions.

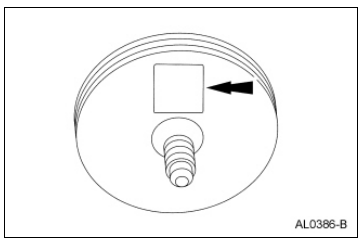
4. If the refrigerant flow stops before the refrigerant charge is complete, start the engine, select MAX A/C operation and allow the refrigerant charge to complete.

Refrigerant System Filtering Following Air Conditioning (A/C) Compressor Installation

Special Tool(s)

 ST2985-A	A/C Flush Adapter Kit 219-00074 or equivalent
 ST2469-A	A/C Flush and Purge Fitting Kit 219-00024 or equivalent

Material



Item	Specification
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B

NOTICE: **An Air Conditioning (A/C) refrigerant analyzer must be used before the recovery of any vehicle's A/C refrigerant. Failure to do so puts the shop's bulk refrigerant at risk of contamination. If the vehicle's A/C refrigerant is contaminated, refer the customer to the service facility that carried out the last A/C service. If the customer wishes to pay the additional cost, use the A/C recovery equipment that is designated for recovering contaminated A/C refrigerant. All contaminated A/C refrigerant must be disposed of as hazardous waste. For all equipment, follow the equipment manufacturer's procedures and instructions.**

NOTICE: **On vehicles being serviced for an internal compressor or desiccant failure, a new suction accumulator or receiver/drier, Thermostatic Expansion Valve (TXV) or evaporator core orifice and any hoses containing mufflers must be installed prior to filtering the Air Conditioning (A/C) system. Internal plumbing of these devices makes it impossible to correctly remove any foreign material. These components are typically discarded after A/C system contamination. Hoses without mufflers can normally be reused unless they are clogged with foreign material. The filter is intended for use on one vehicle only.**

1. **NOTE:** The filter inlet is marked with a label on one side of the filter body.

   Orient the filter inlet toward the A/C condenser core.

2. ***NOTICE:*** **The flexible extension adapters included in the A/C Flush Adapter Kit are designed for low-pressure flushing and are not designed for use with a charged refrigerant system. Do**

not make the condenser fitting connections using the flexible extension adapters or damage to the adapters and loss of refrigerant will occur.

NOTE: The F8VZ-19E773-AB pancake filter is not permanently installed and will be removed at the end of this procedure.

Disconnect the condenser outlet fitting and temporarily install the pancake filter between the 2 halves of the fitting.

- Use flexible R-134a service hoses of 17,238 kPa (2,500 psi) burst rating.
- Make the connections using the correct adapters from the A/C Flush Adapter Kit and/or A/C Flush and Purge Fitting Kit.

3. Lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to Refrigerant Oil Adding in this section.

4. Evacuate and charge the refrigerant system. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

5. Check all refrigerant system hoses, lines and the position of the newly installed filters to be sure they do not interfere with other engine compartment components. If necessary, use tie straps to make adjustments.

6. Provide adequate airflow to the front of the vehicle (with a fan, if necessary). Select A/C operation and set the blower motor speed to maximum. Start the engine and let it idle briefly. Make sure the A/C system is operating correctly.

7. Using a scan tool, command the idle to gradually bring the engine up to 1,200 rpm by running it at lower rpms for short periods (first at 800 rpm, then at 1,000 rpm). Set the engine at 1,200 rpm and run it for one hour with the A/C system operating.

8. Stop the engine.

9. Recover the refrigerant. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

10. Remove the adapters, flexible hoses and pancake filter from between the condenser and the condenser to evaporator tube.

11. Discard the pancake filter. It can be used one time only.

12. Reconnect the condenser outlet fitting.

13. Evacuate, charge and leak-test the refrigerant system. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

Refrigerant Oil Adding

Special Tool(s)

 ST3057-A	R-134a Loop/Add On Injector Kit-Set 219-00069 or equivalent

Material

Item	Specification
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B

Refrigerant Oil Adding

NOTE: During normal A/C operation, oil is circulated through the system with the refrigerant, and a small amount is retained in each component. If certain components of the system are removed, some of the PAG oil will go with the component. To maintain the original total oil charge, it is necessary to compensate for the oil lost by adding oil to the system with the new part.

1. Refer to the chart below for refrigerant oil adding amounts and methods of installation.

Component	PAG Oil Amount	Method of Adding
A/C Compressor	Refer to Adding Refrigerant Oil After A/C Compressor Replacement	Add or remove directly through A/C compressor low-side port before installation.
Suction Accumulator or Receiver/Drier	Refer to Adding Refrigerant Oil After New Suction Accumulator or Receiver/Drier Replacement	Add directly to suction accumulator inlet port or inject to low-side service port during system charging.
Evaporator Core	45 ml (1.5 fl oz) added to the amount collected during refrigerant recovery	Add directly to evaporator core inlet tube or inject to low-side service port during system charging.
Condenser Core	60 ml (2 fl oz) added to the amount collected during refrigerant recovery	Add directly to condenser core inlet or inject to low-side service port during system charging.
Evaporator Core Orifice or Thermostatic Expansion Valve (TXV)	The amount collected during refrigerant recovery	Inject to low-side service port during system charging.
A/C Pressure Relief Valve	60 ml (2 fl oz) added to the amount collected during refrigerant recovery	Inject to low-side service port during system charging.

Refrigerant Hose/Line	60 ml (2 fl oz) added to the amount collected during refrigerant recovery [a]	Inject to low-side service port during system charging.
O-ring Leak Repair	60 ml (2 fl oz) added to the amount collected during refrigerant recovery [b]	Inject to low-side service port during system charging.
Service Port Leak Repair	60 ml (2 fl oz) added to the amount collected during refrigerant recovery	Inject to low-side service port during system charging.

[a] If an excessive amount of PAG oil is lost due to a hose rupture/separation or other damage, the total system PAG oil capacity must be added.
[b] The amount specified may be used for one or multiple O-ring leak repairs. Do not multiply the PAG oil amount by the number of O-ring leaks being repaired.

Adding Refrigerant Oil After A/C Compressor Replacement

Service A/C compressors shipped without clutch and pulley

1. Rotate the old A/C compressor shaft 6 to 8 revolutions while collecting oil in a clean measuring device.
    - If the amount of oil drained from the old A/C compressor is between 85-142 ml (3-5 oz), pour the same amount plus 30 ml (1 oz) of clean PAG Refrigerant Compressor Oil (R-134a Systems) (YN-12-D) WSH M1C231-B or equivalent into the new A/C compressor.
    - If the amount of oil that was removed from the old A/C compressor is greater than 142 ml (5 oz), pour the same amount drained of clean PAG Refrigerant Compressor Oil (R-134a Systems) or equivalent into the new A/C compressor.
    - If the amount of oil that was removed from the old A/C compressor is less than 85 ml (3 oz), pour 85 ml (3 oz) of clean A/C Refrigerant Compressor Oil (R-134a Systems) or equivalent into the new A/C compressor.

Service A/C compressors shipped with clutch and pulley

2. Rotate the old A/C compressor shaft 6 to 8 revolutions while collecting oil in a clean measuring device.
    - If the amount of oil drained from the old A/C compressor is less than 89 ml (3 oz), remove 118 ml (4 oz) from the new A/C compressor.
    - If the amount of oil drained from the old A/C compressor is 89 ml (3 oz), remove 89 ml (3 oz) from the new A/C compressor.
    - If the amount of oil drained from the old A/C compressor is 118 ml (4 oz), remove 59 ml (2 oz) from the new A/C compressor.
    - If the amount of oil drained from the old A/C compressor is 148 ml (5 oz), remove 29 ml (1 oz) from the new A/C compressor.
    - If the amount of oil drained from the old A/C compressor is greater than 148 ml (5 oz), remove 0 ml (0 oz) from the new A/C compressor.

Adding Refrigerant Oil After New Suction Accumulator or Receiver/Drier Replacement

NOTE: This refrigerant oil adding method is to be used when a new suction accumulator or receiver drier only has been installed. If a new A/C compressor and evaporator core orifice or Thermostatic Expansion Valve (TXV) have also been installed due to system contamination, refer to the appropriate heading.

1. Drill one 12.7 mm (1/2 in) hole in the old suction accumulator or receiver/drier cylinder and drain the oil into a clean measuring cup.

2. Add the same quantity of new PAG oil, plus the amount collected during refrigerant recovery and 60 ml (2 fl oz).

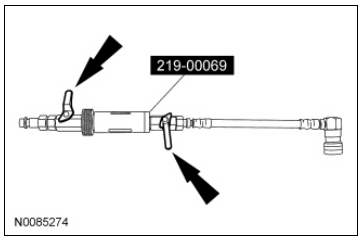
Adding Refrigerant Oil After Multiple Component Replacement After A/C System Contamination

NOTE: This refrigerant oil adding method is to be used when a new A/C compressor, suction accumulator or receiver drier and evaporator core orifice or TXV have been installed due to system contamination and the A/C system has been flushed.

1. If the new A/C compressor is shipped with a new clutch and pulley already installed, remove the shipping caps and rotate the new A/C compressor shaft 6 to 8 revolutions while collecting the oil in a clean measuring cup.

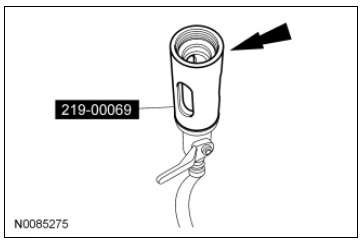
2. Add 60 ml (2 fl oz) directly to the new A/C compressor suction port.

3. Inject the total vehicle PAG oil capacity minus 60 ml (2 fl oz) to the low-side service port during system charging. For the total PAG oil capacity specification, refer to the Specifications table in this section.



Oil Injection Using a Dye/Lubricant Injector

NOTE: If fluorescent leak detection dye is also to be added during A/C charging, the dye may be added to the dye/lubricant injector, from the R-134a Loop/Add On Injector Kit-Set, along with the PAG oil.



1. Evacuate the refrigerant system. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

2. Assemble the dye/lubricant injector and the correct adapters from the R-134a Loop/Add On Injector Kit-Set to match the amount of refrigerant compressor oil to be injected.

3. Verify that all the valves on the dye/lubricant injector are closed.

4. Fill the dye/lubricant injector with the correct amount of clean, new PAG oil.

5. Install the dye/lubricant injector between the low-side service gauge port valve and the refrigerant service station or manifold gauge set.

6. Open all valves and charge the refrigerant system. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

Refrigerant Identification Testing

Special Tool(s)

 ST3090-A	Refrigerant Blend Identifier with Printer 198-00012 or equivalent

Refrigerant Identification

1. **NOTE:** A Refrigerant Blend Identifier with Printer must be used to identify gas samples taken directly from the refrigeration system or storage containers prior to recovering or charging the refrigerant system.

   Follow the instructions included with the Refrigerant Blend Identifier with Printer to obtain the sample for testing.

2. The Refrigerant Blend Identifier with Printer will display one of the following:
   - If the purity level of R-134a is 98% or greater by weight, the green PASS LED will light. The weight concentrations of R-134a, R-12, R-22, hydrocarbons and air will be displayed on the digital display.
   - If refrigerant R-134a does not meet the 98% purity level, the red FAIL LED will light and an alarm will sound alerting the user of potential hazards. The weight concentrations of R-134a, R-12, R-22 and hydrocarbons will be displayed on the digital display.
   - If hydrocarbon concentrations are 2% or greater by weight, the red FAIL LED will light, "Hydrocarbon High" will be displayed on the digital display, and an alarm will sound alerting the user of potential hazards. The weight concentrations of R-134a, R-12, R-22 and hydrocarbons will also be displayed on the digital display.

3. The percentage of air contained in the sample will be displayed if the R-134a content is 98% or greater. The Refrigerant Blend Identifier with Printer eliminates the effect of air when determining the refrigerant sample content because air is not considered a contaminant, although air can affect A/C system performance. When the Refrigerant Blend Identifier with Printer has determined that a refrigerant source is pure (R-134a is 98% or greater by weight) and air concentration levels are 2% or greater by weight, it will prompt the user if an air purge is desired.

4. If contaminated refrigerant is detected, repeat the refrigerant identification test to verify that the refrigerant is indeed contaminated.

Contaminated Refrigerant Handling

NOTICE: **If contaminated refrigerant is detected, DO NOT recover the refrigerant into R-134a recovery/recycling equipment. Recovery of contaminated refrigerant will contaminate the recovered refrigerant supply and may damage the recovery/recycling equipment.**

NOTE: A new suction accumulator or receiver/drier must be installed as directed by the A/C system flushing procedure.

1. Recover the contaminated refrigerant using suitable recovery-only equipment designed for capturing and storing contaminated refrigerant only.
    - If this equipment is not available, contact an A/C service facility in the area with the correct equipment to carry out this service.

2. Determine and correct the cause of the customer's initial concern.

3. Flush the A/C system.

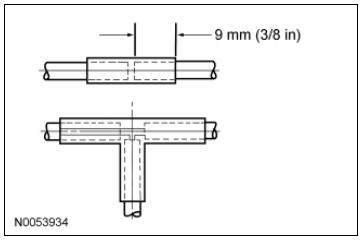
4. Dispose of the contaminated refrigerant in accordance with all federal, state and local regulations.

Vacuum Hose Repair - Mini-Tube

Special Tool(s)

 ST1176-A	Vacuum Pump Kit 416-D002 (D95L-7559-A) or equivalent

1. Measure the length of the damaged area of the mini-tube vacuum hose.



2. Cut a piece of standard 1/8-inch inner diameter vacuum hose approximately 25 mm (1 in) longer than the damaged area of the mini-tube vacuum hose.

3. Cut off the mini-tube vacuum hose on each side of the damaged area.

4. **⚠ WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.**

   Dip the mini-tube hose ends in commercially available paint thinner containing Methyl Ethyl Ketone (MEK). This solvent will seal the mini-tube in the vacuum hose.

5. Insert the ends of the mini-tube vacuum hose approximately 9 mm (3/8 in) into the ends of the standard 1/8-inch repair vacuum hose section.

6. Shake the repair joint after assembly to make sure the solvent is dispersed and the vacuum line is not plugged.

7. Test the system for a vacuum leak in the repair area.
   - Use the Vacuum Pump Kit or equivalent.

Air Conditioning (A/C) Odor Treatment

Special Tool(s)

 ST2940-A	Flexible Applicator Tool 258-00004

Material

Item	Specification
A/C Cooling Coil Coating YN-29	-

⚠ WARNING: Carry out this procedure in a well-ventilated area with all vehicle windows and doors opened. Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION, seek medical advice. On Ford/Motorcraft products in the USA or Canada call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS), if available. Failure to follow these instructions may result in serious personal injury.

NOTE: There are typically 4 types of objectionable odors found in a vehicle:

- Chemical odors
- Environmental odors
- Human and other interior-generated odors
- Microbiological odors

Before determining that A/C odor treatment is required, the source and the circumstances under which the odor occurs must be determined.

NOTE: Chemical odors are usually constant regardless of the climate control system setting although they may be enhanced by A/C operation. Most chemical odors are caused by fluid leaks or incorrectly cured adhesives. Chemical odors can be eliminated by repairing the leaking component and removing any residue.

NOTE: Environmental odors usually occur for a short time and diminish after the vehicle passes through the affected area. These odors are typically only detected when the vehicle windows are open, or when the climate control system is operating in a mode that allows for fresh air. Environmental odors cannot be eliminated because they are external in source, but they may be minimized by switching to a climate control setting that uses recirculated air.

NOTE: Human and other interior-generated odors occur while the source is present and may linger for a short time after. These odors may be more noticeable during A/C operation. Human odors may be eliminated by removing the source and cleaning the affected area.

NOTE: Microbiological odors, if in the A/C system, usually last for about 30 seconds after the system is turned on. They will be detected while the A/C is turned on and using either outside or recirculated air. Microbiological odors that occur in areas other than the A/C system (for example, water in doors or wet carpeting) may last indefinitely and will be more intense when recirculated air is used. Microbiological odors

will not be present at temperatures at or below 10°C (50°F).

Microbiological odors can be eliminated by removing the source and treating the affected area. Standing water must be allowed to drain and dry out. A/C systems may be treated by using A/C cooling coil coating as described in the service procedure below.

Microbiological odors result from microbial growth supported by warm temperatures and moisture. Microbiological odors are described as musty/mildew type smells and may occur on/in:

- foam seals.
- rubber seals.
- adhesives.
- standing water.
- water soaked carpet/trim.

1. Identify the type of odor present in the vehicle. Do not proceed with A/C odor treatment if the odor source is found to be outside of the A/C system. Refer to the following chart for examples.

Odor Source	Odor Description
Chemical Odors	
Coolant	Sweet smell
Fuel	Gasoline or diesel fuel smell
Oil	Oil type or burning smell
Power Steering Fluid	Oil type or burning smell
Transmission Fluid	Oil type or burning smell
Washer Fluid	Alcohol type smell
Gear Lube	Garlic/sulfur smell
Refrigerant Oil	Ether type smell
Carpet/trim Adhesives	Fishy, urine or sweet smell
Evaporator Core Coating	Wet cement type smell
Environmental Odors	
Exhaust	Exhaust, fuel or burning type smell
Industrial Pollutants	Various smells
Dust	Musty, mildew or wet cement type smell
Pollen	Sweet smell
Tobacco	Burning, tar smell
Human and Other Interior Generated Odors	
Body Secretions	Body odor
Perfuming Agents	Sweet or fragrance smell
Clothing	Musty, mildew or body odors
Food/Beverage	Sweet, musty, mildew or fishy smell
Microbiological Odors	
Microbiological Odors Occurring Inside of A/C System	Musty, mildew smell lasting about 30 seconds after A/C is turned on
Microbiological Odors Occurring Outside of A/C System	Musty, mildew smell lasting indefinitely and possibly more pronounced when using recirculated air

2. Identify the source of the odor.
    - Check the evaporator core drain tube for restriction.
    - Check the passenger and driver side carpet for moisture. If moisture is found, A/C odor treatment is not necessary. Diagnose for a water leak as needed.
    - Check the blower motor and blower motor cover (if equipped) for moisture resulting from water bypassing the cowl baffling system. If moisture is found, A/C odor treatment is not necessary. Diagnose for a water leak as needed.
    - Check the cowl top panel and air inlet screen for standing water or foreign material. If possible, remove any standing water and clean the air inlet screen using a wet/dry vacuum.

3. Open all vehicle windows and doors.

4. Make sure that the A/C is off.

5. Set the following.
    - Select PANEL mode (A/C off).
    - Adjust the temperature setting to full warm.
    - Adjust the blower motor speed to HI.

6. Run the engine for 25 minutes to dry out the A/C system.

7. Turn the ignition OFF.

8. Remove the blower motor.

9. **NOTE:** Blower motor speed controls that are mounted outside of the evaporator core housing and not exposed to the blower motor airflow do not need to be removed.

   Remove the blower motor resistor (if equipped) or blower motor speed control (if equipped and exposed to the inside of the evaporator core housing).

10. ***NOTICE:*** **To avoid damage to the vehicle interior, do not spill or spray this product on any interior surface.**

    Add one full bottle of A/C cooling coil coating to the Flexible Applicator Tool.

11. Insert the nozzle into the evaporator housing and direct the spray toward the evaporator core face. Spray the entire evaporator core face until empty.

12. Install the blower motor and blower motor resistor (if equipped) or blower motor speed control (if equipped).

13. Repeat Steps 4 through 6 to cure the evaporator core coating.

Material

Item	Specification	Fill Capacity
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B	266 ml (9 fl oz) (without auxiliary climate control)

Air Conditioning

The A/C system is a clutch cycling orifice tube type. The system components include the following:

- A/C compressor
- A/C condenser core
- A/C evaporator core
- Suction accumulator
- Connecting refrigerant lines

The A/C system operation is controlled by the following:

- Evaporator core orifice tube
- A/C cycling switch
- A/C compressor pressure relief valve
- A/C pressure transducer

The A/C system incorporates an A/C compressor controlled by the PCM through an A/C clutch relay.

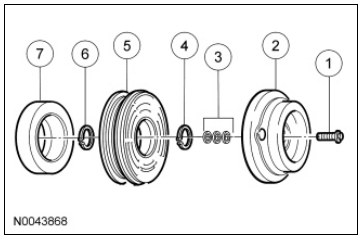
The A/C cycling switch senses evaporator core pressure to control A/C compressor operation.

An evaporator core orifice tube is installed in the condenser-to-evaporator line to meter the liquid refrigerant into the evaporator core.

The A/C compressor clutch will only be engaged by the PCM if all of the following conditions are met:

- The climate control assembly or HVAC module is set to a mode which provides an A/C request to the PCM.
- The A/C cycling switch is reading an acceptable evaporator core pressure.
- The A/C pressure transducer is reading an acceptable pressure in the high side of the refrigerant system.
- The engine coolant temperature is not excessively high.
- The PCM has not detected a Wide Open Throttle (WOT) condition.

An A/C compressor pressure relief valve is installed in the compressor to protect the refrigerant system against excessively high refrigerant pressures.



A/C Compressor and Clutch Assembly

NOTE: Internal FS18/FS20 A/C compressor components are not serviced separately. The A/C compressor is serviced only as an assembly. The clutch disc and hub, A/C compressor pulley and bearing, and clutch field coil are serviceable.

The FS18/FS20 A/C compressor has the following characteristics:

- A non-serviceable shaft seal
- A pressure relief valve is installed in the rear of the compressor to protect the refrigerant system against excessively high refrigerant pressures

- The A/C compressor uses PAG oil or equivalent. This oil contains special additives required for the A/C compressor
- The A/C compressor oil may have some slightly dark-colored streaks while maintaining normal lubricant properties. This is normal for this A/C compressor because of break-in wear that can discolor the oil
- Use standard oil matching procedures when installing new compressors

Item	Part Number	Description
1	W711877	A/C clutch bolt
2	19D786	A/C clutch disc and hub
3	19D648	A/C clutch disc and hub spacers
4	N805338	A/C compressor pulley snap ring
5	19D784	A/C compressor pulley
6	W711883	A/C clutch field coil snap ring (FS20 only)
7	19D798	A/C clutch field coil

When battery voltage is applied to the A/C clutch field coil, the clutch disc and hub assembly is drawn toward the A/C compressor pulley. The magnetic force locks the clutch disc and hub assembly and the A/C compressor pulley together as one unit, causing the compressor shaft to rotate. When battery voltage is removed from the A/C clutch field coil, an annular ring in the clutch disc and hub assembly moves the clutch disc away from the A/C compressor pulley.

A/C Pressure Relief Valve

NOTE: If the A/C compressor is operating within limits and the A/C pressure relief valve is venting, or if the A/C pressure relief valve is leaking around the threads, replace the A/C pressure relief valve and O-ring. If the A/C pressure relief valve still vents after it is replaced, diagnose the refrigerant system for a restriction.

An A/C compressor pressure relief valve is installed in the compressor to relieve unusually high refrigerant system discharge pressure buildups. The compressor pressure relief valve will avoid total refrigerant loss by closing after the excessive pressure has been relieved.

The A/C pressure relief valve is a separate component and can be replaced separately from the A/C compressor. It is necessary to recover the refrigerant before removing the A/C pressure relief valve.

Condenser Core

The condenser is an aluminum fin and tube design heat exchanger, located in front of the vehicle radiator. It cools compressed refrigerant gas by allowing air to pass over fins and tubes to extract heat and by condensing gas to liquid refrigerant as it is cooled.

Evaporator Core

NOTE: If an evaporator core leak is suspected, the evaporator core must be vacuum leak tested before it is removed from the vehicle.

The evaporator core is an aluminum plate/fin type and is located in the heater core and evaporator core housing. A mixture of refrigerant and oil enters the bottom of the evaporator core through the evaporator core inlet tube and continues out of the evaporator core through the evaporator core outlet tube. Air from the blower motor is cooled and dehumidified as it flows through the evaporator core fins.

Evaporator Core Orifice

NOTE: A new evaporator core orifice should be installed whenever a new A/C compressor is installed.

The evaporator core orifice is located in the condenser-to-evaporator line, and can be removed through an access fitting. The evaporator core orifice provides a restriction to the flow of refrigerant from the high-pressure side of the refrigerant system and separates the low-pressure and high-pressure sides of the refrigerant system.

Suction Accumulator

NOTE: Installation of a new suction accumulator is not required when repairing the A/C system, except when there is physical evidence of contamination from a failed A/C compressor or damage to the suction accumulator. Damage to the suction accumulator includes leaks in the suction accumulator, physical damage to the suction accumulator shell or desiccant, or moisture contamination. Moisture contamination results only from a complete loss of refrigerant, and equalization of the refrigerant system pressure with atmospheric pressure for a period longer than 1 hour. If even a slight amount of positive refrigerant pressure is present in the refrigerant system before repairs are carried out, the suction accumulator should not be replaced.

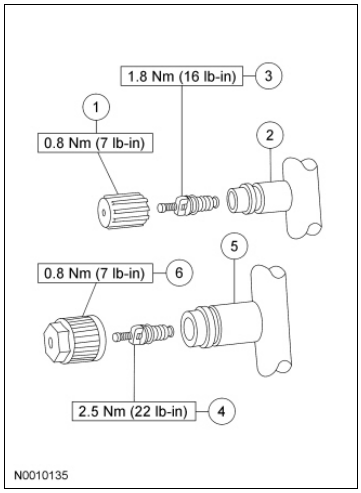
The suction accumulator is located at the RH rear of the engine compartment. The suction accumulator is used to prevent residual liquid refrigerant from reaching the A/C compressor after leaving the evaporator core. The suction accumulator allows the accumulated heavier liquid refrigerant and oil mixture to re-enter the compressor suction line at a controlled rate. A desiccant bag is mounted inside the canister to absorb any moisture in the refrigerant system.

A/C Cycling Switch

The A/C cycling switch is used to prevent icing of the evaporator core by cycling OFF the A/C compressor clutch when the suction pressure in the low-pressure side of the refrigerant system drops below acceptable levels. When the A/C cycling switch circuit is open, the PCM will disengage the A/C compressor clutch.

The A/C cycling switch is installed on a Schrader-type valve core fitting on the suction accumulator. It is not necessary to recover the refrigerant before removing the A/C cycling switch.

A/C Pressure Transducer



The A/C pressure transducer is used by the PCM to monitor the discharge pressure in the high-pressure side of the refrigerant system. When the A/C pressure transducer is reading a discharge pressure above acceptable levels, the PCM will disengage the A/C compressor clutch.

The A/C pressure transducer is installed on a Schrader-type valve core fitting on the compressor-to-condenser discharge line. It is not necessary to recover the refrigerant before removing the A/C pressure transducer.

Service Gauge Port Valves

The high-pressure service gauge port valve is located on the compressor-to-condenser discharge line.

The low-pressure service gauge port valve is located on the suction accumulator.

Item	Part Number	Description
1	19D702	A/C charging valve cap
2	-	Low-pressure service gauge port valve
3	19D701	Low-pressure Schrader-type valve
4	19D701	High-pressure Schrader-type valve
5	-	High-pressure service gauge port valve
6	19D702	A/C charging valve cap

The fitting is an integral part of the A/C line or component.

- Special couplings are required for both the high-side and low-side service gauge ports.
- A very small amount of leakage will always be detectable around the Schrader-type valve with the service gauge port valve cap removed, and is considered normal. A new Schrader-type valve core can be installed if the seal leaks excessively.
- The service gauge port valve caps are used as primary seals in the refrigerant system to prevent leakage through the Schrader-type valves from reaching the atmosphere. Always install and tighten the A/C service gauge port valve caps to the correct torque after they are removed.

Refrigerant System Dye

Fluorescent refrigerant system dye is added to the refrigerant system at the factory to assist in refrigerant system leak diagnosis using a Rotunda-approved UV blacklight. It is not necessary to add additional dye to the refrigerant system before diagnosing leaks, even if a significant amount of refrigerant has been removed from the system. Replacement suction accumulators are shipped with a fluorescent dye "wafer" included in the desiccant bag which will dissolve after approximately 30 minutes of continued A/C operation. It is not necessary to add dye after flushing or filtering the refrigerant system because a new suction accumulator is installed as part of the flushing or filtering procedure. Additional refrigerant system dye should only be added if more than 50% of the refrigerant system lubricant capacity has been lost due to a fitting separation, hose rupture or other damage.

Air Distribution and Filtering

Air Distribution

NOTE: The air distribution system of this vehicle cannot be equipped with a cabin air filter.

There are 2 sources of air available to the air distribution system:

- Outside air
- Recirculated air

Recirculated air is used in OFF and is available in all modes except DEFROST and FLOOR/DEFROST.

Air distribution on vehicles equipped with dual-zone Electronic Automatic Temperature Control (EATC) is determined by the HVAC module in the AUTOMATIC mode but can be overridden by the driver if desired.

There are 4 independently actuated airflow mode doors used to direct airflow within the heater core and evaporator core housing and the plenum chamber. Vacuum control motors are used to position these airflow mode doors.

Vehicles with dual-zone EATC use a partitioned heater core and evaporator core housing assembly with 2 separate temperature blend doors. This allows individual temperature settings to be selected for the RH and LH air outlets. The airflow mode doors are not partitioned. Therefore, the airflow mode for the RH and LH outlets will remain similar in all modes, regardless of the temperature settings.

The air distribution system is designed to provide airflow from the defroster duct when no vacuum is applied to any of the vacuum control motors. This is done to prevent a situation where defrost cannot be obtained due to a system vacuum leak.

Air enters the passenger compartment from the:

- instrument panel A/C registers.
- floor ducts.
- windshield defroster duct.
- side window demisters.
- center flow-through console.

Passenger compartment air is exhausted from the vehicle through open windows or body air vents located at the rear lamp assemblies.

Control Components

Manual Climate Control

The manual climate control components are used to select:

- air inlet source (outside or recirculated).
- blower motor speed.
- discharge air temperature (temperature blend).
- discharge air location (defrost, panel, floor).
- A/C compressor operation.

Control System Inputs

The climate control assembly has 3 system control inputs.

Climate Control Assembly

The climate control assembly integrates the temperature control switch, A/C request button and rear defog switch into a single unit.

The temperature control switch setting determines air temperature. Temperature selection is accomplished with a potentiometer (temperature control switch) connected to the temperature blend door actuator. Movement of the temperature control switch from COOL (blue) to WARM (red) causes a corresponding movement of the temperature blend door and determines the air discharge temperature that the air distribution system will maintain. The temperature control switch is an integral part of the manual climate control assembly and a new one cannot be separately installed.

The A/C request switch determines A/C compressor operation, except when the function selector switch is in the OFF, MAX, DEFROST or FLOOR/DEFROST positions. The A/C request switch is an integral part of the manual climate control assembly and a new one cannot be separately installed.

The rear defog button signals activation of the heated backlight and heated mirrors. The rear defog button is an integral part of the manual climate control assembly and a new one cannot be separately installed.

Function Selector Switch

The function selector switch combines a vacuum selector valve that determines air distribution and an electrical switch to supply battery voltage to the A/C compressor circuit and the blower motor circuit. When the function selector switch is in the MAX A/C, DEFROST or FLOOR/DEFROST positions, the A/C compressor will be operational regardless of the A/C request switch status.

Blower Motor Switch

The blower motor switch controls blower motor speed by adding or bypassing resistors in the blower motor switch resistor in all function selector switch positions except OFF.

Control System Outputs

The climate control system has 5 system outputs.

Blower Motor Resistor

The blower motor resistor has 3 resistor elements mounted on the resistor board to provide 4 blower motor speeds. Depending on the blower motor switch position, series resistance is added or bypassed in the blower motor circuit to decrease or increase blower motor speed. The blower motor resistor has an overheating device (thermal limiter) that opens the resistor coil when the temperature reaches approximately 184°C (363°F), interrupting the blower motor operation in all speeds except HIGH. The thermal limiter cannot be reset and is not serviceable.

Temperature Blend Door Actuator

The temperature blend door actuator moves the temperature blend door on command from the temperature control switch using a reversible electric motor. The temperature blend door actuator contains an internal controller that will recognize the temperature control switch signal and drive the temperature blend door to the desired position.

The temperature blend door actuator is located on the LH side of the heater core and evaporator core housing.

Vacuum Control Motors

The 4 vacuum control motors move the airflow mode doors to direct system airflow to the vehicle interior as determined by the function selector switch. Vacuum control motors are used to control the:

- air inlet mode door.
- defrost mode door.
- panel mode door.
- floor mode door.

Heater Control Valve Vacuum Switch

The heater control valve vacuum switch applies vacuum to the heater control valve when the temperature blend door is in the full COOL position. The temperature blend door actuates the heater control valve vacuum switch with an arm attached to the RH side of the temperature blend door pivot shaft.

The heater control valve vacuum switch is mounted on the RH side of the heater core and evaporator core housing just below the defrost door vacuum control motor.

Dual-Zone Electronic Automatic Temperature Control (EATC)

The HVAC module analyzes input from the following major sources:

- Temperature, airflow direction and blower selection (made by the vehicle occupants)
- In-vehicle temperature
- Ambient temperature
- Sunload
- Vehicle speed
- Engine coolant temperature

Using these inputs, the HVAC module determines the correct conditions for the following outputs:

- A/C compressor operation
- Blower speed

- LH side temperature blend door position
- RH side temperature blend door position
- Air inlet mode door position
- Defrost mode door position
- Panel mode door position
- Floor mode door position

Control System Inputs

The dual-zone EATC system has 5 control system inputs.

NOTE: If installing a new HVAC module, the new module must be configured for the vehicle. Refer to Section 418-01 .

HVAC Module

The HVAC module has a vacuum fluorescent display for displaying set temperature, airflow direction, blower speed and DTCs. The HVAC module utilizes an On-Board Diagnostic (OBD) feature to supply the technician with DTCs. These DTCs help direct the technician to the inoperative component.

Steering Wheel Audio/Climate Control Switch

The steering wheel audio/climate control switch is located on the right side of the steering wheel. The steering wheel audio/climate control switch allows the driver to adjust the passenger compartment temperature setting and manually override the blower motor speed setting.

Ambient Temperature Sensor

The ambient temperature sensor signal is received by the HVAC module and indicates the outside air temperature. The ambient temperature sensor is located in front of the radiator on the LH side of the radiator support.

The ambient temperature sensor signal is not the sole factor considered by the HVAC module for the outside air temperature display. Therefore, the ambient temperature PID monitored with a scan tool may not exactly match the HVAC module display. For information regarding the HVAC module outside air temperature display, refer to Section 412-00 .

In-Vehicle Temperature Sensor

The in-vehicle temperature sensor contains a thermistor which measures the in-vehicle air temperature and sends that reading to the HVAC module. A hose and elbow is connected between the heater core and evaporator core housing and the in-vehicle temperature sensor. The automatic temperature control sensor hose and elbow takes air from the heater core and evaporator core housing air stream to create a suction in the in-vehicle temperature sensor. The suction draws in-vehicle air into the in-vehicle temperature sensor and across the thermistor.

Solar Radiation Sensor (Sunload Sensor)

The solar radiation sensor supplies information to the HVAC module indicating LH side and RH side sunload.

Control System Outputs

The dual-zone EATC system has 4 control system outputs.

Automatic Temperature Control Solenoid and Manifold

The automatic temperature control solenoid and manifold uses 5 internal solenoid-type valves to distribute vacuum to the vacuum control motors and heater control valve based on the HVAC module settings. Manifold vacuum is always available at the automatic temperature control solenoid and manifold from the vacuum reservoir when the engine is running. The 4 vacuum control motors and the heater control valve vacuum lines are each connected to a separate internal solenoid. The HVAC module will apply voltage to the desired solenoids to open the solenoid to the manifold vacuum supply and complete the vacuum circuit to the desired component.

Blower Motor Speed Control

The blower speed control converts low power signals from the HVAC module to a high current, variable ground feed for the blower motor. A delay function is used to provide a gradual increase or decrease in blower motor speed under all conditions.

Temperature Blend Door Actuators

The dual-zone EATC system uses 2 temperature blend door actuators to control 2 separate temperature blend doors. The temperature blend doors independently vary the LH side and RH side temperature settings, as desired. The temperature blend door actuators each contain a reversible electric motor and a potentiometer. The HVAC module applies a 5-volt signal to one end of the potentiometer and ground to the other. The potentiometer wiper is connected to the actuator output shaft and moves with the output shaft. The voltage available at the wiper indicates the position of the temperature blend door. The actuator wiper voltage is sent to the HVAC module which drives the actuator motor in whichever direction is necessary to make the actuator wiper voltage agree with the expected HVAC module wiper voltage value.

Vacuum Control Motors

The 4 vacuum control motors move the airflow mode doors to direct system airflow to the vehicle interior as determined by the function selector switch. Vacuum control motors are used to control the:

- air inlet door.
- defrost mode door.
- panel mode door.
- floor mode door.

Heating and Ventilation

The heating and ventilation system has the following features:

- Controls the temperature and, during A/C operation, reduces the relative humidity of the air inside the vehicle.
- Delivers heated or cooled air to maintain the vehicle interior temperature and comfort level.
- Cooling or heating can be adjusted to maintain the desired temperature.
- On vehicles with dual-zone Electronic Automatic Temperature Control (EATC), the temperature can be adjusted individually by the driver and passenger.

Heater Core

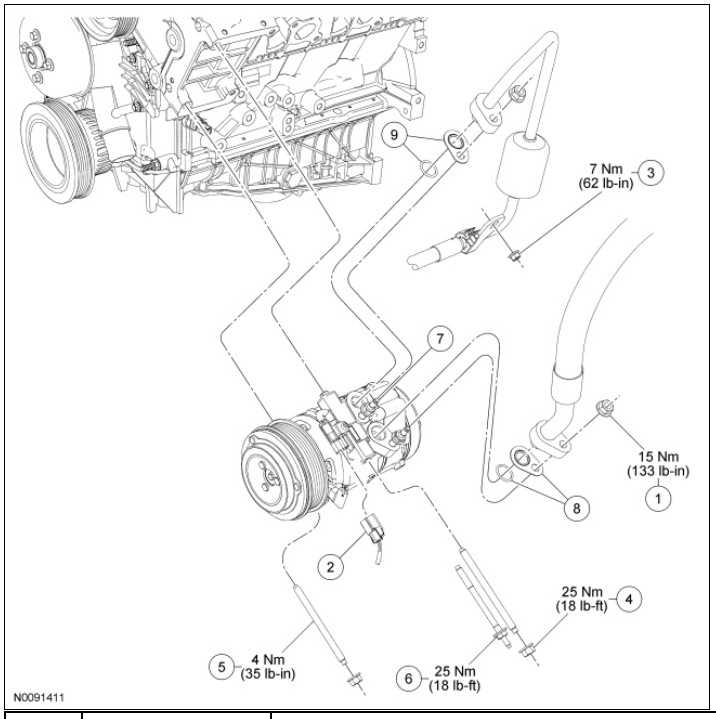
The heater core consists of fins and tubes arranged to extract heat from the engine coolant and transfer it to air passing through the heater core.

Blower Motor

The blower motor pulls air from the air inlet and forces it into the heater core and evaporator core housing and the plenum chamber where it is mixed and distributed.

Heater Control Valve

The heater control valve is actuated by the heater control valve vacuum switch (manual climate control) or the heater control valve vacuum control circuit (Electronic Automatic Temperature Control (EATC)). When the heater control valve is closed (full vacuum), coolant flow through the heater core is shut OFF and A/C cooling efficiency is increased.



Heater Core and Evaporator Core Housing

The heater core and evaporator core housing directs airflow from the blower motor through the evaporator core and heater core. All airflow from the blower motor passes through the evaporator core. The airflow is then directed through or around the heater core by the temperature blend door(s). Vehicles equipped with dual-zone Electronic Automatic Temperature Control (EATC) use a partitioned heater core and evaporator core housing with 2 electric actuator-positioned temperature blend doors. This allows for separate temperatures to be selected for the driver and passenger sides of the passenger compartment. Manual systems use a single electric actuator-positioned temperature blend door to direct airflow through or around the heater core.

Air Conditioning (A/C) Compressor - 4.0L SOHC

Material

Item	Specification
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B

Item	Part Number	Description
1	W520413	A/C compressor fitting nut (2 required)
2	-	Field coil electrical connector (part of 14A280)
3	W520111	Compressor-to-condenser discharge line bracket nut
4	N621939	A/C compressor nut (2 required)
5	W704795	A/C compressor stud (2 required)
6	W707821	A/C compressor bolt
7	19703	A/C compressor
8	19B596	O-ring seal and gasket seal kit
9	19B596	O-ring seal and gasket seal kit

Removal and Installation

NOTICE: **If installing a new Air Conditioning (AC) compressor due to an internal failure of the old unit, the following procedures must be carried out to remove contamination from the A/C system. Failure to remove contamination from the A/C system, if present, will result in poor A/C performance**

and/or damage to the new A/C compressor and other components.

- If A/C flushing equipment is available, carry out flushing of the A/C system prior to installing a new A/C compressor. For additional information, refer to Section 412-00 .
- If A/C flushing equipment is not available, carry out filtering of the A/C system after a new A/C compressor has been installed. For additional information, refer to Section 412-00 .
- Install a new evaporator core orifice and auxiliary Thermostatic Expansion Valve (TXV) (if equipped), as directed by the A/C flushing or filtering procedure.
- Install a new suction accumulator as directed by the A/C flushing or filtering procedure.

NOTE: A new A/C compressor may come equipped with an A/C clutch disc and hub, A/C compressor pulley and A/C clutch field coil already installed. If these components are not pre-installed, it will be necessary to transfer these parts from the old A/C compressor to the new compressor prior to installation of the A/C compressor if suitable for reuse.

NOTE: Installation of a new suction accumulator is not required when repairing the A/C system except when there is physical evidence of system contamination from a failed A/C compressor or damage to the suction accumulator.

1. If flushing of the A/C system has not been carried out, recover the refrigerant. For additional information, refer to Section 412-00 .

2. Remove the drive belt from the A/C compressor pulley.

3. Remove the 2 A/C compressor fitting nuts.
   - Discard the O-ring seals and gasket seals.
   - To install, tighten to 15 Nm (133 lb-in).

4. Disconnect the field coil electrical connector and detach the harness from the A/C compressor stud.

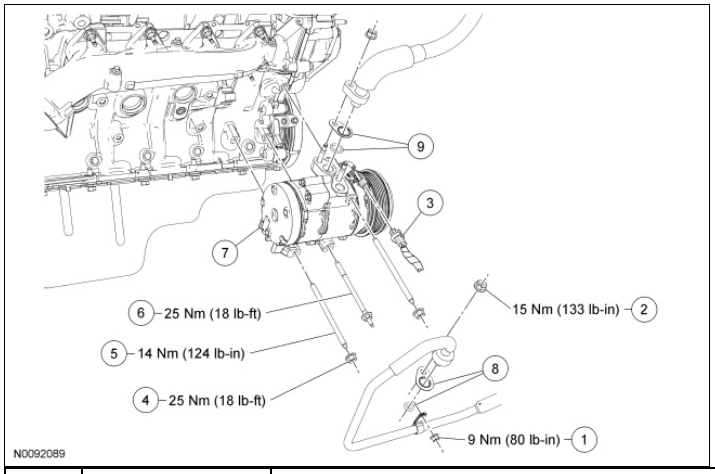
5. Remove the compressor-to-condenser discharge line bracket nut and detach the bracket.
   - To install, tighten to 7 Nm (62 lb-in).

6. Remove the 2 A/C compressor nuts.
   - To install, tighten to 25 Nm (18 lb-ft).

7. Remove the 2 A/C compressor studs.
   - To install, tighten to 4 Nm (35 lb-in).

8. Remove the A/C compressor bolt.
   - To install, tighten to 25 Nm (18 lb-ft).

9. Remove the A/C compressor.



10. To install, reverse the removal procedure.
    - If a new A/C compressor is to be installed, the clutch assembly may need to be transferred from the old unit to the new unit. For additional information, refer to Clutch and Clutch Field Coil in this section.
    - Install new O-ring seals and gasket seals.
    - If filtering of the A/C system is not to be carried out, lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to Section 412-00 .

11. If filtering of the A/C system is not to be carried out, evacuate, leak test and charge the refrigerant system. For additional information, refer to Section 412-00 .

Air Conditioning (A/C) Compressor - 4.6L

Material

Item	Specification
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B

Item	Part Number	Description
1	W520111	Compressor-to-condenser discharge line bracket nut
2	W520413	A/C compressor fitting nut (2 required)
3	-	Field coil electrical connector (part of 14A280)
4	N621939	A/C compressor nut (2 required)
5	W704795	A/C compressor stud (2 required)
6	W707821	A/C compressor bolt
7	19703	A/C compressor
8	19B596	O-ring seal and gasket seal kit
9	19B596	O-ring seal and gasket seal kit

Removal and Installation

NOTICE: **If installing a new Air Conditioning (A/C) compressor due to an internal failure of the old unit, the following procedures must be carried out to remove contamination from the A/C system. Failure to remove contamination from the A/C system, if present, will result in poor A/C performance and/or damage to the new A/C compressor and other components.**

- If A/C flushing equipment is available, carry out flushing of the A/C system prior to installing a new A/C compressor. For additional information, refer to Section 412-00 .
- If A/C flushing equipment is not available, carry out filtering of the A/C system after a new A/C compressor has been installed. For additional information, refer to Section 412-00 .

- Install a new evaporator core orifice and auxiliary Thermostatic Expansion Valve (TXV) (if equipped), as directed by the A/C flushing or filtering procedure.
- Install a new suction accumulator as directed by the A/C flushing or filtering procedure.

NOTE: A new A/C compressor may come equipped with an A/C clutch disc and hub, A/C compressor pulley and A/C clutch field coil already installed. If these components are not pre-installed, it will be necessary to transfer these parts from the old A/C compressor to the new compressor prior to installation of the A/C compressor if suitable for reuse.

NOTE: Installation of a new suction accumulator is not required when repairing the A/C system except when there is physical evidence of system contamination from a failed A/C compressor or damage to the suction accumulator.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. If flushing of the A/C system has not been carried out, recover the refrigerant. For additional information, refer to Section 412-00 .

3. Remove the drive belt from the A/C compressor pulley.

4. Remove the RH front wheel and tire. For additional information, refer to Section 204-04 .

5. Remove the front portion of the RH fender splash shield.

6. Remove the 2 A/C compressor fitting nuts and disconnect the compressor suction fitting.
   - Discard the O-ring seal and gasket seal.
   - To install, tighten to 15 Nm (133 lb-in).

7. Disconnect the field coil electrical connector and detach the wire harness from the A/C compressor stud.

8. Remove the compressor-to-condenser discharge line bracket nut and detach the bracket.
   - To install, tighten to 9 Nm (80 lb-in).

9. Remove the A/C compressor bolt.
   - To install, tighten to 25 Nm (18 lb-ft).

10. Remove the lower rear A/C compressor nut.
    - To install, tighten to 25 Nm (18 lb-ft).

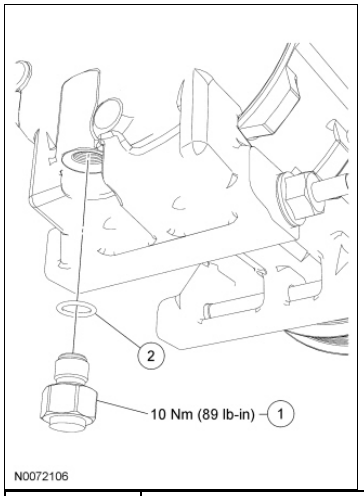
11. Remove the lower rear A/C compressor stud.
    - To install, tighten to 14 Nm (124 lb-in).

12. Remove the upper A/C compressor nut.
    - To install, tighten to 25 Nm (18 lb-ft).

13. Remove the upper A/C compressor stud.
    - To install, tighten to 14 Nm (124 lb-in).

14. **NOTE:** The A/C compressor can be removed through the opening at the RH wheel well.

    Disconnect the A/C compressor discharge fitting and remove the A/C compressor.



- Discard the O-ring seal and gasket seal.

15. To install, reverse the removal procedure.
    - If a new A/C compressor is to be installed, the clutch assembly may need to be transferred from the old unit to the new unit. For additional information, refer to Clutch and Clutch Field Coil in this section.
    - Install new O-ring seals and gasket seals.
    - If filtering of the A/C system is not to be carried out, lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to Section 412-00 .
16. If filtering of the A/C system is not to be carried out, evacuate, leak test and charge the refrigerant system. For additional information, refer to Section 412-00 .

Air Conditioning (A/C) Pressure Relief Valve

Material

Item	Specification
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B

Item	Part Number	Description
1	19D644	A/C compressor pressure relief valve
2	-	O-ring seal (part of 19D644)

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

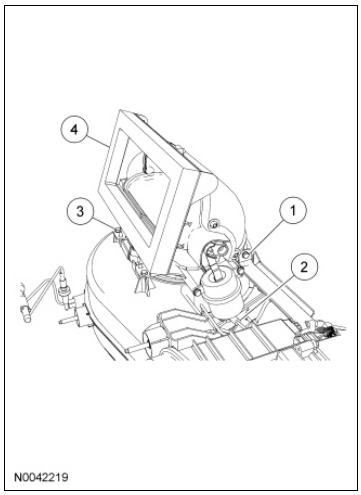
2. Recover the refrigerant. For additional information, refer to Section 412-00 .

3. Remove the A/C compressor pressure relief valve and O-ring seal.
   - To install, tighten to 10 Nm (89 lb-in).

4. **NOTE:** A new O-ring seal will already be installed on the new A/C pressure relief valve service part.

   To install, reverse the removal procedure.

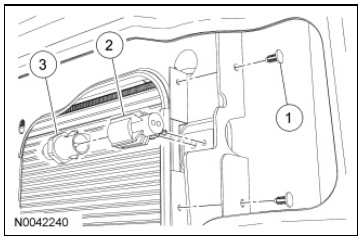
   - Lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to Section 412-00 .



5. Evacuate, leak test and charge the refrigerant system. For additional information, refer to Section 412-00 .

Air Inlet Duct

Removal and Installation

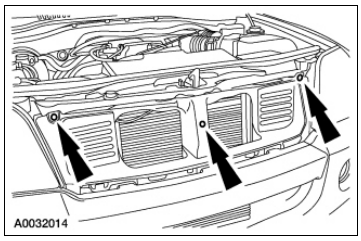


1. Remove the heater core and evaporator core housing. For additional information, refer to Section 412-02 .

2. Remove the air inlet duct.
    1. Remove the support bracket screw.
    2. Disconnect the air inlet door vacuum control motor vacuum connector.
    3. Remove the 3 air inlet duct screws.
    4. Remove the air inlet duct.

3. To install, reverse the removal procedure.

Ambient Air Temperature Sensor



Item	Part Number	Description
1	N806799	Air deflector pin-type retainer (2 required)
2	-	Ambient air temperature sensor electrical connector (part of 14398)
3	12A647	Ambient air temperature sensor

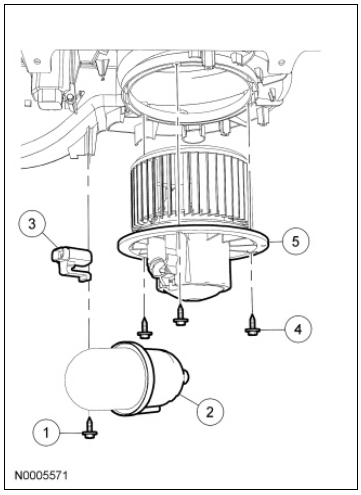
Removal and Installation

Mountaineer

1. Remove the radiator grille. For additional information, refer to Section 501-08 .

2. Remove the pin-type retainers and position the air deflector forward.

3. Remove the 2 air deflector pin-type retainers and detach the air deflector from the 2 locator pins on the radiator support.

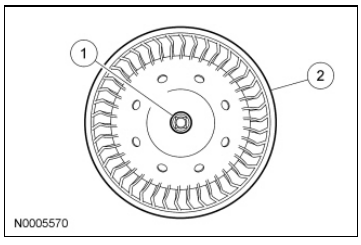


All vehicles

4. Detach the ambient air temperature sensor electrical connector.

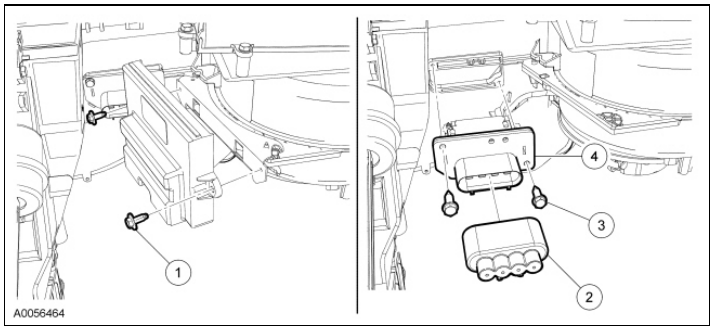
5. Remove the ambient air temperature sensor.

6. To install, reverse the removal procedure.



Blower Motor

Item	Part Number	Description
1	W701696	Vacuum reservoir screw
2	19A566	Vacuum reservoir
3	-	Blower motor electrical connector (part of 14401)
4	W701696	Blower motor screw (3 required)
5	19805	Blower motor

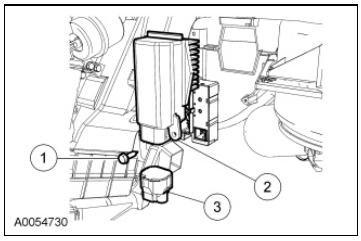


Removal and Installation

1. Remove the vacuum reservoir screw.
2. Position the vacuum reservoir aside.
3. Disconnect the blower motor electrical connector.
4. Remove the 3 blower motor screws.
5. Remove the blower motor.
6. Remove the blower motor wheel from the blower motor.
    1. Remove the push clip.
    2. Remove the blower motor wheel.

7. To install, reverse the removal procedure.

Blower Motor Resistor

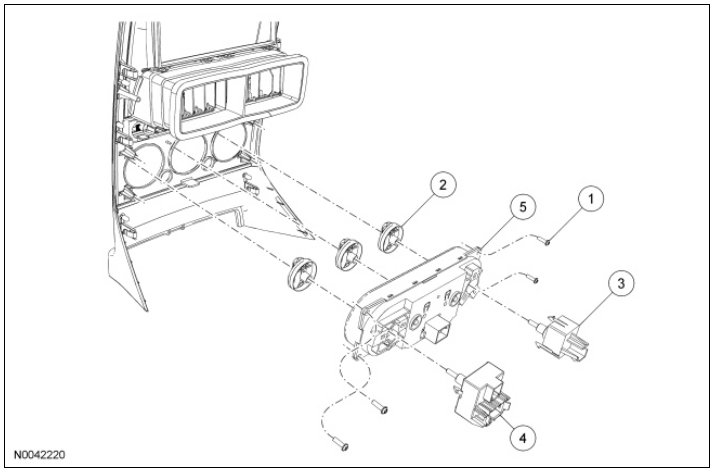


Item	Part Number	Description
1	W705314	4X4 control module screw (2 required)
2	-	Blower motor resistor electrical connector (part of 19C603)
3	W701696	Blower motor resistor screw (2 required)
4	19A706	Blower motor resistor

Removal and Installation

1. Remove the two 4X4 control module screws.
2. Disconnect the blower motor resistor electrical connector.
3. Remove the 2 blower motor resistor screws.
4. Remove the blower motor resistor.
5. To install, reverse the removal procedure.

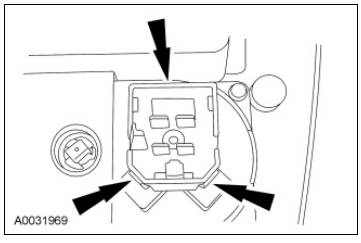
Blower Motor Speed Control



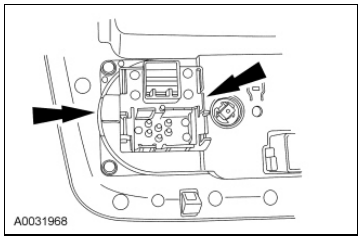
Item	Part Number	Description
1	W701696	Blower motor speed control screw
2	19E624	Blower motor speed control
3	-	Blower motor speed control electrical connector (part of 19C603)

Removal and Installation

1. Remove the blower motor speed control screw.
2. Remove the blower motor speed control.
3. Disconnect the blower motor speed control electrical connector.
4. To install, reverse the removal procedure.



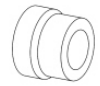
Climate Control Assembly

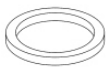


Item	Part Number	Description
1	W701679	Climate control assembly screw (4 required)
2	18519	Climate control knob (3 required)
3	19986	Blower motor switch
4	19B888	Function selector switch
5	19980	Climate control assembly

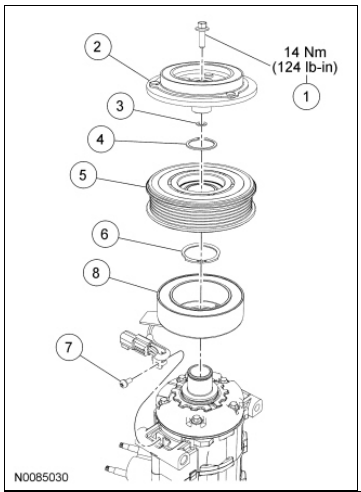
Removal and Installation

1. Remove the center instrument panel finish panel. For additional information, refer to Section 501-12 .
2. Remove the 4 climate control assembly screws.
3. Remove the climate control assembly.
4. Remove the 3 climate control knobs.
5. Depress the tabs and remove the blower motor switch.





6. Depress the tabs and remove the function selector switch.

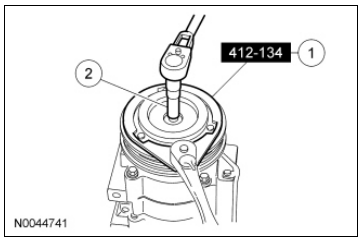


7. To install, reverse the removal procedure.

Clutch and Clutch Field Coil

Special Tool(s)

 ST1232-A	Coil Replacer (FS18 only) 412-065 (T89P-19623-EH)
 ST1233-A	Field Coil Remover (FS18 only) 412-067 (T89P-19623-FH)
 ST1234-A	Field Coil Replacer (FS18 only) 412-078 (T91L-19623-CH)
 ST2946-A	Holding Fixture, Compressor Clutch Disc and Hub 412-134
 ST2382-A	Remover, Compressor Pulley 412-001 (T71P-19703-B)

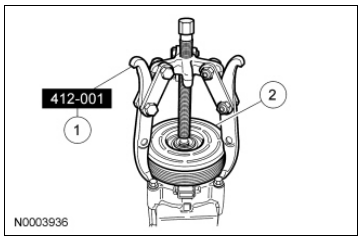


Item	Part Number	Description
1	W711887	A/C clutch disc and hub bolt
2	19D786	A/C clutch disc and hub
3	19D648	A/C clutch disc and hub spacers
4	N805338	A/C compressor pulley snap ring
5	19D784	A/C compressor pulley
6	W711883	A/C clutch field coil snap ring (FS20 only)
7	W710797	A/C clutch field coil electrical connector screw (FS20 only)
8	19D798	A/C clutch field coil

Removal

All vehicles

1. Remove the A/C compressor. For additional information, refer to Air Conditioning (A/C) Compressor - 4.0L SOHC or Air Conditioning (A/C) Compressor - 4.6L in this section.

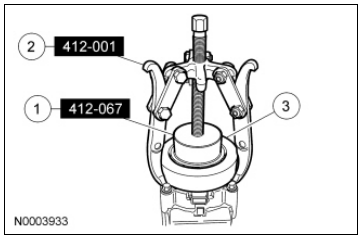


2. Remove the A/C clutch disc and hub bolt.
    1. Hold the A/C clutch disc and hub with the Compressor Clutch Disc and Hub Holding Fixture.
    2. Remove the A/C clutch disc and hub bolt.

3. Remove the A/C clutch disc and hub.

4. Remove the A/C compressor pulley snap ring.

5. Remove the A/C compressor pulley.
    1. Install the Compressor Pulley Remover
    2. Remove the A/C compressor pulley.



FS18 compressors only

6. ***NOTICE:*** **Do not use air tools. The Air Conditioning (A/C) clutch field coil can be easily damaged.**

   Remove the A/C clutch field coil.

    1. Install the Field Coil Remover.
    2. Install the Compressor Pulley Remover.
    3. Remove the A/C clutch field coil.

FS20 compressors only

7. Remove the A/C clutch field coil snap ring.

8. Remove the A/C clutch field coil electrical connector screw.

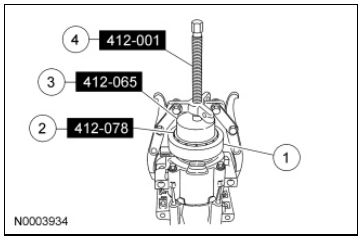
9. Remove the A/C clutch field coil.

Installation

NOTE: If installing a new A/C compressor, the A/C clutch components should be reused unless obvious signs of damage are found. If excessive grooving is found, a new A/C clutch disc and hub and A/C compressor pulley must be installed together. Otherwise, each component can be installed individually where needed.

All vehicles

1. Visually inspect the A/C clutch disc and hub, A/C compressor pulley and A/C clutch field coil for damage.
    - Inspect for physical damage, including cracked or melted components or discoloration due to excessive heat.
    - Inspect for excessive wear, including grooving in the A/C clutch disc and hub or A/C compressor pulley that is more than fingernail depth.
    - Inspect for roughness in the A/C compressor pulley bearing.



2. Clean the A/C clutch field coil and pulley mounting surfaces.

FS18 compressors only

3. ***NOTICE:*** **Do not use air tools. The Air Conditioning (A/C) clutch field coil can be easily damaged.**

   Install the A/C clutch field coil.

    1. Place the A/C clutch field coil on the A/C compressor with the A/C clutch field coil electrical connector correctly positioned.
    2. Place the Field Coil Replacer on the A/C clutch field coil.
    3. Place the Coil Replacer 412-065 on the Field Coil Replacer 412-078.
    4. Use the Compressor Pulley Remover to install the A/C clutch field coil.

FS20 compressors only

4. Install the A/C clutch field coil.

5. Install the A/C clutch field coil electrical connector screw.

6. Install the A/C clutch field coil snap ring.

All vehicles

7. **NOTE:** The A/C clutch pulley is a tight fit on the A/C compressor head. It must be correctly aligned during installation.

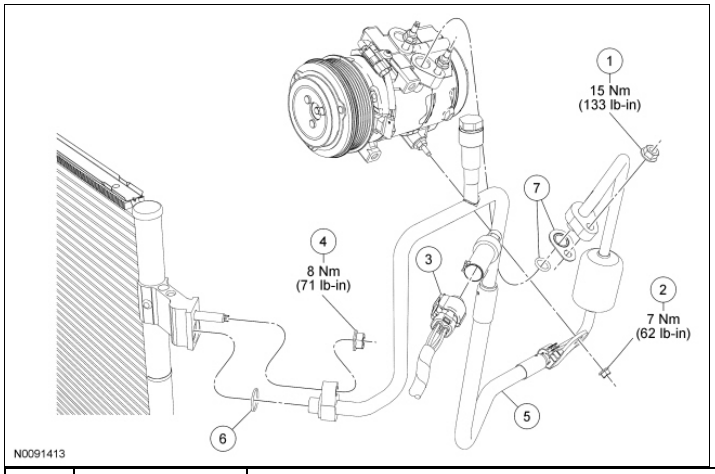
   Install the A/C clutch pulley.

8. Install the A/C clutch pulley snap ring with the bevel side out.

9. Place one nominal thickness A/C clutch disc and hub spacer inside the clutch hub spline opening.

10. Install the A/C clutch disc and hub assembly.

11. Install the A/C clutch disc and hub bolt.
    1. Hold the A/C clutch disc and hub with the Compressor Clutch Disc and Hub Holding Fixture.
    2. Install the A/C clutch disc and hub bolt.
    - Tighten to 14 Nm (124 lb-in).



12. Measure and adjust the clutch air gap by removing or adding A/C clutch hub spacers.

13. Install the A/C compressor. For additional information, refer to Air Conditioning (A/C) Compressor - 4.0L SOHC or Air Conditioning (A/C) Compressor - 4.6L in this section.

Compressor to Condenser Discharge Line - 4.0L SOHC

Material

Item	Specification
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B

Item	Part Number	Description
1	W520413	Compressor discharge fitting nut
2	W520111	Compressor-to-condenser discharge line bracket nut
3	-	A/C pressure transducer electrical connector (part of 14398)
4	W520413	Condenser inlet fitting nut
5	19972	Compressor-to-condenser discharge line
6	19E889	O-ring seal (2 required)
7	19B596	O-ring seal and gasket seal kit

Removal and Installation

1. Recover the refrigerant. For additional information, refer to Section 412-00 .

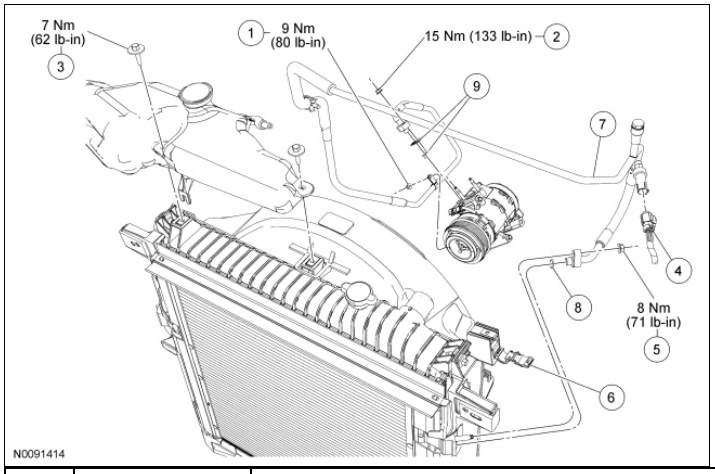
2. Remove the compressor-to-condenser discharge line bracket nut and detach the bracket.
   - To install, tighten to 7 Nm (62 lb-in).

3. Remove the compressor discharge fitting nut and disconnect the fitting.
   - Discard the O-ring seal and gasket seal.
   - To install, tighten to 15 Nm (133 lb-in).

4. Disconnect the A/C pressure transducer electrical connector.

5. Remove the condenser inlet fitting nut and disconnect the fitting.
    - Discard the O-ring seal.
    - To install, tighten to 8 Nm (71 lb-in).

6. Remove the compressor-to-condenser discharge line.



7. To install, reverse the removal procedure.
    - Install a new gasket seal and O-ring seals.
    - Lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to Section 412-00 .

8. Evacuate, leak test and charge the refrigerant system. For additional information, refer to Section 412-00 .

Compressor to Condenser Discharge Line - 4.6L

Material

Item	Specification
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B

Item	Part Number	Description
1	W520111	Compressor-to-condenser discharge line bracket nut
2	W520413	A/C compressor discharge fitting nut
3	W709027	Coolant expansion tank bolt (2 required)
4	-	Pressure transducer electrical connector (part of 14398)
5	W520413	Condenser inlet fitting nut
6	19N704	Compressor-to-condenser discharge line clip (2 required)
7	19972	Compressor-to-condenser discharge line
8	19E889	O-ring seal and gasket seal kit
9	19B596	O-ring seal and gasket seal kit

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Recover the refrigerant. For additional information, refer to Section 412-00 .
3. Remove the Air Cleaner (ACL) and ACL outlet tube. For additional information, refer to Section 303-12 .
4. Remove the compressor-to-condenser discharge line bracket nut and detach the bracket.

- To install, tighten to 9 Nm (80 lb-in).

5. Remove the compressor outlet fitting nut and disconnect the fitting.
   - Discard the O-ring seal and gasket seal.
   - To install, tighten to 15 Nm (133 lb-in).

6. Remove the 2 coolant expansion tank bolts and position the coolant expansion tank aside.
   - To install, tighten to 7 Nm (62 lb-in).

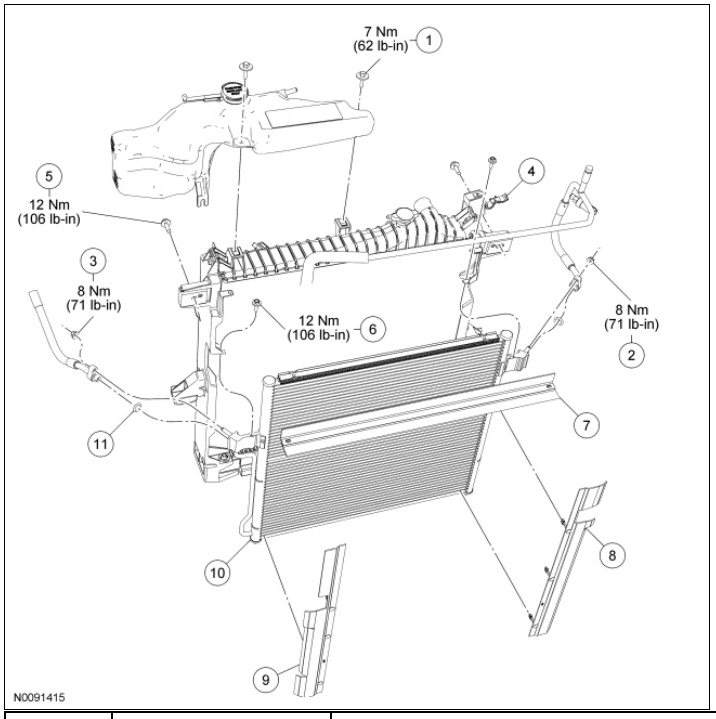
7. Disconnect the A/C pressure transducer electrical connector.

8. Remove the condenser inlet fitting nut and disconnect the fitting.
   - Discard the O-ring seal.
   - To install, tighten to 8 Nm (71 lb-in).

9. **NOTE:** The LH clip should be disconnected from the line. The RH clip should be disconnected from the cooling module.

   Detach the 2 compressor-to-condenser discharge line clips at the cooling module.

10. Remove the compressor-to-condenser discharge line.



11. To install, reverse the removal procedure.
    - Install a new gasket seal and O-ring seals.
    - Lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to Section 412-00 .

12. Evacuate, leak test and charge the refrigerant system. For additional information, refer to Section 412-00 .

Condenser Core

Material

Item	Specification
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B

Item	Part Number	Description
1	W709027	Coolant expansion tank bolt (2 required)
2	W520413	Condenser inlet fitting nut
3	W520413	Condenser outlet fitting nut
4	19N704	Compressor-to-condenser discharge line clip
5	W709390	Cooling module bolt (2 required)
6	W711343	Condenser bolt (2 required)
7	19E572	Upper radiator air deflector
8	19E572	LH condenser air deflector
9	19E572	RH condenser air deflector
10	19712	Condenser core
11	19E889	O-ring seal (2 required)

Removal and Installation

1. Recover the refrigerant. For additional information, refer to Section 412-00 .

2. Remove the Air Cleaner (ACL). For additional information, refer to Section 303-12 .

3. Remove the 2 coolant expansion tank bolts and position the coolant expansion tank aside.
   - To install, tighten to 7 Nm (62 lb-in).

4. Disconnect the A/C pressure transducer electrical connector.

5. Remove the condenser inlet fitting nut and disconnect the fitting.
   - Discard the O-ring seal.
   - To install, tighten to 8 Nm (71 lb-in).

6. Remove the condenser outlet fitting nut and disconnect the fitting.
   - Discard the O-ring seal.
   - To install, tighten to 8 Nm (71 lb-in).

7. Detach the 2 compressor-to-condenser discharge line clips.

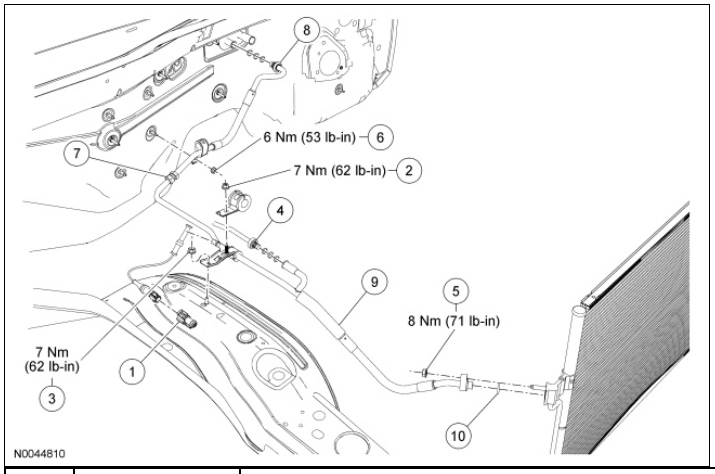
8. Remove the 2 cooling module bolts and position the cooling module rearward.
   - To install, tighten to 12 Nm (106 lb-in).

9. Remove the upper radiator air deflector.

10. Remove the 2 condenser core bolts.
    - To install, tighten to 12 Nm (106 lb-in).

11. Remove the condenser core.

12. Remove the 2 condenser air deflectors.



13. To install, reverse the removal procedure.
    - Install new O-ring seals.
    - Lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to Section 412-00 .

14. Evacuate, leak test and charge the refrigerant system. For additional information, refer to Section 412-00 .

Condenser to Evaporator Line

Material

Item	Specification
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B

Item	Part Number	Description
1	-	Wheel speed sensor electrical connector (part of 14398)
2	W707137	Suction accumulator-to-compressor line bracket nut
3	N621905	Condenser-to-evaporator line bracket nut
4	-	Auxiliary evaporator inlet line fitting (part of 19835) (if equipped)
5	W520413	Condenser outlet fitting nut
6	W705760	A/C line bracket nut
7	-	Evaporator core orifice access fitting (part of 19835)
8	-	Evaporator inlet fitting (part of 19835)
9	19835	Condenser-to-evaporator line
10	19E889	O-ring seal (7 required)

Removal and Installation

All vehicles

1. Remove the Air Cleaner (ACL) and ACL outlet tube. For additional information, refer to Section 303-12 .

2. Recover the refrigerant. For additional information, refer to Section 412-00 .

3. Remove the PCM and PCM bracket. For additional information, refer to Section 303-14 .

4. Disconnect the RH wheel speed sensor electrical connector and detach the wire harness from the condenser-to-evaporator line bracket.

Vehicles equipped with 4.6L engine

5. Remove the suction accumulator-to-compressor line bracket nut.
    - To install, tighten to 7 Nm (62 lb-in).

All vehicles

6. Disconnect the evaporator core orifice access fitting.
    - Discard the O-ring seal.

7. Remove the condenser-to-evaporator line bracket nut.
    - To install, tighten to 7 Nm (62 lb-in).

8. Remove the condenser outlet fitting nut and disconnect the fitting.
    - Discard the O-ring seal.
    - To install, tighten to 8 Nm (71 lb-in).

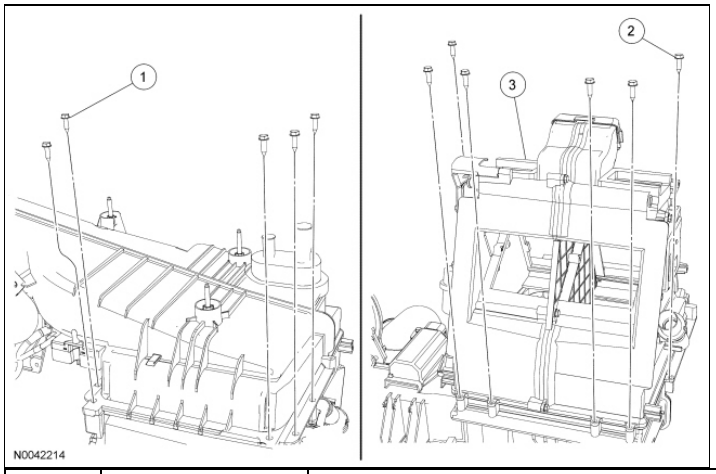
9. Disconnect the auxiliary evaporator inlet line fitting (if equipped).
    - Discard the O-ring seals.

10. Remove the front portion of the condenser-to-evaporator line.

11. Remove the A/C line bracket nut at the dash panel and detach the bracket.
    - To install, tighten to 6 Nm (53 lb-in).

12. Disconnect the evaporator inlet fitting.
    - Discard the O-ring seals.

13. Remove the rear portion of the condenser-to-evaporator line.



14. To install, reverse the removal procedure.
    - Install new O-ring seals.
    - Lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to Section 412-00 .

15. Evacuate, leak test and charge the refrigerant system. For additional information, refer to Section 412-00 .

Evaporator Core

Material

Item	Specification
RTV Silicone Sealant TA-31	-

Item	Part Number	Description
1	W701696	Outer evaporator core cover screw (5 required)
2	W701696	Inner evaporator core cover screw (6 required)
3	-	Evaporator core cover (part of 19850)

Removal and Installation

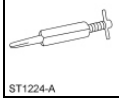
NOTE: If an evaporator core leak is suspected, the evaporator core must be vacuum leak tested before it is removed from the vehicle. For additional information, refer to Section 412-00 .

1. Remove the heater core. For additional information, refer to Heater Core in this section.

2. Remove the 5 outer evaporator core cover screws.

3. Remove the 6 inner evaporator core cover screws.

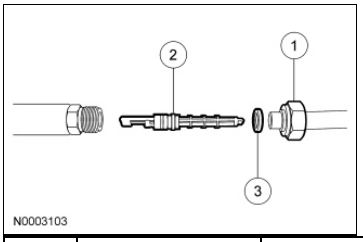
4. Separate the evaporator core cover from the heater core and evaporator core housing.
   - Discard the rope seal.



5. Remove the evaporator core.

6. To install, reverse the removal procedure.
   - Apply a bead of RTV sealant around the entire evaporator core housing groove joint in place of the rope seal.
   - Tighten the evaporator core cover screws in a diagonal pattern to distribute the RTV sealant

evenly.



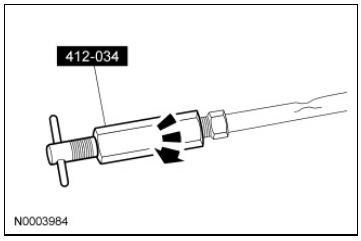
Evaporator Core Orifice

Special Tool(s)

 ST1223-A	Remover, Broken Orifice 412-035 (T83L-19990-B)
 ST1224-A	Remover/Installer, Fixed Orifice 412-034 (T38L-19990-A)

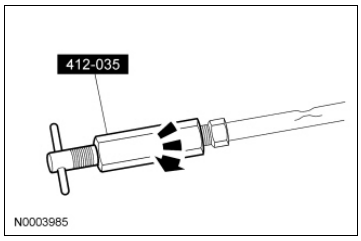
Material

Item	Specification
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B



Item	Part Number	Description
1	-	Evaporator core orifice access fitting (part of 19835)
2	19D990	Evaporator core orifice
3	19E889	O-ring

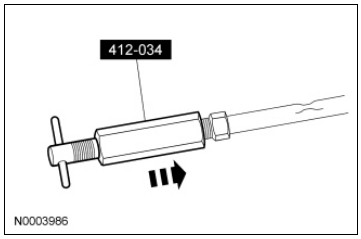
Removal



1. Recover the refrigerant. For additional information, refer to Section 412-00 .
2. **NOTE:** The evaporator core orifice access fitting is located in the condenser-to-evaporator line below the powertrain control module.

   Disconnect the evaporator core orifice access fitting.

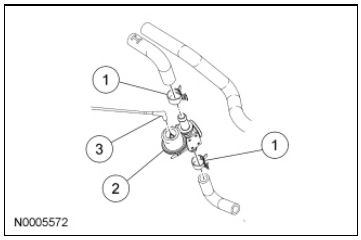
   - Discard the O-ring seal.
3. Inspect the evaporator core orifice for damage before attempting to remove it from the line.
4. If the evaporator core orifice is intact, engage the Fixed Orifice Remover/Installer. Hold the T-handle stationary while rotating the tool body to remove the evaporator core orifice.



5. If the evaporator core orifice is broken, screw the end of the Broken Orifice Remover into the broken orifice. Hold the T-handle stationary while rotating the tool body to remove the evaporator core orifice.

Installation

1. Lubricate the evaporator core orifice O-rings with clean PAG oil and install the evaporator core orifice using the Fixed Orifice Remover/Installer.



2. Install a new O-ring seal and connect the evaporator core orifice access fitting.
   - To install, tighten to 18 Nm (159 lb-in).

3. Lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to Section 412-00 .

4. Evacuate, leak test and charge the refrigerant system. For additional information, refer to Section 412-00 .

Heater Control Valve

Item	Part Number	Description
1	8287	Inlet and outlet hose clamps (2 required)
2	18495	Heater control valve
3	-	Heater control valve vacuum connector (part of 18C581)

Removal and Installation

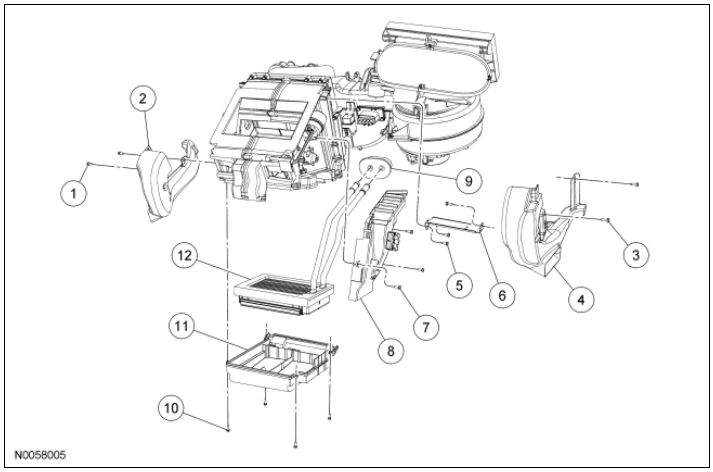
Vehicles with 4.0L and oil cooler, without auxiliary climate control

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

All vehicles

2. Drain the engine coolant. For additional information, refer to Section 303-03 .
3. Disconnect the 2 inlet and outlet heater hose clamps.
4. Disconnect the heater control valve vacuum hose.

Vehicles with 4.0L and oil cooler, without auxiliary climate control



5. Remove the heater control valve bolt.

All vehicles

6. Remove the heater control valve.
7. **NOTE:** Lubricate the coolant hoses with plain water only if needed.

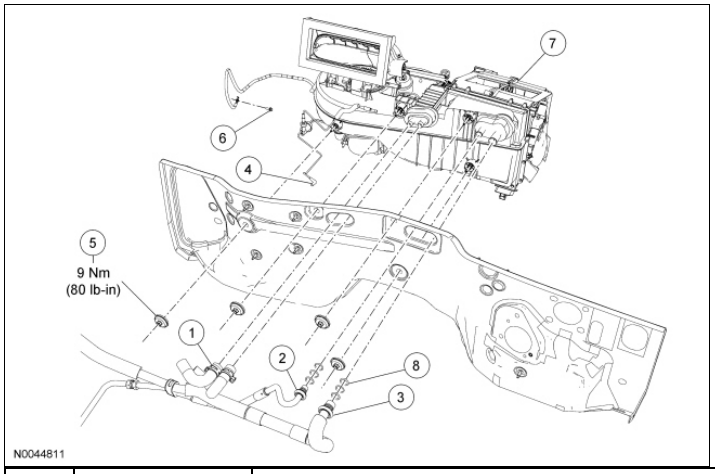
   To install, reverse the removal procedure.
8. Fill the engine cooling system. For additional information, refer to Section 303-03 .

Heater Core

Item	Part Number	Description
1	W701696	LH floor duct screw (2 required)
2	18C433	LH floor duct
3	W701696	RH floor duct screw (2 required)
4	18C433	RH floor duct
5	W701696	Housing brace screw (3 required)
6	19C897	Housing brace
7	W701696	Heater tube cover screw (3 required)
8	18N332	Heater tube cover
9	18658	Heater tube seal
10	W701696	Heater core cover screw (4 required)
11	18B299	Heater core cover
12	18476	Heater core

Removal and Installation

NOTE: If a heater core leak is suspected, the heater core must be pressure leak tested before it is removed from the vehicle.



1. Remove the heater core and evaporator core housing. For additional information, refer to Heater Core And Evaporator Core Housing in this section.
2. Remove the 2 LH floor duct screws.
3. Remove the LH floor duct.
4. Remove the 2 RH floor duct screws.
5. Remove the RH floor duct.
6. Remove the 3 housing brace screws.

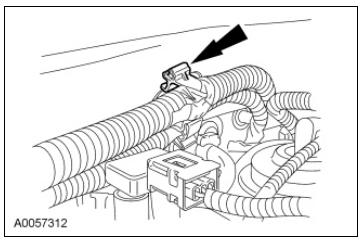
7. Remove the housing brace.
8. Remove the 3 heater tube cover screws.
9. Remove the heater tube cover.
10. Remove the heater tube seal.
11. Remove the 4 heater core cover screws.
12. Remove the heater core cover.
13. Remove the heater core.
14. To install, reverse the removal procedure.

Heater Core And Evaporator Core Housing

Material

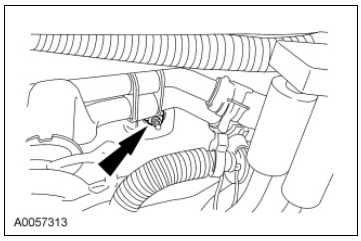
Item	Specification
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B

Item	Part Number	Description
1	8287	Heater hose clamp (2 required) (part of 18C553)
2	-	Evaporator inlet fitting (part of 19835)
3	-	Evaporator outlet fitting (part of 19835)
4	-	Vacuum connector (2 required) (part of 18C581)
5	W708206	Heater core and evaporator core housing nut (4 required)
6	W706287	Ground terminal bolt
7	19850	Heater core and evaporator core housing
8	19E889	O-ring seal (6 required)



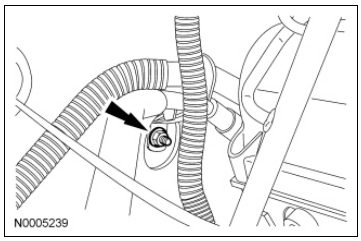
Removal and Installation

NOTE: If an evaporator core leak is suspected, the evaporator core must be vacuum leak tested before it is removed from the vehicle.



NOTE: Lubricate the coolant hoses with plain water only if needed.

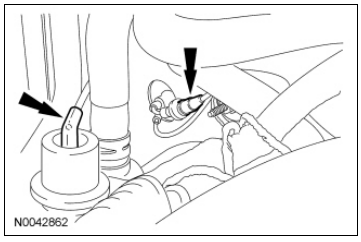
1. Recover the refrigerant. For additional information, refer to Section 412-00 .
2. Drain the engine coolant. For additional information, refer to Section 303-03 .
3. Remove the instrument panel. For additional information, refer to Section 501-12 .



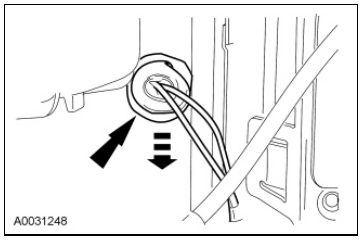
4. Detach the wiring harness bracket and position the harness aside.

5. Remove the heater tube bracket nut.

6. Remove the dash panel A/C line bracket nut.
    - To install, tighten to 11 Nm (97 lb-in).



7. Disconnect the 2 heater hose clamps at the heater core.



8. Disconnect the evaporator inlet fitting.
    - Discard the O-ring seals.

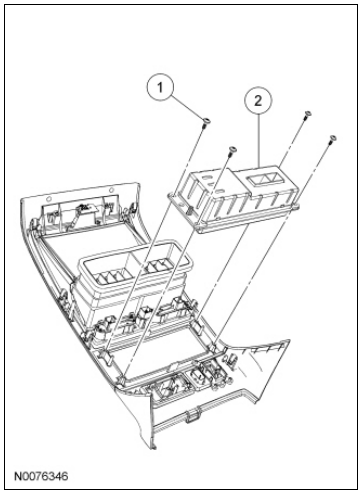
9. Disconnect the evaporator outlet fitting.
    - Discard the O-ring seals.

10. Disconnect the 2 vacuum connectors.

11. Detach the grommet and push the vacuum lines into the passenger compartment.

12. Remove the 4 heater core and evaporator core housing nuts.
    - To install, tighten to 9 Nm (80 lb-in).

13. Disconnect the ground terminal bolt.



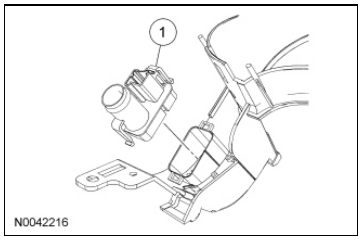
14. Remove the heater core and evaporator core housing.

15. To install, reverse the removal procedure.
    - Install new O-ring seals.
    - Lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to Section 412-00 .

16. Fill and the engine cooling system. For additional information, refer to Section 303-03 .

17. Evacuate, leak test and charge the refrigerant system. For additional information, refer to Section 412-00 .

Heating Ventilation Air Conditioning (HVAC) Module



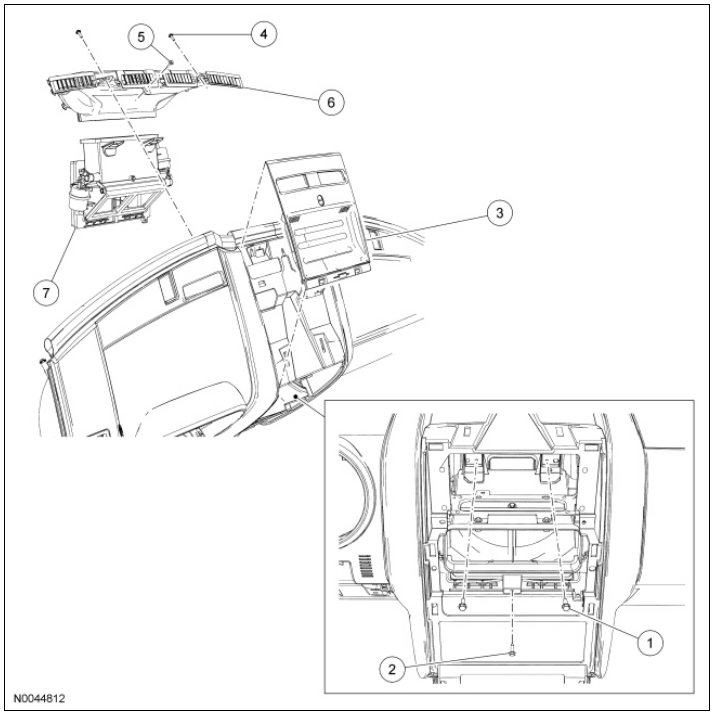
Item	Part Number	Description
1	W701679	HVAC module screw (4 required)
2	19980	HVAC module

Removal and Installation

NOTE: If installing a new HVAC module, the new module must be configured for the vehicle. For additional information, refer to Section 418-01 .

1. Remove the center instrument panel finish panel. For additional information, refer to Section 501-12 .
2. Remove the 4 HVAC module screws.
3. Remove the HVAC module.
4. To install, reverse the removal procedure.

In-Vehicle Temperature Sensor



Item	Part Number	Description
1	19C734	In-vehicle temperature sensor

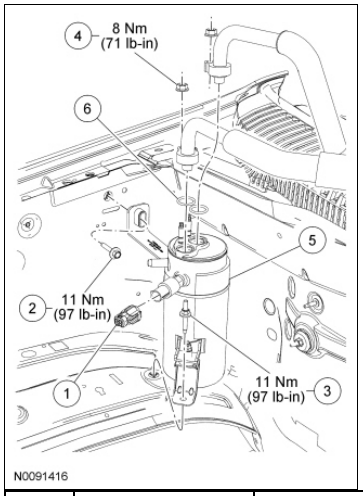
Removal and Installation

1. Remove the instrument cluster finish panel. For additional information, refer to Section 501-12 .
2. Remove the in-vehicle temperature sensor.
3. To install, reverse the removal procedure.

Plenum Chamber

Item	Part Number	Description
1	W707628	Upper plenum chamber screw (2 required)
2	W707281	Lower plenum chamber screw
3	78044A92	Instrument panel upper finish panel
4	W707281	Outer defroster duct screw (2 required)
5	W707628	Center defroster duct screw
6	18490	Defroster duct
7	18471	Plenum chamber

Removal and Installation



1. Remove the instrument panel. For additional information, refer to Section 501-12 .
2. Remove the Audio Control Module (ACM). For additional information, refer to Section 415-00 .
3. Remove the 3 plenum chamber screws.
4. Remove the instrument panel upper finish panel.
5. Remove the 3 defroster duct screws.
6. Remove the defroster duct.
7. Remove the plenum chamber.

8. To install, reverse the removal procedure.

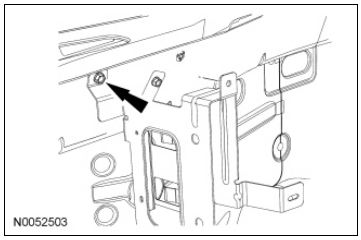
Suction Accumulator

Material

Item	Specification
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B

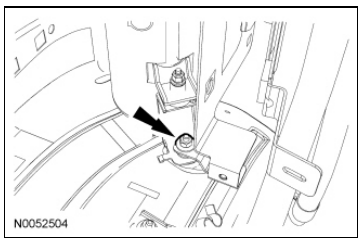
Item	Part Number	Description
1	-	A/C cycling switch electrical connector (part of 14398)
2	W711973	Suction accumulator bolt
3	W711897	Suction accumulator stud
4	W703845	Suction accumulator fitting nut (2 required)
5	19C836	Suction accumulator
6	19E889	O-ring seal (2 required)

Removal and Installation



NOTICE: **Care must be taken to minimize exposure of the inside of the suction accumulator to outside air. If multiple Air Conditioning (A/C) system components are being removed and installed, the suction accumulator should be installed last. The suction accumulator shipping caps should not be removed until the fittings are ready to be connected. Evacuation of the A/C system must be started as soon as the suction accumulator is installed. Excessive exposure of the inside of the suction accumulator to outside air will result in moisture contamination of the suction accumulator desiccant.**

NOTE: Installation of a new suction accumulator is not required when repairing the A/C system, except when there is physical evidence of contamination from a failed A/C compressor or damage to the suction accumulator. Damage to the suction accumulator includes leaks in the suction accumulator, physical damage to the suction accumulator shell or desiccant, or moisture contamination. Moisture contamination results only from a complete loss of refrigerant, and equalization of the refrigerant system pressure with atmospheric pressure for a period longer than 1 hour. If even a slight amount of positive refrigerant pressure is present in



the refrigerant system before repairs are carried out, the suction accumulator should not be replaced.

All vehicles

1. Recover the refrigerant. For additional information, refer to Section 412-00 .
2. Remove the PCM. For additional information, refer to Section 303-14 .
3. Disconnect the A/C cycling switch electrical connector.
4. Remove the suction accumulator bolt.
   - To install, tighten to 11 Nm (97 lb-in).
5. Remove the PCM bracket bolt.

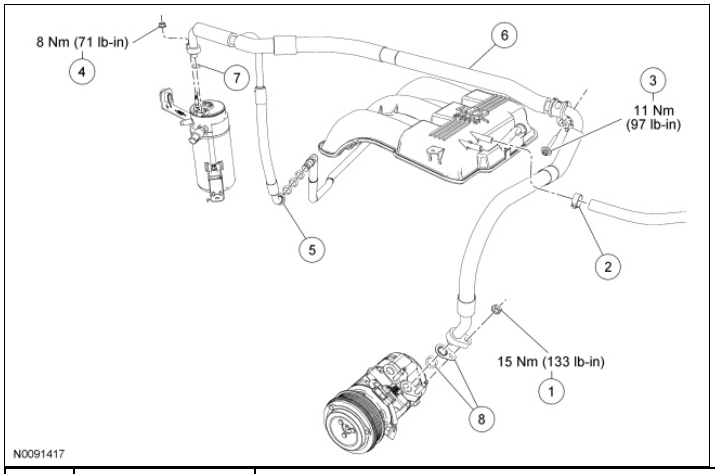
6. Remove the PCM bracket nut and the PCM bracket.

7. Remove the suction accumulator stud.
   - To install, tighten to 11 Nm (97 lb-in).

4.6L vehicles

8. Remove the suction accumulator-to-compressor line bracket nut at the condenser-to-evaporator line bracket.

All vehicles



9. Remove the suction accumulator bracket bolt and suction accumulator.
10. Remove the 2 suction accumulator fitting nuts and disconnect the fittings.
    - Discard the O-ring seals.
    - To install, tighten to 8 Nm (71 lb-in).
11. Remove the suction accumulator.
12. To install, reverse the removal procedure.
    - Install new O-ring seals.
    - Lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to Section 412-00 .

13. Evacuate, leak test and charge the refrigerant system. For additional information, refer to Section 412-00 .

Suction Accumulator to Compressor Line - 4.0L SOHC

Material

Item	Specification
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B

Item	Part Number	Description
1	W520413	Compressor suction fitting nut
2	382984	Brake booster vacuum hose clamp
3	W712189	Suction accumulator-to-compressor line bracket bolt
4	W520413	Suction accumulator outlet fitting nut
5	-	Auxiliary evaporator outlet line fitting (part of 19867)
6	19867	Suction accumulator-to-compressor line
7	19E889	O-ring seal (4 required)
8	19B596	O-ring seal and gasket seal kit

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Recover the refrigerant. For additional information, refer to Section 412-00 .

3. Remove the compressor suction fitting nut and disconnect the fitting.
   - Discard the O-ring seal and gasket seal.
   - To install, tighten to 15 Nm (133 lb-in).

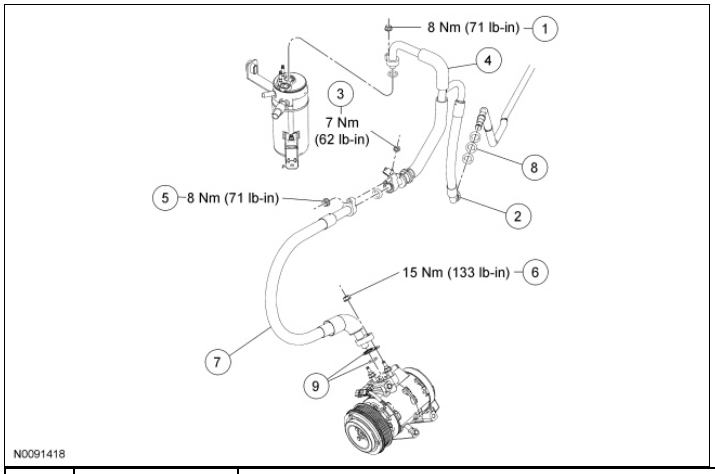
4. Release the brake booster vacuum hose clamp and disconnect the hose.

5. Remove the suction accumulator-to-compressor line bracket bolt at the dash panel.
    - To install, tighten to 11 Nm (97 lb-in).

6. Remove the suction accumulator outlet fitting nut.
    - To install, tighten to 8 Nm (71 lb-in).

7. Disconnect the auxiliary evaporator outlet line fitting (if equipped).
    - Discard the O-ring seals.

8. Remove the suction accumulator-to-compressor line.
    - Discard the O-ring seal.



9. To install, reverse the removal procedure.
    - Install new O-ring seals and a new gasket seal.
    - Lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to Section 412-00 .

10. Evacuate, leak test and charge the refrigerant system. For additional information, refer to Section 412-00 .

Suction Accumulator to Compressor Line - 4.6L

Material

Item	Specification
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B

Item	Part Number	Description
1	W520413	Suction accumulator outlet fitting nut
2	-	Auxiliary evaporator outlet line fitting (part of 19867) (if equipped)
3	W707137	Suction accumulator-to-compressor line bracket nut
4	19867	Rear suction accumulator-to-compressor line
5	W520413	Suction accumulator-to-compressor line middle fitting nut
6	W520413	Compressor suction fitting nut
7	19D742	Front suction accumulator-to-compressor line
8	19E889	O-ring seal (5 required)
9	19B596	O-ring seal and gasket seal kit

Removal and Installation

1. Recover the refrigerant. For additional information, refer to Section 412-00 .

2. Remove the suction accumulator outlet fitting nut.
   - To install, tighten to 8 Nm (71 lb-in).

3. Disconnect the auxiliary evaporator outlet line fitting.
   - Discard the O-ring seals.

4. Remove the suction accumulator-to-compressor line bracket nut.
    - To install, tighten to 7 Nm (62 lb-in).

5. Remove the suction accumulator-to-compressor line middle fitting nut and disconnect the fitting.
    - Discard the O-ring seal.
    - To install, tighten to 8 Nm (71 lb-in).

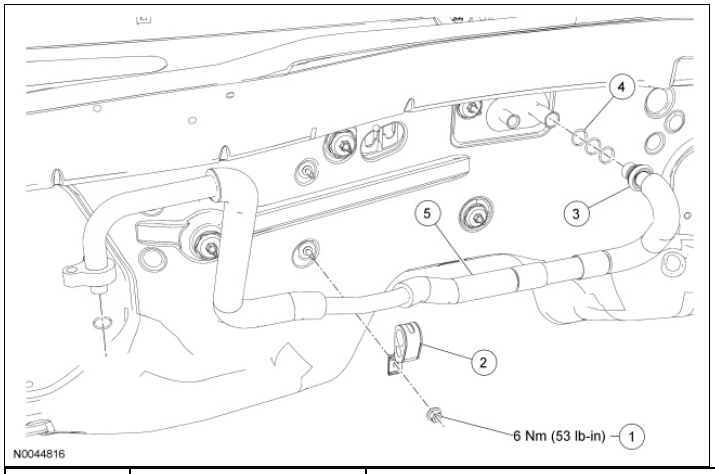
6. Remove the rear suction accumulator-to-compressor line.
    - Discard the O-ring seal.

7. **NOTE:** The compressor suction fitting nut can be accessed through the RH wheel well.

   Remove the compressor suction fitting nut and disconnect the fitting.

    - Discard the O-ring seal and gasket seal.
    - To install, tighten to 15 Nm (133 lb-in).

8. Remove the front suction accumulator-to-compressor line.



9. To install, reverse the removal procedure.
    - Install new O-ring seals and a new gasket seal.
    - Lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to Section 412-00 .

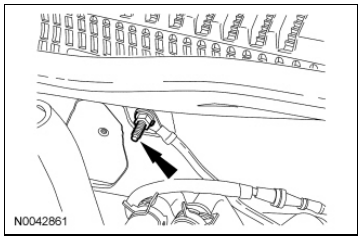
10. Evacuate, leak test and charge the refrigerant system. For additional information, refer to Section 412-00 .

Suction Accumulator To Evaporator Line

Material

Item	Specification
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B

Item	Part Number	Description
1	W705760	A/C line bracket nut
2	19812	A/C line bracket
3	-	Evaporator outlet fitting (part of 19835)
4	19E889	O-ring seal (4 required)
5	19835	Suction accumulator-to-evaporator line

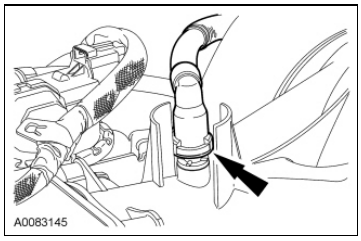


Removal and Installation

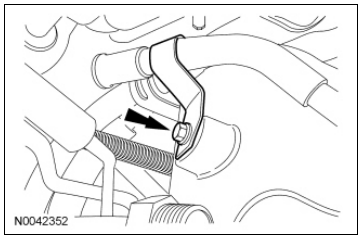
All vehicles

1. Remove the suction accumulator. For additional information, refer to Suction Accumulator in this section.

2. Remove the A/C line bracket nut at the dash panel and remove the A/C line bracket.
   - To install, tighten to 6 Nm (53 lb-in).

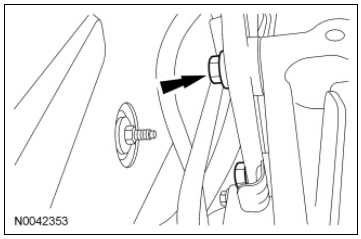


3. Remove the ground strap bolt at the dash panel.



4. Disconnect the evaporator outlet fitting.
    - Discard the O-ring seals.

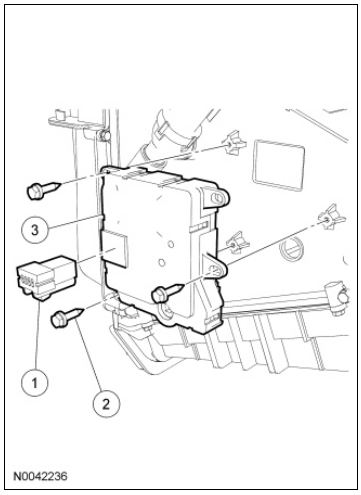
Vehicles with 4.0L engine



5. Disconnect the Evaporative Emission (EVAP) return line fitting at the intake manifold.

6. Remove the fuel line bracket bolt at the rear of the RH valve cover.

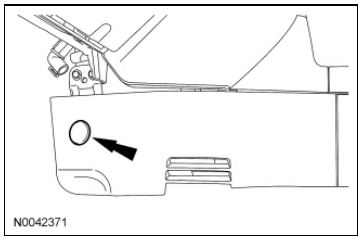
7. Remove the wire harness bolt at the rear of the RH cylinder head.



All vehicles

8. Remove the suction accumulator-to-evaporator line.

9. To install, reverse the removal procedure.
    - Install new O-ring seals.
    - Lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to Section 412-00 .



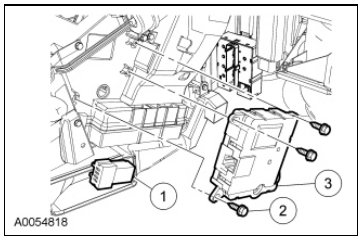
Temperature Blend Door Actuator - LH

Item	Part Number	Description
1	-	LH temperature blend door actuator electrical connector (part of 14401)
2	W701696	LH temperature blend door actuator screw (3 required)
3	19E616	LH temperature blend door actuator

Removal and Installation

1. Remove the LH floor console finish panel.

2. Position the in-vehicle temperature sensor aspirator hose away from the LH temperature blend door actuator.

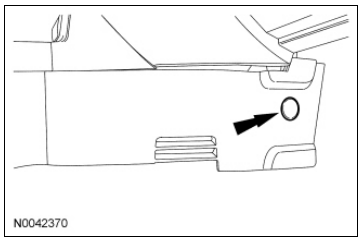


3. Remove the 3 LH temperature blend door actuator screws.

4. Disconnect the LH temperature blend door actuator electrical connector.

5. Remove the LH temperature blend door actuator.

6. To install, reverse the removal procedure.

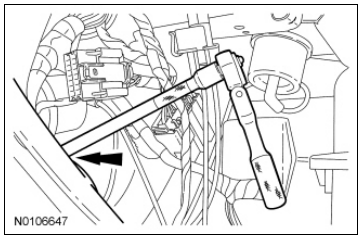


Temperature Blend Door Actuator - RH, EATC

Item	Part Number	Description
1	-	RH temperature blend door actuator electrical connector (part of 14401)
2	W701696	RH temperature blend door actuator screw (3 required)
3	19E616	RH temperature blend door actuator

Removal and Installation

1. Remove the RH floor console finish panel.

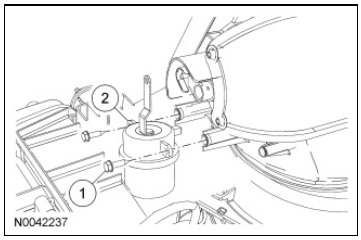


2. Lower the glove compartment.

3. Disconnect the RH temperature blend door actuator electrical connector.

4. **NOTE:** The upper RH temperature blend door actuator screw can be removed using a shallow 1/4-inch drive swivel-type socket and extension.

   Working through the glove compartment opening, remove the upper RH temperature blend door actuator screw.

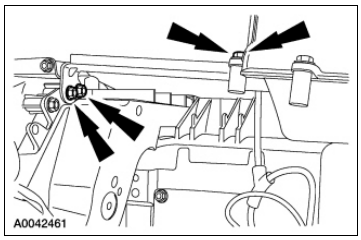


5. Remove the 2 remaining RH temperature blend door actuator screws.

6. Remove the RH temperature blend door actuator.

7. To install, reverse the removal procedure.

Vacuum Control Motor - Air Inlet Door

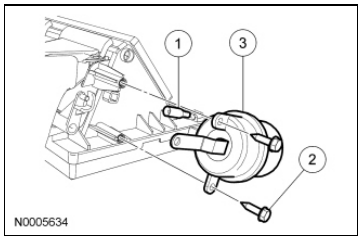


Item	Part Number	Description
1	W701696	Air inlet door vacuum control motor screw (2 required)
2	18A318	Air inlet door vacuum control motor

Removal and Installation

1. Lower the glove compartment.

2. Remove the screws and the heater core and evaporator core housing support brace.

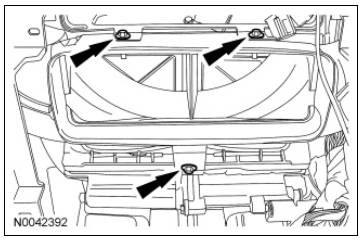


3. Disconnect the air inlet door vacuum control motor vacuum connector.

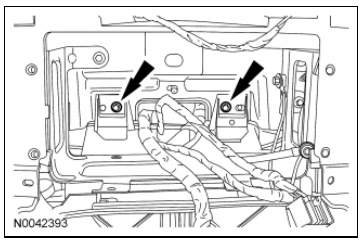
4. Remove the 2 air inlet door vacuum control motor screws.

5. Rotate the air inlet door vacuum control motor until it clears the retaining arm and remove the vacuum control motor.

6. To install, reverse the removal procedure.



Vacuum Control Motor - Defroster Door

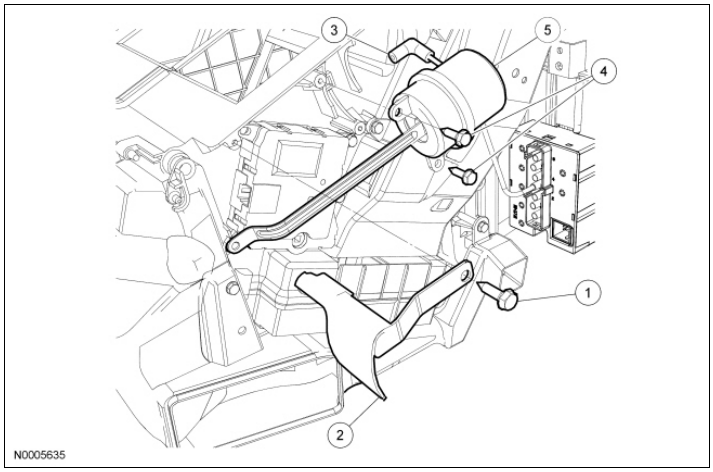


Item	Part Number	Description
1	-	Defrost door vacuum control motor vacuum connector (part of 19C827)
2	W701696	Defrost door vacuum control motor screw (2 required)
3	18A318	Defrost door vacuum control motor

Removal and Installation

1. Remove the Audio Control Module (ACM). For additional information, refer to Section 415-00 .
2. Remove the lower steering column cover. For additional information, refer to Section 501-12 .
3. Remove the 3 center panel duct screws and position the center panel duct aside.

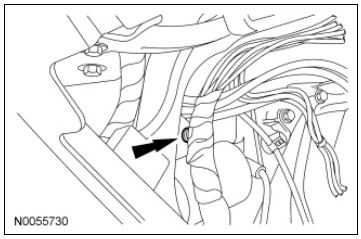
4. Remove the 2 plenum chamber screws.



5. Disconnect the defrost door vacuum control motor vacuum connector.
6. Remove the 2 defrost door vacuum control motor screws.
7. **NOTE:** The plenum chamber must be slightly repositioned to allow the defrost door vacuum control motor to be rotated far enough to clear the retaining arm.

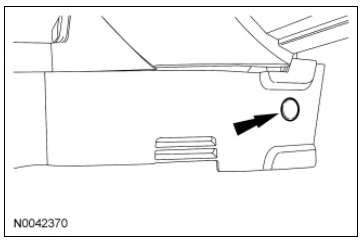
Rotate the defrost door vacuum control motor until it clears the retaining arm and remove the defrost door vacuum control motor.

8. To install, reverse the removal procedure.



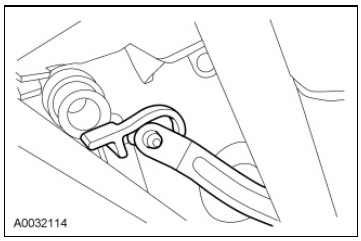
Vacuum Control Motor - Floor Door

Item	Part Number	Description
1	W701696	Shield screw
2	19A804	Shield
3	-	Floor door vacuum control motor vacuum connector (part of 18C581)
4	W701696	Floor door vacuum control motor screws (2 required)
5	18A318	Floor door vacuum control motor



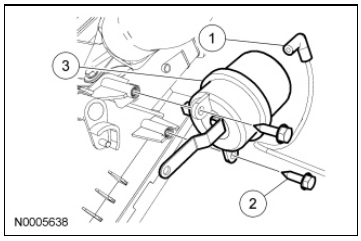
Removal and Installation

1. Remove the center instrument panel finish panel. For additional information, refer to Section 501-12 .
2. Remove the shield screw.
3. Remove the shield.
4. Lower the glove compartment.
5. Disconnect the floor door vacuum control motor vacuum connector.
6. Detach the instrument panel harness pin-type retainer and position the harness aside.



7. Remove the 2 floor door vacuum control motor screws.

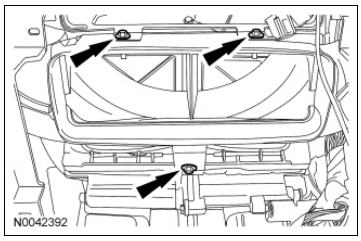
8. Remove the RH floor console finish panel.



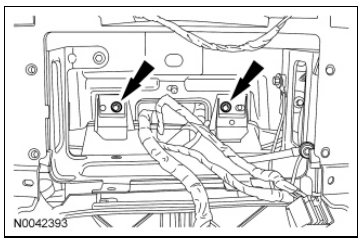
9. **NOTE:** The retaining arm must be slightly deflected away from the vacuum control motor arm to provide clearance.

   Partially actuate and rotate the floor door vacuum control motor until it clears the retaining arm and remove the vacuum control motor.

10. To install, reverse the removal procedure.



Vacuum Control Motor - Panel Door

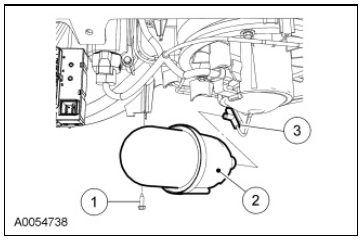


Item	Part Number	Description
1	-	Panel door vacuum control motor vacuum connector (part of 19C827)
2	W701696	Panel door vacuum control motor screw (2 required)
3	18A318	Panel door vacuum control motor

Removal and Installation

1. Remove the Audio Control Module (ACM). For additional information, refer to Section 415-00 .
2. Lower the glove compartment.
3. Remove the 3 center panel duct screws and position the center panel duct aside.

4. Remove the 2 plenum chamber screws.



5. Disconnect the panel door vacuum control motor vacuum connector.
6. Remove the 2 panel door vacuum control motor screws.
7. **NOTE:** The plenum chamber must be slightly repositioned to allow the panel door vacuum control motor to be rotated far enough to clear the retaining arm.

Rotate the panel door vacuum control motor until it clears the retaining arm and remove the panel door vacuum control motor.

8. To install, reverse the removal procedure.

Vacuum Reservoir

Item	Part Number	Description
1	W701696	Vacuum reservoir screw
2	19A566	Vacuum reservoir
3	-	Vacuum connector (part of 18C581)

Removal and Installation

1. Remove the vacuum reservoir screw.
2. Remove the vacuum reservoir.
3. Disconnect the vacuum connector.
4. To install, reverse the removal procedure.

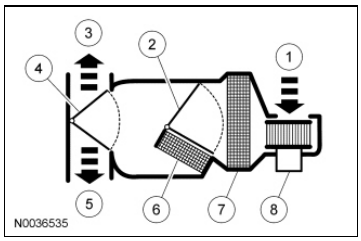
Material

Item	Specification	Fill Capacity
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B	47 ml (16 fl oz) (with auxiliary climate control)

Torque Specifications

Description	Nm	lb-ft	lb-in
Auxiliary evaporator line fitting nuts	8	-	71
Auxiliary heater core and evaporator core housing bolts	6	-	53
Auxiliary heater core and evaporator core housing nut	6	-	53
Auxiliary line bracket bolts	6	-	53
Auxiliary line bracket nuts	6	-	53
Auxiliary line floorpan bracket nuts	8	-	71
Thermostatic Expansion Valve (TXV) fittings	23	17	-

Auxiliary Climate Control



The auxiliary climate control system is a one-piece unit that is located on the LH side of the vehicle between the side windows and the floorpan, behind the rear wheel well. The driver has control of the auxiliary climate control system using the auxiliary climate control assembly.

All of the auxiliary climate control system components are serviceable from the inside of the vehicle except the lines.

Auxiliary System Air Distribution

A vertical air distribution duct supplies air to the integral headliner air distribution duct. Airflow is then directed to the passengers through adjustable registers. The floor duct supplies air to a fixed register which is integral to the side trim panel and directs airflow through the fixed register to the passenger compartment.

System Airflow

Item	Part Number	Description
1	-	Recirc air inlet
2	-	Temperature blend door (part of 18C424)
3	-	Panel headliner airflow
4	-	Mode door (part of 18C424)
5	-	Floor airflow
6	18476	Heater core
7	-	Evaporator core (part of 18C424 assembly)
8	19805	Blower motor

The auxiliary climate control system has the following features:

- The auxiliary blower motor recirculates the air inside the vehicle. Outside air is not available to the auxiliary climate control system.
- Air is cooled and dehumidified by the auxiliary evaporator core only if the instrument panel mounted climate control assembly is adjusted to a position that requires A/C compressor operation.
- The temperature blend door and the air distribution mode door are controlled by electronic actuator motors.
- Movement of the auxiliary temperature control between COOL and WARM causes a corresponding movement of the temperature blend door to direct blower motor airflow through and/or around the auxiliary heater core.
- Toggling of the auxiliary air distribution control between PANEL and FLOOR causes a corresponding movement of the air distribution door to direct airflow between the panel (headliner) registers and the floor duct.

Blower Motor

The auxiliary climate control system contains a blower motor which is controlled by the blower motor switch on the auxiliary climate control assembly. The blower motor is located on the auxiliary heater core and evaporator core housing and can be accessed through an access panel in the LH quarter trim panel.

Control Assembly

The auxiliary climate control assembly consists of temperature, blower speed and air distribution mode. The auxiliary climate control assembly is mounted in the overhead console.

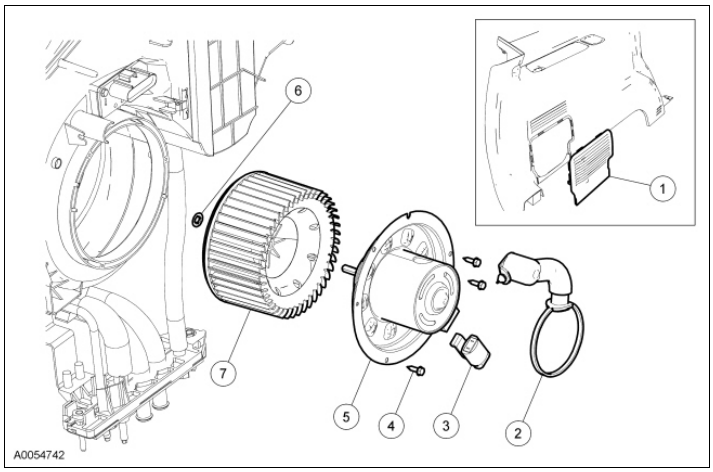
Heater Core

The heater core consists of fins and tubes arranged to extract heat from the engine coolant and transfer the heat to air passing through the auxiliary heater core and evaporator core housing. The heater core is located in the auxiliary heater core and evaporator core housing.

Evaporator Core

The evaporator core is an aluminum plate/fin type and is located in the auxiliary heater core and evaporator core housing. A mixture of refrigerant and oil enters the bottom of the evaporator core through the evaporator core inlet tube and then moves out of the evaporator core through the evaporator core outlet tube as a vapor. When the A/C compressor is operating, air from the blower motor is cooled and dehumidified as it flows through the evaporator core fins.

The evaporator core is located in the auxiliary heater core and evaporator core housing.

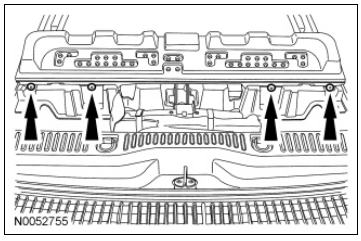


Thermostatic Expansion Valve

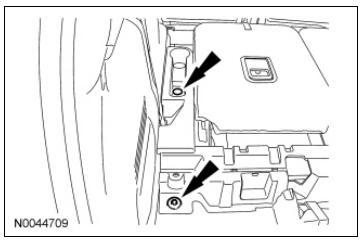
NOTE: An in-line filter is installed in the auxiliary evaporator inlet line at the floorpan bracket connection. A restriction in this filter may cause misdiagnosis of a failed Thermostatic Expansion Valve (TXV). This filter must be inspected before a new TXV is installed.

The TXV restricts the flow of refrigerant from the high pressure side of the refrigerant system and separates the low pressure and high pressure sides of the auxiliary refrigerant system. Refrigerant entering the auxiliary evaporator core passes through the TXV . A temperature sensing bulb senses the temperature of the refrigerant flowing out of the evaporator core and adjusts an internal pin-type valve to meter the refrigerant flow into the evaporator core. The internal pin-type valve decreases the amount of refrigerant entering the evaporator core at lower temperatures and increases the amount of refrigerant entering the evaporator core at higher temperatures.

The TXV is mounted to the evaporator core inlet and outlet fittings behind the LH quarter trim panel.



Auxiliary Blower Motor

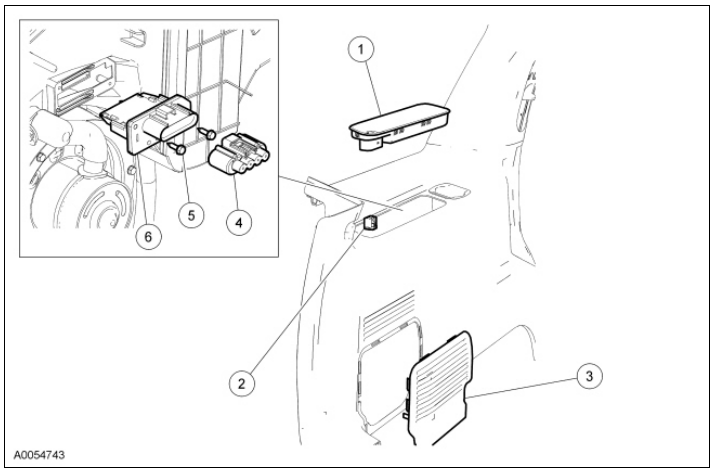


Item	Part Number	Description
1	7831013	Access panel
2	19A786	Vent tube
3	-	Blower motor electrical connector (part of 19D887)
4	W701696	Blower motor screw (3 required)
5	19805	Blower motor
6	18A287	Blower motor wheel retainer
7	18504	Blower motor wheel

Removal and Installation

1. Remove the bolts and the rear cargo management cover.

2. Remove the screw and pin-type retainer and remove the rear cargo management system.

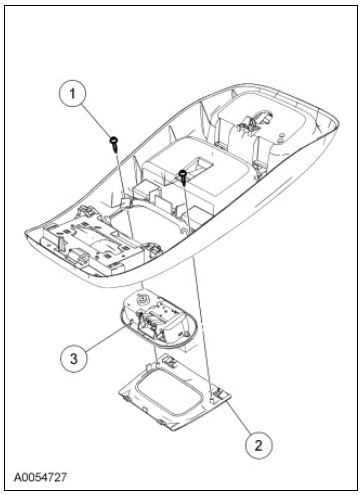


3. Remove the access panel.

4. Remove the vent tube.

5. Disconnect the blower motor electrical connector.
6. Remove the 3 blower motor screws.
7. Remove the blower motor.
8. Remove the blower motor retainer.
9. Remove the blower motor wheel.
10. To install, reverse the removal procedure.

Auxiliary Blower Motor Resistor



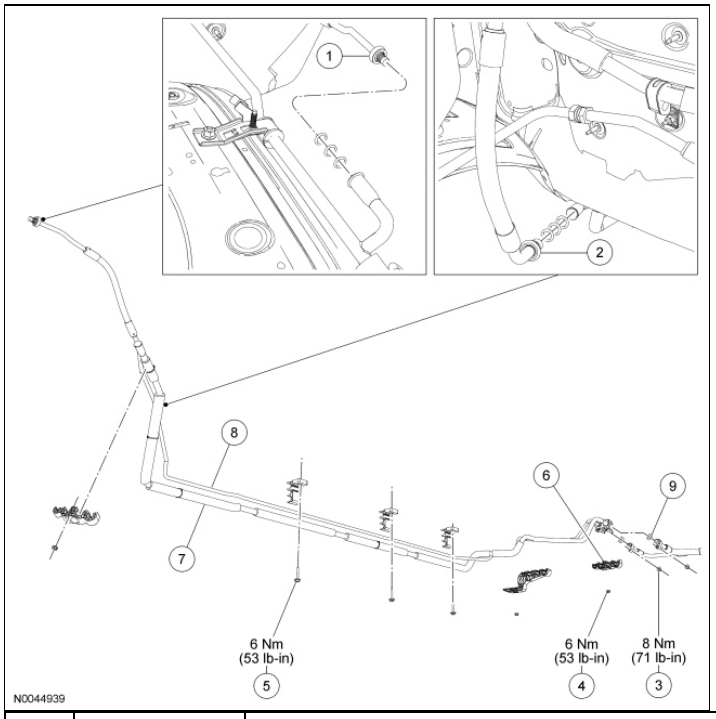
Item	Part Number	Description
1	7831013	Switch bezel
2	-	Power lock switch electrical connector (part of 14A488)
3	7831013	Access panel
4	-	Auxiliary blower motor resistor electrical connector (part of 19D887)
5	W701606	Auxiliary blower motor resistor screw (2 required)
6	19A706	Auxiliary blower motor resistor

Removal and Installation

1. Remove the switch bezel.
2. Disconnect the power lock switch electrical connector.
3. Remove the access panel.
4. Disconnect the auxiliary blower motor resistor electrical connector.
5. Remove the 2 auxiliary blower motor resistor screws.
6. Remove the auxiliary blower motor resistor.
7. To install, reverse the removal procedure.

Auxiliary Climate Control Assembly

Item	Part Number	Description
1	-	Screw (2 required)
2	78519D06	Bezel
3	19980	Auxiliary climate control assembly



Removal and Installation

1. Remove the overhead console. For additional information, refer to Section 501-12 .
2. Remove the 2 screws.
3. Remove the bezel.
4. Remove the auxiliary climate control assembly.
5. To install, reverse the removal procedure.

Auxiliary Evaporator Outlet and Inlet Line - Front

Material

Item	Specification
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B

Item	Part Number	Description
1	-	Front auxiliary evaporator inlet line front fitting (part of 19835)
2	-	Front auxiliary evaporator outlet line front fitting (part of 19867)
3	W520413	Front auxiliary evaporator line fitting nut (2 required)
4	W520512	Auxiliary line bracket nut (3 required)
5	W505426	Auxiliary line bracket bolt (3 required)
6	18N332	Auxiliary line bracket (6 required) (3 types)
7	19867	Front auxiliary evaporator outlet line
8	19835	Front auxiliary evaporator inlet line
9	19E889	O-ring

Removal and Installation

1. Recover the refrigerant. For additional information, refer to Section 412-00 .

2. Disconnect the front auxiliary evaporator inlet line front fitting.
    - Discard the O-ring seals.

3. Remove the RH running board. For additional information, refer to Section 501-08 .

4. Disconnect the front auxiliary evaporator outlet line front fitting.

5. Remove the RH rear wheel.

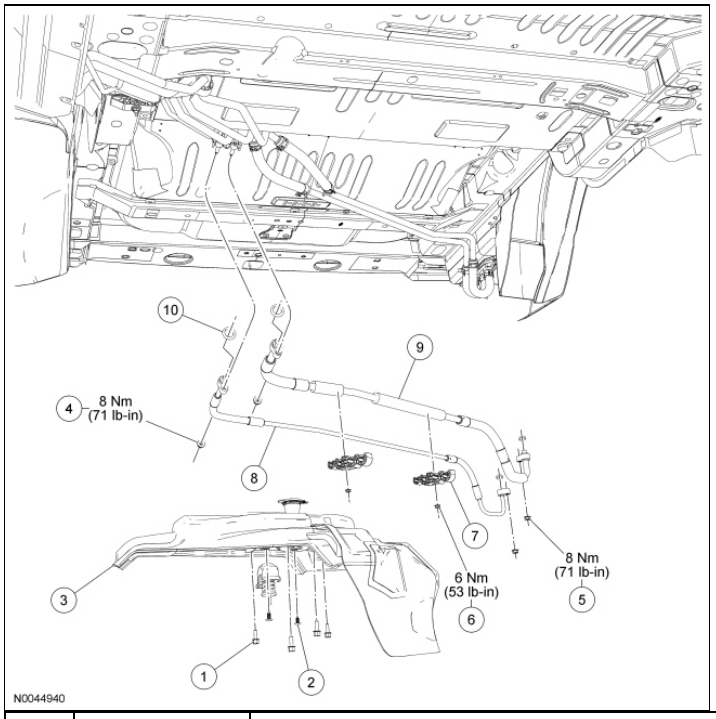
6. Remove the front auxiliary evaporator line fitting nuts and disconnect the fittings.
    - Discard the O-ring seals.
    - To install, tighten to 8 Nm (71 lb-in).

7. Remove the 3 auxiliary line bracket nuts.
    - To install, tighten to 6 Nm (53 lb-in).

8. Remove the 3 auxiliary line bracket bolts.
    - To install, tighten to 6 Nm (53 lb-in).

9. Remove the 6 auxiliary line brackets.

10. Remove the front auxiliary evaporator outlet and inlet lines.



11. To install, reverse the removal procedure.
    - Install new O-ring seals.
    - Lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to Section 412-00 .

12. Evacuate, leak test and charge the refrigerant system. For additional information, refer to Section 412-00 .

Auxiliary Evaporator Outlet and Inlet Line - Rear

Material

Item	Specification
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B

Item	Part Number	Description
1	W500624	Spare tire carrier bolt (4 required)
2	-	Spare tire carrier shield pin-type retainer
3	1K353	Spare tire carrier
4	W520413	Rear auxiliary evaporator line front fitting nut (2 required)
5	W520413	Rear auxiliary evaporator line rear fitting nut (2 required)
6	W520512	Auxiliary line bracket nut (2 required)
7	18N332	Auxiliary line bracket (2 required)
8	19835	Rear auxiliary evaporator inlet line
9	19867	Rear auxiliary evaporator outlet line
10	19E889	O-ring seal (4 required)

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Recover the refrigerant. For additional information, refer to Section 412-00 .

3. Remove the spare tire.

4. Remove the 4 spare tire carrier bolts and the 2 spare tire carrier shield pin-type retainers.

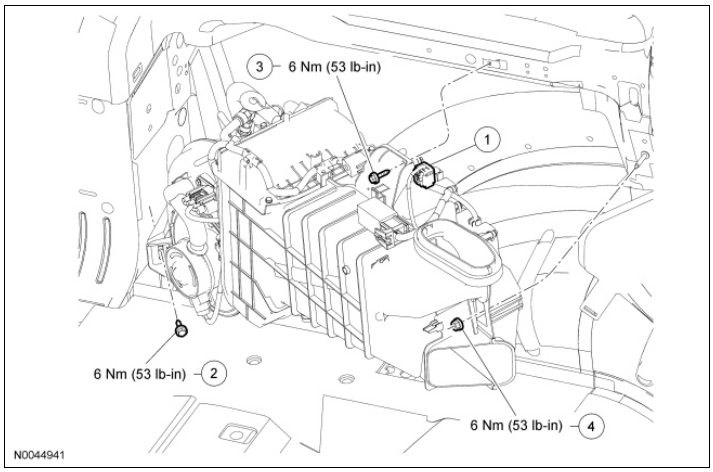
5. Remove the spare tire carrier.

6. Remove the 2 rear auxiliary evaporator line front fitting nuts and disconnect the fittings.
   - Discard the O-ring seals.
   - To install, tighten to 8 Nm (71 lb-in).

7. Remove the 2 rear auxiliary evaporator line rear fitting nuts and disconnect the fittings.
   - Discard the O-ring seals.
   - To install, tighten to 8 Nm (71 lb-in).

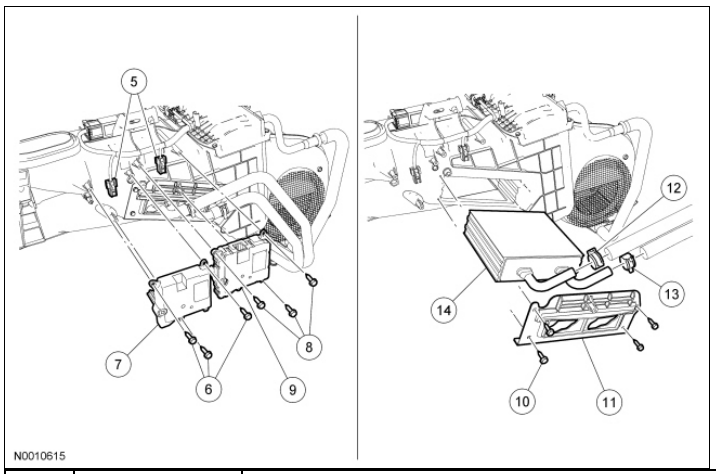
8. Remove the auxiliary line bracket nut.
   - To install, tighten to 6 Nm (53 lb-in).

9. Remove the 2 auxiliary line brackets.



10. Remove the rear auxiliary evaporator outlet line.

11. Remove the rear auxiliary evaporator inlet line.
    - Discard the Thermostatic Expansion Valve (TXV) filter.



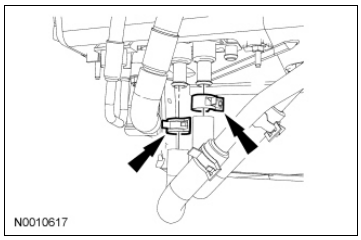
12. To install, reverse the removal procedure.
    - Install new O-ring seals.
    - Install a new TXV filter.
    - Lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to Section 412-00 .

13. Evacuate, leak test and charge the refrigerant system. For additional information, refer to Section 412-00 .

Auxiliary Heater Core

Item	Part Number	Description
1	-	Auxiliary harness electrical connector (part of 14A488)
2	W705549	Auxiliary heater core and evaporator core housing bolt
3	W705549	Auxiliary heater core and evaporator core housing bolt
4	W705277	Auxiliary heater core and evaporator core housing nut

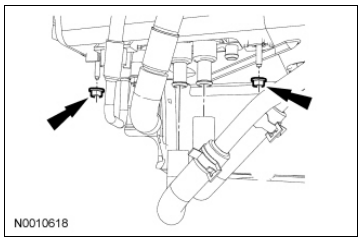
Item	Part Number	Description
5	-	Auxiliary actuator electrical connectors (2 required) (part of 19D887)
6	W701696	Auxiliary mode door actuator screws (3 required)
7	19E616	Auxiliary mode door actuator
8	W701696	Auxiliary temperature blend door actuator screws (3 required)
9	19E616	Auxiliary temperature blend door actuator
10	W701696	Heater core cover screw (4 required)



11	18N276	Heater core cover
12	8287	Heater core hose clamp
13	8287	Heater core hose clamp
14	18476	Auxiliary heater core

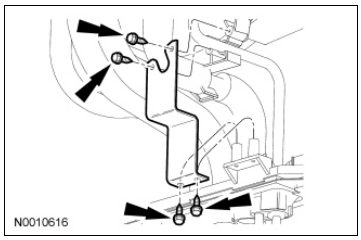
Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .



2. Drain the engine coolant. For additional information, refer to Section 303-03 .

3. Release the 2 heater hose clamps and disconnect the heater hoses.



4. Remove the rear quarter trim panel. For additional information, refer to Section 501-05 .

5. Remove the 2 auxiliary line floorpan bracket nuts.

6. **NOTE:** The screw and line bracket are located inside the vehicle above the floorpan line bracket.

   Remove the 4 line bracket screws and the line bracket.

7. Disconnect the auxiliary harness electrical connector.

8. Remove the 2 auxiliary heater core and evaporator core housing bolts and auxiliary heater core and evaporator core housing nut.
   - To install, tighten to 6 Nm (53 lb-in).

9. Disconnect the 2 auxiliary actuator electrical connectors.

10. Remove the 3 auxiliary mode door actuator screws.

11. Remove the auxiliary mode door actuator.

12. Remove the 3 auxiliary temperature blend door actuator screws.

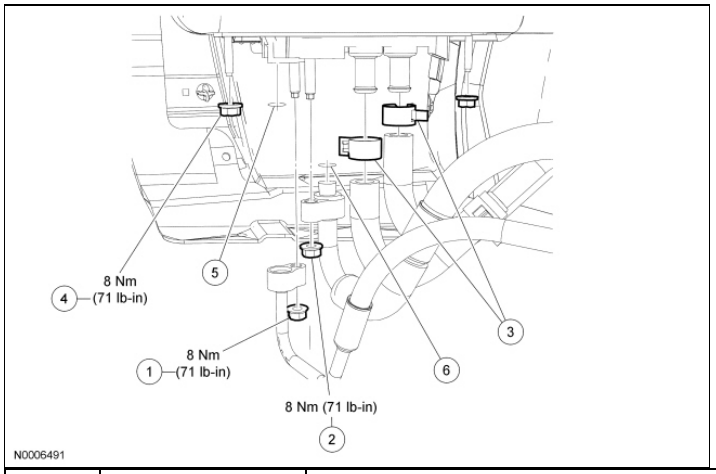
13. Remove the auxiliary temperature blend door actuator.

14. Remove the 4 heater core cover screws.

15. Remove the heater core cover.

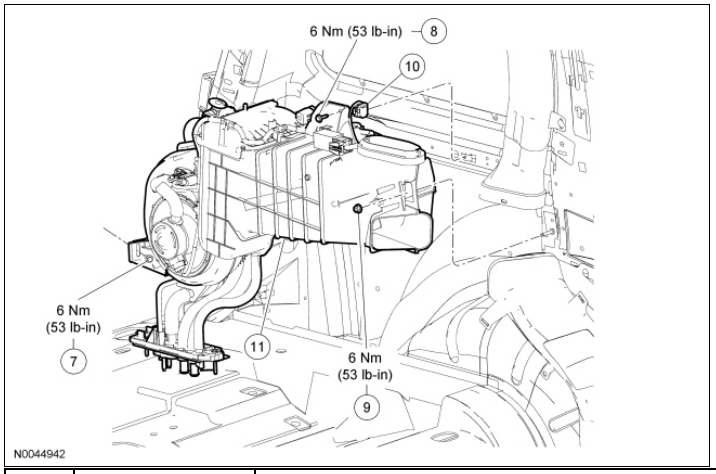
16. Disconnect the 2 heater core hose clamps.

17. Remove the auxiliary heater core.



18. To install, reverse the removal procedure.
    - Lubricate the coolant hoses with plain water only if needed.

19. Fill the engine cooling system. For additional information, refer to Section 303-03 .



Auxiliary Heater Core and Evaporator Core Housing

Material

Item	Specification
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B

Item	Part Number	Description
1	W520413	Auxiliary evaporator inlet line fitting nut
2	W520413	Auxiliary evaporator outlet line fitting nut
3	8287	Heater hose clamps (2 required)
4	N807609	Auxiliary line floorpan bracket nut (2 required)
5	19E889	O-ring
6	19E889	O-ring

Item	Part Number	Description

7	W705549-S	Auxiliary heater core and evaporator core housing bolt
8	W705549-S	Auxiliary heater core and evaporator core housing bolt
9	W705277	Auxiliary heater core and evaporator core housing nut
10	-	Auxiliary harness electrical connector (part of 14335)
11	18C424	Auxiliary heater core and evaporator core housing

Removal and Installation

NOTE: Clean and lubricate the coolant hoses with plain water only if needed.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Recover the refrigerant. For additional information, refer to Section 412-00 .

3. Drain the engine coolant. For additional information, refer to Section 303-03 .

4. Remove the LH quarter trim panel. For additional information, refer to Section 501-05 .

5. Detach the headliner duct from the auxiliary climate control housing.

6. Remove the auxiliary evaporator inlet and outlet line fitting nuts.
   - Discard the O-ring seals.
   - Discard the Thermostatic Expansion Valve (TXV) filter.
   - To install, tighten to 8 Nm (71 lb-in).

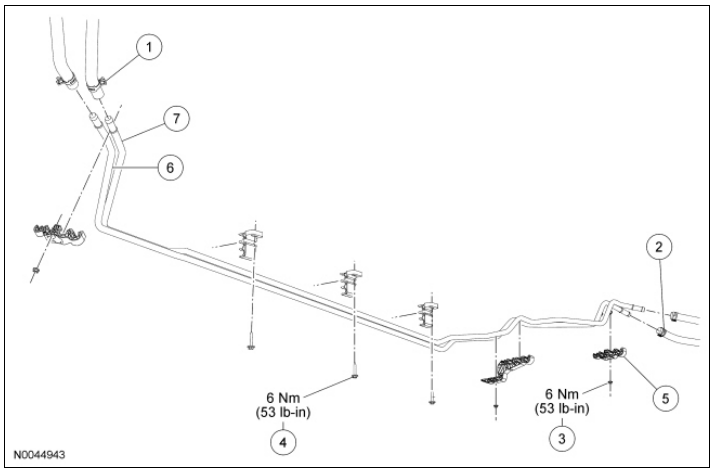
7. Release the heater hose clamps and disconnect the heater hoses.
   - After disconnecting the heater hoses, allow any residual coolant to drain from the auxiliary heater core to avoid coolant spilling inside the passenger compartment.

8. Remove the 2 auxiliary line floorpan bracket nuts.
   - To install, tighten to 8 Nm (71 lb-in).

9. Remove the 2 auxiliary heater core and evaporator core housing bolts.
   - To install, tighten to 6 Nm (53 lb-in).

10. Remove the auxiliary heater core and evaporator core housing nut.
    - To install, tighten to 6 Nm (53 lb-in).

11. Disconnect the auxiliary harness electrical connector.



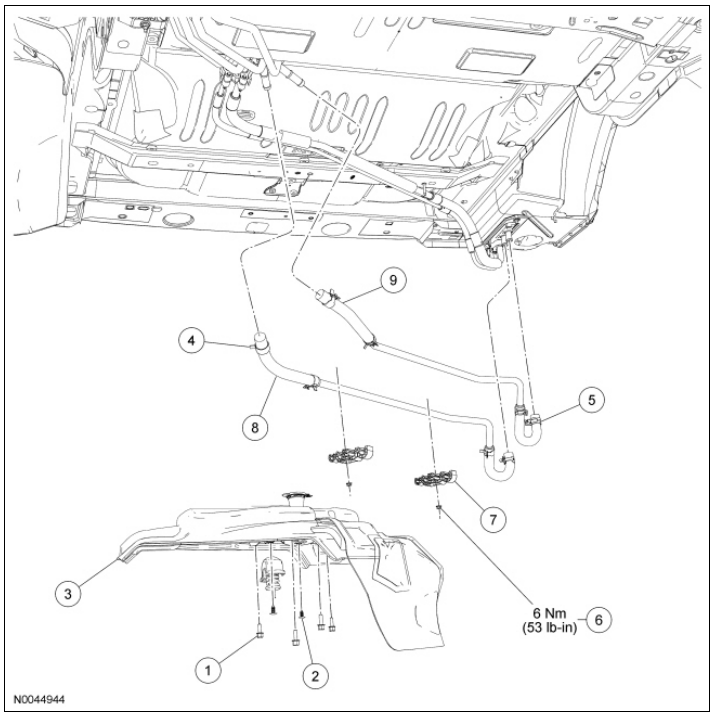
12. Remove the auxiliary heater core and evaporator core housing.

13. To install, reverse the removal procedure.
    - Clean and lubricate the coolant hoses with plain water only if needed.
    - Install new O-ring seals.
    - Install a new TXV filter.
    - Lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to Section 412-00 .

14. Fill the engine cooling system. For additional information, refer to Section 303-03 .

15. Evacuate, leak test and charge the refrigerant system. For additional information, refer to Section 412-00 .

Auxiliary Heater Outlet and Inlet Line - Front



Item	Part Number	Description
1	8287	Front auxiliary heater line front clamp (2 required)
2	8287	Front auxiliary heater line rear clamp (2 required)
3	W520512	Auxiliary line bracket nut (3 required)
4	W505426	Auxiliary line bracket bolt (3 required)
5	18N332	Auxiliary line bracket (6 required) (3 types)
6	18663	Front auxiliary heater outlet line
7	18696	Front auxiliary heater inlet line

Removal and Installation

1. Remove the RH running board. For additional information, refer to Section 501-08 .
2. Drain the engine coolant. For additional information, refer to Section 303-03 .
3. Remove the RH rear wheel.
4. Release the front auxiliary heater line front clamps and disconnect the heater hoses.
5. Release the front auxiliary heater line rear clamps and disconnect the heater hoses.
6. Remove the 3 auxiliary line bracket nuts.
   - To install, tighten to 6 Nm (53 lb-in).
7. Remove the 3 auxiliary line bracket bolts.
   - To install, tighten to 6 Nm (53 lb-in).
8. Remove the 6 auxiliary line brackets.
9. Remove the front auxiliary heater outlet and inlet lines.
10. To install, reverse the removal procedure.

11. Fill the engine cooling system. For additional information, refer to Section 303-03 .

Auxiliary Heater Outlet and Inlet Line - Rear

Item	Part Number	Description
1	W705195	Spare tire carrier bolt (4 required)
2	-	Spare tire carrier shield pin-type retainer
3	1A131	Spare tire carrier
4	8287	Rear auxiliary heater line front hose clamp (2 required)
5	8287	Rear auxiliary heater line rear hose clamp (2 required)
6	W520512	Auxiliary line bracket nut (2 required)
7	18N332	Auxiliary line bracket (2 required)
8	18696	Rear auxiliary heater inlet line
9	18663	Rear auxiliary heater outlet line

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Drain the engine coolant. For additional information, refer to Section 303-03 .

3. Remove the spare tire.

4. Remove the 4 spare tire carrier bolts and the 2 spare tire carrier shield pin-type retainers.

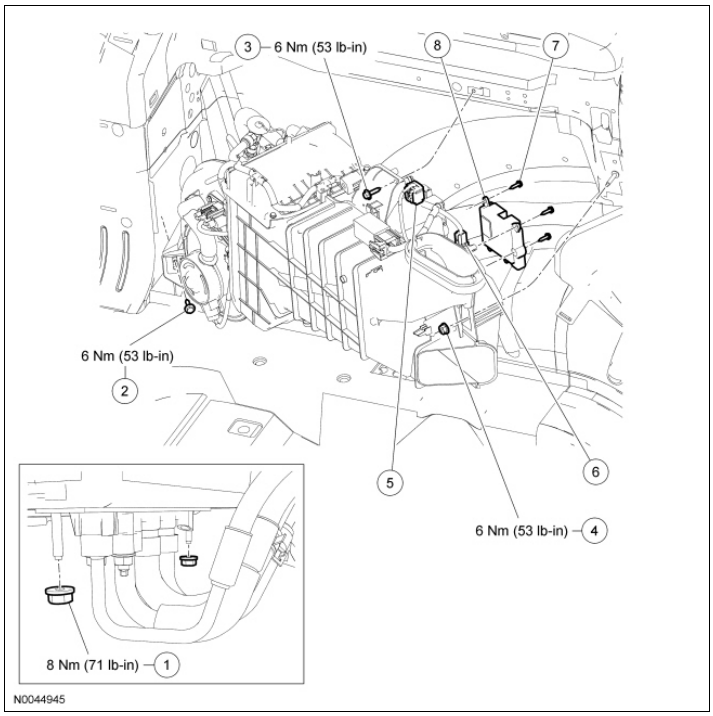
5. Remove the spare tire carrier.

6. Release the 2 rear auxiliary heater line front hose clamps and disconnect the hoses.

7. Release the 2 rear auxiliary heater line rear hose clamps and disconnect the hoses.

8. Remove the 2 auxiliary line bracket nuts.
   - To install, tighten to 8 Nm (71 lb-in).

9. Remove the 2 auxiliary line brackets.



10. Remove the rear auxiliary heater outlet line.

11. Remove the rear auxiliary heater inlet line.

12. To install, reverse the removal procedure.

13. Fill the engine cooling system. For additional information, refer to Section 303-03 .

Auxiliary Mode Door Actuator

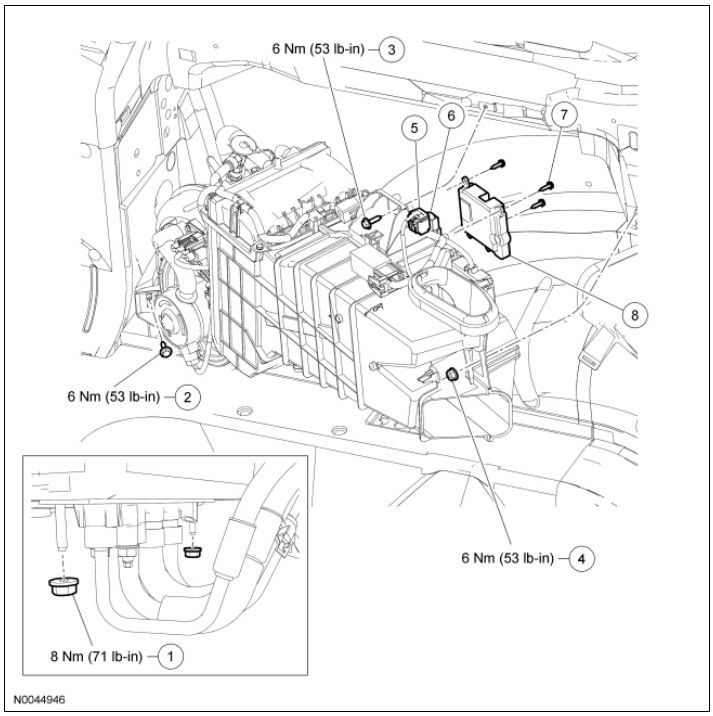
Item	Part Number	Description
1	N807609	Auxiliary line floorpan bracket nut (2 required)
2	W705549	Auxiliary heater core and evaporator core housing bolt
3	W705549	Auxiliary heater core and evaporator core housing bolt
4	W705277	Auxiliary heater core and evaporator core housing nut
5	14A488	Auxiliary harness electrical connector
6	-	Auxiliary mode door actuator electrical connector (part of 19D887)
7	W701696	Auxiliary mode door actuator screw (3 required)
8	19E616	Auxiliary mode door actuator

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the LH quarter trim panel. For additional information, refer to Section 501-05 .

3. Remove the 2 auxiliary line floorpan bracket nuts.
   - To install, tighten to 8 Nm (71 lb-in).



4. Remove the 2 auxiliary heater core and evaporator core housing bolts.
   - To install, tighten to 6 Nm (53 lb-in).

5. Remove the auxiliary heater core and evaporator core housing nut.

- To install, tighten to 6 Nm (53 lb-in).

6. Disconnect the auxiliary harness electrical connector.
7. Disconnect the auxiliary mode door actuator electrical connector.
8. Remove the 3 auxiliary mode door actuator screws.
9. Remove the auxiliary mode door actuator.
10. To install, reverse the removal procedure.

Auxiliary Temperature Blend Door Actuator

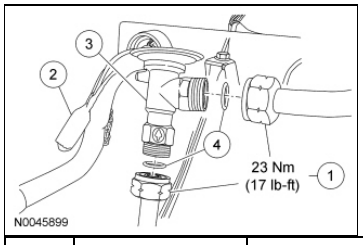
Item	Part Number	Description
1	N807609	Auxiliary line floorpan bracket nut (2 required)
2	W705549	Auxiliary heater core and evaporator core housing bolt
3	W705549	Auxiliary heater core and evaporator core housing bolt
4	W705277	Auxiliary heater core and evaporator core housing nut
5	-	Auxiliary harness electrical connector (part of 14A488)
6	-	Auxiliary temperature blend door actuator electrical connector (part of 14A488)
7	W701696	Auxiliary temperature blend door actuator screw (3 required)
8	19E616	Auxiliary temperature blend door actuator

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the LH quarter trim panel. For additional information, refer to Section 501-05 .

3. Remove the 2 auxiliary line floorpan bracket nuts.
   - To install, tighten to 8 Nm (71 lb-in).



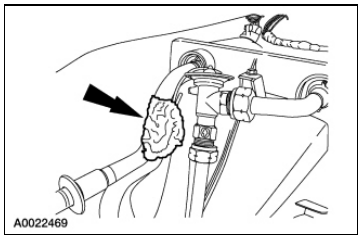
4. Remove the 2 auxiliary heater core and evaporator core housing bolts.
   - To install, tighten to 6 Nm (53 lb-in).

5. Remove auxiliary heater core and evaporator core housing nut.
    - To install, tighten to 6 Nm (53 lb-in).
6. Disconnect the auxiliary harness electrical connector.
7. Disconnect the auxiliary temperature blend door actuator electrical connector.
8. Remove the 3 auxiliary temperature blend door actuator screws.
9. Remove the auxiliary temperature blend door actuator.
10. To install, reverse the removal procedure.

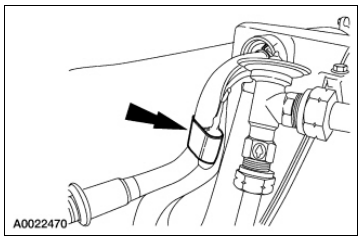
Thermostatic Expansion Valve

Material

Item	Specification
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B



Item	Part Number	Description
1	-	Thermostatic Expansion Valve (TXV) fittings (part of 19849)
2	-	Temperature sensing bulb (part of 19849)
3	19849	TXV
4	19E889	O-ring seals



Removal and Installation

NOTE: An in-line filter is installed in the auxiliary evaporator inlet line at the floorpan bracket connection. A restriction in this filter may cause misdiagnosis of a failed Thermostatic Expansion Valve (TXV). This filter must be inspected before a new TXV is installed.

1. Recover the refrigerant. For additional information, refer to Section 412-00 .
2. Remove the D-pillar trim panel. For additional information, refer to Section 501-05 .
3. Detach the rear portion of the LH quarter trim panel and position away from the TXV .
4. Remove the 4 clips and the TXV cover.
5. Remove the insulating tape.
   - Retain the tape for reuse.

6. Remove the temperature sensing bulb clip and detach the temperature sensing bulb from the evaporator outlet line.

7. Disconnect the 2 TXV fittings and remove the TXV .
    - Discard the O-ring seals.
    - To install, tighten to 23 Nm (17 lb-ft).

8. To install, reverse the removal procedure.
    - Install new O-ring seals.
    - Lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to Section 412-00 .

9. Evacuate, leak test and charge the refrigerant system. For additional information, refer to Section 412-00 .

Instrument Cluster and Panel Illumination

NOTE: The Smart Junction Box (SJB) is also known as the Generic Electronic Module (GEM).

The Instrument Cluster (IC) and panel illumination is used to provide backlighting to the instrument panel, switches, and control components when the parking lamps are on, and the ambient light sensor status senses or equals night. The level of intensity is adjustable by rotating the instrument panel dimmer switch either up to increase intensity or down to decrease intensity.

The IC and panel illumination system consists of both dimmable and non-dimmable (fixed) illumination sources. The IC and panel illumination is used to provide backlighting to the instrument panel, switches, and control components when the parking lamps are on.

The dimmable backlighting system provides backlighting to the following components:

- Audio Control Module (ACM)
- Adjustable pedal switch (if equipped)
- Auxiliary climate control (if equipped)
- HVAC module
- Floor shifter
- Four-Wheel Drive (4WD) mode select switch (if equipped)
- Headlamp switch
- Heated seat/windshield switch (if equipped)
- IC
- Message center switch (if equipped)
- Memory set switch (if equipped)
- Traction control switch
- Steering wheel control switches

The fixed backlighting system consists of the following component:

- Window control switches
- Door lock control switches
- Heated mirror switch

Instrument Cluster and Panel Illumination

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
 ST1137-A	73III Automotive Meter 105-R0057 or equivalent
 ST2574-A	Flex Probe Kit 105-R025C or equivalent

Principles of Operation

NOTE: The Smart Junction Box (SJB) is also known as the Generic Electronic Module (GEM).

Dimmable Backlighting

When the parking lamps are on, the SJB monitors the input from the instrument panel dimmer switch. The SJB sends a pulse-width modulated voltage to the hardwired dimmable components based on input received from the instrument panel dimmer switch. The SJB also sends a message over the Controller Area Network (CAN) to the Audio Control Module (ACM), and the Instrument Cluster (IC) to indicate the backlighting intensity level.

The ACM and IC default to full nighttime brightness if they do not receive the illumination message.

Fixed Backlighting

When the accessory delay relay is energized, switched voltage is supplied to the non-dimmable components and switches. The window control switches and the door lock control switches are the only non-dimmable components.

Field-Effect Transistor (FET) Protection

The SJB utilizes a Field-Effect Transistor (FET) protective circuit strategy for many of its outputs (for example, the headlamp output circuit). Output loads (current level) are monitored for excessive current (typically short circuits) and are shut down (turns off the voltage or ground provided by the module) when a fault is detected. A continuous DTC is stored at the time of the fault. The circuit then resets after a customer demand of the function (switching the component on, battery saver being energized). When an excessive circuit load occurs several times, the module shuts down the output until a repair procedure is carried out. At the same time, the continuous DTC that was stored on the first failure can not be cleared by a command to clear the continuous DTCs. The module does not allow this code to be cleared or the circuit restored to normal until a successful on-demand self-test proves that the fault has been repaired. After the on-demand self-test has successfully completed (no on-demand DTCs present), the continuous DTC clears and the circuit function

returns.

Each circuit has 3 predefined levels of short circuit tolerance established in the module based on each circuits' capability. When the first or second level is reached, the continuous DTC associated with the circuit sets along with DTC B106E. These DTCs may be cleared using the Clear DTC operation on the scan tool as long as the fault itself has been corrected. If any of the circuits are shorted past the third level, then DTCs B106F and B1342 set along with the associated continuous DTC. These DTCs cannot be cleared and the module must be replaced.

The SJB FET protected output circuits for the instrument panel illumination system are for the LED backlighting output circuit.

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of electrical damage.

Visual Inspection Chart

Electrical
• Smart Junction Box (SJB) fuse 23 (15A) • Bulb • Wiring, terminals or connectors • Traction control switch • Memory set switch (if equipped) • Auxiliary climate control (if equipped) • Door lock control switches • Window control switches • Headlamp switch • HVAC module • Audio Control Module (ACM) • Heated seat/windshield switch (if equipped) • Adjustable pedal switch (if equipped) • Four-Wheel Drive (4WD) mode select switch (if equipped) • Message center switch (if equipped) • Steering wheel control switches • Floor shifter • Heated mirror switch • SJB • Instrument Cluster (IC)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM .
   - Refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication with one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the SJB .

9. If the DTCs retrieved are related to the concern, go to DTC Charts. For all other DTCs, refer to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

DTC Charts

Smart Junction Box (SJB) DTC Chart

DTC	Description	Action
B2026	Incandescent Backlighting Output Circuit Failure	If all the hardwired backlighting components are inoperative, GO to Pinpoint Test D . If all the hardwired backlighting components are always on, GO to Pinpoint Test E .
B2027	LED Backlighting Output Circuit Failure	If all the hardwired backlighting components are inoperative, GO to Pinpoint Test D . If all the hardwired backlighting components are always on, GO to Pinpoint Test E .
B2121	Illumination Switch Short To Battery	If the control illumination is inoperative, GO to Pinpoint Test B . If the control illumination does not dim, GO to Pinpoint Test F .
B2132	Dimmer Switch Circuit Short to Gnd	If the control illumination is inoperative, GO to Pinpoint Test B . If the control illumination does not dim, GO to Pinpoint Test F .
	-	

All other DTCs		REFER to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .

Symptom Chart

Symptom Chart

Pinpoint Tests

Pinpoint Test A: The Control Illumination Is Inoperative - All Hardwired Illumination

Refer to Wiring Diagrams Cell 71 , Cluster and Panel Illumination for schematic and connector information.

Normal Operation

When the parking lamps are on, the Smart Junction Box (SJB) sends a pulse-width modulated voltage to the dimmable illumination sources based on input received from the instrument panel dimmer switch.

This pinpoint test is intended to diagnose the following:

- Fuse
- SJB

PINPOINT TEST A: THE CONTROL ILLUMINATION IS INOPERATIVE - ALL HARDWIRED ILLUMINATION

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
A1 CHECK THE EXTERIOR LAMP OPERATION	
• Place the headlamp switch in the PARKING LAMPS ON position. • **Are the parking lamps illuminated?**	**Yes** VERIFY the SJB fuse 23 (15A) is OK. If OK, GO to A2 . If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short. **No** REFER to Section 417-01 .
A2 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern

♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	may have been caused by a loose or corroded connector.

Pinpoint Test B: The Control Illumination Is Inoperative - All Network Controlled And Hardwired Components

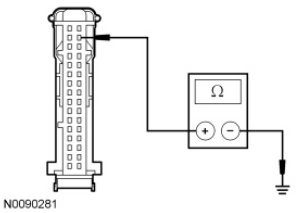
Refer to Wiring Diagrams Cell 71 , Cluster and Panel Illumination for schematic and connector information.

Normal Operation

The Smart Junction Box (SJB) monitors the input from the instrument panel dimmer switch by sending a voltage reference signal through circuit CLN27 (WH/BN) to the instrument panel dimmer switch. The return signal is sent through circuit CLN17 (BN) back to the SJB . Based on the return signal intensity, the SJB sends a pulse-width modulated voltage signal to the dimmable illumination sources. If the SJB detects a concern with the circuitry to the instrument panel dimmer switch, the SJB defaults the backlighting to a full intensity level.

- DTC B2132 (Dimmer Switch Circuit Short to Gnd) - a continuous and on-demand DTC that may set when the SJB detects a short to ground on the dimmer switch input circuit.

This pinpoint test is intended to diagnose the following:



- Wiring, terminals or connectors
- Instrument panel dimmer switch
- SJB

PINPOINT TEST B: THE CONTROL ILLUMINATION IS INOPERATIVE - ALL NETWORK CONTROLLED AND HARDWIRED COMPONENTS

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
B1 CHECK THE INSTRUMENT PANEL DIMMER SWITCH	
• Ignition OFF. • Disconnect: Instrument Panel Dimmer Switch C2298. • Carry out the instrument panel dimmer switch component test.	**Yes** GO to B2 . **No** INSTALL a new instrument panel dimmer switch. REFER to Instrument Panel Dimmer Switch in this section. TEST the system for normal operation.

Refer to Wiring Diagrams Cell 149 for component testing. • **Is the instrument panel dimmer switch OK?**	
B2 CHECK CIRCUIT CLN27 (WH/BN) FOR A SHORT TO GROUND	
• Disconnect: SJB C2280d. • Measure the resistance between the SJB C2280d-18, circuit CLN27 (WH/BN), harness side and ground.  • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to B3 . **No** REPAIR the circuit. TEST the system for normal operation.
B3 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

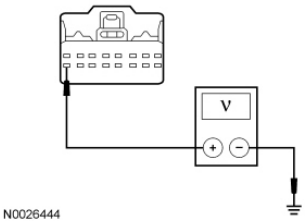
Pinpoint Test C: The Steering Wheel Control Illumination Is Inoperative

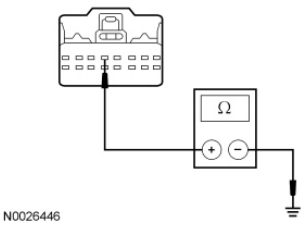
Refer to Wiring Diagrams Cell 71 , Cluster and Panel Illumination for schematic and connector information.

Normal Operation

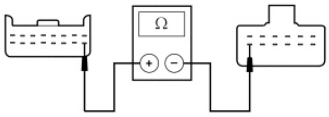
The Smart Junction Box (SJB) sends a pulse-width modulated voltage to the steering wheel controls through circuit CLN04 (BU/BN) to the clockspring. The voltage passes through the clockspring to the steering wheel harness and on to the steering wheel control switches. Ground is supplied through the clockspring on circuit GD143 (BK/VT).

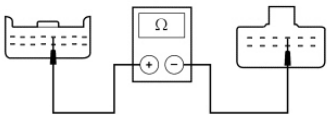
This pinpoint test is intended to diagnose the following:





- Wiring, terminals or connectors
- Steering wheel harness
- Steering wheel control switch





- Clockspring

PINPOINT TEST C: THE STEERING WHEEL CONTROL ILLUMINATION IS INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
C1 CHECK CIRCUIT CLN04 (BU/BN) FOR AN OPEN	
• Ignition OFF. • Depower the Supplemental Restraint System (SRS). Refer to Section 501-20B . • Disconnect: Clockspring C218a. • Connect: Negative Battery Cable. • Place the headlamp switch in the PARKING LAMPS ON position. • Rotate the instrument panel dimmer switch to the full illumination position. • Measure the voltage between the clockspring C218a-16, circuit CLN04 (BU/BN), harness side and ground.  N0026444 • **Is the voltage great than 10 volts?**	**Yes** TURN the parking lamps off. GO to C2 . **No** REPAIR the circuit. REPOWER the SRS . REFER to Section 501-20B . TEST the system for normal operation.
C2 CHECK CIRCUIT GD143 (BK/VT) FOR AN OPEN	
• Disconnect: Negative Battery Cable. • Measure the resistance between the clockspring C218a-5, circuit GD143 (BK/VT), harness side and ground.  N0026446 • **Is the resistance less than 5 ohms?**	**Yes** GO to C3 . **No** REPAIR the circuit. REPOWER the SRS . REFER to Section 501-20B . TEST the system for normal operation.

C3 CHECK THE CLOCKSPRING FOR AN OPEN	
• Remove the driver air bag module. Refer to Section 501-20B . • Disconnect: Upper Clockspring C218b. • Measure the resistance between the clockspring C218a pin 16, component side and the upper clockspring C218b pin 7, component side.  N0069076 • Measure the resistance between the clockspring C218a pin 5, component side and the upper clockspring C218b pin 4, component side.  N0072676 • **Are the resistances less than 5 ohms?**	**Yes** GO to C4 . **No** INSTALL a new clockspring. REFER to Section 501-20B . TEST the system for normal operation.
C4 CHECK THE STEERING WHEEL HARNESS	
• Disconnect: Steering Wheel Control Switch C203 and Audio/Climate Control Switch C2208. • Measure the resistance between the upper clockspring, harness side, and the steering wheel control switch as follows: **Connector-Pin** / **Connector-Pin** / **Circuit** C218b-7 / Speed control switch C203-4 / CLN04 (OG) C218b-7 / Audio/climate control switch C2208-6 / CLN04 (OG) C218b-4 / Speed control switch C203-3 / GD143 (BU) C218b-4 / Audio/climate control switch C2208-1 / GD143 (BU)	**Yes** INSTALL a new steering wheel control switch. REFER to Section 310-03 or Section 415-00 as necessary. INSTALL the driver air bag module. REFER to Section 501-20B . TEST the system for normal operation. **No** REPAIR or INSTALL a new steering wheel harness. INSTALL the driver air bag module. REFER to Section 501-20B . TEST the system for normal operation.

• **Are the resistances less than 5 ohms?**	

Pinpoint Test D: An Individual/More Than One Hardwired Component Illumination Is Inoperative

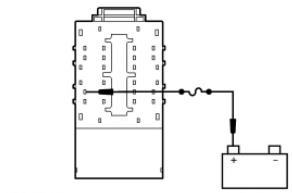
Refer to Wiring Diagrams Cell 71 , Cluster and Panel Illumination for schematic and connector information.

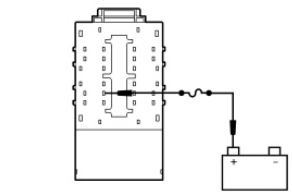
Normal Operation

The Smart Junction Box (SJB) sends a pulse-width modulated voltage to the dimmable components through circuit CLN04 (BU/BN). Ground for the illumination source is supplied through circuits GD138 (BK/WH), GD133 (BK), GD151 (BK/GN), GD149 (BK/GY) and GD145 (BK/BU). The SJB also controls the accessory delay relay. The accessory delay relay sends a set voltage to the door lock control switches through circuit CBP05 (YE). The LH door lock control switch is grounded through circuit GD133 (BK). The RH door lock control switch is grounded through circuit GD151 (BK/YE).

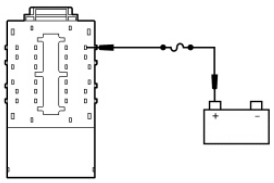
- B2026 (Incandescent Backlighting Output Circuit Failure) - a continuous and on-demand DTC that may set if a short to ground is present from the illumination supply circuit.
- B2027 (LED Backlighting Output Circuit Failure) - a continuous and on-demand DTC that may set if a short to ground is present from the illumination supply circuit.

This pinpoint test is intended to diagnose the following:





- Wiring, terminals or connectors
- Four-Wheel Drive (4WD) mode select switch
- Memory set switch (if equipped)
- HVAC module
- Heated seat/windshield switch (if equipped)
- Auxiliary climate control switches (if equipped)
- Adjustable pedal switch (if equipped)
- Message center switch (if equipped)
- Traction control switch (if equipped)
- Headlamp switch
- Floor shifter
- Door lock control switch
- Heated mirror switch
- SJB



PINPOINT TEST D: AN INDIVIDUAL/MORE THAN ONE HARDWIRED COMPONENT ILLUMINATION IS INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
D1 CHECK THE ILLUMINATION SOURCE(S) OPERATION	
	Yes For the floor shifter

• Place the headlamp switch in the PARKING LAMPS ON position and turn the dimmer switch to the full illumination position. • **Is only one illumination source inoperative?**	on vehicles without auxiliary climate controls and with automatic temperature control, GO to D2 . For all others, GO to D3 . **No** GO to D2 .
D2 CHECK THE ILLUMINATION OUTPUT FOR A SHORT TO GROUND	
NOTE: If the jumper wire fuse fails, refer to the Wiring Diagrams Manual to identify the possible causes of the circuit short. • Ignition OFF. • Disconnect: SJB C2280a (Door Lock Control Switches). • Disconnect: SJB C2280c (Dimmable Components). • If both door lock control switches are inoperative, connect a fused jumper wire between the SJB C2280a-9, circuit CBP05 (YE), harness side and battery positive.  N0088207 • If the floor shifter is inoperative, connect a fused jumper wire between the SJB C2280c-10, circuit CLN04 (BU/BN), harness side and battery positive.  N0075536 • If all other instrument panel switch illumination is inoperative, connect a fused jumper wire between the SJB C2280c-28, circuit CLN04 (BU/BN), harness side and battery positive.	**Yes** REMOVE the jumper wire. GO to D5 . **No** REMOVE the jumper wire. For the floor shifter on vehicles without auxiliary climate controls and with automatic temperature control, GO to D3 . For all others, REPAIR the circuit in question for an open. TEST the system for normal operation.

N0075537

- **Do the components in question illuminate?**

D3 CHECK THE VOLTAGE TO THE SINGLE ILLUMINATION SOURCE FOR AN OPEN

NOTE: If the headlamp switch is the inoperative source, unplug the headlamp switch connector to measure the illumination circuit voltage. Unplugging the connector causes the SJB to turn the exterior lights on by default for 10 minutes, so it is unnecessary to turn the headlamp switch on.

- Connect: SJB C2280c.
- Ignition OFF.
- Disconnect: Inoperative Illumination Source.
- Place the headlamp switch to the PARKING LAMPS ON position.
- Rotate the instrument panel dimmer switch to the full illumination position.
- Measure the voltage between the inoperative illumination source, harness side and ground as follows:

Component	Connector-Pin	Circuit
4WD mode select switch	C284-1	CLN04 (BU/BN)
Memory set switch	C2094-3	CLN04 (BU/BN)
Heated seat/windshield switch	C2347-1	CLN04 (BU/BN)
HVAC module (automatic climate control)	C228b-16	CLN04 (BU/BN)
HVAC module (manual climate control)	C294c-10	CLN04 (BU/BN)
Auxiliary climate control	C951b-6	CLN04 (BU/BN)
Adjustable pedals switch	C2089-5	CLN04 (BU/BN)
Message center switch	C253-1	CLN04 (BU/BN)
Traction control switch	C280-3	CLN04 (BU/BN)
Headlamp switch	C205-2	CLN04 (BU/BN)
Floor shifter	C2008-7	

Yes
GO to D4 .

No
REPAIR the circuit in question for an open. TEST the system for normal operation.

		CLN04 (BU/BN)
LH door lock control switch	C505-2	CBP05 (YE)
RH door lock control switch	C605-2	CBP05 (YE)
Heated mirror switch	C2382-5	CLN04 (BU/BN)

- **Is the voltage greater than 10 volts?**

D4 CHECK THE GROUND CIRCUIT TO THE SINGLE ILLUMINATION SOURCE FOR AN OPEN

- Place the headlamp switch in the OFF position.
- Disconnect: Negative Battery Cable.
- Measure the resistance between the inoperative illumination source, harness side and ground as follows:

Component	Connector-Pin	Circuit
4WD mode select switch	C284-4	GD138 (BK/WH)
Memory set switch	C2094-4	GD138 (BK/WH)
Heated seat/windshield switch	C2347-6	GD138 (BK/WH)
HVAC module (automatic climate control)	C228a-2	GD145 (BK/BU)
HVAC module (manual climate control)	C294c-6	GD138 (BK/WH)
Auxiliary climate control	C951a-1 C951b-9	GD149 (BK/GY)
Adjustable pedals switch	C2089-4	GD138 (BK/WH)
Message center switch	C253-4	GD138 (BK/WH)
Traction control switch	C280-2	GD138 (BK/WH)
Headlamp switch	C205-1	GD138 (BK/WH)
Floor shifter	C2008-6	GD138 (BK/WH)
LH door lock control switch	C505-4	GD133 (BK)
RH door lock control switch	C605-4	GD151 (BK/GN)
Heated mirror switch	C2382-6	GD138 (BK/WH)

Yes
INSTALL a new component in question. TEST the system for normal operation.

No
REPAIR the ground circuit in question for an open. TEST the system for normal operation.

• **Is the resistance less than 5 ohms?**	
D5 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test E: The Control Illumination Is Always On - All Hardwired Illumination

Refer to Wiring Diagrams Cell 71 , Cluster and Panel Illumination for schematic and connector information.

Normal Operation

The Smart Junction Box (SJB) supplies a pulse-width modulated voltage signal to the dimmable illumination sources on circuit CLN04 (BU/BN).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- SJB

PINPOINT TEST E: THE CONTROL ILLUMINATION IS ALWAYS ON - ALL HARDWIRED ILLUMINATION

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
E1 CHECK THE EXTERIOR LIGHTING	
• Ignition OFF. • Place the headlamp switch in the OFF position. • Observe the exterior lighting components. • **Are any exterior lighting components illuminated?**	**Yes** REFER to Section 417-01 . **No** GO to E2 .
E2 CHECK THE DIMMABLE LIGHTING OUTPUT FOR A SHORT TO VOLTAGE	
• Disconnect: SJB C2280c.	**Yes** REPAIR circuit CLN04 (BN/BU) for a short to

• Disconnect: SJB C2280a. • Ignition ON. • **Do any dimmable backlighting components continue to illuminate?**	voltage. TEST the system for normal operation. **No** GO to E3 .
E3 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

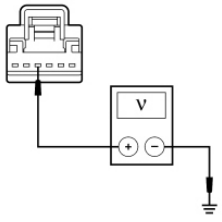
Pinpoint Test F: All Control Illumination Does Not Dim

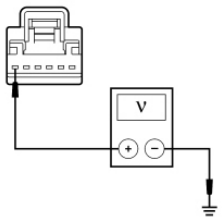
Refer to Wiring Diagrams Cell 71 , Cluster and Panel Illumination for schematic and connector information.

Normal Operation

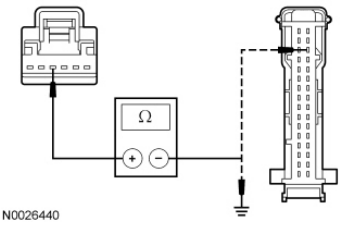
The Smart Junction Box (SJB) monitors the input from the instrument panel dimmer switch by sending a voltage reference signal through circuit CLN27 (WH/BN) to the instrument panel dimmer switch. The return signal is sent through circuit CLN17 (BN) back to the SJB . Based on the input, the SJB sends a pulse-width modulated voltage signal to the dimmable illumination sources. If the SJB detects a concern with the circuitry to the instrument panel dimmer switch, the SJB defaults the backlighting to a full intensity level.

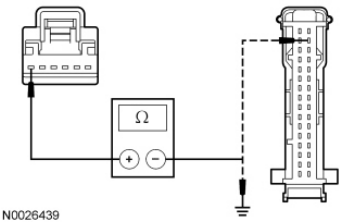
- DTC B2121 (Illumination Switch Short to Battery) - a continuous and on-demand DTC that may set when the SJB detects an open or short to voltage on the illumination dimmer switch input circuit.
- DTC B2132 (Dimmer Switch Circuit Short to Gnd) - a continuous and on-demand DTC that may set when the SJB detects a short to ground on the dimmer switch input circuit.





This pinpoint test is intended to diagnose the following:





- Wiring, terminals or connectors
- Instrument panel dimmer switch
- SJB

PINPOINT TEST F: ALL CONTROL ILLUMINATION DOES NOT DIM

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

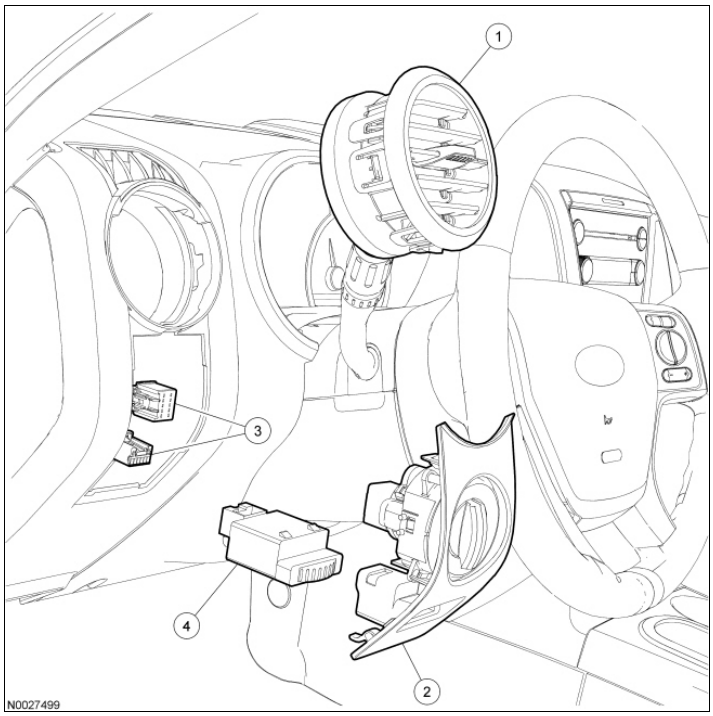
Test Step	Result / Action to Take
F1 CHECK THE INSTRUMENT PANEL DIMMER SWITCH	
• Ignition OFF. • Disconnect: Instrument Panel Dimmer Switch C2298.	**Yes** GO to F2 .

• Carry out the instrument panel dimmer switch component test. Refer to Wiring Diagrams Cell 149 for component testing. • **Is the instrument panel dimmer switch OK?**	**No** INSTALL a new instrument panel dimmer switch. REFER to Instrument Panel Dimmer Switch in this section. TEST the system for normal operation.
F2 CHECK CIRCUIT CLN17 (BN) FOR A SHORT TO VOLTAGE	
• Disconnect: SJB C2280d. • Ignition ON. • Measure the voltage between the instrument panel dimmer switch C2298-4, circuit CLN17 (BN), harness side and ground.  N0026447 • **Is any voltage present?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to F3 .
F3 CHECK CIRCUIT CLN27 (WH/BN) FOR A SHORT TO VOLTAGE	
• Measure the voltage between the instrument panel dimmer switch C2298-6, circuit CLN27 (WH/BN), harness side and ground.  N0026448 • **Is any voltage present?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** GO to F4 .
F4 CHECK CIRCUIT CLN17 (BN) FOR AN OPEN OR SHORT TO GROUND	
• Ignition OFF. • Measure the resistance between the instrument panel dimmer switch C2298-4, circuit CLN17 (BN), harness side and the SJB C2280d-19, circuit CLN17 (BN), harness side; and between the instrument panel dimmer switch C2298-4, circuit CLN17 (BN), harness side and ground.	**Yes** GO to F5 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

 N0026440 • **Is the resistance less than 5 ohms between the instrument panel dimmer switch and the SJB and greater than 10,000 ohms between the instrument panel dimmer switch and ground?**	
F5 CHECK CIRCUIT CLN27 (WH/BN) FOR AN OPEN OR SHORT TO GROUND	
• Measure the resistance between the instrument panel dimmer switch C2298-6, circuit CLN27 (WH/BN), harness side and the SJB C2280d-18, circuit CLN27 (WH/BN), harness side; and between the instrument panel dimmer switch C2298-6, circuit CLN27 (WH/BN), harness side and ground.  N0026439 • **Is the resistance less than 5 ohms between the instrument panel dimmer switch and the SJB and greater than 10,000 ohms between the instrument panel dimmer switch and ground?**	**Yes** GO to F6 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
F6 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Instrument Cluster Bulb

1. Remove the Instrument Cluster (IC). For additional information, refer to Section 413-01 .

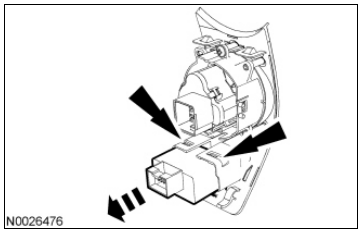


2. **NOTE:** To remove the illumination bulb, rotate the bulb one quarter turn counterclockwise and lift out from the IC .

   Remove the illumination bulb(s).

3. To install, reverse the removal procedure.

Instrument Panel Dimmer Switch



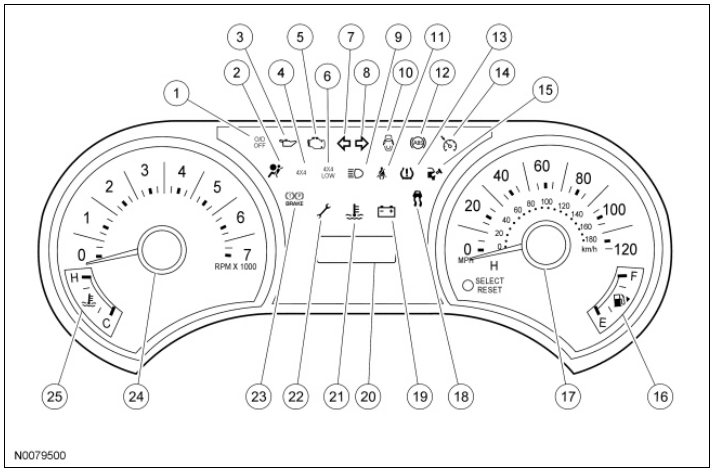
Item	Part Number	Description
1	19893	Driver side register
2	04338	Headlamp switch and bezel
3	-	Headlamp switch electrical connectors (part of 14401)
4	11691	Instrument panel dimmer switch

Removal and Installation

1. Remove the driver side register.

2. Remove the headlamp switch and bezel as an assembly.
   - Disconnect the electrical connectors.

3. Release the 2 tabs and remove the instrument panel dimmer switch.



4. To install, reverse the removal procedure.

Instrument Cluster (IC)

NOTE: Base Instrument Cluster (IC) shown, other clusters are similar.

NOTE: The Smart Junction Box (SJB) is also known as the Generic Electronic Module (GEM).

Item	Part Number	Description
1	-	Overdrive (O/D) off indicator
2	-	Air bag warning indicator
3	-	Low engine oil pressure warning indicator
4	-	Four-Wheel Drive (4WD) high indicator
5	-	Malfunction Indicator Lamp (MIL) indicator
6	-	4WD low indicator
7	-	LH turn indicator
8	-	RH turn indicator
9	-	High beam indicator
10	-	Door ajar warning indicator
11	-	Safety belt warning indicator
12	-	ABS warning indicator
13	-	Low Tire Pressure Monitoring System (TPMS) indicator
14	-	Speed control indicator
15	-	Check fuel cap indicator (base IC only)
16	-	Fuel gauge
17	-	Speedometer
18	-	Traction control with Roll Stability Control (RSC®) indicator
19	-	Charging system indicator (base IC only)
20	-	Message center/integrated display
21	-	

		Engine over temperature warning indicator (base IC only)
22	-	Powertrain malfunction (wrench) indicator (base IC only)
23	-	Brake warning indicator
24	-	Tachometer
25	-	Engine coolant temperature gauge

The Instrument Cluster (IC) is available with an integrated Liquid Crystal Display (LCD) (base IC) or with a message center (high series IC). Both the base IC and the message center IC contain gauges, indicator lamps, and warning lamps that are designed to provide the driver with a system status and to alert the driver that certain conditions exist in the vehicle. The IC lens and mask assembly, and some of the indicator bulbs are the only parts that may be installed separately.

Gauges

Gauges provide information to the driver indicating the status of systems. The system that use gauges are as follows:

- Engine coolant temperature
- Engine rpm
- Fuel level
- Vehicle speed

Informational Indicators

Informational indicators provide information to the driver of conditions that exist in the vehicle. The informational indicators are grouped into the following system/subsystems:

- Engine/powertrain control
  - ♦ Malfunction Indicator Lamp (MIL)
  - ♦ Powertrain malfunction (wrench)
  - ♦ Transmission (overdrive)
  - ♦ Evaporative emission system
- Lighting
  - ♦ High beam
  - ♦ Turn signal
- Vehicle control
  - ♦ Speed control
  - ♦ Traction control
  - ♦ 4WD control

Warning Indicators

Warning indicator lamps provide information to the driver of conditions that could potentially alter vehicle performance. The warning indicators are grouped into the following system/subsystem:

- Engine/powertrain control
  - ♦ Charging system
  - ♦ Low engine oil pressure
  - ♦ Engine over-temperature
- Occupant/drive safety
  - ♦ Door ajar
  - ♦ Safety belt

    - Low Tire Pressure Monitoring System (TPMS)
    - Supplemental Restraint System (SRS) (air bag)
- Vehicle control
    - ABS
    - Brake system

Hardwired Inputs

The hardwired inputs are provided from the following systems or components:

- Engine oil pressure switch
- Fuel level
- Message center switch
- Compass
- Washer fluid level
- Outside air temperature

Network Message Inputs

Module messaging is becoming the standard for sending and receiving information required to operate the IC . For a complete list of module messages with the message origination sources, refer to Section 418-00 .

The status and information message that the IC requires from other vehicle inputs are grouped into the following systems/subsystems:

- ABS
    - Anti-lock braking
    - Traction control
- Base brake system
    - Brake fluid level status
    - Parking brake status
- Lighting system
    - LH/RH turn
    - High beam
- Powertrain
    - Charging
    - Engine rpm
    - Overdrive (O/D) off
    - Engine temperature
    - Evaporative emission system
    - Vehicle speed
    - SRS
    - TPMS
    - 4WD control

Information And Message Center

The message center is a Liquid Crystal Display (LCD), integrated into the Instrument Cluster (IC). The message center functions are controlled by the SELECT/RESET button on base IC , and by the message center switches on high series IC . The base series IC message center has a display format of 2 lines x 12 characters, and the high series IC message center has a display format of 4 lines x 12 characters. The message center displays important vehicle information by constantly monitoring different vehicle systems. The message center notifies the driver of a potential vehicle problem by displaying a warning message pertaining to the system in which a fault has been detected.

The message center information can be selected through the SELECT/RESET button (base instrument cluster [IC]) and by the INFO, SETUP, and RESET buttons (high series IC).

The message center provides the following features:

- Information displays
- Setup displays
- System check messages
- Warning messages

Outside Air Temperature Sensor (IC Without Electronic Automatic Temperature Control (EATC))

The IC receives the outside air temperature data from the outside air temperature sensor. This data is then displayed on the message center. The outside air temperature sensor is located on the radiator core support behind the front grill assembly and is fastened with a pin-type retainer. If equipped with EATC , the outside air temperature data from the outside air temperature sensor is displayed in the HVAC module. Refer to Section 412-00 for the outside air temperature display in the EATC .

Compass

The compass heading is displayed as one of N, NE, E, SE, S, SW, W and NW in the message center display. The compass reading may be affected when you drive near large buildings, bridges, power lines and powerful broadcast antenna. Magnetic or metallic objects placed in, on or near the vehicle may also affect compass accuracy. The compass sensor module is mounted behind the interior rear view mirror.

Message Center Configuration

The message center has the capability of configuring items such as language and display units (English or metric) as well as a variety of systems on/off status such as easy entry (if equipped) or auto locks.

Oil Life and Oil Life Start Value

The oil life is displayed in percentages and is preset to a maximum of approximately 12,000 km (7,500 miles) or 180 days. The oil life start value is used to increase or decrease the starting point of the oil life. The value can be changed back to the maximum of approximately 12,000 km (7,500 miles) if the value was previously changed or to lower the value by 10% increments down to 30%. Each 10% reduction lowers the oil life in both mileage and the days.

For example, if the oil life start value is lowered to 50%, the maximum mileage is 6,000 km (3,750 miles) or 90 days. The oil life remains at the selected setting (50% in this example) until the driver changes the oil life

start value. When the oil life (**not oil life start value**) is reset back to 100% following an oil change, the oil life resets to 6,000 km (3,750 miles). For configuration of the oil life and oil life start value, refer to Message Center Configuration in this section.

Information Displays

Base Instrument Cluster (IC)

The information displays are non-timed modes. The selected mode remains on until the driver presses the SELECT/RESET switch to change the mode, or until it is overridden by another mode. The information display modes are:

- Odometer/trip odometer, compass headings
- Outside air temperature display (if equipped)
- Distance to empty
- Average fuel economy
- Setup menu

High Series Instrument Cluster (IC)

The information displays are non-timed modes. The selected mode remains on until the driver presses a message center switch to change the mode, or until it is overridden by another mode. The information display modes are:

- Odometer/trip odometer, compass headings, outside air temperature display
- Distance to empty
- Average fuel economy
- Instantaneous fuel economy
- Fuel used
- Trip elapsed drive time
- Blank

Setup Displays

Base Instrument Cluster (IC)

The setup displays are timed modes and terminate after a finite interval. Press the SELECT/RESET button to scroll through the SETUP MENU display sequence. If the SELECT/RESET button is not pressed within 4 seconds, the message center returns to the INFO MENU. The setup display modes are:

- System check
- Units (English/metric)
- Language
- Autolamp
- Autolock
- Auto-unlock
- Parking aid (if equipped)
- Oil life reset and start value
- Trailer sway control

High Series Instrument Cluster (IC)

The setup displays are timed modes and terminate after a finite interval. Press the SETUP button for the following displays:

- System check
- Units (English/metric)
- Language
- Autolamp
- Autolock
- Auto-unlock
- Running boards (if equipped)
- Easy entry/exit seat (if equipped)
- Parking aid (if equipped)
- Compass zone
- Compass calibration
- Oil life reset and start value
- Trailer sway control

System Check Displays

Selecting this function from the SETUP MENU causes the message center to cycle through each of the systems being monitored. For each of the monitored systems, the message center indicates either an OK message or a warning message for 2 seconds. For base IC , the SELECT/RESET button must be held down after pressing the SELECT/RESET button to cycle the messages through each of the systems being monitored. For high series IC , pressing the RESET control switch cycles the message center through each of the systems being monitored. The system check report is as follows:

- OIL LIFE
- CHARGING SYSTEM
- WASHER FLUID
- DOOR AJAR
- EXTERIOR LAMPS
- BRAKE FLUID LEVEL
- PARK BRAKE
- FUEL LEVEL AND DISTANCE TO EMPTY (high series IC)
- MILES TO EMPTY (base IC)
- FUEL LEVEL LOW (base IC)

System Warnings

The system warnings alert the operator to possible problems or malfunctions in the vehicle operating systems. The message center displays the last selected feature if there are no more warning messages. This allows the operator full functionality of the message center after acknowledgement of the warning message by pressing the reset button and clearing the message. The warning messages are divided into 4 categories:

- They cannot be cleared until the condition is corrected.
- They reappear on the display 10 minutes from the reset if the condition has not been corrected.
- They do not reappear until an ignition OFF-ON cycle has been completed.
- They reappear if the condition clears then reoccurs within the same ignition ON-OFF cycle.

The warning displays that cannot be reset are:

- DOOR AJAR

The warning messages that reoccur after 10 minutes are:

- FUEL LEVEL LOW
- PARK BRAKE ENGAGED

- CHECK BRAKE SYSTEM

The warning messages that display whenever the ignition switch is turned from the OFF position to the ON position are:

- CHECK PARK AID (if equipped)
- BRAKE FLUID LEVEL LOW
- CHECK HEADLAMP
- CHECK HIGHBEAM
- CHECK TURN LAMP
- WASHER FLUID LOW LEVEL
- OIL CHANGE REQUIRED
- ENGINE OIL CHANGE SOON
- TRAILER SWAY REDUCE SPEED

The warning messages that return after a condition has cleared then reoccurs within the same ignition ON-OFF cycle are:

- LIFTGATE/GLASS AJAR
- CLEAR OBJECTS BY PASS SEAT
- CHECK CHARGING SYSTEM
- LOW TIRE PRESSURE
- TIRE MONITOR FAULT
- TIRE SENSOR FAULT

The message center displays messages that indicate a system state during the operation of the Four-Wheel Drive (4WD) system. The displayed warning messages are as follows:

- FOR 4X4 LOW STOP VEHICLE (if equipped)
- FOR 4X4 LOW SHIFT TO N (if equipped)
- TO EXIT 4X4 LOW STOP VEHICLE (if equipped)
- TO EXIT 4X4 LOW SHIFT TO N (if equipped)

The message center displays messages that indicate a system state during repair procedures related to the tire pressure monitoring system (TPMS). The displayed warning messages are as follows:

- TRAIN TIRES
- TIRES TRAINED
- TIRES NOT TRAINED

The message center displays messages that indicate a system state during repair procedures related to the compass display. The displayed warning messages are as follows:

- COMPASS ZONE XX (base IC)
- RESET FOR ZONE SETTING (high series IC)
- ZONE XX RESET TO CHANGE (high series IC)
- ZONE XX IS SET
- PRESS RESET FOR CALIBRATION (high series IC)
- CIRCLE SLOW TO CALIBRATE (base IC)
- CIRCLE SLOWLY TO CALIBRATE (high series IC)
- CALIBRATION COMPLETED

The message center displays messages that indicate a system state during repair procedures related to the oil life and oil life start value. The displayed warning messages are as follows:

- HOLD RESET IF NEW OIL
- OIL LIFE SET TO 100%
- OIL LIFE START VALUE SET TO XXX% (high series IC)
- OIL LIFE SET TO XXX% (base IC)

Warning Chimes

The warning chime sounds to remind or alert the driver:

- To turn the headlamps off when exiting the vehicle.
- To remove the ignition key when exiting the vehicle.
- To close the doors after starting the vehicle.
- To fasten the safety belt after starting the vehicle.
- To turn off the turn signal.
- To disengage the parking brake.
- That a fault is present in the air bag warning indicator circuit.
- When the message center displays a door ajar, Tire Pressure Monitoring System (TPMS), and/or a low fuel level warning message.

The Instrument Cluster (IC) controls the warning chime function using various inputs to determine when to sound the warning chime. The warning chime sounds:

- If the headlamps are on with the key removed from the ignition lock cylinder and the driver door is ajar.
- If the key is in the ignition lock cylinder in the OFF position and the driver door is ajar.
- If a door is ajar and the ignition key is in the ON position.
- If the safety belts are not fastened and the ignition key is in the ON position.
- If the turn signal is on for more than 3.2 km (2 miles).
- If the parking brake is engaged and the vehicle is moving at a speed higher than 5 km/h (3 mph).
- If the ignition switch is in the ON position, a secondary air bag warning chime request is received from the Restraints Control Module (RCM), and the IC determines a fault is present in the air bag warning indicator.
- When the message center displays a door ajar, TPMS, and/or a low fuel level warning message.

Audible signals are also provided to confirm operation of the following vehicle systems:

- Turn signal
- Hazard signal

Instrumentation, Message Center and Warning Chimes

Special Tool(s)

 ST1137-A	73III Automotive Meter 105-R0057 or equivalent
 ST1473-A	Instrument Gauge System Tester 014-R1063 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
 ST2574-A	Flex Probe Kit 105-R025C or equivalent

Principles of Operation

NOTE: The Smart Junction Box (SJB) is also known as the Generic Electronic Module (GEM).

NOTE: Whenever a network message is suspected as missing and confirmed by a missing message DTC (U-code), it is important to look for other symptoms that may also be present in the Instrument Cluster (IC) and throughout the vehicle. Once a DTC is set in the IC , it may be helpful to review the complete message list available in Section 418-00 to see what other modules also rely on the same message and run the self-test for those modules. If the message is missing from other modules, the same DTC may also be set in those modules. Confirmation of missing messages common to multiple modules may indicate that the originating module is the source of the concern or the communication network may be experiencing some problems.

The IC utilizes a microprocessor to control the gauge, indicator, message center and warning chime functions. Data is sent to the IC over the High Speed Controller Area Network (HS-CAN), the Medium Speed Controller Area Network (MS-CAN) and through hardwired circuitry from individual components. The IC uses each input to output an action to the gauges or indicators.

The IC uses input messages from other modules to control the gauges, informational indicators, warning indicators and reconfigurable telltale indicators over the communication networks. If a required message is missing or invalid for less than 5 seconds, the gauge or indicator that requires the message remains at the last commanded state based upon the last known good message. For example, if the brake status message is missing for less than 5 seconds and the brake warning indicator was on, the indicator remains in the on state until the next good message is received. If the message remains missing or invalid for greater than 5 seconds, the IC sets a U-code DTC and the output becomes a default action for the indicator or gauge. Each indicator or gauge utilizes a different default strategy depending on the nature of the indication. Refer to the normal operation descriptions located before each individual pinpoint test for a further description of the default action specific to each indicator or gauge. If the messaged input to the IC returns at any time, the normal function of the gauge or indicator resumes.

It is very important to understand:

- where the input originates.
- all the information necessary in order for a feature to operate.
- which module(s) receive(s) the input or command message.
- does the module which received the input control the output of the feature, or does it output a message over the communication network to another module.
- which module controls the output of the feature.

Instrument Cluster (IC)

IC Gateway Function

The IC acts as a gateway module by receiving information in one format and transmitting it to other modules using another format. For example, the IC receives the vehicle speed data from the PCM over the HS-CAN , converts the data into a MS-CAN message and sends (gateways) the message to other network modules such as the HVAC module, the Audio Control Module (ACM), and the SJB . This enables network communication between modules that do not communicate using the same network (HS-CAN or the MS-CAN).

IC Configuration

The IC contains items that are configurable. While some configurable items are customer preference items, which are configurable using the scan tool, most items are configured at the end of the line production and only available for configuration using the Programmable Module Installation (PMI) procedures. Refer to PMI in Section 418-01 for module configuration.

NOTE: When installing a new IC , it is necessary to upload the module configuration to the scan tool. Following installation of the IC , download the module configuration from the scan tool into the new IC . Refer to Section 418-01 to carry out PMI . Following installation of a new IC , the IC and the PCM need to be mated. Refer to Section 419-01 to carry out a parameter reset procedure.

The following are the configurable customer preference items:

- Auto lock
- Auto-unlock
- Belt-Minder®
- Language
- Oil life warning threshold

IC Prove-Out

The IC and other vehicle modules carry out a display prove-out to verify that all module controlled warning/indicator lamps and monitored systems are functioning correctly within the IC . When the ignition switch is cycled to the ON position with the engine off, the indicators illuminate to prove-out according the following table:

Indicator	Indicator Type	Prove-Out Duration
Air bag	Warning	6 seconds
ABS	Warning	3 seconds

Brake	Warning	3 seconds
Charge	Informational	Engine start up
Check fuel cap (Sport Trac base IC only)	Informational	3 seconds
Door ajar	Warning	No prove-out
Engine coolant over-temperature	Warning	3 seconds
Four-Wheel Drive (4WD) low	Informational	3 seconds (if equipped)
4WD high	Informational	3 seconds (if equipped)
High beam	Informational	No prove-out
Low engine oil pressure	Warning	Engine startup
Malfunction Indicator Lamp (MIL)	Warning	Engine startup
Overdrive (O/D) off	Informational	No prove-out
Powertrain malfunction (wrench) (base IC)	Informational	3 seconds
RH/LH turn signals	Informational	No prove-out
Safety belt	Warning	60 seconds if the safety belt is unbuckled, turns off when the safety belt is buckled
Speed control	Informational	No prove-out
Traction control/stability assist	Informational	3 seconds
Tire Pressure Monitoring System (TPMS)	Warning	3 seconds

Information And Message Center

The message center is an integral part of the IC that receives and acts upon much of the same information that is input and used to operate the IC gauges, informational indicators, and warning indicators. The message center, located in the center of the IC is a Liquid Crystal Display (LCD). The message center electronic functions use both hardwired and the Controller Area Network (CAN) circuitry to transmit and receive information.

Whenever conditions are present that require a warning message, the message center replaces the last selected display with the new warning display. Once the message is reset or cleared, the message center returns to the last selected display. If multiple warnings are present, the message center displays each warning for approximately 4 seconds. Warning messages are also generally associated with other observable IC indications. For example, when the LH front door is opened, the message center displays the message DRIVER DOOR AJAR along with the door ajar warning indicator. This allows the message center to be a more informative supplement to the IC gauges and indicators.

Trailer Sway Message

The message center provides the trailer sway message to inform the driver that the current traction control event is due to trailer sway. If the ABS module determines that the trailer is causing the vehicle to sway, the traction control/stability assist indicator is turned on along with the TRAILER SWAY REDUCE SPEED message in the message center.

Warning Chimes

The IC uses different chimes to alert the driver of various vehicle conditions as follows:

- Safety belt warning (repetitive chime)
- Belt-Minder® warning (repetitive chime after a delay and after the safety belt chime is completed)
- Key-in-ignition warning (repetitive chime)
- Headlamps on warning (repetitive chime)
- Turn signal on warning (single tone chime after 3.2 km [2 miles])
- Turn signal tone (tick-tock chime)
- Parking brake warning (repetitive chime)
- Air bag secondary warning chime (repetitive chime)
- Message center general tone (single tone)

Safety Belt Warning Chime

The safety belt warning chime warns that the safety belt is not fastened. The safety belt warning chime sounds when the driver safety belt is not fastened and the ignition key is turned from the OFF/LOCK or ACC to the RUN or START position.

The safety belt warning chime stops sounding when the safety belt is fastened, when the ignition key is turned from the RUN or START position to the OFF/LOCK or ACC position, or when the chime has sounded for approximately 6 seconds.

The safety belt warning chime inputs are the:

- Ignition switch RUN/START status
- Driver safety belt switch data communicated by the Restraints Control Module (RCM) to the IC through the CAN

Belt-Minder®

The Belt-Minder® is configurable. To configure using a scan tool, refer to Section 418-01 . To configure without using a scan tool, refer to Belt-Minder® Deactivating/Activating in this section.

The Belt-Minder® feature supplements the current safety belt warning function. The Belt-Minder® is enabled after the current safety belt warning is complete. The Belt-Minder® reminds the driver that the driver or passenger safety belt is unbuckled by intermittently sounding a chime and illuminating the safety belt warning lamp in the IC once the vehicle speed exceeds 5 km/h (3 mph). While activated, the Belt-Minder® alternates the chime and indicator from on for 6 seconds to off for 60 seconds.

NOTE: The Belt-Minder® is disabled for one ignition switch on cycle if the safety belt is buckled then unbuckled during that specific cycle.

Key-In-Ignition Warning Chime

The key-in-ignition warning chime warns that the key is still in the ignition lock cylinder when the driver door is ajar. The key-in-ignition warning chime sounds when the driver door is ajar, the key is in the ignition lock cylinder and in the OFF/LOCK or ACC position.

The key-in-ignition warning chime stops sounding when the driver door is closed, the key is removed from the ignition lock cylinder, or if the ignition key is turned to the RUN position.

The key-in-ignition warning chime inputs are the:

- Ignition switch RUN/START status
- Door ajar data communicated by the SJB to the IC through the CAN
- Key-in-ignition switch signal from the ignition switch

Headlamps On Warning Chime

The headlamps on warning chime warns that the headlamps are on when the driver door is ajar and the key is removed from the ignition lock cylinder. The headlamps on warning chime sounds if the driver door is ajar, the headlamp switch is in the HEADLAMP or PARKING LAMP on position, and the ignition switch in the OFF/LOCK position.

The headlamps on warning chime stops sounding when any one of the above conditions are removed.

The headlamps on warning chime inputs are the:

- Ignition switch RUN/START status
- Driver door ajar data communicated by the SJB to the IC through the CAN
- Headlamp switch data communicated by the SJB to the IC through the CAN

Turn Signal On Warning Chime

The turn signal on warning chime warns that the turn signal has not been cancelled. The turn signal on warning chime sounds if the left or right turn signal is on and the vehicle has traveled more than 3.2 km (2 miles).

The turn signal on warning chime stops sounding if the turn signal is turned off, or if the ignition key is turned to the OFF or ACC position.

The turn signal on warning chime inputs are the:

- Turn signal data communicated by the SJB to the IC through the CAN communication
- Odometer count data communicated by the PCM to the IC through the CAN

Parking Brake Warning Chime

The parking brake warning chime warns that the parking brake is engaged when the vehicle is in motion. The parking brake warning chime sounds if the ignition key is in the RUN position, the parking brake is engaged, and the vehicle speed is greater than 5 km/h (3 mph).

The parking brake warning chime stops sounding if the parking brake is released, the ignition key is not in the RUN position, or if the vehicle speed is less than 5 km/h (3 mph).

The parking brake warning chime inputs are the:

- Ignition switch RUN/START status
- Parking brake switch data communicated by the SJB to the IC through the CAN
- Vehicle speed data communicated by the PCM to the IC through the CAN

Air Bag Secondary Warning Chime

The air bag secondary warning chime warns that the air bag warning indicator light does not work correctly. The IC monitors the air bag warning indicator status internally. When a fault is present in the air bag warning indicator and the IC receives an air bag warning indicator on request from the RCM , the air bag secondary warning chime sounds.

The air bag secondary warning chime inputs are the:

- Ignition switch RUN/START status
- Air bag warning indicator request data communicated by the RCM to the IC

Turn/Hazard On Tone

The turn/hazard on tone provides an audible tick-tock in addition to the turn/hazard indicator lamps. The turn/hazard on tone sounds if the turn or hazard signals are on.

The turn/hazard on tone inputs are the:

- Left turn indicator signal from the SJB to the IC
- Right turn indicator signal from the SJB to the IC

Message Center Warning Chime

The message center warning chime sounds when a new warning message is displayed on the message center. If multiple warning messages are present, a chime tone sounds for each of the warnings that are displayed. The message center warning chime inputs are the warning messages displayed on the message center. The message center warning chime sounds to alert the driver when a concern is detected in one of the following systems:

- Tire Pressure Monitoring System (TPMS)
- Door ajar
- Low fuel level

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Accessory drive belt • Brake fluid level • Door adjustment • Engine coolant level • Engine oil level • Fuel tank • Fuel evaporative system • Liftgate adjustment • Tire pressure • Washer fluid level	• Smart Junction Box (SJB) fuse(s): ♦ 8 (15A) ♦ 18 (10A) ♦ 24 (10A) • Wiring, terminals or connectors • Bulb(s) • Message center switch • Key-in-ignition warning switch (part of the ignition switch) • Instrument Cluster (IC)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before

proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM .
   - Refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the IC , ABS module, Restraints Control Module (RCM), SJB and PCM.

9. If the DTCs retrieved are related to the concern, go to DTC Charts. For all other DTCs, refer to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart - Instrument Cluster (IC) , GO to Symptom Chart - Information And Message Center or GO to Symptom Chart - Warning Chimes .

IC Dealer Test Mode

To enter the IC dealer test mode with the engine off, press and hold the SELECT/RESET button (base IC) or the message center RESET button (message center IC). Turn the ignition switch to the ON position and hold the button for approximately 3 to 5 seconds. Release the button and press the reset button one time to display ENGINEERING TEST MODE. Press the reset button once to advance to each stage of the self-test. The information from this mode is displayed in the odometer display. All gauges and lamps will operate normally during this test mode unless otherwise noted.

To exit the IC self-test mode, turn the ignition to the OFF position.

Message Center IC Display	Description
ENGINEERING TEST MODE	Initial entry display into the self-test mode.
GAUGE TEST	Carries out a gauge sweep of all the gauges, then displays the present gauge values.
	Carries out the prove-out of all dot matrix pixels in all characters.

All pixels illuminated	
TELLTALE TEST	Illuminates all the micro-controlled lamps and LEDs.
PART NUMBER, XXXX - XX	Return to normal operation of all micro controlled lamps/LEDs and displays the alpha-numeric prefix and suffix IC part number.
ROM LEVEL $XXXX	Carries out checksum tests on ROM. Displays Hex and ROM level and type.
NVM LEVEL $XX	Carries out checksum tests on NVM.
MANUFACTURE DATE $XXXX	Displays the final manufacturing test date.
Auto configuration BYTE 1 $XX	Displays the Hex coding of first (1) byte of module configuration settings.
B&A CONFIG BYTE 1 $XX	Displays the Hex coding of second (2) byte of module configuration settings.
MANUF CONFIG BYTE 1 $XX	Displays the Hex coding of the NVM module configuration settings.
CONTINUOUS DTC $XXXX	Displays a 16-bit DTC in hexadecimal format. DTCs displayed are those detected in continuous operation, not during the self-test.
VEHICLE SPD XXX.X MPH	Displays the English speed value being input. The speedometer indicates the present speed.
VEHICLE SPD XXX.X KMH	Displays the metric speed value being input. The speedometer indicates the present speed.
TACHOMETER XXXX RPM	Displays the tachometer value being input to the IC . Tachometer indicates present rpm.
FUEL LEVEL XXX INST	Displays the present fuel level analog/digital ratio input in decimal. The IC indicates present fuel level.
FUEL LEVEL %, STATUS XXX	Displays the present fuel level percent status in decimal.
INSTANT DTE XXX MILES	Displays the instant calculated DTE.
FUEL ON/OFF Z XXX XXX XXX	Displays the key-on, key-off and zero speed fuel level values.
F#S ON/OFF Z XXX XXX XXX	Displays the key-on, key-off and zero speed fuel number of samples.
COOLANT TEMP XXX C	Displays the last temperature gauge input value from High Speed Controller Area Network (HS-CAN) in degrees C. The temperature gauge indicates present value.
ODOMETER XXX COUNTS	Displays the odometer input received from HS-CAN in decimal format. Value is a rolling count.
TRIP ODO XXX.X MI	Displays the trip odometer value stored in RAM in miles.
BATTERY XX.X VOLTS	Displays the present VBAT analog/digital readings in volts, compensated to yield voltage at IC input pin.
KEY IN SW X	Displays the input status of key-in-ignition switch.
DIMMING CMD XXX	Displays the Smart Junction Box (SJB) dimming command in decimal.
DIMMING STEP XX	Displays the IC dimming step in decimal.
	Displays the present message center switch input analog/digital counts in decimal.

MC SWITCH XXX A/D CNTS	
LWF OPS OAT X X XXX	Displays the present low washer fluid, oil pressure switch and outside air temperature input analog/digital counts in decimal.
COMPASS XXX	Displays the present input from sensor in decimal.
LAST CHIME SOUNDED XX	Displays either the last chime sounded by the IC or the chime that is presently sounding, this excludes the trip reset button chime used to enter ETM or scroll through ETM. AB = air bag chime, BU = backup, BM = Belt-Minder®, F1 = failsafe cooling 1, F2 = failsafe cooling 2, HL = headlamps on, KI = key in ignition, MB = message center button press, MW = message center warning, OS = overspeed, PB = park brake, SB = seatbelt, TS = turn signal, TR = turn signal reminder, TP = tire pressure low, TL = losing tire pressure, -- = none.
GAUGE TEST	Repeats the test display cycle.

DTC Charts

Instrument Cluster (IC) DTC Chart

DTC	Description	Action
B1203	Fuel Sender Circuit Short to Battery	GO to Pinpoint Test B .
B1204	Fuel Sender Circuit Short to Ground	GO to Pinpoint Test B .
B1213	Anti-Theft Number of Programmed Keys Is Below Minimum	REFER to Section 419-01 .
B1255	Air Temperature External Sensor Circuit Open	GO to Pinpoint Test AE .
B1257	Air Temperature External Sensor Circuit Short to Ground	GO to Pinpoint Test AE .
B1317	Battery Voltage High	GO to Pinpoint Test AO .
B1318	Battery Voltage Low	GO to Pinpoint Test AP .
B1342	ECU is Faulted	CLEAR the DTCs. REPEAT the self-test. If DTC B1342 is still present, REPROGRAM the IC . REFER to Section 418-01 . If the DTC is still present after the reprogramming, INSTALL a new IC . REFER to Instrument Cluster (IC) in this section. TEST the system for normal operation.
B1600	PATS Ignition Key Transponder Signal Is Not Received	REFER to Section 419-01 .
B1601	PATS Received Incorrect Key-Code From Ignition Key Transponder	REFER to Section 419-01 .
B1602	PATS Received Invalid Format Of Key-Code From Ignition Key Transponder	REFER to Section 419-01 .
B1681	PATS Transceiver Module Signal Is Not Received	REFER to Section 419-01 .

B1868	Lamp Air Bag Warning Indicator Circuit Failure	CLEAR the DTCs. REPEAT the self-test. If DTC B1868 is still present, INSTALL a new IC . REFER to Instrument Cluster (IC) in this section. TEST the system for normal operation.
B1915	Air Bag Driver Circuit Failure	CLEAR the DTCs. REPEAT the self-test. If DTC B1915 is still present, INSTALL a new IC . REFER to Instrument Cluster (IC) in this section. TEST the system for normal operation.
B2097	Compass Module Failure	GO to Pinpoint Test AB .
B2103	Antenna Not Connected	REFER to Section 419-01 .
B2141	NVM Configuration Failure	REFER to Section 419-01 .
B2143	NVM Memory Failure	CLEAR the DTCs. REPEAT the self-test. If DTC B2143 is still present, INSTALL a new IC . REFER to Instrument Cluster (IC) in this section. TEST the system for normal operation.
B2431	Transponder Programming Failed	REFER to Section 419-01 .
B2477	Module Configuration Failure	CARRY OUT the IC Programmable Module Installation (PMI). REFER to Section 418-01 . CLEAR the DTCs. REPEAT the self-test. If DTC B2477 is still present, INSTALL a new IC . REFER to Instrument Cluster (IC) in this section.
U0140	Lost Communication With Body Control Module (GEM)	GO to Pinpoint Test AQ .
U0159	Lost Communication With Parking Assist Control Module (PAM)	GO to Pinpoint Test AR .
U0208	Lost Communication With Seat Control Module (DSM)	GO to Pinpoint Test AS .
U0244	Lost Communication With Running Board Control Module (PRB)	GO to Pinpoint Test AT .
U1900	CAN Communication Bus Fault - Receive Error	REPAIR all other DTCs first. CLEAR the DTCs. CYCLE the key off then on and wait 10 seconds. REPEAT the self-test. If DTC U1900 is still present, REFER to Section 418-00 .
U2013	Compass Module is Not Responding	GO to Pinpoint Test AB .
U2023	Fault Received From External Node	DTC U2023 is set when a module receives invalid network data from another module with a faulted input. RETRIEVE and REPAIR all non-network DTCs in the other modules on the network. REFER to Section 419-10 for a list of all DTCs.
U2050	No Application Present	REPROGRAM the IC . REFER to Section 418-01 . If the DTC occurs after the reprogramming, REPROGRAM the IC again. If the DTC is present after each attempt to reprogram, INSTALL a new IC . REFER to Instrument Cluster (IC) in this section. TEST the system for normal operation.

U2051	One or More Calibration Files Missing/Corrupt	CARRY OUT the Programmable Module Installation (PMI) for the IC . REFER to Section 418-01 . If the DTC is still present, INSTALL a new IC . REFER to Instrument Cluster (IC) in this section. TEST the system for normal operation.
U2510	CAN - Invalid data for Vehicle Security	REFER to Section 419-01 .
U2511	CAN - Data Mis-Match (Receive data does not match expected)	REFER to Section 419-01 .
U261A	CAN Data Configuration Setup Mismatch	REFER to Section 419-01 .

PCM DTC Chart

DTC	Description	Action
P0457	Evaporative Emission System Leak Detected (Fuel Cap Loose/Off)	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual first. GO to Pinpoint Test AA .
P0460	Fuel Level Sensor A Circuit	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual first. If sent here from the PC/ED manual, GO to Pinpoint Test B .
P0461	Fuel Level Sensor A Circuit Range/Performance	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual first. If sent here from the PC/ED manual, GO to Pinpoint Test B .
P0462	Fuel Level Sensor A Circuit Low	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual first. If sent here from the PC/ED manual, GO to Pinpoint Test B .
P0463	Fuel Level Sensor A Circuit High	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual first. If sent here from the PC/ED manual, GO to Pinpoint Test B .
All other DTCs	-	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Pinpoint Tests

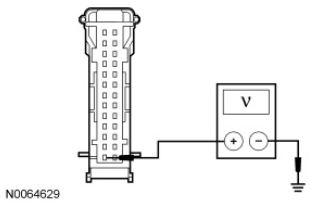
Pinpoint Test A: The Instrument Cluster (IC) Is Inoperative

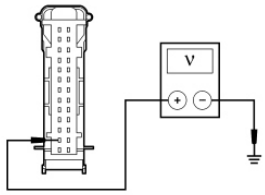
Refer to Wiring Diagrams Cell 60 , Instrument Cluster for schematic and connector information.

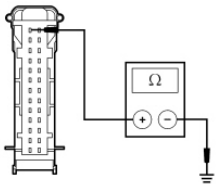
Normal Operation

With the ignition switch in the START or RUN position, the Instrument Cluster (IC) receives voltage from the ignition switch through circuit CDC34 (WH/OG). With the ignition switch in the OFF position, the IC receives its keep-alive voltage from the Smart Junction Box (SJB) through circuit SBP24 (VT/RD). The IC is grounded through circuit GD145 (BK/BU).

This pinpoint test is intended to diagnose the following:







- Fuse
- Wiring, terminals or connectors
- IC

PINPOINT TEST A: THE IC IS INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
A1 CHECK CIRCUIT SBP24 (VT/RD) FOR VOLTAGE	
• Ignition OFF. • Disconnect: IC C220. • Measure the voltage between the IC C220-1, circuit SBP24 (VT/RD), harness side and ground.	**Yes** GO to A2 . **No** VERIFY the SJB fuse 24 (10A) is OK. If OK, REPAIR the circuit. TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams Manual to identify the possible cause of the circuit short.

 N0064629 • **Is the voltage greater than 10 volts?**	
A2 CHECK CIRCUIT CDC34 (WH/OG) FOR VOLTAGE	
• Ignition ON. • Measure the voltage between the IC C220-2, circuit CDC34 (WH/OG), harness side and ground.  N0094137 • **Is the voltage greater than 10 volts?**	**Yes** GO to A3 . **No** REPAIR the circuit. TEST the system for normal operation.
A3 CHECK CIRCUIT GD145 (BK/BU) FOR AN OPEN	
• Ignition OFF. • Disconnect: Negative Battery Cable. • Measure the resistance between the IC C220-13, circuit GD145 (BK/BU), harness side and ground.  N0058826 • **Is the resistance less than 5 ohms?**	**Yes** GO to A4 . **No** REPAIR the circuit. TEST the system for normal operation.
A4 CHECK FOR CORRECT IC OPERATION	
• Disconnect the IC connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins	**Yes** INSTALL a new IC . REFER to Instrument Cluster (IC) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded

• Connect the IC connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	connector.

Pinpoint Test B: Incorrect Fuel Gauge Indication

Refer to Wiring Diagrams Cell 60 , Instrument Cluster for schematic and connector information.

Normal Operation

The fuel pump module is hardwired to the Instrument Cluster (IC) through the input circuit VMC11 (YE/VT) and return circuit RMC32 (GN/BU). The fuel level sender (part of the pump module) is a variable resistor actuated by a float with resistance ranging between 180 ohms ± 4 ohms at empty (E) to 10 ohms ± 2 ohms at full (F). The IC provides a reference voltage to the fuel pump module on the input circuit. As the fuel level changes, the fuel level sender float moves up or down according to the fuel level altering the fuel level signal voltage through the resistor. The IC interprets this signal and commands the fuel gauge pointer to sweep to the correct level.

The IC uses 4 different operating modes to calculate the fuel level:

- Anti-slosh (default mode)
- Key OFF fueling
- Key ON fueling
- Recovery

After a fuel fill up, the time for the fuel gauge to move from empty (E) to full (F) ranges from 2 seconds to 55 minutes depending on which operating mode the fuel gauge is in.

Anti-Slosh Mode

The default fuel gauge mode is called the anti-slosh mode. To prevent fuel gauge changes from fuel slosh (gauge instability due to changes in fuel sender readings caused by fuel moving around in the tank), the fuel gauge takes approximately 55 minutes to go from empty (E) to full (F).

Key OFF Fueling Mode

The key OFF fueling mode (2 seconds to read empty [E] to full [F]) requires 3 conditions be met:

- The key must be in the OFF position throughout the entire refueling of the vehicle.
- At least 15% of the vehicle's fuel capacity must be added to the fuel tank.
- The IC must receive a valid key ON fuel sender reading within 1 second of the key being put into the RUN position. The key ON sample readings are considered valid if the fuel sender reading is between 10 ohms ± 2 ohms and 180 ohms ± 4 ohms.

If these conditions are not met, the fuel gauge stays in the anti-slosh mode, which results in a slow to read full (F) event.

Key ON Fueling Mode

The key ON fueling mode (approximately 90 seconds to read empty [E] to full [F]) requires 3 conditions be met:

- The transmission is in PARK (P).
- The key is in the RUN position.
- At least 15% of the vehicle's fuel capacity must be added to the fuel tank.

In key ON fueling mode, a 30-second timer activates after the transmission is placed in the PARK (P) position. When the 30-second time has elapsed and at least 15% of the vehicle's fuel capacity has been added, the fuel gauge response time is 90 seconds to read from empty (E) to full (F). When the transmission is shifted out of PARK (P), the fuel gauge strategy reverts to the anti-slosh mode. The key ON fueling mode prevents slow to read full events from happening if the customer refuels the vehicle with the key in the RUN position.

Recovery Mode

Recovery mode is incorporated into the IC strategy to recover from a missing fuel level input after a refueling event. Missing fuel level inputs result from intermittent opens in the fuel sender or its circuits. Recovery mode (empty [E] to full [F] approximately 20 minutes) is initiated when the following 2 conditions are met:

- The IC is in the anti-slosh (default) mode.
- The actual fuel level in the tank is greater than what is being displayed by the fuel gauge.

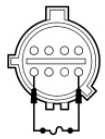
Instrument Cluster (IC) DTCs

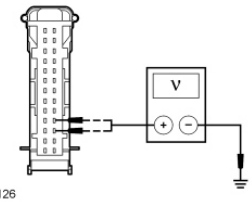
DTC Description	Fault Trigger Condition
• DTC B1203 - Fuel Sender Circuit Short to Battery	A continuous and on-demand DTC that sets if the IC detects an open or short to voltage on the input circuit VMC11 (YE/VT) for more than 33 seconds.
• DTC B1204 - Fuel Sender Circuit Short to Ground	A continuous and on-demand DTC that sets if the IC detects a short to ground on the input circuit VMC11 (YE/VT) or a short together between the input circuit VMC11 (YE/VT) and the return circuit RMC32 (BN/BU) for more than 33 seconds.

PCM DTCs

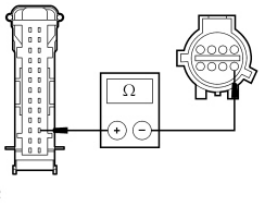
DTC Description	Fault Trigger Condition
• P0460 - Fuel Level Sensor A Circuit	Sets when the PCM determines the value of the fuel pump module signal is stuck, that the fuel level input signal does not change or does not correspond with the calculated fuel usage.
• P0461 - Fuel Level Sensor A Circuit Range/Performance	Sets when the PCM determines the fuel pump module signal repeatedly moves in and out of range, exceeding the minimum or maximum allowable calibrated parameters for a specified fuel fill percentage in the fuel tank.
• P0462 - Fuel Level Sensor A Circuit Low	Sets in the PCM when the PCM detects a short to ground on the fuel pump module signal circuit based on the messaged input received from the IC .

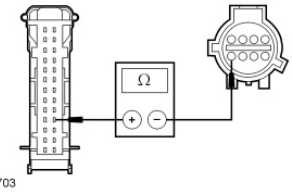
• P0463 - Fuel Level Sensor A Circuit High	Sets in the PCM when the PCM detects an open or a short to voltage on the fuel pump module signal circuit based on the messaged input received from the IC .



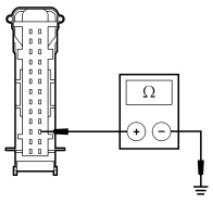


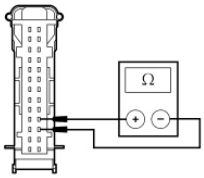
This pinpoint test is intended to diagnose the following:

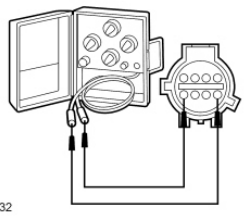




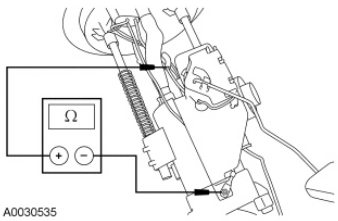
- Wiring, terminals or connectors
- Fuel level sender (float and card)
- Fuel pump module assembly
- Fuel tank
- IC







PINPOINT TEST B: INCORRECT FUEL GAUGE INDICATION



NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
B1 RETRIEVE THE RECORDED DTCs FROM THE IC SELF-TEST	
• Ignition OFF. • Check for recorded IC DTCs from the self-test. • **Are any IC DTCs recorded?**	**Yes** For DTC B1203, GO to B3 . For DTC B1204, GO to B7 . For all other DTCs, REFER to DTC Charts in this section. **No** GO to B2 .
B2 CARRY OUT THE IC FUEL GAUGE ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IC DataLogger. • Select the IC fuel gauge (FUEL) active command. Command and scroll the fuel gauge level at 0%, 20%, 80% and 100%. • **Does the fuel gauge display empty (E) with 0%, approximately 1/4 tank with 20%, 3/4 tank with 80% and full (F) with 100%?**	**Yes** GO to B10 . **No** GO to B13 .
B3 CHECK THE FUEL PUMP MODULE FOR AN OPEN	

• Disconnect: Fuel Pump Module In-Line C495. • Connect a fused jumper wire between the fuel pump module in-line C495-8, circuit VMC11 (YE/VT), harness side and the fuel pump module in-line C495-5, circuit RMC32 (GN/BU), harness side.  N0056227 • Ignition ON. • Wait one minute. • Enter the following diagnostic mode on the scan tool: IC Self-Test. • **NOTE:** It may be normal for DTC B1203 to be present when carrying out this test step and should be ignored. • Clear the IC DTCs. Repeat the IC self-test. • **Is DTC B1204 retrieved?**	**Yes** REMOVE the jumper wire. GO to B12 . **No** REMOVE the jumper wire. GO to B4 .
B4 CHECK CIRCUITS VMC11 (YE/VT) AND RMC32 (GN/BU) FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: IC C220. • Ignition ON. • Measure the voltage between the IC C220-16, circuit VMC11 (YE/VT), harness side and ground; and between the IC C220-17, circuit RMC32 (GN/BU), harness side and ground.  N0057126 • **Is any voltage present?**	**Yes** REPAIR the circuit in question. REPEAT the self-test. CLEAR the DTCs. **No** GO to B5 .
B5 CHECK CIRCUIT VMC11 (YE/VT) FOR AN OPEN	
• Ignition OFF. • Measure the resistance between the IC C220-16, circuit VMC11 (YE/VT), harness side and the fuel pump module in-line C495-8, circuit VMC11 (YE/VT), harness side.	**Yes** GO to B6 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

 N0072702 • **Is the resistance less than 5 ohms?**	
B6 CHECK CIRCUIT RMC32 (GN/BU) FOR AN OPEN	
• Measure the resistance between the IC C220-17, circuit RMC32 (GN/BU), harness side and the fuel pump module C495-5, circuit RMC32 (BK/OG), harness side.  N0072703 • **Is the resistance less than 5 ohms?**	**Yes** GO to B13 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
B7 CHECK THE FUEL PUMP MODULE FOR A SHORT TO GROUND	
• Disconnect: Fuel Pump Module In-Line C495. • Wait one minute. • Enter the following diagnostic mode on the scan tool: IC Self-Test. • **NOTE:** It may be normal for DTC B1204 to be present when carrying out this test step and should be ignored. • Clear the IC DTCs. Repeat the IC self-test. • **Is DTC B1203 retrieved?**	**Yes** GO to B12 . **No** GO to B8 .
B8 CHECK CIRCUIT VMC11 (YE/VT) FOR A SHORT TO GROUND	
• Disconnect: IC C220. • Measure the resistance between the IC C220-16, circuit VMC11 (YE/VT), harness side and ground.	**Yes** GO to B9 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

 N0057129 • **Is the resistance greater than 10,000 ohms?**	
B9 CHECK CIRCUITS VMC11 (YE/VT) AND RMC32 (GN/BU) FOR A SHORT TOGETHER	
• Measure the resistance between the IC C220-16, circuit VMC11 (YE/VT), harness side and the IC C220-17, circuit RMC32 (GN/BU), harness side.  N0058749 • **Is the resistance greater than 10,000 ohms?**	**Yes** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test. **No** GO to B13 .
B10 CHECK THE FUEL INPUT TO THE IC	
NOTE: Since the IC may be in anti-slosh fuel indication mode, the PID values may not match the fuel gauge readings. The actual gauge indication should be disregarded during this test step. • Ignition OFF. • Disconnect: Fuel Pump Module In-Line C495. • Connect one lead of the instrument gauge tester to the fuel pump module C495-8, circuit VMC11 (YE/VT), harness side and the other lead of the instrument gauge tester to the fuel pump module C495-5, circuit RMC32 (BK/OG), harness side.  N0027032 • Ignition ON. • Enter the IC Dealer Test Mode. • **NOTE:** The XXX represents a numeric value that displays the current analog/digital (A/D) ratio fuel level input in decimal format.	**Yes** DISCONNECT the instrument gauge tester. GO to B11 . **No** DISCONNECT the instrument gauge tester. GO to B13 .

• Press and release the SELECT/RESET button (base IC) or RESET button (message center IC) to advance to FUEL LEVEL XXX INST. • **NOTE:** It is extremely important to confirm the gauge tester settings with an ohmmeter to make sure that the gauge tester is in the correct position. Failure to follow this check may result in inaccurate test results. • Monitor the fuel level fuel level input displayed with the gauge tester set at 180 ohms, 90 ohms, 55 ohms, 30 ohms then 10 ohms. • **Does the fuel level input display approximately 3, change to 70, 127, 185 then 251?**	
B11 CHECK THE FUEL TANK	
• Check the fuel tank for any damage or deformation. • **Is the fuel tank OK?**	**Yes** GO to B12 . **No** VERIFY the fuel level sender and the fuel pump module are OK. INSTALL a new fuel tank. REFER to Section 310-01 . CLEAR the DTCs. REPEAT the self-test.
B12 CHECK THE FUEL LEVEL SENDER	
NOTE: The fuel level sender resistance measures between 10 ohms ± 2 ohms at the upper stop position and 180 ohms ± 4 ohms at the lower stop position. • Remove the fuel pump module. Refer to Section 310-01 . • **NOTE:** Disconnect the fuel level sender input wire from the fuel level sender for this measurement. • Measure the resistance between the fuel level sender input wire and the fuel level sender ground while slowly moving the float arm between the upper stop to the lower stop position.  A0030535 • **Does the resistance slowly increase from approximately 10 ohms at the upper stop to 180 ohms at the lower stop?**	**Yes** INSTALL a new fuel pump module. REFER to Section 310-01 . CLEAR the DTCs. REPEAT the self-test. **No** INSTALL a new fuel level sender. REFER to Section 310-01 . CLEAR the DTCs. REPEAT the self-test.
B13 CHECK FOR CORRECT IC OPERATION	
• Disconnect the IC connector.	**Yes** INSTALL a new IC . REFER to

• Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the IC connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	Instrument Cluster (IC) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test C: The Temperature Gauge Is Inoperative

Normal Operation

The PCM receives the Engine Coolant Temperature (ECT) status through hardwired circuitry to the ECT sensor (4.0L engine), or from the Cylinder Head Temperature (CHT) sensor (4.6L engine). The Instrument Cluster (IC) receives the ECT data from the PCM over the High Speed Controller Area Network (HS-CAN). The IC monitors the engine coolant temperature data received from the PCM and commands the temperature gauge indication with a corresponding movement of the pointer.

This pinpoint test is intended to diagnose the following:

- PCM
- IC

PINPOINT TEST C: THE TEMPERATURE GAUGE IS INOPERATIVE

Test Step	Result / Action to Take
C1 RETRIEVE THE RECORDED DTCs FROM THE PCM KOEO SELF-TEST	
• Check for recorded PCM DTCs from the Key ON Engine OFF (KOEO) self-test. • **Are any PCM DTCs recorded?**	**Yes** REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** GO to C2 .
C2 RETRIEVE THE RECORDED DTCs FROM THE IC SELF-TEST	
• Check for recorded IC DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** For DTC U1900, REFER to Section 418-00 . For all other DTCs, REFER to DTC Charts in this section. **No** GO to C3 .
C3 CARRY OUT THE IC TEMPERATURE GAUGE ACTIVE COMMAND USING THE SCAN TOOL	

• Ignition ON. • Enter the following diagnostic mode on the scan tool: IC DataLogger. • Select the IC temperature gauge (ENGCOOLNT) active command. Command the temperature gauge on and off. Observe the temperature gauge. • **Does the temperature gauge start at C (cold) and move to H (hot) when commanded on, and return to C (cold) when commanded off?**	**Yes** INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation. **No** INSTALL a new IC . REFER to Instrument Cluster (IC) in this section. TEST the system for normal operation.

Pinpoint Test D: Incorrect Temperature Gauge Indication

Normal Operation

The PCM receives the engine coolant temperature status through hardwired circuitry to the Engine Coolant Temperature (ECT) sensor (4.0L engine), or from the Cylinder Head Temperature (CHT) sensor (4.6L engine). The Instrument Cluster (IC) receives the ECT data from the PCM over the High Speed Controller Area Network (HS-CAN). The IC monitors the ECT data received from the PCM and commands the temperature gauge indication with a corresponding movement of the pointer.

This pinpoint test is intended to diagnose the following:

- ECT sensor (4.0L)
- CHT sensor (4.6L)
- PCM concern
- IC

PINPOINT TEST D: INCORRECT TEMPERATURE GAUGE INDICATION

Test Step	Result / Action to Take
D1 RETRIEVE THE RECORDED DTCs FROM THE PCM KOEO SELF-TEST	
• Check for recorded PCM DTCs from the Key ON Engine OFF (KOEO) self-test. • **Are any PCM DTCs recorded?**	**Yes** REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** GO to D2 .
D2 RETRIEVE THE RECORDED DTCs FROM THE IC SELF-TEST	
• Check for recorded IC DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** For DTC U1900, REFER to Section 418-00 . For all other DTCs, REFER to DTC Charts in this section. **No**

	GO to D3 .
D3 CARRY OUT THE TEMPERATURE GAUGE ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IC DataLogger. • **NOTE:** The coolant temperature should range between 0°-59°C (32°-138°F) with the gauge in the cold (C) range, between 60°-120°C (140°-248°F) with the gauge in the normal or mid-range and above 121°C (249°F) with the gauge in the hot (H) range. • Select the temperature gauge (ENGCOOLNT) active command. Command the temperature gauge to 50°C (122°F), 100°C (212°F) and 125°C (257°F) while monitoring the gauge. • **Does the temperature begin in approximately the center of the cold (C) range, move to approximately the center of the gauge then to the full hot (H) position?**	**Yes** GO to D4 . **No** INSTALL a new IC . REFER to Instrument Cluster (IC) in this section. TEST the system for normal operation.
D4 CHECK THE COOLANT TEMPERATURE INPUT USING THE IC DEALER TEST MODE	
• Ignition ON. • Enter the IC Dealer Test Mode. • **NOTE:** The display below uses xxx's to represent a numeric or alpha-numeric value. The value may display the same amount of characters represented by the xxx's or there may be more/less depending on the type of display and that the minus symbol in parenthesis will only appear if the temperature is below 0°C. For example: COOLANT TEMP/xxx C may display COOLANT TEMP/20 C. Note that there were 3 x's in the display description but only 2 digits in the actual display. • Scroll down to COOLANT TEMP/xxx C. • Start the engine and run the engine through a variety of engine temperatures. • **NOTE:** The coolant temperature should range between 0°-59°C (32°-138°F) with the gauge in the cold (C) range, between 60°-120°C (140°-248°F) with the gauge in the normal or mid-range and above 121°C (249°F) with the gauge in the hot (H) range. • Monitor the ECT input to the IC and the coolant temperature gauge indication. • **Does the engine coolant input agree with the position of the temperature gauge indication?**	**Yes** GO to D5 . **No** INSTALL a new IC . REFER to Instrument Cluster (IC) in this section. TEST the system for normal operation.
D5 CHECK THE PCM TEMPERATURE PIDs	
NOTE: The coolant temperature should range between 0°-59°C (32°-138°F) with the gauge in the cold (C) range, between 60°-120°C (140°-248°F) with the gauge in the normal or mid-range and above 121°C (249°F) with the gauge in the hot (H) range. • Enter the following diagnostic mode on the scan tool: PCM DataLogger.	**Yes** INSTALL a new CHT sensor or ECT sensor. REFER to Section 303-14 . TEST the system for normal operation. **No** INSTALL a new IC . REFER to Instrument Cluster (IC) in

• Select the PCM PID (ECT) (4.0L) or CHT (4.6L). With the engine running, monitor the PCM ECT PID. • **Does the PCM PID agree with the position of the temperature gauge indication?**	this section. TEST the system for normal operation.

Pinpoint Test E: The Tachometer Is Inoperative

Normal Operation

The tachometer is electrically operated and indicates the engine speed in revolutions per minute (rpm). The tachometer range is 0 to 7,000 rpm. The PCM uses the Crankshaft Position (CKP) sensor to measure the engine rpm. The PCM sends the engine rpm data to the Instrument Cluster (IC), over the High Speed Controller Area Network (HS-CAN), to command the tachometer gauge. If the rpm information sent to the IC is invalid or missing, the IC defaults the tachometer to 0 rpm.

This pinpoint test is intended to diagnose the following:

- PCM
- IC

PINPOINT TEST E: THE TACHOMETER IS INOPERATIVE

Test Step	Result / Action to Take
E1 RETRIEVE THE RECORDED DTCs FROM THE PCM KOEO SELF-TEST	
• Check for recorded PCM DTCs from the Key ON Engine OFF (KOEO) self-test. • **Are any PCM DTCs recorded?**	**Yes** REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** GO to E2 .
E2 RETRIEVE THE RECORDED DTCs FROM THE IC SELF-TEST	
• Check for recorded IC DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** For DTC U1900, REFER to Section 418-00 . For all other DTCs, REFER to DTC Charts in this section. **No** GO to E3 .
E3 CARRY OUT THE IC TACHOMETER ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IC DataLogger. • Select the IC tachometer (TACH_IND) active command. Command the tachometer on and off. Observe the tachometer.	**Yes** INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation. **No** INSTALL a new IC . REFER to Instrument Cluster (IC) in this section. TEST the system for

• **Does the tachometer start at 0 rpm and move to 7,000 rpms when commanded on, and return to 0 when commanded off?**	normal operation.

Pinpoint Test F: Incorrect Tachometer Indication

Normal Operation

The tachometer is electrically operated and indicates the engine speed in revolutions per minute (rpm). The tachometer range is 0 to 7,000 rpm. The PCM uses the Crankshaft Position (CKP) sensor to measure the engine rpm. The PCM sends the engine rpm data to the Instrument Cluster (IC), over the High Speed Controller Area Network (HS-CAN), to command the tachometer gauge. If the rpm information sent to the IC is invalid or missing, the IC defaults the tachometer to 0 rpm.

This pinpoint test is intended to diagnose the following:

- PCM
- IC

PINPOINT TEST F: INCORRECT TACHOMETER INDICATION

Test Step	Result / Action to Take
F1 RETRIEVE THE RECORDED DTCs FROM THE PCM KOEO SELF-TEST	
• Check for recorded PCM DTCs from the Key ON Engine OFF (KOEO) self-test. • **Are any PCM DTCs recorded?**	**Yes** REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** GO to F2 .
F2 RETRIEVE THE RECORDED DTCs FROM THE IC SELF-TEST	
• Check for recorded IC DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** For DTC U1900, REFER to Section 418-00 . For all other DTCs, REFER to DTC Charts in this section. **No** GO to F3 .
F3 CARRY OUT THE TACHOMETER ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IC DataLogger. • Select the IC tachometer (TACH_IND) active command. Command the tachometer in increments of 10% while	**Yes** GO to F4 . **No** INSTALL a new IC . REFER to Instrument Cluster (IC) in this

monitoring the tachometer. The tachometer indication should increase in increments of approximately 700 rpm for each 10% change. • **Does the tachometer indication increase within specifications?**	section. TEST the system for normal operation.
F4 CHECK THE ENGINE RPM INPUT USING THE IC DEALER TEST MODE	
• Ignition ON. • Enter the IC Dealer Test Mode. • **NOTE:** The display below uses xxx's to represent a numeric or alpha-numeric value. The value may display the same amount of characters represented by the xxx's or there may be more/less depending on the type of display. For example: TACHOMETER xxx RPM may display TACHOMETER 650 RPM. • Scroll down to TACHOMETER xxx RPM. • Start the engine and operate the engine at 1,000, 1,500 and 2,000 rpm while monitoring both the tachometer and the engine rpm input in the dealer test mode. • **Does the engine rpm input agree with the position of the tachometer indication?**	**Yes** INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation. **No** INSTALL a new IC . REFER to Instrument Cluster (IC) in this section. TEST the system for normal operation.

Pinpoint Test G: The Speedometer/Odometer Is Inoperative

Normal Operation

The Instrument Cluster (IC) receives the vehicle speed data from the PCM over the High Speed Controller Area Network (HS-CAN). The IC monitors the vehicle speed input from the PCM and commands the speedometer with a corresponding movement of the pointer.

The vehicle speed on the 5R55 transmission is generated by the PCM and calculated from the transmission Output Shaft Speed (OSS) input and the tire size and axle ratio that is programmed at the end of the production line in the Vehicle Identification (VID) block.

The vehicle speed on the 6R60 transmission is generated by the PCM and calculated from the transmission OSS input sent from the Transmission Control Module (TCM) over the HS-CAN bus and the tire size and axle ratio that is programmed at the end of the production line in the VID block. If the OSS signal to the PCM is missing or the OSS Controller Area Network (CAN) message is missing, then the PCM will use an ABS vehicle speed sent by the ABS module to the PCM over the HS-CAN bus.

The odometer indicates the vehicle distance traveled whenever the ignition switch is in the RUN position, based upon rolling count data sent from the PCM over the HS-CAN . The IC provides a reset button to allow the trip odometer to be reset to 0. When the reset button is pressed, the trip odometer is reset. The trip odometer accumulates and registers up to 999.9 kilometers or 999.9 miles.

This pinpoint test is intended to diagnose the following:

- PCM
- IC

PINPOINT TEST G: THE SPEEDOMETER/ODOMETER IS INOPERATIVE

Test Step	Result / Action to Take
G1 RETRIEVE THE RECORDED DTCs FROM THE PCM KOEO SELF-TEST	
• Check for recorded PCM DTCs from the Key ON Engine OFF (KOEO) self-test. • **Are any PCM DTCs recorded?**	**Yes** REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** GO to G2 .
G2 RETRIEVE THE RECORDED DTCs FROM THE IC SELF-TEST	
• Check for recorded IC DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** For DTC U1900, REFER to Section 418-00 . For all other DTCs, REFER to DTC Charts in this section. **No** GO to G3 .
G3 CARRY OUT THE IC SPEEDOMETER ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IC DataLogger. • Select the IC speedometer (SPDOMETER) active command. Command the speedometer on and off. Observe the speedometer. • **Does the speedometer start at 0 and move to 193 km/h (120 mph) when commanded on, and return to 0 when commanded off?**	**Yes** GO to G4 . **No** INSTALL a new IC . REFER to Instrument Cluster (IC) in this section. TEST the system for normal operation.
G4 MONITOR THE DISPLAY SEGMENT CONTROL DISPLAY	
• Observe the odometer in the message center (message center IC) or integrated circuit (base IC) display area. • **Does the odometer display ERROR?**	**Yes** INSTALL a new IC . REFER to Instrument Cluster (IC) in this section. TEST the system for normal operation. **No** INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation.

Pinpoint Test H: Incorrect Speedometer Indication

Normal Operation

The Instrument Cluster (IC) receives the vehicle speed data from the PCM over the High Speed Controller Area Network (HS-CAN). The IC monitors the vehicle speed input from the PCM and commands the speedometer with a corresponding movement of the pointer.

The vehicle speed on the 5R55 transmission is generated by the PCM and calculated from the transmission Output Shaft Speed (OSS) input and the tire size and axle ratio that is programmed at the end of the production line in the Vehicle Identification (VID) block.

The vehicle speed on the 6R60 transmission is generated by the PCM and calculated from the transmission OSS input sent from the Transmission Control Module (TCM) over the HS-CAN bus and the tire size and axle ratio that is programmed at the end of the production line in the VID block. If the OSS signal to the PCM is missing or the OSS Controller Area Network (CAN) message is missing, then the PCM will use an ABS vehicle speed sent by the ABS module to the PCM over the HS-CAN bus.

The IC provides a tolerance which biases the speed indication and displays between 3% below and 7% above the actual vehicle speed. This means that with an actual vehicle speed of 96.6 km/h (60 mph), the speedometer may indicate between 93.7-103.3 km/h (58.2-64.2 mph). Other factors that could potentially affect the speedometer accuracy are incorrect tire size, tire size configuration and axle ratio configuration.

This pinpoint test is intended to diagnose the following:

- Tire size configuration
- Axle ratio configuration
- ABS concern
- PCM concern
- IC

PINPOINT TEST H: INCORRECT SPEEDOMETER INDICATION

Test Step	Result / Action to Take
H1 VERIFY THE VEHICLE TIRE SIZE AND AXLE RATIO CONFIGURATION	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Module Programming. • Select programmable parameters and confirm that the axle ratio and tire size are correctly configured. • **Are the axle ratio and tire size correctly configured?**	**Yes** GO to H2 . **No** Configure the axle ratio or tire size as required. TEST the system for normal operation.
H2 VERIFY THE VEHICLE TIRE SIZE	
• Referring to the vehicle certification label, check to make sure the vehicle has the correct tire size. Refer to Section 100-01 . • **Does the tire size match the door sticker specification?**	**Yes** GO to H3 . **No** ADVISE the customer that incorrect tire size affects speedometer accuracy.
H3 RETRIEVE THE RECORDED DTCs FROM THE PCM KOEO SELF-TEST	
• Check for recorded PCM DTCs from the Key ON Engine OFF (KOEO) self-test. • **Are any PCM DTCs recorded?**	**Yes** REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No**

	GO to H4 .
H4 RETRIEVE THE RECORDED DTCs FROM THE ABS MODULE SELF-TEST	
• Check for recorded ABS module DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** REFER to Section 206-09 . **No** GO to H5 .
H5 RETRIEVE THE RECORDED DTCs FROM THE IC SELF-TEST	
• Check for recorded IC DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** For DTC U1900, REFER to Section 418-00 . For all other DTCs, REFER to DTC Charts in this section. **No** GO to H6 .
H6 CARRY OUT THE SPEEDOMETER ACTIVE COMMAND USING THE SCAN TOOL	
• Enter the following diagnostic mode on the scan tool: IC DataLogger. • Select the speedometer (SPDOMETER) active command. Command the speedometer in 10% increments while monitoring the speedometer. The speed indicated should increase in increments of approximately 19.2 km/h (12 mph) for each 10% change. • **Does the speed indicated increase within specifications?**	**Yes** GO to H7 . **No** INSTALL a new IC . REFER to Instrument Cluster (IC) in this section. TEST the system for normal operation.
H7 CHECK THE PCM VSS PID	
• Enter the following diagnostic mode on the scan tool: PCM DataLogger. • Select the PCM vehicle speed sensor (VSS) PID and monitor the PID while driving the vehicle at 32 km/h (20 mph), 64 km/h (40 mph) and 97 km/h (60 mph). • **Does the speedometer indicate between 31-34 km/h (19-21mph), 63-69 km/h (39-43 mph) and 93-103 km/h (58-64 mph) at the 3 PCM PID values?**	**Yes** The speedometer is operating correctly at this time. **No** INSTALL a new IC . REFER to Instrument Cluster (IC) in this section. TEST the system for normal operation.

Pinpoint Test I: The Brake Warning Indicator Is Never On

Refer to Wiring Diagrams Cell 60 , Instrment Cluster for schematic and connector information.

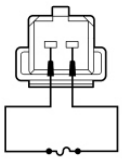
Refer to Wiring Diagrams Cell 42 , Vehicle Dynamic Systems for schematic and connector information.

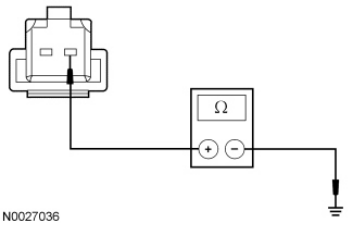
Normal Operation

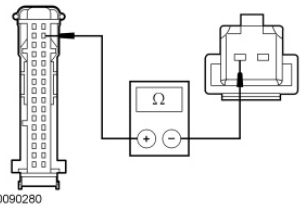
When the parking brake is applied, circuit CCB09 (GY/BU), to the Smart Junction Box (SJB), is grounded by the parking brake switch through circuit GD143 (BK/VT). The SJB receives the ground signal and sends the Instrument Cluster (IC) a message over the Medium Speed Controller Area Network (MS-CAN) to illuminate the brake warning indicator. The brake fluid level switch is hardwired to the ABS module through circuits CMC19 (GY/VT) and RMC19 (YE/GY). The brake fluid level switch is grounded through circuit GD120 (BK/GN). The ABS module monitors the brake fluid level and when the brake fluid level is low or a base brake system concern is detected, the ABS module sends a signal to the IC over the High Speed Controller Area Network (HS-CAN) to illuminate the brake warning indicator.

NOTE: When the ABS module detects an Electronic Brake Distribution (EBD) fault, the ABS module sends a message to the IC . Whenever the IC receives an EBD message from the ABS module, the IC turns on both the brake warning indicator and the ABS warning indicator simultaneously.

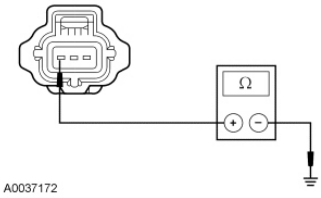
This pinpoint test is intended to diagnose the following:







- Wiring, terminals or connectors
- Parking brake switch
- Brake fluid level switch (part of the master cylinder)
- ABS module
- SJB
- IC



PINPOINT TEST I: THE BRAKE WARNING INDICATOR IS NEVER ON

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
I1 CARRY OUT THE IC INDICATOR LAMP ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IC DataLogger. • Select the IC brake warning indicator (BRK_LAMP). Command the brake warning indicator on. Observe the brake warning indicator. • **Does the brake warning indicator illuminate when commanded on?**	**Yes** GO to I2 . **No** INSTALL a new IC . REFER to Instrument Cluster (IC) in this section. TEST the system for normal operation.
I2 CHECK THE PARKING BRAKE SWITCH PID	
• Enter the following diagnostic mode on the scan tool: SJB DataLogger. • Select the SJB parking brake switch PID (PRK_BRK) while applying the parking brake. • **Does the PID agree with the parking brake position?**	**Yes** GO to I6 . **No** GO to I3 .

I3 CHECK THE PARKING BRAKE SWITCH	
• Ignition OFF. • Disconnect: Parking Brake Switch C2015. • Ignition ON. • Connect a fused jumper wire between the parking brake switch C2015-1, circuit GD143 (BK/VT), harness side and the parking brake switch C2015-2, circuit CCB09 (GY/BU), harness side.  N0002774 • **Does the brake warning indicator illuminate?**	**Yes** INSTALL a new parking brake switch. TEST the system for normal operation. **No** REMOVE the jumper wire. GO to I4 .
I4 CHECK CIRCUIT GD143 (BK/VT) FOR AN OPEN	
• Disconnect: Negative Battery Cable. • Measure the resistance between the parking brake switch C2015-1, circuit GD143 (BK/VT), harness side and ground.  N0027036 • **Is the resistance less than 5 ohms?**	**Yes** GO to I5 . **No** REPAIR the circuit. TEST the system for normal operation.
I5 CHECK CIRCUIT CCB09 (GY/BU) FOR AN OPEN	
• Disconnect: SJB C2280b. • Measure the resistance between the SJB C2280b-18, circuit CCB09 (GY/BU), harness side and the parking brake switch C2015-2, circuit CCB09 (GY/BU), harness side.  N0090280 • **Is the resistance less than 5 ohms?**	**Yes** GO to I9 . **No** REPAIR the circuit. TEST the system for normal operation.
I6 CHECK THE ABS MODULE OPERATION	
	Yes

• Ignition OFF. • Disconnect: Brake Fluid Level Switch C124. • Ignition ON. • Observe the brake warning indicator after the IC proves out. • **Does the brake warning indicator illuminate with the brake fluid level switch disconnected?**	REMOVE the jumper wire. GO to I7 . **No** REMOVE the jumper wire. GO to I8 .
I7 CHECK CIRCUIT GD120 (BK/GN) FOR AN OPEN	
• Disconnect: Negative Battery Cable. • Measure the resistance between the brake fluid level switch C124-1, circuit GD120 (BK/GN), harness side and ground.  • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new brake master cylinder. REFER to Section 206-06 . TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
I8 CHECK FOR CORRECT ABS MODULE OPERATION	
• Disconnect the ABS module connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Correct the ABS module connector and make sure it seats correctly. • Operate the system and verify that the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ABS module. REFER to Section 206-09 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.
I9 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify that the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test J: The Brake Warning Indicator Is Always On

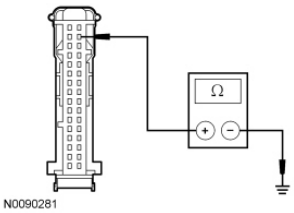
Refer to Wiring Diagrams Cell 60 , Instrment Cluster for schematic and connector information.

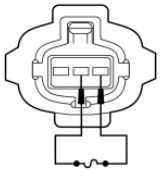
Refer to Wiring Diagrams Cell 42 , Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

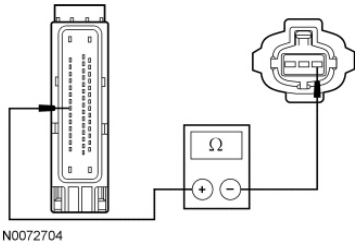
When the parking brake is applied, circuit CCB09 (GY/BU), to the Smart Junction Box (SJB), is grounded by the parking brake switch through circuit GD143 (BK/VT). The SJB receives the ground signal and sends the Instrument Cluster (IC) a message over the Medium Speed Controller Area Network (MS-CAN) to illuminate the brake warning indicator. The brake fluid level switch is hardwired to the ABS module through circuits CMC19 (GY/VT) and RMC19 (YE/GY). The brake fluid level switch is grounded through circuit GD120 (BK/GN). The ABS module monitors the brake fluid level and when the brake fluid level is low or a base brake system concern is detected, the ABS module sends a signal to the IC over the high High Speed Controller Area Network (HS-CAN) to illuminate the brake warning indicator.

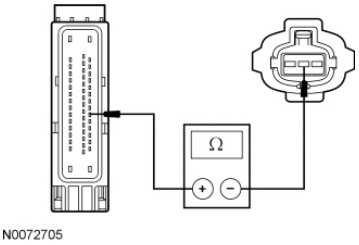
NOTE: When the ABS module detects an Electronic Brake Distribution (EBD) fault, the ABS module sends a message to the IC . Whenever the IC receives an EBD message from the ABS module, the IC turns on both the brake warning indicator and the ABS warning indicator simultaneously.

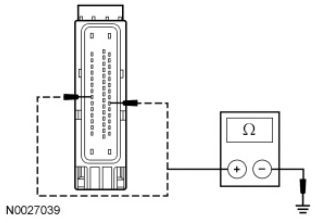




This pinpoint test is intended to diagnose the following:







- Wiring, terminals or connectors
- Parking brake switch
- Brake fluid level switch (part of the master cylinder)
- SJB
- ABS module
- IC

PINPOINT TEST J: THE BRAKE WARNING INDICATOR IS ALWAYS ON

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
J1 CARRY OUT THE IC INDICATOR LAMP ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IC DataLogger. • Select the IC brake warning lamp (BRK_LAMP) active command. Command the brake warning indicator on and off. Observe the brake warning indicator. • **Does the brake warning indicator illuminate when commanded on and turn off when commanded off?**	**Yes** GO to J2 . **No** INSTALL a new IC . REFER to Instrument Cluster (IC) in this section. TEST the system for normal operation.
J2 CHECK THE SJB PARKING BRAKE INPUT	
• Enter the following diagnostic mode on the scan tool: SJB DataLogger. • Monitor the SJB parking brake PID (PRK_BRK) with the parking brake fully released. • **Does the PID indicate the parking brake is off?**	**Yes** GO to J5 . **No** GO to J3 .
J3 CHECK THE PARKING BRAKE SWITCH	

• Disconnect: Parking Brake Switch C2015. • Observe the brake warning indicator. • **Does the brake warning indicator continue to illuminate?**	**Yes** GO to J4 . **No** INSTALL a new parking brake switch. TEST the system for normal operation.
J4 CHECK CIRCUIT CCB09 (GY/BU) FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: SJB C2280b. • Measure the resistance between the SJB C2280b-18, circuit CCB09 (GY/BU), harness side and ground.  N0090281 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to J10 . **No** REPAIR the circuit. TEST the system for normal operation.
J5 CHECK THE ABS MODULE OPERATION	
NOTE: Verify that the master cylinder reservoir is filled to the MAX line. • Ignition OFF. • Disconnect: Brake Fluid Level Switch C124. • Observe the brake warning indicator after the IC proves out. • Connect a fused jumper wire between the brake fluid level switch C124-3, circuit CMC19 (GY/VT), harness side and the brake fluid level switch C124-2, circuit RMC19 (YE/GY), harness side.  N0002771 • Ignition ON. • **Does the brake warning indicator turn off?**	**Yes** REMOVE the jumper wire. INSTALL a new brake master cylinder. REFER to Section 206-06 . TEST the system for normal operation. **No** REMOVE the jumper wire. GO to J6 .
J6 CHECK CIRCUIT CMC19 (GY/VT) FOR AN OPEN	

• Ignition OFF. • Disconnect: ABS Module C155. • Measure the resistance between the ABS module C155-39, circuit CMC19 (GY/VT), harness side and the brake fluid level switch C124-3, circuit CMC19 (GY/VT), harness side.  N0072704 • **Is the resistance less than 5 ohms?**	**Yes** GO to J7 . **No** REPAIR the circuit. TEST the system for normal operation.
J7 CHECK CIRCUIT RMC19 (YE/GY) FOR AN OPEN	
• Measure the resistance between the ABS module C155-7, circuit RMC19 (YE/GY), harness side and the brake fluid level switch C124-2, circuit RMC19 (YE/GY), harness side.  N0072705 • **Is the resistance less than 5 ohms?**	**Yes** GO to J8 . **No** REPAIR the circuit. TEST the system for normal operation.
J8 CHECK CIRCUITS CMC19 (GY/VT) AND RMC19 (YE/GY) FOR A SHORT TO GROUND	
• Measure the resistance between the ABS module C155-39, circuit CMC19 (GY/VT), harness side and ground; and between the ABS module C155-7, circuit RMC19 (YE/GY), harness side and ground.  N0027039 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to J9 . **No** REPAIR the circuit in question. TEST the system for normal operation.
J9 CHECK FOR CORRECT ABS MODULE OPERATION	

• Disconnect the ABS module connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Correct the ABS module connector and make sure it seats correctly. • Operate the system and verify that the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ABS module. REFER to Section 206-09 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.
J10 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify that the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test K: The ABS Warning Indicator Is Never/Always On

Normal Operation

The status of the ABS system is sent to the Instrument Cluster (IC) from the ABS module over the High Speed Controller Area Network (HS-CAN). The IC monitors the ABS input and illuminates the ABS warning indicator when a concern is present.

NOTE: When the ABS module detects an Electronic Brake Distribution (EBD) fault, the ABS module sends a message to the IC . Whenever the IC receives an EBD message from the ABS module, the IC turns on both the brake warning indicator and the ABS warning indicator simultaneously.

This pinpoint test is intended to diagnose the following:

- ABS module
- IC

PINPOINT TEST K: THE ABS WARNING INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
K1 RETRIEVE THE RECORDED DTCs FROM THE ABS MODULE SELF-TEST	
• Retrieve the recorded ABS module DTCs from the self-test. • **Are any ABS module DTCs retrieved?**	**Yes** REFER to Section 206-09 . **No** GO to K2 .

K2 RETRIEVE THE RECORDED DTCs FROM THE IC SELF-TEST	
• Check for recorded IC DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** For DTC U1900, REFER to Section 418-00 . For all other DTCs, REFER to DTC Charts in this section. **No** GO to K3 .
K3 CARRY OUT THE IC INDICATOR LAMP ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IC DataLogger. • Select the IC ABS warning indicator (ABS_LAMP) active command. Command the ABS warning indicator on and off. Observe the ABS warning indicator. • **Does the ABS warning indicator illuminate when commanded on, and turn off when commanded off?**	**Yes** INSTALL a new ABS module. REFER to Section 206-09 . TEST the system for normal operation. **No** INSTALL a new IC . REFER to Instrument Cluster (IC) in this section. TEST the system for normal operation.

Pinpoint Test L: The Safety Belt Warning Indicator Is Never/Always On

Normal Operation

The safety belt switch is hardwired to the Restraints Control Module (RCM). The RCM monitors the safety belt position through the safety belt buckle switch and communicates the safety belt status to the Instrument Cluster (IC) over the High Speed Controller Area Network (HS-CAN). When the safety belt is buckled, the RCM receives a ground signal and sends a message to the IC to turn off the safety belt warning indicator. When the safety belt is unbuckled, the ground to the RCM is removed and the RCM sends a message to the IC to illuminate the safety belt warning indicator.

This pinpoint test is intended to diagnose the following:

- RCM
- IC

PINPOINT TEST L: THE SAFETY BELT WARNING INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
L1 RETRIEVE THE RECORDED DTCs FROM THE RCM SELF-TEST	
• Retrieve the recorded RCM DTCs from the self-test. • **Are any RCM DTCs recorded?**	**Yes** REFER to Section 501-20B . **No**

	GO to L2 .
L2 RETRIEVE THE RECORDED DTCs FROM THE IC SELF-TEST	
• Check for recorded IC DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** For DTC U1900, REFER to Section 418-00 . For all other DTCs, REFER to DTC Charts in this section. **No** GO to L3 .
L3 CARRY OUT THE IC INDICATOR LAMP ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IC DataLogger. • Select the IC safety belt warning indicator (SBLT_LMP) active command. Command the safety belt warning indicator on and off. Observe the safety belt warning indicator. • **Does the safety belt warning indicator illuminate when commanded on, and turn off when commanded off?**	**Yes** INSTALL a new RCM . REFER to Section 501-20B . TEST the system for normal operation. **No** INSTALL a new IC . REFER to Instrument Cluster (IC) in this section. TEST the system for normal operation.

Pinpoint Test M: The LH/RH Turn or High Beam Indicator Is Never/Always On

Normal Operation

When the multifunction switch is in the LH/RH TURN position or the headlamps are in the HIGH BEAM position, a message is sent to the Instrument Cluster (IC) from the Smart Junction Box (SJB) through the Medium Speed Controller Area Network (MS-CAN), to flash the LH/RH turn signal indicator on and off or to turn on the high beam indicator.

This pinpoint test is intended to diagnose the following:

- Exterior lighting concern
- SJB
- IC

PINPOINT TEST M: THE LH/RH TURN OR HIGH BEAM INDICATOR IS NEVER/ALWAYS ON

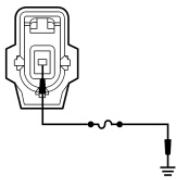
Test Step	Result / Action to Take
M1 VERIFY THE LH/RH TURN SIGNAL OR HIGH BEAM OPERATION	
• Ignition ON. • Operate the LH/RH turn signals or the high beams. Observe the LH/RH turn signal or high beam lamps.	**Yes** GO to M2 . **No** REFER to Section 417-01 .

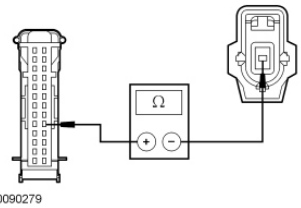
• **Do the LH/RH turn signal or high beam lamps operate correctly?**	
M2 RETRIEVE THE RECORDED DTCs FROM THE IC SELF-TEST	
• Check for recorded IC DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** For DTC U0140, GO to Pinpoint Test AQ . For all other DTCs, REFER to DTC Charts in this section. **No** GO to M3 .
M3 CARRY OUT THE IC INDICATOR LAMP ACTIVE COMMAND USING THE SCAN TOOL	
• Enter the following diagnostic mode on the scan tool: IC DataLogger. • Select the IC left turn indicator (LHTURN), right turn indicator (RHTURN) or high beam indicator (HIGH_BEAM) active command. Command the LH/RH turn or high beam indicator on and off. Observe the LH/RH turn or high beam indicator. • **Does the LH or RH turn signal indicator illuminate when commanded on, and turn off when commanded off?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** INSTALL a new IC . REFER to Instrument Cluster (IC) in this section. TEST the system for normal operation.

Pinpoint Test N: The Low Oil Pressure Warning Indicator Is Never/Always On

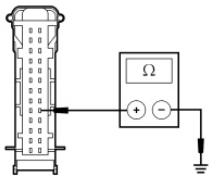
Refer to Wiring Diagrams Cell 60 , Instrument Cluster for schematic and connector information.

Normal Operation





The engine oil pressure switch is hardwired to the Instrument Cluster (IC) through circuit CMC24 (GY). When the oil pressure is within normal ranges, the engine oil pressure switch closes and grounds circuit CMC24 (GY) to the IC , turning off the low oil pressure warning indicator. When engine oil pressure is low, the engine oil pressure switch opens, removing the ground to the IC , turning on the low oil pressure warning indicator.



This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Base engine concern
- Engine oil pressure switch
- IC

PINPOINT TEST N: THE LOW OIL PRESSURE INDICATOR IS NEVER/ALWAYS ON

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
N1 DETERMINE THE CONDITION	
• Start the engine. • Observe the low oil pressure indicator. • **Is the low oil pressure indicator illuminated?**	**Yes** GO to N2 . **No** GO to N5 .
N2 CHECK THE LOW OIL PRESSURE INDICATOR OPERATION	
NOTE: If the fused jumper wire fails, refer to the Wiring Diagrams Manual to identify the possible cause of the circuit short. • Ignition OFF. • Disconnect: Engine Oil Pressure Switch C103. • Connect a fused jumper wire between the engine oil pressure switch C103-1, circuit CMC24 (GY) (4.6L) or circuit CMC24 (WH/RD) (4.0L), harness side and ground.  A0089586 • Ignition ON. • **Does the low oil pressure indicator continue to illuminate?**	**Yes** REMOVE the jumper wire. GO to N3 . **No** REMOVE the jumper wire. GO to N4 .
N3 CHECK CIRCUIT CMC24 (GY) OR CIRCUIT CMC24 (WH/RD) (4.0L) FOR AN OPEN	
• Ignition OFF. • Disconnect: IC C220. • Measure the resistance between the IC C220-18, circuit CMC24 (GY), and the engine oil pressure switch C103-1, circuit CMC24 (GY) (4.6L) or circuit CMC24 (WH/RD) (4.0L), harness side and ground.  N0090279 • **Is the resistance less than 5 ohms?**	**Yes** GO to N7 . **No** REPAIR the circuit. TEST the system for normal operation.
N4 CARRY OUT THE ENGINE OIL PRESSURE TEST	

• Ignition OFF. • Carry out the engine oil pressure test. Refer to Section 303-00 . • **Is the engine oil pressure within specification?**	**Yes** INSTALL a new oil pressure switch. TEST the system for normal operation. **No** REFER to Section 303-00 .
N5 CARRY OUT THE IC PROVE OUT	
• Ignition OFF. • Disconnect: Engine Oil Pressure Switch C103. • Ignition ON. • Wait until the IC carries out the bulb prove out while observing the low oil pressure indicator. • **Does the low oil pressure indicator illuminate after the IC prove out?**	**Yes** INSTALL a new engine oil pressure switch. TEST the system for normal operation. **No** GO to N6 .
N6 CHECK CIRCUIT CMC24 (GY) FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: IC C220. • Ignition ON. • Measure the resistance between the IC C220-18, circuit CMC24 (GY), harness side and ground.  N0057131 • **Is the resistance than greater than 10,000 ohms?**	**Yes** GO to N7 . **No** REPAIR the circuit. TEST the system for normal operation.
N7 CHECK FOR CORRECT IC OPERATION	
• Disconnect the IC connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the IC connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new IC . REFER to Instrument Cluster (IC) in this section. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test O: The Malfunction Indicator Lamp (MIL) Is Never/Always On

Normal Operation

The Malfunction Indicator Lamp (MIL) informs the driver of a malfunction in the powertrain that affects the vehicle emissions system. When an emission related fault condition exists, the PCM sets a DTC and sends a command to the Instrument Cluster (IC) over the High Speed Controller Area Network (HS-CAN) to turn on the MIL.

This pinpoint test is intended to diagnose the following:

- PCM
- IC

PINPOINT TEST O: THE MIL IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
O1 RETRIEVE THE RECORDED DTCs FROM THE PCM KOEO SELF-TEST	
• Retrieve the recorded PCM DTCs from the Key ON Engine OFF (KOEO) self-test. • **Are any PCM DTCs recorded?**	**Yes** REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** GO to O2 .
O2 RETRIEVE THE RECORDED DTCs FROM THE IC SELF-TEST	
• Check for recorded IC DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** For DTC U1900, REFER to Section 418-00 . For all other DTCs, REFER to DTC Charts in this section. **No** GO to O3 .
O3 CARRY OUT THE IC INDICATOR LAMP ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IC DataLogger. • Select the IC MIL indicator (MIL_IC) active command. Command the MIL on and off. Observe the MIL . • **Does the MIL illuminate when commanded on, and turn off when commanded off?**	**Yes** INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation. **No** INSTALL a new IC . REFER to Instrument Cluster (IC) in this section. TEST the system for normal operation.

Pinpoint Test P: The Air Bag Warning Indicator Is Never/Always On

Normal Operation

The air bag warning indicator is used to provide a status of the Supplemental Restraint System (SRS). The Instrument Cluster (IC) receives a message from the Restraints Control Module (RCM) over the High Speed Controller Area Network (HS-CAN). If an air bag system concern is detected, a DTC is logged and the RCM sends a message to the IC to illuminate the air bag warning indicator. If the IC does not receive the restraints control command, the IC illuminates the air bag warning indicator.

This pinpoint test is intended to diagnose the following:

- RCM
- IC

PINPOINT TEST P: THE AIR BAG WARNING INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
P1 RETRIEVE THE RECORDED DTCs FROM THE RCM SELF-TEST	
• Retrieve the recorded RCM DTCs from the self-test. • **Are any RCM DTCs recorded?**	**Yes** REFER to Section 501-20B . **No** GO to P2 .
P2 RETRIEVE THE RECORDED DTCs FROM THE IC SELF-TEST	
• Check for recorded IC DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** For DTC U1900, REFER to Section 418-00 . For all other DTCs, REFER to DTC Charts in this section. **No** GO to P3 .
P3 CARRY OUT THE IC INDICATOR LAMP ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IC DataLogger. • Select the IC air bag warning indicator (AIRBAG) active command. Command the air bag warning indicator on and off. Observe the air bag warning indicator. • **Does the air bag warning indicator illuminate when commanded on, and turn off when commanded off?**	**Yes** INSTALL a new RCM . REFER to Section 501-20B . TEST the system for normal operation. **No** INSTALL a new IC . REFER to Instrument Cluster (IC) in this section. TEST the system for normal operation.

Pinpoint Test Q: The Speed Control Indicator Is Never/Always On

Normal Operation

The speed control status information is sent to the Instrument Cluster (IC) from the PCM over the High Speed Controller Area Network (HS-CAN). When the speed control is engaged, the PCM provides a signal to the IC to illuminate the speed control indicator.

This pinpoint test is intended to diagnose the following:

- Speed control system concern
- PCM
- IC

PINPOINT TEST Q: THE SPEED CONTROL INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
Q1 CHECK THE SPEED CONTROL OPERATION	
• Verify the speed control operates correctly. • **Does the speed control operate correctly?**	**Yes** GO to Q2 . **No** REFER to Section 310-03 .
Q2 RETRIEVE THE RECORDED DTCs FROM THE IC SELF-TEST	
• Check for recorded IC DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** For DTC U1900, REFER to Section 418-00 . For all other DTCs, REFER to DTC Charts in this section. **No** GO to Q3 .
Q3 CARRY OUT THE IC INDICATOR LAMP ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IC DataLogger. • Select the IC speed control indicator (CRUISE) active command. Command the speed control indicator on and off. Observe the speed control indicator. • **Does the speed control indicator illuminate when commanded on, and turn off when commanded off?**	**Yes** INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation. **No** INSTALL a new IC . REFER to Instrument Cluster (IC) in this section. TEST the system for normal operation.

Pinpoint Test R: The Powertrain Malfunction (Wrench) Warning Indicator is Never/Always On (Base IC)

Normal Operation

The Instrument Cluster (IC) receives the powertrain status from the PCM over the High Speed Controller Area Network (HS-CAN). When a system concern is detected, the PCM sends the IC a command signal to illuminate the powertrain malfunction (wrench) warning indicator. If the 4X4 control module detects a failure with the Four-Wheel Drive (4WD) system, the 4X4 control module sends a message to the IC over the HS-CAN to illuminate the powertrain malfunction (wrench) warning indicator. On 4.6L engines, if the Transmission Control Module (TCM), detects a failure with the transmission, the TCM sends a message to the IC over the HS-CAN to illuminate the powertrain malfunction (wrench) warning indicator.

This pinpoint test is intended to diagnose the following:

- 4WD system concern
- IC

PINPOINT TEST R: THE POWERTRAIN MALFUNCTION (WRENCH) WARNING INDICATOR IS NEVER/ALWAYS ON (BASE IC)

Test Step	Result / Action to Take
R1 CARRY OUT THE IC INDICATOR LAMP ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IC DataLogger. • Select the IC all lamps active command (ALL_LAMP). Command all the lamps on and off while monitoring the powertrain malfunction (wrench) indicator. • **Does the powertrain malfunction (wrench) indicator turn on when commanded on and turn off when commanded off?**	**Yes** GO to R2 . **No** INSTALL a new IC . REFER to Instrument Cluster (IC) in this section. TEST the system for normal operation.
R2 VERIFY THE 4WD OPERATION	
• Verify that the vehicle is in 2-wheel drive when the 4x4 high is switched off, and that the 4WD high operates when switched to the 4x4. • **Does the 4x4 high operate correctly?**	**Yes** GO to R3 . **No** REFER to Section 308-07A .
R3 RETRIEVE THE RECORDED DTCs FROM THE PCM KOEO SELF-TEST	
• Retrieve the recorded PCM DTCs from the Key ON Engine OFF (KOEO) self-test. • **Are any PCM DTCs recorded?**	**Yes** REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** GO to R4 .
R4 RETRIEVE THE RECORDED DTCs FROM THE TCM SELF-TEST	
• Retrieve the recorded TCM DTCs from the self-test.	**Yes** REFER to Section 307-01B .

• **Are any TCM DTCs recorded?**	**No** INSTALL a new IC . REFER to Instrument Cluster (IC) in this section. TEST the system for normal operation.

Pinpoint Test S: The Door Ajar Warning Indicator Is Never/Always On

Normal Operation

The door ajar warning indicator informs the driver that one or more doors, the liftgate or the liftglass is open while the ignition key is in the RUN position. When a door, liftgate, or liftglass is ajar, the Smart Junction Box (SJB) sends a message to the Instrument Cluster (IC) over the Medium Speed Controller Area Network (MS-CAN) to illuminate the door ajar warning indicator.

This pinpoint test is intended to diagnose the following:

- SJB
- IC

PINPOINT TEST S: THE DOOR AJAR WARNING INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
S1 CHECK THE OPERATION OF THE INTERIOR LAMPS	
• Open and close each door, the liftgate, and the liftgate glass, while monitoring the interior lamps. • **Do the interior lamps operate correctly?**	**Yes** GO to S2 . **No** REFER to Section 417-02 .
S2 RETRIEVE THE RECORDED DTCs FROM THE IC SELF-TEST	
• Check for recorded IC DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** For DTC U0140, GO to Pinpoint Test AQ . For all other DTCs, REFER to DTC Charts in this section. **No** GO to S3 .
S3 CARRY OUT THE IC INDICATOR LAMP ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IC DataLogger. • Select the IC door ajar warning lamp (DRAJLMP) active command. Command the door ajar warning indicator on and off. Observe the door ajar warning indicator.	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** INSTALL a new IC . REFER to Instrument Cluster (IC) in this section.

• **Does the door ajar warning indicator illuminate when commanded on, and turn off when commanded off?**	TEST the system for normal operation.

Pinpoint Test T: The O/D OFF Indicator Is Never/Always On

Normal Operation

The Overdrive (O/D) off function is controlled by the O/D off switch located on the shifter assembly. The O/D off status is transmitted to the Instrument Cluster (IC) from the PCM (4.0L engine), or the Transmission Control Module (TCM) (4.6L engine) over the High Speed Controller Area Network (HS-CAN).

This pinpoint test is intended to diagnose the following:

- TCM (4.6L engine)
- PCM (4.0L engine)
- IC

PINPOINT TEST T: THE O/D OFF INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
T1 RETRIEVE THE RECORDED DTCs FROM THE PCM AND TCM KOEO SELF-TEST	
• Retrieve the recorded PCM (4.0L engine) or TCM (4.6L engine) DTCs from the Key ON Engine OFF (KOEO) self-test. • **Are any DTCs recorded?**	**Yes** If equipped with a 4.0L engine, REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. If equipped with a 4.6L engine, REFER to Section 307-01B . **No** GO to T2 .
T2 CARRY OUT THE IC INDICATOR LAMP ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IC DataLogger. • Select the IC O/D off indicator (OVERDRV) active command. Command the O/D OFF indicator on and off. Observe the O/D OFF indicator. • **Does the O/D OFF indicator illuminate when commanded on, and turn off when commanded off?**	**Yes** If equipped with a 4.0L engine, INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation. If equipped with a 4.6L engine, INSTALL a new TCM (mechatronic assembly). REFER to Section 307-01B . TEST the system for normal operation. **No** INSTALL a new IC . REFER to Instrument Cluster (IC) in this section. TEST the system for normal operation.

Pinpoint Test U: The Tire Pressure Monitoring System (TPMS) Warning Indicator is Never/Always On

Normal Operation

Each road tire is equipped with a tire pressure sensor fastened to the inside rim of the wheel. The tire-mounted pressure sensors transmit signals to the Smart Junction Box (SJB) by using the valve stem as an antenna. These signals are sent approximately every 60 seconds when the vehicle speed exceeds 32 km/h (20 mph). The SJB compares each tire pressure sensor signal against low and high pressure limits. If the SJB determines that the tire pressure has exceeded the limit, the SJB communicates over the Medium Speed Controller Area Network (MS-CAN) to the Instrument Cluster (IC), which then illuminates the Tire Pressure Monitoring System (TPMS) warning indicator. If the TPMS status message is missing for more than 5 seconds, the IC sets DTC U0140 and flashes the TPMS indicator for approximately 70 seconds then turns on the TPMS indicator.

This pinpoint test is intended to diagnose the following:

- TPMS concern
- SJB
- IC

PINPOINT TEST U: THE TPMS WARNING INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
U1 CHECK THE TIRE PRESSURE	
• Verify that the tire pressure in all tires meets the recommended tire pressures on the vehicle certification label. Refer to Section 100-01 . • **Do all the tires meet the recommended tire pressures?**	**Yes** GO to U2 . **No** CORRECT the tire pressures. TEST the system for normal operation.
U2 CHECK FOR MESSAGE CENTER TPMS WARNING MESSAGES	
• Ignition ON. • Monitor the message center for TPMS related warning messages. • **Are any TPMS warning messages displayed in the message center?**	**Yes** REFER to Section 204-04 . **No** GO to U3 .
U3 RETRIEVE THE RECORDED DTCs FROM THE SJB SELF-TEST	
• Check for recorded SJB DTCs from the self-test. • **Are any TPMS related SJB DTCs recorded?**	**Yes** REFER to Section 419-10 . **No** GO to U4 .
U4 CARRY OUT THE IC INDICATOR LAMP ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON.	**Yes** INSTALL a new SJB . REFER to Section

• Enter the following diagnostic mode on the scan tool: IC DataLogger. • Select the IC TPMS warning indicator (TIRE_PRES) active command. Command the TPMS warning indicator on and off. Observe the low tire pressure warning indicator. • **Does the TPMS warning indicator illuminate when commanded on, and turn off when commanded off?**	419-10 . TEST the system for normal operation. **No** INSTALL a new IC . REFER to Instrument Cluster (IC) in this section. TEST the system for normal operation.

Pinpoint Test V: The 4X4 High Indicator Is Never/Always On

Normal Operation

The 4X4 control module sends the 4X4 high command, over the High Speed Controller Area Network (HS-CAN). The Instrument Cluster (IC) monitors the command from the 4X4 control module and illuminates the 4X4 high indicator when the vehicle is in 4X4 high.

This pinpoint test is intended to diagnose the following:

- Four-Wheel Drive (4WD) system concern
- 4X4 control module
- IC

PINPOINT TEST V: THE 4X4 HIGH INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
V1 RETRIEVE THE RECORDED DTCs FROM THE 4X4 CONTROL MODULE SELF-TEST	
• Check for recorded 4X4 control module DTCs from the self-test. • **Are any 4X4 control module DTCs recorded?**	**Yes** REFER to Section 308-07A . **No** GO to V2 .
V2 VERIFY THE 4WD OPERATION	
• Verify that the vehicle is in 2-wheel drive when the 4X4 high is switched off, and that the 4WD high operates when switched to the 4X4. • **Does the 4X4 high operate correctly?**	**Yes** GO to V3 . **No** REFER to Section 308-07A .
V3 CARRY OUT THE IC INDICATOR LAMP ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IC DataLogger. • Select the IC all warning lamps (ALL_LAMP) active command. Command all the warning lamps on and off. Observe the 4x4 high indicator.	**Yes** INSTALL a new 4X4 control module. REFER to Section 308-07A . TEST the system for normal operation. **No** INSTALL a new IC . REFER to Instrument Cluster (IC) in this section.

• **Does the 4x4 high indicator illuminate when commanded on, and turn off when commanded off?**	TEST the system for normal operation.

Pinpoint Test W: The 4x4 Low Indicator Is Never/Always On

Normal Operation

The 4X4 control module sends the 4X4 low command, over the High Speed Controller Area Network (HS-CAN). The Instrument Cluster (IC) monitors the command from the 4X4 control module and illuminates the 4X4 LOW indicator when the vehicle is in 4X4 low.

This pinpoint test is intended to diagnose the following:

- Four-Wheel Drive (4WD) system concern
- 4X4 control module
- IC

PINPOINT TEST W: THE 4X4 LOW INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
W1 RETRIEVE THE RECORDED DTCs FROM THE 4X4 CONTROL MODULE SELF-TEST	
• Check for recorded 4X4 control module DTCs from the self-test. • **Are any 4X4 control module DTCs recorded?**	**Yes** REFER to Section 308-07A . **No** GO to W2 .
W2 VERIFY THE 4WD OPERATION	
• Verify that the vehicle is in 2-wheel drive when the 4X4 LOW is switched off, and that the 4WD low operates when switched to 4X4 LOW. • **Does the 4X4 low operate correctly?**	**Yes** GO to W3 . **No** REFER to Section 308-07A .
W3 CARRY OUT THE IC INDICATOR LAMP ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IC DataLogger. • Select the IC all warning lamps (ALL_LAMP) active command. Command all the warning lamps on and off. Observe the 4x4 LOW indicator. • **Does the 4x4 LOW indicator illuminate when commanded on, and turn off when commanded off?**	**Yes** INSTALL a new 4X4 control module. REFER to Section 308-07A . TEST the system for normal operation. **No** INSTALL a new IC . REFER to Instrument Cluster (IC) in this section. TEST the system for normal operation.

Pinpoint Test X: The Engine Coolant Over-Temperature Warning Indicator Is Never/Always On (Base IC)

Normal Operation

The PCM receives the Engine Coolant Temperature (ECT) status through hardwired circuitry to the ECT sensor (4.0L engine), or from the Cylinder Head Temperature (CHT) sensor (4.6L engine). The Instrument Cluster (IC) receives the ECT data from the PCM over the High Speed Controller Area Network (HS-CAN). The IC monitors the ECT data received from the PCM and when the ECT is high, the engine over-temperature warning indicator illuminates.

This pinpoint test is intended to diagnose the following:

- PCM
- IC

PINPOINT TEST X: THE ENGINE COOLANT OVER-TEMPERATURE WARNING INDICATOR IS NEVER/ALWAYS ON (BASE IC)

Test Step	Result / Action to Take
X1 RETRIEVE THE RECORDED DTCs FROM THE PCM KOEO SELF-TEST	
• Check for recorded PCM DTCs from the Key ON Engine OFF (KOEO) self-test. • **Are any PCM DTCs recorded?**	**Yes** REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** GO to X2 .
X2 CARRY OUT THE IC INDICATOR LAMP ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IC DataLogger. • Select the IC all lamps active command (ALL_LAMP). Command all the lamps on and off. Observe the engine coolant over-temperature warning indicator. • **Does the engine coolant over-temperature warning indicator illuminate when commanded on, and turn off when commanded off?**	**Yes** INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation. **No** INSTALL a new IC . REFER to Instrument Cluster (IC) in this section. TEST the system for normal operation.

Pinpoint Test Y: The Traction Control/Stability Assist Indicator Is Never/Always On

Normal Operation

The traction control/stability assist indicator informs the driver that a traction control or stability assist event is taking place, by flashing the traction control/stability assist indicator during the event. The traction control/stability assist indicator illuminates constantly (not flashing) when a malfunction is detected in the traction control or stability assist system, or if the traction control or stability assist system is disabled by the operator. The ABS module sends a message to the Instrument Cluster (IC) along the High Speed Controller Area Network (HS-CAN) bus to illuminate the traction control/stability assist indicator.

This pinpoint test is intended to diagnose the following:

- Traction control/stability assist system concern
- ABS module
- IC

PINPOINT TEST Y: THE TRACTION CONTROL/STABILITY ASSIST INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
Y1 CHECK THE TRACTION CONTROL/STABILITY ASSIST INDICATOR OPERATION USING THE STABILITY/TRACTION CONTROL DISABLE SWITCH	
• Ignition ON. • Press the traction control/stability assist disable switch 1 time to disable the traction control/stability assist system then press the traction control/stability assist switch again while monitoring the traction control/stability assist indicator. • **Does the traction control/stability assist indicator illuminate with the first switch press and turn off with the second switch press?**	**Yes** If the traction control/stability assist indicator does not operate while in traction active mode, INSTALL a new ABS module. REFER to Section 206-09 . TEST the system for normal operation. If the traction control/stability assist indicator operates in traction active mode, the system is operating normally at this time. **No** GO to Y2 .
Y2 RETRIEVE THE RECORDED DTCs FROM THE ABS MODULE SELF-TEST	
• Check for recorded ABS module DTCs from the self-test. • **Are any ABS module DTCs recorded?**	**Yes** REFER to Section 206-09 . **No** GO to Y3 .
Y3 CARRY OUT THE IC INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL	
• Enter the following diagnostic mode on the scan tool: IC DataLogger. • Select the traction control/stability assist active indicator (ACTIVELMP) active command. Command the traction control/stability assist indicator on and off. Observe the stability/traction control indicator. • **Does the traction control/stability assist indicator illuminate when commanded on, and turn off when commanded off?**	**Yes** REFER to Section 206-09 to diagnose the traction control/RSC system cannot be disabled. **No** INSTALL a new IC . REFER to Instrument Cluster (IC) in this section. TEST the system for normal operation.

Pinpoint Test Z: The Charging System Warning Indicator Is Never/Always On (Base IC)

Normal Operation

The charging system warning indicator is controlled by the Instrument Cluster (IC) based upon data received from the PCM over the High Speed Controller Area Network (HS-CAN). When a generator malfunction occurs that prevents the generator from charging the battery, the generator regulator grounds the PCM input to ground. The PCM senses the ground state and sends a communication message over the HS-CAN to the IC to illuminate charging system warning indicator, which indicates a charging system fault has occurred.

This pinpoint test is intended to diagnose the following:

- Charging system concern
- PCM
- IC

PINPOINT TEST Z: THE CHARGING SYSTEM WARNING INDICATOR IS NEVER/ALWAYS ON (BASE IC)

Test Step	Result / Action to Take
Z1 CARRY OUT THE IC INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IC DataLogger. • Select the IC charging system warning indicator (CHARGE _ LMP) active command. Command the charging system warning indicator on and off. Observe the charging system warning indicator. • **Does the charging system warning indicator illuminate when commanded on, and turn off when commanded off?**	**Yes** GO to Z2 . **No** INSTALL a new IC . REFER to Instrument Cluster (IC) in this section. TEST the system for normal operation.
Z2 RETRIEVE THE RECORDED DTCs FROM THE PCM KOEO SELF-TEST	
• Check for recorded PCM DTCs from the Key ON Engine OFF (KOEO) self-test. • **Are any charging system DTCs recorded?**	**Yes** REFER to Section 414-00 . **No** GO to Z3 .
Z3 CHECK THE CHARGING SYSTEM OPERATION	
• Check the charging system operation. REFER to Section 414-00 . • **Does the charging system operate correctly?**	**Yes** GO to Z4 . **No** REFER to Section 414-00 .
Z4 RETRIEVE THE RECORDED DTCs FROM THE IC SELF-TEST	
• Check for recorded IC DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** For DTC U1900, REFER to Section 418-00 . For all other DTCs, REFER to DTC

	Charts in this section. **No** INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation.

Pinpoint Test AA: The Check Fuel Cap Indicator Is Never/Always On (Sport Trac Base IC Only)

Normal Operation

The PCM monitors the fuel tank evaporative emission system for significant leaks that occur following refueling of the vehicle. Once the PCM detects a fuel vapor leak, the PCM sends the Instrument Cluster (IC) a message over the communication network to turn on the check fuel cap indicator. DTC P0457 sets in the PCM following a successful cruise test, which is initiated when the vehicle is driven at a steady speed above 64 km/h (40 mph) for a duration of approximately 4-5 minutes. If the PCM is unable to successfully run the cruise test, the IC does not receive the check fuel cap message and the check fuel cap indicator remains off.

- DTC P0457 (Evaporative Emission System Leak Detected [Fuel Cap Loose/Off]) - sets in the PCM if a fuel tank pressure change greater than -23.7 kPa (-7 in-Hg) of vacuum within 30 seconds after refueling occurs, or there is an excessive purge (fuel vapor) flow of greater than 454 g (1.0 lb) per minute.

This pinpoint test is intended to diagnose the following:

- PCM
- IC

PINPOINT TEST AA: THE CHECK FUEL CAP INDICATOR IS NEVER/ALWAYS ON (SPORT TRAC BASE IC ONLY)

Test Step	Result / Action to Take
AA1 RETRIEVE THE RECORDED DTCs FROM THE IC SELF-TEST	
• Check for recorded IC DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** For DTC U1900, REFER to Section 418-00 . For all other DTCs, REFER to DTC Charts in this section. **No** GO to AA2 .
AA2 CARRY OUT THE IC INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IC DataLogger.	**Yes** GO to AA2 . **No** INSTALL a new IC . REFER to Instrument Cluster (IC) in this

• Select the IC all lamps (ALL_LAMPS) active command. Command all the lamps on and off while monitoring the check fuel cap indicator. • **Does the check fuel cap indicator turn on when commanded on and turn off when commanded off?**	section. TEST the system for normal operation.
AA3 RETRIEVE THE RECORDED DTCs FROM THE PCM KOEO SELF-TEST	
• Check for recorded PCM DTCs from the Key ON Engine OFF (KOEO) self-test. • **Is DTC P0457 recorded?**	**Yes** If the check fuel cap indicator is illuminated, REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. If the check fuel cap indicator is not illuminated, GO to AA3 **No** If the check fuel cap indicator is always on, INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation. If the check fuel cap indicator is not illuminated, the system is operating normally at this time. If the fuel cap was left off and the check fuel cap warning indicator did not turn on, driving conditions may not have allowed for the PCM to run the cruise test and message the IC to turn on the check fuel cap warning indicator.

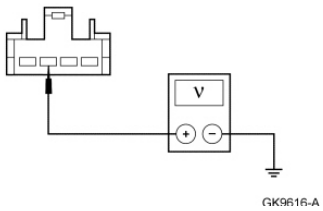
Pinpoint Test AB: The Compass Is Inoperative

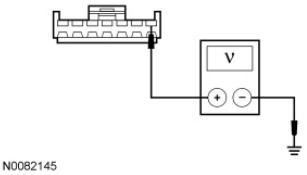
Refer to Wiring Diagrams Cell 60 , Instrument Cluster for schematic and connector information.

Normal Operation

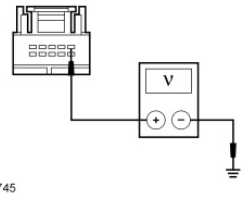
The compass sensor module (early build) or auto-dimming mirror (late build) receives voltage from the Smart Junction Box (SJB) through circuit CBP18 (GY/OG) (early build) or CBP05 (YE) (late build). The compass module (early build) or auto-dimming mirror (late build) is grounded through circuit GD143 (BK/VT). The compass sensor module (early build) or auto-dimming mirror (late-build) communicates the vehicle direction to the Instrument Cluster (IC), through a compass data plus circuit and compass data minus circuit.

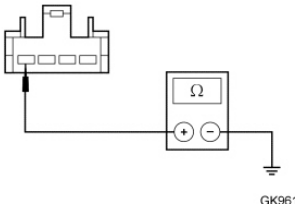
- DTC B2097 (Compass Module Failure) - a continuous memory DTC that sets in the IC if the data received from the compass module (early build) or the auto-dimming mirror (late-build) is invalid.
- DTC U2013 (Compass Module is Not Responding) - a continuous and on-demand DTC that sets if the IC fails to receive a response from the compass module (early build) or the auto-dimming mirror (late-build) after 4 consecutive attempts.

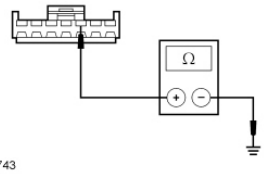


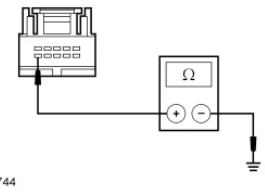


This pinpoint test is intended to diagnose the following:

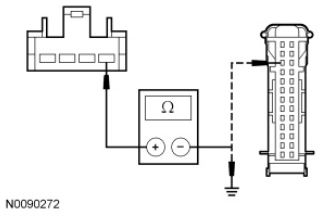


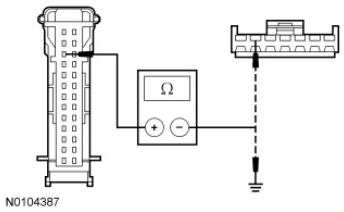


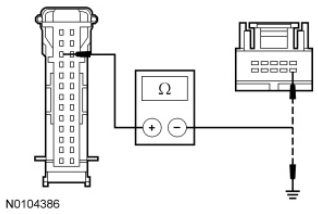




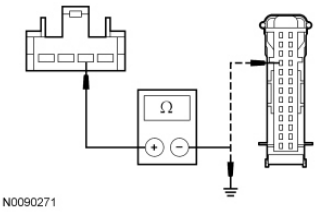
- Fuse
- Wiring, terminals or connectors
- Compass sensor module (early build)
- Auto-dimming mirror (late build)

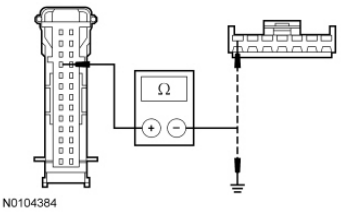


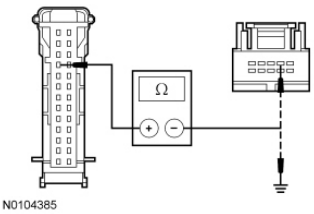




PINPOINT TEST AB: THE COMPASS IS INOPERATIVE







NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
AB1 CHECK THE COMPASS MODULE (EARLY BUILD) OR AUTO-DIMMING MIRROR (LATE BUILD) FOR VOLTAGE	
• Ignition OFF. • Disconnect: Compass Sensor Module C909 (Early Build). • Disconnect: Auto-Dimming Mirror C911 (Without Microphone) (Late Build). • Disconnect: Auto-Dimming Mirror C9012 (With Microphone) (Late Build). • Ignition ON. • For early build vehicles, measure the voltage between the compass sensor module C909-3, circuit CBP18 (GY/OG), harness side and ground.  • For late build vehicles without a microphone, measure the voltage between the auto-dimming mirror C911-1, circuit CBP05 (YE), harness side and ground.  • For late build vehicles with a microphone, measure the voltage between the auto-dimming mirror C9012-1, circuit CBP05 (YE), harness side and ground.	**Yes** GO to AB2 . **No** VERIFY the SJB fuse 18 (10A) (early build) or fuse 5 (5A) (late build) is OK. If OK, REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short.

 N0085745 • **Is the voltage greater than 10 volts?**	
AB2 CHECK THE COMPASS MODULE (EARLY BUILD) OR AUTO-DIMMING MIRROR (LATE BUILD) GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: Negative Battery Cable. • For early build vehicles, measure the resistance between the compass sensor module C909-4, circuit GD143 (BK/VT), harness side and ground.  GK9617-A • For late build vehicles without a microphone, measure the resistance between the auto-dimming mirror C911-3, circuit GD143 (BK/VT), harness side and ground.  N0085743 • For late build vehicles with a microphone, measure the resistance between the auto-dimming mirror C9012-10, circuit GD143 (BK/VT), harness side and ground.  N0085744 • **Is the resistance less than 5 ohms?**	**Yes** GO to AB3 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
AB3 CHECK THE COMPASS DATA PLUS CIRCUIT FOR AN OPEN AND A SHORT TO GROUND	

• Disconnect: IC C220. • On early build vehicles, measure the resistance between the compass sensor module C909-1, circuit VMC31 (YE/GN), harness side and the IC C220-11, circuit VMC31 (GY/BU), harness side; and between the compass sensor module C909-1, circuit VMC31 (YE/GN), harness side and ground.  N0090272 • On late build vehicles without a microphone, measure the resistance between the IC C220-11, circuit VMC31 (YE/GN), harness side and the auto-dimming mirror C911-6, circuit VMC31 (BU/OG), harness side; and between the IC C220-11, circuit VMC31 (YE/GN), harness side and ground.  N0104387 • On late build vehicles with a microphone, measure the resistance between the IC C220-11, circuit VMC31 (YE/GN), harness side and the auto-dimming mirror C9012-6, circuit VMC31 (BU/OG), harness side; and between the IC C220-11, circuit VMC31 (YE/GN), harness side and ground.  N0104386 • **Is the resistance less than 5 ohms between the compass sensor module and the IC (early build) or between the IC and the auto-dimming mirror (late build), and greater than 10,000 ohms between the compass module and ground (early build) or between the auto-dimming mirror and ground (late build)?**	**Yes** GO to AB4 . **No** REPAIR the circuit. TEST the system for normal operation.
AB4 CHECK THE COMPASS DATA MINUS CIRCUIT FOR AN OPEN AND A SHORT TO GROUND	

• On early build vehicles, measure the resistance between the compass sensor module C909-2, circuit VMC30 (BU/GY), harness side and the IC C220-10, circuit VMC30 (BU/GY), harness side; and between the compass sensor module C909-2, circuit VMC30 (BU/GY), harness side and ground.  N0090271 • On late build vehicles without a microphone, measure the resistance between the IC C220-10, circuit VMC30 (BU/GY), harness side and the auto-dimming mirror C911-7, circuit VMC30 (BU/GY), harness side; and between the IC C220-10, circuit VMC30 (BU/GY), harness side and ground.  N0104384 • On late build vehicles with a microphone, measure the resistance between the IC C220-10, circuit VMC30 (BU/GY), harness side and the auto-dimming mirror C9012-2, circuit VMC30 (BU/GY), harness side; and between the IC C220-10, circuit VMC30 (BU/GY), harness side and ground.  N0104385 • **Is the resistance less than 5 ohms between the compass sensor module and the IC (early build) or between the IC and the auto-dimming mirror (late build), and greater than 10,000 ohms between the compass module and ground (early build) or between the auto-dimming mirror and ground (late build)?**	**Yes** On early build vehicles, INSTALL a new compass sensor module. On late build vehicles, INSTALL a new auto-dimming mirror. REFER to Section 501-09 . SET the zone. REFER to Compass Zone Adjustment in this section. CALIBRATE the compass. REFER to Compass Calibration in this section. CLEAR the DTCs. REPEAT the self-test. **No** REPAIR the circuit. TEST the system for normal operation.

Pinpoint Test AC: The Compass Is Inaccurate

Normal Operation

The compass sensor module (early build) or the auto-dimming mirror (late build) communicates the vehicle direction to the Instrument Cluster (IC) through the compass communication data plus and compass communication data minus circuits. The magnetic fields generated by the earths north and south poles are divided into zones that differ from each other with respect to how the magnetic fields appear. The magnetic north can change by up to 4 degrees between zones and become noticeable across multiple zones. The compass zone must be set to the correct zone for the compass to read accurately. Factors within the vehicle may affect the ability of the compass module to accurately read the magnetic north. Calibrating the compass allows the compass module to compensate for vehicle factors that influence the accuracy of the compass.

This pinpoint test is intended to diagnose the following:

- Calibration
- Zone setting
- Compass sensor module (early build)
- Auto-dimming mirror (late build)

PINPOINT TEST AC: THE COMPASS IS INACCURATE

<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>
<tr><td>AC1 CHECK THE COMPASS ACCURACY</td><td></td></tr>
<tr><td>• Position the vehicle and observe the compass display as follows:

<table><tr><th>Direction</th><th>Compass Display</th></tr><tr><td>North</td><td>N</td></tr><tr><td>Northeast</td><td>NE</td></tr><tr><td>East</td><td>E</td></tr><tr><td>Southeast</td><td>SE</td></tr><tr><td>South</td><td>S</td></tr><tr><td>Southwest</td><td>SW</td></tr><tr><td>West</td><td>W</td></tr><tr><td>Northwest</td><td>NW</td></tr></table>
• Does the compass display as indicated?</td><td>Yes
The compass is OK.

No
GO to AC2 .</td></tr>
<tr><td>AC2 CHECK THE COMPASS ZONE SETTING AND CALIBRATION</td><td></td></tr>
<tr><td>• Set the zone. Refer to Compass Zone Adjustment in this section.
• Calibrate the compass. Refer to Compass Zone Adjustment in this</td><td>Yes
The compass is OK. The concern may have been caused by an incorrect zone setting or the compass was out of calibration.</td></tr>
</table>

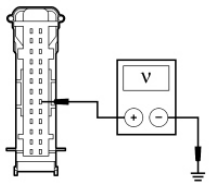
section. • **Does the compass calibrate correctly?**	**No** On early build vehicles, INSTALL a new compass sensor module. On late build vehicles, INSTALL a new auto-dimming mirror. REFER to Section 501-09 . SET the zone. REFER to Compass Zone Adjustment in this section. CALIBRATE the compass. REFER to Compass Calibration in this section. CLEAR the DTCs. REPEAT the self-test.

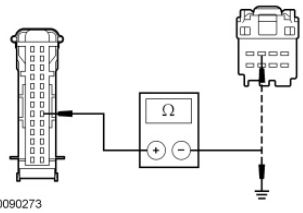
Pinpoint Test AD: The Message Center Is Not Operating Correctly (High Series IC)

Refer to Wiring Diagrams Cell 60 , Instrument Cluster for schematic and connector information.

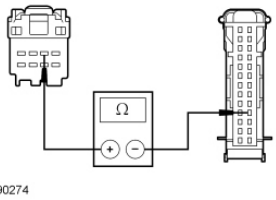
Normal Operation

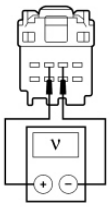
The message center functionality is controlled through the message center switch, which is hardwired to the Instrument Cluster (IC) through circuits CMC29 (GN/VT) and RMC32 (GN/BU). The message center switch uses circuit CMC29 (GN/VT) to communicate the requested switch function to the IC message center. The message center switch is grounded through circuit RMC32 (GN/BU). Each message center switch uses a different resistance value allowing the IC to determine which switch is pressed.





This pinpoint test is intended to diagnose the following:





- Wiring, terminals or connectors
- Message center switch
- IC

PINPOINT TEST AD: THE MESSAGE CENTER IS NOT OPERATING CORRECTLY (HIGH SERIES IC)

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
AD1 CHECK THE MESSAGE CENTER DISPLAY ILLUMINATION	
• Ignition ON. • Observe the message center display segments illumination. • **Does the message center display illuminate all segments?**	**Yes** GO to AD2 . **No** INSTALL a new IC . REFER to Instrument Cluster (IC) in this section. TEST the system for normal operation.
AD2 CHECK THE IC PID FOR THE MESSAGE CENTER SWITCH	
• Ignition ON.	**Yes** INSTALL a new IC . REFER to

• Enter the following diagnostic mode on the scan tool: IC DataLogger. • Select the IC message center switch PIDs (INFOSW, SETUPSW and RES_SW). Monitor the PIDs while pressing each message center switch (INFO, SETUP, and RESET). • **Do the PIDs agree with the switch position?**	Instrument Cluster (IC) in this section. TEST the system for normal operation. **No** GO to AD3 .
AD3 CHECK CIRCUIT CMC29 (GN/VT) FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: IC C220. • Ignition ON. • Measure the voltage between the IC C220-19, circuit CMC29 (GN/VT), harness side and ground.  N0075647 • **Is any voltage present?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to AD4 .
AD4 CHECK CIRCUIT CMC29 (GN/VT) FOR AN OPEN AND A SHORT TO GROUND	
• Ignition OFF. • Disconnect: Message Center Switch C253. • Measure the resistance between the IC C220-19, circuit CMC29 (GN/VT), harness side and the message center switch C253-3, circuit CMC29 (GN/VT), harness side; and between the IC C220-19, circuit CMC29 (GN/VT), harness side and ground.  N0090273 • **Is the resistance less than 5 ohms between the IC and the message center switch, and greater than 10,000 ohms between the IC and ground?**	**Yes** GO to AD5 . **No** REPAIR the circuit. TEST the system for normal operation.
AD5 CHECK CIRCUIT RMC32 (GN/BU) FOR AN OPEN	

• Ignition OFF. • Measure the resistance between the message center switch C253-2, circuit RMC32 (GN/BU), harness side and the IC C220-17, circuit RMC32 (GN/BU), harness side.  N0090274 • **Is the resistance less than 5 ohms?**	**Yes** GO to AD6 . **No** REPAIR the circuit. TEST the system for normal operation.
AD6 CHECK FOR VOLTAGE FROM THE IC	
• Connect: IC C220. • Ignition ON. • Measure the voltage between the message center switch C253-3, circuit CMC29 (GN/VT), harness side and the message center switch C253-2, circuit RMC32 (GN/BU), harness side.  N0064498 • **Is the voltage approximately 5 volts or greater?**	**Yes** INSTALL a new message center switch. REFER to Message Center Switch in this section. TEST the system for normal operation. **No** GO to AD7 .
AD7 CHECK FOR CORRECT IC OPERATION	
• Disconnect the IC connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the IC connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new IC . REFER to Instrument Cluster (IC) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test AE: The Outside Air Temperature Display Does Not Operate Correctly

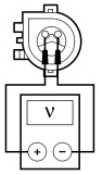
Refer to Wiring Diagrams Cell 60 , Instrument Cluster for schematic and connector information.

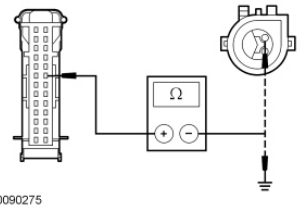
NOTE: The outside air temperature display is only available in base Instrument Cluster (IC) without Electronic Automatic Temperature Control (EATC).

Normal Operation

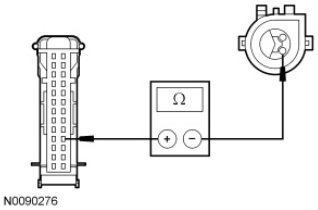
The outside air temperature sensor is mounted on the radiator core support in front of the radiator and A/C condenser and is hardwired to the IC through input circuit VH407 (YE/GN) and return circuit RMC32 (GN/BU). The IC provides a reference voltage to the ambient air temperature sensor and monitors the change in voltage resulting from changes in resistance as determined by outside air temperature. When the engine has been off for an extended period of time, or the engine temperature is cold, the IC displays the current outside air temperature as measured by the ambient air temperature sensor. When the engine has only been turned off for a short time, or if the engine is not cold, the IC takes a reading of the current temperature and compares the current reading against the last reading at key off. If the temperature is less than the last key off temperature reading, the IC displays the current temperature. If the temperature is greater than the last key off temperature reading, the IC displays the last key off temperature reading until the ambient air temperature has had time to stabilize with vehicle movement.

- DTC B1255 (Air Temperature External Sensor Circuit Open) - a continuous and on-demand DTC that sets if the IC detects an open on the outside air temperature sensor input circuit VH407 (YE/GN). If the IC detects an open on the outside air temperature input, the IC defaults the display to 23.5° Celsius (75° F).
- DTC B1257 (Air Temperature External Sensor Circuit Short to Ground) - a continuous and on-demand DTC that sets if the IC detects a short to ground on the outside air temperature sensor input circuit VH407 (YE/GN). If the IC detects a short to ground on the outside air temperature input, the IC defaults the display to 23.5° Celsius (75° F).





This pinpoint test is intended to diagnose the following:



- Wiring, terminals or connectors
- Ambient air temperature sensor
- IC

PINPOINT TEST AE: THE OUTSIDE AIR TEMPERATURE DISPLAY DOES NOT OPERATE CORRECTLY

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

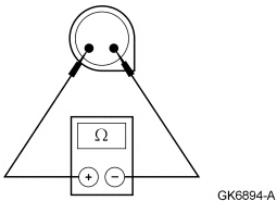
Test Step	Result / Action to Take
AE1 RETRIEVE AND RECORD THE DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND INSTRUMENT CLUSTER (IC) SELF-TESTS	
• Check for recorded instrument cluster (IC) DTCs from the continuous and on-demand self-tests. • **Are DTCs B1255 or B1257 retrieved?**	**Yes** GO to AE2 . **No** If the outside air temperature display is inoperative, GO to AE7 . If the outside air temperature display is inaccurate, GO to AE5 .
AE2 CHECK THE AMBIENT AIR TEMPERATURE SENSOR FUNCTION	

• Ignition OFF. • Disconnect: Ambient Air Temperature Sensor C132. • Ignition ON. • Measure the voltage between the ambient air temperature sensor C132-1, circuit VH407 (YE/GN), harness side and the ambient air temperature sensor C132-2, circuit RMC32 (GN/BU), harness side.  N0084209 • **Is the voltage approximately 5 volts?**	**Yes** INSTALL a new ambient air temperature sensor. REFER to Section 412-01 . CLEAR the DTCs. REPEAT the self-test. **No** GO to AE3 .
AE3 CHECK CIRCUIT VH407 (YE/GN) FOR AN OPEN AND A SHORT TO GROUND	
• Ignition OFF. • Disconnect: Instrument Cluster (IC) C220a. • Measure the resistance between the instrument cluster (IC) C220a-13, circuit VH407 (YE/GN), harness side and the ambient air temperature sensor C132-1, circuit VH407 (YE/GN), harness side; and between the instrument cluster (IC) C220a-13, circuit VH407 (YE/GN), harness side and ground.  N0090275 • **Is the resistance less than 5 ohms between the instrument cluster (IC) and the ambient air temperature sensor, and greater than 10,000 ohms between the instrument cluster (IC) and ground?**	**Yes** GO to AE4 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
AE4 CHECK CIRCUIT RMC32 (GN/BU) FOR AN OPEN AND A SHORT TO GROUND	
• Measure the resistance between the instrument cluster (IC) C220a-14, circuit RMC32 (GN/BU), harness side and the ambient air temperature sensor C132-2, circuit RMC32 (GN/BU), harness side.	**Yes** GO to AE7 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

- **Is the resistance less than 5 ohms between the instrument cluster (IC) and the ambient air temperature sensor, and greater than 10,000 ohms between the instrument cluster (IC) and ground?**

AE5 VERIFY THE SPEEDOMETER OPERATION

- Operate the vehicle and verify the speedometer operation.
- **Does the speedometer operate correctly?**



Yes
GO to AE6 .

No
GO to Pinpoint Test G .

AE6 CHECK THE AMBIENT AIR TEMPERATURE SENSOR FUNCTION

- Ignition OFF.
- Disconnect: Ambient Air Temperature Sensor C132.
- Measure the resistance between the ambient air temperature sensor C132 pin 1, component side and the ambient air temperature sensor C132 pin 2, component side according to the following table.

Ambient Air Temperature	Ambient Air Temperature Sensor Resistance
0-10°C (32-50°F)	91K-62K ohms
10-20°C (50-68°F)	56K-39K ohms
20-30°C (68-86°F)	35K-25K ohms
30-40°C (86-104°F)	23K-17K ohms

- **Does the ambient air temperature sensor resistance match the ambient air temperature according to the table?**

Yes
The system is operating normally at this time. Explain to the customer the normal operation of the system.

No
INSTALL a new ambient air temperature sensor. CLEAR the DTCs. REPEAT the self-test.

AE7 CHECK FOR CORRECT INSTRUMENT CLUSTER (IC) OPERATION

- Disconnect all the instrument cluster (IC) connectors.
- Check for:

Yes
INSTALL a new instrument cluster (IC). REFER to

♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the instrument cluster (IC) connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	Instrument Cluster (IC) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test AF: The WASHER FLUID LOW LEVEL Warning Is Inoperative

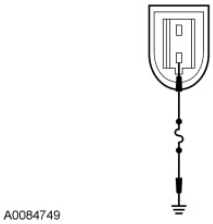
Refer to Wiring Diagrams Cell 60 , Instrument Cluster for schematic and connector information.

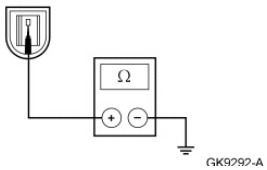
Normal Operation

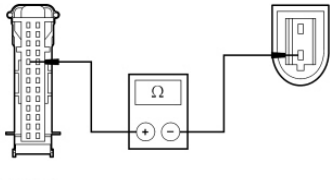
The Instrument Cluster (IC) is hardwired to the low washer fluid switch (part of the windshield washer reservoir) through circuit CMC20 (VT). The low washer fluid switch closes when the washer fluid level is approximately one-third full, providing a ground to the IC through circuit GD108 (BK/VT) and displaying the WASHER FLUID LOW LEVEL warning. When the washer fluid is above the low level, the low washer fluid switch opens, removing the ground to the IC , and the WASHER FLUID LOW LEVEL warning turns off.

This pinpoint test is intended to diagnose the following:

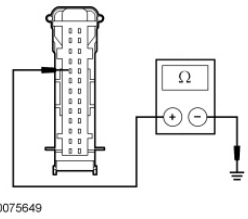
- Wiring, terminals or connectors
- Washer fluid level switch (part of the windshield washer reservoir)
- IC







PINPOINT TEST AF: THE WASHER FLUID LOW LEVEL WARNING IS INOPERATIVE



NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Verify that the washer fluid reservoir is full and that the key has been cycled at least once prior to carrying out the pinpoint test.

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
AF1 DETERMINE THE CONDITION	
• Ignition ON. • **Does the WASHER FLUID LOW LEVEL warning display?**	**Yes** GO to AF5 . **No** GO to AF2 .
AF2 CHECK THE WASHER FLUID LEVEL SWITCH	

• Ignition OFF. • Disconnect: Washer Fluid Level Switch C138. • Connect a fused jumper wire between the washer fluid level switch C138-2, circuit CMC20 (VT), harness side and ground.  A0084749 • Ignition ON. • Wait one minute. • **Does the WASHER FLUID LOW LEVEL warning display?**	**Yes** REMOVE the jumper wire. GO to AF3 . **No** REMOVE the jumper wire. GO to AF4 .
AF3 CHECK CIRCUIT GD108 (BK/VT) FOR AN OPEN	
• Disconnect: Negative Battery Cable. • Measure the resistance between the washer fluid level switch C138-1, circuit GD108 (BK/VT), harness side and ground.  GK9292-A • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new windshield washer reservoir. REFER to Section 501-16 . TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
AF4 CHECK CIRCUIT CMC20 (VT) FOR AN OPEN	
• Ignition OFF. • Disconnect: IC C220. • Measure the resistance between the IC C220-9, circuit CMC20 (VT), harness side and the washer fluid level switch C138-2, circuit CMC20 (VT), harness side.  N0090277 • **Is the resistance less than 5 ohms?**	**Yes** GO to AF7 . **No** REPAIR the circuit. TEST the system for normal operation.
AF5 CHECK THE WASHER FLUID LEVEL SWITCH OPERATION	

• Ignition OFF. • Disconnect: Washer Fluid Level Switch C138. • Ignition ON. • Wait one minute. • Monitor the WASHER FLUID LOW LEVEL warning. • **Does the WASHER FLUID LOW LEVEL warning turn off?**	**Yes** INSTALL a new windshield washer reservoir. REFER to Section 501-16 . TEST the system for normal operation. **No** GO to AF6 .
AF6 CHECK CIRCUIT CMC20 (VT) FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: IC C220. • Measure the resistance between the IC C220-9, circuit CMC20 (VT), harness side and ground.  N0075649 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to AF7 . **No** REPAIR the circuit. TEST the system for normal operation.
AF7 CHECK FOR CORRECT IC OPERATION	
• Disconnect the IC connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the IC connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new IC . REFER to Instrument Cluster (IC) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test AG: The CHECK CHARGING SYSTEM Warning Is Inoperative

Normal Operation

The charging system warning is controlled by the Instrument Cluster (IC) based upon the data received from the PCM over the High Speed Controller Area Network (HS-CAN).

This pinpoint test is intended to diagnose the following:

- Charging system
- IC

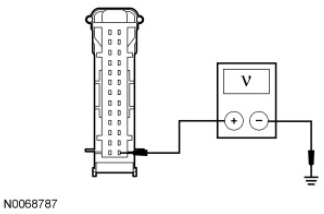
PINPOINT TEST AG: THE CHECK CHARGING SYSTEM WARNING IS INOPERATIVE

Test Step	Result / Action to Take
AG1 CHECK THE MESSAGE CENTER OPERATION	
• Start the engine. • Close all doors. • Open the driver door. • **Does the DOOR AJAR message display in the message center?**	**Yes** GO to AG2 . **No** INSTALL a new IC . REFER to Section 413-01 . TEST the system for normal operation.
AG2 RETRIEVE THE RECORDED DTCs FROM THE PCM KOEO SELF-TEST	
• Check for recorded PCM DTCs from the Key ON Engine OFF (KOEO) self-test. • **Are any charging system DTCs recorded?**	**Yes** REFER to Section 414-00 . **No** GO to AG3 .
AG3 CHECK THE CHARGING SYSTEM OPERATION	
• Check the charging system operation. REFER to Section 414-00 . • **Does the charging system operate correctly?**	**Yes** GO to AG4 . **No** REFER to Section 414-00 .
AG4 RETRIEVE THE RECORDED DTCs FROM THE IC SELF-TEST	
• Check for recorded IC DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** For DTC U1900, REFER to Section 418-00 . For all other DTCs, REFER to DTC Charts in this section. **No** INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation.

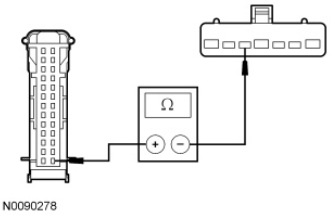
Pinpoint Test AH: The Key-In-Ignition Warning Chime Is Inoperative

Refer to Wiring Diagrams Cell 60 , Instrument Cluster for schematic and connector information.

Normal Operation



When the key is inserted into the ignition lock cylinder, the key-in-ignition switch (part of the ignition switch) closes, providing a voltage signal to the Instrument Cluster (IC) through circuit CDC30 (BU/GY). The door ajar status is communicated to the IC from the Smart Junction Box (SJB) through the Medium Speed Controller Area Network (MS-CAN). If the IC detects that the ignition switch is in the OFF or ACC position, the key is inserted in the ignition lock cylinder, and the SJB communicates to the IC that the driver door is ajar, the key-in-ignition warning chime sounds.



This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Key-in-ignition switch (part of the ignition switch)
- IC

PINPOINT TEST AH: THE KEY-IN-IGNITION WARNING CHIME IS INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
AH1 CHECK THE DOOR AJAR INDICATOR	
• Make sure all the doors are closed. • While observing the door ajar warning indicator, open the driver door. • **Is the door ajar warning indicator illuminated with the driver door open?**	**Yes** GO to AH2 . **No** GO to Pinpoint Test S .
AH2 CHECK CIRCUIT CDC30 (BU/GY) FOR VOLTAGE	
• Ignition OFF. • Disconnect: IC C220. • Place the key into the ignition cylinder. • Measure the voltage between the IC C220-14, circuit CDC30 (BU/GY), harness side and ground.  N0068787 • **Is the voltage greater than 10 volts?**	**Yes** GO to AH4 . **No** GO to AH3 .
AH3 CHECK CIRCUIT CDC30 (BU/GY) FOR AN OPEN	
• Disconnect: Ignition Switch C250. • Measure the resistance between the IC C220-14, circuit CDC30 (BU/GY), harness side and the ignition switch C250-5, circuit CDC30 (BU/GY), harness side.	**Yes** INSTALL a new ignition switch. REFER to Section 211-05 . CLEAR the DTCs. REPEAT the self-test. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

 • **Is the resistance less than 5 ohms?**	
AH4 CHECK FOR CORRECT IC OPERATION	
• Disconnect the IC connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the IC connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new IC . REFER to Instrument Cluster (IC) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test AI: The Headlamps On Warning Chime Is Inoperative

Normal Operation

The headlamps on warning chime sounds when the driver door is opened with the ignition switch in the OFF position, the key not in the ignition lock cylinder, and the headlamp switch is in the HEADLAMP or PARKING LAMP position. The Smart Junction Box (SJB) communicates to the Instrument Cluster (IC) when the headlamps or parking lamps are on and the driver door is opened. The autolamps feature must not be selected for the headlamps on warning chime to operate.

This pinpoint test is intended to diagnose the following:

- IC

PINPOINT TEST AI: THE HEADLAMPS ON WARNING CHIME IS INOPERATIVE

Test Step	Result / Action to Take
AI1 CHECK THE EXTERIOR LAMPS FOR OPERATION	
• Turn the headlamp switch to the HEADLAMP or PARKING LAMP position. • **Do the headlamps or parking lamps illuminate with the headlamp switch in the PARKING LAMP position?**	**Yes** GO to AI2 . **No** REFER to Section 417-01 .
AI2 CHECK THE DOOR AJAR INDICATOR	
• Ignition ON. • While observing the door ajar warning indicator,	**Yes** INSTALL a new IC . REFER to Instrument Cluster (IC) in this section. TEST the

open the driver door. • **Is the door ajar warning indicator illuminated with the driver door open?**	system for normal operation. **No** GO to Pinpoint Test S .

Pinpoint Test AJ: The Turn Signal On Warning Chime Is Inoperative

Normal Operation

The turn signal on warning chime sounds when the vehicle travels more than 3.2 km (2 miles) with the turn signal on. The Smart Junction Box (SJB) communicates the turn signal switch status to the Instrument Cluster (IC) over the controller area network (CAN). The PCM communicates the odometer rolling count data to the IC over the CAN.

This pinpoint test is intended to diagnose the following:

- Turn signal indication concern
- Odometer rolling count input
- IC

PINPOINT TEST AJ: THE TURN SIGNAL ON WARNING CHIME IS INOPERATIVE

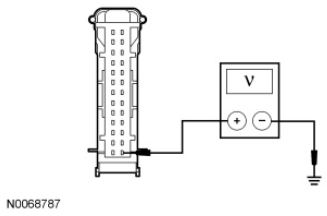
Test Step	Result / Action to Take
AJ1 CHECK THE TURN SIGNAL INDICATORS OPERATION	
• Ignition ON. • Verify the turn signal indicators operation. • **Do the turn signal indicators operate correctly?**	**Yes** GO to AJ2 . **No** GO to Pinpoint Test M .
AJ2 CHECK THE ODOMETER FOR CORRECT OPERATION	
• Drive the vehicle and observe the odometer for correct operation. • **Does the odometer operate correctly?**	**Yes** INSTALL a new IC . REFER to Instrument Cluster (IC) in this section. TEST the system for normal operation. **No** GO to Pinpoint Test G .

Pinpoint Test AK: The Chime Sounds When The Driver Door Is Ajar (No Key In Ignition And Headlamps Off)

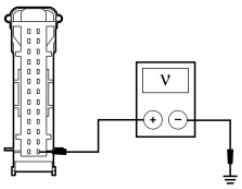
Refer to Wiring Diagrams Cell 60 , Instrument Cluster for schematic and connector information.

Normal Operation

When the key is inserted into the ignition lock cylinder, the key-in-ignition switch (part of the ignition switch) closes, providing a voltage signal to the Instrument Cluster (IC) through circuit CDC30 (BU/GY). The door ajar status is communicated to the IC from the Smart Junction Box (SJB) through the controller area network



(CAN). If the IC detects that the ignition switch is in the OFF or ACC position, the key is inserted in the ignition lock cylinder, and the SJB communicates to the IC that the driver door is ajar, the key-in-ignition warning chime sounds. The SJB communicates to the IC that the headlamps or parking lamps are on and the driver door is opened. The headlamps on warning chime sounds when the driver door is opened with the ignition switch in the OFF position, the key is not in the ignition lock cylinder, and the headlamp switch is in the HEADLAMP or PARKING LAMP position.



This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Key-in-ignition warning switch (part of the ignition switch)
- IC

PINPOINT TEST AK: THE CHIME SOUNDS WHEN THE DRIVER DOOR IS AJAR (NO KEY IN IGNITION AND HEADLAMPS OFF)

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
AK1 CHECK THE EXTERIOR LIGHTS FOR OPERATION	
• Turn the headlamp switch to the OFF position. • **Are the headlamps or parking lamps illuminated?**	**Yes** REFER to Section 417-01 . **No** GO to AK2 .
AK2 CHECK CIRCUIT CDC30 (BU/GY) FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Remove the key from the ignition lock cylinder. • Disconnect: IC C220. • Measure the voltage between the IC C220-14, circuit CDC30 (BU/GY), harness side and ground.  N0068787 • **Is any voltage present?**	**Yes** GO to AK3 . **No** GO to AK4 .
AK3 CHECK THE IGNITION SWITCH	

• Disconnect: Ignition Switch C250. • Measure the voltage between the IC C220-14, circuit CDC30 (BU/GY), harness side and ground.  N0068787 • **Is any voltage present?**	**Yes** REPAIR circuit CDC30 (BU/GY) for a short to voltage. TEST the system for normal operation. **No** INSTALL a new ignition switch. REFER to Section 211-05 . TEST the system for normal operation.
AK4 CHECK FOR CORRECT IC OPERATION	
• Disconnect the IC connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the IC connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new IC . REFER to Instrument Cluster (IC) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test AL: The Safety Belt Warning Chime Does Not Operate Correctly

Normal Operation

The Restraints Control Module (RCM) monitors the operation of the driver safety belt buckle. When the safety belt is buckled and unbuckled, the RCM sends the Instrument Cluster (IC) a status message over the controller area network (CAN). The IC monitors these messages and operates the chime according to the data. The safety belt warning chime sounds when the driver safety belt is not fastened and the ignition key is turned from the OFF/LOCK or ACC to the ON or START position. The safety belt warning chime stops sounding when the safety belt is fastened, when the ignition key is turned from the ON or START position to the OFF/LOCK or ACC position, or when the chime has sounded for approximately 6 seconds.

This pinpoint test is intended to diagnose the following:

- RCM
- IC

PINPOINT TEST AL: THE SAFETY BELT WARNING CHIME DOES NOT OPERATE CORRECTLY

Test Step	Result / Action to Take
AL1 RETRIEVE THE RECORDED DTCs FROM THE RCM SELF-TEST	

• Check for recorded RCM DTCs from the self-test. • **Are any RCM DTCs recorded?**	**Yes** REFER to Section 501-20B . **No** GO to AL2 .
AL2 CHECK THE IC SAFETY BELT WARNING INDICATOR OPERATION	
NOTE: The safety belt warning chime stops sounding when the safety belt is fastened , when the ignition key is turned from the ON or START position to the OFF/LOCK or ACC position, or when the chime has sounded for approximately 6 seconds. • Ignition ON. • Following the IC prove-out, observe the safety belt warning indicator with the safety belt buckled and unbuckled. • **Does the safety belt warning indicator operate correctly?**	**Yes** GO to AL3 . **No** GO to Pinpoint Test L .
AL3 CHECK THE IC CHIME FOR OPERATION	
• Enter the following diagnostic mode on the scan tool: IC Self-Test. • Carry out the IC on-demand self-test while listening for the IC chime. • **Does the IC chime operate?**	**Yes** INSTALL a new RCM . REFER to Section 501-20B . TEST the system for normal operation. **No** INSTALL a new IC . REFER to Instrument Cluster (IC) in this section. TEST the system for normal operation.

Pinpoint Test AM: The Belt-Minder® Feature Does Not Operate Correctly

Normal Operation

The Restraints Control Module (RCM) monitors the operation of the safety belt buckles. When the safety belts are buckled and unbuckled, the RCM sends the Instrument Cluster (IC) a status message over the High Speed Controller Area Network (HS-CAN). The Belt-Minder® reminds the driver that the driver or passenger safety belt is unbuckled by intermittently sounding a chime and illuminating the safety belt warning lamp in the IC once the vehicle speed has exceeded 5 km/h (3 mph).

This pinpoint test is intended to diagnose the following:

- Belt-Minder® deactivated
- RCM
- IC

PINPOINT TEST AM: THE BELT-MINDER® FEATURE DOES NOT OPERATE CORRECTLY

Test Step	Result / Action to Take
AM1 CHECK THE BELT-MINDER® CONFIGURATION	

• Verify that the Belt-Minder® is activated or configured on for the seating position in question. Refer to Belt-Minder® Deactivating/Activating in this section to configure without a scan tool. • **Is the Belt-Minder® activated for the seating position in question?**	**Yes** GO to AM2 . **No** ACTIVATE the Belt-Minder® for the seating position in question. REFER to Belt-Minder® Deactivating/Activating in this section. TEST the system for normal operation.
AM2 CHECK THE SPEEDOMETER OPERATION	
• Start the engine. • Verify that the speedometer is operating correctly. • **Does the speedometer operate correctly?**	**Yes** GO to AM3 . **No** GO to Pinpoint Test G .
AM3 RETRIEVE THE RECORDED DTCs FROM THE RCM SELF-TEST	
• Check for recorded RCM DTCs from the self-test. • **Are any RCM DTCs recorded?**	**Yes** REFER to Section 501-20B . **No** GO to AM4 .
AM4 CHECK THE IC CHIME FOR OPERATION	
• Enter the following diagnostic mode on the scan tool: IC Self-Test. • Carry out the IC self-test while listening for the IC chime. • **Does the IC chime operate?**	**Yes** INSTALL a new RCM . REFER to Section 501-20B . TEST the system for normal operation. **No** INSTALL a new IC . REFER to Instrument Cluster (IC) in this section. TEST the system for normal operation.

Pinpoint Test AN: The Parking Brake Warning Chime Is Inoperative

Normal Operation

The parking brake warning chime warns that the parking brake is engaged when the vehicle is in motion. The parking brake warning chime sounds if the ignition key is in the RUN position, the parking brake is engaged, and the vehicle speed is greater than 5 km/h (3 mph). The Smart Junction Box (SJB) monitors the parking brake status and when the parking brake is applied or released, the SJB sends the Instrument Cluster (IC) the parking brake status over the controller area network (CAN). The IC monitors these messages and operates the chime according to the data.

This pinpoint test is intended to diagnose the following:

- Brake warning indication
- Vehicle speed input
- IC

PINPOINT TEST AN: THE PARKING BRAKE WARNING CHIME IS INOPERATIVE

Test Step	Result / Action to Take
AN1 CHECK THE BRAKE WARNING INDICATOR OPERATION	
• Ignition ON. • Apply the parking brake. • Observe the brake warning indicator. • **Does the brake warning indicator turn on with the parking brake applied?**	**Yes** GO to AN2 . **No** GO to Pinpoint Test I .
AN2 CHECK THE SPEEDOMETER FOR CORRECT OPERATION	
• Verify the speedometer operates. • **Does the speedometer operate correctly?**	**Yes** GO to AN3 . **No** GO to Pinpoint Test G .
AN3 CHECK THE PARKING BRAKE WARNING CHIME OPERATION	
• Slightly apply the parking brake and drive the vehicle at a speed greater than 5 km/h (3 mph). Observe the parking brake warning chime. • **Does the parking brake warning chime operate correctly?**	**Yes** The system is operating correctly at this time. The vehicle must be moving at a speed greater than 5 km/h (3 mph) with the parking brake applied. **No** INSTALL a new IC . REFER to Instrument Cluster (IC) in this section. TEST the system for normal operation.

Pinpoint Test AO: DTC B1317

Refer to Wiring Diagrams Cell 60 , Instrument Cluster for schematic and connector information.

Normal Operation

- DTC B1317 (Battery Voltage High) - a continuous memory and on-demand DTC that sets in the Instrument Cluster (IC) if the IC detects battery voltage above 16 volts on the B+ keep alive voltage input circuit SBP24 (VT/RD).

This pinpoint test is intended to diagnose the following:

- Charging system concern
- IC

PINPOINT TEST AO: DTC B1317

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: DTC B1317 may be stored in the module memory due to past battery charging or vehicle jump starting events.

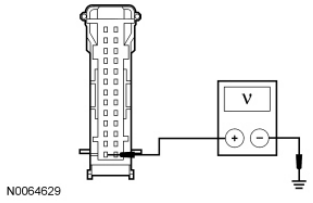
Test Step	Result / Action to Take
AO1 CHECK FOR DTC B1317, B1676 OR P0536 SET IN OTHER MODULES	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Self-Test. • Retrieve the continuous memory DTCs from all modules. • **Is DTC B1317, B1676 or P0536 (PCM) set in more than one module?**	**Yes** REFER to Section 414-00 to diagnose an overcharging condition. **No** GO to AO2 .
AO2 CHECK THE BATTERY VOLTAGE	
• Turn off all interior/exterior lights and accessories. • Start and run the engine at approximately 2,000 rpm for 3 minutes while monitoring the battery voltage. • **Does the battery voltage rise to 15.5 volts or higher?**	**Yes** REFER to Section 414-00 to diagnose an overcharging condition. **No** GO to AO3 .
AO3 RECHECK FOR DTC B1317	
• Turn the engine off. • Ignition ON. • Enter the following diagnostic mode on the scan tool: IC Self-Test. • Clear the continuous memory DTCs. • Carry out the IC self-test. • **Is DTC B1317 present?**	**Yes** INSTALL a new IC . REFER to Instrument Cluster (IC) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The DTC may have been set previously during battery charging or while jump starting the vehicle.

Pinpoint Test AP: DTC B1318

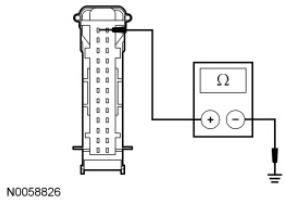
Refer to Wiring Diagrams Cell 60 , Instrument Cluster for schematic and connector information.

Normal Operation

- DTC B1318 (Battery Voltage Low) - sets in continuous memory and on-demand if the Instrument Cluster (IC) voltage drops below 9 volts on the B+ keep alive voltage input circuit SBP24 (VT/RD).



This pinpoint test is intended to diagnose the following:



- Wiring, terminals or connectors
- High circuit resistance
- IC

PINPOINT TEST AP: DTC B1318

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
AP1 RECHECK THE IC DTCs	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IC Self-Test. • Clear the DTCs. Repeat the IC self-test. • **Is DTC B1318 still present?**	**Yes** GO to AP2 . **No** The system is operating correctly at this time. The DTC may have been set due to a previous low battery voltage condition.
AP2 CHECK THE CHARGING SYSTEM DTCs IN THE PCM	
• Enter the following diagnostic mode on the scan tool: PCM Self-Test. • Retrieve the continuous memory DTCs from all modules. • **Is DTC P0620, P0622, P0625, P0626 or P065B set in the PCM?**	**Yes** REFER to Section 414-00 . **No** GO to AP3 .
AP3 CHECK THE BATTERY CONDITION AND STATE OF CHARGE	
• Check the battery condition and verify that the battery is fully charged. Refer to Section 414-01 . • **Is the battery OK and fully charged?**	**Yes** GO to AP4 . **No** REFER to Section 414-01 .
AP4 CHECK THE IC VOLTAGE SUPPLY	
• Ignition OFF. • Measure and record the voltage at the battery. • Disconnect: IC C220. • Ignition ON. • Measure the voltage between the IC C220-1, circuit SBP24 (VT/RD), harness side and ground.  	**Yes** GO to AP5 . **No** REPAIR the circuit for high resistance. CLEAR the DTC. REPEAT the self-test.

• **Is the voltage within 0.2 volts of the recorded battery?**	
AP5 CHECK THE IC GROUND CIRCUITS	
• Ignition OFF. • Disconnect: Negative Battery Cable. • Measure the resistance between the IC C220-13, circuit GD145 (BK/BU), harness side and ground.  N0058826 • **Is the resistance less than 5 ohms?**	**Yes** GO to AP6 . **No** REPAIR the circuit for high resistance. CLEAR the DTC. REPEAT the self-test.
AP6 CHECK FOR CORRECT IC OPERATION	
• Disconnect the IC connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the IC connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new IC . REFER to Instrument Cluster (IC) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test AQ: DTC U0140

Normal Operation

- DTC U0140 (Lost Communication With Body Control Module [GEM]) - sets in the Instrument Cluster (IC) if the data messages received from the Smart Junction Box (SJB) over the High Speed Controller Area Network (HS-CAN) are missing for 5 seconds or longer.

This pinpoint test is intended to diagnose the following:

- SJB
- IC

PINPOINT TEST AQ: DTC U0140

Test Step	Result / Action to Take
AQ1 VERIFY CUSTOMER CONCERN	
• Ignition ON.	**Yes** GO to AQ2 .

• Verify that there is an observable symptom present. • **Is an observable symptom present?**	**No** The system is operating normally at this time. The DTC may have been set due to high network traffic or intermittent fault condition.
AQ2 CHECK THE COMMUNICATION NETWORK	
• Enter the following diagnostic mode on the scan tool: Network Test. • Carry out the network test. • **Does the SJB pass the network test?**	**Yes** GO to AQ3 . **No** REFER to Section 418-00 .
AQ3 RETRIEVE THE RECORDED DTCs FROM THE SELF-TEST	
• Check for recorded IC DTCs from the self-test. • **Is DTC B1317 or B1318 recorded?**	**Yes** For DTC B1317, GO to Pinpoint Test AO . For DTC B1318, GO to Pinpoint Test AP . **No** GO to AQ4 .
AQ4 RECHECK THE IC DTCs	
NOTE: If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during Programmable Module Installation (PMI) or the PMI may not have been carried out. • Clear the DTCs. Repeat the IC self-test. • **Is DTC U0140 still present?**	**Yes** GO to AQ5 . **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic.
AQ5 CHECK FOR DTC U0140 SET IN OTHER MODULES	
• Clear all DTCs. • Ignition OFF. • Ignition ON. • Wait 10 seconds. • Enter the following diagnostic mode on the scan tool: Self-Test. • Retrieve the continuous memory DTCs from all modules. • **Is DTC U0140 set in the Audio Control Module (ACM)?**	**Yes** REFER to Section 418-00 to diagnose no communication with the SJB . **No** INSTALL a new IC . REFER to Instrument Cluster (IC) in this section. TEST the system for normal operation.

Pinpoint Test AR: DTC U0159

Normal Operation

- DTC U0159 (Lost Communication With Parking Assist Control Module [PAM]) - sets in the Instrument Cluster (IC) if data messages received from the Parking Aid Module (PAM) over the Medium Speed Controller Area Network (MS-CAN) are missing for 5 seconds or longer.

This pinpoint test is intended to diagnose the following:

- PAM
- IC

PINPOINT TEST AR: DTC U0159

Test Step	Result / Action to Take
AR1 VERIFY CUSTOMER CONCERN	
• Ignition ON. • Verify that there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to AR2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or intermittent fault condition.
AR2 CHECK THE COMMUNICATION NETWORK	
• Enter the following diagnostic mode on the scan tool: Network Test. • Carry out the network test. • **Does the PAM pass the network test?**	**Yes** GO to AR3 . **No** REFER to Section 418-00 .
AR3 RETRIEVE THE RECORDED DTCs FROM THE SELF-TEST	
• Check for recorded IC DTCs from the self-test. • **Is DTC B1317 or B1318 recorded?**	**Yes** For DTC 1317, GO to Pinpoint Test AO . For DTC 1318, GO to Pinpoint Test AP . **No** GO to AR4 .
AR4 RECHECK THE IC DTCs	
NOTE: If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during Programmable Module Installation (PMI) or the PMI may not have been carried out. • Clear the DTCs. Repeat the IC self-test. • **Is DTC U0159 still present?**	**Yes** INSTALL a new PAM . REFER to Section 413-13 . TEST the system for normal operation. REPEAT the IC self-test. If DTC U0159 is still present, INSTALL a new IC . REFER to Instrument Cluster (IC) in this section. TEST the system for normal operation.

	No The system is operating correctly at this time. The DTC may have been set due to high network traffic or intermittent fault condition.

Pinpoint Test AS: DTC U0208

Normal Operation

- DTC U0208 (Lost Communication With Seat Control Module [DSM]) - sets in the Instrument Cluster (IC) if data messages received from the Driver Seat Module (DSM) over the Medium Speed Controller Area Network (MS-CAN) are missing for 5 seconds or longer.

This pinpoint test is intended to diagnose the following:

- DSM
- IC

PINPOINT TEST AS: DTC U0208

Test Step	Result / Action to Take
AS1 VERIFY CUSTOMER CONCERN	
• Ignition ON. • Verify that there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to AS2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or intermittent fault condition.
AS2 CHECK THE COMMUNICATION NETWORK	
• Enter the following diagnostic mode on the scan tool: Network Test. • Carry out the network test. • **Does the DSM pass the network test?**	**Yes** GO to AS3 . **No** REFER to Section 418-00 .
AS3 RETRIEVE THE RECORDED DTCs FROM THE SELF-TEST	
• Check for recorded IC DTCs from the self-test. • **Is DTC B1317 or B1318 recorded?**	**Yes** For DTC 1317, GO to Pinpoint Test AO . For DTC 1318, GO to Pinpoint Test AP . **No** GO to AS4 .
AS4 RECHECK THE IC DTCs	

NOTE: If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during Programmable Module Installation (PMI) or the PMI may not have been carried out. • Clear the DTCs. Repeat the IC self-test. • **Is DTC U0208 still present?**	**Yes** INSTALL a new DSM . REFER to Section 419-10 . TEST the system for normal operation. REPEAT the IC self-test. If DTC U0208 is still present, INSTALL a new IC . REFER to Instrument Cluster (IC) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or intermittent fault condition.

Pinpoint Test AT: DTC U0244

Normal Operation

- DTC U0244 (Lost Communication With Running Board Control Module [PRB]) - sets in the Instrument Cluster (IC) if data messages received from the Power Running Board (PRB) module over the Medium Speed Controller Area Network (MS-CAN) are missing for 5 seconds or longer.

This pinpoint test is intended to diagnose the following:

- Power Running Board (PRB) module
- IC

PINPOINT TEST AT: DTC U0244

Test Step	Result / Action to Take
AT1 VERIFY CUSTOMER CONCERN	
• Ignition ON. • Verify that there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to AT2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or intermittent fault condition.
AT2 CHECK THE COMMUNICATION NETWORK	
• Enter the following diagnostic mode on the scan tool: Network Test. • Carry out the network test. • **Does the PRB module pass the network test?**	**Yes** GO to AT3 . **No** REFER to Section 418-00 .
AT3 RETRIEVE THE RECORDED DTCs FROM THE SELF-TEST	

• Check for recorded IC DTCs from the self-test. • **Is DTC B1317 or B1318 recorded?**	**Yes** For DTC 1317, GO to Pinpoint Test AO . For DTC 1318, GO to Pinpoint Test AP . **No** GO to AT4 .
AT4 RECHECK THE IC DTCs	
NOTE: If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during Programmable Module Installation (PMI) or the PMI may not have been carried out. • Clear the DTCs. Repeat the IC self-test. • **Is DTC U0244 still present?**	**Yes** INSTALL a new PRB module. REFER to Section 501-08 . TEST the system for normal operation. REPEAT the IC self-test. If DTC U0244 is still present, INSTALL a new IC . REFER to Instrument Cluster (IC) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or intermittent fault condition.

Message Center Configuration

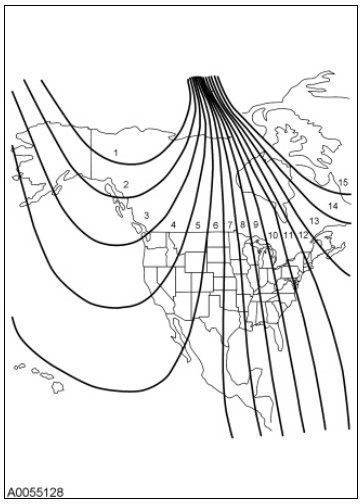
Oil Life Reset And Start Value - With Message Center

NOTE: The oil life calculation is set at a maximum of approximately 12,000 km (7,500 miles) or 180 days.

1. From the setup menu, press and release the RESET button to display HOLD RESET IF NEW OIL.
2. Press and hold the RESET button for 2 seconds and release to reset the oil life to 100%.
3. The message center displays OIL LIFE SET TO 100%.
4. Once the message center displays OIL LIFE SET TO 100%, release the RESET button then press and release the RESET button to reduce the start value (10% for each button press).

Oil Life Reset And Start Value - Without Message Center

NOTE: Oil life calculation is set at a maximum of approximately 12,000 km (7,500 miles) or 180 days.

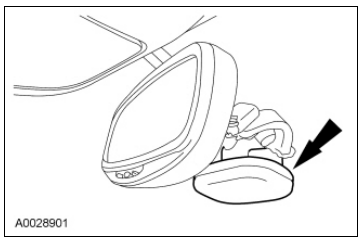


NOTE: All message center functions are carried out using the single stem reset button in the Instrument Cluster (IC).

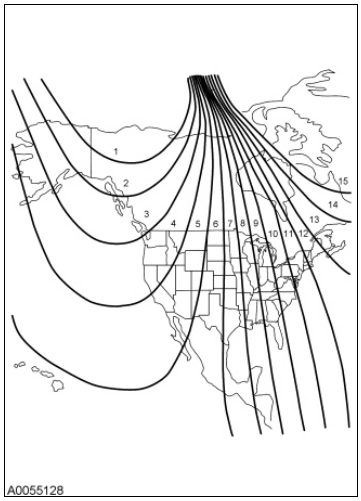
1. Press and release the SELECT/RESET button to scroll through the information displays until the message center displays HOLD RESET IF NEW OIL.
2. Press and hold the SELECT/RESET button for approximately 2 seconds until the message center displays OIL LIFE SET TO 100%.
3. Once OIL LIFE SET TO 100% is displayed, press and hold the SELECT/RESET button for more than 2 seconds until the message center displays OIL LIFE SET TO XXX%.
4. Press and release the SELECT/RESET button to reduce the start value (10% for each button press).
5. Press and release the SELECT/RESET button to exit the procedure.

Compass Zone Adjustment

With Message Center



1. Turn the ignition switch to the ON position.
2. From the SETUP menu, select compass zone.
3. Determine which magnetic zone you are in for your geographic location.



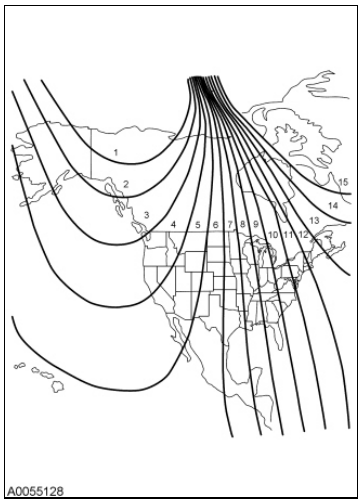
4. Press the RESET button until the message center display changes to show the current zone setting.
5. Press the RESET button repeatedly until the correct zone setting for your geographic location is displayed.
6. Wait 4 seconds when the correct zone is chosen.

Without Message Center - Early Build

1. Turn the ignition switch to the ON position.
2. Locate the reset button on top of the compass sensor located behind the mirror.

3. Determine which magnetic zone you are in for your geographic location.

4. Press and hold the reset button on the compass module for approximately 4 seconds until COMPASS ZONE XX appears in the instrument cluster display.



5. Continue to press the reset button until the correct zone setting for your geographic location appears in the instrument cluster display.

6. After 4 seconds, ZONE SET appears in the instrument cluster display. The zone is updated.

Without Message Center - Late Build

1. Turn the ignition switch to the ON position.

2. Determine which magnetic zone you are in for your geographic location.

3. Press and release the SELECT/RESET button until HOLD RESET FOR SYSTEM CHECK is displayed in the integrated circuit display.

4. Quickly release the SELECT/RESET button.

5. Press and release the SELECT/RESET button to scroll through the setup menu until COMPASS ZONE XX is displayed in the integrated circuit display.

6. Press and hold the SELECT/RESET button for approximately 2 seconds to enter the compass zone setting mode.

7. Press and release the SELECT/RESET button until the correct zone setting for your geographic location appears in the integrated circuit display.

8. Release the SELECT/RESET button and allow the setup timer to expire to exit the procedure.

Compass Calibration

With Message Center

1. **NOTE:** For optimum calibration, drive to an open, level location away from large metallic objects or structures. Switch off all non-essential electrical accessories (rear window defrost, heater, A/C, map lamps, wipers, heated windshield, etc.) and make sure all doors are closed.

   Start the vehicle.

2. From the SETUP menu, press the SETUP button to select the compass calibration function.

3. Press the RESET button.

4. **NOTE:** It takes up to 5 circles to complete the calibration.

   NOTE: If not calibrated within 3 minutes or if the RESET button is pressed during CIRCLE SLOWLY TO CALIBRATE, CIRCLE SLOWLY TO CALIBRATE changes to CAL and the calibration process must start over.

   Slowly drive the vehicle in a circle at no more than 5 km/h (3 mph) until CIRCLE SLOWLY TO CALIBRATE changes to CALIBRATION COMPLETED in the message center.

Without Message Center - Early Build

1. **NOTE:** For optimum calibration, drive to an open, level location away from large metallic objects or structures. Switch off all non-essential electrical accessories (rear window defrost, heater A/C, map lamps, wipers, heated windshield, etc.) and make sure all doors are closed.

   Start the vehicle.

2. Locate the reset button on top of the compass sensor located behind the mirror.

3. Press and hold the reset button on the compass module for approximately 8 seconds until CIRCLE SLOWLY TO CALIBRATE is displayed and release.

4. **NOTE:** It takes up to 5 circles to complete the calibration.

   NOTE: If not calibrated within 3 minutes or if the reset button is pressed during CIRCLE SLOWLY TO CALIBRATE, CIRCLE SLOWLY TO CALIBRATE changes to CAL and the calibration process must start over.

Slowly drive the vehicle in a circle at no more than 5 km/h (3 mph) until CIRCLE SLOWLY TO CALIBRATE changes to CALIBRATION COMPLETE in the Instrument Cluster (IC) display.

Without Message Center - Late Build

1. **NOTE:** For optimum calibration, drive to an open, level location away from large metallic objects or structures. Switch off all non-essential electrical accessories (rear window defrost, heater A/C, map lamps, wipers, heated windshield, etc.) and make sure all doors are closed.

   Start the vehicle.

2. Press and release the SELECT/RESET button to scroll through the information menu until HOLD RESET FOR SYSTEM CHECK is displayed.

3. Quickly release the SELECT/RESET button.

4. Press and release the SELECT/RESET button to scroll through the setup menu until COMPASS ZONE XX is displayed in the integrated circuit display.

5. Press and hold the SELECT/RESET button for approximately 2 seconds to enter the compass zone setting mode.

6. Release the SELECT/RESET button.

7. Press and hold the SELECT/RESET button until CIRCLE SLOWLY TO CALIBRATE appears in the integrated display.

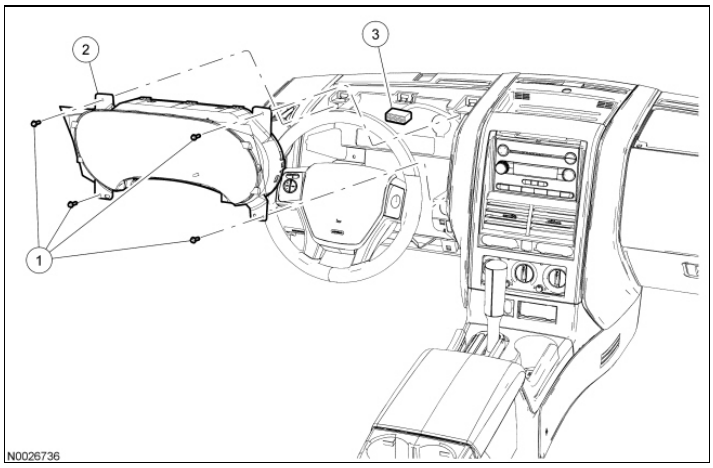
8. **NOTE:** It can take up to 5 circles to complete the calibration.

   Slowly drive the vehicle in a circle at no more than 5 km/h (3 mph) until CIRCLE SLOWLY TO CALIBRATE changes to CALIBRATION COMPLETE in the IC display.

Belt-Minder® Deactivating/Activating

Preparation

NOTE: The Belt-Minder® Deactivating/Activating procedure can also be carried out using the scan tool.



1. Apply the parking brake before deactivating/activating the Belt-Minder®.
2. Place the gear selector lever in PARK (P).
3. Place the ignition switch in the OFF position.
4. Close all the vehicle doors.
5. Unbuckle the driver and the front passenger safety belts.

Deactivating/Activating

1. Turn the ignition switch to the ON position (do not start the engine).
2. Wait until the safety belt warning indicator turns off (approximately 1 minute).
3. **NOTE:** Step 3 must be completed within 50 seconds after the safety belt warning indicator turns off.

   For the seating position being disabled, at a moderate speed, buckle then unbuckle the safety belt 9 times, ending with the safety belt in the unbuckled state. After this step the safety belt warning indicator illuminates for 3 seconds.
4. Within 5 seconds after the safety belt warning indicator turns off, at a moderate speed, buckle then unbuckle the safety belt.
   - This disables the Belt-Minder® feature for that seating position, if it is currently enabled. As confirmation, the safety belt warning indicator flashes 4 times per second for 3 seconds.
   - This enables the Belt-Minder® feature for that seating position, if it is currently disabled. As confirmation, the safety belt warning indicator flashes 4 times per second for 3 seconds followed by a second flash sequence after a brief pause.
5. After confirmation, the deactivation/activation procedure is complete.

Instrument Cluster (IC)

Item	Part Number	Description
1	W707628	Instrument Cluster (IC) screws (4 required)
2	10849	IC
3	-	Electrical connector (part of 14401)

Removal

NOTE: Prior to removal of the Instrument Cluster (IC), it is necessary to download the IC configuration information to the diagnostic tool. For additional information, refer to Section 418-01 .

NOTE: If installing a new IC , all vehicle keys are erased during the parameter reset procedure. Verify at least 2 of the vehicle keys are available prior to carrying out this procedure.

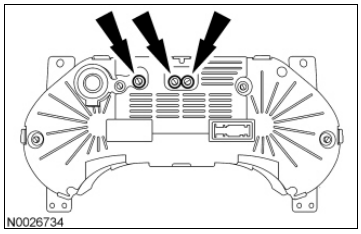
1. Depower the Supplemental Restraint System (SRS). For additional information, refer to Section 501-20B .
2. Lower the tilt steering column to the lowest position.
3. Remove the instrument cluster finish panel. For additional information, refer to Section 501-12 .
4. Remove the 4 screws and the IC .
    - Disconnect the electrical connector.

Installation

1. Position the IC in the instrument panel, connect the electrical connector and install the screws.
2. Install the instrument cluster finish panel. For additional information, refer to Section 501-12 .
3. Repower the SRS . For additional information, refer to Section 501-20B .
4. Following installation of the IC , download the module configuration information and the Vehicle Identification Number (VIN) from the scan tool into the new IC . For additional information, refer to Section 418-01 .

5. **NOTE:** If the IC is installed new, updated, or re-configured, the IC requires a parameter reset to allow the IC and the PCM to recognize the Passive Anti-Theft System (PATS) keys. Failure to carry out the parameter reset to the Instrument Cluster (IC) may result in a no start condition.

   Carry out the parameter reset and key programming procedure. For additional information, refer to Section 419-01 .



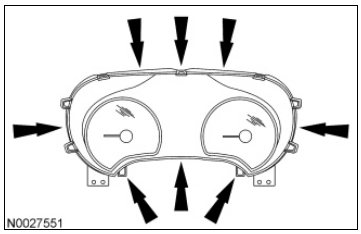
Warning Indicator Bulb

Removal and Installation

1. Remove the Instrument Cluster (IC). For additional information, refer to Instrument Cluster (IC) in this section.

2. **NOTE:** To remove a warning indicator bulb, rotate the bulb one quarter turn counterclockwise and lift it out from the IC .

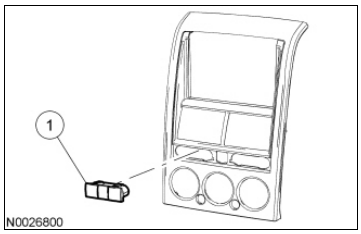
   Remove the warning indicator bulb(s) in question.



3. To install, reverse the removal procedure.

Instrument Cluster (IC) Lens

Removal and Installation

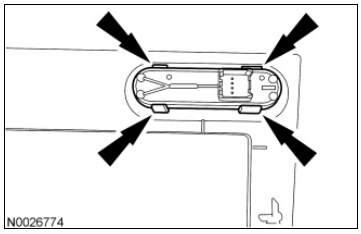


1. Remove the Instrument Cluster (IC). For additional information, refer to Instrument Cluster (IC) in this section.

2. Release the 8 tabs and remove the IC lens and mask assembly.

3. To install, reverse the removal procedure.

Message Center Switch



Item	Part Number	Description
1	10D996	Message center switch

Removal and Installation

1. Remove the instrument panel center finish panel. For additional information, refer to Section 501-12 .

2. Press the retaining tabs and remove the message center switch.

3. To install, reverse the removal procedure.

Torque Specifications

Description	Nm	lb-in
Horn nut	10	89

SECTION 413-06: Horn

2009 Explorer/Mountaineer/Explorer Sport Trac Workshop Manual

DESCRIPTION AND OPERATION

Procedure revision date: 08/13/2008

Horn

NOTE: The Smart Junction Box (SJB) is also known as the Generic Electronic Module (GEM).

The horn system consists of the following components:

- Horn switch (part of the steering wheel)
- Clockspring
- Horn relay (part of the SJB)
- Horn
- SJB

Horn Location

The horn is mounted behind the LH front fender splash shield on the inner side of the fender well.

Horn

Special Tool(s)

 ST1137-A	73III Automotive Meter 105-R0057 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
 ST2574-A	Flex Probe Kit 105-R025C or equivalent

Principles of Operation

NOTE: The Smart Junction Box (SJB) is also known as the Generic Electronic Module (GEM).

The Battery Junction Box (BJB) supplies voltage to the horn relay (part of the SJB). When the horn switch (part of the steering wheel) is pressed, ground is supplied to the horn relay coil through the clockspring. The horn relay then energizes, sending voltage to the horn, enabling the horn to sound.

The SJB also provides ground to the horn relay coil to sound the horn when the anti-theft system is armed, an intrusion is detected or the panic button is pressed on the Remote Keyless Entry (RKE) transmitter, or to indicate a programming feature sequence.

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Horn • Horn switch (part of the steering wheel)	• Smart Junction Box (SJB) fuse 14 (20A) • Wiring, terminals or connectors • Clockspring • SJB

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM .
   - Refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication with one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the SJB .

9. If the DTCs retrieved are related to the concern, go to DTC Charts. For all other DTCs, refer to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

DTC Charts

Smart Junction Box (SJB) DTC Chart

DTC	Description	Action
B1217	Horn Relay Coil Circuit Failure	If the horn is inoperative, GO to Pinpoint Test A . If the horn always sounds, GO to Pinpoint Test B .
B1218	Horn Relay Coil Circuit Short to Vbatt	GO to Pinpoint Test A .
All other DTCs	-	REFER to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .

Symptom Chart

Symptom Chart

Pinpoint Tests

Pinpoint Test A: The Horn Is Inoperative

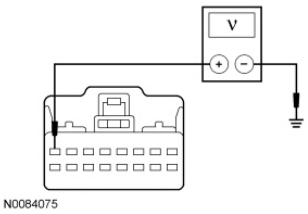
Refer to Wiring Diagrams Cell 44 , Horn/Cigar Lighter for schematic and connector information.

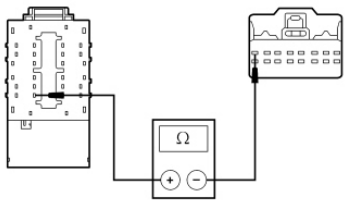
Normal Operation

The horn relay is part of the Smart Junction Box (SJB) and cannot be replaced independently. When the horn switch (part of the steering wheel) is pressed, the switch closes and ground is applied from the steering wheel harness through the clockspring to the horn relay through circuit CRH02 (BU/WH). The horn relay is then energized, applying voltage to the horn through circuit CBP14 (VT/OG), enabling the horn to sound. Ground for the horn is supplied through circuit GD120 (BK/GN).

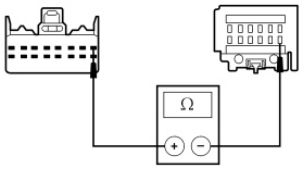
- DTC B1217 (Horn Relay Coil Circuit Failure) - a continuous and on-demand DTC that sets when the SJB detects an open on the horn relay coil circuit.
- DTC B1218 (Horn Relay Coil Circuit Short to Vbatt) - a continuous and on-demand DTC that sets when the SJB detects a short to voltage on the horn relay coil circuit.

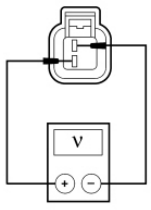
This pinpoint test is intended to diagnose the following:

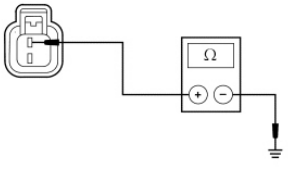




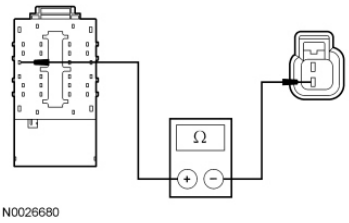
- Fuse
- Wiring, terminals or connectors
- Steering wheel harness
- Horn
- Clockspring
- Horn switch (part of the steering wheel)
- SJB







PINPOINT TEST A: THE HORN IS INOPERATIVE



NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
A1 CHECK THE SJB OUTPUT	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: SJB DataLogger. • Select the SJB horn PID (HORNRLY). Active command the horn on and then off. • **Does the horn sound when commanded on?**	**Yes** GO to A2 . **No** GO to A6 .
A2 CHECK CIRCUIT CRH02 (BU/WH) FOR VOLTAGE	

• Ignition OFF. • Depower the Supplemental Restraint System (SRS). Refer to Section 501-20B . • Disconnect: Clockspring C218a. • Connect: Negative Battery Cable. • Measure the voltage between the clockspring C218a-8, circuit CRH02 (BU/WH), harness side and ground.  N0084075 • **Is the voltage greater than 10 volts?**	**Yes** GO to A4 . **No** GO to A3 .
A3 CHECK CIRCUIT CRH02 (BU/WH) FOR AN OPEN	
• Disconnect: SJB C2280c. • Measure the resistance between the clockspring C218a-8, circuit CRH02 (BU/WH), harness side and the SJB C2280c-6, circuit CRH02 (BU/WH), harness side.  N0026512 • **Is the resistance less than 5 ohms?**	**Yes** GO to A9 . **No** REPAIR the circuit. REPOWER the SRS . REFER to Section 501-20B . CLEAR the DTCs. REPEAT the self-test.
A4 CHECK THE CLOCKSPRING FOR AN OPEN	
• Remove the driver air bag module. Refer to Section 501-20B . • Disconnect: Upper Clockspring. • Measure the resistance between the clockspring C218a pin 8, component side and the upper clockspring C218b pin 1, component side.	**Yes** GO to A5 . **No** INSTALL a new clockspring. REFER to Section 501-20B . CLEAR the DTCs. REPEAT the self-test.

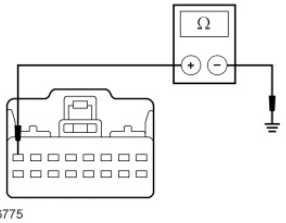
 N0027244 • **Is the resistance less than 5 ohms?**	
A5 CHECK THE STEERING WHEEL HARNESS FOR DAMAGE OR OPENS	
• Inspect the steering wheel harness for damage or opens. • **Is the steering wheel harness OK?**	**Yes** INSTALL a new steering wheel. REFER to Section 211-04 . CLEAR the DTCs. REPEAT the self-test. **No** REPAIR or INSTALL a new steering wheel harness. INSTALL the driver air bag module. REFER to Section 501-20B . CLEAR the DTCs. REPEAT the self-test.
A6 CHECK CIRCUIT CBP14 (VT/OG) FOR VOLTAGE	
• Disconnect: Horn C1101. • While pressing the horn switch, measure the voltage between the horn C1101-2, circuit CBP14 (VT/OG), harness side and the horn C1101-1, circuit GD120 (BK/GN), harness side.  N0013171 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new horn. REFER to Horn in this section. CLEAR the DTCs. REPEAT the self-test. **No** VERIFY the SJB fuse 14 (20A) is OK. If OK, GO to A7 . If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short.
A7 CHECK CIRCUIT GD120 (BK/GN) FOR AN OPEN	
• Disconnect: Negative Battery Cable. • Measure the resistance between the horn C1101-1, circuit GD120 (BK/GN), harness side and ground.  A0032815	**Yes** GO to A8 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

• **Is the resistance less than 5 ohms?**	
A8 CHECK CIRCUIT CBP14 (VT/OG) FOR AN OPEN	
• Measure the resistance between the SJB C2280e-17, circuit CBP14 (VT/OG), harness side and the horn C1101-2, circuit CBP14 (VT/OG), harness side.  N0026680 • **Is the resistance less than 5 ohms?**	**Yes** GO to A9 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
A9 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

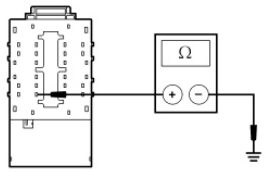
Pinpoint Test B: The Horn Is Always On

Refer to Wiring Diagrams Cell 44 , Horn/Cigar Lighter for schematic and connector information.

Normal Operation

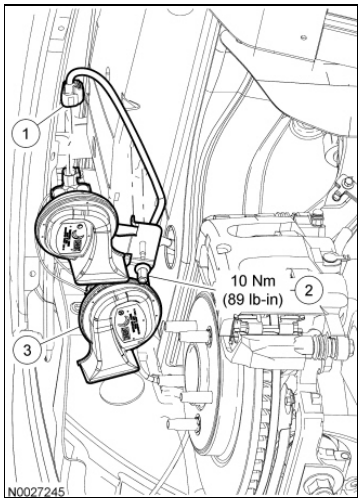


The horn relay is part of the Smart Junction Box (SJB) and cannot be replaced independently. When the horn switch (part of the steering wheel) is pressed, the switch closes and ground is applied from the steering wheel harness through the clockspring to the horn relay through circuit CRH02 (BU/WH). The horn relay is then energized, applying voltage to the horn through circuit CBP14 (VT/OG), enabling the horn to sound.



This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Steering wheel harness
- Clockspring
- Horn switch (part of the steering wheel)
- SJB



PINPOINT TEST B: THE HORN IS ALWAYS ON

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
B1 CHECK CIRCUIT CBP14 (VT/OG) FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: SJB C2280e. • **Does the horn continue to sound?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** GO to B2 .
B2 CHECK THE HORN SWITCH INPUT	
• Connect: SJB C2280e. • Disconnect: SJB C2280c. • **Does the horn continue to sound?**	**Yes** GO to B6 . **No** GO to B3 .
B3 CHECK CIRCUIT CRH02 (BU/WH) FOR A SHORT TO GROUND	
• Depower the Supplemental Restraint System (SRS). Refer to Section 501-20B . • Disconnect: Clockspring C218a. • Measure the resistance between the clockspring C218a-8, circuit CRH02 (BU/WH), harness side and ground.  N0026775 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to B4 . **No** REPAIR the circuit. REPOWER the SRS . REFER to Section 501-20B . CLEAR the DTCs. REPEAT the self-test.
B4 CHECK THE CLOCKSPRING FOR A SHORT TO GROUND	
• Remove the driver air bag module. REFER to Section 501-20B . • Connect: Clockspring C218a. • Measure the resistance between the SJB C2280c-6, circuit CRH02 (BU/WH), harness side and ground.	**Yes** GO to B5 . **No** INSTALL a new clockspring. REFER to Section 501-20B . CLEAR the DTCs. REPEAT the self-test.

 N0026515 • **Is the resistance greater than 10,000 ohms?**	
B5 CHECK THE STEERING WHEEL HARNESS FOR DAMAGE OR SHORTS	
• Inspect the steering wheel harness for damage or shorts. • **Is the steering wheel harness OK?**	**Yes** INSTALL a new steering wheel. REFER to Section 211-04 . CLEAR the DTCs. REPEAT the self-test. **No** REPAIR or INSTALL a new steering wheel harness. INSTALL the driver air bag module. REFER to Section 501-20B . CLEAR the DTCs. REPEAT the self-test.
B6 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Horn

Item	Part Number	Description
1	-	Electrical connector (part of 14398)
2	-	Horn nut
3	13832	Horn

Removal and Installation

1. Remove the LH front fender splash shield. For additional information, refer to Section 501-02 .

2. Disconnect the electrical connector.

3. Remove the nut and the horn.
   - To install, tighten to 10 Nm (89 lb-in).

4. To install, reverse the removal procedure.

General Specifications

Item	Specification
Explorer	
Azimuth system check object position 1 (P1) and position 5 (P5), distance from sensor	46 cm (18 in) rear 50 cm (20 in) side
Azimuth system check object position 2 (P2), 3 (P3) and 4 (P4), distance from sensor	274 cm (9 ft)
Mountaineer, Explorer Sport Trac	
Azimuth system check object position 1 (P1) and position 5 (P5), distance from sensor	30 cm (12 in) rear
Azimuth system check object position 2 (P2) and position 4 (P4), distance from sensor	91 cm (36 in) rear
Azimuth system check object position 3 (P3), distance from sensor	152 cm (60 in) rear

Parking Aid

Explorer

The parking aid system utilizes radar technology only. The parking aid radar sensor is integral to the Parking Aid Module (PAM) and is located in the center of the rear bumper between the bumper isolator and the bumper cover. The parking aid speaker is located in the RH D-pillar area.

The parking aid system consists of the following:

- Radar sensor
- PAM
- Parking aid speaker (audible warning tone)
- Parking aid disable feature (integral to theInstrument Cluster (IC) message center)

Mountaineer, Explorer Sport Trac

The parking aid system utilizes ultrasonic technology only. The 4 parking aid ultrasonic sensors are located in the rear bumper cover.

The parking aid system consists of the:

- Parking aid sensors
- PAM and speaker assembly (located in the passenger lower D-pillar (Mountaineer) or behind the passenger rear seat (Explorer Sport Trac))
- Parking aid disable feature (integral to the IC message center)

Parking Aid - Explorer

Special Tool(s)

 ST1137-A	73III Automotive Meter 105-R0057 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) with appropriate hardware, or equivalent scan tool
 ST2574-A	Flex Probe Kit 105-R025C or equivalent

Principles of Operation

NOTE: The liftgate must be closed for correct operation of the parking aid system.

NOTE: The Smart Junction Box (SJB) is also known as the Generic Electronic Module (GEM).

With the ignition switch in the RUN position, the Parking Aid Module (PAM) detects objects behind the vehicle when the REVERSE (R) gear is selected. The PAM calculates the distance to an object by the use of a radar sensor mounted in the rear bumper. The radar does this by calculating the distance to an object with in a 170 degree semicircular area emitted around the rear of the vehicle.

- At speeds under 4 km/h (2.5 mph), the system reports multiple beeps at ranges of up to 2.6 m (9 ft). A solid tone is reported if an object is within approximately 0.5m (1.5ft).
- At speeds between (2.5-5 mph), the system reports objects up to 5 m (16 ft).
- At speeds above 8 km/h (5 mph), the system reports objects up to 5 m (16 ft) and reports a fast beep alarm indicating time to collision is less than 1.5 seconds.
- The system is not effective at speeds greater than 10 km/h (6 mph) and may not detect certain angular or moving objects.
- Audio system volume is reduced when the PAM speaker is sounding (beeping).

The parking aid system is disabled if any fault is detected, and the message center indicates the parking aid is disabled. The parking aid system is also disabled when the operator selects parking aid disable through the message center. The parking aid system remains disabled until either the ignition key is cycled from OFF to RUN, or parking aid enable is selected through the message center.

The PAM communicates with the scan tool, the Smart Junction Box (SJB) and the Instrument Cluster (IC). The following chart describes network messages used by the PAM .

NOTE: Both the Medium Speed Controller Area Network (MS-CAN) and High Speed Controller Area Network (HS-CAN) are used for intermodule communication. A gateway message is transferred from one network to another network through the Instrument Cluster (IC). Refer to Section 418-00 .

Parking Aid Module (PAM) Network Communication Messages

Broadcast Message	Originating Module	Network Type	Receiving Module
Ignition switch position	Smart Junction Box (SJB)	MS-CAN	Parking Aid Module (PAM)
Parking aid disable switch status	Instrument Cluster (IC)	MS-CAN	PAM
Parking aid system status	PAM	MS-CAN	IC
Transmission selector range (PRNDL)	Transmission Control Module (TCM) (6R60 transmission)	HS-CAN	IC
Transmission selector range (PRNDL)	PCM (5R55S transmission)	HS-CAN	IC
Transmission selector range (PRNDL) (gateway)	IC	MS-CAN	PAM
Vehicle speed	PCM	HS-CAN	IC
Vehicle speed (gateway)	IC	MS-CAN	PAM
Audio system volume cutback request	PAM	MS-CAN	Audio Control Module (ACM)

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical and electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Rear bumper height and alignment	• Smart Junction Box (SJB) fuse 18 (10A) • Wiring, terminals or connectors • Parking Aid Module (PAM) • Parking aid speaker • Reversing lamps system

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).
5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

- Check the VCM connection to the vehicle.
- Check the scan tool connection to the VCM .
- Refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the PAM .

9. **NOTE:** Follow the non-network DTC diagnostics (B-codes, C-codes, P-codes) prior to the network DTC diagnostics (U-codes).

   If the DTCs retrieved are related to the concern, go to DTC Charts. For all other DTCs, refer to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

DTC Charts

Parking Aid Module (PAM) DTC Chart

DTC	Description	Action
B1317	Battery Voltage High	GO to Pinpoint Test I .
B1318	Battery Voltage Low	GO to Pinpoint Test B .
B1342	ECU is Faulted	CLEAR the DTCs. REPEAT the Parking Aid Module (PAM) self-test. If DTC B1342 is retrieved again, INSTALL a new PAM . REFER to Parking Aid Module (PAM) - Explorer in this section. CLEAR all DTCs. REPEAT the self-test.
C1742	Rear Sounder Circuit Failure	GO to Pinpoint Test C .
C1743	Rear Sounder Circuit Short To Vbatt	GO to Pinpoint Test C .

U0155	Lost Communication with Instrument Panel Cluster (IPC) Control Module	GO to Pinpoint Test K .
U2023	Fault Received From External Node	DISREGARD this DTC. RETRIEVE and FOLLOW other PAM DTCs.
U2471	Unexpected PRNDL State	GO to Pinpoint Test D .
U2472	Unexpected Ignition State	GO to Pinpoint Test E .
U2473	Unexpected Vehicle Speed (VSS)	GO to Pinpoint Test F .
	-	

All other DTCs		REFER to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .

Symptom Chart

Symptom Chart

Pinpoint Tests

Pinpoint Test A: Parking Aid Is Inoperative

Normal Operation

The parking aid system is disabled if any fault is detected, and the message center indicates the parking aid is disabled. The parking aid system may also be disabled when the operator selects parking aid disable through the message center. The parking aid system remains disabled until the fault is corrected, the ignition key is cycled from OFF to RUN (if previously disabled through the message center) or parking aid enable is selected through the message center. The Parking Aid Module (PAM) communicates with the scan tool, the Smart Junction Box (SJB) and the Instrument Cluster (IC) on the Medium Speed Controller Area Network (MS-CAN).

This pinpoint test is intended to diagnose the following:

- PAM

PINPOINT TEST A: PARKING AID IS INOPERATIVE

Test Step	Result / Action to Take
A1 VERIFY THE PAM COMMUNICATES WITH THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Network Test. • Carry out the network test. • **Does the PAM communicate with the scan tool?**	**Yes** GO to A2 . **No** REFER to Section 418-00 .
A2 CHECK THE DTCs FROM THE PAM ON-DEMAND SELF-TEST	
• Enter the following diagnostic mode on the scan tool: PAM Self-Test. • Retrieve the DTCs from the PAM on-demand self-test. • **Are any DTCs recorded?**	**Yes** REFER to DTC Charts in this section. **No** GO to A3 .

A3 CHECK THE MESSAGE CENTER DISPLAY	
• Observe the message center. • **Does the message center display PARK AID OFF?**	**Yes** ENABLE parking aid in the message center. TEST the system for normal operation. **No** GO to A4 .
A4 CHECK FOR CORRECT PAM OPERATION	
• Disconnect the PAM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the PAM connector and make sure it seats correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PAM . REFER to Parking Aid Module (PAM) - Explorer in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test B: DTC B1318

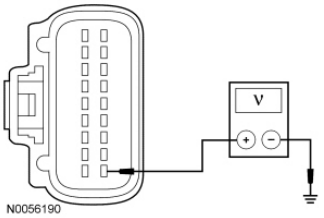
Refer to Wiring Diagrams Cell 131 , Parking Aid for schematic and connector information.

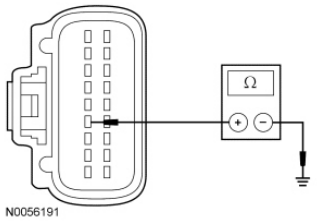
Normal Operation

Voltage is supplied to the Parking Aid Module (PAM) on circuit CBP18 (GY/OG) while circuit GD145 (BK/BU) provides ground.

- DTC B1318 (Battery Voltage Low) - a continuous and on-demand DTC that sets if available voltage to the PAM drops below 8 volts for 3 or more seconds.

This pinpoint test is intended to diagnose the following:





- Wiring, terminals or connectors
- Charging system concern

PINPOINT TEST B: DTC B1318

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
B1 CHECK THE PAM VOLTAGE SUPPLY CIRCUIT	

• Ignition OFF. • Disconnect: PAM C4226. • Ignition ON. • Measure the voltage between the PAM C4226-18, circuit CBP18 (GY/OG), harness side and ground.  • **Is the voltage greater than 10 volts?**	**Yes** GO to B2 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
B2 CHECK THE PAM GROUND CIRCUIT	
• Ignition OFF. • Disconnect: Negative Battery Cable. • Measure the resistance between the PAM C4226-6, circuit GD145 (BK/BU), harness side and ground.  • **Is resistance less than 5 ohms?**	**Yes** REFER to Section 414-00 to diagnose the low battery voltage concern. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

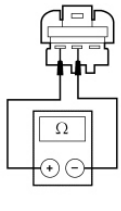
Pinpoint Test C: DTC C1742 Or DTC C1743

Refer to Wiring Diagrams Cell 131 , Parking Aid for schematic and connector information.

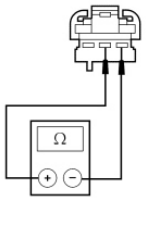
Normal Operation

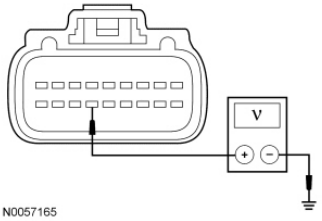
With the ignition switch in the RUN position and the REVERSE (R) gear selected, the parking aid system calculates the distance to an object by the use of a radar sensor. A variable rate warning tone is generated by the parking aid speaker.

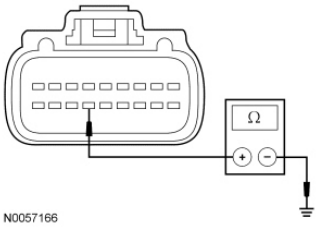
The parking aid speaker tone is controlled by the Parking Aid Module (PAM) through circuit CMP09 (BN/BU) and is grounded through circuit RMP09 (BU/GN). The parking aid speaker is located in the driver D-pillar area.



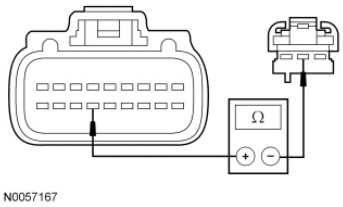
- DTC C1742 (Rear Sounder Circuit Failure) - a continuous and on-demand DTC that sets if the PAM detects a short to ground or open on the rear speaker circuit CMP09 (BN/BU) when the vehicle is in REVERSE (R) and a detectable object is within the azimuth field.
- DTC C1743 (Rear Sounder Circuit Short To Vbatt) - a continuous and on-demand DTC that sets if the PAM detects a short to voltage on the rear speaker circuit CMP09 (BN/BU) when the vehicle is in REVERSE (R) and a detectable object is within the azimuth field.

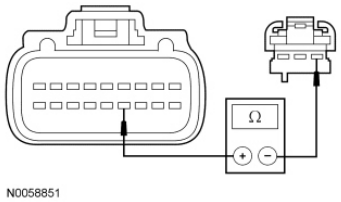






This pinpoint test is intended to diagnose the following:





- Wiring, terminals or connectors
- Parking aid speaker
- PAM

PINPOINT TEST C: DTC C1742 OR DTC C1743

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
C1 CHECK THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND SELF-TESTS	
• Enter the following diagnostic mode on the scan tool: PAM Self-Test. • Check the recorded PAM DTCs from the continuous and on-demand and self-test. • **Is DTC C1742 or C1743 recorded?**	**Yes** GO to C2 . **No** REFER to DTC Charts in this section.
C2 MEASURE THE PARKING AID SPEAKER RESISTANCE	
• Ignition OFF. • Disconnect: Parking Aid Speaker C4015. • Measure the resistance between the parking aid speaker pin 1, component side, and the parking aid speaker pin 2, component side.  N0068957 • **Is the speaker resistance between 45 and 57 ohms?**	**Yes** If DTC C1742 was recorded, GO to C3 . If DTC C1743 was recorded, GO to C4 . **No** INSTALL a new parking aid speaker. REFER to Parking Aid Speaker in this section. CLEAR the DTCs. REPEAT the self-test.
C3 CHECK THE PARKING AID SPEAKERS FOR A SHORT TOGETHER	
• Disconnect: PAM C4226. • Measure the resistance between the parking aid speaker C4015-2, circuit CMP09 (BN/BU), harness side, and the parking aid speaker C4015-1, circuit RMP09 (BU/GN), harness side.	**Yes** GO to C5 . **No** REPAIR the circuits. CLEAR the DTCs. REPEAT the self-test.

 N0094173 • **Is the resistance greater than 10,000 ohms?**	
C4 CHECK THE PARKING AID SPEAKER (+) CIRCUIT FOR A SHORT TO VOLTAGE	
• Disconnect: PAM C4226. • Ignition ON. • Measure the voltage between the PAM C4226-15, circuit CMP09 (BN/BU), harness side and ground.  N0057165 • **Is any voltage indicated?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** GO to C8 .
C5 CHECK THE PARKING AID SPEAKER (+) CIRCUIT FOR A SHORT TO GROUND	
• Measure the resistance between the PAM C4226-15, circuit CMP09 (BN/BU), harness side and ground.  N0057166 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to C6 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
C6 CHECK THE PARKING AID SPEAKER (+) CIRCUIT FOR AN OPEN	
• Measure the resistance between the PAM C4226-15, circuit CMP09 (BN/BU), harness side and the parking aid speaker C4015-2, circuit CMP09 (BN/BU), harness side.	**Yes** GO to C7 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

 N0057167 • **Is the resistance less than 5 ohms?**	
C7 CHECK THE PARKING AID SPEAKER (-) CIRCUIT FOR AN OPEN	
• Disconnect: Parking Aid Speaker C4015. • Measure the resistance between the PAM C4226-13, circuit RMP09 (BU/GN), harness side and the parking aid speaker C4015-1, circuit RMP09 (BU/GN), harness side.  N0058851 • **Is the resistance less than 5 ohms?**	**Yes** GO to C8 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
C8 CHECK FOR CORRECT PAM OPERATION	
• Disconnect the PAM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the PAM connector and make sure it seats correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PAM . REFER to Parking Aid Module (PAM) - Explorer in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test D: DTC U2471

Normal Operation

The Parking Aid Module (PAM) receives the PRNDL state from the Instrument Cluster (IC) as a gateway message from the PCM or the Transmission Control Module (TCM).

- DTC U2471 (Unexpected PRNDL State) - a continuous and on-demand DTC that sets when the PAM receives an unknown PRNDL state message from the IC .

This pinpoint test is intended to diagnose the following:

- IC

- Network data fault

PINPOINT TEST D: DTC U2471

Test Step	Result / Action to Take
D1 CHECK THE DTCs FROM THE ON-DEMAND SELF-TEST	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: PAM Self-Test. • Clear the DTCs. Repeat the PAM on-demand self-test. • **Are any DTCs present?**	**Yes** If DTCs U2471 and U0155 are both present, REFER to Section 418-00 to diagnose no communication with the IC . For DTC U2471 only, GO to D2 . **No** System is operating normally at this time.
D2 VERIFY THE REVERSING LAMPS FUNCTION CORRECTLY	
• Move the gearshift lever through the range of positions. • **Do the reversing lamps operate with the gearshift lever in REVERSE (R)?**	**Yes** GO to D3 . **No** REFER to Section 417-01 .
D3 CHECK FOR CORRECT IC OPERATION	
• Disconnect the IC connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the IC connector and make sure it seats correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new IC . REFER to Section 413-01 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test E: DTC U2472

Refer to Wiring Diagrams Cell 149 , Component Testing for component testing.

Normal Operation

The Parking Aid Module (PAM) receives the PRNDL state from the Smart Junction Box (SJB) as a network message.

- DTC U2472 (Unexpected Ignition State) - a continuous and on-demand DTC that sets when the PAM receives an unknown ignition switch state message.

This pinpoint test is intended to diagnose the following:

- SJB
- Network data fault

PINPOINT TEST E: DTC U2472

Test Step	Result / Action to Take
E1 CHECK THE DTCs FROM THE PAM ON-DEMAND SELF-TEST	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: PAM Self-Test. • Clear the DTCs. Repeat the PAM on-demand self-test. • **Is DTC U2472 present?**	**Yes** GO to E2 . **No** System is operating normally at this time.
E2 CHECK THE DTCs FROM THE SJB SELF-TEST	
• Enter the following diagnostic mode on the scan tool: SJB Self-Test. • Carry out the SJB self-test. • **Is DTC B1359, B1363 and/or B1555 recorded?**	**Yes** REFER to Section 211-05 . **No** GO to E3 .
E3 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test F: DTC U2473

Normal Operation

The Parking Aid Module (PAM) receives the vehicle speed from the Instrument Cluster (IC) as a gateway message from the PCM.

- DTC U2473 (Unexpected Vehicle Speed (VSS)) - a continuous and on-demand DTC that sets when the PAM receives an unknown vehicle speed message.

This pinpoint test is intended to diagnose the following:

- IC fault
- Network data fault

PINPOINT TEST F: DTC U2473

Test Step	Result / Action to Take
F1 CHECK THE DTCs FROM THE PAM ON-DEMAND SELF-TEST	
• Enter the following diagnostic mode on the scan tool: PAM Self-Test. • Check the recorded results from the PAM self-test. • **Is DTC U0155 recorded?**	**Yes** REFER to Section 418-00 . **No** GO to F2 .
F2 CHECK THE SPEEDOMETER OPERATION	
• Observe the speedometer operation while test driving the vehicle. • **Does the speedometer operate correctly?**	**Yes** GO to F3 . **No** REFER to Section 413-01 .
F3 CHECK FOR CORRECT IC OPERATION	
• Disconnect the IC connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the IC connector and make sure it seats correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new IC . REFER to Section 413-01 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test G: Continuous or Intermittent Tone When No Obstacles or Fault Codes Are Present

Normal Operation

With the ignition switch in the RUN position and the REVERSE (R) gear selected, the parking aid system calculates the distance to an object by the use of a radar sensor. The speaker increases its warning tone rate as the vehicle gets closer to an obstacle. When an object is detected within 46 cm (18 in) of the vehicle, the warning tone becomes continuous. A dirty, damaged or obstructed rear bumper results in the parking aid system not operating correctly.

This pinpoint test is intended to diagnose the following:

- Rear bumper cover impact damage, alignment or obstruction concerns
- Parking Aid Module (PAM)

PINPOINT TEST G: CONTINUOUS OR INTERMITTENT TONE WHEN NO OBSTACLES OR FAULT CODES ARE PRESENT

Test Step	Result / Action to Take
G1 CARRY OUT REAR BUMPER COVER VISUAL INSPECTION	
• Visually inspect the rear bumper or bumper cover for any of the following conditions: ♦ Dirty or iced over rear bumper cover ♦ Rear bumper cover impact damage ♦ Rear bumper height or alignment incorrect ♦ Rear bumper cover aftermarket add-ons present including but not limited to trailer hitches, emblems, and metallic stickers • **Are any of the above conditions present?**	**Yes** REMOVE the aftermarket equipment or REPAIR the rear bumper cover damage as necessary. **No** GO to G2 .
G2 CARRY OUT THE AZIMUTH AND ELEVATION SYSTEM CHECKS	
• Carry out the azimuth and elevation checks. Refer to Azimuth System Check and Elevation System Check in this section. • **Does the parking aid system pass both system checks?**	**Yes** The system is operating correctly at this time. **No** GO to G3 .
G3 CHECK FOR CORRECT PAM OPERATION	
• Disconnect the PAM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the PAM connector and make sure it seats correctly.	**Yes** INSTALL a new PAM . REFER to Parking Aid Module (PAM) - Explorer in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

• Operate the system and determine if the concern is still present. • **Is the concern still present?**	

Pinpoint Test H: The Volume Cutback Is Inoperative

Normal Operation

With the ignition switch in the RUN position and the gear selector in REVERSE (R), the parking aid system calculates the distance to an object by the use of a radar sensor. A volume cutback request message is sent to the Audio Control Module (ACM) from the Parking Aid Module (PAM) over the Medium Speed Controller Area Network (MS-CAN) to decrease the volume of the ACM . The sounder increases its warning tone rate as the vehicle gets closer to an obstacle. When an object is detected within 46 cm (18 in) of the vehicle, the warning tone becomes continuous.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- PAM
- ACM

PINPOINT TEST H: THE VOLUME CUTBACK IS INOPERATIVE

Test Step	Result / Action to Take
H1 VERIFY THE PAM COMMUNICATES WITH THE IC MESSAGE CENTER DISPLAY	
• Apply the park brake. • Ignition ON. • Apply the brake pedal and place the gear selector in REVERSE (R). • Disable/enable the parking aid system by pressing the reset button on the message center switch. • **Can the PAM be disabled/enabled in the Instrument Cluster (IC) message center display?**	**Yes** GO to H3 . **No** GO to H2 .
H2 VERIFY THE CORRECT PAM IS INSTALLED	
• Check to make sure the correct PAM is installed. • **Has the PAM been replaced prior?**	**Yes** VERIFY the correct PAM is installed. If correct, GO to H3 . If incorrect, INSTALL the correct PAM . REFER to Parking Aid Module (PAM) - Explorer in this section. TEST the system for normal operation. **No** GO to H3

H3 CHECK FOR CORRECT PAM OPERATION	
• Disconnect the PAM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the PAM connector and make sure it seats correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PAM . REFER to Parking Aid Module (PAM) - Explorer in this section. TEST the system for normal operation. **No** The system is operating correctly at this time.

Pinpoint Test I: DTC B1317

Refer to Wiring Diagrams Cell 131 , Parking Aid for schematic and connector information.

Normal Operation

The Parking Aid Module (PAM) sets DTC B1317 in continuous memory and on-demand if the PAM detects high battery voltage above 15 volts on circuit CBP18 (GY/OG).

This pinpoint test is intended to diagnose the following:

- Charging system concern
- PAM

PINPOINT TEST I: DTC B1317

NOTE: DTC B1317 may be stored in the module memory due to past battery charging or vehicle jump starting events.

Test Step	Result / Action to Take
I1 CHECK FOR DTC B1317, B1676 OR P0563 SET IN OTHER MODULES	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Self-Test. • Retrieve the continuous memory DTCs from all modules. • **Is DTC B1317, B1676 or P0563 (PCM) set in more than 1 module?**	**Yes** REFER to Section 414-00 to diagnose an overcharging condition. **No** GO to I2 .
I2 CHECK THE BATTERY VOLTAGE	
• Turn off all interior/exterior lights and accessories. • Start and run the engine at approximately 2,000 rpm for 3	**Yes** REFER to Section 414-00 to diagnose an overcharging condition. **No**

minutes while monitoring the battery voltage. • **Does the battery voltage rise to 15 volts or higher?**	GO to I3 .
I3 RECHECK FOR DTC B1317	
• Turn the engine off. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self-Test. • Clear the continuous memory DTCs. • Carry out the PAM self-test. • **Is DTC B1317 present?**	**Yes** INSTALL a new PAM . REFER to Parking Aid Module (PAM) - Explorer in this section. TEST the system for normal operation. **No** The system is operating normally at this time. The DTC may have been set previously during battery charging or while jump starting the vehicle.

Pinpoint Test J: DTC U0140

Normal Operation

Several modules receive network messages from the Smart Junction Box (SJB) via the Medium Speed Controller Area Network (MS-CAN). The information is included in the message is ignition switch position.

As more than one module receives each of these messages, all modules receiving a particular message should exhibit a symptom if the message is missing.

- DTC U0140 (Lost Communication With Body Control Module (GEM)) - set by the Parking Aid Module (PAM) when network messages are missing from the SJB for greater than 5 seconds with the ignition in RUN.

This pinpoint test is intended to diagnose the following:

- Module communication
- PAM
- SJB

PINPOINT TEST J: DTC U0140

Test Step	Result / Action to Take
J1 VERIFY THE CUSTOMER CONCERN	
• Ignition ON. • Verify that there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to J2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or intermittent fault condition.
J2 CHECK THE COMMUNICATION NETWORK	

• Ignition ON. • Enter the following diagnostic mode on the scan tool: Network Test. • Carry out the network test. • **Does the SJB pass the network test?**	**Yes** GO to J3 . **No** REFER to Section 418-00 .
J3 RETRIEVE THE RECORDED DTCs FROM THE SELF-TEST	
• Check for recorded PAM DTCs from the self-test. • **Is DTC B1317 or DTC B1318 recorded?**	**Yes** For DTC B1317, GO to Pinpoint Test I . For DTC B1318, GO to Pinpoint Test B . **No** GO to J4 .
J4 RECHECK THE PAM DTCs	
NOTE: If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during Programmable Module Installation (PMI) or the PMI may not have been carried out. • Clear the DTCs. Repeat the PAM self-test. • **Is DTC U0140 still present?**	**Yes** GO to J5 . **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic.
J5 CHECK FOR DTC U0140 SET IN OTHER MODULES	
• Clear all DTCs. • Ignition OFF. • Ignition ON. • Wait 10 seconds. • Enter the following diagnostic mode on the scan tool: Self-Test. • Retrieve the continuous memory DTCs from all modules. • **Is DTC U0140 set in any module?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** INSTALL a new PAM . REFER to Parking Aid Module (PAM) - Explorer in this section. TEST the system for normal operation.

Pinpoint Test K: DTC U0155

Normal Operation

Several modules receive network messages from the Instrument Cluster (IC) via the Medium Speed Controller Area Network (MS-CAN). The following information is included in the messages:

- ♦ Transmission gear selected
- ♦ Vehicle speed
- ♦ Parking aid disable switch status

As more than one module receives these messages, all modules receiving a particular message should exhibit a symptom if the message is missing.

- DTC U0155 (Lost Communication With Instrument Panel Cluster (IC) Control Panel) - set by the Parking Aid Module (PAM) when network messages are missing from the IC for greater than 5 seconds with the ignition in RUN.

This pinpoint test is intended to diagnose the following:

- Module communication
- PAM
- IC

PINPOINT TEST K: DTC U0155

Test Step	Result / Action to Take
K1 VERIFY THE CUSTOMER CONCERN	
• Ignition ON. • Verify that there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to K2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or intermittent fault condition.
K2 CHECK THE COMMUNICATION NETWORK	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Network Test. • Carry out the network test. • **Does the IC pass the network test?**	**Yes** GO to K3 . **No** REFER to Section 418-00 .
K3 RETRIEVE THE RECORDED DTCs FROM THE SELF-TEST	
• Check for recorded PAM DTCs from the self-test. • **Is DTC B1317 or DTC B1318 recorded?**	**Yes** For DTC B1317, GO to Pinpoint Test I . For DTC B1318, GO to Pinpoint Test B . **No** GO to K4 .
K4 RECHECK THE PAM DTCs	
NOTE: If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during Programmable Module Installation (PMI) or the PMI may not have been carried out. • Clear the DTCs. Repeat the PAM self-test. • **Is DTC U0155 still present?**	**Yes** GO to K5 . **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic.

K5 CHECK FOR DTC U0155 SET IN OTHER MODULES	
• Clear all DTCs. • Ignition OFF. • Ignition ON. • Wait 10 seconds. • Enter the following diagnostic mode on the scan tool: Self-Test. • Retrieve the continuous memory DTCs from all modules. • **Is DTC U0155 set in any module?**	**Yes** INSTALL a new IC . REFER to Section 413-01 . TEST the system for normal operation. **No** INSTALL a new PAM . REFER to Parking Aid Module (PAM) - Explorer in this section. TEST the system for normal operation.

Parking Aid - Mountaineer, Explorer Sport Trac

Special Tool(s)

 ST1137-A	73III Automotive Meter 105-R0057 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
 ST2574-A	Flex Probe Kit 105-R025C or equivalent

Principles of Operation

NOTE: The Smart Junction Box (SJB) is also known as the Generic Electronic Module (GEM).

The parking aid system detects objects behind the vehicle when the REVERSE (R) gear is selected. The Parking Aid Module (PAM) calculates the distance to an object by the use of 4 ultrasonic sensors mounted in the rear bumper. The PAM does this by calculating the distance to an object within the 170 degree semicircular area around the rear of the vehicle.

The parking aid sensors detect objects approximately 1.8 m (5.9 ft) from the rear of the vehicle, 50 cm (1.6 ft) from the rear side of the vehicle, and 16 cm (6 in) above the ground. A variable rate warning tone is generated from a parking aid speaker attached to the PAM . The parking aid speaker increases its warning tone rate as the vehicle gets closer to an obstacle. When an object is detected within 25 cm (10 in) of the sensors, the warning tone becomes continuous.

The parking aid system is enabled when the ignition switch is in the RUN position and the REVERSE (R) gear is selected. The parking aid system is disabled if a fault is detected in 1 of the 4 sensors, the parking aid speaker, or the PAM . This is indicated by the parking aid disabled warning message in the message center. The PAM is on the Medium Speed Controller Area Network (MS-CAN) and can be diagnosed with a scan tool.

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of electrical damage.

Visual Inspection Chart

Electrical

- Smart Junction Box (SJB) fuse 18 (10A)
- Wiring, terminals or connectors
- Parking Aid Module (PAM)
- Parking aid sensors
- Parking aid speaker

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM .
   - Refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the PAM .

9. **NOTE:** Follow the non-network DTC diagnostics (B-codes, C-codes, P-codes) prior to the network DTC diagnostics (U-codes).

   If the DTCs retrieved are related to the concern, go to DTC Charts. For all other DTCs, refer to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

Pinpoint Tests

Pinpoint Test L: The Parking Aid Is Inoperative/Does Not Operate Correctly

Refer to Wiring Diagrams Cell 131 , Parking Aid for schematic and connector information.

Normal Operation

The parking aid system is enabled when the ignition switch is in the RUN position and the REVERSE (R) gear is selected. The Parking Aid Module (PAM) receives reverse gear input from the Instrument Cluster (IC) through the Medium Speed Controller Area Network (MS-CAN). Voltage is supplied to the parking aid sensors from the PAM on circuit LMP07 (BU/WH). The PAM supplies ground to the parking aid sensors on circuit RMP07 (GN/WH). The PAM receives a signal from the parking aid sensors on circuits VMP14 (WH/OG), VMP15 (YE/GN), VMP16 (YE/GY) and VMP17 (YE/OG). The system can be disabled through the message center which is part of the IC .

This pinpoint test is intended to diagnose the following:

- Rear bumper cover
- Parking aid sensors alignment
- PAM

PINPOINT TEST L: THE PARKING AID IS INOPERATIVE/DOES NOT OPERATE CORRECTLY

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
L1 VERIFY THE PAM COMMUNICATES WITH THE SCAN TOOL	

• Ignition ON. • Enter the following diagnostic mode on the scan tool: Network Test. • Carry out the network test. • **Does the PAM communicate with the scan tool?**	**Yes** GO to L2 . **No** REFER to Section 418-00 .
L2 CHECK THE DTCs FROM THE PAM SELF-TEST	
• Enter the following diagnostic mode on the scan tool: PAM Self-Test. • Retrieve the DTCs from the PAM on-demand self-test. • **Are any PAM DTCs recorded?**	**Yes** REFER to DTC Charts in this section. **No** GO to L3 .
L3 CHECK THE PARKING AID SENSORS FOR CORRECT ALIGNMENT	
NOTE: If the vehicle was in a rear end collision, the parking aid sensors may not be aligned correctly. • Check the bumper for correct alignment. • Carry out the azimuth system check. Refer to Azimuth System Check in this section. • Carry out the elevation system check. Refer to Elevation System Check in this section. • **Does the parking aid system pass both system checks?**	**Yes** GO to L4 . **No** REALIGN or INSTALL a new bumper cover. REFER to Section 501-19 . If the vehicle was in a rear end collision, further body work may be required to bring the parking aid sensors into correct alignment.
L4 CHECK THE PAM REVERSE INDICATION PID	
• Apply the parking brake. • Ignition ON. • Select REVERSE. • Enter the following diagnostic mode on the scan tool: PAM DataLogger. • Monitor the PAM PID (TRANSGR). • **Does the PID indicate YES (transmission in reverse)?**	**Yes** GO to L5 . **No** INSTALL a new PAM . REFER to Parking Aid Module (PAM) - Mountaineer or Parking Aid Module (PAM) - Explorer Sport Trac in this section.
L5 CHECK THE MESSAGE CENTER FOR PARKING AID DISABLE SWITCH OPERATION	
• While observing the IC message center, disable and enable the parking aid system. • **Does the message center display PARKING AID OFF when the parking aid system is disabled, and display PARKING AID ON when the parking aid system is activated?**	**Yes** GO to L6 . **No** REFER to Section 413-01 .
L6 CHECK FOR CORRECT PAM OPERATION	

• Disconnect the PAM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the PAM connector and make sure it seats correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PAM . REFER to Parking Aid Module (PAM) - Mountaineer or Parking Aid Module (PAM) - Explorer Sport Trac in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test M: DTCs C1700, C1703, C1706 And C1709

Refer to Wiring Diagrams Cell 131 , Parking Aid for schematic and connector information.

Normal Operation

Voltage is supplied to the parking aid sensors from the Parking Aid Module (PAM) on circuit LMP07 (BU/WH). The PAM supplies ground to the parking aid sensors on circuit RMP07 (GN/WH). The PAM receives a signal from the parking aid sensors on circuits VMP14 (WH/OG), VMP15 (YE/GN), VMP16 (YE/GY) and VMP17 (YE/OG).

DTC Description	Fault Trigger Conditions
• C1700 - Left Rear Sensor Circuit Failure or Blockage	Sets when any of the left rear parking aid sensor circuits are open or the sensor signal line is shorted to ground.
• C1703 - Right Rear Sensor Circuit Failure or Blockage	Sets when any of the right rear parking aid sensor circuits are open or the sensor signal line is shorted to ground.
• C1706 - Left Rear Center Sensor Circuit Failure	Sets when any of the left rear center parking aid sensor circuits are open or the sensor signal line is shorted to ground.
• C1709 - Right Rear Center Sensor Circuit Failure	Sets when any of the right rear center parking aid sensor circuits are open or the sensor signal line is shorted to ground.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Parking aid sensor(s)
- Parking aid bumper harness
- PAM

PINPOINT TEST M: DTCs C1700, C1703, C1706 AND C1709

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>
<tr><td>M1 RETRIEVE THE DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND PAM SELF-TESTS</td><td></td></tr>
<tr><td>• Check the PAM DTCs from the continuous and on-demand self-tests.
• Are multiple DTCs recorded?</td><td>Yes

C1709	RH inner	C3267-12	C4012-3	RMP07 (GN/WH)

- **Are the resistances less than 5 ohms?**

M4 CHECK THE SENSOR CIRCUITRY FOR SHORTS TO GROUND

- Measure the resistance between the suspect parking aid sensor, harness side and ground as follows:

DTC	Rear Sensor	Connector-Pin	Circuit
C1700	LH outer	C4009-2	VMP15 (YE/GN)
C1703	RH outer	C4011-2	VMP17 (YE/OG)
C1706	LH inner	C4010-2	VMP14 (WH/OG)
C1709	RH inner	C4012-2	VMP16 (YE/GY)

- **Is the resistance greater than 10,000 ohms?**

Yes
If all of the parking aid sensors recorded DTCs, GO to M5 .

If one or more parking aid sensor(s) recorded DTCs, INSTALL a new sensor(s) for the one in question. REFER to Parking Aid Sensor - Mountaineer, Explorer Sport Trac in this section. CLEAR the DTCs. REPEAT the self-test.

No
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

M5 CHECK FOR CORRECT PAM OPERATION

- Disconnect the PAM connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the PAM connector and make sure it seats correctly.
- Operate the system and determine if the concern is still present.
- **Is the concern still present?**

Yes
INSTALL a new PAM . REFER to Parking Aid Module (PAM) - Mountaineer or Parking Aid Module (PAM) - Explorer Sport Trac in this section. TEST the system for normal operation.

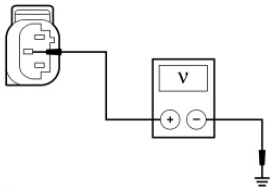
No
The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test N: DTCs C1699, C1702, C1705 And C1708

Refer to Wiring Diagrams Cell 131 , Parking Aid for schematic and connector information.

Normal Operation

Voltage is supplied to the parking aid sensors from the Parking Aid Module (PAM) on circuit LMP07 (BU/WH). The PAM supplies ground to the parking aid sensors on circuit RMP07 (GN/WH). The PAM receives a signal from the parking aid sensors on circuits VMP14 (WH/OG), VMP15 (YE/GN), VMP16 (YE/GY) and VMP17 (YE/OG).



DTC Description	Fault Trigger Conditions
• C1699 - Left Rear Sensor Circuit Short to Vbat	Sets when the left rear parking aid sensor signal line is shorted to voltage.
• C1702 - Right Rear Sensor Circuit Short to Vbat	Sets when the right rear parking aid sensor signal line is shorted to voltage.
• C1705 - Left Rear Center Sensor Circuit Short to Vbat	Sets when the left rear center parking aid sensor signal line is shorted to voltage.
• C1708 - Right Rear Center Sensor Circuit Short to Vbat	Sets when the right rear center parking aid sensor signal line is shorted to voltage.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Parking aid sensor(s)
- Parking aid bumper harness
- PAM

PINPOINT TEST N: DTCs C1699, C1702, C1705 AND C1708

Test Step	Result / Action to Take
N1 RETRIEVE THE DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND PAM SELF-TESTS	
• Check the PAM DTCs from the continuous and on-demand self-tests. • **Are multiple DTCs recorded?**	**Yes** GO to N2 . **No** For DTC C1699, C1702, C1705 or C1708, GO to N3 . For all other DTCs, REFER to DTC Charts in this section.
N2 CHECK THE BUMPER WIRING HARNESS	
• Inspect the bumper wiring harness for opens, shorts, grounds, or corrosion. • **Is bumper wiring harness OK?**	**Yes** GO to N3 . **No** REPAIR or INSTALL a new bumper wiring harness. CLEAR the DTCs. REPEAT the self-test.
N3 CHECK THE SENSOR CIRCUITRY FOR SHORTS TO VOLTAGE	

• Ignition OFF. • Disconnect: Suspect Parking Aid Sensors C4009, C4010, C4011 and C4012. • Disconnect: PAM C4014. • Ignition ON. • Measure the voltage between the suspect parking aid sensor, harness side and ground as follows: **DTC / Rear Sensor / Connector-Pin / Circuit** C1699 / LH outer / C4009-2 / VMP15 (YE/GN) C1702 / RH outer / C4011-2 / VMP17 (YE/OG) C1705 / LH inner / C4010-2 / VMP14 (WH/OG) C1708 / RH inner / C4012-2 / VMP16 (YE/GY)  A0085471 • **Is any voltage present?**	**Yes** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test. **No** GO to N4 .
N4 CHECK THE PARKING AID SENSORS	
• Install a known good parking aid sensor(s) for each of the suspect parking aid sensor(s). • Clear the DTCs. Repeat the self-test. • Test the system for normal operation. • **Is the concern still present?**	**Yes** If all of the parking aid sensors recorded DTCs prior, GO to N5 . If one or more parking aid sensor(s) recorded DTCs, INSTALL a new sensor(s) for the one in question. REFER to Parking Aid Sensor - Mountaineer, Explorer Sport Trac in this section. CLEAR the DTCs. REPEAT the self-test. **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.
N5 CHECK FOR CORRECT PAM OPERATION	
• Disconnect the PAM connector. • Check for: ♦ corrosion ♦ damaged pins	**Yes** INSTALL a new PAM . REFER to Parking Aid Module (PAM) - Mountaineer or Parking Aid Module (PAM) - Explorer Sport Trac in this section. TEST the system

♦ pushed-out pins • Connect the PAM connector and make sure it seats correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test O: DTCs C1701, C1704, C1707 And C1710

Normal Operation

The parking aid system is enabled when the ignition switch is in the RUN position and the REVERSE (R) gear is selected. The Parking Aid Module (PAM) calculates the distance to an object by the use of 4 ultrasonic sensors mounted in the rear bumper. The parking aid sensors can detect obstructions in the path behind the vehicle.

DTC Description	Fault Trigger Conditions
• C1701 - Left Rear Sensor Circuit Fault	Sets when the left rear parking aid sensor has internally failed or has an incorrect attenuation time.
• C1704 - Right Rear Sensor Circuit Fault	Sets when the right rear parking aid sensor has internally failed or has an incorrect attenuation time.
• C1707 - Left Rear Center Sensor Circuit Fault	Sets when the left rear center parking aid sensor has internally failed or has an incorrect attenuation time.
• C1710 - Right Rear Center Sensor Circuit Fault	Sets when the right rear center parking aid sensor has internally failed or has an incorrect attenuation time.

This pinpoint test is intended to diagnose the following:

- Dirty or obstructed parking aid sensor
- Wiring, terminals or connectors
- Parking aid sensor
- Parking aid bumper harness
- PAM

PINPOINT TEST O: DTCs C1701, C1704, C1707 AND C1710

Test Step	Result / Action to Take
O1 CHECK THE DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND PAM SELF-TESTS	

• Check the PAM DTCs from the continuous and on-demand self-tests. • **Are parking aid DTCs other than C1701, C1704, C1707 or C1710 recorded?**	**Yes** DIAGNOSE the other DTCs first. REFER to DTC Charts in this section. **No** GO to O2 .
O2 CHECK THE PARKING AID SENSOR OPERATION	
NOTE: Make sure the area around the vehicle is clear of anything that might activate the parking aid system. • Clean the rear bumper and sensors with high-pressure water. • Carry out the azimuth system check. Refer to Azimuth System Check in this section. • Carry out the elevation system check. Refer to Elevation System Check in this section. • **Does the parking aid system pass both system checks?**	**Yes** The system is operating correctly at this time. The concern may have been caused by a dirty or blocked parking aid sensor. CLEAR the DTCs. REPEAT the self-test. **No** GO to O3 .
O3 CHECK THE PARKING AID SENSOR DISTANCE PIDs	
• Make sure the suspect parking aid sensor(s) is flush-mounted in the bezel. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Parking Aid DataLogger. • **NOTE:** Make sure that no objects are present behind the vehicle. • With the brake pedal applied, shift the transmission into REVERSE (R) and monitor the parking aid sensor distance PID. The PID reads 255 cm (100 in) on a correctly functioning sensor. • **Does the PID read 255 cm (100 in)?**	**Yes** GO to O4 . **No** GO to O5 .
O4 CHECK THE PARKING AID SENSOR ATTENUATION PIDs	
• Check the parking aid sensor attenuation PIDs. • **Do the attenuation PIDs read between 0 and 16?**	**Yes** GO to O6 . **No** GO to O5 .
O5 INSTALL A KNOWN GOOD SENSOR	
• Install a known good sensor for the suspect parking aid sensor. • Ignition ON. • Clear the DTCs. Repeat the self-test. Operate the system and verify the concern is still present.	**Yes** GO to O6 . **No** INSTALL a new parking aid sensor. REFER to Parking Aid Sensor - Mountaineer, Explorer Sport Trac in this section. CLEAR the DTCs.

• **Is the concern still present?**	REPEAT the self-test.
O6 CHECK FOR CORRECT PAM OPERATION	
• Disconnect the PAM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the PAM connector and make sure it seats correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PAM . REFER to Parking Aid Module (PAM) - Mountaineer or Parking Aid Module (PAM) - Explorer Sport Trac in this section. REPEAT the self-test. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test P: DTC B1299

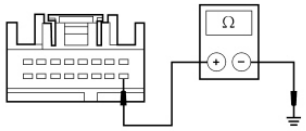
Refer to Wiring Diagrams Cell 131 , Parking Aid for schematic and connector information.

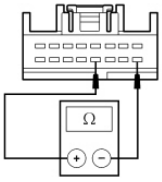
Normal Operation

Voltage is supplied to the parking aid sensors from the Parking Aid Module (PAM) on circuit LMP07 (BU/WH). The PAM supplies ground to the parking aid sensors on circuit RMP07 (GN/WH).

- DTC B1299 (Power Supply Sensor Circuit Short To Ground) - sets when the sensor power supply circuit is shorted to ground or to circuit RMP07 (GN/WH).

This pinpoint test is intended to diagnose the following:





- Wiring, terminals or connectors
- Parking aid sensor(s)
- Parking aid bumper harness
- PAM

PINPOINT TEST P: DTC B1299

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
P1 CHECK THE BUMPER WIRING HARNESS	
• Inspect the bumper wiring harness for opens, shorts, grounds, or corrosion. • **Is the bumper wiring harness OK?**	**Yes** GO to P2 . **No** REPAIR or INSTALL a new bumper wiring harness. CLEAR the DTCs. REPEAT the self-test.
P2 CHECK THE LH OUTER SENSOR FOR AN INTERNAL SHORT	

• Ignition OFF. • Disconnect: Parking Aid Sensor C4009. • Ignition ON. • Clear the DTCs. Repeat the on-demand self-test. • **Is DTC B1299 still present?**	**Yes** GO to P3 . **No** INSTALL a new LH outer parking aid sensor. REFER to Parking Aid Sensor - Mountaineer, Explorer Sport Trac in this section. CLEAR the DTCs. REPEAT the self-test.
P3 CHECK THE RH OUTER SENSOR FOR AN INTERNAL SHORT	
• Ignition OFF. • Disconnect: Parking Aid Sensor C4011. • Ignition ON. • Clear the DTCs. Repeat the on-demand self-test. • **Is DTC B1299 still present?**	**Yes** GO to P4 . **No** INSTALL a new RH outer parking aid sensor. REFER to Parking Aid Sensor - Mountaineer, Explorer Sport Trac in this section. CLEAR the DTCs. REPEAT the self-test.
P4 CHECK THE LH INNER SENSOR FOR AN INTERNAL SHORT	
• Ignition OFF. • Disconnect: Parking Aid Sensor C4010. • Ignition ON. • Clear the DTCs. Repeat the on-demand self-test. • **Is DTC B1299 still present?**	**Yes** GO to P5 . **No** INSTALL a new LH inner parking aid sensor. REFER to Parking Aid Sensor - Mountaineer, Explorer Sport Trac in this section. CLEAR the DTCs. REPEAT the self-test.
P5 CHECK THE RH INNER SENSOR FOR AN INTERNAL SHORT	
• Ignition OFF. • Disconnect: Parking Aid Sensor C4012. • Ignition ON. • Clear the DTCs. Repeat the on-demand self-test. • **Is DTC B1299 still present?**	**Yes** GO to P6 . **No** INSTALL a new RH inner parking aid sensor. REFER to Parking Aid Sensor - Mountaineer, Explorer Sport Trac in this section. CLEAR the DTCs. REPEAT the self-test.
P6 CHECK THE PARKING AID SENSOR VOLTAGE SUPPLY CIRCUIT FOR A SHORT TO GROUND	

• Ignition OFF. • Disconnect: PAM C4014 (Mountaineer) or C3267 (Explorer Sport Trac). • Measure the resistance between the PAM C4014-9 (Mountaineer) or C3267-9 (Explorer Sport Trac), circuit LMP07 (BU/WH), harness side and ground.  N0057381 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to P7 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.
P7 CHECK THE PARKING AID SENSOR VOLTAGE SUPPLY CIRCUIT FOR A SHORT TO THE PARKING AID SENSOR GROUND CIRCUIT	
• Ignition OFF. • Measure the resistance between the PAM C4014-9 (Mountaineer) or C3267-9 (Explorer Sport Trac), circuit LMP07 (BU/WH), harness side and the PAM C4014-12 (Mountaineer) or C3267-12 (Explorer Sport Trac), circuit RMP07 (GN/WH).  N0058809 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to P8 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.
P8 CHECK FOR CORRECT PAM OPERATION	
• Disconnect the PAM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the PAM connector and make sure it seats correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PAM . REFER to Parking Aid Module (PAM) - Mountaineer or Parking Aid Module (PAM) - Explorer Sport Trac in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

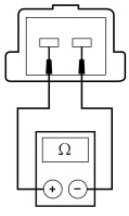
Pinpoint Test Q: DTC C1742 Or DTC C1743

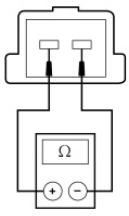
Refer to Wiring Diagrams Cell 131 , Parking Aid for schematic and connector information.

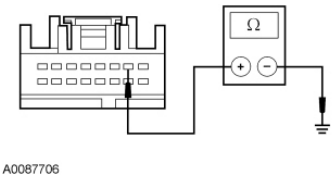
Normal Operation

A variable rate warning tone is generated from a parking aid speaker. The parking aid speaker increases the warning tone rate as the vehicle gets closer to an obstacle.

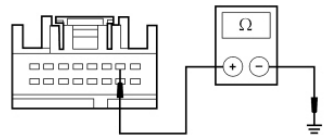
- DTC C1742 (Rear Sounder Circuit Failure) - sets when the sounder circuit is open or shorted to ground.
- DTC C1743 (Rear Sounder Circuit Short to VBATT) - sets when the sounder circuit is shorted to voltage.

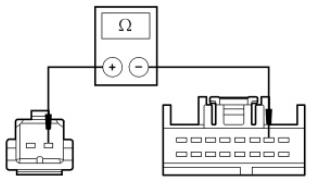


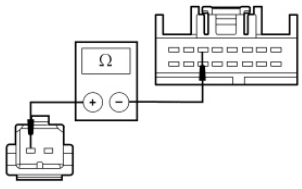




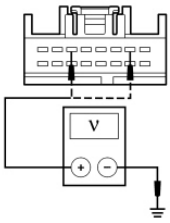
This pinpoint test is intended to diagnose the following:







- Wiring, terminals or connectors
- Parking Aid Module (PAM)
- Parking aid speaker



PINPOINT TEST Q: DTC C1742 OR DTC C1743

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
Q1 USE THE RECORDED DTCs FROM THE PAM SELF-TEST	
• Use the recorded results from the PAM self-test. • **Is DTC C1742 or C1743 recorded?**	**Yes** GO to Q2 . **No** All other DTCs, GO to DTC Charts. If no DTCs are recorded, GO to Pinpoint Test L .
Q2 MEASURE THE PARKING AID SPEAKER RESISTANCE	
• Ignition OFF. • Disconnect: Parking Aid Speaker C4015. • Measure the resistance between the parking aid speaker pin 1, component side, and the parking aid speaker pin 2, component side.	**Yes** If DTC C1742 was recorded, GO to Q3 . If DTC C1743 was recorded, GO to Q8 . **No** INSTALL a new parking aid speaker. REFER to Parking Aid Module (PAM) - Mountaineer or Parking Aid Module (PAM) - Explorer Sport Trac in this section. CLEAR the DTCs. REPEAT the self-test.

 N0062395 • **Is the resistance between 40 and 60 ohms?**	
Q3 MEASURE THE PARKING AID SPEAKER CIRCUITS FOR A SHORT TOGETHER	
• Measure the resistance between the parking aid speaker C4015-2, circuit CMP09 (BN/BU), harness side and the parking aid speaker C4015-1, circuit RMP09 (BU/GN), harness side.  N0062395 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to Q4 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
Q4 CHECK THE PARKING AID SPEAKER (+) CIRCUIT FOR A SHORT TO GROUND	
• Connect: Parking Aid Speaker C4015. • Disconnect: PAM C4014 (Mountaineer) or C3267 (Explorer Sport Trac). • Measure the resistance between the PAM , C4014-2 (Mountaineer) or C3267-2 (Explorer Sport Trac), circuit CMP09 (BN/BU), harness side and ground.  A0087706 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to Q6 . **No** GO to Q5 .
Q5 CHECK THE PARKING AID SPEAKER (+) CIRCUIT FOR A SHORT TO GROUND WITH THE PARKING AID SPEAKER DISCONNECTED	

• Disconnect: Parking Aid Speaker C4015. • Measure the resistance between the PAM C4014-2 (Mountaineer) or C3267-2 (Explorer Sport Trac), circuit CMP09 (BN/BU), harness side and ground.  A0087706 • **Is the resistance greater than 10,000 ohms?**	**Yes** REPAIR circuit RMP09 (BU/GN). CLEAR the DTCs. REPEAT the self-test. **No** REPAIR circuit CMP09 (BN/BU). CLEAR the DTCs. REPEAT the self-test.
Q6 CHECK THE PARKING AID SPEAKER (+) CIRCUIT FOR AN OPEN	
• Disconnect: Parking Aid Speaker C4015. • Measure the resistance between the parking aid speaker C4015-2, circuit CMP09 (BN/BU), harness side and the PAM C4014-2 (Mountaineer) or C3267-2 (Explorer Sport Trac), circuit CMP09 (BN/BU), harness side.  A0087707 • **Is the resistance less than 5 ohms?**	**Yes** GO to Q7 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
Q7 CHECK THE PARKING AID SPEAKER (-) CIRCUIT FOR AN OPEN	
• Measure the resistance between the parking aid speaker C4015-1, circuit RMP09 (BU/GN), harness side and the PAM C4014-6 (Mountaineer) or C3267-6 (Explorer Sport Trac), circuit RMP09 (BU/GN), harness side.  A0087708 • **Is the resistance less than 5 ohms?**	**Yes** GO to Q9 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
Q8 CHECK THE PARKING AID SPEAKER CIRCUITRY FOR A SHORT TO VOLTAGE	

• Disconnect: PAM C4014 (Mountaineer) or C3267 (Explorer Sport Trac). • Ignition ON. • Measure the voltage between the PAM , C4014-2 (Mountaineer) or C3267-2 (Explorer Sport Trac), circuit CMP09 (BN/BU), harness side and ground; and between the PAM , C4014-6 (Mountaineer) or C3267-6 (Explorer Sport Trac), circuit RMP09 (BU/GN), harness side and ground.  A0087727 • **Is any voltage present?**	**Yes** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test. **No** GO to Q8 .
Q9 CHECK FOR CORRECT PAM OPERATION	
• Disconnect the PAM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the PAM connector and make sure it seats correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PAM . REFER to Parking Aid Module (PAM) - Mountaineer or Parking Aid Module (PAM) - Explorer Sport Trac in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test R: DTC U0140

Normal Operation

Several modules receive network messages from the Smart Junction Box (SJB) via the Medium Speed Controller Area Network (MS-CAN). The information is included in the message is ignition switch position.

As more than one module receives each of these messages, all modules receiving a particular message should exhibit a symptom if the message is missing.

- DTC U0140 (Lost Communication With Body Control Module (GEM)) - set by the Parking Aid Module (PAM) when network messages are missing from the SJB for greater than 5 seconds with the ignition in RUN.

This pinpoint test is intended to diagnose the following:

- Module communication
- PAM

- SJB

PINPOINT TEST R: DTC U0140

Test Step	Result / Action to Take
R1 VERIFY THE CUSTOMER CONCERN	
• Ignition ON. • Verify that there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to R2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or intermittent fault condition.
R2 CHECK THE COMMUNICATION NETWORK	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Network Test. • Carry out the network test. • **Does the SJB pass the network test?**	**Yes** GO to R3 . **No** REFER to Section 418-00 .
R3 RECHECK THE PAM DTCs	
NOTE: If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during Programmable Module Installation (PMI) or the PMI may not have been carried out. • Clear the DTCs. Repeat the PAM self-test. • **Is DTC U0140 still present?**	**Yes** GO to R4 . **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic.
R4 CHECK FOR DTC U0140 SET IN OTHER MODULES	
• Clear all DTCs. • Ignition OFF. • Ignition ON. • Wait 10 seconds. • Enter the following diagnostic mode on the scan tool: Self-Test. • Retrieve the continuous memory DTCs from all modules. • **Is DTC U0140 set in any module?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** INSTALL a new PAM . REFER to Parking Aid Module (PAM) - Mountaineer or Parking Aid Module (PAM) - Explorer Sport Trac in this section. TEST the system for normal operation.

Pinpoint Test S: DTC U0155

Normal Operation

Several modules receive network messages from the Instrument Cluster (IC) via the Medium Speed Controller Area Network (MS-CAN). The following information is included in the messages:

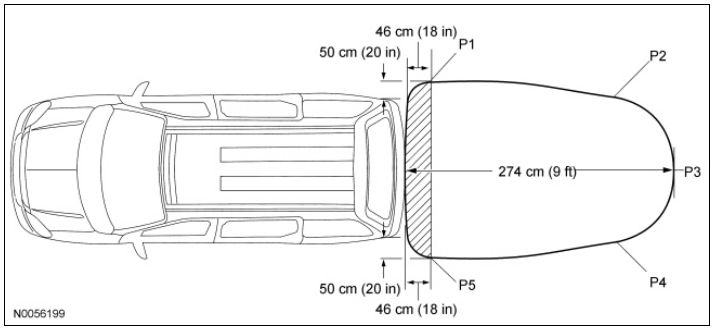
- ♦ Transmission gear selected
- ♦ Vehicle speed
- ♦ Parking aid disable switch status

As more than one module receives these messages, all modules receiving a particular message should exhibit a symptom if the message is missing.

- DTC U0155 (Lost Communication With Instrument Panel Cluster (IC) Control Panel) - set by the Parking Aid Module (PAM) when network messages are missing from the IC for greater than 5 seconds with the ignition in RUN.

This pinpoint test is intended to diagnose the following:

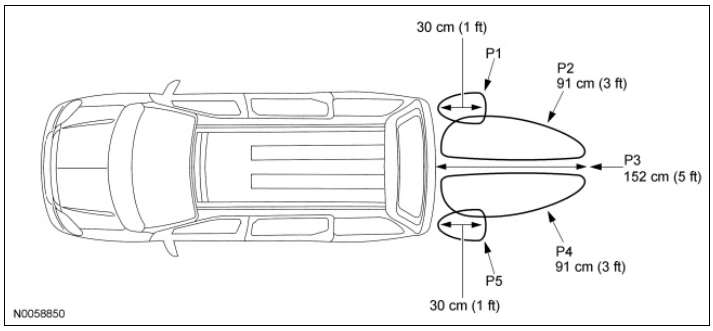
- Module communication
- PAM
- IC



PINPOINT TEST S: DTC U0155

Test Step	Result / Action to Take
S1 VERIFY THE CUSTOMER CONCERN	
• Ignition ON. • Verify that there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to S2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or intermittent fault condition.
S2 CHECK THE COMMUNICATION NETWORK	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Network Test. • Carry out the network test. • **Does the IC pass the network test?**	**Yes** GO to S3 . **No** REFER to Section 418-00 .
S3 RECHECK THE PAM DTCs	
NOTE: If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during Programmable Module Installation (PMI) or the PMI may not have been carried out. • Clear the DTCs. Repeat the PAM self-test. • **Is DTC U0155 still present?**	**Yes** GO to S4 . **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic.
S4 CHECK FOR DTC U0155 SET IN OTHER MODULES	

• Clear all DTCs. • Ignition OFF. • Ignition ON. • Wait 10 seconds. • Enter the following diagnostic mode on the scan tool: Self-Test. • Retrieve the continuous memory DTCs from all modules. • **Is DTC U0155 set in any module?**	**Yes** INSTALL a new IC . REFER to Section 413-01 . TEST the system for normal operation. **No** INSTALL a new PAM . REFER to Parking Aid Module (PAM) - Mountaineer or Parking Aid Module (PAM) - Explorer Sport Trac in this section. TEST the system for normal operation.



Azimuth System Check

Minimum Detectable Object Locations - Explorer

Minimum Detectable Object Locations - Mountaineer, Explorer Sport Trac

NOTE: Mountaineer shown, Explorer Sport Trac similar.

NOTE: The object used in this system check can be fabricated from 9 cm O.D. (3 in I.D) plastic pipe 100 cm (39 in) in length (available as Polyvinyl Chloride (PVC) pipe, or similar from a hardware or plumbing supply).

NOTE: The following system check should be carried out with the vehicle on a level surface. The specified object locations are approximate, not absolute

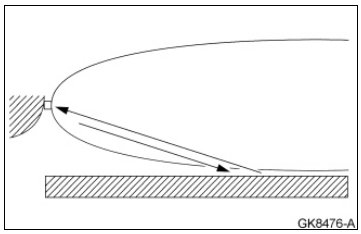
NOTE: The parking aid system will default to on when the ignition key is cycled from OFF to ON.

NOTE: For Explorer Sport Trac and Mountaineer only, the scan tool may be used to monitor distance PIDs. The distance PIDs read between 0 and 255 cm (0 and 8 ft) on a correctly functioning system.

1. Turn the ignition to the ON position, engine off.

2. Set the parking brake on.

3. Place the gear shift in REVERSE (R).



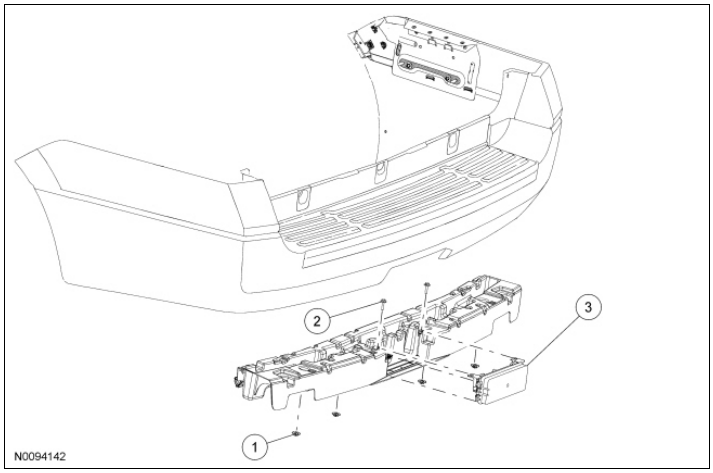
4. Verify that the parking aid system detects the specified object when placed within the 5 specified locations (P1, P2, P3, P4, P5). The pipe should be inside of these locations.
   - The speaker should beep slowly when objects are detected on the outer edges of the detection zone, and increase as the object is moved closer to the vehicle.

- When the object is within 46 cm (18 in) of the rear bumper, the sounder should be on continuously.
- If the Parking Aid Module (PAM) does not detect the object above, refer to Parking Aid - Explorer or Parking Aid - Mountaineer, Explorer Sport Trac in the Diagnosis and Testing portion of in this section.

Elevation System Check

1. **NOTE:** The following system check should be carried out with the vehicle on a 3.0 m wide by 4.5 m deep (10 ft wide by 15 ft deep) smooth concrete surface, free of all obstacles and noise from fan and pneumatic tools.

   Turn the ignition to the ON position, engine off.

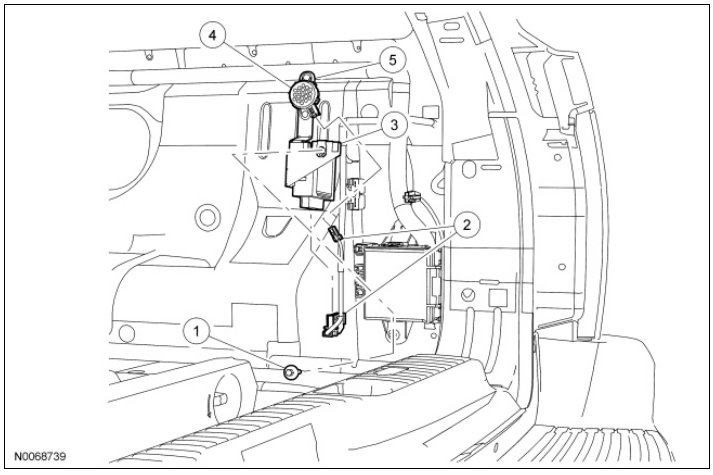


2. Set the parking brake.

3. Place the gear shift in REVERSE (R).

4. Verify that no audible alerts are heard. If audible alerts are heard, check to make sure the bumper is correctly installed and is not tilted downward so that the sensor is pointing at the ground.
   - If the audible warning tone is heard, refer to Parking Aid - Explorer or Parking Aid - Mountaineer, Explorer Sport Trac in the Diagnosis and Testing portion of in this section.

Parking Aid Module (PAM) - Explorer



Item	Part Number	Description
1	-	Insulator-to-bumper cover nuts (4 required)
2	W505425-S	Parking Aid Module (PAM) bolts (2 required)
3	15K859	PAM

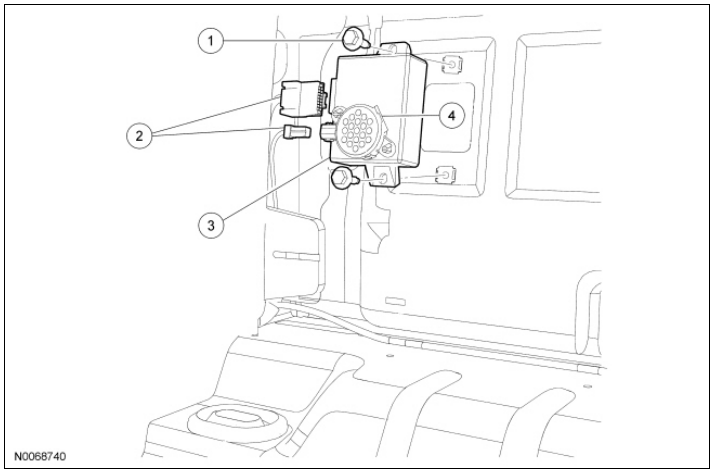
Removal and Installation

1. Disconnect the Parking Aid Module (PAM) bumper harness from the body harness.
2. Remove the rear bumper cover. For additional information, refer to Section 501-19 .
3. Remove the 4 insulator-to-bumper cover nuts and the insulator from the bumper cover.
4. Disconnect the PAM bumper harness from the PAM .
5. Remove the 2 PAM bolts.
6. Remove the PAM assembly.
7. To install, reverse the removal procedure.

Parking Aid Module (PAM) - Mountaineer

Item	Part Number	Description
1	W505413-S309	Parking Aid Module (PAM) bracket screw
2	-	PAM and parking aid speaker wiring harness connectors (part of 15K866)
3	15K866	PAM and bracket assembly
4	15A866	Parking aid speaker
5	-	Parking aid speaker push pins (2 required)

Removal and Installation



1. Remove the RH quarter trim panel. For additional information, refer to Section 501-05 .

2. If replacing the parking aid speaker only, proceed as follows:
   - Disconnect the parking aid speaker electrical connector.
   - Remove the parking aid speaker push pins.
   - Remove the parking aid speaker.

3. If replacing the Parking Aid Module (PAM), proceed as follows:
   - Disconnect the electrical connectors.
   - Remove the PAM screw.
   - Remove the PAM .

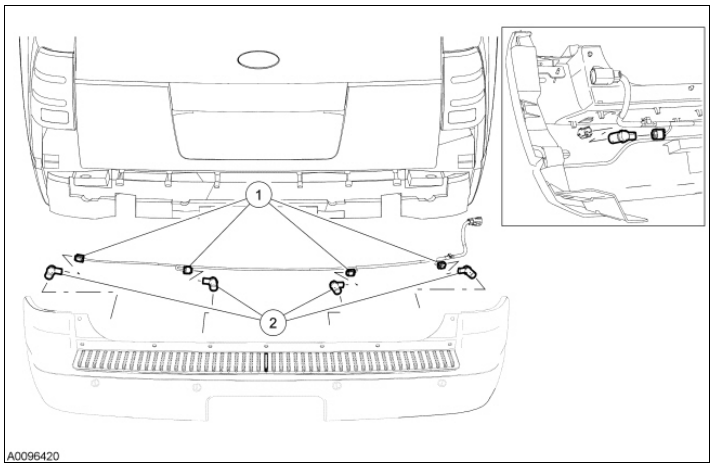
4. To install, reverse the removal procedure.

Parking Aid Module (PAM) - Explorer Sport Trac

Item	Part Number	Description
1	W702434-S439	Parking Aid Module (PAM) bracket screw
2	-	PAM and parking aid speaker wiring harness connectors (part of 13A409)
3	15K866	PAM and bracket assembly
4	15A866	Parking aid speaker

Removal and Installation

1. Remove the cab rear trim panel. For additional information, refer to Section 501-05 .



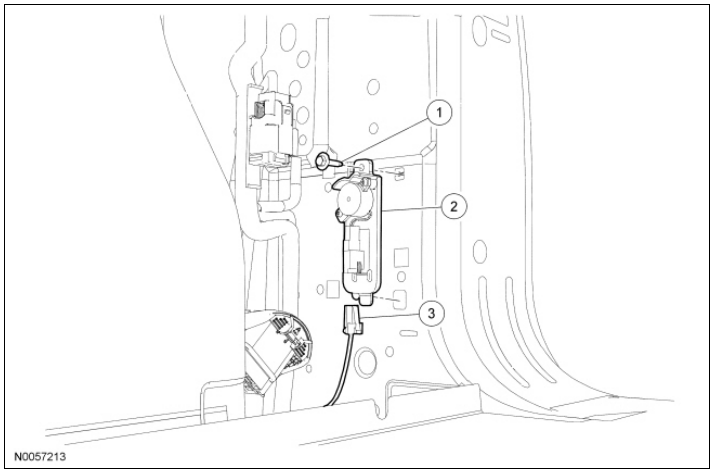
2. If replacing the parking aid speaker only, proceed as follows:
   - Disconnect the parking aid speaker electrical connector.
   - Disengage the parking aid speaker clips.
   - Remove the parking aid speaker.

3. If replacing the Parking Aid Module (PAM), proceed as follows:
   - Disconnect the electrical connectors.
   - Remove the PAM screw.
   - Remove the PAM .

4. To install, reverse the removal procedure.

Parking Aid Sensor - Mountaineer, Explorer Sport Trac

NOTE: Mountaineer shown, Explorer Sport Trac similar.



Item	Part Number	Description
1	-	Parking aid sensor electrical connectors (part of 15K868)
2	14489	Parking aid sensors

Removal and Installation

1. Remove the rear bumper cover. For additional information, refer to Section 501-19 .
2. Disconnect the parking aid sensor(s) electrical connector(s).
3. Press the retaining tabs and remove the parking aid sensor(s).
4. To install, reverse the removal procedure.

Parking Aid Speaker

Item	Part Number	Description
1	-	Parking aid speaker bracket bolt
2	-	Parking aid speaker and bracket assembly
3	-	Parking aid speaker electrical connector

Removal and Installation

1. Remove the LH C-pillar trim panel. For additional information, refer to Section 501-05 .

2. Remove the bolt and the speaker and bracket assembly.
   - Disconnect the electrical connector.

3. To install, reverse the removal procedure.

General Specifications

Item	Specification
Generator - 4.0L	
Generator pulley ratio	2.63:1
Rating	70 amps @ 500 rpm (min) to 105 amps @ 2,000 rpm (max)
Voltage regulator type	Electronic internal with generator
Generator - 4.6L	
Generator pulley ratio	2.72:1
Rating	82 amps @ 500 rpm (min) to 155 amp @ 2,000 rpm (max)
Voltage regulator type	Electronic internal with generator

Torque Specifications

Description	Nm	lb-ft	lb-in
Generator B+ terminal nut	17	-	150
Generator bolts (4.0L)	47	35	-
Generator bolts (4.6L)	25	18	-
Generator bracket bolts (4.6L)	10	-	89
Generator pulley nut	109	80	-
Radial arm adapter nut	9	-	80

Charging System

The charging system is a negative ground system consisting of:

- a generator with an internal voltage regulator.
- a charging system warning indicator.
- a battery.
- circuitry and cables.
- a PCM.
- a radial arm adapter (serviceable separately from the generator)

The generator is driven by the accessory drive belt. When the engine is started, the generator begins to generate AC which is internally converted to DC. The DC is controlled by the voltage regulator (located on the rear of the generator) and supplied to the battery. The PCM controls the voltage regulation set point, working with the generator internal voltage regulator over 2 control and communication circuits.

Principles of Operation

The PCM-controlled charging system, or "Smart Charge" charging system, determines the optimal voltage set point for the charging system and communicates this information to the voltage regulator. The "Smart Charge" charging system is designed to set 1 of 6 DTCs any time a charging system fault is present. All of the DTCs can set continuous faults, but not all DTCs will set as on-demand faults.

DTC	KOEO	KOER	Continuous
P0562	X	X	X
P0563	X	X	X
P0620			X
P0625		X	X
P0626		X	X
P065B			X

This system uses 2 communication lines between the PCM and the generator/voltage regulator. Both of these communication lines use Pulse-Width Modulation (PWM). The generator communication (GENCOM) line communicates the desired set point from the PCM to the voltage regulator. The generator monitor (GENMON) line communicates the generator load and error conditions to the PCM. The GENCOM command is only sent by the PCM when it is necessary to adjust the voltage set point. If the set point does not need to be changed, several seconds may elapse between PCM GENCOM commands. This normal operation will appear in the PID as occasional "bursts" of pulse-width commands. The third pin on the voltage regulator, the A circuit pin, is a circuit dedicated to monitor or sense battery voltage.

The PCM simultaneously controls and monitors the output of the generator. When the current consumption is high or the battery is discharged, the PCM will raise engine speed as needed to increase generator output. The generator charges the battery and at the same time supplies power for all of the electrical loads that are required. The battery is more effectively charged with a higher voltage when the battery is cold and a lower voltage when the battery is warm. The PCM is able to adjust the charging voltage according to the battery temperature by using a signal from the Intake Air Temperature (IAT) sensor. The PCM also uses other inputs to control charging system voltage such as the Vehicle Speed Sensor (VSS) and Engine Coolant Temperature (ECT). The voltage set point is calculated by the PCM and communicated to the voltage regulator by the GENCOM circuit based on the needs of the vehicle and the conditions.

The PCM turns off the generator during cranking to reduce the generator load and improve cranking speed. Once the engine starts, the PCM slowly increases generator output to desired voltage.

The PCM controls the charging system warning indicator by sending a message over the High Speed Controller Area Network (HS-CAN) to the Instrument Cluster (IC) module. The IC module will then control charging system warning indication based on the message from the PCM. The status of the PCM charging system warning indicator and/or message can be confirmed by viewing PCM PID generator fault indicator lamp (GENFIL). Any charging system fault detected by the PCM will result in 1 or more DTCs being set and the PID GENFIL having a status of On. If equipped with a charging system warning indicator, the IC module will turn the indicator ON or OFF. If equipped with a message center, the IC module will display a CHECK

CHARGING SYSTEM message. When the ignition is ON and the engine is OFF on vehicles equipped with a message center, the CHECK CHARGING SYSTEM message may not be displayed. For information regarding the IC module and message center, refer to Section 413-01 .

Under certain circumstances, the charging system may have a concern, but will still keep the battery charged and the vehicle running. GENCOM is normally used to initiate charging, but the generator may charge with a fault in this circuit. If the engine is operated at greater than 2,000 rpm momentarily, the generator may "self-excite" or start charging on its own. The charging system warning indicator is illuminated and/or CHECK CHARGING SYSTEM message is displayed, and the generator operates in a default mode (approximately 13.5 volts) until the engine is turned off. When the engine is restarted and the engine is operated at greater than 2,000 rpm momentarily, the generator may again self-excite and again the charging system warning indicator is illuminated and/or CHECK CHARGING SYSTEM message is displayed.

The PIDs and their associated descriptions used in the charging system diagnosis are listed below:

PID Chart

PID	Description	Normal Display	Associated Circuit Name	Connector, Circuit
GENMON	Generator Monitor	Constant fluctuating percentage 3%-98%	Generator monitor (GENMON)	C102A-1, CDC15 (VT)
GENCMD	Generator Command	Fluctuating percentage or small intermittent bursts 3%-98%	Generator communication (GENCOM)	C102A-2, CDC10 (BU/OG)
GENVDSD	Generator Voltage Desired	Voltage varies by vehicle needs - May be controlled by an output state control	-	-
GENFIL	Generator Fault Indicator Lamp	OFF if charging system is OK	-	-
GENCMD_LF	Generator Command Line Fault	NO FAULT if GENCOM circuit (GENCMD PID) is OK	-	-
GENMON_HZ	Generator Monitor Frequency	Frequency value	-	-
VPWR	Module Supply Voltage	Within 0.5 volt of battery voltage	-	-
RPM	Engine Revolutions Per Minute	Engine rpm - May be controlled by an output state control	-	-

Inspection And Verification

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

⚠ WARNING: Batteries contain sulfuric acid and produce explosive gases. Work in a well-ventilated area. Do not allow the battery to come in contact with flames, sparks or burning substances. Avoid contact with skin, eyes or clothing. Shield eyes when working near the battery to protect against possible splashing of acid solution. In case of acid contact with skin or eyes, flush immediately with water for a minimum of 15 minutes, then get prompt medical attention. If acid is swallowed, call a physician immediately. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Always lift a plastic-cased battery with a battery carrier or with hands on opposite corners. Excessive pressure on the battery end walls may cause acid to flow through the vent caps, resulting in personal injury and/or damage to the vehicle or battery.

NOTICE: **Do not make jumper connections except as directed. Incorrect connections may damage the voltage regulator test terminals, fuses or fusible links.**

NOTICE: **Do not allow any metal object to come in contact with the generator housing and internal diode cooling fins. A short circuit may result and burn out the diodes.**

NOTE: While carrying out any pinpoint test, disregard any DTCs set while following a specific pinpoint test. After the completion of a test, be sure to clear all DTCs in the PCM.

NOTE: All voltage measurements are referenced to the negative (-) battery post unless otherwise specified.

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Battery • Front End Accessory Drive (FEAD) belt • Generator pulley	• Wiring, terminals or connectors • Cables • Battery • Generator • Fusible links

	• Fuses • Radial arm adapter

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. Verify the battery condition. Refer to Section 414-01 .

5. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

6. **NOTE:** The Vehicle Communication Module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM .
   - refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

7. If the scan tool does not communicate with the vehicle:
   - verify the ignition is ON.
     - The air bag warning indicator prove-out (other indicators may NOT prove ignition is ON) confirms ignition ON. If ignition does not turn ON, refer to Section 211-05 to diagnose no power in RUN.
   - refer to Section 418-00 Inspection and Verification to establish a scan tool session (without the ignition ON).
   - verify the scan tool operation with a known good vehicle.

8. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .

NOTE: Use the Integrated Diagnostic System (IDS) feature that retrieves all Continuous Memory Diagnostic Trouble Codes (CMDTCs) from all modules at one time.

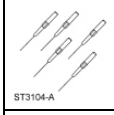
9. Retrieve CMDTCs from all modules.

10. **NOTE:** If no charging system DTCs are present, the charging system is operating correctly. If the charging system has a concern, it will usually set a charging system DTC.

    If the DTCs retrieved are related to the concern, go to the Diagnostic Trouble Code (DTC) Chart in this section. For all other DTCs, refer to the Master DTC Chart in Section 419-10 or Powertrain Control/Emissions Diagnosis (PC/ED) manual.

11. If no DTCs related to the concern are retrieved, go to the Symptom Chart in this section.

Diagnostic Trouble Code (DTC) Chart



DTCs	Description	Source	Action
P0563	System Voltage High	PCM	GO to Pinpoint Test A .
P0563	System Voltage High	Various Modules	GO to Pinpoint Test A
P0620	Generator Control Circuit	PCM	GO to Pinpoint Test C .
P0625	Generator Field Terminal Circuit Low	PCM	GO to Pinpoint Test D .
P0626	Generator Field Terminal Circuit High	PCM	GO to Pinpoint Test D .
P065B	Generator Control Circuit Range/Performance	PCM	GO to Pinpoint Test E .
All other DTCs	-	Various Modules	REFER to the Master DTC Chart in Section 419-10 or the Powertrain Control/Emissions Diagnosis (PC/ED) manual. If directed to this section from another section, GO to Symptom Chart in this section.

Pinpoint Test

Special Tool(s)

 ST3104-A	Backprobe Pins POM 6411
 ST2574-A	Flex Probe Kit 300-NUD105-R025DE or equivalent
 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST3094-A	Test Light SGT27000 or equivalent 250-350 mA incandescent bulb test lamp SGT27000
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Pinpoint Test A: System Voltage High

Refer to Wiring Diagrams Cell 12 , Charging System for schematic and connector information.

NOTE: DTC P0563, B1317 or B1676 can be set if the vehicle has been recently jump started, the battery has been recently charged or the battery has been discharged. The battery may become discharged due to excessive load(s) on the charging system from aftermarket accessories or if vehicle accessories have been operating for an extended period of time without the engine running.

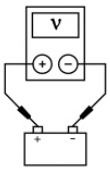
Normal Operation

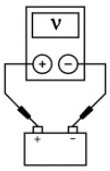
With the engine running, the charging system supplies voltage to the battery and the vehicle electrical system through the battery B+ cable. The voltage that is supplied to the vehicle electrical system is used for the operation of the various vehicle systems and modules. Many modules monitor this voltage and if it rises above their calibrated set point, a DTC will be set.

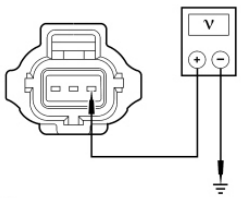
- DTC P0563 (System Voltage High) - If the PCM detects a voltage from the charging system higher than 15.2 volts with vehicle speed above 8 km/h (5 mph), this DTC will be set.

This pinpoint test is intended to diagnose the following:

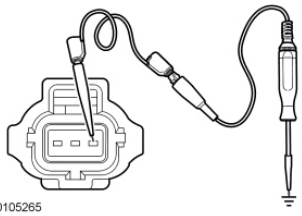
- Fuse
- Wiring, terminals or connectors
- Engine, generator and battery grounds
- Battery
- Generator

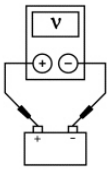


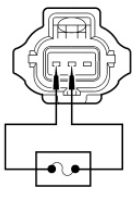




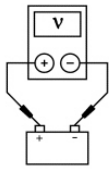
- PCM

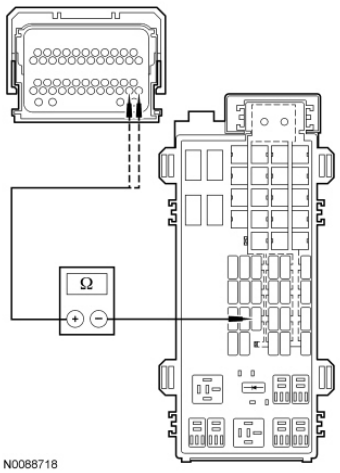






PINPOINT TEST A: SYSTEM VOLTAGE HIGH





NOTE: Make sure battery voltage is greater than 12.2 volts prior to and during this pinpoint test.

NOTE: Do not have a battery charger attached during vehicle testing.

Test Step	Result / Action to Take
A1 CHECK BATTERY CONDITION	
• Refer to Section 414-01 and carry out Pinpoint Test A: Battery Condition Test to determine if the battery can hold a charge and is OK for use. • **Does the battery pass the condition test?**	**Yes** GO to A2 . **No** INSTALL a new battery. REFER to Section 414-01 . CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
A2 CHECK FOR DTCs IN THE PCM	
• Enter the following diagnostic mode on the scan tool: Self Test - PCM. • **Is DTC P0620, P0625, P0626 or P065B present?**	**Yes** REFER to the DTC Chart in this section for the correct pinpoint test and DIAGNOSE those DTCs first. **No** GO to A3 .
A3 MONITOR PCM PID GENERATOR VOLTAGE DESIRED (GENVDSD)	
• Start the engine. • **NOTE:** Many of the PCM PIDs selected will be monitored later in this pinpoint test. • Select and monitor the following PCM PIDs: ♦ Generator Monitor (GENMON) ♦ Generator Command (GENCMD) ♦ Generator Voltage Desired (GENVDSD) ♦ Module Supply Voltage (VPWR) • Monitor the GENVDSD PID. • **Does the GENVDSD PID indicate 15.1 volts or less?**	**Yes** GO to A4 . **No** GO to A11 .
A4 MONITOR PCM PID GENERATOR VOLTAGE DESIRED (GENVDSD)	
• With the engine still running at idle, measure battery voltage and record.	**Yes** The fault is not present at this time. This may indicate an intermittent fault. CARRY OUT a wiggle test on the charging system circuits to try and RECREATE the concern. CHECK generator connections for corrosion, loose connections and/or bent terminals. REPAIR as necessary. CLEAR

 AJ0210-A • Monitor the GENVDSD PID. • **Is battery voltage within ±0.6 volt of the PID GENVDSD?**	the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to A5 .
A5 MEASURE THE A SENSE VOLTAGE	
• Ignition OFF. • Disconnect: Generator C1104A. • Ignition ON. • Measure battery voltage and record.  AJ0210-A • Measure the voltage between generator C1104A-3, circuit SDC02 (RD), harness side and ground.  N0105264 • **Is the A sense voltage equal to battery voltage?**	**Yes** GO to A6 . **No** VERIFY fusible links are OK. If OK, REPAIR circuit SDC02 (RD). If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
A6 A SENSE CIRCUIT LOAD TEST	
NOTICE: **The following step uses a test light to simulate normal circuit loads. Use only the test light recommended in the Special Tools table at the beginning of this section. To avoid connector terminal damage, use the Flex Probe Kit for the test light probe connection to the vehicle. Do not use the test light probe directly on any connector.** **NOTE:** This step puts a load on the A sense circuit. If there are corroded or loose connections, loading the circuit may help show the fault. A 250-350 mA incandescent 12-volt test lamp is required for this step. This circuit will not be	**Yes** GO to A7 . **No** REPAIR resistance due to corroded or loose connection on circuit SDC02 (RD). INSPECT generator C1104A-3, circuit SDC02 (RD) for damage. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

loaded properly using an LED-style test lamp. • Using a 12-volt test lamp connected to ground, check for voltage at generator C1104A-3, circuit SDC02 (RD), harness side.  N0105265 • **Does the test lamp illuminate?**	
A7 CHECK THE GENERATOR OUTPUT	
• Start the engine. • Increase engine rpm until generator starts to generate output. • With the engine running, measure battery voltage and record.  AJ0210-A • **Is the voltage above 14.5 volts?**	**Yes** INSTALL a new generator. REFER to Generator - 4.0L SOHC or Generator - 4.6L (2V) in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to A8 .
A8 MONITOR PCM PIDs GENERATOR COMMAND (GENCMD), GENERATOR MONITOR (GENMON) AND GENERATOR VOLTAGE DESIRED (GENVDSD)	
• Ignition OFF. • Connect a fused jumper wire between generator C1104A-1, CDC15 (VT), harness side and generator C1104A-2, circuit CDC10 (BU/OG), harness side.  N0074142 • Start the engine.	**Yes** GO to A9 . **No** INSTALL a new PCM. REFER to Section 303-14 . CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

• Monitor the GENVDSD, GENMON and GENCMD PIDs. • Using the active command, set GENVDSD PID to 14 volts. • **Does the GENCMD PID read within 5% of GENMON PID?**	
A9 COMPARE PCM SUPPLY VOLTAGE (VPWR) PID TO BATTERY VOLTAGE	
• With the engine still running at idle, measure the battery voltage at the battery and monitor the PCM VPWR PID.  AJ0210-A • **Does PCM VPWR PID accurately display battery voltage within ±0.5 volt?**	**Yes** INSTALL a new generator. REFER to Generator - 4.0L SOHC or Generator - 4.6L (2V) in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to A10 .
A10 CHECK PCM SUPPLY VOLTAGE CIRCUITS	
• Ignition OFF. • Disconnect: Fused Jumper Wire. • Disconnect: PCM C175B. • Inspect the connector pins for damage. Measure resistance between BJB fuse 39 (15A), output side and: ♦ PCM C175B-35, circuit CBB39 (VT/WH), harness side. ♦ PCM C175B-36, circuit CBB39 (VT/WH), harness side.  N0088718 • **Are the resistances less than 0.5 ohm?**	**Yes** GO to A11 . **No** REPAIR high resistance or loose connections in the affected circuit(s). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
A11 CHECK FOR CORRECT PCM OPERATION	

• Ignition OFF. • Check the PCM harness and component side connectors for: ♦ corrosion. ♦ pushed-out/bent pins. • Connect the PCM and generator, make sure the connectors seat correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PCM. REFER to Section 303-14 . CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

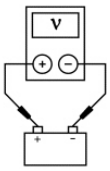
Pinpoint Test B: System Voltage Low or Battery is Discharged

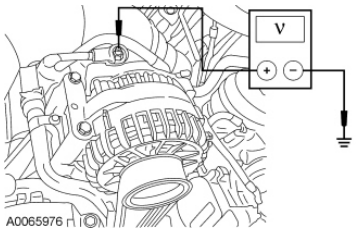
Refer to Wiring Diagrams Cell 12 , Charging System for schematic and connector information.

Normal Operation

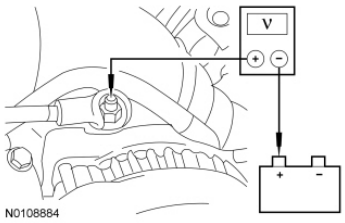
With the engine running, the charging system supplies voltage to the battery and the vehicle electrical system through the battery B+ cable. The PCM monitors this voltage through the battery positive post through the Battery Junction Box (BJB). If this voltage drops 1.5 volts or more below the generator voltage desired, this DTC will be set after 30 seconds.

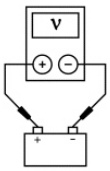
- DTC P0562 (System Voltage Low) - If the PCM detects a voltage from the charging system that is 1.5 volts lower than the generator voltage desired, this DTC will be set.

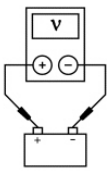




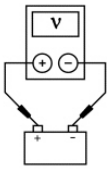
This pinpoint test is intended to diagnose the following:
- Fusible link
- Wiring, terminals or connectors
- Radial arm adapter
- Battery
- Generator
- PCM

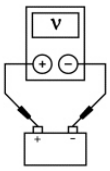






PINPOINT TEST B: SYSTEM VOLTAGE LOW OR BATTERY IS DISCHARGED





NOTE: Make sure battery voltage is greater than 12.2 volts prior to and during this pinpoint test.

NOTE: Do not have a battery charger attached during vehicle testing.

Test Step	Result / Action to Take
B1 CHECK FOR OTHER PCM DTCs	
• Enter the following diagnostic mode on the scan tool: Self Test - PCM. • **Is DTC P0620, P0625, P0626 or P065B present?**	**Yes** REFER to the DTC Chart in this section for the correct pinpoint test and DIAGNOSE those DTCs first. **No** GO to B2 .
B2 CHECK BATTERY CONDITION	

• Refer to Section 414-01 and carry out Pinpoint Test A: Battery Condition Test to determine if the battery can hold a charge and is OK for use. • **Does the battery pass the condition test?**	**Yes** GO to B3 . **No** INSTALL a new battery. REFER to Section 414-01 . TEST the system for normal operation.
B3 CHECK THE GENERATOR CONNECTIONS	
• Ignition OFF. • Inspect generator C1104A connection. Connector should be installed correctly and tight. • Disconnect: Generator C1104A. • Inspect generator C102A for bent and/or pushed-out pins. • Inspect generator C102B, B+ circuit SDC02 (RD) and radial arm adapter connection(s). Connection should be tight. • Measure the battery voltage.  AJ0210-A • Measure the voltage between generator C1104B, B+ circuit SDC02 (RD) and ground.  • **Are the generator C102B and radial arm adapter connections tight and does the generator B+ measure battery voltage?**	**Yes** GO to B4 . **No** TIGHTEN or INSTALL a new C1104B (B+ nut) and/or radial arm adapter as needed. REFER to Specifications in this section. VERIFY the fusible link is OK. If the fusible link is OK, REPAIR circuit SDC02 (RD). If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
B4 CHECK THE VOLTAGE DROP IN THE B+ CIRCUIT	
• Connect: Generator C1104A. • Start the engine. • With the engine running at idle, headlamps on and blower on high, measure the voltage drop between generator B+ C1104B, circuit SDC02 (RD) and the positive battery	**Yes** GO to B5 . **No** INSPECT circuit SDC02 (RD), radial arm adapter and the positive battery cable for loose connections, physical damage or wire corrosion.

terminal.  • Carry out a wiggle test of the generator wiring and connections while measuring voltage drop. • **Is the voltage drop less than 0.5 volt?**	REPAIR as required. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
B5 COMPARE PCM MODULE SUPPLY VOLTAGE (VPWR) PID	
• With the engine still running at idle, headlamps on and blower on high, measure the battery voltage at the battery and monitor the PCM VPWR PID.  • **Does PCM VPWR PID display battery voltage within ±0.5 volt?**	**Yes** GO to B6 . **No** REPAIR high resistance or loose connections in the affected PCM power circuit(s). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
B6 CHECK PCM GROUND FOR HIGH RESISTANCE	
• Monitor PCM VPWR PID. • With the engine still running at idle, turn off all accessory loads, measure the battery voltage at the battery and note the PCM VPWR PID.  • With the engine still running at idle, turn headlamps on and blower on high, measure the battery voltage at the battery and monitor	**Yes** GO to B7 . **No** REPAIR the affected PCM ground circuits. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

the PCM VPWR PID.  AJ0210-A • **Does the VPWR PID read within ±0.5 volt with accessory loads on as compared to accessory loads off?**	
B7 MONITOR PID VPWR AT WOT	
• With the engine still running at idle, turn off all accessory loads, measure the battery voltage at the battery and monitor the PCM VPWR PID.  AJ0210-A • Monitor the VPWR PID and momentarily accelerate the engine to Wide Open Throttle (WOT) and release. Repeat this step 4-5 times while continuing to monitor the VPWR PID. • **Does the VPWR PID stay within 0.5 volt of battery voltage when the engine rpms are increased?**	**Yes** GO to B8 . **No** INSTALL a new PCM. REFER to Section 303-14 . CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
B8 CHECK FOR DISCHARGED BATTERY	
• With the engine still running at idle, measure the battery voltage at the battery. • Monitor PCM PIDs generator voltage desired (GENVDSD) and generator monitor (GENMON). • **Does GENMON PID frequently rise above 90% and battery voltage drop below GENVDSD PID by 0.5 volt or more?**	**Yes** CARRY OUT the Component Test, Battery - Drain Test. REFER to Section 414-01 . **No** VERIFY fusible links are OK. If OK, REPAIR circuit SDC02 (RD). If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test C: DTC P0620

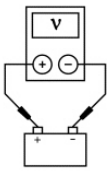
Refer to Wiring Diagrams Cell 12 , Charging System for schematic and connector information.

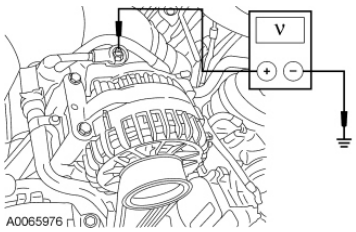
Normal Operation

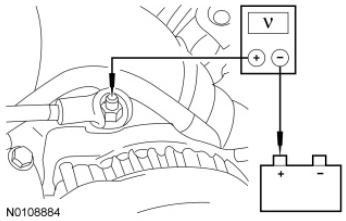
The PCM monitors the generator output via the GENMON circuit. The PCM uses the GENCOM circuit to command the generator to either increase or decrease output. If the GENCOM circuit (generator control circuit) or the A sense circuit are open or shorted to ground, the PCM will be unable to control the generator output. When the engine speed rises above approximately 2,000 rpm, the generator will default to a steady voltage output of approximately 13.5 volts and the PCM will send a request to the Instrument Cluster (IC) to illuminate the charging system warning indicator. A GENCOM circuit fault can be confirmed by viewing the PCM PID generator command line fault (GENCMD_LF) (YES status indicator fault).

- DTC P0620 (Generator Control Circuit) - If the GENCOM circuit or A sense circuit are open or shorted to ground, the PCM will set this DTC.

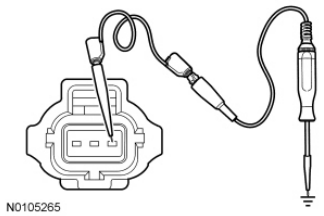
This pinpoint test is intended to diagnose the following:



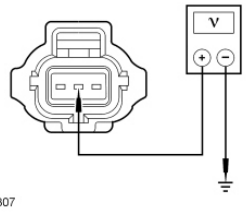


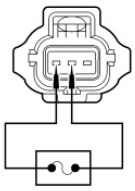


- Fuse
- Wiring, terminals or connectors
- Radial arm adapter
- Generator
- PCM

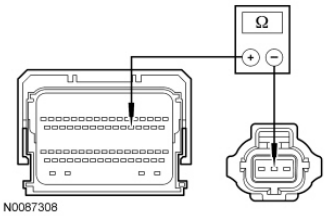


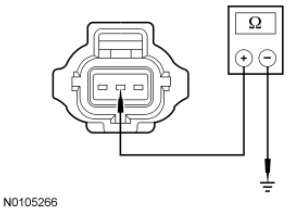
PINPOINT TEST C: DTC P0620



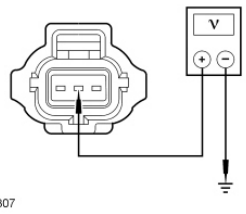


NOTE: Make sure battery voltage is greater than 12.2 volts prior to and during this pinpoint test.





NOTE: Do not have a battery charger attached during vehicle testing.



Test Step	Result / Action to Take
C1 CHECK THE BATTERY CONDITION	
• Refer to Section 414-01 and carry out Pinpoint Test A: Battery Condition Test to determine if the battery can hold a charge and is OK for use. • **Does the battery pass the condition test?**	**Yes** GO to C2 . **No** INSTALL a new battery. REFER to Section 414-01 . CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
C2 CHECK THE GENERATOR CONNECTIONS	
• Ignition OFF. • Inspect generator C1104A connection. Connector should be installed correctly and tight. • Disconnect: Generator C1104A. • Inspect generator C1104A for bent and/or pushed-out pins. • Inspect generator C1104B, B+ circuit SDC02 (RD) and radial arm connection(s). Connection should be tight. • Measure the battery voltage.	**Yes** GO to C3 . **No** TIGHTEN or INSTALL a new C1104B (B+ nut) and/or radial arm adapter as needed. REFER to Specifications in this section. VERIFY the fusible link is OK. If the fusible link is OK, REPAIR circuit SDC02 (RD). If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal

 AJ0210-A • Measure the voltage between generator C1104B, B+ circuit SDC02 (RD) and ground.  A0065976 • **Are the generator C1104B and radial arm adapter connections tight and does the generator B+ measure battery voltage?**	operation.
C3 CHECK THE VOLTAGE DROP IN THE B+ CIRCUIT	
• Connect: Generator C1104A. • Start the engine. • With the engine running at idle, headlamps on and blower on high, measure the voltage drop between generator B+ C1104B, circuit SDC02 (RD) and the positive battery terminal.  N0108884 • Carry out a wiggle test of the generator wiring and connections while measuring voltage drop. • **Is the voltage drop less than 0.5 volt?**	**Yes** GO to C4 . **No** INSPECT circuit SDC02 (RD), radial arm adapter and the positive battery cable for loose connections, physical damage or wire corrosion. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
C4 A SENSE CIRCUIT LOAD TEST	
NOTICE: **The following step uses a test light to simulate normal circuit loads. Use only the test light recommended in the Special Tools table at the beginning of this section. To avoid connector terminal damage, use the Flex Probe Kit for the test light probe connection to the vehicle. Do not use the test light probe**	**Yes** GO to C5 . **No** VERIFY fusible links are OK. If OK, REPAIR circuit SDC02 (RD). If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. CLEAR

directly on any connector. **NOTE:** This step puts a load on the A sense circuit. If there are corroded or loose connections, loading the circuit may help show the fault. A 250-350 mA incandescent 12-volt test lamp is required for this step. This circuit will not be loaded properly using an LED-style test lamp. • Ignition OFF. • Disconnect: Generator C1104A. • Ignition ON. • Using a 12-volt test lamp connected to ground, check for voltage at generator C1104A-3, circuit SDC02 (RD), harness side.  N0105265 • **Does the test lamp illuminate?**	the DTCs. REPEAT the self-test. TEST the system for normal operation.
C5 CHECK THE GENERATOR COMMAND LINE FAULT (GENCMD_LF) PID	
• Ignition OFF. • Connect: Generator C1104A. • Start the engine. • **NOTE:** Many of the PCM PIDs selected will be monitored later in this pinpoint test. • Select and monitor the following PCM PIDs: ♦ Generator Monitor (GENMON) ♦ Generator Command (GENCMD) ♦ Generator Command Line Fault (GENCMD_LF) • With the engine running at idle, monitor the GENCMD_LF PID. • **Does the GENMON_LF PID indicate FAULT?**	**Yes** GO to C6 . **No** GO to C9 .
C6 CHECK THE GENERATOR COMMAND CIRCUIT FOR A SHORT TO POWER	
• Ignition OFF. • Disconnect: Generator C1104A. • Ignition ON. • Measure the voltage between generator C1104A-2, circuit CDC10 (BU/OG), harness side and ground.	**Yes** GO to C7 . **No** GO to C11 .

 N0087307 • **Does voltage read 1 volt or less?**	
C7 COMPARE THE PCM PIDs GENERATOR MONITOR (GENMON) AND GENERATOR COMMAND (GENCMD)	
• Ignition OFF. • Connect a fused jumper wire between generator C1104A-1, circuit CDC15 (VT), harness side and generator C1104A-2, circuit CDC10 (BU/OG), harness side.  N0074142 • Start the engine. • Monitor the GENMON and GENCMD PIDs while performing a wiggle test on the generator harness. • **Does the GENMON PID read within 5% of the GENCMD PID?**	**Yes** GO to C8 . **No** GO to C12 .
C8 CHECK THE GENERATOR COMMAND CIRCUIT FOR DAMAGE OR AN OPEN	
• Ignition OFF. • Disconnect: Fused Jumper Wire. • Disconnect: PCM C175B. • Inspect the following harness connectors for damaged or pushed-out pins: ♦ PCM C175B-22, circuit CDC10 (BU/OG) ♦ Generator C1104A-2, circuit CDC10 (BU/OG) • Measure the resistance between PCM C175B-22, circuit CDC10 (BU/OG), harness side and generator C1104A-2, circuit CDC10 (BU/OG, harness side.	**Yes** GO to C9 . **No** REPAIR circuit CDC10 (BU/OG). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

 • **Are the connectors and pins free of damage and is the resistance less than 5 ohms?**	
C9 CHECK THE GENERATOR COMMAND CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: Generator C1104A (if not previously disconnected). • Disconnect: PCM C175B. • Measure the resistance between the generator C1104A-2, circuit CDC10 (BU/OG), harness side and ground.  • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to C10 . **No** REPAIR circuit CDC10 (BU/OG). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
C10 CHECK THE CHARGING SYSTEM CIRCUITS FOR INTERMITTENT FAULTS	
• Connect: Generator C102A. • Connect: PCM C175B. • Ignition ON. • Clear all DTCs. • Start the engine and let the engine run for 5 minutes. • Retrieve Continuous Memory Diagnostic Trouble Codes (CMDTCs) from all modules. • **Did any charging system DTC get stored into memory?**	**Yes** INSTALL a new generator. REFER to Generator - 4.0L SOHC or Generator - 4.6L (2V) in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** The fault is not present at this time. This may indicate an intermittent fault. CARRY OUT a wiggle test on the charging system circuits to try and RECREATE the concern. CHECK generator connections for corrosion, loose connections and/or bent terminals. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
C11 CHECK THE GENERATOR COMMAND AND PCM FOR A SHORT TO VOLTAGE	

• Ignition OFF. • Disconnect: PCM C175B. • Ignition ON. • Measure the voltage between generator C1104A-2, circuit CDC10 (BU/OG), harness side and ground.  • **Does voltage read 0 volt?**	**Yes** INSTALL a new PCM. REFER to Section 303-14 . CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** REPAIR circuit CDC10 (BU/OG). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
C12 INSPECT GENERATOR CONNECTORS AND CIRCUITS	
• Ignition OFF. • Disconnect: PCM C175B. • Inspect the following connector pins for damage and/or corrosion: ♦ PCM C175B-50, circuit GD113 (BK/YE) ♦ Generator C1104A-1, circuit CDC15 (VT) ♦ Generator C1104A-2, circuit CDC10 (BU/OG) • **Are the connectors and circuits OK?**	**Yes** INSTALL a new PCM. REFER to Section 303-14 . CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** REPAIR high resistance or loose connections in the affected circuit(s). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

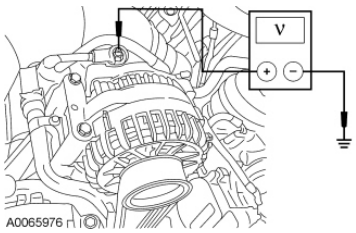
Pinpoint Test D: DTC P0625 or P0626

Refer to Wiring Diagrams Cell 12 , Charging System for schematic and connector information.

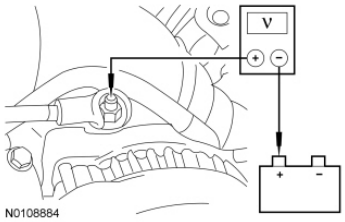
Normal Operation

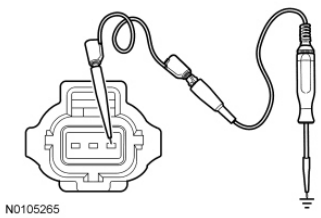
The PCM monitors the generator output via the GENMON circuit (generator field terminal circuit). If the PCM cannot read the GENMON circuit due to an open or short to ground, when the engine rises above approximately 2,000 rpm, the generator will default to a steady voltage of approximately 13.5 volts and the PCM will send a request to the Instrument Cluster (IC) to illuminate the charging system warning indicator. A GENMON duty cycle of 3% or less indicates a short to ground fault is present and will result in DTC P0625 setting in the PCM. A GENMON duty cycle of 98% or more indicates an open or short to voltage fault is present and will result in DTC P0626 setting in the PCM.

- DTC P0625 (Generator Field Terminal Circuit Low) - If the GENMON circuit is shorted to ground, the A sense circuit is open or the B+ circuit is open, the PCM will set this DTC. This DTC can also be set by a faulted PCM or generator.
- DTC P0626 (Generator Field Terminal Circuit High) - If the GENMON circuit is open or shorted to power, the PCM will set this DTC. This DTC can also be set by a faulted PCM or generator.

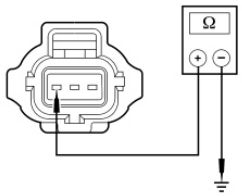


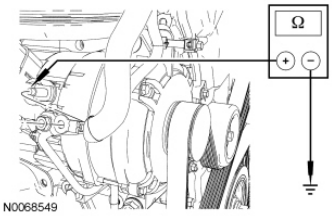
This pinpoint test is intended to diagnose the following:



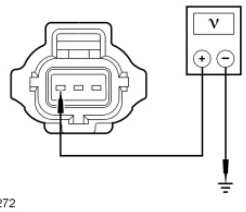


- Fuse
- Wiring, terminals or connectors
- Radial arm adapter
- Engine, generator and battery grounds
- Battery
- Generator
- PCM

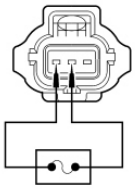




PINPOINT TEST D: DTC P0625 OR P0626



NOTE: Make sure battery voltage is greater than 12.2 volts prior to and during this pinpoint test.



NOTE: Do not have a battery charger attached during vehicle testing.

Test Step	Result / Action to Take
D1 CHECK THE BATTERY CONDITION	
• Refer to Section 414-01 and carry out Pinpoint Test A: Battery Condition Test to determine if the battery can hold a charge and is OK for use. • **Does the battery pass the condition test?**	**Yes** GO to D2 . **No** INSTALL a new battery. REFER to Section 414-01 . CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
D2 CHECK THE GENERATOR B+ CONNECTION	
• Ignition OFF. • Inspect generator C1104B, circuit SDC14 (RD), harness side. Connection should be tight. • Inspect generator radial adapter connection on rear of generator. Connection should be tight. • Measure the voltage between generator C1104B, circuit SDC02 (RD) and ground.  • **Are the generator C1104B and radial arm adapter connections tight and does the generator B+ measure battery voltage?**	**Yes** GO to D3 . **No** TIGHTEN or INSTALL a new C1104B (B+ nut) and/or radial arm adapter as needed. REFER to Specifications in this section. VERIFY the fusible link is OK. If the fusible link is OK, REPAIR circuit SDC02 (RD). If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
D3 CHECK THE VOLTAGE DROP IN THE B+ CIRCUIT	

• Start the engine. • With the engine running at idle, headlamps on and blower on high, measure the voltage drop between generator B+ C1104B, circuit SDC02 (RD) and the positive battery terminal.  • Carry out a wiggle test of the generator wiring and connections while measuring voltage drop. • **Is the voltage drop less than 0.5 volt?**	**Yes** For DTC P0625, GO to D4 . For DTC P0626, GO to D6 . **No** INSPECT circuit SDC02 (RD), radial arm adapter and the positive battery cable for loose connections, physical damage or wire corrosion. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
D4 A SENSE CIRCUIT LOAD TEST	
NOTICE: **The following step uses a test light to simulate normal circuit loads. Use only the test light recommended in the Special Tools table at the beginning of this section. To avoid connector terminal damage, use the Flex Probe Kit for the test light probe connection to the vehicle. Do not use the test light probe directly on any connector.** **NOTE:** This step puts a load on the A sense circuit. If there are corroded or loose connections, loading the circuit may help show the fault. A 250-350 mA incandescent 12-volt test lamp is required for this step. This circuit will not be loaded properly using an LED-style test lamp. • Ignition OFF. • Disconnect: Generator C1104A . • Ignition ON. • Using a 12-volt test lamp connected to ground, check for voltage at C1104A-3, circuit SDC02 (RD), harness side.  • **Does the test lamp illuminate?**	**Yes** GO to D5 . **No** VERIFY fusible links are OK. If OK, REPAIR circuit SDC02 (RD). If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

D5 CHECK CIRCUIT CDC15 (VT) FOR DAMAGE OR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: PCM C175B. • Inspect the following harness connectors for damaged or pushed-out pins: ♦ PCM C175B-26, circuit CDC15 (VT) ♦ Generator C1104A-1, circuit CDC15 (VT) • Measure the resistance between generator C1104A-1, circuit CDC15 (VT), harness side and ground.  N0105271 • **Are the connectors and pins free of damage and is the resistance greater than 10,000 ohms?**	**Yes** GO to D10 . **No** REPAIR the connector(s) and/or circuit CDC15 (VT). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
D6 CHECK THE GENERATOR B+ RESISTANCE	
• Ignition OFF. • **NOTE:** Failure to disconnect the battery will result in false resistance readings. • Disconnect the battery. Refer to Section 414-01 . • Disconnect: Generator C102B. • Measure the resistance between generator C102B, component side and the generator housing.  N0068549 • **Is the resistance greater than 25K ohms?**	**Yes** GO to D7 . **No** INSTALL a new generator. REFER to Generator - 4.0L SOHC or Generator - 4.6L (2V) in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
D7 CHECK THE RESISTANCE OF THE VOLTAGE REGULATOR INTERNAL CIRCUITS TO GROUND	
• Disconnect: Generator C1104A. • Measure the resistance between generator C1104A, component side and ground. Refer to	**Yes** GO to D8 . **No**

the following table. | Pin	Expected Resistance | |---|---| | 1 | Greater than 10K ohms | | 2 | Greater than 10K ohms | | 3 | Greater than 10K ohms | • **Are the resistance values as indicated?**	INSTALL a new generator. REFER to Generator - 4.0L SOHC or Generator - 4.6L (2V) in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
D8 CHECK CIRCUIT CDC15 (VT) FOR DAMAGE OR AN OPEN	
• Disconnect: PCM C175B. • Inspect the following harness connectors for damaged or pushed-out pins: ♦ PCM C175B-26, circuit CDC15 (VT) ♦ Generator C1104A-1, circuit CDC15 (VT) • Measure the resistance between PCM C175B-26, circuit CDC15 (VT), harness side and generator C1104A-1, circuit CDC15 (VT), harness side. • **Are the connectors and pins free of damage and is the resistance less than 5 ohms?**	**Yes** GO to D9 . **No** REPAIR the connector(s) and/or circuit CDC15 (VT). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
D9 CHECK CIRCUIT CDC15 (VT) FOR A SHORT TO POWER	
• Connect the battery. Refer to Section 414-01 . • Ignition ON. • Measure the voltage between generator C1104A-1, circuit CDC15 (VT), harness side and ground.  N0105272 • **Is there any voltage present?**	**Yes** REPAIR the connector(s) and/or circuit CDC15 (VT). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to D10 .
D10 COMPARE THE PCM PIDs GENERATOR MONITOR (GENMON) AND GENERATOR COMMAND (GENCMD)	

• Ignition OFF. • Connect: PCM C175B. • Connect a fused jumper wire between generator C1104A-1, circuit CDC15 (VT), harness side and generator C1104A-2, circuit CDC10 (BU/OG), harness side.  N0074142 • Start the engine. • Using the active command, set the GENVDSD PID to 14.0 volts. • Monitor the GENMON and GENCMD PIDs while carrying out a wiggle test on the generator wiring harness. • **Does the GENMON PID read within 2% of the GENCMD PID?**	**Yes** INSTALL a new generator. REFER to Generator - 4.0L SOHC or Generator - 4.6L (2V) in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to D11 .
D11 CHECK FOR CORRECT PCM OPERATION	
• Ignition OFF. • Disconnect: Fused Jumper Wire. • Check the PCM harness, generator harness, PCM component side and generator component side connectors for: ♦ corrosion. ♦ pushed-out/bent pins. • Connect the PCM and/or generator connectors. Make sure the connectors seat correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PCM. REFER to Section 303-14 . CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

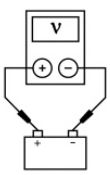
Pinpoint Test E: DTC P065B

Refer to Wiring Diagrams Cell 12 , Charging System for schematic and connector information.

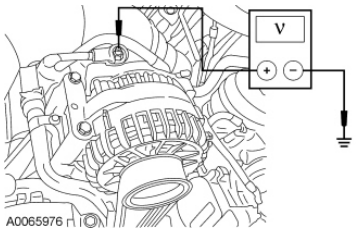
Normal Operation

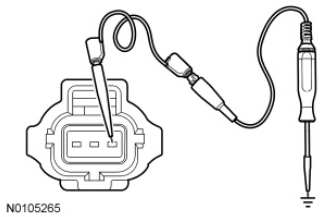
With the engine running, the PCM expects to receive a valid generator monitor (GENMON) signal with a duty cycle greater than 5% and less than 98%. The PCM also monitors the state of the generator command (GENCMD) signal line to make sure it is not stuck high or stuck low. If the GENMON or GENCMD signal fluctuates between out-of-valid range, or stuck high, or stuck low, or some combination and normal, a DTC will be set. When engine speed rises above approximately 2,000 rpm, the generator will default to a steady voltage of approximately 13.5 volts and the PCM will send a request to the Instrument Cluster (IC) to illuminate the charging system warning indicator lamp.

- DTC P065B (Generator Control Circuit Range/Performance) - If the input frequency was continuously less than 80 Hz or more than 200 Hz the PCM will set this DTC. Additionally, if the signal shows a faulted condition that is happening in a fluctuating manner, the PCM will track the fluctuations between faulted and normal conditions. If the fluctuations occur frequently within a short amount of time, this DTC will also be set.

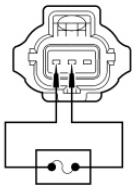


This pinpoint test is intended to diagnose the following:





- Wiring, terminals or connectors
- Radial arm adapter
- Generator
- PCM



PINPOINT TEST E: DTC P065B

NOTE: Make sure battery voltage is greater than 12.2 volts prior to carrying out this pinpoint test.

NOTE: Do not have a battery charger attached during vehicle testing.

Test Step	Result / Action to Take
E1 CHECK THE BATTERY CONDITION	
• Refer to Section 414-01 and carry out Pinpoint Test A: Battery Condition Test to determine if the battery can hold a charge and is OK for use. • **Does the battery pass the condition test?**	**Yes** GO to E2 . **No** INSTALL a new battery. REFER to Section 414-01 . CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
E2 CHECK THE GENERATOR CONNECTIONS	
• Ignition OFF. • Inspect generator C1104A connection. Connector should be installed correctly and tight. • Disconnect: Generator C1104A. • Inspect generator C102A for bent and/or pushed-out pins. • Inspect generator C1104B, B+ circuit SDC02 (RD) and radial arm connection(s). Connection should be tight. • Measure the battery voltage.  AJ0210-A • Measure the voltage between generator C1104B, B+ circuit SDC02 (RD) and ground.	**Yes** GO to E3 . **No** TIGHTEN or INSTALL a new C1104B (B+ nut) and/or radial arm adapter as needed. REFER to Specifications in this section. VERIFY the fusible link is OK. If the fusible link is OK, REPAIR circuit SDC02 (RD). If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

 • **Are the generator C1104B and radial arm adapter connections tight and does the generator B+ measure battery voltage?**	
E3 A SENSE CIRCUIT LOAD TEST	
NOTICE: **The following step uses a test light to simulate normal circuit loads. Use only the test light recommended in the Special Tools table at the beginning of this section. To avoid connector terminal damage, use the Flex Probe Kit for the test light probe connection to the vehicle. Do not use the test light probe directly on any connector.** **NOTE:** This step puts a load on the A sense circuit. If there are corroded or loose connections, loading the circuit may help show the fault. A 250-350 mA incandescent 12-volt test lamp is required for this step. This circuit will not be loaded properly using an LED-style test lamp. • Ignition ON. • Using a 12-volt test lamp connected to ground, check for voltage at C1104A-3, circuit SDC02 (RD), harness side.  • **Does the test lamp illuminate?**	**Yes** GO to E4 . **No** VERIFY fusible links are OK. If OK, REPAIR circuit SDC02 (RD). If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
E4 CHECK THE PCM GENERATOR MONITOR FREQUENCY (GENMON_HZ) PID	
• Ignition OFF. • Connect: Generator C1104A. • Start the engine. • **NOTE:** Many of the PCM PIDs selected will be monitored later in this pinpoint test. • Select and monitor the following PCM PIDs: ♦ Generator Voltage Desired (GENVDSD) ♦ Generator Monitor Frequency (GENMON_HZ) • Monitor the GENMON_HZ PID. • **Does the PID read between 80-200 Hz?**	**Yes** GO to E8 . **No** GO to E5 .

E5 CHECK THE PCM GENERATOR MONITOR FREQUENCY (GENMON_HZ) PID WITH GENERATOR C1104A DISCONNECTED	
• Ignition OFF. • Disconnect: Generator C1104A. • Start the engine. • Monitor the GENMON_HZ PID. • **Does the PID read between 0-2 Hz?**	**Yes** GO to E7 . **No** GO to E6 .
E6 CHECK GENERATOR CIRCUITRY	
• Ignition OFF. • ***NOTICE:*** **This pinpoint test step directs testing circuits using a back-probe method. Use the special back-probe tool specified in the tool list in this section. Do not force test leads or other probes into connectors. Adequate care must be exercised to avoid connector terminal damage while making sure that good electrical contact is made with the circuit or terminal. Failure to follow these instructions may cause damage to wiring, terminals, or connectors and subsequent electrical faults.** • With PCM C175B connected, connect a fused jumper wire between PCM C175B-26, circuit CDC15 (VT) and ground by carefully back probing the connector. • Start the engine. • Monitor the GENMON_HZ PID. • **Does the PID read 0 Hz?**	**Yes** INSPECT the harness for wire to wire shorts or insulation chaffing, mis-pinned connectors and correct wire colors and REPAIR generator circuit CDC15 (VT) as needed. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** INSTALL a new PCM. REFER to Section 303-14 . CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
E7 MONITOR THE PCM PID GENERATOR MONITOR FREQUENCY (GENMON_HZ) WHILE ACTIVATING THE GENERATOR VOLTAGE DESIRED (GENVDSD) PID	
• Ignition OFF. • Connect a fused jumper wire between generator C1104A-1, circuit CDC15 (VT), harness side and generator C1104A-2, circuit CDC10 (BU/OG), harness side.  N0074142 • Start the engine. • With the engine running at idle, set the active command GENVDSD PID to 14 volts. • Monitor the GENMON_HZ PID. • **Does the GENMON_HZ PID read between 120-130 Hz?**	**Yes** INSTALL a new generator. REFER to Generator - 4.0L SOHC or Generator - 4.6L (2V) in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** INSTALL a new PCM. REFER to Section 303-14 . CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
E8 CHECK THE PCM GENERATOR COMMAND LINE FAULT (GENCMD_LF) PID	

• With the engine running and all selectable loads OFF, monitor the PCM PID GENCMD_LF. • **Does the PCM PID GENCMD_LF fluctuate from YES FAULT to NO FAULT?**	**Yes** INSTALL a new generator. REFER to Generator - 4.0L SOHC or Generator - 4.6L (2V) in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** The fault is not present at this time. This may indicate an intermittent fault. CARRY OUT a wiggle test on the charging system circuits to try and RECREATE the concern. CHECK generator connections for corrosion, loose connections and/or bent terminals. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test F: The Generator is Noisy

Refer to Wiring Diagrams Cell 12 , Charging System for schematic and connector information.

Normal Operation

The generator is belt-driven by the engine accessory drive system. There are several sources of generator noise which include: bearing noise, electrical fault noise, generator or belt pulley misalignment. A generator with certain types of diode or stator failures may also produce an audible noise.

This pinpoint test is intended to diagnose the following:

- Accessory drive belt
- Loose bolts/brackets
- Generator/pulley

PINPOINT TEST F: THE GENERATOR IS NOISY

Test Step	Result / Action to Take
F1 CHECK FOR ACCESSORY DRIVE BELT NOISE AND LOOSE MOUNTING BRACKETS	
• Ignition OFF. • Check the accessory drive belt and tensioner for damage and correct installation. Refer to Section 303-05 . • Check the accessory mounting brackets and generator pulley for looseness or misalignment. • **Is the accessory drive OK?**	**Yes** GO to F2 . **No** REPAIR as necessary. REFER to Section 303-05 for diagnosis and testing of the accessory drive system. TEST the system for normal operation.

F2 CHECK THE GENERATOR MOUNTING	
• Check the generator mounting for loose bolts or misalignment. • **Is the generator mounted correctly?**	**Yes** GO to F3 . **No** REPAIR as necessary. TEST the system for normal operation.
F3 CHECK THE GENERATOR FOR NOISE	
• With the engine running, use a stethoscope or equivalent listening device to probe the generator and the accessory drive area for unusual mechanical noise. • **Is the generator the noise source?**	**Yes** INSTALL a new generator. REFER to Generator - 4.0L SOHC or Generator - 4.6L (2V) in this section. **No** REFER to Section 303-00 to diagnose the source of the engine noise.

Pinpoint Test G: Radio Interference

Refer to Wiring Diagrams Cell 12 , Charging System for schematic and connector information.

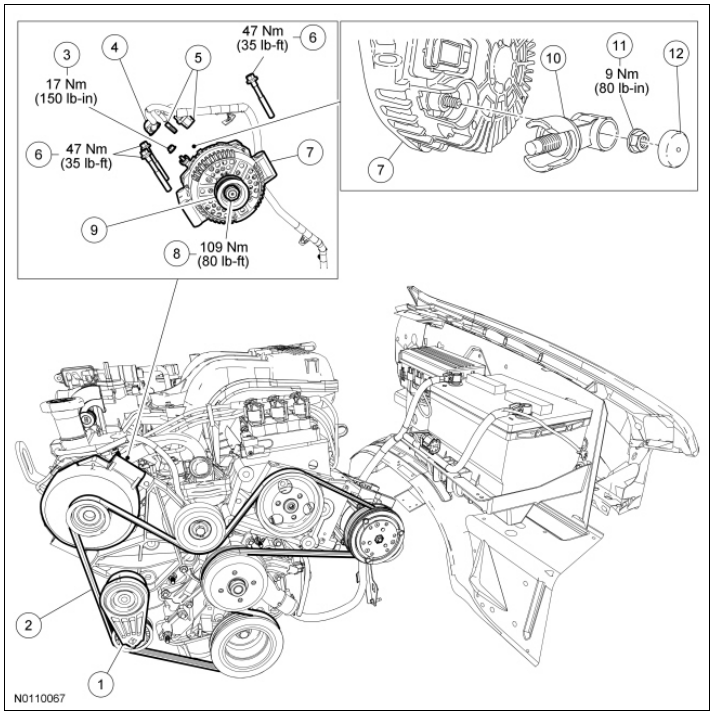
Normal Operation

The generator radio suppression equipment reduces interference transmitted through the speakers by the vehicle electrical system.

This pinpoint test is intended to diagnose the following:
- Generator
- Wiring, terminals or connectors
- In-vehicle entertainment system

PINPOINT TEST G: RADIO INTERFERENCE

NOTE: If the OEM audio unit has been replaced with an aftermarket unit, the vehicle may not pass this test. Return the vehicle to OEM condition before following this pinpoint test.



NOTE: If the engine is operated at greater than 2,000 rpm momentarily, the generator will self-excite. Make sure when the generator is disconnected the engine rpm stays below 2,000 rpm. If it does rise above 2,000 rpm, turn the ignition to the off position and start the test over again.

NOTE: Inspect for any after market accessories that have been added to the vehicle. Check the wiring for these accessories and be sure they have not been attached to the generator circuits and are positioned away from the generator wiring.

Test Step	Result / Action to Take
G1 VERIFY THE GENERATOR IS THE SOURCE OF THE RADIO INTERFERENCE	
• Start the engine and allow the engine to idle.	**Yes** REFER to Section 415-00 for diagnosis and testing of the in-vehicle entertainment system.

• Tune the audio unit to a station where the interference is present. • Ignition OFF. • Disconnect: Generator C1104B. • Start the engine and allow the engine to idle, determine if the interference is still present. • **Is the interference present with the generator disconnected?**	**No** INSTALL a new generator. REFER to Generator - 4.0L SOHC or Generator - 4.6L (2V) in this section. TEST the system for normal operation.

Generator - 4.0L SOHC

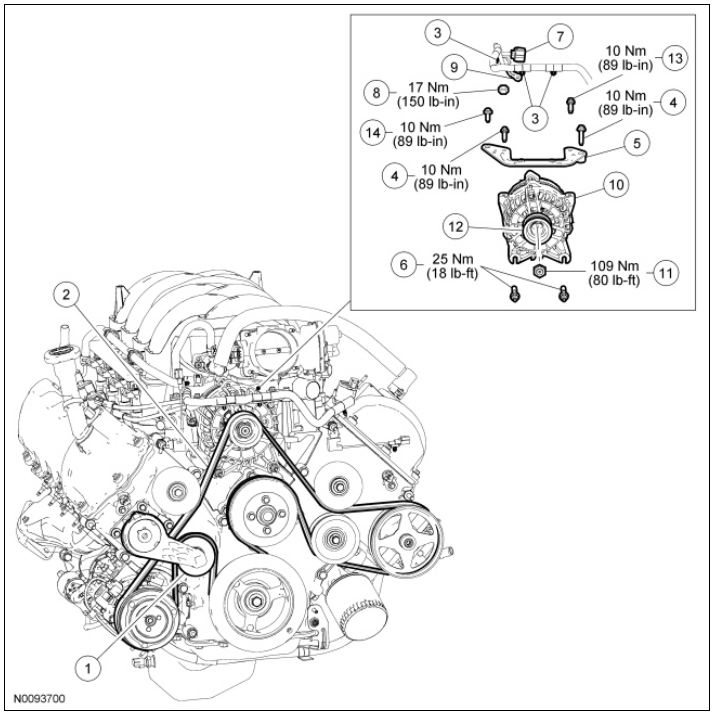
Item	Part Number	Description
1	6B209	Front End Accessory Drive (FEAD) belt tensioner
2	8620	FEAD belt
3	W711953	Generator B+ terminal nut
4	-	Generator B+ terminal (part of 14300)
5	-	Generator electrical connectors (part of 14300)
6	W500328	Generator bolts (3 required)
7	10300	Generator
8	N807805	Generator pulley nut
9	10344	Generator pulley
10	10329	Radial arm adapter
11	-	Radial arm adapter nut (part of 10329)
12	-	Radial arm adapter cap (part of 10329)

Removal and Installation

NOTE: The radial arm adapter is a serviceable item. Do not replace the generator if the radial arm adapter is the only concern.

1. Disconnect the battery. For additional information, refer to Section 414-01 .
2. Rotate the Front End Accessory Drive (FEAD) belt tensioner counterclockwise and position the FEAD belt aside.

3. Position the protective cover aside and remove and discard the generator B+ terminal nut.
    - To install, tighten to 17 Nm (150 lb-in).



4. Disconnect the generator B+ terminal and the 2 electrical connectors.

5. Remove the 3 bolts and the generator.
    - To install, tighten to 47 Nm (35 lb-ft).

6. If necessary, remove the nut and the generator pulley.
    - To install, tighten to 109 Nm (80 lb-ft).

7. To install, reverse the removal procedure.
    - Install a new generator B+ terminal nut.

Generator - 4.6L (2V)

Item	Part Number	Description
1	6B209	Front End Accessory Drive (FEAD) belt tensioner
2	8620	FEAD belt
3	-	Generator harness locators (3 required) (part of 14305)
4	N807309	Generator bracket bolts (2 required)
5	10153	Generator bracket
6	N804178	Generator nuts (2 required)
7	-	Generator electrical connector (part of 14305)
8	W711953	Generator B+ terminal nut
9	-	Generator B+ terminal (part of 14305)
10	10300	Generator
11	N807805	Generator pulley nut
12	10344	Generator pulley
13	N704682	Generator bolt
14	N807691	Generator bolt

Removal and Installation

1. Disconnect the battery. For additional information, refer to Section 414-01 .

2. Remove the Throttle Body (TB). For additional information, refer to Section 303-04B .

3. Rotate the Front End Accessory Drive (FEAD) belt tensioner clockwise and position the FEAD aside.

4. Remove the 3 harness locators from the generator bracket.

5. Remove the 4 bolts and the generator bracket.
    - To install, tighten to 10 Nm (89 lb-in).

6. Loosen the 2 bolts and position the generator aside.
    - To install, tighten to 25 Nm (18 lb-ft).

7. Disconnect the generator electrical connector.

8. Position the protective cover aside, remove and discard the nut and position the generator B+ terminal aside.
    - To install, tighten to 17 Nm (150 lb-in).

9. Remove the generator.

10. If necessary, remove the nut and the generator pulley.
    - To install, tighten to 109 Nm (80 lb-ft).

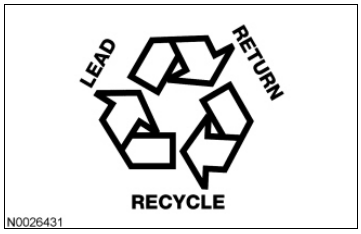
11. To install, reverse the removal procedure.
    - Install a new generator B+ terminal nut.

General Specifications

Item	Specification
Battery	
Cold Cranking Amps (CCA) measured at -18°C (0°F)	650 CCA
Voltage	12 volts

Torque Specifications

Description	Nm	lb-ft	lb-in
Battery cable body ground terminal nut	9	-	80
Battery cable bracket nuts (4.6L)	20	-	177
Battery cable engine front cover bracket nut (4.0L)	20	-	177
Battery cable engine front cover bracket nut (4.6L)	10	-	89
Battery cable engine ground terminal nut (4.6L)	25	18	-
Battery cable frame bracket nut (4.0L)	9	-	80
Battery cable right engine mount bracket bolt (4.6L)	20	-	177
Battery cable terminal bolts	7	-	62
Battery hold-down bolt	9	-	80
Battery Junction Box (BJB) terminal nuts	9	-	80
Battery tray bolts	20	-	177
Generator B+ terminal nut	17	-	150
Power steering line bracket nut (4.6L)	12	-	106
Starter motor ground cable terminal nut (4.0L)	25	18	-
Starter solenoid positive cable terminal nut	12	-	106
Starter solenoid wire cable terminal nut	6	-	53



Battery and Cables

Vehicles are equipped with a 12V, maintenance-free battery.

The battery and cable system consists of the following components:

- Battery
- Battery cable assembly
- Battery tray

Ford Motor Company strongly recommends that lead-acid batteries be returned to an authorized recycling facility for disposal.

Principles of Operation

Battery Eye Operation

The battery eye indicates the state-of-charge of the battery by responding to the specific gravity of a single battery cell electrolyte. The battery eye has a viewing plate, 2 colored balls of different specific gravity and a small passage. As the state-of-charge and specific gravity changes, the balls change their position in the passageway and subsequently display a different color in the viewing eye. The primary purpose of the battery is to be a quick indicator of state-of-charge for assembly plants and dealership pre-delivery processes.

The color of the battery eye indicates the approximate state-of-charge.

- Red - indicates low state-of-charge.
- Yellow/Black - indicates between high and low state-of-charge.
- Green - indicates high state-of-charge.
- No color can occur after the battery has been in service for several years and some of the plate material has coated the balls.
- A clear battery eye can occur if the battery case becomes damaged and the electrolyte has fallen below the plates.

NOTE: The battery eye may remain red for a period of time (up to several days), even after the battery is fully charged, because the acid is not yet fully mixed.

Do not install a new battery based solely on the indication of the battery eye. The battery eye color simply indicates the battery state-of-charge, not its condition. For example, a red or yellow/black battery eye usually indicates the battery is discharged, not defective. If the battery eye indicates the battery may be discharged, it is necessary to recharge the battery before testing its condition.

Charging a Battery

Batteries discharge while the vehicle is on the dealer lot or parked by the customer for an extended period of time due to normal parasitic key-off loads. Also, vehicles still in dealer inventory or in long-term storage may be driven short distances with heavy electrical loads. Over a period of time (30 days or more), this could result in vehicles having shallow or deeply discharged batteries.

- Deeply discharged - A battery that is drained over a prolonged period of time, such as an unsold vehicle or a vehicle in storage, to the point the battery is dead.
- Shallow discharge - A battery that is drained by leaving an accessory on for several hours or a few days and has a very low charge.

The vehicle charging system is designed to supply the electrical power needed to maintain the battery near full charge during normal vehicle use. The charging system is not capable of bringing a deeply discharged battery back to near full charge in a short amount of time such as allowing the vehicle to idle for 15 minutes to "recharge the battery". Discharged batteries should be charged using an external charger.

NOTE: Battery chargers have improved greatly with the addition of the new generation pulse chargers. These chargers pulse current into the battery, breaking down the sulfation layer on the battery plates and generally reduce charging times to less than an hour.

NOTE: Cold batteries will not readily accept a charge. Therefore, batteries should be allowed to warm to approximately 5°C (41°F) before charging. This may require 4 to 8 hours at room temperature.

The following chart summarizes 2 recommended methods of charging.

Type of Battery Discharge	Pulse Charger	Standard Charger
Deeply discharged	Follow directions supplied with the pulse charger	2 to 8 hours and may take up to an hour to accept initial charge
Shallow discharge	45 minutes to an hour charge	2 hours below (40A) on manual setting or medium automatic setting

Inspection And Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Battery • Battery mounting	• Battery cables • Battery posts

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the fault is not visually evident, GO to Pinpoint Test A in the Pinpoint Test procedure.

Pinpoint Test

Special Tool(s)

 ST3285-A	GR 1 190 V3.0 Intelligent Diagnostic Charger 162-00036 or equivalent

Pinpoint Test A: Battery Condition Test

Normal Operation

Battery condition is determined by measuring battery terminal voltage after a specific discharge current is applied for a specified time period.

This pinpoint test is intended to diagnose the following:

- Battery charge
- Battery

PINPOINT TEST A: BATTERY CONDITION TEST

Test Step	Result / Action to Take
A1 TEST THE BATTERY CONDITION	
NOTE: A red test-eye indicates the battery is discharged, not necessarily defective. **NOTE:** Failure to fully charge the battery before retesting may cause false readings. • Verify the battery condition using the Intelligent Diagnostic Charger. • **Is the battery OK?**	**Yes** RETURN the battery to service. **No** If the analyzer reads REPLACE BATTERY or REPLACE-BAD CELL, INSTALL a new battery. REFER to Battery in this section.

Component Test

Battery - Drain Tests

⚠ WARNING: Batteries contain sulfuric acid and produce explosive gases. Work in a well-ventilated area. Do not allow the battery to come in contact with flames, sparks or burning substances. Avoid contact with skin, eyes or clothing. Shield eyes when working near the battery to protect against possible splashing of acid solution. In case of acid contact with skin or eyes, flush immediately with water for a minimum of 15 minutes, then get prompt medical attention. If acid is swallowed, call a physician immediately. Failure to follow these instructions may result in serious personal injury.

NOTICE: **To prevent damage to the meter, do not crank the engine or operate accessories that draw more than 10A.**

NOTE: No factory-equipped vehicle should have more than a 50 mA (0.050 amp) draw.

Check for current drains on the battery in excess of 50 mA (0.050 amp) with all the electrical accessories off and the vehicle at rest for at least 40 minutes. Current drains can be tested with the following procedure.

NOTE: Many electronic modules draw 10 mA (0.010 amp) or more continuously.

NOTE: Typically, a drain of approximately 1 amp is attributed to an engine compartment lamp, glove compartment lamp or interior lamp staying on continually. Other component failures or wiring shorts are located by selectively pulling fuses to pinpoint the location of the current drain. When the current drain is found, the meter reading falls to an acceptable level. If the drain is still not located after checking all the fuses, it may be due to the generator. Disconnect the generator and retest.

NOTE: To accurately test the drain on a battery, an in-line ammeter must be used between the negative battery post and its respective cable. Use of a test lamp or voltmeter is not an accurate method.

1. Drive the vehicle at least 5 minutes and over 48 km/h (30 mph) to turn on and activate the vehicle systems.

2. After driving the vehicle and before testing, make sure the junction box(es)/fuse panel(s) is accessible without turning on the interior lights or the underhood lights.

3. Allow the vehicle to sit with the key out of the ignition for at least 40 minutes to allow the modules to time out/power down.

4. Connect a fused jumper wire (30A) between the negative battery cable and the negative battery post to prevent modules from resetting.

5. Disconnect the negative battery cable from the negative battery post without breaking the connection of the jumper wire.

6. **NOTE:** It is very important that continuity is not broken between the battery and the negative battery cable when connecting the meter. If this happens, the entire 40-minute procedure must be repeated.

Connect the battery tester between the negative battery cable and the post. The meter must be capable of reading milliamps and should have a 10-amp capability.

7. **NOTE:** If the meter settings need to be switched or the test leads need to be moved to another jack, the jumper wire must be reinstalled to avoid breaking continuity.

   Remove the jumper wire.

8. Note the amperage draw. Draw varies from vehicle to vehicle depending on the equipment package. Compare to a similar vehicle for reference.

NOTE: If the vehicle sits for an extended period of time and the battery drains, there is the possibility of a control module staying alive and not going into sleep mode. If a module does stay alive, it can also result in battery drain. If a module is suspect, isolate individual modules by disconnecting each module one at a time and note if the excessive draw goes away.

NOTE: For vehicles equipped with aftermarket bodies or boxes which contain electrical connections, disconnect the aftermarket to factory connections to isolate the body from the chassis.

9. If the current draw is excessive, remove the fuses from the Battery Junction Box (BJB) one at a time and note the current drop. When the current level drops to an acceptable level after removing a fuse, the circuit containing the excessive draw has been located. The excessive draw can be isolated by continuing to pull sub system fuses. Do not reinstall the fuses until testing is finished. To correctly isolate each of the circuits, all of the fuses may need to be removed, then install one fuse and note the amperage draw, remove the fuse and install the next fuse. Continue this process with each fuse.
   - Once the main circuit is identified, continue to remove the fuses from the Smart Junction Box (SJB) one at a time and note the current reading. Do not reinstall the fuses until testing is finished. To correctly isolate each of the circuits, all of the fuses may need to be removed, then install one fuse and note the amperage draw, remove the fuse and install the next fuse. Continue this process with each fuse.

10. Check the wiring diagrams for any circuits that run from the battery without passing through the BJB or the SJB . If the current draw is still excessive, disconnect these circuits until the draw is found. Also, disconnect the generator electrical connections and retest if the draw cannot be located. The generator may be internally shorted, causing the current drain.

Battery Disconnect

⚠ WARNING: Batteries contain sulfuric acid and produce explosive gases. Work in a well-ventilated area. Do not allow the battery to come in contact with flames, sparks or burning substances. Avoid contact with skin, eyes or clothing. Shield eyes when working near the battery to protect against possible splashing of acid solution. In case of acid contact with skin or eyes, flush immediately with water for a minimum of 15 minutes, then get prompt medical attention. If acid is swallowed, call a physician immediately. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Always deplete the backup power supply before repairing or installing any new front or side air bag supplemental restraint system (SRS) component and before servicing, removing, installing, adjusting or striking components near the front or side impact sensors or the restraints control module (RCM). Nearby components include doors, instrument panel, console, door latches, strikers, seats and hood latches. Refer to the Description and Operation portion of Section 501-20B for location of the RCM and impact sensor(s). To deplete the backup power supply energy, disconnect the battery ground cable and wait at least 1 minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped). Failure to follow these instructions may result in serious personal injury or death in the event of an accidental deployment.

⚠ WARNING: Always lift a plastic-cased battery with a battery carrier or with hands on opposite corners. Excessive pressure on the battery end walls may cause acid to flow through the vent caps, resulting in personal injury and/or damage to the vehicle or battery.

NOTICE: **If equipped with the CD6 audio unit, precautions must be taken when the battery has been disconnected. When reconnecting the battery, make sure no interruption of power occurs for 30 seconds. If power is interrupted during the first 30 seconds, permanent damage to the CD6 audio unit will result.**

1. **NOTE:** When the battery is disconnected and connected, some abnormal drive symptoms may occur while the vehicle relearns its adaptive strategy. The vehicle may need to be driven to relearn its strategy.

   NOTE: When disconnecting the battery ground cable to interrupt power to the vehicle electrical system, disconnect the battery ground cable only. It is not necessary to disconnect the positive battery cable.

   Disconnect the battery ground cable.

   - To connect, tighten to 7 Nm (62 lb-in).

2. Disconnect the positive battery cable.
   - To connect, tighten to 7 Nm (62 lb-in).

3. To connect, reverse the disconnect procedure.

Battery and Battery Tray - Exploded View

Item	Part Number	Description
1	W712657	Battery hold-down bolt
2	10747	Battery hold-down clamp

Battery

Removal and Installation

⚠ WARNING: Always lift a plastic-cased battery with a battery carrier or with hands on opposite corners. Excessive pressure on the battery end walls may cause acid to flow through the vent caps, resulting in personal injury and/or damage to the vehicle or battery.

1. Disconnect the battery. For additional information, refer to Battery Disconnect in this section.

2. Remove the battery hold-down clamp and bolt.
   - To install, tighten to 9 Nm (80 lb-in).

3. ***NOTICE:*** **Be sure the battery cover is re-installed to avoid premature battery failure.**

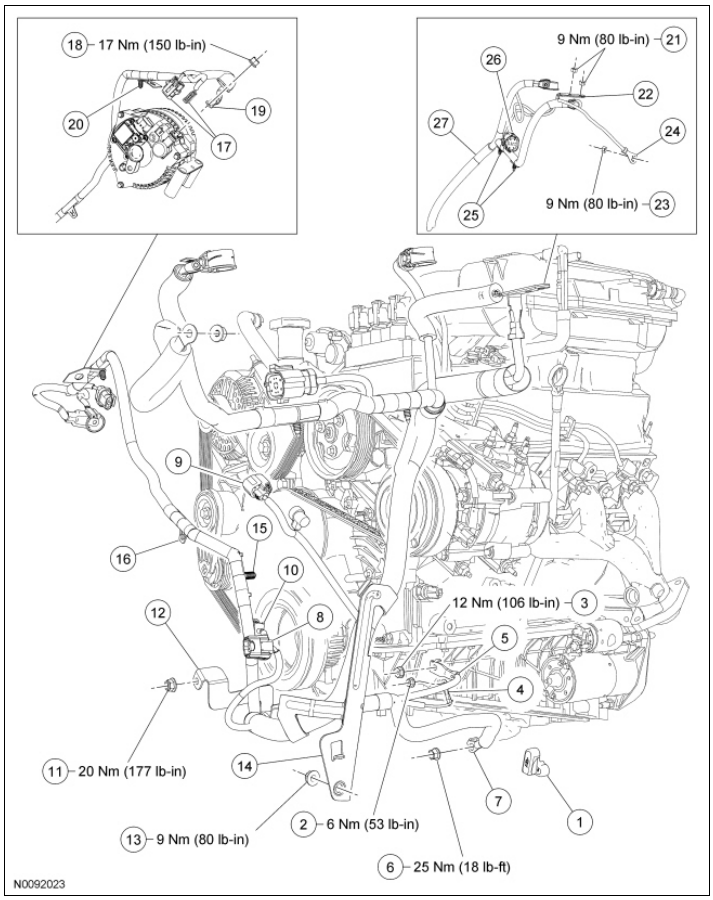
   Remove the battery, and if equipped, remove the battery cover.

4. To install, reverse the removal procedure.

Battery Tray

Removal and Installation

⚠ WARNING: Always lift a plastic-cased battery with a battery carrier or with hands on opposite corners. Excessive pressure on the battery end walls may cause acid to flow through the vent caps, resulting in personal injury and/or damage to the vehicle or battery.



1. Remove the battery. For additional information, refer to Battery in this section.

2. Remove the 4 battery tray bolts.
   - To install, tighten to 20 Nm (177 lb-in).

3. Remove the battery tray.
   - Release the battery cable harness locators.

4. To install, reverse the removal procedure.

Battery Cables - 4.0L

Item	Part Number	Description

17	-	Generator electrical connectors (part of 14300)
18	W705790	Generator B+ terminal nut
19	-	Generator B+ terminal (part of 14300)
20	-	Battery cable harness locator (part of 14300)
21	W705790	Battery Junction Box (BJB) nuts (2 required)
22	-	BJB terminal (part of 14300)
23	W705790	Battery cable body ground terminal nut
24	-	Battery cable body ground terminal (part of 14300)
25	-	Battery cable harness locators (2 required) (part of 14300)
26	-	Battery cable harness electrical connector (part of 14300)
27	14300	Battery cable

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Disconnect the battery. For additional information, refer to Battery Disconnect in this section.
3. Remove the starter solenoid terminals protective cap.
4. Remove the starter solenoid wire cable terminal nut.
   - To install, tighten to 6 Nm (53 lb-in).
5. Remove the starter solenoid positive cable terminal nut.
   - To install, tighten to 12 Nm (106 lb-in).
6. Disconnect the starter solenoid wire cable terminal.
7. Disconnect the starter solenoid positive cable terminal.
8. Remove the nut and disconnect the starter motor ground cable terminal.
   - To install, tighten to 25 Nm (18 lb-ft).
9. Disconnect the power steering pressure switch electrical connector.
10. Disconnect the A/C compressor electrical connector.
11. Disconnect the oil pressure sending unit electrical connector.
12. Remove the nut and position the battery cable engine front cover bracket aside.
    - To install, tighten to 20 Nm (177 lb-in).
13. Remove the nut and position the battery cable frame bracket aside.
    - To install, tighten to 9 Nm (80 lb-in).
14. Release the battery cable harness locators from the front of the engine.

15. Disconnect the 2 generator electrical connectors.

16. Position the protective cover aside, remove the nut and position the generator B+ terminal aside.
    - To install, tighten to 17 Nm (150 lb-in).

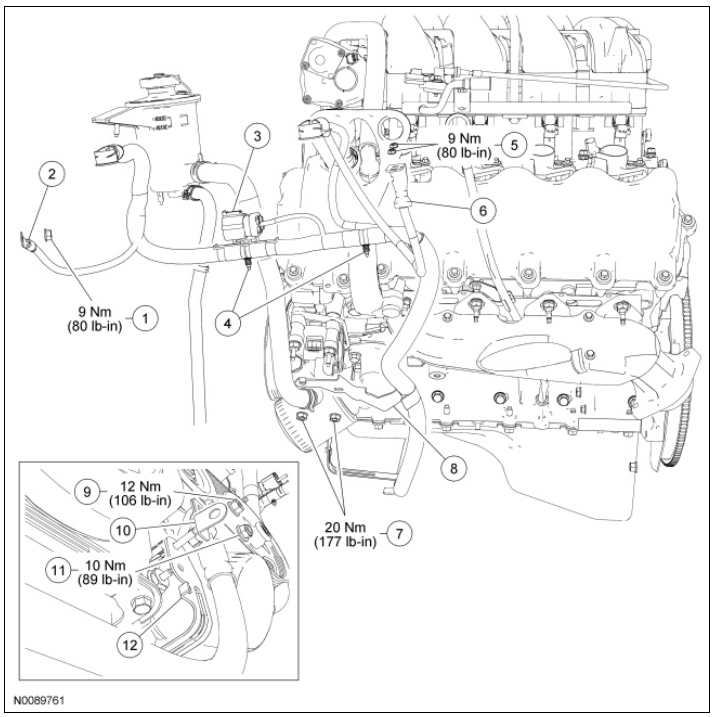
17. Release the battery cable harness locator from the generator harness guide.

18. Open the Battery Junction Box (BJB) cover and remove the 2 BJB nuts.
    - To install, tighten to 9 Nm (80 lb-in).

19. Disconnect the BJB terminal.

20. Remove the nut and position the battery cable body ground terminal aside.
    - To install, tighten to 9 Nm (80 lb-in).

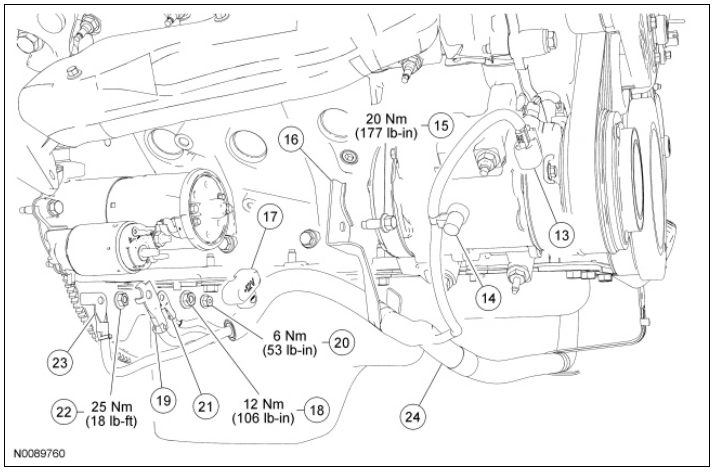
21. Remove the 2 battery cable harness locators from the battery tray.



22. Disconnect the battery cable harness electrical connector.

23. Remove the battery cables.

24. To install, reverse the removal procedure.



Battery Cables - 4.6L

LH Engine Connections

Item	Part Number	Description
1	W705790	Battery cable body ground terminal nut
2	-	Battery cable body ground terminal (part of 14300)
3	-	Battery cable electrical connector (part of 14300)
4	-	Battery cable locators (2 required) (part of 14300)
5	W705790	Battery Junction Box (BJB) terminal nuts (2 required)
6	-	BJB terminal (part of 14300)
7	W520112	Battery cable bracket nuts (2 required)

12	-	Battery cable engine front cover bracket (part of 14300)

RH Engine Connections

Item	Part Number	Description
13	-	A/C compressor electrical connector (part of 14300)
14	-	A/C compressor electrical connector harness locator (part of 14300)
15	W505223	Battery cable right engine mount bracket bolt
16	10W652	Battery cable right engine mount bracket
17	11N087	Starter solenoid terminals protective cap
18	W706414	Starter solenoid positive cable terminal nut
19	-	Starter solenoid positive cable terminal (part of 14300)
20	W705790	Starter solenoid wire cable terminal nut
21	-	Starter solenoid wire cable terminal (part of 14300)
22	W520112	Battery cable engine ground terminal nut
23	-	Battery cable engine ground terminal (part of 14300)
24	14300	Battery cable

Removal and Installation

1. Disconnect the battery. For additional information, refer to Battery Disconnect in this section.

2. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

3. Remove the nut and position the battery cable body ground terminal aside.
   - To install, tighten to 9 Nm (80 lb-in).

4. Disconnect the battery cable electrical connector.

5. Remove the 2 battery cable locators from the battery tray.

6. Remove the Battery Junction Box (BJB) terminal nuts.
   - To install, tighten to 9 Nm (80 lb-in).

7. Position the generator harness terminal aside.

8. Position the BJB terminal aside.

9. Remove the 2 nuts and position the battery cable bracket aside.

- To install, tighten to 20 Nm (177 lb-in).

10. Remove the nut and position the power steering line bracket aside.
    - To install, tighten to 12 Nm (106 lb-in).

11. Remove the nut and position the battery cable engine front cover bracket aside.
    - To install, tighten to 10 Nm (89 lb-in).

12. Disconnect the A/C compressor electrical connector.

13. Remove the A/C compressor electrical connector harness locator.

14. Remove the bolt and position the battery cable right engine mount bracket aside.
    - To install, tighten to 20 Nm (177 lb-in).

15. Remove the starter solenoid terminals protective cap.

16. Remove the nut and position the starter solenoid positive cable terminal aside.
    - To install, tighten to 12 Nm (106 lb-in).

17. Remove the nut and position the starter solenoid wire cable terminal aside.
    - To install, tighten to 6 Nm (53 lb-in).

18. Remove the nut and position the battery cable engine ground terminal aside.
    - To install, tighten to 25 Nm (18 lb-ft).

19. Remove the battery cable.

20. To install, reverse the removal procedure.

Torque Specifications

Description	Nm	lb-in
Antenna cable bracket bolt	8	71
Satellite radio antenna bolt	5	44
Satellite Digital Audio Receiver System (SDARS) module bolt	7	62
SDARS module nut	7	62
Subwoofer enclosure bolt (except Explorer Sport Trac)	5	44

Information and Entertainment System

Audio Line-Up

The following audio systems are available:

- Base
  - AM/FM single CD Audio Front Control Module (ACM)
  - Four speakers
- Audiophile
  - AM/FM 6-CD changer ACM
  - Four speakers plus subwoofer
- Navigation
  - Navigation ACM
  - Audiophile sound system (4 speakers plus subwoofer)

All audio systems include the following features:

- Speed sensitive volume
- Accessory delay
- MP3 capability
- Audio input jack

The following options are available:

- Satellite radio
- SYNC system
- Family entertainment system

Antenna - AM/FM, Satellite Radio, and Global Positioning System (GPS)

The vehicle is equipped with a fixed mast AM/FM antenna mounted on the right front fender. The AM/FM antenna cable has 2 parts. The AM/FM antenna upper cable is included as part of the antenna base. The AM/FM lead-in cable connects the ACM to the upper cable. The 2 cables connect behind the glove compartment.

The satellite radio antenna (if equipped) consists of a satellite radio antenna cable and a roof-mounted satellite radio antenna. For vehicles with satellite audio and navigation, a combination satellite audio/Global Positioning System (GPS) antenna is utilized, as well as a 2-piece satellite radio antenna cable to connect the satellite radio antenna to the ACM .

Speakers

All vehicles are equipped with 4 speakers mounted in the doors. The subwoofer is mounted behind the rear seat (Explorer Sport Trac), or behind the RH rear quarter trim panel (Explorer, Mountaineer).

Navigation System

The navigation system consists of the following:

- Navigation ACM
- GPS antenna (integral to the satellite radio antenna)
- Satellite radio/ GPS splitter cable (located behind the ACM)
- Microphone (located in the auto-dimming interior mirror)

The ACM controls the operation of the navigation system and the audio system. The system uses a GPS antenna, a vehicle speed input, and other sensor information to accurately establish the vehicle position.

Family Entertainment System

The family entertainment system consists of the following:

- Rear Entertainment Module (RETM) (mounted to the headliner)
- A/V ports for connecting a gaming system
- 2 wireless headphones
- A wireless remote control

SYNC System

The SYNC system consists of the following:

- Accessory Protocol Interface Module (APIM), located in the floor console
- SYNC-specific steering wheel controls
- Microphone (located in the auto-dimming interior mirror)
- Universal Serial Bus (USB) cable and port (located in the center console)
- Audio input jack (located in the center console)

SYNC is a hands-free communications and entertainment system that allows the following interactions:

- Send and receive phone calls via a Bluetooth-enabled phone
- Send and receive text messages via a Bluetooth-enabled phone
- Connect media devices (such as an iPod® or USB flash device) in order to play audio files
- Play media files via a Bluetooth-enabled audio device

For vehicles with SYNC V2, the following additional features are provided:

- Vehicle health reports
    - ♦ Provides vehicle data to the customer upon request
- Emergency call (eCall)
    - ♦ Initiates an emergency call through a paired mobile phone when the air bags deploy

Once a vehicle has had the APIM flashed to V2, it cannot be reverted back to V1.

Not all features are available with every phone.

For additional information on audio system operation, including the SYNC system, refer to the Owner's Literature.

Satellite Audio

The satellite audio system is comprised of the following:

- Satellite Digital Audio Receiver System (SDARS) module, located behind the glove compartment (vehicles without navigation)

- ACM (vehicles with navigation)
- Satellite radio antenna cable
- Satellite radio antenna

For vehicles with navigation, the satellite radio receiver is built-in to the ACM .

Information and Entertainment System

Special Tool(s)

 ST1137-A	73III Automotive Meter 105-R0057 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
 ST2574-A	Flex Probe Kit 105-R025C or equivalent
 ST3086-A	Multi-Media Interface Tester 105-00120
 ST3051-A	Universal Serial Bus (USB) Male-A to Male-A Cable CCMUSB2-AM-AM-10

Principles of Operation

NOTE: The Smart Junction Box (SJB) is also known as the Generic Electronic Module (GEM).

Audio Front Control Module (ACM)

The Audio Front Control Module (ACM) can be operated with the ignition in RUN or ACC. The accessory delay feature allows the audio system to be operated for a preset period of time after the ignition is turned off and a front door has not been opened. The ACM sends AC voltage audio signals to the speakers or to the amplifier, depending on vehicle configuration. The ACM can produce its own DTCs, which can be communicated to the scan tool through the Medium Speed Controller Area Network (MS-CAN).

Satellite Audio

The satellite audio system consists of a Satellite Digital Audio Receiver System (SDARS) module (integral to the ACM for vehicles with navigation), a satellite radio antenna, and a satellite radio antenna cable. The satellite radio antenna receives digital audio signals and sends them to the satellite receiver. The stand-alone SDARS module communicates via the MS-CAN .

Navigation System

The vehicle navigation system guides the user to a pre-entered destination. No navigation map DVD is needed, as the map guidance information is stored in the ACM . The ACM calculates route information based on Global Positioning System (GPS) data. The GPS antenna tracks several satellites simultaneously. The ACM also uses vehicle speed and transmission gear selected signals received through the MS-CAN to detect

vehicle speed and direction, resulting in more accurate navigation tracking.

The navigation display is shown on the ACM display. Either the touchscreen or the buttons on the ACM can be used to interact with the navigation system.

The compass heading is derived from the GPS antenna signal. There are no serviceable parts for the compass.

A voice recognition system allows the user to interface with the system without using the touchscreen. A microphone located in the auto-dimming interior mirror provides a direct input to the ACM . The microphone is shared with the SYNC system.

Jukebox Feature

The navigation ACM contains a 10 Gigabyte on-board hard drive that is capable of storing music ripped (recorded) from a music disc. The music can be loaded into the jukebox by inserting a disc (in the proper format) and following the on-screen instructions to load the music into the ACM . The jukebox cannot rip MP3 discs.

SYNC System

The SYNC system allows interaction with several types of customer devices, including mobile phones and media devices. The system is comprised of the Accessory Protocol Interface Module (APIM), a microphone (located in the auto-dimming interior mirror), the Universal Serial Bus (USB) cable and port, and the audio input jack. The APIM contains an on-board Bluetooth chipset, which enables certain wireless devices to interact with the system.

The APIM consists of 2 internal modules: the Consumer Interface Processor (CIP) and the Vehicle Interface Processor (VIP). The modules are not replaceable individually, but can be flashed independently, if required.

The CIP interfaces with all of the inputs to the APIM . It contains an analog-to-digital-to-analog converter, as well as the Bluetooth chipset. Any consumer-available application upgrades that are available are loaded directly to the CIP through the USB port.

The VIP provides an interface between the CIP and the vehicle. Its main functions are controlling the APIM power management and translating both inbound and outbound signals over the CAN . In addition, the VIP interrogates the modules on the network to retrieve any DTCs when a vehicle health report is requested.

The APIM can receive inputs from the following audio sources:

- USB port
- Audio input jack
- Bluetooth

The USB port can be used for connecting a media device (such as an iPodÂ®) with the device's available cable, or for directly plugging in a portable mass storage device (such as a "thumb drive"). When playing media files stored on a mass storage device, the SYNC system only plays files that do not have Digital Rights Management (DRM) protection. The USB port can also be used for uploading vehicle application upgrades.

The USB port is powered by the APIM , so no external power source is needed to power a device plugged into the USB port if the device supports this feature.

The audio input jack can be used for connecting a media device (such as an iPodÂ®) utilizing a 1/8-inch audio jack. When a device is connected through the audio input jack, only the speaker volume can be controlled by the ACM . All other functions (such as seek, fast forward, pause, etc.) must be carried out on the

device itself.

The Bluetooth interface can accommodate both Bluetooth-enabled mobile phones and Bluetooth-enabled media devices. Any Bluetooth device used with the SYNC system must first be paired with the system before it is operational.

Bluetooth is a secure, short-range radio frequency that allows devices to communicate wirelessly through radio waves. The operating range of a Bluetooth signal is a maximum of 32 feet.

Only one Bluetooth phone and one Bluetooth media device can be connected to the system at any one time. If an additional device of either type is paired with the system and made active, the APIM disconnects any active connection and establishes a connection with the new device.

It is important to understand that not all mobile phones have the same level of features when interacting with the SYNC system. For a list of compatible phones, refer to the SyncMyRide website .

In addition to audio information, metadata may also be sent to the APIM from a device plugged into the USB port. Metadata consists of information such as artist, album title, song title, and genre. The metadata is used by the APIM to create indexes that can be used to sort for particular music, based on customer preference. Not all USB devices can send metadata to the APIM ; also, no metadata is transferred when a device is connected through the audio input jack. When a new media device is connected to the SYNC system, the APIM automatically indexes the information. This may take several minutes (depending on the amount of data on the device), and is considered normal operation. When a device that was previously connected to the SYNC system is reconnected, the APIM updates the index (rather than creating a new one), which reduces the amount of time needed to index the device.

The APIM receives both stereo and mono sound inputs, and can also transmit both stereo and mono sound. The mono function is used to receive the microphone input. It is also used to send sound to the ACM for voice prompts, the Text-To-Speech (TTS) feature, ringtones, and any audio received through a connected mobile phone. The TTS feature speaks information so that it does not have to be read from the display.

The APIM communicates on the MS-CAN and High Speed Controller Area Network (HS-CAN). Communication with the scan tool is established through the HS-CAN .

Voice Recognition For Vehicles With Navigation And The SYNC System

When the audio system enters voice recognition mode, the ACM initially controls the voice recognition feature. The microphone is wired directly to the APIM , which relays the microphone input to the ACM through dedicated wiring. If the first command spoken is part of the ACM voice recognition set, the ACM retains control of the voice recognition and takes the appropriate action(s). If the first command spoken is part of the APIM voice recognition set, the ACM shuts off its own voice recognition and broadcasts a Controller Area Network (CAN) message to the APIM , transferring the voice recognition to the SYNC system and providing the voice command that was spoken. The ACM controls the voice engine for the base audio, navigation, and climate control systems. The APIM controls the voice engine for the SYNC system (USB port, audio input jack, Bluetooth).

AM/FM Antenna

The AM/FM antenna is located on the right front fender. The antenna mast receives radio waves and sends them to the ACM through the 2-piece AM/FM antenna cable.

Global Positioning System (GPS) Antenna

For vehicles equipped with navigation, the GPS antenna receives information from satellites. The compass

heading is also derived from the GPS signal. The vehicle utilizes a combination satellite radio/ GPS antenna.

Steering Wheel Controls

The steering wheel controls consist of a series of resistors. Each steering wheel control switch function corresponds with a specific resistance value within the switch. When a switch is pressed, the ACM (or the APIM) monitors the change in reference voltage to determine the requested function.

Family Entertainment System

When a video disc is inserted into the Rear Entertainment Module (RETM) and the PLAY button is pressed, an image is displayed on the screen and a stereo signal is transmitted to the ACM . The family entertainment system allows for single/dual-play mode. The RETM communicates via the MS-CAN .

Single-Play Mode

In single-play mode, any audio input routed through the RETM is broadcast through all of the vehicle speakers. These audio inputs include the RETM , SYNC system audio, and peripheral devices plugged into the RETM .

Dual-Play Mode

In dual-play mode, the ACM continues to control the output to the front speakers, while the RETM mutes the audio to the rear speakers. The RETM continues to broadcast the rear audio source to the headphones. When the headphones are set to channel A, all audio sources can be accessed. When the headphones are set to channel B, only the DVD audio and auxiliary audio sources (such as a gaming system) can be sent to the headphones.

Audio Input Jack

The audio input jack allows for a portable MP3 player to be connected to the vehicle audio system. When a portable MP3 player is connected, audio from the MP3 player can be played through the vehicle speakers.

Subwoofer

The Audiophile subwoofer and amplifier are integral. The enable/clip detection circuit carries out 2 functions: to turn the amplifier on, and to indicate to the ACM when the subwoofer output distortion signal reaches a damaging level. The ACM then clips the audio output signal to prevent damage to the subwoofer.

Noise Suppression Equipment

The radio frequency suppression equipment reduces interference transmitted through the speakers by the engine ignition and electrical systems. When installing any new radio suppression equipment components, make sure that a good contact is made at all connections.

Audio Signals

Stereo signals contain left and right channel information. They are used for most audio signals.

A mono signal is used for the microphone input to the APIM . The mono signal is also used for the voice prompts, the TTS feature, ringtones, and any audio received through a connected mobile phone. These audio signals are output from the APIM to the ACM . The mono output from the APIM utilizes separate circuits from the stereo output.

A digital signal is used to transmit data from a media device connected through the USB port to the APIM . The APIM then converts the signal to analog and relays the signal to the receiving module, which varies by vehicle configuration.

A wireless signal is used to broadcast audio signals from a Bluetooth media device to the APIM , which converts the wireless audio signal to analog and relays it to the ACM .

Network Communication

The following audio system components communicate via the MS-CAN :

- ACM
- Navigation ACM
- SDARS module
- RETM

There are numerous messages internal to the audio system. The functions of these messages include (but are not limited to):

- Changing the audio source
- Changing equalizer settings
- Updating the ACM display
- Dialing phone numbers from the ACM (if equipped with the SYNC system)

In addition, the following messages are utilized by the audio system in conjunction with systems outside of the audio system:

Audio System Message List

Message	Transmitting Module	Receiving Module(s)	Audio System Function
Accessory Delay Status	SJB	Navigation ACM RETM	When active, this signal allows the audio component to be operated after the vehicle is shut off.
eCall Notification	Restraints Control Module (RCM)	APIM	Provides the eCall status to the RCM . This message is also used to confirm that the APIM and RCM are both configured for the eCall feature.
eCall Status	APIM	RCM	Provides the eCall status to the APIM . This message is also used to confirm that the APIM and RCM are both configured for the eCall feature.
Ignition Switch Position	SJB	ACM RETM	Indicates the ignition position to the audio system modules in order to control power management.
Illumination Dimmer Level	SJB	ACM RETM	Controls the backlight intensity, based on the position of the dimmer switch.
Navigation Radio Rolling Wheel Count	IC	ACM	Provides for more accurate tracking of the vehicle position when the GPS signal is temporarily unavailable. This message only applies to vehicles

			with navigation.
Odometer Rolling Count	PCM	APIM	Provides the odometer reading to the APIM in order to initiate maintenance interval notifications. This message only applies to vehicles with SYNC V2.
Transmission Selector (PRNDL) Range	IC	ACM	For the navigation system, this signal is used for more accurate navigation tracking. For the parking assist system, this signal is used by the ACM to determine if it should enable the speaker mute feature if a parking aid tone sounds.
Vehicle Speed	IC	ACM	Used by the ACM for the speed-compensated volume function.
Volume Cutback	Parking Aid Module (PAM)	ACM	When this signal is active, the speaker output is reduced to allow the parking aid tone to be more easily heard.

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Audio Front Control Module (ACM) • AM/FM antenna • Satellite radio antenna • Rear Entertainment Module (RETM) • Noise suppression equipment	• Smart Junction Box (SJB) fuse(s): ♦ 3 (20A) (ACM hot at all times) ♦ 5 (5A) (auto-dimming interior mirror) ♦ 11 (5A) (ACM hot in START) ♦ 12 (5A) (ACM hot in RUN/ACC) • Battery Junction Box (BJB) fuse(s): ♦ 22 (20A) (subwoofer) ♦ 41 (15A) (Accessory Protocol Interface Module (APIM), RETM , Satellite Digital Audio Receiver System (SDARS) module) • Wiring, terminals or connectors

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).
5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM .

If the scan tool does not communicate with the VCM :

- Check the VCM connection to the vehicle.
- Check the scan tool connection to the VCM .
- Refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. **NOTE:** Do not press any buttons on the ACM while it is carrying out the self-test.

   Clear the continuous DTCs and carry out the self-test diagnostics for the ACM .

9. If the DTCs retrieved are related to the concern, go to DTC Charts. For all other DTCs, refer to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Charts.

Pinpoint Tests

Pinpoint Test A: Poor Reception â AM/FM

Normal Operation

The AM/FM radio antenna receives AM and FM radio waves. The antenna then sends the radio waves to the Audio Front Control Module (ACM) through the AM/FM antenna cable.

The noise suppression equipment reduces engine ignition and electrical systems interference transmitted through the speakers.

The RDS function allows the vehicle operator to choose which genre (category) of music to listen to. When the SCAN button is pressed, the ACM only stops at songs falling within the selected category. If no song in the selected category is found, the ACM continues to scan without stopping. This may appear to be a reception issue, but it is actually due to the customer setting.

- DTC B1A56:21 (Antenna: Signal Amplitude â © Minimum) â sets when the signal strength is less than the pre-configured threshold value during the ACM self-test. This DTC applies to vehicles with navigation only.
- DTC B2103 (Antenna Not Connected) â sets when the signal strength is less than the pre-configured threshold value during the ACM self-test. In order for this DTC to set, the ACM must be tuned to AM, and the self-test must be run with the scan tool. This DTC applies to vehicles without navigation only.

This pinpoint test is intended to diagnose the following:

- No song found in the selected category
- AM/FM antenna
- AM/FM antenna cable
- Charging system
- Ignition system
- Noise suppression equipment
- ACM

PINPOINT TEST A: POOR RECEPTION â AM/FM

Test Step	Result / Action to Take
A1 CHECK THE RDS SETTING	
• Turn the RDS function off. Refer to the Owner's Literature. • Scan for a good channel. • **Does the audio system find a good channel with normal reception?**	**Yes** The system is operating correctly. The concern was a result of no song being found in the selected category. **No** GO to A2 .
A2 CHECK THE AUDIO SYSTEM RECEPTION	
• Check the audio system reception with the engine running, and with the engine off. • **Does the poor reception only occur with the engine running?**	**Yes** GO to A3 . **No** GO to A7 .
A3 CHECK THE NOISE SUPPRESSION EQUIPMENT	
• Check all required noise suppression equipment and the radio frequency interference suppression bond for security, cleanliness, and	**Yes** GO to A4 . **No** CLEAN and SECURE the antenna connections, or

metal-to-metal contact. • **Are the connections clean, secure, and in metal-to-metal contact?**	INSTALL new noise suppression equipment as needed. TEST the system for normal operation.
A4 CHECK THE RADIO INTERFERENCE CAPACITOR	
• Install a new radio interference capacitor. • Start the vehicle. • Operate the audio system in radio tuner (AM/FM) mode. • **Is the reception OK?**	**Yes** The cause of the concern was an inoperative radio interference capacitor. The system is now operating correctly. **No** GO to A5 .
A5 CHECK THE GENERATOR	
• Ignition OFF. • Disconnect: Generator C102a. • Start the engine. • Operate the audio system in radio tuner (AM/FM) mode. • **Is the reception OK?**	**Yes** INSTALL a new generator. REFER to Section 414-00 . TEST the system for normal operation. **No** GO to A6 .
A6 CHECK THE IGNITION CIRCUITS	
• Ignition OFF. • Connect: Generator C102a. • Check the ignition circuits for correct routing, grounding, and integrity of the connections. • **Are the ignition components OK?**	**Yes** USE a jumper cable to ground various parts of the vehicle to the frame (for example: engine, fenders, quarter panels, stone deflectors, air cleaner, body sheet metal). When the noise is eliminated, PROVIDE a permanent ground where necessary. TEST the system for normal operation. **No** REPAIR the ignition system as necessary. TEST the system for normal operation.
A7 CHECK THE AM/FM ANTENNA CABLE	
• Ignition OFF. • Disconnect: AM/FM Antenna Cable-to-AM/FM Antenna Connection. • Disconnect: AM/FM Antenna Cable At ACM . • Measure the resistance of the AM/FM antenna cable between the ACM and the rear AM/FM antenna cable; and between the front AM/FM antenna cable core and shield. • **Is the resistance of the AM/FM antenna cable core less than 2 ohms, and the resistance between the core and shield of the AM/FM antenna cable greater than 10,000 ohms?**	**Yes** GO to A8 . **No** INSTALL a new AM/FM antenna cable. REFER to Antenna Lead-In Cable in this section. TEST the system for normal operation.
A8 ISOLATE THE AM/FM ANTENNA	

• Connect: AM/FM Antenna Cable At ACM . • Install a new AM/FM antenna. Refer to Antenna â AM/FM in this section. • Operate the audio system in radio tuner (AM/FM) mode. • **Is the reception OK?**	**Yes** The cause of the concern was an inoperative AM/FM antenna. The system is now operating correctly. **No** GO to A9 .
A9 ISOLATE THE AM/FM ANTENNA CABLE	
• Ignition OFF. • Install a new AM/FM antenna cable. Refer to Antenna Lead-In Cable in this section. • Operate the audio system in radio tuner (AM/FM) mode. • **Is the reception OK?**	**Yes** The cause of the concern was an inoperative antenna cable. The system is now operating correctly. **No** GO to A10 .
A10 CHECK FOR CORRECT ACM OPERATION	
• Disconnect all the ACM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the ACM connectors and make sure they seat correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ACM . REFER to Audio Control Module (ACM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test B: Poor Reception/Poor Sound Quality/No Sound â Satellite Radio

Normal Operation â Vehicles Without Navigation

Digital signals are received by the satellite radio antenna and sent to the Satellite Digital Audio Receiver System (SDARS) module, which converts the signals and provides audio signals to the Audio Front Control Module (ACM) (vehicles without the SYNC system) or to the Accessory Protocol Interface Module (APIM) (vehicle with the SYNC system). For vehicles equipped with a family entertainment system, the audio signals first route through the Rear Entertainment Module (RETM), then to the appropriate receiving module.

Vehicles With Navigation

Digital signals are received by the satellite radio antenna and sent directly to the ACM , as the satellite radio receiver is built-in to the ACM .

A short to ground in the satellite radio antenna typically has no effect on the antenna signal; however, an open in the antenna circuit results in no sound from the satellite radio system. A short to voltage in the antenna circuit can have varying effects on the system.

DTC Description	Fault Trigger Conditions
• B1031 â SDARS Satellite Antenna Open	Set by the SDARS module when an open or high resistance is detected in the satellite antenna circuit. This DTC can be either continuous or on-demand, and applies to vehicles without navigation only.
• B1032 â SDARS Satellite Antenna Short	Set by the SDARS module when a short to ground or short to voltage is detected in the satellite antenna circuit. This DTC can be either continuous or on-demand, and applies to vehicles without navigation only.
• B1A89:01 â Satellite Antenna: General Electrical Failure	Set by the ACM when any fault is detected in the satellite radio antenna circuit. This DTC can be either continuous or on-demand, and applies to vehicles with navigation only.
• B1A89:13 â Satellite Antenna: Circuit Open	Set by the ACM when an open is detected in the satellite antenna circuit. This DTC can be either continuous or on-demand, and applies to vehicles with navigation only.

This pinpoint test is intended to diagnose the following:

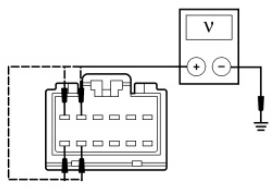
- Obstructions to the line of sight
- No song found in the selected category
- Antenna
- Satellite radio antenna cable
- Wiring, terminals or connectors
- SDARS module (vehicles without navigation)
- ACM (vehicles with navigation)

PINPOINT TEST B: POOR RECEPTION/POOR SOUND QUALITY/NO SOUND â SATELLITE AUDIO

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
B1 CHECK FOR A SATELLITE ANTENNA FAULT MESSAGE	
• Operate the audio system in satellite radio mode and observe the audio system display. • **Does the display indicate a satellite radio antenna fault?**	**Yes** GO to B2 . **No** GO to B4 .
B2 CHECK THE SATELLITE RADIO ANTENNA CABLE RESISTANCE	
• Ignition OFF. • Disconnect: Satellite Radio Antenna Connection At SDARS Module (or ACM). • Disconnect: Satellite Radio Antenna Cable In-Line Connection At RH Kick Panel (Vehicles Without Navigation).	**Yes** GO to B3 . **No** INSTALL a new satellite radio antenna cable, as necessary. REFER to Antenna Cable â Satellite Radio in this section.

• Disconnect: Satellite Radio Antenna Connection At Satellite Radio Antenna. • Measure the resistance of the upper satellite radio antenna cable core between the SDARS module (vehicles without navigation) or the in-line connection (vehicles with navigation) and the satellite radio antenna connection. • Measure the resistance of the lower satellite radio antenna cable core between the ACM and the in-line connection (vehicles with navigation). • Measure the resistance of each satellite radio antenna cable between the core and the shield of the antenna cable. • **Is the resistance of each satellite radio antenna cable core less than 2 ohms, and the resistance between the core and shield of each satellite radio antenna cable greater than 10,000 ohms?**	CLEAR any DTCs present. TEST the system for normal operation.
B3 ISOLATE THE SATELLITE RADIO ANTENNA	
• Install a new satellite radio antenna. Refer to Antenna â Satellite Radio in this section. • Operate the audio system in satellite radio mode. • **Is the reception OK?**	**Yes** The concern was caused by an inoperative satellite radio antenna. The system is operating correctly at this time. **No** For vehicles without navigation, GO to B16 . For vehicles with navigation, GO to B19 .
B4 CHECK THE CATEGORY FILTER SETTING	
• Turn the category filter function off. For additional information, refer to the Owner's Literature. • Scan for a good channel. • **Does the satellite radio system find a good channel with normal reception?**	**Yes** The system is operating correctly at this time. The concern was a result of no song being found in the selected category. **No** GO to B5 .
B5 CHECK THE OPERATION OF THE SATELLITE AUDIO	
• Drive the vehicle to an open location, free of obstacles. • Operate the audio system in satellite radio mode. • **Is the reception/sound quality OK?**	**Yes** The system is OK at this time. ADVISE the customer that the satellite signal can be affected by obstructions to the satellite antenna line of sight. **No** For vehicles without navigation, GO to B6 . For vehicles with navigation, GO to B19 .
B6 DETERMINE THE VEHICLE CONTENT	



<table>
<tr><td>• Determine if the vehicle is equipped with the SYNC system and/or the family entertainment system.
• Is the vehicle equipped with the SYNC system and/or the family entertainment system?</td><td>Yes
For vehicles equipped with only the family entertainment system, GO to B12 .

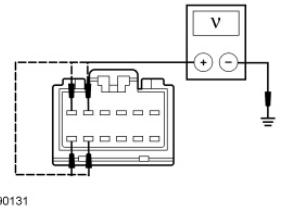
For vehicles equipped with the SYNC system (with or without the family entertainment system), GO to B7 .

No
GO to B10 .</td></tr>
<tr><td>B7 CHECK THE SYNC SYSTEM OR FAMILY ENTERTAINMENT SYSTEM AUDIO</td><td></td></tr>
<tr><td>• For vehicles without a family entertainment system, using the Multi-Media Interface Tester, test the audio output for the audio input jack, USB port, and Bluetooth connection.
• For vehicles with a family entertainment system, insert a known good DVD and operate the audio system in family entertainment system mode.
• Do the SYNC system and/or family entertainment system audio sources operate correctly?</td><td>Yes
GO to B8 .

No
For vehicles without a family entertainment system, GO to Pinpoint Test U .

For vehicles with a family entertainment system, GO to Pinpoint Test G .</td></tr>
<tr><td>B8 CHECK THE AUDIO CIRCUITS TO THE APIM FOR A SHORT TO VOLTAGE</td><td></td></tr>
<tr><td>• Ignition OFF.
• Disconnect: SDARS Module C3290.
• Disconnect: APIM C3342.
• Ignition ON.
• Measure the voltage between the SDARS module, harness side and ground as follows:

<table><tr><th>Positive Meter Lead</th><th>Negative Meter Lead</th></tr><tr><td>C3290-5</td><td>VME41 (GN/OG)</td></tr><tr><td>C3290-11</td><td>RME41 (BU/BN)</td></tr><tr><td>C3290-6</td><td>VME42 (VT/BN)</td></tr><tr><td>C3290-12</td><td>RME42 (YE/BU)</td></tr></table>
 



N0090131</td><td>Yes
REPAIR the circuit in question. TEST the system for normal operation.

No
GO to B9 .</td></tr>
</table>

• **Is any voltage present?**	
B9 CHECK THE AUDIO CIRCUITS TO THE APIM FOR AN OPEN OR SHORT TO GROUND	
• Ignition OFF. • Measure the resistance between the SDARS module, harness side and the APIM , harness side; and between the SDARS module, harness side and ground as follows: • **Is the resistance less than 5 ohms between the SDARS module and the APIM , and greater than 10,000 ohms between the SDARS module and ground?**	**Yes** GO to B14 . **No** REPAIR the circuit in question. TEST the system for normal operation.
B10 CHECK THE AUDIO CIRCUITS TO THE ACM FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: SDARS Module C3290. • Disconnect: ACM C290b. • Ignition ON. • Measure the voltage between the SDARS module, harness side and ground as follows:	**Yes** REPAIR the circuit in question. TEST the system for normal operation. **No** GO to B11 .

Positive Meter Lead	Negative Meter Lead	Circuit
C3290-5	C3342-10, then ground	VME41 (GN/OG)
C3290-11	C3342-11, then ground	RME41 (BU/BN)
C3290-6	C3342-7, then ground	VME42 (VT/BN)
C3290-12	C3342-8, then ground	RME42 (YE/BU)

Positive Meter Lead	Negative Meter Lead
C3290-5	VME41 (GN/OG)
C3290-11	RME41 (BU/BN)
C3290-6	VME42 (VT/BN)
C3290-12	RME42 (YE/BU)

- **Is any voltage present?**

B11 CHECK THE AUDIO CIRCUITS TO THE ACM FOR AN OPEN OR SHORT TO GROUND

- Ignition OFF.
- Measure the resistance between the SDARS module, harness side and the ACM , harness side; and between the SDARS module, harness side and ground as follows:

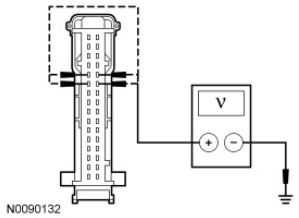
Positive Meter Lead	Negative Meter Lead	Circuit
C3290-5	C290b-1, then ground	VME41 (GN/OG)/ VME17 (GN) (at ACM)
C3290-11	C290b-2, then ground	RME41 (BU/BN)/ RME17 (GY) (at ACM)
C3290-6	C290b-9, then ground	VME42 (VT/BN)/ VME18 (VT) (at ACM)
C3290-12	C290b-10, then ground	RME42 (YE/BU)/ RME18 (YE) (at ACM)

- **Is the resistance less than 5 ohms between the SDARS module and the ACM , and greater than 10,000 ohms between the SDARS module and ground?**

Yes
GO to B16 .

No
REPAIR the circuit in question. TEST the system for normal operation.

B12 CHECK THE AUDIO CIRCUITS TO THE RETM FOR A SHORT TO VOLTAGE



- Ignition OFF.
- Disconnect: SDARS Module C3290 (If Connected).
- Disconnect: RETM C9029.
- Ignition ON.
- Measure the voltage between the RETM , harness side and ground as follows:

Positive Meter Lead	Negative Meter Lead
C9029-5	VME58 (YE/VT)
C9029-6	RME58 (BN/BU)

Yes
REPAIR the circuit in question. TEST the system for normal operation.

No
GO to B13 .

C9029-21	VME59 (YE/OG)
C9029-22	RME59 (WH/GN)

- **Is any voltage present?**

B13 CHECK THE AUDIO CIRCUITS TO THE RETM FOR AN OPEN OR SHORT TO GROUND

- Ignition OFF.
- Measure the resistance between the RETM , harness side and the SDARS module, harness side; and between the RETM , harness side and ground as follows:

Positive Meter Lead	Negative Meter Lead	Circuit
C9029-5	C3290-5, then ground	VME58 (YE/VT)/ VME41 (GN/OG) (at SDARS module)
C9029-6	C3290-11, then ground	RME58 (BN/BU)/ RME41 (BU/BN) (at SDARS module)
C9029-21	C3290-6, then ground	VME59 (YE/OG)/ VME42 (VT/BN) (at SDARS module)
C9029-22	C3290-12, then ground	RME59 (WH/GN)/ RME42 (YE/BU) (at SDARS module)

- **Is the resistance less than 5 ohms between the RETM and the SDARS module, and greater than 10,000 ohms between the RETM and ground?**

Yes
GO to B15 .

No
REPAIR the circuit in question. TEST the system for normal operation.

B14 ISOLATE THE APIM

- Ignition OFF.
- Connect: SDARS Module C3290.
- Connect: ACM C290b.
- Connect: RETM C9029 (If Equipped).
- Connect fused jumper wires between the APIM pins as follows:

Yes
REMOVE the jumper wires. GO to B17 .

No
REMOVE the jumper wires.

	If the vehicle is equipped with a family entertainment system GO to B15 . Otherwise, GO to B16 .

APIM Connector-Pin/Circuit	APIM Connector-Pin/Circuit
C3342-7 VME42 (VT/BN)	C3342-23 VME53 (VT/GN)
C3342-8 RME42 (YE/BU)	C3342-24 RME53 (BN/WH)
C3342-10 VME41 (GN/OG)	C3342-25 VME52 (BU)
C3342-11 RME41 (BU/BN)	C3342-26 RME52 (GY/OG)

- Operate the audio system in satellite radio mode.
- **Does the satellite radio audio operate correctly?**

B15 ISOLATE THE RETM

- Ignition OFF.
- Connect: SDARS Module C3290 (If Disconnected).
- Connect: ACM C290b (If Disconnected).
- Connect: APIM C3342 (If Disconnected).
- Disconnect: RETM C9029 (If Connected).
- Connect fused jumper wires between the RETM pins as follows:

Yes
REMOVE the jumper wires. GO to B18 .

No
REMOVE the jumper wires. GO to B16 .

RETM Connector-Pin/Circuit	RETM Connector-Pin/Circuit
C9029-5 VME58 (YE/VT)	C9029-10 VME17 (GN)
C9029-6 RME58 (BN/BU)	C9029-9 RME17 (GY)
C9029-21 VME59 (YE/OG)	C9029-26 VME18 (VT)
C9029-22 RME49 (WH/GN)	C9029-25 RME18 (YE)

- Operate the audio system in satellite radio mode.
- **Does the satellite radio audio operate correctly?**

B16 CHECK FOR CORRECT SDARS MODULE OPERATION	
• Connect: All Disconnected Connectors. • Disconnect the SDARS module connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the SDARS module connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SDARS module. REFER to Satellite Digital Audio Receiver System (SDARS) Module in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.
B17 CHECK FOR CORRECT APIM OPERATION	
• Connect: All Disconnected Connectors. • Disconnect the APIM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the APIM connector and make sure it seats correctly. • Wait 2 minutes for the APIM to re-initalize. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new APIM . REFER to Accessory Protocol Interface Module (APIM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.
B18 CHECK FOR CORRECT RETM OPERATION	
• Connect: All Disconnected Connectors. • Disconnect the RETM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the RETM connector and make sure it seats correctly. • **Is the concern still present?**	**Yes** INSTALL a new RETM . REFER to Rear Entertainment Module (RETM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.
B19 CHECK FOR CORRECT ACM OPERATION	
• Connect: All Disconnected Connectors. • Ignition OFF. • Disconnect all the ACM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the ACM connectors and make sure they seat correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ACM . REFER to Audio Control Module (ACM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test C: Poor Quality/Distorted/No Sound From One Or More Speakers (Not All Speakers) â Except Audiophile

Refer to Wiring Diagrams Cell 130 , Audio System/Navigation for schematic and connector information.

Refer to Wiring Diagrams Cell 132 , Video System for schematic and connector information.

Normal Operation

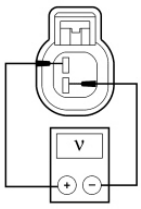
The Audio Front Control Module (ACM) directs audio signals to the speakers in the form of an AC voltage. The ACM provides internal circuit protection for shorts to ground or shorts to voltage.

If the vehicle is equipped with the family entertainment system, the rear channel audio signals from the ACM route to the Rear Entertainment Module (RETM), then to the speakers. In dual-play mode, the RETM mutes the rear speaker output. Make sure the audio system is in single-play mode before diagnosing a rear speaker concern.

A short to ground or short to voltage in the circuitry to one of the speakers may cause multiple speakers to lose sound due to the built-in overload protection feature of the ACM . In this case, a speaker fault DTC will set, and this pinpoint test should be followed to isolate the damaged circuit.

- DTC B2965 (Audio System Speaker Circuit Fault) â sets when an open, short to ground, or short to voltage is detected on any of the speaker circuits. If the ACM activates the built-in overload protection, DTC B1342 may also be set. The cause of DTC B2965 must be repaired before DTC B1342 can be cleared.

This pinpoint test is intended to diagnose the following:



- Wiring, terminals or connectors
- Speaker
- ACM
- RETM (if equipped)

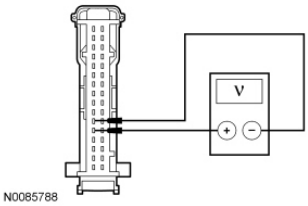
PINPOINT TEST C: POOR QUALITY/DISTORTED/NO SOUND FROM ONE OR MORE SPEAKERS (NOT ALL SPEAKERS)

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
C1 CHECK THE AUDIO SIGNALS TO THE SUSPECT SPEAKER	
• Ignition OFF. • Disconnect: Suspect Speaker. • Operate the audio system in radio tuner (AM/FM), single-play mode. • Measure the AC voltage between the suspect speaker pin 1 and pin 2, harness side as follows:	**Yes** INSTALL a new speaker for the suspect speaker. REFER to Speaker â Door in this section. CLEAR any DTCs present. TEST the system for normal operation.

Suspect Speaker	Positive Meter Lead	Negative Meter Lead
LH front	C523-1 VME07 (WH)	C523-2 RME07 (WH/BN)
RH front	C612-1 VME10 (WH/VT)	C612-2 RME10 (WH/OG)
LH rear	C702-1 VME09 (WH/GN)	C702-2 RME09 (BN/YE)
RH rear	C802-1 VME12 (BN/WH)	C802-2 RME12 (BN/BU)

N0085779



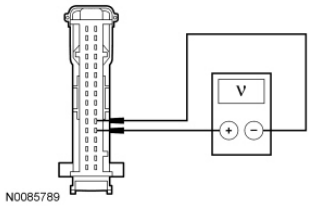
- **Is a fluctuating AC voltage present?**

No
If the vehicle is equipped with the family entertainment system and the concern is with a rear speaker, GO to C2 .

Otherwise, GO to C5 .

C2 CHECK THE AUDIO SIGNALS TO THE RETM

- Ignition OFF.
- Disconnect: RETM C9029.
- Operate the audio system in radio tuner (AM/FM), single-play mode.
- Measure the AC voltage between the RETM C9029-11, circuit VME12 (BN/WH), harness side and the RETM C9029-12, circuit RME12 (BN/BU), harness side.

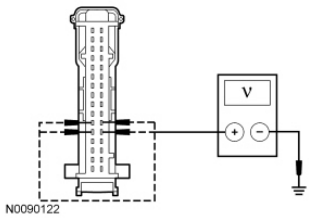


N0085788

- Measure the AC voltage between the RETM C9029-27, circuit VME09 (WH/GN), harness side and the RETM C9029-28, circuit RME09 (BN/YE), harness side.

Yes
GO to C5 .

No
GO to C3 .



- **Is a fluctuating AC voltage present?**

C3 CHECK THE AUDIO CIRCUITS TO THE RETM FOR A SHORT TO VOLTAGE

- Ignition OFF.
- Disconnect: ACM C290a.
- Ignition ON.
- Measure the voltage between the RETM , harness side and ground as follows:

Positive Meter Lead	Negative Meter Lead
C9029-11 VME12 (BN/WH)	Ground
C9029-12 RME12 (BN/BU)	Ground
C9029-27 VME09 (WH/GN)	Ground
C9029-28 RME09 (BN/YE)	Ground

- **Is any voltage present?**

Yes
REPAIR the circuit in question.
CLEAR any DTCs present.
TEST the system for normal operation.

No
GO to C4 .

C4 CHECK THE AUDIO CIRCUITS TO THE RETM FOR AN OPEN OR SHORT TO GROUND

- Ignition OFF.
- Measure the resistance between the RETM , harness side and the ACM , harness side; and between the RETM , harness side and ground as follows:

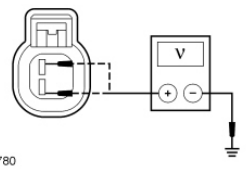
Yes
GO to C7 .

No
REPAIR the circuit in question.
CLEAR any DTCs present.
TEST the system for normal

operation.

Positive Meter Lead	Negative Meter Lead	Circuit
C9029-11	C290a-10, then ground	VME12 (BN/WH)
C9029-12	C290a-23, then ground	RME12 (BN/BU)
C9029-27	C290a-9, then ground	VME09 (WH/GN)
C9029-28	C290a-22, then ground	RME09 (BN/YE)

- **Are the resistances less than 5 ohms between the RETM and the ACM , and greater than 10,000 ohms between the RETM and ground?**



C5 CHECK THE CIRCUITS TO THE SUSPECT SPEAKER FOR A SHORT TO VOLTAGE

- Ignition OFF.
- Disconnect: ACM C290a.
- Ignition ON.
- Measure the voltage between the suspect speaker, harness side and ground as follows:

Yes
REPAIR the circuit in question.
CLEAR any DTCs present.
TEST the system for normal operation.

No
GO to C6 .

Suspect Speaker	Positive Meter Lead	Negative Meter Lead
LH front	C523-1	VME07 (WH)
	C523-2	RME07 (WH/BN)
RH front	C612-1	VME10 (WH/VT)
	C612-2	RME10 (WH/OG)
LH rear	C702-1	VME09 (WH/GN)
	C702-2	RME09 (BN/YE)
RH rear	C802-1	VME12 (BN/WH)
	C802-2	RME12 (BN/BU)

- **Is any voltage present?**

C6 CHECK THE CIRCUITS TO THE SUSPECT SPEAKER FOR AN OPEN OR SHORT TO GROUND	
• Ignition OFF. • Measure the resistance between the ACM (or RETM), harness side and the suspect speaker, harness side; and between the ACM (or RETM), harness side and ground as follows: • **Is the resistance less than 5 ohms between the ACM (or RETM) and the suspect speaker, and greater than 10,000 ohms between the ACM (or RETM) and ground?**	**Yes** If the vehicle is equipped with the family entertainment system, GO to C8 . Otherwise, GO to C7 . **No** REPAIR the circuit in question. CLEAR any DTCs present. TEST the system for normal operation.

Suspect Speaker	Positive Meter Lead	Negative Meter Lead	Circuit
LH front	C290a-8	C523-1, then ground	VME07 (WH)
	C290a-21	C523-2, then ground	RME07 (WH/BN)
RH front	C290a-11	C612-1, then ground	VME10 (WH/VT)
	C290a-12	C612-2, then ground	RME10 (WH/OG)
LH rear	C290a-9 or C9029-30	C702-1, then ground	VME09 (WH/GN)
	C290a-22 or C9029-29	C702-2, then ground	RME09 (BN/YE)
RH rear	C290a-10 or C9029-14	C802-1, then ground	VME12 (BN/WH)
	C290a-23 or C9029-13	C802-2, then ground	RME12 (BN/BU)

C7 CHECK FOR CORRECT ACM OPERATION	
• Ignition OFF. • Connect: All Disconnected Connectors. • Disconnect all the ACM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the ACM connectors and make sure they seat correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ACM . REFER to Audio Control Module (ACM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR any DTCs present.
C8 CHECK FOR CORRECT RETM OPERATION	
• Ignition OFF.	**Yes** INSTALL a new RETM .

• Connect: All Disconnected Connectors. • Disconnect the RETM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the RETM connector and make sure it seats correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	REFER to Rear Entertainment Module (RETM) in this section. CLEAR any ACM DTCs present. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR any ACM DTCs present.

Pinpoint Test D: The Subwoofer is Inoperative/Does Not Operate Correctly

Refer to Wiring Diagrams Cell 130 , Audio System/Navigation for schematic and connector information.

Normal Operation

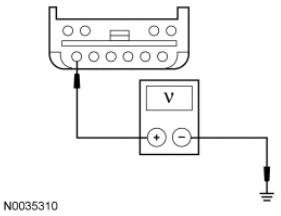
To enable the subwoofer amplifier, the Audio Front Control Module (ACM) sends voltage through the enable/clip circuit. The circuit acts as both an output (to enable the amplifier) and an input (to detect an amplifier overload condition). The voltage sent by the ACM passes through a variable resistor in the subwoofer amplifier, then to ground. As the amplifier reaches maximum output, the resistance in the variable resistor decreases. This decreases the voltage drop, resulting in the ACM detecting a higher voltage on the enable/clip circuit. When the voltage reaches the clip threshold, the ACM clips the audio output signal to the amplifier (heard as distortion), in order to prevent damage to the amplifier and speakers.

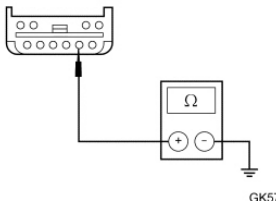
The enable/clip status is based on the following voltages, as detected by the ACM :

- Less then 0.4 volt: amplifier disabled
- Between 3.8 and 6.7 volts: amplifier enabled
- Greater than 8.5 volts: amplifier clipped

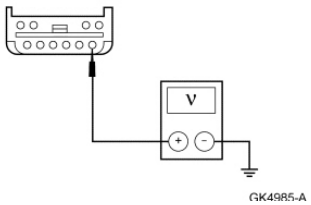
An open in the enable/clip circuit causes the subwoofer to produce no sound because the enable signal does not reach the subwoofer amplifier. A short to ground or short to voltage can cause severe distortion to be heard in the subwoofer.

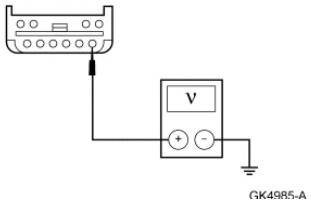
The subwoofer amplifier and subwoofer speaker are integral to the enclosure and cannot be serviced separately.

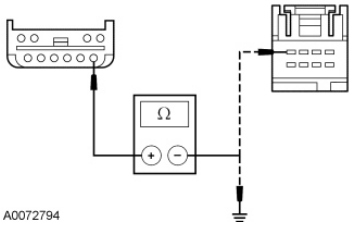




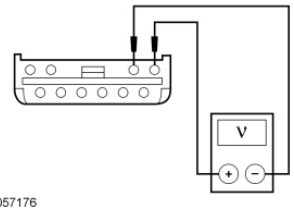
DTC B1A05:01 (Speaker #5: General Electrical Failure) â sets on-demand when a failure is detected on the audio signal circuitry to the subwoofer. This DTC applies to vehicles with navigation only.

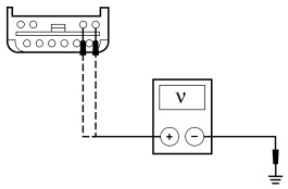






This pinpoint test is intended to diagnose the following:





- Fuse
- Wiring, terminals or connectors
- Subwoofer
- ACM

PINPOINT TEST D: THE SUBWOOFER IS INOPERATIVE/DOES NOT OPERATE CORRECTLY

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
D1 CHECK THE SUBWOOFER VOLTAGE SUPPLY	
• Ignition OFF. • Disconnect: Subwoofer C466 (Explorer, Mountaineer) or C3041 (Explorer Sport Trac). • Measure the voltage between the subwoofer C466-6 (Explorer, Mountaineer) or C3041-6 (Explorer Sport Trac), circuit SBB22 (BN/RD), harness side and ground.  N0035310 • **Is the voltage greater than 10 volts?**	**Yes** GO to D2 . **No** VERIFY the Battery Junction Box (BJB) fuse 22 (20A) is OK. If OK, REPAIR the circuit. TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short.
D2 CHECK THE SUBWOOFER GROUND CIRCUIT FOR CONTINUITY	
• Measure the resistance between the subwoofer C466-2 (Explorer, Mountaineer) or C3041-2 (Explorer Sport Trac), circuit GD114 (BK/BU), harness side and ground.  GK5794-A • **Is the resistance less than 5 ohms?**	**Yes** GO to D3 . **No** REPAIR the circuit. TEST the system for normal operation.
D3 CHECK THE SUBWOOFER ENABLE CIRCUIT FOR CORRECT VOLTAGE	
• Operate the audio system in radio tuner (AM/FM) mode. • Measure the voltage between the subwoofer C466-1 (Explorer, Mountaineer) or C3041-1 (Explorer Sport Trac), circuit SME23 (VT/RD), harness side and ground.	**Yes** GO to D6 . **No** GO to D4 .

 • **Is the voltage between 3.8 and 6.7 volts?**	
D4 CHECK THE SUBWOOFER ENABLE CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: ACM C290c. • Disconnect: Subwoofer C466 (Explorer, Mountaineer) or C3041 (Explorer Sport Trac). • Ignition ON. • Measure the voltage between the subwoofer C466-1 (Explorer, Mountaineer) or C3041-1 (Explorer Sport Trac), circuit SME23 (VT/RD), harness side and ground.  • **Is any voltage present?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to D5 .
D5 CHECK CIRCUIT SME23 (VT/RD) FOR AN OPEN OR SHORT TO GROUND	
• Ignition OFF. • Measure the resistance between the subwoofer C466-1 (Explorer, Mountaineer) or C3041-1 (Explorer Sport Trac), circuit SME23 (VT/RD), harness side and the ACM C290c-4, circuit SME23 (VT/RD), harness side; and between the subwoofer C466-1 (Explorer, Mountaineer) or C3041-1 (Explorer Sport Trac), circuit SME23 (VT/RD), harness side and ground.  • **Is the resistance less than 5 ohms between the subwoofer and the ACM , and greater than 10,000 ohms between the subwoofer and ground?**	**Yes** GO to D9 . **No** REPAIR the circuit. TEST the system for normal operation.
D6 CHECK THE AUDIO SIGNAL TO THE SUBWOOFER	

• Operate the audio system in radio tuner (AM/FM) mode. • Measure the AC voltage between the subwoofer C466-7 (Explorer, Mountaineer) or C3041-7 (Explorer Sport Trac), circuit VME22 (VT/GN), harness side and the subwoofer C466-8 (Explorer, Mountaineer) or C3041-8 (Explorer Sport Trac), circuit RME22 (GN/WH), harness side.  A0057176 • **Is a fluctuating AC voltage present?**	**Yes** INSTALL a new subwoofer. REFER to Subwoofer Speaker â Explorer, Mountaineer or Subwoofer Speaker â Explorer Sport Trac in this section. TEST the system for normal operation. **No** GO to D7 .
D7 CHECK THE AUDIO CIRCUITS FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: ACM C290c. • Ignition ON. • Measure the voltage between the subwoofer C466-7 (Explorer, Mountaineer) or C3041-7 (Explorer Sport Trac), circuit VME22 (VT/GN), harness side and ground; and between the subwoofer C466-8 (Explorer, Mountaineer) or C3041-8 (Explorer Sport Trac), circuit RME22 (GN/WH), harness side and ground.  N0035293 • **Is any voltage present?**	**Yes** REPAIR the circuit in question. TEST the system for normal operation. **No** GO to D8 .
D8 CHECK THE AUDIO CIRCUITS FOR AN OPEN OR SHORT TO GROUND	
• Ignition OFF. • Measure the resistance between the subwoofer, harness side and the ACM , harness side; and between the subwoofer, harness side and ground as follows:	**Yes** GO to D9 . **No** REPAIR the circuit in question. TEST the system for normal operation.

Positive Meter Lead	Negative Meter Lead	Circuit
	C290c-1	

C466-7 (Explorer, Mountaineer) C3041-7 (Explorer Sport Trac)		VME22 (VT/GN)
C466-8 (Explorer, Mountaineer) C3041-8 (Explorer Sport Trac)	C290c-2	RME22 (GN/WH)

- **Is the resistance less than 5 ohms between the subwoofer and the ACM , and greater than 10,000 ohms between the subwoofer and ground?**

D9 CHECK FOR CORRECT ACM OPERATION	
• Ignition OFF. • Connect: All Disconnected Connectors. • Disconnect all the ACM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the ACM connectors and make sure they seat correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ACM . REFER to Audio Control Module (ACM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test E: The Audio Does Not Reduce When The Parking Aid Tone Sounds

Normal Operation

The Parking Aid Module (PAM) sends the volume cutback message to the Audio Front Control Module (ACM) via the Medium Speed Controller Area Network (MS-CAN). When the PAM sounds the parking aid tone, it sends an enabled message to the ACM . When the ACM receives this message, it reduces the speaker output so that the parking aid tone can be heard more clearly.

- DTC U0159 (Lost Communication With Parking Assist Control Module (PAM)) â set by the non-navigation ACM when the volume cutback message is missing for greater than 5 seconds. When the message is missing, the ACM defaults to no volume cutback when the parking aid tone is sounding.

- DTC U0159:00 (Lost Communication With Parking Assist Control Module "A": No Sub Type Information) â set by the navigation ACM when the volume cutback message is missing for greater than 5 seconds. When the message is missing, the ACM defaults to no volume cutback when the parking aid tone is sounding.

This pinpoint test is intended to diagnose the following:

- Parking aid system concern
- ACM

PINPOINT TEST E: THE AUDIO DOES NOT REDUCE WHEN THE PARKING AID TONE SOUNDS

Test Step	Result / Action to Take
E1 CHECK THE PARKING AID SIGNAL	
• Apply the parking brake. • Place an object behind the vehicle within the range of the parking aid sensors. Refer to Section 413-13 . • Ignition ON. • Place the transmission in REVERSE (R). • Enter the following diagnostic mode on the scan tool: ACM DataLogger. • Monitor the parking aid input status PID (RPA_STAT) while the parking aid tone is sounding. • **Does the PID read "Enabled" while the parking aid tone is sounding?**	**Yes** GO to E2 . **No** REFER to Section 413-13 to continue diagnosis of the parking aid system.
E2 CHECK FOR CORRECT ACM OPERATION	
• Disconnect all the ACM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the ACM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ACM . REFER to Audio Control Module (ACM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test F: The Steering Wheel Controls Are Inoperative/Do Not Operate Correctly

Refer to Wiring Diagrams Cell 130 , Audio/Navigation for schematic and connector information.

Normal Operation

There are 4 different steering wheel controls configurations:

- Non-navigation, without the SYNC system
  - ♦ VOL-, VOL+, SEEK-, SEEK+, MEDIA
  - ♦ All switches are wired to the Audio Control Module (ACM).
- Non-navigation, with the SYNC system
  - ♦ VOL-, VOL+, SEEK-, SEEK+, VOICE, MEDIA, PHONE, OK
  - ♦ The VOL-, VOL+, SEEK-, and SEEK+ switches are wired to the ACM. The remaining switches are wired to the Accessory Protocol Interface Module (APIM).
- Navigation, without the SYNC system
  - ♦ VOL-, VOL+, SEEK-, SEEK+, VOICE, MEDIA
  - ♦ All switches are wired to the ACM.
- Navigation, with the SYNC system
  - ♦ VOL-, VOL+, SEEK-, SEEK+, VOICE, MEDIA, PHONE

- All switches are wired to the ACM.

Voltage is sent from the APIM (or ACM) to the steering wheel controls, and the same module grounds the return circuit. The VOL-, VOL+, SEEK- and SEEK+ switches share signal and return circuits, while the VOICE, MEDIA, PHONE and OK switches share separate signal and return circuits.

For all configurations, when a switch is pressed, the voltage is routed through a specific resistor value for each function. The ACM (or APIM) then uses the reference voltage to determine which control input function has been selected.

DTC Description	Fault Trigger Conditions
• B1117 â Audio Steering Wheel Button Stuck (ACM)	Set by the non-navigation ACM when a steering wheel control switch is detected as active for more than 120 seconds during normal operation, or for any duration during the self-test. A short to ground in the signal return circuit should not set this DTC.
• B1117 â Audio Steering Wheel Button Stuck (APIM)	Set by the APIM (V1) when a steering wheel control switch is detected as active for more than 120 seconds during normal operation, or for any duration during the self-test. A short to ground in the signal return circuit should not set this DTC, as the reference voltage would fall out-of-range, resulting in DTC B1136 being set.
• B1136 â Audio Steering Wheel Switch #2 Circuit Failure	Set by the APIM (V1) when a steering wheel control voltage is out-of-range. This can be caused by any failure except a stuck button, which would result in DTC B1117 being set.
• B11BA:1C â Steering Wheel Audio Switch Pack: Circuit Voltage Out of Range	Set by the navigation ACM when the reference voltage to the steering wheel controls is out-of-range. This can be caused by a number of different failures on the steering wheel controls circuit except for a stuck switch or a short to ground in the signal return circuit. This DTC applies to the VOL-, VOL+, SEEK-, SEEK+, and MEDIA switches.
• B11BA:63 â Steering Wheel Audio Switch Pack: Circuit / Component Protection Time-Out	Set by the navigation ACM when a steering wheel control switch is detected as active for more than 120 seconds during normal operation, or for more than 3 seconds during the self-test. A short to ground in the signal return circuit should not set this DTC, as the reference voltage would fall out-of-range, resulting in DTC B11BA:1C being set. This DTC applies to the VOL-, VOL+, SEEK-, SEEK+, and MEDIA switches.
• B1201:1C â Steering Wheel Audio Switch Pack 2: Circuit Voltage Out of Range	Set by the navigation ACM when the reference voltage to the steering wheel controls is out-of-range. This can be caused by a number of different failures on the steering wheel controls circuit except for a stuck switch or a short to ground in the signal return circuit. This DTC applies to the VOICE and PHONE switches.
	Set by the APIM (V2) when the reference voltage to the steering wheel controls is out-of-range. This can be caused by a number of different failures on the steering

• B1201:1C â Steering Wheel Audio Switch Pack 2: Circuit Voltage Out of Range	wheel controls circuit except for a stuck switch or a short to ground in the signal return circuit. This DTC only applies to vehicles without navigation.
• B1201:63 â Steering Wheel Audio Switch Pack 2: Circuit / Component Protection Time-Out	Set by the navigation ACM when a steering wheel control switch is detected as active for more than 120 seconds during normal operation, or for any duration during the self-test. A short to ground in the signal return circuit should not set this DTC, as the reference voltage would fall out-of-range, resulting in DTC B1201:1C being set. This DTC applies to the VOICE and PHONE switches.
• B1201:63 â Steering Wheel Audio Switch Pack 2: Circuit / Component Protection Time-Out	Set by the APIM (V2) when a steering wheel control switch is detected as active for more than 120 seconds during normal operation, or for any duration during the self-test. A short to ground in the signal return circuit should not set this DTC, as the reference voltage would fall out-of-range, resulting in DTC B1201:1C being set. This DTC only applies to vehicles without navigation.
• B2404 â Audio Steering Wheel Switch Circuit Failure	Set by the non-navigation ACM when the reference voltage to the steering wheel controls is out-of-range. This can be caused by a number of different failures on the steering wheel controls circuit except for a stuck switch or a short to ground in the signal return circuit.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Clockspring
- Steering wheel controls
- ACM
- APIM (without navigation only)

PINPOINT TEST F: THE STEERING WHEEL CONTROLS ARE INOPERATIVE/DO NOT OPERATE CORRECTLY

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: For vehicles equipped with navigation or not equipped with SYNC, start this pinpoint test at Step F3.

Test Step	Result / Action to Take
F1 CHECK THE SYNC SYSTEM OPERATION	
NOTE: Carrying out a Master Reset returns all preference settings to the factory defaults, erases all the phone book and call histories, and deletes any devices paired with the SYNC system.	**Yes** The SYNC system is operating correctly at this time. For a concern with the VOL-, SEEK-,

<table>
<tr><td>• Connect: Multi-Media Interface Tester.
• Using the Multi-Media Interface Tester, test the audio output for the audio input jack, USB port, and Bluetooth connection using the VOICE switch on the steering wheel controls to enter each mode.
• Do all of the SYNC inputs function correctly?</td><td>SEEK+ or MEDIA switch, GO to F3 .

For all other concerns, CARRY OUT a SYNC system Master Reset. REFER to the Owner's Literature. REVIEW the SYNC system operation with the customer. If the customer device still does not operate correctly, the fault is with the customer device.

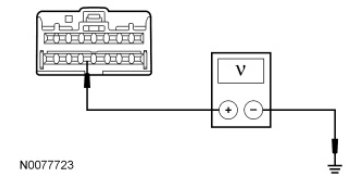
No
GO to F2 .</td></tr>
<tr><td>F2 RESET THE APIM AND RECHECK SYNC SYSTEM OPERATION</td><td></td></tr>
<tr><td>• Carry out an APIM power reset by disconnecting the battery for 5 minutes, then reconnecting it.
• Connect: Multi-Media Interface Tester.
• Using the Multi-Media Interface Tester, test the audio output for the audio input jack, USB port, and Bluetooth connection using the VOICE switch on the steering wheel controls to enter each mode.
• Do all of the SYNC inputs function correctly?</td><td>Yes
The SYNC system is operating correctly at this time. CARRY OUT a SYNC system Master Reset. REFER to the Owner's Literature.

REVIEW the SYNC system operation with the customer. If the customer device still does not operate correctly, the fault is with the customer device.

No
GO to F3 .</td></tr>
<tr><td>F3 DETERMINE THE INOPERATIVE STEERING WHEEL CONTROLS</td><td></td></tr>
<tr><td>• Determine which steering wheel controls are inoperative by pressing each steering wheel control switch individually while operating the audio system in various modes (AM/FM, SYNC (if equipped), etc.).
• Is the concern with the VOL-, VOL+, SEEK-, SEEK+, or MEDIA switch?</td><td>Yes
GO to F4 .

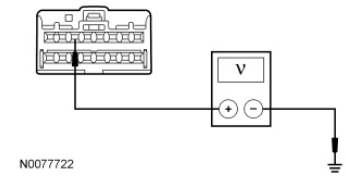
No
GO to F5 .</td></tr>
<tr><td>F4 MONITOR THE STEERING WHEEL CONTROL PIDs (EXCEPT NAVIGATION/SYNC SWITCHES)</td><td></td></tr>
<tr><td>• Enter the following diagnostic mode on the scan tool: ACM DataLogger.
• Monitor the steering wheel controls PIDs while pressing each steering wheel controls switch as follows:

<table><tr><th>Steering Wheel Controls Switch</th><th>PID</th></tr><tr><td>VOL-</td><td>SW_VOLDOWN</td></tr><tr><td>VOL+</td><td>SW_VOLUP</td></tr><tr><td>SEEK-</td><td>SW_SEEKMINUS</td></tr><tr><td>SEEK+</td><td>SW_SEEKPLUS</td></tr></table></td><td>Yes
GO to F11 .



No
If only one PID value is incorrect or the PID value always reads one particular switch position, INSTALL new steering wheel controls. REFER to Steering Wheel Controls in this section. CLEAR any DTCs present. TEST the system for normal operation.

Otherwise, GO to F6 .</td></tr>
</table>



MEDIA	SW_MODE

- **Do the PID values agree with the switch positions?**

F5 MONITOR THE STEERING WHEEL CONTROL PIDs (NAVIGATION/SYNC SWITCHES)	
• Enter the following diagnostic mode on the scan tool: ACM DataLogger (With Navigation) or APIM DataLogger (Without Navigation). • Monitor the steering wheel controls PIDs while pressing each steering wheel controls switch as follows: **ACM PIDs** **Steering Wheel Controls Switch** / **ACM PID** VOICE / SW_VOICE PHONE / SW_PHONE **APIM PIDs** **Steering Wheel Controls Switch** / **APIM PID** VOICE / VOICE_SW PHONE / PHONE_SW OK / OK_SW • **Do the PID values agree with the switch positions?**	**Yes** For vehicles with navigation, GO to F11 . For vehicles without navigation, GO to F12 . **No** If only one PID value is incorrect or the PID value always reads one particular switch position, INSTALL new steering wheel controls. REFER to Steering Wheel Controls in this section. CLEAR any DTCs present. TEST the system for normal operation. Otherwise, GO to F6 .
F6 CHECK THE REFERENCE VOLTAGE CIRCUIT TO THE CLOCKSPRING FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: Clockspring C218a. • Disconnect: ACM C290a or APIM C3342. • Ignition ON. • For a concern with the VOL-, VOL+, SEEK-, SEEK+, or MEDIA switches, measure the voltage between the clockspring C218a-13, circuit VME14 (GY/YE), harness side and ground.	**Yes** REPAIR the circuit in question. CLEAR any DTCs present. TEST the system for normal operation. **No** GO to F7 .

- For a concern with the VOICE, PHONE, or OK switches, measure the voltage between the clockspring C218a-6, circuit VMN02 (WH/BN), harness side and ground.

- **Is any voltage present?**

F7 CHECK THE CIRCUITS TO THE CLOCKSPRING FOR AN OPEN OR SHORT TO GROUND

NOTE: Circuits RME24 (BU/WH) and RH106 (VT/OG) do not need to be checked for a short to ground.

- Ignition OFF.
- For a concern with the VOL-, VOL+, SEEK-, SEEK+, or MEDIA switches, measure the resistance between the ACM , harness side and the clockspring, harness side; and between the ACM , harness side and ground as follows:

Positive Meter Lead	Negative Meter Lead	Circuit
C90a-18	C218a-13, then ground	VME14 (GY/YE)
C290a-19	C218a-12	RME124 (BU/WH)

- For a concern with the VOICE, PHONE, or OK switches, measure the voltage between ACM (vehicles with navigation) or APIM (vehicles without navigation), harness side and the clockspring, harness side; and between the ACM (vehicles with navigation) or APIM (vehicles without navigation), harness side and ground as follows:

Yes
GO to F8 .

No
REPAIR the circuit in question. CLEAR any DTCs present. TEST the system for normal operation.

Positive Meter Lead	Negative Meter Lead	Circuit
C290a-17 or C3342-14	C218a-6, then ground	VMN02 (WH/BN)
C290a-16 or C3342-15	C218a-4	RH106 (VT/OG)

- **Is the resistance less than 5 ohms between the ACM (or APIM) and the clockspring, and greater than 10,000 ohms between the ACM (or APIM) and ground?**

F8 CHECK THE REFERENCE VOLTAGE CIRCUIT TO THE STEERING WHEEL CONTROLS FOR A SHORT TO VOLTAGE

- Ignition OFF.
- Disconnect: Clockspring C218b.
- Disconnect: Steering Wheel Controls C2208.
- Ignition ON.
- For a concern with the VOL-, VOL+, SEEK-, SEEK+, or MEDIA switches, measure the voltage between the clockspring C218b-10, circuit VME14 (GY/YE), harness side and ground.
- For a concern with the VOICE, PHONE, or OK switches, measure the voltage between the clockspring C218b-12, circuit VMN02 (WH/BN), harness side and ground.
- **Is any voltage present?**

Yes
REPAIR the circuit. CLEAR any DTCs present. TEST the system for normal operation.

No
GO to F9 .

F9 CHECK THE CIRCUITS TO THE STEERING WHEEL CONTROLS FOR AN OPEN OR SHORT TO GROUND

NOTE: Circuits RME24 (BU/WH) and RH106 (VT/OG) do not need to be checked for a short to ground.

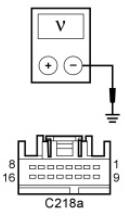
- Ignition OFF.
- For a concern with the VOL-, VOL+, SEEK-, SEEK+, or MEDIA switches, measure the resistance between the clockspring, harness side and the steering wheel controls, harness side; and between the clockspring, harness side and ground as follows:

Positive Meter Lead	Negative Meter Lead	Circuit
C218b-10		

Yes
GO to F10 .

No
REPAIR the circuit in question. CLEAR any DTCs present. TEST the system for normal operation.

	C2208-2, then ground	VME14 (GY/YE)
C218b-11	C2208-4	RME24 (BU/WH)



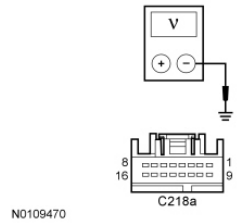
- For a concern with the VOICE, PHONE, or OK switches, measure the voltage between the upper clockspring connector, harness side and the steering wheel controls, harness side; and between the upper clockspring connector, harness side and ground as follows:

Positive Meter Lead	Negative Meter Lead	Circuit
C218b-12	C2208-6	VMN02 (WH/BN)
C218b-6	C2208-7	RH106 (VT/OG)

- **Is the resistance less than 5 ohms between the clockspring and the steering wheel controls, and greater than 10,000 ohms between the clockspring and ground?**

F10 CHECK THE REFERENCE VOLTAGE CIRCUITS TO THE CLOCKSPRING

- Ignition OFF.
- Disconnect: Clockspring C218a.
- Ignition ON.
- For vehicles without the SYNC system, measure the voltage between the lower clockspring C218a-6, circuit VMN02 (WH/BN) and C218a-12, circuit RME24 (BU/WH); and between the lower clockspring C218a-13, circuit VME14 (GY/YE) and C218a-12, circuit RME24 (BU/WH).



N0109470

- For vehicles with the SYNC system, measure the voltage between the lower clockspring C218a-6, circuit VMN02 (WH/BN) and C218a-4, circuit RH106 (VT/OG); and between the lower clockspring C218a-13, circuit VME14 (GY/YE) and C218a-12, circuit RME24

Yes
INSTALL a new clockspring. REFER to Section 501-20B . CLEAR any DTCs present. TEST the system for normal operation.

No
For vehicles without SYNC, GO to F11 .

For vehicles with SYNC, GO to F12 .

(BU/WH).  N0109470 • **Is the voltage approximately 5 volts?**	
F11 CHECK FOR CORRECT ACM OPERATION	
• Ignition OFF. • Connect: All Disconnected Connectors. • Disconnect all the ACM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the ACM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ACM . REFER to Audio Control Module (ACM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR any DTCs present.
F12 CHECK FOR CORRECT APIM OPERATION	
• Connect: All Disconnected Connectors. • Disconnect the APIM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the APIM connector and make sure it seats correctly. • Wait 2 minutes for the APIM to re-initalize. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new APIM . REFER to Accessory Protocol Interface Module (APIM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR any DTCs present.

Pinpoint Test G: The Family Entertainment System Is Inoperative/Does Not Operate Correctly

Refer to Wiring Diagrams Cell 130 , Audio System/Navigation for schematic and connector information.

Refer to Wiring Diagrams Cell 132 , Video System for schematic and connector information.

Normal Operation

The Rear Entertainment Module (RETM) routes audio signals to the Audio Front Control Module (ACM). In single-play mode, the ACM plays the DVD audio on all speakers. In dual-play mode, the audio to the rear speakers is muted and the RETM continues to control the rear audio source to the headphones.

If the vehicle is equipped with the SYNC system, the audio signals from the Accessory Protocol Interface Module (APIM) are routed through the RETM to the ACM . This allows for single-play and dual-play to

include SYNC system audio sources.

For vehicles without navigation, the satellite radio signals are also routed to the RETM after passing from the Satellite Digital Audio Receiver System (SDARS) module through the APIM .

This pinpoint test is intended to diagnose the following:

- Incorrect customer setting
- Damaged DVD
- Wiring, terminals or connectors
- RETM
- ACM

PINPOINT TEST G: THE VIDEO SYSTEM IS INOPERATIVE/DOES NOT OPERATE CORRECTLY

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Before diagnosing the family entertainment system, make sure a known good DVD is installed.

Test Step	Result / Action to Take
G1 IDENTIFY THE SYMPTOM	
• Operate the audio system in DVD single-play mode and observe the DVD audio. Refer to the Owner's Literature. • **Does the DVD audio operate correctly?**	**Yes** GO to G2 . **No** If the vehicle is equipped with satellite audio (but not navigation) or the SYNC system, GO to G3 . Otherwise, GO to G4 .
G2 CHECK THE OPERATION OF THE DVD VIDEO	
• Operate the audio system in DVD single-play mode and observe the DVD audio. • **Does the DVD video operate correctly?**	**Yes** The system is operating correctly at this time. The concern was either caused by an incorrect system setting, or the customer using a damaged DVD. INFORM the customer that pressing the power button or the VIDEO button while a DVD is playing can cause the display to go blank. **No** GO to G6 .
G3 CHECK THE RETM AUDIO PASS-THROUGH	
NOTE: If the vehicle is equipped with both the SYNC system and satellite radio (but not navigation), either step 1 or step 2 can be followed.	**Yes** GO to G6 . **No** GO to G4 .

- For vehicles equipped with the SYNC system, connect the Multi-Media Interface Tester, and operate the audio system in SYNC mode. Refer to the tool instructions.
- For vehicles equipped with satellite radio (but not navigation), operate the audio system in satellite radio mode
- Observe the audio output.
- **Does the SYNC system (or satellite radio) audio operate correctly?**

G4 CHECK THE AUDIO CIRCUITS TO THE ACM FOR A SHORT TO VOLTAGE

- Ignition OFF.
- Disconnect: RETM C9029.
- Disconnect: ACM C290b.
- Ignition ON.
- Measure the voltage between the ACM , harness side and ground as follows:

Positive Meter Lead	Negative Meter Lead	Circuit
C240b-1	Ground	VME17 (GN)
C240b-2	Ground	RME17 (GY)
C240b-9	Ground	VME18 (VT)
C240b-10	Ground	RME18 (YE)

- **Is any voltage present?**

Yes
REPAIR the circuit in question. TEST the system for normal operation.

No
GO to G5 .

G5 CHECK THE AUDIO CIRCUITS TO THE ACM FOR AN OPEN OR SHORT TO GROUND

- Ignition OFF.
- Measure the resistance between the ACM , harness side and the RETM , harness side; and between the ACM , harness side and ground as follows:

Positive Meter Lead	Negative Meter Lead	Circuit
C240b-1		

Yes
GO to G6 .

No
REPAIR the circuit in question. TEST the system for normal operation.

	C9029-10, then ground	VME17 (GN)
C240b-2	C9029-9, then ground	RME17 (GY)
C240b-9	C9029-26, then ground	VME18 (VT)
C240b-10	C9029-25, then ground	RME18 (YE)

- **Is the resistance less than 5 ohms between the ACM and the RETM , and greater than 10,000 ohms between the ACM and ground?**

G6 CHECK FOR LOST COMMUNICATION DTCs	
• Using the scan tool, retrieve all continuous DTCs from all modules. • **Is DTC U0184, U0184:00, U0196, or DTC U0196:00 present in any module?**	**Yes** REFER to the DTC Charts in this section. **No** GO to G7 .
G7 CHECK FOR CORRECT RETM OPERATION	
• Connect: ACM C290b. • Disconnect the RETM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the RETM connector and make sure it seats correctly. • **Is the concern still present?**	**Yes** INSTALL a new RETM . REFER to Rear Entertainment Module (RETM) in this section. TEST the system for normal operation. If the concern remains, GO to G8 . **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.
G8 CHECK FOR CORRECT ACM OPERATION	
• Ignition OFF. • Disconnect all the ACM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the ACM connectors and make sure they seat correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ACM . REFER to Audio Control Module (ACM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test H: The Satellite Radio Is Inoperative/Does Not Operate Correctly â Vehicles Without Navigation

Refer to Wiring Diagrams Cell 130 , Audio System/Navigation for schematic and connector information.

Normal Operation

Digital signals are received by the satellite radio antenna and sent through the satellite radio antenna cable to the Satellite Digital Audio Receiver System (SDARS) module, where the signals are converted to analog. The digital audio signals are converted to analog and sent to the appropriate module, depending on vehicle configuration.

When a satellite radio subscription is activated, the Electronic Serial Number (ESN) of the SDARS module is associated with the Vehicle Identification Number (VIN). As a result, the SDARS module cannot be swapped from one vehicle to another.

If there is an open in the satellite radio antenna circuit, there is no satellite audio. The audio system display indicates a satellite antenna concern when the audio system is operated in satellite radio mode. To diagnose an open in the satellite radio antenna circuit, GO to Pinpoint Test B .

This pinpoint test is intended to diagnose the following:

- Subscription status
- SDARS module

PINPOINT TEST H: THE SATELLITE RADIO IS INOPERATIVE/DOES NOT OPERATE CORRECTLY

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
H1 VERIFY THE AUDIO SYSTEM OPERATION	
• Operate the audio system in radio tuner (AM/FM) mode. • **Does the audio system operate correctly?**	**Yes** GO to H2 . **No** GO to Symptom Chart to diagnose the audio system concern.
H2 VERIFY AN ACTIVE SUBSCRIPTION	
• Operate the audio system in satellite radio mode and observe the audio system display. • **Does the display read CALL SIRIUS?**	**Yes** The subscription has expired. INFORM the customer to contact Sirius to re-activate the subscription. **No** If the display indicates a satellite antenna fault, GO to Pinpoint Test B . Otherwise, GO to H3 .
H3 CHECK FOR SDARS MODULE DTCs	
• Carry out the SDARS module self-test. • **Are any satellite audio system DTCs present?**	**Yes** If DTC B1031 or DTC B1032 is present, GO to Pinpoint Test B . For all other DTCs, REFER to the DTC Charts in this section.

	No GO to H4 .
H4 CHECK FOR CORRECT SDARS MODULE OPERATION	
• Ignition OFF. • Disconnect the SDARS module connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the SDARS module connector and make sure it seats correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SDARS module. REFER to Satellite Digital Audio Receiver System (SDARS) Module in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test I: The Audio Input Jack Is Inoperative/Does Not Operate Correctly

Refer to Wiring Diagrams Cell 130 , Audio System/Navigation for schematic and connector information.

Normal Operation â Vehicles Without the SYNC System

Audio signals are sent from the audio input jack to the Audio Front Control Module (ACM). There are no external power or ground circuits to the audio input jack.

Vehicles With the SYNC System

Audio signals are sent from the audio input jack to the Accessory Protocol Interface Module (APIM). The signals are then sent to the ACM . There are no external power or ground circuits to the audio input jack.

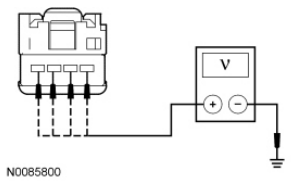
- DTC B1D78:13 (Auxiliary Input: Circuit Open) â sets in continuous memory by the navigation ACM (vehicles without the SYNC system only) when an open is detected in the audio input jack circuitry for greater than 250 milliseconds.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Audio input jack
- APIM (vehicles with the SYNC system)
- ACM (vehicles without the SYNC system)

PINPOINT TEST I: THE AUDIO INPUT JACK IS INOPERATIVE/DOES NOT OPERATE CORRECTLY

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**



NOTE: Before carrying out this pinpoint test, make sure the MP3 device is operating correctly.

<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>
<tr><td>I1 CHECK THE AUDIO INPUT JACK AUDIO</td><td></td></tr>
<tr><td>• Using the Multi-Media Interface Tester, attempt to play a file using the audio input jack.
• Does the file play correctly?</td><td>Yes
The system is operating correctly at this time. The concern may be with the customer device.

No
GO to I2 .</td></tr>
<tr><td>I2 DETERMINE THE VEHICLE CONTENT</td><td></td></tr>
<tr><td>• Determine if the vehicle is equipped with the SYNC system.
• Is the vehicle equipped with the SYNC system?</td><td>Yes
GO to I3 .

No
GO to I4 .</td></tr>
<tr><td>I3 CHECK THE APIM AUDIO OUTPUT</td><td></td></tr>
<tr><td>• Using the Multi-Media Interface Tester, attempt to play a file using either the Universal Serial Bus (USB) port or Bluetooth.
• Is the audio output OK for the USB port or Bluetooth?</td><td>Yes
GO to I4 .

No
GO to Pinpoint Test P .</td></tr>
<tr><td>I4 CHECK THE AUDIO INPUT JACK CIRCUITS FOR A SHORT TO VOLTAGE</td><td></td></tr>
<tr><td>• Ignition OFF.
• Disconnect: Audio Input Jack C3312.
• Disconnect: ACM C290b (Vehicles Without the SYNC System) or APIM C3342 (Vehicles With the SYNC System).
• Ignition ON.
• Measure the voltage between the audio input jack, harness side and ground as follows:

<table><tr><th>Connector-Pin</th><th>Circuit</th></tr><tr><td>C3312-1</td><td>VME46 (BU/GN)</td></tr><tr><td>C3312-2</td><td>RME46 (WH/GN)</td></tr><tr><td>C3312-3</td><td>RME45 (YE/GN)</td></tr><tr><td>C3312-4</td><td>VME45 (BU)</td></tr></table>
 

• Is any voltage present?</td><td>Yes
REPAIR the circuit in question. TEST the system for normal operation.

No
GO to I5 .</td></tr>
</table>

I5 CHECK THE AUDIO INPUT JACK CIRCUITS FOR AN OPEN OR SHORT TO GROUND

- Ignition OFF.
- Measure the resistance between the audio input jack, harness side and the ACM (or APIM , if equipped with the SYNC system), harness side; and between the audio input jack, harness side and ground as follows:

Vehicles Without The SYNC System

Positive Meter Lead	Negative Meter Lead	Circuit
C3312-1	C240b-6, then ground	VME46 (BU/GN)
C3312-2	C240b-14, then ground	RME46 (WH/GN)
C3312-3	C240b-8, then ground	RME45 (YE/GN)
C3312-4	C240b-7, then ground	VME45 (BU)

Vehicles With The SYNC System

Positive Meter Lead	Negative Meter Lead	Circuit
C3312-1	C3342-47, then ground	VME46 (BU/GN)
C3312-2	C3342-48, then ground	RME46 (WH/GN)
C3312-3	C3342-46, then ground	RME45 (YE/GN)
C3312-4	C3342-45, then ground	VME45 (BU)

- **Is the resistance less than 5 ohms between the audio input jack and the ACM (or APIM , if equipped with the SYNC system), and greater than 10,000 ohms between the audio input jack and ground?**

Yes
GO to I6 .

No
REPAIR the circuit in question. TEST the system for normal operation.

I6 ISOLATE THE AUDIO INPUT JACK

- Connect: ACM C290b (Vehicles Without the SYNC System) or APIM C3342 (Vehicles With the SYNC System).

Yes
The concern was caused by an inoperative audio input jack. The system is operating correctly at this time.

• Install a new audio input jack. Refer to Audio Input Jack in this section. • Using the Multi-Media Interface Tester, attempt to play a file using the audio input jack. • **Does the system operate correctly?**	**No** For vehicles without the SYNC system, GO to I7 . For vehicles with the SYNC system, GO to I8 .
I7 CHECK FOR CORRECT ACM OPERATION	
• Ignition OFF. • Disconnect all the ACM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the ACM connectors and make sure they seat correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ACM . REFER to Audio Control Module (ACM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.
I8 CHECK FOR CORRECT APIM OPERATION	
• Ignition OFF. • Disconnect the APIM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the APIM connector and make sure it seats correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new APIM . REFER to Accessory Protocol Interface Module (APIM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

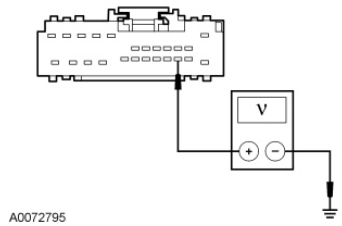
Pinpoint Test J: Loud Popping Sound When Cycling The Ignition

Refer to Wiring Diagrams Cell 130 , Audio System/Navigation for schematic and connector information.

Normal Operation

Voltage is sent through the start input circuit to the Audio Front Control Module (ACM) with the ignition in the START position. Upon receiving this signal, the ACM mutes all speaker outputs to eliminate the possibility of voltage spikes producing a popping noise through the speakers.

For the Audiophile audio system, the ACM disables the subwoofer and the audio amplifier while the ignition is in the START position by keeping the enable circuit voltages below 0.4 volt.



If there is a short to voltage on either of the enable circuits, distortion is heard in the speakers whenever the ACM is powered up, and that should be the primary concern addressed. If the speakers have distorted sound, GO to Symptom Chart - Sound Quality .

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- ACM

PINPOINT TEST J: LOUD POPPING SOUND WHEN CYCLING THE IGNITION

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
J1 CHECK THE START INPUT CIRCUIT VOLTAGE	
• Ignition OFF. • Disconnect: ACM C290a. • Disconnect: Starter Relay. • Hold the key in the START position. • Measure the voltage between the ACM C290a-15, circuit CBP11 (BN), harness side and ground.  • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new ACM . REFER to Audio Control Module (ACM) in this section. TEST the system for normal operation. **No** VERIFY the Smart Junction Box (SJB) fuse 11 (5A) is OK. If OK, REPAIR the circuit. TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short.

Pinpoint Test K: No Global Positioning System (GPS) Antenna Signal

Normal Operation

The Global Positioning System (GPS) antenna (integral to the satellite radio antenna) provides information from the GPS satellite system to the Audio Front Control Module (ACM). This information is used to calculate vehicle position and direction of travel.

A splitter is used in the lower satellite radio antenna cable to split the signals between the satellite radio and the GPS . It is possible that a concern in the GPS signal line after the splitter may cause a navigation system concern without affecting the satellite radio.

- DTC B119F:01 (GPS Antenna: General Electrical Failure) â sets when any failure is detected in the GPS antenna circuit.
- DTC B119F:13 (GPS Antenna: Circuit Open) â sets when an open is detected in the GPS antenna circuit.

This pinpoint test is intended to diagnose the following:

- Satellite radio antenna cable
- ACM

PINPOINT TEST K: NO GPS ANTENNA SIGNAL

Test Step	Result / Action to Take
K1 CHECK THE OPERATION OF THE SATELLITE RADIO	
• Operate the audio system in satellite radio mode. • Observe the audio system display. • **Does the audio system display indicate a satellite radio antenna fault?**	**Yes** GO to Pinpoint Test B . **No** GO to K2 .
K2 CHECK FOR GPS SIGNAL-RELATED DTCs	
• Clear the ACM DTCs. • Carry out the ACM self-test. • **Is DTC B119F:01 or DTC B119F:13 retrieved?**	**Yes** INSTALL a new lower satellite radio antenna cable. REFER to Antenna Cable â Satellite Radio in this section. CLEAR the DTCs. TEST the system for normal operation. **No** GO to K3 .
K3 CHECK FOR CORRECT ACM OPERATION	
• Disconnect all the ACM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the ACM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ACM . REFER to Audio Control Module (ACM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR any DTCs present.

Pinpoint Test L: The Voice Guidance Is Inoperative/Does Not Operate Correctly

Normal Operation

The voice-assisted route guidance is broadcast through the front speakers. The voice guidance volume can be adjusted using the settings on the Audio Front Control Module (ACM).

This pinpoint test is intended to diagnose the following:

- Incorrect voice guidance setting
- Audio system concern
- ACM

PINPOINT TEST L: THE VOICE GUIDANCE IS INOPERATIVE/DOES NOT OPERATE CORRECTLY

Test Step	Result / Action to Take
L1 CHECK THE VOICE GUIDANCE SETTING	
• Adjust the voice volume to approximately 50%. Refer to the Owner's Literature. • Set a destination and start the route using the navigation controls. Refer to the Owner's Literature. • Observe the voice guidance. • **Does the voice guidance operate correctly?**	**Yes** The concern was caused by an incorrect customer setting. INSTRUCT the customer about the correct use of the voice guidance feature. **No** GO to L2 .
L2 CHECK THE SPEAKER OUTPUT	
• Carry out the speaker walk test. Refer to Audio Control Module (ACM) Self-Diagnostic Mode in this section. • **Do the front speakers operate correctly?**	**Yes** GO to L3 . **No** GO to Pinpoint Test X .
L3 CHECK FOR CORRECT ACM OPERATION	
• Disconnect all the ACM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the ACM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ACM . REFER to Audio Control Module (ACM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test M: The Position Cursor Is Inaccurate

Normal Operation

The primary source of vehicle location for the navigation system is the Audio Front Control Module (ACM) receiving the position signal through the Global Positioning System (GPS) antenna (integral to the satellite radio antenna).

In addition, the ACM receives the navigation rolling wheel count signal from the Instrument Cluster (IC) (which gateways the signal from the ABS module). This secondary signal is used to calculate vehicle position

when the GPS signal is lost. It also supports the adaptive learning function of the ACM , whereby the ACM can compensate for long-term differences between the GPS signal location and the actual distance traveled by the vehicle.

If DTC B119F:01 or B119F:13 is present, GO to Pinpoint Test K to diagnose a concern with the GPS antenna.

- DTC U2014:09 (Control Module Hardware: Component Failure) â sets when the ACM detects a fault in the internal gyroscope. The gyroscope is not serviceable.

This pinpoint test is intended to diagnose the following:

- GPS antenna concern
- Communication network concern
- ACM

PINPOINT TEST M: THE POSITION CURSOR IS INACCURATE

Test Step	Result / Action to Take
M1 CHECK THE ACM FOR GPS -RELATED DTCs	
• Retrieve the ACM continuous DTCs. • **Is DTC B119F:01 or B119F:13 present?**	**Yes** GO to Pinpoint Test K . **No** GO to M2 .
M2 CHECK FOR DTC U0155:00	
• Review the ACM continuous DTCs. • **Is DTC U0155:00 present?**	**Yes** GO to Pinpoint Test AK . **No** GO to M3 .
M3 CHECK FOR CORRECT ACM OPERATION	
• Disconnect all the ACM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the ACM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ACM . REFER to Audio Control Module (ACM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR any DTCs present.

Pinpoint Test N: Voice Recognition Is Inoperative/Does Not Operate Correctly â Vehicles Without The SYNC System

Refer to Wiring Diagrams Cell 130 , Audio System/Navigation for schematic and connector information.

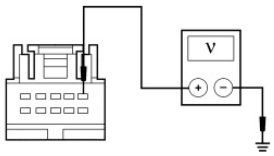
Normal Operation

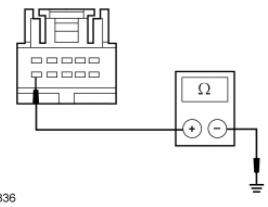
When the VOICE switch is pressed, it changes the reference voltage from the Audio Front Control Module (ACM) on the voice recognition circuit, and the ACM enters voice recognition mode. A microphone located in the audio-dimming interior mirror receives the voice command and sends a signal to the ACM .

The microphone test is available through the Integrated Diagnostic System (IDS) scan tool or through the ACM self-diagnostic mode. Running this test causes the ACM to produce a test tone. If the system is operating correctly, the microphone detects the tone and produces a voltage signal to the ACM indicating the tone was heard.

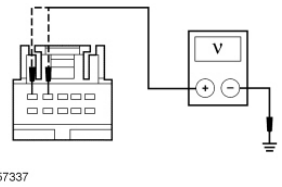
- DTC B1D79:01 (Microphone Input: General Electrical Failure) â set by the ACM during the microphone test when it does not receive an adequate signal from the microphone when the test tone is sounded.

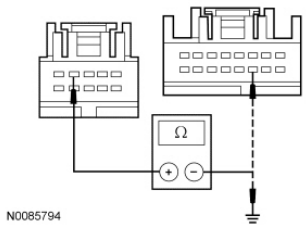
This pinpoint test is intended to diagnose the following:

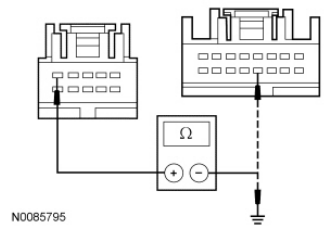




- Fuse
- Wiring, terminals or connectors
- Steering wheel controls
- Microphone (part of the auto-dimming interior mirror)
- ACM







PINPOINT TEST N: VOICE RECOGNITION IS INOPERATIVE/DOES NOT OPERATE CORRECTLY â VEHICLES WITHOUT THE SYNC SYSTEM

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
N1 CHECK THE OPERATION OF THE STEERING WHEEL CONTROLS	
• Operate the audio system in radio tuner (AM/FM) mode. • Press the VOICE button on the steering wheel controls. • **Does the audio system enter voice recognition mode?**	**Yes** GO to N2 . **No** GO to Pinpoint Test F to diagnose the steering wheel controls system.
N2 CHECK FOR DTC B1D79:01	
• Carry out the microphone test. Refer to Audio Control Module (ACM) Self-Diagnostic Mode in this section. • Observe the display once the test tone has stopped sounding. • **Is DTC B1D79:01 present?**	**Yes** GO to N4 . **No** GO to N3 .
N3 CHECK THE OPERATION OF THE VOICE RECOGNITION â NAVIGATION SYSTEM	

• Press the VOICE switch on the steering wheel controls. • Wait for the audio system to acknowledge the VOICE switch being pressed. • While still in voice recognition mode, speak the command "NAVIGATION", and observe the audio system. • **Does the navigation system acknowledge the command "NAVIGATION"?**	**Yes** The system is operating correctly at this time. ADVISE the customer on the correct operation of the voice recognition system. **No** GO to N4 .
N4 CHECK THE MICROPHONE VOLTAGE SUPPLY	
• Ignition OFF. • Disconnect: Auto-Dimming Interior Mirror C9012. • Ignition ON. • Measure the voltage between the auto-dimming interior mirror C9012-1, circuit CBP05 (YE), harness side and ground.  N0057331 • **Is the voltage greater than 10 volts?**	**Yes** GO to N5 . **No** VERIFY the Smart Junction Box (SJB) fuse 5 (5A) is OK. If OK, REPAIR the circuit. TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams Manual to identify the possible sources of the circuit short.
N5 CHECK THE MICROPHONE GROUND FOR CONTINUITY	
• Ignition OFF. • Disconnect: Negative Battery Cable. • Measure the resistance between the auto-dimming interior mirror C9012-10, circuit GD143 (BK/VT), harness side and ground.  N0057336 • **Is the resistance less than 5 ohms?**	**Yes** GO to N6 . **No** REPAIR the circuit. TEST the system for normal operation.
N6 CHECK THE MICROPHONE CIRCUITS FOR A SHORT TO VOLTAGE	

• Connect: Negative Battery Cable. • Disconnect: ACM C290b. • Ignition ON. • Measure the voltage between the auto-dimming interior mirror C9012-4, circuit VMN07 (GY), harness side and ground; and between the auto-dimming interior mirror C9012-5, circuit RMN07 (VT), harness side and ground.  N0057337 • **Is any voltage present?**	**Yes** REPAIR the circuit in question. TEST the system for normal operation. **No** GO to N7 .
N7 CHECK THE MICROPHONE CIRCUITS FOR AN OPEN OR SHORT TO GROUND	
• Ignition OFF. • Measure the resistance between the auto-dimming interior mirror C9012-4, circuit VMN07 (GY), harness side and the ACM C290b-11, circuit VMN07 (GY), harness side; and between the auto-dimming interior mirror C9012-4, circuit VMN07 (GY), harness side and ground.  N0085794 • Measure the resistance between the auto-dimming interior mirror C9012-5, circuit RMN07 (VT), harness side and the ACM C290b-12, circuit RMN07 (VT), harness side; and between the auto-dimming interior mirror C9012-5, circuit RMN07 (VT), harness side and ground.  N0085795	**Yes** GO to N8 . **No** REPAIR the circuit in question. TEST the system for normal operation.

• **Is the resistance less than 5 ohms between the auto-dimming interior mirror and the ACM , and greater than 10,000 ohms between the auto-dimming interior mirror and ground?**	
N8 ISOLATE THE AUTO-DIMMING INTERIOR MIRROR	
• Connect: ACM C290b. • Install a new auto-dimming interior mirror. Refer to Interior Rear View Mirror in Section 501-09 . • Operate the audio system in radio tuner (AM/FM) mode. • Press the VOICE button on the steering wheel controls, and attempt several voice commands. • **Does the voice recognition operate correctly?**	**Yes** The fault was caused by an inoperative auto-dimming interior mirror. The system is now operating correctly. **No** GO to N9 .
N9 CHECK FOR CORRECT ACM OPERATION	
• Disconnect the ACM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the ACM connectors and make sure they seat correctly. • **Is the concern still present?**	**Yes** INSTALL a new ACM . REFER to Audio Control Module (ACM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test O: The Speed Sensitive Volume Does Not Operate Correctly

Refer to Wiring Diagrams Cell 130 , Audio System/Navigation for schematic and connector information.

Normal Operation

The speed sensitive volume function adjusts the volume based on the Vehicle Speed Sensor (VSS) signal from the Instrument Cluster (IC). The IC does not generate the VSS signal; it gateways the signal from the PCM. The Smart Junction Box (SJB) also receives this signal and should exhibit symptoms if the signal is lost.

This pinpoint test is intended to diagnose the following:

- Speed sensitive volume setting
- VSS signal concern
- Communication network concern
- ACM

PINPOINT TEST O: THE SPEED SENSITIVE VOLUME DOES NOT OPERATE CORRECTLY

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take

O1 CHECK THE SPEEDOMETER OPERATION	
• Drive the vehicle and observe the speedometer. • **Does the speedometer operate correctly?**	**Yes** GO to O2 . **No** REFER to Section 413-01 .
O2 CHECK THE SPEED SENSITIVE VOLUME SETTING	
• Turn the speed sensitive volume off. Refer to the Owner's Literature. • Operate the audio system in radio tuner (AM/FM) mode. • Drive the vehicle at various speeds and observe the speaker volume. • Set the speed sensitive volume to maximum compensation. Refer to the Owner's Literature. • Operate the audio system in radio tuner (AM/FM) mode. • Drive the vehicle at various speeds and observe the speaker volume. • **Does the volume remain constant with the speed sensitive volume turned off, and increase and decrease with vehicle speed with the speed sensitive volume set to maximum?**	**Yes** The system is operating correctly at this time. INSTRUCT the customer about the correct usage of the speed sensitive volume feature. **No** GO to O3 .
O3 CHECK FOR DTC U0155 OR DTC U0155:00	
• Using the scan tool, retrieve all continuous DTCs. • **Is DTC U0155:00 or DTC U0155 retrieved in any module?**	**Yes** GO to Pinpoint Test AK . **No** GO to O4 .
O4 CHECK FOR CORRECT ACM OPERATION	
• Disconnect all the ACM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the ACM connectors and make sure they seat correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ACM . REFER to Audio Control Module (ACM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR any DTCs present.

Pinpoint Test P: The SYNC System Is Completely Inoperative

Normal Operation

When a button on the Audio Control Module (ACM) is pressed, a network message is sent to the Accessory Protocol Interface Module (APIM) via the Medium Speed Controller Area Network (MS-CAN). The APIM takes the appropriate action and sends a status message to the ACM in order to update the display screen.

- DTC U3000:04 (Control Module: System Internal Failure) â sets when the APIM (V2) detects a fault due to a device conflict or an internal failure.

This pinpoint test is intended to diagnose the following:

- Audio system concern
- Communication network concern
- Customer error
- Customer device
- ACM
- APIM

PINPOINT TEST P: THE SYNC SYSTEM IS COMPLETELY INOPERATIVE

Test Step	Result / Action to Take
P1 CHECK FOR SCAN TOOL COMMUNICATION WITH THE APIM	
• Carry out the network test using the scan tool. • **Does the APIM pass the network test?**	**Yes** GO to P2 . **No** REFER to Section 418-00 .
P2 CHECK THE SYNC SYSTEM OPERATION	
NOTE: Carrying out a Master Reset returns all preference settings to the factory defaults, erases all the phone book and call histories, and deletes any devices paired with the SYNC system. • Connect: Multi-Media Interface Tester. • Using the Multi-Media Interface Tester, test the audio output for the audio input jack, USB port, and Bluetooth connection using the VOICE switch on the steering wheel controls to enter each mode. • **Do all of the SYNC inputs function correctly?**	**Yes** The SYNC system is operating correctly at this time. CARRY OUT a SYNC system Master Reset. REFER to the Owner's Literature. REVIEW the SYNC system operation with the customer. If the customer device still does not operate correctly, the fault is with the customer device. **No** GO to P3 .
P3 RESET THE APIM AND RECHECK SYNC SYSTEM OPERATION	
• Carry out an APIM power reset by disconnecting the battery for 5 minutes, then reconnecting it. • Connect: Multi-Media Interface Tester. • Using the Multi-Media Interface Tester, test the audio output for the audio input jack, USB port, and Bluetooth connection using the VOICE switch on the steering wheel controls to enter each mode. • **Do all of the SYNC inputs function correctly?**	**Yes** The SYNC system is operating correctly at this time. CARRY OUT a SYNC system Master Reset. REFER to the Owner's Literature. REVIEW the SYNC system operation with the customer. If the customer device still does not operate correctly, the fault is with the customer device. **No** If only some (but not all) of the inputs are inoperative, GO to Symptom Chart - SYNC System to diagnose the observed symptom. If all inputs are inoperative

	and/or DTC U3000:04 is present, INSTALL a new APIM . REFER to Accessory Protocol Interface Module (APIM) in this section.

Pinpoint Test Q: Unable To Pair Bluetooth Device

Normal Operation

When a new Bluetooth device is added, the Accessory Protocol Interface Module (APIM) and the Bluetooth device must be paired together. Most Bluetooth devices can pair with the SYNC system, although functionality may vary. To determine if a Bluetooth device is supported, retrieve the Consumer Interface Processor (CIP) software level using the Accessory Protocol Interface Module (APIM) Software Level Check in this section, and verify the customer device is on the compatibility list for the current CIP software level.

Pairing a Bluetooth device is accomplished through the "Add Device" selection of the phone menu. When pairing a device, the SYNC system generates a unique Personal Identification Number (PIN) that must be entered on the Bluetooth device in order for the pairing process to be successful. There are also some device-specific actions that must take place. For additional information on the pairing process, refer to the Owner's Literature.

This pinpoint test is intended to diagnose the following:

- Incompatible Bluetooth device
- Customer error
- Customer Bluetooth device
- APIM

PINPOINT TEST Q: UNABLE TO PAIR BLUETOOTH DEVICE

Test Step	Result / Action to Take
Q1 CHECK THE BLUETOOTH CONNECTION	
NOTE: Carrying out a Master Reset returns all preference settings to the factory defaults, erases all the phone book and call histories and deletes any devices paired with the SYNC system. • Connect: Multi-Media Interface Tester. • Using the Multi-Media Interface Tester, connect to the SYNC system using Bluetooth. • Enter the following diagnostic mode on the scan tool: APIM DataLogger. • Monitor the Bluetooth device paired PID (BT_PAIR) and the Bluetooth device connected PID (BT_CONN). • **Do the PIDs BT_PAIR and BT_CONN both read "Yes"?**	**Yes** The SYNC system is operating correctly at this time. CARRY OUT a SYNC system Master Reset. REFER to the Owner's Literature. REVIEW the pairing process with the customer. If the customer device still does not pair, the fault is with the customer device. **No** GO to Q2 .
Q2 CHECK FOR CORRECT APIM OPERATION	
• Disconnect the APIM connector.	**Yes** INSTALL a new APIM . REFER to

• Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the APIM connector and make sure it seats correctly. • Wait 2 minutes for the APIM to re-initalize. • Operate the system and verify the concern is still present. • **Is the concern still present?**	Accessory Protocol Interface Module (APIM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test R: The Universal Serial Bus (USB) Port Is Inoperative/Does Not Operate Correctly

Normal Operation

The Universal Serial Bus (USB) port is connected to the Accessory Protocol Interface Module (APIM) through the USB cable. The USB port can be used to play audio files or upload software from mass storage devices, or for connecting a media device.

If supported by the user device, the USB can provide charging. Because of this feature, when a USB device is plugged into the USB port, the SYNC system does not automatically switch to the device.

If a USB mass storage device is used to play an audio file, the SYNC system only plays audio files that do not have Digital Rights Management (DRM) protection.

The USB cable and port are not serviceable separately.

- DTC B1252:04 (USB Port: System Internal Failure) â sets when the APIM (V2) detects an over-temperature condition in the USB circuit. This can be caused by a fault in the USB cable and port, or by the customer USB device.
- DTC B1252:11 (USB Port: Circuit Short to Ground) â sets when the APIM (V2) detects an over-current condition in the USB circuit. This can be caused by a fault in the USB cable and port, or by the customer USB device.
- DTC U261C (USB #1 Device Error) â sets when the APIM (V1) detects a fault in the USB circuit. This can be caused by a fault in the USB cable and port, or by the customer USB device.

This pinpoint test is intended to diagnose the following:

- Customer USB device
- USB cable and port
- APIM

PINPOINT TEST R: THE USB PORT IS INOPERATIVE/DOES NOT OPERATE CORRECTLY

Test Step	Result / Action to Take
R1 CHECK THE USB CONNECTION	
• Connect: Multi-Media Interface Tester. • Using the Multi-Media Interface Tester, attempt to play a file using the USB port.	**Yes** The SYNC system is operating correctly. REVIEW the operation of the USB port with the customer. If the customer device still does not operate correctly, the fault is with the customer

• **Does the audio file play successfully using the USB connection?**	device. **No** GO to R2 .
R2 INSPECT THE USB CABLE	
• Ignition OFF. • Disconnect: USB Cable At APIM . • Inspect the USB cable for damage. • Connect: USB Cable At APIM . • Ignition ON. • Connect: Multi-Media Interface Tester. • Using the Multi-Media Interface Tester, attempt to play a file using the USB port. • **Does the audio file play successfully using the USB connection?**	**Yes** The concern was caused by the USB connection not being seated correctly. The system is now operating correctly. **No** GO to R3 .
R3 RESET THE APIM AND RECHECK SYNC SYSTEM OPERATION	
NOTE: Carrying out a Master Reset returns all preference settings to the factory defaults, erases all the phone book and call histories, and deletes any devices paired with the SYNC system. • Carry out an APIM power reset by disconnecting the battery for 5 minutes, then reconnecting it. • Connect: Multi-Media Interface Tester. • Using the Multi-Media Interface Tester, test the audio output for the audio input jack, USB port, and Bluetooth connection using the VOICE switch on the steering wheel controls to enter each mode. • **Do all of the SYNC inputs function correctly?**	**Yes** The SYNC system is operating correctly at this time. CARRY OUT a SYNC system Master Reset. REFER to the Owner's Literature. REVIEW the SYNC system operation with the customer. If the customer device still does not operate correctly, the fault is with the customer device. **No** If only the USB port is inoperative, GO to R4 . If additional inputs are inoperative, GO to Symptom Chart - SYNC System to diagnose the observed symptom. If all inputs are inoperative, INSTALL a new APIM . REFER to Accessory Protocol Interface Module (APIM) in this section.
R4 ISOLATE THE USB CABLE AND PORT	
• Install a new USB cable and port. Refer to Universal Serial Bus (USB) Cable and Port in this section. • Connect: Multi-Media Interface Tester. • Using the Multi-Media Interface Tester, attempt to play a file using the USB port. • **Does the audio file play successfully using the USB connection?**	**Yes** The concern was caused by an inoperative USB cable. The system is now operating correctly. **No** GO to R5 .
R5 CHECK FOR CORRECT APIM OPERATION	
• Disconnect the APIM connector. • Check for: ♦ corrosion	**Yes** INSTALL a new APIM . REFER to Accessory Protocol Interface Module (APIM) in this section. TEST the system for normal operation.

♦ damaged pins ♦ pushed-out pins • Connect the APIM connector and make sure it seats correctly. • Wait 2 minutes for the APIM to re-initalize. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR any DTCs present.

Pinpoint Test S: The SYNC System Audible Prompts Are Inoperative/Do Not Operate Correctly

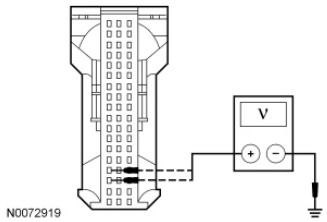
Refer to Wiring Diagrams Cell 130 , Audio System/Navigation for schematic and connector information.

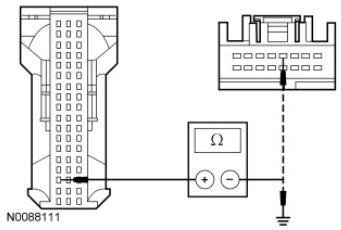
Normal Operation

The Text-To-Speech (TTS) and voice prompt features speak certain text information and interaction requests in order to minimize driver distraction by having to look at the audio system display while driving. The ring tone alerts the driver to an incoming call.

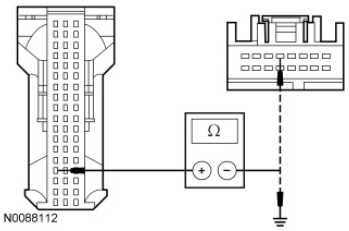
Audible prompts can range from a simple tone to more elaborate spoken text, based on the customer setting. When interaction mode is set to standard, detailed guidance is provided. When interaction mode is set to advanced, most prompts are tones only and minimal audible guidance is provided. Refer to the Owner's Literature for further information on voice interaction.

The audio signals for the TTS and voice prompt features, the ringtones, and audio from the outside device during a phone call, are sent from the Accessory Protocol Interface Module (APIM) to the Audio Front Control Module (ACM).





This pinpoint test is intended to diagnose the following:



- Customer setting
- Wiring, terminals or connectors
- APIM
- ACM

PINPOINT TEST S: THE SYNC SYSTEM AUDIBLE PROMPTS ARE INOPERATIVE/DO NOT OPERATE CORRECTLY

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
S1 CHECK THE AUDIBLE PROMPT SETTING	
• Operate the audio system in SYNC mode. • Verify the audible prompts are enabled. Refer to "SYNC Voice Recognition Feature" in the Owner's Literature. • Press the VOICE button on the steering wheel controls and observe the SYNC voice prompt. • **Does the SYNC system produce an audible prompt correctly?**	**Yes** The system is operating correctly at this time. The concern was caused by a customer setting. INSTRUCT the customer about the correct operation of the audible prompt feature. **No** GO to S2 .

S2 CHECK FOR A VOLTAGE SIGNAL FROM THE APIM	
• Operate the audio system in SYNC mode, and verify the audible prompts are enabled. Refer to "SYNC Voice Recognition Feature" in the Owner's Literature. • While pressing the VOICE switch repeatedly, measure the AC voltage by back-probing between the ACM C290b-4, circuit VMN14 (WH/VT), harness side and the ACM C290b-5, circuit RMN14 (GY/BN), harness side. • **Is an AC voltage produced each time the VOICE switch is pressed?**	**Yes** GO to S6 . **No** GO to S3 .
S3 CHECK THE AUDIBLE PROMPT CIRCUITS FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: ACM C290b. • Disconnect: APIM C3342. • Ignition ON. • Measure the voltage between the APIM C3342-3, circuit VMN14 (WH/VT), harness side and ground; and between the APIM C3342-4, circuit RMN14 (GY/BN), harness side and ground.  • **Is any voltage present?**	**Yes** REPAIR the circuit in question. TEST the system for normal operation. **No** GO to S4 .
S4 CHECK THE AUDIBLE PROMPT CIRCUITS FOR AN OPEN OR SHORT TO GROUND	
• Ignition OFF. • Measure the resistance between the APIM C3342-3, circuit VMN14 (WH/VT), harness side and the ACM C290b-4, circuit VMN14 (WH/VT), harness side; and between the APIM C3342-3, circuit VMN14 (WH/VT), harness side and ground.  	**Yes** GO to S5 . **No** REPAIR the circuit in question. TEST the system for normal operation.

• Measure the resistance between the APIM C3342-4, circuit RMN14 (GY/BN), harness side and the ACM C290b-5, circuit RMN14 (GY/BN), harness side; and between the APIM C3342-4, circuit RMN14 (GY/BN), harness side and ground.  • **Is the resistance less than 5 ohms between the APIM and the ACM , and greater than 10,000 ohms between the APIM and ground?**	
S5 CHECK FOR CORRECT APIM OPERATION	
• Connect: ACM C290b. • Disconnect the APIM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the APIM connector and make sure it seats correctly. • Wait 2 minutes for the APIM to re-initalize. • **Is the concern still present?**	**Yes** INSTALL a new APIM . REFER to Accessory Protocol Interface Module (APIM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.
S6 CHECK FOR CORRECT ACM OPERATION	
• Ignition OFF. • Disconnect all the ACM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the ACM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ACM . REFER to Audio Control Module (ACM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test T: The Satellite Radio Is Inoperative/Does Not Operate Correctly â Vehicles With Navigation

Refer to Wiring Diagrams Cell 130 , Audio System/Navigation for schematic and connector information.

Refer to Wiring Diagrams Cell 132 , Video System for schematic and connector information.

Normal Operation

Digital signals are received by the satellite radio antenna and sent to the Audio Front Control Module (ACM) through the satellite radio antenna cable. The satellite receiver is internal to the ACM .

When a satellite radio subscription is activated, the Electronic Serial Number (ESN) of the built-in satellite receiver is associated with the Vehicle Identification Number (VIN). As a result, the ACM cannot be swapped from one vehicle to another.

If there is an open in the satellite radio antenna circuit, there is no satellite audio. The audio system display indicates a satellite antenna concern when the audio system is operated in satellite radio mode. To diagnose an open in the satellite radio antenna circuit, GO to Pinpoint Test K .

- DTC U2014:96 (Control Module Hardware: Component Internal Failure) â sets when the ACM detects an internal fault to the built-in satellite radio receiver. This results in complete loss of satellite radio functionality.

This pinpoint test is intended to diagnose the following:

- Subscription status
- ACM

PINPOINT TEST T: THE SATELLITE RADIO IS INOPERATIVE/DOES NOT OPERATE CORRECTLY â VEHICLES WITH NAVIGATION

Test Step	Result / Action to Take
T1 CHECK THE ACM DTCs	
• Retrieve the ACM DTCs. • **Is DTC U2014:96 present?**	**Yes** GO to T4 . **No** GO to T2 .
T2 CHECK THE SATELLITE RADIO DISPLAY	
• Turn the audio system on. • Operate the audio system in satellite radio mode and observe the ACM display. • **Does satellite radio information show on the ACM display?**	**Yes** GO to T3 . **No** GO to Pinpoint Test Z .
T3 VERIFY AN ACTIVE SUBSCRIPTION	
• Operate the audio system in satellite radio mode and observe the audio system display. • **Does the display read CALL SIRIUS?**	**Yes** The subscription has expired. INFORM the customer to contact Sirius to re-activate the subscription. **No** If the display indicates a satellite antenna fault, GO to Pinpoint Test B .

	Otherwise, GO to T4 .
T4 CHECK FOR CORRECT ACM OPERATION	
• Ignition OFF. • Disconnect all the ACM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the ACM connectors and make sure they seat correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ACM . REFER to Audio Control Module (ACM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs.

Pinpoint Test U: Poor Quality/Distorted/No Sound â SYNC System

Refer to Wiring Diagrams Cell 130 , Audio System/Navigation for schematic and connector information.

Refer to Wiring Diagrams Cell 132 , Video System for schematic and connector information.

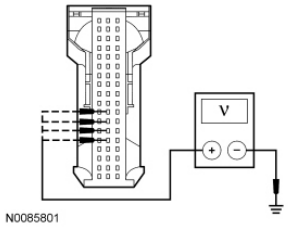
Normal Operation

The Accessory Protocol Interface Module (APIM) transmits left and right channel analog audio signals. The signals include inputs from the Universal Serial Bus (USB) port, the audio input jack, and a Bluetooth media device.

If the vehicle is equipped with the family entertainment system, these audio signals are sent to the Rear Entertainment Module (RETM), then to the Audio Front Control Module (ACM). In vehicles without the family entertainment system, the audio signals are sent directly to the ACM .

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- APIM
- RETM (if equipped)
- ACM



PINPOINT TEST U: POOR QUALITY/DISTORTED SOUND WHILE IN SYNC MODE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
U1 VERIFY THE OPERATION OF THE SYNC SYSTEM AUDIO SOURCES	
• Connect: Multi-Media Interface Tester. • Using the Multi-Media Interface Tester, test	**Yes** If the vehicle is equipped with the family entertainment system, GO to U2 .

the audio output for the audio input jack, USB port, and Bluetooth connection. • **Is there poor quality/distorted sound from each SYNC audio source?**	Otherwise, GO to U3 . **No** If the concern is only with one of the audio sources, GO to Symptom Chart - SYNC System to diagnose the observed symptom. If all audio sources operate correctly, the concern is with the customer device.
U2 CHECK THE OPERATION OF THE FAMILY ENTERTAINMENT SYSTEM AUDIO	
• **NOTE:** Make sure a known good DVD is inserted in the RETM before carrying out this step. • Operate the audio system in single-play DVD mode. • Observe the audio output. • **Is there poor quality/distorted sound while in DVD mode?**	**Yes** GO to Pinpoint Test G . **No** GO to U3 .
U3 CHECK THE AUDIO CIRCUITS FROM THE APIM FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: ACM C290b (Vehicles Without A Family Entertainment System). • Disconnect: RETM C9029 (Vehicles With A Family Entertainment System). • Disconnect: APIM C3342. • Measure the voltage between the APIM , harness side and ground as follows:	**Yes** REPAIR the circuit in question. TEST the system for normal operation. **No** GO to U4 .

Positive Meter Lead	Negative Meter Lead
C3342-23 VME53 (VT/GN)	Ground
C3342-24 RME53 (BN/WH)	Ground
C3342-25 VME52 (BU)	Ground
C3342-26 RME52 (GY/OG)	Ground

- **Is any voltage present?**

U4 CHECK THE AUDIO CIRCUITS FROM THE APIM FOR AN OPEN OR SHORT TO GROUND

- Ignition OFF.
- Measure the resistance between the APIM , harness side, and the ACM (or RETM if equipped with the family entertainment system), harness side; and between the APIM , harness side and ground as follows:

Positive Meter Lead	Negative Meter Lead	Circuit
C3342-23	C290b-9 or C9029-20, then ground	VME53 (VT/GN)/ VME18 (VT) (at ACM)
C3342-24	C290b-10 or C9029-19, then ground	RME53 (BN/WH)/ RME18 (YE) (at ACM)
C3342-25	C290b-1 or C9029-4, then ground	VME52 (BU)/ VME17 (GN) (at ACM)
C3342-26	C290b-2 or C9029-3, then ground	RME52 (GY/OG)/ RME17 (GY) (at ACM)

- **Is the resistance less than 5 ohms between the APIM and the ACM (or RETM), and greater than 10,000 ohms between the APIM and ground?**

Yes
REPAIR the circuit in question. TEST the system for normal operation.

No
GO to U5 .

U5 CHECK FOR CORRECT APIM OPERATION

- Connect: All Disconnected Connectors.
- Disconnect the APIM connector.
- Check for:
  - ♦ corrosion

Yes
INSTALL a new APIM . REFER to Accessory Protocol Interface Module (APIM) in this section. TEST the system for normal operation. If the concern is still present and the vehicle is equipped

♦ damaged pins ♦ pushed-out pins • Connect the APIM connector and make sure it seats correctly. • Wait 2 minutes for the APIM to re-initalize. • Operate the system and verify the concern is still present. • **Is the concern still present?**	with the family entertainment system, GO to U6 . If the concern is still present and the vehicle is not equipped with the family entertainment system, GO to U7 . **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.
U6 CHECK FOR CORRECT RETM OPERATION	
• Disconnect the RETM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the RETM connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new RETM . REFER to Rear Entertainment Module (RETM) in this section. TEST the system for normal operation. If the concern is still present, GO to U7 . **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.
U7 CHECK FOR CORRECT ACM OPERATION	
• Disconnect all the ACM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the ACM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ACM . REFER to Audio Control Module (ACM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test V: Voice Recognition Is Inoperative/Does Not Operate Correctly â Vehicles With The SYNC System

Refer to Wiring Diagrams Cell 130 , Audio System/Navigation for schematic and connector information.

Normal Operation

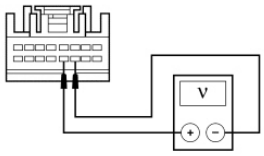
When the VOICE switch is pressed, it changes a reference voltage signal, and the audio system enters voice recognition mode. If the vehicle is equipped with navigation, the VOICE switch is wired to the Audio Front Control Module (ACM). If the vehicle is not equipped with navigation, the VOICE switch is wired to the Accessory Protocol Interface Module (APIM). A microphone located in the auto-dimming interior mirror receives the voice command and sends a signal to the APIM . The microphone is also used to detect outgoing audio during a phone call.

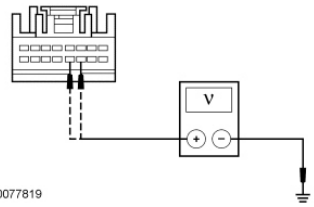
If the vehicle is equipped with navigation, the APIM receives the microphone input and also broadcasts it to the ACM . The first voice commands spoken determine which system handles the voice commands.

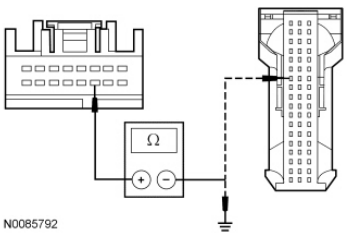
The microphone test (vehicles with navigation only) is available through the Integrated Diagnostic System (IDS) scan tool or through the ACM self-diagnostic mode. Running this test causes the ACM to produce a test tone. If the system is operating correctly, the microphone detects the tone and produces a signal to the ACM indicating the tone was heard.

- DTC B1038 (Microphone Input Circuit Failure) â set by the APIM (V1) during the on-demand self-test if it does not detect the microphone.
- DTC B1D79:01 (Microphone Input: General Electrical Failure) â set by the navigation ACM or the APIM (V2) during the microphone test when it does not receive an adequate signal from the microphone when the test tone is sounded.

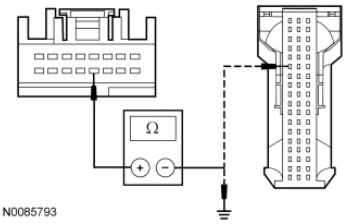
This pinpoint test is intended to diagnose the following:

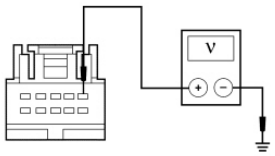




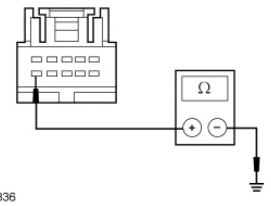


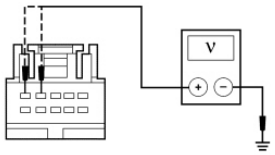
- Fuse
- Wiring, terminals or connectors
- Microphone (part of the auto-dimming interior mirror)
- Steering wheel controls
- ACM (if equipped with navigation)
- APIM

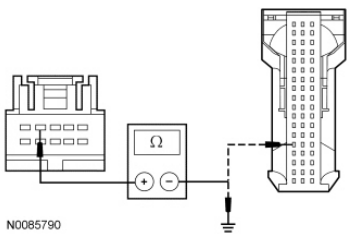




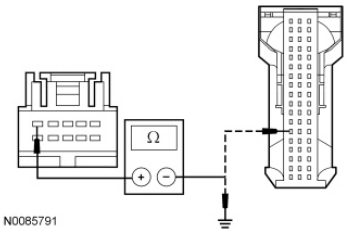
PINPOINT TEST V: VOICE RECOGNITION IS INOPERATIVE/DOES NOT OPERATE CORRECTLY â VEHICLES WITH THE SYNC SYSTEM







NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**



NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
V1 VERIFY THE OPERATION OF THE STEERING WHEEL CONTROLS	
• Operate the audio system in radio tuner (AM/FM) mode. • Press the VOICE switch on the steering wheel controls. • **Does the audio system enter voice recognition mode?**	**Yes** If the vehicles is equipped with navigation, GO to V2 . Otherwise, GO to V5 . **No** GO to Pinpoint Test F to diagnose the steering wheel controls system.
V2 CHECK THE MICROPHONE SIGNAL TO THE ACM	
• Operate the audio system in radio tuner (AM/FM) mode. • Disconnect: ACM C290b. • **NOTE:** ACM C290b must be disconnected after the ACM is powered on or the ACM will not receive the RUN message over the network. • Press the VOICE switch on the steering wheel controls.	**Yes** GO to V11 . **No** GO to V3 .

• While speaking a command, measure the AC voltage between the ACM C290b-11, circuit VMN01 (BU/BN), harness side and the ACM C290b-12, circuit RMN01 (GN), harness side.  N0077818 • **Is a fluctuating AC voltage present?**	
V3 CHECK THE MICROPHONE CIRCUITS TO THE ACM FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: APIM C3342. • Ignition ON. • Measure the voltage between the ACM C290b-11, circuit VMN01 (BU/BN), harness side and ground; and between the ACM C290b-12, circuit RMN01 (GN), harness side and ground.  N0077819 • **Is any voltage present?**	**Yes** REPAIR the circuit in question. TEST the system for normal operation. **No** GO to V4 .
V4 CHECK THE MICROPHONE CIRCUITS TO THE ACM FOR AN OPEN OR SHORT TO GROUND	
• Ignition OFF. • Measure the resistance between the ACM C290b-11, circuit VMN01 (BU/BN), harness side and the APIM C3342-12, circuit VMN01 (BU/BN), harness side; and between the ACM C290b-11, circuit VMN01 (BU/BN), harness side and ground.  N0085792	**Yes** GO to V5 . **No** REPAIR the circuit in question. TEST the system for normal operation.

• Measure the resistance between the ACM C290b-12, circuit RMN01 (GN), harness side and the APIM C3342-13, circuit RMN01 (GN), harness side; and between the ACM C290b-12, circuit RMN01 (GN), harness side and ground.  N0085793 • **Is the resistance less than 5 ohms between the ACM and the APIM , and greater than 10,000 ohms between the ACM and ground?**	
V5 CHECK THE MICROPHONE VOLTAGE SUPPLY	
• Ignition OFF. • Disconnect: Auto-Dimming Interior Mirror C9012. • Ignition ON. • Measure the voltage between the interior rear view mirror C9012-1, circuit CBP05 (YE), harness side and ground.  N0057331 • **Is the voltage greater than 10 volts?**	**Yes** GO to V6 . **No** VERIFY the Smart Junction Box (SJB) fuse 5 (5A) is OK. If OK, REPAIR the circuit. TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams Manual to identify the possible sources of the circuit short.
V6 CHECK THE MICROPHONE GROUND CIRCUIT FOR CONTINUITY	
• Ignition OFF. • Disconnect: Negative Battery Cable. • Measure the resistance between the auto-dimming interior mirror C9012-10, circuit GD143 (BK/VT), harness side and ground.	**Yes** GO to V7 . **No** REPAIR the circuit. TEST the system for normal operation.

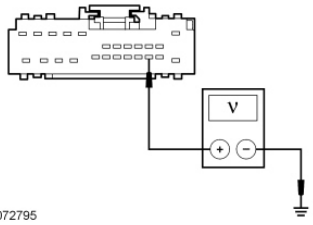
 N0057336 • **Is the resistance less than 5 ohms?**	
V7 CHECK THE MICROPHONE CIRCUITS FOR A SHORT TO VOLTAGE	
• Connect: Negative Battery Cable. • Disconnect: APIM C3342. • Ignition ON. • Measure the voltage between the auto-dimming interior mirror C9012-4, circuit VMN07 (GY), harness side and ground; and between the auto-dimming interior mirror C9012-5, circuit RMN07 (VT), harness side and ground.  N0057337 • **Is any voltage present?**	**Yes** REPAIR the circuit in question. TEST the system for normal operation. **No** GO to V8 .
V8 CHECK THE MICROPHONE CIRCUITS FOR AN OPEN OR SHORT TO GROUND	
• Ignition OFF. • Measure the resistance between the auto-dimming interior mirror C9012-4, circuit VMN07 (GY), harness side and the APIM C3342-5, circuit VMN07 (GY), harness side; and between the auto-dimming interior mirror C9012-4, circuit VMN07 (GY), harness side and ground.  N0085790 • Measure the resistance between the auto-dimming interior mirror C9012-5, circuit RMN07 (VT), harness side and the APIM C3342-6, circuit RMN07 (VT), harness side; and between the auto-dimming interior mirror C9012-5, circuit RMN07 (VT),	**Yes** GO to V9 . **No** REPAIR the circuit in question. TEST the system for normal operation.

harness side and ground.  • **Is the resistance less than 5 ohms between the auto-dimming interior mirror and the APIM , and greater than 10,000 ohms between the auto-dimming interior mirror and ground?**	
V9 ISOLATE THE AUTO-DIMMING INTERIOR MIRROR	
• Connect: APIM C3342. • Install a new auto-dimming interior mirror. Refer to Section 501-09 . • Operate the audio system in radio tuner (AM/FM) mode. • Press the VOICE switch on the steering wheel controls, and attempt several voice commands. • **Does the voice recognition operate correctly?**	**Yes** The fault was caused by an inoperative auto-dimming interior mirror. The system is now operating correctly. **No** GO to V10 .
V10 CHECK FOR CORRECT APIM OPERATION	
• Connect: All Disconnected Connectors. • Disconnect the APIM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the APIM connector and make sure it seats correctly. • Wait 2 minutes for the APIM to re-initalize. • **Is the concern still present?**	**Yes** INSTALL a new APIM . REFER to Accessory Protocol Interface Module (APIM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.
V11 CHECK FOR CORRECT ACM OPERATION	
• Disconnect all the ACM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the ACM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ACM . REFER to Audio Control Module (ACM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test W: Poor Quality/Distorted/No Sound From All Speakers

Refer to Wiring Diagrams Cell 130 , Audio System/Navigation for schematic and connector information.

Normal Operation



When the ignition is in the START position, voltage is supplied to the Audio Front Control Module (ACM) through the start sense circuit. When the ACM receives this voltage, it mutes the speaker output to prevent popping in the speakers as a result of voltage spikes during engine cranking; however, if there is a short to voltage on this circuit, the ACM continuously mutes the audio output, resulting in no sound from all speakers.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- ACM

PINPOINT TEST W: POOR QUALITY/DISTORTED/NO SOUND FROM ALL SPEAKERS

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
W1 CHECK THE START SENSE CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: ACM C290a. • Ignition ON. • Measure the voltage between the ACM C290a-15, circuit CBP11 (BN), harness side and ground.  A0072795 • **Is any voltage present?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to W2 .
W2 CHECK FOR CORRECT ACM OPERATION	
• Ignition OFF. • Disconnect all the ACM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the ACM connectors and make sure they seat correctly.	**Yes** INSTALL a new ACM . REFER to Audio Control Module (ACM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

• Operate the system and determine if the concern is still present. • **Is the concern still present?**	

Pinpoint Test X: Poor Quality/Distorted/No Sound From One Or More Speakers (Not All Speakers) â Audiophile

Refer to Wiring Diagrams Cell 130 , Audio System/Navigation for schematic and connector information.

Normal Operation

The Audio Front Control Module (ACM) directs audio signals to the audio amplifier in the form of an AC voltage. The amplifier boosts the audio signals and sends them to the speakers. The ACM provides internal circuit protection for shorts to ground or shorts to voltage.

If the vehicle is equipped with the family entertainment system, the rear channel audio signals from the ACM route to the Rear Entertainment Module (RETM), then to the audio amplifier. In dual-play mode, the RETM mutes the rear speaker output. Make sure the audio system is in single-play mode before diagnosing a speaker concern.

A short to ground or short to voltage in the circuitry to the audio amplifier can cause multiple speakers to lose sound due to the built-in overload protection feature of the ACM . In this case, a speaker fault DTC sets, and this pinpoint test should be followed to isolate the damaged circuit.

It should also be noted that when the ACM activates the built-in overload protection, DTC B1342 can also be set. The circuit failure must be repaired before DTC B1342 can be cleared.

To enable the audio amplifier, the ACM sends voltage through the enable/clip circuit. The circuit acts as both an output (to enable the amplifier) and an input (to detect an amplifier overload condition). The voltage sent by the ACM passes through a variable resistor in the audio amplifier, then to ground. As the amplifier reaches maximum output, the resistance in the variable resistor decreases. This decreases the voltage drop, resulting in the ACM detecting a higher voltage on the enable/clip circuit. When the voltage reaches the clip threshold, the ACM clips the audio output signal to the amplifier (heard as distortion), in order to prevent damage to the amplifier and speakers.

The enable/clip status is based on the following voltages, as detected by the ACM :

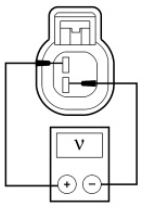
- Less than 0.4 volt: amplifier disabled
- Between 3.8 and 6.7 volts: amplifier enabled
- Greater than 8.5 volts: amplifier clipped

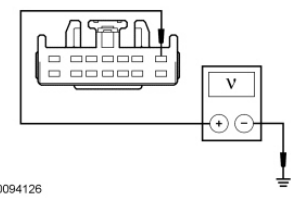
An open in the enable/clip circuit causes the speakers to produce no sound because the enable signal does not reach the audio amplifier. A short to ground or short to voltage can cause severe distortion to be heard in the speakers. In either of these scenarios, the subwoofer should continue to operate correctly, as it utilizes a separate amplifier and enable/clip circuit.

The speaker walk test can be used to isolate a concern with a particular speaker. This can reduce the diagnostic steps necessary to isolate the concern. To carry out the speaker walk test, refer to Audio Control Module (ACM) Self-Diagnostic Mode in this section.

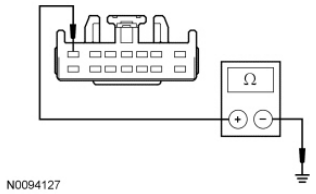
DTC Description	Fault Trigger Conditions
• B1A01:01 â Speaker #1: General Electrical Failure	Set by the navigation ACM when a failure is detected on the LH front speaker circuitry to the audio amplifier. When this DTC sets, the speaker output is disabled.
• B1A02:01 â Speaker #2: General Electrical Failure	Set by the navigation ACM when a failure is detected on the RH front speaker circuitry to the audio amplifier. When this DTC sets, the speaker output is disabled.
• B1A03:01 â Speaker #3: General Electrical Failure	Set by the navigation ACM when a failure is detected on the RH rear speaker circuitry to the audio amplifier. When this DTC sets, the speaker output is disabled.
• B1A04:01 â Speaker #4: General Electrical Failure	Set by the navigation ACM when a failure is detected on the LH rear speaker circuitry to the audio amplifier. When this DTC sets, the speaker output is disabled.
• B2965 â Audio System Speaker Circuit Fault	Set by the non-navigation ACM when a failure is detected on any of the speaker circuits to the audio amplifier. When this DTC sets, the speaker output is disabled.

This pinpoint test is intended to diagnose the following:





- Fuse
- Wiring, terminals or connectors
- Speaker
- Audio amplifier
- RETM (if equipped)
- ACM



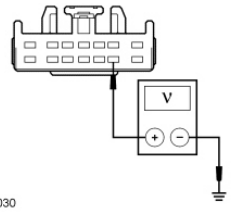
PINPOINT TEST X: POOR QUALITY/DISTORTED/NO SOUND FROM ONE OR MORE SPEAKERS (NOT ALL SPEAKERS) â AUDIOPHILE

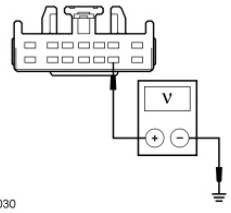
NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

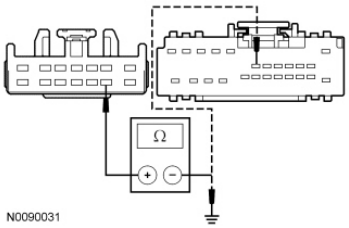
Test Step	Result / Action to Take
X1 DETERMINE THE INOPERATIVE SPEAKER(S)	
• Carry out the speaker walk test. Refer to Audio Control Module (ACM) Self-Diagnostic Mode in this section. • **Is the concern with the subwoofer speaker?**	**Yes** GO to Pinpoint Test D . **No** GO to X2 .
X2 CHECK THE AUDIO SIGNALS TO THE SUSPECT SPEAKER	

• Ignition OFF. • Disconnect: Suspect Speaker. • Operate the audio system in radio tuner (AM/FM), single-play mode. • Measure the AC voltage between the suspect speaker pins, harness side as follows: **Suspect Speaker** / **Positive Meter Lead** / **Negative Meter Lead** LF door / C523-1 VME07 (WH) / C523-2 RME07 (WH/BN) RF door / C612-1 VME10 (WH/VT) / C612-2 RME10 (WH/OG) LR door / C702-1 VME09 (WH/GN) / C702-2 RME09 (BN/YE) RR door / C802-1 VME12 (BN/WH) / C802-2 RME12 (BN/BU)  N0085779 • **Is a fluctuating AC voltage present?**	**Yes** INSTALL a new speaker for the suspect speaker. REFER to Speaker â Door in this section. TEST the system for normal operation. **No** GO to X3 .
X3 CHECK THE AUDIO AMPLIFIER VOLTAGE	
• Ignition OFF. • Disconnect: Audio Amplifier C3154b. • Measure the voltage between the audio amplifier C3154b-1, circuit SBP03 (BU/RD), harness side and ground.  N0094126 • **Is the voltage greater than 10 volts?**	**Yes** GO to X4 . **No** VERIFY the Smart Junction Box (SJB) fuse 3 (20A) is OK. If OK, REPAIR the circuit. TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short.





<table>
<tr><td>X4 CHECK THE AUDIO AMPLIFIER GROUND CIRCUIT FOR CONTINUITY</td><td></td></tr>
<tr><td>• Disconnect: Negative Battery Cable.
• Measure the resistance between the audio amplifier C3154b-7, circuit GD114 (BK/BU), harness side and ground.
 



• Is the resistance less than 5 ohms?</td><td>Yes
GO to X5 .

No
REPAIR the circuit. TEST the system for normal operation.</td></tr>
<tr><td>X5 CHECK THE AUDIO SIGNALS TO THE AUDIO AMPLIFIER</td><td></td></tr>
<tr><td>• Ignition OFF.
• Connect: Audio Amplifier C3154b.
• Disconnect: Audio Amplifier C3154a.
• Operate the audio system in radio tuner (AM/FM) mode.
• Measure the AC voltage between the audio amplifier pins, harness side as follows:
<table><tr><th>Suspect Speaker</th><th>Positive Meter Lead</th><th>Negative Meter Lead</th></tr><tr><td>LF door</td><td>C3154a-8

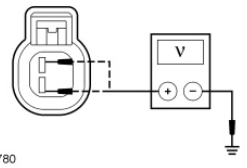
GO to X6 .

No
If the vehicle is equipped with the family entertainment system and the concern is with a rear speaker, GO to X11 .

Otherwise, GO to X14 .</td></tr>
<tr><td>X6 CHECK THE AUDIO AMPLIFIER ENABLE CIRCUIT FOR CORRECT VOLTAGE</td><td></td></tr>
</table>

• Ignition OFF. • Disconnect: Audio Amplifier C3154b. • Operate the audio system in radio tuner (AM/FM) mode. • Measure the voltage between the audio amplifier C3154b-9, circuit CME27 (YE/VT), harness side and ground.  N0090030 • **Is the voltage between 3.8 and 6.7 volts?**	**Yes** GO to X9 . **No** GO to X7 .
X7 CHECK THE AUDIO AMPLIFIER ENABLE CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: ACM C290a. • Ignition ON. • Measure the voltage between the audio amplifier C3154b-9, circuit CME27 (YE/VT), harness side and ground.  N0090030 • **Is any voltage present?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to X8 .
X8 CHECK THE AUDIO AMPLIFIER ENABLE CIRCUIT FOR AN OPEN OR SHORT TO GROUND	
• Ignition OFF. • Measure the resistance between the audio amplifier C3154b-9, circuit CME27 (YE/VT), harness side and the ACM C290a-7, circuit CME27 (YE/VT); and between the audio amplifier C3154b-9, circuit CME27 (YE/VT), harness side and ground.	**Yes** GO to X16 . **No** REPAIR the circuit. TEST the system for normal operation.

- **Is the resistance less than 5 ohms between the audio amplifier and the ACM , and greater than 10,000 ohms between the audio amplifier and ground?**



X9 CHECK THE SPEAKER CIRCUITS FOR A SHORT TO VOLTAGE

- Ignition OFF.
- Disconnect: Suspect Speaker.
- Measure the voltage between the suspect speaker, harness side and ground as follows:

Suspect Speaker	Positive Meter Lead	Negative Meter Lead
LF door	C523-1 VME07 (WH)	Ground
	C523-2 RME07 (WH/BN)	Ground
RF door	C612-1 VME10 (WH/VT)	Ground
	C612-2 RME10 (WH/OG)	Ground
LR door	C702-1 VME09 (WH/GN)	Ground
	C702-2 RME09 (BN/YE)	Ground
RR door	C802-1 VME12 (BN/WH)	Ground
	C802-2 RME12 (BN/BU)	Ground

Yes
REPAIR the circuit in question. TEST the system for normal operation.

No
GO to X10 .

- **Is any voltage present?**

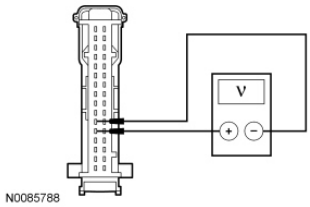
X10 CHECK THE SPEAKER CIRCUITS FOR AN OPEN OR SHORT TO GROUND

- Ignition OFF.
- Measure the resistance between the audio amplifier, harness side and the suspect speaker, harness side; and between the audio amplifier, harness side and ground as follows:

Suspect Speaker	Positive Meter Lead	Negative Meter Lead	Circuit
LF door	C3154b-13	C523-1, then ground	VME07 (WH)
	C3154b-6	C523-2, then ground	RME07 (WH/BN)
RF door	C3154b-11	C612-1, then ground	VME10 (WH/VT)
	C3154b-4	C612-2, then ground	RME10 (WH/OG)
LR door	C3154b-12	C702-1, then ground	VME09 (WH/GN)
	C3154b-5	C702-2, then ground	RME09 (BN/YE)
RR door	C3154b-10	C802-1, then ground	VME12 (BN/WH)
	C3154b-3	C802-2, then ground	RME12 (BN/BU)

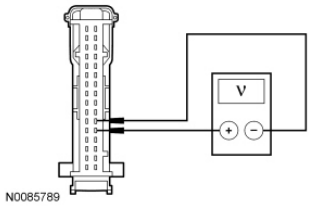
- **Are the resistances less than 5 ohms between the audio amplifier and the suspect speaker, and greater than 10,000 ohms between the audio amplifier and ground?**

Yes
INSTALL a new audio amplifier. REFER to Audio Amplifier in this section. TEST the system for normal operation.



No
REPAIR the circuit in question. TEST the system for normal operation.

X11 CHECK THE AUDIO SIGNALS TO THE RETM



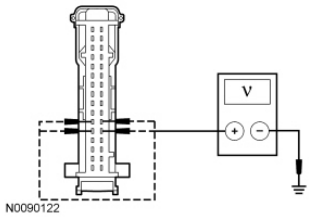
- Ignition OFF.
- Disconnect: RETM C9029.
- Operate the audio system in radio tuner (AM/FM), single-play mode.
- Measure the AC voltage between the RETM C9029-11, circuit VME12 (BN/WH), harness side and the RETM C9029-12, circuit RME12 (BN/BU), harness side.

Yes
GO to X14 .

No
GO to X12 .

- Measure the AC voltage between the RETM C9029-27, circuit VME09 (WH/GN), harness side and the RETM C9029-28, circuit RME09 (BN/YE), harness side.

- **Is a fluctuating AC voltage present?**



X12 CHECK THE AUDIO CIRCUITS TO THE RETM FOR A SHORT TO VOLTAGE

- Ignition OFF.
- Disconnect: ACM C290a.
- Ignition ON.
- Measure the voltage between the RETM , harness side and ground as follows:

Positive Meter Lead	Negative Meter Lead
C9029-11 VME12 (BN/WH)	Ground
C9029-12 RME12 (BN/BU)	Ground
C9029-27 VME09 (WH/GN)	Ground
C9029-28 RME09 (BN/YE)	Ground

Yes
REPAIR the circuit in question. CLEAR any DTCs present. TEST the system for normal operation.

No
GO to X13 .

- **Is any voltage present?**

X13 CHECK THE AUDIO CIRCUITS TO THE RETM FOR AN OPEN OR SHORT TO GROUND

- Ignition OFF.
- Measure the resistance between the RETM , harness side and the ACM , harness side; and between the RETM , harness side and ground as follows:

Positive Meter Lead	Negative Meter Lead	Circuit
C9029-11	C290a-10, then ground	VME12 (BN/WH)
C9029-12	C290a-23, then ground	RME12 (BN/BU)
C9029-27	C290a-9, then ground	VME09 (WH/GN)
C9029-28	C290a-22, then ground	RME09 (BN/YE)

- **Are the resistances less than 5 ohms between the RETM and the ACM , and greater than 10,000 ohms between the RETM and ground?**

Yes
GO to X14 .

No
REPAIR the circuit in question. CLEAR any DTCs present. REPEAT the self-test.

X14 CHECK THE AUDIO CIRCUITS TO THE AUDIO AMPLIFIER FOR A SHORT TO VOLTAGE

- Ignition OFF.
- Disconnect: ACM C290a.
- Ignition ON.
- Measure the voltage between the audio amplifier, harness side and ground as follows:

Suspect Speaker	Positive Meter Lead	Negative Meter Lead
LF door	C3154a-8 VME07 (WH)	Ground
	C3154a-4	Ground

Yes
REPAIR the circuit in question. CLEAR any DTCs present. TEST the system for normal operation.

No
GO to X15 .

	RME07 (WH/BN)	
RF door	C3154a-6 VME10 (WH/VT)	Ground
	C3154a-2 RME10 (WH/OG)	Ground
LR door	C3154a-7 VME09 (WH/GN)	Ground
	C3154a-3 RME09 (BN/YE)	Ground
RR door	C3154a-5 VME12 (BN/WH)	Ground
	C3154a-1 RME12 (BN/BU)	Ground

- **Is any voltage present?**

X15 CHECK THE AUDIO CIRCUITS TO THE AUDIO AMPLIFIER FOR AN OPEN OR SHORT TO GROUND

- Ignition OFF.
- For a front speaker concern, measure the resistance between the audio amplifier, harness side and the ACM , harness side; and between the audio amplifier, harness side and ground as follows:

Suspect Speaker	Positive Meter Lead	Negative Meter Lead	Circuit
LF door	C3154a-8	C290a-8, then ground	VME07 (WH)
	C3154a-4	C290a-21, then ground	RME07 (WH/BN)
RF door	C3154a-6	C290a-11, then ground	VME10 (WH/VT)
	C3154a-2	C290a-12, then ground	RME10 (WH/OG)

- For a rear speaker concern, measure the resistance between the audio amplifier, harness side and the RETM , harness side; and between the audio amplifier, harness side and ground as follows:

Yes
If the vehicle is equipped with the family entertainment system and the concern is with a rear speaker, GO to X17 .

Otherwise, GO to X16 .

No
REPAIR the circuit in question. CLEAR any DTCs present. TEST the system for normal operation.

Suspect Speaker	Positive Meter Lead	Negative Meter Lead	Circuit
LR door	C3154a-7	C9029-30, then ground	VME09 (WH/GN)
	C3154a-3	C9029-29, then ground	RME09 (BN/YE)
RR door	C3154a-5	C9029-14, then ground	VME12 (BN/WH)
	C3154a-1	C9029-13, then ground	RME12 (BN/BU)

- **Are the resistances less than 5 ohms?**

X16 CHECK FOR CORRECT ACM OPERATION	
• Ignition OFF. • Connect: All Disconnected Connectors. • Disconnect all the ACM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the ACM connectors and make sure they seat correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ACM . REFER to Audio Control Module (ACM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR any DTCs present.
X17 CHECK FOR CORRECT RETM OPERATION	
• Ignition OFF. • Connect: All Disconnected Connectors. • Disconnect the RETM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the RETM connector and make sure it seats correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new RETM . REFER to Rear Entertainment Module (RETM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR any DTCs present.

Pinpoint Test Y: The Audio Front Control Module (ACM) Does Not Respond To Touchscreen Or Button Presses

Normal Operation

When a button is pressed on the Audio Front Control Module (ACM) (whether it is a hard button or the touchscreen), a signal is sent over the Medium Speed Controller Area Network (MS-CAN) to the modules in the audio system.

- B2924 (Audio Button Stuck) â sets in continuous memory when an ACM hard button is stuck for longer than 2 minutes, or during the on-demand self-test if an ACM hard button is detected as active for any duration. Make sure no ACM buttons are pressed during the self-test. This DTC applies to vehicles without navigation only.
- U2013:63 (Switch Pack: Circuit / Component Protection Time-Out) â sets in continuous memory when an ACM hard button is stuck for longer than 2 minutes, or during the on-demand self-test if an ACM hard button is detected as active for any duration. Make sure no ACM buttons are pressed during the self-test. This DTC applies to vehicles with navigation only.

This pinpoint test is intended to diagnose the following:

- Communication network concern
- ACM

PINPOINT TEST Y: THE ACM DOES NOT RESPOND TO TOUCHSCREEN OR BUTTON PRESSES

Test Step	Result / Action to Take
Y1 CHECK FOR DTC B2924 OR DTC U2013:63	
• Ignition ON. • Clear the ACM DTCs. • Wait 3 minutes. • Repeat the ACM self-test, making sure that no buttons are pressed during the test. • **Is DTC B2924 or DTC U2013:63 set in the ACM ?**	**Yes** GO to Y3 . **No** GO to Y2 .
Y2 CHECK FOR LOST COMMUNICATION DTCs	
NOTE: Audio system lost communication DTCs include U0184, U0184:00, U0193, U0193:00, U0196, U0196:00, U0197, and U0197:00. • Using the scan tool, retrieve all continuous DTCs from all modules. • **Are audio system lost communication DTCs present in any module?**	**Yes** REFER to the DTC Charts in this section. **No** GO to Y3 .
Y3 CHECK FOR CORRECT ACM OPERATION	
• Ignition OFF. • Disconnect all the ACM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the ACM connectors and make sure they seat correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ACM . REFER to Audio Control Module (ACM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test Z: The Audio Front Control Module (ACM) Display Touchscreen Display Is Inoperative/Does Not Operate Correctly â Vehicles With Navigation

Normal Operation

The Audio Front Control Module (ACM) receives inputs via the Medium Speed Controller Area Network (MS-CAN) from the following modules:

- ♦ Accessory Protocol Interface Module (APIM): SYNC system information (if equipped)
- ♦ Rear Entertainment Module (RETM): family entertainment system information (if equipped)

If the ACM loses the signal from any of these modules, only that specific display is inoperative.

Because the satellite radio receiver is internal to the ACM , all satellite radio information on the display is directly generated by the ACM .

The compass heading is derived from the Global Positioning System (GPS) antenna. If there is a concern with the compass display, there should also be a concern with the GPS signal. GO to Pinpoint Test K .

This pinpoint test is intended to diagnose the following:

- Communication network concern
- ACM

PINPOINT TEST Z: THE ACM DISPLAY TOUCHSCREEN DISPLAY IS INOPERATIVE/DOES NOT OPERATE CORRECTLY â VEHICLES WITH NAVIGATION

<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>
<tr><td>Z1 OBSERVE THE ACM DISPLAY</td><td></td></tr>
<tr><td>• Turn the audio system on and observe the ACM screen.
• Is the ACM display completely inoperative?</td><td>Yes
GO to Z4 .

No
GO to Z2 .</td></tr>
<tr><td>Z2 CHECK THE ACM DISPLAY SEGMENTS</td><td></td></tr>
<tr><td>• Carry out the Audio Display Test. Refer to Audio Control Module (ACM) Self-Diagnostic Mode in this section.
• Do all of the ACM segments illuminate?</td><td>Yes
GO to Z3 .

No
GO to Z5 .</td></tr>
<tr><td>Z3 OBSERVE THE SPECIFIC INOPERATIVE DISPLAY</td><td></td></tr>
<tr><td>• Observe the inoperative ACM display while carrying out the indicated diagnostic method as follows:

<table><tr><th>Inoperative Display</th><th>Diagnostic Method</th><th>Expected Results</th></tr></table></td><td>Yes
The system is operating correctly at this time. INSTRUCT the customer about the operation of the ACM displays.</td></tr>
</table>

Audio system	Turn the audio system on, press the RADIO button, and adjust the audio settings using the touchscreen.	The ACM changes the setting and updates the display to show the change in audio setting.	**No** GO to Z4 .
Satellite radio system	Turn the audio system on, press the MEDIA button until satellite radio mode is entered, and adjust the settings using the touchscreen.	The ACM changes the setting and updates the display to show the change in satellite radio setting.	
SYNC system (if equipped)	Turn the audio system on, press the PHONE button, and attempt several functions using the touchscreen.	The ACM display shows information relating to the phone.	
Family entertainment system (if equipped)	Turn the audio system on, insert a known good DVD in the RETM , press the AUX button until the audio system is in rear entertainment mode, and observe the display.	The ACM display shows information relating to the family entertainment system.	

- **Does the inoperative display confirm the expected results?**

Z4 CHECK FOR LOST COMMUNICATION DTCs	
NOTE: Audio system lost communication DTCs include U0184, U0184:00, U0196, U0196:00, U0197, and U0197:00. • Using the scan tool, retrieve all continuous DTCs from all modules. • **Are audio system lost communication DTCs present in any module?**	**Yes** REFER to the DTC Charts in this section. **No** GO to Z5 .
Z5 CHECK FOR CORRECT ACM OPERATION	
• Ignition OFF. • Disconnect all the ACM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the ACM connectors and make sure they seat correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ACM . REFER to Audio Control Module (ACM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test AA: No Auxiliary Headphone Audio

Normal Operation

The Rear Entertainment Module (RETM) sends wireless audio signals to the headphones. In dual-play mode, the audio to the rear speakers is muted and the RETM continues to control the rear audio source to the headphones. When the headphones are set to channel A, all audio sources can be accessed. When the headphones are set to channel B, only the DVD audio and auxiliary audio sources (such as a gaming system) can be sent to the headphones.

This pinpoint test is intended to diagnose the following:

- Customer setting
- Headphone batteries
- Headphones
- RETM

PINPOINT TEST AA: NO AUXILIARY HEADPHONE AUDIO

Test Step	Result / Action to Take
AA1 CHECK THE HEADPHONE AUDIO	
NOTE: For additional information on operating the headphones, refer to the Owner's Literature. • Turn the suspect headphones on, and set them to channel A. • Operate the audio system in dual-play mode, and set the channel A source to FM1. • Adjust the volume as necessary, and observe the suspect headphone audio. • Set the suspect headphones to channel B. • Insert a known good DVD into the RETM . • Set the channel B source to DVD, adjust the volume as necessary, and observe the suspect headphone audio. • **Does the headphone audio operate correctly for both channels?**	**Yes** The system is OK at this time. The concern may have been caused by a customer setting. INSTRUCT the customer about the correct operation of the family entertainment system. **No** If there is no audio for both channels, GO to AA2 . If only one channel has no audio, REPLACE the suspect headphones. TEST the system for normal operation.
AA2 SUBSTITUTE THE HEADPHONE BATTERIES	
• Install new batteries in the suspect headphones. • Operate the audio system in dual-play mode and observe the headphone audio.	**Yes** The concern was caused by inoperative batteries. The system is now operating correctly. **No** GO to AA3 .

• **Does the headphone audio operate correctly?**	
AA3 ISOLATE THE HEADPHONES	
• Substitute a known good set of headphones. • Operate the audio system in dual-play mode and observe the headphone audio. • **Does the headphone audio operate correctly?**	**Yes** REPLACE the suspect headphones. TEST the system for normal operation. **No** GO to AA4 .
AA4 CHECK FOR CORRECT RETM OPERATION	
• Ignition OFF. • Disconnect the RETM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the RETM connector and make sure it seats correctly. • **Is the concern still present?**	**Yes** INSTALL a new RETM . REFER to Rear Entertainment Module (RETM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test AB: While In Dual-Play Mode With Both Audio Sources Set To The SYNC System, One Audio Source Is Inoperative â Vehicles With A Family Entertainment System

Normal Operation

The Rear Entertainment Module (RETM) allows for dual-play mode to include separate SYNC system audio sources on the front and rear channels. To do this, the Accessory Protocol Interface Module (APIM) transmits SYNC system audio signals over an additional set of circuits.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- APIM
- RETM

PINPOINT TEST AB: WHILE IN DUAL-PLAY MODE WITH BOTH AUDIO SOURCES SET TO THE SYNC SYSTEM, ONE AUDIO SOURCE IS INOPERATIVE â VEHICLES WITH A FAMILY ENTERTAINMENT SYSTEM

Test Step	Result / Action to Take
AB1 CHECK THE AUDIO CIRCUITS TO THE RETM FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: RETM C9029. • Disconnect: APIM C3342. • Ignition ON.	**Yes** REPAIR the circuit in question. TEST the system for normal operation. **No**

• Measure the voltage between the RETM , harness side and ground as follows: **Positive Meter Lead** / **Negative Meter Lead** / **Circuit** C9029-3 / Ground / RME52 (GY/OG) C9029-4 / Ground / VME52 (BU) C9029-19 / Ground / RME53 (BN/WH) C9029-20 / Ground / VME53 (VT/GN) • **Is any voltage present?**	GO to AB2 .
AB2 CHECK THE AUDIO CIRCUITS TO THE RETM FOR AN OPEN OR SHORT TO GROUND	
• Ignition OFF. • Measure the resistance between the RETM , harness side and the APIM , harness side; and between the RETM , harness side and ground as follows: **Positive Meter Lead** / **Negative Meter Lead** / **Circuit** C9029-3 / C3342-26, then ground / RME52 (GY/OG) C9029-4 / C3342-25, then ground / VME52 (BU) C9029-19 / C3342-24, then ground / RME53 (BN/WH) C9029-20 / C3342-23, then ground / VME53 (VT/GN) • **Is the resistance less than 5 ohms between the RETM and the APIM , and greater than 10,000 ohms between the RETM and ground?**	**Yes** GO to AB3 . **No** REPAIR the circuit in question. TEST the system for normal operation.
AB3 CHECK FOR CORRECT APIM OPERATION	
• Connect: RETM C9029. • Disconnect the APIM connector. • Check for: ♦ corrosion	**Yes** INSTALL a new APIM . REFER to Accessory Protocol Interface Module (APIM) in this section. TEST the system for normal operation. If the concern is still present, GO to AB4 .

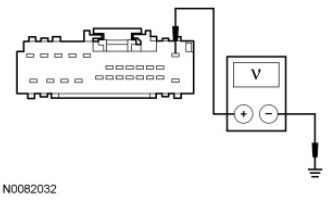
♦ damaged pins ♦ pushed-out pins • Connect the APIM connector and make sure it seats correctly. • Wait 2 minutes for the APIM to re-initalize. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.
AB4 CHECK FOR CORRECT RETM OPERATION	
• Ignition OFF. • Disconnect the RETM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the RETM connector and make sure it seats correctly. • **Is the concern still present?**	**Yes** INSTALL a new RETM . REFER to Rear Entertainment Module (RETM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test AC: DTC B1318 Or DTC U3003:16 (Audio Front Control Module (ACM))

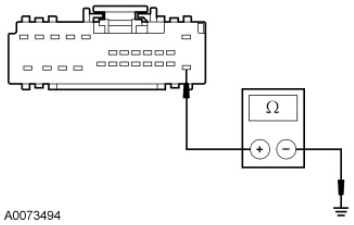
Normal Operation

- DTC B1318 (Battery Voltage Low) â set by the non-navigation Audio Front Control Module (ACM) when the supply voltage falls below 10 volts for at least 10 seconds during normal operation.
- DTC U3003:16 (Battery Voltage: Circuit Voltage Below Threshold) â set by the navigation Audio Front Control Module (ACM) when the supply voltage falls below 10 volts for at least 10 seconds during normal operation, or for greater than 250 milliseconds during the self-test.

This pinpoint test is intended to diagnose the following:



- Wiring, terminals or connectors
- High circuit resistance
- ACM



PINPOINT TEST AC: DTC B1318 OR U3003:16 (ACM)

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
AC1 RECHECK THE ACM DTCs	
• Ignition ON. • Clear the ACM DTCs. • Wait at least 15 seconds.	**Yes** GO to AC2 . **No**

• Repeat the ACM self-test. • **Is DTC B1318 or U3003:16 still present?**	The system is operating correctly at this time. The DTC may have been set due to a previous low battery voltage condition.
AC2 CHECK FOR CHARGING SYSTEM DTCs IN THE PCM	
• Retrieve the continuous DTCs from all modules. • **Is DTC P0620, P0622, P0625, or P065B set in the PCM?**	**Yes** REFER to Section 414-00 . **No** GO to AC3 .
AC3 CHECK THE BATTERY CONDITION AND STATE OF CHARGE	
• Check the battery condition and verify that the battery is fully charged. Refer to Section 414-01 . • **Is the battery OK and fully charged?**	**Yes** GO to AC4 . **No** REFER to Section 414-01 .
AC4 CHECK THE ACM VOLTAGE SUPPLY	
• Ignition OFF. • Measure and record the voltage at the battery. • Disconnect: ACM C290a. • Ignition ON. • Measure the voltage between the ACM C290a-1, circuit SBP03 (BU/RD), harness side and ground.  N0082032 • **Is the voltage at the ACM within 0.2 volt of the recorded battery voltage?**	**Yes** GO to AC5 . **No** REPAIR the circuit for high resistance. CLEAR the DTCs. REPEAT the self-test.
AC5 CHECK THE ACM GROUND CIRCUIT FOR CONTINUITY	
• Ignition OFF. • Disconnect: Negative Battery Cable. • Measure the resistance between the ACM C290a-13, circuit GD114 (BK/BU), harness side and ground.	**Yes** GO to AC6 . **No** REPAIR the circuit for high resistance. CLEAR the DTCs. REPEAT the self-test.

 • **Is the resistance less than 5 ohms?**	
AC6 CHECK FOR CORRECT ACM OPERATION	
• Ignition OFF. • Connect: Negative Battery Cable. • Disconnect all the ACM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the ACM connectors and make sure they seat correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ACM . REFER to Audio Control Module (ACM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs.

Pinpoint Test AD: DTC U3003:17 (Audio Front Control Module (ACM) â With Navigation)

Normal Operation

- DTC U3003:17 (Battery Voltage: Circuit Voltage Above Threshold) â set by the Audio Front Control Module (ACM) when the supply voltage is greater than 15.8 volts for more than 250 milliseconds during normal operation or the self-test.

This pinpoint test is intended to diagnose the following:

- Charging system concern
- ACM

PINPOINT TEST AD: DTC U3003:17 (ACM â WITH NAVIGATION)

NOTE: DTC U3003:17 may be stored in the module memory due to past battery charging or vehicle jump starting events.

Test Step	Result / Action to Take
AD1 CHECK FOR HIGH VOLTAGE DTCs SET IN OTHER MODULES	
• Ignition ON. • Retrieve all continuous DTCs from all modules. • **Is DTC B1317, B1676, P0563 (PCM), or U3003:17 set in more than one module?**	**Yes** REFER to Section 414-00 to diagnose an overcharging condition. **No** GO to AD2 .
AD2 CHECK THE BATTERY VOLTAGE	

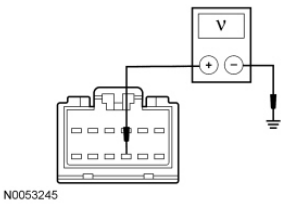
• Turn off all interior/exterior lights and accessories. • Start and run the engine at approximately 2,000 rpm for 3 minutes while monitoring the battery voltage. • **Does the battery voltage rise to 15.5 volts or higher?**	**Yes** REFER to Section 414-00 to diagnose an overcharging condition. **No** GO to AD3 .
AD3 RECHECK FOR DTC U3003:17	
• Ignition OFF. • Ignition ON. • Clear the ACM DTCs. • Repeat the ACM self-test. • **Is DTC U3003:17 still present?**	**Yes** INSTALL a new ACM . REFER to Audio Control Module (ACM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The DTC may have been set previously during battery charging or while jump starting the vehicle.

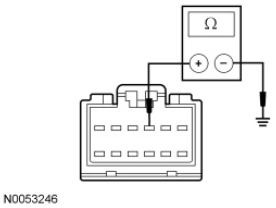
Pinpoint Test AE: DTC B1318 (Satellite Digital Audio Receiver System (SDARS) Module)

Normal Operation

- DTC B1318 (Battery Voltage Low) â set by the Satellite Digital Audio Receiver System (SDARS) module when the supply voltage falls below 10 volts for at least 10 seconds during normal operation.

This pinpoint test is intended to diagnose the following:





- Wiring, terminals or connectors
- High circuit resistance
- SDARS module

PINPOINT TEST AE: DTC B1318 (SDARS MODULE)

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
AE1 RECHECK THE SDARS MODULE DTCs	
• Ignition ON. • Clear the SDARS module DTCs. • Wait at least 15 seconds. • Repeat the SDARS module self-test. • **Is DTC B1318 still present?**	**Yes** GO to AE2 . **No** The system is operating correctly at this time. The DTC may have been set due to a previous low battery voltage condition.
AE2 CHECK FOR CHARGING SYSTEM DTCs IN THE PCM	

• Retrieve the continuous DTCs from all modules. • **Is DTC P0620, P0622, P0625, or P065B set in the PCM?**	**Yes** REFER to Section 414-00 . **No** GO to AE3 .
AE3 CHECK THE BATTERY CONDITION AND STATE OF CHARGE	
• Check the battery condition and verify that the battery is fully charged. Refer to Section 414-01 . • **Is the battery OK and fully charged?**	**Yes** GO to AE4 . **No** REFER to Section 414-01 .
AE4 CHECK THE SDARS MODULE VOLTAGE SUPPLY	
• Ignition OFF. • Measure and record the voltage at the battery. • Disconnect: SDARS Module C3290. • Ignition ON. • Measure the voltage between the SDARS module C3290-9, circuit SBB41 (RD), harness side and ground.  N0053245 • **Is the voltage at the SDARS module within 0.2 volt of the recorded battery voltage?**	**Yes** GO to AE5 . **No** REPAIR the circuit for high resistance. CLEAR the DTCs. REPEAT the self-test.
AE5 CHECK THE SDARS MODULE GROUND CIRCUIT FOR CONTINUITY	
• Ignition OFF. • Disconnect: Negative Battery Cable. • Measure the resistance between the SDARS module C3290-3, circuit GD114 (BK/BU), harness side and ground.  N0053246	**Yes** GO to AE6 . **No** REPAIR the circuit for high resistance. CLEAR the DTCs. REPEAT the self-test.

• **Are the resistances less than 5 ohms?**	
AE6 CHECK FOR CORRECT SDARS MODULE OPERATION	
• Ignition OFF. • Connect: Negative Battery Cable. • Disconnect the SDARS module connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the SDARS module connector and make sure it seats correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SDARS module. REFER to Satellite Digital Audio Receiver System (SDARS) Module in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test AF: DTC B1317 Or DTC U3003:17 (Accessory Protocol Interface Module (APIM))

Normal Operation

- DTC B1317 (Battery Voltage High) â set by the Accessory Protocol Interface Module (APIM) (V1) when the supply voltage is greater than 15.8 volts for more than 250 milliseconds during normal operation.
- DTC U3003:17 (Battery Voltage: Circuit Voltage Above Threshold) â set by the APIM (V2) when the supply voltage is greater than 15.8 volts for more than 250 milliseconds during normal operation.

This pinpoint test is intended to diagnose the following:

- Charging system concern
- APIM

PINPOINT TEST AF: DTC B1317 OR DTC U3003:17 (APIM)

NOTE: DTC B1317 or DTC U3003:17 may be stored in the module memory due to past battery charging or vehicle jump starting events.

Test Step	Result / Action to Take
AF1 CHECK FOR HIGH VOLTAGE DTCs SET IN OTHER MODULES	
• Ignition ON. • Retrieve all continuous DTCs from all modules. • **Is DTC B1317, B1676, P0563 (PCM), or U3003:17 set in more than one module?**	**Yes** REFER to Section 414-00 to diagnose an overcharging condition. **No** GO to AF2 .
AF2 CHECK THE BATTERY VOLTAGE	
• Turn off all interior/exterior lights and accessories.	**Yes** REFER to Section 414-00 to diagnose an overcharging condition.

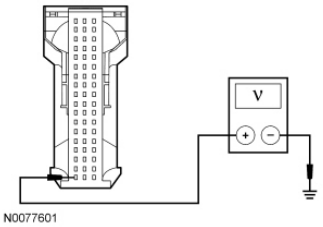
• Start and run the engine at approximately 2,000 rpm for 3 minutes while monitoring the battery voltage. • **Does the battery voltage rise to 15.5 volts or higher?**	**No** GO to AF3 .
AF3 RECHECK FOR DTC B1317 OR DTC U3003:17	
• Ignition OFF. • Ignition ON. • Clear the APIM DTCs. • Repeat the APIM self-test. • **Is DTC B1317 or DTC U3003:17 still present?**	**Yes** INSTALL a new APIM . REFER to Accessory Protocol Interface Module (APIM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The DTC may have been set previously during battery charging or while jump starting the vehicle.

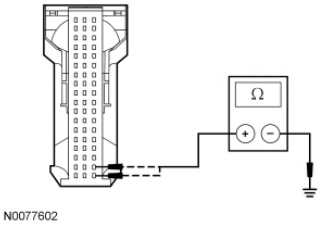
Pinpoint Test AG: DTC B1318 Or DTC U3003:16 (Accessory Protocol Interface Module (APIM))

Normal Operation

- DTC B1318 (Battery Voltage Low) â set by the Accessory Protocol Interface Module (APIM) (V1) when the supply voltage falls below 10 volts for at least 10 seconds during normal operation.
- DTC U3003:16 (Battery Voltage: Circuit Voltage Below Threshold) â set by the APIM (V2) when the supply voltage falls below 10 volts for at least 10 seconds during normal operation.

This pinpoint test is intended to diagnose the following:





- Wiring, terminals or connectors
- High circuit resistance
- APIM

PINPOINT TEST AG: DTC B1318 OR DTC U3003:16 (APIM)

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
AG1 RECHECK THE APIM DTCs	
• Ignition ON. • Clear the APIM DTCs. • Wait at least 15 seconds. • Repeat the APIM self-test. • **Is DTC B1318 or DTC U3003:16 still present?**	**Yes** GO to AG2 . **No** The system is operating correctly at this time. The DTC may have been set due to a previous low battery voltage condition.

AG2 CHECK FOR CHARGING SYSTEM DTCs IN THE PCM	
• Retrieve the continuous DTCs from all modules. • **Is DTC P0620, P0622, P0625, or P065B set in the PCM?**	**Yes** REFER to Section 414-00 . **No** GO to AG3 .
AG3 CHECK THE BATTERY CONDITION AND STATE OF CHARGE	
• Check the battery condition and verify that the battery is fully charged. Refer to Section 414-01 . • **Is the battery OK and fully charged?**	**Yes** GO to AG4 . **No** REFER to Section 414-01 .
AG4 CHECK THE APIM VOLTAGE SUPPLY	
• Ignition OFF. • Measure and record the voltage at the battery. • Disconnect: APIM C3342. • Ignition ON. • Measure the voltage between the APIM C3342-1, circuit SBB41 (RD), harness side and ground.  N0077601 • **Is the voltage at the APIM within 0.2 volt of the recorded battery voltage?**	**Yes** GO to AG5 . **No** REPAIR the circuit for high resistance. CLEAR the DTCs. REPEAT the self-test.
AG5 CHECK THE APIM GROUND CIRCUITS FOR CONTINUITY	
• Ignition OFF. • Disconnect: Negative Battery Cable. • Measure the resistance between the APIM C3342-37, circuit GD114 (BK/BU), harness side and ground; and between the APIM C3342-38, circuit GD114 (BK/BU), harness side and ground.  N0077602 • **Are the resistances less than 5 ohms?**	**Yes** GO to AG6 . **No** REPAIR the circuit in question for high resistance. CLEAR the DTCs. REPEAT the self-test.

AG6 CHECK FOR CORRECT APIM OPERATION	
• Disconnect the APIM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the APIM connector and make sure it seats correctly. • Wait 2 minutes for the APIM to re-initalize. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new APIM . REFER to Accessory Protocol Interface Module (APIM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs.

Pinpoint Test AH: DTC B1317 (Rear Entertainment Module (RETM))

Normal Operation

- DTC B1317 (Battery Voltage High) â set by the Rear Entertainment Module (RETM) when the supply voltage is greater than 16.0 volts for more than 10 seconds during normal operation.

This pinpoint test is intended to diagnose the following:

- Charging system concern
- RETM

PINPOINT TEST AH: DTC B1317 (RETM)

NOTE: DTC B1317 may be stored in the module memory due to past battery charging or vehicle jump starting events.

Test Step	Result / Action to Take
AH1 CHECK FOR HIGH VOLTAGE DTCs SET IN OTHER MODULES	
• Ignition ON. • Retrieve all continuous DTCs from all modules. • **Is DTC B1317, B1676, P0563 (PCM), or U3003:17 set in more than one module?**	**Yes** REFER to Section 414-00 to diagnose an overcharging condition. **No** GO to AH2 .
AH2 CHECK THE BATTERY VOLTAGE	
• Turn off all interior/exterior lights and accessories. • Start and run the engine at approximately 2,000 rpm for 3 minutes while monitoring the battery voltage.	**Yes** REFER to Section 414-00 to diagnose an overcharging condition. **No** GO to AH3 .

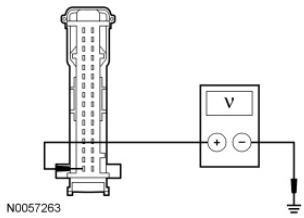
• **Does the battery voltage rise to 15.5 volts or higher?**	
AH3 RECHECK FOR DTC B1317	
• Ignition OFF. • Ignition ON. • Clear the RETM DTCs. • Repeat the RETM self-test. • **Is DTC B1317 still present?**	**Yes** INSTALL a new RETM . REFER to Rear Entertainment Module (RETM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The DTC may have been set previously during battery charging or while jump starting the vehicle.

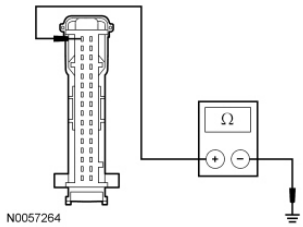
Pinpoint Test AI: DTC B1318 (Rear Entertainment Module (RETM))

Normal Operation

- DTC B1318 (Battery Voltage Low) â set by the Rear Entertainment Module (RETM) when the supply voltage falls below 10 volts for at least 10 seconds during normal operation.

This pinpoint test is intended to diagnose the following:





- Wiring, terminals or connectors
- High circuit resistance
- RETM

PINPOINT TEST AI: DTC B1318 (RETM)

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
AI1 RECHECK THE RETM DTCs	
• Ignition ON. • Clear the RETM DTCs. • Wait at least 15 seconds. • Repeat the RETM self-test. • **Is DTC B1318 still present?**	**Yes** GO to AI2 . **No** The system is operating correctly at this time. The DTC may have been set due to a previous low battery voltage condition.
AI2 CHECK FOR CHARGING SYSTEM DTCs IN THE PCM	
• Retrieve the continuous DTCs from all modules. • **Is DTC P0620, P0622, P0625, or P065B set in the PCM?**	**Yes** REFER to Section 414-00 . **No** GO to AI3 .

AI3 CHECK THE BATTERY CONDITION AND STATE OF CHARGE	
• Check the battery condition and verify that the battery is fully charged. Refer to Section 414-01 . • **Is the battery OK and fully charged?**	**Yes** GO to AI4 . **No** REFER to Section 414-01 .
AI4 CHECK THE RETM VOLTAGE SUPPLY	
• Ignition OFF. • Measure and record the voltage at the battery. • Disconnect: RETM C9029. • Ignition ON. • Measure the voltage between the RETM C9029-16, circuit SBB41 (RD), harness side and ground.  • **Is the voltage at the RETM within 0.2 volt of the recorded battery voltage?**	**Yes** GO to AI5 . **No** REPAIR the circuit for high resistance. CLEAR the DTCs. REPEAT the self-test.
AI5 CHECK THE RETM GROUND CIRCUITS FOR CONTINUITY	
• Ignition OFF. • Disconnect: Negative Battery Cable. • Measure the resistance between the RETM C9029-1, circuit GD114 (BK/BU), harness side and ground.  • **Is the resistance less than 5 ohms?**	**Yes** GO to AI6 . **No** REPAIR the circuit for high resistance. CLEAR the DTCs. REPEAT the self-test.
AI6 CHECK FOR CORRECT RETM OPERATION	
• Ignition OFF. • Connect: Negative Battery Cable. • Disconnect the RETM connector.	**Yes** INSTALL a new RETM . REFER to Rear Entertainment Module (RETM) in this section. TEST the system for normal operation.

• Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the RETM connector and make sure it seats correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test AJ: DTC U0140 Or DTC U0140:00

Normal Operation

Several audio system modules receive network messages from the Smart Junction Box (SJB) via the Medium Speed Controller Area Network (MS-CAN). The following information is included in the messages:

- ♦ Ignition switch position
- ♦ Illumination dimmer control
- ♦ Accessory delay status

As more than one module receives each of these messages, all modules receiving a particular message should exhibit a symptom if the message is missing.

- DTC U0140 (Lost Communication With Body Control Module (GEM)) â set by the non-navigation Audio Front Control Module (ACM) and the Rear Entertainment Module (RETM) when network messages are missing from the SJB for greater than 5 seconds with the ignition in RUN.
- DTC U0140:00 (Lost Communication With Body Control Module: No Sub Type Information) â set by the navigation ACM or the Accessory Protocol Interface Module (APIM) (V2) when network messages are missing from the SJB for greater than 5 seconds with the ignition in RUN.

This pinpoint test is intended to diagnose the following:

- Communication network concern
- Audio system concern
- SJB

PINPOINT TEST AJ: DTC U0140 OR DTC U0140:00

Test Step	Result / Action to Take
AJ1 CHECK FOR LOST COMMUNICATION DTCs	
• Ignition ON. • Clear continuous DTCs from all modules. • Ignition OFF. • Ignition ON. • Wait at least 10 seconds.	**Yes** GO to AJ2 . **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.

• Retrieve all continuous DTCs from all modules. • **Is DTC U0140 or DTC U0140:00 set in any audio system module?**	
AJ2 CHECK FOR BATTERY VOLTAGE OUT-OF-RANGE DTCs	
• Carry out the self-test for the following modules: ♦ ACM ♦ APIM ♦ RETM (if equipped) ♦ SJB • **Is DTC B1317, B1318, U3003:16, or U3003:17 recorded in any module?**	**Yes** For an audio system module, GO to DTC Charts in this section. For the SJB , REFER to Section 419-10 . **No** GO to AJ3 .
AJ3 CHECK FOR DTC U0140 OR DTC U0140:00 SET IN MULTIPLE MODULES	
• Review the recorded results from the self-test. • **Is DTC U0140 or DTC U0140:00 set in more than one audio system module?**	**Yes** GO to AJ4 . **No** If there is an observable symptom, GO to Symptom Chart - General Audio System to diagnose the observed symptom. If there is no observable symptom, DISREGARD the DTC.
AJ4 CHECK FOR CORRECT SJB OPERATION	
• Ignition OFF. • Disconnect the SJB connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the SJB connector and make sure it seats correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . CLEAR all continuous DTCs. REPEAT the self-test. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR all continuous DTCs.

Pinpoint Test AK: DTC U0155 Or DTC U0155:00

Normal Operation

The Audio Front Control Module (ACM) receives network messages from the Instrument Cluster (IC) via the Medium Speed Controller Area Network (MS-CAN). The following information is included in the messages:

- ♦ Transmission gear selected
- ♦ Vehicle speed

As more than one module (including modules outside of the audio system) receives these messages, all modules receiving a particular message should exhibit a symptom if the message is missing.

- DTC U0155 (Lost Communication With Instrument Panel Cluster (IC) Control Panel) â set by the non-navigation Audio Front Control Module (ACM) when network messages are missing from the IC for greater than 5 seconds with the ignition in RUN.
- DTC U0155:00 (Lost Communication With Instrument Panel Cluster (IPC) Control Module: No Sub Type Information) â set by the navigation ACM or the Accessory Protocol Interface Module (APIM) (V2) when network messages are missing from the IC for greater than 5 seconds with the ignition in RUN.

This pinpoint test is intended to diagnose the following:

- Communication network concern
- Audio system concern
- IC

PINPOINT TEST AK: DTC U0155 OR DTC U0155:00

Test Step	Result / Action to Take
AK1 CHECK FOR LOST COMMUNICATION DTCs	
• Ignition ON. • Clear continuous DTCs from all modules. • Ignition OFF. • Ignition ON. • Wait at least 10 seconds. • Retrieve all continuous DTCs from all modules. • **Is DTC U0155 or DTC U0155:00 set in any module?**	**Yes** GO to AK2 . **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
AK2 CHECK FOR BATTERY VOLTAGE OUT-OF-RANGE DTCs	
• Carry out the self-test for the following modules: ♦ ACM ♦ APIM ♦ Smart Junction Box (SJB) ♦ IC • **Is DTC B1317, B1318, U3003:16, or U3003:17 recorded in any module?**	**Yes** For an audio system module, REFER to DTC Charts in this section. For all other modules, REFER to the Master Diagnostic Trouble Code (DTC) Chart in Section 419-10 . **No** GO to AK3 .
AK3 CHECK FOR DTC U0155 OR DTC U0155:00 SET IN MULTIPLE MODULES	
• Review the recorded results from the self-test. • **Is DTC U0155 or DTC U0155:00 set in more than one module?**	**Yes** GO to AK4 . **No** If there is an observable symptom, GO to Symptom Chart

	- General Audio System to diagnose the observed symptom. If there is no observable symptom, DISREGARD the DTC.
AK4 CHECK FOR CORRECT IC OPERATION	
• Ignition OFF. • Disconnect the IC connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the IC connector and make sure it seats correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new IC . REFER to Section 413-01 . CLEAR all continuous DTCs. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR all continuous DTCs.

Pinpoint Test AL: DTC U0184 Or DTC U0184:00

Normal Operation

Several audio system modules receive network messages from the Audio Front Control Module (ACM) via the Medium Speed Controller Area Network (MS-CAN).

As more than one module receives each of these messages, all modules receiving a particular message should exhibit a symptom if the message is missing.

- DTC U0184 (Lost Communication With Radio (ACM)) â set by the Satellite Digital Audio Receiver System (SDARS) module, the Accessory Protocol Interface Module (APIM) (V1), and the Rear Entertainment Module (RETM) when network messages are missing from the ACM for greater than 5 seconds with the ignition in RUN.
- DTC U0184:00 (Lost Communication With Radio) â set by the APIM (V2) when network messages are missing from the ACM for greater than 5 seconds with the ignition in RUN.

This pinpoint test is intended to diagnose the following:

- Communication network concern
- Audio system concern
- ACM

PINPOINT TEST AL: DTC U0184 OR DTC U0184:00

Test Step	Result / Action to Take
AL1 CHECK FOR LOST COMMUNICATION DTCs	
• Ignition ON.	**Yes** GO to AL2 .

• Clear continuous DTCs from all modules. • Ignition OFF. • Ignition ON. • Wait at least 10 seconds. • Retrieve all continuous DTCs from all modules. • **Is DTC U0184 or DTC U0184 set in any audio system module?**	**No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
AL2 CHECK FOR BATTERY VOLTAGE OUT-OF-RANGE DTCs	
• Carry out the self-test for the following modules: ♦ ACM ♦ APIM (if equipped) ♦ RETM (if equipped) • **Is DTC B1317, B1318, U3003:16, or U3003:17 recorded in any module?**	**Yes** REFER to DTC Charts in this section. **No** GO to AL3 .
AL3 CHECK FOR DTC U0184 OR DTC U0184:00 SET IN MULTIPLE MODULES	
• Review the recorded results from the self-test. • **Is DTC U0184 or DTC U0184:00 set in more than one audio system module?**	**Yes** GO to AL4 . **No** If there is an observable symptom, GO to Symptom Chart - General Audio System to diagnose the observed symptom. If there is no observable symptom, DISREGARD the DTC.
AL4 CHECK FOR CORRECT ACM OPERATION	
• Ignition OFF. • Disconnect all the ACM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the ACM connectors and make sure they seat correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ACM . REFER to Audio Control Module (ACM) in this section. CLEAR all continuous DTCs. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR all continuous DTCs.

Pinpoint Test AM: DTC U0193

Normal Operation

Certain audio system modules receive network messages from the Satellite Digital Audio Receiver System (SDARS) module via the Medium Speed Controller Area Network (MS-CAN).

As more than one module receives each of these messages, all modules receiving a particular message should exhibit a symptom if the message is missing.

- DTC U0193 (Lost Communication With Digital Audio Control Module (SDARS)) â set by the non-navigation Audio Front Control Module (ACM) and the Rear Entertainment Module (RETM) when network messages are missing from the SDARS module for greater than 5 seconds with the ignition in RUN.

This pinpoint test is intended to diagnose the following:

- Communication network concern
- Audio system concern
- SDARS module

PINPOINT TEST AM: DTC U0193

Test Step	Result / Action to Take
AM1 CHECK FOR LOST COMMUNICATION DTCs	
• Ignition ON. • Clear continuous DTCs from all modules. • Ignition OFF. • Ignition ON. • Wait at least 10 seconds. • Retrieve all continuous DTCs from all modules. • **Is DTC U0193 set in any audio system module?**	**Yes** GO to AM2 . **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
AM2 CHECK FOR BATTERY VOLTAGE OUT-OF-RANGE DTCs	
• Carry out the self-test for the following modules: ♦ ACM ♦ RETM (if equipped) ♦ SDARS module • **Is DTC B1317, B1318, U3003:16, or U3003:17 recorded in any module?**	**Yes** GO to the DTC Charts in this section. **No** GO to AM3 .
AM3 CHECK FOR DTC U0193 SET IN MULTIPLE MODULES	
• Review the recorded results from the self-test. • **Is DTC U0193 set in more than one audio system module?**	**Yes** GO to AM4 . **No** If there is an observable symptom, GO to Symptom Chart - General Audio System to diagnose the observed symptom. If there is no observable symptom, DISREGARD the DTC.

AM4 CHECK FOR CORRECT SDARS MODULE OPERATION	
• Ignition OFF. • Disconnect the SDARS module connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the SDARS module connector and make sure it seats correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SDARS module. REFER to Satellite Digital Audio Receiver System (SDARS) Module in this section. CLEAR all continuous DTCs. REPEAT the self-test. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR all continuous DTCs.

Pinpoint Test AN: DTC U0196 Or DTC U0196:00

Normal Operation

Several audio system modules receive network messages from the Rear Entertainment Module (RETM) via the Medium Speed Controller Area Network (MS-CAN).

As more than one module receives each of these messages, all modules receiving a particular message should exhibit a symptom if the message is missing.

- DTC U0196 (Lost Communication With Entertainment Control Module - Rear (AUX)) â set by the non-navigation Audio Front Control Module (ACM), the Accessory Protocol Interface Module (APIM) (V1), and the Satellite Digital Audio Receiver System (SDARS) module when network messages are missing from the RETM for greater than 5 seconds with the ignition in RUN.
- DTC U0196:00 (Lost Communication With Entertainment Control Module-Rear "A": No Sub Type Information) â set by the navigation ACM and the APIM (V2) when network messages are missing from the RETM for greater than 5 seconds with the ignition in RUN.

This pinpoint test is intended to diagnose the following:

- Communication network concern
- Audio system concern
- RETM

PINPOINT TEST AN: DTC U0196 OR DTC U0196:00

Test Step	Result / Action to Take
AN1 CHECK FOR LOST COMMUNICATION DTCs	
• Ignition ON. • Clear continuous DTCs from all modules.	**Yes** GO to AN2 . **No**

• Ignition OFF. • Ignition ON. • Wait at least 10 seconds. • Retrieve all continuous DTCs from all modules. • **Is DTC U0196 or DTC U0196:00 set in any audio system module?**	The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
AN2 CHECK FOR BATTERY VOLTAGE OUT-OF-RANGE DTCs	
• Carry out the self-test for the following modules: ♦ ACM ♦ RETM ♦ SDARS module (if equipped) ♦ APIM (if equipped) • **Is DTC B1317, B1318, U3003:16, or U3003:17 recorded in any module?**	**Yes** GO to the DTC Charts in this section. **No** GO to AN3 .
AN3 CHECK FOR DTC U0196 OR DTC U0196:00 SET IN MULTIPLE MODULES	
• Review the recorded results from the self-test. • **Is DTC U0196 or DTC U0196:00 set in more than one audio system module?**	**Yes** GO to AN4 . **No** If there is an observable symptom, GO to Symptom Chart - General Audio System to diagnose the observed symptom. If there is no observable symptom, DISREGARD the DTC.
AN4 CHECK FOR CORRECT RETM OPERATION	
• Ignition OFF. • Disconnect the RETM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the RETM connector and make sure it seats correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new RETM . REFER to Rear Entertainment Module (RETM) in this section. CLEAR all continuous DTCs. REPEAT the self-test. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR all continuous DTCs.

Pinpoint Test AO: DTC U0197 Or DTC U0197:00

Normal Operation

Several audio system modules receive network messages from the Accessory Protocol Interface Module (APIM) via the Medium Speed Controller Area Network (MS-CAN).

As more than one module receives each of these messages, all modules receiving a particular message should exhibit a symptom if the message is missing.

- DTC U0197 (Lost Communication With Telephone Control Module) â set by the non-navigation Audio Front Control Module (ACM) and the Satellite Digital Audio Receiver System (SDARS) module when network messages are missing from the APIM for greater than 5 seconds with the ignition in RUN.
- DTC U0197:00 (Lost Communication With Telephone Control Module: No Sub Type Information) â set by the navigation ACM when network messages are missing from the APIM for greater than 5 seconds with the ignition in RUN.

This pinpoint test is intended to diagnose the following:

- Communication network concern
- Audio system concern
- APIM

PINPOINT TEST AO: DTC U0197 OR DTC U0197:00

Test Step	Result / Action to Take
AO1 CHECK FOR LOST COMMUNICATION DTCs	
• Ignition ON. • Clear continuous DTCs from all modules. • Ignition OFF. • Ignition ON. • Wait at least 10 seconds. • Retrieve all continuous DTCs from all modules. • **Is DTC U0197 or DTC U0197:00 set in any audio system module?**	**Yes** GO to AO2 . **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
AO2 CHECK FOR BATTERY VOLTAGE OUT-OF-RANGE DTCs	
• Carry out the self-test for the following modules: ♦ ACM ♦ SDARS module (if equipped) ♦ APIM • **Is DTC B1317, B1318, U3003:16, or U3003:17 recorded in any module?**	**Yes** GO to the DTC Charts in this section. **No** GO to AO3 .
AO3 CHECK FOR DTC U0197 OR DTC U0197:00 SET IN MULTIPLE MODULES	
• Review the recorded results from the self-test. • **Is DTC U0197 or DTC U0197:00 set in more than one audio system module?**	**Yes** GO to AO4 . **No** If there is an observable symptom, GO to Symptom Chart - General Audio System to diagnose the observed

	symptom. If there is no observable symptom, DISREGARD the DTC.
AO4 CHECK FOR CORRECT APIM OPERATION	
• Disconnect the APIM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the APIM connector and make sure it seats correctly. • Wait 2 minutes for the APIM to re-initalize. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new APIM . REFER to Accessory Protocol Interface Module (APIM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR all continuous DTCs.

Pinpoint Test AP: DTC U0100:00

Normal Operation

The Accessory Protocol Interface Module (APIM) (V2 only) receives network messages from the PCM via the High Speed Controller Area Network (HS-CAN). These messages include the odometer reading and the fuel level.

As other modules outside of the audio system also receive these messages, all modules receiving a particular message should exhibit a symptom if the message is missing.

- DTC U0100:00 (Lost Communication With ECM /PCM "A": No Sub Type Information) â set by the APIM when it is missing messages from the PCM over the HS-CAN for greater than 5 seconds with the ignition in the RUN position.

This pinpoint test is intended to diagnose the following:

- Communication network concern
- PCM

PINPOINT TEST AP: DTC U0100:00

Test Step	Result / Action to Take
AP1 CHECK FOR LOST COMMUNICATION DTCs	
• Ignition ON. • Clear continuous DTCs from all modules. • Ignition OFF. • Ignition ON.	**Yes** GO to AP2 . **No** The system is operating correctly at this time. The

• Wait at least 10 seconds. • Retrieve all continuous DTCs from all modules. • **Is DTC U0100 or DTC U0100:00 set in any modules?**	DTC may have been set due to an intermittent fault in the network wiring.
AP2 CHECK FOR BATTERY VOLTAGE OUT-OF-RANGE DTCs	
• Carry out the self-test for the following modules: ♦ APIM ♦ PCM ♦ Instrument Cluster (IC) • **Is DTC B1317, B1318, U3003:16, or U3003:17 recorded in any module?**	**Yes** For the APIM , REFER to DTC Charts in this section. For all other modules, REFER to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 . **No** GO to AP3 .
AP3 CHECK FOR DTC U0100 OR DTC U0100:00 SET IN MULTIPLE MODULES	
• Review the recorded results from the self-test. • **Is DTC U0100 or DTC U0100:00 set in more than one module?**	**Yes** GO to AP4 . **No** If there is an observable symptom, GO to Symptom Chart - General Audio System to diagnose the observed symptom. If there is no observable symptom, CHECK the wiring between the APIM and the PCM for an intermittent fault.
AP4 CHECK FOR CORRECT PCM OPERATION	
• Disconnect all the PCM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the PCM connectors and make sure they seat correctly. • **Is the concern still present?**	**Yes** INSTALL a new PCM. Refer to the appropriate section in Group 303 for the procedure. CLEAR all continuous DTCs. REPEAT the APIM self-test. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR all continuous DTCs. REPEAT the APIM self-test.

Pinpoint Test AQ: DTC U0151:00

Normal Operation

The Accessory Protocol Interface Module (APIM) (V2 only) receives the air bag deployment notification message from the Restraints Control Module (RCM) via the High Speed Controller Area Network (HS-CAN). The APIM uses this message to activate the emergency call system.

As other modules outside of the audio system also receive this message, all modules receiving it should exhibit a symptom if the message is missing.

- DTC U0151:00 (Lost Communication With Restraints Control Module: No Sub Type Information) â set by the APIM when it is missing the air bag deployment notification message from the RCM over the HS-CAN for greater than 5 seconds with the ignition in the RUN position.

This pinpoint test is intended to diagnose the following:

- Communication network concern
- Restraints system concern

PINPOINT TEST AQ: DTC U0151:00

Test Step	Result / Action to Take
AQ1 CHECK FOR LOST COMMUNICATION DTCs	
• Ignition ON. • Clear continuous DTCs from all modules. • Ignition OFF. • Ignition ON. • Wait at least 10 seconds. • Retrieve all continuous DTCs from all modules. • **Is DTC U0151 or DTC U0151:00 set in any modules?**	**Yes** GO to AQ2 . **No** The system is operating correctly at this time. The DTC may have been set due to an intermittent fault in the network wiring.
AQ2 CHECK FOR BATTERY VOLTAGE OUT-OF-RANGE DTCs	
• Carry out the self-test for the following modules: ♦ APIM ♦ PCM ♦ RCM ♦ Instrument Cluster (IC) • **Is DTC B1317, B1318, U3003:16, or U3003:17 recorded in any module?**	**Yes** For the APIM , REFER to DTC Charts in this section. For all other modules, REFER to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 . **No** GO to AQ3 .
AQ3 CHECK FOR DTC U0151 OR DTC U0151:00 SET IN MULTIPLE MODULES	
• Review the recorded results from the self-test. • **Is DTC U0151 or DTC U0151:00 set in more than one module?**	**Yes** GO to AQ4 . **No** If there is an observable audio system symptom, GO to Symptom Chart - General Audio System to diagnose the observed symptom. If there is an observable restraints system symptom, REFER to Section 501-20B to diagnose the symptom.

	If there is no observable symptom, CHECK the wiring between the APIM and the RCM for an intermittent fault.
AQ4 CHECK FOR CORRECT RCM OPERATION	
• Disconnect all the RCM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the RCM connectors and make sure they seat correctly. • **Is the concern still present?**	**Yes** INSTALL a new RCM . REFER to Section 501-20B . CLEAR all continuous DTCs. REPEAT the APIM self-test. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR all continuous DTCs. REPEAT the APIM self-test.

Accessory Protocol Interface Module (APIM) Software Level Check

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
 ST3051-A	Universal Serial Bus (USB) Male-A to Male-A Cable CCMUSB2-AM-AM-10 or equivalent

NOTE: This procedure applies to checking the Accessory Protocol Interface Module (APIM) software level. To program the APIM , refer to Accessory Protocol Interface Module (APIM) Programming in Section 418-01 .

1. Turn the Audio Front Control Module (ACM) on.

2. Connect the scan tool to the Data Link Connector (DLC).

3. Connect one end of the Universal Serial Bus (USB) male-A to male-A cable to the scan tool.

4. Connect the other end of the USB male-A to male-A cable to the vehicle USB port.

5. From the technician service publication website, run On-Line Automotive Service Information System (OASIS) using Quick Start or by manually entering the Vehicle Identification Number (VIN).

6. From the OASIS tab, select the "Sync/APIM" bullet.

7. Select the "Read APIM" button to verify the current APIM software level.
   - The display shows both the Vehicle Interface Processor (VIP) and Consumer Interface Processor (CIP) software levels.

8. The scan tool displays the following information:
   - Last Recorded State - Hardware
     - VIN : vehicle identification number associated with the current APIM
     - Installed date: date the APIM was installed
     - Radio: currently identified ACM in the vehicle
     - HW Part No.: APIM hardware part number
     - Un-installed date: date (if any) the APIM was uninstalled
     - S/N: APIM serial number
   - Last Recorded State - Software
     - Date/Time: date and time of last recorded software installation
     - VIP : VIP software that was installed at that time
     - CIP : CIP software that was installed at that time
     - Description: a description of the content of the software revision
   - History - Software
     - Date/Time: date and time of any recorded software installation

- ♦ VIP : VIP software that was installed at that time
- ♦ CIP : CIP software that was installed at that time
- ♦ Description: a description of the content of the software revision

- Available Software for Programming
  - ♦ Select: allows the software package to be selected
  - ♦ Lineage: the original software release, if the software available is a revision
  - ♦ VIP : VIP software level that is available with the selection
  - ♦ CIP : CIP software level that is available with the selection
  - ♦ Description: a description of the content of the software revision

9. Click a CIP software level to view the device compatibility list associated with the CIP software level, if desired.

10. To exit the APIM software level check, disconnect the scan tool from the DLC and the USB port, or exit the OASIS screen.

Audio Control Module (ACM) Self-Diagnostic Mode

Audio Systems Without Navigation

1. Turn the Audio Front Control Module (ACM) on.

2. Operate the audio system in radio tuner (AM/FM) mode.

3. Press and hold preset buttons 3 and 6 for 3 seconds until the speaker walk test begins.
   - The display indicates each speaker as it is tested.

4. **NOTE:** If the speaker walk test is the only test required, this procedure can be stopped after Step 3 by turning the ACM off.

   Before the speaker walk test is complete, carry out any of the following actions:

Preset Button Press	Diagnostic Function	Display	Diagnostic Function Description
1	ACM Self-Test	SELF TEST	The ACM carries out a self-test. At the end of the self-test, the display either indicates SELF PASS or scrolls through any DTCs present. Note that the self-test may not indicate all DTCs that are present. If additional DTCs are suspected, retrieve continuous and on-demand DTCs using the scan tool.
2	View DTCs	NO DTCS, or scrolls through DTCs	The ACM displays any DTCs that are present. To scroll through the DTCs, press the TUNE UP button. If no DTCs are present, the display reads NO DTCS.
3	AM/FM Antenna Signal Strength	SIGNAL ###	The ACM displays the AM/FM antenna signal strength. To run this test, the audio system should be in AM radio tuner mode before entering the ACM self-diagnostic mode.
4	Software Levels	SOFT LEVELS	The ACM displays software levels for various components of the audio system. Knowing the software levels may not aid diagnostics. Press the TUNE UP button to scroll through the software levels.
5	Display Test	DISPLAY TEST, then all segments illuminate	All of the ACM display segments illuminate.
6	Retrieve ACM Part Number	RADIO CONFIG	The ACM displays the ACM part number and various configuration levels. Press the TUNE UP button to scroll to the desired function.

5. To exit the self-diagnostic mode, turn the ACM off.

Satellite Radio Electronic Serial Number (ESN) Retrieval - Vehicles Without Navigation

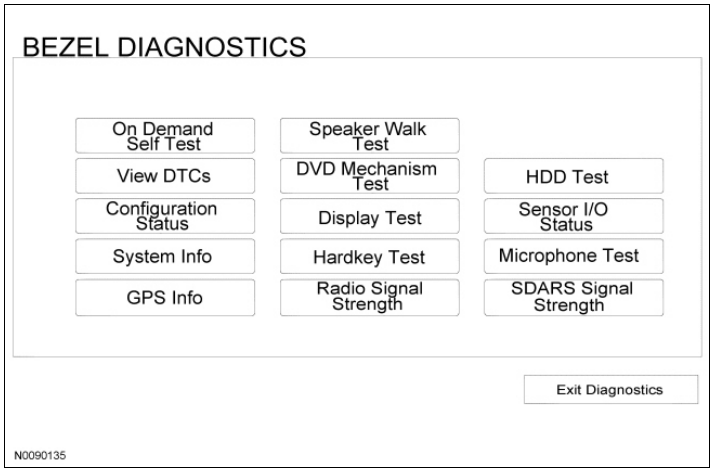
1. Operate the audio system in satellite radio mode.

2. Press and hold the AUX button and preset button 1, simultaneously.
   - The Satellite Digital Audio Receiver System (SDARS) module Electronic Serial Number (ESN) displays on the screen.

3. Record the SDARS module ESN .

4. Turn the audio system off.

Audio Systems With Navigation



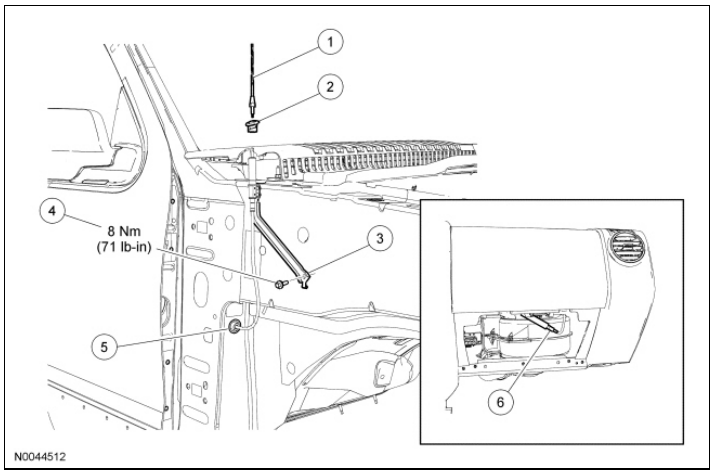
1. Turn the Audio Front Control Module (ACM) on.

2. Operate the audio system in radio tuner (AM/FM) mode.

3. Press and hold preset buttons 3 and 6 for 3 seconds until the speaker walk test begins.
   - The display indicates each speaker as it is tested.

4. **NOTE:** If the speaker walk test is the only test required, this procedure can be stopped after this step, or by allowing the speaker walk test to complete on its own.

   Before the speaker walk test is complete, press the "End Test" selection.



5. The following tests are available through the "BEZEL DIAGNOSTICS" menu:

Display Selection	Diagnostic Function Description
On Demand Self Test	The ACM carries out a self-test. At the end of the self-test, the display either indicates "Test Passed" or lists any DTCs present. Note that the self-test may not indicate all DTCs that are present. If DTCs are suspected, retrieve continuous and on-demand DTCs using the scan tool.
View DTCs	The ACM displays any DTCs that are present. If there is more than a full screen of DTCs present, to scroll through the DTCs, press the down arrow on the display. If no DTCs are present, the display reads NO DTCS. Press the "Clear DTCs" selection to clear any DTCs present.

Configuration Status	The display shows the ACM configuration. A "0" indicates the item is configured off, while a "1" indicates the item is configured on. If the ACM appears to be misconfigured, refer to Section 418-01 .
System Info	The ACM displays system information for various components of the audio system. The following items are most important for servicing the audio system: • Nav Radio Part Number - provides the ACM part number • ESN1 - provides the satellite radio Electronic Serial Number (ESN)
GPS Info	The current Global Positioning System (GPS) satellite information is shown, along with the current vehicle position. Pressing the "SV Status" selection provides additional information, if present.
Speaker Walk Test	The ACM carries out the speaker walk test.
DVD Mechanism Test	The ACM tests the internal CD/DVD drive mechanism.
Display Test	This test provides for testing of the touchscreen colors and the touchscreen sectors. Pressing any of the colors on the display causes the whole display to change to that color; pressing the display again returns to the Display Test menu. Pressing the "Touchscreen Activation Test" selection enters the touchscreen sector test. Press any area of the screen to test the touchscreen sector; press the "X" at the RH lower corner of the display to return to the Display Test menu.
Hardkey Test	This test provides for testing of the ACM buttons (not the touchscreen). When each button is pressed, the screen displays the button that is active. This test can also be used to isolate a stuck button.
Radio Signal Strength	The ACM displays the AM/FM antenna signal strength. To run this test, the audio system should be in AM radio tuner mode before entering the ACM self-diagnostic mode.
HDD Test	The ACM tests its internal hard drive.
Sensor I/O Status	The ACM displays inputs it is receiving from external sources. These inputs include: • Ignition - indicates ON (ignition in ACC or RUN) or OFF • Brake - indicates ON (vehicle in PARK) or OFF (vehicle not in PARK) • Illumination - indicates ON or OFF • ReverseGear - indicates ON (vehicle in REVERSE) or OFF (vehicle not in REVERSE)
Microphone Test	The ACM tests the microphone by supplying a test tone and monitoring the input from the microphone. If there is a concern with the microphone input, the ACM sets DTC B1D79:01. For diagnostics, refer to Diagnosis and Testing in this section.
SDARS Signal Strength	The ACM displays the satellite radio antenna signal strength.

6. To exit the self-diagnostic mode, press the "Exit Diagnostics" selection from the "BEZEL DIAGNOSTICS" menu.

Antenna - AM/FM

Item	Part Number	Description
1	18813	Antenna mast
2	18922	Antenna mast stanchion
3	18936	Antenna cable bracket
4	W705661	Antenna cable bracket bolt
5	18912	Antenna cable grommet
6	18812	Antenna cable connection

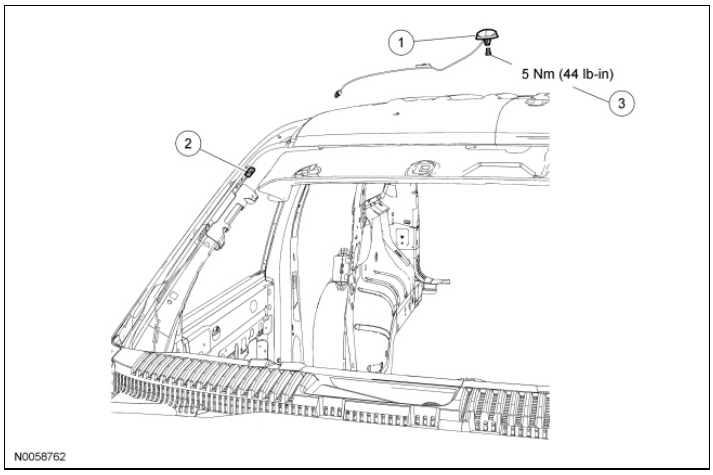
Removal and Installation

1. **NOTE:** To access the antenna cable-to-antenna lead-in cable connection, lower the glove compartment door.

   Disconnect the antenna cable from the antenna lead-in cable and release the pin-type retainers.

2. Remove the RH cowl side trim panel and the RH front door scuff plate trim panel. For additional information, refer to Section 501-05 .

3. Remove the antenna mast and the antenna mast stanchion.



4. Remove the RH fender splash shield. For additional information, refer to Section 501-02 .

5. Release the antenna cable grommet.

6. Remove the antenna cable bracket bolt and the antenna cable assembly.
   - To install, tighten to 8 Nm (71 lb-in).

7. To install, reverse the removal procedure.

Antenna - Satellite Radio

Item	Part Number	Description
1	18C964	Satellite radio antenna
2	-	Satellite radio antenna electrical connector (part of 19A397)
3	-	Satellite radio antenna bolt (part of 18C964)

Removal and Installation

1. Remove the RH A-pillar trim panel. For additional information, refer to Section 501-05 .

2. Remove the 3 screws, the RH sun visor retaining clip, and the RH sun visor.
   - If equipped, disconnect the electrical connector.

3. Lower the front of the headliner enough to gain access to the satellite radio antenna electrical connector.

4. **NOTE:** Remove the satellite antenna and pigtail through the mounting opening in the roof panel.

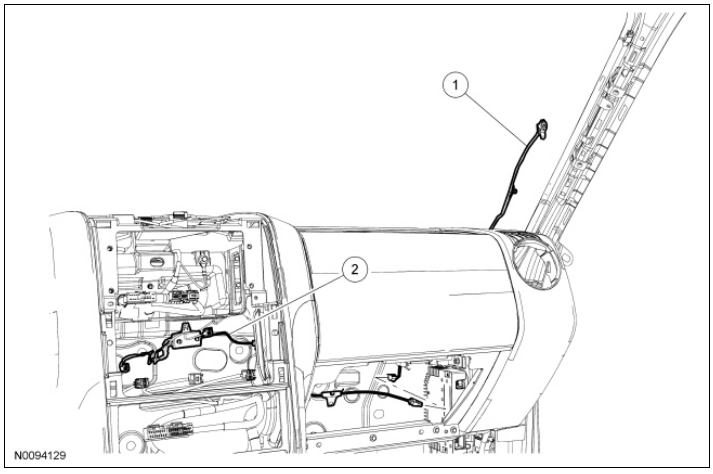
   Remove the satellite antenna.

   - Disconnect the electrical connector.
   - Loosen the antenna bolt.
     - ♦ To install, tighten to 5 Nm (44 lb-in).
   - Compress the tabs and release the satellite antenna from the roof panel.

5. To install, reverse the removal procedure.

Antenna Cable - Satellite Radio

Vehicles Without Navigation



NOTE: Instrument panel shown removed for clarity.

Item	Part Number	Description
1	-	Upper satellite radio antenna electrical connector (part of 10E893)
2	-	Upper satellite radio antenna cable
3	-	Upper satellite radio antenna cable-to-Satellite Digital Audio Receiver System (SDARS) module electrical connector (part of 19A397)

Vehicles With Navigation

NOTE: Glove compartment shown removed for clarity.

Item	Part Number	Description
1	19A397	Upper satellite radio antenna cable
2	10E928	Lower satellite radio antenna cable

Removal and Installation

NOTE: Vehicles without navigation only have an upper satellite radio antenna cable.

Lower cable (vehicles with navigation)

NOTE: The lower satellite antenna cable is only serviceable by cutting the ends off the existing antenna cable and taping them to prevent NVH concerns. The new cable should be overlaid on the electrical harness and secured, as necessary.

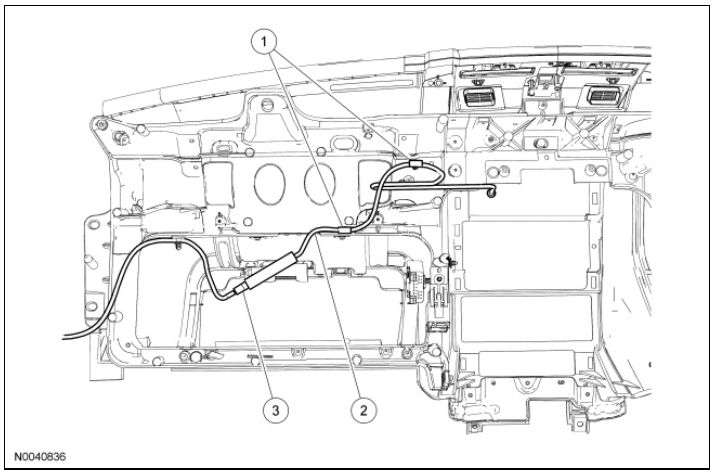
1. Remove the Audio Front Control Module (ACM). For additional information, refer to Audio Control Module (ACM) in this section.

Upper cable (all vehicles)

2. Remove the RH A-pillar trim panel. For additional information, refer to Section 501-05 .

3. Disconnect the satellite antenna electrical connector.

Both cables



4. **NOTE:** Lower the glove compartment completely to access the connection.

   Disconnect the upper satellite radio antenna cable from the Satellite Digital Audio Receiver System (SDARS) module (vehicles without navigation) or the lower satellite radio antenna cable (vehicles with navigation).

5. Remove the satellite radio antenna cable.

6. To install, reverse the removal procedure.

Antenna Lead-In Cable

Item	Part Number	Description
1	-	Antenna lead-in cable pin-type retainers (part of 18812)
2	18812	Antenna lead-in cable
3	-	Antenna lead-in cable connection (part of 18812)

Removal and Installation

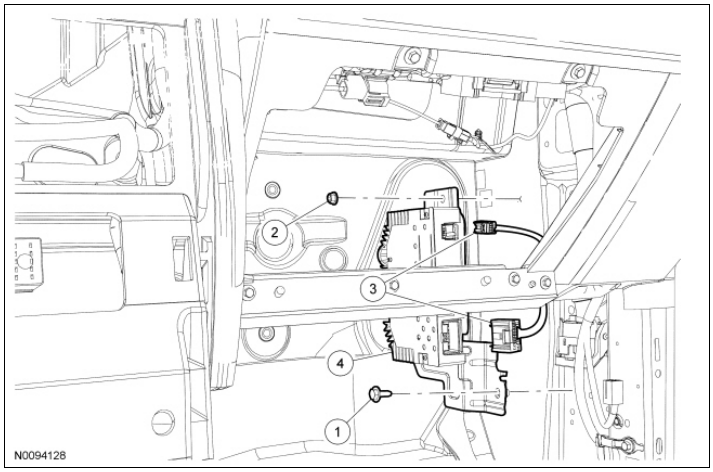
1. Remove the Audio Front Control Module (ACM). For additional information, refer to Audio Control Module (ACM) in this section.
2. Lower the glove compartment door.
3. **NOTE:** Release the pin-type retainers.

   Disconnect the antenna lead-in cable connection and remove the antenna lead-in cable.
4. To install, reverse the removal procedure.

Audio Input Jack

Removal and Installation

1. Remove the floor console finish panel. For additional information, refer to Section 501-12 .



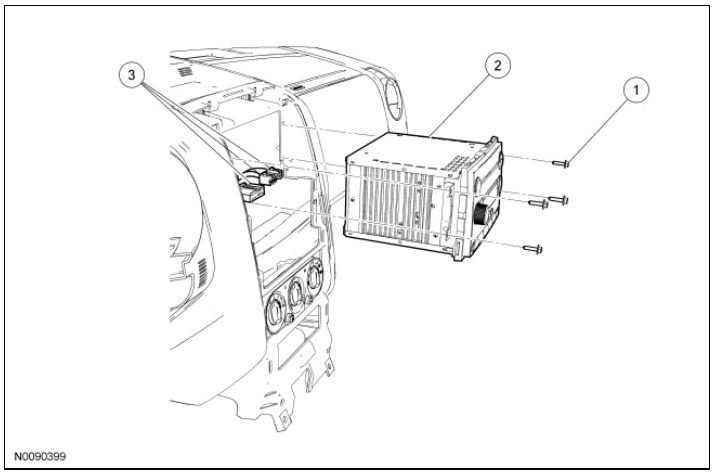
2. Release the tabs and remove the audio input jack.

3. To install, reverse the removal procedure.

Audio Amplifier

NOTE: Glove compartment shown removed for clarity.

Item	Part Number	Description
1	W707491-S	Audio amplifier bolt
2	W700101-S	Audio amplifier nut
3	-	Audio amplifier electrical connectors (part of 14A488)
4	18B849	Audio amplifier



Removal and Installation

1. Remove the RH cowl side trim panel. For additional information, refer to Section 501-05 .
2. **NOTE:** Lower the glove compartment door to access the top nut.

   Remove the bolt, the nut, and the audio amplifier.

   - Disconnect the electrical connectors.
3. To install, reverse the removal procedure.

Audio Control Module (ACM)

Item	Part Number	Description
1	W707628	Audio Front Control Module (ACM) screws (4 required)
2	18C868	ACM
3	-	ACM electrical connectors (part of 14489)

Removal and Installation

NOTE: It is not necessary to remove the Audio Front Control Module (ACM) to retrieve the part number. For additional information, refer to Audio Control Module (ACM) Self-Diagnostic Mode in this section.

1. **NOTE:** Module configuration is required when a new ACM is being installed.

   Upload the ACM configuration information to the scan tool. For additional information, refer to Programmable Module Installation (PMI) in Section 418-01 .

2. Remove the instrument panel center finish panel. For additional information, refer to Section 501-12 .

3. Remove the 4 screws and the ACM .
   - Disconnect the ACM electrical connectors.

4. To install, reverse the removal procedure.
   - Download the configuration information to the ACM . For additional information, refer to PMI in Section 418-01 .

Rear Entertainment Module (RETM)

Item	Part Number	Description
1	W704875-S	Rear Entertainment Module (RETM) screws (4 required)
2	-	J-hook (part of 10E957)
3	-	U-hook (part of 10E947)
4	10E947	RETM
5	-	RETM electrical connector (part of 15A657)

Removal

NOTE: Module configuration is required when a new Rear Entertainment Module (RETM) is being installed.

1. Upload the RETM configuration to the scan tool. For additional information, refer to Programmable Module Installation (PMI) in Section 418-01 .

2. **NOTE:** Open the RETM display.

   Remove the 4 screws.

3. Remove the RETM .
   - Pull down on the sides of the RETM to disengage the clips from the bracket.
   - Using a suitable tool (such as a flat-bladed screwdriver), push the rear most U-hook forward and release the U-hooks.
   - Hang the RETM on the J-hooks and disconnect the electrical connector.
   - Remove the RETM from the J-hooks.

Installation

1. Hang the RETM on the J-hooks.

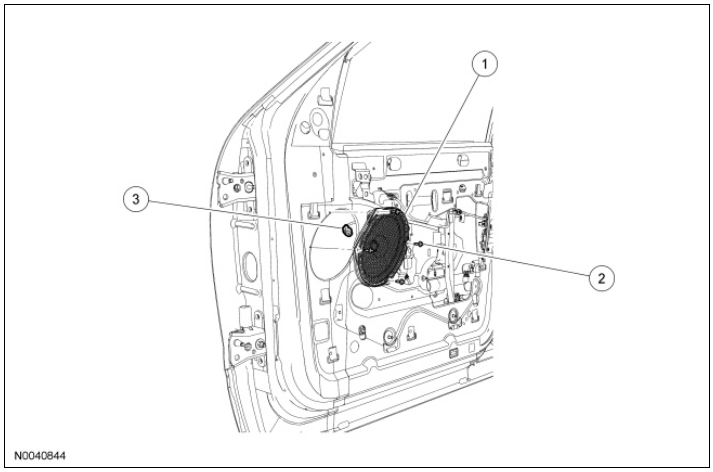
2. Connect the electrical connector.

3. Remove the RETM from the J-hooks.

4. **NOTE:** Tilt the RETM , as necessary, to align it correctly.

   Align the left side guide pin with the left side locating hole.

5. Lift up the right side of the RETM and engage the U-hooks.



6. Install the 4 screws.

7. Push on the left and right sides of the RETM to engage the clips.

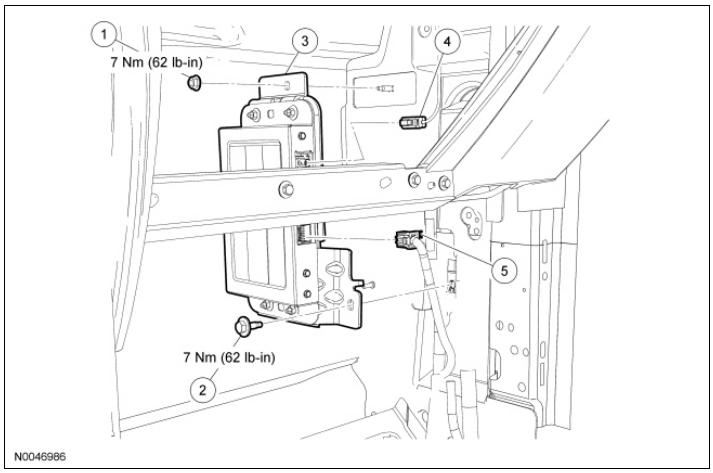
8. Download the RETM configuration from the scan tool. For additional information, refer to PMI in Section 418-01 .

Speaker - Door

NOTE: RH front shown, others similar.

Item	Part Number	Description
1	18808	Door speaker
2	W701930	Door speaker screws (4 required)
3	14A488	Door speaker electrical connector

Removal and Installation



1. Remove the door trim panel. For additional information, refer to Section 501-05 .

2. Remove the 4 screws and the door speaker.
   - Disconnect the electrical connector.

3. To install, reverse the removal procedure.

Satellite Digital Audio Receiver System (SDARS) Module

NOTE: This procedure applies to vehicles without navigation only. For vehicles with navigation, the satellite receiver is built-in to the Audio Front Control Module (ACM).

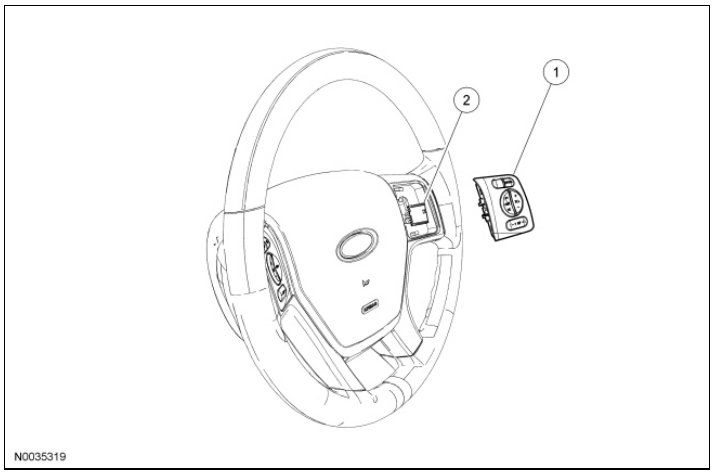
Item	Part Number	Description
1	-	Satellite Digital Audio Receiver System (SDARS) module nut
2	-	SDARS module bolt
3	18C960	SDARS module
4	19A397	Satellite radio antenna connector
5	-	SDARS module electrical connector (part of 14401)

Removal and Installation

1. **NOTE:** Module configuration is required when a new Satellite Digital Audio Receiver System (SDARS) module is being installed.

   Upload the SDARS module configuration information to the scan tool. For additional information, refer to Programmable Module Installation (PMI) in Section 418-01 .

2. Remove the RH cowl side trim panel. For additional information, refer to Section 501-05 .



3. **NOTE:** Lower the glove compartment door to access the top nut.

   Remove the bolt, the nut, and the SDARS module.

   - Disconnect the satellite radio antenna connector and the electrical connector.
   - To install, tighten to 7 Nm (62 lb-in).

4. To install, reverse the removal procedure.
   - Download the configuration information to the SDARS module. For additional information, refer to PMI in Section 418-01 .

Steering Wheel Controls

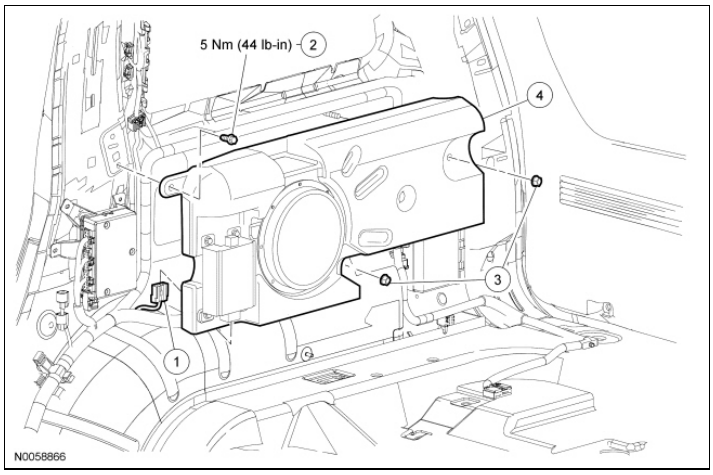
Item	Part Number	Description
1	9C888	Steering wheel controls
2	3600	Steering wheel controls electrical connector

Removal and Installation

1. **NOTE:** It is not necessary to remove the driver air bag module during this procedure.

   NOTE: When removing the steering wheel controls, disengage the RH side of the controls first.

   Using a suitable tool (such as a trim removal tool), pry the steering wheel controls out of the steering wheel.



2. **NOTE:** Do not allow the electrical connector to fall back into the steering wheel.

   Remove the steering wheel controls.

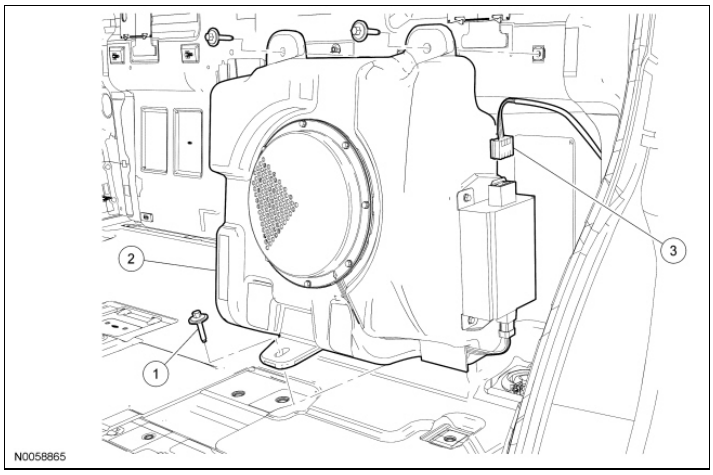
   - Disconnect the electrical connector.

3. To install, reverse the removal procedure.

Subwoofer Speaker - Explorer, Mountaineer

Item	Part Number	Description
1	14A488	Subwoofer amplifier electrical connector
2	W701695-S437	Subwoofer enclosure bolt
3	N806769-S441	Subwoofer enclosure nuts (2 required)
4	18C804	Subwoofer enclosure

Removal and Installation



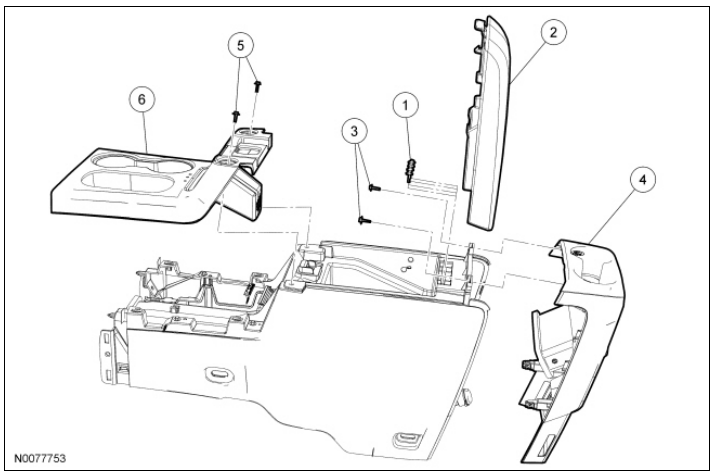
1. Remove the RH rear quarter trim panel. For additional information, refer to Section 501-05 .

2. Disconnect the electrical connector.

3. Remove the bolt, the 2 nuts and the subwoofer enclosure.
   - To install, tighten the bolt to 5 Nm (44 lb-in).

4. To install, reverse the removal procedure.

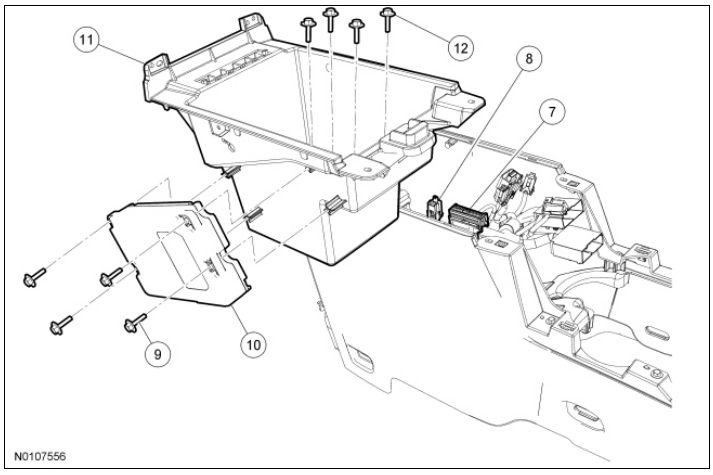
Subwoofer Speaker - Explorer Sport Trac



Item	Part Number	Description
1	W707332-S437	Subwoofer enclosure bolts (3 required)
2	18C804	Subwoofer speaker
3	-	Subwoofer amplifier electrical connector (part of 14A009)

Removal and Installation

1. Remove the rear trim panel. For additional information, refer to Section 501-05 .
2. Disconnect the electrical connector.
3. Remove the 3 bolts and the subwoofer enclosure.
4. To install, reverse the removal procedure.



Accessory Protocol Interface Module (APIM)

Floor Console Components

Item	Part Number	Description
1	W707607-S	Front floor console stowage door screws (4 required)
2	78060244	Front floor console stowage door
3	W707607-S	Front floor console rear trim panel screws (2 required)
4	78045E24	Front floor console rear trim panel
5	W707607-S	Front floor console finish panel screws (2 required)
6	78045A76	Front floor console finish panel

Accessory Protocol Interface Module (APIM)

Item	Part Number	Description
7	-	Accessory Protocol Interface Module (APIM) electrical connector (part of 14B079)
8	-	

		Universal Serial Bus (USB) cable electrical connector (part of 14D202)
9	W707607-S	APIM screws (4 required)
10	14D212	APIM
11	-	Front floor console stowage bin (part of 78045A36)
12	W707607-S	Front floor console stowage bin screws (4 required)

Removal and Installation

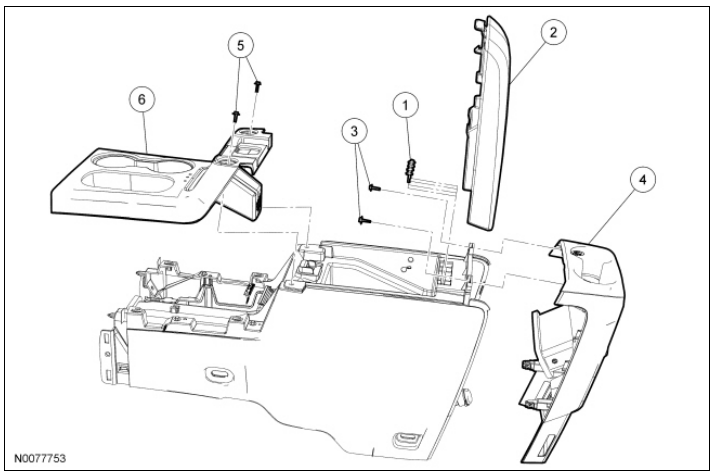
1. **NOTE:** Replacing the Accessory Protocol Interface Module (APIM) with the correct part number is critical to retain feature levels and SYNC functionality. There are two different versions of the APIM (for SYNC V1 and V2) and the correct version must be installed.

   Retrieve and record the current APIM software and hardware level. For additional information, refer to Accessory Protocol Interface Module (APIM) Software Level Check in this section.

2. Remove the 4 screws and the front floor console stowage door.

3. Remove the 2 screws and the front floor console rear trim panel.
   - Pull straight back to disengage the clips.

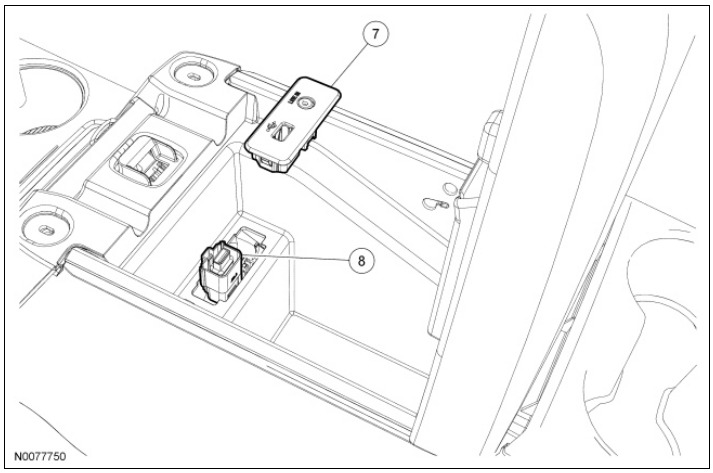
4. Remove the 2 screws and the front floor console finish panel.
   - Pull straight up to disengage the clips.



5. Remove the front floor console stowage bin.
   - Remove the 4 screws.
   - Disconnect the audio input jack electrical connector.
   - Disconnect the Universal Serial Bus (USB) port electrical connector.
   - Disconnect the APIM electrical connector.
   - Disconnect the USB cable electrical connector (at the APIM).

6. Remove the 4 screws and the APIM .

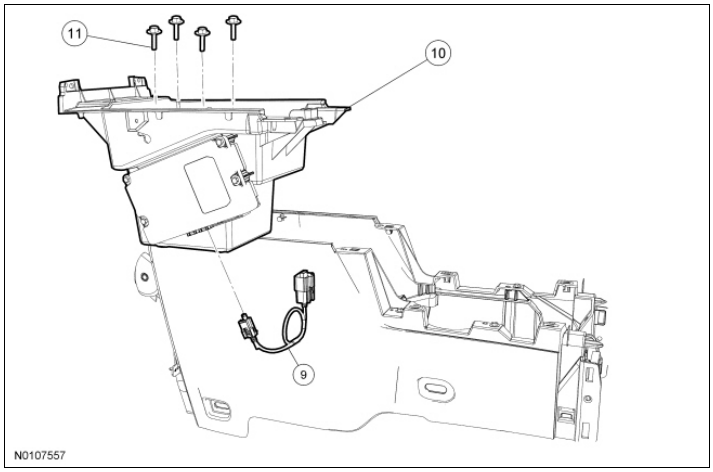
7. To install, reverse the removal procedure.
   - If a new APIM is being installed, program the APIM to the correct software level. For additional information, refer to Section 418-01 .



Universal Serial Bus (USB) Cable and Port

Floor Console Components

Item	Part Number	Description
1	W707607-S	Front floor console stowage door screws (4 required)
2	78060244	Front floor console stowage door
3	W707607-S	Front floor console rear trim panel screws (2 required)
4	78045E24	Front floor console rear trim panel
5	W707607-S	Front floor console finish panel screws (2 required)
6	78045A76	Front floor console finish panel



Universal Serial Bus (USB) Cable And Port-To-Bezel

Item	Part Number	Description
7	19C149	Audio input jack bezel
8	-	

		Universal Serial Bus (USB) port connector (part of 14D202)

USB Cable And Port-To-Accessory Protocol Interface Module (APIM)

Item	Part Number	Description
9	14D202	USB cable and port
10	-	Front floor console stowage bin (part of 78045A36)
11	W707607-S	Front floor console stowage bin screws (4 required)

Removal and Installation

1. Remove the 4 screws and the front floor console stowage door.

2. Remove the 2 screws and the front floor console rear trim panel.
   - Pull straight back to disengage the clips.

3. Remove the 2 screws and the front floor console finish panel.
   - Pull straight up to disengage the clips.

4. Using a suitable tool (such as a trim removal tool) pry the audio input jack bezel from the storage bin.
   - Disconnect the audio input jack electrical connector.

5. Disconnect the Universal Serial Bus (USB) port connector from the audio input jack bezel.

6. Remove the 4 screws and the front floor console stowage bin.

7. Remove the USB cable and port.
   - Disconnect the electrical connector.

8. To install, reverse the removal procedure.

Exterior Lighting

NOTE: The Smart Junction Box (SJB) is also known as the Generic Electronic Module (GEM).

Lamp Assembly Condensation

Exterior lamps are vented to accommodate normal changes in pressure. Condensation can be a natural by-product of this design. When moist air enters the lamp assembly through the vents, there is a possibility that condensation can occur if the temperature is cold. When normal condensation occurs, a thin film of mist can form on the interior of the lens. The thin mist eventually clears and exits through the vents during normal operation. Time to clear the lens of acceptable mist varies with ambient humidity and lamp types. Normal condensation clears from any lamp in 48 hours under dry conditions.

Do **not** replace a lamp assembly with acceptable levels of condensation such as:

- presence of thin mist (no streaks, drip marks or droplets are present)
- fine mist covers less than 50% of the lens

Examples of unacceptable moisture (usually caused by a lamp housing leak):

- water puddling inside the lamp
- large water droplets, drip marks or streaks present on the interior of the lens

Headlamps

The headlamp system is a dual-beam pattern system. It consists of a low and high beam, with a replaceable bulb. The headlamp assembly has the park/turn indicator lamp integrated into the headlamp assembly. The SJB supplies voltage to the headlamps when demanded.

Autolamps

The autolamp system provides light sensitive automatic on/off control of the exterior lamps. The autolamp system keeps the exterior lamps on for a pre-selected period of time after the ignition switch is turned to the OFF position. The pre-selected time lapse is adjustable up to approximately 3 minutes.

To program the time delay, refer to Autolamps Time Delay Adjustment in this section.

Vehicles equipped with autolamps also have a feature that turns on the exterior lamps when the windshield wipers are turned on. For additional information, refer to Section 501-16 .

Stoplamps

The high mounted stoplamp and rear stoplamps are supplied voltage when the brake pedal is applied.

Turn Signal/Hazard Lamps

The front turn signal lamps are located within the headlamp assemblies. When the multifunction switch is placed in the LH or RH TURN positions, the SJB routes voltage to the LH or RH turn signal lamps. The SJB then cycles the voltage on and off approximately 80 times per minute. If a front or rear turn bulb is

inoperative, the SJB cycles the voltage on and off approximately 160 times per minute for bulb outage indication.

The hazard switch is integral to the multifunction switch. When the hazard switch is engaged, the SJB supplies voltage to all the turn lamps. The SJB cycles the voltage on and off approximately 80 times per minute.

Parking Lamps

The SJB supplies voltage to the parking lamps when demanded. The front parking lamps are located in the headlamp assemblies. The rear parking lamps are located in the rear lamp assemblies.

Fog Lamps

The fog lamp switch is integral to the headlamp switch. When the fog lamp switch is engaged, the fog lamp relay is energized and routes voltage to the fog lamps. The fog lamps can be turned on when the ignition switch is in the RUN or ACC position, the low beam headlamps are on, and the high beam headlamps are off.

Reversing Lamps

When the transmission is placed in REVERSE (R), the SJB provides a ground for the reversing lamp relay coil (internal to the SJB). The reversing lamps receive voltage when the reversing lamp relay is energized. The reversing lamps are located within the rear lamp assemblies.

Trailer Tow

The SJB supplies voltage to the trailer tow stop/turn, parking and reversing lamps. When the vehicle's rear stop/turn lamp, parking lamps, or reversing lamps are illuminated, voltage is supplied to the trailer tow connector.

The trailer tow battery charge relay provides voltage to the trailer tow connector when the ignition switch is in the RUN or ACC position.

The vehicle comes equipped with circuitry to support trailer tow electric brakes.

Vehicles equipped with the trailer tow package are also equipped with a trailer sway control feature. For diagnostics and other information regarding this feature, refer to Section 206-09 .

Daytime Running Lamps (DRL)

The Daytime Running Lamps (DRL) system operates the low beam headlamps at a reduced intensity. The SJB supplies pulse width modulated voltage to illuminate the low beam headlamps at a reduced intensity when the following conditions are met:

- The headlamp switch is not in the HEADLAMPS ON position.
- The ignition switch is in the RUN position.
- The transmission is not in PARK (P).

The SJB can be configured to turn the DRL on for this vehicle. Refer to Section 418-01 for programmable parameter information.

B2282	Left Turn Switch Short to Ground	GO to Pinpoint Test L .
B2382	Backup Light Relay Circuit - Open	CLEAR the DTC. REPEAT the on-demand self-test. If DTC B2382 is retrieved again, INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation.
B2407	Backup Light Relay Circuit - High	CLEAR the DTC. REPEAT the on-demand self-test. If DTC B2407 is retrieved again, INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation.
B2501	LF Lamp Low Beam Circuit Failure	If the low beam is inoperative, GO to Pinpoint Test B . If the low beam is always on, GO to Pinpoint Test D .
B2503	RF Lamp Low Beam Circuit Failure	If the low beam is inoperative, GO to Pinpoint Test B . If the low beam is always on, GO to Pinpoint Test D .
B2505	LF Lamp High Beam Circuit Failure	If the high beam is inoperative, GO to Pinpoint Test C . If the high beam is always on, GO to Pinpoint Test D .
B2507	RF Lamp High Beam Circuit Failure	If the high beam is inoperative, GO to Pinpoint Test C . If the high beam is always on, GO to Pinpoint Test D .
B2512	Front Fog Lamp Relay Ckt Short to Battery	If the fog lamps are inoperative, GO to Pinpoint Test Q . If the fog lamps are always on, GO to Pinpoint Test S .
C1446	Brake Switch Circuit Failure	GO to Pinpoint Test J .
C1788	Stoplamp Relay Output Circuit Short to Ground	GO to Pinpoint Test I .
C1961	Park Lamp Relay Coil Circuit Failure	INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation.
All other DTCs	-	REFER to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .

Headlamps

Special Tool(s)

 ST1137-A	73III Automotive Meter 105-R0057 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
 ST2574-A	Flex Probe Kit 105-R025C or equivalent

Principles of Operation

NOTE: The Smart Junction Box (SJB) is also known as the Generic Electronic Module (GEM).

The SJB monitors the headlamp switch position by sending voltage reference signals on multiple circuits to the headlamp switch. At any given time, one of the signal circuits is routed to ground. If the SJB does not detect any of the inputs to the headlamp switch is active (routed to ground) for 5 seconds, the SJB turns on the exterior lights and keeps them on for 10 minutes after the ignition switch is turned off (or 10 minutes from the time the SJB does not detect any headlamp switch input if the ignition switch was already off). If the SJB detects multiple circuits short to ground, the SJB implements a planned strategy depending on the multiple inputs received. If either of these situations occur, the SJB should not be ruled immediately as being at fault. This is normal behavior of the SJB design as it has detected a fault with the inputs from the headlamp switch.

The SJB also monitors the multifunction switch for a flash-to-pass or high beam request. There are 2 voltage reference circuits which monitor this. When the multifunction switch is in the FLASH-TO-PASS or HIGH BEAM position, the voltage signal is routed to ground.

When the SJB receives an input requesting the headlamps on, the SJB supplies voltage to the low beam and high beam bulbs as necessary.

Field-Effect Transistor (FET) Protection

The SJB utilizes a Field-Effect Transistor (FET) protective circuit strategy for many of its outputs (for example, a headlamp output circuit). Output loads (current level) are monitored for excessive current (typically short circuits) and are shut down (turns off the voltage or ground provided by the module) when a fault event is detected. A continuous DTC is stored at the fault event and a cumulative counter is started.

When the demand for the output is no longer present, the module resets the FET circuit protection to allow the circuit to function. The next time the driver requests a circuit to activate that has been shut down by a previous short (FET protection) and the circuit remains shorted, the FET protection shuts off the circuit again and the cumulative counter advances.

When the excessive circuit load occurs often enough, the module shuts down the output until a repair procedure is carried out. Each FET protected circuit has 3 predefined levels of short circuit tolerance based on the harmful effect of each circuit fault on the FET and the ability of the FET to withstand it. A module lifetime level of fault events is established based upon the durability of the FET . If the total tolerance level is determined to be 600 fault events, the 3 predefined levels would be 200, 400 and 600 fault events.

When each tolerance level is reached, the continuous DTC that was stored on the first failure cannot be cleared by a command to clear the continuous DTCs. The module does not allow this code to be cleared or the circuit restored to normal operation until a successful self-test proves that the fault has been repaired. After the self-test has successfully completed (no on-demand DTCs present), the continuous DTC automatically clears and the circuit function returns.

When the first or second level is reached, the continuous DTC (associated with the short circuit) sets along with DTC B106E. These DTCs can be cleared using the module on-demand self-test, then the Clear DTC operation on the scan tool (if the on-demand test shows the fault corrected). The module never resets the fault event counter to zero and continues to advance the fault event counter as short circuit fault events occur.

If the number of short circuit fault events reach the third level, then DTCs B106F and B1342 set along with the associated continuous DTC. This DTC cannot be cleared and the module must be replaced.

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Headlamp switch • Multifunction switch	• Battery Junction Box (BJB) fuse(s): ♦ 29 (15A) (RH headlamp) ♦ 34 (15A) (LH headlamp) • Bulb(s) • Wiring, terminals or connectors • Smart Junction Box (SJB)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

NOTE: Make sure the headlamp switch is in the OFF position.

NOTE: Make sure the multifunction switch is in the LOW BEAM position.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM .
   - Refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication with the SJB , refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the SJB .

9. If the DTCs retrieved are related to the concern, go to Diagnostic Trouble Code (DTC) Chart in this section. For all other DTCs, refer to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

Symptom Chart

Symptom Chart

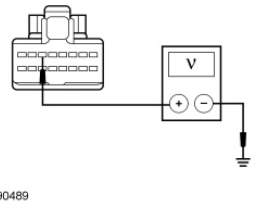
Pinpoint Tests

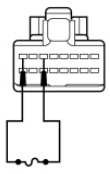
Pinpoint Test A: Both High Beams Are Inoperative

Refer to Wiring Diagrams Cell 85 , Headlamps/Autolamps for schematic and connector information.

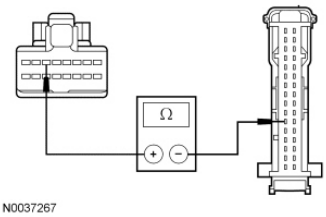
Normal Operation

When the headlamp switch is placed in the HEADLAMPS ON position, the Smart Junction Box (SJB) monitors the high beam request circuit from the multifunction switch through circuit CLF17 (WH/OG). When the multifunction switch is placed in the HIGH BEAM position, the signal is routed to ground through circuit GD145 (BK/BU). The SJB then supplies voltage to the high beam headlamps.





This pinpoint test is intended to diagnose the following:



- Wiring, terminals or connectors
- Multifunction switch
- SJB

PINPOINT TEST A: BOTH HIGH BEAMS ARE INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
A1 CHECK FOR VOLTAGE TO THE MULTIFUNCTION SWITCH	
• Ignition OFF. • Disconnect: Multifunction Switch C202. • Measure the voltage between the multifunction switch C202-6, circuit CLF17 (WH/OG), harness side and ground.  N0090489 • **Is the voltage greater than 10 volts?**	**Yes** GO to A2 . **No** GO to A3 .
A2 CHECK THE MULTIFUNCTION SWITCH	
• Connect a fused jumper wire between the multifunction switch C202-6, circuit CLF17 (WH/OG), harness side and the multifunction switch C202-8, circuit GD145 (BK/BU), harness side.  N0057365 • Place the headlamp switch in the HEADLAMPS ON position. • **Do the high beams illuminate?**	**Yes** REMOVE the jumper wire. INSTALL a new multifunction switch. REFER to Section 211-05 . TEST the system for normal operation. **No** REMOVE the jumper wire. REPAIR circuit GD145 (BK/BU) for an open. TEST the system for normal operation.
A3 CHECK CIRCUIT CLF17 (WH/OG) FOR AN OPEN	

• Measure the resistance between the multifunction switch C202-6, circuit CLF17 (WH/OG), harness side and the SJB C2280d-11, circuit CLF17 (WH/OG), harness side.  N0037267 • **Is the resistance less than 5 ohms?**	**Yes** GO to A4 . **No** REPAIR circuit CLF17 (WH/OG) for an open. TEST the system for normal operation.
A4 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test B: One Low Beam Headlamp Is Inoperative

Refer to Wiring Diagrams Cell 85 , Headlamps/Autolamps for schematic and connector information.

Normal Operation

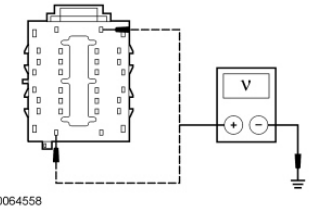
The Smart Junction Box (SJB) receives voltage from the Battery Junction Box (BJB) through circuits SBB34 (YE/RD) (LH headlamp) and SBB29 (GY/RD) (RH headlamp). When the SJB detects the headlamp switch in the HEADLAMPS ON position and the multifunction switch in the LOW BEAM position, the SJB provides voltage through circuits CLF04 (BN/BU) (LH headlamp) and CLF05 (BU/GN) (RH headlamp) to the low beam headlamps. Ground is supplied on circuits GD120 (BK/GN) (LH headlamp) and GD123 (BK/GY) (RH headlamp).

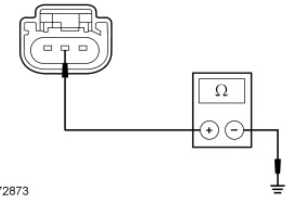
- DTC B1797 (Lamp Headlamp Low-Beam Circuit Short to Ground) - a continuous and on-demand DTC that sets when the SJB detects a short to ground (high amperage draw) from the LH or RH low beam voltage supply circuit. The self-test must be run after the repair in order for the SJB to enable the output for the low beam voltage supply.
- DTC B2501 (LF Lamp Low Beam Circuit Failure) - a continuous and on-demand DTC that sets when the SJB detects an open from the LH low beam voltage supply circuit.
- DTC B2503 (RF Lamp Low Beam Circuit Failure) - a continuous and on-demand DTC that sets when the SJB detects an open from the RH low beam voltage supply circuit.

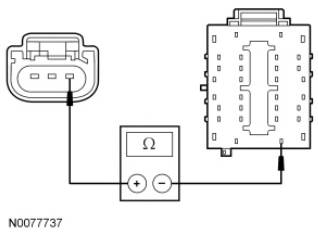
This pinpoint test is intended to diagnose the following:

- Fuse

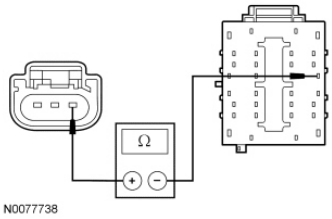
- Wiring, terminals or connectors
- SJB





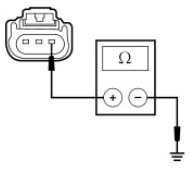


PINPOINT TEST B: ONE LOW BEAM HEADLAMP IS INOPERATIVE



NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Due to the varying wattage ratings and resulting current draw of certain aftermarket headlamp bulbs, the SJB may activate its short circuit protection strategy, resulting in the low beam output circuit becoming inoperative. Make sure that the bulbs meet Ford specifications. If the bulbs do not meet Ford specifications, install the correct bulbs. Run the on-demand self-test (required to clear certain DTCs and reset the SJB). Correct any unresolved DTCs. Clear all DTCs. Test the system for normal operation.



NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
B1 CHECK THE RECORDED DTCs FROM THE SJB SELF-TEST	
• Check the recorded DTCs from the SJB self-test. • **Is DTC B1797 recorded?**	**Yes** GO to B6 . **No** GO to B2 .
B2 CHECK THE HIGH BEAM OPERATION	
• Ignition ON. • Place the headlamp switch in the HEADLAMPS ON position. • Place the multifunction switch in the HIGH BEAM position and observe the headlamp in question. • **Does the high beam in the headlamp in question illuminate?**	**Yes** GO to B5 . **No** TURN the headlamps off. GO to B3 .
B3 CHECK CIRCUIT SBB34 (YE/RD) (LH HEADLAMP) OR CIRCUIT SBB29 (GY/RD) (RH HEADLAMP) FOR AN OPEN	
• Ignition OFF. • Disconnect: SJB C2280e. • Measure the voltage between the SJB C2280e-2 (LH headlamp), circuit SBB34 (YE/RD), harness side and ground; or between the SJB C2280e-31 (RH headlamp), circuit SBB29 (GY/RD), harness side and ground.	**Yes** GO to B4 . **No** VERIFY the BJB fuse 34 (20A) or fuse 29 (20A) is OK. If OK, REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short.

 N0064558 • **Is the voltage greater than 10 volts?**	
B4 CHECK CIRCUIT GD120 (BK/GN) (LH HEADLAMP) OR CIRCUIT GD123 (BK/GY) (RH HEADLAMP) FOR AN OPEN	
• Disconnect: Negative Battery Cable. • Disconnect: Inoperative Headlamp. • Measure the resistance between the LH headlamp C1284-2 or C1021-2, circuit GD120 (BK/GN), harness side and ground; or between the RH headlamp C1285-2 or C1041-2, circuit GD123 (BK/GY), harness side and ground.  N0072873 • **Is the resistance less than 5 ohms?**	**Yes** GO to B7 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.
B5 CHECK CIRCUIT CLF04 (BN/BU) (LH HEADLAMP) OR CIRCUIT CLF05 (BU/GN) (RH HEADLAMP) FOR AN OPEN	
• Ignition OFF. • Disconnect: Inoperative Headlamp. • Disconnect: SJB C2280e. • If the LH low beam is inoperative, measure the resistance between the LH headlamp C1284-1 or C1021-3, circuit CLF04 (BN/BU), harness side and the SJB C2280e-3, circuit CLF04 (BN/BU), harness side.  N0077737 • If the RH low beam is inoperative, measure the resistance between the RH headlamp C1285-1 or C1041-3, circuit CLF05 (BU/GN), harness side and	**Yes** GO to B7 . **No** REPAIR the circuit in question. CLEAR any DTCs. REPEAT the self-test.

the SJB C2280e-20, circuit CLF05 (BU/GN), harness side.  N0077738 • **Is the resistance less than 5 ohms?**	
B6 CHECK CIRCUIT CLF04 (BN/BU) (LH HEADLAMP) OR CIRCUIT CLF05 (BU/GN) (RH HEADLAMP) FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: Inoperative Headlamp. • Disconnect: SJB C2280e. • Measure the resistance between the inoperative headlamp, harness side and ground as follows:	**Yes** GO to B7 . **No** REPAIR the circuit in question. RUN the on-demand self-test (required to clear certain DTCs). CORRECT any unresolved DTCs. CLEAR all DTCs. TEST the system for normal operation.

Inoperative Low Beam	Vehicle	Headlamp Connector-Pin/Circuit
LH	Explorer Explorer Sport Trac	C1284-1 CLF04 (BN/BU)
RH	Explorer Explorer Sport Trac	C1285-1 CLF05 (BU/GN)
LH	Mountaineer	C1021-3 CLF04 (BN/BU)
RH	Mountaineer	C1041-3 CLF05 (BU/GN)

N0066278

• **Is the resistance greater than 10,000 ohms?**

B7 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test C: One High Beam Headlamp Is Inoperative

Refer to Wiring Diagrams Cell 85 , Headlamps/Autolamps for schematic and connector information.

Normal Operation

When the Smart Junction Box (SJB) detects the headlamp switch in the HEADLAMPS ON position and the multifunction switch in the HIGH BEAM position, the SJB sends voltage through circuits CLF02 (GY/BN) (LH headlamp) and CLF03 (VT/OG) (RH headlamp) to the high beam headlamps.

- DTC B1570 (Lamp Headlamp High-Beam Circuit Short to Ground) - a continuous and on-demand DTC that sets when the SJB detects a short to ground (high amperage draw) from the LH or RH high beam voltage supply circuit. The self-test must be run after the repair in order for the SJB to enable the output for the high beam voltage supply.
- DTC B2505 (LF Lamp High Beam Circuit Failure) - a continuous and on-demand DTC that sets when the SJB detects an open from the LH high beam voltage supply circuit.
- DTC B2507 (RF Lamp High Beam Circuit Failure) - a continuous and on-demand DTC that sets when the SJB detects an open from the RH high beam voltage supply circuit.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- SJB

PINPOINT TEST C: ONE HIGH BEAM HEADLAMP IS INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Due to the varying wattage ratings and resulting current draw of certain aftermarket headlamp bulbs, the SJB may activate its short circuit protection strategy, resulting in the low beam output circuit becoming inoperative. Make sure that the bulbs meet Ford specifications. If the bulbs do not meet Ford specifications, install the correct bulbs. Run the on-demand self-test (required to clear certain DTCs and reset the SJB). Correct any unresolved DTCs. Clear all DTCs. Test the system for normal operation.

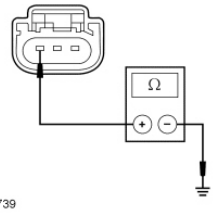
Test Step	Result / Action to Take
C1 CHECK THE LOW BEAMS	

<table>
<tr><td>• NOTE: Make sure the multifunction switch is in the LOW BEAM position.
• Place the headlamp switch in the HEADLAMPS ON position.
• Is the low beam in the headlamp in question illuminated?</td><td>Yes
GO to C2 .

No
GO to Pinpoint Test B .</td></tr>
<tr><td>C2 CHECK THE RECORDED DTCs FROM THE SJB SELF-TEST</td><td></td></tr>
<tr><td>• Place the headlamp switch in the OFF position.
• Check the recorded results from the SJB self-test.
• Is DTC B1570 recorded?</td><td>Yes
GO to C3 .

No
GO to C4 .</td></tr>
<tr><td>C3 CHECK CIRCUIT CLF02 (GY/BN) (LH HEADLAMP) OR CIRCUIT CLF03 (VT/OG) (RH HEADLAMP) FOR A SHORT TO GROUND</td><td></td></tr>
<tr><td>• Ignition OFF.
• Disconnect: Inoperative Headlamp.
• Disconnect: SJB C2280e.
• Measure the resistance between the inoperative rear lamp, harness side and ground as follows:

<table>
<tr><th>Inoperative Low Beam</th><th>Vehicle</th><th>Connector-Pin/Circuit</th></tr>
<tr><td>LH</td><td>Explorer



Explorer Sport Trac</td><td>C1284-3

CLF02 (GY/BN)</td></tr>
<tr><td>RH</td><td>Explorer

<tr><td>LH</td><td>Mountaineer</td><td>C1021-1

CLF02 (GY/BN)</td></tr>
<tr><td>RH</td><td>Mountaineer</td><td>C1041-1

CLF03 (VT/OG)</td></tr>
</table>

• Is the resistance greater than 10,000 ohms?</td><td>Yes
GO to C5 .

No
REPAIR the circuit in question. RUN the on-demand self-test (required to clear certain DTCs). CORRECT any unresolved DTCs. CLEAR all DTCs. TEST the system for normal operation.</td></tr>
</table>

C4 CHECK CIRCUIT CLF02 (GY/BN) (LH HEADLAMP) OR CIRCUIT CLF03 (VT/OG) (RH HEADLAMP) FOR AN OPEN	
• Ignition OFF. • Disconnect: Inoperative Headlamp. • Disconnect: SJB C2280e. • If the LH high beam is inoperative, measure the resistance between the LH headlamp C1284-3 or C1021-1, circuit CLF02 (GY/BN), harness side and the SJB C2280e-16, CLF02 (GY/BN), harness side.  N0077740 • If the RH high beam is inoperative, measure the resistance between the RH headlamp C1285-3 or C1041-1, circuit CLF03 (VT/OG), harness side and the SJB C2280e-30, CLF03 (VT/OG), harness side.  N0077741 • **Is the resistance less than 5 ohms?**	**Yes** GO to C5 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.
C5 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test D: The Headlamps Are On Continuously

Refer to Wiring Diagrams Cell 85 , Headlamps/Autolamps for schematic and connector information.

Normal Operation

The Smart Junction Box (SJB) sends reference signals to the headlamp switch through circuits CLF18 (BU/WH), CLF19 (VT/GN), CLF23 (WH/VT) and CLS34 (GY). When the headlamp switch is placed in the HEADLAMPS ON position, the voltage signal is routed to ground through circuit GD145 (BK/BU). If the SJB detects a fault with the headlamp switch inputs, the SJB turns the exterior lamps on by default.

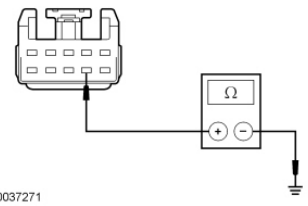
When the SJB detects the headlamp switch in the HEADLAMPS ON position and the multifunction switch in the LOW BEAM position, the SJB sends voltage through circuits CLF04 (BN/BU) (LH headlamp) and CLF05 (BU/GN) (RH headlamp) to the low beam headlamps.

When the SJB detects the headlamp switch in the HEADLAMPS ON position and the multifunction switch in the HIGH BEAM position, the SJB sends voltage through circuits CLF02 (GY/BN) (LH headlamp) and CLF03 (VT/OG) (RH headlamp) to the high beam headlamps.

The SJB sends a reference signal to the multifunction switch through circuits CLF27 (GN/BN) and CLF17 (WH/OG). When the multifunction switch is placed in the FLASH-TO-PASS or HIGH BEAM position, the voltage signal is routed to ground. When the SJB detects a request for the flash-to-pass, the SJB sends voltage to the high beam headlamps.

DTC Description	Fault Trigger Conditions
• B1472 - Lamp Headlamp Input Circuit Short to Ground	An on-demand DTC that sets when the SJB detects a short to ground from the headlamps on request circuit or no input from the headlamp switch.
• B1510 - Flash-to-Pass Switch Circuit Short to Ground	An on-demand DTC that sets when the SJB detects a short to ground from the flash-to-pass input circuit.
• B2501 - LF Lamp Low Beam Circuit Failure	A continuous and on-demand DTC that sets when the SJB detects a short to voltage from the LH low beam voltage supply circuit.
• B2503 - RF Lamp Low Beam Circuit Failure	A continuous and on-demand DTC that sets when the SJB detects a short to voltage from the RH low beam voltage supply circuit.
• B2505 - LF Lamp High Beam Circuit Failure	A continuous and on-demand DTC that sets when the SJB detects a short to voltage from the LH high beam voltage supply circuit.
• B2507 - RF Lamp High Beam Circuit Failure	A continuous and on-demand DTC that sets when the SJB detects a short to voltage from the RH high beam voltage supply circuit.

This pinpoint test is intended to diagnose the following:

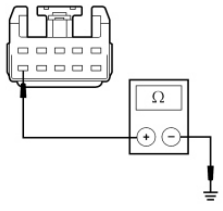


- Wiring, terminals or connectors
- Headlamp switch
- Multifunction switch
- SJB

PINPOINT TEST D: THE HEADLAMPS ARE ON CONTINUOUSLY

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .



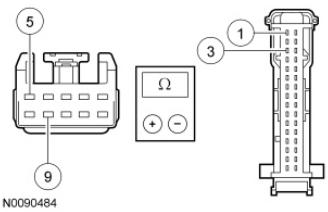
Test Step	Result / Action to Take
D1 VERIFY THE HEADLAMP OPERATION	
• Ignition ON. • Make sure the headlamp switch is in the OFF position and the multifunction switch is in the LOW BEAM position. • **Are the low beam headlamps illuminated?**	**Yes** GO to D2 . **No** GO to D9 .
D2 CHECK FOR AUTOLAMP DTCs	
• Check the recorded DTCs from the SJB self-test. • **Is DTC B1696, B1791, B1793 or B2008 recorded?**	**Yes** REFER to DTC Charts in this section. **No** GO to D3 .
D3 CHECK THE SJB HEADLAMP SWITCH PID	
• Enter the following diagnostic mode on the scan tool: SJB DataLogger. • Monitor the SJB headlamp switch PIDs (P_LMP_SW, HEAD_L) while moving the headlamp switch through all positions. • **Do the headlamp switch positions agree with the PIDs?**	**Yes** GO to D8 . **No** GO to D4 .
D4 CHECK THE HEADLAMP SWITCH	
• Ignition OFF. • Disconnect: Headlamp Switch C205. • Carry out the headlamp switch component test. Refer to Wiring Diagrams Cell 149 for component testing. • **Is the headlamp switch OK?**	**Yes** GO to D5 . **No** INSTALL a new headlamp switch. REFER to Headlamp Switch in this section. CLEAR the DTCs. REPEAT the self-test.
D5 CHECK CIRCUIT GD145 (BK/BU) FOR AN OPEN	
• Disconnect: Negative Battery Cable. • Measure the resistance between the headlamp switch C205-7, circuit GD145 (BK/BU), harness side and ground.	**Yes** GO to D6 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

- **Is the resistance less than 5 ohms?**

D6 CHECK THE HEADLAMP SWITCH INPUT CIRCUIT FOR A SHORT TO GROUND

- Disconnect: SJB C2280d.
- Measure the resistance between the headlamp switch C205-10, circuit CLF18 (BU/WH), harness side and ground.

- **Is the resistance greater than 10,000 ohms?**



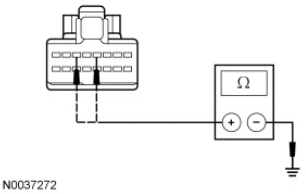
Yes
GO to D7 .

No
REPAIR circuit CLF18 (BU/WH) for an open. CLEAR the DTCs. REPEAT the self-test.

D7 CHECK THE HEADLAMP SWITCH INPUT CIRCUITS FOR AN OPEN

- Measure the resistance between the headlamp switch, harness side and the SJB , harness side as follows:

Headlamp Switch Connector-Pin	Connector-Pin	Circuit
C205-5	C2280d-3	CLS34 (GY)
C205-9	C2280d-1	CLF23 (WH/VT)



- **Are the resistances less than 5 ohms?**

Yes
GO to D13 .

No
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

D8 CHECK CIRCUITS CLF04 (BN/BU) (LH HEADLAMP) AND CLF05 (BU/GN) (RH HEADLAMP) FOR A SHORT TO VOLTAGE

• Disconnect: SJB C2280e. • **Does the LH or RH headlamp continue to illuminate?**	**Yes** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test. **No** GO to D13 .
D9 CHECK THE SJB MULTIFUNCTION SWITCH PIDs	
• Enter the following diagnostic mode on the scan tool: SJB DataLogger. • **NOTE:** Make sure the multifunction switch is in the NEUTRAL position. • Monitor the SJB high beam and flash-to-pass PIDs (HBEAMSW, Pass). • **Do the PIDs indicate the multifunction switch HIGH BEAM or FLASH-TO-PASS position is active?**	**Yes** GO to D10 . **No** GO to D12 .
D10 CHECK THE MULTIFUNCTION SWITCH	
• Ignition OFF. • Disconnect: Multifunction Switch C202. • Ignition ON. • Enter the following diagnostic mode on the scan tool: SJB DataLogger. • Monitor the SJB high beam and flash-to-pass PIDs (HBEAMSW, Pass). • **Do the PIDs indicate the multifunction switch HIGH BEAM or FLASH-TO-PASS position is active?**	**Yes** GO to D11 . **No** INSTALL a new multifunction switch. REFER to Section 211-05 . CLEAR the DTCs. REPEAT the self-test.
D11 CHECK CIRCUIT CLF17 (WH/OG) (HIGH BEAM) AND CIRCUIT CLF27 (GN/BN) (FLASH-TO-PASS) FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: SJB C2280d. • Measure the resistance between the multifunction switch C202-6, circuit CLF17 (WH/OG), harness side and ground; and between the multifunction switch C202-4, circuit CLF27 (GN/BN), harness side and ground.  N0037272 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to D13 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.
D12 CHECK CIRCUITS CLF02 (GY/BN) (LH HEADLAMP) AND CLF03 (VT/OG) FOR A SHORT TO VOLTAGE	
• Ignition OFF.	**Yes** REPAIR the circuit in question.

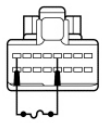
• Disconnect: SJB C2280e. • Ignition ON. • **Does the LH or RH headlamp continue to illuminate?**	CLEAR the DTCs. REPEAT the self-test. **No** GO to D13 .
D13 CHECK FOR CORRECT SJB OPERATION	
• Ignition OFF. • Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

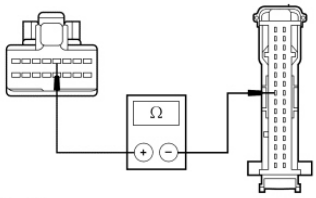
Pinpoint Test E: The Flash-To-Pass Feature Is Inoperative

Refer to Wiring Diagrams Cell 85 , Headlamps/Autolamps for schematic and connector information.

Normal Operation

The Smart Junction Box (SJB) sends a reference signal to the multifunction switch through circuit CLF27 (GN/BN). When the multifunction switch is placed in the FLASH-TO-PASS position, the voltage signal is routed to ground. When the SJB detects a request for the flash-to-pass, the SJB sends voltage to the high beam headlamps.





This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Multifunction switch
- SJB

PINPOINT TEST E: THE FLASH-TO-PASS FEATURE IS INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
E1 VERIFY THE HEADLAMP OPERATION	
• Ignition ON. • Place the headlamp switch in the HEADLAMPS ON position. • Place the multifunction switch in the HIGH BEAM position while observing the headlamps. • **Do the high beam headlamps illuminate?**	**Yes** GO to E2 . **No** GO to Pinpoint Test A .
E2 CHECK THE MULTIFUNCTION SWITCH	

• Ignition OFF. • Disconnect: Multifunction Switch C202. • Connect a fused jumper wire between the multifunction switch C202-4, circuit CLF27 (GN/BN), harness side and the multifunction switch C202-8, circuit GD145 (BK/BU), harness side.  N0037273 • **Do the high beam headlamps illuminate?**	**Yes** REMOVE the jumper wire. INSTALL a new multifunction switch. REFER to Section 211-05 . TEST the system for normal operation. **No** REMOVE the jumper wire. GO to E3 .
E3 CHECK CIRCUIT CLF27 (GN/BN) FOR AN OPEN	
• Disconnect: SJB C2280d. • Measure the resistance between the multifunction switch C202-4, circuit CLF27 (GN/BN), harness side and the SJB C2280d-8, circuit CLF27 (GN/BN), harness side.  N0037274 • **Is the resistance less than 5 ohms?**	**Yes** GO to E4 . **No** REPAIR the circuit. TEST the system for normal operation.
E4 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Autolamps

Special Tool(s)

 ST1137-A	73III Automotive Meter 105-R0057 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
 ST2574-A	Flex Probe Kit 105-R025C or equivalent

Principles of Operation

NOTE: The Smart Junction Box (SJB) is also known as the Generic Electronic Module (GEM).

The SJB monitors the headlamp switch position by sending multiple voltage reference signals to the headlamp switch. When the headlamp switch is in any given position, that input signal is routed to ground.

The SJB also monitors the light sensor with a voltage reference signal. The light sensor input to the SJB varies with the ambient light conditions.

When the SJB receives an input from the headlamp switch indicating a request for the autolamps, the SJB then monitors the light sensor for the ambient light condition. If the SJB determines the ambient light level is dark, the SJB supplies voltage to the exterior lamps.

Vehicles equipped with autolamps also have a feature that turns on the exterior lamps when the windshield wipers are on. When the SJB detects a ground signal from the windshield wiper motor, the SJB turns the exterior lamps on.

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Headlamp switch	• Wiring, terminals or connectors • Light sensor

	• Windshield wiper motor • Smart Junction Box (SJB)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

NOTE: Make sure the headlamp switch is in the OFF position.

NOTE: Make sure the multifunction switch is in the LOW BEAM position.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM .
   - Refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication with the SJB , refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the SJB .

9. If the DTCs retrieved are related to the concern, go to Diagnostic Trouble Code (DTC) Chart in this section. For all other DTCs, refer to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

Symptom Chart

Symptom Chart

Pinpoint Tests

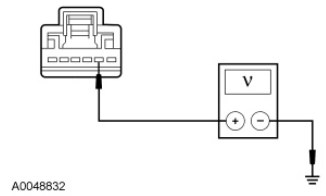
Pinpoint Test F: The Autolamps Are Inoperative

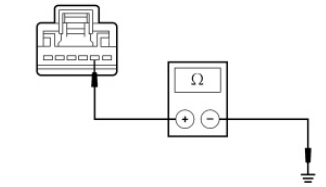
Refer to Wiring Diagrams Cell 85 , Headlamps/Autolamps for schematic and connector information.

Normal Operation

The Smart Junction Box (SJB) sends a reference signal to the headlamp switch through circuit CLF19 (VT/GN) and a signal to the light sensor through circuit VLF14 (BU/BN). Ground for the light sensor is provided by circuit GD145 (BK/BU). When the headlamp switch is placed in the AUTOLAMPS ON position, the voltage signal is routed to ground through circuit GD145 (BK/BU). When the SJB detects the headlamp switch in the AUTOLAMPS ON position, the SJB sends out voltage to the exterior lamps if the ambient light conditions are dark. The light sensor determines the amount of light based on the input received from the ambient sky conditions. When the ambient level has reached a point (determined by the internal programming of the SJB), the SJB sends voltage to the headlamps, parking, and license plate lamps.

- DTC B1793 (Autolamp Sensor Input Circuit Short to Ground) - a continuous and on-demand DTC that sets when the SJB detects a short to ground on the autolamp sensor input circuit.





This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Light sensor
- SJB

PINPOINT TEST F: THE AUTOLAMPS ARE INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
F1 CHECK THE RECORDED DTCs FROM THE SJB SELF-TEST	
• Check the recorded results from the SJB self-test. • **Was DTC B1793 recorded?**	**Yes** GO to F3 . **No** GO to F2 .
F2 CHECK THE MANUAL HEADLAMP OPERATION	
• Ignition OFF. • Place the headlamp switch in the HEADLAMPS ON position. • **Do the headlamps operate correctly?**	**Yes** GO to F3 . **No** REFER to Headlamps in this section.
F3 CHECK FOR VOLTAGE TO THE LIGHT SENSOR	
• Ignition OFF. • Disconnect: Light Sensor C286. • Ignition ON. • Place the headlamp switch in the AUTOLAMPS ON position.	**Yes** INSTALL a new light sensor. REFER to Light Sensor in this section. CLEAR the DTCs. REPEAT the self-test. **No** GO to F4 .

• Measure the voltage between the light sensor C286-2, circuit VLF14 (BU/BN), harness side and ground.  A0048832 • **Is the voltage approximately 5 volts?**	
F4 CHECK CIRCUIT VLF14 (BU/BN) FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: SJB C2280d. • Measure the resistance between the light sensor C286-2, circuit VLF14 (BU/BN), harness side and ground.  N0037276 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to F5 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
F5 CHECK FOR CORRECT SJB OPERATION	
• Ignition OFF. • Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test G: The Autolamps Are On Continuously

Refer to Wiring Diagrams Cell 85 , Headlamps/Autolamps for schematic and connector information.

Normal Operation

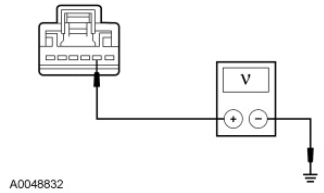
The Smart Junction Box (SJB) sends a reference signal to the headlamp switch through circuit CLF19 (VT/GN) for the autolamps request. The SJB also sends a reference signal to the light sensor through circuit VLF14 (BU/BN). Ground for the light sensor is sent through circuit GD145 (BK/BU). When the headlamp switch is placed in the AUTOLAMPS ON position, the voltage signal is routed to ground through circuit GD145 (BK/BU). When the SJB detects the headlamp switch in the AUTOLAMPS ON position, the SJB sends out voltage to the exterior lamps if the ambient light conditions are dark. The light sensor determines the amount of light based on the input received from the ambient sky conditions. When the ambient level has reached a point (determined by the internal programming of the SJB), the SJB sends voltage to the headlamps, parking, and license plate lamps.

The SJB also sends a reference signal to the windshield wiper motor through circuit CRW22 (WH/BU). When the windshield wiper motor is on, the reference signal is routed to ground.

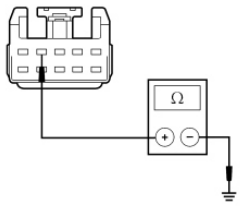
If the SJB detects a fault with the headlamp switch inputs, the exterior lamps are faulted on.

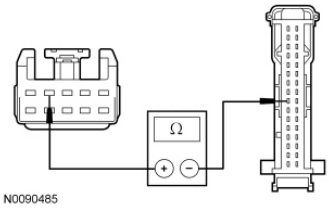
- DTC B1696 (Autolamp On Circuit Short to Ground) - an on-demand DTC that sets when the SJB detects a short to ground from the autolamps on input circuit.
- DTC B1791 (Autolamp Sensor Input Circuit Open) - a continuous and on-demand DTC that sets when the SJB detects an open or short to voltage from the light sensor input circuit.
- DTC B2008 (Wipers On Signal Circuit Short to Ground) - an on-demand DTC that sets when the SJB detects a short to ground from the wipers on input circuit.

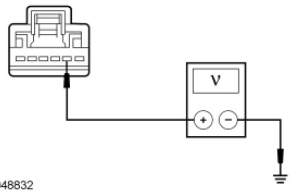
This pinpoint test is intended to diagnose the following:



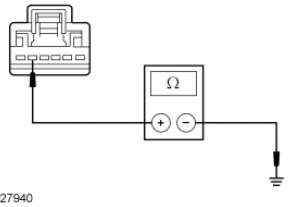
- Wiring, terminals or connectors
- Light sensor
- Headlamp switch
- Windshield wiper motor
- SJB

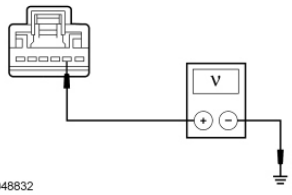


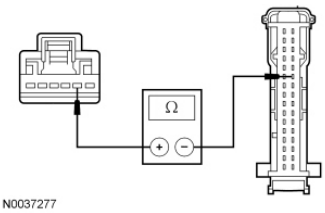




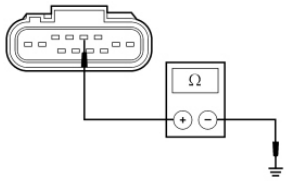
PINPOINT TEST G: THE AUTOLAMPS ARE ON CONTINUOUSLY







NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**



NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
G1 CHECK THE RECORDED DTCs FROM THE SJB SELF-TEST	
• Ignition OFF. • Check the recorded results from the SJB self-test. • **Were any DTCs recorded?**	**Yes** For DTC B1696, GO to G4 . For DTC B1791, GO to G7 . For DTC B2008, GO to G11 . For all other DTCs, REFER to the DTC Chart in this section.

	No GO to G2 .
G2 CHECK THE SJB HEADLAMP SWITCH PID	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: SJB DataLogger. • Monitor the SJB headlamp switch PID (AUTOLMP) while moving the headlamp switch from the OFF to the AUTOLAMPS ON position. • **Do the headlamp switch positions agree with the PID?**	**Yes** GO to G3 . **No** GO to G4 .
G3 CHECK FOR VOLTAGE TO THE LIGHT SENSOR (NO DTC)	
• Ignition OFF. • Disconnect: Light Sensor C286. • Ignition ON. • Measure the voltage between the light sensor C286-2, circuit VLF14 (BU/BN), harness side and ground.  A0048832 • **Is the voltage approximately 5 volts?**	**Yes** INSTALL a new light sensor. REFER to Light Sensor in this section. TEST the system for normal operation. **No** GO to G13 .
G4 CHECK THE HEADLAMP SWITCH	
• Ignition OFF. • Disconnect: Headlamp Switch C205. • Carry out the headlamp switch component test. Refer to Wiring Diagrams Cell 149 for component testing. • **Is the headlamp switch OK?**	**Yes** If no DTC was recorded, GO to G6 . If DTC B1696 was recorded , GO to G5 . **No** INSTALL a new headlamp switch. REFER to Headlamp Switch in this section. CLEAR the DTCs. REPEAT the self-test.
G5 CHECK THE AUTOLAMP REQUEST INPUT CIRCUIT FOR A SHORT TO GROUND	
• Disconnect: SJB C2280d. • Measure the resistance between the headlamp switch C205-4, circuit CLF19 (VT/GN), harness side and ground.	**Yes** GO to G13 . **No** REPAIR circuit CLF19 (VT/GN) for a short to ground. CLEAR the DTCs. REPEAT the self-test.

 N0084274 • **Is the resistance greater than 10,000 ohms?**	
G6 CHECK THE AUTOLAMP REQUEST INPUT CIRCUIT FOR AN OPEN	
• Disconnect: SJB C2280d. • Measure the resistance between the headlamp switch C205-4, circuit CLF19 (VT/GN), harness side and the SJB C2280d-9, circuit CLF19 (VT/GN), harness side.  N0090485 • **Is the resistance less than 5 ohms?**	**Yes** GO to G13 . **No** REPAIR circuit CLF19 (VT/GN) for an open. CLEAR the DTCs. REPEAT the self-test.
G7 CHECK FOR VOLTAGE TO THE LIGHT SENSOR (DTC B1791)	
• Disconnect: Light Sensor C286. • Ignition ON. • Place the headlamp switch in the AUTOLAMPS ON position. • Measure the voltage between the light sensor C286-2, circuit VLF14 (BU/BN), harness side and ground.  A0048832 • **Is the voltage approximately 5 volts?**	**Yes** GO to G8 . **No** GO to G9 .
G8 CHECK CIRCUIT GD145 (BK/BU) FOR AN OPEN	

• Ignition OFF. • Disconnect: Negative Battery Cable. • Measure the resistance between the light sensor C286-5, circuit GD145 (BK/BU), harness side and ground.  A0027940 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new light sensor. REFER to Light Sensor in this section. TEST the system for normal operation. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
G9 CHECK CIRCUIT VLF14 (BU/BN) FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: SJB C2280d. • Ignition ON. • Measure the voltage between the light sensor C286-2, circuit VLF14 (BU/BN), harness side and ground.  A0048832 • **Is any voltage present?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** GO to G10 .
G10 CHECK CIRCUIT VLF14 (BU/BN) FOR AN OPEN	
• Ignition OFF. • Measure the resistance between the light sensor C286-2, circuit VLF14 (BU/BN), harness side and the SJB C2280d-22, circuit VLF14 (BU/BN), harness side.  N0037277 • **Is the resistance less than 5 ohms?**	**Yes** GO to G13 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
G11 CHECK THE WINDSHIELD WIPER MOTOR	
• Disconnect: Windshield Wiper Motor C125.	**Yes** GO to G12 .

• Ignition ON. • Enter the following diagnostic mode on the scan tool: SJB Self-Test. • Repeat the SJB self-test. • **Is DTC B2008 still present?**	**No** INSTALL a new windshield wiper motor. REFER to Section 501-16 . CLEAR the DTCs. REPEAT the self-test.
G12 CHECK CIRCUIT CRW22 (WH/BU) FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: SJB C2280e. • Measure the resistance between the windshield wiper motor C125-2, circuit CRW22 (WH/BU), harness side and ground.  N0046955 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to G13 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
G13 CHECK FOR CORRECT SJB OPERATION	
• Ignition OFF. • Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Special Tool(s)

 ST1137-A	73III Automotive Meter 105-R0057 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
 ST2574-A	Flex Probe Kit 105-R025C or equivalent

Principles of Operation

NOTE: The Smart Junction Box (SJB) is also known as the Generic Electronic Module (GEM).

The SJB monitors the input from the stoplamp switch. When the brake pedal is applied, voltage is routed to the SJB . The SJB then supplies voltage to the stoplamps.

Field-Effect Transistor (FET) Protection

The SJB utilizes a Field-Effect Transistor (FET) protective circuit strategy for many of its outputs (for example, a headlamp output circuit). Output loads (current level) are monitored for excessive current (typically short circuits) and are shut down (turns off the voltage or ground provided by the module) when a fault event is detected. A continuous DTC is stored at the fault event and a cumulative counter is started.

When the demand for the output is no longer present, the module resets the FET circuit protection to allow the circuit to function. The next time the driver requests a circuit to activate that has been shut down by a previous short (FET protection) and the circuit remains shorted, the FET protection shuts off the circuit again and the cumulative counter advances.

When the excessive circuit load occurs often enough, the module shuts down the output until a repair procedure is carried out. Each FET protected circuit has 3 predefined levels of short circuit tolerance based on the harmful effect of each circuit fault on the FET and the ability of the FET to withstand it. A module lifetime level of fault events is established based upon the durability of the FET . If the total tolerance level is determined to be 600 fault events, the 3 predefined levels would be 200, 400 and 600 fault events.

When each tolerance level is reached, the continuous DTC that was stored on the first failure cannot be cleared by a command to clear the continuous DTCs. The module does not allow this code to be cleared or the circuit restored to normal operation until a successful self-test proves that the fault has been repaired. After the self-test has successfully completed (no on-demand DTCs present), the continuous DTC automatically clears and the circuit function returns.

When the first or second level is reached, the continuous DTC (associated with the short circuit) sets along with DTC B106E. These DTCs can be cleared using the module on-demand self-test, then the Clear DTC operation on the scan tool (if the on-demand test shows the fault corrected). The module never resets the fault event counter to zero and continues to advance the fault event counter as short circuit fault events occur.

If the number of short circuit fault events reach the third level, then DTCs B106F and B1342 set along with the associated continuous DTC. This DTC cannot be cleared and the module must be replaced.

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Stoplamp switch	• Smart Junction Box (SJB) fuse(s): ♦ 22 (15A) (stoplamp switch) ♦ 27 (15A) (rear stoplamps) (Mountaineer) • Bulb(s) • Wiring, terminals or connectors • SJB

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

NOTE: Make sure the headlamp switch is in the OFF position.

NOTE: Make sure the multifunction switch is in the LOW BEAM position.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM .
   - Refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.

- Refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication with the SJB , refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory DTCs.
8. Clear the continuous DTCs and carry out the self-test diagnostics for the SJB .
9. If the DTCs retrieved are related to the concern, go to Diagnostic Trouble Code (DTC) Chart in this section. For all other DTCs, refer to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .
10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

Symptom Chart

Symptom Chart

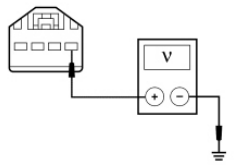
Pinpoint Tests

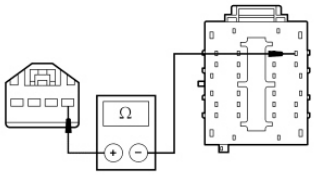
Pinpoint Test H: All The Stoplamps Are Inoperative

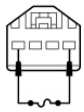
Refer to Wiring Diagrams Cell 90 , Turn Signal/Stop/Hazard Lamps for schematic and connector information.

Normal Operation

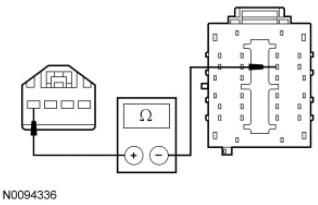
The stoplamp switch is supplied voltage through circuit SBP22 (BN/RD) from the Smart Junction Box (SJB). When the brake pedal is applied, the stoplamp switch routes voltage to the SJB through circuit CCB08 (VT/WH) which then supplies voltage to all the stoplamps.







This pinpoint test is intended to diagnose the following:



- Fuse
- Wiring, terminals or connectors
- Stoplamp switch
- SJB

PINPOINT TEST H: ALL THE STOPLAMPS ARE INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
H1 CHECK CIRCUIT SBP22 (BN/RD) FOR VOLTAGE	

• Ignition OFF. • Disconnect: Stoplamp Switch C278. • Measure the voltage between the stoplamp switch C278-1, circuit SBP22 (BN/RD), harness side and ground.  N0038805 • **Is the voltage greater than 10 volts?**	**Yes** GO to H3 . **No** VERIFY the SJB fuse 22 (15A) is OK. If OK, GO to H2 . If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short.
H2 CHECK CIRCUIT SBP22 (BN/RD) FOR AN OPEN	
• Disconnect: SJB C2280e. • Measure the resistance between the stoplamp switch C278-1, circuit SBP22 (BN/RD), harness side and the SJB C2280e-28, circuit SBP22 (BN/RD), harness side.  N0094335 • **Is the resistance less than 5 ohms?**	**Yes** GO to H5 . **No** REPAIR the circuit. TEST the system for normal operation.
H3 CHECK THE STOPLAMP SWITCH	
• Connect a fused jumper wire between the stoplamp switch C278-1, circuit SBP22 (BN/RD), harness side and the stoplamp switch C278-4, circuit CCB08 (VT/WH), harness side.  N0038807 • **Do the stoplamps illuminate?**	**Yes** REMOVE the jumper wire. INSTALL a new stoplamp switch. REFER to Stoplamp Switch in this section. TEST the system for normal operation. **No** REMOVE the jumper wire. GO to H4 .
H4 CHECK CIRCUIT CCB08 (VT/WH) FOR AN OPEN	

• Disconnect: SJB C2280e. • Measure the resistance between the stoplamp switch C278-4, circuit CCB08 (VT/WH), harness side and the SJB C2280e-23, circuit CCB08 (VT/WH), harness side.  N0094336 • **Is the resistance less than 5 ohms?**	**Yes** GO to H5 . **No** REPAIR the circuit. TEST the system for normal operation.
H5 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test I: One Or More Stoplamps Are Inoperative

Refer to Wiring Diagrams Cell 90 , Turn Signal/Stop/Hazard Lamps for schematic and connector information.

Normal Operation - All Vehicles

When the brake pedal is applied, the stoplamp switch routes voltage to the Smart Junction Box (SJB). The voltage is then routed out of the SJB to the high mounted stoplamp through circuit CCB08 (VT/WH).

Explorer

When the SJB detects the brake pedal is applied, the SJB provides voltage to the LH and RH rear stoplamps through circuits CLS18 (GY/BN) and CLS19 (VT/OG). Ground for the high mounted stoplamp and the LH rear stoplamp is provided through circuit GD149 (BK/GY). Ground for the RH rear stoplamp is provided through circuit GD151 (BK/GN).

Explorer Sport Trac

When the SJB detects the brake pedal is applied, the SJB provides voltage to the LH and RH rear stoplamps through circuits CLS18 (GY/BN) and CLS19 (VT/OG). Ground for the high mounted stoplamp is provided through circuit GD133 (BK). Ground for the LH and RH rear stoplamps is provided through circuit GD148 (BK/YE).

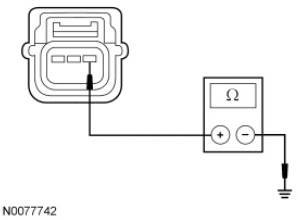
Mountaineer

When the SJB detects the brake pedal is applied, the SJB provides voltage to the LH and RH rear stoplamps through circuit CLS44 (VT/BN). Ground for the high mounted stoplamp and the LH rear stoplamp is provided

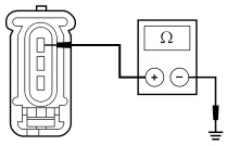
through circuit GD149 (BK/GY). Ground for the RH rear stoplamp is provided through circuit GD151 (BK/GN).

DTC Description	Fault Trigger Conditions
• B2048 - Left Rear Turn Lamp Circuit Short to Ground	A continuous and on-demand DTC that sets when the SJB detects a short to ground from the LH rear turn lamp voltage supply circuit. The self-test must be run after the repair in order for the SJB to enable the output for the LH rear turn lamp voltage supply.
• B2049 - Left Rear Turn Lamp Circuit Open	A continuous and on-demand DTC that sets when the SJB detects an open from the LH rear turn lamp voltage supply circuit.
• B2050 - Right Rear Turn Lamp Circuit Short to Ground	A continuous and on-demand DTC that sets when the SJB detects a short to ground from the RH rear turn lamp voltage supply circuit. The self-test must be run after the repair in order for the SJB to enable the output for the RH rear turn lamp voltage supply.
• B2051 - Right Rear Turn Lamp Circuit Open	A continuous and on-demand DTC that sets when the SJB detects an open from the RH rear turn lamp voltage supply circuit.
• C1788 - Stoplamp Relay Output Circuit Short to Ground	A continuous and on-demand DTC (Mountaineer only) that sets when the SJB detects a short to ground from the rear stoplamp (tricolor stop) voltage supply circuit. The self-test must be run after the repair in order for the SJB to enable the output for the rear stoplamp voltage supply.

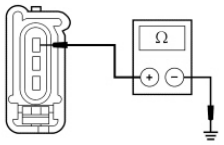
This pinpoint test is intended to diagnose the following:

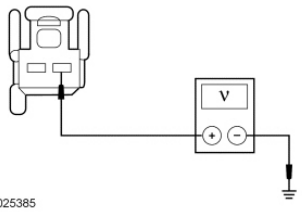


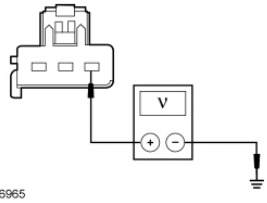
- Fuse
- Wiring, terminals or connectors
- High mounted stoplamp
- LED module
- SJB



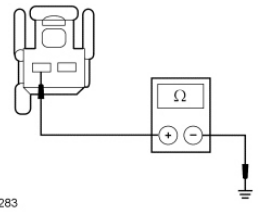
PINPOINT TEST I: ONE OR MORE STOPLAMPS ARE INOPERATIVE

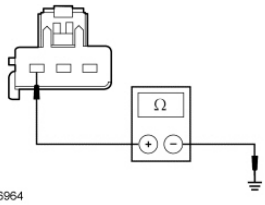


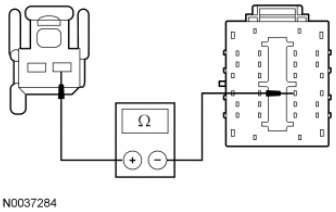




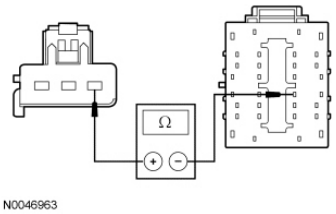
NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

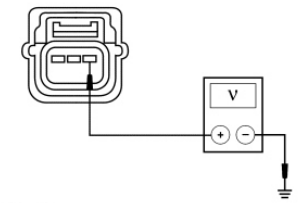






NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .





Test Step	Result / Action to Take

I1 CHECK THE RECORDED DTCs FROM THE SJB SELF-TEST	
• Check the recorded results from the SJB self-test. • **Is DTC C1788, B2048 or B2050 recorded?**	**Yes** For DTC C1788, GO to I2 . For DTC B2048 or B2050, GO to I5 . **No** GO to I7 .
I2 CHECK THE LH LED MODULE FOR A SHORT TO GROUND	
• Disconnect: LH Rear Lamp C419. • Ignition ON. • Enter the following diagnostic mode on the scan tool: SJB Self-Test. • Clear the DTCs and repeat the SJB on-demand self-test. • **Is DTC C1788 still present?**	**Yes** GO to I3 . **No** INSTALL a new LED module. RUN the on-demand self-test (required to clear certain DTCs). CORRECT any unresolved DTCs. CLEAR all DTCs. TEST the system for normal operation.
I3 CHECK THE RH LED MODULE FOR A SHORT TO GROUND	
• Disconnect: RH Rear Lamp C418. • Enter the following diagnostic mode on the scan tool: SJB Self-Test. • Clear the DTCs and repeat the SJB on-demand self-test. • **Is DTC C1788 still present?**	**Yes** GO to I4 . **No** INSTALL a new LED module. RUN the on-demand self-test (required to clear certain DTCs). CORRECT any unresolved DTCs. CLEAR all DTCs. TEST the system for normal operation.
I4 CHECK CIRCUIT CLS44 (VT/BN) FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: SJB C2280a. • Measure the resistance between the LH rear lamp C419-1, circuit CLS44 (VT/BN), harness side and ground.  N0077742 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to I15 . **No** VERIFY the SJB fuse 27 (15A) is OK. If OK, REPAIR the circuit. RUN the on-demand self-test (required to clear certain DTCs). CORRECT any unresolved DTCs. CLEAR all DTCs. TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short.
I5 CHECK THE BULB HOLDER FOR A SHORT TO GROUND	

• Disconnect: Inoperative Stoplamp. • Ignition ON. • Enter the following diagnostic mode on the scan tool: SJB Self-Test. • Clear the DTCs and repeat the SJB on-demand self-test. • **Is DTC B2048 or B2050 still present?**	**Yes** GO to I6 . **No** INSTALL a new bulb holder in question. TEST the system for normal operation.
I6 CHECK CIRCUIT CLS18 (GY/BN) OR CLS19 (VT/OG) FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: SJB C2280a. • For Explorer, measure the resistance between the inoperative rear lamp, harness side and ground as follows: **Inoperative Stoplamp / Connector-Pin / Circuit** LH rear / C4036-3 / CLS18 (GY/BN) RH rear / C4034-3 / CLS19 (VT/OG)  N0090486 • For Explorer Sport Trac, measure the resistance between the inoperative rear lamp, harness side and ground as follows: **Inoperative Stoplamp / Connector-Pin / Circuit** LH rear / C4035-3 / CLS18 (GY/BN) RH rear / C4032-3 / CLS19 (VT/OG)	**Yes** GO to I15 . **No** VERIFY the SJB fuse 22 (15A) is OK. If OK, REPAIR the circuit in question. RUN the on-demand self-test (required to clear certain DTCs). CORRECT any unresolved DTCs. CLEAR all DTCs. TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short.

 N0090487 • **Is the resistance greater than 10,000 ohms?**	
I7 DETERMINE THE INOPERATIVE STOPLAMP	
• Ignition OFF. • Apply the brake pedal. • Verify the high mounted stoplamp operation. • **Is the high mounted stoplamp illuminated?**	**Yes** If one rear stoplamp is inoperative, GO to I11 . For Mountaineer, if both rear stoplamps are inoperative, GO to I13 . For Explorer Sport Trac, if both rear stoplamps are inoperative, GO to I14 . For Explorer, if both rear stoplamps are inoperative, GO to I15 . **No** GO to I8 .
I8 CHECK CIRCUIT CCB08 (VT/WH) FOR VOLTAGE	
• For Explorer or Mountaineer, while applying the brake pedal, measure the voltage between the high mounted stoplamp C475-1, circuit CCB08 (VT/WH), harness side and ground.  A0025385 • For Explorer Sport Trac, while applying the brake pedal, measure the voltage between the high mounted stoplamp C927-3, circuit CCB08 (VT/WH), harness side and ground.  N0046965 • **Is the voltage greater than 10 volts?**	**Yes** GO to I9 . **No** GO to I10 .

I9 CHECK THE HIGH MOUNTED STOPLAMP GROUND CIRCUIT FOR AN OPEN	
• Disconnect: Negative Battery Cable. • Disconnect: High Mounted Stoplamp C475 (Explorer, Mountaineer) or C927 (Explorer Sport Trac). • For Explorer or Mountaineer, measure the resistance between the high mounted stoplamp C475-2, circuit GD149 (BK/GY), harness side and ground.  N0037283 • For Explorer Sport Trac, measure the resistance between the high mounted stoplamp C927-1, circuit GD133 (BK), harness side and ground.  N0046964 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new high mounted stoplamp. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
I10 CHECK CIRCUIT CCB08 (VT/WH) FOR AN OPEN	
• Disconnect: SJB C2280a. • For Explorer or Mountaineer, measure the resistance between the high mounted stoplamp C475-1, circuit CCB08 (VT/WH), harness side and the SJB C2280a-15, circuit CCB08 (VT/WH), harness side.  N0037284 • For Explorer Sport Trac, measure the resistance between the high mounted stoplamp C927-3, circuit CCB08 (VT/WH), harness side and the SJB C2280a-15, circuit CCB08 (VT/WH), harness side.	**Yes** GO to I15 . **No** REPAIR the circuit. TEST the system for normal operation.

 N0046963 • **Is the resistance less than 5 ohms?**	
I11 CHECK THE REAR LAMP GROUND CIRCUIT FOR AN OPEN	
• Place the headlamp switch in the PARKING LAMPS ON position. • **Does the rear lamp in question illuminate?**	**Yes** For Mountaineer, TURN the parking lamps off. GO to I12 . For Explorer or Explorer Sport Trac, TURN the parking lamps off. GO to I13 . **No** REPAIR the ground circuit in question for an open. CLEAR the DTCs. REPEAT the self-test.
I12 CHECK CIRCUIT CLS44 (BU/RD) FOR AN OPEN	
• Disconnect: Inoperative Rear Lamp. • While applying the brake pedal, measure the voltage between the LH rear lamp (LED module) C419-1, circuit CLS44 (BU/RD), harness side and ground; or between the RH rear lamp (LED module) C418-1, circuit CLS44 (BU/RD), harness side and ground.  N0037285 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new LED module. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
I13 CHECK THE REAR STOPLAMP VOLTAGE SUPPLY CIRCUIT FOR AN OPEN	
• Disconnect: Inoperative Rear Lamp. • Disconnect: SJB C2280a. • Measure the resistance between the inoperative rear lamp, harness side and the SJB , harness side as follows:	**Yes** GO to I15 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

Inoperative Stoplamp	Vehicle	Connector-Pin/Circuit	Connector-Pin/Circuit
LH rear	Explorer	C4036-3 CLS18 (GY/BN)	C2280a-25 CLS18 (GY/BN)
RH rear	Explorer	C4034-3 CLS19 (VT/OG)	C2280a-27 CLS19 (VT/OG)
LH rear	Explorer Sport Trac	C4035-3 CLS18 (GY/BN)	C2280a-25 CLS18 (GY/BN)
RH rear	Explorer Sport Trac	C4032-3 CLS19 (VT/OG)	C2280a-27 CLS19 (VT/OG)
LH rear	Mountaineer	C419-1 CLS44 (VT/BN)	C2280a-12 CLS44 (VT/BN)
RH rear	Mountaineer	C418-1 CLS44 (VT/BN)	C2280a-12 CLS44 (VT/BN)

- **Is the resistance less than 5 ohms?**

I14 CHECK CIRCUIT GD148 (BK/YE) FOR AN OPEN	
• Place the headlamp switch in the PARKING LAMPS ON position. • **Are both rear parking lamps inoperative?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** GO to I15 .
I15 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test J: The Stoplamps Are On Continuously

Refer to Wiring Diagrams Cell 90 , Turn Signal/Stop/Hazard Lamps for schematic and connector information.

Refer to Wiring Diagrams Cell 42 , Vehicle Dynamic Systems for schematic and connector information.

Normal Operation - All Vehicles

When the brake pedal is applied, the stoplamp switch routes voltage to the Smart Junction Box (SJB), the brake shift interlock actuator, the Trailer Brake Control (TBC) module, the ABS module, and the PCM through circuit CCB08 (VT/WH). The voltage is then routed out of the SJB to the high mounted stoplamp through circuit CCB08 (VT/WH).

Explorer, Explorer Sport Trac

When the SJB detects the brake pedal is applied, the SJB provides voltage to the LH and RH rear stoplamps through circuits CLS18 (GY/BN) and CLS19 (VT/OG).

Mountaineer

When the SJB detects the brake pedal is applied, the SJB provides voltage to the LH and RH rear stoplamps through circuit CLS44 (VT/BN).

- DTC B1446 (Brake Switch Circuit Failure) - an on-demand DTC that sets when the SJB detects a short to voltage from the brake pedal applied input circuit.
- DTC B2049 (Left Rear Turn Lamp Circuit Open) - a continuous and on-demand DTC that sets when the SJB detects a short to voltage from the LH rear turn lamp voltage supply circuit.
- DTC B2051 (Right Rear Turn Lamp Circuit Open) - a continuous and on-demand DTC that sets when the SJB detects an open from the RH rear turn lamp voltage supply circuit.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Stoplamp switch
- TBC module
- Brake shift interlock actuator
- ABS module
- PCM
- SJB

PINPOINT TEST J: THE STOPLAMPS ARE ON CONTINUOUSLY

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
J1 DETERMINE IF ALL THE STOPLAMPS ARE ILLUMINATED	
• Ignition OFF. • Observe the stoplamps with the brake pedal released. • **Are all of the stoplamps illuminated?**	**Yes** GO to J2 . **No** GO to J9 .

J2 CHECK THE STOPLAMP SWITCH	
• Disconnect: Stoplamp Switch C278. • **Do the stoplamps continue to illuminate?**	**Yes** GO to J3 . **No** INSTALL a new stoplamp switch. REFER to Stoplamp Switch in this section. CLEAR the DTCs. REPEAT the self-test.
J3 CHECK THE BRAKE SHIFT INTERLOCK ACTUATOR	
• Disconnect: Brake Shift Interlock Actuator C2008. • **Do the stoplamps continue to illuminate?**	**Yes** GO to J4 . **No** INSTALL a new brake shift interlock actuator. REFER to Section 307-05 . CLEAR the DTCs. REPEAT the self-test.
J4 CHECK THE ABS MODULE	
• Disconnect: ABS Module C155. • **Do the stoplamps continue to illuminate?**	**Yes** If equipped with a Trailer Brake Control (TBC) module, GO to J5 . If not equipped with a TBC module, GO to J6 . **No** GO to J10 .
J5 CHECK THE TBC MODULE	
• Disconnect: TBC Module C238. • **Do the stoplamps continue to illuminate?**	**Yes** GO to J6 . **No** INSTALL a new TBC module. CLEAR the DTCs. REPEAT the self-test.
J6 CHECK THE PCM	
• Disconnect: PCM C175b. • **Do the stoplamps continue to illuminate?**	**Yes** GO to J7 . **No** GO to J12 .
J7 CHECK CIRCUIT CCB08 (VT/WH) FOR A SHORT TO VOLTAGE (TO OTHER MODULES)	
• Disconnect: SJB C2280c. • **Do the stoplamps continue to illuminate?**	**Yes** GO to J8 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
J8 CHECK CIRCUIT CCB08 (VT/WH) FOR A SHORT TO VOLTAGE (FROM STOPLAMP SWITCH)	

• Disconnect: SJB C2280e. • **Do the stoplamps continue to illuminate?**	**Yes** GO to J9 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
J9 CHECK CIRCUIT CCB08 (VT/WH) FOR A SHORT TO VOLTAGE (TO HIGH MOUNTED STOPLAMP)	
• Disconnect: SJB C2280a. • **Do the stoplamps continue to illuminate?**	**Yes** If the high mounted stoplamp continues to illuminate, REPAIR circuit CCB08 (VT/WH). CLEAR the DTCs. REPEAT the self-test. For Explorer or Explorer Sport Trac, if the LH rear lamp continues to illuminate, REPAIR circuit CLS18 (GY/BN). CLEAR the DTCs. REPEAT the self-test. If the RH rear lamp continues to illuminate, REPAIR circuit CLS19 (VT/OG). CLEAR the DTCs. REPEAT the self-test. For Mountaineer, if the rear lamps continue to illuminate, REPAIR circuit CLS44 (VT/BN). CLEAR the DTCs. REPEAT the self-test. **No** GO to J11 .
J10 CHECK FOR CORRECT ABS MODULE OPERATION	
• Disconnect the ABS module connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the ABS module connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ABS module. REFER to Section 206-09 . CLEAR the DTCs. REPEAT the self-test. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.
J11 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly.	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

• Operate the system and verify the concern is still present. • **Is the concern still present?**	
J12 CHECK FOR CORRECT PCM OPERATION	
• Disconnect all the PCM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the PCM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Turn Signal and Hazard Lamps

Special Tool(s)

 ST1137-A	73III Automotive Meter 105-R0057 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
 ST2574-A	Flex Probe Kit 105-R025C or equivalent

Principles of Operation

NOTE: The Smart Junction Box (SJB) is also known as the Generic Electronic Module (GEM).

The SJB monitors the multifunction switch position by sending multiple voltage reference signals to the multifunction switch. When the multifunction switch is in the LH or RH TURN positions, or the hazard lamp switch is engaged, that input signal is routed to ground.

When the SJB receives an input from the multifunction switch indicating a request for a turn signal or hazard lamps, the SJB cycles the voltage on and off approximately 80 times per minute to the appropriate turn lamps.

If a front or rear turn bulb is inoperative, the SJB cycles the voltage on and off approximately 160 times per minute for bulb outage indication.

Field-Effect Transistor (FET) Protection

The SJB utilizes a Field-Effect Transistor (FET) protective circuit strategy for many of its outputs (for example, a headlamp output circuit). Output loads (current level) are monitored for excessive current (typically short circuits) and are shut down (turns off the voltage or ground provided by the module) when a fault event is detected. A continuous DTC is stored at the fault event and a cumulative counter is started.

When the demand for the output is no longer present, the module resets the FET circuit protection to allow the circuit to function. The next time the driver requests a circuit to activate that has been shut down by a previous short (FET protection) and the circuit remains shorted, the FET protection shuts off the circuit again and the cumulative counter advances.

When the excessive circuit load occurs often enough, the module shuts down the output until a repair procedure is carried out. Each FET protected circuit has 3 predefined levels of short circuit tolerance based on the harmful effect of each circuit fault on the FET and the ability of the FET to withstand it. A module lifetime level of fault events is established based upon the durability of the FET . If the total tolerance level is determined to be 600 fault events, the 3 predefined levels would be 200, 400 and 600 fault events.

When each tolerance level is reached, the continuous DTC that was stored on the first failure cannot be cleared by a command to clear the continuous DTCs. The module does not allow this code to be cleared or the circuit restored to normal operation until a successful self-test proves that the fault has been repaired. After the self-test has successfully completed (no on-demand DTCs present), the continuous DTC automatically clears and the circuit function returns.

When the first or second level is reached, the continuous DTC (associated with the short circuit) sets along with DTC B106E. These DTCs can be cleared using the module on-demand self-test, then the Clear DTC operation on the scan tool (if the on-demand test shows the fault corrected). The module never resets the fault event counter to zero and continues to advance the fault event counter as short circuit fault events occur.

If the number of short circuit fault events reach the third level, then DTCs B106F and B1342 set along with the associated continuous DTC. This DTC cannot be cleared and the module must be replaced.

The SJB FET protected output circuits for the turn lamp system are for the LH front turn lamp output, the RH front turn lamp output, the LH rear turn lamp output (Mountaineer only) and the RH rear turn lamp output (Mountaineer only) circuits. For Explorer and Explorer Sport Trac, the rear turn lamps utilize the stoplamp circuitry.

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Multifunction switch	• Bulb(s) • Wiring, terminals or connectors • Smart Junction Box (SJB)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM .

- Refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication with the SJB , refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the SJB .

9. If the DTCs retrieved are related to the concern, go to Diagnostic Trouble Code (DTC) Chart in this section. For all other DTCs, refer to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

Symptom Chart

Symptom Chart

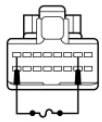
Pinpoint Tests

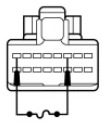
Pinpoint Test K: The Turn Signal Lamps Are Inoperative

Refer to Wiring Diagrams Cell 90 , Turn Signal/Stop/Hazard Lamps for schematic and connector information.

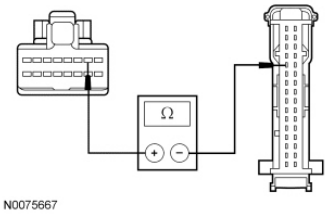
Normal Operation

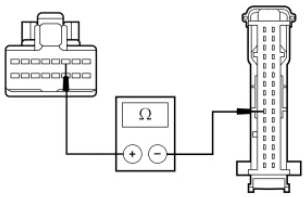
The Smart Junction Box (SJB) sends reference signals to the multifunction switch through circuits CLS39 (VT/WH) (LH turn input) and CLS41 (GY/YE) (RH turn input). When the multifunction switch is switched to the LH or RH TURN positions, the voltage signal is routed to ground. When the SJB detects the multifunction switch in the LH or RH TURN position, the SJB sends voltage to the appropriate turn lamps.





All the turn lamps are wired to the SJB . The timed on/off cycle is determined by the SJB and is set to flash approximately 80 times per minute if both the front and rear turn lamps operate correctly. If only an individual turn signal lamp operates, the SJB flashes the remaining turn lamp approximately 160 times per minute for bulb outage indication.





This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Multifunction switch
- SJB

PINPOINT TEST K: THE TURN SIGNAL LAMPS ARE INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
K1 CHECK FOR CORRECT HIGH BEAM OPERATION	
• Place the headlamp switch in the HEADLAMPS ON position. • Place the multifunction switch in the HIGH BEAM position while observing the high beam headlamps. • **Do the high beams illuminate?**	**Yes** PLACE the headlamp switch in the OFF position. GO to K2 . **No** REFER to Headlamps in this section.
K2 CHECK THE MULTIFUNCTION SWITCH	
• Ignition OFF. • Disconnect: Multifunction Switch C202. • For an inoperative LH turn signal, connect a fused jumper wire between the multifunction switch C202-2, circuit CLS39 (VT/WH), harness side and the multifunction switch C202-8, circuit GD145 (BK/BU), harness side.  N0069012 • For an inoperative RH turn signal, connect a fused jumper wire between the multifunction switch C202-3, circuit CLS41 (GY/YE), harness side and the multifunction switch C202-3, circuit GD145 (BK/BU), harness side.  N0069013 • Ignition ON. • **Do the turn signals in question flash on and off?**	**Yes** REMOVE the jumper wire. INSTALL a new multifunction switch. REFER to Section 211-05 . TEST the system for normal operation. **No** REMOVE the jumper wire. GO to K3 .
K3 CHECK CIRCUIT CLS39 (VT/WH) (LH TURN SIGNAL) OR CLS41 (GY/YE) (RH TURN SIGNAL) FOR AN OPEN	

• Ignition OFF. • Disconnect: SJB C2280d. • Ignition ON. • For the LH turn lamps, measure the resistance between the multifunction switch C202-2. circuit CLS39 (VT/WH), harness side and the SJB C2280d-5, circuit CLS39 (VT/WH), harness side.  N0075667 • For the RH turn lamps, measure the resistance between the multifunction switch C202-3, circuit CLS41 (GY/YE), harness side and the SJB C2280d-10, circuit CLS41 (GY/YE), harness side.  N0075668 • **Is the resistance less than 5 ohms?**	**Yes** GO to K4 . **No** REPAIR the circuit. TEST the system for normal operation.
K4 CHECK FOR CORRECT SJB OPERATION	
• Ignition OFF. • Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

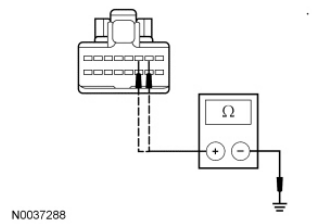
Pinpoint Test L: The Turn Signal Lamps Are Always On

Refer to Wiring Diagrams Cell 90 , Turn Signal/Stop/Hazard Lamps for schematic and connector information.

Normal Operation

The Smart Junction Box (SJB) sends voltage reference signals to the multifunction switch through circuits CLS39 (VT/WH) (LH turn input) and CLS41 (GY/YE) (RH turn input). When the multifunction switch is switched to the LH or RH TURN positions, the voltage signal is routed to ground. When the SJB detects the

multifunction switch in the LH or RH TURN position, the SJB sends voltage to the appropriate turn lamps.



- DTC B2281 (Right Turn Switch Short to Ground) - an on-demand DTC that sets when the SJB detects a short to ground from the RH turn signal input circuit.
- DTC B2282 (Left Turn Switch Short to Ground) - an on-demand DTC that sets when the SJB detects a short to ground from the LH turn signal input circuit.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Multifunction switch
- SJB

PINPOINT TEST L: THE TURN SIGNAL LAMPS ARE ALWAYS ON

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
L1 CHECK THE MULTIFUNCTION SWITCH	
• Ignition OFF. • Disconnect: Multifunction Switch C202. • Ignition ON. • **Do the turn lamps continue to flash on and off?**	**Yes** GO to L2 . **No** INSTALL a new multifunction switch. REFER to Section 211-05 . CLEAR the DTCs. REPEAT the self-test.
L2 CHECK CIRCUIT CLS39 (VT/WH) (LH TURN SIGNALS) OR CIRCUIT CLS41 (GY/YE) (RH TURN SIGNALS) FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: SJB C2280d. • Measure the resistance between the multifunction switch C202-2 (LH turn lamps), circuit CLS39 (VT/WH), harness side and ground; or between the multifunction switch C202-3 (RH turn lamps), circuit CLS41 (GY/YE), harness side and ground.  • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to L3 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.
L3 CHECK FOR CORRECT SJB OPERATION	

• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR any DTCs. REPEAT the self-test.

Pinpoint Test M: One Turn Signal/Hazard Lamp Is Inoperative/Always On

Refer to Wiring Diagrams Cell 90 , Turn Signal/Stop/Hazard Lamps for schematic and connector information.

Normal Operation - Explorer, Explorer Sport Trac

When the Smart Junction Box (SJB) detects the multifunction switch in the LH TURN position, the SJB provides voltage through circuit CLS21 (BU/GN) to the LH front turn lamp. When the SJB detects the multifunction switch in the RH TURN position, the SJB provides voltage through circuit CLS25 (YE/VT) to the RH front turn lamp. Circuits GD120 (BK/GN) and GD123 (BK/GY) provide ground for the LH and RH front turn lamps. The rear turn lamps are controlled utilizing the rear stoplamp circuits.

Mountaineer

When the SJB detects the multifunction switch in the LH TURN position, the SJB provides voltage through circuit CLS21 (BU/GN) to the LH front turn and LH side repeater lamps, and through circuit CLS18 (GY/BN) to the LH rear turn lamp. When the SJB detects the multifunction switch in the RH TURN position, the SJB provides voltage through circuit CLS25 (YE/VT) to the RH front turn and RH side repeater lamps, and through circuit CLS19 (VT/OG) to the RH rear turn lamp. Circuits GD120 (BK/GN) and GD123 (BK/GY) provide ground for the LH front turn/side repeater lamps and the RH front turn/side repeater lamps. Circuits GD149 (BK/GY) and GD151 (BK/GN) provide ground for the LH and RH rear turn lamps.

DTC Description	Fault Trigger Conditions
• B1499 - Lamp Turn Signal Left Circuit Failure	A continuous and on-demand DTC that sets when the SJB detects an open or short to voltage from the LH front turn lamp voltage supply circuit.
• B1502 - Lamp Turn Signal Left Circuit Short to Ground	A continuous and on-demand DTC that sets when the SJB detects a short to ground from the LH front turn lamp voltage supply circuit. The self-test must be run after the repair in order for the SJB to enable the output for the LH front turn lamp voltage supply.
• B1503 - Lamp Turn Signal Right Circuit Failure	A continuous and on-demand DTC that sets when the SJB detects an open or short to voltage from the RH front turn lamp voltage supply circuit.

• B1506 - Lamp Turn Signal Right Circuit Short to Ground	A continuous and on-demand DTC that sets when the SJB detects a short to ground from the RH front turn lamp voltage supply circuit. The self-test must be run after the repair in order for the SJB to enable the output for the RH front turn lamp voltage supply.
• B2048 - Left Rear Turn Lamp Circuit Short to Ground	A continuous and on-demand DTC that sets when the SJB detects a short to ground from the LH rear turn lamp voltage supply circuit. The self-test must be run after the repair in order for the SJB to enable the output for the LH rear turn lamp voltage supply.
• B2049 - Left Rear Turn Lamp Circuit Open	A continuous and on-demand DTC that sets when the SJB detects an open or short to voltage from the LH rear turn lamp voltage supply circuit.
• B2050 - Right Rear Turn Lamp Circuit Short to Ground	A continuous and on-demand DTC that sets when the SJB detects a short to ground from the RH rear turn lamp voltage supply circuit. The self-test must be run after the repair in order for the SJB to enable the output for the RH rear turn lamp voltage supply.
• B2051 - Right Rear Turn Lamp Circuit Open	A continuous and on-demand DTC that sets when the SJB detects an open or short to voltage from the RH rear turn lamp voltage supply circuit.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Bulb holder
- SJB

PINPOINT TEST M: ONE TURN SIGNAL/HAZARD LAMP IS INOPERATIVE/ALWAYS ON

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
M1 DETERMINE IF A TURN LAMP IS ALWAYS ON	
• Ignition ON. • Observe the turn lamps. • **Is any turn lamp always on?**	**Yes** GO to M2 . **No** GO to M3 .
M2 CHECK THE TURN LAMP VOLTAGE SUPPLY CIRCUITRY FOR A SHORT TO VOLTAGE	

• Ignition OFF. • Disconnect: SJB C2280a (Rear Lamp) or C2280e (Front/Side Repeater Lamp). • Ignition ON. • **Does the turn lamp in question continue to illuminate?**	**Yes** REPAIR circuit CLS21 (BU/GN) (LH front turn lamp), circuit CLS25 (YE/VT) (RH front turn lamp), circuit CLS18 (GY/BN) (LH rear turn lamp), or circuit CLS19 (VT/OG) (RH rear turn lamp) as necessary. CLEAR the DTCs. REPEAT the self-test. **No** GO to M9 .
M3 CHECK THE RECORDED DTCs FROM THE SJB SELF-TEST	
• Check the recorded results from the SJB self-test. • **Is DTC B1502, B1507, B2048 or B2050 recorded?**	**Yes** For a front lamp or side repeater on a Mountaineer, GO to M4 . For all other lamps, GO to M5 . **No** GO to M7 .
M4 CHECK THE SIDE REPEATER BULB HOLDER FOR A SHORT TO GROUND	
• Disconnect: Inoperative Side Repeater Lamp. • Enter the following diagnostic mode on the scan tool: SJB Self-Test. • Clear the DTCs and repeat the SJB on-demand self-test. • **Is DTC B1502 or B1507 still present?**	**Yes** GO to M5 . **No** INSTALL a new side repeater bulb holder in question. RUN the on-demand self-test (required to clear certain DTCs). CORRECT any unresolved DTCs. CLEAR all DTCs. TEST the system for normal operation.
M5 CHECK THE BULB HOLDER FOR A SHORT TO GROUND	
• Disconnect: Inoperative Turn Lamp. • Enter the following diagnostic mode on the scan tool: SJB Self-Test. • Clear the DTCs and repeat the SJB on-demand self-test. • **Is DTC B1502, B1507, B2048 or B2050 still present?**	**Yes** GO to M6 . **No** INSTALL a new bulb holder in question. RUN the on-demand self-test (required to clear certain DTCs). CORRECT any unresolved DTCs. CLEAR all DTCs. TEST the system for normal operation.
M6 CHECK THE TURN LAMP VOLTAGE SUPPLY CIRCUITRY FOR A SHORT TO GROUND	

NOTE: For the front turn or side repeater lamps on a Mountaineer, both lamps must be disconnected for accurate test results.

- Disconnect: SJB C2280a (Rear Lamp) or C2280e (Front/Side Repeater Lamp).
- Measure the resistance between the inoperative turn lamp, harness side and ground as follows:

Inoperative Turn Lamp	Connector-Pin	Circuit
LH front (Explorer, Explorer Sport Trac)	C1023-3	CLS21 (BU/GN)
RH front (Explorer, Explorer Sport Trac)	C1043-3	CLS25 (YE/VT)
LH front (Mountaineer)	C1115-3	CLS21(BU/GN)
RH front (Mountaineer)	C1116-3	CLS25 (YE/VT)
LH side repeater (Mountaineer)	C1108-1	CLS21 (BU/GN)
RH side repeater (Mountaineer)	C1109-1	CLS25 (YE/VT)
LH rear (Mountaineer)	C413-1	CLS18 (GY/BN)
RH rear (Mountaineer)	C416-1	CLS19 (VT/OG)

- **Is the resistance greater than 10,000 ohms?**

Yes
GO to M10 .

No
REPAIR the circuit in question. RUN the on-demand self-test (required to clear certain DTCs). CORRECT any unresolved DTCs. CLEAR all DTCs. TEST the system for normal operation.

M7 CHECK FOR VOLTAGE TO THE INOPERATIVE LAMP WITH THE HAZARD FLASHER LAMP SWITCH ENGAGED

- Ignition OFF.
- Disconnect: Inoperative Turn Lamp.
- Measure the voltage between the inoperative turn lamp, harness side and ground as follows:

	Connector-Pin	Circuit

Yes
GO to M8 .

No
GO to M9 .

Inoperative Turn Lamp		
LH front (Explorer, Explorer Sport Trac)	C1023-3	CLS21 (BU/GN)
RH front (Explorer, Explorer Sport Trac)	C1043-3	CLS25 (YE/VT)
LH front (Mountaineer)	C1115-3	CLS21(BU/GN)
RH front (Mountaineer)	C1116-3	GD123 (YE/VT)
LH side repeater (Mountaineer)	C1108-1	CLS21 (BU/GN)
RH side repeater (Mountaineer)	C1109-1	CLS25 (YE/VT)
LH rear (Mountaineer)	C413-1	CLS18 (GY/BN)
RH rear (Mountaineer)	C416-1	CLS19 (VT/OG)

- **Does the voltage alternate from 0 to greater than 10 volts?**

M8 CHECK THE TURN LAMP GROUND CIRCUITRY FOR AN OPEN

- Disconnect: Negative Battery Cable.
- Measure the resistance between the inoperative turn lamp, harness side and ground as follows:

Inoperative Turn Lamp	Connector-Pin	Circuit
LH front (Explorer, Explorer Sport Trac)	C1023-1	GD120 (BK/GN)
RH front (Explorer, Explorer Sport Trac)	C1043-1	GD123 (BK/GY)
LH front (Mountaineer)	C1115-1	GD120 (BK/GN)
	C1116-1	

Yes
INSTALL a new bulb holder in question. CLEAR the DTCs. REPEAT the self-test.

No
REPAIR the ground circuit in question for an open. CLEAR the DTCs. REPEAT the self-test.

RH front (Mountaineer)		GD123 (BK/GY)
LH side repeater (Mountaineer)	C1108-2	GD120 (BK/GN)
RH side repeater (Mountaineer)	C1109-2	GD123 (BK/GY)
LH rear (Mountaineer)	C413-3	GD149 (BK/GY)
RH rear (Mountaineer)	C416-3	GD151 (BK/GN)

- **Is the resistance less than 5 ohms?**

M9 CHECK THE TURN LAMP VOLTAGE SUPPLY CIRCUITRY FOR AN OPEN

- Disconnect: SJB C2280a (Rear Lamp) or C2280e (Front/Side Repeater Lamp).
- Measure the resistance between the inoperative turn lamp, harness side and the SJB , harness side as follows:

Inoperative Turn Lamp Connector-Pin	SJB Connector-Pin	Circuit
LH front (Explorer, Explorer Sport Trac) C1023-3	C2280e-24	CLS21 (BU/GN)
RH front (Explorer, Explorer Sport Trac) C1043-3	C2280e-27	CLS25 (YE/VT)
LH front (Mountaineer) C1115-3	C2280e-24	CLS21 (BU/GN)
RH front (Mountaineer) C1116-3	C2280e-27	CLS25 (YE/VT)
LH side repeater (Mountaineer) C1108-1	C2280e-24	CLS21 (BU/GN)
RH side repeater (Mountaineer) C1109-1	C2280e-27	CLS25 (YE/VT)
LH rear (Mountaineer) C413-1	C2280a-25	CLS18 (GY/BN)

Yes
GO to M9 .

No
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

RH rear (Mountaineer) C416-1	C2280a-27	CLS19 (VT/OG)

- **Is the resistance less than 5 ohms?**

M10 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

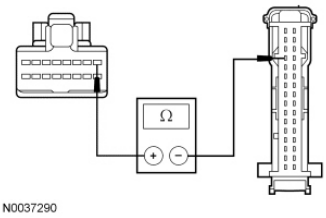
Pinpoint Test N: The Hazard Lamps Are Inoperative/Always On

Refer to Wiring Diagrams Cell 90 , Turn Signal/Stop/Hazard Lamps for schematic and connector information.

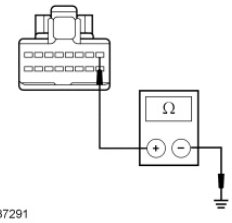
Normal Operation

The Smart Junction Box (SJB) sends a voltage reference signal to the multifunction switch through circuit CLS32 (BN/YE). When the hazard switch is switched on, the voltage signal is routed to ground. When the SJB detects a request for the hazard lamps, the SJB sends voltage to the appropriate turn lamps.

- DTC B2071 (Hazard Switch Signal Short to Ground) - an on-demand DTC that sets when the SJB detects a short to ground from the hazard switch input circuit.



This pinpoint test is intended to diagnose the following:



- Wiring, terminals or connectors
- Multifunction switch
- SJB

PINPOINT TEST N: THE HAZARD LAMPS ARE INOPERATIVE/ALWAYS ON

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
N1 CHECK FOR CORRECT HIGH BEAM OPERATION	
• Place the headlamp switch in the HEADLAMPS ON position. • Place the multifunction switch in the HIGH BEAM position while observing the high beam headlamps.	**Yes** PLACE the headlamp switch in the OFF position. GO to N2 . **No**

• **Do the high beams illuminate?**	REFER to Headlamps in this section.
N2 CHECK THE RECORDED DTCs FROM THE SJB SELF-TEST	
• Check the recorded results from the SJB self-test. • **Is DTC B2071 present?**	**Yes** GO to N5 . **No** GO to N3 .
N3 CHECK THE MULTIFUNCTION SWITCH (HAZARD LAMPS INOPERATIVE)	
• Ignition OFF. • Disconnect: Multifunction Switch C202. • Carry out the multifunction switch component test. Refer to Wiring Diagrams Cell 149 for component testing. • **Is the multifunction switch OK?**	**Yes** GO to N4 . **No** INSTALL a new multifunction switch. REFER to Section 211-05 . TEST the system for normal operation.
N4 CHECK CIRCUIT CLS32 (BN/YE) FOR AN OPEN	
• Disconnect: SJB C2280d. • Measure the resistance between the multifunction switch C202-1, circuit CLS32 (BN/YE), harness side and the SJB C2280d-4, circuit CLS32 (BN/YE), harness side.  N0037290 • **Is the resistance less than 5 ohms?**	**Yes** GO to N7 . **No** REPAIR the circuit. TEST the system for normal operation.
N5 CHECK THE MULTIFUNCTION SWITCH (HAZARD LAMPS ALWAYS ON)	
• Ignition OFF. • Disconnect: Multifunction Switch C202. • Ignition ON. • Enter the following diagnostic mode on the scan tool: SJB Self-Test. • Clear the DTCs and repeat the SJB on-demand self-test. • **Is DTC B2071 still present?**	**Yes** GO to N6 . **No** INSTALL a new multifunction switch. REFER to Section 211-05 . TEST the system for normal operation.
N6 CHECK CIRCUIT CLS32 (BN/YE) FOR A SHORT TO GROUND	

• Ignition OFF. • Disconnect: SJB C2280d. • Measure the resistance between the multifunction switch C202-1, circuit CLS32 (BN/YE), harness side and ground.  N0037291 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to N7 . **No** REPAIR the circuit. TEST the system for normal operation.
N7 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Parking, Rear and License Plate Lamps

Special Tool(s)

 ST1137-A	73III Automotive Meter 105-R0057 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
 ST2574-A	Flex Probe Kit 105-R025C or equivalent

Principles of Operation

NOTE: The Smart Junction Box (SJB) is also known as the Generic Electronic Module (GEM).

The SJB monitors the headlamp switch position by sending multiple voltage reference signals to the headlamp switch. When the headlamp switch is in any given position, that input signal is routed to ground.

When the SJB receives an input from the headlamp switch indicating a request for the parking lamps, the SJB energizes the parking lamp relay (internal to the SJB), which supplies voltage to the exterior lamps.

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Headlamp switch	• Smart Junction Box (SJB) fuse 26 (15A) • Bulb(s) • Wiring, terminals or connectors • SJB

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

NOTE: Make sure the headlamp switch is in the OFF position.

NOTE: Make sure the multifunction switch is in the LOW BEAM position.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM .
   - Refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication with the SJB , refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the SJB .

9. If the DTCs retrieved are related to the concern, go to Diagnostic Trouble Code (DTC) Chart in this section. For all other DTCs, refer to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

Symptom Chart

Symptom Chart

Pinpoint Tests

Pinpoint Test O: One Or More Parking, Rear or License Plate Lamps Is Inoperative

Refer to Wiring Diagrams Cell 92 , Parking, Rear and License Lamps for schematic and connector information.

Normal Operation - Explorer, Mountaineer

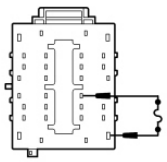
When the headlamp switch is switched to the PARKING LAMPS ON position, the Smart Junction Box (SJB) provides a ground for the parking lamp relay coil (integrated into the SJB).

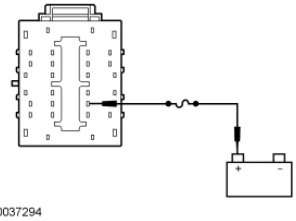
When the parking lamp relay is energized, voltage is routed through circuit CBP26 (BU/WH) to the rear and front parking lamps. Ground is provided to the LH rear parking and license plate lamps through circuit GD149 (BK/GY). Ground for the RH rear parking lamp is provided through circuit GD151 (BK/GN). Ground is provided to the LH front parking lamps through circuit GD120 (BK/GN). Ground is provided to the RH front parking lamps through circuit GD123 (BK/GY).

Explorer Sport Trac

When the headlamp switch is switched to the PARKING LAMPS ON position, the SJB provides a ground for the parking lamp relay coil (integrated into the SJB).

When the parking lamp relay is energized, voltage is sent through circuit CBP26 (BU/WH) to the rear and front parking lamps. Ground is provided to the LH and RH rear parking and license plate lamps through circuit GD148 (BK/YE). Ground is provided to the LH front parking lamps through circuit GD120 (BK/GN). Ground is provided to the RH front parking lamps through circuit GD123 (BK/GY).





This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Bulb holder
- LED module
- SJB

PINPOINT TEST O: ONE OR MORE PARKING, REAR OR LICENSE PLATE LAMPS IS INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
O1 CHECK THE STOPLAMPS AND TURN LAMPS	
• Ignition ON. • Operate the turn signals and apply the brake pedal while observing the exterior lamps. • **Do the stoplamps and turn lamps operate correctly?**	**Yes** GO to O2 . **No** REFER to Stoplamps or Turn Signal and Hazard Lamps in this section.
O2 DETERMINE IF ALL THE PARKING LAMPS ARE INOPERATIVE	
• Ignition OFF. • Place the headlamp switch to the PARKING LAMPS ON position. • **Are all the parking lamps inoperative?**	**Yes** VERIFY the SJB fuse 26 (15A) is OK. If OK, GO to O7 . If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short. **No**

	PLACE the headlamp switch in the OFF position. If all front parking lamps are inoperative, GO to O3 . If all rear parking and license plate lamps are inoperative, GO to O4 . If an individual parking or license plate lamp is inoperative, GO to O5 .
O3 CHECK CIRCUIT CBP26 (BU/WH) FOR AN OPEN (FRONT LAMPS)	
• Disconnect: SJB C2280e. • Connect a fused jumper wire between the SJB C2280e-4, circuit SBB02 (YE/RD), harness side and the SJB C2280e-15, circuit CBP26 (BU/WH), harness side.  N0064562 • **Do the front parking lamps illuminate?**	**Yes** REMOVE the jumper wire. GO to O7 . **No** REMOVE the jumper wire. REPAIR the circuit. TEST the system for normal operation.
O4 CHECK CIRCUIT CBP26 (BU/WH) FOR AN OPEN (REAR LAMPS)	
• Disconnect: SJB C2280a. • Connect a fused jumper wire between the positive battery terminal and the SJB C2280a-11, circuit CBP26 (BU/WH), harness side.  N0037294 • **Do the rear parking lamps illuminate?**	**Yes** REMOVE the jumper wire. GO to O7 . **No** REMOVE the jumper wire. REPAIR the circuit. TEST the system for normal operation.
O5 CHECK FOR VOLTAGE TO THE INOPERATIVE PARKING LAMP	

- Disconnect: Inoperative Lamp.
- Place the headlamp switch in the PARKING LAMPS ON position.
- Measure the voltage between the inoperative lamp, harness side and ground as follows:

Yes
GO to O6 .

No
REPAIR circuit CBP26 (BU/WH for an open. TEST the system for normal operation.

- **Is the voltage greater than 10 volts?**

O7 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

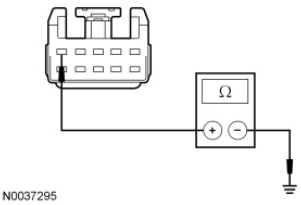
Pinpoint Test P: The Parking, Rear Or License Plate Lamps Are On Continuously

Refer to Wiring Diagrams Cell 92 , Parking, Rear and License Lamps for schematic and connector information.

Normal Operation

The SJB sends a reference signal to the headlamp switch through circuit CLS34 (GY) to monitor for a parking lamp on request. When the headlamp switch is placed in the PARKING LAMPS ON position, the voltage signal is routed to ground. The SJB then energizes an internal relay, routing voltage through circuit CBP26 (BU/WH) to the rear and front parking lamps.

- DTC B1578 (Lamp Park Input Circuit Short to Ground) - an on-demand DTC that sets when the SJB detects a short to ground from the parking lamp request input circuit.



This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Headlamp switch
- SJB

PINPOINT TEST P: THE PARKING, REAR OR LICENSE PLATE LAMPS ARE ON CONTINUOUSLY

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
P1 CHECK THE RECORDED DTCs FROM THE SJB SELF-TEST	
• Check the recorded results from the SJB self-test.	**Yes** GO to P2 .

• **Is DTC B1578 present?**	**No** GO to P4 .
P2 CHECK THE HEADLAMP SWITCH	
• Ignition OFF. • Disconnect: Headlamp Switch C205. • Carry out the headlamp switch component test. Refer to Wiring Diagrams Cell 149 for component testing. • **Is the headlamp switch OK?**	**Yes** GO to P3 . **No** INSTALL a new headlamp switch. REFER to Headlamp Switch in this section. CLEAR the DTCs. REPEAT the self-test.
P3 CHECK CIRCUIT CLS34 (GY) FOR A SHORT TO GROUND	
• Disconnect: SJB C2280d. • Measure the resistance between the headlamp switch C205-5, circuit CLS34 (GY), harness side and ground.  • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to P6 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
P4 CHECK CIRCUIT CBP26 (BU/WH) FOR A SHORT TO VOLTAGE (TO REAR LAMPS)	
• Disconnect: SJB C2280a. • **Do any parking lamps continue to illuminate?**	**Yes** If the rear parking lamps continue to illuminate, REPAIR circuit CBP26 (BU/WH) for a short to voltage. TEST the system for normal operation. If the front parking lamps continue to illuminate, GO to P5 . **No** REPAIR circuit CAT17 (BN) for a short to voltage. TEST the system for normal operation.
P5 CHECK CIRCUIT CBP26 (BU/WH) FOR A SHORT TO VOLTAGE (TO FRONT LAMPS)	
• Disconnect: SJB C2280e. • **Do the front parking lamps continue to illuminate?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to P6 .
P6 CHECK FOR CORRECT SJB OPERATION	

• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Fog Lamps

Special Tool(s)

 ST1137-A	73III Automotive Meter 105-R0057 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
 ST2574-A	Flex Probe Kit 105-R025C or equivalent

Principles of Operation

NOTE: The Smart Junction Box (SJB) is also known as the Generic Electronic Module (GEM).

The SJB monitors the headlamp switch position by sending a voltage reference signal to the headlamp switch. When the fog lamp switch is engaged, the voltage reference signal is routed to ground.

When the low beam headlamps are on and the SJB receives an input from the headlamp switch indicating a request for the fog lamps, the SJB provides voltage to the fog lamp relay. When the fog lamp relay is energized, voltage is routed to the fog lamps.

Field-Effect Transistor (FET) Protection

The SJB utilizes a Field-Effect Transistor (FET) protective circuit strategy for many of its outputs (for example, a headlamp output circuit). Output loads (current level) are monitored for excessive current (typically short circuits) and are shut down (turns off the voltage or ground provided by the module) when a fault event is detected. A continuous DTC is stored at the fault event and a cumulative counter is started.

When the demand for the output is no longer present, the module resets the FET circuit protection to allow the circuit to function. The next time the driver requests a circuit to activate that has been shut down by a previous short (FET protection) and the circuit remains shorted, the FET protection shuts off the circuit again and the cumulative counter advances.

When the excessive circuit load occurs often enough, the module shuts down the output until a repair procedure is carried out. Each FET protected circuit has 3 predefined levels of short circuit tolerance based on the harmful effect of each circuit fault on the FET and the ability of the FET to withstand it. A module lifetime level of fault events is established based upon the durability of the FET . If the total tolerance level is determined to be 600 fault events, the 3 predefined levels would be 200, 400 and 600 fault events.

When each tolerance level is reached, the continuous DTC that was stored on the first failure cannot be cleared by a command to clear the continuous DTCs. The module does not allow this code to be cleared or the circuit restored to normal operation until a successful self-test proves that the fault has been repaired. After the

self-test has successfully completed (no on-demand DTCs present), the continuous DTC automatically clears and the circuit function returns.

When the first or second level is reached, the continuous DTC (associated with the short circuit) sets along with DTC B106E. These DTCs can be cleared using the module on-demand self-test, then the Clear DTC operation on the scan tool (if the on-demand test shows the fault corrected). The module never resets the fault event counter to zero and continues to advance the fault event counter as short circuit fault events occur.

If the number of short circuit fault events reach the third level, then DTCs B106F and B1342 set along with the associated continuous DTC. This DTC cannot be cleared and the module must be replaced.

The SJB FET protected output circuits for the fog lamp system are the LH fog lamp relay/fog lamps on indicator output circuits.

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of electrical damage.

Visual Inspection Chart

Electrical
• Battery Junction Box (BJB) fuse 31 (15A) (fog lamps) • Bulb(s) • Wiring, terminals or connectors • Fog lamp relay • Headlamp switch • Smart Junction Box (SJB)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

NOTE: Make sure the headlamp switch is in the OFF position.

NOTE: Make sure the multifunction switch is in the LOW BEAM position.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

   - Check the VCM connection to the vehicle.

- Check the scan tool connection to the VCM .
- Refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication with the SJB , refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the SJB .

9. If the DTCs retrieved are related to the concern, go to Diagnostic Trouble Code (DTC) Chart in this section. For all other DTCs, refer to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

Symptom Chart

Symptom Chart

Pinpoint Tests

Pinpoint Test Q: The Fog Lamps Are Inoperative

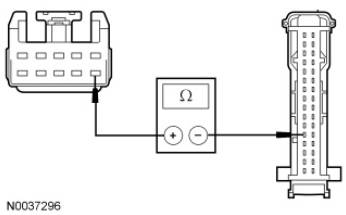
Refer to Wiring Diagrams Cell 86 , Fog Lamps for schematic and connector information.

Normal Operation

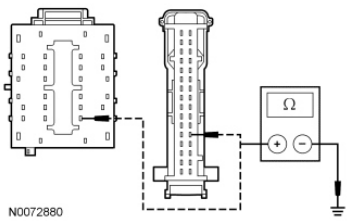
The Smart Junction Box (SJB) sends a reference signal to the headlamp switch through circuit CLF21 (GY/VT). When the fog lamp switch is engaged, the voltage signal is routed to ground.

Voltage is supplied to the switched side of the fog lamp relay from the Battery Junction Box (BJB) fuse 31 (15A) through circuit SBB31 (WH/RD).

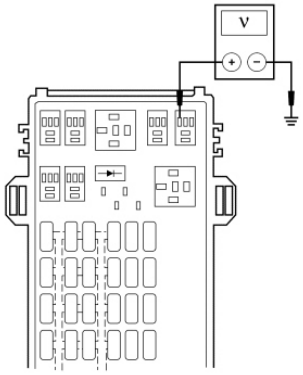
When the SJB detects the fog lamp on request, the SJB provides a voltage to the fog lamp relay coil through circuit CLF28 (BN/WH). The fog lamp relay coil ground is provided through circuit GD120 (BK/GN). When the fog lamp relay is energized, voltage is routed through circuit CLF12 (BN/YE) to the fog lamps. The fog lamps share a common ground through circuit GD123 (BK/GY).

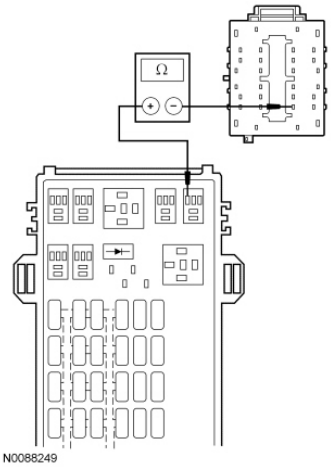


- DTC B2030 (Front Fog Lamp Relay Ckt Failure) - a continuous and on-demand DTC that sets when the SJB detects a short to ground from the fog lamp relay coil ground controlled circuit. The self-test must be run after the repair in order for the SJB to enable the output for the fog lamp voltage supply.
- DTC B2512 (Front Fog Lamp Relay Ckt Short to Battery) - a continuous and on-demand DTC that sets when the SJB detects an open from the fog lamp relay coil voltage supply circuit.

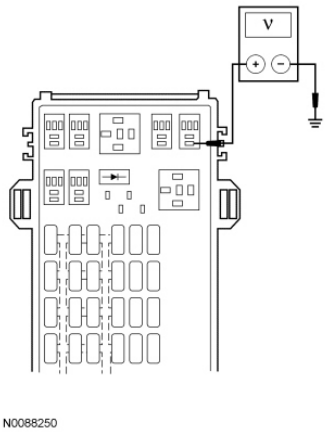


This pinpoint test is intended to diagnose the following:





- Fuse
- Wiring, terminals or connectors
- Fog lamp relay
- Headlamp switch
- SJB



PINPOINT TEST Q: THE FOG LAMPS ARE INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
Q1 CHECK THE HEADLAMP SWITCH PID	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: SJB DataLogger. • Monitor the SJB headlamp switch PID (FOG SW) while engaging the fog lamp switch. • **Does the PID agree with the headlamp switch position?**	**Yes** GO to Q4 . **No** GO to Q2 .
Q2 CHECK THE HEADLAMP SWITCH	
• Ignition OFF. • Disconnect: Headlamp Switch C205. • Carry out the headlamp switch component test. Refer to Wiring Diagrams Cell 149 for component testing. • **Is the headlamp switch OK?**	**Yes** GO to Q3 . **No** INSTALL a new headlamp switch. REFER to Headlamp Switch in this section. CLEAR the DTCs. REPEAT the self-test.
Q3 CHECK CIRCUIT CLF21 (GY/VT) FOR AN OPEN	
• Disconnect: SJB C2280d. • Measure the resistance between the headlamp switch C205-6, circuit CLF21 (GY/VT), harness side and the SJB C2280d-12, circuit CLF21 (GY/VT), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** GO to Q13 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
Q4 CHECK THE RECORDED DTCs FROM THE SJB SELF-TEST	
• Check the recorded results from the SJB self-test.	**Yes** For DTC B2030, GO to Q5 .

• **Is DTC B2030 or B2512 present?**	For DTC B2512, GO to Q8 . **No** GO to Q11 .
Q5 CHECK THE FOG LAMP RELAY (DTC B2030)	
• Disconnect: Fog Lamp Relay. • Enter the following diagnostic mode on the scan tool: SJB Self-Test. • **NOTE:** DTC B2512 may be present and should be ignored. • Repeat the SJB self-test. • **Is DTC B2030 retrieved again?**	**Yes** GO to Q6 . **No** INSTALL a new fog lamp relay. CLEAR the DTCs. REPEAT the self-test.
Q6 CHECK THE HEADLAMP SWITCH (DTC B2030)	
• Disconnect: Headlamp Switch C205. • Enter the following diagnostic mode on the scan tool: SJB Self-Test. • **NOTE:** Other DTCs will be present and should be ignored. • Repeat the SJB self-test. • **Is DTC B2030 retrieved again?**	**Yes** GO to Q7 . **No** INSTALL a new headlamp switch. REFER to Headlamp Switch in this section. CLEAR the DTCs. REPEAT the self-test.
Q7 CHECK CIRCUIT CLF28 (BN/WH) FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: SJB C2280d and C2280e. • Measure the resistance between the SJB C2280e-7, circuit CLF28 (BN/WH), harness side and ground; and between the SJB C2280d-28, circuit CLF28 (BN/WH), harness side and ground.  • **Are resistances greater than 10,000 ohms?**	**Yes** GO to Q13 . **No** REPAIR the circuit in question for a short to ground. RUN the on-demand self-test (required to clear certain DTCs). CORRECT any unresolved DTCs. CLEAR all DTCs. TEST the system for normal operation.
Q8 CHECK THE FOG LAMP RELAY (DTC B2512)	
• Disconnect: Fog Lamp Relay. • Substitute a known good relay. • Enter the following diagnostic mode on the scan tool: SJB DataLogger. • Command the SJB fog lamp active command (FOG_LMP) on and then off. • **Do the fog lamps illuminate when commanded on?**	**Yes** REMOVE the known good relay. INSTALL a new fog lamp relay. CLEAR the DTCs. REPEAT the self-test. **No** REMOVE the known good relay. GO to Q9 .

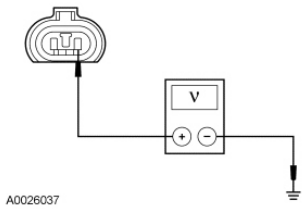
Q9 CHECK CIRCUIT CLF28 (BN/WH) FOR VOLTAGE	
• Measure the voltage between the fog lamp relay pin 2, circuit CLF28 (BN/WH), BJB face side and ground.  N0088248 • Enter the following diagnostic mode on the scan tool: SJB DataLogger. • Command the SJB fog lamp active command (FOG_LMP) on and then off. • **Is the voltage greater than 10 volts when the fog lamps are commanded on?**	**Yes** REPAIR circuit GD120 (BK/GN) for an open. CLEAR the DTCs. REPEAT the self-test. **No** GO to Q10 .
Q10 CHECK CIRCUIT CLF28 (BN/WH) FOR AN OPEN	
• Ignition OFF. • Disconnect: SJB C2280e. • Measure the resistance between the fog lamp relay pin 2, circuit CLF28 (BN/WH), BJB face side and the SJB C2280e-7, circuit CLF28 (BN/WH), harness side.  N0088249 • **Is the resistance less than 5 ohms?**	**Yes** GO to Q13 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
Q11 CHECK THE FOG LAMP RELAY (NO DTCs)	

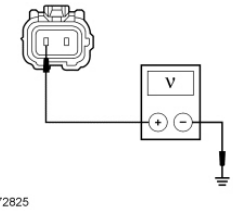
• Disconnect: Fog Lamp Relay. • Substitute a known good relay. • Enter the following diagnostic mode on the scan tool: SJB DataLogger. • Command the SJB fog lamp active command (FOG_LMP) on and then off. • **Do the fog lamps illuminate when commanded on?**	**Yes** REMOVE the known good relay. INSTALL a new fog lamp relay. TEST the system for normal operation. **No** REMOVE the known good relay. GO to Q12 .
Q12 CHECK CIRCUIT SBB31 (WH/RD) FOR AN OPEN	
• Ignition OFF. • Measure the voltage between the fog lamp relay pin 3, circuit SBB31 (WH/RD), BJB face side and ground.  N0088250 • **Is the voltage greater than 10 volts?**	**Yes** REPAIR circuit CLF12 (BN/YE) for an open. TEST the system for normal operation. **No** VERIFY the BJB fuse 31 (15A) is OK. If OK, REPAIR the circuit. TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short.
Q13 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR any DTCs. REPEAT the self-test.

Pinpoint Test R: An Individual Fog Lamp Is Inoperative

Refer to Wiring Diagrams Cell 86 , Fog Lamps for schematic and connector information.

Normal Operation





When the fog lamp relay is energized, voltage is routed through circuit CLF12 (BN/YE) to the fog lamps. Ground for the fog lamps is provided through circuit GD123 (BK/GY).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors

PINPOINT TEST R: AN INDIVIDUAL FOG LAMP IS INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
R1 CHECK FOR VOLTAGE TO THE FOG LAMP	
NOTE: Make sure the fog lamp bulb is good before continuing diagnostics. • Ignition OFF. • Disconnect: Inoperative Fog Lamp. • Ignition ON. • Place the headlamp switch in the PARKING LAMPS ON position and engage the fog lamp switch. • For all except the Adrenalin package, measure the voltage between the LH fog lamp C152-1, circuit CLF12 (BN/YE), harness side and ground; or between the RH fog lamp C162-1, circuit CLF12 (BN/YE), harness side and ground.  A0026037 • For the Adrenalin package, measure the voltage between the LH fog lamp C1322-A, circuit CLF12 (BN/YE), harness side and ground; or between the RH fog lamp C1323-A, circuit CLF12 (BN/YE), harness side and ground.  N0072825 • **Is the voltage greater than 10 volts?**	**Yes** REPAIR circuit GD123 (BK/GY) for an open. CLEAR the DTCs. REPEAT the self-test. **No** REPAIR circuit CLF12 (BN/YE) for an open. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test S: The Fog Lamps Are On Continuously

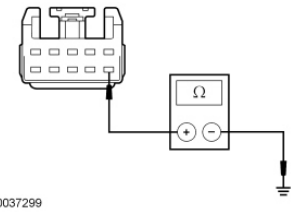
Refer to Wiring Diagrams Cell 86 , Fog Lamps for schematic and connector information.

Normal Operation

The Smart Junction Box (SJB) sends a reference signal to the headlamp switch through circuit CLF21 (GY/VT). When the fog lamp switch is engaged, the voltage signal is routed to ground.

When the SJB detects the fog lamp on request, the SJB provides a voltage to the fog lamp relay coil through circuit CLF28 (BN/WH). The fog lamp relay coil ground is provided through circuit GD120 (BK/GN). When the fog lamp relay is energized, voltage is sent through circuit CLF12 (BN/YE) to the fog lamps.

- DTC B2254 (Front Fog Lamp Switch Failure) - an on-demand DTC that sets when the SJB detects a short to ground from the fog lamps on input circuit.
- DTC B2512 (Front Fog Lamp Relay Ckt Short to Battery) - a continuous and on-demand DTC that sets when the SJB detects a short to voltage from the fog lamp relay coil voltage supply circuit.



This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Fog lamp relay
- Headlamp switch
- SJB

PINPOINT TEST S: THE FOG LAMPS ARE ON CONTINUOUSLY

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
S1 CHECK THE HEADLAMP SWITCH PID	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: SJB DataLogger. • **NOTE:** Make sure the headlamp switch is in the OFF position. • Monitor the SJB headlamp switch PID (FOG SW). • **Does the PID agree with the headlamp switch position?**	**Yes** GO to S4 . **No** GO to S2 .
S2 CHECK THE HEADLAMP SWITCH	
• Ignition OFF. • Disconnect: Headlamp Switch C205. • Carry out the headlamp switch component test. Refer to Wiring Diagrams Cell 149 for component testing. • **Is the headlamp switch OK?**	**Yes** GO to S3 . **No** INSTALL a new headlamp switch. REFER to Headlamp Switch in this section. CLEAR the DTCs. REPEAT the self-test.
S3 CHECK CIRCUIT CLF21 (GY/VT) FOR A SHORT TO GROUND	

• Disconnect: SJB C2280d. • Measure the resistance between the headlamp switch C205-6, circuit CLF21 (GY/VT), harness side and ground.  N0037299 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to S9 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
S4 CHECK CIRCUIT CLF12 (BN/YE) FOR A SHORT TO VOLTAGE	
• Disconnect: Fog Lamp Relay. • **Do the fog lamps continue to illuminate?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** GO to S5 .
S5 CHECK THE FOG LAMP RELAY	
• Substitute a known good relay. • **Do the fog lamps continue to illuminate?**	**Yes** REMOVE the known good relay. INSTALL the original fog lamp relay. GO to S6 . **No** REMOVE the known good relay. INSTALL a new fog lamp relay. CLEAR the DTCs. REPEAT the self-test.
S6 CHECK THE HEADLAMP SWITCH FOR A SHORT TO VOLTAGE	
• Disconnect: Headlamp Switch C205. • **Do the fog lamps continue to illuminate?**	**Yes** GO to S7 . **No** INSTALL a new headlamp switch. REFER to Headlamp Switch in this section. CLEAR the DTCs. REPEAT the self-test.
S7 CHECK CIRCUIT CLF28 (BN/WH) FOR A SHORT TO VOLTAGE (TO HEADLAMP SWITCH)	
• Disconnect: SJB C2280d. • **Do the fog lamps continue to illuminate?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** GO to S8 .
S8 CHECK CIRCUIT CLF28 (BN/WH) FOR A SHORT TO VOLTAGE (TO FOG LAMP RELAY)	

• Disconnect: SJB C2280e. • **Do the fog lamps continue to illuminate?**	**Yes** GO to S9 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
S9 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR any DTCs. REPEAT the self-test.

Reversing Lamps

Special Tool(s)

 ST1137-A	73III Automotive Meter 105-R0057 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
 ST2574-A	Flex Probe Kit 105-R025C or equivalent

Principles of Operation

NOTE: The Smart Junction Box (SJB) is also known as the Generic Electronic Module (GEM).

The SJB receives transmission gear status from the PCM through the Instrument Cluster (IC) gateway, over the communication network. When a message is sent over the communication network stating the transmission is in REVERSE (R), the SJB energizes an internal relay which supplies voltage to the reversing lamps.

The PCM sets DTCs if there are any concerns with the input from the TR sensor.

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of electrical damage.

Visual Inspection Chart

Electrical
• Smart Junction Box (SJB) fuse 15 (10A) • Bulb(s) • Wiring, terminals or connectors • SJB

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

NOTE: Make sure the headlamp switch is in the OFF position.

NOTE: Make sure the multifunction switch is in the LOW BEAM position.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM .
   - Refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication with the SJB , refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the SJB .

9. If the DTCs retrieved are related to the concern, go to Diagnostic Trouble Code (DTC) Chart in this section. For all other DTCs, refer to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

Symptom Chart

Symptom Chart

Pinpoint Tests

Pinpoint Test T: Both Reversing Lamps Are Inoperative

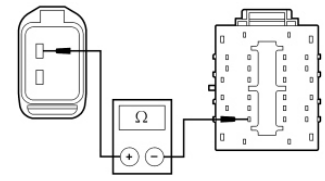
Refer to Wiring Diagrams Cell 93 , Reversing Lamps for schematic and connector information.

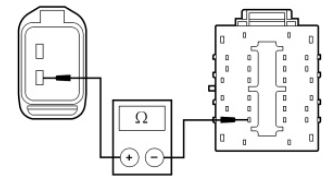
Normal Operation

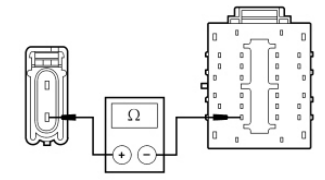
The Smart Junction Box (SJB) receives the transmission gear status from the powertrain control module (PCM) (5R55S transmission), or the Transmission Control Module (TCM) (6R60 transmission), through the instrument cluster gateway, over the communication network. When the transmission is placed in REVERSE (R), the PCM sends a message over the communication network indicating the transmission is in reverse. The SJB then provides ground to an internal relay, which routes voltage to circuit CBP15 (BN/BU) to the reversing lamps.

The PCM or TCM sets DTCs if there are any concerns with the input from the Transmission Range (TR) sensor.

This pinpoint test is intended to diagnose the following:







- Fuse
- Wiring, terminals or connectors
- SJB

PINPOINT TEST T: BOTH REVERSING LAMPS ARE INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Make sure the stoplamps operate correctly before continuing diagnostics.

Test Step	Result / Action to Take
T1 CARRY OUT THE PCM OR TCM SELF-TEST	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: PCM or TCM Self-Test. • Carry out the PCM (5R55S transmission) or the TCM (6R60 transmission) self-test. • **Are any PCM or TCM Transmission Range (TR) sensor DTCs present?**	**Yes** REFER to Section 307-01A or Section 307-01B . **No** GO to T2 .
T2 RETRIEVE THE RESULTS FROM THE SJB SELF-TEST	
• Review the recorded results from the SJB self-test. • **Are any DTCs present?**	**Yes** REFER to Section 419-10 . **No** VERIFY the SJB fuse 15 (10A) is OK. If OK, GO to T3 . If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short.
T3 CHECK CIRCUIT CBP15 (BN/BU) FOR AN OPEN	

• Disconnect: LH Reversing Lamp. • Disconnect: SJB C2280a. • For Explorer, measure the resistance between the LH reversing lamp C487-2, circuit CBP15 (BN/BU), harness side and the SJB C2280a-6, circuit CBP15 (BN/BU), harness side.  N0072883 • For Mountaineer, measure the resistance between the LH reversing lamp C487-1, circuit CBP15 (BN/BU), harness side and the SJB C2280a-6, circuit CBP15 (BN/BU), harness side.  N0072884 • For Explorer Sport Trac, measure the resistance between the LH reversing lamp C451-3, circuit CBP15 (BN/BU), harness side and the SJB C2280a-6, circuit CBP15 (BN/BU), harness side.  N0046967 • **Is the resistance less than 5 ohms?**	**Yes** GO to T4 . **No** REPAIR the circuit. CLEAR the DTC. REPEAT the self-test.
T4 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly.	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

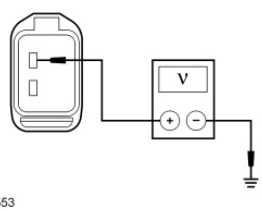
• Operate the system and verify the concern is still present. • **Is the concern still present?**	CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test U: An Individual Reversing Lamp Is Inoperative

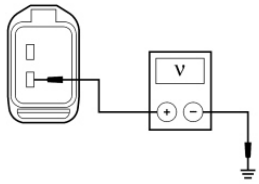
Refer to Wiring Diagrams Cell 93 , Reversing Lamps for schematic and connector information.

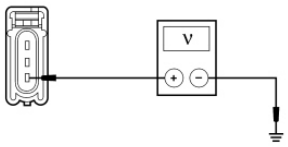
Normal Operation

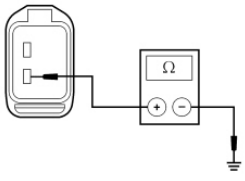
When the transmission is placed in REVERSE (R), voltage is routed through circuit CBP15 (BN/BU) to the reversing lamps. The reversing lamps are ground through circuit GD148 (BK/YE) (Explorer Sport Trac), circuit GD149 (BK/GY) (LH reversing lamp, Explorer/Mountaineer), or circuit GD151 (BK/GN) (RH reversing lamp, Explorer/Mountaineer).



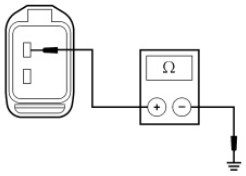
This pinpoint test is intended to diagnose the following:

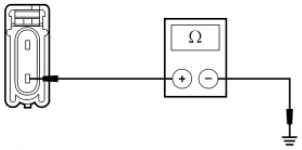






- Wiring, terminals or connectors
- Bulb holder





PINPOINT TEST U: AN INDIVIDUAL REVERSING LAMP IS INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
U1 CHECK FOR VOLTAGE TO THE REVERSING LAMP	
• Ignition OFF. • Disconnect: Inoperative Reversing Lamp. • Apply the parking brake. • Ignition ON. • Select REVERSE. • For Explorer, measure the voltage between the LH reversing lamp C487-2, circuit CBP15 (BN/BU), harness side and ground; or between the RH reversing lamp C488-2, circuit CBP15 (BN/BU), harness side and ground.  A0057553 • For Mountaineer, measure the voltage between the LH reversing lamp C487-1, circuit CBP15 (BN/BU), harness side and ground;	**Yes** GO to U2 . **No** REPAIR circuit CBP15 (BN/BU) for an open. TEST the system for normal operation.

or between the RH reversing lamp C488-1, circuit CBP15 (BN/BU), harness side and ground.  A0057554 • For Explorer Sport Trac, measure the voltage between the LH reversing lamp C451-3, circuit CBP15 (BN/BU), harness side and ground; or between the RH reversing lamp C461-3, circuit CBP15 (BN/BU), harness side and ground.  N0088216 • **Is the voltage greater than 10 volts?**	
U2 CHECK THE REVERSING LAMP GROUND CIRCUIT FOR AN OPEN	
• Select PARK. • Disconnect: Negative Battery Cable. • Ignition OFF. • For Explorer, measure the resistance between the LH reversing lamp C487-1, circuit GD149 (BK/GY), harness side and ground; or between the RH reversing lamp C488-1, circuit GD151 (BK/GN), harness side and ground.  N0072885 • For Mountaineer, measure the resistance between the LH reversing lamp C487-2, circuit GD149 (BK/GY), harness side and ground; or between the RH reversing lamp C488-2, circuit GD151 (BK/GN), harness side and ground.	**Yes** INSTALL a new bulb holder. TEST the system for normal operation. **No** REPAIR the ground circuit in question for an open. TEST the system for normal operation.

 N0072886 • For Explorer Sport Trac, measure the resistance between the LH reversing lamp C451-1, circuit GD148 (BK/YE), harness side and ground; or between the RH reversing lamp C461-1, circuit GD148 (BK/YE), harness side and ground.  A0088192 • **Is the resistance less than 5 ohms?**	

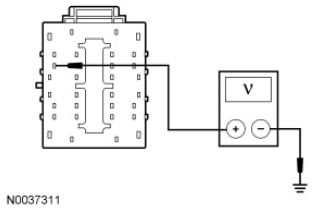
Pinpoint Test V: The Reversing Lamps Are On Continuously

Refer to Wiring Diagrams Cell 93 , Reversing Lamps for schematic and connector information.

Normal Operation

The Smart Junction Box (SJB) receives the transmission gear status from the PCM (5R55S transmission), or the Transmission Control Module (TCM) (6R60 transmission), through the Instrument Cluster (IC) gateway, over the communication network. When the transmission is placed in REVERSE (R), the PCM sends a message over the communication network indicating the transmission is in reverse. The SJB then provides ground to an internal relay, which routes voltage to circuit CBP15 (BN/BU) to the reversing lamps and the rear view mirror, and through circuit CAT16 (GY/BN) to the trailer tow connector.

The PCM sets DTCs if there are any concerns with the input from the Transmission Range (TR) sensor.



This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Interior rear view mirror
- SJB

PINPOINT TEST V: THE REVERSING LAMPS ARE ON CONTINUOUSLY

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
V1 CARRY OUT THE PCM OR TCM SELF-TEST	

• Ignition ON. • Enter the following diagnostic mode on the scan tool: PCM or TCM Self-Test. • Carry out the PCM (5R55S transmission) or the TCM (6R60 transmission) self-test. • **Are any PCM or TCM Transmission Range (TR) sensor DTCs present?**	**Yes** REFER to Section 307-01A or Section 307-01B . **No** GO to V2 .
V2 CHECK THE INTERIOR REAR VIEW MIRROR	
• Ignition OFF. • Disconnect: Interior Rear View Mirror C911 or C9012. • Ignition ON. • **Do the reversing lamps continue to illuminate?**	**Yes** GO to V3 . **No** INSTALL a new interior rear view mirror. REFER to Section 501-09 . TEST the system for normal operation.
V3 CHECK CIRCUIT CBP15 (BN/BU) FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: SJB C2280a. • Ignition ON. • **Do the reversing lamps continue to illuminate?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to V4 .
V4 CHECK CIRCUIT CAT16 (GY/BN) FOR A SHORT TO VOLTAGE	
• Measure the voltage between the SJB C2280a-21, circuit CAT16 (GY/BN), harness side and ground.  • **Is any voltage present?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to V5 .
V5 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present.	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR any DTCs. REPEAT the self-test.

• **Is the concern still present?**	

Trailer Lamps

Special Tool(s)

 ST1137-A	73III Automotive Meter 105-R0057 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
 ST2574-A	Flex Probe Kit 105-R025C or equivalent

Principles of Operation

NOTE: The Smart Junction Box (SJB) is also known as the Generic Electronic Module (GEM).

The SJB uses existing inputs to determine if voltage needs to be supplied to the individual trailer stop/turn lamps. The SJB has separate drivers that provide voltage for the trailer stop/turn lamps. The trailer parking and reversing lamps share the vehicle lighting outputs.

The vehicle is supplied with wiring to support an aftermarket .

The trailer tow battery charging is controlled by a relay. When the ignition switch is in the RUN or ACC position, the trailer tow battery charge relay is energized, which routes voltage to the trailer tow connector.

Field-Effect Transistor (FET) Protection

The SJB utilizes a Field-Effect Transistor (FET) protective circuit strategy for many of its outputs (for example, a headlamp output circuit). Output loads (current level) are monitored for excessive current (typically short circuits) and are shut down (turns off the voltage or ground provided by the module) when a fault event is detected. A continuous DTC is stored at the fault event and a cumulative counter is started.

When the demand for the output is no longer present, the module resets the FET circuit protection to allow the circuit to function. The next time the driver requests a circuit to activate that has been shut down by a previous short (FET protection) and the circuit remains shorted, the FET protection shuts off the circuit again and the cumulative counter advances.

When the excessive circuit load occurs often enough, the module shuts down the output until a repair procedure is carried out. Each FET protected circuit has 3 predefined levels of short circuit tolerance based on the harmful effect of each circuit fault on the FET and the ability of the FET to withstand it. A module lifetime level of fault events is established based upon the durability of the FET . If the total tolerance level is determined to be 600 fault events, the 3 predefined levels would be 200, 400 and 600 fault events.

When each tolerance level is reached, the continuous DTC that was stored on the first failure cannot be cleared by a command to clear the continuous DTCs. The module does not allow this code to be cleared or the circuit restored to normal operation until a successful self-test proves that the fault has been repaired. After the self-test has successfully completed (no on-demand DTCs present), the continuous DTC automatically clears and the circuit function returns.

When the first or second level is reached, the continuous DTC (associated with the short circuit) sets along with DTC B106E. These DTCs can be cleared using the module on-demand self-test, then the Clear DTC operation on the scan tool (if the on-demand test shows the fault corrected). The module never resets the fault event counter to zero and continues to advance the fault event counter as short circuit fault events occur.

If the number of short circuit fault events reach the third level, then DTCs B106F and B1342 set along with the associated continuous DTC. This DTC cannot be cleared and the module must be replaced.

The SJB FET protected output circuits for the trailer lamp system are the LH and RH trailer stop/turn output circuits.

Inspection and Verification

1. Verify the customer concern.
2. Verify the exterior lighting system of the vehicle is operating correctly. If not, refer to the appropriate pinpoint test in this section.
3. Visually inspect for obvious signs of electrical damage.

Visual Inspection Chart

Electrical
• Battery Junction Box (BJB) fuse(s): ♦ 13 (30A) (trailer tow battery charge relay - switched) ♦ 17 (30A) • Smart Junction Box (SJB) fuse(s): ♦ 7 (15A) (trailer stop/turn lamps) ♦ 12 (5A) (trailer tow battery charge relay coil) ♦ 16 (10A) (trailer reversing lamps) ♦ 25 (15A) (trailer parking lamps) • Circuity • Trailer • SJB

4. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

NOTE: Make sure the headlamp switch is in the OFF position.

NOTE: Make sure the multifunction switch is in the LOW BEAM position.

5. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

6. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM .
   - Refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

7. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to Section 418-00 to diagnose no response from the PCM.

8. Carry out the network test.
   - If the scan tool responds with no communication with the SJB , refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory DTCs.

9. Clear the continuous DTCs and carry out the self-test diagnostics for the SJB .

10. If the DTCs retrieved are related to the concern, go to Diagnostic Trouble Code (DTC) Chart in this section. For all other DTCs, refer to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .

11. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

Symptom Chart

Symptom Chart
NOTE: When diagnosing the trailer tow lamps, begin by verifying that the vehicle lamp systems are all functioning correctly with the trailer disconnected.

Condition	Possible Sources	Action
• All the trailer lamps are inoperative	• Wiring, terminals or connectors • Trailer tow connector • Trailer	• GO to Pinpoint Test W .
• The trailer lamps are inoperative - parking lamps	• Fuse • Wiring, terminals or connectors	

- Trailer tow connector
- Trailer

Pinpoint Tests

Pinpoint Test W: All the Trailer Lamps Are Inoperative

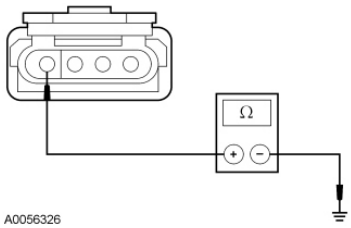
Refer to Wiring Diagrams Cell 95 , Trailer/Camper Adapter for schematic and connector information.

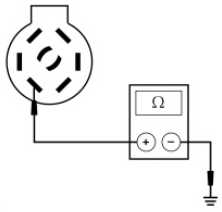
Normal Operation

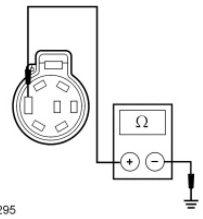
Ground for all the trailer lamps is provided through circuit RAT08 (WH).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Trailer tow connector
- Trailer







PINPOINT TEST W: ALL THE TRAILER LAMPS ARE INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Before beginning diagnostics, visually inspect the trailer tow connector for signs of corrosion or damage. Repair or install a new trailer tow connector as required.

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take

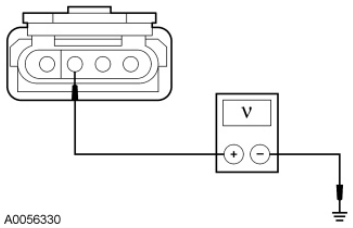
W1 CHECK CIRCUIT RAT08 (WH) FOR AN OPEN TO THE TRAILER TOW CONNECTOR	
• Disconnect the trailer from the vehicle. • Disconnect: Negative Battery Cable. • For the 4-pin connector, measure the resistance between the trailer tow C439-4, circuit RAT08 (WH), harness side and ground.  A0056326 • For the 7-pin connector, measure the resistance between the trailer tow connector pin 2, circuit RAT08 (WH), component side and ground.  N0068878 • **Is the resistance less than 5 ohms?**	**Yes** The vehicle is operating correctly. SEND the trailer to an authorized camper/trailer repair facility. **No** For the 4-pin connector, REPAIR the circuit. TEST the system for normal operation. For the 7-pin connector, GO to W2 .
W2 CHECK CIRCUIT RAT08 (WH) FOR AN OPEN	
• Disconnect: Trailer Tow C473. • Measure the resistance between the trailer tow C473-2, circuit RAT08 (WH), harness side and ground.  N0066295 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new trailer tow connector. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.

Pinpoint Test X: The Trailer Lamps Are Inoperative - Parking Lamps

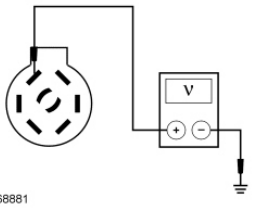
Refer to Wiring Diagrams Cell 95 , Trailer/Camper Adapter for schematic and connector information.

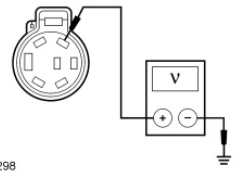
Normal Operation

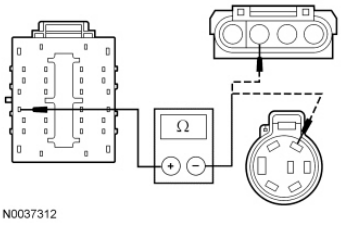
When the vehicle parking lamps are on, the Smart Junction Box (SJB) provides voltage to the trailer parking lamps through circuit CAT17 (BN).



This pinpoint test is intended to diagnose the following:







- Fuse
- Wiring, terminals or connectors
- Trailer tow connector
- Trailer
- SJB

PINPOINT TEST X: THE TRAILER LAMPS ARE INOPERATIVE - PARKING LAMPS

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Before beginning diagnostics, visually inspect the trailer tow connector for signs of corrosion or damage. Repair or install a new trailer tow connector as required.

Test Step	Result / Action to Take
X1 CHECK FOR VOLTAGE TO THE TRAILER TOW CONNECTOR	
• Ignition OFF. • Disconnect the trailer from the vehicle. • Place the headlamp switch in the PARKING LAMPS ON position. • For the 4-pin connector, measure the voltage between the trailer tow C439-3, circuit CAT17 (BN), harness side and ground.  A0056330 • For the 7-pin connector, measure the voltage between the trailer tow connector pin 6, circuit CAT17 (BN), component side and ground.	**Yes** The vehicle is operating correctly. SEND the trailer to an authorized camper/trailer repair facility. **No** VERIFY the SJB fuse 25 (15A) is OK. If OK for the 4-pin connector, GO to X3 . If OK for the 7-pin connector, GO to X2 . If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short.

 • **Is the voltage greater than 10 volts?**	
X2 CHECK FOR VOLTAGE TO THE TRAILER TOW CONNECTOR (7-PIN)	
• Disconnect: Trailer Tow C473. • Measure the voltage between the trailer tow C473-6, circuit CAT17 (BN), harness side and ground.  • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new trailer tow connector. TEST the system for normal operation. **No** GO to X3 .
X3 CHECK CIRCUIT CAT17 (BN) FOR AN OPEN	
• Place the headlamp switch in the OFF position. • Disconnect: SJB C2280a. • Measure the resistance between the SJB C2280a-13, circuit CAT17 (BN), harness side and the trailer tow C439-3 (4-pin connector) or C473-6 (7-pin connector), circuit CAT17 (BN), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** GO to X4 . **No** REPAIR the circuit. TEST the system for normal operation.
X4 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The

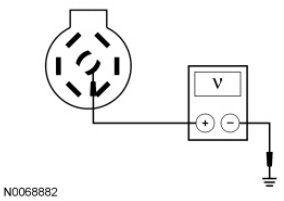
	concern may have been caused by a loose or corroded connector.

Pinpoint Test Y: The Trailer Lamps Are Inoperative - Reversing Lamps

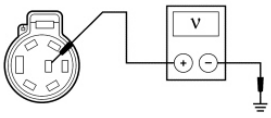
Refer to Wiring Diagrams Cell 95 , Trailer/Camper Adapter for schematic and connector information.

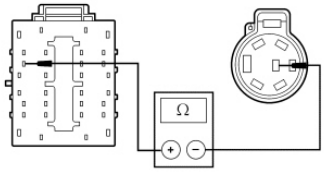
Normal Operation

Voltage to the trailer reversing lamps is supplied by the Smart Junction Box (SJB) through circuit CAT16 (GY/BN).



This pinpoint test is intended to diagnose the following:





- Fuse
- Wiring, terminals or connectors
- Trailer tow connector
- Trailer
- SJB

PINPOINT TEST Y: THE TRAILER LAMPS ARE INOPERATIVE - REVERSING LAMPS

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Before beginning diagnostics, visually inspect the trailer tow connector for signs of corrosion or damage. Repair or install a new trailer tow connector as required.

Test Step	Result / Action to Take
Y1 CHECK FOR VOLTAGE TO THE TRAILER TOW CONNECTOR	
• Ignition OFF. • Disconnect the trailer from the vehicle. • Apply the parking brake. • Ignition ON. • Select REVERSE. • Measure the voltage between the trailer tow connector pin 7, circuit CAT16 (GY/BN), component side and ground.  	**Yes** The vehicle is operating correctly. SEND the trailer to an authorized camper/trailer repair facility. **No** VERIFY the SJB fuse 16 (10A) is OK. If OK, GO to Y2 . If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short.

• **Is the voltage greater than 10 volts?**	
Y2 CHECK FOR VOLTAGE ON CIRCUIT CAT16 (GY/BN)	
• Disconnect: Trailer Tow C473. • Measure the voltage between the trailer tow C473-7, circuit CAT16 (GY/BN), harness side and ground.  A0025848 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new trailer tow connector. TEST the system for normal operation. **No** GO to Y3 .
Y3 CHECK CIRCUIT CAT16 (GY/BN) FOR AN OPEN	
• Select PARK. • Ignition OFF. • Disconnect: SJB C2280a. • Measure the resistance between the SJB C2280a-21, circuit CAT16 (GY/BN), harness side and the trailer tow C473-7, circuit CAT16 (GY/BN), harness side.  N0037313 • **Is the resistance less than 5 ohms?**	**Yes** GO to Y4 . **No** REPAIR the circuit. TEST the system for normal operation.
Y4 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test Z: The Individual Trailer Lamp Is Inoperative - LH Stop/Turn Lamp

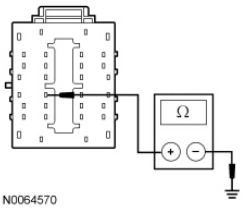
Refer to Wiring Diagrams Cell 95 , Trailer/Camper Adapter for schematic and connector information.

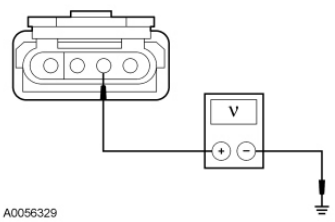
Normal Operation

Voltage to the LH trailer stop/turn lamp is supplied by the Smart Junction Box (SJB) through circuit CAT06 (YE).

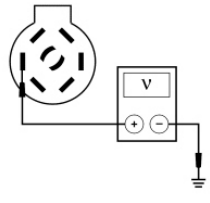
- DTC B2070 (Trailer Tow Relay Coil(s) Circuit Failure) - a continuous DTC that sets when the SJB detects a short to ground from the LH trailer stop/turn lamp voltage supply circuit. The self-test must be run after the repair in order for the SJB to enable the output for the LH trailer stop/turn lamp voltage supply. A trailer equipped with too many LH stop/turn bulbs may also set the DTC.

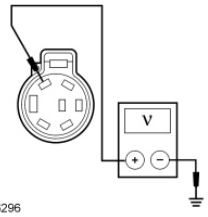
This pinpoint test is intended to diagnose the following:

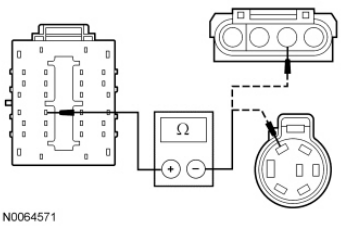




- Trailer equipped with too many bulbs
- Wiring, terminals or connectors
- Trailer tow connector
- Trailer
- SJB







PINPOINT TEST Z: THE INDIVIDUAL TRAILER LAMP IS INOPERATIVE - LH STOP/TURN LAMP

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Before beginning diagnostics, visually inspect the trailer tow connector for signs of corrosion or damage. Repair or install a new trailer tow connector as required.

Test Step	Result / Action to Take
Z1 CHECK THE RECORDED DTCs FROM THE SJB SELF-TEST	
• Check the recorded results from the SJB self-test. • **Was DTC B2070 present?**	**Yes** GO to Z2 . **No** GO to Z6 .
Z2 CLEAR THE DTCs AND REPEAT THE ON-DEMAND SELF-TEST WITH THE TRAILER DISCONNECTED	
• Disconnect the trailer from the vehicle. • Enter the following diagnostic mode on the scan tool: SJB Self-Test. • Clear the continuous DTCs. Repeat the on-demand self-test. • **Is DTC B2070 still present?**	**Yes** For the 4-pin connector, GO to Z5 . For the 7-pin connector, GO to Z4 . **No** GO to Z3 .
Z3 CHECK THE NUMBER OF BULBS ON THE TRAILER	
• Inspect the trailer for more than 2 LH stop/turn lamp bulbs. • **Are more than 2 LH stop/turn lamp bulbs present?**	**Yes** INFORM the customer that the vehicle can only support 2 stop/turn lamp bulbs per side. Any additional stop/turn lamp bulbs need to be removed from the trailer or an

	adapter kit installed for the trailer tow lamps to operate correctly. **No** The vehicle is operating correctly. SEND the trailer to an authorized camper/trailer repair facility.
Z4 CHECK THE TRAILER TOW CONNECTOR	
• Disconnect: Trailer Tow C473. • Enter the following diagnostic mode on the scan tool: SJB Self-Test. • Clear the continuous DTCs. Repeat the on-demand self-test. • **Is DTC B2070 still present?**	**Yes** GO to Z5 . **No** INSTALL a new trailer tow connector. TEST the system for normal operation.
Z5 CHECK CIRCUIT CAT06 (YE) FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: SJB C2280a. • Measure the resistance between the SJB C2280a-14, circuit CAT06 (YE), harness side and ground.  N0064570 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to Z9 . **No** REPAIR the circuit. RUN the on-demand self-test (required to clear certain DTCs). CORRECT any unresolved DTCs. CLEAR all DTCs. TEST the system for normal operation.
Z6 CHECK FOR VOLTAGE TO THE TRAILER TOW CONNECTOR	
• Disconnect the trailer from the vehicle. • Ignition OFF. • For the 4-pin connector, while applying the brake pedal, measure the voltage between the trailer tow C439-2, circuit CAT06 (YE), harness side and ground.  A0056329 • For the 7-pin connector, while applying the brake pedal, measure the voltage between the trailer tow	**Yes** The vehicle is operating correctly. SEND the trailer to an authorized camper/trailer repair facility. TEST the system for normal operation. **No** For the 4-pin connector, GO to Z8 . For the 7-pin connector, GO to Z7 .

connector pin 1, circuit CAT06 (YE), component side and ground.  N0068879 • **Is the voltage greater than 10 volts?**	
Z7 CHECK FOR VOLTAGE TO THE TRAILER TOW CONNECTOR (7-PIN)	
• Disconnect: Trailer Tow C473. • While applying the brake pedal, measure the voltage between the trailer tow C473-1, circuit CAT06 (YE), harness side and ground.  N0066296 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new trailer tow connector. TEST the system for normal operation. **No** GO to Z8 .
Z8 CHECK CIRCUIT CAT06 (YE) FOR AN OPEN	
• Disconnect: SJB C2280a. • Measure the resistance between the SJB C2280a-14, circuit CAT06 (YE), harness side and the trailer tow C439-2 (4-pin) or C473-1 (7-pin), circuit CAT06 (YE), harness side.  N0064571 • **Is the resistance less than 5 ohms?**	**Yes** GO to Z9 . **No** REPAIR the circuit. TEST the system for normal operation.
Z9 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation.

♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test AA: The Individual Trailer Lamp Is Inoperative - RH Stop/Turn Lamp

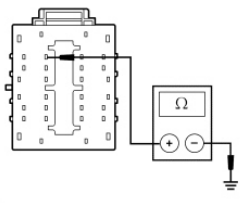
Refer to Wiring Diagrams Cell 95 , Trailer/Camper Adapter for schematic and connector information.

Normal Operation

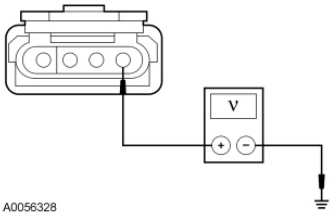
Voltage to the RH trailer stop/turn lamp is supplied by the Smart Junction Box (SJB) through circuit CAT09 (GN).

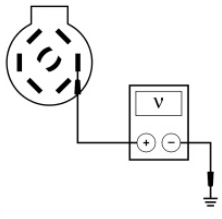
- DTC B2070 (Trailer Tow Relay Coil(s) Circuit Failure) - a continuous DTC that sets when the SJB detects a short to ground from the RH trailer stop/turn lamp voltage supply circuit. The self-test must be run after the repair in order for the SJB to enable the output for the RH trailer stop/turn lamp voltage supply. A trailer equipped with too many RH stop/turn bulbs may also set the DTC.

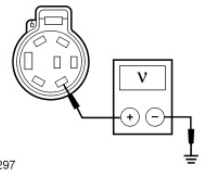
This pinpoint test is intended to diagnose the following:



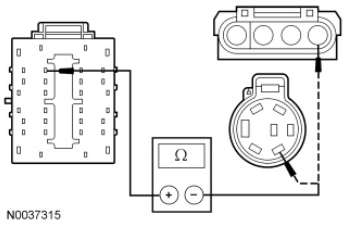
- Trailer equipped with too many bulbs
- Wiring, terminals or connectors
- Trailer tow connector
- Trailer
- SJB







PINPOINT TEST AA: THE INDIVIDUAL TRAILER LAMP IS INOPERATIVE - RH STOP/TURN LAMP



NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Before beginning diagnostics, visually inspect the trailer tow connector for signs of corrosion or damage. Repair or install a new trailer tow connector as required.

Test Step	Result / Action to Take
AA1 CHECK THE RECORDED DTCs FROM THE SJB SELF-TEST	
• Check the recorded results from the SJB self-test. • **Was DTC B2070 present?**	**Yes** GO to AA2 . **No** GO to AA6 .
AA2 CLEAR THE DTCs AND REPEAT THE ON-DEMAND SELF-TEST WITH THE TRAILER DISCONNECTED	
	Yes

• Disconnect the trailer from the vehicle. • Enter the following diagnostic mode on the scan tool: SJB Self-Test. • Clear the continuous DTCs. Repeat the on-demand self-test. • **Is DTC B2070 still present?**	For the 4-pin connector, GO to AA5 . For the 7-pin connector, GO to AA4 . **No** GO to AA3 .
AA3 CHECK THE NUMBER OF BULBS ON THE TRAILER	
• Inspect the trailer for more than 2 RH stop/turn lamp bulbs. • **Are more than 2 RH stop/turn lamp bulbs present?**	**Yes** INFORM the customer that the vehicle can only support 2 stop/turn lamp bulbs per side. Any additional stop/turn lamp bulbs need to be removed from the trailer or an adapter kit installed for the trailer tow lamps to operate correctly. **No** The vehicle is operating correctly. SEND the trailer to an authorized camper/trailer repair facility.
AA4 CHECK THE TRAILER TOW CONNECTOR	
• Disconnect: Trailer Tow 473. • Enter the following diagnostic mode on the scan tool: SJB Self-Test. • Clear the continuous DTCs. Repeat the on-demand self-test. • **Is DTC B2070 still present?**	**Yes** GO to AA5 . **No** INSTALL a new trailer tow connector. TEST the system for normal operation.
AA5 CHECK CIRCUIT CAT09 (GN) FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: SJB C2280a. • Measure the resistance between the SJB C2280a-26, circuit CAT09 (GN), harness side and ground.  N0064572 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to AA9 . **No** REPAIR the circuit. RUN the on-demand self-test (required to clear certain DTCs). CORRECT any unresolved DTCs. CLEAR all DTCs. TEST the system for normal operation.
AA6 CHECK FOR VOLTAGE TO THE TRAILER TOW CONNECTOR	

• Ignition OFF. • Disconnect the trailer from the vehicle. • For the 4-pin connector, while applying the brake pedal, measure the voltage between the trailer tow C439-1, circuit CAT09 (GN), harness side and ground.  A0056328 • For the 7-pin connector, while applying the brake pedal, measure the voltage between the trailer tow connector pin 4, circuit CAT09 (GN), component side and ground.  N0068880 • **Is the voltage greater than 10 volts?**	**Yes** The vehicle is operating correctly. SEND the trailer to an authorized camper/trailer repair facility. TEST the system for normal operation. **No** For the 4-pin connector, GO to AA8 . For the 7-pin connector, GO to AA7 .
AA7 CHECK FOR VOLTAGE TO THE TRAILER TOW CONNECTOR (7-PIN)	
• Disconnect: Trailer Tow C473. • While applying the brake pedal, measure the voltage between the trailer tow C473-4, circuit CAT09 (GN), harness side and ground.  N0066297 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new trailer tow connector. TEST the system for normal operation. **No** GO to AA8 .
AA8 CHECK CIRCUIT CAT09 (GN) FOR AN OPEN	

• Disconnect: SJB C2280a. • Measure the resistance between the SJB C2280a-26, circuit CAT09 (GN), harness side and the trailer tow C439-1 (4-pin) or C473-4 (7-pin), circuit CAT09 (GN), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** GO to AA9 . **No** REPAIR the circuit. TEST the system for normal operation.
AA9 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test AB: The Trailer Lamps Are On Continuously

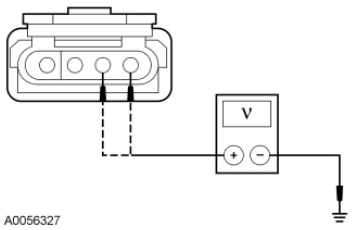
Refer to Wiring Diagrams Cell 95 , Trailer/Camper Adapter for schematic and connector information.

Normal Operation

Voltage to the trailer tow lamps is controlled by the Smart Junction Box (SJB). Circuits CAT06 (YE) and CAT09 (GN) supply voltage to the trailer tow LH and RH stoplamps.

The trailer tow parking lamps share the same voltage supply with the vehicle parking lamps.

This pinpoint test is intended to diagnose the following:



- Wiring, terminals or connectors
- Trailer
- SJB

PINPOINT TEST AB: THE TRAILER LAMPS ARE ON CONTINUOUSLY

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Before beginning diagnostics, visually inspect the trailer tow connector for signs of corrosion or damage. Repair or install a new trailer tow connector as required.

<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>
<tr><td>AB1 CHECK FOR VOLTAGE AT THE TRAILER TOW CONNECTOR</td><td></td></tr>
<tr><td>• Ignition OFF.
• Disconnect the trailer from the vehicle.

No
GO to AB3 .</td></tr>
</table>

RH	C439-1 (4-pin)	CAT09 (GN)

- **Is any voltage present?**

AB3 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . CLEAR any DTCs. REPEAT the self-test. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

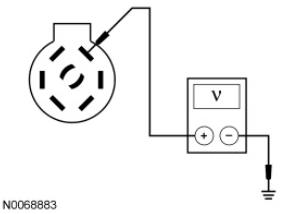
Pinpoint Test AC: The Trailer Battery Charging Is Inoperative/Does Not Operate Correctly

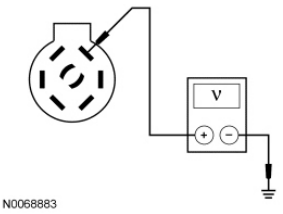
Refer to Wiring Diagrams Cell 95 , Trailer/Camper Adapter for schematic and connector information.

Normal Operation

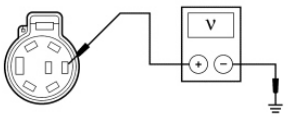
The trailer battery charge relay coil receives voltage from the Smart Junction Box (SJB) fuse 12 (5A) through circuit CBP12 (GN/WH) when the ignition switch is in the RUN or ACC position. Ground for the trailer battery charge relay coil is supplied through circuit GD120 (BK/GN). The Battery Junction Box (BJB) fuse 13 (30A) supplies voltage to the trailer battery charge relay switch through circuit SSB13 (GY/RD). When the trailer battery charge relay is energized, the voltage is routed to the trailer tow connector through circuit CAT14 (OG).

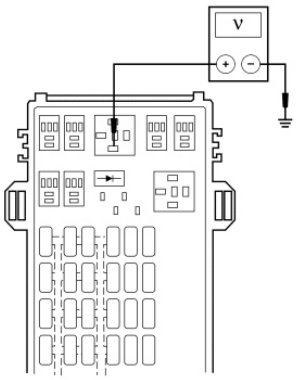
This pinpoint test is intended to diagnose the following:



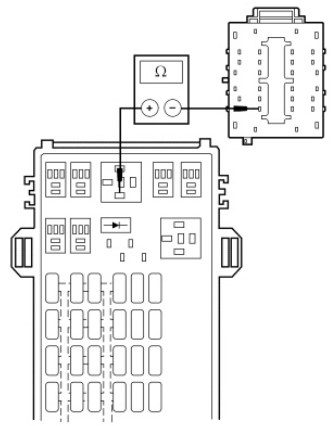


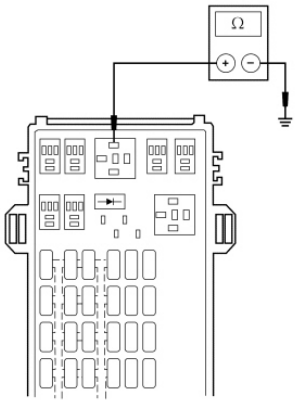
- Fuse
- Wiring, terminals or connectors
- Trailer battery charge relay
- Trailer tow connector
- Trailer
- SJB



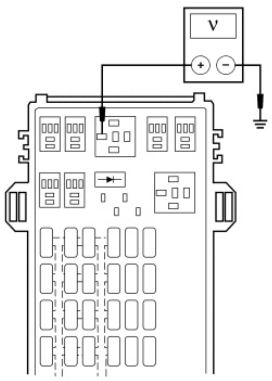


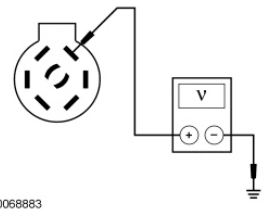
PINPOINT TEST AC: THE TRAILER BATTERY CHARGING IS INOPERATIVE/DOES NOT OPERATE CORRECTLY

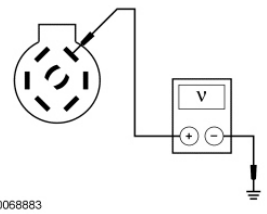




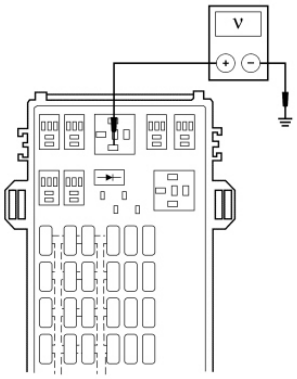
NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

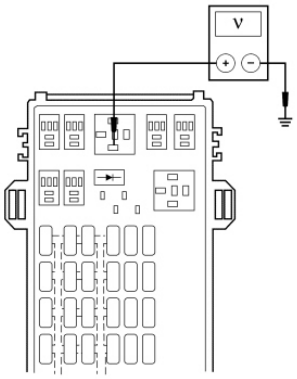






NOTE: Before beginning diagnostics, visually inspect the trailer tow connector for signs of corrosion or damage. Repair or install a new trailer tow connector as required.





NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
AC1 CHECK FOR VOLTAGE AT THE TRAILER TOW CONNECTION (BATTERY CHARGE INOPERATIVE)	
• Ignition OFF. • Disconnect the trailer from the vehicle. • Ignition ON. • Measure the voltage between the trailer tow connector pin 5, circuit CAT14 (OG), component side and ground.  • **Is the voltage greater than 10 volts?**	**Yes** GO to AC8 . **No** VERIFY the BJB fuse 13 (30A) is OK. If OK, GO to AC2 . If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short.
AC2 CHECK THE TRAILER BATTERY CHARGE RELAY (INOPERATIVE)	
• Ignition OFF. • Disconnect: Trailer Battery Charge Relay. • Substitute the trailer battery charge relay with a known good relay. • Ignition ON. • Measure the voltage between the trailer tow connector pin 5, circuit CAT14 (OG), component side and ground.  • **Is the voltage greater than 10 volts?**	**Yes** REMOVE the known good relay. INSTALL a new trailer battery charge relay. TEST the system for normal operation. **No** REMOVE the known good relay. INSTALL the original relay. GO to AC3 .
AC3 CHECK THE TRAILER TOW CONNECTOR	

• Ignition OFF. • Disconnect: Trailer Tow C473. • Ignition ON. • Measure the voltage between the trailer tow C473-5, circuit CAT14 (OG) and ground.  A0025428 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new trailer tow connector. TEST the system for normal operation. **No** GO to AC4 .
AC4 CHECK FOR VOLTAGE TO THE TRAILER BATTERY CHARGE RELAY COIL	
• Ignition OFF. • Disconnect: Trailer Battery Charge Relay. • Ignition ON. • Measure the voltage between the trailer battery charge relay pin 86, circuit CBP12 (GN/WH), BJB face side and ground.  N0088251 • **Is the voltage greater than 10 volts?**	**Yes** GO to AC6 . **No** VERIFY the SJB fuse 12 (5A) is OK. If OK, GO to AC5 . If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short.
AC5 CHECK CIRCUIT CBP12 (GN/WH) FOR AN OPEN	
• Ignition OFF. • Disconnect: SJB C2280e. • Measure the resistance between trailer battery charge relay pin 86, circuit CBP12 (GN/WH), BJB face side and the SJB C2280e-6, circuit CBP12 (GN/WH), harness side.	**Yes** GO to AC12 . **No** REPAIR the circuit. TEST the system for normal operation.

 N0088252 • **Is the resistance less than 5 ohms?**	
AC6 CHECK CIRCUIT GD120 (BK/GN) FOR AN OPEN	
• Ignition OFF. • Disconnect: Negative Battery Cable. • Measure the resistance between the trailer battery charge relay pin 85, circuit GD120 (BK/GN), BJB face side and ground.  N0088253 • **Is the resistance less than 5 ohms?**	**Yes** GO to AC7 . **No** REPAIR the circuit. TEST the system for normal operation.
AC7 CHECK FOR VOLTAGE TO THE TRAILER BATTERY CHARGE RELAY	
• Measure the voltage between the trailer battery charge relay pin 30, circuit SSB13 (GY/RD), BJB face side and ground.	**Yes** REPAIR circuit CAT14 (OG) for an open. TEST the system for normal operation. **No** REPAIR circuit SSB13 (GY/RD) for an open. TEST the system for normal operation.

 N0088254 • **Is the voltage greater than 10 volts?**	
AC8 CHECK FOR VOLTAGE AT THE TRAILER TOW CONNECTOR (BATTERY CHARGE ALWAYS ON)	
• Ignition OFF. • Measure the voltage between the trailer tow connector pin 5, circuit CAT14 (OG), component side and ground.  N0068883 • **Is any voltage present?**	**Yes** GO to AC9 . **No** The vehicle is operating correctly. SEND the trailer to an authorized camper/trailer repair facility.
AC9 CHECK CIRCUIT CAT14 (OG) FOR A SHORT TO VOLTAGE	
• Disconnect: Trailer Battery Charge Relay. • Measure the voltage between the trailer tow connector pin 5, circuit CAT14 (OG), component side and ground.  N0068883 • **Is any voltage present?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to AC10 .
AC10 CHECK THE TRAILER BATTERY CHARGE RELAY (ALWAYS ON)	

• Measure the voltage between the trailer battery charge relay pin 86, circuit CBP12 (GN/WH), BJB face side and ground.  N0088251 • **Is any voltage present?**	**Yes** GO to AC11 . **No** INSTALL a new trailer battery charge relay. TEST the system for normal operation.
AC11 CHECK CIRCUIT CBP12 (GN/WH) FOR A SHORT TO VOLTAGE	
• Disconnect: SJB C2280e. • Measure the voltage between the trailer battery charge relay pin 86, circuit CBP12 (GN/WH), harness side and ground.  N0088251 • **Is any voltage present?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to AC12 .
AC12 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins	**Yes** INSTALL a new SJB . REFER to Section 419-10 . CLEAR any DTCs. REPEAT the self-test. **No** The system is operating correctly at

• Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test AD: The Trailer Electric Brakes Are Inoperative/Do Not Operate Correctly

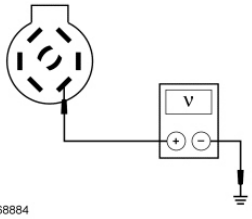
Refer to Wiring Diagrams Cell 95 , Trailer/Camper Adapter for schematic and connector information.

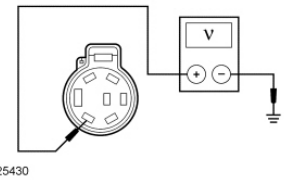
Normal Operation

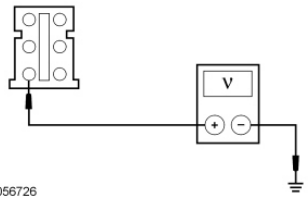
The is provided voltage at all times by the Battery Junction Box (BJB) fuse 17 (30A) through circuit SBB17 (RD). Ground for the TBC module is provided through circuit GD138 (BK/WH). The TBC module receives voltage from the stoplamp switch through circuit CCB08 (VT/WH) when the brake pedal is applied. When requested, the TBC module provides voltage to the trailer tow connector through circuit CAT19 (BU).

This pinpoint test is intended to diagnose the following:

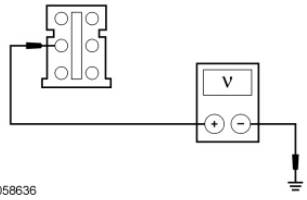
- Fuse
- Wiring, terminals or connectors
- TBC module
- Trailer tow connector
- Trailer

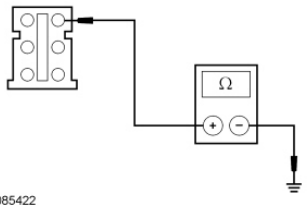


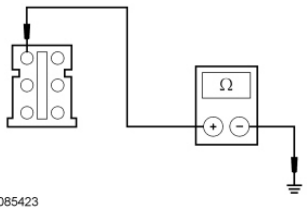




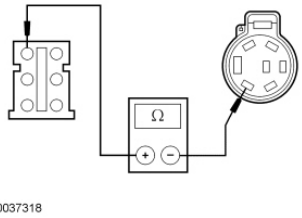
PINPOINT TEST AD: THE TRAILER ELECTRIC BRAKES ARE INOPERATIVE/DO NOT OPERATE CORRECTLY

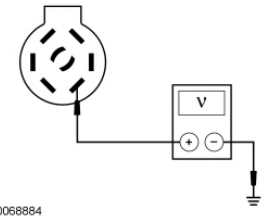


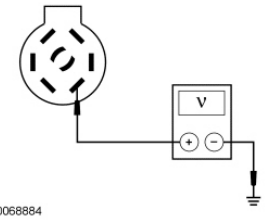




NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**







NOTE: Before beginning diagnostics, visually inspect the trailer tow connector for signs of corrosion or damage. Repair or install a new trailer tow connector as required.

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
AD1 CHECK FOR VOLTAGE TO THE TRAILER TOW CONNECTOR (INOPERATIVE CONDITION)	
• Ignition OFF. • Disconnect the trailer from the vehicle. • While applying the brake pedal, measure the voltage between the trailer tow connector pin 3, circuit CAT19 (BU), component side and ground.	**Yes** GO to AD8 . **No** GO to AD2 .

 N0068884 • **Is the voltage greater than 10 volts?**	
AD2 CHECK THE TRAILER TOW CONNECTOR	
• Disconnect: Trailer Tow C473. • While applying the brake pedal, measure the voltage between the trailer tow C473-3, circuit CAT19 (BU), harness side and ground.  A0025430 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new trailer tow connector. TEST the system for normal operation. **No** GO to AD3 .
AD3 CHECK CIRCUIT SBB17 (RD) FOR AN OPEN	
• Disconnect: C238. • Measure the voltage between the TBC module C238-1, circuit SBB17 (RD), harness side and ground.  A0056726 • **Is the voltage greater than 10 volts?**	**Yes** GO to AD4 . **No** VERIFY the BJB fuse 17 (30A) is OK. If OK, REPAIR the circuit. TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short.
AD4 CHECK CIRCUIT CCB08 (VT/WH) FOR AN OPEN	
• While applying the brake pedal, measure the voltage between the TBC module C238-2, circuit CCB08 (VT/WH), harness side and ground.	**Yes** GO to AD5 . **No** REPAIR the circuit. TEST the system for normal operation.

 A0058636 • **Is the voltage greater than 10 volts?**	
AD5 CHECK CIRCUIT GD138 (BK/WH) FOR AN OPEN	
• Disconnect: Negative Battery Cable. • Measure the resistance between the TBC module C238-6, circuit GD138 (BK/WH), harness side and ground.  A0085422 • **Is the resistance less than 5 ohms?**	**Yes** GO to AD6 . **No** REPAIR the circuit. TEST the system for normal operation.
AD6 CHECK CIRCUIT CAT19 (BU) FOR A SHORT TO GROUND	
• Measure the resistance between the TBC module C238-3, circuit CAT19 (BU), harness side and ground.  A0085423 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to AD7 . **No** REPAIR the circuit. TEST the system for normal operation.
AD7 CHECK CIRCUIT CAT19 (BU) FOR AN OPEN	
• Measure the resistance between the TBC module C238-3, circuit CAT19 (BU), harness side and the trailer tow C473-3, circuit CAT19 (BU), harness side.	**Yes** INSTALL a new TBC module. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.

 N0037318 • **Is the resistance less than 5 ohms?**	
AD8 CHECK FOR VOLTAGE TO THE TRAILER TOW CONNECTOR (DOES NOT OPERATE CORRECTLY)	
• With the brake pedal released, measure the voltage between the trailer tow connector pin 3, circuit CAT19 (BU), component side and ground.  N0068884 • **Is any voltage present?**	**Yes** GO to AD9 . **No** The vehicle is operating correctly. SEND the trailer to an authorized camper/trailer repair facility.
AD9 CHECK CIRCUIT CAT19 (BU) FOR A SHORT TO VOLTAGE	
• Disconnect: TBC Module C238. • Measure the voltage between the trailer tow connector pin 3, circuit CAT19 (BU), component side and ground.  N0068884 • **Is any voltage present?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** INSTALL a new TBC module. TEST the system for normal operation.

Daytime Running Lamps (DRL)

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Principles of Operation

NOTE: The Smart Junction Box (SJB) is also known as the Generic Electronic Module (GEM).

The Daytime Running Lamps (DRL) feature operates the low beam headlamps at a reduced intensity when the ignition switch is in the RUN position, the headlamps are not on from any other input, and the transmission is not in PARK (P).

The SJB controls the DRL by using various inputs to determine whether or not the DRL should be illuminated. These inputs include:

- Ignition switch position
- Headlamp switch position
- Headlamps on or off
- Transmission gear selection

The SJB can be configured to turn the DRL on for this vehicle. Refer to Section 418-01 for programmable parameter information.

Inspection and Verification

1. Verify the customer concern.

2. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

NOTE: Make sure the headlamp switch is in the OFF position.

NOTE: Make sure the multifunction switch is **not** in the HIGH BEAM position.

3. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

4. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

- Check the VCM connection to the vehicle.
- Check the scan tool connection to the VCM .
- Refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

5. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to Section 418-00 to diagnose no response from the PCM.

6. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory DTCs.

7. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

Symptom Chart

Symptom Chart

Pinpoint Tests

Pinpoint Test AE: The Daytime Running Lamps (DRL) Are Inoperative

Normal Operation

When the ignition switch is in the RUN position, the headlamps are not on (from the autolamp system or manual control from the headlamp switch) and the transmission is not in PARK (P), the Smart Junction Box (SJB) provides a pulse-width modulated voltage to the low beam headlamps. This illuminates the headlamps at a reduced intensity.

This pinpoint test is intended to diagnose the following:

- Exterior lighting system input/output
- Ignition switch input
- Transmission gear input
- SJB

PINPOINT TEST AE: THE DRL ARE INOPERATIVE

Test Step	Result / Action to Take
AE1 VERIFY THE DRL OPERATION	
• Ignition ON. • Place the headlamp switch in the OFF position. • Place the gear selector lever in any gear other than PARK (P).	**Yes** The system is operating correctly. INFORM the customer of the conditions required for the DRL to operate correctly.

• **Are the DRL illuminated?**	**No** GO to AE2 .
AE2 CHECK THE OPERATION OF THE HEADLAMPS	
• Place the headlamp switch in the HEADLAMPS ON position and observe the headlamps. • **Do the headlamps operate correctly?**	**Yes** GO to AE3 . **No** REFER to Headlamps in this section.
AE3 CHECK THE IGNITION SWITCH INPUT	
• Place the headlamp switch in the OFF position. • Enter the following diagnostic mode on the scan tool: SJB DataLogger. • Monitor the SJB ignition switch PIDs (IGN_A_ECU, IGN_O_ECU, IGN_R_ECU, IGN_S_ECU) while cycling the ignition switch through all its positions. • **Do the PIDs agree with the ignition switch positions?**	**Yes** GO to AE4 . **No** REFER to Section 211-05 to diagnose the input from the ignition switch.
AE4 CHECK THE TRANSMISSION GEAR INPUT	
• Enter the following diagnostic mode on the scan tool: PCM or TCM DataLogger. • Monitor the PCM or TCM transmission gear status PID (TR) while placing the gear selector lever through all its positions. • **Does the PID agree with the gear selection?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** REFER to Section 307-01A or Section 307-01B to diagnose the transmission range input.

Headlamp Adjustment

Special Tool(s)

 ST3041-A	Vision 100 Headlamp Aimer 196-00005 or equivalent

Headlamp Aiming

1. The headlamp aiming procedure depends on what type of beam pattern the headlamp is equipped with. Vehicles may come equipped with visually optically aligned left (VOL) or visually optically aligned right (VOR) headlamps. To identify the headlamp beam pattern, look on the headlamp lens. Molded in small letters on the headlamp lens is one of the following:
    - VOL and SAE
    - VOR and SAE

2. Once the headlamp beam pattern is identified, aim the headlamps using one of the following methods as applicable.
    - Photometric aimers can aim VOL- and VOR- headlamps. This is the preferred method of headlamp aiming.
    - Visual or screen method aiming can be used to aim VOL- and VOR- headlamps.
    - Mechanical aimers cannot be used with VOR- or VOL-type headlamps. Aerodynamic lamps that can be aimed mechanically have 3 nibs molded into the lens of the lamp.

Photometric Aiming

1. For the photometric aiming procedure, refer to the appropriate photometric headlamp aimer instruction manual.

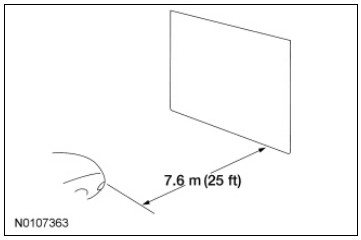
Screen Method Aiming

All headlamp types

NOTE: Horizontal aim is not adjustable for VOL or VOR headlamps.

NOTE: Consult your state vehicle inspection manual for recommended tolerance ranges for visual aiming.

NOTE: The radiator sight shield may need to be positioned or removed for access to the adjusters.



NOTE: Consult the vehicles Owners Literature for the location of the headlamp adjusters.

1. Before starting headlamp adjustment:
    - check that the vehicle is on level ground.
    - check the tire inflation.

- check that no other load is in the vehicle other than a half tank of fuel.
- check that the headlamps are clean.
- check for correct headlamp operation.
- if the vehicle is equipped with air suspension, make sure that the switch is on.

2. **NOTE:** The vertical wall or screen must be a minimum of 2.4 m (8 ft) wide.

   Park the vehicle on a level surface approximately 7.6 m (25 ft) from the vertical wall or screen directly in front of it.

3. **NOTE:** The center of the lamp is marked either on the lens (circle, crosshair or other mark) or on the bulb shield internal to the lamp (crosshair or other mark).

   Mark a horizontal reference line on the vertical wall or screen.

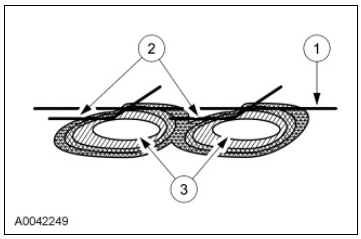
   1. Measure the center of the headlamp height to ground and record the measurement.
   2. Make a 2.4 m (8 ft) horizontal mark (using masking tape) on the vertical wall or screen at the same distance from the ground as previously recorded.

4. **NOTE:** This procedure should be done in a dark environment to effectively see the headlamp beam pattern.

   Turn on the low beam headlamps to illuminate the wall or screen and open the hood.

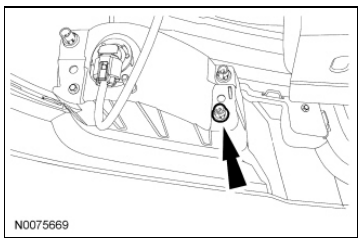
5. On the wall or screen, locate the high intensity area of the beam pattern.

VOR-type headlamps



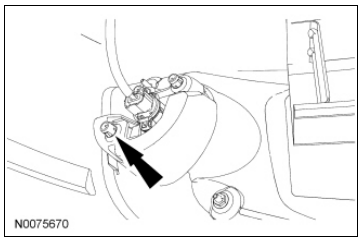
6. **NOTE:** The appearance of the VOR beam pattern may vary between vehicles.

   Identify at the top edge of this high intensity area a distinct horizontal cutoff in the beam pattern. If the top edge of this cutoff is not even with the horizontal reference line, the headlamp beam needs to be adjusted using the headlamp adjusting screw.



VOL-type headlamps

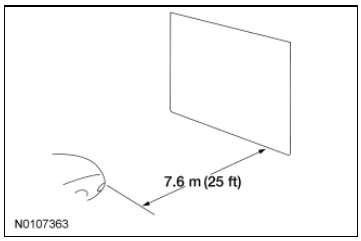
7. For VOL-type headlamps, there is a distinct cutoff in the left portion of the beam pattern. The edge of this cutoff should be positioned 50.2 mm (2 in) below the horizontal reference line. Adjust the headlamp as necessary using the headlamp adjusting screw.
    1. Horizontal reference line.
    2. Top edge of the beam pattern.
    3. High intensity zone.



Front Fog Lamp Adjustment

Fog Lamp Adjustment Screw Location - Base Fog Lamp

Fog Lamp Adjustment Screw Location - Adrenalin Package



1. **NOTE:** Horizontal aim is not required for this vehicle and is not adjustable. Consult your state vehicle inspection center for recommended tolerance ranges for visual aiming.

   Before starting the fog lamp assembly adjustment:

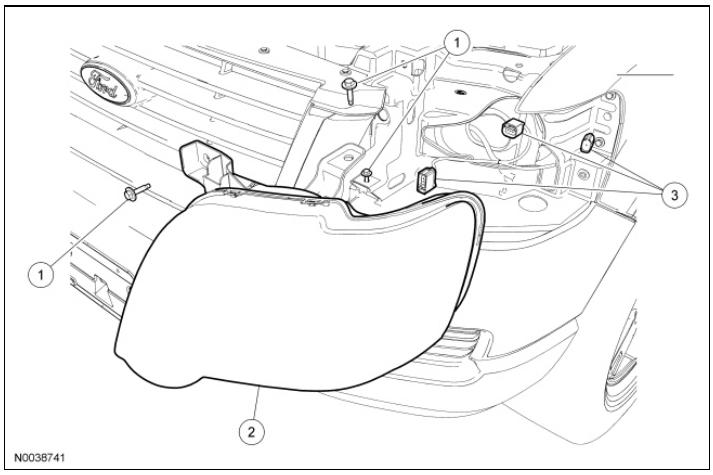
   - check the tire inflation.
   - make sure there are no other loads in the vehicle other than a half tank of fuel.
   - make sure the vehicle is on level ground.
   - make sure the fog lamps and headlamps are clean.
   - make sure the headlamps are operating and are correctly aimed.

2. **NOTE:** The vertical wall screen must be a minimum of 2.4 m (8 ft) wide.

   Park the vehicle on a level surface approximately 7.6 m (25 ft) from the vertical wall or screen directly in front of it.

3. The correct visual aim for the fog lamps is with the top edge of the high-intensity zone 10 cm (4 in) below the horizontal center of the fog lamps.

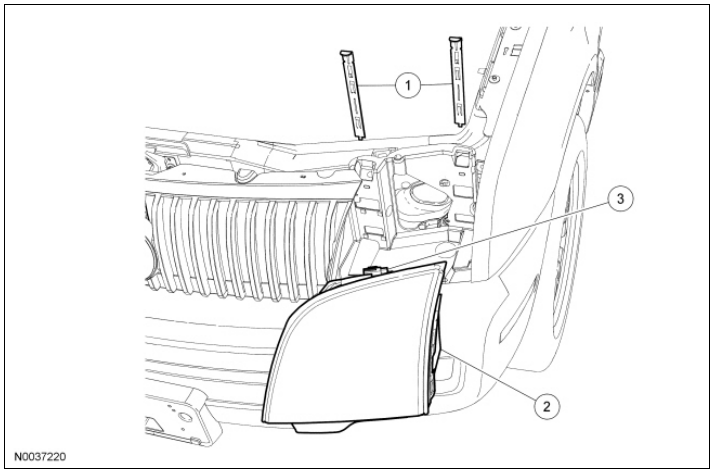
4. If necessary, rotate the adjusting screw until the fog lamp beam is within specification.



Autolamps Time Delay Adjustment

NOTE: Steps 2 through 5 must be carried out within a 10-second period.

1. Start with the ignition switch OFF position and the headlamp switch in the AUTOLAMPS ON position.
2. Place the headlamp switch in the OFF position.
3. Place the ignition switch in the RUN position.
4. Place the ignition switch in the OFF position.
5. Place the headlamp switch in the AUTOLAMPS ON position. The exterior lamps turn on at this point.
6. Wait the desired amount of time and place the headlamp switch in the OFF position (maximum of 3 minutes). The exterior lamps turn off and the autolamp time delay is now set.



Headlamp Assembly

Explorer, Explorer Sport Trac

Item	Part Number	Description
1	W505425	Headlamp assembly bolts (3 required)
2	13006/13005	Headlamp assembly (LH/RH)
3	-	Headlamp assembly electrical connectors (part of 14398)

Mountaineer

Item	Part Number	Description
1	13N020	Headlamp assembly retainers (2 required)
2	13006/13005	Headlamp assembly (LH/RH)
3	-	Headlamp assembly electrical connector (part of 14398)

Removal and Installation

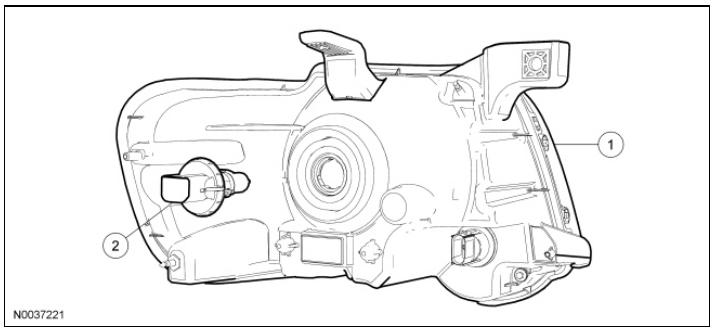
NOTE: Make sure the headlamp switch and ignition switch are in the OFF position.

Explorer, Explorer Sport Trac

1. Loosen the lower headlamp assembly bolt.

2. Remove the 2 upper bolts and the headlamp assembly.
    - Disconnect the electrical connectors.

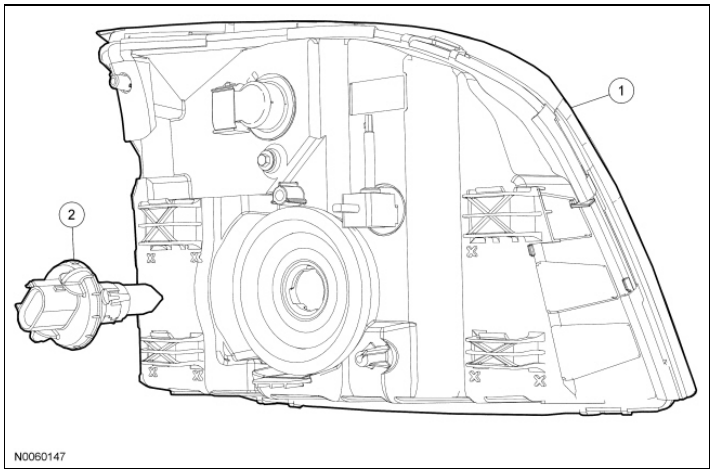
Mountaineer



3. Remove the 2 retainers and the headlamp assembly.
    - Disconnect the electrical connector.

All vehicles

4. To install, reverse the removal procedure.



Headlamp Bulb

Explorer, Explorer Sport Trac

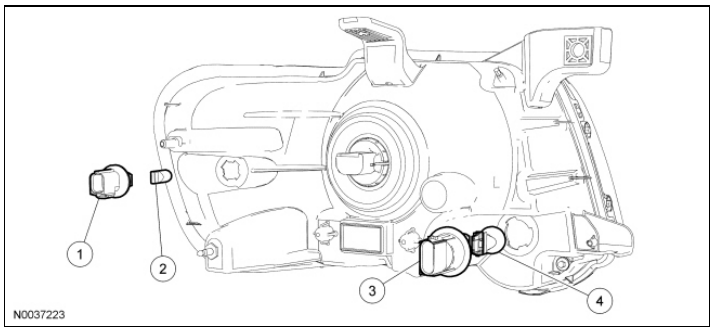
Item	Part Number	Description
1	13006/13005	Headlamp assembly (LH/RH)
2	13N021	Headlamp bulb

Mountaineer

Item	Part Number	Description
1	13006/13005	Headlamp assembly (LH/RH)
2	13N021	Headlamp bulb

Removal and Installation

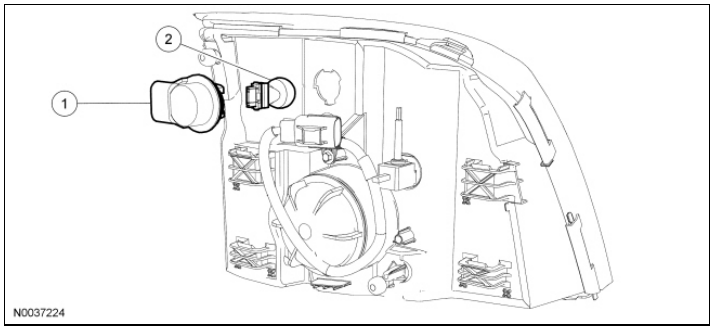
⚠ WARNING: The bulb contains gas under pressure. The bulb may shatter if the glass envelope is scratched or if the bulb is dropped. Handle the bulb only by its base. Avoid touching the glass envelope. Failure to follow these instructions may result in personal injury.



NOTE: The headlamp bulb should not be removed from the headlamp assembly until just before a new bulb is installed. Removing the bulb for an extended period of time may affect headlamp bulb performance. Contaminants may enter the headlamp assembly where they can settle on the lens and reflector. Never turn on

the headlamps with the bulb removed from the headlamp assembly.

1. Remove the headlamp assembly. For additional information, refer to Headlamp Assembly in this section.
2. Rotate the headlamp bulb one-eighth turn counterclockwise and remove the headlamp bulb.
3. To install, reverse the removal procedure.



Parking Lamp Bulb - Front

Explorer, Explorer Sport Trac

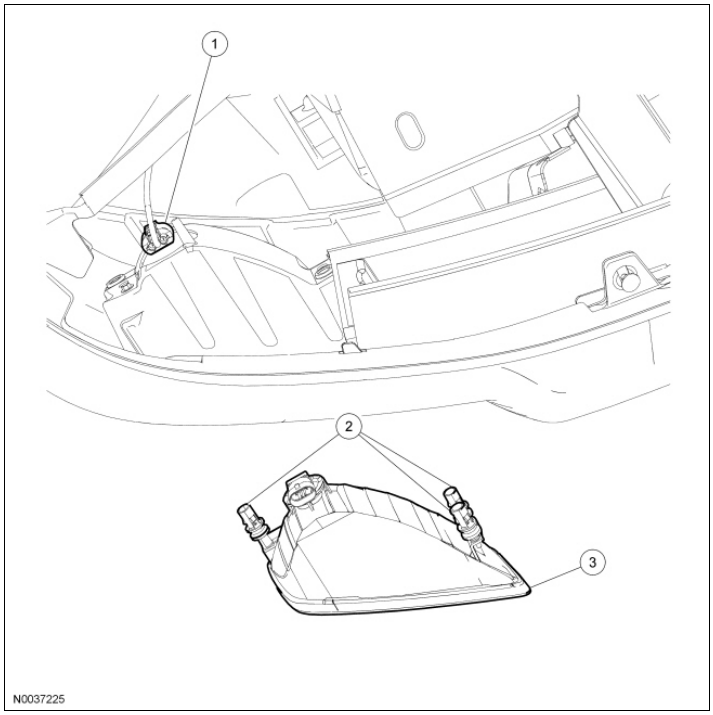
Item	Part Number	Description
1	13411	Parking lamp bulb socket
2	13466	Parking lamp bulb
3	13411	Parking/turn lamp bulb socket
4	13466	Parking/turn lamp bulb

Mountaineer

Item	Part Number	Description
1	-	Parking/turn lamp bulb socket
2	13466	Parking/turn lamp bulb

Removal and Installation

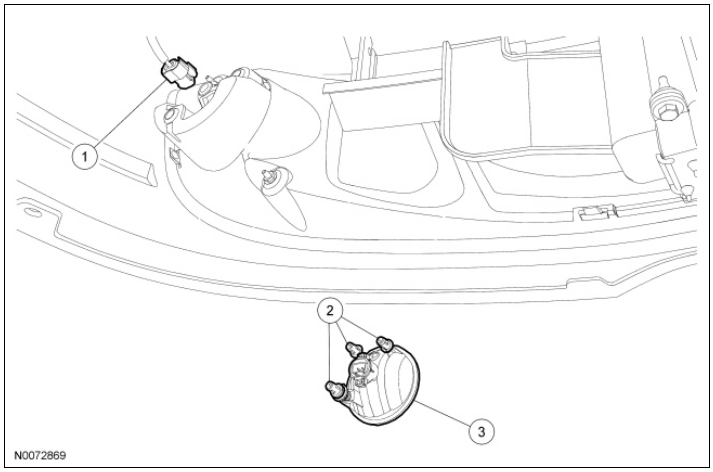
1. Remove the headlamp assembly. For additional information, refer to Headlamp Assembly in this section.



2. Remove the parking lamp bulb socket from the headlamp assembly.
   - Remove the parking lamp bulb from the socket.

3. To install, reverse the removal procedure.

Fog Lamp



Base Fog Lamp

NOTE: Explorer, Explorer Sport Trac shown, Mountaineer similar.

Item	Part Number	Description
1	-	Fog lamp electrical connector (part of 14398)
2	-	Fog lamp retainers (part of 15201/15200)
3	15201/15200	Fog lamp (LH/RH)

Adrenalin Package Fog Lamp

Item	Part Number	Description
1	-	Fog lamp electrical connector (part of 14398)
2	-	Fog lamp retainers (part of 15200)
3	15200	Fog lamp

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

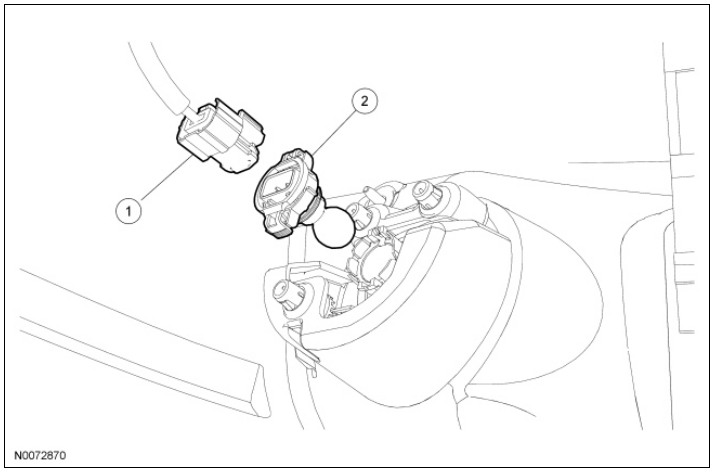
2. Disconnect the fog lamp electrical connector.

3. **NOTE:** Use a 13 mm (0.5 in) diameter tool to collapse the tabs.

   Collapse the tabs and remove the fog lamp.

4. To install, reverse the removal procedure.

Fog Lamp Bulb



Base Fog Lamp Bulb

NOTE: Explorer, Explorer Sport Trac shown, Mountaineer similar.

Item	Part Number	Description
1	-	Fog lamp electrical connector (part of 14398)
2	13N021	Fog lamp bulb

Adrenalin Package Fog Lamp Bulb

Item	Part Number	Description
1	-	Fog lamp electrical connector (part of 14398)
2	13N021	Fog lamp bulb

Removal and Installation

⚠ WARNING: The bulb contains gas under pressure. The bulb may shatter if the glass envelope is scratched or if the bulb is dropped. Handle the bulb only by its base. Avoid touching the glass envelope. Failure to follow these instructions may result in personal injury.

NOTE: The fog lamp bulb should not be removed from the fog lamp assembly until just before a new bulb is installed. Removing the bulb for an extended period of time may affect fog lamp bulb performance. Contaminants may enter the fog lamp assembly where they can settle on the lens and reflector. Never turn on the fog lamps with the bulb removed from the fog lamp assembly.

NOTE: Make sure the headlamp switch and ignition switch are in the OFF position.

All vehicles

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

Vehicles with base fog lamp

2. **NOTE:** To remove, rotate the bulb approximately one-eighth turn counter clockwise.

   Disconnect the electrical connector and remove the fog lamp bulb.

Vehicles with Adrenalin fog lamp

3. **NOTE:** To remove, squeeze the tabs and pull the fog lamp bulb from the fog lamp assembly.

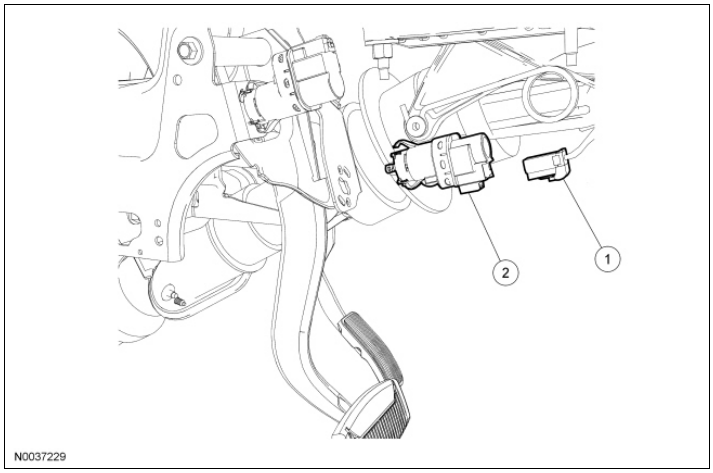
   Disconnect the electrical connector and remove the fog lamp bulb.

All vehicles

4. To install, reverse the removal procedure.

Side Marker Lamp

NOTE: LH front shown, others similar.



Item	Part Number	Description
1	13411	Side marker lamp bulb socket
2	W707501	Side marker lamp nuts (2 required)
3	13201	Side marker lamp

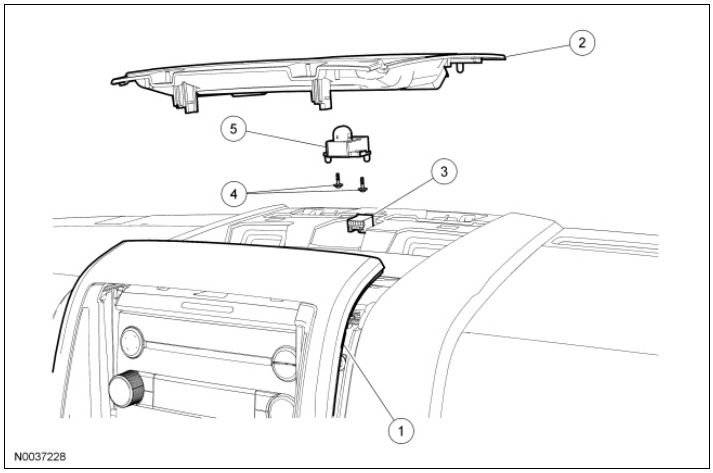
Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the socket from the side marker lamp.
3. Remove the 2 nuts and the side marker lamp.
4. To install, reverse the removal procedure.

Stoplamp Switch

Item	Part Number	Description
1	-	Stoplamp switch electrical connector (part of 14390)
2	13480	Stoplamp switch

Removal and Installation



NOTICE: **Do not remove or repair the brake pedal, brake booster or master cylinder without first removing the stoplamp switch. Do not install the stoplamp switch without the brake pedal arm secured to the brake booster push rod. Do not pull or push on the brake pedal when removing or installing the stoplamp switch, as misadjustment or damage to the switch may occur.**

1. Disconnect the stoplamp switch electrical connector.

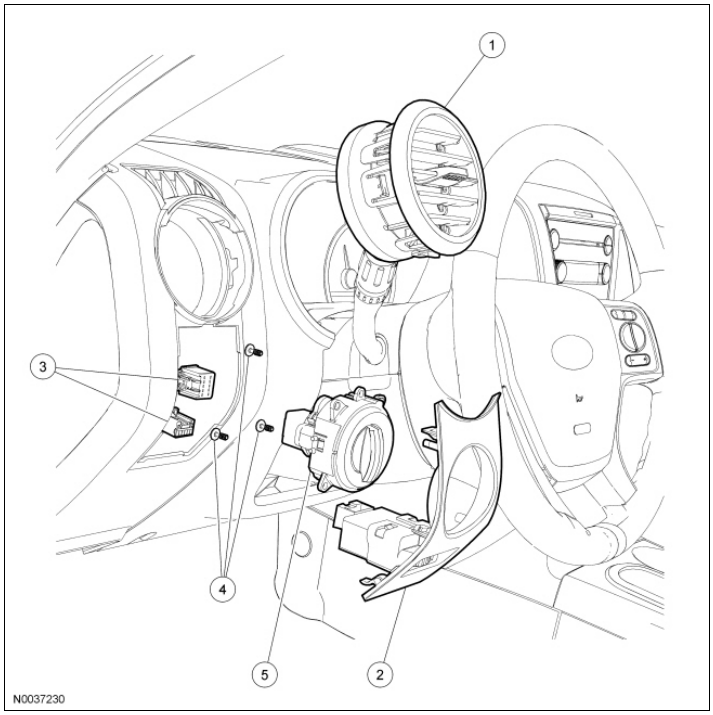
2. Rotate the stoplamp switch 45 degrees clockwise and remove the stoplamp switch.

3. To install, reverse the removal procedure.

Light Sensor

Item	Part Number	Description
1	7804302	Lower center instrument panel finish panel
2	78042A82	Upper center instrument panel finish panel
3	-	Light sensor electrical connector (part of 14401)
4	W701679	Light sensor screws (2 required)
5	13A018	Light sensor

Removal and Installation



1. Position the top portion of the lower center instrument panel finish panel rearward.

2. Remove the upper center instrument panel finish panel.
   - Disconnect the electrical connector.

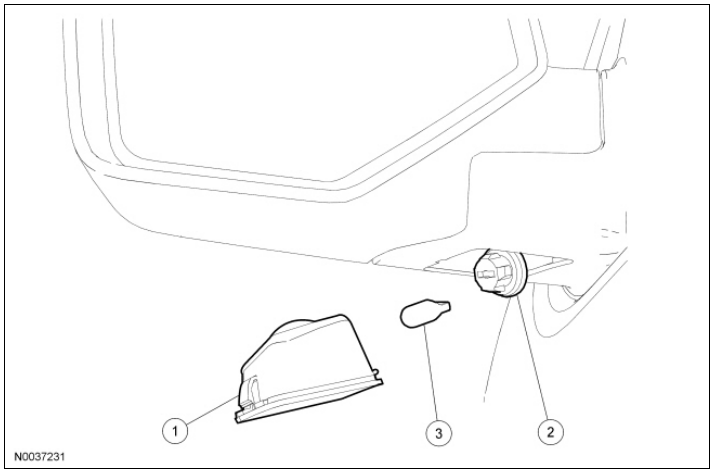
3. Remove the 2 screws and the light sensor.

4. To install, reverse the removal procedure.

Headlamp Switch

Item	Part Number	Description
1	19893	Driver side register
2	7804338	Headlamp switch bezel
3	-	Headlamp switch electrical connectors (part of 14401)
4	W701679	Headlamp switch screws (3 required)
5	11654	Headlamp switch

Removal and Installation



1. Remove the driver side register.

2. Remove the headlamp switch and bezel as an assembly.
   - Disconnect the electrical connectors.

3. Remove the 3 screws and the headlamp switch.

4. To install, reverse the removal procedure.

Puddle Lamp

Item	Part Number	Description
1	-	Puddle lamp lens (part of 17683)
2	-	Puddle lamp socket (part of 17683)
3	13466	Puddle lamp bulb

Removal and Installation

1. **NOTE:** Use a thin-bladed tool to release the tab on the puddle lamp lens.

   Release the tab and remove the puddle lamp lens.

   - Remove the puddle lamp socket from the puddle lamp lens.

2. Remove the puddle lamp bulb from the puddle lamp socket.

3. To install, reverse the removal procedure.

Interior Lighting

NOTE: The Smart Junction Box (SJB) is also known as the Generic Electronic Module (GEM).

The interior lighting system consists of the following components:

- SJB
- Instrument panel dimmer switch
- Interior/map lamps
- Cargo lamp
- Glove compartment lamp
- Vanity mirror lamps
- Door ajar switches
- Puddle lamps

The interior lighting system consists of 2 subsystems:

- Courtesy lamps
- Demand lamps

Courtesy Lamps

The courtesy lamps are controlled by the SJB . The courtesy lamp subsystem consists of the interior dome lamps, the cargo lamp, the puddle lamps (if equipped) and the overhead console lamps (if equipped). The SJB supplies voltage to the courtesy lamps when the SJB receives the required input.

Demand Lamps

The demand lamps are controlled by the SJB . The demand lamps subsystem consists of the glove compartment lamp, all map/reading lamps, and the vanity mirror lamps.

Interior Lighting Delay

The interior lighting delay feature provides temporary illumination of the courtesy lamps after the doors are opened and then closed. The interior lighting delay feature keeps the courtesy lamps on for a period of 25 seconds. If during the 25-second delay, the SJB detects that the ignition has been turned to RUN, ACC, START position, or if the vehicle is locked using the Remote Keyless Entry (RKE) transmitter, the courtesy lamp illumination is discontinued.

Illuminated Entry

The illuminated entry requests the courtesy lamps to illuminate when the ignition is off and the RKE transmitter UNLOCK button is pressed. The illuminated entry requests the courtesy lamps off after 25 seconds have elapsed, the ignition is switched to ON, or when the RKE transmitter LOCK button is pressed.

Illuminated Exit

The illuminated exit illuminates the courtesy lamps for 25 seconds when all doors are closed and the ignition key is removed from the ignition lock cylinder. The illuminated exit deactivates when any door becomes ajar,

the ignition key is inserted into the ignition lock cylinder, or 25 seconds have elapsed.

Theater Lighting

The theater lighting option ramps-up the courtesy lamps over 0.7 seconds when courtesy lamp activation is requested. The theater lighting feature ramps-down the courtesy lamps over 1.7 seconds when interior lighting deactivation is requested by any feature other than the panic alarm or battery saver.

Interior Lighting

Special Tool(s)

 ST1137-A	73III Automotive Meter 105-R0057 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
 ST2574-A	Flex Probe Kit 105-R025C or equivalent

Principles of Operation

NOTE: The Smart Junction Box (SJB) is also known as the Generic Electronic Module (GEM).

The SJB supplies voltage to the interior lighting system. The interior lighting system illuminates the courtesy lamps to enhance visibility of the interior while a vehicle door is ajar (or a request from the instrument panel dimmer switch is received), and the vehicle speed is less than 15 km/h (9 mph). The SJB controls all interior lighting functions and timing by monitoring inputs from the door ajar switches, liftgate ajar switch, liftgate glass ajar switch, instrument panel dimmer switch, and vehicle speed.

Interior Lamp Arbitrator

The interior lamp arbitrator (part of the SJB programming) chooses between the interior lighting, the interior mode, the interior lighting delay, the illuminated entry, the illuminated exit, the battery saver, and the alarm flash processing to determine which feature has precedence of activating and deactivating the interior lamps.

Battery Saver

The battery saver is internal to the SJB and provides automatic shut off of the demand lamps (vanity lamps, map lamps and glove compartment lamp) and courtesy lamps after a time-out period in order to save battery voltage. A timer in the SJB is started when the ignition is turned to the OFF position. When the time-out period for the lamps has elapsed, the voltage is automatically shutoff to the lamps by the battery saver. While the battery saver has voltage disabled, if the ignition is turned to any position other than off, any door or liftgate/glass becomes ajar, the UNLOCK button of the Remote Keyless Entry (RKE) transmitter is pressed, the instrument panel dimmer switch is placed in the DOME position, the battery saver restores voltage and starts the timer again.

NOTE: Time out is 1 minute if the vehicle has less than 80 km (50 miles).

The battery saver time-outs are as follows:

- Courtesy lamps if the dome lamp is off and the liftgate/liftgate glass is closed = 10 minutes
- Courtesy lamps if the dome lamp is on or the liftgate/liftgate glass is open = 30 minutes

- Demand lamps = 30 minutes

Field-Effect Transistor (FET) Protection

The SJB utilizes a Field-Effect Transistor (FET) protective circuit strategy for many of its outputs (for example, a headlamp output circuit). Output loads (current level) are monitored for excessive current (typically short circuits) and are shut down (turns off the voltage or ground provided by the module) when a fault event is detected. A continuous DTC is stored at the fault event and a cumulative counter is started.

When the demand for the output is no longer present, the module resets the FET circuit protection to allow the circuit to function. The next time the driver requests a circuit to activate that has been shut down by a previous short (FET protection) and the circuit remains shorted, the FET protection shuts off the circuit again and the cumulative counter advances.

When the excessive circuit load occurs often enough, the module shuts down the output until a repair procedure is carried out. Each FET protected circuit has 3 predefined levels of short circuit tolerance based on the harmful effect of each circuit fault on the FET and the ability of the FET to withstand it. A module lifetime level of fault events is established based upon the durability of the FET . If the total tolerance level is determined to be 600 fault events, the 3 predefined levels would be 200, 400 and 600 fault events.

When each tolerance level is reached, the continuous DTC that was stored on the first failure cannot be cleared by a command to clear the continuous DTCs. The module does not allow this code to be cleared or the circuit restored to normal operation until a successful self-test proves that the fault has been repaired. After the self-test has successfully completed (no on-demand DTCs present), the continuous DTC automatically clears and the circuit function returns.

When the first or second level is reached, the continuous DTC (associated with the short circuit) sets along with DTC B106E. These DTCs can be cleared using the module on-demand self-test, then the Clear DTC operation on the scan tool (if the on-demand test shows the fault corrected). The module never resets the fault event counter to zero and continues to advance the fault event counter as short circuit fault events occur.

If the number of short circuit fault events reach the third level, then DTCs B106F and B1342 set along with the associated continuous DTC. This DTC cannot be cleared and the module must be replaced.

The SJB FET protected output circuits for the instrument panel illumination system are the courtesy and demand lamp system output circuits.

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Door ajar switches • Liftgate ajar switch (part of the liftgate latch)	• Smart Junction Box (SJB) fuse 23 (15A) • Wiring, terminals or connectors

• Liftgate glass ajar switch (part of the liftgate window latch)	• Courtesy lamp • Map lamp • Puddle lamps • Cargo lamp • Vanity lamps • Glove compartment lamp • SJB

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM .
   - Refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication with the SJB , refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the SJB .

9. If the DTCs retrieved are related to the concern, go to DTC Charts. For all other DTCs, refer to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

DTC Charts

Smart Junction Box (SJB) DTC Chart

NOTE: Make sure the instrument panel dimmer switch is not in the dome lamp or dome lamp defeat position.

DTC	Description	Action
B1316	Battery Saver Relay Coil Circuit Short to Ground	GO to Pinpoint Test E .
B1319	Driver Door Ajar Circuit Failure	GO to Pinpoint Test C .

B1327	Passenger Door Ajar Circuit Failure	GO to Pinpoint Test C .
B1335	Door Ajar RR Circuit Failure	GO to Pinpoint Test C .
B1374	Illuminated Entry Relay Short to Ground	GO to Pinpoint Test A .
B1571	Door Ajar LR Circuit Failure	GO to Pinpoint Test C .
B1687	Lamp Dome Input Circuit Short to Battery	If the courtesy lamps do not turn on with one door open, GO to Pinpoint Test D . If the dome defeat is inoperative, GO to Pinpoint Test M .
B1688	Lamp Dome Input Circuit Short to Ground	GO to Pinpoint Test C .
B2077	Liftgate Ajar Sw Circuit Failure	GO to Pinpoint Test C .
B2089	Puddle/Approach Lamp Fault	VERIFY the Smart Junction Box (SJB) fuse 23 (15A) is OK. If OK, INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short.
All other DTCs	-	REFER to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .

Symptom Chart

Symptom Chart

Pinpoint Tests

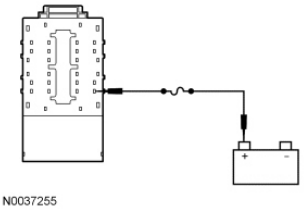
Pinpoint Test A: The Courtesy Lamps Are Inoperative

Refer to Wiring Diagrams Cell 89 , Interior Lamps for schematic and connector information.

Normal Operation

The Smart Junction Box (SJB) fuse 23 (15A) supplies voltage to the courtesy/demand and puddle lamps through a solid-state relay in the SJB . When any door, liftgate, liftgate glass is opened, or the instrument panel dimmer switch is placed in the dome position, the SJB interprets this as a request for the courtesy lamps. Based on the input, the SJB energizes the solid-state relay supplying voltage to the courtesy lamps on circuit CLN03 (YE/GY). The interior courtesy lamps share a common ground through circuit GD133 (BK).

- DTC B1374 (Illuminated Entry Relay Short to Gnd) - a continuous and on-demand DTC that sets when the SJB detects a short to ground on the courtesy lamp output circuit.



This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors

- SJB

PINPOINT TEST A: THE COURTESY LAMPS ARE INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
A1 CHECK THE PUDDLE LAMP OPERATION	
• Ignition OFF. • Open any door and observe the puddle lamps. • **Do the puddle lamps illuminate?**	**Yes** GO to A2 . **No** For Explorer or Mountaineer, GO to Pinpoint Test J . For Explorer Sport Trac, GO to Pinpoint Test K .
A2 CHECK THE DEMAND LAMP FUNCTION	
• Using the demand lamp function, turn any demand lamp on (map lamp or vanity mirror lamp). • **Does the demand lamp illuminate?**	**Yes** GO to A3 . **No** REPAIR circuit GD133 (BK) for an open. TEST the system for normal operation.
A3 BYPASS THE SJB	
NOTE: If the fuse in the jumper wire fails, refer to the Wiring Diagrams Manual to identify the possible causes of the circuit short. • Disconnect: SJB C2280a. • Connect a fused jumper wire between the SJB C2280a-8, circuit CLN03 (YE/GY), harness side and battery positive.  N0037255 • **Do the courtesy lamps illuminate?**	**Yes** REMOVE the jumper wire. GO to A4 . **No** REMOVE the jumper wire. REPAIR circuit CLN03 (YE/GY) for an open. CLEAR the DTCs. REPEAT the self-test.
A4 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation.

♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test B: An Individual Courtesy Lamp Is Inoperative

Refer to Wiring Diagrams Cell 89 , Interior Lamps for schematic and connector information.

Normal Operation

Circuit CLN03 (YE/GY) provides voltage to each courtesy lamp when activated. The courtesy lamps are grounded through circuits GD133 (BK) and GD149 (BK/GY).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Interior lamp

PINPOINT TEST B: AN INDIVIDUAL COURTESY LAMP IS INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>
<tr><td>B1 CHECK THE INTERIOR LAMP</td><td></td></tr>
<tr><td>• Ignition OFF.
• Disconnect: Suspect Interior Lamp.
• Open the driver door.
• Measure the voltage between the suspect interior lamp pins, harness side as follows:

<table>
<tr><th>Location</th><th>Connector-Pin/ Circuit</th><th>Connector-Pin/ Circuit</th></tr>
<tr><td>Front interior lamp (without overhead console)</td><td>C981-1

CLN03 (YE/GY)</td><td>C981-2

<tr><td>Front interior/map lamp (with overhead console)</td><td>C929-3

CLN03 (YE/GY)</td><td>C929-2

GD133 (BK)</td></tr>
<tr><td></td><td></td><td></td></tr>
</table>
</td><td>Yes
INSTALL a new interior lamp for the lamp in question. REFER to Interior Lamp - Front or Interior Lamp - Rear in this section. TEST the system for normal operation.

No
GO to B2 .</td></tr>
</table>

Rear interior lamp (Explorer/Mountaineer)	C901-1 CLN03 (YE/GY)	C901-2 GD149 (BK/GY)
Rear interior lamp (Explorer Sport Trac)	C901-1 CLN03 (YE/GY)	C901-2 GD133 (BK)
Cargo lamp (Explorer/Mountaineer)	C926-1 CLN03 (YE/GY)	C926-2 GD149 (BK/GY)

- **Is the voltage greater than 10 volts?**

B2 CHECK CIRCUIT CLN03 (YE/GY) FOR VOLTAGE	
• Measure the voltage between the suspect interior lamp, circuit CLN03 (YE/GY), harness side and ground as follows: **Location / Connector-Pin / Circuit** Front interior lamp (without overhead console) — C981-1 — CLN03 (YE/GY) Front interior/map lamp (with overhead console) — C929-3 — CLN03 (YE/GY) Rear interior lamp — C901-1 — CLN03 (YE/GY) Cargo lamp (Explorer/Mountaineer) — C926-1 — CLN03 (YE/GY) • **Is the voltage greater than 10 volts?**	**Yes** REPAIR circuit GD133 (BK) or GD149 (BK/GY) of the lamp in question for an open. TEST the system for normal operation. **No** REPAIR circuit CLN03 (YE/GY) for an open. TEST the system for normal operation.

Pinpoint Test C: The Courtesy Lamps Stay On Continuously

Refer to Wiring Diagrams Cell 71 , Cluster and Panel Illumination for schematic and connector information.

Refer to Wiring Diagrams Cell 89 , Interior Lamps for schematic and connector information.

Refer to Wiring Diagrams Cell 117 , Remote Keyless Entry and Alarm for schematic and connector information.

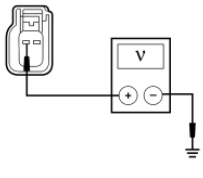
Normal Operation

When any door, the liftgate or the liftgate glass is opened, the ajar switch opens the circuit to the Smart Junction Box (SJB). The SJB monitors the ajar circuits, and based on the ajar status, the SJB supplies voltage to the courtesy lamps on circuit CLN03 (YE/GY).

When the instrument panel dimmer switch is rotated to the dome detent, ground is supplied on circuit CLN28 (GN/BU) to the SJB . The SJB monitors the dome input circuit. Based on the input, the SJB supplies voltage to the courtesy lamps on circuit CLN03 (YE/GY).

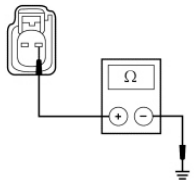
DTC Description	Fault Trigger Conditions
• B1319 - Driver Door Ajar Circuit Failure • B1327 - Passenger Door Ajar Circuit Failure • B1335 - Door Ajar RR Circuit Failure • B1571 - Door Ajar LR Circuit Failure	An on-demand DTC that sets when the SJB detects an open from the door ajar circuits.
• B1688 - Lamp Dome Input Circuit Short to Ground	An on-demand DTC that sets when the SJB detects a short to ground from the dome request input circuit.
• B2077 - Liftgate Ajar Circuit Failure	An on-demand DTC that sets when the SJB detects an open from the liftgate/liftgate glass ajar circuit.

This pinpoint test is intended to diagnose the following:



- Wiring, terminals or connectors
- Ajar switch
- Instrument panel dimmer switch
- SJB

PINPOINT TEST C: THE COURTESY LAMPS STAY ON CONTINUOUSLY



NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
C1 CHECK THE SJB DTCs FROM BOTH CONTINUOUS AND ON-DEMAND SELF-TESTS	
• Use the recorded results from the SJB continuous and on-demand self-tests. • **Are any DTCs recorded?**	**Yes** For DTC B1319, B1327, B1335 or B1571, GO to C2 . For DTC B2077

	(Explorer/Mountaineer), GO to C5 . For DTC B2077 (Explorer Sport Trac), GO to C6 . For DTC B1688, GO to C10 . For all other DTCs, REFER to DTC Charts in this section. **No** GO to C12 .
C2 CHECK FOR VOLTAGE TO THE DOOR AJAR SWITCH	
• Ignition OFF. • Disconnect: Suspect Ajar Switch. • Measure the voltage between the suspect ajar switch connector, harness side and ground as follows: **Location** / **Connector-Pin** / **Circuit** LH front / C526-2 / CPL26 (GN/VT) RH front / C602-2 / CPL31 (GN/BK) LH rear / C715-2 / CPL36 (GN) RH rear / C820-2 / CPL39 (YE)  N0075516 • **Is the voltage greater than 10 volts?**	**Yes** GO to C3 . **No** GO to C4 .
C3 CHECK CIRCUIT GD133 (BK/OG) OR CIRCUIT GD143 (BK/VT) FOR AN OPEN	
• Disconnect: Negative Battery Cable. • Measure the resistance between the suspect ajar switch, harness side and ground as follows: **Location** / **Connector-Pin** / **Circuit** LH front / C526-1 / GD133 (BK/OG) RH front / C602-1 / GD133 (BK/OG)	**Yes** INSTALL a new ajar switch in question. REFER to Section 501-14 . CLEAR the DTCs. REPEAT the self-test. **No** REPAIR the ground circuit in question for an open. CLEAR the DTCs. REPEAT the self-test.

LH rear	C715-1	GD143 (BK/VT)
RH rear	C820-1	GD143 (BK/VT)

N0058796

- **Is the resistance less than 5 ohms?**

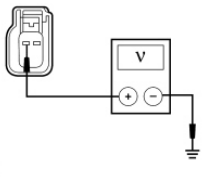
C4 CHECK THE DOOR AJAR SWITCH INPUT CIRCUIT FOR AN OPEN

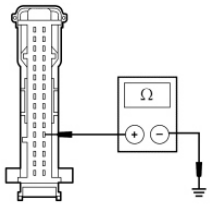
- Disconnect: SJB C2280b.
- Measure the resistance between the SJB , harness side and the suspect door ajar switch, harness side as follows:

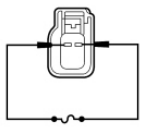
Location	SJB Connector-Pin/ Circuit	Ajar Switch Connector-Pin/ Circuit
LH front	C2280b-17 CPL26 (GN/VT)	C526-2 CPL26 (GN/VT)
RH front	C2280b-19 CPL31 (WH)	C602-2 CPL31 (GN/BK)
LH rear	C2280b-20 CPL36 (GN)	C715-2 CPL36 (GN)
RH rear	C2280b-21 CPL39 (YE)	C820-2 CPL39 (YE)

- **Is the resistance less than 5 ohms?**

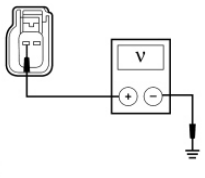
Yes
GO to C13 .

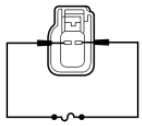




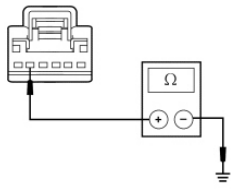


No
REPAIR the circuit in question for an open. CLEAR the DTCs. REPEAT the self-test.





C5 CHECK FOR VOLTAGE TO THE LIFTGATE GLASS AJAR SWITCH



- Disconnect: Liftgate Glass Ajar Switch C478.
- Measure the voltage between the liftgate glass ajar switch C478-2, circuit CPL58 (GY/OG), harness side and ground.

Yes
GO to C7 .

No
GO to C6 .

 N0075516 • **Is the voltage greater than 10 volts?**	
C6 CHECK THE LIFTGATE/LIFTGATE GLASS AJAR SWITCH INPUT CIRCUIT FOR AN OPEN	
NOTE: For Explorer/Mountaineer, make sure the liftgate and liftgate glass are closed. • Ignition OFF. • Connect: Liftgate Glass Ajar Switch C478. • Disconnect: Negative Battery Cable. • Disconnect: SJB C2280b. • Measure the resistance between the SJB C2280b-28, circuit CPL58 (GY/OG) (Explorer/Mountaineer), or circuit GD143 (BK/VT) (Explorer Sport Trac), harness side and ground.  N0072748 • **Is the resistance less than 5 ohms?**	**Yes** GO to C13 . **No** For Explorer/Mountaineer, REPAIR circuit CPL58 (GY/OG) for an open. CLEAR the DTCs, REPEAT the self-test. For Explorer Sport Trac, REPAIR circuit GD143 (BK/VT) for an open. CLEAR the DTCs. REPEAT the self-test.
C7 BYPASS THE LIFTGATE GLASS SWITCH	
• **NOTE:** Make sure the liftgate is closed.  N0075517 • Connect a fused jumper wire between the liftgate glass ajar switch C478-2, circuit CPL58 (GY/OG), harness side and the liftgate glass ajar switch C478-1, circuit CPL44 (YE/OG), harness side. • Wait 30 seconds and observe the interior lamps. • **Do the courtesy lamps continue to illuminate?**	**Yes** REMOVE the jumper wire. GO to C8 . **No** REMOVE the jumper wire. INSTALL a new liftgate glass ajar switch. REFER to Section 501-14 . CLEAR the DTCs. REPEAT the self-test.
C8 CHECK CIRCUIT CPL44 (YE/OG) FOR AN OPEN	

• Connect: Liftgate Glass Ajar Switch C478. • Disconnect: Liftgate Ajar Switch C479. • **NOTE:** Make sure the liftgate glass is closed. • Measure the voltage between the liftgate ajar switch C479-2, circuit CPL44 (YE/OG), harness side and ground.  N0075516 • **Is the voltage greater than 10 volts?**	**Yes** GO to C9 . **No** REPAIR circuit CPL44 (YE/OG) for an open. CLEAR the DTCs. REPEAT the self-test.
C9 BYPASS THE LIFTGATE AJAR SWITCH	
• Connect a fused jumper wire between the liftgate ajar switch C479-2, circuit CPL44 (YE/OG), harness side and the liftgate ajar switch C479-1, circuit GD143 (BK/VT), harness side.  N0075517 • Wait 30 seconds and observe the courtesy lamps. • **Do the courtesy lamps continue to illuminate?**	**Yes** REMOVE the jumper wire. REPAIR circuit GD143 (BK/VT) for an open. CLEAR the DTCs. REPEAT the self-test. **No** REMOVE the jumper wire. INSTALL a new liftgate glass ajar switch. REFER to Section 501-12 . CLEAR the DTCs. REPEAT the self-test.
C10 CHECK THE INSTRUMENT PANEL DIMMER SWITCH	
• Ignition OFF. • Disconnect: Instrument Panel Dimmer Switch C2298. • **NOTE:** Make sure all the doors are closed. • Wait 30 seconds and observe the courtesy lamps. • **Are the courtesy lamps still illuminated?**	**Yes** GO to C11 . **No** INSTALL a new instrument panel dimmer switch. REFER to Section 413-00 . CLEAR the DTCs. REPEAT the self-test.
C11 CHECK CIRCUIT CLN28 (GN/BU) FOR A SHORT TO GROUND	
• Disconnect: SJB C2280d. • Measure the resistance between the instrument panel dimmer switch C2298-5, circuit CLN28 (GN/BU), harness side and ground.	**Yes** GO to C13 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

 • **Is the resistance greater than 10,000 ohms?**	
C12 CHECK CIRCUIT CLN03 (YE/GY) FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: SJB C2280a. • Observe the courtesy lamps. • **Are the courtesy lamps still illuminated?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** GO to C13 .
C13 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

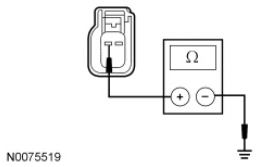
Pinpoint Test D: The Courtesy Lamps Do Not Turn On With One Door Open

Refer to Wiring Diagrams Cell 89 , Interior Lamps for schematic and connector information.

Refer to Wiring Diagrams Cell 117 , Remote Keyless Entry and Alarm for schematic and connector information.

Normal Operation

When any door, the liftgate or the liftgate glass is opened, the ajar switch opens the circuit to the Smart Junction Box (SJB). The SJB monitors the ajar circuits, and based on the ajar status, the SJB supplies voltage to the courtesy lamps on circuit CLN03 (YE/GY). The SJB also monitors the instrument panel dimmer switch for the dome defeat request through circuit VLN36 (GY/OG).



This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Instrument panel dimmer switch
- Ajar switch
- SJB

PINPOINT TEST D: THE COURTESY LAMPS DO NOT TURN ON WITH ONE DOOR OPEN

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
D1 CHECK THE SJB DTCs FROM BOTH CONTINUOUS AND ON-DEMAND SELF-TESTS	
• Verify all the doors, the liftgate and the liftgate glass are closed. • Use the recorded results from the SJB continuous and on-demand self-tests. • **Are any DTCs recorded?**	**Yes** REFER to DTC Charts in this section. **No** GO to D2 .
D2 CHECK THE INSTRUMENT PANEL DIMMER SWITCH	
• Ignition OFF. • Enter the following diagnostic mode on the scan tool: Instrument Panel Dimmer Switch C2298. • Open any door. • **Do the courtesy lamps illuminate?**	**Yes** INSTALL a new instrument panel dimmer switch. TEST the system for normal operation. **No** GO to D3 .
D3 CHECK THE LIFTGATE AJAR SWITCH PID	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: SJB DataLogger. • Check the liftgate ajar switch SJB PID (LGATESW) while opening and closing the liftgate and then the liftgate glass. • **Does the liftgate ajar PID values agree with the liftgate and liftgate glass positions?**	**Yes** GO to D4 . **No** If the PID does not agree for both positions, GO to D6 . If the PID does not agree for only the liftgate, GO to D8 . If the PID does not agree for only the liftgate glass, INSTALL a new liftgate ajar switch. REFER to Section 501-14 . TEST the system for normal operation.
D4 CHECK THE AJAR SWITCH OPERATION	
• Disconnect: Suspect Ajar Switch . • **Do the courtesy lamps turn on?**	**Yes** INSTALL a new ajar switch in question. REFER to Section 501-14 . TEST the system for normal operation. **No** GO to D5 .
D5 CHECK THE AJAR SWITCH CIRCUIT FOR A SHORT TO GROUND	
• Disconnect: SJB C2280b. • Measure the resistance between the suspect ajar switch, harness side and ground as follows:	**Yes** GO to D9 . **No** REPAIR the circuit in question. TEST the

	system for normal operation.
Location / **Connector-Pin** / **Circuit** LH front / C526-2 / CPL26 (GN/VT) RH front / C602-2 / CPL31 (GN/BK) LH rear / C715-2 / CPL36 (GN) RH rear / C820-2 / CPL39 (YE) • **Is the resistance greater than 10,000 ohms?**	
D6 CHECK THE REAR WIPER MOTOR	
• Ignition OFF. • Disconnect: Rear Wiper Motor C4323. • Open the liftgate. • **Do the courtesy lamps turn on?**	**Yes** INSTALL a new rear window wiper motor. REFER to Section 501-16 . TEST the system for normal operation. **No** GO to D7 .
D7 CHECK CIRCUIT CPL58 (GY/OG) FOR A SHORT TO GROUND	
• Disconnect: SJB C2280B. • Disconnect: Liftgate Glass Ajar Switch C478. • Measure the resistance between the liftgate glass ajar switch C478-2, circuit CPL58 (GY/OG), harness side and ground.  • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to D9 . **No** REPAIR the circuit. TEST the system for normal operation.
D8 CHECK THE LIFTGATE AJAR SWITCH	
• Disconnect: Liftgate Ajar Switch C479. • **Do the courtesy lamps turn on?**	**Yes** INSTALL a new liftgate ajar switch. REFER to Section 501-14 . TEST the system for normal operation. **No** REPAIR circuit CPL44 (YE/OG) for a short to ground. TEST the system for normal operation.
D9 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation.

♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

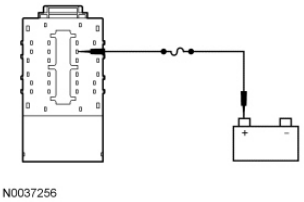
Pinpoint Test E: All The Demand Lamps Are Inoperative

Refer to Wiring Diagrams Cell 89 , Interior Lamps for schematic and connector information.

Normal Operation

The Smart Junction Box (SJB) supplies voltage to the demand lamps on circuit CLN01 (GN/VT). The demand lamps are grounded through circuit GD133 (BK) or circuit GD149 (BK/GY).

- DTC B1316 (Battery Saver Relay Coil Circuit Short to Ground) - a continuous and on-demand DTC that sets when the SJB detects a short to ground on the demand lamp voltage supply circuits.



This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- SJB

PINPOINT TEST E: ALL THE DEMAND LAMPS ARE INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
E1 CHECK THE PUDDLE LAMP OPERATION	
• Ignition OFF. • Open any door and observe the puddle lamps. • **Do the puddle lamps illuminate?**	**Yes** GO to E2 . **No** For Explorer or Mountaineer, GO to Pinpoint Test J . For Explorer Sport Trac, GO to Pinpoint Test K .
E2 CHECK THE SJB DTCs FROM BOTH CONTINUOUS AND ON-DEMAND SELF-TESTS	
• Use the recorded results from the SJB continuous and on-demand self-tests. • **Is DTC B1316 recorded?**	**Yes** REFER to the Wiring Diagrams Manual to isolate the possible causes of the circuit short on circuits CLN01 (GN/VT) and CLN15 (GY/YE). **No** GO to E3 .

E3 CHECK THE GLOVE BOX LAMP OPERATION	
• Ignition OFF. • Open the glove box and observe the glove box lamp. • **Does the glove box lamp operate correctly?**	**Yes** GO to E4 . **No** GO to E5 .
E4 CHECK CIRCUIT CLN01 (GN/VT) FOR AN OPEN	
• Ignition OFF. • Disconnect: SJB C2280a. • Connect a fused jumper wire between the SJB C2280a-23, circuit CLN01 (GN/VT), harness side and battery positive.  N0037256 • Operate any demand lamp on. • **Does the demand lamp illuminate?**	**Yes** GO to E5 . **No** REPAIR circuit CLN01 (GN/VT) for an open. TEST the system for normal operation.
E5 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test F: An Individual Demand Lamp Is Inoperative

Refer to Wiring Diagrams Cell 89 , Interior Lamps for schematic and connector information.

Normal Operation

The Smart Junction Box (SJB) supplies voltage to the demand lamps on circuit CLN01 (GN/VT). The demand lamps are grounded through circuit GD133 (BK) or circuit GD149 (BK/GY).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Interior lamp

PINPOINT TEST F: AN INDIVIDUAL DEMAND LAMP IS INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: To diagnose the glove compartment lamp, GO to Pinpoint Test H .

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>
<tr><td>F1 CHECK CIRCUIT CLN01 (GN/VT) FOR VOLTAGE</td><td></td></tr>
<tr><td>

Ignition OFF.
Disconnect: Suspect Demand Lamp.
Ignition ON.
Measure the voltage between the suspect demand lamp connector, harness side and ground as follows:

<table>
<tr><th>Location</th><th>Connector-Pin</th><th>Circuit</th></tr>
<tr><td>RH vanity mirror lamp</td><td>C906-1</td><td>CLN01 (GN/VT)</td></tr>
<tr><td>LH vanity mirror lamp</td><td>C907-1</td><td>CLN01 (GN/VT)</td></tr>

Is the voltage greater than 10 volts?

</td><td>Yes
GO to F2 .

No
REPAIR circuit CLN01 (GN/VT) for an open. TEST the system for normal operation.</td></tr>
<tr><td>F2 CHECK THE GROUND CIRCUIT FOR AN OPEN</td><td></td></tr>
</table>

• Disconnect: Negative Battery Cable. • Measure the resistance between the suspect demand lamp, harness side and ground as follows: • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new interior lamp for the lamp in question. REFER to Interior Lamp - Front or Interior Lamp - Rear in this section. TEST the system for normal operation. **No** REPAIR the ground circuit in question for an open. TEST the system for normal operation.

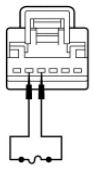
Location	Connector-Pin	Circuit
RH vanity mirror lamp	C906-2	GD133 (BK)
LH vanity mirror lamp	C907-2	GD133 (BK)
Front interior lamp (without overhead console)	C981-2	GD149 (BK/GY)
Front interior/map lamp (with overhead console)	C929-2	GD133 (BK)
Rear interior lamp	C901-2	GD149 (BK/GY)
Cargo lamp (Explorer/Mountaineer)	C926-2	GD149 (BK/GY)

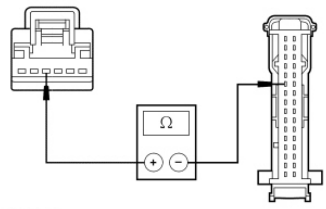
Pinpoint Test G: The Courtesy Lamps Are Inoperative From The Instrument Panel Dimmer Switch

Refer to Wiring Diagrams Cell 71 , Cluster and Panel Illumination for schematic and connector information.

Normal Operation

The Smart Junction Box (SJB) monitors the instrument panel dimmer switch status on circuit CLN28 (GN/BU) to determine if the courtesy lamps are requested. Based on the instrument panel dimmer switch status, the SJB supplies voltage to the courtesy lamps through circuit CLN03 (YE/GY).





This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Instrument panel dimmer switch
- SJB

PINPOINT TEST G: THE COURTESY LAMPS ARE INOPERATIVE FROM THE INSTRUMENT PANEL DIMMER SWITCH

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
G1 CHECK THE SJB DTCs FROM BOTH CONTINUOUS AND ON-DEMAND SELF-TESTS	

• Use the recorded results from the SJB continuous and on-demand self-test. • **Are any DTCs recorded?**	**Yes** REFER to DTC Charts in this section. **No** GO to G2 .
G2 BYPASS THE INSTRUMENT PANEL DIMMER SWITCH	
• Ignition OFF. • Disconnect: Instrument Panel Dimmer Switch C2298. • Connect a fused jumper wire between the instrument panel dimmer switch C2298-5, circuit CLN28 (GN/BU), harness side and the instrument panel dimmer switch C2298-4, circuit CLN17 (BN), harness side.  N0037303 • **Do the courtesy lamps illuminate?**	**Yes** REMOVE the jumper wire. INSTALL a new instrument panel dimmer switch. REFER to Section 413-00 . TEST the system for normal operation. **No** REMOVE the jumper wire. GO to G3 .
G3 CHECK THE INSTRUMENT PANEL DIMMER SWITCH INPUT CIRCUIT FOR AN OPEN	
• Measure the resistance between the instrument panel dimmer switch C2298-4, circuit CLN28 (GN/BU), harness side and the SJB C2280d-6, circuit CLN28 (GN/BU), harness side.  N0090490 • **Is the resistance less than 5 ohms?**	**Yes** GO to G4 . **No** REPAIR circuit CLN28 (GN/BU) for an open. TEST the system for normal operation.
G4 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly.	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded

• Operate the system and verify the concern is still present. • **Is the concern still present?**	connector. CLEAR the DTCs. REPEAT the self-test.

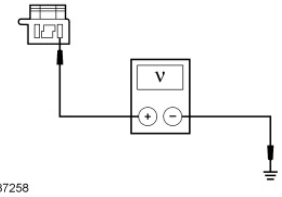
Pinpoint Test H: The Glove Compartment Lamp Is Inoperative

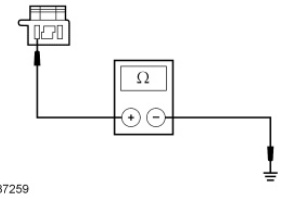
Refer to Wiring Diagrams Cell 89 , Interior Lamps for schematic and connector information.

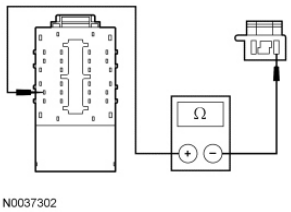
Normal Operation

The Smart Junction Box (SJB) provides voltage to the glove compartment lamp on circuit CLN15 (GY/YE). The glove compartment lamp is grounded through circuit GD138 (BK/WH).

This pinpoint test is intended to diagnose the following:







- Wiring, terminals or connectors
- Glove compartment lamp
- SJB

PINPOINT TEST H: THE GLOVE COMPARTMENT LAMP IS INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Section 414-01 .

Test Step	Result / Action to Take
H1 CHECK THE OPERATION OF THE DEMAND LIGHTING	
• Ignition ON. • Operate the demand lamps. • **Do the demand lamps illuminate?**	**Yes** GO to H2 . **No** GO to Pinpoint Test E .
H2 CHECK CIRCUIT CLN15 (GY/YE) FOR VOLTAGE	
• Ignition OFF. • Disconnect: Glove Compartment Lamp C254. • Ignition ON. • Measure the voltage between the glove compartment lamp C254-1, circuit CLN15 (GY/YE) and ground.	**Yes** GO to H3 . **No** GO to H4 .

 N0037258 • **Is the voltage greater than 10 volts?**	
H3 CHECK CIRCUIT GD138 (BK/WH) FOR AN OPEN	
• Ignition OFF. • Disconnect: Negative Battery Cable. • Measure the resistance between the glove compartment lamp C254-2, circuit GD138 (BK/WH) and ground.  N0037259 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new glove compartment lamp. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
H4 CHECK CIRCUIT CLN15 (GY/YE) FOR AN OPEN	
• Ignition OFF. • Disconnect: SJB C2280c. • Measure the resistance between the SJB C2280c-9, circuit CLN15 (GY/YE), harness side and the glove compartment lamp C254-1, circuit CLN15 (GY/YE), harness side.  N0037302 • **Is the resistance less than 5 ohms?**	**Yes** GO to H5 . **No** REPAIR the circuit. TEST the system for normal operation.
H5 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No**

• Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

Pinpoint Test I: The Battery Saver Does Not Deactivate After Time-Out

Refer to Wiring Diagrams Cell 89 , Interior Lamps for schematic and connector information.

Normal Operation

The Smart Junction Box (SJB) provides a battery saver function. The battery saver function provides automatic shutoff of the interior lamps (courtesy lamps and demand lamps) after a predetermined time has elapsed in order to save battery power.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- SJB

PINPOINT TEST I: THE BATTERY SAVER DOES NOT DEACTIVATE AFTER TIME-OUT

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
I1 CHECK CIRCUIT CLN03 (YE/GY) FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: SJB C2280a. • Ignition ON. • Operate any map lamp. • **Does the lamp illuminate?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to I2 .
I2 CHECK CIRCUIT CLN15 (GY/YE) FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: SJB C2280c. • Ignition ON. • Operate the glove compartment lamp. • **Does the glove compartment lamp illuminate?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to I3 .
I3 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation.

♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

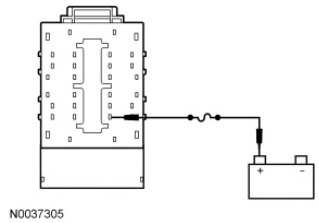
Pinpoint Test J: The Puddle Lamps Are Inoperative - Explorer, Mountaineer

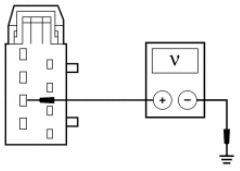
Refer to Wiring Diagrams Cell 89 , Interior Lamps for schematic and connector information.

Normal Operation

The Smart Junction Box (SJB) provides voltage to the puddle lamps through circuit CLN25 (VT). The puddle lamps have separate ground circuits. The LH exterior mirror is grounded through circuit GD133 (BK), and the RH exterior mirror is grounded through circuit GD151 (BK/GN).

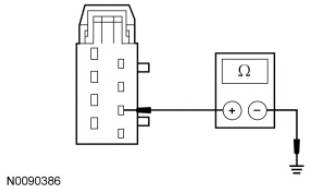
This pinpoint test is intended to diagnose the following:





- Fuse
- Wiring, terminals or connectors
- Exterior mirror
- SJB

PINPOINT TEST J: THE PUDDLE LAMPS ARE INOPERATIVE - EXPLORER, MOUNTAINEER



NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
J1 CHECK THE RECORDED RESULTS FROM THE SJB CONTINUOUS AND ON-DEMAND SELF-TESTS	
• Review the recorded results from the continuous and on-demand self-tests. • **Are any DTCs present?**	**Yes** REFER to DTC Charts in this section. **No** GO to J2 .
J2 CHECK THE PUDDLE LAMP OPERATION	
• Observe the puddle lamps. • **Are both the puddle lamps inoperative?**	**Yes** VERIFY the SJB fuse 23 (15A) is OK. If OK, GO to J3 . If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short. **No** GO to J4 .

J3 CHECK CIRCUIT CLN25 (VT) FOR AN OPEN	
• Ignition OFF. • Disconnect: SJB C2280a. • Connect a fused jumper wire between the SJB C2280a-7, circuit CLN25 (VT), harness side and battery positive.  N0037305 • **Do the puddle lamps illuminate?**	**Yes** REMOVE the jumper wire. GO to J6 . **No** REMOVE the jumper wire. REPAIR circuit CLN25 (VT) for an open. TEST the system for normal operation.
J4 CHECK CIRCUIT CLN25 (VT) FOR VOLTAGE	
• Ignition OFF. • Disconnect: Suspect Exterior Mirror. • **NOTE:** The courtesy lamps must be active during this test. • Measure the voltage between the suspect exterior mirror connector, harness side and ground as follows: **Location** / **Connector-Pin** / **Circuit** RH exterior mirror / C601-6 / CLN25 (VT) LH exterior mirror / C520-6 / CLN25 (VT)  N0090385 • **Is the voltage greater than 10 volts?**	**Yes** GO to J5 . **No** REPAIR circuit CLN25 (VT) for an open. TEST the system for normal operation.
J5 CHECK THE GROUND CIRCUIT FOR AN OPEN	
• Disconnect: Negative Battery Cable. • Measure the resistance between the suspect exterior mirror connector, harness side and ground as follows:	**Yes** INSTALL a new exterior mirror in question. REFER to Section 501-09 . TEST the system for normal operation. **No** REPAIR the ground circuit in question for an open. TEST the system for normal

Location	Connector-Pin	Circuit
RH exterior mirror	C601-5	GD151 (BK/GN)
LH exterior mirror	C520-5	GD133 (BK)

- **Is the resistance less than 5 ohms?**

operation.

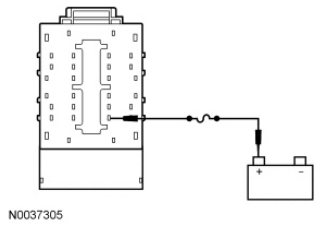
J6 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test K: The Puddle Lamp(s)/Cargo Lamp Is Inoperative - Explorer Sport Trac

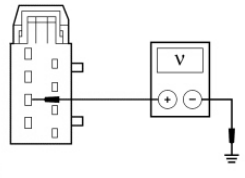
Refer to Wiring Diagrams Cell 89 , Interior Lamps for schematic and connector information.

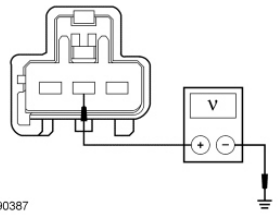
Normal Operation

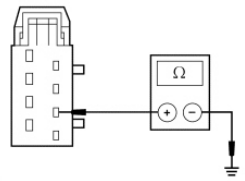
The Smart Junction Box (SJB) provides voltage to the puddle lamps and the cargo lamp through circuit CLN25 (VT). The puddle lamps and the cargo lamp have separate ground circuits. The LH exterior mirror is grounded through circuit GD133 (BK), and the RH exterior mirror is grounded through circuit GD151 (BK/GN). The cargo lamp is grounded through circuit GD133 (BK).

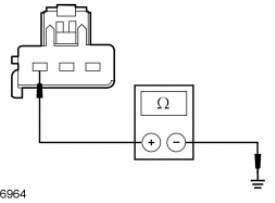


This pinpoint test is intended to diagnose the following:









- Fuse
- Wiring, terminals or connectors
- Exterior mirror
- SJB

PINPOINT TEST K: THE PUDDLE LAMP(S)/CARGO LAMP IS INOPERATIVE - EXPLORER SPORT TRAC

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
K1 CHECK THE RECORDED RESULTS FROM THE SJB CONTINUOUS AND ON-DEMAND SELF-TEST	
• Review the recorded results from the continuous and on-demand self-tests. • **Are any DTCs present?**	**Yes** REFER to the DTC Charts in this section. **No** GO to K2 .
K2 CHECK THE PUDDLE LAMP OPERATION	
• Observe the puddle lamps. • **Are both puddle lamps inoperative?**	**Yes** VERIFY the SJB fuse 23 (15A) is OK. If OK, GO to K3 . If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short. **No** GO to K4 .
K3 CHECK CIRCUIT CLN25 (VT) FOR AN OPEN	
• Ignition OFF. • Disconnect: SJB C2280a. • Connect a fused jumper wire between the SJB C2280a-7, circuit CLN25 (VT), harness side and battery positive.  N0037305 • **Do the puddle lamps illuminate?**	**Yes** REMOVE the jumper wire. GO to K6 . **No** REMOVE the jumper wire. REPAIR circuit CLN25 (VT) for an open. TEST the system for normal operation.
K4 CHECK CIRCUIT CLN25 (VT) FOR VOLTAGE	
• Disconnect: Suspect Exterior Mirror or Cargo Lamp. • **NOTE:** The courtesy lamps must be active during this test. • For an inoperative puddle lamp, measure the voltage between the RH exterior mirror C601-6, circuit CLN25 (VT), harness side and ground; and between the LH exterior mirror C520-6, circuit CLN25 (VT), harness side and ground	**Yes** GO to K5 . **No** REPAIR circuit CLN25 (VT) for an open. TEST the system for normal operation.

 N0090385 • For an inoperative cargo lamp, measure the voltage between the suspect cargo lamp connector C927-2, circuit CLN25 (VT), harness side and ground.  N0090387 • **Is the voltage greater than 10 volts?**	
K5 CHECK THE GROUND CIRCUIT FOR AN OPEN	
• Disconnect: Negative Battery Cable. • For an inoperative puddle lamp, measure the resistance between the RH exterior mirror C601-5, circuit GD151 (BK/GN), harness side and ground; and between the LH exterior mirror C520-5, circuit GD133 (BK), harness side and ground  N0090386 • For an inoperative cargo lamp, measure the resistance between the suspect cargo lamp connector C927-1, circuit CLN25 (VT), harness side and ground.  N0046964 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new cargo lamp or exterior mirror in question. REFER to Section 501-09 . TEST the system for normal operation. **No** REPAIR the ground circuit in question for an open. TEST the system for normal operation.
K6 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors.	**Yes** INSTALL a new SJB . REFER

• Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test L: The Puddle Lamps/Cargo Lamp Is Always On

Refer to Wiring Diagrams Cell 89 , Interior Lamps for schematic and connector information.

Normal Operation

The Smart Junction Box (SJB) provides voltage to the puddle lamps and the cargo lamp through circuit CLN25 (VT).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- SJB

PINPOINT TEST L: THE PUDDLE LAMPS/CARGO LAMP IS ALWAYS ON

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
L1 CHECK CIRCUIT CLN25 (VT) FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: SJB C2280a. • Ignition ON. • **Do the puddle lamps continue to illuminate?**	**Yes** REPAIR circuit CLN25 (VT) for a short to voltage. TEST the system for normal operation. **No** GO to L2 .
L2 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

concern is still present. • **Is the concern still present?**	

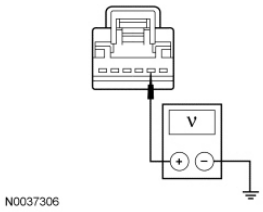
Pinpoint Test M: The Dome Defeat Feature Is Inoperative

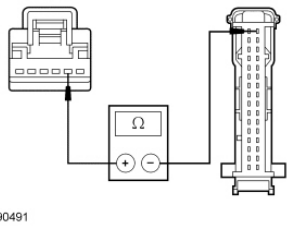
Refer to Wiring Diagrams Cell 71 , Cluster and Panel Illumination for schematic and connector information.

Normal Operation

The Smart Junction Box (SJB) send a reference signal to the instrument panel dimmer switch through circuit VLN36 (GY/OG) to monitor the dome defeat request. The voltage signal is routed through a series of resistors within the switch and then back to the SJB . When the instrument panel dimmer switch is placed in the DOME DEFEAT position, the signal is routed through a single resistor, signaling the SJB a request for the dome defeat feature. When the SJB detects a dome defeat request, the SJB does not turn the courtesy lamps on when a door/liftgate/liftgate glass is opened, a door is unlocked using a key or when the doors are unlocked using the Remote Keyless Entry (RKE) transmitter.

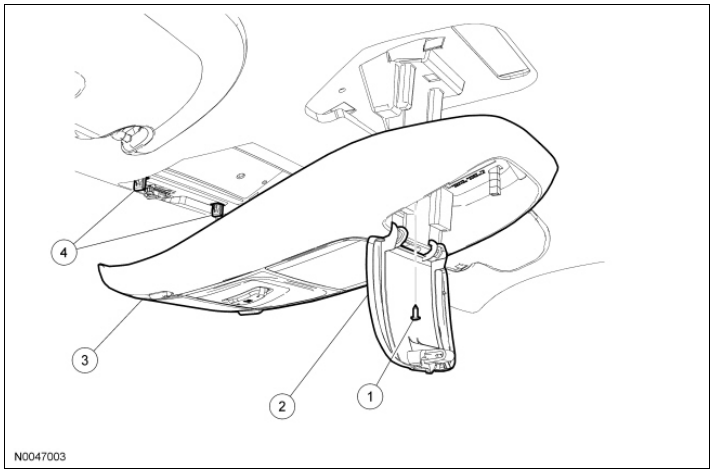
- DTC B1687 (Lamp Dome Input Circuit Short to Ground) - a continuous and on-demand DTC that may set when the SJB detects an open or short to voltage from the dome defeat request input circuit.





This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Instrument panel dimmer switch
- SJB



PINPOINT TEST M: THE DOME DEFEAT FEATURE IS INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
M1 CHECK THE DIMMABLE LIGHTING SYSTEM FOR CORRECT OPERATION	
• Ignition OFF. • Place the headlamp switch in the PARKING LAMPS ON position. • Rotate the instrument panel dimmer switch to the lowest and highest setting while observing the dimmable components. • **Does the dimmable lighting operate correctly?**	**Yes** GO to M2 . **No** REFER to Section 413-00 .
M2 CHECK THE INSTRUMENT PANEL DIMMER SWITCH	
• Place the headlamp switch in the OFF position. • Disconnect: Instrument Panel Dimmer Switch C2298. • Carry out the instrument panel dimmer switch component test.	**Yes** GO to M3 . **No** INSTALL a new instrument panel dimmer switch. REFER to Section 413-00 .

Refer to Wiring Diagrams Cell 149 for component testing. • **Is the instrument panel dimmer switch OK?**	CLEAR the DTCs. REPEAT the self-test.
M3 CHECK DOME DEFEAT REQUEST INPUT CIRCUIT FOR A SHORT TO VOLTAGE	
• Disconnect: SJB C2280d. • Ignition ON. • Measure the voltage between the instrument panel dimmer switch C2298-2, circuit VLN36 (GY/OG), harness side and ground.  • **Is any voltage present?**	**Yes** REPAIR circuit VLN36 (GY/OG) for a short to voltage. CLEAR the DTCs. REPEAT the self-test. **No** GO to M4 .
M4 CHECK DOME DEFEAT REQUEST INPUT CIRCUIT FOR AN OPEN	
• Ignition OFF. • Measure the resistance between the instrument panel dimmer switch C2298-2, circuit VLN36 (GY/OG), harness side and the SJB C2280d-6, circuit VLN36 (GY/OG), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** GO to M5 . **No** REPAIR circuit VLN36 (GY/OG) for an open. CLEAR the DTCs. REPEAT the self-test.
M5 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR any DTCs. REPEAT the self-test.

Interior Lamp - Front

Item	Part Number	Description
1	-	Overhead console screw
2	-	Overhead console storage door (part of 78519A70)
3	78519A70	Overhead console
4	-	Overhead console retainer clips

Removal and Installation

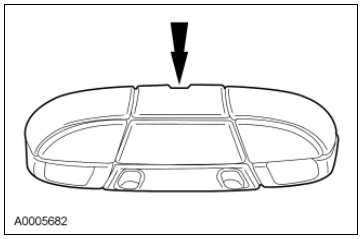
1. **NOTE:** Use a small screwdriver to pry open the garage door opener bin.

   Open the rear overhead console storage or garage door opener bin to access the retaining screw.

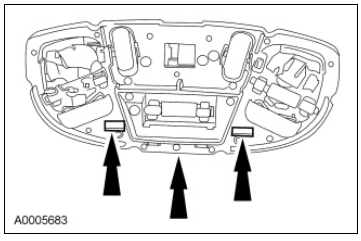
   - Remove the screw.

2. Pull the front of the overhead console down and remove the console from the console retaining clips.
   - Disconnect the electrical connector(s).

3. To install, reverse the removal procedure.



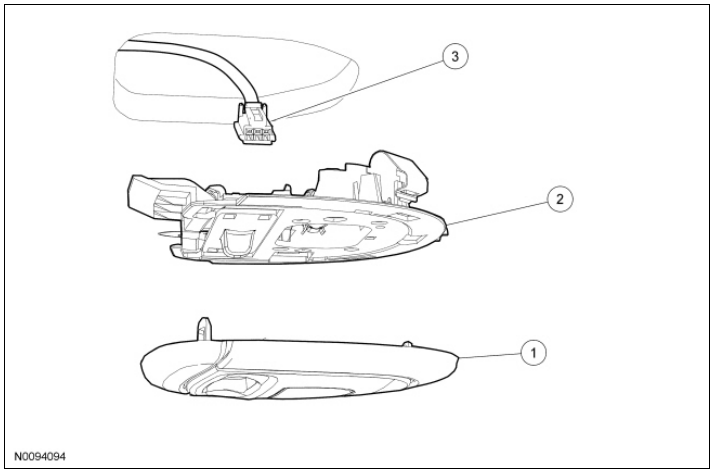
Interior Lamp - Rear



Item	Part Number	Description
1	13783	Rear interior lamp lens
2	13776	Rear interior lamp
3	-	Rear interior lamp electrical connector (part of 14335)

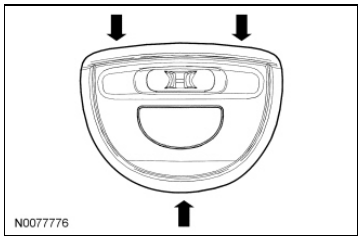
Removal and Installation

1. Remove the rear interior lamp lens.

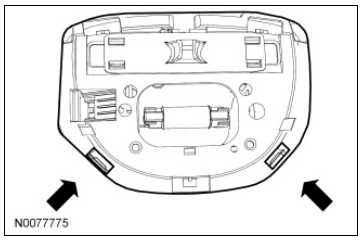


2. Release the 2 retaining clips (through the access holes) and remove the rear interior lamp assembly.
   - Disconnect the electrical connector.

3. To install, reverse the removal procedure.



Cargo Lamp



Item	Part Number	Description
1	13783	Cargo lamp lens
2	13776	Cargo lamp
3	-	Interior lamp electrical connector (part of 14335)

Removal and Installation

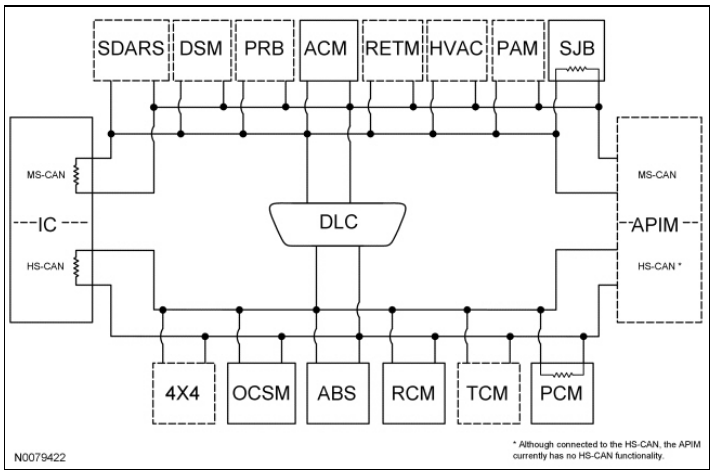
1. Remove the cargo lamp lens.

2. Release the 2 retaining clips (through the access holes) and remove the cargo lamp.
   - Disconnect the electrical connector.

3. To install, reverse the removal procedure.

Communications Network

NOTE: The Smart Junction Box (SJB) is also known as the Generic Electronic Module (GEM).



Vehicle communication utilizes both Medium Speed (MS) and High Speed (HS) Controller Area Network (CAN) communications. CAN is used for many modules to communicate with each other on a common network. CAN in-vehicle networking is a method for transferring data among distributed electronic modules via serial data bus. Without serial networking, intermodule communication requires dedicated, point to point wiring resulting in bulky, expensive, complex, and difficult to install wiring harnesses. Applying a serial data network reduces the number of wires, combining the signals on a single network. Information is sent to the individual control modules that control each function.

The vehicle has 2 module communication networks:

- Medium Speed Controller Area Network (MS-CAN)
- High Speed Controller Area Network (HS-CAN)

Both networks are connected to the Data Link Connector (DLC). This makes diagnosis and testing of these systems easier by allowing one scan tool to be able to diagnose and control any module on both networks from one connector. The DLC can be found under the instrument panel between the steering column and the Audio Front Control Module (ACM).

Network Topology

Module Name	Network Type	Termination Module
4X4 control module (if equipped)	HS-CAN	No
ABS module	HS-CAN	No
Accessory Protocol Interface Module (APIM)	HS-CAN MS-CAN	No No
Audio Front Control Module (ACM)	MS-CAN	No
Driver Seat Module (DSM) (if equipped)	MS-CAN	No

HVAC module (if equipped)	MS-CAN	No
Instrument Cluster (IC) (gateway module)	HS-CAN MS-CAN	Yes Yes
Occupant Classification System Module (OCSM)	HS-CAN	No
Parking Aid Module (PAM) (if equipped)	MS-CAN	No
PCM	HS-CAN	Yes
Power Running Board (PRB) module (if equipped)	MS-CAN	No
Rear Entertainment Module (RETM) (if equipped)	MS-CAN	No
Restraints Control Module (RCM)	HS-CAN	No
Satellite Digital Audio Receiver System (SDARS) module (if equipped)	MS-CAN	No
Smart Junction Box (SJB)	MS-CAN	Yes
Transmission Control Module (TCM) (if equipped)	HS-CAN	No

Medium Speed Controller Area Network (MS-CAN) Operation

The MS-CAN communicates using bussed messages. The MS-CAN has an unshielded twisted pair cable, data bus (+) and data bus (-) circuits. In addition to scan tool communication, this network allows sharing of information between all modules on the network.

The MS-CAN is a medium speed communication network used for the following modules:

- Accessory Protocol Interface Module (APIM)
- Audio Front Control Module (ACM)
- Driver Seat Module (DSM) (if equipped)
- HVAC module (if equipped)
- Instrument Cluster (IC)
- Parking Aid Module (PAM) (if equipped)
- Power Running Board (PRB) module (if equipped)
- Rear Entertainment Module (RETM) (if equipped)
- Satellite Digital Audio Receiver System (SDARS) module (if equipped)
- Smart Junction Box (SJB)

High Speed Controller Area Network (HS-CAN) Operation

The HS-CAN communicates using bussed messages. The HS-CAN uses an unshielded twisted pair cable, data bus (+) and data bus (-) circuits. In addition to scan tool communication, this network allows sharing of information between all modules on the network.

The HS-CAN is a high speed communication network used for the following modules:

- 4X4 control module (if equipped)
- ABS module
- APIM
- IC
- Occupant Classification System Module (OCSM)
- PCM
- Restraints Control Module (RCM)
- Transmission Control Module (TCM) (if equipped)

Network Termination

The CAN uses a network termination circuit to improve communication reliability. The network termination of the CAN bus takes place inside the termination modules by termination resistors. Termination modules are located at either end of the bus network. As network messages are broadcast in the form of voltage signals, the network voltage signals are stabilized by the termination resistors. Each termination module has a 120 ohm resistor across the positive and negative bus connection in the termination module. With 2 termination modules on each network, and the 120 ohm resistors located in a parallel circuit configuration, the total network impedance, or total resistance is 60 ohms.

Network termination improves bus message reliability by:

- Stabilizing bus voltage
- Eliminating electrical interference

Gateway Module

The IC is the gateway module, translating HS-CAN to MS-CAN and vice versa. This information allows a message to be distributed throughout both networks. The IC is the only module on this vehicle that has this ability.

Communications Network

Special Tool(s)

 ST1137-A	73III Automotive Meter 105-R0057 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
 ST2574-A	Flex Probe Kit 105-R025C or equivalent

Principles of Operation

NOTE: The Smart Junction Box (SJB) is also known as the Generic Electronic Module (GEM).

Vehicle communication utilizes both Medium Speed (MS) and High Speed (HS) Controller Area Network (CAN) communications. CAN is a method for transferring data among distributed electronic modules via a serial data bus.

The vehicle is equipped with 2 module communication networks:

- Medium Speed Controller Area Network (MS-CAN)
- High Speed Controller Area Network (HS-CAN)

Medium Speed Controller Area Network (MS-CAN)

The MS-CAN is a medium speed communication network that uses an unshielded twisted pair cable of data (+) and data (-) circuits. The data (+) and the data (-) circuits are each regulated to approximately 2.5 volts during neutral or rested network traffic. As bus messages are sent on the data (+) circuit, voltage is increased by approximately 1.0 volt. Inversely, the data (-) circuit is reduced by approximately 1.0 volt when a bus message is sent. Multiple bus messages can be sent over the network CAN circuits allowing multiple modules to communicate with each other. The MS-CAN will not communicate while certain faults are present, but will operate with diminished performance with other faults present. The MS-CAN may remain operational when 1 of the 2 termination resistors are not present.

The MS-CAN operates at a maximum data transfer speed of 125 Kbps for bus messages and designed for general information transfer. The network will remain operational, but at a degraded level, when certain circuit faults are present.

The following modules are on the MS-CAN :

- Accessory Protocol Interface Module (APIM) (if equipped)
- Audio Front Control Module (ACM)

- Driver Seat Module (DSM) (if equipped)
- HVAC module (if equipped)
- Instrument Cluster (IC)
- Parking Aid Module (PAM) (if equipped)
- Power Running Board (PRB) module (if equipped)
- Rear Entertainment Module (RETM) (if equipped)
- Satellite Digital Audio Receiver System (SDARS) module (if equipped)
- Smart Junction Box (SJB)

The following fault chart describes the specific MS-CAN failures and their resulting symptom:

Medium Speed Controller Area Network (MS-CAN) Communication Fault Chart

Failure Description	Symptom
MS-CAN (+) shorted to MS-CAN (-)	No communication
MS-CAN (+) short to voltage	No communication
MS-CAN (-) short to voltage	No communication
MS-CAN (+) short to ground	No communication
MS-CAN (-) short to ground	Unreliable communication possible to all network modules
MS-CAN (+) open	Unreliable communication possible to all network modules
MS-CAN (-) open	Unreliable communication possible to all network modules
Module loss of voltage or ground	No communication
Module internal failure	No communication

High Speed Controller Area Network (HS-CAN)

The HS-CAN is a high speed communication network that uses an unshielded twisted pair cable of data (+) and data (-) circuits. The data (+) and the data (-) circuits are each regulated to approximately 2.5 volts during neutral or rested network traffic. As bus messages are sent on the data (+) circuit, voltage is increased by approximately 1.0 volt. Inversely, the data (-) circuit is reduced by approximately 1.0 volt when a bus message is sent. Multiple bus messages can be sent over the network CAN circuits allowing multiple modules to communicate with each other. The HS-CAN will not communicate while certain faults are present, but will operate with diminished performance with other faults present. The HS-CAN bus may remain operational when 1 of the 2 termination resistors are not present.

The HS-CAN operates at a maximum data transfer speed of 500 Kbps and is designed for real time information transfer and control. The network will remain operational, but at a degraded level, when certain circuit faults are present.

The following modules are on the HS-CAN :

- 4X4 control module (if equipped)
- ABS module
- Accessory Protocol Interface Module (APIM) (if equipped)
- Instrument Cluster (IC)
- Occupant Classification System Module (OCSM)
- PCM
- Restraints Control Module (RCM)

- Transmission Control Module (TCM) (if equipped)

The following fault chart describes the specific HS-CAN failures and their resulting symptom:

High Speed Controller Area Network (HS-CAN) Communication Fault Chart

Failure Description	Symptom
HS-CAN (+) shorted to HS-CAN (-)	No communication
HS-CAN (+) short to voltage	No communication
HS-CAN (-) short to voltage	No communication
HS-CAN (+) short to ground	No communication
HS-CAN (-) short to ground	Unreliable communication possible to all network modules
HS-CAN (+) open	Unreliable communication possible to all network modules
HS-CAN (-) open	Unreliable communication possible to all network modules
Module loss of voltage or ground	No communication
Module internal failure	No communication

The following chart describes the specific CAN messages broadcast by each module, and the module(s) that receive the message:

CAN Module Communication Message Chart

Broadcast Message	Originating Module	Network Type	Receiving Module(s)
ABS event in progress	ABS module	HS-CAN	• PCM • RCM

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of electrical damage.
   - If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

Visual Inspection Chart

Electrical
• Battery Junction Box (BJB) fuse(s): ♦ 3 (50A) (no communication with Smart Junction Box (SJB)) ♦ 6 (40A) (no communication with ABS module) ♦ 19 (30A) (no communication with Power Running Board (PRB) module) ♦ 23 (20A) (no communication with 4X4 control module) ♦ 24 (10A) (no communication with PCM) ♦ 26 (20A) (no communication with 4X4 control module) ♦ 27 (20A) (no communication with Transmission Control Module (TCM)) ♦ 33 (30A) (no communication with ABS module) ♦ 39 (15A) (no communication with PCM) ♦ 41 (15A) (no communication with Accessory Protocol Interface Module (APIM), Satellite Digital Audio Receiver System (SDARS) module, Rear Entertainment Module (RETM)) • SJB fuse(s): ♦ 1 (20A) (no communication with Driver Seat Module (DSM)) ♦ 2 (5A) (no communication with SJB) ♦ 3 (20A) (no communication with Audio Front Control Module (ACM)) ♦ 4 (10A) (no power to scan tool) ♦ 8 (15A) (no communication with Instrument Cluster (IC)) ♦ 9 (2A) (no communication with TCM , PCM) ♦ 12 (5A) (no communication with ACM) ♦ 17 (10A) (no communication with Restraints Control Module (RCM), Occupant Classification System Module (OCSM))

- ♦ 18 (10A) (no communication with ABS module, 4X4 control module, Parking Aid Module (PAM))
- ♦ 20 (10A) (no communication with HVAC module)
- ♦ 24 (10A) (no communication with IC)
- ♦ 28 (10A) (no communication with HVAC module)

- Data Link Connector (DLC)
- Wiring harness
- Wiring, terminals or connectors

3. Connect the scan tool to the DLC .
   - **NOTE:** Make sure to use the latest scan tool software release.

     NOTE: The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM .

     If the Integrated Diagnostic System (IDS) does not communicate with the VCM :

     - ♦ Check the VCM connection to the vehicle.
     - ♦ Check the scan tool connection to the VCM .
     - ♦ GO to Pinpoint Test U , to diagnose No Power To The Scan Tool.

4. Establish a scan tool session.
   - **NOTE:** The scan tool will first attempt to communicate with the PCM, after establishing communication with the PCM, the scan tool will then attempt to communicate with all other modules on the vehicle.

     If an IDS session cannot be established with the vehicle, (IDS may state "No communication can be established with the PCM"):

     - ♦ Choose "NO" when the scan tool prompts whether or not to retry communication.
     - ♦ Enter either a PCM part number, tear tag or calibration number to identify the vehicle and start a session (the PCM part number and 4-character tear tag are printed on the PCM label).
     - ♦ GO to Pinpoint Test A , to diagnose "The PCM Does Not Respond To The Scan Tool".

5. Carry out the network test.
   - If the network test passes, retrieve and record the continuous memory DTCs and proceed to Step 6.
   - If the network test fails, GO to Symptom Chart to diagnose the failed communication network.
   - If a module fails to communicate during the network test, GO to Symptom Chart .

6. Retrieve and review the DTCs.
   - If the DTCs retrieved are related to the concern, go to DTC Charts. Follow the non-network DTC diagnostics (B-codes, C-codes, P-codes) prior to the network DTC diagnostics (U-codes). For all other DTCs, refer to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .
   - If no DTCs related to the concern are retrieved, GO to Symptom Chart .

DTC Charts

NOTE: Network DTCs (U-codes) are often a result of intermittent concerns such as damaged wiring or low battery voltage occurrences. Additionally, vehicle service procedures such as module reprogramming will often set network DTCs. Replacing a module to resolve a network DTC is unlikely to resolve the concern. To prevent repeat network DTC concerns, inspect all network wiring, especially connectors. Test the vehicle battery, refer to Section 414-01 .

NOTE: Some modules on this vehicle utilize a 5-character DTC followed by a 2-character failure-type code. The failure-type code provides information about specific fault conditions such as opens, or shorts to ground. Continuous memory DTCs have an additional 2-character DTC status code suffix to assist in determining DTC history.

Network DTC Chart

NOTE: DTC U1900 will set in a module that is reporting a communication fault from another module on the data bus. The module that reports the fault is not the problem module.

DTC	Description	Source	Action
U0073	Control Module Communication Bus A Off	Transmission Control Module (TCM)	The module could not communicate on the network at a point in time. The fault is currently not present. CLEAR the DTC. REPEAT the network test with the scan tool.
U0100	Lost Communication With ECM /PCM	TCM	The module could not communicate on the network at a point in time. The fault is currently not present. CLEAR the DTC. REPEAT the network test with the scan tool.
U0100:00	Lost Communication With ECM /PCM "A": No Sub Type Information	Accessory Protocol Interface Module (APIM)	REFER to Section 415-00 .
U0101	Lost Communication With TCM	4X4 control module	CLEAR the DTC. REPEAT the network test with the scan tool. FOLLOW the appropriate pinpoint test for the module that fails the network test.
U0102	Lost Communication With Transfer Case Control Module (4x4CM)	TCM	CLEAR the DTC. REPEAT the network test with the scan tool. FOLLOW the appropriate pinpoint test for the module that fails the network test.
U0121	Lost Communication With Anti-Lock Brake System (ABS) Control Module	4X4 control module	CLEAR the DTC. REPEAT the network test with the scan tool. FOLLOW the appropriate pinpoint test for the module that fails the network test.
U0121	Lost Communication With Anti-Lock Brake System (ABS) Control Module	TCM	CLEAR the DTC. REPEAT the network test with the scan tool. FOLLOW the appropriate pinpoint test for the module that fails the network test.
U0140	Lost Communication With Body Control Module (GEM)	Audio Front Control Module (ACM)	REFER to Section 415-00 .
U0140	Lost Communication With Body Control Module (	Instrument Cluster (IC)	CLEAR the DTC. REPEAT the network test with the scan tool. FOLLOW the appropriate

	GEM)		pinpoint test for the module that fails the network test.
U0140	Lost Communication With Body Control Module (GEM)	Parking Aid Module (PAM)	CLEAR the DTC. REPEAT the network test with the scan tool. FOLLOW the appropriate pinpoint test for the module that fails the network test.
U0140	Lost Communication With Body Control Module (GEM)	Rear Entertainment Module (RETM)	REFER to Section 415-00 .

U0244	Lost Communication With Running Board Control Module (PRB)	IC	CLEAR the DTC. REPEAT the network test with the scan tool. FOLLOW the appropriate pinpoint test for the module that failed the network test.
U0253:00	Lost Communication With Accessory Protocol Interface Module: No Sub Type Information	RCM	CLEAR the DTC. REPEAT the network test with the scan tool. If the DTC returns, GO to Pinpoint Test P .
U0422:00	Invalid Data Received From Body Control Module: No Sub Type Information	APIM	RETRIEVE and FOLLOW non-network DTCs from the SJB .

U0423:00	Invalid Data Received From Instrument Panel Cluster (IPC) Control Module: No Sub Type Information	APIM	RETRIEVE and FOLLOW non-network DTCs from the IPC .
U0485:00	Invalid Data Received From Radio: No Sub Type Information	APIM	RETRIEVE and FOLLOW non-network DTCs from the ACM .
U1900	CAN Communication Bus Fault-Receive Error	4X4 control module	GO to Symptom Chart for module that failed the network test.
U1900	CAN Communication Bus Fault-Receive Error	ABS module	GO to Symptom Chart for module that failed the network test.
U1900	CAN Communication Bus Fault-Receive Error	Driver Seat Module (DSM)	GO to Symptom Chart for module that failed the network test.
U1900	CAN Communication Bus Fault-Receive Error	IC	GO to Symptom Chart for module that failed the network test.
U1900	CAN Communication Bus Fault-Receive Error	Occupant Classification System Module (OCSM)	GO to Symptom Chart for module that failed the network test.
U1900	CAN Communication Bus Fault-Receive Error	Power Running Board (PRB) module	GO to Symptom Chart for module that failed the network test.
U1900	CAN Communication Bus Fault-Receive Error	RCM	GO to Symptom Chart for module that failed the network test.
U1901	CAN Network #2 Communication Bus Fault - Receive Error	ABS module	REFER to Section 206-09 .
U2013	Compass Module Is Not Responding	IC	REFER to Section 413-01 .
U2023	Fault Received From External Node	4X4 control module	U2023 is set when a module receives invalid network data from another module with a faulted input. RETRIEVE and REPAIR all non-network DTCs in the other modules on the network. REFER to Section 419-10 for a list of all DTCs.
U2023	Fault Received From External Node	ABS module	U2023 is set when a module receives invalid network data from another module with a faulted input. RETRIEVE and REPAIR all non-network DTCs in the other modules on the network. REFER to Section 419-10 for a list of all DTCs.
U2023	Fault Received From External Node	IC	U2023 is set when a module receives invalid network data from another module with a faulted input. RETRIEVE and REPAIR all non-network DTCs in the other modules on the network. REFER to Section 419-10 for a list of all DTCs.
U2023	Fault Received From External Node	PAM	U2023 is set when a module receives invalid network data from another module with a faulted input. RETRIEVE and REPAIR all non-network DTCs in the other modules on the

			network. REFER to Section 419-10 for a list of all DTCs.
U2471	Unexpected PRNDL State	PAM	RETRIEVE and FOLLOW non-network DTCs from the other modules. REFER to Section 419-10 for a list of all DTCs.
U2472	Unexpected Ignition State	PAM	RETRIEVE and FOLLOW non-network DTCs from the other modules. REFER to Section 419-10 for a list of all DTCs.
U2473	Unexpected Vehicle Speed (VSS)	PAM	RETRIEVE and FOLLOW non-network DTCs from the other modules. REFER to Section 419-10 for a list of all DTCs.
U2510	CAN - Invalid Data For Vehicle Security	IC	RETRIEVE and FOLLOW non-network DTCs from the other modules. REFER to Section 419-01 .
U2511	CAN - Data Mis-Match (Receive Data Does Not Match Expected)	IC	RETRIEVE and FOLLOW non-network DTCs from the other modules. REFER to Section 419-01 .
U3000:88	Control Module: Bus Off	APIM	The module could not communicate on the network at a point in time. The fault is currently not present since the module is currently communicating with the scan tool reporting this DTC. CLEAR the DTC. REPEAT the network test with the scan tool.

Symptom Chart

Symptom Chart

Pinpoint Tests

Pinpoint Test A: The PCM Does Not Respond To The Scan Tool

Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.

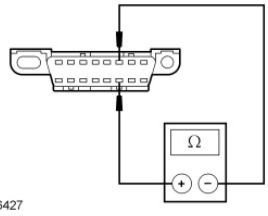
Refer to Wiring Diagrams Cell 23 , Electronic Engine Controls - 4.0L for schematic and connector information.

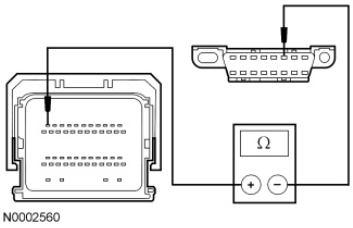
Refer to Wiring Diagrams Cell 24 , Electronic Engine Controls - 4.6L for schematic and connector information.

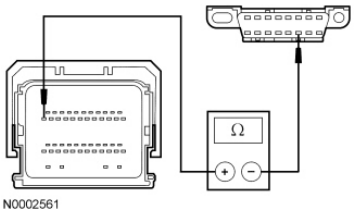
Normal Operation

The PCM communicates with the scan tool through the High Speed Controller Area Network (HS-CAN). Circuits VDB04 (WH/BU) (HS-CAN +) and VDB05 (WH) (HS-CAN -) provide the network connection to the PCM.

This pinpoint test is intended to diagnose the following:







- Wiring, terminals or connectors
- PCM

PINPOINT TEST A: THE PCM DOES NOT RESPOND TO THE SCAN TOOL

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
A1 VERIFY WHETHER OTHER HS-CAN MODULES PASS THE NETWORK TEST	
• Enter the following diagnostic mode on the scan tool: Network Test. • In the left hand pane of the Integrated Diagnostic System (IDS) network test display screen, verify whether any HS-CAN modules passed the network test. • **Is the text "pass" or a DTC listed next to any of the following modules (if equipped): 4x4 control module, ABS module, Accessory Protocol Interface Module (APIM), Instrument Cluster (IC), Occupant Classification System Module (OCSM), PCM or Restraints Control Module (RCM)?**	**Yes** If "pass" or a DTC was listed next to the PCM, a network fault is not currently present. GO to Pinpoint Test T to diagnose an intermittent HS-CAN fault condition. If "pass" or a DTC was listed next to one or more modules other than the PCM, GO to A2 . **No** No modules are currently communicating on the HS-CAN . GO to Pinpoint Test S to diagnose no HS-CAN communication.
A2 PC/ED MANUAL PINPOINT TEST QA VERIFICATION CHECK	
• Verify that pinpoint test QA has been performed. • **Has pinpoint test QA been performed?**	**Yes** GO to A3 . **No** REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual, Section 5, pinpoint test QA to diagnose no communication with the PCM.
A3 CHECK THE HS-CAN TERMINATION RESISTANCE	
• Ignition OFF. • Disconnect: Negative Battery Cable. • Measure the resistance between the Data Link Connector (DLC) C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.	**Yes** CONNECT the negative battery cable. GO to A5 . **No** GO to A4 .

 N0026427 • **Is the resistance between 54 and 66 ohms?**	
A4 CHECK THE CAN CIRCUITS BETWEEN THE DLC AND THE PCM FOR AN OPEN	
• Disconnect: PCM C175b. • Measure the resistance between the PCM C175b-11, circuit VDB04 (WH/BU), harness side and the DLC C251-6, circuit VDB04 (WH/BU), harness side.  N0002560 • Measure the resistance between the PCM C175b-23, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0002561 • **Are the resistances less than 5 ohms?**	**Yes** CONNECT the negative battery cable. GO to A5 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
A5 CHECK FOR CORRECT PCM OPERATION	
• Disconnect all the PCM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the PCM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PCM. REFER to Section 303-14 . CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test B: The Transmission Control Module (TCM) Does Not Respond To The Scan Tool

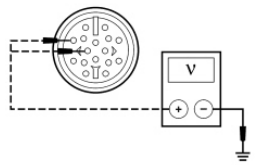
Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.

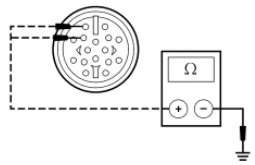
Refer to Wiring Diagrams Cell 30 , Transmission Controls - 6R60 for schematic and connector information.

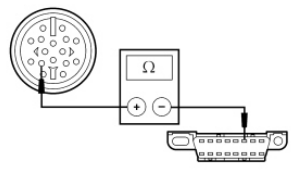
Normal Operation

The 6R60 transmission utilizes a Transmission Control Module (TCM) to control transmission functions. The TCM communicates with the scan tool through the High Speed Controller Area Network (HS-CAN). Circuits VDB04 (WH/BU) (HS-CAN +) and VDB05 (WH) (HS-CAN -) provide the network connection to the TCM . Voltage for the TCM is provided by circuits SBB27 (BU/RD) and CE517 (BU/GN). Circuit GD113 (BK/YE) provides ground.

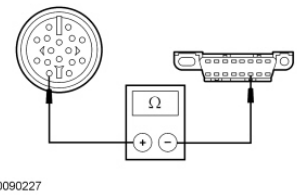
This pinpoint test is intended to diagnose the following:







- Fuse
- Wiring, terminals or connectors
- TCM



PINPOINT TEST B: THE TCM DOES NOT RESPOND TO THE SCAN TOOL

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
B1 CHECK THE TCM VOLTAGE SUPPLY CIRCUITS FOR AN OPEN	
• Ignition OFF. • Disconnect: TCM C1575 (6R60 Transmission). • Ignition ON. • Measure the voltage between the TCM C1575-9, circuit CE517 (BU/GN), harness side and ground; and between the TCM C1575-14, circuit SBB27 (BU/RD), harness side and ground	**Yes** GO to B2 . **No** VERIFY that the Battery Junction Box (BJB) fuse 27 (20A) or Smart Junction Box (SJB) fuse 9 (2A) is OK. If OK, REPAIR the circuit in question. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the network test with the scan tool.

 N0090217 • **Are the voltages greater than 10 volts?**	
B2 CHECK THE TCM GROUND CIRCUITS FOR AN OPEN	
• Ignition OFF. • Disconnect: Negative Battery Cable. • Measure the resistance between the TCM C1575-13, circuit GD113 (BK/YE), harness side and ground; and between the TCM C1575-16, circuit GD113 (BK/YE), harness side and ground.  N0090218 • **Are the resistances less than 5 ohms?**	**Yes** GO to B3 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
B3 CHECK THE HS-CAN CIRCUITS BETWEEN THE TCM AND THE DLC FOR AN OPEN	
• Measure the resistance between the TCM C1575-6, circuit VDB04 (WH/BU), harness side and the DLC C251-6, circuit VDB04 (WH/BU), harness side.  N0090226 • Measure the resistance between the TCM C1575-2, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.	**Yes** CONNECT the negative battery cable. GO to B4 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

 • **Are the resistances less than 5 ohms?**	
B4 CHECK FOR CORRECT TCM OPERATION	
• Disconnect the TCM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the TCM connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new TCM . REFER to Mechatronic Assembly in Section 307-01B . CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test C: The ABS Module Does Not Respond To The Scan Tool

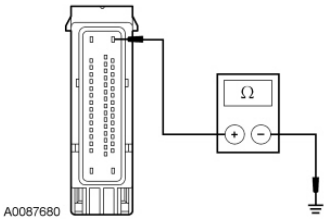
Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.

Refer to Wiring Diagrams Cell 42 , Vehicle Dynamic Systems for schematic and connector information.

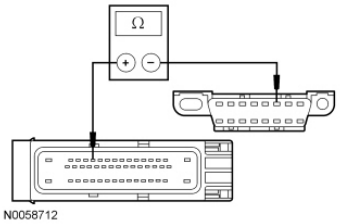
Normal Operation

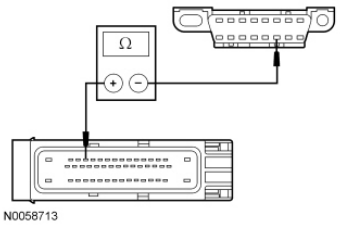
The ABS module communicates with the scan tool through the High Speed Controller Area Network (HS-CAN). Circuits VDB04 (WH/BU) (HS-CAN +) and VDB05 (WH) (HS-CAN -) provide the network connection to the ABS module. Voltage for the ABS module is provided by circuits CBP18 (GY/OG), SBB06 (BN/RD) and SBB33 (RD). Ground is provided by circuit GD120 (BK/GN).

This pinpoint test is intended to diagnose the following:



- Fuse
- Wiring, terminals or connectors
- ABS module





PINPOINT TEST C: THE ABS MODULE DOES NOT RESPOND TO THE SCAN TOOL

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take

C1 CHECK THE ABS VOLTAGE SUPPLY CIRCUITS FOR AN OPEN	
• Ignition OFF. • Disconnect: ABS Module C155. • Ignition ON. • Measure the voltage between the ABS module, harness side and ground as follows: **Connector-Pin / Circuit** C155-1 / SBB06 (BN/RD) C155-8 / CBP18 (GY/OG) C155-32 / SBB33 (RD) • **Are the voltages greater than 10 volts?**	**Yes** GO to C2 . **No** VERIFY the Battery Junction Box (BJB) fuse 6 (40A) or fuse 33 (30A) and the Smart Junction Box (SJB) fuse 18 (10A) is OK. If OK, REPAIR the circuit in question. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the network test with the scan tool.
C2 CHECK THE ABS GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: Negative Battery Cable. • Measure the resistance between the ABS module C155-16, circuit GD120 (BK/GN) harness side and ground.  • **Is the resistance less than 5 ohms?**	**Yes** GO to C3 . **No** REPAIR the circuit. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
C3 CHECK THE HS-CAN CIRCUITS BETWEEN THE ABS MODULE AND THE DLC FOR AN OPEN	
• Measure the resistance between the ABS module C135-12, circuit VDB04 (WH/BU), harness side and the DLC C251-6, circuit VDB04 (WH/BU), harness side.	**Yes** CONNECT the negative battery cable. GO to C4 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

 N0058712 • Measure the resistance between the ABS module C135-13, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0058713 • **Are the resistances less than 5 ohms?**	
C4 CHECK FOR CORRECT ABS MODULE OPERATION	
• Disconnect the ABS module connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the ABS module connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ABS module. REFER to Section 206-09 . CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test D: The Restraints Control Module (RCM) Does Not Respond To The Scan Tool

Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.

Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

Normal Operation

The Restraints Control Module (RCM) communicates with the scan tool through the High Speed Controller Area Network (HS-CAN). Circuits VDB04 (WH/BU) (HS-CAN +) and VDB05 (WH) (HS-CAN -) provide the network connection to the RCM . Voltage for the RCM is provided by circuit CBP17 (BN/GN), and the RCM is case grounded.

This pinpoint test is intended to diagnose the following:

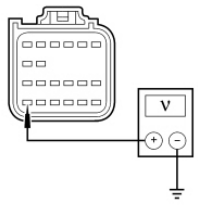
- Fuse
- Wiring, terminals or connectors

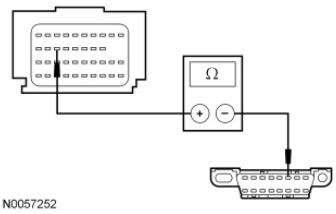
- Case ground open
- RCM

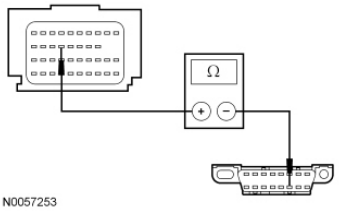
PINPOINT TEST D: THE RCM DOES NOT RESPOND TO THE SCAN TOOL

⚠ WARNING: Never probe the electrical connectors on air bag, Safety Canopy® or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

⚠ WARNING: Never disassemble or tamper with seat belt deployable components, including pretensioners, load limiters and inflators. Never back probe deployable device electrical connectors. Tampering or back probing may cause an accidental deployment and result in personal injury or death.







NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
D1 CHECK THE RCM CONNECTION	
• Ignition OFF. • Depower the SRS . Refer to Section 501-20B . • Disconnect: RCM C310a. • Disconnect: RCM C310b. • **Are RCM C310a pin 24 and RCM C310b pins 17 and 18 OK?**	**Yes** GO to D2 . **No** REPAIR the RCM connector pins as necessary. REPOWER the SRS . REFER to Section 501-20B . CLEAR the DTCs. REPEAT the network test with the scan tool.
D2 CHECK THE RCM VOLTAGE SUPPLY CIRCUIT FOR AN OPEN	
• Deactivate the SRS . Refer to Section 501-20B . • Repower the SRS . Refer to Section 501-20B . • Ignition ON. • Measure the voltage between the RCM C310a-24, circuit CBP17 (BN/GN), harness side and ground.	**Yes** GO to D3 . **No** VERIFY the Smart Junction Box (SJB) fuse 17 (10A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short. REACTIVATE the SRS . REFER to Section 501-20B . CLEAR the DTCs. REPEAT the network test with the scan tool.

 N0037003 • **Is the voltage greater than 10 volts?**	
D3 CHECK THE RCM CASE GROUND	
• Ignition OFF. • Disconnect: Negative Battery Cable. • Measure the resistance between the RCM case and a good chassis ground. • **Is the resistance less than 5 ohms?**	**Yes** GO to D4 . **No** REPAIR the RCM case ground as necessary. CONNECT the negative battery cable. REACTIVATE the SRS . REFER to Section 501-20B . CLEAR the DTCs. REPEAT the network test with the scan tool.
D4 CHECK THE HS-CAN CIRCUITS BETWEEN THE RCM AND THE DLC FOR AN OPEN	
• Measure the resistance between the RCM C310b-18, circuit VDB04 (WH/BU), harness side and the DLC C251-6, circuit VDB04 (WH/BU), harness side.  N0057252 • Measure the resistance between the RCM C310b-17, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0057253 • **Are the resistances less than 5 ohms?**	**Yes** CONNECT the negative battery cable. GO to D5 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. REACTIVATE the SRS . REFER to Section 501-20B . CLEAR the DTCs. REPEAT the network test with the scan tool.
D5 CHECK FOR CORRECT RCM OPERATION	

• Disconnect all the RCM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the RCM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new RCM . REACTIVATE the SRS . REFER to Section 501-20B . CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. REACTIVATE the SRS . REFER to Section 501-20B . CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test E: The 4X4 Control Module Does Not Respond To The Scan Tool

Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.

Refer to Wiring Diagrams Cell 34 , Four Wheel Drive Systems for schematic and connector information.

Normal Operation

The 4X4 control module communicates with the scan tool through the High Speed Controller Area Network (HS-CAN). Circuits VDB04 (WH/BU) (HS-CAN +) and VDB05 (WH) (HS-CAN -) provide the network connection to the 4X4 control module. Voltage is supplied by circuits CBP18 (GY/OG), SBB23 (RD/WH) and SBB26 (RD/BK). Ground is supplied by circuits GD138 (BK/WH) and GD145 (BK/BU).

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- 4X4 control module

PINPOINT TEST E: THE 4X4 CONTROL MODULE DOES NOT RESPOND TO THE SCAN TOOL

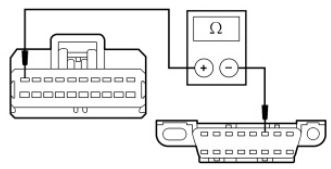
NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
E1 CHECK THE 4X4 CONTROL MODULE VOLTAGE SUPPLY CIRCUITS FOR AN OPEN	
• Ignition OFF. • Disconnect: 4X4 Control Module C281a. • Disconnect: 4X4 Control Module C281b. • Ignition ON. • Measure the voltage between the 4X4 control module, harness side and ground as follows:	**Yes** GO to E2 . **No** VERIFY the Battery Junction Box (BJB) fuse 23 (20A) or fuse 26 (20A) is OK and the Smart Junction Box (SJB) fuse 18 (10A) is OK. If OK, REPAIR the circuit in question. If not OK,

	REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the network test with the scan tool.

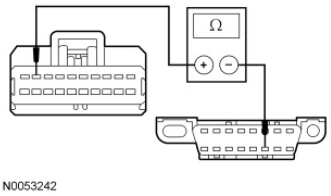
Connector-Pin	Circuit
C281a-8	CBP18 (GY/OG)
C281b-6	SBB23 (WH/RD)
C281b-7	SBB26 (YE/RD)



- **Are the voltages greater than 10 volts?**

E2 CHECK THE 4X4 CONTROL MODULE GROUND CIRCUITS FOR AN OPEN	
• Ignition OFF. • Disconnect: Negative Battery Cable. • Measure the resistance between the 4X4 control module, harness side and ground as follows:	**Yes** GO to E3 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

Connector-Pin	Circuit
C281b-3	GD145 (BK/BU)
C281b-10	GD138 (BK/WH)



- **Are the resistances less than 5 ohms?**

E3 CHECK THE HS-CAN CIRCUITS BETWEEN THE 4X4 CONTROL MODULE AND THE DLC FOR AN OPEN	
• Measure the resistance between the 4X4 control module C281a-10, circuit VDB04 (WH/BU), harness side and the DLC C251-6, circuit VDB04 (WH/BU), harness side.	**Yes** CONNECT the negative battery cable. GO to E4 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

N0053241

- Measure the resistance between the 4X4 control module C281a-9, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.

 N0053242 • **Are the resistances less than 5 ohms?**	
E4 CHECK FOR CORRECT 4X4 CONTROL MODULE OPERATION	
• Disconnect all the 4X4 control module connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the 4X4 control module connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new 4X4 control module. REFER to Section 308-07A . CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test F: The Occupant Classification System Module (OCSM) Does Not Respond To The Scan Tool

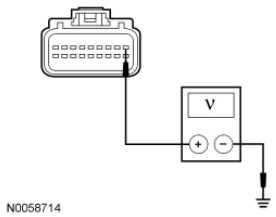
Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.

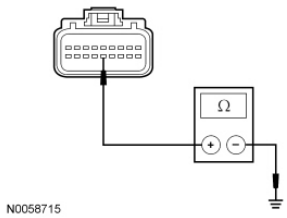
Refer to Wiring Diagrams Cell 46 , Supplemental Restraint System for schematic and connector information.

Normal Operation

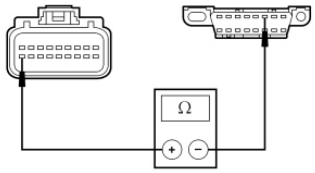
The Occupant Classification System Module (OCSM) communicates with the scan tool through the High Speed Controller Area Network (HS-CAN). Circuits VDB04 (WH/BU) (HS-CAN +) and VDB05 (WH) (HS-CAN -) provide the network connection to the OCSM . Voltage to the OCSM is supplied by circuit CBP17 (BN/GN). Ground is supplied by circuit GD145 (BK/BU).

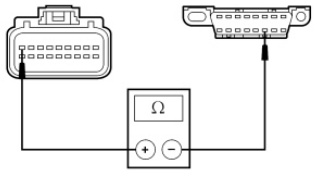
This pinpoint test is intended to diagnose the following:





- Fuse
- Wiring, terminals or connectors
- OCSM





PINPOINT TEST F: THE OCSM DOES NOT RESPOND TO THE SCAN TOOL

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

Test Step	Result / Action to Take
F1 CHECK THE OCSM VOLTAGE SUPPLY CIRCUIT FOR AN OPEN	
⚠ WARNING: Never disassemble or tamper with seat belt deployable components, including pretensioners, load limiters and inflators. Never back probe deployable device electrical connectors. Tampering or back probing may cause an accidental deployment and result in personal injury or death. **NOTE:** The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer. • Ignition OFF. • Depower the SRS . Refer to Section 501-20B . • Disconnect: OCSM C3159. • Deactivate the SRS . Refer to Section 501-20B . • Repower the SRS . Refer to Section 501-20B . • Ignition ON. • Measure the voltage between the OCSM C3159-1, circuit CBP17 (BN/GN), harness side and ground.  N0058714 • **Is the voltage greater than 10 volts?**	**Yes** GO to F2 . **No** VERIFY the Smart Junction Box (SJB) fuse 17 (10A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short. REACTIVATE the SRS . REFER to Section 501-20B . CLEAR the DTCs. REPEAT the network test with the scan tool.
F2 CHECK THE OCSM GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: Negative Battery Cable. • Measure the resistance between the OCSM C3159-14, circuit GD145 (BK/BU), harness side and ground.  N0058715	**Yes** GO to F3 . **No** REPAIR the circuit. CONNECT the negative battery cable. REACTIVATE the SRS . REFER to Section 501-20B . CLEAR the DTCs. REPEAT the network test with the scan tool.

• **Is the resistance less than 5 ohms?**	
F3 CHECK THE HS-CAN CIRCUITS BETWEEN THE OCSM AND THE DLC FOR AN OPEN	
• Measure the resistance between the OCSM C3159-18, circuit VDB04 (WH/BU), harness side and the DLC C251-6, circuit VDB04 (WH/BU), harness side.  N0026670 • Measure the resistance between the OCSM C3159-9, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0026671 • **Are the resistances less than 5 ohms?**	**Yes** CONNECT the negative battery cable. GO to F4 . **No** REPAIR the circuit. REACTIVATE the SRS . REFER to Section 501-20B . CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
F4 CHECK FOR CORRECT OCSM OPERATION	
• Disconnect the OCSM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the OCSM connector and make sure it seats correctly. • Verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new OCSM . REACTIVATE the SRS . REFER to Section 501-20B . CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. REACTIVATE the SRS . REFER to Section 501-20B . CLEAR the DTCs. REPEAT the network test with the scan tool.

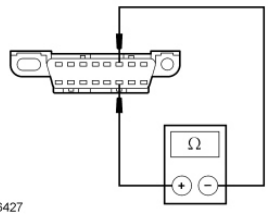
Pinpoint Test G: The Instrument Cluster (IC) Does Not Respond To The Scan Tool

Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.

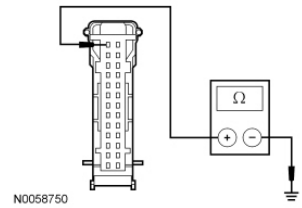
Refer to Wiring Diagrams Cell 60 , Instrument Cluster for schematic and connector information.

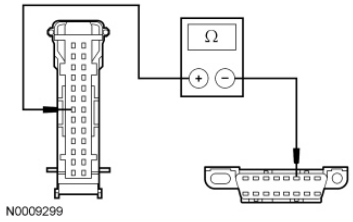
Normal Operation

The Instrument Cluster (IC) communicates with the scan tool through the High Speed Controller Area Network (HS-CAN). Circuits VDB04 (WH/BU) (HS-CAN +) and VDB05 (WH) (HS-CAN -) provide the HS-CAN connection to the IC and circuits VDB06 (GY/OG) (MS-CAN +) and VDB07 (VT/OG) (MS-CAN -) provide the MS-CAN connection to the IC . Voltage for the IC is provided by circuits CDC34 (WH/OG) and SBP24 (VT/RD). Circuit GD145 (BK/BU) provides ground.

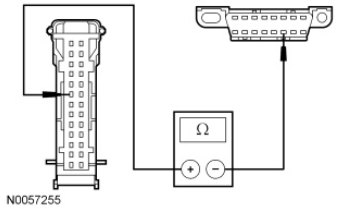


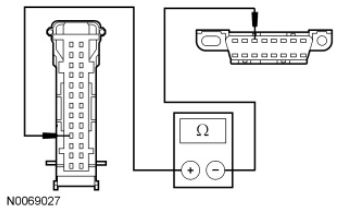
This pinpoint test is intended to diagnose the following:

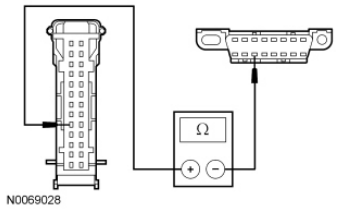




- Fuse
- Wiring, terminals or connectors
- IC







PINPOINT TEST G: THE IC DOES NOT RESPOND TO THE SCAN TOOL

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
G1 CHECK THE HS-CAN TERMINATION RESISTANCE	
• Ignition OFF. • Disconnect: Negative Battery Cable. • Disconnect the scan tool cable from the Data Link Connector (DLC). • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  • **Is the resistance between 54 and 66 ohms?**	**Yes** GO to G2 . **No** GO to G4 .
G2 CHECK THE IC GROUND CIRCUIT FOR AN OPEN	

• Measure the resistance between the IC C220-13, circuit GD145 (BK/BU), harness side and ground.  • **Is the resistance less than 5 ohms?**	**Yes** CONNECT the negative battery cable. GO to G3 . **No** REPAIR the circuit. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
G3 CHECK THE IC VOLTAGE SUPPLY CIRCUITS FOR AN OPEN	
• Disconnect: IC C220. • Ignition ON. • Measure the voltage between the IC , harness side and ground as follows: **IC Connector-Pin** / **Circuit** C220-1 / SBP24 (VT/RD) C220-2 / CDC34 (WH/OG) • **Are the voltages greater than 10 volts?**	**Yes** GO to G5 . **No** VERIFY the Smart Junction Box (SJB) fuse 8 (15A) or fuse 24 (10A) is OK. If OK, REPAIR the circuit in question. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the network test with the scan tool.
G4 CHECK THE HS-CAN CIRCUITS BETWEEN THE IC AND THE DLC FOR AN OPEN	
• Measure the resistance between the IC C220-7, circuit VDB04 (WH/BU), harness side and the DLC C251-6, circuit VDB04 (WH/BU), harness side.  • Measure the resistance between the IC C220-8, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.	**Yes** GO to G5 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

 • **Are the resistances less than 5 ohms?**	
G5 CHECK THE MS-CAN CIRCUITS BETWEEN THE IC AND THE DLC FOR AN OPEN	
• Measure the resistance between the IC C220-4, circuit VDB06 (GY/OG), harness side and the DLC C251-3, circuit VDB06 (GY/OG), harness side.  • Measure the resistance between the IC C220-5, circuit VDB07 (VT/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  • **Are the resistances less than 5 ohms?**	**Yes** CONNECT the negative battery cable. GO to G6 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
G6 CHECK FOR CORRECT IC OPERATION	
• Disconnect the IC connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the IC connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new IC . REFER to Section 413-01 . CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

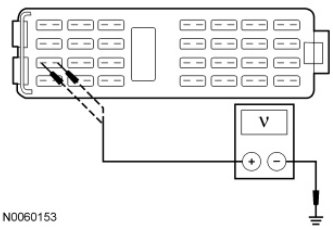
Pinpoint Test H: The Smart Junction Box (SJB) Does Not Respond To The Scan Tool

Refer to Wiring Diagrams Cell 10 , Grounds for schematic and connector information.

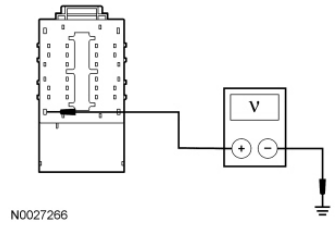
Refer to Wiring Diagrams Cell 13 , Power Distribution/SJB for schematic and connector information.

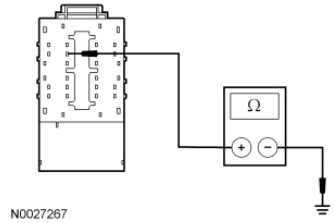
Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.

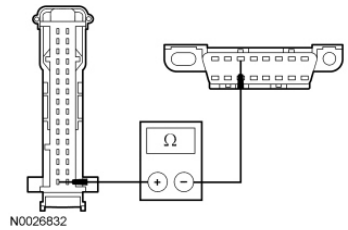
Normal Operation



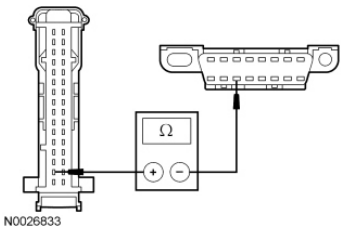
The Smart Junction Box (SJB) communicates with the scan tool through the Medium Speed Controller Area Network (MS-CAN). Circuits VDB06 (GY/OG) (MS-CAN +) and VDB07 (VT/OG) (MS-CAN -) provide the network connection to the SJB . Voltage for the SJB is provided by circuit SBB03 (BU/RD). Circuit GD108 (BK/VT) provides ground.







This pinpoint test is intended to diagnose the following:



- Fuse
- Wiring, terminals or connectors
- SJB

PINPOINT TEST H: THE SJB DOES NOT RESPOND TO THE SCAN TOOL

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
H1 CHECK THE SJB FUSE FOR VOLTAGE	
• Ignition OFF. • **NOTE:** Measurements are taken with the fuses installed. • Measure the voltage between the SJB fuse 2 (5A) and ground.  • **Are the voltages greater than 10 volts?**	**Yes** GO to H3 . **No** VERIFY the Smart Junction Box (SJB) fuse 2 (5A) is OK. If OK, GO to H2 . If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the network test with the scan tool.
H2 CHECK THE SJB VOLTAGE SUPPLY CIRCUIT FOR AN OPEN	

• Disconnect: SJB C2280e. • Measure the voltage between the SJB C2280e-1, circuit SBB03 (BU/RD), harness side and ground.  N0027266 • **Is the voltage greater than 10 volts?**	**Yes** GO to H5 . **No** VERIFY the Battery Junction Box (BJB) fuse 3 (50A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the network test with the scan tool.
H3 CHECK THE SJB GROUND CIRCUIT FOR AN OPEN	
• Disconnect: Negative Battery Cable. • Disconnect: SJB C2280e. • Measure the resistance between the SJB C2280e-22, circuit GD108 (BK/VT), harness side and ground.  N0027267 • **Is the resistance less than 5 ohms?**	**Yes** GO to H4 . **No** REPAIR the circuit. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
H4 CHECK THE MEDIUM SPEED CAN CIRCUITS BETWEEN THE SJB AND THE DLC FOR AN OPEN	
• Disconnect: SJB C2280d. • Measure the resistance between the SJB C2280d-16, circuit VDB06 (GY/OG), harness side and the DLC C251-3, circuit VDB06 (GY/OG), harness side.  N0026832 • Measure the resistance between the SJB C2280d-15, circuit VDB07 (VT/OG),	**Yes** CONNECT the negative battery cable. GO to H5 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  • **Are the resistances less than 5 ohms?**	
H5 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

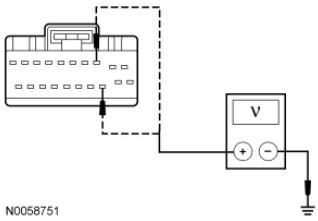
Pinpoint Test I: The HVAC Module Does Not Respond To The Scan Tool

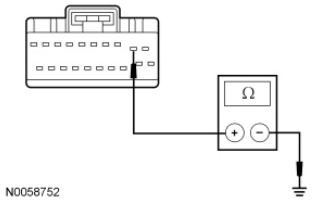
Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.

Refer to Wiring Diagrams Cell 55 , Automatic Climate Control System for schematic and connector information.

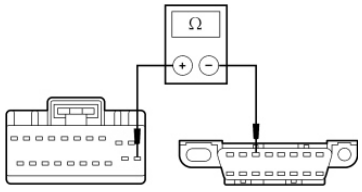
Normal Operation

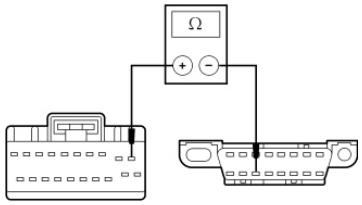
The HVAC module communicates with the scan tool through the Medium Speed Controller Area Network (MS-CAN). Circuits VDB06 (GY/OG) (MS-CAN +) and VDB07 (VT/OG) (MS-CAN -) provide the network connection to the HVAC module. Voltage for the HVAC module is provided by circuits CBP20 (YE/VT) and SBP28 (GN/RD). Circuit GD145 (BK/BU) provides ground.





This pinpoint test is intended to diagnose the following:





- Fuse
- Wiring, terminals or connectors
- HVAC module

PINPOINT TEST I: THE HVAC MODULE DOES NOT RESPOND TO THE SCAN TOOL

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
I1 CHECK THE HVAC MODULE VOLTAGE SUPPLY CIRCUITS FOR AN OPEN	
• Ignition OFF. • Disconnect: HVAC Module C228a. • Ignition ON. • Measure the voltage between the HVAC module C228a-13, circuit SBP28 (GN/RD), and between the HVAC module C228a-3, circuit CBP20 (YE/VT) and ground.  • **Are the voltages greater than 10 volts?**	**Yes** GO to I2 . **No** VERIFY the Smart Junction Box (SJB) fuse 20 (10A) or fuse 28 (10A) is OK. If OK, REPAIR the circuit in question. CLEAR the DTCs. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short. REPEAT the network test with the scan tool.
I2 CHECK THE HVAC GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: Negative Battery Cable. • Measure the resistance between the HVAC module C228a-2, circuit GD145 (BK/BU) and ground.  • **Is the resistance less than 5 ohms?**	**Yes** GO to I3 . **No** REPAIR the circuit. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
I3 CHECK THE MS-CAN CIRCUITS BETWEEN THE HVAC MODULE AND THE DLC FOR AN OPEN	
• Measure the resistance between the HVAC module C228a-11, circuit VDB06 (GY/OG), harness side and the DLC C251-3, circuit VDB06 (GY/OG), harness side.	**Yes** CONNECT the negative battery cable. GO to I4 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs.

 N0026826 • Measure the resistance between the HVAC module C228a-1, circuit VDB07 (VT/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0026827 • **Are the resistances less than 5 ohms?**	REPEAT the network test with the scan tool.
I4 CHECK FOR CORRECT HVAC MODULE OPERATION	
• Disconnect all the HVAC module connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the HVAC module connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new HVAC module. REFER to Section 412-01 . CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test J: The Audio Front Control Module (ACM) Does Not Respond To The Scan Tool

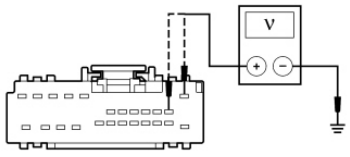
Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.

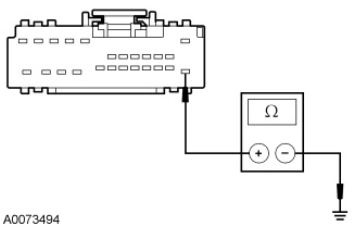
Refer to Wiring Diagrams Cell 130 , Audio System/Navigation for schematic and connector information.

Normal Operation

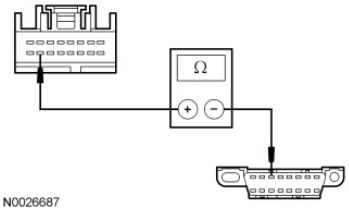
Circuits VDB06 (GY/OG) (MS-CAN +) and VDB07 (VT/OG) (MS-CAN -) provide the network connection to the Audio Front Control Module (ACM). Voltage for the ACM is provided by circuits CBP12 (GN/WH) and SBP03 (BU/RD). Circuit GD114 (BK/BU) provides ground.

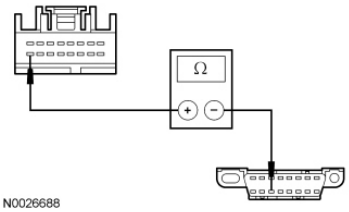
This pinpoint test is intended to diagnose the following:





- Fuse





- Wiring, terminals or connectors
- ACM

PINPOINT TEST J: THE ACM DOES NOT RESPOND TO THE SCAN TOOL

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
J1 CHECK THE ACM VOLTAGE SUPPLY CIRCUITS FOR AN OPEN	
• Ignition OFF. • Disconnect: ACM C290a. • Ignition ON. • Measure the voltage between the ACM C290a-1, circuit SBP03 (BU/RD), harness side and ground; and between the ACM C290a-2, circuit CBP12 (GN/WH), harness side and ground.  A0073493 • **Are the voltages greater than 10 volts?**	**Yes** GO to J2 . **No** VERIFY the Smart Junction Box (SJB) fuse 3 (20A) or fuse 12 (5A) is OK. If OK, REPAIR the circuit in question. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the network test with the scan tool.
J2 CHECK THE ACM GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: Negative Battery Cable. • Measure the resistance between the ACM C290a-13, circuit GD114 (BK/BU), harness side and ground.  A0073494 • **Is the resistance less than 5 ohms?**	**Yes** GO to J3 . **No** REPAIR the circuit. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

J3 CHECK THE MS-CAN CIRCUITS BETWEEN THE ACM AND THE DLC FOR AN OPEN	
• Measure the resistance between the ACM C290b-15, circuit VDB06 (GY/OG), harness side and the DLC C251-3, circuit VDB06 (GY/OG), harness side.  N0026687 • Measure the resistance between the base ACM C290b-16, circuit VDB07 (VT/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0026688 • **Are the resistances less than 5 ohms?**	**Yes** CONNECT the negative battery cable. GO to J4 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
J4 CHECK FOR CORRECT ACM OPERATION	
• Disconnect all the ACM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the ACM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ACM . REFER to Section 415-00 . CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

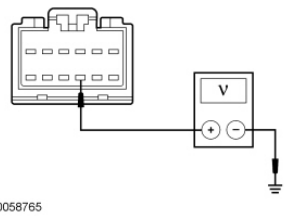
Pinpoint Test K: The Satellite Digital Audio Receiver System (SDARS) Module Does Not Respond To The Scan Tool

Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.

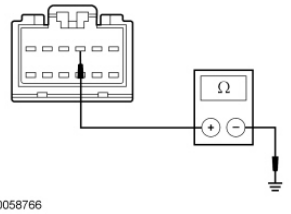
Refer to Wiring Diagrams Cell 130 , Audio System/Navigation for schematic and connector information.

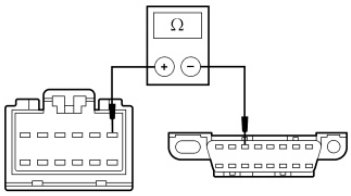
Normal Operation

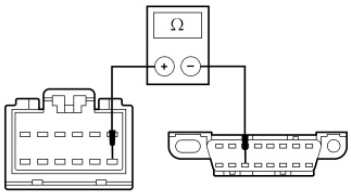
The Satellite Digital Audio Receiver System (SDARS) module communicates with the scan tool through the Medium Speed Controller Area Network (MS-CAN). Circuits VDB06 (GY/OG) (MS-CAN +) and VDB07 (VT/OG) (MS-CAN -) provide the network connection to the SDARS module. Voltage for the SDARS module is provided by circuit SBB41 (RD). Circuit GD114 (BK/BU) provides ground.



This pinpoint test is intended to diagnose the following:







- Fuse
- Wiring, terminals or connectors
- SDARS module

PINPOINT TEST K: THE SDARS MODULE DOES NOT RESPOND TO THE SCAN TOOL

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
K1 CHECK THE SDARS MODULE VOLTAGE SUPPLY CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: SDARS Module C3290. • Ignition ON. • Measure the voltage between the SDARS module C3290-9, circuit SBB41 (RD), harness side and ground.  • **Is the voltage greater than 10 volts?**	**Yes** GO to K2 . **No** VERIFY the Battery Junction Box (BJB) fuse 41 (15A) is OK. If OK, REPAIR the circuit in question. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the network test with the scan tool.
K2 CHECK THE SDARS MODULE GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: Negative Battery Cable. • Measure the resistance between the SDARS module C3290-3, circuit GD114 (BK/BU), harness side and ground.	**Yes** GO to K3 . **No** REPAIR the circuit. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

 N0058766 • **Is the resistance less than 5 ohms?**	
K3 CHECK THE MS-CAN CIRCUITS BETWEEN THE SDARS MODULE AND THE DLC FOR AN OPEN	
• Measure the resistance between the SDARS module C3290-1, circuit VDB06 (GY/OG), harness side and the DLC C251-3, circuit VDB06 (GY/OG), harness side.  N0026834 • Measure the resistance between the SDARS module C3290-7, circuit VDB07 (VT/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0026835 • **Are the resistances less than 5 ohms?**	**Yes** CONNECT the negative battery cable. GO to K4 . **No** REPAIR the circuit. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
K4 CHECK FOR CORRECT SDARS MODULE OPERATION	
• Disconnect the SDARS module connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the SDARS module connector and make sure it seats correctly. • Operate the system and verify the concern is still present.	**Yes** INSTALL a new SDARS module. REFER to Section 415-00 . CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

• **Is the concern still present?**	

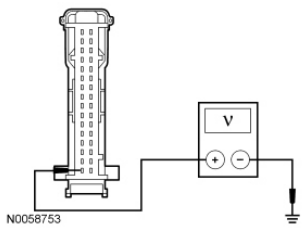
Pinpoint Test L: The Rear Entertainment Module (RETM) Does Not Respond To The Scan Tool

Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.

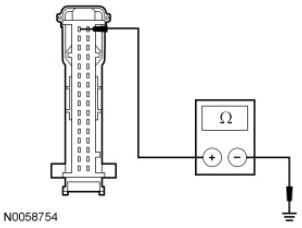
Refer to Wiring Diagrams Cell 130 , Audio System/Navigation for schematic and connector information.

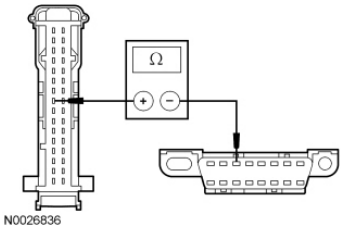
Normal Operation

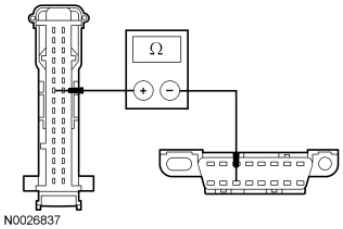
The Rear Entertainment Module (RETM) communicates with the scan tool through the Medium Speed Controller Area Network (MS-CAN). Circuits VDB06 (GY/OG) (MS-CAN +) and VDB07 (VT/OG) (MS-CAN -) provide the network connection to the RETM . The RETM is only on vehicles equipped with rear seat entertainment. Voltage for the RETM is provided by circuit SBB41 (RD). Circuit GD114 (BK/BU) provides ground.



This pinpoint test is intended to diagnose the following:







- Fuse
- Wiring, terminals or connectors
- RETM

PINPOINT TEST L: THE RETM DOES NOT RESPOND TO THE SCAN TOOL

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
L1 CHECK THE RETM VOLTAGE SUPPLY CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: RETM C9029. • Ignition ON. • Measure the voltage between the RETM C9029-16, circuit SBB41 (RD), harness side and ground.  	**Yes** GO to L2 . **No** VERIFY the Battery Junction Box (BJB) fuse 41 (15A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the network test with the scan tool.

• **Is the voltage greater than 10 volts?**	
L2 CHECK THE RETM GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: Negative Battery Cable. • Measure the resistance between the RETM C9029-1, circuit GD114 (BK/BU), harness side and ground.  • **Is the resistance less than 5 ohms?**	**Yes** GO to L3 . **No** REPAIR the circuit. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
L3 CHECK THE MS-CAN CIRCUITS BETWEEN THE RETM AND THE DLC FOR AN OPEN	
• Measure the resistance between the RETM C9029-8, circuit VDB06 (GY/OG), harness side and the DLC C251-3, circuit VDB06 (GY/OG), harness side.  • Measure the resistance between the RETM C9029-7, circuit VDB07 (VT/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  • **Are the resistances less than 5 ohms?**	**Yes** CONNECT the negative battery cable. GO to L4 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
L4 CHECK FOR CORRECT RETM OPERATION	
• Disconnect the RETM connector.	**Yes** INSTALL a new RETM . REFER to Section

• Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the RETM connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	415-00 . CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test M: The Driver Seat Module (DSM) Does Not Respond To The Scan Tool

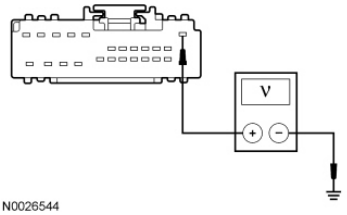
Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.

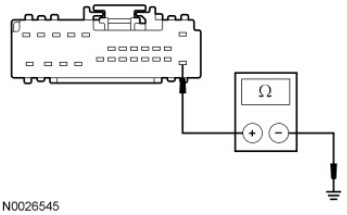
Refer to Wiring Diagrams Cell 123 , Memory Seats for schematic and connector information.

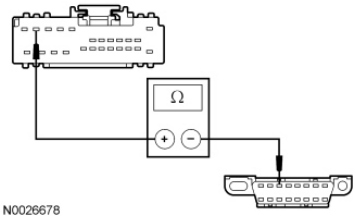
Normal Operation

The Driver Seat Module (DSM) communicates with the scan tool through the Medium Speed Controller Area Network (MS-CAN). Circuits VDB06 (GY/OG) (MS-CAN +) and VDB07 (VT/OG) (MS-CAN -) provide the network connection to the DSM . Voltage for the DSM is provided by circuit SBP01 (RD). Circuit GD143 (BK/OG) provides ground.

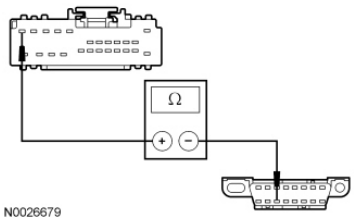
This pinpoint test is intended to diagnose the following:







- Fuse
- Wiring, terminals or connectors
- DSM



PINPOINT TEST M: THE DSM DOES NOT RESPOND TO THE SCAN TOOL

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
M1 CHECK THE DSM VOLTAGE SUPPLY CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: DSM C341c. • Ignition ON. • Measure the voltage between the DSM C341c-1, circuit SBP01 (RD), harness side and ground.	**Yes** GO to M2 . **No** VERIFY the Smart Junction Box (SJB) fuse 1 (20A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the network test with the scan tool.

 N0026544 • **Is the voltage greater than 10 volts?**	
M2 CHECK THE DSM GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: Negative Battery Cable. • Measure the resistance between the DSM C341c-13, circuit GD143 (BK/OG), harness side and ground.  N0026545 • **Is the resistance less than 5 ohms?**	**Yes** GO to M3 . **No** REPAIR the circuit. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
M3 CHECK THE MS-CAN CIRCUITS BETWEEN THE DLC AND THE DSM FOR AN OPEN	
• Measure the resistance between the DSM C341c-11, circuit VDB06 (GY/OG), harness side and the DLC C251-3, circuit VDB06 (GY/OG), harness side.  N0026678 • Measure the resistance between the DSM C341c-12, circuit VDB07 (VT/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.	**Yes** CONNECT the negative battery cable. GO to M4 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

 • **Are the resistances less than 5 ohms?**	
M4 CHECK FOR CORRECT DSM OPERATION	
• Disconnect all the DSM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the DSM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new DSM . REFER to Section 419-10 . CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

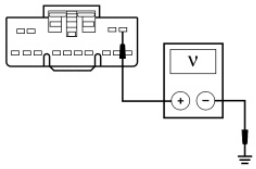
Pinpoint Test N: The Power Running Board Module Does Not Respond To The Scan Tool

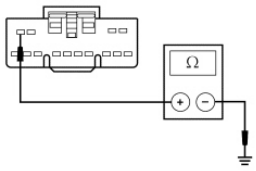
Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.

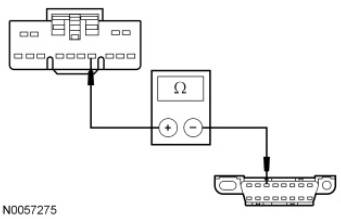
Normal Operation

The Power Running Board (PRB) module communicates with the scan tool through the Medium Speed Controller Area Network (MS-CAN). Circuits VDB06 (GY/OG) (MS-CAN +) and VDB07 (VT/OG) (MS-CAN -) provide the network connection to the PRB module. Voltage for the PRB module is provided by circuit SBB19 (BU/RD). Circuit GD151 (BK/GN) provides ground.

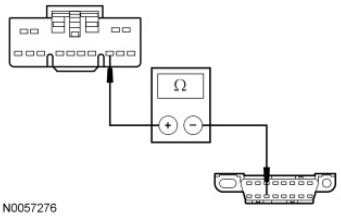
This pinpoint test is intended to diagnose the following:







- Fuse
- Wiring, terminals or connectors
- PRB module



PINPOINT TEST N: THE PRB MODULE DOES NOT RESPOND TO THE SCAN TOOL

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
N1 CHECK THE PRB MODULE VOLTAGE SUPPLY CIRCUIT FOR AN OPEN	

• Ignition OFF. • Disconnect: PRB Module C4322b. • Ignition ON. • Measure the voltage between the PRB module C4322b-1, circuit SBB19 (BU/RD), harness side and ground.  N0057277 • **Is the voltage greater than 10 volts?**	**Yes** GO to N2 . **No** VERIFY the Battery Junction Box (BJB) fuse 19 (30A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the network test with the scan tool.
N2 CHECK THE PRB MODULE GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: Negative Battery Cable. • Measure the resistance between the PRB module C4322b-4, circuit GD151 (BK/GN), harness side and ground.  N0057278 • **Is the resistance less than 5 ohms?**	**Yes** GO to N3 . **No** REPAIR the circuit. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
N3 CHECK THE MS-CAN CIRCUITS BETWEEN THE PRB MODULE AND THE DLC FOR AN OPEN	
• Measure the resistance between the PRB module C4322b-8, circuit VDB06 (GY/OG), harness side and the DLC C251-3, circuit VDB06 (GY/OG), harness side.  N0057275	**Yes** CONNECT the negative battery cable. GO to N4 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

• Measure the resistance between the PRB module C4322b-7, circuit VDB07 (VT/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  • **Are the resistances less than 5 ohms?**	
N4 CHECK FOR CORRECT PRB MODULE OPERATION	
• Disconnect all the PRB module connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the PRB module connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PRB module. REFER to Section 501-08 . CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

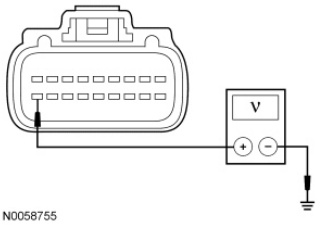
Pinpoint Test O: The Parking Aid Module (PAM) Does Not Respond To The Scan Tool

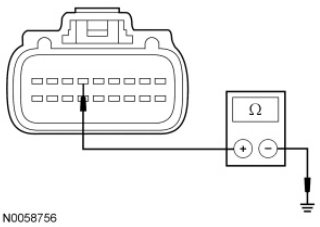
Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.

Refer to Wiring Diagrams Cell 131 , Parking Aid for schematic and connector information.

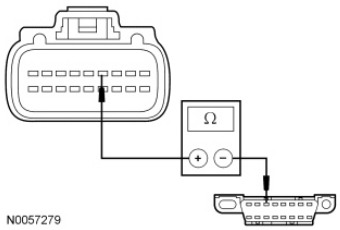
Normal Operation

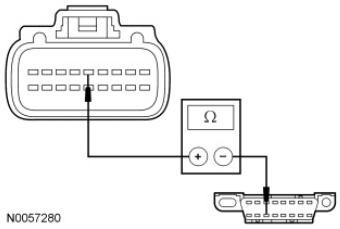
The Parking Aid Module (PAM) communicates with the scan tool through the Medium Speed Controller Area Network (MS-CAN). Circuits VDB06 (GY/OG) (MS-CAN +) and VDB07 (VT/OG) (MS-CAN -) provide the network connection to the PAM . Voltage for the PAM is provided by circuit CBP18 (GY/OG). Circuit GD145 (BK/BU) provides ground.

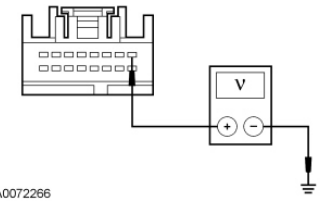




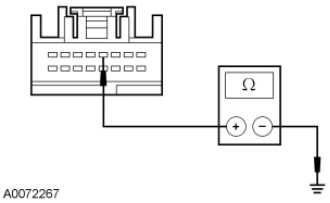
This pinpoint test is intended to diagnose the following:

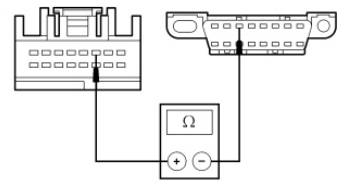


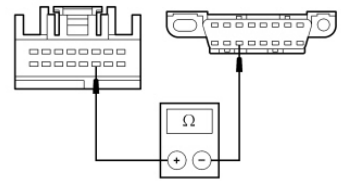




- Fuse
- Wiring, terminals or connectors
- PAM







PINPOINT TEST O: THE PAM DOES NOT RESPOND TO THE SCAN TOOL

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
O1 VERIFY PARKING AID SYSTEM TYPE	
• **NOTE:** The Explorer uses a radar parking aid system while the Mountaineer and Explorer Sport Trac use an ultrasonic system. • Verify the parking aid system. • **Is the vehicle equipped with a RADAR parking aid system?**	**Yes** GO to O2 . **No** GO to O5 .
O2 CHECK THE PAM VOLTAGE SUPPLY CIRCUIT FOR AN OPEN (RADAR)	
• Ignition OFF. • Disconnect: PAM C4226. • Ignition ON. • Measure the voltage between the PAM C4226-18, circuit CBP18 (GY/OG), harness side and ground.  N0058755 • **Is the voltage greater than 10 volts?**	**Yes** GO to O3 . **No** VERIFY the Smart Junction Box (SJB) fuse 18 (10A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the network test with the scan tool.
O3 CHECK THE PAM GROUND CIRCUIT FOR AN OPEN (RADAR)	
• Ignition OFF. • Disconnect: Negative Battery Cable. • Measure the resistance between the PAM C4226-6, circuit GD145 (BK/BU), harness side and ground.  N0058756 • **Is the resistance less than 5 ohms?**	**Yes** GO to O4 . **No** REPAIR the circuit. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

O4 CHECK THE MS-CAN CIRCUITS BETWEEN THE PAM AND THE DLC FOR AN OPEN (RADAR)	
• Measure the resistance between the PAM C4226-4, circuit VDB06 (GY/OG), harness side and the DLC C251-3, circuit VDB06 (GY/OG), harness side.  • Measure the resistance between the PAM C4226-5, circuit VDB07 (VT/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  • **Are the resistances less than 5 ohms?**	**Yes** CONNECT the negative battery cable. GO to O8 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
O5 CHECK THE PAM VOLTAGE SUPPLY CIRCUIT FOR AN OPEN (ULTRASONIC)	
• Ignition OFF. • Disconnect: PAM C4014 (Mountaineer) or C3267 (Explorer Sport Trac). • Ignition ON. • Measure the voltage between the PAM C4014-1 (Mountaineer) or C3267-1 (Explorer Sport Trac), circuit CBP18 (GY/OG), harness side and ground.  • **Is the voltage greater than 10 volts?**	**Yes** GO to O6 . **No** VERIFY the Smart Junction Box (SJB) fuse 18 (10A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the network test with the scan tool.
O6 CHECK THE PAM GROUND CIRCUIT FOR AN OPEN (ULTRASONIC)	

• Ignition OFF. • Disconnect: Negative Battery Cable. • Measure the resistance between the PAM C4014-4 (Mountaineer) or C3267-4 (Explorer Sport Trac), circuit GD145 (BK/BU), harness side and ground.  A0072267 • **Is the resistance less than 5 ohms?**	**Yes** GO to O7 . **No** REPAIR the circuit. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
O7 CHECK THE MS-CAN CIRCUITS BETWEEN THE PAM AND THE DLC FOR AN OPEN (ULTRASONIC)	
• Measure the resistance between the PAM C4014-3 (Mountaineer) or C3267-3 (Explorer Sport Trac), circuit VDB06 (GY/OG), harness side and the DLC C251-3, circuit VDB06 (GY/OG), harness side.  N0058843 • Measure the resistance between the PAM C4014-11 (Mountaineer) or C3267-11 (Explorer Sport Trac), circuit VDB07 (VT/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0058844 • **Are the resistances less than 5 ohms?**	**Yes** CONNECT the negative battery cable. GO to O8 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
O8 CHECK FOR CORRECT PAM OPERATION	
• Disconnect the PAM connector. • Check for: ♦ corrosion ♦ damaged pins	**Yes** INSTALL a new PAM . REFER to Section 413-13 . CLEAR the DTCs. REPEAT the network test with the scan tool.

♦ pushed-out pins • Connect the PAM connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

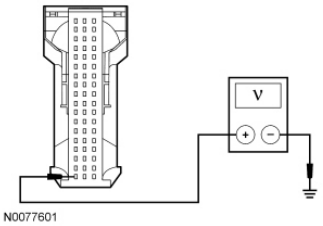
Pinpoint Test P: The Accessory Protocol Interface Module (APIM) Does Not Respond To The Scan Tool

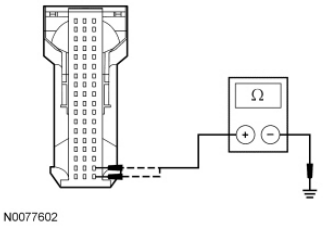
Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.

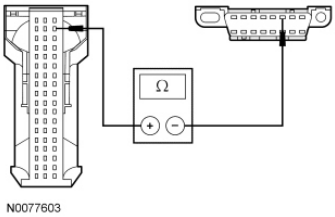
Normal Operation

The Accessory Protocol Interface Module (APIM) communicates with the scan tool through the High Speed Controller Area Network (HS-CAN). Circuits VDB04 (WH/BU) (HS-CAN +) and VDB05 (WH) (HS-CAN -) provide the HS-CAN connection to the APIM . Circuits VDB06 (GY/OG) (MS-CAN +) and VDB07 (VT/OG) (MS-CAN -) provide the MS-CAN connection to the APIM . Voltage for the APIM is provided by circuit SBB41 (RD). Circuit GD114 (BK/BU) provides ground.

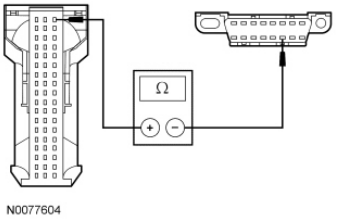
This pinpoint test is intended to diagnose the following:

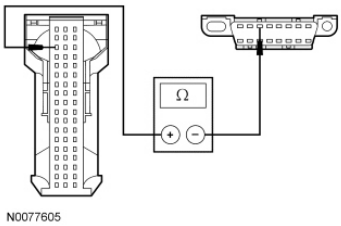


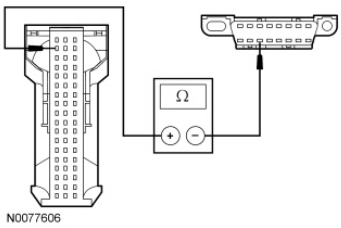




- Fuse
- Wiring, terminals or connectors
- APIM







PINPOINT TEST P: THE APIM DOES NOT RESPOND TO THE SCAN TOOL

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
P1 CHECK THE APIM VOLTAGE SUPPLY CIRCUIT FOR AN OPEN	
• Disconnect: APIM C3342. • Ignition ON. • Measure the voltage between the APIM C3342-1, circuit SBB41 (RD), harness side and ground.	**Yes** GO to P2 . **No** VERIFY the BJB fuse 41 (15A) is OK. If OK, REPAIR the circuit in question. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the network test with the scan tool.

 N0077601 • **Is the voltage greater than 10 volts?**	
P2 CHECK THE APIM GROUND CIRCUITS FOR AN OPEN	
• Ignition OFF. • Disconnect: Negative Battery Cable. • Measure the resistance between the APIM C3342-37, circuit GD114 (BK/BU), harness side and ground; and between the APIM C3342-38, circuit GD114 (BK/BU), harness side and ground.  N0077602 • **Are the resistances less than 5 ohms?**	**Yes** GO to P3 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
P3 CHECK THE HS-CAN CIRCUITS BETWEEN THE APIM AND THE DLC FOR AN OPEN	
• Measure the resistance between the APIM C3342-53, circuit VDB04 (WH/BU), harness side and the DLC C251-6, circuit VDB04 (WH/BU), harness side.  N0077603 • Measure the resistance between the APIM C3342-54, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.	**Yes** GO to P4 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

 N0077604 • **Are the resistances less than 5 ohms?**	
P4 CHECK THE MS-CAN CIRCUITS BETWEEN THE DLC AND THE APIM FOR AN OPEN	
• Measure the resistance between the APIM C3342-16, circuit VDB06 (GY/OG), harness side and the DLC C251-3, circuit VDB06 (GY/OG), harness side.  N0077605 • Measure the resistance between the APIM C3342-17, circuit VDB07 (VT/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0077606 • **Are the resistances less than 5 ohms?**	**Yes** CONNECT the negative battery cable. GO to P5 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
P5 CHECK FOR CORRECT APIM OPERATION	
• Disconnect all the APIM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the APIM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new APIM . REFER to Section 415-00 . CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

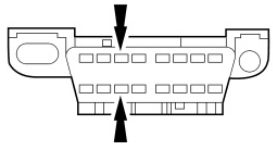
Pinpoint Test Q: No Medium Speed Controller Area Network (MS-CAN) Communication, All Modules Are Not Responding

Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.

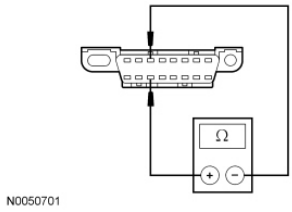
Normal Operation

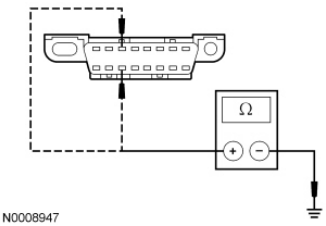
The Medium Speed Controller Area Network (MS-CAN) uses an unshielded twisted pair cable, circuits VDB06 (GY/OG) and VDB07 (VT/OG) provide the network connection to all modules on the network.

This pinpoint test is intended to diagnose the following:

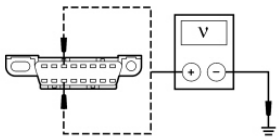


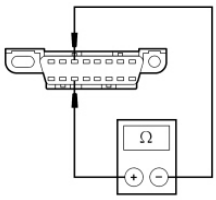
- Wiring, terminals or connectors
- Accessory Protocol Interface Module (APIM) (if equipped)
- Audio Front Control Module (ACM)
- Driver Seat Module (DSM) (if equipped)
- HVAC module (if equipped)
- Instrument Cluster (IC)
- Parking Aid Module (PAM) (if equipped)
- Power Running Board (PRB) module (if equipped)
- Rear Entertainment Module (RETM) (if equipped)
- Satellite Digital Audio Receiver System (SDARS) module (if equipped)
- Smart Junction Box (SJB)

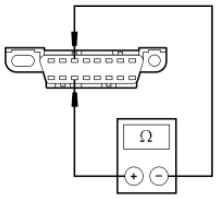




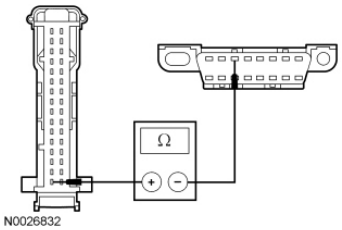
PINPOINT TEST Q: NO MS-CAN COMMUNICATION, ALL MODULES ARE NOT RESPONDING

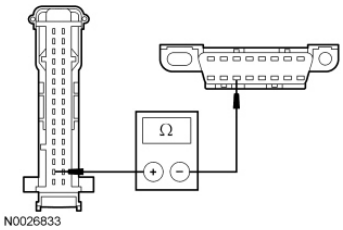


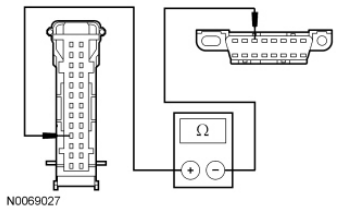


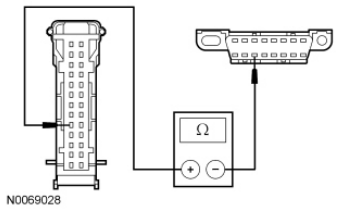


NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

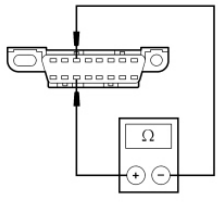


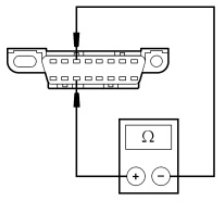


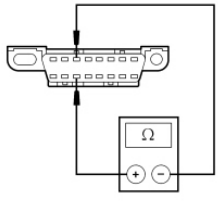




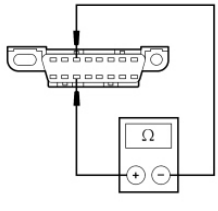
NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

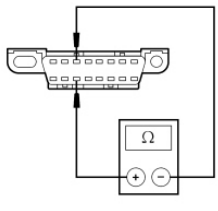




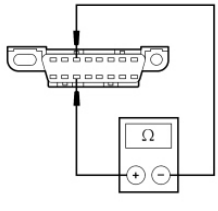


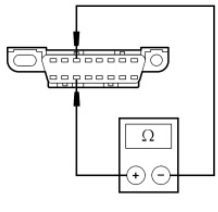
NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .





Test Step	Result / Action to Take
Q1 CHECK THE DLC PINS FOR DAMAGE	
• Ignition OFF. • Disconnect the scan tool cable from the Data Link Connector (DLC). • Inspect DLC pins 3 and 11 for damage.  N0053178	**Yes** GO to Q2 . **No** REPAIR the DLC as necessary. CLEAR the DTCs. REPEAT the network test with the scan tool.

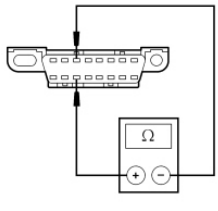


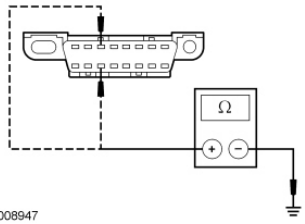


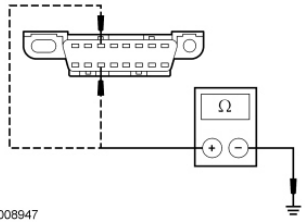
• **Are DLC pins 3 and 11 OK?**	
Q2 CHECK THE MS-CAN TERMINATION RESISTANCE	
• Disconnect: Negative Battery Cable. • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  • **Is the resistance between 54 and 66 ohms?**	**Yes** GO to Q3 . **No** GO to Q5 .
Q3 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TO GROUND	
• Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and ground; and between the DLC C251-11, circuit VDB07 (VT/OG), harness side and ground.  • **Are the resistances greater than 1,000 ohms?**	**Yes** GO to Q4 . **No** GO to Q28 .
Q4 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TO VOLTAGE	
• Connect: Negative Battery Cable. • Ignition ON. • Measure the voltage between the DLC C251-3, circuit VDB06 (GY/OG), harness side and ground; and between the DLC C251-11, circuit VDB07 (VT/OG), harness side and ground.	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The CAN has tested within specifications. GO to Pinpoint Test R to diagnose the intermittent MS-CAN fault.

 N0050702 • **Is the voltage greater than 6 volts?**	
Q5 CHECK THE MS-CAN TERMINATION RESISTOR	
• Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0050701 • **Is the resistance between 108 and 132 ohms?**	**Yes** GO to Q6 . **No** GO to Q9 .
Q6 CHECK THE MS-CAN TERMINATION RESISTOR WITH THE SJB DISCONNECTED	
• Disconnect: SJB C2280b. • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0050701 • **Is the resistance between 108 and 132 ohms?**	**Yes** GO to Q7 . **No** GO to Q8 .
Q7 CHECK THE MS-CAN CIRCUITS BETWEEN THE SJB AND THE DLC FOR AN OPEN	
• Measure the resistance between the SJB C2280d-16, circuit VDB06 (GY/OG), harness side and the DLC C251-3, circuit VDB06 (GY/OG), harness side.	**Yes** CONNECT the negative battery cable. GO to Q54 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

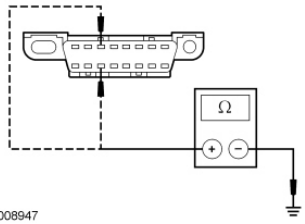
 N0026832 • Measure the resistance between the SJB C2280d-15, circuit VDB07 (VT/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0026833 • **Are the resistances less than 5 ohms?**	
Q8 CHECK THE MS-CAN CIRCUITS BETWEEN THE IC AND THE DLC FOR AN OPEN	
• Disconnect: IC C220. • Measure the resistance between the IC C220-4, circuit VDB06 (GY/OG), harness side and the DLC C251-3, circuit VDB06 (GY/OG), harness side.  N0069027 • Measure the resistance between the IC C220-5, circuit VDB07 (VT/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0069028 • **Are the resistances less than 5 ohms?**	**Yes** CONNECT the negative battery cable. GO to Q45 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
Q9 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TOGETHER	

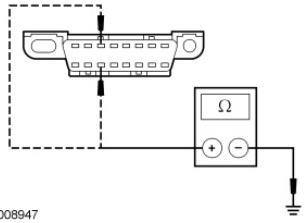




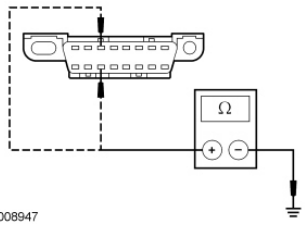


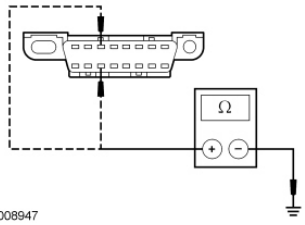
• Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0050701 • **Is the resistance less than 5 ohms?**	**Yes** GO to Q11 . **No** GO to Q10 .
Q10 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR AN OPEN	
• Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0050701 • **Is the resistance greater than 10,000 ohms?**	**Yes** REPAIR the DLC or REPAIR the circuit in question. CONNECT the negative battery cable. VERIFY the scan tool operation on a substitute vehicle. CLEAR the DTCs. REPEAT the network test on the suspect vehicle. **No** A capacitor internal to a module may still be draining causing irregular resistance readings. WAIT 5 minutes. REPEAT the pinpoint test.
Q11 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE IC DISCONNECTED	
• Disconnect: IC C220. • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0050701 • **Is the resistance less than 5 ohms?**	**Yes** GO to Q12 . **No** CONNECT the negative battery cable. GO to Q45 .
Q12 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE ACM DISCONNECTED	



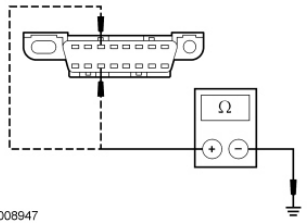


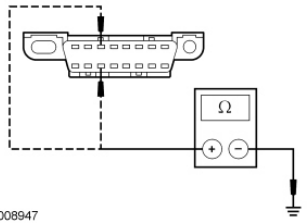
• Disconnect: ACM C290b. • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0050701 • **Is the resistance less than 5 ohms?**	**Yes** GO to Q13 . **No** CONNECT the negative battery cable. GO to Q46 .
Q13 VERIFY VEHICLE EQUIPMENT - HVAC MODULE	
• Inspect the vehicle for an HVAC module. • **Is the vehicle equipped with an HVAC module?**	**Yes** GO to Q14 . **No** GO to Q15 .
Q14 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE HVAC MODULE DISCONNECTED	
• Disconnect: HVAC Module C228a. • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0050701 • **Is the resistance less than 5 ohms?**	**Yes** GO to Q15 . **No** CONNECT the negative battery cable. GO to Q47 .
Q15 VERIFY VEHICLE EQUIPMENT - RETM	
• Inspect the vehicle for an RETM . • **Is the vehicle equipped with an RETM ?**	**Yes** GO to Q16 . **No** GO to Q17 .
Q16 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE RETM DISCONNECTED	



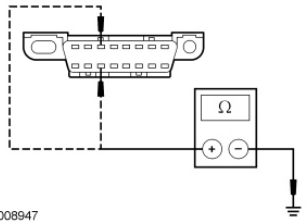


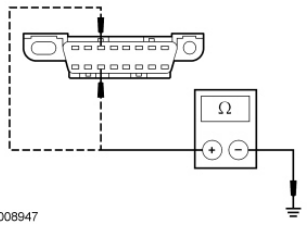
• Disconnect: RETM C9029. • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0050701 • **Is the resistance less than 5 ohms?**	**Yes** GO to Q17 . **No** CONNECT the negative battery cable. GO to Q48 .
Q17 VERIFY VEHICLE EQUIPMENT - DSM	
• Inspect the vehicle for a DSM . • **Is the vehicle equipped with a DSM ?**	**Yes** GO to Q18 . **No** GO to Q19 .
Q18 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE DSM DISCONNECTED	
• Disconnect: DSM C341c. • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0050701 • **Is the resistance less than 5 ohms?**	**Yes** GO to Q19 . **No** CONNECT the negative battery cable. GO to Q49 .
Q19 VERIFY VEHICLE EQUIPMENT - SDARS MODULE	
• Inspect the vehicle for a SDARS module. • **Is the vehicle equipped with a SDARS module?**	**Yes** GO to Q20 . **No** GO to Q21 .
Q20 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE SDARS MODULE DISCONNECTED	





• Disconnect: SDARS C3290. • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0050701 • **Is the resistance less than 5 ohms?**	**Yes** GO to Q21 . **No** CONNECT the negative battery cable. GO to Q50 .
Q21 VERIFY VEHICLE EQUIPMENT - PRB MODULE	
• Inspect the vehicle for a PRB module. • **Is the vehicle equipped with a PRB module?**	**Yes** GO to Q22 . **No** GO to Q23 .
Q22 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE PRB MODULE DISCONNECTED	
• Disconnect: PRB Module C4322b. • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0050701 • **Is the resistance less than 5 ohms?**	**Yes** GO to Q23 . **No** CONNECT the negative battery cable. GO to Q51 .
Q23 VERIFY VEHICLE EQUIPMENT - PAM	
• Inspect the vehicle for a PAM . • **Is the vehicle equipped with a PAM ?**	**Yes** GO to Q24 . **No** GO to Q25 .
Q24 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE PAM DISCONNECTED	





• Disconnect: PAM C4014 (Mountaineer), C3267 (Explorer Sport Trac) or C4226 (Explorer). • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0050701 • **Is the resistance less than 5 ohms?**	**Yes** GO to Q25 . **No** CONNECT the negative battery cable. GO to Q52 .
Q25 VERIFY VEHICLE EQUIPMENT - APIM	
• Inspect the vehicle for an APIM . • **Is the vehicle equipped with an APIM ?**	**Yes** GO to Q26 . **No** GO to Q27 .
Q26 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE APIM DISCONNECTED	
• Disconnect: APIM C3342. • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0050701 • **Is the resistance less than 5 ohms?**	**Yes** GO to Q27 . **No** CONNECT the negative battery cable.GO to Q53 .
Q27 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE SJB DISCONNECTED	
• Disconnect: SJB C2280d. • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.	**Yes** REPAIR the circuit. CONNECT all modules. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** CONNECT the negative battery cable. GO to Q54 .

 N0050701 • **Is the resistance less than 5 ohms?**	
Q28 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE IC DISCONNECTED	
• Disconnect: IC C220. • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and ground; and between the DLC C251-11, circuit VDB07 (VT/OG), harness side and ground.  N0008947 • **Are the resistances greater than 1,000 ohms?**	**Yes** CONNECT the negative battery cable. GO to Q45 . **No** GO to Q29 .
Q29 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE ACM DISCONNECTED	
• Disconnect: ACM C290b. • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and ground; and between the DLC C251-11, circuit VDB07 (VT/OG), harness side and ground.  N0008947 • **Are the resistances greater than 1,000 ohms?**	**Yes** CONNECT the negative battery cable. GO to Q46 . **No** GO to Q30 .
Q30 VERIFY VEHICLE EQUIPMENT - HVAC MODULE	
• Inspect the vehicle for an HVAC module. • **Is the vehicle equipped with an HVAC module?**	**Yes** GO to Q31 . **No** GO to Q32 .

Q31 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE HVAC MODULE DISCONNECTED	
• Disconnect: HVAC Module C228a. • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and ground; and between the DLC C251-11, circuit VDB07 (VT/OG), harness side and ground.  N0008947 • **Are the resistances greater than 1,000 ohms?**	**Yes** CONNECT the negative battery cable. GO to Q47 . **No** GO to Q32 .
Q32 VERIFY VEHICLE EQUIPMENT - RETM	
• Inspect the vehicle for a RETM . • **Is the vehicle equipped with a RETM ?**	**Yes** GO to Q33 . **No** GO to Q34 .
Q33 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE RETM DISCONNECTED	
• Disconnect: RETM C9029. • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and ground; and between the DLC C251-11, circuit VDB07 (VT/OG), harness side and ground.  N0008947 • **Are the resistances greater than 1,000 ohms?**	**Yes** CONNECT the negative battery cable. GO to Q48 . **No** GO to Q34 .
Q34 VERIFY VEHICLE EQUIPMENT - DSM	
• Inspect the vehicle for a DSM . • **Is the vehicle equipped with a DSM ?**	**Yes** GO to Q35 . **No** GO to Q36 .
Q35 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE	

DSM DISCONNECTED	
• Disconnect: DSM C341c. • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and ground; and between the DLC C251-11, circuit VDB07 (VT/OG), harness side and ground.  • **Are the resistances greater than 1,000 ohms?**	**Yes** CONNECT the negative battery cable. GO to Q49 . **No** GO to Q36 .
Q36 VERIFY VEHICLE EQUIPMENT - SDARS MODULE	
• Inspect the vehicle for a SDARS module. • **Is the vehicle equipped with a SDARS module?**	**Yes** GO to Q37 . **No** GO to Q38 .
Q37 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE SDARS MODULE DISCONNECTED	
• Disconnect: SDARS Module C3290. • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and ground; and between the DLC C251-11, circuit VDB07 (VT/OG), harness side and ground.  • **Are the resistances greater than 1,000 ohms?**	**Yes** CONNECT the negative battery cable. GO to Q50 . **No** GO to Q38 .
Q38 VERIFY VEHICLE EQUIPMENT - PRB MODULE	
• Inspect the vehicle for a PRB module. • **Is the vehicle equipped with a PRB module?**	**Yes** GO to Q39 . **No** GO to Q40 .
Q39 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE PRB MODULE DISCONNECTED	

• Disconnect: PRB Module C4322b. • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and ground; and between the DLC C251-11, circuit VDB07 (VT/OG), harness side and ground.  N0008947 • **Are the resistances greater than 1,000 ohms?**	**Yes** CONNECT the negative battery cable. GO to Q51 . **No** GO to Q40 .
Q40 VERIFY VEHICLE EQUIPMENT - PAM	
• Inspect the vehicle for a PAM . • **Is the vehicle equipped with a PAM ?**	**Yes** GO to Q41 . **No** GO to Q42 .
Q41 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE PAM DISCONNECTED	
• Disconnect: PAM C4014 (Mountaineer), C3267 (Explorer Sport Trac) or C4226 (Explorer). • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and ground; and between the DLC C251-11, circuit VDB07 (VT/OG), harness side and ground.  N0008947 • **Are the resistances greater than 1,000 ohms?**	**Yes** CONNECT the negative battery cable. GO to Q52 . **No** GO to Q42 .
Q42 VERIFY VEHICLE EQUIPMENT - APIM	
• Inspect the vehicle for an APIM . • **Is the vehicle equipped with an APIM ?**	**Yes** GO to Q43 . **No** GO to Q44 .
Q43 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE APIM DISCONNECTED	

• Disconnect: APIM C3342. • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and ground; and between the DLC C251-11, circuit VDB07 (VT/OG), harness side and ground.  • **Are the resistances greater than 1,000 ohms?**	**Yes** CONNECT the negative battery cable. GO to Q53 . **No** GO to Q44 .
Q44 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE SJB DISCONNECTED	
• Disconnect: SJB C2280d. • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and ground; and between the DLC C251-11, circuit VDB07 (VT/OG), harness side and ground.  • **Are the resistances greater than 1,000 ohms?**	**Yes** CONNECT the negative battery cable. GO to Q54 . **No** REPAIR the circuit in question. CONNECT all modules. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
Q45 CHECK FOR CORRECT IC OPERATION	
• Disconnect the IC connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the IC connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new IC . REFER to Section 413-01 . CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool.
Q46 CHECK FOR CORRECT ACM OPERATION	
• Disconnect all the ACM connectors. • Check for:	**Yes** INSTALL a new ACM . REFER to Section 415-00 . CONNECT all

♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the ACM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	modules. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool.
Q47 CHECK FOR CORRECT HVAC MODULE OPERATION	
• Disconnect all the HVAC module connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the HVAC module connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new HVAC module. REFER to Section 412-01 . CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool.
Q48 CHECK FOR CORRECT RETM OPERATION	
• Disconnect the RETM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the RETM connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new RETM . REFER to Section 415-00 . CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool.
Q49 CHECK FOR CORRECT DSM OPERATION	
• Disconnect all the DSM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the DSM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new DSM . REFER to Section 419-10 . CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT all modules. CLEAR the DTCs. REPEAT the network test with

	the scan tool.
Q50 CHECK FOR CORRECT SDARS MODULE OPERATION	
• Disconnect the SDARS module connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the SDARS module connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SDARS module. REFER to Section 415-00 . CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool.
Q51 CHECK FOR CORRECT PRB MODULE OPERATION	
• Disconnect all the PRB module connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the PRB module connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PRB module. REFER to Section 501-08 . CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool.
Q52 CHECK FOR CORRECT PAM OPERATION	
• Disconnect the PAM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the PAM connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PAM . REFER to Section 413-13 . CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool.
Q53 CHECK FOR CORRECT APIM OPERATION	
• Disconnect the APIM connector. • Check for: ♦ corrosion ♦ damaged pins	**Yes** INSTALL a new APIM . REFER to Section 415-00 . CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool.

♦ pushed-out pins • Connect the APIM connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool.
Q54 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test R: Intermittent No Medium Speed Controller Area Network (MS-CAN) Communication, One Or More Modules Are Not Responding During Network Test

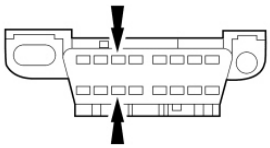
Normal Operation

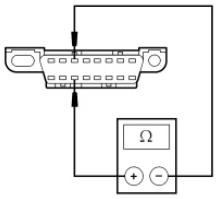
An open circuit VDB06 (GY/OG) (MS-CAN +) or VDB07 (VT/OG) (MS-CAN -) may cause intermittent or unreliable communication to all modules on the Medium Speed Controller Area Network (MS-CAN). The MS-CAN is used for communication between the following modules:

- Accessory Protocol Interface Module (APIM)
- Audio Front Control Module (ACM)
- Driver Seat Module (DSM)
- HVAC module
- Instrument Cluster (IC)
- Parking Aid Module (PAM)
- Power Running Board (PRB) module
- Rear Entertainment Module (RETM)
- Satellite Digital Audio Receiver System (SDARS) module
- Smart Junction Box (SJB)

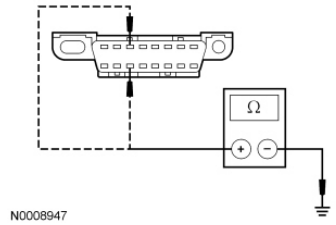
In the event that 1 of the 2 network circuits (MS-CAN + or MS-CAN -) becomes open to a module on the network, unreliable network communication to all modules on the network may result.

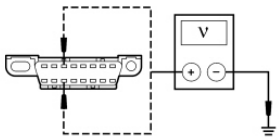
This pinpoint test is intended to diagnose the following:





- Wiring, terminals or connectors





PINPOINT TEST R: INTERMITTENT NO MS-CAN COMMUNICATION, ONE OR MORE MODULES ARE NOT RESPONDING DURING NETWORK TEST

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Various network DTCs will set while disabling modules in this test procedure which will need to be cleared after the diagnostic procedure is completed.

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
R1 CHECK THE DLC PINS FOR DAMAGE	
• Ignition OFF. • Disconnect the scan tool cable from the DLC . • Inspect DLC pins 3 and 11 for damage.  N0053178 • **Are DLC pins 3 and 11 OK?**	**Yes** GO to R2 . **No** REPAIR the DLC as necessary. CLEAR the DTCs. REPEAT the network test with the scan tool.
R2 CHECK THE MS-CAN TERMINATION RESISTANCE	
• Disconnect: Negative Battery Cable. • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0050701 • **Is the resistance between 54 and 66 ohms?**	**Yes** GO to R3 . **No** CONNECT the negative battery cable. GO to Pinpoint Test Q .
R3 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TO GROUND	
• Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and ground; and between the DLC C251-11, circuit VDB07 (VT/OG), harness side and ground.	**Yes** CONNECT the negative battery cable. GO to R4 . **No** CONNECT the negative battery

 N0008947 • **Are the resistances greater than 1,000 ohms?**	cable. GO to Pinpoint Test P .
R4 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TO VOLTAGE	
• Ignition ON. • Measure the voltage between the DLC C251-3, circuit VDB06 (GY/OG), harness side and ground; and between the DLC C251-11, circuit VDB07 (VT/OG), harness side and ground.  N0050702 • **Are the voltages greater than 6 volts?**	**Yes** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** GO to R5 .
R5 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE HVAC MODULE DISABLED	
• Disconnect: SJB Fuses 20 (10A) and 28 (10A). • Enter the following diagnostic mode on the scan tool: Network Test. • Repeat the network test. • **Do all other modules pass the network test?**	**Yes** INSTALL the removed fuses. GO to Pinpoint Test I . **No** INSTALL the removed fuses. GO to R6 .
R6 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE ACM DISABLED	
• Disconnect: SJB Fuse 3 (20A) and 12 (5A). • Enter the following diagnostic mode on the scan tool: Network Test. • Repeat the network test. • **Do all other modules pass the network test?**	**Yes** INSTALL the removed fuses. GO to Pinpoint Test J . **No** INSTALL the removed fuses. GO to R7 .
R7 VERIFY VEHICLE EQUIPMENT - DSM	
• Inspect the vehicle for a DSM . • **Is the vehicle equipped with a DSM ?**	**Yes** GO to R8 . **No**

	GO to R9 .
R8 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE DSM DISABLED	
• Disconnect: SJB Fuse 1 (20A). • Enter the following diagnostic mode on the scan tool: Network Test. • Repeat the network test. • **Do all other modules pass the network test?**	**Yes** INSTALL the removed fuse. GO to Pinpoint Test M . **No** INSTALL the removed fuse. GO to R9 .
R9 VERIFY VEHICLE EQUIPMENT - PRB MODULE	
• Inspect the vehicle for power running boards. • **Is the vehicle equipped with power running boards?**	**Yes** GO to R10 . **No** GO to R11 .
R10 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE PRB MODULE DISABLED	
• Disconnect: BJB Fuse 19 (30A). • Enter the following diagnostic mode on the scan tool: Network Test. • Repeat the network test. • **Do all other modules pass the network test?**	**Yes** INSTALL the removed fuse. GO to Pinpoint Test N . **No** INSTALL the removed fuse. GO to R11 .
R11 VERIFY VEHICLE EQUIPMENT - RETM APIM AND/OR SDARS MODULE	
• Inspect the vehicle for an RETM , an APIM , and/or a SDARS module. • **Is the vehicle equipped with an RETM , an APIM and/or a SDARS module?**	**Yes** GO to R12 . **No** GO to R14 .
R12 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE RETM , APIM , AND/OR SDARS MODULE DISABLED	
NOTE: When re-running the network test, the network test application must be first closed or the screen display will revert back to the prior run network test results. • Disconnect: BJB Fuse 41 (15A). • Enter the following diagnostic mode on the scan tool: Network Test. • Repeat the network test. • **Do all other modules pass the network test?**	**Yes** INSTALL the removed fuse. For vehicles equipped with two or more of the following modules: RETM , APIM , SDARS module, GO to R13 . For vehicles equipped with a RETM only, GO to Pinpoint Test L . For vehicles equipped with a APIM only, GO to Pinpoint Test P . For vehicles equipped with a SDARS module only, GO to

	Pinpoint Test K . **No** INSTALL the removed fuse. GO to R16 .
R13 VERIFY VEHICLE EQUIPMENT - RETM	
• Inspect the vehicle for an RETM . • **Is the vehicle equipped with an RETM ?**	**Yes** GO to R14 . **No** GO to R15 .
R14 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE RETM DISCONNECTED	
NOTE: When re-running the network test, the network test application must be first closed or the screen display will revert back to the prior run network test results. • Disconnect: RETM C9029. • Enter the following diagnostic mode on the scan tool: Network Test. • Repeat the network test. • **Do all other modules pass the network test?**	**Yes** CONNECT the RETM . GO to Pinpoint Test L . **No** GO to R15
R15 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE APIM DISCONNECTED	
NOTE: When re-running the network test, the network test application must be first closed or the screen display will revert back to the prior run network test results. • Disconnect: APIM C3342. • Enter the following diagnostic mode on the scan tool: Network Test. • Repeat the network test. • **Do all other modules pass the network test?**	**Yes** CONNECT the APIM . GO to Pinpoint Test P . **No** CONNECT the APIM . GO to Pinpoint Test K .
R16 VERIFY VEHICLE EQUIPMENT - PAM	
• Inspect the vehicle for a PAM . • **Is the vehicle equipped with a PAM ?**	**Yes** GO to R17 . **No** GO to R18 .
R17 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE PAM DISABLED	
• Disconnect: SJB Fuse 18 (10A). • Enter the following diagnostic mode on the scan tool: Network Test. • Repeat the network test. • **Do all other modules pass the network test?**	**Yes** INSTALL the removed fuse. GO to Pinpoint Test O . **No** INSTALL the removed fuse. GO to R18 .
R18 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE IC DISABLED	

NOTE: When re-running the network test, the network test application must be first closed or the screen display will revert back to the prior run network test results. • Disconnect: SJB Fuse 8 (15A) and 24 (10A). • Enter the following diagnostic mode on the scan tool: Network Test. • Repeat the network test. • **Do all other modules pass the network test?**	**Yes** INSTALL the removed fuses. GO to Pinpoint Test G . **No** INSTALL the removed fuses. An intermittent fault is not present. GO to Pinpoint Test Q .

Pinpoint Test S: No High Speed Controller Area Network (HS-CAN) Communication, All Modules Are Not Responding

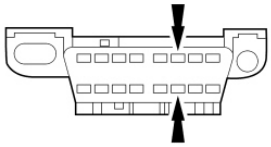
Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.

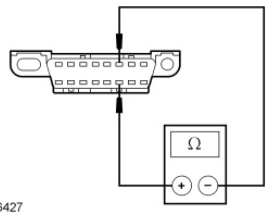
Normal Operation

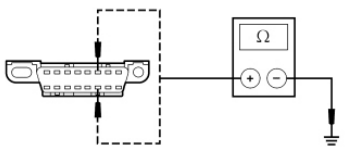
The High Speed Controller Area Network (HS-CAN) uses an unshielded twisted pair cable, circuits VDB04 (WH/BU) and VDB05 (WH).

This pinpoint test is intended to diagnose the following:

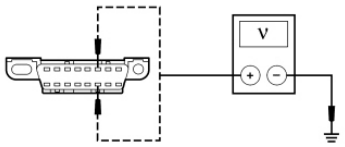
- Wiring, terminals or connectors
- 4X4 control module (if equipped)
- ABS module
- Accessory Protocol Interface Module (APIM) (if equipped)
- Instrument Cluster (IC)
- Occupant Classification System Module (OCSM)
- PCM
- Restraints Control Module (RCM)
- Transmission Control Module (TCM) (if equipped)

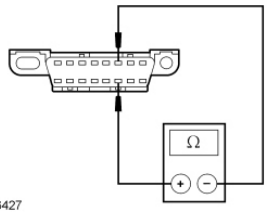


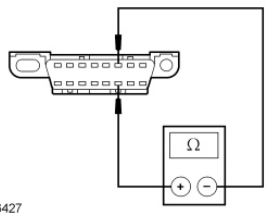




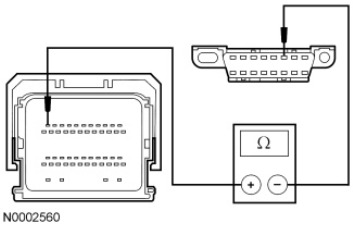
PINPOINT TEST S: NO HS-CAN COMMUNICATION, ALL MODULES ARE NOT RESPONDING

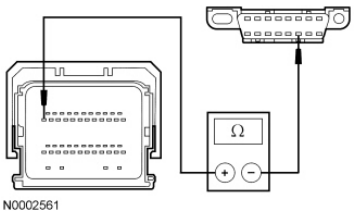


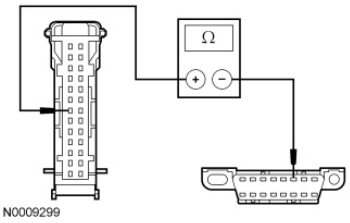


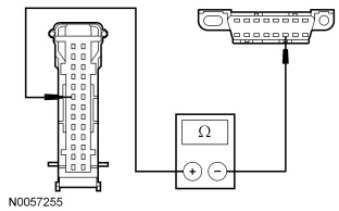


NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

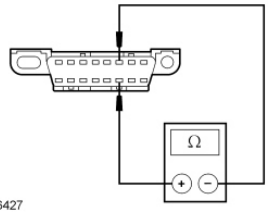


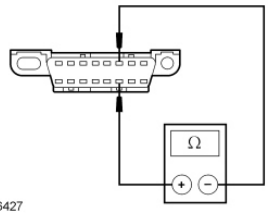


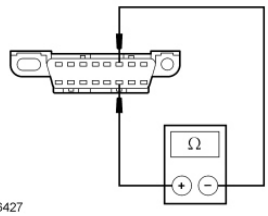




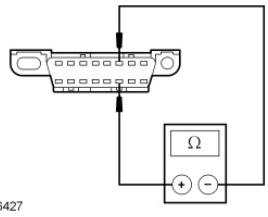
NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

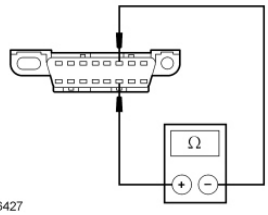




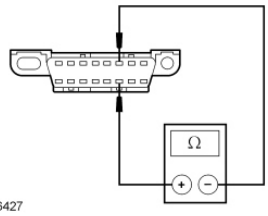


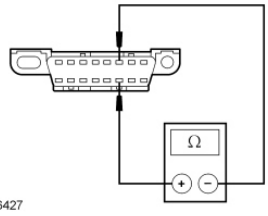
NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

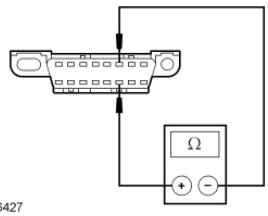




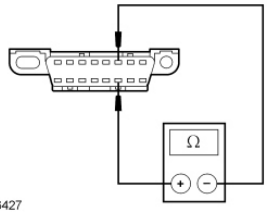
Test Step	Result / Action to Take
S1 CHECK THE DLC PINS FOR DAMAGE	

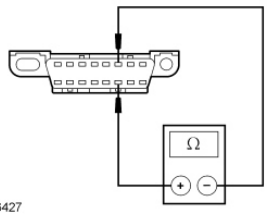


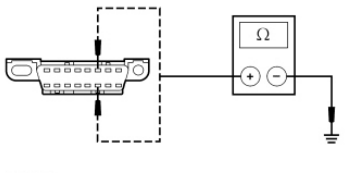




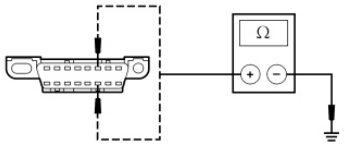
• Ignition OFF. • Disconnect the scan tool cable from the Data Link Connector (DLC). • Inspect DLC pins 6 and 14 for damage.  A0093867 • **Are DLC pins 6 and 14 OK?**	**Yes** GO to S2 . **No** REPAIR the DLC as necessary. CLEAR the DTCs. REPEAT the network test with the scan tool.
S2 CHECK THE HS-CAN TERMINATION RESISTANCE	
• Ignition OFF. • Disconnect: Negative Battery Cable. • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0026427 • **Is the resistance between 54 and 66 ohms?**	**Yes** GO to S3 . **No** GO to S5 .
S3 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TO GROUND	
• Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and ground; and between the DLC C251-14, circuit VDB05 (WH), harness side and ground.  N0002963 • **Are the resistances greater than 1,000 ohms?**	**Yes** GO to S4 . **No** GO to S19 .
S4 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TO VOLTAGE	

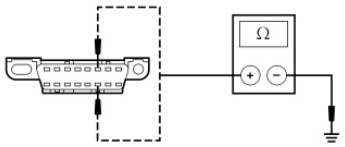


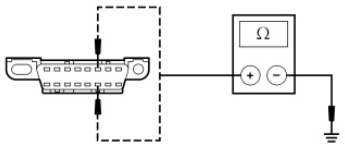




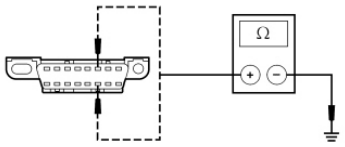
• Connect: Negative Battery Cable. • Ignition ON. • Measure the voltage between the DLC C251-6, circuit VDB04 (WH/BU), harness side and ground; and between the DLC C251-14, circuit VDB05 (WH), harness side and ground.  N0002964 • **Are the voltages greater than 6 volts?**	**Yes** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The CAN has tested within specifications. GO to Pinpoint Test T to diagnose an intermittent HS-CAN fault.
S5 CHECK THE HS-CAN TERMINATION RESISTOR	
• Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0026427 • **Is the resistance between 108 and 132 ohms?**	**Yes** GO to S6 . **No** GO to S9 .
S6 CHECK THE HS-CAN TERMINATION RESISTOR WITH THE PCM DISCONNECTED	
• Disconnect: PCM C175b. • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0026427 • **Is the resistance between 108 and 132 ohms?**	**Yes** GO to S7 . **No** GO to S8 .
S7 CHECK THE HS-CAN CIRCUITS BETWEEN THE PCM AND THE DLC FOR AN OPEN	

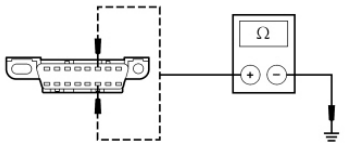




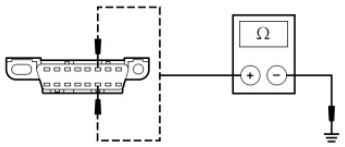


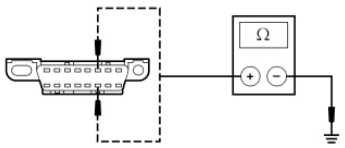
• Measure the resistance between the PCM C175b-11, circuit VDB04 (WH/BU), harness side and the DLC C251-6, circuit VDB04 (WH/BU), harness side.  N0002560 • Measure the resistance between the PCM C175b-23, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0002561 • **Are the resistances less than 5 ohms?**	**Yes** CONNECT the negative battery cable. GO to S27 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
S8 CHECK THE HS-CAN CIRCUITS BETWEEN THE IC AND THE DLC FOR AN OPEN	
• Measure the resistance between the IC C220-7, circuit VDB04 (WH/BU), harness side and the DLC C251-6, circuit VDB04 (WH/BU), harness side.  N0009299 • Measure the resistance between the IC C220-8, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0057255	**Yes** CONNECT the negative battery cable. GO to S34 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.





• **Are the resistances less than 5 ohms?**	
S9 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TOGETHER	
• Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** GO to S11 . **No** GO to S10 .
S10 CHECK THE HS-CAN CIRCUITS FOR AN OPEN AT THE DLC	
• Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  • **Is the resistance greater than 10,000 ohms?**	**Yes** REPAIR the DLC or REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** A capacitor internal to a module may still be draining causing irregular resistance readings. WAIT 5 minutes. REPEAT the pinpoint test.
S11 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE PCM DISCONNECTED	
• Disconnect: PCM C175b. • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** GO to S12 . **No** CONNECT the negative battery cable. GO to S27 .





S12 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE ABS MODULE DISCONNECTED	
• Disconnect: ABS Module C155. • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** If the vehicle is equipped with a 4X4 control module, GO to S13 . If the vehicle is not equipped with a 4X4 control module, GO to S14 . **No** CONNECT the negative battery cable. GO to S28 .
S13 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE 4X4 CONTROL MODULE DISCONNECTED	
• Disconnect: 4X4 Control Module C281a. • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** GO to S14 . **No** CONNECT the negative battery cable. GO to S29 .
S14 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE OCSM DISCONNECTED	
• Disconnect: OCSM C3159. • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.	**Yes** If the vehicle is equipped with an APIM , GO to S15 . If the vehicle is not equipped with an APIM , GO to S16 . **No** CONNECT the negative battery cable. GO to S30 .

 • **Is the resistance less than 5 ohms?**	
S15 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE APIM DISCONNECTED	
• Disconnect: APIM C3342. • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** GO to S16 . **No** CONNECT the negative battery cable. GO to S31 .
S16 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE RCM DISCONNECTED	
• Disconnect: RCM C310b. • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** If the vehicle is equipped with a Transmission Control Module (TCM), GO to S17 . If the vehicle is not equipped with a TCM , GO to S18 . **No** CONNECT the negative battery cable. GO to S32 .
S17 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE TCM DISCONNECTED	
• Disconnect: TCM C1575. • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.	**Yes** GO to S18 . **No** CONNECT the negative battery cable. GO to S33 .

 N0026427 • **Is the resistance less than 5 ohms?**	
S18 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE IC DISCONNECTED	
• Disconnect: IC C220. • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0026427 • **Is the resistance less than 5 ohms?**	**Yes** REPAIR the circuits. CONNECT all modules. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** CONNECT the negative battery cable. GO to S34 .
S19 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE PCM DISCONNECTED	
• Disconnect: PCM C175b. • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and ground; and between the DLC C251-14, circuit VDB05 (WH), harness side and ground.  N0002963 • **Are the resistances greater than 1,000 ohms?**	**Yes** CONNECT the negative battery cable. GO to S27 . **No** GO to S20 .
S20 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE ABS MODULE DISCONNECTED	

• Disconnect: ABS C155. • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and ground; and between the DLC C251-14, circuit VDB05 (WH), harness side and ground.  N0002963 • **Are the resistances greater than 1,000 ohms?**	**Yes** CONNECT the negative battery cable. GO to S28 . **No** If the vehicle is equipped with a 4X4 control module, GO to S21 . If the vehicle is not equipped with a 4X4 control module, GO to S22 .
S21 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE 4X4 CONTROL MODULE DISCONNECTED	
• Disconnect: 4X4 Control Module C281a. • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and ground; and between the DLC C251-14, circuit VDB05 (WH), harness side and ground.  N0002963 • **Are the resistances greater than 1,000 ohms?**	**Yes** CONNECT the negative battery cable. GO to S29 . **No** GO to S22 .
S22 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE OCSM DISCONNECTED	
• Disconnect: OCSM C3159. • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and ground; and between the DLC C251-14, circuit VDB05 (WH), harness side and ground.  N0002963	**Yes** CONNECT the negative battery cable. GO to S30 . **No** If the vehicle is equipped with an APIM , GO to S23 . If the vehicle is not equipped with an APIM , GO to S24 .

• **Are the resistances greater than 1,000 ohms?**	
S23 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE APIM DISCONNECTED	
• Disconnect: APIM C3342. • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and ground; and between the DLC C251-14, circuit VDB05 (WH), harness side and ground.  N0002963 • **Are the resistances greater than 1,000 ohms?**	**Yes** CONNECT the negative battery cable. GO to S31 . **No** GO to S24 .
S24 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE RCM DISCONNECTED	
• Disconnect: RCM C310b. • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and ground; and between the DLC C251-14, circuit VDB05 (WH), harness side and ground.  N0002963 • **Are the resistances greater than 1,000 ohms?**	**Yes** CONNECT the negative battery cable. GO to S32 . **No** If the vehicle is equipped with a Transmission Control Module (TCM), GO to S25 . If the vehicle is not equipped with a TCM , GO to S26 .
S25 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE TCM DISCONNECTED	
• Disconnect: TCM C1575. • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and ground; and between the DLC C251-14, circuit VDB05 (WH), harness side and ground.	**Yes** CONNECT the negative battery cable. GO to S33 . **No** GO to S26 .

 N0002963 • **Are the resistances greater than 1,000 ohms?**	
S26 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE IC DISCONNECTED	
• Disconnect: IC C220. • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and ground; and between the DLC C251-14, circuit VDB05 (WH), harness side and ground.  N0002963 • **Are the resistances greater than 1,000 ohms?**	**Yes** CONNECT the negative battery cable. GO to S34 . **No** REPAIR the circuit in question. CONNECT all modules. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
S27 CHECK FOR CORRECT PCM OPERATION	
• Disconnect all the PCM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the PCM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PCM. REFER to Section 303-14 . CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.
S28 CHECK FOR CORRECT ABS MODULE OPERATION	
• Disconnect the ABS module connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the ABS module connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ABS module. REFER to Section 206-09 . CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT all modules.

	CLEAR the DTCs. REPEAT the network test with the scan tool.
S29 CHECK FOR CORRECT 4X4 CONTROL MODULE OPERATION	
• Disconnect the 4X4 control module connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the 4X4 control module connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new 4X4 control module. REFER to Section 308-07A . CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool.
S30 CHECK FOR CORRECT OCSM OPERATION	
• Disconnect the OCSM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the OCSM connector and make sure it seats correctly. • Verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new OCSM . REFER to Section 501-20B . CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool.
S31 CHECK FOR CORRECT APIM OPERATION	
• Disconnect the APIM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the APIM connector and make sure it seats correctly. • Verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new APIM . REFER to Section 415-00 . CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool.
S32 CHECK FOR CORRECT RCM OPERATION	
• Disconnect all the RCM connectors. • Check for: ♦ corrosion ♦ damaged pins	**Yes** INSTALL a new RCM . REFER to Section 501-20B . CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool.

♦ pushed-out pins • Connect all the RCM connectors and make sure they seat correctly. • Verify the concern is still present. • **Is the concern still present?**	**No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT all modules. REPEAT the network test with the scan tool.
S33 CHECK FOR CORRECT TCM OPERATION	
• Disconnect the TCM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the TCM connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new TCM . REFER to Section 307-01B . CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool.
S34 CHECK FOR CORRECT IC OPERATION	
• Disconnect the IC connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the IC connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new IC . REFER to Section 413-01 . CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test T: Intermittent No High Speed Controller Area Network (HS-CAN) Communication, One Or More Modules Are Not Responding During Network Test

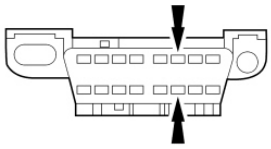
Normal Operation

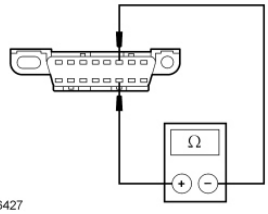
An open circuit VDB04 (WH/BU) (HS-CAN +) or VDB05 (WH) (HS-CAN -) may cause intermittent or unreliable communication to all modules on the HS-CAN . The HS-CAN is used for communication between the following modules:

- 4X4 control module (if equipped)
- ABS module
- Accessory Protocol Interface Module (APIM) (if equipped)
- Instrument Cluster (IC)
- Occupant Classification System Module (OCSM)
- PCM

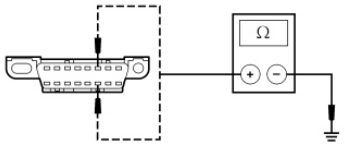
- Restraints Control Module (RCM)
- Transmission Control Module (TCM) (6R60 transmission only)

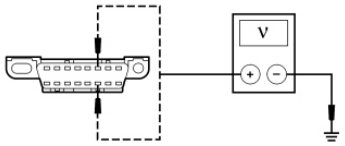
In the event that one of the 2 network circuits (HS-CAN + or HS-CAN -) becomes open to a module on the network, unreliable network communication to all modules on the network may result.





This pinpoint test is intended to diagnose the following:





- Wiring, terminals or connectors

PINPOINT TEST T: INTERMITTENT NO HS-CAN COMMUNICATION, ONE OR MORE MODULES ARE NOT RESPONDING DURING NETWORK TEST

NOTE: Various modules will set network DTCs during this test procedure. Clear DTCs from all modules after the diagnostic procedure is completed.

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
T1 CHECK THE DLC PINS FOR DAMAGE	
• Ignition OFF. • Disconnect the scan tool cable from the DLC . • Inspect DLC pins 6 and 14 for damage.  A0093867 • **Are DLC pins 6 and 14 OK?**	**Yes** GO to T2 . **No** REPAIR the DLC as necessary. CLEAR the DTCs. REPEAT the network test with the scan tool.
T2 CHECK THE HS-CAN TERMINATION RESISTANCE	
• Disconnect: Negative Battery Cable. • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0026427 • **Is the resistance between 54 and 66 ohms?**	**Yes** GO to T3 . **No** CONNECT the negative battery cable. GO to Pinpoint Test S .

T3 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TO GROUND	
• Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and ground; and between the DLC C251-14, circuit VDB05 (WH), harness side and ground.  N0002963 • **Are the resistances greater than 1,000 ohms?**	**Yes** CONNECT the negative battery cable. GO to T4 . **No** CONNECT the negative battery cable. GO to Pinpoint Test R .
T4 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TO VOLTAGE	
• Ignition ON. • Measure the voltage between the DLC C251-6, circuit VDB04 (WH/BU), harness side and ground; and between the DLC C251-14, circuit VDB05 (WH), harness side and ground.  N0002964 • **Are the voltages greater than 6 volts?**	**Yes** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** GO to T5 .
T5 CHECK FOR RESTORED COMMUNICATION WITH THE PCM DISABLED	
NOTE: A scan tool session must be established prior to disabling the PCM in this test step. If the PCM has failed communication during multiple attempts to identify the vehicle, first identify the vehicle manually by entering a PCM part number, calibration number or tear tag when prompted by the IDS . **NOTE:** When a vehicle is manually identified by a PCM part number, calibration number or tear tag, the IDS will not automatically run a network test. The network test must be manually selected and run. • Disconnect: BJB Fuse 24 (10A) and 39 (15A). • Enter the following diagnostic mode on the scan tool:	**Yes** INSTALL the removed fuses. GO to Pinpoint Test A . **No** INSTALL the removed fuses. GO to T6 .

Network Test. • Repeat the network test. • **Do all other modules pass the network test?**	
T6 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE ABS MODULE AND 4X4 CONTROL MODULE (IF EQUIPPED) DISABLED	
NOTE: When re-running the network test, the network test application must be first closed or the screen display will revert back to the prior run network test results. • Disconnect: SJB fuse 18 (10A). • Enter the following diagnostic mode on the scan tool: Network Test. • Repeat the network test. • **Do all other modules pass the network test?**	**Yes** INSTALL the removed fuse. If the vehicle is equipped with a 4X4 control module, GO to T7 . If the vehicle is not equipped with a 4X4 control module, GO to Pinpoint Test C . **No** INSTALL the removed fuse. GO to T8 .
T7 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE ABS MODULE DISCONNECTED	
NOTE: When re-running the network test, the network test application must be first closed or the screen display will revert back to the prior run network test results. • Disconnect: ABS Module C155. • Enter the following diagnostic mode on the scan tool: Network Test. • Repeat the network test. • **Do all other modules pass the network test?**	**Yes** CONNECT the ABS module. GO to Pinpoint Test C . **No** CONNECT the ABS module. GO to Pinpoint Test E .
T8 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE RCM AND OCSM DISABLED	
NOTE: When re-running the network test, the network test application must be first closed or the screen display will revert back to the prior run network test results. • Disconnect: SJB Fuse 17 (10A). • Enter the following diagnostic mode on the scan tool: Network Test. • Repeat the network test. • **Do all other modules pass the network test?**	**Yes** INSTALL the removed fuse. GO to T9 . **No** INSTALL the removed fuse. GO to T10 .
T9 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE RCM DISCONNECTED	
NOTE: When re-running the network test, the network test application must be first closed or the screen display will revert back to the prior run network test results. • Disconnect: RCM C310b.	**Yes** CONNECT the RCM . GO to Pinpoint Test D . **No** CONNECT the RCM . GO to Pinpoint Test F .

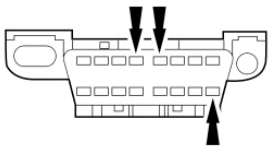
• Enter the following diagnostic mode on the scan tool: Network Test. • Repeat the network test. • **Do all other modules pass the network test?**	
T10 VERIFY VEHICLE EQUIPMENT - TCM	
• A TCM is present in 6R60 transmission equipped vehicles only. Inspect the vehicle for a 6R60 transmission. • **Is the vehicle equipped with a 6R60 transmission?**	**Yes** GO to T11 . **No** GO to T12 .
T11 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE TCM DISABLED	
NOTE: When re-running the network test, the network test application must be first closed or the screen display will revert back to the prior run network test results. • Disconnect: BJB Fuse 27 (20A) and SJB Fuse 9 (2A). • Enter the following diagnostic mode on the scan tool: Network Test. • Repeat the network test. • **Do all other modules pass the network test?**	**Yes** INSTALL the removed fuses. GO to Pinpoint Test B . **No** INSTALL the removed fuses. GO to T12 .
T12 VERIFY VEHICLE EQUIPMENT - APIM	
• Inspect the vehicle for an APIM . • **Is the vehicle equipped with an APIM ?**	**Yes** GO to T13 . **No** GO to T14 .
T13 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE APIM DISABLED	
NOTE: When re-running the network test, the network test application must be first closed or the screen display will revert back to the prior run network test results. • Disconnect: BJB Fuse 41 (15A). • Enter the following diagnostic mode on the scan tool: Network Test. • Repeat the network test. • **Do all other modules pass the network test?**	**Yes** INSTALL the removed fuse. GO to Pinpoint Test P . **No** INSTALL the removed fuse. GO to T14 .
T14 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE IC DISABLED	
NOTE: When re-running the network test, the network test application must be first closed or the screen display will revert back to the prior run network test results. • Disconnect: SJB Fuses 8 (15A) and 24 (10A). • Enter the following diagnostic mode on the scan tool: Network Test. • Repeat the network test. • **Do all other modules pass the network test?**	**Yes** INSTALL the removed fuses. GO to Pinpoint Test G . **No** INSTALL the removed fuses. An intermittent fault is not present. GO to Pinpoint Test S .

Pinpoint Test U: No Power To The Scan Tool

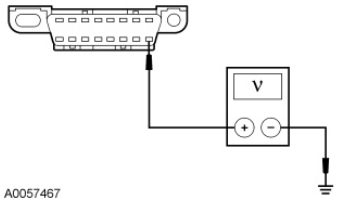
Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.

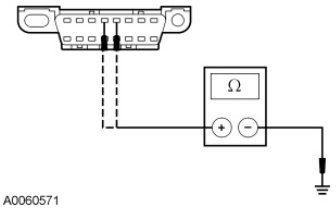
Normal Operation

The scan tool is connected to the Data Link Connector (DLC) to communicate with the High Speed Controller Area Network (HS-CAN) and the Medium Speed Controller Area Network (MS-CAN). Voltage for the scan tool is provided by circuit SBP04 (GN/RD). Ground is provided by circuits GD108 (BK/VT) and GD138 (BK/WH).



This pinpoint test is intended to diagnose the following:





- Fuse
- Wiring, terminals or connectors
- DLC
- Scan tool

PINPOINT TEST U: NO POWER TO THE SCAN TOOL

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
U1 CHECK THE DLC PINS FOR DAMAGE	
• Disconnect the scan tool cable from the DLC . • Inspect DLC pins 4, 5 and 16 for damage.  N0050767 • **Are DLC pins 4, 5 and 16 OK?**	**Yes** GO to U2 . **No** REPAIR the DLC as necessary. CLEAR the DTCs. REPEAT the network test with the scan tool.
U2 CHECK THE DLC VOLTAGE SUPPLY CIRCUIT FOR AN OPEN	

• Measure the voltage between the DLC C251-16, circuit SBP04 (GN/RD), harness side and ground.  A0057467 • **Is the voltage greater than 10 volts?**	**Yes** GO to U3 . **No** VERIFY the Smart Junction Box (SJB) fuse 4 (10A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short. REPEAT the network test with the scan tool.
U3 CHECK THE DLC GROUND CIRCUITS FOR AN OPEN	
• Disconnect: Negative Battery Cable. • Measure the resistance between the DLC C251-5, circuit GD138 (BK/WH), harness side and ground; and between the DLC C251-4, circuit GD138 (BK/WH), harness side and ground.  A0060571 • **Are the resistances less than 5 ohms?**	**Yes** REPAIR the scan tool. CONNECT the negative battery cable. REPEAT the network test with the scan tool. **No** REPAIR the circuit in question. CONNECT the negative battery cable. REPEAT the network test with the scan tool.

Module Configuration

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Principles of Operation

NOTE: The Smart Junction Box (SJB) is also known as the Generic Electronic Module (GEM).

Configurable modules accommodate a variety of vehicle options, eliminating the need for many unique modules for one vehicle line. These modules must be configured when replaced as part of a repair procedure. Configurable modules should not be exchanged between vehicles since the settings are unique to each vehicle. Failure to configure a new module may result in incorrect operation and/or DTCs setting.

The following are the 3 different methods of configuration:

- Programmable Module Installation (PMI)
- Module reprogramming ("flashing")
- Programmable parameters

Some modules do not support all 3 methods.

Definition of Terms

The following are definitions of configuration terms:

Programmable Module Installation (PMI)

PMI is a scan tool process which configures settings in a new module. Data used for the PMI process is automatically downloaded from the original module and stored when a scan tool session is started. If this data cannot be retrieved from the module being replaced, the scan tool may prompt for As-Built data entry or display a list of parameter values that need to be manually selected. Some modules are reprogrammed during PMI when a strategy/calibration update is available. To carry out PMI , refer to Programmable Module Installation (PMI) in this section.

NOTE: It is important that the scan tool identifies the vehicle and obtains configuration data prior to removing any modules. The new module must be able to communicate with the scan tool in order to carry out PMI .

Module Reprogramming

Module reprogramming (also referred to as "flashing") is a scan tool process which updates the strategy/calibration in a module. Reprogramming a module with the same level of software will not improve module operation or repair a hardware failure. Module reprogramming is automatically carried out during

PMI when a later strategy/calibration is available.

NOTE: Module reprogramming should be limited to circumstances where a published TSB procedure recommends doing so.

NOTE: A module cannot communicate with other modules on the communication network while being reprogrammed. Clear any network communication DTCs which may have been set in other modules during the reprogramming process.

Accessory Protocol Interface Module (APIM) Programming

APIM programming is a process that updates the APIM Consumer Interface Processor (CIP) and Vehicle Interface Processor (VIP) software. The VIP programming updates the calibration files in the portion of the APIM that interfaces with the Controller Area Network (CAN). The CIP programming updates calibration files in the portion of the APIM that interfaces with mobile phones and other customer devices.

APIM programming uses the VCM to read and program the VIP software through the Data Link Connector (DLC). A web-based OASIS application is used to read and program the CIP software via a Universal Serial Bus (USB) cable between the scan tool and vehicle USB port. Both the VCM and OASIS application must be running on the scan tool during APIM programming. To carry out APIM programming, refer to Accessory Protocol Interface Module (APIM) Programming in this section.

Programmable Parameters

Programmable parameters are customer preference items that may be modified by the dealer via scan tool or in some cases modified by the customer following a procedure listed in the vehicle Owner's Literature. While many configuration options may exist for a module, only a few of these options are programmable parameters.

Adaptive Learning and Calibration

Some modules require a separate learning procedure be carried out if replaced as part of a repair procedure. For adaptive learning and calibration instructions, refer to the specific module removal and installation procedures.

Vehicle Identification Block

Some PCMs contain a memory area called a vehicle identification block. The PCM vehicle identification block commonly stores powertrain configuration items such as Vehicle Identification Number (VIN), tire size, axle ratio, and whether or not the vehicle is equipped with speed control.

Module Address

A unique module address is assigned to each module on the network for identification.

As-Built Data

As-Built data is a VIN -specific module configuration record. During vehicle build, the configuration from all modules is downloaded and stored in the As-Built database. As-Built data does not reflect customer preference items that have been changed from the default state. These items need to be changed using programmable parameters after the module is configured.

NOTE: It is not necessary to obtain As-Built data unless directed to do so by the scan tool. This data may be accessed from the technician service publication website.

The following chart lists As-Built data addresses and describes specific module configuration information:

Module Configuration and Parameter Chart

Module	Module Address	Requires PMI	Reprogram/ Flash Capable	Requires Adaptive Learning or Calibration	Available Programmable Parameters
4X4 control module	761	No	Yes	No	None
ABS module	760	Yes	Yes	• IVD (stability control) initialization	None
Accessory Protocol Interface Module (APIM)	7D0	Yes	Yes	No	• Steering wheel controls • Stereo in pass-through
Audio Front Control Module (ACM)	727	Yes	Yes	No	• Destination (navigation only) • Satellite Digital Audio Receiver System (SDARS) module (except navigation) • Phone module (except navigation)
Driver Seat Module (DSM)	744	Yes	Yes	No	• Easy entry/exit • Memory pedals • Memory recline
HVAC module	733	Yes	Yes	No	None
Instrument Cluster (IC)	720	Yes	Yes	No	• Autolocks • Auto-unlock • Belt-Minder® • Language • Oil life threshold
Occupant Classification System Module (OCSM)	765	No	Yes	• Seat weight sensor re-zero	None
Parking Aid Module (PAM) - Explorer	736	No	No	No	None
PAM - Mountaineer, Explorer Sport Trac	736	Yes	No	No	None
PCM	7E0	Yes	Yes	• Adaptive airflow	• Speed control enable/disable

				• Idle speed • Refueling event • Fuel trim	• Axle ratio • Tire size • 4X4 low range input
Power Running Board (PRB) module	766	No	Yes	No	None
Rear Entertainment Module (RETM)	771	Yes	Yes	No	• Language • SDARS module
Restraints Control Module (RCM)	737	Yes	Yes	• Seat weight sensor re-zero	• Emergency call present (late build only) • Belt-Minder® (driver) enable • Belt-Minder® (passenger) enable
Satellite Digital Audio Receiver System (SDARS) module	782	Yes	Yes	No	None
Smart Junction Box (SJB)	726	Yes	Yes	• Tire Pressure Monitoring System (TPMS) sensor training	• Autolocks • Auto-unlock • Daytime Running Lamps (DRL) (Sport Trac only) • Trim switch inhibit • Tri-color stop lamps (Sport Trac only)
Transmission Control Module (TCM)	7E1	No	Yes	Yes	None

Inspection and Verification

This section provides step-by-step module configuration procedures. Carry out the Programmable Module Installation (PMI) procedure in this section when another workshop manual section directs to carry out configuration or when DTCs from the below list are present:

NOTE: Some of these modules utilize a 5-character DTC followed by a 2-character failure-type code. The failure-type code provides information about specific fault conditions such as opens, or shorts to ground. Continuous memory DTCs have an additional 2-character DTC status code suffix to assist in determining DTC history.

Diagnostic Trouble Code (DTC) Chart

DTC	Description	Source	Action
B2477	Module Configuration Failure	• ABS module • Audio Front Control Module (ACM) • Driver Seat Module (DSM) • HVAC module • Instrument Cluster (IC) • Parking Aid Module (PAM) • Rear Entertainment Module (RETM) • Restraints Control Module (RCM) • Satellite Digital Audio Receiver System (SDARS) module • Smart Junction Box (SJB)	CARRY OUT PMI . REFER to Programmable Module Installation (PMI) in this section.
B2477	Module Configuration Failure	• Accessory Protocol Interface Module (APIM)	REFER to Accessory Protocol Interface Module (APIM) Programming in this section.
B2477	Module Configuration Failure	• Occupant Classification System Module (OCSM)	INSTALL a new OCSM . REFER to Section 501-20B .
B2900	VIN mismatch	• ABS module • RCM	CARRY OUT PMI . REFER to Programmable Module Installation (PMI) in this section.
P0602	Powertrain Control Module Programming Error	• PCM	CARRY OUT PMI . REFER to Programmable Module Installation (PMI) in this section.

Programmable Module Installation (PMI)

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Programmable Module Installation (PMI) Using the Integrated Diagnostic System (IDS) When the Original Module is Available

NOTE: Following module installation, some modules require a separate learning procedure be carried out. For adaptive learning and calibration instructions, refer to the specific module removal and installation procedures.

1. Connect the IDS and identify the vehicle as normal.
2. From the Toolbox icon, select Module Programming and press the check mark.
3. Select Programmable Module Installation.
4. Select the module that is being replaced.
5. Follow the on-screen instructions, turn the ignition key to the OFF position, and press the check mark.
6. Install the new module and press the check mark.
7. Follow the on-screen instructions, turn the ignition key to the ON position, and press the check mark.
8. The IDS downloads the data into the new module and displays Module Configuration Complete.
9. Test module for correct operation.

Programmable Module Installation (PMI) Using the Integrated Diagnostic System (IDS) When the Original Module is NOT Available

NOTE: Following module installation, some modules require a separate learning procedure be carried out. For adaptive learning and calibration instructions, refer to the specific module removal and installation procedures.

1. Install the new module.
2. Connect the IDS and identify the vehicle as normal.
3. From the Toolbox icon, select Module Programming and press the check mark.

4. Select Programmable Module Installation.
5. Select the module that was replaced.
6. Follow the on-screen instructions, turn the ignition key to the OFF position, and press the check mark.
7. Follow the on-screen instructions, turn the ignition key to the ON position, and press the check mark.
8. If the data is not available, the IDS displays a screen stating to contact the As-Built Data Center. Retrieve the data from the technician service publication website at this time and press the check mark.
9. Enter the module data and press the check mark.
10. The IDS downloads the data into the new module and displays Module Configuration Complete.
11. Test module for correct operation.

Accessory Protocol Interface Module (APIM) Programming

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
 ST3051-A	Universal Serial Bus (USB) Male-A to Male-A Cable CCMUSB2-AM-AM-10 or equivalent

Accessory Protocol Interface Module (APIM) Programming Using the Integrated Diagnostic System (IDS)

NOTE:

- If a new Accessory Protocol Interface Module (APIM) is being installed, install a new APIM before carrying out the following procedure. For additional information, refer to Section 415-00 .
- When carrying out the programming procedures, follow the scan tool on-screen directions.
- Make sure the battery is fully charged before carrying out the programming steps.
- A hardwired internet connection is strongly recommended when programming.
- If unable to complete programming because operation stops or errors are received, internet browser settings may need to be configured. From the on-line OASIS tab, select the "Service Tips" tab, then select "SYNC Software Programming" under "Job Aids".

NOTE:

- For APIM flash programming:
  - The scan tool and a USB male A to male A cable (CCMUSB2-AM-AM-10 or equivalent) are required.
  - The flash procedure deletes any paired phones that were in the SYNC® system.
  - The file for the flash needs to be downloaded from the online database. Allow for extra time for the file to download. The files are approximately 80 megabyte.

1. **NOTE:** The IDS program must be closed before attempting to program the APIM .

   Open a session for the vehicle from the technician service publication web site, and run On-Line Automotive Service Information System (OASIS) using "Read VIN and DTC's".

2. From the OASIS tab, select the "SYNC" button.

3. There are 3 available options for APIM programming:
   - Standard (latest version of current software and applications): Use this option to update the APIM to the latest software level.
   - Custom (show what's available, and let me choose): Use this option to show all the available options that can be programmed, or if a Technical Service Bulletin (TSB) directs for specific software version to be programmed.

- Module Replacement (restore software for newly installed hardware): Use this option when the APIM has been replaced.

4. After selecting 1 of the 3 options (Standard, Custom or Module Replacement), click the "Read SYNC" button to verify the current APIM , Vehicle Interface Processor (VIP) and Consumer Interface Processor (CIP) software levels.
    - The versions are compared to a online database. After the comparison, the available software is displayed.

5. **NOTE:** Do not disconnect the Vehicle Communication Module (VCM) or the USB cable during APIM programming.

   When carrying out the programming procedures, follow the scan tool on-screen directions.

   NOTE: If unable to complete programming because operation stops or errors are received, interned browser settings may need to be configured. From the on-line OASIS tab, select the "Service Tips" tab, then select "SYNC Software Programming" under "Job Aids".

   Select the "Program SYNC" button to begin the APIM programming process.

6. Follow the scan tool on-screen directions for APIM programming.
    - After programming is complete the scan tool displays "Programming has been completed successfully."

Anti-Theft

NOTE: If the Instrument Cluster (IC) or the PCM (or both) is installed, the parameters must be reset in both modules or the vehicle will experience a Passive Anti-Theft System (PATS) no-start. Refer to Passive Anti-Theft System (PATS) Parameter Reset in this section.

The Passive Anti-Theft System (PATS) consists of the following components:

- Anti-theft indicator (located in the autolamp/sunload sensor)
- Encoded (the key contains a transponder) ignition key
- PATS transceiver
- IC
- PCM

The PATS uses radio frequency identification technology to deter a drive-away theft. Passive means that it does not require any activity by the user.

The vehicle is equipped with 2 PATS keys. A maximum of 8 PATS keys can be programmed to start the vehicle. If additional PATS keys are desired, refer to Spare Key Programming - Unlimited Key Mode in this section.

Passive Anti-Theft System (PATS) Function

The PATS function is controlled by the IC . The PATS uses the IC to carry out all of the PATS functions, such as receiving the identification code from the PATS key, issuing a signal to the PCM to control the starter and fuel injectors enable, and initiating the key interrogation sequence when the ignition key is turned to the ON or START position. Because of the interaction between the IC and the PCM, there are parameters that must be set if the IC or the PCM (or both) are replaced. Refer to Passive Anti-Theft System (PATS) Parameter Reset in this section. If the IC must be replaced for any reason (PATS concerns or IC concerns), the PATS keys also must be programmed into the new IC . Refer to Key Programming Using Diagnostic Equipment in this section. All elements of PATS must be functional before the vehicle will start. If any of the components are not working correctly, the vehicle does not start.

PATS is active only for a few seconds when the vehicle is starting. It is not a PATS concern if the vehicle stalls after it has been running for a minimum of 3 seconds. PATS does not disable a running vehicle.

PATS may cause a vehicle no start due to either the fuel injectors or the starter not operating (starter relay does not close) or both. Always check for PATS DTCs from the IC and DTCs from the PCM when a no-crank or no-start condition exists. After a valid key read has been completed, low battery voltage may cause the PATS to allow starter operation, but prevent the fuel injectors from operating.

If the anti-theft indicator does not prove out (it may be either flashing or glowing steadily) and one (or both) of the previous conditions (fuel injectors and/or starter inoperative) are present, it may be due to a PATS issue. If the anti-theft indicator proves out, it may not be a PATS issue. If the anti-theft indicator does not illuminate at all, it may be a circuitry/ IC issue. GO to Symptom Chart in this section.

PATS is not compatible with aftermarket remote start systems, which allow the vehicle to be started from the exterior of the vehicle. These systems may reduce the security of the vehicle, and also may be the cause of no-start concerns. Remote start systems must be removed from the vehicle before any PATS -related no-start concerns are investigated.

Unlimited Key Mode

PATS contains a feature called unlimited key mode. This feature allows a customer to program more than 8 vehicle keys, if requested. Each vehicle in unlimited key mode is set up with a special unlimited transponder security key code. This allows all the customer vehicles to share the same mechanically cut keys. For an individual customer, any randomly selected security key that has been previously mechanically cut and electronically programmed to the vehicle is acceptable. Refer to Spare Key Programming - Unlimited Key Mode in this section.

Anti-Theft

Special Tool(s)

 ST1137-A	73III Automotive Meter 105-R0057 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
 ST2574-A	Flex Probe Kit 105-R025C or equivalent

Principles of Operation

NOTE: The Smart Junction Box (SJB) is also known as the Generic Electronic Module (GEM).

NOTE: Replacement of the Passive Anti-Theft System (PATS) transceiver does not require the PATS keys to be programmed into the Instrument Cluster (IC) again.

NOTE: Make sure any aftermarket remote start systems have been removed from the vehicle before any PATS -related no-start concerns are investigated.

NOTE: A minimum of 2 PATS keys must be programmed into the IC before the vehicle will start.

NOTE: If the IC or the PCM is being replaced (or both), the parameters must be reset in both modules or the vehicle will experience a PATS no-start. Refer to Passive Anti-Theft System (PATS) Parameter Reset in this section.

Anti-Theft Indicator

PATS uses a visual anti-theft indicator located in the autolamp/sunload sensor. The indicator proves out for 3 seconds when the ignition key is in the ON or START position. If there is a PATS concern, this indicator either flashes rapidly or glows steadily when the ignition key is turned to the ON or START position. PATS also flashes the anti-theft indicator every 2 seconds when the ignition key is in the OFF position to act as a visual theft deterrent.

Passive Anti-Theft System (PATS) Keys

The PATS uses a special ignition key that is larger than a conventional ignition key because it contains a permanently installed electronic device called a transponder. Each transponder contains a unique, encrypted identification code which is one of a very large number of combinations. The addition of this transponder to the key makes it an "encoded" key. The PATS key does not require batteries and should last the lifetime of the vehicle. Each PATS key must be programmed into the IC before it can be used to start the vehicle. Up to 8 PATS keys can be programmed into the IC . If additional PATS keys are desired, a standard PATS key must

be used. There are special general procedures described in this section that must be carried out if a new PATS key is necessary. Refer to Key Programming Using Diagnostic Equipment in this section.

Passive Anti-Theft System (PATS) Transceiver

The PATS transceiver is located under the steering column shroud and communicates with the encoded ignition key. During each vehicle start sequence, the PATS transceiver reads the encoded ignition key identification code and sends data to the IC . The IC validates the code, and if it is the correct code, sends a message to the PCM to ground the starter relay solenoid coil and allow the fuel injectors to operate.

Passive Anti-Theft System (PATS) Operation

The PATS function is controlled by the IC . With this type of PATS , there are parameters that need to be reset if either the IC or the PCM (or both) are replaced. Refer to Passive Anti-Theft System (PATS) Parameter Reset in this section. When the PATS key is turned to the ON or START position, the IC initiates the key interrogation sequence by sending a voltage signal to the PATS transceiver. The transceiver then uses its antenna to bounce a signal off the transponder in the PATS key. This process "reads" the PATS key identification code and sends the key identification code back to the IC , which interprets it and determines if it matches one of the stored key codes. If it does match one of the stored key codes, the IC sends a message to the PCM to ground the starter relay solenoid coil and allow the fuel injectors to operate. If it does not match one of the stored key codes, or it is only a partial key read or no key read, the IC sends a message to the PCM to not ground the starter relay solenoid coil and not allow fuel injector operation. The anti-theft indicator flashes (or may glow steadily) and the IC stores one or more DTCs.

All elements of PATS must be functional before the vehicle will start. If any of the components are not working correctly, the vehicle does not start. If the IC must be replaced for any reason (PATS concerns or IC concerns), the PATS keys must also be programmed into the new IC . Refer to Key Programming Using Diagnostic Equipment in this section.

PATS disables the vehicle from starting if there is:

- a damaged PATS key.
- a non-programmed PATS key.
- a non- PATS key (key has no electronics).
- damaged wiring.
- a damaged transceiver.
- a damaged IC .
- a damaged PCM.

Passive Anti-Theft System (PATS) Parameter Identification (PIDs)

Monitoring the PATS PIDs can be very useful in determining which diagnostic steps to follow. Viewing the MASTERKEY (verifies if the key is programmed) PID with both keys determines if the key is a programmed key and also proves out the transceiver, circuitry and the IC . A master key is any key that is programmed into the IC .

Viewing the MIN_KEY (minimum number of keys) PID (this PID does not change) determines the minimum number of keys that must be programmed into the IC . There must be at least 2 keys programmed into the IC in this type of PATS before the vehicle starts.

Viewing the N_KEYCODE (number of keys programmed) PID determines if the minimum number of keys have been programmed into the IC . If the N_KEYCODE PID reads 0 or 1, additional key(s) need to be programmed into the IC in order to meet the minimum of 2 keys. If the N_KEYCODE PID reads 0 or 1, and the MASTERKEY PID reads NOTPREST, that particular key must be programmed into the IC .

If the N_KEYCODE PID reads 1, and the MASTERKEY PID reads PRESNT, that particular key is already programmed into the IC . If the IC was replaced, the parameters in the IC , and the parameters in the PCM need to be reset. When the parameters in the IC are reset, that clears (erases) the PCM ID from the IC . A PCM parameter reset sends a PCM ID to the IC that is necessary for the system to operate. Make sure to make 3-5 attempts to start the vehicle for 3-5 seconds each before attempting more procedures. The extra key cycles are necessary for the PCM ID to be sent (by the PCM) and then stored by the IC . If only a PCM parameter reset occurs, the IC may encounter 2 PCM IDs (the original one and the new one) and may cause a PATS -related no-start. If a PCM parameter reset occurs before the IC parameter reset occurs, there is no PCM ID stored in the IC , and a PATS -related no-start may occur. If the PCM_ID (PCM ID status) PID reads STORED, the IC has a PCM ID stored. If it reads NOTSTRD, a parameter reset of the PCM may resolve this issue. If the PATSENABLE (vehicle enable status) PID reads NO, and the N_KEYCODE PID reads 2 or more and the MASTERKEY reads PRESNT, the IC , and the PCM will need to have their parameters reset.

If the PATSENABLE PID reads NO, and the N_KEYCODE PID reads 1 and the MASTERKEY reads PRESNT, or if the N_KEYCODE PID reads 0 and the MASTERKEY PID reads NOTPRESNT, a minimum of 2 keys will need to be programmed into the IC . Refer to Key Programming Using Diagnostic Equipment in this section.

If the MASTERKEY PID continues to read NOTPRESNT after programming, this may indicate an inoperative key. The SPAREKEY (spare key) PID is defaulted to ENABLE. With the SPAREKEY PID displaying ENABLE, the IC accepts more than 2 keys (up to a maximum of 8) being programmed into the IC using the Key Programming Using Two Programmed Keys procedure in this section. It can be toggled to DISABL if the customer does not want any more than 2 keys programmed into the IC . Refer to Key Programming Switch State Control in this section. This switch state control does not affect the Key Programming Using Diagnostic Equipment, the Spare Key Programming - Using Diagnostic Equipment or the Spare Key Programming - Unlimited Key Mode procedures.

In summary for the PATS PIDs and their correct state in order for the vehicle to start:

PID	Normal State
N_KEYCODE	must read 2 or more
MASTERKEY	must read PRESNT
PATSENABLE	must read ENABLED
PCM_ID	must read STORED

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical

• Large metallic objects, a second Passive Anti-Theft System (PATS) key on the same key ring as the PATS key, or electronic devices on the key ring that can be used to purchase gasoline or similar items • Ignition lock cylinder • PATS key • Use of a non- PATS key or incorrect PATS key • More than one PATS key on the key ring • Remote start system installed	• Smart Junction Box (SJB) fuse(s): ♦ 8 (15A) ♦ 24 (10A) • Wiring, terminals or connectors • PATS transceiver • Ignition switch • Instrument Cluster (IC) • PCM

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM .
   - Refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the IC .

9. If the DTCs retrieved are related to the concern, go to DTC Charts. For all other DTCs, refer to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

DTC Charts

Instrument Cluster (IC) DTC Chart

DTC	Description	Action
B1213	Anti-Theft Number of Programmed Keys is Below Minimum	**NOTE:** If DTC B1600, B1601, B1602, B1681 or B2103 are present, they must be addressed first. If DTC B1213 is the only DTC present, PROGRAM additional keys. REFER to Key Programming Using Diagnostic Equipment in this section. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test.
B1600	PATS Ignition Key Transponder Signal is Not Received	GO to Pinpoint Test B .
B1601	PATS Received Incorrect Key-Code From Ignition Key Transponder	GO to Pinpoint Test C .
B1602	PATS Received Invalid Format of Key-Code From Ignition Key Transponder	GO to Pinpoint Test D .
B1681	PATS Transceiver Module Signal is Not Received	GO to Pinpoint Test E .
B2103	Antenna Not Connected	GO to Pinpoint Test A .
B2141	NVM Configuration Failure	There is no PCM ID stored in the IC . CARRY OUT a parameter reset of the IC and the PCM and CYCLE the ignition 3-5 times, making an attempt to start the vehicle each key cycle. REFER to Passive Anti-Theft System (PATS) Parameter Reset in this section.
B2431	Transponder Programming Failed	The ignition key was not programmed. PROGRAM the key. REFER to Key Programming Using Diagnostic Equipment in this section. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test.
U1900	CAN Communication Bus Fault - Receive Error	**NOTE:** If DTCs U1900 and U2510 are both present, address DTC U2510 first. GO to Pinpoint Test G .
U2510	CAN - Invalid Data for Vehicle Security	CARRY OUT a parameter reset of the IC and the PCM and CYCLE the ignition 3-5 times, making an attempt to start the vehicle each key cycle. REFER to Passive Anti-Theft System (PATS) Parameter Reset in this section. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test.
U2511	CAN - Data Mis-Match (Receive Data Does Not Match Expected)	**NOTE:** If DTCs U2510 and U2511 are both present, address DTC U2510 first. GO to Pinpoint Test G .
All other DTCs	-	REFER to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .

PCM DTC Chart

DTC	Description	Action
P1260	Theft Detected, Vehicle Immobilized	If there are any Passive Anti-Theft System (PATS) DTCs present in the Instrument Cluster (IC), ADDRESS them first. This DTC can also indicate a Controller Area Network (CAN) concern or a parameter reset concern. Make sure to verify if there are any communication concerns/DTCs with any modules. REFER to Section 418-00 . If DTC P1260 is the only DTC present, there may be a parameter reset concern or a power or ground concern with the PCM. REFER to Passive Anti-Theft System (PATS) Parameter Reset in this section. If necessary, CHECK the powers and ground to the PCM. REFER to the Wiring Diagrams Manual to determine the PCM power and ground circuits.
All other DTCs	-	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Symptom Chart

Symptom Chart

Pinpoint Tests

Pinpoint Test A: DTC B2103

Normal Operation

The Passive Anti-Theft System (PATS) transceiver communicates with the PATS key. During each vehicle start sequence, the PATS transceiver reads the PATS key identification code and sends the data to the Instrument Cluster (IC). The IC carries out all of the PATS functions such as receiving the identification code from the PATS key and sending a message to the PCM, which controls the engine enable. The IC initiates the key interrogation sequence when the key is turned to the ON or START position.

- DTC B2103 (Antenna Not Connected) - sets when there has been a PATS transceiver antenna failure.

This pinpoint test is intended to diagnose the following:

- PATS transceiver

PINPOINT TEST A: DTC B2103

Test Step	Result / Action to Take

A1 INSPECT THE PATS TRANSCEIVER FOR CORRECT INSTALLATION OR PHYSICAL DAMAGE	
NOTE: Replacement of the PATS transceiver does not require the PATS keys to be programmed into the IC again. • Ignition OFF. • Verify the PATS transceiver is correctly installed. Refer to Passive Anti-Theft System (PATS) Transceiver in this section. • Clear the continuous IC DTCs. • Ignition OFF. • Ignition ON. • Retrieve the IC DTCs. • **Is DTC B2103 retrieved?**	**Yes** INSTALL a new PATS transceiver. REFER to Passive Anti-Theft System (PATS) Transceiver in this section. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test. **No** The system is OK.

Pinpoint Test B: DTC B1600

Normal Operation

The Passive Anti-Theft System (PATS) transceiver communicates with the PATS key. During each vehicle start sequence, the PATS transceiver reads the PATS key identification code and sends the data to the Instrument Cluster (IC). The IC carries out all of the PATS functions such as receiving the identification code from the PATS key and sending a message to the PCM, which controls the engine enable. The IC initiates the key interrogation sequence when the key is turned to the ON or START position.

- DTC B1600 (PATS Ignition Key Transponder Signal is Not Received) - sets when no PATS key has been read by the IC . No PATS key has been read by the IC .

This pinpoint test is intended to diagnose the following:

- PATS encoded ignition key
- PATS transceiver
- IC

PINPOINT TEST B: DTC B1600

NOTE: Large metallic objects, electronic devices on the key ring that can be used to purchase gasoline or similar items, or a second key on the same key ring as the PATS ignition key may cause a vehicle starting concern and record DTCs under certain conditions. If a fault cannot be identified, examine the customer's key ring for such objects or devices. If present, inform the customer that they need to keep these objects from touching the PATS ignition key while starting the engine. These objects and devices cannot damage the PATS ignition key, but can cause a momentary concern if they are too close to the key during engine start. If a concern occurs, turn the ignition OFF and restart the engine with all other objects on the key ring held away from the ignition key. Check to make sure the encoded ignition key used by the customer is a Ford approved PATS key (PATS keys from Ford, Rotunda, Strattec, and Huf are approved Ford PATS keys).

Test Step	Result / Action to Take
B1 CHECK THE DTCs	
• Clear the continuous IC DTCs. • Ignition OFF. • Ignition ON. • Retrieve the IC DTCs. • **Is DTC B1600 retrieved?**	**Yes** GO to B2 . **No** If DTCs other than PATS DTCs are retrieved, REFER to Section 413-01 . If no PATS DTCs are retrieved, the system is OK.
B2 INSTALL A NEW PATS IGNITION KEY	
NOTE: Check to make sure the customer and the new encoded PATS ignition keys (contains a transponder) are Ford approved PATS ignition keys. Unapproved PATS keys do not always operate correctly over different temperature ranges (Ford, Rotunda, Strattec, and Huf are the only approved PATS ignition keys). • Cut a new ignition key. • Program the new ignition key. Refer to Spare Key Programming - Using Diagnostic Equipment in this section. • Clear the continuous IC DTCs. • Ignition OFF. • Ignition ON. • Retrieve the IC DTCs. • **Is DTC B1600 present?**	**Yes** GO to B3 . **No** If no PATS DTCs are retrieved, one (or both) of the original PATS keys are damaged. REPEAT the self-test with the original keys to determine if one (or both) keys are damaged.
B3 INSTALL A NEW PATS TRANSCEIVER	
NOTE: Replacement of the PATS transceiver does not require the PATS keys to be programmed into the IC again. **NOTE:** Do not use the PATS key that was programmed in Step B2. • Ignition OFF. • Install a new PATS transceiver. Refer to Passive Anti-Theft System (PATS) Transceiver in this section. • Ignition ON. • Clear the continuous IC DTCs. • Ignition OFF. • Turn the key to the ON position using an existing customer PATS key. • Retrieve the IC DTCs. • **Is DTC B1600 retrieved?**	**Yes** REMOVE the new transceiver and INSTALL the original transceiver. GO to B4 . **No** The system is OK.
B4 CHECK FOR CORRECT IC OPERATION	
NOTE: When a new IC is installed, the PATS keys must be programmed into the IC .	**Yes** INSTALL a new IC . REFER to Section 413-01 . PROGRAM the PATS keys into the new IC .

NOTE: When a new IC is installed, the parameters must be reset in the IC and the PCM. • Disconnect the IC connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the IC connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	REFER to Key Programming Using Diagnostic Equipment in this section. REPEAT the self-test. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test.

Pinpoint Test C: DTC B1601

Normal Operation

The Passive Anti-Theft System (PATS) transceiver communicates with the PATS key. During each vehicle start sequence, the PATS transceiver reads the PATS key identification code and sends the data to the Instrument Cluster (IC). The IC then sends a message to the PCM. The PCM carries out the function of controlling the engine enable. The IC initiates the key interrogation sequence when the key is turned to the ON or START position.

- DTC B1601 (PATS Received Incorrect Key-Code From Ignition Key Transponder) - sets when there is an unprogrammed PATS key. The concern is not with the PATS key itself, but the key must be programmed into the PATS memory (unless the maximum number of keys are already programmed). There is an unprogrammed PATS key.

This pinpoint test is intended to diagnose the following:

- PATS key
- IC

PINPOINT TEST C: DTC B1601

NOTE: Large metallic objects, electronic devices on the key ring that can be used to purchase gasoline or similar items, or a second key on the same key ring as the PATS key may cause a vehicle starting concern and record DTCs under certain conditions. If a fault cannot be identified, examine the customer key ring for such objects or devices. If present, inform the customer that they need to keep these objects from touching the PATS key while starting the engine. These objects and devices cannot damage the PATS key, but can cause a momentary concern if they are too close to the key during engine start. If a concern occurs, turn the ignition switch off and restart the engine with all other objects on the key ring held away from the ignition key. Check to make sure the PATS key used by the customer is an approved Ford PATS key (PATS keys from Ford, Rotunda, Strattec, and Huf are approved Ford PATS keys).

NOTE: Only 8 PATS keys can be programmed into the IC during normal programming procedures (unless the unlimited key mode is enabled). If the N_KEYCODE (number of keys programmed) PID reads more than 2 and less than 8, the concern may be the PATS key being used is an unprogrammed key. Verify this by also viewing the MASTERKEY (master key) PID. It must read PRESNT for the key to be valid.

Test Step	Result / Action to Take

C1 RETRIEVE THE DTCs	
• Clear the continuous IC DTCs. • Ignition OFF. • Ignition ON. • Retrieve the IC DTCs. • **Is DTC B1601 retrieved?**	**Yes** GO to C2 . **No** The system is OK. CHECK all customer encoded PATS ignition keys by attempting to start the vehicle with each key to VERIFY all other encoded PATS ignition keys are programmed.
C2 CHECK FOR PROGRAMMED ENCODED IGNITION KEYS - MONITOR THE IC N_KEYCODE PID	
• Enter the following diagnostic mode on the scan tool: IC DataLogger. • Monitor the IC N_KEYCODE PID. • **Does the IC N_KEYCODE PID display 8?**	**Yes** PROGRAM the keys. REFER to Key Programming Using Diagnostic Equipment in this section. CLEAR the DTCs. REPEAT the self-test. **No** GO to C3 .
C3 CHECK THE NUMBER OF PROGRAMMED IGNITION KEYS AVAILABLE	
• Verify there are at least 2 currently programmed PATS ignition keys available with the vehicle. • **Are at least 2 currently programmed PATS ignition keys available with the vehicle?**	**Yes** GO to C4 . **No** CUT a new PATS ignition key so that at least 2 PATS ignition keys are available. PROGRAM the PATS ignition keys. REFER to Key Programming Using Diagnostic Equipment in this section. GO to C5 .
C4 VERIFY THE IC SPAREKEY PID INDICATES YES	
• Enter the following diagnostic mode on the scan tool: IC DataLogger. • Monitor the IC SPAREKEY PID. • **Does the IC SPAREKEY PID indicate ENABLED?**	**Yes** Spare key programming is enabled. PROGRAM the keys. REFER to Key Programming Using Two Programmed Keys in this section. CLEAR the DTCs. REPEAT the self-test. **No** ENABLE the IC PID SPAREKEY. REFER to Key Programming Switch State Control in this section. CLEAR the DTCs. REPEAT the self-test.
C5 CHECK THE PATS IGNITION KEYS FOR CORRECT OPERATION	
• Ignition OFF. • Turn the key to ON for 3 seconds using the first PATS ignition key. • Ignition OFF. • Turn the key to ON for 3 seconds using the second PATS ignition key.	**Yes** The system is OK. If there are additional keys that need to be programmed, REFER to Key Programming Using Two Programmed Keys in this section. **No**

• Start the vehicle using the second PATS ignition key. • **Does the vehicle start?**	GO to C6 .
C6 RETRIEVE THE DTCs - CHECK FOR DTC B1601	
• Clear the continuous IC DTCs. • Ignition OFF. • Ignition ON. • Retrieve the IC DTCs. • **Is DTC B1601 retrieved?**	**Yes** GO to C7 . **No** The system is OK.
C7 CHECK FOR CORRECT IC OPERATION	
NOTE: When a new IC is installed, the PATS keys must be programmed into the IC . **NOTE:** When a new IC is installed, the parameters must be reset in the IC and the PCM. • Disconnect the IC connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the IC connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new IC . REFER to Section 413-01 . PROGRAM the PATS keys into the new IC . REFER to Key Programming Using Diagnostic Equipment in this section. REPEAT the self-test. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test.

Pinpoint Test D: DTC B1602

Normal Operation

The Passive Anti-Theft System (PATS) transceiver communicates with the PATS key. During each vehicle start sequence, the PATS transceiver reads the PATS key identification code and sends the data to the Instrument Cluster (IC). The IC then sends a message to the PCM to control the engine enable. The IC initiates the key interrogation sequence when the key is turned to the ON or START position.

- DTC B1602 (PATS Received Invalid Format Of Key-Code From Ignition Key Transponder) - sets when only a partial PATS key was read. Remote starter equipment can also cause this DTC.

This pinpoint test is intended to diagnose the following:

- PATS key
- PATS transceiver
- IC

PINPOINT TEST D: DTC B1602

NOTE: Large metallic objects, electronic devices on the key ring that can be used to purchase gasoline or similar items, or a second key on the same key ring as the PATS key may cause a vehicle starting concern and record DTCs under certain conditions. If a fault cannot be identified, examine the customer key ring for such objects or devices. If present, inform the customer that they need to keep these objects from touching the PATS key while starting the engine. These objects and devices cannot damage the PATS key, but can cause a momentary concern if they are too close to the key during engine start. If a concern occurs, turn the ignition off and restart the engine with all other objects on the key ring held away from the ignition key. Check to make sure the PATS key used by the customer is an approved Ford PATS key (PATS keys from Ford, Rotunda, Strattec, and Huf are approved Ford PATS keys).

NOTE: Only 8 PATS keys can be programmed into the IC during normal programming procedures (unless the unlimited key mode is enabled). If the N_KEYCODE (number of keys programmed) PID reads more than 2 and less than 8, the concern may be the PATS key being used is an unprogrammed key. Verify this by also viewing the MASTERKEY (master key) PID. It must read PRESNT for the key to be valid.

Test Step	Result / Action to Take
D1 RETRIEVE THE DTCs	
• Enter the following diagnostic mode on the scan tool: Clear the IC Continuous DTCs . • Ignition OFF. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Retrieve the IC DTCs. • **Is DTC B1602 retrieved?**	**Yes** GO to D2 . **No** The system is OK. CHECK all the customer PATS keys by attempting to start the vehicle with each key to VERIFY all other PATS keys are programmed.
D2 INSTALL A NEW PATS IGNITION KEY	
NOTE: Check to make sure the customer and the new encoded PATS ignition keys (contains a transponder) are Ford approved PATS ignition keys. Unapproved PATS keys do not always operate correctly over different temperature ranges (Ford, Rotunda, Strattec, and Huf are the only approved PATS ignition keys). • Cut a new PATS ignition key. • Program a new PATS ignition key. Refer to Spare Key Programming - Using Diagnostic Equipment in this section. • Clear the continuous IC DTCs. • Ignition OFF. • Ignition ON. • Retrieve the IC DTCs. • **Is DTC B1602 retrieved?**	**Yes** GO to D3 . **No** If DTCs other than PATS DTCs are retrieved, REFER to Section 413-01 . If no PATS DTCs are retrieved, the system is OK.
D3 INSTALL A NEW PATS TRANSCEIVER	
NOTE: Replacement of the PATS transceiver does not require the PATS keys to be programmed into the IC again. • Clear the continuous IC DTCs. • Ignition OFF.	**Yes** GO to D4 . **No** The system is OK.

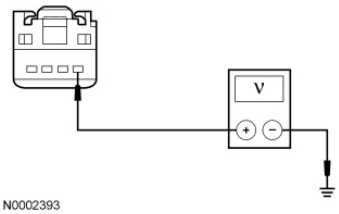
• Install a new PATS transceiver. Refer to Passive Anti-Theft System (PATS) Transceiver in this section. • Ignition ON. • Retrieve the IC DTCs. • **Are any PATS DTCs retrieved?**	
D4 CHECK FOR CORRECT IC OPERATION	
NOTE: When a new IC is installed, the PATS keys must be programmed into the new IC . **NOTE:** When a new IC is installed, the parameters must be reset in the IC and the PCM. • Disconnect the IC connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the IC connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new IC . REFER to Section 413-01 . PROGRAM the PATS keys into the new IC . REFER to Key Programming Using Diagnostic Equipment in this section. REPEAT the self-test. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test.

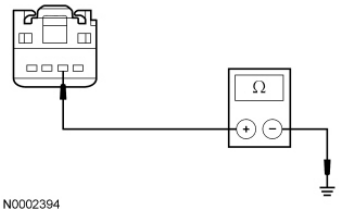
Pinpoint Test E: DTC B1681

Refer to Wiring Diagrams Cell 112 , Passive Anti-Theft System for schematic and connector information.

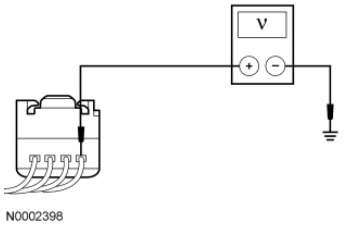
Normal Operation

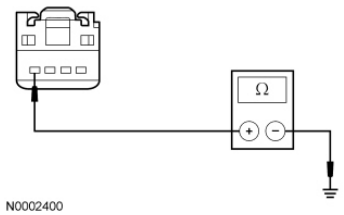
The Passive Anti-Theft System (PATS) transceiver receives voltage from the Smart Junction Box (SJB) on circuit CDC34 (WH/OG) and ground on circuit RRT25 (VT/WH). The PATS transceiver communicates with the PATS key. During each vehicle start sequence, the PATS transceiver reads the PATS key identification code and sends the data to the Instrument Cluster (IC). The IC and the PATS transceiver communicate on circuits VRT23 (VT/GY) and VRT24 (YE/OG). The IC then sends a message to the PCM to control the engine enable. The IC initiates the key interrogation sequence when the key is turned to the ON or START position.



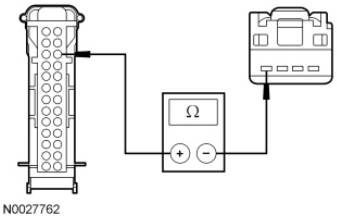


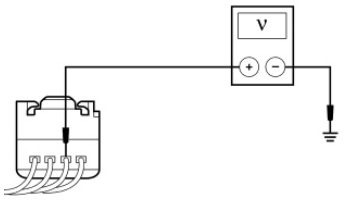
- DTC B1681 (PATS Transceiver Module Signal Is Not Received) - sets when the IC did not receive the PATS transceiver signal. Remote starter equipment can also cause this DTC.

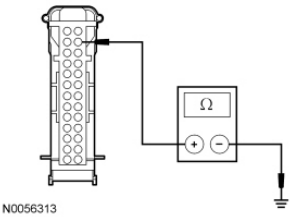




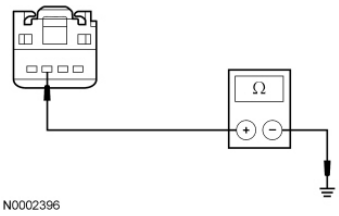
This pinpoint test is intended to diagnose the following:

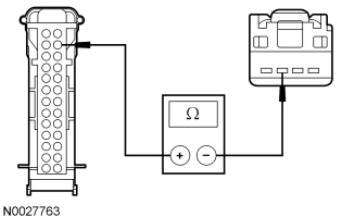




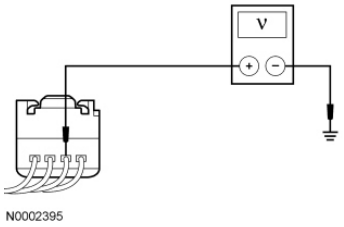


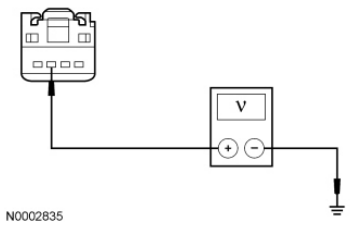
- Fuse
- Wiring, terminals or connectors
- PATS transceiver
- IC





PINPOINT TEST E: DTC B1681





NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
E1 RETRIEVE THE DTCs	
• Clear the continuous IC DTCs. • Ignition OFF. • Ignition ON. • Retrieve the IC DTCs. • **Is DTC B1681 retrieved?**	**Yes** GO to E2 . **No** The system is OK.
E2 CHECK THE PATS TRANSCEIVER POWER CIRCUIT CDC34 (WH/OG) FOR VOLTAGE	
• Ignition OFF. • Disconnect: PATS Transceiver C2007. • Ignition ON. • Measure the voltage between the PATS transceiver C2007-1, circuit CDC34 (WH/OG), harness side and ground.  N0002393 • **Is the voltage greater than 10 volts?**	**Yes** GO to E3 . **No** VERIFY the SJB fuse 8 (15A) is OK. If OK, REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test. If not OK, REFER to the Wiring Diagrams Manual to identify the possible sources of the circuit short.
E3 CHECK THE PATS TRANSCEIVER GROUND CIRCUIT RRT25 (VT/WH) FOR AN OPEN	
• Ignition OFF. • Measure the resistance between the PATS transceiver C2007-2, circuit RRT25 (VT/WH), harness side and ground.  N0002394 • **Is the resistance less than 5 ohms?**	**Yes** GO to E4 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
E4 CHECK THE PATS TRANSCEIVER RECEIVE CIRCUIT VRT23 (VT/GY) FOR VOLTAGE	

• Connect: PATS Transceiver C2007. • Ignition ON. • Measure the voltage by backprobing between the PATS transceiver C2007-4, circuit VRT23 (VT/GY), harness side and ground.  N0002398 • **Is the voltage greater than 9 volts?**	**Yes** GO to E6 . **No** GO to E5 .
E5 CHECK THE PATS TRANSCEIVER RECEIVE CIRCUIT VRT23 (VT/GY) FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: PATS Transceiver C2007. • Measure the resistance between the PATS transceiver C2007-4, circuit VRT23 (VT/GY), harness side and ground.  N0002400 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to E6 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. If the DTC sets again, GO to E13 .
E6 CHECK THE PATS TRANSCEIVER RECEIVE CIRCUIT VRT23 (VT/GY) FOR AN OPEN	
• Ignition OFF. • Disconnect: PATS Transceiver C2007. • Disconnect: IC C220. • Measure the resistance between the IC C220-24, circuit VRT23 (VT/GY), harness side and the PATS transceiver C2007-4, circuit VRT23 (VT/GY), harness side.	**Yes** GO to E7 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

 N0027762 • **Is the resistance less than 5 ohms?**	
E7 CHECK THE PATS TRANSCEIVER TRANSMIT CIRCUIT VRT24 (YE/OG) FOR VOLTAGE	
• Ignition OFF. • Connect: PATS Transceiver C2007. • Connect: IC C220. • Ignition ON. • Measure the voltage by backprobing between the PATS transceiver C2007-3, circuit VRT24 (YE/OG), harness side and ground.  N0002395 • **Is the voltage greater than 9 volts?**	**Yes** GO to E11 . **No** GO to E8 .
E8 CHECK THE PATS TRANSCEIVER TRANSMIT CIRCUIT VRT24 (YE/OG) FOR A SHORT TO GROUND WITH THE TRANSCEIVER CONNECTED	
• Ignition OFF. • Disconnect: IC C220. • Measure the resistance between the IC C220-25, circuit VRT24 (YE/OG), harness side and ground.  N0056313 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to E10 . **No** GO to E9 .
E9 CHECK THE PATS TRANSCEIVER TRANSMIT CIRCUIT VRT24 (YE/OG)	

FOR A SHORT TO GROUND WITH THE TRANSCEIVER DISCONNECTED	
NOTE: Replacement of the PATS transceiver does not require the PATS keys to be programmed into the IC again. • Disconnect: PATS Transceiver C2007. • Measure the resistance between the PATS transceiver C2007-3, circuit VRT24 (YE/OG), harness side and ground.  N0002396 • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new PATS transceiver. REFER to Passive Anti-Theft System (PATS) Transceiver in this section. CLEAR the DTCs. REPEAT the self-test. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
E10 CHECK THE PATS TRANSCEIVER TRANSMIT CIRCUIT VRT24 (YE/OG) FOR AN OPEN	
• Disconnect: PATS Transceiver C2007. • Measure the resistance between the IC C220-25, circuit VRT24 (YE/OG), harness side and the PATS transceiver C2007-3, circuit VRT24 (YE/OG), harness side.  N0027763 • **Is the resistance less than 5 ohms?**	**Yes** GO to E13 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
E11 CHECK THE PATS TRANSCEIVER TRANSMIT CIRCUIT VRT24 (YE/OG) FOR VOLTAGE	

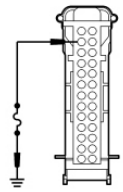
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IC DataLogger. • Select the IC active command TRANSMIT. • Trigger TRANSMIT to ON. • Measure the voltage by backprobing between the PATS transceiver C2007-3, circuit VRT24 (YE/OG), harness side and ground.  N0002395 • **Is the voltage less than 5 volts?**	**Yes** INSTALL a new PATS transceiver, REFER to Passive Anti-Theft System (PATS) Transceiver in this section. CLEAR the DTCs. REPEAT the self-test. **No** GO to E12 .
E12 CHECK THE PATS TRANSCEIVER TRANSMIT CIRCUIT VRT24 (YE/OG) FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: IC C220. • Disconnect: PATS Transceiver C2007. • Ignition ON. • Measure the voltage between the PATS transceiver C2007-3, circuit VRT24 (YE/OG), harness side and ground.  N0002835 • **Is voltage present?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** GO to E13 .
E13 CHECK FOR CORRECT IC OPERATION	
NOTE: When a new IC is installed, the PATS keys must be programmed into the new IC . **NOTE:** When a new IC is installed, the parameters must be reset in the IC and the PCM. • Disconnect the IC connector.	**Yes** INSTALL a new IC . REFER to Section 413-01 . RESET the parameters in the IC and the PCM. REFER to Passive Anti-Theft System (PATS) Parameter Reset in this section. PROGRAM the PATS keys into the new IC . REFER to Key Programming Using Diagnostic Equipment in this section. REPEAT the self-test. **No**

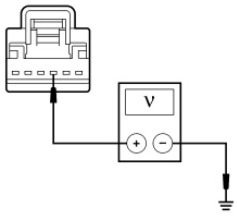
• Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the IC connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test.

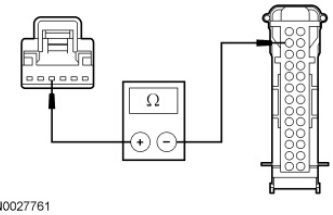
Pinpoint Test F: The Anti-Theft Indicator Is Always/Never On

Refer to Wiring Diagrams Cell 112 , Passive Anti-Theft System for schematic and connector information.

Normal Operation







The Passive Anti-Theft System (PATS) uses a visual anti-theft indicator located in the autolamp/sunload sensor. This indicator proves out for 3 seconds when the key is turned to ON or START. If there is a PATS issue, this indicator flashes rapidly when the key is turned to ON or START. PATS also flashes the anti-theft indicator every 2 seconds at ignition OFF to act as a visual theft deterrent.

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Anti-theft indicator
- Instrument Cluster (IC)

PINPOINT TEST F: THE ANTI-THEFT INDICATOR IS ALWAYS/NEVER ON

Test Step	Result / Action to Take
F1 CHECK THE IC DTCs	
• Retrieve the IC DTCs. • **Are there any IC DTCs present?**	**Yes** GO to the DTC Charts in this section. **No** GO to F2 .
F2 CHECK FOR CORRECT ANTI-THEFT INDICATOR OPERATION	
• Ignition OFF. • Disconnect: IC C220. • Connect and disconnect a fused jumper wire between the IC C220-12, circuit CRT04 (YE/BU), harness side and ground.	**Yes** REMOVE the fused jumper wire. GO to F5 . **No** REMOVE the fused jumper wire. If the anti-theft indicator is always on, REPAIR circuit CRT04 (YE/BU) for a short to ground. If the anti-theft indicator is never on, GO to F3 .

 N0057340 • **Does the anti-theft indicator illuminate with the jumper wire connected and turn off with the jumper wire disconnected?**	
F3 CHECK CIRCUIT SBP24 (VT/RD) FOR AN OPEN	
• Disconnect: Autolamp/Sunload Sensor C286. • Measure the voltage between the autolamp/sunload sensor C286-3, circuit SBP24 (VT/RD), harness side and ground.  A0063169 • **Is the voltage greater than 10 volts?**	**Yes** GO to F4 . **No** VERIFY the Smart Junction Box (SJB) fuse 24 (10A) is OK. If OK, REPAIR the circuit. TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short.
F4 CHECK CIRCUIT CRT04 (YE/BU) FOR AN OPEN	
• Measure the resistance between the autolamp/sunload sensor C286-4, circuit CRT04 (YE/BU), harness side and the IC C220-12, circuit CRT04 (YE/BU), harness side.  N0027761 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new autolamp/sunload sensor. REFER to Section 417-01 . TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
F5 CHECK FOR CORRECT IC OPERATION	
NOTE: When a new IC is installed, the PATS keys must be programmed into the new IC .	**Yes** INSTALL a new IC . REFER to Section 413-01 . PROGRAM the PATS keys into the new IC . REFER to Key Programming Using Diagnostic

NOTE: When a new IC is installed, the parameters must be reset in the IC and the PCM. • Disconnect the IC connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the IC connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	Equipment in this section. CYCLE the ignition. REPEAT the self-test. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test.

Pinpoint Test G: DTC U1900

Refer to Wiring Diagrams Cell 14 , Module Communications Network for schematic and connector information.

Normal Operation

The Passive Anti-Theft System (PATS) uses a visual anti-theft indicator located in the Instrument Cluster (IC). This indicator proves out for 3 seconds when the key is turned to the ON or START position under normal operation. If there is a PATS concern, this indicator either flashes rapidly or glows steadily (for more than 3 seconds) when the key is turned to the ON or START position. PATS also flashes the anti-theft indicator every 2 seconds at key off to act as a visual theft deterrent. The anti-theft indicator operation is controlled by the IC .

If DTC U2510 is present, refer to DTC Charts.

- DTC U1900 (CAN Communication Bus Fault - Receive Error) - sets in continuous memory only when the IC loses communication with the PCM. The fault may not be present at the time of testing. This DTC may be caused by a High Speed Controller Area Network (HS-CAN) circuit issue or by the IC or the PCM.
- DTC U2511 (CAN - Data Mis-Match [Receive Data Does Not Match Expected]) - sets in continuous memory only when the IC does not receive the expected response from the PCM over the HS-CAN . The fault may not be present at the time of testing. The data sent by the PCM does not match the data expected by the IC and this DTC is set. This DTC can be caused by the HS-CAN circuits between the IC and the PCM, by either module, or if the battery voltage is low.

This pinpoint test is intended to diagnose the following:

- Low battery state of charge
- Wiring, terminals or connectors
- IC
- PCM

PINPOINT TEST G: DTC U1900

NOTE: When a new IC is installed, the PATS keys must be programmed into the new IC .

NOTE: When a new IC is installed, the parameters must be reset in the IC and the PCM.

Test Step	Result / Action to Take
G1 CHECK THE BATTERY STATE OF CHARGE	
• Ignition OFF. • Check the battery state of charge with the battery condition test. Refer to Section 414-01 . • **Does the battery pass the battery condition test?**	**Yes** GO to G2 . **No** REFER to Section 414-00 to diagnose the low battery voltage condition.
G2 CHECK FOR MODULE COMMUNICATION ON THE HS-CAN	
• Connect the scan tool. • Ignition ON. • Carry out the network test using the scan tool. • **Is the scan tool unable to communicate with any of the modules on the HS-CAN ?**	**Yes** REFER to Section 418-00 to diagnose the module that is not communicating with the scan tool. **No** GO to G3 .
G3 INSPECT THE HS-CAN CIRCUITRY	
• Ignition OFF. • Inspect all of the HS-CAN circuitry, including the pin crimps, connector fit, corroded/bent/pushed-out/damaged pins and splice integrity in the 8 splices and 10 connections (5 connectors) between the PCM and the IC. This includes: ♦ C175B (PCM) ♦ S122 ♦ S124 ♦ C126 ♦ C300 ♦ S317 ♦ S318 ♦ S319 ♦ S320 ♦ C214 ♦ S220 ♦ S224 ♦ C220 (IC) • **Does the HS-CAN circuitry pass the component inspection?**	**Yes** GO to G4 . **No** REPAIR the HS-CAN circuitry as necessary. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test. TEST the system for normal operation.
G4 CHECK FOR CORRECT PCM OPERATION	
NOTE: When a new PCM is installed, the	**Yes** INSTALL a new PCM. REFER to Section 303-14

PATS keys do not need to be programmed into the IC . **NOTE:** When a new PCM is installed, the parameters must be reset in the IC and the PCM. • Disconnect all the PCM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the PCM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	. RESET the parameters in both the IC and the PCM. REFER to Passive Anti-Theft System (PATS) Parameter Reset in this section. CYCLE the ignition. REPEAT the self-test. TEST the system for normal operation. If the concern is still present, GO to G5 . **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test. TEST the system for normal operation.
G5 CHECK FOR CORRECT IC OPERATION	
NOTE: When a new IC is installed, the PATS keys must be programmed into the new IC . **NOTE:** When a new IC is installed, the parameters must be reset in the IC and the PCM. • Disconnect the IC connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the IC connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new IC . REFER to Section 413-01 . RESET the parameters in both the IC and the PCM. REFER to Passive Anti-Theft System (PATS) Parameter Reset in this section. PROGRAM the PATS keys into the new IC . REFER to Key Programming Using Diagnostic Equipment in this section. CYCLE the ignition. REPEAT the self-test. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test H: The Vehicle Does Not Start

Normal Operation

The Passive Anti-Theft System (PATS) uses a visual anti-theft indicator located in the autolamp/sunload sensor. This indicator proves out for 3 seconds when the key is turned to the ON or START position under normal operation. If there is a PATS concern, this indicator either flashes rapidly or glows steadily (for more than 3 seconds) when the key is turned to the ON or START position. PATS also flashes the anti-theft indicator every 2 seconds at key off to act as a visual theft deterrent. The anti-theft indicator operation is controlled by the Instrument Cluster (IC).

This pinpoint test is intended to diagnose the following:

- Starting system concern
- PATS concern

PINPOINT TEST H: THE VEHICLE DOES NOT START

Test Step	Result / Action to Take
H1 CHECK FOR COMMUNICATION WITH THE PCM AND IC	
• Connect the scan tool. • Ignition ON. • Carry out the network test using the scan tool. • **Does the scan tool establish communication with the PCM and the IC ?**	**Yes** GO to H2 . **No** REFER to Section 418-00 to diagnose the module that is not communicating with the scan tool.
H2 CHECK FOR IC DTCs	
• Retrieve the IC continuous and on-demand DTCs. • **Are any IC DTCs present?**	**Yes** REFER to DTC Charts in this section. **No** The no-start condition is not PATS -related. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual to diagnose the cause of the no-start condition.

Key Programming Using Two Programmed Keys

NOTE: This procedure only works if 2 or more programmed ignition keys are available. If 2 programmed keys are not available, refer to Key Programming Using Diagnostic Equipment in this section.

NOTE: The Instrument Cluster (IC) PID SPAREKEY must be enabled for this procedure to operate. If this IC PID is not enabled, refer to Key Programming Switch State Control in this section, then select SPAREKEY programming switch; ENABLED. The IC PID SPAREKEY is set to ENABLE when the vehicle is built.

NOTE: If the programming procedure is successful, the new key(s) will start the vehicle and the anti-theft indicator will prove-out for approximately 3 seconds. If the programming procedure is not successful and the new key(s) does not start the engine, leave the key in the ON position for at least 3 seconds, then turn the key off. Repeat the key programming procedure from Step 1. If the failure repeats, refer to Anti-Theft in the Diagnosis and Testing portion of this section to review the DTCs and carry out the appropriate pinpoint tests.

NOTE: A maximum of 8 Passive Anti-Theft System (PATS) keys can be programmed into the IC during this programming procedure, but only if the IC PID SPAREKEY is ENABLED.

NOTE: A minimum of 2 PATS keys must be programmed into the IC before the vehicle will start.

NOTE: If the vehicle is in unlimited key mode, this spare key programming procedure still functions. Any 2 keys that can start the vehicle can be used to program an additional unlimited key.

NOTE: If additional keys are to be programmed, and the remaining keys are with the customer, or are not available, instruct the customer to refer to the Owner's Literature for instructions on programming the remaining keys. In this case, the IC PID SPAREKEY must be enabled.

NOTE: If the steps are not carried out as outlined, the programming procedure will end.

NOTE: Ignition keys must have a correct mechanical key cut for the vehicle and must be PATS encoded keys (contain a transponder).

NOTE: This procedure is not necessary if only the PATS transceiver was replaced. Replacement of the transceiver does not erase the PATS key codes in the IC .

NOTE: When in the unlimited key mode, the N_KEYCODE PID will always read 2 (after the first 2 keys have been programmed), no matter how many keys are programmed to the vehicle.

1. Insert the first programmed key into the ignition lock cylinder and turn the key from the OFF position to the ON position (maintain the key in the ON position for a minimum of 3 seconds and less than 10 seconds).

2. Turn the key to the OFF position and remove the first key from the ignition lock cylinder.

3. Within 5 seconds of turning the key to the OFF position, insert the second programmed key into the ignition lock cylinder and turn the key from the OFF position to the ON position (maintain the key in the ON position for a minimum of 3 seconds and less than 10 seconds).

4. Turn the key to the OFF position and remove the key from the ignition lock cylinder.

5. Within 10 seconds of turning the key to the OFF position, insert the unprogrammed key (the new key) into the ignition lock cylinder and turn the key from the OFF position to the ON position (maintain the key in the ON position for a minimum of 3 seconds and less than 10 seconds).

6. If it is desired to program additional key(s) (only up to 8 keys total can be programmed into the IC), repeat Steps 1-5 for each additional key that needs to be programmed.

7. Start the vehicle with the new key(s).

Key Programming Using Diagnostic Equipment

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

NOTE: This procedure is used when a customer needs keys programmed into the system and does not have 2 programmed ignition keys available. This procedure is also useful when a programmed ignition key(s) is lost or the ignition lock cylinder is replaced, and it is desired to erase key code(s) from the Passive Anti-Theft System (PATS) memory.

NOTE: This procedure erases all programmed ignition keys from the vehicle memory. The vehicle will not start until a minimum of 2 keys are programmed into the Instrument Cluster (IC).

NOTE: A minimum of 2 PATS keys must be programmed into the IC before the vehicle will start.

NOTE: Two PATS encoded (contains a transponder) keys with the correct mechanical cut must be available to carry out this procedure. One or both of them may be the customer's original keys.

NOTE: If additional keys are to be programmed, refer to Key Programming Using Two Programmed Keys in this section. If the remaining keys are with the customer and are not available with the vehicle, instruct the customer to refer to the Owner's Literature for instructions on programming the remaining keys. In this case, the PID SPAREKEY must be enabled.

NOTE: This procedure is not necessary if only the PATS transceiver was replaced. Replacement of the transceiver does not erase the PATS key codes in the IC .

1. Turn the key from the OFF position to the ON position.
2. From the scan tool, enter TOOLBOX. Select BODY - SECURITY - PATS Functions and follow the on-screen instructions to ENTER SECURITY ACCESS. For additional information, refer to Anti-Theft Security Access in this section.
3. From the scan tool menu select: "Ignition Key Code Erase" and follow the on-screen instructions.
4. Turn the key to the OFF position and disconnect the scan tool.
5. Insert the first PATS key into the ignition lock cylinder and turn the key to the ON position for 3 seconds.
6. Turn the first PATS key to the OFF position and remove the key from the ignition lock cylinder.
7. Insert the next PATS key into the ignition lock cylinder and turn the key to the ON position for 3 seconds.
8. The vehicle should now start with both PATS ignition keys.

9. If it is desired to program additional key(s) (only up to 8 keys total can be programmed into the IC), refer to Key Programming Using Two Programmed Keys in this section for each additional key that needs to be programmed.

Key Programming Switch State Control

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

NOTE: The spare key programming switch is a programmable switch which provides the capability to enable/disable the normal customer spare key programming procedure detailed in the Owner's Literature. It must read ENABLE if more than 2 keys need to be programmed into the Instrument Cluster (IC). For additional information, refer to Key Programming Using Two Programmed Keys in this section. This programmable switch is provided as a convenience for rental company fleets or other fleet purchasers who may not want the spare key programming procedure available to the vehicle driver.

NOTE: The spare key programming switch state can be viewed with the IC PID SPAREKEY.

NOTE: If the SPAREKEY PID reads ENABLE, up to 8 keys total can be programmed into the IC using Key Programming Using Two Programmed Keys in this section. If the SPAREKEY PID reads DISABLED, the Key Programming Using Two Programmed Keys procedure will not function. This switch is set to ENABLE when the vehicle is built. This PID does not affect the Key Programming Using Diagnostic Equipment, the Spare Key Programming - Unlimited Key Mode or the Spare Key Programming - Using Diagnostic Equipment procedures.

1. Insert a programmed Passive Anti-Theft System (PATS) key into the ignition lock cylinder and turn the key from the OFF position to the ON position.

2. From the scan tool, enter TOOLBOX. Select BODY - SECURITY - PATS Functions and follow the on-screen instructions to ENTER SECURITY ACCESS. For additional information, refer to Anti-Theft Security Access in this section.

3. **NOTE:** The default setting of the key programming switch on delivery of all new vehicles is ENABLED, when viewing the IC PID SPAREKEY.

   From the scan tool menu select: "Customer Spare Key Programming Enable" (or "Customer Spare Key Programming Disable"), and follow the on-screen instructions.

   - "Customer Spare Key Programming Enable" - the spare key programming procedure is accessible.
   - "Customer Spare Key Programming Disable" - the spare key programming procedure is not accessible.

Spare Key Programming - Using Diagnostic Equipment

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

NOTE: This procedure is used when a customer needs to have an additional key programmed into the vehicle without erasing stored key codes, but does not have 2 programmed keys available. This procedure is also useful when attempting to determine if an ignition key is damaged, as a new key can be installed without erasing keys or without having 2 programmed keys available.

NOTE: Before programming, the new key must have the correct mechanical cut for the ignition lock cylinder.

NOTE: If 8 keys are already programmed, this procedure does not allow any more ignition keys to be programmed. The number of keys that are programmed into the Passive Anti-Theft System (PATS) can be determined by viewing the Instrument Cluster (IC) PID N_KEYCODE.

NOTE: When in the unlimited key mode, the N_KEYCODE PID will always read 2 (after the first 2 keys have been programmed), no matter how many keys are programmed to the vehicle.

1. Turn the unprogrammed PATS key from the OFF position to the ON position.

2. From the scan tool, enter TOOLBOX. Select BODY - SECURITY - PATS Functions and follow the on-screen instructions to ENTER SECURITY ACCESS. For additional information, refer to Anti-Theft Security Access in this section.

3. **NOTE:** Make sure the selection made is "PROGRAM" (Program additional ignition key). If the "ERASE" (Ignition Key Code Erase) selection is made, all of the keys will be erased from the system.

   From the scan tool menu select: "Program additional ignition key" and follow the on-screen instructions.

4. Turn the key to the OFF position and disconnect the scan tool.

5. Start the vehicle with the new PATS key. The vehicle will now start with the new PATS key and also with the original PATS keys.

Spare Key Programming - Unlimited Key Mode

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Enabling Unlimited Key Mode

NOTE: Unlimited key mode is intended for use by those customers who need more than 8 keys for their vehicle.

NOTE: Before programming, the new key(s) must have the correct mechanical cut for the ignition lock cylinder(s).

NOTE: The unlimited key mode is set up by creating a special, unique unlimited transponder security key code and programming this key code into all of the vehicle keys so they contain the same key code.

NOTE: When in the unlimited key mode, the N_KEYCODE PID always reads 2, no matter how many keys are programmed to the vehicle (after the first 2 keys have been programmed).

1. The customer must choose an 8-digit number (except for 00000000 or 00000001) to be programmed into all of their vehicles keys (or, to all of the keys they want programmed to one vehicle). All customer vehicles keys (or all keys for one vehicle) need to use the same number. Valid digits are 0-9 and the letters A-F.

2. **NOTE:** If the Instrument Cluster (IC) UNL_KEY_ID PID is not available, unlimited key mode is turned on, and must be turned off before viewing the stored code. At this time, unlimited keys may be programmed to the vehicle(s). To view/change the stored code, follow the procedure for disabling the unlimited key mode below.

   Monitor the IC UNL_KEY_ID PID and compare its value against the code chosen in Step 1. It should not be the same key code.

3. From the scan tool, enter TOOLBOX. Select BODY-SECURITY-PATS Functions and follow the on-screen instructions to ENTER SECURITY ACCESS. This procedure takes approximately 10 minutes to carry out, during which time the ignition key must be in the ON position and the scan tool must be connected to the vehicle. For additional information, refer to Anti-Theft Security Access in this section.

4. Once in security access, select: "program unlimited key code" and follow the on-screen instructions. Enter the 8-digit code chosen by the customer in Step 1 of this procedure and follow the on-screen instructions.

5. Select: "unlimited key mode ON" and follow the on-screen instructions.

6. Select: "Ignition Key Code Erase" and follow the on-screen instructions.

7. Disconnect the scan tool and turn the ignition key to the OFF position (the key does not need to be removed at this time).

8. Turn the first Passive Anti-Theft System (PATS) key in the ignition lock cylinder to the ON position for 3 seconds.

9. Turn the first PATS key to the OFF position and remove the key from the ignition lock cylinder.

10. Insert the second PATS key into the ignition lock cylinder and turn the key to the ON position for 3 seconds.

11. The vehicle should now start with both PATS keys.

12. If it is desired to program additional key(s), refer to Key Programming Using Two Programmed Keys in this section for each additional key that needs to be programmed.

Disabling Unlimited Key Mode

NOTE: By disabling the unlimited key mode, the previous access code no longer operates the vehicle.

1. From the scan tool, enter TOOLBOX. Select BODY-SECURITY-PATS Functions and follow the on-screen instructions to ENTER SECURITY ACCESS. This procedure takes approximately 10 minutes to carry out, during which time the ignition key must be in the ON position and the scan tool must be connected to the vehicle. For additional information, refer to Anti-Theft Security Access in this section.

2. Select: "unlimited key mode OFF" and follow the on-screen instructions.

3. Select: "Ignition Key Code Erase" and follow the on-screen instructions.

4. Disconnect the scan tool and turn the ignition switch to the OFF position (the key does not need to be removed at this time).

5. Turn the first PATS key in the ignition lock cylinder to the ON position for 3 seconds.

6. Turn the first PATS key to the OFF position and remove the key from the ignition lock cylinder.

7. Insert the second PATS key into the ignition lock cylinder and turn the key to the ON position for 3 seconds.

8. **NOTE:** With the unlimited key mode turned off, a maximum of 8 keys can be programmed into the Instrument Cluster (IC) using the Key Programming Using Two Programmed Keys procedure in this section. The IC SPAREKEY PID must be enabled.

   If it is desired to program additional key(s), refer to Key Programming Using Two Programmed Keys in this section for each additional key (up to 8 keys, total) that needs to be programmed. The IC SPAREKEY PID must be enabled.

Passive Anti-Theft System (PATS) Parameter Reset

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

NOTE: A minimum of 2 Passive Anti-Theft System (PATS) keys must be programmed into the Instrument Cluster (IC) to complete this procedure and allow the vehicle to start.

1. Turn the key from the OFF position to the ON position.
2. From the scan tool, follow the on-screen instructions to ENTER SECURITY ACCESS. For additional information, refer to Anti-Theft Security Access in this section.
3. From the scan tool, select: Parameter Reset and follow the on-screen instructions.
4. **NOTE:** If the IC or the IC and the PCM were replaced, updated or reconfigured, follow Steps 4-9. All vehicle keys are erased during the parameter reset procedure. Verify at least 2 vehicle keys are available prior to carrying out the PATS parameter reset. If only the PCM was replaced, go to Step 9.

   From the scan tool, select: Ignition Key Code Erase and follow the on-screen instructions.
5. Turn the key to the OFF position and disconnect the scan tool.
6. Turn the key to the ON position for 6 seconds.
7. Turn the key to the OFF position and remove the key.
8. Insert the second PATS key into the ignition lock cylinder and turn the key to the ON position for 6 seconds.
9. Both keys now start the vehicle.
10. If more keys are required to be programmed, refer to Key Programming Using Two Programmed Keys in this section.
11. Program the Remote Keyless Entry (RKE) transmitter portion of the Integrated Keyhead Transmitter (IKT) PATS keys. For additional information, refer to Section 501-14 .

Anti-Theft Security Access

Special Tool(s)

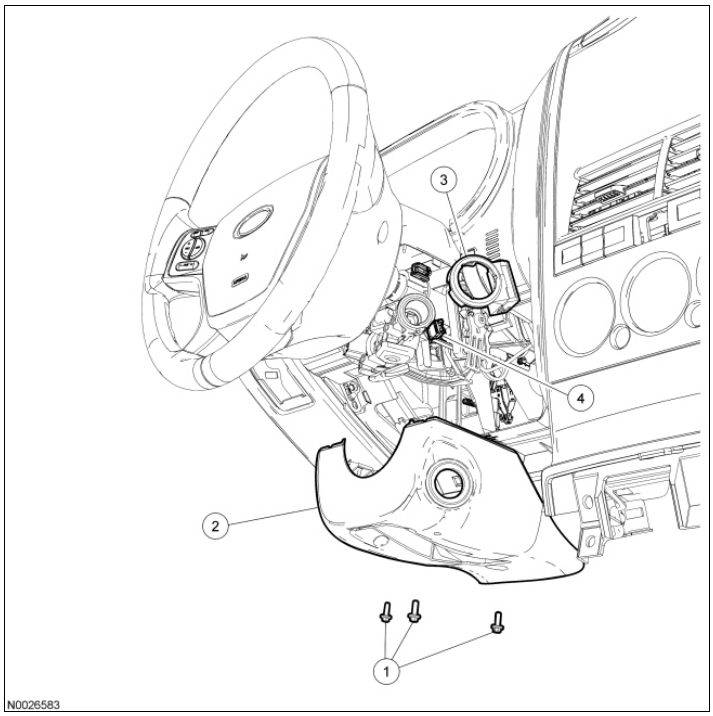
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

NOTE: The anti-theft security access procedure is used to obtain Passive Anti-Theft System (PATS) security access. PATS security access must be granted to erase ignition key codes, program ignition key codes, enable/disable unlimited key mode, set unlimited transponder key ID, reset Instrument Cluster (IC) or PCM parameters and enable/disable the spare key programming switch (PID SPAREKEY). The anti-theft security access procedure invokes a 10-minute time delay prior to granting security access during which the scan tool must remain connected to the vehicle. Once security access is granted, a security access command menu is displayed which offers various command options.

NOTE: Once security access has been granted, multiple security access commands should be executed (if necessary) prior to exiting the command menu. This avoids an additional security access procedure and the associated 10-minute time delay.

NOTE: If anti-theft security access has been entered to reset parameters, make sure to cycle the ignition several times, holding the key in each position for a minimum of 3 seconds. The vehicle may not start until the key has been cycled a minimum of 3 times. This allows the modules to send and receive the IDs after the parameter resets have occurred.

NOTE: When using the IDS , the IC and the PCM parameters are reset at the same time.



NOTE: Once security access has been granted for either the IC or the PCM, you can toggle between the 2 modules without having to wait an additional 10 minutes (if not using the IDS).

1. Turn the key from the OFF position to the ON position.

2. From the scan tool, enter TOOLBOX. Select BODY - SECURITY - PATS Functions and follow the on-screen instructions to ENTER SECURITY ACCESS. For additional information, refer to Anti-Theft Security Access in this section.

3. After the 10-minute security access procedure is completed, follow the on-screen instructions and a new menu is displayed with command options. Select only those functions required before exiting out of this menu. Do not select more functions than the procedure calls for. Once exited out of this menu, the security access procedure must be repeated again to carry out additional commands.

Passive Anti-Theft System (PATS) Transceiver

Item	Part Number	Description
1	-	Steering column shroud screws (3 required)
2	3530	Steering column shroud (lower)
3	15607	Passive Anti-Theft System (PATS) transceiver
4	-	PATS transceiver electrical connector (part of 14401)

Removal and Installation

1. Remove the steering column opening cover. For additional information, refer to Section 501-12 .

2. Remove the ignition lock cylinder. For additional information, refer to Section 501-14 .

3. Remove the 3 screws and the lower steering column shroud.

4. Remove the Passive Anti-Theft System (PATS) transceiver.
    1. Release the 2 tabs.
    2. Disconnect the electrical connector.

5. **NOTE:** Replacement of the PATS transceiver does not require the PATS keys to be programmed into the Instrument Cluster (IC) again.

   To install, reverse the removal procedure.

Universal Transmitter

Vehicles With Roof Opening Panel and Auxiliary A/C

The universal transmitter is an integral part of the LH sun visor.

All Other Vehicles

The universal transmitter is an integral part of the overhead console.

The universal transmitter provides a convenient way to substitute up to 3 hand-held transmitters with a single built-in device. The universal transmitter can learn the radio frequency codes of most current transmitters. The universal transmitter:

- operates garage doors, gates and home/office lighting and security systems.
- learns and transmits the radio frequency of up to 3 hand-held transmitters from any of the systems mentioned above.
- is powered by the vehicle battery and charging system.

Universal Transmitter

Special Tool(s)

 ST1137-A	73III Automotive Meter 105-R0057 or equivalent

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of electrical damage.

Visual Inspection Chart

Electrical
• Wiring, terminals or connectors • Universal transmitter • Receiver unit

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the cause is not visually evident, verify the symptom and GO to Symptom Chart .

Symptom Chart

Symptom Chart

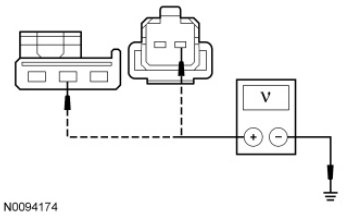
Pinpoint Tests

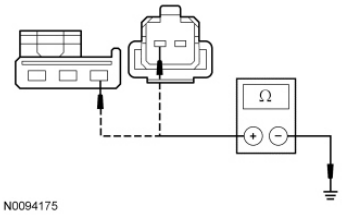
Pinpoint Test A: The Universal Transmitter Is Inoperative

Refer to Wiring Diagrams Cell 89 , Interior Lamps for schematic and connector information.

Normal Operation

Vehicles with roof opening panel and auxiliary A/C will have the universal transmitter located as an integral part of the LH sun visor. For all other vehicles, the universal transmitter is integral to the overhead console. The universal transmitter can be programmed to operate up to 3 garage doors, entry gates, security systems, and home or office lighting. Voltage is supplied from the battery saver relay in the Smart Junction Box (SJB) to the universal transmitter through circuit CLN01 (GN/VT) and the universal transmitter is grounded on circuit GD133 (BK).





This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Universal transmitter
- Receiver unit

PINPOINT TEST A: THE UNIVERSAL TRANSMITTER IS INOPERATIVE

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
A1 CHECK THE UNIVERSAL TRANSMITTER	
• Press any of the buttons on the universal transmitter. • **Does the universal transmitter LED illuminate?**	**Yes** GO to A2 . **No** GO to A3 .
A2 PROGRAM A HAND-HELD TRANSMITTER INTO THE UNIVERSAL TRANSMITTER	
• Program the universal transmitter. Refer to Universal Transmitter Programming in this section. • **Does the universal transmitter program successfully?**	**Yes** The universal transmitter is OK. VERIFY the receiver operates correctly. **No** INSTALL a new universal transmitter. For vehicles with roof opening panel and auxiliary A/C, REFER to Headliner in Section 501-05 . For all other vehicles, REFER to Overhead Console in Section 501-12 . TEST the system for normal operation.
A3 CHECK CIRCUIT CLN01 (GN/VT) FOR AN OPEN	

• Ignition OFF. • Disconnect: LH Vanity Mirror Lamp C907 (with roof opening panel and auxiliary A/C) or Universal Transmitter C928 (all other vehicles). • Ignition ON. • Measure the voltage between the universal transmitter C907-1 (with roof opening panel and auxiliary A/C) or C928-2 (all other vehicles), circuit CLN01 (GN/VT), harness side and ground.  N0094174 • **Is the voltage greater than 10 volts?**	**Yes** GO to A4 . **No** REPAIR the circuit. TEST the system for normal operation.
A4 CHECK CIRCUIT GD133 (BK) FOR AN OPEN	
• Ignition OFF. • Disconnect: Negative Battery Cable. • Measure the resistance between the universal transmitter C907-2 (with roof opening panel and auxiliary A/C) or C928-1 (all other vehicles), circuit GD133 (BK), harness side and ground.  N0094175 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new universal transmitter. For vehicles with roof opening panel and auxiliary A/C, REFER to Headliner in Section 501-05 . For all other vehicles, REFER to Overhead Console in Section 501-12 . TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.

Universal Transmitter Programming

NOTE: A new battery in the hand-held transmitter may allow quicker and easier training due to a more accurate transmission of the radio frequency signal.

1. Verify the hand-held transmitter is operative.

2. Turn the key to the ON position.

3. Prepare for programming the universal transmitter by erasing all 3 channels by holding down the 2 outside buttons until the red light begins to flash (20-30 seconds). Release both buttons.

4. Select 1 of the 3 universal transmitter buttons to be used for programming.

5. Hold the end of the hand-held transmitter 25-76 mm (1-3 in) away from the front surface of the universal transmitter so that the universal transmitter red light can still be seen.

6. **NOTE:** During programming, the hand-held transmitter may automatically stop transmitting after 2 seconds, which may not be long enough to program the universal transmitter. If programming with this type of hand-held transmitter, continue to hold the button on the universal transmitter while pressing and releasing the hand-held transmitter button every 2 seconds.

   At the same time, press the hand-held transmitter button and the desired button on the universal transmitter until the red light on the universal transmitter flashes first slowly, and then rapidly. Release both buttons when the rapid flashing begins.

7. Firmly press and hold for 5 seconds, then release the just-trained universal transmitter button up to 2 separate times to activate the door. If after 2 separate times, the door still does not activate, press and hold the just-trained universal transmitter button and observe the indicator light.
   - If the indicator light stays on constantly, programming is complete and the device should activate when the universal transmitter button is pressed and released.
   - If the indicator light blinks rapidly for 2 seconds and then turns to a constant light, follow the Training a Garage Door Opener Equipped With "Rolling Codes" procedure to complete the programming of a rolling code equipped device.

Training a Garage Door Opener Equipped With "Rolling Codes"

1. At the garage door opener receiver (motor-head unit) in the garage, locate the "learn" or "smart" button. This can usually be found where the hanging antenna wire is attached to the motor-head unit.

2. Firmly press and release the "learn" or "smart" button. (The name and color of the button may vary by manufacturer.) There are 30 seconds to initiate step 3.

3. Return to the vehicle and firmly press, hold for 2 seconds and release the programmed universal transmitter button. Repeat the press/hold/release sequence a second time, and depending on the brand of the garage door opener (or other rolling code equipped device), repeat this sequence a third time to complete the programming process.

Torque Specifications

Description	Nm	lb-in
Parking brake control bolts	20	177

Module Controlled Functions

NOTE: The Smart Junction Box (SJB) is also known as the Generic Electronic Module (GEM).

The 2 multifunction electronic modules on this vehicle are the:

- Driver Seat Module (DSM)
- Smart Junction Box (SJB)

Driver Seat Module (DSM)

The Driver Seat Module (DSM) is located under the driver seat. The DSM controls the memory functions of the memory seat positions and the adjustable pedals. The memory driver seat feature allows the driver to program a personalized seat position that can be recalled using the memory switches or the Remote Keyless Entry (RKE) transmitter. Refer to Section 501-14 .

Smart Junction Box (SJB)

The SJB (located under the instrument panel on the driver side) is a combination of a multifunction electronic module and an interior junction box. The SJB functions control multiple systems, which include:

- Accessory delay
- Battery saver
- Exterior lighting
- Heated rear window and mirrors
- Horn
- Illuminated entry and interior lighting
- Power door locks
- RKE system/keyless entry keypad
- Tire Pressure Monitoring System (TPMS)
- Warning chimes
- Windshield wiper

Diagnostic Trouble Code (DTC) Chart

NOTE: Most powertrain (P-code) DTCs are diagnosed in the Powertrain Control/Emissions Diagnosis (PC/ED) manual. If the P-code retrieved is not listed below, refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual to continue diagnostics.

NOTE: The Smart Junction Box (SJB) is also known as the Generic Electronic Module (GEM).

NOTE: Some of these modules utilize a 5-character DTC followed by a 2-character failure-type code. The failure-type code provides information about specific fault conditions such as opens, or shorts to ground. Continuous memory DTCs have an additional 2-character DTC status code suffix to assist in determining DTC history.

B1374	Illuminated Entry Relay Short to Ground	SJB	REFER to Section 417-02 .
B1396	Power Door Lock Circuit Short to Battery	SJB	REFER to Section 501-14 .
B1397	Power Door Unlock Circuit Short to Battery	SJB	REFER to Section 501-14 .
B1472	Lamp Headlamp Input Circuit Short to Ground	SJB	REFER to Section 417-01 .
B1483	Brake Pedal Input Circuit Failure	ABS module	REFER to Section 206-09 .
B1499	Lamp Turn Signal Left Circuit Failure	SJB	REFER to Section 417-01 .
B1502	Lamp Turn Signal Left Circuit Short to Ground	SJB	REFER to Section 417-01 .
B1503	Lamp Turn Signal Right Circuit Failure	SJB	REFER to Section 417-01 .
B1506	Lamp Turn Signal Right Circuit Short to Ground	SJB	REFER to Section 417-01 .
B1510	Flash-To-Pass Switch Circuit Short to Ground	SJB	REFER to Section 417-01 .
B1530	Memory Set Switch Circuit Short to Ground	DSM	REFER to Section 501-10 .
B1534	Memory 1 Switch Circuit Short to Ground	DSM	REFER to Section 501-10 .
B1538	Memory 2 Switch Circuit Short to Ground	DSM	REFER to Section 501-10 .
B1555	Ignition Run/Start Circuit Failure	4X4 control module	REFER to Section 308-07A .
B1555	Ignition Run/Start Circuit Failure	SJB	REFER to Section 211-05 .
B1570	Lamp Headlamp High-Beam Circuit Short to Ground	SJB	REFER to Section 417-01 .
B1571	Door Ajar LR Circuit Failure	SJB	REFER to Section 417-02 .
B1578	Lamp Park Input Circuit Short to Ground	SJB	REFER to Section 417-01 .
B1600	PATS Ignition Key Transponder Signal is Not Received	IC	REFER to Section 419-01 .
B1601	PATS Received Incorrect Key-Code From Ignition Key Transponder	IC	REFER to Section 419-01 .
B1602		IC	REFER to Section 419-01 .

	PATS Received Invalid Format Of Key-Code From Ignition Key Transponder		
B1663	Seat Driver Front Up/Down Motor Stalled	DSM	REFER to Section 501-10 .
B1664	Seat Driver Rear Up/Down Motor Stalled	DSM	REFER to Section 501-10 .
B1665	Seat Driver Forward/Backward Motor Stalled	DSM	REFER to Section 501-10 .
B1666	Seat Driver Recline Motor Stalled	DSM	REFER to Section 501-10 .
B1676	Battery Pack Voltage Out of Range	ABS module	REFER to Section 206-09 .
B1676	Battery Pack Voltage Out of Range	HVAC module	REFER to Section 412-00 .
B1681	PATS Transceiver Module Signal is not Received	IC	REFER to Section 419-01 .
B1687	Lamp Dome Input Circuit Short to Battery	SJB	REFER to Section 417-02 .
B1688	Lamp Dome Input Circuit Short to Ground	SJB	REFER to Section 417-02 .
B1696	Autolamp On Circuit Short-to-ground	SJB	REFER to Section 417-01 .
B1703	Seat Driver Recline Forward Switch Circuit Short to Battery	DSM	REFER to Section 501-10 .
B1707	Seat Driver Recline Rearward Switch Circuit Short to Battery	DSM	REFER to Section 501-10 .
B1711	Seat Driver Front Up Switch Circuit Short to Battery	DSM	REFER to Section 501-10 .
B1715	Seat Driver Front Down Switch Circuit Short to Battery	DSM	REFER to Section 501-10 .
B1719	Seat Driver Forward Switch Circuit Short to Battery	DSM	REFER to Section 501-10 .
B1723	Seat Driver Rearward Switch Circuit Short to Battery	DSM	REFER to Section 501-10 .
B1727	Seat Driver Rear Up Switch Circuit Short to Battery	DSM	REFER to Section 501-10 .
B1731	Seat Driver Rear Down Switch Circuit Short to Battery	DSM	REFER to Section 501-10 .
B1791	Autolamp Sensor Input Circuit Open	SJB	REFER to Section 417-01 .
B1793	Autolamp Sensor Input Circuit Short to Ground	SJB	REFER to Section 417-01 .
B1795	Lamp Headlamp Low Beam Circuit Open	SJB	REFER to Section 417-01 .
B1797	Lamp Headlamp Low Beam Circuit Short to Ground	SJB	REFER to Section 417-01 .
B1868	Lamp Air Bag Warning Indicator Circuit Failure	IC	REFER to Section 413-01 .

B1884	PAD Warning Lamp Circuit Failure	RCM	REFER to Section 501-20B .
B1890	PAD Warning Lamp Circuit Short to Battery	RCM	REFER to Section 501-20B .
B1915	Air Bag Driver Circuit Failure	IC	REFER to Section 413-01 .
B1952	Seat Rear Up/Down Feedback Position Circuit Short to Battery	DSM	REFER to Section 501-10 .
B1953	Seat Rear Up/Down Feedback Position Circuit Short to Ground	DSM	REFER to Section 501-10 .
B1956	Seat Front Up/Down Position Feedback Circuit Short to Battery	DSM	REFER to Section 501-10 .
B1957	Seat Front Up/Down Position Feedback Circuit Short to Ground	DSM	REFER to Section 501-10 .
B1960	Seat Recline Forward/Backward Feedback Circuit Short to Battery	DSM	REFER to Section 501-10 .
B1961	Seat Recline Forward/Backward Feedback Circuit Short to Ground	DSM	REFER to Section 501-10 .
B1964	Seat Horizontal Forward/Rearward Position Feedback Circuit Short to Battery	DSM	REFER to Section 501-10 .
B1965	Seat Horizontal Forward/Rearward Position Feedback Circuit Short to Ground	DSM	REFER to Section 501-10 .
B1982	Driver's Door Unlock Relay Coil Circuit Failure	SJB	REFER to Section 501-14 .
B1983	Driver's Door Unlock Relay Coil Circuit Short to Battery	SJB	REFER to Section 501-14 .
B1A01:01	Speaker #1: General Electrical Failure	ACM	REFER to Section 415-00 .
B1A02:01	Speaker #2: General Electrical Failure	ACM	REFER to Section 415-00 .
B1A03:01	Speaker #3: General Electrical Failure	ACM	REFER to Section 415-00 .
B1A04:01	Speaker #4: General Electrical Failure	ACM	REFER to Section 415-00 .
B1A05:01	Speaker #5: General Electrical Failure	ACM	REFER to Section 415-00 .
B1A56:21	Antenna: Signal Amplitude	ACM	REFER to Section 415-00 .
B1A89:01	Satellite Antenna: General Electrical Failure	ACM	REFER to Section 415-00 .
B1A89:13	Satellite Antenna: Circuit Open	ACM	REFER to Section 415-00 .
B1D19:49	Compact Disc Unit: Internal Electronic Failure	ACM	REFER to Section 415-00 .
B1D19:4B	Compact Disc Unit: Over Temperature	ACM	REFER to Section 415-00 .
B1D78:13	Auxiliary Input: Circuit Open	ACM	REFER to Section 415-00 .
B1D79:01	Microphone Input: General Electrical Failure	ACM	REFER to Section 415-00 .

B1D79:01	Microphone Input: General Electrical Failure	APIM	REFER to Section 415-00 .
B2008	Wipers on Signal Circuit Short to Ground	SJB	REFER to Section 417-01 .
B2026	Incandescent Backlighting Output Circuit Failure	SJB	REFER to Section 413-00 .
B2027	LED Backlighting Output Circuit Failure	SJB	REFER to Section 413-00 .
B2030	Front Fog Lamps Relay Coil Circuit Failure	SJB	REFER to Section 417-01 .
B2048	Left Rear Turn Lamp Circuit Short to Ground	SJB	REFER to Section 417-01 .
B2049	Left Rear Turn Lamp Circuit Open	SJB	REFER to Section 417-01 .
B2050	Right Rear Turn Lamp Circuit Short to Ground	SJB	REFER to Section 417-01 .
B2051	Right Rear Turn Lamp Circuit Open	SJB	REFER to Section 417-01 .
B2070	Trailer Tow Relay Coil(s) Circuit Failure	SJB	REFER to Section 417-01 .
B2071	Hazard Switch/Circuit Short to Ground	SJB	REFER to Section 417-01 .
B2077	Lift Gate Ajar Switch/Circuit Failure	SJB	REFER to Section 417-02 .
B2084	Memory SET Indicator Short to Ground	DSM	REFER to Section 501-10 .
B2089	Puddle/Approach Lamp Fault	SJB	REFER to Section 417-02 .
B2097	Compass Module Failure	IC	REFER to Section 413-01 .
B2103	Antenna Not Connected	ACM	REFER to Section 415-00 .
B2103	Antenna Not Connected	IC	REFER to Section 419-01 .
B2121	Illumination Switch Short to Battery	SJB	REFER to Section 413-00 .
B2132	Dimmer Switch Circuit Short to Ground	SJB	REFER to Section 413-00 .
B2139	Data Mismatch (Receive Data Does Not Match What Was Expected)	PRB module	REFER to Section 501-08 .
B2141	NVM Configuration Failure	IC	REFER to Section 419-01 .
B2141	NVM Configuration Failure	SJB	REFER to Smart Junction Box (SJB) in this section.
B2143	NVM Memory Failure	DSM	REFER to Driver Seat Module (DSM) in this section.
B2143	NVM Memory Failure	IC	REFER to Section 413-01 .
B2250	All Door's Unlock Relay Circuit Failure	SJB	REFER to Section 501-14 .
B2254	Front Fog Lamp Switch Failure	SJB	REFER to Section 417-01 .
B2266	Left Side Blend Door Circuit Failure	HVAC module	REFER to Section 412-00 .
B2267		HVAC module	REFER to Section 412-00 .

	Right Side Blend Door Circuit Failure		
B2276	Less Than 2 Transmitters Programmed	SJB	REFER to Section 501-14 .
B2281	Right Turn Switch Short to Ground	SJB	REFER to Section 417-01 .
B2282	Left Turn Switch Short to Ground	SJB	REFER to Section 417-01 .
B2290	Occupant Classification System Fault	OCSM	REFER to Section 501-20B .
B2290	Occupant Classification System Fault	RCM	REFER to Section 501-20B .
B2292	Restraint System - Seatbelt Pretensioner Fault	RCM	REFER to Section 501-20B .
B2293	Restraint System - Airbag Fault	RCM	REFER to Section 501-20B .
B2294	Restraint System - Curtain Fault	RCM	REFER to Section 501-20B .
B2295	Restraint System - Side Airbag Fault	RCM	REFER to Section 501-20B .
B2296	Restraint System - Impact Sensor Fault	RCM	REFER to Section 501-20B .
B229A	Occupant Classification Sensor Contamination	OCSM	REFER to Section 501-20B .
B229B	Occupant Classification System Obstruction	OCSM	REFER to Section 501-20B .
B2382	Backup Light Relay Circuit Open	SJB	REFER to Section 417-01 .
B2404	Audio Steering Wheel Switch Circuit Fault	ACM	REFER to Section 415-00 .
B2405	Audio Disc CD Player Thermal Shutdown Fault	ACM	REFER to Section 415-00 .
B2406	Audio Disc CD Player Internal Fault	ACM	REFER to Section 415-00 .
B2407	Backup Light Relay Circuit High	SJB	REFER to Section 417-01 .
B2425	Remote Keyless Entry Out of Synchronization	SJB	REFER to Section 501-14 .
B2431	Transponder Programming Failed	IC	REFER to Section 419-01 .
B2434	Driver Seat Belt Buckle Switch Circuit Short to Ground	RCM	REFER to Section 501-20B .
B2435	Driver Seat Belt Buckle Switch Resistance Out of Range	RCM	REFER to Section 501-20B .
B2438	Passenger Seat Belt Buckle Switch Circuit Short to Ground	RCM	REFER to Section 501-20B .
B2439	Passenger Seat Belt Buckle Switch Resistance Out of Range	RCM	REFER to Section 501-20B .
B2477	Module Configuration Failure	ABS module	REFER to Section 418-01 .
B2477	Module Configuration Failure	ACM	REFER to Section 418-01 .
B2477	Module Configuration Failure	DSM	REFER to Section 418-01 .
B2477	Module Configuration Failure	HVAC module	REFER to Section 418-01 .
B2477	Module Configuration Failure	IC	REFER to Section 418-01 .

B2477	Module Configuration Failure	OCSM	REFER to Section 501-20B .
B2477	Module Configuration Failure	PAM	REFER to Section 418-01 .
B2477	Module Configuration Failure	RCM	REFER to Section 418-01 .
B2477	Module Configuration Failure	RETM	REFER to Section 418-01 .
B2477	Module Configuration Failure	SDARS module	REFER to Section 418-01 .
B2477	Module Configuration Failure	SJB	REFER to Section 418-01 .
B2501	LF Lamp Low Beam Circuit Failure	SJB	REFER to Section 417-01 .
B2503	RF Lamp Low Beam Circuit Failure	SJB	REFER to Section 417-01 .
B2505	LF Lamp High Beam Circuit Failure	SJB	VERIFY the bulbs meet OEM specifications. REFER to Section 417-01 .
B2507	RF Lamp High Beam Circuit Failure	SJB	VERIFY the bulbs meet OEM specifications. REFER to Section 417-01 .
B2512	Front Fog Lamps Relay Coil Circuit Short to Battery	SJB	REFER to Section 417-01 .
B2574	Driver's Door LOCK Switch Short to Ground	SJB	REFER to Section 501-14 .
B2575	Driver's Door UNLOCK Switch Short to Ground	SJB	REFER to Section 501-14 .
B2607	Harness/Configuration Mismatch	RCM	REFER to Section 501-20B .
B2656	DVD (Digital Versatile Disk) Error	RETM	REFER to Section 415-00 .
B2667	Liftglass Release Switch Circuit Failure	SJB	REFER to Section 501-14 .
B2670	Liftglass Release Relay Coil Short to Vbatt	SJB	REFER to Section 501-14 .
B2671	Liftglass Release Relay Coil Circuit Failure	SJB	REFER to Section 501-14 .
B2691	Seat Belt Buckle Switch Circuit Fault, Front Driver Seat	RCM	REFER to Section 501-20B .
B2692	Front Passenger Seat Belt Buckle Switch Circuit Fault	RCM	REFER to Section 501-20B .
B2695	Keypad_A Switch Circuit Failure	SJB	REFER to Section 501-14 .
B2696	Keypad_B Switch Circuit Failure	SJB	REFER to Section 501-14 .
B2697	Keypad_C Switch Circuit Failure	SJB	REFER to Section 501-14 .
B2741	Sensor Cluster Defective	ABS module	REFER to Section 206-09 .
B2792	Cross Link Between Firing Loops	RCM	REFER to Section 501-20B .
B2794	Third Row Power Fold Circuit Failure	SJB	VERIFY the module is configured on for this option. REFER to Section 501-10 .
B2813	LH Power Running Board Stow Time Fail	PRB module	REFER to Section 501-08 .
B2814	LH Power Running Board Deploy Time Fail	PRB module	REFER to Section 501-08 .

B2816	RH Power Running Board Stow Time Fail	PRB module	REFER to Section 501-08 .
B2817	RH Power Running Board Deploy Time Fail	PRB module	REFER to Section 501-08 .
B2868	Left Front Tire Pressure Sensor Fault	SJB	CARRY OUT the TPMS sensor training in order to clear the DTC. REFER to Section 204-04 .
B2869	Right Front Tire Pressure Sensor Fault	SJB	CARRY OUT the TPMS sensor training in order to clear the DTC. REFER to Section 204-04 .
B2870	Right Rear Tire Pressure Sensor Fault	SJB	CARRY OUT the TPMS sensor training in order to clear the DTC. REFER to Section 204-04 .
B2871	Left Rear Tire Pressure Sensor Fault	SJB	CARRY OUT the TPMS sensor training in order to clear the DTC. REFER to Section 204-04 .
B2872	Tire Pressure Sensor Fault	SJB	Replacement of the SJB will not resolve this concern. REFER to Section 204-04 .
B287A	Tire Pressure System Fault	SJB	REFER to Section 204-04 .
B2900	VIN Mismatch	ABS module	REFER to Section 418-01 .
B2924	Audio Button Stuck	ACM	REFER to Section 415-00 .
B2924	Audio Button Stuck	RETM	REFER to Section 415-00 .
B2965	Audio System Speaker Circuit Fault	ACM	REFER to Section 415-00 .
B2984	Deployable Steering Column Circuit Open	RCM	REFER to Section 501-20B .
B2985	Deployable Steering Column Circuit Short to Battery	RCM	REFER to Section 501-20B .
B2986	Deployable Steering Column Circuit Short to Ground	RCM	REFER to Section 501-20B .
B2987	Deployable Steering Column Circuit Resistance Low on Squib	RCM	REFER to Section 501-20B .
C1095	ABS Hydraulic Pump Motor Circuit Failure	ABS module	REFER to Section 206-09 .
C1145	Speed Wheel Sensor RF Input Circuit Failure	ABS module	REFER to Section 206-09 .
C1155	Speed Wheel Sensor LF Input Circuit Failure	ABS module	REFER to Section 206-09 .
C1165	Speed Wheel Sensor RR Input Circuit Failure	ABS module	REFER to Section 206-09 .
C1175	Speed Wheel Sensor LR Input Circuit Failure	ABS module	REFER to Section 206-09 .
C1233	Speed Wheel LF Input Signal Missing	ABS module	REFER to Section 206-09 .
C1234	Speed Wheel RF Input Signal Missing	ABS module	REFER to Section 206-09 .
C1235	Speed Wheel RR Input Signal Missing	ABS module	REFER to Section 206-09 .

C1236	Speed Wheel LR Input Signal Missing	ABS module	REFER to Section 206-09 .
C1277	Steering Wheel Angle 1 and 2 Circuit Failure	ABS module	REFER to Section 206-09 .
C1278	Steering Wheel Angle 1 and 2 Signal Faulted	ABS module	REFER to Section 206-09 .
C1279	Yaw Rate Sensor Circuit Failure	ABS module	REFER to Section 206-09 .
C1280	Yaw Rate Sensor Signal Fault	ABS module	REFER to Section 206-09 .
C1281	Lateral Accelerometer Circuit Failure	ABS module	REFER to Section 206-09 .
C1282	Lateral Accelerometer Signal Fault	ABS module	REFER to Section 206-09 .
C1285	Booster Solenoid Circuit Failure	ABS module	REFER to Section 206-09 .
C1287	Booster Pedal Force Switch Circuit Failure	ABS module	REFER to Section 206-09 .
C1288	Pressure Transducer Main/Primary Input Circuit Failure	ABS module	REFER to Section 206-09 .
C1414	Incorrect Module Design Level	RCM	REFER to Section 501-20B .
C1440	Pressure Transducer Main/Primary Signal Faulted	ABS module	REFER to Section 206-09 .
C1446	Brake Switch Circuit Failure	SJB	REFER to Section 417-01 .
C1470	TCS Function Temporarily Disabled (Thermal Brake Protection)	ABS module	REFER to Section 206-09 .
C1516	Roll Rate Sensor Signal Fault	ABS module	REFER to Section 206-09 .
C1517	Roll Rate Sensor Circuit Failure	ABS module	REFER to Section 206-09 .
C1699	Left Rear Sensor Circuit Short to Vbat	PAM	REFER to Section 413-13 .
C1700	Left Rear Sensor Circuit Failure or Blockage	PAM	REFER to Section 413-13 .
C1701	Left Rear Sensor Circuit Fault	PAM	REFER to Section 413-13 .
C1702	Right Rear Sensor Circuit Short to Vbat	PAM	REFER to Section 413-13 .
C1703	Right Rear Sensor Circuit Failure or Blockage	PAM	REFER to Section 413-13 .
C1704	Right Rear Sensor Circuit Fault	PAM	REFER to Section 413-13 .
C1705	Left Rear Center Sensor Circuit Short to Vbat	PAM	REFER to Section 413-13 .
C1706	Left Rear Center Sensor Circuit Failure	PAM	REFER to Section 413-13 .
C1707	Left Rear Center Sensor Circuit Fault	PAM	REFER to Section 413-13 .
C1708	Right Rear Center Sensor Circuit Short to Vbat	PAM	REFER to Section 413-13 .
C1709	Right Rear Center Sensor Circuit Failure	PAM	REFER to Section 413-13 .
C1710	Right Rear Center Sensor Circuit Fault	PAM	REFER to Section 413-13 .

C1729	Transfer Case Unable to Transition Between 4H and 4L	4X4 control module	REFER to Section 308-07A .
C1742	Rear Sounder Circuit Failure	PAM	REFER to Section 413-13 .
C1743	Rear Sounder Circuit Short to Vbatt	PAM	REFER to Section 413-13 .
C1788	Stoplamp Relay Output Circuit Short to Ground	SJB	REFER to Section 417-01 .
C1805	Mismatched PCM and/or ABS-TC Module	ABS module	REFER to Section 206-09 .
C1941	Zero Seat Weight Test Failure	OCSM	REFER to Section 501-20B .
C1946	Front Driver's Seat Track Position Switch Circuit Open	RCM	REFER to Section 501-20B .
C1947	Front Driver's Seat Track Position Switch Circuit Short to Ground	RCM	REFER to Section 501-20B .
C1948	Front Driver's Seat Track Position Switch Circuit Resistance Out of Range	RCM	REFER to Section 501-20B .
C1961	Park Lamp Relay Coil Circuit Failure	SJB	REFER to Section 417-01 .
C1963	Stability Control Inhibit Warning	ABS module	REFER to Section 206-09 .
C1970	4x4 Low Mode Switch LED Short to Battery	4X4 control module	REFER to Section 308-07A .
C1971	4x4 Low Mode Switch LED Circuit Failure	4X4 control module	REFER to Section 308-07A .
C1981	Front Driver's Seat Track Position Switch Circuit Fault	RCM	REFER to Section 501-20B .
C1991	Module Calibration Failure	ABS module	REFER to Section 206-09 .
C1996	Active Yaw and Roll Stability Control Disabled	ABS module	REFER to Section 206-09 .
C2769	Longitudinal Acceleration Sensor Electrical Failure	ABS module	REFER to Section 206-09 .
C2770	Longitudinal Acceleration Sensor Plausibility Failure	ABS module	REFER to Section 206-09 .
C2777	Sensor Cluster BUS Failure	ABS module	REFER to Section 206-09 .
C2778	Sensor Power Supply Failure	ABS module	REFER to Section 206-09 .
C2780	ECU in Manufacturer Sub-State	SJB	CARRY OUT the TPMS sensor training in order to clear the DTC. REFER to Section 204-04 .
P0218	Transmission Fluid Over Temperature Condition	Transmission Control Module (TCM)	REFER to Section 307-01B .
P0512	Starter Request Circuit	PCM	REFER to Section 303-06 .
P0562	System Voltage Low	TCM	REFER to Section 307-01B .
P0563	System Voltage High	TCM	REFER to Section 307-01B .
P0605	Powertrain Control Module EEPROM Error	TCM	REFER to Section 307-01B .
P0613	Transmission Control Module Processor	TCM	REFER to Section 307-01B .

P0620	Generator Control Circuit	PCM	REFER to Section 414-00 .
P062F	Powertrain Control Module EEPROM Error	TCM	REFER to Section 307-01B , Mechatronic Assembly.
P0634	PCM/ ECM / TCM Internal Temperature Too High	TCM	REFER to Section 307-01B .
P0641	Sensor Reference Voltage A Circuit/Open	TCM	REFER to Section 307-01B .
P0657	Actuator Supply Voltage A Circuit/Open	TCM	REFER to Section 307-01B .
P0658	Actuator Supply Voltage A Circuit Low	TCM	REFER to Section 307-01B .
P0659	Actuator Supply Voltage A Circuit High	TCM	REFER to Section 307-01B .

Smart Junction Box (SJB)

Special Tool(s)

 ST1137-A	73III Automotive Meter 105-R0057 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
 ST2574-A	Flex Probe Kit 105-R025C or equivalent

Principles of Operation

NOTE: The Smart Junction Box (SJB) is also known as the Generic Electronic Module (GEM).

The SJB receives inputs and delivers outputs to electronically-controlled features of the vehicle. The SJB constantly monitors the systems under its control and reports a concern in the form of a DTC. The DTC can be retrieved with a scan tool through the Medium Speed Controller Area Network (MS-CAN).

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of electrical damage.

Visual Inspection Chart

Electrical
• Battery Junction Box (BJB) fuses: ♦ 1 (50A) ♦ 2 (50A) ♦ 3 (50A) • Smart Junction Box (SJB) fuse 2 (5A) • Wiring, terminals or connectors • SJB

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM .
   - Refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the SJB .

9. If the DTCs retrieved are related to the concern, refer to Diagnostic Trouble Code (DTC) Chart in this section.

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

DTC Charts

Smart Junction Box (SJB) DTC Chart

DTC	Description	Action
B106E	Module Output Pin Disabled To Protect From External Fault	**NOTE:** External fault must be repaired before this DTC is cleared. GO to Pinpoint Test A .
B106F	Module Disabled Due to External Fault	GO to Pinpoint Test A .
B1317	Battery Voltage High	GO to Pinpoint Test B .
B1318	Battery Voltage Low	GO to Pinpoint Test C .
B1342	ECU is Faulted	CLEAR the DTCs. REPEAT the self-test. If DTC B1342 is retrieved again, INSTALL a new SJB . REFER to Smart Junction Box (SJB) in this section. TEST the system for normal operation.
B2141	NVM Configuration Failure	CONFIGURE the SJB . REFER to Section 418-01 . CLEAR the DTCs. RETRIEVE the DTCs and VERIFY successful module

		configuration. If DTC B2141 is retrieved again, INSTALL a new SJB . REFER to Smart Junction Box (SJB) in this section. REPEAT the self-test.
U0155	Lost Communication With Instrument Panel Cluster (IC) Control Module	GO to Pinpoint Test D .
U0164	Lost Communication With HVAC Control Module (EATC)	Replacement of the SJB will not resolve this concern. CLEAR the DTCs. REPEAT the self-test. If the DTC is retrieved again, GO to Pinpoint Test E .
All other DTCs	-	REFER to Diagnostic Trouble Code (DTC) Chart in this section.

Symptom Chart

Symptom Chart

Pinpoint Tests

Pinpoint Test A: DTC B106E/B106F

Normal Operation

The Smart Junction Box (SJB) controls the output of the Daytime Running Lamps (DRL), fog lamps, one-touch down driver power window, accessory delay relay, windshield wiper park/run, windshield wiper speed, and windshield washer. When a repetitive fault causing a circuit overload is detected on any of the output circuits, the SJB disables the circuit by removing voltage, or ground, to the affected circuit. The circuit remains disabled until the fault is corrected and an on-demand self-test is run. After the on-demand self-test has been run, any DTCs related to the fault will be cleared.

- DTC B106E (Module Output Pin Disabled To Protect From External Fault) - sets when the SJB has temporarily disabled a circuit due to a repetitive fault causing a circuit overload. A corresponding DTC for the circuit in question will also set as follows:
  - DTC B106F (Module Disabled Due to External Fault) - sets when one or more output functions are permanently disabled due to a repetitive circuit overload fault. DTC B106F will be set with DTC B106E. When DTC B106F is present, the SJB must be replaced after the fault condition has been corrected.
  - DTC B1304 (Accessory Delay Relay Coil Circuit Short to Battery) - Accessory delay relay circuit short to battery voltage
  - DTC B2512 (Front Fog Lamp Relay Ckt Short to Battery) - Fog lamp relay circuit short to battery voltage
  - DTC B2973 (Daytime Running Lamp Output Shorted to Ground) - DRL output short to ground

This pinpoint test is intended to diagnose the following:

- Output circuit short to ground or voltage
- SJB

PINPOINT TEST A: DTCs B106E/B106F

NOTICE: **If DTC B106F is present and the Smart Junction Box (SJB) is to be replaced, the fault condition must be corrected first. Failure to correct the fault condition first may cause damage to the new SJB , resulting in a repeat repair.**

Test Step	Result / Action to Take
A1 CHECK FOR DTC B106E	
• Review the DTCs from the SJB self-test. • **Is DTC B106E present?**	**Yes** GO to A2 . **No** GO to A3 .
A2 CHECK FOR OTHER DTCs	
• Review the DTCs from the SJB self-test. • **Are any SJB DTCs present other than DTC B106E?**	**Yes** CORRECT any other DTCs. REFER to the Diagnostic Trouble Code (DTC) Chart in this section. REPEAT the self-test (on-demand DTCs). **No** CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
A3 CHECK FOR DTC B106F	
• Review the DTCs from the SJB self-test. • **Is DTC B106F present?**	**Yes** CORRECT any other DTCs. REFER to Diagnostic Trouble Code (DTC) Chart in this section. INSTALL a new SJB . REFER to Smart Junction Box (SJB) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern was caused by a fault in one of the output circuits.

Pinpoint Test B: DTC B1317

Refer to Wiring Diagrams Cell 117 , Remote Keyless Entry and Alarm for schematic and connector information.

Normal Operation

The Smart Junction Box (SJB) monitors the voltage from the battery to determine if it goes above or below specific thresholds and sets DTC B1317 in continuous memory if the SJB detects high battery voltage above 15 volts on circuit SBB01 (RD).

- DTC B1317 (Battery Voltage High) - a continuous memory DTC that sets when the SJB detects battery voltage above 15 volts on circuit SBB01 (RD).

This pinpoint test is intended to diagnose the following:

- Charging system concern
- SJB

PINPOINT TEST B: DTC B1317

NOTE: DTC B1317 may be stored in the module memory due to previous battery charging or vehicle jump starting events.

Test Step	Result / Action to Take
B1 CHECK FOR DTC B1317, B1676 OR P0563 SET IN OTHER MODULES	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: (All Modules) Self-Test. • Retrieve the continuous memory DTCs from all modules. • **Is DTC B1317, B1676 or P0563 (PCM) set in more than one module?**	**Yes** REFER to Section 414-00 to diagnose an overcharging condition. **No** GO to B2 .
B2 CHECK THE BATTERY VOLTAGE	
• Turn off all interior/exterior lights and accessories. • Start and run the engine at approximately 2,000 rpm for 3 minutes while monitoring the battery voltage. • **Does the battery voltage rise to 15 volts or higher?**	**Yes** REFER to Section 414-00 to diagnose an overcharging condition. **No** GO to B3 .
B3 RECHECK FOR DTC B1317	
• Turn the engine off. • Ignition ON. • Enter the following diagnostic mode on the scan tool: SJB Self-Test. • Clear the continuous memory DTCs. • Carry out the SJB self-test. • **Is DTC B1317 present?**	**Yes** INSTALL a new SJB . REFER to Smart Junction Box (SJB) in this section. TEST the system for normal operation. **No** The system is operating normally at this time. The DTC may have been set previously during battery charging or while jump starting the vehicle.

Pinpoint Test C: DTC B1318

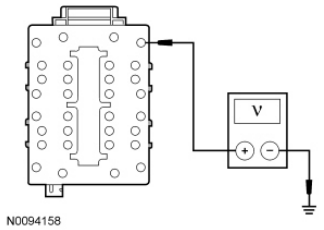
Refer to Wiring Diagrams Cell 117 , Remote Keyless Entry and Alarm for schematic and connector information.

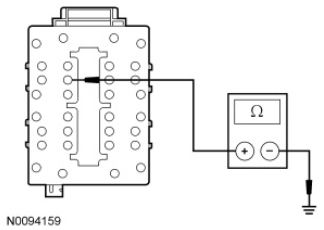
Normal Operation

The Smart Junction Box (SJB) monitors the voltage from the battery to determine if it goes above or below specific thresholds and sets DTC B1318 in continuous memory if the SJB detects low battery voltage below 10 volts on circuit SBB01 (RD).

- DTC B1318 (Battery Voltage Low) - a continuous memory DTC that sets when the SJB detects battery voltage below 10 volts on circuit SBB01 (RD).

This pinpoint test is intended to diagnose the following:





- Wiring, terminals or connectors
- High circuit resistance
- SJB

PINPOINT TEST C: DTC B1318

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
C1 RECHECK THE SJB DTCs	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: SJB Self-Test. • Clear the DTCs. Repeat the SJB self-test. • **Is DTC B1318 still present?**	**Yes** GO to C2 . **No** The system is operating normally at this time. The DTC may have been set previously during battery charging or while jump starting the vehicle.
C2 CHECK FOR CHARGING SYSTEM DTCs IN THE PCM	
• Enter the following diagnostic mode on the scan tool: PCM Self-Test. • Retrieve the continuous memory DTCs from the PCM. • **Is DTC P0620, P0625, P0626 or P065B set in the PCM?**	**Yes** REFER to Section 414-00 . **No** GO to C3 .
C3 CHECK THE BATTERY CONDITION AND STATE OF CHARGE	
• Ignition OFF. • Check the battery condition and verify the battery is fully charged. Refer to Section 414-01 , Battery Condition Test. • **Is the battery OK and fully charged?**	**Yes** GO to C4 . **No** REFER to Section 414-00 .
C4 CHECK THE SJB VOLTAGE SUPPLY	

• Measure and record the voltage at the battery. • Disconnect: SJB C2280E. • Ignition ON. • Measure the voltage between the SJB C2280E-32, circuit SBB01 (RD), harness side and ground.  • **Is the voltage within 0.2 volt of the recorded battery voltage?**	**Yes** GO to C5 . **No** REPAIR the circuit for high resistance. CLEAR the DTC. REPEAT the self-test.
C5 CHECK THE SJB GROUND CIRCUIT	
• Ignition OFF. • Disconnect: Negative Battery Cable. • Measure the resistance between the SJB C2280E-22, circuit GD108 (BK/VT), harness side and ground.  • **Is the resistance less than 5 ohms?**	**Yes** CONNECT the negative battery cable. GO to C6 . **No** REPAIR the circuit for high resistance. CONNECT the negative battery cable. TEST the system for normal operation.
C6 CHECK FOR CORRECT SJB OPERATION	
• Disconnect the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Smart Junction Box (SJB) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test D: DTC U0155

Normal Operation

- DTC U0155 (Lost Communication With Instrument Panel Cluster (IC) Control Module) - set by the SJB whenever it receives invalid data from the Instrument Cluster (IC).

This pinpoint test is intended to diagnose the following:

- Module communication
- SJB
- IC

PINPOINT TEST D: DTC U0155

Test Step	Result / Action to Take
D1 VERIFY CUSTOMER CONCERN	
• Ignition ON. • Verify that there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to D2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
D2 CHECK THE COMMUNICATION NETWORK	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Network Test. • Carry out the network test. • **Does the IC pass the network test?**	**Yes** GO to D3 . **No** REFER to Section 418-00 .
D3 RETRIEVE THE RECORDED DTCs FROM THE SELF-TEST	
• Check for recorded SJB DTCs from the self-test. • **Is DTC B1317 or B1318 recorded?**	**Yes** For DTC B1317, GO to Pinpoint Test B . For DTC B1318, GO to Pinpoint Test C . **No** GO to D4 .
D4 RECHECK THE SJB DTCs	
NOTE: If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during Programmable Module Installation (PMI) or the PMI may not have been carried out. • Clear the DTCs. Repeat the SJB self-test. • **Is DTC U0155 still present?**	**Yes** GO to D5 . **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
D5 CHECK FOR DTC U0155 SET IN OTHER MODULES	
• Clear all DTCs.	**Yes** INSTALL a new IC . REFER to

• Ignition OFF. • Ignition ON. • Wait 10 seconds. • Enter the following diagnostic mode on the scan tool: Self-Test. • Retrieve the continuous memory DTCs from all modules. • **Is DTC U0155 set in the ACM , DSM , audio DSP module or PAM ?**	Section 413-01 . **No** INSTALL a new SJB . REFER to Smart Junction Box (SJB) in this section.

Pinpoint Test E: DTC U0164

Normal Operation

- DTC U0164 (Lost Communication With HVAC Control Module (EATC)) - set by the Smart Junction Box (SJB) if data messages received from the (module name) over the (network name) are missing for (insert specified time).

This pinpoint test is intended to diagnose the following:

- Module communication
- SJB
- HVAC module

PINPOINT TEST E: DTC U0164

Test Step	Result / Action to Take
E1 VERIFY CUSTOMER CONCERN	
• Ignition ON. • Verify that there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to E2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or intermittent fault condition.
E2 CHECK THE COMMUNICATION NETWORK	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Network Test. • Carry out the network test. • **Does the (insert sending module name) pass the network test?**	**Yes** GO to E3 . **No** REFER to Section 418-00 .
E3 RETRIEVE THE RECORDED DTCs FROM THE SELF-TEST	
• Check for recorded SJB DTCs from the self-test. • **Is DTC B1317 or B1318 recorded?**	**Yes** For DTC B1317, GO to Pinpoint Test B . For DTC B1318, GO to Pinpoint

	Test C . **No** GO to E4 .
E4 RECHECK THE SJB DTCs	
NOTE: If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during Programmable Module Installation (PMI) or the PMI may not have been carried out. • Clear the DTCs. Repeat the SJB self-test. • **Is DTC U0164 still present?**	**Yes** INSTALL a new HVAC module. TEST the system for normal operation. REPEAT the SJB self-test. If DTC U0164 is still present, INSTALL a new SJB . REFER to Smart Junction Box (SJB) in this section. **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or intermittent fault condition.

Driver Seat Module (DSM)

Special Tool(s)

 ST1137-A	73III Automotive Meter 105-R0057 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
 ST2574-A	Flex Probe Kit 105-R025C or equivalent

Principles of Operation

The Driver Seat Module (DSM) controls the memory driver seat positions and the memory adjustable pedals. The DSM receives inputs from the memory set switches in order to program the 2 separate, personalized memory positions for the seats and (if equipped) the adjustable pedals. These positions can be recalled by either pressing the memory switches or by unlocking the vehicle with the remote transmitters.

The DSM also receives inputs from the driver seat switch and outputs the requested command to the seats. If the vehicle has memory, the DSM will also receive inputs from the adjustable pedal switch and outputs the requested commands to the adjustable pedal motor. The memory driver seat feature allows the driver to program a personalized seat position that can be recalled using the memory switches or the Remote Keyless Entry (RKE) transmitter. Refer to Section 501-14 for the remote memory activation general procedure.

The DSM is on the Medium Speed Controller Area Network (MS-CAN). The DSM supports inter-module and scan tool communications.

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of electrical damage.

Visual Inspection Chart

Electrical
• Battery Junction Box (BJB) fuse 14 (30A)

- Smart Junction Box (SJB) fuse 1 (20A)
- Wiring, terminals or connectors
- Driver Seat Module (DSM)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM .
   - Refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the DSM .

9. If the DTCs retrieved are related to the concern, refer to Diagnostic Trouble Code (DTC) Chart in this section.

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

DTC Charts

Driver Seat Module (DSM) DTC Chart

DTC	Description	Action
B1317	Battery Voltage High	GO to Pinpoint Test F .
B1318	Battery Voltage Low	GO to Pinpoint Test G .
B1342	ECU is Faulted	CLEAR the DTCs. REPEAT the self-test. If DTC B1342 is retrieved again, INSTALL a new DSM . REFER to Driver Seat Module (DSM) in this section. TEST the system for normal operation.
B2143		

	NVM Memory Failure	CONFIGURE the DSM . REFER to Section 418-01 . CLEAR the DTCs. RETRIEVE the DTCs and VERIFY successful module configuration. If DTC B2143 is retrieved again, INSTALL a new DSM . REFER to Driver Seat Module (DSM) in this section. REPEAT the self-test.
All other DTCs	-	REFER to Diagnostic Trouble Code (DTC) Chart in this section.

Symptom Chart

Symptom Chart

Pinpoint Tests

Pinpoint Test F: DTC B1317

Refer to Wiring Diagrams Cell 117 , Remote Keyless Entry and Alarm for schematic and connector information.

Normal Operation

The Driver Seat Module (DSM) monitors the voltage from the battery to determine if it goes above or below specific thresholds and sets DTC B1317 in continuous memory if the DSM detects high battery voltage above 15 volts on circuit SBB14 (BN/RD).

- DTC B1317 (Battery Voltage High) - a continuous memory DTC that sets when the DSM detects battery voltage above 15 volts on circuit SBB14 (BN/RD).

This pinpoint test is intended to diagnose the following:

- Charging system concern
- DSM

PINPOINT TEST F: DTC B1317

NOTE: DTC B1317 may be stored in the module memory due to previous battery charging or vehicle jump starting events.

Test Step	Result / Action to Take
F1 CHECK FOR DTCs B1317, B1676 OR P0563 SET IN OTHER MODULES	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: (All Modules) Self-Test. • Retrieve the continuous memory DTCs from all modules.	**Yes** REFER to Section 414-00 to diagnose an overcharging condition. **No** GO to F2 .

• **Is DTC B1317, B1676 or P0563 (PCM) set in more than one module?**	
F2 CHECK THE BATTERY VOLTAGE	
• Turn off all interior/exterior lights and accessories. • Start and run the engine at approximately 2,000 rpm for 3 minutes while monitoring the battery voltage. • **Does the battery voltage rise to 15 volts or higher?**	**Yes** REFER to Section 414-00 to diagnose an overcharging condition. **No** GO to F3 .
F3 RECHECK FOR DTC B1317	
• Turn the engine off. • Ignition ON. • Enter the following diagnostic mode on the scan tool: DSM Self-Test. • Clear the continuous memory DTCs. • Carry out the DSM self-test. • **Is DTC B1317 present?**	**Yes** INSTALL a new DSM . REFER to Driver Seat Module (DSM) in this section. TEST the system for normal operation. **No** The system is operating normally at this time. The DTC may have been set previously during battery charging or while jump starting the vehicle.

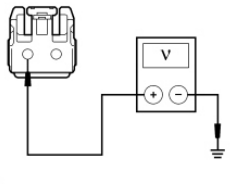
Pinpoint Test G: DTC B1318

Refer to Wiring Diagrams Cell 117 , Remote Keyless Entry and Alarm for schematic and connector information.

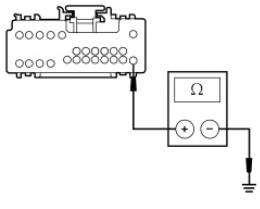
Normal Operation

The Driver Seat Module (DSM) monitors the voltage from the battery to determine if it goes above or below specific thresholds and sets DTC B1318 in continuous memory if the DSM detects low battery voltage below 10 volts on circuit SBB14 (BN/RD).

- DTC B1318 (Battery Voltage Low) - a continuous memory DTC that sets when the DSM detects battery voltage below 10 volts on circuit SBB14 (BN/RD).



This pinpoint test is intended to diagnose the following:

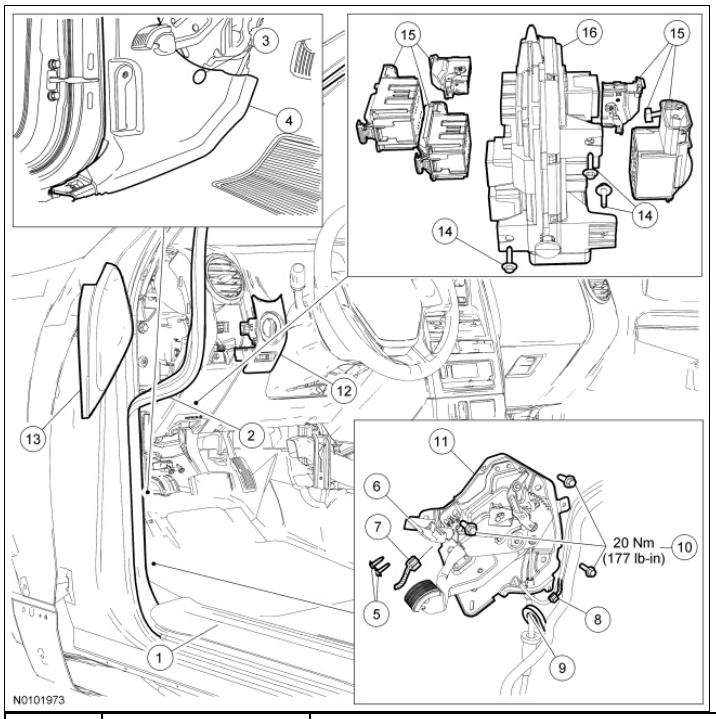


- Wiring, terminals or connectors
- High circuit resistance
- DSM

PINPOINT TEST G: DTC B1318

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .



Test Step	Result / Action to Take
G1 RECHECK THE DSM DTCs	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: DSM Self-Test. • Clear the DTCs. Repeat the DSM self-test. • **Is DTC B1318 still present?**	**Yes** GO to G2 . **No** The system is operating normally at this time. The DTC may have been set previously during battery charging or while jump starting the vehicle.
G2 CHECK FOR CHARGING SYSTEM DTCs IN THE PCM	
• Enter the following diagnostic mode on the scan tool: PCM Self-Test. • Retrieve the continuous memory DTCs from the PCM. • **Is DTC P0620, P0625, P0626 or P065B set in the PCM?**	**Yes** REFER to Section 414-00 . **No** GO to G3 .
G3 CHECK THE BATTERY CONDITION AND STATE OF CHARGE	
• Ignition OFF. • Check the battery condition and verify the battery is fully charged. Refer to Section 414-01 , Battery Condition Test. • **Is the battery OK and fully charged?**	**Yes** GO to G4 . **No** REFER to Section 414-00 .
G4 CHECK THE DSM VOLTAGE SUPPLY	
• Measure and record the voltage at the battery. • Disconnect: DSM C341A. • Ignition ON. • Measure the voltage between the DSM C341A-2, circuit SBB14 (BN/RD), harness side and ground.  N0094160 • **Is the voltage within 0.2 volt of the recorded battery voltage?**	**Yes** GO to G5 . **No** REPAIR the circuit for high resistance. CLEAR the DTC. REPEAT the self-test.
G5 CHECK THE DSM GROUND CIRCUIT	

• Ignition OFF. • Disconnect: Negative Battery Cable. • Disconnect: DSM C341C. • Measure the resistance between the DSM C341C-13, circuit GD143 (BK/VT), harness side and ground.  • **Is the resistance less than 5 ohms?**	**Yes** CONNECT the negative battery cable. GO to G6 . **No** REPAIR the circuit for high resistance. CONNECT the negative battery cable. TEST the system for normal operation.
G6 CHECK FOR CORRECT DSM OPERATION	
• Disconnect the DSM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the DSM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new DSM . REFER to Driver Seat Module (DSM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Smart Junction Box (SJB)

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Item	Part Number	Description
1	13208	Driver door scuff plate
2	-	LH door weather seal
3	-	Cowl side trim panel pushpin
4	7802344	Cowl side trim panel
5	W707628	Parking brake release handle bolts (2 required)
6	-	Parking brake release handle
7	-	Parking brake switch electrical connector
8	-	Hood release cable pushpin
9	-	Harness clip
10	N806497	Parking brake control bolts (3 required)
11	2780	Parking brake control
12	11654	Headlight switch assembly
13	7804481	LH instrument panel side finish panel
14	-	Smart Junction Box (SJB) bolts (3 required)

15	-	SJB electrical connectors (5 required)
16	15604	SJB

Removal

NOTICE: **If the Smart Junction Box (SJB) is dropped, damage to the internal components may occur. A new SJB must be installed.**

NOTICE: **Electronic modules are sensitive to static electrical charges. If exposed to these charges, damage may result.**

NOTE: Prior to the replacement of the module, it is necessary to upload the module configuration information into the appropriate scan tool. This information must be downloaded into the new module after installation. For additional information, refer to Section 418-01 .

NOTE: The Tire Pressure Monitoring System (TPMS) functionality is integral to the SJB . The steps in this procedure are critical to restoring the vehicle security and the TPMS to normal operation. A new SJB is delivered in a manufacturing mode with 6 pre-set DTCs related to the TPMS . To clear the DTCs, successful configuration of the SJB must occur, followed by successful TPMS sensor training, and a successful self-test, including clearing of the DTCs. The DTCs are as follows:

- B2477 (Module Configuration Failure)
- B2868 (Left Front Tire Pressure Sensor Fault)
- B2869 (Right Front Tire Pressure Sensor Fault)
- B2870 (Right Rear Tire Pressure Sensor Fault)
- B2871 (Left Rear Tire Pressure Sensor Fault)
- C2780 (ECU in Manufacturer Sub-State)

1. **NOTE:** This step is necessary only if the SJB is being replaced.

   Upload the module configuration information from the SJB . For additional information, refer to Section 418-01 .

2. Remove the driver door scuff plate. For additional information, refer to Section 501-05 .

3. Position the LH door opening weather seal aside.

4. **NOTE:** While pulling the trim panel rearward, pull the hood release lever rearward in order for the release lever to slide through the trim panel.

   Remove the pushpin and the cowl side trim panel.

5. Remove the 2 bolts and the parking brake release handle.

6. Disconnect the parking brake switch electrical connector.

7. Release the hood release cable pushpin from the parking brake control bracket.

8. Release the harness clip from the parking brake cable housing.

9. **NOTE:** Rotating the parking brake control counterclockwise allows enough access to clear the instrument panel reinforcement.

   Remove the 3 bolts and position the parking brake control assembly under the brake pedal.

10. *NOTICE:* **The lower side of the headlight switch bezel includes 2 tabs that slide down onto the instrument panel and may be broken if any prying force is exerted in the lower area of the bezel.**

    Using a suitable tool (such as a trim removal tool), pry the mid-to-upper side of the headlight switch bezel away from the instrument panel (then lift it upward to disengage the lower tangs from the instrument panel), disconnect 2 electrical connectors and position the bezel assembly aside.

11. If necessary, push the LH instrument panel side finish panel out and position it aside.

12. Through the headlight switch bezel opening, remove the 2 SJB bolts.

13. From under the instrument panel, remove the third (lower right) SJB bolt.

14. Pull the SJB down out of the 2 locating pins, disconnect the electrical connectors and remove the SJB .

Installation

NOTE: When a new SJB is installed, all customer Remote Keyless Entry (RKE) transmitters may be required to be present in order to program the RKE transmitters to the new SJB .

1. Position the SJB into the 2 locating pins and connect the electrical connectors.

2. From under the instrument panel, install the lower right SJB bolt.

3. Through the headlight switch bezel opening, install the 2 SJB bolts.

4. If necessary, install the LH instrument panel side finish panel.

5. Connect the electrical connectors and install the headlight switch bezel assembly into the instrument panel.

6. Position the parking brake control assembly and install the 3 bolts.
   - Tighten to 20 Nm (177 lb-in).

7. Install the harness clip on the parking brake cable housing.

8. Install the hood release cable pushpin into the parking brake control bracket.

9. Connect the parking brake switch electrical connector.

10. Position the parking brake release handle and install the 2 bolts.

11. **NOTE:** While installing the trim panel, pull the hood release lever rearward in order for the release lever to slide through the trim panel.

    Position the cowl side trim panel and install the pushpin.

12. Position the LH door opening weather seal.

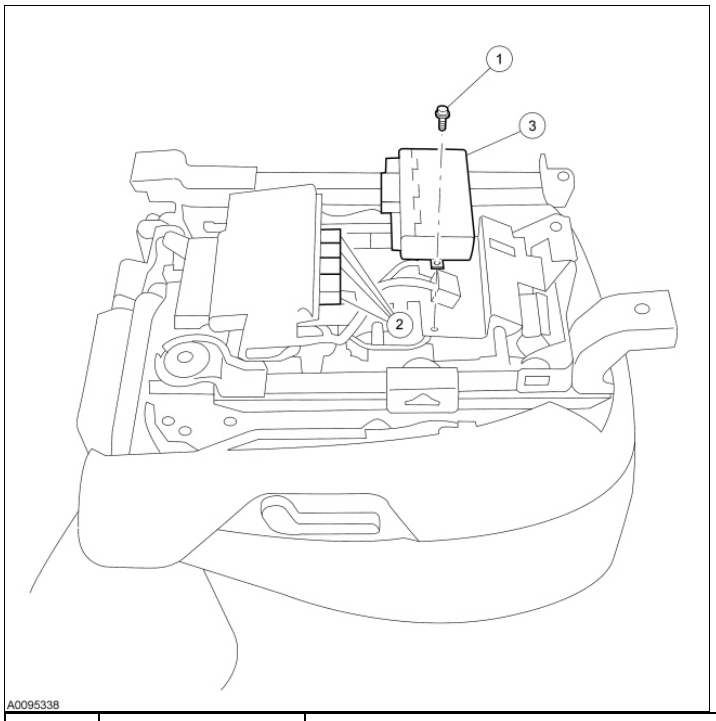
13. **NOTE:** If the SJB was not replaced, this is the last step that is necessary.

    Install the driver door scuff plate. For additional information, refer to Section 501-05 .

14. **NOTE:** When successful, this step programs the remote transmitters into the new SJB . In the event the remote transmitters do not program to the new SJB , all of the remote transmitters needs to be present and refer to Section 501-14 . This action programs the remote transmitters into the new SJB .

    Download the SJB configuration information from the scan tool into the new SJB . For additional information, refer to Section 418-01 .

15. Train the tire pressure sensors. For additional information, refer to Section 204-04 .



16. **NOTE:** DTC C2780 does not clear if any of the pre-set DTCs are still present in the SJB . When successful, this step clears DTC C2780.

    Carry out the SJB self-test (must include an on-demand) by clearing DTCs, and then retrieving DTCs to confirm all DTCs have been cleared.

Driver Seat Module (DSM)

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Item	Part Number	Description
1	-	Driver Seat Module (DSM) screws (2 required)
2	-	DSM electrical connectors (part of 14C719)
3	13C789	DSM

Removal and Installation

NOTICE: **Electronic modules are sensitive to static electrical charges. If exposed to these charges, damage may result.**

NOTE: Prior to the removal of the module, it is necessary to upload the module configuration information to a scan tool. This information must be downloaded into the new Driver Seat Module (DSM) after installation. For additional information, refer to Section 418-01 .

1. **NOTE:** This step is necessary only if the DSM is being replaced.

   Upload the module configuration information from the DSM . For additional information, refer to Section 418-01 .

2. Remove the driver seat. For additional information, refer to Section 501-10 .

3. Remove the 2 DSM screws.

4. Disconnect the electrical connectors and remove the DSM .

5. **NOTE:** When a new DSM is installed, it is necessary to download the module configuration information from the scan tool into the new DSM . For additional information, refer to Section 418-01 .

   To install, reverse the removal procedure.

INTRODUCTION

NOTE: Ford Motor Company reserves the right to discontinue models at any time, or change specifications or design without notice and without incurring any obligation.

REPAIR TECHNIQUES

Appropriate service methods and procedures are essential for the safe, reliable operation of all motor vehicles as well as the personal safety of the individual doing the work. This manual provides general directions for performing service with tested, effective techniques. Following them will help assure reliability.

There are numerous variations in procedure, techniques, tools and parts for servicing vehicles, as well as in the skill of the individual doing the work. This manual cannot possibly anticipate all such variations and provide advice or cautions as to each. Accordingly, anyone who departs from the instructions provided in this manual must first establish that they compromise neither their personal safety nor the vehicle integrity by their choice of methods, tools or parts.

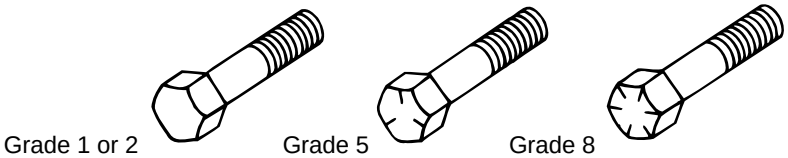
NOTE, NOTICE, CAUTION AND WARNING

As you read through this manual, you may come across a **NOTE**, **NOTICE**, or **WARNING**. Older Manuals may also include a **CAUTION**. Each one is there for a specific purpose. A NOTE calls attention to unique, additional, or essential information related to the subject procedure. A **NOTICE** or **CAUTION** identifies a hazard that could damage the vehicle or property. A **WARNING** identifies a hazard that could result in severe personal injury or death to yourself or others. Some general **WARNINGS** that you should always follow when you work on a vehicle are listed below.

- **ALWAYS WEAR SAFETY GLASSES FOR EYE PROTECTION.**
- **KEEP SOLVENTS AWAY FROM IGNITION SOURCES. SOLVENTS MAY BE FLAMMABLE AND COULD IGNITE OR EXPLODE IF NOT HANDLED CORRECTLY.**
- **USE SAFETY STANDS WHENEVER A PROCEDURE REQUIRES YOU TO BE UNDER THE VEHICLE.**
- **MAKE SURE THAT THE IGNITION SWITCH IS ALWAYS IN THE OFF POSITION, UNLESS OTHERWISE REQUIRED BY THE PROCEDURE.**
- **SET THE PARKING BRAKE WHEN WORKING ON THE VEHICLE. IF YOU HAVE AN AUTOMATIC TRANSMISSION, SET IN PARK UNLESS INSTRUCTED OTHERWISE FOR A SPECIFIC OPERATION. IF YOU HAVE A MANUAL TRANSMISSION, IT SHOULD BE IN REVERSE (ENGINE OFF) OR NEUTRAL (ENGINE ON) UNLESS INSTRUCTED OTHERWISE FOR A SPECIFIC OPERATION. PLACE WOOD BLOCKS (4" X 4" OR LARGER) OR WHEEL CHOCKS AGAINST THE FRONT AND REAR SURFACES OF THE TIRES TO HELP PREVENT THE VEHICLE FROM MOVING.**
- **OPERATE THE ENGINE ONLY IN A WELL-VENTILATED AREA TO AVOID THE DANGER OF CARBON MONOXIDE POISONING.**
- **KEEP YOURSELF AND YOUR CLOTHING AWAY FROM MOVING PARTS WHEN THE ENGINE IS RUNNING, ESPECIALLY THE DRIVE BELTS.**
- **TO PREVENT SERIOUS BURNS, AVOID CONTACT WITH HOT METAL PARTS SUCH AS THE RADIATOR, EXHAUST MANIFOLD, TAIL PIPE, THREE-WAY CATALYTIC CONVERTER AND MUFFLER.**
- **DO NOT SMOKE WHILE WORKING ON A VEHICLE.**
- **TO AVOID INJURY, ALWAYS REMOVE RINGS, WATCHES, LOOSE HANGING JEWELRY AND LOOSE CLOTHING BEFORE BEGINNING TO WORK ON A VEHICLE.**
- **WHEN IT IS NECESSARY TO WORK UNDER THE HOOD, KEEP HANDS AND OTHER OBJECTS CLEAR OF THE COOLING FAN BLADES!**

TOOLS

Commercially available hand tools and equipment are used along with Essential Special Service Tools (ESST) and Rotunda equipment. Power tools have become the acceptable industry standard and are used for disassembly only where applicable, unless specified otherwise in the Workshop Manual. The only exception to this policy is installing wheels in conjunction with the use of torque sticks, when possible.

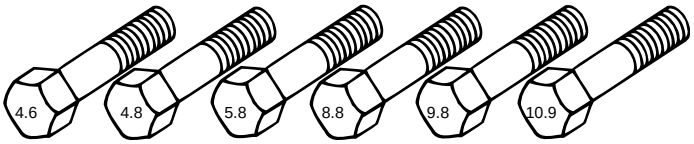


MATERIALS

Throughout this manual, chemicals or materials are specified that must be used to properly complete a service procedure or diagnostic step. In the event a specific material is not readily available, a substitute material meeting the same specification may be used. Substitute materials not meeting Ford specifications may cause degraded performance, premature failures, and/or vehicle component damage.

METRICS

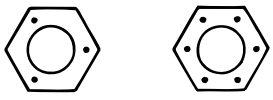
BOLT STRENGTH IDENTIFICATION



ENGLISH SYSTEM

Grade 1 or 2 Grade 5 Grade 8

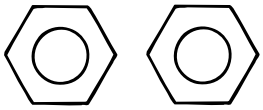
English bolts: Identification marks on the bolt head represent Rockwell hardness. Generally, the bolt's grade is equal to the number of marks plus two. The higher the grade, the stronger the bolt.



METRIC SYSTEM

Metric bolts: Identification class numbers on bolt heads represent tensile strength. Higher numbers indicate stronger bolts. Common metric fastener bolt strength properties are 9.8 and 10.9.

HEX NUT STRENGTH IDENTIFICATION

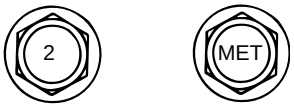


ENGLISH SYSTEM

Grade 5 Grade 8

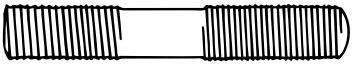
Identification dots represent Rockwell hardness. The nut's grade is equal to the number of dots plus two. The higher the grade, the stronger the nut.

METRIC SYSTEM



Identification class numbers on nuts represent tensile strength. Higher numbers indicate stronger nuts. Nuts may also have blue finish or paint daub on hex flat.

OTHER TYPES OF PARTS



Metric identification schemes vary by type of part, most often a variation of that used for bolts and nuts. Note that many types of English and Metric fasteners carry no special identification if they are otherwise unique.

–Stamped U-Nuts

–Tapping, thread forming and certain other case hardened screws.

CLASS 10.9 CLASS 9.8 CLASS 8.8

–Studs, Large studs may carry the property class number. Smaller studs use a geometric code on the end.
